Network log	Log entries of active connections from a server to external networks.

Account log

The following table lists fields that are supported in queries.

Supported fields of Account logs

Field	Date type	Description
uuid	String	The agent ID.
ip	String	The server IP address.
warn_ip	String	The source IP address.
warn_port	String	The logon port.
warn_user	String	The username for the logon.
warn_type	String	The logon type.
warn_count	String	The number of logon attempts.

Brute Force log

The following table lists fields that are supported in queries.

Supported fields of the Brute Force logs

Field	Date type	Description
uuid	String	The agent ID.

Field	Date type	Description
ip	String	The server IP address.
warn_ip	String	The attacker IP address.
warn_port	String	The target port number.
warn_user	String	The target username.
warn_type	String	The type.
warn_count	String	The number of brute-force attack attempts.

Process log

The following table lists fields that are supported in queries.

Supported fields of Process logs

Field	Date type	Description
uuid	String	The agent ID.
ip	String	The server IP address.
pid	String	The process ID.
groupname	String	The name of the user group.
ppid	String	The ID of the parent process.
uid	String	The ID of the user.
username	String	The user name.
filename	String	The file name.
pfilename	String	The file name of the parent process.
cmdline	String	The command line.
filepath	String	The process path.
pfilepath	String	The parent process path.

Network Snapshot log

The following table lists fields that are supported in queries.

Supported fields of Network Snapshot logs

Field	Date type	Description
uuid	String	The agent ID.
ip	String	The server IP address.
src_port	String	The listening port.
src_ip	String	The listening IP address.

Field	Date type	Description
proc_path	String	The process path.
pid	String	The process ID.
proc_name	String	The process name.
proto	String	The protocol.

Account Snapshot log

The following table lists fields that are supported in queries.

Supported fields of Account Snapshot logs

Field	Date type	Description
uuid	String	The agent ID.
ip	String	The server IP address.
perm	String	Indicates whether the agent has root permissions.
home_dir	String	The home directory.
warn_time	String	The time when the password expiration notification was sent.
groups	String	The group to which the user belongs.
login_ip	String	The IP address of the last logon.
last_chg	String	The last time when the password was changed.
shell	String	The Linux shell command.
domain	String	The Windows domain.
tty	String	The logon terminal.
account_expire	String	The time when the account expired.
passwd_expire	String	The time when the password expired.
last_logon	String	The last logon time.
user	String	The user.
status	String	The user status. Valid values: <ul style="list-style-type: none"> 0: disabled 1: normal

Process Snapshot log

The following table lists fields that are supported in queries.

Supported fields of Process Snapshot logs

Field	Date type	Description
uuid	String	The agent ID.
ip	String	The server IP address.
path	String	The process path.
start_time	String	The time when the process was started.
uid	String	The ID of the user.
cmdline	String	The command line.
pname	String	The name of the parent process.
name	String	The process name.
pid	String	The process ID.
user	String	The user name.
md5	String	The MD5 value of the process file. This value is not calculated if the file size exceeds 1 MB.

Network log

The following table lists fields that are supported in queries.

Supported fields in Network logs

Field	Date type	Description
uuid	String	The agent ID.
ip	String	The server IP address.
src_ip	String	The source IP address.
src_port	String	The source port.
proc_path	String	The process path.
dst_port	String	The destination port.
proc_name	String	The process name.
dst_ip	String	The destination IP address.
status	String	The status.

28.6.5.4. Logical operators

The log retrieval feature supports multiple search conditions. You can add multiple logical operators in one search condition for one log source, or combine multiple search conditions for several log sources by using different logical operators. This topic describes the logical operators that are supported in log retrieval. Examples are provided to help you understand these operators.

The following table describes the logical operators that are supported in log queries.

Logical operator	Description
and	<p>Binary operator.</p> <p>This operator is in the format of <code>query1 and query2</code> , which indicates the intersection of the query results of <code>query1</code> and <code>query2</code> .</p> <p>Note If no logical operators are used for multiple keywords, the default operator is "AND".</p>
or	<p>Binary operator.</p> <p>This operator is in the format of <code>query1 or query2</code> , which indicates the union of the query results of <code>query1</code> and <code>query2</code> .</p>
not	<p>Binary operator.</p> <p>This operator is in the format of <code>query1 not query2</code> , which indicates results that match <code>query1</code> but does not match <code>query2</code> . This format is equivalent to <code>query1 - query2</code> .</p> <p>Note <code>not query1</code> indicates that the log data that does not contain the query results of <code>query1</code> is returned.</p>

28.6.6. Settings

28.6.6.1. Install the Server Guard agent

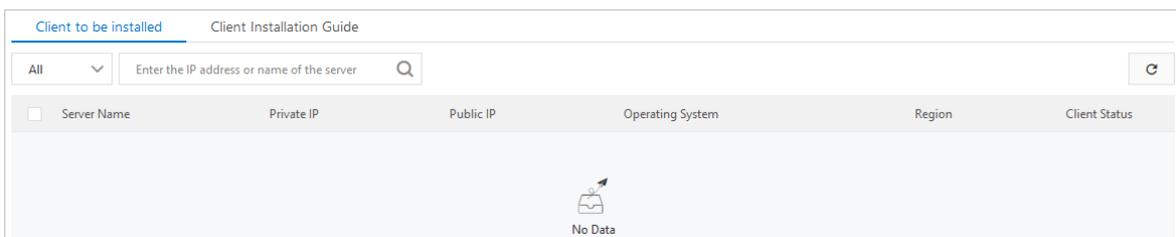

This topic describes how to install the Server Guard agent by specifying parameters.

Context

To use the protection services provided by Server Guard, you must install the Server Guard agent on the operating system of your server.

Procedure

1. [Log on to Apsara Stack Security Center.](#)
2. In the left-side navigation pane, choose **Server Security > Server Settings > Client Installation**.
3. (Optional) On the Client Installation page, click the **Client to be installed** tab to view the number of servers on which the Server Guard agent is not installed. On this tab, you can also view the relevant information in the server list. You can specify the operating system type, IP address, or server name to search for a target server.

4. Click the **Client Installation Guide** tab.
5. Obtain and install the Server Guard agent based on the operating system type of your server.

- **Windows**
 - a. In the left-side pane of the page, click **Click to download** to download the client software package to your computer.
 - b. Upload the installation package to your server. For example, you can use an FTP client to upload the package to your server.
 - c. Run the installation package on your server as an administrator.

 **Note** When you install the agent on a server that is not in Alibaba Cloud, you will be prompted to enter the installation verification key. You can find the installation verification key on the Server Guard agent installation page.

- **Linux**
 - a. In the right-side pane of the page, select **Alibaba Cloud Server** or **Non-Alibaba Server**.
 - b. Select the installation command for your 32-bit or 64-bit operating system and click **Copy** to copy the command.
 - c. Log on to your Linux server as an administrator.
 - d. Run the installation command on your Linux server to download and install the Server Guard agent.

28.6.6.2. Manage protection modes

This topic describes how to manage protection modes for each server to make them more efficient and secure.

Procedure

1. [Log on to Apsara Stack Security Center](#).
2. In the left-side navigation pane, choose **Server Security** > **Server Settings** > **Protection Mode**.
3. On the Protection Mode page, click **Manage**. Configure protection modes for each server.
 - **Business First Mode**: The peak CPU utilization is less than 10%, and the peak memory usage is less than 50 MB.
 - **Protection First Mode**: The peak CPU utilization is less than 20%, and the peak memory usage is less than 80 MB.
4. Click **OK**.

28.7. Application security

28.7.1. Quick start

This topic helps you get started with Web Application Firewall (WAF).

WAF uses intelligent semantic analysis algorithms to identify web attacks. WAF also integrates a learning model to enhance its analysis capabilities and meet your daily security protection requirements without relying on traditional rule libraries.

The following content describes the procedure for using WAF:

1. **Customize WAF protection rules.**

WAF provides a default protection policy. You can also customize policies that suit your business requirements.

 - For more information about how to configure protection policies, see [Configure protection policies](#).
 - For more information about how to configure custom rules, see [Create a custom rule](#).
 - For more information about how to configure HTTP flood protection rules, see [Configure an HTTP flood protection rule](#).
2. **Add protected websites.**

WAF can protect Internet websites and virtual private cloud (VPC) websites.

- For more information about how to add an Internet website to WAF for protection, see [Add an Internet website for protection](#).
 - For more information about how to add a VPC website to WAF for protection, see [Add a VPC website for protection](#).
3. Configure Domain Name System (DNS) resolution.
- For more information about how to change the DNS-resolved source IP address of a website to a virtual IP address of WAF, see [Modify DNS resolution settings](#).
4. View WAF protection results.
- For more information about how to view the protection overview, see [View protection overview](#).
 - For more information about how to view the service access information, see [View Web service access information](#).
 - For more information about how to view the detection logs for web attacks, see [View attack detection logs](#).
 - For more information about how to view the detection logs for HTTP flood attacks, see [View HTTP flood protection logs](#).

28.7.2. Detection overview

28.7.2.1. View protection overview

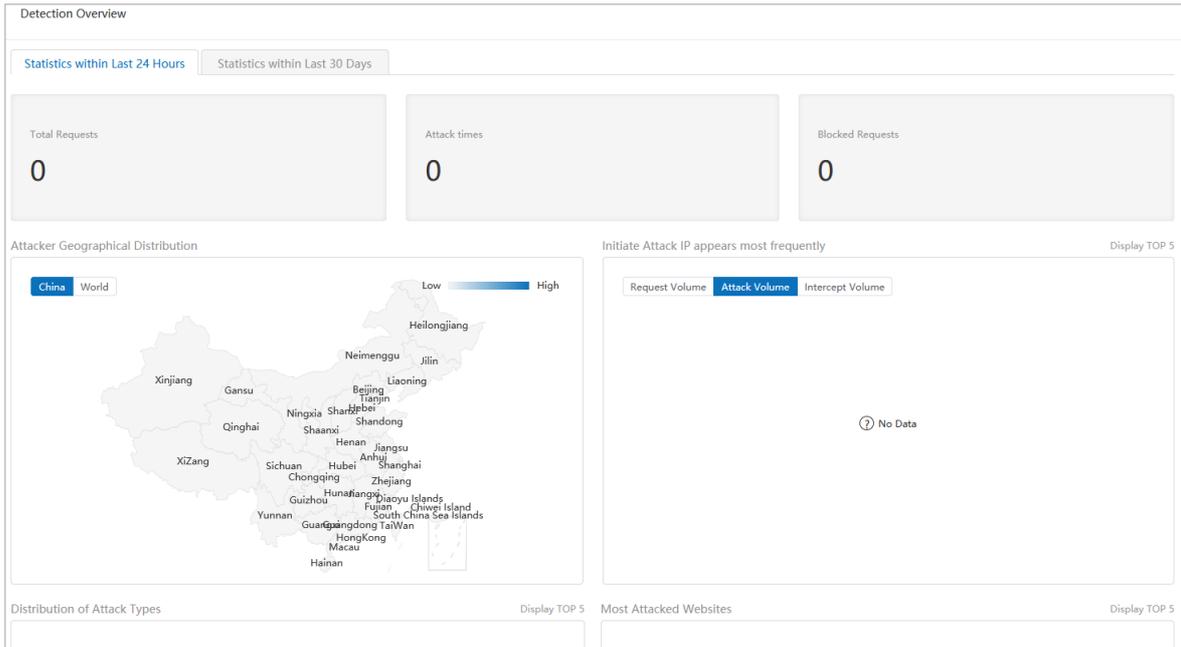

This topic describes how to view the Web Application Firewall (WAF) detection overview.

Context

The Protection Overview page displays information such as the statistics of previous attacks, the geographical distribution of attackers, and the numbers of total requests and blocked requests. You can learn the web attack protection information and custom protection rules.

Procedure

1. [Log on to Apsara Stack Security Center](#).
2. In the left-side navigation pane, choose **Application Security > WAF**.
3. In the left-side navigation tree, choose **Detection Overview > Detection Overview**.
4. On the **Detection Overview** page, you can view **Statistics within Last 24 Hours** and **Statistics within Last 30 Days**.

- **Requests**
Displays the total number of requests.
- **Attacks**
Displays the total number of attacks.
- **Blocked requests**
Displays the total number of blocked requests.
- **Attacker geographical distribution on a map**
Displays the distribution of attackers on a map. You can select a map of China or a map of the world.
- **Distribution of total requests and blocked requests.**
- **Distribution of top five attack IP addresses**
Displays the top five IP addresses that have launched the most attacks in a bar chart. The X-axis indicates the number of requests. The Y-axis indicates the IP address.
- **Distribution of top five attack types**
Displays the distribution of the top five attack types and the number of attacks of each type in a pie chart.
- **Top five attacked websites**
Displays the top five attacked websites and the number of attacks on each website in a bar chart .

28.7.2.2. View web service access information

This topic describes how to view the service access information.

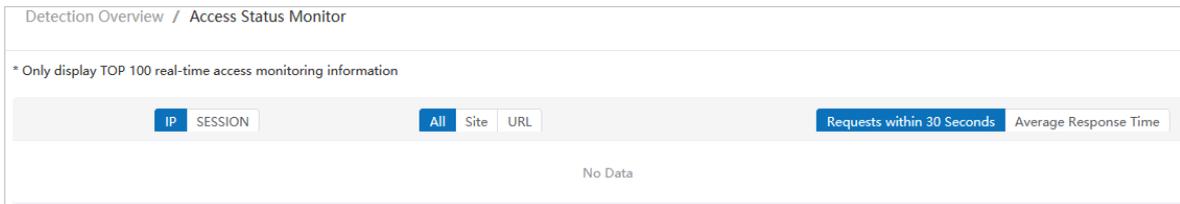

Context

Web Application Firewall (WAF) monitors the web service access information. This allows security administrators to analyze the business access information and detect vulnerabilities.

Procedure

1. **Log on to Apsara Stack Security Center.**
2. In the left-side navigation pane, choose **Application Security > WAF**.

- In the left-side navigation tree, choose **Detection Overview > Access Status Monitor**.
- Filter the access records to view the details.

28.7.3. Protection logs

28.7.3.1. View attack detection logs

This topic describes how to view attack detection logs.

Context

These logs allow you to analyze the attacks on your web services. Based on the analysis, you can update the attack protection policies and custom rules and fix the web service vulnerabilities.

Procedure

- Log on to [Apsara Stack Security Center](#).
- In the left-side navigation pane, choose **Application Security > WAF**.
- In the left-side navigation tree, choose **Detection Logs > Attack Detection Logs**.
- Click **Filter**, specify filter conditions, and click **OK**.

 **Note** If you specify multiple conditions, all of the conditions must be met.

- View the detected attacks.

28.7.3.2. View HTTP flood protection logs

This topic describes how to view HTTP flood protection logs.

Context

These logs allow you to analyze HTTP flood attacks on your web services. Based on the analysis, you can update the HTTP flood protection rules and HTTP flood whitelist and fix the web service vulnerabilities.

Procedure

- Log on to [Apsara Stack Security Center](#).
- In the left-side navigation pane, choose **Application Security > WAF**.
- In the left-side navigation tree, choose **Detection Logs > HTTP Flood Detection Logs**.
- Click **Filter**, specify filter conditions, and then click **OK**.

 **Note** If you specify multiple conditions, all of the conditions must be met.

- View the HTTP flood detection result. The blocked HTTP flood attacks, related rules, and attack time are displayed.

28.7.3.3. View system operation logs

This topic describes how to view system operations logs.

Procedure

1. [Log on to Apsara Stack Security Center.](#)
2. In the left-side navigation pane, choose **Application Security > WAF.**
3. In the left-side navigation tree, choose **Detection Logs > System operation log.**
4. View the system operations logs. The usernames, content, IP addresses, and creation time are displayed.

28.7.3.4. View access logs

This topic describes how to view access logs.

Procedure

1. [Log on to Apsara Stack Security Center.](#)
2. In the left-side navigation pane, choose **Application Security > WAF.**
3. In the left-side navigation tree, choose **Detection Logs > Access Log.**
4. Click **Filter**, specify filter conditions, and then click **OK.**

 **Note** If you specify multiple conditions, all of the conditions must be met.

5. View the access logs. The requested IP addresses, destination IP addresses, source IP addresses, methods, and response codes are displayed.

28.7.4. Protection configuration

28.7.4.1. Configure protection policies

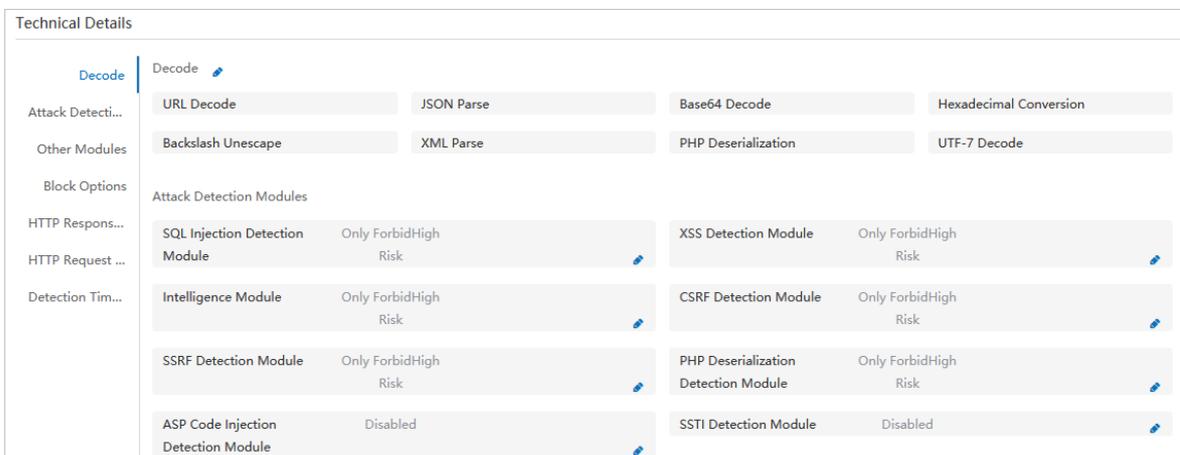

This topic describes how to configure Web Application Firewall (WAF) protection policies.

Context

WAF provides a default protection policy. You can also customize policies that suit your business requirements.

Procedure

1. [Log on to Apsara Stack Security Center.](#)
2. In the left-side navigation pane, choose **Application Security > WAF.** On the **Detection Overview** page, choose **Protection Configuration > Website Protection Policies.**
3. Click **Add protection policy.** In the dialog box that appears, specify **Policy name** and click **Confirm.**
4. In the **Operation** column of the new protection policy, click the  icon to view details.

Parameter	Description
Decode	Select algorithms for decoding the requests.
Attack Detection Modules	Specify the types of attacks to be detected and the risk levels of attacks to be blocked.
Block Options	Specify the status code and image to be returned when an attack is blocked.
HTTP Response Processing	Set the status of the Enable HTTP response processing switch and specify Response Detection Max Body Size.
HTTP Request Body Detection	Specify Response Detection Max Body Size.
Detection Timeout	Set the status of the Enable Detection Timeout switch, and specify Timeout Threshold.

For example, perform the following steps to configure **Attack Detection Modules**:

- i. Move the pointer over a specific module in the **Attack Detection Modules** section, for example, **SQL Injection Detection Module**, and click the modify icon.
- ii. In the **SQL Injection Detection Module** dialog box, specify the detection parameters.

Parameter	Description
Enabled	Indicates whether to enable the detection module.
Blocking Threshold	You can select NotForbid , Only ForbidHigh Risk , ForbidMedium or High Risk , or Forbid All .
Record Threshold	You can select Notrecord , Onlyrecord High Risk , recordMedium or High Risk , or record All .
Detect Non-Injected SQL	Indicates whether to enable detection for non-injected SQL attacks.

iii. Click **OK**.

5. Manage the protection policies.

To delete a protection policy, click the protection policy first. Then, in the upper-right corner, choose **More > Delete Selected Protection Policies**. In the dialog box that appears, click **OK**.

 **Note** You cannot delete the default policy.

28.7.4.2. Create a custom rule

This topic describes how to create a custom rule for Web Application Firewall (WAF).

Context

Security administrators can customize rules to meet various requirements for intrusion detection. You can add, edit, or delete custom rules in the WAF console as an administrator or by using an administrator account. You can use custom rules to filter out requests that meet specific conditions.

Multiple custom rules have the **OR** logical relation. If two custom rules specify the same conditions but differentiate in the operating mode such as blocking traffic and allowing traffic, the system runs the first rule.

Procedure

1. [Log on to Apsara Stack Security Center](#).

- In the left-side navigation pane, choose **Application Security > WAF**. On the **Detection Overview** page, choose **Protection Configuration > Customized Rules**.
- In the upper-right corner, click **Add Rule**. In the **Add Customized Rule** dialog box, configure parameters.

Parameters for creating a custom rule

Parameter	Description
Type	The operating mode of the rule. Valid values: Block , Allow , Monitor , and Detection module control . <ul style="list-style-type: none"> ◦ Block: An HTTP request is blocked if it meets the conditions of the rule. ◦ Allow: An HTTP request is allowed if it meets the conditions of the rule. ◦ Monitor: An HTTP request is allowed and recorded if it meets the conditions of the rule. ◦ Detection module control.
Comment	The remarks of the rule, such as the purpose of the rule.
Risk Level	The risk level. Valid values: No threat , Low Risk , Medium Risk , and High Risk .
Matching Patter	The conditions that trigger the rule. Click Add Pattern to specify multiple conditions. Multiple conditions have the AND logical relation. The custom rule takes effect only when all conditions are met.
Apply to Websites	The websites to be protected by the rule.
Log Recording Option	Specifies whether to record a protection event in the intrusion detection logs if the rule is triggered. The default value is Enable Log Recording . After Log Recording Option is set to Enable Log Recording , all interception records are recorded in the intrusion detection logs.
Attack type	The type of attack to be blocked by the rule.
Expiration Time	The time when the rule expires.

- Click **Confirm**.

5. Manage a custom rule.

- Edit a rule.

To edit a rule, click the  icon in the Actions column.

- Enable a rule.

To enable a rule, select this rule and click **Enable Selected Rules**.

- Disable a rule.

To disable a rule, select this rule and click **Disable Selected Rules**.

- Delete a rule.

To delete a rule, select this rule and click **Delete Selected Rules**.

28.7.4.3. Configure an HTTP flood detection rule

This topic describes how to configure an HTTP flood protection rule.

Context

An HTTP flood is a type of distributed denial of service (DDoS) attack that targets at web applications. Attackers use proxy servers or zombies to overwhelm targeted web servers by sending large quantities of HTTP requests.

Create an HTTP flood protection rule

1. [Log on to Apsara Stack Security Center](#).
2. In the left-side navigation pane, choose **Application Security > WAF**. On the Detection Overview page, choose **Protection Configuration > HTTP Flood Detection**.
3. Click **Add Rule**. The **Add HTTP Flood Detection Rules** dialog box appears.
4. Configure parameters and click **Confirm**.

Add HTTP Flood Detection Rules
×

Rule Mode Observe Blocking Mode

Rule Types Restrict Users by Policy Restrict Known Users

Rule Name *

Target Type IP SESSION

Restricted IP List * Fill IP

One IP address or IP address segment per line
If it is an IP address segment, please use "IP address/subnet mask" format such as
192.168.100.200

Cancel
Confirm

Parameter	Description
Rule Mode	<p>The operating mode of the HTTP flood protection rule. Valid values: Blocking Mode and Observe.</p> <ul style="list-style-type: none"> ◦ Blocking Mode: blocks the requests that meet the access control rules. ◦ Observe: records the requests that meet the access control rules, but does not block the requests.
Rule Types	<p>The type of the HTTP flood detection rule. Valid values: Restrict Users by Policy and Restrict Known Users. The difference between the two types is that whether the user is a known IP address or session.</p> <ul style="list-style-type: none"> ◦ Restrict Users by Policy: Restrict users who meet all configuration items of the restriction rule. Configuration items include Restriction Trigger Threshold, Restricted URL Address, Restriction Mode, Restriction Time, and Statistical Range of Visits in the Advanced section. ◦ Restrict Known Users: Restrict known users based on the restriction rule. To achieve this purpose, you must configure the IP address or session list and the restriction mode. After the configuration is complete, the restriction rule takes effect.
Rule Name	The name of the HTTP flood detection rule.
Target Type	<p>The type of the restricted target. Valid values: IP and Session.</p> <div style="border: 1px solid #ccc; background-color: #e6f2ff; padding: 5px; margin-top: 10px;"> <p> Note If Target Type is set to SESSION, you must set User Identification to WAF User System when you add a website bound to this HTTP flood protection rule to WAF. For more information, see Add an Internet website for protection.</p> </div>
Restriction Trigger Threshold	If Rule Types is set to Restrict Users by Policy , you must complete the configuration items that trigger the restriction rule.
Restricted URL Address	<p>If Rule Types is set to Restrict Users by Policy, you must specify the target URL address to be protected by the restriction rule.</p> <ul style="list-style-type: none"> ◦ URL Prefix ◦ URL ◦ Record all IP addresses
Restricted IP List or Restricted Session List	If Rule Types is set to Restrict Known Users , enter the IP addresses or sessions to be restricted based on the setting of Rule Types. Specify only one IP address or session in each line.
Restricted URL Address	<p>If Rule Types is set to Restrict Known Users, you must specify the target URL address to be protected by the restriction rule.</p> <ul style="list-style-type: none"> ◦ URL Prefix ◦ URL ◦ Restrict user access to all addresses

Parameter	Description
Restriction Mode	<p>The mode in which the requests from a user are restricted. Valid values:</p> <ul style="list-style-type: none"> ○ Forbidden: All requests from the restricted user to the specified URL are blocked. ○ Frequency control: The frequency at which requests from the restricted user are allowed to the specified URL is limited.
Restriction Time	The time when the restriction rule takes effect.
Statistical Range of Visits	<p>If Target Type is set to Restrict Users by Policy, you can specify the range of targets that you want to analyze in the Advanced section.</p> <ul style="list-style-type: none"> ○ Statistics Full Access Data: After you select Statistics Full Access Data, the request frequency is limited for all users who have passed WAF and meet the frequency restrictions. However, this decreases system performance. ○ Statistics TOP Access Data: After you select Statistics TOP Access Data, the request frequency is limited only for the top 100 data records in real-time access monitoring. When the size of the full access data is greater than that of the top 100 data records, the system performance decrease is insignificant.

Manage an HTTP flood protection rule

1. [Log on to Apsara Stack Security Center.](#)
2. In the left-side navigation pane, choose **Application Security > WAF**. On the **Detection Overview** page, choose **Protection Configuration > HTTP Flood Detection**.
3. In the rule list, manage the added HTTP flood detection rules.
 - Search for a rule.
Click **Filter** and add filter conditions to find a rule.
 - Enable a rule.
Select a rule that is in the **Disabled** state and choose **More > Enable Selected Rules**.
 - Disable a rule.
Select a rule that is in the **Enabled** state and choose **More > Disable Selected Rules**.
 - Delete a rule.
Select a rule and choose **More > Delete Selected Rules**.

28.7.4.4. Configure an HTTP flood protection whitelist

This topic describes how to configure an HTTP flood protection whitelist.

Context

If a request source is trusted, you can add this request source to an HTTP flood protection whitelist to allow the requests from this source.

Procedure

1. [Log on to Apsara Stack Security Center.](#)
2. In the left-side navigation pane, choose **Application Security > WAF**. On the **Detection Overview** page, choose **Protection Configuration > HTTP Flood Detection**. On the page that appears, click the **HTTP Flood Detection Whitelist** tab.

3. Click the HTTP Flood Detection Whitelist tab. On the HTTP Flood Detection Whitelist tab, click **Add Whitelist Item** to add a request source to the whitelist, and click **Confirm**.

Parameter	Description
Type	Set the type of the whitelisted request source to IP or Session.
IP or SESSION	Specify the IP addresses or sessions based on the selected Type. Specify one IP address or session in each line.
Comment	Enter comments for the whitelist.

4. Manage the users in the whitelist.
 - Search for a user in the whitelist.

Click **Filter**. In the dialog box that appears, click **Add Filter Item** to find a whitelisted user.
 - Remove a whitelisted user.

Select a whitelisted user and choose **More > Delete Selected Items**.

28.7.4.5. Manage SSL certificates

This topic describes how to upload or delete SSL certificate files.

Context

After you upload an SSL certificate file on the **SSL Certificate Management** page, you can select this certificate file when you add an HTTPS website for protection.

Note When you add an HTTPS website for protection on the **Protected Websites** page, you must select the SSL certificate file that corresponds to the domain.

Procedure

1. Log on to **Apsara Stack Security Center**.
2. In the left-side navigation pane, choose **Application Security > WAF**.

3. On the page that appears, choose **Protection Configuration > SSL Certificate Management**.
4. Upload a new certificate file.
 - i. Click **Upload SSL Certificate**.
 - ii. In the **Add File** dialog box, specify **Name**. We recommend that you enter the domain name for easier management.

 **Note** If your certificate and private key are in the same file, select **Include private key in certificate file**.

- iii. In the **File** section, upload the HTTPS certificate file and private key.
 - iv. Specify **Certificate Password**.
 - v. Click **Confirm**.
5. (Optional) Delete an uploaded SSL certificate file. You can delete expired SSL certificate files.
 - i. In the SSL certificate list, select the certificate file that you want to delete.
 - ii. Choose **More > Delete selected SSL Certificates**.
 - iii. In the dialog box that appears, click **Confirm**.

28.7.4.6. Add Internet websites for protection

This topic describes how to add Internet websites to Web Application Firewall (WAF) for protection.

Context

WAF can protect the following types of websites:

- Internet websites.
- Virtual Private Cloud (VPC) websites. For more information about how to add a VPC website for protection, see [Add a VPC website for protection](#).

Procedure

1. [Log on to Apsara Stack Security Center](#).
2. In the left-side navigation pane, choose **Application Security > WAF**.
3. In the left-side navigation pane of the **Detection Overview** page, choose **Protection Configuration > Protection site management**. Then click the **Internet Websites** tab.
4. Click **Add a site** in the upper-right corner.
5. In the **Add Protected Site** pane, configure parameters in the **Monitoring Information** step and click **Next**.
Specify the Internet website to be protected. WAF can protect both HTTP and HTTPS websites.

Backend Server Address *

Fill in the back-to-source address Return to the back-to-source instance

http:// : 80 Weight

Response mode	Configuration item	Description
Forward to Backend Server	Load Balancing Algorithm	The algorithm for load balancing. Valid values: Weighted Round Robin , Source Address Hash , and Least Connections Method .
	Backend Server Address	The IP address of the origin server to which WAF forwards inbound traffic based on traffic filtering. Valid values: Fill in the back-to-source address and Return to the back-to-source instance . <ul style="list-style-type: none"> ◦ Fill in the back-to-source address: Enter the address of the origin server. If you enter multiple addresses, load balancing is performed based on the specified load balancing algorithm. ◦ Return to the back-to-source instance: Enter the address of a specific ECS or SLB instance. If you enter multiple addresses, load balancing is performed based on the specified load balancing algorithm.
	X-Forwarded-For	The passthrough mode of the source IP address. The X-Forwarded-For (XFF) HTTP header is used to identify the original IP address of an HTTP client. It is used for request forwarding services such as HTTP proxy and load balancing.
Redirect	Response Status Code	WAF forwards inbound traffic to a specified address. You can set this parameter to 301 , 302 , or 307 . <ul style="list-style-type: none"> ◦ 301: The requested page has been permanently moved to another URL. ◦ 302: The requested page has been temporarily moved to another URL. The requester must continue to use the original URL for future requests. ◦ 307: The resource requested has been temporarily moved to the URL given by the Location headers. The method and the body of the original request are reused to perform the redirected request.
	Redirect address	The target URL of redirection.
Respond with Specified Content	Response Status Code	Specify the content of the response. You can select a value from multiple status codes, such as 200 , 404 , and 503 .
	Response	Upload the response content. For example, upload an image. This image is returned if a user visits the website.

7. In the Protection Policy step, configure parameters and click Next. Then go to the Finish step to complete website addition.

 **Note** You can configure a protection policy only if Request Processing Method is set to Forward to Backend Server.

Parameter	Description
Protection Policy	Select a WAF protection policy. For more information, see Configure protection policies .
User Identification	Specify whether to enable the user identification feature. <div style="border: 1px solid #add8e6; padding: 5px;"> <p>? Note If you have enabled HTTP flood protection for the protected website and have set Target Type to Session when you configure request limits, you must set User Identification to WAF User System.</p> </div>

28.7.4.7. Add VPC websites for protection

This topic describes how to add VPC websites to WAF for protection.

Context

WAF can protect the following types of websites:

- Internet websites. For more information about how to add an Internet website for protection, see [Add an Internet website for protection](#).
- VPC websites.

Procedure

1. [Log on to Apsara Stack Security Center](#).
2. In the left-side navigation pane, choose **Application Security > WAF**. In the left-side navigation pane of the Detection Overview page, choose **Protection Configuration > Protection site management**. Then click the **VPC Websites** tab.
3. Click **Add a site** in the upper-right corner. The **Add Protected Site** pane appears.
4. In the **Monitoring Information** step, configure parameters and click **Next**.

Specify the VPC website to be protected. WAF can protect both HTTP and HTTPS websites.

Add Protected Site
✕

1 Monitoring Information

Configure Protected Site Information on WAF

Protected Website Name *

Domain Name *

Remarks

Port Settings * Enable SSL

2 set up VPC

Parameter	Description
Protected Website Name	The name of the website to be protected.
Domain Name	<p>The domain name of the website.</p> <ul style="list-style-type: none"> You can use an asterisk (*) as a wildcard domain name. Separate multiple domain names with commas (,).
Port Settings	<p>The port that WAF listens on.</p> <ul style="list-style-type: none"> If the website supports HTTPS requests, select Enable SSL and upload an HTTPS certificate. If the website can be accessed over multiple ports, click Add a group of ports to add required ports.
Cert Setting	<p>The HTTPS certificate of the website. Valid values: Upload a New Certificate and Choose an Existing Certificate.</p> <div style="background-color: #e6f2ff; padding: 5px; margin-bottom: 10px;"> <p> Note Specify this parameter only if you select Enable SSL next to Port Settings.</p> </div> <ul style="list-style-type: none"> Upload a New Certificate: If the HTTPS certificate used by the website has not been uploaded to WAF, select this option. By default, the HTTPS certificate and private key are separately uploaded. If you select Include private key in certificate file, you need to upload only a file that contains both the HTTPS certificate and private key. Choose an Existing Certificate: If the HTTPS certificate used by the website has been uploaded to WAF, select this option, and then select the required HTTPS certificate from the drop-down list.
Name	<p>The name of the HTTPS certificate.</p> <div style="background-color: #e6f2ff; padding: 5px; margin-top: 10px;"> <p> Note Specify this parameter only if you select Enable SSL next to Port Settings and set Cert Setting to Upload a New Certificate.</p> </div>
File	<p>Upload the HTTPS certificate and private key. By default, the HTTPS certificate and private key are separately uploaded. If you select Include private key in certificate file next to Name, you need to upload only a file that contains both the HTTPS certificate and private key.</p> <div style="background-color: #e6f2ff; padding: 5px; margin-top: 10px;"> <p> Note Specify this parameter only if you select Enable SSL next to Port Settings.</p> </div>

5. In the set up VPC step, configure parameters and click **Next**.

Add Protected Site

1 Monitoring Information
Configure Protected Site Information on WAF

2 set up VPC
Configure the VPC and related parameters of the protection site

Protected VPC *

Virtual Switch *

Create Virtual IP Method

VPC Virtual IP *

3 Request Processing Method
Configure WAF server response method

Parameter	Description
Protected VPC	The VPC to which the website belongs.
Virtual Switch	The VSwitch to which the website belongs.
Create Virtual IP Method	The method to create a virtual IP address. Valid values: Select an existing virtual IP and Create virtual IP.
VPC Virtual IP	<ul style="list-style-type: none"> ◦ If you set Create Virtual IP Method to Select an existing virtual IP, select an existing virtual IP address from the VPC Virtual IP drop-down list. ◦ If you set Create Virtual IP Method to Create virtual IP, click Click to Create Vip next to VPC Virtual IP to generate a virtual IP address.

6. In the Request Processing Method step, configure parameters and click Next.

Response mode	Configuration item	Description
Forward to Backend Server	Load Balancing Algorithm	Select an algorithm for load balancing. Valid values: Weighted Round Robin, Source Address Hash, and Least Connections Method.
	Backend Server Address	The IP address of the origin server to which WAF forwards inbound traffic based on traffic filtering.
	X-Forwarded-For	The passthrough mode of the source IP address. The XFF HTTP header is used to identify the original IP address of an HTTP client. It is used for request forwarding services such as HTTP proxy and load balancing.

Response mode	Configuration item	Description
Redirect	Response Status Code	<p>WAF forwards inbound traffic to a specified address.</p> <p>You can set this parameter to 301, 302, or 307.</p> <ul style="list-style-type: none"> ○ 301: The requested page has been permanently moved to another URL. ○ 302: The requested page has been temporarily moved to another URL. The requester must continue to use the original URL for future requests. ○ 307: The resource requested has been temporarily moved to the URL given by the Location headers. The method and the body of the original request are reused to perform the redirected request.
	Redirect address	The target URL of redirection.
Respond with Specified Content	Response Status Code	<p>Specify the content of the response.</p> <p>You can select a value from multiple status codes, such as 200, 404, and 503.</p>
	Response	<p>Upload the response content.</p> <p>For example, upload an image. This image is returned if a user visits the website.</p>

7. In the Protection Policy step, configure parameters and click Next. Then go to the Finish step to complete website addition.

Parameter	Description
Protection Policy	Select a WAF protection policy. For more information, see Configure protection policies .
User Identification	Specify whether to enable the user identification feature.

28.7.4.8. Verify the access configuration of a domain on your computer

This topic describes how to verify the access configuration of a domain on your computer.

Context

Before you redirect traffic to Web Application Firewall (WAF), we recommend that you perform a verification on your computer. This allows you to ensure that the domain is connected to WAF. This also allows you to ensure that WAF can correctly forward traffic. After you add the virtual IP address of WAF and the domain name of a website to the hosts file on your computer, the request to access the domain from a local browser passes through WAF first.

Procedure

1. [Log on to Apsara Stack Security Center](#).
2. Add the virtual IP and domain name to the `hosts` file on your computer. If your computer runs Windows 7, in Windows 7, the hosts file is stored in the following path: `C:\Windows\System32\drivers\etc\hosts`.
 - i. Open the hosts file by using a text editor such as Notepad.

- ii. Add the following content to the end of the file: `<Protected website virtual IP address><Protected website domain>` .

```
# localhost name resolution is handled within DNS itself.
# ->127.0.0.1 ..... localhost
# ->::1 ..... localhost
# ->4.115 ..... example.com
```

Note The IP address preceding the domain name is the virtual IP address assigned by WAF.

- Ping the protected domain name from your computer. The resolved IP address must be the virtual IP address of WAF in the hosts file. If the resolved IP address is still origin IP address, refresh the local Domain Name System (DNS) cache.
- Enter the domain name in the address bar of a browser and press Enter. If the access configuration on WAF is correct, you can visit the requested website.
- Verify the WAF protection feature. Simulate a web attack request to check whether WAF blocks the request.

For example, add `/? alert(xss)` after the URL. If you try to visit `www.example.com /? alert(xss)`, WAF must block the request.

28.7.4.9. Modify DNS resolution settings

This topic describes how to modify the DNS resolution settings to connect your business to WAF.

Context

Before you modify the DNS resolution settings and redirect business traffic to WAF, make sure that you have passed local verification.

The domain name of a protected website may not be resolved by a DNS provider. For example, a website may use an SLB instance to connect to the Internet. To connect such a domain name to WAF, perform the following steps to specify the virtual IP address of the protected website as the origin IP address of the SLB instance:

Procedure

- Log on to [Apsara Stack Security Center](#).
- In the left-side navigation pane, choose **Application Security > WAF**.
- In the left-side navigation pane of the Detection Overview page, choose **Protection Configuration > Protection site management**.
- Find the target website and click the  icon in the Operation column.
- On the **Basic Information** tab, obtain the virtual IP address of the protected website.
- Log on to the console provided by the DNS provider and find the domain name resolution settings for the relevant domain name. Then, change the value of record A to the virtual IP address of the protected site.

Note We recommend that you set the TTL to 600s in DNS resolution settings. The greater the TTL is, the longer it takes to synchronize and update the DNS records.

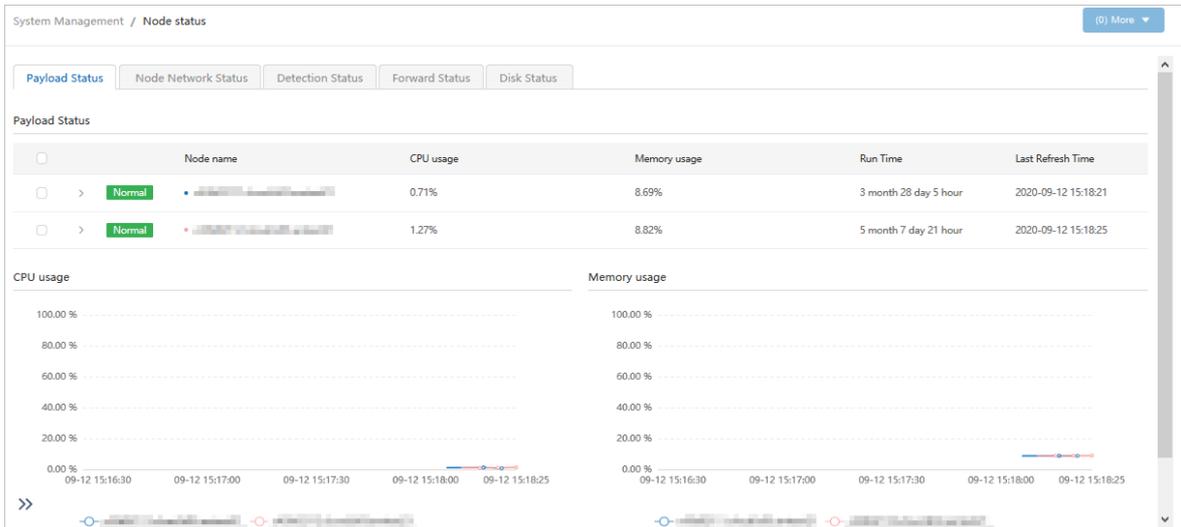

28.7.5. System management

28.7.5.1. View the payload status of nodes

This topic describes how to view the CPU utilization and memory usage of WAF nodes. You can use the query results to identify faults or check whether scaling is required.

Procedure

1. Log on to Apsara Stack Security Center.
2. In the left-side navigation pane, choose Application Security > WAF. In the left-side navigation pane of the Detection Overview page, choose System Management > Node status.
3. On the Payload Status tab, view the payload status of WAF nodes.

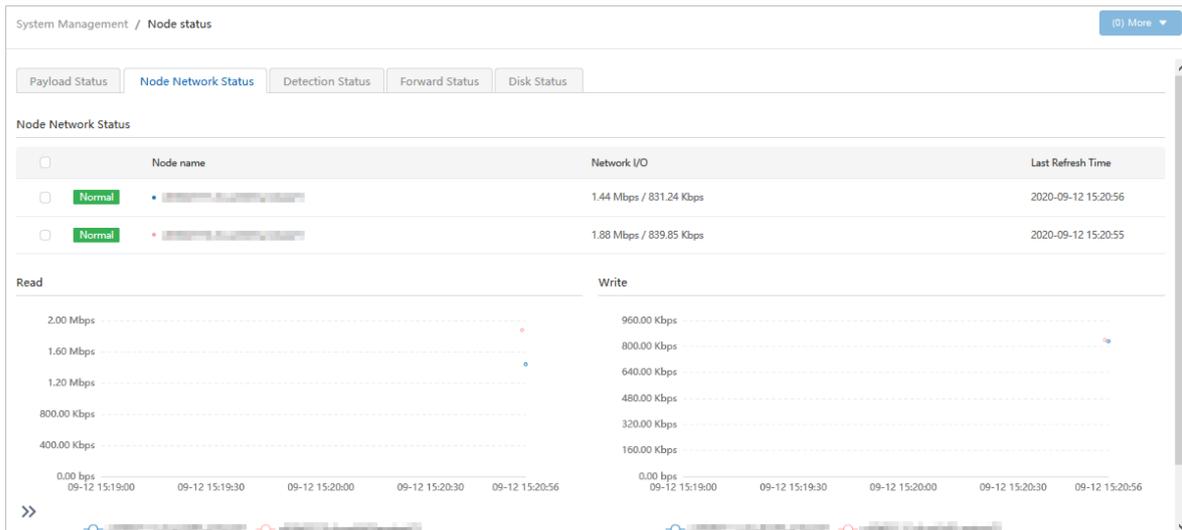

In the Payload Status section, you can view the CPU utilization and memory usage of each node. In the CPU usage and Memory usage sections, you can view changes in the CPU utilization and memory usage over a period of time.

28.7.5.2. View the network status of nodes

This topic describes how to view the network status of WAF nodes, such as the network I/O, traffic detection status, and traffic forwarding status.

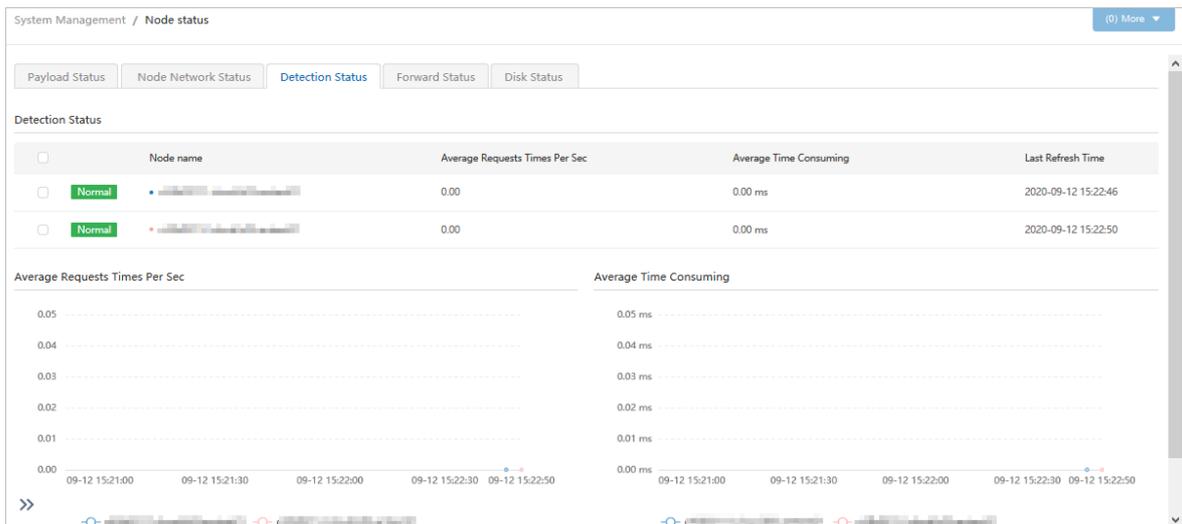

Node network status

1. Log on to Apsara Stack Security Center.
2. In the left-side navigation pane, choose Application Security > WAF. In the left-side navigation pane of the Detection Overview page, choose System Management > Node status.
3. Click the Node Network Status tab.
4. View the network I/O of WAF nodes.

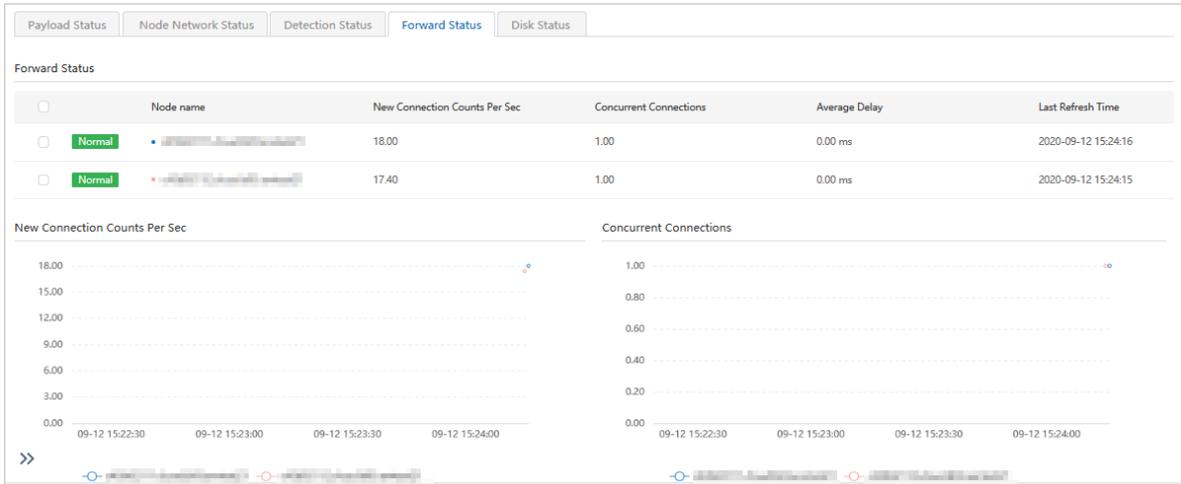

Traffic detection status

1. [Log on to Apsara Stack Security Center.](#)
2. In the left-side navigation pane, choose **Application Security > WAF**. In the left-side navigation pane of the Detection Overview page, choose **System Management > Node status**.
3. Click the **Detection Status** tab.
4. View the network traffic detection status of WAF nodes.

Traffic forwarding status

1. [Log on to Apsara Stack Security Center.](#)
2. In the left-side navigation pane, choose **Application Security > WAF**. In the left-side navigation pane of the Detection Overview page, choose **System Management > Node status**.
3. Click the **Forward Status** tab.
4. View the network traffic forwarding status of WAF nodes.

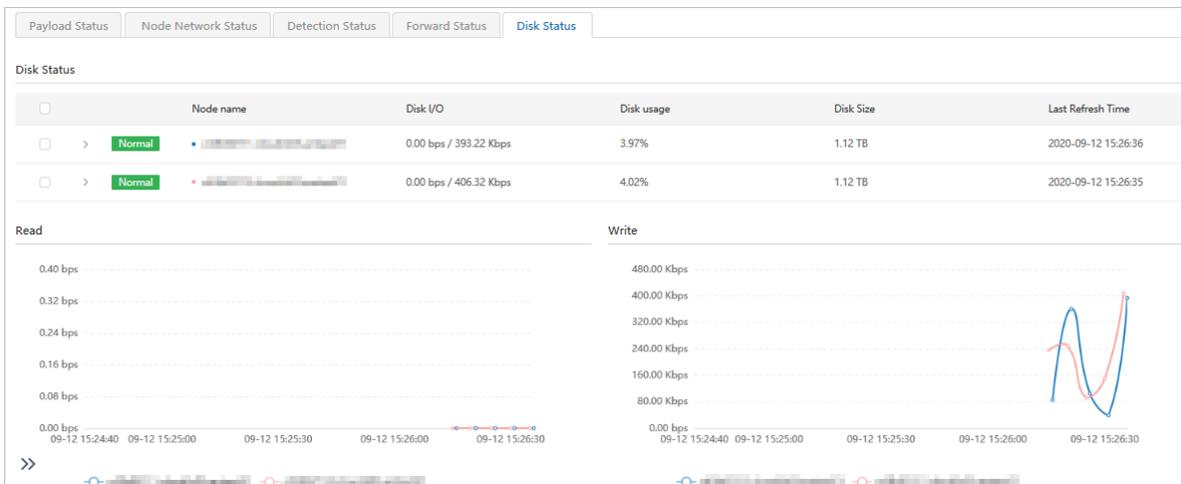

28.7.5.3. View the disk status of nodes

This topic describes how to view the disk status of WAF nodes. You can use the query results to identify faults or check whether scaling is required.

Procedure

1. Log on to Apsara Stack Security Center.
2. In the left-side navigation pane, choose Application Security > WAF. In the left-side navigation pane of the Detection Overview page, choose System Management > Node status.
3. Click the Disk Status tab to view the disk status of WAF nodes.

In the Disk Status section, you can view the disk I/O and disk usage of nodes. In the Read and Write sections, you can view the disk read and write changes over a period of time.

28.7.5.4. Configure alert service

This topic describes how to add a syslog server to WAF. After the syslog server is added, WAF alert logs can be pushed to the syslog server over the syslog protocol.

Procedure

1. Log on to Apsara Stack Security Center.
2. In the left-side navigation pane, choose Application Security > WAF. On the Detection Overview page, choose System Management > Syslog Configuration.
3. Click the Alarm Service Configuration tab and click Add alarm service.

4. In the **Add Alarm Service** pane that appears, specify the syslog server parameters.

Parameter	Description
Syslog Server	The IP address and port number of the syslog server.
RFC	The syslog protocol. Valid values: RFC3164 and RFC5424.
Protocol	The transport protocol. Valid values: TCP and UDP.
Comment	The description of the syslog server. This information facilitates subsequent identification and management.
Security	Allows you to select the module to which syslog logs are sent.

5. Click **Confirm**. The newly added syslog server will be displayed in the syslog list.
6. Find the newly added syslog server and click  in the **Operation** column to check whether alerts are sent properly.
- If a message appears, indicating that the alert test is successful, the syslog server is added.
 - If an error message appears, WAF cannot connect to the syslog server.

28.7.5.5. Configure alert thresholds

This topic describes how to configure alert thresholds.

Procedure

1. **Log on to Apsara Stack Security Center.**
2. In the left-side navigation pane, choose **Application Security > WAF**. On the **Detection Overview** page, choose **System Management > Syslog Configuration**.
3. Click the **Alarm ThresholdConfiguration** tab and click the edit icon  next to the thresholds that you want to modify.
4. In the edit pane that appears, specify the thresholds.

Threshold	Description
Concurrent Connections	No alerts are sent if a large number of concurrent connections exist.
Number of new connections	No alerts are sent if a large number of new connections are set up.
CPU usage is too high	Alerts are sent if the CPU utilization exceeds a specified percentage in a period of time.
Memory usage is too high	Alerts are sent if the memory usage exceeds a specified percentage in a period of time.

Threshold	Description
Disk usage is too high	Alerts are sent if the disk usage exceeds a specified percentage.

5. Click Ok.

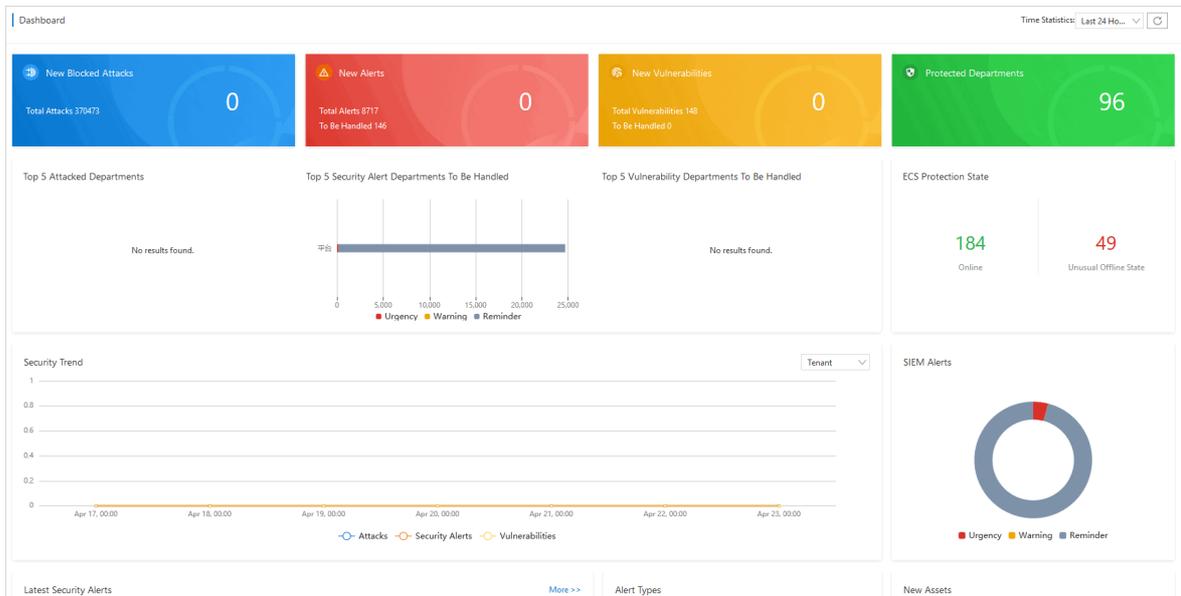

28.8. Security Operations Center (SOC)

28.8.1. View the dashboard

This topic describes how to view the overall security information of the Apsara Stack network environment.

Procedure

1. [Log on to Apsara Stack Security Center.](#)
2. In the left-side navigation pane, choose **Security Operations Center (SOC) > Overview.**
3. In the upper-right corner of the **Dashboard** page that appears, select a time range from the **Time Statistics** drop-down list. You can select *Last 24 Hours*, *Last 7 Days*, or *Last 30 Days* from the drop-down list.
4. View the overall security information.

The dashboard displays the following information:

- **New Blocked Attacks, New Alerts, New Vulnerabilities, and Protected Departments**
- **Top 5 Attacked Departments, Top 5 Security Alert Departments To Be Handled, and Top 5 Vulnerability Departments To Be Handled**
- **Security trend based on the tenant or platform**
- **Latest Security Alerts and Alert Types**
- **Latest Attacks and Attack Types**
- **ECS Protection State, SIEM Alerts, New Assets, and Protected Assets**

28.8.2. Security Monitoring

28.8.2.1. View security monitoring data of tenants

This topic describes how to view the security monitoring data of tenants on the **Attack Protections**, **Security Alerts**, and **Vulnerabilities** tabs.

Attack Protections

1. **Log on to Apsara Stack Security Center.**
2. In the left-side navigation pane, choose **Security Operations Center (SOC) > Security Monitoring > Tenant Security Monitoring**. On the Tenant Security Monitoring page that appears, click the **Attack Protections** tab.
3. Set search conditions.

 **Note** Skip this step if you want to view all attack protection events.

All Departments	All Data Sources	All States	All Attack Types	Start time	-	End time	Attack Name/Attached Asset
Search condition	Description						
Department	The department to which the assets affected by the attack belong.						
Data source	The data source.						
State	The attack status.						
Attack type	The attack type.						
Start time and end time	The time range for which you want to view attack events.						
Attack name or asset keyword	The attack name or the keywords of the affected asset.						

4. View the details in the attack list.
5. Click the buttons in the upper-left corner to refresh or export the list.

Security Alerts

1. **Log on to Apsara Stack Security Center.**
2. In the left-side navigation pane, choose **Security Operations Center (SOC) > Security Monitoring > Tenant Security Monitoring**. On the Tenant Security Monitoring page that appears, click the **Security Alerts** tab.
3. (Optional)Set search conditions.

 **Note** Skip this step if you want to view all security alerts.

All Departments	All Data Sources	Reminder ×	Warning ×	Urgency ×	All States	All Alert Types	Alert Name/Assets
Search condition	Description						
Department	The department to which the assets associated with the security alerts belong.						
Data source	The data source.						
Level	The alert level. You can select one or more levels. Valid values: <ul style="list-style-type: none"> ○ Urgent ○ Warning ○ Reminder 						

Search condition	Description
Alert state	The alert status.
Alert type	The alert type, which can be set to All Alert Types or a specific type.
Alert name or asset keyword	The alert name or the keywords of affected assets.

4. View details in the security alert list.
5. Click the buttons in the upper-left corner to refresh or export the list.

Vulnerabilities

1. Log on to Apsara Stack Security Center.
2. In the left-side navigation pane, choose Security Operations Center (SOC) > Security Monitoring > Tenant Security Monitoring. On the Tenant Security Monitoring page that appears, click the Vulnerabilities tab.
3. Click the Vulnerabilities or Server Configurations tab.
 - o Vulnerabilities: provides vulnerability information.
 - o Server Configurations: lists risks in server configurations.
4. Set search conditions.

Note Skip this step if you list to view all vulnerabilities or server configuration risks.

Search condition	Description
Department	The department to which the asset affected by the vulnerability or server configuration risk belongs.
Level	The vulnerability level or server configuration risk level.
Type	The vulnerability type or server configuration risk type.
State	The status of the vulnerability or the server configuration risk.
Vulnerability name or asset keyword	The vulnerability or risk name, or the keywords of affected assets.

5. Click the buttons in the upper-left corner to refresh or export a list of vulnerabilities or server configuration risks.

28.8.2.2. View security monitoring data of platforms

This topic describes how to view the security monitoring data of platforms on the Attack Protections, Security Alerts, and Vulnerabilities tabs.

Attack Protections

1. Log on to Apsara Stack Security Center.
2. In the left-side navigation pane, choose Security Operations Center (SOC) > Security Monitoring > Platform

Security Monitoring. On the Platform Security Monitoring page that appears, click the **Attack Protections** tab.

3. Set search conditions to search for attack protection events.

 **Note** Skip this step if you want to view all events.

Search condition	Description
Data source	The data source.
State	The attack status.
Attack type	The attack type.
Attack name or asset keyword	The attack name or the keywords of the affected asset.
Start time and end time	The time range to query.

4. View the details in the attack list.
5. Click the buttons in the upper-left corner to refresh or export the list.

Security Alerts

1. [Log on to Apsara Stack Security Center.](#)
2. In the left-side navigation pane, choose **Security Operations Center (SOC) > Security Monitoring > Platform Security Monitoring**. On the Platform Security Monitoring page that appears, click the **Security Alerts** tab.
3. (Optional)Set search conditions.

 **Note** Skip this step if you want to view all security alerts.

Search condition	Description
Data source	The data source.
Level	The alert level. You can select one or more alert levels. Valid values: <ul style="list-style-type: none"> ◦ Urgency ◦ Warning ◦ Reminder
Alert state	The alert status.
Alert type	The alert type, which can be set to All Alert Types or a specific alert type.
Alert name or asset keyword	The alert name or the keyword of the affected asset.

4. View details in the security alert list.
5. Click the buttons in the upper-left corner to refresh or export the list.

Vulnerabilities

1. **Log on to Apsara Stack Security Center.**
2. In the left-side navigation pane, choose **Security Operations Center (SOC) > Security Monitoring > Platform Security Monitoring**. On the Platform Security Monitoring page that appears, click the **Vulnerabilities** tab and then click **Platform Baseline**.
3. Set search conditions.

 **Note** Skip this step if you want to view all baseline risks of the platform.

Search condition	Description
Level	The risk level.
Type	The baseline risk type.
State	The processing status.
Risk name or asset name	The risk name or the keywords of the affected asset.

4. Click the buttons in the upper-left corner to refresh or export the list.

28.8.3. Asset Management

28.8.3.1. View tenant assets

This topic describes how to view the assets of tenants, including ECS instances, RDS instances, OSS instances, SLB instances, and Elastic IP addresses (EIPs).

Procedure

1. **Log on to Apsara Stack Security Center.**
2. In the left-side navigation pane, choose **Security Operations Center (SOC) > Asset Management > Tenant Assets**.
3. Select the target service, for example, **Elastic Compute Service (ECS)**.
4. Set search conditions to view a target asset.

 **Note** Skip this step if you want to view all assets.

Search condition	Description
Department	The department to which the asset belongs.
VPC	The VPC to which the asset belongs.
State	The running status of the asset.
New	Specifies whether the asset to query is newly added.
Server name or IP address	The keywords of the asset name.

5. View asset information in the asset list.

28.8.3.2. View platform assets

This topic describes how to view the assets of the platform.

Procedure

1. [Log on to Apsara Stack Security Center](#).
2. In the left-side navigation pane, choose **Security Operations Center (SOC) > Asset Management > Platform Assets**.
3. Set search conditions to view a target asset.

 **Note** Skip this step if you want to view all assets.

4. View asset information in the asset list.

28.8.4. Log Analysis

28.8.4.1. View log analysis results

This topic describes how to view log analysis results.

Procedure

1. [Log on to Apsara Stack Security Center](#).
2. In the left-side navigation pane, choose **Security Operations Center (SOC) > Log Analysis > Log Analysis**.
3. Set search conditions to view the target information.
4. View log analysis results.

28.8.4.2. Security Audit

28.8.4.2.1. Overview

A security audit refers to the systemic and independent inspection and verification of activities and behavior in the computer network environment. Delegated by property owners and authorized by management authorities, professional auditors give their assessments according to relevant laws and regulations. When the administrator needs to backtrack system operations, the administrator can perform a security audit.

Security audits are long-term security management activities throughout the lifecycle of cloud services. The security audit feature of Apsara Stack Security can collect system security data, analyze weaknesses in system operations, report audit events, and classify audit events into important, moderate, and low risk levels. The security administrator views and analyzes audit events to continuously improve the system and ensure the security and reliability of cloud services.

28.8.4.2.2. View security audit overview

This topic describes how to view the summarized information of security audit.

Context

The **Overview** page provides reports on the raw log trend, audit event trend, audit risk distribution, and security issue distribution. The reports are displayed in the form of a run chart or pie chart to help the security administrator analyze the trend of risks facing your cloud services.

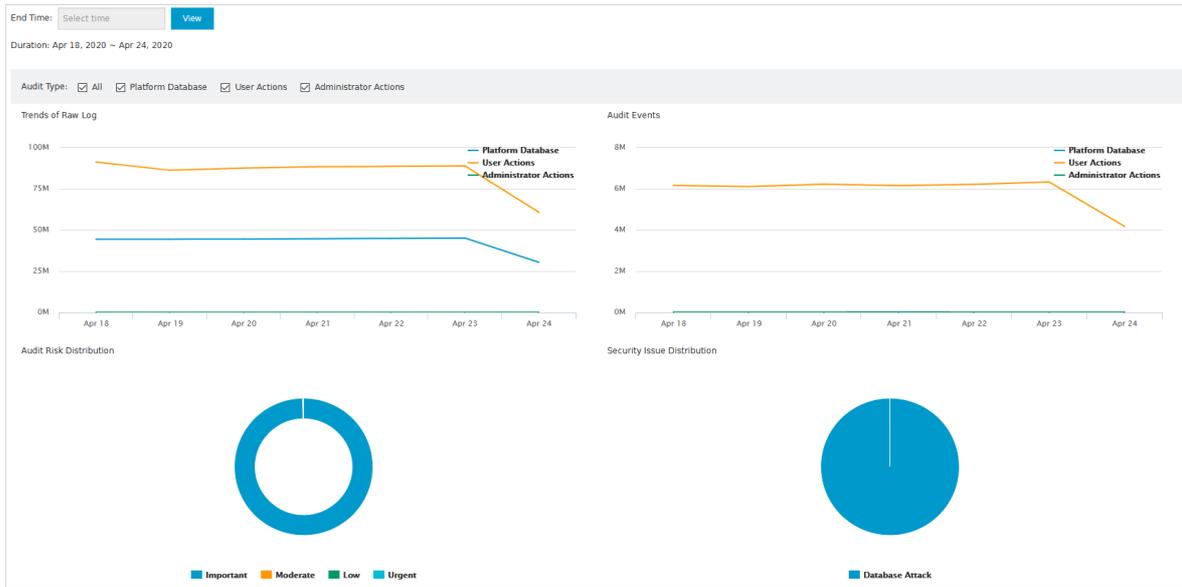

On the **Overview** page, the security administrator can check the number of log entries and the storage usage of each audit type in a specified time range.

Procedure

1. [Log on to Apsara Stack Security Center](#).
2. In the left-side navigation pane, choose **Security Operations Center (SOC) > Log Analysis > Security Audit**.

On the Security Audit page, click the Overview tab.

3. On the Overview tab, view the audit summary for the last seven days.

○ Trends of Raw Log

This chart displays the trend of logs generated by physical servers, network devices, RDS instances, ECS instances, and the API in the last seven days. The security administrator can analyze the trend in the number of logs to check whether the number of log entries is at a normal level.

○ Audit Events

This chart displays the trend of audit events generated by physical servers, network devices, RDS instances, ECS instances, and the API in the last seven days. The security administrator can analyze this chart to check whether the number of audit events is at a normal level.

○ Audit Risk Distribution

This chart displays the percentage distribution of audit events of different risk levels in the last seven days. Risk levels include important, moderate, and low. The security administrator can analyze this chart to check whether the audit events are at acceptable risk levels.

○ Security Issue Distribution

This chart displays the percentage distribution of different event types in the last seven days. The security administrator can analyze this chart to check for the most frequent audit events and identify potential risks to improve security protection.

○ Log Size

This chart displays the size of online logs and offline logs. If these logs consume many storage resources, we recommend that you back up required audit logs and delete unnecessary logs.

○ Audit Log Size

This chart displays the size of logs for each audit type.

4. View the audit summary in a specified time period.

- i. Specify End Time as the end time of the period to query.
- ii. In Audit Type, select the audit types to query.
- iii. Click View to view the audit summary for the last seven days before the specified end time.

28.8.4.2.3. Query audit events

This topic describes how to query audit events.

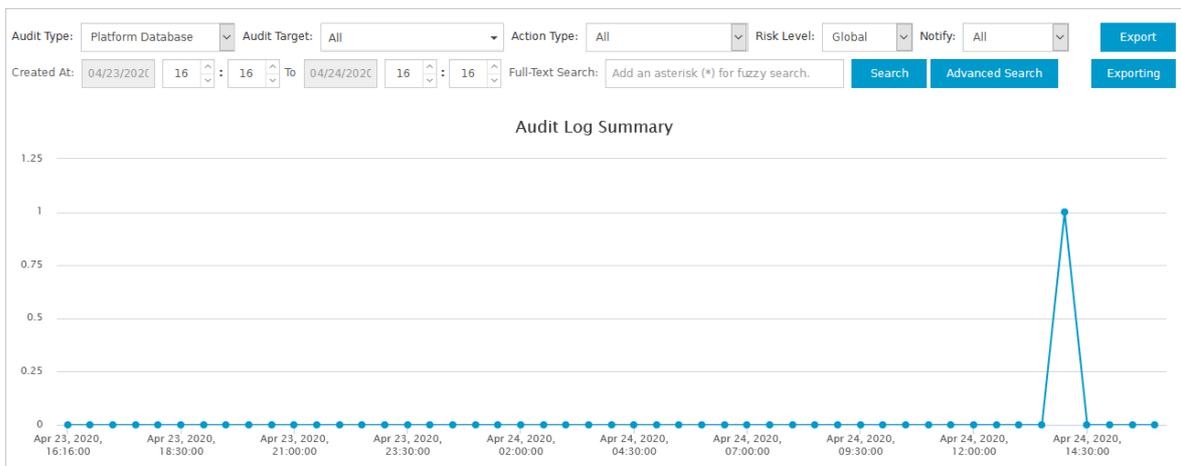

Context

On the **Audit Query** tab, you can view the details of audit events, including log creation time, audit type, audit object, action type, risk level, and log content.

The system matches the logs collected by a security audit module with audit rules. If the log content matches one regular expression in the audit rules, an audit event is reported. For more information about audit rules, see [Add an audit policy](#).

Procedure

1. [Log on to Apsara Stack Security Center](#).
2. In the left-side navigation pane, choose **Security Operations Center (SOC) > Log Analysis > Security Audit**. On the Security Audit page, click the **Audit Query** tab.
3. On the **Audit Query** tab, configure query conditions to view audit events within a specific time range.

- **Basic query**
 - a. Configure **Audit Type**, **Audit Target**, **Action Type**, **Risk Level**, and **Notify**.
 - b. Specify a time range to query.
 - c. In the **Full-Text Search** search box, enter a keyword.
 - d. Click **Search**.
 - **Advanced query**

In addition to the basic query conditions, you can also configure advanced query conditions.

 - a. Configure basic query conditions.
 - b. Click **Advanced Search**.
 - c. Under **Filter Condition**, specify **User**, **Target**, **Action**, **Result**, and **Cause**.
 - d. Click **Save**.
4. Click **Export** to export the data. Download the exported file for analysis. For more information, see [Manage export tasks](#).

28.8.4.2.4. View raw logs

This topic describes how to view raw audit logs.

Context

On the **Raw Log** tab, you can view the raw logs generated by a running audit object. Raw logs contain information required for debugging. Security administrators can use raw logs to troubleshoot system failures.

Procedure

1. **Log on to Apsara Stack Security Center.**
2. In the left-side navigation pane, choose **Security Operations Center (SOC) > Log Analysis > Security Audit**. On the Security Audit page, click the **Raw Log** tab.
3. On the **Raw Log** tab, configure query conditions to view the log summary chart and raw logs within a specific time range.
 - i. Specify **Audit Type** and **Audit Target**.
 - ii. Enter a keyword.
 - iii. Specify a time range to query.
 - iv. Click **Search**.
4. Click **Export** to export the data. Download the exported file for analysis. For more information, see **Manage export tasks**.

28.8.4.2.5. Manage log sources

This topic describes how to view and manage log sources.

Context

You can view the number of log entries and specify whether to show logs by log type or log source.

- The **Log Types** sub-tab provides the number of all log entries for a specific audit object.
- The **Log Sources** sub-tab provides the number of log entries for all audit objects of a specific device instance.

Procedure

1. **Log on to Apsara Stack Security Center.**
2. In the left-side navigation pane, choose **Security Operations Center (SOC) > Log Analysis > Security Audit**. On the Security Audit page, click the **Log Sources** tab.
3. Click the **Log Types** sub-tab and view the number of log entries from each audit object.

You can view the number of log entries recorded on the current day and the number of log entries recorded during the last 30 days from each audit object.

If you do not want to show the log data from a specific audit log, perform the following steps:

- i. Find the target audit object and click **Hide** in the **Actions** column.
- ii. In the Note message, click **Confirm**.

 **Note** The procedure used to show log data is similar to that used to hide log data.

4. Click the **Log Sources** sub-tab and view the number of log entries from each device instance.

You can view the number of log entries recorded on the current day and the number of log entries recorded during the last 30 days from each device instance.

If you do not want to show the log data from a specific device instance, perform the following steps:

- i. Find the target device instance and click **Hide** in the **Actions** column.
- ii. In the Note message, click **Confirm**.

 **Note** The procedure used to show log data is similar to that used to hide log data.

28.8.4.2.6. Policy settings

28.8.4.2.6.1. Manage audit rules

This topic describes how to add, modify, or remove an audit rule.

Context

If a log entry matches an audit rule, an audit event is reported. You can set regular expressions in an audit rule to match log entries. A regular expression defines a character string matching pattern, which can be used to check whether a string contains a specific substring. Example:

Regular expression	Description
<code>^\d{5,12}\$</code>	Matches the consecutive numbers from the fifth number to the twelfth number.
<code>load_file\{</code>	Matches the "load_file{" string.

The security audit module defines the default audit rule based on the string generated in the log when an audit event is reported. The security administrator can also customize audit rules based on the string generated in the log when the system encounters an attack.

Procedure

1. [Log on to Apsara Stack Security Center.](#)
2. In the left-side navigation pane, choose **Security Operations Center (SOC) > Log Analysis > Security Audit**. On the Security Audit page, click the **Policies** tab.
3. On the **Policies** tab, click the **Audit Rules** sub-tab.
4. Add an audit rule.
 - i. Click **New** in the upper-right corner.
 - ii. In the **Add Policy** dialog box, configure parameters.

Add Policy
✕

Policy Name

Audit Type: Platform Database ▼

Audit Target: Global ▼

Action Type: Resource Management ▼
Risk Level: Important ▼

Notify: Enable Alert ▼

Filter Condition:

Field	Operator	Value	Action
User	Equals	Enter a user	✕
		+	
Target	Equals	Enter a target	✕
		+	
Action	Equals	Enter a command	✕
		+	
Result	Equal	Search by result keyword	

Add Cancel

- iii. Click **Add**.

After you add an audit rule, if one string in an audit log of the specified audit type, audit object, or risk level matches the regular expression of the audit rule, an alert email is sent to the specified recipient.

5. Manage audit rules. You can add, query, disable, enable, and remove audit rules.
 - Query audit rules
Specify **Audit Type** and **Audit Target**. Enter a keyword in the search bar and click **Search**.
 - Disable an audit rule
Find the target audit rule and click **Disable** in the **Actions** column.
 - Enable an audit rule
Find the target audit rule that has been disabled and click **Enable** in the **Actions** column.
 - Remove an audit rule
Find the target audit rule and click **Delete** in the **Actions** column.

 **Note** You can remove only custom rules.

28.8.4.2.6.2. Configure alert recipients

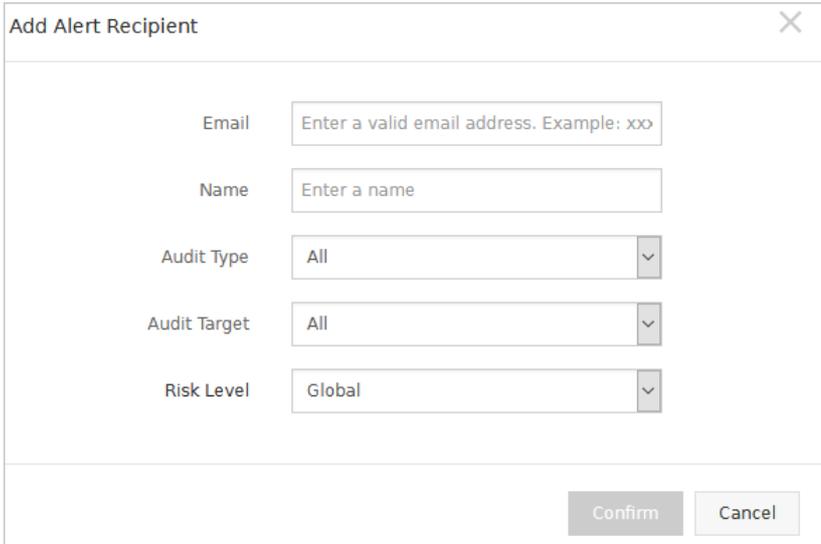

This topic describes how to configure the recipients of alerts on audit events.

Context

You can add an alert recipient by entering an email address that can be used to receive alerts on audit events.

Procedure

1. **Log on to Apsara Stack Security Center.**
2. In the left-side navigation pane, choose **Security Operations Center (SOC) > Log Analysis > Security Audit**. On the Security Audit page, click the **Policies** tab.
3. On the **Policies** tab, click the **Alert Settings** sub-tab.
4. Add an alert recipient.
 - i. Click **New** in the upper-right corner.
 - ii. In the **Add Alert Recipient** dialog box, configure information about the target alert recipient.

- iii. Click **Confirm**.
5. Manage alert recipients.
 - Search for alert recipients

Specify **Audit Type**, **Audit Target**, and **Risk Level**, enter a keyword of the email address, and click **Search**.

- Remove alert recipients

Find the target email address and click **Delete** in the **Actions** column.

28.8.4.2.6.3. Manage archives of events and logs

This topic describes how to query and download the archives of audit events and raw logs.

Context

To ensure the security of the Apsara Stack environment, you can download the archives of events and logs to analyze audit events.

Procedure

1. [Log on to Apsara Stack Security Center](#).
2. In the left-side navigation pane, choose **Security Operations Center (SOC) > Log Analysis > Security Audit**. On the **Security Audit** page, click the **Policies** tab.
3. On the **Policies** tab, click the **Archiving** sub-tab.
4. Query the archives of events and logs.
 - i. Specify **Audit Type** and **Archiving Type**.
 - ii. Specify a time range to query.
 - iii. Click **Search**.
5. Find the target file where the archive information is stored and click **Download** in the **Actions** column to save the archive file to your local machine.

28.8.4.2.6.4. Manage export tasks

This topic describes how to download or delete exported audit events and logs.

Context

After you export audit events or logs on the **Audit Query** or **Raw Log** tab of the **Security Audit** page, you can manage the export tasks on the **Exporting** sub-tab.

Procedure

1. [Log on to Apsara Stack Security Center](#).
2. In the left-side navigation pane, choose **Security Operations Center (SOC) > Log Analysis > Security Audit**. On the **Security Audit** page, click the **Policies** tab.
3. On the **Policies** tab, click the **Exporting** sub-tab.
4. View the created export tasks.

Created At	Export Task ID	Task Type	Filter Condition	Task Status	Format	Actions

5. Click **Download** to download audit events or log files to your local machine.
6. Click **Delete** to delete the export task.

28.8.4.2.6.5. Modify system settings

This topic describes how to configure system parameters for security audit.

Context

By configuring system parameters, you can configure the maximum number of system alerts per day and the maximum number of audits per day for raw logs.

Procedure

1. [Log on to Apsara Stack Security Center.](#)
2. In the left-side navigation pane, choose **Security Operations Center (SOC) > Log Analysis > Security Audit.** On the Security Audit page, click the **Policies** tab.
3. On the **Policies** tab, click the **System Settings** sub-tab.
4. Find the target configuration item and click **Edit** in the **Actions** column.

Audit Rules				
Alert Settings Archiving Exporting <u>System Settings</u>				
ID	Description	Updated At	Value	Actions
1	Maximum Alerts per Day	Nov 20, 2019, 00:44:19	1000	Edit
2	Total Logs Audited per Day (GB/day)	Nov 20, 2019, 00:44:19	500	Edit
3	Database Logs Audited per Day (GB/day)	Nov 20, 2019, 00:44:19	-1	Edit
4	Server Logs Audited per Day (GB/day)	Nov 20, 2019, 00:44:19	-1	Edit
5	Network Device Logs Audited per Day (GB/day)	Nov 20, 2019, 00:44:19	-1	Edit
6	User Operation Logs Audited per Day (GB/day)	Nov 20, 2019, 00:44:19	-1	Edit
7	Administration Logs Audited per Day (GB/day)	Nov 20, 2019, 00:44:19	-1	Edit

5. Enter a required value in the **Value** column and click **Confirm** in the **Actions** column.

28.8.5. Rules

28.8.5.1. Create traffic monitoring IPS rules

This topic describes how to add Intrusion Prevention System (IPS) rules to Cloud Firewall. Cloud Firewall has built-in IPS rules. This topic describes how to customize IPS rules based on your business requirements and network environment.

Procedure

1. [Log on to Apsara Stack Security Center.](#)
2. In the left-side navigation pane, choose **Security Operations Center (SOC) > Rules.**
3. On the **Rules** page, click the **Cloud Firewall IPS Rules** tab.
4. Click **Create Rule** in the upper-right corner of this tab.
5. In the **Create Rule** pane, configure rule-related parameters.

Parameter	Description
Rule Name	The name of the IPS rule. We recommend that you enter a name that indicates the purpose of the rule.
Rules Engine	The rules engine. Valid values: Basic Policies and Virtual Patches .
Attack Type	The attack type to be detected by the rule.
Severity	The severity. Valid values: Low , Medium , and High .
CVE	The CVE ID of the vulnerability listed in the rule. <div style="border: 1px solid #ccc; background-color: #e6f2ff; padding: 5px; margin-top: 10px;"> ? Note Common Vulnerabilities and Exposures (CVE) provides the publicly known information-security vulnerabilities. CVE IDs are allocated by a CVE Numbering Authority (CNA). </div>
Application	The name of the attacked application.

Parameter	Description
Rule Mode	The rule mode. Valid values: Packet and Traffic.
Direction	The direction of traffic to be monitored by IPS. Valid values: Inbound and Outbound, Inbound, and Outbound.
Rule Content	The rule content that is specified by using the Snort syntax. <div style="background-color: #e0f2f1; padding: 5px; margin-top: 10px;"> <p> Note To avoid negative impacts on your business, make sure that you enter the correct rule content.</p> </div>
Rule Description	The rule description. We recommend that you enter information such as the purpose and impact of the rule.
Description	The remarks about the rule. We recommend that you enter information such as the purpose and impact of the rule.

6. Click **OK**.

28.8.5.2. Manage IPS rules of Cloud Firewall

This topic describes how to view, enable, and disable the IPS rules of Cloud Firewall.

Context

On the **Cloud Firewall IPS Rules** tab of the **Rules** page in the Apsara Stack Security console, you can view the built-in and custom IPS rules, and enable or disable the rules based on your business requirements.

Procedure

1. [Log on to Apsara Stack Security Center](#).
2. In the left-side navigation pane, choose **Security Operations Center (SOC) > Rules**.
3. On the **Rules** page, click the **Cloud Firewall IPS Rules** tab.
4. **Manage IPS rules of Cloud Firewall.** In the list of IPS rules, you can view rule details, enable rules, and disable rules.
 - **View rule details**
Find the target rule and click **Details** in the **Actions** column to view the rule details.
 - **Enable a rule**
Find the target rule and click the toggle in the **Enable or not** column to change the rule state from **Disable** to **Enable**.
 - **Disable a rule**
If a rule is not suitable for your business, you can disable it.
Find the target rule and click the toggle in the **Enable or not** column to change the rule state from **Enable** to **Disable**.

28.8.5.3. Create traffic monitoring IDS rules

This topic describes how to create traffic monitoring IDS rules.

Procedure

1. [Log on to Apsara Stack Security Center](#).
2. In the left-side navigation pane, choose **Security Operations Center (SOC) > Rules**.

3. On the Rules page that appears, click the **Traffic Monitoring IDS Rules** tab.
4. Click **Create Rule** in the upper-right corner of this tab.
5. In the **Create Rule** pane, configure rule-related parameters.

Parameter	Description
Rule Name	The name of the IPS rule. We recommend that you enter a name that indicates the purpose of the rule.
Rules Engine	The rules engine. Valid values: Basic Policies and Virtual Patches .
Attack Type	The attack type to be detected by the rule.
Severity	The severity. Valid values: Low , Medium , and High .
CVE	<p>The CVE ID of the vulnerability listed in the rule.</p> <div style="background-color: #e6f2ff; padding: 5px;"> <p> Note Common Vulnerabilities and Exposures (CVE) provides the publicly known information-security vulnerabilities. CVE IDs are allocated by a CVE Numbering Authority (CNA).</p> </div>
Application	The name of the attacked application.
Rule Mode	The rule mode. Valid values: Packet and Traffic .
Direction	The direction of traffic to be monitored by IPS. Valid values: Inbound and Outbound , Inbound , and Outbound .
Rule Content	<p>The rule content that is specified by using the Snort syntax.</p> <div style="background-color: #e6f2ff; padding: 5px;"> <p> Note To avoid negative impacts on your business, make sure that you enter the correct rule content.</p> </div>
Rule Description	The rule description. We recommend that you enter information such as the purpose and impact of the rule.
Description	The remarks about the rule. We recommend that you enter information such as the purpose and impact of the rule.

6. Click **OK**.

28.8.5.4. Manage traffic monitoring IDS rules

This topic describes how to view, enable, and disable traffic monitoring IDS rules.

Context

On the **Traffic Monitoring IDS Rules** tab, you can view the built-in and custom IDS rules, and enable or disable the rules based on your business needs.

Procedure

1. **Log on to Apsara Stack Security Center.**
2. In the left-side navigation pane, choose **Security Operations Center (SOC) > Rules**.
3. On the Rules page that appears, click the **Traffic Monitoring IDS Rules** tab.
4. Manage traffic monitoring IDS rules. In the IDS rule list, you can view rule details, enable rules, and disable rules.

- View rule details
Find the target rule and click **Details** in the **Actions** column to view the rule details.
- Enable a rule
Find the target rule and click the toggle in the **Enable or not** column to change the rule state from **Disable** to **Enable**.
- Disable a rule
If a rule is not suitable for your business, you can disable it.
Find the target rule and click the toggle in the **Enable or not** column to change the rule state from **Enable** to **Disable**.

28.8.5.5. Customize DDoS traffic scrubbing policies and traffic rerouting thresholds

This topic describes how to customize DDoS traffic scrubbing policies and traffic rerouting thresholds. Default traffic rerouting thresholds have been configured. You can perform the following steps to customize the thresholds as needed.

Procedure

1. [Log on to Apsara Stack Security Center](#).
2. In the left-side navigation pane, choose **Security Operations Center (SOC) > Rules**.
3. Customize the DDoS traffic scrubbing thresholds.
 - i. Choose **AliGuard Rules > Scrubbing Policy**.
 - ii. In the **Actions** column for the target rule, click **Modify Threshold**.
 - iii. In the **Modify Threshold** dialog box that appears, enter a threshold value.
 - iv. Click **OK**.
4. Customize the traffic rerouting thresholds.
 - i. Choose **AliGuard Rules > Reroute Threshold**.
 - ii. In the **Actions** column for the target rule, click **Modify Threshold**.
 - iii. In the **Modify Threshold** dialog box that appears, enter a threshold.
 - iv. Click **OK**.

28.8.5.6. View Server Guard rules

This topic describes how to view the operation status of Server Guard, including the list of vulnerabilities, baselines, and host exceptions.

Procedure

1. [Log on to Apsara Stack Security Center](#).
2. In the left-side navigation pane, choose **Security Operations Center (SOC) > Rules > Server Guard Rules**.
3. In the overview section, you can view the total number of vulnerability libraries, number of baselines, and number of host exceptions as well as the available engines.
4. View the vulnerability list.
 - i. Click the **Vulnerabilities** tab.
 - ii. In the overview section, you can view the total number of Linux vulnerabilities, total number of Windows vulnerabilities, total number of Web-CMS vulnerabilities, and total number of emergency vulnerabilities.

- iii. Set search conditions to view the vulnerability list.

 **Note** Skip this step if you want to view all vulnerabilities.

In the vulnerability list, you can view the vulnerability name, CVE ID, vulnerability type, system, update time, and status.

5. View the baseline list.

- i. Click the **Baselines** tab.
- ii. In the overview section, you can view the number of baseline types and check items.
- iii. Set search conditions to view the baseline list.

 **Note** Skip this step if you want to view all baselines.

In the baseline list, you can view the baseline type, check item category, check item name, risk level, update time, and status.

6. View the host exception list.

- i. Click the **Host Exceptions** tab.
- ii. In the overview section, you can view the number of rule alert subcategories, number of webshells, and number of malicious viruses.
- iii. Set search conditions to view the host exception list.

 **Note** Skip this step if you want to view all exceptions.

In the host exception list, you can view the subcategory name, rule category, risk level, update time, source, and status.

28.8.6. Create a report task

This topic describes how to create a report task. After you create a report task, the system sends reports on a regular basis.

Procedure

1. **Log on to Apsara Stack Security Center.**
2. In the left-side navigation pane, choose **Security Operations Center (SOC) > Report Management**.
3. On the Report Management page that appears, click **Create Report**.
4. In the **Create Report** dialog box that appears, specify the parameters.

Parameter	Description
Report Name	The name of the report task. We recommend that you enter information such as the report purpose for easier identification and management.
Task Type	The task type. Valid values: Daily Report, Weekly Report, and Monthly Report.
Department	The department related to the report.
Email Box	The email address of the report recipient. Separate multiple email addresses with commas (,).

5. Click **OK**.

Result

In the report task list, you can view, edit, and delete the created report tasks.

28.8.7. System Configurations

28.8.7.1. Alert settings

28.8.7.1.1. Set alert recipients

This topic describes how to add and manage alert recipients.

Context

Apsara Stack Security sends alerts to alert recipients by SMS, email, or DingTalk. When the detected information matches an alert rule, an alert notification is sent to the alert recipient.

Procedure

1. [Log on to Apsara Stack Security Center](#).
2. In the left-side navigation pane, choose **Security Operations Center (SOC) > System Configurations > Alert Settings > Alert Recipient**.
3. Click **Add Recipient**.
4. Enter the recipient information and click **OK**.

Recipient Name	Mobile Number	Email	DingTalk	Actions
<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="button" value="Add Recipient"/> <input type="button" value="OK"/> <input type="button" value="Cancel"/>

5. **Manage alert recipients.** In the recipient list, find a recipient and click **Edit** in the **Actions** column to edit the recipient information.

28.8.7.1.2. Set alert notifications

This topic describes how to set the alert notification method for security events on tenants or platforms.

Context

In the **Alerts** section, the security administrator can set the alert notification method for security events. When a security event occurs, the system notifies the alert recipients by email, SMS, or DingTalk. For more information about how to set alert recipients, see [Set alert recipients](#).

Alerts on tenants

1. [Log on to Apsara Stack Security Center](#).
2. In the left-side navigation pane, choose **Security Operations Center (SOC) > System Configurations > Alert Settings > Tenant Alerts**.
3. In the **Alerts** section, select a notification method for each security event.

Alerts		
	<input type="checkbox"/> All	<input type="checkbox"/> All
Security Events	Notification Method	
Logon Security: Unusual Logon The account has been logged on in an disapproved location.	<input type="checkbox"/> Mobile Number	<input type="checkbox"/> Email
Emergency Alerts	Notification Method	
Website Defacement An attack that changes the visual appearance of the site, which can adversely affect SEO performance and cause the site to be flagged as malicious by the search engine.	<input type="checkbox"/> Mobile Number	<input type="checkbox"/> Email
Zombie Attack If a server launches DDoS attacks or brute-force attacks on other servers, it may have been controlled by attackers.	<input type="checkbox"/> Mobile Number	<input type="checkbox"/> Email

4. **Click Confirm.**

Alerts on the platform

1. [Log on to Apsara Stack Security Center](#).
2. In the left-side navigation pane, choose **Security Operations Center (SOC) > System Configurations > Alert Settings > Platform Alerts**.
3. In the **Alerts** section, select a notification method for each security event.

Platform Security Monitoring	Alert Level	Notification Method
Security Alerts The detected invasions on the platform, including webshells, malicious code, and suspicious processes.	Urgent	<input checked="" type="checkbox"/> DingTalk <input checked="" type="checkbox"/> Mobile Number <input checked="" type="checkbox"/> Email
Attack Protection The handled attacks, including Web attacks, CC attacks, port scanning, brute-force attacks, and DDoS attacks.	Important	<input checked="" type="checkbox"/> DingTalk <input checked="" type="checkbox"/> Mobile Number <input checked="" type="checkbox"/> Email
Vulnerabilities (Platform Inspection) The detected vulnerability configurations of the platform, such as inappropriate network access control.	Moderate	<input checked="" type="checkbox"/> DingTalk <input checked="" type="checkbox"/> Mobile Number <input checked="" type="checkbox"/> Email

[Confirm](#)

4. Click **Confirm**.

28.8.7.2. Updates

28.8.7.2.1. Overview of the system updates feature

The system updates feature allows you to manually or automatically update the Apsara Stack Security and rule libraries for up-to-date protection.

The supported package import method depends on the Apsara Stack network environment.

- If Apsara Stack is connected to the Internet, you can choose **Automatically Download Update Packages**.
- If Apsara Stack is not connected to the Internet, you can choose **Manually Import Update Packages**.

The following table lists the update statuses of a rule library.

Update statuses of a rule library

Status	Description
To Be Updated	Indicates that a new version of the rule library is available for update.
Updating	Indicates that the rule library is being downloaded from Alibaba Cloud for update.
Updated	Indicates that the rule library has been updated.
Update Failed	Indicates that the rule library failed to be updated.

28.8.7.2.2. Automatically download an update package

This topic describes how to automatically download update packages and update the services.

Context

If the Apsara Stack environment can connect to the Internet, you can enable automatic download of update packages to update the rule libraries.

Procedure

1. **Log on to Apsara Stack Security Center.**
2. In the left-side navigation pane, choose **Security Operations Center (SOC) > System Configurations > Updates**.
3. Turn on **Auto Update Configuration** to enable automatic download of update packages. After this switch is turned on, the system automatically downloads update packages on a regular basis.

4. Update a rule library. You can update one or more rule libraries at a time.
 - Update multiple rule libraries at a time
Click **Batch Update** in the upper-right corner to update all rule libraries.
 - Update a single rule library
 - a. Click the tab of the rule type you want to update. For example, click **Server Security**.
 - b. Click **Update** in the **Actions** column.

28.8.7.2.3. Manually import an update package and update the services

This topic describes how to manually import an update package and update the services.

Prerequisites

The security administrator has obtained the offline update package.

Context

If the Apsara Stack environment cannot connect to the Internet, you can update a rule library after you import an offline update package.

Procedure

1. **Log on to Apsara Stack Security Center.**
2. In the left-side navigation pane, choose **Security Operations Center (SOC) > System Configurations > Updates**.
3. Manually import an update package.
 - i. Click **Import Update Package** next to **Manual Update** in the upper-left corner.
 - ii. In the **Import Update Package** dialog box that appears, click **Browse** to select an offline update package that is downloaded to your local device.
 - iii. Click **Confirm**.
4. Update a rule library. You can update one or more rule libraries at a time.
 - Update multiple rule libraries at a time
Click **Batch Update** in the upper-right corner to update all rule libraries.
 - Update a single rule library
 - a. Click the tab of the rule type you want to update. For example, click **Server Security**.
 - b. Click **Update** in the **Actions** column.

28.8.7.2.4. Roll back a rule library

This topic describes how to roll a rule library back to a previous version.

Context

If an error occurs with an updated rule library, you can roll it back to a previous version to avoid service interruption.

Procedure

1. **Log on to Apsara Stack Security Center.**
2. In the left-side navigation pane, choose **Security Operations Center (SOC) > System Configurations > Updates**.
3. Click the tab of the target rule library, such as **Server Security**.

4. In the Actions column for the target rule library, choose **More > Roll Back**.
5. In the **Version Rollback** dialog box that appears, click **Confirm**.

28.8.7.2.5. View update history of a rule library

This topic describes how to view the update history of a rule library.

Context

You can view the update history of a rule library. If an error occurs with the latest version, you can locate the problem and roll the rule library back to an earlier version.

Procedure

1. [Log on to Apsara Stack Security Center](#).
2. In the left-side navigation pane, choose **Security Operations Center (SOC) > System Configurations > Updates**.
3. Click the tab of the target rule library, such as **Server Security**.
4. In the Actions column for a rule library, click **History**. On the **Previous Updates** page, you can view the update history of the rule library. Click **Details** to view the details of an update package.

28.8.7.3. Global Settings

28.8.7.3.1. Set CIDR blocks for traffic monitoring

28.8.7.3.1.1. Add a CIDR block for traffic monitoring

This topic describes how to add a Classless Inter-Domain Routing (CIDR) block for traffic monitoring. Network Traffic Monitoring System of Apsara Stack Security monitors the traffic of a specified CIDR block.

Context

CIDR blocks are configured for Network Traffic Monitoring System. The security administrator can change the CIDR blocks for monitoring as needed. The settings of CIDR blocks apply only to a data center that is deployed in the region to which the specified CIDR block belongs.

Note

Changes to CIDR block settings take effect immediately without the intervention of security administrators. If you add the same CIDR block on the traffic collection CIDR block setting page and region setting page, ensure that you select the same region on both pages.

Procedure

1. [Log on to Apsara Stack Security Center](#).
2. In the left-side navigation pane, choose **Security Operations Center (SOC) > System Configurations > Global Settings > Traffic Collection IP Range**.
3. Click **Add**.
4. In the **Add CIDR Block for Monitoring** dialog box that appears, specify a CIDR block.

- **CIDR Block:** Enter a CIDR block for traffic monitoring.

 **Note** Note that the CIDR block that you entered must be valid and unique.

- **Region:** Specify the region of the data center.

5. Click **Confirm**.

28.8.7.3.1.2. Manage CIDR blocks for traffic monitoring

This topic describes how to modify or delete Classless Inter-Domain Routing (CIDR) blocks for traffic monitoring.

Procedure

1. [Log on to Apsara Stack Security Center.](#)
2. In the left-side navigation pane, choose **Security Operations Center (SOC) > System Configurations > Global Settings > Traffic Collection IP Range**.
3. Select a region, enter the target CIDR block, and then click **Search**.

View the information about the CIDR block for traffic monitoring and the region in the search result.

4. In the **Actions** column, manage a CIDR block for traffic monitoring by clicking a button.
 - **Modify the CIDR block for traffic monitoring.**
Click **Modify** to modify the region of the CIDR block for traffic monitoring.
 - **Delete the CIDR block for traffic monitoring.**
Click **Delete** to delete the CIDR block for traffic monitoring.

28.8.7.3.2. Region settings

28.8.7.3.2.1. Add a CIDR block for a region

This topic describes how to add Classless Inter-Domain Routing (CIDR) blocks for regions that are detected and reported by Server Guard.

Context

Region settings are used for region detection of Server Guard agents. Server Guard servers automatically detect and match the regions of servers based on the IP address information reported by Server Guard agents.

 **Note** You can change the region of a CIDR block. After modification, you must modify the region for all assets in the CIDR block on the Asset Overview page.

Procedure

1. [Log on to Apsara Stack Security Center.](#)

2. In the left-side navigation pane, choose **Security Operations Center (SOC) > System Configurations > Global Settings > Region**.
3. Click **Add**.
4. In the **Add CIDR Block** dialog box that appears, set the parameters.

- **CIDR Block:** Enter a CIDR block for the region.

 **Note** Enter a valid CIDR block. You cannot enter a CIDR block that is configured in the system.

- **Region:** Specify the region.

5. Click **Confirm**.

28.8.7.3.2.2. Manage CIDR blocks for a region

This topic describes how to modify or delete Classless Inter-Domain Routing (CIDR) blocks for a region.

Procedure

1. **Log on to Apsara Stack Security Center.**
2. In the left-side navigation pane, choose **Security Operations Center (SOC) > System Configurations > Global Settings > Region**.
3. Select a region, enter the target CIDR block, and then click **Search**. View the information about the CIDR block for the region in the search result.
4. In the **Actions** column, manage a CIDR block for the region by clicking a button.
 - **Modify the CIDR block for the region.**
Click **Modify** to modify the CIDR block for the region.
 - **Delete the CIDR block for the region.**
Click **Delete** to delete the CIDR block for the region.

28.8.7.3.3. Configure whitelists

This topic describes how to configure the brute-force attack blocking whitelist in Server Guard and the following whitelists in Threat Detection Service (TDS): IP addresses allowed by server brute-force attack blocking, IP addresses allowed by application attack blocking, and IP addresses allowed by web attack blocking.

Context

If a normal request is regarded as an attack by the attack blocking function of TDS or the unusual logon detection function of Server Guard, you can add the source IP address to the whitelist to avoid further false positives.

 **Note** Make sure that the IP addresses in the whitelist can be trusted.

Procedure

1. [Log on to Apsara Stack Security Center.](#)
2. In the left-side navigation pane, choose **Security Operations Center (SOC) > System Configurations > Global Settings**. On the Global Settings page, click the **Whitelist** tab.
3. Click **Add**.
4. In the **Add to Whitelist** dialog box, configure the following parameters.

Parameter	Description
Source IP	Enter a source IP address or Classless Inter-Domain Routing (CIDR) block.
Username	The name of the user who creates the whitelist.
Type	<ul style="list-style-type: none"> ◦ Brute-Force Attack Blocking Whitelist: Server Guard does not alert you on brute-force attacks or unusual logons that are started by the IP addresses in this whitelist. ◦ Beaver WAF Whitelist: The attack blocking function does not alert you on the web attacks that are started by the IP addresses in this whitelist. ◦ Servers with Brute-Force Attack Permissions: The attack blocking function does not alert you on brute-force attacks that are started by the IP addresses in this whitelist. ◦ IPs with Application Attack Permissions: The traffic from the IP addresses in this whitelist is not detected as suspicious application attack traffic.

5. Click **Confirm**.
If you want to delete an existing whitelist, click **Delete** in the **Actions** column. In the **Delete Whitelist** message, click **Confirm**.

28.8.7.3.4. Configure request blocking policies

This topic describes how to enable web attack blocking and brute-force attack blocking.

Context

The attack blocking functions protect your servers against web attacks and brute-force attacks.

Procedure

1. [Log on to Apsara Stack Security Center.](#)

2. In the left-side navigation pane, choose **Security Operations Center (SOC) > System Configurations > Global Settings**. On the Global Settings page, click the **Policy Configuration** tab.
3. Turn on or off the switches in the **Actions** column to enable or disable **Web Attack Blocking** or **Brute-Force Attack Blocking**.

Category	Status	Description	Actions
Web Attack Blocking	Disabled	 Web attack blocking is disabled. Only the warning function is provided.	
Brute-Force Attack Blocking	Disabled	 Brute-Force attack blocking is disabled. Only the warning function is provided.	

 **Note**

In the **Actions** column, a red switch indicates a disabled function and a green switch indicates an enabled function.

After you disable the blocking function for an attack type, Apsara Stack Security Center provides only the alert function on the attacks.

28.8.7.3.5. Block IP Addresses

This topic describes how to manually block requests from a specified IP address based on traffic analysis results provided by Cloud Firewall.

Procedure

1. **Log on to Apsara Stack Security Center.**
2. In the left-side navigation pane, choose **Security Operations Center (SOC) > System Configurations > Global Settings**. On the Global Settings page, click the **Block IP Addresses** tab.
3. Click **Add**.
4. In the **Add** dialog box that appears, specify the IP address to block.

Add ✕

Source IP

Destination IP

Destination Port

Blocking Duration --Select-- ▼

Type Blacklist ▼

Note: The whitelist mechanism has precedence over the blacklist.

Confirm
Cancel

Parameter	Description
Source IP	Enter the source IP address that you want to block.
Destination IP	Enter the destination IP address to which the requests need to be blocked.

Parameter	Description
Destination Port	Enter the destination port to which the requests need to be blocked.
Blocking Duration	Select a time range for which you want to block requests. You can select 1 Day, 7 Days, or 30 Days.
Type	Set the blocking mode to Whitelist or Blacklist.

5. Click Confirm.

28.8.7.3.6. Configure custom IP addresses and locations

28.8.7.3.6.1. Add custom IP addresses and locations

This topic describes how to add custom IP addresses and locations. You can customize internal IP addresses based on your network planning. After that, IP addresses from the public address library do not match the addresses outside of China.

Procedure

1. [Log on to Apsara Stack Security Center.](#)
2. In the left-side navigation pane, choose **Security Operations Center (SOC) > System Configurations > Global Settings**. On the Global Settings page, click the **Custom IP Location** tab.
3. Click **Add**. If you want to add multiple IP addresses and locations at a time, click **Batch Upload (.txt)** to import multiple IP addresses and locations as a template.
4. In the Add dialog box, specify the custom IP address and location.
5. Click **Confirm**.

28.8.7.3.6.2. Manage custom IP addresses and locations

This topic describes how to modify and delete custom IP addresses and locations.

Procedure

1. [Log on to Apsara Stack Security Center.](#)
2. In the left-side navigation pane, choose **Security Operations Center (SOC) > System Configurations > Global Settings**. On the Global Settings page, click the **Custom IP Location** tab.
3. In the **Actions** column, manage custom IP addresses and locations.
 - To modify a custom IP address and a location:
Click **Modify** to modify the custom IP address and location.
 - To delete a custom IP address and a location:
Click **Delete** to delete the custom IP address and location.

28.8.7.4. System Monitoring

28.8.7.4.1. Configure CIDR blocks for traffic redirection in Cloud Firewall

Before you use Cloud Firewall, configure Classless Inter-Domain Routing (CIDR) blocks for traffic redirection.

Procedure

1. [Log on to Apsara Stack Security Center.](#)
2. In the left-side navigation pane, choose **Security Operations Center (SOC) > System Configuration > System Monitoring**. On the System Monitoring tab, click the ICFW tab.
3. On the ICFW tab, click **Add** on the right of **ISW Traffic Diversion Settings - Business CIDR Block**.
4. In the **Add** dialog box, specify **CIDR Block for Traffic Diversion** and **Type**.
5. Click **OK**.
After the configuration is complete, you can view related information in **ISW Traffic Diversion Settings - Business CIDR Block**, **Service Self-check Status**, and **Interface Status**.

28.8.7.5. Remote operations

28.8.7.5.1. Enable Remote O&M

This topic describes how to enable remote operations.

Context

The remote operations function provides remote security operations and rules operations.

Procedure

1. [Log on to Apsara Stack Security Center.](#)
2. In the left-side navigation pane, choose **Security Operations Center (SOC) > System Configurations > Remote O&M**.
3. On the **Remote O&M** page, turn on the switch to enable remote operations.

Note The function is enabled if the switch turns green.

4. Select the departments for which you want to enable remote operations.
 - i. Click **Update** on the right of **Enabled Departments**.
 - ii. In the **Update Enabled Departments** dialog box, click the **Department** drop-down list to select the departments for which you want to enable remote operations.

iii. Click OK.

Note After you perform these operations, the security logs of Enabled Departments are encrypted and uploaded to Apsara Stack Security Center.

5. Select fields to encrypt and upload for remote operations.
 - If you select **Required Nonsensitive Fields**, the system encrypts and uploads the data.
 - If you select **Available Fields and Masking**, the system masks the data before encrypting and uploading it.

28.8.7.6. Account management

28.8.7.6.1. View and modify Apsara Stack accounts

This topic describes how to view and modify the information of Apsara Stack accounts bound to the system.

Context

Note All assets in Apsara Stack Security are bound to Alibaba Cloud accounts. Proceed with caution when you modify the account information.

Procedure

1. **Log on to Apsara Stack Security Center.**
2. In the left-side navigation pane, choose **Security Operations Center (SOC) > System Configurations > Accounts**. On the Accounts page, click the **Apsara Stack Account** tab.
3. Modify the information of your Apsara Stack account.
 - i. In the Actions column, click **Modify**.
 - ii. In the **Change Account** dialog box, modify the account information.

The screenshot shows a 'Change Account' dialog box with the following fields:

- Apsara Stack Account
- User ID
- Access Key
- Access Secret (masked with dots)

Buttons: Confirm, Cancel

iii. Click **Confirm**.

4. View the details of your Apsara Stack account.
 - i. In the Actions column, click **Details**.
 - ii. View the account details.

The details include the license expiration date and the number of Server Guard licenses. The information is obtained based on the user ID and the AccessKey pair.

Details	
Apsara Stack Account:	[Redacted]
User ID:	[Redacted]
Access Key:	[Redacted]
Access Secret:	*****
License Due Date:	05/16/2020
Server Guard Licenses:	0

[Confirm](#)

28.8.7.6.2. Add a public cloud account

This topic describes how to add a public cloud account in Apsara Stack Security Center to use features in a hybrid cloud.

Context

After you add a public cloud account in Apsara Stack, you can manage the Anti-DDoS Pro, Anti-DDoS Premium, and Web Application Firewall (WAF) instances under this public cloud account in Apsara Stack. This allows you to use features in a hybrid cloud.

Procedure

1. [Log on to Apsara Stack Security Center.](#)
2. In the left-side navigation pane, choose **Security Operations Center (SOC) > System Configurations > Accounts**. On the Accounts page, click the **Public Cloud Account** tab.
3. Click **Add**.
4. In the **Add Account** dialog box, enter the public cloud account information and select public cloud services.
 - Enter the **AccessKey ID** and **AccessKey** secret of the public cloud account.
 - Select the public cloud services to use. You can select **Anti-DDoS Pro**, **Web Application Firewall**, or both.
5. Click **Confirm**.

Result

After an account is added, it is displayed on the **Public Cloud Account** tab. To modify or delete an account, you can click **Modify** or **Delete** in the **Actions** column.

28.9. Optional security products

28.9.1. Anti-DDoS settings

28.9.1.1. Overview

In Distributed Denial of Service (DDoS) attacks, attackers exploit the client-server model to combine multiple computers into a platform that can launch attacks on one or more targets. This greatly increases the threat of attacks.

Common DDoS attack types include:

- **Network-layer attacks:** A typical example is UDP reflection attacks, such as NTP flood. These attacks use heavy traffic to congest the network of the victim, disabling proper responses to user requests.
- **Transport-layer attacks:** Typical examples include SYN flood and connection flood. These attacks consume a large number of connection resources of a server to cause denial of service.
- **Session-layer attacks:** A typical example is SSL flood. These attacks consume the SSL session resources of a server to cause denial of service.
- **Application-layer attacks:** Typical attack types include DNS flood, HTTP flood, and game zombie attacks. These attacks consume a large amount of application processing resources of a server to cause denial of service.

Apsara Stack Security can redirect, scrub, and re-inject attack traffic to protect your server against DDoS attacks and ensure normal business operations.

 **Note** Apsara Stack Security cannot scrub the traffic between internal networks.

28.9.1.2. View and configure anti-DDoS policies

This topic describes how to view and configure anti-DDoS policies. Anti-DDoS provides default anti-DDoS policies and distributed denial of service (DDoS) traffic scrubbing policies.

Context

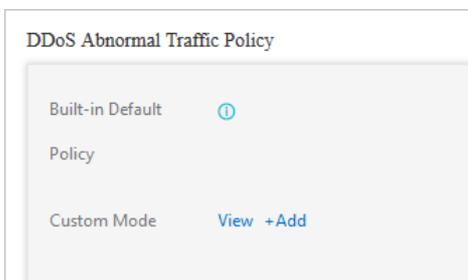

After an alert threshold of DDoS traffic is set for an IP address, an alert is triggered if the traffic to the IP address reaches the threshold. The alert thresholds for an IP address must be set based on the traffic volume. An abnormally large traffic volume indicates a possible DDoS attack. We recommend that you set an alert threshold to a value slightly higher than the peak traffic volume.

Apsara Stack Security supports global alert thresholds or alert thresholds for a specific Classless Inter-Domain Routing (CIDR) block or IP address.

- **Global alert threshold:** You cannot set a global alert threshold. It is set when the service is initialized.
- **Alert threshold for a specific CIDR block:** You can set an alert threshold for a specific CIDR block based on its traffic volume. Compared with global alert thresholds, CIDR block-specific alert thresholds allow you to control the traffic to each CIDR block.

Procedure

1. [Log on to Apsara Stack Security Center.](#)
2. In the left-side navigation pane, choose **Network Security > Policy Configuration > DDoS Defense Policy.**
3. **View and configure anti-DDoS policies.**

Option	Description
View default policies.	Move the pointer over the position indicated by 1 in the preceding figure to view the default anti-DDoS policies.
Customize an anti-DDoS policy.	Click View to view CIDR block-specific policies, and click Add to customize a policy for a CIDR block.

To customize a policy for a CIDR block, perform the following steps:

- i. Click **+Add** next to **Custom Mode**.
- ii. In the **Set Thresholds for Alerts** dialog box, configure parameters.

Parameter	Description
CIDR Block	The CIDR block for which the alert thresholds are used.
Bandwidth Threshold	The alert threshold for bandwidth usage in a data center. When the sum of inbound and outbound throughput reaches this threshold, DDoS detection is triggered. Set this parameter to a value slightly higher than the peak traffic rate. We recommend that you set the value to 100 or higher. Unit: Mbit/s.
Packets Threshold	The alert threshold for the packet rate of a data center. When the sum of the inbound and outbound packet rates reaches this threshold, DDoS detection is triggered. Set this parameter to a value slightly higher than the peak packet rate. We recommend that you set the value to 20,000 or higher. Unit: packets per second (PPS).

- iii. Click **OK**.

4. In the **DDoS Scrubbing Defense Strategy** section, click **View** to view DDoS traffic scrubbing policies.

28.9.1.3. View DDoS events

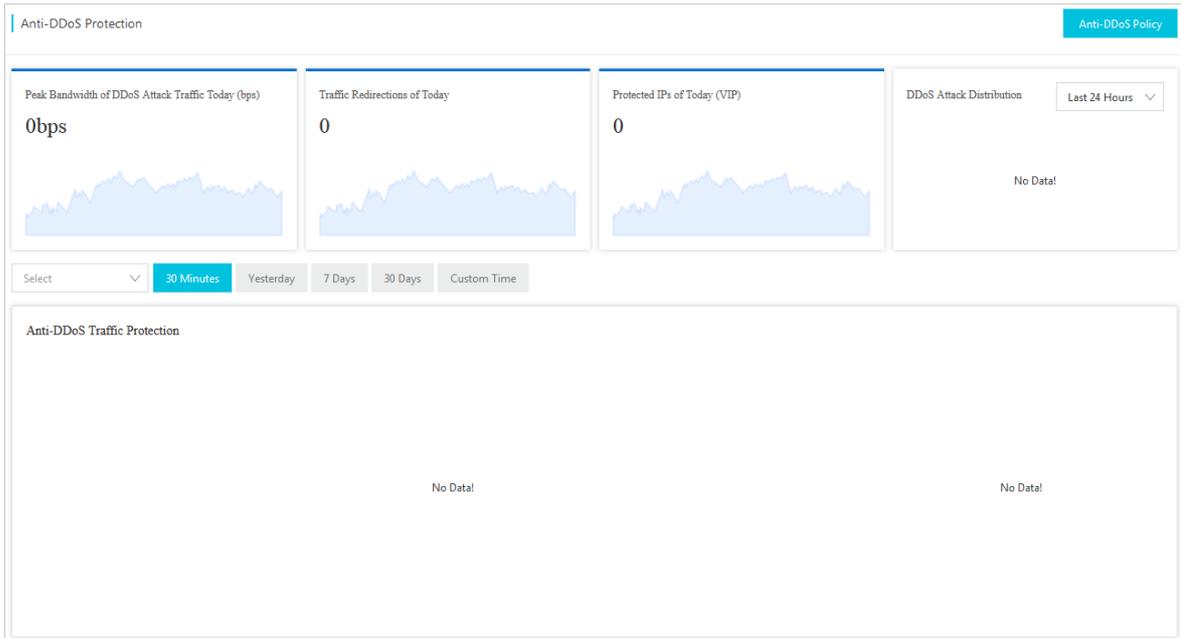

This topic describes how to view distributed denial of service (DDoS) events.

Context

During or after traffic scrubbing, Apsara Stack Security reports security events to Apsara Stack Security Center.

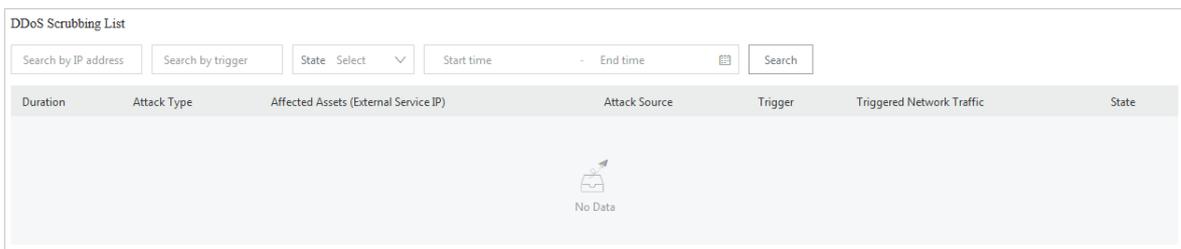

Procedure

1. [Log on to Apsara Stack Security Center](#).
2. In the left-side navigation pane, choose **Network Security > DDoS Defense Policy**.
3. View anti-DDoS statistics.

4. (Optional) In the DDoS Scrubbing List section, specify search conditions and click Search.

Note Skip this step if you need to view all traffic scrubbing events.

Search condition	Description
Search by IP address	The IP address that was under a DDoS attack.
Search by trigger	The metric that exceeds the configured alert threshold in the DDoS attack traffic.
State	<ul style="list-style-type: none"> Scrubbing: indicates that traffic scrubbing is in progress. Scrubbing Complete: indicates that traffic scrubbing is complete.
Start time and End time	The start time and end time of DDoS traffic scrubbing.

5. In the DDoS Scrubbing List section, view details about DDoS traffic scrubbing events.

28.9.2. Cloud Firewall

28.9.2.1. Access control

28.9.2.1.1. Configure the Internet firewall switch policy

This topic describes how to enable and disable the Internet firewall switch policy for assets. You can manually synchronize assets and manage the protection status of target assets.

Manually synchronize assets

If new public IP addresses are not in the list, click Update Assets to update the public IP address list.

1. [Log on to Apsara Stack Security Center.](#)
2. In the left-side navigation pane, choose **Network Security > Policy Configuration > Firewall Switch Policy.**
3. Click the **Internet Firewall** tab. In the upper-right corner of the page, click **Update Assets.**
4. In the **Update Assets** message, click **OK.**
After the assets are synchronized, the system automatically updates the public IP address list.

28.9.2.1.2. Create a VPC firewall

A virtual private cloud (VPC) firewall is a distributed firewall that can detect and control traffic between VPCs. Cloud Firewall can be used to analyze and control traffic between two VPCs only after a VPC firewall is created and enabled.

Context

A VPC firewall can be created only between two VPCs that are connected. VPCs can be connected by using Express Connect or Cloud Enterprise Network (CEN).

Procedure

1. [Log on to Apsara Stack Security Center.](#)
2. In the left-side navigation pane, choose **Network Security > Policy Configuration > Firewall Switch Policy.**
3. On the **Firewalls** page, click the **VPC-VPC** tab. Find the target VPC, In the **Actions** column, click **Create.**

Parameter	Description
Instance Name	Enter a name for the VPC firewall. We recommend that you enter a unique name that indicates the specific business to make it easy to identify the VPC firewall. The name can contain letters, digits, underscores (_), and hyphens (-). However, the name cannot contain only digits.
Route Table	When you create a VPC, the system automatically creates a default route table. You can add system routes to the route table to manage VPC traffic. VPC allows you to create multiple route tables. When you create a VPC firewall in the Cloud Firewall console, Cloud Firewall automatically reads your VPC route tables. Express Connect supports multiple route tables. When you create a VPC firewall for an Express Connect, you can view multiple VPC route tables and can select the route tables that you want to protect.
Destination CIDR Block	After you select a route table from the Route Table drop-down list, the default destination Classless Inter-Domain Routing (CIDR) block of the route table is displayed in the Destination CIDR Block section. If you need to protect traffic to other CIDR blocks, you can manually modify destination CIDR blocks. You can add multiple CIDR blocks that are separated with commas (,).
Peer Route Table	Confirm the region and name of the peer VPC, and select the target route table.
Peer Destination CIDR Blocks	The destination CIDR block of the peer VPC.

Parameter	Description
Firewall Mode	<ul style="list-style-type: none"> ◦ Test: This mode is used to test the health status of the CIDR block or the IP address to ensure that the link is normal. ◦ Active: This mode is used to redirect and protect traffic. ◦ Bypass: The firewall does not redirect the traffic in this mode. If the self-test or the health test fails, the firewall is automatically changed to the Bypass mode. <p>When you create a VPC firewall, you can set Firewall Mode only to Test. After the firewall is created, you can change its mode to Active or Bypass. You cannot directly change the mode from Bypass to Active. You must change the mode from Bypass to Test first, and then to Active.</p> <p>In the Health Test section, enter the 32-bit test IP addresses that are created in the local and peer VPCs.</p>
IPS Mode	<p>Select the working mode of the intrusion prevention system (IPS). Valid values</p> <ul style="list-style-type: none"> ◦ Monitoring Mode: If you select this option, Cloud Firewall monitors traffic. In addition, Cloud Firewall sends alerts if it detects malicious traffic. ◦ Traffic Control Mode: If you select this option, Cloud Firewall intercepts malicious traffic and blocks intrusion attempts.
IPS Capabilities	<p>Select the intrusion prevention policies that you want to enable. Valid values:</p> <ul style="list-style-type: none"> ◦ Basic Policies: This feature provides basic intrusion prevention capabilities such as protection against brute-force attacks and attacks that exploit command execution vulnerabilities. It also allows you to manage and control the connections from infected hosts to a command and control (C&C) server. ◦ Virtual Patches: This feature defends against the most common high-risk application vulnerabilities in real time.
Enable VPC Firewall	<p>After you turn on Enable VPC Firewall, a VPC firewall is enabled automatically after it is created. If you do not require the VPC firewall to be automatically enabled after it is created, turn off this switch.</p>

4. Click **Submit**. When the VPC firewall takes effect, Firewall Status of the VPC firewall changes to **Enabled**.

28.9.2.1.3. Create an IDC-VPC firewall

An IDC-VPC firewall can detect the traffic between an on-premises data center and a virtual private cloud (VPC). Cloud Firewall allows you to control traffic through IDC-VPC firewalls. This topic describes how to create an IDC-VPC firewall.

Procedure

1. [Log on to Apsara Stack Security Center](#).
2. In the left-side navigation pane, choose **Network Security > Policy Configuration > Firewall Switch Policy**.
3. On the **Firewalls** page, click the **IDC-VPC** tab. In the upper-right corner, click **Create**.

Parameter	Description
Instance Name	<p>Enter a name for the VPC firewall. We recommend that you enter a unique name that indicates the specific business to make it easy to identify the VPC firewall.</p> <p>The name can contain letters, digits, underscores (_), and hyphens (-). However, the name cannot contain only digits.</p>
VPC Instance	<p>Select the ID of a VPC. The ID is the unique identifier of the VPC. Cloud Firewall automatically synchronizes the VPCs that are connected to the on-premises data center.</p>
VPC Route Table	<p>When you create a VPC, the system automatically creates a default route table. You can add system routes to the route table to manage VPC traffic. VPC allows you to create multiple route tables.</p> <p>When you create a VPC firewall in the Cloud Firewall console, Cloud Firewall automatically reads your VPC route tables. Express Connect supports multiple route tables. When you create a VPC firewall for an Express Connect, you can view multiple VPC route tables and can select the route tables that you want to protect.</p>
VPC Destination CIDR Block	<p>After you select a route table from the VPC Route Table drop-down list, the default destination Classless Inter-Domain Routing (CIDR) block of the route table is displayed in the Destination CIDR Block section. If you need to protect traffic to other CIDR blocks, you can manually modify destination CIDR blocks.</p> <p>You can add multiple CIDR blocks that are separated with commas (,).</p>
IDC Express Connect Circuit (Primary)	<p>Select a leased line ID that you create when you connect the on-premises data center to Apsara Stack.</p> <p>When the customer edge (CE) in the on-premises data center connects to the primary and secondary VSwitches, you must specify a primary leased line. The IDC-VPC firewall automatically synchronizes the primary leased line that you specify. You must specify this parameter when you create the IDC-VPC firewall.</p>

Parameter	Description
VBR (Primary)	Select a virtual border router (VBR) that is bound to the primary leased line in the on-premises data center. The VBR facilitates communication between the VPC and the on-premises data center. The IDC-VPC firewall automatically synchronizes the VBR that you specify. You must specify this parameter when you create the IDC-VPC firewall.
IDC Express Connect Circuit (Secondary)	Select a leased line ID that you create when you connect the on-premises data center to Apsara Stack. You must specify a secondary leased line when the customer edge (CE) in the on-premises data center connects to the primary and secondary VSwitches. The value of this parameter cannot be the same as that of the IDC Express Connect Circuit (Primary) parameter. The IDC-VPC firewall automatically synchronizes the secondary leased line that you specify. You must specify this parameter when you create the IDC-VPC firewall.
VBR(Secondary)	Select a VBR that is bound to the secondary leased line in the on-premises data center. The VBR facilitates communication between the VPC and the on-premises data center. The IDC-VPC firewall automatically synchronizes the VBR that you specify. You must specify this parameter when you create the IDC-VPC firewall.
VPC Destination CIDR Block	The destination CIDR block of the peer VPC.
Firewall Mode	<ul style="list-style-type: none"> ◦ Test: This mode is used to test the health status of the CIDR block or the IP address to ensure that the link is normal. ◦ Active: This mode is used to redirect and protect traffic. ◦ Bypass: The firewall does not redirect the traffic in this mode. If the self-test or the health test fails, the firewall is automatically changed to the Bypass mode. <p>When you create a VPC firewall, you can set Firewall Mode only to Test. After the firewall is created, you can change its mode to Active or Bypass. You cannot directly change the mode from Bypass to Active. You must change the mode from Bypass to Test first and then to Active.</p> <p>In the Health Test section, enter a 32-bit test IP address that is created in the local VPC.</p>
IPS Mode	Select the working mode of the intrusion prevention system (IPS). Valid values: <ul style="list-style-type: none"> ◦ Monitoring Mode: If Cloud Firewall detects malicious traffic, it monitors traffic and sends alerts. ◦ Traffic Control Mode: Cloud Firewall intercepts malicious traffic and blocks intrusion attempts.
IPS Capabilities	Select the intrusion prevention policies that you want to enable. Valid values: <ul style="list-style-type: none"> ◦ Basic Policies: This feature provides basic intrusion prevention capabilities such as protection against brute-force attacks and attacks that exploit command execution vulnerabilities. It also allows you to manage and control the connections from infected hosts to a command and control (C&C) server. ◦ Virtual Patches: This feature defends against the most common high-risk application vulnerabilities in real time.
Enable VPC Firewall	After you turn on Enable VPC Firewall, an IDC-VPC firewall is enabled automatically after it is created. If you do not require the IDC-VPC firewall to be automatically enabled after it is created, turn off this switch.

4. Click **Submit**. When the IDC-VPC firewall takes effect, Firewall Status of the IDC-VPC firewall changes to **Enabled**.

28.9.2.1.4. Manage address books

This topic describes how to create and manage IP address books and port address books. You can use address books to store one or more Classless Inter-Domain Routing (CIDR) blocks or ports.

Context

You can store frequently used IP addresses and ports in address books to facilitate configurations of the Internet firewall.

Create an IP address book

1. Log on to [Apsara Stack Security Center](#).
2. In the left-side navigation pane, choose **Network Security > Access Control**.
3. On the Access Control page, click the **Internet Firewall** tab.
4. In the upper-right corner, click **Address Books**. In the dialog box that appears, click the **IP Address Books** tab.
5. Click **+Create Address Book** to specify parameters.

Parameter	Description
Address Book Type	Select the type of the address book. Set the value to IP Addresses .
Address Book Name	Specify the name of the address book. The name must be unique. The name can contain letters, digits, underscores (_), and hyphens (-). However, the name cannot contain only digits.
IP Address	Enter a CIDR block. Separate multiple CIDR blocks with commas (,).
Description	Enter the content and scenarios of the address book. The description must be 2 to 512 characters in length.

6. Click **Submit**.
After the address book is created, you can view the address book on the **IP Address Books** tab. You can click **Modify** or **Delete** to manage address books.

Create a port address book

1. Log on to [Apsara Stack Security Center](#).
2. In the left-side navigation pane, choose **Network Security > Access Control**.
3. On the Access Control page, click the **Internet Firewall** tab.

4. In the upper-right corner, click **Address Books**. In the dialog box that appears, click the **Port Address Books** tab.
5. Click **+Create Address Book** to specify parameters.

Parameter	Description
Address Book Name	Specify the name of the address book. The name must be unique. The name can contain letters, digits, underscores (_), and hyphens (-). However, the name cannot contain only digits.
Ports	Enter a port number or port range. Separate multiple port numbers or ranges with commas (,).
Description	Enter the content and scenarios of the address book. The description must be 2 to 512 characters in length.

6. Click **Submit**.
After the address book is created, you can view the address book on the **Port Address Books** tab. You can click **Modify** or **Delete** to manage address books.

28.9.2.1.5. Configure an Internet firewall

The access control feature allows you to configure access control policies for Internet firewalls. You can configure inbound and outbound policies on the Internet Firewall tab to control the traffic between the Internet and your servers.

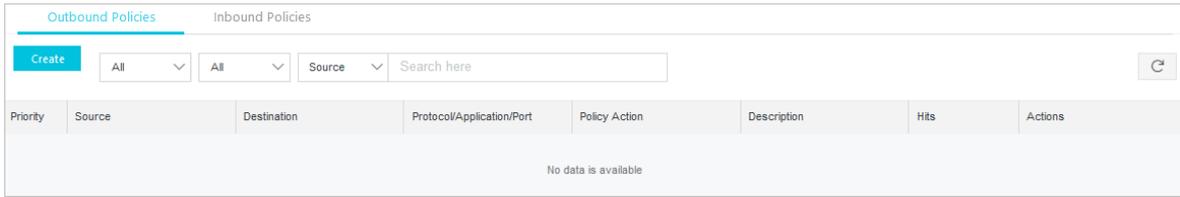

Context

An Internet firewall supports **Outbound Policies** and **Inbound Policies**.

In this topic, IP address books, port address books, and domain address books are used. For more information about how to create these address books, see [Manage address books](#).

Procedure

1. [Log on to Apsara Stack Security Center](#).
2. In the left-side navigation pane, choose **Network Security > Access Control**.
3. Click the **Internet Firewall** tab.
4. Click the **Outbound Policies** or **Inbound Policies** tab based on the direction of traffic that you want to control.

- **Outbound Policies tab:** You can configure control policies for traffic from your internal network to the Internet.
- **Inbound Policies tab:** You can configure control policies for traffic from the Internet to your internal network.

5. Click **Create**. In the **Create Outbound Policy** dialog box, configure the following parameters.

Parameter	Description
Source Type	<p>Select the type of the traffic source. Valid values: IP and Address Book.</p> <ul style="list-style-type: none"> ○ IP: indicates only one CIDR block. ○ Address Book: indicates a preset IP address book. An IP address book contains multiple CIDR blocks. This allows you to control traffic from multiple IP addresses.
Source	<p>Specify the source addresses that are allowed to access the Internet.</p> <ul style="list-style-type: none"> ○ If you set Source Type to IP, enter a CIDR block. Example: 1.1.1.1/32. ○ If you set Source Type to Address Book, click Select Address Book. In the Select Address Book as Source dialog box, select an IP address book.
Destination Type	<p>Select the type of the traffic destination. Valid values: IP, Address Book, Domain, and Region.</p>

Parameter	Description
Destination	<p>Specify the destination addresses that can be accessed. You must set Destination to addresses on the Internet.</p> <ul style="list-style-type: none"> ◦ If you set Destination Type to IP, enter a CIDR block. Example: 1.1.1.1/32. ◦ If you set Destination Type to Address Book, click Select Address Book. In the Select Address Book as Destination dialog box, select an IP address book. ◦ If you set Destination Type to Domain, enter a domain name. Example: www.example.com. ◦ If you set Destination Type to Region, select one or more destination regions from the drop-down list.
Protocol	<p>Select the protocol for outbound traffic. Valid values: TCP, UDP, ICMP, and ANY. If you are not sure which protocol is used, select ANY.</p>
Port Type	<p>Select the type of ports that are used for the selected protocol. Valid values: Ports and Address Book.</p> <ul style="list-style-type: none"> ◦ Ports: indicates a port range. ◦ Address Book: indicates a preset port address book. A port address book contains multiple ports. This allows you to control traffic on multiple ports.
Ports	<p>Specify the ports on which you want to control traffic. Enter a port number range or select a port address book, depending on the Port Type parameter.</p> <ul style="list-style-type: none"> ◦ If you set Port Type to Ports, enter a port range. ◦ If you set Port Type to Address Book, click Select Address Book. In the Select Ports dialog box, select a port address book.
Application	<p>Select the application to which the policy applies.</p>
Policy Action	<p>Specify whether the policy allows or denies traffic on the Internet firewall.</p> <ul style="list-style-type: none"> ◦ Allow: If outbound traffic meets the preceding conditions that you specify for the policy, the traffic is allowed. ◦ Monitor: If outbound traffic meets the preceding conditions that you specify for the policy, the traffic is recorded and allowed. ◦ Deny: If outbound traffic meets the preceding conditions that you specify for the policy, the traffic is denied.
Description	<p>Enter a description to identify the policy.</p> <p>The description can contain digits, letters, and underscores (_).</p>

6. Click **Submit**.

Result

After the policy is created, it appears in the policy list. In the **Actions** column that corresponds to the policy, you can click **Modify**, **Delete**, **Insert**, or **Move** to manage the policy.

28.9.2.1.6. Create a policy group

This topic describes how to create a policy group for an internal firewall. You can configure access control policies to restrict unauthorized access between ECS instances.

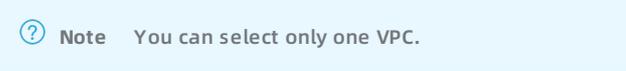

Context

An internal firewall is implemented by leveraging the security group module of ECS. The access control policies that you configure on the **Internal Firewall** tab are automatically synchronized to the security group module of

ECS.

Procedure

1. [Log on to Apsara Stack Security Center](#).
2. In the left-side navigation pane, choose **Network Security > Access Control**.
3. Click the **Internal Firewall** tab.
4. In the upper-right corner, click **Create Policy Group**.
5. In the **Create Policy Group** dialog box, configure the following parameters.

Parameter	Description	Configuration method
Name	The name of the policy group. The name must be 2 to 128 characters in length.	Enter a name to identify the policy group.
VPC	The VPC to which the policy group is applied.	Select a VPC from the VPC drop-down list. 
Instance ID	The ID of the ECS instance in the selected VPC.	Select an ECS instance ID from the Instance ID drop-down list. 
Description	The description of the policy group. The description must be 2 to 256 characters in length.	Enter a description to identify the policy group.
Template	The template of the policy group.	Select a template from the Template drop-down list. Valid values: <ul style="list-style-type: none"> ◦ default-accept-login: allows all inbound traffic on ports 22 and 3389. ◦ default-drop-all: denies all traffic in the policy group. ◦ default-accept-all: allows all traffic in the policy group.

6. Click **Submit**.

28.9.2.1.7. Manage an internal firewall

This topic describes how to view the policy groups of an internal firewall, configure access control policies in the policy groups, and synchronize the policies to the security group module of ECS.

Context

On the **Internal Firewall** tab, you can view custom policy groups and security groups that are synchronized from ECS.

For more information about how to create a custom policy group, see [Create a policy group](#).

Procedure

1. [Log on to Apsara Stack Security Center](#).
2. In the left-side navigation pane, choose **Network Security > Access Control**.
3. Click the **Internal Firewall** tab.
4. (Optional)Specify filter conditions, and click **Search** to search for the target policy group.

 **Note** If you want to view all policy groups, skip this step.

The search results are displayed in the policy group list.

5. Find the target policy group and configure its access control policy.

- i. In the **Actions** column, click **Configure Policy**.
- ii. On the **Policies** page, click **Create Policy**.

 **Note** If you want to modify or delete an access control policy, you can perform the following operations: Click the **Inbound** or **Outbound** tab, find the target policy, and then click **Modify** or **Delete**.

iii. In the **Create Policy** dialog box, configure the following parameters.

Parameter	Description	Configuration method
Network Type	The type of the network to which the policy is applied.	The default value is Internal , which indicates that the policy is applied to an internal network.
Direction	The direction of traffic that is controlled by the policy.	Valid values: <ul style="list-style-type: none"> ▪ Inbound: traffic from other ECS instances to the specified ECS instance. ▪ Outbound: traffic from the specified ECS instance to other ECS instances.
Policy Type	Indicates whether the policy allows or denies traffic on the internal firewall.	Valid values: <ul style="list-style-type: none"> ▪ Allow ▪ Deny
Protocol Type	The protocol of traffic that is controlled by the policy.	Select a protocol type from the Protocol Type drop-down list. Valid values: <ul style="list-style-type: none"> ▪ TCP ▪ UDP ▪ ICMP ▪ ANY: If you are not sure which protocol is used, select ANY.
Port Range	The destination port of traffic that is controlled by the policy.	Enter a port range. Example: 22/22.
Priority	The priority of the policy.	Enter a priority number. <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p> Note The priority number must be an integer from 1 to 100. Different policies can have the same priority. If an Allow policy and a Deny policy have the same priority, the Deny policy takes precedence. If two Allow policies have the same priority, both policies take effect.</p> </div>

Parameter	Description	Configuration method
Source Type	The type of the traffic source.	<p>Valid values:</p> <ul style="list-style-type: none"> ▪ CIDR Block: The traffic source is a CIDR block. ▪ Policy Group: The traffic source is any ECS instance in a policy group. <p> Note For a policy created in the security group module of ECS, you cannot set Source Type to Policy Group.</p>
Source	The source of the traffic.	<p>Enter a CIDR block or select a policy group, depending on the Source Type parameter.</p> <ul style="list-style-type: none"> ▪ If you set Source Type to CIDR Block, enter only one CIDR block. ▪ If you set Source Type to Policy Group, select a policy group from the Source drop-down list. In this case, the traffic source is any ECS instance in the selected policy group. <p> Note You can select only one policy group from the Source drop-down list.</p>
Destination	The destination of traffic that is controlled by the policy.	<p>Valid values:</p> <ul style="list-style-type: none"> ▪ All ECS Instances: The policy is applied to traffic destined for your ECS instances. ▪ CIDR Block: The policy is applied to traffic destined for the specified CIDR block.
Description	The description that is used to identify the policy.	Enter a description that is 2 to 256 characters in length.

iv. Click **Submit**.

6. Find the target policy group and click **Publish** in the **Actions** column to apply the policy and synchronize it to the security group module of ECS.

28.9.2.1.8. Manage a VPC firewall

A VPC firewall detects and controls the traffic between two VPCs. Cloud Firewall allows you to configure access control policies for VPC firewalls. This topic describes how to configure access control policies for VPC firewalls.

Prerequisites

VPC firewalls are not automatically created. Before you configure access control policies for VPCs, you must create and enable a VPC firewall.

Access control policies take effect only after you enable the VPC firewall.

Context

A VPC firewall allows all traffic by default. If you want to control traffic between VPCs, you can configure access control policies to deny traffic from untrusted sources. You can also allow traffic from trusted sources and deny traffic from all other sources.

Procedure

1. Log on to Apsara Stack Security Center.
2. In the left-side navigation pane, choose Network Security > Access Control.
3. Click the VPC Firewall tab.
4. Click Create.
5. In the Create VPC Firewall Policy dialog box, configure the following parameters.

Create VPC Firewall Policy
✕

Source Type: IP Address Book

Parameter	Description
Source Type	<p>The type of the traffic source. Valid values: IP and Address Book.</p> <ul style="list-style-type: none"> ◦ If you set Source Type to IP, enter a CIDR block. ◦ If you set Source Type to Address Book, select a preset IP address book. <p>You can add multiple CIDR blocks to an address book to simplify policy configuration.</p>
Source	<p>The source of the traffic.</p> <div style="background-color: #e1f5fe; padding: 5px; border: 1px solid #cfe2f3; margin: 5px 0;"> ? Note If you set Source Type to IP, enter a CIDR block. Example: 1.1.1.1/32. </div> <p>If you set Source Type to Address Book, select a preset address book.</p>

Parameter	Description
Destination Type	<ul style="list-style-type: none"> ◦ IP: Set the destination to a CIDR block. ◦ Address Book: Set the destination to an address book. ◦ Domain Name: Set the destination to a domain name. Wildcard domain names are supported. Example: <i>*.aliyun.com</i>. <p> Note By default, if an HTTP header does not contain the Host field or an HTTPS request does not contain the Server Name Indication (SNI), Cloud Firewall allows the traffic.</p>
Destination	<p>The destination of the traffic. You can enter only one CIDR block.</p> <p>If you set Destination Type to Domain Name, enter a domain name. Wildcard domain names are supported. Example: <i>*.aliyun.com</i>.</p>
Protocol Type	<ul style="list-style-type: none"> ◦ ANY ◦ TCP ◦ UDP ◦ ICMP
Ports	<p>You can specify a port range. 0/0 indicates any port.</p> <p> Note If you set Protocol to ICMP, the port configuration does not take effect. If you set Protocol to ANY, the port configuration does not take effect in ICMP traffic control.</p>
Application	<p>Valid values: ANY, HTTP, HTTPS, Memcache, MongoDB, MQTT, MySQL, RDP, Redis, SMTP, SMTPS, SSH, and VNC.</p> <p>If you set Protocol to TCP, multiple applications are available. If you set Protocol to a value other than TCP, only ANY is available.</p> <p> Note Cloud Firewall identifies applications based on packet characteristics, instead of port numbers. If Cloud Firewall fails to identify the application in a packet, it allows the packet.</p>
Policy Action	<p>Specify whether the policy allows or denies traffic on the VPC firewall.</p> <ul style="list-style-type: none"> ◦ Allow: If traffic meets the preceding conditions that you specify for the policy, the traffic is allowed. ◦ Deny: If traffic meets the preceding conditions that you specify for the policy, the traffic is denied. ◦ Monitor: If traffic meets the preceding conditions that you specify for the policy, the traffic is recorded and allowed. After you observe the traffic for a period of time, you can change the policy action to Allow or Deny.
Description	<p>Enter a description to identify the policy.</p>

6. Click **Submit**.

28.9.2.1.9. Manage an IDC-VPC firewall

An IDC-VPC firewall can detect the traffic between an on-premises data center and a virtual private cloud (VPC). Cloud Firewall allows you to control accesses by using IDC-VPC firewalls. This topic describes access control that is implemented by using IDC-VPC firewalls.

Prerequisites

IDC-VPC firewalls are not automatically created. Before you configure access control policies between an on-premises data center and a VPC, you must create and enable an IDC-VPC firewall.

Access control policies take effect only after you enable the IDC-VPC firewall.

Context

An IDC-VPC firewall allows all traffic by default. If you want to control traffic between an on-premises data center and a VPC, you can configure access control policies to deny traffic from untrusted sources. You can also allow traffic from trusted sources and deny traffic from all other sources.

Procedure

1. **Log on to Apsara Stack Security Center.**
2. In the left-side navigation pane, choose **Network Security > Access Control**.
3. On the page that appears, click the **IDC-VPC Firewall** tab.
4. Click **Create**.
5. In the **Create VPC Firewall Policy** dialog box, configure a policy.

Create VPC Firewall Policy ✕

Destination	<p>The destination of the traffic. You can enter only one CIDR block.</p> <p>If you set Destination Type to Domain Name, enter a domain name. Wildcard domain names are supported. Example: <i>*.aliyun.com</i>.</p>
Protocol	<ul style="list-style-type: none"> ◦ ANY: any protocol ◦ TCP ◦ UDP ◦ ICMP
Ports	<p>You can specify a port range. 0/0 indicates all ports can be matched.</p> <p> Note If you set Protocol to ICMP, the destination ports do not take effect. If you set Protocol to ANY, the port configuration does not take effect in ICMP throttling.</p>
Application	<p>Valid values:</p> <p>ANY, HTTP, HTTPS, Memcache, MongoDB, MQTT, MySQL, RDP, Redis, SMTP, SMTPS, SSH, SSL, and VNC.</p> <p>If you set Protocol to TCP, multiple applications are available. If you set Protocol to a value other than TCP, only ANY is available.</p> <p> Note Cloud Firewall identifies applications based on packet characteristics, instead of port numbers. If Cloud Firewall fails to identify the application in a packet, it allows the packet.</p>

Parameter	Description
Policy Action	Specify whether the IDC-VPC firewall allows or denies traffic. <ul style="list-style-type: none"> ○ Allow: Matched traffic is allowed. ○ Deny: Matched traffic is denied, and no notifications are sent. ○ Monitor: Matched traffic is monitored but allowed. After you observe the traffic for a period of time, you can change the policy action to Allow or Deny.
Description	The description of the policy that helps you identify the policy.

6. Click **Submit**.

28.9.2.2. Intrusion prevention

28.9.2.2.1. Configure intrusion prevention policies

Cloud Firewall uses a built-in threat detection engine to defend against intrusions and common cyber attacks. It provides virtual patches against vulnerabilities to intelligently block intrusion attempts.

Procedure

1. [Log on to Apsara Stack Security Center](#).
2. In the left-side navigation pane, choose **Network Security > Policy Configuration > Intrusion Prevention Policies**.
3. Select a running mode for the threat engine.

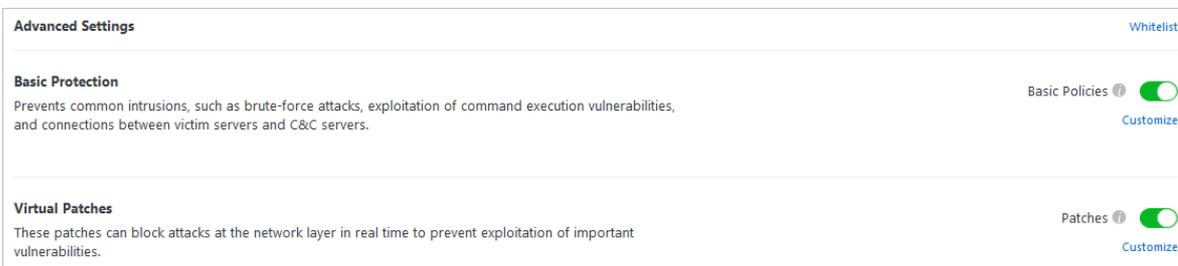

Valid values: **Monitoring Mode** and **Traffic Control Mode**.

- **Monitoring Mode:** In monitoring mode, the system generates alerts on intrusions instead of blocking the malicious traffic.
- **Traffic Control Mode:** In traffic control mode, the system automatically blocks malicious traffic.

To configure **Traffic Control Mode**, perform the following steps:

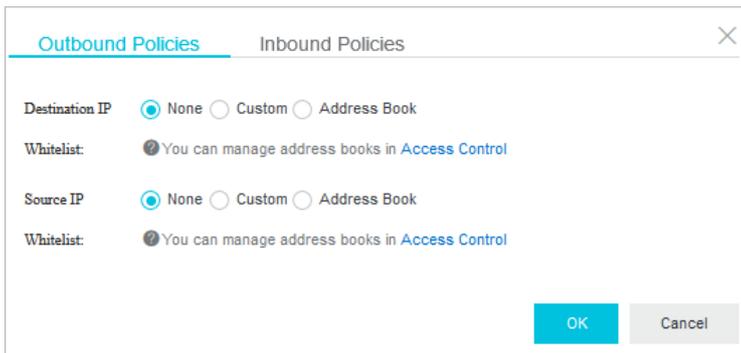

- i. **Select Traffic Control Mode.**
- ii. In the dialog box that appears, click **OK**.

4. Configure the advanced features.

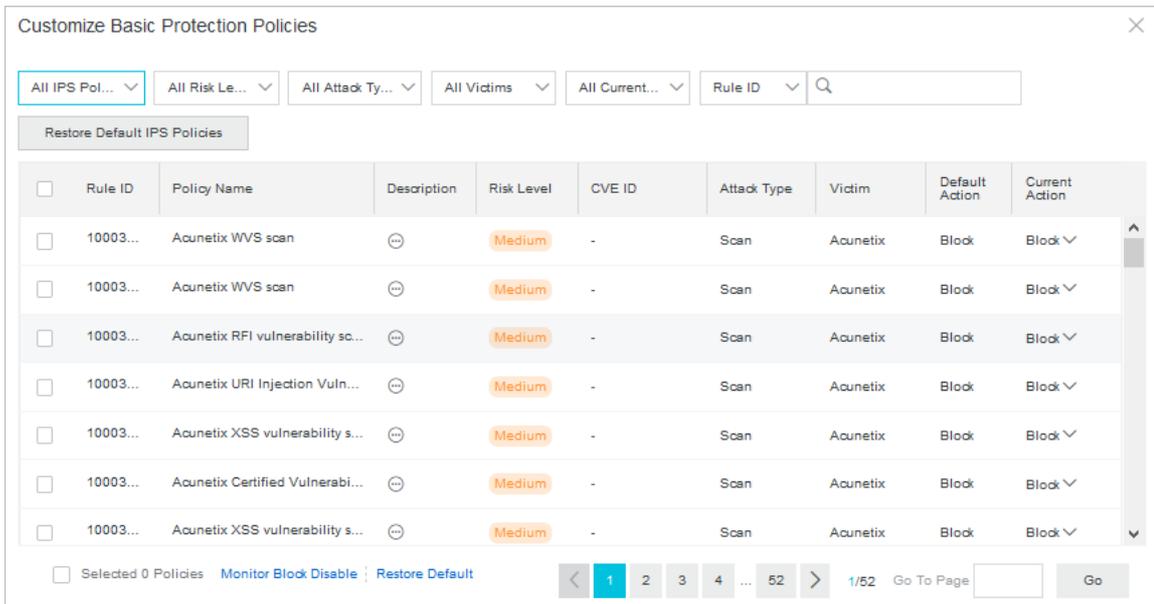

- **Cloud Firewall allows traffic from IP addresses in the whitelist.**
In the **Advanced Settings** section, click **Whitelist** to add trusted IP addresses to a whitelist.

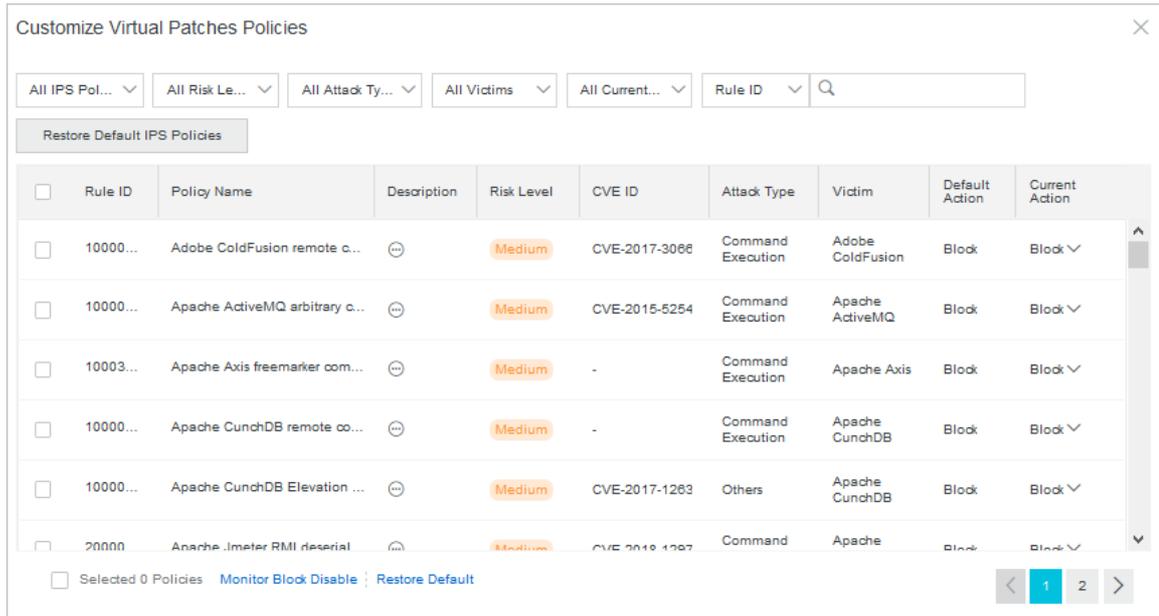

You can add the trusted source IP addresses, destination IP addresses, or address books of both inbound and outbound traffic to the whitelist.

- The basic protection feature defends your network against common intrusions, such as brute-force attacks and command execution vulnerabilities. The basic protection feature also manages connections from infected hosts to a command-and-control (C&C) server.
 - a. Click **Basic Policies** to enable the basic protection feature.
 - b. In the **Basic Protection** section, click **Customize**. In the **Customize Basic Protection Policies** dialog box, you can customize one or more basic protection policies.

- Virtual patches are installation-free. You can use them to defend against high-risk vulnerabilities.
 - a. Click **Patches** to enable the virtual patch feature.
 - b. In the **Virtual Patches** section, click **Customize**. In the **Customize Virtual Patches Policies** dialog box, configure one or more basic virtual patch policies.

28.9.2.2.2. View event logs

All traffic passing through Cloud Firewall is recorded on the Log Audit page. The logs are classified into traffic logs and event logs. You can use the logs to audit your network traffic in real time and take actions accordingly. This topic describes how to view event logs.

Procedure

1. Log on to Apsara Stack Security Center.
2. In the left-side navigation pane, choose Network Security > Log Audit > Event Log.
3. On the Event Logs tab, click Internet Firewall, VPC-VPC Firewall or IDC-VPC Firewall.
4. Specify the search conditions and click Search.

Note If you want to view all event logs, skip this step.

Search condition	Description
Source IP	Specify the source IP address of the event.
Destination IP	Specify the destination IP address of the event.
Type	Select the event type
Action	Select the event action. Valid values: <i>All</i> , <i>Monitor</i> , and <i>Discard</i> .
Time	Set the time range.

5. The event logs record the information of event. This includes the event detection time, threat type, traffic direction (inbound or outbound), source IP address, destination IP address, application type, severity, and policy action.

28.9.2.3. Log analysis

28.9.2.3.1. View traffic logs

All traffic passing through Cloud Firewall is recorded on the Log Audit page. The logs are classified into traffic logs and event logs. You can use the logs to audit your network traffic in real time and take actions accordingly. This topic describes how to view traffic logs.

Procedure

1. Log on to Apsara Stack Security Center.
2. In the left-side navigation pane, choose **Network Security > Log Audit > Traffic Log**.
3. On the **Event Logs** tab, click **Internet Firewall, VPC-VPC Firewall** or **IDC-VPC Firewall**.
4. Specify the search condition and click **Search**.

Note If you want to view all traffic logs, skip this step.

Search condition	Description
Source IP	Specify the source IP address of the traffic.
Destination IP	Specify the destination IP address of the traffic.
Application	Select the application type.
Time	Set the time range.

To enable the advanced features, perform the following steps:

- **Show Advanced Search**
Click **Show Advanced Search** to configure more search conditions.
 - **List Configuration**
Click **List Configuration** to select items for the traffic list.
5. The traffic logs record the information of access traffic. This includes the start time and end time of the access traffic, traffic direction (inbound or outbound), source IP address, destination IP address, application type, supported protocol, bytes, and packets.

28.9.3. Sensitive Data Discovery and Protection

28.9.3.1. Grant access permissions

This topic describes how to authorize Sensitive Data Discovery and Protection (SDDP) to access data of your department before you use SDDP.

Prerequisites

The department name and AccessKey pair are obtained. For more information, see [Obtain the AccessKey pair of an organization in ASCM Console User Guide](#). To find the topic, choose **Enterprise > Organizations > Obtain the AccessKey pair of an organization**.

Context

Before you use SDDP, you must perform the following operations:

- Authorize SDDP to access the data of your department.
- Authorize SDDP to access data of Apsara Stack services of your department. These services include MaxCompute, Object Storage Service (OSS), and Tablestore.

Procedure

1. Log on to Apsara Stack Security Center.
2. In the left-side navigation pane, choose Data Security > Sensitive Data Protection. The Authorization page appears.

Note If SDDP is not authorized to access the data of your department, configure parameters on the Authorization page to authorize SDDP.

Authorization

Add Authorization

* Department * Department AccessKey ID * Department AccessKey Secret

Authorized Account Information

Department	Department Alibaba Cloud Account	Display Name	Authorization Time
	dtdep-1:		Nov 1, 2019, 10:21:47

Total: 1 < Previous **1** Next >

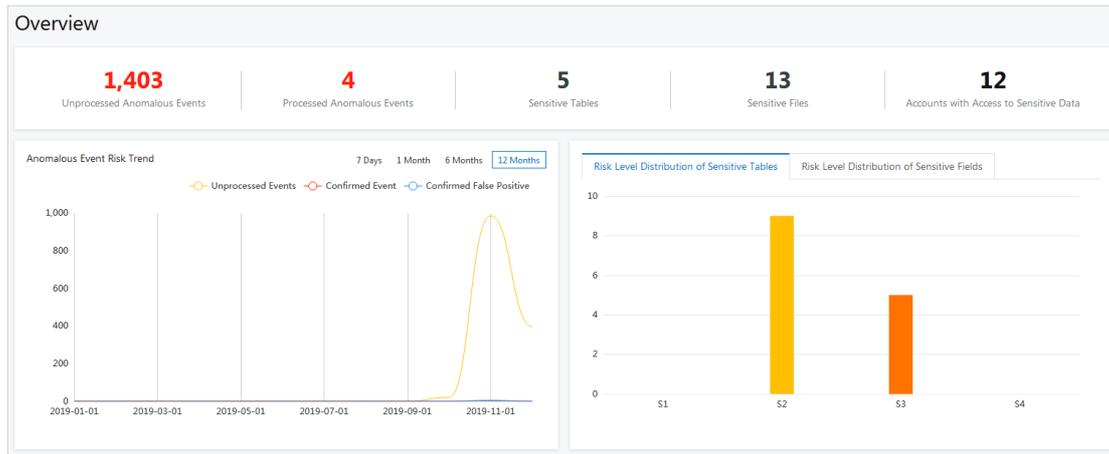

3. In the Add Authorization section, authorize SDDP to access data of your department.
 - i. In the Department drop-down list, enter a keyword and select the department.
 - ii. Specify Department AccessKey ID and Department AccessKey Secret.
 - iii. Click Submit.
4. In the Authorized Account Information section, view the departments that SDDP is authorized to access.

28.9.3.2. Overview

This topic describes the Overview page of Sensitive Data Discovery and Protection (SDDP). This page displays the overall security status of data protected by SDDP, and allows a security administrator to understand the current security status of sensitive data.

SDDP can detect sensitive data in your data assets based on sensitive data detection rules and track the use of sensitive data. SDDP also provides a data overview for you to obtain the security status of your data assets in real time.

In the left-side navigation pane, choose Data Security > Sensitive Data Discovery and Protection. In the left-side navigation tree, click Overview. On the Overview page, view the overall security status of the sensitive data.

- **Overview:** displays the overall information of sensitive data. This includes the number of unprocessed anomalous events, the number of anomalous events confirmed as violations, the total number of sensitive tables, the total number of sensitive objects, and accounts that accessed sensitive data.
- **Abnormal Event risk Trend:** displays the trends of anomalous events in a line chart. You can select 7 Days, 1 Month, 6 Months, or 12 Months to view the trends of Unprocessed Events, Confirmed Events, and Confirmed False Positive.
- **Risk Level Distribution of Sensitive Tables:** displays the distribution of sensitive tables at the S1, S2, and S3 risk levels.
- **Risk Level Distribution of Sensitive Fields:** displays the distribution of sensitive fields at the S1, S2, and S3 risk levels.
- **Data Flow Status:**
 - Displays the dynamic statistics on core data flows in DataHub and Cloud Data Pipeline (CDP).
 - Provides a data flowchart that dynamically displays the data flow status and abnormal output. You can click an anomalous event in the flowchart to go to the **Abnormal data flow** page.

Monitors the data links among entities such as data storage services MaxCompute, , Object Storage Service (OSS), and Tablestore, data transmission services DataHub and CDP, the data flow processing service Blink, external databases, and external files.

28.9.3.3. Detect sensitive data

28.9.3.3.1. Sensitive data overview

This topic describes how to view the overall security status of your data assets.

Choose **Data Security > Sensitive Data Discovery and Protection > Sensitive data identification > Sensitive data overview**. On the **Sensitive data overview** page, you can view the overall security status of your data assets.

- You can view the overall information about sensitive data. The information includes the total numbers of tables, objects, sensitive instances, sensitive tables, and sensitive objects.
- You can search for sensitive data based on conditions such as the risk level, asset type, sensitive data type, and asset name.
- You can view the statistics on the authorization information and sensitive data in Apsara Stack services such as MaxCompute, Object Storage Service (OSS), and Table Store in real time.

28.9.3.3.2. View statistics on sensitive data in MaxCompute

This topic describes how to view statistics on sensitive data in MaxCompute.

Context

MaxCompute is a rapid and fully-managed data warehouse solution that can process terabytes or petabytes of data. MaxCompute provides you with complete data import schemes and various classic distributed computing models. It supports fast computing on a large amount of data, effectively saves costs for enterprises, and guarantees data security.

Procedure

1. Log on to Apsara Stack Security Center.
2. In the left-side navigation pane, choose Data Security > Sensitive Data Protection > Sensitive Data Identification > MaxCompute.
3. View statistics on sensitive data in MaxCompute.

- i. In the Sensitive Data Statistics section, enter a keyword and select the target MaxCompute project from the drop-down list.

Note To view statistics on all MaxCompute projects, select All from the drop-down list.

- ii. On the Proportion of Sensitive Tables and Proportion of Sensitive Fields tabs, view the proportions of sensitive and non-sensitive tables and fields.
 - iii. On the Risk Level Distribution of Sensitive Tables and Risk Level Distribution of Sensitive Fields tabs, view the distribution of sensitive tables and fields at the S1, S2, S3, and S4 risk levels.
4. Query sensitive data in MaxCompute.

By default, the system displays all MaxCompute projects. Different risk levels are indicated by different colors. To view information about a specific project, package, table, or field, follow these steps:

- i. Select a risk level from the Risk Level drop-down list.
- ii. Enter a keyword of the project, package, or table in the search box.
- iii. Click **Project Search**, **Package Search**, or **Table Search**. You can view the relationships among the projects, packages, tables, and fields, and the related authorization information in a tree map.
 - The tree map displays the distribution of sensitive data in MaxCompute.
 - You can view the authorization information of a project, package, table, or field. The system displays the authorization information by category, including the authorized users and violations.
 - You can click Package management under a project to view packages in the project, including the tables and fields in the packages and related authorization information.
- iv. Move the pointer over the project, package, or table to view details.

28.9.3.3.3. View statistics on sensitive data in Tablestore

This topic describes how to view statistics on sensitive data in Tablestore.

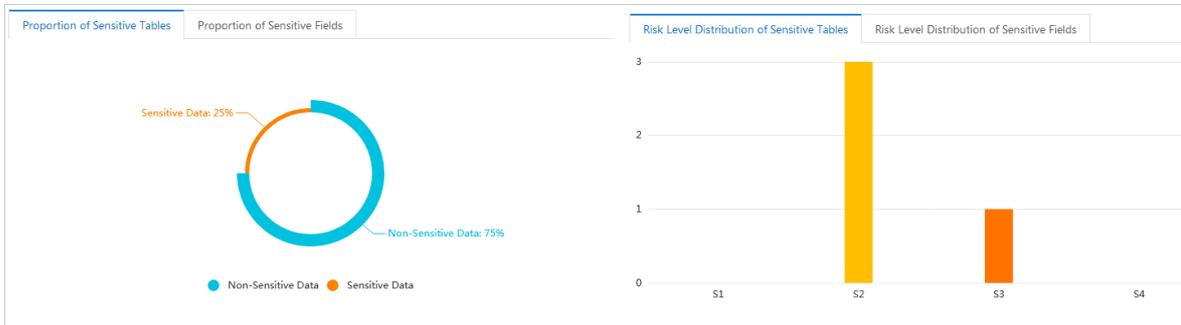

Context

Tablestore is a multi-model NoSQL database service provided by Apsara Stack. It can store a large amount of structured data and supports fast query and analysis. The distributed storage and powerful index-based search engine allow Tablestore to store petabytes of data while ensuring a 10 million TPS and a latency within milliseconds.

Procedure

1. [Log on to Apsara Stack Security Center.](#)

2. In the left-side navigation pane, choose **Data Security > Sensitive Data Protection > Sensitive Data Identification > Table Store**.
3. View statistics on sensitive data in Tablestore.

- i. In the **Sensitive Data Statistics** section, enter a keyword and select the target Tablestore instance from the drop-down list.

Note To view statistics on all Tablestore instances, select **All** from the drop-down list.

- ii. On the **Proportion of Sensitive Tables** and **Proportion of Sensitive Fields** tabs, view the proportions of sensitive and non-sensitive tables and fields.
 - iii. On the **Risk Level Distribution of Sensitive Tables** and **Risk Level Distribution of Sensitive Fields** tabs, view the distribution of sensitive tables and fields at the S1, S2, S3, and S4 risk levels.
4. Query sensitive data in Tablestore.

Sensitive Data Search

Risk Level: ▼ Enter a resource name. Fuzzy search is supported. Instance Search Table Search

- S1 LowRisk Level
- S2 MediumRisk Level
- S3 HighRisk Level
- S4 HighestRisk Level

OTS

- msg-bk Authorization Information
- ictx-prod Authorization Information
- databus Authorization Information
- ictx-ots-test Authorization Information
- demo-7cq6 Authorization Information
- test-ots Authorization Information
- S2 yundun-ots2 Authorization Information
- qianyun-ceshi Authorization Information
- S3 yundun-ots1 Authorization Information
- bbbb Authorization Information

By default, the system displays all Tablestore instances. To view information about a specific instance or table, perform the following steps:

- i. Select a risk level from the **Risk Level** drop-down list.
- ii. Enter a keyword of the instance or table in the search field.
- iii. Click **Instance Search** or **Table Search**.
 - The tree map displays the distribution of sensitive data in Tablestore.
 - You can view the authorization information of an instance or table. The system displays the authorization information by category, including the authorized users and violations.
- iv. Move the pointer over the instance or table to view details.

28.9.3.3.4. View statistics on sensitive data in OSS

This topic describes how to view statistics on sensitive data in Object Storage Service (OSS).

Context

OSS is a secure and reliable cloud storage service provided by Apsara Stack. It can store a large amount of data at low costs. OSS can store all types of files and is suitable for various websites, enterprises, and developers.

Procedure

1. [Log on to Apsara Stack Security Center](#).
2. In the left-side navigation pane, choose **Data Security > Sensitive Data Protection > Sensitive Data Identification > OSS**.
3. View statistics on sensitive data in OSS.

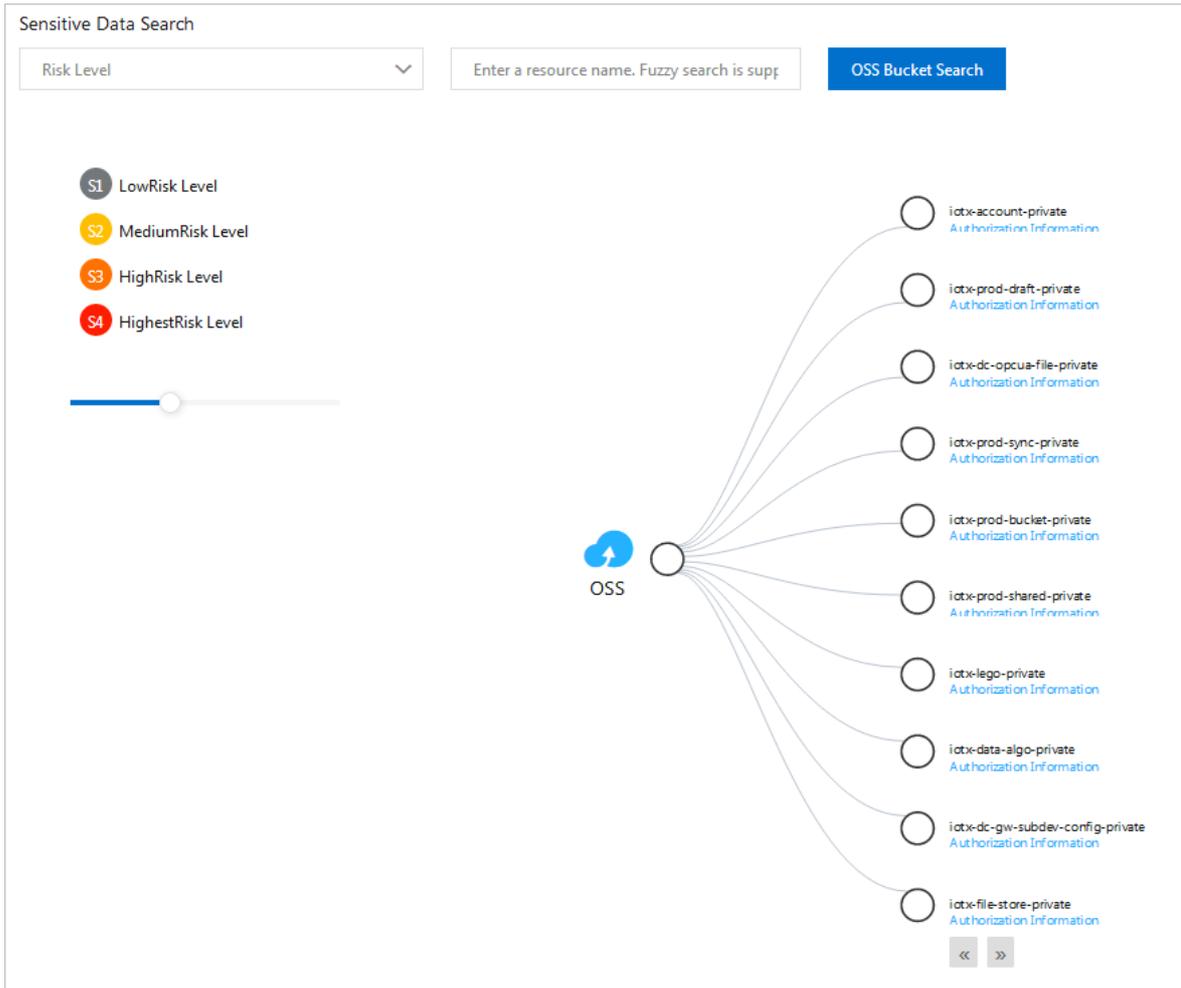

View the charts on the **Proportion of Sensitive File Objects** and **Risk Level Distribution of Sensitive Objects** tabs.

To view the charts for a specific OSS bucket, follow these steps:

- i. In the **Sensitive Data Statistics** section, enter a keyword and select the target OSS bucket from the drop-down list.

Note To view statistics on all OSS buckets, select *All* from the drop-down list.

- ii. On the **Proportion of Sensitive File Objects** tab, view the proportions of sensitive and non-sensitive objects.
 - iii. On the **Risk Level Distribution of Sensitive Objects** tab, view the distribution of sensitive objects at the S1, S2, S3, and S4 risk levels.
4. Query OSS sensitive data.

By default, the system displays all OSS buckets. To view information about a specific bucket, follow these steps:

- i. Select a risk level from the **Risk Level** drop-down list.
- ii. Enter a keyword of the bucket in the search field and click **OSS Bucket Search**.
 - The tree map displays the distribution of sensitive data in OSS.
 - You can view the authorization information of a bucket. The system displays the authorization information by category, including the authorized users and violations.
- iii. Move the pointer over the bucket to view details.

28.9.3.3.5. View statistics on sensitive data in AnalyticDB

This topic describes how to view statistics on sensitive data in AnalyticDB.

Context

AnalyticDB is an Alibaba-developed real-time online analytical processing (OLAP) service that can process a massive amount of data at high concurrency. It can analyze hundreds of billions of data records from multiple dimensions within milliseconds. This provides data-driven insights into your business. AnalyticDB can compute a large amount of data and quickly respond to requests. It enables you to instantly and agilely explore and find data values. You can also embed AnalyticDB into your business system to provide end users with analytics services.

Procedure

1. **Log on to Apsara Stack Security Center.**

2. In the left-side navigation pane, choose **Data Security > Sensitive Data Protection > Sensitive Data Identification > ADS**.
3. View statistics on sensitive data in AnalyticDB.

On the **Proportion of Sensitive Tables**, **Proportion of Sensitive Fields**, **Risk Level Distribution of Sensitive Tables**, and **Risk Level Distribution of Sensitive Fields** tabs, view the statistics.

To view the charts for a specific database, follow these steps:

- i. In the **Sensitive Data Statistics** section, enter a keyword and select the target database from the drop-down list.

 **Note** To view statistics on all databases, select *All* from the drop-down list.

- ii. On the **Proportion of Sensitive Tables** and **Proportion of Sensitive Fields** tabs, view the proportions of sensitive and non-sensitive tables and fields.
 - iii. On the **Risk Level Distribution of Sensitive Tables** and **Risk Level Distribution of Sensitive Fields** tabs, view the distribution of sensitive tables and fields at the S1, S2, S3, and S4 risk levels.
4. Query sensitive data in AnalyticDB. All AnalyticDB databases are displayed by default. To view information about a specific database or table, follow these steps:
 - i. Select a risk level from the **Risk Level** drop-down list.
 - ii. Enter a keyword of the database or table in the search box.
 - iii. Click **Database Search** or **Table Search**.
 - The tree map displays the distribution of sensitive data in AnalyticDB.
 - You can view the authorization information of a database or table. The system displays the authorization information by category, including authorized users and violations.
 - iv. Move the pointer over the database or table to view details.

28.9.3.3.6. View statistics on sensitive data in ApsaraDB for RDS

This topic describes how to view statistics on sensitive data in ApsaraDB for RDS.

Procedure

1. [Log on to Apsara Stack Security Center](#).
2. In the left-side navigation pane, choose **Data Security > Sensitive Data Protection > Sensitive Data Identification > RDS**.
3. View statistics on sensitive data in ApsaraDB for RDS.

On the **Proportion of Sensitive Tables**, **Proportion of Sensitive Fields**, **Risk Level Distribution of Sensitive Tables**, and **Risk Level Distribution of Sensitive Fields** tabs, view the statistics.

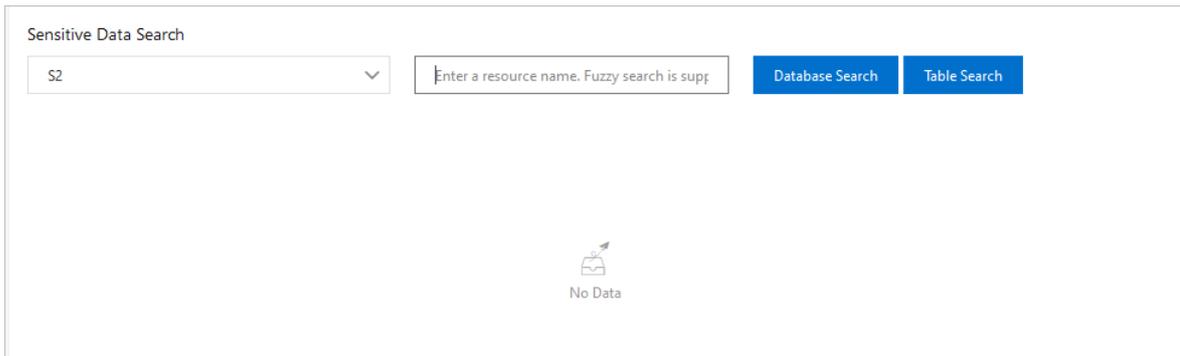

To view the charts for a specific database, follow these steps:

- i. In the **Sensitive Data Statistics** section, enter a keyword and select the target database from the drop-down list.

 **Note** To view statistics on all databases, select *All* from the drop-down list.

- ii. On the **Proportion of Sensitive Tables** and **Proportion of Sensitive Fields** tabs, view the proportions of sensitive and non-sensitive tables and fields.
- iii. On the **Risk Level Distribution of Sensitive Tables** and **Risk Level Distribution of Sensitive Fields** tabs, view the distribution of sensitive tables and fields at the S1, S2, S3, and S4 risk levels.

4. Query sensitive data in ApsaraDB for RDS.

All ApsaraDB for RDS databases are displayed by default. To view information about a specific database or table, follow these steps:

- i. Select a risk level from the **Risk Level** drop-down list.
- ii. Enter a keyword of the database or table in the search box.
- iii. Click **Database Search** or **Table Search**.
 - The tree map displays the distribution of sensitive data in ApsaraDB for RDS.
 - You can view the authorization information of a database or table. The system displays the authorization information by category, including authorized users and violations.
- iv. Move the pointer over the database or table to view details.

28.9.3.4. Check data permissions

28.9.3.4.1. View permission statistics

This topic describes how to view permission statistics.

Context

On the **Permission Management** page, you can view the overall permission distribution of Apsara Stack. You can also quickly identify high-risk accounts and users, and troubleshoot and resolve security issues in a timely manner.

Procedure

1. [Log on to Apsara Stack Security Center](#).
2. In the left-side navigation pane, choose **Data Security > Sensitive Data Protection > Data Permissions > Permission Management**.
3. View the overall permission statistics.

- **Accounts with Access to Sensitive Data:** the number of accounts that can access sensitive data.
- **Departments:** the number of departments in Apsara Stack.
- **Users:** the number of users in Apsara Stack.
- **Accounts:** the number of accounts in Apsara Stack.

4. View the department-level permission statistics.

Department Name	Users	Apsara Stack Console Accounts	Accounts	RAM Users	Permission Anomalous Events	Risk-Confirmed Permission Anomalous Events	Permission Anomalous Events of Yesterday	Permission Anomalous Type with Most Confirmed Violations
[Redacted]	2	2	1	0	0	0	0	--
[Redacted]	1	3	1	0	0	0	0	--
[Redacted]	1	1	1	0	0	0	0	--
[Redacted]	2	2	1	0	3	0	0	Login time is abnormal

You can view the statistics on the users, accounts, and anomalous activities related to permissions for each department.

28.9.3.4.2. View permissions of an account

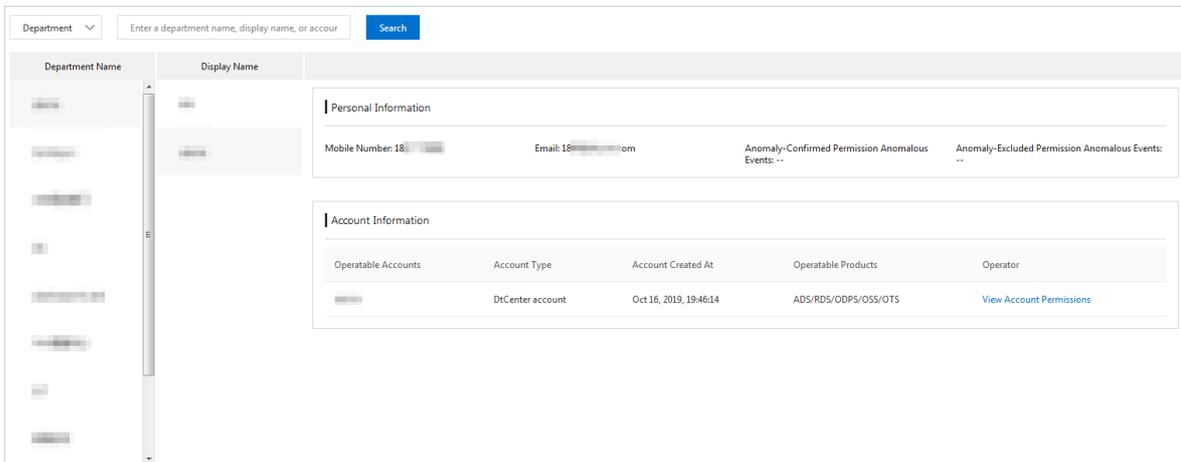

This topic describes how to view permissions of an account.

Context

You can search for an account to view its information so that you can quickly find the owner of sensitive data.

Procedure

1. [Log on to Apsara Stack Security Center.](#)
2. Choose **Data Security > Sensitive Data Protection > Data Permissions > Permission Search.**

3. Search for the target account. To search for an account, perform the following steps:
 - i. Select **Department** or **Employee** from the drop-down list.
 - ii. Enter a keyword in the search field.
 - iii. Click **Search**. The accounts that contain the keyword are listed in the **Display Name** column. You can also click a department in the **Department Name** column. All accounts of the department are listed in the **Display Name** column.
4. In the **Display Name** column, click the target account.
5. View information in the **Personal Information** and **Account Information** sections on the right.

- **Personal Information**

You can view the contact information of the account owner, the number of confirmed anomalous activities related to permission access, and the number of excluded anomalous activities related to permission access.

- **Account Information**

You can view the accounts that the owner can use, the types and creation time of the accounts, and Apsara Stack services that the accounts can access.

You can click **View Account Permissions** in the Actions column of an account to view the resources, resource types, resource paths, and operation permissions.

28.9.3.5. Monitor data flows

28.9.3.5.1. View data flows in DataHub

This topic describes how to view data flows in DataHub.

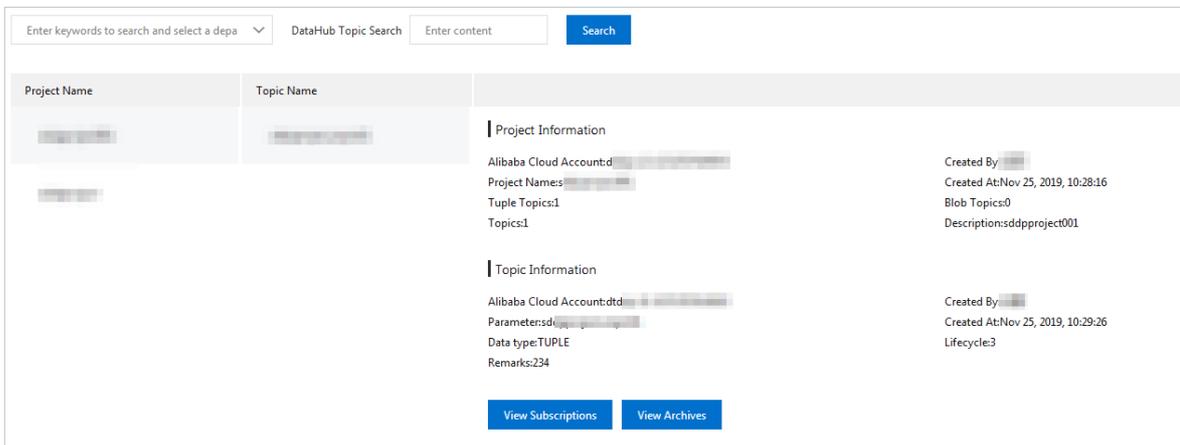

Context

DataHub is a platform designed to process streaming data. You can publish and subscribe to streaming data in DataHub and distribute the data to other platforms. DataHub allows you to analyze streaming data and build applications based on the streaming data.

On the **DataHub** page, you can view the details of data flows in DataHub, including the relationships between DataHub projects and topics and the relationships among topics, subscribed applications, and archive sources.

Procedure

1. **Log on to Apsara Stack Security Center.**
2. **Choose Data Security > Sensitive Data Protection > Data Flow Monitoring > DataHub.**
3. **Enter a keyword and select a department from the drop-down list. Enter a topic keyword in the DataHub Topic Search field and click Search.**

Note

You can also click the target project in the **Project Name** column and then click the target topic in the **Topic Name** column.

In the **Project Information** and **Topic Information** sections, you can view information about the project and topic.

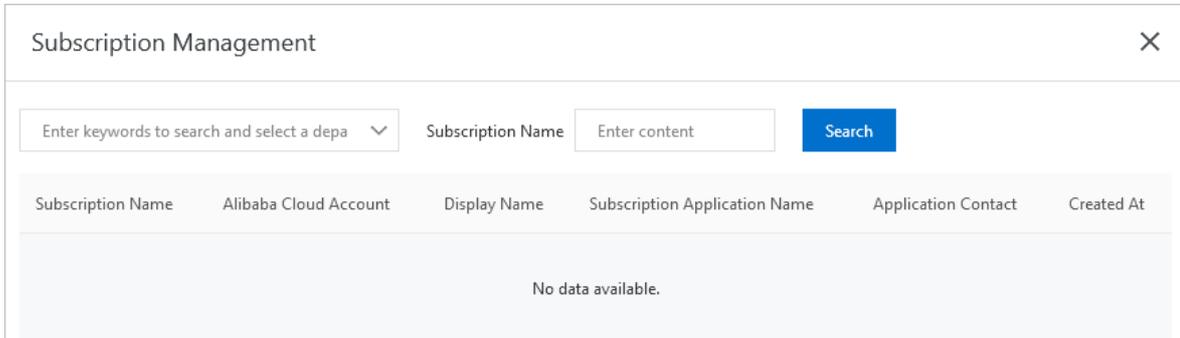

- **Project Information**

Displays information such as the project name, Apsara Stack account, creator, creation time, and number of topics.

- **Topic Information**

Displays information such as the project name, Apsara Stack account, creator, creation date, and type.

4. Click **View Subscriptions** to view the subscription list. The subscription list contains information such as the subscription name, Apsara Stack account of the creator, display name, name of the subscribed application, and application contact.

- i. Enter a keyword and select a department from the drop-down list.
 - ii. Enter a keyword in the **DataHub Topic Search** field.
 - iii. Click **Search** to search for the target DataHub topic.
5. Click **View Archives** to view the archive list. The archive list contains information such as the name of the connected instance, Apsara Stack account of the creator, display name, source service, resource path, and risk level.
 - i. Enter a keyword and select a department from the drop-down list.
 - ii. Enter a keyword in the **DataHub Topic Search** field.
 - iii. Click **Search** to find the target DataHub topic.

28.9.3.5.2. View data flows in Data Integration

This topic describes how to view data flows in Data Integration.

Context

DataWorks is a comprehensive, professional cloud R&D platform for big data. DataWorks serves as an operating system and delivers intelligent, efficient, secure, and reliable big data services. It meets your requirements for data governance and quality management, and allows you to provide data services for external users.

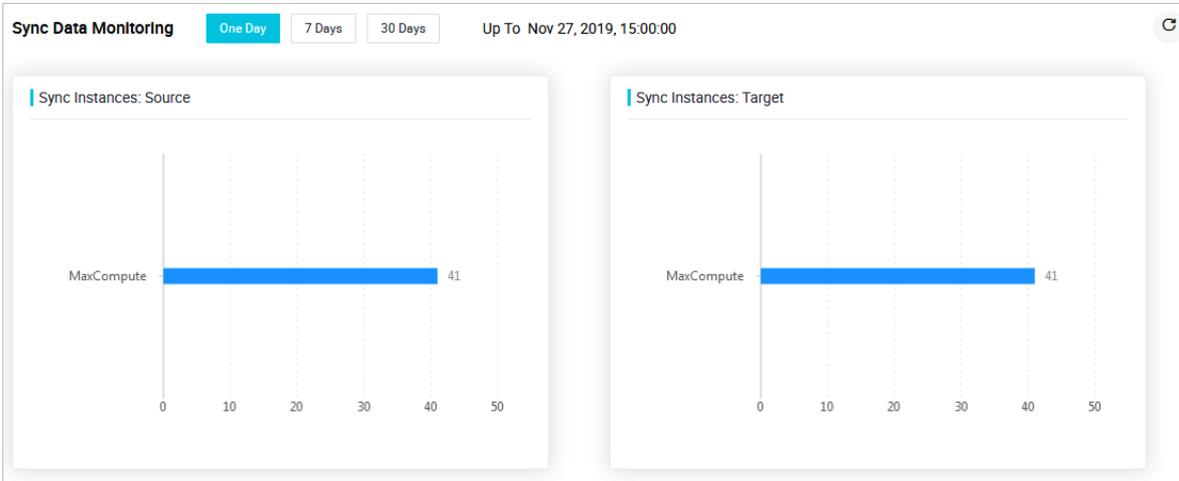

DataWorks provides the Data Integration feature, which is a stable, efficient, and scalable data synchronization platform on Apsara Stack. Data Integration implements fast and stable data transmission and synchronization between various data sources in complicated networks.

Procedure

1. [Log on to Apsara Stack Security Center](#).
2. In the left-side navigation pane, choose **Data Security > Sensitive Data Protection > Data Flow Monitoring > CDP Flow Monitoring**.
3. On the **Data Integration** page, click **Sync Data Monitoring**.
4. View the statistical graph for the number of synchronized instances.

Note

- The number of synchronized instances is measured from two aspects: Sync Instances: Source and Sync Instances: Target.
- You can view statistics within different periods of time (One Day, 7 Days, and 30 Days).

5. In the Sync Instances section, view information such as the ID, time, node name, data type, and amount of synchronized data.

28.9.3.6. Sensitive data masking

28.9.3.6.1. Add a static desensitization task

This topic describes how to add a static desensitization task and run the task to mask sensitive data.

Procedure

1. Log on to Apsara Stack Security Center.
2. In the left-side navigation pane, choose Data Security > Sensitive Data Protection > Sensitive Data Desensitization > Static Desensitization.
3. In the upper-right corner of the Desensitization Tasks section, click Add Desensitization Task.
4. On the Add Desensitization Task page, configure the parameters.
 - i. In the Basic Task Information step, specify Task Name and Remarks. Then, click Next.
 - ii. In the Desensitization Source Configuration step, configure the parameters and click Next.

Source Type MaxCompute/RDS Table/AnalyticDB Table Bucket File

Source Product

Project

Source Partition

Product	Parameter	Description
	Source Type	Select MaxCompute/RDS Table/AnalyticDB Table.

Product	Parameter	Description
MaxCompute	Source Product	Select MaxCompute.
	Project	Select the project that contains the table with the sensitive data you want to desensitize.
	Table Name	Select the name of the table with the sensitive data you want to desensitize.
	Source Partition	<p>Enter the name of the partition that contains the sensitive data you want to desensitize.</p> <p>You can configure partitions when you create a MaxCompute table. Partitions define different logical divisions of a table to help you efficiently query specific content.</p> <p>Note If you leave Source Partition empty, SDDP desensitizes sensitive data in all partitions of the table.</p>
RDS	Source Type	Select MaxCompute/RDS Table/AnalyticDB Table.
	Source Product	Select RDS.
	Project	Select the database that contains the table with the sensitive data you want to desensitize.
	Table Name	Select the name of the table with the sensitive data you want to desensitize.
	Sample SQL	Optional. Enter an SQL statement to select the data you want to desensitize.
OSS	Source Type	Select Bucket File.
	File Source	<p>Upload a file from a bucket or your local computer.</p> <ul style="list-style-type: none"> ■ Uploaded Local File: If you select this option, click Select File to select a local file. ■ Bucket: If you select this option, select a file from the Source File drop-down list.
	Source File Description	<p>Enter the remarks of the file to quickly identify the task.</p> <p>Note Specify this parameter only when File Source is set to Uploaded Local File.</p>
	Source File	<p>Select a file from an OSS bucket.</p> <p>Note Specify this parameter only when File Source is set to Bucket.</p>
	Source File Name	<p>Optional. Enter the name of the file from the bucket.</p> <p>Note Specify this parameter only when File Source is set to Bucket.</p>

- iii. In the **Desensitization Algorithm Configuration** step, configure the parameters and click **Next**. You must specify the algorithm type, select an algorithm, and turn on the desensitization switch for the source field you want to desensitize.
- iv. In the **Destination Location Configuration** step, configure the parameters and click **Next**.
- v. In the **Confirm Process Logic** step, configure the parameters to confirm the processing logic.

Parameter	Description
Select Trigger Method	<p>The mode in which the desensitization task runs. Valid values:</p> <ul style="list-style-type: none"> ▪ Manual Only: You must manually run the desensitization task on the Static Desensitization page. ▪ Scheduled Only: The desensitization task automatically runs at a specified time on an hourly, daily, or monthly basis. ▪ Manual + Scheduled: You can manually run the desensitization task or enable automatic desensitization at a specified time on an hourly, daily, or monthly basis.
Table Name Conflict Resolution	<p>The solution used when the specified target table name already exists. Valid values:</p> <ul style="list-style-type: none"> ▪ Delete the target table and create a new table with the same name ▪ Insert new data to the target table (recommended)
Row Conflict Resolution	<p>The handling method for a row conflict. Valid values:</p> <ul style="list-style-type: none"> ▪ Keep conflicting rows in the target table and discard the new data (recommended) ▪ Delete conflicting rows from the target table and insert the new data

- vi. Click **Submit**.

After the task is created, you can view it in the **Desensitization Tasks** section.

- 5. In the **Desensitization Tasks** section, turn on the switch and click **Start** to run the created desensitization task.
- 6. In the **Task Execution Query** section, view **Execution Progress** and **Status** of the task.

28.9.3.7. Abnormal activity detection

28.9.3.7.1. Add a custom rule for abnormal activities

This topic describes how to add a custom rule for abnormal activities. If Sensitive Data Discovery and Protection (SDDP) detects an activity that matches the custom rule, it identifies the activity as abnormal.

Procedure

1. [Log on to Apsara Stack Security Center](#).
2. In the left-side navigation pane, choose **Data Security > Sensitive Data Protection > Anomaly Detection > Anomalous Event Rules**.
3. On the **Anomalous Event Rules** page, click **Add Rule**.
4. In the **Add Rule** dialog box, configure the parameters.

Add Rule
✕

Cancel

Parameter	Description
Rule Name	The name of the rule.
Risk Level	The risk level of the rule. Valid values: Low , Medium , and High .
Asset Type	The type of the service to which the rule applies. Valid values: OSS , MaxCompute , and RDS .
Filters	The filter conditions of the rule.
Warning Conditions	The warning conditions of the rule. Activities that match the filter conditions are checked, and alerts are sent for abnormal activities.

5. Click OK.

What's next

After you create a custom rule, SDDP checks for abnormal activities based on the rule. You can view statistics of the abnormal activities on the **Custom Anomalous Event** tab of the **Anomalous Events** page. For more information, see [Process anomalous activities](#).

28.9.3.7.2. Process abnormal activities

This topic describes how to process abnormal activities in Sensitive Data Discovery and Protection (SDDP). SDDP detects abnormal activities related to sensitive data and generates alerts. On the **Anomalous Events** page, you can confirm abnormal activities as violations or exclude them as false positives.

Context

SDDP divides abnormal activities into the following types:

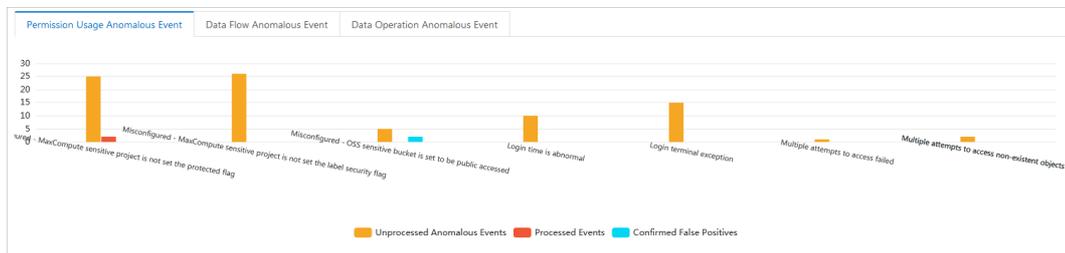

- **Permission Usage Anomalous Event:** Permissions are used in an inappropriate way. For example, a user logs on from an unusual IP address or by using the AccessKey pair of another user.

- **Data Flow Anomalous Event:** Abnormal activities are detected in data flows. For example, a user downloads sensitive data files unnecessarily or during an unusual period.
- **Data Operation Anomalous Event:** Unusual operations are performed on sensitive data. For example, a user modifies sensitive fields.
- **Custom Anomalous Event:** Abnormal activities are detected based on custom rules. For more information, see [Add a custom rule for abnormal activities](#).

Procedure

1. [Log on to Apsara Stack Security Center](#).
2. In the left-side navigation pane, choose **Data Security > Sensitive Data Protection > Anomaly Detection > Anomalous Events**.
3. View the statistics on abnormal activities. You can view statistics on different types of abnormal activities in the upper part of the **Anomalous Events** page. The statistics include the types of abnormal activities, number of processed abnormal activities, and number of unprocessed abnormal activities.

Statistics on abnormal activities

- Click the **Permission Usage Anomalous Event**, **Data Flow Anomalous Event**, **Data Operation Anomalous Event**, or **Custom Anomalous Event** tab to view the bar charts of the statistics.
 - Move the pointer over the chart to view the details.
4. Configure search conditions and click **Search**. You can search for abnormal activities by keyword, department, type, status, and alert time.
 5. Process abnormal activities. In the lower part of the **Anomalous Events** page, process abnormal activities detected by SDDP in the abnormal activity list.

Account	Department	Event Type	Event Subtype	Alert Time	Status	Operator
dtdep-13-157-129547170741		Custom exceptions		Dec 7, 2019, 08:03:56	To be processed	View Details Process
dtdep-13-157-129547170741		Custom exceptions		Dec 7, 2019, 08:03:56	To be processed	View Details Process
dtdep-13-157-129547170741		Custom exceptions		Dec 7, 2019, 07:37:48	To be processed	View Details Process
dtdep-13-157-129547170741		Custom exceptions		Dec 7, 2019, 07:02:46	To be processed	View Details Process

- i. Find the target abnormal activity, and click **View Details** in the **Actions** column to view the details of the abnormal activity.
- ii. Find the target abnormal activity, and click **Process** in the **Actions** column.

iii. In the Anomalous Event Processing dialog box, process the abnormal activity.

Parameter	Description
Add Processing Record	Check the abnormal activity and record the verification process.
Anomalous Event Verification	<ul style="list-style-type: none"> ▪ Confirmed and Processed: Confirm that the activity is abnormal. If you select this option without manually processing the abnormal activity, SDDP keeps generating alerts for this activity. ▪ False Positive: Set the abnormal activity as a false positive. If you select this option, SDDP no longer generates alerts for the activity. This activity will no longer appear on the Anomalous Events page.
Anomalous Event Sample-based Enhancement	<p>Specify whether to enhance detection of abnormal activities based on the processing result of the abnormal activity.</p> <div style="background-color: #e1f5fe; padding: 10px;"> <p> Note If you select this option:</p> <ul style="list-style-type: none"> ▪ An abnormal activity that is set as a false positive is returned to the algorithm as a false positive sample. ▪ An abnormal activity that is confirmed as a violation is returned to the algorithm as a positive sample. <p>This improves the accuracy of subsequent abnormal activity detection, but may increase the false negative rate.</p> </div>

iv. Click Completed.

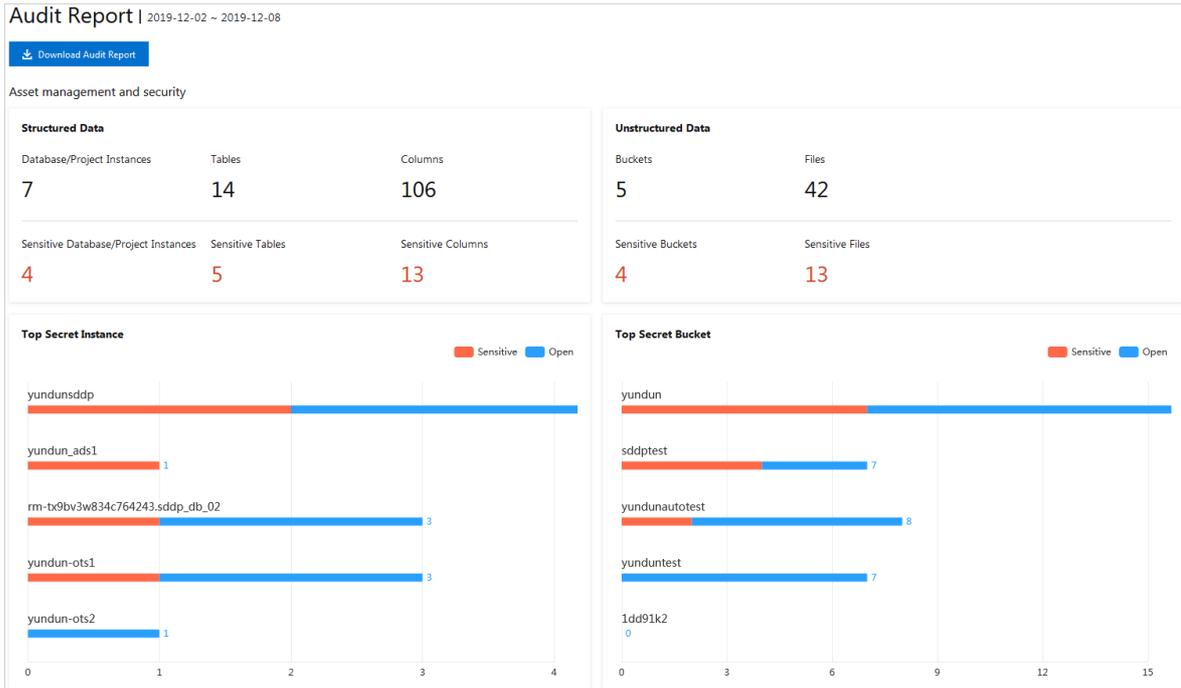

28.9.3.8. Intelligent audit

28.9.3.8.1. View and download audit reports

This topic describes how to view and download audit reports of sensitive data.

Procedure

1. [Log on to Apsara Stack Security Center](#).
2. In the left-side navigation pane, choose **Data Security > Sensitive Data Protection > Intelligent Audit > Audit Report**.
3. On the **Audit Report** page, view an audit report.

4. Click **Download Audit Report**.

28.9.3.8.2. View audit logs

This topic describes how to view audit logs.

Procedure

1. **Log on to Apsara Stack Security Center.**
2. In the left-side navigation pane, choose **Data Security > Sensitive Data Protection > Intelligent Audit > Audit Logs**.
3. (Optional) On the **Audit Logs** page, specify the time period to filter audit logs.

Dec 5, 2019 - Dec 12, 2019 Reset Advanced Search

Select an asset type Search Reset

If you require more detailed filter conditions, follow these steps:

- i. Click **Advanced Search**.
 - ii. Specify filter conditions such as the asset type, asset name, account, and source IP address.
 - iii. Click **Search**.
4. View audit logs in the log list.

28.9.3.8.3. View raw logs

This topic describes how to view raw logs of Object Storage Service (OSS), MaxCompute, and ApsaraDB for RDS.

Procedure

1. **Log on to Apsara Stack Security Center.**
2. In the left-side navigation pane, choose **Data Security > Sensitive Data Protection > Intelligent Audit > Raw Logs**.
3. On the **Raw Logs** page, click the required tab. On the **Raw Logs** page, you can view raw logs of OSS,

MaxCompute, and RDS.

4. (Optional) Specify conditions to filter raw logs.
5. View information of raw logs in the log list.

Bucket	Object	Account	Time	Source IP Address	User-Agent	Operation Type	Status Code	Operator
sddptest	xxxxxxx.xlsx	1295xxxxxx	12/Dec/2019:17:32:13 +0800	10.0.0.0	aliyun-sdk-go/1.9.3 (Linux/4.9.1...	GetObject	200	Details
sddptest	xxxxxxx.yid.doc	1295xxxxxx	12/Dec/2019:17:32:13 +0800	10.0.0.0	aliyun-sdk-go/1.9.3 (Linux/4.9.1...	GetObject	200	Details
sddptest	xxxxxxx	1295xxxxxx	12/Dec/2019:17:32:13 +0800	10.0.0.0	aliyun-sdk-go/1.9.3 (Linux/4.9.1...	GetObject	200	Details

6. Find the target raw log, and click **Details** in the **Operator** column.

28.9.3.8.4. Add an audit rule

This topic describes how to add an audit rule. Sensitive Data Discovery and Protection (SDDP) audits raw logs that match the audit rule.

Procedure

1. Log on to [Apsara Stack Security Center](#).
2. In the left-side navigation pane, choose **Data Security > Sensitive Data Protection > Intelligent Audit > Audit Rules**.
3. Click **Add Rule**.
4. In the **Add Rule** dialog box, configure the parameters.

Parameter	Description
Rule Name	The name of the audit rule.
Risk Level	The risk level of the rule. Valid values: Low , Medium , and High .
Asset Type	The type of the asset.
Filters	The filter conditions of the rule. Raw logs that match the filter conditions are audited.

5. Click **OK**.

Result

After you create an audit rule, it is displayed in the rule list. You can view its details or click the operations in the **Operator** column to edit or delete the rule.

28.9.3.9. Security configuration

28.9.3.9.1. Manage rules used to identify sensitive data

This topic describes how to create and manage rules used to identify sensitive data.

Context

Sensitive Data Discovery and Protection (SDDP) can identify and classify sensitive data in Apsara Stack services such as MaxCompute, Object Storage Service (OSS), and Table Store.

SDDP identifies sensitive data based on the rules. You can use built-in rules provided by SDDP or configure custom rules based on your business needs to identify sensitive data.

Procedure

1. **Log on to Apsara Stack Security Center.**
2. In the left-side navigation pane, choose **Data Security > Sensitive Data Protection > Security Configuration > Rule Configuration.**
3. Click the **Sensitive Data Identification Rules** tab to view the existing rules used to identify sensitive data.

Rule Name	Rule Type	Rule Source	Risk Level	Operator
AccessKeyId	Regular expression	Built-in		<input checked="" type="checkbox"/> Delete Details
AccessKeySecret	Regular expression	Built-in		<input checked="" type="checkbox"/> Delete Details
IPv6 address	Regular expression	Built-in		<input checked="" type="checkbox"/> Delete Details
GPS position	Regular expression	Built-in		<input checked="" type="checkbox"/> Delete Details

Specify **Rule Type**, **Risk Level**, and **Rule Name**. Then, click **Search** to search for rules.

SDDP provides built-in algorithms to identify sensitive data such as ID card numbers, addresses, phone numbers, and bank card numbers. It uses file clustering, deep neural network, and machine learning to identify sensitive images, text, and fields.

4. Create a rule. You can create a rule to identify sensitive data.
 - i. Click **Add Rule**.
 - ii. In the **Add Rule** dialog box, configure the parameters.

* Rule Type

* Rule Name

* Risk Level

* Rule Definition

- **Rule Type:** the type of the rule. Valid values: *Keyword* and *Regular expression*.
- **Rule Name:** the name of the rule. We recommend that you name the rule based on its purpose.
- **Risk Level:** the risk level of the rule. Valid values: *S1 (low)*, *S2 (medium)*, *S3 (high)*, and *S4 (critical)*.
- **Rule Definition:** the content of the rule.

iii. Click **Submit**.

5. Manage the rules. In the rule list, click an operation in the **Operator** column to disable, enable, or delete a rule.

Note

- You can delete rules but cannot modify them. After you delete a rule, SDDP no longer uses it to identify sensitive data. Proceed with caution.
- A rule is enabled by default after it is created. If you do not want to identify sensitive data that matches a rule, you can disable the rule. After you disable a rule, SDDP no longer uses it to identify sensitive data. We recommend that you enable all rules to reduce risks.
- Rules marked as *Built-in* in the Rule Source column are default rules. If no custom rules are configured, SDDP identifies sensitive data based on these default rules. The default rules cannot be modified or deleted.

28.9.3.9.2. Manage thresholds and rules used to detect abnormal activities

This topic describes how to manage the thresholds and rules used to detect abnormal activities.

Context

On the Rule Configuration page, you can customize the thresholds and rules used to detect abnormal activities.

Procedure

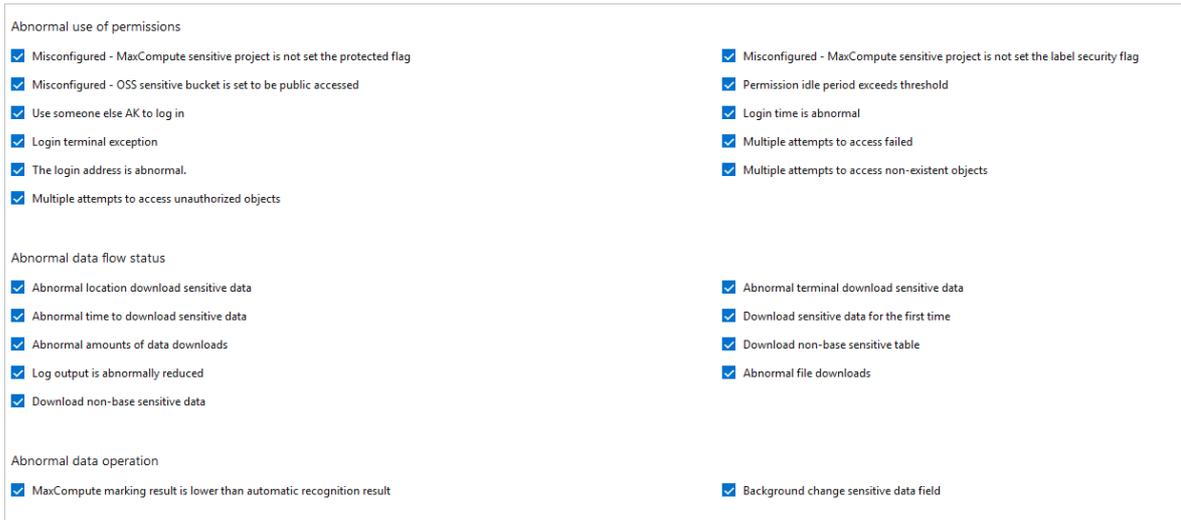

1. [Log on to Apsara Stack Security Center.](#)
2. In the left-side navigation pane, choose **Data Security > Sensitive Data Protection > Security Configuration > Rule Configuration.**
3. Click the **Anomaly Alert Configuration** tab to view the thresholds and rules used to detect abnormal activities.
4. Configure the thresholds used to detect abnormal activities.

Sensitive Data Discovery and Protection (SDDP) provides default thresholds that can be customized.

- i. In the **General Configuration for Anomaly Alerts** section, click **Modify** next to a threshold.
 - ii. Enter a value and click **Submit**.
5. Configure the rules used to detect abnormal activities.

In the **Enable Anomaly Alerts** section, select the types of abnormal activities that you want SDDP to detect.

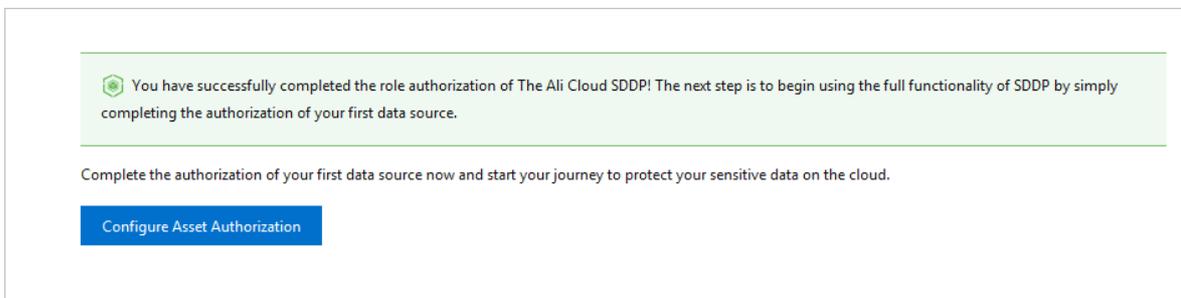

After you configure the rules, you can view statistics on suspicious events on the **Anomalous Events** page.

28.9.3.9.3. Configure an authorized asset

This topic describes how to configure an authorized asset for Sensitive Data Discovery and Protection (SDDP). After the configuration, SDDP scans the authorized asset. You can view abnormal activities of data leaks or sensitive data on the **Anomalous Events** page.

Procedure

1. [Log on to Apsara Stack Security Center](#).
2. In the left-side navigation pane, choose **Data Security > Sensitive Data Protection > Security Configuration > Authorization Configuration**.
3. On the **Authorization Configuration** page, click **Configure Asset Authorization**.

4. Select a region from the **Region** drop-down list and a database from the **Database Name** drop-down list.

5. Click **Complete Authorization**.

Result

After the configuration is complete, SDDP scans the authorized asset.

28.9.3.9.4. Configure desensitization algorithms

This topic describes how to configure desensitization algorithms.

Context

Sensitive Data Discovery and Protection (SDDP) supports the following desensitization methods:

- **Hashing:** performs tokenization or masks passwords. Raw data cannot be retrieved after it is desensitized by using this method. The MD5, Secure Hash Algorithm 1 (SHA-1), SHA-256, and hash-based message authentication code (HMAC) salted algorithms are supported.
- **Masking:** replaces targeted information in sensitive data with asterisks (*) or number signs (#) in any of the following ways:
 - Keep the first N characters and the last M characters.
 - Keep characters from the Xth position to the Yth position.
 - Mask the first N characters and the last M characters.
 - Mask characters from the Xth position to the Yth position.
 - Mask characters before a special character.
 - Mask characters after a special character.
- **Replacement:** uses a mapping table or interval to randomly replace or map entire or partial field values. Raw data can be retrieved after it is desensitized by using this method. SDDP provides multiple built-in mapping tables in the .txt and .rtf formats and allows you to add custom replacement algorithms. This method is suitable for fields with a fixed format, such as ID card numbers.
- **Transformation:** rounds or offsets field values to desensitize them. You can round numbers and dates or offset characters in text based on specified parameters. Raw data can be retrieved after it is offset but cannot be retrieved after it is rounded.
- **Encryption:** uses the Data Encryption Standard (DES), Triple Data Encryption Standard (3DES), or Advanced Encryption Standard (AES) algorithm to encrypt data. Raw data can be retrieved after it is desensitized by using this method.
- **Shuffling:** shuffles values of a field within a specified range of a source table. The values can be shuffled randomly or be offset in a specified way. Raw data can be retrieved after it is offset but cannot be retrieved after it is shuffled.

Hashing

1. [Log on to Apsara Stack Security Center.](#)
2. In the left-side navigation pane, choose **Data Security > Sensitive Data Protection > Security Configuration > Desensitization Algorithm Configuration.**
3. Click the **Hashing** tab.
4. Set a salt value for each algorithm.

 **Note**

In cryptography, you can insert a specific string to a fixed position of a password to generate a hash value that is different from that of the original password. This process is called salting.

A salt value is the specific string that you insert.

MD5	<input type="text" value="15ef85cd"/>	<input type="button" value="Test"/>	<input type="button" value="Submit"/>
SHA1	<input type="text" value="Enter a salt value"/>	<input type="button" value="Test"/>	<input type="button" value="Submit"/>

HMAC	<input type="text" value="Enter a salt value"/>	<input type="button" value="Test"/>	<input type="button" value="Submit"/>

5. Click **Test** for an algorithm. In the **Desensitization Algorithm Test** dialog box, enter the original value and click **Test** to check whether the algorithm works.

Desensitization Algorithm Test ✕

Enter an original value

Desensitization Result

6. After the test, close the **Desensitization Algorithm Test** dialog box. Then, click **Save**.

Masking

1. [Log on to Apsara Stack Security Center.](#)
2. In the left-side navigation pane, choose **Data Security > Sensitive Data Protection > Security Configuration > Desensitization Algorithm Configuration.**
3. Click the **Masking** tab.
4. Configure the parameters.

Select Source Type *

* #

Keep the First N Characters and the Last M Characters

n m

Keep Characters from the Xth Place to the Yth Place

x y

Mask the First N Characters and the Last M Characters

n m

Mask Characters from the Xth Place to the Yth Place

x y

Special character front cover (for the first time the character appears)

@ & .

After masking of special characters (for the first appearance of the character)

@ & .

5. Click **Test** for an algorithm. In the **Desensitization Algorithm Test** dialog box, enter the original value and click **Test** to check whether the algorithm works.
6. After the test, close the **Desensitization Algorithm Test** dialog box. Then, click **Save**.

Replacement

1. [Log on to Apsara Stack Security Center](#).
2. In the left-side navigation pane, choose **Data Security > Sensitive Data Protection > Security Configuration > Desensitization Algorithm Configuration**.
3. Click the **Replacement** tab.
4. Configure the parameters.

Note By default, SDDP provides multiple common replacement algorithms, such as ID Card Number Mapping Replacement and Telephone Number Random Replacement.

- If you want to customize a mapping table, click the required mapping table, replace the original content with your own mapping table, and click **Save**.
 - If you need to customize an algorithm, click **Add Replacement Desensitization Algorithm** and specify the interval and mapping table.
5. Click **Test** for an algorithm. In the **Desensitization Algorithm Test** dialog box, enter the original value and click **Test** to check whether the algorithm works.
 6. After the test, close the **Desensitization Algorithm Test** dialog box. Then, click **Save**.

Transformation

1. **Log on to Apsara Stack Security Center.**
2. In the left-side navigation pane, choose **Data Security > Sensitive Data Protection > Security Configuration > Desensitization Algorithm Configuration.**
3. Click the **Transformation** tab.
4. Configure the parameters.

Number Rounding	Deciman rounding level	<input type="text" value="1"/>	<input type="button" value="Test"/>	<input type="button" value="Submit"/>
Date Rounding	Date rounding level	<input type="text" value="Month"/>	<input type="button" value="Test"/>	<input type="button" value="Submit"/>
Character Offset	Number of cyclical bits offset	<input type="text" value="0"/>	<input type="radio"/> Left <input type="radio"/> Right	<input type="button" value="Test"/> <input type="button" value="Submit"/>

5. Click **Test** for an algorithm. In the **Desensitization Algorithm Test** dialog box, enter the original value and click **Test** to check whether the algorithm works.
6. After the test, close the **Desensitization Algorithm Test** dialog box. Then, click **Save**.

Encryption

1. **Log on to Apsara Stack Security Center.**
2. In the left-side navigation pane, choose **Data Security > Sensitive Data Protection > Security Configuration > Desensitization Algorithm Configuration**.
3. Click the **Encryption** tab.
4. Specify a key for an algorithm.

DES	<input type="text" value="1"/>	<input type="button" value="Test"/>	<input type="button" value="Submit"/>
3DES	<input type="text" value="2"/>	<input type="button" value="Test"/>	<input type="button" value="Submit"/>
	<input type="text" value="2"/>		
AES	<input type="text" value="3"/>	<input type="button" value="Test"/>	<input type="button" value="Submit"/>
	<input type="text" value="1"/>		

5. Click **Test** for an algorithm. In the **Desensitization Algorithm Test** dialog box, enter the original value and click **Test** to check whether the algorithm works.
6. After the test, click the close icon in the **Desensitization Algorithm Test** dialog box. Then, click **Save**.

Shuffling

1. **Log on to Apsara Stack Security Center.**
2. In the left-side navigation pane, choose **Data Security > Sensitive Data Protection > Security Configuration > Desensitization Algorithm Configuration**.
3. Click the **Shuffling** tab.
4. Select a shuffling method.

Randomly Shuffle	Shuffling Method	<input checked="" type="radio"/> Reset <input type="radio"/> Random Selection	<input type="button" value="Submit"/>
------------------	------------------	---	---------------------------------------

5. Click **Save**.

29. Key Management Service (KMS)

29.1. Manage keys in the KMS console

29.1.1. Log on to the KMS console

This topic describes how to log on to the KMS console.

Prerequisites

- The domain name of the ASCM console is obtained from the deployment personnel before you log on to the ASCM console.
- A browser is available. We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL used to log on to the ASCM console. Press the Enter key.
2. Enter your username and password.

Obtain the username and password used to log on to the console from the operations administrator.

 **Note** When you log on to the ASCM console for the first time, you must change the password of your username. For security reasons, your password must meet the minimum complexity requirements. The password must be 8 to 20 characters in length and must contain at least two of the following character types:

- Uppercase or lowercase letters.
- Digits.
- Special characters. Special characters include exclamation points (!), at signs (@), number signs (#), dollar signs (\$), and percent signs (%).

3. Click **Login** to go to the ASCM console homepage.
4. In the top navigation bar, choose **Products > Security > Key Management Service**.

29.1.2. Create a CMK

This topic describes how to create a CMK for subsequent encryption and decryption operations.

Procedure

1. **Log on to the KMS console.**
2. On the **Keys** page, click **Create Key**.
3. On the **Create Key** page, select an organization from the **Organizations** drop-down list. Then, **Resource Set** and **Region** are automatically specified.
4. In the **Basic Settings** section, specify **Key Spec**, **Purpose**, and **Protection Level**.
5. Specify **Alias** and **Description**.
6. In the **Advanced Settings** section, specify **Rotation Period**.
 - **Disable:** The CMK is not automatically rotated.
 - **Enable:** The CMK is automatically rotated. You can select or customize a rotation period.
7. Specify **Key Material Source**.
 - **Alibaba Cloud KMS:** Use KMS to generate key material.
 - **External:** Manually import external key material.

 **Note** If you select **External**, it means that you have read and understood the implications of importing external key material.

8. Click **Submit**.

29.1.3. View CMK details

After you create a CMK, you can view the details about the CMK, such as the key ID, status, purpose, and creation time.

Procedure

1. [Log on to the KMS console](#).
2. On the **Keys** page, find the target CMK, and click its alias or choose **More > Key Details** in the **Actions** column.
3. In the **Key Details** section, view the details about the CMK, such as the key ID, status, purpose, and creation time.

29.1.4. Enable a CMK

This topic describes how to enable a CMK.

Procedure

1. [Log on to the KMS console](#).
2. On the **Keys** page, find a CMK that is in the **Disabled** state and click **Enable** in the **Actions** column.
3. In the **Enable Key** message, click **OK**.

29.1.5. Disable a CMK

This topic describes how to disable a CMK.

Context

If a CMK is disabled, it cannot be used for encryption or decryption. The ciphertext encrypted by using the CMK cannot be decrypted until the CMK is enabled again.

Procedure

1. [Log on to the KMS console](#).
2. On the **Keys** page, find a CMK that is in the **Enabled** state and click **Disable** in the **Actions** column.
3. In the **Disable Key** message, click **OK**.

 **Note** After you disable the CMK, its state changes from **Enabled** to **Disabled**.

29.1.6. Schedule the deletion of a CMK

You can schedule the deletion of a CMK by specifying a waiting period. After the period elapses, the CMK is automatically deleted.

Context

You must specify a waiting period of 7 to 30 days.

 **Warning**

- During the waiting period, the CMK is in the Pending Deletion state. It cannot be used to encrypt data, decrypt data, or generate data keys.
- Deleting a CMK may have a severe impact on data availability. Therefore, in most cases, we recommend that you disable a CMK instead of deleting the CMK.
- After a CMK is deleted, it cannot be recovered. The data encrypted by using this CMK and the ciphertext data keys generated by using this CMK cannot be decrypted. Therefore, KMS only allows you to schedule the deletion of a CMK. You cannot immediately delete a CMK.
- KMS deletes the CMK within 24 hours after the specified waiting period elapses.

For example, if you submit a deletion application at 14:00, September 10, 2017 and specify a waiting period of seven days, KMS deletes the CMK within 24 hours after 14:00, September 17, 2017.

Procedure

1. [Log on to the KMS console](#).
2. On the **Keys** page, find the target CMK and choose **More > Schedule Key Deletion** in the **Actions** column.
3. In the **Schedule Key Deletion** dialog box, specify **Delete In (7-30 days)**.
4. Click **OK**.

The state of the CMK becomes **Pending Deletion**.

Before the specified period ends, you can perform the following operations to cancel the deletion: Choose **More > Cancel Key Deletion** in the **Actions** column. In the **Cancel Key Deletion** message, click **OK**.

29.1.7. Configure automatic rotation of a CMK

This topic describes how to configure automatic rotation of a CMK.

Procedure

1. [Log on to the KMS console](#).
2. On the **Keys** page, find a symmetric key and choose **More > Key Details** in the **Actions** column. You can determine whether a CMK is a symmetric key based on the value of **Key Spec**.
3. In the **Key Version** section, click **Set Rotation Policy**.
4. In the **Set Rotation Policy** dialog box, specify **Rotation Period**.The following options are available:
 - **30 Days, 90 Days, 180 Days, 365 Days**: If you select one of these options, the next rotation date is displayed.
 - **Disable**: If you select this option, the CMK is not automatically rotated.
 - **Customize**: If you select this option, you must specify **Days (7–730)**. The next rotation date is displayed.
5. Click **OK**.

Related information

- [Automatic key rotation](#)
- [Manual key rotation](#)

29.2. Use a CLI to manage CMKs

KMS allows you to use a command-line interface (CLI) to create, delete, enable, disable, and view CMKs. This topic describes how to use a CLI to manage CMKs.

Prerequisites

The CLI tool required for your operating system is installed.

- **Windows**: <https://www.alibabacloud.com/help/doc-detail/121510.htm>

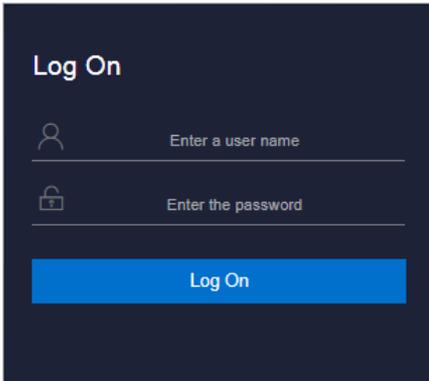

- Linux: <https://www.alibabacloud.com/help/doc-detail/121541.htm>
- macOS: <https://www.alibabacloud.com/help/doc-detail/121544.htm>

Context

CMKs are basic resources of KMS. A CMK is composed of a key ID, basic metadata (such as key state), and key material that is used to encrypt and decrypt data. You can create a CMK and call API operations to encrypt data, decrypt data, and generate data keys. You can also manage the lifecycle of CMKs.

Obtain the domain name and region of KMS

1. Open the browser. Enter the ASO access address `http://region-id.aso.intranet-domain-id.com` in the address bar and then press Enter.

Note You can select the language from the drop-down list in the upper-right corner to change the language of ASO.

2. Enter the correct username and password.
 - The system has three default users:
 - Security officer: manages other users or roles.
 - Auditor officer: views audit logs.
 - System administrator: used for other functions except those of the security officer and auditor officer.
 - You must modify the password of your username as instructed when you log on to ASO for the first time. To improve security, the password must be 10-20 characters long and can contain English uppercase/lowercase letters (A-Z or a-z), numbers (0-9), and special characters, such as exclamation points (!), at signs (@), number signs (#), dollar signs (\$), and percent signs (%), which meets the minimum complexity requirements.
3. Click **Log On** to log on to ASO.
4. In the left-side navigation pane, click **Products > Product List > Apsara Infrastructure Management Framework**.
5. On the **All Reports** page that appears, search for **Registration Vars of Services**. Click **Registration Vars of Services**.
6. On the **Registration Vars of Services** page, move the pointer over **Service** and click the  icon that appears. In the dialog box that appears, search for **kms**.
7. Right-click the value in the **Service Registration** column that corresponds to **kms** and select **Show More** from the shortcut menu.
8. In the **Details** dialog box, check the value of **kms-intranet-domain**. This value is the domain name of KMS.

Note The following information is used in the subsequent sections of this topic:

- Domain name: kms.example.com
- Region: cn-qingdao
- AccessKey ID: \${please-replace-your-access-key-id}
- AccessKey secret: \${please-replace-your-access-key-secret}

Create a CMK

Call the CreateKey operation to create a CMK.

```
./aliyun --skip-secure-verify --region cn-qingdao --endpoint kms.example.com --access-key-id ${please-replace-your-access-key-id} --access-key-secret ${please-replace-your-access-key-secret} kms CreateKey --Description "this is a test key"
```

Information of the created CMK is returned. KeyId is the globally unique identifier of the CMK. In all subsequent operations that require the CMK, you need to use KeyId to specify the CMK.

Sample success responses

```
{
  "KeyMetadata": {
    "Arn": "acs:kms:cn-qingdao-env25-d01:133418746167: :key/769472ec-07d6-47e8-a32a-bc163f66",

    "LastRotationDate": "2020-05-13T07:45:52Z",
    "MaterialExpireTime": "",
    "Origin": "Aliyun_KMS",
    "PrimaryKeyVersion": "0b0b989b-7601-4e54-aa7d-5ae280ba-1111",
    "ProtectionLevel": "SOFTWARE"
  },
  "RequestId": "3bfac037-7026-4748-b5be-de4c2cd1fe44"
}
```

Schedule the deletion of a CMK

Call the ScheduleKeyDeletion operation to schedule the deletion of a CMK.

```
./aliyun --skip-secure-verify --region cn-qingdao --endpoint kms.example.com --access-key-id ${please-replace-your-access-key-id} --access-key-secret ${please-replace-your-access-key-secret} kms ScheduleKeyDeletion --KeyId 769472ec-07d6-47e8-a32a-bc163f66**** --PendingWindowInDays 7
```

After you schedule the deletion of a CMK, you can call the DescribeKey operation to check the state and deletion date of the CMK. If the deletion is scheduled, the CMK state is PendingDeletion, and the deletion date is the current date plus the value of PendingWindowInDays. The value range of PendingWindowInDays is 7 to 30 days.

Sample success responses

```
{
  "KeyMetadata": {
    "Arn": "acs:kms:cn-qingdao-env25-d01:133418746167:example.com:key/769472ec-07d6-47e8-a32a-bc163f66",
    "AutomaticRotation": "Disabled",
    "CreationDate": "2020-05-13T07:45:52Z",
    "Creator": "133418746167",
    "DeleteDate": "2020-05-20T07:52:35Z",

  },
  "RequestId": "8c931766-ff2d-45b0-a829-981b2d9b49ad"
}
```

29.3. Use RAM for access control

Key Management Service (KMS) uses Resource Access Management (RAM) to control access to resources. This topic describes the resource types, actions, and policy conditions in KMS.

Alibaba Cloud accounts have full operation permissions on their own resources. RAM users and roles are granted operation permissions on resources based on RAM authorization.

Resource types in KMS

The following table lists all resource types and corresponding Alibaba Cloud Resource Names (ARNs) in KMS. They can be used in the `Resource` parameter of a RAM policy.

Resource type	ARN
Key container	acs:kms:\${region}:\${account}:key
Secret container	acs:kms:\${region}:\${account}:secret

Resource type	ARN
Alias container	acs:kms:\${region}:\${account}:alias
Key	acs:kms:\${region}:\${account}:key/\${key-id}
Secret	acs:kms:\${region}:\${account}:secret/\${secret-name}
Alias	acs:kms:\${region}:\${account}:alias/\${alias-name}

Actions defined in KMS

KMS defines actions used in RAM policies for each API operation that requires access control. Actions must be in the `kms:${api-name}` format.

 **Note** The DescribeRegions operation requires no access control. It can be called by Alibaba Cloud accounts, RAM users, or RAM roles after they pass RAM authentication.

The following table lists the relationship between KMS API operations, RAM actions, and resource types.

- Key API operations

Operation	Action	Resource type
ListKeys	kms:ListKeys	Key container

Operation	Action	Resource type
ListResourceTags	kms:ListResourceTags	Key or secret
UntagResource	kms:UntagResource	Key or secret
TagResource	kms:TagResource	Key or secret

Policy conditions in KMS

You can add conditions to RAM policies to control access to KMS. RAM authentication will be successful only when the specified conditions are met. For example, you can use `acs:CurrentTime` to control the time period when a RAM policy is valid.

In addition to global conditions, you can use tags as filters to restrict the use of cryptographic API operations such as Encrypt, Decrypt, and GenerateDataKey. Filters must be in the `kms:tag/${tag-key}` format.

RAM policy examples

- A RAM policy that allows users to access all KMS resources

```
{
  "Version": "1",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "kms:*"
      ],
      "Resource": [
        "*"
      ]
    }
  ]
}
```

- A RAM policy that allows users to only query keys, aliases, and key usage permissions

```
{
  "Version": "1",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "kms:List*", "kms:Describe*",
        "kms:Encrypt", "kms:Decrypt", "kms:GenerateDataKey"
      ],
      "Resource": [
        "*"
      ]
    }
  ]
}
```

- A RAM policy that allows users to use keys that contain the following tag to perform cryptographic operations:
 - Tag key: Project
 - Tag value: Apollo

```
{
  "Version": "1",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "kms:Encrypt", "kms:Decrypt", "kms:GenerateDataKey"
      ],
      "Resource": [
        "*"
      ],
      "Condition": {
        "StringEqualsIgnoreCase": {
          "kms:tag/Project": [
            "Apollo"
          ]
        }
      }
    }
  ]
}
```

29.4. Use aliases

Aliases are optional to CMKs.

Aliases must be unique in a region for each Alibaba Cloud account. An Alibaba Cloud account can have identical aliases in different regions. An alias can be bound to only one CMK in a region, but a CMK can have multiple aliases.

Although aliases are bound to CMKs, aliases are resources independent of CMKs. Take note of the following points about aliases:

- You can call the UpdateAlias operation to bind an alias to a different CMK. This operation does not affect the CMK.
- If you delete an alias, the CMK to which the alias is bound is not deleted.
- RAM users must be authorized before they can perform operations on an alias. For more information, see [Use RAM for access control](#).
- Aliases cannot be modified. To change the alias of a CMK, you must delete the old alias and create a new one for the CMK.

You can replace the CMK ID in the request parameters for the following API operations with an alias that is bound to the CMK:

- DescribeKey
- Encrypt
- GenerateDataKey
- GenerateDataKeyWithoutPlaintext

 **Note** For more information about the API operations, see *Developer Guide* in the manual *API referencetopic*.

To specify an alias instead of a CMK ID in the request parameters for the preceding operations, a RAM user must have the relevant permissions on the CMK. The RAM user does not need to have permissions on the alias.

You can perform the following alias-related operations:

- [Create an alias](#)
- [Bind an alias to a different CMK](#)
- [Delete an alias](#)
- [Query all aliases](#)
- [Query aliases bound to a specific CMK](#)

When you use an alias, you must make sure that the alias is complete. Example:

```
//A complete alias must have the alias/ prefix.  
alias/example
```

Create an alias

- An alias must contain the `alias/` prefix. An alias (excluding the prefix) can contain letters, digits, underscores (`_`), hyphens (`-`), and forward slashes (`/`). An alias (excluding the prefix) must be 1 to 255 characters in length.
- To create an alias, a RAM user must have permissions on both the alias and the CMK to which the alias is bound.
- Creating a new alias for a CMK does not affect the existing aliases of the CMK.
- You can call the CreateAlias operation to create an alias.

```
//Grant RAM user 123456 the permissions to create the alias/example alias for the 08ec3bb9-034f-485b-b1cd-3459baa8
**** CMK.
{
  "Version": "1",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "kms:CreateAlias"
      ],
      "Resource": [
        "acs:kms:cn-hangzhou:123456:key/08ec3bb9-034f-485b-b1cd-3459baa8****",
        "acs:kms:cn-hangzhou:123456:alias/example"
      ]
    }
  ]
}

//Create an alias.
aliyun kms CreateAlias --KeyId 08ec3bb9-034f-485b-b1cd-3459baa8**** --AliasName alias/example
```

Bind an alias to a different CMK

- You can call the UpdateAlias operation to bind an existing alias to a different CMK.
- To bind an alias to a different CMK, a RAM user must have permissions on the alias, the CMK to which the alias is currently bound, and the CMK to which you want to bind the alias.

```
//Grant RAM user 123456 the permissions to bind the alias/example alias to the 127d2f84-ee5f-4f4d-9d41-dbc1aca2878  
8 CMK. The alias is originally bound to the 08ec3bb9-034f-485b-b1cd-3459baa8**** CMK.
```

```
{  
  "Version": "1",  
  "Statement": [  
    {  
      "Effect": "Allow",  
      "Action": [  
        "kms:UpdateAlias"  
      ],  
      "Resource": [  
        "acs:kms:cn-hangzhou:123456:key/08ec3bb9-034f-485b-b1cd-3459baa8****",  
        "acs:kms:cn-hangzhou:123456:key/127d2f84-ee5f-4f4d-9d41-dbc1aca2****",  
        "acs:kms:cn-hangzhou:123456:alias/example"  
      ]  
    }  
  ]  
}
```

```
//Bind an alias to a different CMK.
```

```
aliyun kms UpdateAlias --AliasName alias/example --KeyId 127d2f84-ee5f-4f4d-9d41-dbc1aca2****
```

Delete an alias

- You can call the DeleteAlias operation to delete an alias. Deleting an alias does not affect the CMK to which the alias is bound.
- To delete an alias, a RAM user must have permissions on both the alias and the CMK to which the alias is bound.

```
//Grant RAM user 123456 the permissions to delete the alias/example alias of the 127d2f84-ee5f-4f4d-9d41-dbc1aca2**
** CMK.
{
  "Version": "1",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "kms:DeleteAlias"
      ],
      "Resource": [
        "acs:kms:cn-hangzhou:123456:key/127d2f84-ee5f-4f4d-9d41-dbc1aca2****",
        "acs:kms:cn-hangzhou:123456:alias/example"
      ]
    }
  ]
}

//Delete an alias.
aliyun kms DeleteAlias --AliasName alias/example
```

Query all aliases

- You can call the ListAliases operation to query all aliases under your Alibaba Cloud account in the current region.
- To query all aliases, a RAM user must have permissions on alias resources.

```
//Grant RAM user 123456 the permissions to query all aliases.
{
  "Version": "1",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "kms:ListAliases"
      ],
      "Resource": [
        "acs:kms:cn-hangzhou:123456:alias"
      ]
    }
  ]
}

//Query all aliases.
aliyun kms ListAliases
```

Query aliases bound to a specific CMK

- You can call the ListAliasesByKeyId operation to query all aliases bound to a specific CMK.
- To query the aliases bound to a specific CMK, a RAM user must have permissions on the CMK.

```
//Grant RAM user 123456 the permission to query all aliases bound to the 127d2f84-ee5f-4f4d-9d41-dbc1aca2**** CMK.
{
  "Version": "1",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "kms:DeleteAlias"
      ],
      "Resource": [
        "acs:kms:cn-hangzhou:123456:key/127d2f84-ee5f-4f4d-9d41-dbc1aca2****"
      ]
    }
  ]
}

//Query the aliases bound to a specific CMK.
aliyun kms ListAliasesByKeyId --KeyId 127d2f84-ee5f-4f4d-9d41-dbc1aca2****
```

29.5. CMK overview

You can host different types of customer master keys (CMKs) in Key Management Service (KMS) based on your business requirements. For example, you can use a CMK to encrypt and decrypt data. You can also use a CMK to generate and verify a signature.

Key-based cryptographic algorithms

KMS allows you to use various algorithms to support cryptographic operations. The algorithms are classified into two types: symmetric key algorithms and asymmetric key algorithms, as listed in the following table.

Algorithm class	Algorithm subclass	Support encryption and decryption	Support signature generation and verification
Symmetric key algorithm	AES	Yes	No
Symmetric key algorithm	SM4 ^{Note}	Yes	No
Asymmetric key algorithm	RSA	Yes	Yes
Asymmetric key algorithm	ECC	No	Yes
Asymmetric key algorithm	SM2 ^{Note}	Yes	Yes

Symmetric keys are mainly used to encrypt or decrypt data. If you do not specify the KeySpec parameter during key creation, KMS creates a symmetric key. You can call the Encrypt or Decrypt operation to encrypt or decrypt data without the need to obtain the plaintext of a symmetric key. For more information, see [Overview of symmetric encryption](#).

Asymmetric keys can be used to encrypt data, decrypt data, generate a signature, or verify a signature. An asymmetric CMK in KMS consists of a public key and a private key, which are cryptographically related to each other. The public key can be made available for anyone to use, but the private key must be kept secure. To keep private keys secure, KMS does not provide an API operation for you to export the private key of an asymmetric key pair. You can use a private key to decrypt data or generate a signature by calling the related operations. Anyone with a public key can use it to encrypt data or verify the signature generated by the corresponding private key. For more information, see [Overview of asymmetric keys](#).

 **Note**

- Only hardware security modules (HSMs) support SM2 and SM4 keys.
- Only KMS of the Advanced edition supports Rivest-Shamir-Adleman (RSA) and elliptic-curve cryptography (ECC) keys.

Protection levels

KMS provides the Managed HSM feature. You can set the protection level of your CMK to HSM to host the CMK in an HSM. Managed HSM uses HSMs as dedicated hardware to safeguard keys. For a CMK whose protection level is HSM, the plaintext of its key material is stored only inside an HSM. KMS calls an HSM-related API operation to perform cryptographic operations. During the operations, no one can have access to the plaintext of the key material. The plaintext of the key material cannot be exported from the HSM.

Key managers

In most cases, you are the manager of your CMK in KMS, and its Creator attribute is set to the ID of your Alibaba Cloud account.

Alibaba Cloud services that are integrated with KMS can implement server-side encryption. In this scenario, an Alibaba Cloud service can automatically host an encryption key in KMS to encrypt and protect your data. This makes it easier for you to use the entry-level data encryption features and reduces your overhead for key lifecycle and permission management. These service-managed keys are called service keys. To facilitate identification, KMS sets the Creator attribute of the service key hosted by an Alibaba Cloud service to the code of this service and assigns an alias in the format of `acs/<Code of the Alibaba Cloud service>` to the service key. For example, the Creator attribute of the service key hosted by Alibaba Cloud Object Storage Service (OSS) is set to OSS and alias `acs/oss` is assigned to the service key.

29.6. Use symmetric keys

29.6.1. Overview of symmetric encryption

This topic describes symmetric encryption, which is the most commonly used data encryption method. KMS provides easy-to-use API operations that allow you to encrypt and decrypt data on the cloud.

 **Note** For more information about the API operations, see API reference in *Developer Guide*.

If you do not specify the KeySpec parameter during key creation, KMS creates a symmetric key. KMS supports popular symmetric key algorithms and provides high-level data security by using strong cryptography.

Classification of symmetric keys

KMS supports the following two types of symmetric keys:

-
- SM4

KMS supports the commercial symmetric algorithm SM4 standardized by China National Standards. If SM4 is used, set the KeySpec parameter to `Aliyun_SM4`. The Encrypt API operation uses Galois/Counter Mode (GCM) for encryption.

Encryption and decryption features

When you call API operations to encrypt data or data keys, you only need to specify a CMK ID or alias. KMS uses the specified CMK for encryption and returns ciphertext. When you call the Decrypt API operation, you only need to specify the ciphertext that you want to decrypt. You do not need to specify a CMK. The Decrypt operation is only available for you to decrypt the ciphertext that is generated by calling the Encrypt, GenerateDataKey, or GenerateDataKeyWithoutPlaintext operation.

AAD

Symmetric keys of KMS use GCM for block ciphers. You can use additional authenticated data (AAD) to provide supplemental protection for the integrity of encrypted data. By encapsulating AAD, KMS enables you to easily customize authentication data. For more information, see [Encryption Context](#).

Envelope encryption

With the GenerateDataKey and GenerateDataKeyWithoutPlaintext API operations, KMS can generate a two-level key hierarchy to accelerate envelope encryption.

For more information about envelope encryption, see the Envelope encryption topic of *Features* in *Technical White Paper*.

Rotation of symmetric keys

Each symmetric CMK that is generated in KMS supports multiple key versions. KMS automatically rotates CMKs by generating new key versions. You can customize the key rotation policy.

If a CMK has multiple versions, the latest version of the CMK is used to encrypt data or data keys in the Encrypt, GenerateDataKey, and GenerateDataKeyWithoutPlaintext operations. When you call the Decrypt operation, you do not need to specify a CMK ID or key version ID. KMS automatically identifies the CMK and its key version with which the corresponding data or data key is encrypted. Then KMS uses the key material of the identified key version to decrypt the ciphertext.

KMS rotates a CMK by generating a new version of the CMK. After a rotation is complete, KMS automatically uses the new key version to encrypt data or data keys. However, the earlier key version is still available for decrypting the ciphertext generated before the rotation. For more information, see [Automatic key rotation](#).

BYOK

KMS allows you to encrypt your data on the cloud by using the Bring Your Own Key (BYOK) feature. This feature helps you meet stringent security and compliance requirements. We recommend that you use Managed HSM to protect your keys. You can import your key material into a CMK whose protection level is HSM. Keys in a managed HSM can only be destroyed, and their plaintext cannot be exported. For more information, see [Overview of symmetric encryption](#).

29.6.2. EncryptionContext

EncryptionContext is a JSON string that can be used in KMS API operations, such as Encrypt, GenerateDataKey, and Decrypt.

Function of EncryptionContext

EncryptionContext is a JSON string. It must be in the string-string format and is used to ensure data integrity.

If this parameter is specified during encryption, you must specify equivalent EncryptionContext for decryption. Encryption is involved in Encrypt and GenerateDataKey, and decryption is involved in Decrypt.

EncryptionContext is related to decryption, but is not included in ciphertext, which corresponds to CipherBlob.

Valid values of EncryptionContext

A valid value of EncryptionContext is a JSON string of up to 8,192 characters only in the string-string format. When you specify EncryptionContext for an API operation, consider the escape characters.

Example of valid EncryptionContext

```

{"ValidKey": "ValidValue"}
{"Key1": "Value1", "Key2": "Value2"}

```

(Partial) Example of invalid EncryptionContext

```

[{"Key": "Value"}] // JSON array
{"Key": 12345} // String-int
{"Key": ["value1", "value2"]} // String-array

```

Equivalent EncryptionContext

In essence, EncryptionContext is a map or hash table in the string-string format. When EncryptionContext is used as a parameter, make sure that the key-value pairs indicated by the JSON string match. This allows you to obtain equivalent EncryptionContext. You can use EncryptionContext that is equivalent to EncryptionContext that you entered during encryption to decrypt ciphertext, rather than retaining the original string.

Example of equivalent EncryptionContext

```

{"Key1": "Value1", "Key2": "Value2"} is equivalent to {"Key2": "Value2", "Key1": "Value1"}.

```

29.6.3. Import and delete key material

This topic describes how to import and delete external key material.

Context

CMKs are basic resources of KMS. A CMK is composed of a key ID, basic metadata (such as key state), and key material that is used to encrypt and decrypt data. When you call the CreateKey operation to create a CMK, you can set the Origin parameter to `Aliyun_KMS` (default value). In this case, KMS generates key material. If you set the Origin parameter to `EXTERNAL`, you must import external key material to the CMK. In this case, KMS does not create key material. You can call the DescribeKey operation to check the key material source of an existing CMK.

 **Note** For more information about the API operations, see *API reference* in *Developer Guide*.

- If the value of Origin in KeyMetadata is `Aliyun_KMS`, the key material is generated by KMS. In this case, the CMK is considered to be a **normal key**.
- If the value of Origin is `EXTERNAL`, the key material is imported from an external source. In this case, the CMK is considered to be an **external key**.

Before you import external key material, take note of the following points:

- Make sure that the source of randomness from which the key material is generated meets security requirements.
- Make sure that the key material is reliable.
 - KMS ensures the high availability of imported key material. However, it cannot ensure that the imported key material has the same reliability as the key material generated by KMS.
 - You can call the DeleteKeyMaterial operation to delete the key material that you have imported. You can also set an expiration period to enable KMS to automatically delete the key material after the expiration period ends. The CMK is not deleted. To delete key material generated by KMS, you can only call the ScheduleKeyDeletion operation to specify a waiting period of 7 to 30 days for deleting the CMK. The key material is deleted with the relevant CMK after the waiting period ends.

- After you delete the imported key material, you can re-import the same key material to make the relevant CMK available again. Therefore, we recommend that you save a copy of the key material.
- Key material is unique for each CMK. When you import key material into a CMK, the CMK is associated with that key material. Even after the key material expires or is deleted, you cannot import different key material into that CMK. If you need to rotate a CMK that uses external key material, you must create a new CMK and then import new key material.
- CMKs are independent. You cannot use a CMK to decrypt data that is encrypted by using another CMK, even if the two CMKs use the same key material.
- The key material to be imported must be a 256-bit symmetric key.

Import key material

1. Create an external key. You can use one of the following methods to create an external key:

- Method 1: Log on to the KMS console and click Create Key. In the Advanced section of the Create Key dialog box, set Key Material Source to External. For more information, see [Create a CMK](#).
- Method 2: Call the CreateKey operation. Set Origin to *EXTERNAL*.

```
./aliyun --skip-secure-verify --region ${please-replace-your-region} --endpoint ${please-replace-your-endpoint} --access-key-id ${please-replace-your-access-key-id} --access-key-secret ${please-replace-your-access-key-secret} kms CreateKey --Origin EXTERNAL --Description "External key"
```

2. Obtain parameters that are used to import key material. The parameters include a public key that is used to encrypt the key material and an import token. You can use one of the following methods to obtain the parameters:

- Method 1: Obtain the parameters in the KMS console.
- Method 2: Call the GetParametersForImport operation to obtain the parameters.

```
./aliyun --skip-secure-verify --region ${please-replace-your-region} --endpoint ${please-replace-your-endpoint} --access-key-id ${please-replace-your-access-key-id} --access-key-secret ${please-replace-your-access-key-secret} kms GetParametersForImport --KeyId 1339cb7d-54d3-47e0-b595-c7d3dba8**** --WrappingAlgorithm RSAES_OAEP_SHA_1 --WrappingKeySpec RSA_2048
```

3. Import key material.

- You can import key material into an external key that never has key material. You can also reset the expiration time of key material or re-import key material that has expired or been deleted.
- Each import token is bound to a public key that is used to encrypt key material. A CMK is specified when an import token is generated. The import token can only be used to import key material into the specified CMK.
- The lifecycle of an import token is 24 hours. It can be used repeatedly within this period. After it expires, you must obtain a new import token and a new public key.
 - i. Use the public key to encrypt the key material. The public key is a 2048-bit Rivest-Shamir-Adleman (RSA) public key. The encryption algorithm must be consistent with that specified when you obtain the import parameters. Because the public key returned when you call the GetParametersForImport operation is Base64 encoded, you must first decode the public key. Currently, KMS supports the following encryption algorithms: RSAES_OAEP_SHA_1, RSAES_OAEP_SHA_256, and RSAES_PKCS1_V1_5.
 - ii. Base64 encode the encrypted key material.
 - iii. Call the ImportKeyMaterial operation to import the encoded key material and the import token to KMS.

```
./aliyun --skip-secure-verify --region ${please-replace-your-region} --endpoint ${please-replace-your-endpoint} --access-key-id ${please-replace-your-access-key-id} --access-key-secret ${please-replace-your-access-key-secret} kms ImportKeyMaterial --KeyId 1339cb7d-54d3-47e0-b595-c7d3dba8**** --EncryptedKeyMaterial xxx --ImportToken xxxx
```

Delete key material

After you import key material into an external key, you can use the external key just like a normal key. The only difference is that the key material of an external key may expire and can be deleted independently. After the key material of an external key expires or is deleted, the external key can no longer be used, and the ciphertext encrypted by using this external key cannot be decrypted. To enable the external key and related decryption again, you must re-import the same key material.

If an external key is in the Pending Deletion state before its key material expires or is deleted, the key state does not change after the key material expires or is deleted. Otherwise, the key state changes to Pending Import after the key material expires or is deleted.

You can use one of the following methods to delete key material:

- Method 1: Delete key material in the KMS console.
- Method 2: Call the DeleteKeyMaterial operation to delete key material.

```
./aliyun --skip-secure-verify --region ${please-replace-your-region} --endpoint ${please-replace-your-endpoint}
--access-key-id ${please-replace-your-access-key-id} --access-key-secret ${please-replace-your-access-key-secret} kms DeleteKeyMaterial --KeyId 1339cb7d-54d3-47e0-b595-c7d3dba8****
```

Use OpenSSL to encrypt and upload key material

1. Create an external key.
2. Generate key material. The key material must be a 256-bit symmetric key. In this example, OpenSSL is used to generate a 32-byte random number.

```
openssl rand -out KeyMaterial.bin 32
```

3. Obtain parameters that are used to import the key material.
4. Encrypt the key material.
 - i. Base64 decode the public key that is used to encrypt the key material.
 - ii. Use an encryption algorithm such as RSAES_OAEP_SHA_1 to encrypt the key material.
 - iii. Base64 encode the encrypted key material and save it as a text file.

```
openssl rand -out KeyMaterial.bin 32
openssl enc -d -base64 -A -in PublicKey_base64.txt -out PublicKey.bin
openssl rsautl -encrypt -in KeyMaterial.bin -oaep -inkey PublicKey.bin -keyform DER -pubin -out EncryptedKeyMaterial.bin
openssl enc -e -base64 -A -in EncryptedKeyMaterial.bin -out EncryptedKeyMaterial_base64.txt
```

- iv. Upload the encrypted key material and the import token.

Use SDK for Java to encrypt and upload key material.

```
//Use the latest KMS SDK for Java.
//KmsClient.java

import com.aliyuncs.kms.model.v20160120.*;
import com.aliyuncs.profile.DefaultProfile;

//KMS API encapsulation
public class KmsClient {
    DefaultAcsClient client;

    public KmsClient( String region_id, String ak, String secret) {
```

```

        DefaultProfile profile = DefaultProfile.getProfile(region_id, ak, secret);
        this.client = new DefaultAcsClient(profile);
    }

    public CreateKeyResponse createKey() throws Exception {
        CreateKeyRequest request = new CreateKeyRequest();
        request.setOrigin("EXTERNAL"); //Create an external key.
        return this.client.getAcsResponse(request);
    }
    //... Omitted. The remaining operations are the same as those in the API method.
}
//example.java
import com.aliyuncs.kms.model.v20160120.*;
import KmsClient
import java.security.KeyFactory;
import java.security.PublicKey;
import java.security.spec.MGF1ParameterSpec;
import javax.crypto.Cipher;

public class CreateAndImportExample {
    public static void main(String[] args) {
        String regionId = "cn-hangzhou";
        String accessKeyId = "**** Provide your AccessKeyId ****";
        String accessKeySecret = "**** Provide your AccessKeySecret ****";
        KmsClient kmsClient = new KmsClient(regionId,accessKeyId,accessKeySecret);
        //Create External Key
        try {
            CreateKeyResponse keyResponse = kmsClient.createKey();
            String keyId = keyResponse.KeyMetadata.getKeyId();
            //Generate a 32-bit random number.
            byte[] keyMaterial = new byte[32];
            new Random().nextBytes(keyMaterial);
            //Obtain parameters that are used to import the key material.
            GetParametersForImportResponse paramResponse = kmsClient.getParametersForImport(keyId,"RSAES_OAEP_
SHA_256");
            String importToken = paramResponse.getImportToken();
            String encryptPublicKey = paramResponse.getPublicKey();
            //Base64 decode the public key.
            byte[] publicKeyDer = DataConverter.parseBase64Binary(encryptPublicKey);
            //Use RSA to parse the public key.
            KeyFactory keyFact = KeyFactory.getInstance("RSA");
            X509EncodedKeySpec keySpec = new X509EncodedKeySpec(publicKeyDer);

```

Algorithm	Key type	Description	Purpose
SM2	EC_SM2	ECC defined by GB/T 32918	<ul style="list-style-type: none"> • Encrypt or decrypt data. • Generate a digital signature.

Data encryption

In data encryption, asymmetric keys are used to transmit sensitive information. The following steps describe a typical scenario:

1. An information receiver distributes a public key to a transmitter.
2. The transmitter uses the public key to encrypt sensitive information.
3. The transmitter sends the ciphertext generated from the sensitive information to the information receiver.
4. The information receiver uses the private key to decrypt the ciphertext.

The private key can be used only by the information receiver. This ensures that the plaintext of sensitive information cannot be intercepted and decrypted by unauthorized parties during transmission. This encryption method is widely used to exchange keys. For example, session keys are exchanged in Transport Layer Security (TLS) handshakes, and encryption keys are exported and imported between different hardware security modules (HSMs).

For more information, see [Encrypt and decrypt data by using an asymmetric CMK](#).

Digital signature

Asymmetric keys are also used to generate digital signatures. Private keys can be used to sign messages or information. Private keys are strictly protected and can be used only by trusted users to generate signatures. After a signature is generated, you can use the corresponding public key to verify the signature to achieve the following purposes:

- Verify data integrity. If the data does not match its signature, the data may be tampered with.
- Verify message authenticity. If a message does not match its signature, the message transmitter does not hold the private key.
- Provide non-repudiation for signatures. If the data matches its signature, the signer cannot deny this signature.

The following operations describe a typical signature verification scenario:

1. A signer sends a public key to a message receiver.
2. The signer uses the private key to sign data.
3. The signer sends the data and signature to the message receiver.
4. After receiving the data and signature, the message receiver uses the public key to verify the signature.

Digital signatures are widely used to defend against data tampering and authenticate identities.

For more information, see [Generate and verify a digital signature by using an asymmetric CMK](#).

Key version

KMS does not support automatic rotation of asymmetric CMKs. You can call the [CreateKeyVersion](#) operation to create a key version in a specific CMK and generate a new pair of public and private keys. If you use a new key version to generate a digital signature or encrypt data, you must also distribute the new version of the public key.

In addition, unlike symmetric CMKs, asymmetric CMKs do not have a primary key version. Therefore, to call the operations related to asymmetric keys in KMS, you must specify the CMK ID or CMK alias and a key version.

Public key operation

In most cases, you can call the `GetPublicKey` operation to obtain a public key and distribute it to users for encryption or verification. Then, the users can use cryptographic libraries such as OpenSSL and Java Cryptography Extension (JCE) on the business end to perform local calculation.

You can also call the `AsymmetricEncrypt` or `AsymmetricVerify` operation to perform public key operations. If you call these operations, KMS records the logs of the calls and allows you to use Resource Access Management (RAM) to put limits on the use of public keys. Compared with local calculation on the business end, KMS offers flexible functions that better suit your needs.

Private key operation

You can call only the `AsymmetricDecrypt` or `AsymmetricSign` operation to use a private key to decrypt data or generate a digital signature.

29.7.2. Encrypt and decrypt data by using an asymmetric CMK

This topic describes how to use an asymmetric customer master key (CMK) to encrypt and decrypt data in Alibaba Cloud CLI.

Asymmetric encryption generally includes the following steps:

1. An information receiver distributes a public key to a transmitter.
2. The transmitter uses the public key to encrypt sensitive information.
3. The transmitter sends the ciphertext generated from the sensitive information to the receiver.
4. The receiver uses the private key to decrypt the ciphertext.

Before you start

Call the `CreateKey` operation to create an asymmetric CMK in KMS. Set the `KeySpec` parameter to a desired key type and the `KeyUsage` parameter to `ENCRYPT/DECRYPT`.

The following code demonstrates how to create an RSA encryption key:

```
$ aliyun kms CreateKey --KeySpec=RSA_2048 --KeyUsage=ENCRYPT/DECRYPT --ProtectionLevel=HSM
```

Obtain the public key

1. Call the `GetPublicKey` operation to obtain the public key of the asymmetric key pair.

```
$ aliyun kms GetPublicKey --KeyId=**** --KeyVersionId=****
```

Sample success responses:

```
{
  "RequestId": "82c383eb-c377-4mf6-bxx8-81hkc1g5g7ab",
  "KeyId": "****",
  "KeyVersionId": "****",
  "PublicKey": "PublicKey-DataBlob"
}
```

2. Save the public key to the `rsa_publickey.pub` file. `PublicKey-DataBlob` is a placeholder. You must replace it with the obtained public key.

```
$ echo PublicKey-DataBlob > rsa_publickey.pub
```

Use the public key to encrypt data

1. Create a sample plaintext file plaintext-file.txt that contains "this is plaintext".

```
echo "this is plaintext" > plaintext-file.txt
```

2. Use OpenSSL to encrypt the file and write the obtained binary ciphertext into the plaintext-file.enc file.

```
openssl pkeyutl -encrypt -in plaintext-file.txt \
-inkey rsa_publickey.pub -pubin \
-pkeyopt rsa_padding_mode:oaep \
-pkeyopt rsa_oaep_md:sha256 \
-pkeyopt rsa_mgf1_md:sha256 \
-out plaintext-file.enc
```

Call the KMS API to decrypt data

You must call the KMS API and use the private key to decrypt data.

1. Before you transmit the encrypted data over the network, encode it in Base64.

```
$ openssl base64 -in plaintext-file.enc
```

The following Base64-encoded ciphertext is returned:

```
5kdCB06HHeAwgfH9ARY4/9Nv5vlpQ94GXZcmaC9FE59Aw8v8RYdozT6ggSbyZbi+
8STKVq9402MEfmUDmWjLuu0qgAZsCe5wU4JWHh1y84Qn6HT068j0qOy5X2Hilrjs

mGLzK4J3Rh/l7PQHiVMdc4hSnXosg68QmMVdZBGLK9/cD9SYngPDiirU7z0q7Git
dleloyCAUDFyuQC6a+SqzA==
```

2. Pass the Base64-encoded ciphertext to KMS to decrypt data.

```
aliyun kms AsymmetricDecrypt \
--KeyId **** \
--KeyVersionId **** \
--Algorithm RSAES_OAEP_SHA_256 \
--CiphertextBlob 5kdCB06HHeAwgfH9ARY4/9Nv5vlpQ94GXZcmaC9FE59Aw8v8RYdozT6ggSbyZbi+8STKVq9402MEfmUDm
wJLuu0qgAZsCe5wU4JWHh1y84Qn6HT068j0qOy5X2HilrjsfCdetgtMtVorSgb3bbERk2RV67nHWrdkecNbUaz+6ik4ALZxv2uWrV

sg68QmMVdZBGLK9/cD9SYngPDiirU7z0q7GitdleloyCAUDFyuQC6a+SqzA==
```

Example output:

```
{
  "KeyId": "****",
  "KeyVersionId": "****",
  "Plaintext": "dGhpcyBpcyBwbGFpbnRleHQgDQo=",
  "RequestId": "6be7a8e4-35b9-4549-ad05-c5b1b535a22c"
}
```

3. Decode the returned Base64-encoded plaintext in Base64.

```
echo dGhpcyBpcyBwbGFpbnRleHQgDQo= | openssl base64 -d
```

The following decrypted plaintext is returned:

```
this is plaintext
```

29.7.3. Generate and verify a digital signature by using an asymmetric CMK

This topic uses Alibaba Cloud CLI as an example to describe how to use an asymmetric customer master key (CMK) to generate and verify a digital signature. You can also perform this operation by using the KMS SDK.

Asymmetric encryption generally includes the following steps:

1. A signer sends a public key to a receiver.
2. The signer uses the private key to sign data.
3. The signer sends the data and signature to the receiver.
4. After receiving the data and signature, the receiver uses the public key to verify the signature.

Before you start

Call the `CreateKey` operation to create an asymmetric CMK in KMS. Set the `KeySpec` parameter to a desired key type and the `KeyUsage` parameter to `SIGN/VERIFY`.

- Create an RSA signature key:

```
$ aliyun kms CreateKey --KeySpec=RSA_2048 --KeyUsage=SIGN/VERIFY --ProtectionLevel=HSM
```

- Create a NIST P-256 signature key:

```
$ aliyun kms CreateKey --KeySpec=EC_P256 --KeyUsage=SIGN/VERIFY --ProtectionLevel=HSM
```

- Create a secp256k1 signature key:

```
$ aliyun kms CreateKey --KeySpec=EC_P256K --KeyUsage=SIGN/VERIFY --ProtectionLevel=HSM
```

Preprocess signature: compute a message digest

Both RSA and ECC signature operations involve first computing the digest of an unsigned message and then signing the digest.

 **Note** The algorithm used to obtain a message digest must match the algorithm used to call KMS to compute a signature. For example, the `ECDSA_SHA_256` signature algorithm must be used in conjunction with the `SHA-256` digest algorithm. It does not support the `SHA-384` digest algorithm.

The following example uses the SHA-256 digest algorithm.

1. Save the message "this is message" that needs to be signed into the file message-file.txt:

```
$ echo "this is message" > message-file.txt
```

2. Compute the SHA-256 digest of the message and save the binary digest to the file message-sha256.bin:

```
$ openssl dgst -sha256 -binary -out message-sha256.bin message-file.txt
```

Call KMS to compute the signature

You must call the KMS API to compute the signature of a message with the private key.

1. Before you transmit the message digest over the network, encode it in Base64.

```
$ openssl base64 -in message-sha256.bin
```

The following Base64 encoded digest is returned:

```
hRP2cuRFSlfEoUXCGuPyi7kZr18VCTZeVOTw0jbUB6w=
```

2. Pass the Base64 encoded digest to KMS to generate a signature.

 **Note** The parameters passed and the results generated vary depending on key types and signature algorithms. Each signature result generated in the example is stored in a different file.

• RSASSA-PSS

For RSA keys, you can use the RSASSA-PSS signature algorithm and the SHA-256 digest algorithm to create a signature. Run the following command:

```
$ aliyun kms AsymmetricSign --KeyId=**** --KeyVersionId=**** \  
--Algorithm=RSA_PSS_SHA_256 --Digest=hRP2cu...  
{  
  "KeyId": "****",  
  "KeyVersionId": "****",  
  "Value": "J7xmdnZ...",  
  "RequestId": "70f78da9-c1b6-4119-9635-0ce4427cd424"  
}
```

Decode the signature value in Base64 and generate a binary signature. This signature is saved in the file rsa_pss_signature.bin:

```
$ echo J7xmdnZ... | openssl base64 -d -out rsa_pss_signature.bin
```

• RSASSA_PKCS1_V1_5

For RSA keys, you can use the RSASSA_PKCS1_V1_5 signature algorithm and the SHA-256 digest algorithm to create a signature. Run the following command:

```
$ aliyun kms AsymmetricSign --KeyId=**** --KeyVersionId=**** \
--Algorithm=RSA_PKCS1_SHA_256 --Digest=hrP2cu...
{
  "KeyId": "****",
  "KeyVersionId": "****",
  "Value": "qreBkH/u...",
  "RequestId": "4be57288-f477-4ecd-b7be-ad8688390fbc"
}
```

Decode the signature value in Base64 and generate a binary signature. This signature is saved in the file `rsa_pkcs1_signature.bin`:

```
echo qreBkH/u... | openssl base64 -d -out rsa_pkcs1_signature.bin
```

- **NIST P-256**

For NIST curve P-256, you can use the ECDSA signature algorithm and the SHA-256 digest signature to create a signature. Run the following command:

```
$ aliyun kms AsymmetricSign --KeyId=**** --KeyVersionId=**** \
--Algorithm=ECDSA_SHA_256 --Digest=hrP2cu...
{
  "KeyId": "****",
  "KeyVersionId": "****",
  "Value": "MEYCIQD33Y98...",
  "RequestId": "472d789c-d4be-4271-96bb-367f7f0f8ec3"
}
```

Decode the signature value in Base64 and generate a binary signature. This signature is saved in the file `ec_p256_signature.bin`:

```
echo MEYCIQD33Y98... | openssl base64 -d -out ec_p256_signature.bin
```

- **secp256k1**

For SECG curve secp256k1, you can use the ECDSA signature algorithm and the SHA-256 digest algorithm to create a signature. Run the following command:

```
$ aliyun kms AsymmetricSign --KeyId=**** --KeyVersionId=**** \
--Algorithm=ECDSA_SHA_256 --Digest=hrP2cu...
{
  "KeyId": "****",
  "KeyVersionId": "****",
  "Value": "MEYCIQDWuul...",
  "RequestId": "fe41abed-91e7-4069-9f6b-0048f5bf4de5"
}
```

Decode the signature Value in Base64 and generate a binary signature. This signature is saved in the file `ec_p256k_signature.bin`:

```
echo MEYCIQDWuul... | openssl base64 -d -out ec_p256k_signature.bin
```

Obtain the public key

Obtain the public key of the created asymmetric key pair from the KMS. The preceding example assumes that:

- The public key of the RSA key pair is saved to the file `rsa_publickey.pub`.
- The public key of the NIST P-256 key pair is saved to the file `ec_p256_publickey.pub`.
- The public key of the `secp256k1` key pair is saved to the file `ec_p256k_publickey.pub`.

Use the public key to verify the signature

Run the following command lines to verify the signature (the command varies depending on the algorithm used to generate the public key):

- **RSASSA-PSS**

```
$ openssl dgst \  
-verify rsa_publickey.pub \  
-sha256 \  
-sigopt rsa_padding_mode:pss \  
-sigopt rsa_pss_saltlen:-1 \  
-signature rsa_pss_signature.bin \  
message-file.txt
```

- **RSASSA_PKCS1_V1_5**

```
$ openssl dgst \  
-verify rsa_publickey.pub \  
-sha256 \  
-signature rsa_pkcs1_signature.bin \  
message-file.txt
```

- **NIST P-256**

```
$ openssl dgst \  
-verify ec_p256_publickey.pub \  
-sha256 \  
-signature ec_p256_signature.bin \  
message-file.txt
```

- **secp256k1**

```
$ openssl dgst \  
-verify ec_p256k_publickey.pub \  
-sha256 \  
-signature ec_p256k_signature.bin \  
message-file.txt
```

If the verification succeeds, the system displays the following message:

```
Verified OK
```

29.8. Key rotation

29.8.1. Overview

Keys are often used to protect data. The security of data is dependent on the security of its corresponding keys. You can use key versions and the periodic rotation mechanism to improve key security and implement security policies and best practices for data protection.

Security goals

You can use the periodic key rotation mechanism to:

- Reduce the amount of data encrypted by each key

The security of a key is inversely proportional to the amount of data encrypted by it. This amount is usually defined by the total bytes of data or the total number of messages that are encrypted by the same key. For example, National Institute of Standards and Technology (NIST) defines the secure lifecycle of a key in GCM mode as the total number of messages encrypted based on the key. The periodic key rotation mechanism enables each key to remain secure and minimize vulnerability to cryptanalytic attacks.

- Respond in advance to security events

In the early days of system design, key rotation was introduced as a routine O&M method. This provides the system with a method to handle security events when they occur, and complies with the fail early, fail often principle of software engineering. If key rotation is not executed until an emergency event has already occurred, the probability of system failure increases exponentially.

- Provide logical isolation of data

Encrypted data is isolated with each key rotation from other data encrypted using different keys. The impact of key-related security events can be identified quickly and preventive measures can be taken.

- Reduce the window of time to crack keys

Periodic rotation of encryption keys ensures that you can control and reduce the window of time for which the key and its encrypted data are vulnerable to being cracked. Attackers only have a limited period of time between rotation tasks during which they are able to crack the key. This practice greatly increases the security of your data against cryptanalytic attacks.

Regulatory compliance

The periodic key rotation mechanism facilitates compliance with various regulations, which include but are not limited to:

- Payment Card Industry Data Security Standard (PCI DSS)
- Cryptography-related industrial standards issued by State Cryptography Administration, such as GM/T 0051-2016
- Cryptography-related standards issued by NIST, such as NIST Publication 800-38D

29.8.2. Automatic key rotation

This topic describes how to configure automatic rotation of CMKs in KMS.

Key versions

A CMK may have multiple key versions. Each key version represents an independently generated key. Key versions of the same CMK do not have any cryptographic relation to each other. KMS automatically rotates CMKs by generating new key versions.

There are two types of key versions:

- Primary key versions
 - The primary key version of a CMK is an active encryption key. Each CMK has only one primary key version at any point in time.
 - When you call an encryption API operation such as `GenerateDataKey` or `Encrypt`, KMS uses the primary key version of a specified CMK to encrypt the target plaintext.
 - You can call the `DescribeKey` operation to view the `PrimaryKeyVersion` attribute.
- Non-primary key versions

- A non-primary key version of a CMK is an inactive encryption key. Each CMK can have any number of non-primary key versions.
- Each non-primary key version was a primary key version and acted as the active encryption key in the past.
- When a new primary key version is created, KMS does not delete or disable non-primary key versions because they will be used to decrypt data.

 **Note** When you call an encryption API operation, the primary key version of a specified CMK is used. When you call a decryption API operation, the key version that was used to encrypt the ciphertext is used.

You can generate a key version in either of the following ways:

- Create a CMK.

You can call the `CreateKey` operation to create a CMK. If you set the `Origin` parameter to `Aliyun_KMS`, KMS generates an initial key version and sets it as the primary key version.

- Execute an automatic rotation policy.

After you configure an automatic rotation policy, KMS executes the policy on a regular basis to generate new key versions.

Automatic key rotation

Configure a key rotation policy.

When you call the `CreateKey` operation to create a CMK, you can specify an automatic rotation policy for the CMK. You can call the `UpdateRotationPolicy` operation to update the current automatic rotation policy. When you call the API operations, you must configure the following parameters:

- `EnableAutomaticRotation`: specifies whether to enable automatic rotation.
- `RotationInterval`: indicates the time period for automatic rotation.

You can call the `DescribeKey` operation to view the configured automatic rotation policy. The following parameters are returned:

- `AutomaticRotation`: indicates whether automatic rotation is enabled. *Disabled* indicates that automatic rotation is not enabled. *Enabled* indicates that automatic rotation is enabled. *Suspended* indicates that KMS suspends the execution of automatic rotation although automatic rotation is enabled.
- `RotationInterval`: indicates the period for automatic rotation.

Execute an automatic rotation policy.

When automatic rotation is enabled, KMS calculates the time of the next rotation by using the following formula:

$$\${NextRotationTime} = \${LastRotationTime} + \${RotationInterval}$$

where:

- `LastRotationTime` : specifies the time the last key version is created. You can call the `DescribeKey` operation and check the `LastRotationDate` parameter to obtain the time.
- `NextRotationTime` : specifies the time KMS performs the next rotation task to create a new key version. You can call the `DescribeKey` operation and check the `NextRotationDate` parameter to obtain the time.

 **Notice** When you update the `RotationInterval` parameter of an automatic rotation policy, the value of `NextRotationTime` may be a point in time in the past. This does not affect the execution of the automatic rotation policy. If this situation occurs, KMS executes the automatic rotation policy immediately.

Impact of CMK status on automatic rotation

A new key version can be created for a CMK only if this CMK is in the *Enabled* state (the value of `KeyState`). You must take note of the following points:

- If a CMK is in the *Disabled* or *Pending Deletion* state, do not call the `UpdateRotationPolicy` operation to update its automatic rotation policy.
- If a CMK enters the *Disabled* or *Pending Deletion* state after you enable automatic rotation for it, KMS suspends the execution of automatic rotation. In this case, if you call the `DescribeKey` operation, the returned value of the `AutomaticRotation` parameter is *Suspended*. When the CMK enters the *Enabled* state again, its automatic rotation policy becomes active.

Limits

The following keys do not support multiple key versions:

- **Managed keys:** the default keys managed by KMS for specific cloud services. These keys belong to users of the cloud services and are used to provide basic encryption protection for data of the users.
- **Keys based on BYOK:** the keys that you have imported to KMS. For more information, see [Import and delete key material](#). The `Origin` attribute of these keys is *EXTERNAL*. KMS does not generate key material or initiate rotation tasks for these keys.

These two types of keys do not support version-based manual or automatic key rotation. A BYOK-based key does not have multiple versions in KMS. First, users have strong control over the persistence and lifecycle of BYOK-based keys. This makes management of the keys difficult and error-prone. For example, you must have on-premises key management facilities, data must be synchronized between on-premises and cloud facilities, and no grace period is provided for key material deletion on the cloud. The complexity of maintaining multiple versions of BYOK-based keys makes key management much more risky. Second, both primary and non-primary key versions may become unavailable at different points in time. For example, if key versions are deleted by KMS or imported again when they expire, it will be impossible to synchronize the CMKs and protected data or guarantee system integrity.

29.8.3. Manual key rotation

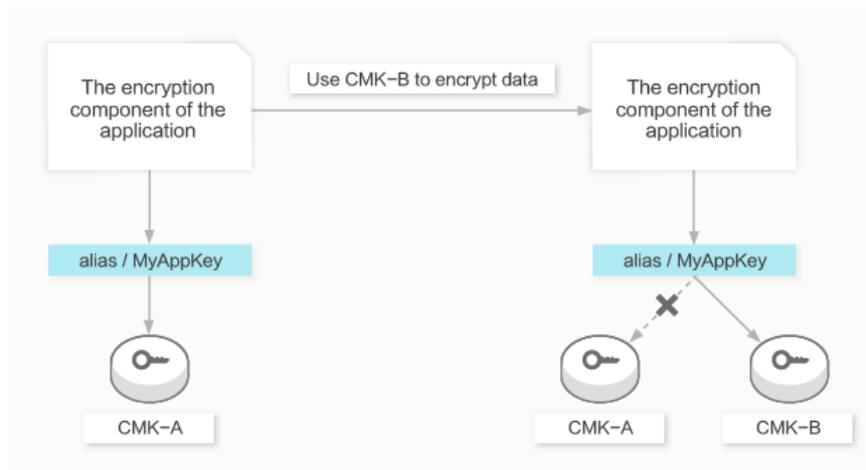

If your Customer Master Keys (CMKs) do not support version-based automatic rotation, you can manually rotate the CMKs. This is an alternative solution that does not depend on whether automatic key rotation is supported.

Custom data encryption scenario

On-premise or cloud applications can call the API operation to implement custom data encryption. Examples:

- Encrypt sensitive data such as ID card numbers, credit card information, and home addresses before writing it to databases
- Encrypt data at the client side before uploading it to OSS
- Encrypt service profiles that contain sensitive data and SSL key certificates such as application profiles

You can use the key alias feature to rotate encryption keys within applications. The ID and alias of the key are not required when you call the `Decrypt` API operation.

In this scenario, you must perform the following steps:

1. Initial configuration

- i. The administrator creates a CMK, whose ID is CMK-A.
- ii. The administrator binds the `alias/MyAppKey` alias to CMK-A.
- iii. When the application encryption module calls the Encrypt API operation, the value of the `KeyId` parameter is `alias/MyAppKey`. KMS finds that `alias/MyAppKey` is bound to CMK-A and then uses CMK-A to encrypt data.
- iv. When the application decryption module calls the Decrypt API operation, the `KeyId` parameter is not used. KMS uses the CMK used to encrypt the data to decrypt the data.

2. Manual rotation

- i. The administrator creates a CMK, whose ID is CMK-B.
- ii. The administrator calls the `UpdateAlias` API operation to bind the `alias/MyAppKey` alias to CMK-B.
- iii. When the application encryption module calls the Encrypt API operation, the value of the `KeyId` parameter is `alias/MyAppKey`. KMS finds that `alias/MyAppKey` is bound to CMK-B and uses CMK-B to encrypt data.
- iv. When the application decryption module calls the Decrypt API operation, the `KeyId` parameter is not used. KMS uses the CMK used to encrypt the data to decrypt the data.

Server encryption scenario

Other cloud services can encrypt their data by integrating KMS API operations. The following situations may occur in key rotation scenarios:

- Automatic rotation policies configured on KMS affect the server encryption of other cloud services

Cause: After CMK encryption is configured for cloud services, they will call the `GenerateDataKey` API operation of KMS to generate data keys. When KMS generates a new primary key version, cloud services use the new version to generate new data key. A typical example of such cloud services is OSS. In this situation, if you want to enable automatic key rotation, you cannot use service managed keys or BYOKs imported to KMS because they do not support automatic rotation.

- Automatic rotation policies configured on KMS do not affect server encryption of other cloud services

Cause: After CMK encryption is configured for cloud services, the services only call the `GenerateDataKey` API operation of KMS once to generate keys to encrypt specific resources. When KMS generates a new primary key version, cloud services will not use it. For example, when encrypting a cloud disk, ECS calls the `GenerateDataKey` API operation of KMS once to generate a volume encryption key. This key will not be updated again after it is created.

If automatic rotation policies configured on KMS do not affect server encryption of other cloud services or you want to rotate data keys when BYOKs are used, you can change configurations and copy data to achieve the same effect as key rotation. These methods depend on the features of different cloud services. For more information, see documentation of respective cloud services.

30. Log Service

30.1. What is Log Service?

Log Service (SLS) is a one-stop logging service developed by Alibaba Cloud that is widely used by Alibaba Group in big data scenarios. You can use Log Service to collect, query, and consume log data.

Without the need to invest in in-house data collection and processing systems. This enables you to focus on your business, improving business efficiency and helping your business to expand.

Log Service provides the following features:

- **Log collection:** Log Service allows you to collect events, binary logs, and text logs in real time by using multiple methods, such as Logtail and JavaScript.
- **Query and analysis:** Log Service allows you to query and analyze the collected log data and view analysis results on charts and dashboards.
- **Status alert:** Log Service can automatically run query statements at regular intervals after you create an alert task. If the query results meet the conditions of the alert task, Log Service sends an alert to the specified recipients in real time.
- **Real-time consumption:** Log Service provides real-time consumption interfaces through which log consumers can consume log data.

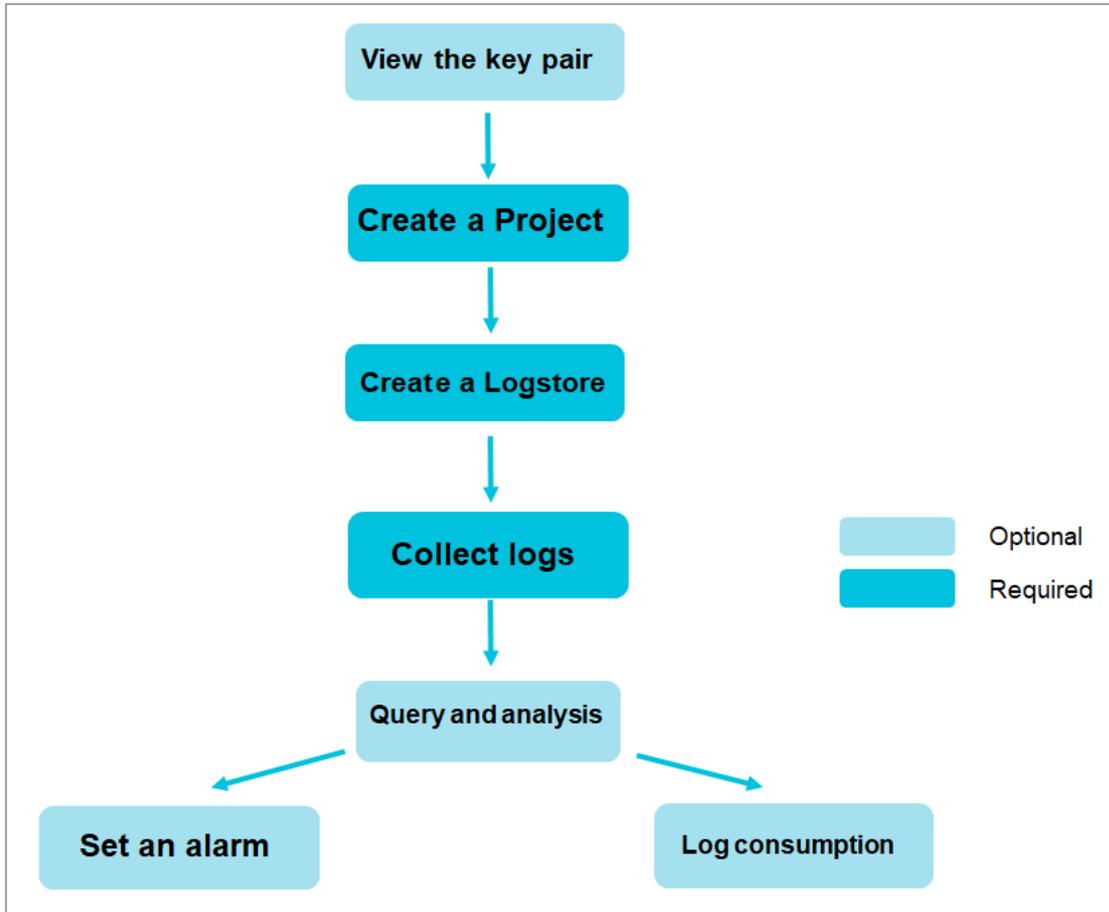

30.2. Quick start

30.2.1. Procedure

This topic provides the basic procedure to use Log Service. You can use this procedure to create projects, create Logstores, and collect log data.

The following figure shows the **Procedure**.

Procedure

1. **Optional. Obtain an AccessKey pair.**
 Before you can use Log Service through APIs or SDKs, you must have an AccessKey pair.
2. **Create a project.**
 Create a project in a specified region and add a description.
3. **Create a Logstore.**
 Create a Logstore for the project and specify the number of shards.
4. **Collect text logs**
 Select a method to collect log data based on your business requirements. Text log collection is used as an example.
5. **Enable the index feature and configure indexes for a Logstore,** and query and analyze logs.
 Log Service supports **real-time log query** and **analysis**. After you enable the indexing feature, you can query and analyze logs and configure **Overview** and **dashboards**.
6. **Configure alerts.**
 Log Service allows you to configure alerts based on log query results. Then, Log Service sends alerts by using multiple methods, such as a custom webhook.
7. **Consume logs in real time.**
 Log Service allows you to consume logs by using multiple methods, such as a **Spark Streaming client**, **Storm spout**, and **Flink connector**.

30.2.2. Log on to the Log Service console

This topic describes how to log on to the Log Service console.

Prerequisites

- The domain name of the ASCM console is obtained from the deployment personnel before you log on to the ASCM console.
- A browser is available. We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL used to log on to the ASCM console. Press the Enter key.
2. Enter your username and password.

Obtain the username and password used to log on to the console from the operations administrator.

 **Note** When you log on to the ASCM console for the first time, you must change the password of your username. For security reasons, your password must meet the minimum complexity requirements. The password must be 8 to 20 characters in length and must contain at least two of the following character types:

- Uppercase or lowercase letters.
- Digits.
- Special characters. Special characters include exclamation points (!), at signs (@), number signs (#), dollar signs (\$), and percent signs (%).

3. Click **Login** to go to the ASCM console homepage.
4. In the top navigation bar, choose **Products > Log Service**.
5. On the page that appears, select the organization and region, and then click **SLS**. The home page of the Log Service console is displayed.

30.2.3. Obtain an AccessKey pair

This topic describes how to obtain an AccessKey pair in the Apsara Stack Cloud Management (ASCM) console.

Obtain the AccessKey pair of an organization

To obtain the AccessKey pair of an organization, perform the following operations:

1. Log on to the Apsara Stack Cloud Management (ASCM) console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Organizations**.
4. In the **Organizations** navigation tree, click the  icon on the right of the organization to be added.
5. Select **AccessKey**.
6. In the message that appears, view the AccessKey pair of the organization.

 **Note** An AccessKey pair is automatically allocated to a level-1 organization. Subordinate organizations use the same AccessKey pair as their level-1 organization.

Obtain the AccessKey pair of a personal account

To obtain the AccessKey pair of a personal account, perform the following operations:

1. Log on to the ASCM console as an administrator.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and click **User Information**.
3. In the **Apsara Stack AccessKey Pair** section of the **User Information** page, view your AccessKey pair.

Apsara Stack AccessKey Pair You must use the AccessKey pair when you access Apsara Stack resources.

The AccessKey pair including the AccessKey ID and AccessKey secret is the credential to for you to use Apsara Stack resources with full permissions. You must keep the AccessKey pair confidential.

Region	AccessKey ID	AccessKey Secret
cn-qingdao-env4b-d01	AKIAI44QH8D8DFQ13O9G5	Show

Note The AccessKey pair consists of an AccessKey ID and an AccessKey secret. They allow you to access Apsara Stack resources with full permissions for your account. You must keep them confidential.

30.2.4. Manage projects

This topic describes how to create, modify, and delete projects in the Log Service console.

Context

A project in Log Service is a resource management unit. The resources in each project are isolated from resources in other projects. We recommend that you store the log data of different applications in dedicated projects. You can manage Logstores, Logtail configurations, log sources, log data, and machine groups in a project. Each project provides an endpoint for you to access the resources.

A project provides the following features:

- Allows you to store log data from different sources in different Logstores of a project. You can use Log Service to collect log data from multiple sources such as business projects, products, and environments. You can then store the log data of each source in a separate Logstore. This simplifies the downstream processes such as the consuming, exporting, and indexing of log data. In addition, you can manage access permissions at the project level.
- Provides an endpoint for you to access the resources in the project. Log Service allocates an exclusive endpoint to each project. You can use the endpoint to read, write, and manage the log data in the project.

Create a project

Note

- You can create a project only by using the Log Service console.
- You can create up to 50 projects under each Apsara Stack tenant account.

1. Log on to the Log Service console.
2. In the Projects section, click Create Project.
3. Set the parameters based on your requirements. The following table describes the parameters.

Parameter	Description
Project Name	<p>The name of the project. The project name must be unique across all regions. Use the following naming conventions:</p> <ul style="list-style-type: none"> ◦ The name can contain lowercase letters, digits, and hyphens (-). ◦ The name must start and end with a lowercase letter or digit. ◦ The name must be 3 to 63 characters in length. <p>Note After a project is created, its name cannot be modified.</p>
Description	<p>The description of the project. After the project is created, the description is displayed in the Projects section. If you need to modify the description after the project is created, find the project in the Projects section, and click Edit in the Actions column. The description must be 0 to 64 characters in length and cannot contain the following characters: < > ' \ " \ \ .</p>

Parameter	Description
Region	<p>The region to which the project belongs. We recommend that you select a region that is closer to the log source.</p> <p>After a project is created, its region cannot be modified. This means that projects cannot be migrated across regions.</p>

4. Click **OK**.

Modify the description of a project

To modify the description of a project, perform the following steps:

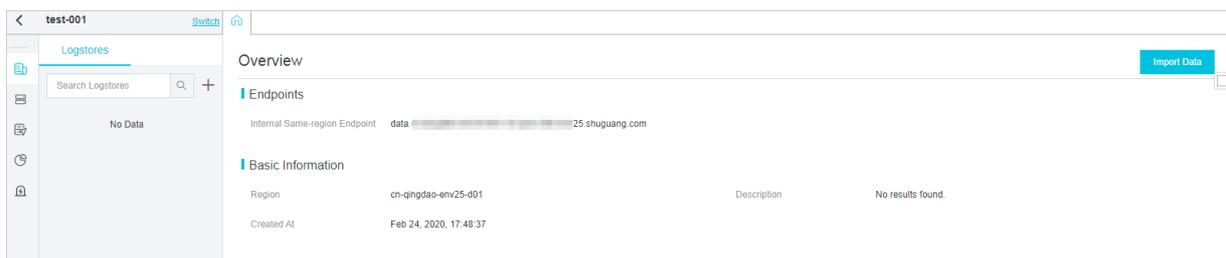

1. In the **Projects** section, find the project.
2. In the **Actions** column, click **Edit**.
3. In the **Modify Project** dialog box, modify the description of the project.

 **Note** You cannot modify the project name or region.

4. Click **OK**.

View the information of a project

To view the information of a project, click the project name in the **Projects** section. On the **Overview** page, you can view the project information such as the endpoint and region.

Delete a project

To delete a project, perform the following steps:

 **Warning** After you delete a project, all logs and configurations in the project are deleted and cannot be restored.

1. In the **Projects** section, find the project.
2. In the **Actions** column, click **Delete**.
3. In the dialog box that appears, select a reason for deletion. If you select **Other issues**, enter the reason in the text box.

Delete Project ×

 You cannot restore the project data after the project is deleted. Are you sure you want to delete the project?

Project Name: test-001

Reason for Deletion The project name is incorrect.

The region of the project is incorrect.

Business issue. Log analysis is no longer required.

The data in the project is for test and must be cleared.

Cost issue.

Do not know how to use Log Service.

Cannot import logs to the project.

Other issues.

4. Click OK.

30.2.5. Manage Logstores

This topic describes how to create, modify, and delete a Logstore in the Log Service console. A Logstore is a collection of resources inside a project. The log data in a Logstore is collected from the same source.

Context

You can create multiple Logstores in a project. We recommend that you create a Logstore for each type of application log.

Logstores provide the following features:

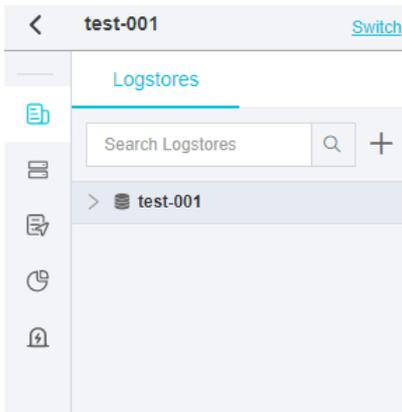

- Real-time log collection
- Log storage and real-time log consumption
- Log indexing and real-time log query

Create a Logstore

 **Note** You can create a maximum of 100 Logstores in each project.

1. [Log on to the Log Service console.](#)
2. In the **Projects** section, click the name of a project.

3. On the page that appears, click next to the search box.

4. In the Create Logstore pane, set the parameters and click OK.

Parameter	Description
Logstore Name	<p>The name of the Logstore. The Logstore name must be unique in the project to which the Logstore belongs.</p> <ul style="list-style-type: none"> ◦ The name can contain lowercase letters, digits, hyphens (-), and underscores (_). ◦ The name must start and end with a lowercase letter or digit. ◦ The name must be 3 to 63 characters in length. <p>Note After a Logstore is created, its name cannot be modified.</p>
WebTracking	Specifies whether to enable the WebTracking feature for the Logstore. You can use WebTracking to collect the log data of HTML websites, HTML5 websites, iOS apps, or Android apps and forward the data to Log Service. This feature is not enabled by default.
Permanent Storage	Specifies whether to permanently store the log data in the Logstore. If you disable this feature, you must specify a retention period for log data.
Data Retention Period	The duration for which log data is stored in the Logstore after the log data is collected. Unit: days. Valid values: 1 to 3000. When this period expires, the log data is deleted.
Shards	The number of shards in the Logstore. You can divide a Logstore into 1 to 10 shards.
Automatic Sharding	Specifies whether to enable the automatic sharding feature. This feature is not enabled by default. If you enable this feature, Log Service automatically splits shards in the Logstore when the data transfer exceeds the capacity of the existing shards.
Maximum Shards	The maximum number of shards. This parameter is required if you enable the automatic sharding feature. Maximum value: 64.

Delete : test-001

You cannot restore the data that has been deleted. Are you sure to delete the data?

OK

Cancel

30.2.6. Manage shards

This topic describes how to split, merge, and delete shards in the Log Service console. Logs are stored on shards in a Logstore. Each Logstore can have multiple shards. When you create a Logstore, you must specify the number of shards in the Logstore. After a Logstore is created, you can split or merge the shards.

Hash key

Log Service uses 128-bit MD5 hashes as the hash key of a Logstore. The entire MD5 hash range is [00000000000000000000000000000000,ffffffffffffffffffffffffffff). The hash key range of a Logstore falls within the entire MD5 hash range. When you create a Logstore, you must specify the number (N) of shards in the Logstore. The hash key range of the Logstore is evenly divided into N parts. Each part is assigned to a shard.

The hash key range of a shard is a left-closed and right-open interval that is specified by the following parameters:

- **BeginKey:** the start of the hash key range. The value of this parameter is included in the range.
- **EndKey:** the end of the hash key range. The value of this parameter is excluded from the range.

If you split a shard, the hash key range of the shard is evenly split. If you merge two shards, the hash key ranges of the shards are also merged. A hash key range determines the scope of a shard. When you push log data to a Logstore, you can specify a hash key for the log data. Log Service then writes the log data to the shard whose hash key range includes the specified hash key. This is called the hash key mode. If you do not specify a hash key for log data, the load balancing mode is used and Log Service writes the log data to a random available shard. However, when you pull log data from a Logstore, you must specify the shard where the log data is stored.

For example, a Logstore is divided into four shards and the hash key range of the Logstore is [00,FF). [Example shards](#) lists the hash key range of each shard.

Example shards

Shard	Hash key range
Shard0	[00,40)
Shard1	[40,80)
Shard2	[80,C0)
Shard3	[C0,FF)

If you set the hash key of log data to 5F, Log Service writes the log data to shard 1 because the hash key range of shard 1 includes 5F. If you set the hash key to 8C, the log data is written to shard 2 because the hash key range of shard 2 includes 8C.

Read/write capacity

Each shard provides an identical read/write capacity. Therefore, the read/write capacity of a Logstore depends on the number of shards in the Logstore. We recommend that you adjust the capacity of a Logstore based on the data traffic. For a Logstore, if the data traffic exceeds the read/write capacity, you can split shards to increase the Logstore capacity. If the data traffic is much less than the read/write capacity, you can merge shards to reduce the Logstore capacity and save costs.

For example, a Logstore consists of two read/write shards and the shards provide a maximum write capacity of 10 MB/s. If log data is written to the Logstore at a rate of 14 MB/s, we recommend that you split one of the shards into two shards. However, if log data is written at a rate of 3 MB/s, you can merge the two shards because the capacity of one shard already meets the read/write requirements.

 **Note**

- If an API operation that writes data to a Logstore constantly returns 403 or 500 errors, you can check the data traffic metrics that are provided by Log Service and determine whether to split shards.
- If the data traffic of a Logstore exceeds the read/write capacity of the Logstore, Log Service provides the best possible service but does not guarantee the service quality.

Shard status

A shard can be in one of the following states:

- Read/write
- Read-only

After a shard is created, the default status of the shard is read/write. If you split or merge shards, the status of the original shards changes to read-only and the new shards are in the read/write state. You can write data to and read data from a read/write shard. However, you can only read data from a read-only shard and cannot write data to the shard.

If you need to split a shard in a Logstore, you must specify the ID of the shard and an MD5 hash. The shard must be in the read/write state. The MD5 hash must be greater than the value of the BeginKey parameter of the shard and less than the value of the EndKey parameter of the shard. After the shard is split, the Logstore has two more shards. The status of the original shard changes from read/write to read-only. You can consume the log data in the original shard but cannot write log data to the shard. The new shards are in the read/write state and are listed below the original shard. The hash key ranges of the new shards cover that of the original shard.

If you need to merge shards in a Logstore, you must specify a read/write shard. The shard cannot be the last read/write shard in the shard list. Log Service finds the shard whose hash key range follows the hash key range of the specified shard, and merges the two shards into a new shard. The status of the original shards changes from read/write to read-only. You can consume the log data in the original shards but cannot write log data to the shards. The new shard is in the read/write state. The hash key range of the new shard covers those of the original shards.

You can perform the following operations on shards in the Log Service console:

- Split a shard.
- Merge shards.

Split a shard

Each shard provides a write capacity of 5 MB/s and a read capacity of 10 MB/s. For a Logstore, if the data traffic exceeds the total read/write capacity of existing shards, we recommend that you split shards to increase the capacity.

1. [Log on to the Log Service console](#).
2. In the **Projects** section, click the name of a project.
3. On the page that appears, click the  icon next to the Logstore, and select **Modify** from the shortcut menu.
4. In the upper-right corner of the **Logstore Attributes** page, click **Modify**.

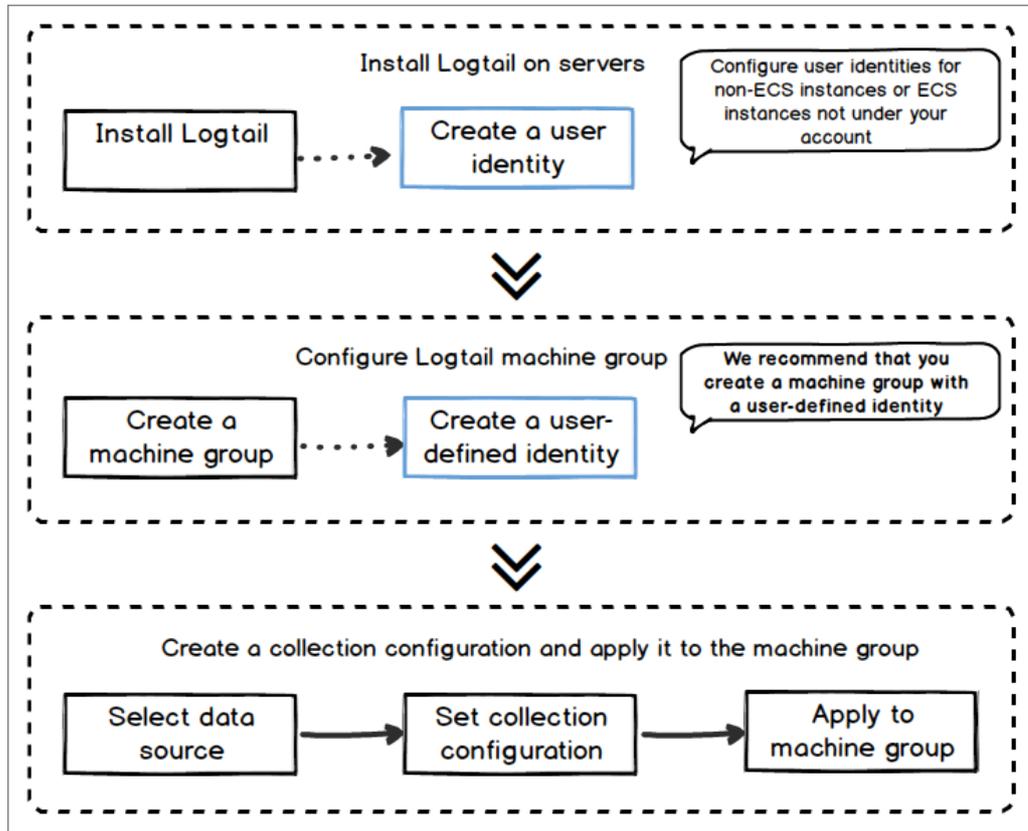

- Provides a comprehensive self-protection mechanism. To minimize the impact of Logtail on the performance of the related servers, Logtail limits the usage of CPU, memory, and network resources.

Processing capabilities and limits

For more information, see [Limits](#).

Configuration process

Configuration process

To collect logs from servers by using Logtail, follow these steps:

1. Install Logtail. For more information about how to install Logtail on a server from which you want to collect logs, see [Install Logtail in Linux](#) and [Install Logtail in Windows](#).
2. Log Service use server groups to manage all servers from which you want to collect logs by using Logtail. Log Service allows you to define server groups by using IP addresses or custom identifiers. You can create a server group as prompted when you apply Logtail configurations to server groups.
3. Create a Logtail configuration and apply it to the server group. For more information about how to create a Logtail configuration, see [Configure text log collection](#).

After the preceding process is complete, logs on the server are automatically collected and sent to the selected Logstore. However, historical logs are not collected. You can use the Log Service console, SDKs, or APIs to query these logs. Log Service allows you to view the status of log collection and check whether errors occur.

For more information, see [Collect logs by using Logtail](#).

Containers

- For information about Alibaba Cloud Container Service for Kubernetes or user-created Kubernetes clusters, see [Collect Kubernetes logs](#).
- For information about other user-created Docker clusters, see [Collect standard Docker logs](#).

Terms

- **Server group:** A server group contains one or more servers from which logs of a specific type are collected. You can apply Logtail configurations to a server group. This enables Log Service to collect logs from all servers in the server group. You can use the Log Service console to manage a sever group. For example, you can create, delete, add, or remove a server. Each server group can contain different versions of Windows servers or Linux servers.
- **Logtail:** Logtail is the agent that collects logs from the servers on which Logtail runs. For more information, see [Install Logtail in Linux](#) and [Install Logtail in Windows](#). After you install Logtail on a server, you must create a Logtail configuration and apply it to the server group to which the server belongs.
 - In Linux, Logtail is installed in the `/usr/local/ilogtail` directory. Logtail initiates two separate processes whose names start with `ilogtail`. One is a collection process and the other is a daemon process. The program running log is `/usr/local/ilogtail/ilogtail.LOG`.
 - In Windows, Logtail is installed in the `C:\Program Files\Alibaba\Logtail` (for 32-bit systems) or `C:\Program Files (x86)\Alibaba\Logtail` (for 64-bit systems) directory. You can choose Administrative Tools > Services to view the two Windows services generated from Logtail. One is LogtailWorker (log collection process) and the other is LogtailDaemon. The program running log is `logtail_*.log` in the installation directory.
- **Logtail configuration:** A Logtail configuration is a set of policies that are used by Logtail to collect logs. You can specify Logtail parameters such as the data source and collection mode. This allows you to customize log collection policies for all servers in a server group. A Logtail configuration determines how to collect a type of logs from a server, parse the logs, and send them to a specified Logstore. You can create a Logtail configuration for a Logstore in the Log Service console. This enables the Logstore to receive logs that are collected by using this Logtail configuration.

Features

Logtail provides the following features:

Feature	Description
Real-time log collection	<p>Logtail dynamically monitors log files and reads and parses incremental logs in real time. In most cases, logs are sent to Log Service within 3 seconds after they are generated.</p> <div style="border: 1px solid #ccc; background-color: #e6f2ff; padding: 5px; margin-top: 10px;"> <p> Note Logtail does not collect historical data. If Logtail reads a log later than 12 hours after the log was generated, Logtail drops the log.</p> </div>
Automatic log rotation	<p>Some applications rotate log files based on the file size or date. In the rotation process, the original log files are renamed and empty log files are created. For example, files such as <code>app.LOG.1</code> and <code>app.LOG.2</code> are generated for the <code>app.LOG</code> file after log rotation. You can specify the file (for example, <code>app.LOG</code>) to which collected logs are written. Logtail monitors the log rotation process to ensure that no logs are lost.</p>
Multiple data sources	<p>Logtail can collect text logs, syslogs, HTTP logs, and MySQL binlogs.</p>
Automatic exception handling	<p>If data transmission fails due to exceptions such as Log Service errors, network errors, or quota exhaustion, Logtail retries log collection based on the specific scenario. If the retry fails, Logtail writes the data to the local cache and resends the data after the exception no longer exists.</p>

Feature	Description
Flexible collection policy configuration	<p>You can create a Logtail configuration to specify how logs are collected from an ECS instance. You can select log directories and files by using exact match or wildcard match based on actual scenarios. You can also customize the extraction method of collected logs and the names of extracted fields. Log Service allows you to extract logs by using regular expressions.</p> <p>The log data models of Log Service require that each log has a precise timestamp. Logtail provides custom log time formats. This allows you to extract the required timestamps from log data of different formats.</p>
Automatic synchronization of Logtail configurations	After you create or update a Logtail configuration in the Log Service console, Logtail receives and validates the configuration within 3 minutes. No data loss occurs during the configuration update process.
Automatic upgrade	After you install Logtail on a server, Log Service manages the automatic upgrade of Logtail without manual intervention. No data loss occurs during the Logtail upgrade process.
Status monitoring	Logtail monitors its consumption of CPU and memory in real time. This prevents Logtail from excessively consuming your resources. If the resource consumption exceeds the limit, Logtail restarts to avoid affecting other services on the server. Logtail limits network traffic to avoid excessive bandwidth consumption.
Data transmission with a signature	<p>Logtail obtains your Alibaba Cloud AccessKey pair and uses it to sign all log data packets before they are sent. This prevents data tampering during transmission.</p> <p> Note Logtail obtains your Alibaba Cloud AccessKey pair over HTTPS to ensure the security of your AccessKey pair.</p>

Data collection reliability

During data collection, Logtail stores the collected checkpoints to the local directory on a regular basis. If an exception (for example, an unexpected server shutdown or a process crash) occurs, Logtail restarts and then collects data from the last recorded checkpoint to prevent data loss. Logtail runs based on the **resource limits** specified in the configuration file. If the usage of a resource exceeds the limit for more than 5 minutes, Logtail restarts. After the restart, duplicate data may be generated.

Logtail uses multiple internal mechanisms to improve log collection reliability. However, logs may be lost in the following conditions:

- Logtail is not running but logs are rotated multiple times.
- The log rotation rate is high, for example, one rotation per second.
- The log collection rate is lower than the log generation rate for a long period of time.

30.3.1.1.2. Log collection process of Logtail

This topic describes the process that Logtail uses to collect server logs. The process consists of the following steps: monitor files, read files, process logs, filter logs, aggregate logs, and send logs.

 **Note** After the Logtail configuration is applied to a machine group, unmodified logs on the servers in the machine group are considered as historical logs. Logtail does not collect historical logs in normal running mode. If you want to collect historical logs, see **Import historical logs**.

Monitor files

After you install Logtail on a server and create a Logtail configuration based on a data source, the Logtail configuration is delivered from Log Service to Logtail in real time. Then, Logtail starts to monitor files based on the Logtail configuration.

1. Logtail scans log directories and files that comply with the specified file naming rules based on the specified log path and maximum monitoring directory depth.

Logtail registers event monitoring and periodical polling for the directory from which Logtail collect logs. In Linux, **Inotify** is used. In Windows, **ReadDirectoryChangesW** is used. This method ensures the timeliness and stability of log collection.

2. If the compliant log files in the specified directory are not modified after the configuration is applied, Logtail does not collect these files. If modification events are generated for log files, Logtail triggers the collection process and reads these files.

Read files

After Logtail detects that a log file has been updated, Logtail reads the log file.

- If Logtail reads the log file for the first time, it checks the file size.
 - If the file size is less than 1 MB, Logtail reads the file from the beginning.
 - If the file size is greater than 1 MB, Logtail reads the file from the last 1 MB of data.
- If Logtail has read the file before, Logtail reads the file from the last checkpoint.
- Logtail can read up to 512 KB of data at a time. Therefore, you must limit the log size to 512 KB.

 **Notice** If you have changed the system time on your server, you must manually restart Logtail. Otherwise, the log time is incorrect and logs are dropped.

Process logs

When Logtail reads a log, it divides the log into multiple lines, parses the log, and sets the time field of the log.

- Divide each log into multiple lines

If you specifies **Regex to Match First Line Only** in the Logtail configuration, the log data read by Logtail at one time is divided into multiple lines based on the specified beginning of the line. If the beginning of the line is not specified, each data block is processed as a log.

- Parse each log

Logtail parses each log based on the Logtail configuration, such as regular expressions, delimiters, and JSON.

 **Notice** A complicated regular expression may lead to high CPU usage. Therefore, we recommend that you use an efficient regular expression.

- Handle parsing failures

Logtail determines how to handle parsing failures based on whether the **Drop Failed to Parse Logs** switch is turned on in the Logtail configuration.

- If the **Drop Failed to Parse Logs** is turned on, Logtail drops the logs that fail to be parsed and reports an error.
- If the feature switch is turned off, Logtail uploads the logs that fail to be parsed. In these logs, the key is set to **raw_log** and the value is set to the log content.

- Set the time field of a log

- If the time field of the log is not specified, the log time is the current parsing time.
- If the time field of the log is specified, the following operations are performed:
 - The log time is extracted from the parsed log fields if the difference between the log time and the current time is less than 12 hours.
 - The log is dropped and an error is reported if the difference between the log time and the current time is greater than 12 hours.

Filter logs

After Logtail process logs, it filters the logs based on the filter configuration.

- If the **Filter Configuration** is not specified, Logtail does not filter logs and proceed with the next step.
- If the **Filter Configuration** is specified, Logtail traverses and verifies all the fields of each log.
 - Logtail collects a log if the log matches the filter configuration.
 - Logtail does not collect a log if the log does not match the filter configuration.

Aggregate logs

Logtail sends the logs that match the filter configuration to Log Service. To reduce the number of network requests, Logtail caches the processed and filtered logs for a period of time. Then, Logtail aggregates and packages these logs before sending them to Log Service.

If one of the following conditions is met during caching, logs are immediately packaged and sent to Log Service.

- The log aggregation period exceeds three seconds.
- The number of aggregated logs exceeds 4,096.
- The total size of aggregated logs exceeds 512 KB.

Send logs

Logtail sends the aggregated logs to Log Service. You can set the `max_bytes_per_sec` and `send_request_concurrency` parameters in [Set Logtail startup parameters](#) to adjust the log data sending rate and the maximum concurrent requests. In this case, Logtail ensures that the sending rate and the concurrent requests do not exceed the limits.

If the log data fails to be sent, Logtail retries or stops the operation based on the error message.

Error	Description	Handling method
401	Logtail is not authorized to collect data.	Logtail drops the log packets.
404	The specified project or Logstore does not exist in the Logtail configuration.	Logtail drops the log packets.
403	The shard quota is exhausted.	Logtail waits for three seconds and retries.
500	A Log Service exception has occurred.	Logtail waits for three seconds and retries.
Network timeout	A network connection error has occurred.	Logtail waits for three seconds and retries.

30.3.1.1.3. Logtail configuration files and record files

This topic describes the basic configuration files and record files of Logtail. When Logtail is active, it uses a series of configuration files and generates record files.

The basic configuration files are as follows:

- [Startup configuration file \(ilogtail_config.json\)](#)
- [Account ID configuration file](#)
- [User-defined identifier file \(user_defined_id\)](#)
- [Logtail configuration file \(user_log_config.json\)](#)

The basic record files are as follows:

- [AppInfo record file \(app_info.json\)](#)
- [Logtail operational log file \(ilogtail.LOG\)](#)
- [Logtail plug-in log file \(logtail_plugin.LOG\)](#)
- [Container path mapping file \(docker_path_config.json\)](#)

Startup configuration file (ilogtail_config.json)

This file is used to query or set Logtail runtime parameters. The file is in the JSON format.

After you install Logtail, you can use the startup configuration file to perform the following operations:

- Change the values of the Logtail runtime parameters.

You can change the CPU usage threshold, usage threshold of terminate and stay resident (TSR) programs, and other settings.

- Check whether the installation commands are correct.

The settings of `config_server_address` and `data_server_list` in this file depend on the parameters and installation commands selected when you installed Logtail. If the region specified in `config_server_address` is unreachable or is different from the region where Log Service resides, the selected parameters or commands are incorrect. In this case, Logtail cannot collect logs and must be reinstalled.

Warning

- The file must be a valid JSON file. Otherwise, Logtail cannot be started.
- If you modify the file, you must restart Logtail to validate your modifications.

The following table describes the default parameters in the startup configuration file. You can also add other parameters. For more information, see [Set Logtail startup parameters](#).

Default parameters

Parameter	Description
<code>config_server_address</code>	The address that Logtail uses to receive the configuration file from Log Service. This address depends on the parameters and installation commands that you selected when you installed Logtail. Ensure that the address is reachable and is in the same region as Log Service.
<code>data_server_list</code>	The data server address. This address depends on the parameters and installation commands that you selected when you installed Logtail. Ensure that the address is reachable and is in the same region as Log Service.
<code>cluster</code>	The name of the region where a server resides.
<code>endpoint</code>	The endpoint of Log Service. For more information, see View the information of a project .
<code>cpu_usage_limit</code>	The CPU usage threshold, which is calculated by core.
<code>mem_usage_limit</code>	The TSR usage threshold.
<code>max_bytes_per_sec</code>	The traffic limit on the raw data that is sent by Logtail. If the value of this parameter is greater than 20 Mbit/s, traffic limiting does not take effect.
<code>process_thread_count</code>	The number of threads that Logtail uses to write data to log files.
<code>send_request_concurrency</code>	The number of concurrent requests for sending data packets asynchronously. Logtail sends data packets asynchronously by default. If the write transactions per second (TPS) is high, you can set a greater value for this parameter.

- File path
 - Linux: The file is stored in `/usr/local/ilogtail/ilogtail_config.json`.

- **Container Service:** The file is stored in a Logtail container. The file path is specified in the environment variable `ALIYUN_LOGTAIL_CONFIG` of the Logtail container. You can run the command `docker inspect ${logtail_container_name} | grep ALIYUN_LOGTAIL_CONFIG` to query the file path. For example, the file path is `/etc/ilogtail/conf/cn-hangzhou/ilogtail_config.json`.
- **Windows:**
 - 64-bit: The file is stored in `C:\Program Files (x86)\Alibaba\Logtail\ilogtail_config.json`.
 - 32-bit: The file is stored in `C:\Program Files\Alibaba\Logtail\ilogtail_config.json`.
- **Sample file**

```
$cat /usr/local/ilogtail/ilogtail_config.json
{
  "config_server_address": "http://logtail.cn-hangzhou-intranet.log.aliyuncs.com",
  "data_server_list":
  [
    {
      "cluster": "ap-southeast-2",
      "endpoint": "cn-hangzhou-intranet.log.aliyuncs.com"
    }
  ],
  "cpu_usage_limit": 0.4,
  "mem_usage_limit": 100,
  "max_bytes_per_sec": 2097152,
  "process_thread_count": 1,
  "send_request_concurrency": 4,
  "streamlog_open": false
}
```

Account ID configuration file

This file contains the ID of your Apsara Stack tenant account. The file indicates that the account can collect logs from the server where Logtail is installed. If you want to collect logs from ECS instances that do not belong to your account or from on-premises data centers, you must create an account ID configuration file.

Note

- The file is used only when you collect logs from ECS instances that do not belong to your account and or from on-premises data centers.
- The file can contain only the ID of your Apsara Stack tenant account. It cannot contain the IDs of RAM users under your Apsara Stack tenant account.
- The file name cannot contain a suffix.
- Each Logtail can have multiple account ID configuration files. Each Logtail container can have only one account ID configuration file.

● File path

- **Linux:** The file is stored in `/etc/ilogtail/users/`.
- **Container Service:** The file is stored in a Logtail container. The file path is specified in the environment variable `ALIYUN_LOGTAIL_USER_ID` of the Logtail container. You can run the command `docker inspect ${logtail_container_name} | grep ALIYUN_LOGTAIL_USER_ID` to query the file path.
- **Windows:** The file is stored in `C:\LogtailData\users\`.

- Sample file

```
$ls /etc/ilogtail/users/  
*****
```

User-defined identifier file (user_defined_id)

This file is used to configure machine groups with user-defined identifiers. For more information, see [Create a machine group based on a custom ID](#).

 Note

- This file is used only when you configure a machine group with user-defined identifiers.
- If you configure multiple user-defined identifiers for a machine group, separate them with line breaks.

- File path

- Linux: The file is stored in `/etc/ilogtail/user_defined_id`.
- Container Service: The file is stored in a Logtail container. The file path is specified in the environment variable `ALIYUN_LOGTAIL_USER_DEFINED_ID` of the Logtail container. You can run the command `docker inspect $(logtail_container_name) | grep ALIYUN_LOGTAIL_USER_DEFINED_ID` to query the file path.
- Windows: The file is stored in `C:\LogtailData\user_defined_id`.

- Sample file

```
$cat /etc/ilogtail/user_defined_id  
aliyun-ecs-rs1e16355
```

Logtail configuration file (user_log_config.json)

This file contains the Logtail configuration that Logtail receives from Log Service. The file is in the JSON format and is updated along with configuration updates. You can use this file to check whether the Logtail configuration is delivered to the server where Logtail is installed. If the Logtail configuration file exists and all contents in the file are up to date, the Logtail configuration is delivered.

 Notice

- We recommend that you do not modify the Logtail configuration file unless you need to specify sensitive information, such as the AccessKey pair and database password.
- You must upload this file when you submit a ticket.

- File path

- Linux: The file is stored in `/usr/local/ilogtail/user_log_config.json`.
- Container Service: The file is stored in `/usr/local/ilogtail/user_log_config.json`.
- Windows
 - 64-bit: The file is stored in `C:\Program Files (x86)\Alibaba\Logtail\user_log_config.json`.
 - 32-bit: The file is stored in `C:\Program Files\Alibaba\Logtail\user_log_config.json`.

- Sample file

```
$cat /usr/local/ilogtail/user_log_config.json  
{  
  "metrics": {  
    "##1.0##k8s-log-c12ba2028****939f0b$app-java": {

```

AppInfo record file (app_info.json)

This file contains the startup time of Logtail. It also contains the IP address and hostname that Logtail obtains. You must check the IP address obtained by Logtail when you configure an [IP address-based machine group](#).

In most cases, Logtail obtains server IP addresses based on the following rules:

- If the IP address of a server is associated with its hostname in the `/etc/hosts` server file, Logtail obtains the IP address.
- If the IP address of a server is not associated with its hostname, Logtail obtains the IP address of the first network interface card (NIC) on the server.

 Note

- The AppInfo record file contains only the basic Logtail information, which cannot be manually modified.
- If you modify the hostname or other network settings of the server, you must restart Logtail to obtain a new IP address.

Parameters

Parameter	Description
UUID	The serial number of the server.
hostname	The hostname.
instance_id	The unique identifier of Logtail. This identifier is randomly generated.
ip	<p>The IP address that is obtained by Logtail. If this parameter is not specified, Logtail has not obtained the IP address of a server. In this case, Logtail cannot function properly. You must set an IP address for your server and restart Logtail.</p> <div data-bbox="612 1064 1390 1249" style="background-color: #e1f5fe; padding: 5px;"> <p> Note If the machine group is an IP address-based machine group, ensure that the IP address specified for the machine group is the same as the value of this parameter. If the two IP address are different, modify the IP address that you specified for the machine group in the Log Service console. Check the IP addresses again after 1 minute.</p> </div>
logtail_version	The version of Logtail.
os	The version of the operating system.
update_time	The last startup time of Logtail.

- File path
 - Linux: The file is stored in `/usr/local/ilogtail/app_info.json`.
 - Container Service: The file is stored in `/usr/local/ilogtail/app_info.json`.
 - Windows
 - 64-bit: The file is stored in `C:\Program Files (x86)\Alibaba\Logtail\app_info.json`.
 - 32-bit: The file is stored in `C:\Program Files\Alibaba\Logtail\app_info.json`.
- Sample file

```
$cat /usr/local/ilogtail/app_info.json
{
  "UUID" : "",
  "hostname" : "logtail-ds-slpn8",
  "instance_id" : "E5F93BC6-B024-11E8-8831-0A58AC14039E_1**. ***. ***. ***_1536053315",
  "ip" : "1**. ***. ***. **",
  "logtail_version" : "0.16.13",
  "os" : "Linux; 3.10.0-693.2.2.el7.x86_64; #1 SMP Tue Sep 12 22:26:13 UTC 2017; x86_64",
  "update_time" : "2018-09-04 09:28:36"
}
```

Logtail operational log file (ilogtail.LOG)

This file contains operational information about Logtail. Log severity levels are ranked as follows in ascending order: `INFO` , `WARN` , `ERROR` . Logs of the `INFO` level can be ignored.

- File path
 - For Linux: The file is stored in `/usr/local/ilogtail/ilogtail.LOG`.
 - Container Service: The file is stored in `/usr/local/ilogtail/ilogtail.LOG`.
 - Windows
 - 64-bit: The file is stored in `C:\Program Files (x86)\Alibaba\Logtail\logtail_*.log`.
 - 32-bit: The file is stored in `C:\Program Files\Alibaba\Logtail\logtail_*.log`.
- Sample file

```
$tail /usr/local/ilogtail/ilogtail.LOG
[2018-09-13 01:13:59.024679] [INFO] [3155] [build/release64/sls/ilogtail/elogtail.cpp:123] change working dir:/usr/local/ilogtail/
[2018-09-13 01:13:59.025443] [INFO] [3155] [build/release64/sls/ilogtail/AppConfig.cpp:175] load logtail config file, path:/etc/ilogtail/conf/ap-southeast-2/ilogtail_config.json
[2018-09-13 01:13:59.025460] [INFO] [3155] [build/release64/sls/ilogtail/AppConfig.cpp:176] load logtail config file, detail:{
  "config_server_address" : "http://logtail.ap-southeast-2-intranet.log.aliyuncs.com",
  "data_server_list" : [
    {
      "cluster" : "ap-southeast-2",
      "endpoint" : "ap-southeast-2-intranet.log.aliyuncs.com"
    }
  ]
}
```

Logtail plug-in log file (logtail_plugin.LOG)

This file contains operational information about plug-ins, such as `stdout`, `binlog`, and `HTTP` plug-ins. Log severity levels are ranked as follows in ascending order: `INFO` , `WARN` , `ERROR` . Logs of the `INFO` level can be ignored.

- File path
 - Linux: The file is stored in `/usr/local/ilogtail/logtail_plugin.LOG`
 - Container Service: The file is stored in `/usr/local/ilogtail/logtail_plugin.LOG`.
 - Windows: The file is not supported.
- Sample file

```

$tail /usr/local/ilogtail/logtail_plugin.LOG

```

Container path mapping file (docker_path_config.json)

This file is automatically created only when container files are collected. It records path mappings between container files and actual files. The file is in the JSON format.

 **Note** This file is only an information record file. Modifications to this file do not take effect. If you delete this file, another one is automatically created without service interruptions.

- **File path**
The file is stored in `/usr/local/ilogtail/docker_path_config.json`.
- **Sample file**

```
$cat /usr/local/ilogtail/docker_path_config.json
{
  "detail": [
    {
      "config_name": "##1.0##k8s-log-c12ba2028cfb444238cd9ac1286939f0b$nginx",
      "container_id": "df19c06e854a0725ea7fca7e0378b0450f7bd3122f94fe3e754d8483fd330d10",
      "params": "{\n  \"ID\": \"df19c06e854a0725ea7fca7e0378b0450f7bd3122f94fe3e754d8483fd330d10\",\n  \"Path\n\": \"/logtail_host/var/lib/docker/overlay2/947db346695a1f65e63e582ecfd10ae1f57019a1b99260b6c83d00fcd1892874\n/diff/var/log\",\n  \"Tags\": [\n    \"nginx-type\",\n    \"access-log\",\n    \"_image_name_\",\n    \"registry.cn-h\nangzhou.aliyuncs.com/log-service/docker-log-test:latest\",\n    \"_container_name_\",\n    \"nginx-log-demo\",\n    \"_pod_name_\",\n    \"nginx-log-demo-h2lzc\",\n    \"_namespace_\",\n    \"default\",\n    \"_pod_uid_\",\n    \"8\n7e56ac3-b65b-11e8-b172-00163f008685\",\n    \"_container_ip_\",\n    \"172.20.4.224\",\n    \"purpose\",\n    \"test\n\"\n ]\n}\n"
    }
  ],
  "version": "0.1.0"
}
```

30.3.1.2. Installation

30.3.1.2.1. Install Logtail in Linux

This topic describes how to install Logtail on a Linux server.

Supported systems

Logtail supports the following x86-64 (64-bit) Linux operating systems:

- Aliyun Linux
- Ubuntu
- Debian
- CentOS
- openSUSE
- Red Hat

Procedure

Note If you have installed Logtail, the installer will uninstall the existing version of Logtail, delete the `/usr/local/ilogtail` directory, and then reinstall Logtail. By default, Logtail runs after the installation and at startup.

1. Run the following command to download the Logtail installer:

```
wget http://${service:sls-backend-server:sls_data.endpoint}/logtail.sh -O logtail.sh; chmod 755 logtail.sh
```

Note You must replace `${service:sls-backend-server:sls_data.endpoint}` in the command with the actual endpoint. For more information about endpoints, see [View the information of a project](#).

2. Run the installation command. Start Linux PowerShell and run the following command as an administrator to install Logtail:

```
./logtail.sh install
```

Note If you have installed Logtail, the installer will uninstall the existing version of Logtail, delete the `/usr/local/ilogtail` directory, and then reinstall Logtail.

3. Configure an account ID for a server.

View the version of Logtail

To view the version of Logtail, open the file in the `/usr/local/ilogtail/app_info.json` directory. The `logtail_version` field shows the version of Logtail.

```
$cat /usr/local/ilogtail/app_info.json
{
  "UUID" : "ODF18E97-0F2D-486F-B77F-*****",
  "hostname" : "david*****",
  "instance_id" : "F4FAFADA-F1D7-11E7-846C-00163E30349E_*****_1515129548",
  "ip" : "*****",
  "logtail_version" : "0.16.0",
  "os" : "Linux; 2.6.32-220.23.2.ali1113.el5.x86_64; #1 SMP Thu Jul 4 20:09:15 CST 2013; x86_64",
  "update_time" : "2018-01-05 13:19:08"
}
```

Upgrade Logtail

You can use the Logtail installer (`logtail.sh`) to upgrade Logtail. The installer selects an upgrade method based on the configurations of the existing Logtail.

Note During the upgrade, Logtail is temporarily stopped. Only related files are overwritten. The configuration file, checkpoint file, and logs are retained.

Run the following commands to upgrade Logtail:

```
# Download the Logtail installer.
wget http://${service:sls-backend-server:sls_data.endpoint}/logtail.sh -O logtail.sh; chmod 755 logtail.sh
# Upgrade Logtail.
sudo ./logtail.sh upgrade
```

Response:

```
# The upgrade is successful.
Stop logtail successfully.
ilogtail is running
Upgrade logtail success
{
  "UUID" : "****",
  "hostname" : "****",
  "instance_id" : "****",
  "ip" : "****",
  "logtail_version" : "0.16.11",
  "os" : "Linux; 3.10.0-693.2.2.el7.x86_64; #1 SMP Tue Sep 12 22:26:13 UTC 2017; x86_64",
  "update_time" : "2018-08-29 15:01:36"
}
# The upgrade fails because the current version is the latest version.
[Error]: Already up to date.
```

Start and stop Logtail

- Start Logtail

Run the following command as an administrator:

```
/etc/init.d/ilogtailed start
```

- Stop Logtail

Run the following command as an administrator:

```
/etc/init.d/ilogtailed stop
```

Uninstall Logtail

Run Linux PowerShell as an administrator to download *logtail_installer* and uninstall Logtail:

```
wget http://${service:sls-backend-server:sls_data.endpoint}/logtail.sh -O logtail.sh
chmod 755 logtail.sh
./logtail.sh uninstall
```

30.3.1.2.2. Install Logtail in Windows

This topic describes how to install Logtail on a Windows server.

Supported systems

Logtail supports the following Windows operating systems:

- Windows 7 (Client) 32-bit
- Windows 7 (Client) 64-bit
- Windows Server 2008 32-bit
- Windows Server 2008 64-bit
- Windows Server 2012 64-bit
- Windows Server 2016 64-bit

Procedure

1. Download the installation package. Run the following command to download the installation package:

```
wget http://${service:sls-backend-server:sls_data.endpoint}/windows/logtail_installer.zip
```

Note You must replace `${service:sls-backend-server:sls_data.endpoint}` in the command with the actual endpoint. For more information about endpoints, see [View the information of a project](#).

2. Decompress the `logtail_installer.zip` package to the current directory.
3. Run the installation command. Run Windows PowerShell or Command Prompt as an administrator. Enter the `logtail_installer` directory, and then run the installation command based on the network type.

```
.\logtail_installer.exe install me-east-1
```

Note You must replace `${region}` in the command with the actual endpoint. For more information about endpoints, see [View the information of a project](#).

4. [Configure an account ID for a server](#).

Installation directory

After you run the installation command, Logtail is installed in the specified directory. The directory cannot be changed. In the directory, you can [View the version of Logtail](#) in the `app_info.json` file or [Uninstall Logtail](#).

The installation directory is as follows:

- 32-bit Windows: `C:\Program Files\Alibaba\Logtail`
- 64-bit Windows: `C:\Program Files (x86)\Alibaba\Logtail`

Note You can run 32-bit or 64-bit applications in a 64-bit Windows operating system. However, the operating system stores 32-bit applications in separate x86 folders to ensure compatibility.

Logtail for Windows is a 32-bit application. Therefore, it is installed in the `Program Files (x86)` folder in 64-bit Windows. If Logtail for 64-bit Windows becomes available in the future, it will be installed in the `Program Files` folder.

View the version of Logtail

To view the version of Logtail, go to the [default installation directory](#), and then use the notepad or another text editor to open the `app_info.json` file. The `logtail_version` field shows the version of Logtail.

In the following example, the version of Logtail is 1.0.0.0:

```
{
  "logtail_version" : "1.0.0.0"
}
```

Upgrade Logtail

- Automatic upgrade
Logtail later than 1.0.0.0 is automatically upgraded in Windows.
- Manual upgrade
Logtail earlier than 1.0.0.0 must be manually upgraded. The manual upgrade procedure is the same as the [installation procedure](#).

 **Note** During a manual upgrade, the files in the original installation directory are deleted. We recommend that you back up the files before you perform a manual upgrade.

Start and stop Logtail

Open the **Control Panel**, choose **System and Security > Administrative Tools**, and then double-click **Services**.

Find the service based on your Logtail version.

- Logtail 0.x.x.x: LogtailWorker.
- Logtail 1.0.0.0 and later: LogtailDaemon.

Perform the following operations as required:

- **Start Logtail**

Right-click the service and select **Start** from the shortcut menu.

- **Stop Logtail**

Right-click the service and select **Stop** from the shortcut menu.

- **Restart Logtail**

Right-click the service and select **Restart** from the shortcut menu.

Uninstall Logtail

Run Windows PowerShell or Command Prompt as an administrator. Enter the `logtail_installer` directory, and then run the following command:

```
.\logtail_installer.exe uninstall
```

After Logtail is uninstalled, the **installation directory** is deleted. However, some residual configuration data is still maintained in the `C:\LogtailData` directory. You can manually delete the data. The residual configuration data includes the following information:

- *checkpoint*: checkpoints of all plug-ins, for example, the Windows event log plug-in.
- *logtail_check_point*: checkpoints of Logtail.
- *users*: IDs of Apsara Stack tenant accounts.

30.3.1.2.3. Set Logtail startup parameters

This topic describes how to set Logtail startup parameters.

Context

You may need to set Logtail startup parameters in the following scenarios:

- You need to collect a large number of log files that consume much memory. You want to maintain the metadata (such as the file signature, collection location, and file name) of each file in the memory.
- The CPU usage is high due to heavy log data traffic.
- The traffic sent to Log Service is heavy due to a large amount of log data.
- You want to collect syslogs or TCP data streams.

Startup configurations

- **File path**

```
/usr/local/ilogtail/ilogtail_config.json
```

- **File format**

JSON

- Sample file (only partial configurations are provided)

```

{
  ...
  "cpu_usage_limit" : 0.4,
  "mem_usage_limit" : 100,
  "max_bytes_per_sec" : 2097152,
  "process_thread_count" : 1,
  "send_request_concurrency" : 4,
  "streamlog_open" : false,
  "streamlog_pool_size_in_mb" : 50,
  "streamlog_rcv_size_each_call" : 1024,
  "streamlog_formats":[],
  "streamlog_tcp_port" : 11111,
  "buffer_file_num" : 25,
  "buffer_file_size" : 20971520,
  "buffer_file_path" : "",
  ...
}
    
```

Startup parameters

Parameter	Description	Example
cpu_usage_limit	The CPU usage threshold for a single core. Data type: double.	For example, the value 0.4 indicates that the CPU usage of Logtail is limited to 40% processing capacity of a single core. In most cases, the processing capacity of a single core is about 24 MB/s in the simple mode and 12 MB/s in the full regex mode.
mem_usage_limit	The usage threshold of the resident memory. Data type: integer. Unit: MB.	For example, the value 100 indicates that the memory usage of Logtail is limited to 100 MB. If the threshold is exceeded, Logtail restarts. If you want to collect more than 1,000 log files, you can increase the threshold value.
max_bytes_per_sec	The traffic limit on the raw data that is sent by Logtail. Data type: integer. Unit: bytes/s.	For example, the value 2097152 indicates that the data transfer rate of Logtail is limited to 2 MB/s.
process_thread_count	The number of threads that Logtail uses to process data.	Default value: 1. Each thread provides a write speed of 24 MB/s in the simple mode and 12 MB/s in the full regex mode. We recommend that you do not modify the default value.
send_request_concurrency	Logtail sends data packets asynchronously by default. If the write transactions per second (TPS) is high, you can set this parameter to a greater value.	Twenty asynchronous concurrencies are provided by default. Each concurrency can provide 0.5 MB/s to 1 MB/s network throughput. The number of concurrencies varies with the network delay.
streamlog_open	Specifies whether to receive syslogs. Data type: Boolean.	The value false indicates that syslogs are not received. The value true indicates that syslogs are received.

Parameter	Description	Example
streamlog_pool_size_in_mb	The size of memory pool that the syslog server uses to cache syslogs. Unit: MB.	Logtail requests memory when it starts. Set the memory pool size based on the server memory size and your business requirements.
streamlog_rcv_size_each_call	The size of the buffer that Logtail uses when the linux socket rcv API is called. Unit: bytes. Valid values: 1024 to 8192.	You can set a greater value if the syslog traffic is high.
streamlog_formats	The method that is used to parse received syslogs.	N/A
streamlog_tcp_addr	The associated address that Logtail uses to receive syslogs. Default value: 0.0.0.0.	N/A
streamlog_tcp_port	The TCP port that Logtail uses to receive syslogs.	Default value: 11111.
buffer_file_num	The maximum number of cached files. If a network exception occurs or the writing quota is exceeded, Logtail writes parsed logs to local files in the installation directory. After the network recovers or a new writing quota is available, Logtail retries to send the logs to Log Service.	Default value: 25.
buffer_file_size	The maximum number of bytes that can be contained in each cache file. The maximum disk space available for cache files is the value of <code>buffer_file_num</code> multiplied by the value of <code>buffer_file_size</code> .	Default value: 20971520 bytes (20 MB).
buffer_file_path	The directory in which cached files are stored. If you modify this parameter, you must move the files (for example, <code>logtail_buffer_file_*</code>) in the old cache directory to the new directory. Then, Logtail can read, send, and delete the cache files.	The default value is null, which indicates that the cached files are stored in the Logtail installation directory <code>/usr/local/ilogtail</code> .
bind_interface	The name of the NIC associated with the local machine, for example, <code>eth1</code> . This parameter is valid only for Logtail that runs in Linux.	By default, the available NICs are automatically associated with the local machine. If you specify this parameter, Logtail will use the specified NIC to upload logs.

Parameter	Description	Example
check_point_filename	The full path in which the checkpoint file is stored. This parameter is used to customize the path to store the checkpoint file of Logtail.	Default value: <code>/tmp/logtail_checkpoint</code> . We recommend that Docker users modify this path and mount the directory where the checkpoint file resides to the host. Otherwise, duplicate collection occurs due to checkpoint data loss when the container is released. For example, you can set <code>check_point_filename</code> to <code>/data/logtail/check_point.dat</code> in Docker and add <code>-v /data/docker1/logtail:/data/logtail</code> to the Docker startup command. Then, the <code>/data/docker1/logtail</code> directory of the host is mounted to the <code>/data/logtail</code> directory of Docker.

 Note

- The preceding table lists only the common startup parameters. If the `ilogtail_config.json` file contains parameters that are not listed in the table, the default settings are used for these parameters.
- We recommend that you do not add unnecessary parameters to the `ilogtail_config.json` file.

Modify configurations

1. Configure the `ilogtail_config.json` file as needed.
Ensure that the modified configurations are in the valid JSON format.
2. Restart Logtail to apply the modified configurations.

```
/etc/init.d/ilogtaild stop
/etc/init.d/ilogtaild start
/etc/init.d/ilogtaild status
```

30.3.1.3. Logtail machine group

30.3.1.3.1. Overview

Log Service uses server groups to manage the servers from which you want to collect logs by using Logtail.

A server group is a virtual group that contains multiple servers. If you want to use the same Logtail configuration to collect logs from multiple servers, you can add the servers to a server group and apply the Logtail configuration to the server group.

To define a server group, you can use either of the following methods:

- **IP address:** Add the IP addresses of servers to a server group. Each server in the server group can be identified by using its unique IP address.
- **Custom ID-based server groups:** Customize an identifier for a server group and use the identifier for the servers in the server group.

 Note Windows and Linux servers cannot be added to the same server group.

IP address-based server groups

You can add multiple servers to a server group by adding their IP addresses to the server group. Then, you can create a Logtail configuration for all the servers at the same time.

- If you use ECS instances and have not associated them with hostnames or changed their network types, you can add the private IP addresses of the instances to the server group.

- In other cases, you must add the server IP addresses obtained by Logtail to a server group. The IP address of each server is recorded in the IP address field of the `app_info.json` file on the server.

 **Note** The `app_info.json` file records the internal information of Logtail. This file includes the server IP addresses obtained by Logtail. If you modify the IP address field of the file, the IP addresses obtained by Logtail remain unchanged.

Logtail obtains a server IP address by using the following methods:

- If the IP address of a server is associated with the hostname in the `/etc/hosts` file of the server, Logtail obtains this IP address.
- If the IP address of a server is not associated with the hostname, Logtail obtains the IP address of the first network interface controller (NIC) on the server.

For more information, see [Create an IP address-based server group](#).

Custom ID-based server groups

You can use custom IDs to dynamically define server groups.

An application system consists of multiple modules. You can scale out each module by adding multiple servers to the module. If you want to collect logs by module, you can create a server group for each module. Therefore, you must specify a custom ID for each server in each module. For example, a website consists of an HTTP request processing module, a caching module, a logic processing module, and a storage module. The custom IDs of these modules can be `http_module`, `cache_module`, `logic_module`, and `store_module`.

For more information, see [Create a machine group based on a custom ID](#).

30.3.1.3.2. Create a machine group based on a server IP address

This topic describes how to create a machine group based on a server IP address. You can create a machine group based on a server IP address that is obtained by using a Logtail configuration file. You can then use the same Logtail configuration file to collect logs from the machine group.

Prerequisites

- A project is created. A Logstore is created in the project.
- One or more servers are available. The IP addresses of the servers are obtained.
- Logtail is installed on the servers. For more information, see [Install Logtail in Linux](#) or [Install Logtail in Windows](#).
- The ID of your Apsara Stack tenant account is configured on the server. For more information, see [Configure an account ID for a server](#).

Procedure

1. [Log on to the Log Service console](#).
2. In the **Projects** section, click the name of a project.
3. In the left-side navigation pane, click the **Machine Groups** icon.
4. In the pane that appears, click the  icon next to **Machine Group** and select **Create Machine Group** from the shortcut menu. You can also create a machine group in the Logtail configuration wizard.
5. Create a machine group.
 - i. Enter a machine group name in the `name` field. The machine group name must be 3 to 128 characters in length and can contain lowercase letters, digits, hyphens (-), and underscores (_). It must start and end with a lowercase letter or digit.

 **Notice** After the machine group is created, its name cannot be modified.

- ii. Select **IP Addresses** from the **Identifier** drop-down list.

- iii. Enter a topic name in the **Topic** field. For more information about topics, see [Generate a topic](#).
- iv. Enter the IP addresses of the servers in the **IP Addresses** text box.

 Notice

- Separate each IP address with a line break.
- Do not add Windows servers and Linux servers to the same machine group.

6. Click **OK**.

Result

You can view the created machine group in the **Machine Groups** pane.

30.3.1.3.3. Create a machine group based on a custom ID

This topic describes how to create a machine group based on a custom ID.

Context

You can use a custom ID to identify a machine group in the following scenarios:

- Servers reside in multiple custom network environments such as virtual private clouds (VPCs). IP addresses of different servers may be the same. In this scenario, Log Service cannot distinguish between servers based on IP addresses.
- You want to implement automatic server discovery. To do this, you only need to set a custom ID of a new server to the custom ID of an existing machine group. Log Service automatically identifies the server and adds it to the machine group.

Procedure

1. Set a custom ID on a server.

○ **Linux Logtail**

Set a custom ID in the `/etc/ilogtail/user_defined_id` file.

For example, if you need to set a custom ID of a server to `userdefined`, run the following command to open the file:

```
# vim /etc/ilogtail/user_defined_id
```

In the file, enter `userdefined`.

○ **Windows Logtail**

Set a custom ID in the `C:\LogtailData\user_defined_id` file.

For example, if you need to set a custom ID of a server, run the following command:

```
C:\LogtailData>more user_defined_id  
userdefined_windows
```

Notice

- A machine group cannot include both Linux and Windows servers. Therefore, do not set a custom ID of a Linux server and a custom ID of a Windows server to the same value.
- You can set multiple custom IDs for a single server. Separate each custom ID with a line break.
- If the `/etc/ilogtail/` or `C:\LogtailData` directory or the `/etc/ilogtail/user_defined_id` or `C:\LogtailData\user_defined_id` file does not exist, create the directory or the file.

2. Create a machine group.

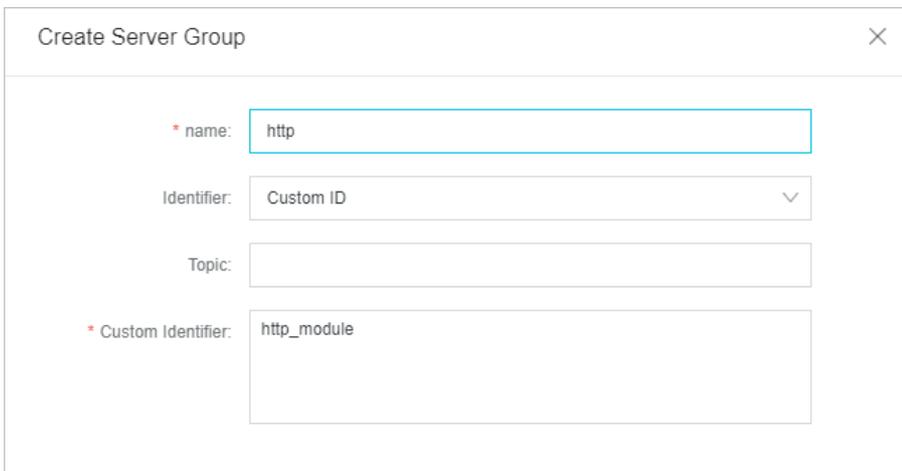

- Log on to the Log Service console.**
- In the **Projects** section, click a project.
- In the left-side navigation pane, click the **Machine Groups** icon.
- Click the  icon next to **Machine Groups**, and select **Create Machine Group** from the shortcut menu.
- Set the parameters of the machine group.

- **name:** Enter a machine group name.

The machine group name must be 3 to 128 characters in length and can contain lowercase letters, digits, hyphens (-), and underscores (_). It must start and end with a lowercase letter or digit.

 **Note** After the machine group is created, its name cannot be modified.

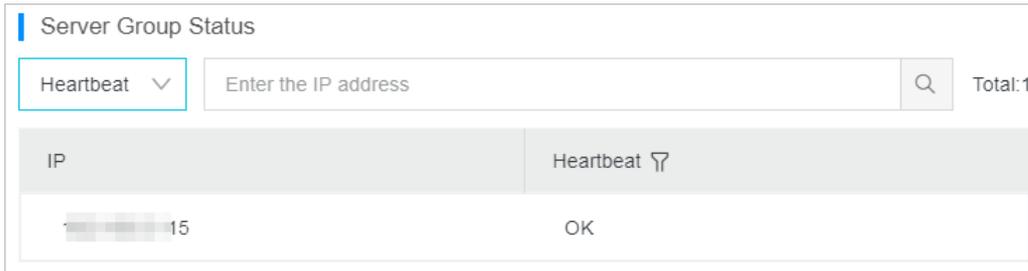

- **Identifier:** Select **Custom ID**.
- **Topic:** Enter a topic name for the machine group. For more information, see [Generate a topic](#).
- **Custom Identifier:** Enter the custom ID that you set in Step 1.

- Click **OK**.

 **Note** If you need to add a server to the machine group, set a custom ID of the server to the custom ID of the machine group. The server is then listed in the **Machine Group Status** section.

- View the status of the machine group.** In the **Machine Groups** pane, click the name of the machine group. On the **Machine Group Settings** page, view the status of the machine group. You can view the IP address list of the servers in the machine group and their heartbeat status.

Note

- The **Machine Group Status** section lists the IP addresses of the servers whose custom ID is the same as the custom ID that you set for the machine group.
For example, the custom ID of a machine group is `userdefined` and the IP addresses in the **Machine Group Status** section are `10.10.10.10`, `10.10.10.11`, and `10.10.10.12`. This means that the custom ID `userdefined` is set for the three servers. If you need to add the server whose IP address is `10.10.10.13` to the machine group, set the custom ID `userdefined` for the server. Then, the IP address of the server is displayed in the **Machine Group Status** section. Log Service collects logs from the server based on the Logtail configuration file of the machine group.
- The heartbeat status indicates whether the connection between a server and Log Service is normal. For information about how to troubleshoot heartbeat errors, see [What can I do if no heartbeat packet is received from a Logtail client?](#)

Delete the custom IDs of a server

If you need to change the ID of a server from a custom ID to the server IP address, delete the `user_defined_id` file. The change takes effect within 1 minute.

- In Linux, run the following command to delete the file:

```
rm -f /etc/ilogtail/user_defined_id
```

- In Windows, run the following command to delete the file:

```
del C:\LogtailData\user_defined_id
```

Time required for a change to take effect

After you create, edit, or delete a `user_defined_id` file, the change takes effect within 1 minute.

If you need the change to take immediate effect, restart Logtail.

- In Linux, run the following commands to restart Logtail:

```
/etc/init.d/ilogtaild stop
/etc/init.d/ilogtaild start
```

- In Windows, perform the following steps to restart Logtail:

Open the Control Panel. In the window that appears, choose **Control Panel > Administrative Tools > Services**. Right-click **LogtailWorker**, and select **Restart** from the shortcut menu.

Example

An application consists of multiple modules. Each module runs on multiple servers. For example, a website consists of an HTTP request processor, a cache, a logic processor, and a storage. You may scale out each module by adding multiple servers. You need to collect logs from both the existing and new servers.

1. Set a custom ID for each server. Install Logtail on the servers and set a custom ID for each server. In this example, you can use four custom IDs: `http_module`, `cache_module`, `logic_module`, and `store_module`. Each custom ID corresponds to a module.

2. Create a machine group for each module. When you create a machine group for a module, enter the custom ID of the module in the Custom Identifier field.

The screenshot shows a 'Create Server Group' dialog box with the following fields:

- * name:** http
- Identifier:** Custom ID
- Topic:** (empty)
- * Custom Identifier:** http_module

3. View the status of the machine group. On the Machine Group Settings page of the machine group, you can view the status of the machine group in the Machine Group Status section. You can view the list of servers in the machine group and their heartbeat status.
4. If you need to add a server whose IP address is 10.1.1.3 to the machine group whose custom ID is http_module, set the custom ID http_module for the server. Then, you can view the server in the Machine Group Status section.

IP	Heartbeat
[blurred]	OK
10.1.1.3	OK

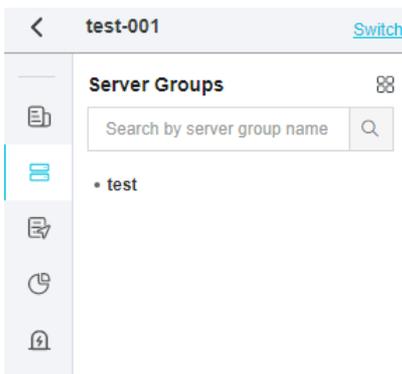

Search bar: IP [dropdown] Enter the IP address [input] [search icon] Total: 2

30.3.1.3.4. View server groups

This topic describes how to view the server groups of a project on the Server Groups page in the Log Service console.

Procedure

1. Log on to the Log Service console.
2. Find the target project in the project list and click the project name.
3. In the left-side navigation pane of the page that appears, click the Server Groups icon to display the list of server groups. You can view all server groups of the project.

30.3.1.3.5. Modify a server group

This topic describes how to modify a server group in the Log Service console. After you create a server group, you can modify the parameters of the server group.

Procedure

1. [Log on to the Log Service console](#).
2. Find the target project in the project list and click the project name.
3. In the left-side navigation pane of the page that appears, click the **Server Groups** icon to display the list of server groups.
4. Click the name of the server group to be modified. On the **Server Group Settings** page, click **Modify**.

 **Note** The name of the server group cannot be modified.

5. Modify the parameters of the server group, and then click **Save**.

30.3.1.3.6. View the status of a server group

This topic describes how to view the status of a server group in the Log Service console. You can view the heartbeat information of Logtail to check whether Logtail is installed on the servers in a server group.

Procedure

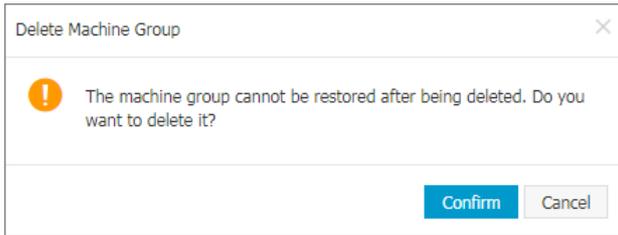

1. [Log on to the Log Service console](#).
2. Find the target project in the project list and click the project name.
3. In the left-side navigation pane of the page that appears, click the **Server Groups** icon to display the list of server groups.
4. Click the name of the server group. On the **Server Group Settings** page, check the server group status.
 - If the heartbeat is OK, Logtail is installed on the servers in the server group and Logtail is connected to Log Service.
 - If the heartbeat status is FAIL, Logtail fails to connect to Log Service. If the FAIL state persists, perform troubleshooting based on the instructions provided in [What can I do if no heartbeat packet is received from a Logtail client?](#)

30.3.1.3.7. Delete a server group

This topic describes how to delete a server group in the Log Service console. You can delete a server group if you no longer need to collect logs from the server group.

Procedure

1. [Log on to the Log Service console](#).
2. Find the target project in the project list and click the project name.
3. In the left-side navigation pane of the page that appears, click the **Server Groups** icon to display the list of server groups.
4. Find the server group that you want to delete, click the  icon next to the server group, and then select **Delete**.
5. In the dialog box that appears, click **OK**.

30.3.1.3.8. Manage server group configurations

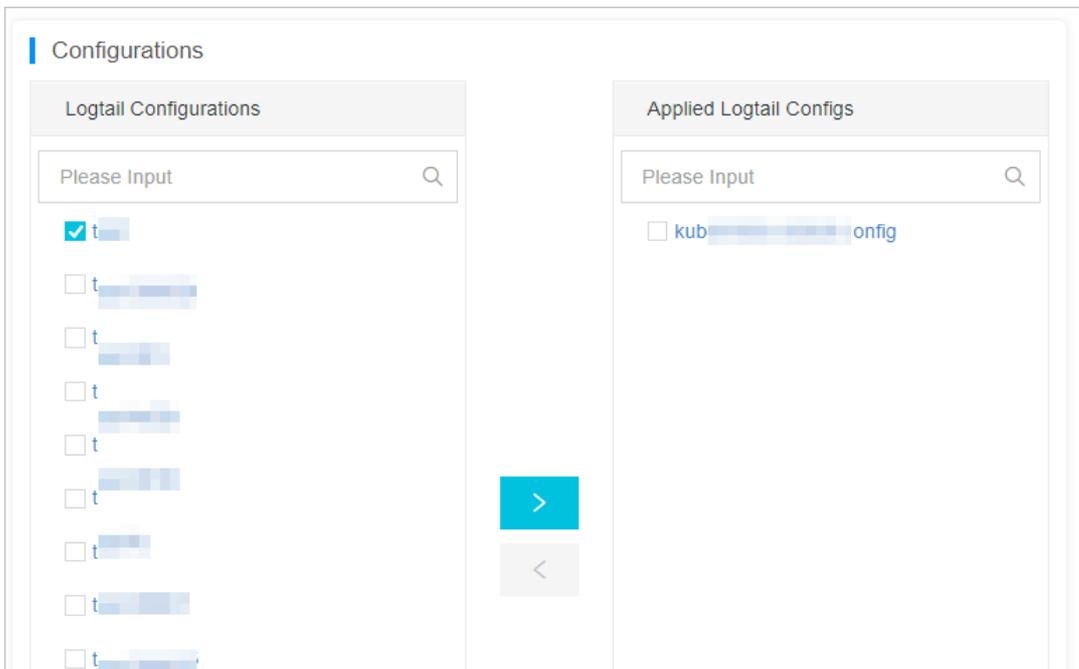

This topic describes how to manage server group configurations in the Log Service console. Log Service uses server groups to manage the servers from which you collect logs by using Logtail. In the Log Service console, you can create, view, modify, and delete server groups. You can also view the status of server groups, manage server group configurations, and apply server group identifiers.

Context

Log Service allows you to manage the Logtail configurations that you create for Logtail installed on the servers in a server group. You can apply Logtail configurations to a server group. The Logtail configurations determine what logs are collected on each server, how the logs are parsed, and which Logstore the logs are written to.

Procedure

1. [Log on to the Log Service console](#).
2. Find the target project in the project list and click the project name.
3. In the left-side navigation pane of the page that appears, click the **Server Groups** icon to display the list of server groups.
4. Click the name of the server group whose configurations you want to modify. On the **Server Group Settings** page, click **Modify**.
5. In the **Configurations** section, modify the Logtail configuration that you want to apply to the server group and click **Save**. After a Logtail configuration is added, it is delivered to Logtail on each server in the server group. After a Logtail configuration is removed, it is removed from Logtail.

30.3.1.3.9. Manage a Logtail configuration

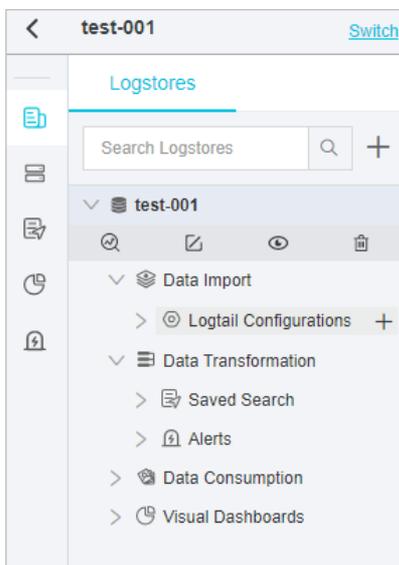

This topic describes how to manage a Logtail configuration in the Log Service console. Before you can collect logs from a server, you must install Logtail on the server. After you install Logtail, you must create a Logtail configuration in the Log Service console and apply the Logtail configuration to the server. You can create and modify Logtail configurations in Logstores.

Create a Logtail configuration

For information about how to create a Logtail configuration in the Log Service console, see [Configure text log collection](#).

View Logtail configurations

1. [Log on to the Log Service console](#).
2. Find the target project in the project list and click the project name.
3. In the left-side navigation pane, click the closing angle bracket (>) next to the target Logstore and choose **Data Import > Logtail Configurations**. Each item under **Logtail Configurations** indicates a Logtail configuration.

Modify a Logtail configuration

Under **Logtail Configurations**, click the name of the Logtail configuration. On the **Logtail Config** page, click **Modify**.

You can also change the log collection mode of the Logtail configuration, and then apply the Logtail configuration to the server group again. The process of modifying a Logtail configuration is the same as the process of creating a Logtail configuration.

Delete a Logtail configuration

Click the  icon next to the Logtail configuration, and then select **Delete**.

After the Logtail configuration is deleted, it is disassociated from the server group. Logtail no longer collects logs specified by the Logtail configuration.

30.3.1.3.10. Configure an account ID on a server

This topic describes how to configure the ID of an Apsara Stack tenant account on a server.

Prerequisites

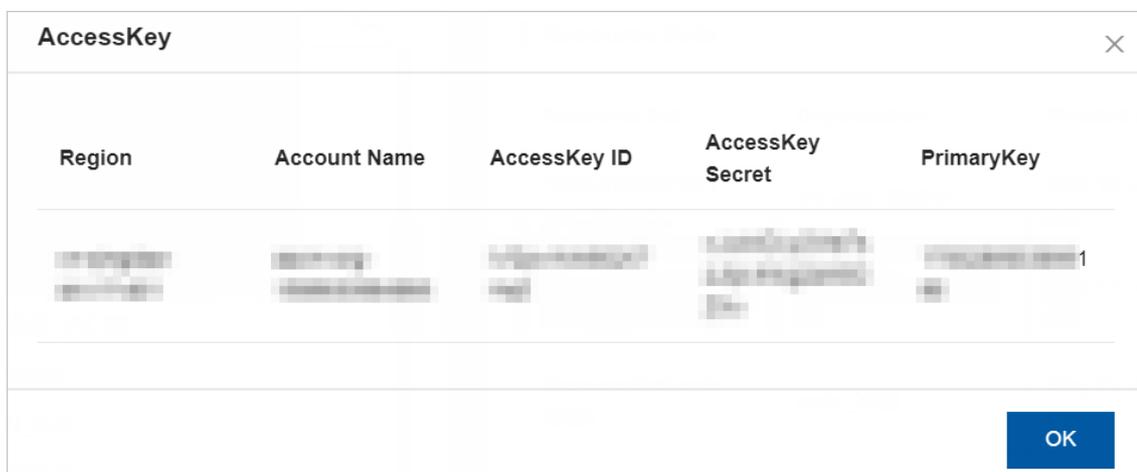

Logtail is installed on the server. For more information, see [Install Logtail in Linux](#) or [Install Logtail in Windows](#).

Context

You must configure the ID of your Apsara Stack tenant account on the server on which Logtail is installed if the server is an ECS instance that belong to another Apsara Stack tenant account, a cloud server that is provided by a third-party vendor, or an on-premises server. If you do not configure the account ID on the server, Log Service cannot receive heartbeats from the server, or use Logtail to collect logs from the server.

Procedure

1. View the ID of your Apsara Stack tenant account.
 - i. Log on to the Apsara Stack Cloud Management (ASCM) console. For more information, see [Log on to the Log Service console](#).
 - ii. In the top navigation bar, click **Enterprise**.
 - iii. In the left-side navigation pane, click **Organizations**.
 - iv. On the page that appears, click the  icon next to the account, and select **AccessKey** from the shortcut menu.
 - v. In the **AccessKey** dialog box, view the account ID.

2. Log on to the server and configure the account ID on the server.

- o Linux server:

In the `/etc/ilogtail/users` directory, create a file. Set the name of the file to the account ID. If the directory does not exist, create the directory first. You can configure multiple account IDs on a server. For example, you can run the following commands to create files for two account IDs:

```
touch /etc/ilogtail/users/1*****
touch /etc/ilogtail/users/1*****
```

If you no longer need to collect logs from the server to a Log Service project of an Apsara Stack tenant account, run the following command to delete the file of the account:

```
rm /etc/ilogtail/users/1*****
```

- o Windows server:

In the `C:\LogtailData\users` directory, create a file. Set the name of the file to the account ID. To delete the account ID, delete the file.

For example, the path to the file of an account ID is `C:\LogtailData\users\1*****`.

Note

- After you configure the ID of an Apsara Stack tenant account on a server, the account is authorized to use Logtail for collecting logs from the server. If an account is no longer used to collect logs from the server, delete the account ID file from the server at the earliest opportunity.
- After you configure or delete an account ID, the change takes effect within 1 minute.

30.3.1.4. Text logs

30.3.1.4.1. Configure text log collection

This topic describes how to configure Logtail in the Log Service console to collect text logs from specified servers.

Prerequisites

Logtail is installed. Logtail can be installed on a Windows or Linux operating system. For more information, see [Install Logtail in Linux](#) and [Install Logtail in Windows](#).

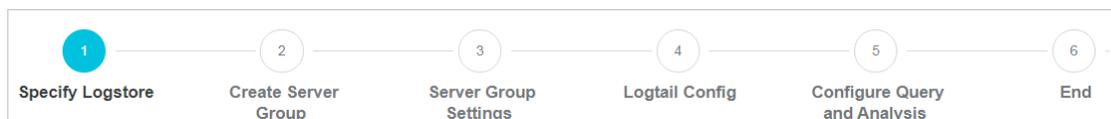

Limits

- Each log file can be collected by using only one Logtail configuration. If you want to collect a log file by using more than one Logtail configuration, we recommend that you use symbolic links. For example, to collect a log file by using two Logtail configurations in the `/home/log/nginx/log` directory, you can use the original log path for one Logtail configuration. Then, run the `ln -s /home/log/nginx/log /home/log/nginx/link_log` command to create a symbolic link for this directory and use the symbolic link as the log path for the other Logtail configuration.
- Logtail supports only Windows or Linux operating systems. For more information, see [Logtail overview](#).

Logtail configuration procedure

You can specify Logtail configurations in the Log Service console. Logtail supports various collection modes, such as simple mode, NGINX configuration mode, Apache configuration mode, IIS configuration mode, delimiter mode, JSON mode, and full regex mode.

Configuration procedure

Collection modes

Logtail supports various collection modes, such as simple mode, NGINX configuration mode, Apache configuration mode, IIS configuration mode, delimiter mode, JSON mode, and full regex mode.

- Simple mode
Logtail can be used to collect logs in the simple mode. For more information, see [Collect logs by line](#).
- Full regex mode
Logtail can be used to collect logs in the full regex mode. For more information, see [Use regular expressions to collect logs](#).
- Delimiter mode
Logtail can be used to collect logs in the delimiter mode. For more information, see [Collect DSV formatted logs](#).
- JSON mode

Logtail can be used to collect logs in the JSON mode. For more information, see [Collect JSON logs](#).

- **NGINX configuration mode**

Logtail can be used to collect logs in the NGINX configuration mode. For more information, see [Collect NGINX logs](#).

- **IIS configuration mode**

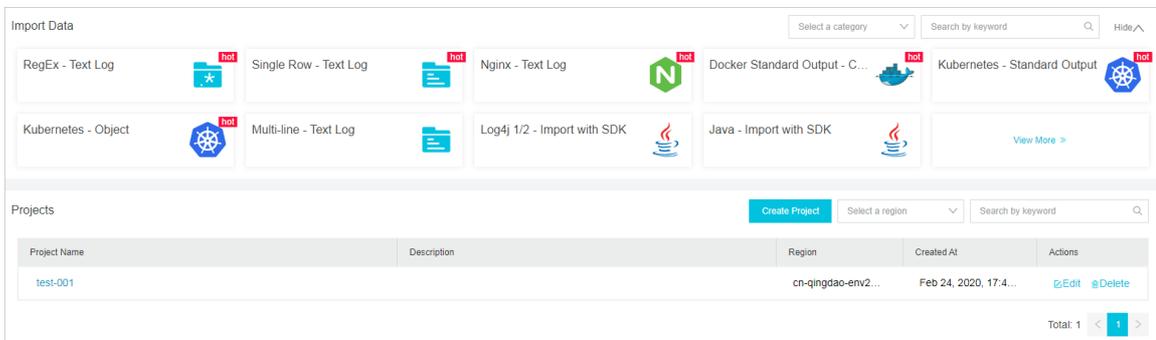

Logtail can be used to collect logs in the IIS configuration mode. For more information, see [Collect IIS logs](#).

- **Apache configuration mode**

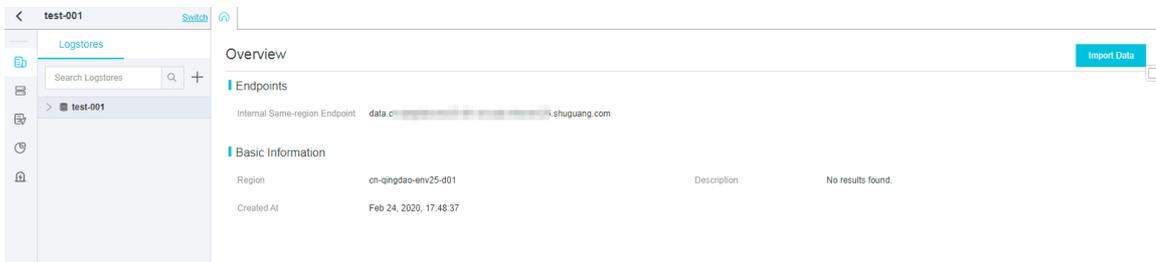

Logtail can be used to collect logs in the Apache configuration mode. For more information, see [Collect Apache logs](#).

Procedure

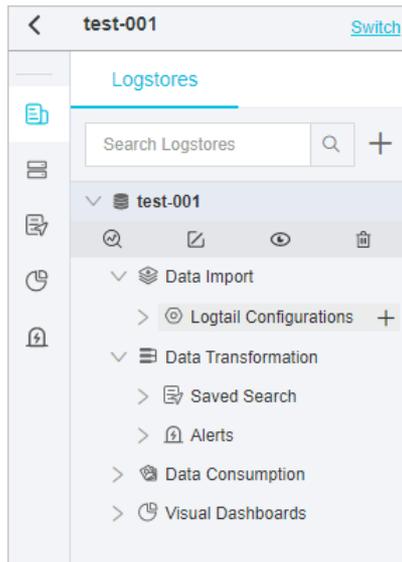

1. [Log on to the Log Service console](#).
2. Select a data source. You can use one of the following three methods to select a data source:
 - On the homepage of the Log Service console, select a data source in the **Import Data** section.

- In the **Projects** section, click a project name. On the **Overview** page, click **Import Data**.

- On the **Logstores** tab in the left-side navigation pane, find a Logstore and click the closing angle bracket (>) in front of the Logstore name. Then, click the plus sign (+) next to **Data Import**.

Select a data source based on your business requirements. Log Service supports the following log sources of text logs: **RegEx-Text Log**, **Single Row-Text Log**, **Multi-Row-Text Log**, **Delimiter Mode-Text Log**, **JSON-Text Log**, **Nginx-Text Log**, **IIS-Text Log**, and **Apache-Text Log**.

3. Select a Logstore, and then click Next. Select an existing project and Logstore. You can also click **Create Now** to create a project and Logstore. For more information, see [Manage a Logstore](#).

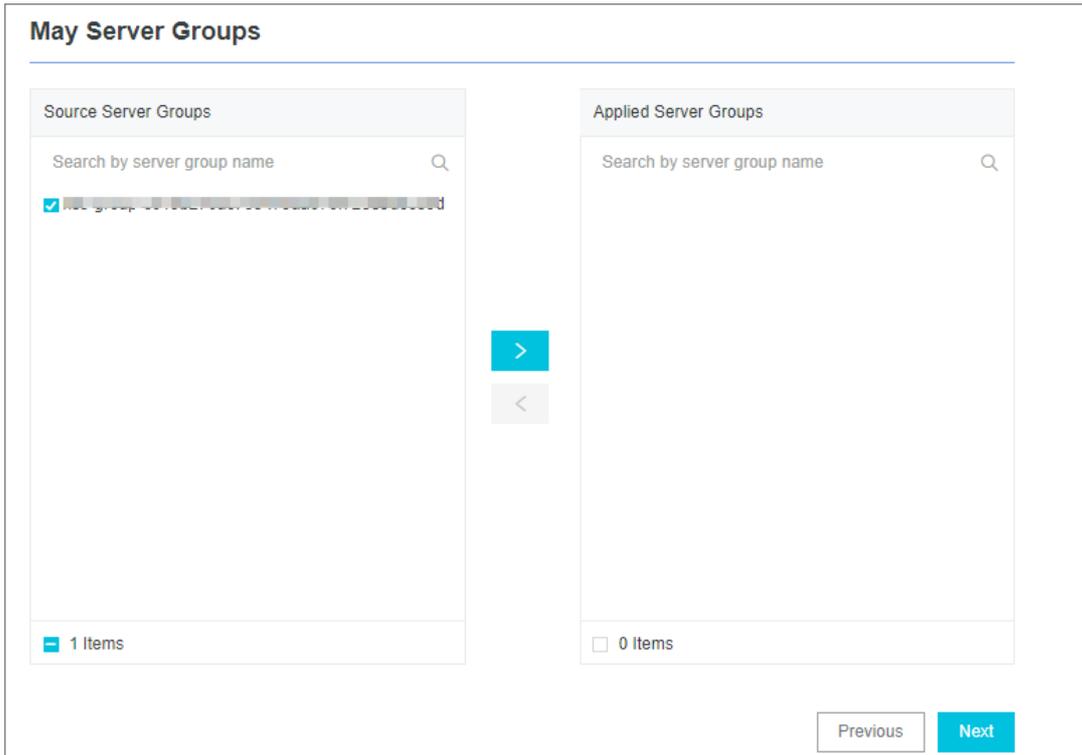

If you enter the configuration procedure by clicking the plus sign (+) next to **Data Import** under a Logstore on the Logstores tab, the system skips this step.

4. Create a server group. Before you create a server group, ensure that Logtail is installed.

Install Logtail as prompted. For more information, see [Install Logtail in Linux](#) or [Install Logtail in Windows](#).

After you install Logtail, click **Complete Installation** to create a server group. For more information, see [Overview](#). If you have created a server group, click **Use Existing Server Groups** to select the server group.

5. Configure the server group, and then click Next. Select a server group and move the group from **Source Server Groups** to **Applied Server Groups**.

6. Specify Logtail parameters. Logtail parameters vary based on collection modes. For more information, see the relevant parameters for specific collection modes.
7. (Optional)Specify **Advanced Options** and click **Next**.Specify **Advanced Options** based on your business requirements. We recommend that you do not modify the default settings unless otherwise required.

Parameter	Description
Enable Plug-in Processing	Specifies whether to enable plug-in processing. If you turn on this switch, you can use the plug-in of Logtail to process text logs.
Upload Raw Log	Specifies whether to upload raw logs. If you turn on this switch, raw logs are written to the <code>__raw__</code> field and uploaded with the parsed logs.
Topic Generation Mode	<ul style="list-style-type: none"> ◦ Null - Do not generate topic: This mode is selected by default. In this mode, the topic is set to an empty string and you can query logs without the need to enter a topic. ◦ Server Group Topic Attributes: This mode is used to differentiate log data that is generated by different frontend servers. ◦ File Path RegEx: If you select this mode, you must enter a value in the Custom RegEx field to extract part of the path as the topic. This mode is used to differentiate log data that is generated by users or instances.
Custom RegEx	Specifies a custom regular expression. If you select File Path RegEx for Topic Generation Mode , you must enter a custom regular expression.
Log File Encoding	<ul style="list-style-type: none"> ◦ <code>utf8</code>: indicates UTF-8 encoding. ◦ <code>gbk</code>: indicates GBK encoding.

Parameter	Description
Timezone	<p>Specifies the time zone where logs are collected.</p> <ul style="list-style-type: none"> System Timezone: This option is selected by default. It indicates that the time zone where logs are collected is the same as the time zone to which the server belongs. Custom: Select a time zone.
Timeout	<p>If a log file is not updated within a specific period of time, Logtail considers the file to be timed out.</p> <ul style="list-style-type: none"> Never: All log files are continuously monitored and never time out. 30 Minute Timeout: If a log file is not updated within 30 minutes, Logtail considers the log file to be timed out and no longer monitors the file.
Filter Configuration	<p>Only logs that meet all filter conditions are collected.</p> <p>Examples:</p> <ul style="list-style-type: none"> Collect logs that meet a condition: Set the condition to <code>Key:level Regex:WARNIN G ERROR</code> . It indicates that only logs with the severity level of WARNING or ERROR are collected. Filter logs that do not meet a condition: <ul style="list-style-type: none"> Set the condition to <code>Key:level Regex:^(?!.*(INFO DEBUG)).*</code> . It indicates that logs with the severity level of INFO or DEBUG are not collected. Set the condition to <code>Key:url Regex:.^(?!.*(healthcheck)).*</code> . It indicates that logs whose URL contains the keyword healthcheck are not collected. For example, logs in which the key is url and the value is <code>/inner/healthcheck/jiankong.html</code> are not collected.

8. Configure an index. Configure an index based on your business requirements. For more information, see [Enable the index feature and configure indexes for a Logstore](#).

After you complete the settings, you can start to collect logs.

30.3.1.4.2. Collect logs by line

This topic describes how to collect logs by line and configure indexes. You can specify the required settings in the Log Service console.

Context

To collect logs by line, you must select the simple mode. The simple mode can be divided into two types:

- Singleline mode

In this mode, each line of log data is considered as a log. Two logs in a log file are separated by a line break.

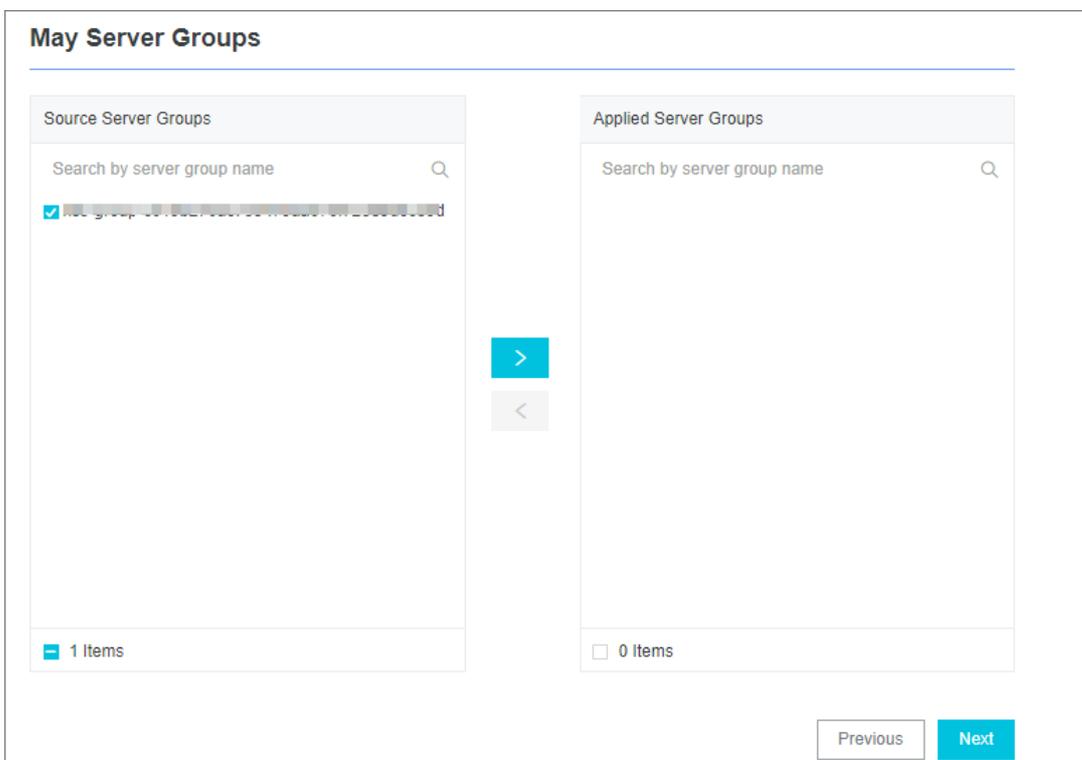

Logtail does not extract log fields in this mode. The default regular expression is `(.*)` . Logtail records the system time of the current server as the timestamp of a log. You can modify or manage advanced Logtail settings after you have completed the configuration procedure. For more information, see [Manage a Logtail configuration](#).

- Multi-line mode

In the multi-line mode, a regular expression is used to match the first line of a log. The settings in the multi-line mode are similar to the settings in the full regex mode. For more information, see [Use regular expressions to collect logs](#).

Procedure

1. Log on to the Log Service console.
2. Select a data source. Select **Single Row-Text Log**.
3. Select a Logstore, and then click **Next**. Select an existing project and Logstore. You can also click **Create Now** to create a project and Logstore. For more information, see [Manage a Logstore](#).
If you enter the configuration procedure by clicking the plus sign (+) next to **Data Import** under a Logstore on the Logstores tab, the system skips this step.
4. Create a server group. Before you create a server group, ensure that Logtail is installed.
Install Logtail as prompted. For more information, see [Install Logtail in Linux](#) or [Install Logtail in Windows](#).
After you install Logtail, click **Complete Installation** to create a server group. For more information, see [Overview](#). If you have created a server group, click **Use Existing Server Groups** to select the server group.
5. Configure the server group, and then click **Next**. Select a server group and move the group from **Source Server Groups** to **Applied Server Groups**.

6. Create a Logtail configuration. The following table lists the Logtail parameters.

Parameter	Description
Config Name	<p>The configuration name must be 3 to 128 characters in length, and can contain lowercase letters, digits, hyphens (-), and underscores (_). It must start and end with a lowercase letter or digit.</p> <p>Note The configuration name cannot be modified after it is created.</p>

Parameter	Description
Log Path	<p>The directory and name of the log file.</p> <ul style="list-style-type: none"> The specified log file name can be a complete file name or a file name that contains wildcards. Recursive directory matching is used in the log file search. If this matching method is applied, all files that match the specified file name in the specified directory and its sub-directories are monitored. <ul style="list-style-type: none"> Example 1: <code>/apsara/nuwa/ ... /*.log</code> indicates the files whose extension is <code>.log</code> in the <code>/apsara/nuwa</code> directory and its sub-directories are monitored. Example 2: <code>/var/logs/app_* ... /*.log*</code> indicates the files whose file name contains <code>.log</code> in the following directories are monitored: the sub-directories of the <code>/var/logs</code> directory that match the <code>app_*</code> format and the sub-directories of these matching sub-directories. <div style="background-color: #e1f5fe; padding: 10px; margin-top: 10px;"> <p> Note</p> <ul style="list-style-type: none"> Each log file can be collected by using only one Logtail configuration. Only the asterisk (<code>*</code>) and question mark (<code>?</code>) can be used as wildcards in the log path. </div>
Docker File	If the log file to be collected is in a Docker container, you can configure the internal path and container tag. Logtail monitors the creation and destruction of the container, filters logs of the container based on the tag, and collects the filtered logs.
Mode	If you have specified Single Row-Text Log for the data source, the default mode is Simple Mode. You can change the mode.
Maximum Directory Monitoring Depth	The maximum number of directory layers that can be recursively monitored when logs are collected from the data source. Valid values: 0 to 1000. The value 0 indicates that only the directory that is specified in the log path is monitored.

7. (Optional)Specify Advanced Options and click Next.Specify Advanced Options based on your business requirements. We recommend that you do not modify the default settings unless otherwise required.

Parameter	Description
Enable Plug-in Processing	Specifies whether to enable plug-in processing. If you turn on this switch, you can use the plug-in of Logtail to process text logs.
Upload Raw Log	Specifies whether to upload raw logs. If you turn on this switch, raw logs are written to the <code>__raw__</code> field and uploaded with the parsed logs.
Topic Generation Mode	<ul style="list-style-type: none"> Null - Do not generate topic: This mode is selected by default. In this mode, the topic is set to an empty string and you can query logs without the need to enter a topic. Server Group Topic Attributes: This mode is used to differentiate log data that is generated by different frontend servers. File Path RegEx: If you select this mode, you must enter a value in the Custom RegEx field to extract part of the path as the topic. This mode is used to differentiate log data that is generated by users or instances.

Parameter	Description
Custom RegEx	Specifies a custom regular expression. If you select File Path RegEx for Topic Generation Mode, you must enter a custom regular expression.
Log File Encoding	<ul style="list-style-type: none"> utf8: indicates UTF-8 encoding. gbk: indicates GBK encoding.
Timezone	<p>Specifies the time zone where logs are collected.</p> <ul style="list-style-type: none"> System Timezone: This option is selected by default. It indicates that the time zone where logs are collected is the same as the time zone to which the server belongs. Custom: Select a time zone.
Timeout	<p>If a log file is not updated within a specific period of time, Logtail considers the file to be timed out.</p> <ul style="list-style-type: none"> Never: All log files are continuously monitored and never time out. 30 Minute Timeout: If a log file is not updated within 30 minutes, Logtail considers the log file to be timed out and no longer monitors the file.
Filter Configuration	<p>Only logs that meet all filter conditions are collected.</p> <p>Examples:</p> <ul style="list-style-type: none"> Collect logs that meet a condition: Set the condition to <code>Key:level RegEx:WARNIN G ERROR</code>. It indicates that only logs with the severity level of WARNING or ERROR are collected. Filter logs that do not meet a condition: <ul style="list-style-type: none"> Set the condition to <code>Key:level RegEx:^(?!.*(INFO DEBUG)).*</code>. It indicates that logs with the severity level of INFO or DEBUG are not collected. Set the condition to <code>Key:url RegEx:.^(?!.*(healthcheck)).*</code>. It indicates that logs whose URL contains the keyword healthcheck are not collected. For example, logs in which the key is url and the value is <code>/inner/healthcheck/jiangong.html</code> are not collected.

8. Configure an index. Configure an index based on your business requirements. For more information, see [Enable the index feature and configure indexes for a Logstore](#).

After you complete the settings, you can start to collect logs by line.

30.3.1.4.3. Use regular expressions to collect logs

This topic describes how to collect logs by using regular expressions and configure indexes. You can specify the required settings in the Log Service console.

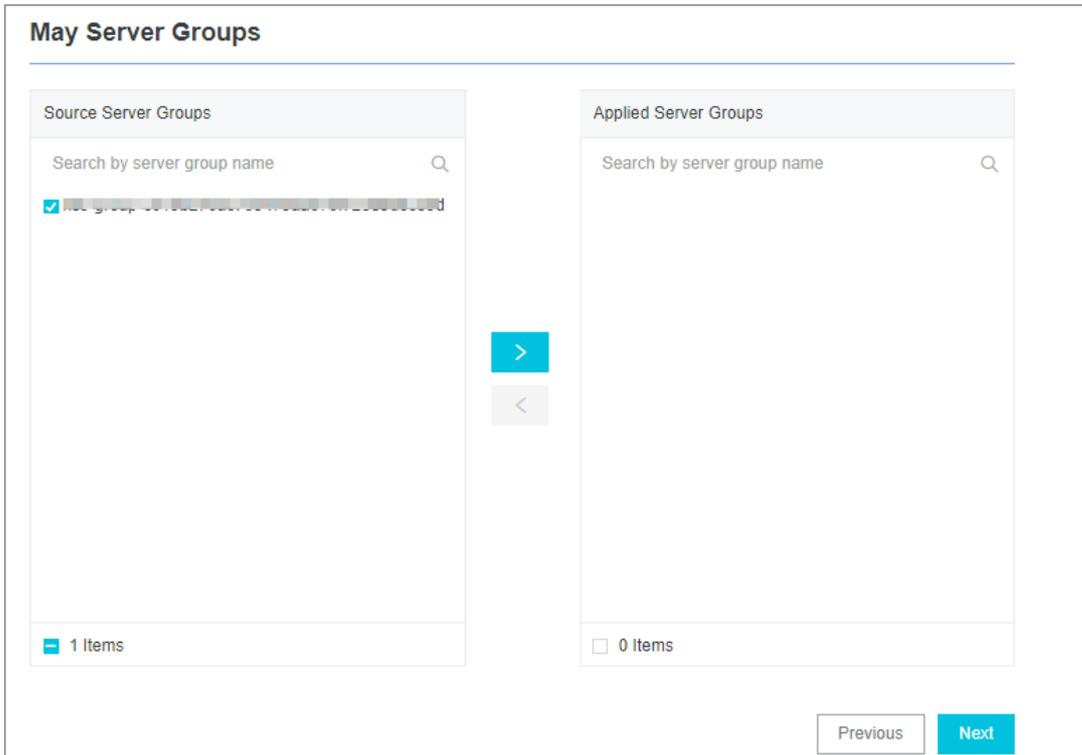

Context

If you need to collect multi-line logs and extract fields from logs, we recommend that you use regular expressions. Log Service can generate a regular expression based on a sample log that you enter in the Import Data wizard. However, you must modify the expression to match fields in the sample log as expected. For more information, see [How do I test a regular expression?](#).

Procedure

1. [Log on to the Log Service console](#).
2. Select a data source. Select **RegEx-Text Log**.

3. Select a Logstore, and then click Next. Select an existing project and Logstore. You can also click **Create Now** to create a project and Logstore. For more information, see [Manage a Logstore](#).
If you enter the configuration procedure by clicking the plus sign (+) next to **Data Import** under a Logstore on the Logstores tab, the system skips this step.
4. Create a server group. Before you create a server group, ensure that Logtail is installed.
Install Logtail as prompted. For more information, see [Install Logtail in Linux](#) or [Install Logtail in Windows](#).
After you install Logtail, click **Complete Installation** to create a server group. For more information, see [Overview](#). If you have created a server group, click **Use Existing Server Groups** to select the server group.
5. Configure the server group, and then click Next. Select a server group and move the group from **Source Server Groups** to **Applied Server Groups**.

6. Create a Logtail configuration. The following table lists the Logtail parameters.

Parameter	Description
Config Name	<p>The configuration name must be 3 to 128 characters in length, and can contain lowercase letters, digits, hyphens (-), and underscores (_). It must start and end with a lowercase letter or digit.</p> <div style="border: 1px solid #ccc; background-color: #e0f2f1; padding: 5px; margin-top: 10px;"> <p>? Note The configuration name cannot be modified after it is created.</p> </div>

Parameter	Description
Log Path	<p>The directory and name of the log file.</p> <ul style="list-style-type: none"> ○ The specified log file name can be a complete file name or a file name that contains wildcards. ○ Recursive directory matching is used in the log file search. If this matching method is applied, all files that match the specified file name in the specified directory and its sub-directories are monitored. <ul style="list-style-type: none"> ▪ Example 1: <code>/apsara/nuwa/ ... /*.log</code> indicates the files whose extension is <code>.log</code> in the <code>/apsara/nuwa</code> directory and its sub-directories are monitored. ▪ Example 2: <code>/var/logs/app_* ... /*.log*</code> indicates the files whose file name contains <code>.log</code> in the following directories are monitored: the sub-directories of the <code>/var/logs</code> directory that match the <code>app_*</code> format and the sub-directories of these matching sub-directories. <div style="border: 1px solid #ccc; background-color: #e6f2ff; padding: 10px; margin-top: 10px;"> <p> Note</p> <ul style="list-style-type: none"> ▪ Each log file can be collected by using only one Logtail configuration. ▪ Only the asterisk (<code>*</code>) and question mark (<code>?</code>) can be used as wildcards in the log path. </div>
Docker File	<p>If the log file to be collected is in a Docker container, you can configure the internal path and container tag. Logtail monitors the creation and destruction of the container, filters logs of the container based on the tag, and collects the filtered logs.</p>
Mode	<p>If you have specified Regex-Text Log for the data source, the default mode is Full Regex Mode. You can change the mode.</p>
Singleline	<p>The singleline mode is enabled by default. In this mode, logs are separated by line. To collect multi-line logs, such as Java program logs, you must disable the Singleline mode and configure Regex to Match First Line.</p>
Log Sample	<p>Enter a sample log that is retrieved from the data source. Then, Log Service generates a regular expression.</p>
Regex to Match First Line	<p>You can click Auto Generate or Manual. After you enter a sample log entry and click Auto Generate, the system generates a regular expression. If no regular expression is generated, you can switch to the manual mode and enter a regular expression for verification.</p>
Extract Field	<p>To analyze and process specific fields in logs, you can turn on the Extract Field switch. Then, the specified fields are converted to key-value pairs and sent to Log Service. You must specify a regular expression to parse the log content.</p>

Parameter	Description
RegEx	<p>If you turn on the Extract Field switch, you must specify this setting.</p> <ul style="list-style-type: none"> Automatically generate a regular expression You can select the fields to be extracted from the sample log and then click Generate Regular Expression. The system generates a regular expression. Enter a regular expression You can also enter a regular expression. Click Manually to switch to the manual mode. After you enter a regular expression, click Validate to check whether the regular expression can parse the log content. For more information, see How do I test a regular expression?.
Extracted Content	<p>If you turn on the Extract Field switch, you must specify this setting.</p> <p>After a regular expression is automatically generated or manually specified, you must specify the key name for each extracted field.</p>
Use System Time	<p>If you turn on the Extract Field switch, you must specify this setting.</p> <p>If you turn off the Use System Time switch, you must specify a field as the time field and name this field <code>time</code>. After you specify the <code>time</code> field, click Auto Generate in the Time Conversion Format field to automatically parse the time. For more information, see Configure the time format.</p>
Drop Failed to Parse Logs	<p>Specifies whether to upload logs to Log Service if the logs fail to be parsed.</p> <ul style="list-style-type: none"> If you turn on this switch, logs that fail to be parsed are not uploaded to Log Service. If you turn off this switch, raw logs are uploaded to Log Service when logs fail to be parsed.
Maximum Directory Monitoring Depth	<p>The maximum number of directory layers that can be recursively monitored when logs are collected from the data source. Valid values: 0 to 1000. The value 0 indicates that only the directory specified in the log path is monitored.</p>

7. (Optional)Specify Advanced Options and click Next.Specify Advanced Options based on your business requirements. We recommend that you do not modify the default settings unless otherwise required.

Parameter	Description
Enable Plug-in Processing	<p>Specifies whether to enable plug-in processing. If you turn on this switch, you can use the plug-in of Logtail to process text logs.</p>
Upload Raw Log	<p>Specifies whether to upload raw logs. If you turn on this switch, raw logs are written to the <code>__raw__</code> field and uploaded with the parsed logs.</p>
Topic Generation Mode	<ul style="list-style-type: none"> Null - Do not generate topic: This mode is selected by default. In this mode, the topic is set to an empty string and you can query logs without the need to enter a topic. Server Group Topic Attributes: This mode is used to differentiate log data that is generated by different frontend servers. File Path RegEx: If you select this mode, you must enter a value in the Custom RegEx field to extract part of the path as the topic. This mode is used to differentiate log data that is generated by users or instances.

Parameter	Description
Custom RegEx	Specifies a custom regular expression. If you select File Path RegEx for Topic Generation Mode, you must enter a custom regular expression.
Log File Encoding	<ul style="list-style-type: none"> utf8: indicates UTF-8 encoding. gbk: indicates GBK encoding.
Timezone	<p>Specifies the time zone where logs are collected.</p> <ul style="list-style-type: none"> System Timezone: This option is selected by default. It indicates that the time zone where logs are collected is the same as the time zone to which the server belongs. Custom: Select a time zone.
Timeout	<p>If a log file is not updated within a specific period of time, Logtail considers the file to be timed out.</p> <ul style="list-style-type: none"> Never: All log files are continuously monitored and never time out. 30 Minute Timeout: If a log file is not updated within 30 minutes, Logtail considers the log file to be timed out and no longer monitors the file.
Filter Configuration	<p>Only logs that meet all filter conditions are collected.</p> <p>Examples:</p> <ul style="list-style-type: none"> Collect logs that meet a condition: Set the condition to <code>Key:level RegEx:WARNIN G ERROR</code>. It indicates that only logs with the severity level of WARNING or ERROR are collected. Filter logs that do not meet a condition: <ul style="list-style-type: none"> Set the condition to <code>Key:level RegEx:^(?!.*(INFO DEBUG)).*</code>. It indicates that logs with the severity level of INFO or DEBUG are not collected. Set the condition to <code>Key:url RegEx:.^(?!.*(healthcheck)).*</code>. It indicates that logs whose URL contains the keyword healthcheck are not collected. For example, logs in which the key is url and the value is <code>/inner/healthcheck/jiangkok.html</code> are not collected.

8. Configure an index. Configure an index based on your business requirements. For more information, see [Enable the index feature and configure indexes for a Logstore](#).

After you complete the settings, you can start to use regular expressions to collect logs.

30.3.1.4.4. Collect DSV formatted logs

This topic describes how to collect delimiter-separated values (DSV) formatted logs and configure indexes. You can specify the required settings in the Log Service console.

Context

DSV formatted logs use line breaks as boundaries. Each line is a log. The fields of each log are separated with a fixed delimiter. The characters that can be used as delimiters include the tab (\t), space, vertical bar (|), comma (,), and semicolon (;). A field that contains a delimiter must be enclosed in double quotation marks (""), which are used as quotes.

Log formats

Common DSV formatted logs include comma-separated values (CSV) and tab-separated values (TSV) formatted logs.

A delimiter can contain a single character or multiple characters.

Single-character delimiter

You can specify a single-character delimiter and a quote in the console.

- **Delimiter:** The fields of each log are separated with a single-character delimiter, such as the tab (`\t`), vertical bar (`|`), space, comma (`,`), and semicolon (`;`). You can also specify a non-printable character as the delimiter.

 **Note** A double quotation mark (`"`) cannot be used as a delimiter.

If a double quotation mark (`"`) is included in a log but not used as a quote, it must be escaped and processed as double quotation marks (`""`). When Log Service parse logs, it restores double quotation marks (`""`) into a double quotation mark (`"`). You can use a double quotation mark (`"`) on each boundary of a field as a quote. You can also use a double quotation mark (escaped as `""`) in the content of a field. If the use of a double quotation mark (`"`) does not comply with the defined format, you can use the simple mode or full regex mode to parse fields.

If you use commas as delimiters while double quotation marks and commas are included in a field, enclose the field with quotes and escape the double quotation marks into `""` . For example, a processed log is `1999, Chevy,"Venture ""Extended Edition, Very Large""",",5000.00` . The log can be parsed into five fields as follows: `1999` , `Chevy` , `Venture "Extended Edition, Very Large"` , empty field, and `5000.00` .

- **Quote:** If a log field contains delimiters, you must specify a quote to enclose the field. Otherwise, the field cannot be parsed as expected. Log Service parses the content enclosed in quotes as one field. Only delimiters can exist between fields.

You can use one of the following characters as the quote: tab (`\t`), vertical bar (`|`), space, comma (`,`), semicolon (`;`), and non-printable characters.

For example, a log is `1997,Ford,E350,"ac, abs, moon",3000.00` . In this example, the comma (`,`) is used as the delimiter and the double quotation mark (`"`) is used as the quote. The log entry can be parsed into five fields as follows: `1997` , `Ford` , `E350` , `ac, abs, moon` , and `3000.00` . Among the five fields, `ac, abs, moon` enclosed in quotes is regarded as one field.

 **Note** Log Service allows you to use a non-printable character as a delimiter or quote. Non-printable characters are characters whose decimal ASCII codes are in the range of 1 to 31 and 127. If you use a non-printable character as a delimiter or quote, you must find the hexadecimal ASCII code of this character and enter the character in the following format: `0xthe hexadecimal ASCII code of the non-printable character` . For example, to use the non-printable character whose decimal ASCII code is 1 and hexadecimal ASCII code is 01, you must enter `0x01` .

Multi-character delimiter

Each multi-character delimiter can contain two or three characters, such as `||` , `&&&` , and `^_^` . If you specify a multi-character delimiter, Log Service parses logs only based on the delimiter. You do not need to use quotes to enclose log fields.

 **Note** You must ensure that log fields do not contain the delimiter. Otherwise, Log Service cannot parse these fields as expected.

For example, if the delimiter is set to `&&` , the log `1997&&Ford&&E350&&ac&abs&moon&&3000.00` is parsed into the following five fields: `1997` , `Ford` , `E350` , `ac&abs&moon` , and `3000.00` .

Sample log

- **Single-character delimiter**

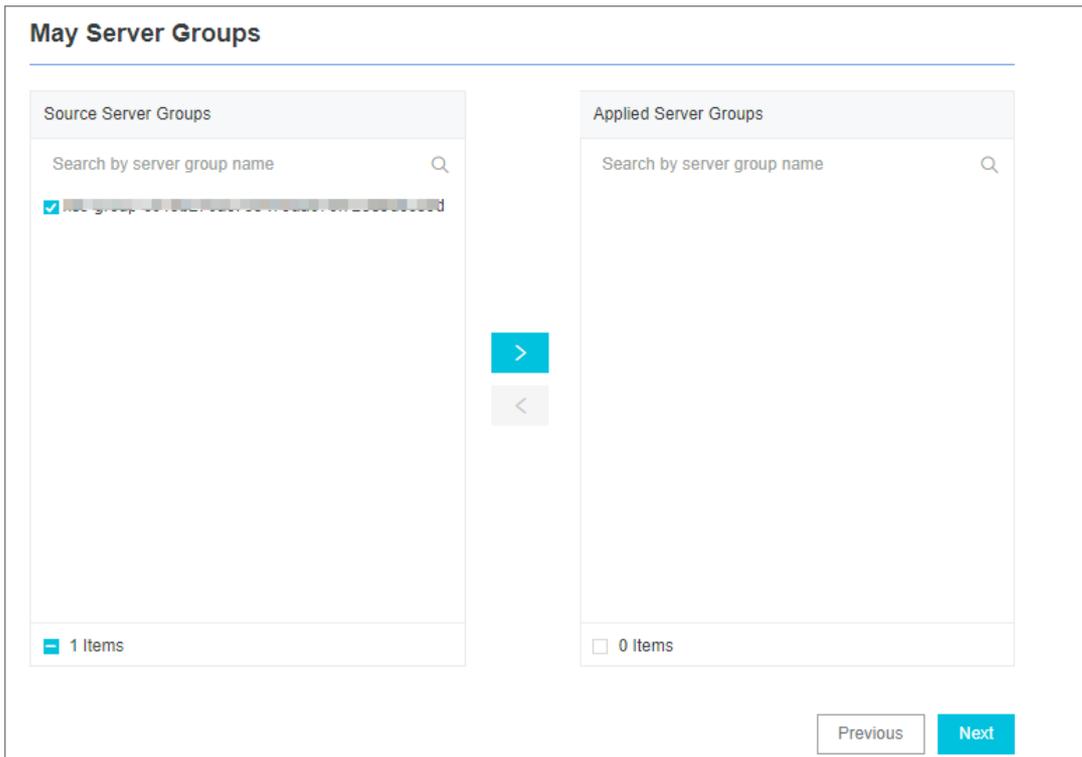

```
05/May/2016:13:30:28,10.10. *. *, "POST /PutData? Category=YunOsAccountOpLog&AccessKeyId=*****&Date

Procedure

1. [Log on to the Log Service console.](#)
2. Select a data source. Select **Delimiter-Text Log**.
3. Select a Logstore, and then click **Next**. Select an existing project and Logstore. You can also click **Create Now** to create a project and Logstore. For more information, see [Manage a Logstore](#).
If you enter the configuration procedure by clicking the plus sign (+) next to **Data Import** under a Logstore on the Logstores tab, the system skips this step.
4. Create a server group. Before you create a server group, ensure that Logtail is installed.
Install Logtail as prompted. For more information, see [Install Logtail in Linux](#) or [Install Logtail in Windows](#).
After you install Logtail, click **Complete Installation** to create a server group. For more information, see [Overview](#). If you have created a server group, click **Use Existing Server Groups** to select the server group.
5. Configure the server group, and then click **Next**. Select a server group and move the group from **Source Server Groups** to **Applied Server Groups**.

6. Create a Logtail configuration. The following table lists the Logtail parameters.

Parameter	Description
Config Name	<p>The configuration name must be 3 to 128 characters in length, and can contain lowercase letters, digits, hyphens (-), and underscores (_). It must start and end with a lowercase letter or digit.</p> <p>Note The configuration name cannot be modified after it is created.</p>

Parameter	Description
Log Path	<p>The directory and name of the log file.</p> <ul style="list-style-type: none"> The specified log file name can be a complete file name or a file name that contains wildcards. Recursive directory matching is used in the log file search. If this matching method is applied, all files that match the specified file name in the specified directory and its sub-directories are monitored. <ul style="list-style-type: none"> Example 1: <code>/apsara/nuwa/ ... /*.log</code> indicates the files whose extension is <code>.log</code> in the <code>/apsara/nuwa</code> directory and its sub-directories are monitored. Example 2: <code>/var/logs/app_* ... /*.log*</code> indicates the files whose file name contains <code>.log</code> in the following directories are monitored: the sub-directories of the <code>/var/logs</code> directory that match the <code>app_*</code> format and the sub-directories of these matching sub-directories. <div style="background-color: #e1f5fe; padding: 10px; margin-top: 10px;"> <p>Note</p> <ul style="list-style-type: none"> Each log file can be collected by using only one Logtail configuration. Only the asterisk (<code>*</code>) and question mark (<code>?</code>) can be used as wildcards in the log path. </div>
Docker File	<p>If the log file to be collected is in a Docker container, you can configure the internal path and container tag. Logtail monitors the creation and destruction of the container, filters logs of the container based on the tag, and collects the filtered logs.</p>
Mode	<p>If you have specified Delimiter-Text Log for the data source, the default mode is Delimiter Mode. You can change the mode.</p>
Log Sample	<p>Enter a sample log that is retrieved from the data source. Then, Log Service generates a regular expression.</p>
Delimiter	<p>Select a delimiter.</p> <p>Select a delimiter based on the log format. Otherwise, logs may fail to be parsed.</p> <div style="background-color: #e1f5fe; padding: 10px; margin-top: 10px;"> <p>Note If you use a non-printable character as a delimiter, you must find the hexadecimal ASCII code of this character and enter the character in the following format: <code>0xthe hexadecimal ASCII code of the non-printable character</code> . For example, to use the non-printable character whose decimal ASCII code is 1 and hexadecimal ASCII code is 01, you must enter <code>0x01</code> .</p> </div>

Parameter	Description
Quote	<p>Select a quote.</p> <p>Select a quote based on the log format. Otherwise, logs may fail to be parsed.</p> <div style="border: 1px solid #add8e6; padding: 5px; background-color: #e6f2ff;"> <p> Note If you use a non-printable character as a quote, you must find the hexadecimal ASCII code of this character and enter the character in the following format: <code>0xthe hexadecimal ASCII code of the non-printable character</code>. For example, to use the non-printable character whose decimal ASCII code is 1 and hexadecimal ASCII code is 01, you must enter <code>0x01</code>.</p> </div>
Extracted Content	<p>After you enter a sample log and select a delimiter, Log Service extracts log fields based on the delimiter and defines the fields as values. You must specify a key for each value.</p>
Incomplete Entry Upload	<p>Specifies whether to upload a log whose number of parsed fields is less than the number of the specified keys. If you turn on this switch, the log is uploaded. If you turn off this switch, the log is dropped.</p> <p>For example, if you set the delimiter to the vertical bar (), the sample log <code>11 22 33 44 55</code> can be parsed into the following fields: <code>11</code>, <code>22</code>, <code>33</code>, <code>44</code>, and <code>55</code>. You can set the keys to <code>A</code>, <code>B</code>, <code>C</code>, <code>D</code>, and <code>E</code>. If you turn on the Incomplete Entry Upload switch, the <code>55</code> field is uploaded as the value of the <code>D</code> key when Log Service collects the log <code>11 22 33 55</code>. If you turn off the Incomplete Entry Upload switch, Log Service drops the log because the fields and keys do not match.</p>
Use System Time	<p>If you turn on the Extract Field switch, you must specify this setting.</p> <p>If you turn off the Use System Time switch, you must specify a field as the time field and name this field <code>time</code>. After you specify the <code>time</code> field, click Auto Generate in the Time Conversion Format field to automatically parse the time. For more information, see Configure the time format.</p>
Drop Failed to Parse Logs	<p>Specifies whether to upload logs to Log Service if the logs fail to be parsed.</p> <ul style="list-style-type: none"> ◦ If you turn on this switch, logs that fail to be parsed are not uploaded to Log Service. ◦ If you turn off this switch, raw logs are uploaded to Log Service when logs fail to be parsed.
Maximum Directory Monitoring Depth	<p>The maximum number of directory layers that can be recursively monitored when logs are collected from the data source. Valid values: 0 to 1000. The value 0 indicates that only the directory specified in the log path is monitored.</p>

7. (Optional)Specify Advanced Options and click Next.Specify Advanced Options based on your business requirements. We recommend that you do not modify the default settings unless otherwise required.

Parameter	Description
Enable Plug-in Processing	<p>Specifies whether to enable plug-in processing. If you turn on this switch, you can use the plug-in of Logtail to process text logs.</p>

Parameter	Description
Upload Raw Log	Specifies whether to upload raw logs. If you turn on this switch, raw logs are written to the <code>__raw__</code> field and uploaded with the parsed logs.
Topic Generation Mode	<ul style="list-style-type: none"> ◦ Null - Do not generate topic: This mode is selected by default. In this mode, the topic is set to an empty string and you can query logs without the need to enter a topic. ◦ Server Group Topic Attributes: This mode is used to differentiate log data that is generated by different frontend servers. ◦ File Path RegEx: If you select this mode, you must enter a value in the Custom RegEx field to extract part of the path as the topic. This mode is used to differentiate log data that is generated by users or instances.
Custom RegEx	Specifies a custom regular expression. If you select File Path RegEx for Topic Generation Mode , you must enter a custom regular expression.
Log File Encoding	<ul style="list-style-type: none"> ◦ utf8: indicates UTF-8 encoding. ◦ gbk: indicates GBK encoding.
Timezone	<p>Specifies the time zone where logs are collected.</p> <ul style="list-style-type: none"> ◦ System Timezone: This option is selected by default. It indicates that the time zone where logs are collected is the same as the time zone to which the server belongs. ◦ Custom: Select a time zone.
Timeout	<p>If a log file is not updated within a specific period of time, Logtail considers the file to be timed out.</p> <ul style="list-style-type: none"> ◦ Never: All log files are continuously monitored and never time out. ◦ 30 Minute Timeout: If a log file is not updated within 30 minutes, Logtail considers the log file to be timed out and no longer monitors the file.
Filter Configuration	<p>Only logs that meet all filter conditions are collected.</p> <p>Examples:</p> <ul style="list-style-type: none"> ◦ Collect logs that meet a condition: Set the condition to <code>Key:level Regex:WARNIN G ERROR</code>. It indicates that only logs with the severity level of WARNING or ERROR are collected. ◦ Filter logs that do not meet a condition: <ul style="list-style-type: none"> ▪ Set the condition to <code>Key:level Regex:^(?!.*(INFO DEBUG)).*</code>. It indicates that logs with the severity level of INFO or DEBUG are not collected. ▪ Set the condition to <code>Key:url Regex:.*(?!.*(healthcheck)).*</code>. It indicates that logs whose URL contains the keyword healthcheck are not collected. For example, logs in which the key is url and the value is <code>/inner/healthcheck/jiangkok.html</code> are not collected.

8. **Configure an index.** Configure an index based on your business requirements. For more information, see [Enable the index feature and configure indexes for a Logstore](#).

After you complete the settings, you can start to collect DSV formatted logs.

30.3.1.4.5. Collect JSON logs

This topic describes how to use Logtail to collect JSON logs and configure indexes. You can specify the required settings in the Log Service console.

Context

Logtail can parse JSON objects from logs. It extracts the keys and values from the first layer of an object as the names and values of log fields. The valid data types of field values include object, array, and primitive data types such as string or number.

JSON logs can be written in the following two types of structures:

- Object: a collection of key-value pairs.
- Array: an ordered list of values.

Lines of JSON logs are separated with `\n`. Each line is extracted as a single log.

Logtail can parse only JSON logs of the object type. If you want to parse JSON logs of other types, such as JSON arrays, you must use regular expressions to extract the fields or specify the simple mode to collect logs by line.

Sample log

A sample JSON log is as follows:

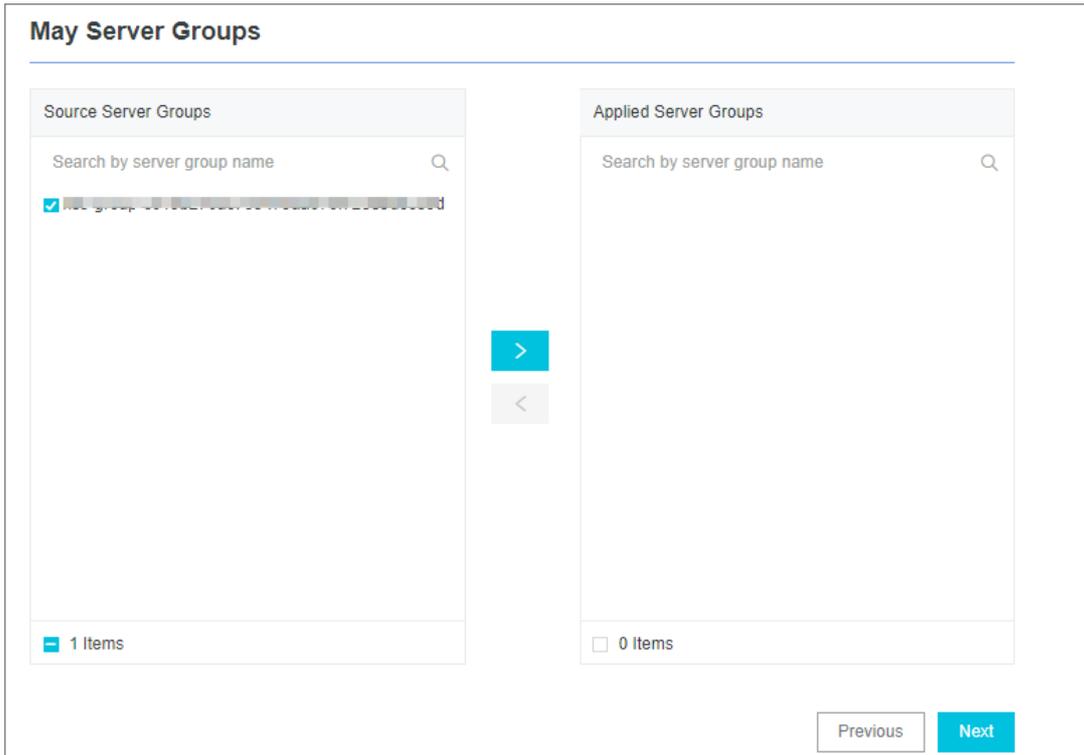

```
{"url": "POST /PutData? Category=YunOsAccountOpLog&AccessKeyId=U0Ujpek*****&Date=Fri%2C%2028%20Jun%202013%2006%3A53%3A30%20GMT&Topic=raw&Signature=pD12XYLmGxKQ%2BmKd6x7hAgQ7b1c%3D HTTP/1.1", "ip": "10.200.98.220", "user-agent": "aliyun-sdk-java", "request": {"status": "200", "latency": "18204"}, "time": "05/May/2016:13:30:28"}
{"url": "POST /PutData? Category=YunOsAccountOpLog&AccessKeyId=U0Ujpek*****&Date=Fri%2C%2028%20Jun%202013%2006%3A53%3A30%20GMT&Topic=raw&Signature=pD12XYLmGxKQ%2BmKd6x7hAgQ7b1c%3D HTTP/1.1", "ip": "10.200.98.210", "user-agent": "aliyun-sdk-java", "request": {"status": "200", "latency": "10204"}, "time": "05/May/2016:13:30:29"}
}
```

Procedure

1. [Log on to the Log Service console](#).
2. Select a data source. Select **JSON-Text Log**.
3. Select a Logstore, and then click Next. Select an existing project and Logstore. You can also click **Create Now** to create a project and Logstore. For more information, see [Manage a Logstore](#).

If you enter the configuration procedure by clicking the plus sign (+) next to **Data Import** under a Logstore on the Logstores tab, the system skips this step.

4. Create a server group. Before you create a server group, ensure that Logtail is installed.
Install Logtail as prompted. For more information, see [Install Logtail in Linux](#) or [Install Logtail in Windows](#).
After you install Logtail, click **Complete Installation** to create a server group. For more information, see [Overview](#). If you have created a server group, click **Use Existing Server Groups** to select the server group.
5. Configure the server group, and then click Next. Select a server group and move the group from **Source Server Groups** to **Applied Server Groups**.

6. Create a Logtail configuration. The following table lists the Logtail parameters.

Parameter	Description
Config Name	<p>The configuration name must be 3 to 128 characters in length, and can contain lowercase letters, digits, hyphens (-), and underscores (_). It must start and end with a lowercase letter or digit.</p> <p>Note The configuration name cannot be modified after it is created.</p>

Parameter	Description
Log Path	<p>The directory and name of the log file.</p> <ul style="list-style-type: none"> The specified log file name can be a complete file name or a file name that contains wildcards. Recursive directory matching is used in the log file search. If this matching method is applied, all files that match the specified file name in the specified directory and its sub-directories are monitored. <ul style="list-style-type: none"> Example 1: <code>/apsara/nuwa/ ... /*.log</code> indicates the files whose extension is <code>.log</code> in the <code>/apsara/nuwa</code> directory and its sub-directories are monitored. Example 2: <code>/var/logs/app_* ... /*.log*</code> indicates the files whose file name contains <code>.log</code> in the following directories are monitored: the sub-directories of the <code>/var/logs</code> directory that match the <code>app_*</code> format and the sub-directories of these matching sub-directories. <div style="border: 1px solid #ccc; background-color: #e6f2ff; padding: 10px; margin-top: 10px;"> <p> Note</p> <ul style="list-style-type: none"> Each log file can be collected by using only one Logtail configuration. Only the asterisk (<code>*</code>) and question mark (<code>?</code>) can be used as wildcards in the log path. </div>
Docker File	<p>If the log file to be collected is in a Docker container, you can configure the internal path and container tag. Logtail monitors the creation and destruction of the container, filters logs of the container based on the tag, and collects the filtered logs.</p>
Mode	<p>If you have specified JSON-Text Log for the data source, the default mode is JSON Mode. You can change the mode.</p>
Use System Time	<p>If you turn on the Extract Field switch, you must specify this parameter.</p> <p>If you turn off the Use System Time switch, you must specify a field as the time field and name this field <code>time</code>. After you specify the <code>time</code> field, click Auto Generate in the Time Conversion Format field to automatically parse the time. For more information, see Configure the time format.</p>
Drop Failed to Parse Logs	<p>Specifies whether to upload logs to Log Service if the logs fail to be parsed.</p> <ul style="list-style-type: none"> If you turn on this switch, logs that fail to be parsed are not uploaded to Log Service. If you turn off this switch, raw logs are uploaded to Log Service when logs fail to be parsed.
Maximum Directory Monitoring Depth	<p>The maximum number of directory layers that can be recursively monitored when logs are collected from the data source. Valid values: 0 to 1000. The value 0 indicates that only the directory specified in the log path is monitored.</p>

7. (Optional)Specify **Advanced Options** and click **Next**.Specify **Advanced Options** based on your business requirements. We recommend that you do not modify the default settings unless otherwise required.

Parameter	Description
Enable Plug-in Processing	Specifies whether to enable plug-in processing. If you turn on this switch, you can use the plug-in of Logtail to process text logs.
Upload Raw Log	Specifies whether to upload raw logs. If you turn on this switch, raw logs are written to the <code>__raw__</code> field and uploaded with the parsed logs.
Topic Generation Mode	<ul style="list-style-type: none"> ◦ Null - Do not generate topic: This mode is selected by default. In this mode, the topic is set to an empty string and you can query logs without the need to enter a topic. ◦ Server Group Topic Attributes: This mode is used to differentiate log data that is generated by different frontend servers. ◦ File Path RegEx: If you select this mode, you must enter a value in the Custom RegEx field to extract part of the path as the topic. This mode is used to differentiate log data that is generated by users or instances.
Custom RegEx	Specifies a custom regular expression. If you select File Path RegEx for Topic Generation Mode , you must enter a custom regular expression.
Log File Encoding	<ul style="list-style-type: none"> ◦ <code>utf8</code>: indicates UTF-8 encoding. ◦ <code>gbk</code>: indicates GBK encoding.
Timezone	<p>Specifies the time zone where logs are collected.</p> <ul style="list-style-type: none"> ◦ System Timezone: This option is selected by default. It indicates that the time zone where logs are collected is the same as the time zone to which the server belongs. ◦ Custom: Select a time zone.
Timeout	<p>If a log file is not updated within a specific period of time, Logtail considers the file to be timed out.</p> <ul style="list-style-type: none"> ◦ Never: All log files are continuously monitored and never time out. ◦ 30 Minute Timeout: If a log file is not updated within 30 minutes, Logtail considers the log file to be timed out and no longer monitors the file.
Filter Configuration	<p>Only logs that meet all filter conditions are collected.</p> <p>Examples:</p> <ul style="list-style-type: none"> ◦ Collect logs that meet a condition: Set the condition to <code>Key:level Regex:WARNIN G ERROR</code>. It indicates that only logs with the severity level of WARNING or ERROR are collected. ◦ Filter logs that do not meet a condition: <ul style="list-style-type: none"> ▪ Set the condition to <code>Key:level Regex:^(?!.*(INFO DEBUG)).*</code>. It indicates that logs with the severity level of INFO or DEBUG are not collected. ▪ Set the condition to <code>Key:url Regex:.*(?!.*(healthcheck)).*</code>. It indicates that logs whose URL contains the keyword healthcheck are not collected. For example, logs in which the key is url and the value is <code>/inner/healthcheck/jiangkok.html</code> are not collected.

8. Configure an index. Configure an index based on your business requirements. For more information, see [Enable the index feature and configure indexes for a Logstore](#).

After you complete the settings, you can start to collect JSON logs.

30.3.1.4.6. Collect NGINX logs

This topic describes how to collect NGINX logs and configure indexes. You can connect Log Service to NGINX and specify the required settings in the Log Service console.

Context

The NGINX log format and path are specified in the `/etc/nginx/nginx.conf` configuration file.

NGINX log format

In the configuration file, the format of NGINX logs is defined as follows:

```
log_format main '$remote_addr - $remote_user [$time_local] "$request" '
    '$request_time $request_length '
    '$status $body_bytes_sent "$http_referer" '
    '"$http_user_agent";
```

The path of the log file is declared as follows. The "main" portion that follows the path indicates that logs are written in the preceding format.

```
access_log /var/logs/nginx/access.log main
```

Sample log

A sample NGINX log is as follows:

```
192.168.1.2 - - [10/Jul/2015:15:51:09 +0800] "GET /ubuntu.iso HTTP/1.0" 0.000 129 404 168 "-" "Wget/1.11.4 Red Hat modified"
```

NGINX log fields

Field	Description
remote_addr	The IP address of the client.
remote_user	The username of the client.
request	The URL and HTTP protocol of the request.
status	The status of the request.
body_bytes_sent	The number of bytes in the response that is returned to the client, excluding the size of the response header.
connection	The serial number of a connection.
connection_requests	The number of requests that are received from a connection.
msec	The time when the log is written. The time is measured in seconds, accurate to milliseconds.
pipe	Indicates whether the request is pipelined. If the request is pipelined, the field value is <code>p</code> . Otherwise, the field value is <code>.</code> .

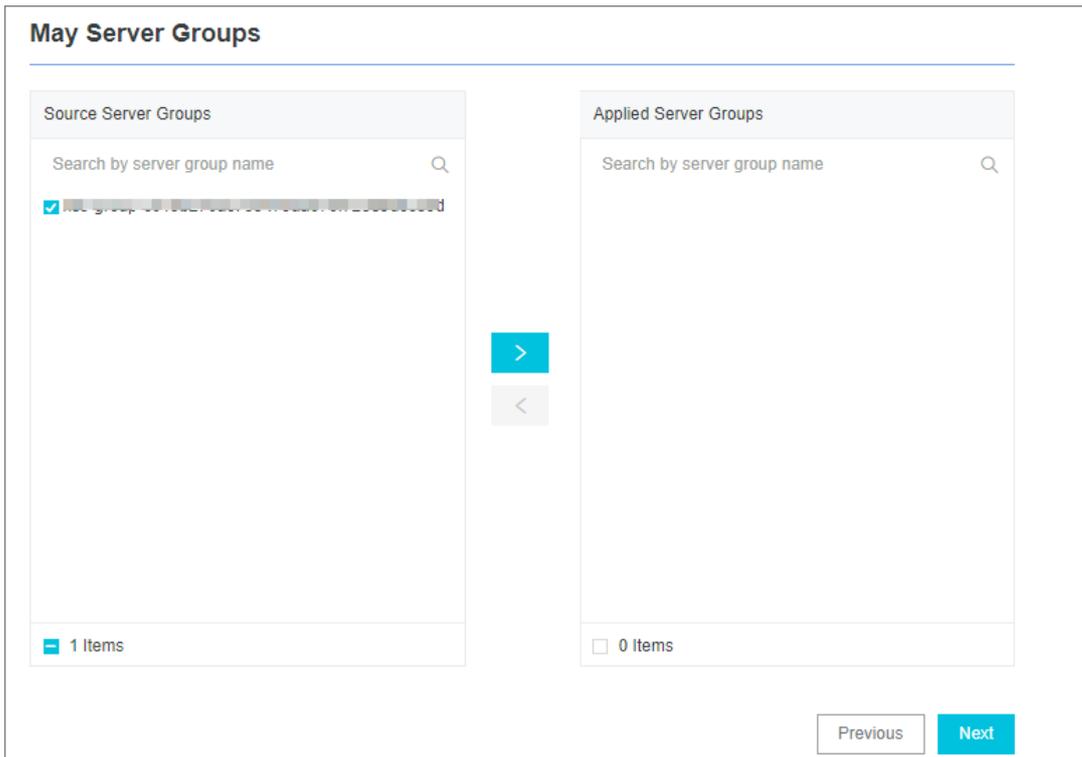

Field	Description
http_referer	The URL of the web page linked to the resource that is being requested.
"http_user_agent"	The browser information of the client. The information must be enclosed by double quotation marks ("").
request_length	The length of the request. The length includes the request line, request header, and request body.
request_time	The time period for which the request is processed. The time period is measured in seconds, accurate to milliseconds. The time period starts when the first byte is read from the client and ends when the log is written after the last byte is sent to the client.
[\$time_local]	The local time in the Common Log Format. The time must be enclosed by brackets [].

Procedure

1. [Log on to the Log Service console.](#)
2. Select a data source. Select **Nginx-Text Log**.
3. Select a Logstore, and then click **Next**. Select an existing project and Logstore. You can also click **Create Now** to create a project and Logstore. For more information, see [Manage a Logstore](#).

If you enter the configuration procedure by clicking the plus sign (+) next to **Data Import** under a Logstore on the Logstores tab, the system skips this step.

4. Create a server group. Before you create a server group, ensure that Logtail is installed.
Install Logtail as prompted. For more information, see [Install Logtail in Linux](#) or [Install Logtail in Windows](#).
After you install Logtail, click **Complete Installation** to create a server group. For more information, see [Overview](#). If you have created a server group, click **Use Existing Server Groups** to select the server group.
5. Configure the server group, and then click **Next**. Select a server group and move the group from **Source Server Groups** to **Applied Server Groups**.

6. Create a Logtail configuration. The following table lists the Logtail parameters.

Parameter	Description
Config Name	<p>The configuration name must be 3 to 128 characters in length, and can contain lowercase letters, digits, hyphens (-), and underscores (_). It must start and end with a lowercase letter or digit.</p> <p>Note The configuration name cannot be modified after it is created.</p>

Parameter	Description
Log Path	<p>The directory and name of the log file.</p> <ul style="list-style-type: none"> The specified log file name can be a complete file name or a file name that contains wildcards. Recursive directory matching is adopted in the log file search. If this matching method is applied, all files that match the specified file name in the specified directory and its sub-directories are monitored. <ul style="list-style-type: none"> Example 1: <code>/apsara/nuwa/ ... /*.log</code> indicates the files whose extension is <code>.log</code> in the <code>/apsara/nuwa</code> directory and its sub-directories are monitored. Example 2: <code>/var/logs/app_* ... /*.log*</code> indicates the files whose file name contains <code>.log</code> in the following directories are monitored: the sub-directories of the <code>/var/logs</code> directory that match the <code>app_*</code> format and the sub-directories of these matching sub-directories. <div style="border: 1px solid #ccc; background-color: #e6f2ff; padding: 10px; margin-top: 10px;"> <p> Note</p> <ul style="list-style-type: none"> Each log file can be collected by using only one Logtail configuration. Only the asterisk (<code>*</code>) and question mark (<code>?</code>) can be used as wildcards in the log path. </div>
Docker File	If the log file to be collected is in a Docker container, you can configure the internal path and container tag. Logtail monitors the creation and destruction of the container, filters logs of the container based on the tag, and collects the filtered logs.
Mode	If you have specified Nginx-Text Log for the data source, the default mode is NGINX Configuration Mode. You can change the mode.
NGINX Log Configuration	Enter the log configuration section that is specified in a standard NGINX configuration file. The section starts with <code>log_format</code> .
NGINX Key	Log Service reads the keys of NGINX logs.
Drop Failed to Parse Logs	<p>Specifies whether to upload logs to Log Service if the logs fail to be parsed.</p> <ul style="list-style-type: none"> If you turn on this switch, logs that fail to be parsed are not uploaded to Log Service. If you turn off this switch, raw logs are uploaded to Log Service when logs fail to be parsed.
Maximum Directory Monitoring Depth	The maximum number of directory layers that can be recursively monitored when logs are collected from the data source. Valid values: 0 to 1000. The value 0 indicates that only the directory specified in the log path is monitored.

7. (Optional)Specify Advanced Options and click Next.Specify Advanced Options based on your business requirements. We recommend that you do not modify the default settings unless otherwise required.

Parameter	Description
Enable Plug-in Processing	Specifies whether to enable plug-in processing. If you turn on this switch, you can use the plug-in of Logtail to process text logs.

Parameter	Description
Upload Raw Log	Specifies whether to upload raw logs. If you turn on this switch, raw logs are written to the <code>__raw__</code> field and uploaded with the parsed logs.
Topic Generation Mode	<ul style="list-style-type: none"> ◦ Null - Do not generate topic: This mode is selected by default. In this mode, the topic is set to an empty string and you can query logs without the need to enter a topic. ◦ Server Group Topic Attributes: This mode is used to differentiate log data that is generated by different frontend servers. ◦ File Path RegEx: If you select this mode, you must enter a value in the Custom RegEx field to extract part of the path as the topic. This mode is used to differentiate log data that is generated by users or instances.
Custom RegEx	Specifies a custom regular expression. If you select File Path RegEx for Topic Generation Mode , you must enter a custom regular expression.
Log File Encoding	<ul style="list-style-type: none"> ◦ utf8: indicates UTF-8 encoding. ◦ gbk: indicates GBK encoding.
Timezone	<p>Specifies the time zone where logs are collected.</p> <ul style="list-style-type: none"> ◦ System Timezone: This option is selected by default. It indicates that the time zone where logs are collected is the same as the time zone to which the server belongs. ◦ Custom: Select a time zone.
Timeout	<p>If a log file is not updated within a specific period of time, Logtail considers the file to be timed out.</p> <ul style="list-style-type: none"> ◦ Never: All log files are continuously monitored and never time out. ◦ 30 Minute Timeout: If a log file is not updated within 30 minutes, Logtail considers the log file to be timed out and no longer monitors the file.
Filter Configuration	<p>Only logs that meet all filter conditions are collected.</p> <p>Examples:</p> <ul style="list-style-type: none"> ◦ Collect logs that meet a condition: Set the condition to <code>Key:level Regex:WARNIN G ERROR</code>. It indicates that only logs with the severity level of WARNING or ERROR are collected. ◦ Filter logs that do not meet a condition: <ul style="list-style-type: none"> ▪ Set the condition to <code>Key:level Regex:^(?!.*(INFO DEBUG)).*</code>. It indicates that logs with the severity level of INFO or DEBUG are not collected. ▪ Set the condition to <code>Key:url Regex:. *^(?!.*(healthcheck)).*</code>. It indicates that logs whose URL contains the keyword healthcheck are not collected. For example, logs in which the key is url and the value is <code>/inner/healthcheck/jiankong.html</code> are not collected.

8. Configure an index. Configure an index based on your business requirements. For more information, see [Enable the index feature and configure indexes for a Logstore](#).

After you complete the settings, you can start to collect NGINX logs.

30.3.1.4.7. Collect IIS logs

This topic describes how to collect Internet Information Services (IIS) logs and configure indexes. You can specify the required settings in the Log Service console.

Context

To meet log analysis requirements, we recommend that you use the W3C Extended Log File Format. To use this format, click **Select Fields** in the IIS Manager, and then select **sc-bytes** and **cs-bytes** in the Standard Fields list.

Log format

The W3C Extended Log File Format is as follows:

```
logExtFileFlags="Date, Time, ClientIP, UserName, SiteName, ComputerName, ServerIP, Method, UriStem, UriQuery, HttpStatus, Win32Status, BytesSent, BytesRecv, TimeTaken, ServerPort, UserAgent, Cookie, Referer, ProtocolVersion, Host, HttpSubStatus"
```

• Field prefixes

Prefix	Description
s-	The server action.
c-	The client action.
cs-	The client-to-server action.
sc-	The server-to-client action.

• Fields

Field	Description
date	The date on which the client sends the request.
time	The time when the client sends the request.
s-sitename	The Internet service name and instance number of the site visited by the client.
s-computername	The name of the server on which the log is generated.
s-ip	The IP address of the server on which the log is generated.
cs-method	The HTTP request method that is used by the client, for example, GET or POST.
cs-uri-stem	The URI resource requested by the client.
cs-uri-query	The query string that follows the question mark (?) in the HTTP request.
s-port	The port number of the server to which the client is connected.
cs-username	The username used by the client to access the server. Authenticated users are referenced as <code>domain\username</code> . Anonymous users are indicated by a hyphen (-).
c-ip	The IP address of the client that sends the request.
cs-version	The protocol version that is used by the client, for example, HTTP 1.0 or HTTP 1.1.

Field	Description
user-agent	The browser that is used by the client.
Cookie	The content of the sent or received cookie. A hyphen (-) is used if no cookie is sent or received.
referer	The site that the client last visited. This site provides a link to the current site.
cs-host	The header name of the host.
sc-status	The HTTP or FTP status code that is returned by the server.
sc-substatus	The HTTP substatus code that is returned by the server.
sc-win32-status	The Windows status code that is returned by the server.
sc-bytes	The number of bytes that are sent by the server.
cs-bytes	The number of bytes that are received by the server.
time-taken	The processing time of the request. Unit: milliseconds.

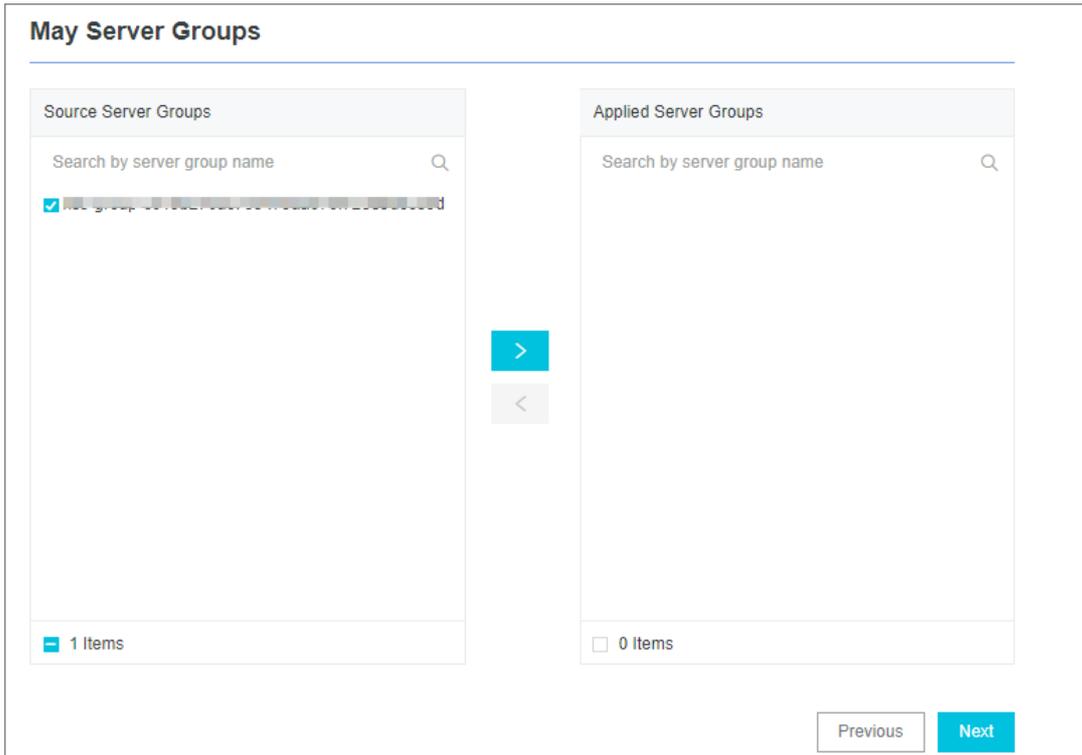

Procedure

1. [Log on to the Log Service console.](#)
2. Select a data source. Select **IIS-Text Log**.
3. Select a Logstore, and then click **Next**. Select an existing project and Logstore. You can also click **Create Now** to create a project and Logstore. For more information, see [Manage a Logstore](#).

If you enter the configuration procedure by clicking the plus sign (+) next to **Data Import** under a Logstore on the Logstores tab, the system skips this step.
4. Create a server group. Before you create a server group, ensure that Logtail is installed.

Install Logtail as prompted. For more information, see [Install Logtail in Linux](#) or [Install Logtail in Windows](#).

After you install Logtail, click **Complete Installation** to create a server group. For more information, see [Overview](#). If you have created a server group, click **Use Existing Server Groups** to select the server group.
5. Configure the server group, and then click **Next**. Select a server group and move the group from **Source Server Groups** to **Applied Server Groups**.

6. Create a Logtail configuration. The following table lists the Logtail parameters.

Parameter	Description
Config Name	<p>The configuration name must be 3 to 128 characters in length, and can contain lowercase letters, digits, hyphens (-), and underscores (_). It must start and end with a lowercase letter or digit.</p> <p>Note The configuration name cannot be modified after it is created.</p>

Parameter	Description
Log Path	<p>The directory and name of the log file.</p> <ul style="list-style-type: none"> The specified log file name can be a complete file name or a file name that contains wildcards. Recursive directory matching is used in the log file search. If this matching method is applied, all files that match the specified file name in the specified directory and its sub-directories are monitored. <ul style="list-style-type: none"> Example 1: <code>/apsara/nuwa/ ... /*.log</code> indicates the files whose extension is <code>.log</code> in the <code>/apsara/nuwa</code> directory and its sub-directories are monitored. Example 2: <code>/var/logs/app_* ... /*.log*</code> indicates the files whose file name contains <code>.log</code> in the following directories are monitored: the sub-directories of the <code>/var/logs</code> directory that match the <code>app_*</code> format and the sub-directories of these matching sub-directories. <div style="border: 1px solid #add8e6; padding: 10px; margin-top: 10px;"> <p> Note</p> <ul style="list-style-type: none"> Each log file can be collected by using only one Logtail configuration. Only the asterisk (<code>*</code>) and question mark (<code>?</code>) can be used as wildcards in the log path. </div>
Docker File	<p>If the log file to be collected is in a Docker container, you can configure the internal path and container tag. Logtail monitors the creation and destruction of the container, filters logs of the container based on the tag, and collects the filtered logs. For more information, see Collect container text logs.</p>
Mode	<p>If you have specified IIS-Text Log for the data source, the default mode is IIS Configuration Mode. You can change the mode.</p>
Log Format	<p>Select the log format of your IIS server logs. Valid values:</p> <ul style="list-style-type: none"> IIS: Microsoft IIS log file format NCSA: NCSA Common log file format W3C: W3C Extended Log File Format
IIS Configuration	<p>Enter the log configuration section that is specified in an IIS configuration file.</p> <ul style="list-style-type: none"> If you select IIS or NCSA, the fields of the IIS log format are preconfigured. If you select W3C, enter the content that is specified for the <code>logFile logExtFileFlags</code> in the configuration file. For more information, see Specify the IIS Configuration field.
IIS Key Name	<p>Log Service reads the keys of IIS logs.</p>
Drop Failed to Parse Logs	<p>Specifies whether to upload logs to Log Service if the logs fail to be parsed.</p> <ul style="list-style-type: none"> If you turn on this switch, logs that fail to be parsed are not uploaded to Log Service. If you turn off this switch, raw logs are uploaded to Log Service when logs fail to be parsed.

Parameter	Description
Maximum Directory Monitoring Depth	The maximum number of directory layers that can be recursively monitored when logs are collected from the data source. Valid values: 0 to 1000. The value 0 indicates that only the directory that is specified in the log path is monitored.

7. Specify the IIS Configuration field.

i. Open the IIS configuration file.

- Default path of the IIS5 configuration file: *C:\WINNT\system32\inetrv\MetaBase.bin*
- Default path of the IIS6 configuration file: *C:\WINDOWS\system32\inetrv\MetaBase.xml*
- Default path of the IIS7 configuration file: *C:\Windows\System32\inetrv\config\applicationHost.config*

ii. Find the `logFile logExtFileFlags` field and copy the text in the quotation marks that follow the field name.

iii. Paste the text into the quotation marks (") in the IIS Configuration field.

8. (Optional)Specify Advanced Options and click Next.Specify Advanced Options based on your business requirements. We recommend that you do not modify the default settings unless otherwise required.

Parameter	Description
Enable Plug-in Processing	Specifies whether to enable plug-in processing. If you turn on this switch, you can use the plug-in of Logtail to process text logs.
Upload Raw Log	Specifies whether to upload raw logs. If you turn on this switch, raw logs are written to the <code>__raw__</code> field and uploaded with the parsed logs.
Topic Generation Mode	<ul style="list-style-type: none"> ○ Null - Do not generate topic: This mode is selected by default. In this mode, the topic is set to an empty string and you can query logs without the need to enter a topic. ○ Server Group Topic Attributes: This mode is used to differentiate log data that is generated by different frontend servers. ○ File Path RegEx: If you select this mode, you must enter a value in the Custom RegEx field to extract part of the path as the topic. This mode is used to differentiate log data that is generated by users or instances.
Custom RegEx	Specifies a custom regular expression. If you select File Path RegEx for Topic Generation Mode , you must enter a custom regular expression.
Log File Encoding	<ul style="list-style-type: none"> ○ <code>utf8</code>: indicates UTF-8 encoding. ○ <code>gbk</code>: indicates GBK encoding.
Timezone	<p>Specifies the time zone where logs are collected.</p> <ul style="list-style-type: none"> ○ System Timezone: This option is selected by default. It indicates that the time zone where logs are collected is the same as the time zone to which the server belongs. ○ Custom: Select a time zone.
Timeout	<p>If a log file is not updated within a specific period of time, Logtail considers the file to be timed out.</p> <ul style="list-style-type: none"> ○ Never: All log files are continuously monitored and never time out. ○ 30 Minute Timeout: If a log file is not updated within 30 minutes, Logtail considers the log file to be timed out and no longer monitors the file.

Parameter	Description
Filter Configuration	<p>Only logs that meet all filter conditions are collected.</p> <p>Examples:</p> <ul style="list-style-type: none"> Collect logs that meet a condition: Set the condition to <code>Key:level Regex:WARNIN G ERROR</code>. It indicates that only logs with the severity level of WARNING or ERROR are collected. Filter logs that do not meet a condition: <ul style="list-style-type: none"> Set the condition to <code>Key:level Regex:^(?!.*(INFO DEBUG)).*</code>. It indicates that logs with the severity level of INFO or DEBUG are not collected. Set the condition to <code>Key:url Regex:.^(?!.*(healthcheck)).*</code>. It indicates that logs whose URL contains the keyword healthcheck are not collected. For example, logs in which the key is url and the value is <code>/inner/healthcheck/jiangong.html</code> are not collected.

9. Configure an index. Configure an index based on your business requirements. For more information, see [Enable the index feature and configure indexes for a Logstore](#).

After you complete the settings, you can start to collect IIS logs.

30.3.1.4.8. Collect Apache logs

This topic describes how to collect Apache logs and configure indexes. You can specify the required settings in the Log Service console.

Log formats

The Apache configuration file defines two log formats: combined log format and common log format. You can also customize a log format.

- Syntax of the combined log format:

```
LogFormat "%h %l %u %t \"%r\" %>s %b \"%{Referer}i\" \"%{User-Agent}i\"" combined
```

- Syntax of the common log format:

```
LogFormat "%h %l %u %t \"%r\" %>s %b"
```

- Syntax of a custom log format:

```
LogFormat "%h %l %u %t \"%r\" %>s %b \"%{Referer}i\" \"%{User-Agent}i\" %D %f %k %p %q %R %T %I %O" customized
```

You must specify the log format, log file directory, and log file name in the Apache configuration file. For example, the following declaration in the configuration file indicates that the combined log format is used. The log file directory is `/var/log/apache2/access_log` and the log file name is `access_log`.

```
CustomLog "/var/log/apache2/access_log" combined
```

Apache log fields

Format string	Key name	Description
%a	client_addr	The IP address of the client in the request.

Format string	Key name	Description
%A	local_addr	The local private IP address.
%b	response_size_bytes	The size of the response. Unit: bytes. If no bytes are sent, the value is "-" .
%B	response_bytes	The size of the response. Unit: bytes. If no bytes are sent, the value is 0.
%D	request_time_msec	The time period for which the request is processed. Unit: milliseconds.
%h	remote_addr	The name of the remote host.
%H	request_protocol_supple	The request protocol.
%l	remote_ident	The identity information that is provided by a remote computer.
%m	request_method_supple	The request method.
%p	remote_port	The port number of the server.
%P	child_process	The ID of the child process.
%q	request_query	The query string. If it does not exist, the value is an empty string.
"%r"	request	The request, which includes the method name, address, and HTTP protocol.
%s	status	The HTTP status code for the response.
%>s	status	The HTTP status code for the final response.
%f	filename	The name of the requested file.
%k	keep_alive	The number of keep-alive requests.
%R	response_handler	The type of the handler that generates the response on the server.
%t	time_local	The local time when the server receives the request.
%T	request_time_sec	The time period for which the request is processed. Unit: seconds.
%u	remote_user	The username that you used to log on to the client.
%U	request_uri_supple	The requested URL, excluding query strings.
%v	server_name	The name of the server.
%V	server_name_canonical	The server name based on the UseCanonicalName setting.
%I	bytes_received	The number of bytes that are received by the server. To use this field, you must enable the mod_logio module.

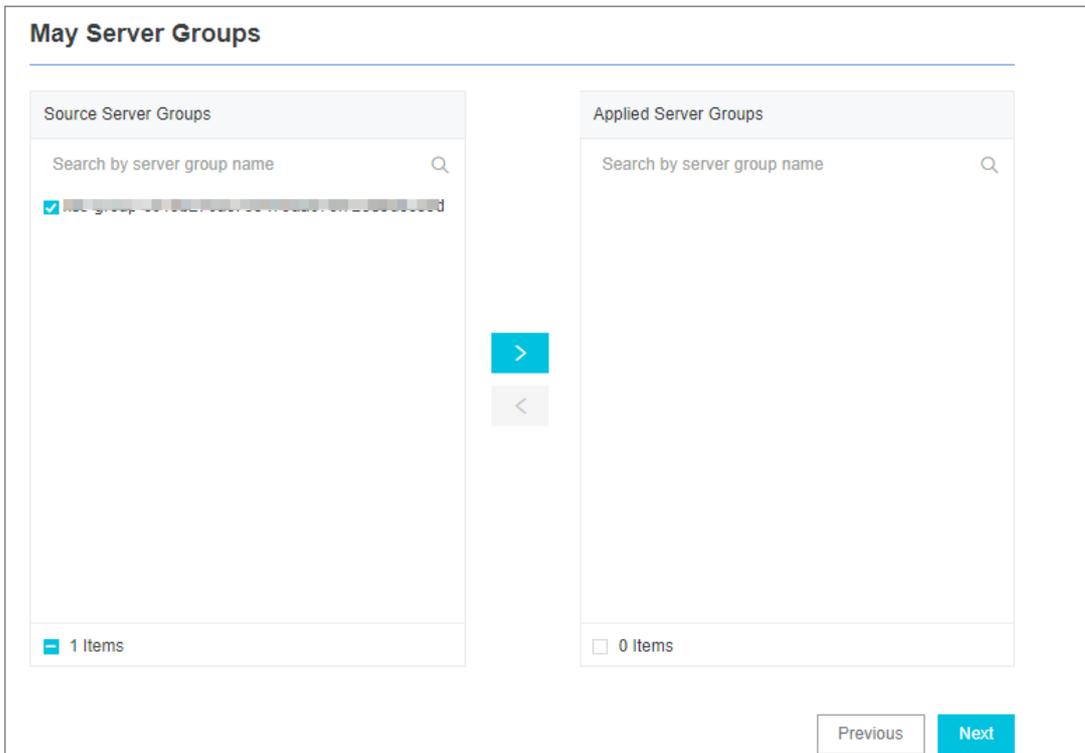

Format string	Key name	Description
%O	bytes_sent	The number of bytes that are sent by the server. To use this field, you must enable the mod_logio module.
"%{User-Agent}i"	http_user_agent	The information about the client.
"%{Referer}i"	http_referer	The URL of the web page linked to the resource that is being requested.

Sample log

```
192.168.1.2 - - [02/Feb/2016:17:44:13 +0800] "GET /favicon.ico HTTP/1.1" 404 209 "http://localhost/x1.html" "Mozilla/5.0 (Macintosh; Intel Mac OS X 10_11_3) AppleWebKit/537.36 (KHTML, like Gecko) Chrome/48.0.2564.97 Safari/537.36"
```

Procedure

1. [Log on to the Log Service console.](#)
2. Select a data source. Select **Apache-Text Log**.
3. Select a Logstore, and then click Next. Select an existing project and Logstore. You can also click **Create Now** to create a project and Logstore. For more information, see [Manage a Logstore](#).
If you enter the configuration procedure by clicking the plus sign (+) next to **Data Import** under a Logstore on the Logstores tab, the system skips this step.
4. Create a server group. Before you create a server group, ensure that Logtail is installed.
Install Logtail as prompted. For more information, see [Install Logtail in Linux](#) or [Install Logtail in Windows](#).
After you install Logtail, click **Complete Installation** to create a server group. For more information, see [Overview](#). If you have created a server group, click **Use Existing Server Groups** to select the server group.
5. Configure the server group, and then click Next. Select a server group and move the group from **Source Server Groups** to **Applied Server Groups**.

6. Create a Logtail configuration. The following table lists the Logtail parameters.

Parameter	Description
Config Name	<p>The configuration name must be 3 to 128 characters in length, and can contain lowercase letters, digits, hyphens (-), and underscores (_). It must start and end with a lowercase letter or digit.</p> <p> Note The configuration name cannot be modified after it is created.</p>
Log Path	<p>The directory and name of the log file.</p> <ul style="list-style-type: none"> ○ The specified log file name can be a complete file name or a file name that contains wildcards. ○ Recursive directory matching is used in the log file search. If this matching method is applied, all files that match the specified file name in the specified directory and its sub-directories are monitored. <ul style="list-style-type: none"> ▪ Example 1: <code>/apsara/nuwa/ ... /*.log</code> indicates the files whose extension is <code>.log</code> in the <code>/apsara/nuwa</code> directory and its sub-directories are monitored. ▪ Example 2: <code>/var/logs/app_* ... /*.log*</code> indicates the files whose file name contains <code>.log</code> in the following directories are monitored: the sub-directories of the <code>/var/logs</code> directory that match the <code>app_*</code> format and the sub-directories of these matching sub-directories. <p> Note</p> <ul style="list-style-type: none"> ▪ Each log file can be collected by using only one Logtail configuration. ▪ Only the asterisk (<code>*</code>) and question mark (<code>?</code>) can be used as wildcards in the log path.
Docker File	<p>If the log file to be collected is in a Docker container, you can configure the internal path and container tag. Logtail monitors the creation and destruction of the container, filters logs of the container based on the tag, and collects the filtered logs. For more information, see Collect container text logs.</p>
Mode	<p>If you have specified Apache-Text Log for the data source, the default mode is Apache Configuration Mode. You can change the mode.</p>
Log Format	<p>Select a log format based on the format declared in your Apache log configuration file. To facilitate the query and analysis of log data, we recommend that you use a custom Apache log format.</p>
APACHE Logformat Configuration	<p>Enter the log configuration section that is specified in the Apache configuration file. The section starts with <code>LogFormat</code>.</p> <p> Note If the specified Log Format is Common or Combined, the system enters a commonly used syntax of the log format. Check whether the log format is the same as that defined in the Apache configuration file.</p>

Parameter	Description
APACHE Key Name	Log Service reads the keys of Apache logs. Confirm the key names on the Logtail configuration page.
Drop Failed to Parse Logs	<p>Specifies whether to upload logs to Log Service if the logs fail to be parsed.</p> <ul style="list-style-type: none"> ◦ If you turn on this switch, logs that fail to be parsed are not uploaded to Log Service. ◦ If you turn off this switch, raw logs are uploaded to Log Service when logs fail to be parsed.
Maximum Directory Monitoring Depth	The maximum number of directory layers that can be recursively monitored when logs are collected from the data source. Valid values: 0 to 1000. The value 0 indicates that only the directory specified in the log path is monitored.

7. (Optional)Specify Advanced Options and click Next.Specify Advanced Options based on your business requirements. We recommend that you do not modify the default settings unless otherwise required.

Parameter	Description
Enable Plug-in Processing	Specifies whether to enable plug-in processing. If you turn on this switch, you can use the plug-in of Logtail to process text logs.
Upload Raw Log	Specifies whether to upload raw logs. If you turn on this switch, raw logs are written to the <code>__raw__</code> field and uploaded with the parsed logs.
Topic Generation Mode	<ul style="list-style-type: none"> ◦ Null - Do not generate topic: This mode is selected by default. In this mode, the topic is set to an empty string and you can query logs without the need to enter a topic. ◦ Server Group Topic Attributes: This mode is used to differentiate log data that is generated by different frontend servers. ◦ File Path RegEx: If you select this mode, you must enter a value in the Custom RegEx field to extract part of the path as the topic. This mode is used to differentiate log data that is generated by users or instances.
Custom RegEx	Specifies a custom regular expression. If you select File Path RegEx for Topic Generation Mode , you must enter a custom regular expression.
Log File Encoding	<ul style="list-style-type: none"> ◦ utf8: indicates UTF-8 encoding. ◦ gbk: indicates GBK encoding.
Timezone	<p>Specifies the time zone where logs are collected.</p> <ul style="list-style-type: none"> ◦ System Timezone: This option is selected by default. It indicates that the time zone where logs are collected is the same as the time zone to which the server belongs. ◦ Custom: Select a time zone.
Timeout	<p>If a log file is not updated within a specific period of time, Logtail considers the file to be timed out.</p> <ul style="list-style-type: none"> ◦ Never: All log files are continuously monitored and never time out. ◦ 30 Minute Timeout: If a log file is not updated within 30 minutes, Logtail considers the log file to be timed out and no longer monitors the file.

Parameter	Description
Filter Configuration	<p>Only logs that meet all filter conditions are collected.</p> <p>Examples:</p> <ul style="list-style-type: none"> ○ Collect logs that meet a condition: Set the condition to <code>Key:level Regex:WARNIN G ERROR</code> . It indicates that only logs with the severity level of WARNING or ERROR are collected. ○ Filter logs that do not meet a condition: <ul style="list-style-type: none"> ▪ Set the condition to <code>Key:level Regex:^(?!.*(INFO DEBUG)).*</code> . It indicates that logs with the severity level of INFO or DEBUG are not collected. ▪ Set the condition to <code>Key:url Regex:.*^(?!.*(healthcheck)).*</code> . It indicates that logs whose URL contains the keyword healthcheck are not collected. For example, logs in which the key is url and the value is <code>/inner/healthcheck/jiangkok.html</code> are not collected.

8. Configure an index. Configure an index based on your business requirements. For more information, see [Enable the index feature and configure indexes for a Logstore](#).

After you complete the settings, you can start to collect Apache logs.

30.3.1.4.9. Configure parsing scripts

This topic describes how to configure log contents for log collection.

Specify a method to separate log lines

A complete access log such as an NGINX access log occupies a line. Separate multiple log entries with line breaks. For example, the following shows two access logs:

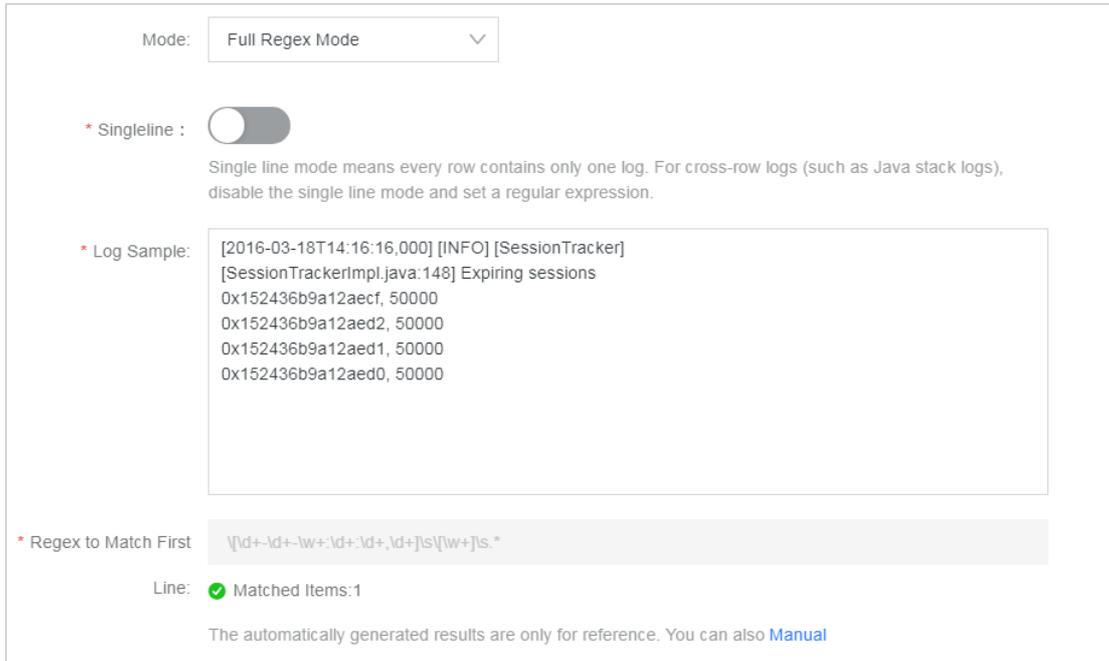

```
10.1.1.1 - - [13/Mar/2016:10:00:10 +0800] "GET / HTTP/1.1" 0.011 180 404 570 "-" "Mozilla/4.0 (compatible; MSIE 6.0; Windows NT 5.1; 360se)"
10.1.1.1 - - [13/Mar/2016:10:00:11 +0800] "GET / HTTP/1.1" 0.011 180 404 570 "-" "Mozilla/4.0 (compatible; MSIE 6.0; Windows NT 5.1; 360se)"
```

For Java applications, a log entry usually spans several lines. Therefore, log entries are separated based on the identifier at the beginning of each log entry. The following example shows a Java application log.

```
[2016-03-18T14:16:16,000] [INFO] [SessionTracker] [SessionTrackerImpl.java:148] Expiring sessions
0x152436b9a12aecf, 50000
0x152436b9a12aed2, 50000
0x152436b9a12aed1, 50000
0x152436b9a12aed0, 50000
```

The preceding Java application log entries each start with a time field. The regular expression that matches these time fields is `[\d+-\d+-\w+:\d+:\d+,\d+]\s.*` . You can enter information in the Log Service console as shown in the following figure.

Full regular expression mode

Extract log fields

To conform to the data models of Log Service, a log contains one or more key-value pairs. If you want to extract specific fields for analysis, you must set a regular expression. If you do not want to process the contents of a log, you can treat the log as a key-value pair.

You can determine whether to extract fields from the preceding NGINX access log.

- Extract fields

The regular expression is `(\S+)\s-\s-\s\[([\S+)\s[^\]]+\]\s"(\w+).*`. The extracted fields are `10.1.1.1`, `13/Mar/2016:10:00`, and `GET`.

- Extract all

The regular expression is `(.*)`. The extracted field is `10.1.1.1 -- [13/Mar/2016:10:00:10 +0800] "GET / HTTP/1.1" 0.011 180 404 570 "-" "Mozilla/4.0 (compatible; MSIE 6.0; Windows NT 5.1; 360se)"`.

Specify a log time

To conform to the data models of Log Service, a log must have a time field in the Unix timestamp format. You can use the system time when Logtail collects a log or the time in the log contents as the log time.

For the preceding NGINX access log:

- If you extract the time field from the log contents as the log time, the time is `13/Mar/2016:10:00:10` and the time expression is `%d/%b/%Y:%H:%M:%S`.
- If you use the system time when the log was collected as the log time, the log time is converted into a timestamp.

30.3.1.4.10. Configure the time format

Each log in Log Service must have a timestamp that records the log generation time. When you collect logs from log files, Logtail must extract the timestamp string of each log and parse it into a timestamp. Therefore, you need to specify a timestamp format to facilitate parsing.

In Linux, Logtail supports all time formats provided by the `strptime()` function. If a timestamp string can match one of the time formats that are provided by the `strptime()` function, Logtail can parse and use the timestamp string.

Note

- The log timestamp is accurate to seconds. Therefore, you need to specify seconds in a time format, without the need for other information such as milliseconds or microseconds.
- In addition, you need to configure the time field rather than other information.

Common log time formats supported by Logtail

The timestamp strings of logs have diverse formats. To make configuration easier, the following table lists the common log time formats supported by Logtail:

Format	Description	Example
%a	The abbreviation of a day in a week.	Fri
%A	The day in a week.	Friday
%b	The abbreviation of a month.	Jan
%B	The month name.	January
%d	The numerical day in a month. Valid values: 01 to 31.	07 and 31
%h	The abbreviation of a month. The format is equivalent to %b .	Jan
%H	The hour in the 24-hour format.	22
%I	The hour in the 12-hour format.	11
%m	The numerical month.	08
%M	The numerical minute. Valid values: 00 to 59.	59
%n	A line break.	Line break
%p	The local time in the a.m. or p.m. format.	AM and PM
%r	The time in the 12-hour format. The format is equivalent to %I:%M:%S %p .	11:59:59 AM
%R	The time includes hours and minutes. The format %R is equivalent to %H:%M .	23:59
%S	The numerical second. Valid values: 00 to 59.	59
%t	A tab.	Tab
%y	The two-digit numerical year. Valid values: 00 to 99.	04 and 98
%Y	The four-digit numerical year.	2004 and 1998

Format	Description	Example
%C	The numerical century. Valid values: 00 to 99.	16
%e	The numerical day in a month. Valid values: 1 to 31. A single digit is preceded by a space.	7 and 31
%j	The numerical day in a year. Valid values: 001 to 366.	365
%u	The numerical day in a week. Valid values: 1 to 7, in which 1 represents Monday.	2
%U	The numerical week in a year. Sunday is the first day of a week. Valid values: 00 to 53.	23
%V	The numerical week in a year. Monday is the first day of a week. If a week has four or more days that start from January 1, the week is treated as the first week. Otherwise, the next week is treated as the first week. Valid values: 01 to 53.	24
%w	The numerical day in a week. Valid values: 0 to 6, in which 0 represents Sunday.	5
%W	The numerical week in a year. Monday is the first day of a week. Valid values: 00 to 53.	23
%c	The standard date and time.	To specify more information such as the long date and short date, you can use the preceding formats to provide exact expression.
%x	The standard date.	To specify more information such as the long date and short date, you can use the preceding formats to provide exact time expressions.
%X	The standard time.	To specify more information such as the long date and short date, you can use the preceding formats to provide exact expression.
%s	The Unix timestamp.	1476187251

Example

The following table lists the common log time formats, examples, and corresponding time expressions.

Log time format	Example	Time expression
Custom	2017-12-11 15:05:07	%Y-%m-%d %H:%M:%S
Custom	[2017-12-11 15:05:07.012]	[%Y-%m-%d %H:%M:%S]

Log time format	Example	Time expression
RFC822	02 Jan 06 15:04 MST	%d %b %y %H:%M
RFC822Z	02 Jan 06 15:04 -0700	%d %b %y %H:%M
RFC850	Monday, 02-Jan-06 15:04:05 MST	%A, %d-%b-%y %H:%M:%S
RFC1123	Mon, 02 Jan 2006 15:04:05 MST	%A, %d-%b-%y %H:%M:%S
RFC3339	2006-01-02T15:04:05Z07:00	%Y-%m-%dT%H:%M:%S
RFC3339Nano	2006-01-02T15:04:05.999999999Z07:00	%Y-%m-%dT%H:%M:%S

30.3.1.4.11. Import historical logs

Logtail collects incremental logs by default. If you want to import historical logs, use the historical log importing feature of Logtail.

Prerequisites

To collect logs from Linux servers, use Logtail 0.16.15 or later. To collect logs from Windows servers, use Logtail 1.0.0.1 or later. To ensure successful log collection, update Logtail to the latest version.

Context

Logtail collects log files based on events. The system captures events by detecting or polling files for changes at intervals. Additionally, Logtail can load events from local files to trigger log collection. Logtail implements historical log collection based on these local events.

You can import historical log files from the Logtail installation directory. The location of the directory varies based on the operating system.

- Linux: `/usr/local/ilogtail`
- Windows:
 - 32-bit: `C:\Program Files\Alibaba\Logtail`
 - 64-bit: `C:\Program Files (x86)\Alibaba\Logtail`

Note

- The maximum interval between the time a local event is generated and the time the local event is imported is one minute.
- Loading local configurations is a special action. Therefore, Logtail sends the `LOAD_LOCAL_EVENT_ALARM` alert to your server to notify you of this action.
- If you want to import a large number of log files, we recommend that you modify the Logtail startup configuration to increase the upper limit of CPU to 2.0 GHz or more and the upper limit of the memory size to 512 MB or more. For more information, see [Set Logtail startup parameters](#).

Procedure

1. Configure log collection. If a collection configuration is only used to import historical log files, you can specify a collection directory that does not exist. For more information, see [Configure text log collection](#).
2. Obtain a unique identifier for a collection configuration. Obtain the unique identifier in the `user_log_config.json` file stored in the installation directory of Logtail. In Linux, use the `grep` command in the directory to query the unique identifier. In Windows, use tools such as Notepad to query the unique identifier. To query a unique identifier in a Linux operating system, run the following command:

```
grep "###" /usr/local/ilogtail/user_log_config.json | awk '{print $1}'
###1.0##log-config-test$multi"
###1.0##log-config-test$ecs-test"
###1.0##log-config-test$metric_system_test"
###1.0##log-config-test$redis-status"
```

3. Add local events. Local events are stored in the *local_event.json* file that resides in the installation directory of Logtail. The file is in the JSON format. The syntax is:

```
[
  {
    "config": "${your_config_unique_id}",
    "dir": "${your_log_dir}",
    "name": "${your_log_file_name}"
  },
  {
    ...
  }
  ...
]
```

Parameters

Parameter	Description	Example
config	The unique identifier that is obtained in Step 2.	###1.0##log-config-test\$ecs-test
dir	The directory where logs are stored. Note The directory cannot end with a slash (/).	/data/logs
name	The name of a log file. Wildcards are supported.	For example, access.log.2018-08-08 and access.log*

Note To prevent Logtail from loading invalid JSON files, save local event configurations to a temporary file, edit the configurations in the temporary file, and copy the contents to the *local_event.json* file.

Configuration examples

In a Windows system, you can use tools such as Notepad to add local events to the *local_event.json* file. In a Linux system, add local events as follows:

```
$ cat /usr/local/ilogtail/local_event.json
[
  {
    "config": "##1.0##log-config-test$ecs-test",
    "dir": "/data/log/",
    "name": "access.log."
  },
  {
    "config": "##1.0##log-config-test$ecs-test",
    "dir": "/tmp",
    "name": "access.log.2017-08-09"
  }
]
```

What's next

- Check whether Logtail has loaded configurations

After you save the `local_event.json` file, Logtail loads the configuration file to the memory within one minute and clears the contents of the `local_event.json` file.

To check whether Logtail has read local events, use the following methods:

- If the contents of the `local_event.json` file are cleared, it indicates that Logtail has read the local events.
- Check whether the `ilogtail.LOG` file in the Logtail installation directory contains the `process local event` keywords. If the contents of the `local_event.json` are cleared and these keywords cannot be found, the local configuration file may be screened due to invalid contents.
- Check whether the configuration is loaded but no data is collected

Possible causes are as follows:

 - The configuration is invalid.
 - The local `config` file does not exist.
 - The log file does not exist in the path specified in the collection configuration.
 - The log file has been collected by Logtail.

30.3.1.4.12. Generate a topic

This topic describes how to generate a topic in the Log Service console. After you generate a topic, you can use the topic to group logs. You can specify topics for logs when these logs are written. You can use a topic as a filter when you query logs.

Topic generation modes

You can set a topic when you use Logtail to collect logs or when you use API operations or SDKs to upload logs. The following topic generation modes are available in the Log Service console: **Null - Do not generate topic**, **Server Group Topic Attributes**, and **File Path RegEx**.

- **Null - Do not generate topic**

When you configure Logtail in the Log Service console to collect text logs, the default topic generation mode is **Null - Do not generate topic**. In this mode, no topic is generated and query logs without specifying a topic.

- **Server Group Topic Attributes**

You can use this mode to identify logs that are generated from multiple servers. Logs from multiple servers can be stored in the same file or directory. To identify these logs based on topics during log collection, you can create server groups and add the servers into different groups. When you create server groups, you must specify a unique topic attribute for each server group and set **Topic Generation Mode** to **Server Group Topic Attributes**. After you complete the configuration, apply the Logtail settings to the server groups.

If the **Server Group Topic Attributes** mode is selected, Logtail uploads the topic attribute of each server group as topics to Log Service. When you query logs, you must specify the topic of the target server group as a filter.

● **File Path RegEx**

- You can use this mode to differentiate between logs that are generated by multiple users or instances. If Log Service stores logs in different directories for different users or instances, duplicate sub-directory names or log file names may exist in these directories. As a result, Log Service cannot identify the source of logs. You can select **File Path RegEx** in the **Topic Generation Mode** field. Enter a regular expression that matches an absolute file path, and set an instance name as a topic.
- If you select **File Path RegEx**, Logtail uses an instance name as the topic of the logs that Logtail uploads to Log Service. The topic generated varies based on your directory structure and configuration. You must specify an instance name as a topic when you query logs. For example, the following directory structure includes directories that each store logs generated by different users or instances:

```

/logs
| - /userA/serviceA
| - service.log
| - /userB/serviceA
| - service.log
| - /userC/serviceA
| - service.log
    
```

- If you want to extract multiple separate fields from a file path, use a multi-layer extraction method of `<key> ?P <key>`. The value of the key can contain lowercase letters and digits. For example:

```

/home/admin/serviceA/userB/access.log
\\home\\admin\\(? P<service>[^\]+)/(? P<user>[^\]+)/. *
    
```

The following custom tags are created for logs:

```

"__tag__ : service : serviceA"
"__tag__ : user : userB"
    
```

 **Note** Logtail 0.16.19 and later are supported.

- If you specify the `/logs` file path and the `service.log` file name in a regular expression, Logtail collects logs from the preceding directories that contain the `service.log` file and uploads the logs to Log Service. However, Log Service cannot identify the log source based on log contents. You can select **File Path RegEx** in the **Topic Generation Mode** field, and enter the `\\(.*)\\serviceA\\.*` regular expression to extract instance names. After the configuration is complete, the following topics are generated for logs in different directories: `userA`, `userB`, and `userC`. You can specify a topic as a filter to query logs.

 **Note** You must escape the forward slashes (/) in the file path that the regular expression contains.

● **Static topic generation**

You can select **File Path RegEx** in the **Topic Generation Mode** field, and enter `customized:// + custom topic` in the **Custom RegEx** field.

 **Note** Logtail 0.16.21 and later are supported.

Set a log topic

1. Configure Logtail in the Log Service console. For more information, see [Configure text log collection](#). To set the topic generation mode to **Server Group Topic Attributes**, go to the **Topic** section on the server group creation or modification page.
2. In the Logtail Configuration for Data Import step, click **Advanced Options** and select a **topic generation mode**.

30.3.1.5. Custom plug-ins

Context

Log Service allows you to collect text logs and system logs through Logtail. Logtail supports connections with multiple data sources, such as HTTP or MySQL query results and MySQL binary logs.

You can collect HTTP request data and upload the processing results to Log Service in real time to check service availability check and continuous availability monitoring. You can configure MySQL query results as the data source, and then synchronize incremental data based on custom IDs or time. You can also configure an SQL data source to synchronize MySQL binary logs, subscribe to database changes, and query or analyze logs in real time.

 **Note** This feature is only supported on Linux and must be used together with Logtail. 0.16.0 or later versions. For more information, see [Install Logtail in Linux](#).

Procedure

1. Configure a method that is used to collect logs from the data source.

Different Logtail configurations for different data sources. Select a Logtail configuration according to your data source.

- [Collect MySQL binary logs](#)
- [Collect MySQL query results](#)
- [Collect HTTP request data](#)
- [Collect container standard outputs](#)

2. Configure a processing method.

Logtail provides multiple processing methods for binary logs, MySQL query results, NGINX monitoring data, and HTTP input sources. You can configure multiple processing methods for a single input source. Each input source supports all processing methods. Logtail runs the configured processing methods in sequence.

For more information, see [Process collected data](#).

3. Apply the configurations to the machine group.

After you configure the collection and processing methods, apply them to the specified machine group. Then, Logtail automatically applies the configurations and starts data collection.

30.3.1.5.1. Collect MySQL binary logs

Logtail acts as a MySQL slave that collects binary logs from a MySQL master. This improves log collection performance. Logtail collects binary logs in a similar way to Alibaba Canal.

Features

- Allows you to collect incremental data of databases through binary logs to improve performance. Supports MySQL databases such as ApsaraDB for RDS databases.
- Supports multiple database filters, such as regular expressions.

- Allows you to set binary log file positions.
- Allows you to records synchronization statuses by using the checkpoint mechanism.

Limits

- MySQL binary logs are available only for Logtail 0.16.0 or later that you install on Linux. For more information about how to update Logtail and view Logtail versions, see [Install Logtail in Linux](#).
- Binary logs in the ROW format must be enabled for MySQL databases. Binary logs in the ROW format are enabled for RDS instances by default.

```
# Check whether binary logs are enabled.
mysql> show variables like "log_bin";
+-----+-----+
| Variable_name | Value |
+-----+-----+
| log_bin      | ON   |
+-----+-----+
1 row in set (0.02 sec)

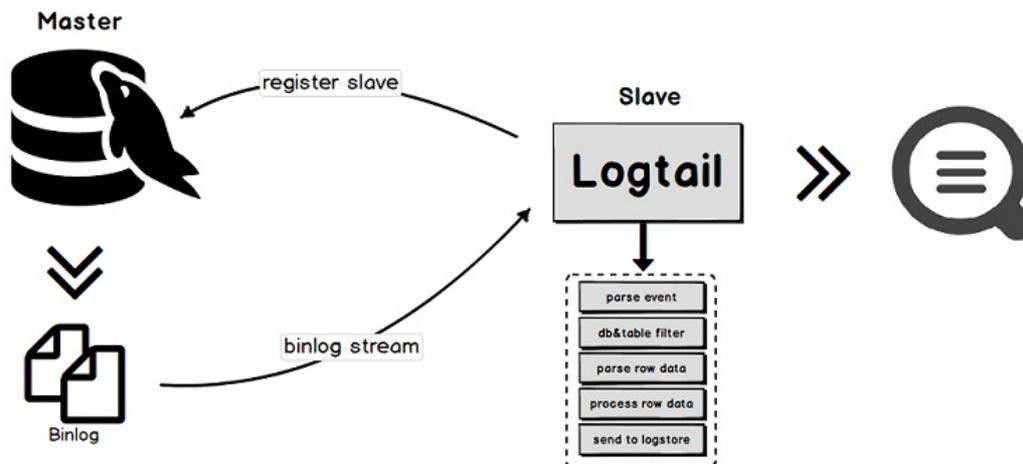

# View the format of binary logs.
mysql> show variables like "binlog_format";
+-----+-----+
| Variable_name | Value |
+-----+-----+
| binlog_format | ROW  |
+-----+-----+
1 row in set (0.03 sec)
```

- Each server ID must be unique. Make sure that the ID of each slave to be synchronized is unique.
- Limits on RDS instances
 - Logtail cannot be installed on an RDS instance. You must install Logtail on an ECS instance that can communicate with the target RDS instance.
 - Secondary RDS databases do not support binary log collection. You must configure a primary RDS database for binary log collection.

Procedure

Logtail enables communication between master and slave MySQL servers. The process is as follows:

1. Logtail acts as a MySQL slave and sends dump requests to the MySQL master.
2. After the dump requests are received, the MySQL master delivers its binary logs to Logtail in real time.
3. Logtail then parses and filters binary logs, and uploads the results to Log Service.

Scenarios

The MySQL binary log feature is suitable for scenarios that require high-performance synchronization of large amounts of data. The following lists some example scenarios:

- Query and analyze incremental data of databases in real time.
- Audit operations performed on databases.
- Use Log Service to perform custom queries and analysis on database updates, visualize the query and analysis results, transform data for stream processing, export log data to MaxCompute for offline computing, and export log data to OSS for long-term storage.

Data reliability

We recommend that you enable the global transaction identifier (GTID) feature of MySQL database servers and upgrade Logtail to version 0.16.15 or later. This avoids repeated data collection in case of a master/slave switchover and ensures data reliability.

- **Incomplete collection of data:** If the network between Logtail and the MySQL server is broken for a long period of time, data may not be completely collected.

A MySQL binary log plug-in acts as a MySQL slave to collect binary logs from the master. Logtail establishes a connection with the master server to obtain data from the server. If the network between Logtail and the master node is broken, the master node still generates new binary logs and deletes expired binary logs. After the network is restored and Logtail is reconnected to the master, Logtail uses the last checkpoint to request binary log data from the master. However, if the network has been disconnected for an extended period of time, the data after the checkpoint may have been deleted. In this case, the recovery mechanism specifies the new point at which Logtail resumes collecting binary logs. The new point at which Logtail resumes collecting binary logs is the most recent binary log file position. If a network is broken for an extended period of time, data collection may be incomplete between the checkpoint and the new data collection point.

- **Repeated data collection:** If the binary log numbers on the master and slave are different and a master/slave switchover occurs, repeated data collection may occur.

When the MySQL master-slave synchronization is configured, the master synchronizes the generated binary log data to the slave, and the slave stores the received binary log data to the local binary log file. If the binary log numbers on the master and slave are different, a master/slave switchover occurs. In this case, the mechanism that uses a binary log file name and an offset as the checkpoint will cause repeated data collection.

For example, a piece of data ranges from (binlog.100, 4) to (binlog.105, 4) on the master while ranges from (binlog.1000, 4) to (binlog.1005, 4) on the slave. Logtail has obtained the data from the master and updated the checkpoint to (binlog.105, 4). In this case, if a master/slave switchover occurs with no exception, Logtail continues to obtain binary logs from the new master based on the local checkpoint (binlog.105, 4). The new master returns the data ranging from (binlog.1000, 4) to (binlog.1005, 4) to Logtail because the numbers of these data on the new master are greater than the numbers of data requested by Logtail, which causes repeated collection of binary log data.

Parameter

The type of input sources is `service_canal`.

Parameter	Type	Required	Description
Host	String	No	The IP address of the host where the database is located. Default value: 127.0.0.1.
Port	Integer	No	The port number you can use to connect to the database. Default value: 3306.
User	String	No	<p>The database username. Default value: root.</p> <p>Make sure that the configured user has the read permissions on the database from which data is collected and the MySQL REPLICATION permission. Example:</p> <pre>CREATE USER canal IDENTIFIED BY 'canal'; GRANT SELECT, REPLICATION SLAVE, REPLICATION CLIENT ON *. * TO 'canal'@'%'; -- GRANT ALL PRIVILEGES ON *. * TO 'canal'@'%'; FLUSH PRIVILEGES;</pre>
Password	String	No	<p>The database password. This parameter is empty by default.</p> <p>If you require a high level of security, we recommend that you set the password to xxx. After configurations are synchronized to the local server, find the Password parameter in the <code>/usr/local/ilogtail/user_log_config.json</code> file and modify the value.</p> <div style="background-color: #e6f2ff; padding: 10px; border: 1px solid #d9e1f2;"> <p> Note</p> <ul style="list-style-type: none"> After you modify the password, use the <code>sudo /etc/init.d/ilogtailed stop; sudo /etc/init.d/ilogtailed start</code> command to restart Logtail. If you modify the value of the Password parameter on the web and synchronize configurations to the local server, configurations on the local server are overwritten. You can change the configurations on the local server in the future. </div>

Parameter	Type	Required	Description
ServerID	Integer	No	<p>The ID of a MySQL slave whose role Logtail assumes. Default value: 125.</p> <p> Note In a MySQL database, each ID must be unique. Otherwise, synchronization fails.</p>
IncludeTables	String array	Yes	<p>The names of matched tables. Each value contains a database name and a table name, for example, <code>test_db.test_table</code>. You must specify a regular expression for the parameter. Logtail does not collect incremental data from tables whose names do not match the regular expression. To collect incremental data from all tables of a database, set the value of the IncludeTables parameter to <code>.*\..*</code>.</p> <p> Note If exact matching is required, start a regular expression with a caret (<code>^</code>) and end with <code>\$</code>. For example: <code>^test_db\\.test_table\$</code>.</p>
ExcludeTables	String array	No	<p>The names of excluded tables expressed as a regular expression. The name of a table must include the name of the database to which the table belongs, such as <code>test_db.test_table</code>. If a table meets one of the conditions specified in the parameter, the table will not be collected. If you leave this parameter empty, incremental data from all tables is collected.</p> <p> Note If exact matching is required, add <code>^</code> to the beginning of a regular expression and <code>\$</code> to the end. Example: <code>^test_db\\.test_table\$</code>.</p>

Parameter	Type	Required	Description
StartBinName	String	No	<p>The name of the first binary log file Logtail collects. If you leave the parameter empty, Logtail collects binary log files that are generated from the current time.</p> <p>To collect data from a specific location, view the name of the current binary log file and the file offset. Then, set <code>StartBinName</code> and <code>StartBinLogPos</code> to corresponding values.</p> <p>Example:</p> <pre># Set StartBinName to "mysql-bin.000063" and StartBinLogPos to 0. mysql> show binary logs; +-----+-----+ Log_name File_size +-----+-----+ mysql-bin.000063 241 mysql-bin.000064 241 mysql-bin.000065 241 mysql-bin.000066 10778 +-----+-----+ 4 rows in set (0.02 sec)</pre> <div style="border: 1px solid #ccc; background-color: #e6f2ff; padding: 5px; margin-top: 10px;"> <p> Note</p> <p>If you set the <code>StartBinName</code> parameter, the first collection will generate a large amount of traffic.</p> </div>
StartBinLogPos	Integer	No	The offset of the first binary log file that is collected. Default value: 0.
EnableGTID	Boolean	No	Specifies whether to add GTID . Default value: true. If the value is false, no GTID is added to uploaded data.
EnableInsert	Boolean	No	Specifies whether to collect log events triggered by INSERT operations. Default value: true. If the value is false, INSERT events are not collected.
EnableUpdate	Boolean	No	Specifies whether to collect UPDATE events. Default value: true. If the value is false, UPDATE events are not collected.
EnableDelete	Boolean	No	Specifies whether to collect DELETE events. Default value: true. If the value is false, DELETE events are not collected.
EnableDDL	Boolean	No	Specifies whether to collect data definition language (DDL) events. Default value: false. If the value is false, DDL events are not collected.
Charset	String	No	The encoding method. Default value: <code>utf-8</code> .

Parameter	Type	Required	Description
TextToString	Boolean	No	Specifies whether to convert data of the text type to a string. Default value: false.
PackValues	Boolean	No	<p>Specifies whether to package event data into the JSON format. Default value: false. If the value is false, event data is not packaged. If this feature is enabled, Logtail packages event data into the data and old_data fields in the JSON format. The old_data field is available only for ROW_UPDATE events.</p> <p>For example, a table has three fields named c1, c2, and c3. If this feature is disabled, the ROW_INSERT event data contains three fields c1, c2, and c3. If this feature is enabled, c1, c2, and c3 are combined into one data field and the value is <code>{"c1": "...", "c2": "...", "c3": "..."} .</code></p> <p> Note This parameter is available only for Logtail 0.16.19 or later.</p>
EnableEvent Meta	Boolean	No	<p>Specifies whether to collect event metadata. Default value: false. If the value is false, event metadata is not collected. The metadata of binary log events includes event_time , event_log_position , event_size , and event_server_id .</p> <p> Note This parameter is available only for Logtail 0.16.21 or later.</p>

Procedure

Synchronize data from tables whose names do not end with `_inner` in the `user_info` RDS database.

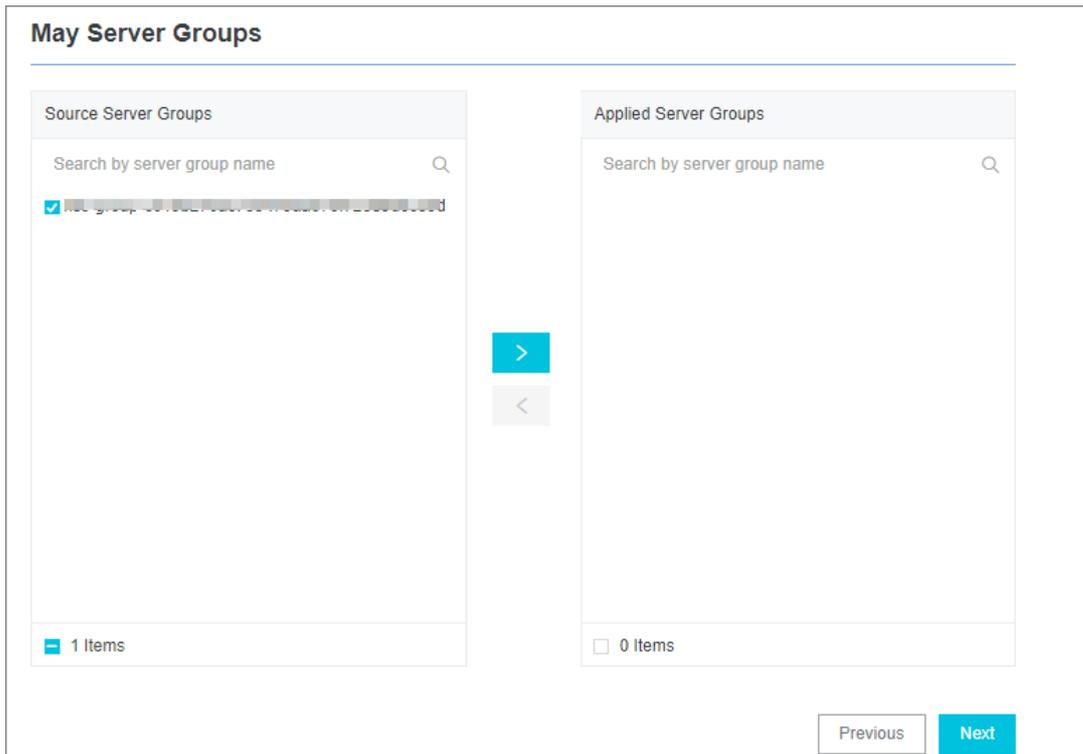

1. [Log on to the Log Service console.](#)
2. Select an input source. Click **Import Data**. On the **Import Data** page that appears, select **MYSQL BinLog**.
3. Select a Logstore, and then click **Next**. Select an existing project and Logstore. You can also click **Create Now** to create a project and Logstore. For more information, see [Manage a Logstore](#).

If you enter the configuration procedure by clicking the plus sign (+) next to **Data Import** under a Logstore on the Logstores tab, the system skips this step.

4. Create a server group. Before you create a server group, ensure that Logtail is installed.

Install Logtail as prompted. For more information, see [Install Logtail in Linux](#) or [Install Logtail in Windows](#).

After you install Logtail, click **Complete Installation** to create a server group. For more information, see [Overview](#). If you have created a server group, click **Use Existing Server Groups** to select the server group.
5. Configure the server group, and then click **Next**. Select a server group and move the group from **Source Server Groups** to **Applied Server Groups**.

6. Configure a data source. Set the Config Name and Plug-in Config fields.

In the **Plug-in Config** field, a default configuration template is specified. Change the parameters in the template based on your business requirements.

```
{
  "inputs": [
    {
      "type": "service_canal",
      "detail": {
        "Host": "*****.mysql.rds.aliyuncs.com",
        "Port": 3306,
        "User": "root",
        "ServerID": 56321,
        "Password": "*****",
        "IncludeTables": [
          "user_info\\..*"
        ],
        "ExcludeTables": [
          ".*\\S+_inner"
        ],
        "TextToString": true,
        "EnableDDL": true
      }
    }
  ]
}
```

- (Required) *inputs* specifies the collection configuration. You must configure statements based on your

data source.

- (Optional) *processors* specifies the processing method. For more information about how to set a processing method, see [Configure data processing methods](#).
7. Configure an index. Configure an index based on your business requirements. For more information, see [Enable the index feature and configure indexes for a Logstore](#).
 8. (Optional) Modify local configuration.

If you do not enter an actual URL, account name, password, and other details on the **Specify Data Source** page, you must complete these details after collection configurations are synchronized to the local server.

 **Note** If you enter actual details, skip this step.

- i. Log on to the server where Logtail is installed, find the `service_canal` keyword in the `/usr/local/ilogtail/user_log_config.json` file, and set related fields. These fields include `Host`, `User`, and `Password`.
- ii. Run the following command to restart Logtail:

```
sudo /etc/init.d/ilogtaild stop; sudo /etc/init.d/ilogtaild start
```

The binary log collection configuration is completed. If changes are made to your database, Logtail will immediately collect the updated data and upload it to Log Service.

 **Note** Logtail collects incremental binary log data. If no data is collected, check whether changes are made to the corresponding table in your database after the configuration is updated.

Metadata fields

During binary log collection, some metadata is also uploaded. The following table lists the fields of uploaded metadata.

Field	Description	Example
<code>_host_</code>	The name of the host where the database resides.	<code>*****.mysql.rds.aliyuncs.com</code>
<code>_db_</code>	The name of the database.	<code>my-database</code>
<code>_table_</code>	The name of the table.	<code>my-table</code>
<code>_event_</code>	The type of the event.	<code>row_update</code> , <code>row_insert</code> , and <code>row_delete</code>
<code>_id_</code>	The ID of the current collection. The value starts from 0 and increments by 1 each time a binary log event is collected.	<code>1</code>
<code>_gtid_</code>	The GTID.	<code>7d2ea78d-b631-11e7-8afb-00163e0eef52:536</code>
<code>_filename_</code>	The name of the binary log file.	<code>binlog.001</code>
<code>_offset_</code>	The offset of the binary log file. The value is updated after each COMMIT operation.	<code>12876</code>

Example

After you complete the preceding steps to set a processing method, perform `INSERT`, `UPDATE`, and `DELETE` operations on the `SpecialAlarm` table in the `user_info` database. The following shows the database scheme, database operations, and Logtail collection.

- Schema

```
CREATE TABLE `SpecialAlarm` (  
  `id` int(11) unsigned NOT NULL AUTO_INCREMENT,  
  `time` datetime NOT NULL,  
  `alarmtype` varchar(64) NOT NULL,  
  `ip` varchar(16) NOT NULL,  
  `count` int(11) unsigned NOT NULL,  
  PRIMARY KEY (`id`),  
  KEY `time` (`time`) USING BTREE,  
  KEY `alarmtype` (`alarmtype`) USING BTREE  
) ENGINE=MyISAM AUTO_INCREMENT=1;
```

- Database operations

Perform the `INSERT`, `DELETE`, and `UPDATE` operations on the database.

```
insert into specialalarm (`time`, `alarmType`, `ip`, `count`) values(now(), "NO_ALARM", "10.10. **.***", 55);  
delete from specialalarm where id = 4829235 ;  
update specialalarm set ip = "10.11. **.***" where id = "4829234";
```

Create an index for `zc.specialalarm`.

```
ALTER TABLE `zc`.`specialalarm`  
ADD INDEX `time_index` (`time` ASC);
```

- Sample logs

On the data preview or search page, you can view a sample log that corresponds to each operation.

- `INSERT` statement

```

Precautions

We recommend that you increase resource limits on Logtail to accommodate traffic surges and avoid risks to your data. If the limits are exceeded, Logtail may be forced to restart.

You can modify the resource limits in the `/usr/local/ilogtail/ilogtail_config.json` file. After modification, run the `sudo /etc/init.d/ilogtailed stop;sudo /etc/init.d/ilogtailed start` command to restart Logtail.

The following example shows how to set the CPU limit to two and memory limit to 2,048 MB.

```

{
  ...
  "cpu_usage_limit":2,
  "mem_usage_limit":2048,
  ...
}

```

30.3.1.5.2. Collect query results from a MySQL database

This topic describes how to use SQL statements to collect query results from a MySQL database.

Context

If you want to collect data from a MySQL database, you can install Logtail on a server and connect the server with the database. Then, you can create a Logtail configuration with a custom SQL statement in the Log Service console and deliver the configuration to Logtail. Logtail can use the custom SQL statement to collect data from the database at regular intervals.

 **Note** This feature applies only to Logtail 0.16.0 and later versions that run on Linux. For more information, see [Install Logtail in Linux](#).

Benefits

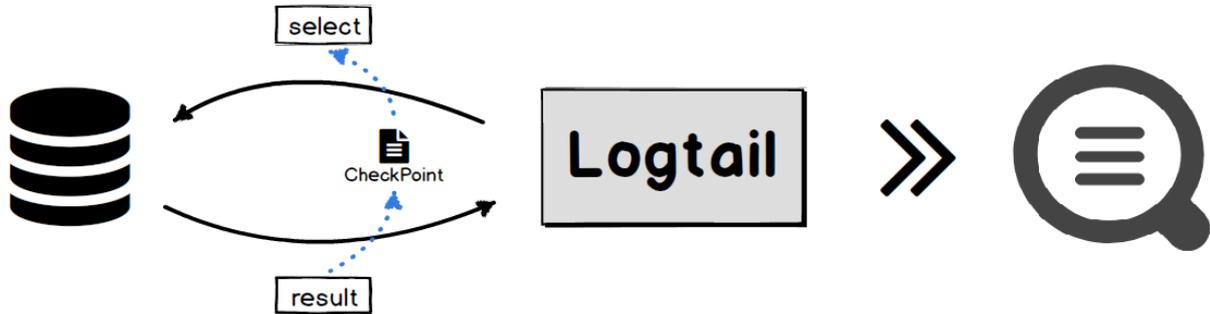

You can collect query results from databases that provide MySQL interfaces, including ApsaraDB for RDS databases. During the collection process, you can perform the following operations:

- Paginate query results.
- Set time zones.

- Set timeout periods.
- Store checkpoints.
- Transmit data over the SSL protocol.
- Set the maximum number of records that are collected for each query.

Implementation

Logtail periodically runs a SELECT statement that you specify and uploads the returned results to Log Service.

When Logtail obtains a result, it locally saves the value of the CheckPoint field specified in the result. The next time Logtail executes the SELECT statement, Logtail adds the last saved value of the CheckPoint field to the SELECT statement. Then, Logtail collects only the incremental data.

Scenarios

- You want to synchronize incremental data based on specific marks such as an auto-increment ID or a point in time.
- You want to customize synchronization based on filtering conditions.

Parameters

The following table describes Logtail parameters. The type of the data source is `service_mysql`.

Parameter	Type	Required	Description
Address	String	No	The address of the MySQL database. Default value: 127.0.0.1:3306.
User	String	No	The username of the MySQL database. Default value: root.
Password	String	No	The password of the MySQL database. This parameter is not specified by default.
DialTimeOutMs	Integer	No	The timeout period for the database connection. Unit: milliseconds. Default value: 5000.
ReadTimeOutMs	Integer	No	The timeout period for database reading. Unit: milliseconds. Default value: 5000.
StateMent	String	Yes	The SQL statement.

Parameter	Type	Required	Description
Limit	Boolean	No	Specifies whether to use limit-based pagination. Default value: false.
PageSize	Integer	No	The number of records to return on each page. This parameter is required when the Limit parameter is set to true.
MaxSyncSize	Integer	No	The maximum number of records to be synchronized at a time. If the value is 0, no limit is imposed. Default value: 0.
CheckPoint	Boolean	No	Specifies whether to use a checkpoint. Default value: false.
CheckPointColumn	String	No	The name of the checkpoint column. This parameter is required when the CheckPoint parameter is set to true.
CheckPointColumnType	String	No	The type of the checkpoint column. Valid values: <code>int</code> and <code>time</code> .
CheckPointStart	String	No	The initial value of the checkpoint.
CheckPointSavePerPage	Boolean	No	If this parameter is set to true, a checkpoint is saved after each pagination. If this parameter is set to false, a checkpoint is saved after each synchronization.
IntervalMs	Integer	Yes	The synchronization interval. Unit: milliseconds.

Limits

- We recommend that you use `limit`-based pagination. When you use `limit`-based pagination, the `LIMIT` clause is added to `StateMent` in the SQL query.
- If `CheckPoint` is set to true, the data selected through `StateMent` must contain the checkpoint column. In addition, the `WHERE` clause in `StateMent` must contain the checkpoint field. The value of the checkpoint field is expressed with a question mark (`?`).
For example, if the checkpoint is "id", `StateMent` is `SELECT * from ... where id > ?`.
- If `CheckPoint` is set to true, `CheckPointColumn`, `CheckPointColumnType`, and `CheckPointStart` must be specified.

- The value of `CheckpointColumnType` can only be set to `int` or `time`. If the value is set to `int`, internal storage uses the `int64` type. If the value is set to `time`, `MySQL DATE`, `DATETIME`, and `TIME` are supported.

Procedure

The following procedure describes how to perform an incremental synchronization from a MySQL database to Log Service. In this procedure, the `logtail.VersionOs` field is synchronized every 10 seconds. The value of the count parameter in this field is greater than 0. The value of the initial checkpoint is 2017-09-25 11:00:00. The pagination method is used and 100 records are returned on each page. The checkpoint is saved after each pagination. The steps are as follows:

1. [Log on to the Log Service console](#).
2. Select a data source. Click **Import Data**. On the **Import Data** page, select **MYSQL Query Result-Plug-in**.
3. Select a Logstore, and then click **Next**. Select an existing project and Logstore. You can also click **Create Now** to create a project and Logstore. For more information, see [Manage a Logstore](#).

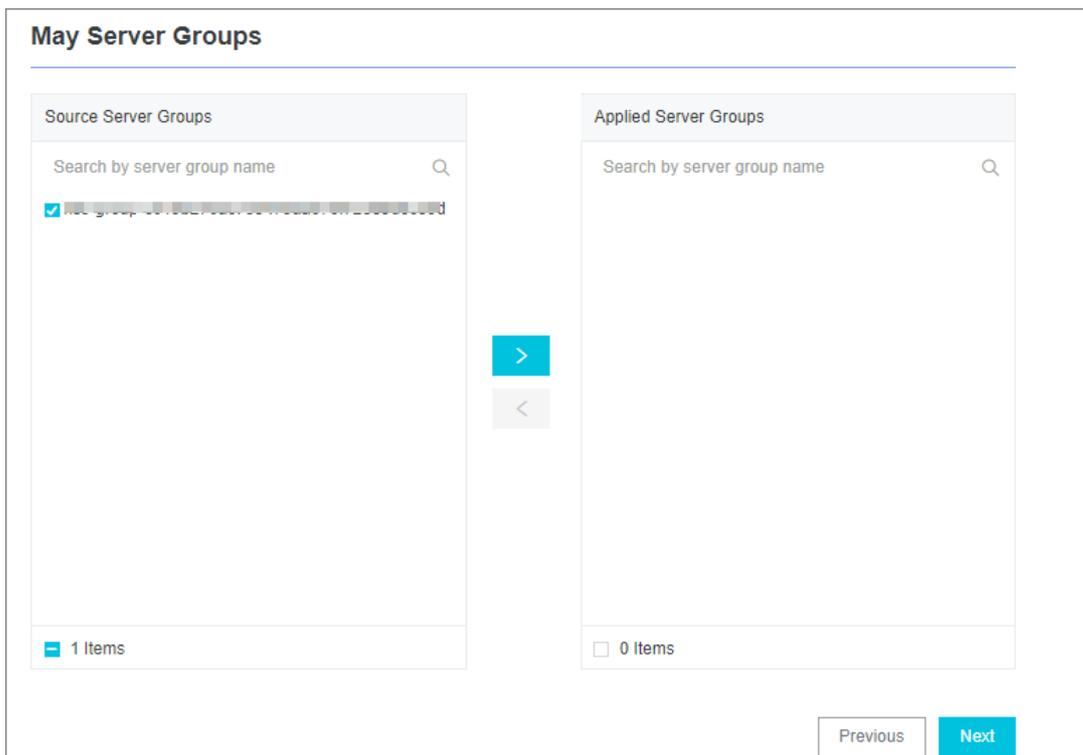

If you enter the configuration procedure by clicking the plus sign (+) next to **Data Import** under a Logstore on the Logstores tab, the system skips this step.

4. Create a server group. Before you create a server group, ensure that Logtail is installed.

Install Logtail as prompted. For more information, see [Install Logtail in Linux](#) or [Install Logtail in Windows](#).

After you install Logtail, click **Complete Installation** to create a server group. For more information, see [Overview](#). If you have created a server group, click **Use Existing Server Groups** to select the server group.

5. Configure the server group, and then click **Next**. Select a server group and move the group from **Source Server Groups** to **Applied Server Groups**.

6. Configure the data source.
 - In the **Plug-in Config** field, a configuration template is provided. Modify the parameters.
 - The **inputs** section is required. It specifies the collection configuration. The **processors** section is optional. It specifies the processing configuration. You must specify a collection statement for the collection configuration based on the data source. You can specify one or more processing methods for the processing configuration. For more information, see [Configure data processing methods](#).

Note If you have high security requirements, we recommend that you set the SQL access username and password to xxx. After you synchronize the Logtail configuration to the server, you can modify the username and password in the `/usr/local/ilogtail/user_log_config.json` file.

A configuration example is as follows:

```
{
  "inputs": [
    {
      "type": "service_mysql",
      "detail": {
        "Address": "*****:3306",
        "User": "logtail",
        "Password": "*****",
        "DataBase": "logtail",
        "Limit": true,
        "PageSize": 100,
        "StateMent": "SELECT * from logtail.VersionOs where time > ?",
        "CheckPoint": true,
        "CheckPointColumn": "time",
        "CheckPointStart": "2017-09-25 11:00:00",
        "CheckPointSavePerPage": true,
        "CheckPointColumnType": "time",
        "IntervalMs": 10000
      }
    }
  ]
}
```

7. Configure an index. Configure an index based on your business requirements. For more information, see [Enable the index feature and configure indexes for a Logstore](#).
8. (Optional) Modify the configurations on the server. If you do not enter your actual URL, account, or password on the **Specify Data Source** page, you must modify the information after you deliver the Logtail configuration to the local server.

Note If you have entered the actual information, skip this step.

- i. Log on to the server where Logtail is installed, find the `service_mysql` keyword in the `/usr/local/ilogtail/user_log_config.json` file and modify the following fields: `Address`, `User`, and `Password`.
- ii. Run the following command to restart Logtail:

```
sudo /etc/init.d/ilogtaild stop; sudo /etc/init.d/ilogtaild start
```

Example

After you configure the processing method, you can view the processed data in the Log Service console. The following code shows examples of the schema and data collected by Logtail.

- Schema

```
CREATE TABLE `VersionOs` (  
  `id` int(11) unsigned NOT NULL AUTO_INCREMENT COMMENT 'id',  
  `time` datetime NOT NULL,  
  `version` varchar(10) NOT NULL DEFAULT "",  
  `os` varchar(10) NOT NULL,  
  `count` int(11) unsigned NOT NULL,  
  PRIMARY KEY (`id`),  
  KEY `timeindex` (`time`)  
)
```

- Sample output

```
"count": "4"  
"id": "721097"  
"os": "Windows"  
"time": "2017-08-25 13:00:00"  
"version": "1.3.0"
```

30.3.1.5.3. Collect syslogs

This topic describes how to use the syslog plug-in of Logtail to collect syslogs from a server.

Prerequisites

Logtail 0.16.13 or a later version is installed on the server.

Overview

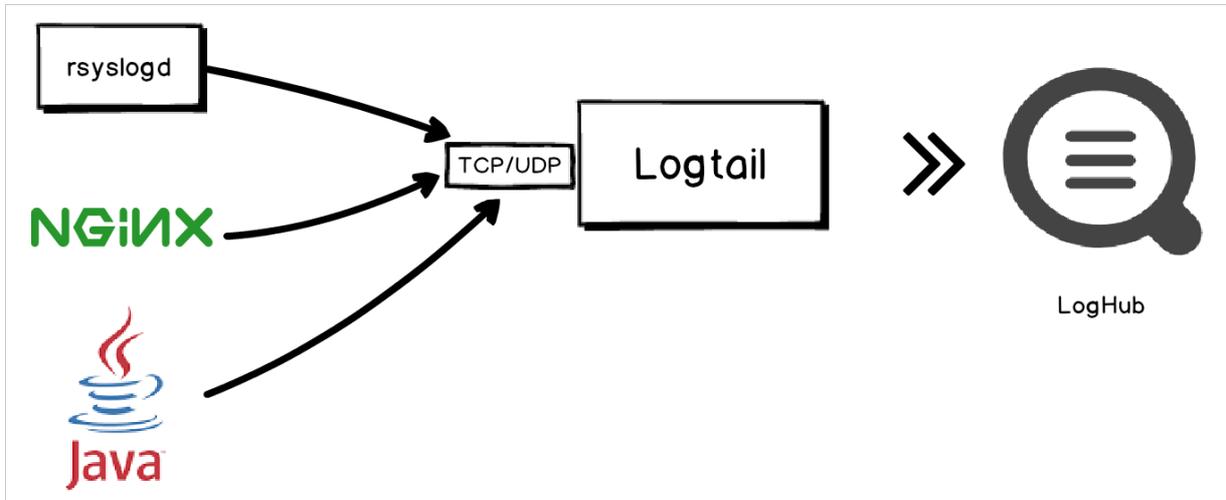

On a Linux server, local syslogs can be forwarded to the IP address and port of a specified server by using syslog agents such as rsyslog. After you create a Logtail configuration for the specified server, the syslog plug-in of Logtail receives the syslogs over TCP or UDP. In addition, the syslog plug-in parses the received syslogs and extract log fields such as facility, tag (program), severity, and content based on the specified syslog protocol. The syslog protocol can be RFC 3164 or RFC 5424.

Note

- Logtail installed on a Windows server does not support the syslog plug-in.
- You can configure multiple syslog plug-ins for Logtail. For example, you can use both TCP and UDP to listen on 127.0.0.1:9999.

Implementation

After the syslog plug-ins start to listen on a specified IP address and port, Logtail can act as a syslog server to collect syslogs from various data sources. These syslogs include system logs collected by rsyslog, access or error logs forwarded by NGINX, and logs forwarded by syslog clients in languages such as Java.

Logtail parameters

The following table describes Logtail parameters. The type of the input is `service_syslog`.

Parameter	Type	Required	Description
Address	String	No	<p>The protocol, address, and port on which the syslog plug-in listens. The syslog plug-in obtains logs based on the value of this parameter. Format: <code>[tcp/udp]://[ip]:[port]</code>. Default value: <code>tcp://127.0.0.1:9999</code>.</p> <div style="background-color: #e0f2f7; padding: 5px;"> <p>Note</p> <ul style="list-style-type: none"> The specified protocol, address, and port must be the same as those specified for the forwarding rule in the rsyslog configuration file. If the server on which Logtail is installed has multiple IP addresses, you can set the IP address to 0.0.0.0. It means that the syslog plug-in listens on all IP addresses of the server. </div>
ParseProtocol	String	No	<p>The protocol that is used to parse logs. This parameter is not specified by default, indicating that logs are not parsed. Valid values:</p> <ul style="list-style-type: none"> <code>rfc3164</code>: The RFC 3164 protocol is used to parse logs. <code>rfc5424</code>: The RFC 5424 protocol is used to parse logs. <code>auto</code>: The syslog plug-in selects a protocol based on the log content.
IgnoreParseFailure	Boolean	No	<p>Specifies whether to ignore a parsing failure. Default value: <code>true</code>. Valid values:</p> <ul style="list-style-type: none"> <code>true</code>: Logs that fail to be parsed are included in the returned content field. <code>false</code>: Logs that fail to be parsed are dropped.

Default fields

Field	Type	Description
hostname	String	The hostname. If a hostname is not provided in the log, the hostname of the current host is obtained.
program	String	The tag field in the protocol.
priority	String	The priority field in the protocol.
facility	String	The facility field in the protocol.
severity	String	The severity field in the protocol.
unixtimestamp	String	The timestamp of the log.
content	String	The log content. If the log fails to be parsed, this field contains the complete content of the log.
ip	String	The IP address of the current host.

Configure the plug-in of Logtail to collect syslogs

1. Add a forwarding rule for rsyslog. Modify the `/etc/rsyslog.conf` rsyslog configuration file on the server from which syslogs are collected. Add a forwarding rule at the end of the configuration file. Then, rsyslog forwards syslogs to the specified IP address and port.
 - If you want to collect syslogs of the server by using Logtail on this server, set the forwarding address to 127.0.0.1 and the port to an idle port.
 - If you want to collect syslogs of the server by using Logtail on a second server (Server B), set the forwarding address to the public IP address of the second server and port to an idle port.

For example, the following forwarding rule indicates that logs are forwarded to 127.0.0.1:9000 over TCP.

```
*.* @127.0.0.1:9000
```

2. Run the following command to restart rsyslog and validate the log forwarding rule:

```
sudo service rsyslog restart
```

3. [Log on to the Log Service console.](#)
4. Select the data source **Custom Data Plug-in**. You can use one of the following three methods to select a data source:
 - On the homepage of the Log Service console, select a data source in the **Import Data** section.
 - In the **Projects** section, click a project name. On the **Overview** page, click **Import Data**, and then select a data source.
 - On the **Logstores** tab in the left-side navigation pane, find a Logstore and click the closing angle bracket (>) in front of the Logstore name. Click the plus sign (+) next to **Data Import**, and then select a data source.

5. Select a Logstore, and then click **Next**. Select an existing project and Logstore. You can also click **Create Now** to create a project and Logstore. For more information, see [Manage a Logstore](#).

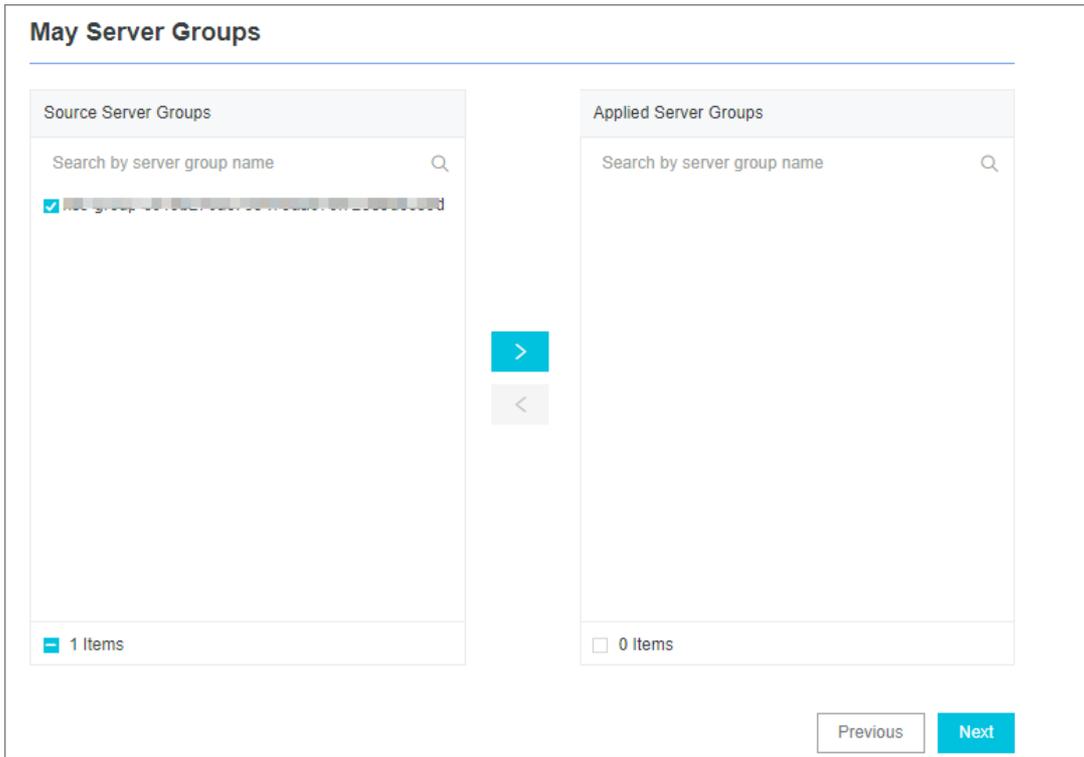

If you enter the configuration procedure by clicking the plus sign (+) next to **Data Import** under a Logstore on the **Logstores** tab, the system skips this step.

6. Create a server group. Before you create a server group, ensure that Logtail is installed.

Install Logtail as prompted. For more information, see [Install Logtail in Linux](#) or [Install Logtail in Windows](#).

After you install Logtail, click **Complete Installation** to create a server group. For more information, see [Overview](#). If you have created a server group, click **Use Existing Server Groups** to select the server group.

7. Configure the server group, and then click Next. Select a server group and move the group from Source Server Groups to Applied Server Groups.

8. Configure the data source. Set **Config Name** and **Plug-in Config**.

The `inputs` section is required. It specifies the collection configuration. The `processors` section is optional. It specifies the processing configuration. You must specify a collection statement for the collection configuration based on the data source. You can specify one or more processing methods for the processing configuration. For more information, see [Configure data processing methods](#).

The following sample code shows how to use UDP and TCP to listen on 127.0.0.1:9000:

```
{
  "inputs": [
    {
      "type": "service_syslog",
      "detail": {
        "Address": "tcp://127.0.0.1:9000",
        "ParseProtocol": "rfc3164"
      }
    },
    {
      "type": "service_syslog",
      "detail": {
        "Address": "udp://127.0.0.1:9001",
        "ParseProtocol": "rfc3164"
      }
    }
  ]
}
```

9. Configure an index. Configure an index based on your business requirements. For more information, see [Enable the index feature and configure indexes for a Logstore](#).

Configure the plug-in of Logtail to collect NGINX logs

NGINX access logs can be forwarded to specified addresses and ports over the syslog protocol. To deliver NGINX access logs as syslogs from a server to Log Service, you can create a Logtail configuration and apply it to the server group to which the server belongs.

1. Add a forwarding rule to the `nginx.conf` configuration file on the NGINX server. For example, add the following content to the configuration file.

```
http {
    ...

    # Add this line.
    access_log syslog:server=127.0.0.1:9000,facility=local7,tag=nginx,severity=info combined;

    ...
}
```

2. Run the following command to restart the NGINX service and validate the configuration.

```
sudo service nginx restart
```

3. Create a Logtail configuration and apply it to the server group to which the server belongs. For more information, see [Configure the plug-in of Logtail to collect syslogs](#).
4. Check whether the Logtail configuration takes effect. Run the `curl http://127.0.0.1/test.html` command in shell to generate an access log. If the Logtail configuration takes effect, you can view the log information on the query page of the Log Service console.

30.3.1.5.4. Configure data processing methods

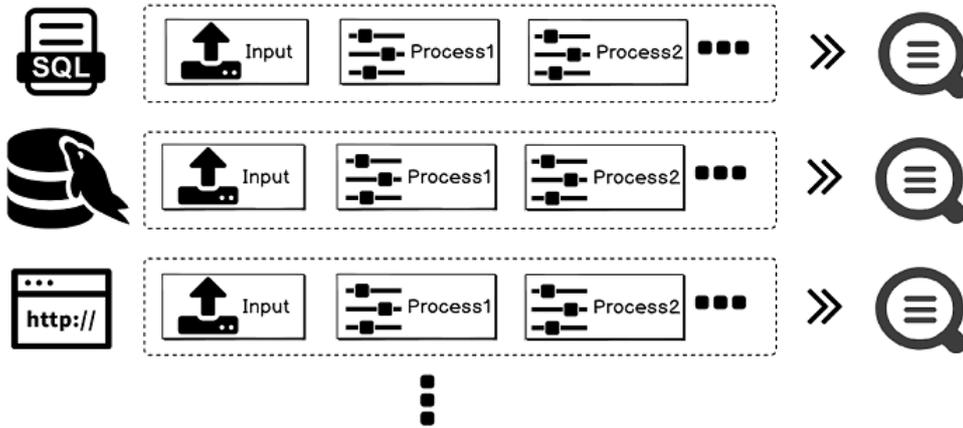

This topic describes how to configure processing methods for the data that you use a Logtail plug-in to collect from data sources. In Log Service, you can configure a plug-in to specify one or more processing methods for a data source when you create a Logtail configuration. After you deliver the Logtail configuration to Logtail installed on the data source, Logtail processes collected data based on the order in which these processing methods are configured.

 **Note** These processing methods are available only for plugin-driven input sources and container standard output.

Implementation

The following figure shows how to process collected data.

Implementation

Plug-in elements

When you configure the data processing methods, you must set the key parameter to `processors` and the value parameter to an array of JSON objects. Each object contains the details of a processing method.

Each object contains the `type` and `detail` fields. The `type` field specifies the type of a processing method and the `detail` field contains configuration details.

```

"processors" : [
  {
    "type": "processor_anchor"
    "detail" : {
      ...
    }
  },
  {
    "type": "processor_regex",
    "detail" : {
      ...
    }
  }
]
    
```

Processing methods

Available processing methods include:

- Regular expression-based extraction
- Calibration extraction
- Single-character delimiter
- Multi-character delimiter
- GeolP conversion
- Regular expression-based filter
- Filed insertion
- Field deletion
- Log time extraction (Go)
- Field expansion (JSON)

- [Field combination \(JSON\)](#)
- [Field renaming](#)
- [Log time extraction \(Strptime\)](#)

You can also create a custom method that includes several preceding methods. For more information, see [Custom methods](#).

Regular expression-based extraction

This method extracts the fields that match a specified regular expression.

The type of the plug-in is `processor_regex`.

Parameters

Parameter	Type	Required	Description
SourceKey	String	Yes	The name of the field to extract by using the regular expression.
Regex	String	Yes	The regular expression. Enclose the value of fields to extract with parentheses <code>()</code> .
Keys	String array	Yes	The array of fields to extract, for example, ["key1" , "key2" ...].
NoKeyError	Boolean	No	Specifies whether to report errors when no field matches the regular expression. Default value: false.
NoMatchError	Boolean	No	Specifies whether to report errors when the specified regular expression does not match logs.
KeepSource	Boolean	No	Specifies whether to return the SourceKey parameter. Default value: false. The value false specifies that the SourceKey parameter is not returned.
FullMatch	Boolean	Yes	Specifies whether to extract fields that exactly match the <code>Regex</code> parameter. Default value: true. The value false specifies that fields that partially match <code>Regex</code> parameter are extracted.

The following example shows how to extract fields from an access log.

- **Input data**

```
"content" : "10.200. **. ** - - [10/Aug/2017:14:57:51 +0800] \"POST /PutData?
Category=YunOsAccountOpLog&AccessKeyId=<yourAccessKeyId>&Date=Fri%2C%2028%20Jun%202013%2006%3A53%
3A30%20GMT&Topic=raw&Signature=<yourSignature> HTTP/1.1\" 0.024 18204 200 37 \"-\" \"aliyun-sdk-java"
```

- **Plug-in configurations**

```
{
  "type": "processor_regex",
  "detail": {"SourceKey": "content",
    "regex": "([\\d\\.]+) \\S+ \\S+ \\[(\\S+) \\S+ \\] \\(\\w+ ([^\\\"]*)\\) ([\\d\\.]+) (\\d+) (\\d+) (\\d+|-) \\("[^\\\"]*" \\ "[^\\\"]*"\\) (\\d+)",
    "key": ["ip", "time", "method", "url", "request_time", "request_length", "status", "length", "ref_url", "browser"],
    "NoKeyError": true,
    "NoMatchError": true,
    "KeepSource": false
  }
}
```

• Results

```
"ip" : "10.200. **. **",
"time" : "10/Aug/2017:14:57:51"
"method" : "POST",
"url" : "/PutData? Category=YunOsAccountOpLog&AccessKeyId=<yourAccessKeyId>&Date=Fri%2C%2028%20Jun%202013%2006%3A53%3A30%20GMT&Topic=raw&Signature=<yourSignature>"
"request_time" : "0.024"
"request_length" : "18204"
"status" : "200"
"length" : "27"
"ref_url" : "-"
"browser" : "aliyun-sdk-java"
```

Calibration extraction

This method uses the `start` and `stop` keywords to extract the required fields. You can extract fields from the JSON string between the start and stop keywords. You can also expand the JSON string into other forms.

The type of the plug-in is `processor_anchor`.

Parameters

Parameter	Type	Required	Parameters
SourceKey	String	Yes	The name of the field to extract.
Anchors	Array	Yes	The array that includes field-value pairs. For more information, see the following table.
NoAnchorError	Boolean	No	Specifies whether to report errors when no specified keyword is found. Default value: false.
NoKeyError	Boolean	No	Specifies whether to report errors when no match exists. Default value: false.
KeepSource	Boolean	No	Specifies whether to return the SourceKey parameter. Default value: false. A value of false specifies that the SourceKey parameter is not returned.

Anchor fields

Field	Type	Required	Description
Start	String	Yes	The start keyword. If you do not specify the parameter, Logtail matches the first character of a string.
Stop	String	Yes	The stop keyword. If you do not specify the parameter, Logtail matches the last character of a string.
FieldName	String	Yes	The name of the field to extract.
FieldType	String	Yes	The type of the field. Valid values: <code>string</code> and <code>json</code> .
ExpondJson	Boolean	No	Specifies whether to expand the JSON string. Default value: <code>false</code> . This parameter is available only if you specify <code>json</code> for the <code>FieldType</code> parameter.
ExpondConnector	String	No	The connector that combines separate field names into a string. Default value: <code>_</code> .
MaxExpondDepth	Integer	No	The maximum depth of JSON expansion. Default value: <code>0</code> , indicating no limit.

The following example shows how to use this method to process input data of multiple types.

- Input data

```
"content" : "time:2017.09.12 20:55:36\tjson:{\"key1\" : \"xx\", \"key2\": false, \"key3\":123.456, \"key4\" : { \"inner1\" : 1, \"inner2\" : false}}"
```

- Plug-in configurations

```
{
  "type": "processor_anchor"
  "detail": {"SourceKey": "content",
    "Anchors": [
      {
        "Start": "time",
        "Stop": "\\t",
        "FieldName": "time",
        "FieldType": "string",
        "ExpondJson": false
      },
      {
        "Start": "json:",
        "Stop": ""
        "FieldName": "val",
        "FieldType": "json",
        "ExpondJson": true,
      }
    ]
  }
}
```

- Results

```
"time" : "2017.09.12 20:55:36"
"val_key1" : "xx"
"val_key2" : "false"
"val_key3" : "123.456"
"value_key4_inner1" : "1"
"value_key4_inner2" : "false"
```

Single-character delimiter

This method uses `single-character delimiters` to split logs into several fields. You can enclose delimited fields with characters that you specify in the Quote parameter.

The type of the plug-in is `processor_split_char`.

Parameters

Parameter	Type	Required	Description
SourceKey	String	Yes	The name of the field to extract.
SplitSep	String	Yes	The single-character delimiter. You must specify a single character as a delimiter. You can specify an invisible character such as <code>\u0001</code> as a delimiter.
SplitKeys	String array	Yes	The names of the fields into which you split a log, for example, ["key1" , "key2" ...].

Parameter	Type	Required	Description
QuoteFlag	Boolean	No	Specifies whether to use the <code>Quote</code> parameter. Default value: false.
Quote	String	No	You must specify a single character. The parameter is available only if you specify true for the <code>QuoteFlag</code> parameter. You can specify invisible characters, such as <code>\u0001</code> .
NoKeyError	Boolean	No	Specifies whether to report errors when no match exists. Default value: false.
NoMatchError	Boolean	No	Specifies whether to report errors when the specified delimiter is not found. Default value: false.
KeepSource	Boolean	No	Specifies whether to return the <code>SourceKey</code> parameter. Default value: false. The value false specifies that the <code>SourceKey</code> parameter is not returned.

The following example shows how to use this method to process a log.

- Input data

```
"content" : "10. **. **. **|10/Aug/2017:14:57:51 +0800|POST|PutData?
Category=YunOsAccountOpLog&AccessKeyId=<yourAccessKeyId>&Date=Fri%2C%2028%20Jun%202013%2006%3A53%
3A30%20GMT&Topic=raw&Signature=<yourSignature>|0.024|18204|200|37|-|
aliyun-sdk-java
```

- Configuration details

```
{
  "type" : "processor_split_char",
  "detail" : {"SourceKey" : "content",
    "SplitSep" : "|",
    "SplitKeys" : ["ip", "time", "method", "url", "request_time", "request_length", "status", "length", "ref_url", "browser"]
  }
}
```

- Results

```
"ip" : "10. **. **. **",
"time" : "10/Aug/2017:14:57:51 +0800"
"method" : "POST",
"url" : "/PutData? Category=YunOsAccountOpLog&AccessKeyId=<yourAccessKeyId>&Date=Fri%2C%2028%20Jun%202013%2006%3A53%3A30%20GMT&Topic=raw&Signature=<yourSignature>"
"request_time" : "0.024"
"request_length" : "18204"
"status" : "200"
"length" : "27"
"ref_url" : "-"
"browser" : "aliyun-sdk-java"
```

Multi-character delimiter

Similar to the single-character delimiter method, this method uses multi-character delimiters to split a log into several fields. The Quote parameter is not available for the method.

The type of the plug-in is `processor_split_string` .

Parameters

Parameter	Type	Required	Description
SourceKey	String	Yes	The name of the field to extract.
SplitSep	String	Yes	The multi-character delimiter. You can specify a combination of several whitespace characters, for example, <code>\u0001\u0002</code> .
SplitKeys	String array	Yes	The names of the fields into which you split a log, for example, ["key1" , "key2" ...].
PreserveOthers	Boolean	No	Specifies whether to retain extra fields when the number of split fields exceeds the number fields defined in the <code>SplitKeys</code> parameter. Default value: false.
ExpandOthers	Boolean	No	Specifies whether to parse extra fields. Default value: false.
ExpandKeyPrefix	String	No	The prefix of the names of extra fields. For example, if you specify <code>expand_</code> for the parameter, extra fields are named <code>expand_1</code> and <code>expand_2</code> .
NoKeyError	Boolean	No	Specifies whether to report errors when no match exists. Default value: false.
NoMatchError	Boolean	No	Specifies whether to report errors when no multi-character delimiter is found. Default value: false.
KeepSource	Boolean	No	Specifies whether to return the SourceKey parameter. Default value: false. A value of false specifies that the SourceKey parameter is not returned.

The following example shows how to use this method to extract fields from a log.

- Input data

```
"content" : "10. **. **. **|#|10/Aug/2017:14:57:51 +0800|#|POST|#|PutData?
Category=YunOsAccountOpLog&AccessKeyId=<yourAccessKeyId>&Date=Fri%2C%2028%20Jun%202013%2006%3A53%
3A30%20GMT&Topic=raw&Signature=<yourSignature>|#|0.024|#|18204|#|200|#|37|#|-|#|
aliyun-sdk-java"
```

- Configuration details

```
{
  "type" : "processor_split_string",
  "detail" : {"SourceKey" : "content",
    "SplitSep" : "|#|",
    "SplitKeys" : ["ip", "time", "method", "url", "request_time", "request_length", "status"],
    "PreserveOthers" : true,
    "ExpandOthers" : true,
    "ExpandKeyPrefix" : "expand_"
  }
}
```

- Results

```
"ip" : "10. **. **. **",
"time" : "10/Aug/2017:14:57:51 +0800"
"method" : "POST",

"status": "red"
"expand_1" : "27"
"expand_2" : "-"
"expand_3" : "aliyun-sdk-java"
```

GeoIP conversion

This method converts IP addresses in a log into geolocation, including countries, provinces, cities, and geographic coordinates.

 **Note** By default, the Logtail installation package does not include GeoIP databases. You must download these databases to your localhost and configure the required parameters. We recommend that you download a version of the GeoIP database that includes the `city` database.

The type of the plug-in is `processor_geoip` .

Parameters

Parameter	Type	Required	Description
SourceKey	String	Yes	The name of the field to which you want to apply IP conversion.

Parameter	Type	Required	Description
DBPath	String	Yes	The absolute path of the GeoIP database. The database format is MMDB. For example, /user/data/GeoLite2-City_20180102/GeoLite2-City.mmdb.
NoKeyError	Boolean	No	Specifies whether to report errors when no match exists. Default value: false.
NoMatchError	Boolean	No	Specifies whether to report errors when the specified IP address is invalid or does not match any IP addresses stored in the library. Default value: false.
KeepSource	Boolean	No	Specifies whether to return the SourceKey parameter. Default value: true.
Language	String	No	The language. Default value: zh-CN. Make sure that converted results can be translated into the language.

The following example shows how to use this method to convert an IP address into geolocation.

- Input data

```
"source_ip" : "***.**.**.**"
```

Download a GeoIP database and install the database on the host where Logtail resides. We recommend that you download **MaxMind GeoLite2** that includes the city database.

 **Note** Make sure that the database format is MMDB.

- Configuration details

```
{
  "type": "processor_geoip",
  "detail": {
    "SourceKey": "ip",
    "NoKeyError": true,
    "NoMatchError": true,
    "KeepSource": true,
    "DBPath" : "/user/local/data/GeoLite2-City_20180102/GeoLite2-City.mmdb"
  }
}
```

- Results

```
"source_ip_city_" : "***.**.**.**",
"source_ip_province_" : "Zhejiang"
"source_ip_city_" : "Hangzhou"
"source_ip_province_code_" : "ZJ"
"source_ip_country_code_" : "CN"
"source_ip_longitude_" : "120.*****"
"source_ip_latitude_" : "30.*****"
```

Regular expression-based filter

This method uses regular expressions to filter logs. You can specify conditions in the `Include` and `Exclude` parameters.

The type of the plug-in is `processor_filter_regex`.

Parameters

Parameter	Type	Required	Description
Include	The JSON object that includes key-value pairs.	No	Each key includes a log field. Each value includes a regular expression. If the value of one of the log fields matches a regular expression, the log is collected.
Exclude	The JSON object that includes key-value pairs.	No	Each key includes a log field. Each value includes a regular expression. If the value of one of the log fields matches a regular expression, the log is dropped.

Note If a regular expression that you specified in the `Include` parameter matches the value of a log field and all regular expressions that you specified in the `Exclude` parameter do not match the value of any one of the log fields, the log is collected. Otherwise, the log is dropped.

The following example shows how to use this method to process logs.

- Input data

- Log 1

```
"ip" : "10. **. **.***",
"method" : "POST",
...
"browser" : "aliyun-sdk-java"
```

- Log 2

```
"ip" : "10. **. **.***",
"method" : "POST",
...
"browser" : "chrome"
```

- Log 3

```
"ip" : "192.168. *.*"
"method" : "POST",
...
"browser" : "ali-sls-ilogtail"
```

- Configuration details

```
{
  "type": "processor_filter_regex",
  "detail": {
    "Include": {
      "ip": "10\\.\\.\\.*",
      "method": "POST",
    },
    "Exclude": {
      "browser": "aliyun.*"
    }
  }
}
```

• Results

Log	Matched	Reason
Log 1	No	The match failed because the value of the browser field matches a regular expression you specified in the Exclude parameter.
Log 2	Yes	N/A
Log 3	No	The match failed because the value of the ip field does not match a regular expression you specified in the Include parameter. The regular expression matches IP addresses that start with 10 .

Filed insertion

You can use this method to add multiple fields to a log.

The type of the plug-in is `processor_add_fields` .

 **Note** This method is available for Logtail 0.16.28 or later.

Parameters

Parameter	Type	Required	Description
Fields	Map	No	The JSON object that includes key-value pairs. You can specify multiple key-value pairs in the parameter.
IgnoreIfExist	Boolean	No	Specifies whether to retain key-value pairs with the same keys. Default value: false.

The following example shows how to use this method to add fields to a log.

• Input data

```
"aaa1": "value1"
```

• Configuration details

```
{
  "processors": [
    {
      "type": "processor_add_fields",
      "detail": {
        "fields": {
          "aaa2": "value2",
          "aaa3": "value3"
        }
      }
    }
  ]
}
```

- Results

```
"aaa1": "value1"
"aaa2": "value2"
"aaa3": "value3"
```

Field deletion

You can use this method to remove specific fields from logs.

The type of the plug-in is `processor_drop` .

 **Note** The method is available for Logtail 0.16.28 or later.

Parameters

Parameter	Type	Required	Description
DropKeys	Array	No	The array that includes a set of strings. You can remove multiple fields from a log.

The following example shows how to remove the `aaa1` and `aaa2` fields from a log.

- Input data

```
"aaa1": "value1"
"aaa2": "value2"
"aaa3": "value3"
```

- Configuration details

```
{
  "processors": [
    {
      "type": "processor_drop",
      "detail": {
        "DropKeys": ["aaa1", "aaa2"]
      }
    }
  ]
}
```

• Results

```
"aaa3": "value3"
```

Log time extraction (Go)

You can use this method to extract time from a log field and convert the time format.

The type of the plug-in is `processor_gotime`.

 **Note** This plug-in is available for Logtail 0.16.28 or later.

Parameters

Parameter	Type	Required	Description
SourceKey	String	Yes	The name of the log field from which you want to extract time.
SourceFormat	String	Yes	The time that parsed in Go.
SourceLocation	Integer	Yes	The time zone.
DestKey	String	Yes	The destination field.
DestFormat	String	Yes	The destination time format in Go.
DestLocation	Integer	No	The destination time zone. An empty value specifies the time zone of localhost.
SetTime	Boolean	No	Specifies whether to overwrite the original time. Default value: true.
KeepSource	Boolean	No	Specifies whether to return the SourceKey parameter. Default value: true.
NoKeyError	Boolean	No	Specifies whether to report errors when no match exists. Default value: true.
AlarmIfFail	Boolean	No	Specified whether to report error when extraction failed. Default value: true.

Use `2006-01-02 15:04:05` (UTC +8) of the `s_key` field as the source time. Convert the time into `2006/01/02 15:04:05` (UTC +9) and save the new time in the `d_key` field. The following example shows how to use this method to process a log.

• Input data

```
"s_key": "2019-07-05 19:28:01"
```

- Configuration details

```
{
  "processors": [
    {
      "type": "processor_gotime",
      "detail": {
        "SourceKey": "s_key",
        "SourceFormat": "2006-01-02 15:04:05",
        "SourceLocation": 8,
        "DestKey": "d_key",
        "DestFormat": "2006/01/02 15:04:05",
        "DestLocation": 9,
        "active": true,
        "KeepSource": true,
        "NoKeyError": true,
        "AlarmIfFail": true
      }
    }
  ]
}
```

- Results

```
"s_key": "2019-07-05 19:28:01"
"d_key": "2019/07/05 20:28:01"
```

Field expansion (JSON)

You can use this method to expand a log field.

The type of the plug-in is `processor_json`.

 **Note** This method is available for Logtail 0.16.28 or later.

Parameters

Name	Data type	Required	Parameters
SourceKey	String	Yes	The name of the field you want to expand.
NoKeyError	Boolean	No	Specifies whether to report errors when no match exists. Default value: true.
ExpandDepth	Integer	No	The depth to expand. Default value: 0, specifying the maximum depth to expand. A value of n specifies that the number of levels deep to expand is n.
ExpandConnector	String	No	The delimiter that you use to connect multiple levels. Default value: <code>_</code> . You can leave this parameter empty.

Name	Data type	Required	Parameters
Prefix	String	No	The prefix that you want to add to the name of each new field after expansion.
KeepSource	Boolean	No	Specifies whether to return the SourceKey parameter. Default value: true.
UseSourceKeyAsPrefix	Boolean	No	Specifies whether to retain the name of the original field as part of the name of each new field after expansion. Default value: false.

The following example shows how to the field expansion (JSON) method to expand the `s_key` field.

- Input data

```
"s_key":>{"k1\":{"k2\":{"k3\":{"k4\":{"k51\":"51\","\k52\":"52\"},\k41\":"41\"}}}}}
```

- Configuration details

```
{
  "processors": [
    {
      "type": "processor_json",
      "detail": {
        "SourceKey": "s_key",
        "NoKeyError": true,
        "ExpandDepth": 0,
        "ExpandConnector": "-",
        "Prefix": "j",
        "KeepSource": false,
        "UseSourceKeyAsPrefix": true
      }
    }
  ]
}
```

- Results

```
"s_key":>{"k1\":{"k2\":{"k3\":{"k4\":{"k51\":"51\","\k52\":"52\"},\k41\":"41\"}}}}}"
"js_key-k1-k2-k3-k4-k51":"51"
"js_key-k1-k2-k3-k4-k52":"52"
"js_key-k1-k2-k3-k41":"41"
```

Field combination (JSON)

You can use this method to combine multiple log fields into one field.

The type of the plug-in is `processor_packjson`.

 **Note** This method is available for Logtail 0.16.28 or later.

Parameters

Name	Type	Required	Description
SourceKeys	Array	Yes	The array that include the names of fields that you want to combine.
DestKey	String	No	The name of the destination field after combination.
KeepSource	Boolean	No	Specifies whether to return the SourceKey parameter. Default value: true.
AlarmIfIncomplete	Boolean	No	Specifies whether to report alerts when no match exists. Default value: true.

The following example shows how to use the method to combine the `a` and `b` fields into the `d_key` field

- Input data

```
"a": "1"
"b": "2"
```

- Configuration details

```
{
  "processors": [
    {
      "type": "processor_packjson",
      "detail": {
        "SourceKeys": ["a", "b"],
        "DestKey": "d_key",
        "KeepSource": false,
        "AlarmIfEmpty": true
      }
    }
  ]
}
```

- Results

```
"a": "1"
"b": "2"
"d_key": "{\"a\": \"1\", \"b\": \"2\"}"
```

Field renaming

You can use this method to rename multiple fields.

The type of the plug-in is `processor_rename` .

 **Note** This method is available for Logtail 0.16.28 or later.

Parameters

Parameter	Data type	Required	Description
-----------	-----------	----------	-------------

Parameter	Data type	Required	Description
NoKeyError	Boolean	No	Specifies whether to report errors when no match exists. Default value: true.
SourceKeys	Array	Yes	The array that includes the names of fields that you want to rename.
DestKeys	Array	Yes	The array that includes the new names of the fields.

The following example shows how to use this method to rename the `aaa1` and `aaa2` fields to `bbb1` and `bbb2` .

- Input data

```
"aaa1": "value1"
"aaa2": "value2"
"aaa3": "value3"
```

- Configuration details

```
{
  "processors": [
    {
      "type": "processor_rename",
      "detail": {
        "SourceKeys": ["aaa1", "aaa2"],
        "DestKeys": ["bbb1", "bbb2"],
        "NoKeyError": true,
      }
    }
  ]
}
```

- Results

```
"bbb1": "value1"
"bbb2": "value2"
"aaa3": "value3"
```

Log time extraction (Strptime)

You can use this method to extract time from a log field and parse the time by using the Linux `strptime()` function.

The type of the plug-in is `processor_strptime` .

 **Note** This method is available for Logtail 0.16.28 or later.

Parameters

Parameter	Type	Required	Description
-----------	------	----------	-------------

Parameter	Type	Required	Description
SourceKey	String	Yes	The name of the field from which you want to extract time.
Format	String	Yes	The time format to parse the time.
AdjustUTCOffset	Boolean	No	Specifies whether to adjust the time zone. Default value: false.
UTCOffset	Integer	No	The offset in seconds. For example, a value of 28800 changes the time zone to UTC +8.
AlarmIfFail	Boolean	No	Specifies whether to report alerts when extraction failed. Default value: true.
KeepSource	Boolean	No	Specifies whether to return the SourceKey parameter. Default value: true.

Parse the value of the `log_time` in the `%Y/%m/%d %H:%M:%S` time format and use the time zone of your localhost. The following examples show how to use this method to process logs.

- Example 1: The time zone is UTC +8.

- Input data

```
"log_time": "2016/01/02 12:59:59"
```

- Configuration details

```
{
  "processors": [
    {
      "type": "processor_strptime",
      "detail": {
        "SourceKey": "log_time",
        "Format": "%Y/%m/%d %H:%M:%S"
      }
    }
  ]
}
```

- Results

```
"log_time": "2016/01/02 12:59:59"
Log.Time = 1451710799
```

- Example 2: The time zone is UTC +7.

- Input data

```
"log_time": "2016/01/02 12:59:59"
```

- Configuration details

```
{
  "processors": [
    {
      "type": "processor_strptime",
      "detail": {
        "SourceKey": "content",
        "Format": "%Y/%m/%d %H:%M:%S",
        "AdjustUTCOffset": true,
        "UTCOffset": 25200
      }
    }
  ]
}
```

- Results

```
"log_time": "2016/01/02 12:59:59"
Log.Time = 1451714399
```

Custom methods

You can use a combination of multiple processing methods to process logs. The following example shows how to use a single-character delimiter to split a log into several fields and then specify calibration points to extract the required contents from the `detail` field.

- Input data

```
"content": {
  "ACCESS|QAS|11. **. **. **|1508729889935|52460dbed4d540b88a973cf5452b1447|1238|appKey=ba,env=pub,requestTime

30.3.1.6. Collect container logs

30.3.1.6.1. Collect standard Docker logs

This topic describes how to use Logtail to collect standard Docker logs and upload these logs together with the container metadata to Log Service.

Procedure

Procedure

1. **Deploy a Logtail container.**
2. **Configure a Logtail server group.**

Create a server group with a custom ID in the Log Service console. The container cluster can automatically scale up or down based on data traffic.

3. **Create a Logtail configuration.**

Create a Logtail configuration in the Log Service console. The Logtail configuration process is completed in the Log Service console. No local configuration is needed.

Deploy a Logtail container

1. Run the following command to pull the Logtail image.

```
docker pull registry.cn-hangzhou.aliyuncs.com/log-service/logtail
```

2. Start a Logtail container. Set the `your_region_name`, `your_aliyun_user_id`, and `your_machine_group_user_defined_id` parameters in the startup template.

```
docker run -d -v /:/logtail_host:ro -v /var/run:/var/run --env
ALIYUN_LOGTAIL_CONFIG=/etc/ilogtail/conf/your_region_name/ilogtail_config.json
--env ALIYUN_LOGTAIL_USER_ID=your_aliyun_user_id --env
ALIYUN_LOGTAIL_USER_DEFINED_ID=your_machine_group_user_defined_id registry.cn-hangzhou.aliyuncs.com/l
og-service/logtail
```

Notice Before you set the parameters, you must complete one of the following configurations. Otherwise, the `container text file busy` error may occur when you delete another container.

- For CentOS 7.4 and later versions, set `fs.may_detach_mounts` to 1. For more information, see [Bug 1468249](#), [Bug 1441737](#), and [Issue 34538](#).
- Grant the `privileged` permission to Logtail by adding the `--privileged` flag to the startup parameters. For more information, see [Docker run reference](#).

Parameter	Description
<code>#{your_region_name}</code>	The region of the project. For more information, see View the information of a project .
<code>#{your_aliyun_user_id}</code>	The user ID. Set this parameter to the ID of your Alibaba Cloud account, which is a string. For information about how to view the ID, see Step 1 in Configure an account ID for a server .
<code>#{your_machine_group_user_defined_id}</code>	The custom ID of your server group. For information about how to set the custom ID, see Step 1 in Create a machine group based on a custom ID .

After you set the parameters, run the following command to start the Logtail container.

```
docker run -d -v /:/logtail_host:ro -v /var/run:/var/run
--env ALIYUN_LOGTAIL_CONFIG=/etc/ilogtail/conf/cn_hangzhou/ilogtail_config.json --env
ALIYUN_LOGTAIL_USER_ID=1654218*****--env ALIYUN_LOGTAIL_USER_DEFINED_ID=log-docker-demo registry.cn-ha
ngzhou.aliyuncs.com/log-service/logtail
```

Notice

You can customize the startup parameters of the Logtail container if the following conditions are met:

- The following environment variables exist before you start the Logtail container: `ALIYUN_LOGTAIL_USER_DEFINED_ID`, `ALIYUN_LOGTAIL_USER_ID`, and `ALIYUN_LOGTAIL_CONFIG`.
- The `/var/run` directory is mounted on the `/var/run` directory of the Logtail container.
- To collect container standard output, container logs, or host files, you must mount the root directory on the `/logtail_host` directory of the Logtail container.
- If an error showing *The parameter is invalid : uuid=none* occurs in the `/usr/local/ilogtail/ilogtail.LOG` Logtail log file, create a file named `product_uuid` on the host. Add a valid UUID such as `169E98C9-ABC0-4A92-B1D2-AA6239C0D261` to the file, and mount the file on the `/sys/class/dmi/id/product_uuid` directory of the Logtail container.

Configure a Logtail server group

- Log on to the [Log Service console](#).
- Click a project name.
- In the left-side navigation pane, click the **Server Groups** icon to show the server group list.
- Click the icon next to **Server Groups**, and then select **Create Server Group**. You can also create a server group when you import data to Log Service.
- In the dialog box that appears, select **Custom ID** from the Identifier drop-down list. Enter the value of `ALIYUN_LOGTAIL_USER_DEFINED_ID` set in the previous step in the **Custom Identifier** field.

Click OK. One minute later, click the name of the server group in the **Server Groups** list. On the **Server Group Settings** page that appears, you can view the heartbeat status of the Logtail container. For more information, see [View the status of a server group](#).

Create a Logtail configuration

Create a Logtail configuration in the console.

- For more information about Docker logs, see [Collect container text logs](#).
- For more information about Docker standard output, see [Collect stdout and stderr logs from containers](#).
- [Host text logs](#).

The root directory of a host is mounted on the `/logtail_host` directory of the Logtail container by default. You must add the `/logtail_host` prefix to the log path. For example, if you want to collect data from the `/home/logs/app_log/` directory of the host, you must set the log path as `/logtail_host/home/logs/app_log/`.

What to do next

- View the status of the Logtail container.

You can run the `docker exec ${logtail_container_id} /etc/init.d/ilogtailed status` command to view the status of Logtail.

- View the version number, IP address, and startup time of Logtail.

You can run the `docker exec ${logtail_container_id} cat /usr/local/ilogtail/app_info.json` command to view Logtail information.

- View the operations logs of Logtail.

The operations logs of Logtail are stored in the `ilogtail.LOG` file in the `/usr/local/ilogtail/` directory. If the log file is rotated and compressed, it is stored as a file named `ilogtail.LOG.x.gz`.

For example:

```
[root@iZbp17enxc2us3624wexh2Z ilogtail]# docker exec a287de895e40 tail -n 5 /usr/local/ilogtail/ilogtail.LOG
[2018-02-06 08:13:35.721864] [INFO] [8] [build/release64/sls/ilogtail/LogtailPlugin.cpp:104] logtail plugin Resume:start
[2018-02-06 08:13:35.722135] [INFO] [8] [build/release64/sls/ilogtail/LogtailPlugin.cpp:106] logtail plugin Resume:success
[2018-02-06 08:13:35.722149] [INFO] [8] [build/release64/sls/ilogtail/EventDispatcher.cpp:369] start add existed check point events, size:0
[2018-02-06 08:13:35.722155] [INFO] [8] [build/release64/sls/ilogtail/EventDispatcher.cpp:511] add existed check point events, size:0 cache size:0 event size:0 success count:0
[2018-02-06 08:13:39.725417] [INFO] [8] [build/release64/sls/ilogtail/ConfigManager.cpp:3776] check container path update flag:0 size:1
```

Ignore the following standard output:

```

start umount useless mount points, /shm$|/merged$|/mqueue$
umount: /logtail_host/var/lib/docker/overlay2/3fd0043af174cb0273c3c7869500fbe2bdb95d13b1e110172ef57fe840c82

umount: /logtail_host/var/lib/docker/overlay2/d5b10aa19399992755de1f85d25009528daa749c1bf8c16edff44beab6e6
9718/merged: must be superuser to unmount
umount: /logtail_host/var/lib/docker/overlay2/5c3125daddacedec29df72ad0c52fac800cd56c6e880dc4e8a640b1e16c2
2dbe/merged: must be superuser to unmount
...
xargs: umount: exited with status 255; aborting
umount done
start logtail
ilogtail is running
logtail status:
ilogtail is running

```

- Restart Logtail.

To restart Logtail, use the following sample code:

```

[root@iZbp17enxc2us3624wexh2Z ilogtail]# docker exec a287de895e40 /etc/init.d/ilogtailed stop
kill process Name: ilogtail pid: 7
kill process Name: ilogtail pid: 8
stop success
[root@iZbp17enxc2us3624wexh2Z ilogtail]# docker exec a287de895e40 /etc/init.d/ilogtailed start
ilogtail is running

```

30.3.1.6.2. Collect Kubernetes logs

This topic describes how to install and use Logtail to collect logs from Kubernetes clusters.

Configuration procedure

Perform the following steps to collect logs from Kubernetes clusters:

1. Install the alibaba-log-controller Helm package.
2. Use the Log Service console to manage log collection configurations.

Step 1: Install Logtail

- Install Logtail in an Alibaba Cloud Container Service for Kubernetes cluster.

If Log Service components are not installed in your cluster, you must manually install the components.

- i. Connect to the Kubernetes cluster by using CloudShell.
- ii. Run the following command in CloudShell to obtain the ID of your Apsara Stack tenant account.

```
echo $ALIBABA_CLOUD_ACCOUNT_ID
```

- iii. After you set the `${your_k8s_cluster_id}`, `${your_ali_uid}`, and `${your_k8s_cluster_region_id}` parameters, run the following command:

```
wget https://acs-logging.oss-cn-hangzhou.aliyuncs.com/alibabacloud-k8s-log-installer.sh -O alibabacloud-k8s-log-installer.sh; chmod 744 ./alibabacloud-k8s-log-installer.sh; ./alibabacloud-k8s-log-installer.sh --cluster-id ${your_k8s_cluster_id} --ali-uid ${your_ali_uid} --region-id ${your_k8s_cluster_region_id}
```

- Install Logtail in a user-created Kubernetes cluster.

 Notice

- The version of the Kubernetes cluster must be 1.8 or later.
- Helm 2.6.4 or later must be installed.

- In the Log Service console, create a project whose name starts with `k8s-log-custom-`.
- Replace the parameters in the following command based on your business requirements:

```
wget http://logtail-release-cn-hangzhou.oss-cn-hangzhou.aliyuncs.com/kubernetes/alibabacloud-log-k8s-custom-install.sh; chmod 744 ./alibabacloud-log-k8s-custom-install.sh; sh ./alibabacloud-log-k8s-custom-install.sh {your-project-suffix} {region-id} {aliuid} {access-key-id} {access-key-secret}
```

The following table lists the parameters in the preceding command.

Parameter	Description
{your-project-suffix}	The portion of the project name at the end of <code>k8s-log-custom-</code> . For example, if you create a project whose name is <code>k8s-log-custom-xxxx</code> , set this parameter to <code>xxxx</code> .
{regionid}	The ID of the region where the project resides. For more information, see View the information of a project .
{aliuid}	The user ID. Set this parameter to the ID of your Apsara Stack tenant account.  Note The ID of an Apsara Stack tenant account is a string. For more information about how to obtain the ID, see Configure an account ID for a server .
{access-key-id}	The AccessKey ID of your Apsara Stack tenant account.
{access-key-secret}	The AccessKey secret of your Apsara Stack tenant account.

After Logtail is installed in the Kubernetes cluster, Log Service automatically creates a machine group named `k8s-group-${your_k8s_cluster_id}` for the project.

 Note

- A Logstore named `config-operation-log` is automatically created in the project. Do not delete the Logstore.
- When you install Logtail in a user-created Kubernetes cluster, Logtail is granted `privileged` permissions by default. This prevents the `container text file busy` error when you delete a pod. For more information, visit [Bug 1468249](#), [Bug 1441737](#), and [Issue 34538](#).

The following example shows a successful installation:

```
[root@iZbp1dsxxxxqfbiaZ ~]# wget http://logtail-release-cn-hangzhou.oss-cn-hangzhou.aliyuncs.com/kubernetes/alicloud-log-k8s-custom-install.sh; chmod 744 ./alicloud-log-k8s-custom-install.sh; sh ./alicloud-log-k8s-custom-install.sh xxxx cn-hangzhou 165xxxxxxxx050 LTAxxxxxxxxx Alxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
....

[INFO] your k8s is using project : k8s-log-custom-xxx, region : cn-hangzhou, aliuid : *****, accessKeyld : LTA*
*****
[SUCCESS] install helm package : alibaba-log-controller success.
```

To check the status of each Log Service component in the Kubernetes cluster, run the `helm status alibaba-log-controller` command. If all pods are in the Running state, Logtail is installed.

Log on to the Log Service console to find the project. If you have multiple projects, search for the project by using the `k8s-log` keyword.

Step 2: Configure log collection

Create Logtail configurations for log collection in the console as required.

- For information about how to collect Kubernetes text logs, see [Collect container text logs](#).
- For information about how to collect Kubernetes stdout logs, see [Collect stdout and stderr logs from](#)

containers.

- **Host text logs.**

By default, the root directory of a host is mounted to the `/logtail_host` directory of the Logtail container. You must add the `/logtail_host` prefix to the log path. For example, if you want to collect data from the `/home/logs/app_log/` directory of the host, you must set the log path to `/logtail_host/home/logs/app_log/`.

Other common commands

- **Store logs of multiple clusters in one project**

You can collect logs from multiple Kubernetes clusters. If you want to store these logs in the same project, you can specify the same cluster ID for the `#{your_k8s_cluster_id}` parameter when you install Log Service components on multiple Kubernetes clusters.

For example, if you have three Kubernetes clusters whose IDs are `abc001`, `abc002`, and `abc003`, specify `abc001` for the `#{your_k8s_cluster_id}` parameter when you install Log Service components for each Kubernetes cluster.

 **Notice** This feature is unavailable for Kubernetes clusters that reside in different regions.

- **Logtail container logs**

Logtail log files named `ilogtail.LOG` and `logtail_plugin.LOG` are stored in the `/usr/local/ilogtail/` directory of a Logtail container. Ignore the following standard output:

```
start umount useless mount points, /shm$|/merged$|/mqueue$
umount: /logtail_host/var/lib/docker/overlay2/3fd0043af174cb0273c3c7869500fbe2bdb95d13b1e110172ef57fe840c82
155/merged: must be superuser to unmount
umount: /logtail_host/var/lib/docker/overlay2/d5b10aa19399992755de1f85d25009528daa749c1bf8c16edff44beab6e6
9718/merged: must be superuser to unmount
umount: /logtail_host/var/lib/docker/overlay2/5c3125daddacedec29df72ad0c52fac800cd56c6e880dc4e8a640b1e16c2
2dbe/merged: must be superuser to unmount
.....
xargs: umount: exited with status 255; aborting
umount done
start logtail
ilogtail is running
logtail status:
ilogtail is running
```

- **View the status of each Log Service component in a Kubernetes cluster**

```
helm status alibaba-log-controller
```

- **Troubleshoot alibaba-log-controller startup failures**

Make sure that the following conditions are met:

- Log Service components are installed on the master node of the Kubernetes cluster.
- The Kubernetes cluster ID that you specified is valid when you install Log Service components.

If Log Service components fail to be installed because the preceding conditions are not met, run the `helm delete --purge alibaba-log-controller` command to delete the installation package and install Log Service components again.

- **View the status of Logtail DaemonSet in a Kubernetes cluster**

Run the `kubectl get ds -n kube-system` command.

 **Note** The default namespace of Logtail is `kube-system`.

- View the version number, IP address, and startup time of Logtail.

Example:

```
[root@iZbp1dsu6v77zfb40qfbiaZ ~]# kubectl get po -n kube-system | grep logtail
NAME          READY   STATUS    RESTARTS   AGE
logtail-ds-gb92k 1/1     Running   0          2h
logtail-ds-wm7lw 1/1     Running   0          4d
[root@iZbp1dsu6v77zfb40qfbiaZ ~]# kubectl exec logtail-ds-gb92k -n kube-system cat /usr/local/ilogtail/app_info.json
{
  "UUID" : "",
  "hostname" : "logtail-ds-gb92k",
  "instance_id" : "0EBB2B0E-0A3B-11E8-B0CE-0A58AC140402_172.20.4.2_1517810940",
  "ip" : "172.20.4.2",
  "logtail_version" : "0.16.2",
  "os" : "Linux; 3.10.0-693.2.2.el7.x86_64; #1 SMP Tue Sep 12 22:26:13 UTC 2017; x86_64",
  "update_time" : "2018-02-05 06:09:01"
}
```

- View the operational logs of Logtail

Logtail operational logs are stored in the `ilogtail.LOG` file in the `/usr/local/ilogtail/` directory. If the log file is rotated and compressed, it is stored as a file named `ilogtail.LOG.x.gz`.

Example:

```
[root@iZbp1dsu6v77zfb40qfbiaZ ~]# kubectl exec logtail-ds-gb92k -n kube-system tail /usr/local/ilogtail/ilogtail.LOG
[2018-02-05 06:09:02.168693] [INFO] [9] [build/release64/sls/ilogtail/LogtailPlugin.cpp:104] logtail plugin Resume: start
[2018-02-05 06:09:02.168807] [INFO] [9] [build/release64/sls/ilogtail/LogtailPlugin.cpp:106] logtail plugin Resume: success
[2018-02-05 06:09:02.168822] [INFO] [9] [build/release64/sls/ilogtail/EventDispatcher.cpp:369] start add existed check point events, size:0
[2018-02-05 06:09:02.168827] [INFO] [9] [build/release64/sls/ilogtail/EventDispatcher.cpp:511] add existed check point events, size:0 cache size:0 event size:0 success count:0
```

- Restart Logtail in a pod

Example:

```
[root@iZbp1dsu6v77zfb40qfbiaZ ~]# kubectl exec logtail-ds-gb92k -n kube-system /etc/init.d/ilogtaild stop
kill process Name: ilogtail pid: 7
kill process Name: ilogtail pid: 9
stop success
[root@iZbp1dsu6v77zfb40qfbiaZ ~]# kubectl exec logtail-ds-gb92k -n kube-system /etc/init.d/ilogtaild start
ilogtail is running
```

30.3.1.6.3. Collect container text logs

Logtail collects text logs generated in containers and uploads these logs together with the container-related metadata information to Log Service.

Features

Compared with basic log file collection, Docker file collection has the following characteristics:

- Allows you to configure the log path of a container, without the need to consider the mapping between the path and the host.
- Allows you to use labels to specify the containers whose logs are to be collected.
- Allows you to use labels to exclude specific containers.
- Allows you to use environment variables to specify the containers whose logs are to be collected.
- Allows you to use environment variables to exclude specific containers.
- Supports multiline logs such as Java Stack logs.
- Supports automatic labeling for container data.
- Supports automatic labeling for Kubernetes containers.

Limits

- Collection stop policy: When a container is stopped and Logtail detects the `die` event on the container, Logtail stops collecting logs of the container (with a latency of no more than 3 seconds). In this case, if a collection latency occurs, some logs generated before the stop action may be lost.
- Docker storage driver: Only overlay and overlay2 are supported. For other storage drivers, you must mount the log directory to the local host.
- Logtail running mode: Logtail must run in a container and must be deployed based on Logtail deployment solutions.
- Label: refers to the label information in `docker inspect`. It is not synonymous with labels in Kubernetes.
- Environment: refers to the environment information configured during container startup.

Procedure

1. Deploy and configure the Logtail container.
2. Configure log collection in Log Service.

Logtail deployment and configuration

- Kubernetes

For more information about Kubernetes log collection, see [Logtail deployment solution for collecting Kubernetes logs](#).

- Management methods for other containers

For more information about management methods for other containers, such as Swarm and Mesos, see [Common deployment solution for collecting Docker logs](#).

Collection configuration

1. [Log on to the Log Service console](#).
2. Click the **Import Data** button. On the **Import Data** page that appears, select **Docker File**.
3. Select a Logstore, and then click **Next**. Select an existing project and Logstore. You can also click **Create Now** to create a project and Logstore. For more information, see [Manage a Logstore](#).

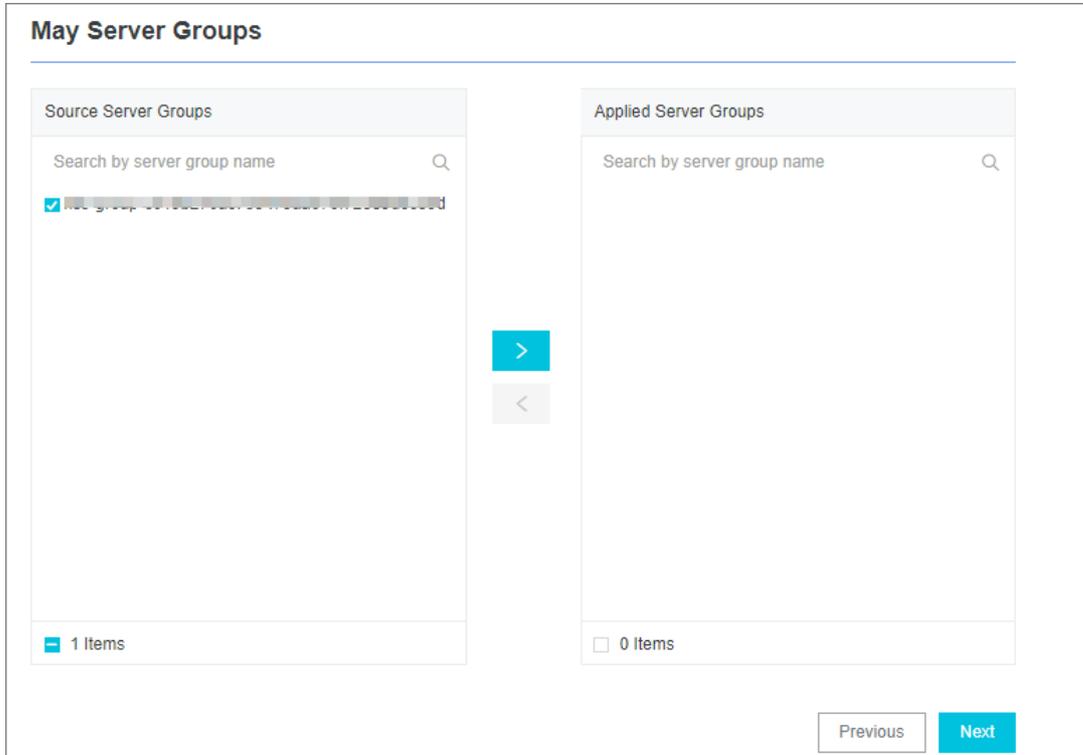

If you enter the configuration procedure by clicking the plus sign (+) next to **Data Import** under a Logstore on the Logstores tab, the system skips this step.

4. Create a server group. Before you create a server group, ensure that Logtail is installed.

Install Logtail as prompted. For more information, see [Install Logtail in Linux](#) or [Install Logtail in Windows](#).

After you install Logtail, click **Complete Installation** to create a server group. For more information, see [Overview](#). If you have created a server group, click **Use Existing Server Groups** to select the server group.

5. Configure the server group, and then click **Next**. Select a server group and move the group from **Source Server Groups** to **Applied Server Groups**.

6. Configure Logtail. The following table lists data source-specific parameters. For more information about common parameters, see [Configure text log collection](#).

Parameter	Description
Docker File	This parameter is used to check whether the collected target file is a Docker file.
Label Whitelist	<p>LabelKey is required. If LabelValue is not empty, only containers whose labels contain LabelKey = LabelValue are collected. If LabelValue is empty, all the containers whose labels contain LabelKey are collected.</p> <div style="background-color: #e0f2f7; padding: 10px; border: 1px solid #ccc;"> <p>? Note</p> <ul style="list-style-type: none"> ◦ Key-value pairs are disjunctive with each other. If the label of a container contains one of the key-value pairs you specify, logs of the container are collected. ◦ Labels refer to Docker labels. </div>

Parameter	Description
Label Blacklist	<p>LabelKey is required. If LabelValue is not empty, only containers whose labels contain LabelKey = LabelValue are excluded. If LabelValue is empty, all containers whose labels contain LabelKey are excluded.</p> <p>Note</p> <ul style="list-style-type: none"> Key-value pairs are disjunctive with each other. If the label of a container contains one of the key-value pairs you specify, the container is excluded. Labels described in this topic refer to the label information in docker inspect.
Environment Variable Whitelist	<p>EnvKey is required. If EnvValue is not empty, only containers whose environment variables contain EnvKey = EnvValue are collected. If EnvValue is empty, all containers whose environment variables contain EnvKey are collected.</p> <p>Note</p> <ul style="list-style-type: none"> Key-value pairs are disjunctive with each other. If the environment variable of a container contains one of the key-value pairs you specify, logs of the container are collected. The environment variable refers to the environment information configured in container startup.
Environment Variable Blacklist	<p>EnvKey is required. If EnvValue is not empty, only containers whose environment variables contain EnvKey = EnvValue are excluded. If EnvValue is empty, all containers whose environment variables contain EnvKey are excluded.</p> <p>Note</p> <ul style="list-style-type: none"> Key-value pairs are disjunctive with each other. If the environment variable of a container contains one of the key-value pairs you specify, the container is excluded. The environment variable refers to the environment information configured in container startup.

Note

- Labels in whitelist and blacklist are different from those defined in Kubernetes. Labels in this topic refer to the label information in docker inspect.
- A namespace and a container name in Kubernetes can be mapped to Docker labels. LabelKey corresponding to a namespace is `io.kubernetes.pod.namespace`. LabelKey corresponding to a container name is `io.kubernetes.container.name`. For example, the namespace of the pod you created is `backend-prod` and the container name is `worker-server`. In this case, you can configure a whitelist label: `io.kubernetes.pod.namespace : backend-prod` or `io.kubernetes.container.name : worker-server`, so that only logs of the container are collected.
- In Kubernetes, we recommend that you only use the `io.kubernetes.pod.namespace` and `io.kubernetes.container.name` labels. In other cases, use an environment variable whitelist or blacklist.

7. Configure an index. Configure an index based on your business requirements. For more information, see [Enable the index feature and configure indexes for a Logstore](#).

Default fields

Each uploaded log of a common Docker container contains the following fields.

Field	Description:
<code>_image_name_</code>	The name of the image.
<code>_container_name_</code>	The name of the container.
<code>_container_ip_</code>	The IP address of the container.

If a Kubernetes cluster is used, each uploaded log contains the following fields.

Field	Description
<code>_image_name_</code>	The name of the image.
<code>_container_name_</code>	The name of the container.
<code>_pod_name_</code>	The name of the pod.
<code>_namespace_</code>	The namespace to which the pod belongs.
<code>_pod_uid_</code>	The unique identifier of the pod.
<code>_container_ip_</code>	The IP address of the pod.

30.3.1.6.4. Collect stdout and stderr logs from containers

This topic describes how to use Logtail to collect standard output (stdout) and standard error (stderr) logs from containers. After you collect stdout and stderr logs, you can upload the logs together with the container-related metadata to Log Service.

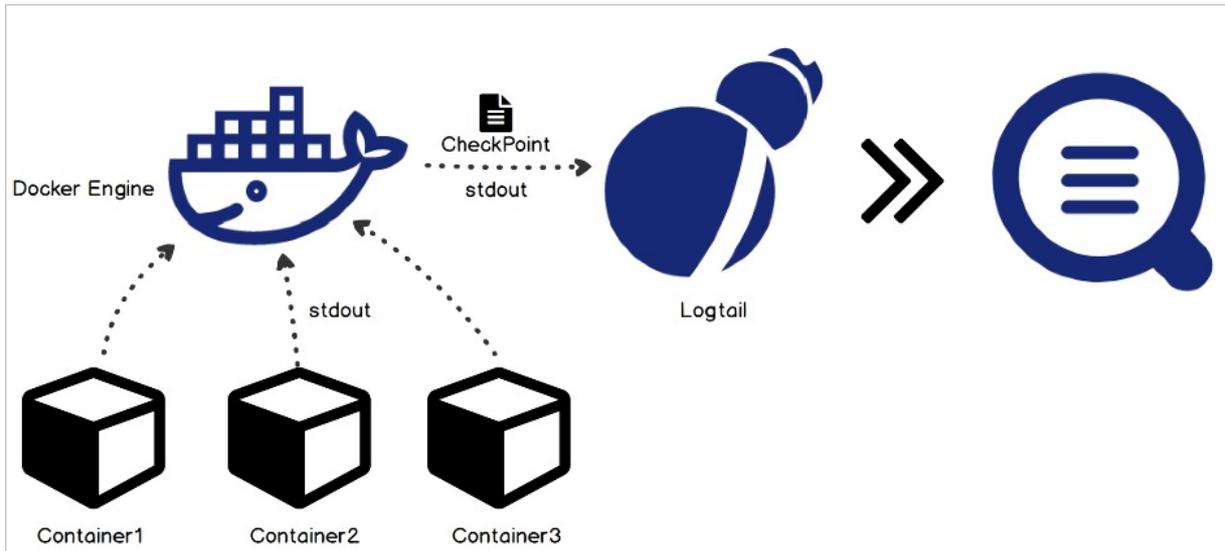

Features

- Collects stdout and xxx logs.
- Labels the containers from which you want to collect stdout and stderr logs.
- Uses tags to exclude specific containers.
- Allows you to use environment variables to specify the containers whose logs are to be collected.
- Allows you to use environment variables to exclude specific containers.
- Supports multiline logs such as Java Stack logs.
- Supports automatic labeling for container data.
- Supports automatic labeling for Kubernetes containers.

Implementation

As shown in the following figure, Logtail communicates with the domain socket of the Docker engine to query containers that run on the Docker engine. Logtail also locates containers from which you want to collect logs based on the specified labels and environment variables. Logtail then uses the docker logs command to collect logs from the specified containers.

When Logtail collects the stdout logs of a container, Logtail records information about log file positions to the checkpoint file at regular intervals. If Logtail is restarted, Logtail collects logs from the last log file position.

Limits

- This feature is available only for Logtail 0.16.0 or later that runs on Linux. For more information about Logtail versions and version updates, see [Install Logtail in Linux](#).
- The domain socket must exist and can access the Docker engine. Otherwise, Logtail cannot access the Docker engine by running the `/var/run/docker.sock` file.
- The last multiline log that you collect must be cached for at least 1,000 seconds. By default, the retention period for a multiline log is 3 seconds. You can specify the period by configuring the `BeginLineTimeoutMs` parameter. The value of the parameter must be a minimum of 1,000 ms. Otherwise, a false positive error may occur.
- Collection stop policy: When a container is stopped and Logtail detects the `die` event on the container, Logtail stops collecting stdout logs of the container. In this case, if a collection latency occurs, some stdout logs that are generated before the stop action may be lost.
- Docker log driver: Only log drivers of the JSON type are supported in the collection of stdout logs.
- Context: By default, a collection configuration is in the same context. If you need to configure different types of containers in different contexts, configure each type separately.
- Data processing: By default, collected logs start with the `content` field. You can apply standard processing methods to these logs. For more information about how to configure one or more processing methods, see [Configure data processing methods](#).
- Label: refers to the label information in docker inspect. It is not related to labels in Kubernetes configurations.
- Environment: refers to environment information that you specified during container startup.

Procedure

1. Deploy and configure Logtail on one or more containers.
2. Create a Logtail configuration and deliver it to Logtail.

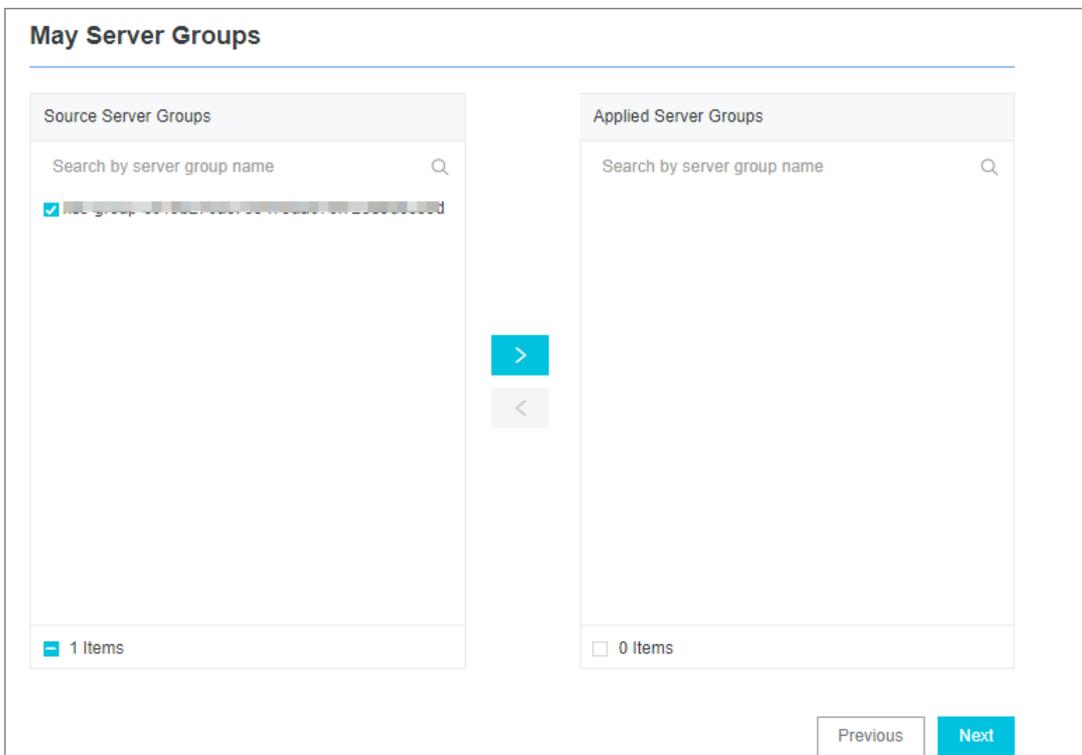

Logtail deployment and configuration

- Kubernetes
 - For more information about how to collect Kubernetes logs, see [Logtail deployment solution for collecting Kubernetes logs](#).
- Configure Logtail on other containers

For more information about how to configure Logtail on other containers, such as Swarm and Mesos, see [Common Logtail deployment solution for collecting Docker logs](#).

Configure a data source

1. [Log on to the Log Service console](#).
2. Click **Import Data**. On the **Import Data** page that appears, select **Docker Standard Output**.
3. Select a Logstore, and then click **Next**. Select an existing project and Logstore. You can also click **Create Now** to create a project and Logstore. For more information, see [Manage a Logstore](#).
If you enter the configuration procedure by clicking the plus sign (+) next to **Data Import** under a Logstore on the Logstores tab, the system skips this step.
4. Create a server group. Before you create a server group, ensure that Logtail is installed.
Install Logtail as prompted. For more information, see [Install Logtail in Linux](#) or [Install Logtail in Windows](#).
After you install Logtail, click **Complete Installation** to create a server group. For more information, see [Overview](#). If you have created a server group, click **Use Existing Server Groups** to select the server group.
5. Configure the server group, and then click **Next**. Select a server group and move the group from **Source Server Groups** to **Applied Server Groups**.

6. Configure a data source.
In the **Plug-in Config** section, set the required parameters. The following example shows how to set these parameters. For more information, see [Parameters](#).

```
{
  "inputs": [
    {
      "type": "service_docker_stdout",
      "detail": {
        "Stdout": true,
        "Stderr": true,
        "IncludeLabel": {
          "io.kubernetes.container.name": "nginx"
        },
        "ExcludeLabel": {
          "io.kubernetes.container.name": "nginx-ingress-controller"
        },
        "IncludeEnv": {
          "NGINX_SERVICE_PORT": "80"
        },
        "ExcludeEnv": {
          "POD_NAMESPACE": "kube-system"
        }
      }
    }
  ]
}
```

7. Configure an index. Configure an index based on your business requirements. For more information, see [Enable the index feature and configure indexes for a Logstore](#).

Parameters

The type of the input source is `service_docker_stdout`.

 **Note** Before Logtail uploads data to Log Service, Logtail can process collected data. For more information about processing methods, see [Configure data processing methods](#).

Parameter	Type	Required	Description
IncludeLabel	JSON text. Key: JSON string. Value: JSON string.	Yes	<p>By default, this parameter is not specified. If the parameter is not specified, Logtail collects logs from all containers. If you set the key field and leave the value field empty, Logtail collects logs from containers whose labels include this key.</p> <div style="background-color: #e6f2ff; padding: 5px; margin-top: 10px;"> <p> Note</p> <ul style="list-style-type: none"> Key-value pairs are disjunctive with each other. If the label of a container matches one of the key-value pairs, logs of the container are collected. Labels refer to docker labels. </div>

Parameter	Type	Required	Description
ExcludeLabel	JSON text. Key: JSON string. Value: JSON string.	No	<p>This parameter is not specified by default. If the parameter is empty, no containers are excluded. If the key is not empty but the value is empty, the containers whose labels include this key are excluded.</p> <p>Note</p> <ul style="list-style-type: none"> Key-value pairs are disjunctive with each other. If the label of a container matches one of the key-value pairs, the container is excluded. Labels described in this topic refer to Docker labels.
IncludeEnv	Map. Key: string. Value: string	No	<p>This parameter is empty by default. If the parameter is empty, logs of all containers are collected. If the key is not empty but the value is empty, logs of the containers whose environment variables include this key are collected.</p> <p>Note</p> <ul style="list-style-type: none"> Key-value pairs are disjunctive with each other. If the environment variable of a container includes one of the key-value pairs, the container is excluded. The environment variable refers to the environment information configured in container startup.
ExcludeEnv	Map. Key: string. Value: string	No	<p>This parameter is empty by default. If you leave the parameter empty, no container is excluded. If you set the key and leave the value empty, the containers whose environment variables include this key are excluded.</p> <p>Note</p> <ul style="list-style-type: none"> Key-value pairs are disjunctive with each other. When the environment variable of a container includes one of the key-value pairs, the container is excluded. The environment variable refers to the environment information configured in container startup.
Stdout	Boolean	No	If the value of the parameter is false, stdout data is not collected. Default value: true.
Stderr	Boolean	No	Default value: true. If the value of the parameter is false, stderr data is not collected.

Parameter	Type	Required	Description
BeginLineRegex	String	No	This parameter is not specified by default. If the parameter is not empty, the regular expression is used to match the first line of each log. If a line matches this regular expression, this line is assumed as the start of a new log. Otherwise, this line is assumed as part of the previous log.
BeginLineTimeoutMs	Integer	No	The timeout period for the regular expression to match a line. Default value: 3000. Unit: ms. If no new log appears within 3 seconds, the most recent log is uploaded.
BeginLineCheckLength	Integer	No	The length of data for the regular expression to match. Default value: 10×1024. Unit: bytes. You can set this parameter to check whether the beginning part of a line can match the regular expression. This improves matching efficiency.
MaxLogSize	Integer	No	The maximum length of a log. Default value: 512×1024. Unit: bytes. If the length exceeds this value, the log data is uploaded directly without finding the first line of logs.

 Note

- Labels defined in IncludeLabel and ExcludeLabel are different from those defined in Kubernetes. Labels in this topic refer to Docker labels.
- A namespace and a container name in Kubernetes can be mapped to Docker labels. The LabelKey parameter corresponding to a namespace is `io.kubernetes.pod.namespace`. The LabelKey parameter corresponding to a container name is `io.kubernetes.container.name`. For example, the namespace of the pod you created is `backend-prod` and the container name is `worker-server`. In this case, you can configure a whitelist label: `io.kubernetes.pod.namespace : backend-prod` or `io.kubernetes.container.name : worker-server`, so that only logs of the container are collected.
- In Kubernetes, we recommend that you use the `io.kubernetes.pod.namespace` and `io.kubernetes.container.name` labels. In other cases, use IncludeEnv or ExcludeEnv.

Default fields

- Common Docker containers

Each uploaded log contains the following fields.

Field	Description:
<code>_time_</code>	The data upload time. Example: <code>2018-02-02T02:18:41.979147844Z</code> .
<code>_source_</code>	The type of the input source. Valid values: <code>stdout</code> and <code>stderr</code> .
<code>_image_name_</code>	The name of the image.
<code>_container_name_</code>	The name of the container.
<code>_container_ip_</code>	The IP address of the container.

- Kubernetes containers

Each uploaded log contains the following fields.

Field	Description
<code>_time_</code>	The data upload time. Example: <code>2018-02-02T02:18:41.979147844Z</code> .
<code>_source_</code>	The type of input sources. Valid values: <code>stdout</code> and <code>stderr</code> .
<code>_image_name_</code>	The name of the image.
<code>_container_name_</code>	The name of the container.
<code>_pod_name_</code>	The name of the pod.
<code>_namespace_</code>	The namespace where the pod is located.
<code>_pod_uid_</code>	The unique identifier of the pod.
<code>_container_id_</code>	The IP address of the pod.

Common configuration examples

- Environment configuration

Collect the logs of the container whose environment variable is `NGINX_PORT_80_TCP_PORT=80` but not `POD_NAMESPACE=kube-system` .

 **Note** The environment variable refers to the environment information configured in container startup.

Environment configuration example

```

openshift: false,
"StdinOnce": false,
"Env": [
  "HTTP_SVC_SERVICE_PORT_HTTP=80",
  "LOG4J_APPENDER_DEMO_SPRING_BOOT_SVC_PORT=:8080",
  "LOG4J_APPENDER_DEMO_SPRING_BOOT_SVC_PORT_8080_TCP_PORT=8080",
  "HTTP_SVC_PORT_80_TCP_ADDR=",
  "NGINX_PORT_80_TCP=tcp://",
  "NGINX_PORT_80_TCP_PROTO=tcp",
  "LOG4J_APPENDER_DEMO_SPRING_BOOT_SVC_SERVICE_PORT=8080",
  "KUBERNETES_SERVICE_HOST=",
  "HTTP_SVC_SERVICE_HOST=",
  "HTTP_SVC_PORT_80_TCP_PROTO=tcp",
  "NGINX_PORT_80_TCP_ADDR=",
  "LOG4J_APPENDER_DEMO_SPRING_BOOT_SVC_PORT_8080_TCP_PROTO=tcp",
  "KUBERNETES_SERVICE_PORT_HTTPS=443",
  "KUBERNETES_PORT=tcp://:443",
  "NGINX_PORT=tcp://:80",
  "HTTP_SVC_PORT=tcp://:80",
  "HTTP_SVC_PORT_80_TCP_PORT=80",
  "NGINX_SERVICE_PORT=80",
  "KUBERNETES_PORT_443_TCP=tcp://:443",
  "KUBERNETES_PORT_443_TCP_PROTO=tcp",
  "HTTP_SVC_SERVICE_PORT=80",
  "KUBERNETES_PORT_443_TCP_ADDR=17.1.1",
  "HTTP_SVC_PORT_80_TCP=tcp://:80",

```

Collection configuration

```

{
  "inputs": [
    {
      "type": "service_docker_stdout",
      "detail": {
        "Stdout": true,
        "Stderr": true,
        "IncludeEnv": {
          "NGINX_PORT_80_TCP_PORT": "80"
        },
        "ExcludeEnv": {
          "POD_NAMESPACE": "kube-system"
        }
      }
    }
  ]
}

```

- Label configuration

Collect the stdout and stderr logs of the container whose label is `io.kubernetes.container.name=nginx` but not `type=pre`.

 **Note** Labels refer to Docker labels.

Label configuration example

```

"onBuild": null,
"Labels": {
  "annotation.io.kubernetes.container.hash": "53073f5a",
  "annotation.io.kubernetes.container.restartCount": "0",
  "annotation.io.kubernetes.container.terminationMessagePath": "/dev/termination-log",
  "annotation.io.kubernetes.container.terminationMessagePolicy": "File",
  "annotation.io.kubernetes.pod.terminationGracePeriod": "30",
  "io.kubernetes.container.logpath": "/var/log/pods/ad00a078-85/nginx_0.log",
  "io.kubernetes.container.name": "nginx",
  "io.kubernetes.docker.type": "container",
  "io.kubernetes.pod.name": "example-foo-86ccd54874-r4mfh",
  "io.kubernetes.pod.namespace": "default",
  "io.kubernetes.pod.uid": "ad00a07",
  "io.kubernetes.sandbox.id": "5216-a8d0b6891dfa6da112969",
  "maintainer": "NGINX Docker Maintainers <docker-maint@nginx.com>"
},
"StopSignal": "SIGTERM"

```

```

{
  "inputs": [
    {
      "type": "service_docker_stdout",
      "detail": {
        "Stdout": true,
        "Stderr": true,
        "IncludeLabel": {
          "io.kubernetes.container.name": "nginx"
        },
        "ExcludeLabel": {
          "type": "pre"
        }
      }
    }
  ]
}

```

Example of configuring multiline log collection

Configuring multiline log collection is important for the collection of Java exception stack logs. The following section introduces a standard collection configuration for Java stdout logs.

- Sample log

```

2018-02-03 14:18:41.968 INFO [spring-cloud-monitor] [nio-8080-exec-4] c.g.s.web.controller.DemoController : service
start
2018-02-03 14:18:41.969 ERROR [spring-cloud-monitor] [nio-8080-exec-4] c.g.s.web.controller.DemoController : java.la
ng.NullPointerException

start done

```

- Collection configuration

Collect logs of the container whose label is `app=monitor` . The first line of each log to be collected is of the date type. To improve matching efficiency, only the first 10 bytes of each line are checked.

```
{
  "inputs": [
    {
      "detail": {
        "BeginLineCheckLength": 10,
        "BeginLineRegex": "\\d+-\\d+-\\d+.*",
        "IncludeLabel": {
          "app": "monitor"
        }
      },
      "type": "service_docker_stdout"
    }
  ]
}
```

Process collected data

Use a regular expression to extract the time, module, thread, class, and info fields.

- Collection configuration

Collect logs from a container whose label is `app=monitor` . The first line of each log to be collected is of the date type. To improve matching efficiency, only the first 10 bytes of each line are checked.

```

level:INFO
module:spring-cloud-monitor
thread:nio-8080-exec-4
class:c.g.s.web.controller.DemoController
message:service start done
    
```

30.3.1.7. Limits

This topic describes the limits on Logtail. These limits are related to log collection, resources, error handling, and other features.

Limits on log collection

Feature	Description
File encoding	Logs encoded in UTF-8 or GBK are supported. We recommend that you use UTF-8 to improve the performance of log processing. Log files encoded in other formats may result in unexpected errors, such as garbled characters and data loss.
Log file size	No limit.
Log rotation	The <code>.log*</code> and <code>.log</code> files are supported.
Log collection behavior upon log parsing block	If log parsing is disabled, Logtail keeps the file descriptor (FD) of the log open. If log rotation occurs multiple times during the block, Logtail attempts to parse each rotated log file in sequence. If the number of rotated logs to be parsed exceeds 20, Logtail does not process subsequent log files.
Soft link	Monitored directories can be soft links.
Size of a single log	The maximum size of a single log is 512 KB. If a multi-line log is divided by using a regular expression to match the first line, the maximum size of each log after division is still 512 KB. If the size of a log exceeds 512 KB, the log is forced to be separated into multiple parts for collection. For example, if a log is 1025 KB, it will be split into three parts: 512 KB, 512 KB, and 1 KB. These log parts are collected in sequence.
Regular expression	Regular expressions can be Perl-based regular expressions.
Applying multiple collection configurations to the same file	Not supported. We recommend that you collect log files and save them to one Logstore and configure multiple subscriptions. If this feature is required, configure soft links for log files to bypass the limit.
File opening behavior	Logtail keeps a log file to be collected open. Logtail automatically closes the log file if the file is not modified for more than 5 minutes (in case that log rotation does not occur).

Feature	Description
First log collection behavior	Logtail collects only incremental log files. If modifications are found in a file for the first time and the file size exceeds 1 MB, Logtail collects the logs from the last 1 MB. Otherwise, Logtail collects the logs from the beginning. If a log file is not modified after the configuration is issued, Logtail does not collect this file.
Non-standard text log	For a log that contains the characters \0, the log is truncated to the position where the characters \0 first appear.

Limits on checkpoints

Limit	Description
Checkpoint timeout interval	If a file remains unchanged for more than 30 days, the checkpoint is deleted.
Checkpoint reservation policy	Checkpoints are saved every 15 minutes and are automatically saved when the Logtail exits.
Checkpoint storage path	The default storage path is <code>/tmp/logtail_checkpoint</code> . You can modify the parameters according to Set Logtail startup parameters .

Limits on configurations

Limit	Description
Configuration updates	A custom configuration update requires about 30 seconds to take effect.
Dynamic loading for configurations	Supported. Updates on a collection configuration do not affect other collection configurations.
Number of collection configurations	No limit in theory. However, we recommend that the number of collection configurations for a server does not exceed 100.
Multi-tenant isolation	Collection configurations for different tenants are isolated.

Limits on resources and performance

Limit	Description
Throughput for log processing	The default throughput of processing raw logs is a maximum of 2 MB/s. After data is encoded and compressed, the data is uploaded. The compression ratio ranges from 5:1 to 10:1. If the actual throughput exceeds the limit, data loss may occur. You can modify the parameters according to Set Logtail startup parameters .
Maximum performance	Single-core capability: The maximum processing capability is 100 MB/s for logs in the simple mode, 20 MB/s for logs in the regular expression format, 40 MB/s for logs in the delimiter-separated format, and 30 MB/s for logs in the JSON format. The capability varies based on the complexity of regular expressions. After multiple processing threads are enabled, the performance can be improved by 1.5 to 3 times.
Number of monitored directories	Logtail sets a limit on the depth of monitored directories to avoid unnecessary consumption of user resources. If the limit is exceeded, Logtail stops monitoring extra directories and log files. Logtail can monitor a maximum of 3,000 directories (including subdirectories).

Limit	Description
Number of monitored files	<p>The maximum Logtail memory capacity can be increased to 2 GB. This means that the maximum number of files for a Logtail collection configuration on each server increases to 100,000 and the maximum number of files that each Logtail client can monitor increases to 1,000,000. Extra files are not monitored.</p> <p>When the limit is reached, you can:</p> <ul style="list-style-type: none"> • Increase the depth of the monitored directory in each Logtail configuration. • Modify the value of the <code>mem_usage_limit</code> parameter to increase the threshold for Logtail memory usage. For more information, see Set Logtail startup parameters. <p>The maximum capacity of memory that Logtail can use can be increased to 2 GB. It specifies that the maximum number of files that a Logtail collection configuration on each server increases to 100,000 and the maximum number of files that each Logtail client can monitor increases to 1,000,000.</p>
Default resources	<p>By default, Logtail consumes up to 40% of CPU usage and 256 MB of memory. If logs are generated at a high speed, you can modify relevant parameters. For more information, see Set Logtail startup parameters.</p>
Solutions to resource quota exceeded issues	<p>If the number of resources consumed by Logtail exceeds the limit and the issue lasts for more than 3 minutes, Logtail is forced to restart. Data loss or duplication issues may occur due to the restart.</p>

Limits on error handling

Limit	Description
Network error handling	<p>If a network error occurs, Logtail sends data again and automatically modify the retry interval.</p>
Resource quota exceeded	<p>If the data transmission rate exceeds the limit of a Logstore, Logtail stops log collection and automatically retries.</p>
Maximum retry period	<p>If Logtail fails to send data for more than six hours, Logtail discards the data.</p>
Status self-check	<p>Logtail automatically restarts each time an exception occurs, for example, application crashes and resource usage limits exceeded.</p>

More limits

Limit	Description
Log collection latency	<p>In most cases, after a log is collected, less than 1 second is required to write the log to a disk. This does not apply when log collection is disabled.</p>
Policies for uploading logs	<p>Logtail automatically uploads a log file when the number of logs in a log file exceeds 2,000, the size of the log file exceeds 2 MB, or Logtail collects logs for more than 3 seconds.</p>

30.3.2. Other collection methods

30.3.2.1. WebTracking

This topic describes how to use WebTracking to collect logs from websites that are written in HTML or HTML5, iOS, and Android.

Context

Log Service uses WebTracking to collect logs from websites written in HTML or HTML5, iOS, and Android. You can customize dimensions and metrics.

In the preceding figure, WebTracking allows you to collect user information from various browsers, iOS apps, and Android apps (except for SDK for iOS or Android). For example:

- Browsers, operating systems, and resolutions used by users.
- Browsing history such as preferences on different websites.
- The length of time that users stay on an app and whether the users are active in the app.

Precautions

- Dirty data may occur due to the use of WebTracking. This occurs because WebTracking allows unauthorized write access from Internet anonymous users to a Logstore.
- GET and POST requests are supported. The size of a request body cannot exceed 16 KB.
- The same limits apply to POST requests and the Putlogs API operation. The maximum number of logs that you can use a POST request to collect at a time is 4,096. The total size of these logs cannot exceed 3 MB.

Step 1: Enable WebTracking

Log on to the Log Service console and enable WebTracking.

1. [Log on to the Log Service console.](#)
2. Select the target Logstore, go to the **Logstore Attributes** page.
 - Method 1: Click the **Modify** icon under the name of the Logstore.
 - Method 2: Click the  icon next to the name of the Logstore, and select **Modify**.

```

import com.aliyun.openservices.log.Client;
import com.aliyun.openservices.log.common.LogStore;
import com.aliyun.openservices.log.exception.LogException;
public class WebTracking {
    static private String accessId = "your accesskey id";
    static private String accessKey = "your accesskey";
    static private String project = "your project";
    static private String host = "log service data address";
    static private String logStore = "your logstore";
    static private Client client = new Client(host, accessId, accessKey);
    public static void main(String[] args) {
        try {
            //Enable WebTracking on an existing Logstore.
            LogStore logSt = client.GetLogStore(project, logStore).GetLogStore();
            client.UpdateLogStore(project, new LogStore(logStore, logSt.GetTtl(), logSt.GetShardCount(), true));
            //Disable WebTracking.
            //client.UpdateLogStore(project, new LogStore(logStore, logSt.GetTtl(), logSt.GetShardCount(), false));
            //Create a Logstore on which you want to enable WebTracking.
            //client.UpdateLogStore(project, new LogStore(logStore, 1, 1, true));
        }
        catch(LogException e){
            e.printStackTrace();
        }
    }
}

```

Step 2: Collect logs

After you enable WebTracking for a Logstore, you can use the following methods to upload data to the Logstore.

- Use the JavaScript SDK
 - i. Copy the *loghub-tracking.js* file to the *web* directory and add the following script to the file. Click [here](#) to copy the script.

```
<script type="text/javascript" src="loghub-tracking.js" async></script>
```

Note To ensure that a page loads, the script asynchronously sends HTTP requests. If data must be sent several times during the page loading, the newest request overwrites the previous HTTP request. A message showing WebTracking is about to exit appears in the browser. To eliminate the issue, send requests in a synchronous manner. To implement the method, perform the following step.

Original statement:

```
this.httpRequest_.open("GET", url, true)
```

Replace the original statement with the following statement:

```
this.httpRequest_.open("GET", url, false)
```

ii. Create a tracker.

```
var logger = new window.Tracker('${host}','${project}','${logstore}');
logger.push('customer', 'zhangsan');
logger.push('product', 'iphone 6s');
logger.push('price', 5500);
logger.logger();
logger.push('customer', 'lisi');
logger.push('product', 'ipod');
logger.push('price', 3000);
logger.logger();
```

The following table lists the parameters:

Parameter	Description
<code>\${host}</code>	The endpoint of the region where Log Service resides. For more information, see the <i>Obtain an endpoint topic in the Log Service Developer Guide</i> .
<code>\${project}</code>	The name of the project that you create in Log Service.
<code>\${logstore}</code>	The name of the Logstore in the <code>\${project}</code> .

After you run the following code, the following logs appear in Log Service.

```
customer:zhangsan
product:iphone 6s
price:5500
```

```
customer:lisi
product:ipod
price:3000
```

- Use HTTP GET requests

```
curl --request GET 'http://${project}.${host}/logstores/${logstore}/track? APIVersion=0.6.0&key1=val1&key2=val2'
```

The following table lists the parameters.

Parameter	Description
<code>\${project}</code>	The name of the project that you create in Log Service.
<code>\${host}</code>	The endpoint of the region where Log Service resides.
<code>\${logstore}</code>	The name of a Logstore that has WebTracking enabled in the <code>\${project}</code> .
<code>APIVersion=0.6.0</code>	(Required) A reserved parameter.
<code>__topic__=yourtopic</code>	(Optional) A reserved parameter that specifies the topic of the log.

Parameter	Description
<i>key1=val1, key2=val2</i>	The key-value pairs that you want to upload to Log Service. You can specify multiple pairs. Make sure that the length of each request URL is less than 16 KB.

- Use HTML img tags

```
<img src='http://${project}.${host}/logstores/${logstore}/track.gif? APIVersion=0.6.0&key1=val1&key2=val2'/>  
<img src='http://${project}.${host}/logstores/${logstore}/track_ua.gif? APIVersion=0.6.0&key1=val1&key2=val2'/>
```

The parameters that you need to specify are the same as the preceding parameters. In addition to custom parameters that are uploaded by track_ua.gif, Log Service also uses UserAgent and referer fields in the HTTP header as the fields of logs.

30.3.2.3. Use SDKs to collect logs

30.3.2.3.1. Producer Library

The Aliyun LOG Java Producer supports Java applications that run in big data processing scenarios with high concurrency. The library is easy to use and highly customizable.

For more information about the related GitHub project, visit [Aliyun LOG Java Producer](#).

30.3.2.3.2. Log4j Appender

Log4j is an open-source logging framework of Apache. You can use Log4j to write logs to the Log Service console, files, graphical user interface (GUI) components, socket servers, NT kernel loggers, or Unix syslog daemons. You can specify the output format of each log. You can also specify the severity level of each log to implement a fine-grained control on log generation.

Log4j consists of three components: loggers, appenders, and layouts.

- Loggers allow you to specify the severity level of each log.
Severity levels are sorted into ERROR, WARN, INFO, and DEBUG in descending order of severity.
- Appenders allow you to specify the destination of each log.
A destination can be the Log Service console or a file.
- Layouts allow you to specify the output format of each log.
The output format defines how logs are displayed.

To write logs to Log Service, use the Alibaba Cloud Log Log4j Appender. For information about where to download the library and how to use it, see [Log4j Appender](#).

30.3.2.3.3. Logback Appender

Logback was created by the same developer of Log4j. Logback allows you to write logs to multiple destinations. These destinations include the Log Service console, files, graphical user interface (GUI) components, socket servers, NT kernel loggers, and Unix syslog daemons. You can define the output format of each log. If you define the severity level of each log, you can implement a fine-grained control on the log generation process.

You can set the destination of logs to Log Service by using the Aliyun Log Logback Appender. The following example shows the format of logs that are uploaded to Log Service.

```
level: ERROR
location: com.aliyun.openservices.log.logback.example.LogbackAppenderExample.main(LogbackAppenderExample.java
:18)
message: error log
throwable: java.lang.RuntimeException: xxx
thread: main
time: 2018-01-02T03:15+0000
log: 2018-01-02 11:15:29,682 ERROR [main] com.aliyun.openservices.log.logback.example.LogbackAppenderExample: err
or log
__source__: xxx
__topic__: yyy
```

For information about where to download the library and how to use it, see [Logback Appender](#).

30.3.2.3.4. Golang Producer Library

The Aliyun LOG Go Producer Library supports Go applications that run in big data processing scenarios with high concurrency. The library is easy to use and highly customizable. You can use the library to create producers that allow you to resend failed logs. Before Go applications send log data to Log Service, you can use these producers to compress the log data. This improves write performance.

For more information about the related GitHub project, visit [Aliyun Log Go Producer](#).

30.3.2.3.5. Python logging

Configurations

For more information about the configurations that are related to the Python logging module, see [Logging configuration](#).

The Python logging module allows you to configure logging by using code or a configuration file. The following example shows how to configure logging by using the `logging.conf` configuration file.

```
[loggers]
keys=root,sls

[handlers]
keys=consoleHandler,slsHandler

[formatters]
keys=simpleFormatter,rawFormatter

[logger_root]
level=DEBUG
handlers=consoleHandler

[logger_sls]
level=INFO
handlers=consoleHandler,slsHandler
qualname=sls
propagate=0

[handler_consoleHandler]
class=StreamHandler
level=DEBUG
formatter=simpleFormatter
args=(sys.stdout,)

[handler_slsHandler]
class=aliyun.log.QueuedLogHandler
level=INFO
formatter=rawFormatter
args=(os.environ.get('ALIYUN_LOG_SAMPLE_ENDPOINT', ''), os.environ.get('ALIYUN_LOG_SAMPLE_ACCESSID', ''), os.environ.get('ALIYUN_LOG_SAMPLE_ACCESSKEY', ''), os.environ.get('ALIYUN_LOG_SAMPLE_TMP_PROJECT', ''), "logstore")

[formatter_simpleFormatter]
format=%(asctime)s - %(name)s - %(levelname)s - %(message)s

[formatter_rawFormatter]
format=%(message)s
```

Two handlers named `root` and `sls` are created. The `sls` handler is an object of the `aliyun.log.QueuedLogHandler` class. The following shows the parameters that are specified for the `sls` handler. For more information, see [Parameters](#).

```
args=(os.environ.get('ALIYUN_LOG_SAMPLE_ENDPOINT', ''), os.environ.get('ALIYUN_LOG_SAMPLE_ACCESSID', ''), os.environ.get('ALIYUN_LOG_SAMPLE_ACCESSKEY', ''), os.environ.get('ALIYUN_LOG_SAMPLE_TMP_PROJECT', ''), "logstore")
```

 **Note** In this case, the `os.environ` function is used to retrieve configurations from environment variables. You can also specify values for these parameters based on your business requirements.

Upload logs

You can use the configuration file to upload logs to Log Service.

```
import logging
import logging.config

# Configurations
logging.config.fileConfig('logging.conf')
logger = logging.getLogger('sls')

# Use the logger
logger.info("test1")

try:
    1/0
except ZeroDivisionError as ex:
    logger.exception(ex)
```

Then, logs are automatically uploaded to Log Service. To use the LogSearch/Analytics feature, you must enable the index feature on the corresponding Logstore.

Configure an index for a Logstore

Enable the index feature on the Logstore that receives logs and configure an index for specific fields. We recommend that you use CLI (Command Line Interface) to configure the index as follows:

```
aliyunlog log update_index --project_name="project1" --logstore_name="logstore1" --index_detail="file:///Users/user1/loghandler_index.json"
```

For more information, see the [python_logging_handler_index.json](#) configuration file.

Specify log fields to be collected

The following table lists supported log fields that you can collect. By default, all of the fields are collected.

Field	Description
message	The contents of a log.
record_name	The name of a handler. In the preceding example, the name is <code>sls</code> .
level	The output level of a logger, such as INFO and ERROR.
file_path	The full path of a configuration file.

Field	Description
func_name	The name of a function.
line_no	The number of a log line.
module	The name of a module where the function resides.
thread_id	The ID of the thread that runs the function.
thread_name	The name of the thread that runs the function.
process_id	The ID of the process that runs the function.
process_name	The name of the process that runs the function.

You can specify log fields to be collected based on the `fields` parameter of the `QueuedLogHandler` class. For more information, see [aliyun.log.LogFields](#).

The following example shows how to modify the preceding configuration file and collect several fields, such as `module` and `func_name`.

```
[handler_slsHandler]
class=aliyun.log.QueuedLogHandler
level=INFO
formatter=rawFormatter
args=('cn-beijing.log.aliyuncs.com', 'ak_id', 'ak_key', 'project1', "logstore1", 'mytopic', ['level', 'func_name', 'module', 'line_no'] )
```

Note

- The message field is collected regardless of your configurations.
- To add a prefix and suffix to the names of these fields, use the `buildin_fields_prefix` and `buildin_fields_suffix` parameters. For example, `__level__`.

Configure logging by using a JSON text

You can use a JSON text to create more flexible logging configurations than code does.

```

#encoding: utf8
import logging, logging.config, os

# Configurations
conf = {'version': 1,
       'formatters': {'rawformatter': {'class': 'logging.Formatter',
                                       'format': '%(message)s'}
                      },
       'handlers': {'sls_handler': {'():
                                   'aliyun.log.QueuedLogHandler',
                                   'level': 'INFO',
                                   'formatter': 'rawformatter',

                                   # custom args:
                                   'end_point': os.environ.get('ALIYUN_LOG_SAMPLE_ENDPOINT', ""),
                                   'access_key_id': os.environ.get('ALIYUN_LOG_SAMPLE_ACCESSID', ""),
                                   'access_key': os.environ.get('ALIYUN_LOG_SAMPLE_ACCESSKEY', ""),
                                   'project': 'project1',
                                   'log_store': "logstore1"
                                   }
                    },
       'loggers': {'sls': {'handlers': ['sls_handler'],
                           'level': 'INFO',
                           'propagate': False}
                   }
               }
logging.config.dictConfig(conf)

# Use the logger
logger = logging.getLogger('sls')
logger.info("Hello world")

```

 **Note** To instantiate an object of the `aliyun.log.QueuedLogHandler` class, pass named parameters to the constructor. For more information, see [Parameters](#).

30.3.2.4. Common log formats

30.3.2.4.1. Log4j logs

Log Service allows you to collect Log4j logs.

Collect Log4j logs by using LogHub Log4j Appender

For more information, see [Log4j Appender](#).

Configure Logtail to collect Log4j logs

This topic describes how to configure regular expressions based on the default configuration of Log4j 1 logs. If Log4j 2 is used, you must modify the default configuration to record the complete date information. Log4j logs are sorted into Log4j 1 logs and Log4j 2 logs.

```
<Configuration status="WARN">
  <Appenders>
    <Console name="Console" target="SYSTEM_OUT">
      <PatternLayout pattern="%d{yyyy-MM-dd HH:mm:ss:SSS zzz} [%t] %-5level %logger{36} - %msg%n"/>
    </Console>
  </Appenders>
  <Loggers>
    <Logger name="com.foo.Bar" level="trace">
      <AppenderRef ref="Console"/>
    </Logger>
    <Root level="error">
      <AppenderRef ref="Console"/>
    </Root>
  </Loggers>
</Configuration>
```

For more information about how to configure Logtail to collect Log4j logs, see [Python logs](#). Configure the required parameters based on your network environment and business requirements.

The automatically generated regular expression is based on the sample log and may not be suitable for other logs. Therefore, you must make minor changes to the regular expression after it is automatically generated

The following shows a sample log of the default Log4j format.

```
2013-12-25 19:57:06,954 [10.207.37.161] WARN impl.PermanentTairDaoImpl - Fail to Read Permanent Tair,key:e:47021731
9319741_1,result:com.example.tair.Result@172e3ebc[rc=code=-1,msg=connection error or timeout,value=,flag=0]
```

Regular expression that matches IP addresses that each indicate the start of a line:

```
\d+-\d+-\d+\s.*
```

Regular expression used to extract log information:

```
(\d+-\d+-\d+\s\d+:\d+:\d+,\d+)\s{1,}([^\s]*)\s{1,}(\S+)\s+(\S+)\s-\s{1,}(.*)
```

Time conversion format:

```
%Y-%m-%d %H:%M:%S
```

The following table lists the extraction results of the sample log.

Key	Value
time	2013-12-25 19:57:06,954
ip	10.207.37.161
level	WARN

Key	Value
class	impl.PermanentTairDaoImpl
message	Fail to Read Permanent Tair,key:e:470217319319741_1,result:com.example.tair.Result@172e3ebc[rc=code=-1, msg=connection error or timeout,value=,flag=0]

30.3.2.4.2. Python logs

The Python logging module provides a general logging system, which can be used by third-party modules or applications.

The Python logging module provides different log levels and logging methods, such as file-based, HTTP GET, HTTP POST, SMTP, and Socket logging. You can also create a custom logging method. The Python logging module works in the same way as the Log4j logging module except for some implementation details. The Python logging module includes the logger, handler, filter, and formatter objects.

To collect Python logs, we recommend that you use log handlers.

- Use log handlers to automatically upload Python logs
- Use log handlers to automatically parse logs that consist of key-value pairs
- Use log handlers to automatically parse logs in the JSON format

Log format

A formatter specifies the output format of logs. To instantiate a formatter, pass two parameters to the constructor. One parameter includes a message format string and the other parameter includes a date format string. The parameters are optional.

Log format:

```
import logging
import logging.handlers
LOG_FILE = 'tst.log'
handler = logging.handlers.RotatingFileHandler(LOG_FILE, maxBytes = 1024*1024, backupCount = 5) # Instantiate the handler
formatter = logging.Formatter('%(asctime)s - %(filename)s:%(lineno)s - %(name)s - %(message)s') # Instantiate the formatter
handler.setFormatter(formatter) # Add the formatter to the handler
logger = logging.getLogger('tst') # Obtain a logger named tst
logger.addHandler(handler) # Add the handler to the logger
logger.setLevel(logging.DEBUG)
logger.info('first info message')
logger.debug('first debug message')
```

Attributes

Formatter attributes are specified in the `%(key)s` format. The following table lists the attributes.

Format	Description
%(name)s	The name of a logger that generates logs.
%(levelno)s	The log output level in the numeric format. Valid values: DEBUG, INFO, WARNING, ERROR, and CRITICAL

Format	Description
%(levelname)s	The log output level in the text format. Valid values: 'DEBUG', 'INFO', 'WARNING', 'ERROR', and 'CRITICAL'.
%(pathname)s	The full path of a source file that contains the logging module.
%(filename)s	The name of the source file.
%(module)s	The name of a module where the statement that you use to generate logs resides.
%(funcName)s	The name of the function that is used to call the log output function.
%(lineno)d	The number of a code line that contains the statement used to call the log output function.
%(created)f	The time when the log was created. The value is a UNIX timestamp representing the number of seconds that have elapsed since January 1, 1970, 00:00:00 (UTC).
%(relativeCreated)d	The interval between the time when a log was created and the time when the logging module was loaded. Unit: milliseconds.
%(asctime)s	The time when the log was created. The value of 2003-07-08 16:49:45,896 is an example of the default format. The number after the comma (,) indicates the number of milliseconds.
%(msecs)d	The time when the log was created. The value is a UNIX timestamp representing the number of milliseconds that have elapsed since January 1, 1970, 00:00:00 (UTC).
%(thread)d	The thread ID.
%(threadName)s	The thread name.
%(process)d	The process ID.
%(message)s	The contents of a log.

Sample logs

Sample log:

```
2015-03-04 23:21:59,682 - log_test.py:16 - tst - first info message
2015-03-04 23:21:59,682 - log_test.py:17 - tst - first debug message
```

Common Python logs and the corresponding regular expressions:

- Sample log:

```
2016-02-19 11:03:13,410 - test.py:19 - tst - first debug message
```

Regular expression:

```
(\d+-\d+-\d+\s\S+)\s+-\s+([\^:]+):(\d+)\s+-\s+(\w+)\s+-\s+(. *)
```

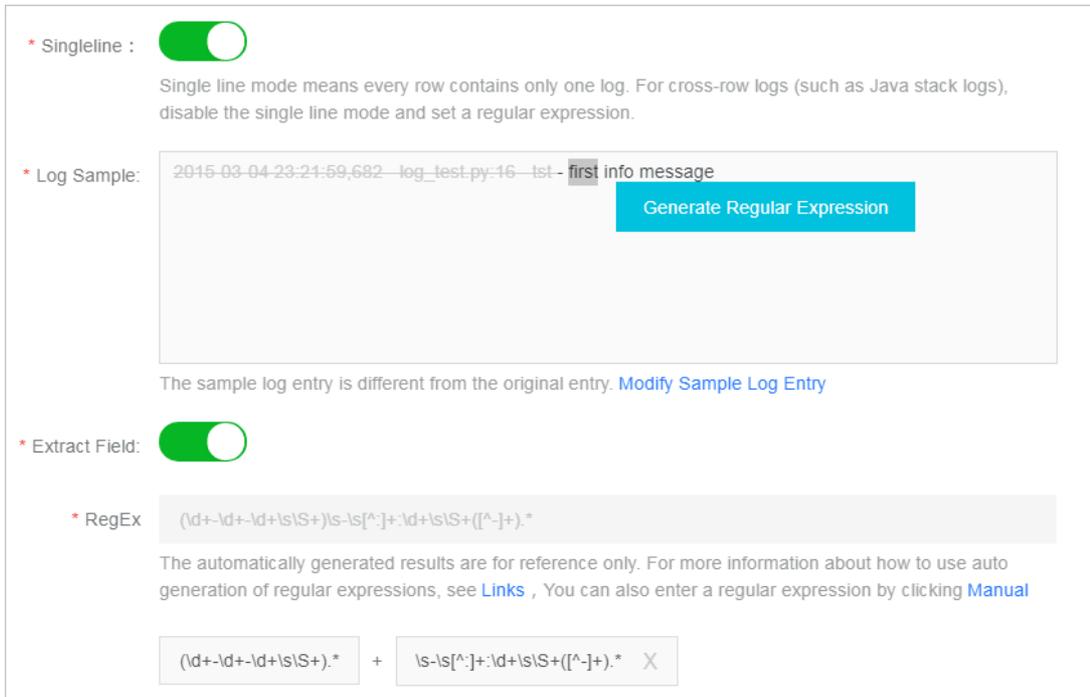

- Log format

```
%(asctime)s - %(filename)s:%(lineno)s - %(levelname)s %(message)s
%(asctime)s - %(filename)s:%(lineno)s - %(levelname)s %(pathname)s %(module)s %(funcName)s %(created)f %(thread)d %(threadName)s %(process)d %(name)s - %(message)s
```

v. Set a regular expression in the RegEx field.

a. Select fields to generate a regular expression

If the regular expression that is automatically generated does not match your sample log, you can select fields in the sample log to generate a regular expression. Log Service can automatically parse the highlighted fields of the sample log to generate a regular expression. In the **Log Sample** field, select the required fields, and click **Generate Regular Expression**. The regular expression of the selected field is displayed in the **RegEx** field. To obtain a full regular expression for the sample log, generate regular expressions for each log field.

* Singleline :

Single line mode means every row contains only one log. For cross-row logs (such as Java stack logs), disable the single line mode and set a regular expression.

* Log Sample: 2015-03-04 23:21:59,682 log_test.py:16 tst - first info message

Generate Regular Expression

The sample log entry is different from the original entry. [Modify Sample Log Entry](#)

* Extract Field:

* RegEx (\\d+\\d+\\d+\\s\\S+)\\s-\\s[^:]+:\\d+\\s\\S+([^-]+).*

The automatically generated results are for reference only. For more information about how to use auto generation of regular expressions, see [Links](#) , You can also enter a regular expression by clicking [Manual](#)

(\\d+\\d+\\d+\\s\\S+).* + \\s-\\s[^:]+:\\d+\\s\\S+([^-]+).* X

b. Modify the regular expression

Actual data formats may vary. In this case, click **Manual** under the RegEx field to adjust the regular expression that is automatically generated based on your business requirements. This ensures that the regular expression is suitable for all formats of the collected logs.

c. Verify the regular expression

After you modify the regular expression, click **Validate** next to the RegEx field. If the regular expression is valid, the extraction results are displayed. If the regular expression is invalid, modify the regular expression again.

- vi. Confirm the extraction results of log fields. View the extraction results of log fields and specify keys for the extracted fields.

Specify an informative name for each log field in the extraction results. For example, time as the name for a time field. If you do not use the system time, you must specify the name of a time field in the Value fields and time in the Key field.

* Extracted Content:

Key	Value
asctime	2015-03-04 23:21:59
filename	682 - log_test.py
lineno	16
name	tst
message	first info message

When you use a regular expression to generate key/value pairs, you can specify the key name in each pair. If you do not specify system time, you must specify a pair that uses "time" as the key name.

- 7. (Optional)Specify Advanced Options and click Next.Specify Advanced Options based on your business requirements. We recommend that you do not modify the default settings unless otherwise required.

Parameter	Description
Enable Plug-in Processing	Specifies whether to enable plug-in processing. If you turn on this switch, you can use the plug-in of Logtail to process text logs.
Upload Raw Log	Specifies whether to upload raw logs. If you turn on this switch, raw logs are written to the <code>__raw__</code> field and uploaded with the parsed logs.
Topic Generation Mode	<ul style="list-style-type: none"> ◦ Null - Do not generate topic: This mode is selected by default. In this mode, the topic is set to an empty string and you can query logs without the need to enter a topic. ◦ Server Group Topic Attributes: This mode is used to differentiate log data that is generated by different frontend servers. ◦ File Path RegEx: If you select this mode, you must enter a value in the Custom RegEx field to extract part of the path as the topic. This mode is used to differentiate log data that is generated by users or instances.
Custom RegEx	Specifies a custom regular expression. If you select File Path RegEx for Topic Generation Mode , you must enter a custom regular expression.
Log File Encoding	<ul style="list-style-type: none"> ◦ utf8: indicates UTF-8 encoding. ◦ gbk: indicates GBK encoding.
Timezone	<p>Specifies the time zone where logs are collected.</p> <ul style="list-style-type: none"> ◦ System Timezone: This option is selected by default. It indicates that the time zone where logs are collected is the same as the time zone to which the server belongs. ◦ Custom: Select a time zone.

Parameter	Description
Timeout	<p>If a log file is not updated within a specific period of time, Logtail considers the file to be timed out.</p> <ul style="list-style-type: none"> Never: All log files are continuously monitored and never time out. 30 Minute Timeout: If a log file is not updated within 30 minutes, Logtail considers the log file to be timed out and no longer monitors the file.
Filter Configuration	<p>Only logs that meet all filter conditions are collected.</p> <p>Examples:</p> <ul style="list-style-type: none"> Collect logs that meet a condition: Set the condition to <code>Key:level Regex:WARNIN G ERROR</code>. It indicates that only logs with the severity level of WARNING or ERROR are collected. Filter logs that do not meet a condition: <ul style="list-style-type: none"> Set the condition to <code>Key:level Regex:^(?!.*(INFO DEBUG)).*</code>. It indicates that logs with the severity level of INFO or DEBUG are not collected. Set the condition to <code>Key:url Regex:.^(?!.*(healthcheck)).*</code>. It indicates that logs whose URL contains the keyword healthcheck are not collected. For example, logs in which the key is url and the value is <code>/inner/healthcheck/jiangong.html</code> are not collected.

8. Configure an index. Configure an index based on your business requirements. For more information, see [Enable the index feature and configure indexes for a Logstore](#).

After the configuration is complete, apply the settings to the server group to collect Python logs.

30.3.2.4.3. Node.js logs

Node.js logs are displayed in the Log Service console by default. This impedes data collection and troubleshooting. You can use the log4js function to write logs into files and customize the log format. This facilitates data collection and consolidation.

Example:

```
var log4js = require('log4js');
log4js.configure({
  appenders: [
    {
      type: 'file', //Output to a file
      filename: 'logs/access.log',
      maxLogSize: 1024,
      backups: 3,
      category: 'normal'
    }
  ]
});
var logger = log4js.getLogger('normal');
logger.setLevel('INFO');
logger.info("this is a info msg");
logger.error("this is a err msg");
```

Log format

After logs are written to text files by using the log4js function, these logs are displayed in the following format:

```
[2016-02-24 17:42:38.946] [INFO] normal - this is a info msg
[2016-02-24 17:42:38.951] [ERROR] normal - this is a err msg
```

The log4js function defines six log severity levels. They are TRACE, DEBUG, INFO, WARN, ERROR, and FATAL in ascending order of severity.

Use Logtail to collect Node.js logs

For more information about how to configure Logtail to collect Python logs, see [Python logs](#). Use configurations based on your network environment and business requirements.

The automatically generated regular expression is based on the sample log and may not apply to other logs. Therefore, you must make minor changes to the regular expression after it is generated. You can use the following sample Node.js logs to configure appropriate regular expressions for your logs.

Sample Node.js logs:

- Example 1

- Sample log

```
[2016-02-24 17:42:38.946] [INFO] normal - this is a info msg
```

- Regular expression:

```
\\([\\^]+)\\s\\([\\^\\]+)\\s(\\w+)\\s-(. *)
```

- Extracted fields:

```
time , level , loggerName , and message
```

- Example 2

- Sample log

```
[2016-01-31 12:02:25.844] [INFO] access - 42.120.73.203 - - "GET /user/projects/ali_sls_log? ignoreError=true HTTP/1.1" 304 - "http://aliyun.com/" "Mozilla/5.0 (Macintosh; Intel Mac OS X 10_10_3) AppleWebKit/537.36 (KHTML, like Gecko) Chrome/48.0.2564.97 Safari/537.36"
```

- Regular expression:

```
\\([\\^]+)\\s\\([\\w+])\\s(\\w+)\\s-\\s(\\S+)\\s-\\s-\\s"([\\^"]+)"\\s(\\d+)[\\^"]+("[\\^"]+)"\\s"([\\^"]+). *
```

- Extracted fields:

```
time , level , loggerName , ip , request , status , referer , and user_agent
```

30.3.2.4.4. WordPress logs

This topic describes the format of WordPress logs and extraction results of a sample log.

Log format

Sample log:

```
172.64.0.2 - - [07/Jan/2016:21:06:39 +0800] "GET /wp-admin/js/password-strength-meter.min.js? ver=4.4 HTTP/1.0" 200
776 "http://wordpress.c4a1a0aecdb1943169555231dcc4adfb7.cn-hangzhou.alicontainer.com/wp-admin/install.php" "Mo
zilla/5.0 (Macintosh; Intel Mac OS X 10_10_5) AppleWebKit/537.36 (KHTML, like Gecko) Chrome/47.0.2526.106 Safari/537.
36"
```

Configure Logtail to collect WordPress logs

Configurations required to collect WordPress logs:

- Regular expression that matches IP addresses that each indicate the start of a line

```
\d+\.\d+\.\d+\.\d+\s-\s.*
```

- Regular expression used to extract information from the log:

```
(\S+) - - \[([^\]]*)] "(\S+) ([^"]+)" (\S+) (\S+) "([^\"]+)" "([^\"]+)"
```

- Time conversion format:

```
%d/%b/%Y:%H:%M:%S
```

- Results after Logtail extracts information from the sample log

Key	Value
ip	10.10.10.1
time	07/Jan/2016:21:06:39 +0800
method	GET
url	/wp-admin/js/password-strength-meter.min.js? ver=4.4 HTTP/1.0
status	200
length	776
ref	http://wordpress.c4a1a0aecdb1943169555231dcc4adfb7.cn-hangzhou.alicontainer.com/wp-admin/install.php
user-agent	Mozilla/5.0 (Macintosh; Intel Mac OS X 10_10_5) AppleWebKit/537.36 (KHTML, like Gecko) Chrome/47.0.2526.106 Safari/537.36

30.3.2.4.5. Unity3D logs

Log Service can use the WebTracking feature to collect Unity3D logs. The following example shows how to collect *Unity logs* of the debug type.

Context

Unity3D is a cross-platform game engine developed by Unity Technologies. The engine allows you to create 3D video games, VR buildings, real-time 3D animation, and other interactive content.

Procedure

1. Enable the WebTracking feature. For more information about how to enable this feature, see [WebTracking](#).
2. Create a Unity3D LogHandler. In a Unity editor, create a C# file named *LogOutputHandler.cs*, add the following code, and modify the following variables.
 - `project`: specifies the name of the project.

- `logstore`: specifies the name of the Logstore.
- `serviceAddr`: specifies the endpoint of the project.

For more information about `serviceAddr`, see [View the information of a project](#).

```
using UnityEngine;
using System.Collections;
public class LogOutputHandler : MonoBehaviour
{
    //Register the HandleLog function on scene start to fire on debug.log events
    public void OnEnable()
    {
        Application.logMessageReceived += HandleLog;
    }
    //Remove callback when object goes out of scope
    public void OnDisable()
    {
        Application.logMessageReceived -= HandleLog;
    }
    string project = "your project name";
    string logstore = "your logstore name";
    string serviceAddr = "http address of your log service project";
    //Capture debug.log output, send logs to Loggly
    public void HandleLog(string logString, string stackTrace, LogType type)
    {
        string parameters = "";
        parameters += "Level=" + WWW.EscapeURL(type.ToString());
        parameters += "&";
        parameters += "Message=" + WWW.EscapeURL(logString);
        parameters += "&";
        parameters += "Stack_Trace=" + WWW.EscapeURL(stackTrace);
        parameters += "&";
        //Add any User, Game, or Device MetaData that would be useful to finding issues later
        parameters += "Device_Model=" + WWW.EscapeURL(SystemInfo.deviceModel);
        string url = "http://" + project + "." + serviceAddr + "/logstores/" + logstore + "/track? APIVersion=0.6.0&" + pa
rameters;
        StartCoroutine(SendData(url));
    }
    public IEnumerator SendData(string url)
    {
        WWW sendLog = new WWW(url);
        yield return sendLog;
    }
}
```

The preceding code allows you to send logs to Log Service in an asynchronous manner. In the code, you can specify more fields you want to collect.

3. Generate Unity logs. In the project, create a C# file named *LogglyTest.cs* and add the following code.

```
using UnityEngine;
using System.Collections.Generic;
public class LogglyTest : MonoBehaviour {
    void Start () {
        Debug.Log ("Hello world");
    }
}
```

4. View logs in the console.

After you complete the preceding steps, run the Unity application. In the Log Service console, view logs that are sent to Log Service.

The preceding code shows how to use *Debug.Log*, *Debug.LogError*, and *Debug.LogException* methods to collect logs. Unity provides Component Object Model (COM)-based exception handling and log handling APIs. These APIs allow you to easily collect device details of clients.

30.4. Query and analysis

30.4.1. Overview

Log Service provides the LogSearch/Analytics feature that you can use to query and analyze a large number of logs. If you do not enable indexes, raw data is consumed in sequence based on shards. The procedure is similar to the sequential consumption of Kafka messages. If you enable indexes, you can query logs and perform statistical analysis on query results in addition to consuming logs in sequence.

Benefits

- **Real-time:** Logs can be analyzed immediately after they are written.
- **Fast:**
 - **Query:** Billions of data records can be processed and queried within one second. Each search statement has a maximum of five conditions specified.
 - **Analysis:** Hundreds of millions of data records can be aggregated and analyzed within one second. Each query has a maximum of five aggregate functions and a GROUP BY clause specified.
- **Flexible:** Query and analysis conditions can be changed as required and the results are returned in real time.
- **All-in-one:** Reports and dashboards are available in the console for quick analysis. In addition to these features, Log Service can work together with Grafana, DataV, Jaeger, and other services. It also supports RESTful APIs, Java Database Connectivity (JDBC) APIs, and other APIs.

Indexing

Indexes refer to a data structure that you can use to sort the values of one or more columns of logs. Indexes allow you to obtain the required information in a timely manner from logs that Log Service collects. Before you use the LogSearch/Analytics feature, you must collect logs and [Enable the index feature and configure indexes for a Logstore](#) on the collected logs.

In Log Service, indexes are sorted into **full-text indexes** and **field-specific indexes**.

- **Full-text index:** Indexing is enabled for the full contents of a log. The values of all fields in a log are queried by default. The log can be queried if one of the fields matches the search term.
- **Field-specific index:** You can configure a field-specific index for a key. Then, you can query logs based on specific keys to narrow the query scope.

To use **field-specific indexes**, you must specify the data type for a field. Available data types for fields in Log Service include **Text**, **JSON**, **Long**, and **Double**. For more information about [Overview](#).

Query methods

- Console

In the Log Service console, you can query logs by specifying time ranges and search statements. For more information about the procedure and search statements, see [Query logs](#) and [Query syntax](#).

- API

To query logs, you can call the `GetLogs` and `GetHistograms` API operations of the Log Service API.

 **Note** Before you query logs, make sure that you collect logs and [Enable the index feature and configure indexes for a Logstore](#).

Search and analysis statements

To apply real-time LogSearch/Analytics to collected logs, you must specify query statements. Each query statement includes the search section and the analytics section. Separate the sections with a vertical bar (`|`).

```
$Search|$Analytics
```

Statement	Required	Description
Search	No	A search statement contains search conditions. These conditions include keywords, fuzzy keywords, values, ranges, and combined conditions. If you leave the statement empty or specify an asterisk (*) for the statement, it indicates that no condition is specified and all data is returned. For more information, see Query syntax .
Analytics	No	You can use an analytics statement to aggregate or analyze data based on query results. If you leave the statement empty, it indicates that no analytics is required and all query results are returned. For more information, see Real-time analysis .

Precautions

You may query a large number of logs. For example, if the number of logs to be queried is more than 1,000,000,000, Log Service may fail to return all results. Log Service returns a partial result set and notifies you that the returned data set includes partial results.

Query results are cached every 15 minutes. If a partial result set is matched in the cache, Log Service continues to scan logs that are not cached. Log Service combines query results of the current query with results of cached results.

Therefore, Log Service enables you to obtain results by calling the API operation multiple times with the same parameters.

30.4.2. Real-time analysis

Log Service supports SQL-like aggregate calculation. This feature integrates search statements with SQL aggregate functions to calculate query results.

Sample statement:

```
status>200|select avg(latency),max(latency) ,count(1) as c GROUP BY method ORDER BY c DESC LIMIT 20
```

Basic syntax:

```
[search query] | [sql query]
```

Separate a search statement and a calculation statement with a vertical bar (|). You can use the search statement to query logs and obtain the required results. Then, use the calculation statement for further aggregation. The search query syntax is specific to Log Service. For more information, see [Query syntax](#).

Prerequisites

To use the statistical analysis feature, click **Index Attributes**. Turn on the **Enable Analytics** switch for the required field. For more information, see [Enable the index feature and configure indexes for a Logstore](#).

- If you turn off the switch, Log Service calculates up to 10,000 rows of data in each shard along with high latency of calculation.
- If you turn on the switch, Log Service analyzes data in seconds.
- The update applies only to new data.
- No extra fee is incurred for the update.

Supported SQL syntax

Log Service supports the following SQL syntax. For more information about a specific topic, click the corresponding link.

- Aggregate functions that are available for SELECT statements include:
 - [General aggregate functions](#)
 - [Security check functions](#)
 - [Map functions](#)
 - [Approximate functions](#)
 - [Mathematical statistics functions](#)
 - [Mathematical calculation functions](#)
 - [String functions](#)
 - [Date and time functions](#)
 - [URL functions](#)
 - [Regular expression functions](#)
 - [JSON functions](#)
 - [Type conversion functions](#)
 - [IP functions](#)
 - [Array functions](#)
 - [Binary string functions](#)
 - [Bitwise operations](#)
 - [Interval-valued comparison and periodicity-valued comparison functions](#)
 - [Comparison functions and operators](#)
 - [Lambda functions](#)
 - [Logical functions](#)
 - [Geospatial functions](#)
 - [Geography functions](#)
 - [Machine learning functions](#)
- [GROUP BY syntax](#)
- [Window functions](#)
- [HAVING syntax](#)
- [ORDER BY syntax](#)
- [LIMIT syntax](#)
- [Syntax for CASE statements and if\(\) functions](#)
- [UNNEST function](#)

- [Field aliases](#)
- [Nested subqueries](#)

Precautions

Before you use SQL statements, note the following items:

- You do not need to specify FROM and WHERE clauses for SQL statements. By default, Log Service queries logs from the current Logstore, and each WHERE clause is specified in the [search query] section.
- The supported clauses include SELECT, GROUP BY, ORDER BY [ASC,DESC], LIMIT, and HAVING.

 **Note** By default, only the first 10 results are returned. If you want to return more results, add a LIMIT clause to the statement. For example, `* | select count(1) as c, ip group by ip order by c desc limit 100`.

Built-in fields

Log Service has multiple built-in fields for statistical analysis. A built-in field is automatically added to a valid column that you create.

Field	Type	Description
<code>__time__</code>	Bigint	The time when a log was created.
<code>__source__</code>	Varchar	The source IP address of a log. When you query logs, the name of the field is source. If you specify the field for an SQL statement, you must add two underscores (__) at both the start and end of source.
<code>__topic__</code>	Varchar	The topic of a log.

Limits

- Maximum number of Logstores from which you can query logs at the same time is 15.
- Maximum length for a field value of the varchar type is 2,048. Extra data will be truncated.
- By default, up to 100 lines of a log file are returned and pagination is not supported. If you want to return more lines, use [LIMIT syntax](#).

Example

Calculate the hourly PV and UV, and the user request of the highest latency.

```
*|select date_trunc('hour',from_unixtime(__time__)) as time,
count(1) as pv,
approx_distinct(userid) as uv,
max_by(url,latency) as top_latency_url,
max(latency,10) as top_10_latency
group by 1
order by time
```

30.4.3. Enable the indexing feature and configure indexes for a Logstore

This topic describes how to enable the indexing feature and configure indexes for a Logstore.

Context

Before you can query logs that are stored in a Logstore, you must enable the indexing feature and configure indexes for the Logstore. We recommend that you configure indexes for your Logstores based on your business requirements.

 **Note** After you enable the indexing feature, the indexes occupy extra storage space and transferring the indexes occupies extra bandwidth.

When you collect a log entry, Log Service adds the relevant information (such as the source and time fields) to the log entry as key-value pairs. These fields are reserved in Log Service. If you enable the indexing feature for a Logstore and configure indexes for fields in the Logstore, the indexing and analytics features are automatically enabled for these fields.

Reserved fields in Log Service

Field	Description
<code>__topic__</code>	The topic of a log entry. If you specify a topic for a log entry, Log Service adds the topic field to the log entry. The key of the field is <code>__topic__</code> and the value of the field is the log topic. For more information, see Specify a log topic .
<code>__source__</code>	The source of a log entry. The source device that generates the log entry.
<code>__time__</code>	The time when a log entry is written to the Logstore by using an SDK.

 **Note** If the values of the `__topic__` and `__source__` fields are null, the keywords that you use to query the two fields must exactly match the field values.

Procedure

1. [Log on to the Log Service console](#).
2. In the **Projects** section, click the target project.
3. Find the target Logstore, and choose  **Search & Analysis**.
4. On the page that appears, click **Enable** in the upper-right corner.

 **Note** If you have created indexes for the Logstore, choose **Index Attributes > Modify** to modify the indexes.

5. Configure the indexes.

 **Note** If you enable a full-text index and a field-specific index at the same time, the field-specific index takes precedence over the full-text index.

Index types

Index type	Description
Full text index	An index is created in the text format for all fields. You can search for key-value pairs that are included in these fields. For fields of the LONG type, you must specify the key name of a field when you query a value of the field. For fields of the other types, you do not need to specify a key name in queries.

Index type	Description
Field-specific index	<p>After you configure a field-specific index, you must specify the name of a key when you query logs. If you configure the field-specific index on a field, the field-specific index takes effect when you query logs. The full-text index does not take effect.</p> <p>Available data types that you can specify for fields include:</p> <ul style="list-style-type: none"> ◦ Query text data ◦ JSON indexes ◦ Numeric (LONG and DOUBLE)

◦ Configure a full-text index.

After you configure a full-text index for a Logstore, the values of all fields in the Logstore are queried by default.

Parameter	Description	Example value
Full Text Index	If you turn on the switch, Log Service traverses the values of all fields in a log entry. If the value of one of the fields matches the keyword, the log entry is returned.	-
Case Sensitive	<p>Specifies whether queries are case-sensitive.</p> <ul style="list-style-type: none"> ▪ If you turn off the switch, queries are not case-sensitive. For example, if you search for <code>internalError</code>, you can use either <code>INTERNALERROR</code> or <code>internalerror</code> as the keyword. ▪ If you turn on the switch, queries are case-sensitive. For example, if you search for <code>internalError</code>, you can use only <code>internalError</code> as the keyword. 	-
Include Chinese	<p>Specifies whether to differentiate the Chinese content and English content.</p> <ul style="list-style-type: none"> ▪ If you turn on the switch, Log Service separates the Chinese content based on the Chinese semantics and English content based on the specified delimiters. ▪ If you turn off the switch, the content of a log entry is separated by the specified delimiters. 	-
Delimiter	<p>The delimiters that you use to separate the content of a log entry into multiple keywords.</p> <p>For example, the content of a log entry is <code>a,b;c;D-F</code>. You can specify commas (<code>,</code>), semicolons (<code>;</code>), and hyphens (<code>-</code>) as delimiters to delimit the log content. Then you can use the five letters <code>a</code>, <code>b</code>, <code>c</code>, <code>D</code>, and <code>F</code> as keywords to match the log entry.</p>	<code>, " ; = () [] { } ? @ & < > / : \ n \ t</code>

◦ Configure a field-specific index.

You can specify fields to be indexed. Field-specific indexes allow you to query log data based on the values of specific fields. This narrows down the query scope.

Parameter	Description	Example value
Key Name	<p>The name of a log field.</p> <div style="border: 1px solid #ccc; background-color: #e6f2ff; padding: 10px; margin: 10px 0;"> <p> Note</p> <ul style="list-style-type: none"> ▪ If you want to configure an index for fields of the tag type, such as fields that include public IP addresses or UNIX timestamps, you must set the value of the Key Name parameter in the <code>__tag__:key</code> format, for example, <code>__tag__:__receive_time__</code>. ▪ Indexes of the numeric types are unavailable for tag fields. You must select text in the Type field for all tag fields. </div>	<code>_address_</code>
Type	<p>The type of a field. Valid values:</p> <ul style="list-style-type: none"> ▪ text: The data type of the field is TEXT. ▪ long: The data type of the field is LONG. You must specify a numeric range to query log data. ▪ double: The data type of the field is DOUBLE. You must specify a numeric range to query log data. ▪ json: The data type of the field is JSON. <div style="border: 1px solid #ccc; background-color: #e6f2ff; padding: 10px; margin: 10px 0;"> <p> Note The Case Sensitive, Include Chinese, and Delimiter parameters are unavailable for fields of numeric types (LONG and DOUBLE).</p> </div>	-
Alias	<p>The alias of a column.</p> <p>Aliases are applied only to SQL statistics. Original names are applied when you store and query log data in Log Service. For more information, see Field aliases.</p>	<code>address</code>
Case Sensitive	<p>Specifies whether queries are case-sensitive.</p> <ul style="list-style-type: none"> ▪ If you turn off the switch, queries are not case-sensitive. For example, if you search for <code>internalError</code>, you can use either <code>INTERNALERROR</code> or <code>internalerror</code> as the keyword. ▪ If you turn on the switch, queries are case-sensitive. For example, if you search for <code>internalError</code>, you can use only <code>internalError</code> as the keyword. 	-

Parameter	Description	Example value
Delimiter	<p>The delimiters that you use to separate the content of a log entry into multiple keywords.</p> <p>For example, the content of a log entry is <code>a,b;c;D-F</code>. You can specify commas (,), semicolons (;), and hyphens (-) as delimiters to delimit the log content. Then you can use the five letters a, b, c, D, and F as keywords to match the log entry.</p>	<code>, "" ; = () [] { } ? @ & < > / : \ \n \t</code>
Include Chinese	<p>Specifies whether to differentiate the Chinese content and English content.</p> <ul style="list-style-type: none"> If you turn on the switch, Log Service separates the Chinese content based on the Chinese semantics and English content based on the specified delimiters. If you turn off the switch, the content of a log entry is separated by the specified delimiters. 	-
Enable Analytics	<p>Specifies whether to enable the analytics feature. The switch is turned on by default.</p> <p>After you turn on the switch, you can use search and analytic statements to obtain statistical results.</p>	-

6. Click **OK**.

Note

- The index configurations take effect within one minute.
- After an index is enabled or modified, the updates on the index apply only to new data that is written to Log Service.

30.4.4. Query logs

This topic describes how to query logs in a Logstore. After you enable and configure the index of the Logstore, you can query and analyze logs in a Logstore in real time.

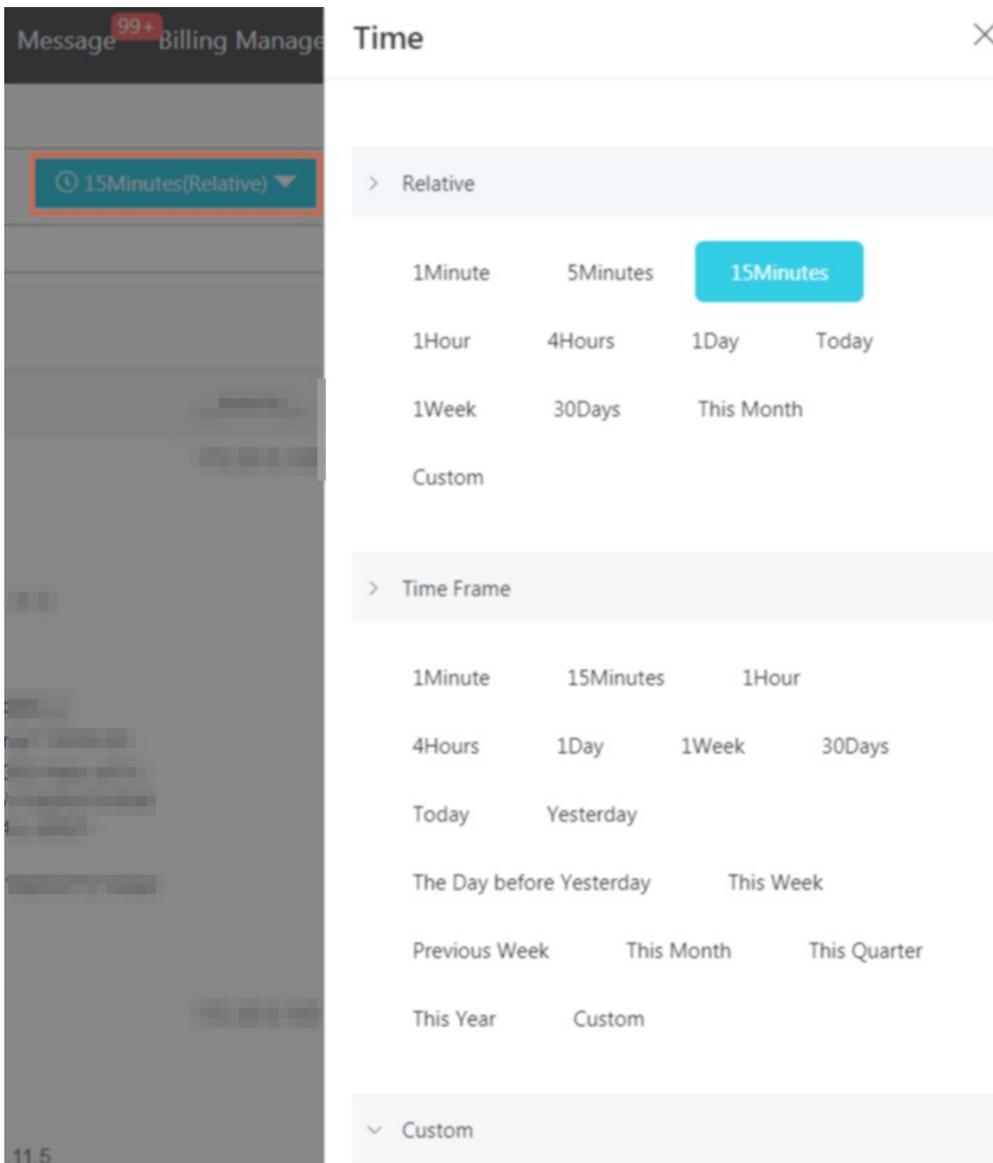

Prerequisites

- Logs are collected and stored in a Logstore.
- Indexes are enabled and configured. For more information, see [Enable the index feature and configure indexes for a Logstore](#).

Procedure

- Log on to the [Log Service console](#).
- Click the  icon next to the name of the Logstore, and then select **Search & Analysis**.
- Enter a query statement in the search box. A query statement consists of a search statement and an analytic statement. The syntax is `search statement|analytic statement`. For more information, see [Search and analysis statements](#).
- On the Search & Analysis page, select **15 Minutes** in the Relative section to set the time range for the query. You can select a relative time, time frame, or a custom time range.

Note The query results may contain logs that are generated 1 minute earlier or later than the specified time period.

5. Click **Query & Analyze** to view the query results. Log Service illustrates query results on log distribution histograms, Raw Logs tab, or statistical graphs.

Note 100 results are returned by default. For information about how to retrieve more results, see [LIMIT syntax](#).

- **Log distribution histogram**

The log distribution histogram shows the distribution of query results across different time ranges.

- Move the pointer over a green block to view a time range and the number of logs obtained within the time range.
- Click a data block to view finer-grained log distribution. You can also view the query results on the Raw Logs tab.

○ Raw Logs tab

On the Raw Logs tab, view logs that match your search conditions.

- Quick analysis: Use this feature to analyze the distribution of values for a specific field within a period of time. For more information, see [Quick analysis](#).
- Log download: Click the download icon in the upper-right corner of the tab, select a time range, and then click OK.
- Column settings: Click Column Settings in the upper-right corner of the tab, select the required fields and click Add to add the fields. Then, the columns that correspond to the fields appear on the tab. The field names are also column names. The columns list the field values.

? **Note** To view the log contents on the tab, select Content.

- Content column settings: If the content of a field exceeds 3,000 characters, extra characters will be hidden. In this case, the message "The character string is too long and has been truncated" will be displayed before the Key field. Click Display Content Column. In the dialog box that appears, set the Key-Value Arrangement and Truncate Character String parameters.

? **Note** If the content limit is set to 10,000 characters, no delimiter will be specified for extra characters.

Parameter		Description
Key-Value Pair Arrangement		You can set this parameter to New Line or Full Line.
Truncate Character String	Key	If a field value contains more than 3,000 characters, the field value is truncated. However, this parameter remains unspecified if no field value exceeds 3,000 characters. The value of this parameter is the key of the truncated value.
	Status	This parameter determines whether to enable the value truncation feature. By default, the feature is enabled. <ul style="list-style-type: none"> ■ Enable: If the value in a key-value pair exceeds the specified Truncate Step, extra characters will be truncated. You can click the Show button at the end of the value to show the truncated characters. The increment per click is the specified truncate step. ■ Disable: If the value in the key-value pair exceeds the specified Truncate Step, extra characters will not be truncated.
	Truncate Step	This parameter specifies the maximum number of characters that a field value shows by default. The parameter also specifies the number of extra characters that you displayed each time you click the Show button. Valid values: 500 to 10000. Default value: 3000.

○ Graph

If you enable the Analytics feature on the Search & Analysis page and use search and analytic statements to query logs, you can view the analytical results on the Graph tab.

- Graphs of multiple types are provided in Log Service, including tables, line charts, and bar charts. You can select a graph to show the required analytical results. For more information, see [Graphs](#).
- Log Service allows you to create dashboards for real-time data analysis. For more information, see [Create and delete a dashboard](#). Click **Add to New Dashboard** to save a common chart as query statements to a dashboard.
- Drill-down analysis allows you to move to deeper data layers, which reveals more detailed information. You can set the drill-down parameters and add the chart to the dashboard. Then, you can click the values in the chart to view the analysis results from more dimensions. For more information, see [Drill-down analysis](#).

You can also click **Save Search** or **Save as Alarm** on the Search & Analysis page to use the saved search and alarm features. For more information, see [Save a query statement as a search](#) and [Configure an alert](#).

30.4.5. Export logs

You can export logs on the current page to a CSV file and save the file to your localhost.

Procedure

1. [Log on to the Log Service console](#).
2. Click a project name.
3. Click the  icon next to the name of the Logstore, and then select **Search & Analysis**.
4. Click the  icon next to the **Raw Logs** tab.
5. In the **Download Log** dialog box, select **Download Log in Current Page**.
6. Click **OK** to export logs of the current page to a .CSV file and save the file to the localhost.

30.4.6. Index data type

30.4.6.1. Overview

Log Service allows you to use full-text indexes or field-specific indexes to query collected logs. If you set a full-text index for a log, the value is the entire log. If you set a field-specific index for a log, you can specify a data type for each key.

Date types

The following table lists the supported data types.

Query type	Data type (index)	Description	Example
Basic query	Text	The text type. You can use keywords and fuzzy matches to query logs.	<code>uri:"login*" method:"post"</code>
	Long	The numeric type. You can specify numeric ranges to query logs.	<code>status>200 and status in [200, 500]</code>
	Double	The floating-point type.	<code>price>28.95 and t in [20.0, 37]</code>

Query type	Data type (index)	Description	Example
Combined query	JSON	Indicates that the index is a JSON field that supports nested queries. By default, the data type of the field is text. You can set indexes of the Text, Long, and Double types for the b elements at layer a in the a.b path format. The fields adopt the configured types.	<pre>level0.key>29.95 level0.key2:"action"</pre>
	Text	Indicates that the full contents of the log are queried as text.	<pre>error and "login fail"</pre>

Query examples

The following table lists the keys included in the sample log.

No.	Key	Type
0	time	N/A
1	class	text
2	status	long
3	latency	double
4	message	json

```

0. time:2018-01-01 12:00:00
1. class:central-log
2. status:200
3. latency:68.75
4. message:
{
  "methodName": "getProjectInfo",
  "success": true,
  "remoteAddress": "1.1.1.1:11111",
  "usedTime": 48,
  "param": {
    "projectId": "ali-log-test-project",
    "requestId": "d3f0c96a-51b0-4166-a850-f4175dde7323"
  },
  "result": {
    "message": "successful",
    "code": "200",
    "data": {
      "clusterRegion": "ap-southeast-1",
      "ProjectName": "ali-log-test-project",
      "CreateTime": "2017-06-08 20:22:41"
    },
    "success": true
  }
}

```

You can set an index as follows.

Set an index

Key Name	Type	Alias	Case Sensitive	Delimiter: ?	Include Chinese	Enable Analytics	Delete
class	text		<input type="checkbox"/>	, ";=000?@&<>/\n\t	<input type="checkbox"/>	<input checked="" type="checkbox"/>	×
message	1 json		<input type="checkbox"/>	, ";=000?@&<>/\n\t	<input type="checkbox"/>	<input type="checkbox"/>	×
methodName	text		<input type="checkbox"/>		<input type="checkbox"/>	<input checked="" type="checkbox"/>	×
param.requestId	text		<input type="checkbox"/>		<input type="checkbox"/>	<input checked="" type="checkbox"/>	×
result.data.clusterRegion	text		<input type="checkbox"/>		<input type="checkbox"/>	<input checked="" type="checkbox"/>	×
usedTime	2 long		<input type="checkbox"/>		<input type="checkbox"/>	<input checked="" type="checkbox"/>	×

In the preceding figure,

- ① specifies that Log Service can query data of the string and Boolean types in JSON fields.
- ② specifies that Log Service can query data of the long type.
- ③ enables SQL analysis for specified fields.

Example

1. Query data of the string and Boolean types

- You do not need to configure JSON fields.
- JSON maps and arrays are automatically expanded and can contain nested fields. Separate multiple levels with periods (.).

```
class : cental*
message.traceInfo.requestId : 92.137_1518139699935_5599
message.param.projectName : ali-log-test-project
message.success : true
```

2. Query data of the double and long types

Each JSON field must be specified separately and cannot be contained in a JSON array.

```
latency>40
message.usedTime > 40
```

3. Combined query

```
class : cental* and message.usedTime > 40 not message.param.projectName:ali-log-test-project
```

30.4.6.2. Query text data

This topic describes how to query text data.

Similar to search engines, Log Service queries text data based on terms. Therefore, you must set the Delimiter, Case Sensitive fields.

Configurations

- Case sensitivity

You can specify whether log queries are case-sensitive. For example, you want to query logs by using a search term named `internalError`.

- *false* specifies a case-insensitive query. Both `INTERNALERROR` and `internalerror` can be the keywords.
- *true* specifies a case-sensitive query. Only the `internalError` can be the keyword.

- Delimiter

You can use delimiters to split a search term into multiple keywords.

For example, you want to query logs by using the following search term.

```
/url/pic/abc.gif
```

- If no delimiter is set, the entire `/url/pic/abc.gif` string is treated as a keyword. You must use the entire string as a keyword or a fuzzy string named `/url/pic/*` to query logs.
- If the delimiter is set to `/`, the search term is split into three words: `url`, `pic`, and `abc.gif`. You can use one of these words or a fuzzy word to query logs. For example, `url`, `abc.gif`, or `pi*`. You can also use the `/url/pic/abc.gif` string as a search term to query logs. However, the search term is split into three keywords named `url`, `pic`, and `abc.gif`.
- If the delimiter is set to `/.`, the search term is split into four keywords named `url`, `pic`, `abc`, and `gif`.

 **Note** You can extend query ranges by setting appropriate delimiters.

- Full-text index

By default, full-text indexes treat each log except for the time field as text data. You do not need to specify any keys for a full-text index. For example, the following log includes the time field, status field, level field, and message field.

```
[20180102 12:00:00] 200,error,some thing is error in this field
```

- `time:2018-01-02 12:00:00`
- `level:"error"`
- `status:200`
- `message:" some thing is error in this field"`

Note

- Prefixes are not required for full-text indexes. If you set the search term to `error`, the level and message fields that include error match the search term.
- You must set delimiters for full-text indexes. For example, if you set a space () as a delimiter, the `status:200` string is a search term. If you set a colon (:) as a delimiter, the search term is split into two keywords named `status` and `200` .
- Numbers are treated as text data. For example, you can use `200` to query logs. Values in the time field are not treated as text data.
- You can query logs by using keys such as `status` .

30.4.6.3. Numeric type

When you configure indexes, you can set the data type of a key to number. To query logs, you can specify a numeric range for the key.

Configurations

Supported types: `long` (long integers) and `double` (decimals). After you set the data type of a key to number, you must specify a numeric range for the key to query logs.

Query examples

To specify a numeric range from 1000 to 2000 (excluding 1000) for a key of the long type, you can use the following methods:

- Query syntax for numbers. For example:

```
longKey > 1000 and longKey <= 2000
```

- Query grammar for numeric ranges. For example:

```
longKey in (1000 2000]
```

For more information about query syntax, see [Query syntax](#).

30.4.6.4. JSON indexes

Log Service can query and analyze logs in the JSON format. You can set the data type of indexes to JSON.

JSON texts include data of multiple types, including string, Boolean, number, array, and map. JSON-formatted data is self-parsed and flexible. You can use JSON-formatted data in various scenarios. In most cases, variable log fields are recorded in the JSON format. For example, HTTP request and response parameters are recorded in a log in the JSON format.

Log Service allows you to set the data type of index fields to JSON so that you can query and analyze logs in the JSON format.

Configurations

- Log Service can parse JSON-formatted fields and generate indexes for all the fields of the text and Boolean types.

```
json_string.key_map.key_text : test_value
json_string.key_map.key_bool : true
```

- To query fields of the double or long type that is not in a JSON array, you can specify a JSON path.

```
Set the data type of the key_map.key_long field to long.
Search condition: json_string.key_map.key_long > 50
```

- To query fields of the text, double, or long type that is not in a JSON array, you can enable the Analytics feature and use SQL statements to analyze these fields.

```
json_string.key_map.key_long > 10 | select count(*) as c ,
"json_string.key_map.key_text" group by
"json_string.key_map.key_text"
```

Note

- JSON objects and JSON arrays are not supported.
- Fields cannot be contained in JSON arrays.
- Fields of the Boolean type can be converted into the text type.
- To query and analyze logs, JSON-formatted fields must be enclosed with double quotation marks (" ").

- Log Service cannot parse invalid JSON-formatted data.

Log Service does not stop parsing logs until it detects an invalid field.

In the following example, data after the key_3 field is truncated and lost in the following text. Log Service can parse the json_string.key_map.key_2 field and the contents before this field.

```
"json_string":
{
  "key_1" : "value_1",
  "key_map" :
  {
    "key_2" : "value_2",
    "key_3" : "valu
```

Query syntax

To query a specific key, you must add the JSON parent path to the query statement as the prefix of the key. The query syntax for the fields of the text and numeric types is the same for both JSON-formatted data and other data. For more information, see [Query syntax](#).

Query example

The following table lists the keys included in the sample log. The data type of the `message` key is JSON.

Number	Key	Type
0	time	N/A
1	class	text
2	status	long
3	latency	double
4	message	json

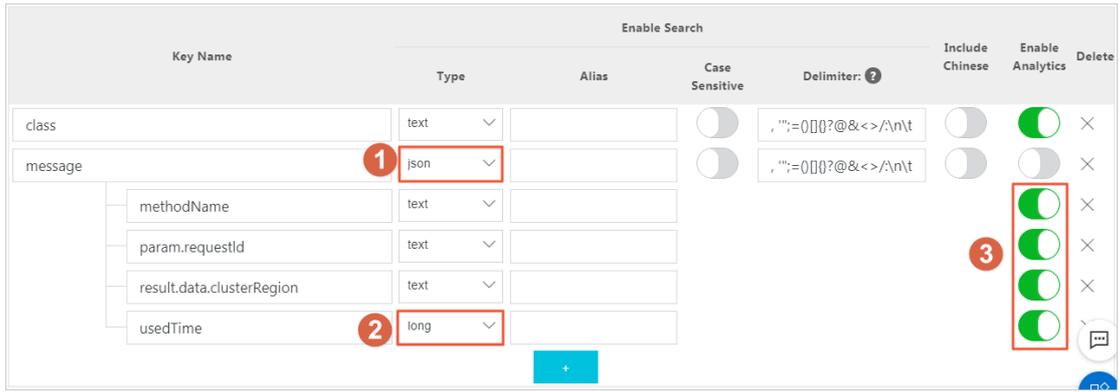

```

0. time:2018-01-01 12:00:00
1. class:central-log
2. status:200
3. latency:68.75
4. message:
{
  "methodName": "getProjectInfo",
  "success": true,
  "remoteAddress": "1.1.1.1:11111",
  "usedTime": 48,
  "param": {
    "projectId": "d3f0c96a-51b0-4166-a850-f4175dde7323",
    "projectName": "ali-log-test-project",
    "requestId": "d3f0c96a-51b0-4166-a850-f4175dde7323"
  },
  "result": {
    "message": "successful",
    "code": "200",
    "data": {
      "clusterRegion": "ap-southeast-1",
      "ProjectName": "ali-log-test-project",
      "CreateTime": "2017-06-08 20:22:41"
    },
    "success": true
  }
}

```

You can set indexes for the log as follows:

Set an index

In the preceding figure:

- ① specifies that Log Service can query data of the string and Boolean types in JSON fields.
- ② specifies that Log Service can query data of the long type.
- ③ enables SQL analysis for specified fields.

Examples

1. Query data of the string and Boolean types

Note

- You do not need to configure JSON fields.
- JSON maps and arrays are automatically expanded and can include hierarchical levels. Separate multiple levels with periods (.).

```
message.traceInfo.requestId : 92.137_1518139699935_5599
message.param.projectName : ali-log-test-project
message.success : true
message.result.data.ProjectStatus : Normal
```

2. Query fields of the double and long types

Note Each JSON field must be configured and cannot be contained in an array.

```
message.usedTime > 40
```

3. Use SQL statements to analyze fields

Note

- Each JSON field must be configured and cannot be contained in an array.
- Each field to be queried must be enclosed with double quotation marks (" ") or be configured with an alias.

```
* | select avg("message.usedTime") as avg_time ,
"message.methodName" group by "message.methodName"
```

30.4.7. Query syntax and functions

30.4.7.1. Search syntax

This topic describes the search syntax that is used in Log Service.

Search types

After you [enable and configure the index feature](#) of a Logstore, you can enter a search statement on the search and analysis page to [query logs](#).

A query statement consists of two sub-statements in sequence: a search statement and an analytic statement. A search statement specifies one or more search conditions and returns the log entries that match the search conditions. You can execute a search statement to perform a full-text search or field-specific search.

- Full-text search

During full-text search, a log entry is considered a key-value pair. The value in the key-value pair indicates the content of the log entry. A full-text search statement returns the log entries that include or exclude the specified keywords.

Full-text search is divided into basic full-text search, phrase search, and wildcard-based search.

- Basic full-text search: You can specify keywords and operators in search conditions of a search statement. You can then execute the search statement to query the log entries that match the search conditions.

For example, the `a and b` statement returns the log entries that include the `a` and `b` keywords.

- Phrase search: A phrase is a string that is enclosed in double quotation marks (""). Substrings in a phrase are separated by space characters. Each substring is a keyword.

For example, the `"http error"` statement returns the log entries that contain the `http` and `error` keywords. This statement is equivalent to `http and error`.

- Wildcard-based search: You can use an asterisk (`*`) or a question mark (`?`) as a wildcard character in a keyword. Each keyword that includes wildcards can contain 1 to 64 characters in length and cannot start with a wildcard character. If a search condition contains a keyword that includes a wildcard character, Log Service returns a maximum of 100 log entries and each log entry contains a word that matches the keyword pattern.

For example, if you execute the `addr?` statement, Log Service returns a maximum of 100 log entries and each log entry contains a word that is prefixed with `addr`.

When you use wildcard-based search, note the following information:

- A keyword cannot start with an asterisk (`*`) or a question mark (`?`).
- The more accurate the keyword is, the more accurate the search results will be.
- Wildcard-based search is not supported for a keyword that contains more than 64 characters in length.
- A search statement returns a maximum of 100 log entries that match the search conditions.

- Field-specific search

After you configure the field index, you can search log entries based on the keys and values of the fields in the field index. For a field of the `DOUBLE` or `LONG` type, you can specify a value range for search. For example, the `Latency>5000 and Method:Get* and not Status:200` statement returns the log entries that meet the following conditions: The value of the `Latency` field is greater than 5000, the value of the `Method` field is prefixed with `Get`, and the value of the `Status` field is not 200.

You can perform a basic query or combined query, depending on the data types of the fields in the field index. For more information, see [Overview](#).

Additional considerations

- If you execute a search statement to perform both full-text search and field-specific search and you set different delimiters for the two search types, the delimiter that is set for field-specific search is used.
- You must set the data type of a field to `DOUBLE` or `LONG` before you specify a value range to search the field. If the data type of a field is not `DOUBLE` or `LONG` or the value range syntax is incorrect, the field-specific

search condition is considered a full-text search condition. In this case, unexpected search results may be returned.

- If you change the data type of a field from TEXT to DOUBLE or LONG, only the equal-to operator (=) can be used to search for the log entries that are collected before the change.

Operators

The following table lists the operators that are supported by search statements.

Operator	Description
and	A binary operator. The syntax is <code>query1 and query2</code> . It indicates the intersection of the search results of <code>query1</code> and <code>query2</code> . The default operator between keywords is <code>and</code> .
or	A binary operator. The syntax is <code>query1 or query2</code> . It indicates the union of the search results of <code>query1</code> and <code>query2</code> .
not	A binary operator. The syntax is <code>query1 not query2</code> . It indicates that the log entries that match <code>query1</code> but do not match <code>query2</code> are returned. The syntax is equivalent to <code>query1-query2</code> . You can also use the <code>not query1</code> syntax. It indicates that the log entries that do not match <code>query1</code> are returned.
(,)	The operator that merges one or more sub-conditions into one search condition. The search based on a sub-condition that is enclosed in parentheses () is performed first.
:	The operator that is used to specify a pattern of key-value pairs. The syntax is <code>term1:term2</code> . If the key or value contains reserved characters such as spaces and colons (:), use double quotation marks ("") to enclose the entire key or value.
"	The operator that converts another operator into a common character. All terms enclosed in double quotation marks ("") are considered keywords rather than operators. In a field-specific search statement, you can enclose the entire key or value in double quotation marks.
\	The operator that escapes a double quotation mark. The escaped double quotation mark is considered a symbol instead of an operator. Example: <code>"\"</code> .
	The pipeline operator that is used to chain a search statement and an analytic statement. The analytic statement that follows the pipeline operator is executed based on the result of the search statement that the pipeline operator follows. Example: <code>query1 select count(1)</code> .
count	The count operator that is used to summarize the number of log entries.
*	The wildcard character that is used to replace zero or more characters. For example, the <code>que*</code> statement returns the log entries with a word that is prefixed with <code>que</code> . <div style="background-color: #e0f2f1; padding: 5px; border: 1px solid #ccc;"> <p> Note A wildcard-based search statement returns a maximum of 100 log entries that match the search condition.</p> </div>

Operator	Description
?	The wildcard character that replaces a single character. The <code>qu?ry</code> statement returns the log entries with a word that is prefixed with <code>qu</code> , is suffixed with <code>ry</code> , and contains a character in between.
<code>__topic__</code>	The operator that specifies zero or more topics from which to query log entries. Example: <code>__topic__:mytopicname</code> .
<code>__tag__</code>	The operator that specifies a tag value of a tag key to query. Example: <code>__tag__:tagkey:tagvalue</code> .
<code>source</code>	The operator that specifies the IP address of a log source whose log entries you want to query. Example: <code>source:127.0.0.1</code> .
>	The greater-than operator. You can use this operator to query the log entries whose value of a field is greater than a specified number. Example: <code>latency > 100</code> .
>=	The greater-than-or-equal-to operator. You can use this operator to query the log entries whose value of a field is greater than or equal to a specified number. Example: <code>latency >= 100</code> .
<	The less-than operator. You can use this operator to query the log entries whose value of a field is less than a specified number. Example: <code>latency < 100</code> .
<=	The less-than-or-equal-to operator. You can use this operator to query the log entries whose value of a field is less than or equal to a specified number. Example: <code>latency <= 100</code> .
=	The equal-to operator. You can use this operator to query the log entries whose value of a field is equal to a specified number. Example: <code>latency = 100</code> .
<code>in</code>	The operator that is used to query the log entries whose value of a field falls in a specified range. Brackets <code>[]</code> indicate closed intervals and parentheses <code>()</code> indicate open intervals. The beginning number and ending number of the range are enclosed in brackets or parentheses and separated by one or more space characters. The <code>in</code> operator must be in lowercase. Example: <code>latency in [100 200]</code> or <code>latency in (100 200)</code> .

 Note

- All operators except the `in` operator are case-insensitive.
- You can use the following operators, which are sorted in descending order of precedence: `:`, `"`, `()`, `and`, `not`, and `or`.
- Log Service uses the following operators: `sort`, `asc`, `desc`, `group by`, `avg`, `sum`, `min`, `max`, and `limit`. If you need to use these operators as keywords, enclose them in double quotation marks (`"`).

Search statement examples

Expected search result	Search statement
Log entries that contain a and b	<code>a and b</code> or <code>a b</code>

Expected search result	Search statement
Log entries that contain a or b	a or b
Log entries that contain a but do not contain b	a not b
Log entries that do not contain a	not a
Log entries that contain a and b but do not contain c	a and b not c
Log entries that contain a or b and contain c	(a or b) and c
Log entries that contain a or b but do not contain c	(a or b) not c
Log entries that contain a and b and may contain c	a and b or c
Log entries whose FILE field contains apsara	FILE:apsara
Log entries whose FILE field contains apsara and shennong	FILE:"apsara shennong" , FILE:apsara FILE:shennong , or FILE:apsara and FILE:shennong
Log entries that contain the following keyword: and	and
Log entries whose FILE field contains apsara or shennong	FILE:apsara or FILE:shennong
Log entries whose file info field contains apsara	"file info":apsara
Log entries that contain double quotation mark (")	\"
Log entries with words that are prefixed with shen	shen*
Log entries whose FILE field is prefixed with shen	FILE:shen*
Log entries whose value of the FILE field is shen*	FILE: "shen**"
Log entries with words that are prefixed shen, are suffixed with ong, and contain a single character in between	shen?ong
Log entries with words that are prefixed with shen and words that are prefixed with aps	shen* and aps*
Log entries of topic1 and topic2	__topic__:topic1 or __topic__ : topic2
Log entries with a tag whose key is tagkey1 and value is tagvalue2	__tag__ : tagkey1 : tagvalue2
Log entries whose value of the latency field is greater than or equal to 100 and less than 200	latency>= 100 and latency < 200 or latency in [100 200)
Log entries whose value of the latency field is greater than 100	latency > 100

Expected search result	Search statement
Log entries that do not contain spider and whose http_referer field does not contain opx	<code>not spider not bot not http_referer:opx</code>
Log entries whose cdnIP field is not empty	<code>not cdnIP:""</code>
Log entries that do not contain the cdnIP field	<code>not cdnIP:*</code>
Log entries that contain the cdnIP field	<code>cdnIP:*</code>
Log entries that contain a specified URL	<code>* select * where url = 'www.xxxxx.com'</code>

Topic-specific search

Each Logstore is divided into one or more topics. You can divide a Logstore into multiple topics if you need level-2 categories of log entries. When you query logs, you can specify topics to increase efficiency.

In a search statement, you can specify one or more topics to query. If no topic is specified, log entries are queried from all topics.

For example, you can classify log entries into multiple topics based on domain names.

Log topics

time	ip	method	url	host	topic
1481270421	127.0.0.1	POST	/users?u=1	a.aliyun.com	siteA
1481270422	127.0.0.1	POST	/users?u=1	a.aliyun.com	siteA
1481270423	127.0.0.1	POST	/users?u=1	b.aliyun.com	siteB
1481270424	127.0.0.1	POST	/users?u=1	b.aliyun.com	siteB
1481270425	127.0.0.1	POST	/users?u=1	c.aliyun.com	siteC
1481270426	127.0.0.1	POST	/users?u=1	c.aliyun.com	siteC
1481270427	127.0.0.1	POST	/users?u=1	d.aliyun.com	siteD
1481270428	127.0.0.1	POST	/users?u=1	d.aliyun.com	siteD
1481270429	127.0.0.1	POST	/users?u=1	e.aliyun.com	siteE
1481270430	127.0.0.1	POST	/users?u=1	e.aliyun.com	siteE

Syntax of topic-specific search:

- In a search statement, you can specify one or more topics to query. If no topic is specified, log entries are queried from all topics.
- The topic-specific search syntax is `__topic__:topicName`. You can also specify a topic in a URL.
- You can query log entries from multiple topics. For example, the `__topic__:topic1 or __topic__:topic2` statement returns the log entries in topic1 and topic2.

30.4.7.2. LiveTail

This topic describes how to use LiveTail to monitor and analyze log data. LiveTail is an interactive feature provided in the Log Service console to monitor and extract key log data in real time.

Prerequisites

- LiveTail is available only after logs are collected.
- LiveTail can only monitor and extract log data collected by Logtail.

Context

In online O&M scenarios, you often need to monitor collected log data in real time and extract key information from the latest log data to locate error causes. In traditional O&M, you must run the `tail -f` command on servers to monitor log files in real time. To easily obtain the required real-time log information, you can include the `grep` or `grep -v` command to filter log entries by keyword. To simplify online O&M, Log Service provides LiveTail in the console to monitor and analyze online log data in real time.

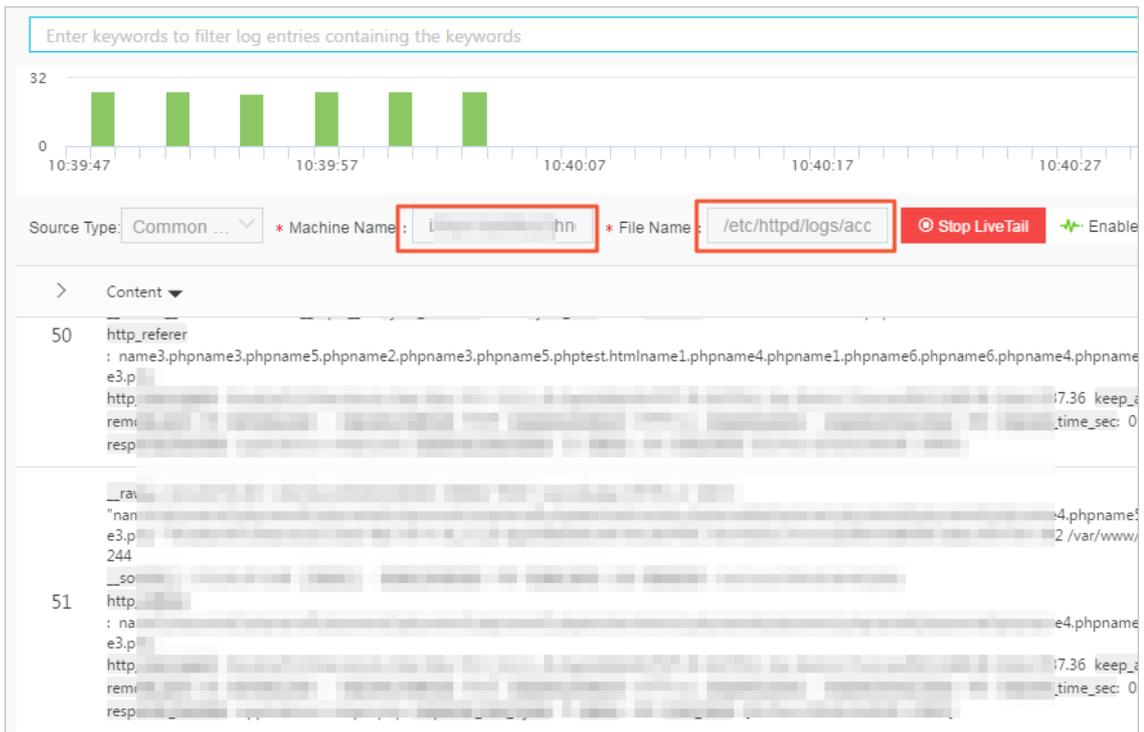

Benefits

- Monitors real-time log information and filters log data by keyword.
- Logs collected based on the log collection configurations are identified by index.
- Log fields are delimited. This allows you to query contextual logs that contain delimiters.
- Log files can be tracked based on a single log entry and monitored in real time without the need to connect to online servers.

Use LiveTail to monitor logs in a Logstore in real time

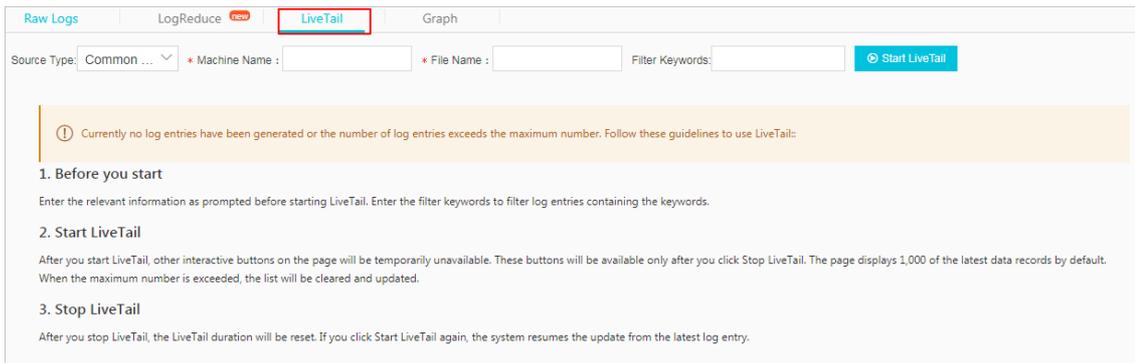

1. Log on to the Log Service console.
2. In the Projects section, click the target project.
3. Click the  icon next to the name of the Logstore, and then select Search & Analysis.
4. (Optional)Start LiveTail.
 - i. On the Raw Logs tab, click the  icon next to the sequence number of the specified raw log entry, and then select LiveTail. The system starts LiveTail and starts timing. The Source Type, Machine Name, and File Name fields are automatically filled in based on the specified raw log entry.

After LiveTail is started, log data collected by Logtail is displayed in order on the page in real time. The latest log data is displayed at the bottom of the page by default. You can view the latest log data without the need to drag the scroll bar. Up to 1,000 log entries can be displayed on the page. If more than 1,000 log entries are collected, the page is automatically refreshed to show the latest 1,000 log entries.

- ii. (Optional)You can also enter keywords in the search box to display log entries that contain the keywords in the monitoring list. By filtering log entries that contain the keyword, you can monitor specific log entries in real time.
5. Customize LiveTail.

i. On the Search & Analysis page, click the LiveTail tab.

ii. Configure LiveTail.

Parameter	Required	Description
Source Type	Yes	The source of log entries. Valid values: <ul style="list-style-type: none"> ■ Physical servers ■ Kubernetes containers ■ Docker
Machine Name	Yes	The name of the server from which log entries are collected.
File Name	Yes	The full path and name of the log file.
Filter Keywords	No	A keyword. After you set a keyword, only log entries that contain the keyword are displayed in the log monitoring list.

iii. Click **Start LiveTail**. After LiveTail is started, log data collected by Logtail is displayed in order on the page in real time. The latest log data is displayed at the bottom of the page by default. You can view the latest log data without the need to drag the scroll bar. Up to 1,000 log entries can be displayed on the page. When more than 1,000 log entries are collected, the page is refreshed to show the latest 1,000 log entries.

6. To analyze logs during real-time log monitoring, click **Stop LiveTail**.

After you stop LiveTail, the LiveTail timing and the real-time log data update also stop.

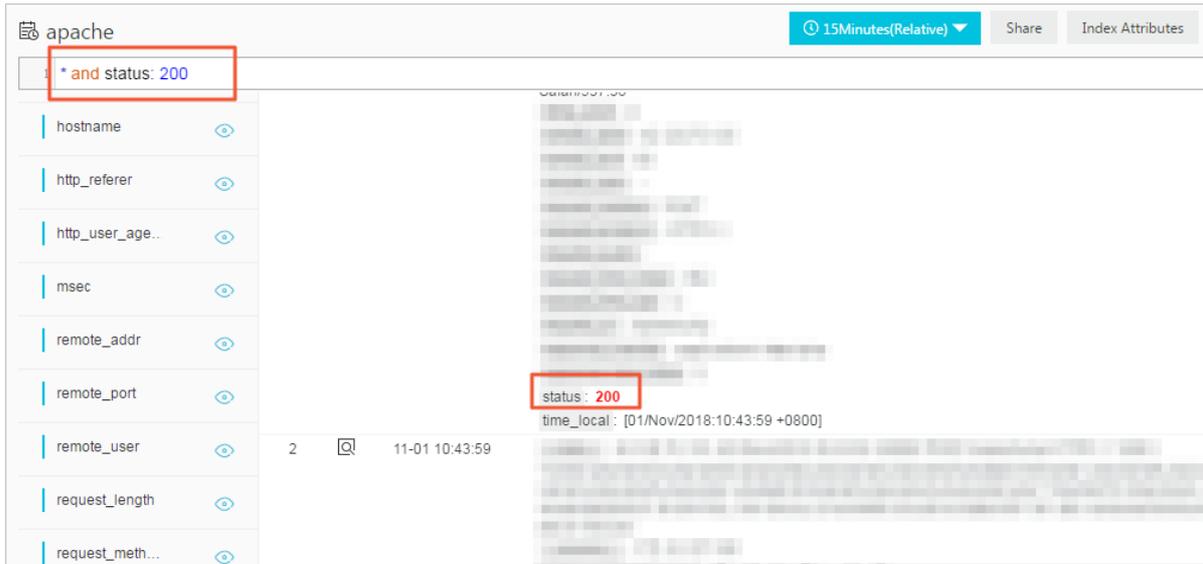

Log Service provides multiple methods to analyze exceptions that are found during log monitoring. For more information, see [Use LiveTail to analyze logs](#).

Use LiveTail to analyze logs

After you stop LiveTail, real-time log updates in the log monitoring list also stop. You can analyze and fix errors that are found during log monitoring.

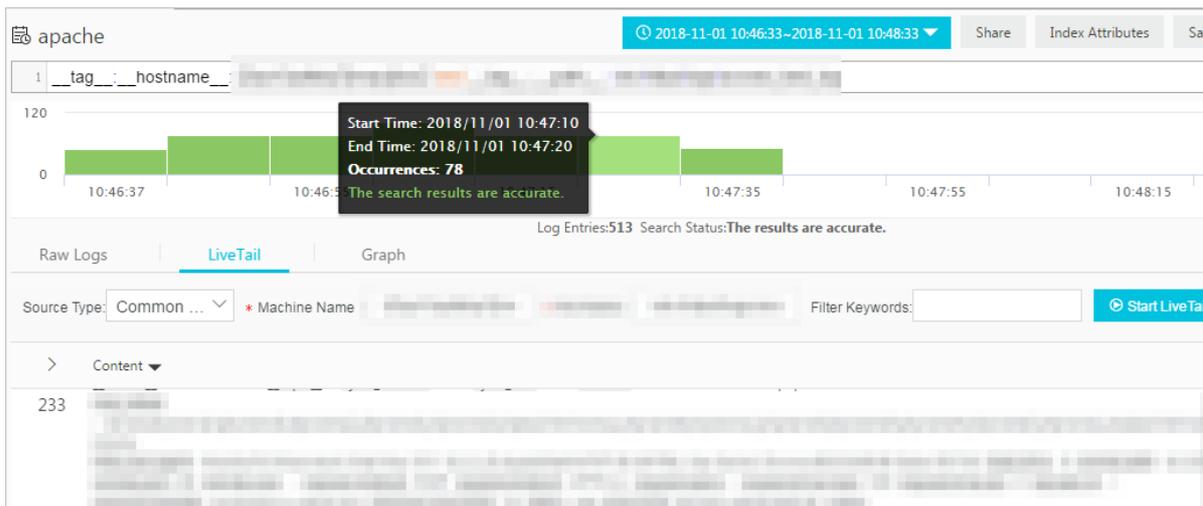

- View log entries that contain specified fields

Log fields are delimited. You can click the value of the specified exception field on the LiveTail tab. Then, you are automatically forwarded to the Raw logs tab and the value of the exception field is used as a keyword to filter all log entries that contain the field and the keyword. You can also analyze log entries that contain the keyword based on contextual queries and statistical charts.

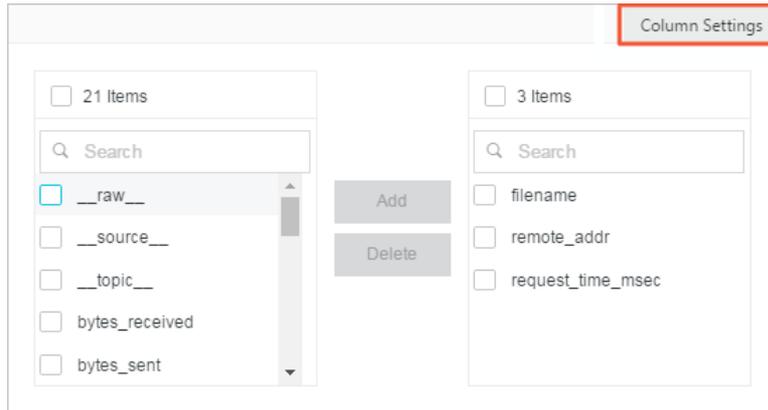

- Narrow down the time range of a log query based on the log distribution histogram

After LiveTail is started, the log distribution histogram is updated at the same time. If you find a distribution exception (for example, a big increase in the number of log entries) in a time range, you can click the corresponding green rectangle to narrow down the time range of the log query. The timeline of the raw logs is associated with the timeline that you click on the LiveTail tab. You can view all relevant raw logs and log distribution details during this time range.

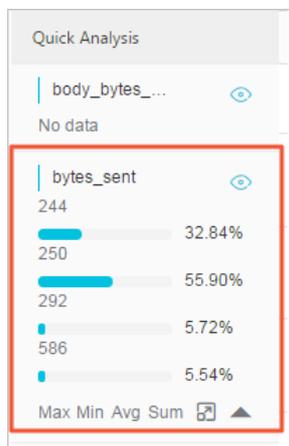

- Highlight key information based on column settings

On the LiveTail tab, click Column Settings in the upper-right corner of the log monitoring list. Then, you can specify a field as a separate column to highlight relevant data.

- Analyze log data

On the **LiveTail** tab, click the arrow in the upper-left corner of the log monitoring list to show the Quick Analysis pane. The time range for quick analysis starts from the time when LiveTail is started and ends at the time when LiveTail is stopped. The quick analysis provided on the LiveTail tab is the same as that provided on the Raw Logs tab. For more information, see [Quick analysis](#).

30.4.7.3. LogReduce

This topic describes how to use LogReduce to group log data in Log Service. The LogReduce feature groups similar log entries by detecting same log patterns during text log collection.

Context

The LogReduce feature allows you to group text logs of multiple formats. You can locate errors, detect anomalies, roll back versions, and perform other O&M operations in DevOps scenarios. You can also detect network intrusions to ensure data security. In addition, you can save the log grouping result to a dashboard as an analysis chart, and then view the grouped data in real time.

Benefits

- Various formats of logs such as Log4j logs, JSON-formatted logs, and syslog logs can be grouped.
- Hundreds of millions of log entries can be grouped in seconds.
- Log entries can be grouped in any pattern.
- Raw log entries can be retrieved based on the signature of log entries grouped in a pattern.
- The number of log entries grouped in a log pattern in different time ranges can be compared.
- The precision of log grouping can be adjusted based on your needs.

Billing method

After the LogReduce feature is enabled, the size of indexes increases by 10% of the raw log size. For example, if the size of raw log data is 100 GB per day, the size of log indexes increases by 10 GB.

Raw log size	Index percentage	Size of indexes generated by LogReduce	Index size
100 GB	20% (20 GB)	100 × 10%	30 GB
100 GB	40% (40 GB)	100 × 10%	50 GB
100 GB	100% (100 GB)	100 × 10%	110 GB

Enable LogReduce of a Logstore

The LogReduce feature is disabled by default.

1. [Log on to the Log Service console.](#)
2. Click the target project in the Projects section.
3. Click the  icon next to the name of the Logstore, and then select **Search & Analysis**.
4. Configure an index.
 - o If you have enabled the index feature and configured indexes for the Logstore, choose **Index Attributes > Modify**.
 - o If you have not enabled the index feature, click **Enable**.
5. Set the index attributes and turn on the **LogReduce** switch. Click **OK**. After LogReduce is enabled, Log Service groups log data that has been collected. Then, you can perform the following operations:
 - o [View log grouping results and raw logs](#)
 - o [Adjust the precision of log grouping](#)
 - o [Compare the number of log entries grouped in different time ranges](#)

View log grouping results and raw logs

1. On the Search & Analysis page, enter a search and analytic statement in the search box, and then click **Search & Analytics**. You can use keywords to filter grouped log entries.

 **Note** SQL statements are not supported. This means analysis results cannot be grouped.

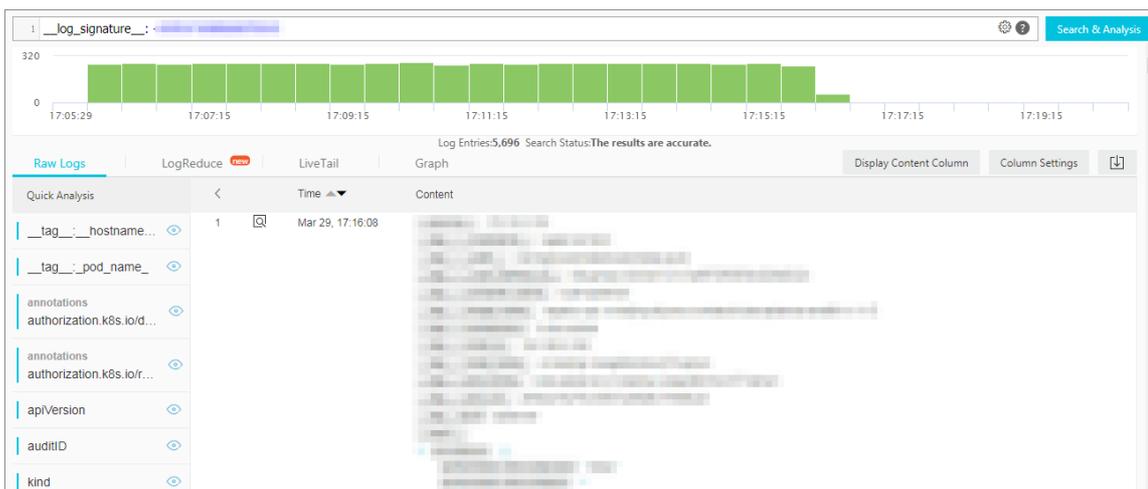

2. Click the **LogReduce** tab to view the log grouping result. The filtered log grouping result is displayed on the **LogReduce** tab.

Item	Description
Number	The sequence number of a log group.
Count	The number of log entries in a log group.
Pattern	The log pattern. Each log group has one or more sub-patterns.

- o Move the pointer over a value in the **Count** column to view the sub-patterns of the corresponding log group and the percentage of each sub-pattern in the log group. You can also click the plus sign (+) before the count value to expand the sub-pattern list.

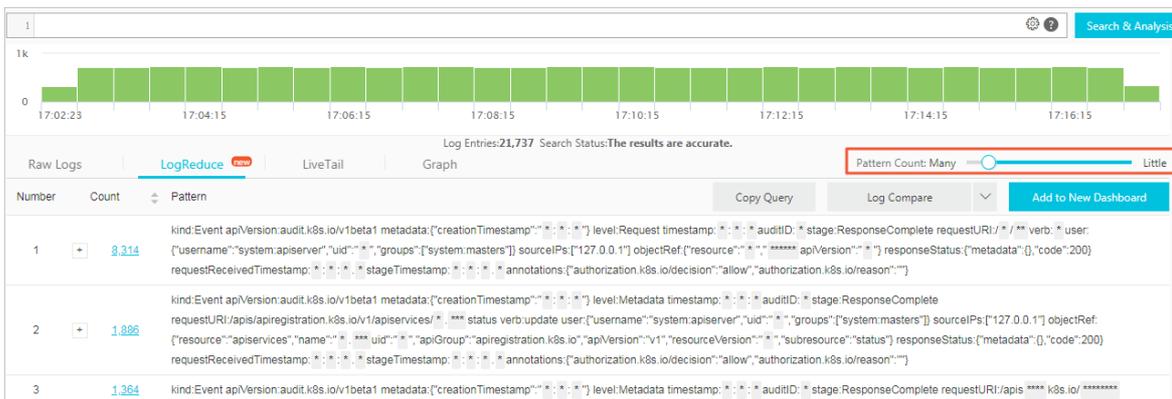

Click a count value to view the raw log entries of the corresponding log group.

Adjust the precision of log grouping

- On the Search & Analysis page, click the LogReduce tab.
- In the upper-right corner of the tab, drag the Pattern Count slider to adjust the precision of log grouping.
 - If you drag the slider towards Many, you can obtain a more precise log grouping result with more detailed patterns.
 - If you drag the slider towards Little, you can obtain a less precise log grouping result with less detailed patterns.

Compare the number of log entries grouped in different time ranges

Click Log Compare on the LogReduce tab, select a time range, and then click OK.

The screenshot shows the Log Service console interface. At the top, there is a SQL query editor with the following query: `select v.signature, v.pattern, v.count, v.count_compare, v.diff from (select compare_log_reduce(3, 86400) as v from log) order by v.diff desc limit 1000 log_reduce(precision)`. Below the query editor is a graph area. The main part of the interface is a table with columns: Number, Pre_Count, Count, Diff, and Pattern. The table contains four rows of log group data. A 'Log Compare' dropdown menu is open over the table, showing options for time ranges: 5Minutes, 15Minutes, 1Hour, 4Hours, 1Day, 1Week, and 30Days. The '1Day' option is selected. There are also input fields for 'Start Time' (2019-04-10 10:17:15) and 'End Time' (2019-04-10 10:32:15), and an 'OK' button.

Item	Description
Number	The sequence number of a log group.
Pre_Count	The number of log entries grouped by the current pattern in the previous time range.
Count	The number of log entries grouped by the current pattern in the current time range.
Diff	The difference between the Pre_Count value and Count value.
Pattern	The pattern of a log group.

SQL statement examples:

- Obtain a log grouping result.

- SQL statement:

```
* | select a.pattern, a.count, a.signature, a.origin_signatures from (select log_reduce(3) as a from log) limit 1000
```

Note When you view the log grouping result in the Log Service console, you can click Copy Query to obtain the relevant SQL statement.

- Input parameter: log_reduce (precision)

precision: an integer from 1 to 16 that can be set as the log grouping precision. A smaller value indicates a higher precision and more patterns. The default value is 3.

- Returned fields:

- pattern: the sub-patterns of log entries in a log group.
- count: the number of log entries in a log group.
- signature: the log pattern of a log group.
- origin_signatures: the original signature of a log group. You can use this field to query raw log entries of the log group.

- Compare the number of log entries grouped in different time ranges.

- SQL statement:

```
* | select v.pattern, v.signature, v.count, v.count_compare, v.diff from (select compare_log_reduce(3, 86400) as v from log) order by v.diff desc limit 1000
```

 **Note** After you click **Log Compare** in the Log Service console, you can click **Copy Query** to obtain the SQL statement.

- Input parameters: `compare_log_reduce(precision, compare_interval)`
 - **precision**: an integer from 1 to 16 that can be set as the log grouping precision. A smaller value indicates a higher precision and more patterns. The default value is 3.
 - **compare_interval**: the number of seconds between when the previous log entries and the current log entries were generated. The value of this parameter must be a positive integer.
- Returned fields:
 - **pattern**: the sub-patterns of log entries in a log group.
 - **signature**: the log pattern of a log group.
 - **count**: the number of log entries in a log group.
 - **count_compare**: the number of log entries for a same-pattern log group within the specified time range.
 - **Diff**: the difference between the values of the count field and the count_compare field.

30.4.7.4. Contextual query

This topic describes the contextual query feature provided in the Log Service console. You can use this feature to query the full context of the log file where specified log entries are obtained.

Prerequisites

The index feature is enabled.

Context

The contextual query feature identifies the server and file where a specified log entry resides. It then queries several log entries before and after the log entry in the original log file. This helps you locate errors during troubleshooting.

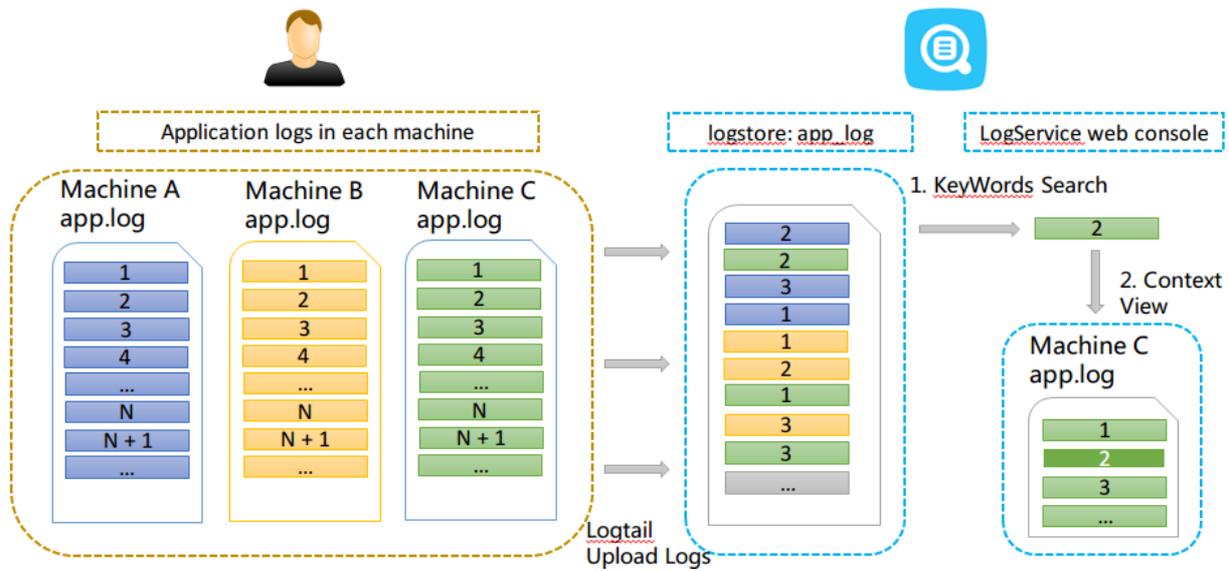

Scenarios

For example, a transaction on an O2O takeout website is logged in an application log file on a server as follows: **User logon > Browse products > Select an item > Add to a shopping cart > Place an order > Payment > Deduction > Generate an order.**

If the order fails, the O&M personnel must locate the cause at the earliest opportunity. In traditional contextual queries, the O&M personnel must be authorized before logging on to each server where the application is deployed. Then, the O&M personnel must use the order ID as a keyword to search application log files to locate the cause of the failure.

In Log Service, the O&M personnel can perform the following steps to locate the cause of the failure:

1. Install Logtail on servers. Then log on to the Log Service console to add the servers to machine groups and configure log collection. After the configurations are complete, Logtail starts to upload incremental logs.
2. On the search and analysis page of the Log Service console, specify the time range and find the error log entry based on the order ID.
3. Based on the error log entry, page up until you find log entries related to the error log entry. For example, you may want to find a log entry that records a credit card payment failure.

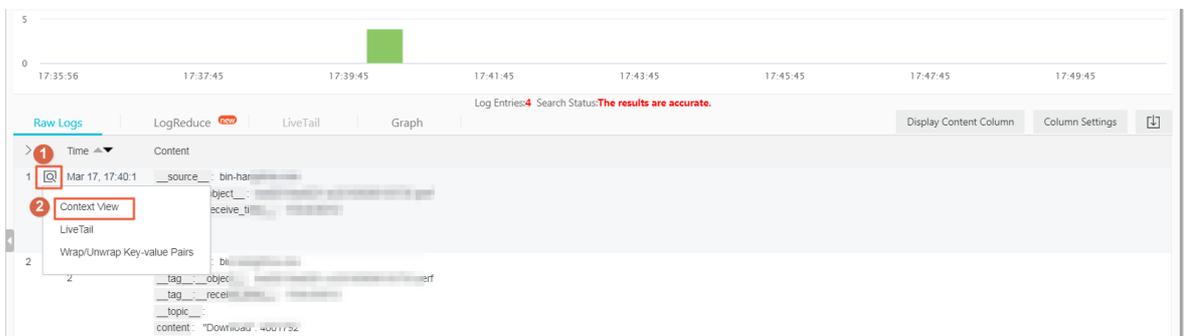

Note The contextual query feature does not support syslog.

Benefits

- Intrusions into applications or changes to log file formats are avoided.
- You can view contextual log entries of a specified log entry in a log file on a server that has been registered in the Log Service console. This helps you avoid logging on to each server to search for logs that you want.
- You can specify the time range based on the time when an event occurs to locate suspicious log entries. Then you can perform a contextual query in the Log Service console. This improves troubleshooting efficiency.
- Data loss caused by log file rotation or insufficient storage space is avoided. You can view historical log data in the Log Service console at any time.

Procedure

1. Log on to the Log Service console.
2. Click the target project in the Projects section.
3. Click the icon next to the name of the Logstore, and then select Search & Analysis.
4. Enter a search and analytic statement, select a time range, and then click Search & Analytics. On the query results page, if the Context View icon is available in the drop-down list of the icon to the left of a log entry, the log entry supports contextual query.

5. Click the icon to the left of a log entry, and select Context View from the drop-down list. On the page that appears, view the contextual log entries of the selected log entry.
6. Scroll up and down to view more contextual log entries. To view earlier or later contextual log entries, click

Old or New.

30.4.7.5. Saved search

This topic describes how to save a search and analytic statement as a saved search for a Logstore. The saved search feature allows you to search and analyze log data in an efficient way.

Prerequisites

The index feature is enabled and configured.

Context

If you need to frequently run a search and analytic statement, you can save the statement as a saved search. In later queries, you can click the name of the saved search on the left side of the search page to run the statement and view the result. You can also use the saved search in alert configurations. Log Service periodically runs the search and analytic statement and sends an alert if a query result meets the trigger condition.

If you want to select **Open Saved Search** in the Event Action field when you configure drill-down analysis, you must preset a saved search and set a placeholder in the query statement. For more information, see [Drill-down analysis](#).

Procedure

1. [Log on to the Log Service console](#).
2. Click the  icon next to the name of the Logstore, and then select **Search & Analysis**.
3. Enter a search and analytic statement in the search box, set a time range, and then click **Search & Analyze**.
4. Click **Save Search** in the upper-right corner of the page.

5. Configure the saved search.
 - i. Enter a **Saved Search Name**.
 - The name can contain only lowercase letters, digits, hyphens (-), and underscores (_).
 - The name must start and end with a lowercase letter or digit.
 - The name must be 3 to 63 characters in length.
 - ii. Check the values of the **Logstores**, **Topic**, and **Query** parameters. If the values of the **Logstores** and **Topic** parameters do not meet your requirements, follow these steps: Return to the **Logstores** page. On this page, find and click the name of the target Logstore. On the page that appears, enter the search and analytic statement in the **Search & Analyze** search box, and then click **Save Search** again.

- iii. (Optional) Select a part of the query statement, and then click **Generate Variable**. The generated variable is a placeholder variable. You can set the placeholder name in the **Variable Name** field. The selected characters are displayed in the **Default Value** field.

Note If you use this saved search for drill-down analysis in another chart where the variable is the same as the **Variable Name**, the **Default Value** is replaced with the chart value that you click to trigger the drill-down event. The search and analytic statement with the replaced chart value is executed. For more information, see [Drill-down analysis](#).

Saved Search Details ✕

* Saved Search Name

Attributes

Logstores

Topic

Query

Select the query statement to generate a placeholder variable. You can configure a drill-down configuration to replace the variable.

Variable Config

Variable Name: Default Value: Matching Mode: ✕

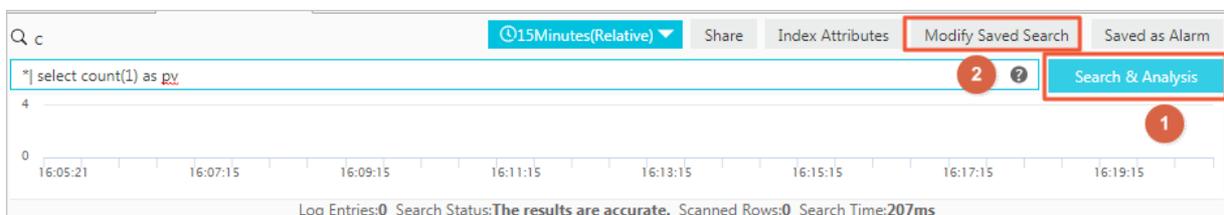

Result

6. Click **OK**.

What's next

To modify a saved search, perform the following operations:

Enter a new search and analytic statement, click **Search & Analytics** to run the statement, and then click **Modify Saved Search**.

30.4.7.6. Quick analysis

This topic describes the quick analysis feature of Log Service. You can use this feature to query log data with one click. This feature allows you to analyze the distribution of a field in a specified time range and reduce the query cost of key data.

Features

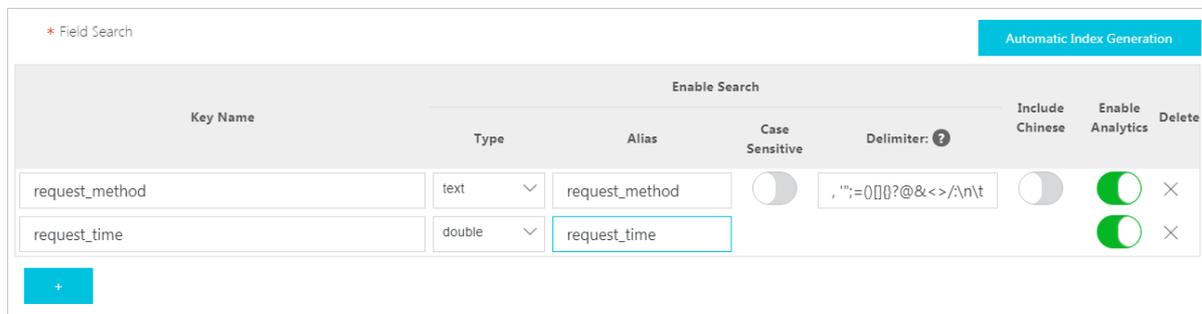

- Groups the first 100,000 values of a `text` field and provides statistics for the top 10 groups.
- Generates `approx_distinct` statements for `text` fields.
- Allows you to perform histogram-based statistics for the approximate distribution of `long` or `double` fields.
- Allows you to search for the maximum, minimum, and average of `long` or `double` fields and calculate the sum of the fields.
- Generates a query statement based on the quick analysis feature.

Prerequisites

Field indexes are configured.

- Indexes are configured for the fields that you need to search and analyze. For more information about how to enable the indexing feature, see [Enable the index feature and configure indexes for a Logstore](#).
- The name of a field is specified as the `key`. The data type, alias, and delimiter of the field are configured.

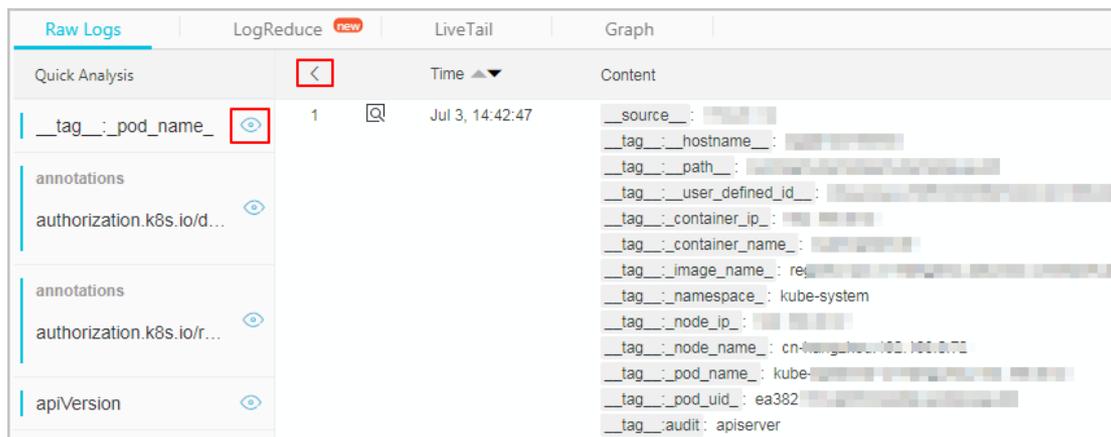

For example, if a log entry contains the `request_method` and `request_time` fields, you can configure indexes for the two fields, as shown in the following figure.

Instructions

After you configure indexes for specified fields, you can go to the Search & Analysis page and click the **Raw Logs** tab to view the specified fields. The fields are listed in the **Quick Analysis** pane on the left of the raw log entries. You can click the icon above the serial number to hide the Quick Analysis pane. You can also click the **Eye** icon to perform quick analysis based on the **Current Time Zone** and **Current Search** conditions.

Quick analysis

Data of the text type

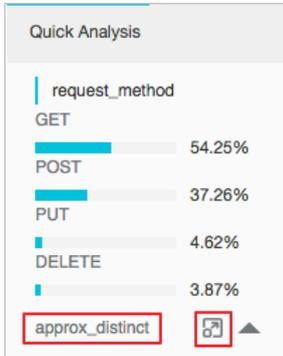

- Group and analyze log data

Click the **Eye** icon next to a `text` field to group the first 100,000 field values and return the percentages of the top 10 groups.

The following statement is used:

```
$Search | select ${keyName} , pv, pv *1.0/sum(pv) over() as percentage from( select count(1) as pv , "${keyName}" from (select "${keyName}" from log limit 100000) group by "${keyName}" order by pv desc) order by pv desc limit 10
```

The following figure shows the grouping and analytics result of the `request_method` field. `GET` requests account for the majority of requests.

- Calculate the number of unique values in a field

Under the target fields in the **Quick Analysis** pane, click **Count Distinct Values** to calculate the number of unique values in the `${keyName}` field.

- Fill the Search & Analyze search box with the grouping and analytics statement

Click the **Count Distinct Values** button on the right of the  icon. The Search & Analyze search box is filled with the grouping and analytics statement. You can edit the statement.

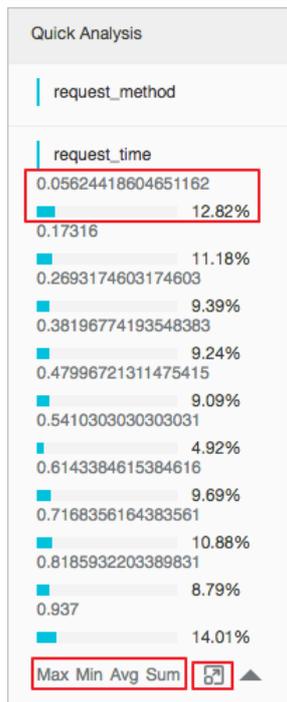

Data of the long and double types

- Display approximate distribution by using histograms

The number of `long` and `double` field values is large. The preceding grouping and analytics method is not suitable for the long and double data types. You can use the following statement to divide field values into 10 groups and display the approximate distribution of the values in a histogram:

```
$Search | select numeric_histogram(10, ${keyName})
```

The following figure shows the approximate distribution of the values in the `request_time` field. The largest percentage of request time is distributed around 0.059 seconds.

- Perform quick analysis by using the `Max` , `Min` , `Avg` , and `Sum` functions
 You can click `Max` under a field to search for the maximum value, `Min` to search for the minimum value, `Avg` to calculate the average value, and `Sum` to calculate the sum of the values.
- Fill the Search & Analyze search box with the query statement of the histogram approximate distribution
 Click the  icon next to `Sum` . The Search & Analyze search box is filled with the query statement of the histogram approximate distribution. You can edit the statement.

30.4.7.7. Other features

Log Service allows you to query log data by using various statements. It also provides many features for data search and analysis. This topic describes the raw log query, chart, saved search, dashboard, quick analysis, and alert features that Log Service supports.

Raw log query

After the index feature is enabled, enter one or more keywords in the search box and set the query time range. Then, click `Search & Analyze` to view the number of log entries displayed in a histogram, the raw logs, and the available charts.

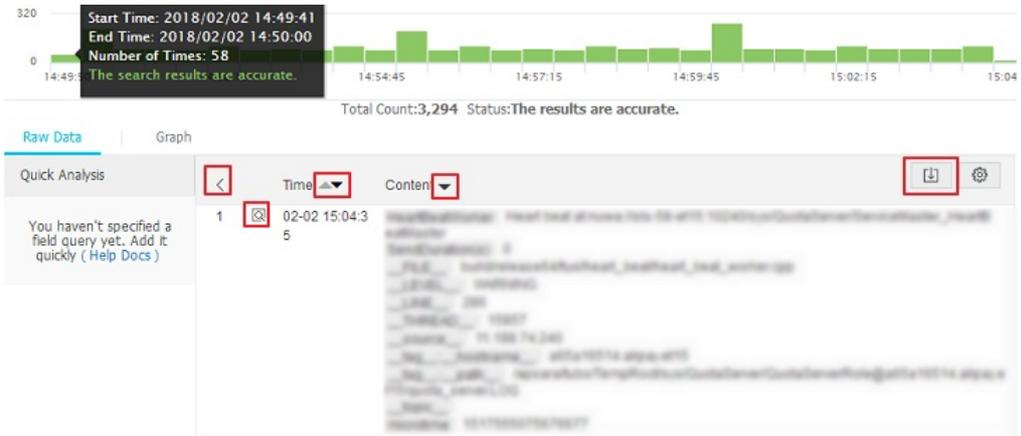

The histogram shows the time-based distribution of log entry occurrences. In the histogram, you can view the changes in the number of matched log entries over a period of time. You can click a rectangular to view the information about the occurrences within the specified time.

On the Raw Logs tab, you can view the matched log data in chronological order.

- You can click the triangle symbol next to `Time` to switch between the chronological order and reverse chronological order.
- You can click `Display Content Column` and then you can select `New Line` or `Full Line` to display the log entries. You can also set `Truncate Character String`.
- You can click the keyword of a field value in the log content to view all log entries that contain this keyword.

- You can click the  icon in the upper-right corner of the Raw Logs tab to download the query results in the CSV format. You can also click **Column Settings** to select fields from the displayed raw log entries. This provides you with an easier way to view target field values of each raw log entry in new columns.
- You can click **Context View** to view the 15 log entries before and after the current log entry in a log file. For more information, see [Contextual query](#).

Note The contextual query feature applies only to the data that is uploaded by using Logtail.

Charts

After you have enabled the index feature and entered a search and analytic statement, you can select a chart on the **Graph** tab to visualize the query results.

- Multiple types of charts are provided, such as the table and line chart. You can select a chart type and configure the chart based on your business requirements.
- You can add charts to a dashboard. For more information, see [Create and delete a dashboard](#).
- You can configure drill-down analysis for a chart. After you add a chart to a dashboard, you can click the chart data to trigger a drill down event and explore in-depth details about the data. For more information about how to configure drill-down analysis, see [Drill-down analysis](#).

Dashboards

Log Service provides the dashboard feature that can visualize the results of search and analytic statements. For more information, see [Create and delete a dashboard](#).

Alerts

Log Service allows you to configure alerts for your dashboard or the charts on your dashboard. You can configure rules to receive alerts from Log Service.

For more information, see [Configure alerts](#).

30.4.8. Analysis grammar

30.4.8.1. General aggregate functions

This topic describes the syntax and examples of general aggregate functions.

The search and analytics feature of Log Service allows you to use general aggregate functions for log analysis. The following table describes the supported general aggregate functions.

Function	Description	Example
<code>arbitrary(x)</code>	Returns a random value from among the values in the x field.	<code>latency > 100 select arbitrary(method)</code>
<code>avg(x)</code>	Returns the arithmetic mean of all values in the x field.	<code>latency > 100 select avg(latency)</code>
<code>checksum(x)</code>	Returns a Base64-encoded checksum of the values of the x field.	<code>latency > 100 select checksum(method)</code>
<code>count(*)</code>	Calculates the number of values of a field.	-
<code>count(x)</code>	Counts the number of non-null values of the x field.	<code>latency > 100 select count(method)</code>
<code>count(digit)</code>	Counts the number of values of a field. The <code>count(digit)</code> function is equivalent to the <code>count(1)</code> and <code>count(*)</code> functions.	-
<code>count_if(x)</code>	Returns the number of the occurrences of the TRUE value.	<code>latency > 100 select count_if(url like '%abc')</code>
<code>geometric_mean(x)</code>	Returns the geometric mean of the values in the x field.	<code>latency > 100 select geometric_mean(latency)</code>
<code>max_by(x,y)</code>	Returns the value of the x field that corresponds to the maximum value of the y field.	<code>* select min_by(method,latency,3)</code> : queries the method that corresponds to the maximum latency.
<code>max_by(x,y,n)</code>	Returns n values of the x field that corresponds to the n largest value of the y field.	<code>* select min_by(method,latency,3)</code> : queries the three methods that corresponds to the three maximum latencies.
<code>min_by(x,y)</code>	Returns the value of the x field that corresponds to the smallest value of the y field.	<code>* select min_by(x,y)</code> : queries the method that corresponds to the minimum latency.
<code>min_by(x,y,n)</code>	Returns n values of the x field that corresponds to the n smallest values of the y field.	<code>* select min_by(method,latency,3)</code> : queries the three methods that corresponds to the three minimum latencies.
<code>max(x)</code>	Returns the maximum value among all values in the x field.	<code>latency > 100 select max(inflow)</code>
<code>min(x)</code>	Returns the minimum value among all values in the x field.	<code>latency > 100 select min(inflow)</code>
<code>sum(x)</code>	Returns the sum among all values in the x field.	<code>latency > 10 select sum(inflow)</code>

Function	Description	Example
<code>bitwise_and_agg(x)</code>	Returns the bitwise AND of all values in the x field in two's complement representation.	-
<code>bitwise_or_agg(x)</code>	Returns the bitwise OR of all values in the x field in two's complement representation.	-

30.4.8.2. Security check functions

Security check functions in Log Services are designed based on the globally shared WhiteHat Security asset library. This topic describes security check functions that you can use to check whether an IP address, domain name, or URL in logs is secure.

Scenarios

- O&M personnel of enterprises and institutions in Internet, gaming, information, and other industries that require robust O&M services can use security check functions to identify suspicious requests or attacks. They can also use the functions to implement in-depth analysis and defend against potential attacks.
- O&M personnel of enterprises and institutions in banking, securities, e-commerce, and other industries that require strong protection for internal assets can use security check functions to identify requests to suspicious websites and downloads initiated by trojans. Then the O&M personnel can take immediate actions to prevent potential losses.

Features

- **Reliability:** built upon the globally shared WhiteHat Security asset library that is updated in a timely manner.
- **Efficiency:** capable of screening millions of IP addresses, domain names, and URLs within seconds.
- **Ease of use:** supports the analysis of network logs by using the `security_check_ip`, `security_check_domain`, and `security_check_url` functions.
- **Flexibility:** supports interactive queries, report creation, and alert configurations and subsequent actions.

Functions

Function	Description	Example
<code>security_check_ip</code>	<p>Checks whether an IP address is secure.</p> <ul style="list-style-type: none"> • The value 1 indicates that the specified IP address is suspicious. • The value 0 indicates that the specified IP address is secure. 	<pre>select security_check_ip(real_client_ip)</pre>
<code>security_check_domain</code>	<p>Checks whether a domain name is secure.</p> <ul style="list-style-type: none"> • The value 1 indicates that the specified domain name is suspicious. • The value 0 indicates that the specified domain name is secure. 	<pre>select security_check_domain(site)</pre>

Function	Description	Example
security_check_url	<p>Checks whether a URL is secure.</p> <ul style="list-style-type: none"> The value 1 indicates that the specified URL is suspicious. The value 0 indicates that the specified URL is secure. 	<pre>select security_check_domain(concat(host, url))</pre>

Examples

- Check external suspicious requests and generate reports

For example, an e-commerce enterprise collects logs from its NGINX servers and wants to scan suspicious client IP addresses. To do this, the enterprise can pass the ClientIP field in logs that are collected from the NGINX servers to the `security_check_ip` function and filter out IP addresses associated with the returned value 1. Then the enterprise can query the countries where the IP addresses are located and ISPs to which the IP addresses belong.

SQL statement for this scenario:

```
* | select ClientIP, ip_to_country(ClientIP) as country, ip_to_provider(ClientIP) as provider, count(1) as PV where security_check_ip(ClientIP) = 1 group by ClientIP order by PV desc
```

Display the ISPs and countries in a map.

- Check internal suspicious requests and send alerts

For example, a securities operator collects logs of its internal devices that access the Internet through gateways. To check requests to suspicious websites, the operator can run the following statement:

```
* | select client_ip, count(1) as PV where security_check_ip(remote_addr) = 1 or security_check_site(site) = 1 or security_check_url(concat(site, url)) = 1 group by client_ip order by PV desc
```

The operator can save this statement as a saved search and configure an alert. An alert is triggered when a client frequently accesses suspicious websites. The statement in the alert can be configured to run every five minutes to check if a client has frequently (more than five times) accessed suspicious websites in the past one hour. The following figure shows the configurations of an alert.

30.4.8.3. Map functions

This topic describes the syntax and examples of map functions.

The following table describes the supported map functions.

Function	Description	Example
Subscript operator []	Retrieves the value corresponding to a specified key from a map.	-
histogram(x)	Groups the values of the parameter x and calculates the number of occurrences of each value. The syntax is equivalent to <code>select count group by x</code> .	The statement <code>latency > 10 select histogram(status)</code> is equivalent to the statement <code>latency > 10 select count(1) group by status</code> .

🔍 Note The returned data is in the JSON format.

Function	Description	Example
<code>histogram_u(x)</code>	<p>Groups the values of the parameter <code>x</code> and calculates the number of occurrences of each value.</p> <p> Note The returned data is in the format of multiple rows and columns.</p>	<p>The statement <code>latency > 10 select histogram_u(status)</code> is equivalent to the statement <code>latency > 10 select count(1) group by status</code>.</p>
<code>map_agg(Key,Value)</code>	<p>Returns a random value of the key in the format of a map that consists of key-value pairs.</p>	<pre>latency > 100 select map_agg(method,latency)</pre>
<code>multimap_agg(Key,Value)</code>	<p>Returns all values of the key in the format of a map that consists of key-value pairs.</p>	<pre>latency > 100 select multimap_agg(method,latency)</pre>
<code>cardinality(x) → bigint</code>	<p>Returns the cardinality of the map <code>x</code>.</p>	-
<code>element_at(map <K, V> , key) → V</code>	<p>Returns the value for the specified key.</p>	-
<code>map() → map <unknown, unknown></code>	<p>Returns an empty map.</p>	-
<code>map(array <K> , array <V>) → map <K,V></code>	<p>Returns a map where each key-value pair consists of two elements from two separate arrays.</p>	<pre>SELECT map(ARRAY[1,3], ARRAY[2,4]); - {1 -> 2, 3 -> 4}</pre>
<code>map_from_entries(array <row<K, V>>) → map <K,V></code>	<p>Converts a multi-dimensional array to a map.</p>	<pre>SELECT map_from_entries(ARRAY[(1, 'x'), (2, 'y')]); - {1 -> 'x', 2 -> 'y'}</pre>
<code>map_concat(map1 <K, V> , map2 <K, V> , ..., mapN <K, V>) → map <K,V></code>	<p>Returns a map that is the union of all specified maps. If a key is found in multiple specified maps, the value of the key in the returned map is the value of the key that occurs in the last specified map.</p>	-
<code>map_filter(map <K, V> , function) → map <K,V></code>	<p>For more information, see the <code>map_filter</code> function in Lambda functions.</p>	-
<code>map_keys(x <K, V>) → array <K></code>	<p>Returns an array of keys in the specified map.</p>	-
<code>map_values(x <K, V>) → array <V></code>	<p>Returns an array of values in the specified map.</p>	-

30.4.8.4. Approximate functions

This topic describes the syntax and examples of approximate functions that Log Service supports for log analysis.

The following table describes the supported approximate functions.

Function	Description	Example
<code>approx_distinct(x)</code>	Returns the approximate number of distinct values of the x field.	-
<code>approx_percentile(x,percentage)</code>	Returns the value located at the specified approximate percentage among the sorted values of the x field.	<code>approx_percentile(x,0.5)</code> : returns the median among the sorted values of the x field.
<code>approx_percentile(x,percentages)</code>	Returns values located at multiple specified approximate percentages among the sorted values of the x field. This function works in a similar manner to the <code>approx_percentile(x,percentage)</code> function.	<code>approx_percentile(x,array[0.1,0.2])</code>
<code>numeric_histogram(buckets, Value)</code>	<p>Distributes all values of the <i>Value</i> field into multiple buckets. The <i>buckets</i> parameter specifies the number of buckets.</p> <p>The key of every bucket and the number of values in a bucket are returned. This function is equivalent to <code>select count group by</code> .</p> <p>Note The response is in the JSON format.</p>	<p><code>method:POST select numeric_histogram(10,latency)</code> : distributes the latencies of POST requests into 10 buckets and calculates the number of latencies in each bucket.</p>
<code>numeric_histogram_u(buckets, Value)</code>	<p>Distribute all values of the <i>Value</i> field into multiple buckets. The <i>buckets</i> parameter specifies the number of buckets.</p> <p>The key of every bucket and the number of values in a bucket are returned. This function is equivalent to <code>select count group by</code> .</p> <p>Note The returned data is in the format of multiple rows and columns.</p>	<p><code>method:POST select numeric_histogram(10,latency)</code> : distributes the latency data of POST requests into 10 buckets and calculates the number of latency data in each bucket.</p>

Note The number of values in every bucket is evenly distributed. It is returned along with the average value of all values in a bucket.

30.4.8.5. Mathematical statistics functions

This topic describes the syntax and examples of mathematical statistics functions.

The search and analytics feature of Log Service allows you to use mathematical statistics functions for log analysis. The following table describes the supported mathematical statistics functions.

Function	Description	Example
<code>corr(y, x)</code>	Returns the correlation coefficient of input values. The result ranges from 0 to 1.	<code>latency>100 select corr(latency,request_size)</code>
<code>covar_pop(y, x)</code>	Returns the population covariance of input values.	<code>latency>100 select covar_pop(request_size,latency)</code>
<code>covar_samp(y, x)</code>	Returns the sample covariance of input values.	<code>latency>100 select covar_samp(request_size,latency)</code>
<code>regr_intercept(y, x)</code>	Returns the linear regression intercept of input values. y is the dependent value. x is the independent value.	<code>latency>100 select regr_intercept(request_size,latency)</code>
<code>regr_slope(y,x)</code>	Returns the linear regression slope of input values. y is the dependent value. x is the independent value.	<code>latency>100 select regr_slope(request_size,latency)</code>
<code>stddev(x)</code> or <code>stddev_samp(x)</code>	Returns the sample standard deviation of the values in the x field.	<code>latency>100 select stddev(latency)</code>
<code>stddev_pop(x)</code>	Returns the population standard deviation of the values in the x field.	<code>latency>100 select stddev_pop(latency)</code>
<code>variance(x)</code> or <code>var_samp(x)</code>	Returns the sample variance of the values in the x field.	<code>latency>100 select variance(latency)</code>
<code>var_pop(x)</code>	Returns the population variance of the values in the x field.	<code>latency>100 select variance(latency)</code>

30.4.8.6. Mathematical calculation functions

This topic describes the syntax and examples of mathematical calculation functions.

By including mathematical calculation functions in SQL statements, you can perform mathematical calculation on log query results.

Mathematical operators

Mathematical operators include the plus sign (+), minus sign (-), multiplication sign (*), division sign (/), and percent sign (%). These operators can be used in SELECT statements.

Example:

```
*|select avg(latency)/100 , sum(latency)/count(1)
```

Mathematical calculation functions

Log Service supports the following mathematical calculation functions.

Function	Description
<code>abs(x)</code>	Returns the absolute values of the values in the x field.
<code>cbrt(x)</code>	Returns the cube roots of the values in the x field.
<code>ceiling(x)</code>	Returns the rounded-up nearest integers of the values in the x field.
<code>cosine_similarity(x,y)</code>	Returns the cosine similarity between the sparse vectors x and y.
<code>degrees</code>	Converts angles in radians to degrees.
<code>e()</code>	Returns the Euler's number.
<code>exp(x)</code>	Returns Euler's number raised to the power of the values in the x field.
<code>floor(x)</code>	Returns the rounded-down nearest integers of the values in the x field.
<code>from_base(string,radix)</code>	Returns the radix number representation of a string.
<code>ln(x)</code>	Returns the natural logarithm of x.
<code>log2(x)</code>	Returns the base 2 logarithm of x.
<code>log10(x)</code>	Returns the base 10 logarithm of x.
<code>log(x,b)</code>	Returns the base b logarithm of x.
<code>pi()</code>	Returns the constant Pi.
<code>pow(x,b)</code>	Returns x raised to the power of b.
<code>radians(x)</code>	Converts angle x in degrees to radians.
<code>rand()</code>	Returns a random number.
<code>random(0,n)</code>	Returns a random number from 0 to n (exclusive).
<code>round(x)</code>	Returns x rounded to the nearest integer.
<code>round(x,y)</code>	Returns x rounded to y decimal places. For example, <code>round(1.012345,2) = 1.01</code> .
<code>sqrt(x)</code>	Returns the square root of x.
<code>to_base(x,radix)</code>	Returns the radix number representation of x.
<code>truncate(x)</code>	Returns x rounded to integer by dropping digits after the decimal point.
<code>acos(x)</code>	Returns the arc cosine of x.

Function	Description
<code>asin(x)</code>	Returns the arc sine of x.
<code>atan(x)</code>	Returns the arc tangent of x.
<code>atan2(y,x)</code>	Returns the arc tangent of y/x.
<code>cos(x)</code>	Returns the cosine of x.
<code>sin(x)</code>	Returns the sine of x.
<code>cosh(x)</code>	Returns the hyperbolic cosine of x.
<code>tan(x)</code>	Returns the tangent of x.
<code>tanh(x)</code>	Returns the hyperbolic tangent of x.
<code>infinity()</code>	Returns the value representing positive infinity.
<code>is_infinity(x)</code>	Determines whether x is infinite.
<code>is_finity(x)</code>	Determines whether x is finite.
<code>is_nan(x)</code>	Determines whether x is not-a-number.

30.4.8.7. String functions

This topic describes string functions that Log Service supports for log data search and analytics.

This following table lists the functions and their descriptions.

Function	Description
<code>chr(x)</code>	Converts an integer to an ASCII character. For example, the result of <code>chr(65)</code> is <code>A</code> .
<code>codepoint(x)</code>	Converts an ASCII character to a code point of the integer type. For example, the result of <code>codepoint('A')</code> is <code>65</code> .
<code>length(x)</code>	Returns the length of a string.
<code>levenshtein_distance(string1, string2)</code>	Returns the Levenshtein distance of string1 and string2.
<code>lower(string)</code>	Converts all uppercase characters in a string into lowercase characters.
<code>lpad(string, size, padstring)</code>	Pads a string to the specified size. If the length of the string is shorter than the specified size, padstring is used to left pad the string. If the length of the string is longer than the specified size, the string is truncated with the specified size.

Function	Description
<code>rpad(string, size, padstring)</code>	Right pads a <code>string</code> with the specified padding. The implementation is similar to that of the <code>lpad</code> function.
<code>ltrim(string)</code>	Removes whitespace characters from the left side of a string.
<code>replace(string, search)</code>	Removes all occurrences of a substring <code>search</code> from a string.
<code>replace(string, search,rep)</code>	Replaces all occurrences of a substring <code>search</code> in a string with another substring <code>rep</code> .
<code>reverse(string)</code>	Reverses a string.
<code>rtrim(string)</code>	Removes whitespace characters from the right side of a string.
<code>split(string,delimiter,limit)</code>	Splits a string based on the specified delimiter and returns an array with the maximum number of elements at <code>limit</code> . The index of the first element in the array is 1.
<code>split_part(string,delimiter,offset)</code>	Splits a string based on a delimiter into an array of substrings and returns the element with the index specified by the <code>offset</code> parameter.
<code>split_to_map(string, entryDelimiter, keyValueDelimiter)</code> → <code>map<varchar, varchar></code>	Splits a string based on the <code>entryDelimiter</code> into multiple entries, each of which is then split based on the <code>keyValueDelimiter</code> into a key and value. This function returns a <code>map</code> .
<code>position(substring IN string)</code>	Returns the position of the first occurrence of the specified substring in a string.
<code>strpos(string, substring)</code>	Returns the position of the first occurrence of the specified substring in a string. Positions start with 1. If the substring is found, 0 is returned.
<code>substr(string, start)</code>	Returns a substring from the start position. Positions start with 1.
<code>substr(string, start, length)</code>	Returns a substring of a specified length from start position. Positions start with 1. The <code>length</code> parameter specifies the length of the substring returned.
<code>trim(string)</code>	Removes leading and trailing whitespace characters from a string.
<code>upper(string)</code>	Converts all lowercase characters in a string into uppercase characters.
<code>concat(string,string...)</code>	Concatenates multiple strings into a single string.
<code>hamming_distance (string1,string2)</code>	Returns the Hamming distance of <code>string1</code> and <code>string2</code> .

Note Strings must be enclosed in single quotation marks ('). Double quotation marks (") are used to enclose field names. For example, `a='abc'` indicates `field a = string 'abc'`, and `"a"="abc"` indicates `field a = field abc`.

30.4.8.8. Date and time functions

This topic describes the available time functions, date functions, interval functions, and a time series padding function in Log Service. You can use these functions when you analyze data.

Date and time data types

- **Unix timestamp:** specifies the number of seconds that have elapsed since 1970-01-01 00:00:00 UTC. The value is in the format of an integer. For example, `1512374067` indicates `Mon Dec 4 15:54:27 CST 2017`. The `_time__` field in every log entry is of this type.
- **Timestamp:** specifies the date and time in the format of a string. For example, `2017-11-01 13:30:00`.

Date functions

The following table lists the commonly used date functions that are supported in Log Service.

Function	Description	Example
<code>current_date</code>	Returns the current date.	<code>latency>100 select current_date</code>
<code>current_time</code>	Returns the current time.	<code>latency>100 select current_time</code>
<code>current_timestamp</code>	Returns the current timestamp. This function is equivalent to the combination of the <code>current_date</code> and <code>current_time</code> functions.	<code>latency>100 select current_timestamp</code>
<code>current_timezone()</code>	Returns the current time zone.	<code>latency>100 select current_timezone()</code>
<code>from_iso8601_timestamp(string)</code>	Parses an ISO 8601 formatted string into a timestamp that specifies the time zone.	<code>latency>100 select from_iso8601_timestamp(iso8601)</code>
<code>from_iso8601_date(string)</code>	Parses an ISO 8601 formatted string into a date.	<code>latency>100 select from_iso8601_date(iso8601)</code>
<code>from_unixtime(unixtime)</code>	Parses a Unix timestamp into a timestamp.	<code>latency>100 select from_unixtime(1494985275)</code>
<code>from_unixtime(unixtime,string)</code>	Parses a Unix timestamp into a timestamp based on the time zone that is specified by the string parameter.	<code>latency>100 select from_unixtime(1494985275,'Asia/Shanghai')</code>
<code>localtime</code>	Returns the local time.	<code>latency>100 select localtime</code>
<code>localtimestamp</code>	Returns the local timestamp.	<code>latency>100 select localtimestamp</code>
<code>now()</code>	Returns the current date and time. This function is equivalent to the <code>current_timestamp</code> function.	N/A
<code>to_unixtime(timestamp)</code>	Parses a timestamp into a Unix timestamp.	<code>* select to_unixtime('2017-05-17 09:45:00.848 Asia/Shanghai')</code>

Time functions

The following table lists the time functions that you can use in Log Service to parse time in the formats supported in MySQL, such as %a, %b, and %y.

Function	Description	Example
<code>date_format(timestamp, format)</code>	Formats a timestamp in the specified format.	<code>latency>100 select date_format(date_parse('2017-05-17 09:45:00','%Y-%m-%d %H:%i:%S'), '%Y-%m-%d')</code>
<code>date_parse(string, format)</code>	Parses a formatted string into a timestamp.	<code>latency>100 select date_format(date_parse(time,'%Y-%m-%d %H:%i:%S'), '%Y-%m-%d')</code>

Formats

Format	Description
%a	The week day in abbreviation, such as Sun and Sat.
%b	The month in abbreviation, such as Jan and Dec.
%c	The month in the numeric format. Valid values: 1 to 12.
%D	The day of the month with a suffix, such as 0th, 1st, 2nd, and 3rd.
%d	The day of the month in the numeric format. Valid values: 01 to 31.
%e	The day of the month in the numeric format. Valid values: 1 to 31.
%H	The hour that applies the 24-hour clock convention. Valid values: 00 to 23.
%h	The hour that applies the 12-hour clock convention. Valid values: 01 to 12.
%l	The hour that applies the 12-hour clock convention. Valid values: 1 to 12.
%i	The minute in the numeric format. Valid values: 00 to 59.
%j	The day of the year. Valid values: 001 to 366.
%k	The hour. Valid values: 0 to 23.
%l	The hour. Valid values: 1 to 12.
%M	The month. Valid values: January to December.
%m	The month in the numeric format. Valid values: 01 to 12.
%p	The abbreviation that indicates the morning or afternoon. Valid values: a.m. and p.m..
%r	The time that applies the 12-hour clock convention: <code>hh:mm:ss AM/PM</code> .
%S	The second. Valid values: 00 to 59.
%s	The second. Valid values: 00 to 59.

Format	Description
%T	The time that applies the 24-hour clock convention, formatted in hh:mm:ss .
%U	The week of the year. Sunday is the first day of a week. Valid values: 00 to 53.
%u	The week of the year. Monday is the first day of a week. Valid values: 00 to 53.
%V	The week of the year. Sunday is the first day of a week. This format is used together with %X. Valid values: 01 to 53.
%v	The week of the year. Monday is the first day of a week. This format is used in combination with %x. Valid values: 01 to 53.
%W	The day of the week. Valid values: Sunday to Saturday.
%w	The day of the week. Valid values: 0 to 6. The value 0 indicates Sunday.
%Y	The year in the 4-digit format.
%y	The year in the 2-digit format.
%%	Escapes the second percent sign (%).

Truncation functions

Log Service supports a truncation function, which can truncate a time by the second, minute, hour, day, month, or year. Typically, this function is used for time-based analytics.

- **Syntax**

```
date_trunc(unit, x)
```

- **Parameters**

The value of the x parameter can be a timestamp or Unix timestamp.

The following table lists the values of the unit parameter and the responses when the x parameter is set to 2001-08-22 03:04:05.000 .

Unit	Response
second	2001-08-22 03:04:05.000
minute	2001-08-22 03:04:00.000
hour	2001-08-22 03:00:00.000
day	2001-08-22 00:00:00.000
week	2001-08-20 00:00:00.000
month	2001-08-01 00:00:00.000
quarter	2001-07-01 00:00:00.000
year	2001-01-01 00:00:00.000

- **Example**

The `date_trunc` function is applicable only to analytics at a fixed time interval. To implement analytics at a flexible interval, for example, every 5 minutes, you need to use a `GROUP BY` clause according to the mathematical modulus method.

```
* | SELECT count(1) as pv, __time__ - __time__% 300 as minute5 group by minute5 limit 100
```

In the preceding statement, `%300` indicates that modulo and truncation are performed every 5 minutes.

The following example shows how to use the `date_trunc` function:

```
*|select date_trunc('minute', __time__) as t,
      truncate (avg(latency) ) ,
      current_date
      group by t
      order by t desc
      limit 60
```

Interval functions

Interval functions perform interval-related calculation. For example, you can use interval functions to add or subtract an interval based on a date, or calculate the interval between two dates.

Function	Description	Example
<code>date_add (unit, value, timestamp)</code>	Adds an interval <code>value</code> of the <code>unit</code> type to a <code>timestamp</code> . To subtract an interval, use a negative <code>value</code> .	<code>date_add('day', -7, '2018-08-09 00:00:00')</code> : indicates seven days before August 9.
<code>date_diff(unit, timestamp1, timestamp2)</code>	Returns the time difference between <code>timestamp1</code> and <code>timestamp2</code> expressed in terms of <code>unit</code> .	<code>date_diff('day', '2018-08-02 00:00:00', '2018-08-09 00:00:00') = 7</code>

The following table lists the values of the `unit` parameter that are supported by the interval functions.

Value	Description
millisecond	The millisecond.
second	The second.
minute	The minute.
hour	The hour.
day	The day.
week	The week.
month	The month.
quarter	The quarter, namely, three months.
year	The year.

Time series padding function

The time series padding function is used to pad time series and corresponding data.

Note This function must be used in combination with the `group by time order by time` clause. When used together, the `order by` clause does not support the `desc` sorting method.

• **Syntax**

```
time_series(time_column, window, format, padding_data)
```

• **Parameters**

Parameter	Description
<i>time_column</i>	The name of the time field in a log entry. The default field name is <code>__time__</code> . The field value is of the LONG or TIMESTAMP type.
<i>window</i>	The time window for a data query. It is composed of a number and a unit. Unit: s (seconds), m (minutes), H (hours), and d (days). For example, 2h, 5m, or 3d.
<i>format</i>	The MySQL time format displayed.
<i>padding_data</i>	The content to be added for a time point. Valid values: <ul style="list-style-type: none"> 0: adds 0. null: adds null. last: adds the value corresponding to the last time point. next: adds the value corresponding to the next time point. avg: adds the average value of the last and next values.

• **Example**

The following statement is used to format data every 2 hours:

```
*| select time_series(__time__, '2h', '%Y-%m-%d %H:%i:%s', '0') as stamp, count(*) as num from log group by stamp order by stamp
```

30.4.8.9. URL functions

This topic describes the syntax of URL functions and provides examples.

URL functions extract fields from standard URLs. A standard URL is described as follows:

```
[protocol:][//host[:port]][path][? query][#fragment]
```

Common URL functions

Function	Description	Example	
		Statement	Response
<code>url_extract_fragment(url)</code>	Extracts the fragment identifier from a URL and returns the fragment identifier of the VARCHAR type.	<pre>* select url_extract_fragment('https://sls.console.aliyun.com/#/project/dashboard-demo/categoryList')</pre>	<pre>/project/dashboard-demo/categoryList</pre>

Function	Description	Example	
		Statement	Response
<code>url_extract_host(url)</code>	Extracts the host information from a URL and returns the host information of the VARCHAR type.	<pre>* select url_extract_host('http://www.aliyun.com/product/sls')</pre>	<code>www.aliyun.com</code>
<code>url_extract_parameter(url, name)</code>	Extracts the value of the name parameter in the query from a URL and returns the value of the VARCHAR type.	<pre>* select url_extract_parameter('http://www.aliyun.com/product/sls?userid=testuser','userid')</pre>	<code>testuser</code>
<code>url_extract_path(url)</code>	Extracts the path from a URL and returns the path of the VARCHAR type.	<pre>* select url_extract_path('http://www.aliyun.com/product/sls?userid=testuser')</pre>	<code>/product/sls</code>
<code>url_extract_port(url)</code>	Extracts the port number from a URL and returns the port number of the BIGINT type.	<pre>* select url_extract_port('http://www.aliyun.com:80/product/sls?userid=testuser')</pre>	<code>80</code>
<code>url_extract_protocol(url)</code>	Extracts the protocol from a URL and returns the protocol of the VARCHAR type.	<pre>* select url_extract_protocol('http://www.aliyun.com:80/product/sls?userid=testuser')</pre>	<code>http</code>
<code>url_extract_query(url)</code>	Extracts the query string from a URL and returns the query string of the VARCHAR type.	<pre>* select url_extract_query('http://www.aliyun.com:80/product/sls?userid=testuser')</pre>	<code>userid=testuser</code>
<code>url_encode(value)</code>	Encodes a URL.	<pre>* select url_encode('http://www.aliyun.com:80/product/sls?userid=testuser')</pre>	<code>http%3a%2f%2fwww.aliyun.com%3a80%2fproduct%2fsls%3fuserid%3dtestuser</code>
<code>url_decode(value)</code>	Decodes a URL.	<pre>* select url_decode('http%3a%2f%2fwww.aliyun.com%3a80%2fproduct%2fsls%3fuserid%3dtestuser')</pre>	<code>http://www.aliyun.com:80/product/sls?userid=testuser</code>

30.4.8.10. Regular expression functions

This topic describes the available regular expression functions. You can use these functions when you query and analyze data in Log Service.

A regular expression function parses a string and returns the required substrings.

The following table lists common regular expression functions.

Function	Description	Example
<code>regexp_extract_all(string, pattern)</code>	Returns an array where each element is a substring that matches the regular expression. These substrings derive from the specified string.	The returned result of <code>* SELECT regexp_extract_all('5a 67b 890m', '\d+')</code> is <code>['5','67','890']</code> . The returned result of <code>* SELECT regexp_extract_all('5a 67a 890m', '(\d+)a')</code> is <code>['5a','67a']</code> .
<code>regexp_extract_all(string, pattern, group)</code>	Returns an array where each element is a part of a substring that matches the regular expression. This part is the content in the group parameter value of the <code>()</code> of a substring that derives from the specified string.	The returned result of <code>* SELECT regexp_extract_all('5a 67a 890m', '(\d+)a',1)</code> is <code>['5','67']</code> .
<code>regexp_extract(string, pattern)</code>	Returns the first substring of the specified string that matches the regular expression.	The returned result of <code>* SELECT regexp_extract('5a 67b 890m', '\d+')</code> is <code>'5'</code> .
<code>regexp_extract(string, pattern, group)</code>	Returns a part of the first substring that matches the regular expression. This part is the content in the group parameter value of the <code>()</code> of the substring that derives from the specified string.	The returned result of <code>* SELECT regexp_extract('5a 67b 890m', '(\d+)([a-z]+)',2)</code> is <code>'a'</code> .
<code>regexp_like(string, pattern)</code>	Returns a Boolean value. If the string and its substrings cannot match the regular expression, the value <code>False</code> is returned.	The returned result of <code>* SELECT regexp_like('5a 67b 890m', '\d+m')</code> is <code>True</code> .
<code>regexp_replace(string, pattern, replacement)</code>	Replaces the substrings of the specified string that match the regular expression with the value of the replacement parameter.	The returned result of <code>* SELECT regexp_replace('5a 67b 890m', '\d+', 'a')</code> is <code>'aa ab am'</code> .
<code>regexp_replace(string, pattern)</code>	Removes the substrings of the specified string that match the regular expression. This function is equivalent to <code>regexp_replace(string, pattern, '')</code> .	The returned result of <code>* SELECT regexp_replace('5a 67b 890m', '\d+')</code> is <code>'a b m'</code> .
<code>regexp_split(string, pattern)</code>	Returns an array where each element is a substring of the specified string that is split based on the regular expression.	The returned result of <code>* SELECT regexp_split('5a 67b 890m', '\d+')</code> is <code>['a','b','m']</code> .

30.4.8.11. JSON functions

JSON functions can convert a string into a JSON type and extract JSON fields. The two major JSON data types are map and array. If a string cannot be converted to a value of the JSON type, null value is returned.

For information about how to expand JSON data into multiple rows, see [UNNEST function](#).

The following table lists the JSON functions that Log Service supports:

Function	Description	Example
<code>json_parse(string)</code>	Converts a string to a JSON-formatted data.	<code>SELECT json_parse('[1, 2, 3]') :</code> returns a JSON array.
<code>json_format(json)</code>	Converts JSON-formatted data to a string.	<code>SELECT json_format(json_parse('[1, 2, 3]')) :</code> returns a string.
<code>json_array_contains(json, value)</code>	Determines whether a value exists in a JSON array or in a string that contains a JSON array.	<code>SELECT json_array_contains(json_parse('[1, 2, 3]'), 2)</code> or <code>SELECT json_array_contains('[1, 2, 3]', 2)</code>
<code>json_array_get(json_array, index)</code>	Retrieves the element at the specified index in the JSON array. This function is equivalent to <code>json_array_contains</code> .	<code>SELECT json_array_get(['a', 'b', 'c'], 0):</code> returns 'a'
<code>json_array_length(json)</code>	Returns the length of the JSON array.	<code>SELECT json_array_length('[1, 2, 3]')</code> : returns 3
<code>json_extract(json, json_path)</code>	Extracts a value from a JSON object and returns a JSON object. The <code>json_path</code> expression works in a similar manner to <code>\$.store.book[0].title</code> .	<code>SELECT json_extract(json, '\$.store.book')</code>
<code>json_extract_scalar(json, json_path)</code>	Returns a string. This function works in a similar manner to <code>json_extract</code> .	N/A
<code>json_size(json,json_path)</code>	Retrieves the length of a JSON object or array.	<code>SELECT json_size('[1, 2, 3]')</code> : returns 3.

30.4.8.12. Type conversion functions

Type conversion functions convert the data type of a specified value or column in a query.

You can use the index attribute feature of Log Service to set the data type of a field to LONG, DOUBLE, TEXT, or JSON. You can also query fields of various data types, including BIGINT, DOUBLE, VARCHAR, and TIMESTAMP. To query fields of a specific data type, you can use type conversion functions to convert the data type configured in an index into the data type that you use in a query.

Syntax

 **Note** We recommend that you use the `try_cast()` function if a log contains dirty data. Otherwise, a query may fail due to the dirty data.

- Convert the data type of a column of values or a specific value into the specified type in a query. If the data type of a value fails to be converted, the query is terminated.

```
cast([key|value] AS type)
```

- Convert the data type of a column of values or a specific value into the specified type in a query. If the data type of a value fails to be converted, NULL is returned for the value, and the query continues.

```
try_cast([key|value] AS type)
```

Parameter	Description
key	The key of a field whose value data type is to be converted.
value	The field value whose data type is to be converted into the specified type.

Example

- To convert the numeric value 123 to a value of the VARCHAR type, use the following statement:

```
cast(123 AS varchar)
```

- To convert the data type of the uid field values to the VARCHAR type, use the following statement:

```
cast(uid AS varchar)
```

30.4.8.13. IP functions

This topic describes the syntax of IP functions and provides examples.

IP functions can identify whether an IP address is an intranet or Internet IP address. IP functions can also identify the country, province, and city where an IP address resides. For information about geohash functions, see [Geography functions](#).

Function	Description	Example
<code>ip_to_domain(ip)</code>	Identifies whether an IP address is an intranet or Internet IP address. This function returns intranet or internet.	<code>SELECT ip_to_domain(ip)</code>
<code>ip_to_country(ip)</code>	Identifies the country where an IP address resides.	<code>SELECT ip_to_country(ip)</code>
<code>ip_to_province(ip)</code>	Identifies the province where an IP address resides.	<code>SELECT ip_to_province(ip)</code>
<code>ip_to_city(ip)</code>	Identifies the city where an IP address resides.	<code>SELECT ip_to_city(ip)</code>
<code>ip_to_geo(ip)</code>	Identifies the longitude and latitude of the city where an IP address resides. The result is returned in the format of <code>latitude, longitude</code> .	<code>SELECT ip_to_geo(ip)</code>
<code>ip_to_city_geo(ip)</code>	Identifies the longitude and latitude of the city where an IP address resides. Each city has only one longitude and latitude. The result is returned in the format of <code>latitude, longitude</code> .	<code>SELECT ip_to_city_geo(ip)</code>

Function	Description	Example
<code>ip_to_provider(ip)</code>	Identifies the network service provider that assigns an IP address.	<code>SELECT ip_to_provider(ip)</code>
<code>ip_to_country(ip,'en')</code>	Identifies the country where an IP address resides. The function returns a country code.	<code>SELECT ip_to_country(ip,'en')</code>
<code>ip_to_country_code(ip)</code>	Identifies the country where an IP address resides. The function returns a country code.	<code>SELECT ip_to_country_code(ip)</code>
<code>ip_to_province(ip,'en')</code>	Identifies the province where an IP address resides.	<code>SELECT ip_to_province(ip,'en')</code>
<code>ip_to_city(ip,'en')</code>	Identifies the city where an IP address resides.	<code>SELECT ip_to_city(ip,'en')</code>

Example

- To query the number of requests that are not sent from an intranet, run the following statement:

```
* | SELECT count(1) where ip_to_domain(ip)! ='intranet'
```

- To query the top 10 provinces from which requests are sent, run the following statement:

```
* | SELECT count(1) as pv, ip_to_province(ip) as province GROUP BY province order by pv desc limit 10
```

Sample response

```
[
  {
    "__source__": "",
    "__time__": "1512353137",
    "province": "Zhejiang",
    "pv": "4045"
  }, {
    "__source__": "",
    "__time__": "1512353137",
    "province": "Shanghai",
    "pv": "3727"
  }, {
    "__source__": "",
    "__time__": "1512353137",
    "province": "Beijing",
    "pv": "954"
  }, {
    "__source__": "",
    "__time__": "1512353137",
    "province": "intranet IP address",
    "pv": "698"
  }, {
    "__source__": "",
    "__time__": "1512353137",
    "province": "Guangdong",
    "pv": "472"
  }, {
    "__source__": "",
    "__time__": "1512353137",
    "province": "Fujian",
    "pv": "71"
  }
]
```

The response contains an intranet IP address. You can use the `SELECT` statement to filter requests that are sent from the IP address.

- To query the top 10 provinces from which intranet requests are sent, run the following statement:

```
* | SELECT count(1) as pv, ip_to_province(ip) as province WHERE ip_to_domain(ip) != 'intranet' GROUP BY province ORDER BY pv desc limit 10
```

- To query the average request latency, the maximum request latency, and the request with the maximum latency from each country, run the following statement:

```
* | SELECT AVG(latency),MAX(latency),MAX_BY(requestId, latency) ,ip_to_country(ip) as country group by country limit 100
```

- To query the average latency of requests supported by each network service provider, run the following statement:

```
* | SELECT AVG(latency) , ip_to_provider(ip) as provider group by provider limit 100
```

- To query the longitude and latitude of the city to which an IP address belongs and show the city on a map, run the following statement:

```
* | SELECT count(1) as pv , ip_to_geo(ip) as geo group by geo order by pv desc
```

The following table shows the format of the result.

pv	geo
100	35.3284,-80.7459

30.4.8.14. GROUP BY syntax

This topic describes the GROUP BY syntax.

GROUP BY statements support multiple columns. A GROUP BY statement allows you to specify a column alias in a SELECT statement to as the corresponding KEY.

Example:

```
method:PostLogstoreLogs |select avg(latency),projectName,date_trunc('hour',__time__) as hour group by projectName, hour
```

The hour alias indicates the third SELECT column `date_trunc('hour',__time__)` . This improves the performance of complicated queries.

The GROUP BY statement supports the GROUPING SETS, CUBE, and ROLLUP clauses.

Example:

```
method:PostLogstoreLogs |select avg(latency) group by cube(projectName,logstore)
method:PostLogstoreLogs |select avg(latency) group by GROUPING SETS ( ( projectName,logstore), (projectName,method))
method:PostLogstoreLogs |select avg(latency) group by rollup(projectName,logstore)
```

Examples

- Use GROUP BY based on time

Each log has a built-in time column named `__time__` . When the analytics feature is enabled on one of the columns, the statistics of the time column are included.

The `date_trunc` function can truncate the time column to minute, hour, day, month, and year. The `date_trunc` function accepts an aligned unit and a column of the Unix timestamp type, such as `__time__` .

- PV statistics per hour and per minute

```
* | SELECT count(1) as pv , date_trunc('hour',__time__) as hour group by hour order by hour limit 100
* | SELECT count(1) as pv , date_trunc('minute',__time__) as minute group by minute order by minute limit 100
```

 **Note** 100 specifies that up to 100 rows can be retrieved. If a LIMIT clause is not specified, up to 10 rows of data are retrieved by default.

- `date_trunc` functions are available only for statistics at a fixed time interval. For statistics based on flexible time dimensions, for example, every 5 minutes, run a `GROUP BY` statement based on the mathematical modulus method.

```
* | SELECT count(1) as pv, __time__ - __time__% 300 as minute5 group by minute5 limit 100
```

In the preceding statement, `%300` indicates that the time is truncated in mod every 5 minutes.

- Retrieve non-aggregation columns from a `GROUP BY` statement

In standard SQL, if a `GROUP BY` statement is used during the `SELECT` operation, Log Service selects only the raw data of the column specified in the `GROUP BY` statement or performs aggregation on any columns.

For example, the following statement is invalid. Log Service cannot determine which row of `b` to return during the `GROUP BY` operation based on `a`, because `b` is not a `GROUP BY` column.

```
*|select a, b , count(c) group by a
```

Instead, you can use the `arbitrary()` function to return `b`.

```
*|select a, arbitrary(b), count(c) group by a
```

30.4.8.15. Window functions

This topic describes the syntax for window functions.

Window functions are used to perform calculations across rows of a log. Common SQL aggregate functions calculate the results of only one row or aggregate all rows into one row for calculation. Window functions support cross-row calculation and fill the calculation results in each row.

Syntax for window functions is

```
SELECT key1, key2, value,
       rank() OVER (PARTITION BY key2
                   ORDER BY value DESC) AS rnk
FROM orders
ORDER BY key1,rnk
```

The important part is

```
rank() OVER (PARTITION BY KEY1 ORDER BY KEY2 DESC)
```

`rank()` is an aggregate function. You can use any functions in analysis syntax or the function listed in this topic. `PARTITION BY` indicates the buckets based on which values are calculated.

Special aggregate functions used in windows

Function	Description
<code>rank()</code>	Returns the rank of a value within a group of values. The rank is one plus the number of preceding rows that are not peers of the current row.
<code>row_number()</code>	Returns a unique, sequential number for each row.
<code>first_value(x)</code>	Returns the first value of the window. In most cases, the function is used to obtain the maximum value after the values of the window are sorted.

Function	Description
last_value(x)	Returns the last value of the window. In most cases, the function is used to obtain the minimum value after the values of the window are sorted.
nth_value(x, offset)	Returns the value at the specified offset from the beginning of the window.
lead(x,offset,default_value)	Returns the value at offset rows after the current row in the window. If the target row does not exist, the default_value is returned.
lag(x,offset,default_value)	Returns the value at offset rows after the current row in the window. If the target row does not exist, the default_value is returned.

Example

- Rank the salaries of employees in their respective departments

```
* | select department, persionId, sallary , rank() over(PARTITION BY department order by sallary desc) as sallary_rank
k order by department,sallary_rank
```

Results

department	persionId	sallary	sallary_rank
dev	john	9000	1
dev	Smith	8000	2
dev	Snow	7000	3
dev	Achilles	6000	4
Marketing	Blan Stark	9000	1
Marketing	Rob Stark	8000	2
Marketing	Sansa Stark	7000	3

- Calculate the salaries of employees as percentages in their respective departments

```
* | select department, persionId, sallary *1.0 / sum(sallary) over(PARTITION BY department ) as sallary_percentage
```

Results

department	persionId	sallary	sallary_percentage
dev	john	9,000	0.3
dev	Smith	8,000	0.26
dev	Snow	7000	0.23
dev	Achilles	6000	0.2
Marketing	Blan Stark	9000	0.375
Marketing	Rob Stark	8000	0.333

department	persionId	sallary	sallary_percentage
Marketing	Sansa Stark	7000	0.29

- Calculate the daily UV increase over the previous day

```
* | select day ,uv, uv *1.0 /(lag(uv,1,0) over() ) as diff_percentage from
(
select approx_distinct(ip) as uv, date_trunc('day',__time__) as day from log group by day order by day asc
)
```

Results

day	uv	diff_percentage
2017-12-01 00:00:00	100	null
2017-12-02 00:00:00	125	1.25
2017-12-03 00:00:00	1,500	1.2
2017-12-04 00:00:00	175	1.16
2017-12-05 00:00:00	2,000	1.14
2017-12-06 00:00:00	225	1.125
2017-12-07 00:00:00	250	1.11

30.4.8.16. HAVING syntax

This topic describes the HAVING syntax.

The LogSearch/Analytics feature of Log Service supports the standard SQL HAVING clause. The HAVING clause is used with the GROUP BY statement to filter GROUP BY results.

Example:

```
method :PostLogstoreLogs |select avg(latency),projectName group by projectName HAVING avg(latency) > 100
```

Difference between HAVING and WHERE clauses

The HAVING clause is used to filter the aggregation and calculation results after you run the GROUP BY statement. The WHERE clause is used to filter the raw data during the aggregation calculation.

Example

Calculate the average rainfall of each province where the temperature is higher than 10°C, and only show the provinces with average rainfall greater than 100 mL in the final results:

```
* | select avg(rain) ,province where temperature > 10 group by province having avg(rain) > 100
```

30.4.8.17. ORDER BY syntax

This topic describes the ORDER BY syntax.

The ORDER BY keyword is used to sort output results. You can sort output results based on only one column.

- Syntax format

```
order by column name [desc|asc]
```

- Example

```
method :PostLogstoreLogs |select avg(latency) as avg_latency,projectName group by projectName
HAVING avg(latency) > 5700000
order by avg_latency desc
```

30.4.8.18. LIMIT syntax

The LIMIT clause is used to limit the number of returned rows.

Syntax formats

Log Service supports the following LIMIT syntax formats:

- Reads only the first N rows:

```
limit N
```

- Reads N rows starting from the S-th row:

```
limit S , N
```

Note

- If you use the LIMIT clause to paginate results, the final results rather than the intermediate results of the SQL query are obtained.
- You cannot apply the LIMIT clause to subqueries. For example, the following statement is not supported:

```
* | select count(1) from ( select distinct(url) from limit 0,1000)
```

- If you use the LIMIT clause for pagination, the offset value cannot exceed 1,000,000. For example, in the `limit S , N` clause, the sum of S and N cannot exceed 1,000,000, and the value of N cannot exceed 10,000.

Example

- To obtain the first 100 rows of results, run the following statement.

```
* | select distinct(url) from log limit 100
```

- To obtain a total of 1,000 results from row 0 to row 999, run the following statement.

```
* | select distinct(url) from log limit 0,1000
```

- To obtain a total of 1,000 results from row 1,000 to row 1,999, run the following statement:

```
* | select distinct(url) from log limit 1000,1000
```

30.4.8.19. Syntax for CASE statements and if() functions

This topic describes the syntax for CASE statements and if() functions.

CASE statements are used to classify continuous data. For example, you can use the following CASE statement to extract information from `http_user_agent` and classify the information into two types: Android and iOS.

```
SELECT
CASE
WHEN http_user_agent like '%android%' then 'android'
WHEN http_user_agent like '%ios%' then 'ios'
ELSE 'unknown' END
as http_user_agent,
count(1) as pv
group by http_user_agent
```

Examples

- Calculate the ratio of requests whose status code is 200 to all requests

```
* | SELECT
sum(
CASE
WHEN status =200 then 1
ELSE 0 end
) *1.0 / count(1) as status_200_percentage
```

- Calculate the distribution of latencies

```
* | SELECT `
CASE
WHEN latency < 10 then 's10'
WHEN latency < 100 then 's100'
WHEN latency < 1000 then 's1000'
WHEN latency < 10000 then 's10000'
else 's_large' end
as latency_slot,
count(1) as pv
group by latency_slot
```

Syntax for if() functions

An if() function works in the same way as a CASE statement does.

```
CASE
WHEN condition THEN true_value
[ ELSE false_value ]
END
```

- if(condition, true_value)

If the condition is true, the true_value column is returned. Otherwise, null is returned.
- if(condition, true_value, false_value)

If the condition is true, the true_value column is returned. Otherwise, the false_value column is returned.

Syntax for coalesce() functions

A coalesce() function returns the first non-null value from multiple columns.

```
COALESCE (value1, value2 [...])
```

Syntax for the nullif() function

If value1 is equal to value2, null is returned. Otherwise, value1 is returned.

```
nullif(value1, value2)
```

Syntax for the try() function

The try() function catches underlying exceptions, such as division by zero errors, and returns null.

```
try(expression)
```

30.4.8.20. Nested subqueries

This describes how to use nested subqueries when you query logs.

You can use nested queries to perform more complicated queries.

Nested queries differ from non-nested queries in the need for specifying the FROM clause in the SQL statement. You must specify the `from log` keyword in each SQL statement to read raw data from logs.

Example:

```
* | select sum(pv) from
(
  select count(1) as pv from log group by method
)
```

30.4.8.21. Array functions

This topic describes the syntax of array functions. It also provides examples that show how to use these functions.

Function	Description	Example
Subscript operator []	The subscript operator [] is used to obtain an element in the array.	N/A
array_distinct	Returns the distinct elements in the array.	N/A
array_intersect(x, y)	Returns the intersection of the x and y arrays.	N/A
array_union(x, y) → array	Returns the union of the x and y arrays.	N/A
array_except(x, y) → array	Returns the subtraction of the x and y arrays.	N/A

Function	Description	Example
<code>array_join(x, delimiter, null_replacement) → varchar</code>	<p>Joins string arrays with the delimiter into a string and replaces null values with <code>null_replacement</code>.</p> <p> Note The maximum size of the returned result of this <code>array_join</code> function is 1 KB. If the returned result exceeds 1 KB, the extra data will be truncated.</p>	N/A
<code>array_max(x) → x</code>	Returns the maximum value in the <code>x</code> array.	N/A
<code>array_min(x) → x</code>	Returns the minimum value in the <code>x</code> array.	N/A
<code>array_position(x, element) → bigint</code>	Returns the subscript of the element in the <code>x</code> array. The subscript starts from 1. The value 0 is returned if no subscript is found.	N/A
<code>array_remove(x, element) → array</code>	Removes the element from the array.	N/A
<code>array_sort(x) → array</code>	Sorts the array and moves null values to the end.	N/A
<code>cardinality(x) → bigint</code>	Returns the array size.	N/A
<code>concat(array1, array2, ..., arrayN) → array</code>	Concatenates arrays.	N/A
<code>contains(x, element) → boolean</code>	Returns true if the <code>x</code> array contains the specified element.	N/A
<code>filter(array, function) → array</code>	For more information about this Lambda function, see the <code>filter()</code> function in Lambda functions .	N/A
<code>flatten(x) → array</code>	Flattens an <code>array(array(T))</code> to an <code>array(T)</code> by concatenating the contained arrays.	N/A
<code>reduce(array, initialState, inputFunction, outputFunction) → x</code>	For more information, see the <code>reduce()</code> function in Lambda functions .	N/A
<code>reverse(x) → array</code>	Returns an array that has the reversed order of the <code>x</code> array.	N/A
<code>sequence(start, stop) → array</code>	Generates a sequence of elements from <code>start</code> to <code>stop</code> . The difference between elements is 1.	N/A
<code>sequence(start, stop, step) → array</code>	Generates a sequence of elements from <code>start</code> to <code>stop</code> . The difference between elements is <code>step</code> .	N/A

Function	Description	Example
<code>sequence(start, stop, step) → array</code>	Generates a sequence of timestamps from start to stop. The difference between timestamps is step. The type of step can be either INTERVAL DAY TO SECOND or INTERVAL YEAR TO MONTH.	N/A
<code>shuffle(x) → array</code>	Shuffles the array.	N/A
<code>slice(x, start, length) → array</code>	Returns a subset of the x array starting from the start value with the specified length.	N/A
<code>transform(array, function) → array</code>	For more information, see the <code>transform()</code> function in Lambda functions .	N/A
<code>zip(array1, array2[, ...]) → array</code>	Merges the specified arrays. The M-th element of the N-th argument will be the N-th field of the M-th output element.	<pre>SELECT zip(ARRAY[1, 2], ARRAY['1b', null, '3b']); -- [ROW(1, '1b'), ROW(2, null), ROW(null, '3b')]</pre>
<code>zip_with(array1, array2, function) → array</code>	For more information, see the <code>zip_with()</code> function in Lambda functions .	N/A
<code>array_agg (key)</code>	An aggregate function that returns an array from values in the key column.	<pre>* select array_agg(key)</pre>
<code>array_transpose(array[array[x,y,z], array[a,b,c]])</code>	Returns a new matrix by transposing the values of the previous matrix from rows to columns.	N/A

30.4.8.22. Binary string functions

This topic describes the syntax of binary string functions. It also provides examples that show how to use these functions.

Data of the VARBINARY type is different from data of the VARCHAR type.

Function	Description
Concatenation operator ()	The result of <code>a b</code> is <code>ab</code> .
<code>length(binary) → bigint</code>	Returns the length in binary.
<code>concat(binary1, ..., binaryN) → varbinary</code>	Connects the binary strings, which is equivalent to .
<code>to_base64(binary) → varchar</code>	Converts a binary string to a Base64 string.
<code>from_base64(string) → varbinary</code>	Converts a Base64 string to a binary string.
<code>to_base64url(binary) → varchar</code>	Converts a string to a URL-safe Base64 string.
<code>from_base64url(string) → varbinary</code>	Converts a URL-safe Base64 string to a binary string.
<code>to_hex(binary) → varchar</code>	Converts a binary string to a hexadecimal string.

Function	Description
<code>from_hex(string) → varbinary</code>	Converts a hexadecimal string to a binary string.
<code>to_big_endian_64(bigint) → varbinary</code>	Convert a number to a binary string in big endian mode.
<code>from_big_endian_64(binary) → bigint</code>	Converts a binary string in big endian mode to a number.
<code>md5(binary) → varbinary</code>	Calculates the MD5 value of a binary string.
<code>sha1(binary) → varbinary</code>	Calculates the SHA1 value of a binary string.
<code>sha256(binary) → varbinary</code>	Calculates the SHA256 hash value of a binary string.
<code>sha512(binary) → varbinary</code>	Calculate the SHA512 value of a binary string.
<code>xxhash64(binary) → varbinary</code>	Calculates the xxhash64 value of a binary string.

30.4.8.23. Bitwise operations

This topic describes the syntax for bitwise operations. It also provides examples that show how to use these operations.

Function	Description	Example
<code>bit_count(x, bits) → bigint</code>	Count the number of 1 in the binary expression of x.	<pre>SELECT bit_count(9, 64); — 2</pre> <pre>SELECT bit_count(9, 8); — 2</pre> <pre>SELECT bit_count(-7, 64); — 62</pre> <pre>SELECT bit_count(-7, 8); — 6</pre>
<code>bitwise_and(x, y) → bigint</code>	Perform the AND operation on x and y in the binary form.	N/A
<code>bitwise_not(x) → bigint</code>	Calculate the opposite values of all bits of x in the binary form.	N/A
<code>bitwise_or(x, y) → bigint</code>	Perform the OR operation on x and y in the binary form.	N/A
<code>bitwise_xor(x, y) → bigint</code>	Perform the XOR operation on x and y in the binary form.	N/A

30.4.8.24. Interval-valued comparison and periodicity-valued comparison functions

Log Service allows you to use interval-valued comparison and periodicity-valued comparison functions to query and analyze log data.

You can use the functions to compare the value for one period with that for a previous period.

Function	Description	Example
----------	-------------	---------

Function	Description	Example
<pre>compare(value, time_window)</pre>	<p>This function compares the value calculated for the current period with that calculated for the period before time_window.</p> <p>The data type of the values to be compared is Double or Long. The time_window parameter is measured in seconds. This function returns an array.</p> <p>Possible return values include the value for the current period, the value for the period before time_window, and the ratio of the current value to the value before time_window.</p>	<pre>* select compare(pv , 86400) from (select count(1) as pv from log)</pre>
<pre>compare(value, time_window1, time_window2)</pre>	<p>This function compares the current value with the values for periods before time_window1 and time_window2. The comparison results are in the JSON array format, where the values must be returned in the following order: [current value, value before time_window1, value before time_window2, current value/value before time_window1, current value/value before time_window2].</p>	<pre>* select compare(pv, 86400, 172800) from (select count(1) as pv from log)</pre>
<pre>compare(value, time_window1, time_window2, time_window3)</pre>	<p>This function compares the value for the current period with the values for periods before time_window1, time_window2, and time_window3. The comparison results are in the JSON array format, where the values must be returned in the following order: [current value, value before time_window1, value before time_window2, value before time_window3, current value/value before time_window1, current value/value before time_window2, current value/value before time_window3].</p>	<pre>* select compare(pv, 86400, 172800,604800) from (select count(1) as pv from log)</pre>

Function	Description	Example
<code>ts_compare(value, time_window)</code>	<p>This function compares the value for the current period with the values for periods before <code>time_window1</code> and <code>time_window2</code> and returns a JSON array. The comparison results are in the JSON array format, where the values must be returned in the following order: [current value, value before <code>time_window1</code>, current value/value before <code>time_window1</code>, Unix timestamp that indicates the start time of the previous period].</p> <p>This function is used to compare time series values. You must specify the <code>GROUP BY</code> keyword for the time column in SQL statements.</p>	<p>For example, <code>* select t, ts_compare(pv, 86400) as d from(select date_trunc('minute',__time__) as t, count(1) as pv from log group by t order by t) group by t</code> specifies that the function compares the calculation result of every minute in the current period with that of every minute in the last period.</p> <p>The comparison result is <code>d: [1251.0,1264.0, 0.9897151898734177, 1539843780.0,1539757380.0]t:2018-10-19 14:23:00.000</code> .</p>

Examples

- Calculate the ratio of the PV for an hour on a day to that for the same time period on a previous day. The start time is 2018-07-25 14:00:00, and the end time is 2018-07-25 15:00:00.

Statement for query and analysis:

```
* | select compare( pv , 86400) from (select count(1) as pv from log)
```

In the preceding statement, 86400 indicates 86,400 seconds before the current period.

Return results:

```
[9.0,19.0,0.47368421052631579]
```

In the preceding results,

- 9.0 is the PV for the period from 2018-07-25 14:00:00 to 2018-07-25 15:00:00.
- 19.0 is the PV for the period from 2018-07-24 14:00:00 to 2018-07-24 15:00:00.
- 0.47368421052631579 is the ratio of the PV for the current period to that for a previous period.

If you want to expand the array into three columns of numbers, the analysis statement is

```
* | select diff[1],diff[2],diff[3] from(select compare( pv , 86400) as diff from (select count(1) as pv from log))
```

- Calculate the PV ratio for every minute of the current hour to that in the same time period as the day before, and output the results in a line chart.

- Calculate the PV ratio for every minute of the current hour to that in the same time period as the day before. The start time is 2018-07-25 14:00:00, and the end time is 2018-07-25 15:00:00.

Statement for query and analysis:

```
* | select t, compare( pv , 86400) as diff from (select count(1) as pv, date_format(from_unixtime(__time__), '%H:%i') as t from log group by t) group by t order by t
```

Return results:

t	diff
14:00	[9520.0,7606.0,1.2516434393899554]

t	diff
14:01	[8596.0,8553.0,1.0050274757395066]
14:02	[8722.0,8435.0,1.0340248962655603]
14:03	[7499.0,5912.0,1.2684370771312586]

In the preceding table, t indicates the time in the format of Hour:Minute . The contents of the diff column are included in an array that contains the following values:

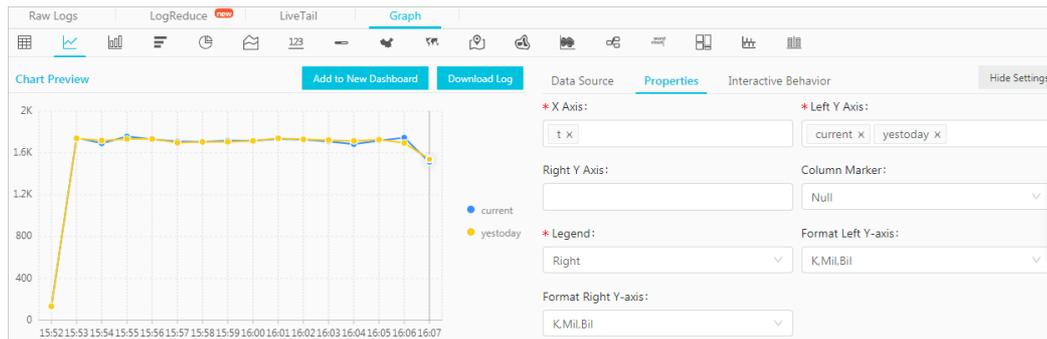

- The PV value of the current period.
- The PV value of the previous period.
- The ratio of the PV value for the current period to that for the previous period.

ii. To show the query results in a line chart, use the following statement:

```
*|select t, diff[1] as current, diff[2] as yestoday, diff[3] as percentage from(select t, compare( pv , 86400) as diff from (select count(1) as pv, date_format(from_unixtime(__time__), '%H:%i') as t from log group by t) group by t order by t)
```

The two lines indicate the PV values of a day and the day before.

Line chart

30.4.8.25. Comparison functions and operators

This topic describes the comparison functions and operators in Log Service. You can use these functions and operators to query and analyze log data.

Comparison functions and operators

A comparison function compares two parameter values of any comparable data types, such as INTEGER, BIGINT, DOUBLE, and TEXT.

Comparison operators

A comparison operator is used to compare two values. If the statement is true, TRUE is returned. Otherwise, FALSE is returned.

Operator	Description
<	Less than
>	Greater than
<=	Less than or equal to

Operator	Description
>=	Greater than or equal to
=	Equal to
<>	Not equal to
!=	Not equal to

Range operator BETWEEN

The BETWEEN operator determines whether a value falls in a specified closed interval.

- If the value falls in the specified closed interval, TRUE is returned. Otherwise, FALSE is returned.

Example: `SELECT 3 BETWEEN 2 AND 6;` . The statement is true, and TRUE is returned.

The preceding statement is equivalent to `SELECT 3 >= 2 AND 3 <= 6;` .

- The BETWEEN operator can be put behind the NOT operator to test whether a value falls out of a specified closed interval.

Example: `SELECT 3 NOT BETWEEN 2 AND 6;` . The statement is false, and FALSE is returned.

The preceding statement is equivalent to `SELECT 3 < 2 OR 3 > 6;` .

- If any of the three values is NULL, NULL is returned.

IS NULL and IS NOT NULL

The IS NULL and IS NOT NULL operators test whether a value is NULL.

IS DISTINCT FROM and IS NOT DISTINCT FROM

These operators are similar to the EQUAL TO and NOT EQUAL TO operators. However, IS DISTINCT FROM and IS NOT DISTINCT FROM can determine whether a NULL value exists.

Examples:

```
SELECT NULL IS DISTINCT FROM NULL; -- false
SELECT NULL IS NOT DISTINCT FROM NULL; -- true
```

The DISTINCT operator compares parameter values under multiple conditions, as described in the following table.

a	b	a = b	a <> b	a DISTINCT b	a NOT DISTINCT b
1	1	TRUE	FALSE	FALSE	TRUE
1	2	FALSE	TRUE	TRUE	FALSE
1	NULL	NULL	NULL	TRUE	FALSE
NULL	NULL	NULL	NULL	FALSE	TRUE

GREATEST and LEAST

These operators are used to obtain the maximum or minimum value from a row of field values.

Example:

```
select greatest(1,2,3) -- Returns 3.
```

Quantified comparison predicates: ALL, ANY, and SOME

The ALL, ANY, and SOME quantifiers can be used to determine whether a parameter value meets specified conditions.

- ALL is used to determine whether a parameter value meets all conditions. If the statement is true, TRUE is returned. Otherwise, FALSE is returned.
- ANY is used to determine whether a parameter value meets a condition. If the statement is true, TRUE is returned. Otherwise, FALSE is returned.
- SOME is used to determine whether a parameter value meets a condition. SOME is equivalent to ANY.
- ALL, ANY, and SOME must immediately follow comparison operators.

ALL and ANY support comparison under multiple conditions, as described in the following table.

Expression	Description
A = ALL (...)	Returns TRUE if A matches all values.
A <> ALL (...)	Returns TRUE if A does not match a value.
A < ALL (...)	Returns TRUE if A is smaller than the smallest value.
A = ANY (...)	Returns TRUE if A is equal to a value. This statement is equivalent to A IN (...).
A <> ANY (...)	Returns TRUE if A does not match a value.
A < ANY (...)	Returns TRUE if A is smaller than the largest value.

Examples:

```
SELECT 'hello' = ANY (VALUES 'hello', 'world'); -- true
SELECT 21 < ALL (VALUES 19, 20, 21); -- false
SELECT 42 >= SOME (SELECT 41 UNION ALL SELECT 42 UNION ALL SELECT 43); -- true
```

30.4.8.26. Lambda functions

This topic describes Lambda functions and provides some examples. You can use Lambda functions to analyze log data in Log Service

Lambda expressions

Lambda expressions use the arrow operator `->`.

Examples:

```
x -> x + 1
(x, y) -> x + y
x -> regexp_like(x, 'a+')
x -> x[1] / x[2]
x -> IF(x > 0, x, -x)
x -> COALESCE(x, 0)
x -> CAST(x AS JSON)
x -> x + TRY(1 / 0)
```

Most MySQL expressions can be used in Lambda functions.

filter(array<T>, function<T, boolean>) → ARRAY<T>

Returns an array whose elements are filtered from the specified array based on the Lambda expression.

Examples:

```
SELECT filter(ARRAY [], x -> true); -- []
SELECT filter(ARRAY [5, -6, NULL, 7], x -> x > 0); -- [5, 7]
SELECT filter(ARRAY [5, NULL, 7, NULL], x -> x IS NOT NULL); -- [5, 7]
```

map_filter(map<K, V>, function<K, V, boolean>) → MAP<K,V>

Returns a map whose elements are filtered based on the Lambda expression. The map is generated from the map function.

Examples:

```
SELECT map_filter(MAP(ARRAY[], ARRAY[]), (k, v) -> true); -- {}
SELECT map_filter(MAP(ARRAY[10, 20, 30], ARRAY['a', NULL, 'c']), (k, v) -> v IS NOT NULL); -- {10 -> a, 30 -> c}
SELECT map_filter(MAP(ARRAY['k1', 'k2', 'k3'], ARRAY[20, 3, 15]), (k, v) -> v > 10); -- {k1 -> 20, k3 -> 15}
```

reduce(array<T>, initialState S, inputFunction<S, T, S>, outputFunction<S, R>) → R

The reduce function starts from the initial state, traverses each element in the array, and then calls `inputFunction(S,T)` to generate a new state. After all the elements in the array are traversed and the final state is generated, the reduce function calls `outputFunction` to assign the final state value to the result `R` and output the result. The procedure is described as follows:

1. Start from the initial state `S`.
2. Traverse each element `T`.
3. Calculate `inputFunction(S,T)` to generate a new state `S`.
4. Repeat steps 2 and 3 until the last element is traversed and has a new state.
5. Turn the final state `S` into the final result `R`.

Examples:

```
SELECT reduce(ARRAY [], 0, (s, x) -> s + x, s -> s); -- 0
SELECT reduce(ARRAY [5, 20, 50], 0, (s, x) -> s + x, s -> s); -- 75
SELECT reduce(ARRAY [5, 20, NULL, 50], 0, (s, x) -> s + x, s -> s); -- NULL
SELECT reduce(ARRAY [5, 20, NULL, 50], 0, (s, x) -> s + COALESCE(x, 0), s -> s); -- 75
SELECT reduce(ARRAY [5, 20, NULL, 50], 0, (s, x) -> IF(x IS NULL, s, s + x), s -> s); -- 75
SELECT reduce(ARRAY [2147483647, 1], CAST (0 AS BIGINT), (s, x) -> s + x, s -> s); -- 2147483648
SELECT reduce(ARRAY [5, 6, 10, 20], -- calculates arithmetic average: 10.25
  CAST(ROW(0.0, 0) AS ROW(sum DOUBLE, count INTEGER)),
  (s, x) -> CAST(ROW(x + s.sum, s.count + 1) AS ROW(sum DOUBLE, count INTEGER)),
  s -> IF(s.count = 0, NULL, s.sum / s.count));
```

transform(array<T>, function<T, U>) → ARRAY<U>

This Lambda function traverses each element in an array to generate a new result `U`.

Examples:

```
SELECT transform(ARRAY [], x -> x + 1); -- []
SELECT transform(ARRAY [5, 6], x -> x + 1); -- [6, 7] -- Increments each element by 1.
SELECT transform(ARRAY [5, NULL, 6], x -> COALESCE(x, 0) + 1); -- [6, 1, 7]
SELECT transform(ARRAY ['x', 'abc', 'z'], x -> x || '0'); -- ['x0', 'abc0', 'z0']
SELECT transform(ARRAY [ARRAY [1, NULL, 2], ARRAY[3, NULL]], a -> filter(a, x -> x IS NOT NULL)); -- [[1, 2], [3]]
```

zip_with(array<T>, array<U>, function<T, U, R>) → array<R>

This Lambda function merges two arrays and generates the element R in the new array based on element T and element U.

Examples:

```
SELECT zip_with(ARRAY[1, 3, 5], ARRAY['a', 'b', 'c'], (x, y) -> (y, x)) --Transposes the elements of the two arrays to gener
ate a new array. Result: [['a', 1], ['b', 3],['c', 5]]
SELECT zip_with(ARRAY[1, 2], ARRAY[3, 4], (x, y) -> x + y); -- Result: [4, 6]
SELECT zip_with(ARRAY['a', 'b', 'c'], ARRAY['d', 'e', 'f'], (x, y) -> concat(x, y)) -- Concatenates the elements of the two arra
ys to generate a new string. Result: ['ad', 'be', 'cf']
```

30.4.8.27. Logical functions

This topic describes the available logical functions in Log Service. You can use these functions to query and analyze log data.

Logical operators

Operator	Description	Example
AND	The result is TRUE if both values are TRUE.	a AND b
OR	The result is TRUE if either value is TRUE.	a OR b
NOT	The result is TRUE if the value is FALSE.	NOT a

Effect of NULL on logical operators

The following tables list the truth values when the values of a and b are TRUE, FALSE, and NULL, respectively.

Truth table 1

a	b	a AND b	a OR b
TRUE	TRUE	TRUE	TRUE
TRUE	FALSE	FALSE	TRUE
TRUE	NULL	NULL	TRUE
FALSE	TRUE	FALSE	TRUE
FALSE	FALSE	FALSE	FALSE
FALSE	NULL	FALSE	NULL

a	b	a AND b	a OR b
NULL	TRUE	NULL	TRUE
NULL	FALSE	FALSE	NULL
NULL	NULL	NULL	NULL

Truth table 2

a	NOT a
TRUE	FALSE
FALSE	TRUE
NULL	NULL

30.4.8.28. Field aliases

This topic describes how to specify an alias for a field and provides some examples.

A field name in an SQL statement must start with letters and contain digits and underscores (_).

If you have configured a field name that does not conform to the SQL standard (such as `User-Agent`), you must specify an alias for the field on the field index configuration page. The alias takes effect only for the duration of the SQL statement. The data is still stored under the original field name. You must specify the original name when you perform a search.

You can also specify an alias for a field in an SQL statement if the original name is long.

Sample aliases

Original field name	Alias
User-Agent	ua
User.Agent	ua
123	col
abceefghijklmnopqrstuvw	a

30.4.8.29. JOIN operations between Logstores and Relational

Database Service (RDS) tables

This topic describes how to join Logstores in Log Service with RDS tables for queries and store the query results in RDS tables.

Procedure

1. Create a VPC. Create an RDS instance and specify the VPC to host the RDS instance. Then the VPC ID and the RDS instance ID are obtained.
2. Configure a whitelist for the RDS instance. Add the following CIDR blocks to the whitelist: `100.104.0.0/16` , `11.194.0.0/16` , and `11.201.0.0/16`
3. Create an external store Run the following statement to create an external store. Replace the parameter values based on your business needs.

```
{
  "externalStoreName": "storeName",
  "storeType": "rds-vpc",
  "parameter": {
    {
      "region": "cn-qingdao",
      "vpc-id": "vpc-m5eq4irc1pucp*****",
      "instance-id": "i-m5eeo2whsn*****",
      "host": "localhost",
      "port": "3306",
      "username": "root",
      "password": "*****",
      "db": "scmc",
      "table": "join_meta"
    }
  }
}
```

Parameters

Parameter	Description
region	The region where your RDS instance resides.
vpc-id	The ID of the VPC where your RDS instance resides.
instance-id	The ID of the RDS instance.
host	The ID of the ECS instance that is used to access the RDS instance.
port	The port of the ECS instance that is used to access the RDS instance.
username	The username that is used to log on to the RDS instance.
password	The password that is used to log on to the RDS instance.
db	The name of the database.
table	The name of the table with which the Logstore is joined.

 **Note** You can join a Logstore with an RDS table that resides only in the China (Beijing), China (Qingdao), and China (Hangzhou) regions.

4. JOIN query. Log on to the Log Service console. In the **Search & Analyze** search box, run a JOIN statement.

Supported JOIN syntax:

- INNER JOIN
- LEFT JOIN
- RIGHT JOIN
- FULL JOIN

```
[ INNER ] JOIN
LEFT [ OUTER ] JOIN
RIGHT [ OUTER ] JOIN
FULL [ OUTER ] JOIN
```

 **Note**

- You can join Logstores only to external tables.
- In the JOIN statement, you must first specify a Logstore before specifying an external store.
- You must specify the name of the external store instead of the name of an RDS table. The external store name automatically changes into the combination of the RDS database name and the name of the RDS table that you want to join with the Logstore.

Sample JOIN statement:

```
method:postlogstorelogs | select count(1) , histogram(logstore) from log l join join_meta m on l.projectid = cast(
m.ikey as varchar)
```

5. Store the query results to the RDS table. You can use the INSERT statement to insert the query results into the RDS table.

```
method:postlogstorelogs | insert into method_output select cast(methodasvarchar(65535)),count(1)fromloggroup
bymethod
```

Sample Python script:

```
# encoding: utf-8
from __future__ import print_function
from aliyun.log import *
from aliyun.log.util import base64_encodestring
from random import randint
import time
import os
from datetime import datetime

endpoint = os.environ.get('ALIYUN_LOG_SAMPLE_ENDPOINT', 'cn-chengdu.log.aliyuncs.com')
accessKeyId = os.environ.get('ALIYUN_LOG_SAMPLE_ACCESSID', '')
accessKey = os.environ.get('ALIYUN_LOG_SAMPLE_ACCESSKEY', '')
logstore = os.environ.get('ALIYUN_LOG_SAMPLE_LOGSTORE', '')
project = "ali-yunlei-chengdu"
client = LogClient(endpoint, accessKeyId, accessKey, token)

### Create an external store
res = client.create_external_store(project, ExternalStoreConfig("rds_store", "region", "rds-vpc", "vpc id", "instance-id", "instance-ip", "port", "username", "password", "db", "table"));
res.log_print()

### Obtain external store details
res = client.get_external_store(project, "rds_store");
res.log_print()

res = client.list_external_store(project, "");
res.log_print();

# Perform the JOIN operation.
req = GetLogStoreLogsRequest(project, logstore, From, To, "", "select count(1) from "+ logstore + " s join meta m on s.projectid = cast(m.ikey as varchar)");
res = client.get_logs(req)
res.log_print();

# Store query results to the RDS table
req = GetLogStoreLogsRequest(project, logstore, From, To, "", "insert into rds_store select count(1) from "+ logstore );
res = client.get_logs(req)
res.log_print();
```

30.4.8.30. Geospatial functions

This topic describes the available geospatial functions in Log Service. You can use these functions to query and analyze log data.

Concept of geometry

Geospatial functions support geometries in the well-known text (WKT) format.

Geometry formats

Geometry	WKT format
Point	POINT (0 0)
LineString	LINestring (0 0, 1 1, 1 2)

Geometry	WKT format
Polygon	<code>POLYGON ((0 0, 4 0, 4 4, 0 4, 0 0), (1 1, 2 1, 2 2, 1 2, 1 1))</code>
MultiPoint	<code>MULTIPOINT (0 0, 1 2)</code>
MultiLineString	<code>MULTILINESTRING ((0 0, 1 1, 1 2), (2 3, 3 2, 5 4))</code>
MultiPolygon	<code>MULTIPOLYGON (((0 0, 4 0, 4 4, 0 4, 0 0), (1 1, 2 1, 2 2, 1 2, 1 1)), ((-1 -1, -1 -2,</code>
GeometryCollection	<code>GEOMETRYCOLLECTION (POINT(2 3), LINESTRING (2 3, 3 4))</code>

Constructors

Constructor description

Function	Description
<code>ST_Point(double, double) → Point</code>	Returns a geometry point instance with the specified coordinate values.
<code>ST_LineFromText(varchar) → LineString</code>	Returns a geometry LineString instance from a WKT representation.
<code>ST_Polygon(varchar) → Polygon</code>	Returns a geometry polygon instance from a WKT representation.
<code>ST_GeometryFromText(varchar) → Geometry</code>	Returns a geometry instance from a WKT representation.
<code>ST_AsText(Geometry) → varchar</code>	Returns the WKT representation of a geometry.

Operations

Function	Description
<code>ST_Boundary(Geometry) → Geometry</code>	Returns the closure of the combinatorial boundary of a geometry.
<code>ST_Buffer(Geometry, distance) → Geometry</code>	Returns the geometry that represents all points whose distance from the specified geometry is shorter than or equal to the specified distance.
<code>ST_Difference(Geometry, Geometry) → Geometry</code>	Returns the geometry value that represents the point set difference of the specified geometries.
<code>ST_Envelope(Geometry) → Geometry</code>	Returns the bounding rectangular polygon of a geometry.
<code>ST_ExteriorRing(Geometry) → Geometry</code>	Returns a line string that represents the exterior ring of the input polygon.
<code>ST_Intersection(Geometry, Geometry) → Geometry</code>	Returns the geometry value that represents the point set intersection of two geometries.
<code>ST_SymDifference(Geometry, Geometry) → Geometry</code>	Returns the geometry value that represents the point set symmetric difference of two geometries.

Relationship tests

Function	Description
<code>ST_Contains(Geometry, Geometry) → boolean</code>	Returns True if and only if no points of the second geometry lie in the exterior of the first geometry, and at least one point of the interior of the first geometry lies in the interior of the second geometry. Returns False if points of the second geometry are on the boundary of the first geometry.
<code>ST_Crosses(Geometry, Geometry) → boolean</code>	Returns True if the specified geometries share some, but not all, interior points in common.
<code>ST_Disjoint(Geometry, Geometry) → boolean</code>	Returns True if the specified geometries do not spatially intersect.
<code>ST_Equals(Geometry, Geometry) → boolean</code>	Returns True if the specified geometries represent the same geometry.
<code>ST_Intersects(Geometry, Geometry) → boolean</code>	Returns True if the specified geometries spatially intersect in two dimensions.
<code>ST_Overlaps(Geometry, Geometry) → boolean</code>	Returns True if the specified geometries share space in the same dimension, but are not completely contained by each other.
<code>ST_Relate(Geometry, Geometry) → boolean</code>	Returns True if the first geometry is spatially related to the second geometry.
<code>ST_Touches(Geometry, Geometry) → boolean</code>	Returns True if the specified geometries have at least one point in common, but their interiors do not intersect.
<code>ST_Within(Geometry, Geometry) → boolean</code>	Returns True if the first geometry is completely inside the second geometry. Returns False if the two geometries have points in common at the boundaries.

Accessors

Function	Description
<code>ST_Area(Geometry) → double</code>	Returns the two-dimensional Euclidean area of a geometry.
<code>ST_Centroid(Geometry) → Geometry</code>	Returns the point value that is the mathematical centroid of a geometry.
<code>ST_CoordDim(Geometry) → bigint</code>	Returns the coordinate dimension of a geometry.
<code>ST_Dimension(Geometry) → bigint</code>	Returns the inherent dimension of a geometry object, which must be less than or equal to the coordinate dimension.
<code>ST_Distance(Geometry, Geometry) → double</code>	Returns the minimum two-dimensional Cartesian distance (based on spatial ref) between two geometries in projected units.
<code>ST_IsClosed(Geometry) → boolean</code>	Returns True if the start and end points of the linestring are coincident.

Function	Description
ST_IsEmpty(Geometry) → boolean	Returns True if the specified geometry is an empty geometry, such as geometry collection, polygon, and point.
ST_IsRing(Geometry) → boolean	Returns True if and only if the line is closed and simple.
ST_Length(Geometry) → double	Returns the length of a LineString or multi-LineString by using Euclidean measurement on a two-dimensional plane (based on spatial ref) in projected units.
ST_XMax(Geometry) → double	Returns the X maximum of the bounding box of the geometry.
ST_YMax(Geometry) → double	Returns the Y maximum of the bounding box of the geometry.
T_XMin(Geometry) → double	Returns the X minimum of the bounding box of the geometry.
ST_YMin(Geometry) → double	Returns the Y minimum of the bounding box of the geometry.
ST_StartPoint(Geometry) → point	Returns the first point of a geometry LineString instance.
ST_EndPoint(Geometry) → point	Returns the last point of a geometry LineString instance.
ST_X(Point) → double	Returns the X coordinate of a point.
ST_Y(Point) → double	Returns the Y coordinate of a point.
ST_NumPoints(Geometry) → bigint	Returns the number of points in a geometry.
ST_NumInteriorRing(Geometry) → bigint	Returns the cardinality of the collection of interior rings of a polygon.

30.4.8.31. Geography functions

This topic describes the syntax of geography functions and provides some examples.

For information about functions that identify the country, province, city, ISP, and the longitude and latitude of a specified IP address, see [IP functions](#).

Geography functions

Function	Description	Example
geohash(string)	Returns the geohash value of the specified geographical location. The geographical location is represented by a string in the format of "latitude, longitude". The values for latitude and longitude are separated by a comma.	<pre>select geohash('34.1,120.6')= 'wwjcbdrnzs'</pre>
geohash(lat,lon)	Returns the geohash value of the specified geographical location. The geographical location is represented by two parameters that indicate the latitude and longitude.	<pre>select geohash(34.1,120.6)= 'wwjcbdrnzs'</pre>

30.4.8.32. JOIN syntax

The JOIN operation joins multiple tables by using one or more fields in the tables. You can join a Logstore created in Log Service with the Logstore itself, with another Logstore, or with an RDS table. This topic describes how to join different Logstores.

Procedure

1. Download the [latest version of the SDK for Python](#).
2. Call the GetProjectLogs operation to query logs.

Sample SDK

```
#!/usr/bin/env python
#encoding: utf-8
import time,sys,os
from aliyun.log.logexception import LogException
from aliyun.log.logitem import LogItem
from aliyun.log.logclient import LogClient
from aliyun.log.getlogsrequest import GetLogsRequest
from aliyun.log.getlogsrequest import GetProjectLogsRequest
from aliyun.log.putlogsrequest import PutLogsRequest
from aliyun.log.listtopicsrequest import ListTopicsRequest
from aliyun.log.listlogstoresrequest import ListLogstoresRequest
from aliyun.log.gethistogramsrequest import GetHistogramsRequest
from aliyun.log.index_config import *
from aliyun.log.logtail_config_detail import *
from aliyun.log.machine_group_detail import *
from aliyun.log.acl_config import *
if __name__=='__main__':
    token = None
    endpoint = "http://cn-hangzhou.log.aliyuncs.com"
    accessKeyId = 'LTAIvKy7U'
    accessKey='6gXLNTLyCdfsfwrewrfhdkfdfsuiwu'
    client = LogClient(endpoint, accessKeyId, accessKey,token)
    logstore = "meta"
    # In the query statements, specify two Logstores, the query time ranges of both Logstores, and the key that you want to use to join the two Logstores.
    req = GetProjectLogsRequest(project,"select count(1) from sls_operation_log s join meta m on s.__date__>'2018-04-10 00:00:00' and s.__date__ < '2018-04-11 00:00:00' and m.__date__ >'2018-04-23 00:00:00' and m.__date__ <'2018-04-24 00:00:00' and s.projectid = cast(m.ikey as varchar)");
    res = client.get_project_logs(req)
    res.log_print();
    exit(0)
```

 **Note** For more information about the JOIN syntax and examples, see [Join](#).

30.4.8.33. UNNEST function

This topic describes the UNNEST function.

Scenarios

Log data is typically stored as primitive data types, such as string or number. In certain scenarios, log data may include complex data types, such as arrays, maps, and JSON objects. The UNNEST function can be used to transform complex data types into rows of primitive data types. This simplifies query and analysis.

Example:

```
__source__: 1.1.1.1
__tag__:__hostname__: vm-req-170103232316569850-tianchi111932.tc
__topic__: TestTopic_4
array_column: [1,2,3]
double_column: 1.23
map_column: {"a":1,"b":2}
text_column: Product
```

The values of the `array_column` field are arrays. To obtain the sum of elements of all `array_column` field values, you must traverse all elements of every array.

UNNEST function

Syntax	Description
<code>unnest(array) as table_alias(column_name)</code>	Expands an array into multiple rows. The column name of these rows is <code>column_name</code> .
<code>unnest(map) as table(key_name, value_name)</code>	Expands a map into multiple rows. <code>key_name</code> specifies the column name of the keys, and <code>value_name</code> specifies the column name of the values.

Note The UNNEST function is used to expand arrays or maps. If you want to expand a string, you must transform the string into a JSON object, and then convert the JSON object into an array or map. To do this, you can use the `cast(json_parse(array_column) as array(bigint))` function.

Traverse every element of an array

Expands an array into multiple rows by using the following SQL SELECT statement:

```
*| select array_column, a from log, unnest( cast( json_parse(array_column) as array(bigint) ) ) as t(a)
```

The UNNEST function `unnest(cast(json_parse(array_column) as array(bigint))) as t(a)` expands the array into multiple rows. The rows are stored in a derived table referenced as `t`, with the column referenced as `a`.

- Calculate the sum of the elements in an array:

```
*| select sum(a) from log, unnest( cast( json_parse(array_column) as array(bigint) ) ) as t(a)
```

- Perform a GROUP BY operation on all elements of an array:

```
*| select a, count(1) from log, unnest( cast( json_parse(array_column) as array(bigint) ) ) as t(a) group by a
```

Traverse every key and value of a map

- Traverse every key and value of a map:

```
* | select map_column , a,b  from log, unnest( cast( json_parse(map_column)  as map(varchar, bigint) ) ) as t(a,b)
```

- Perform a GROUP BY operation on all keys of a map:

```
* | select key, sum(value)  from log, unnest( cast( json_parse(map_column)  as map(varchar, bigint) ) ) as t(key,v  
alue)  GROUP BY key
```

Visualize the query results of the histogram and numeric_histogram functions.

- histogram

The histogram function works in a similar manner to the count group by syntax. For more information about the histogram function, see [Map functions](#).

In most cases, the histogram function returns a JSON object. The following is an example:

```
* | select histogram(method)
```

You can use the UNNEST function to expand JSON data into multiple rows. Then the data can be visualized. The following is an example:

```
* | select key , value  from( select histogram(method) as his from log) , unnest(his ) as t(key,value)
```

- numeric_histogram

The numeric_histogram function assigns a column of numeric values into multiple bins. This function is equivalent to a GROUP BY operation that is performed on a numeric value column. For more information about the syntax of the numeric_histogram function, see [Approximate functions](#).

```
* | select numeric_histogram(10,Latency)
```

Use the following SELECT statement to visualize the result:

```
* | select key,value from(select numeric_histogram(10,Latency) as his from log) , unnest(his) as t(key,value)
```

30.4.9. Machine learning syntax and functions

30.4.9.1. Overview

The machine learning feature of Log Service supports multiple algorithms and calling methods. You can use SELECT statements and machine learning functions to analyze the characteristics of a field or fields within a period of time.

Log Service offers multiple time series analysis algorithms to help you implement time series prediction, time series anomaly detection, time series decomposition, and multi-time series clustering. The algorithms are compatible with standard SQL statements. This greatly simplifies the use of the algorithms and improves the troubleshooting efficiency.

Features

- Supports various smooth operations on single-time series data.
- Supports algorithms related to the prediction, anomaly detection, change point detection, inflection point detection, and multi-period estimation of single-time series data.
- Supports decomposition operations on single-time series data.
- Supports various clustering algorithms of multi-time series data.
- Supports multi-field pattern mining (based on the sequence of numeric data or text).

Limits

- The specified time series data must be sampled based on the same interval.
- The specified time series data cannot contain data repeatedly sampled from the same time point.

Item	Description
Processing capacity of time-series data	Data can be collected from a maximum of 150,000 consecutive time points. If the data volume exceeds the processing capacity, you must aggregate the data or reduce the sampling amount.
Clustering capacity of the density-based clustering algorithm	A maximum of 5,000 time series curves, each of which cannot contain more than 1,440 time points.
Clustering capacity of the hierarchical clustering algorithm	A maximum of 2,000 time series curves, each of which cannot contain more than 1,440 time points.

Machine learning functions

Type	Function	Description
Smooth functions	ts_smooth_simple	Uses the Holt Winters algorithm to smooth time series data.
	ts_smooth_fir	Uses the finite impulse response (FIR) filter to smooth time series data.
	ts_smooth_iir	Uses the infinite impulse response (IIR) filter to smooth time series data.
Multi-period estimation functions	ts_period_detect	Forecasts time series data by period.
Change point detection functions	ts_cp_detect	Finds intervals with different statistical characteristics from time series data. The interval endpoints are change points.
	ts_breakout_detect	Finds the time points when statistics steeply increases or decreases from time series data.
Maximum value detection function	ts_find_peaks	Finds the local maximum value of time series data in a specified window.
Prediction and anomaly detection functions	ts_predicate_simple	Uses default parameters to model time series data and performs simple time series prediction and anomaly detection.
	ts_predicate_ar	Uses an autoregressive (AR) model to model time series data and performs simple time series prediction and anomaly detection.
	ts_predicate_arma	Uses an autoregressive moving average (ARMA) model to model time series data and performs simple time series prediction and anomaly detection.
	ts_predicate_arima	Uses an autoregressive integrated moving average (ARIMA) model to model time series data and performs simple time series prediction and anomaly detection.
	ts_regression_predict	Accurately predicts the trend for a single periodic time series with a certain tendency.

Type	Function	Description
Time series decomposition function	ts_decompose	Uses the Seasonal and Trend decomposition using Loess (STL) algorithm to decompose time series data.
Time series clustering functions	ts_density_cluster	Uses a density-based clustering method to cluster multiple pieces of time series data.
	ts_hierarchical_cluster	Uses a hierarchical clustering method to cluster multiple pieces of time series data.
	ts_similar_instance	Queries curves that are similar to a specified curve.
Frequent pattern statistics function	pattern_stat	Mines representative combinations of attributes among the given multi-attribute field samples to obtain the frequent pattern in statistical patterns.
Differential pattern statistics function	pattern_diff	Finds the pattern that causes differences between two collections under specified conditions.
Root cause analysis function	rca_kpi_search	When a time series metric is abnormal, you can use the root cause analysis function to analyze the dimension attributes that result in the abnormal metric in a timely manner.
Correlation analysis functions	ts_association_analysis	Quickly finds the metrics that are correlated with a specified metric among multiple observed metrics in the system.
ts_similar	Quickly finds the metrics that are correlated with specified time series data among multiple observed metrics in the system.	
Kernel density estimation function	kernel_density_estimation	Uses the smooth peak function to fit the observed data points, thus simulating the real probability distribution curve.

30.4.9.2. Smooth functions

This topic describes the smooth functions that you can use to smooth and filter specified time series curves. Filtering is the first step to discover the shapes of time series curves.

Functions

Function	Description
<code>ts_smooth_simple</code>	Uses the Holt-Winters algorithm to filter time series data. This function is the default smooth function.
<code>ts_smooth_fir</code>	Uses a finite impulse response (FIR) filter to filter time series data.
<code>ts_smooth_iir</code>	Uses an infinite impulse response (IIR) filter to filter time series data.

ts_smooth_simple

- Syntax:

```
select ts_smooth_simple(x, y)
```

- The following table lists the parameters of the function.

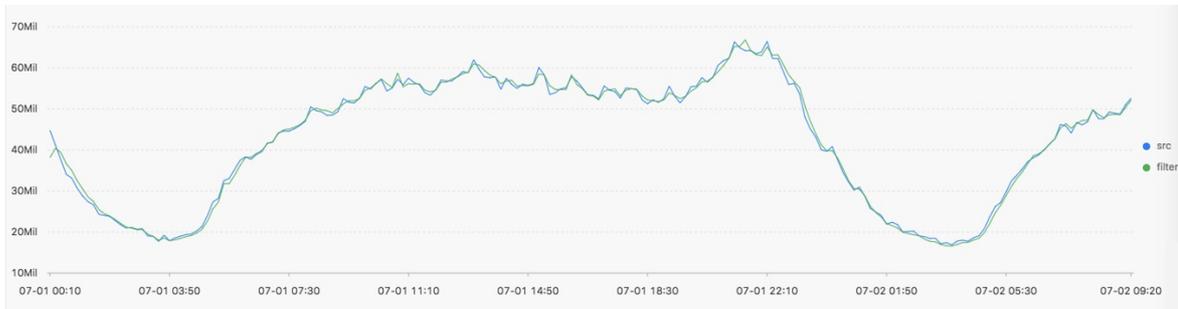

Parameter	Description	Value
<i>x</i>	The time sequence. The time points along the x axis are sorted in the ascending order.	The Unix timestamp of the time series data. Unit: seconds.
<i>y</i>	The sequence of numeric data at each specified time point.	-

- Example

- The search and analytic statement is shown as follows:

```
* | select ts_smooth_simple(stamp, value) from ( select __time__ - __time__ % 120 as stamp, avg(v) as value from lo
g GROUP BY stamp order by stamp )
```

- The following figure shows the response.

- The following table lists the display items.

Item	Description	
Horizontal axis	unixtime	The Unix timestamp of time series data. Unit: seconds.
Vertical axis	src	The unfiltered data.
	filter	The filtered data.

ts_smooth_fir

- Syntax:

- If you cannot determine filter parameters, use built-in window parameters in the following statement:

```
select ts_smooth_fir(x, y,winType,winSize)
```

- If you can determine filter parameters, you can specify the parameters as needed in the following statement:

```
select ts_smooth_fir(x, y,array[])
```

- The following table lists the parameters of the function.

Parameter	Description	Value
-----------	-------------	-------

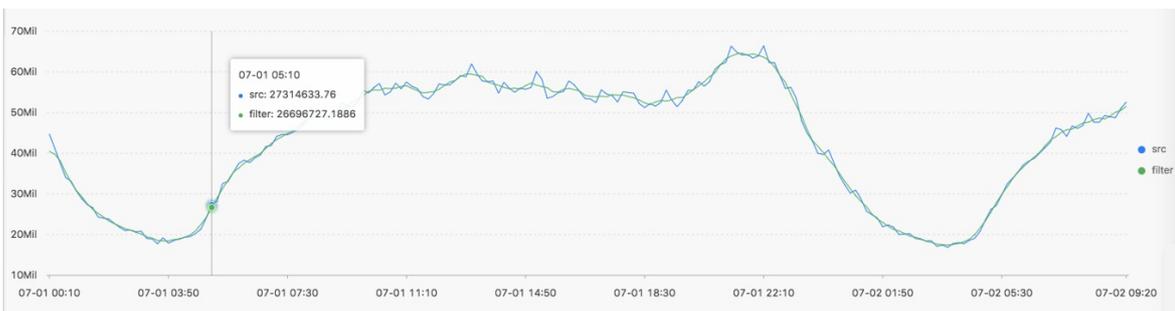

Parameter	Description	Value
<i>x</i>	The time sequence. The time points along the x axis are sorted in the ascending order.	Each time point is a Unix timestamp. Unit: seconds.
<i>y</i>	The sequence of numeric data at each specified time point.	-
<i>winType</i>	The type of window used for filtering.	Valid values: <ul style="list-style-type: none"> ○ rectangle: rectangle window. ○ hanning: hanning window ○ hamming: hamming window. ○ blackman: blackman window. <div style="border: 1px solid #add8e6; padding: 5px; margin-top: 10px;"> ? Note We recommend that you select the rectangle window for better display effects. </div>
<i>winSize</i>	The length of the filtering window.	The value is of the LONG type. Valid values: 2 to 15.
<i>array[]</i>	The parameter used for FIR filtering.	The value is an array where the sum of elements is 1. For example, array[0.2, 0.4, 0.3, 0.1].

● Example 1

- The search and analytic statement is shown as follows:

```
* | select ts_smooth_fir(stamp, value, 'rectangle', 4) from ( select __time__ - __time__ % 120 as stamp, avg(v) as value from log GROUP BY stamp order by stamp )
```

- The following figure shows the response.

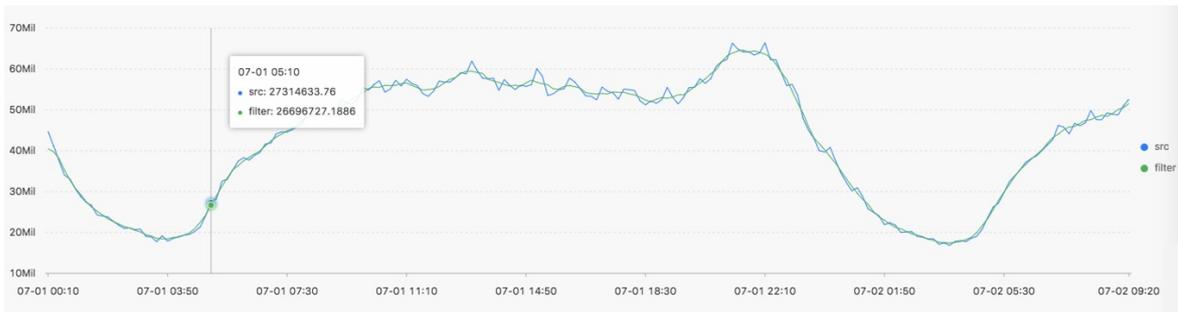

● Example 2

- The search and analytic statement is shown as follows:

```
* | select ts_smooth_fir(stamp, value, array[0.2, 0.4, 0.3, 0.1]) from ( select __time__ - __time__ % 120 as stamp, avg(v) as value from log GROUP BY stamp order by stamp )
```

- The following figure shows the response.

- The following table lists the display items.

Item		Description
Horizontal axis	unixtime	The Unix timestamp of the time series data. Unit: seconds.
Vertical axis	src	The unfiltered data.
	filter	The filtered data.

ts_smooth_iir

- Syntax:

```
select ts_smooth_iir(x, y, array[], array[] )
```

- The following table lists the parameters of the function.

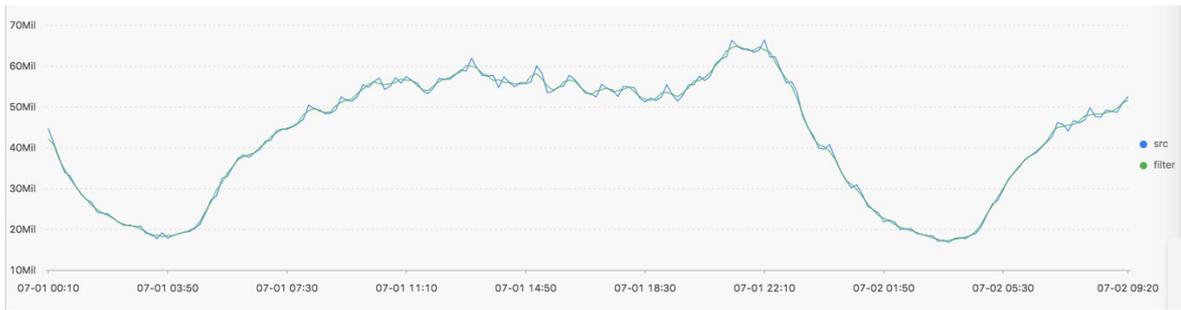

Parameter	Description	Value
<i>x</i>	The time sequence. The time points along the x axis are sorted in ascending order.	Each time point is a Unix timestamp. Unit: seconds.
<i>y</i>	The sequence of numeric data at each specified time point.	-
<i>array[]</i>	The parameter used for IIR filtering in terms of x_i .	The value is an array where the sum of elements is 1. The length of the array ranges from 2 to 15. For example, array[0.2, 0.4, 0.3, 0.1].
<i>array[]</i>	The parameter used for IIR filtering in terms of y_{i-1} .	The value is an array where the sum of elements is 1. The length of the array ranges from 2 to 15. For example, array[0.2, 0.4, 0.3, 0.1].

- Example

- The search and analytic statement is shown as follows:

```
* | select ts_smooth_iir(stamp, value, array[0.2, 0.4, 0.3, 0.1], array[0.4, 0.3, 0.3]) from ( select __time__ - __time__ % 120 as stamp, avg(v) as value from log GROUP BY stamp order by stamp )
```

- The following figure shows the response.

- The following table lists the display items.

Item		Description
Horizontal axis	unixtime	The Unix timestamp of the time series data. Unit: seconds.
Vertical axis	src	The unfiltered data.
	filter	The filtered data.

30.4.9.3. Multi-period estimation functions

This topic describes the available multi-period estimation functions in Log Service. You can use the functions to estimate the periods of time series data in different time intervals and extract periods by using a series of operations such as Fourier transform (FT).

Functions

Function	Description
<code>ts_period_detect</code>	Estimates multiple periods of time series data.
<code>ts_period_classify</code>	Uses FT to calculate the periodicity of specified time series curves. This function can be used to identify periodic curves.

`ts_period_detect`

Syntax:

```
select ts_period_detect(x,y,minPeriod,maxPeriod)
```

The following table lists the parameters of the function.

Parameter	Description	Value
<i>x</i>	The time sequence. The time points along the x axis are sorted in the ascending order.	Each time point is a Unix timestamp. Unit: seconds.
<i>y</i>	The sequence of numeric data at each specified time point.	-
<i>minPeriod</i>	The ratio of the minimum length of the estimation period to the total length of the time series data.	The parameter value must be a decimal number. Valid values: (0.0, 1.0].

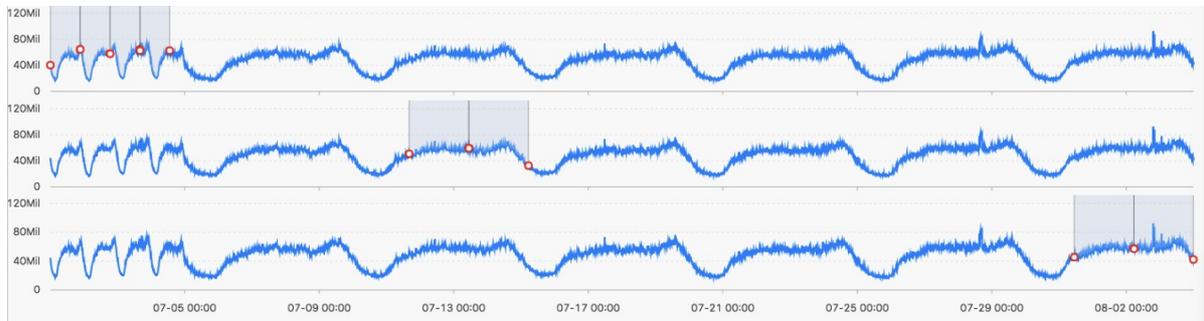

Parameter	Description	Value
<i>maxPeriod</i>	<p>The ratio of the maximum length of the estimation period to the total length of the time series data.</p> <p>Note The <i>maxPeriod</i> parameter value must be greater than the value of the <i>minPeriod</i> parameter.</p>	The parameter value must be a decimal number. Valid values: (0.0, 1.0].

Example:

- The search and analytic statement is shown as follows:

```
* | select ts_period_detect(stamp, value, 0.2, 1.0) from ( select __time__ - __time__ % 120 as stamp, avg(v) as value from m log GROUP BY stamp order by stamp )
```

- The following figure shows the response.

The following table lists the display items.

Display item	Description
<i>period_id</i>	An array with a length of 1. The element in the array indicates the sequence number of the period. The array [0] indicates the original time series curve.
<i>time_series</i>	The sequence of timestamps.
<i>data_series</i>	<p>The sequence of data at each timestamp.</p> <ul style="list-style-type: none"> If <i>period_id</i> is 0, the returned data is the original time series data. When <i>period_id</i> is not 0, the data returned is the filtered time series data.

ts_period_classify

Syntax:

```
select ts_period_classify(stamp,value,instanceName)
```

The following table lists the parameters of the function.

Parameter	Description	Value
<i>stamp</i>	The time sequence. The time points along the x axis are sorted in the ascending order.	Each time point is a Unix timestamp. Unit: seconds.

Parameter	Description	Value
value	The sequence of numeric data at each specified time point.	-
instanceName	The name of the time series curve.	-

Example:

- The search and analytic statement is shown as follows:

```
* and h : nu2h05202.nu8 | select ts_period_classify(stamp, value, name) from log
```

- The following figure shows the response.

line_name	prob	type
asg-2z2p9r6zf5ewg188pg5	1.0	-1.0
asg-bp1j8snc92p6v5pptgpi	0.07203668207039314	0.0
asg-wz99hse7u4ubopo5dt9o	0.0	0.0
asg-bp18oqni0gg96vy851e4	0.05590892692207093	0.0

The following table lists the display items.

Display item	Description
line_name	The name of the time series curve.
prob	The ratio of the primary period length to the length of the time series curve. Valid values: 0 to 1. You can set the value to 0.15 when you perform a test.
type	The type of the curve. Valid values: -1, -2, and 0. <ul style="list-style-type: none"> • The value 1 indicates that the time series curve length is too short (less than 64 points). • The value -2 indicates the time series curve has a high fault rate (the fault rate exceeds 20%). • The value 0 indicates the time series curve is periodic.

30.4.9.4. Change point detection functions

This topic describes the change point detection functions in Log Service. You can use the functions to detect the change points in time series data.

The change point detection functions can detect the following two kinds of change points:

- Statistics feature changes within a specified period of time
- Anomalies in time series data

Functions

Function	Description
<code>ts_cp_detect</code>	Finds intervals in which data has different statistics features. The interval endpoints are change points.
<code>ts_breakout_detect</code>	Finds the time points at which data experiences dramatic changes.

ts_cp_detect

Syntax:

- If you cannot specify an appropriate time window size, use the following syntax. The default window size used in the function is 10.

```
select ts_cp_detect(x, y, samplePeriod)
```

- To adjust the effect specific to your business environment, you can specify the minSize parameter in the following function.

```
select ts_cp_detect(x, y, minSize)
```

The following table lists the parameters of the function.

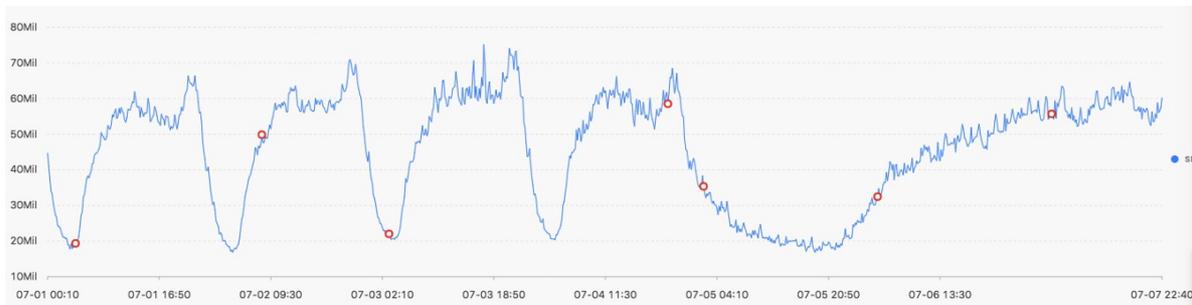

Parameter	Description	Value
<i>x</i>	The time sequence. The time points along the x axis are sorted in the ascending order.	Each time point is a Unix timestamp. Unit: seconds.
<i>y</i>	The sequence of numeric data at each specified time point.	-
<i>minSize</i>	The minimum length of time series data in a continuous interval.	The minimum value is 3 and the maximum value cannot exceed ten percent of the length of the specified time series data.

Example:

- The search and analytic statement is shown as follows:

```
* | select ts_cp_detect(stamp, value, 3) from (select __time__ - __time__ % 10 as stamp, avg(v) as value from log GROUP BY stamp order by stamp)
```

- The following figure shows the response.

The following table lists the display items.

Display item		Description
Horizontal axis	unixtime	The Unix timestamp of time series data, measured in seconds, for example, 1537071480.
	src	The unfiltered data, such as 1956092.7647745228.
Vertical axis	prob	The probability that a time point is a change point. Valid values: 0 to 1.

ts_breakout_detect

Syntax:

```
select ts_breakout_detect(x, y, winSize)
```

The following table lists the parameters of the function.

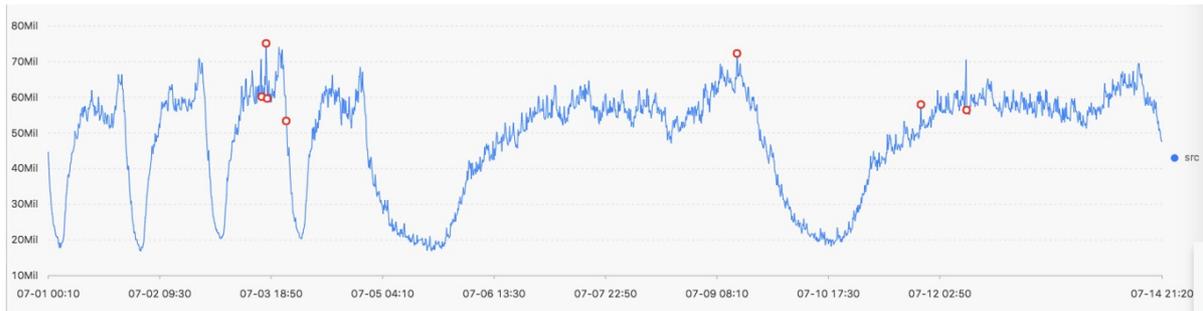

Parameter	Description	Value
<i>x</i>	The time sequence. The time points along the x axis are sorted in the ascending order.	Each time point is a Unix timestamp. Unit: seconds.
<i>y</i>	The sequence of numeric data at each specified time point.	-
<i>winSize</i>	The minimum length of time series data in a continuous interval.	The minimum value is 3 and the maximum value cannot exceed ten percent of the length of the specified time series data.

Example:

- The search and analytic statement is shown as follows:

```
* | select ts_breakout_detect(stamp, value, 3) from (select __time__ - __time__ % 10 as stamp, avg(v) as value from log GROUP BY stamp order by stamp)
```

- The following figure shows the response.

The following table lists the display items.

Display item	Description	
Horizontal axis	unixtime	The Unix timestamp of time series data, measured in seconds, for example, 1537071480.
Vertical axis	src	The unfiltered data, such as 1956092.7647745228.
	prob	The probability that a time point is a change point. Valid values: 0 to 1.

30.4.9.5. Maximum value detection function

This topic describes the available maximum value detection function in Log Service. You can use the functions to find the local maximum value of time series data in a specified window.

ts_find_peaks

Syntax:

```
select ts_find_peaks(x, y, winSize)
```

The following table lists the parameters of the function.

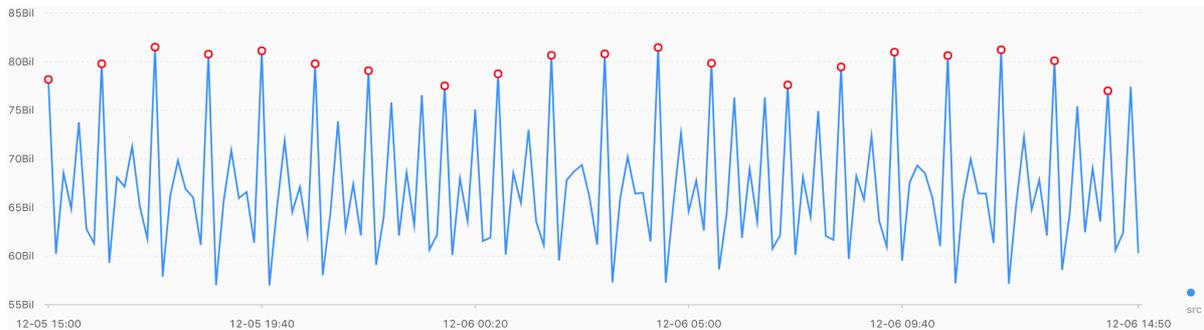

Parameter	Description	Value
<i>x</i>	The time sequence. The time points along the x axis are sorted in the ascending order.	Each time point is a Unix timestamp. Unit: seconds.
<i>y</i>	The sequence of numeric data at each specified time point.	-
<i>winSize</i>	The minimum length of the detection window.	The value of the parameter is of the LONG type, ranging from 1 to the length of time series data. We recommend that you set this parameter to ten percent of the actual data length.

Example:

- The search and analytic statement is shown as follows:

```
* and h : nu2h05202.nu8 and m: NET | select ts_find_peaks(stamp, value, 30) from (select __time__ - __time__ % 10 as stamp, avg(v) as value from log GROUP BY stamp order by stamp)
```

- The following figure shows the response.

The following table lists the display items.

Display item		Description
Horizontal axis	unixtime	The Unix timestamp of time series data, measured in seconds, for example, 1537071480.
Vertical axis	src	The unfiltered data, such as 1956092.7647745228.
	peak_flag	Indicates whether the numeric value at the time point is the maximum value. Valid values: 1.0 and 0.0. <ul style="list-style-type: none"> • 1.0: The numeric value at the time point is the maximum value. • 0.0: The numeric value at the time point is not the maximum value.

30.4.9.6. Prediction and anomaly detection functions

Prediction and anomaly detection functions predict the trend of time series curves and identify the Ksigma and quantiles of the errors between a predicted curve and an actual curve. You can use the functions to detect anomalies.

Functions

Function	Description
<code>ts_predicate_simple</code>	Uses default parameters to model time series data and performs prediction and anomaly detection on time series data.
<code>ts_predicate_ar</code>	Uses an autoregressive (AR) model to model time series data and performs prediction and anomaly detection on time series data.
<code>ts_predicate_arma</code>	Uses an autoregressive moving average (ARMA) model to model time series data and performs prediction and anomaly detection on time series data.
<code>ts_predicate_arima</code>	Uses an autoregressive integrated moving average (ARIMA) model to model time series data and performs prediction and anomaly detection on time series data.
<code>ts_regression_predict</code>	Accurately predicts the trend for a periodic time series curve. Scenario: This function can be used to predict metering data, network traffic, financial data, and different business data that follows certain rules.
<code>ts_anomaly_filter</code>	Filters the anomalies detected from multiple time series curves based on the custom anomaly mode. The anomalies are detected during the anomaly detection. This function helps you find abnormal curves in a timely manner.

ts_predicate_simple

Syntax:

```
select ts_predicate_simple(x, y, nPred, isSmooth)
```

The following table lists the parameters of the function.

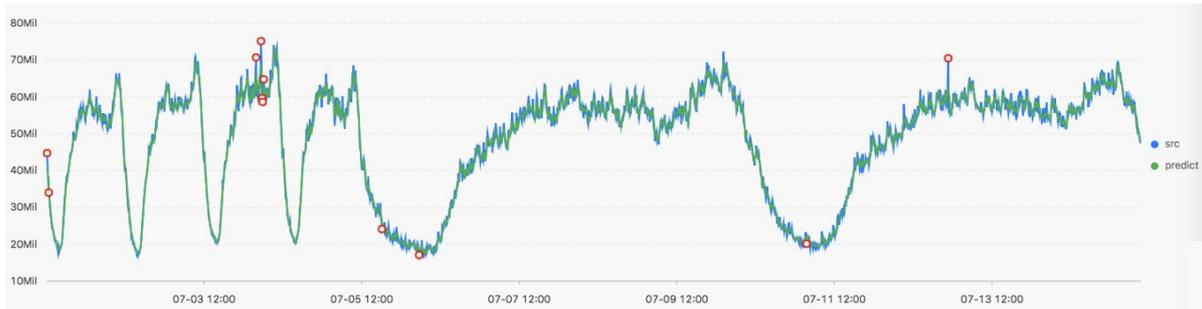

Parameter	Description	Value
<i>x</i>	The time sequence. The time points along the x axis are sorted in the ascending order.	Each time point is a Unix timestamp. Unit: seconds.
<i>y</i>	The sequence of numeric data at each specified time point.	N/A
<i>nPred</i>	The number of points for prediction.	The value is of the LONG data type and must be equal to or greater than 1.
<i>isSmooth</i>	Specifies whether to filter the raw data.	The value is of the Boolean type. The default value is True, which indicates to filter raw data.

Example:

- A search and analytic statement is shown as follows:

```
* | select ts_predicate_simple(stamp, value, 6) from (select __time__ - __time__ % 60 as stamp, avg(v) as value from lo
g GROUP BY stamp order by stamp)
```

- The following figure shows the response.

The following table lists the display items.

Display item		Description
Horizontal axis	unixtime	The Unix timestamp of the data. Unit: seconds.
Vertical axis	src	The raw data.
	predict	The predicted data.
	upper	The upper limit of the prediction. The confidence level is 0.85. This value cannot be modified.
	lower	The lower limit of the prediction. The confidence level is 0.85. This value cannot be modified.
	anomaly_prob	The probability that the point is an anomaly. Valid values: [0, 1].

ts_predicate_ar

Syntax:

```
select ts_predicate_ar(x, y, p, nPred, isSmooth)
```

The following table lists the parameters of the function.

Parameter	Description	Value
<i>x</i>	The time sequence. The time points along the x axis are sorted in the ascending order.	Each time point is a Unix timestamp. Unit: seconds.
<i>y</i>	The sequence of numeric data at each specified time point.	N/A
<i>p</i>	The order of the AR model.	The value is of the LONG data type. Valid values: [2, 8].
<i>nPred</i>	The number of points for prediction.	The value is of the LONG data type. Valid values: [1, 5 × <i>p</i>].
<i>isSmooth</i>	Specifies whether to filter the raw data.	The value is of the Boolean type. The default value is true, which indicates to filter raw data.

An example search and analytic statement is shown as follows:

```
* | select ts_predicate_ar(stamp, value, 3, 4) from (select __time__ - __time__ % 60 as stamp, avg(v) as value from log GR OUP BY stamp order by stamp)
```

Note The response is similar to that of the `ts_predicate_simple` function. For more information, see the response of the `ts_predicate_simple` function.

ts_predicate_arma

Syntax:

```
select ts_predicate_arma(x, y, p, q, nPred, isSmooth)
```

The following table lists the parameters of the function.

Parameter	Description	Value
<i>x</i>	The time sequence. The time points along the x axis are sorted in the ascending order.	Each time point is a Unix timestamp. Unit: seconds.
<i>y</i>	The sequence of numeric data at each specified time point.	N/A
<i>p</i>	The order of the AR model.	The value is of the LONG data type. Valid values: [2, 100].
<i>q</i>	The order of the ARMA model.	The value is of the LONG data type. Valid values: [2, 8].
<i>nPred</i>	The number of points for prediction.	The value is of the LONG data type. Valid values: [<i>p</i> , 5 <i>p</i>].
<i>isSmooth</i>	Specifies whether to filter the raw data.	The value is of the Boolean type. The default value is true, which indicates to filter raw data.

An example search and analytic statement is shown as follows:

```
* | select ts_predicate_arma(stamp, value, 3, 2, 4) from (select __time__ - __time__ % 60 as stamp, avg(v) as value from log GROUP BY stamp order by stamp)
```

Note The response is similar to that of the `ts_predicate_simple` function. For more information, see the response of the `ts_predicate_simple` function.

ts_predicate_arima

Syntax:

```
select ts_predicate_arima(x,y, p, d, q, nPred, isSmooth)
```

The following table lists the parameters of the function.

Parameter	Description	Value
<i>x</i>	The time sequence. The time points along the x axis are sorted in the ascending order.	Each time point is a Unix timestamp. Unit: seconds.
<i>y</i>	The sequence of numeric data at each specified time point.	N/A

Parameter	Description	Value
<i>p</i>	The order of the AR model.	The value is of the LONG data type. Valid values: [2, 8].
<i>d</i>	The order of the ARIMA model.	The value is of the LONG data type. Valid values: [1, 3].
<i>q</i>	The order of the ARMA model.	The value is of the LONG data type. Valid values: [2, 8].
<i>nPred</i>	The number of points for prediction.	The value is of the LONG type. Valid values: [<i>p</i> , 5 <i>p</i>].
<i>isSmooth</i>	Specifies whether to filter the raw data.	The value is of the Boolean type. The default value is True, which indicates to filter raw data.

An example search and analytic statement is shown as follows:

```
* | select ts_predicate_arma(stamp, value, 3, 1, 2, 4) from (select __time__ - __time__ % 60 as stamp, avg(v) as value from m log GROUP BY stamp order by stamp)
```

 **Note** The response is similar to that of the `ts_predicate_simple` function. For more information, see the response of the `ts_predicate_simple` function.

ts_regression_predict

Syntax:

```
select ts_regression_predict(x, y, nPred, algotype, processType)
```

The following table lists the parameters of the function.

Parameter	Description	Value
<i>x</i>	The time sequence. The time points along the x axis are sorted in the ascending order.	Each time point is a Unix timestamp. Unit: seconds.
<i>y</i>	The sequence of numeric data at each specified time point.	N/A
<i>nPred</i>	The number of points for prediction.	The value is of the LONG data type. Valid values: [1, 500].

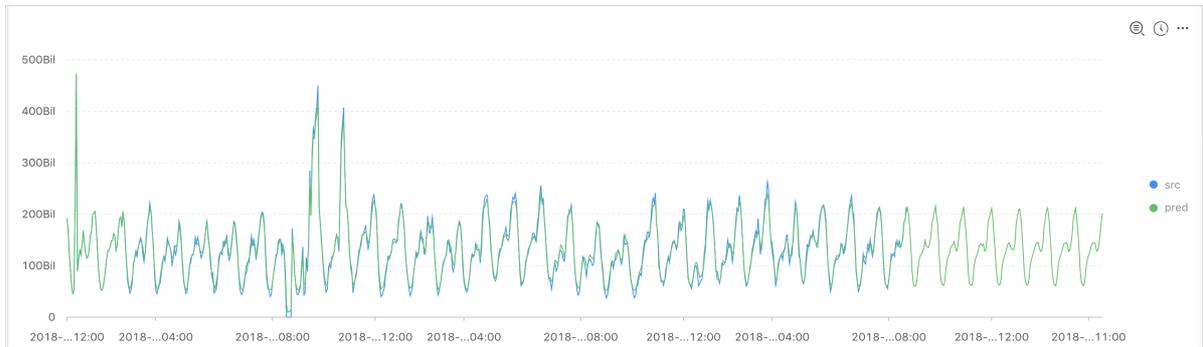

Parameter	Description	Value
<i>algotype</i>	The algorithm type for prediction.	Valid values: <ul style="list-style-type: none"> • origin: uses the Gradient Boosted Regression Tree (GBRT) algorithm for prediction. • forest: uses the GBRT algorithm for prediction based on the trend component decomposed by Seasonal and Trend decomposition using Loess (STL), and then uses the additive model to sum up the decomposed components and obtains the predicted data. • linear: uses the Linear Regression algorithm for prediction based on the trend components decomposed by STL, and then uses the additive model to sum up the decomposed components and obtains the predicted data.
<i>processType</i>	Specifies whether to preprocess the data.	Valid values: <ul style="list-style-type: none"> • 0: no additional data preprocessing is performed. • 1: removes abnormal data before prediction.

Example:

- A search and analytic statement is shown as follows:

```
* and h : nu2h05202.nu8 and m: NET | select ts_regression_predict(stamp, value, 200, 'origin') from (select __time__ - __time__ % 60 as stamp, avg(v) as value from log GROUP BY stamp order by stamp)
```

- The following figure shows the response.

The following table lists the display items.

Display item		Description
Horizontal axis	unixtime	The Unix timestamp of the data. Unit: seconds.
Vertical axis	src	The raw data.
	predict	The predicted data.

ts_anomaly_filter

Syntax:

```
select ts_anomaly_filter(lineName, ts, ds, preds, probs, nWatch, anomalyType)
```

The following table lists the parameters of the function.

Parameter	Description	Value
<i>lineName</i>	The name of each curve. The value is of the VARCHAR data type.	N/A
<i>ts</i>	The time sequence of the curve, which indicates the time of the current curve. The parameter value is an array of time points of the DOUBLE data type sorted in the ascending order.	N/A
<i>ds</i>	The actual value sequence of the curve. The parameter value is an array of data points with the same length as the ts parameter value.	N/A
<i>preds</i>	The predicted value sequence of the curve. The parameter value is an array of data points with the same length as the ts parameter value.	N/A
<i>probs</i>	The sequence of anomaly detection results of the curve. The parameter value is an array of data points with the same length as the ts parameter value.	N/A
<i>nWatch</i>	The number of the recently observed actual values on the curve. The value is of the LONG data type. The value must be smaller than the number of time points on the curve.	N/A
<i>anomalyType</i>	The type of anomaly to be filtered. The value is of the LONG data type.	Valid values: <ul style="list-style-type: none"> • 0: all anomalies. • 1: positive anomalies. • -1: negative anomalies.

Example:

- A search and analytic statement is shown as follows:

```
* | select res.name, res.ts, res.ds, res.preds, res.probs
  from (
    select ts_anomaly_filter(name, ts, ds, preds, probs, cast(5 as bigint), cast(1 as bigint)) as res
  from (
    select name, res[1] as ts, res[2] as ds, res[3] as preds, res[4] as uppers, res[5] as lowers, res[6] as probs
  from (
    select name, array_transpose(ts_predicate_ar(stamp, value, 10)) as res
  from (
    select name, stamp, value from log where name like '%asg-%') group by name)) );
```

- The following figure shows the response.

name	ts	ds	preds	probs
asg-bp1hylzdi2wx7civ0ivk	[1.5513696E9, 1.5513732E9, 1.5513768E9, 1.5513804E9]	[1,2,3,NaN]	[1,2,3,4]	[0,0,1,NaN]

30.4.9.7. Time series decomposition function

The time series decomposition function decomposes time series curves into curves that reveal the trend and periodicity of curves.

ts_decompose

Syntax:

```
select ts_decompose(x, y)
```

The following table lists the parameters of the function.

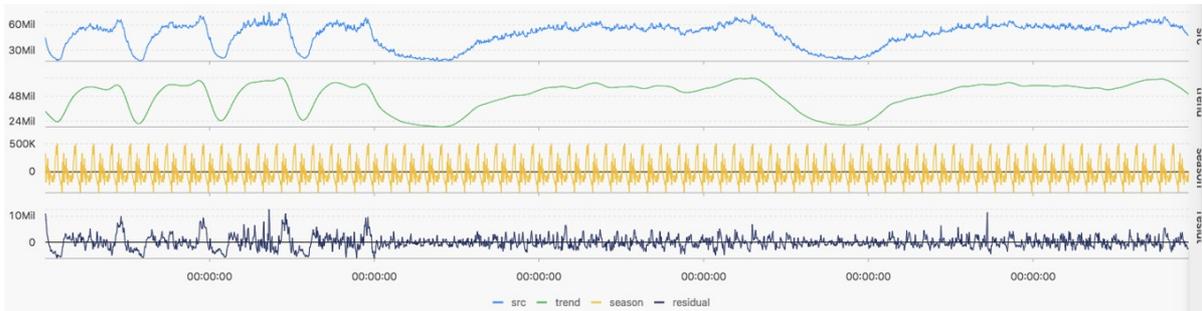

Parameter	Description	Value
x	The time sequence. The time points along the x axis are sorted in the ascending order.	Each time point is a Unix timestamp. Unit: seconds.
y	The sequence of numeric data at each specified time point.	N/A

Example:

- A search and analytic statement is shown as follows:

```
* | select ts_decompose(stamp, value) from (select __time__ - __time__ % 60 as stamp, avg(v) as value from log GROU
P BY stamp order by stamp)
```

- The following figure shows the response.

The following table lists the display items.

Display item	Description	
Horizontal axis	unixtime	The Unix timestamp of the data. Unit: seconds.
Vertical axis	src	The raw time series data.
	trend	The decomposed data that indicates the trend of the time series data.
	season	The decomposed data that indicates the periodicity of the time series data.
	residual	The residual data decomposed from the time series data.

30.4.9.8. Time series clustering functions

You can use time series clustering functions to cluster multiple time series and obtain different curve shapes. Then, you can find the cluster center and identify curves with shapes that are different from other curve shapes in the cluster in a timely manner.

Functions

Function	Description
<code>ts_density_cluster</code>	Uses a density-based clustering method to cluster multiple time series.
<code>ts_hierarchical_cluster</code>	Uses a hierarchical clustering method to cluster multiple time series.
<code>ts_similar_instance</code>	Queries time series curves that are similar to a specified time series curve.

ts_density_cluster

Syntax:

```
select ts_density_cluster(x, y, z)
```

The following table lists the parameters of the function.

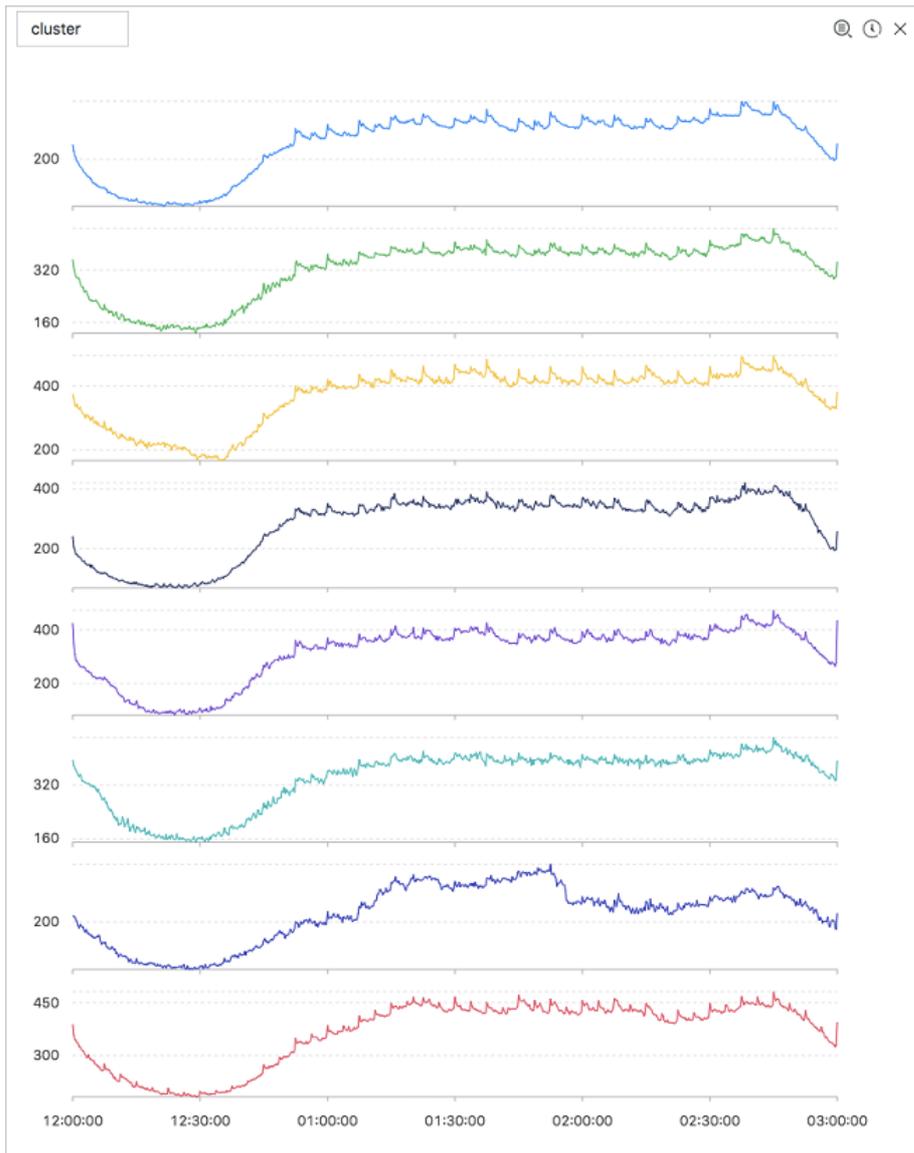

Parameter	Description	Value
<i>x</i>	The time sequence. The time points along the x axis are sorted in the ascending order.	Each time point is a Unix timestamp. Unit: seconds.
<i>y</i>	The sequence of numeric data at each specified time point.	N/A
<i>z</i>	The name of the metric that monitors the data at each time point.	The metric name is a string, for example, machine01.cpu_usr.

Example:

- A search and analytic statement is shown as follows:

```
* and (h: "machine_01" OR h: "machine_02" OR h: "machine_03") | select ts_density_cluster(stamp, metric_value, metric_name) from ( select __time__ - __time__ % 600 as stamp, avg(v) as metric_value, h as metric_name from log GROUP BY stamp, metric_name order BY metric_name, stamp )
```

- The following figure shows the response.

The following table lists the display items.

Display item	Description
cluster_id	The category of the cluster. The value -1 indicates that the cluster is not categorized in any cluster center.
rate	The proportion of instances in the cluster.
time_series	The timestamp sequence of the cluster center.
data_series	The data sequence of the cluster center.
instance_names	The instances that are included in the cluster center.
sim_instance	The name of an instance in the cluster.

ts_hierarchical_cluster

Syntax:

```
select ts_hierarchical_cluster(x, y, z)
```

The following table lists the parameters of the function.

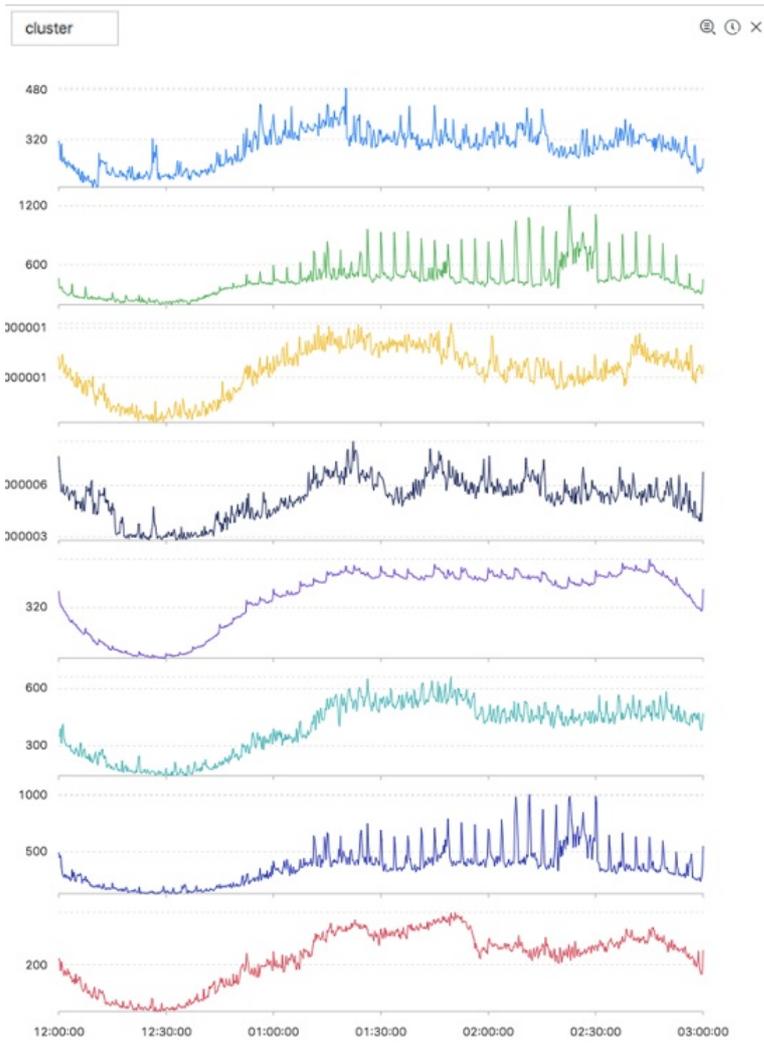

Parameter	Description	Value
<i>x</i>	The time sequence. The time points along the x axis are sorted in the ascending order.	Each time point is a Unix timestamp. Unit: seconds.
<i>y</i>	The sequence of numeric data at each specified time point.	N/A
<i>z</i>	The name of the metric that monitors the data at each time point.	The metric name is a string, for example, machine01.cpu_usr.

Example:

- A search and analytic statement is shown as follows:

```
* and (h: "machine_01" OR h: "machine_02" OR h: "machine_03") | select ts_hierarchical_cluster(stamp, metric_value, metric_name) from ( select __time__ - __time__ % 600 as stamp, avg(v) as metric_value, h as metric_name from log GR OUP BY stamp, metric_name order BY metric_name, stamp )
```

- The following figure shows the response.

The following table lists the display items.

Display item	Description
cluster_id	The category of the cluster. The value -1 indicates that the cluster is not categorized in any cluster center.
rate	The proportion of instances in the cluster.
time_series	The timestamp sequence of the cluster center.
data_series	The data sequence of the cluster center.
instance_names	The instances that are included in the cluster center.
sim_instance	The name of an instance in the cluster.

ts_similar_instance

Syntax:

```
select ts_similar_instance(x, y, z, instance_name, topK, metricType)
```

The following table lists the parameters of the function.

Parameter	Description	Value
<i>x</i>	The time sequence. The time points along the x axis are sorted in the ascending order.	Each time point is a Unix timestamp. Unit: seconds.
<i>y</i>	The sequence of numeric data at each specified time point.	N/A
<i>z</i>	The name of the metric that monitors the data at each time point.	The metric name is a string, for example, machine01.cpu_usr.
<i>instance_name</i>	The name of the specified metric.	The metric name is a string, for example, machine01.cpu_usr.  Note You must specify an existing metric.
<i>topK</i>	The maximum number of curves that are similar to the specified curve can be returned.	N/A
<i>metricType</i>	{'shape', 'manhattan', 'euclidean'} : the metrics used to measure the similarity between time series curves.	N/A

An example search and analytic statement is shown as follows:

```
* and m: NET and m: Tcp and (h: "nu4e01524.nu8" OR h: "nu2i10267.nu8" OR h: "nu4q10466.nu8") | select ts_similar_instance(stamp, metric_value, metric_name, 'nu4e01524.nu8') from ( select __time__ - __time__ % 600 as stamp, sum(v) as metric_value, h as metric_name from log GROUP BY stamp, metric_name order BY metric_name, stamp )
```

The following table lists the display items.

Display item	Description
instance_name	The list of metrics whose results are similar to the results of the specified metric.
time_series	The timestamp sequence of the cluster center.
data_series	The data sequence of the cluster center.

30.4.9.9. Frequent pattern statistics function

The frequent pattern statistics function mines representative combinations of attributes from a specified multi-attribute field sample.

pattern_stat

Syntax:

```
select pattern_stat(array[col1, col2, col3], array['col1_name', 'col2_name', 'col3_name'], array[col5, col6], array['col5_name', 'col6_name'], supportScore, sample_ratio)
```

The following table lists the parameters of the function.

Parameter	Description	Value
<i>array[col1, col2, col3]</i>	A column of values of the character data type.	An array of values, for example, array[clientIP, sourceIP, path, logstore].
<i>array['col1_name', 'col2_name', 'col3_name']</i>	The field names of the values of the character data type.	An array of field names, for example, array['clientIP', 'sourceIP', 'path', 'logstore'].
<i>array[col5, col6]</i>	A column of values of the numeric data type.	An array of values, for example, array[Inflow, OutFlow].
<i>array['col5_name', 'col6_name']</i>	The field names of the values of the numeric data type.	An array of field names, for example, array[originflow, 'OutFlow'].
<i>supportScore</i>	The support ratio of samples for pattern mining.	The value is of the DOUBLE data type. Valid values: (0,1).
<i>sample_ratio</i>	The sampling ratio. The default value is 0.1, which indicates that 10% of samples are used.	The value is of the DOUBLE data type. Valid values: (0,1).

- A search and analytic statement is shown as follows:

```
* | select pattern_stat(array[ Category, ClientIP, ProjectName, LogStore, Method, Source, UserAgent ], array[ 'Category', 'ClientIP', 'ProjectName', 'LogStore', 'Method', 'Source', 'UserAgent' ], array[ InFlow, OutFlow ], array[ 'InFlow', 'OutFlow' ], 0.45, 0.3) limit 1000
```

- Display item

Display item	Description
count	The number of samples in the current pattern.
supportScore	The support ratio for the current pattern.

Display item	Description
pattern	The content of the pattern, organized in the format that is defined by the query conditions.

30.4.9.10. Differential pattern statistics function

The differential pattern statistics function analyzes differential patterns of specified multi-field samples based on the specified condition. It helps you identify the causes of the differences under the current condition in a timely manner.

pattern_diff

Syntax:

```
select pattern_diff(array_char_value, array_char_name, array_numeric_value, array_numeric_name, condition, supportScore, posSampleRatio, negSampleRatio )
```

The following table lists the parameters of the function.

Parameter	Description	Value
<i>array_char_value</i>	A column of values of the character data type.	An array of values, for example, array[clientIP, sourceIP, path, logstore].
<i>array_char_name</i>	The field names of the values of the character data type.	An array of field names, for example, array['clientIP', 'sourceIP', 'path', 'logstore'].
<i>array_numeric_value</i>	A column of values of the numeric data type.	An array of values, for example, array[Inflow, OutFlow].
<i>array_numeric_name</i>	The field names of the values of the numeric data type.	An array of field names, for example, array[originflow, 'OutFlow'].
<i>condition</i>	The condition for filtering data. The value True indicates positive samples, and the value False indicates negative samples.	For example, Latency <= 300.
<i>supportScore</i>	The support ratio of positive and negative samples for pattern mining.	The value is of the DOUBLE data type. Valid values: (0,1].
<i>posSampleRatio</i>	The sampling ratio of positive samples. The default value is 0.5, indicating that 50% of positive samples are collected.	The value is of the DOUBLE data type. Valid values: (0,1].
<i>negSampleRatio</i>	The sampling ratio of negative samples. The default value is 0.5, indicating that 50% of positive samples are collected.	The value is of the DOUBLE data type. Valid values: (0,1].

Example:

- A search and analytic statement is shown as follows:

```
* | select pattern_diff(array[ Category, ClientIP, ProjectName, LogStore, Method, Source, UserAgent ], array[ 'Category', 'ClientIP', 'ProjectName', 'LogStore', 'Method', 'Source', 'UserAgent' ], array[ InFlow, OutFlow ], array[ 'InFlow', 'OutFlow' ], Latency > 300, 0.2, 0.1, 1.0) limit 1000
```

- Display item

Display item	Description
possupport	The support ratio of positive samples for the mined patterns.
posconfidence	The confidence level of the mined patterns in positive samples.
negsupport	The support ratio of negative samples for the mined patterns.
diffpattern	The content of the mined patterns.

30.4.9.11. Root cause analysis function

Log Service provides the alert and analytics features that help you quickly analyze data and locate anomalies of specific subdimensions of a metric. You can use the root cause analysis function to analyze the subdimension attributes that result in anomalies of the monitoring metric.

rca_kpi_search

Syntax

```
select rca_kpi_search(vvarchar_array, name_array, real, forecast, level)
```

The following table lists the parameters of the function.

Parameter	Description	Value
<i>vvarchar_array</i>	The subdimension attributes.	The parameter value is formatted in an array, for example, array[col1, col2, col3].
<i>name_array</i>	The subdimension attribute names.	The parameter value is formatted in an array, for example, array['col1', 'col2', 'col3'].
<i>real</i>	The actual value of each subdimension attribute specified by the <i>vvarchar_array</i> parameter.	The parameter value is of the DOUBLE data type. Valid values: all real numbers.
<i>forecast</i>	The predicted value of each subdimension attribute specified by the <i>vvarchar_array</i> parameter.	The parameter value is of the DOUBLE data type. Valid values: all real numbers.
<i>level</i>	The number of subdimension attributes identified in the returned root cause set. The value 0 indicates that all root causes that are found are returned.	The parameter value is of the LONG data type. Valid values: [0, number of analyzed subdimensions]. The number of analyzed subdimensions is the length of the array specified by the <i>vvarchar_array</i> parameter.

Example:

- The search and analytic statement is shown as follows:

Use a subquery to obtain the actual value and predicted value of each subdimension attribute, and then call the `rca_kpi_search` function to analyze the root causes of anomalies.

```
* not Status:200 |
select rca_kpi_search(
  array[ ProjectName, LogStore, UserAgent, Method ],
  array[ 'ProjectName', 'LogStore', 'UserAgent', 'Method' ], real, forecast, 1)
from (
  select ProjectName, LogStore, UserAgent, Method,
  sum(case when time < 1552436040 then real else 0 end) * 1.0 / sum(case when time < 1552436040
  then 1 else 0 end) as forecast,
  sum(case when time >=1552436040 then real else 0 end) *1.0 / sum(case when time >= 1552436040
  then 1 else 0 end) as real
  from (
  select __time__ - __time__ % 60 as time, ProjectName, LogStore, UserAgent, Method, COUNT(*) as real
  from log GROUP by time, ProjectName, LogStore, UserAgent, Method )
  GROUP BY ProjectName, LogStore, UserAgent, Method limit 100000000)
```

- The following figure shows the response.

The following figure shows the structured response.

```
{
  "rcSets": [
    {
      "rcItems": [
        {
          "kpi": [{"attr": "xxx", "val": "xxx"}],
          "nleaf": 100,
          "change": 0.524543,
          "score": 0.1454543
        }
      ]
    }
  ]
}
```

The following table lists the display items.

Display item	Description
<i>rcSets</i>	The root cause sets. Each value of this parameter is an array.
<i>rcltems</i>	A specific root cause set.

Display item	Description
<i>kpi</i>	A specific item in the root cause set. Each item is formatted in an array where each element is a JSON object. The <code>attr</code> parameter indicates the subdimension name, and the <code>val</code> parameter indicates the attribute name under the subdimension.
<i>nleaf</i>	The number of leaf nodes that an item (KPI) in the root cause set covers in the original data. <div style="background-color: #e0f2f7; padding: 5px;"> Note Leaf node: the log entry that contains the finest-grained attribute information.</div>
<i>change</i>	The ratio of anomalies of leaf nodes in a KPI to the total anomalies in the root cause set that occurred at the same time point.
<i>score</i>	The abnormality score of the current KPI. Valid values: [0, 1].

The response is formatted in a JSON object as follows:

```

{
  "rcSets": [
    {
      "rcItems": [
        {
          "kpi": [
            {
              "attr": "country",
              "val": "*"
            },
            {
              "attr": "province",
              "val": "*"
            },
            {
              "attr": "provider",
              "val": "*"
            },
            {
              "attr": "domain",
              "val": "download.huya.com"
            },
            {
              "attr": "method",
              "val": "*"
            }
          ],
          "nleaf": 119,
          "change": 0.3180687806279939,
          "score": 0.14436007709620113
        }
      ]
    }
  ]
}

```

30.4.9.12. Correlation analysis functions

You can use a correlation analysis function to find the metrics that are correlated with a specified metric or time series data among multiple observed metrics in the system.

Functions

Function	Description
<code>ts_association_analysis</code>	Quickly finds the metrics that are correlated with a specified metric among multiple observed metrics in the system.

Function	Description
<code>ts_similar</code>	Quickly finds the metrics that are correlated with specified time series data among multiple observed metrics in the system.

ts_association_analysis

Syntax

```
select ts_association_analysis(stamp, params, names, indexName, threshold)
```

The following table lists the parameters of the function.

Parameter	Description	Value
<i>stamp</i>	The Unix timestamp of the LONG data type.	-
<i>params</i>	The metrics to be analyzed, formatted in an array where each element is of the DOUBLE data type.	The parameter value is formatted in an array where each element is of the DOUBLE data type. For example, Latency, QPS, and NetFlow.
<i>names</i>	The names of the metrics to be analyzed.	The parameter value is formatted in an array where each element is of the VARCHAR data type. For example, Latency, QPS, and NetFlow.
<i>indexName</i>	The name of the target metric.	The parameter value is of the VARCHAR data type, for example, Latency.
<i>threshold</i>	The threshold of correlation between the metrics to be analyzed and the target metric.	The parameter value is of the DOUBLE data type. Valid values: [0, 1].

Response

- **name**: the name of the metric that meets the specified correlation condition with the target metric.
- **score**: the value of correlation between the returned metric and the target metric. Valid values: [0, 1].

Sample statement

```
* | select ts_association_analysis(
  time,
  array[inflow, outflow, latency, status],
  array['inflow', 'outflow', 'latency', 'status'],
  'latency',
  0.1) from log;
```

Sample response

```
| results      |
| ----- |
| ['latency', '1.0'] |
| ['outflow', '0.6265'] |
| ['status', '0.2270'] |
```

ts_similar

Syntax 1

```
select ts_similar(stamp, value, ts, ds)
select ts_similar(stamp, value, ts, ds, metricType)
```

The following table lists the parameters of the function.

Parameter	Description	Value
<i>stamp</i>	The Unix timestamp of the LONG data type.	-
<i>value</i>	The value of the metric to be analyzed. The parameter value is of the DOUBLE data type.	-
<i>ts</i>	The time sequence of the specified time series curve. The parameter value is formatted in an array where each element is of the DOUBLE data type.	-
<i>ds</i>	The sequence of numeric data of the specified time series curve.	-
<i>metricType</i>	The type of correlation between the measured curves. The parameter value is of the VARCHAR data type.	Valid values: SHAPE, RMSE, PEARSON, SPEARMAN, R2, and KENDALL

Syntax 2

```
select ts_similar(stamp, value, startStamp, endStamp, step, ds)
select ts_similar(stamp, value, startStamp, endStamp, step, ds, metricType )
```

The following table lists the parameters of the function.

Parameter	Description	Value
<i>stamp</i>	The Unix timestamp of the LONG data type.	-
<i>value</i>	The value of the metric to be analyzed. This parameter is of the DOUBLE data type.	-
<i>startStamp</i>	The start timestamp of the specified time series curve. The parameter value is of the LONG data type.	-

Parameter	Description	Value
<i>endStamp</i>	The end timestamp of the specified time series curve. The parameter value is of the LONG data type.	-
<i>step</i>	The time interval between two adjacent data points in a time series. The parameter value is of the LONG data type.	-
<i>ds</i>	The sequence of numeric data of the specified time series curve. The parameter is formatted in an array where each element is of the DOUBLE data type.	-
<i>metricType</i>	The type of correlation between the measured curves. The parameter value is of the VARCHAR data type.	Valid values: SHAPE, RMSE, PEARSON, SPEARMAN, R2, and KENDALL

- **Response**

score: the correlation between the analyzed metric and the specified time series curve. Valid values: [-1, 1].

- **Sample statement**

```
* | select vhost, metric, ts_similar(time, value, 1560911040, 1560911065, 5, array[5.1,4.0,3.3,5.6,4.0,7.2], 'PEARSON') from log group by vhost, metric;
```

- **Sample response**

```
| vhost | metric      | score          |
|-----|-----|-----|
| vhost1 | redolog     | -0.3519082537204182 |
| vhost1 | kv_qps      | -0.15922168009772697 |
| vhost1 | file_meta_write | NaN           |
```

30.4.9.13. Kernel density estimation function

Kernel density estimation (KDE) is a non-parametric way to estimate the probability density function of a random variable.

The Kernel density estimation function uses the smooth peak function to fit the observed data points. In this way, the function simulates the real probability distribution curve.

- **Syntax**

```
select kernel_density_estimation(bigint stamp, double value, varchar kernelType)
```

- **Parameters**

Parameter	Description
stamp	The Unix timestamp of observed data. Unit: second.
value	The observed value.

Parameter	Description
kernelType	<ul style="list-style-type: none"> ◦ box: rectangle window. ◦ epanechniov: Epanechnikov curve. ◦ gausener: Gaussian curve.

• Response

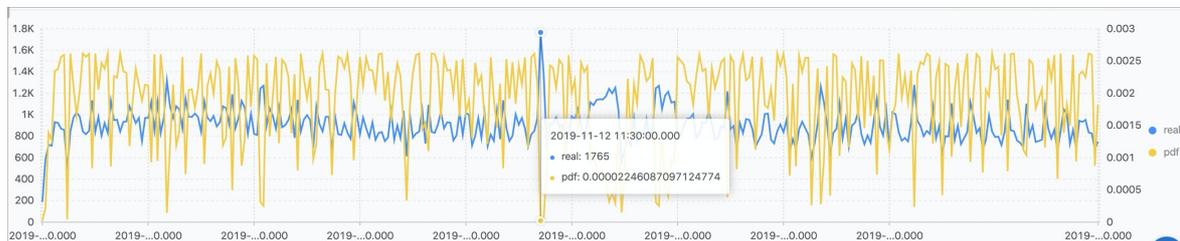

Display item	Description
unixtime	The Unix timestamp of observed data.
real	The observed value.
pdf	The probability of each observed data point.

• Example

◦ Sample statement

```
* |
select
  date_trunc('second', cast(t1[1] as bigint)) as time, t1[2] as real, t1[3] as pdf from (
    select kernel_density_estimation(time, num, 'gaussian') as res from (
      select __time__ - __time__ % 10 as time, COUNT(*) * 1.0 as num from log group by time order by time)
    ), unnest(res) as t(t1) limit 1000
```

◦ Response

30.4.10. Advanced analysis

30.4.10.1. Optimize queries

This topic describes how to optimize queries to improve query efficiency.

You can use the following methods to optimize queries:

- Increase the number of shards.
- Reduce the query time range and data volume.
- Repeat queries multiple times.
- Optimize the SQL statement for queries.

Increase the number of shards

More shards represent more computing resources and faster computing speed. You can increase the number of shards to ensure that the average number of log entries to be scanned in each shard does not exceed 50 million. You can increase the number of shards by splitting shards. For more information, see [Split a shard](#).

 **Note** Splitting shards incurs more fees and only accelerates queries of new data. Existing data is still stored in old shards.

Reduce the query time range and data volume

- The larger the time range, the slower the query. If you query data within a year or a month, data is computed by day. To facilitate computing, you can reduce the query time range.
- The larger the data volume, the slower the query. Reduce the amount of data to be queried as much as possible.

Repeat queries multiple times

If you find that the result of a query is inaccurate, you can repeat the query multiple times. The underlying acceleration mechanism ensures that each query uses the previous query result to analyze data. In this way, multiple queries make the query result more accurate.

Optimize the SQL statement for queries

A time-consuming query statement has the following characteristics:

- Performs the GROUP BY operation on string-type columns.
- Performs the GROUP BY operation on more than five fields.
- Includes operations that generates strings.

You can use the following methods to optimize a query statement:

- Avoid operations that generate strings if possible.
 - If you use the date_format function to generate a formatted timestamp, the query is inefficient.

```
* | select date_format(from_unixtime(__time__), '%H:%i') as t, count(1) group by t
```

- If you use the substr() function, strings are generated. We recommend that you use the date_trunc or time_series function in a query statement.
- Avoid performing the GROUP BY operation on string-formatted columns if possible.

Performing the GROUP BY operation on strings may result in a large number of hash calculations, which account for more than 50% of total calculations. Examples:

```
* | select count(1) as pv, date_trunc('hour', __time__) as time group by time
* | select count(1) as pv, from_unixtime(__time__ - __time__ % 3600) as time group by __time__ - __time__ % 3600
```

Both query 1 and query 2 count the number of log entries per hour. However, query 1 converts the time into a string, for example, 2017-12-12 00:00:00, and then performs the GROUP BY operation on this string. Query 2 calculates the on-the-hour time value, performs the GROUP BY operation on the result, and then converts the value into a string. Query 1 is less efficient than query 2 because query 1 needs to hash strings.

- List fields alphabetically based on the initial letter when performing the GROUP BY operation on multiple columns.

For example, you need to query 100 million users who are from 13 provinces.

```
Fast: * | select province,uid,count(1)groupby province,uid
Slow: * | select province,uid,count(1)groupby uid,province
```

- Use estimating functions.

Estimating functions provide stronger performance than accurate calculation. In estimation, accuracy is compromised to an acceptable extent for fast calculation.

```
Fast: * |select approx_distinct(ip)
Slow: * | select count(distinct(ip))
```

- Specify only required columns in the SQL statement if possible.

You can specify all columns in the search statement. In the SQL statement, specify only required columns if possible. This will speed up calculation.

```
Fast: * |select a,b c
Slow: * |select *
```

- Place columns that do not need to be grouped in an aggregate function if possible.

For example, a user ID is associated with a username. Therefore, you can execute the Group By operation on user IDs to analyze data.

```
Fast: * | select userid, arbitrary(username), count(1)groupby userid
Slow: * | select userid, username, count(1)groupby userid,username
```

- Avoid using the IN operator if possible.

If possible, avoid using the IN clause in SQL statements. Instead, use the OR clause.

```
Fast: key : a or key :b or key:c | select count(1)
Slow: * | select count(1) where key in ('a','b')
```

30.4.10.2. Use cases

This topic provides some use cases of log data analysis.

Trigger an alert when the error rate exceeds 40% over the last 5 minutes

Calculate the percentage of 500 Internal Server Error every minute. An alert is triggered when the error rate exceeds 40% over the last 5 minutes.

```
status:500 | select __topic__, max_by(error_count>window_time)/1.0/sum(error_count) as error_ratio, sum(error_count)
as total_error from (
select __topic__, count(*) as error_count , __time__ - __time__ % 300 as window_time from log group by __topic__, windo
w_time
)
group by __topic__ having max_by(error_count>window_time)/1.0/sum(error_count) > 0.4 and sum(error_count) > 500
order by total_error desc limit 100
```

Calculate the amount of transferred data and configure alerts

Calculate the amount of transferred data every minute. An alert is triggered when transferred data plunges. Transferred data counted in the last minute does not cover a full minute. The `(max(time) - min(time))` clause is used for normalization to count the average traffic per minute.

```
* | SELECT SUM(inflow) / (max(__time__) - min(__time__)) as inflow_per_minute, date_trunc('minute',__time__) as minut
e group by minute
```

Calculate the average latency of traffic data in different sizes

Distribute traffic data to multiple bins based on the data size and calculate the average latency of the data in the bins.

```
* | select avg(latency) as latency , case when originSize < 5000 then 's1' when originSize < 20000 then 's2' when originSi
ze < 500000 then 's3' when originSize < 100000000 then 's4' else 's5' end as os group by os
```

Retrieve the percentages of different results

List the number and the percentage of each result for different departments. This query includes subqueries and window functions. The `sum(c) over()` clause indicates the sum of values in all rows.

```
* | select department, c*1.0/ sum(c) over () from(select count(1) as c, department from log group by department)
```

Count the number of log entries that meet the query condition

To count the number of URLs based on their characteristics, you can use the `CASE WHEN` clause or the `COUNT_IF` clause. The latter clause is simpler.

```
* | select count_if(uri like '%login') as login_num, count_if(uri like '%register') as register_num, date_format(date_trunc('minute', __time__), '%m-%d %H:%i') as time group by time order by time limit 100
```

30.4.10.3. Time field conversion examples

During search and analytics, you often need to process time fields in log data, such as converting a timestamp to another time format. This topic uses some examples to describe how to convert time fields.

A log entry may include multiple time fields, for example:

- `__time__`: the time that you specify when you use the API or SDK to write log data. This field can be used for log data shipping, search, and analytics.
- Original time field in log data: the field that records the time when the log data is generated. This field is in raw logs.

Time fields in different formats are difficult to read. To simplify the read process, you can convert the time format during search and analytics. For example, you can perform the following conversions:

1. [Convert __time__ to a timestamp](#)
2. [Display __time__ in a specified format](#)
3. [Convert a timestamp to a specified format](#)

Convert __time__ to a timestamp

You can use the `from_unixtime` function to convert the `__time__` field to a timestamp.

```
* | select from_unixtime(__time__)
```

Display __time__ in a specified format

To display the `__time__` field in the format of `YYYY-MM-DD HH:MM:SS`, you can use the `date_format` function.

```
* | select date_format(__time__, '%Y-%m-%d %H:%i:%S')
```

Convert the time in a log to a specified format

To convert the time field in a log to the specified format (`YYYY-MM-DD HH:MM:SS`) and perform the `GROUP BY` operation on the `YYYY-MM-DD` part, you can use the `date_format` function.

- Sample log entry

```
__topic__:
body_byte_sent: 307
hostname: www.host1.com
http_user_agent: Mozilla/5.0 (iPhone; CPU iPhone OS 10_3_3 like Mac OS X) AppleWebKit/603.3.8 (KHTML, like Gecko)
Mobile/14G60 QQ/7.1.8.452 V1_IPH_SQ_7.1.8_1_APP_A Pixel/750 Core/UIWebView NetType/WIFI QBWebViewType/1
method: GET
referer: www.host0.com
remote_addr: 36.63.1.23
request_length: 111
request_time: 2.705
status: 200
upstream_response_time: 0.225582883754
url: /? k0=v9&
time:2017-05-17 09:45:00
```

- Example SQL statement

```
* | select date_format (date_parse(time,'%Y-%m-%d %H:%i:%S'), '%Y-%m-%d') as day, count(1) as uv group by day or
der by day asc
```

30.4.11. Visual analysis

30.4.11.1. Analysis graph

30.4.11.1.1. Overview

All search and analytics results can be rendered by using visualized charts.

Prerequisites

- The index feature is enabled and configured. The analytics switches are turned on. For more information, see [Enable the index feature and configure indexes for a Logstore](#).
- An analytic statement is included in a query statement. You cannot use charts to show query results if you do not include an analytic statement in your query statement.

Precautions

When multiple search and analytic statements are being executed in sequence, the **Value Column**, **X Axis**, or **Y Axis** information cannot automatically change based on the search and analytic statement. The X and Y axis information may remain the same as the last search and analytic statement. If this happens, the query results of the current search and analytic statement cannot be automatically displayed in a chart. If the following messages are returned, configure parameters on the **Properties** tab based on the current search and analytic statement:

- The currently selected dimensions are not in the queried results. Check and configure the attributes.
- X-Axis or Y-Axis is not available. Check and configure the attributes.

Chart configurations

On the **Graph** tab, various charts are provided to show query results. You can select a type of chart from the chart bar to show results.

- On the **Graph** tab, you can view the **Chart Preview** and **Data Preview** of query results of the current search and analytic statement. **Chart Preview** is the preview of the query results that are displayed in the specified type of chart. **Data Preview** displays the query results in a table.

- On the **Graph** tab on the right, you can configure the following chart properties:
 - **Data Source:** used to set placeholder variables. For example, you configure the drill-down event of Chart A to redirect to the dashboard where Chart B is located. The placeholder variable you configured for Chart B is the same as the variable that you click to trigger the drill-down event. Then the placeholder variable is replaced with the variable you click to trigger the drill-down event and the search and analytic statement of Chart B is executed. For more information, see [Drill-down analysis](#).

This feature is applicable to scenarios where you configure drill-down events to redirect to targeted dashboards.

- **Properties:** used to configure the display properties of a chart, including the X axis, left and right Y axes, margins, font size and other properties. The properties vary with different type of charts.

This feature is applicable to all search and analytics scenarios.

- **Interactive Behavior:** used to configure drill-down events for a chart. After you configure a drill-down event for the chart, you can click the variable value in the chart to trigger the specified drill-down event. For more information, see [Drill-down analysis](#).

This feature is applicable to triggering drill-down events for charts.

30.4.11.1.2. Table

Tables are the most common method to sort and display data for reference and analysis. All search and analytics results in Log Service can be rendered by using visualized charts. By default, the query results are displayed in a table.

Components

- Table header
- Row
- Column

where,

- You can use a `SELECT` statement to specify the number of columns.
- The number of rows is computed based on the number of log entries in the specified time range. The default clause is `LIMIT 100`.

Procedure

1. On the Search & Analysis page of a Logstore, enter a search and analytic statement in the search box, specify the time range, and then click **Search & Analysis**.
2. On the **Graph** tab that appears, view the data in a table. You do not need to click .
3. On the **Properties** tab on the right, configure the properties of the table.

Properties

Parameter	Description
Items per Page	The number of entries to return on each page.
Zebra Striping	Specifies whether to display the query results in a zebra-striped table.
Transpose Rows and Columns	Specifies whether to transpose rows and columns.
Hide Reserved Fields	Specifies whether to hide reserved fields.
Disable Sorting	Specifies whether to disable the sorting feature.

Parameter	Description
Disable Search	Specifies whether to disable the search feature.
Highlight Settings	The rules for highlighting rows or columns that conform to rules.

30.4.11.1.3. Line chart

A line chart is used to analyze the value changes of fields based on an ordered data type (a continuous time range in most cases).

You can use a line chart to analyze the following change characteristics of field values over a period:

- Increment or decrement
- Increment or decrement rate
- Increment or decrement pattern, for example, periodicity
- Peak value and valley value

Line charts are suitable for analyzing field value changes over time. You can also use a line chart to analyze the value changes of multiple fields in multiple lines over the same period and reveal the relationship between the fields. For example, the values of multiple fields are positively or negatively associated with each other.

Components

- X-axis
- Left Y-axis
- (Optional) Right Y-axis
- Data point
- Line of changing trend
- Legend

Procedure

1. On the Search & Analysis page of a Logstore, enter a search and analytic statement in the search box, specify the time range, and then click **Search & Analyze**.
2. On the Graph tab, click  to select the line chart.
3. On the Properties tab on the right, configure the properties of the line chart.

 **Note** In a line chart, a single line must contain more than two data points. Otherwise, the data trend cannot be analyzed. We recommend that you configure no more than five lines in a line chart.

Properties

Parameter	Description
X Axis	The data on the X-axis, which is usually a time sequence.
Left Y Axis	The numeric data on the left Y-axis. You can configure one or more fields for the left Y-axis.
Right Y Axis	The numeric data on the right Y-axis. You can configure one or more fields for the right Y-axis. The layer of the right Y-axis is higher than that of the left Y-axis.

Parameter	Description
Column Marker	The column on the left Y-axis or right Y-axis that is selected as a histogram.
Legend	The position where the legend is located in the chart. Valid values: Top, Bottom, Left, and Right.
Format Left Y-axis	The format in which data configured on the left Y-axis and right Y-axis is displayed.
Format Right Y-axis	
Margin	The distance of the axis to the borders of the chart, including Top Margin, Bottom Margin, Right Margin, and Left Margin.

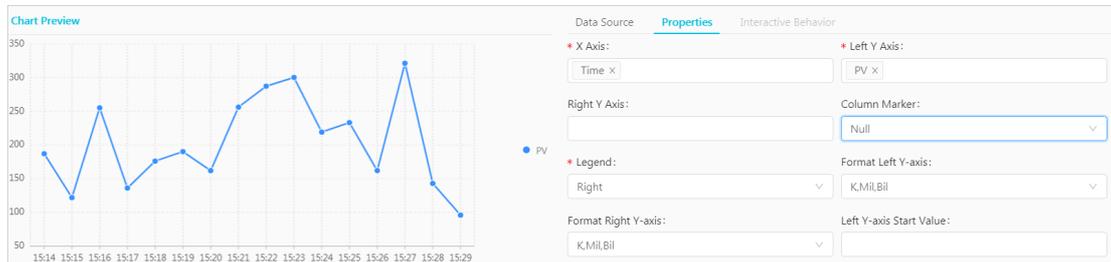

Example of a simple line chart

To query the page views (PVs) of the IP address 10.0.192.0 in the last 24 hours, execute the following statement:

```
remote_addr: 10.0.192.0 | select date_format(date_trunc('hour', __time__), '%m-%d %H:%i')
as time, count(1) as PV group by time order by time limit 1000
```

Select **time** for X Axis, **PV** for Left Y Axis, and **Bottom** for Legend. Adjust the margins based on your needs.

Simple line chart

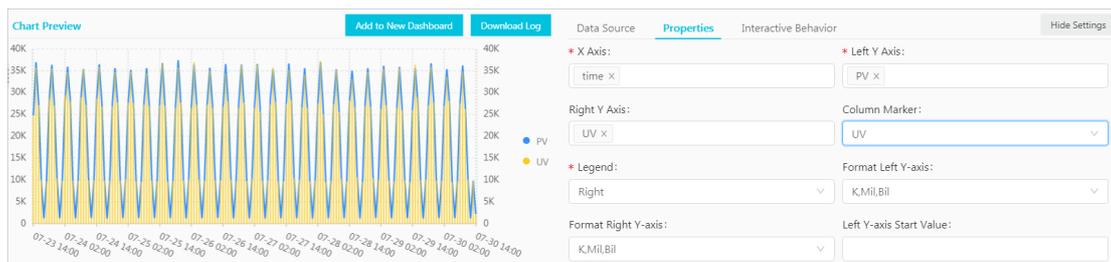

Example of a dual Y-axis line chart

To query the access PVs and unique visitors (UVs) in the last 24 hours, execute the following statement:

```
* | select date_format(date_trunc('hour', __time__), '%m-%d %H:%i') as time, count(1) as PV, approx_distinct(remote_ad
dr) as UV group by time order by time limit 1000
```

Select **time** for X Axis, **PV** for Left Y Axis, **UV** for Right Y Axis, and **PV** for Column Marker.

Dual Y-axis line chart

30.4.11.1.4. Column chart

A column chart uses vertical or horizontal bars to present categorical values and count the number of values in each category. In contrast, a line chart describes ordered data.

Components

- X-axis (horizontal)
- Y-axis (vertical)
- Rectangular block
- Legend

By default, column charts in Log Service use vertical bars. Each rectangular bar has a fixed width and a varying height that indicates a value. You can use a grouped column chart to display the data if multiple columns of data are configured for the Y-axis.

Procedure

1. On the Search & Analysis page of a Logstore, enter a search and analytic statement in the search box, specify the time range, and then click **Search & Analyze**.
2. On the Graph tab, click  to select the column chart.
3. On the Properties tab on the right, configure the properties of the column chart.

 **Note** Column charts are suitable to display query results if the number of returned log entries is no greater than 20. You can use a `LIMIT` clause to control the number of categorical rectangular bars. Analysis results may not be clearly displayed if the chart contains excessive rectangular bars. In addition, we recommend that you configure no more than five fields for the Y-axis.

Properties

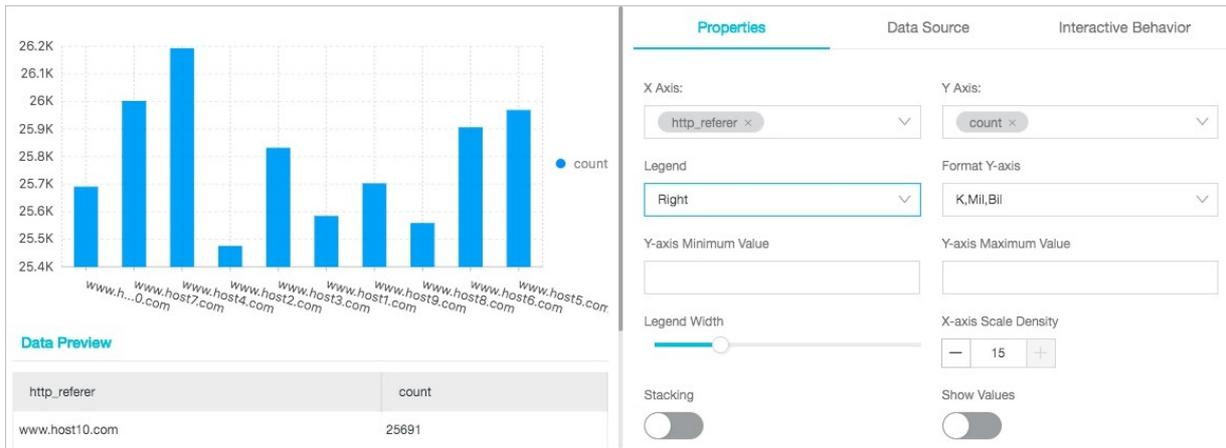

Parameter	Description
X Axis	The categorical data.
Y Axis	The numeric data. You can configure one or more fields for the Y-axis.
Legend	The position where the legend is located in the chart. Valid values: Top, Bottom, Left, and Right.
Format	The format in which data configured for the Y-axis is displayed.
Margin	The distance of the axis to the borders of the chart, including Top Margin, Bottom Margin, Right Margin, and Left Margin.

Example of a simple column chart

To query the number of requests for each `http_referer` in the specified time range, execute the following statement:

```
* | select http_referer, count(1) as count group by http_referer
```

Select `http_referer` for X Axis and `count` for Y Axis.

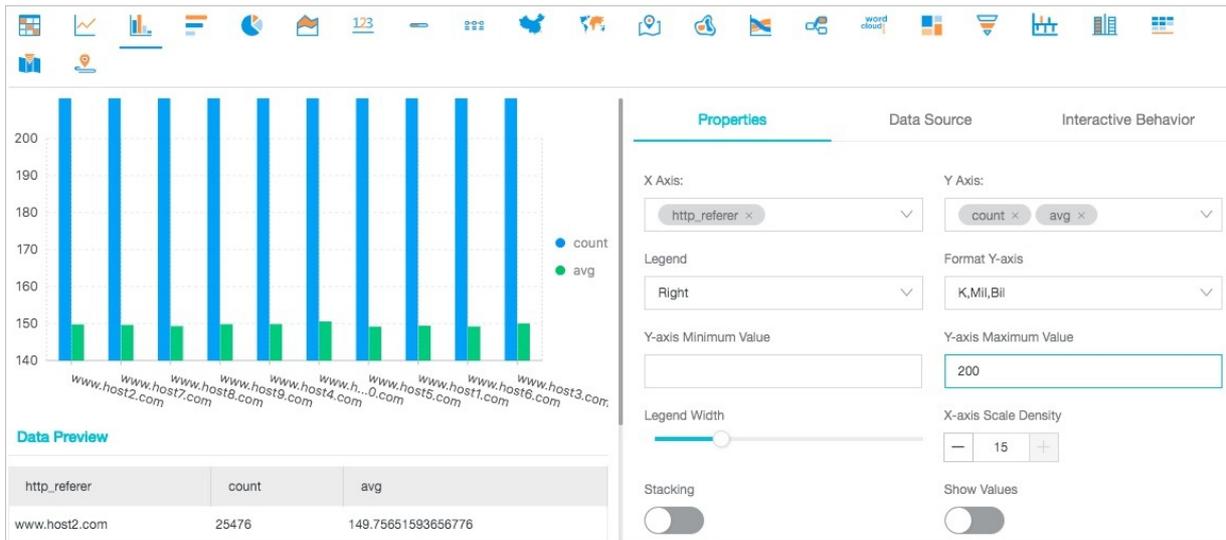

Example of a grouped column chart

To query the number of requests and the average bytes for each `http_referer` in the specified time range, execute the following statement:

```
* | select http_referer, count(1) as count, avg(body_bytes_sent) as avg group by http_referer
```

Select `http_referer` for X Axis. Select `count` and `avg` for Y Axis.

30.4.11.1.5. Bar chart

A bar chart is a horizontal column chart. It is used to analyze the top N values of fields. It is configured in a way similar to a column chart.

Components

- X-axis (vertical)
- Y-axis (horizontal)
- Rectangular block
- Legend

Each rectangular bar has a fixed height and a varying width that indicates a value. You can use a grouped bar chart to display the data if multiple columns of data are configured for the Y-axis.

Procedure

1. On the Search & Analysis page of a Logstore, enter a search and analytic statement in the search box, specify the time range, and then click **Search & Analyze**.
2. On the Graph tab, select the bar chart .
3. On the Properties tab on the right, configure the properties of the bar chart.

Note

- Bar charts are suitable to show query results if the number of returned log entries is no greater than 20. You can use a `LIMIT` clause to control the number of categorical rectangular bars. Analysis results may not be clearly displayed if the chart contains excessive rectangular bars. You can use an `ORDER BY` clause to analyze the top N values of fields. In addition, we recommend that you configure no more than five fields for the Y-axis.
- You can use a grouped bar chart to show query results. However, the values represented by each rectangular bar in a group must be positively or negatively associated with each other.

Properties

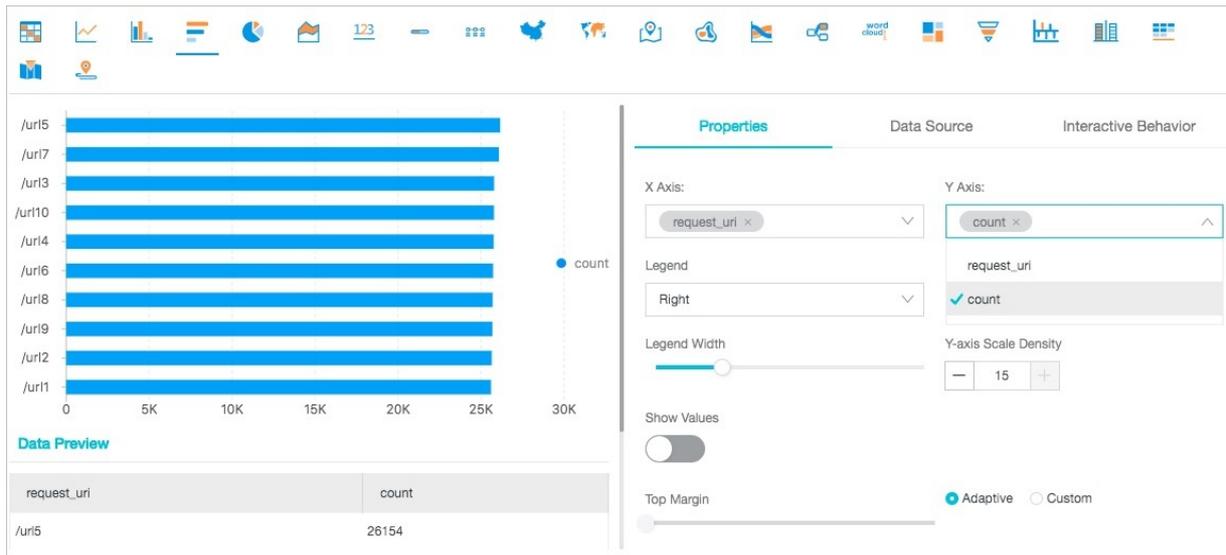

Parameters

Parameter	Description
X Axis	The categorical data.
Y Axis	The numeric data. You can configure one or more fields for the Y-axis.
Legend	The position where the legend is located in the chart. Valid values: Top, Bottom, Left, and Right.
Format X-axis	The format in which data configured for the X-axis is displayed.
Margin	The distance of the axis to the borders of the chart, including Top Margin, Bottom Margin, Right Margin, and Left Margin.

Examples

To analyze the `request_uri` with the top 10 number of visits and display the analysis results in a bar chart, execute the following statement:

```
* | select request_uri, count(1) as count group by request_uri order by count desc limit 10
```

30.4.11.1.6. Pie chart

A pie chart is used to analyze the percentages of the number of occurrences of different field values based on the arc length.

Components

- Sector
- Percentage in the text format
- Legend

Types

Log Service provides three types of pie charts: the default pie chart, the donut chart, and the polar area chart.

- Pie Chart

A pie chart is divided into multiple sectors based on the percentages of various field values. The entire chart indicates all field values. Each arc-shaped sector indicates the percentage of the occurrences of a field value to the total occurrences. The sum of percentages in all sectors is equal to 100%.

- Donut chart

A donut chart is a pie chart with a hollow center. It has the following features:

- A donut chart displays the total number of occurrences in addition to the information that a basic pie chart can display.
- You can obtain the differences between the number of occurrences of the same value in two charts based on the ring length. This is more intuitive than when you compare two pie charts.

- Polar area chart

A polar area chart is not a donut chart, but a column chart in the polar coordinate system. Each category of field values is represented by a sector with the same radian. The radius of a sector indicates the number of occurrences of a field value. Compared with a pie chart, a polar area chart has the following features:

- Pie charts are suitable to display query results if the number of returned log entries is no greater than 10. Polar area charts are suitable to display query results if the number of returned log entries ranges from 10 to 30.
- The area of a sector is proportional to its radius squared. Therefore, the polar area chart can highlight the differences between the number of occurrences of various values. It is especially suitable for comparing the number of occurrences of similar values.

- A circle can be used to display a periodic pattern. Therefore, you can use a polar area chart to analyze value change characteristics in specified periods, such as weeks and months.

Procedure

1. On the Search & Analysis page of a Logstore, enter a search and analytic statement in the search box, specify the time range, and then click **Search & Analyze**.
2. On the Graph tab, click  to select the pie chart.
3. On the **Properties** tab on the right, configure the properties of the pie chart.

Note

- Pie charts and donut charts can be used to display query results if the number of returned log entries is no greater than 10. You can use a `LIMIT` clause to control the number of sectors. Analysis results may not be clearly displayed if the chart contains excessive sectors of different colors.
- Use the polar area chart or column chart if the number of log entries exceeds 10.

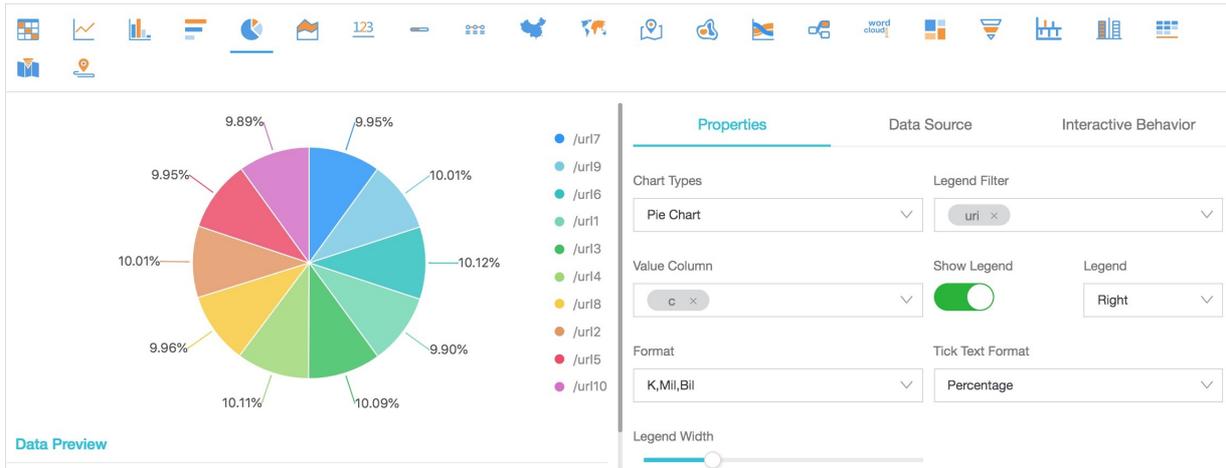

Properties

Parameter	Description
Chart Types	The type of the chart. Valid values: Pie Chart, Donut Chart, and Polar Area Chart. Default value: Pie Chart.
Legend Filter	The categorical data.
Value Column	The values corresponding to different categories of data.
Show Legend	Specifies whether to show the legend.
Legend	The position where the legend is located in the chart. Valid values: Top, Bottom, Left, and Right. You can configure this parameter only after you turn on the Show Legend switch.
Format	The format in which data is displayed.
Tick Text Format	The format of the tick.
Margin	The distance of the axis to the borders of the chart, including Top Margin, Bottom Margin, Right Margin, and Left Margin.

Example of a pie chart

To analyze the percentage of the access `requestURI`, execute the following statement:

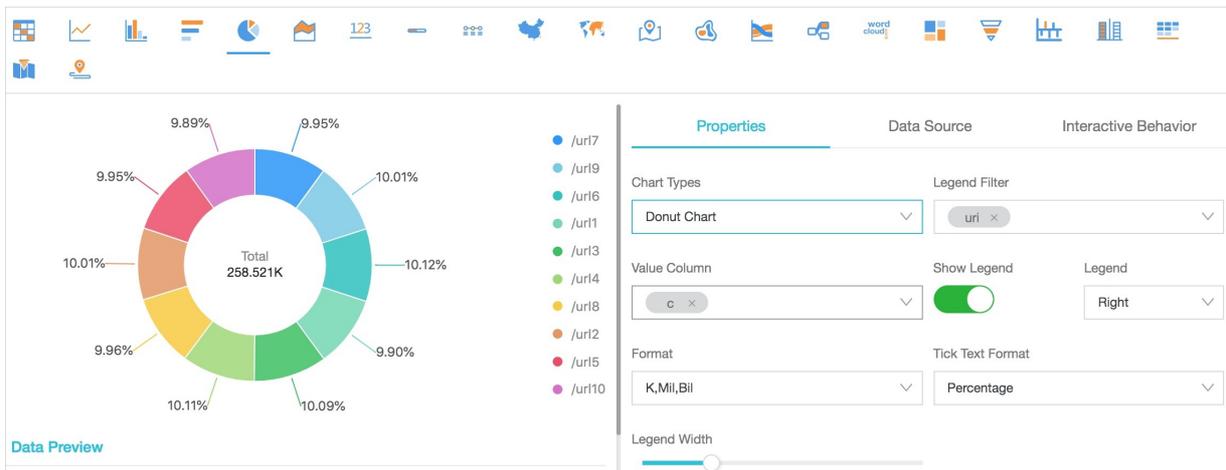

```
* | select requestURI as uri , count(1) as c group by uri limit 10
```

Example of a donut chart

To analyze the percentage of the access `requestURI` , execute the following statement:

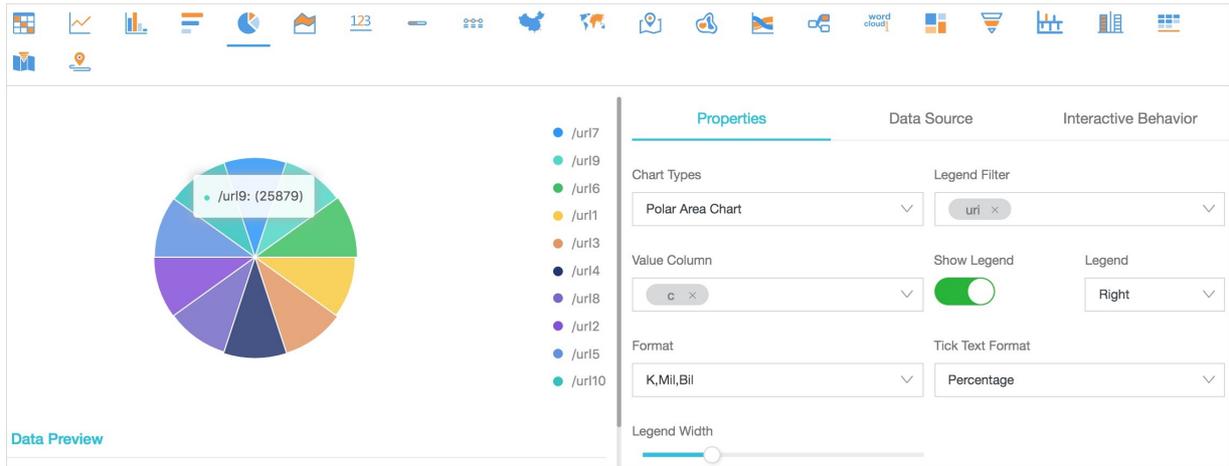

```
* | select requestURI as uri , count(1) as c group by uri limit 10
```

Example of a polar area chart

To analyze the percentage of the access `requestURI` , execute the following statement:

```
* | select requestURI as uri , count(1) as c group by uri limit 10
```

30.4.11.1.7. Area chart

An area chart is constructed based on a line chart. An area chart is the section between a line and the axis that is filled with a color. The color highlights the trend. Similar to a line chart, an area chart emphasizes the numeric value changes over time and is used to highlight the overall data trend. Both the line chart and the area chart indicate the trend and relationship of numeric values. They are not suitable if you want to display specific values.

Components

- X-axis (horizontal)
- Y-axis (vertical)
- Area block

Procedure

1. On the Search & Analysis page of a Logstore, enter a search and analytic statement in the search box, specify the time range, and then click **Search & Analyze**.
2. On the Graph tab, click  to select the area chart.
3. On the Properties tab on the right, configure the properties of the area chart.

 **Note** In an area chart, a single area block must contain more than two data points. Otherwise, the data trend cannot be analyzed. We recommend that you configure no more than five area blocks in an area chart.

Properties

Parameter	Description
X Axis	The data on the X-axis, which is usually a time sequence.
Y Axis	The numeric data. You can configure one or more fields for the Y-axis.
Legend	The position where the legend is located in the chart. Valid values: Top, Bottom, Left, and Right.
Format	The format in which data is displayed.

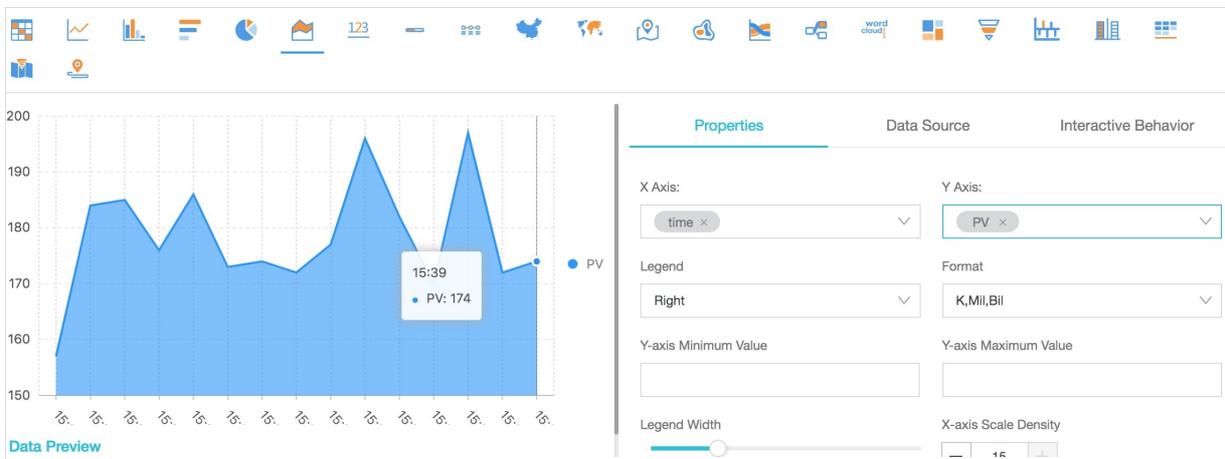

Parameter	Description
Margin	The distance of the axis to the borders of the chart, including Top Margin, Bottom Margin, Right Margin, and Left Margin.

Example of a simple area chart

To query the page views (PVs) of the IP address `10.0.192.0` in the last 24 hours, execute the following statement:

```
remote_addr: 10.0.192.0 | select date_format(date_trunc('hour', __time__), '%m-%d %H:%i') as time, count(1) as PV group by time order by time limit 1000
```

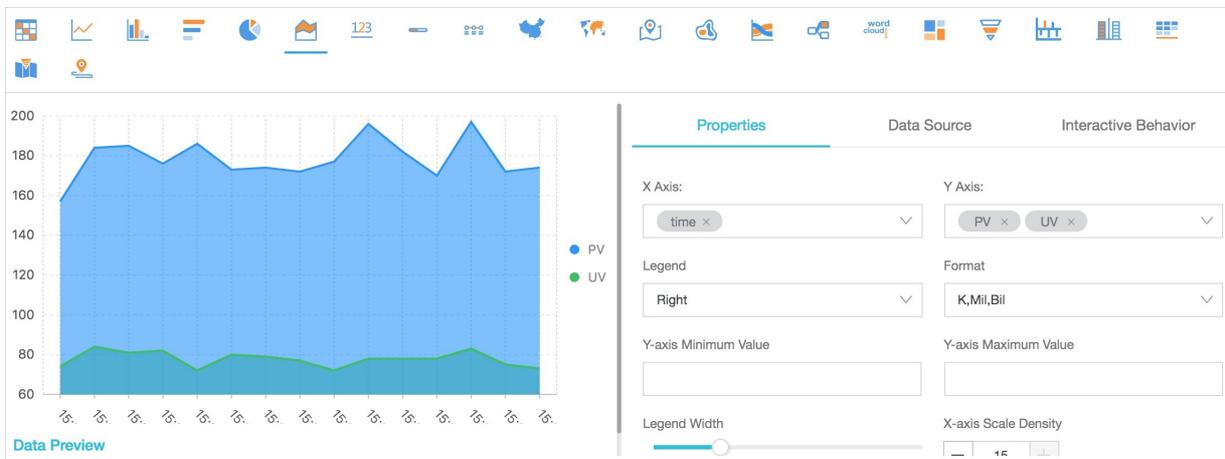

Select `time` for X Axis and `PV` for Y Axis.

Example of a stacked area chart

```
* | select date_format(date_trunc('hour', __time__), '%m-%d %H:%i') as time, count(1) as PV, approx_distinct(remote_addr) as UV group by time order by time limit 1000
```

Select `time` for X Axis. Select `PV` and `UV` for Y Axis.

30.4.11.1.8. Individual value plot

The individual value plot highlights a single value.

Individual value plots include the following types:

- **Rectangle Frame:** shows a general value.
- **Dial:** shows how close the current value is to the configured threshold.
- **Compare Numb Chart:** shows the SQL query results of interval-valued comparison and periodicity-valued comparison functions. For more information about the analytic syntax, see [Interval-valued comparison and periodicity-valued comparison functions](#).

By default, Rectangle Frame is selected. A rectangle frame is the simplest way to display data at a point. In most cases, it is used to show the key information at a time point. To show a proportional metric, you can use a dial.

Components

- Numeric value
- (Optional) Unit
- (Optional) Description
- Chart type

Procedure

1. On the Search & Analysis page of a Logstore, enter a search and analytic statement in the search box, specify the time range, and then click **Search & Analyze**.
2. On the Graph tab, click [123](#) to select the individual value plot.
3. On the Properties tab on the right, configure the properties of the individual value plot.

 **Note** Log Service automatically normalizes data in numeric value-based charts. For example, 230000 is processed as 230K. You can include [Mathematical calculation functions](#) in search and analytic statements to customize numeric formats.

Properties

- The following table lists the parameters of a rectangle frame.

Parameter	Description
Chart Types	The type of the chart. Select Rectangle Frame.
Value Column	The value displayed in the chart. By default, data in the first row of the specified column is displayed.
Unit	The unit of data.
Unit Font Size	The font size of the unit. You can drag the slider to adjust the font size. Valid values: [10, 100]. Unit: pixels.
Description	The description of the value.
Description Font Size	The font size of the value description. You can drag the slider to adjust the font size. Valid values: [10, 100]. Unit: pixels.
Format	The format in which data is displayed.
Font Size	The font size of the value. You can drag the slider to adjust the font size. Valid values: [10, 100]. Unit: pixels.

Parameter	Description
Font color	The color of the value, unit, and description in the chart. You can select the default color or customize a color.
Background Color	The color of the background. You can select the default color or customize a color.

- The following table lists the parameters of a dial.

Parameter	Description
Chart Types	The type of the chart. Select Dial to display query results in a dial.
Actual Value	The actual value in the chart. By default, data in the first row of the specified column is displayed.
Unit	The unit of the value in the dial.
Font Size	The font size of the value and unit. Valid values: [10, 100]. Unit: pixels.
Description	The description of the value.
Description Font Size	The font size of the value description. You can drag the slider to adjust the font size. Valid values: [10, 100]. Unit: pixels.
Dial Maximum	The maximum value of the scale in the dial. Default value: 100.
Maximum Value Column	The maximum value in the specified column. If you turn on the Use Query Results switch, Dial Maximum is replaced by Maximum Value Column. Then you can select the maximum value from query results for this parameter.
Use Query Results	If you turn on the Use Query Results switch, Dial Maximum is replaced by Maximum Value Column. Then you can select the maximum value from query results for this parameter.
Format	The format in which data is displayed.
Colored Regions	The number of segments that the dial is divided into. Each segment is displayed in a different color. Valid values: 2, 3, 4, and 5. Default value: 3.
Region Max Value	The number of segments that the dial is divided into. Each segment is displayed in a different color. <div style="border: 1px solid #add8e6; padding: 5px; background-color: #e6f2ff;"> <p> Note By default, a dial is evenly divided into three colored segments. If you change the value of Colored Regions, Region Max Value is not automatically adjusted. You can set the maximum value for each colored segment based on your needs.</p> </div>
Font color	The color of the value in the dial.
Region	The colored segment that the dial is divided into. By default, a dial is evenly divided into three segments, which are displayed in blue, yellow, and red. If you set Colored Regions to a value greater than 3, the added segments are displayed in blue by default. You can change the color of each segment.

- The following table lists the parameters of a comparison chart.

Parameter	Description
Chart Types	The type of the chart. Select Compare Numb Chart to display query results in a comparison chart.
Show Value	The value displayed in the center of the comparison chart. This value is set to the statistical result calculated by the relevant comparison function in the specified time range.
Compare Value	The value used to compare with the threshold. This value is set to the result of comparison between the statistical results calculated by the relevant comparison function in the specified time range and in the previously specified time range.
Font Size	The font size of the show value. Valid values: [10, 100]. Unit: pixels.
Unit	The unit of the show value.
Unit Font Size	The font size of the unit for the show value. Valid values: [10, 100]. Unit: pixels.
Compare Unit	The unit of the compare value.
Compare Font Size	The font size of the compare value and its unit. Valid values: [10, 100]. Unit: pixels.
Description	The description of the show value and its growth trends.
Description Font Size	The font size of the description. Valid values: [10, 100]. Unit: pixels.
Trend Comparison Threshold	<p>The value used to measure the variation trend of the compare value.</p> <p>For example, the compare value is -1:</p> <ul style="list-style-type: none"> ○ If you set Trend Comparison Threshold to 0, a down arrow is displayed on the page, indicating a value decrease. ○ If you set Trend Comparison Threshold to -1, the system determines that the value remains unchanged and does not display the trend on the page. ○ If you set Trend Comparison Threshold to -2, an up arrow is displayed on the page, indicating a value increase.
Format	The format in which data is displayed.
Font color	The color of the show value and its description.
Growth Font Color	The font color of the compare value that is greater than the threshold.
Growth Background Color	The background color displayed when the compare value is greater than the threshold.
Decrease Font Color	The font color displayed when the compare value is less than the threshold.
Decrease Background Color	The background color displayed when the compare value is less than the threshold.
Equal Background Color	The background color displayed when the compare value is equal to the threshold.

Examples

Run the following search and analytic statements to view the number of requests and display the analysis results in charts:

- Rectangle frame

* | select count(1) as pv

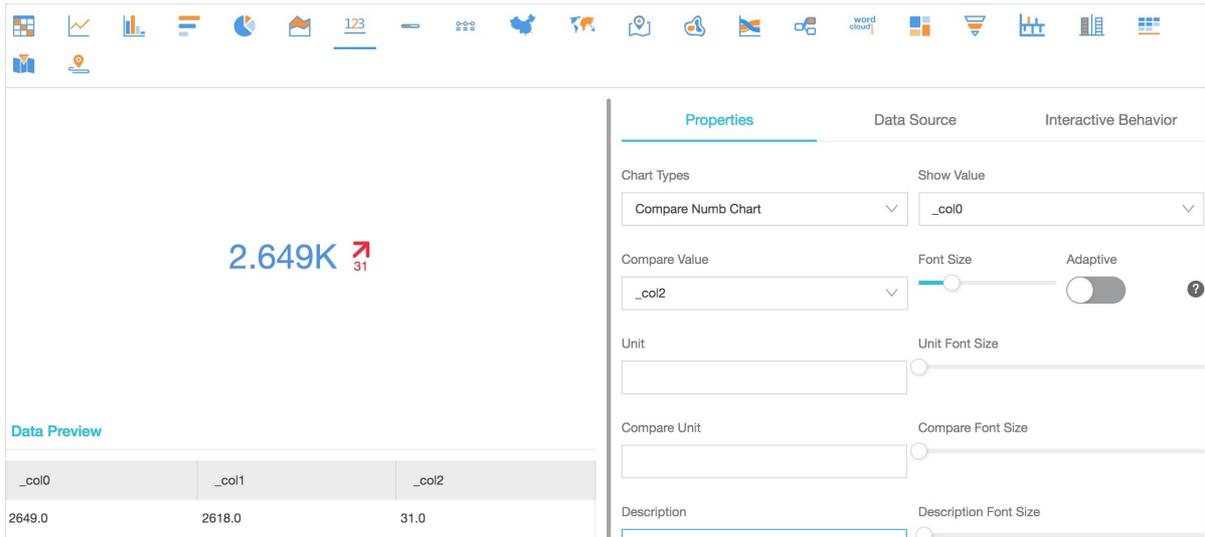

- Dial

* | select count(1) as pv

- Comparison chart

Run the following search and analytic statement to view the comparison of the requests made today and the requests made yesterday:

```
* | select diff[1],diff[2], diff[1]-diff[2] from (select compare( pv , 86400) as diff from (select count(1) as pv from log))
```

30.4.11.1.9. Progress bar

The progress bar shows the percentage of the actual value of a field to the maximum value of the field. You can configure the properties of the progress bar to adjust its style and set display rules.

Components

- Actual value
- (Optional) Unit
- Total value

Procedure

1. On the Search & Analysis page of a Logstore, enter a search and analytic statement in the search box, specify the time range, and then click **Search & Analyze**.
2. Click  to select the progress bar.
3. Configure the properties of the progress bar.

Properties

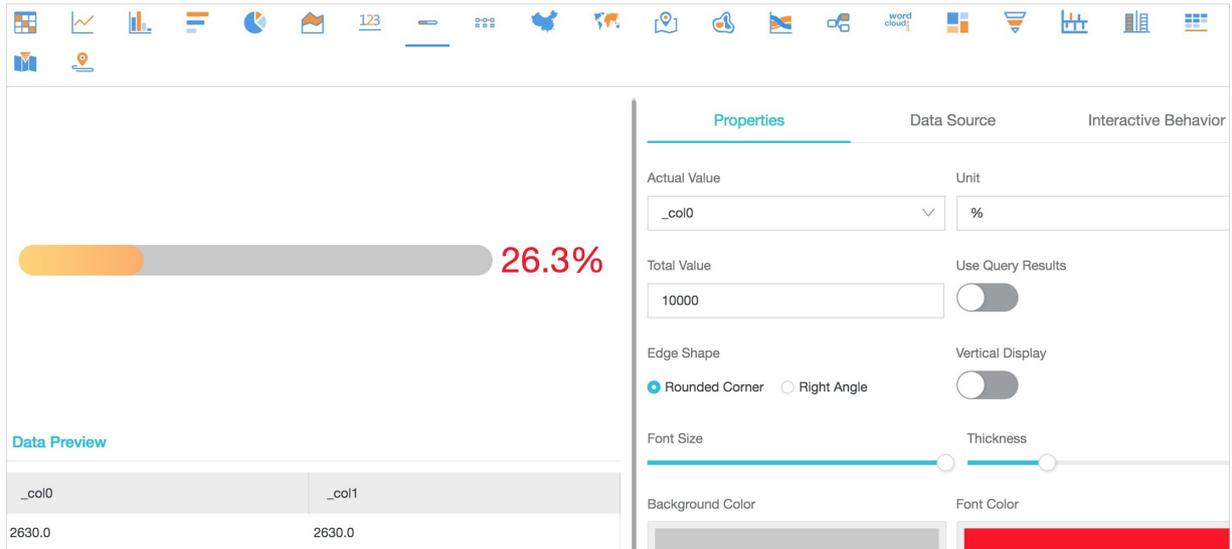

Parameter	Description
Actual Value	The actual value in the chart. By default, the data in the first row of the specified column is displayed.
Unit	The unit of the value in the progress bar.
Total Value	The maximum value indicated by the progress bar. Default value: 100.
Maximum Value Column	The maximum value in the specified column. If you turn on the Use Query Results switch, Total Value is replaced by Maximum Value Column . Then, you can select the maximum value from query results for this parameter.
Use Query Results	Specifies whether to select a value from query results. If you turn on the Use Query Results switch, you can select the maximum value from query results for Maximum Value Column .

Parameter	Description
Edge Shape	The edge shape of the progress bar.
Vertical Display	Specifies whether to display the progress bar in the vertical mode.
Font Size	The font size of the progress bar.
Thickness	The thickness of the progress bar.
Background Color	The background color of the progress bar.
Font Color	The font color of the progress bar.
Default Color	The default color of the progress bar.
Color Display Mode	The color display mode of the progress bar.
Start Color	The start color of the progress bar. This parameter is available when Color Display Mode is set to Gradient .
End Color	The end color of the progress bar. This parameter is available when Color Display Mode is set to Gradient .
Display Color	<p>The display color of the progress bar. This parameter is available when Color Display Mode is set to Display by Rule.</p> <div style="background-color: #e0f2f1; padding: 5px; border: 1px solid #ccc;"> <p> Note The value of Actual Value is compared with that of Threshold based on the condition specified by Operator. If the actual value matches the condition specified by Operator, the progress bar is displayed in the color specified by Display Color. Otherwise, the progress bar is displayed in the default color.</p> </div>
Operator	The condition that is used to determine the color of the progress bar. This parameter is available when Color Display Mode is set to Display by Rule .
Threshold	The threshold that is used to determine the color of the progress bar. This parameter is available when Color Display Mode is set to Display by Rule .

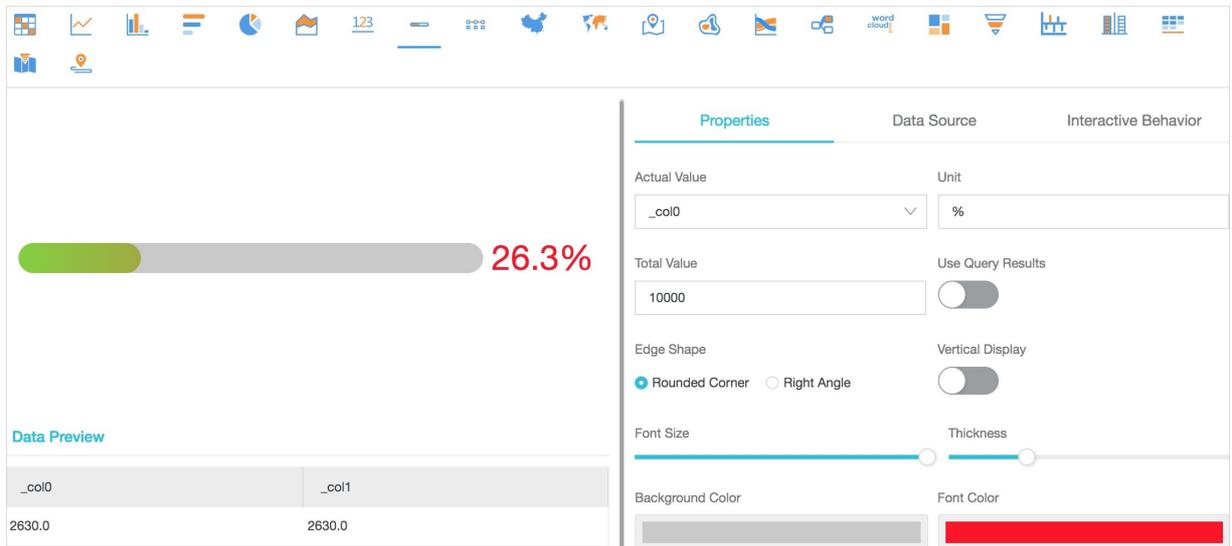

Examples

You can use the progress bar to show the percentage of a metric or the proportion of data.

```
* | select diff[1],diff[2] from (select compare( pv , 86400) as diff from (select count(1) as pv from log))
```

When you select **Display by Rule** as the color display mode, the progress bar changes its color according to the specified condition. If the specified condition is not met, the progress bar is displayed in the default color.

30.4.11.1.10. Map

You can add color blocks and marks to a map to display geographic data. Log Service provides three types of maps: Map of China, World Map, and AMap. Among them, AMap offers the scatter chart and heat map. You can use specific functions in search and analytic statements to display analysis results in different maps.

Components

- Map canvas
- Color block

Properties

Parameter	Description
-----------	-------------

Parameter	Description
Location information	The location information recorded in logs. The dimension varies depending on the type of the map: <ul style="list-style-type: none"> Provinces (Map of China) Country (World Map) Longitude/Latitude (AMap)
Value Column	The data volume of the location information.

Procedure

- On the Search & Analysis page of a Logstore, enter a search and analytic statement in the search box, set the time range, and then click **Search & Analyze**.
 - Map of China: Use the `ip_to_province` function.
 - World Map: Use the `ip_to_country` function.
 - AMap: Use the `ip_to_geo` function.
- Click  to select the map.
- Configure the properties of the map.

Map of China

You can include the `ip_to_province` function to display query results in a map of China.

- SQL statement

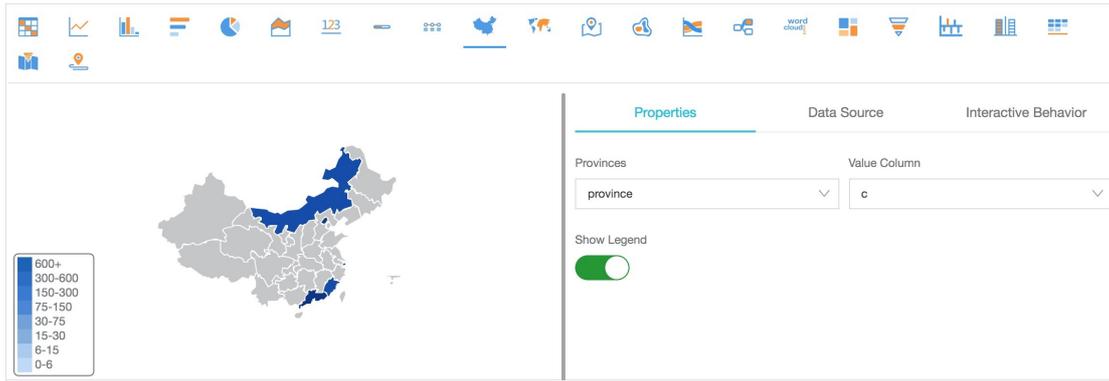

```
* | select ip_to_province(remote_addr) as address, count(1) as count group by address order by count desc limit 10
```

- Dataset

address	count
Guangdong	163
Zhejiang	110
Fujian	107
Beijing	89
Chongqing	28
Heilongjiang	19

Select address for *Provinces* and count for *Value Column*.

Map of China

World Map

You can include the `ip_to_country` function to display query results in a world map.

- SQL statement

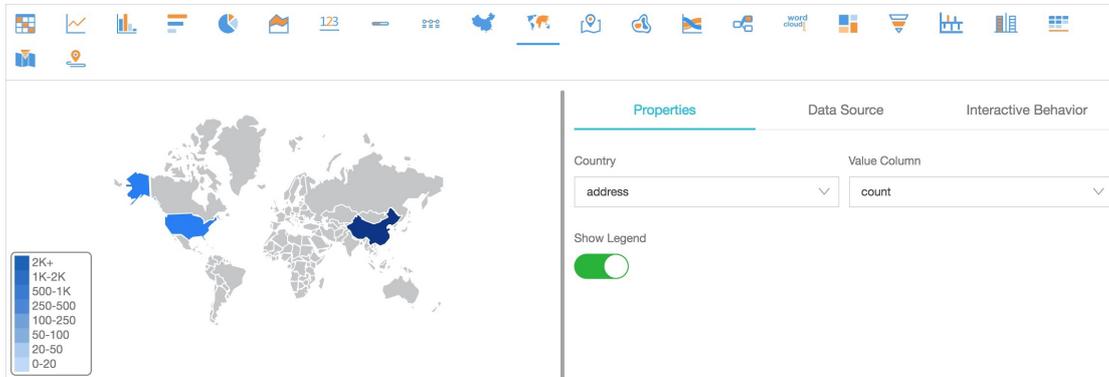

```
* | select ip_to_country(remote_addr) as address, count(1) as count group by address order by count desc limit 10
```

- Dataset

address	count
China	8354
United States	142

Select address for *Country* and count for *Value Column*.

World Map

AMap

You can include the `ip_to_geo` function in a statement to display query results in an AMap. The address column in the dataset contains the latitude and longitude information, which are separated with a comma (,). If the longitude and latitude are indicated by two separate columns named lng and lat, you can use the `concat('lat', ',', lng)` function to integrate the two columns into one column.

- SQL statement

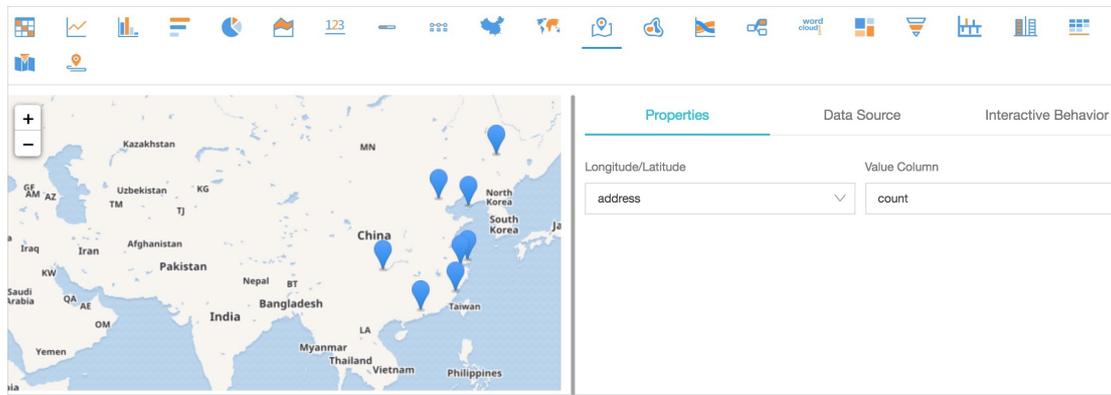

```
* | select ip_to_geo(remote_addr) as address, count(1) as count group by address order by count desc limit 10
```

- Dataset

address	count
39.9289,116.388	771
39.1422,117.177	724
29.5628,106.553	651
30.2936,120.161420	577
26.0614,119.306	545
34.2583,108.929	486

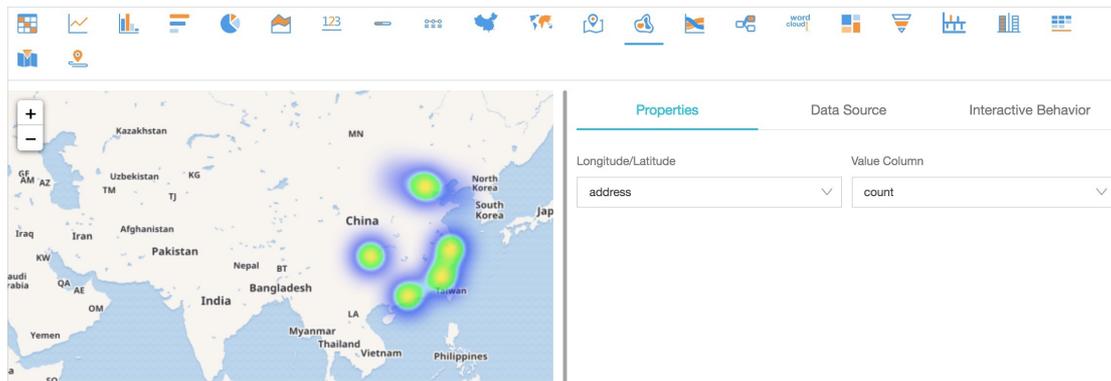

Select address for *Longitude/Latitude* and count for *Value Column*.

AMap: Scatter chart

The scatter chart is used by default. If data points are densely distributed in the map, you can convert it to the heat map.

AMap: Heat map

30.4.11.11. Flow diagram

The flow diagram, also known as ThemeRiver, is a stacked area chart around the central axis. The banded branches with different colors indicate different categorical data. The band width indicates the numeric value. The time information of the data is configured on the X-axis of the chart by default. A flow diagram displays data from three dimensions.

You can convert a flow diagram to a line chart or column chart. The column chart is stacked by default. Each category of data starts from the top of the last categorical data.

Components

- X-axis (horizontal)
- Y-axis (vertical)
- Band

Procedure

1. On the Search & Analysis page of a Logstore, enter a search and analytic statement in the search box, set the time range, and then click Search & Analyze.
2. On the Graph tab, click  to select the flow diagram.
3. On the Properties tab on the right, configure the properties of the flow diagram.

Properties

Parameter	Description
Chart Types	The type of the chart. Valid values: Line Chart, Area Chart, and Column Chart. Default value: Line Chart.
X Axis	The data on the X-axis, which is usually a time sequence.
Y Axis	The numeric data. You can configure one or more fields on the Y-axis.
Aggregate Column	The information required to be aggregated in the third dimension.
Legend	The position where the legend is located in the chart. Valid values: Top, Bottom, Left, and Right.
Format	The format in which data is displayed.
Margin	The distance of the axis to the borders of the chart, including Top Margin, Bottom Margin, Right Margin, and Left Margin.

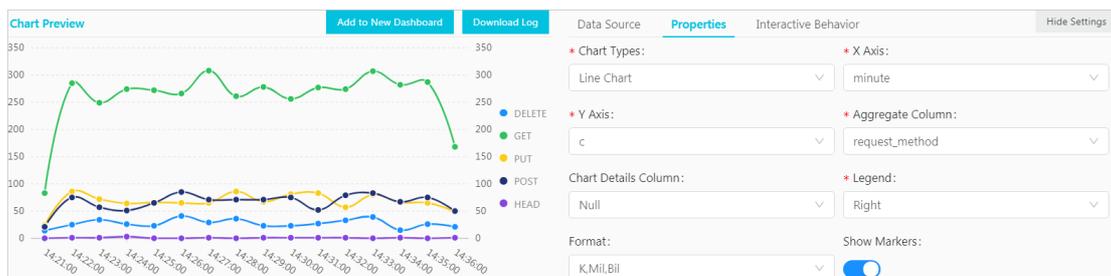

Examples

The flow diagram is suitable to display data from three dimensions, including the time information, categories, and numeric values.

```
* | select date_format(from_unixtime(__time__ - __time__% 60), '%H:%i:%S') as minute, count(1) as c, request_method group by minute, request_method order by minute asc limit 100000
```

Select `minute` for X Axis, `c` for Y Axis, and `request_method` for Aggregate Column.

Flow chart

30.4.11.1.12. Sankey diagram

A sankey diagram is a specific type of flow chart. It is used to describe the flow from one set of values to another.

Sankey diagrams are applicable to scenarios such as network traffic flows. A sankey diagram contains values of three fields: `source`, `target`, and `value`. The `source` and `target` fields describe the source and target nodes and the `value` field describes the flows from the `source` node to the `target` node.

Features

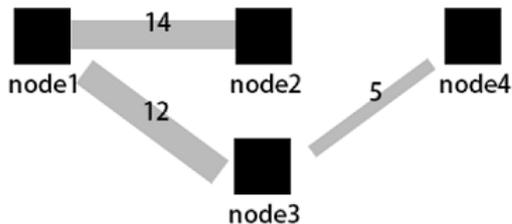

The sankey diagram has the following features:

- The start flow is as large as the end flow. The overall width of all main edges is the same as that of all branch edges. This maintains flow balance.
- In a sankey diagram, different edges indicate the distribution of different flows. The width of an edge is proportional to the flow volume it represents.
- The width of an edge between two nodes represents the flow volume in a state.

For example, the following data can be displayed in a sankey diagram.

source	target	value
node1	node2	14
node1	node3	12
node3	node4	5
...

The sankey diagram in the following figure shows the relationship between the data.

Components

- Node
- Edge

Procedure

1. On the Search & Analysis page of a Logstore, enter a search and analytic statement in the search box, set the time range, and then click Search & Analyze.
2. Click  to select the sankey diagram.
3. On the Properties tab on the right, configure the properties of the area chart.

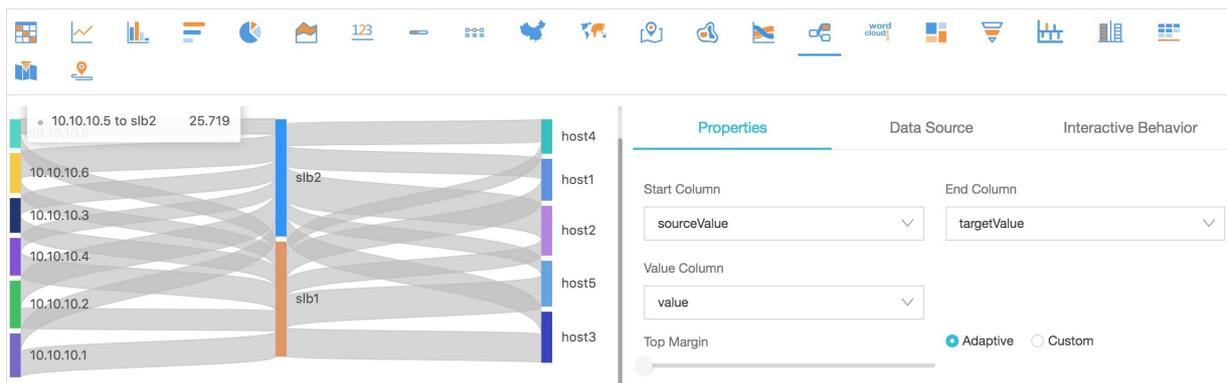

Properties

Parameter	Description
Start Column	The start node.
End Column	The end node.
Value Column	The value that indicates the flow volume from the start node to the end node.
Margin	The distance of the axis to the borders of the chart, including Top Margin, Bottom Margin, Right Margin, and Left Margin.

Example of a simple sankey diagram

If a log entry contains the `source`, `target`, and `value` fields, you can use a **Nested subqueries** statement to obtain the sum of all `streamValue` values.

```
* | select sourceValue, targetValue, sum(streamValue) as streamValue from (select sourceValue, targetValue, streamValue, __time__ from log group by sourceValue, targetValue, streamValue, __time__ order by __time__ desc) group by sourceValue, targetValue
```

30.4.11.1.13. Word cloud

A word cloud visualizes text data. It is a cloud-like and colored image composed of words. It can be used to display a large amount of text data. The font size or color of a word indicates the significance of the word. This allows you to recognize the most significant words in an efficient way.

Components

Sorted words

Procedure

1. On the Search & Analysis page of a Logstore, enter a search and analytic statement in the search box, set the time range, and then click **Search & Analyze**.
2. Click  to select the word cloud.
3. On the Properties tab on the right, configure the properties of the word cloud.

Parameters

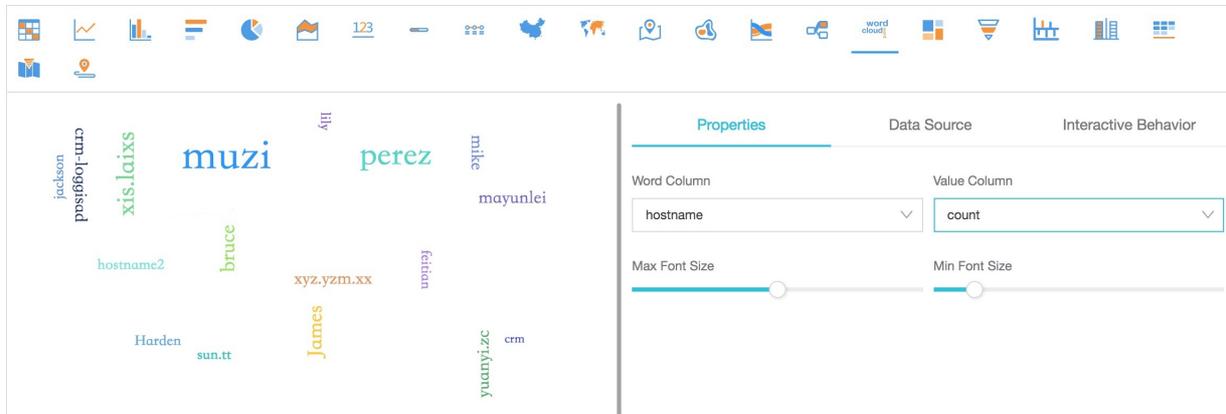

Parameter	Description
Word Column	The words to be displayed.
Value Column	The numeric value corresponds to a word.
Font Size	The font size of a word. <ul style="list-style-type: none"> The minimum font size ranges from 10 pixels to 24 pixels. The maximum font size ranges from 50 pixels to 80 pixels.

Examples

To query the distribution of hostnames in NGINX logs, run the following statement:

```
* | select domain, count(1) as count group by domain order by count desc limit 1000
```

Select **hostname** for Word Column and **count** for Value Column.

30.4.11.1.14. Treemap chart

A treemap chart includes multiple rectangles that represent the data volume. A larger rectangle area represents a larger proportion of the categorical data.

Components

Sorted rectangles

Procedure

1. On the Search & Analysis page of a Logstore, enter a search and analytic statement in the search box, set the time range, and then click **Search & Analyze**.
2. On the Graph tab, click  to select the bar chart.
3. On the Properties tab on the right, configure the properties of the area chart.

Properties

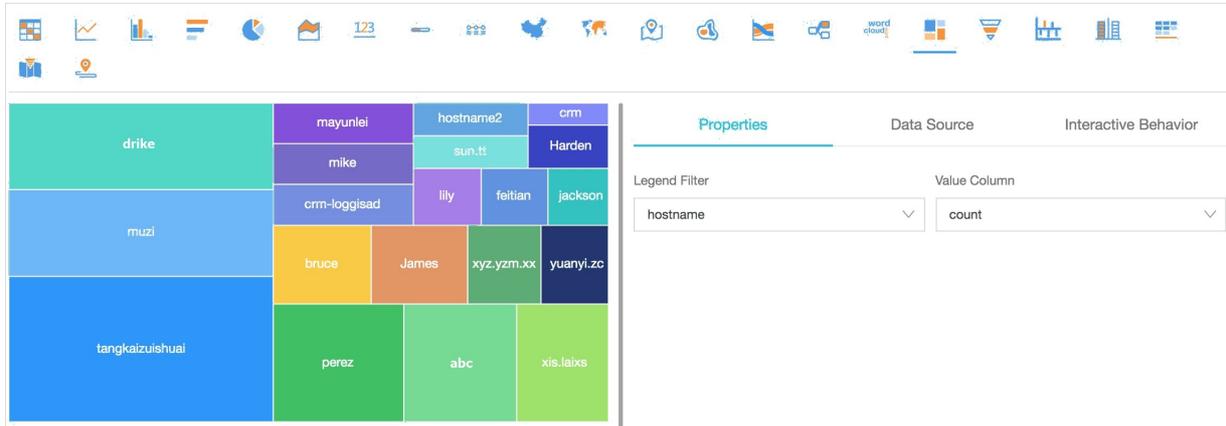

Parameter	MNS logs
Description	The categorical field.
Value Column	The numeric value of a field. A greater field value results in a larger rectangle area.

Example

To query the distribution of hostnames in NGINX logs, run the following statement:

```
* | select hostname, count(1) as count group by hostname order by count desc limit 1000
```

Select **hostname** for **Legend Filter** and **count** for **Value Column** .

30.4.11.2. Dashboard

30.4.11.2.1. Overview

A dashboard provided by Log Service is a platform where you can analyze data in real time. You can add multiple charts to a dashboard for data analysis. Each chart is a visualized search and analytic statement.

A dashboard allows you to view the charts of multiple search and analytic statements at one time. When you open or refresh the dashboard, the statements of the charts run automatically.

After you add a chart to a dashboard, you can configure **Drill-down analysis** for the chart. Then you can click the chart on the dashboard to further analyze data and obtain more fine-grained analysis results.

Limits

- You can create a maximum of 50 dashboards for a project.
- Each dashboard can contain a maximum of 50 analysis charts.

Features

A dashboard has two modes: display mode and edit mode.

- **Configure the display mode of a dashboard**

In the display mode, you can configure multiple display settings on the dashboard page.

- **Dashboard:** You can specify the time range, the automatic refresh interval, full screen, and the display mode of the title for the dashboard, configure alerts for all charts on the dashboard, and filter chart data based on the **Configure and use a filter on a dashboard of a Logstore**.

- **Chart:** You can view the analysis details of a specified chart, specify the time range and configure alerts for the chart, download logs and the chart, and check whether **drill-down** analysis is configured for the chart.

- **Edit mode**

In the edit mode, you can change the configurations of the dashboard and charts.

- **Dashboard:** You can use a dashboard as a canvas and add [Markdown chart](#), custom charts, text, icons, and other chart elements to the dashboard. You can also add lines between chart elements that are self-adaptive to the positions of the charts. You can also add [Configure and use a filter on a dashboard of a Logstore](#), which can be used to filter chart data in the display mode. In addition, you can configure display gridlines to help arrange chart elements such as icons in an orderly manner.
- **Chart:** You can also edit a chart on the dashboard. You can modify the statement, properties, and interactive behavior such as [drill-down analysis](#) of the chart.

30.4.11.2.2. Create and delete a dashboard

This topic describes how to create and delete a dashboard in a Logstore. In the Log Service console, you can run a search and analytic statement and visualize the query result in a chart. After you complete the configurations of the chart, you can add the chart to a dashboard. Each dashboard can display up to 50 charts that support multiple formats and custom settings.

Prerequisites

The index feature of the Logstore is enabled and configured. For more information, see [Enable the index feature and configure indexes for a Logstore](#).

Create a dashboard

1. [Log on to the Log Service console](#).
2. Click a project name.
3. Click the  icon next to the name of the Logstore, and then select **Search & Analysis**.
4. Enter a search and analytic statement in the search box, and then click **Search & Analyze**.
5. On the **Graph** tab that appears, configure the chart properties on the **Properties** tab.
6. (Optional) Set a placeholder variable. For example, you have configured a drill-down event for another chart. This drill-down event redirects you to the current dashboard. You have also specified a placeholder variable for the search and analytic statement of the preceding chart. When you click a chart value to trigger the drill-down event, you are redirected to the current dashboard. The placeholder variable is replaced with the chart value and the current dashboard is refreshed by the new search and analytic statement. For more information, see [Drill-down analysis](#).
 - i. Click the **Data Source** tab, and then select a part of the search and analytic statement in the **Query** field.
 - ii. Click **Generate Variable** to generate a placeholder variable.

iii. Set the parameters in the Variable Config section.

Parameter	Description
Variable Name	The name of the placeholder variable. If the name of the placeholder variable is the same as the variable specified in the chart, the placeholder variable will be replaced with the chart value when the drill-down event is triggered.
Default Value	The default value of the placeholder variable in the current dashboard.
Matching mode	You can select Global Match or Exact Match.
Result	The search and analytic statement that contains the specified variable.

Data Source
Properties
Interactive Behavior
Hide Settings

Query: Generate Variable

```
* | SELECT date_format(__time__ - __time__ % 60, '%H:%i:%s') as time, count(1) as count GROUP BY time ORDER BY time
```

Select the query statement to generate a placeholder variable. You can configure a drill-down configuration to replace the variable. For how to use dashboards, please refer to the documentation ([Help](#))

Variable Config:

* Variable Name:

* Default Value:

* Matching Mode:

interval

60

Global Match v X

Result

```
* | SELECT date_format(__time__ - __time__ % $(interval), '%H:%i:%s') as time, count(1) as count GROUP BY time ORDER BY time
```

...
☰

7. Configure a drill-down event. After you configure a drill-down event, you can click the chart on the dashboard for a deeper analysis. For example, you can be redirected to another dashboard or a saved search. For more information, see [Drill-down analysis](#).

- i. Click the Interactive Behavior tab.
- ii. Select an Event Action.

iii. Set the parameters of the selected event action.

8. Click **Add to New Dashboard** and specify the dashboard name and chart name.

Parameter	Description
Operation	<ul style="list-style-type: none"> ◦ Add to Existing Dashboard: Add the chart to an existing dashboard. ◦ Create Dashboard: Create a dashboard and then add the chart to the dashboard.
Dashboards	Select an existing dashboard name. <div style="background-color: #e6f2ff; padding: 5px; margin-top: 10px;"> ⓘ Note This parameter is required only when you set the Operation parameter to Add to Existing Dashboard. </div>
Dashboard Name	Enter a dashboard name. <div style="background-color: #e6f2ff; padding: 5px; margin-top: 10px;"> ⓘ Note This parameter is required only when you set the Operation parameter to Create Dashboard. </div>
Chart Name	Enter a name for the current chart. The chart name is displayed as the chart title in the dashboard.

9. Click **OK**. You can add up to 50 analysis charts to the dashboard.

Delete a dashboard

You can delete a dashboard when you no longer need it. You cannot recover a deleted dashboard.

1. Log on to the Log Service console, and then click the target project name.
2. In the left-side navigation pane, click the **Dashboard** icon.
3. Click the  icon next to the dashboard that you want to delete, and then select **Delete**.

30.4.11.2.3. Configure the display mode of a dashboard

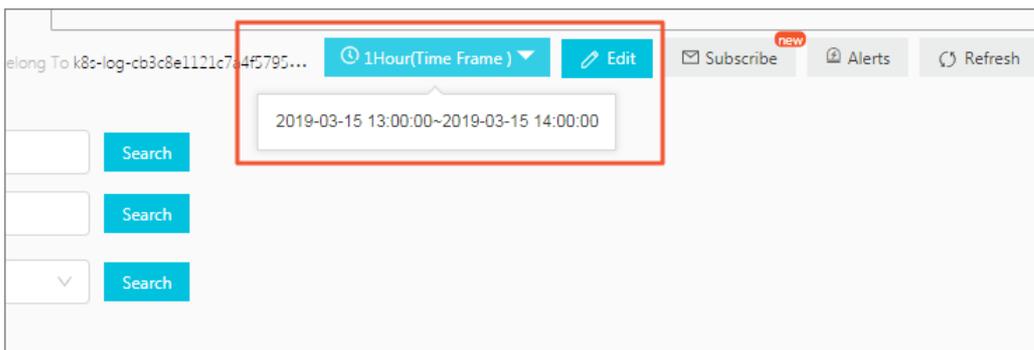

This topic describes how to configure the display mode of a dashboard. By default, you can view all charts in a dashboard in the display mode. When you configure the display mode, you can add chart elements, enable automatic refresh, and set the title display mode.

Set a query time range for a dashboard of a Logstore

By default, all charts in a dashboard use the query time range that is set for the dashboard. For more information about how to set a query time range for a single chart, see [Set a query time range for a chart](#).

Note On the dashboard page, you can click **Time Range** to specify a time range for a query. The specified query time range is used only for the current query. The next time you open the dashboard, the system will display the analysis results in the default query time range.

1. [Log on to the Log Service console](#).
2. Click a project name.
3. In the left-side navigation pane, click the **Dashboard** icon.
4. Click the  icon next to the dashboard, and then select **Details** from the drop-down list.
5. Click **Time Range** to set a time range. You can set one of the following time ranges:
 - **Relative**: queries log data obtained in a time range of 1 minute, 5 minutes, 15 minutes, or other time ranges that end with the current time, accurate to the second. For example, if the current time is 19:20:31 and you select 1Hour as the relative time, the charts on the dashboard display the analysis results of the log data queried from 18:20:31 to 19:20:31.
 - **Time Frame**: If you select or customize a time range less than one hour (for example, 1 minute, 5 minutes, and 15 minutes), log data obtained in the time range that ends with the current time is queried, accurate to the minute. If you select or customize a time range greater than one hour, log data obtained on the hour before the current time is queried. For example, if the current time is 19:20:31 and you select 1Hour as the time frame, the charts on the dashboard display the analysis results of the log data queried from 18:00:00 to 19:00:00.
 - **Custom**: queries log data obtained in a specified time range.
6. Move the pointer over the **Time Range** button to confirm the specified time range.

Switch to the edit mode

Click **Edit** to switch to the edit mode of the dashboard. In the edit mode, you can add [Markdown chart](#), custom charts, text, icons, and other chart elements to the dashboard. For more information, see [Edit mode](#).

Set alerts

On the dashboard page, choose **Alerts > Create** to create an alert. Choose **Alerts > Modify** to modify an alert. An alert must be associated with one or more charts.

For more information, see [Configure alerts](#).

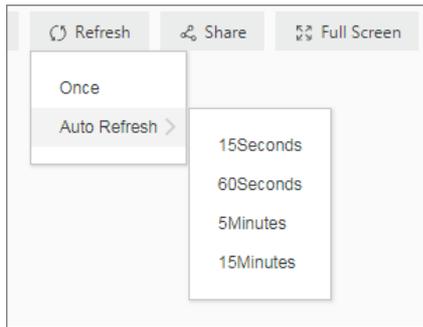

Set a refresh method

You can manually refresh the dashboard, or set an automatic refresh interval for the dashboard.

- To manually refresh the dashboard, choose **Refresh > Once**.
- To set an automatic refresh interval for the dashboard, choose **Refresh > Auto Refresh**, and then select an interval.

The **Auto Refresh** interval can be 15 seconds, 60 seconds, 5 minutes, or 15 minutes.

Note If your browser is inactive, the automatic refresh interval may be inaccurate.

Share a dashboard

To share a dashboard with authorized users, click **Share** to copy the link of the dashboard page and then send the link to the users. The shared dashboard page uses the settings of the dashboard at the time of sharing. The settings include the time range of charts and chart title format.

Note Before you share the dashboard with other users, you must grant relevant permissions to them.

Display a dashboard in full screen

Click **Full Screen**. Then the charts on a dashboard are displayed in full screen.

Set the chart title format

On the dashboard page, click **Title Configuration**. Available title formats include:

- Single-line Title and Time Display
- Title Only
- Time Only

Reset the query time range

To restore the default query time ranges of all charts on the dashboard, click **Reset Time**.

Select chart view

- View analysis details of a chart

To view analysis details of a chart, move the pointer over the **More** icon in the upper-right corner of the chart, and then select **View Analysis Details**. The corresponding **Search & Analysis** page appears, showing the query statement and property settings.

- Set the query time range for a chart

To set the query time range for a chart, move the pointer over the **More** icon in the upper-right corner of the chart, and then select **Select Time Range**. The settings are valid only for the current chart.

- Set an alert for a chart

To set an alert for a chart, move the pointer over the **More** icon in the upper-right corner of the chart, and then select **Create Alert**. For more information, see [Configure alerts](#).

- Download log analysis results of a chart

To download analysis results of a chart, move the pointer over the More icon in the upper-right corner of the chart, and then select **Download Log**.

- Download a chart

To download a chart, move the pointer over the More icon in the upper-right corner of the chart, and then select **Download Chart**.

- Check whether a drill-down event is configured for a chart

To check whether a drill-down event is configured for a chart, move the pointer over the More icon in the upper-right corner of the chart. Then, check the color of the hand icon at the bottom of the shortcut menu. If the icon is red, a drill-down event is configured for the chart. If the icon is gray, no drill-down event is configured for the chart.

 **Note** Different charts in a dashboard have different shortcut menus. For example, you cannot use the shortcut menu of a custom chart or Markdown chart to view analysis details because they are not analysis charts.

30.4.11.2.4. Edit mode

You can click the Edit button on the dashboard page to enter the edit mode. Then you can change the configurations of the dashboard and charts on the dashboard.

- Dashboard:

- You can modify the dashboard name in the upper-left corner of the page.
- You can use a dashboard as a canvas and add **Markdown chart**, custom charts, text, icons, and other chart elements to the dashboard.
- You can add lines between chart elements. The lines are self-adaptive to the positions of the charts.
- You can add a filter to the dashboard that can filter chart data in the display mode. For more information, see **Configure and use a filter on a dashboard of a Logstore**.
- In addition, you can configure display gridlines to help arrange chart elements such as icons in an orderly manner.
- You can use the menu bar to control the chart property settings in the dashboard. For example, you can perform addition, deletion, and cancellation operations and configure the size and location of charts. You can also move a chart to the top of bottom of the dashboard.

- Chart: You can edit a chart on the dashboard. You can modify the statement, properties, and interactive behavior such as **drill-down analysis** of the chart.

 **Note** You must click Save in the upper-right corner of the page for the changes made to the dashboard to take effect.

Chart elements

In the edit mode of a dashboard, you can add the following chart elements:

- Common icons

Log Service allows you to display common icons on a dashboard page. You can drag an icon from the menu bar to the specified position.

- Text

You can drag the text icon from the menu bar to the specified position to insert text. Double-click the text box to modify the text content.

- **Markdown chart**

You can add a Markdown chart to a dashboard and edit the chart with the Markdown syntax.

Drag the Markdown icon from the menu bar to the specified position and select **Edit** from the **More** icon. Then you can set the Markdown content.

- **Filter**

You can add a filter to a dashboard. Then you can add search conditions or replace placeholder variables in query statements.

Click the filter icon in the dashboard menu bar. On the page that appears, configure the filter based on your needs. The filter is in the upper-left corner of the dashboard page by default. To modify the settings of a filter, you can select **Edit** on the **More** icon in the upper-right corner of the page.

- **Customize SVG**

You can upload a Scalable Vector Graphics (SVG) file to a dashboard. Click the SVG icon in the menu bar. On the page that appears, click the box or drag an SVG file to the box to upload the file.

 **Note** The size of an SVG file cannot exceed 10 KB.

- **Customize image's HTTP link**

You can upload the HTTP link of an image to a dashboard. Click the **Customize image's HTTP link** icon in the menu bar. On the page that appears, enter the HTTP link of an image and click **OK**.

Layout

In the edit mode, all charts and chart elements are placed in a canvas. You can drag and scale each chart, except for the lines. The horizontal width of a chart is up to 1,000 units, with each unit equal to $\frac{\text{current browser width}}{1,000}$. The vertical height is unlimited, with each unit equal to 1 pixel. Before you arrange a chart on the dashboard, you can click **Display gridlines** to help arrange the position of the chart and the spacing with other charts.

You can perform the following operations to arrange a chart on the dashboard:

- **Adjust the position of a chart**
 - You can drag a chart to the specified position.
 - After you specify a chart, you can click **L** and **T** to adjust the chart position.
- **Adjust the width and height of a chart**
 - After you specify a chart, you can drag the chart in the lower-right corner to resize the chart.
 - After you specify a chart, you can also specify the **W** and **H** to resize the chart.

- **Add lines to connect charts**

You can add a directional line between two charts. When you adjust the position and size of the charts, the line automatically moves to display the relative position between the two charts.

After you specify a chart, four box marks appear on the border of the chart. These marks indicate the starting point of the connection line. Press and hold one box mark, and the area where the end point of the connection line is automatically displayed. Move the pointer to this position to connect the two charts.

- You can move a chart to the top or bottom of the dashboard. After you select a chart, you can use the menu bar to move the chart to the top or bottom.

Chart configurations

In the edit mode of a dashboard, you can perform the following operations on chart elements:

- **Edit**: modifies the query statement, properties, and interactive behavior such as **drill-down analysis** of a chart.
 - In the upper-right corner of the dashboard page, click **Edit**.
 - Find the **More** icon in the upper-right corner of the chart, and click **Edit**.
 - Modify the query statement of the chart, **Properties**, **Data Source**, or **Interactive Behavior**.
 - Click **Preview**, and then click **OK**.

- v. In the upper-right corner of the dashboard page, click **Save**.
- **Copy:** creates a copy of the specified chart and retains all configurations.
 - i. In the upper-right corner of the dashboard page, click **Edit**.
 - ii. Find the **More** icon in the upper-right corner of the chart, and click **Copy**.
 - iii. Drag the chart copy to the specified position and set the top and left margins and size of the copy.
 - iv. In the upper-right corner of the dashboard page, click **Save**.
- **Delete:** deletes the specified chart from the dashboard.
 - i. In the upper-right corner of the dashboard page, click **Edit**.
 - ii. Find the **More** icon in the upper-right corner of the chart, and click **Delete**.
 - iii. In the upper-right corner of the dashboard page, click **Save**.

30.4.11.2.5. Drill-down analysis

This topic describes how to configure drill-down analysis for a chart of a Logstore. When you add a chart to a dashboard, you can modify the configurations in the drill-down list to obtain deeper data analysis results.

Prerequisites

- The index feature of the Logstore is enabled and configured. For more information, see [Enable the index feature and configure indexes for a Logstore](#).
- A saved search, a dashboard, and a custom link to which you want to be redirected are configured.
- A placeholder variable is specified in the saved search or the query statement of a chart added to a dashboard to which you are redirected if you want to add a variable. For more information, see [Saved search](#) and [Create and delete a dashboard](#).

Context

Drilling is essential for data analysis. This feature allows you to analyze data in a fine-grained or coarse-grained way. This feature includes drill-up and drill-down analysis. You can implement drill-down analysis to gain a deeper insight into data and make a better decision.

Log Service supports drill-down analysis of the following charts: tables, line charts, column charts, bar charts, pie charts, individual value plots, area charts, and treemap charts.

Procedure

1. [Log on to the Log Service console](#).
2. Click the target project name.
3. Click the  icon next to the name of the Logstore, and then select **Search & Analysis** from the drop-down list.
4. Enter a query statement in the search box, set a time range, and then click **Search & Analyze**.
5. On the **Graph** tab that appears, select a **chart type**, and then configure the parameters on the **Properties** tab of the chart.
6. Click the **Interactive Behavior** tab. On this tab, configure the **Event Action** for drill-down analysis.
 - **Disable:** disables drill-down analysis.
 - **Open Logstore:** sets the drill-down event to open a Logstore.

If you configure a filter statement on the **Interactive Behavior** tab, the filter statement automatically fills the **Search & Analyze** search box of the redirected Logstore page when you click a value on the chart.

Parameter	Description
Select Logstore	The name of the Logstore to which you want to be redirected.

Parameter	Description
Open in New Tab	If you turn on this switch, the specified Logstore is opened on a new tab when the interactive behavior is triggered.
Time Range	<p>The query time range of the Logstore to which you are redirected. Valid values:</p> <ul style="list-style-type: none"> ▪ Default: The default time range (15 minutes, accurate to the second) is used for a query statement of the redirected Logstore. ▪ Inherit table time: The time range that a statement queries in the redirected Logstore is the time range specified for the chart when the event is triggered. ▪ Relative: The time range that a statement queries in the redirected Logstore is accurate to the second. ▪ Time Frame: The time range that a statement queries in the redirected Logstore is accurate to the minute, hour, or day. <p>Default value: Default.</p>
Inherit Filtering Conditions	If you turn on the Inherit Filtering Conditions switch, the filtering conditions added to the dashboard are synchronized to a query statement of the specified Logstore. The filtering conditions are added before the query statement by using the logical AND operator.
Filter	<p>Enter a Filter Statement on the Filter tab. The filter statement can contain the Optional Parameter Fields.</p> <p>If you configure a filter statement on the Filter tab, the filter statement automatically fills the Search & Analyze search box of the redirected Logstore page when you click a chart value on the dashboard.</p>

- **Open Saved Search:** sets the drill-down event to execute a saved search.

You can configure variables and a filter statement for a chart at the same time. When you click a value on the chart:

- If you configure a variable for the chart, the variable value that you click replaces the placeholder variable that you have configured for the saved search and the saved search is executed for drill-down analysis.
- If you configure a filter statement, the filter statement is added to the saved search to which you are redirected.

Parameter	Description
Select Saved Search	The name of the saved search to which you want to be redirected. For more information about how to configure a saved search, see Saved search .
Open in New Tab	If you turn on this switch, the specified saved search is opened on a new tab when the interactive behavior is triggered.
Time Range	<p>The time range of the saved search to which you want to be redirected. Valid values:</p> <ul style="list-style-type: none"> ▪ Default: The default time range (15 minutes, accurate to the second) is used for the saved search to which you are redirected. ▪ Inherit table time: The time range of the saved search is the query time range of the chart that you configure on the dashboard. ▪ Relative: The time range of the saved search is accurate to the second. ▪ Time Frame: The time range of the saved search is accurate to the minute, hour, or day. <p>Default value: Default.</p>

Parameter	Description
Inherit Filtering Conditions	If you turn on the Inherit Filtering Conditions switch, the filtering conditions added on the dashboard are synchronized to the saved search of the specified Logstore. The filtering conditions are added before the saved search by using the logical AND operator.
Filter	Click the Filter tab, and then enter a Filter Statement . The filter statement can contain the Optional Parameter Fields . If you configure a filter statement on the Filter tab, the Filter Statement is added to the saved search when you click a chart value on the dashboard.
Variable	Click the Variable tab, click Add Variable , and then set the following parameters: <ul style="list-style-type: none"> ▪ Replace Variable Name: the variable that triggers the drill-down event. When you click this variable, you are redirected to the specified saved search. ▪ Replace the value in the column: the column where the value that you want to replace data with is located. To process multiple columns, you can specify the current column and other columns. The current column is the column on which you want to perform drill-down analysis. Specify the current column in the Replace the value in the column field. Other columns can be the fields in the chart for which you configure drill-down analysis. If the variable name of the saved search is the same as the added variable, the variable of the saved search is replaced with the chart value that triggers the drill-down event. This helps you use the saved search for analysis in an efficient way. <div style="background-color: #e1f5fe; padding: 10px; margin-top: 10px;"> <p> Note</p> <ul style="list-style-type: none"> ▪ If you add a variable for drill-down analysis, you must first configure a placeholder variable for the saved search to which you want to be redirected. ▪ You can add up to five placeholder variables for a saved search. </div>

- **Open Dashboard**: sets the drill-down event to open a dashboard.

Analysis charts on a dashboard are visualized query results. When you click a chart value on the source dashboard:

- If you configure a variable for the chart and set a placeholder variable for the chart on the destination dashboard to which you want to be redirected, the placeholder variable is replaced with the chart value that you click.
- If you configure a filter statement, the filter statement is added to the query statement of the chart on the destination dashboard.

Parameter	Description
Select Dashboard	The name of the dashboard to which you want to be redirected. For more information, see Create and delete a dashboard .
Open in New Tab	If you turn on this switch, the specified dashboard is opened on a new tab when interactive behavior is triggered.

Parameter	Description
Time Range	<p>Set the time range for the dashboard to which you want to be redirected. Valid values:</p> <ul style="list-style-type: none"> ▪ Default: After you are redirected to the dashboard by clicking a chart value on the current dashboard, the selected dashboard uses its original time range. ▪ Inherit table time: After you are redirected to the selected dashboard, the time range of the chart on the selected dashboard is the time range of the chart specified on the source dashboard when the event is triggered. ▪ Relative: After you are redirected to the selected dashboard, set the time range of the selected dashboard to the specified relative time. ▪ Time Frame: After you are redirected to the selected dashboard set the time range of the selected dashboard to the specified time frame. <p>Default value: Default.</p>
Inherit Filtering Conditions	<p>If you turn on the Inherit Filtering Conditions switch, the filtering conditions added on the current dashboard are synchronized to the dashboard to which you are redirected. The filtering conditions are added before the query statement by using the logical AND operator.</p>
Filter	<p>Click the Filter tab, and then enter a Filter Statement. The filter statement can contain the Optional Parameter Fields.</p> <p>If you have set the Filter, a filtering condition is added to the selected dashboard when you click a chart value on the current dashboard. The filtering condition is the specified Filter Statement.</p>
Variable	<p>Click the Variable tab, click Add Variable, and then set the following parameters:</p> <ul style="list-style-type: none"> ▪ Replace Variable Name: the variable that triggers drill-down analysis. When you click this variable, you are redirected to the selected dashboard. ▪ Replace the value in the column: the column where the value that you want to replace data with is located. To process multiple columns, you can specify the Default Column and other columns. The Default Column is the current column on which you want to perform drill-down analysis. Other columns can be fields in the chart for which you configure drill-down analysis. <p>If the variable in the query statement of the chart on the selected dashboard is the same as the added variable, the variable is replaced with the chart value that triggers the drill-down event. This changes the query statement of the chart on the selected dashboard.</p> <div style="background-color: #e1f5fe; padding: 10px; border: 1px solid #cfe2f3;"> <p> Note</p> <ul style="list-style-type: none"> ▪ If you add a variable for drill-down analysis, you must first configure a placeholder in the query statement for the selected dashboard to which you want to be redirected. ▪ You can add up to five variables. </div>

- **Custom HTTP Link:** sets the drill-down event to open a custom HTTP link.

The path in the HTTP link is the path of the destination file in the server. When you add optional parameter fields to the path and click the chart value on the dashboard, the added parameter fields are replaced with the chart value. At the same time, you are redirected to the new HTTP link.

Parameter	Description
Enter Link	The destination address to which you want to be redirected.
Optional Parameter Fields	By clicking an optional parameter variable, you can replace a part of the HTTP link with the chart value that triggers a drill-down event.

7. Click **Add to New Dashboard** and set the dashboard name and chart name.

Example

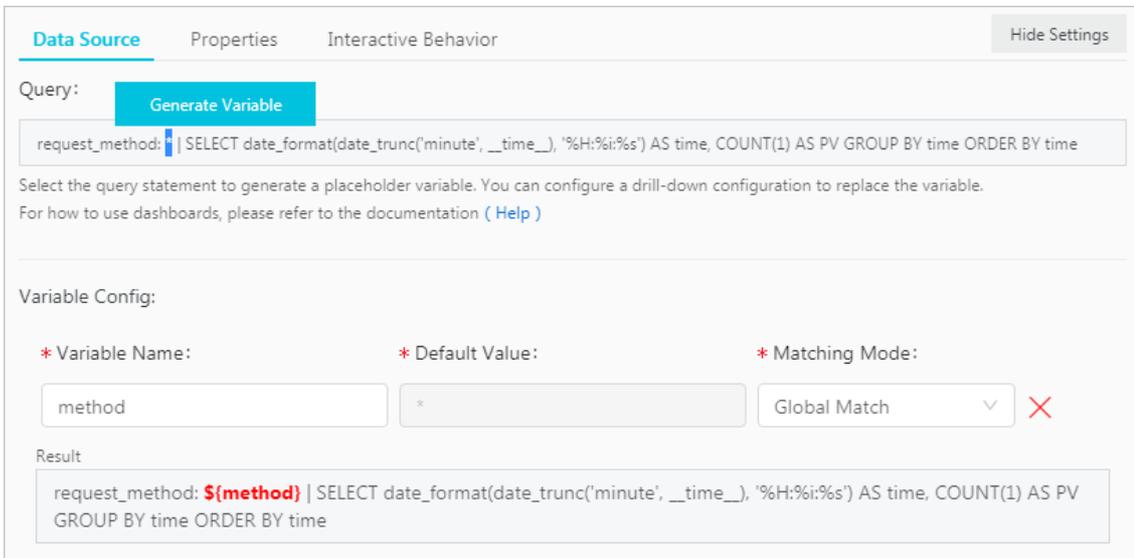

You want to store collected NGINX access logs in a Logstore named `accesslog`, display the relevant analysis results on a dashboard named `RequestMethod`, and display the page view (PV) changes over time on a dashboard named `destination_drilldown`. You can configure drill-down analysis for the table of request methods, add the table to the `RequestMethod` dashboard, and then configure the drill-down event that redirects you to the `destination_drilldown` dashboard. When you click a request method on the table on the `RequestMethod` dashboard, you are redirected to the `destination_drilldown` dashboard. Then you can view the PV changes on the dashboard.

1. Set the dashboard to which you want to be redirected.

- i. Filter log data by request method and analyze how the PV of each request method changes over time. The query statement is shown as follows:

```
request_method: * | SELECT date_format(date_trunc('minute', __time__), '%H:%i:%s') AS time, COUNT(1) AS PV GROUP BY time ORDER BY time
```

- ii. Use a line chart to display the query result and add the line chart to the dashboard named `destination_drilldown`. Before you add the line chart to the dashboard, specify the asterisk (`*`) to generate a placeholder variable and set the variable name to `method`. If the variable name of another chart for which you configure drill-down analysis is `method`, when you click the variable value on the chart to trigger drill-down analysis, the asterisk (`*`) is replaced with the value that you click and the query statement of the line chart is performed.

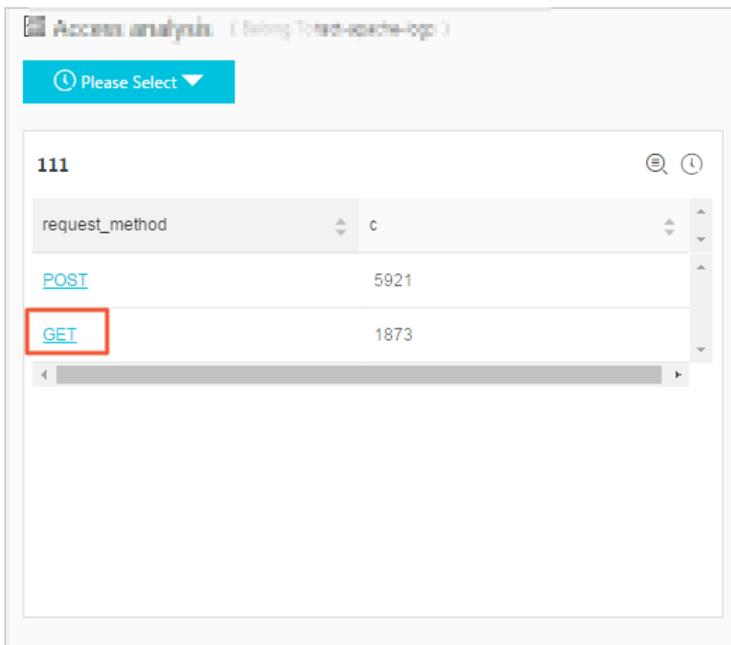

2. Configure drill-down analysis for a chart and add the chart to the dashboard.

- i. On the **Search & Analysis** page, enter a SQL statement to query the number of NGINX access log entries of each request method, and display the result in a table. The query statement is shown as follows:

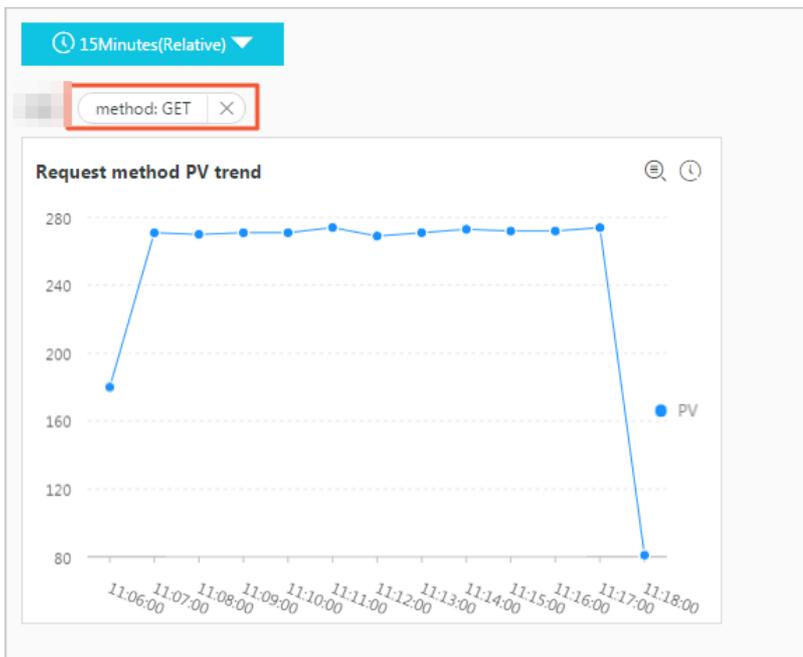

```
*|SELECT request_method, COUNT(1) AS c GROUP BY request_method ORDER BY c DESC LIMIT 10
```

- ii. Configure drill-down analysis for the `request_method` column in the table.

iii. Click the GET request on the RequestMethod dashboard.

iv. Redirected to the destination_drilldown dashboard. You are redirected to the dashboard configured in step . The asterisk (*) in the query statement is replaced with GET . The dashboard shows how the PV of the GET request changes over time.

30.4.11.2.6. Configure and use a filter on a dashboard of a Logstore

This topic describes how to configure and use a filter on a dashboard of a Logstore. Filters help you refine search results or replace placeholder variables with specified values.

Prerequisites

- The index feature of the Logstore is enabled and configured. For more information, see [Enable the index feature and configure indexes for a Logstore](#).
- A dashboard is created. For more information, see [Create and delete a dashboard](#). A placeholder variable is

specified for charts on the dashboard if the filter type is set to Replace Variable.

Context

Each chart on a dashboard is a visualized query statement. When you configure a filter on a dashboard, the specified filtering condition or variables apply to all charts on the dashboard. You can configure the following two types of filters:

- **Filter:** Add key-value pairs as a filtering condition before the query statement [search query]. The new query statement is key:value AND [search query], which means to search the result of the original query statement for log entries that contain key:value. For the Filter type, you can select or enter multiple key-value pairs. When you select multiple key-value pairs as filtering conditions, the logical OR operator is used between the pairs.
- **Replace Variable:** Specify a variable. If the dashboard contains a chart configured with the same placeholder variable, the placeholder variable in the query statement of the chart is replaced with the selected value.

Components

Each filter chart has one or more filters. Each filter consists of the following two components:

- The key, which indicates a filter operation.
- The values of the key.

Procedure

1. [Log on to the Log Service console.](#)
2. Click a project name.
3. In the left-side navigation pane, click the **Dashboard** icon.
4. In the dashboard list, click the name of the target dashboard.
5. On the dashboard page, click **Edit** to enter the edit mode.
6. Click the  icon, and then set the filter parameters. Click **OK**.

Parameters of a filter

Parameter	Description
Filter Name	The name of the filter.
Display Settings	Valid values: <ul style="list-style-type: none"> ◦ Title: specifies to add a title for a filter. You can turn on the Title switch to add a title for a filter. ◦ Border: specifies to add borders for a filter. You can turn on the Border switch to add borders for a filter. ◦ Background: specifies to add a white background for a filter. You can turn on the Background switch to add a white background for a filter.
Type	The filter type. Valid values: <ul style="list-style-type: none"> ◦ If you select Filter, a List Item is a value of a key that is used to filter the results of a query statement. You can set multiple values for a key. After the filter takes effect, you can select one or more values on the dashboard to filter query results based on your needs. ◦ If you select Replace Variable, a List Item is the value that replaces a specified variable. You can set multiple values for a variable. After the filter takes effect, you can select one or more values on the dashboard to filter query results based on your needs.

Parameter	Description
Key	<ul style="list-style-type: none"> For the Filter type, the Key parameter specifies the key in the filtering condition. For the Replace Variable type, the Key parameter specifies the variable. <p> Note The variable must be the same as the placeholder variable that you specified for charts. Otherwise, the placeholder variable cannot be replaced.</p>
Alias	The alias of the key. This parameter is available only when you select Filter . After you set an alias for a key, the alias is displayed in the filter on the dashboard.
Global filter	This switch indicates whether to filter the specified values in all fields. This switch is turned off by default. The switch is available only when you select the Filter type. <ul style="list-style-type: none"> To filter the specified values in all fields, turn on the Global filter switch. To filter the specified values in specified keys, turn off the Global filter switch.
Static List Items	The values of the key that is used as a filtering condition. Click the plus sign and enter a value for the key in the text box.
Add Dynamic List Item	The dynamic value of the key retrieved by running the specified query statement. Turn on the Add Dynamic List Item switch, select a Logstore, and turn on the Inherit Filtering Conditions switch (specifies whether to include the filtering condition in the query statement). Enter a query statement in the search box, specify a time range, and then click Search to preview the dynamic values.

Examples

You can use a filter to modify the query statements of charts on a dashboard and replace placeholder variables in the charts on the dashboard. Each chart represents a query statement in the format of `[search query] | [sql query]`. The filter query is appended to the original query statement to filter data.

- If the filter type is **Filter**, the key-value pairs to be filtered are added before `[search query]` to form a new query statement by using the logical **AND** operator. The new query statement is `key:value AND [search query]`.
- If the filter type is **Replace Variable**, the filter queries all charts that contain the specified placeholder variables on the dashboard and replaces the placeholder variables with the selected `values`.

Example 1: Use different time granularities to analyze logs

After you collect NGINX access logs, you need to query and analyze these logs in real time.

You can use a query statement to view the number of page views (PVs) per minute. However, if you want to view the number of PVs per second, you must modify the value of `__time__ - __time__ % 60` in the query statement. To simplify this operation, you can use a filter to replace variables in the query statement.

- Use the following query statement to view the number of PVs per minute:

```
* | SELECT date_format(__time__ - __time__ % 60, '%H:%i:%s') as time, count(1) as count GROUP BY time ORDER BY time
```

- Add the chart to a dashboard, and select `60` generate a variable with the name `interval`.

The screenshot shows a dashboard interface with a 'Chart Preview' on the left and a 'Data Source' configuration panel on the right. The chart preview displays a table with columns 'time' and 'count'. The data points are:

time	count
17:04:00	4
17:09:00	4
17:13:00	8

The 'Data Source' panel includes a 'Query' section with a 'Generate Variable' button. Below it, there is a 'Variable Config' section with fields for 'Variable Name' (set to 'interval'), 'Default Value' (set to '60'), and 'Matching Mode' (set to 'Global Match'). A 'Result' section shows the query statement with the variable replaced: `* | SELECT date_format(__time__ - __time__ % $interval, '%H:%i:%s') as time, count(1) as count GROUP BY time ORDER BY time`.

3. Add a filter on the dashboard page.

- **Type:** Select **Replace Variable**.
- **Key:** Enter `interval`.
- **Static List Items:** Add `1` and `120` as values of the key. The default unit is seconds.

4. In the Filter section of the dashboard, select `1` from the Interval drop-down list to view statistics by second.

The following statement shows the query statement after the placeholder variable is replaced:

```
* | SELECT date_format(__time__ - __time__ % 1, '%H:%i:%s') as time, count(1) as count GROUP BY time ORDER BY time
```

The screenshot shows a 'Variable' configuration dialog with 'interval: 1' entered. Below the dialog, a table titled 'PV-01 15Minutes(Relative)' displays the following data:

time	count
17:15:00	103
17:16:00	112
17:17:00	68
17:18:00	157

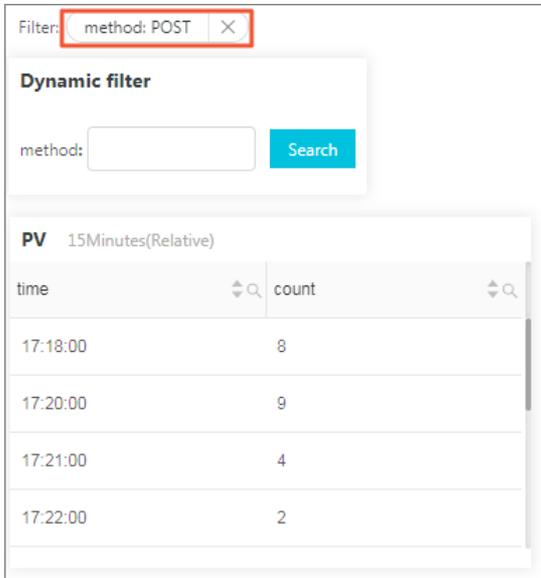

Example 2: Switch between request methods

You can add dynamic values to a filter to dynamically switch between request methods. In example 1, the query statement starts with an asterisk (*), which means no condition is set to filter the query results and all logs are queried. You can add another filter to view the PV data of different request `methods`.

1. Add a filter on the dashboard and turn on the **Add Dynamic List Item** switch. Set the parameters as follows:
 - **Type:** Select **Filter**.
 - **Key:** Enter `method`.
 - **Select Logstore:** Select the Logstore to which the dashboard belongs.
 - **Add Dynamic List Item:** Enter a query statement to obtain the relevant dynamic values, and then click **OK**.

- In the Filter section of the dashboard, select `POST` from the method drop-down list. Only the PV data whose `method` is `POST` is displayed in the chart. The query statement is changed as follows:

```
(* and (method: POST) | SELECT date_format(__time__ - __time__ % 60, '%H:%i:%s') as time, count(1) as count GROUP BY time ORDER BY time
```

30.4.11.2.7. Markdown chart

Log Service allows you to add a Markdown chart to a dashboard. In the Markdown chart, you can insert images, links, videos, and other elements to make your dashboard page more intuitive.

Context

You can create different Markdown charts based on your business needs. Markdown charts can make a dashboard more intuitive. You can insert text such as background information, chart description, notes, extension information, and custom images in a Markdown chart. You can also insert saved searches or dashboard links of other projects to redirect to other query pages.

Scenarios

You can insert links in a Markdown chart to redirect to other dashboard pages of the current project. You can also insert an image corresponding to each link for better recognition. In addition, you can use a Markdown chart to describe parameters of analysis charts.

Procedure

- Log on to the [Log Service console](#).
- Click a project name.
- In the left-side navigation pane, click the **Dashboard** icon.
- In the dashboard list, click the name of the target dashboard.
- On the dashboard page, click **Edit** to enter the edit mode.
- In the edit mode, drag the Markdown icon  from the menu bar to the specified location to create a Markdown chart.
- Click the created Markdown chart, find the More icon in the upper-right corner of the chart, and click **edit**.

Parameter	Description
Chart Name	The name of the Markdown chart.
Show Border	Specifies whether to show the borders of a Markdown chart. You can turn on the Show Border switch to show the borders of a Markdown chart.
Show Title	Specifies whether to show the title of a Markdown chart. You can turn on the Show Title switch to show the title of a Markdown chart.
Show Background	Specifies whether to show the background of a Markdown chart. You can turn on the Show Background switch to show the background of a Markdown chart.
Query Binding	Specifies whether to bind a query statement to a Markdown chart. You can turn on the Query Binding switch and bind a query statement to a Markdown chart. Then, dynamic query results are displayed in the Markdown chart.

8. (Optional)Bind a query statement

- i. Select the target Logstore and enter a query statement in the search box. A query statement consists of a search statement and an analytic statement in the format of `search statement|analytic statement`.
- ii. On the Search & Analysis page, click **15 Minutes(Relative)** to set the time range for the query.
- iii. Click **Search** to display the first values of the returned query result.
- iv. Click the ⊕ icon next to a field to insert the corresponding query result to **Markdown Content**.

9. Edit **Markdown Content**. Enter Markdown content in the **Markdown content** column on the right. Then data preview is displayed in real time in the **Show Chart** column on the right. You can modify the Markdown content based on the data preview on the right.

Modify a Markdown chart

- **Modify the location and size of a Markdown chart**
 - i. Click **Edit** in the upper-right corner of the **Dashboard** page.
 - ii. Drag the Markdown icon to the specified location on the dashboard and drag the lower-right corner of the chart to adjust its size.
 - iii. Click **Save** in the upper-right corner of the dashboard page to save the modification.
- **Modify the title of a Markdown chart**
 - i. Click **Edit** in the upper-right corner of the **Dashboard** page.
 - ii. Click the specified Markdown chart, find the **More** icon in the upper-right corner of the chart, and click **Edit**.
 - iii. Enter a new title in the **Chart name** field and then click **OK**.
 - iv. Click **Save** in the upper-right corner of the dashboard page. On the dialog box that appears, click **OK**.
- **Modify the content of a Markdown chart**
 - i. Click **Edit** in the upper-right corner of the **Dashboard** page.
 - ii. Click the specified Markdown chart, find the **More** icon in the upper-right corner of chart, and click **Edit**.
 - iii. Modify the chart content, and then click **OK**.
 - iv. Click **Save** in the upper-right corner of the dashboard page. On the dialog box that appears, click **OK**.
- **Delete a Markdown chart**
 - i. Click **Edit** in the upper-right corner of the **Dashboard** page.
 - ii. Click the specified Markdown chart, find the **More** icon in the upper-right corner of chart, and click **Delete**.
 - iii. Click **Save** in the upper-right corner of the dashboard page. On the dialog box that appears, click **OK**.

Common Markdown syntax

- Title

Markdown syntax:

```
# Level 1 heading
## Level 2 heading
### Level 3 heading
```

- Link

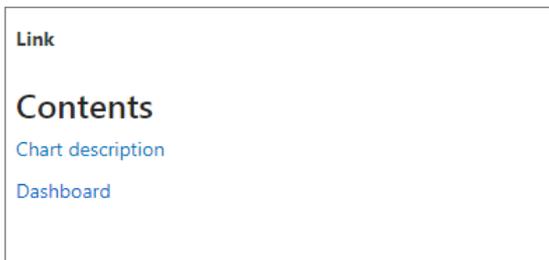

Markdown syntax:

```
### Contents

[Chart description](https:// xxx)

[Dashboard](https:// xxx)
```

Link preview

- Image

Markdown syntax:

```
<div align=center>

! [ Alt txt][id]

With a reference later in the document defining the URL location

[id]: https://octodex.github.com/images/dojocat.jpg "The Dojocat"
```

- Special tag

Markdown syntax:

```

```

30.5. Alerts

30.5.1. Overview

Log Service enables you to configure alerts for charts on a dashboard to monitor the service status in real time.

You can configure alerts on the **Search & Analysis** page of a Logstore or on a **Dashboard** page. When you configure an alert, you must configure the alert name, trigger condition, notification method, and other parameters. After you **Configure alerts**, Log Service checks the query results on the dashboard at an interval and sends an alert notification if the check results meet the specified conditions. In this way, Log Service facilitates real-time monitoring of the service status.

Limits

Item	Description
Associated charts	The number of charts that can be associated with an alert ranges from 1 to 3.
String	If the length of a string exceeds 1,024 characters, only the first 1,024 characters are computed during a query.
Conditional expression	<ul style="list-style-type: none"> The conditional expression must be 1 to 128 characters in length. The conditional expression is evaluated based on the first 100 log entries returned for a query. The conditional expression can be evaluated up to 1,000 times. If the conditional expression is not matched, the alert is not triggered.
Search Period	The time range of each query statement cannot exceed 24 hours.

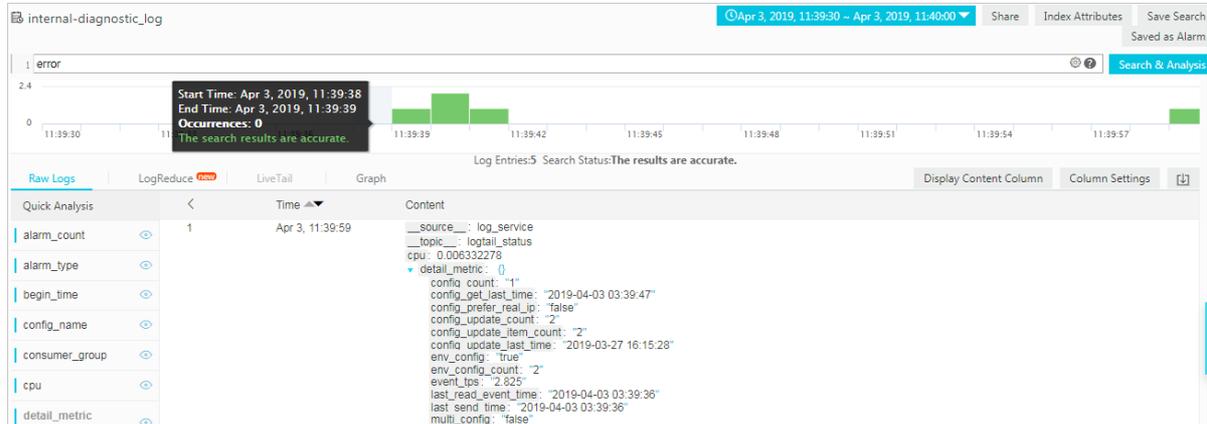

Query statement in an alert

An alert is configured based on analysis charts on a dashboard. An analysis chart is a visualized query result of a query statement. A query statement can include a search statement and an analytic statement.

- If you use only a search statement for a query, log data that matches the search condition is returned.
- If you include search and analytic statements for a query, log data that matches the search condition is analyzed before being returned.
- Search statement

For example, you want to query the data that contains "error" information in the last 15 minutes. The search statement is error. A total of 154 log entries are retrieved. Each log entry consists of key-value pairs. You can set an alert rule for the value of a key.

Note If over 100 log entries are returned for a query, only the first 100 log entries are used for evaluating the conditions set in an alert. An alert is triggered when any of the first 100 log entries returned meets the conditions.

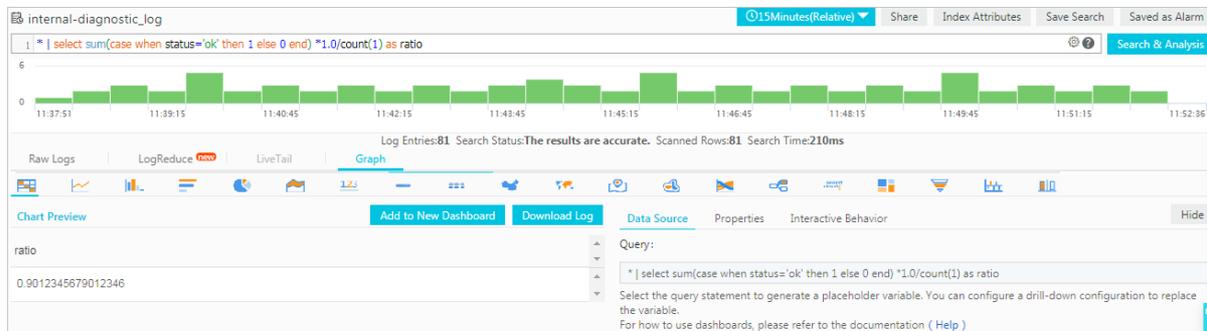

• Search and analytic statement

For example, the following statement queries the ratio of log entries whose status field value is ok to all log entries. For more information about query syntax, see [Query syntax](#).

```
* | select sum(case when status='ok' then 1 else 0 end) *1.0/count(1) as ratio
```

If you set the trigger condition of an alert to `ratio < 0.9`, the alert is triggered when the ratio of log entries whose status field value is ok to all log entries is less than 90%.

30.5.2. Configure an alarm

30.5.2.1. Configure alerts

Log Service allows you to configure alerts on the Search & Analysis page of a Logstore or on a dashboard page. If the trigger condition of an alert is met, the alert is triggered and a notification is sent to specified recipients.

Prerequisites

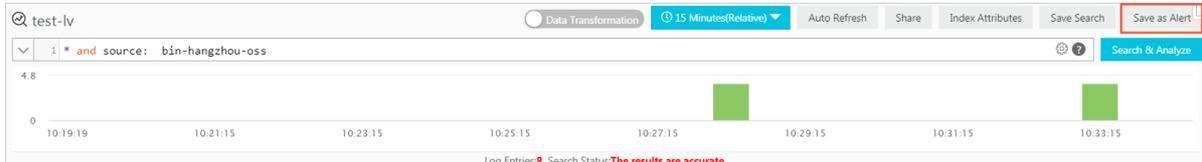

- Log data is collected.
- The indexing feature is enabled and indexes are configured. For more information, see [Enable the index feature and configure indexes for a Logstore](#).

Context

Alerts are configured based on analysis charts. When you view an analysis chart, you can add the chart to a dashboard and configure an alert for the chart. You can also configure an alert for the existing charts on a dashboard.

- Create a chart and configure an alert for the chart

You can save the results of a query statement as a chart on a dashboard, and configure an alert for the chart. When you configure an alert on the Search & Analysis page, you must specify the name of the dashboard on which the chart is saved and the chart name.

- Configure an alert for existing charts on a dashboard.

You can configure an alert for one or more charts on a dashboard at a time. When you configure an alert for multiple charts, you can specify a conditional expression for each chart and combine the conditional expressions into the trigger condition for the alert.

This topic describes how to configure an alert for existing charts on a dashboard.

Note If an alert is configured for a chart on a dashboard and you update the search and analytic statement of the chart, you must update the search and analytic statement in the alert configuration. For more information, see [Modify an alert](#).

For information about example alert configurations, see [FAQ about alerts](#).

Procedure

1. [Log on to the Log Service console](#).
2. In the **Projects** section, click the name of a project.
3. In the left-side navigation pane, click the **Dashboard** icon.
4. Click the target dashboard name.
5. In the upper-right corner of the dashboard, choose **Alerts > Create**.
6. In the **Create Alert** wizard, configure an alert and click **Next**.The following table describes the configuration parameters of an alert.

Parameter	Description
Alert Name	The name of the alert. The name must be 1 to 64 characters in length.
Associated Chart	<p>The chart that is associated with the alert.</p> <p>The Search Period parameter specifies the time range of log data that Log Service reads when you query data. You can select a relative time or a time frame. For example, if you set Search Period to 15 minutes (relative) and start the query at 14:30:06, Log Service reads the log data that was written from 14:15:06 to 14:30:06. If you set Search Period to 15 minutes (time frame) and start the query at 14:30:06, Log Service reads the log data that was written from 14:15:00 to 14:30:00.</p> <p>To associate the alert with multiple charts, you must separately add and configure the charts. The number before the chart name indicates the sequence number of the chart in the alert configuration. You can use the sequence number to associate a chart in the trigger condition.</p>
Frequency	The time interval at which Log Service executes the alert.

Parameter	Description
Trigger Condition	<p>The conditional expression that determines whether to trigger the alert. If the condition is met, Log Service sends an alert notification based on the specified Check Frequency and Notification Interval.</p> <p>For example, you can enter <code>pv%100 > 0 && uv > 0</code> in the Trigger Condition field.</p> <p>Note In the conditional expression, you can use <code>\$sequence number</code> to differentiate charts. For example, you can use <code>\$0</code> to identify the chart whose sequence number is 0.</p>
Advanced	
Notification Trigger Threshold	<p>If the number of times that the trigger condition is met exceeds this threshold and the specified Notification Interval elapses, Log Service sends an alert notification to the specified recipients.</p> <p>The default value of Notification Trigger Threshold is 1. This value indicates that each time the specified Trigger Condition is met, Log Service checks Notification Interval to determine whether to send notifications.</p> <p>You can set a custom value. This way, Log Service sends an alert notification to the specified recipient only after the trigger condition is met multiple times. For example, if you set the value to 100, Log Service checks Notification Interval only after the trigger condition is met 100 times. If the Notification Trigger Threshold and Notification Interval are reached, Log Service sends an alert notifications to the specified recipients. The overall count is then reset to zero. If Log Service fails to check log data due to exceptions such as network failures, the overall count does not change.</p>
Notification Interval	<p>The time interval at which Log Service sends an alert notification.</p> <p>If the number of times that the trigger condition is met exceeds the specified Notification Trigger Threshold and the specified notification interval elapses, Log Service sends an alert notification to the specified recipients. If you set this parameter to 5 minutes, you can receive up to one alert notification every 5 minutes. The default value is No Interval.</p> <p>Note You can use the Notification Trigger Threshold and Notification Interval parameters to control the number of alert notifications that you receive.</p>

7. Set the notification method. Notifications can be sent to a custom webhook address in a specified format. To use this notification method, you must set the Request URL, Request Method, and Request Content parameters. For more information, see [Notification methods](#).

- Request URL: a custom webhook address, for example, `https://webhook.com/notify`.
- Request Method: the request method. Request methods include GET, PUT, POST, DELETE, and OPTIONS.
- Request Content: the content of the notification. The content must be 1 to 500 characters in length. Template variables are supported.

8. Click OK.

30.5.2.2. Grant permissions on alerts to a RAM user

This topic describes how to grant a RAM user the permissions to enable the alerting feature.

Context

Grant a RAM user the permissions only to create and modify alerts. Create a custom authorization policy, and apply the policy to the RAM user. For more information, see Procedure in this topic.

Procedure

1. Log on to the [ASCM console](#) as an administrator.
2. [Create a RAM role](#).
3. [Create a permission policy](#). Use the following policy and replace the `<Project name>` .

```
{
  "Version": "1",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "log:CreateLogStore",
        "log:CreateIndex",
        "log:UpdateIndex"
      ],
      "Resource": "acs:log:*:*:project/<Project name>/logstore/internal-alert-history"
    },
    {
      "Effect": "Allow",
      "Action": [
        "log:CreateDashboard",
        "log:CreateChart",
        "log:UpdateDashboard"
      ],
      "Resource": "acs:log:*:*:project/<Project name>/dashboard/*"
    },
    {
      "Effect": "Allow",
      "Action": [
        "log:*"
      ],
      "Resource": "acs:log:*:*:project/<Project name>/job/*"
    }
  ]
}
```

4. [Create a RAM user](#).
5. [Create a RAM user group](#).
6. [Add a RAM user to a RAM user group](#)
7. [Grant permissions to a RAM role](#).

30.5.2.3. Notification methods

This topic describes the available notification methods that you can configure for an alert in Log Service.

WebHook-Custom

You can set the notification method to WebHook-Custom. When an alert is triggered, Log Service sends an alert notification to a specified webhook URL by using a specified method.

Note The timeout period of the WebHook-Custom notification method is five seconds. If no response is received within five seconds after a notification request is sent, the notification request is deemed to be failed.

1. Configure an alert in the Log Service console. For more information, see [Configure alerts](#). Select **WebHook-Custom** from the Notifications drop-down list.
2. Enter your custom webhook URL in the **Request URL** field. Select a **Request Method**.
3. (Optional) Click **Add Request Headers** to add request header fields. By default, the request header contains the field `Content-Type: application/json;charset=utf-8`. You can add request header fields based on your business needs.
4. Enter the notification content in the **Request Content** field. When an alert is triggered, Log Service sends the specified notification content to the custom webhook URL by using the specified method.
5. Click **Submit**.

Template variables

You must set **Content** for each notification method. In the notification content, you can reference some template variables in the `${fieldName}` format for the alert. When sending an alert notification, Log Service replaces the template variables referenced in the **Content** field with real values. For example, it replaces `${Project}` with the name of the project to which the alert belongs.

Note You must reference valid variables. If a referenced variable does not exist or is invalid, Log Service processes the variable as a null string. If the value of a referenced variable is of the object type, the value is converted and displayed as a JSON string.

The following table lists all the supported variables and reference methods.

Variable	Description	Example	Reference example
Aliuid	The ID of the Apsara Stack tenant account to which the project belongs.	1234567890	The alert configured by the user <code>\${Aliuid}</code> is triggered.
Project	The project to which the alert belongs.	my-project	The alert configured in the project <code>\${Project}</code> is triggered.
AlertID	The unique ID of the alert.	0fdd88063a611aa114938f9371dae6b6-1671a52eb23	The ID of the alert is <code>\${AlertID}</code> .
AlertName	The name of the alert, which must be unique in a project.	alert-1542111415-153472	The alert <code>\${AlertName}</code> is triggered.
AlertDisplayName	The display name of the alert.	My alert	The alert <code>\${AlertDisplayName}</code> is triggered.
Condition	The conditional expression that triggers the alert. Each variable in the conditional expression is replaced with the value that triggers the alert. The value is enclosed in brackets [].	[5] > 1	The conditional expression that triggers the alert is <code>\${Condition}</code> .

Variable	Description	Example	Reference example
RawCondition	The original conditional expression that triggers the alert. Variables in the conditional expression are not replaced.	count > 1	The original conditional expression that triggers the alert is <code>\${RawCondition}</code> .
Dashboard	The name of the dashboard with which the alert is associated.	mydashboard	The alert is associated with the dashboard <code>\${Dashboard}</code> .
DashboardUrl	The URL of the dashboard with which the alert is associated.	https://sls.console.aliyun.com/next/project/myproject/dashboard/mydashboard	The URL of the dashboard associated with the alert is <code>\${DashboardUrl}</code> .
FireTime	The time when the alert is triggered.	2018-01-02 15:04:05	The alert is triggered at <code>\${FireTime}</code> .
FullResultUrl	The URL used to query the history records that an alert rule was executed.	https://sls.console.aliyun.com/next/project/my-project/logsearch/internal-alert-history?endTime=1544083998&queryString=AlertID%3A9155ea1ec10167985519fccede4d5fc7-1678293caad&queryTimeType=99&startTime=1544083968	Click <code>\${FullResultUrl}</code> to view details.

Variable	Description	Example	Reference example
Results	<p>The parameters and results of each log data query. The value is of the array type. For information about parameters in the Results field, see Fields in alert log entries.</p> <p>Note A maximum of 100 alert notifications can be sent.</p>	<pre>[{ "EndTime": 1542507580, "FireResult": { "__time__": "1542453580", "count": "0" }, "LogStore": "test-logstore", "Query": "* SELECT COUNT(*) as count", "RawResultCount": 1, "RawResults": [{ "__time__": "1542453580", "count": "0" }], "StartTime": 1542453580 }]</pre>	<p>The first query starts at <code>#{Results[0].StartTime}</code> and ends at <code>#{Results[0].EndTime}</code>. The alert has been triggered <code>#{Results[0].FireResult.count}</code> times.</p> <p>Note In this example, the number 0 indicates the sequence number of the chart or the search and analytic statement. For more information, see How can I check the sequence number of a chart?</p>

30.5.3. Modify and view an alarm

30.5.3.1. Modify an alert

This topic describes how to modify an alert. After you create an alert, you can modify the alert and then update the alert. To modify an alert associated with a search statement, you can directly modify the search statement.

Precautions

- You can modify only search statements with which alerts are associated. You cannot modify search statements to search and analytic statements, which are in the format of `search statement|analytic statement`.
For example, after you associate the `request_method: GET` statement with an alert, you can modify the statement to `error`, but you cannot modify the statement to `error| select count(1) as c`.
- To modify an alert, you can click **Modify Settings** on the **Alert Overview** page, or choose **Alerts > Modify** on the associated dashboard.

Modify the search statement associated with an alert

If you associate a search statement with an alert, you can modify the search statement to modify the alert.

1. [Log on to the Log Service console.](#)
2. Click a project name.
3. In the left-side navigation pane, click the **Dashboard** icon.
4. In the dashboard list, click the name of the target dashboard.
5. On the dashboard, choose **Alerts > Modify**.
6. Find the search statement, and then click

. You can modify only search statements with which alerts are associated. You cannot modify search statements to search and analytic statements, which are in the format of `search statement|analytic statement`.

7. On the dialog box that appears, enter a new search statement, click **Preview**, and then click **OK** after the search statement is verified.
8. Modify other parameters specific to your environment, such as **Frequency** and **Trigger Condition**, and then click **Next**.
9. Set the notification method, and then click **Submit**.

Modify the chart associated with an alert

After you create an alert, you can modify the chart associated with the alert to modify the alert.

1. In the dashboard list, click the name of the target dashboard.
2. On the dashboard, choose **Alerts > Modify**.
3. Find the **Associated Chart**, and then click

next to **Query**.

4. On the dialog box that appears, enter a new query statement, click **Preview**, and then click **OK** after the query statement is verified.
5. Modify other parameters specific to your environment, such as **Frequency** and **Trigger Condition**, and then click **Next**.
6. Set the notification method.
7. Click **Submit**. The new settings take effect immediately.

30.5.3.2. View history alerts

This topic describes how to view history alerts in the Log Service console. Log Service records alerts as log data and creates a dashboard to display alert details.

View history alerts in the Logstore

When you create an alert, Log Service creates a Logstore named `internal-alert-history` for the project to which the alert belongs. A log entry is generated and written to the Logstore each time the alert rule is executed, regardless of whether the alert is triggered. For more information about the fields in the log entry, see [Fields in alert log entries](#).

Note The Logstore does not incur fees and cannot be deleted or modified. Each alert log entry is retained in the Logstore for seven days.

1. [Log on to the Log Service console](#).
2. Click a project name.
3. Click the  icon next to the `internal-alert-history` Logstore, and then select **Search & Analysis**.
4. On the page that appears, query alert log entries based on your needs.

View history alerts on the dashboard

After you create an alert, Log Service creates a dashboard named `internal-alert-analysis` for the project to which the alert belongs. The dashboard displays the statistics of all previous alerts, including the number of triggered alerts, percentage of successful alerts and notifications, and top 10 alerts whose alert rules are executed.

Note The dashboard cannot be deleted or modified.

1. In the left-side navigation pane, click the **Dashboard** icon.
2. Click **Alert History Statistics** to open the dashboard page. On the **Alert History Statistics** dashboard, the details of history alerts are displayed, including whether the alerts are triggered, why the alerts are triggered, error information, and other information.

30.5.3.3. Manage an alert

This topic describes how to manage an alert after you create the alert.

Context

You can disable, enable, modify, and delete the alert, or view the details of the alert such as the update time.

View the details of an alert

1. [Log on to the Log Service console](#).
2. Click a project name.
3. In the left-side navigation pane, click the **Alerts** icon.
4. In the alert list, click the name of the target alert. On the **Alert Overview** page, you can view the details of the alert, such as the dashboard, creation time, last update time, check frequency, alert status, and notification status.

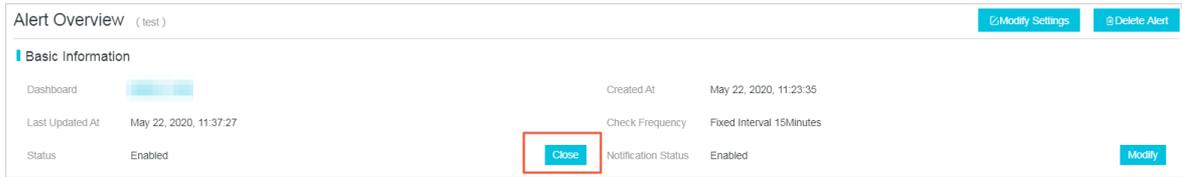

Basic Information			
Dashboard		Created At	Jan 19, 2020, 14:57:16
Last Updated At	Jun 23, 2020, 12:49:45	Check Frequency	Cron Expression:0/5 * * * *
Status	Enabled	Notification Status	Enabled

Disable and enable an alert

After you create an alert, you can disable or enable the alert. If you disable an alert, Log Service no longer checks the alert or send alert notifications.

1. In the left-side navigation pane, click the **Alerts** icon.
2. In the alert list, click the name of the target alert. On the **Alert Overview** page, click **Enable** or **Close** in the

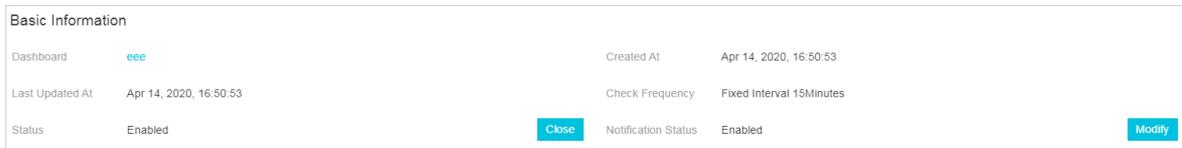

Alert Status field.

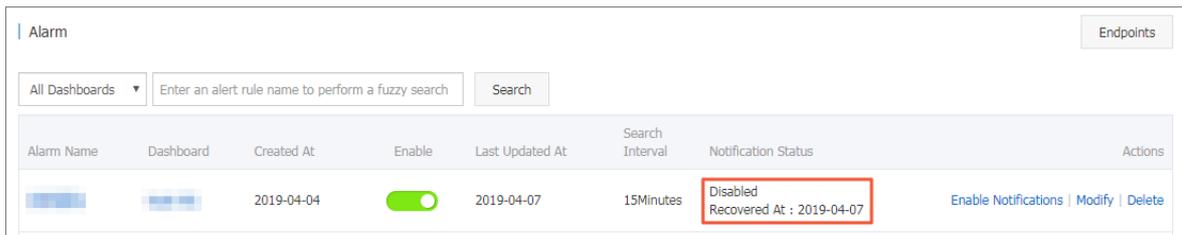

Disable and enable alert notifications

You can disable notifications of enabled alerts. After you disable notifications of an alert, alert notifications are not sent even if the trigger condition is met.

1. In the left-side navigation pane, click the Alerts icon.
2. In the alert list, click the name of the target alert. On the Alert Overview page, click Modify in the Notification Status field.

3. Set the time range for which notifications are disabled, and then click Confirm. After you disable alert notifications, you can view the time when alert notifications resume in the Notification Status field. You can click Modify in the Notification Status field to manually resume alert notifications.

Delete an alert

You cannot recover a deleted alert. Proceed with caution when you delete an alert.

1. In the left-side navigation pane, click the Alerts icon.
2. In the alert list, click the name of the target alert.
3. On the Alert Overview page, click Delete Alert.
4. In the dialog box that appears, click OK.

30.5.4. Relevant syntax and fields for reference

30.5.4.1. Conditional expression syntax of an alert

This topic describes how to configure a conditional expression for an alert in Log Service. An alert is triggered if the conditional expression configured for the alert is met.

In determining whether the conditional expression of an alert is met, the results of query statements configured for the alert are used as the inputs and the log fields in the conditional expression are used as the variables. If the conditional expression is met, the alert is triggered.

Limits

- Negative numbers must be enclosed with parentheses (), for example, $x + (-100) < 100$.
- Numeric data is treated as 64-bit floating-point numbers. If a comparison is performed, errors may occur.
- A variable can contain only letters and digits and must start with a letter.

- A conditional expression can be up to 128 characters in length.
- A conditional expression can be evaluated up to 1,000 times. If an alert is configured for multiple charts and the conditional expression of the alert is not met after 1,000 times of evaluation, the alert is not triggered.
- A maximum of three charts can be associated with an alert.
- An alert is triggered if and only if the Boolean value of its conditional expression is true. For example, the result of the expression `100+100 is 200`, which cannot trigger the alert.
- `true` , `false` , `$` , and `.` are reserved and cannot be used as variables.

Basic syntax

The following table lists the syntax supported in a conditional expression.

Syntax	Description	Examples
Basic operators	Supports the addition operator (+), subtraction operator (-), multiplication operator (*), division operator (/), and modulus operator (%).	<code>x*100+y>200</code> <code>x%10>5</code>
Comparison operators	Supports eight comparison operators, including the greater than operator (>), greater than or equal to operator (>=), less than operator (<), less than or equal to operator (<=), equal to operator (==), not equal to operator (!=), match operator (=~), and mismatch operator (!~). <div style="background-color: #e6f2ff; padding: 5px; border: 1px solid #d9e1f2;"> <p> Note</p> <ul style="list-style-type: none"> • Backslashes (/) must be escaped. • Regular expressions support the RE2 syntax. </div>	<code>x >= 0</code> <code>x < 100</code> <code>x <= 100</code> <code>x == 100</code> <code>x == "foo"</code> Regular expression: <code>x =~ "\\w +"</code>
Logical operators	Supports the logical operators AND (&&) and OR ().	<code>x >=0&& y <=100</code> <code>x > 0 y > 0</code>
Logical negation	Supports the logical negation operator (!).	<code>!(a < 1 && a > 100)</code>
Numeric constants	Numeric constants are processed as 64-bit floating-point numbers.	<code>x > 100</code>
String constants	String constants are formatted in a string enclosed in single quotation marks (').	<code>foo == 'string'</code>
Boolean constants	Supports true and false.	<code>(x > 100) == true</code>
Parentheses	Parentheses () can be used to enforce precedence order.	<code>x*(y+100)>100</code>
contains function	Determines whether a substring is included in a string. For example, if the result of the <code>contains(field, 'xxxx')</code> function is true, the field string includes the <code>xxxx</code> substring.	<code>contains(foo, 'hello')</code>

Conditional expression for results of multiple query statements

- Syntax

If you configure an alert for multiple charts, the variables in a conditional expression must be prefixed. In this way, you can specify from which query result to obtain the corresponding values of the variables when it evaluates your expression. The format is `$N.fieldname`, where N is the sequence number of the query statement. You can configure up to three query statements in an alert. Therefore the value range of N is 0 to 2. For example, `$0.foo` indicates to obtain the value of the foo field returned from the first query statement. If you configure one query statement in an alert, you do not need to specify the prefix.

 **Note** How can I view the sequence number of a query statement?

In the Alert Configuration step, the Associated Chart parameter specifies the sequence number of each query statement (chart). The first query statement is numbered 0, the second query statement is numbered 1, and the third statement is numbered 2.

• Evaluate a conditional expression

If multiple query results are returned, the variables specified in the conditional expression determine how to use the results to evaluate the conditional expression. For example, if you configure three query statements in an alert, x, y, and z log entries are returned when you execute each of the three statements. The conditional expression that you configure for the alert is `$0.foo > 100 && $1.bar < 100`. Then the first two query results are used to evaluate the conditional expression. A maximum of $x \times y$ times of evaluation (or 1,000 if $x \times y$ is greater than 1,000) is performed. If the conditional expression is met within the maximum times of evaluation, true is returned. Otherwise, false is returned.

Operations

 **Note**

- 64-bit floating-point numbers are used in a conditional expression.
- Each string constant must be enclosed in single quotation marks (') or double quotation marks (""), for example, 'string', and "string".
- Boolean values include true and false.

Operator	Operation		
	Operation between variables	Operation between non-string constants and variables	Operation between string constants and variables
Basic operators, including the addition operator (+), subtraction operator (-), multiplication operator (*), division operator (/), and modulus operator (%)	The left and right operands are converted to numbers before being operated.		Unsupported.

Operator	Operation		
	Operation between variables	Operation between non-string constants and variables	Operation between string constants and variables
Comparison operators, including the greater than operator (>), greater than or equal to operator (>=), less than operator (<), less than or equal to operator (<=), equal to operator (==), not equal to operator (!=)	<p>Operations are performed based on the following priorities:</p> <ol style="list-style-type: none"> 1. The left and right operands are converted to numbers before being operated based on the numerical order. If the conversion fails, 2. operands are operated based on the alphabetical order of strings. 	The left and right operands are converted to numbers before being operated based on the numerical order.	The left and right operands are operated based on the alphabetical order of strings.
Regular expression match operator (=~) and regular expression mismatch operator (!~)	The left and right operands are operated based on the alphabetical order of strings.	Unsupported.	The left and right operands are operated based on the alphabetical order of strings.
Logical operators, including AND (&&) and OR ()	These two operators cannot be directly used on the fields in query results. The left and right operands must be sub-expressions, and the values of the sub-expressions are of the Boolean type.		
Logical negation (!)	This operator cannot be directly used on the fields in query results. The left and right operands must be sub-expressions, and the values of the sub-expressions are of the Boolean type.		
contains function	The left and right operands are operated based on the alphabetical order of strings.	Unsupported.	The left and right operands are operated based on the alphabetical order of strings.
Parentheses ()	Parentheses () enforce precedence order.		

30.5.4.2. Fields in alert log entries

After you configure an alert, Log Service automatically creates a Logstore to store log entries that are generated when alert rules are executed and notifications are sent. This topic describes fields in alert log entries.

Fields

Field	Description	Example
AlertDisplayName	The display name of an alert.	Test alert rules
AlertID	The unique ID of an alert.	0fdd88063a611aa114938f9371daeeb6-1671a52eb23
AlertName	The unique name of an alert in a project.	alert-1542111415-153472
Condition	The conditional expression configured for an alert.	\$0.count > 1
Dashboard	The dashboard associated with an alert.	my-dashboard
FireCount	The cumulative times that an alert has been triggered since the last notification was sent.	1
Fired	Indicates whether an alert was triggered. Valid values: true and false.	true
LastNotifiedAt	The time when the last notification was sent. The time is displayed in a Unix timestamp.	1542164541
NotifyStatus	The status of a notification. Valid values: <ul style="list-style-type: none"> Success: indicates that a notification was successfully sent. Failed: indicates that a notification failed to be sent. NotNotified: indicates that no notification was sent. PartialSuccess: indicates that the notification sending partially succeeded. 	Success
Reason	The reason that a notification failed to be sent or no notification was sent.	result type is not bool

Field	Description	Example
Results	The parameters and results of each log data query. The value is of the array type. For information about parameters in the Results field, see Parameters in the Result field .	<pre>[{ "EndTime": 1542334900, "FireResult": null, "LogStore": "test-logstore", "Query": "* select count(1) as count", "RawResultCount": 1, "RawResults": [{ "__time__": "1542334840", "count": "0" }], "StartTime": 1542334840 }]</pre>
Status	The execution result of an alert. Valid values: Success and Failed.	Success

Parameters in the Result field

Parameter	Description	Example
Query	The query statement that is configured in an alert.	* select count(1) as count
LogStore	The target Logstore of a query.	my-logstore
StartTime	The time when a query starts.	2019-01-02 15:04:05
StartTimeTs	The time when a query starts. The time is in the Unix timestamp format.	1542334840
EndTime	The time when a query ends.	2019-01-02 15:19:05
EndTimeTs	The time when a query ends. The time is in the Unix timestamp format. The actual query time range is [StartTime, EndTime) .	1542334900

Parameter	Description	Example
RawResults	The raw query result. The parameter value is formatted in an array where each element is a log entry. The maximum length of the array is 100.	<pre>[{ "__time__": "1542334840", "count": "0" }]</pre>
RawResultsAsKv	The query result that is formatted in key-value pairs. <div style="border: 1px solid #add8e6; padding: 5px; background-color: #e0f0ff;"> ? Note This parameter can only be used as a template variable. It is not saved to a Logstore. </div>	[foo:0]
RawResultCount	The number of log entries that are returned in the RawResults parameter.	1
FireResult	The log entry that records the triggering of an alert. If an alert is not triggered, the parameter value is null.	<pre>{ "__time__": "1542334840", "count": "0" }</pre>
FireResultAsKv	The log entry that records the triggering of an alert, formatted in key-value pairs. <div style="border: 1px solid #add8e6; padding: 5px; background-color: #e0f0ff;"> ? Note This parameter can only be used as a template variable. It is not saved to a Logstore. </div>	[foo:0]

30.6. Real-time consumption

30.6.1. Overview

Log Service allows you to consume log data by using multiple methods.

After data is collected to LogHub, you can consume the log data by using two methods. The following table describes the methods.

Method	Scenarios	Timeliness	Retention period
Real-time consumption (LogHub)	Real-time computing	Real time	Custom

Method	Scenarios	Timeliness	Retention period
Indexing and query (LogSearch)	Online query of hot data	Real time	Custom

Real-time consumption

LogHub allows you to pull log data and consume the data in real time. The following procedure describes how log data in a shard is consumed:

1. Obtain a cursor based on the start time and end time of data consumption.
 2. Read log data based on the cursor and step parameters and return the position of the next cursor.
 3. Move the cursor to continuously consume log data.
- Consume log data by using an SDK
You can use Log Service SDKs in multiple programming languages such as Java, Python, and Go to consume log data.
 - Consume log data by using consumer groups
Log Service provides an advanced method that allows you to consume logs by using consumer groups. A consumer group is a lightweight computing framework that allows multiple consumers to consume data from a Logstore at the same time. The consumers in a consumer group are automatically allocated shards. Data is consumed in order based on the time when it is written to the Logstore. In addition, the consumers can use checkpoints to resume consumption from a breakpoint. You can use consumer group SDKs in multiple programming languages such as Go, Python, and Java to consume log data.
 - Log consumption by using real-time stream processing systems
 - Use [Spark Streaming clients](#) to consume log data.
 - Use [Storm spouts](#) to consume log data.
 - Use [Flink Connector](#) to consume log data.
 - Log consumption by using open-source services
Use [Flume](#) to consume log data and import log data to Hadoop file system (HDFS) instances.

Log search and analytics

- You can query log data in the Log Service console.
- You can also query log data by using an SDK or the API of Log Service. Log Service provides an HTTP-based RESTful API. You can call all log query API operations that are provided by Log Service.

30.6.2. Consume log data

Log Service provides SDKs in various programming languages, such as Java, Python, and Go. You can use an SDK to consume log data.

Use an SDK to consume log data

The following example shows how to use the SDK for Java to consume log data in a shard:

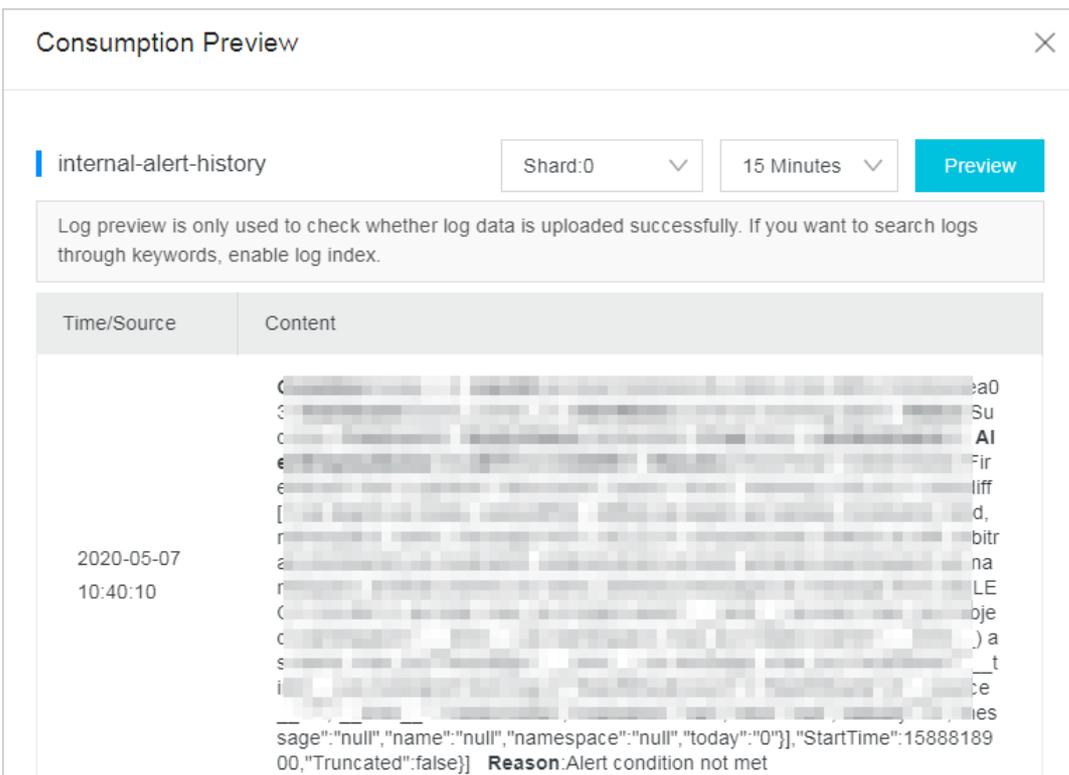

```
Client client = new Client(host, accessId, accessKey);

String cursor = client.GetCursor(project, logStore, shardId, CursorMode.END).GetCursor();
System.out.println("cursor = " + cursor);
try {
    while (true) {
        PullLogsRequest request = new PullLogsRequest(project, logStore, shardId, 1000, cursor);
        PullLogsResponse response = client.pullLogs(request);
        System.out.println(response.getCount());
        System.out.println("cursor = " + cursor + " next_cursor = " + response.getNextCursor());
        if (cursor.equals(response.getNextCursor())) {
            break;
        }
        cursor = response.getNextCursor();
        Thread.sleep(200);
    }
}
catch(LogException e) {
    System.out.println(e.GetRequestId() + e.GetErrorMessage());
}
```

Preview log data in the Log Service console

Log preview is a way of log data consumption. To preview log data that is stored in a Logstore in the Log Service console, perform the following steps:

1. [Log on to the Log Service console](#).
2. In the Projects section, click the target project.
3. In the Logstore list, find the target Logstore, click the  icon next to the Logstore, and then select **Consumption Preview**.
4. In the Consumption Preview dialog box, select a shard, set a time range, and then click **Preview**. The log preview page displays the log data of the first 10 packets in the specified time range.

30.6.3. Consumption by consumer groups

30.6.3.1. Use consumer groups to consume log data

Log consumption by consumer groups

Consumer groups allow you to focus on the business logic during log data consumption. You do not need to consider factors such as Log Service implementation, load balancing among consumers, and failovers that may be introduced when you use SDKs to consume log data.

Terms

The following table describes the terms of consumer groups and consumers.

Term	Description
consumer group	A consumer group consists of multiple consumers. Each consumer in a consumer group consumes different data in a Logstore.
consumer	In a consumer group, a consumer consumes data. Each consumer name in a consumer group must be unique.

A Logstore has multiple shards. A consumer library allocates shards to consumers in a consumer group based on the following principles:

- Each shard can be allocated to one consumer.
- One consumer can consume data in multiple shards.

After a new consumer joins a consumer group, shards allocated to the consumer group are reallocated to each consumer for load balancing. The reallocation is based on the preceding principles and cannot be viewed by users.

A consumer library can also store checkpoints. This allows consumers to resume consumption from a breakpoint and avoid repetitive consumption after a program fault is resolved.

Procedure

Log consumption by consumer groups is implemented in Java or Python. The following section takes Java as an example to describe how consumer groups consume log data.

1. Add Maven dependencies.

```
<dependency>
  <groupId>com.google.protobuf</groupId>
  <artifactId>protobuf-java</artifactId>
  <version>2.5.0</version>
</dependency>
<dependency>
  <groupId>com.aliyun.openservices</groupId>
  <artifactId>loghub-client-lib</artifactId>
  <version>0.6.16</version>
</dependency>
```

2. Create a main.java file.

```

import com.aliyun.openservices.loghub.client.ClientWorker;
import com.aliyun.openservices.loghub.client.config.LogHubConfig;
import com.aliyun.openservices.loghub.client.exceptions.LogHubClientWorkerException;

public class Main {
    // Specify the endpoint of Log Service.
    private static String sEndpoint = "cn-hangzhou.log.aliyuncs.com";
    // Specify a Log Service project name.
    private static String sProject = "ali-cn-hangzhou-sls-admin";
    // Specify a Logstore name of Log Service.
    private static String sLogstore = "sls_operation_log";
    // Specify a consumer group name.
    private static String sConsumerGroup = "consumerGroupX";
    // Specify an AccessKey pair for data consumption.
    private static String sAccessKeyId = "";
    private static String sAccessKey = "";

    public static void main(String[] args) throws LogHubClientWorkerException, InterruptedException {
        // The second parameter is the consumer name. Each consumer name in a consumer group must be unique. However, the names of consumer groups can be the same. When different consumers start multiple processes on multiple servers to consume the data of a Logstore, you can use a server IP address to identify a consumer. The ninth parameter maxFetchLogGroupSize indicates the maximum number of log groups retrieved from the server at a time. Valid values: 1 to 1000. You can use the default value or specify a value based on your needs.
        LogHubConfig config = new LogHubConfig(sConsumerGroup, "consumer_1", sEndpoint, sProject, sLogstore, sAccessKeyId, sAccessKey, LogHubConfig.ConsumePosition.BEGIN_CURSOR);
        ClientWorker worker = new ClientWorker(new SampleLogHubProcessorFactory(), config);
        Thread thread = new Thread(worker);
        // The ClientWorker instance runs automatically after the thread is executed and extends the Runnable interface.
        thread.start();
        Thread.sleep(60 * 60 * 1000);
        // The shutdown function of the ClientWorker instance is called to exit the consumption instance. The associated thread is stopped automatically.
        worker.shutdown();
        // Multiple asynchronous tasks are generated when the ClientWorker instance is running. We recommend that you wait 30 seconds to ensure that all running tasks exit after shutdown.
        Thread.sleep(30 * 1000);
    }
}

```

3. Create a SampleLogHubProcessor.java file.

```

import com.aliyun.openservices.log.common.FastLog;
import com.aliyun.openservices.log.common.FastLogContent;
import com.aliyun.openservices.log.common.FastLogGroup;
import com.aliyun.openservices.log.common.FastLogTag;
import com.aliyun.openservices.log.common.LogGroupData;
import com.aliyun.openservices.loghub.client.LogHubCheckpointTracker;

```

```

import com.aliyun.openservices.loghub.client.ILogHubCheckpointTracker;
import com.aliyun.openservices.loghub.client.exceptions.LogHubCheckpointException;
import com.aliyun.openservices.loghub.client.interfaces.ILogHubProcessor;
import com.aliyun.openservices.loghub.client.interfaces.ILogHubProcessorFactory;

import java.util.List;

public class SampleLogHubProcessor implements ILogHubProcessor {
    private int shardId;
    // Record the last persistent checkpoint time.
    private long mLastCheckTime = 0;

    public void initialize(int shardId) {
        this.shardId = shardId;
    }

    // The main logic of data consumption. All exceptions must be captured and cannot be thrown.
    public String process(List<LogGroupData> logGroups,
        ILogHubCheckpointTracker checkPointTracker) {
        // Display the retrieved data.
        for (LogGroupData logGroup : logGroups) {
            FastLogGroup flg = logGroup.GetFastLogGroup();
            System.out.println(String.format("\tcategory\t:\t%s\n\tsource\t:\t%s\n\ttopic\t:\t%s\n\tmachineUUID\t:\t%s",
                flg.getCategory(), flg.getSource(), flg.getTopic(), flg.getMachineUUID()));
            System.out.println("Tags");
            for (int tagIdx = 0; tagIdx < flg.getLogTagsCount(); ++tagIdx) {
                FastLogTag logtag = flg.getLogTags(tagIdx);
                System.out.println(String.format("\t%s\t:\t%s", logtag.getKey(), logtag.getValue()));
            }
            for (int lIdx = 0; lIdx < flg.getLogsCount(); ++lIdx) {
                FastLog log = flg.getLogs(lIdx);
                System.out.println("-----\nLog: " + lIdx + ", time: " + log.getTime() + ", GetContentCount: " + log.getContentsCount());
                for (int cIdx = 0; cIdx < log.getContentsCount(); ++cIdx) {
                    FastLogContent content = log.getContents(cIdx);
                    System.out.println(content.getKey() + "\t:\t" + content.getValue());
                }
            }
        }
        long curTime = System.currentTimeMillis();
        // Write checkpoints to the server every 30 seconds. If a ClientWorker instance crashes within 30 seconds,
        // a new ClientWorker instance consumes data starting from the last checkpoint. Duplicate data may exist.
        if (curTime - mLastCheckTime > 30 * 1000) {
            try {
                // If the parameter is set to true, checkpoints are updated to the server immediately. If the parameter is
                // set to false, checkpoints are cached locally. The default update interval of checkpoints is 60 seconds.
            }
        }
    }
}

```

```

        checkPointTracker.saveCheckpoint(true);
    } catch (LogHubCheckpointException e) {
        e.printStackTrace();
    }
    mLastCheckTime = curTime;
}
return null;
}

// The ClientWorker instance calls this function upon exit. You can perform a cleanup.
public void shutdown(ILogHubCheckpointTracker checkPointTracker) {
    // Save consumption breakpoints to the server.
    try {
        checkPointTracker.saveCheckpoint(true);
    } catch (LogHubCheckpointException e) {
        e.printStackTrace();
    }
}

class SampleLogHubProcessorFactory implements ILogHubProcessorFactory {
    public ILogHubProcessor generatorProcessor() {
        // Generate a consumption instance.
        return new SampleLogHubProcessor();
    }
}

```

 **Note** Run the preceding code to print all data in a Logstore. If you want multiple consumers to consume a Logstore, you can modify the code based on the comments. You can use the same consumer group name and different consumer names to start a new consumption process.

Limits and troubleshooting

A maximum of 10 consumer groups can be created for each Logstore. The `ConsumerGroupQuotaExceed` error is reported when the number of consumer groups exceeds 10.

We recommend that you configure Log4j for the consumer program to throw error messages within consumer groups for troubleshooting. If you save the `log4j.properties` file to the resources directory and execute the program, you can see the following exception:

```

[WARN ] 2018-03-14 12:01:52,747 method:com.aliyun.openservices.loghub.client.LogHubConsumer.sampleLogError(Log
HubConsumer.java:159)
com.aliyun.openservices.log.exception.LogException: Invalid loggroup count, (0,1000]

```

A typical `log4j.properties` configuration file is described as follows:

```
log4j.rootLogger = info,stdout
log4j.appender.stdout = org.apache.log4j.ConsoleAppender
log4j.appender.stdout.Target = System.out
log4j.appender.stdout.layout = org.apache.log4j.PatternLayout
log4j.appender.stdout.layout.ConversionPattern = [%-5p] %d{yyyy-MM-dd HH:mm:ss,SSS} method:%l%n%m%n
```

Advanced operations

The preceding code can help you consume data in common scenarios. The following section describes how to perform advanced operations in other scenarios.

- Consume data that is logged from a certain time point

LoghubConfig in the preceding code has two constructors:

```
// The value of the consumerStartTimeInSeconds parameter is a Unix timestamp representing the number of second
s that have elapsed since 00:00:00 on January 1, 1970, 00:00:00 UTC.
public LogHubConfig(String consumerGroupName,
    String consumerName,
    String loghubEndPoint,
    String project, String logStore,
    String accessId, String accessKey,
    int consumerStartTimeInSeconds);

// The position parameter is an enumeration variable. LogHubConfig.ConsumePosition.BEGIN_CURSOR indicates that
the consumption starts from the earliest data.LogHubConfig.ConsumePosition.END_CURSOR indicates that the cons
umption starts from the latest data.
public LogHubConfig(String consumerGroupName,
    String consumerName,
    String loghubEndPoint,
    String project, String logStore,
    String accessId, String accessKey,
    ConsumePosition position);
```

You can use different constructors based on your needs. However, if a checkpoint is stored on the server, you need to start data consumption from the checkpoint.

- Reset a checkpoint

In scenarios such as data padding or repeated computing, you may need to set the consumption position to a time point for a consumer group to start data consumption. To set the consumption position, you can use either of the following two methods:

- Delete the consumer group.
 - a. Stop the consumption processes.
 - b. Delete the consumer group from the console.
 - c. Modify the code to specify the start time point for data consumption.
 - d. Restart the consumption processes.
- Use the SDK to reset the start time point of data consumption for the consumer group.
 - a. Stop the consumption processes.
 - b. Use the SDK to modify the checkpoint.
 - c. Restart the consumption processes.

```

public static void updateCheckpoint() throws Exception {
    Client client = new Client(host, accessId, accessKey);
    long timestamp = Timestamp.valueOf("2017-11-15 00:00:00").getTime() / 1000;
    ListShardResponse response = client.ListShard(new ListShardRequest(project, logStore));
    for (Shard shard : response.GetShards()) {
        int shardId = shard.GetShardId();
        String cursor = client.GetCursor(project, logStore, shardId, timestamp).GetCursor();
        client.UpdateCheckPoint(project, logStore, consumerGroup, shardId, cursor);
    }
}

```

Access consumer groups as a RAM user

Before a RAM user can access consumer groups, relevant permissions must be granted to the user. For more information about how to grant permissions to a RAM user, see [Overview](#).

The following table lists the actions you can take as a RAM user.

Action	Resource
log:GetCursorOrData	acs:log:\${regionName}:\${projectOwnerAliUid}:project/\${projectName}/logstore/\${logstoreName}
log:CreateConsumerGroup	acs:log:\${regionName}:\${projectOwnerAliUid}:project/\${projectName}/logstore/\${logstoreName}/consumergroup/*
log:ListConsumerGroup	acs:log:\${regionName}:\${projectOwnerAliUid}:project/\${projectName}/logstore/\${logstoreName}/consumergroup/*
log:ConsumerGroupUpdateCheckPoint	acs:log:\${regionName}:\${projectOwnerAliUid}:project/\${projectName}/logstore/\${logstoreName}/consumergroup/\${consumerGroupName}
log:ConsumerGroupHeartBeat	acs:log:\${regionName}:\${projectOwnerAliUid}:project/\${projectName}/logstore/\${logstoreName}/consumergroup/\${consumerGroupName}
log:UpdateConsumerGroup	acs:log:\${regionName}:\${projectOwnerAliUid}:project/\${projectName}/logstore/\${logstoreName}/consumergroup/\${consumerGroupName}
log:GetConsumerGroupCheckPoint	acs:log:\${regionName}:\${projectOwnerAliUid}:project/\${projectName}/logstore/\${logstoreName}/consumergroup/\${consumerGroupName}

For example, a project named project-test resides in the China (Hangzhou) region. The ID of the Apsara Stack tenant account to which the project belongs is 1234567. The name of the Logstore to be consumed is logstore-test and the consumer group name is consumergroup-test. To allow a RAM user to access the consumer group, you must grant the following permissions to the user.

```

{
  "Version": "1",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "log:GetCursorOrData"
      ],
      "Resource": "acs:log:cn-hangzhou:1234567:project/project-test/logstore/logstore-test"
    },
    {
      "Effect": "Allow",
      "Action": [
        "log:CreateConsumerGroup",
        "log:ListConsumerGroup"
      ],
      "Resource": "acs:log:cn-hangzhou:1234567:project/project-test/logstore/logstore-test/consumergroup/*"

30.6.3.2. View the status of a consumer group

This topic describes how to use the console, API, and SDK to view the status of a consumer group. The consumer group is an advanced mode of real-time data consumption. It implements automatic load balancing among multiple consumption instances for log data consumption. Spark Streaming and Storm use consumer groups as the basic mode for log data consumption.

View consumption progress in the console

1. [Log on to the Log Service console.](#)
2. Click the  icon. Choose **Logstore > Data Consumption**.
3. Click the consumer group whose data consumption progress you want to view. The data consumption progress of each shard in the Logstore is displayed.

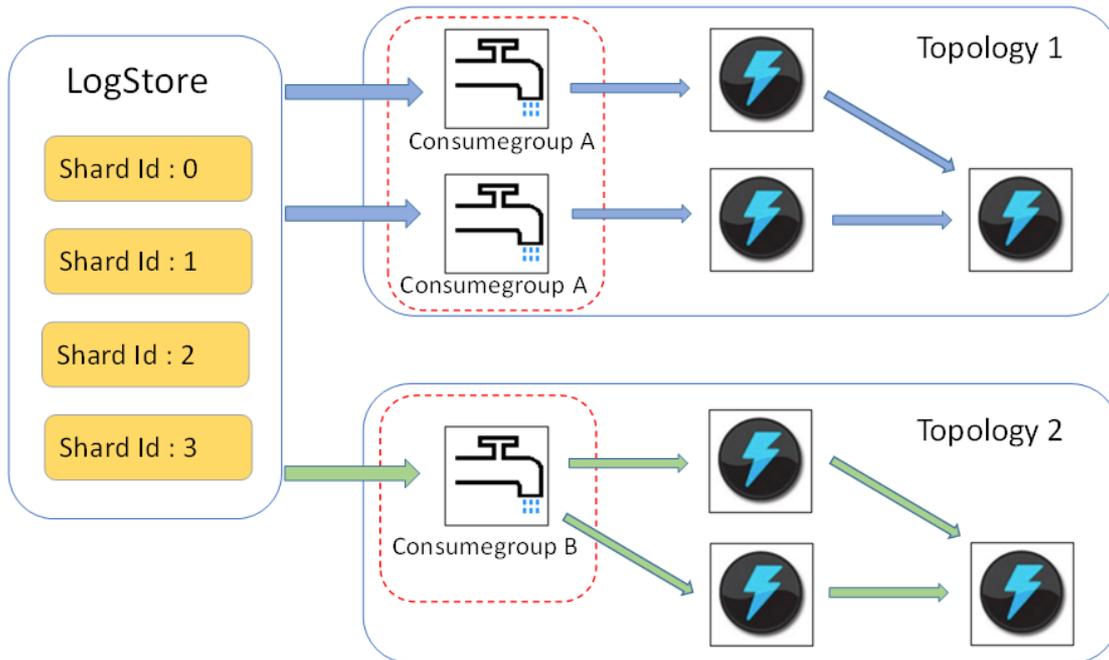

Use the API or SDK to view the data consumption progress

The following example uses the SDK for Java to describe how to call API operations to view the data consumption progress.

```

package test;
import java.util.ArrayList;
import com.aliyun.openservices.log.Client;
import com.aliyun.openservices.log.common.Consts.CursorMode;
import com.aliyun.openservices.log.common.ConsumerGroup;
import com.aliyun.openservices.log.common.ConsumerGroupShardCheckPoint;
import com.aliyun.openservices.log.exception.LogException;
public class ConsumerGroupTest {
    static String endpoint = "";
    static String project = "";
    static String logstore = "";
    static String accessKeyId = "";
    static String accessKey = "";
    public static void main(String[] args) throws LogException {
        Client client = new Client(endpoint, accessKeyId, accessKey);
        //Query all consumer groups of this Logstore. If no consumer group exists, the length of consumerGroups is 0.
        ArrayList<ConsumerGroup> consumerGroups;
        try{
            consumerGroups = client.ListConsumerGroup(project, logstore).GetConsumerGroups();
        }
        catch(LogException e){
            if(e.GetErrorCode() == "LogStoreNotExist")
                System.out.println("this logstore does not have any consumer group");
            else{
                //internal server error branch
            }
            return;
        }
        for(ConsumerGroup c: consumerGroups){
            //Print consumer group properties, including the name, heartbeat timeout, and whether data is consumed in order.
            System.out.println("Name: " + c.getConsumerGroupName());
            System.out.println("Heartbeat timeout: " + c.getTimeout());
            System.out.println("Consumption in order: " + c.isInOrder());
            for(ConsumerGroupShardCheckPoint cp: client.GetCheckPoint(project, logstore, c.getConsumerGroupName()).GetCheckPoints()){
                System.out.println("shard: " + cp.getShard());
                //Format the returned time. The time is a long integer that is accurate to milliseconds.
                System.out.println("The last time when data is consumed: " + cp.getUpdateTime());
                System.out.println("Consumer name: " + cp.getConsumer());
                String consumerPrg = "";
                if(cp.getCheckPoint().isEmpty())
                    consumerPrg = "Consumption not started";
                else{
                    //The Unix timestamp is seconds. Format the output value of the timestamp

```

Limits

- You can create up to 10 consumer groups to consume log data from a Logstore. If a consumer group is no longer in use, you can call the `DeleteConsumerGroup` operation of the SDK for Java to delete the consumer group.
- We recommend that the number of spouts be equal to the number of shards in a Logstore. This is because a single spout may be unable to process a large amount of data in multiple shards.
- If the data volume in a shard exceeds the processing capacity of a single spout, you can split the shard to reduce its data volume.
- LogHub spouts and bolts must use the `ack` method to check whether log data is successfully sent from spouts to bolts and whether the data is successfully processed by the bolts.

Examples

- Use the following code to create spouts and construct a topology:

```
public static void main( String[] args )
{
    String mode = "Local"; // Specify to use the local test mode.
    String consumer_group_name = ""; // Specify a unique consumer group name for each topology. The name can
    not be an empty string. It must be 3 to 63 characters in length and can contain lowercase letters, digits, hyphens (-),
    and underscores (_). It must start and end with a lowercase letter or digit.
    String project = ""; // Specify the project in Log Service.
    String logstore = ""; // Specify the Logstore in Log Service.
    String endpoint = ""; // Specify the endpoint of Log Service.
    String access_id = ""; // Specify the AccessKey ID of the user.
    String access_key = "";
    // Configure a LogHub Storm spout.
    LogHubSpoutConfig config = new LogHubSpoutConfig(consumer_group_name,
        endpoint, project, logstore, access_id,
        access_key, LogHubCursorPosition.END_CURSOR);
    TopologyBuilder builder = new TopologyBuilder();
    // Create a LogHub Storm spout.
```

```

LogHubSpout spout = new LogHubSpout(config);
// You can create the same number of spouts as that of shards in a Logstore in actual business scenarios.
builder.setSpout("spout", spout, 1);
builder.setBolt("exclaim", new SampleBolt()).shuffleGrouping("spout");
Config conf = new Config();
conf.setDebug(false);
conf.setMaxSpoutPending(1);
// Configure the serialization method of LogGroupData by using the LogGroupDataSerializSerializer class if Kry
o is used to serialize and deserialize data.
Config.registerSerialization(conf, LogGroupData.class, LogGroupDataSerializSerializer.class);
if (mode.equals("Local")) {
    logger.info("Local mode...");
    LocalCluster cluster = new LocalCluster();
    cluster.submitTopology("test-jstorm-spout", conf, builder.createTopology());
    try {
        Thread.sleep(6000 * 1000); //waiting for several minutes
    } catch (InterruptedException e) {
        // TODO Auto-generated catch block
        e.printStackTrace();
    }
    cluster.killTopology("test-jstorm-spout");
    cluster.shutdown();
} else if (mode.equals("Remote")) {
    logger.info("Remote mode...");
    conf.setNumWorkers(2);
    try {
        StormSubmitter.submitTopology("stt-jstorm-spout-4", conf, builder.createTopology());
    } catch (AlreadyAliveException e) {
        // TODO Auto-generated catch block
        e.printStackTrace();
    } catch (InvalidTopologyException e) {
        // TODO Auto-generated catch block
        e.printStackTrace();
    }
} else {
    logger.error("invalid mode: " + mode);
}
}
}

```

- Use the following example code of bolts to consume log data and display the content of each log entry:

```

public class SampleBolt extends BaseRichBolt {
    private static final long serialVersionUID = 4752656887774402264L;
    private static final Logger logger = Logger.getLogger(BaseBasicBolt.class);
    private OutputCollector mCollector;
    @Override
    public void prepare(@SuppressWarnings("rawtypes") Map stormConf, TopologyContext context,
        OutputCollector collector) {
        mCollector = collector;
    }
    @Override
    public void execute(Tuple tuple) {
        String shardId = (String) tuple
            .getValueByField(LogHubSpout.FIELD_SHARD_ID);
        @SuppressWarnings("unchecked")
        List<LogGroupData> logGroupDatas = (ArrayList<LogGroupData>) tuple.getValueByField(LogHubSpout.FIELD_L
OGGROUPS);
        for (LogGroupData groupData : logGroupDatas) {
            // Each log group consists of one or more log entries.
            LogGroup logGroup = groupData.getLogGroup();
            for (Log log : logGroup.getLogsList()) {
                StringBuilder sb = new StringBuilder();
                // Each log entry has a time field and other key-value pairs.
                int log_time = log.getTime();
                sb.append("LogTime:").append(log_time);
                for (Content content : log.getContentsList()) {
                    sb.append("\t").append(content.getKey()).append(":")
                        .append(content.getValue());
                }
                logger.info(sb.toString());
            }
        }
        // Spouts must use the ack method to indicate whether data has been successfully sent to bolts.
        // In addition, bolts must use the ack method to indicate whether data is successfully processed by the bolts.
        mCollector.ack(tuple);
    }
    @Override
    public void declareOutputFields(OutputFieldsDeclarer declarer) {
        //do nothing
    }
}

```

Maven

Use the following code to add Maven dependencies for Storm versions earlier than Storm 1.0 (for example, Storm 0.9.6):

```
<dependency>
  <groupId>com.aliyun.openservices</groupId>
  <artifactId>loghub-storm-spout</artifactId>
  <version>0.6.6</version>
</dependency>
```

Use the following code to add Maven dependencies for Storm 1.0 and later versions:

```
<dependency>
  <groupId>com.aliyun.openservices</groupId>
  <artifactId>loghub-storm-1.0-spout</artifactId>
  <version>0.1.3</version>
</dependency>
```

30.6.5. Use Flume to consume log data

This topic describes how to use Flume to consume log data. You can use the aliyun-log-flume plug-in to connect LogHub of Log Service to Flume, and then write and consume log data.

The aliyun-log-flume plug-in connects LogHub to Flume. When LogHub is connected to Flume, you can connect Log Service to other systems such as HDFS and Kafka through Flume. The aliyun-log-flume plug-in provides the Sink and Source methods to connect Log Service to Flume.

- Sink: uses Flume to read data from other data sources and then writes data to LogHub.
- Source: uses Flume to consume LogHub data and then writes data to other systems.

LogHub Sink

You can use the Sink method to transmit data from other data sources to LogHub through Flume. Data can be parsed into the following two formats:

- SIMPLE: writes a Flume event to LogHub as a field.
- DELIMITED: delimits a Flume event with delimiters, parses an event into fields based on the configured column names, and then writes the fields to LogHub.

The following table lists the parameters you can configure when you use the Sink method to read data.

Parameter	Required	Description
type	Yes	Valid value: com.aliyun.loghub.flume.sink.LoghubSink.
endpoint	Yes	The endpoint of Log Service.
project	Yes	The name of the project.
logstore	Yes	The name of the Logstore.
accessKeyId	Yes	The AccessKey ID of your Apsara Stack tenant account.
accessKey	Yes	The AccessKey secret of your Apsara Stack tenant account.
batchSize	No	The number of log entries that are written to LogHub at a time. Default value: 1000.
maxBufferSize	No	The maximum size of the queue in the buffer. Default value: 1000.

Parameter	Required	Description
serializer	No	The serialization format of log data. Valid values: <ul style="list-style-type: none"> DELIMITED: Data is parsed into the DELIMITED format. If you set this parameter to DELIMITED, you must set the columns parameter. SIMPLE: Data is parsed into the SIMPLE format. This is the default value. Custom serializer: Data is parsed into a custom serialization format. If you set this parameter to a custom serializer, you must specify the full name of the class.
columns	No	The configured column names. You must set this parameter if you set the serializer parameter to DELIMITED. Separate multiple columns with commas (,). Ensure that the columns are sorted in the same order as those of the log data.
separatorChar	No	The delimiter, which must be a single character. You can set this parameter if you set the serializer parameter to DELIMITED. Default value: , .
quoteChar	No	The quote character. You can set this parameter if you set the serializer parameter to DELIMITED. Default value: " .
escapeChar	No	The escape character. You can set this parameter if you set the serializer parameter to DELIMITED. Default value: " .
useRecordTime	No	Specifies whether to use the value of the timestamp field as the time when log data is written to Log Service. The default value false indicates that the current time is used.

Loghub Source

You can use the Source method to ship data from LogHub to other data systems through Flume. Data can be output in the following two formats:

- **DELIMITED:** writes delimited log data to Flume.
- **JSON:** writes JSON-formatted log data to Flume.

The following table lists the parameters you can configure when you use the Source method to read data.

Parameter	Required	Description
type	Yes	Valid value: com.aliyun.loghub.flume.source.LoghubSource.
endpoint	Yes	The endpoint of Log Service.
project	Yes	The name of the project.
logstore	Yes	The name of the Logstore.
accessKeyId	Yes	The AccessKey ID of your Apsara Stack tenant account.
accessKey	Yes	The AccessKey secret of your Apsara Stack tenant account.

Parameter	Required	Description
heartbeatIntervalMs	No	The heartbeat interval between the Flume client and LogHub. Unit: milliseconds. Default value: 30000.
fetchIntervalMs	No	The interval for pulling data from LogHub. Unit: milliseconds. Default value: 100.
fetchInOrder	No	Specifies whether to consume log data in the order that log data was generated. Default value: false.
batchSize	No	The number of log entries that are read at a time. Default value: 100.
consumerGroup	No	The name of the consumer group that reads data. The name is randomly generated.
initialPosition	No	The start point from which data is read. Valid values: begin, end, and timestamp. Default value: begin. <div style="border: 1px solid #add8e6; padding: 5px; background-color: #e0f0ff;"> <p> Note If a checkpoint exists on the server, the checkpoint is used.</p> </div>
timestamp	No	The Unix timestamp. You must set this parameter if you set the initialPosition parameter to timestamp. Unix timestamp.
deserializer	Yes	The deserialization format of log data. Valid values: <ul style="list-style-type: none"> DELIMITED: Data is parsed into the DELIMITED format. This is the default value. If you set this parameter to DELIMITED, you must set the columns parameter. JSON: Data is parsed into the JSON format. Custom deserializer: Data is parsed into a custom deserialization format. If you set this parameter to a custom deserializer, you must specify the full name of the class.
columns	No	The configured column names. You must set this parameter if you set the deserializer parameter to DELIMITED. Separate multiple columns with commas (.). Ensure that the columns are sorted in the same order as those of the log data.
separatorChar	No	The delimiter, which must be a single character. You can set this parameter if you set the deserializer parameter to DELIMITED. Default value: <code>,</code> .
quoteChar	No	The quote character. You can set this parameter if you set the deserializer parameter to DELIMITED. Default value: <code>"</code> .
escapeChar	No	The escape character. You can set this parameter if you set the deserializer parameter to DELIMITED. Default value: <code>"</code> .
appendTimestamp	No	Specifies whether to append the timestamp as a field to the end of each log entry. You can set this parameter if you set the deserializer parameter to DELIMITED. Default value: false.

Parameter	Required	Description
sourceAsField	No	Specifies whether to add the log source as a field named <code>__source__</code> . You can set this parameter if you set the deserializer parameter to <code>JSON</code> . Default value: <code>false</code> .
tagAsField	No	Specifies whether to add the log tags as a field with the field name <code>__tag__: {tag names}</code> . You can set this parameter if you set the deserializer parameter to <code>JSON</code> . Default value: <code>false</code> .
timeAsField	No	Specifies whether to add the log time as a field named <code>__time__</code> . You can set this parameter if you set the deserializer parameter to <code>JSON</code> . Default value: <code>false</code> .
useRecordTime	No	Specifies whether to use the value of the timestamp field as the time when log data is read from Log Service. The default value <code>false</code> indicates that the current time is used. Default value: <code>false</code> .

30.6.6. Use open source Flink to consume log data

Log Service provides the `flink-log-connector` plug-in to connect with Flink. This topic describes how to integrate the `flink-log-connector` plug-in with Flink to consume log data.

Prerequisites

- An `AccessKey` pair, a Log Service project, and a Logstore are created.
- If you log on to Log Service with a RAM user, relevant permissions to access a Logstore are granted to a RAM user. For more information, see [Grant permissions to a RAM role](#).

Context

The `flink-log-collector` plug-in includes `flink-log-consumer` and `flink-log-producer`.

- The `flink-log-consumer` plug-in reads data from Log Service. This plug-in supports the exactly-once semantics and load balancing among shards.
- The `flink-log-producer` plug-in writes data into Log Service. When you use the `flink-log-producer` plug-in, you must add the following Maven dependencies to a project:

```
<dependency>
  <groupId>com.aliyun.openservices</groupId>
  <artifactId>flink-log-connector</artifactId>
  <version>0.1.13</version>
</dependency>
<dependency>
  <groupId>com.google.protobuf</groupId>
  <artifactId>protobuf-java</artifactId>
  <version>2.5.0</version>
</dependency>
```

Log Consumer

The `flink-log-consumer` plug-in can consume the log data of a Logstore in Log Service. The exactly-once semantics is achieved during log consumption. The `flink-log-consumer` plug-in detects the change of the number of shards in a Logstore. This increases efficiency.

Each Flink subtask consumes data of some shards in a Logstore. If shards in a Logstore are split or merged, the shards consumed by the subtask also change.

When you use the flink-log-consumer plug-in to consume data from Log Service, you can call the following API operations:

- **GetCursorOrData**

You can call this operation to pull log data from a shard. Frequent API requests may exceed the read speed and IOPS limits of the shard. You can specify the `ConfigConstants.LOG_FETCH_DATA_INTERVAL_MILLIS` and `ConfigConstants.LOG_MAX_NUMBER_PER_FETCH` parameters to control the interval of API requests and number of log entries pulled in each request.

```
configProps.put(ConfigConstants.LOG_FETCH_DATA_INTERVAL_MILLIS, "100");
configProps.put(ConfigConstants.LOG_MAX_NUMBER_PER_FETCH, "100");
```

- **ListShards**

You can call this operation to view all shards in a Logstore and the status of each shard. If the shards are frequently split and merged, you can adjust the call interval to detect the changes in the number of shards.

```
// Call the ListShards operation once every 30 seconds.
configProps.put(ConfigConstants.LOG_SHARDS_DISCOVERY_INTERVAL_MILLIS, "30000");
```

- **CreateConsumerGroup**

You can call this operation to create a consumer group to synchronize checkpoints. This operation can be called only when consumption progress monitoring is enabled.

- **ConsumerGroupUpdateCheckPoint**

You can call this operation to synchronize snapshots of Flink to a consumer group.

The following table lists the Apsara Stack resources required for RAM users to call the preceding API operations.

API	Alibaba Resource Name (ARN)
GetCursorOrData	<code>acs:log:\${regionName}:\${projectOwnerAliUid}:project/\${projectName}/logstore/\${logstoreName}</code>
ListShards	<code>acs:log:\${regionName}:\${projectOwnerAliUid}:project/\${projectName}/logstore/\${logstoreName}</code>
CreateConsumerGroup	<code>acs:log:\${regionName}:\${projectOwnerAliUid}:project/\${projectName}/logstore/\${logstoreName}/consumergroup/*</code>
ConsumerGroupUpdateCheckPoint	<code>acs:log:\${regionName}:\${projectOwnerAliUid}:project/\${projectName}/logstore/\${logstoreName}/consumergroup/\${consumerGroupName}</code>

For more information, see [Grant permissions to a RAM role](#).

1. Configure startup parameters. The following example shows how to consume log data. The `java.util.Properties` class is used as the configuration tool. You can find all constants to be configured in the `ConfigConstants` class.

```

Properties configProps = new Properties();
// Specify the endpoint of Log Service.
configProps.put(ConfigConstants.LOG_ENDPOINT, "cn-hangzhou.log.aliyuncs.com");
// Specify the AccessKey pair.
configProps.put(ConfigConstants.LOG_ACCESSKEYID, "");
configProps.put(ConfigConstants.LOG_ACCESSKEY, "");
// Specify the project.
configProps.put(ConfigConstants.LOG_PROJECT, "ali-cn-hangzhou-sls-admin");
// Specify the Logstore.
configProps.put(ConfigConstants.LOG_LOGSTORE, "sls_consumergroup_log");
// Specify the start position to consume logs.
configProps.put(ConfigConstants.LOG_CONSUMER_BEGIN_POSITION, Consts.LOG_END_CURSOR);
// Specify the data deserialization method.
RawLogGroupListDeserializer deserializer = new RawLogGroupListDeserializer();
final StreamExecutionEnvironment env = StreamExecutionEnvironment.getExecutionEnvironment();
DataStream<RawLogGroupList> logTestStream = env.addSource(
    new FlinkLogConsumer<RawLogGroupList>(deserializer, configProps));

```

Note The number of subtasks in the Flink Streaming is independent of the number of shards in a Logstore. If the number of shards is greater than that of subtasks, each subtask consumes multiple shards exactly once. If the number of shards is less than that of subtasks, some subtasks are idle until new shards are generated.

- Specify the start consumption position. The `flink-log-consumer` plug-in enables you to specify the start consumption position of log data in a shard. By specifying the `ConfigConstants.LOG_CONSUMER_BEGIN_POSITION` parameter, you can start data consumption from the earliest, latest, or a specific time point. The `flink-log-connector` plug-in also allows a consumer group to resume consumption from a specific position. Valid values:
 - `Consts.LOG_BEGIN_CURSOR`: The consumption starts from the earliest data.
 - `Consts.LOG_END_CURSOR`: The consumption starts from the latest data.
 - `Consts.LOG_FROM_CHECKPOINT`: The consumption starts from a checkpoint that is stored in a specific consumer group. You can use the `ConfigConstants.LOG_CONSUMERGROUP` parameter to specify the consumer group.
 - `UnixTimestamp`: a string of the `INTEGER` data type. The timestamp is the number of seconds that have elapsed since 00:00:00 January 1, 1970. The value indicates that data in a shard is consumed from this time point.

You can use the following code to specify a start consumption position:

```

configProps.put(ConfigConstants.LOG_CONSUMER_BEGIN_POSITION, Consts.LOG_BEGIN_CURSOR);
configProps.put(ConfigConstants.LOG_CONSUMER_BEGIN_POSITION, Consts.LOG_END_CURSOR);
configProps.put(ConfigConstants.LOG_CONSUMER_BEGIN_POSITION, "1512439000");
configProps.put(ConfigConstants.LOG_CONSUMER_BEGIN_POSITION, Consts.LOG_FROM_CHECKPOINT);

```

Note If you have configured consumption resumption from a state backend of Flink when you start a Flink job, the `flink-log-connector` plug-in uses checkpoints stored in the state backend.

- (Optional) Configure consumption progress monitoring. The `flink-log-consumer` plug-in enables you to configure consumption progress monitoring. Consumption progress indicates the real-time consumption position of each shard. These positions are indicated by timestamps. For more information, see [View the status of a consumer group](#).

```
configProps.put(ConfigConstants.LOG_CONSUMERGROUP, "your consumer group name");
```

Note This configuration item is optional. If you specify this configuration item and no consumer group exists, the flink-log-consumer plug-in creates a consumer group. Snapshots in the flink-log-consumer plug-in are automatically synchronized to the consumer group of Log Service, and you can view the consumption progress of the flink-log-consumer plug-in in the Log Service console.

4. Configure consumption resumption and the exactly-once semantics. If the checkpointing feature of Flink is enabled, the flink-log-consumer plug-in periodically stores the consumption progress of each shard. When a job fails, Flink restores the flink-log-consumer plug-in and starts to consume data from the latest checkpoint.

While you configure the checkpointing period, the maximum amount of data to be re-consumed when a failure occurs is defined. You can use the following code to configure the checkpointing period:

```
final StreamExecutionEnvironment env = StreamExecutionEnvironment.getExecutionEnvironment();
// Configure the exactly-once semantics.
env.getCheckpointConfig().setCheckpointingMode(CheckpointingMode.EXACTLY_ONCE);
// Store checkpoints every five seconds.
env.enableCheckpointing(5000);
```

For more information about the Flink checkpoints, see [Checkpoints](#) in the Flink documentation.

Log Producer

The flink-log-producer plug-in writes data into Log Service.

Note The flink-log-producer plug-in supports the Flink at-least-once semantics. If a job fails, data written into Log Service may be duplicated but never lost.

When you use the flink-log-producer plug-in to writes data to Log Service, you can call the following API operations:

- PostLogStoreLogs
- ListShards

The following table lists the Apsara Stack resources required for RAM users to call the preceding API operations.

API	ARN
PostLogStoreLogs	acs:log:\${regionName}:\${projectOwnerAliUid}:project/\${projectName}/logstore/\${logstoreName}
ListShards	acs:log:\${regionName}:\${projectOwnerAliUid}:project/\${projectName}/logstore/\${logstoreName}

For more information about RAM users and how to authorize RAM users, see [Grant permissions to a RAM role](#).

1. Initialize the flink-log-producer plug-in.

- i. Configure startup parameters for the flink-log-producer plug-in. The initialization process for the flink-log-producer plug-in is similar to that for the flink-log-consumer plug-in. The following code shows the available parameters that you can configure for the flink-log-producer plug-in. You can use the default values of these parameters. You can also specify the parameters based on your needs.

```
// The number of I/O threads used to send data. Default value: 8.
ConfigConstants.LOG_SENDER_IO_THREAD_COUNT
// The time it takes to send the data after log data is cached. Default value: 3000.
ConfigConstants.LOG_PACKAGE_TIMEOUT_MILLIS
// The number of logs in the cached package. Default value: 4096.
ConfigConstants.LOG_LOGS_COUNT_PER_PACKAGE
// The size of the cached package. Default value: 3 Mbits.
ConfigConstants.LOG_LOGS_BYTES_PER_PACKAGE
// The total memory size that the job can use. Default value: 100 Mbits.
ConfigConstants.LOG_MEM_POOL_BYTES
```

 **Note** These parameters are optional. You can use their default values.

- ii. Reload LogSerializationSchema to define the method of serializing data into RawLogGroup. To use the hash key to specify the shard for data writes, you can use the LogPartitioner method to generate the hash key for the data.

Example:

```
FlinkLogProducer<String> logProducer = new FlinkLogProducer<String>(new SimpleLogSerializer(), configPro
ps);
logProducer.setCustomPartitioner(new LogPartitioner<String>() {
    // Generate a 32-bit hash value.
    public String getHashKey(String element) {
        try {
            MessageDigest md = MessageDigest.getInstance("MD5");
            md.update(element.getBytes());
            String hash = new BigInteger(1, md.digest()).toString(16);
            while(hash.length() < 32) hash = "0" + hash;
            return hash;
        } catch (NoSuchAlgorithmException e) {
        }
        return "0000000000000000000000000000000000000000000000000000000000000000000000000000";
    }
});
```

 **Note** The LogPartitioner method is optional. If you do not configure this method, data is randomly written into a shard.

2. Run the following code and write the generated strings to Log Service.

```
// Serialize data into the format of raw log groups.
class SimpleLogSerializer implements LogSerializationSchema<String> {
    public RawLogGroup serialize(String element) {
        RawLogGroup rlg = new RawLogGroup();
        RawLog rl = new RawLog();
```

```

        rl.setTime((int)(System.currentTimeMillis() / 1000));
        rl.addContent("message", element);
        rlg.addLog(rl);
        return rlg;
    }
}
public class ProducerSample {
    public static String sEndpoint = "cn-hangzhou.log.aliyuncs.com";
    public static String sAccessKeyId = "";
    public static String sAccessKey = "";
    public static String sProject = "ali-cn-hangzhou-sls-admin";
    public static String sLogstore = "test-flink-producer";
    private static final Logger LOG = LoggerFactory.getLogger(ConsumerSample.class);
    public static void main(String[] args) throws Exception {
        final ParameterTool params = ParameterTool.fromArgs(args);
        final StreamExecutionEnvironment env = StreamExecutionEnvironment.getExecutionEnvironment();
        env.getConfig().setGlobalJobParameters(params);
        env.setParallelism(3);
        DataStream<String> simpleStringStream = env.addSource(new EventsGenerator());
        Properties configProps = new Properties();
        // Specify the endpoint of Log Service.
        configProps.put(ConfigConstants.LOG_ENDPOINT, sEndpoint);
        // Specify the AccessKey pair to access Log Service.
        configProps.put(ConfigConstants.LOG_ACCESSKEYID, sAccessKeyId);
        configProps.put(ConfigConstants.LOG_ACCESSKEY, sAccessKey);
        // Specify the project to which logs are written.
        configProps.put(ConfigConstants.LOG_PROJECT, sProject);
        // Specify the Logstore to which logs are written.
        configProps.put(ConfigConstants.LOG_LOGSTORE, sLogstore);
        FlinkLogProducer<String> logProducer = new FlinkLogProducer<String>(new SimpleLogSerializer(), configPro
ps);
        simpleStringStream.addSink(logProducer);
        env.execute("flink log producer");
    }
    // Simulate log generation.
    public static class EventsGenerator implements SourceFunction<String> {
        private boolean running = true;
        @Override
        public void run(SourceContext<String> ctx) throws Exception {
            long seq = 0;
            while (running) {
                Thread.sleep(10);
                ctx.collect((seq++) + "-" + RandomStringUtils.randomAlphabetic(12));
            }
        }
        @Override
        public void cancel() {

```

```

public void cancel() {
    running = false;
}
}
}

```

30.6.7. Use Logstash to consume log data

Log Service allows you to use SDKs developed in various languages and various stream computing systems to consume log data. In addition, Log Service allows you to use Logstash to consume log data. You can configure the Logstash input plug-in to read log data from Log Service and write the data to other systems, such as Kafka and Hadoop Distributed File System (HDFS).

Features

- **Distributed collaborative consumption:** Multiple servers can be configured to consume log data from a Logstore at the same time.
- **High performance:** If you use consumer groups written in Java to consume log data, the consumption speed of a CPU core can reach up to 20 MB/s.
- **High reliability:** Log Service saves the consumption progress. This mechanism enables automatic resumption of log consumption from the last checkpoint after a consumption exception is solved.
- **Automatic load balancing:** Shards are automatically allocated based on the number of consumers in a consumer group. The shards are reallocated if consumers join or leave the consumer group.

30.6.8. Use Spark Streaming to consume log data

This topic describes how to use Spark Streaming to consume log data. After logs are collected to Log Service, you can use the Spark SDK provided by Log Service to process log data in Spark Streaming.

The Spark SDK supports two consumption modes: Receiver and Direct.

The Maven dependency is as follows:

```

<dependency>
<groupId>com.aliyun.emr</groupId>
<artifactId>emr-logservice_2.11</artifactId>
<version>1.7.2</version>
</dependency>

```

Receiver mode

In the Receiver mode, a consumer group consumes data from Log Service and temporarily stores the data in Spark Executor. After a Spark Streaming job is started, it reads and processes data from Spark Executor. For more information, see [Use consumer groups to consume log data](#). Each log entry is returned as a JSON string. The consumer group periodically saves checkpoints to Log Service. You do not need to update checkpoints.

- **Example code**

```

import org.apache.spark.storage.StorageLevel
import org.apache.spark.streaming.aliyun.logservice.LoghubUtils
import org.apache.spark.streaming.{ Milliseconds, StreamingContext}
import org.apache.spark.SparkConf

object TestLoghub {
    def main(args: Array[String]): Unit = {
        if (args.length < 7) {

```

```

System.err.println(
  """Usage: TestLoghub <project> <logstore> <loghub group name> <endpoint>
  |   <access key id> <access key secret> <batch interval seconds>
  """
  .stripMargin)
System.exit(1)
}

val project = args(0)
val logstore = args(1)
val consumerGroup = args(2)
val endpoint = args(3)
val accessKeyId = args(4)
val accessKeySecret = args(5)
val batchInterval = Milliseconds(args(6).toInt * 1000)

def functionToCreateContext(): StreamingContext = {
  val conf = new SparkConf().setAppName("Test Loghub")
  val ssc = new StreamingContext(conf, batchInterval)
  val loghubStream = LoghubUtils.createStream(
    ssc,
    project,
    logstore,
    consumerGroup,
    endpoint,
    accessKeyId,
    accessKeySecret,
    StorageLevel.MEMORY_AND_DISK)

  loghubStream.checkpoint(batchInterval * 2).foreachRDD(rdd =>
    rdd.map(bytes => new String(bytes)).top(10).foreach(println)
  )
  ssc.checkpoint("hdfs:///tmp/spark/streaming") // set checkpoint directory
  ssc
}

val ssc = StreamingContext.getOrCreate("hdfs:///tmp/spark/streaming", functionToCreateContext _)

ssc.start()
ssc.awaitTermination()
}
}

```

- Parameter description

Parameter	Type	Description
project	String	The project in Log Service.

Parameter	Type	Description
logstore	String	The Logstore in Log Service.
consumerGroup	String	The name of the consumer group.
endpoint	String	The endpoint of the region to which the project belongs.
accessKeyId	String	The AccessKey ID used to access Log Service.
accessKeySecret	String	The AccessKey secret used to access Log Service.

- **Notes**

In the Receiver mode, data loss may occur in some cases. To avoid data loss, you can turn on the Write-Ahead Logs switch, which is supported in Spark 1.2 and later versions. For more information, visit [Spark Streaming Programming Guide](#).

Direct mode

In the Direct mode, no consumer group is required. API operations are called to request data from Log Service. Compared with the Receiver mode, the Direct mode has the following benefits:

- **Simplified parallelism.** The number of Spark partitions is the same as the number of shards in a Logstore. You can split shards to improve the parallelism of tasks.
- **Increased efficiency.** You no longer need to turn on the Write-Ahead Logs switch to prevent data loss.
- **Exactly-once semantics.** Data is read directly from Log Service. Checkpoints are submitted after the task is successful. In some cases, data may be repeatedly consumed if the task is not ended due to unexpected exit of Spark.

You must configure the ZooKeeper service when you use the Direct mode. You must set a checkpoint directory in ZooKeeper to store intermediate state data. If you want to re-consume data after restarting a task, you must delete the directory from ZooKeeper and change the name of the consumer group.

- **Example code**

```
import com.aliyun.openservices.loghub.client.config.LogHubCursorPosition
import org.apache.spark.SparkConf
import org.apache.spark.streaming.{ Milliseconds, StreamingContext}
import org.apache.spark.streaming.aliyun.logservice.{ CanCommitOffsets, LoghubUtils}

object TestDirectLoghub {
  def main(args: Array[String]): Unit = {
    if (args.length < 7) {
      System.err.println(
        """Usage: TestDirectLoghub <project> <logstore> <loghub group name> <endpoint>
        |   <access key id> <access key secret> <batch interval seconds> <zookeeper host:port=localhost:2181>
        """.stripMargin)
      System.exit(1)
    }

    val project = args(0)
    val logstore = args(1)
    val consumerGroup = args(2)
```

```

val endpoint = args(3)
val accessKeyId = args(4)
val accessKeySecret = args(5)
val batchInterval = Milliseconds(args(6).toInt * 1000)
val zkAddress = if (args.length >= 8) args(7) else "localhost:2181"

def functionToCreateContext(): StreamingContext = {
  val conf = new SparkConf().setAppName("Test Direct Loghub")
  val ssc = new StreamingContext(conf, batchInterval)
  val zkParas = Map("zookeeper.connect" -> zkAddress,
    "enable.auto.commit" -> "false")
  val loghubStream = LoghubUtils.createDirectStream(
    ssc,
    project,
    logStore,
    consumerGroup,
    accessKeyId,
    accessKeySecret,
    endpoint,
    zkParas,
    LogHubCursorPosition.END_CURSOR)

  loghubStream.checkpoint(batchInterval).foreachRDD(rdd => {
    println(s"count by key: ${rdd.map(s => {
      s.sorted
      (s.length, s)
    }).countByKey().size}")
    loghubStream.asInstanceOf[CanCommitOffsets].commitAsync()
  })
  ssc.checkpoint("hdfs:///tmp/spark/streaming") // set checkpoint directory
  ssc
}

val ssc = StreamingContext.getOrCreate("hdfs:///tmp/spark/streaming", functionToCreateContext _)
ssc.start()
ssc.awaitTermination()
}
}

```

- Parameter description

Parameter	Type	Description
project	String	The project in Log Service.
logstore	String	The Logstore in Log Service.

Parameter	Type	Description
consumerGroup	String	The name of the consumer group (only used to save consumption checkpoints).
endpoint	String	The endpoint of the region to which the project belongs.
accessKeyId	String	The AccessKey ID used to access Log Service.
accessKeySecret	String	The AccessKey secret used to access Log Service.
zkAddress	String	The endpoint of ZooKeeper.

- Parameter settings

In the Direct mode, you must specify the number of log entries that are consumed in each shard in each batch. Otherwise, the data reading process cannot be ended. You can throttle the transmission rate of a single batch by setting the two parameters listed in the following table.

Parameter	Description	Default value
spark.loghub.batchGet.step	The number of log groups returned for a single request.	100
spark.streaming.loghub.maxRatePerShard	The maximum number of log entries that are read in a shard.	10,000

The number of log entries processed in each batch is calculated as follows: $\text{number of shards} \times \max(\text{spark.loghub.batchGet.step} \times n \times \text{number of log entries in a log group}, \text{spark.streaming.loghub.maxRatePerShard} \times \text{duration})$.

- n : the number of requests required to increase the returned rows to $\text{spark.streaming.loghub.maxRatePerShard} \times \text{duration}$.
- duration: the interval between batch processing. Unit: milliseconds.

If you need to combine multiple data streams, the number of shards refers to the total number of shards in all Logstores.

- Example

For example, the number of shards is 100. Each log group contains 50 log entries. Batches are processed at an interval of two seconds. If you want to process 20,000 log entries in each batch, use the following configurations:

- `spark.loghub.batchGet.step: 4`
- `spark.streaming.loghub.maxRatePerShard: 100`

If each log group contains 60 log entries and you want to process 20,000 log entries in each batch, 24,000 log entries will be processed based on the preceding configurations ($60 \times 4 \times 100 = 24,000$).

- Accurate transmission rate throttling

A smaller `spark.loghub.batchGet.step` value increases the accuracy of throttling and the number of requests. We recommend that you count the average number of log entries contained in a log group and then set the preceding two parameters.

30.6.9. Use Realtime Compute to consume log data

You can use Realtime Compute (Blink) to create a schema for Log Service data and consume the data.

Log Service stores streaming data. Therefore, Realtime Compute can use the streaming data as input data. In Log Service, each log entry contains multiple fields that are key-value pairs. The following example is a sample log entry:

```
__source__: 11.85.123.199
__tag__:__receive_time__: 1562125591
__topic__: test-topic
a: 1234
b: 0
c: hello
```

You can use the following data definition language (DDL) statement to create a table in Realtime Compute:

```
create table sls_stream(
  a int,
  b int,
  c varchar
) with (
  type ='sls',
  endPoint ='<your endpoint>',
  accessId ='<your access key id>',
  accessKey ='<your access key>',
  startTime = '2017-07-05 00:00:00',
  project ='ali-cloud-streamtest',
  logStore ='stream-test',
  consumerGroup ='consumerGroupTest1'
);
```

Attribute fields

Realtime Compute can extract fields from the log content. In addition, Realtime Compute can extract three fields and custom fields in tags, such as `__receive_time__`. The following table lists the three fields.

Attribute fields

Field name	Description
<code>__source__</code>	The source of the log entry.
<code>__topic__</code>	The topic of the log entry.
<code>__timestamp__</code>	The time when the log entry is generated.

To extract the preceding fields, you must add HEADERS in the DDL statement. Example:

```

create table sls_stream(
  __timestamp__ bigint HEADER,
  __receive_time__ bigint HEADER
  b int,
  c varchar
) with (
  type ='sls',
  endPoint = '<your endpoint>',
  accessId = '<your access key id>',
  accessKey = '<your access key>',
  startTime = '2017-07-05 00:00:00',
  project = 'ali-cloud-streamtest',
  logStore = 'stream-test',
  consumerGroup = 'consumerGroupTest1'
);

```

Parameters in the WITH clause

The following table describes the parameters in the WITH clause.

Parameter	Required	Description
endPoint	Yes	The endpoint of Log Service.
accessId	Yes	The AccessKey ID of the Apsara Stack tenant account or RAM user that is used to access Log Service.
accessKey	Yes	The AccessKey secret of the Apsara Stack tenant account or RAM user that is used to access Log Service.
project	Yes	The name of the project in Log Service.
logStore	Yes	The name of the Logstore in Log Service.
consumerGroup	No	The name of the consumer group.
startTime	No	The time when Realtime Compute starts to consume data.
heartBeatIntervalMills	No	The heartbeat interval of the client that consumes log data. Unit: seconds. Default value: 10 s.
maxRetryTimes	No	The maximum number of retries to read data. Default value: 5.
batchGetSize	No	The number of log groups that are read at a time. Default value: 10. If the Blink version is 1.4.2 or later, the default value is 100 and the maximum value is 1000.

Parameter	Required	Description
columnErrorDebug	No	Specifies whether to enable debugging. If debugging is enabled, log entries that fail to be parsed are displayed. The default value is false.

Field type mapping

All log fields in Log Service are of the string type. The following table lists the mapping between the type of Log Service fields and the type of Realtime Compute fields. We recommend that you declare the mapping in a data definition language (DDL) statement.

Log Service data type	Realtime Compute data type
STRING	VARCHAR

If you specify another data type to convert Log Service data, an automatic conversion attempt is performed. For example, you can specify BIGINT as the data type to convert the string "1000" and specify timestamp as the data type to convert the string "2018-01-12 12:00:00".

Note

- Blink versions earlier than 2.2.0 do not support shard scaling. If you split or merge shards when a job is reading data from a Logstore, the job fails and cannot continue. In this case, you must restart the job.
- None of the Blink versions allow you to delete or re-create a Logstore whose log data is being consumed.
- For Blink 1.6.0 and earlier versions, if you specify a consumer group to consume log data from a Logstore that contains a large number of shards, the read performance may be affected.
- Log Service data cannot be converted to data of the map type when you create a schema.
- Nonexistent fields are set to null.
- We recommend that you convert the fields in the same order as the fields in the schema. Unordered field conversions are also supported.
- The batchGetSize parameter specifies the number of log groups that are read at a time. If the size of each log entry and the value of the batchGetSize parameter are both large, garbage collection (GC) of data in the memory may frequently occur.

Precautions

- If no new data is written to a shard, the overall latency of a job increases. In this case, you need to adjust the number of concurrent tasks in the job to the same as the number of shards from which data is read and written.
- We recommend that you set the number of concurrent tasks in a job to the same as the number of shards. If they are inconsistent, data may be filtered out when the job reads historical data from two shards at significantly different speeds.
- To extract fields in tags such as `__tag__:__hostname__` and `__tag__:__path__`, you can delete the `__tag__:` prefix and use the method of extracting attribute fields.

 **Note** This type of data cannot be extracted during debugging. We recommend that you use the local debugging method and the print method to display data in logs.

30.7. RAM

30.7.1. Overview

Resource Access Management (RAM) is a resource access control service provided by Apsara Stack.

You can use RAM to manage users, including employees, systems, and applications. You can also use RAM to grant users permissions to access resources.

RAM provides the following features:

- RAM role

To authorize a cloud service in a level-1 organization to use other resources in the organization, you must create a RAM role. This role specifies the operations that the cloud service can perform on the resources.

Only system administrators and level-1 organization administrators can create RAM roles.

- User group

You can create multiple RAM users for an organization and grant the users different permissions on the same cloud resources in the organization.

 **Note** For more information about how to create users and user groups, see *Users and User groups in the ASCM User Guide*.

You can create RAM user groups to classify and authorize RAM users within your Apsara Stack tenant account. This simplifies the management of RAM users and their permissions.

You can create RAM policies to grant permissions to different user groups.

30.7.2. Create a RAM role

To authorize a cloud service in a level-1 organization to use other resources in the organization, you must create a RAM role. This role contains the operations that the cloud service can perform on resources.

Procedure

1. Log on to the ASCM console [ASCM console](#) as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Roles**.
4. In the upper-right corner of the page, click **Create RAM Role**.
5. On the **Roles - Create RAM Role** page that appears, set **Role Name** and **Description**.
6. Click **Create**.

30.7.3. Create a user

This topic describes how an administrator creates a user and assigns a role to the user. The role varies based on the cloud resources that the user needs to access.

Procedure

1. Log on to the [ASCM console](#) as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Users**.
4. On the **Users** page, click **Create**.
5. In the dialog box that appears, set the parameters based on your requirements.

Parameter	Description
Username	The username.

Parameter	Description
Display Name	The display name of the user.
Roles	The role that you want to assign to the user.
Organization	The organization to which the user belongs.
Logon Policy	The logon policy that restricts the logon time and IP address of the user. If you do not specify this parameter, the default policy is attached to the created user.
Mobile Number	The mobile phone number of the user. If you need to send text messages about the usage and requests for resources to the mobile phone number, make sure that the specified mobile phone number is correct.
Landline Number	Optional. The landline number of the user.
Email	The email address of the user. If you need to send emails about the usage and requests for resources to the email address, make sure that the specified email address is correct.
DingTalk Key	Optional. The DingTalk key.
Notify User by SMS	Specifies whether to send text messages about the usage and requests for resources to the specified mobile phone number.
Notify User by Email	Specifies whether to send emails about the usage and requests for resources to the specified email address.
Notify User by DingTalk	Specifies whether to send messages about the usage and requests for resources to the specified DingTalk user.

6. Click OK.

30.7.4. Create a RAM user group

This topic describes how to create a RAM user group in an organization and grant permissions to RAM users in the RAM user group.

Prerequisites

An organization is created.

Context

The relationship between RAM user groups and RAM users:

- A RAM user group can contain zero or more RAM users.
- A RAM user can belong to no RAM user groups.
- You can add a RAM user to multiple RAM user groups.

The relationship between RAM user groups and organizations:

- A RAM user group belongs to only one organization.
- You can create multiple RAM user groups in an organization.

The relationship between RAM user groups and RAM roles:

- Only one RAM role can be assigned to each RAM user group.
- A RAM role can be assigned to multiple RAM user groups.
- When a RAM role is assigned to a RAM user group, the permissions that the RAM role has are automatically granted to RAM users in the RAM user group.

The relationship between RAM user groups and resource sets:

- You can add zero or more user groups to a resource set.
- A user group can be added to multiple resource sets.

Procedure

1. Log on to the [ASCM console](#) as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Users**.
4. In the upper-right corner of the page, click **Create User Group**.
5. In the dialog box that appears, specify the **User Group Name** and **Organization** parameters.
6. Click **OK**.

30.7.5. Add a RAM user to a RAM user group

This topic describes how to add a RAM user to a RAM user group.

Procedure

1. Log on to the [ASCM console](#) as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Users**.
4. Find the user group to which you want to add users, and click **Add User** in the **Actions** column.
5. In the dialog box that appears, select a username from the left pane, and click the right arrow to move them to the right pane.
6. Click **OK**.

30.7.6. Create a permission policy

If you want to use Log Service to access other cloud resources, you must create a permission policy for a RAM role. Then, the policy is automatically attached to the RAM user group to which the RAM role is assigned.

Procedure

1. Log on to the [ASCM console](#) as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Roles**.
4. In the role name list, find the target RAM role, click **More** in the **Actions** column, and choose **Modify** from the drop-down list to go to the **Roles** page.
5. Click the **Permissions** tab.
6. Click **Create Policy**.
7. In the dialog box that appears, enter the policy information.

Add Permission Policy [X]

*Policy Name:
 0/15

Description:
 0/100

*Policy Details:

```
1 | The details of the specified policy must be 2,048 characters in length, and follow the JSON format.
```

[OK] [Cancel]

For more information about how to specify the policy information, see [Use custom policies to grant RAM user the required permissions](#).

30.7.7. Grant permissions to a RAM role

This topic describes how to grant permissions to a RAM role. After a RAM role is granted permissions, the RAM users in the associated RAM user group inherit the permissions.

Procedure

1. Log on to the [ASCM console](#) as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Roles**.
4. In the role name list, find the target RAM role, click **More** in the **Actions** column, and choose **Modify** from the drop-down list to go to the **Roles** page.
5. Click the **Permissions** tab.
6. Click **Select Existing Permission Policy**.
7. In the dialog box that appears, select a permission policy and click **OK**. If no policies are available, create a policy. For more information, see [Create a permission policy](#).

30.7.8. Use custom policies to grant RAM user the required permissions

This topic describes how to use custom Resource Access Management (RAM) policies to grant RAM users the required permissions. You can grant permissions to the RAM users under your Apsara Stack tenant account.

Context

For data security, we recommend that you follow the principle of least privilege (PoLP) when you grant permissions to RAM users. You must grant the read-only permission on the project list to RAM users. Otherwise, the RAM users cannot view the projects in the project list.

Use the RAM console to grant permissions to a RAM user

- The read-only permission on projects

For example, you can use your Apsara Stack tenant account to grant RAM users the following permissions:

- The permission to view the list of projects that belong to the Apsara Stack tenant account
- The permission to read specific projects

Use the following policy:

```
{
  "Version": "1",
  "Statement": [
    {
      "Action": ["log:ListProject"],
      "Resource": ["acs:log:*:*:project/*"],
      "Effect": "Allow"
    },
    {
      "Action": [
        "log:Get*",
        "log:List*"
      ],
      "Resource": "acs:log:*:*:project/<The name of the project>/*",
      "Effect": "Allow"
    }
  ]
}
```

- The permission to read a Logstore, save searches, and use saved searches.

For example, you can use your Apsara Stack tenant account to grant RAM users the following permissions:

- The permission to view the project list of the Apsara Stack tenant account
- The permission to read a Logstore, save searches, and use saved searches

Use the following policy:

```
{
  "Version": "1",
  "Statement": [
    {
      "Action": [
        "log:ListProject"
      ],
      "Resource": "acs:log:*:*:project/*",
      "Effect": "Allow"
    },
    {
      "Action": [
```

```

    "log:List*",
  ],
  "Resource": "acs:log:*:*:project/<The name of the project>/logstore/*",
  "Effect": "Allow"
},
{
  "Action": [
    "log:Get*",
    "log:List*"
  ],
  "Resource": [
    "acs:log:*:*:project/<The name of the project>/logstore/<The name of the Logstore>"
  ],
  "Effect": "Allow"
},
{
  "Action": [
    "log:List*"
  ],
  "Resource": [
    "acs:log:*:*:project/<The name of the project>/dashboard",
    "acs:log:*:*:project/<The name of the project>/dashboard/*"
  ],
  "Effect": "Allow"
},
{
  "Action": [
    "log:Get*",
    "log:List*",
    "log:Create*"
  ],
  "Resource": [
    "acs:log:*:*:project/<The name of the project>/savedsearch",
    "acs:log:*:*:project/<The name of the project>/savedsearch/*"
  ],
  "Effect": "Allow"
}
]
}

```

 **Note** In the policy, a value of the Resource attribute that does not end with an asterisk (*) indicates the exact resource. A value that ends with an asterisk (*) indicates all resources that match the value.

- The permission to read a Logstore and view all saved searches and dashboards in a project

For example, you can use your Apsara Stack tenant account to grant a RAM user the following permissions:

- The permission to view the project list of the Apsara Stack tenant account

- The permission to read a Logstore and view all saved searches and dashboards in a project

Use the following policy:

```
{
  "Version": "1",
  "Statement": [
    {
      "Action": [
        "log:ListProject"
      ],
      "Resource": "acs:log:*:*:project/**",
      "Effect": "Allow"
    },
    {
      "Action": [
        "log:List*"
      ],
      "Resource": "acs:log:*:*:project/<The name of the project>/logstore/**",
      "Effect": "Allow"
    },
    {
      "Action": [
        "log:Get*",
        "log:List*"
      ],
      "Resource": [
        "acs:log:*:*:project/<The name of the project>/logstore/<The name of the Logstore>"
      ],
      "Effect": "Allow"
    },
    {
      "Action": [
        "log:Get*",
        "log:List*"
      ],
      "Resource": [
        "acs:log:*:*:project/<The name of the project>/dashboard",
        "acs:log:*:*:project/<The name of the project>/dashboard/**"
      ],
      "Effect": "Allow"
    },
    {
      "Action": [
        "log:Get*",
        "log:List*"
      ],
      "Resource": [
```

```

    "acs:log:*:*:project/<The name of the project>/savedsearch",
    "acs:log:*:*:project/<The name of the project>/savedsearch/*"
  ],
  "Effect": "Allow"
}
]
}

```

Grant RAM users the permissions that are required to call Log Service operations

- The permission to write data to a project

To grant RAM users only the permission to write data to a project, use the following policy:

```

{
  "Version": "1",
  "Statement": [
    {
      "Action": [
        "log:Post*"
      ],
      "Resource": "acs:log:*:*:project/<The name of the project>/*",
      "Effect": "Allow"
    }
  ]
}

```

- The permission to consume data of a project

To grant RAM users only the permission to consume data of a project, use the following policy:

```

{
  "Version": "1",
  "Statement": [
    {
      "Action": [
        "log:ListShards",
        "log:GetCursorOrData",
        "log:GetConsumerGroupCheckPoint",
        "log:UpdateConsumerGroup",
        "log:ConsumerGroupHeartBeat",
        "log:ConsumerGroupUpdateCheckPoint",
        "log:ListConsumerGroup",
        "log:CreateConsumerGroup"
      ],
      "Resource": "acs:log:*:*:project/<The name of the project>/*",
      "Effect": "Allow"
    }
  ]
}

```

- The permission to consume data of a Logstore

To grant RAM users only the permission to consume data of a Logstore, use the following policy:

```
{
  "Version": "1",
  "Statement": [
    {
      "Action": [
        "log:ListShards",
        "log:GetCursorOrData",
        "log:GetConsumerGroupCheckPoint",
        "log:UpdateConsumerGroup",
        "log:ConsumerGroupHeartBeat",
        "log:ConsumerGroupUpdateCheckPoint",
        "log:ListConsumerGroup",
        "log:CreateConsumerGroup"
      ],
      "Resource": [
        "acs:log:*:*:project/<The name of the project>/logstore/<The name of the Logstore>",
        "acs:log:*:*:project/<the name of the project>/logstore/<the name of the Logstore>/*"
      ],
      "Effect": "Allow"
    }
  ]
}
```

30.8. FAQ

30.8.1. Log collection

30.8.1.1. How do I troubleshoot Logtail collection errors?

If the Logtail preview page is blank or "No Data" is displayed on the query page, perform the following steps:

Procedure

1. Check whether Log Service receives heartbeats from the server group.

You can view the Logtail heartbeat status in the Log Service console. For more information, see [View the status of a server group](#).

If the heartbeat status is OK, go to the next step. If the heartbeat status is FAIL, proceed with further troubleshooting. For more information, see [What can I do if no heartbeat packet is received from a Logtail client?](#).

2. Check whether the Logtail configuration is created. If the heartbeat status of Logtail is OK, check whether the Logtail configuration is created. Make sure that the path and name of monitored logs match the files that are stored on the server. The path can be a full path or a path that includes wildcards.
3. Make sure that the Logtail configuration is applied to the server group. Check whether the target Logtail configuration is applied to the server group. For more information, see [Manage server group configurations](#) and [Manage server group](#).
4. Check collection errors. If Logtail is configured correctly, check whether new logs are generated in real

time. Logtail only collects incremental log data. Logtail does not read log files in which no log is generated. If a log file is updated but the updates cannot be queried in Log Service, you can diagnose the problem as follows:

- View logs of the Logtail client

The client logs include key INFO logs, all WARNING logs, and all ERROR logs. To view complete error information in real time, check the following client logs:

- Linux: `/usr/local/ilogtail/ilogtail.LOG`.
- Linux: `/usr/local/ilogtail/logtail_plugin.LOG`. The file contains the logs such as HTTP logs, MySQL binary logs, and MySQL query results.
- 64-bit Windows: `C:\Program Files (x86)\Alibaba\Logtail\logtail_*.log`.
- 32-bit Windows: `C:\Program Files\Alibaba\Logtail\logtail_*.log`.

- Check whether the log volume exceeds the limit.

To collect large volumes of logs, you may need to modify the Logtail startup parameters for higher log collection throughput. For more information, see [Set Logtail startup parameters](#).

30.8.1.2. What can I do if Log Service does not receive heartbeats from a Logtail client?

If Log Service does not receive heartbeats from a Logtail client, perform the steps that are described in the topic to troubleshoot the problem.

Context

After Logtail is installed on a server, the Logtail client sends heartbeats to Log Service. If the status page of the machine group shows that Log Service does not receive heartbeats from a Logtail client, it indicates that the Logtail client is not installed or disconnected from the server.

Step 1: Check whether Logtail is installed

Use the following method to check whether Logtail is installed:

- On a Linux server, run the following command:

```
sudo /etc/init.d/ilogtailed status
```

If the command returns `ilogtail is running`, it indicates that Logtail is installed. The following script shows an example command and response:

```
[root@*****~]# sudo /etc/init.d/ilogtailed status
ilogtail is running
```

- On a Windows server:
 - i. Press Win+R. In the Run dialog box, enter `services.msc` and click **OK**.
 - ii. In the **Services** window, check the status of the `LogtailDaemon` and `LogtailWorker` services. If the services are in the **Running** state, it indicates that Logtail is installed.

If Logtail is not installed, install it. For more information, see [Install Logtail in Linux](#) or [Install Logtail in Windows](#). Ensure that the Log Service endpoint in the Logtail installation command corresponds to the region to which the Log Service project belongs. If Logtail is running, go to the next step.

Step 2: Check the Log Service endpoint in the Logtail installation command

When you install Logtail, you must specify a [Log Service endpoint](#) based on the region to which the Log Service project belongs. If the endpoint is incorrect or the Logtail installation command is invalid, Log Service cannot receive heartbeats from the Logtail client.

You can view the Log Service endpoint and installation method in the Logtail configuration file named `ilogtail_config.json`. The file is stored in the following path:

- Linux: `/usr/local/ilogtail/ilogtail_config.json`
- 64-bit Windows: `C:\Program Files (x86)\Alibaba\Logtail\ilogtail_config.json`
- 32-bit Windows: `C:\Program Files\Alibaba\Logtail\ilogtail_config.json`

In the Logtail configuration file, check the value of the `config_server_address` parameter. This parameter specifies the Log Service endpoint. Then, check whether the Logtail client can connect to Log Service based on the endpoint. For example, if the endpoint that is recorded in the Logtail configuration file is `logtail.cn-qingdao-env25-d01.sls-pub.inter.env25.shuguang.com`, you can run the following command to check the connection:

- Linux:

```
curl logtail.cn-qingdao-env25-d01.sls-pub.inter.env25.shuguang.com
```

- Windows:

```
telnet logtail.cn-qingdao-env25-d01.sls-pub.inter.env25.shuguang.com 80
```

If the Log Service endpoint in the Logtail installation command is incorrect, re-install Logtail. For more information, see [Install Logtail in Linux](#) or [Install Logtail in Windows](#).

If the Log Service endpoint in the Logtail installation command is correct, go to the next step.

Step 3: Check the server IP addresses in the machine group

The server IP address that is obtained by a Logtail client must be configured in the machine group. Otherwise, Log Service cannot receive heartbeats or collect logs from the Logtail client. Logtail uses the following methods to obtain the IP address of a server:

- If the server is not bound with a hostname, Logtail obtains the IP address of the first network interface controller (NIC) card of the server.
- If the server is bound with a hostname, Logtail obtains the IP address that corresponds to the hostname. You can view the hostname and IP address in the `/etc/hosts` file.

 **Note** You can run the `hostname` command to query the hostname.

Perform the following steps to check whether the server IP address that is obtained by the Logtail client is configured in the machine group.

1. Check the server IP address that is obtained by Logtail.

The `ip` field in the `app_info.json` file indicates the server IP address that is obtained by Logtail. The file is stored in the following path:

- Linux: `/usr/local/ilogtail/app_info.json`
- 64-bit Windows: `C:\Program Files (x86)\Alibaba\Logtail\app_info.json`
- 32-bit Windows: `C:\Program Files\Alibaba\Logtail\app_info.json`

 **Note**

- If the `ip` field in the `app_info.json` file is empty, Logtail cannot work. In this case, you must configure an IP address for the server and restart Logtail.
- The `app_info.json` file is used only to record information. If you modify the IP address in the file, the server IP address obtained by Logtail is not updated.

2. Check the server IP addresses in the machine group. Log on to the Log Service console. In the **Projects** section, click the project to which the machine group belongs. In the left-side navigation pane, click the **Machine Groups** icon. In the **Machine Groups** pane, click the machine group. In the **Machine Group Status**

section of the **Machine Group Settings** page, check the server IP addresses.

If no server IP address in the machine group is the same as the IP address that is obtained by Logtail, perform the following step to modify the IP address configurations in the Log Service console:

- If a server IP address in the machine group is incorrect, change the IP address to the IP address that is obtained by Logtail. Then, check the heartbeat status 1 minute after you save the change.
- If you have modified the IP address of the server where Logtail is installed (for example, the `/etc/hosts` file is modified), restart Logtail. After Logtail obtains the new server IP address, set a server IP address in the machine group to the value of the `ip` field in the `app_info.json` file.

You can use the following method to restart Logtail:

- On a Linux server, run the following commands:

```
sudo /etc/init.d/ilogtaild stop
sudo /etc/init.d/ilogtaild start
```

- On a Windows server:

Press Win+R. In the Run dialog box, enter `services.msc` and click OK. In the **Services** window, find and restart the **LogtailWorker** service.

30.8.1.3. How do I query the local log collection statuses?

You can use Logtail to query the health status of Logtail and log collection statuses. The statuses help you troubleshoot log collection issues and customize status monitoring for log collection.

Instructions

After a Logtail client that supports the status query feature is installed, you can query the local log collection statuses by running commands on the client. For more information about how to install Logtail, see [Install Logtail in Linux](#).

You can run the `/etc/init.d/ilogtaild -h` command on the client to check whether a client supports the feature of querying the local log collection status. If the command output includes the `logtail insight, version` keyword, it indicates that the client supports the status query feature.

```
/etc/init.d/ilogtaild -h
Usage: ./ilogtaild { start | stop (graceful, flush data and save checkpoints) | force-stop | status | -h for help}$
logtail insight, version : 0.1.0
command list :
  status all [index]
    get logtail running status
  status active [--logstore | --logfile] index [project] [logstore]
    list all active logstore | logfile. if use --logfile, please add project and logstore. default --logstore
  status logstore [--format=line | json] index project logstore
    get logstore status with line or json style. default --format=line
  status logfile [--format=line | json] index project logstore fileFullPath
    get log file status with line or json style. default --format=line
  status history beginIndex endIndex project logstore [fileFullPath]
    query logstore | logfile history status.
index : from 1 to 60. in all, it means last $(index) minutes; in active/logstore/logfile/history, it means last $(index)*10
minutes
```

The following table describes the commands that are supported by Logtail:

Command	Function	Maximum time range that can be queried	Time window
all	Queries the status of Logtail.	Last 60 minutes	1 minute
active	Queries the active Logstores that are collecting logs and the active log files from which logs are being collected.	Last 600 minutes	10 minutes
logstore	Queries the collection status of a Logstore.	Last 600 minutes	10 minutes
logfile	Queries the collection status of a log file.	Last 600 minutes	10 minutes
history	Queries the collection status of a Logstore or log file in the query time window.	Last 600 minutes	10 minutes

 Note

- The `index` parameter in the preceding commands indicates the index of the time window. Valid values: 1 to 60. The index of the latest time window is 1 and the time window ends at the current system time. If you specify a 1-minute time window, the status in the past interval of `(index, index-1]` minutes is returned. If you specify a 10-minute time window, the status in the past interval of `(10*index, 10*(index-1)]` minutes is returned.
- All commands in the preceding table is the subcommands of the status command.

Command all

Command syntax

```
/etc/init.d/ilogtaild status all [ index ]
```

 Note The all command is used to query the status of Logtail. The index parameter is optional. Default value: 1.

Examples

```
/etc/init.d/ilogtaild status all 1
ok
/etc/init.d/ilogtaild status all 10
busy
```

Response

Status	Description	Priority	Troubleshooting
ok	Logtail is running as expected.	N/A	No action is required.

Status	Description	Priority	Troubleshooting
busy	The collection speed is high, and Logtail is running as expected.	N/A	No action is required.
many_log_files	A large number of log files are being collected by Logtail.	Low	You can check the Logtail configuration for log files that do not need to be collected.
process_block	The process of log parsing is blocked.	Low	You can check whether a large number of logs are generated in a short time. If you use the all command for multiple times and the returned value is always process_block, you can modify the limit of CPU usage or the limit of concurrent packet sending .
send_block	The process of sending log packets is blocked.	High	You can check whether a large number of logs are generated in a short time and the network connection is stable. If you use the all command for multiple times and the returned value is always send_block, you can modify the limit of CPU usage or the limit of concurrent packet sending .

Command active

Command syntax

```
/etc/init.d/ilogtaild status active [--logstore] index
/etc/init.d/ilogtaild status active --logfile index project-name logstore-name
```

Note

- You can use the `active [--logstore] index` command to query all active Logstores. The `--logstore` parameter is optional.
- The command `active --logfile index project-name logstore-name` is used to query all active log files in the Logstore of a project.
- The active command is used to query log files. We recommend that you query active Logstores before querying active log files in the Logstores.

Examples

```
/etc/init.d/ilogtaild status active 1
sls-zc-test : release-test
sls-zc-test : release-test-ant-rpc-3
sls-zc-test : release-test-same-regex-3

/etc/init.d/ilogtaild status active --logfile 1 sls-zc-test release-test
/disk2/test/normal/access.log
```

Response

- If you run the `active --logstore index` command, the names of the active Logstores are returned in the

following format: `project-name : logstore-name` . If you run the command `active --logfile index project-name logstore-name` , the paths of active log files are returned.

- The status of the inactive Logstores or inactive log files in the query time window is not returned.

Command logstore

Command syntax

```
/etc/init.d/ilogtaild status logstore [--format={line|json}] index project-name logstore-name
```

Note

- The logstore command is used to query the collection status of the specified project and Logstore in the LINE or JSON format.
- The default value of the `--format=` parameter is `--format=line` , which indicates that the status is returned in the LINE format. Noted that the `--format=` parameter is placed after the `logstore` parameter.
- If the Logstore specified in the preceding command does not exist or is not active in the query time window, an empty response in LINE format or the `null` value in the JSON format is returned.

Examples

```
/etc/init.d/ilogtaild status logstore 1 sls-zc-test release-test-same
time_begin_readable : 17-08-29 10:56:11
time_end_readable : 17-08-29 11:06:11
time_begin : 1503975371
time_end : 1503975971
project : sls-zc-test
logstore : release-test-same
status : ok
config : ##1.0##sls-zc-test$same
read_bytes : 65033430
parse_success_lines : 230615
parse_fail_lines : 0
last_read_time : 1503975970
read_count : 687
avg_delay_bytes : 0
max_unsend_time : 0
min_unsend_time : 0
max_send_success_time : 1503975968
send_queue_size : 0
send_network_error_count : 0
send_network_quota_count : 0
send_network_discard_count : 0
send_success_count : 302
send_block_flag : false
sender_valid_flag : true
/etc/init.d/ilogtaild status logstore --format=json 1 sls-zc-test release-test-same
```

```
{
  "avg_delay_bytes" : 0,
  "config" : "##1.0##sls-zc-test$same",
  "last_read_time" : 1503975970,
  "logstore" : "release-test-same",
  "max_send_success_time" : 1503975968,
  "max_unsend_time" : 0,
  "min_unsend_time" : 0,
  "parse_fail_lines" : 0,
  "parse_success_lines" : 230615,
  "project" : "sls-zc-test",
  "read_bytes" : 65033430,
  "read_count" : 687,
  "send_block_flag" : false,
  "send_network_discard_count" : 0,
  "send_network_error_count" : 0,
  "send_network_quota_count" : 0,
  "send_queue_size" : 0,
  "send_success_count" : 302,
  "sender_valid_flag" : true,
  "status" : "ok",

  "time_begin_readable" : "17-08-29 10:56:11",
  "time_end" : 1503975971,
  "time_end_readable" : "17-08-29 11:06:11"
}
```

Response

Parameter	Description	Unit
status	The status of the Logstore. For information about Logstore statuses and actions that are required to deal with each status, see the following table.	N/A
time_begin_readable	The time when logs become readable.	N/A
time_end_readable	The time when logs become unreadable.	N/A
time_begin	The time when statistics collection starts.	Unix timestamp in seconds
time_end	The time when statistics collection ends.	Unix timestamp in seconds
project	The name of the project.	N/A
logstore	The name of the Logstore.	N/A

Parameter	Description	Unit
config	The name of the Logtail configuration, which is globally unique. The format of the name is <code>##1.0## + project + \$ + config</code> .	N/A
read_bytes	The amount of the log data that is read in the query time window.	Byte
parse_success_lines	The number of the log lines that are parsed in the query time window.	Line
parse_fail_lines	The number of the log lines that fail to be parsed in the query time window.	Line
last_read_time	The last time when logs are read in the query time window.	Unix timestamp in seconds
read_count	The number of times that the log file is read in the query time window.	Times
avg_delay_bytes	The average of difference between the actual file size and the offset generated when reading log data each time in the query time window.	Byte
max_unsend_time	The maximum period of time for which an unsend packet waits in the sending queue. An unsend packet refers to a packet that has not been sent at the end of the query time window. If no packets exist in the queue, the value is 0.	Unix timestamp in seconds
min_unsend_time	The minimum period of time for which an unsend packet waits in the sending queue. Unsend packets refer to packets that have not been sent at the end of the query time window. If no packets exist in the queue, the value is 0.	Unix timestamp in seconds
max_send_success_time	The maximum period of time when a packet waited in the sending queue.	Unix timestamp in seconds
send_queue_size	The number of the unsend packets in the sending queue at the end of the query time window.	Number of packets
send_network_error_count	The number of the packets that cannot be sent due to network errors in the query time window.	Number of packets
send_network_quota_count	The number of the packets that cannot be sent due to quota limit in the query time window.	Number of packets
send_network_discard_count	The number of the packets that are discarded due to data errors or lack of permissions.	Number of packets

Parameter	Description	Unit
send_success_count	The number of the packets that are sent in the query time window.	Number of packets
send_block_flag	Indicates whether the sending queue is blocked at the end of the query time window.	N/A
sender_valid_flag	Indicates whether the sender flag of the Logstore is valid. The value true indicates that the sender flag is valid. The value false indicates that the sender flag is invalid and disabled because of a network error or quota error.	N/A

Logstore statuses

Status	Description	Troubleshooting
ok	Logtail is running as expected.	No action is required.
process_block	The process of log parsing is blocked.	You can check whether a large number of logs are generated in a short time. If you use the all command for multiple times and the returned value is always process_block, you can Set Logtail startup parameters modify the limit of CPU usage or of concurrent packet sending.
parse_fail	Logtail fails to parse logs.	You can check whether the format of logs is consistent with that you set in the Logtail configuration.
send_block	The process of sending log packets is blocked.	You can check whether a large number of logs are generated in a short time and the network connection is stable. If you use the all command for multiple times and the returned value is always send_block, you can Set Logtail startup parameters modify the limit of CPU usage or of concurrent packet sending.

Command logfile

Command syntax

```
/etc/init.d/ilogtaild status logfile [--format={line|json}] index project-name logstore-name fileFullPath
```

 Note

- The logfile command is used to query the collection status of the specified log files in the LINE or JSON format.
- The default value of the `--format=` parameter is `--format=line`, which indicates that the status is returned in the LINE format.
- If the log file specified in the command does not exist or is not active in the query time window, an empty response in the LINE format or the `null` value in the JSON format is returned.
- The `--format` parameter is placed after the `logfile` parameter.
- The value of the `filefullpath` parameter must be the full path of the log file.

Examples

```
/etc/init.d/ilogtailed status logfile 1 sls-zc-test release-test-same /disk2/test/normal/access.log
time_begin_readable : 17-08-29 11:16:11
time_end_readable : 17-08-29 11:26:11
time_begin : 1503976571
time_end : 1503977171
project : sls-zc-test
logstore : release-test-same
status : ok
config : ##1.0##sls-zc-test$same
file_path : /disk2/test/normal/access.log
file_dev : 64800
file_inode : 22544456
file_size_bytes : 17154060
file_offset_bytes : 17154060
read_bytes : 65033430
parse_success_lines : 230615
parse_fail_lines : 0
last_read_time : 1503977170
read_count : 667
avg_delay_bytes : 0
/etc/init.d/ilogtailed status logfile --format=json 1 sls-zc-test release-test-same /disk2/test/normal/access.log
{
  "avg_delay_bytes" : 0,
  "config" : "##1.0##sls-zc-test$same",
  "file_dev" : 64800,
  "file_inode" : 22544456,
  "file_path" : "/disk2/test/normal/access.log",
  "file_size_bytes" : 17154060,

```

Response

Parameter	Description	Unit
status	The collection status of the log file in the query time window. For more information, see the status parameter in the Command logstore section.	N/A
time_begin_readable	The time when logs become readable.	N/A
time_end_readable	The time when logs become unreadable.	N/A
time_begin	The time when statistics collection starts.	Unix timestamp in seconds
time_end	The time when statistics collection ends.	Unix timestamp in seconds
project	The name of the project.	N/A
logstore	The name of the Logstore.	N/A
file_path	The path of the log file.	N/A
file_dev	The ID of the device from which the log file is collected.	N/A
file_inode	The inode of the log file.	N/A
file_size_bytes	The size of the log file that is last scanned in the query time window.	Byte
read_offset_bytes	The parsing offset of the log file.	Byte
config	The name of the Logtail configuration, which is globally unique. The format of the name is <code>##1.0## + project + \$ + config</code> .	N/A
read_bytes	The amount of the log data that is read in the query time window.	Byte
parse_success_lines	The number of the log lines that are parsed in the query time window.	Line
parse_fail_lines	The number of the log lines that fail to be parsed in the query time window.	Line
last_read_time	The last time when logs are read in the query time window.	Unix timestamp in seconds
read_count	The number of times that the log file is read in the query time window.	Times
avg_delay_bytes	The average of difference between the actual file size and the offset generated when reading log data each time in the query time window.	Byte

Command history

Command syntax

```
/etc/init.d/ilogtaild status history beginIndex endIndex project-name logstore-name [fileFullPath]
```

Note

- The history command is used to query the collection status of a Logstore or log file in the query time window.
- The `beginIndex` and `endIndex` parameters specify the start and end indexes of the range of time windows that you want to query. You must ensure that `beginIndex <= endIndex`.
- The `fileFullPath` parameter is optional. If you specify the path of a log file, the collection status of the log file is queried. If the path is not specified, the collection status of the Logstore is queried.

Examples

```
/etc/init.d/ilogtaild status history 1 3 sls-zc-test release-test-same /disk2/test/normal/access.log
  begin_time      status   read parse_success parse_fail  last_read_time read_count avg_delay device  ino

```

Response

- The collection status of the Logstore or log file in each query time window is listed in a line.
- For more information about response parameters, see the Command `logstore` and Command `logfile` sections.

Response status codes

Success code

If parameters that you specify in a command is valid (even if the queried Logstore or log file is not found), the code 0 is returned. The following section provides two examples:

```
/etc/init.d/ilogtaild status logfile --format=json 1 error-project error-logstore /no/this/file
null
echo $?
0
/etc/init.d/ilogtaild status all
ok
echo $?
0
```

Error codes

If a non-zero code is returned, it indicates that an error occurs. The following table describes the possible non-zero codes.

Code	Description	Message	Troubleshooting
10	The command is invalid or required parameters in the command are not specified.	invalid param, use -h for help.	You can run the <code>-h</code> command for help.
1	The value of the index parameter is not in the range from 1 to 60.	invalid query interval	You can run the <code>-h</code> command for help.
1	The collection status in the specified query time window cannot be queried.	query fail, error: <code>\$(error)</code> . For more information, visit errno .	The startup time of Logtail is earlier than the query time window. Otherwise, you can submit a ticket for help.
1	The start time of querying is out of the query time window.	no match time interval, please check logtail status	You can check whether Logtail is running. If yes, you can submit a ticket for help.
1	No logs exist in the specified query time window.	invalid profile, maybe logtail restart	You can check whether Logtail is running. If yes, you can submit a ticket for help.

Examples

```
/etc/init.d/ilogtaild status nothiscmd
invalid param, use -h for help.
echo $?
10
/etc/init.d/ilogtaild status/all 99
invalid query interval
echo $?
1
```

Scenarios

You can query the overall status of Logtail, and specific metrics by querying the collection status during collection. You can customize a mechanism to monitor the log collection status based on the queried information.

Monitor the status of Logtail

You can monitor the status of Logtail by using the `all` command.

For example, you can run the command every minute to query Logtail status. If the `process_block`, `send_block` or `send_error` value is returned for 5 consecutive minutes, an alert is triggered.

You can adjust the alert duration and monitoring scope based on the priorities of the collected log files.

Monitor the log collection status

You can monitor the log collection status of a Logstore by using the `logstore` command.

For example, you can run the `logstore` command every 10 minutes to query the collection status of the Logstore. If the value of the `avg_delay_bytes` parameter exceeds 1 MB (1024 × 1024 bytes) or the value of the `status` parameter is not `ok`, an alert is triggered.

You can adjust the alert threshold for the `avg_delay_bytes` metric based on the size of data that is generated during the log collection.

Check whether Logtail has finished collecting log files

You can check whether Logtail has finished collecting log files by using the `logfile` command.

After Logtail stops collecting log files, you can run the `logfile` command every 10 minutes to query the status of the log file. If the value of the `read_offset_bytes` parameter is the same as that of the `file_size_bytes` parameter, it indicates that the log file is collected.

Troubleshoot log collection issues

If log collection latency occurs on a server, you can use the `history` command to query the status history of log collection.

1. The value of the `send_block_flag` parameter is true. This indicates that the log collection is blocked because of unstable network connections.
 - If the value of the `send_network_quota_count` parameter is greater than 0, split shards in the Logstore. For more information, see [Split a shard](#).
 - If the value of the `send_network_error_count` parameter is greater than 0, check the network connections.
 - If no network error occurs, adjust the [limit of concurrent packet sending and data transfer speed](#) of Logtail.
2. The parameters related to packet sending are set to appropriate values. However, the value of the `avg_delay_bytes` parameter is large.
 - Use the value of the `read_bytes` parameter to calculate the average speed of parsing logs, and then determine whether a large amount of data is transferred during log collection based on the average speed.
 - Adjust the [resource usage limits](#) for Logtail.
3. The value of the `parse_fail_lines` parameter is greater than 0.

Check whether the regular expression can match all required log fields as expected.

30.8.1.4. How do I test a regular expression?

If you select the full regex mode when you configure Logtail to collect and parse text logs, you must specify a regular expression based on your sample log entries. This topic describes how to test a regular expression.

Context

To test a regular expression that you have specified in the Log Service console, you can click **Validate** in the console and check the results as follows:

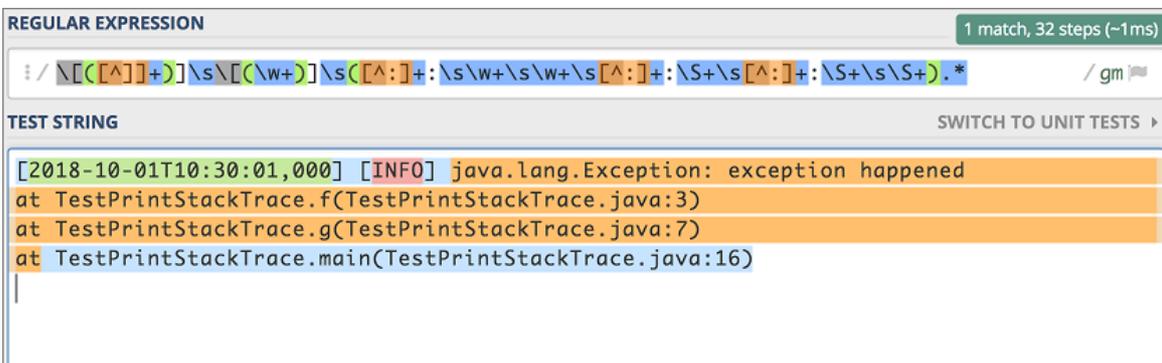

- For the regular expression that matches the first line of logs, check whether the regular expression can match the expected number of log entries.
- For the fields extracted by the regular expression, check whether the value of each field meets your expectations.

If you want to validate more items and test a regular expression, you can use online tools such as regex101.com and regextester.com. You can copy and paste the regular expression that is generated by Log Service to an online tool, and specify a sample log entry as the test string.

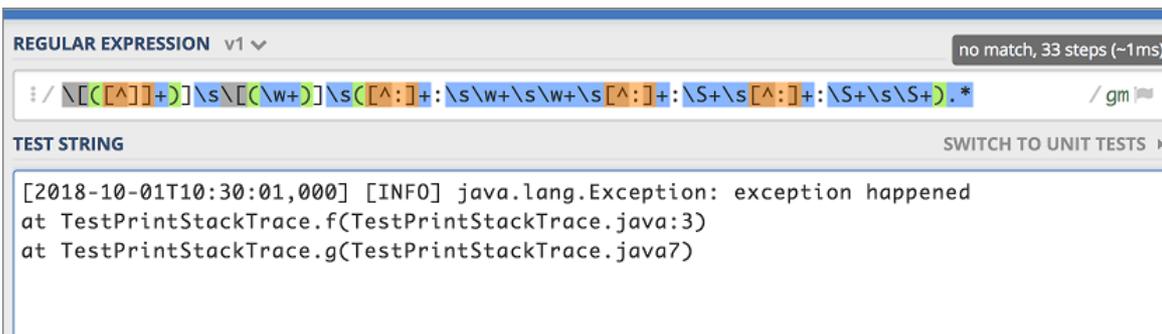

If you use the full regex mode, Log Service automatically generates a regular expression based on a sample log entry. However, the regular expression may fail to match the message field in multi-line log entries as expected. The following example describes how to use the regex101.com tool to test the regular expression.

Procedure

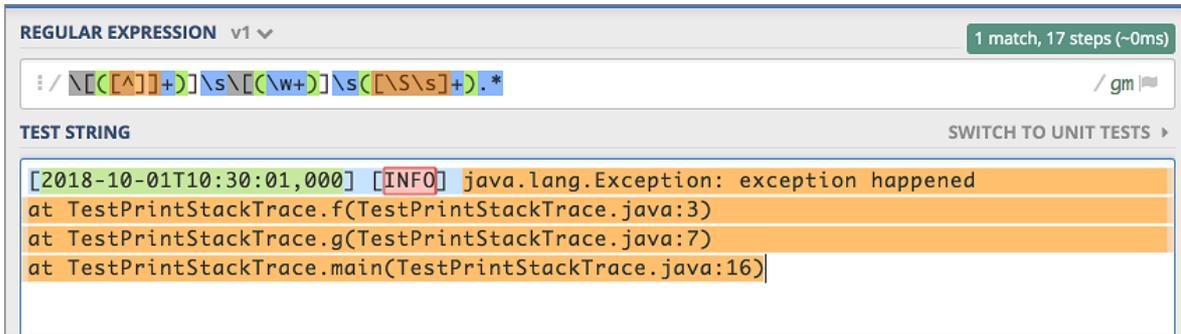

1. Copy the generated regular expression.
2. Visit the regex101.com website.
3. Paste the regular expression in the **REGULAR EXPRESSION** field. On the right side of the page, you can view the explanation of the regular expression.
4. In the **TEST STRING** field, paste a log sample entry. In the following figure, the log contents that are included in the message field are highlighted in orange, and the log contents that are not included are highlighted in blue. The figure shows that the substring following the `at` word is not included in the `message` field. Therefore, this regular expression does not match fields in the sample log entry as expected and cannot be used to collect log data.

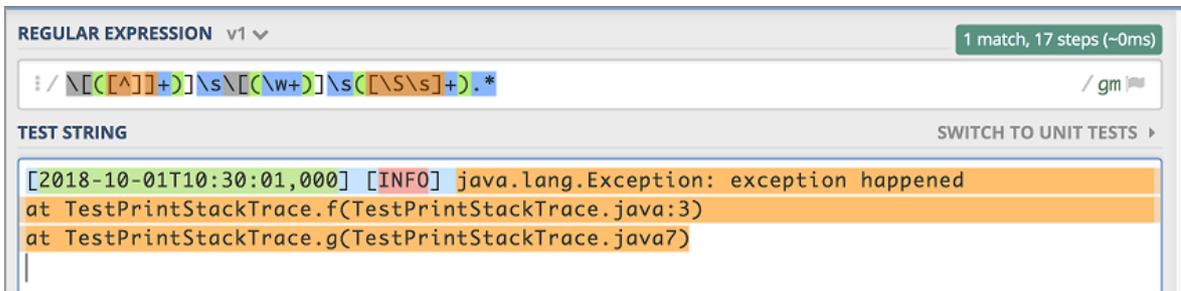

5. Check whether the regular expression can match fields in a sample log entry with two colons as expected. The following figure shows that the regular expression fails to match fields in the sample log entry as expected.

- Replace the last subexpression in the regular expression with `[\S\s]+`, and check whether the regular expression can match fields in the sample log entries as expected. The following figure shows how the modified regular expression matches the substring following the `at` word.

The following figure shows how the modified regular expression matches the sample log entry with two colons.

You can follow the preceding instructions to test your regular expression. After you validate the regular expression, you can apply it to a Logtail configuration.

30.8.1.5. How do I optimize regular expressions?

You can optimize regular expressions to improve the Logtail performance.

When you optimize regular expressions, we recommend that you follow these rules:

- Use precise characters

We recommend that you do not use the wildcard characters `.*` in a regular expression to match fields in log entries. Using wildcard characters may lead to mismatches and low matching performance. For example, if a field that you want to match only consists of letters, use `[A-Za-z]`.
- Use appropriate quantifiers

We recommend that you do not use plus signs (+) or asterisks (*). For example, you can use `\d` instead of `\d+` or `\d{1,3}` to match the IP address.
- Test and modify regular expressions

You can visit the regex101.com website to test and modify a regular expression to decrease the time required to match log entries.

30.8.1.6. How do I use the full regex mode to collect log entries in multiple formats?

The full regex mode requires that log entries to be collected be in the same format. Therefore, if you want to collect log entries that are in multiple formats, you must use the schema-on-write or schema-on-read solution.

Taking Java logs as an example, the following section lists the types of error log entry and normal log entry.

- Multi-line WARNING log entries
- Simple text INFO log entries
- Key-value DEBUG log entries

```
[2018-10-01T10:30:31,000] [WARNING] java.lang.Exception: another exception happened
  at TestPrintStackTrace.f(TestPrintStackTrace.java:3)
  at TestPrintStackTrace.g(TestPrintStackTrace.java:7)
  at TestPrintStackTrace.main(TestPrintStackTrace.java:16)
[2018-10-01T10:30:32,000] [INFO] info something
[2018-10-01T10:30:33,000] [DEBUG] key:value key2:value2
```

To collect log entries of these types, you can use the following solutions:

- Schema-on-write: To extract log fields, you must apply multiple Logtail configurations with different regular expressions to a log file.

 **Note** However, Logtail cannot apply multiple Logtail configurations directly to the same log file. Therefore, you must set up multiple symbolic links for the directory in which the log file resides. Each Logtail configuration applies to a symbolic link to collect log entries in a specific format.

- Schema-on-read: you can use a common regular expression to collect log entries in different formats.

For example, if you want to collect log entries in multiple formats, you can configure a regular expression that matches the time and log level fields as the first line, and specify the rest of the log entries as the log message. If you want to parse the message, create an index for the message, specify a regular expression to extract log messages, and then extract target fields.

 **Note** We recommend that you use this solution only for scenarios in which tens of millions of log entries are collected, or fewer.

30.8.1.7. How do I set the time format for logs?

You must be familiar with the following rules before setting the time format for logs in Logtail configurations.

- The unit of the timestamp in Log Service is seconds. Therefore, you cannot set the unit as milliseconds or microseconds.
- You only need to set the time field. Other parameters are not required.

The following section lists commonly used formats:

* Log Sample: 12345""67890

The sample log entry is different from the original entry. [Modify Sample Log Entry](#)

7. Delete the quotation marks between the digits 5 and 6. Then, a non-printable character is configured in a sample log entry.

* Log Sample: 1234567890

The sample log entry is different from the original entry. [Modify Sample Log Entry](#)

30.8.1.9. How do I troubleshoot errors during container log collection?

Perform the steps that are described in this topic to troubleshoot an error that occurs when you use Logtail to collect logs from common containers or containers in a Kubernetes cluster.

Related O&M operations

- [Log on to a Logtail container](#)
- [View the operational logs of Logtail](#)
- [Ignore the stdout logs of a Logtail container](#)
- [View the status of Log Service components in a Kubernetes cluster](#)
- [View the version number, IP address, and startup time of Logtail](#)

Troubleshoot an error if Log Service does not receive heartbeats from Logtail clients

Perform the following steps to check whether Logtail is installed:

1. In the machine group, count the number of the servers whose heartbeat status is OK.
 - i. [Log on to the Log Service console](#).
 - ii. Click the project to which the machine group belongs.
 - iii. In the left-side navigation pane, click **Machine Groups**.
 - iv. In the **Machine Groups** pane, click the name of the machine group. In the **Machine Group Status** section, count the number of the servers whose heartbeat status is OK.
2. Count the number of worker nodes in the cluster. Run the `kubectl get node | grep -v master` command to query the work nodes in the cluster. Count the number of the work nodes that are returned.

```
$kubectl get node | grep -v master
NAME                                STATUS ROLES   AGE   VERSION
cn-hangzhou.i-bp17enxc2us3624wexh2 Ready <none> 238d  v1.10.4
cn-hangzhou.i-bp1ad2b02jtqd1shi2ut Ready <none> 220d  v1.10.4
```

3. Check whether the number of servers whose heartbeat status is OK in the machine group is equal to the number of worker nodes in the cluster. Troubleshoot the error based on the check result.
 - The number of servers whose heartbeat status is OK is equal to the number of worker nodes. This means that the heartbeat status of all of the servers in the machine group is **Failed**.

- If **Logtail is installed into a common container**, check whether the values of the `your_region_name`, `your_aliyun_user_id`, and `your_machine_group_user_defined_id` parameters are correct. For information about how to set these parameters, see [Collect standard Docker logs](#).
 - If **Logtail is installed into a container in a Container Service for Kubernetes cluster**, submit a ticket.
 - If **Logtail is installed into a container in a user-created Kubernetes cluster**, check whether the values of the `your-project-suffix`, `regionId`, `aliuid`, `access-key-id`, and `access-key-secret` parameters are correct. If the value of a parameter is incorrect, run the `helm del --purge alibaba-log-controller` command to delete the installation package and re-install Logtail. For information about how to set these parameters, see [Collect Kubernetes logs](#).
- The number of servers whose heartbeat status is OK is less than the number of worker nodes.
 - a. Check whether you used a YAML file to manually deploy a DaemonSet.

Run the `kubectl get po -n kube-system -l k8s-app=logtail` command to perform the check. If the command returns pod information, it indicates that you manually deployed a DaemonSet by using a YAML file.
 - b. Download the latest version of the [Logtail DaemonSet template](#).
 - c. Set the `your_region_name`, `your_aliyun_user_id`, and `your_machine_group_name` parameters to the values that are specific to your environment.
 - d. Run the `kubectl apply -f ./logtail-daemonset.yaml` command to update the DaemonSet YAML file.

Submit a ticket if the error persists.

Troubleshoot an error if Log Service collects no logs from containers

If no log is displayed in the **Consumption Preview** pane or on the **Search & Analysis** page of a Logstore, it indicates that Log Service does not collect logs from the machine group of the Logstore. Check the status of the containers that correspond to the servers in the machine group. If the containers are working as expected, perform the following steps to troubleshoot the error:

1. [Check the heartbeat status of the servers in the machine group](#).
2. Check whether the parameter settings in the Logtail configuration files are correct.

Check whether the values of the `IncludeLabel`, `ExcludeLabel`, `IncludeEnv`, and `ExcludeEnv` parameters in the Logtail collection configuration files meet your requirements.

 **Note** The `IncludeLabel` or `ExcludeLabel` parameter specifies whether to include or exclude the container images to which specified labels are attached. You can retrieve a list of container image labels by running the `docker inspect` command. The labels are not the labels that are defined by using Kubernetes. To check whether the parameter settings are correct in a Logtail configuration file, delete the `IncludeLabel`, `ExcludeLabel`, `IncludeEnv`, and `ExcludeEnv` parameters from the file. If Log Service can collect logs from the containers after the parameters are deleted, it indicates that the settings of the parameters are incorrect.

3. Check other items.

Log Service does not collect logs from containers in the following scenarios:

- Log files are not updated.
- The log files of a container are stored in locations that are neither the default storage nor a storage attached to the container.

Log on to a Logtail container

- Common container
 - i. Run the `docker ps | grep logtail` command on the host to search for the Logtail container.
 - ii. Run the `docker exec -it ***** bash` command to log on to the container.

```
$docker ps | grep logtail
223fbd3ed2a6e registry.cn-hangzhou.aliyuncs.com/log-service/logtail "/usr/local/ilogta..." 8 da
ys ago Up 8 days logtail-iba
$docker exec -it 223fbd3ed2a6e bash
```

- Container in a Kubernetes cluster

- Run the `kubectl get po -n kube-system | grep logtail` command to search for the pod where the Logtail container resides.
- Run the `kubectl exec -it -n kube-system ***** bash` command to log on to the pod.

```
$kubectl get po -n kube-system | grep logtail
logtail-ds-g5wgd          1/1   Running   0    8d
logtail-ds-slpn8         1/1   Running   0    8d
$kubectl exec -it -n kube-system logtail-ds-g5wgd bash
```

View the operational logs of Logtail

The operational logs of Logtail are saved in the files named *ilogtail.LOG* and *logtail_plugin.LOG* under the `/usr/local/ilogtail/` directory of a Logtail container.

1. Log on to a Logtail container.
2. Open the `/usr/local/ilogtail/` directory.

```
cd /usr/local/ilogtail
```

3. View the *ilogtail.LOG* and *logtail_plugin.LOG* files.

```
cat ilogtail.LOG
cat logtail_plugin.LOG
```

Ignore the stdout logs of a Logtail container

The standard output (stdout) logs of a Logtail container are useless for troubleshooting. Ignore the following stdout logs:

```
start umount useless mount points, /shm$|/merged$|/mqueue$
umount: /logtail_host/var/lib/docker/overlay2/3fd0043af174cb0273c3c7869500f8e2bdb95d13b1e110172ef57fe840c8215
5/merged: must be superuser to unmount
umount: /logtail_host/var/lib/docker/overlay2/d5b10aa19399992755de1f85d25009528daa749c1bf8c16edff44beab6e697
18/merged: must be superuser to unmount
umount: /logtail_host/var/lib/docker/overlay2/5c3125daddacedec29df72ad0c52fac800cd56c6e880dc4e8a640b1e16c22d
be/merged: must be superuser to unmount
.....
xargs: umount: exited with status 255; aborting
umount done
start logtail
ilogtail is running
logtail status:
ilogtail is running
```

View the status of Log Service components in a Kubernetes cluster

Run the `helm status alibaba-log-controller` command to view the status of Log Service components in a Kubernetes cluster.

View the version number, IP address, and startup time of Logtail

View the information in the `app_info.json` file under the `/usr/local/ilogtail/` directory of the Logtail container. For example, you can run the following command to view the content of the file:

```
kubect exec logtail-ds-gb92k -n kube-system cat /usr/local/ilogtail/app_info.json
{
  "UUID" : "",
  "hostname" : "logtail-gb92k",
  "instance_id" : "0EBB2B0E-0A3B-11E8-B0CE-0A58AC140402_10.10.10.10_1517810940",
  "ip" : "10.10.10.10",
  "logtail_version" : "0.16.2",
  "os" : "Linux; 3.10.0-693.2.2.el7.x86_64; #1 SMP Tue Sep 12 22:26:13 UTC 2017; x86_64",
  "update_time" : "2018-02-05 06:09:01"
}
```

30.8.2. Log search and analysis

30.8.2.1. FAQ about log query

This topic describes the common issues that may occur when you query log data in the Log Service console. It also includes solutions to these issues.

How do I identify the source server from which Logtail collects logs during a query?

If a server group uses IP addresses as its identifier when logs are collected by using Logtail, servers in the server group are distinguished from one another by internal IP addresses. When querying logs, you can use the hostname and custom IP address to identify the source server from which logs are collected.

For example, you can use the following statement to count the times different hostnames appear in logs:

 **Note** You must enable the index feature for the Logstore and enable the statistics feature for the `__tag__:__hostname__` field in advance.

```
* | select "__tag__:__hostname__", count(1) as count group by "__tag__:__hostname__"
```

How do I query IP addresses in logs?

You can use the exact match method to query IP addresses in logs. For example, you can specify IP addresses to query log data that includes or excludes the specified IP addresses. However, you cannot use the partial match method to query log data related to specified IP addresses. This is because decimal points contained in an IP address are not default delimiters in Log Service. If you want to use the partial match method, you can configure the decimal point as a delimiter for indexes. For example, you can use the SDK to download data and then use regular expressions or the `string.indexOf` method in the code.

For example, you use the following statement to query projects that meet the specified conditions.

```
not ip:121.42.0 not status:200 not 360jk not DNSPod-Monitor not status:302 not jiankongbao
not 301 and status:403
```

If the monitoring file is written in real time, you can open the `/usr/local/ilogtail/ilogtail.LOG` file to view the error message. Common error messages are as follows:

- parse delimiter log fail: The error message is returned because an error has occurred when Log Service collects logs in the delimiter mode.
- parse regex log fail: The error message is returned because an error has occurred when Log Service collects logs in the regex mode.

Delimiter setting errors

View the configured delimiters. Check whether you can use a keyword to query log data after the log content is split by using a delimiter. For example, the default delimiters `, ; = () [] { } ? @ & < > / : ' "` are used. If a log entry contains `abc"defg,hij`, it is split into `abc"defg` and `hij`. In this case, you cannot retrieve this log entry by searching for `abc`.

Fuzzy match is also supported. For more information, see [Query syntax](#).

Note

- To save your indexing cost, Log Service has optimized the index feature. If you configure an index for a field, full-text indexing is ineffective for the key of this field. For example, an index is configured for a log field whose key is `message`, and a whitespace character is used as a delimiter. To use a whitespace character as a delimiter, put it in the middle of delimiters that you have configured for an index. You can retrieve the log entries that contain "message: this is a test message" by searching for the key-value-pair-formatted keyword `message:this`. However, if you use the keyword `this` to query the log entries, you cannot retrieve the data because an index is configured for the `message` field and full-text indexing is ineffective.
- You can create indexes or modify existing indexes. However, new or modified indexes take effect only for new data.
You can click Index Attributes to check whether the configured delimiters meet the requirements.

Other reasons

If log data is available, modify the time range of the query and try again. Log Service allows you to preview log data in real time. Due to a maximum latency of one minute, we recommend that you query log data at least one minute after logs are generated.

30.8.2.3. What are the differences between log consumption and log search and analytics?

Both the log consumption and log search and analytics features provided by Log Service need to read log data. The log consumption feature provides log collection and distribution channels. In contrast, the log search and analytics feature allows you to query log data.

Both the log consumption and log search and analytics features need to read log data:

Log collection and consumption (LogHub): provides public channels for log collection and distribution. It reads and writes full data in first-in, first-out (FIFO) order, which is similar to Kafka.

- Each Logstore has one or more shards. Data is written to a random shard.
- You can read multiple log entries at a time from a specified shard based on the order in which the log entries were written to the shard.
- You can set the start position (cursor) to pull log entries from shards based on the time when Log Service receives the log entries.

Log search and analytics: enables you to set conditions to search and analyze large amounts of log data based on LogHub.

- This feature allows you to search for required data based on query conditions.

- This feature allows you to include a combination of Boolean keywords AND, NOT, and OR and SQL statements in a query.
- This feature is independent of shards.

The following table lists the differences between the log search and analytics feature and the LogHub feature.

Feature	Log search and analytics (LogSearch)	LogHub
Search by keyword	Supported.	Not supported.
Data read (a small amount of data)	Fast.	Fast.
Data read (full data)	Slow. LogSearch reads 100 log entries in 100 milliseconds. This method is not recommended.	Fast. LogHub reads 1 MB of log data in 10 milliseconds. This method is recommended.
Data read by topic	Yes.	No. Data is identified only by shard.
Data read by shard	No. Data in all shards of a Logstore is queried.	Yes. You need to specify a shard each time to read data.
Price	Relatively high.	Low.
Scenario	Monitoring, problem investigation, and analysis.	Full data processing scenarios, such as stream computing and batch processing.

30.8.2.4. How do I resolve common errors returned in log data queries?

Common errors returned in log data queries are as follows:

line 1:44: Column 'my_key_field' cannot be resolved;please add the column in the index attribute

- Cause

The `my_key_field` key cannot be included in the query statement because it does not exist.

- Solution

In the upper-right corner of the Search & Analysis page, click Index Attributes to create an index for this field and enable the statistics feature for this field.

Column 'xxxxline' not in GROUP BY clause;please add the column in the index attribute

- Cause

You use the GROUP BY clause and include a non-aggregated field in a SELECT statement. However, this field is not specified in the GROUP BY clause. For example, the key1 field in the `select key1, avg(latency) group by key2` statement is not specified in the GROUP BY clause.

- Solution

An example correct statement is `select key1,avg(latency) group by key1,key2` .

sql query must follow search query,please read syntax doc

- Cause

You do not include a filtering condition in a query statement, for example, `select ip,count(*) group by ip` .

- Solution

An example correct statement is `*|select ip,count(*) group by ip` .

please read syntax document,and make sure all related fields are indexed. error after select .error detail:line 1:10: identifiers must not start with a digit; surround the identifier with double quotes

- Cause

The column name or variable name referenced in an SQL statement starts with a number and does not comply with the rules.

- Solution

Change the name so the name starts with a letter.

please read syntax document,and make sure all related fields are indexed. error after select .error detail:line 1:9: extraneous input " expecting

- Cause

Misspelled words exist in the query statement.

- Solution

Correct the misspelled words.

key (category) is not config as key value config,if symbol : is in your log,please wrap : with quotation mark "

- Cause

No index is configured for the category field. It cannot be used in a query statement.

- Solution

Configure an index for this field in the index attributes. For more information, see [Enable the index feature and configure indexes for a Logstore](#).

Query exceeded max memory size of 3GB

- Cause

The size of memory used by the current query exceeds 3 GB. The common cause is that a large number of values are still returned in the query result after you use the GROUP BY clause to remove duplicates.

- Solution

Reduce the number of keys specified in the GROUP BY clause.

ErrorType:ColumnNotExists.ErrorPosition,line:0,column:1.ErrorMessage:line 1:123: Column '__raw_log__' cannot be resolved; it seems __raw_log__ is wrapper by ";if __raw_log__ is a string ,not a key field, please use '__raw_log__'

- Cause

The `my_key_field` key cannot be included in the query statement because it does not exist.

- Solution

In the upper-right corner of the Search & Analysis page, click Index Attributes to create an index for this field and enable the statistics feature for this field.

30.8.2.5. Why data queries are inaccurate?

This topic describes the causes for inaccurate data queries. It also includes solutions to these issues.

When you search and analyze log data, the message **The results are inaccurate** may prompt in the console. This indicates that the returned result is inaccurate because some log data in a Logstore was not queried.

Possible causes include:

The time range for queries is excessive.

- Cause

The time range for a query is excessively wide, for example, three months or a year. In this case, Log Service cannot scan all log data generated within this time period for one query.

- Solution

Narrow down the query time range and perform multiple queries.

Query statements are complex.

- Cause

The query statement is exceedingly complex or contains multiple frequently used words. In this case, Log Service cannot scan all related log data or read the query results at one time.

- Solution

Narrow down the query scope and perform multiple queries.

The SQL computing needs to read an excessively large amount of data.

- Cause

The SQL computing needs to read an excessively large amount of data. In this case, query results are likely to become inaccurate. A maximum of 1 GB of data can be read from each shard. For example, if the SQL computing needs to read strings from multiple columns, which exceed the threshold data volume, inaccurate query results will be returned.

- Solution

Narrow down the query scope and perform multiple queries.

30.8.2.6. How do I configure indexes for historical log data?

You cannot directly configure indexes for historical log data in Log Service. To configure indexes for historical log data, you can use DataWorks or the command line interface (CLI) to move data into another Logstore.

Indexes take effect on log data that is collected after the indexes are configured. You cannot use indexes to search and analyze historical log data. To configure indexes for historical log data, you can use either of the following two methods:

- Configure indexes in a new Logstore and then use DataWorks to move data into the Logstore.

After you configure indexes in a new Logstore, you can use DataWorks to move historical log data from the Logstore where it is stored to the new Logstore. Then you can use the configured indexes to search and analyze the data.

- After you configure indexes in a new Logstore, you can use the CLI to export historical log data from the Logstore where it is stored to the new Logstore.

 **Note** The preceding two methods copy historical log data and then export the data into a Logstore. They do not change or delete the data.

30.8.3. Alarm

30.8.3.1. FAQ about alerts

This topic describes the common issues that may occur when you configure alerts in the Log Service console. It also includes solutions to these issues.

How can I include the raw error log entries in the notification content?

- Issue

More than five error log entries were generated in the past five minutes, which triggered an alert. How can I include the raw error log entries in notifications that were sent when the alert was triggered?

- Solution

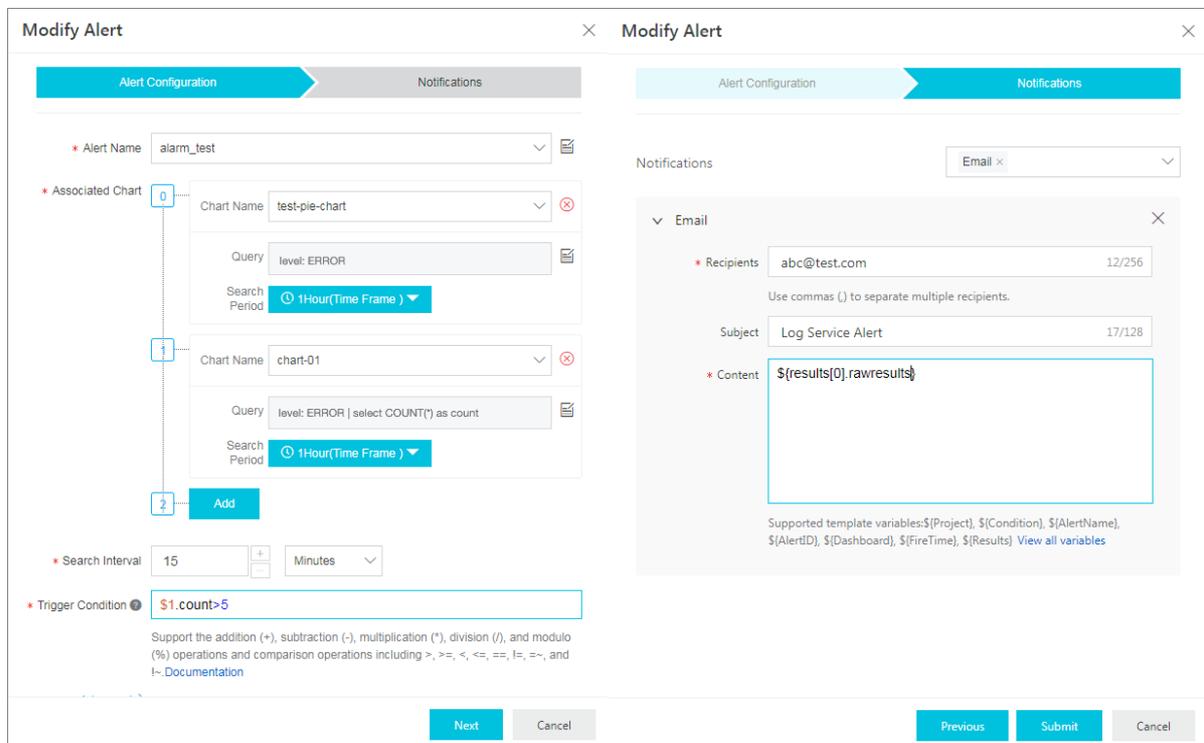

- Associated query statements

- Number 0: `level:ERROR`
- Number 1: `level:ERROR | select COUNT(*) as count`

- Trigger condition: `$1.count > 5`

- Notification content: `${results[0].rawresults}`

- Configuration examples

31. Apsara Stack DNS

31.1. What is Apsara Stack DNS?

Apsara Stack DNS is a service that runs on Apsara Stack to resolve domain names. You can configure rules to map domain names to IP addresses. Apsara Stack DNS then distributes domain name requests from clients to cloud resources, business systems on your internal networks, or the business resources of Internet service providers (ISPs).

Apsara Stack DNS provides DNS resolution in VPCs. You can perform the following operations on your VPC by using Apsara Stack DNS:

- Access other ECS instances deployed in your VPC.
- Access cloud service instances provided by Apsara Stack.
- Access custom enterprise business systems.
- Access Internet services and businesses.
- Establish network connections between DNS and user-created DNS over a leased line.
- Manage internal domain names.
- Manage DNS records of internal domain names.
- Manage forwarding configurations.
- Manage recursive resolution configurations.

31.2. User roles and permissions

Role	Permission
System administrator	A user of this role has read, write, and execute permissions on all level-1 organization resources, global resources, and system configurations.
Level-1 organization administrator	A user of this role has read, write, and execute permissions on level-1 organization resources to which the user belongs, but does not have permissions on level-1 organization resources, global resources, or system configurations to which other users belong.
Lower-level organization administrator	A user of this role does not have permissions on Apsara Stack DNS. The user does not have permissions on level-1 organization resources to which the user belongs, and does not have permissions on level-1 organization resources, global resources, or system configurations to which other users belong.
Resource user	A user of this role does not have permissions on Apsara Stack DNS. The user does not have permissions on level-1 organization resources to which the user belongs, and does not have permissions on level-1 organization resources, global resources, or system configurations to which other users belong.
Other roles	A user of this role does not have permissions on Apsara Stack DNS. The user does not have permissions on level-1 organization resources to which the user belongs, and does not have permissions on level-1 organization resources, global resources, or system configurations to which other users belong.

31.3. Log on to the Apsara Stack DNS console

This topic describes how to log on to the Apsara Stack DNS console by using Google Chrome.

Prerequisites

- The domain name of the ASCM console is obtained from the deployment personnel before you log on to the ASCM console.
- A browser is available. We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL used to log on to the ASCM console. Press the Enter key.
2. Enter your username and password.

Obtain the username and password used to log on to the console from the operations administrator.

 **Note** When you log on to the ASCM console for the first time, you must change the password of your username. For security reasons, your password must meet the minimum complexity requirements. The password must be 8 to 20 characters in length and must contain at least two of the following character types:

- Uppercase or lowercase letters.
- Digits.
- Special characters. Special characters include exclamation points (!), at signs (@), number signs (#), dollar signs (\$), and percent signs (%).

3. Click **Login** to go to the ASCM console homepage.
4. In the top navigation bar, choose **Products > Networking > Apsara Stack DNS**.

31.4. Internal DNS resolution management

Internal DNS resolution management allows you to manage global internal domain names, global forwarding configurations, and global recursive resolution configurations that you have created in Apsara Stack.

31.4.1. Global internal domain names

31.4.1.1. Overview

All the operations of this feature require administrator privileges.

31.4.1.2. View an internal domain name

Procedure

1. [Log on to the Apsara Stack DNS console](#).
2. In the left-side navigation pane, choose **Internal Domains > Global Internal Domains**.
3. In the **Domain Name** search box, enter the domain name that you want to view.
4. Click **Search**. The search result is displayed.

31.4.1.3. Add a domain name

This topic describes how to add a domain name in the Apsara Stack Cloud Management (ASCM) console.

Procedure

1. [Log on to the Apsara Stack DNS console.](#)
2. In the left-side navigation pane, choose **Internal Domains > Global Internal Domains**.
3. Click **Add Domain Name**.
4. In the dialog box that appears, enter **Global Internal Domains**.
5. Click **OK**.

31.4.1.4. Add a description for a domain name

This topic describes how to add a description for a domain name in the Apsara Stack Cloud Management (ASCM) console.

Context

You can add a description for a domain name for easy identification. For example, you can add a hostname or internal system information to describe a domain name.

Procedure

1. [Log on to the Apsara Stack DNS console.](#)
2. In the left-side navigation pane, choose **Internal Domains > Global Internal Domains**.
3. Find the target domain name, click the  icon in the Actions column, and then select **Description**.
4. In the dialog box that appears, enter a description.
5. Click **OK**.

31.4.1.5. Delete a domain name

This topic describes how to delete a domain name in the Apsara Stack Cloud Management (ASCM) console.

Procedure

1. [Log on to the Apsara Stack DNS console.](#)
2. In the left-side navigation pane, choose **Internal Domains > Global Internal Domains**.
3. Find the target domain name, click the  icon in the Actions column, and then select **Delete**.
4. In the message that appears, click **OK**.

31.4.1.6. Delete multiple domain names

This topic describes how to delete multiple domain names at a time in the Apsara Stack Cloud Management (ASCM) console.

Procedure

1. [Log on to the Apsara Stack DNS console.](#)
2. In the left-side navigation pane, choose **Internal Domains > Global Internal Domains**.
3. Select the domain names that you want to delete and click **Delete** in the upper-right corner.
4. In the message that appears, click **OK**.

31.4.1.7. Configure DNS records

This topic describes how to configure DNS records in the Apsara Stack Cloud Management (ASCM) console.

Procedure

1. [Log on to the Apsara Stack DNS console.](#)
2. In the left-side navigation pane, choose **Internal Domains > Global Internal Domains**.
3. Find the target domain name, click the  icon in the Actions column, and then select **Configure DNS Records**.
4. In the upper-right corner of the **Configure DNS Records** page, click **Add DNS Record**.
5. Perform the following operations as needed:

- Add a description for a DNS record

Select the DNS record for which you want to add a description, click  in the Actions column, and then select **Description** from the shortcut menu. In the dialog box that appears, enter a description and click **OK**.

- Delete a DNS record

Select the DNS record that you want to delete, click  in the Actions column, and then select **Delete** from the shortcut menu. In the message that appears, click **OK**.

- Modify a DNS record

Select the DNS record that you want to modify, click  in the Actions column, and then select **Modify** from the shortcut menu. In the dialog box that appears, set the required parameters and click **OK**.

- Delete DNS records in batches

Select the DNS records that you want to delete and click **Delete** in the upper-right corner. In the message that appears, click **OK**.

31.4.1.8. View a resolution policy

Procedure

1. [Log on to the Apsara Stack DNS console.](#)
2. In the left-side navigation pane, choose **Internal Domains > Global Internal Domains**.
3. Find the target domain name, click the  icon in the Actions column, and then select **Configure DNS Records**.
4. On the page that appears, select the domain name for which you want to configure DNS records, and click **Weight** in the **Resolution Policy** column.
5. On the page that appears, view the details of **Resolution Policy**.

31.4.2. Global forwarding configurations

31.4.2.1. Global forwarding domain names

31.4.2.1.1. Overview

All operations of this feature require administrator privileges.

Apsara Stack DNS forwards specific domain names to other DNS servers for resolution.

Two forwarding modes are available: forward all requests without recursion and forward all requests with recursion.

- **Forward all requests without recursion:** Only a specified DNS server is used to resolve domain names. If the

specified DNS server cannot resolve the domain names or the request times out, a message is returned to the DNS client to indicate that the query failed.

- Forward all requests with recursion: A specified DNS server is preferentially used to resolve domain names. If the specified DNS server cannot resolve the domain names, the local DNS is used instead.

31.4.2.1.2. View global forwarding domain names

This topic describes how to view forwarding domain names in the Apsara Stack Cloud Management (ASCM) console. This operation requires administrator permissions.

Procedure

1. [Log on to the Apsara Stack DNS console.](#)
2. In the left-side navigation pane, choose **Internal Domains > Global Forwarding Settings > Global Forwarding Domains**.
3. In the **Domain Name** search box, enter the target domain name and click **Search**.

31.4.2.1.3. Add a domain name

This topic describes how to add a domain name in the Apsara Stack Cloud Management (ASCM) console. This operation requires administrator permissions.

Procedure

1. [Log on to the Apsara Stack DNS console.](#)
2. In the left-side navigation pane, choose **Internal Domains > Global Forwarding Settings > Global Forwarding Domains**.
3. Click **Add Domain Name**.
4. In the dialog box that appears, configure parameters such as *Domain Name*, *Forwarding Mode*, and *Forwarder IP Addresses*. Then, click **OK**.

31.4.2.1.4. Add a description for a domain name

This topic describes how to add a description for a domain name in the ASCM console. This operation requires administrator privileges.

Context

You can add a description for a domain name for identification. For example, you can describe a domain name by using a hostname or internal system information.

Procedure

1. [Log on to the Apsara Stack DNS console.](#)
2. In the left-side navigation pane, choose **Forwarding Configurations > Global Forwarding Settings > Global Forwarding Domains**.
3. Select the domain name for which you want to add a description, click  in the **Actions** column, and then select **Description** from the shortcut menu.
4. In the dialog box that appears, enter a description and click **OK**.

31.4.2.1.5. Modify the forwarding configurations of a domain name

This topic describes how to modify the forwarding configurations of a domain name in the Apsara Stack Cloud Management (ASCM) console. This operation requires administrator permissions.

Procedure

1. [Log on to the Apsara Stack DNS console.](#)
2. In the left-side navigation pane, choose **Internal Domains > Global Forwarding Settings > Global Forwarding Domains**.
3. Find the target domain name, click the  icon in the Actions column, and then select **Modify**.
4. In the dialog box that appears, change the value of *Forwarding Mode* or *Forwarder IP Addresses*, and click **OK**.

31.4.2.1.6. Delete a domain name

This topic describes how to delete a domain name in the Apsara Stack Cloud Management (ASCM) console. This operation requires administrator permissions.

Procedure

1. [Log on to the Apsara Stack DNS console.](#)
2. In the left-side navigation pane, choose **Internal Domains > Global Forwarding Settings > Global Forwarding Domains**.
3. Find the target domain name, click the  icon in the Actions column, and then select **Delete**.
4. In the message that appears, click **OK**.

31.4.2.1.7. Delete multiple domain names

This topic describes how to delete multiple domain names at a time in the Apsara Stack Cloud Management (ASCM) console. This operation requires administrator permissions.

Procedure

1. [Log on to the Apsara Stack DNS console.](#)
2. In the left-side navigation pane, choose **Internal Domains > Global Forwarding Settings > Global Forwarding Domains**.
3. Select one or more domain names that you want to delete and click **Delete** in the upper-right corner of the domain name list.
4. In the message that appears, click **OK**.

31.4.2.2. Global default forwarding configurations

31.4.2.2.1. Enable default forwarding

This topic describes how to enable default forwarding in the Apsara Stack Cloud Management (ASCM) console. This operation requires administrator permissions.

Procedure

1. [Log on to the Apsara Stack DNS console.](#)
2. In the left-side navigation pane, choose **Internal Domains > Global Forwarding Settings > Global Default Forwarding**.
3. Click the  icon in the Actions column and select **Enable**.
4. In the dialog box that appears, configure *Forwarding Mode* and *Forwarder IP Addresses*. Then, click **OK**. Make sure that **Enable Default Forwarding** is set to **ON**.

31.4.2.2.2. Modify default forwarding configurations

This topic describes how to modify default forwarding configurations in the Apsara Stack Cloud Management (ASCM) console. This operation requires administrator permissions.

Procedure

1. [Log on to the Apsara Stack DNS console.](#)
2. In the left-side navigation pane, choose **Internal Domains > Global Forwarding Settings > Global Default Forwarding**.
3. Click the  icon in the Actions column and select **Modify**.
4. In the dialog box that appears, configure *Forwarding Mode* and *Forwarder IP Addresses*. Then, click **OK**.

31.4.2.2.3. Disable default forwarding

This topic describes how to disable default forwarding in the Apsara Stack Cloud Management (ASCM) console. This operation requires administrator permissions.

Procedure

1. [Log on to the Apsara Stack DNS console.](#)
2. In the left-side navigation pane, choose **Internal Domains > Global Forwarding Settings > Global Default Forwarding**.
3. Click the  icon in the Actions column and select **Disable**.
4. In the message that appears, click **OK**.

31.4.3. Global recursive resolution

31.4.3.1. Enable global recursive resolution

Prerequisites

You have administrator permissions.

Procedure

1. [Log on to the Apsara Stack DNS console.](#)
2. Choose **Internal Domains > Global Recursive Resolution**.
3. Click the  icon in the Actions column and select **Enable**.
4. In the dialog box that appears, click **OK**.

31.4.3.2. Disable global recursive resolution

Prerequisites

You have administrator permissions.

Procedure

1. [Log on to the Apsara Stack DNS console.](#)
2. Choose **Internal Domains > Global Recursive Resolution**.
3. Click the  icon in the Actions column and select **Disable**.

4. In the dialog box that appears, click OK.

31.5. PrivateZone (DNS Standard Edition only)

The PrivateZone feature allows you to create VPC-specific tenant domain names. You can bind the domain names to VPCs as required to achieve tenant isolation.

31.5.1. Tenant internal domain name

31.5.1.1. View a domain name

Procedure

1. [Log on to the Apsara Stack DNS console.](#)
2. In the left-side navigation pane, choose **Forwarding Configurations > Tenant Internal Domains.**
3. In the **Domain Name** search box, enter the domain name that you want to view.
4. Click **Search.** The search result is displayed.

31.5.1.2. Add a domain name

Procedure

1. [Log on to the Apsara Stack DNS console.](#)
2. In the left-side navigation pane, choose **Forwarding Configurations > Tenant Internal Domains.**
3. Click **Add Domain Name.**
4. In the dialog box that appears, set *Tenant Internal Domain Name.*
5. Click **OK.**

31.5.1.3. Bind an organization to a VPC

Tenant domain names are isolated based on VPCs. To ensure that the DNS forwarding configurations take effect, you must bind the organization of domain names to a VPC.

Procedure

1. [Log on to the Apsara Stack DNS console.](#)
2. In the left-side navigation pane, choose **Forwarding Configurations > Tenant Internal Domains.**
3. Find the target domain name, click the  icon in the **Actions** column, and select **Associate VPCs.**
4. Select one or more VPCs from the list of VPCs to **Select**, click the right arrow to add them to the list of VPCs **Selected**, and then click **OK.**

31.5.1.4. Unbind a domain name from a VPC

This topic describes how to unbind a domain name from a VPC.

Procedure

1. [Log on to the Apsara Stack DNS console.](#)
2. In the left-side navigation pane, choose **Forwarding Configurations > Tenant Internal Domains.**
3. Find the target domain name and click the number in the **VPCs Associated** column.
4. On the **VPCs Associated** page, find the target VPC, click the  icon in the **Actions** column, and then select **Disassociate.** Make sure that the unbound VPC is no longer displayed on the **VPCs Associated** page.

31.5.1.5. Add a description for a domain name

Procedure

1. Log on to the Apsara Stack DNS console.
2. In the left-side navigation pane, choose Forwarding Configurations > Tenant Internal Domains.
3. Find the target domain name, click the  icon in the Actions column, and then select Description.
4. In the dialog box that appears, enter a description.
5. Click OK.

31.5.1.6. Delete a domain name

Procedure

1. Log on to the Apsara Stack DNS console.
2. In the left-side navigation pane, choose Forwarding Configurations > Tenant Internal Domains.
3. Find the target domain name, click the  icon in the Actions column, and then select Delete.
4. In the message that appears, click OK.

31.5.1.7. Delete multiple domain names

Procedure

1. Log on to the Apsara Stack DNS console.
2. In the left-side navigation pane, choose Forwarding Configurations > Tenant Internal Domains.
3. Select one or more domain names that you want to delete and click Delete in the upper-right corner.
4. In the message that appears, click OK.

31.5.1.8. Configure DNS records

Procedure

1. Log on to the Apsara Stack DNS console.
2. In the left-side navigation pane, choose Forwarding Configurations > Tenant Internal Domains.
3. Find the target domain name, click the  icon in the Actions column, and then select Configure DNS Records.
4. In the upper-right corner of the Configure DNS Records page, click Add DNS Record.
5. In the Add DNS Record dialog box, configure *Host*, *Type*, *TTL*, *Resolution Policy*, and *Record Set*. Then, click OK. The following tables describe the types of DNS records.
 - o A record

Resolution policy	Formatting rule
-------------------	-----------------

Resolution policy	Formatting rule
None	<p>You can enter up to 100 unique IPv4 addresses, each in a separate row.</p> <p>Make sure that the IPv4 addresses are valid.</p> <p>Example:</p> <ul style="list-style-type: none"> ▪ 192.168.1.1 ▪ 192.168.1.2 ▪ 192.168.1.3
Weight	<p>You can enter up to 100 unique IPv4 addresses, each in a separate row.</p> <p>Format:</p> <ul style="list-style-type: none"> ▪ [IPv4 address] [Weight] (The IPv4 address and weight are separated with a space.) ▪ Make sure that the IPv4 addresses are valid. ▪ The weight value is an integer ranging from 0 to 999. A larger value indicates a greater weight. <p>Example:</p> <ul style="list-style-type: none"> ▪ 192.168.1.1 20 ▪ 192.168.1.1 30 ▪ 192.168.1.1 50

○ AAAA record

Resolution policy	Formatting rule
None	<p>You can enter up to 100 unique IPv6 addresses, each in a separate row.</p> <p>Make sure that the IPv6 addresses are valid.</p> <p>Example:</p> <ul style="list-style-type: none"> ▪ 2400:3200::6666 ▪ 2400:3200::6688 ▪ 2400:3200::8888
Weight	<p>You can enter up to 100 unique IPv6 addresses, each in a separate row.</p> <p>Format:</p> <ul style="list-style-type: none"> ▪ [IPv6 address] [Weight] (The IPv6 address and weight are separated with a space.) ▪ Make sure that the IPv6 addresses are valid. ▪ The weight value is an integer ranging from 0 to 999. A larger value indicates a greater weight. <p>Example:</p> <ul style="list-style-type: none"> ▪ 2400:3200::6666 20 ▪ 2400:3200::6688 20 ▪ 2400:3200::8888 60

○ CNAME record

Resolution policy	Formatting rule
None	<p>You can enter only one domain name.</p> <p>The domain name must be a fully qualified domain name (FQDN) that ends with a dot (.). It must be 1 to 255 characters in length.</p> <p>Example: www.example.com.</p>
Weight	<p>You can enter up to 100 unique domain names, each in a separate row.</p> <p>Format:</p> <ul style="list-style-type: none"> ▪ [Domain name] [Weight] (The domain name and weight are separated with a space.) ▪ The domain name must be an FQDN that ends with a period (.). It must be 1 to 255 characters in length. ▪ The weight value is an integer ranging from 0 to 999. A larger value indicates a greater weight. <p>Example:</p> <ul style="list-style-type: none"> ▪ www1.example.com. 20 ▪ www2.example.com. 20 ▪ www3.example.com. 60

○ MX record

Resolution policy	Formatting rule
None	<p>You can enter 100 unique email server hostnames, each in a separate row.</p> <p>Format:</p> <ul style="list-style-type: none"> ▪ [Priority] [Email server hostname] (The priority and hostname are separated with a space.) ▪ The priority value is an integer ranging from 0 to 999. A smaller value indicates a higher priority. ▪ The email server hostname must be an FQDN that ends with a period (.). It must be 1 to 255 characters in length. <p>Example:</p> <ul style="list-style-type: none"> ▪ 10 mailserver1.example.com. ▪ 20 mailserver2.example.com.

○ TXT record

Resolution policy	Formatting rule

6. After you add DNS records, perform the following operations as required:

- Add a description for a DNS record.

Find the target DNS record, click the  icon in the Actions column, and then select **Description**. In the dialog box that appears, enter a description and click **OK**.

- Delete a DNS record.

Find the target DNS record, click the  icon in the Actions column, and then select **Delete**. In the message that appears, click **OK**.

- Modify a DNS record.

Find the target DNS record, click the  icon in the Actions column, and then select **Modify**. In the dialog box that appears, modify the required parameters and click **OK**.

- Delete multiple DNS records.

Select the DNS records that you want to modify and click **Delete** in the upper-right corner. In the message that appears, click **OK**.

31.5.1.9. View a resolution policy

This topic describes how to view the details of a resolution policy.

Procedure

1. [Log on to the Apsara Stack DNS console.](#)
2. In the left-side navigation pane, choose **Forwarding Configurations > Tenant Internal Domains**.
3. Find the target domain name, click the  icon in the Actions column, and then select **Configure DNS Records**.
4. View the resolution policy in the DNS Records list.

31.5.2. Tenant forwarding configurations

31.5.2.1. Tenant forwarding domain names

31.5.2.1.1. View a tenant forwarding domain name

Procedure

1. [Log on to the Apsara Stack DNS console.](#)
2. In the left-side navigation pane, choose **Forwarding Configurations > Tenant Forwarding Settings > Tenant Forwarding Domains**.

3. In the **Domain Name** search box, enter the domain name that you want to view.
4. Click **Search**. The search result is displayed.

31.5.2.1.2. Add a tenant forwarding domain name

Procedure

1. [Log on to the Apsara Stack DNS console.](#)
2. In the left-side navigation pane, choose **Forwarding Configurations > Tenant Forwarding Settings > Tenant Forwarding Domains**.
3. Click **Add Domain Name**.
4. In the dialog box that appears, configure parameters such as *Domain Name*, *Forwarding Mode*, and *Forwarder IP Addresses*.

Parameter	Description
Domain Name	<p>The domain name, which must meet the following formatting rules:</p> <ul style="list-style-type: none"> ◦ The domain name must be 1 to 255 characters in length. This includes the period (.) at the end of the domain name. ◦ The domain name can contain multiple domain name segments that are separated with periods (.). A domain name segment must be 1 to 63 characters in length. It cannot contain consecutive periods (.) or be left blank. ◦ The domain name can only contain letters (a to z, A to Z), digits (0 to 9), hyphens (-), and underscores (_). ◦ The domain name must start with a letter, digit, or underscore (_) and end with a letter, digit, or period (. ◦ The domain name is not case-sensitive. The system saves the domain name in lowercase letters. ◦ The period (.) at the end of the domain name is optional. The system adds a period (.) to the end of the domain name.
Forwarding Mode	<p>For both domain name-based forwarding and default forwarding, the following two forwarding modes are supported:</p> <ul style="list-style-type: none"> ◦ Forward All Requests without Recursion: forwards DNS requests to the target DNS server. If the target DNS server cannot resolve the domain names, a message is returned to the DNS client indicating that the query failed. ◦ Forward All Requests with Recursion: A specified DNS server is preferentially used to resolve domain names. If the specified DNS server cannot resolve the domain names, the local DNS is used instead. If you enter internal IP addresses in the Forwarder IP Addresses field, unexpected results may occur during recursive resolution. For example, a domain name used for internal network services may be resolved to a public IP address.
Forwarder IP Addresses	<p>A list of destination IP addresses.</p> <div style="background-color: #e6f2ff; padding: 5px;"> <p> Note Multiple IP addresses are separated with semicolons (;).</p> </div>

5. Click **OK**.

31.5.2.1.3. Bind an organization to a VPC

Tenant domain names are isolated based on VPCs. You must bind the organization of domain names to a VPC before the DNS forwarding configurations can take effect.

Procedure

1. [Log on to the Apsara Stack DNS console.](#)
2. In the left-side navigation pane, choose **Forwarding Configurations > Tenant Forwarding Settings > Tenant Forwarding Domains.**
3. Find the target domain name, click the  icon in the Actions column, and then select **Associate VPCs.**
4. Select one or more VPCs from the list of VPCs to Select, click the right arrow to add them to the list of VPCs Selected, and then click **OK.**

31.5.2.1.4. Unbind a domain name from a VPC

This topic describes how to unbind a domain name from a VPC.

Procedure

1. [Log on to the Apsara Stack DNS console.](#)
2. In the left-side navigation pane, choose **Forwarding Configurations > Tenant Forwarding Settings > Tenant Forwarding Domains.**
3. Find the target domain name and click the number in the **VPCs Associated** column.
4. On the **VPCs Associated** page, find the target VPC, click the  icon in the Actions column, and then select **Disassociate.** Make sure that the unbound VPC is no longer displayed on the **VPCs Associated** page.

31.5.2.1.5. Modify the forwarding configurations of a domain name

Procedure

1. [Log on to the Apsara Stack DNS console.](#)
2. In the left-side navigation pane, choose **Forwarding Configurations > Tenant Forwarding Settings > Tenant Forwarding Domains.**
3. Find the target domain name, click the  icon in the Actions column, and then select **Modify.**
4. In the dialog box that appears, change the value of **Forwarding Mode** or **Forwarder IP Addresses.**
5. Click **OK.**

31.5.2.1.6. Add a description for a tenant forwarding domain name

Procedure

1. [Log on to the Apsara Stack DNS console.](#)
2. In the left-side navigation pane, choose **Forwarding Configurations > Tenant Forwarding Settings > Tenant Forwarding Domains.**
3. Find the target domain name, click the  icon in the Actions column, and then select **Description.**
4. In the dialog box that appears, enter a description.
5. Click **OK.**

31.5.2.1.7. Delete a tenant forwarding domain name

Procedure

1. [Log on to the Apsara Stack DNS console.](#)
2. In the left-side navigation pane, choose **Forwarding Configurations > Tenant Forwarding Settings >**

Tenant Forwarding Domains.

3. Find the target domain name, click the  icon in the Actions column, and then select **Delete**.
4. In the message that appears, click **OK**.

31.5.2.1.8. Delete multiple tenant forwarding domain names

Procedure

1. [Log on to the Apsara Stack DNS console.](#)
2. In the left-side navigation pane, choose **Forwarding Configurations > Tenant Forwarding Settings > Tenant Forwarding Domains**.
3. Select one or more domain names that you want to delete and click **Delete** in the upper-right corner.
4. In the message that appears, click **OK**.

31.5.2.2. Tenant default forwarding configurations

31.5.2.2.1. View default forwarding configurations

Prerequisites

You have the permissions of a system administrator or level-1 organization administrator.

Procedure

1. [Log on to the Apsara Stack DNS console.](#)
2. In the left-side navigation pane, choose **Forwarding Configurations > Tenant Forwarding Settings > Tenant Default Forwarding**.

31.5.2.2.2. Add a default forwarding configuration

Prerequisites

You have the permissions of a system administrator or level-1 organization administrator.

Procedure

1. [Log on to the Apsara Stack DNS console.](#)
2. In the left-side navigation pane, choose **Forwarding Configurations > Tenant Forwarding Settings > Tenant Default Forwarding**.
3. Click **Add Settings**.
4. In the dialog box that appears, configure parameters such as *Forwarding Mode* and *Forwarder IP Addresses*.

Parameter	Description
-----------	-------------

Parameter	Description
Forwarding Mode	<p>For both domain name-based forwarding and default forwarding, the following two forwarding modes are available:</p> <ul style="list-style-type: none"> Forward All Requests without Recursion: Only a specified DNS server is used to resolve domain names. If the specified DNS server cannot resolve the domain names, a message is returned to the DNS client to indicate that the query failed. Forward All Requests with Recursion: A specified DNS server is preferentially used to resolve domain names. If the specified DNS server cannot resolve the domain names, a local DNS server is used instead. If you enter internal IP addresses in the Forwarder IP Addresses field, unexpected results may occur during recursive resolution. For example, a domain name used for internal network services may be resolved to a public IP address.
Forwarder IP Addresses	<p>A list of destination IP addresses.</p> <p> Note Multiple IP addresses are separated with semicolons (;).</p>

5. Click **OK**.

31.5.2.2.3. Bind an organization to a VPC

Tenant domain names are isolated based on VPCs. You must bind the organization of domain names to a VPC before the DNS forwarding configurations can take effect.

Prerequisites

You have the permissions of a system administrator or level-1 organization administrator.

Procedure

1. [Log on to the Apsara Stack DNS console](#).
2. In the left-side navigation pane, choose **Forwarding Configurations > Tenant Forwarding Settings > Tenant Default Forwarding**.
3. Find the target organization, click the  icon in the Actions column, and then select **Associate VPCs**.
4. Select one or more VPCs from the list of VPCs to Select, click the right arrow to add them to the list of VPCs Selected, and then click **OK**.

31.5.2.2.4. Unbind a domain name from a VPC

This topic describes how to unbind a domain name from a VPC.

Procedure

1. [Log on to the Apsara Stack DNS console](#).
2. In the left-side navigation pane, choose **Forwarding Configurations > Tenant Forwarding Settings > Tenant Default Forwarding**.
3. Find the target domain name and click the number in the **VPCs Associated** column.
4. On the VPCs Associated page, find the target VPC, click the  icon in the Actions column, and then select **Disassociate**. Make sure that the unbound VPC is no longer displayed on the VPCs Associated page.

31.5.2.2.5. Modify a default forwarding configuration

Prerequisites

You have the permissions of a system administrator or level-1 organization administrator.

Procedure

1. [Log on to the Apsara Stack DNS console.](#)
2. In the left-side navigation pane, choose **Forwarding Configurations > Tenant Forwarding Settings > Tenant Default Forwarding.**
3. Find the target organization, click the  icon in the Actions column, and then select **Modify.**
4. In the dialog box that appears, change the value of **Forwarding Mode** or **Forwarder IP Addresses.**
5. Click **OK.**

31.5.2.2.6. Add a default forwarding configuration

Prerequisites

You have the permissions of a system administrator or level-1 organization administrator.

Procedure

1. [Log on to the Apsara Stack DNS console.](#)
2. In the left-side navigation pane, choose **Forwarding Configurations > Tenant Forwarding Settings > Tenant Default Forwarding.**
3. Find the target organization, click the  icon in the Actions column, and then select **Description.**
4. In the dialog box that appears, enter **Description.**
5. Click **OK.**

31.5.2.2.7. Delete a default forwarding configuration

Prerequisites

You have the permissions of a system administrator or level-1 organization administrator.

Procedure

1. [Log on to the Apsara Stack DNS console.](#)
2. In the left-side navigation pane, choose **Forwarding Configurations > Tenant Forwarding Settings > Tenant Default Forwarding.**
3. Find the target organization, click the  icon in the Actions column, and then select **Delete.**
4. In the dialog box that appears, click **OK.**

31.5.2.2.8. Delete multiple default forwarding configurations

Prerequisites

You have the permissions of a system administrator or level-1 organization administrator.

Procedure

1. [Log on to the Apsara Stack DNS console.](#)
2. In the left-side navigation pane, choose **Forwarding Configurations > Tenant Forwarding Settings > Tenant Default Forwarding.**
3. Select one or more domain names that you want to delete and click **Delete** in the upper-right corner.
4. In the message that appears, click **OK.**

31.6. Internal Global Traffic Manager (internal GTM Standard Edition only)

Internal Global Traffic Manager (GTM) supports multi-cloud disaster recovery for domain names of customers. This feature manages traffic loads between multiple Apsara Stack networks.

31.6.1. Scheduling instance management

31.6.1.1. Scheduling Instance

The Scheduling Instance tab displays all existing scheduling instances. You can add, delete, modify, and configure scheduling instances on this tab. When you create a scheduling instance, you must associate an address pool and scheduling domain with the instance.

31.6.1.1.1. Create a scheduling instance

After you create a scheduling instance, you can associate the scheduling instance with a scheduling domain and address pool.

1. Log on to the Apsara Stack DNS console and choose **Recursion Configurations > Scheduling Instances > Scheduling Instance.**
2. Click **Create Scheduling Instance** in the upper-right corner of the list.
3. In the dialog box that appears, enter information of the scheduling instance and click **OK.**

31.6.1.1.2. Modify a scheduling instance

1. Log on to the Apsara Stack DNS console and choose **Recursion Configurations > Scheduling Instances > Scheduling Instance.**
2. Find the target instance and click **Modify** in the Actions column.
3. Modify the configurations of the instance and click **OK.**

31.6.1.1.3. Configure a scheduling instance

This topic describes how to add and delete a scheduling instance and modify the configurations of a scheduling instance.

31.6.1.1.3.1. Create an access policy for a scheduling instance

1. Log on to the Apsara Stack DNS console and choose **Recursion Configurations > Scheduling Instances > Scheduling Instance.** Find the target scheduling instance and click **Configure** in the Actions column. On the **Access Policy Configuration** page, click **Create Access Policy** in the upper-right corner of the page.
2. In the dialog box that appears, enter the required information and click **OK.**

31.6.1.1.3.2. Modify the access policy of a scheduling instance

1. On the **Access Policy Configuration** page, find the target access policy and click **Modify** in the Actions column.

2. In the dialog box that appears, modify the configurations and click OK.

31.6.1.1.3.3. Delete the access policy of a scheduling instance

1. On the Access Policy Configuration page, find the target access policy and click Delete in the Actions column.
2. In the dialog box that appears, click OK after you verify that the displayed information is correct.

31.6.1.1.4. Delete a scheduling instance

1. Log on to the Apsara Stack DNS console and choose Recursion Configurations > Scheduling Instances > Scheduling Instance.
2. Find the target instance and click Delete in the Actions column.
3. In the dialog box that appears, click OK.

Note: After you delete the instance, its configuration data is also deleted.

31.6.1.2. Address Pool

The Address Pool tab allows you to manage address pools. The address pools are classified into three types: IPv4 address pool, IPv6 address pool, and CNAME address pool. You can associate a new scheduling instance with a specific address pool. You can also add weights to address pools.

31.6.1.2.1. Create an address pool

1. Log on to the Apsara Stack DNS console and choose Recursion Configurations > Scheduling Instances > Address Pool.
2. Click Create Address Pool in the upper-right corner of the address pool list.
3. In the dialog box that appears, enter information of the address pool and click OK.

31.6.1.2.2. Modify the configurations of an address pool

1. Log on to the Apsara Stack DNS console and choose Recursion Configurations > Scheduling Instances > Address Pool.
2. Find the target address pool and click Modify in the Actions column.
3. In the dialog box that appears, modify the configurations and click OK.

31.6.1.2.3. Delete an address pool

1. Log on to the Apsara Stack DNS console and choose Recursion Configurations > Scheduling Instances > Address Pool.
2. Find the target address pool and click Delete in the Actions column.
3. In the dialog box that appears, click OK after you verify that the displayed information is correct.

31.6.1.3. Scheduling Domain

The Scheduling Domain tab allows you to add, delete, modify, and query scheduling domains.

You can log on to the Apsara Stack DNS console and choose Recursion Configurations > Scheduling Instances > Scheduling Domain to view the scheduling domain list.

31.6.1.3.1. Create a scheduling domain

1. Log on to the Apsara Stack DNS console and choose Recursion Configurations > Scheduling Instances > Scheduling Domain. Then, click Create Scheduling Domain in the upper-right corner of the scheduling domain list.
2. In the dialog box that appears, enter the custom domain name and click OK.

31.6.1.3.2. Add a description for a scheduling domain

1. Log on to the Apsara Stack DNS console and choose Recursion Configurations > Scheduling Instances > Scheduling Domain.
2. Find the target scheduling domain and click Edit in the Actions column.
3. In the dialog box that appears, add a description in the Edit field and click OK.

31.6.1.3.3. Delete a scheduling domain

1. Log on to the Apsara Stack DNS console and choose Recursion Configurations > Scheduling Instances > Scheduling Domain.
2. Find the target scheduling domain and click Delete in the Actions column.
3. In the dialog box that appears, click OK after you verify that the displayed information is correct.

31.6.2. Data synchronization management

Data synchronization management is used to synchronize Global Traffic Manager (GTM) data between clouds.

31.6.2.1. Data Synchronization Link

The Data Synchronization Link tab displays local system information, information of the cluster nodes between which data synchronization has been established, and their primary/secondary relationships.

31.6.2.1.1. Standalone node on the Data Synchronization Link tab

Services can be switched over between Global Traffic Manager (GTM) nodes. If GTM is deployed in standalone mode, you must add slave nodes because two or more nodes are required for a switchover.

1. On the Data Synchronization Link tab, click Add Slave Node in the Data Synchronization Cluster section.
2. In the dialog box that appears, enter two IP addresses of the slave node that you want to add. Enter one IP address in each row.
3. Click OK. Then, wait for the confirmation of the slave node.

31.6.2.1.2. Master node on the Data Synchronization Link tab

You can switch the master node to the slave node and add slave nodes for the master node.

1. To add a slave node, click Add Slave Node in the Data Synchronization Cluster section on the Data Synchronization Link tab.
2. To switch the master node to the slave node, click Switch to Slave.
3. In the dialog box that appears, click OK after you verify that the displayed information is correct.

31.6.2.1.3. Slave node on the Data Synchronization Link tab

You can switch the standalone node to the slave node or the master node.

31.6.2.2. Link Change Messages

The Link Change Messages tab displays the status of each node in a Global Traffic Manager (GTM) cluster, which can be To Be Processed, Accepted, or Rejected.

You can log on to the Apsara Stack DNS console and choose Recursion Configurations > Data Synchronization > Link Change Messages to view the status of each cluster node.

The Link Change Messages tab displays the node status and the link change messages of the following node types:

Standalone node

Master node

Slave node
