Legal disclaimer

Alibaba Cloud reminds you to carefully read and fully understand the terms and conditions of this legal disclaimer before you read or use this document. If you have read or used this document, it shall be deemed as your total acceptance of this legal disclaimer.

1. You shall download and obtain this document from the Alibaba Cloud website or other Alibaba Cloud-authorized channels, and use this document for your own legal business activities only. The content of this document is considered confidential information of Alibaba Cloud. You shall strictly abide by the confidentiality obligations. No part of this document shall be disclosed or provided to any third party for use without the prior written consent of Alibaba Cloud.
2. No part of this document shall be excerpted, translated, reproduced, transmitted, or disseminated by any organization, company or individual in any form or by any means without the prior written consent of Alibaba Cloud.
3. The content of this document may be changed because of product version upgrade, adjustment, or other reasons. Alibaba Cloud reserves the right to modify the content of this document without notice and an updated version of this document will be released through Alibaba Cloud-authorized channels from time to time. You should pay attention to the version changes of this document as they occur and download and obtain the most up-to-date version of this document from Alibaba Cloud-authorized channels.
4. This document serves only as a reference guide for your use of Alibaba Cloud products and services. Alibaba Cloud provides this document based on the "status quo", "being defective", and "existing functions" of its products and services. Alibaba Cloud makes every effort to provide relevant operational guidance based on existing technologies. However, Alibaba Cloud hereby makes a clear statement that it in no way guarantees the accuracy, integrity, applicability, and reliability of the content of this document, either explicitly or implicitly. Alibaba Cloud shall not take legal responsibility for any errors or lost profits incurred by any organization, company, or individual arising from download, use, or trust in this document. Alibaba Cloud shall not, under any circumstances, take responsibility for any indirect, consequential, punitive, contingent, special, or punitive damages, including lost profits arising from the use or trust in this document (even if Alibaba Cloud has been notified of the possibility of such a loss).
5. By law, all the contents in Alibaba Cloud documents, including but not limited to pictures, architecture design, page layout, and text description, are intellectual property of Alibaba Cloud and/or its affiliates. This intellectual property includes, but is not limited to, trademark rights, patent rights, copyrights, and trade secrets. No part of this document shall be used, modified, reproduced, publicly transmitted, changed, disseminated, distributed, or published without the prior written consent of Alibaba Cloud and/or its affiliates. The names owned by Alibaba Cloud shall not be used, published, or reproduced for marketing, advertising, promotion, or other purposes without the prior written consent of Alibaba Cloud. The names owned by Alibaba Cloud include, but are not limited to, "Alibaba Cloud", "Aliyun", "HiChina", and other brands of Alibaba Cloud and/or its affiliates, which appear separately or in combination, as well as the auxiliary signs and patterns of the preceding brands, or anything similar to the company names, trade names, trademarks, product or service names, domain names, patterns, logos, marks, signs, or special descriptions that third parties identify as Alibaba Cloud and/or its affiliates.
6. Please directly contact Alibaba Cloud for any errors of this document.

Document conventions

Style	Description	Example
 Danger	A danger notice indicates a situation that will cause major system changes, faults, physical injuries, and other adverse results.	 Danger: Resetting will result in the loss of user configuration data.
 Warning	A warning notice indicates a situation that may cause major system changes, faults, physical injuries, and other adverse results.	 Warning: Restarting will cause business interruption. About 10 minutes are required to restart an instance.
 Notice	A caution notice indicates warning information, supplementary instructions, and other content that the user must understand.	 Notice: If the weight is set to 0, the server no longer receives new requests.
 Note	A note indicates supplemental instructions, best practices, tips, and other content.	 Note: You can use Ctrl + A to select all files.
>	Closing angle brackets are used to indicate a multi-level menu cascade.	Click Settings> Network> Set network type .
Bold	Bold formatting is used for buttons, menus, page names, and other UI elements.	Click OK .
Courier font	Courier font is used for commands	Run the <code>cd /d C:/window</code> command to enter the Windows system folder.
<i>Italic</i>	Italic formatting is used for parameters and variables.	<code>bae log list --instanceid</code> <i>Instance_ID</i>
[] or [a b]	This format is used for an optional value, where only one item can be selected.	<code>ipconfig [-all -t]</code>
{ } or {a b}	This format is used for a required value, where only one item can be selected.	<code>switch {active stand}</code>

Table of Contents

1.ASCM console	88
1.1. What is the ASCM console?	88
1.2. User roles and permissions	88
1.3. Log on to the ASCM console	89
1.4. Web page introduction	90
1.5. Initial configuration	91
1.5.1. Configuration description	91
1.5.2. Configuration process	92
1.6. Monitoring	93
1.6.1. View the workbench	93
1.6.2. CloudMonitor	94
1.6.2.1. Cloud Monitor overview	94
1.6.2.2. Metrics	94
1.6.2.3. View monitoring charts	107
1.6.3. Alerts	107
1.6.3.1. View alarm overview	107
1.6.3.2. Enable or disable alert notification	107
1.6.3.3. View alert logs	107
1.6.3.4. Alarm rules	108
1.6.3.4.1. Query alert rules	108
1.6.3.4.2. Create an alarm rule	108
1.6.3.4.3. Disable an alarm rule	110
1.6.3.4.4. Enable an alarm rule	110
1.6.3.4.5. Delete an alarm rule	110
1.7. Enterprise	111
1.7.1. Organizations	111

1.7.1.1. Create an organization	111
1.7.1.2. Query an organization	111
1.7.1.3. View organization information	111
1.7.1.4. Modify the name of an organization	111
1.7.1.5. Change organization ownership	112
1.7.1.6. Obtain the AccessKey pair of an organization	112
1.7.1.7. Delete an organization	113
1.7.2. Resource sets	113
1.7.2.1. Create a resource set	113
1.7.2.2. View the details of a resource set	113
1.7.2.3. Modify the name of a resource set	114
1.7.2.4. Add a member to a resource set	114
1.7.2.5. Add or remove a user group of a resource set	114
1.7.2.6. Delete a resource set	115
1.7.3. Roles	115
1.7.3.1. Create a custom role	115
1.7.3.2. View the details of a role	116
1.7.3.3. Modify custom role information	117
1.7.3.4. Copy a role	117
1.7.3.5. Disable a role	118
1.7.3.6. Enable a role	118
1.7.3.7. Delete a custom role	118
1.7.4. Users	119
1.7.4.1. System users	119
1.7.4.1.1. Create a user	119
1.7.4.1.2. Query a user	120
1.7.4.1.3. Modify user information	120
1.7.4.1.4. Change user roles	121

1.7.4.1.5. Modify the information of a user group	121
1.7.4.1.6. Modify a user logon policy	122
1.7.4.1.7. View the initial password of a user	122
1.7.4.1.8. Reset the password of a user	122
1.7.4.1.9. Disable and enable a user	123
1.7.4.1.10. Delete a user	123
1.7.4.2. Historical users	124
1.7.4.2.1. Query historical users	124
1.7.4.2.2. Restore historical users	124
1.7.5. Logon policies	124
1.7.5.1. Create a logon policy	124
1.7.5.2. Query a logon policy	126
1.7.5.3. Modify a logon policy	126
1.7.5.4. Disable a logon policy	126
1.7.5.5. Enable a logon policy	126
1.7.5.6. Delete a logon policy	127
1.7.6. User groups	127
1.7.6.1. Create a user group	127
1.7.6.2. Add users to a user group	128
1.7.6.3. Delete users from a user group	128
1.7.6.4. Add a role	129
1.7.6.5. Delete a role	129
1.7.6.6. Modify the name of a user group	130
1.7.6.7. Delete a user group	130
1.7.7. Resource pools	130
1.7.7.1. Update associations	130
1.7.8. Change ownership	130
1.8. Configurations	131

1.8.1. Password policies	131
1.8.2. Menus	131
1.8.2.1. Create a menu	131
1.8.2.2. Modify a menu	133
1.8.2.3. Delete a menu	133
1.8.2.4. Display or hide menus	134
1.8.3. Specifications	134
1.8.3.1. Specification parameters	134
1.8.3.2. Create specifications	138
1.8.3.3. View specifications	138
1.8.3.4. Disable specifications	138
1.8.3.5. Export specifications	139
1.8.3.6. View specifications of each resource type in previ...	139
1.8.4. Message center	139
1.8.4.1. View internal messages	139
1.8.4.2. Mark messages as read	140
1.8.5. Resource pool management	140
1.9. Operations	141
1.9.1. Quotas	141
1.9.1.1. Quota parameters	141
1.9.1.2. Set quotas for a cloud service	143
1.9.1.3. Modify quotas	144
1.9.1.4. Reset quotas	144
1.9.2. Usage statistics	145
1.9.2.1. View the usage statistics of cloud resources	145
1.10. Security	145
1.10.1. View operation logs	145
1.11. RAM	146

1.11.1. RAM introduction	146
1.11.2. Permission policy structure and syntax	146
1.11.3. RAM roles	149
1.11.3.1. View basic information about a RAM role	149
1.11.3.2. Create a RAM role	149
1.11.3.3. Add a permission policy	149
1.11.3.4. Modify the content of a RAM permission policy	150
1.11.3.5. Modify the name of a RAM permission policy	150
1.11.3.6. Add a RAM role to a user group	151
1.11.3.7. Grant permissions to a RAM role	151
1.11.3.8. Remove permissions from a RAM role	151
1.11.3.9. Modify a RAM role name	152
1.11.3.10. Delete a RAM role	152
1.11.4. RAM authorization policies	152
1.11.4.1. Create a RAM role	152
1.11.4.2. View the details of a RAM role	153
1.11.4.3. View RAM authorization policies	153
1.12. Personal information management	153
1.12.1. Modify personal information	153
1.12.2. Change your logon password	154
1.12.3. Switch the current role	154
1.12.4. View the AccessKey pair of your Apsara Stack tena...	155
2.Elastic Compute Service (ECS)	156
2.1. What is ECS?	156
2.1.1. Overview	156
2.1.2. Instance types	156
2.1.3. Instance lifecycle	172
2.2. Instructions	173

2.2.1. Restrictions	173
2.2.2. Suggestions	174
2.2.3. Limits	174
2.2.4. Notice for Windows users	174
2.2.5. Notice for Linux users	175
2.2.6. Notice on defense against DDoS attacks	175
2.3. Quick start	175
2.3.1. Overview	175
2.3.2. Log on to the ECS console	176
2.3.3. Create a security group	176
2.3.4. Create an instance	177
2.3.5. Connect to an instance	182
2.3.5.1. Instance connecting overview	182
2.3.5.2. Connect to a Linux instance by using SSH comm...	182
2.3.5.3. Connect to a Linux-based instance by using rem...	182
2.3.5.4. Connect to a Windows instance by using RDP	183
2.3.5.5. Connect to an ECS instance by using the VNC	184
2.4. Instances	185
2.4.1. Create an instance	185
2.4.2. Connect to an instance	189
2.4.2.1. Instance connecting overview	189
2.4.2.2. Connect to a Linux-based instance by using SSH ...	189
2.4.2.3. Connect to a Linux-based instance by using rem...	189
2.4.2.4. Connect to a Windows instance by using RDC	190
2.4.2.5. Install the certificate for VNC in Windows	191
2.4.2.6. Connect to an ECS instance by using the VNC	192
2.4.3. View instances	193
2.4.4. Modify an instance	194

2.4.5. Stop an instance	194
2.4.6. Start an instance	195
2.4.7. Restart an instance	195
2.4.8. Delete an instance	196
2.4.9. Change the instance type of an instance	196
2.4.10. Change an instance logon password	196
2.4.11. Change the VNC password	197
2.4.12. Add an ECS instance to a security group	197
2.4.13. Customize instance data	197
2.4.14. Modify a private IP address	200
2.4.15. Install the CUDA and GPU drivers for a Linux insta...	200
2.4.16. Install the CUDA and GPU drivers for a Windows in...	203
2.5. Disks	204
2.5.1. Create a disk	204
2.5.2. View disks	206
2.5.3. Roll back a disk	207
2.5.4. Modify the disk properties	208
2.5.5. Modify the disk description	208
2.5.6. Attach a disk	209
2.5.7. Partition and format disks	209
2.5.7.1. Format a data disk for a Linux instance	209
2.5.7.2. Format a data disk of a Windows instance	214
2.5.8. Expand a disk	215
2.5.9. Reinitialize a disk	216
2.5.10. Detach a data disk	216
2.5.11. Release a data disk	217
2.6. Images	217
2.6.1. Create a custom image	217

2.6.2. View images	218
2.6.3. View instances related to an image	218
2.6.4. Modify the description of a custom image	219
2.6.5. Share custom images	219
2.6.6. Import custom images	219
2.6.6.1. Limits on importing custom images	219
2.6.6.2. Convert the image file format	223
2.6.6.3. Import a custom image	224
2.6.7. Export a custom image	225
2.6.8. Delete a custom image	226
2.7. Snapshots	226
2.7.1. Create a snapshot	226
2.7.2. View snapshots	227
2.7.3. Delete a snapshot	228
2.8. Automatic snapshot policies	228
2.8.1. Create an automatic snapshot policy	228
2.8.2. View automatic snapshot policies	229
2.8.3. Modify an automatic snapshot policy	230
2.8.4. Configure an automatic snapshot policy	230
2.8.5. Configure an automatic snapshot policy for multiple...	230
2.8.6. Delete an automatic snapshot policy	231
2.9. Security groups	231
2.9.1. Create a security group	231
2.9.2. View security groups	233
2.9.3. Modify a security group	233
2.9.4. Add a security group rule	233
2.9.5. Clone a security group rule	235
2.9.6. Modify a security group rule	235

2.9.7. Export security group rules	236
2.9.8. Import security group rules	236
2.9.9. Add an instance	236
2.9.10. Remove instances from a security group	237
2.9.11. Delete a security group	237
2.10. Elastic Network Interfaces	237
2.10.1. Create an ENI	237
2.10.2. View ENIs	240
2.10.3. Modify a secondary ENI	240
2.10.4. Bind a secondary ENI to an instance	241
2.10.5. Unbind a secondary ENI from an instance	241
2.10.6. Delete a secondary ENI	242
2.11. Deployment sets	242
2.11.1. Create a deployment set	242
2.11.2. View deployment sets	243
2.11.3. Modify a deployment set	244
2.11.4. Delete a deployment set	244
2.12. Install FTP software	244
2.12.1. Overview	244
2.12.2. Install and configure vsftpd in CentOS	244
2.12.3. Install vsftpd in Ubuntu or Debian	245
2.12.4. Build an FTP site in Windows Server 2008	246
2.12.5. Build an FTP site in Windows Server 2012	247
3. Container Service for Kubernetes	248
3.1. What is Container Service?	248
3.2. Planning and preparation	248
3.3. Quick start	248
3.3.1. Flowchart	248

3.3.2. Log on to the Container Service for Kubernetes con...	249
3.3.3. Log on to the Container Registry console	249
3.3.4. Create a Kubernetes cluster	250
3.3.5. Create an application from an orchestration templat...	253
3.4. Kubernetes clusters	255
3.4.1. Authorizations	255
3.4.1.1. Assign RBAC permissions to a RAM user	255
3.4.2. Clusters	257
3.4.2.1. Create a Kubernetes cluster	257
3.4.2.2. View cluster logs	260
3.4.2.3. Connect to a cluster through kubectl	260
3.4.2.4. Connect to a master node by using SSH	261
3.4.2.5. Expand a cluster	262
3.4.2.6. Renew a certificate	262
3.4.2.7. Delete a cluster	263
3.4.2.8. View cluster overview	263
3.4.3. Nodes	264
3.4.3.1. Add an existing node	264
3.4.3.2. View nodes	266
3.4.3.3. Manage node labels	267
3.4.3.4. Set node schedulability	269
3.4.3.5. Remove a node	269
3.4.3.6. View node resource usage	271
3.4.3.7. Upgrade the NVIDIA driver on a GPU node	272
3.4.3.8. Create a Kubernetes cluster for GPU computing	275
3.4.3.9. Use labels to schedule pods to GPU nodes	280
3.4.3.10. Manually upgrade the kernel of a GPU node in...	284
3.4.4. Storage	287

3.4.4.1. Overview	287
3.4.4.2. Use Apsara Stack disks	288
3.4.4.3. Use NAS volumes	295
3.4.4.4. Use OSS volumes	303
3.4.4.5. Create a PVC	307
3.4.4.6. Use a PVC	309
3.4.5. Network management	310
3.4.5.1. Set access control for pods	310
3.4.5.2. Set bandwidth limits for pods	312
3.4.6. Namespaces	313
3.4.6.1. Create a namespace	313
3.4.6.2. Set resource quotas and limits	315
3.4.6.3. Edit a namespace	317
3.4.6.4. Delete a namespace	318
3.4.7. Applications	319
3.4.7.1. Create an application from an image	319
3.4.7.2. Create an application from an orchestration tem...	327
3.4.7.3. Create an application through Kubernetes Dashb...	330
3.4.7.4. Use commands to manage applications	332
3.4.7.5. Create a service	333
3.4.7.6. Scale a service	336
3.4.7.7. View a service	337
3.4.7.8. Update a service	338
3.4.7.9. Delete a service	340
3.4.7.10. Create a trigger on an application	340
3.4.7.11. View pods	342
3.4.7.12. Schedule pods to nodes	343
3.4.7.13. Simplify Kubernetes application deployment by u...	345

3.4.8. SLB and Ingress	350
3.4.8.1. Overview	350
3.4.8.2. Access a service through SLB	350
3.4.8.3. Configure ingress monitoring	354
3.4.8.4. Ingress support	357
3.4.8.5. Ingress configurations	363
3.4.8.6. Create an Ingress in the console	364
3.4.8.7. Update an ingress	371
3.4.8.8. Delete an ingress	371
3.4.9. Config maps and secrets	372
3.4.9.1. Create a ConfigMap	372
3.4.9.2. Use a ConfigMap in a Pod	373
3.4.9.3. Update a ConfigMap	378
3.4.9.4. Delete a ConfigMap	379
3.4.9.5. Create a secret	379
3.4.9.6. Edit a secret	380
3.4.9.7. Delete a secret	381
3.4.10. Templates	382
3.4.10.1. Create an orchestration template	382
3.4.10.2. Update an orchestration template	383
3.4.10.3. Save an orchestration template as a new one	384
3.4.10.4. Download an orchestration template	384
3.4.10.5. Delete an orchestration template	385
3.4.11. Images	385
3.4.11.1. Create an image repository	385
3.4.11.2. Create a namespace	387
3.4.11.3. Synchronize an image	388
3.4.11.4. Sign and verify an image	389

3.4.11.5. Synchronize images between instances	394
3.4.12. Create a batch release	394
3.4.13. Use Log Service to collect Kubernetes logs	397
4.Auto Scaling (ESS)	409
4.1. What is ESS?	409
4.2. Notes	410
4.2.1. Precautions	410
4.2.2. Manual intervention	411
4.2.3. Limits	412
4.2.4. Scaling group status	412
4.2.5. Scaling activity process	413
4.2.6. Remove unhealthy ECS instances	414
4.2.7. Instance rollback after a failed scaling activity	414
4.2.8. Instance lifecycle management	414
4.3. Quick start	415
4.3.1. Overview	415
4.3.2. Log on to the Auto Scaling console	415
4.3.3. Create a scaling group	416
4.3.4. Create a scaling configuration	418
4.3.5. Enable a scaling group	420
4.3.6. Create a scaling rule	421
4.3.7. Create a scheduled task	421
4.3.8. Create an event-triggered task	422
4.4. Scaling groups	424
4.4.1. Create a scaling group	424
4.4.2. Enable a scaling group	426
4.4.3. View scaling groups	426
4.4.4. Modify a scaling group	427

4.4.5. Disable a scaling group	427
4.4.6. Delete a scaling group	428
4.4.7. View ECS instances	428
4.4.8. Put an ECS instance into the Standby state	428
4.4.9. Remove an ECS instance from the Standby state	429
4.4.10. Put an ECS instance into the Protected state	429
4.4.11. Remove an ECS instance from the Protected state	430
4.5. Scaling configurations	430
4.5.1. Create a scaling configuration	430
4.5.2. View scaling configurations	432
4.5.3. Modify a scaling configuration	433
4.5.4. Apply a scaling configuration	433
4.5.5. Delete a scaling configuration	433
4.6. Scaling rules	434
4.6.1. Create a scaling rule	434
4.6.2. View scaling rules	434
4.6.3. Modify a scaling rule	435
4.6.4. Delete a scaling rule	435
4.7. Scaling tasks	435
4.7.1. Manually execute a scaling rule	435
4.7.2. Manually add an ECS instance	436
4.7.3. Manually remove an ECS instance	437
4.8. Scheduled tasks	437
4.8.1. Create a scheduled task	437
4.8.2. View scheduled tasks	438

17. ApsaraDB for MongoDB	1490
17.1. Before you start	1490
17.2. Log on to the ApsaraDB for MongoDB console	1490
17.3. Quick start	1491
17.3.1. Use ApsaraDB for MongoDB	1491
17.3.2. Create an ApsaraDB for MongoDB instance	1491
17.3.3. Configure a whitelist for an ApsaraDB for MongoDB...	1493
17.3.4. Overview of replica set instance connections	1494
17.3.5. Use the mongo shell to connect to a replica set in...	1495
17.4. Instances	1496
17.4.1. Create an ApsaraDB for MongoDB instance	1496
17.4.2. View the details of an ApsaraDB for MongoDB insta...	1498
17.4.3. Restart an ApsaraDB for MongoDB instance	1498
17.4.4. Change the specifications of an ApsaraDB for Mong...	1499

17.4.5. Change the name of an ApsaraDB for MongoDB in...	1499
17.4.6. Reset the password for an ApsaraDB for MongoDB ...	1500
17.4.7. Release an ApsaraDB for MongoDB instance	1500
17.4.8. Back up an ApsaraDB for MongoDB instance	1501
17.4.8.1. Configure automatic backup for an ApsaraDB for...	1501
17.4.8.2. Manually back up an ApsaraDB for MongoDB in...	1501
17.4.9. Monitoring	1502
17.5. Database connection	1504
17.5.1. Use the mongo shell to connect to a replica set ins...	1504
17.5.2. Use DMS to log on to a replica set instance of Aps...	1505
17.5.3. Overview of replica set instance connections	1506
17.6. Security and audit	1507
17.6.1. Configure a whitelist for an ApsaraDB for MongoDB...	1507
17.6.2. Add or delete a whitelist	1508
17.6.3. Audit logs	1509
17.6.4. Configure SSL encryption	1510
17.6.5. Configure TDE	1511
17.6.6. Use the mongo shell to connect to an ApsaraDB fo...	1513
17.7. CloudDBA	1514
17.7.1. Authorize DAS to manage ApsaraDB for MongoDB in...	1514
17.7.2. Performance trends	1514
17.7.3. Real-time performance	1514
17.7.4. Instance sessions	1516
17.7.5. Capacity analysis	1517
17.7.6. Slow query logs	1519
18. ApsaraDB for OceanBase	1521
18.1. What is ApsaraDB for OceanBase?	1521
18.2. Quick start	1521

18.2.1. Overview	1521
18.2.2. Log on to the Apsara Stack Operations console for...	1522
18.2.3. Log on to the ApsaraDB for OceanBase console	1523
18.2.4. Add ApsaraDB for OceanBase RPM packages	1524
18.2.5. Add OBProxy RPM packages	1524
18.2.6. Install the OBProxy	1524
18.2.7. Create clusters	1525
18.2.8. Create instances	1525
18.3. Clusters	1526
18.3.1. Overview	1527
18.3.2. Scale out clusters online	1527
18.3.3. Restart clusters	1527
18.3.4. Delete clusters	1527
18.3.5. Upgrade clusters	1527
18.3.6. View the monitoring information about clusters	1528
18.3.7. View the real-time monitoring information about cl...	1528
18.3.8. View performance metrics	1528
18.4. Instances	1529
18.4.1. Overview	1529
18.4.2. Change instance passwords	1529
18.4.3. View instance details	1529
18.4.4. Change instance specifications	1530
18.4.5. Delete instances	1530
18.4.6. View the performance metrics of instances	1530
18.5. SQL syntax reference	1530
18.5.1. Introduction to ApsaraDB for OceanBase SQL	1530
18.5.2. Overview of ApsaraDB for OceanBase SQL	1531
18.5.2.1. Identifiers	1531

18.5.2.2. Supported SQL statements	1533
18.5.2.3. SQL limits	1533
18.5.3. Partitions	1534
18.5.3.1. Overview	1534
18.5.3.2. Range partitioning	1535
18.5.3.3. Hash partitioning	1539
18.5.3.4. Key partitioning	1540
18.5.3.5. Subpartitioning	1540
18.5.3.6. Handle NULL values	1544
18.5.4. Data types	1545
18.5.4.1. Overview	1545
18.5.4.2. Numeric types	1546
18.5.4.3. String types	1551
18.5.4.4. Date and time data types	1552
18.5.5. Character sets	1557
18.5.6. Auto-increment fields	1558
18.5.6.1. Overview	1558
18.5.6.2. System variables for auto-increment columns	1560
18.5.6.3. Change start values of auto-increment columns	1563
18.5.6.4. LAST_INSERT_ID() function	1564
18.5.6.5. Limits	1565
18.5.7. Functions	1565
18.5.7.1. Overview	1565
18.5.7.2. Date and time functions	1567
18.5.7.3. String functions	1584
18.5.7.4. Type conversion functions	1597
18.5.7.5. Aggregate functions	1598
18.5.7.6. Mathematical functions	1603

18.5.7.7. Comparison functions	1610
18.5.7.8. Flow control functions	1612
18.5.7.9. Information functions	1614
18.5.7.10. Other functions	1616
18.5.7.11. Full-text search functions	1618
18.5.8. Operators and precedences	1619
18.5.8.1. Overview	1619
18.5.8.2. Logical operators	1619
18.5.8.3. Arithmetic operators	1621
18.5.8.4. Comparison operators	1622
18.5.8.5. Vector comparison operators	1626
18.5.8.6. Bitwise operators	1628
18.5.8.7. Operator precedences	1629
18.5.9. Escape characters	1630
18.5.10. DDL statements	1631
18.5.10.1. Overview	1631
18.5.10.2. CREATE DATABASE	1631
18.5.10.3. ALTER_DATABASE	1632
18.5.10.4. DROP DATABASE	1633
18.5.10.5. CREATE TABLE	1633
18.5.10.6. ALTER TABLE	1638
18.5.10.7. DROP TABLE	1644
18.5.10.8. CREATE INDEX	1644
18.5.10.9. DROP INDEX	1647
18.5.10.10. CREATE VIEW	1648
18.5.10.11. DROP VIEW	1649
18.5.10.12. ALTER VIEW	1649
18.5.10.13. TRUNCATE TABLE	1649

18.5.10.14. RENAME TABLE	1650
18.5.10.15. CREATE SYNONYM	1650
18.5.10.16. DROP SYNONYM	1651
18.5.11. DML statements	1651
18.5.11.1. Overview	1651
18.5.11.2. INSERT	1652
18.5.11.3. REPLACE	1658
18.5.11.4. UPDATE	1660
18.5.11.5. DELETE	1663
18.5.11.6. SELECT	1664
18.5.12. Transaction language	1669
18.5.13. Database management language	1670
18.5.13.1. CREATE RESOURCE UNIT	1670
18.5.13.2. ALTER RESOURCE UNIT	1671
18.5.13.3. DROP RESOURCE UNIT	1672
18.5.13.4. CREATE RESOURCE POOL	1672
18.5.13.5. ALTER RESOURCE POOL	1672
18.5.13.6. DROP RESOURCE POOL	1673
18.5.13.7. CREATE TENANT	1673
18.5.13.8. ALTER TENANT	1674
18.5.13.9. Lock or unlock a tenant	1675
18.5.13.10. DROP TENANT	1675
18.5.13.11. CREATE TABLEGROUP	1676
18.5.13.12. DROP TABLEGROUP	1676

19.5.4. Manage change tracking tasks	1926
19.5.4.1. Modify the consumption checkpoint	1926
19.5.4.2. Modify the objects for change tracking	1927
19.5.4.3. Create a consumer group	1928
19.5.4.4. Manage consumer groups	1928
19.5.5. Use the SDK to consume tracked data	1929
19.5.5.1. Methods provided by SDK	1929
19.5.5.2. Quick start	1933
19.5.5.3. Parse tracked SQL statements	1935
19.5.5.4. Run the SDK demo code	1939
19.5.6. Use a Kafka client to consume tracked data	1940
20.Data Management (DMS)	1945
20.1. What is Data Management?	1945
20.2. Log on to an ApsaraDB for RDS instance by using DMS	1946
20.3. SQL operations	1946
20.3.1. Use the command window	1946
20.3.2. Use the SQL window	1948
20.3.2.1. Open an empty SQL window	1948
20.3.2.2. Restore a saved SQL window	1954
20.3.2.3. Manage common SQL statements	1955
20.3.2.4. Use the SQL template	1956
20.3.3. Table operations (based on the Table directory tre...	1956
20.3.3.1. Open a table-based SQL window	1956
20.3.3.2. Edit table data	1956
20.4. Database development	1957
20.4.1. Overview	1957
20.4.2. Table	1957

20.4.2.1. Create a table	1957
20.4.2.2. Edit a table	1958
20.4.2.3. Delete a table	1958
20.4.2.4. Duplicate a table	1959
20.4.2.5. Generate SQL statement templates	1959
20.4.2.6. Query table information	1959
20.4.2.7. Clear data	1960
20.4.2.8. Perform operations on multiple tables	1960
20.4.2.9. Maintain a table	1960
20.4.3. Manage indexes	1961
20.4.4. Manage foreign keys	1962
20.4.5. Create a partition	1962
20.4.6. Create a stored procedure	1962
20.4.7. Create a function	1963
20.4.8. Create a view	1964
20.4.9. Create a trigger	1964
20.4.10. Create an event	1966
20.5. Data processing	1967
20.5.1. Import data	1967
20.5.2. Export data	1968
20.5.2.1. Export a database	1968
20.5.2.2. Export an SQL result set	1968
20.6. Performance	1969
20.6.1. Lock wait	1969
20.6.1.1. View sessions in the lock wait state	1969
20.6.1.2. Terminate a session in the lock wait state	1969
20.7. Extended tools	1970
20.7.1. View statistics on table data volumes	1970

20.7.2. View ER diagrams	1970
21. Server Load Balancer (SLB)	1972
21.1. What is SLB?	1972
21.2. Log on to the SLB console	1973
21.3. Quick start	1973
21.3.1. Overview	1973
21.3.2. Before you begin	1974
21.3.3. Create an SLB instance	1976
21.3.4. Configure an SLB instance	1976
21.3.5. Release an SLB instance	1978
21.4. SLB instances	1978
21.4.1. SLB instance overview	1978
21.4.2. Create an SLB instance	1980
21.4.3. Start and stop an SLB instance	1981
21.4.4. Tags	1982
21.4.4.1. Tag overview	1982
21.4.4.2. Add tags	1982
21.4.4.3. Query SLB instances by tag	1983
21.4.4.4. Remove tags	1983
21.4.5. Release an SLB instance	1984
21.5. Listeners	1985
21.5.1. Listener overview	1985
21.5.2. Add a TCP listener	1985
21.5.3. Add a UDP listener	1988
21.5.4. Add an HTTP listener	1990
21.5.5. Add an HTTPS listener	1993
21.5.6. Enable access control	1997
21.5.7. Disable access control	1998

21.6. Backend servers	1998
21.6.1. Backend server overview	1998
21.6.2. Default server groups	1999
21.6.2.1. Add ECS instances to the default server group	1999
21.6.2.2. Add IDC servers to the default server group	2000
21.6.2.3. Change the weight of a backend server	2002
21.6.2.4. Remove a backend server	2002
21.6.3. VServer groups	2002
21.6.3.1. Add ECS instances to a VServer group	2002
21.6.3.2. Add IDC servers to a VServer group	2003
21.6.3.3. Modify a VServer group	2004
21.6.3.4. Delete a VServer group	2005
21.6.4. Active/standby server groups	2005
21.6.4.1. Add ECS instances to a primary/secondary serve...	2005
21.6.4.2. Add IDC servers to a primary/secondary server ...	2008
21.6.4.3. Delete a primary/secondary server group	2010
21.7. Health check	2010
21.7.1. Health check overview	2011
21.7.2. Configure health check	2018
21.7.3. Disable the health check feature	2020
21.8. Certificate management	2020
21.8.1. Certificate overview	2020
21.8.2. Certificate requirements	2021
21.8.3. Upload a certificate	2023
21.8.4. Generate a CA certificate	2024
21.8.5. Convert the certificate format	2027
21.8.6. Replace a certificate	2028
22.Virtual Private Cloud (VPC)	2029

22.1. What is a VPC?	2029
22.2. Log on to the VPC console	2030
22.3. Quick start	2030
22.3.1. Plan and design a VPC	2030
22.3.2. Create an IPv4 VPC	2033
22.3.3. Create an IPv6 VPC	2036
22.4. VPCs and VSwitches	2040
22.4.1. Overview	2040
22.4.2. VPC management	2042
22.4.2.1. Create a VPC	2042
22.4.2.2. Modify the name and description of a VPC	2044
22.4.2.3. Delete a VPC	2044
22.4.3. VSwitch management	2044
22.4.3.1. Create a VSwitch	2044
22.4.3.2. Create cloud resources in a VSwitch	2046
22.4.3.3. Modify the name and description of a VSwitch	2046
22.4.3.4. Delete a VSwitch	2046
22.5. Route tables	2047
22.5.1. Overview	2047
22.5.2. Add a custom route entry	2051
22.5.3. Export route entries	2052
22.5.4. Modify a route table	2053
22.5.5. Delete a custom route entry	2053
22.6. HAVIPs	2053
22.6.1. Overview	2053
22.6.2. Create an HAVIP	2055
22.6.3. Associate an HAVIP with an ECS instance	2056
22.6.4. Associate an HAVIP with an EIP	2057

22.6.5. Disassociate an HAVIP from an ECS instance	2057
22.6.6. Disassociate an EIP from an HAVIP	2058
22.6.7. Delete an HAVIP	2058
23. IPv6 Gateway	2059
23.1. What is an IPv6 Gateway?	2059
23.2. Log on to the IPv6 Gateway console	2060
23.3. Quick start	2061
23.3.1. Create an IPv6 VPC	2061
23.4. Enable IPv6 for VPCs	2065
23.4.1. Create an IPv4 and IPv6 dual-stack VPC	2065
23.4.2. Enable an IPv6 CIDR block for a VPC network	2066
23.5. Enable IPv6 for VSwitches	2066
23.5.1. Create an IPv4 and IPv6 dual-stack VSwitch	2066
23.5.2. Enable IPv6 for a VSwitch	2068
23.6. Manage IPv6 Gateways	2068
23.6.1. Editions of IPv6 gateways	2068
23.6.2. Create an IPv6 gateway	2069
23.6.3. Modify an IPv6 gateway	2070
23.6.4. Delete an IPv6 gateway	2070
23.7. Manage IPv6 Internet bandwidth	2070
23.7.1. Enable Internet connectivity for an IPv6 address	2070
23.7.2. Modify the maximum bandwidth of an IPv6 address	2071
23.7.3. Disable Internet connectivity for an IPv6 address	2071
23.8. Manage egress-only rules	2072
23.8.1. Create an egress-only rule	2072
23.8.2. Delete an egress-only rule	2072
24. NAT Gateway	2073
24.1. What is NAT Gateway?	2073

24.2. Log on to the NAT Gateway console	2073
24.3. Quick Start	2074
24.3.1. Overview	2074
24.3.2. Create a NAT gateway	2075
24.3.3. Associate an EIP with the a NAT gateway	2076
24.3.4. Create a DNAT entry	2076
24.3.5. Create an SNAT entry	2077
24.4. Manage a NAT gateway	2079
24.4.1. Sizes of NAT gateways	2079
24.4.2. Create a NAT gateway	2080
24.4.3. Modify a NAT gateway	2081
24.4.4. Delete a NAT gateway	2081
24.5. Manage EIPs	2081
24.5.1. Associate an EIP with a NAT gateway	2081
24.5.2. Disassociate an EIP from a NAT gateway	2082
24.6. Manage a DNAT table	2082
24.6.1. DNAT table overview	2082
24.6.2. Create a DNAT entry	2083
24.6.3. Modify a DNAT entry	2084
24.6.4. Delete a DNAT entry	2085
24.7. Manage an SNAT table	2085
24.7.1. SNAT table overview	2085
24.7.2. Create an SNAT entry	2085
24.7.3. Modify an SNAT entry	2087
24.7.4. Delete a SNAT entry	2087
24.8. NAT service plan	2088
24.8.1. Create a NAT service plan	2088
24.8.2. Modify the bandwidth of a NAT service plan	2088

24.8.3. Add an IP address	2089
24.8.4. Release an IP address	2089
24.8.5. Delete a NAT service plan	2089
24.9. Anti-DDoS Basic	2090
25.VPN Gateway	2091
25.1. What is VPN Gateway?	2091
25.2. Log on to the VPN Gateway console	2091
25.3. Get started with IPsec-VPN	2092
25.3.1. Connect on-premises data centers to VPC networks	2092
25.4. Get started with SSL-VPN	2095
25.4.1. Initiate a connection from a Linux client	2095
25.4.2. Initiate a connection from a Windows client	2098
25.4.3. Initiate a connection from a macOS client	2100
25.5. Manage a VPN Gateway	2103
25.5.1. Create a VPN gateway	2103
25.5.2. Modify a VPN gateway	2104
25.5.3. Configure routes of a VPN Gateway	2104
25.5.3.1. VPN Gateway route overview	2104
25.5.3.2. Add a policy-based route entry	2105
25.5.3.3. Add a destination-based route entry	2105
25.5.4. Delete a VPN gateway	2106
25.6. Manage a customer gateway	2106
25.6.1. Create a customer gateway	2106
25.6.2. Modify a customer gateway	2107
25.6.3. Delete a customer gateway	2108
25.7. Configure SSL-VPN	2108
25.7.1. Configuration overview	2108
25.7.2. Manage an SSL server	2109

25.7.2.1. Create an SSL Server	2109
25.7.2.2. Modify an SSL server	2110
25.7.2.3. Configure a routing group	2110
25.7.2.4. Delete an SSL server	2112
25.7.3. Manage an SSL client certificate	2112
25.7.3.1. Create an SSL client certificate	2112
25.7.3.2. Download an SSL client certificate	2113
25.7.3.3. Delete an SSL client certificate	2113
25.8. Configure IPsec-VPN connections	2113
25.8.1. Configuration overview	2113
25.8.2. Manage an IPsec-VPN connection	2114
25.8.2.1. Create an IPsec-VPN connection	2114
25.8.2.2. Modify an IPsec-VPN connection	2116
25.8.2.3. Download the configuration file of an IPsec-VP...	2117
25.8.2.4. Configure a routing group	2117
25.8.2.5. View IPsec-VPN connection logs	2118
25.8.2.6. Delete an IPsec-VPN connection	2119
25.8.3. MTU notes	2119
26.Elastic IP Address	2120
26.1. What is an EIP?	2120
26.2. Log on to the EIP console	2120
26.3. Quick start	2121
26.3.1. Tutorial overview	2121
26.3.2. Create a EIP	2121
26.3.3. Associate an EIP with an ECS instance	2122
26.3.4. Disassociate an EIP from a cloud resource	2123
26.3.5. Release an EIP	2123
26.4. Manage EIPs	2123

26.4.1. Create a EIP	2123
26.4.2. Bind an EIP to a cloud instance	2124
26.4.2.1. Associate an EIP with an ECS instance	2124
26.4.2.2. Associate an EIP with an SLB instance	2125
26.4.2.3. Associate an EIP with an HAVIP	2125
26.4.2.4. Associate an EIP with a NAT gateway	2126
26.4.2.5. Bind an EIP to a secondary ENI	2126

1.ASCM console

1.1. What is the ASCM console?

The Apsara Stack Cloud Management (ASCM) console is a service capability platform based on the Alibaba Cloud Apsara Stack platform and designed for government and enterprise customers. This platform improves IT management and troubleshooting and is dedicated to providing a leading service capability platform of the cloud computing industry. It provides large-scale and cost-efficient end-to-end cloud computing and big data services for customers in industries such as government, education, healthcare, finance, and enterprise.

Overview

The ASCM console simplifies the management and deployment of physical and virtual resources by building an Apsara Stack platform that supports various business types of government and enterprise customers. The console helps you build your business systems in a simple and quick manner, fully improve resource utilization, and reduce O&M costs, allowing you to shift your focus from O&M to business. The console brings the Internet economy model to government and enterprise customers, and builds a new ecosystem chain based on cloud computing.

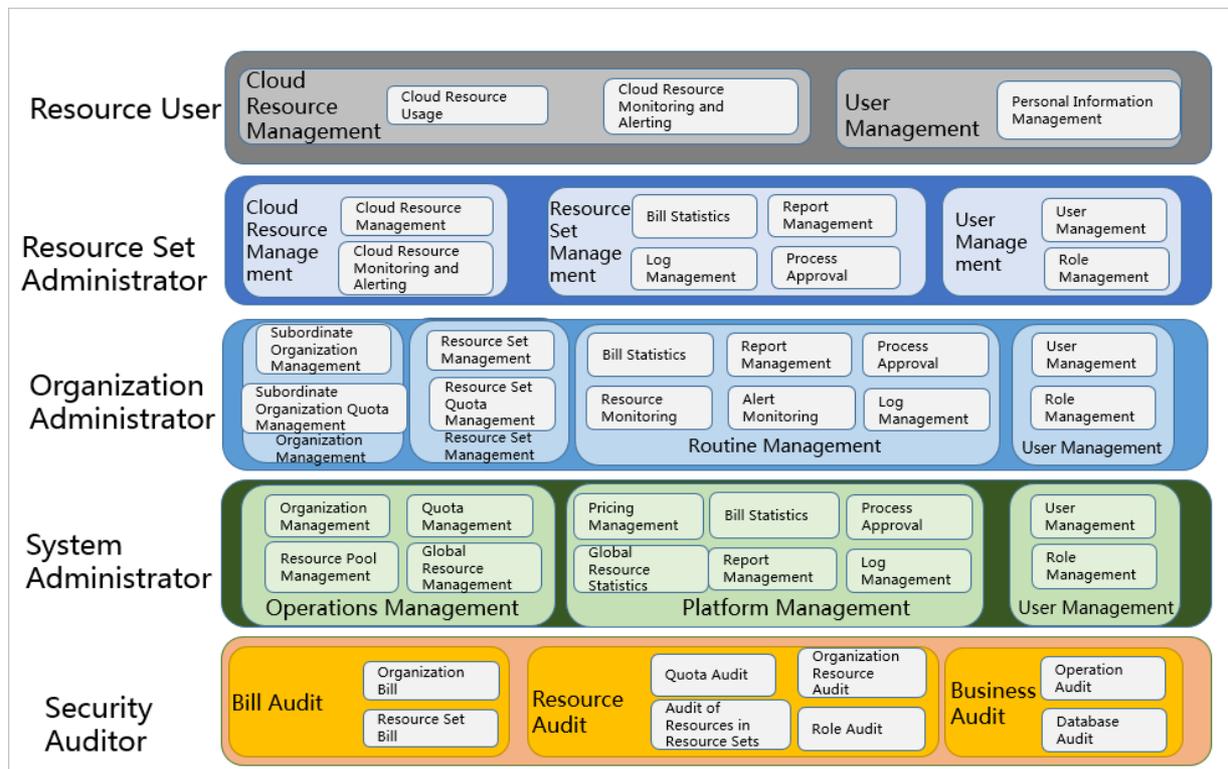

Workflow

ASCM console operations are divided into the following parts:

1. System initialization: This part is designed to complete basic system configurations, such as creating organizations, resource sets, and users, creating basic resources such as VPCs, and creating contacts and contact groups in CloudMonitor.
2. Cloud resource creation: This part is designed to create resources as needed.
3. Cloud resource management: This part is designed to complete resource management operations, such as starting, using, and releasing resources and changing resource configurations.

1.2. User roles and permissions

This topic describes roles and their permissions.

Roles and permissions

Role	Permission
Resource user	This role has the permissions to view and modify resources in a resource set and create alert rules.
Resource set administrator	This role has the permissions to create, modify, and delete resources in a resource set and manage the users of the resource set.
Organization administrator	This role has the permissions to manage an organization and its subordinate organizations, create, modify, and delete the resources of organizations, create and view alert rules for resources, and export reports.
Operations administrator	This role has read and write permissions on all resources.
Security auditor	This role performs security audit on the ASCM console and has the read-only permissions on operation logs of the ASCM console.
Platform administrator	This role has the permissions to initialize the system and create operations administrators.
Resource auditor	This role has the read-only permissions on all resources in the ASCM console.
Organization security administrator	This role manages the security of an organization, including the security of hosts, applications, and networks. This role has the read-only permissions on operation logs of the ASCM console and read and write permissions on cloud databases, ECS instances, and Apsara Stack Security.
Security system configuration administrator	This role configures system security features such as the upgrade center and global configurations. This role has read and write permissions on the upgrade, protection, and configuration features of Apsara Stack Security.
Global organization security administrator	This role manages the security of global tenants by using Cloud Security Operation Center (SOC). This role has read and write permissions on all features of Apsara Stack Security.
Platform security administrator	This role manages the security of the ASCM console by using SOC.
Global organization security auditor	This role checks the security conditions of all organizations by using SOC. This role has the read-only permissions on operation logs of the ASCM console and all features of Apsara Stack Security.
Platform security auditor	This role checks the security conditions of the ASCM console by using SOC. This role has the read-only permissions on operation logs of the ASCM console, Server Guard, Cloud Firewall, Sensitive Data Discovery and Protection, SOC, system configurations, and Web Application Firewall (WAF) configurations as well as read and write permissions on Anti-DDoS, Threat Detection, and Update Center of Apsara Stack Security.
Platform Security Configuration Administrator	This role configures and has read and write permissions on security services in the ASCM console, such as Server Guard and WAF.
Organization resource auditor	This role has the read-only permissions on all resources in an organization to which it belongs.

1.3. Log on to the ASCM console

This topic describes how to log on to the Apsara Stack Cloud Management (ASCM) console.

Prerequisites

- The domain name of the ASCM console is obtained from the deployment personnel before you log on to the ASCM console.
- A browser is available. We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL used to log on to the ASCM console. Press the Enter key.
2. Enter your username and password.

Obtain the username and password used to log on to the console from the operations administrator.

Note When you log on to the ASCM console for the first time, you must change the password of your username. For security reasons, your password must meet the minimum complexity requirements. The password must be 8 to 20 characters in length and must contain at least two of the following character types:

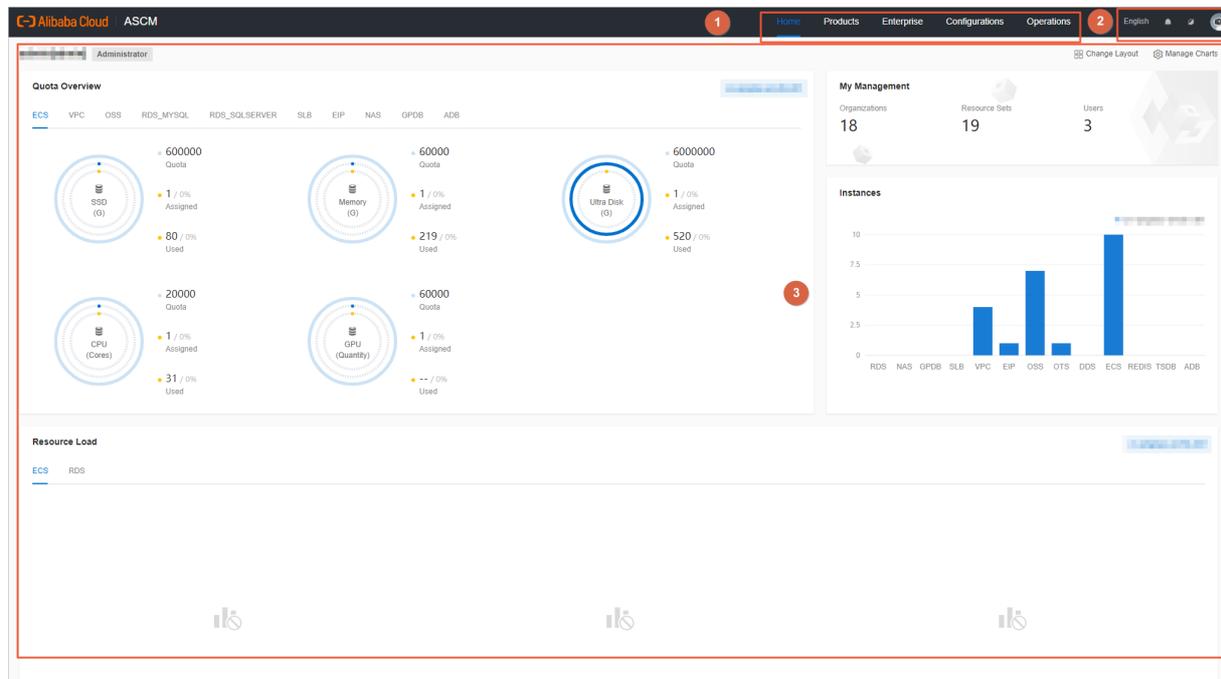

- Uppercase or lowercase letters.
- Digits.
- Special characters. Special characters include exclamation points (!), at signs (@), number signs (#), dollar signs (\$), and percent signs (%).

3. Click Login to go to the ASCM console homepage.

1.4. Web page introduction

The web page of the ASCM console consists of the top navigation bar, information section of the current logon user, and operation section.

ASCM console page

Functional sections of the web page

Section		Description
1	Top navigation bar	<p>This section includes the following modules:</p> <ul style="list-style-type: none"> • Home: uses charts to display the usage and monitoring data of existing system resources in each region. • Products: manages all types of basic cloud services and resources. • Enterprise: manages organizations, resource sets, roles, users, logon policies, user groups, ownership, and resource pools. • Configurations: manages resource pools, password policies, specifications, menus, and RAM roles. • Operations: manages the daily operations of cloud resources, including usage statistics and quotas. • Security: provides operation logs and system logs.
2	Information section of the current logon user	<ul style="list-style-type: none"> •  English: allows you to switch between English, simplified Chinese, and traditional Chinese. • : provides message notifications. • : allows you to switch between day and night mode. • User Information: Click the  icon of the current logon user. The User Information and Exit menu items are displayed. On the User Information page, you can perform the following operations: <ul style="list-style-type: none"> ◦ View basic information. ◦ Modify personal information. ◦ Change the logon password. ◦ View the AccessKey pair of your Apsara Stack tenant account. ◦ Switch the current role. ◦ Enable or disable alert notification.
3	Operation section	<p>Operation section: the information display and operation section.</p>

1.5. Initial configuration

1.5.1. Configuration description

Before you use the ASCM console, you must complete a series of basic configuration operations as an administrator, such as creating organizations, resource sets, users, and roles and initializing resources. This is the initial system configuration.

Based on the service-oriented principle, the ASCM console manages the organizations, resource sets, users, and roles of cloud data centers in a centralized manner to grant different resource access permissions to different users.

- **Organization**

After the ASCM console is deployed, a root organization is automatically generated. You can create other organizations under the root organization.

Organizations are displayed in a hierarchical structure. You can create subordinate organizations under each organization level.

- Resource set

A resource set is a container used to store resources. Each resource must belong to a resource set.

- User

A user is a resource manager and user.

- User group

A role is a set of access permissions. You can assign different roles to different users to meet different requirements for system access control.

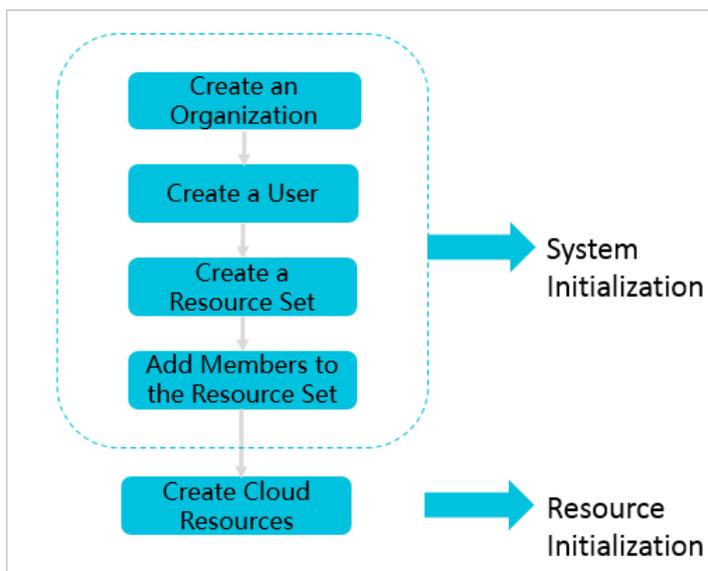

The following table describes the relationships among organizations, resource sets, users, roles, and cloud resources.

Relationship between two items	Relationship type	Description
Organization and resource set	One-to-many	An organization can have multiple resource sets, but each resource set can belong to only a single organization.
Organization and user	One-to-many	An organization can have multiple users, but each user can belong to only a single organization.
Resource set and user	Many-to-many	A user can have multiple resource sets, and a resource set can be assigned to multiple users under the same level-1 organization.
User and role	Many-to-many	A user can have multiple roles, and a role can be assigned to multiple users.
Resource set and resource	One-to-many	A resource set can have multiple resources, but each cloud resource can belong to only a single resource set.

1.5.2. Configuration process

This topic describes the initial configuration process.

Before using the Apsara Stack Cloud Management (ASCM) console, you must complete the initial system configurations as an administrator according to the process shown in the following figure.

1. **Create an organization**

Create an organization to store resource sets and their resources.

2. **Create a user**

Create a user and assign the user different roles to meet different requirements for system access control.

3. **Create a resource set**

Create a resource set before you apply for resources.

4. **Add a member to a resource set**

Add members to the resource set.

5. **Create cloud resources**

Create instances in each service console based on project requirements. For more information about how to create cloud service instances, see the user guide of each cloud service.

1.6. Monitoring

1.6.1. View the workbench

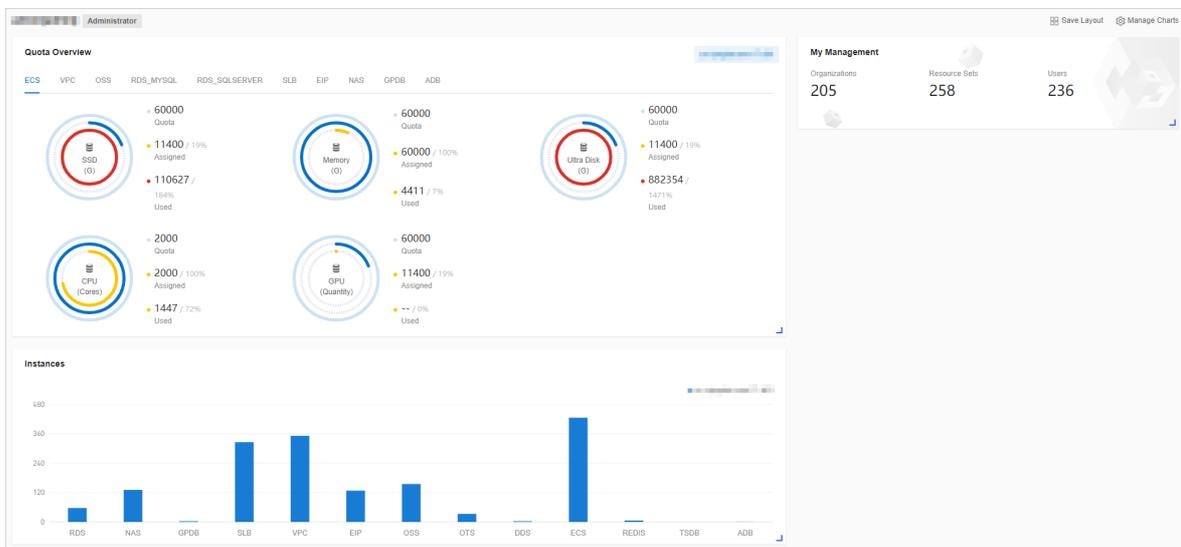

The ASCM console uses charts to keep you up to date on the current usage of resources.

Context

Note The resource types displayed may vary by region type. See your dashboard for available resource types.

Procedure

1. **Log on to the ASCM console.**By default, the workbench page appears when you log on to the ASCM console. To return to the workbench page from other pages, click Home in the top navigation bar.

2. On the **workbench** page, you can view the instance summary information for all regions of the Apsara Stack environment.

You can click **Manage Charts** in the upper-right corner of the page to select all or individual modules to view relevant information. You can also click **Change Layout** in the upper-right corner of the page and drag a specific module to the target location.

- o **Quota Overview**

Shows the usage and quotas of Elastic Compute Service (ECS), ApsaraDB for RDS, Object Storage Service (OSS), and Server Load Balancer (SLB) resources.

- o **Instances**

Shows the numbers of ECS instances, ApsaraDB for RDS instances, SLB instances, and OSS buckets in each region.

- **Instance Trends**

Shows the numbers of ECS instances, ApsaraDB for RDS instances, SLB instances, and OSS buckets for the last five days.

- **Resource Load**

Shows the top five ECS and ApsaraDB for RDS instances in terms of CPU, memory, and disk usage.

- **Alert Rules**

Shows the number of alerts and details of the alerts.

- **Instances by Resource Set**

Displays the number of instances in all resource sets.

- **My Management**

Shows the numbers of organizations, resource sets, and users.

1.6.2. CloudMonitor

1.6.2.1. Cloud Monitor overview

Cloud Monitor provides real-time monitoring, alerting, and notification services for resources to protect your services and businesses.

Cloud Monitor can monitor metrics for a variety of services such as ECS, ApsaraDB for RDS, SLB, OSS, KVStore for Redis, VPN Gateway, AnalyticDB for PostgreSQL, ApsaraDB for MongoDB, EIP, and API Gateway.

You can use the metrics of cloud services to configure alert rules and notification policies. This way, you can stay up to date on the running status and performance of your service instances and scale resources in a timely manner when resources are insufficient.

1.6.2.2. Metrics

This topic describes the metrics available for each service.

Cloud Monitor checks the availability of services based on their metrics. You can configure alert rules and notification policies for these metrics to stay up to date on the running status and performance of monitored service instances.

Cloud Monitor can monitor resources of other services, including Elastic Compute Service (ECS), ApsaraDB for RDS, Server Load Balancer (SLB), Object Storage Service (OSS), KVStore for Redis, VPN Gateway, AnalyticDB for PostgreSQL, ApsaraDB for MongoDB, Elastic IP Address (EIP), and API Gateway. The following tables list the metrics for each service.

Operating system metrics for ECS

Metric	Description	Unit
Host.cpu.total	The CPU utilization of an ECS instance.	%
Host.mem.usedutilization	The memory usage of an ECS instance.	%
Host.load1	The system loads over the last one minute. This metric is not available for Windows operating systems.	N/A

Metric	Description	Unit
Host.load5	The system loads over the last five minutes. This metric is not available for Windows operating systems.	N/A
Host.load15	The system loads over the last 15 minutes. This metric is not available for Windows operating systems.	N/A
Host.disk.utilization	The disk usage of an ECS instance.	%
Host.disk.readbytes	The number of bytes read from the disk per second.	byte/s
Host.disk.writebytes	The number of bytes written to the disk per second.	byte/s
Host.disk.readlops	The number of read requests received by the disk per second.	count/s
Host.disk.writelops	The number of write requests received by the disk per second.	count/s
Host.fs.inode	The inode usage.	%

Basic metrics for ECS

Metric	Description	Unit
CPU utilization	The CPU utilization of an ECS instance.	%
Inbound bandwidth to the Internet	The average rate of inbound traffic to the Internet.	bit/s
Inbound bandwidth to the internal network	The average rate of inbound traffic to the internal network.	bit/s
Outbound bandwidth from the Internet	The average rate of outbound traffic from the Internet.	bit/s
Outbound bandwidth from the internal network	The average rate of outbound bandwidth from the internal network.	bit/s
System disk BPS	The number of bytes read from and written to the system disk per second.	byte/s
System disk IOPS	The number of reads from and writes to the system disk per second.	count/s
Advance CPU credits	The changes in advance CPU credits. Advance CPU credits can be used only when the unlimited mode is enabled.	N/A
CPU credit consumption	The changes in CPU credit consumption. Consumption trends are consistent with CPU utilization.	N/A

Metric	Description	Unit
Overdrawn CPU credits	The changes in overdrawn CPU credits. Overdrawn CPU credits can be used only when the unlimited mode is enabled.	N/A
CPU credit balance	The changes in CPU credit balance. The CPU credit balance is used to maintain CPU credit usage.	N/A

 **Note**

For ECS instances, you must install a monitoring plug-in to collect metric data at the operating system level.

Installation method: On the **CloudMonitor** page, select the target instance from the ECS instance list and click **Batch Install** in the lower part of the page.

Metric data is displayed in the monitoring chart within 5 to 10 minutes after the monitoring plug-in is installed.

Metrics for ApsaraDB RDS for PostgreSQL

Metric	Description	Apsara Stack service	Calculation formula
CPU utilization	The CPU utilization of an ApsaraDB RDS for PostgreSQL instance. Unit: %.	ApsaraDB RDS for PostgreSQL	Used CPU cores of an ApsaraDB RDS for PostgreSQL instance/Total CPU cores of the ApsaraDB RDS for PostgreSQL instance
Memory usage	The memory usage of an ApsaraDB RDS for PostgreSQL instance. Unit: %.	ApsaraDB RDS for PostgreSQL	Used memory of an ApsaraDB RDS for PostgreSQL instance/Total memory of the ApsaraDB RDS for PostgreSQL instance
Disk usage	The disk usage of an ApsaraDB RDS for PostgreSQL instance. Unit: %.	ApsaraDB RDS for PostgreSQL	None
IOPS usage	The number of I/O requests for an ApsaraDB RDS for PostgreSQL instance per second. Unit: %.	ApsaraDB RDS for PostgreSQL	Number of I/O requests for an ApsaraDB RDS for PostgreSQL instance/Statistical period
Connection usage	The number of connections between an application and an ApsaraDB RDS for PostgreSQL instance per second. Unit: %.	ApsaraDB RDS for PostgreSQL	Number of connections between an application and an ApsaraDB RDS for PostgreSQL instance/Statistical period

Metrics for ApsaraDB RDS for MySQL

Metric	Description	Apsara Stack service	Calculation formula
CPU utilization	The CPU utilization of an ApsaraDB RDS for MySQL instance. Unit: %.	ApsaraDB RDS for MySQL	Used CPU cores of an ApsaraDB RDS for MySQL instance/Total CPU cores of the ApsaraDB RDS for MySQL instance

Metric	Description	Apsara Stack service	Calculation formula
Memory usage	The memory usage of an ApsaraDB RDS for MySQL instance. Unit: %.	ApsaraDB RDS for MySQL	Used memory of an ApsaraDB RDS for MySQL instance/Total memory of the ApsaraDB RDS for MySQL instance
Disk usage	The disk usage of an ApsaraDB RDS for MySQL instance. Unit: %.	ApsaraDB RDS for MySQL	None
IOPS usage	The number of I/O requests for an ApsaraDB RDS for MySQL instance per second. Unit: %.	ApsaraDB RDS for MySQL	Number of I/O requests for an ApsaraDB RDS for MySQL instance/Statistical period
Connection usage	The number of connections between an application and an ApsaraDB RDS for MySQL instance per second. Unit: %.	ApsaraDB RDS for MySQL	Number of connections between an application and an ApsaraDB RDS for MySQL instance/Statistical period
Inbound bandwidth to ApsaraDB RDS for MySQL	The inbound traffic to an ApsaraDB RDS for MySQL instance per second.	ApsaraDB RDS for MySQL	None
Outbound bandwidth from ApsaraDB RDS for MySQL	The outbound traffic from an ApsaraDB RDS for MySQL instance per second.	ApsaraDB RDS for MySQL	None

Metrics for ApsaraDB RDS for SQL Server

Metric	Description	Apsara Stack service	Calculation formula
CPU utilization	The CPU utilization of an ApsaraDB RDS for SQL Server instance. Unit: %.	ApsaraDB RDS for SQL Server	Used CPU cores of an ApsaraDB RDS for SQL Server instance/Total CPU cores of the ApsaraDB RDS for SQL Server instance
Memory usage	The memory usage of an ApsaraDB RDS for SQL Server instance. Unit: %.	ApsaraDB RDS for SQL Server	Used memory of an ApsaraDB RDS for SQL Server instance/Total memory of the ApsaraDB RDS for SQL Server instance
Disk usage	The disk usage of an ApsaraDB RDS for SQL Server instance. Unit: %.	ApsaraDB RDS for SQL Server	None
IOPS usage	The number of I/O requests for an ApsaraDB RDS for SQL Server instance per second. Unit: %.	ApsaraDB RDS for SQL Server	Number of I/O requests for an ApsaraDB RDS for SQL Server instance/Statistical period
Connection usage	The number of connections between an application and an ApsaraDB RDS for SQL Server instance per second. Unit: %.	ApsaraDB RDS for SQL Server	Number of connections between an application and an ApsaraDB RDS for SQL Server instance/Statistical period

Metric	Description	Apsara Stack service	Calculation formula
Inbound bandwidth to ApsaraDB RDS for SQL Server	The inbound traffic to an ApsaraDB RDS for SQL Server instance per second.	ApsaraDB RDS for SQL Server	None
Outbound bandwidth from ApsaraDB RDS for SQL Server	The outbound traffic from an ApsaraDB RDS for SQL Server instance per second.	ApsaraDB RDS for SQL Server	None

Metrics for PolarDB

Metric	Description	Apsara Stack service	Calculation formula
CPU utilization	The CPU utilization of a PolarDB instance. Unit: %.	PolarDB	Used CPU cores of a PolarDB instance/Total CPU cores of the PolarDB instance
Memory usage	The memory usage of a PolarDB instance. Unit: %.	PolarDB	Used memory of a PolarDB instance/Total memory of the PolarDB instance
Disk usage	The disk usage of a PolarDB instance. Unit: %.	PolarDB	None
IOPS usage	The number of I/O requests for a PolarDB instance per second. Unit: %.	PolarDB	Number of I/O requests for a PolarDB instance/Statistical period
Connection usage	The number of connections between an application and a PolarDB instance per second. Unit: %.	PolarDB	Number of connections between an application and a PolarDB instance/Statistical period

Metrics for SLB

Metric	Description	Unit
Inbound bandwidth on a port	The average rate of inbound traffic on a port.	bit/s
Outbound bandwidth on a port	The average rate of outbound traffic on a port.	bit/s
Number of new connections on a port	The average number of new TCP connections established between clients and SLB instances in a statistical period.	N/A
Number of inbound packets received on a port	The number of packets received by an SLB instance per second.	count/s
Number of outbound packets sent on a port	The number of packets sent by an SLB instance per second.	count/s

Metric	Description	Unit
Number of active connections on a port	The number of TCP connections in the ESTABLISHED state. If persistent connections are used, a connection can transfer multiple file requests at one time.	N/A
Number of inactive connections on a port	The number of TCP connections that are not in the ESTABLISHED state. You can run the netstat -an command to view the connections for both Windows and Linux instances.	N/A
Number of concurrent connections on a port	The number of established TCP connections.	count/s
Number of dropped connections on a port	The number of connections dropped per second.	count/s
Number of dropped inbound packets on a port	The number of inbound packets dropped per second.	count/s
Number of dropped outbound packets on a port	The number of outbound packets dropped per second.	count/s
Dropped inbound bandwidth on a port	The amount of inbound traffic dropped per second.	bit/s
Dropped outbound bandwidth on a port	The amount of outbound traffic dropped per second.	bit/s

Metrics for monitoring service overview of OSS

Metric	Description	Unit
Availability	The metric that describes the system availability of OSS. You can obtain the metric value based on the following formula: Metric value = $\frac{1 - \text{Server error requests with the returned HTTP status code 5xx/All requests}}{\text{Total number of requests}}$.	%
Valid request percentage	The percentage of valid requests out of all requests.	%
Total number of requests	The total number of requests that are received and processed by the OSS server.	N/A
Number of valid requests	The total number of requests with HTTP status codes 2xx and 3xx returned.	N/A
Outbound traffic from the Internet	The amount of outbound traffic from the Internet.	byte
Inbound traffic to the Internet	The amount of inbound traffic to the Internet.	byte

Metric	Description	Unit
Outbound traffic from the internal network	The amount of outbound traffic from the internal network.	byte
Inbound traffic to the internal network	The amount of inbound traffic to the internal network.	byte
CDN outbound traffic	The amount of outbound traffic sent over CDN after CDN is activated. Such outbound traffic over CDN is back-to-origin traffic.	byte
CDN inbound traffic	The amount of inbound traffic received over CDN after CDN is activated.	byte
Outbound traffic of cross-region replication	The amount of outbound traffic generated during data replication after cross-region replication is enabled.	byte
Inbound traffic of cross-region replication	The amount of inbound traffic generated during data replication after cross-region replication is enabled.	byte
Storage size	The amount of total storage occupied by the buckets of a specified user before the statistics collection deadline.	byte
Number of PUT requests	The total number of PUT requests made by the user between 00:00:00 on the first day of the current month and the statistics collection deadline.	N/A
Number of GET requests	The total number of GET requests made by the user between 00:00:00 on the first day of the current month and the statistics collection deadline.	N/A

Metrics for request status details of OSS

Metric	Description	Unit
Number of requests with server-side errors	The total number of system-level error requests with the returned HTTP status code 5xx.	N/A
Percentage of requests with server-side errors	The percentage of requests with server-side errors out of all requests.	%
Number of requests with network errors	The total number of requests with the returned HTTP status code 499.	N/A
Percentage of requests with network errors	The percentage of requests with network errors out of all requests.	%

Metric	Description	Unit
Number of requests with client-side authorization errors	The total number of requests with the returned HTTP status code 403.	N/A
Percentage of requests with client-side authorization errors	The percentage of requests with authorization errors out of all requests.	%
Number of requests with client-side errors indicating resources not found	The total number of requests with the returned HTTP status code 404.	N/A
Percentage of requests with client-side errors indicating resources not found	The percentage of requests with errors indicating resources not found out of all requests.	%
Number of requests with client-side timeout errors	The total number of requests with the returned HTTP status code 408 or OSS error code RequestTimeout.	N/A
Percentage of requests with client-side timeout errors	The percentage of requests with client-side timeout errors out of all requests.	%
Number of requests with other client-side errors	The total number of requests other than the foregoing client-side error requests with the returned HTTP status code 4xx.	N/A
Percentage of requests with other client-side errors	The percentage of requests with other client-side errors out of all requests.	%
Number of successful requests	The total number of requests with the returned HTTP status code 2xx.	N/A
Percentage of successful requests	The percentage of successful requests out of all requests.	%
Number of redirected requests	The total number of requests with the returned HTTP status code 3xx.	N/A
Percentage of redirected requests	The percentage of redirected requests out of all requests.	%

Metrics for maximum latency of OSS

Metric	Description	Unit
Maximum end-to-end latency of GetObject requests	The maximum end-to-end latency of successful GetObject requests.	ms
Maximum server latency of GetObject requests	The maximum server latency of successful GetObject requests.	ms
Maximum end-to-end latency of HeadObject requests	The maximum end-to-end latency of successful HeadObject requests.	ms
Maximum server latency of HeadObject requests	The maximum server latency of successful HeadObject requests.	ms

Metric	Description	Unit
Maximum end-to-end latency of PutObject requests	The maximum end-to-end latency of successful PutObject requests.	ms
Maximum server latency of PutObject requests	The maximum server latency of successful PutObject requests.	ms
Maximum end-to-end latency of PostObject requests	The maximum end-to-end latency of successful PostObject requests.	ms
Maximum server latency of PostObject requests	The maximum server latency of successful PostObject requests.	ms
Maximum end-to-end latency of AppendObject requests	The maximum end-to-end latency of successful AppendObject requests.	ms
Maximum server latency of AppendObject requests	The maximum server latency of successful AppendObject requests.	ms
Maximum end-to-end latency of UploadPart requests	The maximum end-to-end latency of successful UploadPart requests.	ms
Maximum server latency of UploadPart requests	The maximum server latency of successful UploadPart requests.	ms
Maximum end-to-end latency of UploadPartCopy requests	The maximum end-to-end latency of successful UploadPartCopy requests.	ms
Maximum server latency of UploadPartCopy requests	The maximum server latency of successful UploadPartCopy requests.	ms

Metrics for successful request category of OSS

Metric	Description	Unit
Number of successful GetObject requests	The number of successful GetObject requests.	N/A
Number of successful HeadObject requests	The number of successful HeadObject requests.	N/A
Number of successful PostObject requests	The number of successful PostObject requests.	N/A
Number of successful AppendObject requests	The number of successful AppendObject requests.	N/A
Number of successful UploadPart requests	The number of successful UploadPart requests.	N/A
Number of successful UploadPartCopy requests	The number of successful UploadPartCopy requests.	N/A
Number of successful DeleteObject requests	The number of successful DeleteObject requests.	N/A
Number of successful DeleteObjects requests	The number of successful DeleteObjects requests.	N/A

Metrics for KVStore for Redis

Metric	Description	Apsara Stack service	Unit
CPU utilization	The CPU utilization of a KVStore for Redis instance.	KVStore for Redis	%
Memory usage	The percentage of memory that is in use.	KVStore for Redis	%
Used memory	The amount of memory that is in use.	KVStore for Redis	byte
Number of used connections	The total number of client connections that are in use.	KVStore for Redis	N/A
Percentage of used connections	The percentage of connections that are in use.	KVStore for Redis	%
Write bandwidth	The write traffic per second.	KVStore for Redis	byte/s
Read bandwidth	The read traffic per second.	KVStore for Redis	byte/s
Number of failed operations per second	The number of failed operations on a KVStore for Redis instance per second.	KVStore for Redis	N/A
Write bandwidth usage	The percentage of total bandwidth used by write operations.	KVStore for Redis	%
Read bandwidth usage	The percentage of total bandwidth used by read operations.	KVStore for Redis	%
Used QPS	The number of queries per second (QPS).	KVStore for Redis	N/A
QPS usage	The QPS usage.	KVStore for Redis	%
Average response time	The average response time.	KVStore for Redis	ms
Maximum response time	The maximum response time.	KVStore for Redis	ms
Number of failed commands	The number of failed commands.	KVStore for Redis	N/A
Hit rate	The current hit rate.	KVStore for Redis	%
Inbound traffic	The inbound traffic to a KVStore for Redis instance.	KVStore for Redis	byte
Inbound bandwidth usage	The inbound bandwidth usage of a KVStore for Redis instance.	KVStore for Redis	%
Outbound traffic	The outbound traffic from a KVStore for Redis instance.	KVStore for Redis	byte
Outbound bandwidth usage	The outbound bandwidth usage of a KVStore for Redis instance.	KVStore for Redis	%

Metrics for VPN Gateway

Metric	Dimension	Monitoring period	Unit
Number of inbound packets in a connection per second	User and instance	One minute	pps

Metric	Dimension	Monitoring period	Unit
Number of outbound packets in a connection per second	User and instance	One minute	pps
Inbound bandwidth of a connection	User and instance	One minute	bit/s
Outbound bandwidth of a connection	User and instance	One minute	bit/s
Number of connections	User and instance	One minute	N/A

Metrics for AnalyticDB for PostgreSQL

Metric	Description	Unit
Connection usage	The number of connections between an application and an AnalyticDB for PostgreSQL instance per second.	%
CPU utilization	The CPU utilization of an AnalyticDB for PostgreSQL instance.	%
Disk usage	The disk usage of an AnalyticDB for PostgreSQL instance.	%
IOPS usage	The number of I/O requests for an AnalyticDB for PostgreSQL instance per second.	%
Memory usage	The memory usage of an AnalyticDB for PostgreSQL instance.	%

Metrics for ApsaraDB for MongoDB

Tab	Metric	Description	Unit
Basic metric	CPU utilization	The CPU utilization of an ApsaraDB for MongoDB instance.	%
	Memory usage	The memory usage of an ApsaraDB for MongoDB instance.	%
	Disk usage	The disk usage of an ApsaraDB for MongoDB instance.	%
	IOPS usage	The percentage of the IOPS used by an ApsaraDB for MongoDB instance out of the maximum available IOPS.	%

Tab	Metric	Description	Unit
	Connection usage	The number of connections between an application and an ApsaraDB for MongoDB instance per second.	%
	QPS	The number of queries per second.	N/A
	Number of used connections	The number of current connections to an ApsaraDB for MongoDB instance.	N/A
Disk capacity	Disk space occupied by an instance	The total used space.	byte
	Disk space occupied by data	The disk space occupied by data.	byte
	Disk space occupied by logs	The disk space occupied by logs.	byte
Network request	Inbound traffic to the internal network	The inbound traffic.	byte
	Outbound traffic from the internal network	The outbound traffic.	byte
	Number of requests	The number of processed requests.	N/A
Number of operations	Number of Insert operations	None	N/A
	Number of Query operations	None	N/A
	Number of Update operations	None	N/A
	Number of Delete operations	None	N/A
	Number of Getmore operations	None	N/A
	Number of Command operations	None	N/A

Metrics for EIP

Metric	Description	Dimension	Monitoring period	Unit
Inbound bandwidth	The traffic that passes through EIP to ECS per second.	Instance	One minute	bit/s

Metric	Description	Dimension	Monitoring period	Unit
Outbound bandwidth	The traffic that passes through EIP from ECS per second.	Instance	One minute	bit/s
Number of inbound packets per second	The number of packets that pass through EIP to ECS per second.	Instance	One minute	pps
Number of outbound packets per second	The number of packets that pass through EIP from ECS per second.	Instance	One minute	pps
Packet loss rate due to throttling	The packet loss rate when the actually used bandwidth exceeds the configured upper limit.	Instance	One minute	pps

Metrics for API Gateway

Metric	Description	Dimension	Unit	Monitoring period
Error distribution	The number of 2xx, 4xx, and 5xx status codes returned for an API in the monitoring period.	User and API	N/A	One minute
Inbound traffic	The total traffic of requests received by an API in the monitoring period.	User and API	byte	One minute
Outbound traffic	The total traffic of responses sent by an API in the monitoring period.	User and API	byte	One minute
Response time	The latency between the time when API Gateway calls the backend service of an API and the time when the result is received from the backend service in the monitoring period.	User and API	s	One minute
Number of total requests	The total number of requests received by an API in the monitoring period.	User and API	N/A	One minute

1.6.2.3. View monitoring charts

You can view monitoring charts to obtain up-to-date information about each instance.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, choose **Products > Monitoring and O&M > CloudMonitor**.
3. In the left-side navigation pane of the CloudMonitor page, click **Cloud Service Monitoring**.
4. Click a cloud service.
5. Click **Monitoring Charts** in the **Actions** column corresponding to an instance. On the Monitoring Charts page that appears, you can select a date and time to view the monitoring data of each metric.

1.6.3. Alerts

1.6.3.1. View alarm overview

On the **Overview** page in CloudMonitor, you can view the alarm status statistics and alarm logs.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, choose **Products > Monitoring and O&M > CloudMonitor**.
3. In the left-side navigation pane of the CloudMonitor page, click **Overview**.
4. On the **Overview** page, view the alarm status statistics and alarm logs generated in the last 24 hours.

1.6.3.2. Enable or disable alert notification

You can choose whether to enable alert notification by SMS, email, or DingTalk.

Prerequisites

You must specify valid contact information when you create a user. If your contact information has changed, you must modify personal information. For more information, see [Modify personal information](#).

Procedure

1. [Log on to the ASCM console](#).
2. In the upper-right corner of the homepage, move the pointer over the profile picture and click **User Information**.
3. In the **Notification By** section, select **SMS**, **Email**, or **DingTalk** to enable alert notification. To disable alert notification, you can clear the corresponding check box.

1.6.3.3. View alert logs

You can view alert information to stay up to date on the running status of ECS, ApsaraDB for RDS, SLB, KVStore for Redis, VPN Gateway, AnalyticDB for PostgreSQL, ApsaraDB for MongoDB, EIP, API Gateway, and OSS.

Context

Alert information contains information for all items that do not comply with your configured alert rules.

Note

- The system can retain up to one million alert items generated within the last three months.
- This topic describes how to view alert information for ECS. You can view the alert information for other cloud resources in a similar manner.

Procedure

1. **Log on to the ASCM console** as an administrator.
2. In the top navigation bar, choose **Products > Monitoring and O&M > CloudMonitor**.
3. In the left-side navigation pane of the CloudMonitor page, choose **Alarms > Alarm History**.
4. On the **Alarm Rule History List** page, filter alert information by rule ID, rule name, service, metric, and date. The following table describes the fields in the query result.

Alert information fields

Field	Description
Product	The service for which the alert was triggered.
Fault Instance	The instance for which the alert was triggered.
Occurred At	The time when the alert was triggered.
Rule Name	The name of the alert rule.
Status	The status of the alert rule.
Notification Contact	The recipient of the alert notification.

1.6.3.4. Alarm rules**1.6.3.4.1. Query alert rules**

After you create alert rules, you can view your alert rules on the Alarm Rules page.

Context

The system provides alert rules for ECS, ApsaraDB for RDS, SLB, OSS, KVStore for Redis, VPN Gateway, AnalyticDB for PostgreSQL, ApsaraDB for MongoDB, EIP, and API Gateway.

Procedure

1. **Log on to the ASCM console** as an administrator.
2. In the top navigation bar, choose **Products > Monitoring and O&M > CloudMonitor**.
3. In the left-side navigation pane of the CloudMonitor page, click **Cloud Service Monitoring**.
4. Click a cloud service.
5. Click **Alarm Rules** in the Actions column corresponding to an instance. On the **Alarm Rules** page, view the detailed information of alert rules.

1.6.3.4.2. Create an alarm rule

You can create an alarm rule to monitor an instance.

Prerequisites

For ECS instances, you must install a monitoring plug-in to collect metric data at the operating system level.

The installation methods are as follows:

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, choose **Products > Monitoring and O&M > CloudMonitor**.
3. In the left-side navigation pane, choose **Cloud Service Monitoring > ECS**.
4. In the ECS instance list, select the instances that you want to monitor, and click **Batch Install**.

 **Note**

The monitoring chart displays monitoring data 5 to 10 minutes after the monitoring plug-in is installed.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, choose **Products > Monitoring and O&M > CloudMonitor**.
3. In the left-side navigation pane of the CloudMonitor page, click **Cloud Service Monitoring**.
4. Click a cloud service.
5. Click **Alarm Rules** in the **Actions** column corresponding to an instance to go to its **Alarm Rules** page.

Note You can also use the search function to query specific instances for which you want to create alarm rules.

6. Click **Create Alarm Rule**.

Parameters for creating an alarm rule

Parameter	Description
Product	The monitored cloud product.
Resource Range	The range of resources associated with the alarm rule, including instances and application groups.
Rule Description	The description of the alarm rule.
Add Alarm Rule	Click Add Rule Description to go to the rule configuration page. For more information, see Parameters for adding an alarm rule .
Effective Time	Only a single alarm is sent during each mute duration, even if the metric value exceeds the alarm rule threshold several consecutive times.
Effective From	An alarm is sent only when the threshold is met during the effective period.
HTTP Callback	The callback URL when the alarm conditions are met.
Alarm Contact Group	The group to which alerts are sent.

Parameters for adding an alarm rule

Parameter	Description
Rule Name	The name of the alarm rule. The name must be 1 to 64 characters in length and can contain letters and digits.
Metric Name	Different products have different monitoring metrics. For more information, see Metrics .

Parameter	Description
Comparison	The comparison between thresholds and observed values. The comparison operators include >, >=, <, and <=. When the comparison rule is satisfied, an alarm rule is triggered.
Threshold And Alarm Level	Different metrics have different reference thresholds.

7. Click OK.

1.6.3.4.3. Disable an alarm rule

You can disable one or more alarm rules as needed.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, choose **Products > Monitoring and O&M > CloudMonitor**.
3. In the left-side navigation pane of the CloudMonitor page, click **Cloud Service Monitoring**.
4. Click a cloud service.
5. Click **Alarm Rules** in the **Actions** column corresponding to an instance.
6. On the **Alarm Rules** page, choose **More > Disable** in the **Actions** column corresponding to the alarm rule to be disabled.
7. In the message that appears, click **OK**.

1.6.3.4.4. Enable an alarm rule

After an alarm rule is disabled, it can be re-enabled as needed.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, choose **Products > Monitoring and O&M > CloudMonitor**.
3. In the left-side navigation pane of the CloudMonitor page, click **Cloud Service Monitoring**.
4. Click a cloud service.
5. Click **Alarm Rules** in the **Actions** column corresponding to an instance to go to its **Alarm Rules** page.
6. Select the alarm rule that you want to enable, and click **Enable** below the alarm rule list.
7. In the message that appears, click **OK**.

1.6.3.4.5. Delete an alarm rule

You can delete alarm rules that are no longer needed.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, choose **Products > Monitoring and O&M > CloudMonitor**.
3. In the left-side navigation pane of the CloudMonitor page, click **Cloud Service Monitoring**.
4. Click a cloud service.
5. Click **Alarm Rules** in the **Actions** column corresponding to an instance to go to its **Alarm Rules** page.
6. Select the alarm rule that you want to delete and click **Delete** in the **Actions** column.
7. In the message that appears, click **OK**.

1.7. Enterprise

1.7.1. Organizations

1.7.1.1. Create an organization

You can create organizations to store resource sets and their resources.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Organizations**.
4. In the organization navigation tree, move the pointer over the name of a parent organization, and click  on the right.
5. Choose **Add Organization** from the shortcut menu.
6. In the dialog box that appears, enter an organization name and click **OK**.

1.7.1.2. Query an organization

You can query an organization by name to view its resource sets, users, and user groups.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Organizations**.
4. In the search box below **Organizations**, enter an organization name to query information about the corresponding organization.

1.7.1.3. View organization information

You can view information about an organization on the **Organizations** page.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Organizations**.
4. On the **Organizations** page, click an organization in the organization list.
5. On the right side of the page, view the organization information.
 - In the **Resource Sets** section, you can view information such as the name, creation time, and creator of each resource set in the organization. Click the name of a resource set to view its details.
 - In the **Users** section, you can view information such as the name, status, and role of each user in the organization. Click a username to view the user details.
 - In the **User Groups** section, you can view the name, organization, role, users, and creation time of each user group in the organization.

1.7.1.4. Modify the name of an organization

Users with operation permissions on an organization can modify the name of the organization.

Procedure

1. [Log on to the ASCM console](#).
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Organizations**.
4. In the organization navigation tree, move the pointer over the name of an organization and click  on the right.
5. Choose **Edit Organization** from the shortcut menu.
6. In the dialog box that appears, modify the organization name.
7. Click **OK**.

1.7.1.5. Change organization ownership

Users that have operation permissions on organizations can change the ownership of organizations.

Prerequisites

- Make sure that each organization under the target organization has a unique name.
- The ownership of an organization cannot be changed cross level-1 organizations.

Context

Users can change the ownership of an organization cross parent organizations. This way, the ownership of subordinate organizations, users, and resources are also changed in a cascading manner.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Change Ownership**.
4. On the **Change Ownership** page, select the target organization and click **Change Ownership** on the right.
5. In the **Change Organization** dialog box, select the destination organization and click **OK** to change the ownership of the target organization and resources sets and users under this organization.

1.7.1.6. Obtain the AccessKey pair of an organization

An AccessKey pair consists of an AccessKey ID and an AccessKey secret. The AccessKey pair is used to implement symmetric encryption to verify the identity of the requester. The AccessKey ID is used to identify a user. The AccessKey secret is used to encrypt the signature string. This topic describes how to obtain the AccessKey pair of an organization.

Prerequisites

Only operations administrators and level-1 organization administrators can obtain the AccessKey pair of an organization.

Procedure

1. [Log on to the ASCM console](#).
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Organizations**.
4. In the organization navigation tree, move the pointer over the name of a level-1 organization and click the  icon on the right.
5. Select **AccessKey**.

6. In the message that appears, view the AccessKey pair of the organization.

1.7.1.7. Delete an organization

Administrators can delete organizations that are no longer needed.

Prerequisites

 **Note** Before deleting an organization, make sure that the organization does not contain any users, resource sets, or subordinate organizations. Otherwise, the organization cannot be deleted.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Organizations**.
4. In the organization navigation tree, move the pointer over the name of an organization, and click  on the right.
5. Choose **Delete Organization** from the shortcut menu.
6. In the message that appears, click **OK**.

1.7.2. Resource sets

1.7.2.1. Create a resource set

You must create a resource set before you apply for resources.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Resource Sets**.
4. In the upper-left corner of the **Resource Sets** page, click **Create Resource Set**.
5. In the **Create Resource Set** dialog box, set **Name** and **Organization**.
6. Click **OK**.

1.7.2.2. View the details of a resource set

When you want to use a cloud resource in your organization, you can view the details of the resource set that contains the resource, including all resource instances and users of the resource set.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Resource Sets**.
4. Select an **organization** from the drop-down list, or enter a resource set name in the search bar, and then click **Search**.
5. Click the name of the target resource set.
6. On the **Resource Set Details** page, click the **Resources** and **Members** tabs to view information about all resource instances and users of the resource set.
7. On the **Resources** tab, click the number of a service to go to the instance list page of the service. The list is

automatically filtered and displayed based on the organization and resource set.

1.7.2.3. Modify the name of a resource set

An administrator can modify the name of a resource set to keep it up-to-date.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Resource Sets**.
4. Click **More** in the **Actions** column corresponding to a resource set, and choose **Edit Name** from the shortcut menu.
5. In the dialog box that appears, enter the new name.
6. Click **OK**.

1.7.2.4. Add a member to a resource set

You can add a member to a resource set so that the member can use the resources in the resource set.

Prerequisites

Before adding a member, make sure that the following prerequisites are met:

- A resource set is created. For more information, see [Create a resource set](#).
- A user is created. For more information, see [Create a user](#).

Context

Members of a resource set have the permissions to use resources in the resource set.

Deleting resources from a resource set does not affect the members of the resource set. Similarly, deleting members from a resource set does not affect the resources in the resource set.

You can delete a member that is no longer in use in a resource set. After the member is deleted, it will no longer be able to access the resource set.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Resource Sets**.
4. Click **More** in the **Actions** column corresponding to a resource set, and choose **Add Member** from the shortcut menu.
5. In the dialog box that appears, select a username.
6. Click **OK**.

1.7.2.5. Add or remove a user group of a resource set

You can add or remove a user group of a resource set to manage user group access to resources in the resource set.

Prerequisites

- A resource set is created. For more information, see [Create a resource set](#).
- A user group is created. For more information, see [Create a user group](#).

Context

User groups in a resource set have the permissions to use resources in the resource set.

Deleting resources from a resource set does not affect user groups of the resource set. Similarly, deleting user groups from a resource set does not affect the resources in the resource set.

You can delete a user group that is no longer in use in a resource set. After the user group is deleted, it will no longer be able to access the resource set.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Resource Sets**.
4. Click **More** in the **Actions** column corresponding to the target resource set.
5. Add or remove a user group.
 - Select **Add User Group**. In the dialog box that appears, select a user group. Click **OK** to add the user group.
 - Select **Delete User Group**. In the dialog box that appears, select a user group. Click **OK** to remove the user group.

1.7.2.6. Delete a resource set

You can delete resource sets that are not needed as an administrator.

Prerequisites

Ensure that the resource set to be deleted does not contain resources, users, or user groups.

 **Notice** A resource set cannot be deleted if it contains resources, users, or user groups.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Resource Sets**.
4. Click **More** in the **Actions** column corresponding to the target resource set, and select **Delete**.
5. In the message that appears, click **OK**.

1.7.3. Roles

1.7.3.1. Create a custom role

You can add custom roles in the ASCM console to more efficiently grant permissions to users so that different personnel can work with different functions.

Context

A role is a set of access permissions. Each role has a range of permissions. A user can have multiple roles, which means that the user is granted all of the permissions defined for each role. A role can be used to grant the same set of permissions to a group of users.

The total number of custom and default roles cannot exceed 20.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Enterprise**.

3. In the left-side navigation pane of the Enterprise page, click Roles.
4. In the upper-right corner of the page, click Create Custom Role.
5. On the Roles page, set the role name and management permissions.

The screenshot shows the 'Roles' page with four numbered steps: 1. Role Name and Management Permissions, 2. Application Permissions, 3. Menu Permissions, and 4. Associated Users. Step 1 is active, showing a form with the following elements:

- Role Name:** A text input field with a character count of 0/64.
- Description:** A text area with a character count of 0/100.
- Sharing Scope:** Three radio buttons: Global, Current Organization, and Subordinate Organization.
- Scope:** Three radio buttons: All Organizations, Specified Organization and Subordinate Organizations, and Resource Set.

The following table describes the role parameters.

Role parameters

Parameter	Description
Role Name	The name of the role. The name can be up to 15 characters in length and can contain only letters and digits.
Description	Optional. The description of the role. The description can be up to 100 characters in length and can contain letters, digits, commas (,), semicolons (;), and underscores (_).
Sharing Scope	<ul style="list-style-type: none"> ○ Global The role is visible and valid to all organizations involved. The default value is Global. ○ Current Organization The role is visible and valid to the organization to which the user belongs. ○ Subordinate Organization The role is visible and valid to the organization to which the user belongs and its subordinate organizations.
Scope	<ul style="list-style-type: none"> ○ All Organizations The permissions apply to all organizations involved. ○ Specified Organization and Subordinate Organizations The permissions apply to the organization to which the user belongs and its subordinate organizations. ○ Resource Set The permissions apply to the resource sets assigned to the user.

6. Select the operation permissions that this role has, and click **Next**.
7. In the **Application Permissions** step, select the operation permissions that this role has on the cloud services, and click **Next**.
8. In the **Menu Permissions** step, select the operation permissions that this role has on the menus and the homepage template corresponding to the role, and click **Create Role**.
9. In the **Associated Users** step, select the users associated with the role from the drop-down list. The associated users are granted the permissions of the role.

1.7.3.2. View the details of a role

If you are not certain about the specific permissions of a role, go to the Roles page to view the role permissions.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Roles**.
4. Click the name of the role that you want to view. On the **Roles** page, view information about the role.

1.7.3.3. Modify custom role information

You can modify the name and permissions of a custom role as an administrator.

Context

Information about preset roles cannot be modified.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Roles**.
4. In the role name list, click **More** in the **Actions** column corresponding to the target custom role, and select **Modify**.
5. On the **Roles** page, modify the custom role name, permissions, and associated users or user groups.
 - **Modify role name:** Enter a new role name in the **Role Name** field.
 - **Modify permissions:** Click the **Management Permissions**, **Application Permissions**, or **Menu Permissions** tab, select or clear related permissions from the corresponding tab, and then click **Update**.
 - **Bind a user to a role:** Click the **Associated Users** tab and select a user from the **Select one or more users** drop-down list to add the user. To unbind the user from the role, click **Remove** in the **Actions** column.
 - **Manage user groups:** Click the **User Groups** tab, click **Add User Group**, select a user group from the drop-down list, and then click **OK** to bind the user group. To unbind the user group from the role, click **Remove** in the **Actions** column.

1.7.3.4. Copy a role

You can copy a preset role or a custom role to create a role with the same permissions.

Context

Operations on the **Roles** page are the same as those for creating a custom role. You can add, modify, and remove the role permissions in the copied role. By default, if you do not modify the role permissions, the sharing scope, management permissions, application permissions, menu permissions, and associated users of the copied role are all the same as those of the source role.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Roles**.
4. In the role list, click **More** in the **Actions** column corresponding to the target role, and select **Copy**.
5. On the **Roles** page, set the new role name, sharing scope, and management permissions.

Roles

1 **Role Name and Management Permissions**
Specify the role name and management permissions.

2 **Application Permissions**
Specify permissions on applications.

3 **Menu Permissions**
Specify permissions on menus in the console.

4 **Associated Users**
Associate the specified role with users.

*Role Name: 13/64

Description: 73/100

*Sharing Scope: Global Current Organization Subordinate Organization

*Scope: All Organizations Specified Organization and Subordinate Organizations Resource Set

Note The role name must be unique.

6. Select the operation permissions that this role has and click **Next**.
7. In the **Application Permissions** step, select the operation permissions that this role has on the cloud services and click **Next**.
8. In the **Menu Permissions** step, select the menu permissions that this role has and click **Create Role**.
9. In the **Associated Users** step, select the users associated with the role from the drop-down list. The associated users are granted the permissions of the role.

1.7.3.5. Disable a role

When you disable a role, the permissions of the role are disabled.

Procedure

1. **Log on to the ASCM console** as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Roles**.
4. In the role list, click **More** in the **Actions** column corresponding to a role and choose **Disable** from the shortcut menu.

1.7.3.6. Enable a role

When you enable a disabled role, the permissions of the role are restored.

Procedure

1. **Log on to the ASCM console** as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Roles**.
4. In the role list, click **More** in the **Actions** column corresponding to a disabled role and choose **Enable** from the shortcut menu.

1.7.3.7. Delete a custom role

You can delete a custom role that is no longer needed.

Prerequisites

- Default or preset roles cannot be deleted.
- To delete a role, you must unbind all user groups from the role.

Procedure

1. **Log on to the ASCM console** as an administrator.

2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Roles**.
4. Click **More** in the **Actions** column corresponding to the target role, and select **Delete**.
5. In the message that appears, click **OK**.

1.7.4. Users

1.7.4.1. System users

1.7.4.1.1. Create a user

You can create a user and assign the user different roles as an administrator to meet different requirements for system access control.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. Use one of the following methods to open the **Create User** window:
 - In the left-side navigation pane of the **Enterprise** page, click **Organizations**. In the **Users** section of the **Organizations** page, click **Create User**.
 - In the left-side navigation pane of the **Enterprise** page, click **Users**. On the **System Users** tab of the **Users** page, click **Create**.
4. In the dialog box that appears, configure the parameters.

Parameter	Description
Username	The Apsara Stack account name of the user. The name must be 3 to 30 characters in length, and can contain letters, digits, hyphens (-), underscores (_), periods (.), and at signs (@). It must start with a letter or digit.
Display Name	The display name of the user. The name must be 2 to 30 characters in length, and can contain letters, digits, hyphens (-), underscores (_), periods (.), and at signs (@).
Roles	The role to be assigned to the user.
Organization	The organization to which the user belongs.
Logon Policy	<p>The logon policy that restricts the logon time and IP addresses of the RAM user. The default policy is automatically bound to new users.</p> <div style="background-color: #e6f2ff; padding: 5px;"> <p> Note The default policy does not restrict the time period and IP addresses for users to log on. To restrict the logon time and IP addresses of a user, you can modify the logon policy of the user or create a logon policy for the user. For more information, see Create a logon policy.</p> </div>
Mobile Number	<p>The mobile number of the user. The mobile number is used by the system to notify users of resource application and usage. Make sure that the entered mobile number is correct.</p> <div style="background-color: #e6f2ff; padding: 5px;"> <p> Note If the mobile number is changed, be sure to update it on the system in a timely manner.</p> </div>

Parameter	Description
Landline Number	Optional. The landline number of the user. It must be 4 to 20 characters in length and can contain only digits and hyphens (-).
Email	<p>The email address of the user. Emails about the usage and requests for resources will be sent to the email address. Make sure that the specified email address is correct.</p> <p> Note If the email address is changed, be sure to update it on the system in a timely manner.</p>
DingTalk Key	The key of the chatbot for the DingTalk group where the user is a member. For more information about how to configure the key, see DingTalk development documentation .
Notify User by SMS	<p>After this option is selected, the ASCM console will inform the user configured as the alert contact by SMS whenever an alert is generated.</p> <p> Note You must configure an SMS server to receive an SMS message each time an alert is triggered. For more information, contact on-site O&M engineers.</p>
Notify User by Email	<p>After this option is selected, the ASCM console will inform the user configured as the alert contact by email whenever an alert is generated.</p> <p> Note You must configure an email server to receive an email each time an alert is triggered. For more information, contact on-site O&M engineers.</p>
Notify User by DingTalk	After this option is selected, the ASCM console will inform the user configured as the alert contact by DingTalk whenever an alert is generated.

5. Click OK.

1.7.4.1.2. Query a user

You can view user information such as name, organization, mobile number, email address, role, logon time, and initial password.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Users**.
4. Click the **System Users** tab.
5. Set **Username**, **Organization**, or **Role**, and then click **Search**.
6. Click **More** in the **Actions** column corresponding to a user, and choose **User Information** from the shortcut menu to view basic information about the user.

1.7.4.1.3. Modify user information

You can modify user information such as display name, mobile number, and email address to keep it up-to-date.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Users**.
4. Click the **System Users** tab.
5. Click **More** in the **Actions** column corresponding to a user, and choose **Edit** from the shortcut menu.
6. In the **Modify User Information** dialog box, enter the relevant information and click **OK**.

1.7.4.1.4. Change user roles

You can add, change, and delete roles for a user.

Change user roles by using user management

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Users**.
4. Click the **System Users** tab.
5. Click **More** in the **Actions** column corresponding to the target user, and select **Authorize**.
6. In the **Role** field, add, delete, or change user roles.
7. Click **OK**.

Change user roles by changing ownership

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Change Ownership**.
4. Click the  icon to the left of the target organization and click **Users**.
5. In the **Users** section on the right, set **Logon Policy** and **Role** or **Username**, and click **Search** to query the target user.
6. Find the target user and click **Change Ownership** in the **Actions** column.
7. In the **Organization to Change** dialog box, select the target or original organization and select the role to be added or removed from the **Assigned Roles** drop-down list.

Note

- If you change only roles without changing the organization, select the original organization.
- Blue role names are the roles that are selected, and black role names are the roles that are not selected.

8. Click **OK**.

1.7.4.1.5. Modify the information of a user group

On the **Users** page, you can view the user group information and modify the ownership of users in user groups.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, click **Users**.
4. Click the **System Users** tab, select a target user, and then click **More** in the **Actions** column.
 - Select **Add to User Group**. In the dialog box that appears, select the target user group and click **OK** to

add the user to the user group.

- **Select Remove from User Group.** In the dialog box that appears, select the target user group and click **OK** to remove the user from the user group.

1.7.4.1.6. Modify a user logon policy

An administrator can modify a user's logon policy to restrict the permitted logon time and IP addresses of the user.

Prerequisites

A new logon policy is created. For more information about how to create a logon policy, see [Create a logon policy](#).

Modify a user logon policy

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Users**.
4. Click the **System Users** tab.
5. Click **More** in the **Actions** column corresponding to a user, and choose **Logon Policy** from the shortcut menu.
6. In the **Assign Logon Policy** dialog box, select a logon policy and click **OK**.

Modify multiple user logon policies at a time

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Users**.
4. Click the **System Users** tab.
5. Select multiple users.
6. In the upper-right corner of the page, click **Logon Policy**.
7. In the **Assign Logon Policies** dialog box, select a logon policy.

1.7.4.1.7. View the initial password of a user

After a user is created, the system automatically generates an initial password for the user.

Context

Organization administrators can view the initial passwords of all users in the organizations they manage.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Users**.
4. Click the **System Users** tab.
5. Select the username that you want to query.
6. You can use one of the following methods to view the initial password of a user:
 - Click **View Initial Password** in the upper-right corner of the **Users** page to view the initial password.
 - Click **More** in the **Actions** column corresponding to the user, and choose **User Information** from the shortcut menu. On the user information page, click **View Password** to view the initial password.

1.7.4.1.8. Reset the password of a user

If users forget their logon passwords, the system administrator can reset the logon passwords for them.

Prerequisites

The logon password of a user can be reset by only the user and those who have the permissions to create resource sets for the user.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Users**.
4. Click the **System Users** tab.
5. Select the user for which you want to reset the password.
6. Click **More** in the **Actions** column corresponding to the user, and choose **User Information** from the shortcut menu.
7. Click **Reset Password**. After the password is reset, a message is displayed, indicating that the password has been reset. If you want to view the initial password after password reset, click **View Password**.

1.7.4.1.9. Disable and enable a user

You can disable a user to prevent the user from logging on to the Apsara Stack Cloud Management (ASCM) console. Disabled users must be re-enabled before they can log on to the ASCM console again.

Context

By default, users are enabled when they are created.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Users**.
4. Click the **System Users** tab.
5. You can perform the following operations on the current tab:
 - Select a user whose **Status** is **Enabled**, click **More** in the **Actions** column, and choose **Disable** from the shortcut menu to disable the user.
 - Select a user whose **Status** is **Disabled**, click **More** in the **Actions** column, and choose **Enable** from the shortcut menu to enable the user.

1.7.4.1.10. Delete a user

You can delete a specific user as an administrator.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. On the **Enterprise** page, use one of the following methods to delete a user:
 - In the left-side navigation pane of the **Enterprise** page, click **Users**. On the page that appears, click the **System Users** tab. Click **More** in the **Actions** column corresponding to the target user, and select **Delete**.
 - In the left-side navigation pane of the **Enterprise** page, click **Organizations**. On the page that appears, find the **Users** section. Find the target user, click **More** in the **Actions** column, and then select **Delete**.
4. Click **OK**.

1.7.4.2. Historical users

1.7.4.2.1. Query historical users

You can check whether a user has been deleted, or quickly find and restore the user.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Users**.
4. Click the **Historical Users** tab.
5. Enter the username that you want to query in the **Username** search box.
6. Click **Search**.

1.7.4.2.2. Restore historical users

An administrator can restore a deleted user account from the **Historical Users** tab.

Context

The basic information such as logon password of a restored user will be the same as it was before the user was deleted, except for the organization and role.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Users**.
4. Click the **Historical Users** tab.
5. Find the user to be restored and click **Restore** in the **Actions** column.
6. In the **Restore User** dialog box that appears, select an organization and a role.
7. Click **OK**.

1.7.5. Logon policies

1.7.5.1. Create a logon policy

To improve the security, you can create a logon policy as an administrator to control the logon time and IP addresses of a user.

Context

Logon policies are used to control the time period and IP addresses for users to log on. After a user is bound to a logon policy, user logons will be restricted based on the logon time and IP addresses specified in the policy.

A default policy without restrictions on the logon time and IP addresses is automatically generated in the ASCM console. The default policy cannot be deleted.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Logon Policies**.
4. In the upper-right corner of the page, click **Create**.

- In the Create Logon Policy dialog box, set Name, Sharing Scope, Policy Properties, Time Period, and IP Address.

Create Logon Policy
✕

***Name:**

0/50

Description:

--

***Sharing Scope:**

Global
▾

***Policy Properties:**

Blacklist Whitelist

Time Period:

Select start time
🕒

—

Select end time
🕒

[+ Add Time Period](#)
 The logon time period cannot be empty and start time cannot be later than end time.

IP Address:

[+ Add CIDR Block](#)
 Specify the CIDR block in the format such as 192.168.1.0/24. Use a 32-bit subnet mask in the CIDR block to specify a single IP address.
 CIDR blocks cannot overlap each other.

OK
Cancel

Parameters for creating a logon policy

Parameter	Description
Name	The name of the logon policy. The name must be 2 to 50 characters in length and can contain only letters and digits. The name must be unique in the system.
Description	The description of the logon policy.
Sharing Scope	The scope in which the role is visible. <ul style="list-style-type: none"> ○ Global: The role is globally visible. The default value is Global. ○ Current Organization: The role is visible only in the current organization and is not visible in subordinate organizations. ○ Subordinate Organization: The role is visible in the current organization and all its subordinate organizations.
Policy Properties	The authentication method of the logon policy. <ul style="list-style-type: none"> ○ Whitelist: Logon is allowed if the parameter settings are met. ○ Blacklist: Logon is denied if the parameter settings are met.
Time Period	The permitted logon time period. When this policy is configured, users can log on to the ASCM console only during the configured period. Specify the time in minutes in a 24-hour clock. Example: 16:32 .

Parameter	Description
IP Address	<p>The permitted CIDR block.</p> <ul style="list-style-type: none"> ○ If the Policy properties parameter is set to Whitelist, IP addresses within this CIDR block are allowed to log on to the ASCM console. ○ If the Policy properties parameter is set to Blacklist, IP addresses within this CIDR block are not allowed to log on to the ASCM console.

1.7.5.2. Query a logon policy

When providing services, the Apsara Stack Cloud Management (ASCM) console automatically generates a default policy without restrictions on the logon time and IP addresses.

Context

When providing services, the Apsara Stack Cloud Management (ASCM) console automatically generates a default policy without restrictions on the logon time and IP addresses.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Logon Policies**.
4. Enter the name of the policy that you want to view and click **Search**.
5. View the logon policy, including the permitted logon time and IP addresses.

1.7.5.3. Modify a logon policy

You can modify the policy name, policy properties, permitted logon time period, and IP addresses of a logon policy.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Logon Policies**.
4. Click **More** in the **Actions** column corresponding to a policy, and choose **Modify** from the shortcut menu.
5. In the **Modify Logon Policy** dialog box that appears, modify the logon policy information.
6. Click **OK**.

1.7.5.4. Disable a logon policy

You can disable logon policies that are no longer needed.

Procedure

1. [Log on to the ASCM console](#).
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Logon Policies**.
4. Click **More** in the **Actions** column corresponding to a policy, and choose **Disable** from the shortcut menu.

1.7.5.5. Enable a logon policy

You can re-enable disabled logon policies.

Procedure

1. [Log on to the ASCM console](#).
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Logon Policies**.
4. Click **More** in the **Actions** column corresponding to a policy, and choose **Enable** from the shortcut menu.

1.7.5.6. Delete a logon policy

You can delete logon policies that are no longer needed.

Context

 **Note** The default policy cannot be deleted.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Logon Policies**.
4. Click **More** in the **Actions** column corresponding to a policy, and choose **Delete** from the shortcut menu.
5. In the message that appears, click **OK**.

1.7.6. User groups

1.7.6.1. Create a user group

You can create a user group in a selected organization and grant batch authorizations to users in the group.

Prerequisites

Before creating a user group, you must create an organization. For more information, see [Create an organization](#).

Context

Relationship between user groups and users:

- A user group can contain zero or more users.
- You can add users to user groups as needed.
- You can add a user to multiple user groups.

Relationship between user groups and organizations:

- A user group can only belong to a single organization.
- You can create multiple user groups in an organization.

Relationship between user groups and roles:

- A user group can only be bound to a single role.
- A role can be associated with multiple user groups.
- When a role is associated with a user group, the role permissions are automatically granted to users in the user group.

Relationship between user groups and resource sets:

- You can add zero or more user groups to a resource set.
- A user group can be added to multiple resource sets.

Procedure

1. Log on to the ASCM console as an administrator.
2. In the top navigation bar, click Enterprise.
3. In the left-side navigation pane of the Enterprise page, click User Groups.
4. In the upper-right corner of the page, click Create User Group.
5. In the dialog box that appears, set User Group Name and Organization.

6. Click OK.

1.7.6.2. Add users to a user group

You can add users to a user group.

Procedure

1. Log on to the ASCM console as an administrator.
2. In the top navigation bar, click Enterprise.
3. In the left-side navigation pane of the Enterprise page, click User Groups.
4. Click Add User in the Actions column corresponding to a user group.
5. Select the names of users to be added from the left list, and click the right arrow to move them to the right list.

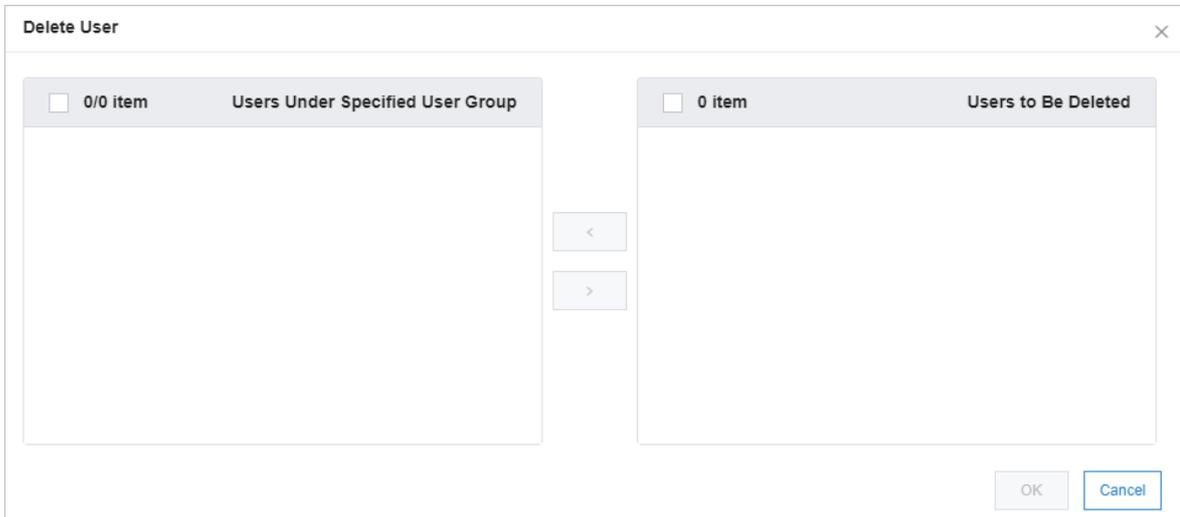

6. Click OK.

1.7.6.3. Delete users from a user group

You can delete users from a user group.

Procedure

1. Log on to the ASCM console as an administrator.
2. In the top navigation bar, click Enterprise.
3. In the left-side navigation pane of the Enterprise page, click User Groups.
4. Click Delete User in the Actions column corresponding to a user group.
5. Select the names of users to be deleted from the Users Under Specified User Group list, and click the right arrow to move them to the Users to Be Deleted list.

6. Click OK.

1.7.6.4. Add a role

You can add a role to a user group and assign the role to all users in the group.

Context

 Note You can add only one role to a user group.

Procedure

1. Log on to the ASCM console as an administrator.
2. In the top navigation bar, click Enterprise.
3. In the left-side navigation pane of the Enterprise page, click User Groups.
4. Click Add Role in the Actions column corresponding to a user group.
5. In the dialog box that appears, select a role.
6. Click OK.

1.7.6.5. Delete a role

You can delete existing roles.

Procedure

1. Log on to the ASCM console as an administrator.
2. In the top navigation bar, click Enterprise.
3. In the left-side navigation pane of the Enterprise page, click User Groups.
4. Click Delete Role in the Actions column corresponding to a user group.
5. In the Confirm message that appears, click OK.

1.7.6.6. Modify the name of a user group

You can modify the names of user groups.

Procedure

1. **Log on to the ASCM console** as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **User Groups**.
4. Click **Edit User Group** in the **Actions** column corresponding to a user group.
5. In the dialog box that appears, enter the new name.
6. Click **OK**.

1.7.6.7. Delete a user group

You can delete user groups that are no longer needed.

Procedure

1. **Log on to the ASCM console** as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **User Groups**.
4. Click **Delete User Group** in the **Actions** column corresponding to a user group.
5. In the **Confirm** message that appears, click **OK**.

1.7.7. Resource pools

1.7.7.1. Update associations

The Apsara Stack Cloud Management (ASCM) console can be deployed in multiple regions. You can update the associations between organizations and regions.

Procedure

1. **Log on to the ASCM console** as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Resource Pool Management**.
4. In the left-side organization tree, click the name of an organization.
5. In the corresponding region list, select the names of regions to be associated.
6. Click **Update Association**.

1.7.8. Change ownership

You can change the ownership of instances in resource sets.

Change the ownership of an instance

1. **Log on to the ASCM console** as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Change Ownership**.
4. Click the  icon to the left of the target organization and click a resource set.
5. In the resource list on the right-side of the page, set a service type and a resource type, enter an instance

ID, and then click **Search** to query the target instance.

6. You can change the ownership of a single instance or add multiple instances to the same resource set at a time.
 - **Single change:** Click **Change Ownership** in the **Actions** column corresponding to the target instance.
 - **Batch change:** Select multiple target instance IDs and click **Batch Change Ownership**.
7. In the **Change Resource Set** dialog box, select the target resource set and click **OK**.

1.8. Configurations

1.8.1. Password policies

You can configure password policies for user logons.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Configurations**.
3. In the left-side navigation pane of the **Configurations** page, click **Password Policies**.
4. On the **Password Policy** page, set the password policy parameters.

The screenshot shows the 'Password Policy' configuration page. It includes the following settings:

- Password Length:** 10 To 32 Digits (Minimum: 8)
- The Password Must Contain:** Lowercase Letters, Uppercase Letters, Digits, Special Characters
- Logon Disabled After Password Expires:** Yes, No
- Password Validity Period (Days):** 90 (The value must be 0 to 1095. The value 0 specifies that the password will not expire.)
- Password Attempts:** allows a maximum of 5 password attempts within an hour. (The value must be 0 to 32. The value 0 specifies that the password history check is disabled.)
- Password History Check:** disables the first 5 passwords. (The value must be 0 to 24. The value 0 specifies that the password history check is disabled.)

Buttons for **Save** and **Reset** are located at the bottom of the form.

To restore to the default password policy, click **Reset**.

1.8.2. Menus

1.8.2.1. Create a menu

You can create a menu and add its URL to the ASCM console for quick access.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Configurations**.
3. In the left-side navigation pane of the **Configurations** page, click **Menu Settings**.
4. On the **Main Menu** page, click **Create** in the upper-right corner.
5. In the **Create** dialog box that appears, set the menu parameters.

Create
✕

*Title:

URL:

*Console Type: asconsole oneconsole other
Different console types correspond to different service endpoints. If you select Other, the endpoint configured in the URL field is used.

Icon:

*Identifier:

Cancel

Menu parameters

Parameter	Description
Title	The display name of the menu.
URL	The URL of the menu.
Console Type	<p>Different console types correspond to different domain names.</p> <ul style="list-style-type: none"> ○ oneconsole: You only need to enter the path in the URL field. The domain name is automatically matched. ○ asconsole: You only need to enter the path in the URL field. The domain name is automatically matched. ○ other: You must enter the domain name in the URL field.
Icon	The icon displayed in the left-side navigation pane. The icon cannot be changed.
Identifier	The unique identifier of the menu in the system. This identifier can be used to indicate whether the menu is selected in the navigation bar. The identifier cannot be changed.
Order	The display order among the same-level menus. The larger the value, the lower the display order. Leave the Order field empty.
Parent Level	The displayed tree structure.
Open With	Specifies whether to open the menu in the current window or in a new window.
Description	The description of the menu.

1.8.2.2. Modify a menu

You can modify an existing menu, including the menu name, URL, icon, and menu order.

Prerequisites

Default menus cannot be modified.

Procedure

1. Log on to the ASCM console as an administrator.
2. In the top navigation bar, click Configurations.
3. In the left-side navigation pane of the Configurations page, click Menu Settings.
4. Click Edit in the Actions column corresponding to a menu.
5. In the Edit dialog box that appears, modify relevant information about the menu.

The screenshot shows an 'Edit' dialog box with the following fields and options:

- *Title:** A text input field containing a blurred value.
- URL:** A text input field containing the value `/module/config?identifier=blink&jumpUrl=true#/jump/blink`.
- *Console Type:** Radio buttons for `asconsole` (selected), `oneconsole`, and `other`. Below this is a note: "Different console types correspond to different service endpoints. If you select Other, the endpoint configured in the URL field is used."
- Icon:** A text input field containing the value `wind-rc-product-icon glyph-sc rotate-0`.
- *Identifier:** A text input field containing the value `blink`.
- *Order:** A text input field containing the value `21`, with '+' and '-' buttons to the right.
- *Parent Level:** A dropdown menu with the value `Products`.
- *Group:** A dropdown menu with the value `Please select`.
- *Open With:** Radio buttons for `Default` and `New Window` (selected).
- Description:** A text input field containing the value `Please input`.

At the bottom right of the dialog box are two buttons: **OK** and **Cancel**.

1.8.2.3. Delete a menu

You can delete menus that are no longer needed.

Prerequisites

Default menus cannot be deleted.

Procedure

1. Log on to the ASCM console as an administrator.
2. In the top navigation bar, click Configurations.
3. In the left-side navigation pane of the Configurations page, click Menu Settings.

4. Click **Delete** in the **Actions** column corresponding to a menu.
5. In the message that appears, click **OK**.

1.8.2.4. Display or hide menus

You can display or hide menus as follows:

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Configurations**.
3. In the left-side navigation pane of the **Configurations** page, click **Menu Settings**.
4. Select or clear the check box in the **Displayed** column corresponding to a menu.

1.8.3. Specifications

1.8.3.1. Specification parameters

This topic describes the specification parameters of each resource type.

OSS

Parameter	Description
Specifications	The specifications that can be configured for OSS.
Specifications Description	The description of the specifications that can be configured for OSS.

NAT Gateway

Parameter	Description
Specifications	The specifications that can be configured for NAT Gateway.
Specifications Description	The description of the specifications that can be configured for NAT Gateway.

AnalyticDB for PostgreSQL

Parameter	Description
Specifications	The specifications that can be configured for AnalyticDB for PostgreSQL.
Specifications Name	The name of the specifications that can be configured for AnalyticDB for PostgreSQL.
CPU	The total number of CPU cores that can be configured for AnalyticDB for PostgreSQL.
Memory	The memory size that can be configured for AnalyticDB for PostgreSQL.
Storage Space	The total storage size that can be configured for AnalyticDB for PostgreSQL.

Parameter	Description
Version	The version of AnalyticDB for PostgreSQL.
Node	The number of nodes that can be configured for AnalyticDB for PostgreSQL.

AnalyticDB for MySQL

Parameter	Description
Specifications	The specifications that can be configured for AnalyticDB for MySQL.
Minimum Nodes and Maximum Nodes	The minimum and maximum number of nodes that can be configured for AnalyticDB for MySQL.
Storage Space	The storage space that can be configured for AnalyticDB for MySQL.

SLB

Parameter	Description
Specifications	The specifications that can be configured for SLB.
Specifications Name	The name of the specifications that can be configured for SLB.
Maximum Connections	The maximum number of connections that can be configured for SLB.
New Connections	The number of new connections that can be configured for SLB.
QPS	The queries per second (QPS) that can be configured for SLB.
Description	The description of the specifications that can be configured for SLB.

ApsaraDB for RDS

Parameter	Description
Engine Type	The engine type that can be configured for ApsaraDB for RDS.
Minimum Storage (GB)	The minimum storage space that can be configured for ApsaraDB for RDS.
Maximum Storage (GB)	The maximum storage space that can be configured for ApsaraDB for RDS.
Specifications Name	The name of the specifications that can be configured for ApsaraDB for RDS.
Version	The version of the database engine.

Parameter	Description
CPUs	The number of CPU cores that can be configured for ApsaraDB for RDS.
Maximum Connections	The maximum number of connections that can be configured for ApsaraDB for RDS.
Storage	The storage space that can be configured for ApsaraDB for RDS.
Memory (GB)	The memory size that can be configured for ApsaraDB for RDS.
Share Type	The share type that can be configured for ApsaraDB for RDS.

DRDS

Parameter	Description
Instance Type	The instance type that can be configured for Distributed Relational Database Service (DRDS).
Instance Type Name	The name of the instance type that can be configured for DRDS.
Specifications	The specifications that can be configured for DRDS.
Specifications Name	The name of the specifications that can be configured for DRDS.

ECS

Parameter	Description
Instance Family	The instance family that is divided into different instance types based on the scenarios for which they are suitable.
Specifications Level	The level of the specifications that can be configured for ECS.
vCPUs	The maximum number of vCPUs that can be configured for ECS.
Memory (GB)	The memory size that can be configured for ECS.
Instance Specifications	The instance type that can be configured for ECS.
GPU Type	The GPU type that can be configured for ECS.
GPUs	The number of GPUs that can be configured for ECS.
Supported ENIs	The number of elastic network interfaces (ENIs) that can be configured for ECS.
Number Of Private IP Addresses	The number of private IP addresses that can be configured for ECS.

IPv6 Translation Service

Parameter	Description
Specifications	The specifications that can be configured for IPv6 Translation Service.
Specifications Name	The name of the specifications that can be configured for IPv6 Translation Service.

REDIS

Parameter	Description
Specifications Name	The name of the specifications that can be configured for KVStore for Redis.
Instance Specifications	The instance type that can be configured for KVStore for Redis.
Maximum Connections	The maximum number of connections that can be configured for KVStore for Redis.
Maximum Bandwidth	The maximum bandwidth that can be configured for KVStore for Redis.
CPUs	The number of CPU cores that can be configured for KVStore for Redis.
Version	The version of KVStore for Redis.
Architecture	The architecture of KVStore for Redis.
Billing Method	The node type of KVStore for Redis.
Service Plan	The service plan that can be configured for KVStore for Redis.

MongoDB

Parameter	Description
Specifications	The specifications that can be configured for ApsaraDB for MongoDB.
Specifications Name	The name of the specifications that can be configured for ApsaraDB for MongoDB.
Engine Type	The engine type that can be configured for ApsaraDB for MongoDB.
Version	The version of ApsaraDB for MongoDB.
Serial Number	The serial number of ApsaraDB for MongoDB.
Sequence Description	The description of the serial number of ApsaraDB for MongoDB.
Maximum Connections	The maximum number of connections that can be configured for ApsaraDB for MongoDB.
IOPS	The input/output operations per second (IOPS) of ApsaraDB for MongoDB.

Parameter	Description
Storage Space	The storage space that can be configured for ApsaraDB for MongoDB.
Minimum Storage	The minimum storage space that can be configured for ApsaraDB for MongoDB.
Maximum Storage	The maximum storage space that can be configured for ApsaraDB for MongoDB.

HITSDB

Parameter	Description
Specifications Name	The name of the specifications that can be configured for Time Series Database (TSDB).
Maximum Time Limit	The maximum duration of connections in TSDB.
TPS	The number of transactions that can be processed per second by TSDB.
Storage Space	The storage space that can be configured for TSDB.

1.8.3.2. Create specifications

You can customize specifications for each resource type.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Configurations**.
3. In the left-side navigation pane of the **Configurations** page, click **Specifications**.
4. Click the resource type for which you want to create specifications.
5. In the upper-right corner of the page, click **Create Specifications**.
6. In the dialog box that appears, set the parameters. For more information about specification parameters, see [Specification parameters](#).
7. Click **OK**.

1.8.3.3. View specifications

You can view the specifications of each resource type.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Configurations**.
3. In the left-side navigation pane of the **Configurations** page, click **Specifications**.
4. Click the resource type for which you want to view specifications.
5. On the **Resource Specifications** tab, set a region, column, and value. The corresponding information is displayed in the specifications list.
6. Click the **Existing Specifications** tab and view the existing specifications and their quantity.

1.8.3.4. Disable specifications

By default, the status of newly created specifications is Enabled.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Configurations**.
3. In the left-side navigation pane of the **Configurations** page, click **Specifications**.
4. Select the resource type for which you want to disable specifications.
5. Click **Disable** in the **Actions** column corresponding to the target specifications.
6. In the message that appears, click **OK**.

1.8.3.5. Export specifications

You can export specifications that you want to view and share.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Configurations**.
3. In the left-side navigation pane of the **Configurations** page, click **Specifications**.
4. Click the resource type for which you want to create specifications.
5. In the upper-right corner of the page, click **Export**.
6. Save the specifications file to the target path.

1.8.3.6. View specifications of each resource type in previous versions

You can view specifications of each resource type in previous versions.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Configurations**.
3. In the left-side navigation pane of the **Configurations** page, click **Specifications**.
4. On the **Specifications** page, click the resource type for which you want to view specifications.
5. Click the **Specifications History** tab. View the detailed information in the specifications list.

1.8.4. Message center

1.8.4.1. View internal messages

You can view the IDs and creation time of all internal messages, including unread and read messages.

Context

When an instance is created in a resource, all users that have read and operation permissions on this resource will receive the message that the instance is created.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, move the pointer over the  icon and click **More**.

3. In the left-side navigation pane of the **Message Center** page, click the target message scope.
 - Choose **Internal Messages > All Messages** to view all messages, including unread and read messages.
 - Choose **Internal Messages > Unread Messages** to view unread messages.
 - Choose **Internal Messages > Read Messages** to view read messages.

1.8.4.2. Mark messages as read

You can mark unread messages as read messages to facilitate message management.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, move the pointer over the  icon and click **More**.
3. In the left-side navigation pane of the **Message Center** page, choose **Internal Messages > Unread Messages**.
4. On the **Unread Messages** page, click **Mark as Read** in the **Actions** column.
5. In the **Mark as Read** message, click **OK**.

1.8.5. Resource pool management

You can modify the maximum usage of each resource.

Prerequisites

- If the physical inventory is unlimited, the logical inventory cannot be less than the used inventory.
- If the physical inventory is limited, the logical inventory cannot be less than the used inventory or greater than the physical inventory.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Configurations**.
3. In the left-side navigation pane of the **Configurations** page, click **Resource Pool Management**.
4. On the **Resource Pools** page, click the  icon in the target module and modify the number of resources.

Resource Pool Configuration

Region

ECS				VPC				OSS			
Item	Logical Inventory	Physical Inventory	Used	Item	Logical Inventory	Physical Inventory	Used	Item	Logical Inventory	Physical Inventory	Used
CPU Quota	20,000	Unknown	31	VPC Quota	10,000	Unlimited	4	OSS Quota (GB)	Not Set	Unknown	0
Memory Quota (GB)	60,000	Unknown	219								
GPU Quota	60,000	Unknown	0								
SSD Quota (GB)	600,000	Unknown	80								
Ultra Disk Quota (GB)	6,000,000	Unknown	520								

RDS-MYSQL				RDS-SQLServer				RDS-postgreSQL			
Item	Logical Inventory	Physical Inventory	Used	Item	Logical Inventory	Physical Inventory	Used	Item	Logical Inventory	Physical Inventory	Used
CPU Quota	Not Set	Unknown	0	CPU Quota	Not Set	Unknown	0	CPU Quota	Not Set	Unknown	0

Disk Quota (GB)	Not Set	Unknown	0	Disk Quota (GB)	Not Set	Unknown	0	Disk Quota (GB)	Not Set	Unknown	0

SLB				EIP				ODPS			
Item	Logical Inventory	Physical Inventory	Used	Item	Logical Inventory	Physical Inventory	Used	Item	Logical Inventory	Physical Inventory	Used
Virtual IP Quota	2,304	2,304	0	EIP Quota	10,000	Unlimited	1	CU Quota	Not Set	Unknown	0
Public Virtual IP Quota	512	512	0					Disk Quota (GB)	Not Set	Unknown	0

5. Click the icon to complete modification.

1.9. Operations

1.9.1. Quotas

1.9.1.1. Quota parameters

This topic describes the quota parameters of each service.

An organization administrator can set resource quotas and create resources within the allowed quotas for the organization. When the quotas for the organization are used up, the system does not allow the organization administrator to create more resources for the organization. To create more resources, you must first increase the quotas for the organization.

If no quotas are set, you can create an unlimited amount of resources.

ECS

Parameter	Description
CPU Quota	The total number of CPU cores that you can configure for ECS and the number of used cores.
Memory Quota (GB)	The total memory size that you can configure for ECS.
GPU Quota	The total number of GPU cores that you can configure for ECS.
SSD Quota (GB)	The total SSD capacity that you can configure for ECS.
Ultra Disk Quota (GB)	The total number of cloud disks that you can configure for an ECS instance.

VPC

Parameter	Description
VPC Quota	The maximum number of VPCs that you can configure.

OSS

Parameter	Description
OSS Quota	The maximum capacity that you can allocate for OSS.

RDS-MySQL

Parameter	Description
CPU Quota	The total number of CPU cores that you can configure for ApsaraDB RDS for MySQL and the number of used cores.
Memory Quota (GB)	The total memory size that you can configure for ApsaraDB RDS for MySQL.
Disk Quota (GB)	The total storage size that you can configure for ApsaraDB RDS for MySQL.

RDS-SQLServer

Parameter	Description
CPU Quota	The total number of CPU cores that you can configure for ApsaraDB RDS for SQL Server and the number of used cores.
Memory Quota (GB)	The total memory size that you can configure for ApsaraDB RDS for SQL Server.
Disk Quota (GB)	The total storage size that you can configure for ApsaraDB RDS for SQL Server.

RDS-PostgreSQL

Parameter	Description
CPU Quota	The total number of CPU cores that you can configure for ApsaraDB RDS for PostgreSQL and the number of used cores.
Memory Quota (GB)	The total memory size that you can configure for ApsaraDB RDS for PostgreSQL.
Disk Quota (GB)	The total storage size that you can configure for ApsaraDB RDS for PostgreSQL.

SLB

Parameter	Description
Virtual IP Quota	The maximum number of internal IP addresses that you can configure for SLB.
Public Virtual IP Quota	The maximum number of public IP addresses that you can configure for SLB.

EIP

Parameter	Description
EIP Quota	The maximum number of EIPs that you can configure.

ODPS

Parameter	Description
CU Quota	The total number of capacity units (CUs) that you can configure for MaxCompute.
Disk Quota (GB)	The total storage size that you can configure for MaxCompute.

DRDS

Parameter	Description
CPU Quota	The total number of CPUs that you can configure for DRDS.

NAS

Parameter	Description
Disk Quota (TB)	The total storage size that you can configure for Apsara File Storage NAS.

GPDB

Parameter	Description
CPU Quota	The total number of CPU cores that you can configure for AnalyticDB for PostgreSQL and the number of used cores.
Memory Quota (GB)	The total memory size that you can configure for AnalyticDB for PostgreSQL.
Disk Quota (GB)	The total storage size that you can configure for AnalyticDB for PostgreSQL.

ADB

Parameter	Description
CPU Quota	The total number of CPU cores that you can configure for AnalyticDB for MySQL and the number of used cores.
Memory Quota (GB)	The total memory size that you can configure for AnalyticDB for MySQL.
Disk Quota (GB)	The total storage size that you can configure for AnalyticDB for MySQL.

1.9.1.2. Set quotas for a cloud service

The Apsara Stack Cloud Management (ASCM) console allows you to set quotas to properly allocate resources among organizations.

Prerequisites

You must set quotas for a parent organization before you can set quotas for its subordinate organizations.

Context

If the parent organization has quotas (except when the parent organization is a level-1 organization), the available quotas for a subordinate organization are equal to the quotas for the parent organization minus the quotas for other subordinate organizations.

This topic describes how to set quotas for ECS. You can set quotas for other cloud resources in a similar manner.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Operations**.
3. In the left-side navigation pane of the **Operations** page, click **Quotas**.
4. In the left-side navigation tree, click the name of the organization for which you want to create cloud resources.
5. Select the cloud service for which you want to set quotas. For this example, **ECS** is selected.
6. In the upper-right corner of the quota section, click **Set**.
7. Set the total quotas and click **Save**.

For more information about quota parameters, see [Quota parameters](#).

1.9.1.3. Modify quotas

Administrators can adjust quotas for cloud resources based on organizational requirements.

Context

This topic describes how to modify quotas for ECS. You can modify quotas for other cloud resources in a similar manner.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Operations**.
3. In the left-side navigation pane of the **Operations** page, click **Quotas**.
4. In the left-side navigation tree, click the name of the organization for which you want to create cloud resources.
5. Select the Apsara Stack service for which you want to modify quotas. For this example, **ECS** is selected.
6. In the upper-right corner of the quota area, click **Modify**.
7. Set the total quotas and click **Save**.

For more information about quota parameters, see [Quota parameters](#).

1.9.1.4. Reset quotas

Administrators can reset quotas as needed.

Prerequisites

Before deleting a quota for an organization, make sure that no subordinate organizations have any quotas.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Operations**.

3. In the left-side navigation pane of the **Operations** page, click **Quotas**.
4. In the left-side organization navigation tree, click the name of the target organization.
5. Select the cloud service for which you want to reset quotas. For this example, **ECS** is selected.
6. In the upper-right corner of the quota section, click **Reset**.
7. In the message that appears, click **OK**.

1.9.2. Usage statistics

1.9.2.1. View the usage statistics of cloud resources

The ASCM console displays statistics about the number of resource instances that run in the Apsara Stack environment by time, organization, resource set, or region. You can also export statistical reports from the ASCM console.

Context

The cloud resources that can be metered include ECS, VPC, SLB, OSS, ApsaraDB RDS for MySQL, EIP, Apsara File Storage NAS, Tablestore, PolarDB-X, KVStore for Redis, AnalyticDB for MySQL, AnalyticDB for PostgreSQL, ApsaraDB for MongoDB, Message Queue, ApsaraDB RDS for PostgreSQL, and ApsaraDB RDS for SQL Server.

This topic describes how to set quotas for ECS. You can set quotas for other cloud resources in a similar manner.

Procedure

1. **Log on to the ASCM console** as an administrator.
2. In the top navigation bar, click **Operations**.
3. In the left-side navigation pane of the **Operations** page, click **Usage Statistics**.
4. In the **Resource Type** section, click **Elastic Compute Service ECS**.
5. In the **Search Conditions** section, set **Time Period**, **Organization**, **Resource Set**, **Region**, and **Instance ID** to filter resources. You can view the statistics in the console or click **Export** in the upper-right corner to export the statistics to your personal computer in the `.xls` format.

 **Note** In the console, you can view or export up to 1,000 statistical records to a `.xls` file. Use the statistics query API to obtain more statistical data.

The exported file is named `<Resource type name>.xls`. Find the downloaded file from the download path of the browser.

1.10. Security

1.10.1. View operation logs

You can view operation logs to obtain up-to-date information about various resources and functional modules in the Apsara Stack Cloud Management (ASCM) console. You can also export operation logs to your personal computer.

Procedure

1. **Log on to the ASCM console** as a security administrator.
2. In the top navigation bar, click **Security**.
3. You can filter logs by username, object, level, source IP address, details, start time, and end time.

The following table describes the fields in the query result.

Fields in the query result

Log field	Description
Username	The name of the operator.
Object	The Apsara Stack service on which operations are performed. The operations include creating, modifying, deleting, querying, updating, binding, unbinding, enabling, and disabling service instances, applying for and releasing service instances, and changing the ownership of service instances.
Level	The operation level. Valid values: INFO, DEBUG, and ERROR.
Source IP	The IP address of the operator.
Details	The brief introduction of the operation.
Start Time	The time when the operation started.
End Time	The time when the operation ended.

- (Optional) Click **Export** to export the logs displayed on the current page to your personal computer in `xls` format.

The exported log file is named `log.xls` and stored in the `C:\Users\Username\Downloads` directory.

1.11. RAM

1.11.1. RAM introduction

Resource Access Management (RAM) is a resource access control service provided by Apsara Stack.

You can use RAM to manage users and control which resources are accessible to employees, systems, and applications.

RAM provides the following features:

- RAM role

To authorize a cloud service in a level-1 organization to use other resources in the organization, you must create a RAM role. This role specifies the operations that the cloud service can perform on resources.

Only system administrators and level-1 organization administrators can create RAM roles.

- User group

You can create multiple users within an organization and grant them different operation permissions on cloud resources.

You can create RAM user groups to classify and authorize RAM users within your Apsara Stack tenant account. This simplifies the management of RAM users and their permissions.

You can create RAM permission policies to grant different operation permissions to different user groups.

1.11.2. Permission policy structure and syntax

This topic describes the structure and syntax used to create or update permission policies in Resource Access Management (RAM).

Policy characters and usage rules

- Characters in a policy

- The following characters are JSON tokens and are included in policies: `{ } [] " , : .`
- The following characters are special characters in the syntax and are not included in policies: `= < > () |`.

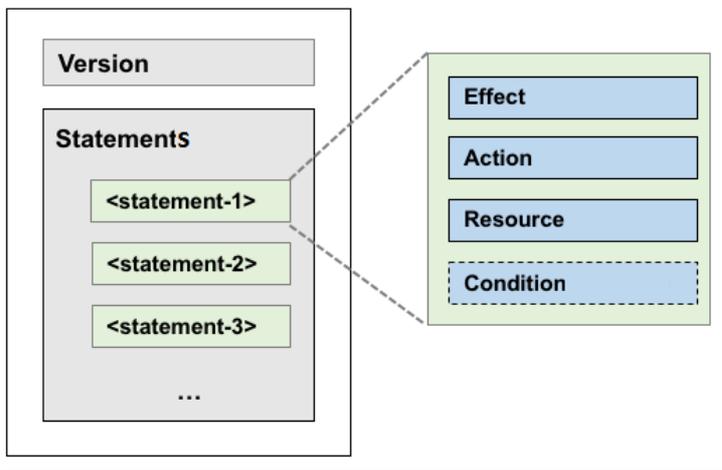

- Use of characters

- If an element can have more than one value, you can perform the following operations:
 - Separate multiple values by using commas (,) as delimiters between each value and use an ellipsis (...) to describe the remaining values. Example: [<action_string>, <action_string>, ...] .
 - Include only one value. Examples: "Action": [<action_string>] and "Action": <action_string> .
- A question mark (?) following an element indicates that the element is optional. Example: <condition_block ?> .
- A vertical bar (|) between elements indicates multiple options. Example: ("Allow" | "Deny") .
- Elements that must be text strings are enclosed in double quotation marks ("). Example: <version_block> = "Version" : ("1") .

Policy structure

The policy structure includes the following components:

- The version number.
- A list of statements. Each statement contains the following elements: Effect, Action, Resource, and Condition. The Condition element is optional.

Policy syntax

```

policy = {
  <version_block>,
  <statement_block>
}
<version_block> = "Version" : ("1")
<statement_block> = "Statement" : [ <statement>, <statement>, ... ]
<statement> = {
  <effect_block>,
  <action_block>,
  <resource_block>,
  <condition_block? >
}
<effect_block> = "Effect" : ("Allow" | "Deny")
<action_block> = ("Action" | "NotAction") :
  ("*" | [<action_string>, <action_string>, ...])
<resource_block> = ("Resource" | "NotResource") :
  ("*" | [<resource_string>, <resource_string>, ...])
<condition_block> = "Condition" : <condition_map>
<condition_map> = {
  <condition_type_string> : {
    <condition_key_string> : <condition_value_list>,
    <condition_key_string> : <condition_value_list>,
    ...
  },
  <condition_type_string> : {
    <condition_key_string> : <condition_value_list>,
    <condition_key_string> : <condition_value_list>,
    ...
  }, ...
}
<condition_value_list> = [<condition_value>, <condition_value>, ...]
<condition_value> = ("String" | "Number" | "Boolean")

```

Description:

- The current policy version is 1.
- The policy can have multiple statements.
 - The effect of each statement can be either `Allow` or `Deny` .

 **Note** In a statement, both the Action and Resource elements can have multiple values.

- Each statement can have its own conditions.

 **Note** A condition block can contain multiple conditions with different operators and logical combinations of these conditions.

- You can attach multiple policies to a RAM user. If policies that apply to a request include an `Allow` statement and a `Deny` statement, the Deny statement overrides the Allow statement.

- Element value:
 - If an element value is a number or Boolean value, it must be enclosed in double quotation marks ("") in the same way as strings.
 - If an element value is a string, characters such as the asterisk (*) and question mark (?) can be used for fuzzy matching.
 - The asterisk (*) indicates any number (including zero) of allowed characters. For example, `ecs:Describe*` indicates all ECS API operations that start with `Describe` .
 - The question mark (?) indicates an allowed character.

Policy format check

Policies are stored in RAM as JSON documents. When you create or update a policy, RAM first checks whether the JSON format is valid.

- For more information about JSON syntax standards, see [RFC 7159](#).
- We recommend that you use tools such as JSON validators and editors to check whether the policies meet JSON syntax standards.

1.11.3. RAM roles

1.11.3.1. View basic information about a RAM role

You can view basic information about a RAM role, including its user groups and existing permission policies.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Roles**.
4. On the **Roles** page, click the name of the target RAM role.
5. In the basic information section, click the **User Groups and Permissions** tabs to view relevant information.

1.11.3.2. Create a RAM role

To authorize a cloud service in a level-1 organization to use other resources in the organization, you must create a RAM role. This role contains the operations that the cloud service can perform on resources.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Roles**.
4. In the upper-right corner of the page, click **Create RAM Role**.
5. On the **Roles - Create RAM Role** page that appears, set **Role Name** and **Description**.
6. Click **Create**.

1.11.3.3. Add a permission policy

To use a cloud service to access other cloud resources, you must create a permission policy and attach it to a user group.

Procedure

1. [Log on to the ASCM console](#) as an administrator.

2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Roles**.
4. In the role name list, click **More** in the **Actions** column corresponding to a RAM role, and choose **Modify** from the shortcut menu to go to the **Roles** page.
5. Click the **Permissions** tab.
6. Click **Add Permission Policy**.
7. In the dialog box that appears, enter information about the permission policy.

For more information about how to enter the policy content, see [Permission policy structure and syntax](#).

1.11.3.4. Modify the content of a RAM permission policy

You can modify the content of a RAM permission policy as needed.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Roles**.
4. In the role list, click **More** in the **Actions** column corresponding to a RAM role, and choose **Modify** from the shortcut menu to go to the **Roles** page.
5. Click the **Permissions** tab.
6. Click the name of a permission policy in the **Permission Policy Name** column.
7. In the **Modify Permission Policy** dialog box that appears, modify the relevant information and click **OK**. For more information about how to modify the policy content, see [Permission policy structure and syntax](#).

1.11.3.5. Modify the name of a RAM permission policy

You can modify the name of a RAM permission policy as needed.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Roles**.
4. In the role name list, click **More** in the **Actions** column corresponding to a RAM role, and choose **Modify** from the shortcut menu to go to the **Roles** page.
5. Click the **Permissions** tab. Click the name of a permission policy in the **Permission Policy Name** column.
6. In the **Modify Permission Policy** dialog box that appears, modify the permission policy name.

1.11.3.6. Add a RAM role to a user group

You can bind RAM roles to user groups as needed.

Prerequisites

You must create a user group before RAM roles can be added. If no user groups have been created, see [Add a role](#).

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Roles**.
4. In the role name list, click **More** in the **Actions** column corresponding to a RAM role, and choose **Modify** from the shortcut menu to go to the **Roles** page.
5. Click the **User Groups** tab.
6. Click **Add User Group**. In the dialog box that appears, select a user group.
7. Click **OK**.

1.11.3.7. Grant permissions to a RAM role

When you grant permissions to a RAM role, all users in the user groups that are assigned this role will share the granted permissions.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Roles**.
4. In the role name list, click **More** in the **Actions** column corresponding to a RAM role, and choose **Modify** from the shortcut menu to go to the **Roles** page.
5. Click the **Permissions** tab.
6. Click **Select Existing Permission Policy**.
7. In the dialog box that appears, select a RAM permission policy and click **OK**. If no RAM permission policies are available, see [Add a permission policy](#).

1.11.3.8. Remove permissions from a RAM role

You can remove permissions that are no longer needed from RAM roles.

Procedure

1. [Log on to the ASCM console](#) as an administrator.

2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Roles**.
4. In the role name list, click **More** in the **Actions** column corresponding to a RAM role, and choose **Modify** from the shortcut menu to go to the **Roles** page.
5. Click the **Permissions** tab.
6. Click **Remove** in the **Actions** column corresponding to the permission policy that you want to remove.

1.11.3.9. Modify a RAM role name

Administrators can modify the names of RAM roles.

Context

 **Note** The name of a preset role cannot be modified.

Procedure

1. **Log on to the ASCM console** as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Roles**.
4. In the role name list, click **More** in the **Actions** column corresponding to a RAM role, and choose **Modify** from the shortcut menu to go to the **Roles** page.
5. Move the pointer over the role name and click  to enter a new role name.

1.11.3.10. Delete a RAM role

This topic describes how to delete a RAM user.

Prerequisites

Before you delete a RAM role, make sure that no policies are attached to the RAM role.

Procedure

1. **Log on to the ASCM console** as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Roles**.
4. In the role name list, click **More** in the **Actions** column corresponding to a RAM role, and choose **Delete** from the shortcut menu.
5. In the message that appears, click **OK**.

1.11.4. RAM authorization policies

1.11.4.1. Create a RAM role

You can create authorization policies and grant them to organizations as needed.

Procedure

1. **Log on to the ASCM console** as an administrator.
2. In the top navigation bar, click **Configurations**.
3. In the left-side navigation pane of the **Configurations** page, click **RAM Roles**.
4. In the upper-right corner of the page, click **Create RAM User**.

5. On the **Create RAM User** page, set **Organization and Service**.
6. Click **OK**.

1.11.4.2. View the details of a RAM role

You can view the details of a RAM role, including its role name, creation time, description, and Alibaba Cloud Resource Name (ARN).

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Configurations**.
3. In the left-side navigation pane of the **Configurations** page, click **RAM Roles**.
4. On the **RAM Users** page, set **Role Name**, **Service Name**, or **Organization Name**, and click **Search** in the upper-right corner. To perform another search, click **Clear**.
5. Find the target RAM role and click **Details** in the **Actions** column.

1.11.4.3. View RAM authorization policies

You can view the details of a RAM authorization policy, including its policy name, policy type, default version, description, association time, and policy content.

Prerequisites

A RAM authorization policy is created. For more information, see [Create a RAM role](#).

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the top navigation bar, click **Configurations**.
3. In the left-side navigation pane of the **Configurations** page, click **RAM Roles**.
4. On the **RAM Users** page, set **Role Name** or **Service Name**, and click **Search** in the upper-right corner. To perform another search, click **Clear**.
5. Find the RAM role that you want to view and click **Details** in the **Actions** column.
6. Click the **Role Policy** tab to view information about the role authorization policy. Click **Details** in the **Actions** column to view the policy details.

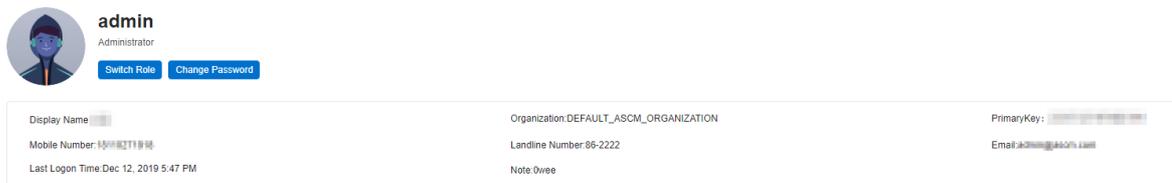

1.12. Personal information management

1.12.1. Modify personal information

You can modify your personal information to keep it up-to-date.

Procedure

1. [Log on to the ASCM console](#) as an administrator.
2. In the upper-right corner of the homepage, move the pointer over the user profile picture and choose **User Information** from the shortcut menu.

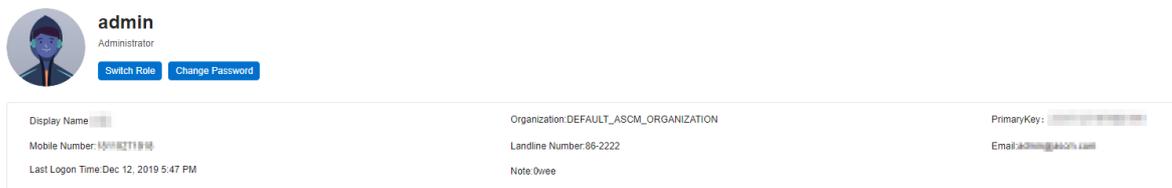

3. Click  next to the item you want to modify.
4. In the Modify User Information dialog box that appears, modify the relevant information.
5. Click OK.

1.12.2. Change your logon password

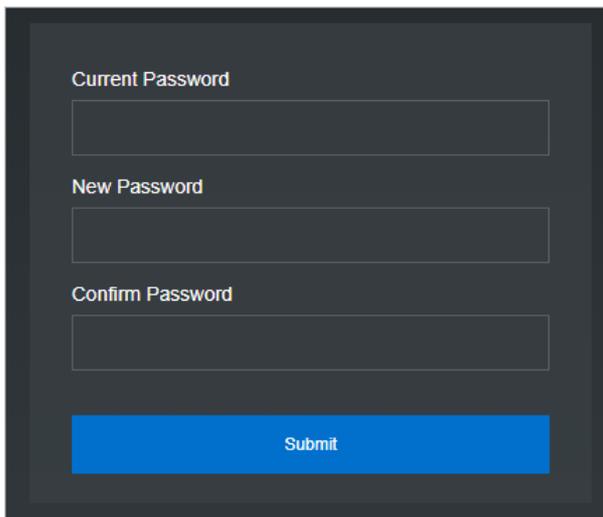

To improve security, you must change your logon password in a timely manner.

Procedure

1. Log on to the ASCM console as an administrator.
2. In the upper-right corner of the homepage, move the pointer over the user profile picture and choose User Information from the shortcut menu.

3. Click Change Password. On the page that appears, set Current Password, New Password, and Confirm Password.

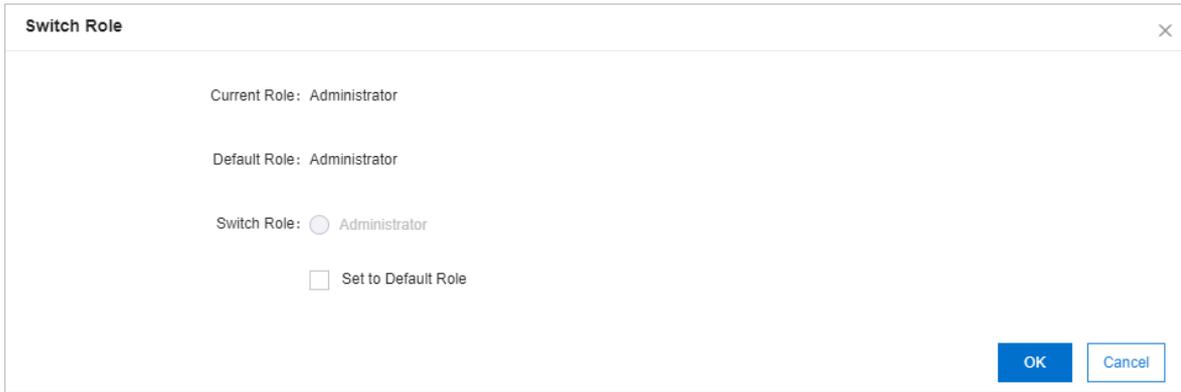

4. Click Submit.

1.12.3. Switch the current role

You can switch the scope of your current role.

Procedure

1. Log on to the ASCM console as an administrator.
2. In the upper-right corner of the homepage, move the pointer over the user profile picture and choose User Information from the shortcut menu.
3. Click Switch Role.
4. In the Switch Role dialog box that appears, select the role that you want to switch to.

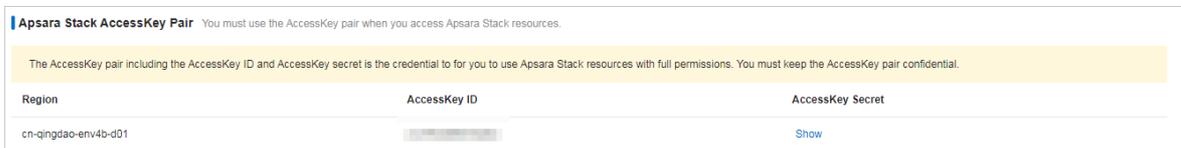

You can also switch back to the default role.

1.12.4. View the AccessKey pair of your Apsara Stack tenant account

To secure cloud resources, the system must verify the identity of visitors and ensure that they have the relevant permissions. You must obtain the AccessKey ID and AccessKey secret of your personal account to access cloud resources.

Procedure

1. Log on to the [ASCM console](#) as an administrator.
2. In the upper-right corner of the homepage, move the pointer over the user profile picture and choose **User Information** from the shortcut menu.
3. In the **Apsara Stack AccessKey Pair** section, view your AccessKey pair.

Note The AccessKey pair is made up of the AccessKey ID and AccessKey secret. These credentials provide you full permissions on Apsara Stack resources. You must keep the AccessKey pair confidential.

2. Elastic Compute Service (ECS)

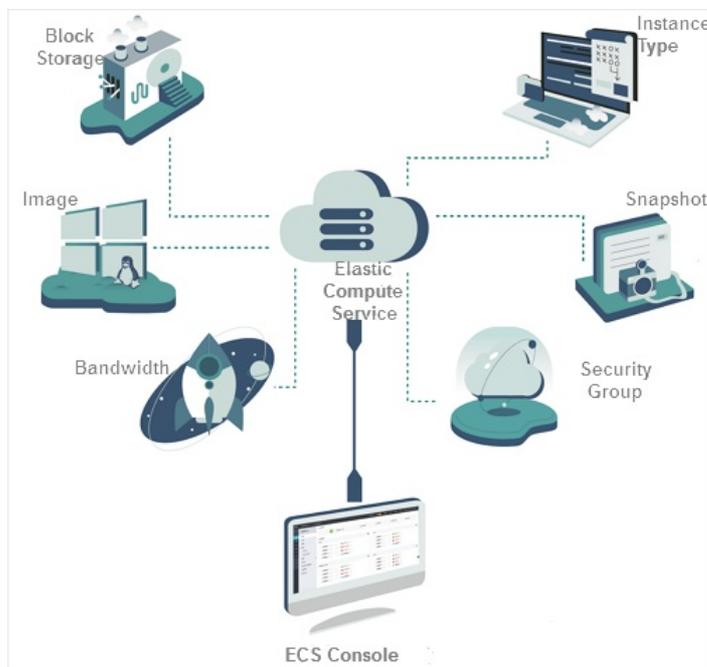

2.1. What is ECS?

2.1.1. Overview

Elastic Compute Service (ECS) is a type of computing service that features elastic processing capabilities. Compared with physical servers, ECS can be more efficiently managed and is more user-friendly. You can create instances, resize disks, and add or release any number of ECS instances at any time based on your business needs.

An ECS instance is a virtual computing environment that contains the most basic components of computers such as the CPU, memory, and storage. Users perform operations on ECS instances. Instances are core components of ECS, and operations can be performed on instances by using the ECS console. Other resources such as block storage, images, and snapshots can only be used after they are integrated into ECS instances. For more information, see [ECS components](#).

ECS components

2.1.2. Instance types

An ECS instance is the smallest unit that can provide compute capabilities and services for your business. The compute capabilities of instances vary by instance type.

An ECS instance type defines the basic properties of ECS instances, such as CPU, clock speed, and memory. In addition to the instance type, you must also configure the Block Storage devices, image, and network type when you create an ECS instance. The following table describes instance families and lists the instance types of each instance family.

Instance family	Instance type	vCPUs	Memory (GiB)	Local storage (GiB)	Bandwidth (Gbit/s)	Packet forwarding rate (Kpps)	NIC queues	ENIs (including one primary ENI)

Instance family	Instance type	vCPUs	Memory (GiB)	Local storage (GiB)	Bandwidth (Gbit/s)	Packet forwarding rate (Kpps)	NIC queues	ENIs (including one primary ENI)
n4	ecs.n4.small	1	2.0	N/A	0.5	50	1	1
	ecs.n4.large	2	4.0	N/A	0.5	100	1	1
	ecs.n4.xlarge	4	8.0	N/A	0.8	150	1	2

	ecs.gn6i-c14g1.14xlarge	56	224.0	N/A	20.0	4,000	12	8	4 × T4
	ecs.gn6i-c20g1.5xlarge	20	80.0	N/A	10.0	1,500	4	6	1 × T4
	ecs.gn6i-c20g1.10xlarge	40	160.0	N/A	20.0	3,000	8	8	2 × T4
gn6v	ecs.gn6v-c8g1.2xlarge	8	32.0	N/A	2.5	800	4	4	1 × NVIDIA V100
	ecs.gn6v-c8g1.8xlarge	32	128.0	N/A	10.0	2,000	8	8	4 × NVIDIA V100
	ecs.gn6v-c8g1.16xlarge	64	256.0	N/A	20.0	2,500	16	8	8 × NVIDIA V100
sccgn6p	ecs.sccgn6p.24xlarge	96	768.0	N/A	30.0	4,500	8	32	8 × NVIDIA V100

The following table describes shared instance families that support IPv6.

Instance family	Instance type	vCPUs	Memory (GiB)	Local storage (GiB)	Bandwidth (Gbit/s)	Packet forwarding rate (Kpps)	IPv6 support	NIC queues	ENIs (including one primary ENI)
n4v2	ecs.n4v2.small	1	2.0	N/A	0.5	50	Yes	1	1
	ecs.n4v2.large	2	4.0	N/A	0.5	100	Yes	1	1
	ecs.n4v2.xlarge	4	8.0	N/A	0.8	150	Yes	1	2
	ecs.n4v2.2xlarge	8	16.0	N/A	1.2	300	Yes	1	2
	ecs.n4v2.4xlarge	16	32.0	N/A	2.5	400	Yes	1	2
	ecs.n4v2.8xlarge	32	64.0	N/A	5.0	500	Yes	1	2
mn4v2	ecs.mn4v2.small	1	4.0	N/A	0.5	50	Yes	1	1
	ecs.mn4v2.large	2	8.0	N/A	0.5	100	Yes	1	1
	ecs.mn4v2.xlarge	4	16.0	N/A	0.8	150	Yes	1	2
	ecs.mn4v2.2xlarge	8	32.0	N/A	1.2	300	Yes	1	2
	ecs.mn4v2.4xlarge	16	64.0	N/A	2.5	400	Yes	1	2
	ecs.mn4v2.8xlarge	32	128.0	N/A	5.0	500	Yes	2	8
xn4v2	ecs.xn4v2.small	1	1.0	N/A	0.5	50	Yes	1	1
e4v2	ecs.e4v2.small	1	8.0	N/A	0.5	50	Yes	1	1
	ecs.e4v2.large	2	16.0	N/A	0.5	100	Yes	1	1
	ecs.e4v2.xlarge	4	32.0	N/A	0.8	150	Yes	1	2
	ecs.e4v2.2xlarge	8	64.0	N/A	1.2	300	Yes	1	3
	ecs.e4v2.4xlarge	16	128.0	N/A	2.5	400	Yes	1	8

The following table describes burstable instance families.

Instance family	Instance type	vCPUs	Memory (GiB)	Baseline CPU computing performance	CPU credits per hour	Max CPU credit balance	Local storage (GiB)	Bandwidth (Gbit/s)	Packet forwarding rate (Kpps)	NIC queues	ENIs (including one primary ENI)
t5	ecs.t5- lc2m1.nano	1	0.5	20%	12	288	N/A	0.1	40	1	1
	ecs.t5- lc1m1.small	1	1.0	20%	12	288	N/A	0.2	60	1	1
	ecs.t5- lc1m2.small	1	2.0	20%	12	288	N/A	0.2	60	1	1
	ecs.t5- lc1m2.large	2	4.0	20%	24	576	N/A	0.4	100	1	1
	ecs.t5- lc1m4.large	2	8.0	20%	24	576	N/A	0.4	100	1	1
	ecs.t5- c1m1.large	2	2.0	25%	30	720	N/A	0.5	100	1	1
	ecs.t5- c1m2.large	2	4.0	25%	30	720	N/A	0.5	100	1	1
	ecs.t5- c1m4.large	2	8.0	25%	30	720	N/A	0.5	100	1	1
	ecs.t5- c1m1.xlarge	4	4.0	25%	60	1,440	N/A	0.8	200	1	2
	ecs.t5- c1m2.xlarge	4	8.0	25%	60	1,440	N/A	0.8	200	1	2
	ecs.t5- c1m4.xlarge	4	16.0	25%	60	1,440	N/A	0.8	200	1	2

Instance family	Instance type	vCPUs	Memory (GiB)	Baseline CPU computing performance	CPU credits per hour	Max CPU credit balance	Local storage (GiB)	Bandwidth (Gbit/s)	Packet forwarding rate (Kpps)	NIC queues	ENIs (including one primary ENI)
	ecs.t5-c1m1.2xlarge	8	8.0	25%	120	2,880	N/A	1.2	400	1	2
	ecs.t5-c1m2.2xlarge	8	16.0	25%	120	2,880	N/A	1.2	400	1	2
	ecs.t5-c1m4.2xlarge	8	32.0	25%	120	2,880	N/A	1.2	400	1	2
	ecs.t5-c1m1.4xlarge	16	16.0	25%	240	5,760	N/A	1.2	600	1	2
	ecs.t5-c1m2.4xlarge	16	32.0	25%	240	5,760	N/A	1.2	600	1	2

The following table describes the ecs.anyshare custom instance type.

Instance family	vCPUs (x)	Memory (GiB)	Bandwidth (Gbit/s)	Packet forwarding rate (Kpps)	NIC queues	ENIs (including one primary ENI)	Disk bandwidth (Gbit/s)
Custom instance type ecs.anyshare	$0 < x \leq 2$	1 to 16	0.5	100	1	2	0.5
	$2 < x \leq 4$	2 to 32	0.8	$100 + (x - 2)/0.2$	1	2	0.8
	$4 < x \leq 8$	4 to 64	$0.8 + (x - 5)/4$	$200 + (x - 4)/0.2$	1	3	$0.8 + (x - 5)/4$
	$8 < x \leq 12$	8 to 96	$1.5 + (x - 8)/8$	$400 + (x - 8)/0.8$	2	3	$1.5 + (x - 8)/4$
	$12 < x \leq 16$	12 to 128	$2 + (x - 12)/4$	$450 + (x - 12)/0.8$	3	4	1
	$16 < x \leq 24$	16 to 196	$3 + (x - 16)/8$	$500 + (x - 16)/0.8$	3	5	$1 + (x - 16)/8$

Instance family	vCPUs (x)	Memory (GiB)	Bandwidth (Gbit/s)	Packet forwarding rate (Kpps)	NIC queues	ENIs (including one primary ENI)	Disk bandwidth (Gbit/s)
	$24 < x \leq 32$	24 to 256	$4 + (x - 24)/8$	$600 + (x - 24)/0.4$	4	6	$2 + (x - 24)/8$
	$x > 32$	32 to 352	$\min(5 + (x - 32)/8, 10)$	$\min(800 + (x - 32)/0.8, 1200)$	4	8	$\min(3 + (x - 32)/8, 8)$

The following instance types are applicable only in environments that are upgraded from Apsara Stack V2 to V3.

Instance family	Instance type	vCPUs	Memory (GiB)
n1	ecs.n1.tiny	1	1.0
	ecs.n1.small	1	2.0
	ecs.n1.medium	2	4.0
	ecs.n1.large	4	8.0
	ecs.n1.xlarge	8	16.0
	ecs.n1.3xlarge	16	32.0
	ecs.n1.7xlarge	32	64.0
n2	ecs.n2.small	1	4.0
	ecs.n2.medium	2	8.0
	ecs.n2.large	4	16.0
	ecs.n2.xlarge	8	32.0
	ecs.n2.3xlarge	16	64.0
	ecs.n2.7xlarge	32	128.0
e3	ecs.e3.small	1	8.0
	ecs.e3.medium	2	16.0
	ecs.e3.large	4	32.0
	ecs.e3.xlarge	8	64.0
	ecs.e3.3xlarge	16	128.0
c1	ecs.c1.small	8	8.0
	ecs.c1.large	8	16.0
c2	ecs.c2.medium	16	16.0
	ecs.c2.large	16	32.0

Instance family	Instance type	vCPUs	Memory (GiB)
	ecs.c2.xlarge	16	64.0
m1	ecs.m1.medium	4	16.0
	ecs.m1.xlarge	8	32.0
m2	ecs.m2.medium	4	32.0
s1	ecs.s1.small	1	2.0
	ecs.s1.medium	1	4.0
	ecs.s1.large	1	8.0
s2	ecs.s2.small	2	2.0
	ecs.s2.large	2	4.0
	ecs.s2.xlarge	2	8.0
	ecs.s2.2xlarge	2	16.0
s3	ecs.s3.medium	4	4.0
	ecs.s3.large	4	8.0
t1	ecs.t1.small	1	1.0

2.1.3. Instance lifecycle

The lifecycle of an ECS instance begins when the instance is created and ends when the instance is released. This topic describes the instance states in the ECS console, state attributes, and corresponding instance states in API responses.

The following table describes the states that an ECS instances may go through during its lifecycle.

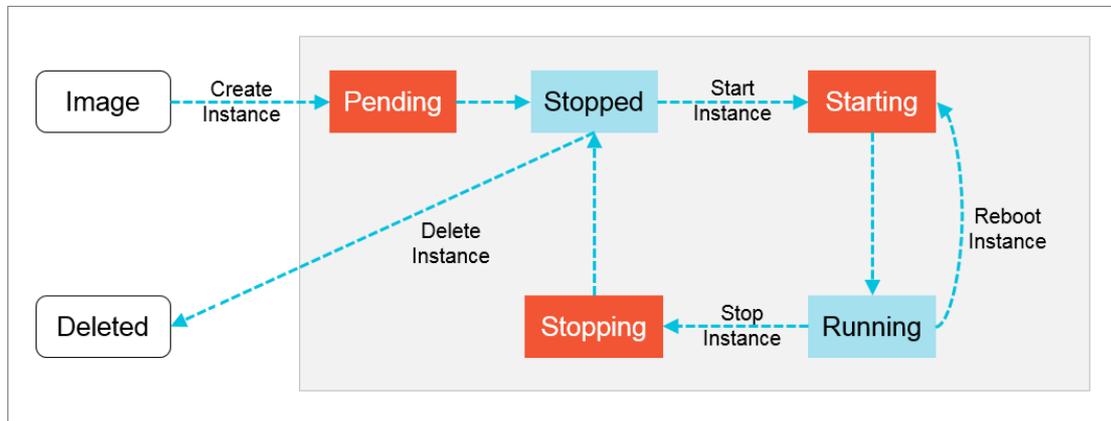

Instance states

State	State attribute	Description	State in an API response
Instance being created	Intermediate	The instance is being created and waiting to be started. If an instance remains in the Instance being created state for an extended period of time, an exception has occurred.	Pending
Starting	Intermediate	When you start or restart an instance by using the ECS console or calling an API operation, the instance enters this state before it enters the Running state. If an instance remains in the Starting state for an extended period of time, an exception has occurred.	Starting
Running	Stable	While an instance is in the Running state, the instance can function normally and can accommodate your business needs.	Running

State	State attribute	Description	State in an API response
Stopping	Intermediate	When you stop an instance by using the ECS console or calling an API operation, the instance enters this state before it enters the Stopped state. If an instance remains in the Stopping state for an extended period of time, an exception has occurred.	Stopping
Stopped	Stable	An instance enters this state when it is stopped. An instance in the Stopped state cannot provide external services.	Stopped
Reinitializing	Intermediate	When you re-initialize the system disk or a data disk of an instance by using the ECS console or calling an API operation, the instance enters this state before it enters the Running state. If an instance remains in the Reinitializing state for an extended period of time, an exception has occurred.	Stopped
Changing system disk	Intermediate	When you replace the system disk of an instance by using the ECS console or calling an API operation, the instance enters the Changing system disk state before it enters the Running state. If an instance remains in the Changing system disk state for an extended period of time, an exception has occurred.	Stopped

Instance states describes the relationships between instance states in the ECS console and instance states in API responses. The following figure shows the transitions between instance states in API responses.

Transitions between instance states in API responses

2.2. Instructions

2.2.1. Restrictions

Learn about restrictions before performing operations on ECS instances.

- Do not upgrade the kernel or operating system version of an ECS instance.
- Do not start SELinux for Linux systems except CentOS and RedHat.
- Do not detach PVDriver.
- Do not arbitrarily modify the MAC address of the network interface.

2.2.2. Suggestions

Consider the following suggestions to make more efficient use of ECS:

- ECS instances with 4 GiB or higher memory must use a 64-bit operating system. 32-bit operating systems have a maximum of 4 GiB of memory addressing.
- A 32-bit Windows operating system supports a maximum of 4 CPU cores.
- To ensure service continuity and avoid failover-induced service unavailability, we recommend that you configure service applications to boot automatically at system startup.

2.2.3. Limits

Before using ECS instances, you must be familiar with the limits of instance families.

General limits

- Windows operating systems support a maximum of 64 vCPUs in instance specifications.
- ECS instances do not support the installation of virtualization software and secondary virtualization.
- Sound card applications are not supported. Only GPU instances support virtual sound cards. External hardware devices, such as hardware dongles, USB flash drives, external hard disks, and bank U keys, cannot be directly connected to ECS instances.
- ECS does not support multicast protocols. If multicasting services are required, we recommend that you use unicast instead.

Instance family ga1

To create a ga1 instance, you must use one of the following images pre-installed with drivers:

- Ubuntu 16.04 with an AMD GPU driver pre-installed
- Windows Server 2016 English version with an AMD GPU driver pre-installed
- Windows Server 2008 R2 English version with an AMD GPU driver pre-installed

Note:

- A ga1 instance uses an optimized driver provided by Alibaba Cloud and AMD. The driver is installed in images provided by Alibaba Cloud and is currently unavailable for download.
- If the GPU driver malfunctions due to improper removal of related components, you need to replace the system disk to restore GPU related functions.

 **Note** This operation causes data loss.

- If the driver malfunctions because an improper image is selected, you need to replace the system disk to reselect an image with an AMD GPU driver pre-installed.
- For Windows Server 2008 or earlier, you cannot connect to the VNC after the GPU driver takes effect. The VNC is irresponsive with a black screen or stuck at the splash screen. You can use other methods such as Remote Desktop Protocol (RDP) to access the system.
- RDP does not support DirectX, OpenGL, or other related applications. You need to install the VNC and a client, or use other supported protocols such as PCoIP and XenDesktop HDX 3D.

Instance families gn4, gn5i, and gn5

- **Bandwidth:** If you use an image of Windows Server 2008 R2 for a gn4 instance, you cannot use the Connect to VNC function in the ECS console to connect to the instance after the installed GPU driver takes effect. You need to set the bandwidth to a non-zero value or attach an Elastic IP address to the created instance.
- **Image:** If an NVIDIA GPU driver is not required, you can select any image, and then [Install the CUDA and GPU drivers for a Linux instance](#) or [Install the CUDA and GPU drivers for a Windows instance](#).

2.2.4. Notice for Windows users

Before using Windows-based ECS instances, you must consider the following points:

- Data loss may occur if a local disk is used as the data disk of an instance. We recommend that you use a cloud disk to create your instance if you are not sure about the reliability of the data architecture.
- Do not close the built-in shutdownmon.exe process. Otherwise, the server may require a longer time to restart.
- Do not rename, delete, or disable Administrator accounts or it may affect the use of the server.
- We do not recommend that you use virtual memory.
- When you modify your computer name, you must synchronize the following key values in the registry. Otherwise, the computer name cannot be modified, causing failure when installing certain third-party programs. The following key values must be modified in the registry:

```
HKEY_LOCAL_MACHINE\SYSTEM\ControlSet001\Control\ComputerName\ActiveComputerName
```

```
HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\ComputerName\ComputerName
```

2.2.5. Notice for Linux users

Before using Linux-based ECS instances, you must consider the following points:

- Do not modify content of the default /etc/issue files under a Linux instance. Otherwise, the custom image created from the instance cannot be recognized, and instances created based on the image cannot start as expected.
- Do not arbitrarily modify the permissions of each directory in the partition where the root directory is located, especially permissions of /etc, /sbin, /bin, /boot, /dev, /usr, and /lib directories. Improper modification of permissions can cause errors.
- Do not rename, delete, or disable Linux root accounts.
- Do not compile or perform any other operations on the Linux kernel.
- We do not recommend the use of Swap for partitioning.
- Do not enable the NetWorkManager service. This service conflicts with the internal network service of the system, causing network errors.

2.2.6. Notice on defense against DDoS attacks

You need to purchase Anti-DDoS Pro to defend against DDoS attacks. For more information, see *Apsara Stack Security Product Introduction*.

2.3. Quick start

2.3.1. Overview

This topic describes how to quickly create and connect to an ECS instance.

Perform the following procedure:

1. **Create a security group**

A security group is a virtual firewall used to control traffic to and from ECS instances. Each ECS instance must be added to at least one security group. Before creating an instance, you must select a security group to control traffic to and from the instance.

2. **Create an instance**

An ECS instance is a virtual machine that contains basic computing components such as CPU, memory, operating system, network, and disks. After a security group is created, you can select an instance type based on your business requirements. For more information, see [Instance types](#).

3. **Connect to an instance**

Select a remote connection method based on the network configuration and operating system of the ECS instance and your local operating system. After you log on to the instance, you can perform other operations on it, such as installing applications.

2.3.2. Log on to the ECS console

This topic describes how to log on to the ECS console.

Prerequisites

- Before logging on to the ASCM console, make sure that you have obtained the IP address or domain name of the ASCM console from the deployment personnel. The URL used to access the ASCM console is in the following format: `https://[IP address or domain name of the ASCM console]`.
- We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL used to access the ASCM console. Press the Enter key.
2. Enter your username and password.

Obtain the username and password for logging on to the console from the operations administrator.

Note When you log on to the ASCM console for the first time, you must change the password of your username as prompted. Due to security concerns, your password must meet the minimum complexity requirements: The password must be 8 to 20 characters in length and must contain at least two of the following character types: uppercase letters, lowercase letters, digits, and special characters such as exclamation points (!), at signs (@), number signs (#), dollar signs (\$), and percent signs (%).

3. Click **Login** to go to the ASCM console homepage.
4. In the top navigation bar, choose **Products > Elastic Computing > Elastic Compute Service**.

2.3.3. Create a security group

Security groups are an important means for network security isolation. They are used to set network access control for one or more ECS instances.

Prerequisites

A Virtual Private Cloud (VPC) has been created. For more information, see *VPC User Guide*.

Context

Instances that belong to the same account and are in the same region and in the same security group can communicate with each other over the internal network. If instances that belong to the same account in the same region are in different security groups, you can implement internal network communication by authorizing mutual access between two security groups.

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, choose **Networks and Security > Security Groups**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Click **New Security Group**.
5. Configure the parameters of the security group.

Type	Parameter	Required	Description
------	-----------	----------	-------------

Type	Parameter	Required	Description
Region	Organization	Yes	The organization to which the security group belongs. Make sure that the security group and the VPC belong to the same organization.
	Resource Set	Yes	The resource set to which the security group belongs. Make sure that the security group and the VPC belong to the same resource set.
	Region	Yes	The region to which the security group belongs. Make sure that the security group and the VPC belong to the same region.
	Zone	Yes	The ID of the zone where the security group resides.
Basic Settings	VPC	Yes	The VPC to which the security group belongs.
	Security Group Name	No	The name must be 2 to 128 characters in length and start with a letter. It can contain letters, digits, periods (.), underscores (_), hyphens (-), colons (:), and commas (,). It cannot start with http:// or https://.
	Description	No	The description of the security group. We recommend that you provide an informational description to simplify future management operations. The name must be 2 to 256 characters in length and start with a letter. It can contain letters, digits, periods (.), underscores (_), hyphens (-), and commas (,). It cannot start with http:// or https://.

6. Click **Submit**.

2.3.4. Create an instance

An ECS instance is a virtual machine that contains the basic computing components of a server, such as CPU, memory, operating system, network, and disks.

Prerequisites

- A VPC and a VSwitch are created. For more information, see *Create a VPC and Create a VSwitch* in Apsara Stack VPC User Guide.
- If you want to assign an IPv6 address to the instance that you want to create, make sure that the VPC and VSwitch are associated with IPv6 CIDR blocks. For more information, see *Enable an IPv6 CIDR block for a VPC and Enable an IPv6 CIDR block for a VSwitch* in Apsara Stack VPC User Guide.
- A security group is available. If no security group is available, create a security group. For more information, see [Create a security group](#).

Context

Some limits apply when you create GPU-accelerated instances. For more information, see [Limits](#).

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, click **Instances**.
3. Click **Create Instance**.
4. Configure parameters listed in the following tables to create an instance.
 - i. Configure the basic settings of the instance.

Parameter	Required	Description
Organization	Yes	Select an organization in which to create the instance.
Resource Set	Yes	Select a resource set in which to create the instance.

- ii. Select a region and zone for the instance.

Parameter	Required	Description
Region	Yes	Select a region in which to create the instance.
Zone	Yes	Select a zone in which to create the instance. Zones are the physical zones with separate power supplies and networks in the same region. The internal networks of zones are interconnected, and faults in one zone are isolated from the other zones. To increase the availability of your applications, we recommend that you create instances in different zones.

iii. Configure the network of the instance.

Parameter	Required	Description
Network Type	Yes	Select the type of the network in which to create the instance. VPC is available.
VPC	Yes	Select a VPC in which to create the instance.
VSwitch	Yes	Select a VSwitch to be connected to the instance.
Private IP	No	Specify a private IP address for the instance. The private IP address must be within the CIDR block of the VSwitch. If you do not specify a private IP address, the system will automatically allocate a private IP address to the instance.

iv. (Optional)Specify whether to assign an IPv6 address to the instance.

v. Select a security group in which to create the instance.

vi. Select an instance family and instance type for the instance.

Parameter	Required	Description
Instance Family	Yes	Select an instance family for the instance. After you select an instance family, you must select an instance type.
Instance Type	Yes	Select an instance type. Windows Server images require specific CPU and memory combinations. For more information, see Limits in <i>ECS Product Introduction</i> .

vii. Configure the image to be used by the instance.

Parameter	Required	Description
Image Type	Yes	Select an image type. Valid values: Public Image and Custom Image .

Parameter	Required	Description
Public Image	Subject to the image type	<p>Select a public image for the instance. Public images provided by Alibaba Cloud are licensed, secure, and stable. Public images include Windows Server images and major Linux images.</p> <p>This parameter must be specified when you set Image Type to Public Image.</p> <p>When you use an image that supports DHCPv6 to create an instance, an IPv6 address is automatically assigned to the instance. The created instance can use this IPv6 address to communicate over the internal network. When you use an image that does not support DHCPv6 to create an instance, you must manually assign an IPv6 address to the instance. The following images support DHCPv6:</p> <ul style="list-style-type: none"> ▪ Linux images: <ul style="list-style-type: none"> ▪ CentOS 7.6 IPv6 64-bit ▪ CentOS 6.10 64-bit ▪ SUSE Linux Enterprise Server 12 SP4 64-bit ▪ Windows Server images <p> Note To use an IPv6 address to communicate over the Internet, you must also enable public bandwidth for the IPv6 address. For more information, see <i>Enable Internet bandwidth for an IPv6 address in Apsara Stack V PC User Guide</i>.</p>
Custom Image	Subject to the image type	<p>Select a custom image for the instance. Custom images are created from instances or snapshots, or imported from your local device.</p> <p>This parameter must be specified when you set Image Type to Custom Image.</p>

viii. Configure the storage settings for the instance.

Parameter	Required	Description
System Disk	Yes	Specify the disk category and capacity of the system disk. Valid disk categories: Ultra Disk and SSD Disk . The system disk size must range from 20 GiB to 500 GiB.
Data Disk	No	You can click Data Disk to add data disks. Specify the disk category and capacity of each data disk. Valid disk categories: Ultra Disk and SSD Disk . A maximum of 16 data disks can be added to an instance. The maximum capacity of each data disk is 32 TiB. You can select or clear Release with Instance and Encrypt for each data disk. To encrypt a data disk, set Encryption Algorithm to AES256 or SM4 and set Encryption Key to a key created in Key Management Service (KMS) . You can also add data disks after the instance is created. For more information, see Create a disk .

ix. Configure the logon password settings for the instance.

Parameter	Required	Description
Set Password	Yes	Specify when to set the password. Valid values: Now and Later . If Later is selected, you can use the password reset feature to set a password at a later time. For more information, see . <div style="border: 1px solid #ccc; background-color: #e6f2ff; padding: 5px; margin-top: 10px;"> ? Note The password is used to log on to the instance, not to the VNC. </div>
Logon Password	No	Set the password to be used to log on to the instance. The password must be 8 to 30 characters in length and must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. The supported special characters include <code>()`~!@# \$ % ^ & * - _ + = { } [] : ; ' < > , . ? /</code>
Confirm Password	No	Re-enter the password.

- x. (Optional) Select a deployment set in which to create the instance.
- xi. (Optional) Enter a name for the instance. The name must be 2 to 128 characters in length and start with a letter. It can contain periods (.), underscores (_), colons (:), and hyphens (-).
If you do not specify a name, the system will assign an instance name at random.
- xii. (Optional) In the **User Data** field, enter the user data to be automatically run upon instance startup. Windows supports **Batch** and **PowerShell** scripts. Before you perform Base64 encoding, make sure that the content to be encoded includes `[bat]` or `[powershell]` as the first line. Linux supports shell scripts.
- xiii. Enter the number of instances that you want to create. The number must be an integer ranging from 1 to 100.

5. Click **Submit**.

Result

The instance appears in the instance list. When the instance is being created, it is in the **Preparing** state. After the instance is created, it enters the **Running** state.

2.3.5. Connect to an instance

2.3.5.1. Instance connecting overview

After an instance is created, you can connect to the instance to perform operations such as installing applications.

You can use one of the following methods to connect to an instance:

- Use remote connection tools to connect to instances that have public IP addresses. For more information about the procedure, see the following topics:
 - [Connect to a Linux-based instance by using SSH commands in Linux or Mac OS X](#)
 - [Connect to a Linux-based instance by using remote connection tools in Windows](#)
 - [Connect to a Windows-based instance by using RDP](#)
- Use the VNC feature in the ECS console. For more information, see .

The username of a Windows instance is Administrator, and that of a Linux instance is root.

2.3.5.2. Connect to a Linux instance by using SSH commands in

Linux or Mac OS X

This topic describes how to use SSH commands to connect to a Linux instance.

Prerequisites

- The instance and the security group are created.
- The instance is in the **Running** state.
- A logon password is set for the instance.
- An Elastic IP address (EIP) is bound with the instance.
- An inbound security group rule is added to the security group to allow the SSH port.

Rule direction	Authorization policy	Protocol type	Port range	Priority	Authorization type	Authorization object
Inbound	Accept	TCP	22/22	1	IPv4 CIDR block	0.0.0.0/0

Procedure

1. Enter the following command and press the Enter key.

```
ssh root@instance IP
```

2. Enter the instance password of the root user and press the Enter key.

2.3.5.3. Connect to a Linux-based instance by using remote connection tools in Windows

This topic describes how to connect to an instance by using the PuTTY tool.

Prerequisites

Remote connection tools are designed with similar logics. In this example, PuTTY is used to connect to an instance. Download PuTTY at the following URL: .

Procedure

1. Download and install PuTTY for Windows.
2. Start the PuTTY client and complete the following settings:
 - Host Name (or IP Address): Enter the EIP of the instance to be connected.
 - Port: Select the default port 22.
 - Connection Type: Select SSH.
 - Saved Session: Enter the name of the session. Click **Save**. After the settings are saved, PuTTY remembers the name and IP address of the instance. This eliminates the need to enter them every time you connect to the instance.
3. Click **Open** to connect to the instance. When you connect to the instance for the first time, PuTTY displays security alerts. Click **Yes** to proceed.
4. Enter the username `root` and press **Enter**.
5. Enter the password for the instance and press **Enter**.

If a message similar to the following one appears, a connection to the instance is established.

```
Welcome to aliyun Elastic Compute Server!
```

2.3.5.4. Connect to a Windows instance by using RDP

This topic describes how to connect to a Windows instance by using Remote Desktop Protocol (RDP).

Prerequisites

- The instance and the security group are created.
- The instance is in the **Running** state.
- A logon password is set for the instance.
- An Elastic IP address (EIP) is bound with the instance.
- An inbound security group rule is added to the security group to allow the RDP port.

Rule direction	Authorization policy	Protocol type	Port range	Priority	Authorization type	Authorization object
Inbound	Accept	TCP	3389/3389	1	IPv4 CIDR block	0.0.0.0/0

- CredSSP-related security updates are installed on the operating system of the instance.

Procedure

1. Activate the Remote Desktop Connection feature by using any of the following methods:
 - Click **Start**, enter `mstsc` in the search box, and click `mstsc` in the search result.
 - Press **Windows Key + R**. In the Run dialog box that appears, enter `mstsc` and click **OK**.
2. In the Remote Desktop Connection dialog box, enter the EIP of the instance and click **Show Options**.
3. Enter the username. The default username is `administrator`.
4. (Optional) If you do not want to enter the password upon subsequent logons, select **Allow me to save credentials**.
5. Click **Connect**.

6. In the **Windows Security** dialog box that appears, enter the password for the account and click **OK**.

Result

After you log on to the instance, the Windows desktop appears.

If authentication errors occur or the required function is not supported, install security updates.

1. **Connect to an ECS instance by using the VNC** before proceeding.
2. Choose **Start > Control Panel**.
3. Click **System and Security**.
4. Click **Check for updates** in the **Windows Updates** pane.
5. If updates are available, click **Install updates**.
6. Restart the instance.

2.3.5.5. Connect to an ECS instance by using the VNC

You can access your instance by using the VNC in the ECS console when other SSH clients such as PuTTY, Xshell, and SecureCRT do not work properly.

Prerequisites

- The instance is in the **Running** state.
- The root certificate is imported to your web browser. For more information, see [Install a certificate](#).
- If you log on to an instance for the first time after the instance is created, make sure that you set a new VNC password. For more information, see [VNC Password](#).

Context

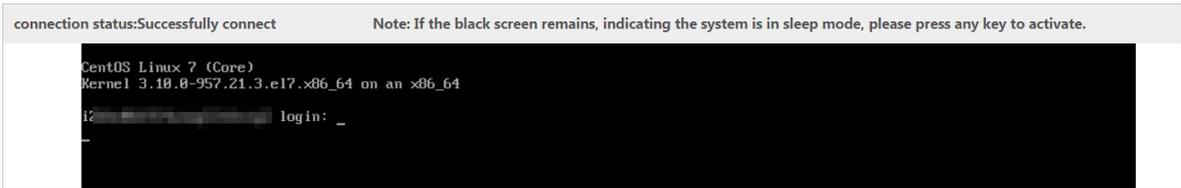

The VNC password is used to log on to the VNC of the ECS console, and the instance password is used to log on to an instance.

You can use the VNC to connect to an instance to solve issues shown in the following table.

Scenario	Resolution
The instance startup is slowly due to self-check upon startup.	Check the progress of the self check.
The firewall of the operating system is enabled by mistake.	Disable the firewall.
Abnormal processes appear, which consume large amounts of CPU or bandwidth resources.	Troubleshoot and terminate the abnormal processes.

Procedure

1. **Log on to the ECS console**.
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the ECS instance, and click **Remote Connection** in the **Actions** column.
5. Enter the VNC password, and then click **OK**. After the connection is successful, the logon page is displayed, as shown in the following figure.

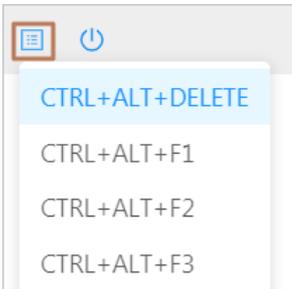

6. Enter the username and password.

- For Linux instances: Enter the username *root* and the logon password.

Note Passwords in Linux are not displayed as you type. Press the Enter key after you enter the password.

- For Windows instances: To use key combinations such as Ctrl + Alt + Delete, click the corresponding key combination in the upper-right corner of the VNC page.

Enter the username and password as prompted, and click the Log In icon .

2.4. Instances

2.4.1. Create an instance

An ECS instance is a virtual machine that contains the basic computing components of a server, such as CPU, memory, operating system, network, and disks.

Prerequisites

- A VPC and a VSwitch are created. For more information, see *Create a VPC and Create a VSwitch* in Apsara Stack VPC User Guide.
- If you want to assign an IPv6 address to the instance that you want to create, make sure that the VPC and VSwitch are associated with IPv6 CIDR blocks. For more information, see *Enable an IPv6 CIDR block for a VPC and Enable an IPv6 CIDR block for a VSwitch* in Apsara Stack VPC User Guide.
- A security group is available. If no security group is available, create a security group. For more information, see [Create a security group](#).

Context

Some limits apply when you create GPU-accelerated instances. For more information, see [Limits](#).

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, click **Instances**.
3. Click **Create Instance**.
4. Configure parameters listed in the following tables to create an instance.

i. Configure the basic settings of the instance.

Parameter	Required	Description
Organization	Yes	Select an organization in which to create the instance.
Resource Set	Yes	Select a resource set in which to create the instance.

ii. Select a region and zone for the instance.

Parameter	Required	Description
Region	Yes	Select a region in which to create the instance.
Zone	Yes	Select a zone in which to create the instance. Zones are the physical zones with separate power supplies and networks in the same region. The internal networks of zones are interconnected, and faults in one zone are isolated from the other zones. To increase the availability of your applications, we recommend that you create instances in different zones.

iii. Configure the network of the instance.

Parameter	Required	Description
Network Type	Yes	Select the type of the network in which to create the instance. VPC is available.
VPC	Yes	Select a VPC in which to create the instance.
VSwitch	Yes	Select a VSwitch to be connected to the instance.
Private IP	No	Specify a private IP address for the instance. The private IP address must be within the CIDR block of the VSwitch. If you do not specify a private IP address, the system will automatically allocate a private IP address to the instance.

iv. (Optional)Specify whether to assign an IPv6 address to the instance.

v. Select a security group in which to create the instance.

vi. Select an instance family and instance type for the instance.

Parameter	Required	Description
Instance Family	Yes	Select an instance family for the instance. After you select an instance family, you must select an instance type.
Instance Type	Yes	Select an instance type. Windows Server images require specific CPU and memory combinations. For more information, see Limits in <i>ECS Product Introduction</i> .

vii. Configure the image to be used by the instance.

Parameter	Required	Description
Image Type	Yes	Select an image type. Valid values: Public Image and Custom Image .
Public Image	Subject to the image type	<p>Select a public image for the instance. Public images provided by Alibaba Cloud are licensed, secure, and stable. Public images include Windows Server images and major Linux images.</p> <p>This parameter must be specified when you set Image Type to Public Image.</p> <p>When you use an image that supports DHCPv6 to create an instance, an IPv6 address is automatically assigned to the instance. The created instance can use this IPv6 address to communicate over the internal network. When you use an image that does not support DHCPv6 to create an instance, you must manually assign an IPv6 address to the instance. The following images support DHCPv6:</p> <ul style="list-style-type: none"> ▪ Linux images: <ul style="list-style-type: none"> ▪ CentOS 7.6 IPv6 64-bit ▪ CentOS 6.10 64-bit ▪ SUSE Linux Enterprise Server 12 SP4 64-bit ▪ Windows Server images <div style="background-color: #e6f2ff; padding: 5px; margin-top: 10px;"> <p> Note To use an IPv6 address to communicate over the Internet, you must also enable public bandwidth for the IPv6 address. For more information, see <i>Enable Internet bandwidth for an IPv6 address</i> in <i>Apsara Stack V PC User Guide</i>.</p> </div>
Custom Image	Subject to the image type	<p>Select a custom image for the instance. Custom images are created from instances or snapshots, or imported from your local device.</p> <p>This parameter must be specified when you set Image Type to Custom Image.</p>

viii. Configure the storage settings for the instance.

Parameter	Required	Description
System Disk	Yes	Specify the disk category and capacity of the system disk. Valid disk categories: Ultra Disk and SSD Disk . The system disk size must range from 20 GiB to 500 GiB.
Data Disk	No	You can click Data Disk to add data disks. Specify the disk category and capacity of each data disk. Valid disk categories: Ultra Disk and SSD Disk . A maximum of 16 data disks can be added to an instance. The maximum capacity of each data disk is 32 TiB. You can select or clear Release with Instance and Encrypt for each data disk. To encrypt a data disk, set Encryption Algorithm to AES256 or SM4 and set Encryption Key to a key created in Key Management Service (KMS) . You can also add data disks after the instance is created. For more information, see Create a disk .

ix. Configure the logon password settings for the instance.

Parameter	Required	Description
Set Password	Yes	Specify when to set the password. Valid values: Now and Later . If Later is selected, you can use the password reset feature to set a password at a later time. For more information, see . <div style="border: 1px solid #ccc; background-color: #e0f2f1; padding: 5px; margin-top: 10px;"> ? Note The password is used to log on to the instance, not to the VNC. </div>
Logon Password	No	Set the password to be used to log on to the instance. The password must be 8 to 30 characters in length and must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. The supported special characters include () ` ~ ! @ # \$ % ^ & * - _ + = { } [] ; ' < > , . ? /
Confirm Password	No	Re-enter the password.

- x. (Optional) Select a deployment set in which to create the instance.
- xi. (Optional) Enter a name for the instance. The name must be 2 to 128 characters in length and start with a letter. It can contain periods (.), underscores (_), colons (:), and hyphens (-).
If you do not specify a name, the system will assign an instance name at random.
- xii. (Optional) In the **User Data** field, enter the user data to be automatically run upon instance startup. Windows supports **Batch** and **PowerShell** scripts. Before you perform Base64 encoding, make sure that the content to be encoded includes `[bat]` or `[powershell]` as the first line. Linux supports shell scripts.
- xiii. Enter the number of instances that you want to create. The number must be an integer ranging from 1 to 100.

5. Click **Submit**.

Result

The instance appears in the instance list. When the instance is being created, it is in the **Preparing** state. After the instance is created, it enters the **Running** state.

2.4.2. Connect to an instance

2.4.2.1. Instance connecting overview

After an instance is created, you can connect to the instance to perform operations such as installing applications.

You can use one of the following methods to connect to an instance:

- Use remote connection tools to connect to instances that have public IP addresses. For more information about the procedure, see the following topics:
 - [Connect to a Linux-based instance by using SSH commands in Linux or Mac OS X](#)
 - [Connect to a Linux-based instance by using remote connection tools in Windows](#)
 - [Connect to a Windows-based instance by using RDP](#)
- Use the VNC feature in the ECS console. For more information, see [.](#)

The username of a Windows instance is Administrator, and that of a Linux instance is root.

2.4.2.2. Connect to a Linux-based instance by using SSH commands in Linux or Mac OS X

This topic describes how to use SSH commands to connect to a Linux-based instance.

Prerequisites

Create a security group and an instance.

Procedure

1. Enter the following command: `ssh root@instance IP` .
2. Enter the password for the `root` user to log on to the instance.

2.4.2.3. Connect to a Linux-based instance by using remote connection tools in Windows

This topic describes how to connect to an instance by using the PuTTY tool.

Prerequisites

Remote connection tools are designed with similar logics. In this example, PuTTY is used to connect to an instance. Download PuTTY at the following URL: [.](#)

Procedure

1. Download and install PuTTY for Windows.
2. Start the PuTTY client and complete the following settings:
 - **Host Name (or IP Address):** Enter the EIP of the instance to be connected.
 - **Port:** Select the default port 22.
 - **Connection Type:** Select SSH.

- **Saved Session:** Enter the name of the session. Click **Save**. After the settings are saved, PuTTY remembers the name and IP address of the instance. This eliminates the need to enter them every time you connect to the instance.
3. Click **Open** to connect to the instance. When you connect to the instance for the first time, PuTTY displays security alerts. Click **Yes** to proceed.
 4. Enter the username `root` and press **Enter**.
 5. Enter the password for the instance and press **Enter**.

If a message similar to the following one appears, a connection to the instance is established.

```
Welcome to aliyun Elastic Compute Server!
```

2.4.2.4. Connect to a Windows instance by using RDC

This topic describes how to connect to a Windows instance by using Remote Desktop Connection (RDC).

Prerequisites

- A security group and a Windows instance are created.
- The instance is in the **Running** state.
- A logon password is set for the instance.
- An Elastic IP address is associated with the instance.
- An inbound security group rule is added to the security group to allow traffic on the RDP port.

Rule direction	Action	Protocol	Port range	Priority	Authorization type	Authorization object
Inbound	Allow	tcp	3389/3389	1	IPv4 addresses	0.0.0.0/0

Procedure

1. Use one of the following methods to enable RDC:
 - Click **Start**, enter `mstsc` in the search box, and click `mstsc` in the search result.
 - Press the Windows logo key+R. In the Run dialog box that appears, enter `mstsc` and click **OK**.
2. In the **Remote Desktop Connection** dialog box, enter the Elastic IP address of the instance and click **Show Options**.
3. Enter the username. The default username is `administrator`.
4. (Optional)If you do not want to enter the password upon subsequent logons, select **Allow me to save credentials**.
5. Click **Connect**.
6. In the **Windows Security** dialog box that appears, enter the password corresponding to the username you entered and click **OK**.

Result

If the Windows desktop appears, a connection to the Windows instance is established.

If an error message is returned indicating that an authentication error has occurred and the function requested is not supported, install CredSSP updates and try again. Follow these steps to install the updates:

1. [Connect to an ECS instance by using the VNC](#).
2. Choose **Start > Control Panel**.
3. Click **System and Security**.
4. Click **Check for updates** in the **Windows Updates** section.

5. If updates are available, click **Install updates**.
6. Restart the instance.

2.4.2.5. Install the certificate for VNC in Windows

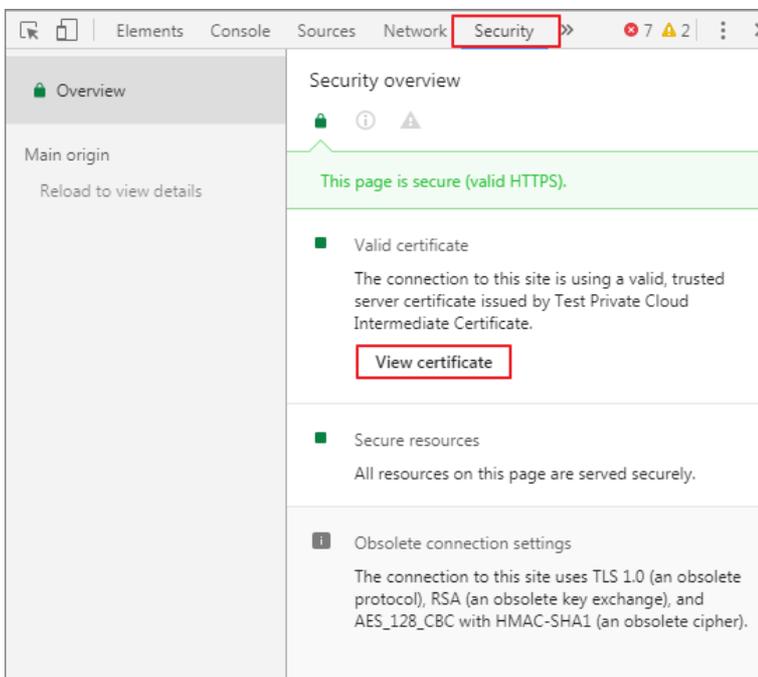

Before you log on to VNC, you must export the relative certificate from the site such as the Apsara Stack Cloud Management (ASCM) console and install the certificate in your local browser.

Context

The VNC feature is provided by the VNC proxy service. The VNC proxy service uses the relative certificate different from that of Apsara Infrastructure Management Framework. The certificate of the VNC proxy service must be manually imported.

Procedure

1. Export the certificate from the ASCM console.
 - i. Log on to the ASCM console. Press the **F12** key or **Fn+F12** to view and select the certificate. For example, in the Chrome browser, press the **F12** key to open Chrome DevTools.

- ii. In the **Certificate** dialog box, click the **Certificate Path** tab, select the root certificate, and then click **View Certificate**.
 - iii. In the **Certificate** dialog box, click the **Details** tab, and click **Copy to File**.
 - iv. In the **Certificate Export Wizard** dialog box, click **Next**.
 - v. Select **DER encoded binary X.509 (.CER)** as the format and then click **Next**.
 - vi. Click **Browse**, select where to store the certificate, enter a file name, and then click **Save**.
 - vii. Click **Next**.
 - viii. Click **Finish**.
 - ix. Click **OK**.
2. Install the certificate in your local browser.
 - i. Double-click the certificate.
 - ii. In the **Certificate** dialog box, click **Install Certificate**.
 - iii. In the **Certificate Import Wizard** dialog box, click **Next**.

- iv. Select **Place all certificates in the following store** and click **Browse**.
 - v. In the **Select Certificate Store** dialog box, select **Trusted Root Certificate Authority** and then click **OK**.
 - vi. In the **Certificate Import Wizard** dialog box, click **Next**.
 - vii. Click **Finish**.
 - viii. If a security warning message is displayed, click **Yes**.
3. Restart your browser and log on to the ASCM console. If no security warning message is displayed in the left part of the address bar, the certificate is installed.

2.4.2.6. Connect to an ECS instance by using the VNC

You can access your instance by using the VNC in the ECS console when other SSH clients such as PuTTY, Xshell, and SecureCRT do not work properly.

Prerequisites

- The instance is in the **Running** state.
- The root certificate is imported to your web browser. For more information, see [Install a certificate](#).
- If you log on to an instance for the first time after the instance is created, make sure that you set a new VNC password. For more information, see [Set a VNC password](#).

Context

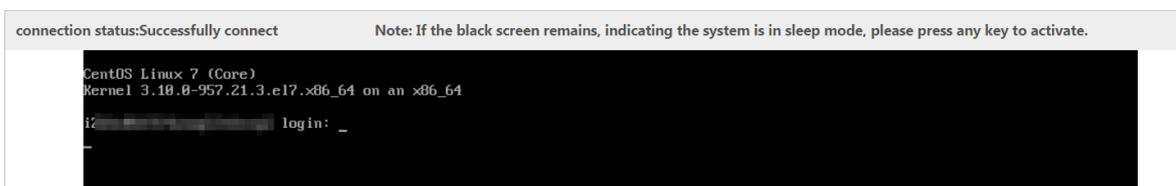

The VNC password is used to log on to the VNC of the ECS console, and the instance password is used to log on to an instance.

You can use the VNC to connect to an instance to solve issues shown in the following table.

Scenario	Resolution
The instance startup is slowly due to self-check upon startup.	Check the progress of the self check.
The firewall of the operating system is enabled by mistake.	Disable the firewall.
Abnormal processes appear, which consume large amounts of CPU or bandwidth resources.	Troubleshoot and terminate the abnormal processes.

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the ECS instance, and click **Remote Connection** in the **Actions** column.
5. Enter the VNC password, and then click **OK**. After the connection is successful, the logon page is displayed, as shown in the following figure.

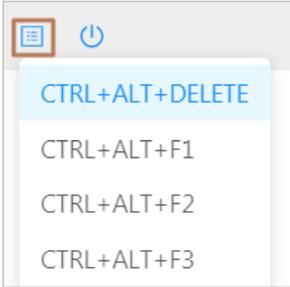

6. Enter the username and password.

- For Linux instances: Enter the username *root* and the logon password.

 **Note** Passwords in Linux are not displayed as you type. Press the Enter key after you enter the password.

- For Windows instances: To use key combinations such as Ctrl + Alt + Delete, click the corresponding key combination in the upper-right corner of the VNC page.

Enter the username and password as prompted, and click the Log In icon .

2.4.3. View instances

You can view the list of created instances and the details of individual instances. The details of an instance include basic configurations, disks, snapshots, security groups, and elastic network interfaces (ENIs).

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, select an organization, a resource set, and a region. The created instances that match the specified criteria are displayed.
4. Select a filter option from the drop-down list, enter the relevant information in the search bar, and click **Search**.

You can select multiple filter options to narrow down search results.

Filter option	Description
Instance Name	Enter an instance name to search for the instance.
Instance ID	Enter an instance ID to search for the instance.
IP Address	Enter the IP address of an instance to search for the instance.
VPC ID	Enter a VPC ID to search for the instances that belong to the VPC.
Image ID	Enter an image ID to search for the instances that use the image.

Filter option	Description
Status	Select an instance status to search for the instances in that status. Valid values: <ul style="list-style-type: none"> Running Stopped Starting Stopping
Security Group ID	Enter a security group ID to search for the instances that belong to the security group.
Operating System	Enter the name of operating system to search for the instances that use the operating system.

- Use one of the following methods to go to the Instance Details page of an instance:
 - In the Instance ID/Name column, click the instance ID.
 - Click **Manage** in the Actions column corresponding to the instance.
 - In the Actions column corresponding to the instance, choose **More > Show Details**.

2.4.4. Modify an instance

You can modify the name, description, and custom data of an existing instance.

Procedure

- Log on to the ECS console.
- In the left-side navigation pane, click **Instances**.
- In the top navigation bar, select an organization, a resource set, and a region.
- Find the instance and choose **More > Modify** from the Actions column.
- Modify the name, description, and custom data for the instance. The name must be 2 to 128 characters in length. The description must be 2 to 256 characters in length. The custom data must be 2 to 999 characters in length.
- Click **OK**.

2.4.5. Stop an instance

You can stop an instance that is not in use. Stopping an instance will interrupt the services that are running on it. Exercise caution when you stop an instance.

Prerequisites

The instance is in the **Running** state.

Procedure

- Log on to the ECS console.
- In the left-side navigation pane, click **Instances**.
- In the top navigation bar, select an organization, a resource set, and a region.
- Use one of the following methods to stop the instance:
 - To stop a single instance, find the instance and choose **More > Instance Status > Stop** in the Actions column.
 - To stop one or more instances at a time, select the instances and click **Stop** in the lower-left corner of the Instances page.

5. In the message that appears, click **OK**.

Result

In the **Status** column, the instance state changes from **Running** to **Stopping**. After the instance is stopped, its state changes to **Stopped**.

2.4.6. Start an instance

You can start a stopped instance.

Prerequisites

The instance is in the **Stopped** state.

Procedure

1. **Log on to the ECS console.**
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Use one of the following methods to start the instance:
 - To start a single instance, find the instance and choose **More > Instance Status > Start** in the **Actions** column.
 - To start one or more instances at a time, select the instances and click **Start** in the lower-left corner of the **Instances** page.
5. In the message that appears, click **OK**.

Result

In the **Status** column, the instance state changes from **Stopped** to **Starting**. After the instance is started, its state changes to **Running**.

2.4.7. Restart an instance

You must restart an instance after you change its logon password or install system updates. Restarting an instance will stop the instance and interrupt the services that are running on it for a period of time. Exercise caution when you restart an instance.

Prerequisites

The instance is in the **Running** state.

Procedure

1. **Log on to the ECS console.**
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Use one of the following methods to restart the instance:
 - To restart a single instance, find the instance and choose **More > Instance Status > Restart** in the **Actions** column.
 - To restart one or more instances at a time, select the instances and click **Restart** in the lower-left corner of the **Instances** page.
5. In the **Restart Instance** dialog box, select a restart mode.
 - **Restart**: restarts the instance normally.
 - **Force Restart**: forces the instance to restart. This may result in loss of unsaved data.
6. Click **OK**.

2.4.8. Delete an instance

You can delete an instance that is no longer needed to release its resources. Deleted instances cannot be recovered. We recommend that you back up data before you delete an instance. If a data disk is released along with the instance, the data on the disk cannot be recovered.

Prerequisites

The instance is in the **Stopped** state.

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Select the instance and click **Delete** in the lower-left corner of the Instances page.
5. In the message that appears, click **OK**.

2.4.9. Change the instance type of an instance

You can change the instance type of an instance to suit your business needs. This eliminates the need to create a new instance.

Prerequisites

The instance is in the **Stopped** state.

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the instance and click **Upgrade/Downgrade** in the **Actions** column.
5. On the **Change Specifications** page that appears, select a new instance type and click **Submit**. The instance types available for selection are displayed on the **Change Specifications** page.
6. Restart the instance by using the console or calling an API operation for the new instance type to take effect. For more information, see [Start an instance](#) or `StartInstance` in *ECS Developer Guide*.

2.4.10. Change an instance logon password

If you did not set a logon password when creating an instance or forgot the password, you can reset the password.

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the instance and select one of the following methods to access the instance details page.
 - In the **Instance ID/Name** column, click the instance ID.
 - Click **Manage** in the **Actions** column.
 - In the **Actions** column, choose **More > Show Details**.
5. Click **Change Password**.
6. Enter and confirm the new password, and then click **OK**. The password must be 8 to 30 characters in length

and must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. The supported special characters include `()'~!@#$%^&*-_+=|{}[]:;';
<>,.?/`

7. Restart the instance in the console or by calling an API operation to make the new password take effect. For more information, see [Restart an instance](#) or *the RebootInstance section* in ECS Developer Guide.

2.4.11. Change the VNC password

If you log on to the VNC for the first time or forget the VNC password, you can reset the password.

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the instance and select one of the following methods to access the instance details page.
 - In the **Instance ID/Name** column, click the instance ID.
 - Click **Manage** in the **Actions** column.
 - In the **Actions** column, choose **More > Show Details**.
5. Click **Change VNC Password**.
6. Enter and confirm the new password, and click **OK**. The password must be 6 characters in length and can contain digits and uppercase and lowercase letters. It does not support special characters.
7. Restart the instance in the console or by calling an API operation to make the new password take effect. For more information, see [Restart an instance](#) or *the RebootInstance section* in ECS Developer Guide.

2.4.12. Add an ECS instance to a security group

You can add a created instance to a security group and use security group rules to control network access to the instance.

Context

A security group acts as a virtual firewall and is used to provide security isolation. A security group controls access to ECS instances.

Instances that belong to the same account and are in the same region and in the same security group can communicate with each other over the internal network. If instances that belong to the same account in the same region are in different security groups, you can implement internal network communication by authorizing mutual access between two security groups.

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, choose **Networks and Security > Security Groups**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the security group and click **Manage Instances** in the **Actions** column.
5. Click **Add Instance**.
6. Select the instance and click **OK**. An instance can be added to five security groups. After an instance is added, the security group rules automatically apply to the instance.

2.4.13. Customize instance data

ECS allows you to run the instance customization script upon startup and import data into instances.

Context

The instance data customization feature is applicable to both Windows and Linux instances. It allows you to:

- Run the instance customization script upon startup.
- Import data into instances.

Usage instructions

• Limits

The instance data customization feature can only be used when an instance meets all the following requirements:

- Network type: VPC
- Image: a system image or a custom image that is inherited from the system image
- Operating system: one type included in [Supported operating systems](#)

Supported operating systems

Windows	Linux
<ul style="list-style-type: none"> ▪ Windows Server 2016 64-bit ▪ Windows Server 2012 64-bit ▪ Windows Server 2008 64-bit 	<ul style="list-style-type: none"> ▪ CentOS ▪ Ubuntu ▪ SUSE Linux Enterprise ▪ OpenSUSE ▪ Debian ▪ Aliyun Linux

- When you configure instance data customization scripts, you must enter custom data based on the type of operating system and script.

 **Note** Only English characters are allowed.

- If your data is Base64 encoded, select **Enter Base64 Encoded Information**.

 **Note** The size of the customization script cannot exceed 16 KB before the data is Base64 encoded.

- For Linux instances, the script format must meet the requirements described in [Types of Linux instance customization scripts](#).
- For Windows instances, the script can only start with `[bat]` or `[powershell]`.
- After starting an instance, run a command to view the following information:
 - Execution result of the instance customization script
 - Data imported to instances
- **Console:** You can modify the custom instance data in the console. Whether the modified instance customization script needs to be re-executed depends on the script type. For example, if the `bootcmd` script in Cloud Config is modified for Linux instances, the script is automatically executed each time instances are restarted.
- **OpenAPI:** You can also use OpenAPI to customize instance data. For more information, see [CreateInstance](#) and [ModifyInstanceAttribute](#) in *ECS Developer Guide*.

Linux instance data customization scripts

Linux instance data customization scripts provided by Alibaba Cloud are designed based on the cloud-init architecture. They are used to automatically configure parameters of Linux instances. Customization script types are compatible with the cloud-init.

Description of Linux instance data customization scripts

- Linux instance customization scripts are executed after instances are started and before `/etc/init` is executed.
- Linux instance customization scripts can only be executed with root permissions by default.

Types of Linux instance customization scripts

• User-Data Script

- Description: A script, such as shell script, is used to customize data.
- Format: The first line must include `#!`, such as `#!/bin/sh`.
- Limit: The script size (including the first line) cannot exceed 16 KB before the data is Base64 encoded.
- Frequency: The script is executed only when instances are started for the first time.
- Example:

```
#!/bin/sh
echo "Hello World. The time is now $(date -R)!" | tee /root/output10.txt
```

• Cloud Config Data

- Description: Predefined data is used to configure services, such as specifying yum sources or importing SSH keys.
- Format: The first line must be `#cloud-config`.
- Limit: The script size (including the first line) cannot exceed 16 KB before the data is Base64 encoded.
- Frequency: The script execution frequency varies with the specific service.
- Example:

```
#cloud-config
apt:
primary:
- arches: [default]
uri: http://us.archive.ubuntu.com/ubuntu/
```

• Include

- Description: The configuration content can be saved in a text file and imported into cloud-init as a URL.
- Format: The first line must be `#include`.
- Limit: The script size (including the first line) cannot exceed 16 KB before the data is Base64 encoded.
- Frequency: The script execution frequency depends on the script type in the text file.
- Example:

```
#include
http://ecs-image-test.oss-cn-hangzhou.aliyuncs.com/userdata/cloudconfig
```

• GZIP format

- Description: Cloud-init limits the size of customization scripts to 16 KB. You can compress and import the script file into the customization script if the file size exceeds 16 KB.
- Format: The `.gz` file is imported into the customization script as a URL in `#include`.
- Frequency: The script execution frequency depends on the script content contained in the GZIP file.

- Example:

```
#include
http://ecs-image-test.oss-cn-hangzhou.aliyuncs.com/userdata/config.gz
```

View the custom data of a Linux instance

Run the following command in the instance:

```
curl http://100.100.100.200/latest/user-data
```

Windows instance customization scripts

Windows instance customization scripts independently developed by Alibaba Cloud can be used to initialize Windows instances.

There are two types of Windows instance customization scripts:

- Batch processing program: starts with `[bat]` and serves as the first line. The script size must be smaller than 16 KB before the data is Base64 encoded.
- PowerShell script: starts with `[powershell]` and serves as the first line. The script size must be smaller than 16 KB before the data is Base64 encoded.

View the custom data of a Windows instance

Run the following PowerShell command in the instance:

```
Invoke-RestMethod http://100.100.100.200/latest/user-data/
```

2.4.14. Modify a private IP address

Each instance is assigned a private NIC and bound with a private IP address. You can modify the private IP address of the instance. The private IP address you use must be within the CIDR block of the VSwitch to which the instance belongs and cannot be used by another instance.

Prerequisites

The instance is in the **Stopped** state.

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the instance and choose **More > Change Private IP Address** from the **Actions** column.
5. Enter a new private IP address and click **OK**. The private IP address you can use must be within the CIDR block of the VSwitch to which the instance belongs and cannot be used by another instance or for a specific purpose.

For example, if the CIDR block of the VSwitch is 192.168.1.0/24, you can use an IP address in the range of 192.168.1.1 to 192.168.1.254. The first address 192.168.1.0 identifies the subnet itself, and the last address 192.168.1.255 identifies the broadcast address. Both addresses are reserved and cannot be used.

2.4.15. Install the CUDA and GPU drivers for a Linux instance

You must install a GPU driver on GPU instances to use the GPU. If the image you use does not contain a pre-installed GPU driver, you must manually install the CUDA and GPU drivers for the instance.

Prerequisites

If your instance cannot connect to the Internet, the installation file cannot be downloaded. You can install an FTP client on the instance to transfer the installation file to the instance.

Context

When installing NVIDIA drivers, you must install the kernel package that contains the kernel header file before you install the CUDA and GPU drivers on the instance.

Procedure

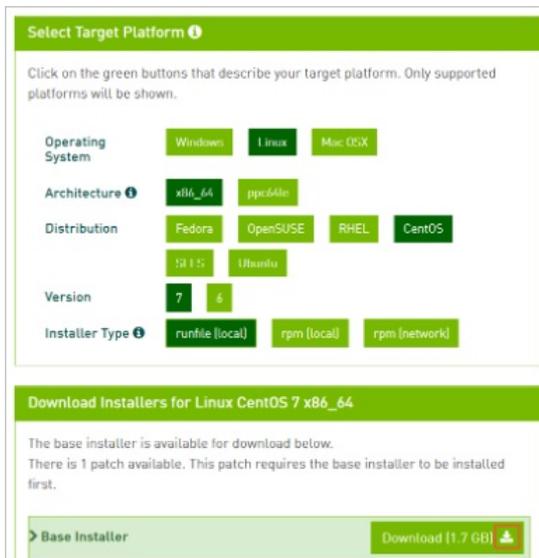

1. Install the kernel package.
 - i. Run the `uname -r` command to view the current kernel version. A similar output is displayed:
 - CentOS: `3.10.0-862.14.4.el7.x86_64`
 - Ubuntu: `4.4.0-117-generic`
 - ii. Copy the kernel package of the corresponding version to the instance and install the package.
 - CentOS: Copy the RPM package of the `kernel-devel` component and run the `rpm -ivh 3.10.0-862.14.4.el7.x86_64.rpm` command to install the package. `3.10.0-862.14.4.el7.x86_64.rpm` is used as an example. Replace it with the actual package name.
 - Ubuntu: Copy the DEB package of the `linux-headers` component and run the `dpkg -i 4.4.0-117-generic.deb` command to install the package. `4.4.0-117-generic.deb` is used as an example. Replace it with the actual package name.
2. Download the CUDA Toolkit.
 - i. Access the [official CUDA download page](#). Choose the version based on the GPU application requirements for CUDA. This example uses [CUDA Toolkit 9.2](#).

Download the CUDA Toolkit

The screenshot shows the 'Latest Release' section with 'CUDA Toolkit 10.0 (Sept 2018)'. Below it is the 'Archived Releases' section with a list of versions: 'CUDA Toolkit 9.2 (May 2018), Online Documentation', 'CUDA Toolkit 9.1 (Dec 2017), Online Documentation', 'CUDA Toolkit 9.0 (Sept 2017), Online Documentation', 'CUDA Toolkit 8.0 GA2 (Feb 2017), Online Documentation', 'CUDA Toolkit 8.0 GA1 (Sept 2016), Online Documentation', 'CUDA Toolkit 7.5 (Sept 2015)', 'CUDA Toolkit 7.0 (March 2015)', 'CUDA Toolkit 6.5 (August 2014)', and 'CUDA Toolkit 6.0 (April 2014)'. The 'CUDA Toolkit 9.2' link is highlighted with a red rectangular box.

- ii. Choose a platform based on your operating system. Select **Installer Type** to **runfile (local)** and click **Download**. NVIDIA drivers are already included in the CUDA Toolkit.

Download the drivers

3. Copy the downloaded `cuda_9.2.148_396.37_linux.run` file to the instance. `cuda_9.2.148_396.37_linux.run` is used as an example. Replace it with the actual file name.
4. Run the `sudo sh ./cuda_9.2.148_396.37_linux.run --silent --verbose --driver --toolkit --samples` command to install the CUDA driver. `cuda_9.2.148_396.37_linux.run` is used as an example. Replace it with the actual file name.

The installation takes about 10 to 20 minutes. When `Driver: Installed` is displayed, the installation is successful.

View the CUDA installation result

```

= Summary =
-----
Driver: Installed
Toolkit: Installed in /usr/local/cuda-9.2
Samples: Installed in /home/lb164654, but missing recommended libraries

Please make sure that
- PATH includes /usr/local/cuda-9.2/bin
- LD_LIBRARY_PATH includes /usr/local/cuda-9.2/lib64, or, add /usr/local/cuda-9.2/lib64 to /etc/ld.so.conf and run ldconfig as root

To uninstall the CUDA Toolkit, run the uninstall script in /usr/local/cuda-9.2/bin
To uninstall the NVIDIA Driver, run nvidia-uninstall

Please see CUDA_Installation_Guide_Linux.pdf in /usr/local/cuda-9.2/doc/pdf for detailed information on setting up CUDA.

Logfile is /tmp/cuda_install_19765.log

```

5. Run the `nvidia-smi` command to view the GPU driver status. If the output displays the details of the GPU driver, the driver is running properly.

View the GPU driver status

```

$ nvidia-smi
Mon Oct 15 19:05:00 2018

```

What's next

If you want to run the OpenGL program, you must first purchase the licenses and install the GRID drivers. For information about the installation procedure, see the official NVIDIA documentation.

2.4.16. Install the CUDA and GPU drivers for a Windows instance

You must install a GPU driver on GPU instances to use the GPU. If the image you use does not contain a pre-installed GPU driver, you must manually install the CUDA and GPU drivers for the instance.

Prerequisites

- If your instance cannot connect to the Internet, the installation file cannot be downloaded. You can install an FTP client on the instance to transfer the installation file to the instance.
- To compile CUDA programs, first install a Windows compiling environment, such as Visual Studio 2015. If you do not need to compile CUDA programs, ignore it.

Procedure

1. Download the CUDA Toolkit.
 - i. Access the [official CUDA download page](#). Choose the version based on the GPU application requirements for CUDA. This example uses [CUDA Toolkit 9.2](#).
 - ii. Choose a platform based on your operating system. Set **Installer Type** to **exe (local)** and click **Download**. NVIDIA drivers are already included in the CUDA Toolkit.
2. Copy the downloaded `cuda_9.2.148_windows.exe` file to the instance. `cuda_9.2.148_windows.exe` is used as an example. Replace it with the actual file name.
3. Double-click `cuda_9.2.148_windows.exe` and follow the installation wizard to install the CUDA driver. `cuda_9.2.148_windows.exe` is used as an example. Replace it with the actual file name. The installation takes about 10 to 20 minutes. When `Installed: - Nsight Monitor and HUD Launcher` is displayed, the driver is installed.
4. Press **Win + R** and enter `devmgmt.msc`. The NVIDIA device is displayed in **Display Adapter**.
5. Press **Win + R**, enter `cmd`, and run the `"C:\Program Files\NVIDIA Corporation\NVSMI\nvidia-smi"` command. If the output displays the details of the GPU driver, the driver is running properly.

What's next

If you want to run the OpenGL and DirectX programs, you must first purchase the licenses and install the GRID drivers. For information about the installation procedure, see the official NVIDIA documentation.

2.5. Disks

2.5.1. Create a disk

You can create an independent data disk and attach it to an ECS instance to increase the storage space of the instance. This topic describes how to create an empty data disk. You cannot create independent system disks.

Context

We recommend that you plan the number and size of data disks before you create them. The following limits apply to data disks:

- A maximum of 16 data disks can be attached to an instance. Disks and Shared Block Storage devices share this quota.
- Each Shared Block Storage device can be attached to up to four ECS instances at the same time.
- Each ultra disk, shared ultra disk, standard SSD, or shared SSD can have a maximum capacity of 32 TiB.
- Disks cannot be combined in ECS. They are independent of each other. You cannot combine multiple disks into one by formatting them.

We recommend that you do not use Logical Volume Manager (LVM) to create logical volumes across multiple disks, because a snapshot can only back up data of a single disk. If you create a logical volume across several disks, data discrepancies will occur when you restore these disks.

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, choose **Storage > Disks**.
3. Click **Create Disk**.
4. Configure parameters listed in the following table to create a disk.

Section	Parameter	Required	Description
Region	Organization	Yes	Select an organization in which to create the disk.
	Resource Set	Yes	Select a resource set in which to create the disk.
	Region	Yes	Select a region in which to create the disk.
	Zone	Yes	Select a zone in which to create the disk.
	Name	Yes	Enter a name for the disk. The name must be 2 to 128 characters in length. It must start with a letter and cannot start with http:// or https://. It can contain letters, digits, periods (.), underscores (_), hyphens (-), colons (:), and commas (,).

Section	Parameter	Required	Description
Basic Settings	Specifications	Yes	<p>Select a disk category and specify the disk size. Valid disk categories:</p> <ul style="list-style-type: none"> ◦ SSD Disk ◦ Ultra Disk ◦ Shared SSD: shared SSD ◦ Shared Ultra Disk: shared ultra disk <p>The disk size must range from 20 GiB to 32768 GiB.</p>
	Encrypt	No	Specify whether to encrypt the disk.
	Encryption Algorithm	No	<p>Select an encryption algorithm. This parameter is required when you set Encrypt to Yes.</p> <p>Valid values:</p> <ul style="list-style-type: none"> ◦ AES256: AES256 encryption algorithm. ◦ SM4: Chinese encryption algorithm SM4.
	Encryption Key	No	<p>Select an encryption key. This parameter is required when you set Encrypt to Yes.</p> <div style="border: 1px solid #add8e6; padding: 5px; margin-top: 10px;"> <p> Note If no key is available, create a key in KMS.</p> </div>

Section	Parameter	Required	Description
	Use Snapshot	No	<p>Specify whether to create the disk from a snapshot. If you select Yes, you must specify a snapshot. The size of the created disk depends on the size of the specified snapshot.</p> <ul style="list-style-type: none"> ◦ If the disk size that you specify is greater than the snapshot size, the disk will be created with the size you specified. ◦ If the disk size that you specify is smaller than the snapshot size, the disk will be created with the snapshot size.

5. Click **Submit**.

Result

The created disk is displayed in the disk list and in the **Pending** state.

What's next

After the disk is created, you must attach the disk to an instance and partition and format the disk. For more information, see the following topics:

-
- [Format a data disk for a Linux instance](#)
- [Format a data disk of a Windows instance](#)

2.5.2. View disks

You can view the list of created disks and the details of individual disks.

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, choose **Storage > Disks**.
3. In the top navigation bar, select an organization, a resource set, and a region. The created disks that match the specified criteria are displayed.
4. Select a filter option from the drop-down list, enter the relevant information in the search box, and click **search**.

You can select multiple filter options to narrow down search results.

Filter option	Description
Disk Name	Enter a disk name to search for the disk.
Disk ID	Enter a disk ID to search for the disk.

Filter option	Description
Instance ID	Enter an instance ID to search for the disks that are attached to the instance.
Disk Status	<p>Select a disk status to search for disks in that status. Valid values:</p> <ul style="list-style-type: none"> ◦ Running ◦ Pending ◦ Attaching ◦ Detaching ◦ Creating ◦ Deleting ◦ Deleted <div style="border: 1px solid #ccc; background-color: #e0f2f1; padding: 5px; margin: 5px 0;"> <p>? Note Deleted disks are no longer displayed in the disk list.</p> </div> <ul style="list-style-type: none"> ◦ Initializing ◦ All Statuses
Disk Properties	<p>Select a disk type to search for disks of that type. Valid values:</p> <ul style="list-style-type: none"> ◦ All ◦ System Disk ◦ Data Disk
Policy ID	Enter the ID of an automatic snapshot policy to search for the disks that use the policy.
Encryption Key ID	Enter the ID of an encryption key to search for the disks that are encrypted with the key.

5. In the **Disk ID/Name** column, click a disk ID to go to the Disk Details page of the disk. The properties and mount information of the disk are displayed on the Disk Details page.

2.5.3. Roll back a disk

If you have created snapshots for a disk, you can use a snapshot to roll back the disk to the state it was when the snapshot was taken. Rolling back a disk is irreversible. Once the disk is rolled back, the disk data before the rollback time cannot be restored. Exercise caution when you perform this operation.

Prerequisites

- Snapshots have been created for the disk.
- The disk is not released.
- The instance where the target disk resides must be in the **Stopped** state.

Procedure

1. **Log on to the ECS console.**
2. In the left-side navigation pane, choose **Snapshots and Images > Snapshots**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Select a filtering option from the drop-down list, enter the relevant information in the search bar, and click **Search**.

You can select multiple filtering options to narrow down the search results.

Filtering option	Description
Snapshot Name	Enter a snapshot name to search for the snapshot.
Snapshot ID	Enter a snapshot ID to search for the snapshot.
Instance ID	Enter an instance ID to search for the snapshots related to the instance.
Disk ID	Enter a disk ID to search for the snapshots related to the disk.
Snapshot Type	Select a snapshot type to search for the snapshots of that type. Options include: <ul style="list-style-type: none"> ◦ All ◦ User Snapshots: manual snapshots. ◦ Automatic snapshots: automatic snapshots.
Creation Time	Enter a creation time to search for the snapshots that were created at that time.

5. Find the snapshot and click **Restore** in the **Actions** column.
6. Click **OK**.

2.5.4. Modify the disk properties

You can modify the properties of a created disk, such as changing the settings of the Release Disk with Instance and Release Automatic Snapshots with Disk options.

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, choose **Storage > Disks**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the disk and choose **More > Modify Disk Properties** from the **Actions** column.
5. Modify the release mode.
 - **Release Disk with Instance:** When this option is selected, the disk is released together when the instance it is attached to is deleted. When this option is not selected, the disk changes to the **Pending** state when the instance it is attached to is deleted.
 - **Release Automatic Snapshots with Disk:** When this option is selected, the automatic snapshots created for the disk is released together when the disk is deleted. When this option is not selected, the automatic snapshots are retained.
6. Click **OK**.

2.5.5. Modify the disk description

You can modify the name and description of a created disk.

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, choose **Storage > Disks**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the disk and choose **More > Modify Disk Description** from the **Actions** column.

5. Modifies the name and description of the disk. The name must be 2 to 128 characters in length and start with a letter. It can contain periods (.), underscores (_), colons (:), and hyphens (-).

The description must be 2 to 256 characters in length and cannot start with `http://` and `https://`.

6. Click OK.

2.5.6. Attach a disk

You can attach a disk that is created separately to an ECS instance as a data disk. The disk and the instance must be in the same region and the same zone.

Prerequisites

The disk is in the **Pending** state.

Context

- You do not need to attach data disks that are created at the same time as an instance.
- A disk can only be attached to an instance that is in the same zone and region as the disk.
- You can attach a disk to a single ECS instance at a time.
- A Shared Block Storage device can be attached to a maximum of four ECS instances at the same time.

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, choose **Storage > Disks**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the disk and choose **More > Attach** from the **Actions** column.
5. Specify the destination instance and configure the release mode as needed.
 - If you select **Release Disk with Instance**, the disk is released together when the instance it is attached to is deleted.
 - If you do not select **Release Disk with Instance**, the disk changes to the **Pending** state when the instance it is attached to is deleted.
6. Click OK.

2.5.7. Partition and format disks

2.5.7.1. Format a data disk for a Linux instance

Data disks created separately are not partitioned or formatted. This topic describes how to partition and format a data disk of a Linux instance.

Prerequisites

The disk has been attached to the instance.

Procedure

1. [Connect to the instance](#).
2. Run the `fdisk -l` command to view all data disks attached to the ECS instance. If `/dev/vdb` is not displayed in the command output, the ECS instance does not have a data disk. Check whether the data disk is attached to the instance.

```
[root@iZ*****eZ ~]# fdisk -l
Disk /dev/vda: 42.9 GB, 42949672960 bytes
255 heads, 63 sectors/track, 5221 cylinders
Units = cylinders of 16065 * 512 = 8225280 bytes
Sector size (logical/physical): 512 bytes / 512 bytes
I/O size (minimum/optimal): 512 bytes / 512 bytes
Disk identifier: 0x00078f9c

Device Boot      Start         End      Blocks   Id  System
/dev/vda1 *          1         5222   41940992   83  Linux
Disk /dev/vdb: 21.5 GB, 21474836480 bytes
16 heads, 63 sectors/track, 41610 cylinders
Units = cylinders of 1008 * 512 = 516096 bytes
Sector size (logical/physical): 512 bytes / 512 bytes
I/O size (minimum/optimal): 512 bytes / 512 bytes
Disk identifier: 0x00000000
```

3. Create partitions for the data disk.
 - i. Run the `fdisk /dev/sdb` command.
 - ii. Enter `n` to create a new partition.
 - iii. Enter `p` to set the partition as the primary partition.
 - iv. Enter a partition number and press the Enter key. In this example, `7` is entered to create Partition 1.
 - v. Enter the number of the first available sector. This example uses the default value. This is done by pressing the Enter key. You can also enter a value from 1 to 41610 and press the Enter key.
 - vi. Enter the number of the last sector. This example uses the default value. This is done by pressing the Enter key. You can also enter a value from 1 to 11748 and press the Enter key.
 - vii. (Optional)Optional. To create multiple partitions, repeat steps b through f until all four primary partitions are created.

viii. Run the `wq` command to start partitioning.

```
[root@iZ*****eZ ~]# fdisk /dev/vdb
Device contains neither a valid DOS partition table, nor Sun, SGI or OSF disklabel
Building a new DOS disklabel with disk identifier 0x01ac58fe.
Changes will remain in memory only, until you decide to write them.
After that, of course, the previous content won't be recoverable.

Warning: invalid flag 0x0000 of partition table 4 will be corrected by w(rite)

WARNING: DOS-compatible mode is deprecated. It's strongly recommended to
        switch off the mode (command 'c') and change display units to
        sectors (command 'u').

Command (m for help): n
Command action
   e   extended
   p   primary partition (1-4)
p
Partition number (1-4): 1
First cylinder (1-41610, default 1):
Using default value 1
Last cylinder, +cylinders or +size{K,M,G} (1-41610, default 41610):
Using default value 41610

Command (m for help): wq
The partition table has been altered!
```

4. Run the `fdisk -l` command to view the partitions. If `/dev/vdb1` is displayed in the command output, new partition `vdb1` is created.

```
[root@iZ*****eZ ~]# fdisk -l
Disk /dev/vda: 42.9 GB, 42949672960 bytes
255 heads, 63 sectors/track, 5221 cylinders
Units = cylinders of 16065 * 512 = 8225280 bytes
Sector size (logical/physical): 512 bytes / 512 bytes
I/O size (minimum/optimal): 512 bytes / 512 bytes
Disk identifier: 0x00078f9c

Device Boot      Start         End      Blocks   Id  System
/dev/vda1 *          1         5222    41940992   83  Linux
Disk /dev/vdb: 21.5 GB, 21474836480 bytes
16 heads, 63 sectors/track, 41610 cylinders
Units = cylinders of 1008 * 512 = 516096 bytes
Sector size (logical/physical): 512 bytes / 512 bytes
I/O size (minimum/optimal): 512 bytes / 512 bytes
Disk identifier: 0x01ac58fe

Device Boot      Start         End      Blocks   Id  System
/dev/vdb1          1         41610    20971408+   83  Linux
```

5. Format the new partition. In this example, the new partition is formatted as ext3 after you run the `mkfs.ext3 /dev/vdb1` command. The time required for formatting depends on the disk size. You can also format the new partition to another file system. For example, you can run the `mkfs.ext4 /dev/vdb1` command to format the partition as ext4.

Compared with ext2, ext3 only adds the log function. Compared with ext3, ext4 improves on some important data structures. ext4 provides better performance and reliability, and more functions.

```
[root@iZ*****leZ ~]# mkfs.ext3 /dev/vdb1
mke2fs 1.41.12 (17-May-2010)
Filesystem label=
OS type: Linux
Block size=4096 (log=2)
Fragment size=4096 (log=2)
Stride=0 blocks, Stripe width=0 blocks
1310720 inodes, 5242852 blocks
262142 blocks (5.00%) reserved for the super user
First data block=0
Maximum filesystem blocks=4294967296
160 block groups
32768 blocks per group, 32768 fragments per group
8192 inodes per group
Superblock backups stored on blocks:
    32768, 98304, 163840, 229376, 294912, 819200, 884736, 1605632, 2654208,
    4096000

Writing inode tables: done
Creating journal (32768 blocks): done
Writing superblocks and filesystem accounting information: done

This filesystem will be automatically checked every 25 mounts or
180 days, whichever comes first. Use tune2fs -c or -i to override.
```

6. Run the `echo '/dev/vdb1 /mnt ext3 defaults 0 0' >> /etc/fstab` command to write the information of the new partition to the `/etc/fstab` file. You can run the `cat /etc/fstab` command to view the new partition information. Ubuntu 12.04 does not support barriers. To write the information of the new partition into the `/etc/fstab` file, you must run the `echo '/dev/vdb1 /mnt ext3 barrier=0 0 0' >> /etc/fstab` command.

In this example, the partition information is added to the ext3 file system. You can also modify the ext3 parameter to add the partition information to another type of file system.

To attach the data disk to a specific folder, for example, to store web pages, modify the `/mnt` part of the preceding command.

```
[root@iZ*****eZ ~]# echo '/dev/vdb1 /mnt ext3 defaults 0 0' >> /etc/fstab
[root@iZbp19cdhgdj0aw5r2izleZ ~]# cat /etc/fstab

#
# /etc/fstab
# Created by anaconda on Thu Aug 14 21:16:42 2014
#
# Accessible filesystems, by reference, are maintained under '/dev/disk'
# See man pages fstab(5), findfs(8), mount(8) and/or blkid(8) for more info
#
UUID=94e4e384-0ace-437f-bc96-057dd64f**** / ext4 defaults,barrier=0 1 1
tmpfs      /dev/shm      tmpfs defaults    0 0
devpts     /dev/pts      devpts gid=5,mode=620 0 0
sysfs      /sys          sysfs defaults    0 0
proc       /proc         proc  defaults    0 0
/dev/vdb1 /mnt ext3 defaults 0 0
```

7. Mount the new partitions. Run the `mount -a` command to mount all the partitions listed in `/etc/fstab` and run the `df -h` command to view the result. If the following information is displayed, the new partitions are mounted and available for use.

```
[root@iZ*****eZ ~]# mount -a
[root@iZ*****eZ ~]# df -h
Filesystem      Size  Used Avail Use% Mounted on
/dev/vda1       40G  5.6G  32G  15% /
tmpfs           499M   0 499M   0% /dev/shm
/dev/vdb1       20G  173M  19G   1% /mnt
```

2.5.7.2. Format a data disk of a Windows instance

Data disks created separately are not partitioned or formatted. This topic describes how to partition and format a data disk of a Windows instance. This example uses Windows Server 2008.

Prerequisites

The disk has been attached to an instance.

Procedure

1. In the lower-left corner of the screen, click the **Server Manager** icon.
2. In the left-side navigation pane of the Server Manager window, choose **Storage > Disk Management**.
3. Right-click an empty partition and select **New Simple Volume** from the shortcut menu. If the disk status is **Offline**, change it to **Online**.
4. Click **Next**.
5. Set the size of the simple volume, which is the partition size. Then click **Next**. The default value is the maximum value of the disk space. You can specify the partition size as needed.
6. Specify the drive letter and then click **Next**.
7. Specify the formatting options and then click **Next**. We recommend that you format the partition with the default settings provided by the wizard.
8. When the wizard prompts that the partition has been completed, click **Finish** to close the wizard.

2.5.8. Expand a disk

You can expand system or data disks online. After a disk is expanded, you do not need to restart the instance to which the disk is attached for the new disk capacity to take effect.

Prerequisites

- To avoid data loss, we recommend that you create a snapshot to back up disk data before you expand a disk. For more information, see [Create a snapshot](#).
- No snapshot is being created for the disk to be expanded.
- The disk or the instance to which the disk is attached meets the following requirements:
 - If the disk is a system disk, the instance is in the **Running** state.
 - If the disk is a data disk, one of the following requirements is met:
 - The disk is in the **Pending** state.
 - If the disk is attached to an instance, the instance is in the **Running** state.
 - If the disk is a Shared Block Storage device, it is in the **Pending** state.

Context

The following limits apply when you expand a disk.

Limit	Description
Disk category	<ul style="list-style-type: none"> • Ultra disks and standard SSDs can be expanded. • Shared SSDs and shared ultra disks can be expanded.
Operating system	The system disks of Windows Server 2003 instances cannot be expanded.
Partitioning mode	You cannot expand a data disk that uses the MBR partitioning scheme to more than 2 TiB. To expand this kind of disk to more than 2 TiB, we recommend that you create and attach a new data disk with the desired size. Use the GPT partitioning scheme to partition the new data disk and then copy data from the original data disk to the new data disk.
File system	For Windows instances, you can expand only disks that use NTFS file systems.
Maximum capacity	<ul style="list-style-type: none"> • Ultra disk and standard SSD: 32,768 GiB • Shared SSD and shared ultra disk: 32,768 GiB
Operations	<ul style="list-style-type: none"> • When you expand disks, only the capacity of the disks is expanded. The sizes of partitions and file systems do not change. You must manually re-allocate storage space on a disk after the disk is expanded. • You cannot shrink an expanded disk by any means, such as by rolling it back.

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, choose **Storage > Disks**.
3. Find the target disk and choose **More > Expand Disk** in the **Actions** column.
4. In the Expand Disk dialog box that appears, specify a new capacity for the disk. The new capacity must be greater than the current capacity.
5. Click **OK**.

Result

When you expand disks, only the capacity of the disks is expanded. The sizes of partitions and file systems do not change. You must manually re-allocate storage space on a disk after the disk is expanded.

2.5.9. Reinitialize a disk

You can reinitialize a disk to restore it to its initial state.

Prerequisites

- The disk is in the **Running** state.
- The instance is in the **Stopped** state.
- After a disk is reinitialized, its data is lost and cannot be recovered. Exercise caution when you perform this operation. We recommend that you back up the data of the disk or create snapshots before you reinitialize the disk. For more information, see [Create a snapshot](#).

Context

The result of disk reinitialization depends on the disk type and how the disk is created.

- **System disk:**
 - The disk is restored to the initial state of the image used by the disk.
 - If the original image is deleted, the disk cannot be reinitialized.
- **Data disk:**
 - If the disk is empty when created, the disk is restored to an empty disk.
 - If the disk is created from a snapshot, the disk is restored to a disk with only the data of the source snapshot.
 - If the disk is created from a snapshot and the snapshot is deleted, the disk cannot be reinitialized.

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, choose **Storage > Disks**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the data disk and click **Reinitialize** in the **Actions** column.
5. Perform the following operations based on the disk type.
 - For a system disk, enter and confirm a new logon password, select the **Start Instance After Reinitializing Disk** option as needed, and then click **OK**.
 The password must be 8 to 30 characters in length and must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. The supported special characters include `()'~!@#$%^&*-_+=|{}[]:;<>,./`
 - For a data disk, click **OK**.

Result

When the disk is being reinitialized, the disk enters the **Initializing** state. After the reinitialization, it changes to the **Running** state.

2.5.10. Detach a data disk

You can detach a data disk, not a system disk.

Prerequisites

- For a Windows instance, you must bring the data disk offline in Disk Management.

 **Note** To guarantee data integrity, we recommend that you stop read/write operations on the data disk when you detach the disk. Otherwise, data may be lost.

- For a Linux instance, you must connect to the instance and unmount the partitions on the disk.

 **Note** If you have configured the `/etc/fstab` file to automatically mount the disk partitions upon instance startup, you must delete the mounting information from the `/etc/fstab` file before you detach the disk. Otherwise, you cannot connect to the instance after the instance is restarted.

- The data disk to be detached is in the **Running** state.

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, choose **Storage > Disks**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the data disk and choose **More > Detach** from the **Actions** column.
5. Click **OK**.

2.5.11. Release a data disk

You can release a data disk that is no longer needed. The released data disk cannot be recovered. Exercise caution when you release a data disk.

Prerequisites

The data disk is in the **Pending** state. If the data disk is attached to an instance, detach the disk from the instance first.

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, choose **Storage > Disks**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the data disk and choose **More > Release** from the **Actions** column.
5. Click **OK**.

2.6. Images

2.6.1. Create a custom image

You can create a custom image and use it to create identical instances or replace the system disks of existing instances. This allows you to have multiple instances with the same operating system and data environment.

Create a custom image from a snapshot

You can create a custom image from a system disk snapshot to fully load the operating system and data environment of the snapshot to the image. Before you perform this operation, make sure that a snapshot of system disks is used. You cannot create a custom image from snapshots of data disks.

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, choose **Snapshots and Images > Snapshots**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the snapshot and click **Create Custom Image** in the **Actions** column.
5. Enter the name and description of the image, and then click **OK**. The name must be 2 to 128 characters in

length and can contain periods (.), underscores (_), hyphens (-), and colons (:). It cannot start with a special character or digit.

The description must be 2 to 256 characters in length and cannot start with `http://` and `https://`.

Create a custom image from an instance

You can create a custom image from an instance to completely replicate the data of all disks of the instance, including the system disk and data disks.

 **Note** To avoid data security risks, delete sensitive data before you create a custom image.

When you create a custom image from an instance, a snapshot is generated for each disk in the instance, and all the snapshots constitute a complete custom image.

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the instance and choose **More > Create Custom Image** from the **Actions** column.
5. Enter the name and description of the custom image, and then click **OK**. The name must be 2 to 128 characters in length and can contain periods (.), underscores (_), hyphens (-), and colons (:). It cannot start with a special character or digit.

The description must be 2 to 256 characters in length and cannot start with `http://` and `https://`.

2.6.2. View images

You can view the list of created images.

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, choose **Snapshots and Images > Images**.
3. In the top navigation bar, select an organization, a resource set, and a region.
The created images that match the specified criteria are displayed.
4. Select the tab based on the type of images you want to view. You can select the **Custom Images** or **Public Images** tab.
5. Select a filtering option from the drop-down list, enter the relevant information in the search bar, and click **Search**.

You can select multiple filtering options to narrow down the search results.

Filtering option	Description
Image Name	Enter an image name to search for the image.
Image ID	Enter an image ID to search for the image.
Snapshot ID	Enter a snapshot ID to search for the images associated with the snapshot. This option is not available for public images.

2.6.3. View instances related to an image

You can view the instances that use the specified image.

Procedure

1. [Log on to the ECS console](#).

2. In the left-side navigation pane, choose **Snapshots and Images > Images**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Select a tab based on the type of the image. You can select the **Custom Images** or **Public Images** tab.
5. Find the target image and click **Related Instances** in the **Actions** column.

Result

The **Instances** page appears, showing the instances that use the image. You can perform operations on these instances, such as updating the image.

2.6.4. Modify the description of a custom image

You can modify the description of a created custom image.

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, choose **Snapshots and Images > Images**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the target custom image and click **Modify Description** in the **Actions** column.
5. In the dialog box that appears, modify the image description in the **Basic Settings** field. The description must be 2 to 256 characters in length and cannot start with `http://` or `https://`.
6. Click **OK**.

2.6.5. Share custom images

You can share a custom image that you create to organizations that you manage to create multiple identical ECS instances in a short time.

Context

Only custom images can be shared. Shared images are not counted towards the image quota assigned to the organization.

The organization can use the shared image to create instances or replace system disks of existing instances.

You can delete shared images. After a shared image is deleted, the image is no longer visible to the organization to which the image was shared. The system disk of instances created from the shared image can no longer be reinitialized.

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, choose **Snapshots and Images > Images**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the image and click **Share Image** in the **Actions** column.
5. Select the organization to which you want to share the image and click **OK**. An image can be shared only to the organizations that the image owner manages.

2.6.6. Import custom images

2.6.6.1. Limits on importing custom images

This topic describes the limits on importing images. You must understand the limits to ensure image availability and improve import efficiency.

The following limits apply when you import custom images:

- [Limits on importing custom images in Linux](#)

- [Limits on importing custom images in Windows](#)

Limits on importing custom images in Linux

When you import custom images in Linux, note the following limits:

- Multiple network interfaces are not supported.
- IPv6 addresses are not supported.
- The password must be 8 to 30 characters in length. It must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters.
- The firewall is disabled, and port 22 is opened.
- The Linux system disk size ranges from 40 GiB to 500 GiB.
- DHCP must be enabled in the image.
- SELinux is disabled.
- The Kernel-based Virtual Machine (KVM) driver must be installed.
- We recommend that you install cloud-init to configure the hostname and NTP and yum sources.

Limits

Item	Standard operating system image	Non-standard operating system image
Description	<p>The supported standard 32-bit and 64-bit operating systems include:</p> <ul style="list-style-type: none"> • CentOS • Ubuntu • SUSE • openSUSE • Red Hat • Debian • CoreOS • Aliyun Linux <div style="border: 1px solid #add8e6; padding: 5px; margin-top: 10px;"> <p> Note Support for standard operating systems may be subject to version changes. You can access the ECS console to check the latest supported operating systems.</p> </div>	<p>Non-standard operating systems include:</p> <ul style="list-style-type: none"> • Operating systems that are not supported by Alibaba Cloud. • Standard operating systems that do not meet the requirements of critical system configuration files, basic system environments, and applications. <p>If you want to use non-standard operating system images, you must select Others Linux when importing images. If you import non-standard operating system images, Alibaba Cloud does perform any processing on the instances created from these images. After you create an instance, you must connect to the instance by clicking Connect to VPN in the ECS console. You can then configure the IP address, route, and password for the instance.</p>

Item	Standard operating system image	Non-standard operating system image
Critical system configuration files	<ul style="list-style-type: none"> Do not modify <code>/etc/issue*</code> . Otherwise, the version of the operating system cannot be identified, which leads to system creation failure. Do not modify <code>/boot/grub/menu.lst</code> . Otherwise, the system may fail to start. Do not modify <code>/etc/fstab</code> . Otherwise, partitions cannot be loaded, which leads to system startup failure. Do not modify <code>/etc/shadow</code> to read-only. Otherwise, the password file cannot be modified, which leads to system creation failure. Do not modify <code>/etc/selinux/config</code> to enable SELinux. Otherwise, the system may fail to start. 	Requirements for standard operating system images are not met.
Requirements for the basic system environment	<ul style="list-style-type: none"> Do not adjust the system disk partitions. Only disks with a single root partition are supported. Make sure that the system disk has sufficient storage space. Do not modify critical system files, such as <code>/sbin</code> , <code>/bin</code> , and <code>/lib*</code> . Before importing an image, confirm the integrity of the file system. Only ext3 and ext4 file systems are supported. 	
Applications	Do not install <code>qemu-ga</code> on a custom image. Otherwise, some of the services that Alibaba Cloud needs may be unavailable.	
Image file formats	Only images in the RAW, VHD, or qcow2 format can be imported. If you want to import images in other formats, use a tool to convert the format before importing the image. We recommend that you import images in the VHD format, which has a smaller transmission footprint.	
Image file size	We recommend that you configure the disk size for importing images based on the virtual disk size (not the image file size). The disk size for importing images must be at least 40 GiB.	

Limits on importing custom images in Windows

When you import custom images in Windows, note the following limits:

- The password must be 8 to 30 characters in length. It must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters.
- Imported Windows images do not provide the Windows activation service.
- The firewall must be disabled. Otherwise, remote logon is unavailable. Port 3389 must be opened.
- The Windows system disk size ranges from 40 GiB to 500 GiB.

Limits

Item	Description
Operating system versions	<p>Alibaba Cloud supports importing the following versions of 32-bit and 64-bit operating system images:</p> <ul style="list-style-type: none"> • Microsoft Windows Server 2016 • Microsoft Windows Server 2012, including: <ul style="list-style-type: none"> ◦ Microsoft Windows Server 2012 R2 (Standard Edition) ◦ Microsoft Windows Server 2012 (Standard Edition and Datacenter Edition) • Microsoft Windows Server 2008, including: <ul style="list-style-type: none"> ◦ Microsoft Windows Server 2008 R2 (Standard Edition, Datacenter Edition, and Enterprise Edition) ◦ Microsoft Windows Server 2008 (Standard Edition, Datacenter Edition, and Enterprise Edition) • Microsoft Windows Server 2003, including: <ul style="list-style-type: none"> ◦ Microsoft Windows Server 2003 R2 (Standard Edition, Datacenter Edition, and Enterprise Edition) ◦ Microsoft Windows Server 2003 (Standard Edition, Datacenter Edition, and Enterprise Edition) or later, including Service Pack 1 (SP1) • Microsoft Windows 7, including: <ul style="list-style-type: none"> ◦ Microsoft Windows 7 (Professional Edition) ◦ Microsoft Windows 7 (Enterprise Edition) <p> Note Support for standard operating systems may be subject to version changes. You can access the ECS console to check the latest supported operating systems.</p>
Requirements for the basic system environment	<ul style="list-style-type: none"> • Multi-partition system disks are supported. • Make sure that the system disk has sufficient storage space. • Do not modify critical system files. • Before importing an image, confirm the integrity of the file system. • The NTFS file system with the MBR partition type is supported.
Applications	<p>Do not install qemu-ga on an imported image. If it is installed, some of the services that Alibaba Cloud needs may be unavailable.</p>

Item	Description
Image file formats	<ul style="list-style-type: none"> • RAW • VHD • qcow2 <p>We recommend that you configure the system disk size for importing images based on the virtual disk size (not the image file size). The system disk size for importing images must range from 40 GiB to 500 GiB.</p> <div style="border: 1px solid #ccc; background-color: #e6f2ff; padding: 5px; margin-top: 10px;"> <p> Note We recommend that you import images in the VHD format, which has a smaller transmission footprint.</p> </div>

2.6.6.2. Convert the image file format

You can only import image files in the RAW, VHD, and qcow2 formats to ECS. If you want to import images in other formats, you must convert the image into a supported format. This topic describes how to convert the image format in Windows and Linux.

Context

You can use the `qemu-img` tool to convert an image from VMDK, VDI, VHDX, qcow1, or QED to RAW, VHD, or qcow2, or implement conversion between RAW, VHD, and qcow2.

 **Note** We recommend that you use the qcow2 format if your application environment supports this format.

Windows

1. Download `qemu`. Visit [QEMU Binaries for Windows \(64 bit\)](#) to download the `qemu` tool. Select a `qemu` version based on your operating system.
2. Install `qemu`. The installation path in this example is `C:\Program Files\qemu`.
3. Configure the environment variables for `qemu`.
 - i. Choose **Start > Computer**, right-click **Computer**, and choose **Properties** from the shortcut menu.
 - ii. In the left-side navigation pane, click **Advanced System Settings**.
 - iii. In the **System Properties** dialog box that appears, click the **Advanced** tab and then click **Environment Variables**.
 - iv. In the **Environment Variables** dialog box that appears, find the **Path** variable from the **System variables** section.
 - If the **Path** variable exists, click **Edit**.
 - If the **Path** variable does not exist, click **New**.
 - v. Add a system variable value.
 - In the **Edit System Variable** dialog box that appears, add `C:\Program Files\qemu` to the **Variable value** field, separate different variable values with semicolons (;), and then click **OK**.
 - In the **New System Variable** dialog box that appears, enter `Path` in the **Variable name** field, enter `C:\Program Files\qemu` in the **Variable value** field, and then click **OK**.
4. Open **Command Prompt** in Windows and run the `qemu-img --help` command. If a successful response is displayed, the tool is installed.
5. In the **Command Prompt** window, run the `cd [Directory of the source image file]` command to switch to a new file directory, for example, `cd D:\ConvertImage`.

- In the Command Prompt window, run the `qemu-img convert -f raw -O qcow2 centos.raw centos.qcow2` command to convert the image file format. The parameters are described as follows:
 - The `-f` parameter is followed by the source image format.
 - The `-O` parameter (case-sensitive) is followed by the destination image format, source file name, and destination file name.

After the conversion is complete, the destination file appears in the directory of the source image file.

Linux

- Install the `qemu-img` tool.
 - For Ubuntu, run the `apt install qemu-img` command.
 - For CentOS, run the `yum install qemu-img` command.
- Run the `qemu-img convert -f raw -O qcow2 centos.raw centos.qcow2` command to convert the image file format.

The parameters are described as follows:

 - The `-f` parameter is followed by the source image format.
 - The `-O` parameter (case-sensitive) is followed by the destination image format, source file name, and destination file name.

2.6.6.3. Import a custom image

After you upload a local image to an OSS bucket, you can import the image to the ECS environment as a custom image.

Prerequisites

- An image that meets the limits and requirements for image import has been made. The image must be in the RAW, VHD, or qcow2 format. For more information, see [Limits on importing custom images](#) and [Convert the image file format](#).
- You have been authorized to import images. For more information, see *the RAM authorization section* in ASCM Console User Guide.
- A local image has been uploaded to a bucket by using the OSS console or calling an OSS API operation. For more information, see *the Upload objects section* in *OSS User Guide* or *the PutObject section* in *OSS Developer Guide*.

 **Note** Make sure that the bucket is in the same region as the custom image you want to create.

Procedure

- [Log on to the ECS console](#).
- In the left-side navigation pane, choose **Snapshots and Images > Images**.
- In the top navigation bar, select an organization, a resource set, and a region.
- Click **Import Image**.
- Configure the parameters of the image.

Parameter	Required	Description
Region	Yes	The region of the custom image to be imported.
Organization	Yes	The organization to which the custom image belongs.

Parameter	Required	Description
Resource Set	Yes	The resource set of the custom image.
OSS Bucket Name	Yes	The name of the OSS bucket where the image to be imported resides.
OSS Object Name	Yes	The endpoint of the OSS object where the image is stored. For information about how to obtain the endpoint of an OSS object, see <i>the Obtain object UR Ls section</i> in OSS User Guide.
Image Name	Yes	The name of the custom image. The name must be 2 to 128 characters in length. It must start with a letter and can contain letters, periods (.), underscores (_), and hyphens (-).
Operating System	Yes	Linux and Windows are available.
System Disk	Yes	The size of the system disk of the ECS instance. Unit: GiB.
System Architecture	Yes	x86_64 and i386 are available.
Platform	Yes	<p>Linux:</p> <ul style="list-style-type: none"> ◦ CentOS ◦ Ubuntu ◦ SUSE ◦ OpenSUSE ◦ Debian ◦ CoreOS ◦ Aliyun ◦ Others Linux ◦ Customized Linux <p>Windows:</p> <ul style="list-style-type: none"> ◦ Windows Server 2003 ◦ Windows Server 2008 ◦ Windows Server 2012
Image Format	Yes	The format of the custom image. RAW, VHD, and qcow2 are available.
Description	No	The description of the custom image.

6. Click **OK**.

Result

You can go to the Images page to view the progress of custom image creation. For more information, see . When 100% is displayed in the Progress column of the Images page, the image is created.

2.6.7. Export a custom image

You can export a custom image to an OSS bucket and then download it to your local device.

Prerequisites

- OSS is activated and an OSS bucket is created. For more information, see the *"Create buckets" section* in OSS

User Guide.

- You are authorized to export images. For more information, see *the "RAM" chapter* in ASCM Console User Guide.

Context

You can export custom images to the RAW, VHD, or qcow2 format. After a custom image is exported to an OSS bucket, you can download the image to your local device. For more information, see *the "Obtain object URLs" section* in OSS User Guide.

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, choose **Snapshots and Images > Images**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the target custom image and click **Export Image** in the **Actions** column.
5. Select a bucket for **OssBucket**. Enter a prefix in the **OSS Prefix** field. Then click **OK**. The **OSS Prefix** field is optional. The prefix must be 1 to 30 characters in length and can contain digits and letters.

2.6.8. Delete a custom image

You can delete a custom image that is no longer needed. However, public images cannot be deleted.

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, choose **Snapshots and Images > Images**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Select one of the following methods to delete custom images.
 - To delete one image, find the image and click **Delete Image** in the **Actions** column.
 - To delete multiple images, select images and click **Delete** at the bottom of the image list.
5. Click **OK**.

2.7. Snapshots

2.7.1. Create a snapshot

You can manually create a snapshot for a disk to back up disk data.

Prerequisites

- The instance to which the disk is attached is in the **Running** or **Stopped** state.
- The disk is in the **Running** state.

Context

You can create up to 64 snapshots for each disk.

Snapshots can be used in the following scenarios:

- Restore a disk from one of its snapshots.
- Create a custom image from a system disk snapshot.
 - For more information, see [. Data disk snapshots cannot be used to create custom images.](#)
- Create a new data disk from a data disk snapshot.

To create a data disk from a snapshot, set Use Snapshot to Yes and specify a snapshot on the Create Disk page. For more information, see [Create a disk](#). When you re-initialize a data disk created from a snapshot, the disk is restored to the status of the snapshot.

Note the following considerations when you create a snapshot:

- For each disk, the first snapshot is a full snapshot and subsequent snapshots are incremental snapshots. It takes an extended period of time to create the first snapshot. It takes a short period of time to create an incremental snapshot. The amount of taken time depends on the volume of data that has been changed since the last snapshot. The more data that has been changed, the more time it takes.
- Avoid creating snapshots during peak hours.

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, choose **Storage > Disks**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the target disk and click **Create Snapshot** in the **Actions** column.
5. Enter a snapshot name and description and then click **OK**.

 **Note** The names of manual snapshots cannot start with auto because auto is a prefix reserved for automatic snapshots.

You can go to the Snapshots page to check the progress of snapshot creation. For more information, see [View snapshots](#). When 100% is displayed in the Progress column, the snapshot is created.

2.7.2. View snapshots

You can view the list of created snapshots.

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, choose **Snapshots and Images > Snapshots**.
3. In the top navigation bar, select an organization, a resource set, and a region.
The created snapshots that match the specified criteria are displayed.
4. Select a filter option from the drop-down list, enter the relevant information in the search bar, and click **Search**.

You can select multiple filter options to narrow down search results.

Filter option	Description
Snapshot Name	Enter a snapshot name to search for the snapshot.
Snapshot ID	Enter a snapshot ID to search for the snapshot.
Instance ID	Enter an instance ID to search for the snapshots related to the instance.
Disk ID	Enter a disk ID to search for the snapshots related to the disk.
Snapshot Type	Select a snapshot type to search for the snapshots of that type. Valid values: <ul style="list-style-type: none"> ○ All ○ User Snapshots: manual snapshots ○ Automatic Snapshots: automatic snapshots

Filter option	Description
Creation Time	Enter a time to search for the snapshots that were created at that time.

2.7.3. Delete a snapshot

You can delete a snapshot that is no longer needed. After the snapshot is deleted, it cannot be recovered. You cannot delete system disk snapshots that have been used to create custom images.

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, choose **Snapshots and Images > Snapshots**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Use one of the following methods to delete the snapshot:
 - To delete a single snapshot, find the snapshot and click **Delete** in the **Actions** column.
 - To delete one or more snapshots at a time, select the snapshots and click **Delete** in the lower-left corner of the Snapshots page.
5. In the message that appears, click **OK**.

2.8. Automatic snapshot policies

2.8.1. Create an automatic snapshot policy

Automatic snapshot policies can apply to both system disks and data disks and can be used to create periodical snapshots for the disks. Using automatic snapshot policies can improve data availability and operation error tolerance.

Context

Automatic snapshot policies can effectively eliminate the following risks associated with manual snapshot creation:

- When applications such as personal websites or databases deployed on an ECS instance encounter attacks or system vulnerabilities, you may not be able to manually create snapshots. In this case, you can use the latest automatic snapshot to roll back the affected disks to restore your data and reduce losses.
- You can also specify an automatic snapshot policy to create snapshots before regular system maintenance tasks. This eliminates the need to manually create snapshots and ensures that snapshots are always created before maintenance.

You can create up to 64 snapshots for each disk. If the maximum number of snapshots for a disk is reached when a new snapshot is being created, the system deletes the oldest automatic snapshot.

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, choose **Snapshots and Images > Automatic Snapshot Policies**.
3. Click **Create Policy**.
4. Configure the properties of the automatic snapshot policy.

Parameter	Required	Description
Region	Yes	The ID of the region to which the automatic snapshot policy applies.

Parameter	Required	Description
Organization	Yes	The organization to which the automatic snapshot policy applies.
Policy Name	Yes	The name of the automatic snapshot policy. The name must be 2 to 128 characters in length and cannot start with a special character or digit. It can contain periods (.), underscores (_), hyphens (-), and colons (:).
Creation Time	Yes	<p>The time when a snapshot is automatically created. You can select any hour from 00:00 to 23:00.</p> <div style="border: 1px solid #add8e6; padding: 5px; margin: 5px 0;"> <p> Note The default time zone for the snapshot policy is UTC+8. You can change the time zone based on your business requirements.</p> </div> <p>The creation of an automatic snapshot is canceled if the scheduled time for creating the snapshot is reached but the previous automatic snapshot is still being created. This may occur if the disk stores a large volume of data. For example, you can specify a policy for the system to create automatic snapshots at the following points in time: 00:00, 01:00, and 02:00. When the system starts creating a snapshot at 00:00, it takes 70 minutes for the system to complete the snapshot task. Therefore, the system does not create another snapshot at 01:00. Instead, after the system completes the snapshot task at 01:10, the system creates the next snapshot at 02:00.</p>
Frequency	Yes	The day when a snapshot is created. You can select multiple values. The day ranges from Monday to Sunday.
Retention Policy	No	<p>The retention policy of the automatic snapshot. The default value of the retention time is 30 days. You can configure the following parameters:</p> <ul style="list-style-type: none"> ◦ Keep for: Specify the number of days during which the snapshots can be retained. Valid values: 1 to 65536. ◦ Always keep the snapshots until the number of snapshots reaches the upper limit: Select this option to retain the snapshots until the maximum number of snapshots is reached.

5. Click OK.

What's next

After the automatic snapshot policy is created, you need to apply it to a disk to automatically create snapshots for the disk. For more information, see .

2.8.2. View automatic snapshot policies

You can view the list of automatic snapshot policies.

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, choose **Snapshots and Images > Automatic Snapshot Policies**.
3. In the top navigation bar, select an organization, a resource set, and a region.
The created automatic snapshot policies that match the specified criteria are displayed.
4. View the list of automatic snapshot policies.

2.8.3. Modify an automatic snapshot policy

You can modify the properties of an automatic snapshot policy, such as the name, creation time, frequency, and retention policy.

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, choose **Snapshots and Images > Automatic Snapshot Policies**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the automatic snapshot policy and click **Modify Policy** in the **Actions** column.
5. Modify the properties of the policy. Changes made to the retention duration do not take effect on existing snapshots, but take effect only on newly created snapshots.
6. Click **OK**.

2.8.4. Configure an automatic snapshot policy

After you apply an automatic snapshot policy to a disk, snapshots will be created automatically for the disk based on the policy settings. You can cancel an applied automatic snapshot policy at any time.

Context

We recommend that you configure the automatic snapshot policy to create automatic snapshots during off-peak hours. You can also manually create a snapshot for the disk that already has an automatic snapshot policy applied. When an automatic snapshot is being created, you must wait until the snapshot is complete before you can create a manual snapshot. The automatic snapshot is named in the following format: `auto_yyyyMMdd_1`, such as `auto_20140418_1`.

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, choose **Storage > Disks**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the disk and click **Configure Automatic Snapshot Policy** in the **Actions** column.
5. Select a procedure based on the operation you want to perform on the policy.
 - To apply an automatic snapshot policy, turn on **Automatic Snapshot Policy**, select a policy, and then click **OK**.
 - To cancel an automatic snapshot policy, turn off **Automatic Snapshot Policy** and click **OK**.

2.8.5. Configure an automatic snapshot policy for multiple disks

After you apply an automatic snapshot policy to a disk, snapshots will be created automatically for the disk based on the policy settings. You can cancel an applied automatic snapshot policy at any time.

Context

We recommend that you configure the automatic snapshot policy to create automatic snapshots during off-peak hours. You can also manually create a snapshot for the disk that already has an automatic snapshot policy applied. When an automatic snapshot is being created, you must wait until the snapshot is complete before you can create a manual snapshot. The automatic snapshot is named in the following format: `auto_yyyyMMdd_1`, such as `auto_20140418_1`.

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, choose **Snapshots and Images > Automatic Snapshot Policies**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the automatic snapshot policy and click **Apply Policy** in the **Actions** column.
5. Select a tab based on the operation you want to perform on the disks.
 - To apply the automatic snapshot policy, click the **Disks Without Policy Applied** tab, select one or more disks, and click **Apply Policy** at the bottom of the disk list.
 - To cancel the automatic snapshot policy, click the **Disks With Policy Applied** tab, select one or more disks, and click **Disable Automatic Snapshot Policy** at the bottom of the disk list.

2.8.6. Delete an automatic snapshot policy

You can delete an automatic snapshot policy that is no longer needed. After you delete the automatic snapshot policy, the policy is automatically canceled for disks that have it applied.

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, choose **Snapshots and Images > Automatic Snapshot Policies**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the automatic snapshot policy and click **Delete Policy** in the **Actions** column.
5. In the message that appears, click **OK**.

2.9. Security groups

2.9.1. Create a security group

Security groups are an important means for network security isolation. They are used to set network access control for one or more ECS instances.

Prerequisites

A Virtual Private Cloud (VPC) has been created. For more information, see *VPC User Guide*.

Context

Instances that belong to the same account and are in the same region and in the same security group can communicate with each other over the internal network. If instances that belong to the same account in the same region are in different security groups, you can implement internal network communication by authorizing mutual access between two security groups.

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, choose **Networks and Security > Security Groups**.
3. In the top navigation bar, select an organization, a resource set, and a region.

4. Click **New Security Group**.

5. Configure the parameters of the security group.

Type	Parameter	Required	Description
Region	Organization	Yes	The organization to which the security group belongs. Make sure that the security group and the VPC belong to the same organization.
	Resource Set	Yes	The resource set to which the security group belongs. Make sure that the security group and the VPC belong to the same resource set.
	Region	Yes	The region to which the security group belongs. Make sure that the security group and the VPC belong to the same region.
	Zone	Yes	The ID of the zone where the security group resides.
Basic Settings	VPC	Yes	The VPC to which the security group belongs.
	Security Group Name	No	The name must be 2 to 128 characters in length and start with a letter. It can contain letters, digits, periods (.), underscores (_), hyphens (-), colons (:), and commas (,). It cannot start with http:// or https://.
	Description	No	The description of the security group. We recommend that you provide an informational description to simplify future management operations. The name must be 2 to 256 characters in length and start with a letter. It can contain letters, digits, periods (.), underscores (_), hyphens (-), and commas (,). It cannot start with http:// or https://.

6. Click **Submit**.

2.9.2. View security groups

You can view the list of security groups that you create.

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, choose **Networks and Security > Security Groups**.
3. In the top navigation bar, select an organization, a resource set, and a region. The created security groups that match the specified criteria are displayed.
4. Select a filtering option from the drop-down list, enter the relevant information in the search bar, and click **Search**.

You can select multiple filtering options to narrow down the search results.

Filtering option	Description
Security Group ID	Enter a security group ID to search for the security group.
Security Group Name	Enter a security group name to search for the security group.
VPC ID	Enter a VPC ID to search for the security groups that belong to the VPC.

2.9.3. Modify a security group

You can modify the name and description of a created security group.

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, choose **Networks and Security > Security Groups**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the security group and click **Modify** in the **Actions** column.
5. Modify the name and description of the security group.
6. Click **OK**.

2.9.4. Add a security group rule

You can use security group rules to control access to and from the ECS instances in a security group over the Internet and the internal network.

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, choose **Networks and Security > Security Groups**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the target security group and click **Rules** in the **Actions** column.
5. Click **Create Rule**.
6. Configure parameters listed in the following table to create a security group rule.

Parameter	Required	Description
ENI Type	Yes	Valid value: Internal Network ENI . In VPCs, you cannot find public NICs in ECS instances and can add only internal security group rules. However, the added security group rules apply to both the Internet and internal network.
Direction	Yes	<ul style="list-style-type: none"> ◦ Outbound: access from the ECS instances in the current security group to other ECS instances on the internal network or resources on the Internet. ◦ Inbound: access from other ECS instances on the internal network or resources on the Internet to the ECS instances in the current security group.
Action	Yes	<ul style="list-style-type: none"> ◦ Allow: allows access requests on the specified port or ports. ◦ Deny: discards data packets and returns no messages. <p>If two security group rules are different only in the Action parameter, the Deny rule takes effect while the Allow rule is ignored.</p>
Protocol	Yes	<ul style="list-style-type: none"> ◦ All: all protocols. This value can be used in total trust scenarios. ◦ TCP: can be used to allow or deny traffic on one or several successive ports. ◦ UDP: can be used to allow or deny traffic on one or several successive ports. ◦ ICMP: can be used when the <code>ping</code> command is used to test the status of the network connection between instances. ◦ ICMPv6: can be used when the <code>ping6</code> command is used to test the status of the network connection between instances. ◦ GRE: can be used for VPN.
Port Range	Yes	<p>The port range depends on the protocol type.</p> <ul style="list-style-type: none"> ◦ When you set Protocol to All, -1/-1 is displayed, indicating all ports. You cannot specify a port range in this case. ◦ When you set Protocol to TCP, you can use the <start port number>/<end port number> format to specify a port range. Valid port numbers: 1 to 65535. Set the start port number and end port number to the same value to specify a single port. For example, use 22/22 to specify port 22. ◦ When you set Protocol to UDP, you can use the <start port number>/<end port number> format to specify a port range. Valid port numbers: 1 to 65535. Set the start port number and end port number to the same value to specify a single port. For example, use 3389/3389 to specify port 3389. ◦ When you set Protocol to ICMP, -1/-1 is displayed, indicating all ports. You cannot specify a port range in this case. ◦ When you set Protocol to ICMPv6, -1/-1 is displayed, indicating all ports. You cannot specify a port range in this case. ◦ When you set Protocol to GRE, -1/-1 is displayed, indicating all ports. You cannot specify a port range in this case.
Priority	Yes	The priority of the rule. Valid values: 1 to 100. The default value is 1, indicating the highest priority.

Parameter	Required	Description
Authorization Type	Yes	<ul style="list-style-type: none"> ◦ IPv4 Addresses: IPv4 addresses or IPv4 CIDR blocks. ◦ IPv6 Addresses: IPv6 addresses or IPv6 CIDR blocks. ◦ Security Groups: another security group. This authorization type takes effect only on the internal network.
Authorization Object	Yes	<p>Authorization objects depend on the authorization type.</p> <p>When you set Authorization Type to IPv4 Addresses:</p> <ul style="list-style-type: none"> ◦ Enter an IPv4 address or IPv4 CIDR block. Example: <i>12.1.1.1</i> or <i>13.1.1.1/25</i>. ◦ You can enter up to 10 authorization objects at a time. Separate multiple objects with commas (,). ◦ If you specify <i>0.0.0.0/0</i>, all IPv4 addresses will be allowed or denied based on the Action parameter. Exercise caution when you specify <i>0.0.0.0/0</i>. <p>When you set Authorization Type to IPv6 Addresses:</p> <ul style="list-style-type: none"> ◦ Enter an IPv6 address or IPv6 CIDR block. Example: <i>2001:0db8::1428:****</i> or <i>2001:0db8::1428:****/128</i>. ◦ You can enter up to 10 authorization objects at a time. Separate multiple objects with commas (,). ◦ If you specify <i>::/0</i>, all IPv6 addresses will be allowed or denied based on the Action parameter. Exercise caution when you specify <i>::/0</i>. <p>When you set Authorization Type to Security Groups, select a security group ID. If the current security group is of the VPC type, the selected security group must be in the same VPC as the current security group.</p>
Description	No	<p>The description of the security group rule. We recommend that you provide an informational description to simplify future management operations. The description must be 2 to 256 characters in length and cannot start with <code>http://</code> or <code>https://</code>.</p>

7. Click OK.

2.9.5. Clone a security group rule

You can clone a security group rule to quickly create a similar rule.

Procedure

1. [Log on to the ECS console.](#)
2. In the left-side navigation pane, choose **Networks and Security > Security Groups**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the target security group and click **Rules** in the **Actions** column.
5. On the Rules page that appears, click the **Inbound** or **Outbound** tab.
6. Find the target security group rule and click **Clone** in the **Actions** column.
7. In the **Clone Security Group Rule** dialog box, modify the attributes of the security group rule. For more information about the attributes of security group rules, see [Add a security group rule.](#)
8. Click OK.

2.9.6. Modify a security group rule

You can modify improper rules in a security group to ensure the security of ECS instances in the security group.

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, choose **Networks and Security > Security Groups**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the target security group and click **Rules** in the **Actions** column.
5. On the Rules page that appears, click the **Inbound** or **Outbound** tab.
6. Find the target security group rule and click **Modify** in the **Actions** column.
7. In the **Modify Security Group Rule** dialog box, modify the attributes of the security group rule. For more information about the attributes of security group rules, see [Add a security group rule](#).
8. Click **OK**.

2.9.7. Export security group rules

You can export security group rules of a security group to a local device for backup.

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, choose **Networks and Security > Security Groups**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the target security group and click **Rules** in the **Actions** column.
5. On the Rules page that appears, click the **Inbound** or **Outbound** tab.
6. Click **Export** in the upper-right corner to download and save the rules to a local device.

2.9.8. Import security group rules

You can import a local backup file of security group rules into a security group to quickly create or restore security group rules.

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, choose **Networks and Security > Security Groups**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the target security group and click **Rules** in the **Actions** column.
5. On the Rules page that appears, click the **Inbound** or **Outbound** tab.
6. Click **Import** in the upper-right corner.
7. In the **Import Rule** dialog box, click **Choose File**.
8. Select the target local backup file of security group rules and click **Open**. Then, click **OK**. The local backup file must be in the CSV format. You can download a template file from the **Import Rule** dialog box.

2.9.9. Add an instance

You can add an existing instance to a security group in the same region. After the instance is added, the security group rules of the security group automatically apply to the instance.

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, choose **Networks and Security > Security Groups**.
3. In the top navigation bar, select an organization, a resource set, and a region.

4. Find the security group and click **Manage Instances** in the **Actions** column.
5. Click **Add Instance**.
6. Select an instance and click **OK**.

2.9.10. Remove instances from a security group

You can remove instances from a security group, but each of the instances must always belong to at least one security group.

Prerequisites

The instances to be removed are added to two or more security groups.

Context

After an ECS instance is removed from a security group, the instance will be isolated from the other ECS instances in the security group. We recommend that you perform a full test in advance to ensure that services can run properly after you remove the instance.

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, choose **Networks and Security > Security Groups**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the target security group and click **Manage Instances** in the **Actions** column.
5. On the **Instances** page that appears, select one or more instances and click **Remove** in the lower-left corner.
6. Click **OK**.

2.9.11. Delete a security group

You can delete a security group that is no longer needed.

Prerequisites

No instances exist in the security group.

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, choose **Networks and Security > Security Groups**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Use one of the following methods to delete the security group:
 - To delete a single security group, find the security group and click **Delete** in the **Actions** column.
 - To delete one or more security groups at a time, select the security groups and click **Delete** in the lower-left corner of the **Security Groups** page.
5. In the message that appears, click **OK**.

2.10. Elastic Network Interfaces

2.10.1. Create an ENI

You can bind elastic network interfaces (ENIs) to instances to create high-availability clusters and implement fine-grained network management. You can also unbind an ENI from an instance and then bind the ENI to another instance to implement a low-cost failover solution.

Prerequisites

- A virtual private cloud (VPC) and a VSwitch are created. For more information, see [Create a VPC](#) and [Create a VSwitch](#) in *Apsara Stack VPC User Guide* .
- A security group is available in the VPC. If no security group is available in the VPC, create a security group. For more information, see [Create a Security Group](#) .

Context

ENIs are classified into primary and secondary ENIs.

A primary ENI is created by default when an instance is created in a VPC. This primary ENI has the same lifecycle as the instance and cannot be unbound from the instance.

ENIs created separately are secondary ENIs. You can bind secondary ENIs to or unbind them from instances. This topic describes how to create a secondary ENI.

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, choose **Networks and Security > ENIs**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Click **Create ENI**.
5. Configure parameters listed in the following table to create an ENI.

Section	Parameter	Required	Description
Region	Organization	Yes	The organization in which to create the ENI.
	Resource Set	Yes	The resource set in which to create the ENI.
	Region	Yes	The region in which to create the ENI.
	Zone	Yes	The zone in which to create the ENI.
	VPC	Yes	The VPC in which to create the ENI. The secondary ENI can be bound only to an instance in the same VPC. <div style="border: 1px solid #ccc; background-color: #e6f2ff; padding: 5px; margin-top: 10px;"> ? Note After the ENI is created, you cannot change its VPC. </div>

Section	Parameter	Required	Description
Basic Settings	VSwitch	Yes	<p>The VSwitch to be associated with the ENI. The secondary ENI can be bound only to an instance in the same VPC. Select a VSwitch that is in the same zone as the instance to which the ENI will be bound. The VSwitch of the ENI can be different from that of the instance.</p> <div style="border: 1px solid #ccc; background-color: #e6f2ff; padding: 5px; margin-top: 10px;"> <p> Note After an ENI is created, you cannot change its VSwitch.</p> </div>
	Security Group	Yes	<p>The security group in which to create the ENI within the specified VPC. The rules of the security group automatically apply to the ENI.</p>
	ENI Name	Yes	<p>The name of the ENI. The name must be 2 to 128 characters in length. It must start with a letter and cannot start with http:// or https://. It can contain letters, digits, periods (.), underscores (_), hyphens (-), colons (:), and commas (,).</p>
	Description	No	<p>The description of the ENI. We recommend that you provide an informational description to simplify future management operations. The description must be 2 to 256 characters in length. It must start with a letter and cannot start with http:// or https://. It can contain letters, digits, periods (.), underscores (_), hyphens (-), colons (:), and commas (,).</p>

Section	Parameter	Required	Description
	Primary Private IP	No	The primary private IPv4 address of the ENI. The IPv4 address must be within the CIDR block of the specified VSwitch. If you do not specify a primary private IP address, the system automatically assigns a private IP address to the ENI.

6. Click **Submit**.

Result

The created ENI is displayed on the ENIs page and is in the **Available** state.

2.10.2. View ENIs

You can view the list of created ENIs.

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, choose **Networks and Security > ENIs**.
3. In the top navigation bar, select an organization, a resource set, and a region.
The created ENIs that match the specified criteria are displayed.
4. Select a filter option from the drop-down list, enter the relevant information in the search bar, and click **Search**.

You can select multiple filter options to narrow down search results.

Filter option	Description
ENI Name	Enter an ENI name to search for the ENI.
ENI ID	Enter an ENI ID to search for the ENI.
VSwitch ID	Enter a VSwitch ID to search for the ENIs that are associated with the VSwitch.
Security Group ID	Enter a security group ID to search for the ENIs that belong to the security group.
Instance ID	Enter an instance ID to search for the ENIs that are bound to the instance.

2.10.3. Modify a secondary ENI

You can modify the attributes of a secondary elastic network interface (ENI), including the name, security group, and description.

Prerequisites

The secondary ENI is in the **Available** state.

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, choose **Networks and Security > ENIs**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the secondary ENI and click **Modify** in the **Actions** column.
5. In the Modify ENI dialog box that appears, modify the name, security group, and description of the ENI.
6. Click **OK**.

2.10.4. Bind a secondary ENI to an instance

You can bind a secondary elastic network interface (ENI) to an instance. After the ENI is bound to the instance, the instance can process the traffic on the ENI.

Prerequisites

- The secondary ENI is in the **Available** state.
- The instance to which you want to bind the secondary ENI is in the **Running** or **Stopped** state.
- The instance and the secondary ENI belong to the same VPC.
- The VSwitch with which the secondary ENI is associated is in the same zone as the VSwitch to which the instance is connected. An ENI can be bound only to an instance in the same zone. The VSwitches of the ENI and of the instance can be different but must be in the same zone.

Context

The following limits apply when you bind an ENI to an instance:

- You can manually bind only secondary ENIs. Primary ENIs share the same lifecycle as instances and cannot be manually bound.
- An ENI can only be bound to a single ECS instance. However, an ECS instance can be bound with multiple ENIs. The maximum number of ENIs that can be bound to an instance depends on the instance type. For more information about the number of ENIs that can be bound to an instance of each instance type, see *Instance families in ECS Product Introduction*.

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, choose **Networks and Security > ENIs**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the target secondary ENI and click **Bind** in the **Actions** column.
5. In the Bind dialog box that appears, select an instance and click **OK**.

Result

In the **Status/Creation Time** column, the status of the secondary ENI changes to **Bound**.

2.10.5. Unbind a secondary ENI from an instance

You can unbind a secondary elastic network interface (ENI) from an instance. After the secondary ENI is unbound from the instance, the instance no longer processes the traffic on the ENI.

Prerequisites

- The secondary ENI is in the **Bound** state.
- The instance is in the **Running** or **Stopped** state.

Context

Only secondary ENIs can be unbound. Primary ENIs share the same lifecycle as instances and cannot be unbound.

Procedure

1. [Log on to the ECS console.](#)
2. In the left-side navigation pane, choose **Networks and Security > ENIs**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the secondary ENI and click **Unbind** in the **Actions** column.
5. Click **OK**.

Result

In the **Status/Creation Time** column, the status of the secondary ENI changes to **Available**.

2.10.6. Delete a secondary ENI

You can delete a secondary elastic network interface (ENI) that is no longer needed.

Prerequisites

The secondary ENI is in the **Available** state.

Context

You can delete only secondary ENIs. Primary ENIs share the same lifecycle as instances and cannot be deleted.

Procedure

1. [Log on to the ECS console.](#)
2. In the left-side navigation pane, choose **Networks and Security > ENIs**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the secondary ENI and click **Delete** in the **Actions** column.
5. Click **OK**.

2.11. Deployment sets

2.11.1. Create a deployment set

You can use a deployment set to distribute or aggregate instances involved in your business. You can select hosts, racks, or network switches to improve service availability or network performance based on your needs.

Procedure

1. [Log on to the ECS console.](#)
2. In the left-side navigation pane, click **Deployment Sets**.
3. Click **Create Deployment Set**.
4. Configure the parameters of the deployment set.

Category	Parameter	Required	Description
Region	Organization	Yes	The organization to which the deployment set belongs.
	Resource Set	Yes	The resource set to which the deployment set belongs.
	Region	Yes	The region where the deployment set is located.
	Zone	Yes	The zone where the deployment set is located.

Category	Parameter	Required	Description
Basic Settings	Deployment Domain	Yes	This parameter setting determines the Deployment Target options. Valid values: <ul style="list-style-type: none"> ◦ Default: When Default is selected, the deployment target options are Host, Rack, and Network Switch. ◦ Switch: When Switch is selected, the deployment target options are Host and Rack.
	Deployment Target	Yes	The basic unit that can be scheduled when you deploy instances. <ul style="list-style-type: none"> ◦ Host: Instances are distributed or aggregated at the host level. ◦ Rack: Instances are distributed or aggregated at the rack level. ◦ VSwitch: Instances are distributed or aggregated at the VSwitch level.
	Deployment Policy	Yes	The dispersion policies are used to improve service availability to avoid business impact when a host, rack, or switch fails. The aggregation policies are used to improve network performance to minimize the access latency between instances. Options are: <ul style="list-style-type: none"> ◦ Loose Dispersion ◦ Strict Dispersion ◦ Loose Aggregation ◦ Strict Aggregation
	Deployment Set Name	No	The name of the deployment set. The name must be 2 to 128 characters in length. It must start with a letter but cannot start with http:// or https://. It can contain digits, periods (.), underscores (_), hyphens (-), colons (:), and commas (,).
	Description	No	The description of the deployment set. We recommend that you provide an informational description to simplify future management operations. The description must be 2 to 256 characters in length. It must start with a letter but cannot start with http:// or https://. It can contain digits, periods (.), underscores (_), hyphens (-), colons (:), and commas (,).

5. Click **Submit**.

2.11.2. View deployment sets

You can view the list of created deployment sets.

Procedure

1. **Log on to the ECS console.**
2. In the left-side navigation pane, click **Deployment Sets**.
3. In the top navigation bar, select an organization, a resource set, and a region.
The created deployment sets that match the specified criteria are displayed.
4. Select a filter option from the drop-down list, enter the relevant information in the search bar, and then

click **Search**.

You can select multiple filter options to narrow down search results.

Filter option	Description
Deployment Set Name	Enter a deployment set name to search for the deployment set.
Deployment Set ID	Enter a deployment set ID to search for the deployment set.
Resource Set	Enter a resource set name to search for the deployment sets that belong to the resource set.

2.11.3. Modify a deployment set

You can modify the name and description of a deployment set.

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, click **Deployment Sets**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the deployment set and click **Modify** in the **Actions** column.
5. In the Change Deployment Set dialog box, change the name of the deployment set.
6. Click **OK**.

2.11.4. Delete a deployment set

You can delete a deployment set that is no longer needed.

Prerequisites

No instances exist in the deployment set.

Procedure

1. [Log on to the ECS console](#).
2. In the left-side navigation pane, click **Deployment Sets**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the deployment set and click **Delete** in the **Actions** column.
5. Click **OK**.

2.12. Install FTP software

2.12.1. Overview

File Transfer Protocol (FTP) transfers files between a client and a server by establishing two TCP connections. One is the command link for transferring commands between a client and a server. The other is the data link used to upload or download data. Before uploading files to an instance, you must build an FTP site for the instance.

2.12.2. Install and configure vsftpd in CentOS

This topic describes how to install and configure vsftpd in CentOS to transfer files.

Procedure

1. Install vsftpd.

```
yum install vsftpd -y
```

2. Add an FTP account and a directory.

- i. Check the location of the *nologin* file, which is usually under the */usr/sbin* or */sbin* directory.
- ii. Create an FTP account. Run the following commands to create the */alidata/www/wwwroot* directory and specify this directory as the home directory of the account *pwftp*. You can also customize the account name and directory.

```
mkdir -p /alidata/www/wwwroot  
useradd -d /alidata/www/wwwroot -s /sbin/nologin pwftp
```

iii. Modify the account password.

```
passwd pwftp
```

iv. Modify the permissions on the specified directory.

```
chown -R pwftp.pwftp /alidata/www/wwwroot
```

3. Configure vsftpd.

i. Open the vsftpd configuration file.

```
vi /etc/vsftpd/vsftpd.conf
```

ii. Change the value of `anonymous_enable` from `YES` to `NO`.

iii. Delete the comment delimiter (`#`) from the following configuration lines:

```
local_enable=YES  
write_enable=YES  
chroot_local_user=YES
```

iv. Press the Esc key to exit the edit mode, and enter `:wq` to save the modifications and exit.

4. Modify the shell configuration.

i. Open the shell configuration file.

```
vi /etc/shells
```

ii. If the file does not contain */usr/sbin/nologin* or */sbin/nologin*, add it to the file.

5. Start vsftpd and perform a logon test.

i. Start vsftpd.

```
service vsftpd start
```

ii. Use the account *pwftp* to perform an FTP logon test. This example uses the directory */alidata/www/wwwroot*.

2.12.3. Install vsftpd in Ubuntu or Debian

This topic describes how to install and configure vsftpd in an instance running Ubuntu or Debian to transfer files.

Procedure

1. Update the software source.

```
apt-get update
```

2. Install vsftpd.

```
apt-get install vsftpd -y
```

3. Add an FTP account and a directory.

- i. Check the location of the *nologin* file, which is typically under the */usr/sbin* or */sbin* directory.
- ii. Create an FTP account. Run the following commands to create the */alidata/www/wwwroot* directory and specify this directory as the home directory of the account *pwftp*. You can also customize the account name and directory.

```
mkdir -p /alidata/www/wwwroot
useradd -d /alidata/www/wwwroot -s /sbin/nologin pwftp
```

iii. Modify the account password.

```
passwd pwftp
```

iv. Modify the permissions on the specified directory.

```
chown -R pwftp.pwftp /alidata/www/wwwroot
```

4. Configure vsftpd.

i. Open the vsftpd configuration file.

```
vi /etc/vsftpd.conf
```

- ii. Change the value of `anonymous_enable` from `YES` to `NO`.
- iii. Delete the comment delimiter (`#`) from the following configuration lines:

```
local_enable=YES
write_enable=YES
chroot_local_user=YES
chroot_list_enable=YES
chroot_list_file=/etc/vsftpd.chroot_list
```

- iv. Press the Esc key to exit the edit mode, and enter `:wq` to save the modifications and exit.
- v. Open the */etc/vsftpd.chroot_list* file and add the FTP account name to the file. Save the modifications and exit. You can follow steps a to d to open and save the file.

5. Modify shell configurations.

i. Open the shell configuration file.

```
vi /etc/shells
```

- ii. If the file does not contain */usr/sbin/nologin* or */sbin/nologin*, add it to the file.

6. Start vsftpd and perform a logon test.

i. Start vsftpd.

```
service vsftpd restart
```

- ii. Use the account *pwftp* to perform an FTP logon test. This example uses the directory */alidata/www/wwwroot*.

2.12.4. Build an FTP site in Windows Server 2008

This topic describes how to build an FTP site on an instance running Windows Server 2008.

Prerequisites

You have added the Web Server (IIS) role and installed FTP on an instance.

Procedure

1. **Connect to an instance.**
2. Choose **Start > Administrative Tools > Internet Information Services (IIS) Manager**.
3. Right-click the server name and select **Add FTP Site** from the shortcut menu.
4. Enter an FTP site name and a physical path, and then click **Next**.
5. Set **IP Address** to **All Unassigned** and **SSL** to **No SSL**, and then click **Next**.
6. Set **Authentication** to **Basic**, **Authorization** to **All Users**, and **Permissions** to **Read and Write**, and click **Finish**.

Result

Then you can use the administrator account and password to upload and download files through FTP. Make sure that the following conditions are met:

- The port for the FTP site is not in use by other applications, and Windows firewall is not blocking the port.
- The security group of the instance contains a security group rule that allows inbound access to the FTP port.

2.12.5. Build an FTP site in Windows Server 2012

This topic describes how to build an FTP site on an instance running Windows Server 2012.

Prerequisites

You have added the Web Server (IIS) role and installed FTP on an instance.

Procedure

1. **Connect to an instance.**
2. Click the **Server Manager** icon.
3. In the left-side navigation pane, click **IIS**.
4. In the **Server** area, right-click the server name and select **Internet Information Services (IIS) Manager** from the shortcut menu.
5. Right-click the server name and select **Add FTP Site** from the shortcut menu.
6. Enter an FTP site name and a physical path, and then click **Next**.
7. Set **IP Address** to **All Unassigned** and **SSL** to **No SSL**, and then click **Next**.
8. Set **Authentication** to **Basic**, **Authorization** to **All Users**, and **Permissions** to **Read and Write**, and click **Finish**.

Result

Then you can use the administrator account and password to upload and download files through FTP. Make sure that the following conditions are met:

- The port for the FTP site is not in use by other applications, and Windows firewall is not blocking the port.
- The security group of the instance contains a security group rule that allows inbound access to the FTP port.

3. Container Service for Kubernetes

3.1. What is Container Service?

Container Service provides high-performance, scalable, and enterprise-class management service for Kubernetes containerized applications throughout the application lifecycle.

Container Service simplifies the deployment and scaling operations on Kubernetes clusters. Integrated with services such as virtualization, storage, network, and security, Container Service aims to provide the optimal cloud environment for Kubernetes containerized applications. Alibaba Cloud is a Kubernetes Certified Service Provider (KCSP). As one of the first services to participate in the Certified Kubernetes Conformance Program, Container Service provides you with professional support and services.

3.2. Planning and preparation

Before you start using Container Service, you need to create cloud resources such as VPC networks, VSwitches, disks, and OSS buckets based on your application requirements.

Before you create a Kubernetes cluster, make the following preparations:

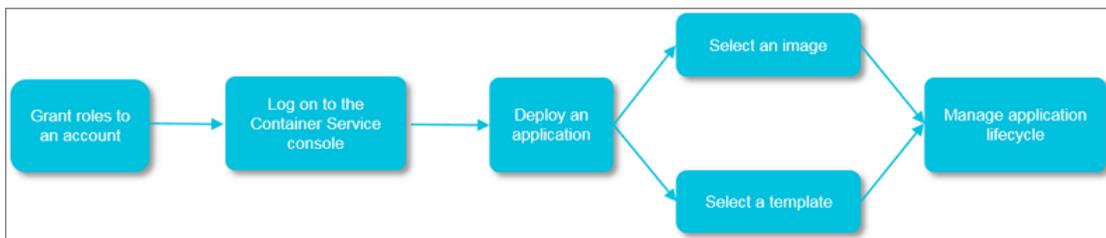

- **Create a VPC network (optional)**
To create a cluster in an existing VPC network, you must create the VPC network and VSwitches in advance.
- **Create a volume (optional)**
To create a stateful application with network storage, you must create disks or OSS buckets in advance.

3.3. Quick start

3.3.1. Flowchart

You can take the following steps to use Container Service.

The flowchart is as follows:

Step 1: Authorize the default role

Authorize the Container Service default role to perform operations on the resources under the target organization.

Step 2: Log on to the Container Service console

Log on to the Container Service console. For more information, see [Log on to the Container Service console](#).

Step 3: Create a cluster

Set the network environment and the number of nodes, and configure node details.

Step 4: Deploy an application by using an image or orchestration template

You can use an existing image or orchestration template, or create a new image or orchestration template.

To create an application that consists of services based on different images, use an orchestration template.

Step 5: Manage the application lifecycle

3.3.2. Log on to the Container Service for Kubernetes console

You can perform the following steps to log on to the Container Service for Kubernetes console.

Prerequisites

- The domain name of the ASCM console is obtained from the deployment personnel before you log on to the ASCM console.
- A browser is available. We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL used to log on to the ASCM console. Press the Enter key.
2. Enter your username and password.

Obtain the username and password used to log on to the console from the operations administrator.

 **Note** When you log on to the ASCM console for the first time, you must change the password of your username. For security reasons, your password must meet the minimum complexity requirements. The password must be 8 to 20 characters in length and must contain at least two of the following character types:

- Uppercase or lowercase letters.
- Digits.
- Special characters. Special characters include exclamation points (!), at signs (@), number signs (#), dollar signs (\$), and percent signs (%).

3. Click **Login** to go to the ASCM console homepage.
4. In the top navigation bar, choose **Products > Elastic Computing > Container Service for Kubernetes**.
5. Select the target organization and region.
6. Click **ACK** to go to the Container Service for Kubernetes console.

3.3.3. Log on to the Container Registry console

You can perform the following steps to log on to the Container Registry console.

Prerequisites

- The domain name of the ASCM console is obtained from the deployment personnel before you log on to the ASCM console.
- A browser is available. We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL used to log on to the ASCM console. Press the Enter key.
2. Enter your username and password.

Obtain the username and password used to log on to the console from the operations administrator.

 **Note** When you log on to the ASCM console for the first time, you must change the password of your username. For security reasons, your password must meet the minimum complexity requirements. The password must be 8 to 20 characters in length and must contain at least two of the following character types:

- Uppercase or lowercase letters.
- Digits.
- Special characters. Special characters include exclamation points (!), at signs (@), number signs (#), dollar signs (\$), and percent signs (%).

3. Click **Login** to go to the ASCM console homepage.
4. In the top navigation bar, choose **Products > Elastic Computing > ACK-CR**.
5. Select the target organization and region.
6. Click **CR** to go to the Container Registry console.

3.3.4. Create a Kubernetes cluster

To create a Kubernetes cluster, you need to set a series of parameters. For more information, see [Cluster parameters](#).

Procedure

1. [Log on to the Container Service for Kubernetes console](#).
2. In the left-side navigation pane, choose **Clusters > Clusters**. On the Clusters page, click **Create Kubernetes Cluster** in the upper-right corner.
3. Configure basic parameters.

Cluster parameters

Parameter	Description
Cluster Name	<p>The name of the cluster. The name must be 1 to 63 characters in length and can contain digits, Chinese characters, letters, and hyphens (-).</p> <div style="background-color: #e6f2ff; padding: 5px; border: 1px solid #d9e1f2;"> <p> Note The cluster name must be unique under one account.</p> </div>
Region	The region where the cluster is deployed.
Zone	The zone where the cluster belongs.

Parameter	Description
VPC	<p>You can select a VPC network from the drop-down list.</p> <ul style="list-style-type: none"> ◦ If the VPC network that you select already has a NAT gateway, Container Service will use this NAT gateway. ◦ Otherwise, the system automatically creates a NAT gateway. If you do not want the system to create a NAT gateway, clear the Configure SNAT for VPC check box. <div style="background-color: #e6f2ff; padding: 5px; border: 1px solid #d9e1f2;"> <p> Note In this case, you need to manually create a NAT gateway or configure SNAT rules to enable Internet access to the VPC network. Otherwise, cluster creation will fail.</p> </div>
Node Type	Currently, only pay-as-you-go nodes are supported.
Master Configuration	<p>Select the instance types and system disk type.</p> <ul style="list-style-type: none"> ◦ Instance Type: You can select multiple instance types. For more information, see the <i>Instance types</i> chapter of ECS User Guide. ◦ System Disk: SSD and ultra disks are supported. ◦ Quantity: You can add three master nodes.
Worker Instance	You can choose to create instances or add existing instances.
Worker Configuration	<p>If you choose Create Instance, you need to set the following parameters:</p> <ul style="list-style-type: none"> ◦ Instance Type: You can select multiple instance types. For more information, see the <i>Instance types</i> chapter of ECS User Guide. ◦ Quantity: Set the number of worker nodes. ◦ System Disk: SSD and ultra disks are supported. ◦ Attach Data Disk: SSD, ultra, and basic disks are supported.
Docker Version and Kubernetes Version	Supported Docker and Kubernetes versions are displayed. Select based on your needs.
Password	<p>Set the node logon password.</p> <div style="background-color: #e6f2ff; padding: 5px; border: 1px solid #d9e1f2;"> <p> Note The password must be 8 to 30 characters in length and contain three of the following four types of characters: uppercase letters, lowercase letters, digits, and special characters.</p> </div>
Confirm Password	Enter the logon password again.

Parameter	Description
Network Plug-in	Flannel and Terway are supported. Flannel is enabled by default.
Pod CIDR Block and Service CIDR (Optional)	For more information, see the <i>Network planning</i> chapter of VPC User Guide. <div style="border: 1px solid #add8e6; padding: 5px; background-color: #e0f0ff;"> <p> Note These options are available when you select an existing VPC network.</p> </div>
Configure SNAT	Optional. If you clear this check box, you need to create a NAT gateway or configure SNAT rules to enable Internet access to the VPC network.
Public SLB	If you select this check box, a public SLB instance is created and the 6443 port used by the API server is enabled on master nodes. You can use kubeconfig to connect to the cluster through the Internet. <div style="border: 1px solid #add8e6; padding: 5px; background-color: #e0f0ff;"> <p> Note If you clear the Expose API Server with Public SLB check box, you cannot access the cluster API server through the Internet.</p> </div>
SSH logon	<ul style="list-style-type: none"> ◦ If you select this check box, you can use SSH to access the cluster. ◦ If you clear this check box, you cannot use SSH or kubectl to access the cluster.
Log Service	If you enable Log Service, select an existing project or create a new one. The Log Service plug-in is automatically installed in the cluster.
Delete Protection	If you select this check box, the cluster cannot be deleted through the console or API operations.
RDS Whitelist	Add the IP addresses of nodes to the RDS whitelist.
Node Protection	This check box is selected by default to prevent nodes from being deleted through the console or APIs.
Labels	Attach labels to the nodes.
Advanced Options	<ul style="list-style-type: none"> ◦ Pods on Each Node: The maximum number of pods that can run on a single node. ◦ Cluster Domain: Default is cluster.local. Custom domains are supported. ◦ Cluster CA: Set whether to enable custom cluster CA.

4. Click **Create Cluster** in the upper-right corner.
5. On the **Confirm** page, click **OK** to start the deployment.

Result

You can find the newly created cluster on the Clusters page.

3.3.5. Create an application from an orchestration template

Container Service provides orchestration templates that you can use to create applications quickly. You can also modify the templates based on YAML syntax to customize applications.

Prerequisites

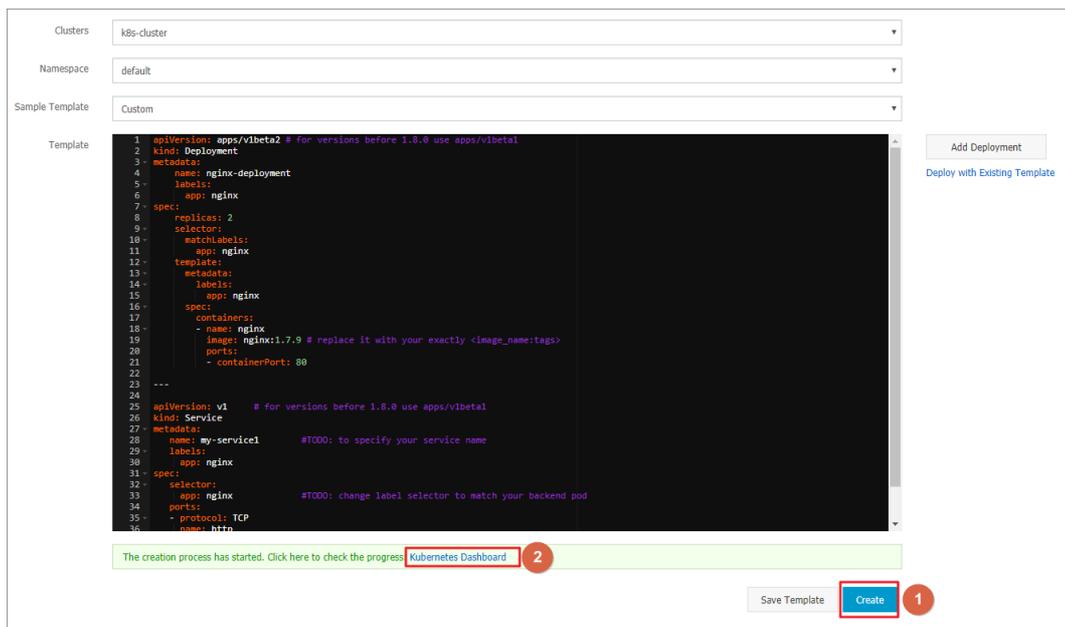

You have created a Kubernetes cluster. For more information, see [Create a Kubernetes cluster](#).

Context

The following example demonstrates how to create an NGINX application consisting of a deployment and a service. The service is associated with a pod created by the deployment.

Procedure

1. [Log on to the Container Service console](#).
2. In the left-side navigation pane, choose **Applications > Deployments**. The **Deployments** page appears.
3. In the upper-right corner, click **Create from Template**.
4. Set the parameters and click **Create**.
 - **Cluster:** Select the cluster where the resource objects are to be deployed.
 - **Namespace:** Select the namespace to which the resource objects belong. The default namespace is default. Except for underlying computing resources such as nodes and PVs, most resources are scoped to namespaces.
 - **Sample Template:** Container Service provides YAML templates of various resource types to help you deploy resource objects quickly. You can also create a custom template based on YAML syntax to describe the resource that you want to define.
 - **Add Deployment:** This feature allows you to quickly define a YAML template.
 - **Use Existing Template:** You can import an existing template to the configuration page.

Based on an orchestration template provided by Container Service, the following sample template creates a deployment of an NGINX application.

 **Note** Container Service supports YAML syntax. You can use the `---` symbol to separate multiple resource objects. This enables you to create multiple resource objects in a single template.

```

apiVersion: apps/v1beta2 # for versions before 1.8.0 use apps/v1beta1
kind: Deployment
metadata:
  name: nginx-deployment
  labels:
    app: nginx
spec:
  replicas: 2
  selector:
    matchLabels:
      app: nginx
  template:
    metadata:
      labels:
        app: nginx
    spec:
      containers:
      - name: nginx
        image: nginx:1.7.9 # replace it with your exactly <image_name:tags>
        ports:
        - containerPort: 80

---

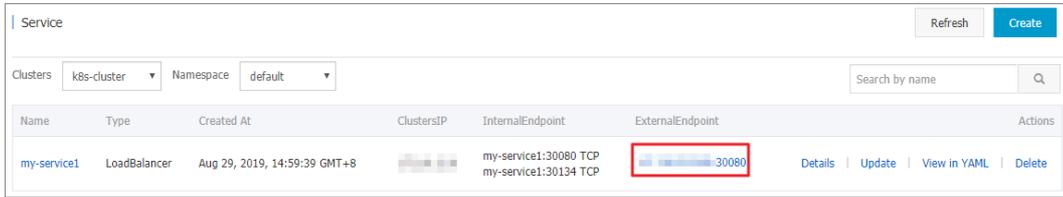

apiVersion: v1 # for versions before 1.8.0 use apps/v1beta1
kind: Service
metadata:
  name: my-service1 #TODO: to specify your service name
  labels:
    app: nginx
spec:
  selector:
    app: nginx #TODO: change label selector to match your backend pod
  ports:
  - protocol: TCP
    name: http
    port: 30080 #TODO: choose an unique port on each node to avoid port conflict
    targetPort: 80
  type: LoadBalancer ## This example changes the service type from NodePort to LoadBalancer.

```

5. Click **Create**. A message appears indicating the deployment status.

In the left-side navigation pane, choose **Ingresses and Load Balancing** > **Services** to view the newly created service.

- On Kubernetes Dashboard, verify that a my-service1 service is running and its external endpoint is displayed. Click the address in the External Endpoint column.

- You can visit the NGINX welcome page in the browser.

What's next

You can also choose **Ingresses and Load Balancing > Services** in the left-side navigation pane to view the NGINX service.

3.4. Kubernetes clusters

3.4.1. Authorizations

3.4.1.1. Assign RBAC permissions to a RAM user

This topic describes how to assign role-based access control (RBAC) permissions to Resource Access Management (RAM) users. By default, RBAC policies are enabled for Kubernetes 1.6 and later versions. RBAC policies are important for you to improve the management of clusters. You can use RBAC policies to specify the types of operations that are allowed for specific users based on their roles in an organization.

Procedure

- Log on to the Container Service console.
- In the left-side navigation pane, choose **Clusters > Authorizations** to go to the Authorizations page.
- Choose **Select RAM User > RAM Users**, select the required RAM user, and then click **Modify Permissions**.

Note Before you authorize a RAM user, make sure that the RAM user has been granted the RBAC administrator permissions or the cluster-admin role for the specified cluster.

- On the **Configure Role-Based Access Control (RBAC)** wizard page, click the plus sign (+) to add permissions on one or all clusters and namespaces, select a predefined role in the **Permission** field, or click the minus sign (-) for a target role to delete the role, and then click **Next Step**.

Note You can add permissions of a predefined role and one or more custom roles on a specified cluster or namespace.

The following table defines the permissions of predefined roles on one or all clusters and namespaces.

Roles and permissions

Role	RBAC-based permission on one or all clusters
Administrator	Granted the read and write permissions on resources in all namespaces.
O&M Engineer	Granted the read and write permissions on resources in all namespaces and the read-only permissions on nodes, persistent volumes (PVs), namespaces, and quotas.
Developer	Granted the read and write permissions on resources in one or all namespaces.
Restricted User	Granted the read-only permissions on resources in one or all namespaces.
Custom	Different cluster roles have different permissions. Before you authorize a RAM user, make sure that you are aware of all resource access permissions of the selected cluster roles. This avoids unnecessary permissions granted to the RAM user.

After the authorization, you can use the specified RAM user to log on to the Container Service for Kubernetes console and manage the service. For more information, see [Log on to the Container Service console](#).

Custom permissions

Container Service for Kubernetes supports predefined roles to grant different permissions. These predefined roles include: administrator, O&M engineer, developer, and restricted user. These predefined roles meet most of your requirements when you manage the service in the console. If you want to customize permissions on clusters, you can use custom roles.

Container Service for Kubernetes provides multiple custom roles.

 **Note** The cluster-admin role has permissions of a super administrator of clusters and has permissions on all resources.

You can log on to the master node of the specified cluster and run the following command to view the details of custom permissions.

```
# kubectl get clusterrole
```

```
# kubectl get clusterrole
NAME                                AGE
admin                                13d
alibaba-log-controller              13d
alicloud-disk-controller-runner    13d
cluster-admin                       13d
cs:admin                            13d
edit                                13d
flannel                             13d
kube-state-metrics                 22h
node-exporter                      22h
prometheus-k8s                    22h
prometheus-operator                22h
system:aggregate-to-admin          13d
....
system:volume-scheduler            13d
view                                13d
```

In this example, the cluster-admin role is used. On the command line, run the following command to view the permission details:

```
# kubectl get clusterrole cluster-admin -o yaml
```

 **Notice** After a RAM user is granted the permissions of cluster-admin, for the specified cluster, the RAM user has the same permissions as your Alibaba Cloud account and has all permissions on all resources in the cluster. Proceed with caution.

```
# kubectl get clusterrole cluster-admin -o yaml
apiVersion: rbac.authorization.k8s.io/v1
kind: ClusterRole
metadata:
  annotations:
    rbac.authorization.kubernetes.io/autoupdate: "true"

3.4.2. Clusters

3.4.2.1. Create a Kubernetes cluster

To create a Kubernetes cluster, you need to set a series of parameters. For more information, see [Cluster parameters](#).

Procedure

1. [Log on to the Container Service for Kubernetes console](#).
2. In the left-side navigation pane, choose **Clusters > Clusters**. On the Clusters page, click **Create Kubernetes Cluster** in the upper-right corner.
3. Configure basic parameters.

Cluster parameters

Parameter	Description
Cluster Name	<p>The name of the cluster. The name must be 1 to 63 characters in length and can contain digits, Chinese characters, letters, and hyphens (-).</p> <p> Note The cluster name must be unique under one account.</p>
Region	The region where the cluster is deployed.
Zone	The zone where the cluster belongs.
VPC	<p>You can select a VPC network from the drop-down list.</p> <ul style="list-style-type: none"> ◦ If the VPC network that you select already has a NAT gateway, Container Service will use this NAT gateway. ◦ Otherwise, the system automatically creates a NAT gateway. If you do not want the system to create a NAT gateway, clear the Configure SNAT for VPC check box. <p> Note In this case, you need to manually create a NAT gateway or configure SNAT rules to enable Internet access to the VPC network. Otherwise, cluster creation will fail.</p>
Node Type	Currently, only pay-as-you-go nodes are supported.
Master Configuration	<p>Select the instance types and system disk type.</p> <ul style="list-style-type: none"> ◦ Instance Type: You can select multiple instance types. For more information, see the <i>Instance types</i> chapter of ECS User Guide. ◦ System Disk: SSD and ultra disks are supported. ◦ Quantity: You can add three master nodes.
Worker Instance	You can choose to create instances or add existing instances.
Worker Configuration	<p>If you choose Create Instance, you need to set the following parameters:</p> <ul style="list-style-type: none"> ◦ Instance Type: You can select multiple instance types. For more information, see the <i>Instance types</i> chapter of ECS User Guide. ◦ Quantity: Set the number of worker nodes. ◦ System Disk: SSD and ultra disks are supported. ◦ Attach Data Disk: SSD, ultra, and basic disks are supported.
Docker Version and Kubernetes Version	Supported Docker and Kubernetes versions are displayed. Select based on your needs.

Parameter	Description
Password	<p>Set the node logon password.</p> <p>Note The password must be 8 to 30 characters in length and contain three of the following four types of characters: uppercase letters, lowercase letters, digits, and special characters.</p>
Confirm Password	Enter the logon password again.
Network Plug-in	Flannel and Terway are supported. Flannel is enabled by default.
Pod CIDR Block and Service CIDR (Optional)	<p>For more information, see the <i>Network planning</i> chapter of VPC User Guide.</p> <p>Note These options are available when you select an existing VPC network.</p>
Configure SNAT	Optional. If you clear this check box, you need to create a NAT gateway or configure SNAT rules to enable Internet access to the VPC network.
Public SLB	<p>If you select this check box, a public SLB instance is created and the 6443 port used by the API server is enabled on master nodes. You can use kubeconfig to connect to the cluster through the Internet.</p> <p>Note If you clear the Expose API Server with Public SLB check box, you cannot access the cluster API server through the Internet.</p>
SSH logon	<ul style="list-style-type: none"> If you select this check box, you can use SSH to access the cluster. If you clear this check box, you cannot use SSH or kubectl to access the cluster.
Log Service	If you enable Log Service, select an existing project or create a new one. The Log Service plug-in is automatically installed in the cluster.
Delete Protection	If you select this check box, the cluster cannot be deleted through the console or API operations.
RDS Whitelist	Add the IP addresses of nodes to the RDS whitelist.
Node Protection	This check box is selected by default to prevent nodes from being deleted through the console or APIs.
Labels	Attach labels to the nodes.

Parameter	Description
Advanced Options	<ul style="list-style-type: none"> Pods on Each Node: The maximum number of pods that can run on a single node. Cluster Domain: Default is cluster.local. Custom domains are supported. Cluster CA: Set whether to enable custom cluster CA.

4. Click **Create Cluster** in the upper-right corner.
5. On the **Confirm** page, click **OK** to start the deployment.

Result

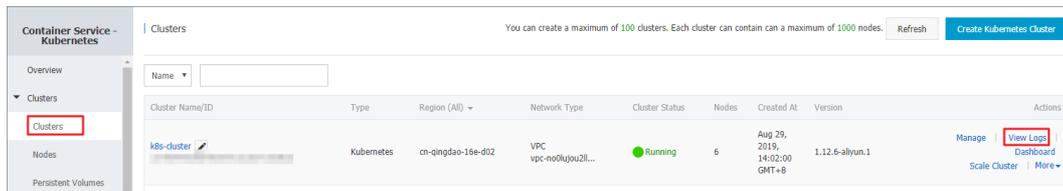

You can find the newly created cluster on the **Clusters** page.

3.4.2.2. View cluster logs

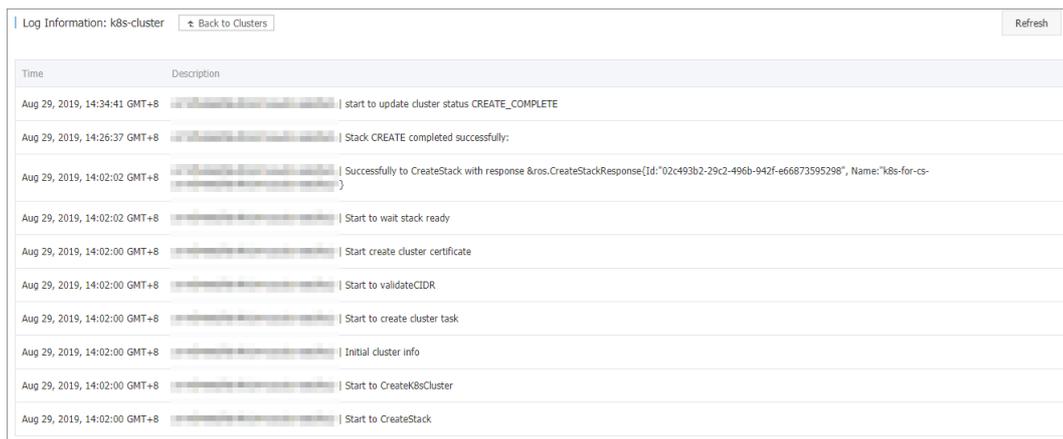

You can view operation logs through the console.

Procedure

1. [Log on to the Container Service console](#).
2. In the left-side navigation pane, choose **Clusters**. The **Clusters** page appears.
3. Find the target cluster and click **View Logs** in the **Actions** column.

You can view operations performed on the cluster.

3.4.2.3. Connect to a cluster through kubectl

You can use the Kubernetes command line tool, **kubectl**, to connect to a Kubernetes cluster from a local computer.

Procedure

1. Download the latest kubectl client from the [Kubernetes change log page](#).

2. Install and set up the kubectl client.

For more information, see [Install and set up kubectl](#).

3. Configure the cluster credentials.

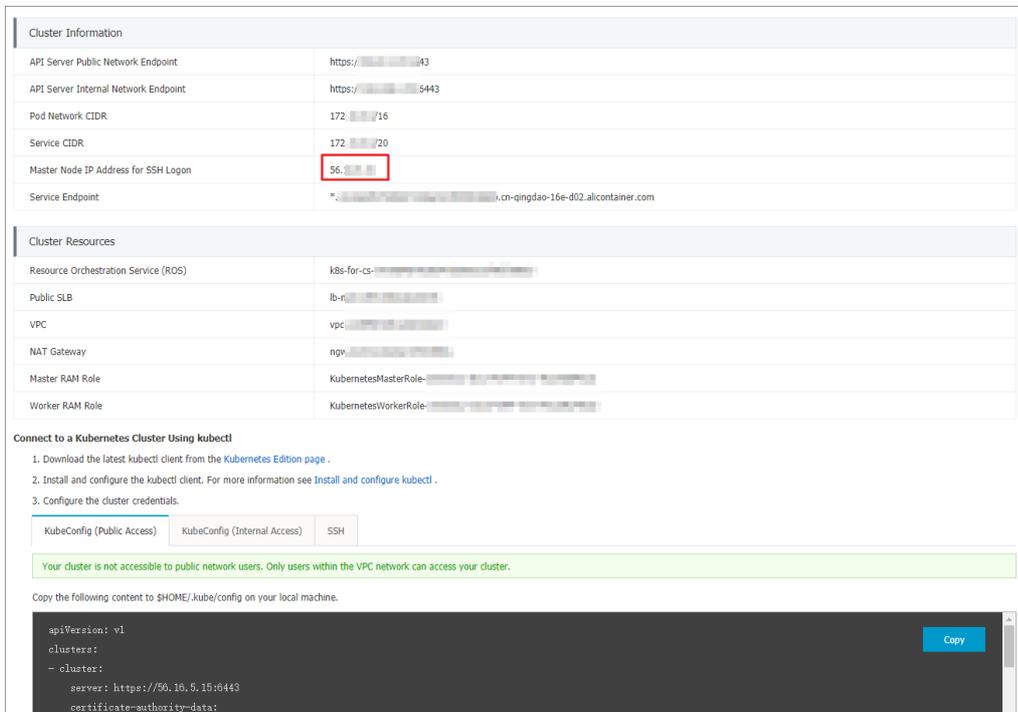

You can use the `scp` command to securely copy the master node configuration file from the `/etc/kubernetes/kube.conf` directory of the master VM and paste it to the `$HOME/.kube/config` directory of the local computer, where the `kubectl` credentials are expected to be stored.

```
mkdir $HOME/.kube
scp root@<master-public-ip>:/etc/kubernetes/kube.conf $HOME/.kube/config
```

You can find `master-public-ip` on the cluster details page.

- i. [Log on to the Container Service console](#).
- ii. In the left-side navigation pane, click **Clusters**. The Clusters page appears.
- iii. Find the target cluster and click **Manage** in the Actions column.

In the **Cluster Information** section, you can find the master node IP address.

3.4.2.4. Connect to a master node by using SSH

You can access a master node in a cluster by using a Secure Shell (SSH) client.

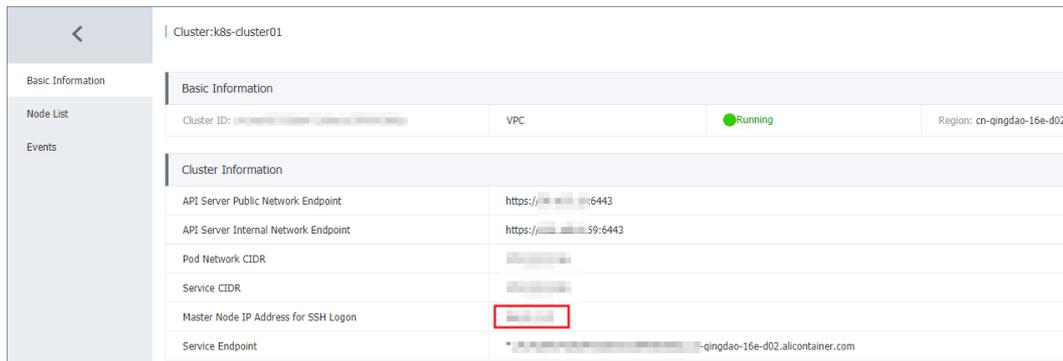

Prerequisites

- A Kubernetes cluster is created and **Use SSH to Access the Cluster from the Internet** is selected for the cluster. For more information, see [Create a Kubernetes cluster](#).
- The SSH client can connect to the network where the cluster is deployed.

Procedure

1. [Log on to the Container Service for Kubernetes console](#).
2. In the left-side navigation pane, choose **Clusters > Clusters** to go to the Clusters page. Find the cluster that you want to manage, and click **Manage** in the Actions column for the cluster.

- The Basic Information page appears. In the Cluster Information section, you can find the IP address that is displayed in the Master Node IP Address for SSH Logon field.

- Use SSH to connect to the cluster from an SSH client that has access to the cluster network.
 - If you have a leased line that connects to the cluster network over the Internet, you can use tools such as PuTTY to create an SSH connection.
 - If you have an Elastic Compute Service (ECS) instance that is connected to the Virtual Private Cloud (VPC) network of the cluster, run the following command to create an SSH connection:

```
ssh root@ssh_ip #ssh_ip specifies the IP address of the master node for SSH connection.
```

3.4.2.5. Expand a cluster

You can adjust the number of worker nodes in a cluster based on business needs in the console.

Context

Currently, you cannot adjust the number of master nodes in a cluster.

Procedure

- Log on to the Container Service console.
- In the left-side navigation pane, choose Clusters > Clusters. The Clusters page appears.
- Select the target cluster and click Expand in the Actions column.
- On the Expand page, specify the number of worker nodes.
 - In this example, increase the number of worker nodes from zero to two.
- Configure worker nodes. Instance Type: You can select multiple instance types.
- Configure node logon settings.
 - Password: Set the logon password.
 - Confirm Password: Enter the logon password again.
- Click Submit.

What's next

In the left-side navigation pane, choose Clusters > Nodes. On the Nodes page, verify that the number of worker nodes is now changed to two.

3.4.2.6. Renew a certificate

This topic describes how to renew a Kubernetes certificate in the console.

Prerequisites

You have created a Kubernetes cluster and its certificate is about to expire.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, choose Clusters > Clusters. The Clusters page appears.
3. Select the target cluster and click Update Certificate. The Update Certificate page appears.

Note The Update Certificate button will be displayed two months before your cluster certificate expires.

4. Click Update and the Confirm page appears.
5. Click Confirm.

Result

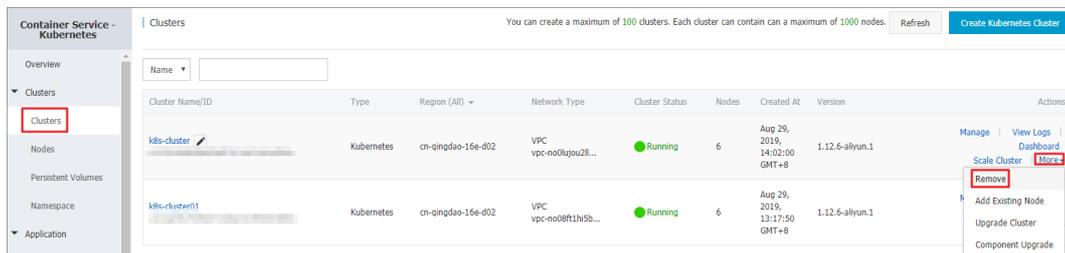

- On the Update Certificate page, the following message appears: The certificate has been updated.
- On the Clusters page, the Update Certificate button has disappeared.

3.4.2.7. Delete a cluster

You can delete clusters in the Container Service console.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, choose Clusters > Clusters. The Clusters page appears.
3. Find the target cluster and choose More > Delete in the Actions column.

What's next

Resource Orchestration Service (ROS) has no permission to delete resources that were manually added under ROS-created resources. For example, if you manually add a VSwitch under a ROS-created VPC instance, ROS cannot delete the VPC instance and therefore the cluster cannot be deleted.

Container Service allows you to force delete clusters. If your first attempt to delete a cluster fails, you can forcibly delete the cluster and ROS stack. However, you still need to manually release the resources that were manually added in the first place.

An error message appears when an attempt to delete a cluster fails.

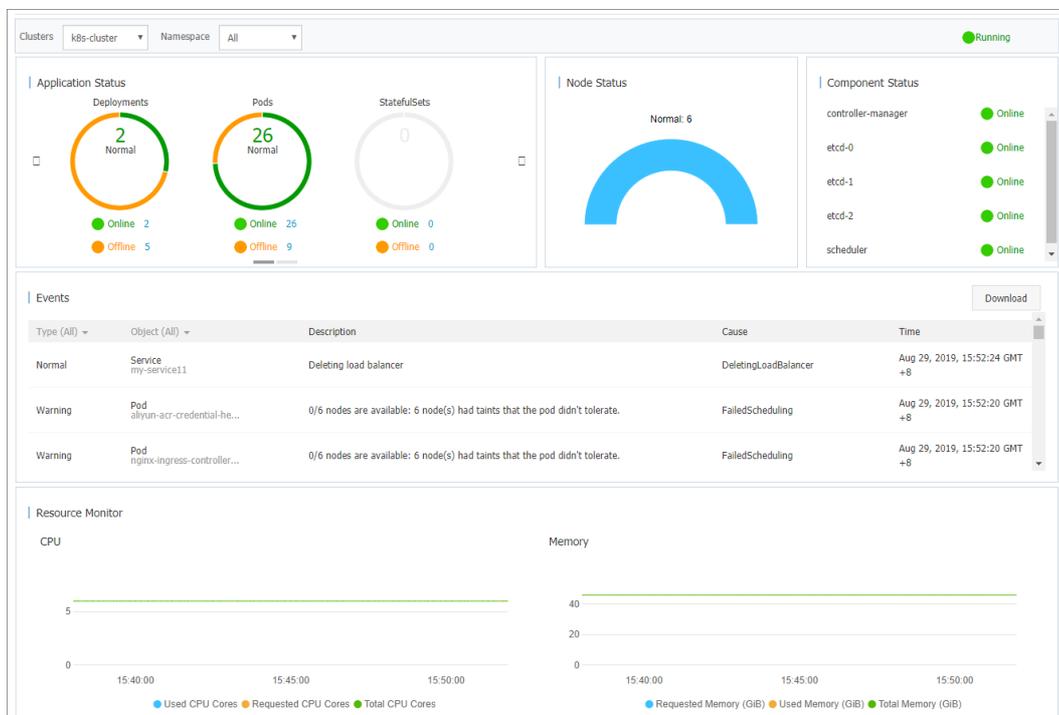

Select the cluster that you failed to delete and choose More > Delete in the Actions column. In the dialog box that appears, you can view the resources that were manually added. Select the Force Delete check box and click OK to delete the cluster and ROS resource stack.

3.4.2.8. View cluster overview

The Container Service for Kubernetes console provides a cluster overview page. This page displays the information such as application status, component status, and resource monitoring status. This allows you to check the health status of your cluster at your convenience.

Procedure

1. [Log on to the Container Service for Kubernetes console.](#)
2. In the left-side navigation pane, click **Overview**. The Overview page appears.
3. Select the target cluster and namespace. You can view the application status, component status, and resource monitoring charts.
 - **Application Status:** displays the statuses of the deployments, pods, and replica sets that are running in the cluster. Green sections indicate a normal state and yellow sections indicate an exception state.
 - **Node Status:** displays the statuses of the nodes in the cluster.
 - **Component Status:** Components are deployed in the kube-system namespace. Core components are used, such as the scheduler, controller-manager, and etcd.
 - **Events:** displays events such as warnings and errors. If no events are displayed, the cluster is running in the normal state.
 - **Monitoring:** displays CPU and memory monitoring charts. CPU usage is measured in cores or millicores and accurate to three decimal places. A millicore is one thousandth of a core. Memory usage is measured in GiB and accurate to three decimal places. For more information, see [Meaning of CPU](#) and [Meaning of memory](#).

3.4.3. Nodes

3.4.3.1. Add an existing node

You can add an existing ECS instance to a cluster. Currently, you can only add worker nodes to clusters.

Prerequisites

- You have created a Kubernetes cluster. For more information, see [Log on to the Container Service console.](#)
- You have created an ECS instance. Ensure that the region, zone, department, project, security group, VPC network, and operating system settings of the ECS instance are the same as those of the cluster.

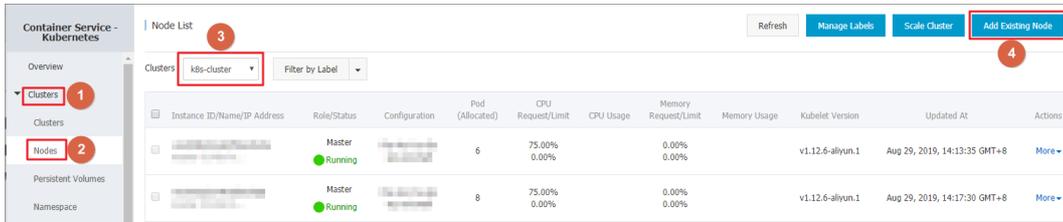

Context

- By default, a cluster can contain up to 50 nodes. To add more nodes to a cluster, submit a ticket.
- The ECS instance must be in the same region and VPC network as the cluster.

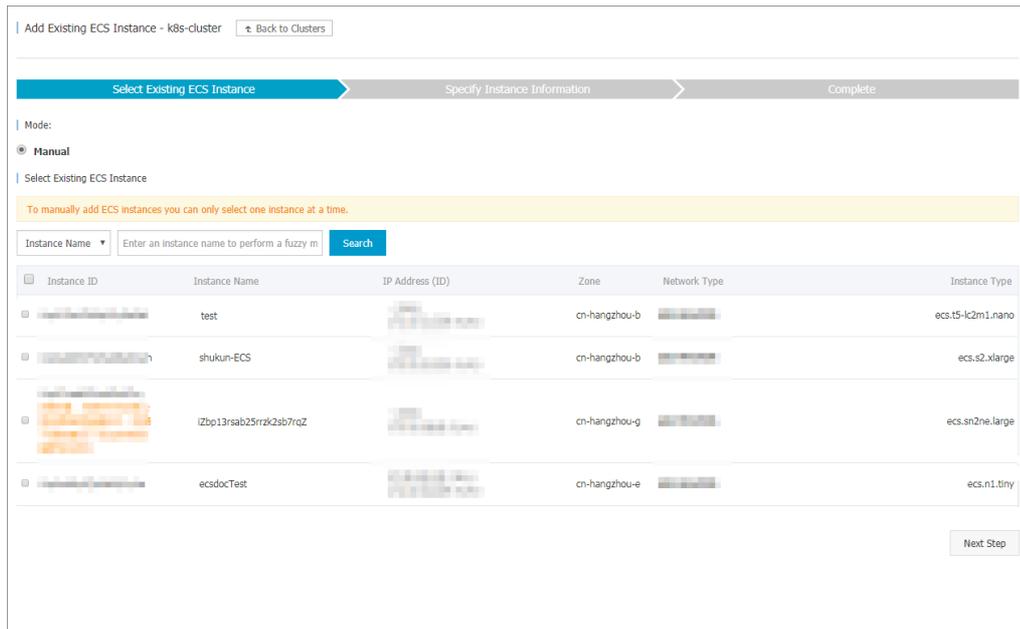

- The ECS instance must belong to the same account as the cluster.
- The ECS instance must be running the CentOS operating system.

Procedure

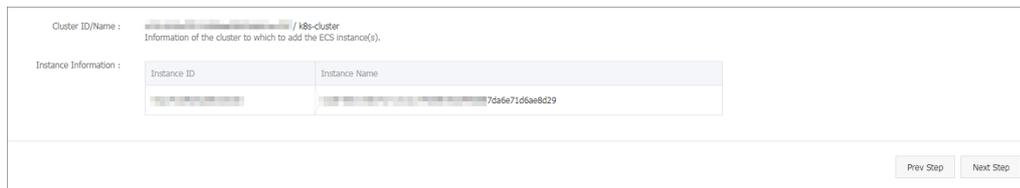

1. Log on to the Container Service console.
2. In the left-side navigation pane, choose Clusters > Nodes to go to the Nodes page.
3. Select the target cluster and click Add Existing Node in the upper-right corner.

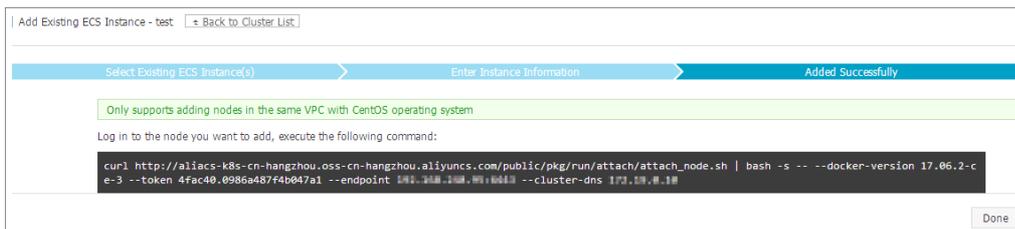

4. On the page that appears, you can manually add existing ECS instances to the cluster. To manually add an ECS instance, you need to obtain the installation command and log on to the ECS instance to run the command. You can only add one ECS instance at a time.
 - i. Select the ECS instance that you want to add and click Next Step. You can add only one ECS instance at a time.

- ii. Confirm the instance information and click Next Step.

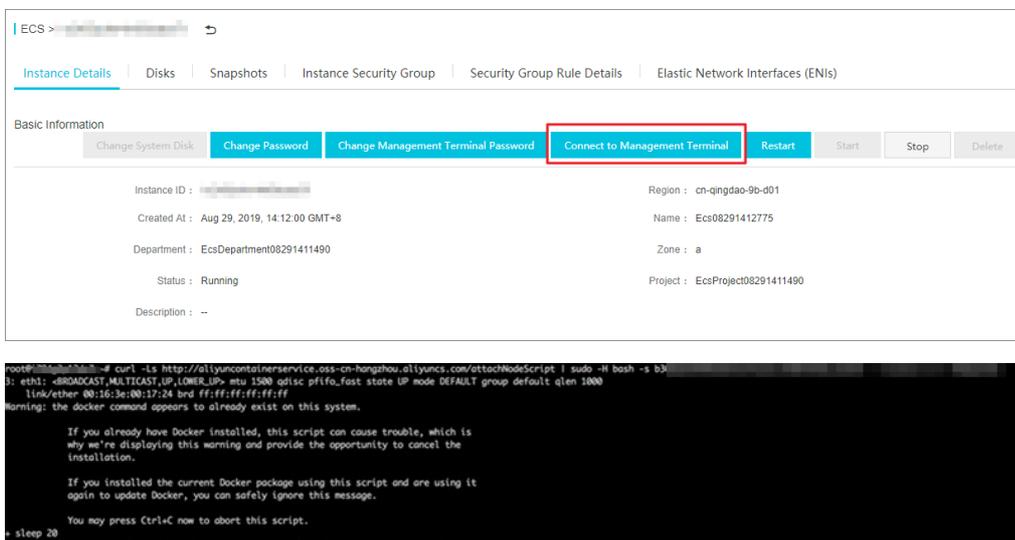

iii. Copy the command.

iv. Click Complete.

- v. Go to the ASCM console. In the top navigation bar, choose **Products > Elastic Compute Service**. On the **Instances** page, select the department and region of the cluster, and then find the target ECS instance.
- vi. Click the instance name to go to the Instance Details tab. Click **Connect to VNC**. In the dialog box that appears, enter the VNC password and then click **OK**. After you log on to the instance, paste the copied command and click **OK** to execute the script.

- vii. When the script execution succeeds, the ECS instance is added to the cluster. You can go to the Clusters page and click the cluster ID to view nodes in the cluster. Check whether the ECS instance has been added to the cluster.

3.4.3.2. View nodes

You can view the nodes in a cluster through commands, the console, or the Kubernetes Dashboard.

Through commands

Note To view the nodes in a cluster through commands, you need to **Connect to a Kubernetes cluster through kubectl**.

Use kubectl to connect to a cluster and run the following command to view the nodes in the cluster.

```
kubectl get nodes
```

A sample output is as follows:

```
$ kubectl get nodes
```

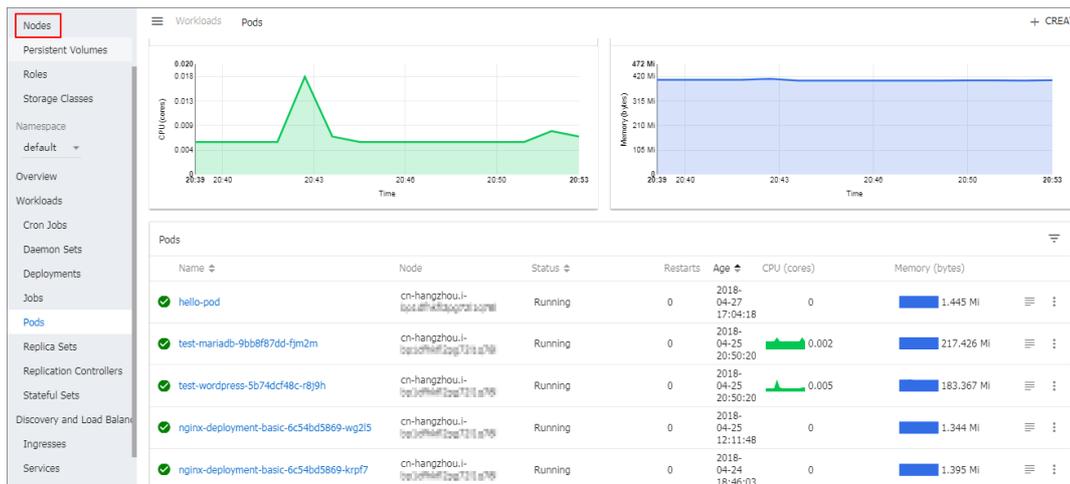

NAME	STATUS	AGE	VERSION
iz2ze2n6ep53tch701yh9zz	Ready	19m	v1.6.1-2+ed9e3d33a07093
iz2zeaf762wibijx39e5az	Ready	7m	v1.6.1-2+ed9e3d33a07093
iz2zeaf762wibijx39e5bz	Ready	7m	v1.6.1-2+ed9e3d33a07093
iz2zef4dnn9nos8elyr32kz	Ready	14m	v1.6.1-2+ed9e3d33a07093
iz2zeitvvo8enoreufstkmz	Ready	11m	v1.6.1-2+ed9e3d33a07093

Through the Container Service console

1. [Log on to the Container Service console.](#)
2. In the left-side navigation pane, choose **Clusters > Nodes** to go to the Nodes page.
3. Select the target cluster to view the nodes in the cluster.

Through the Kubernetes Dashboard

1. [Log on to the Container Service console.](#)
2. In the left-side navigation pane, click **Clusters** to go to the Clusters page.
3. Select the target cluster and click **Dashboard** in the Actions column to go to the Kubernetes Dashboard.
4. In the left-side navigation pane, click **Nodes**. On the page that appears, you can view all nodes in the cluster.

3.4.3.3. Manage node labels

You can manage node labels through the console. You can add a label to multiple nodes at the same time, filter nodes by label, and remove labels.

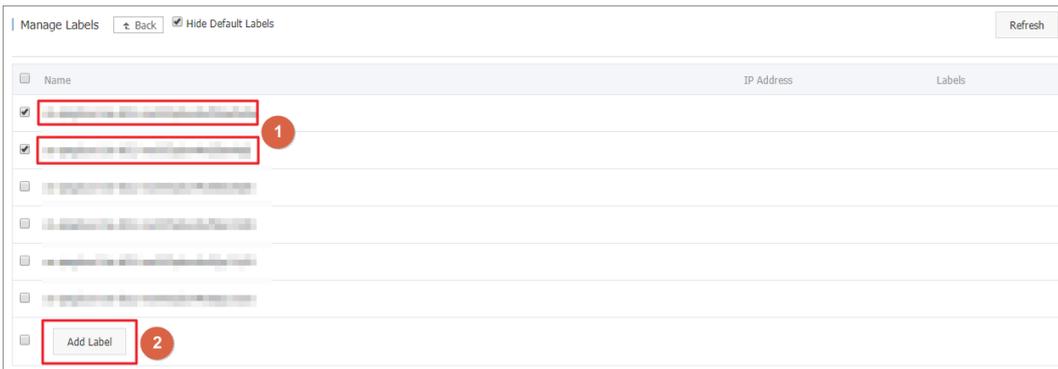

For more information about how to use labels to schedule nodes, see [Set node scheduling.](#)

Prerequisites

You have created a Kubernetes cluster. For more information, see [Create a Kubernetes cluster.](#)

Add a label to multiple nodes

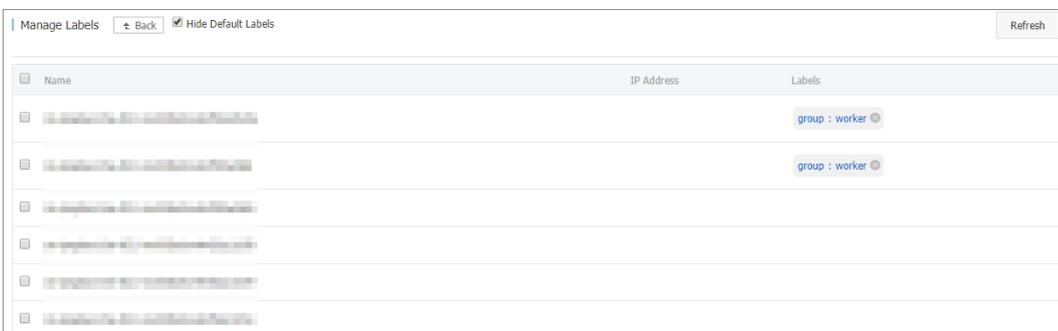

1. [Log on to the Container Service console.](#)
2. In the left-side navigation pane, choose **Clusters > Nodes** to go to the Nodes page.
3. Select the target cluster and click **Manage Labels** in the upper-right corner.
4. Select multiple nodes and then click **Add Label**.

5. In the dialog box that appears, enter the label name and value, and then click **OK**.

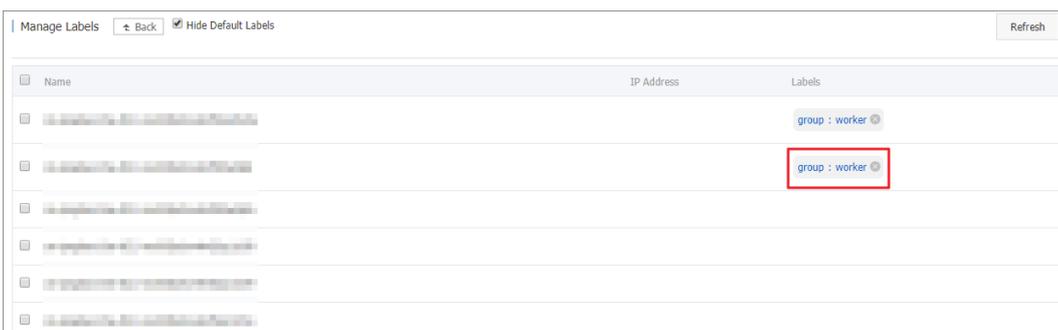

On the Manage Labels page, the selected nodes now have the same label.

Remove a label

1. Log on to the Container Service console.
2. In the left-side navigation pane, choose Clusters > Nodes to go to the Nodes page.
3. Select the target cluster and click Manage Labels in the upper-right corner.
4. Select a node and click the cross sign at the end of a label, for example, `group:worker` .

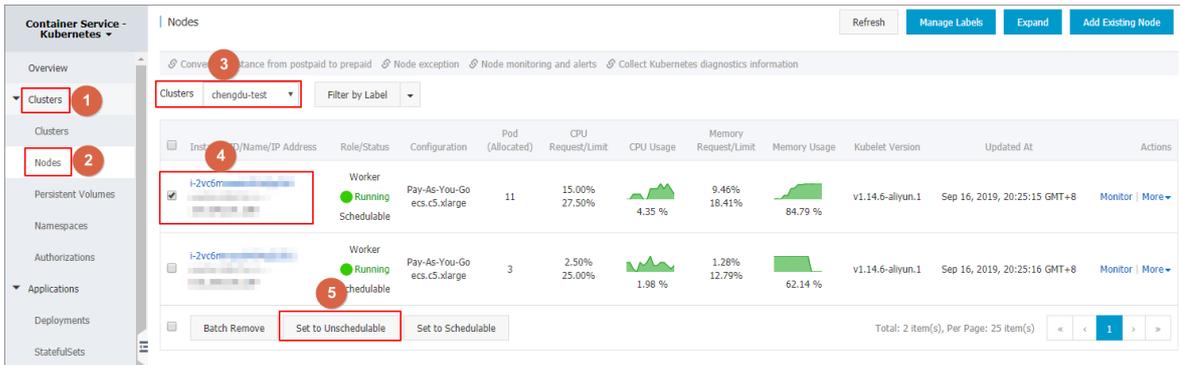

Click **Confirm** to remove the label.

3.4.3.4. Set node schedulability

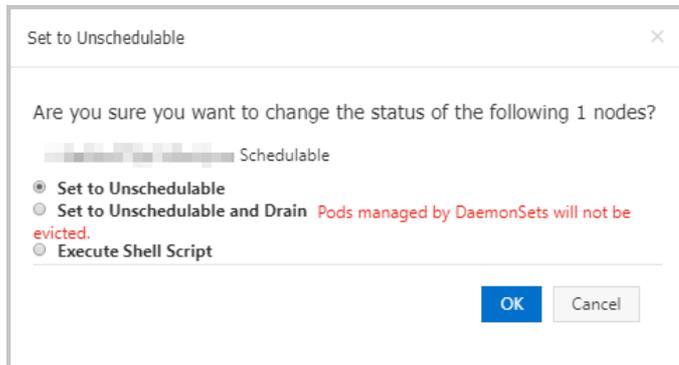

Procedure

1. Log on to the [Container Service for Kubernetes console](#).
2. In the left-side navigation pane, choose **Clusters > Nodes** to go to the **Nodes** page.
3. Select the target cluster and select one or more nodes. Click **Set to Unscheduleable**.

4. In the dialog box that appears, you can set the specified nodes to either of the following statuses:
 - **Set to Unscheduleable:** Pods will not be scheduled to this node when you deploy new applications.
 - **Set to Unscheduleable and Drain:** Pods will not be scheduled to this node when you deploy new applications. Pods on this node will be evicted, except for the pods that are managed by DaemonSets.

In this example, **Set to Unscheduleable** is selected.

5. Click **OK**. The node status is now changed to **Unscheduleable**.

What's next

Pods will not be scheduled to the node when you deploy new applications.

3.4.3.5. Remove a node

To restart or release an ECS node in a cluster, you must remove the node from the cluster first. This topic describes how to remove a node.

Prerequisites

- You have created a Kubernetes cluster. For more information, see [Create a Kubernetes cluster](#).

- You can use `kubectl` to connect to the Kubernetes cluster. For more information, see [Connect to a Kubernetes cluster through kubectl](#).

Context

- When you remove a node, pods running on the node will be migrated to other nodes, which may cause service interruptions. We recommend that you remove nodes during off-peak hours.
- Unexpected errors may occur when you remove a node. We recommend that you back up your data in advance.
- The node that you choose to remove will be set to the unschedulable state.
- You can only remove worker nodes.

Procedure

1. Run the following command to migrate the pods on the target node to other nodes.

 **Note** Make sure that the other nodes have sufficient resources.

```
kubectl drain node-name
```

 **Note** *node-name* must be in the format of *your-region-name.node-id*.

- *your-region-name* represents the region where your cluster is deployed.
- *node-id* represents the ID of the ECS instance where the target node is deployed. For example, *cn-hangzhou.i-xxx*.

2. In the left-side navigation pane, choose **Clusters > Nodes** to go to the **Nodes** page.
3. Select the target cluster. Find the target node and choose **More > Remove** in the Actions column. The **Remove Node** page appears.

 **Note** To remove multiple nodes at the same time, select nodes on the **Nodes** page and click **Batch Remove**.

4. (Optional) To release the ECS instance where the target node is deployed, select the **Release ECS Instance** check box.

Note

- This option only releases pay-as-you-go ECS instances.
- Subscription ECS instances will be automatically released after the subscription expires.
- If you do not select the Release ECS Instance check box, you will continue to be billed for the ECS instance where the target node is deployed.

5. Click OK to remove the node.

3.4.3.6. View node resource usage

You can view the resource usage of the nodes in a cluster through the console.

Prerequisites

You have created a Kubernetes cluster. For more information, see [Create a Kubernetes cluster](#).

Procedure

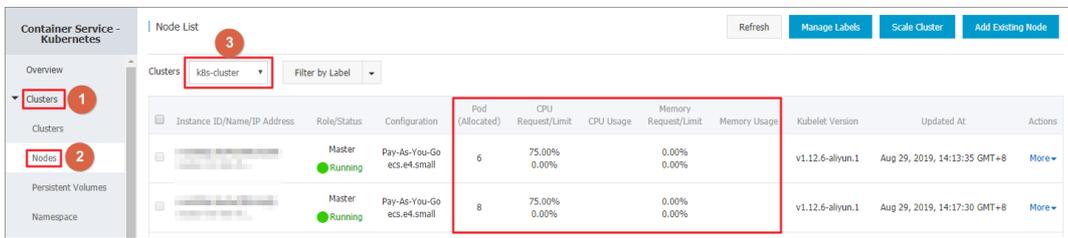

1. [Log on to the Container Service console](#).
2. In the left-side navigation pane, choose Clusters > Nodes to go to the Nodes page.

You can view the request and usage rate of CPU and memory on each node.

- CPU request rate = sum (The amount of CPU requested by all pods on the node) / Total CPU of the node
- CPU usage rate = sum (The amount of CPU used by all pods on the node) / Total CPU of the node
- Memory request rate = (The amount of memory requested by all pods on the node) / Total memory of the node
- Memory usage rate = sum (The amount of memory used by all pods on the node) / Total memory of the node

Note

- You can adjust the workload of a node based on resource usage. For more information, see [Set node scheduling](#).
- When the request or usage rate of a node reaches 100%, pods will not be scheduled to the node.

3.4.3.7. Upgrade the NVIDIA driver on a GPU node

This topic describes how to upgrade the NVIDIA driver on a GPU node when workloads are deployed on the node and when no workload is deployed on the node.

Upgrade the NVIDIA driver on a GPU node where workloads are deployed

- Connect to a Kubernetes cluster through `kubectl`
- Run the following command to set the target node to unschedulable.

```
kubectl cordon node-name
```

Note

- Currently, you can only upgrade the NVIDIA driver on worker nodes.
- `node-name` must be in the format of `your-region-name.node-id`.
 - `your-region-name` represents the region where your cluster is deployed.
 - `node-id` represents the ID of the ECS instance where the target node is deployed.

You can run the following command to query `node-name`.

```
kubectl get node
```

```
[root@gpu-test ~]# kubectl cordon cn-hangzhou.i-... node/cn-hangzhou.i-... already cordoned
```

- Run the following command to migrate pods from the target node to other nodes:

```
kubectl drain node-name --grace-period=120 --ignore-daemonsets=true
```

```
[root@gpu-test ~]# kubectl drain cn-hangzhou.i-... --grace-period=120 --ignore-daemonsets=true
node/cn-hangzhou.i-... cordoned
WARNING: Ignoring DaemonSet-managed pods: flexvolume-..., kube-flannel-ds-..., kube-proxy-worker-..., logtail-ds-...
pod/domain-nginx-... evicted
pod/old-nginx-... evicted
pod/new-nginx-... evicted
pod/old-nginx-... evicted
```

- Run the following command to log on to the target node:

```
ssh root@xxx.xxx.x.xx
```

- Run the following command to check the current NVIDIA driver version:

```
nvidia-smi
```

```
[root@ ~]# nvidia-smi
Fri Jan 18 16:44:52 2019

+-----+
| NVIDIA-SMI 384.111                Driver Version: 384.111 |
+-----+-----+
| GPU  Name            Persistence-M| Bus-Id        Disp.A | Volatile Uncorr. ECC |
| Fan  Temp            Perf          Pwr:Usage/Cap|      Memory-Usage | GPU-Util  Compute M. |
+-----+-----+-----+-----+-----+-----+
|  0   Tesla P4             0n          6W / 75W | 0MiB / 7606MiB |      0%      Default |
+-----+-----+-----+-----+-----+-----+

Processes:
GPU      PID    Type   Process name                      GPU Memory
Usage
+-----+-----+-----+-----+-----+-----+
No running processes found
+-----+-----+-----+-----+-----+-----+

```

6. Run the following commands to uninstall the existing driver:

Note

- If your driver version is *384.111*, perform the following steps.
- If your driver version is not *384.111*, download the corresponding driver from the official NVIDIA website first.

```
cd /tmp

curl -O https://cn.download.nvidia.cn/tesla/384.111/NVIDIA-Linux-x86_64-384.111.run

chmod u+x NVIDIA-Linux-x86_64-384.111.run

./NVIDIA-Linux-x86_64-384.111.run --uninstall -a -s -q
```

7. Run the following command to restart the target node:

```
reboot
```

8. Download the driver that you want to use from the official NVIDIA website. In this example, version *410.79* is used.

9. Run the following command to install the downloaded driver under the directory where it was saved:

```
sh ./NVIDIA-Linux-x86_64-410.79.run -a -s -q
```

10. Run the following commands to configure the driver:

```
nvidia-smi -pm 1 || true

nvidia-smi -acp 0 || true
```

11. Run the following commands to update device-plugin:

```
mv /etc/kubernetes/manifests/nvidia-device-plugin.yml /

mv /nvidia-device-plugin.yml /etc/kubernetes/manifests/
```

12. Log on to a master node and run the following command to set the target node to schedulable:

```
kubectl uncordon node-name
```

Result

Run the following command on a master node to check the NVIDIA driver version on the target node. The driver version is now *410.79*.

Note Replace *node-name* with the target node name.

```
kubectl exec -n kube-system -t nvidia-device-plugin-node-name nvidia-smi
```

```
[root@gpu-test ~]# kubectl exec -n kube-system -t nvidia-device-plugin-cn- nvidia-smi
Mon Jan 21 03:14:48 2019
+-----+
| NVIDIA-SMI 410.79      | Driver Version: 410.79      | CUDA Version: N/A      |

| GPU      PID  Type  Process name                               | Usage            |
+-----+-----+-----+-----+-----+
| No running processes found                |                  |
+-----+-----+-----+-----+-----+
```

Upgrade the NVIDIA driver on a GPU node where no workload is deployed

1. Run the following command to log on to the target node:

```
ssh root@xxx.xxx.x.xx
```

2. Run the following command to check the current NVIDIA driver version:

```
nvidia-smi
```

```
[root@ ~]# nvidia-smi
Fri Jan 18 16:44:52 2019
+-----+
| NVIDIA-SMI 384.111    | Driver Version: 384.111    |
+-----+-----+-----+
| GPU  Name            | Persistence-M| Bus-Id        | Disp.A | Volatile Uncorr. ECC |
| Fan  Temp   Perf     | Pwr:Usage/Cap|      Memory-Usage | GPU-Util  Compute M. |
+-----+-----+-----+-----+-----+
|   0   Tesla P4             |      0n      | 00000000:00:08:0 | Off    |          0          |
| N/A   24C    P8             |   6W / 75W   |     0MiB / 7606MiB |    0%    | Default           |
+-----+-----+-----+-----+-----+
+-----+
| Processes:                                | GPU Memory Usage |
| GPU      PID  Type  Process name                               | Usage            |
+-----+-----+-----+-----+-----+
| No running processes found                |                  |
+-----+-----+-----+-----+-----+
```

3. Run the following commands to uninstall the existing driver:

Note

- If your driver version is *384.111*, perform the following steps.
- If your driver version is not *384.111*, download the corresponding driver from the official NVIDIA website first.

```
cd /tmp
```

```
curl -O https://cn.download.nvidia.cn/tesla/384.111/NVIDIA-Linux-x86_64-384.111.run
```

```
chmod u+x NVIDIA-Linux-x86_64-384.111.run
```

```
./NVIDIA-Linux-x86_64-384.111.run --uninstall -a -s -q
```

4. Run the following command to restart the target node.

```
reboot
```

5. Download the driver that you want to use from the official NVIDIA website. In this example, version *410.79* is used.

6. Run the following command to install the downloaded driver under the directory where it was saved:

```
sh ./NVIDIA-Linux-x86_64-410.79.run -a -s -q
```

7. Run the following commands to configure the driver:

```
nvidia-smi -pm 1 || true
```

```
nvidia-smi -acp 0 || true
```

Result

Run the following command on a master node to check the NVIDIA driver version on the target node. The driver version is now *410.79*.

Note Replace *node-name* with the target node name.

```
kubectl exec -n kube-system -t nvidia-device-plugin-node-name nvidia-smi
```

```
[root@gpu-test ~]# kubectl exec -n kube-system -t nvidia-device-plugin-cn-... nvidia-smi
Mon Jan 21 03:14:48 2019
+-----+

```

3.4.3.8. Create a Kubernetes cluster for GPU computing

This topic describes how to create a Kubernetes cluster for GPU computing.

Prerequisites

The Container Service for Kubernetes, Resource Orchestration Service (ROS), and Resource Access Management (RAM) services are activated.

Note Container Service for Kubernetes uses ROS to deploy applications in Kubernetes clusters. Before you create a Kubernetes cluster, you must activate ROS.

Context

Starting from version 1.8, Kubernetes adds support for the following hardware acceleration devices by using **device plug-ins**: NVIDIA GPUs, InfiniBand devices, and field-programmable gate arrays (FPGAs). GPU solutions developed by the community will be phased out in version 1.10, and removed from the master code in version 1.11. Container Service for Kubernetes enables you to use a GPU-accelerated Kubernetes cluster to run compute-intensive tasks such as machine learning and image processing. You can deploy applications and achieve auto scaling without the need to install NVIDIA drivers or Compute Unified Device Architecture (CUDA) in advance.

You must complete the following operations in the Container Service for Kubernetes console to create a Kubernetes cluster:

- Create Elastic Compute Service (ECS) instances, configure a public key to enable SSH logon from master nodes to other nodes, and configure the Kubernetes cluster by using cloud-init.
- Create a security group that allows access to the Virtual Private Cloud (VPC) network over Internet Control Message Protocol (ICMP).
- Create a VPC network and a VSwitch and create SNAT rules for the VSwitch if you do not specify an existing VPC network.
- Create VPC routing rules.
- Create a NAT gateway and an elastic IP address.
- Create a RAM user and grant it permissions to query, create, and delete ECS instances and permissions to add and delete cloud disks. The RAM user is also granted all permissions on Server Load Balancer (SLB), Cloud Monitor, VPC, Log Service, and Network Attached Storage (NAS). The Kubernetes cluster dynamically creates SLB instances, cloud disks, and VPC routing rules based on your settings.
- Create an internal SLB instance and open port 6443.
- Create a public SLB instance and open ports 6443, 8443, and 22. If you choose to enable SSH logon when you create the cluster, port 22 is enabled. Otherwise, port 22 is not enabled.

Limits

- Kubernetes clusters support only VPC networks.
- By default, each account has specific quotas on the amount of cloud resources that can be created. You cannot create clusters if the quota limit is exceeded. Make sure that you have sufficient quotas before you create a cluster. To request a quota increase, submit a ticket.
 - You can create up to five clusters across all regions for an account. A cluster can contain up to 40 nodes. To create more clusters or nodes, submit a ticket.

Note In a Kubernetes cluster, you can create up to 48 route entries per VPC. This means that a cluster can contain up to 48 nodes. To increase the number of nodes, submit a ticket to increase the number of route entries first.

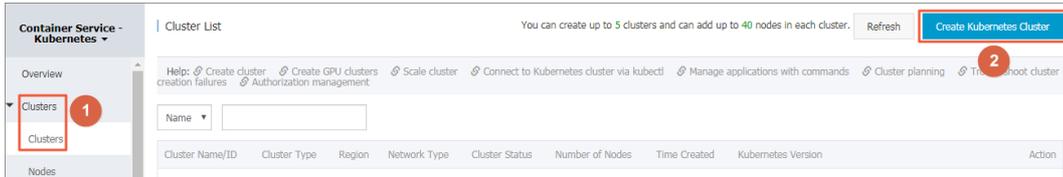

- You can create up to 100 security groups for each account.
- You can create up to 60 pay-as-you-go SLB instances for each account.
- You can create up to 20 elastic IP addresses for each account.
- ECS instances have the following limit:

Only CentOS is supported.

Create a GN5 Kubernetes cluster

GN5 Kubernetes clusters support only Kubernetes 1.12.6-aliyun.1. Kubernetes 1.11.5 is not supported.

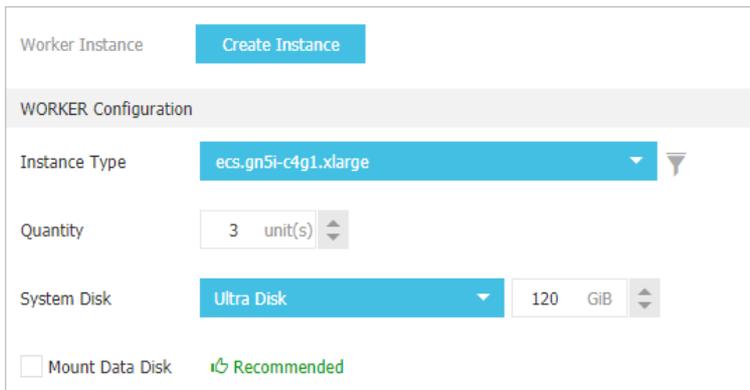

1. Log on to the [Container Service for Kubernetes console](#).
2. In the left-side navigation pane, choose **Clusters > Clusters**. The **Clusters** page appears.
3. In the upper-right corner of the page, click **Create Kubernetes Cluster**. The **Create Kubernetes Cluster** page appears.

You are redirected to the **Dedicated Kubernetes** tab by default.

Note To create a cluster for GPU computing, select ECS instance types with GPU capabilities to create worker nodes. For more information about other parameters, see [Cluster parameters](#).

4. Configure worker nodes. In this example, worker nodes are used to run GPU tasks and the gn5i-c4g1 instance type is selected.
 - i. If you choose to create worker instances, you must set Instance Type and Quantity. Three worker nodes with GPU capabilities are created in this example.

Note We recommend that you use SSD disks.

- ii. If you choose to add existing instances, you must create GPU-accelerated instances in the target region in advance.
5. Set the other parameters and click **Create Cluster** to start the deployment. After the cluster is created, choose **Clusters > Nodes** to go to the **Nodes** page.

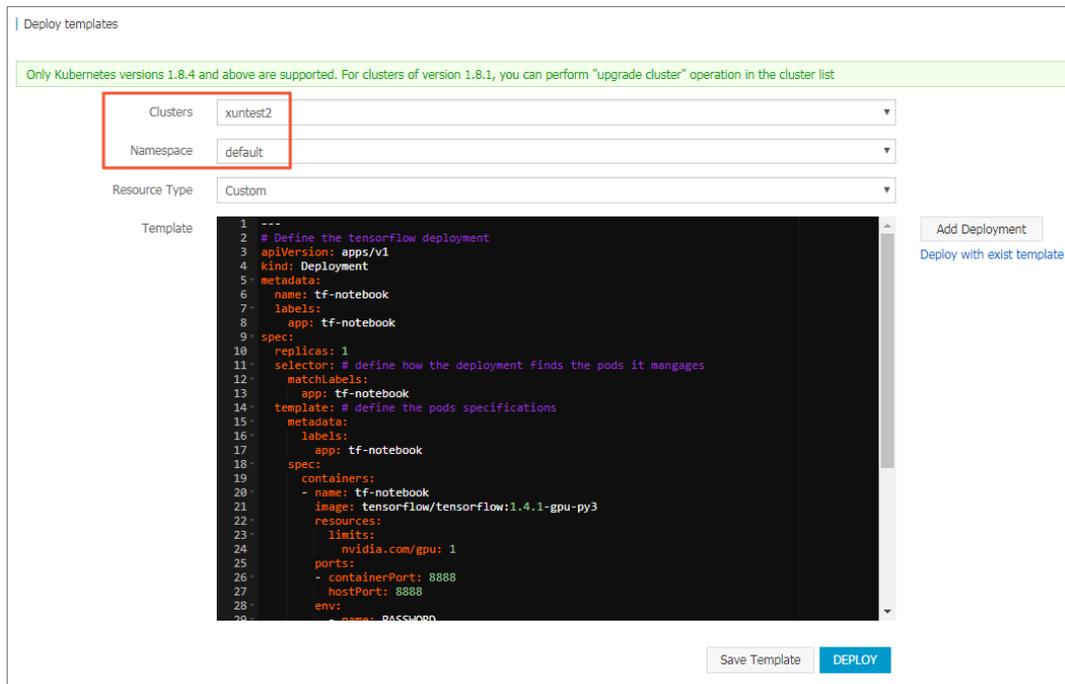

Select the target cluster. Find one of the created nodes and choose **More > Details** to view the GPU-based devices attached to the node.

Create a GPU experimental environment to run TensorFlow

Jupyter is a standard tool that is used by data scientists to create the experimental environment to run TensorFlow. The following example shows how to deploy a Jupyter application.

1. In the left-side navigation pane, choose **Applications > Deployments** to go to the **Deployments** page.
2. In the upper-right corner of the page, click **Create from Template**.

3. Select the target cluster and namespace. Select a sample template, or set Sample Template to Custom and customize the template in the Template field. Then, you can click Create.

In this example, a Jupyter application template is implemented. The template includes a deployment and a service.

```

---
# Define the tensorflow deployment
apiVersion: apps/v1
kind: Deployment
metadata:
  name: tf-notebook
  labels:
    app: tf-notebook
spec:
  replicas: 1
  selector: # define how the deployment finds the pods it manages
  matchLabels:
    app: tf-notebook
  template: # define the pods specifications
  metadata:
    labels:
      app: tf-notebook
  spec:
    containers:
      - name: tf-notebook
        image: tensorflow/tensorflow:1.4.1-gpu-py3
        resources:
          limits:
            nvidia.com/gpu: 1          #Specifies the number of NVIDIA GPUs that are called by the application.
    
```

```

ports:
  - containerPort: 8888
    hostPort: 8888
env:
  - name: PASSWORD          #Specifies the password used to access the Jupyter instance. You can mod
    ify the password as required.
    value: mypassw0rd

# Define the tensorflow service
---
apiVersion: v1
kind: Service
metadata:
  name: tf-notebook
spec:
  ports:
    - port: 80
      targetPort: 8888
      name: jupyter
  selector:
    app: tf-notebook
  type: LoadBalancer      #Creates an SLB service to ensure that the Jupyter instance is accessible over
                           the Internet.

```

4. In the left-side navigation pane, choose **Ingresses and Load Balancing > Services**. Select the target cluster and namespace. Find the tf-notebook service and check its external endpoint.

Name	Label	Type	Time Created	ClustersIP	InternalEndpoint	ExternalEndpoint	Action
kubernetes	component:apiserver provider:kubernetes	ClusterIP	05/17/2019,18:12:33		kubernetes:443 TCP	-	Details Update View YAML Delete
tf-notebook	-	LoadBalancer	05/23/2019,10:46:02		tf-notebook:80 TCP tf-notebook:30708 TCP		Details Update View YAML Delete

5. To connect to the Jupyter instance in a browser, enter `http://EXTERNAL-IP` in the address bar and enter the password specified in the template.
6. You can run the following program to verify that the Jupyter instance has access to GPU-based devices. The program lists all devices that can be used by TensorFlow:

```

from tensorflow.python.client import device_lib

def get_available_devices():
    local_device_protos = device_lib.list_local_devices()
    return [x.name for x in local_device_protos]

print(get_available_devices())

```

```

In [2]: from tensorflow.python.client import device_lib

def get_available_devices():
    local_device_protos = device_lib.list_local_devices()
    return [x.name for x in local_device_protos]

print(get_available_devices())

['/device:CPU:0', '/device:GPU:0']
    
```

3.4.3.9. Use labels to schedule pods to GPU nodes

To use Kubernetes clusters for GPU computing, you need to schedule pods to GPU nodes. To make the scheduling more flexible and efficient, you can add labels to GPU nodes.

Context

When Kubernetes deploys nodes with NVIDIA GPUs, the attributes of these GPUs will be discovered and exposed as node labels, which have the following benefits:

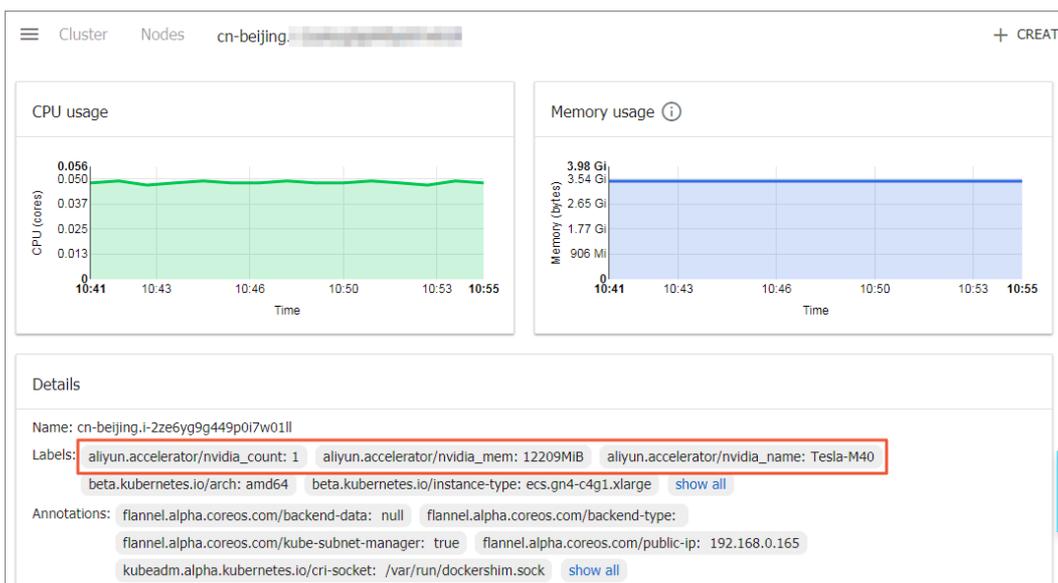

- You can quickly filter GPU nodes by label.
- You can use labels as scheduling conditions when you deploy pods.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, choose Clusters > Nodes. The Nodes page appears.

Note This example selects a cluster with three worker nodes, among which two are equipped with GPUs. Note the node IP addresses.

3. Select a GPU node and choose More > Details in the Actions column to go to Kubernetes Dashboard. You can view the labels attached to the node.

You can also log on to a master node and run the following command to view the labels on GPU nodes:

```
# kubectl get nodes
NAME                STATUS  ROLES  AGE  VERSION
cn-beijing.i-2ze2dy2h9w97v65u**** Ready  master  2d   v1.12.6-aliyun.1
cn-beijing.i-2ze8o1a45qdv5q8a**** Ready  <none>  2d   v1.12.6-aliyun.1 # Compare these nodes with t
he nodes displayed in the console to identify GPU nodes.
cn-beijing.i-2ze8o1a45qdv5q8a**** Ready  <none>  2d   v1.12.6-aliyun.1
cn-beijing.i-2ze9xylyn11vop7g**** Ready  master  2d   v1.12.6-aliyun.1
cn-beijing.i-2zed5sw8snjniq6m**** Ready  master  2d   v1.12.6-aliyun.1
cn-beijing.i-2zej9s0zjykp9pw**** Ready  <none>  2d   v1.12.6-aliyun.1
```

Select a GPU node and run the following command to query its labels:

```
# kubectl describe node cn-beijing.i-2ze8o1a45qdv5q8a****
Name:          cn-beijing.i-2ze8o1a45qdv5q8a7luz
Roles:        <none>
Labels:       aliyun.accelerator/nvidia_count=1 # This field is important.
              aliyun.accelerator/nvidia_mem=12209MiB
              aliyun.accelerator/nvidia_name=Tesla-M40
              beta.kubernetes.io/arch=amd64
              beta.kubernetes.io/instance-type=ecs.gn4-c4g1.xlarge
              beta.kubernetes.io/os=linux
              failure-domain.beta.kubernetes.io/region=cn-beijing
              failure-domain.beta.kubernetes.io/zone=cn-beijing-a
              kubernetes.io/hostname=cn-beijing.i-2ze8o1a45qdv5q8a****
.....
```

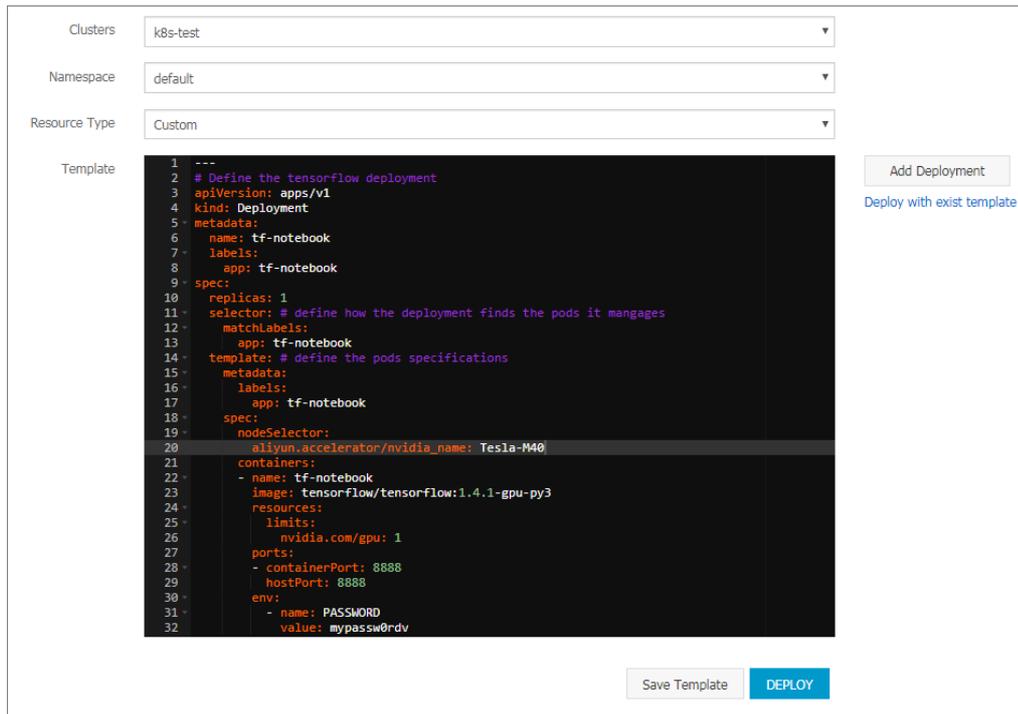

In this example, the GPU node is attached with the following three labels:

key	value
aliyun.accelerator/nvidia_count	The number of GPU cores.
aliyun.accelerator/nvidia_mem	The size of the GPU memory in MiB.
aliyun.accelerator/nvidia_name	The name of the NVIDIA graphics card.

GPU nodes of the same type have the same graphics card name. You can use this label to filter nodes.

```
# kubectl get no -l aliyun.accelerator/nvidia_name=Tesla-M40
NAME                STATUS  ROLES  AGE  VERSION
cn-beijing.i-2ze8o1a45qdv5q8a**** Ready  <none>  2d   v1.12.6-aliyun.1
cn-beijing.i-2ze8o1a45qdv5q8a**** Ready  <none>  2d   v1.12.6-aliyun.1
```

4. Go to the homepage of the Container Service console. In the left-side navigation pane, choose **Applications > Deployments**. On the page that appears, click **Create from Template** in the upper-right corner.
 - i. Create a TensorFlow deployment and schedule it to a GPU node.

The screenshot shows a web interface for configuring a Kubernetes deployment. At the top, there are three dropdown menus: 'Clusters' set to 'k8s-test', 'Namespace' set to 'default', and 'Resource Type' set to 'Custom'. Below these is a 'Template' section with a code editor containing a YAML template. To the right of the code editor are two buttons: 'Add Deployment' and 'Deploy with exist template'. At the bottom right of the interface are two buttons: 'Save Template' and 'DEPLOY'.

```
1 ---
2 # Define the tensorflow deployment
3 apiVersion: apps/v1
4 kind: Deployment
5 metadata:
6   name: tf-notebook
7   labels:
8     app: tf-notebook
9 spec:
10  replicas: 1
11  selector: # define how the deployment finds the pods it mangages
12  matchLabels:
13    app: tf-notebook
14  template: # define the pods specifications
15    metadata:
16      labels:
17        app: tf-notebook
18    spec:
19      nodeSelector:
20        aliyun.accelerator/nvidia_name: Tesla-M40
21      containers:
22      - name: tf-notebook
23        image: tensorflow/tensorflow:1.4.1-gpu-py3
24        resources:
25          limits:
26            nvidia.com/gpu: 1
27        ports:
28          - containerPort: 8888
29            hostPort: 8888
30        env:
31          - name: PASSWORD
32            value: mypassw0rdv
```

This example uses the following YAML template:

```
---
# Define the tensorflow deployment
apiVersion: apps/v1
kind: Deployment
metadata:
  name: tf-notebook
  labels:
    app: tf-notebook
spec:
  replicas: 1
  selector: # define how the deployment finds the pods it mangages
    matchLabels:
      app: tf-notebook
  template: # define the pods specifications
    metadata:
      labels:
        app: tf-notebook
    spec:
      nodeSelector:
        aliyun.accelerator/nvidia_name: Tesla-M40          # This field is important.
      containers:
        - name: tf-notebook
          image: tensorflow/tensorflow:1.4.1-gpu-py3
          resources:
            limits:
              nvidia.com/gpu: 1                               # This field is important.
          ports:
            - containerPort: 8888
              hostPort: 8888
          env:
            - name: PASSWORD
              value: mypassw0rdv
```

- ii. You can also avoid deploying an application to a GPU node. The following example deploys an NGINX pod and schedules the pod based on node affinity. For more information, see the part about node affinity in [Create an application from an image](#).

This example uses the following YAML template:

```
apiVersion: v1
kind: Pod
metadata:
  name: not-in-gpu-node
spec:
  affinity:
    nodeAffinity:
      requiredDuringSchedulingIgnoredDuringExecution:
        nodeSelectorTerms:
          - matchExpressions:
              - key: aliyun.accelerator/nvidia_name
                operator: DoesNotExist
  containers:
    - name: not-in-gpu-node
      image: nginx
```

5. In the left-side navigation pane, choose **Applications > Pods**. On the page that appears, select the target cluster and namespace.

Result

On the Pods page, the two pods from preceding examples have been scheduled to the target nodes. You can use labels to schedule pods to specific GPU nodes with ease.

3.4.3.10. Manually upgrade the kernel of a GPU node in a cluster

This topic describes how to manually upgrade the kernel of a GPU node in a cluster.

Context

The current kernel version is earlier than `3.10.0-957.21.3`.

Procedure

1. [Connect to a Kubernetes cluster through kubectl](#).
2. Run the following command to set the target GPU node to unschedulable. This example uses node `cn-beijing.i-2ze19qyi8votgjz12345` as the target node.

```
kubectl cordon cn-beijing.i-2ze19qyi8votgjz12345

node/cn-beijing.i-2ze19qyi8votgjz12345 already cordoned
```

3. Run the following command to drain the target GPU node:

```
# kubectl drain cn-beijing.i-2ze19qyi8votgjz12345 --grace-period=120 --ignore-daemonsets=true

node/cn-beijing.i-2ze19qyi8votgjz12345 cordoned
WARNING: Ignoring DaemonSet-managed pods: flexvolume-9scb4, kube-flannel-ds-r2qmh, kube-proxy-worker-l62sf, logtail-ds-f9vbg
pod/nginx-ingress-controller-78d847fb96-5fkkw evicted
```

4. Uninstall the existing nvidia-driver.

 **Note** This step uninstalls the version 384.111 driver. If your driver version is not 384.111, you need to download a driver from the official NVIDIA website and replace 384.111 with your actual version number.

i. Log on to the target GPU node and run the `nvidia-smi` command to query the driver version.

```
# nvidia-smi -a | grep 'Driver Version'
Driver Version          : 384.111
```

ii. Run the following commands to download the driver installation package:

```
cd /tmp/
curl -O https://cn.download.nvidia.cn/tesla/384.111/NVIDIA-Linux-x86_64-384.111.run
```

 **Note** The installation package is required to uninstall the driver.

iii. Run the following commands to uninstall the existing nvidia-driver:

```
chmod u+x NVIDIA-Linux-x86_64-384.111.run
./NVIDIA-Linux-x86_64-384.111.run --uninstall -a -s -q
```

5. Run the following commands to upgrade kernel:

```
yum clean all && yum makecache
yum update kernel -y
```

6. Run the following command to restart the GPU node:

```
reboot
```

7. Log on to the GPU node and run the following command to install the kernel-devel package.

```
yum install -y kernel-devel-$(uname -r)
```

8. Run the following commands to download the required driver and install it on the target node. In this example, version 410.79 is used.

```
cd /tmp/  
curl -O https://cn.download.nvidia.cn/tesla/410.79/NVIDIA-Linux-x86_64-410.79.run  
chmod u+x NVIDIA-Linux-x86_64-410.79.run  
sh . /NVIDIA-Linux-x86_64-410.79.run -a -s -q  
  
# warm up GPU  
nvidia-smi -pm 1 || true  
nvidia-smi -acp 0 || true  
nvidia-smi --auto-boost-default=0 || true  
nvidia-smi --auto-boost-permission=0 || true  
nvidia-modprobe -u -c=0 -m || true
```

9. Check the `/etc/rc.d/rc.local` file and check whether the following configurations are included. If not, add the following content.

```
nvidia-smi -pm 1 || true  
nvidia-smi -acp 0 || true  
nvidia-smi --auto-boost-default=0 || true  
nvidia-smi --auto-boost-permission=0 || true  
nvidia-modprobe -u -c=0 -m || true
```

10. Run the following commands to restart kubelet and Docker.

```
service kubelet stop  
service docker restart  
service kubelet start
```

11. Run the following command to set the GPU node to schedulable:

```
# kubectl uncordon cn-beijing.i-2ze19qyi8votgjz12345  
  
node/cn-beijing.i-2ze19qyi8votgjz12345 already uncordoned
```

12. Run the following command on the `nvidia-device-plugin` container to check the driver version:

```
kubectl exec -n kube-system -t nvidia-device-plugin-cn-beijing.i-2ze19qyi8votgjz12345 nvidia-smi
Thu Jan 17 00:33:27 2019

```

3.4.4. Storage

3.4.4.1. Overview

In the Container Service console, you can create volumes of other Apsara Stack services, enabling you to create stateful applications and use Apsara Stack disks and OSS to implement persistent storage.

Both static and dynamic volumes are supported. The following table shows how static and dynamic volumes are supported.

Apsara Stack storage	Static volume	Dynamic volume
Apsara Stack disk	<p>You can use a static disk volume through either of the following methods:</p> <ul style="list-style-type: none"> • Use a volume directly • Use a volume through a PV and PVC 	Supported
Apsara Stack NAS	<p>You can use a static NAS volume through either of the following methods:</p> <ul style="list-style-type: none"> • Use a volume through the FlexVolume plug-in <ul style="list-style-type: none"> ◦ Use a volume directly ◦ Use a volume through a PV or PVC • Use a volume through the Kubernetes NFS driver 	Supported

Apsara Stack storage	Static volume	Dynamic volume
Apsara Stack OSS	<p>You can use a static OSS volume through either of the following methods:</p> <ul style="list-style-type: none"> • Use a volume directly • Use a volume through a PV or PVC 	Not supported

3.4.4.2. Use Apsara Stack disks

You can use Apsara Stack disks to create volumes.

You can use volumes created from Apsara Stack disks in Kubernetes clusters.

Apsara Stack disks can be attached to Kubernetes clusters as the following volume types:

- **Statically provisioned volumes**

You can use the statically provisioned volumes in either of the following ways:

- Use a disk as a volume.
- Create a persistent volume (PV) or a persistent volume claim (PVC).

- **Dynamically provisioned volumes**

Considerations

- A disk is a non-shared storage device that can only be attached to a single pod at a time.
- To use a disk as a volume, you must have created the disk and obtained its disk ID.

The disk must meet the following capacity requirements:

- A basic disk must have a minimum capacity of 5 GiB.
- An ultra disk must have a minimum capacity of 20 GiB.
- An SSD disk must have a minimum capacity of 20 GiB.

- `volumeId`: the ID of the attached disk. The value must be the same as `volumeName` and `PV Name`.
- The node and the disk to be attached must be in the same zone.
- Only pay-as-you-go disks can be attached to nodes. If you change the billing method of an Elastic Compute Service (ECS) instance in the cluster from pay-as-you-go to subscription, you cannot change the billing method of its disks to subscription. Otherwise, the disks cannot be attached to the cluster.

Statically provisioned volumes

You can use disks as volumes or by creating PVs and PVCs.

Prerequisites

A disk is created in the ECS console.

- **Use a disk as a volume**

Use the following `disk-deploy.yaml` file to create a pod.

```
apiVersion: extensions/v1beta1
kind: Deployment
metadata:
  name: nginx-disk-deploy
spec:
  replicas: 1
  template:
    metadata:
      labels:
        app: nginx
    spec:
      containers:
        - name: nginx-flexvolume-disk
          image: nginx
          volumeMounts:
            - name: "d-bp1j17ifxfasvts3tf40"
              mountPath: "/data"
      volumes:
        - name: "d-bp1j17ifxfasvts3tf40"
          flexVolume:
            driver: "alicloud/disk"
            fsType: "ext4"
            options:
              volumeId: "d-bp1j17ifxfasvts3tf40"
```

- **Use a disk to create a PV and a PVC**

- i. **Use a disk to create a PV**

You can create a PV in the console or by using a YAML file.

- Create a PV by using a YAML file

Use the following `disk-pv.yaml` file to create a PV.

 **Note** The PV name must be the same as the disk ID.

```
apiVersion: v1
kind: PersistentVolume
metadata:
  name: d-bp1j17ifxfasvts3tf40
  labels:
    failure-domain.beta.kubernetes.io/zone: cn-hangzhou-b
    failure-domain.beta.kubernetes.io/region: cn-hangzhou
spec:
  capacity:
    storage: 20Gi
  storageClassName: disk
  accessModes:
    - ReadWriteOnce
  flexVolume:
    driver: "alicloud/disk"
    fsType: "ext4"
    options:
      volumeId: "d-bp1j17ifxfasvts3tf40"
```

- Create a PV in the console
 - a. Log on to the Container Service for Kubernetes console.
 - b. In the left-side navigation pane, choose Clusters > Persistent Volumes to go to the PVs and PVCs page.
 - c. On the Persistent Volumes tab, select the target cluster and click Create in the upper-right corner.
 - d. Set the parameters in the Create PV dialog box.

PV parameters

Parameter	Description
PV Type	In this example, Cloud Disk is selected.
Volume Plug-in	Flexvolume and CSI are supported.
Access Mode	By default, ReadWriteOnce is used.
Disk ID	Select a disk that is in the same region and zone as your cluster.
File System Type	Select the file system of the disk. Supported file systems include ext4, ext3, xfs, and vfat. Default value: ext4.
Label	Add labels to the PV.

The screenshot shows a 'Create PV' dialog box with the following configuration:

- PV Type:** Cloud Disk (selected), NAS, OSS
- Access Mode:** ReadWriteOnce (selected)
- Disk ID:** Select Disk
- File System Type:** ext4
- Label:** Add Label

Buttons: Create, Cancel

- e. Click Create.
- ii. Create a PVC

Use the following `disk-pvc.yaml` file to create a PVC:

```

kind: PersistentVolumeClaim
apiVersion: v1
metadata:
  name: pvc-disk
spec:
  accessModes:
    - ReadWriteOnce
  storageClassName: disk
resources:
  requests:
    storage: 20Gi

```

iii. Create a pod

Use the following *disk-pod.yaml* file to create a pod.

```

apiVersion: v1
kind: Pod
metadata:
  name: "flexvolume-alicloud-example"
spec:
  containers:
    - name: "nginx"
      image: "nginx"
      volumeMounts:
        - name: pvc-disk
          mountPath: "/data"
  volumes:
    - name: pvc-disk
      persistentVolumeClaim:
        claimName: pvc-disk

```

Dynamically provisioned volumes

To use a dynamically provisioned volume, you must manually create a StorageClass, and use `storageClassName` to specify the disk type in a PVC.

1. Create a StorageClass

```

kind: StorageClass
apiVersion: storage.k8s.io/v1beta1
metadata:
  name: alicloud-disk-common-hangzhou-b
provisioner: alicloud/disk
parameters:
  type: cloud_ssd
  regionid: cn-hangzhou
  zoneid: cn-hangzhou-b

```

Parameters

- `provisioner`: Set the value to `alicloud/disk`, which means that the Alibaba Cloud Provisioner plug-in is

used to create the StorageClass.

- **type:** the type of the disk. Valid values: `cloud_efficiency`, `cloud_ssd`, and `available`. If you set this parameter to `available`, the system will try to create a disk in the following order: ultra disk, SSD disk, and basic disk. The system will stop trying until a disk is created.
- **regionid:** the region of the disk.
- **zoneid:** the zone of the disk.

2. Create a service

```
kind: PersistentVolumeClaim
apiVersion: v1
metadata:
  name: disk-common
spec:
  accessModes:
    - ReadWriteOnce
  storageClassName: alicloud-disk-common-hangzhou-b
  resources:
    requests:
      storage: 20Gi
---
kind: Pod
apiVersion: v1
metadata:
  name: disk-pod-common
spec:
  containers:
    - name: disk-pod
      image: nginx
      volumeMounts:
        - name: disk-pvc
          mountPath: "/mnt"
  restartPolicy: "Never"
  volumes:
    - name: disk-pvc
      persistentVolumeClaim:
        claimName: disk-common
```

Default options

By default, Kubernetes clusters support the following types of StorageClasses:

- `alicloud-disk-efficiency`: ultra disk.
- `alicloud-disk-ssd`: SSD disk.
- `alicloud-disk-available`: This option ensures high availability. The system tries to create an ultra disk first. If no ultra disk is available in the specified zone, the system tries to create an SSD disk.

3. Create a multi-instance StatefulSet by using a disk

We recommend that you use the `volumeClaimTemplates` parameter. This allows the system to dynamically create multiple PVCs and PVs. PVCs are associated with PVs and pods.

```
apiVersion: v1
```

```
kind: Service
metadata:
  name: nginx
  labels:
    app: nginx
spec:
  ports:
    - port: 80
      name: web
  clusterIP: None
  selector:
    app: nginx
---
apiVersion: apps/v1beta2
kind: StatefulSet
metadata:
  name: web
spec:
  selector:
    matchLabels:
      app: nginx
  serviceName: "nginx"
  replicas: 2
  template:
    metadata:
      labels:
        app: nginx
    spec:
      containers:
        - name: nginx
          image: nginx
          ports:
            - containerPort: 80
              name: web
          volumeMounts:
            - name: disk-common
              mountPath: /data
      volumeClaimTemplates:
        - metadata:
            name: disk-common
          spec:
            accessModes: [ "ReadWriteOnce" ]
            storageClassName: "alicloud-disk-common"
            resources:
              requests:
                storage: 10Gi
```

3.4.4.3. Use NAS volumes

This topic describes how to use Network Attached Storage (NAS) file systems in Kubernetes clusters.

NAS file systems can be mounted to Kubernetes clusters as the following volume types:

- **Statically provisioned NAS volumes**

You can use statically provisioned NAS volumes in the following ways:

- Use the FlexVolume plug-in
 - Use a NAS file system as a volume
 - Use a NAS file system to create a persistent volume (PV) and a persistent volume claim (PVC)
- Use the Network File System (NFS) driver of Kubernetes.

- **Dynamically provisioned NAS volumes**

Prerequisites

A NAS file system is created in the NAS console and a mount target is added. The mount target is used to mount the file system to the Kubernetes cluster. The NAS file system and the Kubernetes cluster are deployed in the same Virtual Private Cloud (VPC) network.

Statically provisioned NAS volumes

You can use the FlexVolume plug-in provided by Alibaba Cloud or the NFS driver provided by Kubernetes to manage NAS file systems.

Use the FlexVolume plug-in

The FlexVolume plug-in allows you to use a NAS file system as a volume. You can also use a NAS file system to create a PV and a PVC.

 **Note**

- NAS is a shared storage system that provides storage services for multiple pods at the same time.
- server: the mount target of the NAS volume.
- path: the mounted directory in the NAS file system. You can specify a subdirectory as a volume. If no subdirectory exists, the system automatically creates and mounts a subdirectory.
- vers: the version of the NFS mounting protocol. Version 4.0 is supported.
- mode: the access permissions on the mounted directory. If the root directory of the NAS file system is specified as the mounted directory, you cannot modify the access permissions. If the NAS file system stores a large amount of data, the mounting process may take a long time or fail. Therefore, we recommend that you do not set the mode parameter.

Use a NAS file system as a volume

Use the following `nas-deploy.yaml` file to create a pod.

```

apiVersion: v1
kind: Pod
metadata:
  name: "flexvolume-nas-example"
spec:
  containers:
    - name: "nginx"
      image: "nginx"
      volumeMounts:
        - name: "nas1"
          mountPath: "/data"
  volumes:
    - name: "nas1"
      flexVolume:
        driver: "alicloud/nas"
        options:
          server: "0cd8b4a576-grs79.cn-hangzhou.nas.aliyuncs.com"
          path: "/k8s"
          vers: "4.0"

```

Use a NAS file system to create a PV and a PVC

Step 1: Create a PV

You can use a YAML file or the Container Service for Kubernetes console to create a PV.

- Create a PV by using a YAML file

Use the following `nas-pv.yaml` file to create a PV.

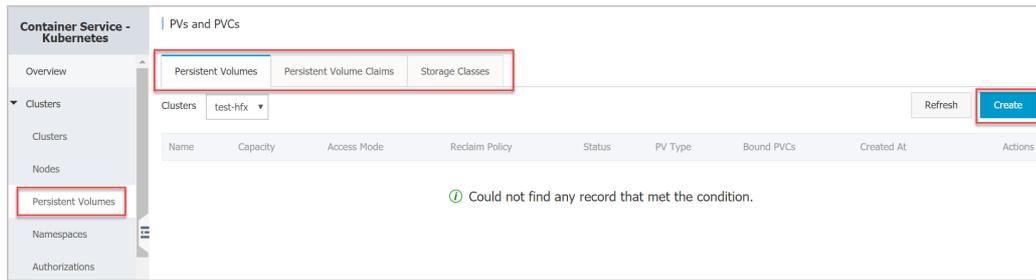

```

apiVersion: v1
kind: PersistentVolume
metadata:
  name: pv-nas
spec:
  capacity:
    storage: 5Gi
  storageClassName: nas
  accessModes:
    - ReadWriteMany
  flexVolume:
    driver: "alicloud/nas"
    options:
      server: "0cd8b4a576-uih75.cn-hangzhou.nas.aliyuncs.com"
      path: "/k8s"
      vers: "4.0"

```

- Create a PV in the console
 - Log on to the [Container Service for Kubernetes console](#).
 - In the left-side navigation pane, choose **Clusters > Persistent Volumes**. The **PVs and PVCs** page appears.

iii. On the **Persistent Volumes** tab, select the target cluster and click **Create** in the upper-right corner.

iv. In the **Create PV** dialog box, set the following parameters:

- **PV Type:** In this example, **NAS** is selected.
- **Volume Name:** the name of the PV. The name must be unique in the cluster. In this example, **pv-nas** is specified.
- **Volume Plug-in:** In this example, **Flexvolume** is selected.
- **Capacity:** the capacity of the PV. The capacity of the PV cannot exceed that of the **NAS** file system.
- **Access Mode:** The default mode is **ReadWriteMany**.
- **Mount Target Domain Name:** Enter the address of the mount target that is used to mount the **NAS** file system to the cluster.
- **Subdirectory:** Enter a subdirectory in the **NAS** file system. The subdirectory must start with a forward slash (/). If this parameter is set, the specified subdirectory is mounted as the PV.
 - If the specified subdirectory does not exist, the system automatically creates this subdirectory.
 - This parameter is optional. By default, the root directory of the **NAS** file system is mounted.
- **Permissions:** Set the access permissions on the mounted directory, for example, **755**, **644**, or **777**.
 - The permissions can be set only when a subdirectory is mounted as the PV.
 - This parameter is optional. By default, the original permissions are used.
- **chmod (Change Mode):** In this example, **Non-recursive** is selected.
- **Version:** The version of the **NFS** mounting protocol. Version 3 and 4.0 are supported. We recommend that you use the default version 3.
- **Label:** Add labels for the PV.

Create PV
✕

Make sure that FlexVolume is upgraded to the latest version.

PV Type Cloud Disk **NAS** OSS

* Volume Name:
The name can only contain lowercase letters, numbers, periods (.), and hyphens (-). It must start with a lowercase letter.

Volume Plug-in **Flexvolume** CSI
Flexvolume is not installed in the cluster. You may not be able to use the PV.

* Capacity

Access Mode **ReadWriteMany** ReadWriteOnce

* Mount Target Domain Name: **Select Mount Target** Custom

Subdirectory:
Permissions: [Configuration Guide](#)

chmod (Change Mode) Non-recursive Recursive [Configuration Guide](#)

Version

▲ Hide

Label [+ Add Label](#)

v. Click Create.

Step 2: Create a PVC

Use the following *nas-pvc.yaml* file to create a PVC.

```

kind: PersistentVolumeClaim
apiVersion: v1
metadata:
  name: pvc-nas
spec:
  accessModes:
    - ReadWriteMany
  storageClassName: nas
resources:
  requests:
    storage: 5Gi

```

Step 3: Create a pod

Use the following *nas-pod.yaml* file to create a pod.

```

apiVersion: v1
kind: Pod
metadata:
  name: "flexvolume-nas-example"
spec:
  containers:
    - name: "nginx"
      image: "nginx"
      volumeMounts:
        - name: pvc-nas
          mountPath: "/data"
  volumes:
    - name: pvc-nas
      persistentVolumeClaim:
        claimName: pvc-nas

```

Use the NFS driver**Step 1: Create a NAS file system**

Log on to the NAS console. For more information, see the *Create a file system* chapter of *NAS User Guide*.

 **Note** The NAS file system and the Kubernetes cluster must be deployed in the same region.

In this example, the following mount target is used: `055f84ad83-ixxxx.cn-hangzhou.nas.aliyuncs.com`.

Step 2: Create a PV

You can use a YAML template or the Container Service for Kubernetes console to create a PV.

- **Create a PV by using a YAML template**

Use the *nas-pv.yaml* file to create a PV.

Run the following command to create a PV from the NAS file system:

```
root@master # cat << EOF | kubectl apply -f -
apiVersion: v1
kind: PersistentVolume
metadata:
  name: nas
spec:
  capacity:
    storage: 8Gi
  accessModes:
    - ReadWriteMany
  persistentVolumeReclaimPolicy: Retain
  nfs:
    path: /
    server: 055f84ad83-ixxxx.cn-hangzhou.nas.aliyuncs.com
EOF
```

- **Create a PV in the console**

For more information, see [Use a NAS file system to create a PV and a PVC.](#)

Step 3: Create a PVC

Create a PVC and associate the PVC with the PV that is created in Step 2.

```
root@master # cat << EOF | kubectl apply -f -
apiVersion: v1
kind: PersistentVolumeClaim
metadata:
  name: nasclaim
spec:
  accessModes:
    - ReadWriteMany
  resources:
    requests:
      storage: 8Gi
EOF
```

Step 4: Create a Pod

Create an application to use the PV.

```
root@master # cat << EOF |kubectl apply -f -
apiVersion: v1
kind: Pod
metadata:
  name: mypod
spec:
  containers:
  - name: myfrontend
    image: registry.aliyuncs.com/spacexnice/netdia:latest
    volumeMounts:
    - mountPath: "/var/www/html"
      name: mypd
  volumes:
  - name: mypd
    persistentVolumeClaim:
      claimName: nasclaim
EOF
```

The NAS file system is now mounted to the application that runs in the pod.

Dynamically provisioned NAS volumes

If you want to use dynamically provisioned NAS volumes, install a driver plug-in and configure a NAS mount target.

Install the plug-in

```
apiVersion: storage.k8s.io/v1
kind: StorageClass
metadata:
  name: alicloud-nas
provisioner: alicloud/nas
---
apiVersion: v1
kind: ServiceAccount
metadata:
  name: alicloud-nas-controller
  namespace: kube-system
---
kind: ClusterRoleBinding
apiVersion: rbac.authorization.k8s.io/v1beta1
metadata:
  name: run-alicloud-nas-controller
subjects:

          operator: Exists
          key: node-role.kubernetes.io/master
        - effect: NoSchedule
          operator: Exists
          key: node.cloudprovider.kubernetes.io/uninitialized
      nodeSelector:
        node-role.kubernetes.io/master: ""
      serviceAccount: alicloud-nas-controller
      containers:
        - name: alicloud-nas-controller
          image: registry.cn-hangzhou.aliyuncs.com/acs/alibabacloud-nas-controller:v1.8.4
          volumeMounts:
            - mountPath: /persistentvolumes
              name: nfs-client-root
          env:
            - name: PROVISIONER_NAME
              value: alicloud/nas
            - name: NFS_SERVER
              value: 0cd8b4a576-mmi32.cn-hangzhou.nas.aliyuncs.com
            - name: NFS_PATH
              value: /
      volumes:
        - name: nfs-client-root
          nfs:
            server: 0cd8b4a576-mmi32.cn-hangzhou.nas.aliyuncs.com
            path: /
```

Use a dynamically provisioned NAS volume

```
apiVersion: apps/v1beta1
kind: StatefulSet
metadata:
  name: web
spec:
  serviceName: "nginx"
  replicas: 2
  volumeClaimTemplates:
  - metadata:
    name: html
    spec:
      accessModes:
      - ReadWriteOnce
      storageClassName: alicloud-nas
      resources:
        requests:
          storage: 2Gi
  template:
    metadata:
      labels:
        app: nginx
    spec:
      containers:
      - name: nginx
        image: nginx:alpine
        volumeMounts:
        - mountPath: "/usr/share/nginx/html/"
          name: html
```

3.4.4.4. Use OSS volumes

You can use OSS buckets to create PVs in Kubernetes clusters.

You can use OSS volumes in the following ways:

- Directly as volumes
- Through PVs and PVCs

Prerequisites

You have created a bucket in the OSS console.

Background

- Currently, you can only use static OSS volumes.
- OSS is a shared storage system that can provide storage services to multiple pods at the same time.
- bucket: Only buckets can be mounted to a Kubernetes cluster. The subdirectories or files in a bucket cannot be mounted to a Kubernetes cluster.
- url: The OSS endpoint, namely, the domain that is used to mount an OSS bucket to a cluster.

- **akId**: Your AccessKey ID.
- **akSecret**: Your AccessKey secret.
- **otherOpts**: The custom parameters for mounting an OSS bucket, in the format of `-o *** -o ***`.

 **Note** To use OSS volumes, you must create a secret with your AccessKey information when you deploy the flexvolume service.

Use static OSS volumes

- **Use an OSS bucket as a volume**

Use the following *oss-deploy.yaml* file to create a pod.

```
apiVersion: extensions/v1beta1
kind: Deployment
metadata:
  name: nginx-oss-deploy
spec:
  replicas: 1
  template:
    metadata:
      labels:
        app: nginx
    spec:
      containers:
        - name: nginx-flexvolume-oss
          image: nginx
          volumeMounts:
            - name: "oss1"
              mountPath: "/data"
      volumes:
        - name: "oss1"
          flexVolume:
            driver: "alicloud/oss"
            options:
              bucket: "docker"
              url: "oss-cn-hangzhou.aliyuncs.com"
              akId: ***
              akSecret: ***
              otherOpts: "-o max_stat_cache_size=0 -o allow_other"
```

- **Use an OSS bucket to create a PV and a PVC**

i. Create a PV

You can create a PV through the console or by using a YAML file.

■ Create a PV by using a YAML file

Use the following *oss-pv.yaml* file to create a PV.

```
apiVersion: v1
kind: PersistentVolume
metadata:
  name: pv-oss
spec:
  capacity:
    storage: 5Gi
  accessModes:
    - ReadWriteMany
  storageClassName: oss
  flexVolume:
    driver: "alicloud/oss"
    options:
      bucket: "docker"
      url: "oss-cn-hangzhou.aliyuncs.com"
      akId: ***
      akSecret: ***
      otherOpts: "-o max_stat_cache_size=0 -o allow_other"
```

■ Create a PV through the console

- a. [Log on to the Container Service console.](#)
- b. In the left-side navigation pane, choose **Clusters > Persistent Volumes**. The **PVs and PVCs** page appears.
- c. On the **Persistent Volumes** tab, select the target cluster and click **Create** in the upper-right corner.
- d. In the **Create PV** dialog box, set the following parameters.

Create a PV through the console

Parameter	Description
PV Type	In this example, select OSS.
Volume Name	The name of the PV. The name must be unique in the cluster. In this example, enter pv-oss.
Volume Plugin-in	Supports Flexvolume and CSI.
Capacity	The capacity of the PV.
Access Mode	Default is ReadWriteMany.
AccessKey ID and AccessKey Secret	The AccessKey pair is required to access OSS buckets. To obtain your AccessKey pair, go to the ASCM console, choose Enterprise > Organizations , click  at the right of the target organization, and click AccessKey .
Optional Parameters	Enter custom parameters in the format of <code>-o *** -o ***</code> .

Parameter	Description
Bucket ID	The name of the OSS bucket that you want to use. Click Select Bucket . In the dialog box that appears, choose the target bucket and click Select .
Endpoint	We recommend that you choose Internal Endpoint .
Label	Add labels to the PV.

e. Click **Create**.

ii. Create a PVC

Use the following *oss-pvc.yaml* file to create a PVC.

```
kind: PersistentVolumeClaim
apiVersion: v1
metadata:
  name: pvc-oss
spec:
  storageClassName: oss
  accessModes:
    - ReadWriteMany
  resources:
    requests:
      storage: 5Gi
```

iii. Create a pod

Use the following *oss-pod.yaml* file to create a pod.

```
apiVersion: v1
kind: Pod
metadata:
  name: "flexvolume-oss-example"
spec:
  containers:
    - name: "nginx"
      image: "nginx"
      volumeMounts:
        - name: pvc-oss
          mountPath: "/data"
  volumes:
    - name: pvc-oss
      persistentVolumeClaim:
        claimName: pvc-oss
```

Use dynamic OSS volumes

Currently, dynamic OSS volumes are not supported.

3.4.4.5. Create a PVC

Prerequisites

- You have created a Kubernetes cluster. For more information, see [Create a Kubernetes cluster](#).
- You have created a PV. This example uses a PV created from a disk. For more information, see [Use Apsara Stack disks](#).

By default, PVCs are associated with PVs that have the `alicloud-pvname` label. PVs created through the Container Service console all have this label. If a PV does not have this label, you need to add the label before you can associate it with a PVC.

Procedure

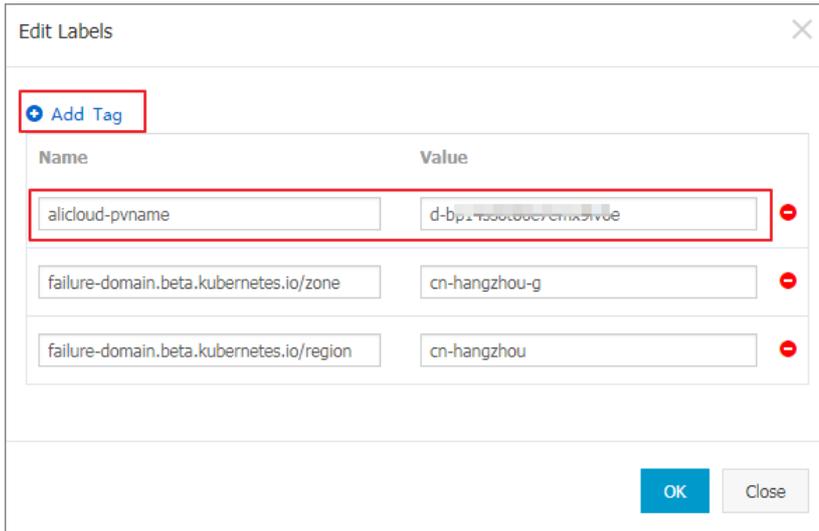

1. [Log on to the Container Service console](#).
2. In the left-side navigation pane, choose **Applications > Persistent Volume Claims**. The **PVs and PVCs** page appears.

3. On the **Persistent Volume Claims** tab, select the target cluster and namespace, and click **Create** in the upper-right corner.
4. In the **Create PVC** dialog box, set the parameters, and click **Create**.

- **Source:** Select an existing PV or use a storage class.
- **PVC Type:** The same as the types of PVs. Three types, cloud disk, NAS, and OSS, are supported.
- **Name:** The name of the PVC.
- **Allocation Mode:** Currently, only existing volumes are supported.
- **Existing Volumes:** Select PVs of the same type as the PVC.
- **Capacity:** The claimed usage, which cannot be larger than the total capacity of associated PVs.

Note If your cluster has a PV that is not used, but you cannot find it in the **Select PV** dialog box, the reason may be that the PV does not have the `alicloud-pvname` label.

If you cannot find available PVs, you can choose **Clusters > Persistent Volumes** in the left-side navigation pane. Find the PV that you want to use and click **Manage Labels** in the **Actions** column. You can attach a label to the PV and set the label name to `alicloud-pvname` and the value to the PV name. By default, the disk ID is used as the PV name if the PV is created from a disk.

5. On the Persistent Volume Claims page, the newly created PVC is now displayed.

3.4.4.6. Use a PVC

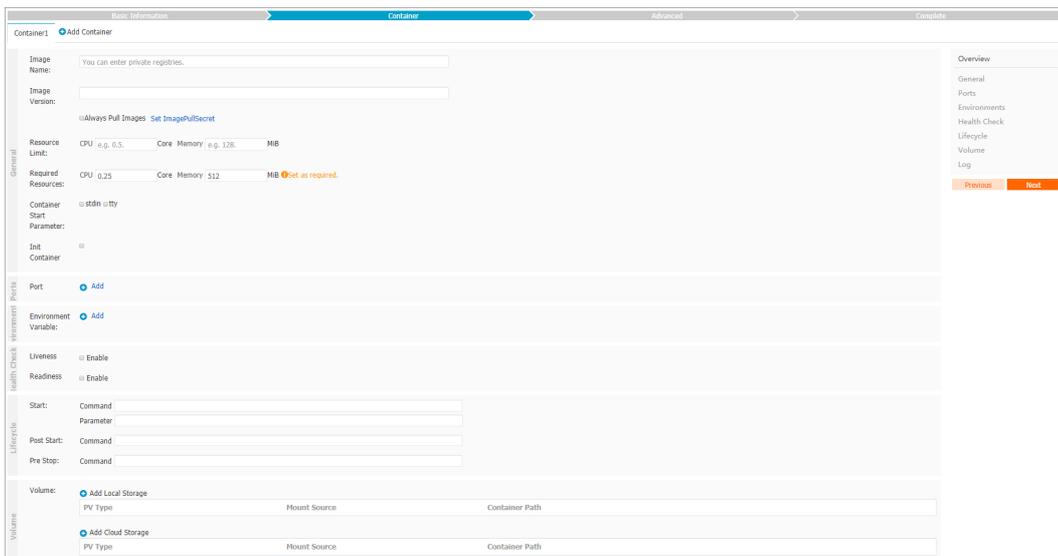

You can use persistent volume claims (PVCs) in your applications.

Prerequisites

- You have created a Kubernetes cluster. For more information, see [Create a Kubernetes cluster](#).
- You have created a PVC. This example uses a PVC named pvc-disk. For more information, see [Create PVCs](#).

Procedure

1. [Log on to the Container Service console](#).
2. In the left-side navigation pane, choose **Applications > Deployments**. The **Deployments** page appears. In the upper-right corner, click **Create from Image**.
3. On the **Basic Information** page, specify the application name, cluster, namespace, number of replicas, type, labels, and annotations. Then click **Next**.
4. On the **Container** page, select the image. Then, specify the type of cloud volume. Currently, cloud disks, NAS, and OSS are supported. In this example, select the pvc-disk PVC and click **Next**.

5. Configure the test-nginx application, and then click **Create**.

- After the application is created, choose **Applications > Pods** in the left-side navigation pane. Select the pod to which the application belongs, and click **View Details**.
- On the pod details page, click the **Volumes** tab. Verify that the pod is now associated with the **pvc-disk** PVC.

Pod details page showing Overview, Conditions, and Volumes tabs. The Volumes tab is active, displaying a table with one volume entry:

Name	Type	Details
volume-1530693170118	persistentVolumeClaim	claimName: pvc-disk

3.4.5. Network management

3.4.5.1. Set access control for pods

This topic describes how to use network policies to control access between pods.

Prerequisites

You have created a Kubernetes cluster and selected the **Terway network plug-in**. For more information, see [Create a Kubernetes cluster](#).

Context

You can declare network policies to control access between pods and thus prevent applications from interfering each other.

Procedure

For more information about standard Kubernetes network policies, see [Network policies](#).

- Create a pod that runs as a server and attach `label run=nginx` to the pod. For more information, see [Create an application from an orchestration template](#). The sample YAML file is as follows:

```
apiVersion: v1
kind: Pod
metadata:
  name: server
  labels:
    run: nginx
spec:
  containers:
  - name: nginx
    image: registry.acs.intranet.env22.com/nginx:1.8
```

2. Create a network policy. For more information, see [Create an application from an orchestration template](#). The sample YAML file is as follows:

```
kind: NetworkPolicy
apiVersion: networking.k8s.io/v1
metadata:
  name: access-nginx
spec:
  podSelector:
    matchLabels:
      run: nginx # Apply the network policy to pods with the run=nginx label
  ingress:
    - from:
      - podSelector:
          matchLabels:
            access: "true" # Only pods with the access=true label are accessible
```

3. Use the *client.yaml* and *client-label* files to create two pods that run as clients. One pod has the required label and the other does not.
 - i. Create the *client.yaml* and *client-label* files with the following contents respectively.

```
# This pod has no label
apiVersion: v1
kind: Pod
metadata:
  name: client
spec:
  containers:
    - name: busybox
      image: registry.acs.intranet.env22.com/acs/busybox
      command: ["sh", "-c", "sleep 200000"]
```

```
# This pod has the label
apiVersion: v1
kind: Pod
metadata:
  name: client-label
  labels:
    access: "true"
spec:
  containers:
    - name: busybox
      image: registry.acs.intranet.env22.com/acs/busybox
      command: ["sh", "-c", "sleep 200000"]
```

- ii. Run the following commands to create these pods:

```
kubectl apply -f client.yaml
kubectl apply -f client-label.yaml
```

You can see that only the pod with the required label can access the server.

3.4.5.2. Set bandwidth limits for pods

This topic describes how to limit the bandwidth of inbound and outbound traffic that flows through a pod.

Prerequisites

You have created a Kubernetes cluster and selected the Terwaynetwork plug-in. For more information, see [Create a Kubernetes cluster](#).

Context

Throttling pods helps prevent performance degradation of the host or other workloads when certain pods occupy excessive resources.

Method

You can use the `k8s.aliyun.com/ingress-bandwidth` and `k8s.aliyun.com/egress-bandwidth` annotations for pod throttling.

- `k8s.aliyun.com/ingress-bandwidth` : limits the pod inbound bandwidth.
- `k8s.aliyun.com/egress-bandwidth` : limits the pod outbound bandwidth.
- The bandwidth limit is measured in m and k, which represent Mbit/s and Kbit/s respectively.

Procedure

1. Create a pod that runs as a server in the console. For more information, see [Create an application from an orchestration template](#). The sample YAML file is as follows:

```
apiVersion: v1
kind: Pod
metadata:
  name: server
  annotations:
    k8s.aliyun.com/ingress-bandwidth: 10m # Set the inbound bandwidth limit to 10 Mbit/s
    k8s.aliyun.com/egress-bandwidth: 10m
spec:
  containers:
    - name: nginx
      image: registry.acs.intranet.env22.com/nginx:1.8
```

2. Run the `kubectl exec` command to connect to the pod. To verify that pod throttling is effective, run the following commands to create a file on the pod. Assume that the IP address of the pod created in [step 1](#) is 172.16.XX.XX.

```
cd /usr/share/nginx/html
dd if=/dev/zero of=bigfile bs=1M count=1000
```

3. Use the `client-deploy.yaml` file to create a pod that runs as a client.

- i. Create the `client-deploy.yaml` file with the following content:

```
apiVersion: v1
kind: Pod
metadata:
  name: client
  annotations:
    k8s.aliyun.com/ingress-bandwidth: 10m # Set the inbound bandwidth limit to 10 Mbit/s
    k8s.aliyun.com/egress-bandwidth: 10m
spec:
  containers:
    - name: busybox
      image: registry.acs.intranet.env22.com/acs/netdia
      command: ["sh", "-c", "sleep 200000"]
```

- ii. Run the following command to create the pod:

```
kubectl apply -f client-deploy.yaml
```

4. Run the following command to check whether bandwidth is limited:

```
kubectl exec -it client sh
```

3.4.6. Namespaces

3.4.6.1. Create a namespace

You can create a namespace in the console.

Prerequisites

You have created a Kubernetes cluster.

Context

In a Kubernetes cluster, you can use namespaces to create multiple virtual spaces. When a large number of users share a cluster, you can use namespaces to divide different workspaces and allocate cluster resources to different tasks. Furthermore, you can use [resource quotas](#) to allocate resources to each namespace.

Procedure

1. [Log on to the Container Service console](#).
2. In the left-side navigation pane, choose **Clusters > Namespaces**. The Namespaces page appears.
3. Select the target cluster and click **Create** in the upper-right corner.
4. In the dialog box that appears, set the parameters.

Create Namespace

Name:

The namespace name must be 1 to 63 characters in length and can contain numbers lowercase letters and hyphens (-). It must start with a letter or a number.

Variable Key	Variable Value	Actions
env	test	Edit Delete

Create a namespace

Parameter	Description
Name	Enter a name for the namespace. In this example, enter test. The name must be 1 to 63 characters in length and can contain digits, letters, and hyphens (-). It must start and end with a letter or digit.
Label	<p>Label: Add one or more labels to the namespace. Labels are used to add marks to namespaces. For example, you can use a label to mark the namespace as one used in the test environment.</p> <p>Enter a variable key and value. Then click Add on the right to add a label.</p>

5. Click **OK**.
6. The newly created namespace is now displayed on the **Namespaces** page.

Namespace

Clusters: k8s-cluster01

Name	Label	Status	Created At	Actions
default		● Ready	Aug 29, 2019, 13:29:29 GMT+8	Resource Quotas and Limits Edit Delete
kube-public		● Ready	Aug 29, 2019, 13:29:29 GMT+8	Resource Quotas and Limits Edit Delete
kube-system		● Ready	Aug 29, 2019, 13:29:29 GMT+8	Resource Quotas and Limits Edit Delete

3.4.6.2. Set resource quotas and limits

You can set resource quotas and limits for a namespace in the console.

Prerequisites

- You have created a Kubernetes cluster. For more information, see [Create a Kubernetes cluster](#).
- You have created the sample namespace test. For more information, see [Create a namespace](#).
- You can connect to a master node of the cluster. For more information, see [Connect to a Kubernetes cluster through kubectl](#).

Context

By default, a running pod uses the CPU and memory resources of a node without limit. This means that any pod can use the computing resources of a cluster without restraints. Therefore, pods of a namespace may deplete the cluster resources.

Namespaces can be used as virtual clusters to serve multiple purposes and meet different needs. We recommend that you set resource quotas for all namespaces.

For a namespace, you can set quotas on resources such as CPU, memory, and pod quantity. For more information, see [Resource Quotas](#).

Procedure

1. [Log on to the Container Service console](#).
2. In the left-side navigation pane, choose **Clusters > Namespaces**. On the Namespaces page, select the target cluster. Find the target namespace and click **Resource Quotas and Limits** in the Actions column.
3. In the dialog box that appears, set resource quotas and default resource limits.

Note After you set CPU and memory quotas for a namespace, you must specify CPU and memory limits when you create a pod. Alternatively, you can set the default resource limits for the namespace. For more information, see [Resource Quotas](#).

i. Set resource quotas for the namespace.

The screenshot shows the 'Resource Quotas and Limits' dialog box with the 'Resource Quota' tab selected. The settings are as follows:

Category	Resource	Total	Unit
Compute Resource Quota	CPU Limit	2	Cores
	Memory Limit	4Gi	
Storage Resource Quota	Storage Capacity	1024Gi	
	PVCs	50	
Other Limits	ConfigMaps	100	
	Pods	50	
	Services	20	
	Load Balancer Services	5	
	Secrets	10	

ii. You can set resource limits and resource requests for containers in the namespace. This enables you to control the amount of resources consumed by containers. For more information, see <https://kubernetes.io/memory-default-namespace/>.

The screenshot shows the 'Resource Quotas and Limits' dialog box with the 'LimitRange' tab selected. The settings are as follows:

Resource	Limit	Request	Unit
CPU	0.5	0.1	Cores
Memory	512Mi	256Mi	

4. After you set resource quotas and limits, connect to a master node of the cluster and run the following commands to query the resource configurations of the namespace.

```
# kubectl get limitrange,ResourceQuota -n test
NAME AGE
limitrange/limits 8m

NAME AGE
resourcequota/quota 8m

# kubectl describe limitrange/limits resourcequota/quota -n test
Name: limits
Namespace: test
Type Resource Min Max Default Request Default Limit Max Limit/Request Ratio
-----
Container cpu -- 100m 500m -
Container memory -- 256Mi 512Mi -

Name: quota
Namespace: test
Resource Used Hard
-----
configmaps 0 100
limits.cpu 0 2
limits.memory 0 4Gi
persistentvolumeclaims 0 50
pods 0 50
requests.storage 0 1Ti
secrets 1 10
services 0 20
services.loadbalancers 0 5
```

3.4.6.3. Edit a namespace

You can edit an existing namespace.

Prerequisites

- You have created a Kubernetes cluster. For more information, see [Create a Kubernetes cluster](#).
- You have created the sample namespace test. For more information, see [Create a namespace](#).

Context

When you edit a namespace, you can add, delete, or modify namespace labels based on needs.

Procedure

1. [Log on to the Container Service console](#).
2. In the left-side navigation pane, choose **Clusters > Namespaces**. The Namespaces page appears.
3. Select the target cluster. Find the namespace that you want to edit and click **Edit** in the Actions column.
4. In the dialog box that appears, select a label and click **Edit** to modify its key and value. This example changes a label to `env:test-V2`. Then click **Save**.

5. Click **OK**. Go to the Namespaces page and check the newly edited namespace label.

Name	Label	Status	Created At	Actions
default		Ready	Aug 29, 2019, 13:29:29 GMT+8	Resource Quotas and Limits Edit Delete
kube-public		Ready	Aug 29, 2019, 13:29:29 GMT+8	Resource Quotas and Limits Edit Delete
kube-system		Ready	Aug 29, 2019, 13:29:29 GMT+8	Resource Quotas and Limits Edit Delete
test	env: test-V2	Ready	Aug 29, 2019, 17:55:53 GMT+8	Resource Quotas and Limits Edit Delete

3.4.6.4. Delete a namespace

You can delete namespaces that are no longer in use.

Prerequisites

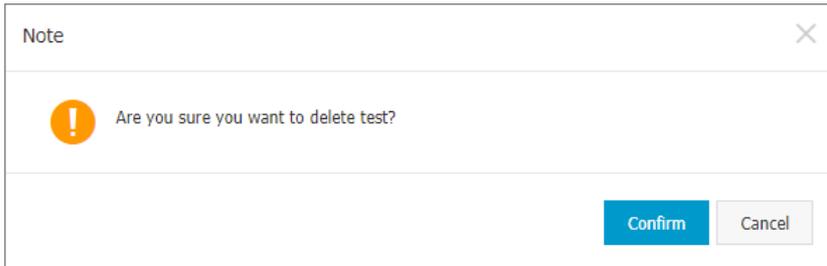

- You have created a Kubernetes cluster. For more information, see [Create a Kubernetes cluster](#).
- You have created the sample namespace test. For more information, see [Create a namespace](#).

Context

Note When you delete a namespace, all resource objects under the namespace will be deleted. Exercise caution when you perform this operation.

Procedure

1. [Log on to the Container Service console](#).
2. In the left-side navigation pane, choose **Clusters > Namespaces**. The Namespaces page appears.
3. Select the target cluster. Find the namespace that you want to delete and click **Delete** in the Actions column.
4. In the dialog box that appears, click **Confirm**.

5. The namespace is now deleted from the Namespaces page. Resource objects under the namespace are also deleted.

3.4.7. Applications

3.4.7.1. Create an application from an image

You can use an image to create an NGINX application that is accessible over the Internet.

Prerequisites

- A Kubernetes cluster is created. For more information, see [Create a Kubernetes cluster](#).
- Your Kubernetes cluster is accessible over the Internet.

Procedure

1. [Log on to the Container Service for Kubernetes console](#).
2. In the left-side navigation pane, choose **Applications > Deployments** to go to the Deployments page. Then, click **Create from Image** in the upper-right corner of the page.
3. In the dialog box that appears, set the parameters, including **Name**, **Cluster**, **Namespace**, **Replicas**, and **Type**, and select **Synchronize Timezone**. Click **Next**.

If you do not set the **Namespace** parameter, the default namespace is used.

The screenshot shows the 'Create Application' dialog box with the following fields and values:

- Name:** nginx
- Cluster:** k8s-cluster01
- Namespace:** default
- Replicas:** 2
- Type:** Deployment

At the bottom right, there are 'Back' and 'Next' buttons.

4. **Configure containers.**

Note You can configure multiple containers for the pods of the application.

i. Configure general settings.

Container general settings

Parameter	Description
Image Name	You can click Select Image , and in the dialog box that appears, select the required image and click OK . In this example, NGINX is selected. You can also enter a private registry URL to specify the image. The registry URL follows this format: <code>domainname/namespace/imagename</code> .
Image Version	You can click Select Image Version to select the required version. If you do not specify the image version, the latest version is used.
Always Pull Images	To improve efficiency, Container Service for Kubernetes caches images. During the deployment, if the version of the specified image is the same as that of a cached image, Container Service for Kubernetes will reuse the cached image instead of pulling the image again. Therefore, when you update the application code, if you do not change the image version for reasons such as to support the upper-layer workloads, the previously cached image will be used. When this check box is selected, Container Service for Kubernetes will always pull the image from the repository to deploy the application. This ensures that the latest image and code are used.
Set Image Pull Secret	Click Set Image Pull Secret to set the secret. The secret is required if you need to access a private repository.
Resource Limit	The upper limits of CPU and memory resources that are available to this application. This prevents the application from occupying excessive resources. The unit of CPU resources is Core. The unit of memory is MiB.
Required Resources	The amount of CPU and memory resources that are reserved for this application. These resources are exclusive to the container. This prevents the application from being unavailable if other services or processes share the resources.
Container Start Parameter	Select stdin to enable standard inputs for the container. Select tty to assign a virtual terminal that is used to send signals to the container. We recommend that you select both check boxes. This allows you to associate the terminal (tty) with the standard inputs (stdin) of the container. For example, an interactive program can be used to obtain standard inputs from users and then display the inputs on the terminal.
Init Container	When this check box is selected, the system creates an Init Container that contains useful tools. For more information, see .

ii. (Optional)Set environment variables.

You can use key-value pairs to set environment variables for pods. Environment variables are used to apply pod configurations to containers. For more information, see [Pod variable](#).

iii. (Optional)Configure health check settings.

Health check settings include liveness and readiness probes. Liveness probes determine when to restart the container. Readiness probes determine whether the container is ready to start accepting traffic. For more information about health checks, see .

The screenshot shows two sections for configuring health checks: Liveness and Readiness. Both sections have an 'Enable' checkbox checked. The 'Request type' is set to 'HTTP Request' for both. The 'Protocol' is set to 'HTTP'. The 'Path' and 'Port' fields are empty. The 'HTTP Header' section has 'name' and 'value' input fields. The 'Initial Delay (s)' is 3, 'Period (s)' is 10, and 'Timeout (s)' is 1. For the Liveness probe, 'Success' is 1 and 'Failure Threshold' is 3. For the Readiness probe, 'Success' is 1 and 'Failure Threshold' is 3.

Request type	Description
<p>HTTP request</p>	<p>Sends an HTTP GET request to the container. Supported parameters include:</p> <ul style="list-style-type: none"> ■ Protocol: HTTP or HTTPS. ■ Path: the requested path on the server. ■ Port: the port opened in the container. The port number must range from 1 to 65535. ■ HTTP Header: The custom headers in the HTTP request. Duplicate headers are allowed. Key-value pairs are supported. ■ Initial Delay (s): the <code>initialDelaySeconds</code> field, which specifies the period between when the container is started and when the system performs the first probe. Unit: seconds. Default value: 3. ■ Period (s): the <code>periodSeconds</code> field, which specifies the intervals between two adjacent probes. Unit: seconds. Default value: 10. Minimum value: 1. ■ Timeout (s): the <code>timeoutSeconds</code> field, which specifies the period after which a probe times out. Unit: seconds. Default value: 1. Minimum value: 1. ■ Healthy Threshold: the minimum number of consecutive successes that must occur for a probe to be considered successful after having failed. Default value: 1. Minimum value: 1. For liveness probes, this parameter must be set to 1. ■ Unhealthy Threshold: the minimum number of consecutive failures that must occur for a probe to be considered failed after having succeeded. Default value: 3. Minimum value: 1.

Request type	Description
TCP connection	<p>Sends a TCP socket to the container. The kubelet will attempt to open the socket on the specified port. If the connection can be established, the container is considered healthy. Otherwise, it is considered unhealthy. Supported parameters include:</p> <ul style="list-style-type: none"> ▪ Port: the port opened in the container. The port number must range from 1 to 65535. ▪ Initial Delay (s): the <code>initialDelaySeconds</code> field, which specifies the period between when the container is started and when the system performs the first probe. Unit: seconds. Default value: 15. ▪ Period (s): the <code>periodSeconds</code> field, which specifies the intervals between two adjacent probes. Unit: seconds. Default value: 10. Minimum value: 1. ▪ Timeout (s): the <code>timeoutSeconds</code> field, which specifies the period after which a probe times out. Unit: seconds. Default value: 1. Minimum value: 1. ▪ Healthy Threshold: the minimum number of consecutive successes that must occur for a probe to be considered successful after having failed. Default value: 1. Minimum value: 1. For liveness probes, this parameter must be set to 1. ▪ Unhealthy Threshold: the minimum number of consecutive failures that must occur for a probe to be considered failed after having succeeded. Default value: 3. Minimum value: 1.
Command line	<p>Runs a probe command in the container to check its health status. Supported parameters include:</p> <ul style="list-style-type: none"> ▪ Command: the probe command that is used to check the health status of the container. ▪ Initial Delay (s): the <code>initialDelaySeconds</code> field, which specifies the period between when the container is started and when the system performs the first probe. Unit: seconds. Default value: 15. ▪ Period (s): the <code>periodSeconds</code> field, which specifies the intervals between two adjacent probes. Unit: seconds. Default value: 10. Minimum value: 1. ▪ Timeout (s): the <code>timeoutSeconds</code> field, which specifies the period after which a probe times out. Unit: seconds. Default value: 1. Minimum value: 1. ▪ Healthy Threshold: the minimum number of consecutive successes that must occur for a probe to be considered successful after having failed. Default value: 1. Minimum value: 1. For liveness probes, this parameter must be set to 1. ▪ Unhealthy Threshold: the minimum number of consecutive failures that must occur for a probe to be considered failed after having succeeded. Default value: 3. Minimum value: 1.

iv. Configure lifecycle events.

You can set the following parameters to configure the lifecycle of the container in the Start, Post Start, and Pre Stop fields. For more information, visit <https://kubernetes.io/docs/tasks/configure-pod-container/attach-handler-lifecycle-event/>.

- **Start:** the pre-start command and parameter.
- **Post Start:** the post-start command.
- **Pre Stop:** the pre-stop command.

Lifecycle	Start:	Command	<code>[\"/bin/sh\", \"-c\", \"echo Hello > /user/share/message\"]</code>
		Parameter	
	Post Start:	Command	
	Pre Stop:	Command	<code>[\"/user/sbin/nginx\", \"-s\", \"quit\"]</code>

v. (Optional)Configure volumes.

Local storage and cloud storage are supported.

- **Local Storage:** supports hostPaths, ConfigMaps, secrets, and temporary directories, and mounts a mount source to the specified path in the container. For more information, see [Volumes](#).
- **Cloud Storage:** supports three types of persistent volumes (PVs): cloud disks, Network Attached Storage (NAS), and Object Storage Service (OSS).

In this example, a PV is created from a cloud disk, and the PV is mounted to the `/tmp` path in the container. Data generated in this path is stored in the cloud disk.

Volume	Volume:										
	<div style="display: flex; justify-content: space-between;"> + Add Local Volume </div> <table border="1"> <thead> <tr> <th>PV Type</th> <th>Mount Source</th> <th>Container Path</th> </tr> </thead> <tbody> <tr> <td colspan="3">+ Add Cloud Volume</td> </tr> <tr> <td>Disk</td> <td>pvc-yunpan-test</td> <td>/tmp</td> </tr> </tbody> </table>			PV Type	Mount Source	Container Path	+ Add Cloud Volume			Disk	pvc-yunpan-test
PV Type	Mount Source	Container Path									
+ Add Cloud Volume											
Disk	pvc-yunpan-test	/tmp									

vi. (Optional)Configure Log Service. You can configure collection methods and custom tags.

Note Make sure that the Log Service agent is installed in the cluster.

Log collection parameters include:

- **Logstore:** the Logstore that is used to store log data in Log Service.
- **Log Path in Container:** You can set this parameter to stdout or a log path.
 - **stdout:** collects standard outputs of the container.
 - **Log Path:** collects logs in the specified path of the container. In this example, logs in the following path are collected: `/var/log/nginx`. Wildcards are supported.

You can also set custom tags, which will be collected and output along with logs. Custom tags simplify statistical analysis of log data.

5. Set other parameters based on your needs and click **Next**.

6. Configure advanced settings, including the access control settings. You can configure the method to access pods and click **Create** to create the application. In this example, a service of the Cluster IP type and an Ingress are created to enable Internet access to the NGINX application.

Note

You can configure access control settings based on your needs:

- **Internal applications:** For applications that run inside the cluster, you can create a service of the Cluster IP or Node Port type to enable internal communication to fit your needs.
- **External applications:** For applications that need to be accessed over the Internet, you can configure access control settings by using one of the following methods:
 - Create a service of the Server Load Balancer (SLB) type and enable access to your application over the Internet by using the SLB instance.
 - Create a service of the Cluster IP or Node Port type, create an Ingress, and then enable access to your application over the Internet by using the Ingress. For more information, see .

- i. To create a service, click **Create** in the **Service** section. In the dialog box that appears, configure the service and click **Create**.

The screenshot shows a 'Create Service' dialog box with the following fields and values:

- Name:** nginx-svc
- Type:** Cluster IP
- Headless Service:**
- Backend:** (empty)
- Port Mapping:**

Service Port	Container Port	Protocol
8080	8080	TCP
- Annotations:** + Add
- Label:** + Add

Buttons: Create, Cancel

Parameter	Description
Name	Enter a name for the service. Default value: <code>applicationname-svc</code> .
Type	<p>Select one of the following types:</p> <ul style="list-style-type: none"> Cluster IP: enables access to the service through an internal IP address of the cluster. If you select this type, the service is only accessible within the cluster. Node Port: enables access to the service through the IP address and static port on each node. The NodePort field specifies the static port. A NodePort service can be used to route requests to a Cluster IP service. The system automatically creates the Cluster IP service. You can access a Node Port service from outside the cluster by requesting <code><NodeIP>:<NodePort></code>. Server Load Balancer: enables access to the service by using an SLB instance over the Internet or an internal network. The SLB instance can route requests to Node Port and Cluster IP services.
Port Mapping	Set a service port and a container port. If the Type parameter is set to Node Port, you must set a node port to avoid port conflicts. TCP and UDP protocols are supported.
Annotations	Add annotations to the service. SLB parameters are supported. For more information, see Access services by using SLB .
Label	Add labels to the service.

- ii. To create an Ingress, click **Create** in the **Ingress** section. In the dialog box that appears, configure Ingress rules and click **Create**. For more information about Ingress configuration, see [Ingress configurations](#). When you create an application from an image, you can create an Ingress for only one service. In this example, a virtual host name is used as the test domain. You must add the following entry to the hosts file to map the domain to the IP address of the Ingress. In actual scenarios, use a domain that has obtained an ICP number.

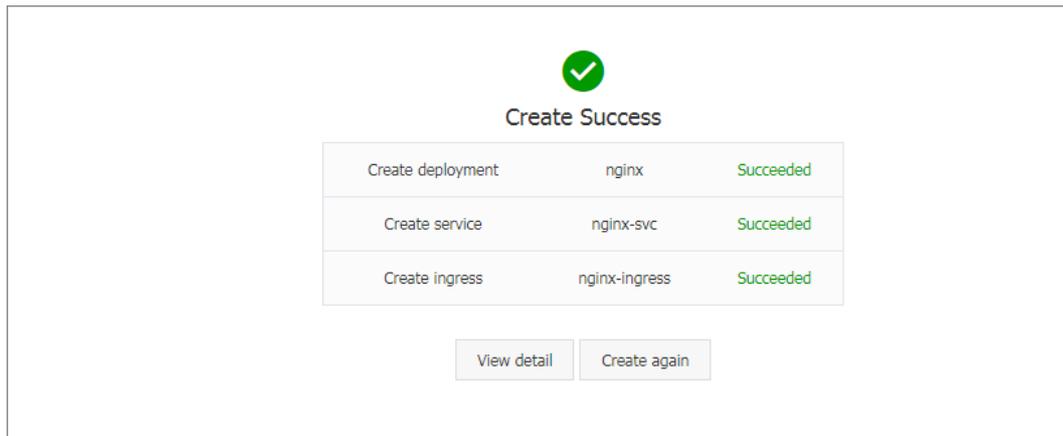

```
101.37.224.146 foo.bar.com #The IP address of the Ingress.
```

- iii. You can find the newly created service and Ingress in the **Access Control** section. You can click **Update** or **Delete** to make changes.

service port	Container Port	Protocol
8080	8080	TCP

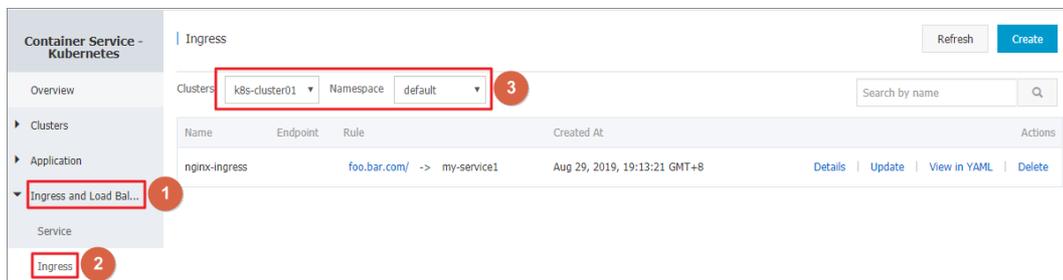

Domain	path	Name	service port
foo.bar.com		nginx-svc	8080

- 7. Click **Create**.
- 8. After the application is created, a message appears to display the resource objects included in the application. You can click **View Details** to view application details.

The nginx-deployment page is displayed by default.

- In the left-side navigation pane, choose **Ingresses and Load Balancing > Ingresses**. The following rule is displayed on the Ingresses page.

- Enter the test domain in the address bar of your browser and press the Enter key. The NGINX welcome page appears.

3.4.7.2. Create an application from an orchestration template

Container Service provides orchestration templates that you can use to create applications quickly. You can also modify the templates based on YAML syntax to customize applications.

Prerequisites

You have created a Kubernetes cluster. For more information, see [Create a Kubernetes cluster](#).

Context

The following example demonstrates how to create an NGINX application consisting of a deployment and a service. The service is associated with a pod created by the deployment.

Procedure

- Log on to the [Container Service console](#).
- In the left-side navigation pane, choose **Applications > Deployments**. The **Deployments** page appears.

3. In the upper-right corner, click **Create from Template**.
4. Set the parameters and click **Create**.
 - **Cluster:** Select the cluster where the resource objects are to be deployed.
 - **Namespace:** Select the namespace to which the resource objects belong. The default namespace is default. Except for underlying computing resources such as nodes and PVs, most resources are scoped to namespaces.
 - **Sample Template:** Container Service provides YAML templates of various resource types to help you deploy resource objects quickly. You can also create a custom template based on YAML syntax to describe the resource that you want to define.
 - **Add Deployment:** This feature allows you to quickly define a YAML template.
 - **Use Existing Template:** You can import an existing template to the configuration page.

The screenshot shows the 'Create from Template' configuration page in the Container Service console. The 'Clusters' dropdown is set to 'k8s-cluster', 'Namespace' is 'default', and 'Sample Template' is 'Custom'. The 'Template' field contains a YAML configuration for an NGINX deployment and service. A green progress bar at the bottom indicates 'The creation process has started. Click here to check the progress: Kubernetes Dashboard'. The 'Create' button is highlighted with a red circle and the number '1', and the 'Kubernetes Dashboard' link in the progress bar is highlighted with a red circle and the number '2'.

```

1  apiVersion: apps/v1beta2 # for versions before 1.8.0 use apps/v1beta1
2  kind: Deployment
3  metadata:
4    name: nginx-deployment
5    labels:
6      app: nginx
7  spec:
8    replicas: 2
9    selector:
10   matchLabels:
11     app: nginx
12   template:
13     metadata:
14       labels:
15         app: nginx
16     spec:
17       containers:
18         - name: nginx
19           image: nginx:1.7.9 # replace it with your exactly <image_name>:tags
20           ports:
21             - containerPort: 80
22   ---
23
24
25  apiVersion: v1 # for versions before 1.8.0 use apps/v1beta1
26  kind: Service
27  metadata:
28    name: my-service1 #T000: to specify your service name
29    labels:
30      app: nginx
31  spec:
32    selector:
33      app: nginx #T000: change label selector to match your backend pod
34    ports:
35      - protocol: TCP
36        name: http

```

Based on an orchestration template provided by Container Service, the following sample template creates a deployment of an NGINX application.

Note Container Service supports YAML syntax. You can use the `---` symbol to separate multiple resource objects. This enables you to create multiple resource objects in a single template.

```
apiVersion: apps/v1beta2 # for versions before 1.8.0 use apps/v1beta1
kind: Deployment
metadata:
  name: nginx-deployment
  labels:
    app: nginx
spec:
  replicas: 2
  selector:
    matchLabels:
      app: nginx
  template:
    metadata:
      labels:
        app: nginx
    spec:
      containers:
      - name: nginx
        image: nginx:1.7.9 # replace it with your exactly <image_name:tags>
        ports:
        - containerPort: 80

---

apiVersion: v1 # for versions before 1.8.0 use apps/v1beta1
kind: Service
metadata:
  name: my-service1 #TODO: to specify your service name
  labels:
    app: nginx
spec:
  selector:
    app: nginx #TODO: change label selector to match your backend pod
  ports:
  - protocol: TCP
    name: http
    port: 30080 #TODO: choose an unique port on each node to avoid port conflict
    targetPort: 80
  type: LoadBalancer ## This example changes the service type from NodePort to LoadBalancer.
```

5. Click **Create**. A message appears indicating the deployment status.

In the left-side navigation pane, choose **Ingresses and Load Balancing > Services** to view the newly created service.

6. On **Kubernetes Dashboard**, verify that a `my-service1` service is running and its external endpoint is displayed. Click the address in the **External Endpoint** column.

Name	Type	Created At	ClustersIP	InternalEndpoint	ExternalEndpoint	Actions
my-service1	LoadBalancer	Aug 29, 2019, 14:59:39 GMT+8	[Redacted]	my-service1:30080 TCP my-service1:30134 TCP	[Redacted]:30080	Details Update View in YAML Delete

7. You can visit the NGINX welcome page in the browser.

What's next

You can also choose **Ingresses and Load Balancing > Services** in the left-side navigation pane to view the NGINX service.

3.4.7.3. Create an application through Kubernetes Dashboard

You can create an application through Kubernetes Dashboard.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, choose **Clusters > Clusters**. The Clusters page appears.
3. Find the target cluster and click **Dashboard** in the Actions column to go to Kubernetes Dashboard.

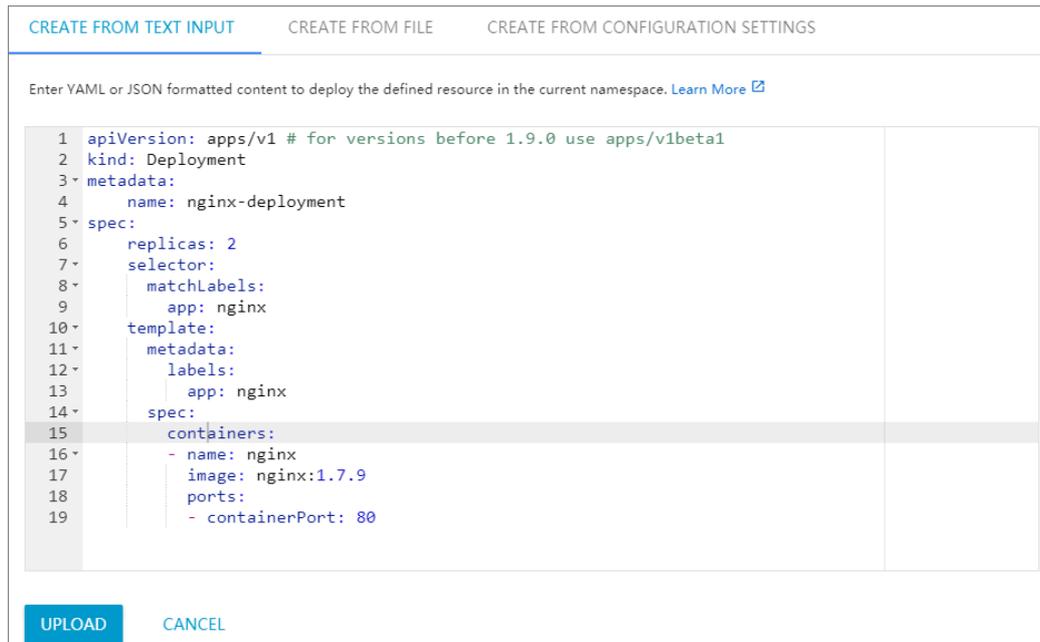

Cluster Name/ID	Type	Region (All)	Network Type	Cluster Status	Nodes	Created At	Version	Actions
k8s-cluster	Kubernetes	cn-qingdao-16e-d02	VPC VDC-	Running	6	Aug 29, 2019, 14:02:00 GMT+8	1.12.6-aliyun.1	Manage View Logs Dashboard Scale Cluster More

4. On the Overview page, click **CREATE** in the upper-right corner.

5. In the dialog box that appears, configure the application.

You can use one of the following methods to create the application.

- **CREATE FROM TEXT INPUT:** Directly enter an orchestration template in YAML or JSON format to create the application. A sample template in YAML format is provided as follows:

- **CREATE FROM FILE:** Import a YAML or JSON configuration file to create the application.
- **CREATE AN APP:** Set parameters to create the application.

Application parameters

Parameter	Description
App name	The name of the application. In this example, enter <code>nginx</code> .
Container image	The URL of the image. In this example, a Docker NGINX image is used.
Number of pods	The number of pods that constitute the application.
Service	Valid values: External and Internal . External: Create a service that is accessible from outside the cluster. Internal: Create a service that is accessible within the cluster.
Advanced options	Click SHOW ADVANCED OPTIONS to set labels and environment variables. The following setting distributes traffic to three pods based on load balancing.

CREATE FROM TEXT INPUT
 CREATE FROM FILE
 CREATE FROM CONFIGURATION SETTINGS

App Name *
nginx-test 10 / 24

Container Image *
nginx

Number of Pods *
3

Service *
External

Port *	Target Port *	Protocol *
80	9080	TCP
Port	Target Port	Protocol

An "app" label with the specified value will be added to the Deployment and service. [Learn More](#)

Enter the URL of a public image on any registry, or a private image hosted on a Docker Hub and Google Container Registry. [Learn More](#)

A Deployment will be created to maintain the pods across your cluster. [Learn More](#)

An internal or external service port is specified to map the container listening port. Internal DNS name for the specified service: nginx-test. [Learn More](#)

[SHOW ADVANCED](#)

DEPLOY
 CANCEL

6. Click **DEPLOY** to deploy the pods and service.

You can also click **SHOW ADVANCED OPTIONS** to configure other parameters.

What's next

After you click **DEPLOY**, you can click the left-side navigation pane to view the service or pods that constitute the application.

In the left-side navigation pane, click **Pods**. The icon on the left side of each pod indicates the status of the pod. 🔄 indicates that the pod is being deployed. ✅ indicates that the pod has been successfully deployed. ❗ indicates that an error occurred while deploying the pod.

Name	Node	Status	Restarts	Age	CPU (cores)	Memory (bytes)
✅ hello-pod	cn-hangzhou.i- b3d4em483agpml3gpm1	Running	0	2018-04-27 17:04:18	0	1.445 Mi
✅ test-mariadb-9bb8f87dd-fjm2m	cn-hangzhou.i- b3d4em483agpml3gpm1	Running	0	2018-04-25 20:50:20	0.002	217.426 Mi
✅ test-wordpress-5b74dcf48c-r8j9h	cn-hangzhou.i- b3d4em483agpml3gpm1	Running	0	2018-04-25 20:50:20	0.005	183.367 Mi
✅ nginx-deployment-basic-6c54bd5869-wq2l5	cn-hangzhou.i- b3d4em483agpml3gpm1	Running	0	2018-04-25 12:11:48	0	1.344 Mi
✅ nginx-deployment-basic-6c54bd5869-krp7	cn-hangzhou.i- b3d4em483agpml3gpm1	Running	0	2018-04-24 18:46:03	0	1.395 Mi

3.4.7.4. Use commands to manage applications

You can use commands to create applications or view application containers.

Prerequisites

Before you use commands on your local host, you have connected to a Kubernetes cluster through kubectl. For more information, see [Connect to a Kubernetes cluster through kubectl](#).

Run a command to create an application

You can use the following command to run a simple container (an NGINX Web server in this example):

```
# kubectl run -it nginx --image=registry.aliyuncs.com/spacexnice/netdia:latest
```

This command creates a service portal for this container. After you specify `--type=LoadBalancer`, an SLB route to the NGINX container is created.

```
# kubectl expose deployment nginx --port=80 --target-port=80 --type=LoadBalancer
```

Run a command to view container information

Run the following command to list all running containers in the default namespace:

```
root@master # kubectl get pods
NAME                READY   STATUS    RESTARTS   AGE
nginx-2721357637-dvwq3    1/1     Running   1          9h
```

3.4.7.5. Create a service

You can create a service for your application through the Container Service console. The service provides access to the application.

A Kubernetes service, generally known as microservice, is an abstraction which defines a logical set of pods and a policy by which to access the pods. A label selector usually determines whether the set of pods can be accessed by the service.

Each pod has its own IP address. Pods are created and deleted dynamically and quickly. Using pods to provide services externally is therefore not a highly available solution. The service abstraction enables the decoupling between the frontend and the backend. The frontend does not need to be aware of how the backend is implemented, which leads to a loosely coupled microservices based architecture.

For more information, see [Kubernetes service](#).

Prerequisites

You have created a Kubernetes cluster. For more information, see [Create a Kubernetes cluster](#).

Step 1: Create a deployment

1. [Log on to the Container Service console](#).
2. In the left-side navigation pane, choose **Applications > Deployments**. In the upper-right corner, click **Create from Template**.
3. Select the target cluster and namespace. Set the **Sample Template** field to **Custom** and enter the following code in the **Template** field. Then click **Create**.

Clusters: k8s-cluster

Namespace: default

Sample Template: Resource - basic Deployment

```

1  apiVersion: apps/v1beta2 # for versions before 1.8.0 use apps/v1beta1
2  kind: Deployment
3  metadata:
4    name: nginx-deployment-basic
5    labels:
6      app: nginx
7  spec:
8    replicas: 2
9    selector:
10   matchLabels:
11     app: nginx
12   template:
13     metadata:
14       labels:
15         app: nginx
16     spec:
17       containers:
18         - name: nginx
19           image: nginx:1.7.9 # replace it with your exactly
20           <image_name:tags>
21           ports:
22             - containerPort: 80
    
```

Add Deployment

Deploy with Existing Template

The creation process has started. Click here to check the progress: [Kubernetes Dashboard](#)

Save Template Create

In this example, the template of an NGINX deployment is used.

```

apiVersion: apps/v1beta2 # for versions before 1.8.0 use apps/v1beta1
kind: Deployment
metadata:
  name: nginx-deployment-basic
  labels:
    app: nginx
spec:
  replicas: 2
  selector:
    matchLabels:
      app: nginx
  template:
    metadata:
      labels:
        app: nginx
    spec:
      containers:
        - name: nginx
          image: nginx:1.7.9 # replace it with your exactly <image_name:tags>
          ports:
            - containerPort: 80 ##expose this port in the service
    
```

4. Click **Kubernetes Dashboard** to view the status of the deployment.

Step 2: Create a service

1. Log on to the Container Service console.
2. In the left-side navigation pane, choose Ingresses and Load Balancing > Services. The Services page appears.
3. Select the target cluster and namespace. Then click Create in the upper-right corner.
4. In the Create Service dialog box that appears, set the following parameters.

The screenshot shows the 'Create Service' dialog box with the following configuration:

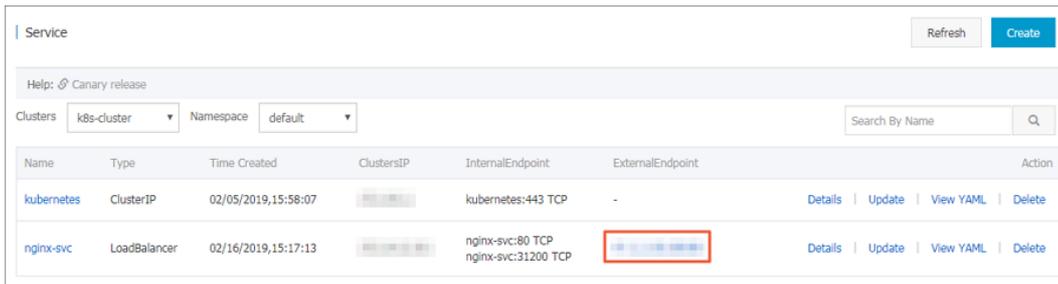

- Name:** nginx-svc
- Type:** Server Load Balancer (dropdown), Public Access (dropdown)
- Backend:** nginx-deployment (dropdown)
- Port Mapping:**
 - + Add
 - Table with columns: Service Port, Container Port, Protocol
 - Row 1: 8080, 8080, TCP (dropdown), -
- Annotations:**
 - + Add SLB Parameters
 - Table with columns: Name, Value
 - Row 1: service.beta.kubernetes.io, 20, -
- Label:**
 - + Add
 - Table with columns: Name, Value
 - Row 1: app, nginx, -

Buttons: Create (blue), Cancel (grey)

- **Name:** The name of the service. In this example, enter nginx-svc.
- **Type:** The type of the service, namely, how to expose the service.
 - **Cluster IP:** Exposes the service through an internal IP address in the cluster. When this option is selected, the service is only accessible within the cluster. This is the default service type.
 - **Node Port:** Exposes the service through the IP address and static port (NodePort) of each node. A NodePort service can route requests to a Cluster IP service, which is automatically created by the system. You can access a Node Port service from outside the cluster by requesting `<NodeIP>:<NodePort>`.
 - **Server Load Balancer:** Exposes the service through an SLB instance, which supports Internet access or internal access. An SLB service can route requests to Node Port and Cluster IP services.
- **Backend:** The backend object that you want to associate with the service. In this example, select nginx-deployment-basic created from the previous step. If you do not specify a deployment, no Endpoint object will be created. You can manually bind the service to an Endpoint object. For more information, see

services-without-selectors.

- **Port Mapping:** Set the service port and container port. The container port must be the same as the one exposed by the backend pod.
 - **Annotations:** Add one or more annotations to the service to configure SLB parameters. For example, set the name to `service.beta.kubernetes.io` and value to `20`. This means that the maximum bandwidth of the service is 20 Mbit/s. For more information, see [Access services by using SLB](#).
 - **Label:** Add labels to the service.
5. Click **Create**. Service `nginx-svc` is displayed on the Services page.
 6. You can view basic information about the service. You can also access its external endpoint through a browser.

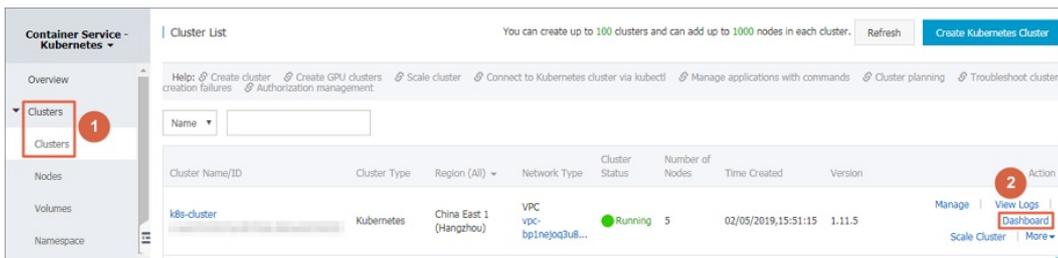

You have created a service and associated it with a backend deployment. You can now visit the NGINX welcome page.

3.4.7.6. Scale a service

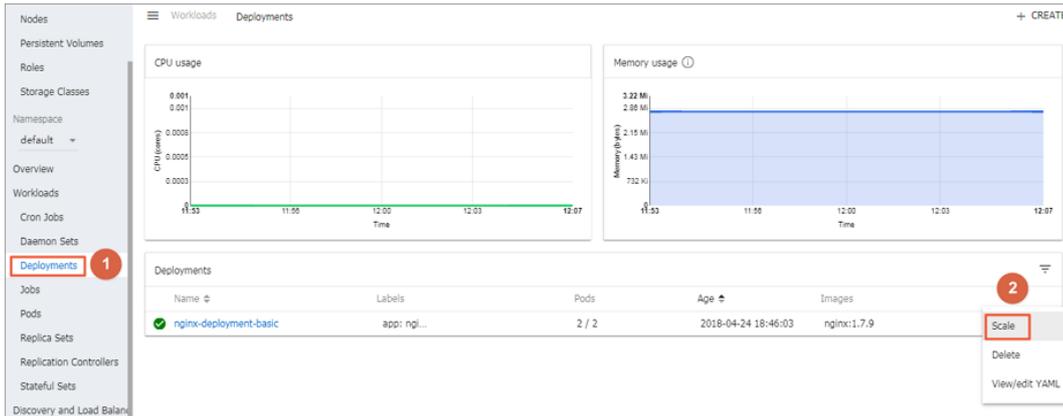

After an application is created, you can scale in or scale out the service based on your needs.

Procedure

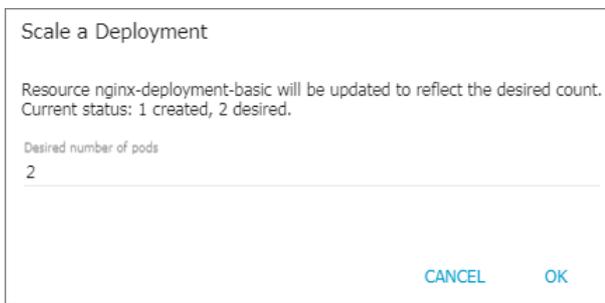

1. [Log on to the Container Service console](#).
2. In the left-side navigation pane, choose **Clusters > Clusters**. The Clusters page appears.
3. Find the target cluster and click **Dashboard** in the Actions column to go to Kubernetes Dashboard.

4. In the left-side navigation pane, click **Deployments**.
5. Find the target application, click the **More** icon on the right, and choose **Scale**.

6. In the dialog box that appears, change the **Desired number of pods** to 2. Then, click **OK**. This action adds a new pod and increases the number of replicas to two.

What's next

The icon on the left side of each Kubernetes object indicates the status of the object.  indicates that the object is being deployed.  indicates that the object has been successfully deployed.

After a deployment is complete, you can click the deployment name to view details of the running web services. You can view the replica sets included in the deployment, and the CPU and memory usage of these replica sets. You can also click  to view container logs.

 **Note** If no resources are displayed, wait a few minutes and then refresh the page.

3.4.7.7. View a service

You can view details about a service through the Container Service console.

Context

If an external service is configured when you create an application, Kubernetes Dashboard creates the external service and preconfigures the SLB instance to direct traffic to containers in the cluster.

Procedure

1. **Log on to the Container Service for Kubernetes console.**
2. In the left-side navigation pane, choose **Ingresses and Load Balancing > Services**. The Services page appears.
3. Select the target cluster and namespace. Find the target service and click **Details** in the Actions column.
4. (Optional) You can also go to Kubernetes Dashboard. In the left-side navigation pane, click **Services** to view all services.

3.4.7.8. Update a service

You can update a service through the Container Service console.

Update a service through the Services page

1. [Log on to the Container Service for Kubernetes console.](#)
2. In the left-side navigation pane, choose **Ingresses and Load Balancing > Services**. The Services page appears.
3. Select the target cluster and namespace. Find the target service and click **Update** in the Actions column. In this example, the target service is `nginx-svc`.
4. In the dialog box that appears, modify the configurations based on your needs and click **Update**.

Update Service
✕

Name:

Type: Server Load Balancer Public Access

Port Mapping: + Add

Service Port	Container Port	Protocol	
<input type="text" value="8080"/>	<input type="text" value="8080"/>	TCP	-

Annotations: + Add SLB Parameters

Name	Value	
<input type="text" value="service.beta.kubernetes."/>	<input type="text" value="20"/>	-

Label: + Add

Name	Value	
<input type="text" value="app"/>	<input style="border: 2px solid green;" type="text" value="nginx-v2"/>	-

Update
Cancel

5. Find the service on the Services page and click **Details** in the Actions column to view configuration changes. In this example, the label of the service is updated.

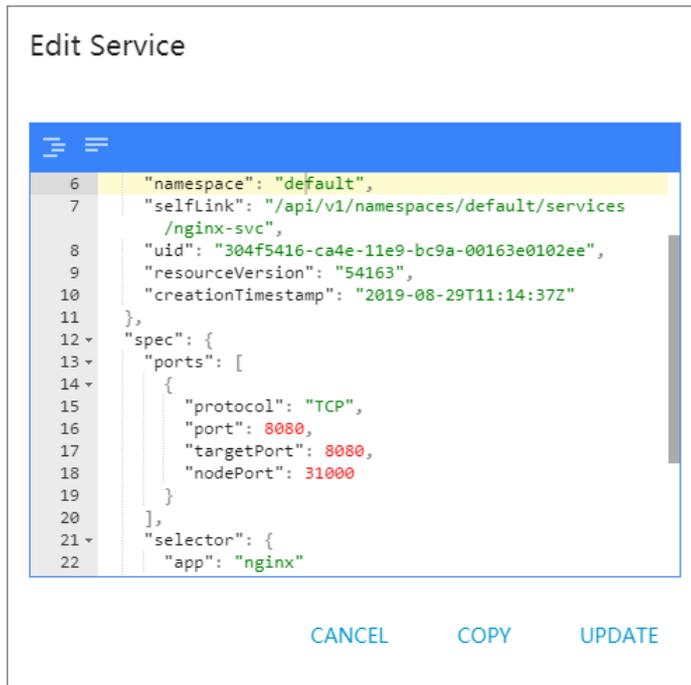

Basic Information	
Name:	nginx-svc
Namespace:	default
Created At:	Aug 29, 2019, 19:44:49 GMT+8
Labels:	app:nginx-v2
Annotations:	service.beta.kubernetes.io:20
Type:	LoadBalancer
ClusterIP:	[Redacted]
InternalEndpoint:	nginx-svc:8080 TCP nginx-svc:31933 TCP
ExternalEndpoint:	[Redacted]:80

Update a service through Kubernetes Dashboard

1. Log on to the Container Service for Kubernetes console.
2. In the left-side navigation pane, choose Clusters. The Clusters page appears.
3. Find the target cluster and click Dashboard in the Actions column.
4. On Kubernetes Dashboard, select the target namespace and click Services in the left-side navigation pane.
5. Find the target service, click the More icon on the right, and choose View/edit YAML.

Name	Labels	Cluster IP	Internal endpoints	External endpoints	Age	Actions
nginx-test	k8s-app: nginx-test	[Redacted]	nginx-test:80 TCP nginx-test:30287 TCF	-	08/29/2019, 19:34:27	⋮
nginx-svc	-	[Redacted]	nginx-svc:8080 TCP	[Redacted]	08/29/2019, 19:14:37	Delete
my-service1	app: nginx	[Redacted]	my-service1:30080 T my-service1:32750 T	[Redacted]	08/29/2019, 15:05:19	View/Edit YAML
kubernetes	component: apiser. provider: kubernetc.	[Redacted]	kubernetes:443 TCP	-	08/29/2019, 13:29:29	⋮

6. In the dialog box that appears, modify the configurations. For example, change nodePort to 31000 . Then click UPDATE.

3.4.7.9. Delete a service

Prerequisites

- You have created a Kubernetes cluster. For more information, see [Create a Kubernetes cluster](#).
- You have created a service. For more information, see [Create Services](#).

Procedure

1. [Log on to the Container Service for Kubernetes console](#).
2. In the left-side navigation pane, choose **Ingresses and Load Balancing > Services**. The Services page appears.
3. Select the target cluster and namespace. Find the target service and click **Delete** in the Actions column. In this example, the target service is nginx-svc.
4. In the dialog box that appears, click **Confirm**. The target service is deleted and disappears from the Services page.

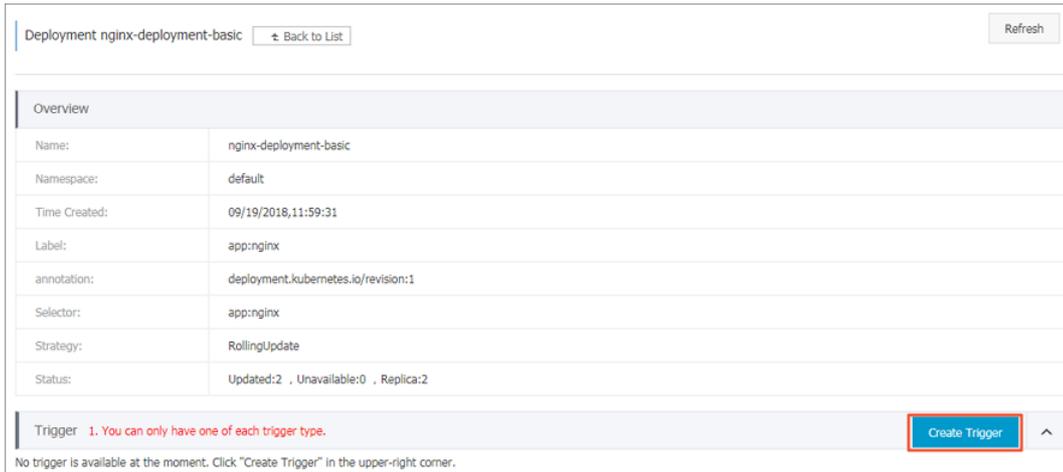

3.4.7.10. Create a trigger on an application

Prerequisites

- You have created a Kubernetes cluster. For more information, see [Create a Kubernetes cluster](#).
- You have created an application based on which the trigger is created and tested. In this example, an NGINX application is created.

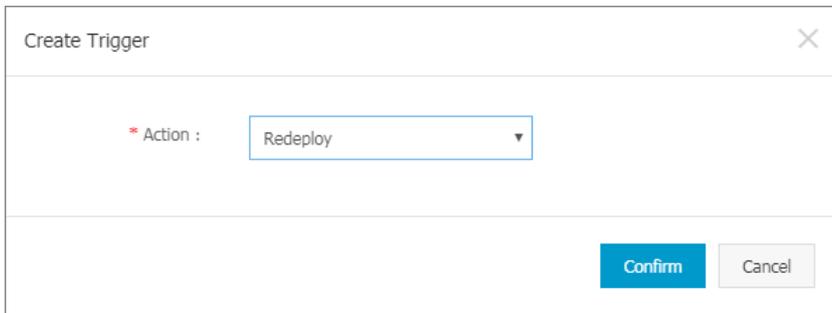

Procedure

1. [Log on to the Container Service console](#).
2. In the left-side navigation pane, choose **Applications > Deployments**. On the Deployments page that appears, select the target cluster and namespace. Then find the NGINX application and click **Details** in the Actions column.
3. On the application details page that appears, click **Create Trigger** in the Trigger section.

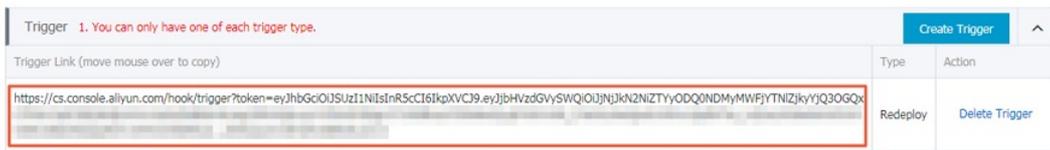

4. In the dialog box that appears, set Action to Redeploy and click OK.

Note Currently, you can only create a trigger to redeploy the application.

After the trigger is created, a trigger link address is displayed in the Trigger section on the Deployment nginx page.

5. Copy the link and open it in your browser. A message appears, displaying information such as the request ID.

6. Go to the Deployment nginx page. A new pod is displayed on the Pods tab.

After the new pod is successfully deployed, the old pod will be automatically deleted.

What's next

You can call triggers through GET or POST requests from a third-party system. For example, you can run curl commands to call triggers.

To call the redeploy trigger, run the following command:

```
curl https://cs.console.aliyun.com/hook/trigger?token=xxxxxxx
```

3.4.7.11. View pods

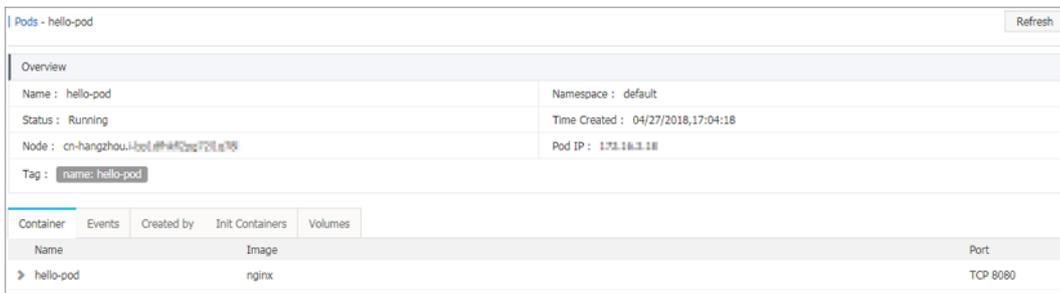

You can view pods through the console.

View pods on the Pods page

1. Log on to the Container Service console.
2. In the left-side navigation pane, choose Applications > Pods. The Pods page appears.
3. Select the target cluster and namespace. Find the target pod and click View Details.

Note You can update or delete pods on the Pods page. We recommend that you use deployments to manage pods if they were created by deployments.

4. On the pod details page, you can view detailed information about the pod.

View pods through Kubernetes Dashboard

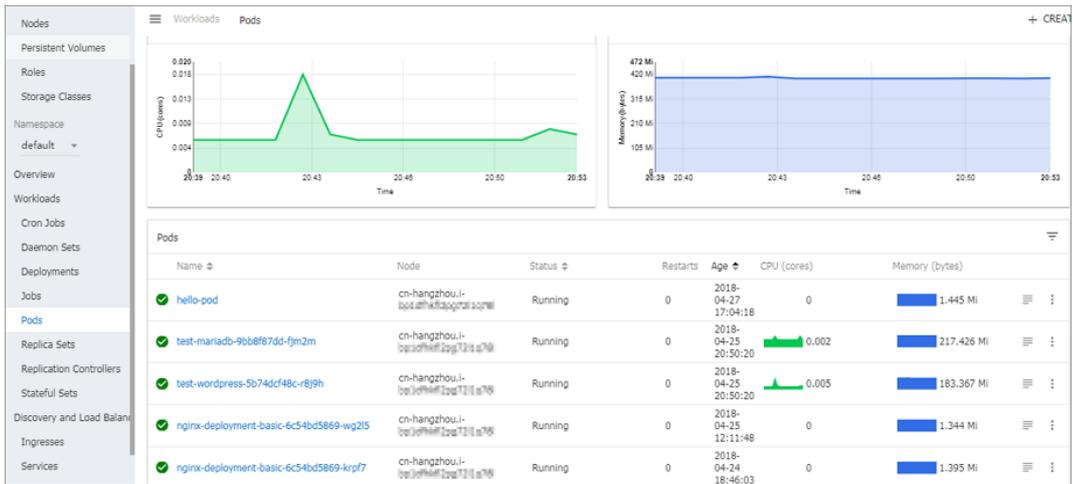

1. Log on to the Container Service console.
2. In the left-side navigation pane, choose Clusters > Clusters. The Clusters page appears.
3. Find the target cluster and click Dashboard in the Actions column. The Kubernetes Dashboard page appears.
4. In the left-side navigation pane, click Pods to view pods of the cluster.

You can also click Services in the left-side navigation pane and then click a service name to view pods of the service.

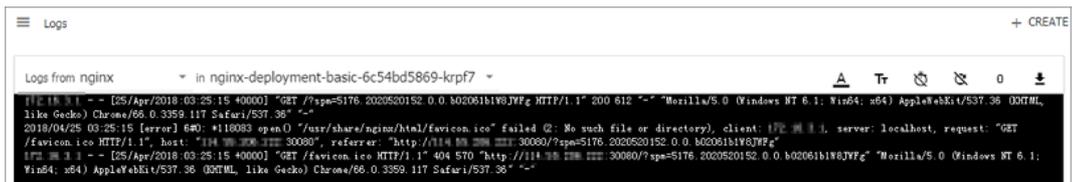

5. The icon at the left side of each pod indicates the status of the pod. 🔄 indicates that the pod is being

deployed.  indicates that the pod has been successfully deployed.

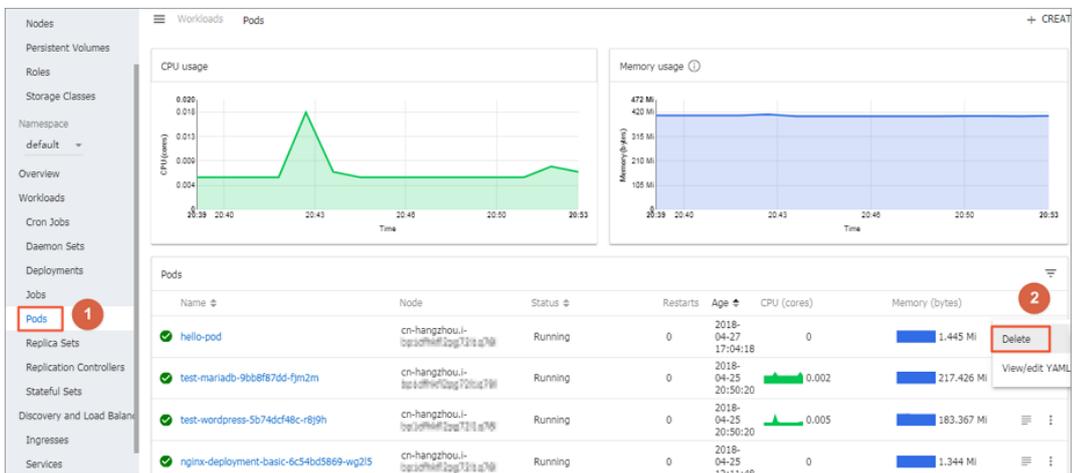

6. Select a pod and click its name to view pod details, including the CPU and memory usage.

7. Select a pod and click  at the right to view logs.

8. You can also click the More icon and click Delete to delete the pod.

3.4.7.12. Schedule pods to nodes

You can add labels to nodes and then configure `nodeSelector` to schedule pods to specific nodes. For more information about how `nodeSelector` works, see [nodeSelector](#).

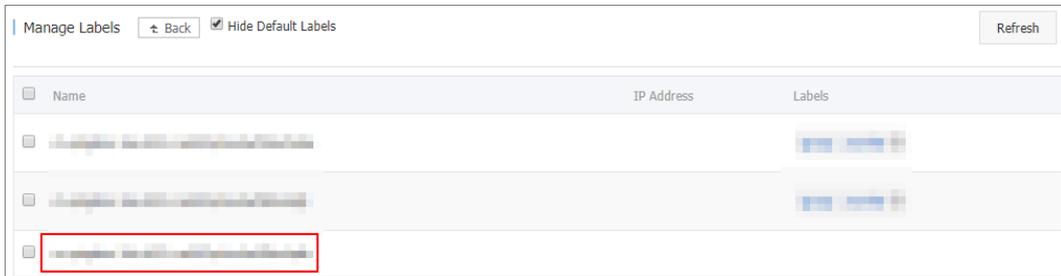

To meet business needs, you may need to deploy a management service on a master node, or deploy certain services on nodes with SSD storage. You can use the following method to schedule pods to specific nodes based on needs.

Prerequisites

You have created a Kubernetes cluster. For more information, see [Create a Kubernetes cluster](#).

Step 1: Add a label to a node

1. [Log on to the Container Service console](#).
2. In the left-side navigation pane, choose **Clusters > Nodes**. The Nodes page appears.
3. Select the target cluster and click **Manage Labels** in the upper-right corner.
4. Select one or more nodes and then click **Add Label**. In this example, select a worker node.

5. In the dialog box that appears, enter the label name and value, and then click **OK**.

On the Manage Labels page, you can find the `group:worker` label next to the selected node.

You can also use the following command to add a label to a node: `kubectl label nodes <node-name> <label-key>=<label-value> .`

Step 2: Schedule a pod to the node

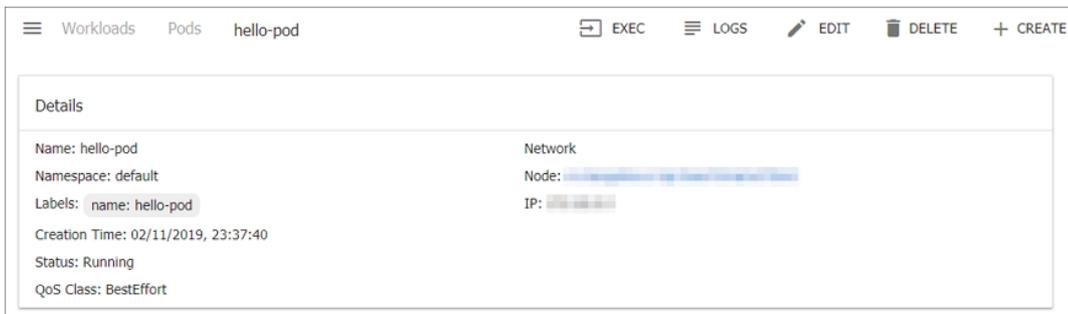

1. [Log on to the Container Service console](#).
2. In the left-side navigation pane, choose **Applications > Deployments**. The Deployments page appears.
3. In the upper-right corner, click **Create from Template**.
4. Configure the template to create a pod and schedule it to the node from step 1. Then, click **Create**.
 - **Cluster:** Select the cluster where the pod is deployed.
 - **Namespace:** Select the namespace where the pod belongs. In this example, select the default namespace.
 - **Sample Template:** In this example, select Custom.

Enter the following template content:

```

apiVersion: v1
kind: Pod
metadata:
  labels:
    name: hello-pod
  name: hello-pod
spec:
  containers:
  - image: nginx
    imagePullPolicy: IfNotPresent
    name: hello-pod
    ports:
    - containerPort: 8080
      protocol: TCP
  resources: {}
  securityContext:
    capabilities: {}
    privileged: false
    terminationMessagePath: /dev/termination-log
  dnsPolicy: ClusterFirst
  restartPolicy: Always
  nodeSelector:
    group: worker ##This value must be the same as the label of the node from step 1.
  status: {}
    
```

5. Click **Create**. A message appears indicating the deployment status. After the pod is created, click **Kubernetes Dashboard** to check the status of hello-pod.

3.4.7.13. Simplify Kubernetes application deployment by using Helm

This topic introduces the basic concepts and components of Helm and describes how to use Helm to deploy the sample applications WordPress and Spark in a Container Service for Kubernetes cluster.

Prerequisites

- A Kubernetes cluster is created in the Container Service for Kubernetes console. For more information, see [Create a Kubernetes cluster](#).

Tiller is automatically deployed to the cluster when the Kubernetes cluster is created. The Helm command-line interface (CLI) is automatically installed on each master node. You must configure the Helm CLI to point to the Alibaba Cloud chart repository.

- The supported Kubernetes version is used.

Only Kubernetes 1.8.4 and later versions are supported. For Kubernetes 1.8.1, you can upgrade the cluster to the required version. To upgrade the cluster, log on to the Container Service for Kubernetes console, go to the Clusters page, find the cluster, and then choose **More > Upgrade Cluster** in the Actions column for the cluster.

Context

When you run and manage applications with Kubernetes, you can use Helm as the package manager to simplify application distribution and deployment. The Helm project enables consistent software packaging and supports version control. In the Container Service for Kubernetes console, the App Catalog feature integrates the Helm binaries and supports the Alibaba Cloud chart repository. This allows you to easily deploy applications by using the Helm CLI or in the Container Service for Kubernetes console.

Overview

Helm is an open source tool that is created by Deis. It can be used to simplify the deployment and management of Kubernetes applications.

Helm works as a Kubernetes package manager and allows you to discover, share, and run applications that are created in Kubernetes. When you use Helm, you must understand the following basic concepts:

- **Chart:** a packaging format used by Helm. Each chart contains the images, dependencies, and resource definitions that are required for running an application. A chart may contain service definitions in a Kubernetes cluster. You can use a chart in a similar way as you use a Homebrew formula, the dpkg packages manager of the Advanced Package Tool (APT) package management system, or the Red Hat Package Manager (RPM) package for Yellowdog Updater, Modified (YUM).
- **Release:** an instance of a chart that runs in a Kubernetes cluster. A chart can be installed many times into the same cluster. After a chart is installed, a new release is created. For example, you can install a MySQL chart. If you want to run two databases in your cluster, you can install the MySQL chart twice. Each installation generates a release with a release name.
- **Repository:** the location where charts are stored and released.

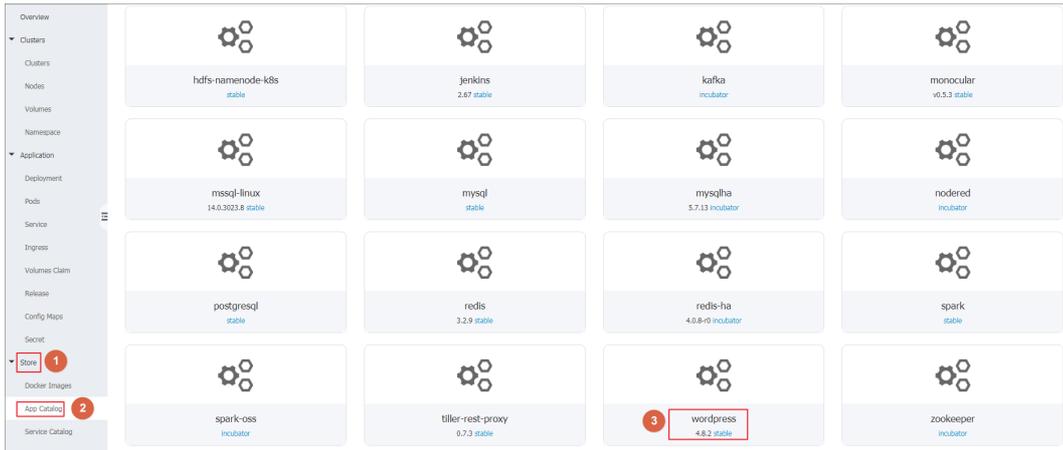

Helm components

Helm works in a client-server architecture and consists of the following components:

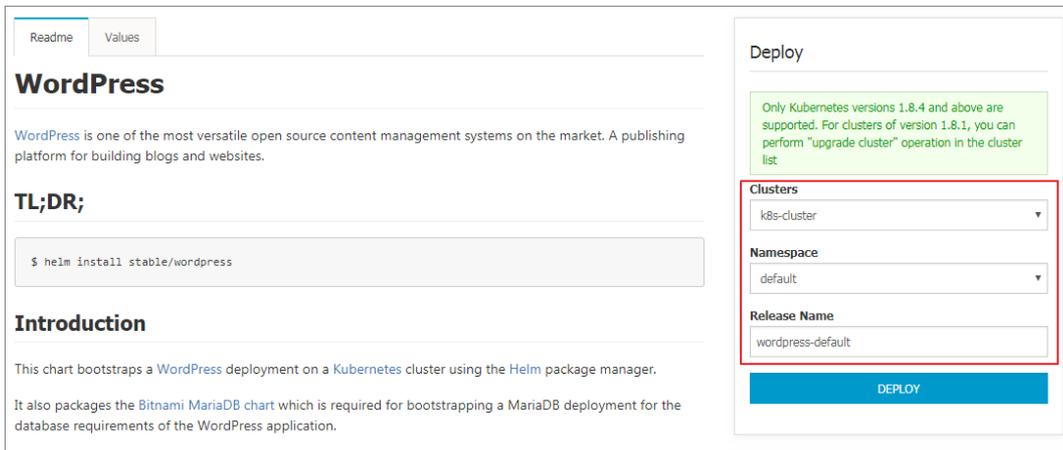

- The Helm CLI is the Helm client that runs on your on-premises computer or on the master nodes of a Kubernetes cluster.
- Tiller is the server-side component and runs on a Kubernetes cluster. Tiller manages the lifecycles of Kubernetes applications.
- A repository is used to store charts. The Helm client can access the index file and packaged charts in a chart repository over HTTP.

Deploy an application in the Container Service for Kubernetes console

1. [Log on to the Container Service console](#)
2. In the left-side navigation pane, choose **Marketplace > App Catalog** to go to the App Catalog page.
3. Click a chart, for example, **WordPress**, to go to the page that shows the details of the chart.

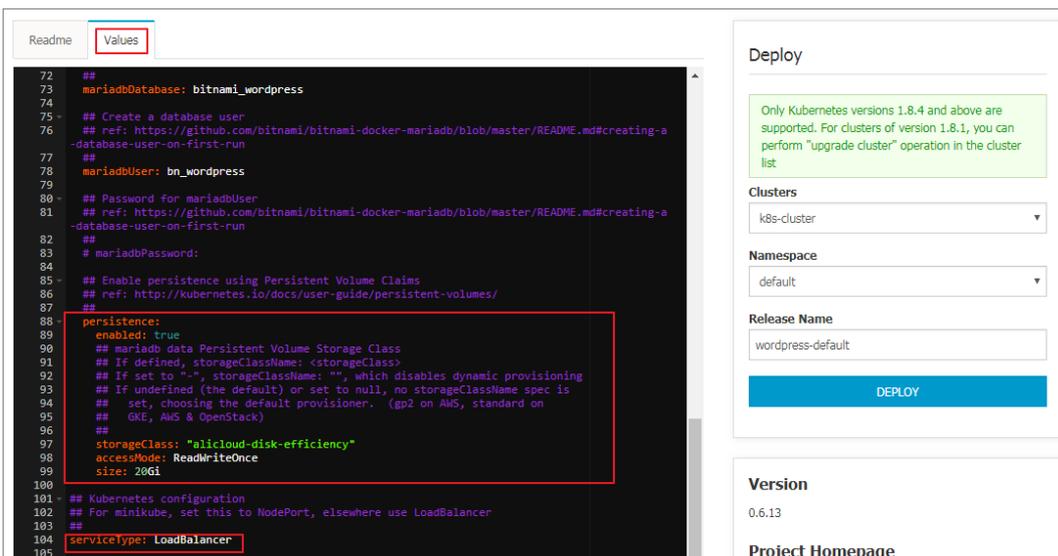

4. In the Deploy section on the right of the page, enter the basic information for the deployment.
 - **Cluster:** Select the cluster to which you want to deploy the application.
 - **Namespace:** Select a namespace for the application. By default, this parameter is set to default.
 - **Release Name:** Enter a release name for the application.

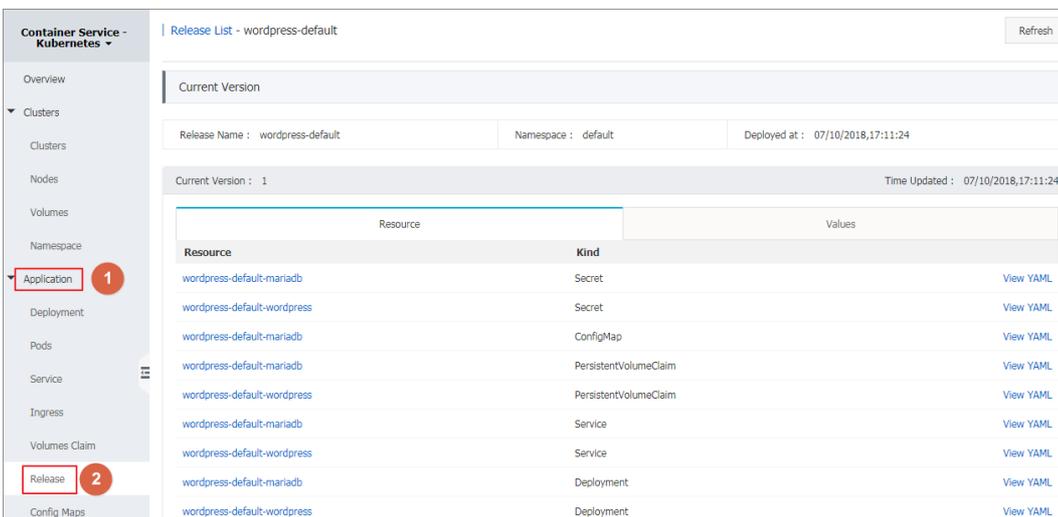

5. Click the **Parameters** tab to set the parameters. In this example, a dynamically provisioned volume is associated with a persistent volume claim (PVC). For more information, see [Use Apsara Stack disks](#).

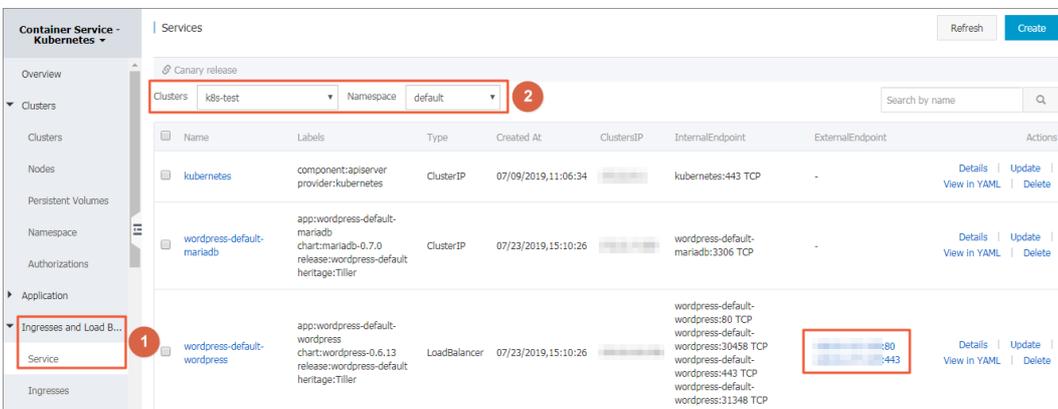

Note Before the association, you must create a persistent volume (PV) as the dynamic volume. The capacity of the PV cannot be less than the value defined by the PVC.

6. After you set the parameters, click Create to deploy the application. After the application is deployed, you are navigated to the release page of the application.

7. In the left-side navigation pane, choose Ingresses and Load Balancing > Services, select the target cluster and namespace, and then find the required service from the list of services. In the External Endpoint column for the service, you can see the external HTTP and HTTPS endpoints.

8. Click either of the endpoints to go to the WordPress application where you can publish blog posts.

Deploy an application by using the Helm CLI

After the Helm CLI is automatically installed on the master node of the Kubernetes cluster and points to the required repository, you can log on to the master node by using SSH. This allows you to deploy applications by using the Helm CLI. For more information, see [Connect to a master node through SSH](#). You can also install and configure the Helm CLI and kubectl on your on-premises computer.

In this example, on your on-premises computer, the Helm CLI and kubectl are installed and configured and the WordPress and Spark applications are deployed.

1. Install and configure the Helm CLI and kubectl.

- i. Install and configure kubectl on your on-premises computer. For more information, see [Connect to a Kubernetes cluster through kubectl](#).

To view the information of the target Kubernetes cluster, on the command line, enter `kubectl cluster-info`.

- ii. Install Helm on your on-premises computer. For more information, see [Install Helm](#).

2. Deploy the WordPress application.

To deploy a WordPress blog website by using Helm, perform the following steps:

- i. On the command line, run the following command:

```
helm install --name wordpress-test stable/wordpress
```

 **Note** Container Service for Kubernetes allows you to use block storage or disks as dynamically provisioned volumes. Before you deploy the WordPress application, you must create dynamically provisioned volumes based on disks.

The following example shows the output:

```
NAME: wordpress-test
LAST DEPLOYED: Mon Nov 20 19:01:55 2017
NAMESPACE: default
STATUS: DEPLOYED
...
```

- ii. On the command line, run the following commands to view the release and service of WordPress.

```
helm list
kubectl get svc
```

- iii. On the command line, run the following command to view the pod that is associated with the WordPress application. The pod may take a few minutes to change to the running state.

```
kubectl get pod
```

- iv. On the command line, run the following command to obtain the endpoint of the WordPress application.

```
echo http://$(kubectl get svc wordpress-test-wordpress -o jsonpath='{.status.loadBalancer.ingress[0].ip}')
```

You can enter the preceding endpoint in your browser to access the WordPress application.

You can also follow the chart instructions described in the console and run the following commands to obtain the administrator account and password of the WordPress application:

```
echo Username: user
echo Password: $(kubectl get secret --namespace default wordpress-test-wordpress -o jsonpath="{.data.wordpress-password}" | base64 --decode)
```

- v. On the command line, run the following command to delete the WordPress application:

```
helm delete --purge wordpress-test
```

Use a third-party chart repository

You can use the default Alibaba Cloud chart repository. You can also use a third-party chart repository if the third-party chart repository is accessible. On the command line, run the following command to add a third-party chart repository:

```
helm repo add Repository name Repository URL
helm repo update
```

For more information about Helm commands, see [Helm documentation](#).

References

The Kubernetes community has experienced rapid technological developments based on Helm. These developments have allowed software providers, such as Bitnami, to offer high-quality charts. For more information about available charts, visit <https://kubernetes.io/docs/concepts/cluster-administration/manage-deployments/#charts>.

3.4.8. SLB and Ingress

3.4.8.1. Overview

Container Service allows you to flexibly manage load balancing and customize load balancing policies for Kubernetes clusters. Kubernetes clusters provide you with a variety of methods to access containerized applications. They also allow you to use SLB or Ingress to access internal services and implement load balancing.

3.4.8.2. Access a service through SLB

You can access a service through Server Load Balancer (SLB).

Use the CLI

1. Create an NGINX application by using the CLI.

```
root@master # kubectl run nginx --image=registry.aliyuncs.com/acs/netdia:latest
root@master # kubectl get po
NAME                                READY   STATUS    RESTARTS   AGE
nginx-2721357637-dvwq3              1/1     Running  1          6s
```

2. Create a service of the Server Load Balancer type for the NGINX application. Set `type=LoadBalancer` to expose the NGINX application to the Internet.

```
root@master # kubectl expose deployment nginx --port=80 --target-port=80 --type=LoadBalancer
root@master # kubectl get svc
NAME            CLUSTER-IP   EXTERNAL-IP   PORT(S)          AGE
nginx          172.19.XX.XX 101.37.XX.XX  80:31891/TCP    4s
```

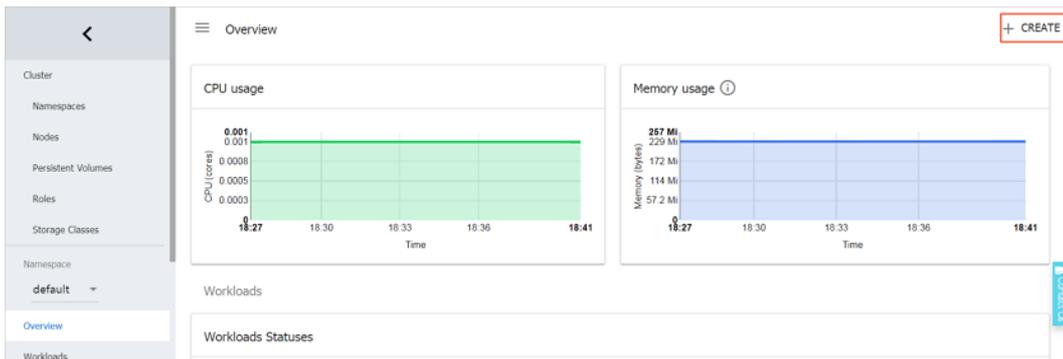

3. Visit `http://101.37.XX.XX` in a browser to access the NGINX application.

Use the Kubernetes Dashboard

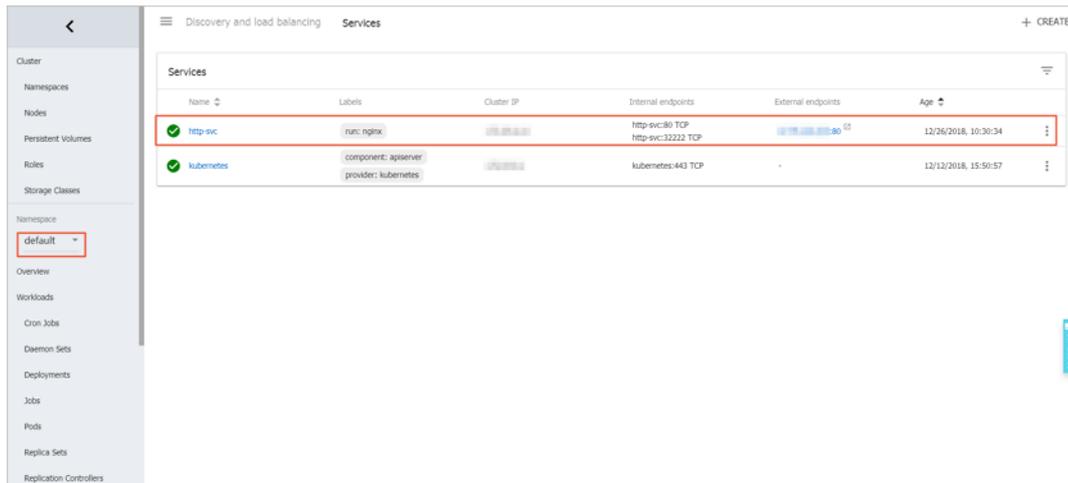

1. Create an `nginx-svc.yml` file with the following code on a local computer.

```
apiVersion: v1
kind: Service
metadata:
  labels:
    run: nginx
  name: http-svc
  namespace: default
spec:
  ports:
    - port: 80
      protocol: TCP
      targetPort: 80
  selector:
    run: nginx
  type: LoadBalancer
```

2. Log on to the Container Service console.
3. Select the target cluster and click Dashboard in the Actions column to go to the Kubernetes Dashboard.
4. Click Create in the upper-right corner to create an application.

5. Click the **CREATE FROM FILE** tab. Select file *nginx-svc.yml*.
6. Click **UPLOAD**.
This creates an `http-svc` service of the Server Load Balancer type and associates the service with the NGINX application.
7. In the left-side navigation pane, select the default namespace and click **Services**.
You can find the newly created service `http-svc` and its external endpoint `http://114.55.XX.XX:80`.

8. Enter the endpoint in a browser to access the service.

See also

Server Load Balancer provides a variety of parameters that you can use to configure settings such as health check, billing method, and SLB instance type. For more information, see [SLB parameters](#).

Annotations

You can add annotations to use the features provided by Server Load Balancer.

Use an existing internal SLB instance

You need to add two annotations as follows. Note that you must replace "yourloadbalancer-id" with your SLB instance ID.

```
apiVersion: v1
kind: Service
metadata:
  annotations:
    service.beta.kubernetes.io/alibaba-cloud-loadbalancer-address-type: intranet
    service.beta.kubernetes.io/alibaba-cloud-loadbalancer-id: your-loadbalancer-id
  labels:
    run: nginx
  name: nginx
  namespace: default
spec:
  ports:
    - name: web
      port: 80
      protocol: TCP
      targetPort: 80
  selector:
    run: nginx
  sessionAffinity: None
  type: LoadBalancer
```

Save the preceding code as an `slb.svc` file and run the following command: `kubectl apply -f slb.svc`.

Create an HTTPS-based service of the Server Load Balancer type

Create a certificate in the Apsara Stack console and copy cert-id. Then create an HTTPS-based service of the Server Load Balancer type as follows:

```

apiVersion: v1
kind: Service
metadata:
  annotations:
    service.beta.kubernetes.io/alibaba-cloud-loadbalancer-cert-id: your-cert-id
    service.beta.kubernetes.io/alibaba-cloud-loadbalancer-protocol-port: "https:443"
  labels:
    run: nginx
  name: nginx
  namespace: default
spec:
  ports:
  - name: web
    port: 443
    protocol: TCP
    targetPort: 443
  selector:
    run: nginx
  sessionAffinity: None
  type: LoadBalancer
    
```

 **Note** Annotations are case sensitive.

SLB parameters

Annotation	Description	Default value
service.beta.kubernetes.io/alibaba-cloud-loadbalancer-protocol-port	The listening port. Separate multiple ports with commas (.). For example, https:443,http:80.	-
service.beta.kubernetes.io/alibaba-cloud-loadbalancer-address-type	The type of the SLB instance. Valid values: internet and intranet.	internet
service.beta.kubernetes.io/alibaba-cloud-loadbalancer-slb-network-type	The network type of the SLB instance. Valid values: classic and vpc.	classic
service.beta.kubernetes.io/alibaba-cloud-loadbalancer-charge-type	The billing method of the SLB instance. Valid values: paybytraffic and paybybandwidth.	paybybandwidth
service.beta.kubernetes.io/alibaba-cloud-loadbalancer-id	The ID of the SLB instance. You can use loadbalancer-id to specify an existing SLB instance and its existing listeners will be overwritten. The SLB instance will not be deleted if the service is deleted.	-
service.beta.kubernetes.io/alibaba-cloud-loadbalancer-backend-label	The labels for specifying the nodes to be added as backend servers of the SLB instance.	-

Annotation	Description	Default value
<code>service.beta.kubernetes.io/alibabacloud-loadbalancer-region</code>	The region where the SLB instance is deployed.	-
<code>service.beta.kubernetes.io/alibabacloud-loadbalancer-bandwidth</code>	The bandwidth of the SLB instance.	50
<code>service.beta.kubernetes.io/alibabacloud-loadbalancer-cert-id</code>	The certificate ID. You need to upload the certificate first.	""
<code>service.beta.kubernetes.io/alibabacloud-loadbalancer-health-check-flag</code>	Specifies whether to enable the health check feature. Valid values: on and off.	off. This annotation is not required for TCP listeners. By default, the health check feature is enabled for TCP listeners and cannot be disabled.
<code>service.beta.kubernetes.io/alibabacloud-loadbalancer-health-check-type</code>	For more information, see the <i>CreateLoadBalancerTCPListener</i> chapter of SLB Developer Guide.	-
<code>service.beta.kubernetes.io/alibabacloud-loadbalancer-health-check-uri</code>	For more information, see the <i>CreateLoadBalancerTCPListener</i> chapter of SLB Developer Guide.	-
<code>service.beta.kubernetes.io/alibabacloud-loadbalancer-health-check-connect-port</code>	For more information, see the <i>CreateLoadBalancerTCPListener</i> chapter of SLB Developer Guide.	-
<code>service.beta.kubernetes.io/alibabacloud-loadbalancer-healthy-threshold</code>	For more information, see the <i>CreateLoadBalancerTCPListener</i> chapter of SLB Developer Guide.	-
<code>service.beta.kubernetes.io/alibabacloud-loadbalancer-unhealthy-threshold</code>	For more information, see the <i>CreateLoadBalancerTCPListener</i> chapter of SLB Developer Guide.	-
<code>service.beta.kubernetes.io/alibabacloud-loadbalancer-health-check-interval</code>	For more information, see the <i>CreateLoadBalancerTCPListener</i> chapter of SLB Developer Guide.	-
<code>service.beta.kubernetes.io/alibabacloud-loadbalancer-health-check-connect-timeout</code>	For more information, see the <i>CreateLoadBalancerTCPListener</i> chapter of SLB Developer Guide.	-
<code>service.beta.kubernetes.io/alibabacloud-loadbalancer-health-check-timeout</code>	For more information, see the <i>CreateLoadBalancerTCPListener</i> chapter of SLB Developer Guide.	-

3.4.8.3. Configure ingress monitoring

You can enable the default VTS module to view ingress monitoring data.

Enable VTS module by using the CLI

1. Modify the ingress ConfigMap to add the following configuration item: `enable-vts-status: "true"` .

```
root@master # kubectl edit configmap nginx-configuration -n kube-system
configmap "nginx-configuration" edited
```

The modified ingress ConfigMap is as follows:

```
apiVersion: v1
data:
  enable-vts-status: "true" # Enable the VTS module
  proxy-body-size: 20m
kind: ConfigMap
metadata:
  annotations:
    kubectL.kubernetes.io/last-applied-configuration: |
      {"apiVersion":"v1","data":{"proxy-body-size":"20m"},"kind":"ConfigMap","metadata":{"annotations":{},"labels":{"app":"ingress-nginx"},"name":"nginx-configuration","namespace":"kube-system"}}
  creationTimestamp: 2018-03-20T07:10:18Z
  labels:
    app: ingress-nginx
    name: nginx-configuration
    namespace: kube-system
  selfLink: /api/v1/namespaces/kube-system/configmaps/nginx-configuration
```

2. Verify that the VTS module is enabled.

```
root@master # kubectl get pods --selector=app=ingress-nginx -n kube-system
NAME                                READY   STATUS    RESTARTS   AGE
nginx-ingress-controller-79877595c8-78gq8  1/1     Running  0          1h
root@master # kubectl exec -it nginx-ingress-controller-79877595c8-78gq8 -n kube-system -- cat /etc/nginx/nginx.conf | grep vhost_traffic_status_display
vhost_traffic_status_display;
vhost_traffic_status_display_format html;
```

3. Access the NGINX Ingress Controller from a local computer.

 **Note** By default, the VTS port is not enabled for security concerns. The following example uses port forwarding to access the controller.

```
root@master # kubectl port-forward nginx-ingress-controller-79877595c8-78gq8 -n kube-system 18080
Forwarding from 127.0.0.1:18080 -> 18080
Handling connection for 18080
```

4. Visit `http://localhost:18080/nginx_status` to access the NGINX Ingress Controller.

Nginx Vhost Traffic Status

[JSON](#) | [GITHUB](#)

Enable VTS module by using the Kubernetes Dashboard

1. Log on to the Container Service console.
2. Find the target cluster and click Dashboard in the Actions column to go to Kubernetes Dashboard.
3. In the left-side navigation pane, select the kube-system namespace and edit the nginx-configuration ConfigMap to add the following configuration item: `enable-vts-status: "true"`.

The modified ingress ConfigMap is as follows:

```
{
  "kind": "ConfigMap",
  "apiVersion": "v1",
  "metadata": {
    "name": "nginx-configuration",
    "namespace": "kube-system",
    "selfLink": "/api/v1/namespaces/kube-system/configmaps/nginx-configuration",
    "creationTimestamp": "2018-03-20T07:10:18Z",
    "labels": {
      "app": "ingress-nginx"
    },
    "annotations": {
      "kubectl.kubernetes.io/last-applied-configuration": "{\"apiVersion\":\"v1\",\"data\":{\"proxy-body-size\":\"20m\"},\"kind\":\"ConfigMap\",\"metadata\":{\"annotations\":{},\"labels\":{\"app\":\"ingress-nginx\"},\"name\":\"nginx-configuration\",\"namespace\":\"kube-system\"}}\n"
    }
  },
  "data": {
    "proxy-body-size": "20m",
    "enable-vts-status": "true"
  }
}
```

4. Access the NGINX Ingress Controller from a local computer.

```
root@master # cat <<EOF | kubectl create -f -
apiVersion: extensions/v1beta1
kind: Ingress
metadata:
  name: simple
  annotations:
    nginx.ingress.kubernetes.io/rewrite-target: /
spec:
  rules:
  - http:
      paths:
      - path: /svc
        backend:
          serviceName: http-svc
          servicePort: 80
EOF
```

```
root@master # kubectl get ing
NAME      HOSTS      ADDRESS      PORTS      AGE
simple    *          101.37.192.211 80         11s
```

You can now visit `http://101.37.192.211/svc` to access the NGINX service.

Simple fanout based on domains

If you have multiple services exposed externally through different domains, you can use the following configuration to implement a simple fanout based on domains:

```

root@master # cat <<EOF | kubectl create -f -
apiVersion: extensions/v1beta1
kind: Ingress
metadata:
  name: simple-fanout
spec:
  rules:
  - host: foo.bar.com
    http:
      paths:
      - path: /foo
        backend:
          serviceName: http-svc1
          servicePort: 80
      - path: /bar
        backend:
          serviceName: http-svc2
          servicePort: 80
  - host: foo.example.com
    http:
      paths:
      - path: /film
        backend:
          serviceName: http-svc3
          servicePort: 80
EOF

```

```

root@master # kubectl get ing
NAME          HOSTS          ADDRESS          PORTS    AGE
simple-fanout *      101.37.192.211 80              11s

```

You can now visit `http://foo.bar.com/foo` to access service `http-svc1`, visit `http://foo.bar.com/bar` to access service `http-svc2`, and visit `http://foo.example.com/film` to access service `http-svc3`.

Note

- In a production environment, you need to point the domain to the returned address `101.37.192.211`.
- In a test environment, you need to add the following mapping rules to the `hosts` file.

```

101.37.192.211 foo.bar.com
101.37.192.211 foo.example.com

```

Default domain for simple routing

If you have no domain address, you can use the default domain associated with the ingress to access the service. The default domain is in the following format: `*.[cluster-id].[region-id].alicontainer.com`. You can obtain the domain address on the cluster basic information page in the console.

You can use the following configuration to expose the two services through the default domain.

```
root@master # cat <<EOF | kubectl create -f -
apiVersion: extensions/v1beta1
kind: Ingress
metadata:
  name: shared-dns
spec:
  rules:
  - host: foo.[cluster-id].[region-id].alicontainer.com ## Replace with the default domain of your cluster
    http:
      paths:
      - path: /
        backend:
          serviceName: http-svc1
          servicePort: 80
  - host: bar.[cluster-id].[region-id].alicontainer.com ## Replace with the default domain of your cluster
    http:
      paths:
      - path: /
        backend:
          serviceName: http-svc2
          servicePort: 80
EOF
```

```
root@master # kubectl get ing
NAME          HOSTS          ADDRESS          PORTS    AGE
shared-dns    foo.[cluster-id].[region-id].alicontainer.com,bar.[cluster-id].[region-id].alicontainer.com    47.95.160.17
1 80 40m
```

You can now visit `http://foo.[cluster-id].[region-id].alicontainer.com/` to access service `http-svc1` and visit `http://bar.[cluster-id].[region-id].alicontainer.com` to access service `http-svc2`.

Secure routing

Container Service supports managing multiple certificates to enhance protection for your services.

1. Prepare your certificate.

If you have no certificate, use the following method to generate a test certificate.

 **Note** The domain must be the same as the one specified in your ingress configuration.

```
root@master # openssl req -x509 -nodes -days 365 -newkey rsa:2048 -keyout tls.key -out tls.crt -subj "/CN=foo.bar.com/O=foo.bar.com"
```

After you run the preceding command, a certificate file `tls.crt` and a private key file `tls.key` are generated.

Use the certificate and private key to create a Kubernetes secret named `foo.bar`. You need to reference the secret when you create the ingress.

```
root@master # kubectl create secret tls foo.bar --key tls.key --cert tls.crt
```

2. Create a secure ingress.

```
root@master # cat <<EOF | kubectl create -f -
apiVersion: extensions/v1beta1
kind: Ingress
metadata:
  name: tls-fanout
spec:
  tls:
  - hosts:
    - foo.bar.com
    secretName: foo.bar
  rules:
  - host: foo.bar.com
    http:
      paths:
      - path: /foo
        backend:
          serviceName: http-svc1
          servicePort: 80
      - path: /bar
        backend:
          serviceName: http-svc2
          servicePort: 80
EOF
```

```
root@master # kubectl get ing
NAME          HOSTS          ADDRESS          PORTS          AGE
tls-fanout    *              101.37.192.211  80             11s
```

3. As described in [Simple fanout based on domains](#), you need to configure the `hosts` file or set a domain to access the `tls` ingress.

You can visit `http://foo.bar.com/foo` to access service `http-svc1` and visit `http://foo.bar.com/bar` to access service `http-svc2`.

You can also access the HTTPS service by using HTTP. By default, the ingress redirects HTTP traffic to the HTTPS address. Traffic to `http://foo.bar.com/foo` is automatically redirected to `https://foo.bar.com/foo`.

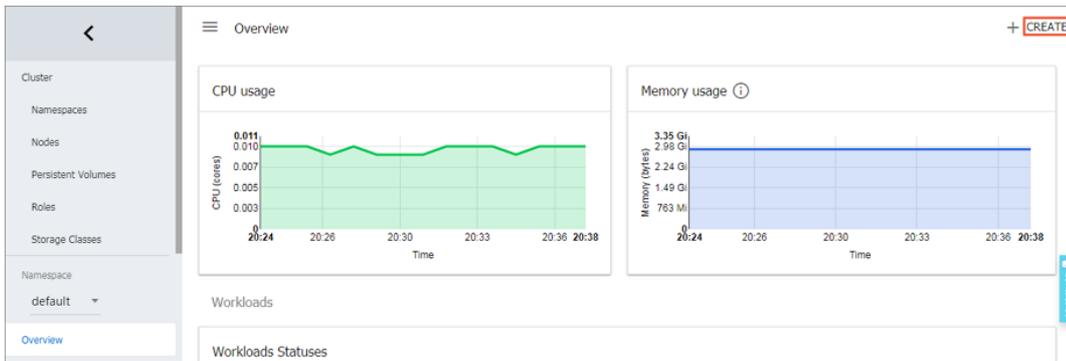

Deploy an ingress in Kubernetes Dashboard

1. Create an `nginx-svc.yml` file with the following code:

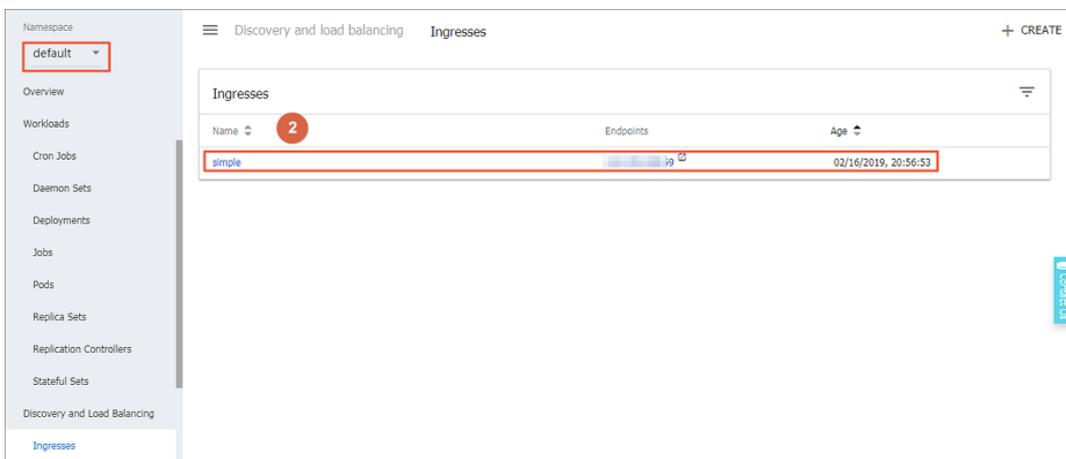

```

apiVersion: extensions/v1beta1
kind: Ingress
metadata:
  name: simple
spec:
  rules:
  - http:
      paths:
      - path: /svc
        backend:
          serviceName: http-svc
          servicePort: 80
    
```

2. Log on to the Container Service console.
3. In the left-side navigation pane, click Clusters. Find the target cluster and click Dashboard in the Actions column to go to the Overview page.
4. Click CREATE in the upper-right corner to create an ingress.

5. Click the CREATE FROM FILE tab. Select file `nginx-ingress.yml`.
6. Click UPLOAD.
This creates an ingress that routes Layer-7 traffic for service `http-svc`.
7. In the left-side navigation pane, select the default namespace and click Ingresses.
You can view the newly created ingress and its endpoint.

8. Enter the endpoint into your browser to access the `http-svc` service.

3.4.8.5. Ingress configurations

Container Service provides Ingress controller components. Integrated with Apsara Server Load Balancer, these components provide Kubernetes clusters with flexible and reliable Ingress service.

An Ingress orchestration template is provided below. When you configure an Ingress through the console, you need to configure annotations and may need to create dependencies. For more information, see [Create an ingress through the console](#), [Ingress support](#), and [Kubernetes Ingress](#). You can also create ConfigMaps to configure Ingresses. For more information, see <https://kubernetes.github.io/ingress-nginx/user-guide/nginx-configuration/configmap/>.

```

apiVersion: extensions/v1beta1
kind: Ingress
metadata:
  annotations:
    nginx.ingress.kubernetes.io/service-match: 'new-nginx: header("foo", /^bar$/)' #Canary release rule. In this example, the request header is used.
    Nginx.ingress.kubernetes.io/service-weight: 'New-nginx: 50, old-nginx: 50' #The route weight.
  creationTimestamp: null
  generation: 1
  name: nginx-ingress
  selfLink: /apis/extensions/v1beta1/namespaces/default/ingresses/nginx-ingress
spec:
  rules: ##The Ingress rule.
  - host: foo.bar.com
    http:
      paths:
        - backend:
            serviceName: new-nginx
            servicePort: 80
          path: /
        - backend:
            serviceName: old-nginx
            servicePort: 80
          path: /
  tls:
    ## Enable TLS for secure routing.
  - hosts:
    - *.xxxxxx.cn-hangzhou.alicontainer.com
    - foo.bar.com
    secretName: nginx-ingress-secret ##The Secret name.
status:
  loadBalancer: {}

```

Annotations

For each Ingress, you can configure its annotations, Ingress controller, and rules, such as the route weight, canary release rule, and rewrite rules. For more information about annotations, see <https://kubernetes.github.io/ingress-nginx/user-guide/nginx-configuration/annotations/>.

For example, the following rewrite annotation, `nginx.ingress.kubernetes.io/rewrite-target: /`, indicates that `/path` is redirected to the root path `/`, which can be recognized by the backend service.

Rules

Ingress rules are used to manage external access to the services in the cluster and can be HTTP or HTTPS rules. You can configure the following items in rules: domain name (virtual hostname), URL path, service name, and port.

For each rule, you need to set the following parameters:

- **Domain:** The test domain or virtual hostname of your service, such as `foo.bar.com`.
- **Path:** The URL path of your service. Each path is associated with a backend service. Server Load Balancer only forwards traffic to the backend if the incoming request matches the domain and path.
- **Service:** Specify the service in the form of `service:port`. You also need to specify a route weight for each service. The Ingress routes traffic to the matching service based on the route weight.
 - **Name:** The name of the backend service.
 - **Port:** The port of the service.
 - **Weight:** The route weight of the service in the service group.

Note

- a. The weight is a percentage value. For example, you can set two services to the same weight of 50%.
- b. A service group includes services that have the same domain and path defined in the Ingress configuration. If no weight is set for a service, the default value, 100, is used.

Canary release

Container Service supports multiple traffic splitting approaches to suit scenarios such as canary release and A/B testing.

 **Note** Currently, only Ingress controllers of 0.12.0-5 and later versions support traffic splitting.

1. Traffic splitting based on request header
2. Traffic splitting based on cookie
3. Traffic splitting based on query parameter

After canary release is configured, only requests that match certain rules are routed to the corresponding service. If the weight of the corresponding service is lower than 100%, requests that match certain rules are routed to one of the services in the service group based on the weight.

TLS

You can use a Secret that contains a TLS private key and certificate to encrypt the Ingress. This ensures secure routing. The TLS Secret must contain a certificate named `tls.crt` and a private key named `tls.key`. For more information about how TLS works, see [TLS](#). For how to create a Secret, see [Configure a secure Ingress](#).

Labels

You can add labels to the Ingress.

3.4.8.6. Create an Ingress in the console

The Container Service for Kubernetes console is integrated with the Ingress service. You can create an Ingress in the console and manage inbound traffic that is forwarded to different services to meet your business requirements.

Prerequisites

- A Kubernetes cluster is created and an Ingress controller runs normally in the cluster. For more information, see [Create a Kubernetes cluster](#).
- You can use kubectl to connect to a master node. For more information, see [Connect to a Kubernetes cluster through kubectl](#).
- In this example, the image is retrieved over the Internet. You can replace the image address with the one that is accessible to your own cluster. Otherwise, you can build the image that is used in this example and push the image to a repository. To use the image, you can pull the image from the repository.

Step 1: Create a deployment and a service

1. [Log on to the Container Service for Kubernetes console](#).
2. In the left-side navigation pane, choose **Applications > Deployments**. The **Deployments** page appears.
3. Click **Create from Template** in the upper-right corner of the page.
4. Select the target cluster and namespace, select a sample template or enter a custom template, and then click **Create**.

In this example, two NGINX applications are created. One is named old-nginx and the other is named new-nginx.

The following code example shows the template that is used to create old-nginx:

```
apiVersion: extensions/v1beta1
kind: Deployment
metadata:
  name: old-nginx
spec:
  replicas: 2
  selector:
    matchLabels:
      run: old-nginx
  template:
    metadata:
      labels:
        run: old-nginx
    spec:
      containers:
        - image: registry.cn-hangzhou.aliyuncs.com/xianlu/old-nginx
          imagePullPolicy: Always
          name: old-nginx
          ports:
            - containerPort: 80
              protocol: TCP
          restartPolicy: Always
---
apiVersion: v1
kind: Service
metadata:
  name: old-nginx
spec:
  ports:
    - port: 80
      protocol: TCP
      targetPort: 80
  selector:
    run: old-nginx
  sessionAffinity: None
  type: NodePort
```

The following code example shows the template that is used to create new-nginx:

```
apiVersion: extensions/v1beta1
kind: Deployment
metadata:
  name: new-nginx
spec:
  replicas: 1
  selector:
    matchLabels:
      run: new-nginx
  template:
    metadata:
      labels:
        run: new-nginx
    spec:
      containers:
        - image: registry.cn-hangzhou.aliyuncs.com/xianlu/new-nginx
          imagePullPolicy: Always
          name: new-nginx
          ports:
            - containerPort: 80
              protocol: TCP
          restartPolicy: Always
---
apiVersion: v1
kind: Service
metadata:
  name: new-nginx
spec:
  ports:
    - port: 80
      protocol: TCP
      targetPort: 80
  selector:
    run: new-nginx
  sessionAffinity: None
  type: NodePort
```

5. In the left-side navigation pane, choose **Ingresses and Load Balancing > Services**.
On the Services page, find the newly created services.

Step 2: Create an Ingress

1. [Log on to the Container Service for Kubernetes console](#).
2. In the left-side navigation pane, choose **Ingresses and Load Balancing > Ingresses**. The Ingresses page appears.
3. Select the target cluster and namespace, and click **Create** in the upper-right corner of the page.
4. In the dialog box that appears, enter the Ingress name. In this example, nginx-ingress is used.
5. Configure Ingress rules.

Ingress rules are used to manage inbound access to the services in the cluster. The rules include HTTP or HTTPS rules. You can configure the following items in rules: domain name (virtual hostname), URL path, service name, port, and weight. For more information, see [Ingress configurations](#).

In this example, a rule is added to specify two services for the default domain name and virtual hostname of the cluster. Traffic routing is based on domains.

Rule: + Add

Domain ✖

foo.bar.com

Select *. [obscured] container.com or Custom

path

e.g./

Service + Add

Name	Port	Weight	Percent of Weight
new-nginx	80	100	50.0%
old-nginx	80	100	50.0%

Simple fanout configurations based on domains

In this example, a virtual hostname is used as the test domain to provide services. Route weights are specified for both services and a canary release is configured for one of the services. In your production environment, you can use a domain name that has obtained an Internet Content Provider (ICP) number to provide services.

- **Domain:** Enter the test domain name. In this example, `foo.bar.com` is used.

You must modify the hosts file to add a domain name mapping rule.

```
118.178.XX.XX foo.bar.com #The IP address of the Ingress.
```

- **Services:** Set the path, name, port, and weight of each service.
 - **Path:** Enter the URL path of each service. In this example, the default root path `/` is used.
 - **Name:** In this example, two service names are used: `old-nginx` and `new-nginx`.
 - **Port:** In this example, port `80` is opened.
 - **Weight:** Set the weight for each service. The weight is a percentage value. Default value: `100`. In this example, the same weight `50` is set for each service.

6. Configure TLS. Select **Enable TLS** to enable TLS and configure secure routing. For more information, see [Configure a secure Ingress](#).

- You can select an existing secret.

TLS: Enable Exist secret Create secret

foo.bar

- Log on to a master node and create the `tls.key` and `tls.crt` files.

```
openssl req -x509 -nodes -days 365 -newkey rsa:2048 -keyout tls.key -out tls.crt -subj "/CN=foo.bar.com/O=foo.bar.com"
```

b. Create a secret.

```
kubectl create secret tls foo.bar --key tls.key --cert tls.crt
```

c. On the command line, enter `kubectl get secret` and verify that the secret has been created. You can then select the `foo.bar` secret.

o You can also use the TLS private key and certificate to create a secret.

a. Log on to a master node and create the `tls.key` and `tls.crt` files.

```
openssl req -x509 -nodes -days 365 -newkey rsa:2048 -keyout tls.key -out tls.crt -subj "/CN=foo.bar.com/O=foo.bar.com"
```

b. On the command line, enter `vim tls.key` and `vim tls.crt` to obtain the private key and certificate that are generated.

c. Copy the certificate to the Cert field and the private key to the Key field.

7. Configure a canary release.

Note Currently, only Ingress controllers of 0.12.0-5 and later versions support traffic splitting.

Container Service for Kubernetes supports multiple traffic splitting methods. This allows you to select more suitable solutions for specific scenarios, such as canary releases and A/B testing, including:

- i. Traffic splitting based on request headers
- ii. Traffic splitting based on cookies
- iii. Traffic splitting based on query parameters

After a canary release is configured, requests that match only the specified rules are routed to the new-nginx service. If the weight of new-nginx is lower than 100%, requests that match the specified rules are routed to this service based on the weight.

In this example, the rule is added to specify a request header that matches the regular expression `foo=^bar$`. Only requests that contain this header can access new-nginx.

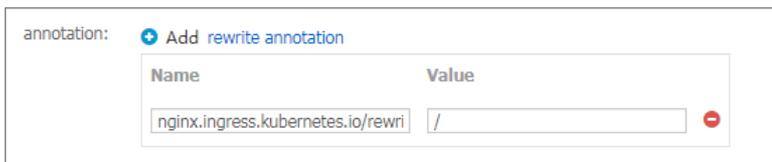

- o **Services:** the service to be accessed.
- o **Type:** the type of the matching rule, such as Header, Cookie, or Query.
- o **Name and Match Value:** custom request fields. The name and matching value comprise a key-value pair.
- o **Matching Rule:** Regular expressions and exact matches are supported.

8. Configure annotations.

Click **Rewrite Annotation** to add a rewrite annotation for the Ingress. For example, `nginx.ingress.kubernetes.io/rewrite-target: /` indicates that `/path` is redirected to the root path `/`. The root path can be recognized by the backend service.

Note In this example, no path is configured for the service. You do not need to configure rewrite annotations. Rewrite annotations allow the Ingress to forward traffic through root paths to the backend service. This avoids the error 404 that is caused by invalid paths.

You can also click **Add** to enter annotation names and values in key-value pairs. For more information about Ingress annotations, visit <https://kubernetes.github.io/ingress-nginx/user-guide/nginx-configuration/annotations/>.

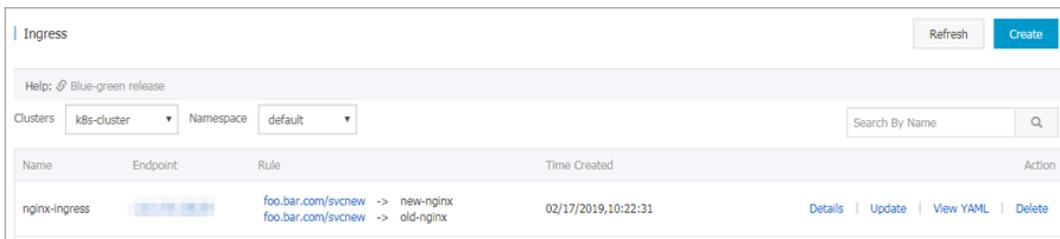

9. Add labels.

Add labels to describe the features of the Ingress.

10. Click **Create**.

You can find the `nginx-ingress` Ingress on the Ingresses page.

11. Click `foo.bar.com` to view the NGINX welcome page.

When you click the domain name that points to `new-nginx`, the `old-nginx` service page appears.

Note By default, when you enter the route address in the browser, requests with headers that do not contain `foo=^bar$` are directed to `old-nginx`.

12. Use SSH to log on to a master node. Run the following commands to simulate requests with specific headers and check the results:

```

curl -H "Host: foo.bar.com" http://47.107.XX.XX
old
curl -H "Host: foo.bar.com" http://47.107.XX.XX
old
curl -H "Host: foo.bar.com" http://47.107.XX.XX          #Similar to a browser request.
old
curl -H "Host: foo.bar.com" -H "foo: bar" http://47.107.XX.XX      #Simulate a request with a specific header. The
results are returned based on the weight.
new
curl -H "Host: foo.bar.com" -H "foo: bar" http://47.107.XX.XX
old
curl -H "Host: foo.bar.com" -H "foo: bar" http://47.107.XX.XX
old
curl -H "Host: foo.bar.com" -H "foo: bar" http://47.107.XX.XX
new
    
```

3.4.8.7. Update an ingress

You can update an ingress through the console.

Prerequisites

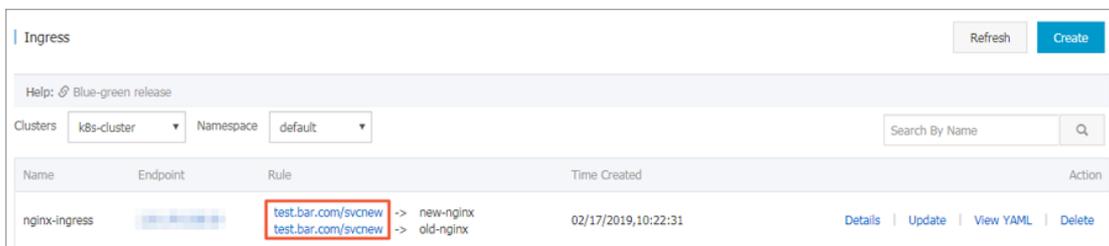

- You have created a Kubernetes cluster and an ingress controller is running normally in the cluster. For more information about creating clusters, see [Create a Kubernetes cluster](#).
- You have created an ingress. For more information, see [Create an ingress through the console](#).

Procedure

1. [Log on to the Container Service console](#).
2. In the left-side navigation pane, choose **Ingresses and Load Balancing > Ingresses**. The Ingresses page appears.
3. Select the target cluster and namespace. Find the ingress that you want to update and click **Update** in the Actions column.
4. In the dialog box that appears, modify the parameters and click **OK**. This example changes `foo.bar.com` to `test.bar.com`.

What's next

On the Ingresses page, you can find the updated ingress rule.

3.4.8.8. Delete an ingress

Prerequisites

- You have created a Kubernetes cluster and an ingress controller is running normally in the cluster. For more information about cluster creation, see [Create a Kubernetes cluster](#).
- You have created an ingress. For more information, see [Create an ingress through the console](#).

Procedure

1. [Log on to the Container Service console](#).
2. In the left-side navigation pane, choose **Ingresses and Load Balancing > Ingresses**.
3. Select the target cluster and namespace. Find the ingress that you want to delete and click **Delete** in the **Actions** column.
4. In the dialog box that appears, click **OK**.

3.4.9. Config maps and secrets

3.4.9.1. Create a ConfigMap

You can create a ConfigMap on the ConfigMaps page or by using a template.

Create a ConfigMap on the ConfigMaps page

1. [Log on to the Container Service console](#).
2. In the left-side navigation pane, choose **Configuration > ConfigMaps**. The ConfigMaps page appears.
3. Select the target cluster and namespace, and then click **Create**.
4. Set the parameters and click **OK**.

Create a ConfigMap on the ConfigMaps page

Parameter	Description
Cluster	The ID of the selected cluster.
Namespace	The selected namespace. A ConfigMap is a kind of Kubernetes resource object and must be scoped into a namespace.
ConfigMap Name	Required. The name can contain lowercase letters, digits, hyphens (-), and periods (.). Other resource objects need to reference ConfigMap names to obtain configuration information.
ConfigMap	Enter the Name and Value , and then click Add to add the key-value pair. You can also click Edit YAML file , modify the parameters in the dialog box that appears, and then click OK .

In this example, two variables named `enemies` and `lives` are created. Their values are set to `aliens` and `3` respectively.

* Namespace: default

* Config Map Name: test-config
Name must consist of lowercase alphanumeric characters, '-' or '.'. Name cannot be empty.

Variable Name	Variable Value	Action
enemies	aliens	Edit Delete
lives	3	Edit Delete

Name Value Add

Variable key must be unique. Variable key and value cannot be empty.

Edit YAML file

OK Cancel

5. Click **OK**. You can find the newly created ConfigMap on the ConfigMaps page.

You can also click **Browse** to upload a configuration file to create a ConfigMap.

Create a ConfigMap from a template

1. [Log on to the Container Service for Kubernetes console](#).
2. In the left-side navigation pane, choose **Applications > Deployments**. The Deployments page appears.
3. In the upper-right corner, click **Create from Template**.
4. On the page that appears, set the parameters and click **Create**.

Create a ConfigMap from a template

Parameter	Description
Cluster	The cluster where the ConfigMap is created.
Namespace	The namespace where the ConfigMap belongs. A ConfigMap is a kind of Kubernetes resource object and must be scoped into a namespace.
Sample Template	Container Service provides various YAML templates for different types of resources. This helps you deploy resources quickly. You can choose <i>Custom</i> and enter your own ConfigMap based on YAML syntax, or select the <i>Resource-ConfigMap</i> template. In the sample template, the ConfigMap is named <i>aliyun-config</i> and contains two variable files <i>game.properties</i> and <i>ui.properties</i> . You can modify the ConfigMap based on your needs.
Template	Enter the template content based on YAML syntax. The template can contain multiple resource objects that are separated by <code>---</code> .
Add Deployment	This feature allows you to quickly define a YAML template. You can click Use Existing Template to import an existing template.

You can find the newly created ConfigMap *aliyun-config* on the ConfigMaps page.

3.4.9.2. Use a ConfigMap in a Pod

You can use a ConfigMap in a Pod in the following scenarios:

- Use a ConfigMap to define environment variables
- Use a ConfigMap to configure command line parameters
- Use a ConfigMap in volumes

For more information, see [Configure a Pod to use a ConfigMap](#).

Limits

To use a ConfigMap in a Pod, make sure that the ConfigMap and Pod are in the same cluster and namespace.

Create a ConfigMap

This example creates a ConfigMap named `special_config`, which consists of two key-value pairs:

```
SPECIAL_LEVEL: very and SPECIAL_TYPE: charm .
```

You can use the following YAML template to create a ConfigMap.

```
apiVersion: v1
kind: ConfigMap
metadata:
  name: special-config
  namespace: default
data:
  SPECIAL_LEVEL: very
  SPECIAL_TYPE: charm
```

You can also log on to the Container Service console and choose **Configuration > ConfigMaps** in the left-side navigation pane. You can then click **Create** to create a ConfigMap.

Clusters: [dropdown]

Namespace: default

* ConfigMap Name:

The name must be 1 to 253 characters in length and can contain only lower-case letters numbers hyphens (-) and periods (.).

ConfigMap:

Name	Value
<input type="text" value="SPECIAL_TYPE"/>	<input type="text" value="charm"/>
<input type="text" value="SPECIAL_LEVEL"/>	<input type="text" value="very"/>

A name can contain only numbers letters underscores (_) hyphens (-) and periods (.).

Use ConfigMaps to define Pod environment variables

Define the value of a ConfigMap as an environment variable

You can log on to the Container Service console and choose **Applications > Deployments** in the left-side navigation pane. Click **Create from Template**, select and modify the Pod type template, and deploy the application. You can also go to the Kubernetes dashboard and choose **Upload YAML or JSON File**.

The following sample template creates a Pod and defines environment variables in the Pod. `valueFrom` is used to reference the value of `SPECIAL_LEVEL` to define an environment variable.

```

apiVersion: v1
kind: Pod
metadata:
  name: config-pod-1
spec:
  containers:
  - name: test-container
    image: busybox
    command: [ "/bin/sh", "-c", "env" ]
    env:
    - name: SPECIAL_LEVEL_KEY
      valueFrom:      ##Use valueFrom to denote that env references the value of a ConfigMap.
        configMapKeyRef:
          name: special-config      ##The referenced ConfigMap name.
          key: SPECIAL_LEVEL       ##The referenced ConfigMap key.
    restartPolicy: Never

```

To define the values of multiple ConfigMaps as environment variables, you only need to add multiple env parameters in the Pod definition.

Define the key-value pairs of a ConfigMap as environment variables

To define the key-value pairs of a ConfigMap as Pod environment variables, you can use the envFrom parameter. The keys in a ConfigMap are used as the names of the environment variables.

A sample template is provided as follows:

```

apiVersion: v1
kind: Pod
metadata:
  name: config-pod-2
spec:
  containers:
  - name: test-container
    image: busybox
    command: [ "/bin/sh", "-c", "env" ]
    envFrom:      ##Reference all the key-value pairs in the special-config ConfigMap.
    - configMapRef:
      name: special-config
    restartPolicy: Never

```

Use a ConfigMap to configure command line parameters

You can use ConfigMaps to configure the commands or parameter values in a container by using the environment variable replacement syntax `$(VAR_NAME)`. A sample template is provided as follows:

```
apiVersion: v1
kind: Pod
metadata:
  name: config-pod-3
spec:
  containers:
    - name: test-container
      image: busybox
      command: [ "/bin/sh", "-c", "echo ${SPECIAL_LEVEL_KEY} ${SPECIAL_TYPE_KEY}" ]
      env:
        - name: SPECIAL_LEVEL_KEY
          valueFrom:
            configMapKeyRef:
              name: special-config
              key: SPECIAL_LEVEL
        - name: SPECIAL_TYPE_KEY
          valueFrom:
            configMapKeyRef:
              name: special-config
              key: SPECIAL_TYPE
      restartPolicy: Never
```

Run the Pod and the output is as follows:

```
very charm
```

Use a ConfigMap in volumes

You can use a ConfigMap to define volumes. The following sample template specifies a ConfigMap name under volumes. This stores the key-value pair data to the mountPath path, which is /etc/config in this example. This generates configuration files that are named after the keys of the ConfigMap. The corresponding values of the ConfigMap are stored in these files.

```

apiVersion: v1
kind: Pod
metadata:
  name: config-pod-4
spec:
  containers:
    - name: test-container
      image: busybox
      command: [ "/bin/sh", "-c", "ls /etc/config/" ] ##List the names of files under this directory.
      volumeMounts:
        - name: config-volume
          mountPath: /etc/config
  volumes:
    - name: config-volume
      configMap:
        name: special-config
  restartPolicy: Never
    
```

Run the Pod and the keys of the ConfigMap are output:

```

SPECIAL_TYPE
SPECIAL_LEVEL
    
```

3.4.9.3. Update a ConfigMap

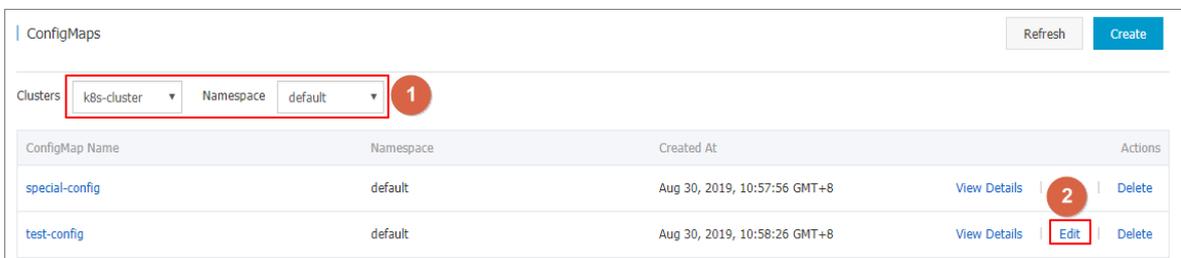

You can use multiple methods to update a ConfigMap.

Note

If you update a ConfigMap, the applications that use this ConfigMap will be affected.

Update a ConfigMap on the ConfigMaps page

1. Log on to the Container Service for Kubernetes console.
2. In the left-side navigation pane, choose Configuration > ConfigMaps to go to the ConfigMaps page.
3. Select the target cluster and namespace, find the ConfigMap that you want to update, and then click Edit in the Actions column for the ConfigMap.

4. In the dialog box that appears, modify the configurations, and click OK.

Update a ConfigMap by using the Kubernetes dashboard

1. Log on to the Container Service for Kubernetes console.
2. In the left-side navigation pane, choose Clusters > Clusters to go to the Clusters page. Find the cluster

that you want to manage and click **Dashboard** in the Actions column for the cluster.

3. On the Overview page, choose **Config and Storage > ConfigMaps** in the left-side navigation pane. Select the target ConfigMap and choose  > **View/edit YAML**.

4. In the dialog box that appears, modify the configurations and click **Update**.

3.4.9.4. Delete a ConfigMap

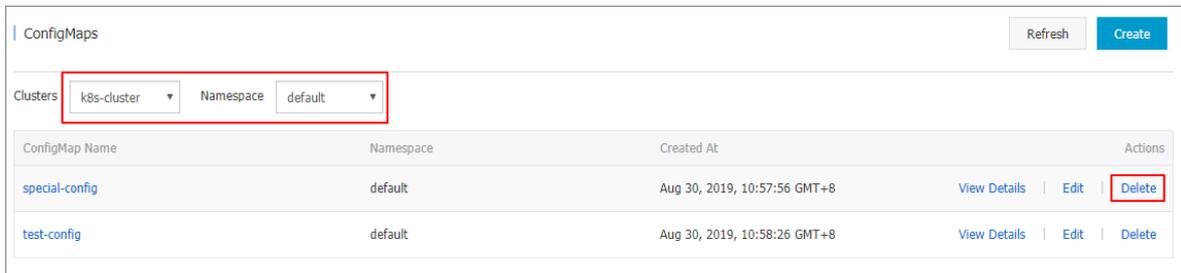

You can use multiple methods to delete a ConfigMap.

Notes

If you delete a ConfigMap, the applications that use this ConfigMap will be affected.

Delete a ConfigMap on the ConfigMaps page

1. **Log on to the Container Service console.**
2. In the left-side navigation pane, choose **Configuration > ConfigMaps**. The ConfigMaps page appears.
3. Select the target cluster and namespace. Find the ConfigMap that you want to delete and click **Delete** in the Actions column.

Delete a ConfigMap through Kubernetes Dashboard

1. **Log on to the Container Service console.**
2. In the left-side navigation pane, choose **Clusters > Clusters**. Find the target cluster and click **Dashboard** in the Actions column.
3. On the Kubernetes Dashboard page, choose **Config and Storage > Config Maps** in the left-side navigation pane. Find the target ConfigMap and choose the **More icon > Delete**.
4. In the dialog box that appears, click **DELETE**.

3.4.9.5. Create a secret

You can create secrets for applications in the Container Service for Kubernetes console.

Prerequisites

A Kubernetes cluster is created.

Context

We recommend that you use secrets to store sensitive information in Kubernetes clusters, such as passwords and certificates.

Secrets are classified into the following types:

- **Service Account:** This type of secret is automatically created by Kubernetes and is automatically mounted to the pod directory `/run/secrets/kubernetes.io/serviceaccount`. You can use this type of secret to access the Kubernetes API.
- **Opaque:** This type of secret is encoded in the Base64 format and used to store sensitive information, such as passwords and certificates.

You can use the Container Service for Kubernetes console to create only Opaque secrets. Opaque data belongs to the map type. The value of this type must be encoded in the Base64 format. You can encode plain text in the Base64 format by using the console.

You can also manually create secrets by using the command-line interface (CLI). For more information, see [Kubernetes secrets](#).

Procedure

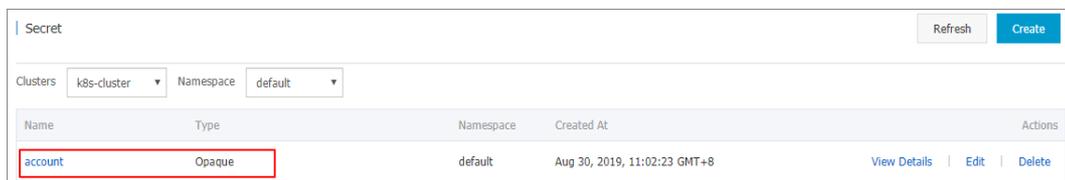

1. [Log on to the Container Service for Kubernetes console](#).
2. In the left-side navigation pane, choose **Configuration > Secrets**. The Secrets page appears.
3. Select the target cluster and namespace. Click **Create** in the upper-right corner of the page.
4. Configure the secret and click **OK**.

 **Note** To enter secret data in plain text, select **Encode Data Values Using Base64**.

Secret parameters

Parameter	Description
Name	The name of the secret that you want to create. The name must be 1 to 253 characters in length and can only contain lowercase letters, digits, hyphens (-), and periods (.).
Data	The data stored in the secret. Click Add , and in the dialog box that appears, enter the key and value as a key-value pair. In this example, two entries are entered: <code>username: admin</code> and <code>password: 1f2d1e2e67df</code> .

5. You can view the newly created secret on the Secrets page.

3.4.9.6. Edit a secret

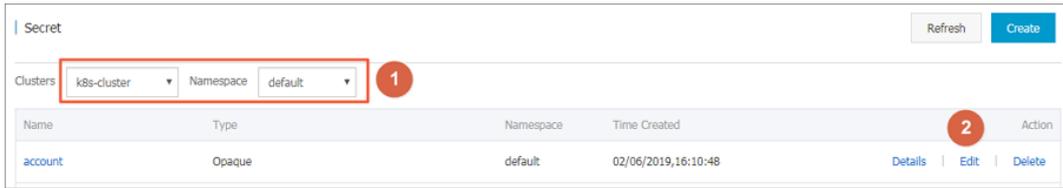

This topic describes how to edit a secret in the Container Service console.

Prerequisites

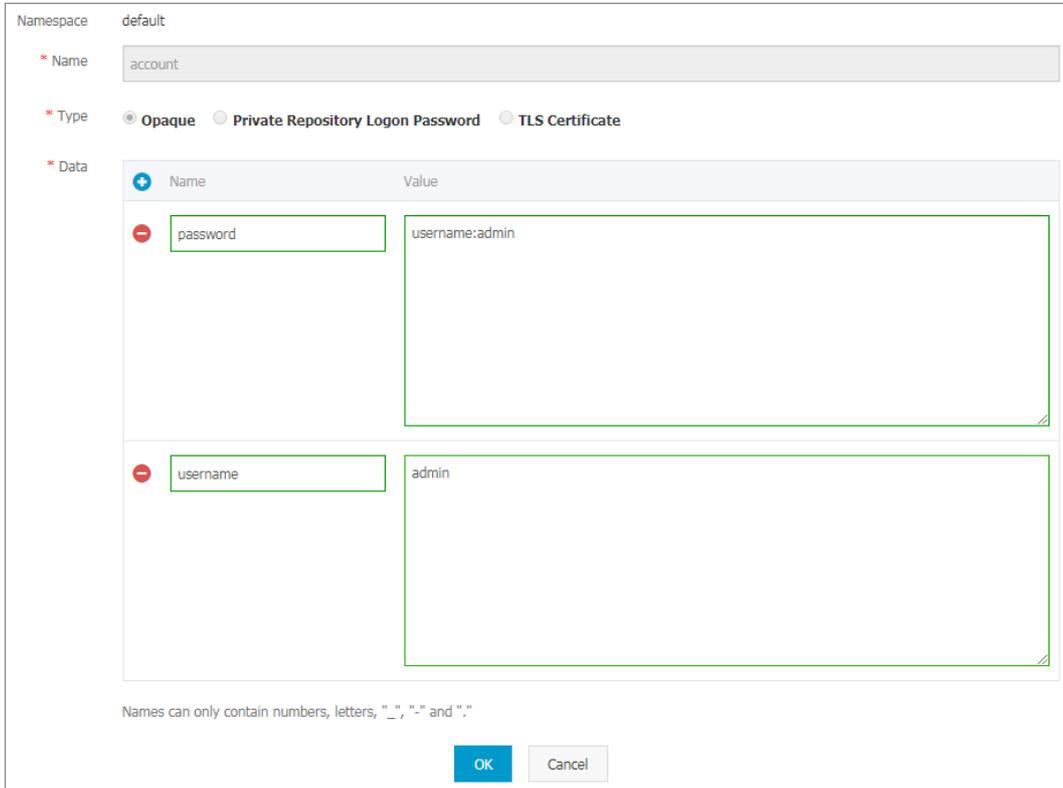

- You have created a Kubernetes cluster.
- You have created a secret. For more information, see [Create a secret](#).

Procedure

1. [Log on to the Container Service console](#).
2. In the left-side navigation pane, choose **Configuration > Secrets** to go to the Secrets page.
3. Select the cluster and namespace. Choose the target secret and click **Edit** in the Actions column.

4. On the Edit Secret page, edit the secret based on your needs.

5. Click **OK** to save your edits.

3.4.9.7. Delete a secret

This topic describes how to delete a secret in the Container Service console.

Prerequisites

- You have created a Kubernetes cluster.
- You have created a secret. For more information, see [Create a secret](#).

Context

Note Do not delete secrets that were generated during the cluster creation process.

Procedure

1. [Log on to the Container Service console](#).
2. In the left-side navigation pane, choose **Configuration > Secrets** to go to the Secrets page.
3. Select the cluster and namespace. Choose the target secret and click **Delete** in the Actions column.
4. In the dialog box that appears, click **OK** to delete the secret.

3.4.10. Templates

3.4.10.1. Create an orchestration template

This topic describes how to use multiple methods to create orchestration templates through the Container Service console.

Procedure

1. Log on to the [Container Service console](#).
2. In the left-side navigation pane, choose **Marketplace > Orchestration Templates** and click **Create** in the upper-right corner.
3. In the dialog box that appears, configure the template, and then click **Save**. This example demonstrates how to create a Tomcat application template that contains a deployment and a service.
 - **Name:** The name of the template.
 - **Description:** Optional. The description of the template.
 - **Template:** Enter the template content based on YAML syntax. The template can contain multiple resource objects that are separated by `---`.

Create

Name:
The name should be 1-64 characters long, and can contain numbers, English letters, Chinese characters and hyphens.

Description:

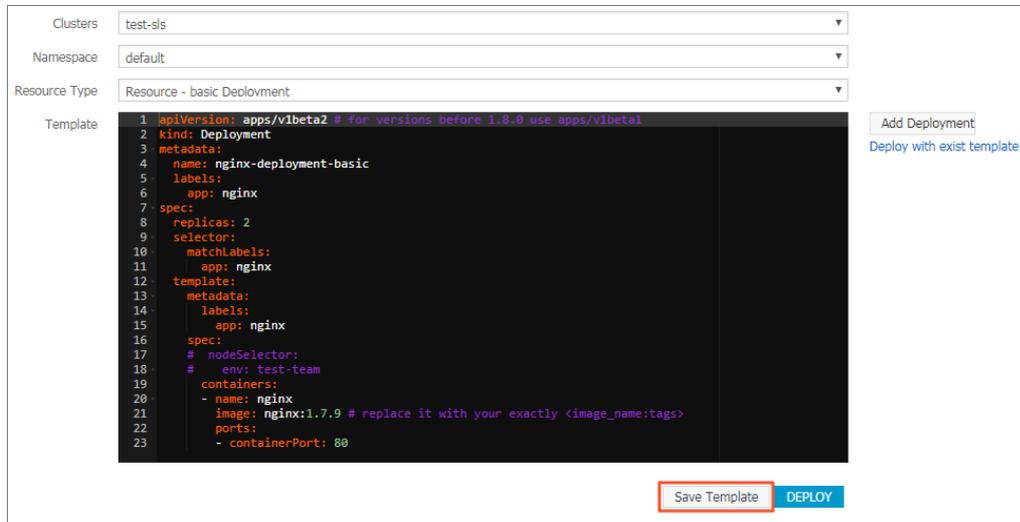

Template:

```
1 apiVersion: apps/v1beta2 # for versions before 1.8.0 use
2   apps/v1beta1
3   kind: Deployment
4   metadata:
5     name: tomcat-deployment
6     labels:
7       app: tomcat
8   spec:
9     replicas: 1
10    selector:
11      matchLabels:
12        app: tomcat
13    template:
14      metadata:
15        labels:
16          app: tomcat
17      spec:
18        containers:
19          - name: tomcat
20            image: tomcat # replace it with your exactly
21              <image_name;tags>
22              ports:
23                - containerPort: 8080
```

4. After the template is created, you are redirected to the **Templates** page by default. You can find the template on the **My Templates** tab.

5. (Optional) You can also choose **Applications > Deployments** in the left-side navigation pane, and click **Create from Template** to go to the **Create from Template** page. You can modify a built-in template provided by Container Service and save it as a custom template.
 - i. Select a built-in template and click **Save Template**.

- ii. In the dialog box that appears, specify the name, description, and content. Click **Save** to save the template.

Note You can modify the built-in template based on your needs.

- iii. In the left-side navigation pane, choose **Marketplace > Orchestration Templates**. You can find the newly created template on the **My Templates** tab.

What's next

You can use the orchestration templates on the **My Templates** tab to quickly create applications.

3.4.10.2. Update an orchestration template

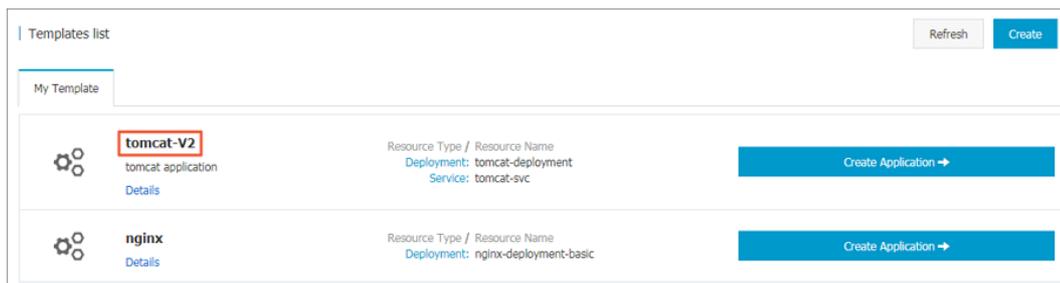

This topic describes how to edit and update an orchestration template.

Prerequisites

You have created an orchestration template. For more information, see [Create orchestration templates](#).

Procedure

1. **Log on to the Container Service console.**
2. In the left-side navigation pane, choose **Marketplace > Orchestration Templates**. The **Templates** page appears. You can view existing templates on the **My Templates** tab.
3. Select the target template and click **Details**.
4. On the template details page, click **Edit** in the upper-right corner.
5. In the dialog box that appears, edit the name, description, and template content, and click **Save**.
6. Go to the **Templates** page. You can view the template that you have updated on the **My Templates** tab.

3.4.10.3. Save an orchestration template as a new one

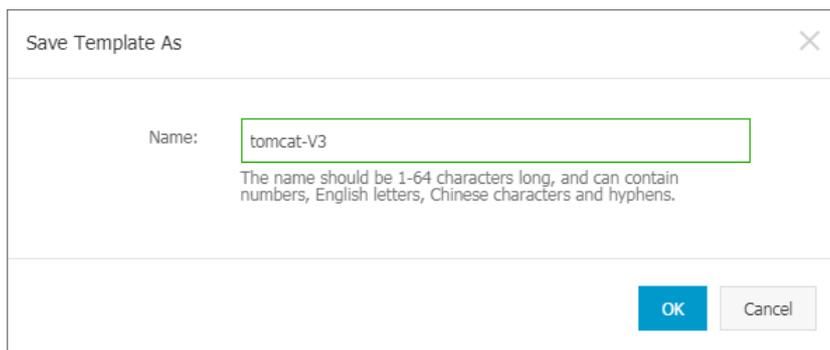

This topic describes how to save an orchestration template as a new one.

Prerequisites

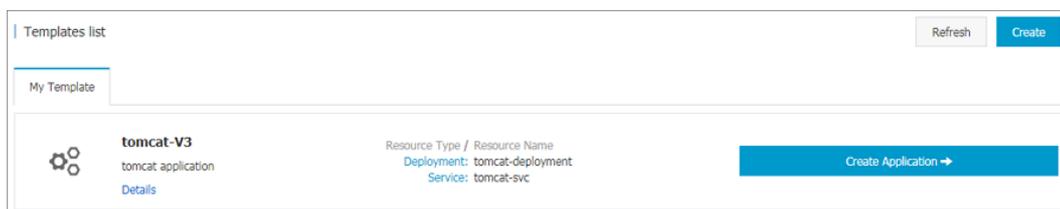

You have created an orchestration template. For more information, see [Create orchestration templates](#).

Procedure

1. Log on to the [Container Service for Kubernetes console](#).
2. In the left-side navigation pane, choose **Marketplace > Orchestration Templates**. The **Templates** page appears. You can view existing templates on the **My Templates** tab.
3. Select the target template and click **Details**.
4. On the template details page, modify the template and click **Save As** in the upper-right corner.
5. In the dialog box that appears, enter the template name and click **OK**.

6. Go to the **Templates** page. The newly saved template is displayed on the **My Templates** tab.

3.4.10.4. Download an orchestration template

This topic describes how to download an orchestration template.

Prerequisites

You have created an orchestration template. For more information, see [Create orchestration templates](#).

Procedure

1. [Log on to the Container Service console.](#)
2. In the left-side navigation pane, choose **Marketplace > Orchestration Templates**. The **Templates** page appears. You can view existing templates on the **My Templates** tab.
3. Select the target template and click **Details**.
4. On the template details page, click **Download** in the upper-right corner to download the template as a YAML file.

3.4.10.5. Delete an orchestration template

Prerequisites

You have created an orchestration template. For more information, see [Create orchestration templates](#).

Procedure

1. [Log on to the Container Service console.](#)
2. In the left-side navigation pane, choose **Marketplace > Orchestration Templates**. The **Templates** page appears. You can view existing templates on the **My Templates** tab.
3. Select the target template and click **Details**.
4. On the template details page, click **Delete** in the upper-right corner.
5. In the dialog box that appears, click **OK**.

3.4.11. Images

3.4.11.1. Create an image repository

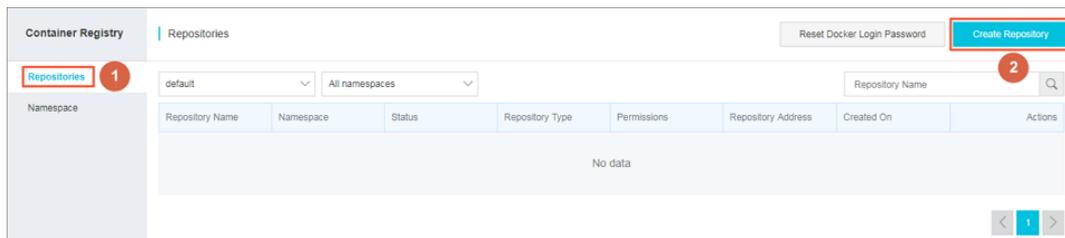

This topic describes how to create an image repository in the Container Registry console.

Prerequisites

The Container Registry service is activated and a namespace is created in the Container Registry service.

Procedure

1. [Log on to the Container Registry console.](#)
2. In the left-side navigation pane, click **Repositories** to go to the **Repositories** page. Click **Create Repository** in the upper-right corner of the page.

3. In the dialog box that appears, set the following parameters and click **Next**.
 - **Region:** Use the default value. The region of the repository must be the same as that of the cluster.
 - **Namespace:** Use the default value. The namespace must be the same as that of the organization that you select when you log on to the console.
 - **Repository Name:** The repository name must be 2 to 64 characters in length and can contain lowercase letters, digits, and special characters, including underscores (_), hyphens (-), and periods (.). It cannot start or end with a special character.
 - **Summary:** Enter the repository summary.
 - **Description:** Enter description information. The description must be 0 to 100 characters in length.

- **Repository Type:** The repository type can be public or private.

Create Repository

1 ————— 2

Repository Info Code Source

Region

* Namespace

* Repository Name

Repository name length: 2-64 characters. The name can contain lowercase English letters numbers and the separators _ - and . (separators cannot be the first or last character)

* Summary

Max. 100 characters

Description

Supports Markdown Format

Repository Type Public Private

Next Cancel

4. Set the code source and click Create Repository.

Note Currently, only local repositories are supported. You can push images to an image repository by using the command-line interface (CLI).

Create Repository

✓ ————— 2

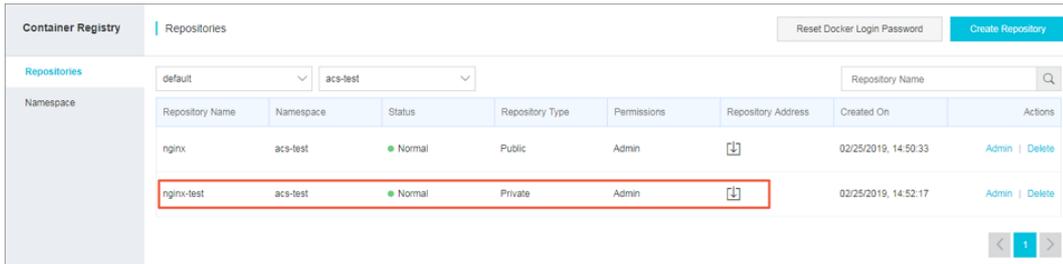

Repository Info Code Source

Code Source

You can use the command line to push this image to the image repository.

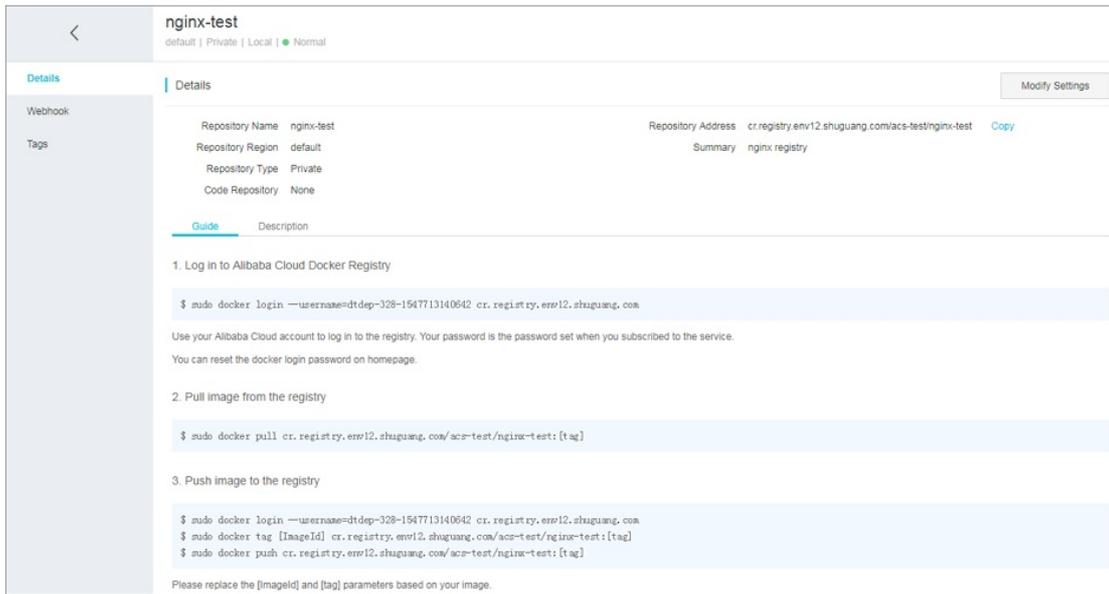

Previous **Create Repository** Cancel

5. Go to the Repositories page to view the newly created repository.

What's next

You can click **Admin** in the **Actions** column for the repository to go to the **Details** page and learn how to manage the repository.

3.4.11.2. Create a namespace

This topic describes how to create a namespace in the Container Registry console.

Context

A namespace is a collection of repositories. We recommend that you place the repositories of a company or an organization in the same namespace.

- You can enter a name that corresponds to a company name, such as aliyun or alibaba.
- You can enter a name that corresponds to a team or organization name for the namespace, such as misaka-team.

Procedure

1. **Log on to the Container Registry console**
2. In the left-side navigation pane, click **Namespace**. On the page that appears, click **Create Namespace** to create a namespace.

Create Namespace ✕

Each account can create at most 5 namespaces. [Tips](#)

* Namespace

Define your namespace. After being set it cannot be modified. The namespace must be 2-30 characters long and can contain lowercase English letters numbers and the separators _ and - (separators cannot be the first or last character)

[Confirm](#)

You can find the newly created namespace on the Namespace page.

? Note

- You can turn on or turn off **Automatically Create Repository** to specify whether to automatically create image repositories for the namespace.
- You can set the repository type to **Public** or **Private** for the namespace.

Container Registry	Namespace						Create Namespace
Repositories	Namespace	Permissions	Status	Automatically Create Repository	Default Repository Type	Actions	
Namespace	acs-test	Admin	● Normal	<input checked="" type="checkbox"/> On	<input type="radio"/> Public <input checked="" type="radio"/> Private	Delete	
	acs-registry	Admin	● Normal	<input checked="" type="checkbox"/> On	<input type="radio"/> Public <input checked="" type="radio"/> Private	Delete	

What's next

You can create more image repositories for the namespace.

3.4.11.3. Synchronize an image

Container Registry can be used to synchronize images across data centers. This allows you to retrieve images from the data center that is nearest to where your workloads are deployed.

Prerequisites

- A namespace is created. For more information, see [Create a namespace](#).
- An image repository for the namespace is created. For more information, see [Create a repository](#).

Procedure

1. [Log on to the Container Registry console](#).
2. In the left-side navigation pane, choose **Repositories** to go to the **Repositories** page.
3. Select the target repository and click **Admin** in the **Actions** column for the repository to go to the **Details** page.
4. In the left-side navigation pane, choose **Tags**. Find the target tag and click **Sync** in the **Actions** column for the tag.
5. On the **Sync** page, specify the tag and target repository, and click **OK**. A message appears to indicate that the synchronization request is submitted.

Result

In the left-side navigation pane of the target repository, click **Sync** to check the status of the synchronization

task.

You can click **Details** in the **Actions** column for the task to check the task status for the specified image.

3.4.11.4. Sign and verify an image

When you manage container images, you can use content trust to verify both the integrity and the publisher of images. Image publishers can encrypt images by using digital signatures that are stored in Container Registry. We recommend that you verify the signatures to ensure that only images signed by trusted authorities are deployed. This way, you can minimize or stop attacks that may occur when you run containers.

Install and configure signature tools

1. Install the aliyun client tool. For more information, see [Install Alibaba Cloud CLI](#).
2. On the command line, run the following command to configure aliyun client:

```
./aliyun configure set \
--profile akProfile \
--mode AK \
--region cn-qingdao-env17-d01 \
--access-key-id yourAK \
--access-key-secret yourAK
```

3. After you install and configure the GPG tool, run the following command to export the public key:

```
#Query the pubKeyId.
gpg --fingerprint

#Export the public key.
gpg --armor --output public-key.txt --export yourUser
```

 **Note** For Apsara Stack instances, instanceId is set to default.

Sign container images

1. On the command line, run the following command to determine the image tag URL:

```
echo image://region/instanceId/namespace/repo@digest | tee imageURL.txt

#e.g.
#echo image://cn-qingdao-env17-d01/default/kritis-test/busybox2@sha256:2f122941b5850006dbb7adda78d2ea5
b382841ca6569fd174bd24c14bfff3dca > imageURL.txt
```

2. On the command line, run the following command to use GPG to sign the unique URL of the image. By default, imageURL.txt.asc is generated.

```
gpg --armor --sign imageURL.txt
```

The imageURL.txt.asc file includes the following content:

```
-----BEGIN PGP MESSAGE-----  
  
owGbwMvMwMEo63vGqaX74wXGNXVJ3CmpaYmlOSV6JRulcZy7vmfmJqanWunr****  
  
.....  
=O2TP  
  
-----END PGP MESSAGE-----
```

3. On the command line, run the following command to create a metadata namespace:

```
./aliyun cr CreateMetadataNamespace --force --version 2018-12-01 --endpoint cr.inter.env17e.shuguang.com --NameSpaceName kritis-test-2 --Description "for test"
```

4. On the command line, run the following command to create a signature note:

```
cat <<EOF > note.json| jq  
{  
  "name": "/namespaces/kritis-test-2/notes/image-sign",  
  "LongDescription": "long",  
  "ShortDescription": "short",  
  "ExpirationTime": "2021-01-01T00:00:00Z",  
  "Kind": "ATTESTATION",  
  "Attestation": {  
    "Hint": {  
      "HumanReadableName": "ACR"  
    }  
  }  
}  
EOF
```

5. On the command line, run the following command to create an occurrence for the image signature and save the occurrence to the metadata service:

```
cat <<EOF > occurrence.json | jq
{
  "Name": "/namespaces/kritis-test-2/occurrences/randomId1",
  "NoteName": "/namespaces/kritis-test-2/notes/image-sign",
  "ResourceUri": "image://cn-qingdao-env17-d01/default/kritis-test/busybox2@sha256:2f122941b5850006dbb7adda78d2ea5b382841ca6569fd174bd24c14bff****",
  "Kind": "ATTESTATION",
  "Attestation": {
    "Signatures": [
      {
        "Signature": $(cat imageURL.txt.asc|jq -R --slurp),
        "PublicKeyId": "E5B5FF2AFC3A1D70FE3CE57C1D4DCC42848****"
      }
    ]
  }
}
EOF
```

```
./aliyun cr CreateMetadataOccurrence --force --version 2018-12-01 --endpoint cr.inter.env17e.shuguang.com --Name
spaceName kritis-test-2 --OccurrenceName randomId1 --Occurrence "$(cat occurrence.json)"
```

6. On the command line, run the following command to query the image signature:

```
#Retrieve a list of occurrences for a specified note. In this example, one occurrence is created.
./aliyun cr ListMetadataOccurrences --force --version 2018-12-01 --endpoint cr.inter.env17e.shuguang.com --Name
spaceName kritis-test-2 --NoteName image-sign --PageNo 1 --PageSize 5

#Retrieve a list of occurrences for a specified note that occurs on a resource. In this example, one occurrence is cr
eated.
./aliyun cr ListMetadataOccurrences --force --version 2018-12-01 --endpoint cr.inter.env17e.shuguang.com --Name
spaceName kritis-test-2 --NoteName image-sign --PageNo 1 --PageSize 5 --ResourceURIs '["image://cn-qingdao-e
nv17-d01/default/kritis-test/busybox2@sha256:2f122941b5850006dbb7adda78d2ea5b382841ca6569fd174bd24c14b
fff****"]'
```

Verify an image signature

The following steps describe how to install an image signature verification component and enable the verification feature on Apsara Stack.

1. Install the image signature verification component.
 - i. [Log on to the Container Service console](#).
 - ii. Go to the Clusters page, find the cluster in which you want to install the image signature verification component, and in the Actions column for the cluster, choose **More** > **Install Kritis**.
2. Configure the signature verification policy.

- i. Set the following signature parameters to configure the signature verification policy:

```
$ export namespace=Actual value of namespace
$ export noteName=Actual value of noteName
$ export publicKeyData=Actual value of publicKeyData
```

- namespace: the ACR namespace setting used for signing an image.
- noteName: the noteName setting used for signing an image.
- publicKeyData: the Base64-encoded GPG public key.

- ii. On the command line, run the following command to set AttestationAuthority:

 **Note** The default namespace is used in the following example.

```
$ cat <<EOF > aa.yaml
apiVersion: kritis.grafeas.io/v1beta1
kind: AttestationAuthority
metadata:
  name: ${noteName}
spec:
  noteReference: namespaces/${namespace}
  publicKeyData: ${publicKeyData}
EOF

$ kubectl -n default apply -f aa.yaml
```

- iii. On the command line, run the following command to set GenericAttestationPolicy:

 **Note** The default namespace is used in the following example.

```
$ cat <<EOF > gap.yaml
apiVersion: kritis.grafeas.io/v1beta1
kind: GenericAttestationPolicy
metadata:
  name: my-gap
spec:
  attestationAuthorityNames:
  - ${noteName}
EOF

$ kubectl -n default apply -f gap.yaml
```

3. Test the signature verification feature.

In the test, a signed image is used: registry.acs.example.com/kritis-test/signed@sha256:2f122941b5850006dbb7adda78d2ea5b382841ca6569fd174bd24c14bfff****. An unsigned image is also used: registry.acs.example.com/kritis-test/not-sign@sha256:efc961b2b3499c25753d3c9f29977f494f49125cf1191071057aa68bffa7****. If the feature functions as expected, the signature verification policy enables the signed image and disables the unsigned image for the default namespace. The following example shows how to test the feature:

```
#A deployment is created based on the signed image.
$ kubectl -n default run test-signed --image=registry.acs.example.com/kritis-test/signed@sha256:2f122941b58500
06dbb7adda78d2ea5b382841ca6569fd174bd24c14bff****
deployment.apps/test-signed created

#The unsigned image fails a deployment.
$ kubectl -n default run test-not-signed --image=registry.acs.example.com/kritis-test/not-sign@sha256:efc961b2b349
9c25753d3c9f29977f494f49125cf1191071057aa68bffa7****
Error from server: admission webhook "kritis-validation-hook-deployments.grafeas.io" denied the request: image
registry.acs.example.com/kritis-test/not-sign@sha256:efc961b2b3499c25753d3c9f29977f494f49125cf1191071057aa68bffa
7**** is not attested
```

 **Note** After you enable image signature verification, when you create resources, the image ID must be a digest value in the format such as @sha256:<hash>.

Appendix 1: Use GPG commands to generate publicKeyData

1. On the command line, run the following command to find the local GPG key user that you want to use:

 **Note** The user in the following example is `abcdef@example.com`.

```
$ gpg --list-keys
pub rsa2048 2020-01-08 [SC] [Expired on: 2022-01-07]
    7726310BC6E11E9B57B9CC08E2932E4363F3***
uid [Absolute] abcdef <abcdef@example.com>
sub rsa2048 2020-01-08 [E] [Expired on: 2022-01-07]
```

2. Export the public key of this user and encode the content of the public key in the Base64 format to generate publicKeyData.

```
$ gpg --armor --export <user> |base64 | tr -d '\n'

#In the example, the user is abcdef@example.com.
#Run this command to generate publicKeyData: gpg --armor --export abcdef@example.com |base64 | tr -d '\n'
# export publicKeyData=$(gpg --armor --export abcdef@example.com |base64 | tr -d '\n')
```

Appendix 2: Retrieve an image digest value

You can use the following method to find an image digest value. In this example, the image URL is `registry.acs.example.com/kritis-test/alpine:3.11`.

```
$ docker pull registry.acs.example.com/kritis-test/alpine:3.11
$ docker images --digests | grep registry.acs.example.com/kritis-test/alpine
registry.acs.example.com/kritis-test/alpine 3.11 sha256:ddba4d27a7ffc3f86dd6c2f92041af252a1f23a8e742c90e6e1297bfa1bc0c45
e7d92cdc71fe 2 months ago 5.59MB
```

The output shows that the image digest value is `sha256:ddba4d27a7ffc3f86dd6c2f92041af252a1f23a8e742c90e6e1297bfa1bc0c45`. When you create resources, the following image ID must be used: `registry.acs.example.com/kritis-test/alpine:sha256:ddba4d27a7ffc3f86dd6c2f92041af252a1f23a8e742c90e6e1297bfa1bc0c45`.

3.4.11.5. Synchronize images between instances

You can configure synchronization rules to automatically synchronize images from a source instance to a destination instance. By default, images are automatically synchronized for instances that are deployed in different regions.

Procedure

1. [Log on to the Container Registry console](#).
2. Go to the **Repositories** page, find the repository that you want to manage, and then click **Admin** in the **Actions** column for the repository.
3. The **Details** page is displayed. In the left-side navigation pane, click **Sync**.
4. In the upper-right corner of the **Sync** page, click **Create**. In the **Sync** dialog box, set the **Tag** and **Target** parameters, specify the namespace, repository name, and tag of the target repository, and then click **OK**. The synchronization rule is created.

Result

After the synchronization rule is created, a synchronization task is automatically triggered when a new image is uploaded to the repository whose name matches the specified synchronization rule.

3.4.12. Create a batch release

Context

Note In Kubernetes clusters of the latest version, alicloud-application-controller is installed by default. This component is only available in Kubernetes 1.9.3 and later. You can upgrade your cluster through the console.

Procedure

1. [Log on to the Container Service console](#).
2. In the left-side navigation pane, choose **Applications > Releases**. Click the **Batch Release** tab and click **Create Batch Release** in the upper-right corner.

Note If the button is dimmed, it indicates that you need to upgrade your cluster first.

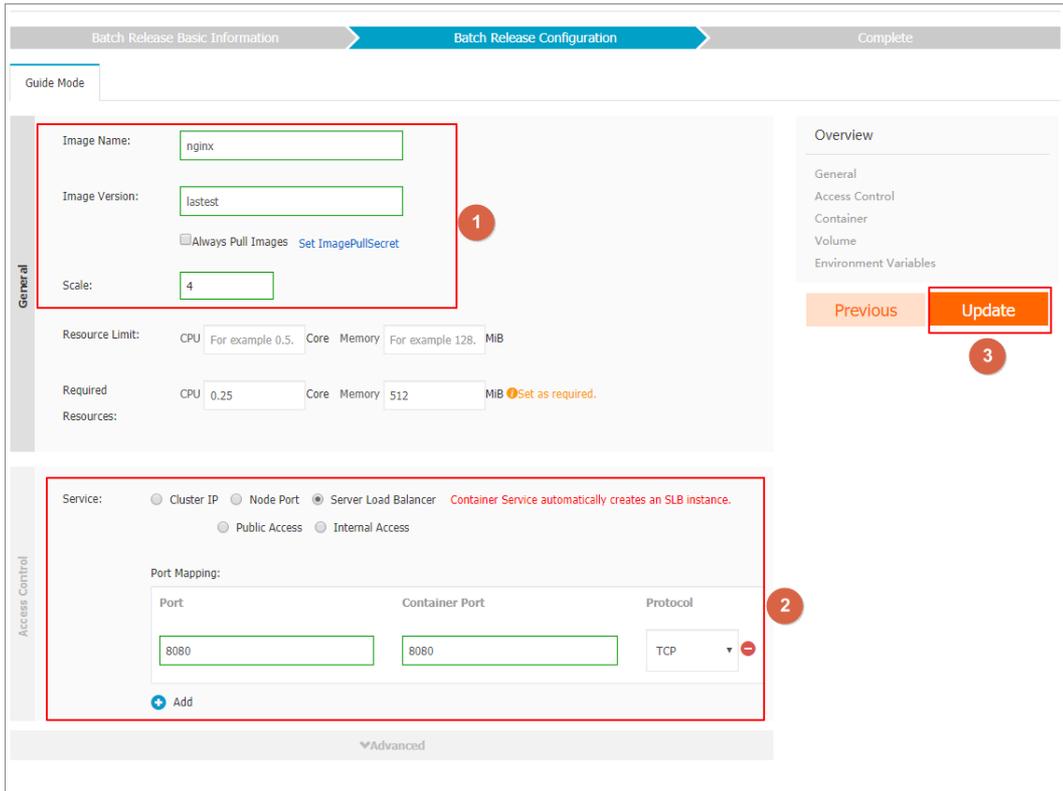

3. On the **Batch Release Basic Information** tab, set the following parameters: application name, cluster, namespace, and release option. Click **Next**.

The screenshot shows the 'Create Batch Release' interface. At the top, there is a breadcrumb 'Create Batch Release' and a link 'Return to Release List'. Below this is a progress bar with three steps: 'Batch Release Basic Information' (active), 'Batch Release Configuration', and 'Complete'. The main form area contains the following fields:

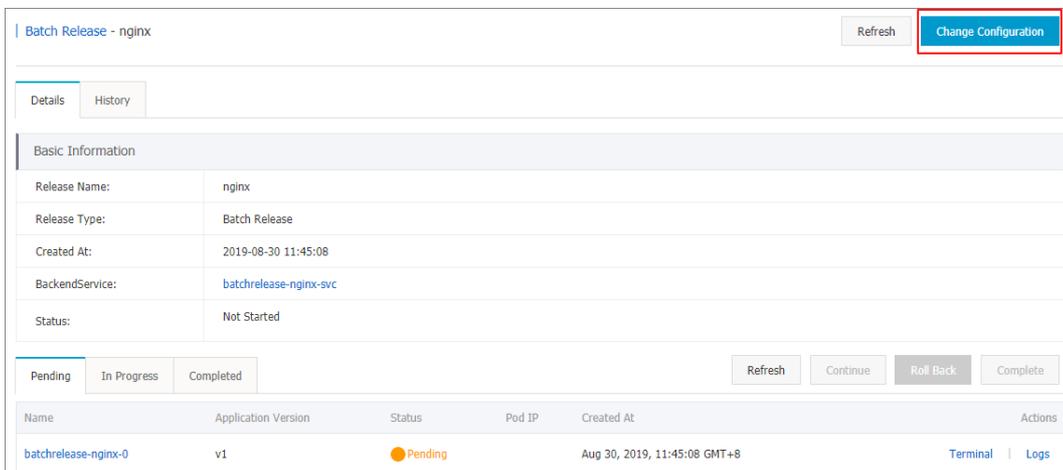

- Name:** A text input field containing 'nginx'. Below it is a note: 'The name must be 1 to 64 characters in length and can contain numbers letters and hyphens (-). The name cannot start with a hyphen (-).'.
- Cluster:** A dropdown menu with 'k8s-cluster' selected.
- Namespace:** A dropdown menu with 'default' selected.
- Release Option:** A dropdown menu with 'Release in two batches. Suspend the release of th' selected.

At the bottom right of the form, there are two buttons: 'Back' and 'Next'. The 'Next' button is highlighted with a red rectangular box.

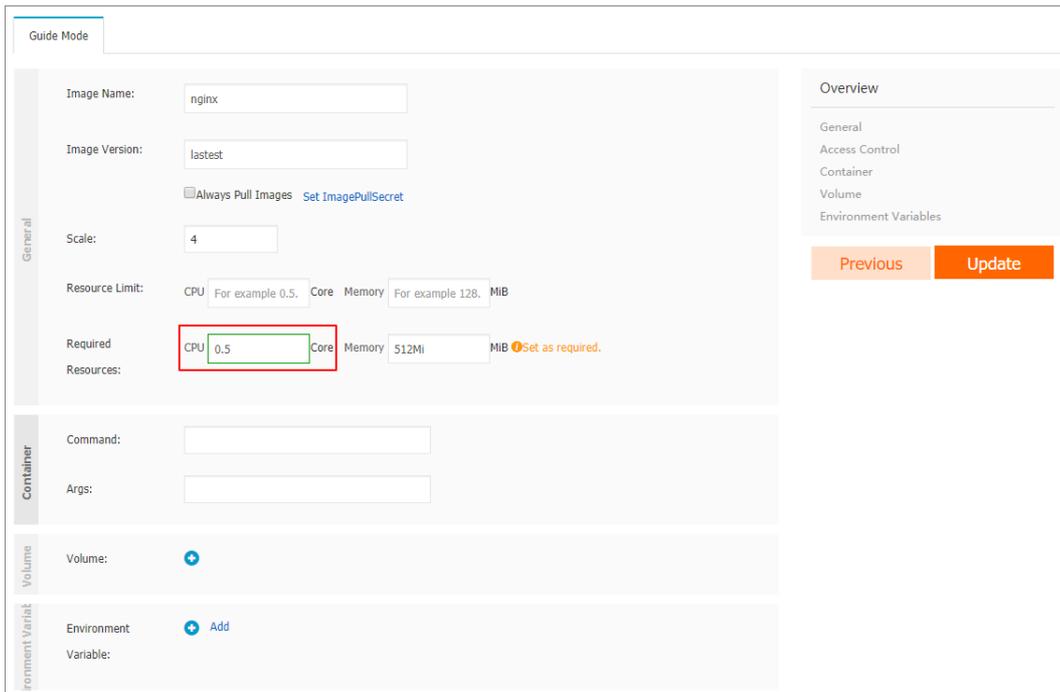

4. On the **Batch Release Configuration** tab, configure the pods and service, and then click **Update** to create an application.

5. Go to the Releases page and click the Batch Release tab. You can find the newly created application and its status is **Not Started**. Click **Details** in the Actions column.
6. On the Details tab, you can find more information about the application. Click **Change Configuration** in the upper-right corner to change the application configuration.

7. On the page that appears, change the configuration and then click **Update**.

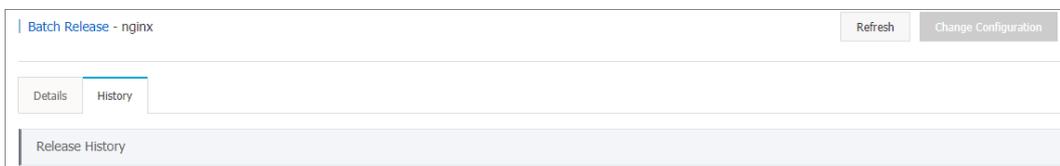

8. You are redirected to the Releases page by default. Click the Batch Release tab and you can find the application status. After the first batch is deployed, click Details.

9. On the details tab, two pods are listed in the Not Started list and two pods are listed in the Completed list. This indicates that the first batch has been released. Click Continue to release the second batch of pods. Click Roll Back to roll back to the previous version.

10. After the release is completed, click the History tab and you can choose to roll back to a previous version.

What's next

You can create a batch release to quickly verify the functionalities of a new application version while serving all production traffic. A batch release requires less resources than a blue-green release. Currently, you can only create batch releases through the wizard. Support for YAML configuration files will be available soon.

3.4.13. Use Log Service to collect Kubernetes logs

Container Service for Kubernetes is integrated with Log Service. When you create a cluster, you can enable Log Service to collect container logs, including standard outputs and text files.

Activate Log Service

To activate Log Service, perform the following steps:

1. Log on to the Apsara Stack Cloud Management (ASCM) console. In the top navigation bar, choose **Products > Log Service** to go to the Log Service page.
2. Select the target organization and region.
3. Click **SLS** to go to the SLS console.

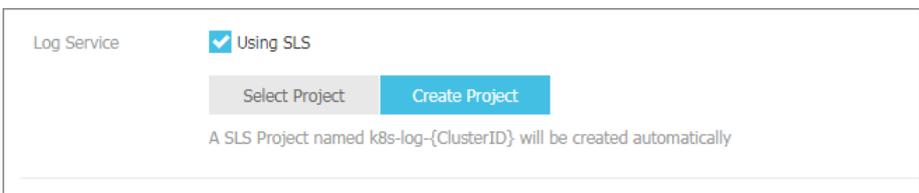

Create a cluster and enable Log Service

To create a Kubernetes cluster, perform the following steps:

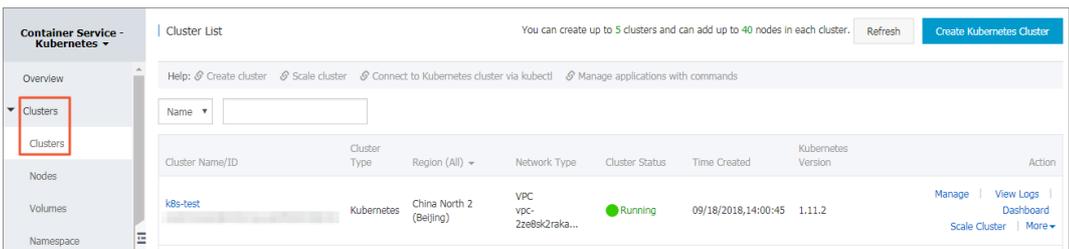

1. **Log on to the Container Service for Kubernetes console.**

Note The specified organization must be the same as the one you selected when you activate Log Service. For more information, see [Activate Log Service](#).

2. In the left-side navigation pane, choose **Clusters > Clusters**. The Clusters page appears.
3. Click **Create Kubernetes Cluster**. For more information about the configurations, see [Create a Kubernetes cluster](#).
4. Select **Enable Log Service** to install the logging agent.
5. After you select the check box, you must specify a project to store log data. You can click **Select Project** and select an existing project from the drop-down list that appears. You can also click **Create Project** to allow the system to automatically create a project for log management. The project is named `k8s-log-{ClusterID}`, where ClusterID is the unique identifier of the cluster.

6. After you set the parameters, click **Create Cluster** in the upper-right corner. In the dialog box that appears, click **OK** to create the cluster. You can find the created cluster on the Clusters page.

Install Log Service components in an existing cluster

If you have already created a Kubernetes cluster and activated Log Service, you can perform the following steps to use Log Service:

1. Connect to the Kubernetes cluster by using CloudShell. For more information, see [Connect to a Kubernetes cluster through kubectl](#).
2. Run the script `logtail-dedicated.sh` to install Log Service components in the cluster.

```
#!/env/bin/bash

yaml=$(cat <<-END

END
)

echo "$yaml" > logtail.yml

kubectl create -f logtail.yml

```

3. Set `<your_server_architecture>` , `<your_k8s_cluster_region_id>` , `<your_k8s_cluster_id>` , `<k8s_cluster_domain_suffix>` , `<your_ali_uid>` , and `<your_image_repo_url>` to the actual values. Then, run the following commands to set the environment variables for deploying the components.

```

export ARCH=<your_server_architecture>
export REGION=<your_k8s_cluster_region_id>
export CLUSTER_ID=<your_k8s_cluster_id>
export INTERNET_DOMAIN=<k8s_cluster_domain_suffix>
export IMAGE_REPO_URL=<your_image_repo_url>
export ALI_UID=<your_ali_uid>
bash logtail-dedicated.sh // Run the script to install the components.

```

Note

- `<your_server_architecture>` : the server architecture, for example, amd64.
- `<your_k8s_cluster_region_id>` : the region where the cluster is deployed, for example, cn-qingdao-apsara-d01.
- `<your_k8s_cluster_id>` : the ID of the cluster.
- `<k8s_cluster_domain_suffix>` : the domain suffix of the cluster, for example, env28.internet.com.
- `<your_ali_uid>` : the Apsara Stack tenant account ID, for example, 1234074238634394.
- `<your_image_repo_url>` : the URL of the image repository, for example, registry.cn-hangzhou.aliyuncs.com.

Create an application and configure Log Service

When you create an application in Container Service for Kubernetes, you can configure Log Service to collect container logs. Currently, you can only use YAML templates to configure Log Service.

1. In the left-side navigation pane, choose **Applications > Deployments**. In the upper-right corner of the Deployments page, click **Create from Template**.
2. Set environment variables in the ENV field to configure log collection and custom tags. To support the specified log collection, you must set the volumeMounts and volumes fields. YAML templates follow the Kubernetes syntax. The following example shows how to configure Log Service in a pod:

```

apiVersion: extensions/v1beta1
kind: Deployment
metadata:
  labels:
    app: logtail-test
  name: logtail-test
spec:
  replicas: 1
  template:
    metadata:
      labels:
        app: logtail-test
        name: logtail-test
    spec:
      containers:
      - name: logtail
        image: registry.acs.env28.intranet.com/acs/busybox:latest
        args:
        - ping
        - 127.0.0.1
        env:
        - name: aliyun_logs_log-stdout
          value: stdout
        - name: aliyun_logs_log-varlog
          value: /log/*.log
        - name: aliyun_logs_log_tags
          value: tag1=v1
        volumeMounts:
        - name: volumn-sls
          mountPath: /log
      volumes:
      - name: volumn-sls
        emptyDir: {}

```

- Specify the following configurations in sequence to fit your needs:
- Use environment variables to configure log collection and custom tags. All environment variables must be prefixed with `aliyun_logs_`.
- Log collection is configured in the following format:

```

- name: aliyun_logs_{Logstore name}
  value: {Log path}

```

In the preceding example, two environment variables are used to configure log collection. The environment variable `aliyun_logs_log-stdout` instructs the system to create a Logstore named `log-stdout`. The Logstore collects standard output logs from the container in the pod.

 **Note** A Logstore name cannot contain underscores (`_`). You can use hyphens (`-`) instead.

- Custom tags are configured in the following format:

```
- name: aliyun_logs_{Tag name without underscores (_)}_tags
  value: {Tag name}={Tag value}
```

After a custom tag is set, it is automatically appended to certain log fields when the Logstore collects logs from the container.

- If you specify a log path to collect log data other than standard output log data, you must add the volumeMounts field.

In the preceding example, the volumeMounts field is added and set to `/var/log`. This allows the specified Logstore to collect `/var/log/*.log` files.

3. After you edit the YAML template, click **Create** to submit the configurations.

Advanced configurations

You can set more environment variables to apply advanced configurations to log collection. The following table provides details of these variables.

Variable	Description	Example	Note
aliyun_logs_{key}	<ul style="list-style-type: none"> • Required. The key field can contain lowercase letters, digits, and hyphens (-), and cannot contain underscores (_). • If the environment variable aliyun_logs_{key}_logstore is not set, a Logstore named {key} is created to collect logs. • To collect standard output logs of the container, set the value to stdout. You can also set the value to another Logstore path. 	<pre>- name: aliyun_logs_catalina stdout - name: aliyun_logs_access-log /var/log/nginx/access.log</pre>	<ul style="list-style-type: none"> • By default, the simple mode is used to collect logs. To parse logs, we recommend that you use the Log Service console. • The key field must be set to a unique value in the cluster.
aliyun_logs_{key}_tags	Optional. This variable is used to add tags to log data. The value must be in the following format: {tag-key}={tag-value}.	<pre>- name: aliyun_logs_catalina_tags app=catalina</pre>	-
aliyun_logs_{key}_project	Optional. This variable specifies a project in Log Service. By default, the project that you specified when you create the cluster is used to manage related logs and resources in Log Service.	<pre>- name: aliyun_logs_catalina_project my-k8s-project</pre>	The region of the project must be the same as where your Logtail is located.

Variable	Description	Example	Note
aliyun_logs_{key}_logstore	Optional. This variable specifies a Logstore in Log Service. By default, the Logstore is named after {key}.	<pre>- name: aliyun_logs_ca talina_tags my-logstore</pre>	-
aliyun_logs_{key}_shard	Optional. This variable specifies the number of shards in the Logstore. Valid values: 1 to 10. Default value: 2.	<pre>- name: aliyun_logs_ca talina_shard 4</pre>	-
aliyun_logs_{key}_ttl	Optional. This variable specifies the number of days for which log data is retained. Valid values: 1 to 3650. <ul style="list-style-type: none"> To retain log data permanently, set the value to 3650. Default value: 90. 	<pre>- name: aliyun_logs_ca talina_ttl 3650</pre>	-
aliyun_logs_{key}_machine group	Optional. This variable specifies the machine group of the application. By default, the machine group is the one where your Logtail is located.	<pre>- name: aliyun_logs_ca talina_machinegroup my-machine-group</pre>	-

- Scenario 1: Collect logs from multiple applications and store them in the same Logstore

In this scenario, you can set the `aliyun_logs_{key}_logstore` variable. The following example shows how to collect standard output logs from two applications and store them in `stdout-logstore`.

Set the following environment variables for Application 1:

```
##### Set environment variables #####
- name: aliyun_logs_app1-stdout
  value: stdout
- name: aliyun_logs_app1-stdout_logstore
  value: stdout-logstore
```

Set the following environment variables for Application 2:

```
##### Set environment variables #####
- name: aliyun_logs_app2-stdout
  value: stdout
- name: aliyun_logs_app2-stdout_logstore
  value: stdout-logstore
```

- Scenario 2: Collect logs from different applications and store them separately in different projects

In this scenario, perform the following steps:

- i. Create a machine group in each project and set the machine group ID in the following format: k8s-group-{cluster-id}, where {cluster-id} is the ID of the cluster. You can customize machine group names.
- ii. Specify the project, Logstore, and machine group in the environment variables for each application.

```
##### Set environment variables #####  
- name: aliyun_logs_app1-stdout  
  value: stdout  
- name: aliyun_logs_app1-stdout_project  
  value: app1-project  
- name: aliyun_logs_app1-stdout_logstore  
  value: app1-logstore  
- name: aliyun_logs_app1-stdout_machinegroup  
  value: app1-machine-group
```

View log data

To view log data, perform the following steps:

1. Log on to the Log Service console. For more information, see [Activate Log Service](#).
2. Select the target project. By default, the project ID is k8s-log-{Cluster ID}.
3. In the list of Logstores, find the target Logstores and click Search in the Log Search column for each Logstore. In this example, the Logstores are log-stdout and log-varlog.
4. On the Raw Logs tab, you can view raw logs in log-stdout and log-varlog.

4.Auto Scaling (ESS)

4.1. What is ESS?

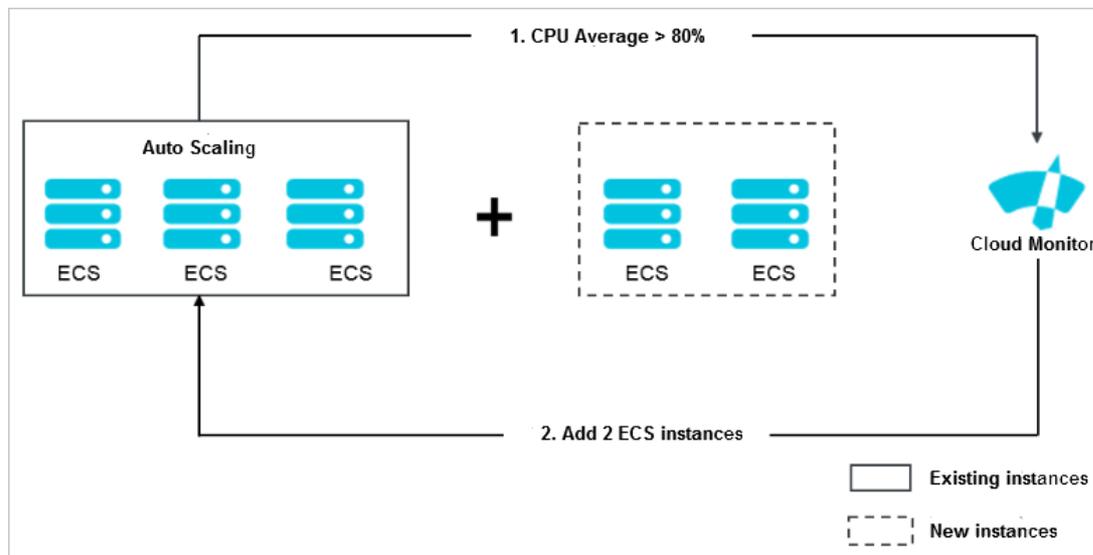

Auto Scaling (ESS) is a management service that automatically adjusts your elastic computing resources based on your business needs and policies.

When business loads increase, ESS automatically adds ECS instances based on the scaling rules that you configured to ensure sufficient computing capabilities. When business loads decrease, ESS automatically removes ECS instances to save costs.

ESS provides the following features:

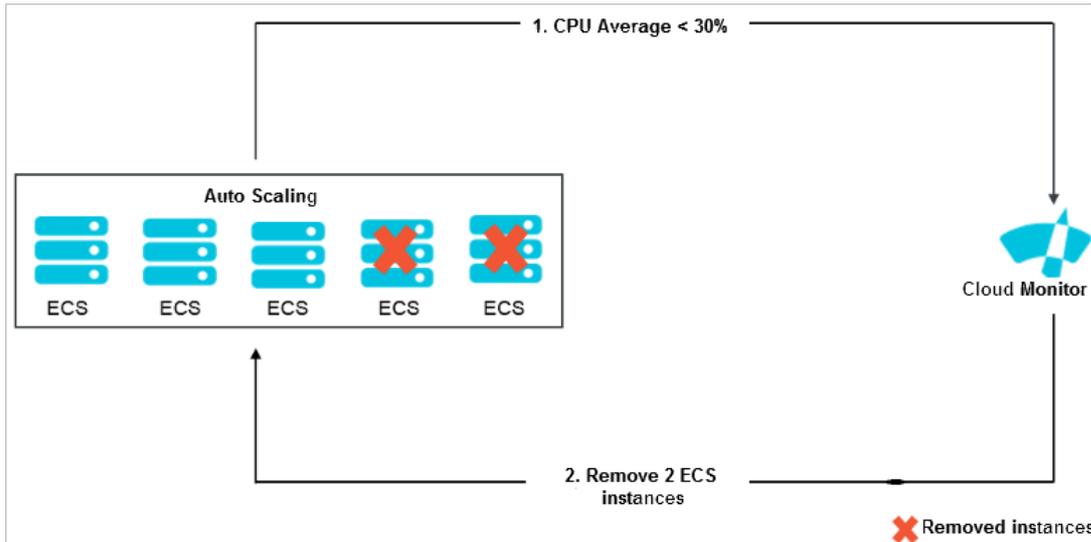

- Scale-out

When business loads surge above normal loads, ESS automatically increases underlying resources. This helps maintain access speed and ensure that resources are not overloaded. For example, if the CPU utilization of ECS instances exceeds 80%, ESS scales out ECS resources based on the rules that you configured. During the scale-out event, ESS automatically creates and adds ECS instances to the scaling group, and adds the new instances to the backend server groups of the associated SLB instances and the whitelists of the associated ApsaraDB for RDS instances. The following figure shows the implementation of a scale-out event.

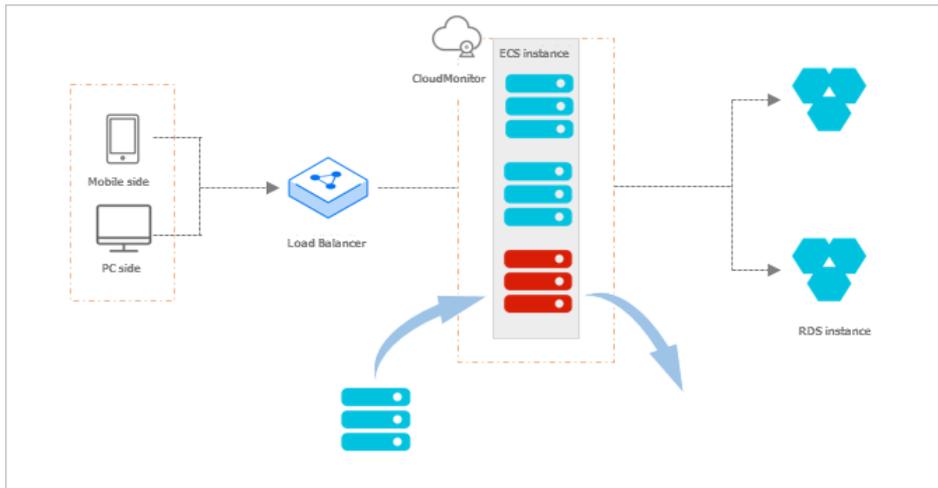

- Scale-in

When your business loads decrease, ESS automatically releases underlying resources to prevent resource wastes and reduce costs. For example, if the CPU utilization of ECS instances in a scaling group is less than 30%, ESS automatically scales in ECS instances based on the scaling rules that you specified. During the scale-in event, ESS removes ECS instances from the scaling group and also from the backend server groups of the associated SLB instances and the whitelists of the associated ApsaraDB for RDS instances. The following figure shows the implementation of a scale-in event.

• Elastic recovery

If an ECS instance in a scaling group is not in the Running state, ESS considers the instance to be unhealthy. If an ECS instance is considered unhealthy, ESS automatically releases the instance and creates a new one. This process is called elastic recovery. It ensures that the number of healthy ECS instances in a scaling group will not fall below the minimum number of ECS instances that you specified for the scaling group. The following figure shows the implementation of elastic recovery.

4.2. Notes

4.2.1. Precautions

This topic describes the precautions when you use Auto Scaling (ESS).

Scaling rules

ESS uses scaling rules to scale ECS instances in a scaling group based on the minimum and maximum numbers of ECS instances specified for the scaling group. Assume that a scaling group can contain up to 45 ECS instances. If you configure a scaling rule to increase the number of ECS instances in the scaling group to 50, ESS only increases the number of ECS instances to 45 at most.

Scaling activities

- Only one scaling activity can be executed at a time in a scaling group.
- An ongoing scaling activity cannot be terminated. For example, if a scaling activity is being executed to

create 20 ECS instances but only five have been created, you cannot forcibly terminate the scaling activity.

- If some ECS instances fail to be added to a scaling group during a scaling activity, ESS considers that the scaling activity is complete without trying to add the failed instances to the scaling group. ESS rolls back the ECS instances that fails to be added but not the scaling activity. For example, if ESS has created 20 ECS instances for a scaling group, and 19 of the instances are added to SLB instances, only the one ECS instance that failed to be added is automatically released.

Cooldown period

- During the cooldown period, if you manually execute a scaling task, such as a scaling rule or scheduled task, the task is immediately executed without waiting for the cooldown period to expire.
- The cooldown period starts after the last ECS instance is added to or removed from a scaling group during a scaling activity.

4.2.2. Manual intervention

If you manually intervene with Auto Scaling (ESS) operations, ESS will process the intervention accordingly.

ESS does not prevent you from performing manual intervention, such as deleting automatically created ECS instances in the ECS console. The following table describes how ESS processes manual intervention.

Resource	Manual intervention type	Processing method
ECS	A user deletes an ECS instance from a scaling group by using the ECS console or calling API operations.	ESS performs health checks to determine whether the ECS instance is unhealthy. If the instance is unhealthy, ESS removes it from the scaling group. The internal IP address of the ECS instance is not automatically deleted from the whitelist of the associated ApsaraDB for RDS (RDS) instance. After the ECS instance is removed, if the number of instances (Total Capacity) in the scaling group is less than the minimum number of instances (MinSize), ESS automatically creates and adds ECS instances to the group until the number of instances is equal to the minimum number of instances (MinSize).
ECS	A user revokes the ECS API permissions granted to ESS.	ESS rejects all scaling activity requests.
SLB	A user manually removes an ECS instance from an SLB instance by using the SLB console or calling API operations.	ESS does not automatically detect this action or handle such exceptions. The ECS instance remains in the scaling group. If this instance is selected based on the removal policy during a scale-in event, the instance is released.
SLB	A user manually deletes an SLB instance or disables the health check feature for an SLB instance by using the SLB console or calling API operations.	ESS does not add ECS instances to scaling groups that are associated with this SLB instance. Scaling tasks can trigger scaling rules to remove ECS instances from the scaling groups. ECS instances that are considered unhealthy through the health check feature are also removed from the scaling groups.
SLB	An SLB instance is unavailable because of system-related reasons.	All scaling activities fail except for instance removal tasks that are manually executed.
SLB	A user revokes the SLB API permissions granted to ESS.	ESS rejects all scaling activity requests for scaling groups that are associated with SLB instances.

Resource	Manual intervention type	Processing method
RDS	A user manually removes the IP address of an ECS instance from the whitelist of the associated RDS instance by using the RDS console or calling API operations.	ESS does not automatically detect this action or handle such exceptions. The ECS instance remains in the scaling group. If this instance is selected based on the removal policy during a scale-in event, the instance is released.
RDS	A user manually deletes an RDS instance by using the RDS console or calling API operations.	ESS does not add ECS instances that are associated with this RDS instance to scaling groups. Scaling tasks can trigger scaling rules to remove ECS instances from the scaling groups. ECS instances that are considered unhealthy through the health check feature are also removed from the scaling groups.
RDS	An RDS instance is unavailable because of system-related reasons.	All scaling activities fail except for instance removal tasks that are manually executed.
RDS	A user revokes the RDS API permissions granted to ESS.	ESS rejects all scaling activity requests for the scaling groups associated with RDS instances.

4.2.3. Limits

This topic describes the limits of ESS.

- ECS instances that are created by ESS cannot be automatically added to whitelists of ApsaraDB for Memcache instances. For more information about ApsaraDB for Memcache instances, see *ApsaraDB for Memcache Product Introduction*.
- ESS does not support vertical scaling. It can only scale the number of ECS instances. The CPU, memory, and bandwidth configurations of ECS instances cannot be automatically adjusted.
- The following table describes the quantity limits that are applied to a scaling group.

Item	Quota
Scaling configuration	You can create a maximum of 10 scaling configurations for a scaling group.
Scaling rule	You can create a maximum of 50 scaling rules for a scaling group.
ECS instance	A scaling group can contain a maximum of 1,000 ECS instances.

4.2.4. Scaling group status

This topic describes the states of a scaling group in the console and in an API operation.

State in the console	State in an API operation
Creating	Inactive
Created	Inactive
Enabling	Inactive
Enabled	Active
Disabling	Inactive
Disabled	Inactive

State in the console	State in an API operation
Deleting	Deleting

4.2.5. Scaling activity process

Before you use ESS, you must understand the processes related to scaling activities.

Automatic scaling of a scaling group

- Automatic scale-out
 - i. Check the health status and boundary conditions of the scaling group.
 - ii. Assign the activity ID and execute the scaling activity.
 - iii. Create ECS instances.
 - iv. Modify Total Capacity.
 - v. Assign IP addresses to the created ECS instances.
 - vi. Add the ECS instances to the whitelist of the associated ApsaraDB for RDS instance.
 - vii. Start ECS instances.
 - viii. Associate the ECS instances with an SLB instance and set the weight to the SLB weight value that is specified when the scaling configuration is created.
 - ix. After the scaling activity is complete, the cooldown period starts.
- Automatic scale-in
 - i. Check the health status and boundary conditions of the scaling group.
 - ii. Assign the activity ID and execute the scaling activity.
 - iii. Remove ECS instances from the associated SLB instance.
 - iv. Stop the ECS instances.
 - v. Remove the ECS instances from the whitelist of the associated ApsaraDB for RDS instance.
 - vi. Release the ECS instances.
 - vii. Modify Total Capacity.
 - viii. After the scaling activity is complete, the cooldown period starts.

Manually add or remove existing ECS instances

- Manually add instances
 - i. Check the health status and boundary conditions of the scaling group, and check the status and type of ECS instances.
 - ii. Assign the activity ID and execute the scaling activity.
 - iii. Add ECS instances.
 - iv. Modify Total Capacity.
 - v. Add the ECS instances to the whitelist of the associated ApsaraDB for RDS instance.
 - vi. Associate the ECS instances with an SLB instance and set the weight to the SLB weight value that is specified in the active scaling configuration.

 **Note** If you want to manually add an instance to a scaling group, its instance type must be the same as that specified in the active scaling configuration of the scaling group. Therefore, you must set the weight to the SLB weight value that is specified in the active scaling configuration.

- vii. After the scaling activity is complete, the cooldown period starts.
- Manually remove instances

- i. Check the health status and boundary conditions of the scaling group.
- ii. Assign the activity ID and execute the scaling activity.
- iii. SLB stops forwarding traffic to ECS instances.
- iv. Remove the ECS instances from SLB after 60 seconds.
- v. Remove the ECS instances from the whitelist of the associated ApsaraDB for RDS instance.
- vi. Modify Total Capacity.
- vii. Remove the ECS instances from the scaling group.
- viii. After the scaling activity is complete, the cooldown period starts.

4.2.6. Remove unhealthy ECS instances

Before you use ESS, you must understand information about the removal of unhealthy ECS instances.

After an ECS instance is added to a scaling group, ESS checks the status of the instance on a regular basis. If the ECS instance is not in the Running state, ESS removes the ECS instance from the scaling group. The removal method depends on how the ECS instance is added:

- If an ECS instance is automatically created, ESS immediately removes and releases it.
- If an ECS instance is manually added, ESS immediately removes it, but does not stop or release it.

The removal of unhealthy ECS instances is not limited by the MinSize value. After the unhealthy ECS instances are removed, the number of ECS instances (Total Capacity) may fall below the MinSize value. In this case, ESS automatically creates ECS instances based on the difference between the actual instance number and MinSize value to ensure that the total number of ECS instances is equal to the MinSize value.

4.2.7. Instance rollback after a failed scaling activity

Before you use ESS, you must understand the mechanism of instance rollback after a failed scaling activity.

If some ECS instances fail to be added to a scaling group during a scaling activity, ESS considers that the scaling activity is complete without trying to add the failed instances to the scaling group. ESS rolls back ECS instances, not the scaling activity.

For example, if a scaling group has created 20 ECS instances, and 19 of the instances are added to SLB instances, only the one ECS instance that failed to be added is automatically released.

4.2.8. Instance lifecycle management

Before you use Auto Scaling (ESS), you must understand concepts related to the instance lifecycle.

Automatically created ECS instances

ECS instances are automatically created by ESS based on user-defined scaling configurations and rules.

ESS manages the entire lifecycle of automatically created ECS instances. ESS creates ECS instances during scale-out events, and stops and releases them during scale-in events.

Manually added ECS instances

ECS instances are manually added to a scaling group.

ESS does not manage the entire lifecycle of manually added ECS instances. These instances are not automatically created by ESS, but are manually added by a user to a scaling group. If the ECS instances are manually or automatically removed from the scaling group, ESS removes the instances but does not stop or release them.

Instance status

An ECS instance in a scaling group goes through the following states during its lifecycle:

- **Pending:** The ECS instance is being added to the scaling group. The instance is being created, added to an SLB instance, or added to the whitelist of the associated ApsaraDB RDS instance.

- **InService:** The ECS instance is added to the scaling group and is providing services normally.
- **Removing:** The ECS instance is being removed from the scaling group.

Instance health status

An ECS instance in a scaling group has the following health states:

- **Healthy**
- **Unhealthy**

If an ECS instance is not in the Running state, ESS considers the instance to be unhealthy and automatically removes it from the scaling group.

- ESS stops and releases automatically created ECS instances.
- ESS does not stop or release manually added ECS instances.

4.3. Quick start

4.3.1. Overview

This topic describes how to create a scaling group and how to add or remove ECS instances.

You can perform the following steps to create a scaling group, and add or remove ECS instances.

1. **Create a scaling group**

Set the parameters for the scaling group, such as the Maximum Capacity and Minimum Capacity of ECS instances.

2. **Create a scaling configuration**

Set the parameters for the scaling configuration, such as Instance Type and Image.

3. **Enable a scaling group**

Enable the scaling group after creating the scaling configuration.

4. **Create a scaling rule**

Specify how to add or remove ECS instances. For example, add an ECS instance to a scaling group.

5. **Create a scheduled task**

Create scheduled tasks to add or remove instances at a specified time point. Auto Scaling executes the scheduled tasks and scaling rules at the specified time. For example, Auto Scaling can trigger a task to execute a specific scaling rule at 08:00 everyday.

4.3.2. Log on to the Auto Scaling console

This topic describes how to log on to the Auto Scaling console.

Prerequisites

- The domain name of the ASCM console is obtained from the deployment personnel before you log on to the ASCM console.
- A browser is available. We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL used to log on to the ASCM console. Press the Enter key.
2. Enter your username and password.

Obtain the username and password used to log on to the console from the operations administrator.

Note When you log on to the ASCM console for the first time, you must change the password of your username. For security reasons, your password must meet the minimum complexity requirements. The password must be 8 to 20 characters in length and must contain at least two of the following character types:

- Uppercase or lowercase letters.
- Digits.
- Special characters. Special characters include exclamation points (!), at signs (@), number signs (#), dollar signs (\$), and percent signs (%).

3. Click **Login** to go to the ASCM console homepage.
4. In the top navigation bar, choose **Products > Elastic Computing > Auto Scaling**.

4.3.3. Create a scaling group

This topic describes how to create a scaling group. A scaling group is a group of ECS instances that is dynamically scaled based on the configured scenario. You can specify the minimum and maximum numbers of ECS instances in a scaling group.

Prerequisites

- A VPC and a VSwitch are created. For more information, see *Create a VPC and a VSwitch in VPC User Guide*.
- To associate a scaling group with SLB instances, make sure that the following requirements are met:
 - You have one or more SLB instances in the **Running** state.
 - The SLB instances and the scaling group are in the same organization, resource set, and region.
- To associate a scaling group with ApsaraDB for RDS (RDS) instances, make sure that the following requirements are met:
 - You have one or more RDS instances in the **Running** state.
 - The RDS instances and the scaling group are in the same organization, resource set, and region.

Procedure

1. **Log on to the Auto Scaling console.**
2. In the top navigation bar, select an organization, a resource set, and a region.
3. Click **Create Scaling Group**.
4. Configure parameters for the scaling group.

Parameter	Required	Description
Scaling Group	Yes	The name of the scaling group. It must be 2 to 40 characters in length and can contain letters, digits, underscores (_), hyphens (-), and periods (.). It must start with a letter or digit.
Organization/Resource Group	Yes	The organization and resource set to which the scaling group belongs.
Maximum Capacity	Yes	The maximum number of instances that a scaling group can contain. This helps control costs within an expected amount. Valid values: 0 to 1000.

Parameter	Required	Description
Minimum Capacity	Yes	<p>The minimum number of instances that a scaling group must contain. Set the value based on business needs to ensure service availability. When the scaling group is enabled, Auto Scaling automatically creates this number of ECS instances.</p> <p>Valid values: 0 to 1000.</p>
Cooldown (seconds)	Yes	<p>The period during which Auto Scaling cannot execute any new scaling activities. This occurs after the scaling group executes a successful scaling activity. During the cooldown period, Auto Scaling rejects all scaling activity requests triggered by event-triggered tasks from Cloud Monitor. However, scaling activities triggered by other types of tasks, such as manually triggered tasks and scheduled tasks are not limited by the cooldown period. These tasks are immediately executed.</p> <p>The value must be an integer that is greater than or equal to zero. Unit: seconds.</p>
Scale-In Policy	No	<p>The policy for automatically removing ECS instances from the scaling group. This parameter contains two steps.</p> <p>Valid values for the first step:</p> <ul style="list-style-type: none"> ◦ Oldest Instance ◦ Newest Instances ◦ Instance with Oldest Scaling Configuration <p>Valid values for the second step:</p> <ul style="list-style-type: none"> ◦ None ◦ Oldest Instance ◦ Newest Instances <p>For example, you can select Instance with Oldest Scaling Configuration for the first step and select Oldest Instance for the second step. This indicates that Auto Scaling filters ECS instances to find the ones that were created based on the earliest scaling configuration, and then filters instances to find the ones that were added to the scaling group at the earliest point in time.</p>
Region/VPC	Yes	The region and VPC to which the scaling group belongs.
VSwitch	Yes	The ID of the VSwitch with which the scaling group is associated.

Parameter	Required	Description
Associate SLB Instances	No	<p>After you associate SLB instances with the scaling group, ECS instances that are added to the scaling group will be automatically added as SLB backend servers. You can specify a server group for the ECS instances. The following section describes two available server groups:</p> <ul style="list-style-type: none"> Default server group: the group of ECS instances that are used to receive requests. If the listener is not configured with a VServer group or a primary/secondary server group, requests are forwarded to the ECS instances in the default server group. VServer group: If you want to distribute different requests to different backend servers or configure domain name- or URL-based routing methods, you can use VServer groups.
Associate RDS Instances	No	<p>After you associate RDS instances with the scaling group, the internal IP addresses of ECS instances that are added to the scaling group will be automatically added to the whitelists of the RDS instances to allow internal communication.</p>

5. Click OK.

Result

The created scaling group is displayed in the scaling group list but is in the **Disabled** state. To enable the scaling group, you must create scaling configurations. For more information, see [Create a scaling configuration](#).

4.3.4. Create a scaling configuration

This topic describes how to create a scaling configuration for a scaling group.

Prerequisites

At least one security group is available. If you do not have any security groups, create a security group. For more information, see [Create a security group](#) in *ECS User Guide*.

Context

You can create only a limited number of scaling configurations for a scaling group. For more information, see the [Limits](#) topic in *Auto Scaling Product Introduction*.

Procedure

1. [Log on to the Auto Scaling console](#).
2. In the top navigation bar, select an organization, a resource set, and a region.
3. Find the target scaling group and click the name of the scaling group in the **Scaling Group Name/ID** column.
4. In the left-side navigation pane, click **Scaling Configuration**.
5. Choose **Create > Create Scaling Configuration**.
6. Configure parameters for the scaling configuration.

Section	Parameter	Required	Description
Region	Region	Yes	The region where the ECS instance is located.

Region Section	Parameter	Required	Description
	Zone	Yes	The zone where the ECS instance is located.
Security Group	Security Group	Yes	The security group to which the ECS instance belongs.
Instance	Instance Family	Yes	The instance family to which the ECS instance belongs.
	Instance Type	Yes	The instance type of the ECS instance.
Image	Image Type	Yes	<ul style="list-style-type: none"> ◦ Public Image: Public images provided by Alibaba Cloud are fully licensed to offer a secure and stable operating environment for applications on ECS instances. ◦ Custom Image: You can create custom images to install software or deploy projects that have special requirements.
Storage	System Disk	Yes	Specify the category and size of the system disk. The operating system is installed on the system disk. You can select Ultra Disk or Standard SSD .
	Data Disk	No	Specify the category and size of the data disk. You can select Ultra Disk or Standard SSD . You can add a maximum of 16 data disks. The maximum capacity of each data disk is 32 TiB. You can set Release with Instance and Encrypt for each data disk.
Password	Set Password	Yes	<p>Select when to set password. You can select Now or Later.</p> <p>If you select Later, you can use the Change Password feature in the console to set the password. For more information, see the Change Password topic in <i>ECS User Guide</i>.</p>

Section	Parameter	Required	Description
	Logon Password	No	The password used to log on to the ECS instance. The password must be 8 to 30 characters in length and must contain at least three of the following character types: digits, uppercase letters, lowercase letters, and special characters.  Note The password is used to log on to the operating system and is not the VNC password.
	Confirm Password	No	Enter the password again.
Deployment Set	Deployment Set	No	The deployment set to which the instance belongs.
Instance Name	Configuration Name	No	The name of the scaling configuration.
	Instance Name	No	The name of the ECS instance.
User Data	User Data	No	Windows supports two formats: Bat and Powershell. Before you perform Base64 encoding, make sure to include <code>[bat]</code> or <code>[powershell]</code> as the first line. You can run shell scripts for Linux ECS instances.
Quantity	Quantity	No	The number of instances to purchase.

7. Click **Submit**.

Result

After the scaling configuration is created, it is in the **Disabled** state and is displayed in your scaling configuration list. To automatically create ECS instances, you must apply a scaling configuration. For more information, see [Apply a scaling configuration](#).

4.3.5. Enable a scaling group

This topic describes how to enable a scaling group. You can enable a scaling group to trigger scaling activities.

Prerequisites

- The scaling group is in the **Disabled** state.
- The scaling group has a scaling configuration that is in the **Enable** state.

Procedure

1. [Log on to the Auto Scaling console](#).
2. In the top navigation bar, select an organization, a resource set, and a region.
3. Find the target scaling group and click **Enable** in the **Actions** column.

4. Click **OK**.

Result

In the **Status** column, the state of the scaling group is changed from **Disabled** to **Enable**.

4.3.6. Create a scaling rule

This topic describes how to create a scaling rule. You can create scaling rules to add or remove ECS instances. For example, you can add an ECS instance to a scaling group.

Context

- You can create only a limited number of scaling rules for a scaling group. For more information, see the **Limits** topic in *Auto Scaling Product Introduction*.
- After a scaling rule is executed, the resulting number of ECS instances in the scaling group may fall outside of the specified range. In this case, Auto Scaling automatically adjusts the number of ECS instances to ensure that the number of ECS instances in the scaling group is within the specified range.

Procedure

1. **Log on to the Auto Scaling console.**
2. In the top navigation bar, select an organization, a resource set, and a region.
3. Find the target scaling group and click the name of the scaling group in the **Scaling Group Name/ID** column.
4. In the left-side navigation pane, click **Scaling Rules**.
5. Click **Create Scaling Rule**.
6. Configure parameters for the scaling rule.

Parameter	Required	Description
Rule Name	Yes	The name of the scaling rule. It must be 2 to 64 characters in length and can contain letters, digits, underscores (_), hyphens (-), and periods (.). It must start with a letter or digit.
Scaling Activity	Yes	The operation that is performed when the scaling rule is triggered. The operations include: <ul style="list-style-type: none"> ◦ Change to N instances: After the scaling rule is executed, the number of instances in the scaling group is changed to N. ◦ Add N instances: After the scaling rule is executed, N instances are added to the scaling group. ◦ Remove N instances: After the scaling rule is executed, N instances are removed from the scaling group.
Default Cooldown (Seconds)	No	The cooldown period. If this parameter is not specified, the default value is used.

7. Click **OK**.

4.3.7. Create a scheduled task

This topic describes how to create a scheduled task to scale computing resources in response to predictable business changes in the future. Scheduled tasks enable the system to automatically obtain sufficient computing resources before business peaks and release idle computing resources after the peaks.

Context

A scheduled task is preconfigured to execute the specified scaling rule at the specified time in the future. When the specified time arrives, the scheduled task automatically scales computing resources. This allows you to reduce costs and also meet business requirements. You can also specify the recurrence for scheduled tasks if business changes are regular.

If multiple scheduled tasks need to be executed in one minute, Auto Scaling executes the most recently created scheduled task.

Procedure

1. [Log on to the Auto Scaling console.](#)
2. In the left-side navigation pane, choose **Scaling Tasks > Scheduled Tasks**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Click **Create Scheduled Task**.
5. In the dialog box that appears, configure parameters for the scheduled task.

Parameter	Required	Description
Task Name	Yes	The name of the scheduled task. The name must be 2 to 64 characters in length and can contain letters, digits, underscores (_), hyphens (-), and periods (.). It must start with a letter or digit.
Description	Yes	The description of the scheduled task.
Organization/Resource Group	Yes	The organization and resource set to which the scheduled task belongs.
Start Time	Yes	The time when the scheduled task is executed.
Scaling Rules	Yes	The scaling group to be monitored and the scaling rule to be executed.
Retry Expiry Time	No	The period of time during which the system retries to execute the scheduled task. Unit: seconds. If a scaling activity fails to be executed at the specified time, Auto Scaling will execute the scheduled task again within the period of time that is specified by the Retry Expiry Time parameter.
Recurrence Settings	No	Specifies whether to execute the scheduled task repeatedly. Select Recurrence Settings and set the Recurrence and Expire parameters. The recurrence options include Daily , Weekly , and Monthly .

6. Click **OK**.

Result

The scheduled task that you created is displayed in the scheduled task list.

4.3.8. Create an event-triggered task

This topic describes how to create an event-triggered task associated with monitoring metrics in response to emergent or unpredictable business changes. After you create and enable an event-triggered task, Auto Scaling collects data for the specified metric in real time, and triggers an alert when the specified condition is met. Then, Auto Scaling executes the scaling rule to dynamically scale ECS instances in the scaling group.

Procedure

1. [Log on to the Auto Scaling console.](#)
2. In the left-side navigation pane, choose **Event-driven Tasks > Alert Tasks**.

3. In the top navigation bar, select an organization, a resource set, and a region.
4. Click **Create Alert**.
5. In the dialog box that appears, configure parameters for the event-triggered task.

Parameter	Required	Description
Task Name	Yes	The name of the event-triggered task. It must be 2 to 40 characters in length and can contain letters, digits, underscores (_), hyphens (-), and periods (.). It must start with a letter or digit.
Description	No	The description of the event-triggered task.
Organization/Resource Group	Yes	The organization and resource set in which to create the event-triggered task.
Monitoring Metrics/Scaling Rules	Yes	The scaling group to be monitored and the scaling rule to be executed.
Monitoring Type	Yes	System-Level Monitoring is selected by default.
Monitoring Metrics	Yes	The metrics that you want to monitor. Valid values: <ul style="list-style-type: none"> ◦ Average CPU Utilization ◦ Memory Usage ◦ Outbound Traffic ◦ Inbound Traffic
Monitoring Period	Yes	The period during which data is aggregated and analyzed. The shorter the period, the higher the frequency that the alert is triggered. Unit: minutes. Valid values: <ul style="list-style-type: none"> ◦ 1 ◦ 2 ◦ 5 ◦ 15
Statistic	Yes	The rule that determines whether to trigger an alert. Select Average , Max Capacity , or Min Capacity , and specify a threshold value. For example, alerts are triggered when the CPU utilization exceeds 80%: <ul style="list-style-type: none"> ◦ Average: Alerts are triggered when the average CPU utilization of all ECS instances in the scaling group exceeds 80%. ◦ Max Capacity: Alerts are triggered when the highest CPU utilization among the ECS instances in the scaling group exceeds 80%. ◦ Min Capacity: Alerts are triggered when the lowest CPU utilization among the ECS instances in the scaling group exceeds 80%.
Alert after occurrences	Yes	The consecutive number of times that the threshold must be exceeded before the alert is triggered. Valid values: <ul style="list-style-type: none"> ◦ 1 ◦ 2 ◦ 3 ◦ 5

- Click **OK**.

4.4. Scaling groups

4.4.1. Create a scaling group

This topic describes how to create a scaling group. A scaling group is a group of ECS instances that is dynamically scaled based on the configured scenario. You can specify the minimum and maximum numbers of ECS instances in a scaling group.

Prerequisites

- A VPC and a VSwitch are created. For more information, see *Create a VPC and a VSwitch* in *VPC User Guide*.
- To associate a scaling group with SLB instances, make sure that the following requirements are met:
 - You have one or more SLB instances in the **Running** state.
 - The SLB instances and the scaling group are in the same organization, resource set, and region.
- To associate a scaling group with ApsaraDB for RDS (RDS) instances, make sure that the following requirements are met:
 - You have one or more RDS instances in the **Running** state.
 - The RDS instances and the scaling group are in the same organization, resource set, and region.

Procedure

- [Log on to the Auto Scaling console](#).
- In the top navigation bar, select an organization, a resource set, and a region.
- Click **Create Scaling Group**.
- Configure parameters for the scaling group.

Parameter	Required	Description
Scaling Group	Yes	The name of the scaling group. It must be 2 to 40 characters in length and can contain letters, digits, underscores (_), hyphens (-), and periods (.). It must start with a letter or digit.
Organization/Resource Group	Yes	The organization and resource set to which the scaling group belongs.
Maximum Capacity	Yes	The maximum number of instances that a scaling group can contain. This helps control costs within an expected amount. Valid values: 0 to 1000.
Minimum Capacity	Yes	The minimum number of instances that a scaling group must contain. Set the value based on business needs to ensure service availability. When the scaling group is enabled, Auto Scaling automatically creates this number of ECS instances. Valid values: 0 to 1000.

Parameter	Required	Description
Cooldown (seconds)	Yes	<p>The period during which Auto Scaling cannot execute any new scaling activities. This occurs after the scaling group executes a successful scaling activity. During the cooldown period, Auto Scaling rejects all scaling activity requests triggered by event-triggered tasks from Cloud Monitor. However, scaling activities triggered by other types of tasks, such as manually triggered tasks and scheduled tasks are not limited by the cooldown period. These tasks are immediately executed.</p> <p>The value must be an integer that is greater than or equal to zero. Unit: seconds.</p>
Scale-In Policy	No	<p>The policy for automatically removing ECS instances from the scaling group. This parameter contains two steps.</p> <p>Valid values for the first step:</p> <ul style="list-style-type: none"> ◦ Oldest Instance ◦ Newest Instances ◦ Instance with Oldest Scaling Configuration <p>Valid values for the second step:</p> <ul style="list-style-type: none"> ◦ None ◦ Oldest Instance ◦ Newest Instances <p>For example, you can select Instance with Oldest Scaling Configuration for the first step and select Oldest Instance for the second step. This indicates that Auto Scaling filters ECS instances to find the ones that were created based on the earliest scaling configuration, and then filters instances to find the ones that were added to the scaling group at the earliest point in time.</p>
Region/VPC	Yes	The region and VPC to which the scaling group belongs.
VSwitch	Yes	The ID of the VSwitch with which the scaling group is associated.
Associate SLB Instances	No	<p>After you associate SLB instances with the scaling group, ECS instances that are added to the scaling group will be automatically added as SLB backend servers. You can specify a server group for the ECS instances. The following section describes two available server groups:</p> <ul style="list-style-type: none"> ◦ Default server group: the group of ECS instances that are used to receive requests. If the listener is not configured with a VServer group or a primary/secondary server group, requests are forwarded to the ECS instances in the default server group. ◦ VServer group: If you want to distribute different requests to different backend servers or configure domain name- or URL-based routing methods, you can use VServer groups.

Parameter	Required	Description
Associate RDS Instances	No	After you associate RDS instances with the scaling group, the internal IP addresses of ECS instances that are added to the scaling group will be automatically added to the whitelists of the RDS instances to allow internal communication.

5. Click **OK**.

Result

The created scaling group is displayed in the scaling group list but is in the **Disabled** state. To enable the scaling group, you must create scaling configurations. For more information, see [Create a scaling configuration](#).

4.4.2. Enable a scaling group

This topic describes how to enable a scaling group. You can enable a scaling group to trigger scaling activities.

Prerequisites

- The scaling group is in the **Disabled** state.
- The scaling group has a scaling configuration that is in the **Enable** state.

Procedure

1. [Log on to the Auto Scaling console](#).
2. In the top navigation bar, select an organization, a resource set, and a region.
3. Find the target scaling group and click **Enable** in the **Actions** column.
4. Click **OK**.

Result

In the **Status** column, the state of the scaling group is changed from **Disabled** to **Enable**.

4.4.3. View scaling groups

This topic describes how to view the scaling group list and the details of a specific scaling group.

Procedure

1. [Log on to the Auto Scaling console](#).
2. In the top navigation bar, select an organization, a resource set, and a region.
The scaling groups that correspond to the specified organization, resource set, and region are displayed.
3. Select a filter option, enter the corresponding information, and then click **Search**.

You can select multiple filter options to narrow down the search results.

Option	Description
Scaling Group	Enter a scaling group name to search for the scaling group.
Scaling Group ID	Enter a scaling group ID to search for the scaling group.

4. Click the name of the scaling group in the **Scaling Group Name/ID** column.
5. View the details of the specified scaling group.

Parameter	Description
Basic Information	The configurations of the scaling group, such as the scaling group ID, scaling group name, total instances, minimum number of instances, maximum number of instances, and scale-in policy.
ECS Instances	The details of ECS instances, such as the list of automatically created ECS instances, the list of manually added ECS instances, and the number of ECS instances that are in service.
Scaling Activities	All the scaling activities that have been executed in the scaling group.
Scaling Configuration	The information of scaling configurations in the scaling group.
Scaling Rules	The information of scaling rules.

4.4.4. Modify a scaling group

This topic describes how to modify a scaling group. You can modify the parameters of a specific scaling group, such as the minimum and maximum numbers of ECS instances.

Context

After you modify the minimum or maximum number of ECS instances that a scaling group can have, if the number of instances in the scaling group is outside this range, Auto Scaling automatically creates or removes ECS instances until the number of instances are within the range.

Procedure

1. [Log on to the Auto Scaling console.](#)
2. In the top navigation bar, select an organization, a resource set, and a region.
3. Find the target scaling group and click **Edit** in the **Actions** column.
4. Modify the parameters of the scaling group. You can modify the scaling configuration and other parameters, but not the organization and resource set. For more information about other parameters, see [Create a scaling group.](#)
5. Click **OK**.

4.4.5. Disable a scaling group

This topic describes how to disable a scaling group.

Prerequisites

- The scaling group does not have scaling activities in progress.
- The scaling group is in the **Enable** state.

Procedure

1. [Log on to the Auto Scaling console.](#)
2. In the top navigation bar, select an organization, a resource set, and a region.
3. Find the target scaling group and click **Disable** in the **Actions** column.
4. Click **OK**.

Result

The status of the scaling group is changed from **Enable** to **Disabled** in the **Status** column.

4.4.6. Delete a scaling group

This topic describes how to delete a scaling group. When you delete a scaling group, Auto Scaling removes and releases ECS instances that are automatically created, removes ECS instances that are manually added, and deletes the scaling configurations and rules in the scaling group. However, the scheduled tasks and event-triggered tasks that are associated with the scaling group are not deleted.

Procedure

1. [Log on to the Auto Scaling console](#).
2. In the top navigation bar, select an organization, a resource set, and a region.
3. Find the target scaling group and click **Delete** in the **Actions** column.
4. Click **OK**.

4.4.7. View ECS instances

You can view all ECS instances in a scaling group and their states.

Procedure

1. [Log on to the Auto Scaling console](#).
2. In the top navigation bar, select an organization, a resource set, and a region.
3. Find the target scaling group and click the name of the scaling group in the **Scaling Group Name/ID** column.
4. In the left-side navigation pane, click **ECS Instances**.
5. View the details of ECS instances.

Category	Description
Automatically created ECS instances	The ECS instances that are automatically created based on the active scaling configuration when the scaling rule is triggered.
Manually added ECS instances	The ECS instances that are manually added to the specified scaling group.
States of ECS instances in the scaling group	<p>The number of ECS instances in various states. The states include:</p> <ul style="list-style-type: none"> ◦ Total: all ECS instances in the scaling group ◦ In Service: the ECS instances that are in normal use ◦ On Standby: the ECS instances that are on standby ◦ Protected: the ECS instances that are protected ◦ Disabled: the ECS instances that are stopped ◦ Adding: the ECS instances that are being added to the scaling group ◦ Removing: the ECS instances that are being removed from the scaling group

4.4.8. Put an ECS instance into the Standby state

This topic describes how to put an ECS instance into the Standby state. Auto Scaling does not perform health checks on or release ECS instances in the Standby state.

Context

After an ECS instance is put into the Standby state:

- The ECS instance stays in the Standby state until you change its status.
- Auto Scaling stops managing the lifecycle of the ECS instance. You must manually manage the lifecycle of the ECS instance.
- If a scale-in event is triggered, Auto Scaling will not remove the ECS instance.
- When the ECS instance is stopped or restarted, its health check status is not affected.
- To release the ECS instance, you must first remove it from the scaling group.
- If you delete the scaling group, the ECS instance is automatically put out of the Standby state and is released.
- You can also perform other operations on the ECS instance, such as stopping, restarting, changing the instance type of, or changing the operating system of the ECS instance.

Procedure

1. **Log on to the Auto Scaling console.**
2. In the top navigation bar, select an organization, a resource set, and a region.
3. Find the target scaling group and click the name of the scaling group in the **Scaling Group Name/ID** column.
4. In the left-side navigation pane, click **ECS Instances**.
5. Select the source of the ECS instance.
 - To select an automatically created ECS instance, click the **Auto Created** tab.
 - To select a manually added ECS instance, click the **Manually Added** tab.
6. Find the target ECS instance and choose **Actions > Switch to Standby** in the **Actions** column.
7. Click **OK**.

4.4.9. Remove an ECS instance from the Standby state

This topic describes how to remove an ECS instance from the Standby state. You can remove an instance from the Standby state to reuse it.

Context

After an ECS instance is removed from the Standby state:

- The ECS instance enters the In Service state.
- When the ECS instance is stopped or restarted, its health status is updated.
- Auto Scaling continues to manage the lifecycle of the ECS instance, and can remove the ECS instance from the scaling group during a scale-in event.

Procedure

1. **Log on to the Auto Scaling console.**
2. In the top navigation bar, select an organization, a resource set, and a region.
3. Find the target scaling group and click the name of the scaling group in the **Scaling Group Name/ID** column.
4. In the left-side navigation pane, click **ECS Instances**.
5. Select the source of the ECS instance.
 - To select an automatically created ECS instance, click the **Auto Created** tab.
 - To select a manually added ECS instance, click the **Manually Added** tab.
6. Find the target ECS instance and choose **Actions > Move Out Of Standby** in the **Actions** column.
7. Click **OK**.

4.4.10. Put an ECS instance into the Protected state

This topic describes how to put an ECS instance into the Protected state. Auto Scaling does not perform health checks on or release ECS instances that are in the Protected state.

Context

After an ECS instance is put into the Protected state:

- The ECS instance stays in the Protected state until you change its status.
- If a scale-in event is triggered, Auto Scaling will not remove the ECS instance. To release the ECS instance, you must remove the ECS instance from the Protected state and then remove it from the scaling group.
- When the ECS instance is stopped or restarted, its health check status is not affected.

Procedure

1. [Log on to the Auto Scaling console](#).
2. In the top navigation bar, select an organization, a resource set, and a region.
3. Find the target scaling group and click the name of the scaling group in the **Scaling Group Name/ID** column.
4. In the left-side navigation pane, click **ECS Instances**.
5. Select the source of the ECS instance.
 - To select an automatically created ECS instance, click the **Auto Created** tab.
 - To select a manually added ECS instance, click the **Manually Added** tab.
6. Find the target ECS instance and choose **Actions > Switch to Protection** in the **Actions** column.
7. Click **OK**.

4.4.11. Remove an ECS instance from the Protected state

This topic describes how to remove an ECS instance from the Protected state. After an ECS instance is removed from the Protected state, Auto Scaling continues to manage the lifecycle of the ECS instance.

Procedure

1. [Log on to the Auto Scaling console](#).
2. In the top navigation bar, select an organization, a resource set, and a region.
3. Find the target scaling group and click the name of the scaling group in the **Scaling Group Name/ID** column.
4. In the left-side navigation pane, click **ECS Instances**.
5. Select the source of the ECS instance.
 - To select an automatically created ECS instance, click the **Auto Created** tab.
 - To select a manually added ECS instance, click the **Manually Added** tab.
6. Find the target ECS instance and choose **Actions > Move Out Of Protection** in the **Actions** column.
7. Click **OK**.

4.5. Scaling configurations

4.5.1. Create a scaling configuration

This topic describes how to create a scaling configuration for a scaling group.

Prerequisites

At least one security group is available. If you do not have any security groups, create a security group. For more information, see [Create a security group](#) in *ECS User Guide*.

Context

You can create only a limited number of scaling configurations for a scaling group. For more information, see

the Limits topic in *Auto Scaling Product Introduction*.

Procedure

1. Log on to the Auto Scaling console.
2. In the top navigation bar, select an organization, a resource set, and a region.
3. Find the target scaling group and click the name of the scaling group in the **Scaling Group Name/ID** column.
4. In the left-side navigation pane, click **Scaling Configuration**.
5. Choose **Create > Create Scaling Configuration**.
6. Configure parameters for the scaling configuration.

Section	Parameter	Required	Description
Region	Region	Yes	The region where the ECS instance is located.
	Zone	Yes	The zone where the ECS instance is located.
Security Group	Security Group	Yes	The security group to which the ECS instance belongs.
Instance	Instance Family	Yes	The instance family to which the ECS instance belongs.
	Instance Type	Yes	The instance type of the ECS instance.
Image	Image Type	Yes	<ul style="list-style-type: none"> ◦ Public Image: Public images provided by Alibaba Cloud are fully licensed to offer a secure and stable operating environment for applications on ECS instances. ◦ Custom Image: You can create custom images to install software or deploy projects that have special requirements.
Storage	System Disk	Yes	Specify the category and size of the system disk. The operating system is installed on the system disk. You can select Ultra Disk or Standard SSD .
	Data Disk	No	Specify the category and size of the data disk. You can select Ultra Disk or Standard SSD . You can add a maximum of 16 data disks. The maximum capacity of each data disk is 32 TiB. You can set Release with Instance and Encrypt for each data disk.

Section	Parameter	Required	Description
Password	Set Password	Yes	Select when to set password. You can select Now or Later . If you select Later , you can use the Change Password feature in the console to set the password. For more information, see the Change Password topic in <i>ECS User Guide</i> .
	Logon Password	No	The password used to log on to the ECS instance. The password must be 8 to 30 characters in length and must contain at least three of the following character types: digits, uppercase letters, lowercase letters, and special characters.  Note The password is used to log on to the operating system and is not the VNC password.
	Confirm Password	No	Enter the password again.
Deployment Set	Deployment Set	No	The deployment set to which the instance belongs.
Instance Name	Configuration Name	No	The name of the scaling configuration.
	Instance Name	No	The name of the ECS instance.
User Data	User Data	No	Windows supports two formats: Bat and Powershell . Before you perform Base64 encoding, make sure to include <code>[bat]</code> or <code>[powershell]</code> as the first line. You can run shell scripts for Linux ECS instances.
Quantity	Quantity	No	The number of instances to purchase.

7. Click **Submit**.

Result

After the scaling configuration is created, it is in the **Disabled** state and is displayed in your scaling configuration list. To automatically create ECS instances, you must apply a scaling configuration. For more information, see [Apply a scaling configuration](#).

4.5.2. View scaling configurations

This topic describes how to view scaling configurations.

Procedure

1. [Log on to the Auto Scaling console.](#)
2. In the top navigation bar, select an organization, a resource set, and a region.
The scaling groups that correspond to the specified organization, resource set, and region are displayed.
3. Find the target scaling group and click the name of the scaling group in the **Scaling Group Name/ID** column.
4. In the left-side navigation pane, click **Scaling Configuration**.
5. View the list of scaling configurations.

4.5.3. Modify a scaling configuration

This topic describes how to modify a scaling configuration. You can modify the parameters of a scaling configuration based on your actual needs.

Procedure

1. [Log on to the Auto Scaling console.](#)
2. In the top navigation bar, select an organization, a resource set, and a region.
3. Find the target scaling group and click the name of the scaling group in the **Scaling Group Name/ID** column.
4. In the left-side navigation pane, click **Scaling Configuration**.
5. Find the target scaling configuration and click its name in the **Scaling Configuration Name/ID** column.
6. Modify the parameters of the scaling configuration. For more information about parameters of the scaling configuration, see [Create a scaling configuration](#).
7. Click **OK**.

4.5.4. Apply a scaling configuration

This topic describes how to apply a scaling configuration. You can create multiple scaling configurations for a scaling group and apply one.

Procedure

1. [Log on to the Auto Scaling console.](#)
2. In the top navigation bar, select an organization, a resource set, and a region.
3. Find the target scaling group and click the name of the scaling group in the **Scaling Group Name/ID** column.
4. In the left-side navigation pane, click **Scaling Configuration**.
5. Find the target scaling configuration and click **Select** in the **Actions** column. Only one scaling configuration can be in the **Enabled** state in a scaling group. After a scaling configuration is applied, other scaling configurations are put into the **Disabled** state.
6. Click **OK**.

Result

The status of the scaling configuration changes from **Disabled** to **Enable** in the **Status** column.

4.5.5. Delete a scaling configuration

This topic describes how to delete a scaling configuration that is no longer needed. After you delete a scaling configuration, existing ECS instances that are created from the scaling configuration are not removed.

Prerequisites

The scaling configuration is in the **Disabled** state.

Procedure

1. [Log on to the Auto Scaling console.](#)
2. In the top navigation bar, select an organization, a resource set, and a region.

3. Find the target scaling group and click the name of the scaling group in the **Scaling Group Name/ID** column.
4. In the left-side navigation pane, click **Scaling Configuration**.
5. Find the target scaling configuration and click **Delete** in the **Actions** column.
6. Click **OK**.

4.6. Scaling rules

4.6.1. Create a scaling rule

This topic describes how to create a scaling rule. You can create scaling rules to add or remove ECS instances. For example, you can add an ECS instance to a scaling group.

Context

- You can create only a limited number of scaling rules for a scaling group. For more information, see the *Limits* topic in *Auto Scaling Product Introduction*.
- After a scaling rule is executed, the resulting number of ECS instances in the scaling group may fall outside of the specified range. In this case, Auto Scaling automatically adjusts the number of ECS instances to ensure that the number of ECS instances in the scaling group is within the specified range.

Procedure

1. [Log on to the Auto Scaling console](#).
2. In the top navigation bar, select an organization, a resource set, and a region.
3. Find the target scaling group and click the name of the scaling group in the **Scaling Group Name/ID** column.
4. In the left-side navigation pane, click **Scaling Rules**.
5. Click **Create Scaling Rule**.
6. Configure parameters for the scaling rule.

Parameter	Required	Description
Rule Name	Yes	The name of the scaling rule. It must be 2 to 64 characters in length and can contain letters, digits, underscores (_), hyphens (-), and periods (.). It must start with a letter or digit.
Scaling Activity	Yes	The operation that is performed when the scaling rule is triggered. The operations include: <ul style="list-style-type: none"> ◦ Change to N instances: After the scaling rule is executed, the number of instances in the scaling group is changed to N. ◦ Add N instances: After the scaling rule is executed, N instances are added to the scaling group. ◦ Remove N instances: After the scaling rule is executed, N instances are removed from the scaling group.
Default Cooldown (Seconds)	No	The cooldown period. If this parameter is not specified, the default value is used.

7. Click **OK**.

4.6.2. View scaling rules

This topic describes how to view scaling rules.

Procedure

1. [Log on to the Auto Scaling console.](#)
2. In the top navigation bar, select an organization, a resource set, and a region.
The scaling groups that correspond to the specified organization, resource set, and region are displayed.
3. Find the target scaling group and click the name of the scaling group in the **Scaling Group Name/ID** column.
4. In the left-side navigation pane, click **Scaling Rules**.
5. View the list of scaling rules.

4.6.3. Modify a scaling rule

This topic describes how to modify a scaling rule. You can modify the following parameters for a scaling rule: Rule Name, Scaling Activity, and Default Cooldown.

Procedure

1. [Log on to the Auto Scaling console.](#)
2. In the top navigation bar, select an organization, a resource set, and a region.
3. Find the target scaling group and click the name of the scaling group in the **Scaling Group Name/ID** column.
4. In the left-side navigation pane, click **Scaling Rules**.
5. Find the scaling rule that you want to modify and click **Edit** in the **Actions** column.
6. Modify the Rule Name, Scaling Activity, and Default Cooldown parameters.
7. Click **OK**.

4.6.4. Delete a scaling rule

This topic describes how to delete a scaling rule that is no longer needed.

Procedure

1. [Log on to the Auto Scaling console.](#)
2. In the top navigation bar, select an organization, a resource set, and a region.
3. Find the target scaling group and click the name of the scaling group in the **Scaling Group Name/ID** column.
4. In the left-side navigation pane, click **Scaling Rules**.
5. Find the target scaling rule and click **Delete** in the **Actions** column.
6. In the message that appears, click **OK**.

4.7. Scaling tasks

4.7.1. Manually execute a scaling rule

This topic describes how to manually execute a scaling rule to add or remove ECS instances.

Prerequisites

- The scaling group to which the scaling rule belongs is in the **Enable** state.
- No scaling activity is in progress in the scaling group to which the scaling rule belongs.

Context

After the scaling rule is executed, if the number of ECS instances is greater than the maximum number or less than the minimum number, Auto Scaling automatically adjusts the number of ECS instances to be within the valid range.

Auto Scaling enables you to manually execute scaling rules. You can also associate an event-triggered task or scheduled task with the scaling rule to automatically adjust the number of ECS instances. For more information, see [Create a scheduled task](#) and [Create an event-triggered task](#).

Procedure

1. [Log on to the Auto Scaling console](#).
2. In the top navigation bar, select an organization, a resource set, and a region.
3. Find the target scaling group and click the name of the scaling group in the **Scaling Group Name/ID** column.
4. In the left-side navigation pane, click **Scaling Rules**.
5. Find the scaling rule that you want to execute and click **Run** in the **Actions** column.
6. In the message that appears, click **OK**.

Result

The **Scaling Activities** page appears. You can view the details of your scaling activity.

4.7.2. Manually add an ECS instance

This topic describes how to manually add an ECS instance to a scaling group. You can add existing ECS instances to a scaling group to take full advantage of the computing resources.

Prerequisites

The ECS instance to be added must meet the following conditions:

- The ECS instance and the scaling group to which to add the instance share the same region, organization, and resource set.
- The ECS instance is in the **Running** state.
- The ECS instance does not belong to any scaling groups.
- The ECS instance and the scaling group are in the same VPC.

The scaling group to which to add the ECS instance must meet the following conditions:

- The scaling group is in the **Enable** state.
- No scaling activity is in progress in the scaling group.

Context

- When no scaling activity is being executed in the scaling group, you can add an ECS instance to the scaling group without the need to wait for the cooldown time to expire.
- If the number of instances in the scaling group is greater than the maximum number of instances after an ECS instance is added to the scaling group, the ECS instance cannot be added.
- The ECS instances that are manually added to a scaling group are not limited by scaling configurations. The instance types of the manually added instances can be different from that of the scaling configuration in the **Enable** state.

Procedure

1. [Log on to the Auto Scaling console](#).
2. In the top navigation bar, select an organization, a resource set, and a region.
3. Find the target scaling group and click the name of the scaling group in the **Scaling Group Name/ID** column.
4. In the left-side navigation pane, click **ECS Instances**.
5. Click **Add Instance**.
6. Select the ECS instance to be added and click **OK**.

Result

The manually added instance is displayed on the **Manually Added** tab.

4.7.3. Manually remove an ECS instance

This topic describes how to manually remove an ECS instance that is no longer needed from a scaling group.

Prerequisites

The scaling group must meet the following conditions:

- The scaling group is in the **Enable** state.
- No scaling activity is in progress in the scaling group.

Context

- When no scaling activity is being executed in the scaling group, you can immediately remove an ECS instance from the scaling group without the need to wait for the cooldown time to expire.
- After an ECS instances is removed from a scaling group, the number of instances in the scaling group must be greater than or equal to the minimum number of instances. Otherwise, the ECS instance cannot be removed.

Procedure

1. [Log on to the Auto Scaling console.](#)
2. In the top navigation bar, select an organization, a resource set, and a region.
3. Find the target scaling group and click the name of the scaling group in the **Scaling Group Name/ID** column.
4. In the left-side navigation pane, click **ECS Instances**.
5. Select the source of the ECS instance.
 - To select an automatically created ECS instance, click the **Auto Created** tab.
 - To select a manually added ECS instance, click the **Manually Added** tab.
6. Use one of the following methods to remove one or more ECS instances from a scaling group: **Manually added ECS instances can only be removed, but cannot be released.**
 - Find the ECS instance that you want to remove and choose **Actions > Remove from Scaling Group** in the **Actions** column.
 - Find the ECS instance that you want to remove and release, and choose **Actions > Remove from Scaling Group and Release** in the **Actions** column.
7. In the message that appears, click **OK**.

4.8. Scheduled tasks

4.8.1. Create a scheduled task

This topic describes how to create a scheduled task to scale computing resources in response to predictable business changes in the future. Scheduled tasks enable the system to automatically obtain sufficient computing resources before business peaks and release idle computing resources after the peaks.

Context

A scheduled task is preconfigured to execute the specified scaling rule at the specified time in the future. When the specified time arrives, the scheduled task automatically scales computing resources. This allows you to reduce costs and also meet business requirements. You can also specify the recurrence for scheduled tasks if business changes are regular.

If multiple scheduled tasks need to be executed in one minute, Auto Scaling executes the most recently created scheduled task.

Procedure

1. [Log on to the Auto Scaling console.](#)
2. In the left-side navigation pane, choose **Scaling Tasks > Scheduled Tasks** .

3. In the top navigation bar, select an organization, a resource set, and a region.
4. Click **Create Scheduled Task**.
5. In the dialog box that appears, configure parameters for the scheduled task.

Parameter	Required	Description
Task Name	Yes	The name of the scheduled task. The name must be 2 to 64 characters in length and can contain letters, digits, underscores (_), hyphens (-), and periods (.). It must start with a letter or digit.
Description	Yes	The description of the scheduled task.
Organization/Resource Group	Yes	The organization and resource set to which the scheduled task belongs.
Start Time	Yes	The time when the scheduled task is executed.
Scaling Rules	Yes	The scaling group to be monitored and the scaling rule to be executed.
Retry Expiry Time	No	The period of time during which the system retries to execute the scheduled task. Unit: seconds. If a scaling activity fails to be executed at the specified time, Auto Scaling will execute the scheduled task again within the period of time that is specified by the Retry Expiry Time parameter.
Recurrence Settings	No	Specifies whether to execute the scheduled task repeatedly. Select Recurrence Settings and set the Recurrence and Expire parameters. The recurrence options include Daily , Weekly , and Monthly .

6. Click **OK**.

Result

The scheduled task that you created is displayed in the scheduled task list.

4.8.2. View scheduled tasks

This topic describes how to view scheduled tasks.

Procedure

1. [Log on to the Auto Scaling console](#).
2. In the left-side navigation pane, choose **Scaling Tasks > Scheduled Tasks**.
3. In the top navigation bar, select an organization, a resource set, and a region.
The scheduled tasks that correspond to the specified organization, resource set, and region are displayed.
4. Select a filter option, enter the corresponding information, and then click **Search**.

You can select multiple filter options to narrow down the search results.

Option	Description
Task Name	Enter a task name to search for the scheduled task.
Task ID	Enter a scheduled task ID to search for the scheduled task.

5. View the scheduled task list.

4.8.3. Modify a scheduled task

This topic describes how to modify a scheduled task. You can modify the following parameters for a scheduled task: Start Time, Scaling Rules, and Retry Expiry Time.

Procedure

1. [Log on to the Auto Scaling console](#).
2. In the left-side navigation pane, choose **Scaling Tasks > Scheduled Tasks**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the scheduled task that you want to modify and click **Edit** in the **Actions** column.
5. Modify the parameters of the scheduled task. You can modify the **Recurrence** and **Expire** parameters if you have enabled the **Recurrence Settings** feature when you create the scheduled task, but the **Recurrence Settings** feature cannot be disabled. For more information about other parameters, see [Create a scheduled task](#).
6. Click **OK**.

4.8.4. Disable a scheduled task

This topic describes how to disable a scheduled task. You can disable a scheduled task if you do not want to use it to trigger scaling activities.

Prerequisites

The scheduled task is in the **Running** state.

Procedure

1. [Log on to the Auto Scaling console](#).
2. In the left-side navigation pane, choose **Scaling Tasks > Scheduled Tasks**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the scheduled task that you want to disable and click **Disabled** in the **Actions** column.
5. In the message that appears, click **OK**.

Result

The status of the scheduled task changes from **Running** to **Stop** in the **Status** column.

4.8.5. Enable a scheduled task

This topic describes how to enable a scheduled task. You can enable a scheduled task that has been disabled and use it to trigger a scaling activity at the specified time point.

Prerequisites

The scheduled task is in the **Stop** state.

Procedure

1. [Log on to the Auto Scaling console](#).
2. In the left-side navigation pane, choose **Scaling Tasks > Scheduled Tasks**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the scheduled task that you want to enable and click **Enable** in the **Actions** column.
5. In the message that appears, click **OK**.

Result

The status of the scheduled task changes from **Stop** to **Running** in the **Status** column.

4.8.6. Delete a scheduled task

This topic describes how to delete a scheduled task that is no longer needed.

Procedure

1. [Log on to the Auto Scaling console](#).
2. In the left-side navigation pane, choose **Scaling Tasks > Scheduled Tasks**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the scheduled task that you want to delete and click **Delete** in the **Actions** column.
5. In the message that appears, click **OK**.

4.9. Event-triggered tasks

4.9.1. Create an event-triggered task

This topic describes how to create an event-triggered task associated with monitoring metrics in response to emergent or unpredictable business changes. After you create and enable an event-triggered task, Auto Scaling collects data for the specified metric in real time, and triggers an alert when the specified condition is met. Then, Auto Scaling executes the scaling rule to dynamically scale ECS instances in the scaling group.

Procedure

1. [Log on to the Auto Scaling console](#).
2. In the left-side navigation pane, choose **Event-driven Tasks > Alert Tasks**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Click **Create Alert**.
5. In the dialog box that appears, configure parameters for the event-triggered task.

Parameter	Required	Description
Task Name	Yes	The name of the event-triggered task. It must be 2 to 40 characters in length and can contain letters, digits, underscores (_), hyphens (-), and periods (.). It must start with a letter or digit.
Description	No	The description of the event-triggered task.
Organization/Resource Group	Yes	The organization and resource set in which to create the event-triggered task.
Monitoring Metrics/Scaling Rules	Yes	The scaling group to be monitored and the scaling rule to be executed.
Monitoring Type	Yes	System-Level Monitoring is selected by default.
Monitoring Metrics	Yes	The metrics that you want to monitor. Valid values: <ul style="list-style-type: none"> ◦ Average CPU Utilization ◦ Memory Usage ◦ Outbound Traffic ◦ Inbound Traffic

Parameter	Required	Description
Monitoring Period	Yes	<p>The period during which data is aggregated and analyzed. The shorter the period, the higher the frequency that the alert is triggered. Unit: minutes. Valid values:</p> <ul style="list-style-type: none"> ○ 1 ○ 2 ○ 5 ○ 15
Statistic	Yes	<p>The rule that determines whether to trigger an alert. Select Average, Max Capacity, or Min Capacity, and specify a threshold value. For example, alerts are triggered when the CPU utilization exceeds 80%:</p> <ul style="list-style-type: none"> ○ Average: Alerts are triggered when the average CPU utilization of all ECS instances in the scaling group exceeds 80%. ○ Max Capacity: Alerts are triggered when the highest CPU utilization among the ECS instances in the scaling group exceeds 80%. ○ Min Capacity: Alerts are triggered when the lowest CPU utilization among the ECS instances in the scaling group exceeds 80%.
Alert after occurrences	Yes	<p>The consecutive number of times that the threshold must be exceeded before the alert is triggered. Valid values:</p> <ul style="list-style-type: none"> ○ 1 ○ 2 ○ 3 ○ 5

6. Click **OK**.

4.9.2. View event-triggered tasks

This topic describes how to view event-triggered tasks.

Procedure

1. [Log on to the Auto Scaling console](#).
2. In the left-side navigation pane, choose **Scaling Tasks > Event-triggered Tasks**.
3. In the top navigation bar, select an organization, a resource set, and a region.
The event-triggered tasks that correspond to the specific organization, resource set, and region are displayed.
4. Select a filter option, enter the corresponding information, and then click **Search**.

You can select multiple filter options to narrow down the search results.

Option	Description
Alert Name	Enter an event-triggered task name to search for the event-triggered task.
Scaling Group ID	Enter a scaling group ID to search for the event-triggered task.

4.9.3. Modify an event-triggered task

This topic describes how to modify an event-triggered task. You can modify one or more of the following parameters: Scaling Rules, Monitoring Type, and Statistic.

Procedure

1. [Log on to the Auto Scaling console](#).
2. In the left-side navigation pane, choose **Scaling Tasks > Event-triggered Tasks**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the event-triggered task that you want to modify and click **Edit** in the **Actions** column.
5. Modify the parameters of the event-triggered task. You cannot modify the following parameters: Organization and Resource Group, Monitoring Metrics, and Monitoring Period. For more information about other parameters, see [Create an event-triggered task](#).
6. Click **OK**.

4.9.4. Disable an event-triggered task

This topic describes how to disable an event-triggered task. You can disable an event-triggered task if you no longer want to use it to trigger scaling activities.

Prerequisites

The event-triggered task is in the **Normal**, **Alerts**, or **Insufficient Data** state.

Procedure

1. [Log on to the Auto Scaling console](#).
2. In the left-side navigation pane, choose **Scaling Tasks > Event-triggered Tasks**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the event-triggered task that you want to disable and click **Disable** in the **Actions** column.
5. In the message that appears, click **OK**.

Result

The status of the event-triggered task is changed to **Stopped** in the **Status** column.

4.9.5. Enable an event-triggered task

This topic describes how to enable an event-triggered task. You can enable an event-triggered task that has been disabled to continue to monitor metrics and trigger scaling activities of a scaling group.

Prerequisites

The event-triggered task is in the **Stopped** state.

Procedure

1. [Log on to the Auto Scaling console](#).
2. In the left-side navigation pane, choose **Scaling Tasks > Event-triggered Tasks**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the event-triggered task that you want to enable and click **Enable** in the **Actions** column.
5. In the message that appears, click **OK**.

Result

The status of the event-triggered task changes from **Stopped** to **Normal** in the **Status** column.

4.9.6. Delete an event-triggered task

This topic describes how to delete an event-triggered task that is no longer needed.

Procedure

1. [Log on to the Auto Scaling console](#).
2. In the left-side navigation pane, choose **Scaling Tasks > Event-triggered Tasks**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the event-triggered task that you want to delete and click **Delete** in the **Actions** column.
5. In the message that appears, click **OK**.

5.Resource Orchestration Service (ROS)

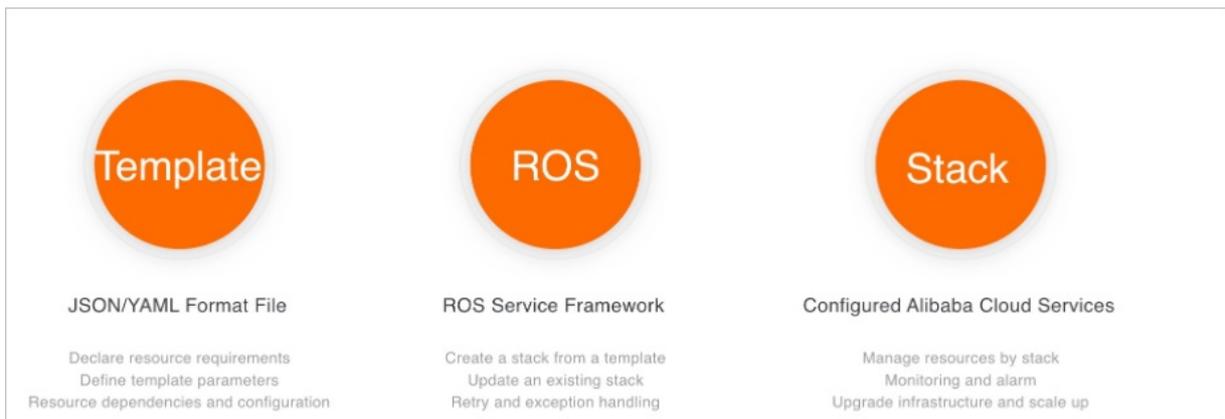

5.1. What is ROS?

Resource Orchestration Service (ROS) is a service provided by Alibaba Cloud to simplify the management of cloud computing resources. You can author stack templates based on the template specifications defined in ROS. Within a template, you can define required cloud computing resources such as ECS and ApsaraDB for RDS instances, and the dependencies between resources. The ROS engine automatically creates and configures all resources in a stack based on a template, making automatic deployment and O&M possible.

An ROS template is a readable, easy-to-author text file. You can directly edit a JSON-formatted template or use the Visual Editor available in the ROS console to edit the template. You can modify templates at any time. You can use version control tools such as SVN and Git to control the template and infrastructure versions. You can use APIs and SDKs to integrate the orchestration capabilities of ROS with your own applications to implement infrastructure as code.

ROS templates are also a standardized way to deliver resources and applications. If you are an independent software vendor (ISV), you can use ROS templates to deliver a holistic system and solution encompassing cloud resources and applications. ISVs can use this method to integrate Alibaba Cloud resources with their own software systems for centralized delivery.

ROS manages a group of cloud resources as a single unit called a stack. A stack is a group of Alibaba Cloud resources. You can create, delete, and clone cloud resources by stack. In DevOps practices, you can use ROS to clone the development, testing, and production environments, as well as migrate and scale out applications.

5.2. Log on to the ROS console

This topic describes how to log on to the ROS console.

Prerequisites

- The domain name of the ASCM console is obtained from the deployment personnel before you log on to the ASCM console.
- A browser is available. We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL used to log on to the ASCM console. Press the Enter key.
2. Enter your username and password.

Obtain the username and password used to log on to the console from the operations administrator.

Note When you log on to the ASCM console for the first time, you must change the password of your username. For security reasons, your password must meet the minimum complexity requirements. The password must be 8 to 20 characters in length and must contain at least two of the following character types:

- Uppercase or lowercase letters.
- Digits.
- Special characters. Special characters include exclamation points (!), at signs (@), number signs (#), dollar signs (\$), and percent signs (%).

3. Click **Login** to go to the ASCM console homepage.
4. In the top navigation bar, choose **Products > Elastic Computing > Resource Orchestration Service**.

5.3. Create a stack

This topic describes how to use Resource Orchestration Service (ROS) to create a stack.

Prerequisites

Log on to the ROS console. For more information, see [Log on to the ROS console](#).

Procedure

1. In the upper-right corner of the page, click **Create Stack**.
2. In the **Select Template** step, set **Organization**, **Resource Set**, and **regionId**.
3. In the **Prepare Template** section, enter template content in the JSON format. Click **Next**.
4. In the **Configure Template Parameters** step, enter the stack name and parameters, and then click **Next**.
5. In the **Configure Stack** step, set **Rollback on Failure** and **Timeout Period**.
6. In the **Confirm** step, ensure the configurations of template and stack are correct and click **Create Stack**.

What's next

On the **Stacks** page in the ROS console:

- To delete a stack, click **Delete** in the **Actions** column corresponding to the target stack.
- To update a stack, click **Update** in the **Actions** column corresponding to the target stack.
- To recreate a stack, click **Recreate** in the **Actions** column corresponding to the target stack.

Note

- If you only need to modify the current template and configurations of a specified stack but do not need to change the region where the stack resides, update the stack.
- If you need to modify the current template and configurations of a specified stack and change the region where the stack resides, recreate the stack.

5.4. Template syntax

5.4.1. Template structure

A template is a UTF-8 encoded JSON file that is used to create stacks. Templates serve as the blueprint for underlying infrastructure and architecture. Templates define the configurations and dependencies of Alibaba Cloud resources.

ROS template structure

```
{
  "ROSTemplateFormatVersion" : "2015-09-01",

  "Description" : "The template description used to provide information such as application scenarios and stack architecture.",
  "Metadata" : {
    // The template metadata that provides information such as layout for visualizations.
  },
  "Parameters" : {
    // The parameters you can specify when you create a stack.
  },

  "Mappings" : {
    // The mapping tables. Mapping tables are nested tables.
  },

  "Conditions": {
    // The conditions defined using internal condition functions. These conditions determine when to create associated resources.
  },

  "Resources" : {
    // The detailed information of resources such as configurations and dependencies.
  },

  "Outputs" : {
    // The outputs used to provide information such as resource properties. You can use the ROS console or API to obtain the information.
  }
}
```

ROSTemplateFormatVersion

Required. The template versions supported by Resource Orchestration Service (ROS). Current version: 2015-09-01.

Description

Optional. The description of the template, which is used to provide information such as the application scenarios and architecture of the template.

A detailed description can help users better understand the content of the template.

Metadata

Optional. The metadata of the template, in the JSON format.

Parameters

Optional. The parameters that you can specify when you create a stack. An ECS instance type is often defined as a parameter. Parameters have default values. Parameters can improve the flexibility and reusability of the template. When you create a stack, select appropriate specifications.

Mappings

Optional. Mappings are defined as nested mapping tables. You can use `Fn::FindInMap` to retrieve values corresponding to keys. You can also use parameter values as keys. For example, you can search the region-image mapping table for desired images by region.

Conditions

Optional. The conditions defined using `Fn::And`, `Fn::Or`, `Fn::Not`, and `Fn::Equals`. Separate multiple conditions with commas (,). The system will evaluate all conditions in the template before creating or updating a stack. All resources associated with true conditions are created, and all resources associated with false conditions are ignored.

Resources

Optional. The detailed information of resources in the stack created based on the template. The information includes resource dependencies and configurations.

Outputs

Optional. The outputs that are used to provide information such as resource properties. You can use the ROS console or API to obtain the information.

5.4.2. Parameters

The Parameters section improves the flexibility and reusability of a template. When you create a stack, you can replace parameter values in the template.

For example, assume that you have a web application requiring a stack that contains one SLB instance, two ECS instances, and one ApsaraDB for RDS instance. If the web application has a heavy workload, you can select an ECS instance with high specifications when you create the stack. Otherwise, you can select an ECS instance with low specifications. The following example shows how to define the `InstanceType` parameter for an ECS instance:

```

"Parameters" : {
  "InstanceType" : {
    "Type" : "String",
    "AllowedValues":["ecs.t1.small","ecs.s1.medium","ecs.m1.medium","ecs.c1.large"],
    "Default": "ecs.t1.small",
    "Label": "The ECS instance type",
    "Description" : "The type of the ECS instance you want to create. Default value: ecs.t1.small. Valid values: ecs.t1.small, ecs.s1.medium, ecs.m1.medium, and ecs.c1.large."
  }
}

```

You can assign a value to the `InstanceType` parameter when you create stacks based on templates. If this parameter is not specified, the default value `ecs.t1.small` is used.

The following example shows how to reference the `InstanceType` parameter when you define a resource:

```

"Websserver" : {
  "Type" : "ALIYUN::ECS::Instance",
  "InstanceType": {
    "Ref": "InstanceType"
  }
}

```

Syntax

Each parameter consists of a name and properties. The parameter name can only contain letters and digits and must be unique within the template. You can use the Label field to define the alias of the parameter.

The following table describes the parameters:

Parameter	Required	Description
Type	Yes	<p>The data type of the parameter.</p> <ul style="list-style-type: none"> String: a string value. Example: <code>"ecs.s1.medium"</code> . Number: an integer or floating-point number. Example: 3.14. CommaDelimitedList: a set of strings or numbers separated with commas (,), which can be indexed by using Fn::Select. Example: <code>"80, foo, bar"</code> . Json: a JSON-formatted string. Example: <code>{ "foo": "bar" }</code> . Boolean: a Boolean value. Example: <code>true</code> or <code>false</code> .
Default	No	If you do not specify a value when you create a stack, Resource Orchestration Service (ROS) checks whether a default value is defined in the template. If a default value is found, it is used. Otherwise, an error is returned.
AllowedValues	No	The list of valid parameter values.
AllowedPattern	No	The regular expression that is used to check whether the specified parameter value is a string. If the input is not a string, an error is returned.
MaxLength	No	The integer value that determines the longest string allowed for a String type parameter.
MinLength	No	The integer value that determines the shortest string allowed for a String type parameter.
MaxValue	No	The numeric value that determines the maximum value allowed for a Number type parameter.
MinValue	No	The numeric value that determines the minimum value allowed for a Number type parameter.
NoEcho	No	Specifies whether to mask the parameter value when the GetStack operation is called. If this parameter is set to true, only asterisks (*) are returned.
Description	No	The string that describes the parameter.
ConstraintDescription	No	The string that explains the parameter constraint.
Label	No	The alias of the parameter, encoded in UTF-8. When web forms are generated using templates, labels can be mapped to parameter names.

Parameter	Required	Description
AssociationProperty	No	<p>Automatically verifies the validity of the parameter value and provides a list of valid values.</p> <p>Valid values:</p> <ul style="list-style-type: none"> ALIYUN::ECS::Instance::ImageId ALIYUN::ECS::Instance::ZoneId ALIYUN::ECS::VPC::VPCId ALIYUN::ECS::VSwitch::VSwitchId <p>When AssociationProperty is set to ALIYUN::ECS::Instance::ImageId, the ROS console verifies whether the specified image ID is available and lists other values in a drop-down list.</p>
Confirm	No	<p>Specifies whether to enter the parameter value a second time when the NoEcho parameter is set to true. Default value: false.</p> <div style="background-color: #e6f2ff; padding: 5px;"> <p> Notice This parameter can be set to true only when it is used with a String type parameter and the NoEcho parameter is set to true.</p> </div>

Examples

In the following example, two parameters are defined in the Parameters section.

- `username`
 - Type: String
 - Default value: anonymous. Valid values:
 - anonymous
 - user-one
 - user-two
 - Length: 6 to 12

 **Notice** The default value must also meet the length and valid value requirements.

- `password`
 - Type: String
 - Length: 1 to 41
 - The password can contain uppercase letters, lowercase letters, and digits.
 - If you set the NoEcho parameter to true, the GetStack operation does not return any parameter values.

```

"Parameters" : {
  "username" : {
    "Label": "Username",
    "Description": "Enter the username",
    "Default": "anonymous",
    "Type" : "String",
    "MinLength" : "6",
    "MaxLength" : "12",
    "AllowedValues": ["anonymous", "user-one", "user-two"]
  },
  "password" : {
    "Label": "Password",
    "NoEcho" : "True",
    "Description": "Enter the password",
    "Type" : "String",
    "MinLength" : "1",
    "MaxLength" : "41",
    "AllowedPattern" : "[a-zA-Z0-9]*"
  }
}

```

Pseudo parameters

Pseudo parameters are internal parameters provided by the ROS engine. They can be referenced in the same manner as user-defined parameters, and their values are determined while ROS is running. The following pseudo parameters are supported:

- ALIYUN::StackName: the name of the stack.
- ALIYUN::StackId: the ID of the stack.
- ALIYUN::Region: the region where the stack resides.
- ALIYUN::AccountId: the user ID of the stack.
- ALIYUN::NoValue: specifies whether the specific resource property is deleted when the resource is created or updated.

5.4.3. Resources

This topic describes the properties of each resource and dependencies of resources in a stack. A resource can be referenced by other resources and output items.

Syntax

Each resource consists of an ID and a description. All resource descriptions are enclosed in braces {}. Separate multiple resources with commas (.). The following sample code shows the Resources syntax:

```

"Resources" : {
  "Resource1 ID" : {
    "Type": "The resource type",
    "Condition": "The condition that specifies whether to create the resource",
    "Properties" : {
      The description of the resource properties
    }
  },
  "Resource2 ID" : {
    "Type": "The resource type",
    "Condition": "The condition that specifies whether to create the resource",
    "Properties" : {
      The description of the resource properties
    }
  }
}

```

Parameter description:

- The resource ID must be unique within the template. You can use the resource ID to reference the resource in other parts of the template.
- The Type parameter specifies the type of resource that is being declared. For example, ALIYUN::ECS::Instance indicates that the resource is an Elastic Cloud Service (ECS) instance.
- The Properties section provides additional options that you can specify for a resource. For example, you must specify an image ID for each Alibaba Cloud ECS instance. The image ID is one of the resource properties.

Examples

```

"Resources" : {
  "ECSInstance" : {
    "Type" : "ALIYUN::ECS::Instance",
    "Properties" : {
      "ImageId" : "m-25l0r****"
    }
  }
}

```

If a resource does not need properties to be declared, omit the Properties section of that resource.

Property values can be text strings, string lists, Boolean values, referenced parameters, or return values of functions.

The following example shows how to declare different types of property values:

```

"Properties" : {
  "String" : "string",
  "LiteralList" : [ "value1", "value2" ],
  "Boolean" : "true"
  "ReferenceForOneValue" : { "Ref" : "ResourceID" },
  "FunctionResultWithFunctionParams" : {
    "Fn::Join" : [ "%", [ "Key=", { "Ref" : "SomeParameter" } ] ] }
}

```

DeletionPolicy

The `DeletionPolicy` parameter specifies whether to retain a resource when its stack is deleted. The following sample code shows how to use the `DeletionPolicy` parameter to retain an ECS instance when its stack is deleted:

```

"Resources" : {
  "ECSInstance" : {
    "Type" : "ALIYUN::ECS::Instance",
    "Properties" : {
      "ImageId" : "m-25l0r****"
    },
    "DeletionPolicy" : "Retain"
  }
}

```

DependsOn

The `DependsOn` parameter allows you to create a specific resource after you create its dependent resource. If you specify the `DependsOn` parameter for a resource, the resource is created only after its dependent resource specified by the `DependsOn` parameter is created.

In the following example, `WebServer` is created only after `DatabaseServer` is created:

```

{
  "ROSTemplateFormatVersion" : "2015-09-01",
  "Resources" : {
    "WebServer": {
      "Type": "ALIYUN::ECS::Instance",
      "DependsOn": "DatabaseServer"
    },
    "DatabaseServer": {
      "Type": "ALIYUN::ECS::Instance",
      "Properties": {
        "ImageId" : "m-25l0r****",
        "InstanceType": "ecs.t1.small"
      }
    }
  }
}

```

Condition

The Condition parameter specifies whether to create the resource. The resource can be created only when the Condition parameter is set to true.

In the following example, WebServer is created only if the condition determined by the MaxAmount parameter is true:

```
{
  "ROSTemplateFormatVersion" : "2015-09-01",
  "Parameters": {
    "MaxAmount": {
      "Type": "Number",
      "Default": 1
    }
  },
  "Conditions": {
    "CreateWebServer": {"Fn::Not": {"Fn::Equals": [0, {"Ref": "MaxAmount"}]}}
  }
  "Resources" : {
    "WebServer": {
      "Type": "ALIYUN::ECS::InstanceGroup",
      "Condition": "CreateWebServer",
      "Properties": {
        "ImageId" : "m-25l0r****",
        "InstanceType": "ecs.t1.small"
        "MaxAmount": {"Ref": "MaxAmount"}
      }
    },
    "DatabaseServer": {
      "Type": "ALIYUN::ECS::Instance",
      "Properties": {
        "ImageId" : "m-25l0r****",
        "InstanceType": "ecs.t1.small"
      }
    }
  }
}
```

Resource declaration example

The following example shows how to declare a resource:

```

"Resources" : {
  "WebServer": {
    "Type": "ALIYUN::ECS::Instance",
    "Properties": {
      "ImageId": "m-25l0r****",
      "InstanceType": "ecs.t1.small",
      "SecurityGroupId": "sg-25zwc****",
      "ZoneId": "cn-beijing-b",
      "Tags": [{
        "Key": "Department1",
        "Value": "HumanResource"
      }{
        "Key": "Department2",
        "Value": "Finance"
      }
    ]
  },
  "ScalingConfiguration": {
    "Type": "ALIYUN::ESS::ScalingConfiguration",
    "Properties": {
      "ImageId": "ubuntu1404_64_20G_aliaegis_2015****.vhd",
      "InstanceType": "ecs.t1.small",
      "InstanceId": "i-25xhh****",
      "InternetChargeType": "PayByTraffic",
      "InternetMaxBandwidthIn": 1,
      "InternetMaxBandwidthOut": 20,
      "SystemDisk_Category": "cloud",
      "ScalingGroupId": "bwhtvpcBcKYac9fe3vd0****",
      "SecurityGroupId": "sg-25zwc****",
      "DiskMappings": [
        {
          "Size": 10
        },
        {
          "Category": "cloud",
          "Size": 10
        }
      ]
    }
  }
}

```

5.4.4. Outputs

The **Outputs** section is used to define the values returned when the `GetStack` operation is called. For example, if you define an ECS instance ID as an output item, the ECS instance ID is returned when the `GetStack` operation is called.

Syntax

Each output item consists of an ID and a description. All output descriptions are enclosed in braces `{}`. Separate multiple output items with commas `,`. Each output item can have multiple values in the array format. The following example shows the **Outputs** syntax:

```
"Outputs" : {
  "Output1 ID" : {
    "Description": "The description of the output item",
    "Condition": "The condition that specifies whether to provide resource properties",
    "Value": "The output value expression"
  },
  "Output2 ID" : {
    "Description": "The description of the output item",
    "Condition": "The condition that specifies whether to provide resource properties",
    "Value" : [
      "Output value expression 1",
      "Output value expression 2",
      ...
    ]
  }
}
```

- **Output ID:** the ID of the output item. Duplicate IDs are not allowed within a template.
- **Description:** optional. The description of the output item.
- **Value:** required. The value returned when the `GetStack` operation is called.
- **Condition:** optional. The condition that specifies whether to create a resource and provide its information. The resource is created and its information is provided only when the specified condition is true.

In the following example, `WebServer` is created only if the condition determined by the `MaxAmount` parameter is true:

```
{
  "ROSTemplateFormatVersion" : "2015-09-01",
  "Parameters": {
    "MaxAmount": {
      "Type": "Number",
      "Default": 1
    }
  },
  "Conditions": {
    "CreateWebServer": {"Fn::Not": {"Fn::Equals": [0, {"Ref": "MaxAmount"}]}}
  }
  "Resources" : {
    "WebServer": {
      "Type": "ALIYUN::ECS::InstanceGroup",
      "Condition": "CreateWebServer",
      "Properties": {
        "ImageId" : "m-25l0r****",
        "InstanceType": "ecs.t1.small"
        "MaxAmount": {"Ref": "MaxAmount"}
      }
    }
  }
  "Outputs": {
    "WebServerIP": {
      "Condition": "CreateWebServer",
      "Value": {
        "Fn::GetAtt": ["WebServer", "PublicIps"]
      }
    }
  }
}
```

Examples

The following example contains two output items.

- The value of the InstanceId parameter of WebServer.
- The values of the PublicIps and PrivateIps parameters of WebServer.

```

"Outputs": {
  "InstanceId": {
    "Value": {"Fn::GetAtt": ["WebServer", "InstanceId"]}
  },
  "PublicIp & PrivateIp": {
    "Value": [
      {"Fn::GetAtt": ["WebServer", "PublicIp"]},
      {"Fn::GetAtt": ["WebServer", "PrivateIp"]}
    ]
  }
}

```

5.4.5. Functions

Resource Orchestration Service (ROS) provides several built-in functions to help you manage stacks. You can use built-in functions to define Resources and Outputs.

Fn::Base64Encode

The Fn::Base64Encode function is used to return the Base64 representation of the input string.

Declaration

```

{"Fn::Base64Encode": "stringToEncode"}

```

Parameters

`stringToEncode` : the string decoded from the Base64-encoded string.

Return value

The Base64 representation of the input string.

Examples

```

{"Fn::Base64Encode": "string to encode"}

```

`c3RyaW55IHRvIGVudY29kZQ==` is returned in this example.

Fn::Base64Decode

The Fn::Base64Decode function is used to return a string decoded from a Base64-encoded string.

Declaration

```

{"Fn::Base64Decode": "stringToEncode"}

```

Parameters

`stringToDecode` : the string decoded from the Base64-encoded string.

Return value

The string decoded from the Base64-encoded string.

Examples

```
{"Fn::Base64Decode": "c3RyaW55IHRvIGVudY29kZQ=="}
```

string to encode is returned in this example.

Fn::Base64

The Fn::Base64 function returns the Base64 representation of the input string.

- Declaration

```
"Fn::Base64": stringToEncode
```

- Parameters

valueToEncode: the string to be encoded in Base64.

- Return value

The Base64 representation of the input string.

- Examples

```
"Fn::Base64": "string to encode"
```

Fn::FindInMap

The Fn::FindInMap function is used to return the values based on keys in a two-level mapping that is declared in the Mappings section.

Declaration

```
"Fn::FindInMap": ["MapName", "TopLevelKey", "SecondLevelKey"]
```

Parameters

- **MapName** : the ID of a mapping declared in the Mappings section that contains keys and values.
- **TopLevelKey** : the top-level key name. The value is a list of key-value pairs.
- **SecondLevelKey** : the second-level key name. The value is a string or a number.

Return value

The value that is assigned to the SecondLevelKey parameter.

Examples

The ImageId property must be specified when you create a WebServer instance. The Mappings section describes the ImageId mappings by region. The Parameters section describes the regions that must be specified by template users. Fn::FindInMap finds the corresponding ImageId mapping in RegionMap based on the region specified by a user, and then finds the corresponding ImageId in the mapping.

- MapName can be set to a custom value, which is "RegionMap" in this example.
- TopLevelKey is set to the region where the stack is created, which is {"Ref": "regionParam"} in this example.
- SecondLevelKey is set to the required architecture, which is "32" in this example.

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Parameters": {
    "regionParam": {
      "Description": "The region where the ECS instance is created",
      "Type": "String",
      "AllowedValues": [
        "hangzhou"
      ]
    }
  }
}
```

- Fn::FindInMap
- Ref

Fn::GetAtt

The Fn::GetAtt function is used to return the value of a property from a resource in a template.

Declaration

```
"Fn::GetAtt": ["resourceID", "attributeName"]
```

Parameters

- `resourceID` : the ID of the resource.
- `attributeName` : the name of the resource property.

Return value

The value of the resource property.

Examples

The ImageId property of MyEcsInstance is returned in this example.

```
{"Fn::GetAtt" : ["MyEcsInstance", "ImageID"]}
```

Fn::Join

The Fn::Join function is used to append a set of values into a single value that is separated by a specified delimiter.

Declaration

```
{"Fn::Join": ["delimiter", ["string1", "string2", ... ]]}
```

Parameters

- `delimiter` : the value used to divide the string. The delimiter value can be left blank so that all the values are directly combined.
- `["string1", "string2", ...]` : the list of values that are combined into a string.

Return value

The combined string.

Examples

```
{"Fn::Join": [ " ", ["a", "b", "c"]]}
```

`"a,b,c"` is returned in this example.

Supported functions

- Fn::Base64Encode
- Fn::GetAtt
- Fn::Join
- Fn::Select
- Ref

Fn::Select

The Fn::Select function is used to return a single data element from a list of data elements by an index.

Declaration

- The following example assumes that the list of data elements is an array:

```
"Fn::Select": ["index", ["value1", "value2", ... ]]
```

- The following example assumes that the list of data elements is a mapping table:

```
"Fn::Select": ["index", {"key1": "value1", ... }]
```

Parameters

`index` : the index of the object data element. If the list of data elements is an array, the index must be an integer ranging from 0 to N-1, where N indicates the number of elements in the array. If the list of data elements is a mapping table, the index must be a key in the mapping table.

If the corresponding value of the index cannot be found, the system returns an empty string.

Return value

The object data element.

Examples

- The following example assumes that the list of data elements is an array:

```
{"Fn::Select": ["1", ["apples", "grapes", "oranges", "mangoes"]]}
```

`"grapes"` is returned in this example.

- The following example assumes that the list of data elements is a mapping table:

```
{"Fn::Select": ["key1", {"key1": "grapes", "key2": "mangoes"}]}
```

`"grapes"` is returned in this example.

- The following example assumes that the list of data elements is a comma-delimited list:

```
"Parameters": {
  "userParam": {
    "Type": "CommaDelimitedList",
    "Default": "10.0.100.0/24, 10.0.101.0/24, 10.0.102.0/24"
  }
}

"Resources": {
  "resourceID": {
    "Properties": {
      "CidrBlock": {"Fn::Select": ["0", {"Ref": "userParam"}]}
    }
  }
}
```

Supported functions

For the `Fn::Select` index value, you can use the `Ref` function.

For the `Fn::Select` list of data elements, you can use the following functions:

- `Fn::Base64Encode`
- `Fn::FindInMap`
- `Fn::GetAtt`

- Fn::Join
- Fn::Select
- Ref

Ref

The Ref function is used to return the value of a specified parameter or resource.

If the specified parameter is a resource ID, the value of the resource is returned. Otherwise, the system will return the value of the specified parameter.

Declaration

```
"Ref": "logicalName"
```

Parameters

`logicalName` : the logical name of the resource or parameter that you want to reference.

Return value

The value of the resource or parameter.

Examples

The following example uses the Ref function to specify `regionParam` as the region parameter for `RegionMap` of `WebServer`:

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Parameters": {
    "regionParam": {
      "Description": "The region where the ECS instance is created",
      "Type": "String",
      "AllowedValues": [
        "hangzhou",
        "beijing"
      ]
    }
  },
  "Mappings": {
    "RegionMap": {
      "hangzhou": {
        "32": "m-25l0rcfjo",
        "64": "m-25l0rcfj1"
      },
      "beijing": {
        "32": "m-25l0rcfj2",
        "64": "m-25l0rcfj3"
      }
    }
  },
  "Resources": {
    "WebServer": {
      "Type": "ALIYUN::ECS::Instance",
```

```

"Properties": {
  "ImageId": {
    "Fn::FindInMap": [
      "RegionMap",
      {"Ref": "regionParam"},
      "32"
    ]
  },
  "InstanceType": "ecs.t1.small",
  "SecurityGroupId": "sg-25zwc****",
  "ZoneId": "cn-beijing-b",
  "Tags": [
    {
      "Key": "tiantt",
      "Value": "ros"
    },
    {
      "Key": "tiantt1",
      "Value": "ros1"
    }
  ]
}
}
}
}
}
}

```

Supported function

When you use Ref function, you cannot use other functions in it at the same time. You must specify a string value for the resource logical ID.

Fn::GetAZs

The Fn::GetAZs function is used to return a list of zones for a specified region.

Declaration

```
"Fn::GetAZs": "region"
```

Parameters

region : the ID of the region.

Return value

The list of zones for the specified region.

Examples

The following example demonstrates how to create an ECS instance in the first zone of a specified region:

```

{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "WebServer": {
      "Type": "ALIYUN::ECS::Instance",
      "Properties": {
        "ImageId": "centos7u2_64_40G_cloudinit_2016****.raw",
        "InstanceType": "ecs.n1.tiny",
        "SecurityGroupId": "sg-2zedcm7ep5quses0****",
        "Password": "Ros1****",
        "AllocatePublicIP": true,
        "InternetChargeType": "PayByTraffic",
        "InternetMaxBandwidthIn": 100,
        "InternetMaxBandwidthOut": 100,
        "SystemDiskCategory": "cloud_efficiency",
        "IoOptimized": "optimized",
        "ZoneId": {"Fn::Select": ["0", {"Fn::GetAZs": {"Ref": "ALIYUN::Region"}}]}
      }
    }
  },
  "Outputs": {
    "InstanceId": {
      "Value": {"Fn::GetAtt": ["WebServer", "InstanceId"]}
    },
    "PublicIp": {
      "Value": {"Fn::GetAtt": ["WebServer", "PublicIp"]}
    }
  }
}

```

Supported functions

- Fn::Base64Encode
- Fn::FindInMap
- Fn::GetAtt
- Fn::Join
- Fn::Select
- Ref

Fn::Replace

The Fn::Replace function is used to replace a specified substring contained in a string with a new substring.

Declaration

```

{"Fn::Replace": [{"object_key": "object_value"}, "object_string"]}

```

Parameters

- `object_key` : the substring to be replaced.

- `object_value` : the new substring to replace the previous substring.
- `object_string` : the string whose `object_key` is replaced.

Return value

The string after replacement.

Examples

The following example demonstrates how to replace "print" with "echo" in the specified script:

```
{
  "ROSTemplateFormatVersion" : "2015-09-01",
  "Resources" : {
    "WebServer": {
      "Type": "ALIYUN::ECS::Instance",
      "Properties": {
        "ImageId" : "centos_7_2_64_40G_base_2017****.vhd",
        "InstanceType": "ecs.n1.medium",
        "SecurityGroupId": "sg-94q49****",
        "Password": "MytestPassword****",
        "IoOptimized": "optimized",
        "VSwitchId": "vsw-94v8v8****",
        "VpcId": "vpc-949uz****",
        "SystemDiskCategory": "cloud_oss",
        "UserData": {"Fn::Replace": [{"print": "echo"},
          {"Fn::Join": ["", [
            "#! /bin/sh\n",
            "mkdir ~/test_ros\n",
            "print hello > ~/1.txt\n"
          ]]}]}
      }
    }
  },
  "Outputs": {
    "Instanceid": {
      "Value" : {"Fn::GetAtt": ["WebServer","Instanceid"]}
    },
    "Publicip": {
      "Value" : {"Fn::GetAtt": ["WebServer","Publicip"]}
    }
  }
}
```

Supported functions

- Fn::Base64Encode
- Fn::GetAtt
- Fn::Join
- Fn::Select
- Ref

Fn::Split

The Fn::Split function is used to split a string into a list of values separated by a specified delimiter and return the list.

Declaration

```
"Fn::Split": ["delim", "original_string"]
```

Parameters

- `delim` : the specified delimiter, which can be commas (,), semicolons (;), line breaks (\n), and indents (\t).
- `original_string` : the string to be split.

Return value

A list of string values.

Examples

- The following example assumes that the list of data elements is an array:

```
{"Fn::Split": [";", "foo; bar; achoo"]}
```

`["foo", " bar", "achoo "]` is returned in this example.

- The following example uses Fn::Split to split InstanceIds:

```
{
  "Parameters": {
    "InstanceIds": {
      "Type": "String",
      "Default": "instane1_id,instance2_id,instance2_id"
    }
  },
  "Resources": {
    "resourceID": {
      "Type": "ALIYUN::SLB::BackendServerAttachment",
      "Properties": {
        "BackendServerList": {
          "Fn::Split": [
            ",",
            {
              "Ref": "InstanceIds"
            }
          ]
        }
      }
    }
  }
}
```

Supported functions

- Fn::Base64Encode
- Fn::FindInMap

- Fn::GetAtt
- Fn::Join
- Fn::Select
- Fn::Replace
- Fn::GetAZs
- Fn::If
- Ref

Fn::Equals

The Fn::Equals function is used to compare whether two values are equal. If the two values are equal, true is returned. If the two values are not equal, false is returned.

Declaration

```
{"Fn::Equals": ["value_1", "value_2"]}
```

Parameters

value : the values to be compared.

Return value

true or false.

Examples

The following example uses Fn::Equals to define a condition in the Conditions section:

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Parameters": {
    "EnvType": {
      "Default": "pre",
      "Type": "String"
    }
  },
  "Conditions": {
    "TestEqualsCond": {
      "Fn::Equals": [
        "prod",
        {"Ref": "EnvType"}
      ]
    }
  }
}
```

Supported functions

- Fn::Or
- Fn::Not
- Fn::Equals
- Fn::FindInMap
- Fn::And

- Ref

Fn::And

The Fn::And function is used to represent the AND operator, and must contain at least two conditions. If all the specified conditions are evaluated as true, true is returned. If any condition is evaluated as false, false is returned.

Declaration

```
{"Fn::And": ["condition", {...]}
```

Parameters

`condition` : the condition to be evaluated.

Return value

true or false.

Examples

The following example uses Fn::And to define a condition in the Conditions section:

```
{
  "ROSTemplateFormatVersion" : "2015-09-01",
  "Parameters":{
    "EnvType":{
      "Default":"pre",
      "Type":"String"
    }
  },
  "Conditions": {
    "TestEqualsCond": {"Fn::Equals": ["prod", {"Ref": "EnvType"}]},
    "TestAndCond": {"Fn::And": ["TestEqualsCond", {"Fn::Equals": ["pre", {"Ref": "EnvType"}]}]}
  }
}
```

Supported functions

- Fn::Or
- Fn::Not
- Fn::Equals
- Fn::FindInMap
- Fn::And
- Ref

Fn::Or

The Fn::Or function is used to represent the OR operator, and must contain at least two conditions. If any specified condition is evaluated as true, true is returned. If all the conditions are evaluated as false, false is returned.

Declaration

```
{"Fn::Or": ["condition", {...]}
```

Parameters

`condition` : the condition to be evaluated.

Return value

true or false.

Examples

The following example uses `Fn::Or` to define a condition in the Conditions section:

```
{
  "ROSTemplateFormatVersion" : "2015-09-01",
  "Parameters":{
    "EnvType":{
      "Default":"pre",
      "Type":"String"
    }
  },
  "Conditions": {
    "TestEqualsCond": {"Fn::Equals": ["prod", {"Ref": "EnvType"}]},
    "TestOrCond": {"Fn::And": ["TestEqualsCond", {"Fn::Equals": ["pre", {"Ref": "EnvType"}]}]}
  }
}
```

Supported functions

- `Fn::Or`
- `Fn::Not`
- `Fn::Equals`
- `Fn::FindInMap`
- `Fn::And`
- `Ref`

Fn::Not

The `Fn::Not` function is used to represent the NOT operator. If a condition is evaluated as false, true is returned. If a condition is evaluated as true, false is returned.

Declaration

```
{"Fn::Not": "condition"}
```

Parameters

`condition` : the condition to be evaluated.

Return value

true or false.

Examples

The following example uses `Fn::Not` to define a condition in the Conditions section:

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Parameters":{
    "EnvType":{
      "Default":"pre",
      "Type":"String"
    }
  },
  "Conditions": {
    "TestNotCond": {"Fn::Not": {"Fn::Equals": ["pre", {"Ref": "EnvType"}]}}
  }
}
```

Supported functions

- Fn::Or
- Fn::Not
- Fn::Equals
- Fn::FindInMap
- Fn::And
- Ref

Fn::If

This function returns one of two possible values. If a specified condition is evaluated as true, one value is returned. If the specified condition is evaluated as false, the other value is returned. The property values of Resources and Outputs in templates support the Fn::If function. You can use the `ALIYUN::NoValue` pseudo parameter as the return value to delete the corresponding property.

Declaration

```
{"Fn::If": ["condition_name", "value_if_true", "value_if_false"]}
```

Parameters

- `condition_name` : the name of the condition in the Conditions section. A condition is referenced by using the condition name.
- `value_if_true` : If the specified condition is evaluated as true, this value is returned.
- `value_if_false` : If the specified condition is evaluated as false, this value is returned.

Examples

The following example demonstrates how to determine whether to create a data disk based on input parameters:

```
{
  "ROSTemplateFormatVersion":"2015-09-01",
  "Parameters":{
    "EnvType":{
      "Default":"pre",
      "Type":"String"
    }
  },
}
```

```

"Conditions":{
  "CreateDisk":{
    "Fn::Equals":[
      "prod",
      {
        "Ref":"EnvType"
      }
    ]
  }
},
"Resources":{
  "WebServer":{
    "Type":"ALIYUN::ECS::Instance",
    "Properties":{
      "DiskMappings":{
        "Fn::If":[
          "CreateDisk",
          [
            {
              "Category":"cloud_efficiency",
              "DiskName":"FirstDataDiskName",
              "Size":40
            },
            {
              "Category":"cloud_ssd",
              "DiskName":"SecondDataDiskName",
              "Size":40
            }
          ],
          {
            "Ref":"ALIYUN::NoValue"
          }
        ]
      },
      "VpcId":"vpc-2zew9pxh2yirtzqxd****",
      "SystemDiskCategory":"cloud_efficiency",
      "SecurityGroupId":"sg-2zece6wcqriejf1v****",
      "SystemDiskSize":40,
      "ImageId":"centos_6_8_64_40G_base_2017****.vhd",
      "IoOptimized":"optimized",
      "VSwitchId":"vsw-2zed9txvy7h2srqo6****",
      "InstanceType":"ecs.n1.medium"
    }
  }
},
"Outputs":{
  "InstanceId":f

```

```

instances: {
  "Value": {
    "Fn::GetAtt": [
      "WebServer",
      "Instanceid"
    ]
  }
},
"Zoneid": {
  "Value": {
    "Fn::GetAtt": [
      "WebServer",
      "Zoneid"
    ]
  }
}
}
}
}

```

Supported functions

- Fn::Or
- Fn::Not
- Fn::Equals
- Fn::FindInMap
- Fn::And
- Ref

Fn::ListMerge

The Fn::ListMerge function is used to merge multiple lists into one list.

Declaration

```
{"Fn::ListMerge": [{"list_1_item_1", "list_1_imte_2", ...}, {"list_2_item_1", "list_2_imte_2", ...}]}
```

Parameters

- ["list_1_item_1", "list_1_imte_2", ...] : the first list to merge.
- ["list_2_item_1", "list_2_imte_2", ...] : the second list to merge into the first list.

Examples

The following example demonstrates how to attach two ECS instance groups to an SLB instance:

```

{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "LoadBalancer": {
      "Type": "ALIYUN::SLB::LoadBalancer",
      "Properties": {
        "LoadBalancerName": "ros",
        "AddressType": "internet",
        "InternetChargeType": "paybybandwidth",
      }
    },
    "BackendServer1": {
      "Type": "ALIYUN::ECS::InstanceGroup",
      "Properties": {
        "ImageId": "m-2ze9uqi7wo61hwep****",
        "InstanceType": "ecs.t1.small",
        "SecurityGroupId": "sg-2ze8yxgempcdsq3****",
        "MaxAmount": 1,
        "MinAmount": 1
      }
    },
    "BackendServer2": {
      "Type": "ALIYUN::ECS::InstanceGroup",
      "Properties": {
        "ImageId": "m-2ze9uqi7wo61hwep****",
        "InstanceType": "ecs.t1.small",
        "SecurityGroupId": "sg-2ze8yxgempcdsq3iu****",
        "MaxAmount": 1,
        "MinAmount": 1
      }
    },
    "Attachment": {
      "Type": "ALIYUN::SLB::BackendServerAttachment",
      "Properties": {
        "LoadBalancerId": {"Ref": "LoadBalancer"},
        "BackendServerList": { "Fn::ListMerge": [
          {"Fn::GetAtt": ["BackendServer1", "InstanceIds"]},
          {"Fn::GetAtt": ["BackendServer2", "InstanceIds"]}
        ]
      }
    }
  }
}

```

Supported functions

- Fn::Base64Encode
- Fn::GetAtt
- Fn::Join
- Fn::Select
- Ref
- Fn::Join
- Fn::If

Fn::GetJsonValue

The Fn::GetJsonValue function is used to resolve a JSON string and obtain its key value from the first layer.

Declaration

```
{"Fn::GetJsonValue": ["key", "json_string"]}
```

Parameters

- `key` : the key value.
- `json_string` : the specified JSON string to be resolved.

Examples

In the following example, the WebServer instance executes UserData and returns a JSON string, and the WebServer2 instance then obtains the corresponding key value from the string.

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "WebServer": {
      "Type": "ALIYUN::ECS::Instance",
      "Properties": {
        "ImageId": "m-2ze45uwova5fedlu****",
        "InstanceType": "ecs.n1.medium",
        "SecurityGroupId": "sg-2ze7pxymaix640qr****",
        "Password": "Wenqiao****",
        "IoOptimized": "optimized",
        "VSwitchId": "vsw-2zei67xd9nhcqxe****",
        "VpcId": "vpc-2zevx9ios1rszqv0a****",
        "SystemDiskCategory": "cloud_ssd",
        "UserData": {"Fn::Join": ["", [
          "#! /bin/sh\n",
          "mkdir ~/test_ros\n",
          "print hello > ~/1.txt\n",
          "Fn::GetAtt": ["WaitConHandle", "CurlCli"],
          "\n",
          "Fn::GetAtt": ["WaitConHandle", "CurlCli"],
          "-d '{\"id\": \"1\", \"data\": [\"1111\", \"2222\"]}'\n"
        ]]},
        "PrivateIpAddress": "192.168.XX.XX",
        "HostName": "userdata-1
      }
    }
  }
}
```

```

},
"WaitConHandle": {
  "Type": "ALIYUN::ROS::WaitConditionHandle"
},
"WaitCondition": {
  "Type": "ALIYUN::ROS::WaitCondition",
  "Properties": {
    "Handle": {"Ref": "WaitConHandle"},
    "Timeout": 900
  }
},
"WebServer2": {
  "Type": "ALIYUN::ECS::Instance",
  "Properties": {
    "ImageId": "m-2ze45uwova5fedlu****",
    "InstanceType": "ecs.n1.medium",
    "SecurityGroupId": "sg-2ze7pxymaix640qr****",
    "Password": "Wenqiao****",
    "IoOptimized": "optimized",
    "VSwitchId": "vsw-2zei67xd9nhcqzxec****",
    "VpcId": "vpc-2zevx9ios1rszqv0a****",
    "SystemDiskCategory": "cloud_ossd",
    "UserData":
      {"Fn::Join": ["", [
        "#! /bin/sh\n",
        "mkdir ~/test_ros\n",
        "echo hello > ~/1.txt\n",
        "server_1_token=",
        {"Fn::GetJsonValue": ["1", {"Fn::GetAtt": ["WaitCondition", "Data"]}]}],
        "\n"}
  ]},
  "PrivateIpAddress": "192.168.XX.XX",
  "HostName": "userdata-2"
}
},
"Outputs": {
  "InstanceId": {
    "Value": {"Fn::GetAtt": ["WebServer", "InstanceId"]}
  },
  "PublicIp": {
    "Value": {"Fn::GetAtt": ["WebServer", "PublicIp"]}
  }
}
}

```

Supported functions

- Fn::Base64Encode
- Fn::GetAtt
- Fn::Join
- Fn::Select
- Ref
- Fn::Join
- Fn::If

Fn::MergeMapToList

The Fn::MergeMapToList function is used to merge multiple mappings into a list of mapping elements.

Declaration

```
{Fn::MergeMapToList: [{"key_1": ["key_1_item_1", "key_1_item_2", ...]}, {"key_2": ["key_2_item_1", "key_2_item_2", ...]}, ...
]}
```

Parameters

- {"key_1": ["key_1_item_1", "key_1_item_2", ...]} : the first mapping to merge. The "key_1" value must be a list. "key_1" is the key for each mapping in the list of merged mappings. The "key_1" value is "key_1_item_1" for the first merged mapping and "key_1_item_2" for the second merged mapping. All values follow the same format. The length of the final list of merged mappings is the length of the longest list "key_x" from all mappings being merged. If a "key_y" list is shorter, the last element of the list is repeated until the list is the longest.
- {"key_2": ["key_2_item_1", "key_2_item_2", ...]} : the second mapping to merge into the first mapping. The "key_2" value must be a list. "key_2" is the key for each mapping in the merged list. The "key_2" value is "key_2_item_1" for the first merged mapping and "key_2_item_2" for the second merged mapping.

Examples

- The following example demonstrates how to merge three mappings. The length of the list based on the key values for each mapping is the same.

```
{
  "Fn::MergeMapToList": [
    {"key_1": ["k1e_1_item_1", "k1e_1_item_2"]},
    {"key_2": ["k2e_2_item_1", "k2e_2_item_2"]},
    {"key_3": ["k3e_3_item_1", "k3e_3_item_2"]}
  ]
}
```

The following code shows the merged result:

```
[
  {
    "key_1": "kye_1_item_1",
    "key_2": "kye_2_item_1",
    "key_3": "kye_3_item_1"
  },
  {
    "key_1": "kye_1_item_2",
    "key_2": "kye_2_item_2",
    "key_3": "kye_3_item_2"
  }
]
```

- The length of the list based on the key values for each mapping varies in the following example:

```
{
  "Fn::MergeMapToList": [
    {"key_1": ["kye_1_item_1", "kye_1_item_2"]},
    {"key_2": ["kye_2_item_1", "kye_2_item_2", "key_2_item_3"]},
    {"key_3": ["kye_3_item_1", "kye_3_item_2"]}
  ]
}
```

The following code shows the merged result:

```
[
  {
    "key_1": "kye_1_item_1",
    "key_2": "kye_2_item_1",
    "key_3": "kye_3_item_1"
  },
  {
    "key_1": "kye_1_item_2",
    "key_2": "kye_2_item_2",
    "key_3": "kye_3_item_2"
  },
  {
    "key_1": "kye_1_item_2",
    "key_2": "kye_2_item_3",
    "key_3": "kye_3_item_2"
  }
]
```

- In the following template example, all instances created in WebServer are added to the VServer group of an SLB instance:

```

{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "WebServer": {
      "Type": "ALIYUN::ECS::InstanceGroupClone",
      "Properties": {
        "SourceInstanceId": "i-xxxxx",
        "Password": "Hello****",
        "MinAmount": 1,
        "MaxAmount": 1
      }
    },
    "CreateVServerGroup": {
      "Type": "ALIYUN::SLB::VServerGroup",
      "Properties": {
        "LoadBalancerId": "lb-****",
        "VServerGroupName": "VServerGroup-****",
        "BackendServers": {
          "Fn::MergeMapToList": [
            {"Port": [6666, 9090, 8080]},
            {"ServerId": {"Fn::GetAtt": ["WebServer", "InstanceIds"]}},
            {"Weight": [20, 100]}
          ]
        }
      }
    }
  }
}

```

Supported functions

- Fn::Base64Encode
- Fn::GetAtt
- Fn::Join
- Fn::Select
- Ref
- Fn::Join
- Fn::If
- Fn::ListMerge
- Fn::GetJsonValue

Fn::Avg

The Fn::Avg function is used to return the average value of a set of numbers.

Declaration

```
{"Fn::Avg": [ndigits, [number1, number2, ... ]]}
```

Parameters

- `ndigits` : the number of decimal places to report. This parameter value must be an integer.
- `[number1, number2, ...]` : the set of numbers for which the average value will be calculated. Each element in the group must be either a number or a string that can be converted into a number.

Return value

The average value of the set of numbers.

Examples

```
{ "Fn::Avg": [ 1, [1, 2, 6.0] ] }
{ "Fn::Avg": [ 1, ['1', '2', '6.0'] ] }
```

3.0 is returned in this example.

Supported functions

- `Fn::GetAtt`
- `Ref`

Fn::SelectMapList

The `Fn::SelectMapList` function is used to return a list of map elements.

Declaration

```
{ "Fn::SelectMapList": ["key2", [{"key1": "value1-1", "key3": "value1-3"}, {"key1": "value2-1", "key2": "value2-2"}, {"key1": "value3-1", "key2": "value3-2"}, ...] ] }
```

Parameters

- `key2` : the key to be queried in the map.
- `[{"key1": "value1-1", "key3": "value1-3"}, ...]` : the list of maps.

Return value

A list of key values for all maps in the map list.

Examples

```
{
  "Fn::SelectMapList": [
    "key2",
    [
      {"key1": "value1-1", "key3": "value1-3"},
      {"key1": "value2-1", "key2": "value2-2"},
      {"key1": "value3-1", "key2": "value3-2"}
    ]
  ]
}
```

`["value2-2","value3-2"]` is returned in this example.

Fn::Add

The `Fn::Add` function is used to sum the values of parameters.

Declaration

```
{"Fn::Add": [{"Product": "ROS"}, {"Fn": "Add"}]}
```

Parameters

- The parameters must be arranged as a list.
- The parameters in the list can be of the Number, List, or Dictionary type. All the parameters must be of the same type. The list must contain at least two parameters.

Return value

If the parameter values are numbers, sum the parameter values. If the parameter values are lists, concatenate the values. If the parameter values are dictionaries, merge the values. If the two parameters have the same key, overwrite the former parameter value with the latter.

Examples

```
{
  "Fn::Add": [
    {"Product": "ROS"},
    {"Fn": "Add"}
  ]
}
```

`{"Fn": "Add", "Product": "ROS"}` is returned in this example.

5.4.6. Mappings

The Mappings section is a key-value mapping table. When mappings are used in Resources or Outputs definitions, use `Fn::FindInMap` to find their values by using corresponding keys.

Syntax

A mapping consists of key-value pairs, where both the keys and values can be strings or numbers. Multiple mappings are separated with commas (,). Each mapping name must be unique. Mappings must be pure data and cannot parse functions.

Examples

The following example shows a correct mapping definition:

```
"Mappings": {
  "ValidMapping": {
    "TestKey1": {"TestValu1": "value1"},
    "TestKey2": {"TestValu2": "value2"},
    1234567890: {"TestValu3": "value3"},
    "TestKey4": {"TestValu4": 1234}
  }
}
```

The following example shows an incorrect mapping definition:

```

"Mappings": {
  "InvalidMapping1": {
    "ValueList": ["foo", "bar"],
    "ValueString": "baz"
  },
  "InvalidMapping2": ["foo", {"bar" : "baz"}],
  "InvalidMapping3": "foobar"
}

```

The following example shows how to use Fn::FindInMap to find the return value:

```

{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Parameters": {
    "regionParam": {
      "Description": "The region where the ECS instance is created",
      "Type": "String",
      "AllowedValues": [
        "hangzhou",
        "beijing"
      ]
    }
  },
  "Mappings": {
    "RegionMap": {
      "hangzhou": {
        "32": "m-25l0rcfjo",
        "64": "m-25l0rcfj1"
      },
      "beijing": {
        "32": "m-25l0rcfj2",
        "64": "m-25l0rcfj3"
      }
    }
  },
  "Resources": {
    "WebServer": {
      "Type": "ALIYUN::ECS::Instance",
      "Properties": {
        "ImageId": {
          "Fn::FindInMap": [
            "RegionMap",
            {
              "Ref": "regionParam"
            }
          ],
          "32"

```

The following example shows how to use conditions in a resource definition:

In this example, a condition is used to determine whether to create a data disk and an OSS bucket for an ECS instance based on the EnvType value.

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Parameters": {
    "EnvType": {
      "Default": "pre",
      "Type": "String"
    }
  },
  "Conditions": {
    "CreateProdRes": {
      "Fn::Equals": [
        "prod",
        {
          "Ref": "EnvType"
        }
      ]
    }
  },
  "Resources": {
    "WebServer": {
      "Type": "ALIYUN::ECS::Instance",
      "Properties": {
        "DiskMappings": {
          "Fn::If": [
            "CreateProdRes",
            [
              {
                "Category": "cloud_efficiency",
                "DiskName": "FirstDataDiskName",
                "Size": 40
              },
              {
                "Category": "cloud_ssd",
                "DiskName": "SecondDataDiskName",
                "Size": 40
              }
            ],
            {
              "Ref": "ALIYUN::NoValue"
            }
          ]
        }
      },
      "VpcId": "vpc-2zew9pxh2yirtzqxd****"
    }
  }
}
```

```

    "SystemDiskCategory": "cloud_efficiency",
    "SecurityGroupId": "sg-2zece6wcqiejf1v****",
    "SystemDiskSize": 40,
    "ImageId": "centos_6_8_64_40G_base_2017****.vhd",
    "IoOptimized": "optimized",
    "VSwitchId": "vsw-2zed9txvy7h2srqo6****",
    "InstanceType": "ecs.n1.medium"
  }
},
"OssBucket": {
  "Type": "ALIYUN::OSS::Bucket",
  "Condition": "CreateProdRes",
  "Properties": {
    "AccessControl": "private",
    "BucketName": "myprodbucket"
  }
}
},
"Outputs": {
  "InstanceId": {
    "Value": {
      "Fn::GetAtt": [
        "WebServer",
        "InstanceId"
      ]
    }
  },
  "OssDomain": {
    "Condition": "CreateProdRes",
    "Value": {
      "Fn::GetAtt": [
        "OssBucket",
        "DomainName"
      ]
    }
  }
}
}
}

```

5.5. Resource types

5.5.1. ECS

5.5.1.1. ALIYUN::ECS::AutoSnapshotPolicy

ALIYUN::ECS::AutoSnapshotPolicy is used to create an automatic snapshot policy.

Statement

```
{  
  "Type" : "ALIYUN::ECS::AutoSnapshotPolicy",  
  "Properties" : {  
    "TimePoints" : String,  
    "RepeatWeekdays" : String,  
    "RetentionDays" : Integer,  
    "DiskIds" : String,  
    "AutoSnapshotPolicyName" : String  
  }  
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
-----------	------	----------	----------	-------------	------------

Parameter	Type	Required	Editable	Description	Constraint
TimePoints	List	Retained	Yes	The points in time at which automatic snapshots are created. Unit: hours.	<p>Value range:[0, 23], represents 24 time points from 00:00 to 23:00. For example: 1 indicating 01:00. To schedule multiple automatic snapshot creation tasks in a day, you can set the TimePoints parameter as an array.</p> <ul style="list-style-type: none"> • The maximum number of time points allowed is 24. • Use one format for multiple time points like [0, 1,... 23]. Separate time points with commas (,).

Parameter	Type	Required	Editable	Description	Constraint
RepeatWeekdays	List	Retained	Yes	The days of a week on which automatic snapshots are created.	<p>Value range:[1, 7], 1 indicates Monday. To schedule multiple automatic snapshot creation tasks in a week, you can set the RepeatWeekdays parameter as an array.</p> <ul style="list-style-type: none"> You can specify up to 7 days over a one week period. Use one format for multiple time points like [1, 2,... 7]. Separate the time points with commas (,).
RetentionDays	Integer	Retained	Yes	The number of days for which you want to retain automatic snapshots.	<p>Default value: -1. Valid values:</p> <ul style="list-style-type: none"> -1: The automatic snapshots are retained indefinitely. [1, 65536]: The automatic snapshots are retained for the specified number of days. <p>Default value: -1.</p>

Parameter	Type	Required	Editable	Description	Constraint
DiskIds	List	Retained	Yes	The ID of the destination disk. When you want to apply the automatic snapshot policy to multiple disks, you can set the diskids "d-zzzzzzzz"]. Separate multiple disk IDs with commas (,).	None
AutoSnapshotPolicyName	String	Yes	True	The name of the automatic snapshot policy.	<ul style="list-style-type: none"> • The name must be 2 to 128 characters in length • It can contain letters, digits, colons (:), underscores (_), and hyphens (-). • It cannot start with http:// or https://. <p>This parameter is empty by default.</p>

Response parameters

Fn::GetAtt

AutoSnapshotPolicyId: the ID of the automatic snapshot policy.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "AutoSnapshotPolicy": {
      "Type": "ALIYUN::ECS::AutoSnapshotPolicy",
      "Properties": {
        "TimePoints": ["0"],
        "RepeatWeekdays": ["1"],
        "RetentionDays": 10,
        "DiskIds": ["<DiskId>"],
        "AutoSnapshotPolicyName": "MyAutoSnapshotPolicy"
      }
    }
  }
}
```

5.5.1.2. ALIYUN::ECS::BandwidthPackage

ALIYUN::ECS::BandwidthPackage is used to create a service plan for a NAT gateway.

Syntax

```
{
  "Type": "ALIYUN::ECS::BandwidthPackage",
  "Properties": {
    "Description": String,
    "NatGatewayId": String,
    "ZoneId": String,
    "BandwidthPackageName": String,
    "Bandwidth": Integer,
    "IpCount": Integer
  }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
NatGatewayId	String	Yes	No	The ID of the NAT gateway to which you want to bind the service plan.	None
Bandwidth	Integer	Yes	No	The bandwidth.	Valid values: 5 to 5000. Unit: Mbit/s. Default value: 5.

Property	Type	Required	Editable	Description	Constraint
IpCount	Integer	Yes	No	The number of public IP addresses assigned to the NAT gateway.	Valid values: 1 to 5.
Description	String	No	No	The description of the service plan.	The description must be 2 to 256 characters in length.
Zoneld	String	No	No	The ID of the zone where the NAT gateway resides.	None
BandwidthPackageName	String	No	No	The name of the service plan.	The name must be 2 to 128 characters in length and can contain letters, digits, underscores (_), hyphens (-), and periods (.). It must start with a letter.

Response parameters

Fn::GetAtt

- **BandwidthPackageId**: the ID of the service plan.
- **BandwidthPackageIps**: all IP addresses included in the service plan.

Examples

```

{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "BandwidthPackage": {
      "Type": "ALIYUN::ECS::BandwidthPackage",
      "Properties": {
        "BandwidthPackageName": "pkg_2",
        "Description": "my_bandwidth",
        "NatGatewayId": "ngw-h1xox****",
        "IpCount": 2,
        "Bandwidth": 5,
        "ZoneId": "cn-beijing-c"
      }
    }
  },
  "Outputs": {
    "BandwidthPackageId": {
      "Value": {"Fn::GetAttr": ["BandwidthPackage","BandwidthPackageId"]}
    },
    "BandwidthPackageIps": {
      "Value": {"Fn::GetAttr": ["BandwidthPackage","BandwidthPackageIps"]}
    }
  }
}

```

5.5.1.3. ALIYUN::ECS::Command

ALIYUN::ECS::Command is used to create a Cloud Assistant command.

Statement

```

{
  "Type": "ALIYUN::ECS::Command",
  "Properties": {
    "Name": String,
    "WorkingDir": String,
    "CommandContent": String,
    "Timeout": Integer,
    "Type": String,
    "Description": String
  }
}

```

Properties

Parameter	Type	Required	Editable	Description	Constraint
Name	String	Yes	True	The name of the command, which supports all character sets. The name can be up to 30 characters in length.	None
WorkingDir	String	Yes	True	The working directory on the ECS instance where the command will be run.	None
CommandContent	String	Yes	Released	The Base64-encoded content of the command. When you specify request parameters <code>Type</code> you must also specify this parameter. The parameter value must be Base64-encoded and cannot exceed 16 KB in size after encoding.	None
Timeout	String	No.	True	The timeout period that is specified for the command to run on ECS instances. Unit: seconds. If the command fails to run within the specified period, the command execution will time out and the process will be forcibly terminated. Default value: 3600.	None
Type	String	No	No	The command type. Valid values: <ul style="list-style-type: none"> RunBatScript: Creates a Bat script for a Windows instance. RunPowerShellScript: Create a PowerShell script to run on a Windows instance. RunShellScript: Creates a Shell script for Linux-based instances. 	None
Description	String	Yes	True	The description of the command, which supports all character sets. The description can be up to 100 characters in length.	None

Response parameters

Fn::GetAtt

CommandId: the ID of the command.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Parameters": {
    "WorkingDir": {
      "Type": "String",
      "Description": "The path where command will be executed in the instance."
    },
    "CommandContent": {
      "Type": "String",
      "Description": "The content of command. Content requires base64 encoding. Maximum size support 16KB."
    },
    "Type": {
      "Type": "String",
      "Description": "The type of command."
    },
    "Description": {
      "Type": "String",
      "Description": "The description of command."
    },
    "Timeout": {
      "Type": "Number",
      "Description": "Total timeout when the command is executed in the instance. Input the time unit as second. Default is 3600s."
    },
    "Name": {
      "Type": "String",
      "Description": "The name of command."
    }
  },
  "Resources": {
    "Command": {
      "Type": "ALIYUN::ECS::Command",
      "Properties": {
        "WorkingDir": {
          "Ref": "WorkingDir"
        },
        "CommandContent": {
          "Ref": "CommandContent"
        },
        "Type": {
          "Ref": "Type"
        },
        "Description": {
          "Ref": "Description"
        }
      }
    }
  }
}
```

```

"Timeout": {
  "Ref": "Timeout"
},
"Name": {
  "Ref": "Name"
}
}
},
"Outputs": {
  "CommandId": {
    "Description": "The id of command created.",
    "Value": {
      "Fn::GetAtt": [
        "Command",
        "CommandId"
      ]
    }
  }
}
}
}

```

5.5.1.4. ALIYUN::ECS::CustomImage

ALIYUN::ECS::CustomImage is used to create a custom image.

Statement

```

{
  "Type": "ALIYUN::ECS::CustomImage",
  "Properties": {
    "Description": String,
    "InstanceId": String,
    "ImageName": String,
    "ImageVersion": String,
    "SnapshotId": String,
    "Tag": List,
    "ResourceGroupId": String,
    "Platform": String,
    "DiskDeviceMapping": List,
    "Architecture": String
  }
}

```

Properties

Parameter	Type	Required or Not	Editable	Description	Constraint
Description	String	Yes	Released	The description of the image.	The description can be up to 256 characters in length. This parameter is empty by default. It cannot start with http:// or https://.
InstanceId	String	Yes	Released	The ID of the ECS instance.	If this parameter is specified, an ECS instance will be used to create the custom image.
ImageName	String	Yes	Released	The name of the image.	The name must be 2 to 128 characters in length and can contain letters, digits, underscores (_), and hyphens(-). It must start with a letter but cannot start with http:// or https://.
ImageVersion	String	Yes	Released	The image version.	The image version must be 1 to 40 characters in length.
SnapshotId	String	Yes	Released	The ID of the snapshot.	<ul style="list-style-type: none"> If this parameter is specified, a snapshot will be used to create the custom image. If both this parameter and the InstanceId parameter are specified, this parameter will be ignored and an instance will be used to create the custom image.
Tags	List	Erased	Released	The tags of the image.	None
ResourceGroupId	String	Yes	Released	The ID of the resource group to which the custom image belongs.	None

Parameter	Type	Required or Not	Editable	Description	Constraint
Platform	String	Yes	Released	If you specify a data disk snapshot to be used to create the system disk of the custom image, you must use the Platform parameter to determine the release version of the operating system for the system disk.	None
DiskDeviceMapping	List	Erased	Released	The mappings between images and snapshots.	None
Architecture	String	Yes	Released	If you specify a data disk snapshot to be used to create the system disk of the custom image, you must use the Architecture parameter to determine the architecture of the system disk. Default value: x86_64.	Valid values: <ul style="list-style-type: none"> i386 x86_64

Tag syntax

```
"Tag": [
  {
    "Key": String,
    "Value": String
  }
]
```

Tag properties

Parameter	Type	Required or Not	Editable	Description	Constraint
Key	String	Yes	Released	The tag key of the image.	The tag key cannot be a null string. The key can be up to 64 characters in length. It cannot start with aliyun or acs: and cannot contain http:// or https://.

Parameter	Type	Required or Not	Editable	Description	Constraint
Value	String	Yes	Released	The tag value of the image.	The tag value can be an empty string. The value can be up to 128 characters in length. It cannot start with aliyun or acs: and cannot contain http:// or https://.

DiskDeviceMapping

```
"DiskDeviceMapping": [
  {
    "Device": String,
    "SnapshotId": String,
    "Size": Integer,
    "DiskType": String
  }
]
```

DiskDeviceMapping properties

Parameter	Type	Required or Not	Editable	Description	Constraint
Device	String	Yes	Released	The device name of disk N in the custom image.	The system allocates a device name in alphabetical order from /dev/xvda to /dev/xvdz.
SnapshotId	String	Yes	Released	The ID of the snapshot that is used to create the custom image.	None
Size	String	Optional	Released	The size of disk N. Unit: GiB.	<p>Valid values: 5 to 2000.</p> <ul style="list-style-type: none"> The default value is the size of the snapshot specified by the DiskDeviceMapping.N.S snapshotId parameter. If the DiskDeviceMapping.N.S snapshotId parameter is not specified, the default disk size is 5 GiB. The disk size must be greater than or equal to the size of the snapshot specified by the DiskDeviceMapping.N.S snapshotId parameter.

Parameter	Type	Required or Not	Editable	Description	Constraint
DiskType	String	Yes	Released	The type of disk N in the custom image. You can specify this parameter to create the system disk of the custom image from a data disk snapshot. If you do not specify this parameter, the disk type is determined by the corresponding snapshot.	Valid values: <ul style="list-style-type: none"> • system: indicates a system disk. • data: indicates a data disk.

Response parameters

Fn::GetAtt

ImageId: the ID of the custom image.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "WebServer": {
      "Type": "ALIYUN::ECS::InstanceGroup",
      "Properties": {

    }
  },
  "InstanceIds": {
    "Value": {
      "Fn::GetAtt": [
        "WebServer",
        "InstanceIds"
      ]
    }
  }
}
}
```

5.5.1.5. ALIYUN::ECS::DedicatedHost

ALIYUN::ECS::DedicatedHost is used to create a dedicated host.

Statement

```
{
  "Type": "ALIYUN::ECS::DedicatedHost",
  "Properties": {
    "DedicatedHostType": String,
    "DedicatedHostName": String,
    "AutoReleaseTime": String,
    "Description": String,
    "AutoPlacement": String,
    "Tags": List,
    "ActionOnMaintenance": String,
    "NetworkAttributesSlbUdpTimeout": Integer,
    "ChargeType": String,
    "ResourceGroupId": String,
    "ZoneId": String,
    "NetworkAttributesUdpTimeout": Integer,
    "Quantity": Integer
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
DedicatedHostType	String	No	No	The dedicated host type.	None
DedicatedHostName	String	Yes	Released	The name of the dedicated host.	<ul style="list-style-type: none"> The name must be 2 to 128 characters in length and can contain letters, digits, colons (:), underscores (_), and hyphens (-). Must start with an uppercase or lowercase letter, and cannot start with <code>http://</code> or <code>https://</code> the beginning. It can contain digits, colons (:), underscores (_), and hyphens (-).

Parameter	Type	Required	Editable	Description	Constraint
AutoReleaseTime	String	Yes	Released	<p>The time scheduled for the dedicated host to be automatically released. If you do not specify the AutoReleaseTime parameter, the dedicated host will not be automatically released.</p> <ul style="list-style-type: none"> The minimum release time must be at least 30 minutes after the current time. The maximum release time must be at most three years from the current time. If the value of <code>ss</code> is not <code>00</code>, the start time is automatically rounded down to the nearest minute based on the value of <code>mm</code>. 	None
Description	String	Yes	Released	The description of the dedicated host.	None
ZoneId	String	Yes	Released	<p>The ID of the zone where the dedicated host resides.</p> <p>This parameter is empty by default. If this parameter is not specified, the system will automatically select a zone.</p>	None
ChargeType	String	Yes	Released	The billing method of the dedicated host.	Valid values: PostPaid and pay-as-you-go.

Parameter	Type	Required	Editable	Description	Constraint
AutoPlacement	String	Yes	Released	Specifies whether to add the dedicated host to the resource pool for automatic deployment. If you do not specify a DedicatedHostId when you create an instance on a DDH, Alibaba Cloud automatically selects a DDH from the resource pool to host the instance.	<p>Valid values:</p> <ul style="list-style-type: none"> on off <p> Note</p> <p>If you do not specify this parameter, the dedicated host is added to the automatic deployment resource pool.</p> <p>If you do not want to add the dedicated host to the resource pool for automatic deployment, set the value to off.</p>
Tags	List	Erased	Released	The custom tags of the instance.	<p>A maximum of 20 tags are supported. The format is as follows:</p> <pre>[{"Key": "tagKey", "Value": "tagValue"}, {"Key": "tagKey2", "Value": "tagValue2"}]</pre>
ActionOnMaintenance	String	Yes	Released	The method used to migrate the instances on the DDH when the DDH fails or needs to be repaired online.	<p>Valid values:</p> <ul style="list-style-type: none"> Migrate: specifies that the instances are migrated to another physical server and restarted. Stop: specifies that all the instances on the DDH are stopped. If the DDH cannot be repaired, the instances are migrated to another physical server and restarted. <p>The default value is "Migrate" for a dedicated host and "Stop" for a local disk.</p>

Parameter	Type	Required	Editable	Description	Constraint
NetworkAttributesSlbUdpTimeout	String	Optional	Released	The timeout period for a UDP session.	Valid values: 15 to 310. Unit: seconds.
ResourceGroupID	String	Yes	Released	The ID of the resource group to which the dedicated host belongs.	None
NetworkAttributesUdpTimeout	String	Optional	Released	The timeout period for UDP sessions that users can access for cloud services running on the dedicated host.	Valid values: 15 to 310. Unit: seconds.
Quantity	String	Optional	Released	The number of DDHs that you want to create this time.	Valid values: 1 to 100. Default value: 1

Response parameters

Fn::GetAtt

- OrderId: the ID of the order.
- DedicatedHostIds: the list of host IDs.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Parameters": {
    "AutoRenewPeriod": {
      "Type": "Number",
      "Description": "The time period of auto renew. When the parameter InstanceChargeType is PrePaid, it will take effect. It could be 1, 2, 3, 6, 12. Default value is 1.",

```

5.5.1.6. ALIYUN::ECS::Disk

ALIYUN::ECS::Disk is used to create an ECS Disk.

Statement

```

{
  "Type": "ALIYUN::ECS::Disk",
  "Properties": {
    "DiskName": String,
    "Description": String,
    "Tags": List,
    "AutoSnapshotPolicyId": String,
    "Encrypted": Boolean,
    "ZoneId": String,
    "ResourceGroupId": String,
    "SnapshotId": String,
    "DiskCategory": String,
    "PerformanceLevel": String,
    "DeleteAutoSnapshot": Boolean,
    "Size": Integer
  }
}

```

Properties

Parameter	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	Yes	Released	The ID of the resource group to which the instance belongs.	None
ZoneId	String	No	No	The ID of the zone where the instance resides.	None
DiskName	String	Yes	Released	The name of the disk.	<ul style="list-style-type: none"> The name must be 2 to 128 characters in length And can contain letters, digits, periods, underscores (_), and hyphens (-). It cannot start with http:// or https://. The disk name will be displayed in the ECS console.
Description	String	Yes	Released	The description of the disk.	<ul style="list-style-type: none"> The description must be 2 to 256 characters in length. Cannot http:// or https:// the beginning. The disk description will be displayed in the ECS console.
Tags	List	Erased	Released	The custom tags of the instance.	Up to four tags are supported. Example values: [{"Key": "tagKey", "Value": "tagValue"}, {"Key": "tagKey2", "Value": "tagValue2"}].

Parameter	Type	Required	Editable	Description	Constraint
DiskCategory	String	Yes	Released	The type of the data disk.	Value range <ul style="list-style-type: none"> cloud: indicates a basic disk. cloud_efficiency: indicates an ultra disk. cloud_ssd: indicates a standard SSD. cloud_essd: enhanced SSD (ESSD) Default value: cloud.
SnapshotId	String	Yes	Released	The ID of the snapshot used to create the data disk.	<ul style="list-style-type: none"> If both this parameter and 'Size' are specified, the value of this parameter prevails. The actual size of the created disk is the size of the specified snapshot. Snapshots created on or before July 15, 2013 cannot be used to create disks.
PerformanceLevel	String	Yes	Released	Specifies the performance level of an ESSD when you create the ESSD.	Default value: PL1. Valid values: <ul style="list-style-type: none"> PL1: A single enhanced SSD delivers up to 50,000 random read/write IOPS. PL2: A single ESSD delivers up to 100,000 random read/write IOPS. PL3: maximum random read/write IOPS of 100,000 per disk.

Parameter	Type	Required	Editable	Description	Constraint
Size	String	Optional	Released	The size of the disk. Unit: GiB. The value of this parameter must be equal to or greater than the capacity of the specified snapshot.	Valid values: <ul style="list-style-type: none"> cloud: 5 to 2000 cloud_efficiency: 20 to 32768 cloud_ssd: 20 to 32768 cloud_essd: 20 to 32768
AutoSnapshotPolicyId	String	Yes	Released	The ID of each automatic snapshot policy.	None
Encrypted	Boolean	Erased	Released	Specifies whether to encrypt the disk.	Valid values: <ul style="list-style-type: none"> true false Default value: false.
DeleteAutoSnapshot	Boolean	Erased	Released	Specifies whether to delete the automatic snapshots of the disk when the disk is released.	Valid values: <ul style="list-style-type: none"> true false Default value: true.

Tags syntax

```
"Tags" : [
  {
    "Value" : String,
    "Key" : String
  }
]
```

Tags properties

Parameter	Type	Required	Editable
Key	String	No	No
Value	String	Yes	Released

Response parameters

Fn::GetAtt

- **DiskId:** the ID of the disk.
- **Status:** The Status of the disk.

Sample request

```
{
  "ROSTemplateFormatVersion" : "2015-09-01",
  "Resources" : {
    "DataDisk": {
      "Type": "ALIYUN::ECS::Disk",
      "Properties": {
        "Size": 10,
        "ZoneId": "cn-beijing-a",
        "DiskName": "DataDisk",
        "Description": "ECSDataDisk"
      }
    }
  },
  "Outputs": {
    "DiskId": {
      "Value" : {"Fn::GetAtt": ["DataDisk","DiskId"]}
    },
    "Status": {
      "Value" : {"Fn::GetAtt": ["DataDisk","Status"]}
    }
  }
}
```

5.5.1.7. ALIYUN::ECS::DiskAttachment

ALIYUN::ECS::DiskAttachment is used to attach an ECS disk.

Statement

```
{
  "Type" : "ALIYUN::ECS::DiskAttachment",
  "Properties" : {
    "DiskId" : String,
    "InstanceId" : String,
    "Device" : String,
    "DeleteWithInstance" : String
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
InstanceId	String	No	No	The ID of the instance.	None

Parameter	Type	Required	Editable	Description	Constraint
DiskId	String	No	No	The ID of the disk.	The disk and the ECS instance must belong to the same zone.
Device	String	Yes	Released	The name of the disk.	If you do not set this parameter, the system will automatically allocate a device name in alphabetical order from /dev/xvdb to /dev/xvdz.
DeleteWithInstance	Boolean	Erased	Released	Specifies whether the disk is to be released together with the instance.	Valid values: <ul style="list-style-type: none"> • true: The disk will be released when the instance is released. • false: The disk will be retained when the instance is released.

Response parameters

Fn::GetAtt

- DiskId: the ID of the disk.
- Status: The Status of the disk.
- The name of the Device: disk.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "DiskAttachment": {
      "Type": "ALIYUN::ECS::DiskAttachment",
      "Properties": {
        "InstanceId": {
          "Ref": "InstanceId"
        },
        "Device": {
          "Ref": "Device"
        }
      },
      "DeleteWithInstance": {
        "Ref": "DeleteWithInstance"
      }
    }
  }
}
```

```

    },
    "DiskId": {
      "Ref": "DiskId"
    }
  }
},
"Parameters": {
  "InstanceId": {
    "Type": "String",
    "Description": "The ID of the instance to attach the disk."
  },
  "Device": {
    "Type": "String",
    "Description": "The device where the volume is exposed on the instance. The device name could be /dev/xvd[a-z]. If this parameter is not specified, the default value will be used."
  },
  "DeleteWithInstance": {
    "Type": "Boolean",
    "Description": "If this parameter is set to true, the disk will be deleted while the instance is deleted. If this parameter is set to false, the disk will be retained after the instance is deleted.",
    "AllowedValues": [
      "True",
      "true",
      "False",
      "false"
    ]
  },
  "DiskId": {
    "Type": "String",
    "Description": "The ID of the disk to be attached."
  }
},
"Outputs": {
  "Status": {
    "Description": "The disk status now.",
    "Value": {
      "Fn::GetAtt": [
        "DiskAttachment",
        "Status"
      ]
    }
  }
},
"Device": {
  "Description": "The device where the volume is exposed on the ECS instance.",
  "Value": {
    "Fn::GetAtt": [

```

```

        "DiskAttachment",
        "Device"
    ]
}
},
"DiskId": {
    "Description": "The ID of the created disk.",
    "Value": {
        "Fn::GetAtt": [
            "DiskAttachment",
            "DiskId"
        ]
    }
}
}
}
}
}
}

```

5.5.1.8. ALIYUN::ECS::ForwardEntry

ALIYUN::ECS::ForwardEntry is used to configure the DNAT table of a NAT Gateway.

Statement

```

{
    "Type": "ALIYUN::ECS::ForwardEntry",
    "Properties": {
        "ExternalIp": String,
        "ExternalPort": String,
        "ForwardTableId": String,
        "InternalIp": String,
        "IpProtocol": String,
        "InternalPort": String
    }
}

```

Properties

Parameter	Type	Required	Editable	Description	Constraint
ExternalIp	String	No	No	The public IP address of the NAT gateway.	It must be an IP address that is included in the shared NAT Gateway of the bandwidth plan to which the DNAT table belongs.

Parameter	Type	Required	Editable	Description	Constraint
ExternalPort	String	No	No	The public port number.	Valid values: 1 to 65535.
ForwardTableId	String	No	No	The ID of the DNAT table.	None
InternalIp	String	No	No	The destination IP address to which the request is forwarded.	This IP address is a private IP address.
IpProtocol	String	No	No	The type of the protocol.	Valid values: TCP, UDP, and Any.
InternalPort	String	No	No	The destination private port.	Valid values: 1 to 65535.

Response parameters

`Fn::GetAtt`

`ForwardEntryId`: the ID of each entry in the DNAT table.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "ForwardEntry": {
      "Type": "ALIYUN::ECS::ForwardEntry",
      "Properties": {
        "ForwardTableId": "my_forwardtable",
        "ExternalIp": "101.201.XX.XX",
        "ExternalPort": "8080",
        "IpProtocol": "TCP",
        "InternalIp": "10.2.XX.XX",
        "InternalPort": "80"
      }
    }
  },
  "Outputs": {
    "ForwardEntryId": {
      "Value": {"Fn::GetAttr": ["ForwardEntry", "ForwardEntryId"]}
    }
  }
}
```

5.5.1.9. ALIYUN::ECS::Instance

`ALIYUN::ECS::Instance` is used to create an ECS instance.

Statement

```
{
  "Type": "ALIYUN::ECS::Instance",
  "Properties": {
    "RamRoleName": String,
    "IoOptimized": String,
    "PrivateIpAddress": String,
    "KeyPairName": String,
    "SystemDiskDiskName": String,
    "Description": String,
    "Tags": List,
    "HostName": String,
    "ImageId": String,
    "ResourceGroupId": String,
    "VSwitchId": String,
    "Password": String,
    "InstanceType": String,
    "SystemDiskCategory": String,
    "UserData": String,
    "SystemDiskSize": Number,
    "ZoneId": String,
    "VpcId": String,
    "InstanceName": String,
    "InternetMaxBandwidthIn": Integer,
    "DeletionProtection": Boolean,
    "DeploymentSetId": String,
    "SecurityGroupId": String,
    "HpcClusterId": String,
    "SystemDiskDescription": String,
    "DiskMappings": List
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	Yes	Released	The ID of the resource group to which the instance belongs.	None

Parameter	Type	Required	Editable	Description	Constraint
ImageId	String	No	Yes	The ID of the image used to start the ECS instance. You can use a public image, a custom image, or an Alibaba Cloud Marketplace image.	<p>When editing a template, you can specify the image type and version or only the image type. ROS automatically selects an appropriate public image ID.</p> <p>You can use the wildcard character (*) to represent part of an image ID.</p> <p>Take all Ubuntu public images provided by Alibaba Cloud as an example. You can use one of the following methods to specify the public image ID for the ECS instance:</p> <ul style="list-style-type: none"> If you enter ubuntu, the system matches it with the following ID: ubuntu16_0402_64_20G_alibase_20170818.vhd If you enter ubuntu_14, the system matches it with the following ID: ubuntu_14_0405_64_20G_alibase_20170824.vhd If you enter ubuntu*14*32, the system matches it with the following ID: ubuntu_14_0405_32_40G_alibase_20170711.vhd If you enter ubuntu_16_0402_32, the system matches it with the following ID: ubuntu_16_0402_32_40G_alibase_20170711.vhd
InstanceType	String	No	No	The type of the ECS instance.	None
SecurityGroupId	String	No	No	The ID of the security group to which the created instance will belong.	None
Description	String	Yes	Released	The description of created instances.	The description can be up to 256 characters in length.
InstanceName	String	Yes	Released	The name of a created instance.	The name can be up to 128 characters in length and can contain letters, digits, underscores (_), periods (.), and hyphens (-).

Parameter	Type	Required	Editable	Description	Constraint
Password	String	Yes	Released	The password used to log on to the ECS instance.	<p>The characters in length is 8 to 30.</p> <p>And must contain at least one of the following character types: uppercase letters, lowercase letters, digits, and special character.</p> <p>Special characters include () ` ~ ! @ # \$ % ^ & * - + = { } [] ; ' < > , . ? / - / - If you specify the Password parameter in the API request, use HTTPS to secure the API and protect your password.</p>
HostName	String	Yes	Released	The hostname of the instance.	<p>The password must be at least 2 characters in length.</p> <p>It cannot And hyphens (-) cannot start or end the hostname and cannot be used consecutively.</p> <p>On Windows, the hostname can be up to 15 characters in length and can contain letters, digits, and hyphens (-). It cannot contain periods (.) and cannot be composed of only digits.</p> <p>On other OSs such as Linux, the hostname can contain a maximum of 30 characters, including periods (.), each segment can contain uppercase or lowercase letters, digits, and hyphens (-).</p>
PrivateIpAddress	String	Yes	Released	The private IP address of an ECS instance in a VPC. The specified IP address must not be used by other instances in the VPC.	None
InternetMaxBandwidthIn	String	Optional	Released	The maximum inbound bandwidth from the Internet.	<p>Valid values: 1 to 100.</p> <p>Default value: 100.</p> <p>Unit: Mbit/s.</p>

Parameter	Type	Required	Editable	Description	Constraint
IoOptimized	String	Yes	Released	Specifies whether an I/O optimized instance is created.	Valid values: <ul style="list-style-type: none"> • none (non-I/O optimized) • optimized Default value: none.
DiskMappings	List	Erased	Released	The data disks to be attached to the instance.	A maximum of 16 disks can be attached to each instance.
SystemDiskCategory	String	Yes	Released	The type of the system disk.	Valid values: <ul style="list-style-type: none"> • cloud • cloud_efficiency • cloud_ssd • ephemeral_ssd
SystemDiskDescription	String	Yes	Released	The description of the ECS instance system disk.	None
SystemDiskDiskName	String	Yes	Released	The name of the ECS instance system disk.	None
SystemDiskSize	Number	No.	True	The size of the system disk. Unit: GB.	Valid values: 40 to 500. If a custom image is used to create a system disk, make sure that the size of the system disk is greater than that of the custom image.
Tags	List	Erased	Released	The custom tags of the instance.	A maximum of 20 tags are supported. The format is as follows: <pre>[{"Key": "tagKey", "Value": "tagValue"}, {"Key": "tagKey2", "Value": "tagValue2"}]</pre>
UserData	String	Yes	Released	The user data that you provide when you create ECS instances.	The user data can be up to 16KB in size. You do not need to use Base64. you must use special characters. \ Escape.
ZoneId	String	Yes	Released	The ID of the zone where the instance resides.	None
HpcClusterId	String	Yes	Released	The ID of the HPC cluster to which the ECS instance belongs.	None

Parameter	Type	Required	Editable	Description	Constraint
VpcId	String	Yes	Released	The ID of the VPC to which the ECS instance belongs.	None
VSwitchId	String	Yes	Released	The ID of the VSwitch for the ECS instance.	None
KeyPairName	String	Yes	Released	The name of the key pair that is used to connect to created ECS instances.	<ul style="list-style-type: none"> For Windows-based instances, this parameter is empty by default. In the Linux, if this parameter is specified, the Password content is still set to the instance, but the Password logon method is disabled by default. The key pair is used to verify the logon.
RamRoleName	String	Yes	Released	The RAM role name of the instance. You can call the ListRoles operation to query the role name.	None
DeletionProtection	Boolean	Erased	Released	The release protection property of created instances. It specifies whether the instances can be released from the ECS console or through the DeleteInstance operation.	Valid values: <ul style="list-style-type: none"> True False
DeploymentSetId	String	Yes	True	Deployment Set ID.	None

DiskMappings syntax

```
"DiskMappings": [
  {
    "Category": String,
    "DiskName": String,
    "Description": String,
    "Device": String,
    "SnapshotId": String,
    "Size": String
  }
]
```

DiskMappings properties

Parameter	Type	Required	Editable	Description	Constraint
Size	String	No	No	The size of data disk N. Unit: GB.	None
Category	String	Yes	Released	The type of the data disk.	Valid values: <ul style="list-style-type: none"> cloud cloud_efficiency cloud_ssd ephemeral_ssd Default value: cloud.
DiskName	String	Yes	Released	The name of data disk N.	The name can be up to 128 characters in length and can contain letters, digits, underscores (_), periods (.), and hyphens (-).
Description	String	Yes	Released	The description of data disk N.	Valid values: 2 to 256. Default value: Null.
Device	String	Yes	Released	The device name of the data disk.	If you do not specify this parameter, the system automatically allocates a device name in alphabetical order from /dev/xvdb to /dev/xvdz.
SnapshotId	String	Yes	Released	The ID of the snapshot used to create the data disk.	None

Tags syntax

```
"Tags": [
  {
    "Value": String,
    "Key": String
  }

```

Tags properties

Parameter	Type	Required	Editable	Description	Constraint
Key	String	No	No	None	None

Parameter	Type	Required	Editable	Description	Constraint
Value	String	Yes	Released	None	Valid values: 1025 to 10000. You cannot use the following commonly used port numbers: 2222, 4500, 4510, 4560, 7505, 9000, 9001, and 9002.

Response parameters

Fn::GetAtt

- **InstanceId:** the ID of the instance. An ID is a globally unique identifier (GUID) generated by the system for an instance.
- **PrivateIp:** The private IP address of the instance in a VPC. This parameter takes effect only when the **NetworkType** parameter is set to VPC.
- **InnerIp:** The private IP address of the instance in a Classic network. This parameter takes effect only when the **NetworkType** parameter is set to Classic.
- **PublicIp:** the public IP address of the instance in a Classic network. This parameter takes effect only when the **NetworkType** parameter is set to Classic.
- **ZoneId:** the zone ID.
- **HostName:** the hostname of the instance.

Sample request

```

    "ZoneId": String,
    "KeyPairName": String
  }
}

```

Properties

Parameter	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	Yes	Released	The ID of the resource group to which the instance belongs.	None
SourceInstanceId	String	No	No	The ID of the ECS instance to be cloned.	The clone operation clones the specified instance, including its instance type, image, bandwidth billing method, bandwidth limit, and network type. If the source ECS instance belongs to multiple security groups, the cloned instance is added only to the first of these security groups.
BackendServerWeight	String	Optional	Released	The weight of the ECS instance in the Server Load Balancer instance.	Value range:[0, 100]. Default value: 100.

Parameter	Type	Required	Editable	Description	Constraint
LoadBalancerIdToAttach	String	Yes	Released	The ID of the SLB instance to which the ECS instance is to be attached.	None
Description	String	Yes	Released	The description of created instances.	The description can be up to 256 characters in length.
ImageId	String	Yes	True	The ID of the image used to start created instances. You can use a public image, a custom image, or an Alibaba Cloud Marketplace image.	<p>When editing a template, you can specify the image type and version or only the image type. ROS automatically selects an appropriate public image ID.</p> <p>You can use the wildcard character (*) to represent part of an image ID.</p> <p>Take all Ubuntu public images provided by Alibaba Cloud as an example. You can use one of the following methods to specify the public image ID for the ECS instance:</p> <p>If you enter ubuntu,</p> <p>the system matches it with the following ID: ubuntu16_0402_64_20G_alibase_20170818.vhd</p> <p>If you enter ubuntu_14,</p> <p>the system matches it with the following ID: ubuntu_14_0405_64_20G_alibase_20170824.vhd</p> <p>If you enter ubuntu*14*32,</p> <p>the system matches it with the following ID: ubuntu_14_0405_32_40G_alibase_20170711.vhd</p> <p>If you enter ubuntu_16_0402_32,</p> <p>the system matches it with the following ID: ubuntu_16_0402_32_40G_alibase_20170711.vhd</p>
SecurityGroupId	String	Yes	Released	The ID of the security group to which the created instance will belong.	None

Parameter	Type	Required	Editable	Description	Constraint
InstanceName	String	Yes	Released	The name of a created instance.	The name can be up to 128 characters in length and can contain letters, digits, underscores (_), periods (.), and hyphens (-).
Password	String	Yes	Released	The password used to log on to the ECS instance.	<p>The password must be 8 to 30 characters in length.</p> <p>The password must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters.</p> <p>Special characters include () ` ~ ! @ # \$ % ^ & * - + = { } [] : ; < > , . ? /</p> <p>If you specify the password parameter in the API request, use HTTPS to secure the API and protect your password.</p>
DiskMappings	List	Erased	Released	The disks to be attached to created instances.	A maximum of 16 disks can be attached to each instance.
Tags	List	Erased	Released	The custom tags of the instance.	A maximum of 20 tags can be specified in the <code>{{"Key": "tagKey", "Value": "tagValue"}, {"Key": "tagKey2", "Value": "tagValue2"}}</code> .
ZoneId	String	Yes	Released	The ID of the zone where the instance resides.	None
InstanceChargeType	String	Yes	Released	The billing method of the new ECS instance.	<p>Valid values: PrePaid and PostPaid.</p> <p>Default value: Postpaid. If you set this parameter to Prepaid, make sure that you have sufficient balance in your account. Otherwise, the instance fails to be created.</p>

Parameter	Type	Required	Editable	Description	Constraint
Period	Number	Erased	Released	The subscription period of the new ECS instance. This parameter is required when the InstanceChargeType parameter is set to PrePaid. This parameter is ignored when the InstanceChargeType parameter is set to PostPaid.	Valid values: 1, 2, 3, 4, 5, 6, 7, 8, 9, 12, 24, and 36. Unit: month.
KeyPairName	String	Yes	Released	The name of the key pair that is used to connect to created ECS instances.	For Windows-based instances, this parameter is empty by default. In the Linux, if this parameter is specified, the Password content is still set to the instance, but the Password logon method is disabled by default. The key pair is used to verify the logon.
RamRoleName	String	Yes	Released	The RAM role name of the instance. You can call the ListRoles operation to query the role name.	None
SpotPriceLimit	String	Yes	Released	The maximum hourly price of the instance.	Parameter SpotStrategy this parameter takes effect only when the value is SpotWithPriceLimit.
SpotStrategy	String	Yes	Released	The bidding policy for the pay-as-you-go instance.	This parameter is valid only when the InstanceChargeType parameter is set to PostPaid. Valid values: NoSpot: applies to regular pay-as-you-go instances. SpotWithPriceLimit: applies to preemptible instances with a maximum hourly price. SpotAsPriceGo: applies to pay-as-you-go instances priced at the market price at the time of purchase. Default value: NoSpot.
InternetMaxBandwidthIn	String	Optional	Released	The maximum inbound bandwidth from the Internet. Unit: Mbit/s.	Valid values: 1 to 200.

Parameter	Type	Required	Editable	Description	Constraint
DeletionProtection	Boolean	Erased	Released	Specifies whether to enable instance release protection in the console or by calling an API operation. (DeleteInstance) Release instances.	Valid values: true and false.

DiskMappings syntax

```
"DiskMappings": [
{
  "Category": String,
  "DiskName": String,
  "Description": String,
  "Device": String,
  "SnapshotId": String,
  "Size": String
}
]
```

DiskMappings properties

Parameter	Type	Required	Editable	Description	Constraint
Size	String	No	No	The size of data disk N. Unit: GB.	None
Category	String	Yes	Released	The type of the data disk.	Valid values: cloud, cloud_efficiency, cloud_ssd, and ephemeral_ssd Default value: cloud.
DiskName	String	Yes	Released	Disk name.	The name can be up to 128 characters in length and can contain letters, digits, underscores (_), periods (.), and hyphens (-).
Description	String	Yes	Released	The description of data disk N.	The description must be 2 to 256 characters in length. This parameter is empty by default.
Device	String	Yes	Released	The device name of the data disk.	If you do not specify this parameter, the system automatically allocates a device name in alphabetical order from /dev/xvdb to /dev/xvdz.

Parameter	Type	Required	Editable	Description	Constraint
SnapshotId	String	Yes	Released	The ID of the snapshot used to create the data disk.	None

Tags syntax

```
"Tags": [
  {
    "Value": String,
    "Key": String
  }
]
```

Tags properties

Parameter	Type	Required	Editable	Description	Constraint
Key	String	No	No	The tag key, which cannot be an empty string. It can be up to 64 characters in length, cannot start with <code>acs:</code> or <code>aliyun</code> , and cannot contain <code>http://</code> or <code>https://</code> .	None
Value	String	Yes	Released	The tag value, which can be an empty string. It can be up to 128 characters in length and cannot start with <code>acs:</code> or <code>aliyun</code> . It cannot contain <code>http://</code> or <code>https://</code> .	Valid values: 1025 to 10000. You cannot use the following commonly used port numbers: 2222, 4500, 4510, 4560, 7505, 9000, 9001, and 9002.

Response parameters

Fn::GetAtt

- **InstanceId:** the ID of the instance. An ID is a globally unique identifier (GUID) generated by the system for an instance.
- **PrivateIp:** The private IP address of the instance in a VPC. This parameter takes effect only when the `NetworkType` parameter is set to `VPC`.
- **InnerIp:** The private IP address of the instance in a Classic network. This parameter takes effect only when the `NetworkType` parameter is set to `Classic`.
- **PublicIp:** the public IP address of the instance in a Classic network. This parameter takes effect only when the `NetworkType` parameter is set to `Classic`.
- **ZoneId:** the zone ID.
- **HostName:** the hostname of the instance.

Sample request

      "Value": {"get_attr": ["WebServer", "PublicIp"]}
    }
  }
}
```

5.5.1.11. ALIYUN::ECS::InstanceGroup

ALIYUN::ECS::InstanceGroup is used to create an ECS instance group.

Syntax

```
{
  "Type": "ALIYUN::ECS::InstanceGroup",
  "Properties": {
    "SystemDiskAutoSnapshotPolicyId": String,
    "DedicatedHostId": String,
    "LaunchTemplateName": String,
    "RamRoleName": String,
    "IoOptimized": String,
    "PrivateIpAddress": String,
    "KeyPairName": String,
    "SystemDiskDiskName": String,
    "Description": String,
    "Tags": List,
    "HostName": String,
    "ImageId": String,
    "ResourceGroupId": String,
    "VSwitchId": String,
    "EniMappings": List,
    "Password": String,
    "InstanceType": String,
    "MaxAmount": Integer,
    "AutoReleaseTime": String,
    "SystemDiskCategory": String,
    "UserData": String,
    "LaunchTemplateId": String,
    "LaunchTemplateVersion": String,
    "SystemDiskSize": Number,
    "ZoneId": String,
    "VpcId": String,
    "InternetMaxBandwidthIn": Integer,
    "DeletionProtection": Boolean,
    "DeploymentSetId": String,
    "Ipv6AddressCount": Integer,
    "SecurityGroupId": String,
    "HpcClusterId": String,
    "SystemDiskDescription": String,
    "Ipv6Addresses": List,
    "NetworkType": String,
    "DiskMappings": List,
    "SystemDiskPerformanceLevel": String
  }
}
```

Properties

Attribute	Type	Required	Editable	Description	Constraint
ResourceGroupID	String	No	Yes	The ID of the resource group to which a created instance belongs.	None.
HpcClusterId	String	No	Yes	The ID of the HPC cluster to which a created instance belongs.	None.
MaxAmount	Integer	Supported	Yes	The maximum number of ECS instances that can be created at a time.	Valid values: 1 to 100. The MaxAmount parameter must be set to a value greater than or equal to the value of MinAmount.
MinAmount	String	Yes	Yes	The minimum number of ECS instances that can be created at a time.	Valid values: 1 to 100. The MinAmount parameter must be set to a value less than or equal to the value of MaxAmount.
Description	String	No	Yes	The description of created instances.	The description can be up to 256 characters in length.
InstanceType	String	Yes	Yes	The type of the ECS instance.	None.
ImageId	String	Yes	Yes	The ID of the image used to start an ECS instance. You can use a public image, a custom image, or an Alibaba Cloud Marketplace image.	You can specify a partial public image ID instead of providing the complete ID. The following example shows how to use a CNAME record: <ul style="list-style-type: none"> • Ubuntu is specified and ubuntu_16_0402_64_20G_alibase_20170818.vhd are matched. • If ubuntu1432 is specified, ubuntu_14_0405_32_40G_alibase_20170711.vhd is matched.

Attribute	Type	Required	Editable	Description	Constraint
SecurityGroupId	String	No	No	The ID of the security group to which created instances belong.	None.
InstanceName	String	No	No	The name of an instance.	The names can be up to 128 characters in length. It can contain English letters, Chinese characters, digits, underscores (_), periods (.), and hyphens (-). By <code>name_prefix[begin_number,bits]name_suffix</code> format to specify different instance name for each ECS instance.
Password	String	No	Yes	The password used to log on to created ECS instances.	<ul style="list-style-type: none"> The password must be 8 to 30 characters in length and must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. The following special characters are supported: <code>:()'~!@#\$%^&* - + = { } [] ; ' < > , . ? /</code> <p>If you specify the Password parameter in the API request, use HTTPS to secure the API and protect your password.</p>
HostName	String	No	No	The hostname of created ECS instances.	The hostname must contain at least two characters in length. The periods and hyphens (-) cannot start or end the hostname and cannot be used together.

Attribute	Type	Required	Editable	Description	Constraint
AutoReleaseTime	String	No	No	The time scheduled for created ECS instances to be automatically released.	The time format must comply with ISO8601 specifications, for example, "yyyy-MM-ddTHH:mm:ssZ". The maximum release time must be within three years from the current time.
PrivateIpAddress	String	No	No	The private IP address of an ECS instance in a VPC.	The specified IP address must not be used by other instances in the VPC.
DiskMappings	List	No	Yes	The data disks to be attached to created instances.	None.
InternetMaxBandwidthIn	Integer	No	No	The maximum inbound bandwidth from the Internet.	Unit: Mbit/s. Valid values: 1 to 100 Default value: 100.
IoOptimized	String	No	No	Specifies whether the created instances are I/O optimized.	Valid values: • none (non-I/O optimized) • optimized Default value: none.
SystemDiskCategory	String	No	Yes	The category of the system disk.	Valid values: cloud: basic disk cloud_efficiency: the ultra disk cloud_ssd: standard SSDs cloud_essd: enhanced SSD ephemeral_ssd: local SSDs
SystemDiskDescription	String	No	Yes	The description of the ECS instance system disk.	None.
SystemDiskDiskName	String	No	Yes	The name of the ECS instance system disk.	None.

Attribute	Type	Required	Editable	Description	Constraint
SystemDiskSize	Number	No	Yes	The size of the system disk.	Valid values: 40 to 500. If a custom image is used to create a system disk, make sure that the size of the system disk is greater than that of the custom image.
Tags	List	No	Yes	The custom tags of a created instance.	A maximum of 20 tags are supported. The format is as follows: [{"Key": "tagKey", "Value": "tagValue"}, {"Key": "tagKey2", "Value": "tagValue2"}].
UserData	String	No	Yes	The user data that you provide when you create ECS instances.	The user data can be up to 16 KB in size. You do not need to use Base64 for transcoding. Special characters need to be escaped.
ZoneId	String	No	No	The zone ID of the disk.	None.
VpcId	String	No	No	The ID of the VPC.	None.
VSwitchId	String	No	No	The ID of the VSwitch for the ECS instance.	None.
KeyPairName	String	No	Yes	The name of the key pair that is used to connect to created ECS instances.	For Windows-based ECS instances, this parameter is ignored and it is empty by default. For Linux-based ECS instances, the Password parameter still takes effect if this parameter is specified. However, logon by password is disabled, and the KeyPairName value is used.
RamRoleName	String	No	Yes	The name of the instance RAM role.	You can call the ListRoles operation to query the role name.
DedicatedHostId	String	No	No	The ID of the dedicated host.	None.

Attribute	Type	Required	Editable	Description	Constraint
LaunchTemplateName	String	No	Yes	The name of the launch template for the instance.	None.
EniMappings	List	No	Yes	The elastic network interfaces (ENIs) to be attached to created instances.	Only one ENI can be attached to each instance.
LaunchTemplateId	String	No	Yes	The ID of the launch template.	None.
LaunchTemplateVersion	String	No	Yes	The version of the launch template.	If you do not specify a version, the default version is used.
NetworkType	String	No	No	The network type of created ECS instances.	Valid values: <ul style="list-style-type: none"> vpc classic Default value: classic.
DeletionProtection	Boolean	No	No	The release protection attribute of the instance. It specifies whether you can use the ECS console or call the DeleteInstance operation to release the instance.	Valid values: <ul style="list-style-type: none"> true false
DeploymentSetId	String	No	Yes	Deployment Set ID.	None.

DiskMappings syntax

```

"DiskMappings": [
  {
    "Category": String,
    "DiskName": String,
    "Description": String,
    "Device": String,
    "SnapshotId": String,
    "Size": String,
    "Encrypted": String,
    "KMSKeyId": String,
    "PerformanceLevel": String,
    "AutoSnapshotPolicyId": String
  }
]

```

DiskMappings properties

Attribute	Type	Required	Editable	Description	Constraint
Size	String	Yes	No	The size of a data disk.	Unit: GB.
Category	String	No	No	The type of the data disk.	Valid values: <ul style="list-style-type: none"> cloud cloud_efficiency cloud_ssd cloud_essd ephemeral_ssd For I/O optimized instances, the default value is cloud_efficiency. For non-I/O optimized instances, the default value is cloud.
DiskName	String	No	No	The name of data disk N.	The name can be up to 128 characters in length. It can contain English letters, Chinese characters, digits, underscores (_), periods (.), and hyphens (-).
Description	String	No	No	The description of data disk N.	The description must be 2 to 256 characters in length. The description cannot start with <code>http://</code> or <code>https://</code> .
Device	String	No	No	The device name of the data disk.	The system allocates a device name in alphabetical order from <code>/dev/xvda</code> to <code>/dev/xvdz</code> .

Attribute	Type	Required	Editable	Description	Constraint
SnapshotId	String	No	No	The ID of the snapshot.	None.
Encrypted	Boolean	No	No	Specifies whether to encrypt the data disk.	Valid values: <ul style="list-style-type: none"> • true • false Default value: false
KMSKeyId	String	No	No	The ID of the KMS key corresponding to the data disk.	None.
AutoSnapshotPolicyId	String	No	Yes	The ID of the automatic snapshot policy.	None.
PerformanceLevel	String	No	No	The performance level of the enhanced SSD used as the data disk.	<ul style="list-style-type: none"> • (Default): Maximum random read /write IOPS of 50,000 per disk • PL2: A single enhanced SSD delivers up to 100,000 random read/write IOPS. • PL3: A single enhanced SSD delivers up to 1,000,000 random read/write IOPS.

Tags syntax

```
"Tags": [
  {
    "Value": String,
    "Key": String
  }
]
```

Tags properties

Attribute	Type	Required	Editable	Description	Constraint
Key	String	Yes	No	The key of tag N.	It must be 1 to 128 characters in length, and cannot start with <code>aliyun</code> and <code>acs:</code> beginning, cannot contain <code>http://</code> or <code>https://</code> .

Attribute	Type	Required	Editable	Description	Constraint
Value	String	No	No	The value of tag N.	It must be 0 to 128 characters in length and cannot start with <code>aliyun</code> and <code>acs:</code> beginning, cannot contain <code>http://</code> or <code>https://</code> .

EniMappings syntax

```
"EniMappings": [
  {
    "SecurityGroupId": String,
    "VSwitchId": String,
    "Description": String,
    "NetworkInterfaceName": String,
    "PrimaryIpAddress": String
  }
]
```

EniMappings properties

Attribute	Type	Required	Editable	Description	Constraint
SecurityGroupId	String	Yes	Yes	The ID of the security group to which an instance belongs.	The security group and the instance must be in the same VPC.
VSwitchId	String	Yes	No	The ID of the VSwitch to which the instance is connected.	None.
Description	String	No	Yes	The description of the ENI.	It can contain 2 to 256 English letters or Chinese character. It cannot start with <code>http://</code> or <code>https://</code> the beginning.

Attribute	Type	Required	Editable	Description	Constraint
NetworkInterfaceName	String	No	Yes	The ENI name.	<ul style="list-style-type: none"> The name must be 2 to 128 characters in length Must start with an uppercase or lowercase letter, and cannot start with <code>http://</code> or <code>https://</code> the beginning. It must start with a letter and cannot start with <code>http://</code> or <code>https://</code>.
PrimaryIpAddress	String	No	No	The primary private IP address of ENI.	The specified IP address must be available within the CIDR block of the VSwitch. If this parameter is not specified, an available IP address in the VSwitch CIDR block will be selected at random.

Return value

Fn::GetAtt

- InstanceIds:** the IDs of created instances in the ECS instance group. An ID is a system-generated globally unique identifier (GUID) for an instance.
- PrivateIps:** the list of private IP addresses of instances in a VPC. This parameter takes effect only when the **NetworkType** parameter is set to VPC. For example, a Json-formatted Array: `["172.16.XX.XX", "172.16.XX.XX", … "172.16.XX.XX"]` the maximum number of IP addresses that can be specified. Separate multiple IP addresses with commas (,).
- InnerIps:** the list of private IP addresses of instances in a classic network. This parameter takes effect only when the **NetworkType** parameter is set to Classic. For example, a Json-formatted Array: `["10.1.XX.XX", "10.1.XX.XX", … "10.1.XX.XX"]` the maximum number of IP addresses that can be specified. Separate multiple IP addresses with commas (,).
- PublicIps:** the list of public IP addresses of instances in a classic network. This parameter takes effect only when the **NetworkType** parameter is set to Classic. For example, a Json-formatted Array: `["42.1.XX.XX", "42.1.XX.XX", … "42.1.XX.XX"]` the maximum number of IP addresses that can be specified. Separate multiple IP addresses with commas (,).
- HostNames:** the list of hostnames of all instances.
- OrderId:** the list of order IDs of all instances.
- ZoneIds:** the IDs of the zones where created instances reside.
- RelatedOrderIds:** the list of related order IDs of created ECS instances.

Examples

```
{
  "ROSTemplateFormatVersion": "2015-09-01",

5.5.1.12. ALIYUN::ECS::InstanceGroupClone

ALIYUN::ECS::InstanceGroupClone is used to clone an ECS instance group.

Statement

```
{
  "Type": "ALIYUN::ECS::InstanceGroupClone",
  "Properties": {
    "BackendServerWeight": Integer,
    "DiskMappings": List,
    "LaunchTemplateName": String,
    "SpotPriceLimit": String,
    "ResourceGroupId": String,
    "KeyPairName": String,
    "SystemDiskDiskName": String,
    "PeriodUnit": String,
    "Description": String,
    "Tags": List,
    "ImageId": String,
    "SpotStrategy": String,
    "SourceInstanceId": String,
    "EniMappings": List,
    "Password": String,
    "MaxAmount": Integer,
    "AutoReleaseTime": String,
    "SystemDiskCategory": String,
    "LoadBalancerIdToAttach": String,
    "LaunchTemplateId": String,
    "LaunchTemplateVersion": String,
    "ZoneId": String,
    "InstanceName": String,
    "InternetMaxBandwidthIn": Integer,
    "DeletionProtection": Boolean,
    "DeploymentSetId": String,
    "SecurityGroupId": String,
    "RamRoleName": String,
    "HpcClusterId": String,
    "SystemDiskDescription": String
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	Yes	Released	The ID of the enterprise resource group to which a created instance belongs.	None

Parameter	Type	Required	Editable	Description	Constraint
HpcClusterId	String	Yes	True	The ID of the E-HPC cluster to which a created instance belongs.	None
SourceInstanceId	String	No	No	The ID of the ECS instance to be cloned.	The clone operation clones the specified instance, including its instance type, image, bandwidth limit, and network type. If the source ECS instance belongs to multiple security groups, the cloned instance is added only to the first of these security groups.
MaxAmount	Integer	Retained	Yes	The maximum number of ECS instances to be created.	Valid values: 1 to 100. The MaxAmount parameter must be set to a value greater than or equal to the value of the MinAmount parameter.
MinAmount	String	No	Yes	The minimum number of ECS instances to be created.	Valid values: 1 to 100. The MinAmount parameter must be set to a value less than or equal to the value of the MaxAmount parameter.
BackendServerWeight	String	Optional	Released	The weight assigned to the ECS instance in the Server Load Balancer instance.	Valid values: 0 to 100. Default value: 100.
LoadBalancerIdToAttach	String	Yes	Released	The ID of the SLB instance to which the ECS instance is to be attached.	None
Description	String	Yes	Released	The description of created instances.	The description can be up to 256 characters in length.

Parameter	Type	Required	Editable	Description	Constraint
ImageId	String	Yes	True	The ID of the image used to start created instances. You can use a public image, a custom image, or an Alibaba Cloud Marketplace image.	<p>You can specify a partial public image ID instead of providing the complete ID. When editing a template used to deploy an ECS instance, you can specify the image type and version or only the image type. ROS automatically selects an appropriate public image ID. You can use the wildcard character (*) to represent part of an image ID.</p> <p>You can use one of the following methods to specify the public image ID for the ECS instance:</p> <ul style="list-style-type: none"> If you set the parameter to ubuntu, ubuntu_16_0402_64_20G_alibase_20170818.vhd. If this parameter is set to ubuntu_14, ubuntu_14_0405_64_20G_alibase_20170824.vhd is returned. Specify: ubuntu1432, which will eventually match: ubuntu_14_0405_32_40G_alibase_20170711.vhd Specify: ubuntu_16_0402_32, which will eventually match: ubuntu_16_0402_32_40G_alibase_20170711.vhd
SecurityGroupId	String	Yes	Released	The ID of the security group to which created instances belong.	None
InstanceName	String	Yes	Released	The name of a created instance.	The name can be up to 128 characters in length and can contain letters, digits, underscores (_), periods (.), and hyphens (-).
Password	String	Yes	Released	The password used to log on to the ECS instance.	The password must be 8 to 30 characters in length and must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special character. Special characters include () ` ~ ! @ # \$ % ^ & * - + = { } [] : ; ' < > , . ? / If the Password parameter is specified, you must use HTTPS to call the operation to ensure that the Password remains confidential.
DiskMappings	List	Erased	Released	The data disks to be attached to the instance.	A maximum of 16 disks can be attached to each instance.
Tags	List	Erased	Released	The custom tags of the instance.	You can specify a maximum of 20 tags. The format is as follows: <pre>[{"Key": "tagKey", "Value": "tagValue"}, {"Key": "tagKey2", "Value": "tagValue2"}]</pre>

Parameter	Type	Required	Editable	Description	Constraint
ZoneId	String	Yes	Released	The ID of the zone where the instance resides.	None
KeyPairName	String	Yes	Released	The name of the key pair that is used to connect to the ECS instance. For Windows-based ECS instances, this parameter is ignored. Default value: empty. For Linux-based instances, the Password parameter still takes effect if this parameter is specified. However, logon by Password is disabled, and the KeyPairName value is used.	None
RamRoleName	String	Yes	Released	The RAM role name of the instance.	You can use RAM API ListRoles you can call this operation to query the RAM role name of an instance.
SpotPriceLimit	String	Yes	Released	The maximum hourly price of the instance.	This parameter supports up to three decimal places. Parameter SpotStrategy this parameter takes effect only when the value is SpotWithPriceLimit.
SystemDiskDiskName	String	Yes	True	The name of the system disk of created instances.	The name must be 2 to 128 characters in length Must start with an uppercase or lowercase letter, and cannot start with <code>http://</code> or <code>https://</code> and can contain digits, colons (:), underscores (_), and hyphens (-).
PeriodUnit	String	Yes	True	The billing cycle for created ECS instances.	Valid values: <ul style="list-style-type: none"> Week. <ul style="list-style-type: none"> 1, 2, 3, and 4} when the value of the PeriodUnit parameter is Week. AutoRenewPeriod values are 1, 2, "3". Month <ul style="list-style-type: none"> 1, 2, 3, 4, 5, 6, and 7 when the PeriodUnit parameter is set to Month "8", "9", "12", "24", "36", "48", "60"}, AutoRenewPeriod can be {"1", "2", "3", "6", "12"}. Default value: Month.
EniMappings	List	No.	True	The elastic network interfaces (ENIs) to be attached to a created instance.	Only a single ENI can be attached to each instance.

Parameter	Type	Required	Editable	Description	Constraint
AutoReleaseTime	String	Yes	Released	<p>The time scheduled for a created ECS instance to be automatically released. Specify the time in the ISO 8601 standard in the YYYY-MM-DDThh:mmZ format. in the yyyy-MM-ddTHH:mm:ssZ format. The time must be in UTC.</p> <ul style="list-style-type: none"> If the value of seconds (ss) is a value other than 00, the start time is automatically rounded down to the nearest minute based on the value of mm. The minimum release time must be at least 30 minutes later than the current time. The maximum release time must be at most three years from the current time. <p>If you do not specify the AutoReleaseTime it indicates that the auto release feature is disabled and the ECS instance will not be automatically released.</p>	None
SystemDiskCategory	String	Yes	True	The type of the system disk.	<p>Valid values:</p> <ul style="list-style-type: none"> cloud: basic disk cloud_efficiency: indicates an ultra disk. cloud_ssd: indicates a standard SSD. ephemeral_ssd: local SSD. cloud_essd: indicates an enhanced SSD (ESSD). ESSDs are still in public preview and only available in some regions. <p>For phased-out instance types that are not I/O optimized, the default value is cloud. For other instances, the default value is cloud_efficiency.</p>
LaunchTemplateName	String	Yes	True	The name of the launch template.	None

Parameter	Type	Required	Editable	Description	Constraint
LaunchTemplateVersion	String	Yes	True	The version of the launch template. If you do not specify this parameter, the default version is used.	None
InternetMaxBandwidthIn	String	Optional	Released	The maximum inbound bandwidth from the Internet. Unit: Mbit/s.	Valid values: 1 to 200. Default value: 200.
LaunchTemplateId	String	Yes	True	The ID of the launch template.	None
SystemDiskDescription	String	Yes	True	The description of the system disk.	The description must be 2 to 256 characters in length and cannot start with http:// or https://. This parameter is empty by default.
DeletionProtection	Boolean	Erased	Released	The release protection attribute of the instance. Specifies whether the ECS console or API DeleteInstance) to release the instance.	Valid values: <ul style="list-style-type: none"> • true • false
DeploymentSetId	String	Yes	True	Deployment Set ID.	None

DiskMappings syntax

```
"DiskMappings": [
  {
    "Category": String,
    "DiskName": String,
    "Description": String,
    "Encrypted": String,
    "KMSKeyId": String,
    "Device": String,
    "SnapshotId": String,
    "Size": String
  }
]
```

DiskMappings properties

Parameter	Type	Required	Editable	Description	Constraint
-----------	------	----------	----------	-------------	------------

Parameter	Type	Required	Editable	Description	Constraint
Encrypted	String	Yes	Released	Specifies whether to encrypt the data disk.	Valid values: <ul style="list-style-type: none"> • true • false Default value: false
KMSKeyId	String	Yes	Released	The KMS key ID for data disk N.	None
Size	String	No	No	The size of data disk N. Unit: GB.	None
Category	String	Yes	Released	The type of the data disk.	Valid values: <ul style="list-style-type: none"> • cloud • cloud_efficiency • cloud_ssd • ephemeral_ssdDefault
DiskName	String	Yes	Released	The name of data disk N.	The name can be up to 128 characters in length and can contain letters, digits, underscores (_), periods (.), and hyphens (-).
Description	String	Yes	Released	The description of data disk N.	Valid values: 2 to 256. Default value: Null.
Device	String	Yes	Released	The device name of the data disk attached to an ECS instance.	The system allocates a device name in alphabetical order from /dev/xvda to /dev/xvdz.
SnapshotId	String	Yes	Released	Create a data disk by using a snapshot.	None

EniMappings syntax

```
"EniMappings": [
  {
    "SecurityGroupId": String,
    "VSwitchId": String,
    "Description": String,
    "NetworkInterfaceName": String,
    "PrimaryIpAddress": String
  }
]
```

EniMappings properties

Parameter	Type	Required	Editable	Description	Constraint
SecurityGroupId	String	No	Yes	The ID of the security group to which the ENI belongs.	None
VSwitchId	String	No	No	The ID of the VSwitch to which the ENI belongs.	None
Description	String	Yes	True	The description of the ENI.	It can contain 2 to 256 English letters or Chinese characters. It cannot start with <code>http://</code> and <code>https://</code> the beginning.
NetworkInterfaceName	String	Yes	True	The name of the ENI.	None
PrimaryIpAddress	String	Yes	Released	The primary IP address of the ENI.	None

Tags syntax

```
"Tags": [
  {
    "Value": String,
    "Key": String
  }
]
```

Tags properties

Parameter	Type	Required	Editable	Description	Constraint
Key	String	No	No	None	None
Value	String	Yes	Released	None	Valid values: 1025 to 10000. You cannot use the following commonly used port numbers: 2222, 4500, 4510, 4560, 7505, 9000, 9001, and 9002.

Response parameters

Fn::GetAtt

- **InstanceIds**: the IDs of instances in the ECS instance group. An ID is a globally unique identifier (GUID) generated by the system for an instance.
- **PrivateIps**: the private IP addresses of VPC-type instances. This parameter is valid only when the **NetworkType** parameter is set to VPC. The parameter value is a JSON-formatted array, containing up to 100 IP addresses separated by commas (,). Example: ["172.16.XX.XX", "172.16.XX.XX", ... "172.16.XX.XX"].
- **InnerIps**: the private IP addresses of instances in the classic network. This parameter is valid only when the

NetworkType parameter is set to Classic. The parameter value is a JSON-formatted array, containing up to 100 IP addresses separated by commas (,). Example: ["10.1.XX.XX", "10.1.XX.XX", ... "10.1.XX.XX"].

- PublicIps: the public IP addresses of instances in the classic network. This parameter is applicable only when the NetworkType parameter is set is Classic. The parameter value is a JSON-formatted array, containing up to 100 IP addresses separated by commas (,). Example: ["42.1.XX.XX", "42.1.XX.XX", ... "42.1.XX.XX"].
- HostNames: the hostnames of all instances. The parameter value is a JSON-formatted array. Example: ["host1", "host2", ... "host3"].
- OrderId: the order IDs of all instances.
- ZoneIds: the IDs of the zones where created instances reside.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "WebServer": {
      "Type": "ALIYUN::ECS::InstanceGroupClone",
      "Properties": {
        "SourceInstanceId": "i-25zsk****",
        "ImageId": "m-25l0r****",
        "SecurityGroupId": "sg-25zwc****",
        "ZoneId": "cn-beijing-b",

    },
    "PublicIps": {
      "Value": {"get_attr": ["WebServer", "PublicIps"]}
    }
  }
}
```

5.5.1.13. ALIYUN::ECS::Invocation

ALIYUN::ECS::Invocation is used to invoke a Cloud Assistant command for one or more ECS instances.

Statement

```
{
  "Type": "ALIYUN::ECS::Invocation",
  "Properties": {
    "Timed": Boolean,
    "Frequency": String,
    "CommandId": String,
    "InstanceIds": List
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
Timed	Boolean	Erased	Released	Specifies whether to invoke the command on a periodic basis. Default value: false.	None
Frequency	String	Yes	Released	The frequency at which the command is invoked.	None
CommandId	String	No	No	The ID of the script.	None
InstanceIds	List	Yes	No	The IDs of the instances for which you want to invoke the command. A maximum of 20 instance IDs can be specified.	Valid values: 1025 to 10000. You cannot use the following commonly used port numbers: 2222, 4500, 4510, 4560, 7505, 9000, 9001, and 9002.

Response parameters

Fn::GetAtt

The execution ID of the Invokeld: command.

Sample request

```
{

}

```

5.5.1.14. ALIYUN::ECS::JoinSecurityGroup

ALIYUN::ECS::JoinSecurityGroup is used to add one or more ECS instances to a specified security group.

Syntax

```

{
  "Type": "ALIYUN::ECS::JoinSecurityGroup",
  "Properties": {
    "InstanceId": String,
    "InstanceIdList": List,
    "SecurityGroupId": String,
    "NetworkInterfaceList": List
  }
}

```

Properties

Property	Type	Required	Editable	Description	Constraint
SecurityGroupId	String	Yes	No	The ID of the security group.	None
InstanceId	String	No	No	The ID of the ECS instance to be added to the security group.	None
InstanceIdList	List	No	Yes	The IDs of the ECS instances to be added to the security group.	None
NetworkInterfaceList	List	No	Yes	The IDs of the elastic network interfaces (ENIs).	None

Response parameters

Fn::GetAtt

None

Examples

JSON format

```
{
  "ROSTemplateFormatVersion": "2015-09-01",

        - i-m5e505hio0wyjc6r****
```

5.5.1.15. ALIYUN::ECS::LaunchTemplate

ALIYUN::ECS::LaunchTemplate is used to create an ECS instance launch template.

Syntax

```

{
  "Type": "ALIYUN::ECS::LaunchTemplate",
  "Properties": {
    "LaunchTemplateName": String,
    "VersionDescription": String,
    "ImageId": String,
    "InstanceType": String,
    "SecurityGroupId": String,
    "NetworkType": String,
    "VSwitchId": String,
    "InstanceName": String,
    "Description": String,
    "InternetMaxBandwidthIn": Integer,
    "InternetMaxBandwidthOut": Integer,
    "HostName": String,
    "ZoneId": String,
    "SystemDiskCategory": String,
    "SystemDiskSize": Number,
    "SystemDiskDiskName": String,
    "SystemDiskDescription": String,
    "IoOptimized": String,
    "InternetChargeType": String,
    "UserData": String,
    "KeyPairName": String,
    "RamRoleName": String,
    "AutoReleaseTime": String,
    "SpotStrategy": String,
    "SpotPriceLimit": String,
    "SecurityEnhancementStrategy": String,
    "DiskMappings": List,
    "NetworkInterfaces": List,
    "Tags": List,
    "TemplateTags": List
  }
}

```

Properties

Property	Type	Required	Editable	Description	Constraint
----------	------	----------	----------	-------------	------------

Property	Type	Required	Editable	Description	Constraint
LaunchTemplateName	String	Yes	No	The name of the instance launch template.	<ul style="list-style-type: none"> The name must be 2 to 128 characters in length. It must start with a letter but cannot start with <code>http://</code> or <code>https://</code>. It can contain letters, digits, colons (:), underscores (_), and hyphens (-).
VersionDescription	String	No	No	The description of the version of the instance launch template.	<ul style="list-style-type: none"> The description must be 2 to 128 characters in length. It must start with a letter but cannot start with <code>http://</code> or <code>https://</code>.
ImageId	String	No	No	The ID of the image.	None
InstanceType	String	No	No	The type of the instance.	None
SecurityGroupId	String	No	No	The ID of the security group.	None
NetworkType	String	No	No	The network type of the instance.	Valid values: <ul style="list-style-type: none"> classic vpc
VSwitchId	String	No	No	The ID of the VSwitch. You must specify this parameter when you create an instance in a VPC.	None
InstanceName	String	No	No	The name of the instance.	<ul style="list-style-type: none"> The name must be 2 to 128 characters in length. It must start with a letter but cannot start with <code>http://</code> or <code>https://</code>.
Description	String	No	No	The description of the instance.	<ul style="list-style-type: none"> The description must be 2 to 128 characters in length. It must start with a letter but cannot start with <code>http://</code> or <code>https://</code>.

Property	Type	Required	Editable	Description	Constraint
InternetMaxBandwidthIn	Integer	No	No	Maximum inbound bandwidth from the Internet.	Valid values: 1 to 200. Unit: Mbit/s.
InternetMaxBandwidthOut	Integer	No	No	Maximum outbound bandwidth to the Internet.	Valid values: 0 to 100. Unit: Mbit/s.
HostName	String	No	No	The hostname of the instance.	<p>The name cannot start or end with a period (.) or a hyphen (-). It cannot contain consecutive periods (.) or hyphens (-).</p> <ul style="list-style-type: none"> For Windows instances: <ul style="list-style-type: none"> The name must be 2 to 15 characters in length and can contain letters, digits, and hyphens (-). It cannot only contain digits. For other instances such as Linux instances: <ul style="list-style-type: none"> The name must be 2 to 64 characters in length and can contain letters, digits, and hyphens (-).
ZoneId	String	No	No	The ID of the zone where the instance resides.	None
SystemDiskCategory	String	No	No	The category of the system disk.	Valid values: <ul style="list-style-type: none"> cloud: the basic disk cloud_efficiency: the ultra disk cloud_ssd: the standard SSD ephemeral_ssd: the local SSD
SystemDiskSize	Number	No	No	The size of the system disk.	Valid values: 20 to 500. Unit: GiB.

Property	Type	Required	Editable	Description	Constraint
SystemDiskDiskName	String	No	No	The name of the system disk.	<ul style="list-style-type: none"> The name must be 2 to 128 characters in length and can contain letters, digits, colons (:), underscores (_), and hyphens (-). It must start with a letter but cannot start with <code>http://</code> or <code>https://</code>.
SystemDiskDescription	String	No	No	The description of the system disk.	The description must be 2 to 256 characters in length and cannot start with <code>http://</code> or <code>https://</code> .
IoOptimized	String	No	No	Specifies whether the instance is I/O optimized.	Valid values: <ul style="list-style-type: none"> none optimized
InternetChargeType	String	No	No	The billing method for network usage.	Valid values: <ul style="list-style-type: none"> PayByBandwidth PayByTraffic
UserData	String	No	No	The user data of the instance.	The data must be encoded in Base64. The maximum size of the raw data is 16 KB.
KeyPairName	String	No	No	The AccessKey pair name.	<ul style="list-style-type: none"> For Windows instances, this parameter is ignored and is empty by default. The Password parameter takes effect even if the KeyPairName parameter is specified. For Linux instances, the username and password authentication method is disabled by default.
RamRoleName	String	No	No	The RAM role name of the instance.	None

Property	Type	Required	Editable	Description	Constraint
AutoReleaseTime	String	No	No	The time scheduled for the instance to be automatically released.	Specify the time in the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time must be in UTC.
SpotStrategy	String	No	No	The preemption policy for pay-as-you-go instances.	This parameter takes effect only when the InstanceChargeType parameter is set to PostPaid. Valid values: <ul style="list-style-type: none"> NoSpot: The instance is created as a regular pay-as-you-go instance. SpotWithPriceLimit: The instance to be created is a preemptible instance with a user-defined maximum hourly price. SpotAsPriceGo: The instance to be created is a preemptible instance whose price is based on the market price at the time of purchase.
SpotPriceLimit	String	No	No	The maximum hourly price of the instance.	A maximum of three decimal places can be specified.
SecurityEnhancementStrategy	String	No	No	Specifies whether to enable security hardening.	Valid values: <ul style="list-style-type: none"> Active: enables security hardening. Deactive: disables security hardening.
DiskMappings	List	No	No	The list of data disks.	A maximum of 16 data disks can be specified.
NetworkInterfaces	List	No	No	The list of elastic network interfaces (ENIs).	A maximum of eight ENIs can be specified.
Tags	List	No	No	The tags of the instance, security group, disks, and ENIs.	A maximum of 20 tags can be specified.
TemplateTags	List	No	No	The tags of the launch template.	A maximum of 20 tags can be specified.

DiskMappings syntax

```
"DiskMappings": [
  {
    "Category": String,
    "DiskName": String,
    "Description": String,
    "SnapshotId": String,
    "Size": String,
    "Encrypted": String,
    "DeleteWithInstance": String
  }
]
```

DiskMappings properties

Property	Type	Required	Editable	Description	Constraint
Category	String	No	No	The category of the data disk.	Valid values: <ul style="list-style-type: none"> cloud: the basic disk cloud_efficiency: the ultra disk cloud_ssd: the standard SSD ephemeral_ssd: the local SSD
DiskName	String	No	No	The name of the data disk.	<ul style="list-style-type: none"> The name must be 2 to 128 characters in length. It must start with a letter but cannot start with <code>http://</code> or <code>https://</code>. It can contain letters, digits, colons (:), underscores (_), and hyphens (-).
Description	String	No	No	The description of the data disk.	The description must be 2 to 256 characters in length and cannot start with <code>http://</code> or <code>https://</code> .
SnapshotId	String	No	No	The ID of the snapshot used to create the data disk.	None

Property	Type	Required	Editable	Description	Constraint
Size	String	No	No	The size of the system disk.	<ul style="list-style-type: none"> Valid values when the Category parameter is set to cloud: 5 to 2000. Valid values when the Category parameter is set to cloud_efficiency: 20 to 32768. Valid values when the Category parameter is set to cloud_ssd: 20 to 32768. Valid values when the Category parameter is set to ephemeral_ssd: 5 to 800. Unit: GiB.
Encrypted	Boolean	No	No	Specifies whether to encrypt the data disk.	None
DeleteWithInstance	Boolean	No	No	Specifies whether to release the data disk when the instance is released.	None

NetworkInterfaces syntax

```

"NetworkInterfaces": [
  {
    "PrimaryIpAddress": String,
    "VSwitchId": String,
    "SecurityGroupId": String,
    "NetworkInterfaceName": String,
    "Description": String
  }
]
    
```

NetworkInterfaces properties

Property	Type	Required	Editable	Description	Constraint
PrimaryIpAddress	String	No	No	The primary private IP address of the ENI.	None
VSwitchId	String	No	No	The ID of the VSwitch to which the ENI belongs.	None
SecurityGroupId	String	No	No	The ID of the security group to which the ENI belongs.	None

Property	Type	Required	Editable	Description	Constraint
NetworkInterfaceName	String	No	No	The name of the ENI.	None
Description	String	No	No	The description of the ENI.	The description must be 2 to 256 characters in length and cannot start with <code>http://</code> or <code>https://</code> .

Tags syntax

```
"Tags": [
  {
    "Value": String,
    "Key": String
  }
]
```

Tags properties

Property	Type	Required	Editable	Description	Constraint
key	String	Yes	No	None	None
value	String	No	No	None	None

TemplateTags syntax

```
"TemplateTags": [
  {
    "Value": String,
    "Key": String
  }
]
```

TemplateTags properties

Property	Type	Required	Editable	Description	Constraint
key	String	Yes	No	None	None
value	String	No	No	None	None

Response parameters

Fn::GetAtt

- **LaunchTemplateId**: the ID of the instance launch template.
- **LaunchTemplateName**: the name of the instance launch template.
- **DefaultVersionNumber**: the default version number of the instance launch template.
- **LatestVersionNumber**: the latest version number of the instance launch template.

Examples

5.5.1.16. ALIYUN::ECS::NatGateway

ALIYUN::ECS::NatGateway is used to create a NAT Gateway for a VPC.

Statement

```

{
  "Type": "ALIYUN::ECS::NatGateway",
  "Properties": {
    "DeletionProtection": Boolean,
    "VpcId": String,
    "Description": String,
    "NatGatewayName": String,
    "VSwitchId": String,
    "DeletionForce": Boolean,
    "Spec": String
  }
}

```

Properties

Parameter	Type	Required	Editable	Description	Constraint
VpcId	String	Yse	No	The ID of the VPC that you want to create NAT Gateway.	None
VSwitchId	String	Yse	No	The ID of the vSwitch in the specified VPC.	None
Description	String	Erased	Released	The description of the NAT Gateway.	The description must be 2 to 256 characters in length.

Parameter	Type	Required	Editable	Description	Constraint
NatGatewayName	String	Erased	Released	The name of the NAT Gateway.	The name must be 2 to 128 characters in length and can contain letters, digits, underscores (_), periods (.), and hyphens (-). It must start with a letter.
Spec	String	Erased	Released	The type of the NAT Gateway.	Valid values: Small, Middle, and Large.
DeletionProtection	Boolean	Erased	Released	Indicates whether deletion protection is enabled. Default value: false.	None
DeletionForce	Boolean	Erased	Released	Specifies whether to forcibly delete SNAT and DNAT entries in the Gateway and unbind EIP from the NAT gateway. Default value: false.	Valid values: 1025 to 10000. You cannot use the following commonly used port numbers: 2222, 4500, 4510, 4560, 7505, 9000, 9001, and 9002.

Response parameters

Fn::GetAtt

- ForwardTableId: the ID of the port forwarding table.
- The ID of the SNatTableId: SNat source network address translation table.
- NatGatewayId: the unique ID of the Nat gateway.

Sample request

```

{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "NatGateway": {
      "Type": "ALIYUN::ECS::NatGateway",
      "Properties": {
        "NatGatewayName": "nat_gateway_1",
        "Description": "my nat gateway",
        "VpcId": "vpc-25o8s****",
        "VSwitchId": "vsw-25rc1****",
        "Spec": "Small"
      }
    }
  },
  "Outputs": {
    "NatGatewayId": {
      "Value": {"Fn::GetAttr": ["NatGateway", "NatGatewayId"]}
    },
    "ForwardTableId": {
      "Value": {"Fn::GetAttr": ["NatGateway", "ForwardTableId"]}
    },
    "SNatTableId": {
      "Value": {"Fn::GetAttr": ["NatGateway", "SNatTableId"]}
    }
  }
}

```

5.5.1.17. ALIYUN::ECS::NetworkInterface

ALIYUN::ECS::NetworkInterface is used to create an elastic network interface (ENI).

Statement

```

{
  "Type": "ALIYUN::ECS::NetworkInterface",
  "Properties": {
    "Description": String,
    "SecurityGroupId": String,
    "PrimaryIpAddress": String,
    "ResourceGroupId": String,
    "VSwitchId": String,
    "NetworkInterfaceName": String
  }
}

```

Properties

Parameter	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	Yes	Released	The ID of the resource group to which the instance belongs.	None
SecurityGroupId	String	No	Yes	The ID of the security group to which the instance belongs. The security group and the instance must be in the same VPC.	None
VSwitchId	String	No	No	The ID of the VSwitch in the VPC.	None
Description	String	Yes	True	The description of the ENI. It can contain 2 to 256 English letters or Chinese character. It cannot start with <code>http://</code> and <code>https://</code> the beginning. This parameter is empty by default.	None
NetworkInterfaceName	String	Yes	True	The name of the ENI. The name must be 2 to 128 characters in length. Must start with an uppercase or lowercase letter, and cannot start with <code>http://</code> and <code>https://</code> the beginning. It can contain letters, digits, colons (:), underscores (_), and hyphens (-). Default value: null.	None

Parameter	Type	Required	Editable	Description	Constraint
PrimaryIpAddress	String	Yes	Released	The primary private IP address of the ENI. The specified IP address must be available within the CIDR block of the VSwitch. If this parameter is not specified, an available IP address in the VSwitch CIDR block is assigned at random.	Valid values: 1025 to 10000. You cannot use the following commonly used port numbers: 2222, 4500, 4510, 4560, 7505, 9000, 9001, and 9002.

Response parameters

Fn::GetAtt

- NetworkInterfaceId: the ID of the ENI.
- The MAC address of the MacAddress: Elastic Network Interface.
- The private IP address of the PrivateIpAddress: Elastic Network Interface.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Parameters": {
    "Description": {
      "Type": "String",
      "Description": "Description of your ENI. It is a string of [2, 256] English or Chinese characters."
    },
    "SecurityGroupId": {
      "Type": "String",
      "Description": "The ID of the security group that the ENI joins. The security group and the ENI must be in a same VPC."
    },
    "VSwitchId": {
      "Type": "String",
      "Description": "VSwitch ID of the specified VPC. Specifies the switch ID for the VPC."
    },
    "NetworkInterfaceName": {
      "Type": "String",
      "Description": "Name of your ENI. It is a string of [2, 128] Chinese or English characters. It must begin with a letter and can contain numbers, underscores (_), colons (:), or hyphens (-)."
    },
    "PrimaryIpAddress": {
      "Type": "String",
      "Description": "The primary private IP address of the ENI. The specified IP address must have the same Host ID as t
```

```

    "Description": "The primary private IP address of the ENI. The specified IP address must have the same Host ID as the VSwitch. If no IP addresses are specified, a random network ID is assigned for the ENI."
  },
  "Resources": {
    "EniInstance": {
      "Type": "ALIYUN::ECS::NetworkInterface",
      "Properties": {
        "Description": {
          "Ref": "Description"
        },
        "SecurityGroupId": {
          "Ref": "SecurityGroupId"
        },
        "VSwitchId": {
          "Ref": "VSwitchId"
        },
        "NetworkInterfaceName": {
          "Ref": "NetworkInterfaceName"
        },
        "PrimaryIpAddress": {
          "Ref": "PrimaryIpAddress"
        }
      }
    }
  },
  "Outputs": {
    "NetworkInterfaceId": {
      "Description": "ID of your Network Interface.",
      "Value": {
        "Fn::GetAtt": [
          "EniInstance",
          "NetworkInterfaceId"
        ]
      }
    }
  }
}

```

5.5.1.18. ALIYUN::ECS::NetworkInterfaceAttachment

ALIYUN::ECS::NetworkInterfaceAttachment is used to attach an elastic network interface (ENI) to an instance in a VPC.

Statement

```
{
  "Type": "ALIYUN::ECS::NetworkInterfaceAttachment",
  "Properties": {
    "InstanceId": String,
    "NetworkInterfaceId": String
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
InstanceId	String	No	No	The ID of the RDS instance.	None
NetworkInterfaceId	String	No	No	The IDs of the elastic network interfaces (ENIs).	Valid values: 1025 to 10000. You cannot use the following commonly used port numbers: 2222, 4500, 4510, 4560, 7505, 9000, 9001, and 9002.

Response parameters

Fn::GetAtt

NetworkInterfaceId: the ID of the ENI.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Parameters": {
    "InstanceId": {
      "Type": "String",
      "Description": "ECS instance id"
    },
    "NetworkInterfaceId": {
      "Type": "String",
      "Description": "Network interface id"
    }
  },
  "Resources": {
    "EniAttachment": {
      "Type": "ALIYUN::ECS::NetworkInterfaceAttachment",
      "Properties": {
        "InstanceId": {
          "Ref": "InstanceId"
        },
        "NetworkInterfaceId": {
          "Ref": "NetworkInterfaceId"
        }
      }
    }
  },
  "Outputs": {
    "NetworkInterfaceId": {
      "Description": "ID of your Network Interface.",
      "Value": {
        "Fn::GetAtt": [
          "EniAttachment",
          "NetworkInterfaceId"
        ]
      }
    }
  }
}
```

5.5.1.19. ALIYUN::ECS::NetworkInterfacePermission

ALIYUN::ECS::NetworkInterfacePermission is used to grant an account the permission to attach an elastic network interface (ENI) to an instance.

Syntax

```
{
  "Type": "ALIYUN::ECS::NetworkInterfacePermission",
  "Properties": {
    "NetworkInterfaceId": String,
    "AccountId": String,
    "Permission": String
  }
}
```

Properties

Name	Type	Required	Editable	Description	Validity
NetworkInterfaceId	String	Yes	No	The ID of the ENI.	None
AccountId	String	Yes	No	The ID of the account.	None
Permission	String	Yes	No	The permission granted to the account.	None

Response parameters

Fn::GetAtt

- NetworkInterfacePermissionId: the ID of the ENI permission.

Examples

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Parameters": {
    "AccountId": {
      "Type": "String",
      "Description": "the account id"
    },
    "Permission": {
      "Type": "String",
      "Description": "the permission",
      "Default": "InstanceAttach"
    },
    "NetworkInterfaceId": {
      "Type": "String",
      "Description": "Network interface id"
    }
  },
  "Resources": {
    "EniPermission": {
      "Type": "ALIYUN::ECS::NetworkInterfacePermission",
      "Properties": {
        "AccountId": {
          "Ref": "AccountId"
        },
        "Permission": {
          "Ref": "Permission"
        },
        "NetworkInterfaceId": {
          "Ref": "NetworkInterfaceId"
        }
      }
    }
  },
  "Outputs": {
    "NetworkInterfacePermissionId": {
      "Description": "the network interface permission id",
      "Value": {
        "Fn::GetAtt": [
          "EniPermission",
          "NetworkInterfacePermissionId"
        ]
      }
    }
  }
}
```

5.5.1.20. ALIYUN::ECS::Route

ALIYUN::ECS::Route is used to create a custom route.

Syntax

```
{
  "Type": "ALIYUN::ECS::Route",
  "Properties": {
    "DestinationCidrBlock": String,
    "RouteTableId": String,
    "NextHopId": String,
    "NextHopType": String,
    "RouteId": String,
    "NextHopList": List
  }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
DestinationCidrBlock	String	Yes	No	The destination Classless Inter-Domain Routing (CIDR) block of the route entry.	None
RouteTableId	String	Yes	No	The ID of the route table.	None
NextHopId	String	No	No	The ID of the next-hop instance of the route entry.	The route is a non-ECMP route.
RouteId	String	Yes	No	The ID of the route.	None
NextHopType	String	No	No	The type of the next hop.	Default value: Instance. Valid values: <ul style="list-style-type: none"> • Instance • Tunnel • HaVip • RouterInterface

Property	Type	Required	Editable	Description	Constraint
NextHopList	List	No	No	The list of next hops of the route entry.	<p>You must specify the NextHopType and NextHopId parameters to specify the next hops.</p> <ul style="list-style-type: none"> If you specify the NextHopList parameter, the route is an ECMP route. The list contains two to four next hops of the ECMP route entry. <div style="border: 1px solid #ccc; background-color: #e6f2ff; padding: 5px; margin: 5px 0;"> <p> Note The NextHopList parameter can be specified only when the route entry belongs to a VRouter. In addition, the next hops must be the router interfaces pointing to the connected VBRs.</p> </div> <ul style="list-style-type: none"> If you do not specify the NextHopList parameter, the route is a non-ECMP route.

NextHopList syntax

```
"NextHopList": [
  {
    "NextHopId": String,
    "NextHopType": String
  }
]
```

NextHopList properties

Property	Type	Required	Editable	Description	Constraint
NextHopId	String	Yes	No	The ID of the next-hop instance of the route entry.	None
NextHopType	String	No	No	The type of the next hop.	<p>Default value: RouterInterface. Valid values:</p> <ul style="list-style-type: none"> Instance Tunnel HaVip RouterInterface

Response parameters

Fn::GetAtt

None

Examples

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "ECSRoute": {
      "Type": "ALIYUN::ECS::Route",
      "Properties": {
        "RouteId": "vrt-25mz0****",
        "RouteTableId": "vtb-25oud****",
        "DestinationCidrBlock": "172.16.XX.XX/24",
        "NextHopId": "i-25xzy****"
      }
    }
  }
}
```

5.5.1.21. ALIYUN::ECS::SNatEntry

ALIYUN::ECS::SNatEntry is used to configure a NAT Gateway table in a source network address translation.

Statement

```
{
  "Type": "ALIYUN::ECS::SNatEntry",
  "Properties": {
    "SNatTableId": String,
    "SNatIp": String,
    "SourceVSwitchId": String
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
SNatTableId	String	Retained	Yes	The ID source network address translation table.	None
SNatIp	String	Retained	Yes	The public IP address used to source network address translation.	The public IP address must be NAT Gateway in the bandwidth plan. It cannot exist in both the forwarding table and the SNAT table.

Parameter	Type	Required	Editable	Description	Constraint
SourceVSwitchId	String	Retained	Yes	The ID of the VSwitch that accesses the Internet through the SNAT function of NAT Gateway.	Valid values: 1025 to 10000. You cannot use the following commonly used port numbers: 2222, 4500, 4510, 4560, 7505, 9000, 9001, and 9002.

Response parameters

Fn::GetAtt

SNatEntryId: the table entry ID in the source network address translation table.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "SNatEntry": {
      "Type": "ALIYUN::ECS::SNatEntry",
      "Properties": {
        "SNatTableId": "stb-3er41****",
        "SourceVSwitchId": "vsw-25rc1****",
        "SNatIp": "101.201.XX.XX"
      }
    }
  },
  "Outputs": {
    "SNatEntryId": {
      "Value": {"Fn::GetAttr": ["SNatEntry", "SNatEntryId"]}
    }
  }
}
```

5.5.1.22. ALIYUN::ECS::SecurityGroup

ALIYUN::ECS::SecurityGroup is used to create a security group.

Statement

```

{
  "Type": "ALIYUN::ECS::SecurityGroup",
  "Properties": {
    "VpcId": String,
    "Description": String,
    "SecurityGroupName": String,
    "Tags": List,
    "SecurityGroupEgress": List,
    "SecurityGroupIngress": List,
    "ResourceGroupId": String,

```

Properties

Parameter	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	Yes	Released	The ID of the resource group to which the instance belongs.	None
VpcId	String	Yes	Released	The ID of the VPC.	None
Description	String	Yes	Released	The description of the new security group.	The description must be 2 to 256 characters in length.
Tags	List	Erased	Released	The tags of the security group.	A maximum of 20 tags can be specified.

Parameter	Type	Required	Editable	Description	Constraint
SecurityGroupName	String	Yes	Released	The name of the new security group.	Default value: empty. <ul style="list-style-type: none"> The name must be 2 to 128 characters in length Must start with an uppercase or lowercase letter, and cannot start with <code>http://</code> and <code>https://</code> the beginning. It must start with a letter and cannot start with <code>http://</code> or <code>https://</code>.
SecurityGroupEgress	List	Erased	Released	The outbound access rules of the security group.	None
SecurityGroupIngress	List	Erased	Released	The inbound access rules of the security group.	None
SecurityGroupType	String	Yes	Released	The type of the new security group.	Valid values: <ul style="list-style-type: none"> normal (basic security group) enterprise (Advanced Security Group)

Tags syntax

```
"Tags": [
  {
    "Value": String,
    "Key": String
  }
]
```

Tags properties

Parameter	Type	Required	Editable	Description	Constraint
Key	String	No	No	None	None
Value	String	Yes	Released	None	None

SecurityGroupEgress syntax

```
"SecurityGroupEgress": [

    "DestGroupOwnerId": String,
    "Ipv6DestCidrIp": String
  }
]
```

SecurityGroupEgress properties

Parameter	Type	Required	Editable	Description	Constraint
Description	String	Yes	Released	The description of the security group rule.	The description must be 1 to 512 characters in length.

Parameter	Type	Required	Editable	Description	Constraint
DestGroupOwnerId	String	Yes	Released	The ID of the Alibaba Cloud account that owns the destination security group. This parameter is used to grant the current security group access to security groups in another Alibaba Cloud account.	If neither the DestGroupOwnerId parameter nor the DestGroupOwnerAccount parameter is specified, the current security group is granted access to other security groups in the same Alibaba Cloud account. If the DestCidrIp parameter is specified, the DestGroupOwnerId parameter is ignored.
IpProtocol	String	No	No	The Internet protocol over which the listener will forward requests.	Valid values: <ul style="list-style-type: none"> • TCP • udp • icmp • GRE • All A value of all specifies that all the four protocols are supported.

Parameter	Type	Required	Editable	Description	Constraint
PortRange	String	Yes	Released	The range of port numbers corresponding to the Internet protocol.	<p>The range of destination ports corresponding to the transport layer protocol. Valid values:</p> <ul style="list-style-type: none"> When the IpProtocol parameter is set to tcp or udp, the port number range is 1 to 65535. Separate the starting port and the ending port with a forward slash (/). Correct example: 1/200. Incorrect example: 200/1. When the IpProtocol parameter is set to icmp, the port number range is -1/-1, indicating that all ports are available. When the IpProtocol parameter is set to gre, the port number range is -1/-1, indicating that all ports are available. When the IpProtocol parameter is set to all, the port number range is -1/-1.
SecurityGroupId	String	Yes	Released	The ID of the security group for which to create the outbound access rules.	None

Parameter	Type	Required	Editable	Description	Constraint
NicType	String	Yes	Released	The network type of the instance. Valid values:	Valid values: <ul style="list-style-type: none"> internet intranet Default value: internet.
Priority	String	Optional	Released	The priority of the authorization policy.	Valid values: 1 to 100. Default value: 1
DestGroupId	String	Yes	Released	The ID of the destination security group within the same region.	You must specify either the DestGroupId parameter or the DestCidrIp parameter. If both parameters are specified, the system authorizes the destination CIDR block specified by the DestCidrIp parameter. If the DestGroupId parameter is specified, but the DestCidrIp parameter is not, you must set the NicType parameter to intranet.
DestCidrIp	String	Yes	Released	The source IPv4 CIDR block.	The value must be in CIDR format. The default value is 0.0.0.0/0, indicating that access from any IP addresses is allowed. Examples of other supported formats include 10.159.XX.XX/12. Only IPv4 addresses are supported.

Parameter	Type	Required	Editable	Description	Constraint
Policy	String	Yes	Released	The authorization policy.	Valid values: <ul style="list-style-type: none"> accept: grants access drop: denies access Default value: accept.
DestGroupOwnerAccount	String	Yes	Released	The Alibaba Cloud account of the destination security group when you grant security group permissions across accounts.	None
Ipv6DestCidrIp	String	Yes	Released	The destination IPv6 CIDR block.	IPv6 addresses in CIDR format are supported. You can only specify the IP addresses for ECS instances in VPCs.

SecurityGroupIngress syntax

```
"SecurityGroupIngress": [
  {
    "SourceGroupOwnerId": String,

    "SourceCidrIp": String
  }
]
```

SecurityGroupIngress properties

Parameter	Type	Required	Editable	Description	Constraint
SourceGroupOwnerid	String	Yes	Released	The ID of the Alibaba Cloud account that owns the source security group.	None
Description	String	Yes	Released	The description of the security group rule.	The description must be 1 to 512 characters in length.
IpProtocol	String	No	No	The Internet protocol over which the listener will forward requests.	Valid values: tcp, udp, icmp, gre, and all. A value of all specifies that all the four protocols are supported.

Parameter	Type	Required	Editable	Description	Constraint
PortRange	String	Yes	Released	The range of port numbers corresponding to the Internet protocol.	<p>The range of destination ports corresponding to the transport layer protocol. Valid values:</p> <ul style="list-style-type: none"> When the IpProtocol parameter is set to tcp or udp, the port number range is 1 to 65535. Separate the starting port and the ending port with a forward slash (/). Correct example: 1/200. Incorrect example: 200/1. When the IpProtocol parameter is set to icmp, the port number range is -1/-1, indicating that all ports are available. When the IpProtocol parameter is set to gre, the port number range is -1/-1, indicating that all ports are available. When the IpProtocol parameter is set to all, the port number range is -1/-1, indicating that all ports are available.

Parameter	Type	Required	Editable	Description	Constraint
SourceGroupId	String	Yes	Released	The ID of the source security group within the same region.	You must specify either the SourceGroupId parameter or the SourceCidrIp parameter. If both parameters are specified, the system authorizes the source CIDR block specified by the SourceCidrIp parameter. If the SourceGroupId parameter is specified, but the SourceCidrIp parameter is not, you must set the NicType parameter to intranet.
SecurityGroupId	String	Yes	Released	The ID of the security group for which you want to create the inbound access rule.	None
NicType	String	Yes	Released	The network type of the instance. Valid values:	Valid values: <ul style="list-style-type: none"> internet intranet Default value: internet.
SourceGroupOwnerAccount	String	Yes	Released	The Alibaba Cloud account of the destination security group when you grant security group permissions across accounts.	None
Priority	String	Optional	Released	The priority of the authorization policy.	Valid values: 1 to 100. Default value: 1

Parameter	Type	Required	Editable	Description	Constraint
SourceCidrIp	String	Yes	Released	The source IPv4 CIDR block.	The value must be in CIDR format. The default value is 0.0.0.0/0, indicating that access from any IP addresses is allowed. Examples of other supported formats include 10.159.XX.XX/12. Only IPv4 CIDR blocks are supported.
Policy	String	Yes	Released	The authorization policy.	Valid values: <ul style="list-style-type: none"> • accept: accepts the request. • drop: access is denied. Default value: accept.

Parameter	Type	Required	Editable	Description	Constraint
SourcePortRange	String	Yes	Released	The range of source ports relevant to transport layer protocols.	Valid values: <ul style="list-style-type: none"> When the IpProtocol parameter is set to tcp or udp, the port number range is 1 to 65535. Separate the starting port and the ending port with a forward slash (/). Correct example: 1/200. Incorrect example: 200/1. When the IpProtocol parameter is set to icmp, the port number range is -1/-1, indicating that all values are valid. When the IpProtocol parameter is set to gre, the port number range is -1/-1, indicating that all ports are available. The IpProtocol value is all: -1/-1.
Ipv6SourceCidrIp	String	Yes	Released	The source IPv6 CIDR block. IPv6 addresses in CIDR format are supported.	You can only specify the IP addresses of ECS instances in VPCs.

Response parameters

Fn::GetAtt

SecurityGroupId: the ID of the new security group.

5.5.1.23. ALIYUN::ECS::SecurityGroupClone

ALIYUN::ECS::SecurityGroupClone is used to clone a security group.

Syntax

```
{
  "Type": "ALIYUN::ECS::SecurityGroupClone",
  "Properties": {
    "DestinationRegionId": String,
    "VpcId": String,
    "Description": String,
    "SecurityGroupName": String,
    "SourceSecurityGroupId": String,
    "ResourceGroupId": String,
    "NetworkType": String,
    "SecurityGroupType": String
  }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	No	No	The ID of the resource group to which the instance belongs.	None
SourceSecurityGroupId	String	Yes	No	The ID of the source security group.	Only applicable security group rules are copied to the new security group. The security group rules are selected based on the network type of the new security group.
NetworkType	String	No	No	The network type of the new security group.	Set the value to Classic.

Property	Type	Required	Editable	Description	Constraint
VpcId	String	No	No	The ID of the VPC to which the new security group belongs.	The NetworkType parameter is ignored if both the VpcId and NetworkType parameters are specified.
Description	String	No	No	The description of the new security group.	The description must be 2 to 256 characters in length. It cannot start with http:// or https://.
SecurityGroupName	String	No	No	The name of the new security group.	This parameter is empty by default. The name must be 2 to 128 characters in length and can contain letters, digits, periods (.), underscores (_), and hyphens (-). It must start with a letter and cannot start with http:// or https://.
DestinationRegionId	String	No	No	The ID of the destination region where the new security group resides.	Default value: CURRENT.
SecurityGroupType	String	No	No	The type of the new security group.	Valid values: normal and enterprise. A value of normal specifies a basic security group. A value of enterprise specifies an advanced security group.

Response parameters

Fn::GetAtt

SecurityGroupId: the ID of the new security group.

    }
  }
}
```

5.5.1.26. ALIYUN::ECS::Snapshot

ALIYUN::ECS::Snapshot is used to create a disk Snapshot.

Statement

```
{
  "Type": "ALIYUN::ECS::Snapshot",
  "Properties": {
    "SnapshotName": String,
    "Timeout": Integer,
    "Description": String,
    "DiskId": String
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
DiskId	String	No	No	The ID of the disk for which you want to create the snapshot.	None

Parameter	Type	Required	Editable	Description	Constraint
SnapshotName	String	Yes	Released	The name of the snapshot.	It must be 2 to 128 characters in length. And can contain letters, digits, underscores (_), and hyphens (-). It cannot start with auto. Snapshot names starting with auto are reserved for automatic snapshots. It cannot start with <code>http://</code> or <code>https://</code> .
Timeout	String	Optional	Released	The timeout period that is specified for the snapshot creation request.	If this parameter is set, the timeout period to create a resource stack is prolonged. If the snapshot is not created within the specified time period, the entire resource stack fails to be created. You must set the timeout period according to the disk size and data amount. Valid values: 200 to 1440. Unit: minute. The default value is 200 minutes.
Description	String	Yes	Released	The description of the snapshot.	The length must be 2 to 256 characters in length. This parameter is empty by default. It cannot start with <code>http://</code> or <code>https://</code> .

Response parameters

Fn::GetAtt

SnapshotId: the ID of the snapshot.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "Snapshot": {
      "Type": "ALIYUN::ECS::Snapshot",
      "Properties": {
        "DiskId": "d-2zedgvuvu8cylvr*****"
      }
    }
  },
  "Outputs": {
    "SnapshotId": {
      "Value": {
        "Fn::GetAtt": [
          "Snapshot",
          "SnapshotId"
        ]
      }
    }
  }
}
```

5.5.1.27. ALIYUN::ECS::SSHKeyPair

ALIYUN::ECS::SSHKeyPair is used to create or import an SSH key pair to an ECS instance.

Statement

```
{
  "Type": "ALIYUN::ECS::SSHKeyPair",
  "Properties": {
    "ResourceGroupId": String,
    "KeyPairName": String,
    "PublicKeyBody": String
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	Yes	Released	The ID of the resource group to which the instance belongs.	None

Parameter	Type	Required	Editable	Description	Constraint
KeyPairName	String	No	No	The globally unique name of the SSH key pair.	The name must be 2 to 128 characters in length and can contain letters, digits, periods (.), underscores (_), and hyphens (-). It cannot start with <code>http://</code> or <code>https://</code> .
PublicKeyBody	String	Yes	Released	Specifies the SSH public key to import.	Valid values: 1025 to 10000. You cannot use the following commonly used port numbers: 2222, 4500, 4510, 4560, 7505, 9000, 9001, and 9002.

Response parameters

Fn::GetAtt

- **KeyPairFingerPrint**: the fingerprint of the key pair. The message-digest algorithm 5 (MD5) is used based on the public key fingerprint format defined in RFC 4716.
- **PrivateKeyBody**: the private key of the key pair. An unencrypted RSA private key must be encoded using PEM and must be in the PKCS#8 format. The private key of a key pair can only be obtained at the time of its creation. If you import an existing public key, no private key information will be available.
- **KeyPairName**: the globally unique name of the SSH key pair.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "SSHKeyPair": {
      "Type": "ALIYUN::ECS::SSHKeyPair",
      "Properties": {
        "KeyPairName": "ssh_key_pair_v1"
      }
    }
  },
  "Outputs": {
    "KeyPairName": {
      "Value": {
        "Fn::GetAtt": [
          "SSHKeyPair",
          "KeyPairName"
        ]
      }
    },
    "PrivateKeyBody": {
      "Value": {
        "Fn::GetAtt": [
          "SSHKeyPair",
          "PrivateKeyBody"
        ]
      }
    },
    "KeyPairFingerPrint": {
      "Value": {
        "Fn::GetAtt": [
          "SSHKeyPair",
          "KeyPairFingerPrint"
        ]
      }
    }
  }
}
```

5.5.1.28. ALIYUN::ECS::SSHKeyPairAttachment

ALIYUN::ECS::SSHKeyPairAttachment is used to bind an SSH key pair to an ECS instance.

Statement

```
{
  "Type": "ALIYUN::ECS::SSHKeyPairAttachment",
  "Properties": {
    "InstanceIds": List,
    "KeyPairName": String
  }
}
```

Properties

Parameter	Type	Required or Not	Editable	Description	Constraint
InstanceIds	List	Retained	Yes	The IDs of the ECS instances with which you want to associate the EIP.	Separate the IDs with a comma (.). Only Linux instances are supported.
KeyPairName	String	No	No	The name of the SSH key pair.	Valid values: 1025 to 10000. You cannot use the following commonly used port numbers: 2222, 4500, 4510, 4560, 7505, 9000, 9001, and 9002.

Response parameters

Fn::GetAtt

None

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "SSHKeyPairAttachment": {
      "Type": "ALIYUN::ECS::SSHKeyPairAttachment",
      "Properties": {
        "KeyPairName": "ssh_key_pair_v1",
        "InstanceIds": [
          'l-2zeiofnh20j**** has been added *',
          'l-2zebt3kfvxm2**** has two records *'
        ]
      }
    }
  }
}
```

5.5.1.29. ALIYUN::ECS::VPC

ALIYUN::ECS::VPC is used to create a VPC.

Statement

```
{
  "Type": "ALIYUN::ECS::VPC",
  "Properties": {
    "Description": String,
    "Ipv6CidrBlock": String,
    "EnableIpv6": Boolean,
    "ResourceGroupId": String,
    "VpcName": String,
    "CidrBlock": String
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	Yes	Released	The ID of the resource group to which the instance belongs.	None
VpcName	String	Yes	True	The name of the VPC.	<ul style="list-style-type: none"> The name must be 2 to 128 characters in length Must start with english letters or starts with a Chinese character. It cannot start with <code>ht</code> <code>tp://</code> or <code>htt</code> <code>ps://</code> . It must start with a letter and cannot start with <code>http://</code> or <code>https://</code>.

Parameter	Type	Required	Editable	Description	Constraint
CidrBlock	String	Yes	True	The CIDR block of the VPC.	Valid values: 10.0.0.0/8, 172.16.0.0/12, and 192.168.0.0/16.
Description	String	Yes	True	The description of the VPC.	The description must be 2 to 256 characters in length. It cannot start with <code>http://</code> or <code>https://</code> .
Ipv6CidrBlock	String	Yes	Released	The IPv6 CIDR block of the VPC.	None
EnableIpv6	Boolean	No.	True	Specifies whether to enable an IPv6 CIDR block.	Valid values: <ul style="list-style-type: none"> • true • false Default value: false.

Response parameters

Fn::GetAtt

- VpcId: The VPC ID allocated by the system.
- VRouterId: the ID of the vRouter.
- RouteTableId: the ID of the routing table.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "EcsVpc": {
      "Type": "ALIYUN::ECS::VPC",
      "Properties": {
        "CidrBlock": "172.16.0.0/12",
        "VpcName": "vpc-test-del"
      }
    }
  },
  "Outputs": {
    "VpcId": {
      "Value": {
        "Fn::GetAtt": [
          "EcsVpc",
          "VpcId"
        ]
      }
    },
    "VRouterId": {
      "Value": {
        "Fn::GetAtt": [
          "EcsVpc",
          "VRouterId"
        ]
      }
    },
    "RouteTableId": {
      "Value": {
        "Fn::GetAtt": [
          "EcsVpc",
          "RouteTableId"
        ]
      }
    }
  }
}
```

5.5.1.30. ALIYUN::ECS::VSwitch

ALIYUN::ECS::VSwitch is used to create a VSwitch.

Statement

```
{
  "Type": "ALIYUN::ECS::VSwitch",
  "Properties": {
    "VSwitchName": String,
    "VpcId": String,
    "Description": String,
    "Ipv6CidrBlock": Integer,
    "ZoneId": String,
    "CidrBlock": String
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
VpcId	String	No	No	The ID of the VPC where a vSwitch is to be created	None
ZoneId	String	No	No	The ID of the zone where the instance resides.	None
VSwitchName	String	Yes	True	The name of the VSwitch.	<ul style="list-style-type: none"> The name must be 2 to 128 characters in length It must start with a letter. Cannot http:// or https:// the beginning. It must start with a letter and cannot start with http:// or https://.
CidrBlock	String	No	No	The CIDR block of the VSwitch.	The VSwitch CIDR block must be a subset of the CIDR block assigned to the VPC where the VSwitch resides and not be used by other VSwitches.

Parameter	Type	Required	Editable	Description	Constraint
Description	String	Yes	True	The description of the vSwitch.	The description must be 2 to 256 characters in length. It cannot start with <code>http://</code> or <code>https://</code> .
Ipv6CidrBlock	String	Optional	Released	The IPv6 CIDR block of the VSwitch. You can customize the last eight bits of the IPv6 CIDR block.	Valid values: 0 to 255. The value is a decimal integer. By default, the prefix of the IPv6 CIDR block of the VSwitch is set to /64.

Response parameters

Fn::GetAtt

- **VSwitchId**: indicates the vSwitch ID allocated by the system.
- **CidrBlock**: the IPv4 CIDR block of the vSwitch.
- **Ipv6CidrBlock**: the IPv6 CIDR block of the vSwitch.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Parameters": {
    "VpcName": {
      "Type": "String"
    },
    "VSwitch1CidrBlock": {

5.5.2. ESS

5.5.2.1. ALIYUN::ESS::AlarmTask

ALIYUN::ESS::AlarmTask is used to create a metric-based alarm task.

Syntax

```

{
  "Type": "ALIYUN::ESS::AlarmTask",
  "Properties": {
    "Statistics": String,
    "Name": String,
    "EvaluationCount": Integer,
    "Period": Integer,
    "MetricType": String,
    "ComparisonOperator": String,
    "Dimensions": List,
    "ScalingGroupId": String,
    "AlarmAction": List,
    "Threshold": Number,
    "MetricName": String,
    "GroupId": Integer,
    "Description": String
  }
}

```

Properties

Property	Type	Required	Editable	Description	Constraint
Statistics	String	No	No	The method used to calculate monitoring data. The statistics must be appropriate for the metric chosen.	Valid values: Average, Minimum, and Maximum. Default value: Average.
Name	String	No	Yes	The name of the alarm rule.	None
EvaluationCount	Integer	No	No	The number of consecutive times that the threshold must be exceeded before an alarm is triggered.	Default value: 3. Minimum value: 1.
Period	Integer	No	No	The metric query period, which must be appropriate for the metric chosen. Unit: seconds.	Valid values: 60, 120, 300, and 900. Default value: 300.
MetricType	String	No	No	The metric type.	Valid values: system and custom.
ComparisonOperator	String	No	No	The alarm comparison operator used to define a condition in the alarm rule.	Valid values: <=, <, >, and >=.
Dimensions	List	No	No	The list of instances associated with the alarm rule.	You must include at least one instance in the list.

Property	Type	Required	Editable	Description	Constraint
ScalingGroupId	String	Yes	No	The ID of the scaling group.	None
AlarmAction	List	Yes	Yes	The list of alarm actions.	You must include one to five alarm actions in the list.
Threshold	Number	Yes	No	The alarm threshold, which must be a numeric value.	None
MetricName	String	Yes	No	The metric name of a service. For more information, see the metrics defined for each service.	None
GroupId	Integer	No	No	The group ID.	None
Description	String	No	Yes	The description of the alarm task.	None

Dimensions syntax

```
"Dimensions": [
  {
    "DimensionKey": String,
    "DimensionValue": String
  }
]
```

Dimensions properties

Property	Type	Required	Editable	Description	Constraint
DimensionValue	String	Yes	No	None	None
DimensionKey	String	Yes	No	None	None

Response parameters

Fn::GetAtt

AlarmTaskId: the ID of the alarm task.

Examples

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Parameters": {
    "ComparisonOperator": {
      "Type": "String",
      "Description": "Comparison Operator",

```

```

    "AlarmTask",
    "AlarmTaskId"
  ]
}
}
}
}
}

```

5.5.2.2. ALIYUN::ESS::AlarmTaskEnable

ALIYUN::ESS::AlarmTaskEnable is used to start an alarm task. You can call this operation to enable alarm tasks when the task is stopped.

Statement

```

{
  "Type": "ALIYUN::ESS::AlarmTaskEnable",
  "Properties": {
    "AlarmTaskId": String,
    "Enable": Boolean
  }
}

```

Properties

Parameter	Type	Required	Editable	Description	Constraint
AlarmTaskId	String	No	No	The ID of the monitoring task.	None
Enable	String	Retained	Yes	Specifies whether to enable the alarm task.	Valid values: 1025 to 10000. You cannot use the following commonly used port numbers: 2222, 4500, 4510, 4560, 7505, 9000, 9001, and 9002.

Response parameters

Fn::GetAtt

None

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Parameters": {
    "Enable": {
      "Type": "Boolean",
      "Description": "Enable alarm task or not",
      "AllowedValues": [
        "True",
        "true",
        "False",
        "false"
      ]
    },
    "AlarmTaskId": {
      "Type": "String",
      "Description": "The id of alarm task."
    }
  },
  "Resources": {
    "AlarmTaskEnable": {
      "Type": "ALIYUN::ESS::AlarmTaskEnable",
      "Properties": {
        "Enable": {
          "Ref": "Enable"
        },
        "AlarmTaskId": {
          "Ref": "AlarmTaskId"
        }
      }
    }
  },
  "Outputs": {}
}
```

5.5.2.3. ALIYUN::ESS::LifecycleHook

ALIYUN::ESS::LifecycleHook is used to create a lifecycle hook for a scaling group.

Syntax

```
{
  "Type": "ALIYUN::ESS::LifecycleHook",
  "Properties": {
    "LifecycleHookName": String,
    "NotificationArn": String,
    "HeartbeatTimeout": Integer,
    "NotificationMetadata": String,
    "ScalingGroupId": String,
    "DefaultResult": String,
    "LifecycleTransition": String
  }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
LifecycleHookName	String	No	Yes	The name of the lifecycle hook. Each lifecycle hook name must be unique within a scaling group.	<p>The name must be 2 to 40 characters in length and can contain letters, digits, underscores (_), hyphens (-), and periods (.). It must start with a letter or digit.</p> <p>The default name is the ID of the lifecycle hook.</p>
NotificationArn	String	No	Yes	The Alibaba Cloud Resource Name (ARN) of the notification target that Auto Scaling uses to notify you when an instance is in the transition state for the lifecycle hook.	<p>This target can be either an MNS queue or an MNS topic. The format of the parameter value is <code>acs:ess:{region}:{account-id}:{resource-relative-id}</code>.</p> <ul style="list-style-type: none"> <code>region</code> : the region where the scaling group resides. <code>account-id</code> : the ID of the Apsara Stack tenant account. <p>Examples:</p> <ul style="list-style-type: none"> MNS queue: <code>acs:ess:{region}:{account-id}:queue/{queueName}</code> MNS topic: <code>acs:ess:{region}:{account-id}:topic/{topicName}</code>

Property	Type	Required	Editable	Description	Constraint
HeartbeatTimeout	Integer	No	Yes	The waiting period before the lifecycle hook times out. When the lifecycle hook times out, the scaling group performs the action specified by the DefaultResult parameter. Unit: seconds.	Valid values: 30 to 21600. Default value: 600.
NotificationMetadata	String	No	Yes	The fixed string to include when Auto Scaling sends a notification about the wait state of a scaling activity. Auto Scaling sends the specified NotificationMetadata parameter value along with the notification message so that you can easily categorize notifications. The NotificationMetadata parameter is valid only after you set the NotificationArn parameter.	The parameter value cannot exceed 128 characters in length.
ScalingGroupId	String	Yes	No	The ID of the scaling group.	None
DefaultResult	String	No	Yes	The action that the scaling group takes when the lifecycle hook times out. If the scaling group has multiple lifecycle hooks and one of them is terminated when the DefaultResult parameter is set to ABANDON during a scale-in event, the remaining lifecycle hooks in the same scaling group will also be terminated. Otherwise, the scaling activity will proceed normally after the waiting period expires and continue with the action specified by the DefaultResult parameter.	Valid values: <ul style="list-style-type: none"> CONTINUE: The scaling group continues the scale-in or scale-out event. ABANDON: The scaling group releases the created ECS instances if the scaling activity type is scale-out or removes the ECS instances to be scaled in if the scaling activity type is scale-in. Default value: CONTINUE.

Property	Type	Required	Editable	Description	Constraint
----------	------	----------	----------	-------------	------------

LifecycleTransition	String	Yes	Yes	The type of scaling activity to which the lifecycle hook applies.	Valid values: <ul style="list-style-type: none"> SCALE_OUT: scale-out events of the scaling group. SCALE_IN: scale-in events of the scaling group.
---------------------	--------	-----	-----	---	--

Response parameters

Fn::GetAtt

LifecycleHookId: the ID of the lifecycle hook.

Examples

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Parameters": {
    "LifecycleHookName": {
      "Type": "String",
      "Description": "The name of the lifecycle hook. Each name must be unique within a scaling group. The name must be 2 to 40 characters in length and can contain letters, numbers, Chinese characters, and special characters including underscores (_), hyphens (-) and periods (.).\nDefault value: Lifecycle Hook ID",
      "AllowedPattern": "^[a-zA-Z0-9\\u4e00-\\u9fa5][-_a-zA-Z0-9\\u4e00-\\u9fa5]{1,63}$"
    },
    "NotificationArn": {
      "Type": "String",
      "Description": "The Alibaba Cloud Resource Name (ARN) of the notification target that Auto Scaling will use to notify you when an instance is in the transition state for the lifecycle hook. This target can be either an SNS queue or an M"
    }
  }
}
```

by you when an instance is in the transition state for the lifecycle hook. This target can be either an MNS queue or an MNS topic. The format of the parameter value is `acs:ess:{region}:{account-id}:{resource-relative-id}.\nregion: the region to which the scaling group locates\naccount-id: Alibaba Cloud ID\nFor example:\nMNS queue: acs:ess:{region}:{account-id}:queue/{queuename}\nMNS topic: acs:ess:{region}:{account-id}:topic/{topicname}`",

```
"AllowedPattern": "^acs:ess:([a-zA-Z0-9-]+):(\d+):(queue|topic)/([a-zA-Z0-9][a-zA-Z0-9-]{0,255})$",
```

```
"MaxLength": 300
```

```
},
```

```
"ScalingGroupId": {
```

```
"Type": "String",
```

```
"Description": "The ID of the scaling group."
```

```
},
```

```
"LifecycleTransition": {
```

```
"Type": "String",
```

"Description": "The scaling activities to which lifecycle hooks apply Value range:\n SCALE_OUT: scale-out event\n SCALE_IN: scale-in event",

      }
    }
  }
}

```

5.5.2.4. ALIYUN::ESS::ScalingConfiguration

ALIYUN::ESS::ScalingConfiguration is used to create a scaling configuration.

Syntax

```
{
  "Type": "ALIYUN::ESS::ScalingConfiguration",
  "Properties": {
    "PasswordInherit": Boolean,
    "DiskMappings": List,
    "RamRoleName": String,
    "IoOptimized": String,
    "InternetChargeType": String,
    "KeyPairName": String,
    "InstanceId": String,
    "InstanceTypes": List,
    "ImageId": String,
    "ResourceGroupId": String,
    "SpotStrategy": String,
    "InstanceType": String,
    "SystemDiskCategory": String,
    "SystemDiskSize": Integer,
    "InternetMaxBandwidthOut": Integer,
    "InstanceName": String,
    "InternetMaxBandwidthIn": Integer,
    "ScalingConfigurationName": String,
    "UserData": String,
    "DeploymentSetId": String,
    "SecurityGroupId": String,
    "SpotPriceLimit": Number,
    "HpcClusterId": String,
    "ScalingGroupId": String,
    "SpotPriceLimitForInstanceType": Map,
    "TagList": List
  }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	No	Yes	The ID of the resource group to which the instance belongs.	None
DeploymentSetId	String	No	No	The ID of the deployment set.	None

Property	Type	Required	Editable	Description	Constraint
HpcClusterId	String	No	No	The ID of the E-HPC cluster to which the instance belongs.	None
ScalingGroupId	String	Yes	No	The ID of the scaling group to which the scaling configuration belongs.	None
DiskMappings	List	No	No	The data disks to be attached to the instance.	A maximum of 16 data disks can be attached.
InternetChargeType	String	No	No	The billing method for Internet usage.	Valid values: PayByBandwidth and PayByTraffic. Default value: PayByTraffic
InternetMaxBandwidthIn	Integer	No	No	The maximum inbound bandwidth from the Internet. Unit: Mbit/s.	Valid values: 1 to 100. Default value: 100.
InternetMaxBandwidthOut	Integer	No	No	The maximum outbound bandwidth to the Internet. Unit: Mbit/s.	Valid values for the PayByBandwidth mode: 0 to 200. Default value: 0. Valid values for the PayByTraffic mode: 1 to 200. If you choose to use the PayByTraffic mode, you must specify this parameter.
InstanceId	String	No	No	The ID of the ECS instance whose properties are used to create the scaling configuration.	None
SystemDiskCategory	String	No	No	The type of the system disk.	Valid values: cloud, cloud_efficiency, cloud_ssd, and ephemeral_ssd.
ImageId	String	No	No	The ID of the image used to start the ECS instance. You can use a public image, custom image, or Alibaba Cloud Marketplace image.	N/A
InstanceType	String	No	No	The type of the ECS instance.	N/A

Property	Type	Required	Editable	Description	Constraint
SecurityGroupId	String	No	No	The ID of the security group to which the created instance belongs.	None
IoOptimized	String	No	No	Specifies whether the instance is I/O optimized.	Valid values: none (non-I/O optimized) and optimized (I/O optimized). Default value: none.
ScalingConfigurationName	String	No	No	The display name of the scaling configuration.	The name must be 2 to 40 characters in length and can contain letters, digits, underscores (_), hyphens (-), and periods (.). It must start with a letter or digit. This parameter must be unique in a scaling group. The default name is the ID of the scaling configuration.
KeyPairName	String	No	No	The name of the key pair that is used to connect to the ECS instance.	For Windows ECS instances, this parameter is ignored and is empty by default. The Password parameter takes effect even if the KeyPairName parameter is specified. However, Linux instances do not allow logon by password, and the KeyPairName value is used instead.
RamRoleName	String	No	No	The RAM role name of the instance.	You can call the ListRoles operation to query the role name.
SystemDiskSize	Integer	No	Yes	The size of the system disk. Unit: GB.	Valid values: 40 to 500. If a custom image is used to create a system disk, ensure that the size of the system disk is greater than that of the custom image.
UserData	String	No	No	The user data provided to create the ECS instance.	The user data can be up to 16 KB in size. You must convert the data into Base64-encoded strings. If the data contains special characters, add a backslash (\) immediately before each special character.

Property	Type	Required	Editable	Description	Constraint
InstanceTypes	List	No	No	The ECS instance types that can be used in a scaling group.	A maximum of 10 ECS instance types can be specified. If this parameter is specified, the InstanceType parameter is ignored.
PasswordInherit	Boolean	No	Yes	Specifies whether to use the preconfigured password of the specified image. To use this parameter, ensure that a password is configured for the specified image.	None
TagList	List	No	Yes	<p>The tags of the instance. Tags must be specified as key-value pairs. A maximum of 20 tags can be specified. The following rules apply to keys and values:</p> <ul style="list-style-type: none"> • A key can contain a maximum of 64 characters and cannot start with aliyun, http://, or https://. You cannot specify an empty string as a key. • A value can contain a maximum of 128 characters and cannot start with aliyun, http://, or https://. You can specify an empty string as a value. 	None
SpotStrategy	String	No	Yes	<p>The preemption policy for pay-as-you-go instances. Valid values:</p> <ul style="list-style-type: none"> • NoSpot: applies to regular pay-as-you-go instances. • SpotWithPriceLimit: applies to preemptible instances with a maximum hourly price. • SpotAsPriceGo: applies to pay-as-you-go instances priced at the market price at the time of purchase. <p>Default value: NoSpot.</p>	Valid values: NoSpot, SpotWithPriceLimit, and SpotAsPriceGo.

Property	Type	Required	Editable	Description	Constraint
InstanceName	String	No	Yes	The name of the instance created based on the current scaling configuration.	None
SpotPriceLimit	Number	No	Yes	The maximum hourly price for preemptible instance N. Valid values of N: 1 to 10. This parameter is valid only when the SpotStrategy parameter is set to SpotWithPriceLimit. A maximum of three decimal places can be specified. The default value of InstanceTypes can be overridden by the value of SpotPriceLimitForInstanceType.	None
SpotPriceLimitForInstanceType	Map	No	Yes	The instance type of preemptible instance N. Valid values of N: 1 to 10. This parameter is valid only when the SpotStrategy parameter is set to SpotWithPriceLimit. Example: { "key1": "value1", "key2": "value2", ... "key5": "value5" }. A key is an ECS instance type. A value can have a maximum of three decimal places.	None

DiskMappings syntax

```
"DiskMappings": [
  {
    "Category": String,
    "Device": String,
    "SnapshotId": String,
    "Size": String,
    "Encrypted": String,
    "KMSKeyId": String,
    "Description": String,
    "DiskName": String
  }
]
```

DiskMappings properties

Property	Type	Required	Editable	Description	Constraint
Size	String	Yes	No	The size of the data disk. Unit: GB.	None
Category	String	No	No	The type of the data disk.	Valid values: cloud, cloud_efficiency, cloud_ssd, and ephemeral_ssd.
DiskName	String	No	No	The name of the data disk.	The name must be 2 to 128 characters in length and can contain letters, digits, colons (:), underscores (_), and hyphens (-). It must start with a letter and cannot start with http:// or https://. This parameter is empty by default.
Description	String	No	No	The description of the data disk.	The description must be 2 to 256 characters in length and cannot start with http:// or https://.
Device	String	No	No	The device name of the data disk.	The system allocates a device name in alphabetical order from /dev/xvda to /dev/xvdz.
SnapshotId	String	No	No	The ID of the snapshot used to create the data disk.	None
Encrypted	String	No	No	Specifies whether to encrypt the data disk.	Default value: false.
KMSKeyId	String	No	No	The KMS key ID for the data disk.	None

TagList syntax

```
"TagList": [
  {
    "Value": String,
    "Key": String
  }
]
```

TagList properties

Property	Type	Required	Editable	Description	Constraint
Key	String	Yes	No	None	None

Property	Type	Required	Editable	Description	Constraint
Value	String	Yes	No	None	None

Response parameters

Fn::GetAtt

ScalingConfigurationId: the ID of the scaling configuration. This ID is a globally unique identifier (GUID) generated by the system.

Examples

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "ScalingConfiguration": {
      "Type": "ALIYUN::ESS::ScalingConfiguration",
      "Properties": {
        "ImageId": "ubuntu1404_64_20G_aliaegis_20150325.vhd",
        "InstanceType": "ecs.t1.small",
        "InstanceId": "i-25xhh****",
        "InternetChargeType": "PayByTraffic",
        "InternetMaxBandwidthIn": 1,
        "InternetMaxBandwidthOut": 20,
        "SystemDisk_Category": "cloud",
        "ScalingGroupId": "bwhtvpcBcKYac9fe3vd0****",
        "SecurityGroupId": "sg-25zwc****",
        "DiskMappings": [
          {
            "Size": 10
          },
          {
            "Category": "cloud",
            "Size": 10
          }
        ]
      }
    }
  },
  "Outputs": {
    "ScalingConfiguration": {
      "Value": {"get_attr": ["ScalingConfigurationId"]}
    }
  }
}
```

5.5.2.5. ALIYUN::ESS::ScalingGroup

ALIYUN::ESS::ScalingGroup is used to create a scaling group. A scaling group is a group of ECS instances that are dynamically scaled based on the configured scenario. A scaling group does not take effect immediately after being created. You must use ALIYUN::ESS::ScalingGroupEnable to enable the scaling group to trigger scaling rules and execute scaling activities.

Syntax

```
{
  "Type": "ALIYUN::ESS::ScalingGroup",
  "Properties": {
    "MultiAZPolicy": String,
    "DesiredCapacity": Integer,
    "NotificationConfigurations": List,
    "ProtectedInstances": List,
    "LaunchTemplateId": String,
    "LaunchTemplateVersion": String,
    "ScalingGroupName": String,
    "VSwitchIds": List,
    "DefaultCooldown": Integer,
    "MinSize": Integer,
    "GroupDeletionProtection": Boolean,
    "MaxSize": Integer,
    "Instanceld": String,
    "VSwitchId": String,
    "LoadBalancerIds": List,
    "StandbyInstances": List,
    "RemovalPolicys": List,
    "HealthCheckType": String,
    "DBInstancelds": List
  }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
----------	------	----------	----------	-------------	------------

Property	Type	Required	Editable	Description	Constraint
MinSize	Integer	Yes	Yes	The minimum number of ECS instances in the scaling group.	Valid values: 0 to 1000. When the number of ECS instances in the scaling group is less than the value of MinSize, Auto Scaling automatically creates ECS instances until the number of instances is equal to the value of MinSize.
MaxSize	Integer	Yes	Yes	The maximum number of ECS instances in the scaling group.	Valid values: 0 to 1000. When the number of ECS instances in the scaling group is greater than the value of MaxSize, Auto Scaling removes the ECS instances from the scaling group until the number of instances is equal to the value of MaxSize.

Property	Type	Required	Editable	Description	Constraint
ScalingGroupName	String	No	Yes	The display name of the scaling group.	<ul style="list-style-type: none"> The name must be 2 to 40 characters in length and can contain letters, digits, underscores (_), hyphens (-), and periods (.). It must start with a letter or digit. The name must be unique to an Alibaba Cloud account in a region. The default value is the ID of the scaling group.
LaunchTemplateId	String	No	Yes	The ID of the instance launch template from which the scaling group obtains launch configurations.	None
LaunchTemplateVersion	String	No	Yes	The version of the instance launch template.	Valid values: <ul style="list-style-type: none"> The fixed template version number. Default: The default template version is always used. Latest: The latest template version is always used.

Property	Type	Required	Editable	Description	Constraint
RemovalPolicys	List	No	Yes	The policies to remove ECS instances from the scaling group.	Default value: OldestScalingConfiguration or OldestInstance. Valid values: <ul style="list-style-type: none"> • OldestInstance: removes the ECS instance that is added to the scaling group at the earliest point in time. • NewestInstance: removes the ECS instance that is added to the scaling group at the latest point in time. • OldestScalingConfiguration: removes the ECS instance that is created based on the earliest scaling configuration.
VSwitchId	String	No	No	The ID of the VSwitch.	None
LoadBalancerIds	List	No	Yes	The IDs of the SLB instances.	This value can be a JSON array that contains up to five SLB instance IDs. Separate multiple IDs with commas (,).

Property	Type	Required	Editable	Description	Constraint
DefaultCooldown	Integer	No	Yes	The cooldown period after a scaling activity (adding or removing ECS instances) is executed.	<ul style="list-style-type: none"> Valid values: 0 to 86400. Unit: seconds. Default value: 300. During the cooldown period, the scaling group does not execute any other scaling activities triggered by CloudMonitor event-triggered tasks.
DBInstanceIds	List	No	Yes	The IDs of ApsaraDB for RDS instances.	This value can be a JSON array that contains up to eight RDS instance IDs. Separate multiple IDs with commas (,).
VSwitchIds	List	No	No	The IDs of VSwitches.	You can specify a maximum of five VSwitch IDs. If this parameter is specified, the VSwitchId parameter is ignored. VSwitches are sorted in descending order of priority. When an ECS instance cannot be created in the zone where the VSwitch with the highest priority resides, the system automatically uses the VSwitch with the next highest priority to create the ECS instance.
					Valid values: <ul style="list-style-type: none"> PRIORITY: ECS instances are

Property	Type	Required	Editable	Description	scaled based on the constraint on the
MultiAZPolicy	String	No	No	The ECS instance scaling policy for the multi-zone scaling group.	<p>specified VSwitch. When an ECS instance cannot be created in the zone where the VSwitch with the highest priority resides, the system automatically uses the VSwitch with the next highest priority to create the ECS instance.</p> <ul style="list-style-type: none"> • BALANCE: ECS instances are distributed evenly in multiple zones specified in the scaling group. • COST_OPTIMIZED: ECS instances are created based on the unit price of vCPUs, from low to high. Preemptible instances are created first when preemptible instance types are specified for the scaling configuration. Pay-as-you-go instances are created automatically when all types of preemptible instances are unavailable due to issues such as insufficient ECS resources.

Property	Type	Required	Editable	Description	Constraint
NotificationConfigurations	List	No	Yes	The notification configurations for event and resource changes.	None
ProtectedInstances	List	No	Yes	The number of protected ECS instances in the scaling group.	Maximum value: 1000.
StandbyInstances	List	No	Yes	The number of ECS instances that are in the standby state in the scaling group.	Maximum value: 1000.
HealthCheckType	String	No	Yes	The health check type.	Valid values: <ul style="list-style-type: none"> ECS NONE
GroupDeletionProtection	Boolean	No	Yes	Specifies whether to enable deletion protection for the scaling group.	Valid values: <ul style="list-style-type: none"> true: enables deletion protection for the scaling group. In this case, you cannot delete the scaling group. false: disables deletion protection for the scaling group. This is the default value.
DesiredCapacity	Integer	No	Yes	The expected number of ECS instances in the scaling group. The scaling group automatically keeps the number of ECS instances at the expected value.	The number of ECS instances must be greater than the value of MinSize and be less than the value of MaxSize.

Property	Type	Required	Editable	Description	Constraint
InstanceId	String	No	No	The ID of the ECS instance from which the scaling group obtains configuration information of the specified instance.	None

Response parameters

`Fn::GetAtt`

`ScalingGroupId`: the ID of the scaling group. This ID is a globally unique identifier (GUID) generated by the system.

Examples

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "ScalingGroup": {
      "Type": "ALIYUN::ESS::ScalingGroup",
      "Properties": {
        "MaxSize": 1,
        "MinSize": 1,
        # "ScalingGroupName": "HeatCreatedR****",
        # "DefaultCooldown": 500,
        # "RemovalPolicy_1": "",
        # "RemovalPolicy_2": "",
      }
    }
  },
  "Outputs": {
    "ScalingGroup": {
      "Value": {"Fn::GetAtt": ["ScalingGroup", "ScalingGroupId"]}
    }
  }
}
```

5.5.2.6. ALIYUN::ESS::ScalingGroupEnable

`ALIYUN::ESS::ScalingGroupEnable` is used to enable a scaling group.

Syntax

```

{
  "Type": "ALIYUN::ESS::ScalingGroupEnable",
  "Properties": {
    "ScalingConfigurationId": String,
    "ScalingRuleArisExecuteVersion": Integer,
    "ScalingRuleAris": List,
    "ScalingGroupId": String,
    "RemoveInstanceIds": List,
    "InstanceIds": List
  }
}

```

Properties

Property	Type	Required	Editable	Description	Constraint
ScalingGroupId	String	Yes	No	The ID of the scaling group.	None
ScalingConfigurationId	String	No	No	The ID of the scaling configuration to be activated in the scaling group.	None
InstanceIds	List	No	Yes	The IDs of ECS instances to be added to the enabled scaling group.	A maximum of 20 instance IDs can be specified.
ScalingRuleArisExecuteVersion	Integer	No	Yes	The version of the identifier for the scaling rule to be executed. If you change this property, all scaling rules specified by ScalingRuleAris will be executed once.	Minimum value: 0.
ScalingRuleAris	List	No	Yes	The unique identifiers of scaling rules in the scaling group. Invalid unique identifiers are not displayed in the query results and no errors are reported.	A maximum of 10 scaling rule identifiers can be specified.

Property	Type	Required	Editable	Description	Constraint
RemoveInstanceIds	List	No	Yes	The IDs of ECS instances to be deleted.	A maximum of 1,000 instance IDs can be specified.

Response parameters

Fn::GetAtt

- **LifecycleState**: the status of the scaling group.
- **ScalingInstances**: the instances that are automatically created in the scaling group.
- **ScalingGroupId**: the ID of the scaling group.
- **ScalingRuleArisExecuteResultInstancesRemoved**: the instances that are removed from the scaling group by executing the scaling rules specified by **ScalingRuleAris**.
- **ScalingRuleArisExecuteResultNumberOfAddedInstances**: the number of instances that are added to the scaling group by executing the scaling rules specified by **ScalingRuleAris**.
- **ScalingInstanceDetails**: the instance scaling details.
- **ScalingRuleArisExecuteErrorInfo**: the error information about the execution of the scaling rules specified by **ScalingRuleAris**.
- **ScalingRuleArisExecuteResultInstancesAdded**: the instances that are added to the scaling group by executing the scaling rules specified by **ScalingRuleAris**.

Examples

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "ScalingGroupEnable": {
      "Type": "ALIYUN::ESS::ScalingGroupEnable",
      "Properties": {
        "ScalingGroupId": "r0HUqbj411cc2eQw8bU****",
        "ScalingConfigurationId": "bjLLfdexm77Ldsyptme1****",
        "InstanceIds": ""
      }
    }
  },
  "Outputs": {
    "ScalingGroupEnable": {
      "Value": {"Fn::GetAtt": ["ScalingGroupEnable", "LifecycleState"]}
    }
  }
}
```

5.5.2.7. ALIYUN::ESS::ScalingRule

ALIYUN::ESS::ScalingRule is used to create a scaling rule.

Syntax

```
{
  "Type": "ALIYUN::ESS::ScalingRule",
  "Properties": {
    "AdjustmentValue": Integer,
    "Cooldown": Integer,
    "ScalingGroupId": String,
    "AdjustmentType": String,
    "ScalingRuleName": String
  }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
AdjustmentValue	Integer	No	Yes	<p>The number of ECS instances to add or release when scaling occurs.</p> <p>The number of ECS instances to be adjusted in a single scaling activity cannot exceed 500.</p>	<p>Valid values in different adjustment modes:</p> <ul style="list-style-type: none"> QuantityChangeInCapacity: -500 to 500. PercentChangeInCapacity: -100 to 10000. TotalCapacity: 0 to 1000.
Cooldown	Integer	No	Yes	The cooldown period of the scaling rule. Unit: seconds.	<p>Valid values: 0 to 86400.</p> <p>This parameter is empty by default.</p>
ScalingGroupId	String	Yes	No	The ID of the scaling group to which the scaling rule belongs.	None
AdjustmentType	String	Yes	Yes	The adjustment mode of the scaling rule.	<p>Valid values:</p> <ul style="list-style-type: none"> QuantityChangeInCapacity: adds or removes a specified number of ECS instances. PercentChangeInCapacity: adds or removes a specified proportion of ECS instances. TotalCapacity: adds or removes ECS instances to ensure that the current scaling group has a specified number of ECS instances.

Property	Type	Required	Editable	Description	Constraint
ScalingRuleName	String	No	Yes	The display name of the scaling rule.	<p>The name must be 2 to 40 characters in length and can contain letters, digits, underscores (_), hyphens (-), and periods (.). It must start with a letter or digit. The name of a scaling rule must be unique within the scaling group that it belongs to.</p> <p>The default value is the ID of the scaling rule.</p>

Response parameters

Fn::GetAtt

- ScalingRuleAri: the unique identifier of the scaling rule.
- ScalingRuleId: the ID of the scaling rule. It is a globally unique identifier (GUID) generated by the system.

Examples

```
{

5.5.2.8. ALIYUN::ESS::ScheduledTask

ALIYUN::ESS::ScheduledTask is used to create a scheduled task based on input parameters.

Syntax

```

{
  "Type": "ALIYUN::ESS::ScheduledTask",
  "Properties": {
    "TaskEnabled": Boolean,
    "Description": String,
    "ScheduledTaskName": String,
    "LaunchExpirationTime": Integer,
    "LaunchTime": String,
    "RecurrenceEndTime": String,
    "RecurrenceType": String,
    "RecurrenceValue": String,
    "ScheduledAction": String
  }
}

```

Properties

Property	Type	Required	Editable	Description	Constraint
TaskEnabled	Boolean	No	Yes	Specifies whether to start the scheduled task. <ul style="list-style-type: none"> true: starts the scheduled task. false: stops the scheduled task. Default value: true.	None
Description	String	No	Yes	The description of the scheduled task.	The description must be 2 to 200 characters in length.

Property	Type	Required	Editable	Description	Constraint
ScheduledTaskName	String	No	Yes	The display name of the scheduled task.	<p>The name must be 2 to 40 characters in length and can contain letters, digits, underscores (_), hyphens (-), and periods (.). It must start with a letter or digit.</p> <p>This parameter must be unique in a region and under an Apsara Stack tenant account.</p> <p>The default value is the ID of the scheduled scaling task.</p>
LaunchExpirationTime	Integer	No	Yes	<p>The time period during which a failed scheduled task is retried.</p> <p>Unit: seconds. Default value: 600.</p>	Valid values: 0 to 21600.
LaunchTime	String	Yes	Yes	<p>The time at which the scheduled task is triggered.</p> <p>Specify the time in the ISO 8601 standard in the YYYY-MM-DDThh:mmZ format. The time must be in UTC.</p> <p>If the RecurrenceType parameter is specified, the task is executed each day at the time specified by LaunchTime.</p> <p>If the RecurrenceType parameter is not specified, the task is only executed once at the date and time specified by LaunchTime.</p> <p>You cannot enter a point in time later than 90 days from the date of scheduled task creation or modification.</p>	None

Property	Type	Required	Editable	Description	Constraint
RecurrenceEndTime	String	No	Yes	<p>The end time after which the scheduled task will not be repeated.</p> <p>Specify the time in the ISO 8601 standard in the YYYY-MM-DDThh:mmZ format. The time must be in UTC.</p> <p>You cannot enter a point in time later than 90 days from the date of scheduled task creation or modification.</p> <p>If you set RecurrenceEndTime, you must also set both RecurrenceType and RecurrenceValue.</p>	None
RecurrenceType	String	No	Yes	<p>The interval that the scheduled task is repeated at.</p>	<p>Valid values:</p> <ul style="list-style-type: none"> • Daily: The scheduled task is executed once every specified number of days. • Weekly: The scheduled task is executed on each specified day of a week. • Monthly: The scheduled task is executed on each specified day of a month. • Cron: The scheduled task is executed based on the specified Cron expression. <p>If you set RecurrenceType, you must also set both RecurrenceEndTime and RecurrenceValue.</p>

Property	Type	Required	Editable	Description	Constraint
RecurrenceValue	String	No	Yes	Specifies how often the scheduled task recurs.	<ul style="list-style-type: none"> • Daily: indicates the interval of days that the scheduled task is repeated on. You can enter a single value ranging from 1 to 31. • Weekly: indicates which days of the week that the scheduled task is repeated on. You can enter multiple values separated by commas (.). The values 0 to 6 correspond to the days of the week in sequence from Sunday to Saturday. • Monthly: indicates which days of the month that the scheduled task is repeated on. You can enter two values ranging from 1 to 31. The format is A-B. B must be greater than or equal to A. • Cron: indicates a user-defined Cron expression that the scheduled task is repeated on. A Cron expression is written in UTC time and consists of five fields: minute, hour, day of month (date), month, and day of week. The expression can contain wildcard characters including commas (,), question marks (?), hyphens (-), asterisks (*), number signs (#), forward slashes (/), and the L and W characters. <p>If you set RecurrenceValue, you must also set both RecurrenceEndTime and RecurrenceType.</p>
ScheduledAction	String	Yes	Yes	<p>The operations to be performed when the scheduled task is triggered.</p> <p>When you set this parameter, you must also enter the unique identifier of the scaling rule.</p>	<p>The parameter value can be up to 200 characters in length.</p>

Response parameters

Fn::GetAtt

ScheduledTaskId: the ID of the scheduled task. This ID is a globally unique identifier (GUID) generated by the system.

Examples

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "ScheduledTask": {
      "Type": "ALIYUN::ESS::ScheduledTask",
      "Properties": {
        "TaskEnabled": "true",
        "Description": "scheduledtask",
        "ScheduledTaskName": "task1",
        "LaunchTime": "2014-08-17T16:52Z",
        "RecurrenceEndTime": "2014-08-17T16:55Z",
        "RecurrenceType": "Daily",
        "RecurrenceValue": "1",
        "ScheduledAction": "ari:acs:ess:cn-qingdao:1344371:scalingRule/cCBpdYdQuBe2cUxOdu6piOk"
      }
    }
  },
  "Outputs": {
    "ScheduledTaskId": {
      "Value": {
        "FN::GetAtt": [
          "ScheduledTask",
          "ScheduledTaskId"
        ]
      }
    }
  }
}
```

5.5.3. OSS

5.5.3.1. ALIYUN::OSS::Bucket

ALIYUN::OSS::Bucket is used to create an OSS bucket.

Syntax

```
{
  "Type": "ALIYUN::OSS::Bucket",
  "Properties": {
    "AccessControl": String,
    "RefererConfiguration": Map,
    "ServerSideEncryptionConfiguration": Map,
    "CORSConfiguration": Map,
    "Tags": Map,
    "LoggingConfiguration": Map,
    "LifecycleConfiguration": Map,
    "StorageClass": String,
    "DeletionForce": Boolean,
    "WebsiteConfiguration": Map,
    "Policy": Map,
    "BucketName": String
  }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
BucketName	String	Yes	No	The name of the bucket.	<ul style="list-style-type: none"> The name must be 3 to 63 characters in length and can contain lowercase letters, digits, and hyphens (-). It must start and end with a lowercase letter or digit.
AccessControl	String	No	No	The access control policy.	Valid values: private, public-read, and public-read-write.
CORSConfiguration	Map	No	No	The configuration of cross-origin resource sharing for objects in the bucket.	None
LifecycleConfiguration	Map	No	No	The lifecycle configuration for objects in the bucket.	None
LoggingConfiguration	Map	No	No	The logging configuration.	None
RefererConfiguration	Map	No	No	The hotlinking protection configuration.	None

Property	Type	Required	Editable	Description	Constraint
DeletionForce	Boolean	No	No	Specifies whether to forcibly delete objects from an OSS bucket	Valid values: <ul style="list-style-type: none"> true false Default value: false.
WebsiteConfiguration	Map	No	No	The information used to configure the bucket as a static website.	None
ServerSideEncryptionConfiguration	Map	No	No	The server-side encryption rules.	None
Tags	Map	No	No	The tags of the bucket. Tags exist as key-value pairs.	<ul style="list-style-type: none"> A maximum of 20 tags can be specified. A tag key must be 1 to 64 bytes in length and cannot start with <code>http://</code>, <code>https://</code>, or <code>Aliyun</code>. A tag value can be up to 128 bytes in length and must be encoded in UTF-8.
StorageClass	String	No	No	The type of the bucket.	Valid values: Standard, IA, and Archive.
Policy	Map	No	No	The bucket policy configuration.	None

CORSConfiguration syntax

```
"CORSConfiguration": {
  "CORSRule": [
    {
      "AllowedHeader": String,
      "AllowedMethod": List,
      "AllowedOrigin": List,
      "ExposeHeader": List,
      "MaxAgeSeconds": Integer
    }
  ]
}
```

CORSConfiguration properties

Property	Type	Required	Editable	Description	Constraint
----------	------	----------	----------	-------------	------------

Property	Type	Required	Editable	Description	Constraint
CORSRule	List	No	No	The rules that define cross-origin resource sharing of objects in the bucket.	None
AllowedHeader	String	No	No	The allowed cross-origin request headers.	Valid values: *, Cache-Control, Content-Language, Content-Type, Expires, Last-Modified, and Pragma.
AllowedMethod	List	No	No	The allowed cross-origin request methods.	Valid values: *, GET, PUT, POST, DELETE, and HEAD.
AllowedOrigin	List	No	No	The origins from which cross-origin requests are allowed.	None
ExposeHeader	List	No	No	The response headers for allowed access requests from applications.	Asterisks (*) cannot be used as wildcard characters.
MaxAgeSeconds	Integer	No	No	The period of time that the browser can cache the response of a preflight (OPTIONS) request to a specific resource.	None

LifecycleConfiguration syntax

```

"LifecycleConfiguration": {
  "Rule": [
    {
      "ID": String,
      "Prefix": String,
      "Status": String,
      "Expiration": Map,
      "AbortMultipartUpload": Map
    }
  ]
}

```

LifecycleConfiguration properties

Property	Type	Required	Editable	Description	Constraint
Rule	List	No	No	The lifecycle rule.	None
ID	String	No	No	The unique ID of the rule.	The ID can be up to 255 characters in length. When this parameter is empty or not specified, OSS generates a unique rule ID.
Prefix	String	No	No	The prefix to which the rule applies.	The rule takes effect only on objects that have a matching prefix.
Status	String	No	No	Specifies whether to enable or disable the rule.	Valid values: Enable and Disable.
Expiration	Map	No	No	The expiration attributes of the rule for the specified object.	None

Property	Type	Required	Editable	Description	Constraint
AbortMultipartUpload	Map	No	No	The expiration attributes of the multipart upload tasks that are not complete.	None

Expiration syntax

```
"Expiration":{
  "Days": Number,
  "CreatedBeforeDate": String
}
```

Expiration properties

Property	Type	Required	Editable	Description	Constraint
Days	Number	No	No	The number of days since the object was last modified after which the rule will take effect.	When the number of days since the object was last modified exceeds the specified number of days, the object is deleted. If you set the Days parameter to 30, objects that were last modified on January 1, 2016 are deleted by the backend application on January 31, 2016.
CreatedBeforeDate	String	No	No	The date before which the rule takes effect.	Specify the time in the ISO 8601 standard. The time must be UTC 00:00. Example: 2002-10-11T00:00:00.000Z.

AbortMultipartUpload syntax

```
"AbortMultipartUpload": {
  "CreatedBeforeDate": String,
  "Days": Number
}
```

AbortMultipartUpload properties

Property	Type	Required	Editable	Description	Constraint
----------	------	----------	----------	-------------	------------

Property	Type	Required	Editable	Description	Constraint
Days	Number	No	No	The number of days since the object was last modified after which the rule will take effect.	When the number of days since the object was last modified exceeds the specified number of days, the object is deleted. If you set the Days parameter to 30, objects that were last modified on January 1, 2016 are deleted by the backend application on January 31, 2016.
CreatedBeforeDate	String	No	No	The date before which the rule takes effect.	Specify the time in the ISO 8601 standard. The time must be UTC 00:00. Example: 2002-10-11T00:00:00.000Z.

LoggingConfiguration syntax

```
"LoggingConfiguration": {
  "TargetBucket": String,
  "TargetPrefix": String
}
```

LoggingConfiguration properties

Property	Type	Required	Editable	Description	Constraint
TargetBucket	String	No	No	The storage space for storing access logs.	None
TargetPrefix	String	No	No	The prefix of the names of saved access log files.	None

WebsiteConfiguration syntax

```
"WebsiteConfiguration":{
  "IndexDocument": String,
  "ErrorDocument": String
}
```

WebsiteConfiguration properties

Property	Type	Required	Editable	Description	Constraint
IndexDocument	String	No	No	The default homepage for a static website.	None

Property	Type	Required	Editable	Description	Constraint
ErrorDocument	String	No	No	The default error page for a static website.	None

RefererConfiguration syntax

```
"RefererConfiguration":{
  "AllowEmptyReferer": String,
  "RefererList": List
}
```

RefererConfiguration properties

Property	Type	Required	Editable	Description	Constraint
AllowEmptyReferer	String	No	No	Specifies whether the Referer field can be left empty in an access request.	None
RefererList	List	No	No	The referer whitelist. OSS allows requests whose Referer field values are in the referer whitelist.	None

ServerSideEncryptionConfiguration syntax

```
"ServerSideEncryptionConfiguration":{
  "KMSMasterKeyID": String,
  "SSEAlgorithm": String
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
KMSMasterKeyID	String	No	No	The ID of the customer master key.	The key ID is required only when the SSEAlgorithm value is KMS and the specified key is used for encryption.
SSEAlgorithm	String	Yes	No	The default server-side encryption method.	Valid values: KMS and AES256.

Response parameters

Fn::GetAtt

- **Name:** the bucket name, which must be globally unique.
- **DomainName:** the public domain name of the specified bucket.

- `InternalDomainName`: the internal domain name of the specified bucket.

Examples

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {

```

5.5.4. RDS

5.5.4.1. ALIYUN::RDS::Account

ALIYUN::RDS::Account is used to create a database management Account.

Statement

```

{
  "Type": "ALIYUN::RDS::Account",
  "Properties": {
    "AccountDescription": String,
    "DBInstanceId": String,
    "AccountPassword": String,
    "AccountType": String,
    "AccountName": String
  }
}

```

Properties

Parameter	Type	Required	Editable	Description	Constraint
AccountDescription	String	Yes	True	The description of the account.	The name must be 2 to 256 characters in length. It can contain digits, letters, underscores (_), and hyphens (-); but must start with a letter.
DBInstanceId	String	No	No	The ID of the RDS instance.	None
AccountPassword	String	No	No	The password of the database account.	The password must be 8 to 32 characters in length.

Parameter	Type	Required	Editable	Description	Constraint
AccountType	String	Yes	Released	The type of the database account.	Valid values: <ul style="list-style-type: none"> Normal: indicates a standard account. Super: indicates a privileged account. Default value: Normal.
AccountName	String	No	No	The name of the database account.	Valid values: 1025 to 10000. You cannot use the following commonly used port numbers: 2222, 4500, 4510, 4560, 7505, 9000, 9001, and 9002.

Response parameters

Fn::GetAtt

AccountName: the name of the database account.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "Account": {
      "Type": "ALIYUN::RDS::Account",
      "Properties": {
        "AccountDescription": {
          "Ref": "AccountDescription"
        },
        "DBInstanceId": {
          "Ref": "DBInstanceId"
        },
        "AccountPassword": {
          "Ref": "AccountPassword"
        },
        "AccountType": {
          "Ref": "AccountType"
        },
        "AccountName": {
          "Ref": "AccountName"
        }
      }
    }
  }

    }
  }
}
}
}

```

5.5.4.2. ALIYUN::RDS::AccountPrivilege

ALIYUN::RDS::AccountPrivilege is used to grant database access permissions to accounts.

Statement

```
{
  "Type": "ALIYUN::RDS::AccountPrivilege",
  "Properties": {
    "AccountPrivilege": String,
    "DBInstancedId": String,
    "DBName": String,
    "AccountName": String
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
-----------	------	----------	----------	-------------	------------

Parameter	Type	Required	Editable	Description	Constraint
AccountPrivilege	String	No	Yes	The permissions of the database account.	<p>Valid values:</p> <ul style="list-style-type: none"> • ReadWrite: has read and write permissions on the database. • ReadOnly: The account has read-only permission on the database. • DDLOnly: The account can run only data definition language (DDL) commands in the database. This is applicable to MySQL and MariaDB. • DMLOnly: The account can run only data manipulation language (DML) commands in the database. This is applicable to MySQL and MariaDB. • DBOwner: The account has full permissions on the database. This is applicable to SQL Server.
DBInstanceId	String	No	No	The ID of the RDS instance.	None
DBName	String	No	No	The name of the database.	None

Parameter	Type	Required	Editable	Description	Constraint
AccountName	String	No	No	The name of the account.	Valid values: 1025 to 10000. You cannot use the following commonly used port numbers: 2222, 4500, 4510, 4560, 7505, 9000, 9001, and 9002.

5.5.4.3. ALIYUN::RDS::DBInstance

ALIYUN::RDS::DBInstance is used to create an ApsaraDB for RDS instance.

Syntax

```
{
  "Type": "ALIYUN::RDS::DBInstance",
  "Properties": {
    "Engine": String,
    "MultiAZ": Boolean,
    "VpcId": String,
    "DBMappings": List,
    "DBInstanceDescription": String,
    "ConnectionMode": String,
    "MasterUsername": String,
    "MasterUserPassword": String,
    "ZonId": String,
    "DBInstanceNetType": String,
    "DBInstanceStorage": Integer,
    "VSwitchId": String,
    "AllocatePublicConnection": Boolean,
    "EngineVersion": String,
    "PreferredBackupTime": String,
    "DBInstanceClass": String,
    "SecurityIPList": String,
    "BackupRetentionPeriod": Integer,
    "PrivateIpAddress": String,
    "PreferredBackupPeriod": List,
    "PeriodType": String,
    "PayType": String,
    "Period": Integer,
    "ResourceGroupId": String
  }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	No	No	The ID of the resource group.	None
Engine	String	Yes	No	The type of the database	Valid values: <ul style="list-style-type: none"> MySQL SQLServer PostgreSQL PPAS

Property	Type	Required	Editable	Description	Constraint
DBInstanceStorage	Integer	Yes	Yes	The storage capacity of the instance.	<ul style="list-style-type: none"> Valid values when Engine is set to MySQL: 5 to 1000. Valid values when Engine is set to SQLServer: 10 to 1000. Valid values when Engine is set to PostgreSQL: 5 to 2000. Valid values when Engine is set to PPAS: 5 to 2000. Unit: GB. <div style="border: 1px solid #add8e6; padding: 5px; margin-top: 10px;"> ⓘ Note This value must be in 5 GB increments. </div>
EngineVersion	String	Yes	No	The engine version of the database.	Valid values: <ul style="list-style-type: none"> When Engine is set to MySQL, the valid values are 5.5, 5.6, 5.7, and 8.0. When Engine is set to SQLServer, set the value to 2008r2. When Engine is set to PostgreSQL, set the value to 9.4. When Engine is set to PPAS, set the value to 9.3.
DBInstanceClasses	String	Yes	Yes	The type of the instance.	Valid values: <ul style="list-style-type: none"> rds.mys2.large rds.mss1.large rds.pg.s1.small
SecurityIPList	String	Yes	Yes	The whitelist of IP addresses that are allowed to access all databases in the instance.	<ul style="list-style-type: none"> Separate multiple IP addresses with commas (.). Each IP address in the whitelist must be unique. A maximum of 1,000 IP addresses can be specified. The 0.0.0.0/0 format is supported. You can specify IP addresses in the 10.23.XX.XX format and CIDR blocks in the 10.23.XX.XX/24 format. In 10.23.XX.XX/24, /24 indicates the length of the prefix in the CIDR block, and a prefix can be 1 to 32 characters in length. 0.0.0.0/0 indicates that no access restriction is applied.
MultiAZ	Boolean	No	No	Specifies whether the instance can be deployed in multiple zones.	None
VpcId	String	No	No	The ID of the VPC.	None

Property	Type	Required	Editable	Description	Constraint
DBMappings	List	No	No	The list of databases created in the instance.	None
DBInstanceDescription	String	No	No	The description or remarks of the instance.	<ul style="list-style-type: none"> The description must be 2 to 256 characters in length and can contain letters, digits, underscores (_), and hyphens (-). It must start with a letter but cannot start with <code>http://</code> or <code>https://</code>.
ConnectionMode	String	No	No	The database connection mode.	Valid values: <ul style="list-style-type: none"> Performance: standard connection mode Safety: safe connection mode If this parameter is not specified, the connection mode assigned by the system is used by default.
MasterUsername	String	No	No	The name for the primary account of the instance.	The name must be unique. The name cannot exceed 16 characters in length and can contain letters, digits, and underscores (_). It must start with a letter.
MasterUserPassword	String	No	No	The password for the primary account of the instance.	The password must be 6 to 32 characters in length and can contain letters, digits, and underscores (_).
ZoneId	String	No	No	The ID of the zone.	None
DBInstanceNetType	String	No	No	The network type of the instance.	Default value: Intranet. Valid value: <ul style="list-style-type: none"> Internet Intranet
VSwitchId	String	No	No	The ID of the VSwitch that is connected to the specified VPC.	None
AllocatePublicConnection	Boolean	No	No	Specifies whether to apply for a public endpoint for the instance.	None

Property	Type	Required	Editable	Description	Constraint
PreferredBackupTime	String	No	No	The backup time.	<ul style="list-style-type: none"> Specify the time in the <code>HH:mmZ- HH:mmZ</code> format. Valid values: 00:00Z-01:00Z, 01:00Z-02:00Z, 02:00Z-03:00Z, 03:00Z-04:00Z, 04:00Z-05:00Z, 05:00Z-06:00Z, 06:00Z-07:00Z, 07:00Z-08:00Z, 08:00Z-09:00Z, 09:00Z-10:00Z, 10:00Z-11:00Z, 11:00Z-12:00Z, 12:00Z-13:00Z, 13:00Z-14:00Z, 14:00Z-15:00Z, 15:00Z-16:00Z, 16:00Z-17:00Z, 17:00Z-18:00Z, 18:00Z-19:00Z, 19:00Z-20:00Z, 20:00Z-21:00Z, 21:00Z-22:00Z, 22:00Z-23:00Z, and 23:00Z-24:00Z.
BackupRetentionPeriod	Number	No	No	The number of days for which backup files can be retained.	Valid values: 7 to 30. Unit: days. Default value: 7.
PrivateIpAddress	String	No	No	The private IP address of the instance on the specified VSwitch.	If this parameter is not specified, the system automatically allocates a private IP address.
PreferredBackupPeriod	List	No	No	The backup periods.	Valid values: <ul style="list-style-type: none"> Monday Tuesday Wednesday Thursday Friday Saturday Sunday
MasterUserType	String	No	No	The type of the primary account.	Default value: Normal. Valid values: <ul style="list-style-type: none"> Normal Super
Tags	Map	No	Yes	The list of tags. Each tag consists of a TagKey and a TagValue.	<ul style="list-style-type: none"> The TagKey is required and the TagValue is optional. Format example: <code>{"key1": "value1", "key2": ""}</code>.
PeriodType	String	No	No	The subscription period type.	Default value: Month. Valid values: <ul style="list-style-type: none"> Month Year

Property	Type	Required	Editable	Description	Constraint
PayType	String	No	No	The billing method of the instance.	Valid values: <ul style="list-style-type: none"> PostPaid: pay-as-you-go PrePaid: subscription
Period	Integer	No	No	The subscription period of the instance.	<ul style="list-style-type: none"> Valid values when the PeriodType parameter is set to Year: 1 to 3. Valid values when the PeriodType parameter is set to Month: 1 to 9.

DBMappings syntax

```
"DBMappings": [
{
  "DBDescription": String,
  "CharacterSetName": String,
  "DBName": String
}
]
```

DBMappings properties

Property	Type	Required	Editable	Description	Constraint
CharacterSetName	String	Yes	No	The character set.	<ul style="list-style-type: none"> Valid values when Engine is set to MySQL: <ul style="list-style-type: none"> utf8 gbk latin1 utf8mb4 (applicable to versions 5.5 and 5.6) Valid values when Engine is set to SQLServer: <ul style="list-style-type: none"> Chinese_PRC_CI_AS Chinese_PRC_CS_AS SQL_Latin1_General_CP1_CI_AS SQL_Latin1_General_CP1_CS_AS Chinese_PRC_BIN
DBName	String	Yes	No	The name of the database.	<p>The name must be unique.</p> <p>The name can be up to 64 characters in length and can contain letters, digits, and underscores (_). It must start with a letter.</p>

Property	Type	Required	Editable	Description	Constraint
DBDescription	String	No	No	The description of the database.	<ul style="list-style-type: none"> The description must be 2 to 256 characters in length and can contain letters, digits, underscores (_), and hyphens (-). It must start with a letter but cannot start with <code>http://</code> or <code>https://</code>.

Response parameters

Fn::GetAtt

- **DBInstanceId:** the ID of the RDS instance.
- **InnerPort:** the internal port of the RDS instance.
- **InnerIPAddress:** the internal IP address of the RDS instance.
- **InnerConnectionString:** the internal endpoint of the RDS instance.
- **PublicPort:** the public port of the RDS instance.
- **PublicConnectionString:** the public endpoint of the RDS instance.
- **PublicIPAddress:** the public IP address of the RDS instance.

Examples

The following example demonstrates how to create an ApsaraDB for RDS instance in the classic network:

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "Database": {
      "Type": "ALIYUN::RDS::DBInstance",
      "Properties": {
        "Engine": "MySQL",
        "EngineVersion": "5.6",
        "DBInstanceClass": "rds.mysql.t1.small",
        "DBInstanceStorage": 10,
        "DBInstanceNetType": "Internet",
        "SecurityIPList": "0.0.0.0/0",
        "MasterUsername": "A****",
        "DBMappings": [{
          "DBName": "hope",
          "CharacterSetName": "utf8"
        }]
      }
    }
  },
  "Outputs": {
    "DBInstanceId": {
      "Value": {"get_attr": ["DBInstanceId"]}
    },
    "PublicConnectionString": {
      "Value": {"get_attr": ["ConnectionString"]}
    },
    "PublicPort": {
      "Value": {"get_attr": ["Port"]}
    }
  }
}
```

The following example demonstrates how to create an ApsaraDB for RDS instance in a VPC:

```

{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "Database": {
      "Type": "ALIYUN::RDS::DBInstance",
      "Properties": {
        "Engine": "MySQL",
        "EngineVersion": "5.6",
        "DBInstanceClass": "rds.mys2.small",
        "DBInstanceStorage": "10",
        "DBInstanceNetType": "Intranet",
        "SecurityIPList": "0.0.0.0/0",
        "VSwitchId": "tvt",
        "VpcId": "myvp****"
      }
    }
  },
  "Outputs": {
    "DBInstanceId": {
      "Value": {"get_attr": ["DBInstanceId"]}
    },
    "InnerConnectionString": {
      "Value": {"get_attr": ["ConnectionString"]}
    },
    "InnerPort": {
      "Value": {"get_attr": ["Port"]}
    }
  }
}

```

5.5.4.4. ALIYUN::RDS::DBInstanceParameterGroup

ALIYUN::RDS::DBInstanceParameterGroup is used to modify the parameter list of an apsaradb for RDS instance.

Statement

```

{
  "Type": "ALIYUN::RDS::DBInstanceParameterGroup",
  "Properties": {
    "Forcerestart": String,
    "DBInstanceId": String,
    "Parameters": List
  }
}

```

Properties

Parameter	Type	Required	Editable	Description	Constraint
DBInstanceid	String	No	No	The ID of the ApsaraDB RDS instance to query.	None
Parameters	List	Yes	No	parameter.	Parameters in JSON format and their values. Example: { "auto_increment_increment": "1" ,"character_set_client": "utf8" }
Forcerestart	String	Yes	Released	Specifies whether to force a restart of the ApsaraDB for RDS instance.	Valid values: <ul style="list-style-type: none"> • true: specifies to forcibly restart the database. • false: Do not force restart Default value: false.

Response parameters

Fn::GetAtt

None

Sample request

```

{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "Database": {
      "Type": "ALIYUN::RDS::DBInstance",
      "Properties": {
        "Engine": "MySQL",
        "EngineVersion": "5.6",
        "DBInstanceClass": "rds.mys2.small",
        "DBInstanceStorage": "10",
        "DBInstanceNetType": "Intranet",
        "SecurityIPList": "0.0.0.0/0"
      }
    },
    "DatabaseConfig": {
      "Type": "ALIYUN::RDS::DBInstanceParameterGroup",
      "Properties": {
        "DBInstanceId": {
          "Ref": "Database"
        },
        "Parameters": [
          {
            "Key": "auto_increment_increment",
            "Value": "xxx"
          }
        ]
      }
    }
  },
  "Outputs": {
    "DBInstanceId": {
      "Value": {
        "Fn::GetAtt": [
          "Database",
          "DBInstanceId"
        ]
      }
    }
  }
}

```

5.5.4.5. ALIYUN::RDS::DBInstanceSecurityIps

ALIYUN::RDS::DBInstanceSecurityIps is used to modify the instance whitelist.

Statement

```
{
  "Type": "ALIYUN::RDS::DBInstanceSecurityIps",
  "Properties": {
    "DBInstanceID": String,
    "DBInstanceIPArrayName": String,
    "DBInstanceIPArrayAttribute": String
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
DBInstanceID	String	No	No	The ID of the RDS instance.	None
DBInstanceIPArrayAttribute	String	No	Yes	The attribute of the IP address whitelist.	The console does not display groups labeled with hidden.
DBInstanceIPArrayName	String	Yes	Released	The name of the IP address whitelist.	The name can contain only lowercase letters and underscores (_). Default value: Default.

Response parameters

Fn::GetAtt

SecurityIps: the IP address whitelist after the modification.

Sample request

```

          "SecurityIps"
        ]
      }
    }
  }
}

```

5.5.4.6. ALIYUN::RDS::PrepayDBInstance

ALIYUN::RDS::PrepayDBInstance is used to create a subscription ApsaraDB for RDS instance.

Statement

```
{
  "Type": "ALIYUN::RDS::PrepayDBInstance",
  "Properties": {
    "DBMappings": List,
    "CouponCode": String,
    "MasterUsername": String,
    "PeriodType": String,
    "PayType": String,
    "DBInstanceNetType": String,
    "MasterUserType": String,
    "AutoRenew": Boolean,
    "PreferredBackupTime": String,
    "PrivateIpAddress": String,
    "Engine": String,
    "MultiAZ": Boolean,
    "VpcId": String,
    "ConnectionMode": String,
    "ResourceGroupId": String,
    "VSwitchId": String,
    "BackupRetentionPeriod": Number,
    "Quantity": Number,
    "CommodityCode": String,
    "ZoneId": String,
    "AutoPay": Boolean,
    "EngineVersion": String,
    "DBInstanceClass": String,
    "PreferredBackupPeriod": List,
    "DBInstanceStorage": Integer,
    "DBInstanceDescription": String,
    "Tags": Map,
    "Period": Number,
    "MasterUserPassword": String,
    "AllocatePublicConnection": Boolean
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
-----------	------	----------	----------	-------------	------------

Parameter	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	Yes	Released	The ID of the resource group to which the RDS instance belongs.	None
DBMappings	List	Erased	Released	The databases created in the instance.	None
CouponCode	String	Yes	Released	None	None
MasterUsername	String	Yes	Released	The name of the Apsara Stack tenant account for the instance.	The name must be unique. The name must be 1 to 16 characters in length and can contain lowercase letters, digits, and underscores (_). It must start with a letter.
PeriodType	String	No	No	The type of the billing cycle.	Valid values: <ul style="list-style-type: none"> Year Month Default value: Month.
DBInstanceNetType	String	Yes	Released	The network type of the instance.	Valid values: <ul style="list-style-type: none"> Internet: used for access from public networks. Intranet: used for private network access. Default value: Intranet.
MasterUserType	String	Yes	Released	The permission type of the account.	Valid values: <ul style="list-style-type: none"> Normal Master
PreferredBackupTime	String	Yes	Released	The preferred backup time.	Specify the time in the HH:mmZ- HH:mmZ format. Valid values: 00:00Z-01:00Z, 01:00Z-02:00Z, 02:00Z-03:00Z, and 03:00Z-04:00 to 23:00Z-24:00Z.
PrivateIpAddress	String	Yes	Released	The private IP address of the instance on the specified VSwitch.	If this parameter is not specified, the system automatically assigns a value.

Parameter	Type	Required	Editable	Description	Constraint
Engine	String	No	No	The database engine that the instance runs.	Valid values: <ul style="list-style-type: none"> MySQL SQLServer PostgreSQL PPAS
MultiAZ	Boolean	Erased	Released	Specifies whether the instance can be deployed across multiple zones.	None
VpcId	String	Yes	Released	The ID of the VPC.	None
ConnectionMode	String	Yes	Released	The access mode of the instance.	Valid values: <ul style="list-style-type: none"> Performance: a standard access mode. Safety: high security access mode. If this parameter is not specified, apsaradb for RDS immediately assigns a value to it. Default value: Safty
AutoRenew	Boolean	Erased	Released	Specifies whether to enable automatic renewal for the instance.	Valid values: <ul style="list-style-type: none"> True False
VSwitchId	String	Yes	Released	The ID of the VSwitch in the specified VPC.	None
BackupRetentionPeriod	Number	Erased	Released	The retention period of backup data. Unit: days.	None
Quantity	Number	Erased	Released	The number of instances to be created.	Valid values: 1 to 99. Default value: 1
CommodityCode	String	No	No	The commodity code.	Valid values: <ul style="list-style-type: none"> rds bards rords
ZoneId	String	Yes	Released	The ID of the zone where the instance resides.	None

Parameter	Type	Required	Editable	Description	Constraint
EngineVersion	String	No	No	The version of the database engine that the instance runs.	The range of valid engine version values varies by database type. <ul style="list-style-type: none"> For an ApsaraDB RDS for MySQL instance, the valid values are 5.5 and 5.6. For an ApsaraDB RDS for SQL Server instance, set the value to 2008r2. For an ApsaraDB RDS for PostgreSQL instance, set the value to 9.4. For an ApsaraDB RDS for PPAS instance, set the value to 9.3.
DBInstanceClass	String	No	Yes	The specification of the instance.	Examples of RDS instance types: rds.mys2.large, rds.ms1.large, and rds.pg.s1.small.
PreferredBackupPeriod	List	Erased	Released	The list of preferred backup periods.	Valid values: <ul style="list-style-type: none"> Monday Tuesday Wednesday Thursday Friday Saturday Sunday
DBInstanceStorage	Integer	Retained	Yes	The storage capacity of the instance.	The range of valid storage capacity values varies by database type. <ul style="list-style-type: none"> MySQL: 5 to 1000 SQL Server: 10 to 1000 PostgreSQL and PPAS: 5 to 2000 Unit: GB. Every 5GB.
DBInstanceDescription	String	Yes	Released	The description of the instance.	The value must be 2 to 256 bytes in length. It must start with a letter and cannot start with http:// or https://. It must start with a letter and cannot start with http:// or https://.
Tags	MAP	No.	True	The tags of the instance.	None

Parameter	Type	Required	Editable	Description	Constraint
Period	Number	Yes	No	The subscription period of the instance.	<ul style="list-style-type: none"> Select monthly payment. Valid values: 1 to 9. Select pay by year. Valid values: 1 to 3.
MasterUserPassword	String	Yes	Released	The password of the Apsara Stack tenant account for the instance.	The password must be 6 to 32 characters in length and can contain letters, digits, and underscores (_).
AllocatePublicConnection	Boolean	Erased	Released	Specifies whether to apply for a public connection string for the instance.	None
PayType	String	Yes	Released	The billing method of the router interface.	Valid values: <ul style="list-style-type: none"> Postpaid: pay-as-you-go Prepaid: Subscription
AutoPay	Boolean	Erased	Released	Specifies whether to enable automatic payment.	Valid values: <ul style="list-style-type: none"> True False Default value: False.

DBMappings syntax

```
"DBMappings": [
  {
    "DBDescription": String,
    "CharacterSetName": String,
    "DBName": String
  }
]
```

DBMappings properties

Parameter	Type	Required	Editable	Description	Constraint
DBDescription	String	Yes	Released	The description of the database.	The description must be 2 to 256 characters in length It cannot start with http:// or https://. It must start with a letter and cannot start with http:// or https://.

Parameter	Type	Required	Editable	Description	Constraint
CharacterSetName	String	No	No	The character set of the database.	Valid values: <ul style="list-style-type: none"> Valid values for MySQL: utf8 gbk latin1 utf8mb4 (applicable to version 5.5 and 5.6). Valid values for an SQL Server database: Chinese_PRC_CI_AS, Chinese_PRC_CS_AS, SQL_Latin1_General_CP1_CI_AS, SQL_Latin1_General_CP1_CS_AS, and Chinese_PRC_BIN.
DBName	String	No	No	The name of the database.	The name must be unique. It can be up to 64 characters in length and can contain lowercase letters, digits, and underscores (_). It must start with a lowercase letter.

Response parameters

Fn::GetAtt

- **InnerPort**: the internal port of the RDS instance.
- **OrderId**: the ID of the order.
- **PublicConnectionString**: public network connection string.
- **InnerIPAddress**: the internal IP address of the instance.
- **DBInstanceId**: the ID of the RDS instance.
- **PublicIPAddress**: the public IP address of the instance.
- **PublicPort**: The public port of the RDS instance.
- **InnerConnectionString**: intranet connection string.

{
  "Type": "ALIYUN::ROS::WaitCondition",
  "Properties": {
    "Count": Number,
    "Handle": String,
    "Timeout": Number
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
Handle	String	No	No	Reference ALIYUN::ROS::WaitConditionHandle.	None
Timeout	Number	Yes	No	The length of time to wait for UserData messages.	Valid values: 1 to 43200. Unit: seconds.
Count	Number	No.	True	The total number of messages to be received.	None

Response parameters

Fn::GetAtt

- **Data:** A JSON-serialized dictionary that contains the signal Data after the most recent stack creation or update.
- **LastData:** a JSON-serialized dictionary that contains the signal data before the most recent stack update.
- **JoinedErrorData:** a string consisting of the ErrorData signal data.
- **JoinedLastErrorData:** a string consisting of the LastErrorData signal data.
- **ErrorData:** a JSON-serialized dictionary that contains the error signal data after the most recent stack creation or update.
- **Lasterprotodata:** a JSON-serialized dictionary that contains the error signal data before the most recent stack update.

Sample request

```

{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "WaitCondition": {
      "Type": "ALIYUN::ROS::WaitCondition",

        ]
      }
    }
  }
}

```

5.5.5.2. ALIYUN::ROS::WaitConditionHandle

ALIYUN::ROS::WaitConditionHandle is used to create an instance that sends and receives messages during UserData execution.

Statement

```
{
  "Type": "ALIYUN::ROS::WaitConditionHandle",
  "Properties": {
    "Count": Integer,
    "Mode": String
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
Count	Integer	No.	True	The total number of messages to be received.	Default value: -1.
Mode	String	Yes	True	If you set this parameter to Increment, all previous signals will be updated before they are deleted. If you set this parameter to Full, no previous signals will be deleted unless the Count parameter is specified.	Valid values: <ul style="list-style-type: none"> Increment Full Default value: Full.

Response parameters

Fn::GetAtt

- **CurlCli:** A curl Command is generated by the resource. You can use the command to send the UserData execution result or status to Resource Orchestration Service.
- **WindowsCurlCli:** provides Windows with cURL CLI command prefixes and sends a message indicating that the execution is completed or failed. Windows does not support the curl command. Therefore, you must install curl.exe and add it to PATH. You can add `--data-binary "{\"status\": \" success \"}` to indicate success, or by adding `--data-binary "{\"status\": \" failure \"}` to indicate failure.
- **PowerShellCurlCli:** provides PowerShell with cURL CLI command prefixes and sends a message indicating that the execution is completed or failed. Because this cmdlet was introduced in PowerShell 3.0, make sure that the PowerShell version meets this constraint. By `$PSVersionTable.PSVersion` displays the version. You can add `-Body {"status": "success "}` to indicate success, or by adding `-Body {"status": "failure "}` to indicate failure.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Parameters": {
    "Mode": {
      "Type": "String",
```

"Description": "If set to Increment, all old signals will be deleted before update. In this mode, WaitCondition.Count should reference an incremental value instead of a full value, such as ScalingGroupEnable.ScalingRuleArisExecuteResultNumberOfAddedInstances.\n\nIf set to Full, no old signal will be deleted unless Count is set. In this mode, WaitCondition.Count should reference a full value, such as the same value with InstanceGroup.MaxAmount. It is recommended to use this mode with Count.\n\nDefault to Full.",

```
"AllowedValues": [
```

```
  "Increment",
```

```
  "Full"
```

```

    "Description": "Convenience attribute, provides curl CLI command prefix for PowerShell, which can be used for signalling handle completion or failure. As this cmdlet was introduced in PowerShell 3.0, ensure the version of PowerShell satisfies the constraint. (Show the version via $PSVersionTable.PSVersion.) You can signal success by adding -Body '{\"status\": \"SUCCESS\"}' , or signal failure by adding -Body '{\"status\": \"FAILURE\"}' ",
    "Value": {
      "Fn::GetAtt": [
        "WaitConditionHandle",
        "PowerShellCurlCli"
      ]
    }
  }
}
}
}
}
}

```

5.5.5.3. ALIYUN::ROS::Stack

ALIYUN::ROS::Stack is used to create a nested stack. You can have a maximum of five nested levels.

ALIYUN::ROS::Stack is used in a top-level template to nest stacks as resources.

You can add output values from a nested stack contained within the template. You can use Fn::GetAtt together with the logical name of the nested stack and the output name in the Outputs.NestedStackOutputName format.

 **Note** We recommend that you run an update to the Nested stack from the parent stack.

When you apply a template change to update a top-level stack, ROS updates the top-level stack and initiates an update to its nested stacks. Resource orchestration service (ROS) updates resources that have been modified in the nested stack, but does not update resources that have not been modified in the nested stack.

Statement

```
{
  "Type": "ALIYUN::ROS::Stack",
  "Properties": {
    "TemplateURL": String,
    "TimeoutMins": Number,
    "Parameters": Map
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
TemplateURL	String	No	Yes	<p>The URL of the file containing the template body. The template file can be up to 524,288 bytes in size.</p> <p>The URL must point to a template located on the http or https Web server or Alibaba Cloud OSS bucket.</p> <p>For example: <code>oss://ros/tem plate/demo</code> , <code>oss://ros/tem plate/demo? RegionId=cn- hangzhou</code> .</p> <p>If the region of the OSS bucket is not specified, the RegionId of the stack is used.</p>	The URL can be up to 1,024 bytes in length.
TimeoutMins	Number	No.	True	The length of time that ROS will wait for the nested stack to be created or updated.	Unit: minutes. Default value: 60.

Parameter	Type	Required	Editable	Description	Constraint
Parameters	Map	No.	True	A set of value pairs that represent the parameters passed to ROS when this Nested stack is created. Each parameter has a name corresponding to a parameter defined in the embedded template and the value to which you want to set the parameter. This parameter is required if the nested stack needs input parameters.	None

Response parameters

Fn::GetAtt

You can use the following code to obtain the output of the nested stack:

```
{
  "Fn::GetAtt": [
    "<nested_stack>",
    "Outputs.<nested_stack_output_name>"
  ]
}
```

When you use `Ref` to reference resources in a nested stack, the Alibaba Cloud Resource Name (ARN) of the nested stack is returned. Example: `arn:acs:ros::cn-hangzhou:12345****:stacks/test-nested-stack-Demo-jzkyq7mn2ykj/e71c1e04-1a57-46fc-b9a4-cf7ce0d3****`

Examples

- The following code provides an example of how to create a VPC, a VSwitch, and a security group in a nested stack and save the output results to the `oss://ros/template/vpc.txt` directory:

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Description": "One VPC, VSwitch, security group.",
  "Parameters": {
    "ZoneId": {
      "Type": "String",
      "Description": "The available zone"
    },
    "SecurityGroupName": {
```

```

SecurityGroupName : {
  "Type": "String",
  "Description": "The security group name",
  "Default": "my-sg-name"
},
VpcName: {
  "Type": "String",
  "Description": "The VPC name",

5.5.6. SLB

5.5.6.1. ALIYUN::SLB::AccessControl

ALIYUN::SLB::AccessControl is used to create an access control list (ACL).

Syntax

```
{
  "Type": "ALIYUN::SLB::AccessControl",
  "Properties": {
    "AddressIPVersion": String,
    "AclName": String,
    "AclEntrys": List
  }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
AddressIPVersion	String	No	No	The Internet protocol version.	Valid values: ipv4 and ipv6.
AclName	String	Yes	Yes	The name of the ACL.	None
AclEntrys	List	No	No	The list of ACL entries.	A list can contain up to 50 ACL entries.

AclEntrys syntax

```
"AclEntrys": [
  {
    "comment": String,
    "entry": String
  }
]
```

AclEntrys properties

Property	Type	Required	Editable	Description	Constraint
comment	String	No	No	The comments on ACL entries.	None
entry	String	Yes	No	The authorized IP addresses or CIDR blocks.	None

Response parameters

Fn::GetAtt

AclId: the ID of the ACL.

Examples

Resource usage example

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
```

```

"Resources": {
  "AccessControl": {
    "Type": "ALIYUN::SLB::AccessControl",
    "Properties": {
      "AddressIPVersion": {
        "Ref": "AddressIPVersion"
      },
      "AclName": {
        "Ref": "AclName"
      },
      "AclEntrys": {
        "Fn::Split": [",", {
          "Ref": "AclEntrys"
        }], {
          "Ref": "AclEntrys"
        }
      ]
    }
  }
},
"Parameters": {
  "AddressIPVersion": {
    "Type": "String",
    "Description": "IP version. Could be \"ipv4\" or \"ipv6\".",
    "AllowedValues": ["ipv4", "ipv6"]
  },
  "AclName": {
    "Type": "String",
    "Description": "The name of the access control list."
  },
  "AclEntrys": {
    "Type": "CommaDelimitedList",
    "Description": "A list of acl entrys. Each entry can be IP addresses or CIDR blocks. Max length: 50.",
    "MaxLength": 50
  }
},
"Outputs": {
  "AclId": {
    "Description": "The ID of the access control list.",
    "Value": {
      "Fn::GetAtt": ["AccessControl", "AclId"]
    }
  }
}
}

```

Example of combined use of SLB-related resources

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "LoadBalancer": {
      "Type": "ALIYUN::SLB::LoadBalancer",
      "Properties": {
        "LoadBalancerName": "slb-with-listener-and-acl",
        "AddressType": "internet",
        "InternetChargeType": "paybybandwidth",
        "Bandwidth": 10,
        "VpcId": "vpc-xxxxxxxxxxxxxxxxxxxx",
        "VSwitchId": "vsw-xxxxxxxxxxxxxxxxxxxx"
      }
    },
    "ACL": {
      "Type": "ALIYUN::SLB::AccessControl",
      "Properties": {
        "AclName": "acl-for-listener",
        "AddressIPVersion": "ipv4",
        "AclEntries": [
          {
            "entry": "192.168.x.x"
          },
          {
            "entry": "10.0.x.x/24",
            "comment": "just comment"
          }
        ]
      }
    },
    "CreateListener": {
      "Type": "ALIYUN::SLB::Listener",
      "Properties": {
        "LoadBalancerId": {
          "Ref": "LoadBalancer"
        },
        "ListenerPort": "80",
        "BackendServerPort": 8080,
        "Bandwidth": 1,
        "Protocol": "http",
        "HealthCheck": {
          "HealthyThreshold": 3,
          "UnhealthyThreshold": 3,
          "Interval": 2,
          "Timeout": 5
        }
      }
    }
  }
}
```

```

    },
    "Scheduler": "wrr",
    "RequestTimeout": 179,
    "IdleTimeout": 59,
    "AclId": {
      "Ref": "ACL"
    },
    "AclStatus": "on",
    "AclType": "white"
  }
}
},
"Outputs": {
  "LoadBalanceDetails": {
    "Value": {
      "Fn::GetAtt": [
        "LoadBalancerId",
        "Listeners"
      ]
    }
  }
}
}
}
}
}

```

5.5.6.2. ALIYUN::SLB::BackendServerAttachment

ALIYUN::SLB::BackendServerAttachment is used to add backend servers.

Statement

```

{
  "Type": "ALIYUN::SLB::BackendServerAttachment",
  "Properties": {
    "LoadBalancerId": String,
    "BackendServers": List,
    "BackendServerList": List,
    "BackendServerWeightList": List
  }
}

```

Properties

Parameter	Type	Required	Editable	Description	Constraint
LoadBalancerId	String	No	No	The unique ID of the SLB instance.	None

Parameter	Type	Required	Editable	Description	Constraint
BackendServerList	List	No.	True	The list of backend servers to add.	You can call this operation with LoadBalancerId and BackendServerWeightList. Separate ECS instance IDs with commas (,). This parameter is ignored when the BackendServers parameter is specified.
BackendServerWeightList	List	No.	True	The weights of the ECS instances in the BackendServerList, which are specified in order.	If this parameter is not specified, the weight of all ECS instances included in the BackendServerList is 100. When the BackendServerWeightList length is less than BackendServerList, the last value in the BackendServerWeightList is used to weight the remaining ECS instances in the BackendServerList.
BackendServers	List	No.	True	The list of backend servers to add.	Only backend servers in the running state can be attached to the SLB instance.

BackendServers syntax

```
"BackendServers": [
  {
    "ServerId" : String,
    "Weight" : Integer
  }
]
```

BackendServers properties

Parameter	Type	Required	Editable	Description	Constraint
ServerId	String	No	Yes	The ID of the ECS instance that acts as a backend server.	The ECS instance must be in the Running state.
Weight	Integer	Retained	Yes	The weight of the ECS instance in the SLB instance.	Valid values: 0 to 100. Default value: 100.

Response parameters

Fn::GetAtt

- **BackendServers:** the backend servers added to the SLB instance.
- **LoadBalancerId:** the ID of the SLB instance.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "Attachment2": {
      "Type": "ALIYUN::SLB::BackendServerAttachment",
      "Properties": {
        "LoadBalancerId": "15187200816-cn-beijing-btc-****",
        "BackendServerList": [
          "i-25o0m****",
          "i-25zsk****"
        ],
        "BackendServerWeightList": [
          "20",
          "100"
        ]
      }
    }
  }
}
```

5.5.6.3. ALIYUN::SLB::BackendServerToVServerGroupAddition

ALIYUN::SLB::BackendServerToVServerGroupAddition is used to add backend servers to an existing VServer group.

Statement

```
{
  "Type": "ALIYUN::SLB::BackendServerToVServerGroupAddition",
  "Properties": {
    "BackendServers": List,
    "VServerGroupId": String
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
VServerGroupId	String	No	No	The ID of the VServer group.	None
BackendServers	List	Retained	Yes	The list of ECS instances to be added.	None

BackendServers syntax

```
"BackendServers": [
  {
    "ServerId": String,
    "Port": Integer,
    "Weight": Integer
  }
]
```

BackendServers properties

Parameter	Type	Required	Editable	Description	Constraint
ServerId	String	No	Yes	The ID of the ECS instance that acts as a backend server.	None
Port	Integer	Retained	Yes	The ECS port number that is listened to in the server load balancer instance.	Valid values: 1 to 65535.
Weight	Integer	Retained	Yes	The weight of the ECS instance to be attached to the SLB instance.	Valid values: 0 to 100.

Response parameters

Fn::GetAtt

VServerGroupId: the ID of the VServer group.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "AttachVServerGroup": {
      "Type": "ALIYUN::SLB::BackendServerToVServerGroupAddition",
      "Properties": {
        "VServerGroupId": "sg-2zenh4ndwrqg14yt0****",
        "BackendServers": [
          {
            "ServerId": "i-25zsk****",
            "Weight": 20,
            "Port": 8080
          },
          {
            "ServerId": "i-25zsk****",
            "Weight": 100,
            "Port": 8081
          }
        ]
      }
    }
  }
}
```

5.5.6.4. ALIYUN::SLB::Certificate

ALIYUN::SLB::Certificate is used to upload a certificate to an SLB instance. Server certificates and CA certificates are supported.

Notice

- You can upload only one CA certificate at a time ("CertificateType": "CA").
- You can upload only one server certificate and the corresponding private key at a time ("CertificateType": "Server").

Syntax

```
{
  "Type": "ALIYUN::SLB::Certificate",
  "Properties": {
    "CertificateName": String,
    "Certificate": String,
    "AliCloudCertificateName": String,
    "PrivateKey": String,
    "ResourceGroupId": String,
    "CertificateType": String,
    "AliCloudCertificateId": String
  }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	No	No	The ID of the resource group.	None
CertificateName	String	No	Yes	The name of the certificate.	None
Certificate	String	Yes	No	The public key of the certificate.	None
AliCloudCertificateName	String	No	No	The name of the Alibaba Cloud certificate.	None
PrivateKey	String	No	No	The server private key that you want to upload.	None
AliCloudCertificateId	String	No	No	The ID of the Alibaba Cloud certificate.	This parameter is required if you use a certificate from Alibaba Cloud SSL Certificates Service.
CertificateType	String	No	No	The type of the certificate.	Valid values: Server and CA.

Response parameters

Fn::GetAtt

- CertificateId: the ID of the certificate.
- Fingerprint: the fingerprint of the certificate.

Examples

```
{
  "ROSTemplateFormatVersion": "2015-09-01"
```

```

ROSTemplateFormatVersion : 2015-09-01 ,
"Parameters": {
  "CertificateType": {
    "Type": "String",
    "Description": "The type of the certificate.",
    "AllowedValues": [
      "Server",
      "CA"
    ],
    "Default": "Server"
  },
  "AliCloudCertificateName": {
    "Type": "String",
    "Description": "The name of the Alibaba Cloud certificate."
  },
  "PrivateKey": {
    "Type": "String",
    "Description": "The private key."
  },
  "CertificateName": {
    "Type": "String",
    "Description": "The name of the certificate."
  },
  "Certificate": {
    "Type": "String",
    "Description": "The content of the certificate public key."
  },
  "AliCloudCertificateId": {
    "Type": "String",
    "Description": "The ID of the Alibaba Cloud certificate."
  }
},
"Resources": {
  "Certificate": {
    "Type": "ALIYUN::SLB::Certificate",
    "Properties": {
      "CertificateType": {
        "Ref": "CertificateType"
      },
      "AliCloudCertificateName": {
        "Ref": "AliCloudCertificateName"
      },
      "PrivateKey": {
        "Ref": "PrivateKey"
      },
      "CertificateName": {
        "Ref": "CertificateName"
      }
    }
  }
}

```

```

    },
    "Certificate": {
      "Ref": "Certificate"
    },
    "AliCloudCertificateId": {
      "Ref": "AliCloudCertificateId"
    }
  }
}
},
"Outputs": {
  "Fingerprint": {
    "Description": "The fingerprint of the certificate.",
    "Value": {
      "Fn::GetAtt": [
        "Certificate",
        "Fingerprint"
      ]
    }
  },
  "CertificateId": {
    "Description": "The ID of the certificate.",
    "Value": {

        "Certificate",
        "CertificateId"
      ]
    }
  }
}
}
}
}

```

5.5.6.5. ALIYUN::SLB::DomainExtension

ALIYUN::SLB::DomainExtension is used to create a domain extension for an SLB instance.

Statement

```

{
  "Type": "ALIYUN::SLB::DomainExtension",
  "Properties": {
    "Domain": String,
    "ListenerPort": Integer,
    "ServerCertificateId": String,
    "LoadBalancerId": String
  }
}

```

Properties

Parameter	Type	Required	Editable	Description	Constraint
Domain	String	No	No	The custom domain name.	None
ListenerPort	Integer	Yes	No	The frontend port used by the HTTPS listener of the SLB instance.	Valid values: 1 to 65535.
ServerCertificateId	String	No	Yes	The ID of the certificate corresponding to the domain name.	None
LoadBalancerId	String	No	No	The ID of the SLB instance.	None

Response parameters

Fn::GetAtt

- **DomainExtensionId**: the ID of the created domain extension.
- **ListenerPort**: The frontend port used by the SLB instance.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "DomainExtension": {
      "Type": "ALIYUN::SLB::DomainExtension",
      "Properties": {
        "Domain": "*.example1.com",
        "ListenerPort": "443",
        "ServerCertificateId": "123157908552****_166f8204689_1714763408_70998****",
        "LoadBalancerId": "lb-bp1o94dp5i6earr9g****"
      }
    }
  },
  "Outputs": {
    "DomainExtensionId": {
      "Value": {
        "Fn::GetAtt": [
          "DomainExtension",
          "DomainExtensionId"
        ]
      }
    },
    "ListenerPort": {
      "Value": {
        "Fn::GetAtt": [
          "DomainExtension",
          "ListenerPort"
        ]
      }
    }
  }
}
```

5.5.6.6. ALIYUN::SLB::Listener

ALIYUN::SLB::Listener is used to create a listener for an SLB instance.

Statement

```

{
  "Type": "ALIYUN::SLB::Listener",
  "Properties": {
    "MasterSlaveServerGroupId": String,
    "AclStatus": String,
    "Protocol": String,
    "AclId": String,
    "ServerCertificateId": String,
    "HealthCheck": Map,
    "RequestTimeout": Integer,
    "IdleTimeout": Integer,
    "ListenerPort": Integer,
    "HttpConfig": Map,
    "Bandwidth": Integer,
    "AclType": String,
    "BackendServerPort": Integer,
    "Scheduler": String,
    "LoadBalancerId": String,
    "CACertificateId": String,
    "Persistence": Map,
    "VServerGroupId": String
  }
}

```

Properties

Parameter	Type	Required	Editable	Description	Constraint
MasterSlaveServerGroupId	String	Yes	Released	The ID of the active/standby server group.	None
AclStatus	String	Yes	Released	Specifies whether to enable access control on the listener.	Valid values: <ul style="list-style-type: none"> on off Default value: off.
AclId	String	Yes	Released	The ID of the access control list (ACL) to which the listener is bound. This parameter is required when the AclStatus parameter is set to on.	None
				The type of the ACL. Valid values: white	

Parameter	Type	Required	Editable	Description	Constraint
AclType	String	Yes	Released	<p>and black:</p> <ul style="list-style-type: none"> white: specifies the ACL as a whitelist. Only requests from the IP addresses or CIDR blocks specified in the ACL are forwarded. Whitelists are applicable to scenarios where you want an application to only be accessed from specific IP addresses. Configuring a whitelist poses risks to your services. After a whitelist is configured, only the IP addresses specified in the whitelist are able to access the SLB listener. If a whitelist is enabled without any IP addresses specified, the SLB listener will not forward any requests. black: specifies the ACL as a blacklist. Requests from the IP addresses or CIDR blocks specified in the ACL are not forwarded. Blacklists are applicable to scenarios where you want an application to only be 	<p>Valid values:</p> <ul style="list-style-type: none"> White Black

Parameter	Type	Required	Editable	Description	Constraint
				denied access from specific IP addresses. If a blacklist is enabled without any IP addresses specified, the SLB listener will forward all requests. This parameter is required when the AclStatus parameter is set to on.	
Protocol	String	No	No	The Internet protocol over which the listener will forward requests.	Valid values: <ul style="list-style-type: none"> • http • https • tcp • udp
ListenerPort	Integer	Yes	No	The frontend port used by the SLB instance.	Valid values: 1 to 65535.

Parameter	Type	Required	Editable	Description	Constraint
Bandwidth	Integer	Yes	No	The peak bandwidth of the listener. Unit: Mbit/s.	<ul style="list-style-type: none"> Valid values:- 1 and 1 to 1000. For an SLB instance that is connected to the Internet and billed by fixed bandwidth, this parameter cannot be set to -1, and the sum of peak bandwidth values assigned to different listeners cannot exceed the Bandwidth value specified when the SLB instance is created. For an SLB instance that is connected to the Internet and billed by traffic, this parameter can be set to -1. Unit: Mbit/s.
BackendServerPort	Integer	Yes	No	The backend port used by the SLB instance.	Valid values: 1 to 65535.
LoadBalancerId	String	No	No	The ID of the SLB instance.	None
HealthCheck	Map	Erased	Released	The health check settings of the listener.	None
Persistence	Map	Erased	Released	The persistence properties.	None

Parameter	Type	Required	Editable	Description	Constraint
Scheduler	String	Yes	Released	The algorithm used to direct traffic to individual servers.	Valid values: <ul style="list-style-type: none"> wrr wlc Default value: wrr
CACertificateId	String	Yes	Released	The ID of the CA certificate.	Only valid for HTTPS
ServerCertificateId	String	Yes	Released	The ID of the server certificate.	This parameter is required and valid only for HTTPS listeners.
VServerGroupId	String	Yes	Released	The ID of the VServer group.	None
RequestTimeout	String	Optional	Released	The request timeout period. Unit: seconds.	Valid values: 1 to 180.
IdleTimeout	String	Optional	Released	The idle connection timeout period. Unit: seconds.	Valid values: 1 to 60.
HttpConfig	Map	Erased	Released	The HTTP configurations.	None

HealthCheck syntax

```
"HealthCheck": {
  "Domain": String,
  "Interval": Integer,
  "URI": String,
  "HttpCode": String,
  "HealthyThreshold": Integer,
  "Timeout": Integer,
  "UnhealthyThreshold": Integer,
  "Port": Integer
}
```

HealthCheck properties

Parameter	Type	Required	Editable	Description	Constraint
-----------	------	----------	----------	-------------	------------

Parameter	Type	Required	Editable	Description	Constraint
Domain	String	Yes	Released	The domain name used for health checks.	<ul style="list-style-type: none"> The value can be <code>\$_ip</code>, a custom string, or an empty string. A custom string must be 1 to 80 characters in length and can contain only letters, digits, hyphens (-), and periods (.). When this parameter is set to <code>\$_ip</code> or left empty, the SLB instance uses the private IP addresses of backend servers as the domain names for health checks.
Interval	String	Optional	Released	The time interval between consecutive health checks. Unit: seconds.	Valid values: 1 to 5. Unit: seconds.
URI	String	Yes	Released	The URI used for health checks.	<ul style="list-style-type: none"> The URI must be 1 to 80 characters in length and can contain letters, digits, hyphens (-), forward slashes (/), periods (.), percent signs (%), question marks (?), number signs (#), and ampersands (&). It must start with a forward slash (/).

Parameter	Type	Required	Editable	Description	Constraint
HttpCode	String	Yes	Released	The HTTP status code that indicates a positive health status of the backend servers.	<ul style="list-style-type: none"> Valid values: http_2xx, http_3xx, http_4xx, and http_5xx. Separate multiple HTTP status codes with commas (,). Default value: http_2xx
HealthyThreshold	String	Optional	Released	The threshold used to determine that the backend servers are healthy. This value indicates the number of consecutive successful health checks required before the health status of a backend server can be changed from fail to success.	Valid values: 1 to 10.
Timeout	String	Optional	Released	The length of time to wait for the response from a health check. Unit: seconds.	Valid values: 1 to 50. <div style="border: 1px solid #add8e6; padding: 5px; margin-top: 10px;">  Notice This parameter is valid only when its value is greater than or equal to that of the Interval parameter. Otherwise, this parameter will be overridden by the Interval value. </div>

Parameter	Type	Required	Editable	Description	Constraint
UnhealthyThreshhold	String	Optional	Released	The threshold used to determine that the backend servers are unhealthy. This value indicates the number of consecutive failed health checks required before the health status of a backend server can be changed from success to fail.	Valid values: 1 to 10.
Port	String	Optional	Released	The port used for health checks.	Valid values: 0 to 65535.

Persistence syntax

```
"Persistence": {
  "PersistenceTimeout": Integer,
  "CookieTimeout": Integer,
  "XForwardedFor": String,
  "Cookie": String,
  "StickySession": String,
  "StickySessionType": String
}
```

Persistence properties

Parameter	Type	Required	Editable	Description	Constraint
StickySession	String	No	No	Specifies whether to enable session persistence.	Valid values: <ul style="list-style-type: none"> on off
PersistenceTimeout	String	Optional	Released	The maximum duration that the client can be connected to the server. Unit: seconds.	Valid values: 0 to 1000. The default value is 0, which indicates that connection persistence is disabled. Unit: seconds.

Parameter	Type	Required	Editable	Description	Constraint
CookieTimeout	String	Optional	Released	The maximum duration the cookie can be retained before it expires. Unit: seconds.	<p>This parameter is required when the StickySession parameter is set to on and the StickySessionType parameter is set to insert.</p> <p>Valid values: 1 to 86400.</p> <p>Unit: seconds.</p>
XForwardedFor	String	Yes	Released	Specifies whether to use the X-Forwarded-For header field to obtain the real IP address of the client.	<p>Valid values:</p> <ul style="list-style-type: none"> • on • off <p>Default value: on</p>
Cookie	String	Yes	Released	The cookie configured on the backend server.	<ul style="list-style-type: none"> • The parameter value must be 1 to 200 characters in length and follow the RFC 2965 standard. It can contain only ASCII characters. It cannot contain commas (,), semicolons (;), or spaces, and cannot start with a dollar sign (\$). • This parameter is required when the StickySession parameter is set to on and the StickySessionType parameter is set to server.

Parameter	Type	Required	Editable	Description	Constraint
StickySessionType	String	Yes	Released	The method for processing cookies.	<ul style="list-style-type: none"> Valid values: insert and server. When this parameter is set to insert, SLB adds a cookie to the first response from the backend server. Then, the next request contains the cookie and the listener distributes the request to the same backend server. When this parameter is set to server, SLB overwrites the original cookie when a new cookie is set. The next time the client carries the new cookie to access SLB, the listener distributes the request to the previously recorded backend server. This parameter is required when the StickySession parameter is set to on. This parameter is ignored when the StickySession parameter is set to off.

HttpConfig syntax

```
"HttpConfig": {
  "ForwardPort": Integer,
  "ListenerForward": String
}
```

HttpConfig properties

Parameter	Type	Required	Editable	Description	Constraint
ForwardPort	String	Optional	Released	The port used to redirect HTTP requests to HTTPS.	Valid values: 1 to 65535. Default value: 443.
ListenerForward	String	No	No	Specifies whether to enable HTTP-to-HTTPS redirection.	Valid values: • on • off Default value: off.

Response parameters

Fn::GetAtt

- LoadBalancerId: the unique ID of the SLB instance.
- ListenerPortsAndProtocol: an array consisting of the ports and protocols used by the SLB listener.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "LoadBalancer": {
      "Type": "ALIYUN::SLB::LoadBalancer",
      "Properties": {
        "LoadBalancerName": "createdByHeat",
        "AddressType": "internet",
        "InternetChargeType": "paybybandwidth"
      }
    },
    "CreateListener": {
      "Type": "ALIYUN::SLB::Listener",
      "Properties": {
        "LoadBalancerId": {"Ref": "LoadBalancer"},
        "ListenerPort": "8094",

        "Protocol": "http",
        "HealthCheck": {
          "HealthyThreshold": 3,
          "UnhealthyThreshold": 3,
          "Interval": 2,
          "Timeout": 5,
          "HttpCode": "http_2xx,http_3xx,http_4xx,http_5xx"
        },
        "Scheduler": "wrr",
        "Persistence": {
          "PersistenceTimeout": 1,
          "XForwardedFor": "on",
          "StickySession": "on",
          "StickySessionType": "insert",
          "CookieTimeout": 10,
          "Cookie": "1"
        }
      }
    }
  },
  "Outputs": {
    "LoadBalanceDetails": {
      "Value": {"Fn::GetAtt": ["LoadBalancer", "LoadBalancerId"]}
    }
  }
}
```

5.5.6.7. ALIYUN::SLB::LoadBalancer

ALIYUN::SLB::LoadBalancer is used to create an SLB instance.

Statement

```
{
  "Type": "ALIYUN::SLB::LoadBalancer",
  "Properties": {
    "DeletionProtection": Boolean,
    "AddressType": String,
    "Tags": List,
    "InternetChargeType": String,
    "Bandwidth": Integer,
    "SlaveZoneId": String,
    "ResourceGroupId": String,
    "AutoPay": Boolean,
    "VpcId": String,
    "PricingCycle": String,
    "LoadBalancerName": String,
    "Duration": Number,
    "VSwitchId": String,
    "LoadBalancerSpec": String,
    "MasterZoneId": String,
    "PayType": String
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	Yes	Released	The ID of the resource group to which the RDS instance belongs.	None
DeletionProtection	Boolean	Erased	Released	Specifies whether to enable deletion protection to prevent the SLB instance from being deleted by mistake.	Valid values: <ul style="list-style-type: none"> • true • false
VpcId	String	Yes	Released	The ID of the VPC.	None

Parameter	Type	Required	Editable	Description	Constraint
SlaveZoneId	String	Yes	Released	The ID of the secondary zone to which the SLB instance belongs.	None
Bandwidth	String	Optional	Released	The peak bandwidth of SLB instances that are connected to the Internet and billed by fixed bandwidth.	For SLB instances that are connected to the Internet and billed by fixed Bandwidth, this parameter is valid only when the Bandwidth parameter of the SLB Listener is specified. For Internet instances whose billing type is to pay by traffic, we recommend that you set the peak Bandwidth through the Listener parameter. In this case, this parameter is ignored. Valid values: 1 to 1000. Unit: Mbps. Default value: 1 VPC-type instances are billed by traffic.
AddressType	String	Yes	Released	The address type of the SLB instance.	Valid values: <ul style="list-style-type: none"> internet intranet Default value: internet.
VSwitchId	String	Yes	Released	The ID of the vSwitch in the VPC.	None

Parameter	Type	Required	Editable	Description	Constraint
LoadBalancerName	String	Yes	Released	The name of the SLB instance to be created.	A custom string. The name must be 1 to 80 characters in length and can contain letters, digits, hyphens (-), forward slashes (/), periods (.), and underscores (_). If this parameter is not specified, the system assigns a value.
InternetChargeType	String	Yes	Released	The billing method of SLB instances that are connected to the Internet.	Valid values: <ul style="list-style-type: none"> • paybybandwidth • paybytraffic Default value: paybytraffic.
MasterZoneId	String	Yes	Released	The ID of the primary zone to which the SLB instance belongs.	None
Tags	List	Erased	Released	The tags to be attached to the SLB instance. The tags are listed in JSON format. Each tag consists of a TagKey and a TagValue.	A maximum of five tags can be attached to an SLB instance.
LoadBalancerSpec	String	Yes	Released	The type of the SLB instance.	Valid values: <ul style="list-style-type: none"> • slb.s1.small • slb.s2.small • slb.s2.medium • slb.s3.small • slb.s3.medium • slb.s3.large The available types vary by region.

Parameter	Type	Required	Editable	Description	Constraint
AutoPay	Boolean	Erased	Released	Specifies whether to automatically pay for subscription SLB instances that are connected to the Internet.	<p>Valid values:</p> <ul style="list-style-type: none"> • true • false <p>Default value: false.</p> <div style="border: 1px solid #ccc; background-color: #e6f2ff; padding: 5px;"> <p> Note This parameter is valid only on the China site (aliyun.com)</p> </div>
PayType	String	Yes	Released	The billing method of the SLB instance.	<p>Valid values:</p> <ul style="list-style-type: none"> • PayOnDemand • PrePay
PricingCycle	String	Yes	Released	The billing cycle of subscription SLB instances that are connected to the Internet.	<p>Valid values:</p> <ul style="list-style-type: none"> • month • year <div style="border: 1px solid #ccc; background-color: #e6f2ff; padding: 5px;"> <p> Note This parameter is valid only on the China site (aliyun.com)</p> </div>

Parameter	Type	Required	Editable	Description	Constraint
Duration	Number	Erased	Released	The subscription period of subscription SLB instances that are connected to the Internet.	Valid values: <ul style="list-style-type: none"> Valid values when the PricingCycle parameter is set to month: 1 to 9. Valid values when the PricingCycle parameter is set to year: 1 to 3. <div style="border: 1px solid #ccc; background-color: #e6f2ff; padding: 5px; margin-top: 10px;"> <p> Note This parameter is valid only on the China site (aliyun.com).</p> </div>

Tags syntax

```
"Tags": [
  {
    "Value": String ,
    "Key": String
  }
]
```

Tags properties

Property	Type	Required or Not	Editable	Description	Constraint
Key	String	No	No	None	None
Value	String	Yes	Released	None	Valid values: 1025 to 10000. You cannot use the following commonly used port numbers: 2222, 4500, 4510, 4560, 7505, 9000, 9001, and 9002.

Response parameters

Fn::GetAtt

- **LoadBalancerId**: the unique ID of the SLB instance.
- **NetworkType**: the network type of the SLB instance, which can be vpc or classic.
- **AddressType**: the address type of the SLB instance, which can be intranet or internet.

- `IpAddress`: the IP address of the SLB instance.
- `OrderId`: the ID of the order.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "CreateLoadBalance": {
      "Type": "ALIYUN::SLB::LoadBalancer",
      "Properties": {
        "LoadBalancerName": "createdByHeat",
        "AddressType": "internet",
        "InternetChargeType": "paybybandwidth",
      }
    }
  },
  "Outputs": {
    "LoadBalanceDetails": {
      "Value": {
        "Fn::GetAtt": ["CreateLoadBalance", "LoadBalancerId"]
      }
    }
  }
}
```

5.5.6.8. ALIYUN::SLB::LoadBalancerClone

`ALIYUN::SLB::LoadBalancerClone` is used to clone an SLB instance.

Syntax

```
{
  "Type": "ALIYUN::SLB::LoadBalancerClone",
  "Properties": {
    "Tags": List,
    "ResourceGroupId": String,
    "VSwitchId": String,
    "LoadBalancerName": String,
    "SourceLoadBalancerId": String,
    "TagsPolicy": String,
    "BackendServersPolicy": String,
    "BackendServers": List
  }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
ResourceGroupI d	String	No	No	The ID of the resource group.	None
VSwitchId	String	No	No	The ID of the VSwitch.	The VSwitch must exist in the VPC to which the source SLB instance belongs. If the parameter is not specified, the VSwitch to which the source SLB instance belongs is used.
SourceLoadBala ncerId	String	Yes	No	The ID of the SLB instance to be cloned.	None

Property	Type	Required	Editable	Description	Constraint
BackendServers Policy	String	No	No	The clone policy. The ECS instances listened by the new SLB instance and the weight of each ECS instance are specified in the policy.	<p>Valid values:</p> <ul style="list-style-type: none"> clone: The ECS instances listened by the source SLB instance and the ECS instance weights are cloned to the new SLB instance. empty: No ECS instances are attached to the new SLB instance. append: The ECS instances listened by the source SLB instance and the ECS instance weights are cloned to the new SLB instance. New ECS instances with specified weights are also attached to the new SLB instance. replace: New ECS instances with specified weights are attached to the new SLB instance. However, the ECS instances listened by the source SLB instance and the ECS instance weights are not cloned to the new SLB instance. <p>Default value: clone.</p>
BackendServers	List	No	Yes	The new ECS instances to be listened.	None

Property	Type	Required	Editable	Description	Constraint
LoadBalancerName	String	No	No	The name of the new SLB instance.	You can set the name to any string. The name must be 1 to 80 characters in length and can contain letters, digits, hyphens (-), forward slashes (/), periods (.), and underscores (_).
Tags	List	No	Yes	The tags of the SLB instance.	Tags must be specified as key-value pairs. A maximum of five tags can be specified.
TagsPolicy	String	No	No	The policy of the tags.	<p>Valid values:</p> <ul style="list-style-type: none"> clone: The tags of the source SLB instance are used. empty: No tags are configured. append: The tags of the source SLB instance are reserved while new tags are added. replace: The tags of the source SLB instance are deleted while new tags are added. <p>Default value: empty.</p>

BackendServers syntax

```
"BackendServers": [
  {
    "ServerId": String,
    "Weight": Integer
  }
]
```

BackendServers properties

Property	Type	Required	Editable	Description	Constraint
ServerId	String	Yes	Yes	The ID of the ECS instance.	The ECS instances must be in the running state.
Weight	Integer	Yes	Yes	The weight of the ECS instance to be attached to the SLB instance.	Valid values: 0 to 100. Default value: 100.

Response parameters

`Fn::GetAtt`

`LoadBalancerId`: the ID of the new SLB instance.

Examples

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "CloneLoadBalance": {
      "Type": "ALIYUN::SLB::LoadBalancerClone",
      "Properties": {
        "SourceLoadBalancerId": "150ebed5f06-cn-beijing-btc-***",
        "LoadBalancerName": "rosnew",
        "BackendServersPolicy": "replace",
        "BackendServers": [
          {
            "ServerId": "i-25zsk****",
            "Weight": 20
          }
        ]
      }
    }
  },
  "Outputs": {
    "LoadBalanceDetails": {
      "Value": {"Fn::GetAtt": ["CloneLoadBalance", "LoadBalancerId"]}
    }
  }
}
```

5.5.6.9. ALIYUN::SLB::MasterSlaveServerGroup

`ALIYUN::SLB::MasterSlaveServerGroup` is used to create a primary/secondary server group.

 **Notice** A primary/secondary server group contains only two ECS instances: a primary server and a secondary server.

Syntax

```
{
  "Type": "ALIYUN::SLB::MasterSlaveServerGroup",
  "Properties": {
    "MasterSlaveServerGroupName": String,
    "MasterSlaveBackendServers": List,
    "LoadBalancerId": String
  }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
MasterSlaveServerGroupName	String	No	No	The name of the primary/secondary server group.	None
MasterSlaveBackendServers	List	Yes	No	The list of backend servers in the primary/secondary server group.	A primary/secondary server group can contain a maximum of two backend servers. If you do not specify this parameter, an empty primary/secondary server group is created.
LoadBalancerId	String	Yes	No	The ID of the SLB instance.	None

MasterSlaveBackendServers syntax

```
"MasterSlaveBackendServers": [
  {
    "ServerId": String,
    "Port": Integer,
    "Weight": Integer,
    "ServerType": String
  }
]
```

MasterSlaveBackendServers properties

Property	Type	Required	Editable	Description	Constraint
ServerId	String	Yes	No	The ID of the ECS instance or Elastic Network Interface (ENI) to be added.	None
ServerType	String	No	No	The type of the server.	Default value: Master. Valid values: <ul style="list-style-type: none"> • Master • Slave
Port	Integer	Yes	No	The port number used by the backend server.	Valid values: 1 to 65535.
Weight	Integer	Yes	No	The weight of the backend server.	Valid values: 0 to 100.

Response parameters

Fn::GetAtt

MasterSlaveServerGroupId: the ID of the primary/secondary server group.

Examples

```

{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "MasterSlaveServerGroup": {
      "Type": "ALIYUN::SLB::MasterSlaveServerGroup",
      "Properties": {
        "MasterSlaveServerGroupName": "Group1",
        "MasterSlaveBackendServers": [
          {
            "ServerId": "vm****",
            "Port": "80",
            "Weight": "100",
            "ServerType": "Master"
          },
          {
            "ServerId": "vm****",
            "Port": "90",
            "Weight": "100",
            "ServerType": "Slave"
          }
        ],
        "LoadBalancerId": "lb-bp1hv944r69al4j9j****"
      }
    }
  },
  "Outputs": {
    "MasterSlaveServerGroupId": {
      "Value": {
        "Fn::GetAtt": [
          "MasterSlaveServerGroup",
          "MasterSlaveServerGroupId"
        ]
      }
    }
  }
}

```

5.5.6.10. ALIYUN::SLB::Rule

ALIYUN::SLB::Rule is used to add forwarding rules for a specified HTTP or HTTPS listener.

Statement

```
{
  "Type": "ALIYUN::SLB::Rule",
  "Properties": {
    "ListenerPort": Integer,
    "RuleList": List,
    "LoadBalancerId": String
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
ListenerPort	Integer	Yes	No	The frontend listener port used by the SLB instance.	Valid values: 1 to 65,535.
RuleList	List	Yes	No	The list of forwarding rules to be added.	<p>A maximum of 10 forwarding rules can be added at a time.</p> <p>Each forwarding rule contains the following parameters: RuleName, Domain, Url, and VServerGroupId.</p> <p>You must specify at least one of the following parameters: Domain and URL.</p> <p>The combination of Domain and URL must be unique in a listener.</p>
LoadBalancerId	String	No	No	The IDs of SLB instances.	None

RuleList syntax

```
"RuleList": [
  {
    "Url": String,
    "Domain": String,
    "VServerGroupId": String,
    "RuleName": String
  }
]
```

RuleList properties

Parameter	Type	Required	Editable	Description	Constraint
Url	String	Yes	Released	The request URL.	The name must be 1 to 80 characters in length and can contain letters, numbers, and special characters. -/., percent signs (%), question marks (?), #& .
Domain	String	Yes	Released	The request domain name associated with the forwarding rule.	None
VServerGroupId	String	No	No	The ID of the destination VServer group specified in the forwarding rule.	None
RuleName	String	No	No	The name of the forwarding rule.	The name must be 1 to 40 characters in length and can contain letters, numbers, and special characters. -/., _ . Forwarding rule names must be unique within each listener.

Response parameters

Fn::GetAtt

Rules: the list of forwarding rules.

Sample request

```

{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "Rule": {
      "Type": "ALIYUN::SLB::Rule",
      "Properties": {
        "ListenerPort": {
          "Ref": "ListenerPort"
        },
        "RuleList": {
          "Fn::Split": [",", {
            "Ref": "RuleList"
          }], {
            "Ref": "RuleList"
          }
        ]
      },
      "LoadBalancerId": {
        "Ref": "LoadBalancerId"
      }
    }
  },
  "Parameters": {
    "ListenerPort": {

}
}
}
}

```

5.5.6.11. ALIYUN::SLB::VServerGroup

ALIYUN::SLB::VServerGroup is used to create a VServer group and adds backend servers to the SLB instance.

Syntax

```

{
  "Type" : "ALIYUN::SLB::VServerGroup",
  "Properties" : {
    "VServerGroupName" : String,
    "BackendServers" : List,
    "LoadBalancerId" : String
  }
}

```

Properties

Property	Type	Required	Editable	Description	Constraint
VServerGroupName	String	Yes	No	The name of the VServer group.	None
BackendServers	List	Yes	Yes	The list of ECS instances to be added.	A list can contain up to 20 instances.
LoadBalancerId	String	Yes	No	The ID of the SLB instance.	None

BackendServers syntax

```

"BackendServers" : [
  {
    "ServerId" : String,
    "Port" : Integer,
    "Weight" : Integer
  }
]

```

BackendServers properties

Property	Type	Required	Editable	Description	Constraint
----------	------	----------	----------	-------------	------------

Property	Type	Required	Editable	Description	Constraint
ServerId	String	Yes	Yes	The ID of the ECS instance.	None
Port	Integer	Yes	Yes	The backend port used by the SLB instance.	Valid values: 1 to 65535.
Weight	Integer	Yes	Yes	The weight of the ECS instance to be attached to the SLB instance.	Valid values: 0 to 100.

Response parameters

Fn::GetAtt

- **VServerGroupId**: the ID of the VServer group.
- **BackendServers**: the list of backend servers added to the SLB instance

Examples

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "CreateVServerGroup": {
      "Type": "ALIYUN::SLB::VServerGroup",
      "Properties": {
        "LoadBalancerId": "lb-2zenh4ndwrqg14yt0****",
        "VServerGroupName": "VServerGroup-****",
        "BackendServers": [
          {
            "ServerId": "i-25zsk****",
            "Weight": 20,
            "Port": 8080
          },
          {
            "ServerId": "i-25zsk****",
            "Weight": 100,
            "Port": 8081
          }
        ]
      }
    }
  },
  "Outputs": {
    "VServerGroupId": {
      "Value": {"Fn::GetAttr": ["CreateVServerGroup", "VServerGroupId"]}
    }
  }
}
```

5.5.7. VPC

5.5.7.1. ALIYUN::VPC::EIP

ALIYUN::VPC::EIP is used to apply for an Elastic IP address.

Statement

```
{
  "Type": "ALIYUN::VPC::EIP",
  "Properties": {
    "Isp": String,
    "Period": Number,
    "ResourceGroupId": String,
    "AutoPay": Boolean,
    "InstanceChargeType": String,
    "PricingCycle": String,
    "InternetChargeType": String,
    "Bandwidth": Number
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	Yes	Released	The ID of the resource group to which the RDS instance belongs.	None
Bandwidth	Number	Erased	Released	The network bandwidth. Unit: Mbit/s.	If this parameter is not specified, the default value 5Mbps is used.
InternetChargeType	String	Yes	Released	The billing method for network usage. Default value: PayByBandwidth.	Valid values: <ul style="list-style-type: none"> PayByBandwidth: pay-by-bandwidth. PayByTraffic Default value: PayByBandwidth.
InstanceChargeType	String	Yes	Released	The billing method of the Elastic IP address. Default value: Postpaid.	Valid values: <ul style="list-style-type: none"> Prepaid Postpaid: pay-as-you-go Default value: PostPaid.
PricingCycle	String	Yes	Released	The billing cycle of the subscription. Default value: Month.	Valid values: <ul style="list-style-type: none"> Month: paid by month. Year Default value: Month. <div style="border: 1px solid #ccc; background-color: #e0f2f1; padding: 5px; margin-top: 10px;"> <p> Note This parameter is required when InstanceChargeType is set to Prepaid.</p> </div>

Parameter	Type	Required	Editable	Description	Constraint
Period	Number	Erased	Released	The subscription period.	<p>Valid values:</p> <ul style="list-style-type: none"> If pay by month is selected, the billing method can be a fee of 1 to 9. If pay-as-you-go is selected, the payment can be in the range of 1 to 3. <p>Default value: 1</p> <p> Note This parameter is required when InstanceChargeType is set to Prepaid.</p>
AutoPay	Boolean	Erased	Released	Specifies whether to enable automatic payment.	<p>Valid values:</p> <ul style="list-style-type: none"> false: Automatic payment is disabled. After an order is generated, you must go to the Order Center to make the payment. true: Automatic payment is enabled. Payments are automatically made. <p> Note This parameter is required when InstanceChargeType is set to Prepaid.</p>
Isp	String	Yes	Released	The ISP tag used for Finance Cloud. This parameter takes effect only when your region is set to China (Hangzhou).	This parameter is ignored if you are not a Finance Cloud user.

Response parameters

Fn::GetAtt

- **EipAddress**: the allocated Elastic IP address.
- **AllocationId**: the ID of the instance that the Elastic IP address is allocated to.
- **OrderId**: The order ID that is returned when you set the InstanceChargeType parameter to Prepaid.

Sample request

```

{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "Eip": {
      "Type": "ALIYUN::VPC::EIP",
      "Properties": {
        "InternetChargeType": "PayByTraffic",
        "Bandwidth": 200
      }
    }
  },
  "Outputs": {
    "EipAddress": {
      "Value": {"Fn::GetAtt": ["Eip", "EipAddress"]}
    },
    "AllocationId": {
      "Value": {"Fn::GetAtt": ["Eip", "AllocationId"]}
    },
    "OrderId": {
      "Value": {"Fn::GetAtt": ["Eip", "OrderId"]}
    }
  }
}

```

5.5.7.2. ALIYUN::VPC::EIPAssociation

ALIYUN::VPC::EIPAssociation is used to associate an Elastic IP address with a cloud service instance.

Statement

```

{
  "Type": "ALIYUN::VPC::EIPAssociation",
  "Properties": {
    "AllocationId": String,
    "InstanceId": String,
    "PrivateIpAddress": String,
    "Mode": String
  }
}

```

Properties

Parameter	Type	Required	Editable	Description	Constraint
AllocationId	String	No	Yes	The ID of the Elastic IP address.	None

Parameter	Type	Required	Editable	Description	Constraint
InstanceId	String	No	Yes	The ID of the cloud service instance.	The following instance types are supported: <ul style="list-style-type: none"> VPC-connected ECS instances VPC-connected SLB instances NAT gateways HAVIP Elastic network interfaces
PrivateIpAddresses	String	Yes	True	The private IP address in the CIDR block of the VSwitch.	None
Mode	String	Yes	True	The association mode.	Valid values: <ul style="list-style-type: none"> NAT MULTI_BINDED

Response parameters

Fn::GetAtt

- EipAddress: The allocated Elastic IP address.
- AllocationId: The ID of the instance to which the Elastic IP address is allocated.

5.5.7.3. ALIYUN::VPC::PeeringRouterInterfaceBinding

ALIYUN::VPC::PeeringRouterInterfaceBinding is used to associate two router interfaces to be interconnected.

Statement

```
{
  "Type": "ALIYUN::VPC::PeeringRouterInterfaceBinding",
  "Properties": {
    "OppositeRouterId": String,
    "OppositeInterfaceId": String,
    "OppositeInterfaceOwnerId": String,
    "RouterInterfaceId": String
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
RouterInterfaceId	String	No	No	The ID of the router interface.	None
OppositeInterfaceId	String	No	No	The ID of the peer router interface.	None
OppositeRouterId	String	Yes	Released	The ID of the router to which the peer router interface belongs.	None
OppositeInterfaceOwnerId	String	Yes	Released	The ID of the owner of the peer router interface.	None

Response parameters

Fn::GetAtt

RouterInterfaceId: the ID of the vRouter.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "InitiatorRouterInterfaceBinding": {
      "Type": "ALIYUN::VPC::PeeringRouterInterfaceBinding",
      "Properties": {
        "RouterInterfaceId": "ri-2zedgo0ih64g1me29****",
        "OppositeInterfaceId": "ri-2zex1tkyym98pjaor****",
        "OppositeRouterId": "vrt-2zexb35tzorIU0286****"
      }
    }
  }
}
```

5.5.7.4. ALIYUN::VPC::PeeringRouterInterfaceConnection

ALIYUN::VPC::PeeringRouterInterfaceConnection is used to initiate a router interface connection.

Statement

```
{
  "Type": "ALIYUN::VPC::PeeringRouterInterfaceConnection",
  "Properties": {
    "OppositeInterfaceId": String,
    "RouterInterfaceId": String
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
OppositeInterfaceId	String	No	No	The ID of the acceptor router interface.	None
RouterInterfaceId	String	No	No	The ID of the router interface to initiate the connection.	None

Response parameters

Fn::GetAtt

- **OppositeInterfaceId**: the ID of the acceptor router interface.
- **RouterInterfaceId**: the ID of the router interface that initiates the connection.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "InitiatorRouterInterfaceBinding": {
      "Type": "ALIYUN::VPC::PeeringRouterInterfaceConnection",
      "Properties": {
        "RouterInterfaceId": "ri-2zedgo0ih64g1me29****",
        "OppositeInterfaceId": "ri-2ze4k5n2aeardu8cy****"
      }
    }
  }
}
```

5.5.7.5. ALIYUN::VPC::RouterInterface

ALIYUN::VPC::RouterInterface is used to create a router interface.

Syntax

```
{
  "Type": "ALIYUN::VPC::RouterInterface",
  "Properties": {
    "OppositeRegionId": String,
    "Description": String,
    "HealthCheckSourceIp": String,
    "RouterType": String,
    "AccessPointId": String,
    "RouterId": String,
    "Role": String,
    "OppositeInterfaceOwnerId": String,
    "OppositeAccessPointId": String,
    "HealthCheckTargetIp": String,
    "OppositeRouterId": String,
    "Spec": String,
    "OppositeRouterType": String,
    "Name": String,
    "PricingCycle": String,
    "Period": Number,
    "AutoPay": Boolean,
    "InstanceChargeType": String
  }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
RouterId	String	Yes	No	The ID of the router	None
Role	String	Yes	No	The role of the router interface.	<ul style="list-style-type: none"> When RouterType is set to VBR, set the value to InitiatingSide. When OppositeRouterType is set to VBR, set the value to AcceptingSide.
RouterType	String	No	No	The type of the router to which the router interface belongs.	Valid values: <ul style="list-style-type: none"> VRouter VBR

Property	Type	Required	Editable	Description	Constraint
AccessPointId	String	No	No	The ID of the access point of the router interface.	<ul style="list-style-type: none"> This parameter is required when RouterType is set to VBR. The access point ID cannot be modified after the router interface is created. This parameter is not required when RouterType is set to VRouter.
Spec	String	No	No	The specifications of the router interface.	<p>The following list includes available specifications and the corresponding bandwidth values:</p> <ul style="list-style-type: none"> Mini.2: 2 Mbit/s Mini.5: 5 Mbit/s Small.1: 10 Mbit/s Small.2: 20 Mbit/s Small.5: 50 Mbit/s Middle.1: 100 Mbit/s Middle.2: 200 Mbit/s Middle.5: 500 Mbit/s Large.1: 1,000 Mbit/s Large.2: 2,000 Mbit/s Large.5: 5,000 Mbit/s Xlarge.1: 10,000 Mbit/s <div style="background-color: #e1f5fe; padding: 10px; border: 1px solid #cfcfcf;"> <p> Note</p> <ul style="list-style-type: none"> This parameter is required when Role is set to InitiatingSide. The value Negative is used by default when Role is set to AcceptingSide. </div>

Property	Type	Required	Editable	Description	Constraint
OppositeRegionId	String	No	No	The region ID of the peer router interface.	None
OppositeInterfaceOwnerId	String	No	No	The ID of the owner of the peer router interface.	The default value is the ID of the current user.
OppositeRouterId	String	No	No	The ID of the router to which the peer router interface belongs.	None
OppositeRouterType	String	No	No	The type of the router to which the peer router interface belongs.	Valid values: <ul style="list-style-type: none"> When RouterType is set to VBR, set the value to VRouter. VBR
OppositeAccessPointId	String	No	No	The ID of the access point of the peer router interface.	<ul style="list-style-type: none"> When OppositeRouterType is set to VBR, this parameter is required. The access point ID cannot be modified after the router interface is created. When OppositeRouterType is set to VRouter, this parameter is not required. When OppositeRouterType is set to VBR, the VBR specified by the OppositeRouterId parameter must be in the access point specified by the OppositeAccessPointId parameter.
Description	String	No	No	The description of the router interface.	<p>The description must be 2 to 256 characters in length. It cannot start with <code>http://</code> or <code>https://</code>.</p> <p>The parameter is empty by default.</p>

Property	Type	Required	Editable	Description	Constraint
Name	String	No	No	The display name of the router interface.	<ul style="list-style-type: none"> The name must be 2 to 128 characters in length and can contain letters, digits, periods(.), underscores (_), and hyphens (-). It must start with a letter but cannot start with <code>http://</code> or <code>https://</code>.
HealthCheckSourceIp	String	No	No	The source IP address of health check packets used in leased line disaster recovery and ECMP scenarios.	<p>This parameter is valid only for VRouter interfaces with a peer router interface on a VBR.</p> <p>It must be an unused IP address in the VPC where the local VRouter is located.</p> <p>The HealthCheckSourceIp and HealthCheckTargetIp parameters must either both be specified or both left unspecified.</p>

Property	Type	Required	Editable	Description	Constraint
HealthCheckTargetIp	String	No	No	The destination IP address of health check packets used in leased line disaster recovery and ECMP scenarios.	<p>This parameter is valid only for VRouter interfaces with a peer router interface on a VBR. Typically, you can use the IP address of a customer premises equipment (CPE) on the user side of the leased line, which is the IP address of the peer gateway on the VBR where the peer router interface is located. You can also specify another IP address on the user side of the leased line as the destination IP address.</p> <p>The HealthCheckSourceIp and HealthCheckTargetIp parameters must either both be specified or both left unspecified.</p>
PricingCycle	String	No	No	The billing cycle of the subscription.	<p>Valid values:</p> <ul style="list-style-type: none"> Month Year
Period	Number	No	No	The subscription duration.	<ul style="list-style-type: none"> Valid values when the PricingCycle parameter is set to Month: 1 to 9. Valid values when the PricingCycle parameter is set to Year: 1 to 3.
AutoPay	Boolean	No	No	Specifies whether to enable automatic payment.	<p>Default value: false.</p> <p>Valid values:</p> <ul style="list-style-type: none"> true false
InstanceChargeType	String	No	No	The billing method of the instance.	<p>Valid values:</p> <ul style="list-style-type: none"> Postpaid: pay-as-you-go Prepaid: subscription

Response parameters

Fn::GetAtt

RouterInterfaceId: the ID of the router interface.

Examples

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "RouterInterface": {
      "Type": "ALIYUN::VPC::RouterInterface",
      "Properties": {
        "Name": "RouterInterface_1",
        "Description": "VPC initiator RouterInterface",
        "RouterId": "vrt-2ze2i147e5n0bicoe****",
        "Role": "AcceptingSide",
        "OppositeRegionId": "cn-beijing",
        "HealthCheckSourceIp": "10.0.XX.XX",
        "HealthCheckTargetIp": "192.168.XX.XX"
      }
    }
  },
  "Outputs": {
    "RouterInterfaceId": {
      "Value": {"Fn::GetAtt": ["RouterInterface", "RouterInterfaceId"]}
    }
  }
}
```

6.Object Storage Service (OSS)

6.1. What is OSS?

Object Storage Service (OSS) is a secure, cost-effective, and highly reliable cloud storage service provided by Alibaba Cloud. It enables you to store a large amount of data in the cloud.

OSS is an immediately available storage solution that has unlimited storage capacity. Compared with user-created server storage, OSS has outstanding advantages in reliability, security, cost-effectiveness, and data processing capabilities. OSS enables you to store and retrieve a variety of unstructured data objects, such as texts, images, audios, and videos over the network at any time.

OSS is an object storage service based on key-value pairs. Files uploaded to OSS are stored as objects in buckets. You can obtain the content of an object based on the object key.

In OSS, you can:

- Create a bucket and upload objects to the bucket.
- Obtain an object URL from OSS to share or download the object.
- Modify the attributes or metadata of a bucket or an object, and configure ACL for the bucket or the object.
- Perform basic and advanced operations in the OSS console.
- Perform basic and advanced operations by using SDKs or calling RESTful API operations in your application.

6.2. Usage notes

Before you use OSS, you must understand the following content:

To allow other users to use all or part of OSS features, you must create RAM users and grant permissions to the users by configuring RAM policies.

Before you use OSS, you must also understand the following limits.

Item	Limit
Bucket	<ul style="list-style-type: none"> • You can create up to 100 buckets. • After a bucket is created, its name and region cannot be modified.
Upload objects	<ul style="list-style-type: none"> • Objects larger than 5 GB cannot be uploaded by using the following modes: console upload, simple upload, form upload, or append upload. To upload an object that is larger than 5 GB, you must use multipart upload. The size of an object uploaded by using multipart upload cannot exceed 48.8 TB. • If you upload an object that has the same name of an existing object in OSS, the new object will overwrite the existing object.
Delete objects	<ul style="list-style-type: none"> • Deleted objects cannot be recovered. • You can delete up to 100 objects at a time in the OSS console. To delete more than 100 objects at a time, you must call an API operation or use an SDK.
Lifecycle	You can configure up to 1,000 lifecycle rules for each bucket.

6.3. Quick start

6.3.1. Log on to the OSS console

This topic describes how to log on to the OSS console.

Prerequisites

- The domain name of the ASCM console is obtained from the deployment personnel before you log on to the ASCM console.
- A browser is available. We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL used to access the ASCM console. Press Enter.
2. Enter your username and password.

Obtain the username and password used to log on to the console from the operations administrator.

 **Note** When you log on to the ASCM console for the first time, you must change the password of your username. For security reasons, your password must meet the minimum complexity requirements. The password must be 8 to 20 characters in length and must contain at least two of the following character types:

- Uppercase or lowercase letters.
- Digits.
- Special characters. Special characters include exclamation points (!), at signs (@), number signs (#), dollar signs (\$), and percent signs (%).

3. Click **Login** to go to the ASCM console homepage.
4. In the top navigation bar, choose **Products > Object Storage Service**.

6.3.2. Create buckets

Objects uploaded to OSS are stored in a bucket. Create a Bucket before you upload any objects to OSS.

Context

The attributes of a bucket include the region, ACL, and other metadata.

Procedure

1. **Log on to the OSS console.**
2. In the left-side navigation pane, click **Create Bucket** if no buckets are available. In the **Create OSS Bucket** dialog box that appears, configure parameters.

 **Note** In the left-side navigation pane, click the + icon next to **Buckets** if buckets exist. The **Create OSS Bucket** dialog box appears.

The following table describes the parameters used to create a bucket.

Parameters

Parameter	Description
Organization	Select an organization from the drop-down list for the bucket.
Resource Set	Select a resource set from the drop-down list for the bucket.

Parameter	Description
Region	<p>Select a region from the drop-down list for the bucket.</p> <div style="background-color: #e6f2ff; padding: 10px; border: 1px solid #d9e1f2;"> <p> Note</p> <ul style="list-style-type: none"> ◦ The region of a bucket cannot be changed after the bucket is created. ◦ If you want to access OSS from your ECS instance over the internal network, select the region where your ECS instance is deployed. </div>
Cluster	Select a cluster for the bucket. Two OSS clusters can be deployed in Apsara Stack.
Bucket Name	<p>Enter the name of the bucket.</p> <div style="background-color: #e6f2ff; padding: 10px; border: 1px solid #d9e1f2;"> <p> Note</p> <ul style="list-style-type: none"> ◦ The bucket name must comply with the naming conventions. ◦ The bucket name must be globally unique among all the existing buckets in Alibaba Cloud OSS. ◦ The bucket name cannot be changed after the bucket is created. </div>
Storage Class	Currently, only Standard buckets are supported.
Capacity	<p>Set the capacity of the bucket:</p> <ul style="list-style-type: none"> ◦ Unlimited: The capacity is unlimited. ◦ Custom: Select this option to set the capacity of the bucket. Valid values: 0 to 2000000. Unit: TB.
Access Control List (ACL)	<p>Set the ACL of the bucket. The following options are available:</p> <ul style="list-style-type: none"> ◦ Private: Only the owner or authorized users of this bucket can read and write objects in the bucket. Other users, including anonymous users cannot access objects in the bucket without authorization. ◦ Public Read: Only the owner or authorized users of this bucket can read and write objects in the bucket. Other users, including anonymous users can only read objects in the bucket. ◦ Public Read/Write: Any users, including anonymous users can read and write objects in the bucket. Fees incurred by such operations are paid by the owner of the bucket. Exercise caution when you configure this option. <div style="background-color: #e6f2ff; padding: 10px; border: 1px solid #d9e1f2;"> <p> Note After a bucket is created, you can modify its ACL. For more information, see Modify bucket ACLs.</p> </div>

Parameter	Description
Server-side Encryption	Configure server-side encryption: <ul style="list-style-type: none"> ◦ No: Server-side encryption is not performed. ◦ AES256: OSS server-side encryption uses AES256 to encrypt each object in the bucket with a different data key. CMKs used to encrypt data keys are rotated regularly. ◦ SM4: OSS server-side encryption uses SM4 to encrypt each object in the bucket with a different data key. CMKs used to encrypt data keys are rotated regularly.

3. Click **Submit**.

6.3.3. Upload objects

After you create a bucket, you can upload objects to it.

Prerequisites

A bucket is created. For more information about how to create a bucket, see [Create buckets](#).

Context

You can upload an object of any format to a bucket. You can use the OSS console to upload an object up to 5 GB in size. To upload an object larger than 5 GB, use an SDK or call an API operation.

Procedure

1. [Log on to the OSS console](#).
2. In the left-side navigation pane, click the name of the bucket to which you want to upload objects to go to the bucket details page.
3. Click the **Files** tab.
4. Click **Upload**. The **Upload** dialog box appears.
5. In the **Upload To** section, set the directory to which the object will be uploaded.
 - **Current**: Objects are uploaded to the current folder.
 - **Specified**: Objects are uploaded to the specified folder. OSS creates the specified folder automatically and uploads the object to it.

 **Note** For more information about folders, see [Create folders](#).

6. In the **File ACL** section, select the ACL of the object to upload. By default, an object inherits the ACL of the bucket to which it belongs.
7. Drag and drop one or more objects to upload to the **Upload** field, or click **Upload** to select one or more objects to upload.

 **Note**

- If the uploaded object has the same name as an existing object in the bucket, the existing object will be overwritten.
- During object upload, do not refresh or close the page. Otherwise, the upload queue will be interrupted and cleared.
- The name of the uploaded object must comply with the following conventions:
 - The name can contain only UTF-8 characters.
 - The name is case-sensitive.
 - The name must be 1 to 1,023 bytes in length.
 - The name cannot start with a forward slash (/) or backslash (\).

8. After the object is uploaded, refresh the Files tab to view the uploaded object.

6.3.4. Obtain object URLs

You can obtain the URL of an object uploaded to a bucket. This URL can be used to share or download the object.

Prerequisites

- A bucket is created. For more information about how to create a bucket, see [Create buckets](#).
- Objects are uploaded to the bucket. For more information about how to upload objects, see [Upload objects](#).

Procedure

1. [Log on to the OSS console](#).
2. In the left-side navigation pane, click the name of the bucket that stores the target object to go to the bucket details page.
3. Click the **Files** tab. The list of objects appears.
4. Click the name of the target object. In the **Preview** dialog box that appears, click **Copy File URL** under the URL field. You can also choose **More > Copy File URL** in the Actions column corresponding to the object. In the dialog box that appears, click **Copy**. You can send the URL to other users so that they can view or download the object.

6.4. Buckets

6.4.1. View bucket information

You can view the details of created buckets in the OSS console.

Prerequisites

A bucket is created. For more information about how to create a bucket, see [Create buckets](#).

Procedure

1. [Log on to the OSS console](#).
2. In the left-side navigation pane, click the name of the target bucket.
3. On the bucket details page that appears, click the **Overview** tab. View the bucket domain names and basic settings.

6.4.2. Delete buckets

You can delete buckets in the OSS console.

Prerequisites

All objects and parts stored in the bucket are deleted. For more information about how to delete objects and parts, see [Delete objects](#) and [Manage parts](#).

 **Warning** Deleted objects, parts, and buckets cannot be recovered. Exercise caution when you delete objects, parts, and buckets.

Procedure

1. [Log on to the OSS console](#).
2. In the left-side navigation pane, click the name of a bucket to go to the bucket details page.
3. On the bucket details page that appears, click **Delete Bucket** in the upper right corner. In the message that appears, click **OK**.

6.4.3. Modify bucket ACLs

You can modify the access control list (ACL) of a bucket in the OSS console to control access to the bucket.

Prerequisites

A bucket is created. For more information about how to create a bucket, see [Create buckets](#).

Context

OSS provides ACL to control access to buckets. By default, the ACL of a bucket is private when you create the bucket. You can modify the ACL of a bucket after the bucket is created.

OSS provides ACL for buckets. The following ACLs are available for a bucket:

- **Private:** Only the owner or authorized users of the bucket can read and write the object.
- **Public read:** Only the owner or authorized users of this bucket can write the object. Other users, including anonymous users can only read the object.
- **Public read/write:** Any users, including anonymous users can read and write the object. Fees incurred by such operations are paid by the owner of the bucket. Exercise caution when you configure this option.

 **Warning** If you set ACL to public read or public read/write, other users can directly read the data in the bucket without authentication, resulting in security risks. For data security reasons, we recommend that you set the bucket ACL to private.

Procedure

1. [Log on to the OSS console](#).
2. In the left-side navigation pane, click the name of the bucket for which you want to modify ACL to go to the bucket details page.
3. On the bucket details page, click the **Basic Settings** tab. Find the **Access Control List (ACL)** section.
4. Click **Configure**. Modify the bucket ACL.
5. Click **Save**.

6.4.4. Configure static website hosting

You can configure static website hosting in the OSS console so that users can access the static website by using the bucket domain name.

Prerequisites

A bucket is created. For more information about how to create a bucket, see [Create buckets](#).

Context

Static website hosting is not enabled if the default pages are not specified.

After the default homepage is configured, the default homepage is displayed if you access the root domain name of the static website or any URL that ends with a forward slash (/) under this domain name.

Procedure

1. [Log on to the OSS console.](#)
2. In the left-side navigation pane, click the name of a bucket to go to the bucket details page.
3. On the bucket details page, click the **Basic Settings** tab. Find the **Static Pages** section.
4. Click **Configure**. Configure the following parameters:
 - **Default Homepage:** Specify the name of the index document that links to the index page. The index page functions similar to index.html. Only HTML objects in the root folder can be used. The default homepage is disabled if you do not specify this parameter.
 - **Default 404 Page:** Specify the name of the error document that links to the error page displayed when the requested resource does not exist. Only HTML, JPG, PNG, BMP, or WebP objects in the root folder can be used. Default 404 Page is disabled if you do not specify this parameter.
5. Click **Save**.

6.4.5. Configure hotlink protection

You can configure hotlink protection for a bucket in the OSS console to prevent unauthorized domain names from accessing the data in your bucket.

Prerequisites

A bucket is created. For more information about how to create a bucket, see [Create buckets](#).

Context

OSS provides hotlink protection to prevent other domain names from accessing your data in OSS. You can configure the Referer field in the HTTP header to implement hotlink protection. You can configure a Referer whitelist for a bucket and configure whether to allow access requests that have an empty Referer field in the OSS console. For example, you can add `http://www.aliyun.com` to the Referer whitelist for a bucket named `oss-example`. Then, requests whose Referer field is set to `http://www.aliyun.com` can access the objects in the `oss-example` bucket.

Procedure

1. [Log on to the OSS console.](#)
2. In the left-side navigation pane, click the name of the bucket to go to the bucket details page.
3. On the bucket details page, click the **Basic Settings** tab. Find the **Hotlink Protection** section.
4. Click **Configure**. Configure the following parameters:
 - **Referer Whitelist:** Add URLs to the whitelist. Referers are typically in URL format. Separate multiple Referers with break lines. You can use question marks (?) and asterisks (*) as wildcard characters.
 - **Allow Empty Referer:** Specify whether to allow requests whose Referer field is empty. If you do not allow empty Referers, only HTTP or HTTPS requests which include the corresponding Referer field value can access the objects in the bucket.
5. Click **Save**.

6.4.6. Configure logging

You can enable or disable bucket logging in the OSS console.

Prerequisites

A bucket is created. For more information about how to create a bucket, see [Create buckets](#).

Context

You can store access logs in the current bucket or in a new bucket.

Procedure

1. [Log on to the OSS console](#).
2. In the left-side navigation pane, click the name of the bucket to go to the bucket details page.
3. On the bucket details page that appears, click the **Basic Settings** tab. Find the **Logging** section.
4. Click **Configure**. Turn on **Logging**. Select **Destination Bucket** and set **Log Prefix**.
 - **Destination Bucket:** Select the name of the bucket in which access logs are to be stored from the drop-down list. You must be the owner of the selected bucket and the bucket must be in the same region as the bucket for which logging is enabled.
 - **Log Prefix:** Enter the prefix and folder where the access logs are stored. If you specify *log/<TargetPrefix>*, the access logs are stored in the *log/* directory.
5. Click **Save**.

6.4.7. Configure CORS

You can configure cross-origin resource sharing (CORS) in the OSS console to enable cross-origin access.

Prerequisites

A bucket is created. For more information about how to create a bucket, see [Create buckets](#).

Context

OSS provides CORS over HTML5 to implement cross-origin access. When OSS receives a cross-origin request (or an OPTIONS request) for a bucket, OSS reads the CORS rules of the bucket and checks the relevant permissions. OSS matches the rules one by one. When OSS finds the first match, OSS returns a corresponding header. If no match is found, OSS does not include any CORS header in the response.

Procedure

1. [Log on to the OSS console](#).
2. In the left-side navigation pane, click the name of the bucket to go to the bucket details page.
3. On the bucket details page, click the **Basic Settings** tab. Find the **Cross-Origin Resource Sharing (CORS)** section. Click **Configure**.
4. Click **Create Rule**. In the **Create Rule** dialog box that appears, configure the following parameters.

Parameter	Required	Description
Sources	Yes	Specifies the sources from which you want to allow cross-origin requests. You can configure multiple origins and separate them with break lines. Each origin can contain only one asterisk (*) wildcard. If Sources is set to asterisk (*), all cross-origin requests are allowed.
Allowed Methods	Yes	Specifies the cross-origin request methods that are allowed.

Parameter	Required	Description
Allowed Headers	No	Specifies the allowed headers in a cross-origin request. Allowed headers are case-insensitive. You can configure multiple headers and separate them with break lines. Each allowed header can contain only one asterisk (*) wildcard. Set this parameter to an asterisk (*) if there are no special requirements.
Exposed Headers	No	Specifies the list of headers that can be exposed to the browser. The headers are the response headers that allow access from an application such as XMLHttpRequest in JavaScript. No asterisk (*) wildcards are allowed.
Cache Timeout (Seconds)	No	Specifies the time the browser can cache the response to a preflight (OPTIONS) request to a specific resource.

 **Note** You can configure up to 10 rules for each bucket.

5. Click OK.

6.4.8. Manage lifecycle rules

You can define and manage lifecycle rules for a bucket in the OSS console.

Prerequisites

A bucket is created. For more information about how to create a bucket, see [Create buckets](#).

Context

You can define a rule for a full set or a subset by specifying the prefix keyword of objects in a bucket. A rule applies to all objects that match the rule. You can manage lifecycle rules to perform operations, such as object management and automatic part deletion.

Notice

- If an object matches a rule, data of the object is deleted within two days from the effective date.
- Data that is deleted based on a lifecycle rule cannot be recovered. Configure a rule only when necessary.

Procedure

1. [Log on to the OSS console](#).
2. In the left-side navigation pane, click the name of the bucket to go to the bucket details page.
3. Click the **Basic Settings** tab. Find the **Lifecycle** section. Click **Configure**.
4. Click **Create Rule**. In the **Create Rule** dialog box that appears, configure the following parameters:
 - **Status**: Configure the status of the rule: **Enabled** or **Disabled**.
 - **Applied To**: You can select **Files with Specified Prefix** or **Whole Bucket**. **Files with Specified Prefix** indicates that this rule applies to objects whose names contain a specified prefix. **Whole Bucket** indicates that this rule applies to all objects in the bucket.

 **Note** If you select **Files with Specified Prefix**, you can configure multiple lifecycle rules that have different prefixing configurations for objects. If you select **Whole Bucket**, only one lifecycle rule can be configured. In addition, if you have created a rule that has **Files with Specified Prefix** configured, you cannot create another rule that has **Whole Bucket** configured for the same bucket.

- **Prefix:** If you set **Applied To** to **Files with Specified Prefix**, you must enter the prefix of the objects to which to apply the rule. If you want to match objects whose names start with `img`, enter `img`.
- **File Lifecycle:** Configure operations to perform on expired objects. You can select **Validity Period (Days)**, **Expiration Date**, or **Disabled**.
 - **Validity Period (Days):** Specify the number of days within which parts can be retained after they are last modified. After the validity period, expired parts are deleted. If you set **Validity Period (Days)** to 30, objects that are last modified on January 1, 2016 are scanned for by the backend application and deleted on January 31, 2016.
 - **Expiration Date:** Specify the date before which parts that are last modified expire and the operation to perform on these parts after they expire. If you select **Delete** and set **Expiration Date** to 2012-12-21, the backend application scans for objects that are last modified before December 21, 2012 and delete those objects.
 - **Disabled:** The automatic object deletion function is not enabled.
- **Delete:** If you select **Validity Period (Days)** or **Expiration Date** for **File Lifecycle**, you can select **Delete** to delete objects based on the validity period or expiration time. If you select **Disabled**, the rule becomes invalid.
- **Part Lifecycle:** Configure the delete operation to perform on expired parts. You can select **Validity Period (Days)**, **Expiration Date**, or **Disabled**.
 - **Validity Period (Days):** Specify the number of days within which parts can be retained after they are last modified. After the validity period, expired parts are deleted. If you set **Validity Period (Days)** to 30, the backend application scans for parts that are last modified before January 1, 2016 and deletes them on January 31, 2016.
 - **Expiration Date:** Specify the date before which parts that are last modified expire and the operation to perform on these parts after they expire. If you set **Expiration Date** to 2012-12-21, parts that are last modified before this date are scanned for and deleted by the backend application.
 - **Disabled:** The automatic part deletion function is not enabled.
- **Delete:** If you select **Validity Period (Days)** or **Expiration Date** for **Part Lifecycle**, you can select **Delete** to delete parts based on the validity period or expiration time. If you select **Disabled**, the rule becomes invalid.

 **Notice** In each lifecycle rule, you must configure at least object lifecycle or part lifecycle. In other words, you must select **Delete** or configure conversion actions for object lifecycle or select **Delete** for part lifecycle.

5. Click **OK**.

6.4.9. Configure storage quota

You can specify the storage quota of a bucket in the OSS console to limit the bucket size. You can specify the storage quota of a bucket when you create the bucket. You can also configure the storage quota of a created bucket. This topic describes how to configure the storage quota of a created bucket.

Prerequisites

A bucket is created. For more information about how to create a bucket, see [Create buckets](#).

Context

After a storage quota is configured for a bucket, if the bucket size exceeds the quota, write operations, including PutObject, MultipartUpload, CopyObject, PostObject, AppendObject, cannot be performed on the bucket. Before configuring the quota of a bucket, ensure that it does not affect your business.

 **Notice** In general, OSS takes one hour to determine whether the bucket size exceeds the quota. In some cases, more than one hour is required for OSS to detect that the bucket size exceeds the quota.

Procedure

1. [Log on to the OSS console](#).
2. In the left-side navigation pane, click the name of the bucket for which you want to configure storage quota to go to the bucket details page.
3. On the bucket details page, click the **Basic Settings** tab. Find the **Storage Quota** section.
4. Click **Configure**. Turn on **Storage Quota** and set the **Storage Quota** value.
 - Units: TB or GB.
 - Valid values: -1 to 2000000

The default value is -1, indicating that the bucket size is not limited.
5. Click **Save**.

6.4.10. Configure cluster-disaster recovery

In cluster-disaster recovery mode, buckets with the same name are replicated. Cluster-based disaster recovery is automatically enabled based on configurations made when the cluster is created. In other words, after a primary bucket is created, a secondary bucket with the same name is automatically created. Information stored in the primary bucket is automatically synchronized to the secondary bucket. By default, this function is enabled.

Prerequisites

A bucket is created. For more information about how to create a bucket, see [Create buckets](#).

Procedure

1. [Log on to the OSS console](#).
2. In the left-side navigation pane, click the name of a bucket for which you want to configure cluster-disaster recovery to go to the bucket details page.
3. On the bucket details page, click the **Basic Settings** tab. Find the **Cluster-disaster Recovery** section.
4. Click **Configure**. Turn on or turn off **Cluster-disaster Recovery**.
5. Click **Save**.

6.4.11. Configure CRR

Cross-region replication (CRR) enables the automatic and asynchronous (near real-time) replication of objects across buckets in different OSS regions. Operations such as the creation, overwriting, and deletion of objects can be synchronized from the source bucket to the destination bucket.

Prerequisites

The steps described in [Create buckets](#) are performed or a bucket is created in the region.

Context

This feature meets the requirements of geo-disaster recovery or data replication. Objects in the destination bucket are extra replicas of objects in the source bucket. They have the same object names, object content, and object metadata such as the creation time, owner, user metadata, and object ACL.

Procedure

1. Log on to the OSS console.
2. In the left-side navigation pane, click the name of a bucket for which you want to configure CRR to go to the bucket details page.
3. On the bucket details page, click the **Basic Settings** tab. Find the **Cross-Region Replication** section.
4. Click **Enable**. In the **Cross-Region Replication** dialog box that appears, configure the parameters described in the following table.

Parameter	Description
Source Region	The region where the current bucket is located.
Source Bucket	The name of the current bucket.
Destination Region	Select the region where the destination bucket is located. The source and destination buckets for CRR must be located in different regions. Data cannot be synchronized between buckets located within the same region.
Destination Bucket	Select the destination bucket. The two buckets with CRR enabled cannot synchronize data with other buckets. If you synchronize data from Bucket A to Bucket B, neither Bucket A nor Bucket B can synchronize data with other buckets.
Applied To	Select the source data to synchronize. <ul style="list-style-type: none"> ◦ All Files in Source Bucket: synchronizes all objects from the source bucket to the destination bucket. ◦ Files with Specified Prefix: synchronizes the objects whose names contain the specified prefix from the source bucket to the destination bucket. For example, if you have a folder named <i>management/</i> in the root folder of a bucket and a subfolder named <i>abc/</i> in <i>management/</i>, when you want to synchronize objects in the <i>abc/</i> subfolder, enter <i>management/abc/</i> as the prefix. You can specify up to five prefixes.
Operations	Select the synchronization policy. <ul style="list-style-type: none"> ◦ Add/Change: synchronizes only added or changed data from the source bucket to the destination bucket. ◦ Add/Delete/Change: synchronizes all data changes such as the creation, overwriting, and deletion of objects from the source bucket to the destination bucket.
Replicate Historical Data	Specify whether to synchronize historical data before you enable CRR. <ul style="list-style-type: none"> ◦ Yes: synchronizes historical data to the destination bucket. <div style="background-color: #e6f2ff; padding: 5px; margin: 5px 0;"> <p> Notice When historical data is synchronized, objects in the source bucket may overwrite objects in the destination bucket if these objects have the same name. Before you select this option, ensure that the data is consistent.</p> </div> <ul style="list-style-type: none"> ◦ No: synchronizes only objects that you want to upload or update after CRR is enabled to the destination bucket.

5. Click **OK**.

 Note

- After the configuration is complete, it may take three to five minutes for CRR to take effect. Synchronization information is displayed after the source bucket is synchronized.
- In CRR, data is asynchronously (near real-time) replicated. It takes several minutes to several hours for the data to be replicated to the destination bucket based on the amount of data.

6.4.12. Access OSS through custom domain names

You can bind a custom domain name to your bucket and add a CNAME record that points to the public endpoint of your bucket. After the CNAME record is added, you are directed to your bucket when you access the custom domain name.

Prerequisites

A bucket is created. For more information about how to create a bucket, see [Create buckets](#).

Step 1: Bind the custom domain name to the bucket

You can use OSS SDK for Java to bind the custom name to the bucket. For the sample code, visit [Bind custom domain name](#).

Step 2: Configure the CNAME record

The domain name of Alibaba Cloud is used as an example to show how to configure the CNAME record.

1. Log on to the DNS console.
2. On the Manage DNS page, click **Configure** in the Actions column corresponding to the target domain name.
3. On the DNS Settings page, click **Add Record**. In the Add Record dialog box, configure parameters listed in the following table.

Parameter	Description
Type	Select the type of the record to direct requests. In this example, select <i>CNAME</i> .
Host	Enter the host record based on the prefix of the domain name. Examples: <ul style="list-style-type: none"> ○ If the domain name is <code>www.aliyun.com</code>, enter <code>www</code>. ○ If the domain name is <code>aliyun.com</code>, enter <code>@</code>. ○ If the domain name is <code>abc.aliyun.com</code>, enter <code>abc</code>. ○ If the domain is a second-level domain such as <code>a.aliyun.com</code> or <code>b.aliyun.com</code>, enter an asterisk (*).
ISP Line	Select the ISP line used to resolve the domain name. We recommend that you select <i>Default</i> to allow the system to select the optimal line.
Value	Enter the value of the record based on the selected record type. In this example, enter the public endpoint of the bucket.
TTL	Select the update interval of the record. In this example, select the default value.

4. Click **OK**.

 **Note** A new CNAME record takes effect immediately. It takes up to 72 hours for the modified CNAME record to take effect.

Verify CNAME status

After a CNAME record is configured, the period required for the record to take effect varies with different DNS providers. You can run the `ping` or `lookup` command to access the added domain name. If the access is directed to the bucket endpoint, the CNAME configuration has taken effect.

6.5. Objects

6.5.1. Search for objects

You can search buckets or folders for objects whose names contain a specified prefix in the OSS console.

Prerequisites

- A bucket is created. For more information about how to create a bucket, see [Create buckets](#).
- Objects are uploaded to the bucket. For more information about how to upload objects, see [Upload objects](#).

Context

When you search for objects based on a prefix, search strings are case-sensitive and cannot contain forward slashes (/). The search range is limited to the root directory of the current bucket or the objects in the current folder (excluding subfolders and the objects in them).

Procedure

1. [Log on to the OSS console](#).
2. In the left-side navigation pane, click the name of the bucket to go to the bucket details page.
3. Click the **Files** tab.
4. On the right side of the Files tab, enter the prefix to search in the search box and press Enter or click the search icon to search for related objects.

The names of the objects and folders that are stored in the current folder and match the prefix are listed.

 **Note** To search for objects in a specified folder, open the folder and enter the prefix in the search box. The names of objects and subfolders in the folder that match the prefix are listed.

6.5.2. Configure object ACL

You can configure the ACL of an object in the OSS console to control access to the object.

Prerequisites

- A bucket is created. For more information about how to create a bucket, see [Create buckets](#).
- Objects are uploaded to the bucket. For more information about how to upload objects, see [Upload objects](#).

Procedure

1. [Log on to the OSS console](#).
2. In the left-side navigation pane, click the name of the target bucket to go to the bucket details page.
3. Click the **Files** tab.
4. On the Files tab, click the name of the target object. The **Preview** dialog box appears.
5. Click **Set ACL** on the right side of **File ACL**. The **Set ACL** dialog box appears. The ACLs that you can select are described as follows:

- **Inherited from Bucket:** The ACL of each object is the same as that of the bucket.
- **Private:** Only the owner or authorized users of this bucket can read and write objects in the bucket. Other users, including anonymous users cannot access the objects in the bucket without authorization.
- **Public Read:** Only the owner or authorized users of this bucket can write objects in the bucket. Other users, including anonymous users can only read objects in the bucket.
- **Public Read/Write:** Any users, including anonymous users can read and write objects in the bucket. Fees incurred by such operations are paid by the owner of the bucket. Configure this option only when necessary.

 **Note** You can also choose **More > Set ACL** in the Actions column corresponding to the target object to open the Set ACL dialog box.

6. Click **OK**.

6.5.3. Create folders

You can create a folder in a bucket in the OSS console.

Prerequisites

A bucket is created. For more information about how to create a bucket, see [Create buckets](#).

Context

OSS does not use traditional folders. All elements are stored as objects. A folder is an object whose size is 0 and has a name that ends with a forward slash (/). A folder is used to sort objects of the same type and process them at a time. The OSS console displays objects that end with a forward slash (/) as folders. These objects can be uploaded and downloaded. You can use OSS folders in the OSS console the way you use folders in Windows.

 **Note** The OSS console displays any objects whose names end with a forward slash (/) as folders, regardless of whether these objects contain data. You can download these objects only by calling an API operation or by using an SDK.

Procedure

1. [Log on to the OSS console](#).
2. In the left-side navigation pane, click the name of the target bucket to go to the bucket details page.
3. Click the **Files** tab. On the page that appears, click **Create Folder**.
4. In the **Create Folder** dialog box that appears, enter the folder name. The folder name must comply with the following conventions:
 - The name can contain only UTF-8 characters. The name cannot contain emojis.
 - The name cannot start with a forward slash (/) or backslash (\). The name cannot contain consecutive forward slashes (/). You can use forward slashes (/) in a folder name to quickly create a subfolder.
 - A subfolder cannot contain two consecutive periods (..) in its name.
 - The folder name must be 1 to 254 characters in length.
5. Click **OK**.

6.5.4. Delete objects

You can delete uploaded objects in the OSS console.

Context

You can delete one or more objects at a time. A maximum of 100 objects can be deleted at a time. You can use SDKs or call an API operation to delete a specific object or more than 100 objects.

 **Notice** Deleted objects cannot be recovered. Exercise caution when you delete objects.

Procedure

1. [Log on to the OSS console](#).
2. In the left-side navigation pane, click the name of the target bucket to go to the bucket details page.
3. Click the **Files** tab.
4. Select one or multiple objects that you want to delete in the object list, and choose **Batch Operation > Delete**. You can also choose **More > Delete** in the Actions column corresponding to the target object.
5. In the message that appears, click **OK**.

6.5.5. Manage parts

When you upload an object in multipart upload mode, the object is split into several smaller parts. After all of the parts are uploaded to the OSS server, you can call `CompleteMultipartUpload` to combine them into a complete object. We recommend that you delete unnecessary parts on a regular basis.

Context

Parts are generated in multipart upload tasks and cannot be read until they are combined into a complete object. To save storage space in the bucket, you can configure lifecycle rules to manage unnecessary parts that are generated when multipart upload tasks fail. For more information, see [Manage lifecycle rules](#).

Procedure

1. [Log on to the OSS console](#).
2. In the left-side navigation pane, click the name of the target bucket to go to the bucket details page.
3. Click the **Files** tab. On the page that appears, click **Parts**.
4. In the **Parts** dialog box that appears, delete parts.
 - To delete all parts in the bucket, select all parts and click **Delete All**.
 - To delete specified parts, select the parts that you want to delete and click **Delete**.
5. In the message that appears, click **OK**.

7. Apsara File Storage NAS

7.1. What is Apsara File Storage NAS?

NAS is a cloud service that provides file storage for compute nodes. These compute nodes include Elastic Compute Service (ECS) instances and Alibaba Cloud Container Service for Kubernetes (ACK) nodes.

NAS supports multiple standard file access protocols. NAS is a distributed file system that offers a variety of benefits. These benefits include unlimited capacity, scalable performance, shared access, high reliability, and high availability. You can work with NAS without the need to modify existing applications. Compared with traditional user-created data stores, NAS helps you reduce a large number of maintenance costs and mitigate data security risks. You can mount an NAS file system on multiple compute nodes at the same time. This helps you reduce a large number of costs in data transmission and synchronization.

You can perform the following operations on an NAS file system:

- Create NAS file systems and mount points.
- Create permission groups for NAS file systems and add rules to permission groups. This allows access to file systems from specific IP addresses or CIDR blocks. This also allows you to grant different levels of access permissions to IP addresses or CIDR blocks.
- Mount file systems on compute nodes. These compute nodes include ECS instances and ACK nodes. NAS allows you to access file systems by using the standard Network File System (NFS) and Server Message Block (SMB) protocols. You can also use POSIX-based APIs to access file systems.
- Manage file systems, mount points, and permission groups in the NAS console.
- Call NAS API operations to manage file systems.

7.2. Precautions

Before you use NAS, you must familiarize yourself with the following limits.

Limits on file systems

- Maximum number of files in a single file system: 1 billion.
- Maximum name length: 255 bytes.
- Maximum size of a single file: 32 TB.
- Maximum directory depth: 1,000 levels deep.
- Maximum capacity of a single file system: 10 PB for NAS Capacity and 1 PB for NAS Performance.
- Maximum number of compute nodes on which you can mount a single file system: 10,000. Note: The file system allows simultaneous access from the 10,000 compute nodes.
- Maximum size of a protocol packet: 4 MB.
- Maximum number of Change Notify requests: 512.

Limits on NFS clients

Limits on the usage of NFS clients are listed as follows.

- You can open a maximum of 32,768 files at a time on an NFS client. Files in the list folder and its subfolders are not counted as part of the total number of open files.
- Each unique mount on an NFS client can acquire a maximum of 8,192 locks across a maximum of 256 unique file or process pairs. For example, a single process can acquire one or more locks on 256 separate files, or 8 processes can each acquire one or more locks on 32 files.
- We recommend that you do not use an NFS client in a Windows environment to access an NFS file system.

Limits on SMB clients

Each file or folder can be opened a maximum of 8,192 times in parallel across compute nodes that each have a file system mounted and users that share access to each of these file systems. This represents a maximum of 8,192 active file handlers for each file system. A maximum of 65,536 active file handlers can exist on a file system.

Limits on the NFS protocol

- NAS supports the NFSv3 and NFSv4 protocols.
- NFSv4.0 does not support the following attributes: `FATTR4_MIMETYPE`, `FATTR4_QUOTA_AVAIL_HARD`, `FATTR4_QUOTA_AVAIL_SOFT`, `FATTR4_QUOTA_USED`, `FATTR4_TIME_BACKUP`, and `FATTR4_TIME_CREATE`. If one of the preceding attributes is applied to a file system, an `NFS4ERR_ATTRNOTSUPP` error appears on a client that has the file system mounted.
- NFSv4.1 does not support the following attributes: `FATTR4_DIR_NOTIF_DELAY`, `FATTR4_DIR_NOTIF_DELAY`, `FATTR4_DACL`, `FATTR4_SACL`, `FATTR4_CHANGE_POLICY`, `FATTR4_FS_STATUS`, `FATTR4_LAYOUT_HINT`, `FATTR4_LAYOUT_TYPES`, `FATTR4_LAYOUT_ALIGNMENT`, `FATTR4_FS_LOCATIONS_INFO`, `FATTR4_MDSTHRESHOLD`, `FATTR4_RETENTION_GET`, `FATTR4_RETENTION_SET`, `FATTR4_RETENT_EVT_GET`, `FATTR4_RETENT_EVT_SET`, `FATTR4_RETENTION_HOLD`, `FATTR4_MODE_SET_MASKED`, `FATTR4_FS_CHARSET_CAP`. If one of the preceding attributes is applied to a file system, an `NFS4ERR_ATTRNOTSUPP` error appears on a client that has the file system mounted.
- NFSv4 does not support the following operations: `OP_DELEGPURGE`, `OP_DELEGRETURN`, and `NFS4_OP_OPENATTR`. If one of the preceding operations is applied to a file system, an `NFS4ERR_ATTRNOTSUPP` error appears on a client that has the file system mounted.
- NFSv4 does not support delegations.
- The following issues are related to user IDs (UIDs) and group IDs (GIDs):
 - On Linux, mappings between UIDs or GIDs and usernames or group names are defined in configuration files. For NFSv3 file systems, if the mapping between an ID and a name is defined in a configuration file, the name is displayed. If no mapping can be found for a UID or GID, the UID or GID is displayed.
 - For NFSv4 file systems, the usernames and group names are displayed as `nobody` for all files if the version of a Linux kernel is earlier than 3.0. If the kernel version is later than 3.0, the rule used by NFSv3 file systems applies to display files.

 **Notice** If a file or directory is stored on an NFSv4 file system and the Linux kernel version is earlier than 3.0, we recommend that you do not use the `chown` or `chgrp` command. If you use either one of the commands, the UID and GID of the file or directory will change to `nobody`.

Limits on the SMB protocol

- NAS supports protocols including SMB 2.1 or later and operating systems including Windows 7, and Windows Server 2008 R2 or later. However, NAS does not support Windows Vista, or Windows Server 2008 or earlier. Compared with SMB 2.1 or later, SMB 1.0 has lower performance and functionality. Furthermore, Windows products that support SMB 1.0 are no longer offered or supported.
- Extended file attributes and client-side caching based on leases.
- Input/output control (IOCTL) or file system control (FSCTL) operations, such as creating sparse files, compressing files, retrieving NIC status, and creating reparse points.
- Alternate data streams.
- Identity authentication provided by Active Directory (AD) or Lightweight Directory Access Protocol (LDAP).
- Several features provided by SMB 3.0 or later, such as SMB Direct, SMB Multichannel, SMB Directory Leasing, and persistent handles.
- Access control lists (ACLs) on files or directories.

7.3. Quick start

7.3.1. Log on to the Apsara File Storage NAS console

This topic describes how to log on to the Apsara File Storage NAS console.

Prerequisites

- The domain name of the ASCM console is obtained from the deployment personnel before you log on to the ASCM console.
- A browser is available. We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL used to log on to the ASCM console. Press the Enter key.
2. Enter your username and password.

Obtain the username and password used to log on to the console from the operations administrator.

 **Note** When you log on to the ASCM console for the first time, you must change the password of your username. For security reasons, your password must meet the minimum complexity requirements. The password must be 8 to 20 characters in length and must contain at least two of the following character types:

- Uppercase or lowercase letters.
- Digits.
- Special characters. Special characters include exclamation points (!), at signs (@), number signs (#), dollar signs (\$), and percent signs (%).

3. Click **Login** to go to the ASCM console homepage.
4. In the top navigation bar, select **Products** and click **Apsara File Storage NAS**.

7.3.2. Create a file system

This topic describes how to create a file system in the Apsara File Storage NAS console.

Context

Before you create a file system, you must note the following limitations:

- You can use an Alibaba Cloud account to create a maximum of 1,000 file systems.
- The maximum capacity of a NAS Performance file system is 1 PB. The maximum capacity of a NAS Capacity file system is 10 PB.

If you want to increase the maximum storage capacity, we recommend that you contact Alibaba Cloud Technical Support.

Procedure

1. [Log on to the Apsara File Storage NAS console](#).
2. Choose **NAS > File System List** and click **Create File System**.
3. In the **Create File System** dialog box, set the required parameters.

Create File System

Region

*Organization:

*Resource Set:

*Region:

Basic Settings

File System Name:

The value must be 2 to 256 characters in length and start with a letter or a C

Storage Configurations

*Storage Type:

After the file system is created, you cannot change the storage type.

*Protocol Type:

After the file system is created, you cannot change the protocol type.

*Capacity (TB):

The following table lists the required parameters.

Parameter	Description
Region	Select a region where you need to create a file system.
Organization	Select an organization from the drop-down list for the instance.
Resource Set	Select a resource set from the drop-down list for the instance.
File System Name	The name of the file system. The name must be 2 to 256 characters in length and can contain letters, digits, and special characters. These special characters include underscores (_) and hyphens (-). The name must start with a letter and cannot start with http:// or https://.
Storage Type	The storage type. Select Performance or Capacity based on your business requirements. The maximum capacity of an NAS Performance file system is 1 PB. The maximum capacity of an NAS Capacity file system is 10 PB.
Protocol Type	The protocol type. Select NFS or SMB based on your business requirements. We recommend that you mount Network File System (NFS) file systems on Linux clients and Server Message Block (SMB) file systems on Windows clients.

Parameter	Description
Capacity (TB)	The capacity of the file system. <ul style="list-style-type: none">○ The capacity of an NAS Performance file system ranges from 0.5 TB to 1024 TB.○ The capacity of an NAS Capacity file system ranges from 0.5 TB to 10240 TB.

4. Click **OK** to complete the creation.

7.3.3. Create a permission group and add rules

This topic describes how to create a permission group and add rules to the permission group in the Apsara File Storage NAS console.

Context

In NAS, each permission group represents a whitelist. You can add rules to a permission group to allow access to a file system from specific IP addresses or CIDR blocks. You can also grant different access permissions to different IP addresses or CIDR blocks.

 **Note** You can use an Alibaba Cloud account to create a maximum of 100 permission groups. If you want to increase the limit, we recommend that you contact Alibaba Cloud Technical Support.

Creates a permission group

1. [Log on to the Apsara File Storage NAS console](#).
2. Choose **NAS > Permission Group** and click **Create Permission Group**.
3. In the **Create Permission Group** dialog box, specify the required parameters.

Create Permission Group

Region

*Organization:

*Resource Set:

*Region:

Basic Settings

*Name:
The value must be 3 to 64 characters in length and can contain letters, digits, and hyphens (-).

*Network Type:

Description:
The value must be 2 to 128 characters in length and start with a letter or a Chinese character. It cannot contain spaces, and cannot start with string http:// or https://.

The following table lists the required parameters.

Parameter	Description
Organization	The organization to which the permission group belongs.
Resource Set	The resource set to which the permission group belongs.
Region	The region where you want to create the permission group.
Name	The name of the permission group. The name must be 3 to 64 characters in length and can contain letters, digits, and hyphens (-).
Network Type	The network type. Select Classic Network or VPC based on your business requirements.

- Click **OK** to complete the creation of the permission group.

Create a rule

- Log on to the [Apsara File Storage NAS console](#).
- On the **Permission Group** page, find the target permission group and click **Manage**.
- Click **Add Rule**.
- In the **Add Rule** dialog box that appears, specify the required parameters.

Add rules
✕

* Authorized address ?

* Read and write permissions

* User permissions

* Priority ?

The following table lists the required parameters.

Parameter	Description
Authorization Address	Specifies the authorized object to which the rule applies. You can specify an IP address or CIDR block. Only IP addresses are available for permission groups of the classic network type.
Read/Write Permission	Specifies whether to allow read-only or read/write access to the file system from the authorized object. Valid values: Read-only and Read/Write.
User Permission	<p>Specifies whether to limit a Linux user's access to a file system.</p> <ul style="list-style-type: none"> ◦ Do not limit root users (no_squash): allows access to a file system from root users. ◦ Limit root users (root_squash): denies access to a file system from root users. All root users are treated as nobody users. ◦ Limit all users (all_squash): denies access to a file system from all users including root users. All users are treated as nobody users. <p>The nobody user is created by default on Linux. The user has only the most basic permissions and can access only the open content of servers. This feature offers high security.</p>
Priority	When multiple rules are applied to an authorized object, the rule with the highest priority takes effect. Valid values: 1 to 100, in which 1 is the highest priority.

5. Click **OK** to complete the creation of the rule.

7.3.4. Add a mount target

This topic describes how to add a mount target. After an Apsara File Storage NAS file system is created, you must add a mount target to the file system. Then, you can use the mount target to mount the file system on compute nodes. These compute nodes include Elastic Compute Service (ECS) instances and Alibaba Cloud Container Service for Kubernetes (ACK) nodes.

Prerequisites

- A file system is created. For more information, see [Create a file system](#).
- A permission group and a rule are created. For more information, see [Create a permission group and add](#)

rules.

Context

A mount target is an endpoint that resides in a VPC or classic network. Each mount target corresponds to a file system. Mount targets of the VPC and classic network types are available for NAS file systems.

Note You use a mount target to mount a file system on multiple compute nodes for shared access. These compute nodes include ECS instances and ACK nodes.

Procedure

1. Log on to the Apsara File Storage NAS console.
2. Choose **NAS > File System List**.
3. Find the target file system and click **Manage**.
4. On the **Mount Target** tab, click **Add Mount Target**.
5. In the **Add Mount Target** dialog box that appears, specify the required parameters.

Mount Target Type: includes **VPC** and **Classic Network**.

Note Mount targets of the classic network type allow access only from ECS instances that belong to the same Alibaba Cloud account as the mount targets.

Add mount point
✕

File system 1b45449e09

?

OK
Cancel

- o If you want to create a mount target of the VPC type, specify the following parameters.

Parameter	Description
VPC	The VPC. <div style="border: 1px solid #ccc; background-color: #e6f2ff; padding: 5px; margin-top: 5px;"> <p>Note The VPC you specify must be the same as the VPC where the compute nodes reside. These compute nodes include ECS instances and ACK nodes.</p> </div>
VSwitch	The VSwitch.

Parameter	Description
Permission Group	The permission group.

- If you want to create a mount target of the classic network type, specify the following parameters.

Parameter	Description
Permission Group	The permission group.

6. Click **OK** to complete the configuration.

7.3.5. Mount an NFS file system

This topic describes how to mount a Network File System (NFS) file system. Before you mount a file system, you must create the file system and a mount target for the file system. Then, you can use the mount target to mount the file system on compute nodes. These compute nodes include Elastic Compute Service (ECS) instances and Alibaba Cloud Container Service for Kubernetes (ACK) nodes.

Prerequisites

- A file system is created. For more information, see [Create a file system](#).
- A permission group and a rule are created. For more information, see [Create a permission group and add rules](#).
- A mount target is created. This topic takes a mount target of the VPC type as an example. For more information, see [Add a mount target](#).
 - If you create a mount target of the VPC type for a file system, you can mount the file system only on ECS instances that reside in the same VPC as the mount target. You can specify a permission group for the mount target. Then, you can add several rules to the permission group. The authorization address of a rule must match the IP range of the VPC that hosts the ECS instances.
 - If you create a mount target of the classic network type for a file system, you can mount the file system only on ECS instances that belong to the same Alibaba Cloud account as the mount target. You can specify a permission group for the mount target. Then, you can add several rules to the permission group. The authorization address of a rule must match the IP range of the private network that hosts the ECS instances.
- A compute node is created. This topic takes a Linux ECS instance as an example.

Step 1: Install an NFS client

Before you mount an NFS file system on a Linux ECS instance, you must install an NFS client. If an NFS client is installed, skip this step.

1. Log on to the Linux ECS instance. For more information, see the [Quick start > Connect to an ECS instance](#) topic of the *ECS User Guide*.
2. Install the NFS client.

- If CentOS, RHEL, or Aliyun Linux runs on the ECS instance, use the following command to install the NFS client.

```
sudo yum install nfs-utils
```

- If Ubuntu or Debian runs on the ECS instance, use the following commands to install the NFS client.

```
sudo apt-get update
```

```
sudo apt-get install nfs-common
```

Step 2: Mount an NFS file system

1. Log on to the Linux ECS instance. For more information, see the [Quick start > Connect to an ECS instance](#) topic of the *ECS User Guide*.
2. Mount the NFS file system.

Use the following command to mount the NFS file system. In the command, replace `file-system-id.region.nas.aliyuncs.com:/mnt` with a value that is specific to your environment.

- To mount an NFSv4 file system, use the following command.

```
sudo mount -t nfs -o vers=4.0,minorversion=0,rsize=1048576,wsiz=1048576,hard,timeo=600,retrans=2,noresvport file-system-id.region.nas.aliyuncs.com:/mnt
```

- To mount an NFSv3 file system, use the following command.

```
sudo mount -t nfs -o vers=3,nolock,proto=tcp,rsize=1048576,wsiz=1048576,hard,timeo=600,retrans=2,noresvport file-system-id.region.nas.aliyuncs.com:/mnt
```

Mount parameters

Parameter	Description
<code>file-system-id.region.nas.aliyuncs.com:/mnt</code>	<p>Specifies the mount target of the NAS file system, the forward slash (/) following the mount target specifies the root directory of the NAS file system, and /mnt specifies a local directory that resides on the Linux ECS instance. You must replace the example values based on your business requirements.</p> <ul style="list-style-type: none"> ■ The mount target, for example, <code>file-system-id.region.nas.aliyuncs.com</code>. To obtain information about a mount target, follow these steps. Log on to the NAS console, find the target system, click Manage next to the file system to go to the Details page. The Details page shows information about the mount target. ■ The directory of the NAS file system: specifies the root directory (/) or a subdirectory (/sub1). If a subdirectory is specified, make sure that the subdirectory exists. ■ The local directory on which you want to mount a file system: specifies the root directory (/) or a subdirectory (/mnt) of a system such as Linux. If a subdirectory is specified, make sure that the subdirectory exists.
<code>vers</code>	The version of the file system. Only NFSv3 and NFSv4 are available.
Mount option	<p>When you mount a file system, multiple mount options are available. Separate multiple mount options with commas (.). For more information, see the following Mount options.</p> <p>Note When you specify mount options, take note of the following items.</p> <ul style="list-style-type: none"> ■ To avoid a decrease in performance, we recommend that you specify the maximum value (1048576) for both the <code>rsize</code> mount option and the <code>wsiz</code> mount option. ■ If you need to modify the <code>timeo</code> mount option, we recommend that you specify a minimum of 150 for the mount option. The <code>timeo</code> mount option is measured in deciseconds (tenths of a second). For example, a value of 150 indicates 15 seconds. ■ To avoid data inconsistency, we recommend that you do not use the <code>soft</code> mount option. Use caution with the <code>soft</code> mount option. ■ We recommend that you use the default values for other mount options. For example, a decrease in performance may occur due to changes in some mount options. These mount options include the size of the read or write buffer or the use of attribute caching.

Mount options

Option	Description
rsize	Specifies the maximum number of bytes in each read request that the NFS client can receive. Recommended value: 1048576.
wsize	Specifies the maximum number of bytes in each write request that the NFS client can send. Recommended value: 1048576.
hard	Specifies that applications must stop accessing a file system when the file system is unavailable, and wait until the file system is available. We recommended that you use the hard mount option.
timeo	Specifies the time in deciseconds (tenths of a seconds) that the NFS client waits before it retries an NFS request. Recommended value: 600.
retrans	Specifies the number of times the NFS client retries a request. Recommended value: 2.
noresvport	Specifies that the NFS client uses a different TCP source port for a new network connection to ensure data integrity. We recommend that you use the noresvport mount option.

- Use the `mount -l` command to view the mount result.

The following figure shows an example of a successful mount.

```

[root@ ~]# df -h
Filesystem      Size  Used Avail Use% Mounted on
/dev/xvdc1     100G  100G   0% 100% /
tmpfs           16G   0%  16G   0% /dev/shm
tmpfs           16G   0%  16G   0% /run
tmpfs           16G   0%  16G   0% /tmp
tmpfs           16G   0%  16G   0% /var/tmp

```

After a file system is mounted, you can use the `df -h` command to view the size of the file system.

- After you mount an NAS file system on an ECS instance, you can access the file system from the ECS instance.

You can access the file system in the same way you access a local directory. The following figure shows an example.

```

[root@iZwe5f6ow1q4t21d4g0f16q2 ~]# mkdir /mnt/dir1
[root@iZwe5f6ow1q4t21d4g0f16q2 ~]# mkdir /mnt/dir2
[root@iZwe5f6ow1q4t21d4g0f16q2 ~]# touch /mnt/file1
[root@iZwe5f6ow1q4t21d4g0f16q2 ~]# echo 'some file content' > /mnt/file2
[root@iZwe5f6ow1q4t21d4g0f16q2 ~]# ls /mnt
dir1 dir2 file1 file2 tmp

```

7.3.6. Mount an SMB file system

This topic describes how to mount a Server Message Block (SMB) file system. Before you mount a file system, you must create the file system and a mount target for the file system. Then, you can use the mount target to mount the file system on compute nodes such as Elastic Compute Service (ECS) instances.

Prerequisites

- A file system is created. For more information, see [Create a file system](#).
- A permission group and a rule are created. For more information, see [Create a permission group and add rules](#).
- A mount target is created. This topic takes a mount target of the Classic Network type as an example. For more information, see [Add a mount target](#).
 - If you create a mount target of the VPC type for a file system, you can mount the file system only on ECS instances that reside in the same VPC as the mount target. You can specify a permission group for the mount target. Then, you can add several rules to the permission group. The authorization address of a rule must match the IP range of the VPC that hosts the ECS instances.
 - If you create a mount target of the Classic Network type for a file system, you can mount the file system

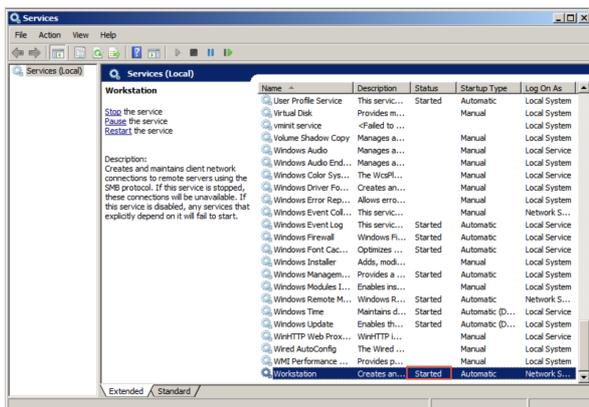

only on ECS instances that belong to the same Alibaba Cloud account as the mount target. You can specify a permission group for the mount target. Then, you can add several rules to the permission group. The authorization address of a rule must match the IP range of the private network that hosts the ECS instances.

4. An ECS instance is created. This topic takes a Windows ECS instance as an example.

5. The following Windows services are started:

- Workstation
 - a. Choose **All Programs > Accessories > Run**, or press **Win+R** and enter **services.msc** to open the Services console.
 - b. Find the Workstation service and ensure that the service is **Running** and the startup type is **Automatic**.

The default state for the Workstation service is Running.

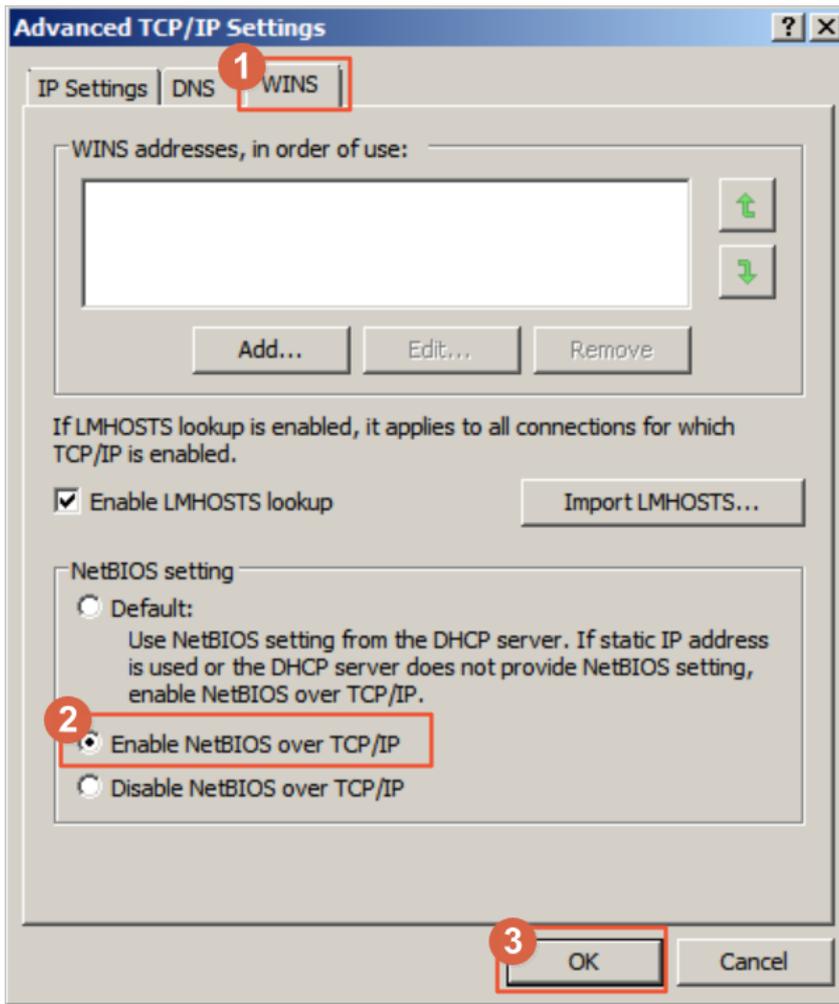

- TCP/IP NetBIOS Helper

Follow these steps to start the TCP/IP NetBIOS Helper service:

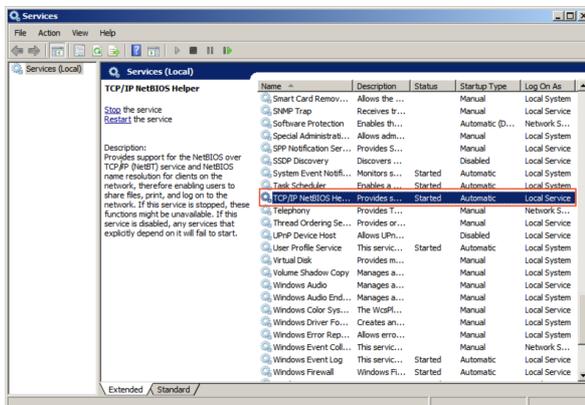

- a. Double-click **Network and Sharing Center** and right-click the active network connection.
- b. Click **Properties** to open the **Local Area Network Properties** dialog box. Double-click **Internet Protocol Version 4 (TCP/IPv4)** to open the **Internet Protocol Version 4 (TCP/IPv4) Properties** dialog box, and then click **Advanced**.

- c. In the Advanced TCP/IP Settings dialog box, choose WINS > Enable NetBIOS over TCP/IP.

- d. Choose All Programs > Accessories > Run, or press Win+R and enter services.msc to open the Services console.
- e. Find the TCP/IP NetBIOS Helper service and make sure that the service is Running and the startup type is Automatic.

The default state for the TCP/IP NetBIOS Helper service is Running.

Procedure

1. Log on to a Windows ECS instance. For more information, see the Quick start > Connect to an ECS instance topic of the ECS User Guide .

- Open the command prompt and use the following command to mount the file system.

```
net use D: \\file-system-id.region.nas.aliyuncs.com\myshare
```

The syntax of the command is `net use <the letter of a local drive> \\<the domain name of a mount target>\myshare .`

- The letter of a local drive: specifies a drive on which you need to mount a file system. You can specify the target drive based on your business requirements.

Note The target drive must be different from any existing drives.

- The domain name of the mount target: When you create a mount target for a file system, the domain name of the mount target is automatically generated. You can replace the domain name based on your business requirements. To obtain the mount target of the file system, follow these steps. Log on to the NAS console, find the target file system, and click **Manage** to go to the Details page.
 - myshare: specifies the name of an SMB share. You cannot change the name.
- Use the `net use` command to check mount results.

The following figure shows an example of a successful mount.

```
C:\Users\Administrator>net use
New connections will be remembered.

Status      Local      Remote                                           Network
-----
OK          D:         \\6... .nas.aliyuncs.com\myshare                Microsoft Windows Network

The command completed successfully.
```

- After you mount an NAS file system on an ECS instance, you can access the file system from the ECS instance.

7.4. File systems

7.4.1. View the details of a file system

This topic describes how to view the details of a file system. The details include the information about the file system and information about the attached mount targets.

Prerequisites

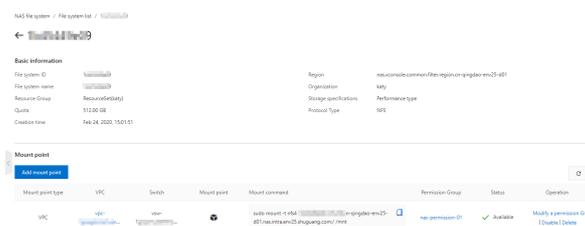

A file system is created. For more information, see [Create a file system](#).

Procedure

- Log on to the [Apsara File Storage NAS console](#).
- Choose **NAS > File System List**.
- Find the target file system and click **Manage** to go to the Details page of the file system.

The following sections are available on the Details page of the file system.

- Basic Information:** includes information about the file system. The information includes the ID, region, protocol type, and storage type.
- Mount Target:** includes mount targets for the file system. You can manage mount targets in the section.

7.4.2. Delete a file system

This topic describes how to delete a file system in the Apsara File Storage NAS console.

Prerequisites

A file system is created. For more information, see [Create a file system](#).

Procedure

1. [Log on to the Apsara File Storage NAS console](#).
2. Choose **NAS > File System List**.
3. Find the target file system, and click **Manage**.

Note

- Before you can delete a file system, you must remove all mount targets from the file system.
- Use caution when you delete a file system. After a file system is deleted, the data on the file system cannot be restored. We recommend that you ensure that all data is backed up.

4. In the **Delete File System** dialog box, click **OK** to complete the deletion.

7.5. Mount targets

7.5.1. View mount targets

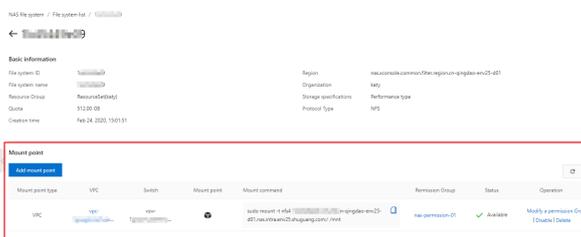

This topic describes how to view mount targets in the Apsara File Storage NAS console.

Context

- A file system is created. For more information, see [Create a file system](#).
- A permission group and a rule are created. For more information, see [Create a permission group and add rules](#).
- A mount target is created. For more information, see [Add a mount target](#).

Procedure

1. [Log on to the Apsara File Storage NAS console](#).
2. Choose **NAS > File System List**.
3. Find the target file system and click **Manage**.
4. In the **Mount Target** section, view mount targets in the file system.

7.5.2. Enable or disable a mount target

This topic describes how to enable or disable a mount target. You can control access to a mount target from clients by enabling or disabling the mount target.

Prerequisites

- A file system is created. For more information, see [Create a file system](#).
- A permission group and a rule are created. For more information, see [Create a permission group and add rules](#).
- A mount target is created. For more information, see [Add a mount target](#).

Procedure

1. [Log on to the Apsara File Storage NAS console](#).
2. Choose **NAS > File System List**.
3. Find the target file system and click **Manage**.
4. After you find the mount target that you want to disable or enable, you can perform the following operations:
 - **Disable the mount target.** Click **Disable**. In the Disable Mount Target dialog box, click **OK** to deny access to the mount target from clients.
 - **Enable the mount target.** Click **Enable**. In the Enable Mount Target dialog box, click **OK** to allow access to the mount target from clients.

7.5.3. Delete a mount target

This topic describes how to delete a mount target in the Apsara File Storage NAS console.

Prerequisites

- A file system is created. For more information, see [Create a file system](#).
- A permission group and a rule are created. For more information, see [Create a permission group and add rules](#).
- A mount target is created. For more information, see [Add a mount target](#).

Procedure

1. [Log on to the Apsara File Storage NAS console](#).
2. Choose **NAS > File System List**.
3. Find the target file system and click **Manage**.
4. Find the mount target that you want to delete and click **Delete**.

Note Use caution when you delete a mount target. After you delete a mount target, the mount target cannot be restored.

5. In the Delete Mount Target dialog box, click **OK**.

7.5.4. Modify the permission group of a mount target

You must add a permission group to each mount target. You can modify the permission group of a mount target in the Apsara File Storage NAS console.

Prerequisites

- A file system is created. For more information, see [Create a file system](#).
- A permission group and a rule are created. For more information, see [Create a permission group and add rules](#).
- A mount target is created. For more information, see [Add a mount target](#).

Procedure

1. **Log on to the Apsara File Storage NAS console.**
2. **Choose NAS > File System List.**
3. **Find the target file system, and click **Manage**.**
4. **Find the mount target that you want to modify and click **Modify Permission Group**.**

5. **In the **Modify Permission Group** dialog box, change the permission group and click **OK**.**

7.6. Permission groups

7.6.1. View permission groups

This topic describes how to view permission groups in the Apsara File Storage console.

Prerequisites

A permission group is created. For more information, see [Create a permission group and add rules](#).

Procedure

1. **Log on to the Apsara File Storage NAS console.**
2. **Choose **NAS > Permission Group** and view permission groups in the region.**

7.6.2. Delete a permission group

This topic describes how to delete a permission group in the Apsara File Storage NAS console.

Prerequisites

A permission group is created. For more information, see [Create a permission group and add rules](#).

Operating system

1. **Log on to the Apsara File Storage NAS console.**
2. **Choose **NAS > Permission Group**.**
3. **Find the target permission group and click **Delete**.**

Note Permission groups in use cannot be deleted. Before you can delete a permission group, you must remove the permission group from the linked mount target.

4. **In the **Delete Permission Group** dialog box, click **OK**.**

7.6.3. Manage permission group rules

This topic describes how to manage permission group rules in the Apsara File Storage NAS console. The management includes viewing the details of rules, modifying rules, and deleting rules.

Prerequisites

A permission group and a permission group rule are created. For more information, see [Create a permission group and add rules](#).

Procedure

1. [Log on to the Apsara File Storage NAS console](#).
2. Choose **NAS > Permission Group**.
3. Find the target permission group and click **Manage**.
4. On the Rules page, you can perform the following operations:
 - View all rules for the permission group.

- Modify a rule. Find the target rule and click **Edit** to modify the details of the rule. The details include the authorization address, read/write permissions, user permission, and priority.
- Delete a rule. Find the target rule and click **Delete**. In the Delete Rule dialog box, click **OK**.

7.7. Manage quotas

This topic describes how to use the Alibaba Cloud `quota_tool` tool to manage quotas on Elastic Compute Service (ECS) instances that have Apsara File Storage NAS file systems mounted. You can configure, view, and cancel quotas on these ECS instances.

Prerequisites

An NFS file system of the NAS Capacity or NAS Performance type is mounted on an ECS instance. For more information, see [Mount an NFS file system](#).

Context

NAS allows you to view and manage directory-level quotas. Directory-level quotas specify the maximum number of files in each directory and the maximum storage space for these files.

From the perspective of the application scope, quotas are sorted into quotas for all users and quotas for a single user or group. Quotas for all users specify the maximum storage space for files that all users can create in a directory. Quotas for a single user or group specify the maximum storage space for files that a user or group can create in a directory.

From the perspective of the restriction level, quotas are sorted into statistical quotas and restriction quotas. Statistical quotas collect only the usage of storage space. You can query and view statistical data. Restriction quotas specify the maximum capacity of storage space for files that you can create in a directory. If the limit is exceeded, you may fail to create a file or subdirectory, append data to a file, or perform other operations.

Notice

- Only statistical quotas are available.
- NAS performs asynchronous calculation for quotas at the backend. When you use the `quota_tool` tool to query statistical data about quotas, the process requires a period of time to complete. In most cases, the time period is about 5 to 15 minutes.

Configure quotas

This topic uses the `/mnt` directory as an example.

1. Log on to an Elastic Compute Service (ECS) instance by using a root account. You can use the `quota_tool` tool on an ECS instance that has a NAS file system mounted. You must run the tool with the root permissions. The following describes how to use the `quota_tool` tool on the ECS instance.
2. Use the following command to download the `quota_tool` tool.

```
wget https://nasimport.oss-cn-shanghai.aliyuncs.com/quota_tool_v1.0 -O quota_tool
```

3. Use the following command to grant the execute permission to the quota_tool tool.

```
sudo chmod a+x quota_tool
```

4. Configure quotas.

Note For each file system, you can configure quotas only for a maximum of 10 directories.

The syntax of the command that you use to configure quotas is `sudo ./quota_tool set --dir [DIR] [OPTION]` .

Parameter	Description
--dir [DIR]	Specifies the directory for which you want to configure quotas. For example, --dir /mnt/data/.
OPTION	<p>Specifies the required options.</p> <p>Note When you specify options, you must follow these rules: 1. the --accounting option is required. 2. One of the --alluser, --uid, and --gid options is required. .</p> <ul style="list-style-type: none"> ○ --accounting: specifies a statistical quota. ○ --alluser: specifies a directory-level quota for all users. ○ --uid: specifies the UID of a user. For example, --uid 505 indicates the quota is configured only for the user whose UID is 505. ○ --gid: specifies the GID of a group. For example, --gid 1000 indicates the quota is configured only for the group whose GID is 1000.

The following examples describe how to configure quotas.

- Use the following command to configure a statistical quota for the /mnt/data/ directory to limit the total number of files that reside in a directory.

```
sudo ./quota_tool set --dir /mnt/data/ --accounting --alluser
```

- Use the following command to configure a statistical quota for the /mnt/data/ directory to limit the total number of files that can be created by the user whose UID is 505.

```
sudo ./quota_tool set --dir /mnt/data/ --accounting --uid 505
```

Query quotas

After you configure a quota for an NAS directory, you can query statistical data about the quota for the directory.

1. Log on to an Elastic Compute Service (ECS) instance by using a root account.
2. Use the following command to query quotas.

```
sudo ./quota_tool get --dir /mnt/data/ --all
```

In the preceding command, the --all parameter is optional. If you specify the parameter, statistical data about all quotas that are configured for the file system returns.

Note

- The first time you query a quota, a state called Initializing appears. After the Initializing process is complete, you can query the quota and a result showing success appears. The duration of the initialization process is based on the number of files and subdirectories in a directory.
- After the initialization process is complete, you can query quotas daily. A delay of 5 to 10 minutes may occur before the expected FileCountReal and SizeReal appear. This occurs due to the asynchronous calculation for quotas at the backend.

```
{
  "Reports" : [
    {
      "Path" : "/mnt/data",
      "Report" : [
        {
          "FileCountLimit" : "Empty",
          "FileCountReal" : "2",
          "Gid" : "All",
          "Quotatype" : "Accounting",
          "SizeLimit" : "Empty",
          "SizeReal" : "4KB",
          "Uid" : "All"
        }
      ],
      "ReportStatus" : "Success"
    }
  ],
  "Status" : 0
}
```

The following table lists parameters that are included in a response in the JSON format.

Parameter	Description
Path	Indicates a directory for which you query a quota.
Report	Includes all information about a quota that is specified for a directory, for example, UID and GID.
ReportStatus	The state for the query of a quota.
FileCountLimit	Indicates the limit for the number of files. A value of Empty indicates no limit.
FileCountReal	Indicates the total number of files including subdirectories, files, and special files that reside in a directory.
QuotaType	Accounting indicates a statistical quota and Force indicates a restriction quota.
Uid	Indicates the UID of a user. A value of All indicates all users.
Gid	Indicates the GID of a group. A value of All indicates all groups.
SizeLimit	Indicates the maximum capacity of files that reside in a directory. A value of Empty indicates no limit.
SizeReal	Indicates the total capacity of files that reside in a directory.

Cancel quotas

You can cancel a quota.

1. Log on to an ECS instance.
2. Use the following command to cancel quotas.

The syntax of the command that you can use to cancel quotas is `sudo ./quota_tool cancel --dir [DIR] [OPTION]`

.

Parameter	Description
--dir [DIR]	Specifies the directory for which you want to cancel quotas, for example, -dir /mnt/data/.
OPTION	<p>Specifies the required options.</p> <p> Note When you specify the OPTION parameter, one of the --alluser, --uid, and --gid options is required.</p> <ul style="list-style-type: none"> ○ --alluser: specifies a directory-level quota for all users. ○ --uid: specifies the UID of a user. For example, --uid 505 indicates that the quota is canceled for the user whose UID is 505. ○ --gid: specifies the GID of a group. For example, --gid 505 indicates that the quota is canceled for the group whose GID is 505.

The following examples describes how to cancel quotas.

- If you have configured a quota for the /mnt/data/ directory, use the following command to cancel the quota for the user whose UID is 100.

```
sudo ./quota_tool cancel --dir /mnt/data/ --uid 100
```

- If you have configured a quota for the /mnt/data/ directory, use the following command to cancel the quota for all users.

```
sudo ./quota_tool cancel --dir /mnt/data/ --alluser
```

7.8. Create and manage a unified namespace

This topic describes how to create a unified namespace and add mount targets in the Apsara File Storage NAS console. The topic also describes how to add, remove, and modify file systems in a namespace, view namespace details, and enable the cross-domain mount orchestration feature.

Features

A unified namespace allows you to mount multiple file systems in a NAS cluster by using a single domain name. You do not need to maintain multiple mount targets and directories.

You can create mount targets for a namespace. You can use a unified namespace to manage multiple file systems in the same way as you manage a single file system.

A unified namespace contains a virtual root directory in which file systems are the first-level subdirectory. You can mount the file systems by using their mount targets even if you add the file systems to a unified namespace.

Limits

A unified namespace has the following limits:

- You can add a maximum of 1,000 file systems to each unified namespace.
- The mapping name of a file system in a unified namespace cannot exceed 255 characters in length. It can contain only letters, digits, and the following special characters:

.+-_()<>@#

 **Note** The mapping name of a file system in a namespace cannot exceed 255 characters. It can contain only letters, digits, and the following special characters:

.+-_()<>@#

- The number of mount targets that are created for a namespace must be the same as that of file systems.
- You can create a maximum of 20 namespaces in each region.
- You can mount a unified namespace only by using the NFSv3 protocol.
- The file systems that are added to a namespace must belong to the same user and cluster as the namespace. The storage type, protocol type, and encryption type of the file systems must be the same.
- The mapping name of a file system must be unique in each unified namespace.
- File systems can be mapped only to first-level subdirectories in a unified namespace. You cannot modify the access permissions, owner, or access control list (ACL).

Procedure

- Create a unified namespace and add mount targets.

Log on to the Apsara File Storage NAS console. In the left-side navigation pane, choose **Unified Namespace > Unified List of Namespaces**. On the page that appears, you can create a unified namespace and add mount targets.

 **Note** To identify CIDR blocks when you mount unified namespaces across regions, we recommend that you use different VPC CIDR blocks. For example, you can use `192.168.0.0/16` for Region 1 and `172.16.0.0/16` for Region 2. For more information, see [Cross-domain mount orchestration](#).

- Add a file system in a unified namespace.

After you create a unified namespace, you can add file systems and set the mapping name.

 **Note** The mapping name is the name of the virtual directory.

- Remove a file system from a unified namespace.

You can remove an existing file system from the unified namespace.

 **Note** The file system is not deleted but removed from the list of file systems in the namespace.

- Modify the name of the file system mapping.

You can also modify the name of the file system mapping in a namespace.

 **Note** If file systems in a namespace are in different mount modes, modification of the mapping name may cause connection failure.

- View the details of a unified namespace.

The details of a namespace are divided into three types:

- Properties
- Mount target list

 **Note** You can create or delete mount targets.

- File system list

 **Note** You can add or remove file systems.

Cross-domain mount orchestration

In traditional solutions, you can add file systems to a namespace only when the file systems and the namespace are in the same region. To resolve the issue, NAS provides the cross-domain mount orchestration feature. To use this feature, perform the following operations:

- Create a unified namespace and add mount targets.
- Map the file systems to the local directory tree of a Network File System (NFS) client by using the feature.
- After the orchestration is complete, specify the root directory to generate an automatic mount script.

 **Notice** The added mount targets or attached directories cannot be modified after they are specified. You can remove the mount targets. However, if you add the mount targets again, you can only attach them to the original root directory.

An NFS client runs the automatic mount script to mount the domain names to the local directory. This allows NFS to access file systems across regions. The local directory for each unified namespace is: `<user-defined Root Directory>/<mapping path for a namespace>` .

Different regions have different VPCs. To enable the cross-domain mount orchestration feature, you must establish connections between different VPCs. In the following example, two VPCs in two regions are used to demonstrate how to establish VPC connections and how to mount file systems on an Elastic Compute Service (ECS) instance.

1. Create two VPCs. [Log on to the Apsara File Storage NAS console](#). In the top navigation bar, choose **Products > Networking > Virtual Private Cloud** to go to the VPC console. Create VPCs for Region 1 and Region 2. Configure the following CIDR blocks:
 - Region 1: `192.168.1.0/24` (skvpc1)
 - Region 2: `192.168.2.0/24` (skvpc2)
2. Configure a peering connection across regions. Configure a peering connection between the VPCs of the two regions.

Configure a peering connection in Region 1 to connect skvpc1 and skvpc2.

- i. Configure the route table for skvpc1.

Send the CIDR block `192.168.2.0/24` to skvpc1 and add the CIDR block to the route table of skvpc1.

- a. In the left-side navigation pane, choose **VPC > Route Tables**. On the page that appears, find skvpc1 and click **Manage**.
- b. Click **Add Route Entry** and set the required parameters. Click **Create VPC-to-VPC Connection** to configure a peering connection between skvpc1 and skvpc2.

-  **Note**
- **Destination CIDR Block** must be the same as the CIDR block of skvpc2.
 - Select **Router Interface (To VPC)** from the **Next Hop Type** drop-down list.
 - If you configure a peering connection across regions for the first time, no VPCs are available.

- ii. Create a VPC-to-VPC connection

Click **Create VPC-to-VPC Connection** to go to the **Create Peering Connection** page. Specify the source VPC ID, destination VPC ID, and bandwidth based on your business requirements.

After the VPC-to-VPC connection is created, the **Express Connect** page appears. If the initiator and acceptor are in the **Activated** state, the connection between skvpc1 and skvpc2 is established.

- iii. View VPC-to-VPC connection.

Return to the **Add Route Entry** page. Click **Refresh**. The VPC-to-VPC connection that you have created appears in the VPC list.

Use the preceding procedure to configure a peering connection in Region 2 to connect skvpc1 and skvpc2.

Select the VPC-to-VPC connection from the VPC list and click **OK** to add a route entry.

When you add a route entry for Region 2, you can select the VPC-to-VPC connection from the VPC list. `vpc-6b xxx42t` is the ID of `skvpc1`.

3. Add rules for NAS access groups. In the top navigation bar, choose **Products > Storage > Apsara File Storage NAS**. In the left-side navigation pane, choose **File System > Access Group > NasTimor**, and click **Management Rules**. On the page that appears, click **Add Rules**. In the dialog box that appears, set the authorized address, read/write permissions, user permissions, and priority. For example, add the IP address segment of `skvpc2`.
4. Create a mount target. In Region 2, you can create a mount target for `skvpc2`. The mount target is used to mount file systems on a specified namespace. In Region 1, you can create a mount target for `skvpc1`. The mount target is used to mount file systems on a specified namespace.
5. Create an ECS instance. For example, if you select `skvpc2` when you create an ECS instance, you can mount file systems on the ECS instance. The following figure shows how to select `skvpc2` when you create an ECS instance.

Note In most cases, each ECS instance uses an independent VPC. You do not need to establish connections between VPCs that are used by mount targets of a namespace in two regions. Instead, you must establish connections between the VPC that is used by mount targets of the namespace and of the VPC that is used by the ECS instance.

7.9. Manage the file lifecycle

This topic describes how to use the Apsara File Storage NAS console to manage the file lifecycle, configure lifecycle management policies, and store cold data as Infrequent Access (IA) data. In the NAS console, you can create, view, and modify lifecycle management policies. You can also query the usage of primary storage and IA storage.

Prerequisites

A Network File System (NFS) file system of the NAS Capacity or NAS Performance type is mounted on an Elastic Compute Service (ECS) instance. For more information, see [Mount an NFS file system](#).

Context

NAS provides the lifecycle management feature that allows you to manage cold data. You can configure lifecycle management policies to transfer infrequently accessed data to a specified OSS bucket. This allows you to reduce the storage cost. You can still access the data that is stored in the OSS bucket.

Limits

The lifecycle management feature supports only NFS file systems. Server Message Block (SMB) file systems or file systems whose data is encrypted are not supported.

Additional considerations

The lifecycle management feature allows you to transfer cold data to a specified OSS bucket. You must be the owner of the specified file system and OSS bucket.

- You cannot delete the OSS bucket before you transfer cold data to the original file system. If you delete the file system, data may be lost and NAS clusters may be affected.
- You cannot revoke Resource Access Management (RAM) permissions on NAS.
- We recommend that you minimize the permissions of OSS bucket to prevent data leakage.
- We recommend that you use an independent OSS bucket for NAS. This reduces the risk of deleting cold data by accident if you store the cold data with other business data in the same OSS bucket.

Preparations

1. Authorize NAS by using RAM.

You must grant permissions to NAS before NAS can access the specified OSS bucket to read and write data.

 **Notice** When you create a RAM role, the organization that you specify is the department where the file system resides, for example, bms.

You need to grant permissions to NAS only once for an organization.

- i. Log on to the [Apsara Stack Cloud Management \(ASCM\) console](#).
 - ii. Choose **Configurations > RAM Authorization > RAM Roles > Create RAM Role** to activate OSS authorization for the user.
 - iii. View the authorization status of bms in the role list to confirm that `AliyunNASTieringRole` is on the list.
2. Create an OSS bucket. You can use an existing OSS bucket or create an OSS bucket. You can set different OSS buckets for each file system.

 **Note** If you use an existing OSS bucket, note the following information:

- The bucket is in the first cluster in the region. The domain name of the first cluster starts with `oss-` whereas the names of the other clusters start with `oss.xxxx`.
- Make sure that the bucket and the file system belong to the same department.

Log on to the [ASCM console](#). In the top navigation bar, choose **Products > Object Storage Service** to go to the OSS console. In the left-side navigation pane, click the **add** icon. Create an OSS bucket for the RAM user.

 **Note** When you create an OSS bucket, note the following information:

- Select **standard** from the storage class drop-down list, and the first cluster from the Cluster drop-down list. The domain name of the first cluster starts with `oss-` whereas the names of the other clusters start with `oss.xxxx`.
- Make sure that the bucket and the file system belong to the same department.

Procedure

After the preparations are complete, you can use the lifecycle management feature in the NAS console. Make sure that an NFS file system of the NAS Capacity or NAS Performance type is mounted on an ECS instance. For more information, see [Mount an NFS file system](#).

1. Create a lifecycle management policy
 - i. Log on to the [ASCM console](#). In the top navigation bar, choose **Products > Apsara File Storage NAS**.
 - ii. In the left-side navigation pane, click **Life Cycle Management**. On the page that appears, click **Create Policy** to create a lifecycle management policy.

After you create a lifecycle management policy for a specific directory of the file system, NAS transfers cold data to the specified OSS bucket. You can set the following parameters:

- **Policy Name:** Specify a unique policy name.
- **File System:** Specify a file system.
- **Directory Path:** Specify a directory path on the instance.
You can enter a forward slash (/) to indicate the root directory.
If you select **Recursive Subdirectory**, all subdirectories in the directory are recurred.
- **Management Rules:** Specify a rule to manage files that have not been accessed more than 14, 30, 60, or 90 days.
- **OSS Bucket:** Specify the OSS bucket to which cold data is transferred.

 **Note** Cold data in a file system must be transferred to an OSS bucket.

Only the OSS buckets of the organization where the file system resides are displayed in the list.

2. View the lifecycle management policies

Log on to the ASCM console. In the left-side navigation pane, click **Life Cycle Management**. On the page that appears, you can view the lifecycle management policies. You can also screen the policies by file system ID.

3. Modify a lifecycle management policy

Log on to the ASCM console. In the left-side navigation pane, click **Life Cycle Management**. On the page that appears, you can modify the lifecycle management policies. You can set the following parameters:

- Recursive Subdirectory
- Management Rules

4. Query the usage of primary storage and IA storage

You can query the primary storage and IA storage usage of the file systems that have lifecycle management policies configured. Log on to the ASCM console. In the left-side navigation pane, click **File System List**.

7.10. Directory-level ACLs that grant the read and write access

7.10.1. Overview

Apsara File Storage NAS supports NFSv4 access control lists (ACLs) and Portable Operating System Interface (POSIX) ACLs. This topic describes POSIX ACLs and NFSv4 ACLs. It also lists precautions for using these ACLs.

Access control and user management are important for enterprise-level users who want to share files between different users and groups by using a shared file system. To control access to different files and directories, you can grant users and groups different types of access. NAS provides Network File System (NFS) ACLs to allow you to meet specific requirements. An ACL consists of one or more access control entries (ACEs) that each grant a user or group one or more permissions to access a file or directory.

The NFSv3 protocol includes the extended support for POSIX ACLs. POSIX ACLs extend the support for access control over file mode creation masks. You can grant permissions to specific users and groups besides users of the owner, group, and other classes. Permissions can also be inherited from parent objects. For more information, see [acl - Linux man page](#).

The NFSv4 protocol includes extended support for NFSv4 ACLs that provide more fine-grained access control than POSIX ACLs do. For more information, see [nfs4_acl - Linux man page](#).

You can mount an NFSv3 file system that has NFSv4 ACLs applied. These NFSv4 ACLs will then be converted into POSIX ACLs. You can also mount an NFSv4 file system that has POSIX ACLs applied. These POSIX ACLs will then be converted into NFSv4 ACLs. If you use NFS ACLs, we recommend that you mount NFSv4 file systems and control access by using NFSv4 ACLs rather than file mode creation masks or POSIX ACLs. This is because: NFSv4 ACLs and POSIX ACLs are not fully compatible. The interaction between ACLs and file mode creation masks is not in an ideal state. The file systems that are mounted by using the NFSv3 do not support locks. For more information about NFS ACL features, see [Features](#).

Precautions for using POSIX ACLs

- We recommend that you use the default inheritance method that allows a subdirectory or file to inherit the same ACL from the parent directory. This allows you to avoid configuring another ACL when you create a new file or subdirectory in the parent directory.
- We recommend that you retain a minimum number of ACEs because a file system needs to scan all ACEs each time it performs permission verification. Abuse of ACLs may diminish the performance of file systems.
- Use caution when you configure ACLs by using the recursive method (`setfacl -R`). Large amounts of metadata are produced when you perform a recursive operation on a directory that contains a large number of files and subdirectories. This may affect your businesses.
- Before you configure ACLs, we recommend that you manage groups and related permissions. For example,

you can add a user to one or more groups. If you want to add, remove, or modify permissions for a user, we recommend that you move the user to a group that has the required permissions. You do not need to modify the ACL of a group as long as the structure of groups remains unchanged. We recommend that you configure ACLs for groups rather than single users. This provides a simple and effective time-saving method to control access and ensure the better organization of permissions.

- You can apply a POSIX ACL to multiple objects that resides on different clients. In such cases, you must ensure that the ACL you apply to each object is the same. Apsara File Storage NAS stores user IDs (UIDs) and group IDs (GIDs) at the backend. You must ensure that the mappings between a username or group name and a UID or GID are the same.
- We recommend that you grant the least permissions to the other class because all users have the permissions that are granted to the other class. A potential security vulnerability may be exposed if the other class has more permissions than any ACE.
- We recommended that you configure the least permissions for the other class. Before creating files or directories, you can use the `umask 777` command to configure the file mode creation mask. This command sets the file mode creation mask to 000 when the mask is used as a parameter to create a new file or directory. This ensures that the newly created file or directory has the least permissions. For more information, see [umask and the default file mode creation mask](#).
- After you enable POSIX ACLs, the semantics of the other class for the POSIX ACL are equal to the semantics of the `EVERYONE@` principal. The semantics of the other class for the file mode creation mask are also equal to the semantics of the `EVERYONE@` principal. When a system performs permission verification, the system treats the other class the same as the `EVERYONE@` principal.

Precautions for using NFSv4 ACLs

- Use UIDs or GIDs such as UID 1001 to configure ACLs.
- We recommend that you do not configure the file mode creation mask after you configure an NFSv4 ACL.
- The `nfs4_setfacl` command provides `-a`, `-x`, `-m`, and other options. You can use these options to add, remove, or modify ACEs. However, we recommend that you use `nfs4_setfacl -e <file>` the command to edit an ACL in an interactive mode.
- We recommend that you configure the least permissions for the `EVERYONE@` principal because NFSv4 ACLs only support allow rather than deny ACEs. A potential security vulnerability may be exposed if the `EVERYONE@` principal has more permissions than other ACEs.
- NFSv4 ACLs have fine-grained permissions. In most cases, it is unnecessary to subdivide permissions at such a fine-grained level. For example, if you have the write access (`w`) to a file but do not have the append-only (`a`) access, an error may occur when you write data to the file. The same issue occurs for a directory. To avoid unexpected permission errors, we recommend that you specify a capital `w` (`W`) as a parameter when you use the `nfs4_setfacl` command to configure an ACL. The `nfs4_setfacl` command converts `W` to a full write access permission. For a file, `W` is expanded to `wadT`. For a directory, `W` is expanded to `wadTD`.
- We recommend that you use the default inheritance method that allows a subdirectory or file to inherit the same ACL from the parent directory. This allows you to avoid configuring another ACL when you create a new file or subdirectory in the parent directory.
- We recommend that you retain a minimum number of ACEs because a file system needs to scan all ACEs each time it performs permission verification. Abuse of ACLs may diminish the performance of file systems.
- Use caution when you configure ACLs by using the recursive method (`nfs4_setfacl -R`). Large amounts of metadata are generated when you perform a recursive operation on a directory that contains a large number of files and subdirectories. This may affect your businesses.
- Before you configure ACLs, we recommend that you manage groups and related permissions. For example, you can add a user to one or more groups. If you want to add, remove, or modify permissions for a user, we recommend that you move the user to a group that has the required permissions. You do not need to modify the ACL of a group as long as the structure of groups remains unchanged. We recommend that you configure ACLs for groups rather than single users. This provides a simple and effective time-saving method to control access and ensure the better organization of permissions.

7.10.2. Features

This topic describes the features of NFSv4 access control lists (ACLs) and POSIX ACLs.

Features of Apsara File Storage NAS NFSv4 ACLs

- Only access control entries (ACEs) of the allow type are supported. ACEs of the following types are not supported: deny, audit, and alarm.

Deny ACEs increase the complexity of access control. In most cases, complexity leads to confusion and increases potential security risks. As agreed by the industry, we recommend that you avoid using deny ACEs. For more information about why deny ACEs are not recommended, see [FAQ](#).

Audit and alarm ACEs are not available for NFS file systems. Instead, you can audit file systems and configure alerts based on auditing results in the NAS console.

- If no ACL is specified for a file or a directory, the default ACL that corresponds to the predefined file mode creation mask is applied.

```
touch file
```

```
[root@vbox test]# ls -l file
-rw-r--r--. 1 root root 0 May  6 14:27 file
```

```
[root@vbox test]# nfs4_getfacl file
# file: file
A::OWNER@:rwatTnNcCy
A::GROUP@:rtncy
A::EVERYONE@:rtncy
```

- An ACL is an ordered list that contains and deduplicates ACEs. This scheme ensures that permissions defined in an ACL are clear and informative.

If you apply both a new ACE and an existing ACE to the same object and the existing ACE is inherited from the parent object, the permissions of the new ACE override the permissions of the existing ACE. For example:

- In most cases, ACEs that include the following principals are queued in sequence at the beginning of an ACL: OWNER@, GROUP@, and EVERYONE@. These ACEs take precedence over other ACEs.

```
[root@vbox test]# nfs4_getfacl file
# file: file
A::OWNER@:rwaxTnNcCy
A::GROUP@:rtncy
A::EVERYONE@:rtncy
A::1001:rwaxTnNcCy
```

- Add an ACE of the read and write permissions to the following ACL for a user principal named 1009. The ACE is placed after the ACE that is defined for a user principal named 1001 based on the predefined order.

```
[root@vbox test]# nfs4_setfacl -a A::1009:X file
[root@vbox test]# nfs4_getfacl file
# file: file
A::OWNER@:rwaxTcCy
A::GROUP@:rwatcy
A::EVERYONE@:tcy
A::1001:rwaxTnNcCy
A::1009:xtcy
```

- Add a new ACE that includes the execute permission to the ACL for the user principal named 1009. The system automatically merges the execute permission into the existing ACE for the 1009 user principal.

```
[root@vbox test]# nfs4_setfacl -a A::1009:W file
[root@vbox test]# nfs4_getfacl file
# file: file
A::OWNER@:rwaxTcCy
A::GROUP@:rwatcy
A::EVERYONE@:tcy
A::1001:rwaxTNcCy
A::1009:waxtTncCy
```

- Add the f and d inheritance flags to an ACE that includes a user principal named 1009. Then, the system splits the ACE into two ACEs. One ACE has an extra inheritance flag named i specified, which indicates an inherit-only ACE. The other ACE only applies to the file object without inheritance flags. If the inheritance type of an existing ACE matches the type for one of the two ACEs, the system combines the existing ACE with the ACE out of the two ACEs. The two matching ACEs are combined into one ACE.

```
[root@vbox test]# nfs4_setfacl -a A:fd:1009:R file
[root@vbox test]# nfs4_getfacl file
# file: file
A::OWNER@:rwaxTcCy
A::GROUP@:rwatcy
A::EVERYONE@:tcy
A::1001:rwaxTNcCy
A::1009:rwaxTNcCy
A:fdi:1009:r
```

- All ACEs can be inherited.
 - For example, the OWNER@ principal has the write access, the GROUP@ principal has the read access, and the EVERYONE@ has no access to the dir directory.

```
[root@vbox nfs]# nfs4_getfacl dir
# file: dir
A::OWNER@:rwaDxtTnNcCy
A::GROUP@:rxscy
A::EVERYONE@:tncy
```

- ii. Add an ACE that grants a user principal named 1000 the read, write, and execute access to the dir directory. The f and d inheritance flags are also specified for the ACE.

```
[root@vbox nfs]# nfs4_setfacl -a A:fd:1000:rw dir
[root@vbox nfs]# nfs4_getfacl dir
# file: dir
A::OWNER@:rwaDxtTcCy
A::GROUP@:rxscy
A::EVERYONE@:tcy
A::1000:rw
A:fdi:1000:rw
```

- iii. When you create a file or subdirectory in the dir directory, the file or the subdirectory automatically inherits all ACEs from the dir directory.

```
[root@vbox nfs]# touch dir/file
[root@vbox nfs]# nfs4_getfacl dir/file
# file: dir/file
A::OWNER@:rwatTcCy
A::GROUP@:rwatcy
A::EVERYONE@:rwatcy
A::1000:rwx
```

```
[root@vbox nfs]# mkdir dir/subdir
[root@vbox nfs]# nfs4_getfacl dir/subdir
# file: dir/subdir
A::OWNER@:rwaDxtTcCy
A::GROUP@:rwaDxtcy
A::EVERYONE@:rwaDxtcy
A:fdi:1000:rwx
```

Note

- We recommend that you grant the least privileges to the `EVERYONE@` principal. Before you perform the following steps, we recommend that you run the `umask 777` command. This command ensures that no access to a file or directory is granted when the file or directory is created. For more information, see [Why doesn't umask change execute permissions on files?](#)
- When Linux calls functions to create files or directory, the predefined file mode creation mask is used as a request parameter. You can obtain the final ACL for a child object from the overlap of the inherited ACL (parent to child) and the file mode creation mask, as specified in the [RFC7530](#) standard. When you modify the group bits of a file mode creation mask based on the standard, permissions included in an ACL for each group must be less than or equal to permissions defined in group bits. However, this scheme results in an invalid inheritance for groups. For example, you create a file and the file attempts to inherit `A:RWX` from a parent object. However, the predefined file mode creation mask sets the group bits to `R`. The final permission for the file becomes `A:R`. In actual practice, we recommend that you only modify file mode creation masks for ACLs that include the following principals: `OWNER@`, `GROUP@`, and `EVERYONE@`. This prevents against potential issues and ensures that semantics are clear. To remove permissions for a group, we recommend that you remove the ACE that relates to the group.

- You need to manage mappings between usernames or group names and user IDs (UIDs) or group IDs (GIDs) across multiple independent instances.

NAS NFS adopts IP security groups rather than usernames to authenticate users. When you configure NFSv4 ACLs, UID or GID that are included in ACEs are stored in Linux. When you print an ACL for an object in a shell, Linux automatically loads the `/etc/passwd` file and converts UID or GID into usernames or group names. You need to manage mappings between usernames or group names and UID or GID across multiple instances. You must ensure a username or group name is mapped to its UID or GID.

- NFSv4 ACLs can be printed by using extended attributes.

```
[root@vbox nfs]# getfattr -n system.nfs4_acl file
# file: file
system.nfs4_acl=0sAAAABgAAAAAAAAAAAAABYBhwAAAAZPV05FUKAAAAAAAAAAAAAAAAABIAhwAAAAZHUK9VUEAAAAA
AAAAAAAAABIAhwAAAAIFVkvS WU9ORUAAAAAAAAAAAAAAAAAAAAEAAAEEMT AwMAAAAAAAAAALAAAAAwAAAAQ
xMDAwAAAAAAAAAAEAAfGgQAAAABTEwMDAxAAAA
```

- Tools such as `cp` are supported for migrating NFSv4 ACLs.

NAS allows you to migrate NFSv4 ACLs by using the `cp`, `tar`, and `rsync` tools. For more information, see [How to preserve NFS v4 ACLs via extended attributes when copying file](#).

The following `cp --preserve=xattr file1 file2` command makes a copy of the file1 file as the file2 file while making a copy of the ACL of the file1 file for the file2 file. The `cp -ar dir1 dir2` command makes a copy of the dir1 directory as the dir2 directory while making a copy of the ACL of the dir1 directory for the dir2 directory.

 **Note** You may fail to migrate NFSv4 ACLs if the version of the `rsync` tool is earlier than 3.1.2.

```
[root@vbox nfs]# nfs4_getfacl file1
# file: file1
A::OWNER@:rwatTcCy
A::GROUP@:rwatcy
A::EVERYONE@:rwatcy
A::1000:rtncy
[root@vbox nfs]# cp --preserve=xattr file1 file2
```

```
[root@vbox nfs]# nfs4_getfacl file2
# file: file2
A::OWNER@:rwatTcCy
A::GROUP@:rwatcy
A::EVERYONE@:rwatcy
A::1000:rtncy
[root@vbox nfs]# cp -ar dir1 dir2
```

- Interaction between NFSv4 ACLs and file mode creation masks is supported. The modification for the ACL of an object may change the file mode creation mask of the object. The modification for the file mode creation mask of an object may change the ACL of the object.

For example, the file mode creation mask of the file object is 0666.

```
[root@vbox nfs]# ls -l file
-rw-rw-rw-. 1 root root 0 May 3 2019 file
[root@vbox nfs]# nfs4_getfacl file
# file: file
A::OWNER@:rwatTcCy
A::GROUP@:rwatcy
A::EVERYONE@:rwatcy
```

- If you add the execute permission to the file mode creation mask by modifying the owner bits, the execute permission is also added to the ACE that includes the OWNER@ principal.

```
[root@vbox nfs]# chmod u+x file
[root@vbox nfs]# ls -l file
-rwxrw-rw-. 1 root root 0 May 3 2019 file
[root@vbox nfs]# nfs4_getfacl file
# file: file
A::OWNER@:rwaxTcCy
A::GROUP@:rwatcy
A::EVERYONE@:rwatcy
```

- If you add the execute permission to an ACE that includes the GROUP@ principal, the execute permission is also added to the related file mode creation mask.

```
[root@vbox nfs]# nfs4_setfacl -a A::GROUP@:x file
[root@vbox nfs]# ls -l file
-rwxrwxrw-. 1 root root 0 May 3 2019 file
```

 **Note**

- In the interaction between ACLs and file mode creation masks, the EVERYONE@ principal is equal to the others class. When you modify the others class, the change also applies to the EVERYONE@ principal. This operation results in a slight impact on the semantics of permissions. For example, the current file mode creation mask is 177. After you run the `chmod o+r` command, all users that include the file owner and group members have the read permission. This occurs because the read permission is added to the related ACE that includes the EVERYONE@ principal. If no change is applied to the default file mode creation mask, the owner and group classes still have no read permission after you run the `chmod o+r` command.
- If no change is applied to NFSv4 ACLs, the others class of the file mode creation mask keeps the same semantics. If an NFSv4 ACL is changed, the semantics of the others class change to the semantics of the EVERYONE@ principal and the latest semantics remain. We recommend that you do not use file mode creation masks after using NFSv4 ACLs.

- Interaction between NFSv4 ACLs and POSIX ACLs is supported.

You can mount NFSv3 file systems that have NFSv4 ACLs applied. These NFSv4 ACLs will then be converted into POSIX ACLs. You can also mount NFSv4 file systems that have POSIX ACLs applied. These POSIX ACLs will then be converted into NFSv4 ACLs.

 **Note** The semantics of POSIX ACLs are different from the semantics of NFSv4 ACLs. For example, the inheritance rules that apply to POSIX ACLs do not differentiate files and directories. NFSv4 ACLs have more permissions than POSIX ACLs, which have only read, write, and execute permissions. We recommend that you use either NFSv4 ACLs or POSIX ACLs to prevent against potential issues.

For example, you configure an NFSv4 ACL for the dir0 directory. The permissions are listed as follows.

```
[root@vbox test] sudo nfs4_getfacl dir0
A::OWNER@:tTnNcCy
A::GROUP@:tnCy
A::EVERYONE@:tnCy
A:fdi:EVERYONE@:tnCy
A:fdi:OWNER@:tTnNcCy
A:fdi:GROUP@:tnCy
A:g:19064:rxtncy
A:g:19065:rwaDxtTnNcCy
A:fdig:19064:rxtncy
A:fdig:19065:rwaDxtTnNcCy
```

You configure a POSIX ACL for the dir0 directory. The permissions are listed as follows.

```
[root@vbox test] sudo getfacl dir0
user::---
group::---
group:players:r-x
group:adminis:rwX
mask::rwX
other::---
default:user::---
default:group::---
default:group:players:r-x
default:group:adminis:rwX
default:mask::rwX
default:other::---
```

For example, you configure an NFSv4 ACL for the dir0/file file. The permissions are listed as follows.

```
[root@vbox test] sudo nfs4_getfacl dir0/file
A::OWNER@:tTnNcCy
A::GROUP@:tncy
A::EVERYONE@:tncy
A:g:19064:rxtncy
A:g:19065:rwaxTnNcCy
```

For example, you configure a POSIX ACL for the dir0/file file. The permissions are listed as follows.

```
[root@vbox test] sudo getfacl dir0/file
user::---
group::---
group:players:r-x
group:adminis:rwX
mask::rwX
other::---
```

- The number of NFSv4 ACLs is limited.

NAS supports a maximum of 100,000 ACLs that are different from one another in each file system. Each ACL contains a maximum of 500 ACEs.

 **Note** We recommend that you do not abuse ACLs and ACEs. This reduces the time and resources consumed for verifying permissions.

Features of NAS POSIX ACLs

- Permissions that are specified for the other class apply to all users.

Everyone includes the owner, group, and users that are related to each ACE. The other class is equal to the EVERYONE@ principal of an NFSv4 ACL.

 **Note** We recommend that you grant the least permissions to the other class in all cases.

For example, the following ACL is configured for the *myfile* file. Although the ACE contains a user named alice who does not have the write permission, the write permission propagates to the ACE because the permission is specified for the other class.

```
[root@vbox 3]# getfacl myfile
# file: myfile
# owner: root
# group: root
user::rw-
user:alice:r--
group::r--
mask::r--
other::rw-
```

- Permissions that are configured by ACLs will not be changed after you run the `chmod` command.

 **Note** We recommend that you avoid modifying the file mode creation mask of a file that has a POSIX ACL applied. You can configure permissions for the file by modifying the POSIX ACL.

- For example, an ACE that grants the players group the read and write access to the *myfile* file.

```
[root@vbox 3]# getfacl myfile
# file: myfile
# owner: root
# group: root
user::rw-
user:player:rw-
group::rw-
group:players:rw-
mask::rw-
other::---
```

- The `chmod g-w myfile` or `chmod u-w myfile` command does not change the permissions that are granted to the player user and the players group, which is different from the **POSIX ACL standard**. However, this ensures that permissions that are granted by POSIX ACLs to non-reserved users are the same after you modify permissions by using file mode creation masks. The non-reserved users include all users except for the users of the owner, group, and other classes.

```
[root@vbox 3]# getfacl myfile
# file: myfile
# owner: root
# group: root
user::r--
user:player:rw-
group::r--
group:players:rw-
mask::rw-
other::---
```

- If the execute permission is not granted to the group and other classes of an ACL, the ACL has no execute permission.

The rule is predefined in Linux. The execute action is allowed by the backend of NAS. However, to make the execute permission in the ACL effective, you must grant the execute permission to the group or other class.

For example, if the group and other classes do not have the execute access to the *myfile* file, the player user cannot execute the file.

```
[root@vbox 3]# getfacl myfile
# file: myfile
# owner: root
# group: root
user::rw-
user:player:r-x
group::r--
mask::r-x
other::r--
```

If you grant the execute permission to the group class, the execute permission also propagates to the player user.

```
[root@vbox 3]# getfacl myfile
# file: myfile
# owner: root
# group: root
user::rw-
user:player:r-x
group::r-x
mask::r-x
other::r--
```

- If you configure inheritable NFSv4 ACLs for directories, these settings may not conform to the POSIX ACL standard when these directories reside in NFSv3 file systems.

Inheritance rules that apply to files are different from those that apply to directories in NFSv4 ACLs. The same inheritance rules apply to both files and directories in POSIX ACLs.

 **Note** We recommend that you apply either NFS4 ACLs or POSIX ACLs to an NFS file system to prevent against potential issues.

- File mode creation masks cannot be modified.

The file mode creation mask of a POSIX ACL is yielded by the combination and interaction of permissions from all users and groups. The mask has no practical meaning and cannot be changed.

- You need to manage mappings between usernames or group names and user IDs (UIDs) or group IDs (GIDs) across multiple instances.

Apsara File Storage NAS NFS adopts IP security groups rather than usernames to authenticate users. When you configure POSIX ACLs, UIDs or GIDs that are included in ACEs are stored in Linux. When you print an ACL for an object in a shell, Linux automatically loads the */etc/passwd* file and converts UIDs or GIDs into actual usernames or group names. You need to manage mappings between usernames or group names and UIDs or GIDs across multiple instances. You must ensure a username or group name is mapped to its related UID or GID.

- POSIX ACLs can be printed by using extended attributes.

```
[root@vbox nfs]# getfattr -n system.posix_acl_access file
# file: file
system.posix_acl_access=0sAgAAAAEAAAD/////AgAFACAEAAAEEAAA/////xAABQD/////IAABAP/////8=
```

- POSIX ACLs can be migrated by using tools such as cp.

NAS allows you to migrate POSIX ACLs by using the `cp`, `tar`, and `rsync` tools. For more information, see [How to preserve NFS v4 ACLs via extended attributes when copying file](#).

The following `cp --preserve=xattr file1 file2` command makes a copy of the file1 file as the file2 file while making a copy of the ACL of the file1 file for the file2 file. The `cp -ar dir1 dir2` command makes a copy of the dir1 directory as the dir2 directory while making a copy of the ACL of the dir1 directory for the dir2 directory.

 **Note** You may fail to migrate POSIX ACLs if the version of the `rsync` tool is earlier than 3.1.2.

```
[root@vbox nfs]# getfacl file1
user::---
user:player:r-x
group::---
mask::r-x
other::--x
[root@vbox nfs]# cp --preserve=xattr file1 file2
```

```
[root@vbox nfs]# getfacl file2
# file: file2
user::---
user:player:r-x
group::---
mask::r-x
other::--x
[root@vbox nfs]# cp -ar dir1 dir2
```

- The number of POSIX ACLs is limited.

NAS supports a maximum of 100,000 ACLs that are different from one another in each file system. Each ACL contains a maximum of 500 ACEs.

 **Note** We recommend that you do not abuse ACLs and ACEs. This reduces the time and resources consumed for verifying permissions.

FAQ

Why are deny ACEs not supported?

- The position of an ACE that resides in an ACL is important.

The sequence for ACEs that reside in an NFSv4 ACL is random. A deny ACE may be placed in any position of an NFSv4 ACL. For example, an ACL contains two ACEs: `A::Alice:r` and `D::Alice:r`. The position of the ACEs determines whether the user named Alice has the write permission.

 **Note** When you configure an ACL, you must consider the position of each ACE.

- The number of ACEs in an ACL experiences a sharp increase.

You may have difficulties to combine and deduplicate ACEs in an ACL because the sequencing for ACEs is not mandatory. The number of ACEs may increase up to tens or hundreds over a long period of time. To manage the final permissions that are produced by these ACEs, you need to check each ACE. The process to check is strenuous and time-consuming.

- The interactions between file mode creation masks and ACLs become more complex after deny ACEs are applied because deny features do not exist in file mode creation masks.

- If deny ACEs are available, you may need to add several ACEs to an ACL when the file mode creation mask is changed. For example, if you change the file mode creation mask to `-rw-rw-rw`, you need to add the following ACEs to an ACL. You must add the ACEs in sequence at the beginning of the ACL.

```
A::OWNER@:rw
D::OWNER@:x
A::GROUP@:rw
D::GROUP@:x
A::EVERYONE@:rw
D::EVERYONE@:x
```

- If deny ACEs are unavailable, you can sequence and deduplicate ACEs. You do not need to differentiate the `EVERYONE@` principal and the other class. You can modify an ACL with ease when the file mode creation mask is changed. In such cases, you only need to find ACEs that contain the `OWNER@`, `GROUP@`, and `EVERYONE@` principals and modify these ACEs as follows.

```
A::OWNER@:rw
A::GROUP@:rw
A::EVERYONE@:rw
```

- Conversions between NFSv4 ACLs and POSIX ACLs are not supported in some cases.
 - POSIX ACLs do not support deny ACEs. If deny ACEs are included in an NFSv4 ACL, you cannot convert the ACL into a POSIX ACL.

7.10.3. Use POSIX ACLs to control access

This topic describes how to configure Portable Operating System Interface (POSIX) access control lists (ACLs). You can use POSIX ACLs to control access to files and directories that reside in an NFSv3 file system.

Prerequisites

An NFSv3 file system is mounted. For more information, see [Mount an NFS file system](#).

Commands

Before you configure POSIX ACLs, we recommend that you familiarize yourself with the related commands.

Command	Description
<code>getfacl <filename></code>	Shows the ACL that applies to the specified file.
<code>setfacl -m g:w <filename></code>	Grants the owning group the write access.
<code>setfacl -m u:player:w <filename></code>	Grants the player user the write access.
<code>setfacl -m g:players:rwx <filename></code>	Grants the players group the read, write, and execute access.
<code>setfacl -x g:players <filename></code>	Removes permissions from the players group
<code>getfacl file1 setfacl --set-file=- file2</code>	Copies the ACL for the <i>file1</i> file to the <i>file2</i> file.
<code>setfacl -b file1</code>	Removes all extended ACEs from the <i>file1</i> file. The base ACEs of the owner, group, and others are retained.
<code>setfacl -k file1</code>	Removes all default ACEs from the <i>file1</i> file.
<code>nfs4_setfacl -R -m g:players:rw dir</code>	Grants the players group the read and write access to files and subdirectories in the <i>dir</i> directory.

Command	Description
<code>setfacl -d -m g:players:rw dir1</code>	Grants the players group the read and write access to the newly created files and subdirectories in the <i>dir1</i> directory.

Procedure

To control access to files and directories by configuring NFS ACLs, follow these steps.

1. Create users and groups.

In this example, the following users are created: `player`, `admini`, and `anonym`. The following groups are created: `players` and `adminis`. The `player` user is added to the `players` group and the `admini` user is added to the `adminis` group.

```
sudo useradd player
sudo groupadd players
sudo usermod -g players player
sudo useradd admini
sudo groupadd adminis
sudo usermod -g adminis admini
sudo useradd anonym
```

2. Configure POSIX ACLs to control access to files and directories.

Use the following commands to complete the operations: create a directory named *dir0* and grant the `players` group the read-only access, the `adminis` group the read, write, and execute permissions, and the others class no access to all the files in the *dir0* directory.

```
sudo umask 777
sudo mkdir dir0
sudo setfacl -m g:players:r-x dir0
sudo setfacl -m g:adminis:rwX dir0
sudo setfacl -m u:--- dir0
sudo setfacl -m g:--x dir0
sudo setfacl -m o:--- dir0
sudo setfacl -d -m g:players:r-x dir0
sudo setfacl -d -m g:adminis:rwX dir0
sudo setfacl -d -m u:--- dir0
sudo setfacl -d -m g:--x dir0
sudo setfacl -d -m o:--- dir0
```

Use the `sudo getfacl dir0` command to verify the result after the configuration is complete.

```
# file: dir0
# owner: root
# group: root
user::---
group::--x
group:players:r-x
group:adminis:rwx
mask::rwx
other::---
default:user::---
default:group::--x
default:group:players:r-x
default:group:adminis:rwx
default:mask::rwx
default:other::---
```

3. Verify the ACL configuration.

- i. Verify that the admini user has read and write access to the dir0/file file.

```
[root@vbox test] sudo su admini -c 'touch dir0/file'
[root@vbox test] sudo su admini -c 'echo 123 > dir0/file'
```

- ii. Use the following command to verify the read-only access of the player user.

```
[root@vbox test] sudo su player -c 'touch dir0/file'
touch: cannot touch 'dir0/file': Permission denied
[root@vbox test] sudo su player -c 'cat dir0/file'
123
[root@vbox test] sudo su player -c 'echo 456 >> dir0/file'
bash: dir0/file: Permission denied
[root@vbox test] sudo su player -c 'getfacl dir0/file'
# file: dir0/file
# owner: admini
# group: adminis
user::---
group::---
group:players:r-x
group:adminis:rwx
mask::rwx
other::---
```

- iii. Verify that the anonym user does not have access to the dir0/file file.

```
[root@vbox test] sudo su anonym -c 'ls dir0'
ls: cannot open directory dir0: Permission denied
[root@vbox test] sudo su anonym -c 'cat dir0/file'
cat: dir0/file: Permission denied
[root@vbox test] sudo su anonym -c 'getfacl dir0/file'
getfacl: dir0/file: Permission denied
```

Related operations

If you want to remove user permissions, use the following method.

When you use NFSv4 ACLs, we recommend that you sort each user into different groups. This allows you to configure permissions for a group rather than a separate user. To disable access to an object from a user, you can remove the user from a group that has access to the object. For example, the following commands remove the admini user from the adminis group and add the user to the adminis2 group.

```
[root@vbox test] sudo groupadd adminis2
[root@vbox test] sudo usermod -g adminis2 admini
[root@vbox test] id admini
uid=1057(admini) gid=1057(admini) groups=1061(adminis2)
[root@vbox test] sudo su admini -c 'ls dir0'
ls: cannot open directory dir0: Permission denied
[root@vbox test] sudo su admini -c 'cat dir0/file'
cat: dir0/file: Permission denied
[root@vbox test] sudo su admini -c 'getfacl dir0/file'
getfacl: dir0/file: Permission denied
```

7.10.4. Use NFSv4 ACLs to control access

This topic describes how to configure NFSv4 access control lists (ACLs) and apply these ACLs to NFSv4 file systems to control access to files and directories.

Prerequisites

An NFSv4 file system is mounted. For more information, see [Mount an NFS file system](#).

Context

You can mount an NFSv4 file system on an Elastic Compute Service (ECS) instance that runs Linux and install the Linux-specific `nfs4-acl-tools` tool on the instance. You can use the standard `nfs4_getfacl` and `nfs4_setfacl` tools to configure NFSv4 ACLs after the installation is completed.

Commands

Before you configure NFSv4 ACLs, we recommend that you familiarize yourself with the related commands.

Command	Description
<code>nfs4_getfacl <filename></code>	Views the access permissions for the specified file.
<code>nfs4_setfacl -a A::GROUP@:W <filename></code>	Adds an access control entry (ACE) that grants the GROUP@ principal the write access to the specified file.
<code>nfs4_setfacl -a A::1000:W <filename></code>	Adds an ACE that grants a user principal named 1000 the write access to the specified file.
<code>nfs4_setfacl -a A:g:10001:W <filename></code>	Adds an ACE that grants a group principal named 10001 the write access to the specified file.
<code>nfs4_setfacl -e <filename></code>	Edits an ACL in an interactive mode.
<code>nfs4_getfacl <filename> > saved_acl.txt</code>	Saves a list of permissions for the specified file as a TXT file.

Command	Description
<code>nfs4_setfacl -S saved_acl.txt <filename></code>	Configures permissions for the specified file by using a TXT file that includes a list of ready-made permissions.
<code>nfs4_setfacl -m A::1001:rwaxTNCy A::1001:rxtcy file1</code>	Modifies the permission of an ACE that applies to the <i>file1</i> file.
<code>nfs4_getfacl file1 nfs4_setfacl -S - file2</code>	Copies the permissions for the <i>file1</i> file to the <i>file2</i> file.
<code>nfs4_getfacl file1 grep @ nfs4_setfacl -S - file1</code>	Deletes all ACEs that apply to the <i>file1</i> file except for ACEs that include the following principals: OWNER@, GROUP@, and EVERYONE@.
<code>nfs4_setfacl -R -a A:g:10001:rW dir</code>	Adds an ACE that grants a group principal named 10001 the read and write access to files and subdirectories in the <i>dir</i> directory.
<code>find dir -type f -exec sh -c 'for ace in \$(nfs4_getfacl \{} grep "^A.*\:1005\:"); do nfs4_setfacl -x \$ace \{}; done' \;</code>	Deletes ACEs that grant a user principal named 1005 access to files in the <i>dir</i> directory.
<code>nfs4_setfacl -a A:fdg:10001:rW dir1</code>	Adds an ACE that grants a group principal named 10001 the read and write access to new files and subdirectories in the <i>dir1</i> directory.
<code>nfs4_setfacl -a A:fg:10001:rx dir1</code>	Adds an ACE that grants a group principal named 10001 the read, write, and execute access to all newly created files in the <i>dir1</i> directory.

Procedure

To control access to files and directories by configuring NFSv4 ACLs, follow these steps.

1. Create users and groups.

In this example, the following users are created: `player`, `admini`, and `anonym`. The following groups are created: `players` and `adminis`. The `player` user is added to the `players` group and the `admini` user is added to the `adminis` group.

```
sudo useradd player
sudo groupadd players
sudo usermod -g players player
sudo useradd admini
sudo groupadd adminis
sudo usermod -g adminis admini
sudo useradd anonym
```

2. Install the related tools to configure NFSv4 ACLs.

If you have installed these tools, skip this step.

```
sudo yum -y install nfs4-acl-tools
```

3. Obtain the group IDs of the `players` and `adminis` groups. Open the `/etc/group` file. The group IDs of the `players` and `adminis` groups are displayed as follows:

```
players:x:19064:player
adminis:x:19065:admini
```

4. Configure NFSv4 ACLs for files and directories. Use the following commands to complete the operations: create a directory named *dir0* and add ACEs that grant the players group the read-only access, the adminis group the read, write, and execute access, and other users no access to all the files in the *dir0* directory.

```
sudo umask 777
sudo mkdir dir0
sudo nfs4_setfacl -a A:fdg:19064:RX dir0
sudo nfs4_setfacl -a A:fdg:19065:RWX dir0
sudo nfs4_setfacl -a A:fdg:OWNER@: dir0
sudo nfs4_setfacl -a A:fdg:GROUP@: dir0
sudo nfs4_setfacl -a A:fdg:EVERYONE@: dir0
```

Use the `sudo nfs4_getfacl dir0` command to verify the configuration.

```
A::OWNER@:tTnNcCy
A::GROUP@:tncy
A::EVERYONE@:tncy
A:fdi:EVERYONE@:tncy
A:fdi:OWNER@:tTnNcCy
A:fdi:GROUP@:tncy
A:g:19064:rxtncy
A:g:19065:rwaDxtTnNcCy
A:fdig:19064:rxtncy
A:fdig:19065:rwaDxtTnNcCy
```

5. Verify the configuration of the ACL.

- i. Use the following commands to verify the read and write access of the admini user.

```
[root@vbox test] sudo su admini -c 'touch dir0/file'
[root@vbox test] sudo su admini -c 'echo 123 > dir0/file'
```

- ii. Use the following command to verify the read-only access of the player user.

```
[root@vbox test] sudo su player -c 'touch dir0/file'
touch: cannot touch 'dir0/file': Permission denied
[root@vbox test] sudo su player -c 'echo 456 >> dir0/file'
bash: dir0/file: Permission denied
[root@vbox test] sudo su player -c 'cat dir0/file'
123
[root@vbox test] sudo su player -c 'nfs4_getfacl dir0/file'
A::OWNER@:tTnNcCy
A::GROUP@:tncy
A::EVERYONE@:tncy
A:g:19064:rxtncy
A:g:19065:rwaxtTnNcCy
```

- iii. Use the following command to verify that the anonym user does not have access to the /dir0/file file.

```
[root@vbox test] sudo su anonym -c 'ls dir0'
ls: cannot open directory dir0: Permission denied
[root@vbox test] sudo su anonym -c 'cat dir0/file'
cat: dir0/file: Permission denied
[root@vbox test] sudo su anonym -c 'nfs4_getfacl dir0/file'
Invalid filename: di
```

Related operations

If you want to remove user permissions, use the following method.

When you use NFSv4 ACLs, we recommend that you sort each user into different groups. This allows you to configure permissions only for a group rather than a separate user. To disable access to an object from a user, you can remove the user from a group that has access to the object. For example, use the following commands to remove the admini user from the adminis group and add the user to the adminis2 group:

```
[root@vbox test] sudo groupadd adminis2
[root@vbox test] sudo usermod -g adminis2 admini
[root@vbox test] id admini
uid=1057(admini) gid=1057(admini) groups=1054(adminis2)
[root@vbox test] sudo su admini -c 'ls dir0'
ls: cannot open directory dir0: Permission denied
[root@vbox test] sudo su admini -c 'cat dir0/file'
cat: dir0/file: Permission denied
[root@vbox test] sudo su admini -c 'nfs4_getfacl dir0/file'
Invalid filename: dir0/file
```

8. Tablestore

8.1. What is Tablestore?

Tablestore is a NoSQL database service independently developed by Alibaba Cloud. Tablestore is a proprietary software program that is certified by the relevant authorities in China. Tablestore is built on the Apsara system of Alibaba Cloud, and can store large amounts of structured data and allow real-time access to these data.

Tablestore provides the following features:

- Offers schema-free data storage. You do not need to define attribute columns before you use them. Table-level changes are not required to add or delete attribute columns. You can configure the time to live (TTL) parameter for a table to manage the lifecycle of data. The expired data is deleted from the table.
- Adopts the triplicate technology to keep three copies of data on three servers across three different racks. A cluster can support single storage type instances (SSD only) or mixed storage type instances (SSD and HDD) to meet different budget and performance requirements.
- Adopts a fully redundant architecture that prevents single points of failure (SPOFs). Tablestore supports smooth online upgrades, hot cluster upgrades, and automatic data migration, which enable you to dynamically add or remove nodes for maintenance without incurring service interruptions. The concurrent read and write throughput and storage capacity can be linearly scaled. Each cluster can have at least 500 hosts.
- Supports highly concurrent read and write operations. Concurrent read and write capabilities can be scaled out as the number of hosts increases. The read and write performance is indirectly related to the amount of data in a single table.
- Supports identity authentication and multi-tenancy. Comprehensive access control and isolation mechanisms are provided to safeguard your data. VPC and access over HTTPS are supported. Provides multiple authentication and authorization mechanisms so that you can define access permissions on individual tables and operations.

8.2. Precautions

Before you use Tablestore, you need to take note of the following precautions and limits.

The following table describes the limits for Tablestore. A part of the limits indicate the maximum allowable values rather than the suggested values. To ensure better performance, set the table scheme and data size in a single row based on actual conditions, and adjust the following configurations.

Item	Limit	Description
The number of instances under an Apsara Stack tenant account	1024	To raise the limit, contact the technical support personnel.
The number of tables in an instance	1024	To raise the limit, contact the technical support personnel.
The length of an instance name	3 to 16 bytes	The instance name can contain uppercase and lowercase letters, digits, and hyphens (-). It must start with a letter and cannot end with a hyphen (-).
The length of a table name	1 to 255 bytes	The table name can contain uppercase and lowercase letters, digits, and underscores (_). It must start with a letter or underscore (_).
The length of a column name	1 to 255 bytes	The column name can contain uppercase and lowercase letters, digits, and underscores (_). It must start with a letter or underscore (_).

Item	Limit	Description
The number of columns in a primary key	1 to 4	A primary key can contain one to four primary key columns.
The size of the value in a string type primary key column	1 KB	The size of the value in a STRING primary key column cannot exceed 1 KB.
The size of the value in a STRING attribute column	2 MB	The size of the value in a STRING attribute column cannot exceed 2 MB.
The size of the value in a BINARY primary key column	1 KB	The size of the value in a BINARY primary key column cannot exceed 1 KB.
The size of the value in a BINARY attribute column	2 MB	The size of the value in a BINARY attribute column cannot exceed 2 MB.
The number of attribute columns in a single row	Unlimited	A single row can contain an unlimited number of attribute columns.
The number of attribute columns written by one request	1,024	During a PutRow, UpdateRow, or BatchWriteRow operation, the number of attribute columns written in a row cannot exceed 1,024.
The data size of a row	Unlimited	The total size of all column names and column values for a row is unlimited.

8.3. Quick start

8.3.1. Log on to the Tablestore console

This topic describes how to log on to the Tablestore console.

Prerequisites

- Before logging on to the ASCM console, make sure that you have obtained the IP address or domain name of the ASCM console from the deployment personnel. The URL used to access the ASCM console is in the following format: `http://IP address or domain name of the ASCM console/manage`.
- We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL used to log on to the ASCM console. Press the Enter key.
2. Enter your username and password.

Obtain the username and password used to log on to the console from the operations administrator.

 **Note** When you log on to the ASCM console for the first time, you must change the password of your username. For security reasons, your password must meet the minimum complexity requirements. The password must be 8 to 20 characters in length and must contain at least two of the following character types:

- Uppercase or lowercase letters.
- Digits.
- Special characters. Special characters include exclamation points (!), at signs (@), number signs (#), dollar signs (\$), and percent signs (%).

3. Click **Login** to go to the ASCM console homepage.

- In the top navigation bar, choose **Products > TableStore**.

8.3.2. Create instances

An instance is a logical entity in Tablestore and is used to manage tables. An instance is the basic unit of the resource management system of Tablestore. Tablestore implements application access control and resource measurement at the instance level. This topic describes how to create an instance.

Procedure

- Log on to the [Tablestore console](#).
- On the **Overview** tab, click **Create Instance**.

 **Note** You can create different instances to manage the tables for different businesses, or create different instances for development, testing, and production environments of the same business. By default, Tablestore allows you to create up to 1,024 instances and up to 1,024 tables in each instance under an Apsara Stack tenant account.

- On the **Create Tablestore Instance** page, configure the following parameters.

Parameter	Description
Region	Select a region from the drop-down list for the instance.
Organization	Select an organization from the drop-down list for the instance.
Resource Set	Select a resource set from the drop-down list for the instance.
Instance Name	Enter a name for the instance. Instance naming conventions: The name must be 3 to 16 characters in length and can contain only letters, digits, and hyphens (-). It must start with a letter and cannot start with case insensitive string <code>ali</code> or <code>ots</code> .
Description	Enter a description for the instance.
Instance Type	Select an instance type from the drop-down list for the instance. Tablestore provides high-performance instances and capacity instances. The instance types vary based on the type of cluster you deploy.

- Click **Submit**.
- In the **Submitted** dialog box, click **Back to Console**. On the **Overview** tab, you can view the created instance.

After the instance is created, you can perform the following operations on the instance:

- Click the instance name or click **Manage Instance** in the **Actions** column. On the **Instance Management** page, click each tab to perform various operations.
 - On the **Instance Details** tab, you can view the Instance Access URL, Basic Information, and Tables sections.
 - On the **Network Management** tab, you can bind or unbind VPCs and view the list of VPCs.
- Click **Release** in the **Actions** column to release an instance.

 **Notice** To create an instance when you release an existing instance, ensure that the name of the instance to create is different from that of the existing instance to avoid conflicts.

8.3.3. Create tables

This topic describes how to create a table in the Tablestore console.

Procedure

1. **Log on to the Tablestore console.**
2. On the **Overview** page, click the name of the target instance or click **Manage Instance** in the **Actions** column.
3. On the **Instance Details** tab, click **Create Table**.

 **Note** You can create a maximum of 1,024 tables in each instance.

4. In the **Create Table** dialog box, set **Table Name** and **Primary Key**. The following table describes the parameters you can configure.

Parameter	Description
Table Name	<p>The name of the table. This name is used to uniquely identify a table in an instance.</p> <p>The name must be 1 to 255 bytes in length and can contain letters, digits, and underscores (_). The name must start with a letter or an underscore (_).</p>
Primary Key	<p>One or more primary key columns in the table that uniquely identify each record in the table.</p> <p>Enter a primary key name and select a data type. Click Add a Primary Key to add a primary key column.</p> <p>You can add one to four primary key columns. By default, the first primary key column is the partition key. The configurations and order of primary key columns cannot be modified after the table is created.</p> <div style="background-color: #e1f5fe; padding: 5px; margin-top: 10px;"> <p> Note</p> <ul style="list-style-type: none"> ◦ In Tablestore, only a primary key column can be used as an auto-increment primary key column. Partition keys cannot be used as auto-increment primary key columns. ◦ After a primary key column is set to an auto-increment primary key column, Tablestore automatically generates a value for the auto-increment primary key column when you write a row of data. You do not need to specify a value for the auto-increment primary key column. The values of auto-increment primary key columns are incremental and unique within the rows that share the same partition key. </div> <ul style="list-style-type: none"> ◦ Naming conventions of primary key columns: The name must be 1 to 255 bytes in length and can contain letters, digits, and underscores (_). The name must start with a letter or underscore (_) ◦ Data types supported by primary key columns are String, Integer, and Binary.

5. **Optional. Configure advanced parameters.** If you need to configure parameters such as **Time to Live** and **Max Versions**, perform this operation.
 - i. **Turn on Advanced Settings.**

- ii. Configure advanced parameters. The following table describes the advanced parameters you can configure.

Parameter	Description
Time to Live	<p>The period for which data in the table can be retained. When the retention period exceeds the Time to Live (TTL) value, the system deletes the expired data.</p> <p>The minimum TTL value is 86,400 seconds (one day). A value of -1 indicates that data never expires.</p>
Max Versions	<p>The maximum number of versions of data that can be retained for an attribute column. When the versions of data in an attribute column exceed the Max Versions value, the system deletes the earliest versions of data to keep the maximum number of versions equal to the Max Versions value.</p> <p>Valid values: 1 to 10.</p>
Max Version Offset	<p>The difference between the version number and the data written time must be within the value of Max Version Offset. Otherwise, an error occurs when the data is written. Unit: seconds.</p> <p>The valid version range for attribute columns is calculated based on the following formula: Valid version range = [Data written time - Max version offset value, Data written time + Max version offset value).</p>
Reserved Read Throughput	<p>You can set this parameter only for high-performance instances.</p> <p>The read and write throughput that is allocated and reserved for the table.</p>
Reserved Write Throughput	<p>Valid values: integers from 0 to 5000.</p> <p>When the specified reserved read and write throughput is 0, Tablestore does not reserve related resources for the table.</p>

6. Optional. Create secondary indexes. If you need to create secondary indexes, perform this operation.

- i. Turn on **Create Secondary Index**.
- ii. Click the **+ Add** button in the **Pre-defined Column** section. Enter the name of the pre-defined column and select a data type from the drop-down list.
 - This operation is performed to create a predefined column for the base table. Tablestore uses a schema-free model. You can write an unlimited number of columns to a row and do not need to specify a fixed number of predefined columns in a schema. When you create a table, you can also predefine columns and specify their data types.
 - You can add up to 14 predefined columns. To delete the predefined column you add, click the  icon on the left of the corresponding predefined column.
 - The name of a predefined column must be 1 to 255 bytes in length and can contain letters, digits, and underscores (_). The name must start with a letter or underscore (_).
 - The data types of predefined columns include **STRING**, **INTEGER**, **BINARY**, **FLOAT**, and **BOOLEAN**.
- iii. Click **Add Secondary Index**. Enter **Index Name** and set **Primary Key** and **Pre-defined Column** for the index table.
 - The name of an index table must be 1 to 255 bytes in length and can contain letters, digits, and underscores (_). The name must start with a letter or underscore (_).
 - You can set the primary key of the index table to the primary key or predefined columns of the base table.
 - **Pre-defined Column** is optional. You can set the predefined columns of the index table to only the predefined columns of the base table.

7. Click **OK**. After a table is created, you can view the table in the **Table List** section. If the created table is not displayed in the list of tables, click the  icon to refresh the list of tables.

After a table is created, you can perform the following operations on the table:

- Click the name of the table or click **Details** in the **Actions** column. On the **Manage Table** page, you can perform the following operations:
 - On the **Details** tab, you can view the description of the table and the primary key columns list, and modify the attributes of the table.
 - On the **Data Editor** tab, you can insert or update data, query data, view data details, and delete multiple data at a time.
- Click the  icon in the **Actions** column corresponding to a table and choose **Delete** from the shortcut menu. Click **OK** in the **Delete Table** dialog box. The table is deleted.

Notice If you delete a table, the table and the data in the table are permanently deleted from Tablestore and cannot be recovered. Exercise caution when you perform this operation.

8.3.4. Read and write data in the console

After a table is created, you can read data from and write data to the table in the console.

Add data

1. [Log on to the Tablestore console.](#)
2. On the **Overview** page, click the name of the target instance or click **Manage Instance** in the **Actions** column.
3. In the **Table List** section of the **Instance Details** tab, click the name of the target table and click the **Data Editor** tab. You can also click **Data Editor** in the **Actions** column.
4. On the **Data Editor** tab, click **Insert**.
5. In the **Insert** dialog box that appears, set **Primary Key Value**. Click **Add Column**. Set **Name**, **Type**, **Value**, and **Version**. By default, **System Time** is selected, indicating that the current system time is used as the version number of the data. You can also clear **System Time** and enter the version number of the data.
6. Click **OK**. Rows that contain the written data are displayed on the **Data Editor** tab.

Delete data

You can delete data you no longer need.

1. [Log on to the Tablestore console.](#)
2. On the **Overview** page, click the name of the target instance or click **Manage Instance** in the **Actions** column.
3. In the **Table List** section of the **Instance Details** tab, click the name of the target table and click the **Data Editor** tab. You can also click **Data Editor** in the **Actions** column.
4. On the **Data Editor** tab, select the row of data you want to delete. Click **Delete**.
5. In the **Delete** message that appears, click **OK**.

Update data

You can update data in the attribute columns of a row.

1. [Log on to the Tablestore console.](#)
2. On the **Overview** page, click the name of the target instance or click **Manage Instance** in the **Actions** column.
3. In the **Table List** section of the **Instance Details** tab, click the name of the target table and click the **Data**

Editor tab. You can also click **Data Editor** in the Actions column.

4. On the **Data Editor** tab, select the row of data to update. Click **Update**.
5. In the **Update** dialog box that appears, modify the type and value for the primary key, add or remove attribute columns, and update or delete data in attribute columns.
 - You can click **+Add Column** to add an attribute column. You can also click the  icon to delete an attribute column.
 - If you select **Update**, you can modify data in attribute columns. If you select **Delete**, select the number of version to delete. If you select **Delete All**, all versions of the data are deleted.
6. Click **OK**.

Query data

In the Tablestore console, you can query data in a single row (**GetRow**) or query data within a specified range (**RangeQuery**).

To query data in a single row, perform the following operations:

1. [Log on to the Tablestore console](#).
2. On the **Overview** page, click the name of the target instance or click **Manage Instance** in the Actions column.
3. In the **Table List** section of the **Instance Details** tab, click the name of the target table and click the **Data Editor** tab. You can also click **Data Editor** in the Actions column.
4. On the **Data Editor** tab, click **Search**.
5. Set filter conditions.
 - i. In the **Search** dialog box, Set **Modes** to **GetRow**.
 - ii. By default, the system returns all columns. To return specified attribute columns, turn off **All Columns**. Enter the names of the attribute columns to return. Separate the names of the attribute columns with commas (,).
 - iii. Set **Primary Key Value**.The integrity and accuracy of the primary key value affect the query results.
 - iv. Set **Count of Versions** to specify the maximum number of versions to return.
6. Click **OK**.Data that meets the filter conditions is displayed on the **Data Editor** tab.

To perform range query, perform the following steps:

1. [Log on to the Tablestore console](#).
2. On the **Overview** page, click the name of the target instance or click **Manage Instance** in the Actions column.
3. In the **Table List** section of the **Instance Details** tab, click the name of the target table and click the **Data Editor** tab. You can also click **Data Editor** in the Actions column.
4. On the **Data Editor** tab, click **Search**.
5. Set filter conditions.
 - i. In the **Search** dialog box, Set **Modes** to **Range Search**.
 - ii. By default, the system returns all columns. To return specified attribute columns, turn off **All Columns**. Enter the names of the attribute columns to return. Separate the names of the attribute columns with commas (,).

- iii. Set **Start Primary Key Column** and **End Primary Key Column**. You can set **Start Primary Key Column** to **Min Value** or **Custom** and **End Primary Key Column** to **Max Value** or **Custom**. If you select **Custom**, enter a custom value.

 **Note**

- The value in the first primary key column takes priority when the range query mode is used. When the minimum and maximum values for the first primary key column are the same, the system uses the value in the second primary key column to perform the query. The query rules for the subsequent primary keys are the same as those for the first two primary keys.
- The Custom range is a left-open and right-closed interval.

- iv. Set **Count of Versions** to specify the maximum number of versions to return.
 - v. Set **Sequence** to **Forward Search** or **Backward Search**.
6. Click **OK**. Data that meets the filter conditions is displayed based on the specified order on the **Data Editor** tab.

8.3.5. Bind a VPC to a Tablestore instance

After you bind a VPC to a Tablestore instance, you can access the Tablestore instance from the ECS instances in the VPC in the same region.

Prerequisites

- A VPC that is within the same region as the Tablestore instance is created.
- After the VPC is created, create an ECS instance in the VPC.

Procedure

1. [Log on to the Table Store console](#).
2. On the **Overview** page, click the name of the target instance or click **Manage Instance** in the **Actions** column.
3. Click the **Network Management** tab.
4. On the **Network Management** tab, click **Bind VPC**.
5. In the **Bind VPC** dialog box, select a VPC and switch, enter **Instance VPC Name**. The name of a VPC can contain only letters and digits and must start with a letter. The name must be 3 to 16 bytes in length.
6. Click **OK**.

After the VPC is bound to the instance, you can view the information of the VPC in the **VPC List** on the **Network Management** tab. You can use the VPC address to access the Tablestore instance from the ECS instances in the VPC.

After you bind a VPC, you can perform the following operations:

- Click **VPC Instance List** in the **Actions** column to view the VPC instances list, which contains the instance name, instance VPC name, and VPC domain name.
- Click **Unbind** in the **Actions** column to unbind the VPC from the instance. After the VPC is unbound, the ECS instance in the VPC can no longer access the Tablestore instance by using the VPC address. To access the Tablestore instance from the ECS instance, you must bind the VPC to the Tablestore instance again.

9. ApsaraDB RDS for MySQL

9.1. What is ApsaraDB for RDS?

ApsaraDB for RDS is a stable, reliable, and scalable online database service. Based on the distributed file system and high-performance storage of Alibaba Cloud, ApsaraDB for RDS allows you to easily perform database operations and maintenance with its set of solutions for disaster recovery, backup, restoration, monitoring, and migration.

ApsaraDB RDS for MySQL

Originally based on a branch of MySQL, ApsaraDB RDS for MySQL provides excellent performance. It is a tried and tested solution that handled the high-volume concurrent traffic during Double 11. ApsaraDB RDS for MySQL provides basic features, such as whitelist configuration, backup and restoration, Transparent Data Encryption (TDE), data migration, and management for instances, accounts, and databases. ApsaraDB RDS for MySQL also provides the following advanced features:

- **Read-only instance:** In scenarios where ApsaraDB for RDS handles a small number of write requests but a large number of read requests, you can create read-only RDS instances that run MySQL 5.6 to scale up the reading capability and increase the application throughput.
- **Read/write splitting:** The read/write splitting feature provides an extra read/write splitting endpoint. This endpoint enables an automatic link for the primary instance and all its read-only instances. An application can connect to the read/write splitting endpoint to read and write data. Write requests are automatically distributed to the primary instance while read requests are distributed to read-only instances based on their weights. To scale up the reading capacity of the system, you can add more read-only instances.

9.2. Log on to the ApsaraDB for RDS console

This topic describes how to log on to the ApsaraDB for RDS console.

Prerequisites

- Before logging on to the ASCM console, make sure that you have obtained the IP address or domain name of the ASCM console from the deployment personnel. The URL used to access the ASCM console is in the following format: `https://[IP address or domain name of the ASCM console]`.
- We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL used to access the ASCM console. Press the Enter key.
2. Enter your username and password.

Obtain the username and password for logging on to the console from the operations administrator.

 **Note** When you log on to the ASCM console for the first time, you must change the password of your username as prompted. Due to security concerns, your password must meet the minimum complexity requirements: The password must be 8 to 20 characters in length and must contain at least two of the following character types: uppercase letters, lowercase letters, digits, and special characters such as exclamation points (!), at signs (@), number signs (#), dollar signs (\$), and percent signs (%).

3. Click **Login** to go to the ASCM console homepage.
4. In the top navigation bar, choose **Products > Database Services > ApsaraDB for RDS**.

9.3. Quick start

9.3.1. Limits

To ensure instance stability and security, ApsaraDB RDS for MySQL has some service limits, as listed in the following table.

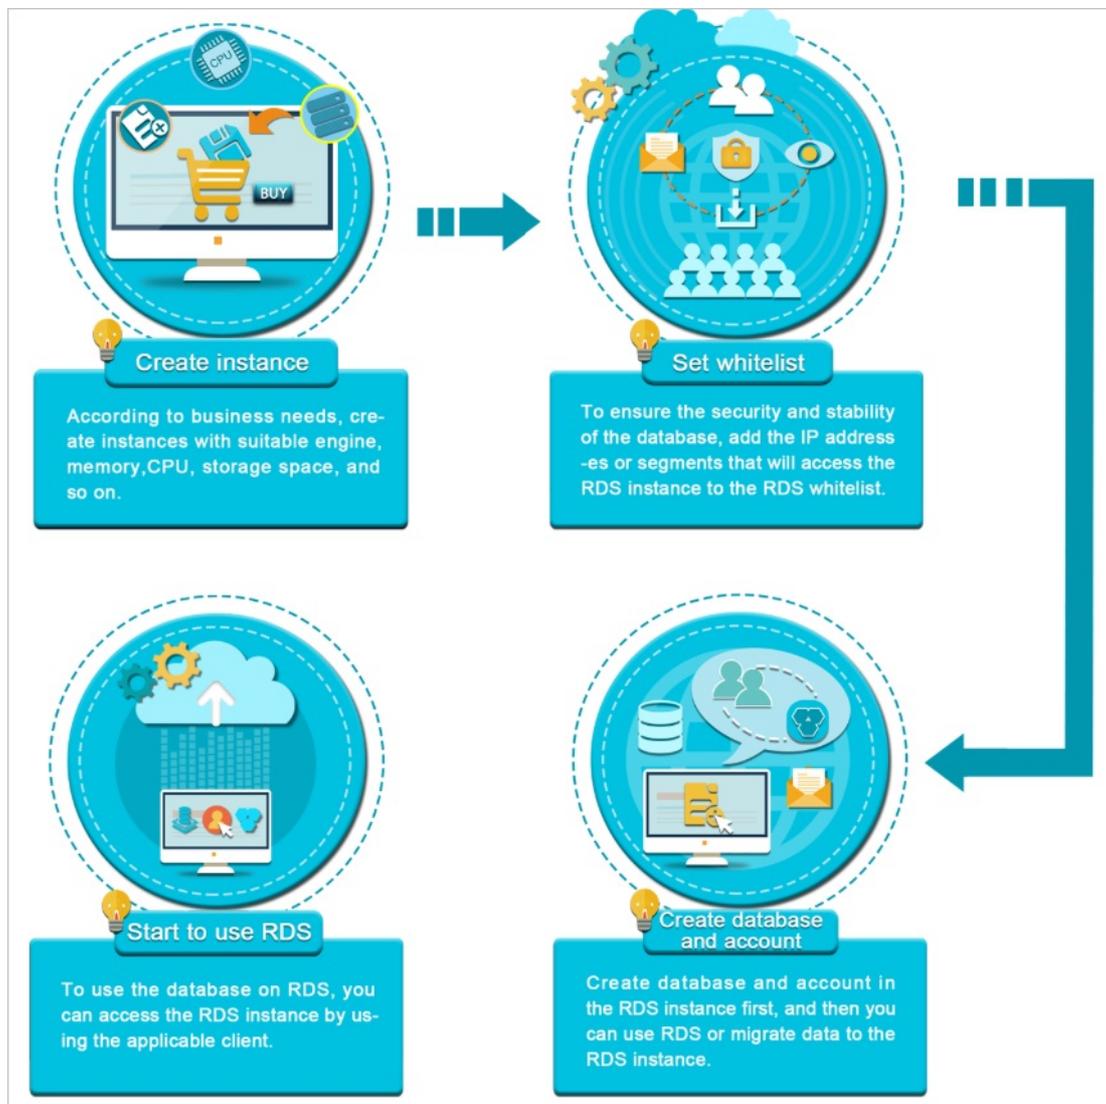

Operation	Description
Instance parameters	Instance parameters can be modified through the RDS console or API operations. Due to security and stability considerations, only specific parameters can be modified.
Root permissions of databases	The root or system administrator permissions are not provided.
Database backup	<ul style="list-style-type: none"> Logical backup can be performed through the command line interface (CLI) or graphical user interface (GUI). Physical backup can only be performed through the RDS console or API operations.
Database restoration	<ul style="list-style-type: none"> Logical restoration can be performed through the CLI or GUI. Physical restoration can only be performed through the RDS console or API operations.
ApsaraDB RDS for MySQL storage engine	<p>Only InnoDB is supported.</p> <ul style="list-style-type: none"> For safety performance and security considerations, we recommend that you use the InnoDB storage engine. The TokuDB engine is not supported. Percona no longer provides support for TokuDB, leading to bugs that cannot be fixed and can cause business losses in extreme cases. The MyISAM engine is not supported. Due to the inherent shortcomings of the MyISAM engine, some data may be lost. Only some existing instances use the MyISAM engine. MyISAM engine tables in newly created instances will be automatically converted to InnoDB engine tables. The Memory engine is not supported. Newly created Memory tables will be automatically converted into InnoDB tables.
Database replication	ApsaraDB RDS for MySQL provides dual-node clusters based on a primary/secondary replication architecture. The secondary instances in this replication architecture are hidden and cannot be accessed directly.
RDS instance restart	Instances must be restarted through the RDS console or API operations.
Account and database management	ApsaraDB RDS for MySQL uses the RDS console to manage accounts and databases. ApsaraDB RDS for MySQL also allows you to create a privileged account to manage users, passwords, and databases.
Standard account	<ul style="list-style-type: none"> Authorization is not allowed. The RDS console allows you to manage accounts and databases. Instances that support standard accounts also support privileged accounts.
Privileged account	<ul style="list-style-type: none"> Authorization is allowed to standard accounts. The RDS console does not provide interfaces to manage accounts or databases. These operations can only be performed through code or DMS. The privileged account cannot be reverted back to a standard account.

9.3.2. Procedure

ApsaraDB for RDS quick start covers the following topics: creating an RDS instance, configuring a whitelist, creating a database, creating an account, and connecting to the instance. This topic uses ApsaraDB RDS for MySQL as an example to describe how to use RDS. It provides all the necessary information to create an RDS instance.

Typically, you must complete several operations after instance creation to make it ready for use, as shown in [Quick start flowchart](#).

Quick start flowchart

- **Create an instance**
An instance is a virtualized database server on which you can create and manage multiple databases.
- **Configure a whitelist**
After creating an RDS instance, you must configure its whitelist to allow access from external devices. The whitelist improves the access security of your RDS instance. We recommend that you maintain the whitelist on a regular basis. The whitelist configuration process does not affect the normal operations of the RDS instance.
- **Create a database and Create an account**
Before using a database, you must first create the database and an account in the RDS instance.
- **Connect to an ApsaraDB RDS for MySQL instance**
After creating an RDS instance, configuring a whitelist, and creating a database and an account, you can connect to the instance from a database client.

9.3.3. Create an instance

This topic describes how to create an instance in the ApsaraDB for RDS console.

Prerequisites

An Apsara Stack tenant account is obtained.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the Instances page, click **Create Instance** in the upper-right corner.
3. Configure the following parameters.

Section	Parameter	Description
Basic Settings	Organization	The organization to which the instance belongs.
	Resource Set	The resource set to which the instance belongs.
Region	Region	The region where the instance resides. Services in different regions cannot communicate over the internal network. After a region is selected, it cannot be changed.
	Zone	The zone where the instance resides.
Specifications	Instance Name	The name of the instance. <ul style="list-style-type: none"> ◦ The name must be 2 to 64 characters in length. ◦ The name must start with a letter. ◦ The name can contain digits and special characters. Special characters include _ - : ◦ The name cannot start with http:// or https://.
	Database Engine	The engine of the database, which varies with regions. The available database engines are displayed on the Create ApsaraDB for RDS Instance page.
	Engine Version	The version of the database engine. Set the value to 5.6 or 5.7.
	Edition	The edition of ApsaraDB for RDS. The actual values are displayed in the console.
	Storage Type	The storage type of the instance. The actual values are displayed in the console.
	Instance Type	The type of the instance. Memory size determines the maximum number of connections and IOPS. The actual values are displayed in the console. Use the following path to navigate the guide: Product Introduction > Instance type in the <i>ApsaraDB for RDS documentation</i> .
	Storage	The storage capacity of the instance, including the space to store data, system files, binary log files, and transaction files. The actual values are displayed in the console.

Section	Parameter	Description
Network Type	Network Type	<p>The network type of the instance. RDS instances support the following network types:</p> <ul style="list-style-type: none"> ◦ <i>Classic Network</i>: Cloud services on the classic network are not isolated. Unauthorized access to a cloud service is blocked only by the security group or whitelist policy of the service. ◦ <i>VPC</i>: A Virtual Private Cloud (VPC) helps you to build an isolated network environment on Alibaba Cloud. You can customize route tables, CIDR blocks, and gateways in a VPC. We recommend that you select VPC for enhanced security. <p> Note After you select VPC as the network type, you must also select the corresponding VPC and VSwitch.</p>
	IP Whitelist	The IP addresses that are allowed to connect to the ApsaraDB for RDS instance.
Access Mode	Access Mode	<p>The access mode of the instance, which is automatically set to Standard.</p> <p> Note Standard: ApsaraDB for RDS uses SLB to eliminate the impact of instance high-availability switchover on the application layer. This mode reduces the response time, but slightly increases the probability of network interruptions and disables SQL interception.</p>

4. After you configure the preceding parameters, click **Submit**.

9.3.4. Initialization settings

9.3.4.1. Configure a whitelist

To ensure database security and reliability, you must modify the whitelist of an ApsaraDB for RDS instance before you enable the instance. You must add the IP addresses or CIDR blocks that are used for database access to the whitelist.

Context

The whitelist improves the access security of your ApsaraDB for RDS instance. We recommend that you maintain the whitelist on a regular basis. The whitelist configuration process does not affect the normal operations of the ApsaraDB for RDS instance.

To configure a whitelist, perform the following operations:

- **Configure a whitelist**: Add IP addresses to allow them to connect to the RDS instance.
- **Configure an ECS security group**: Add an ECS security group for the RDS instance to allow ECS instances in the group to connect to the RDS instance.

Precautions

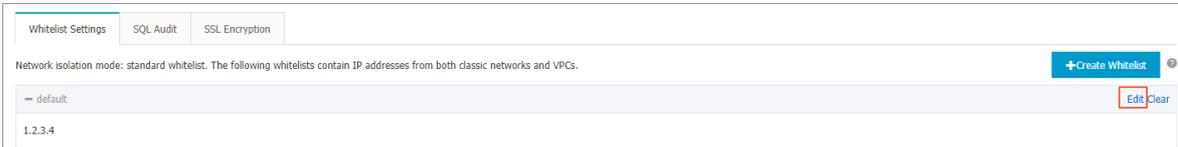

- The default whitelist can be modified or cleared, but cannot be deleted.
- You can add up to 1,000 IP addresses or CIDR blocks to a whitelist. If you want to add a large number of IP addresses, we recommend that you merge them into CIDR blocks, such as 192.168.1.0/24.

Configure a standard IP address whitelist

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic**

Information page.

- In the left-side navigation pane, click **Data Security**.
- On the **Whitelist Settings** tab, click **Edit** corresponding to the default whitelist.

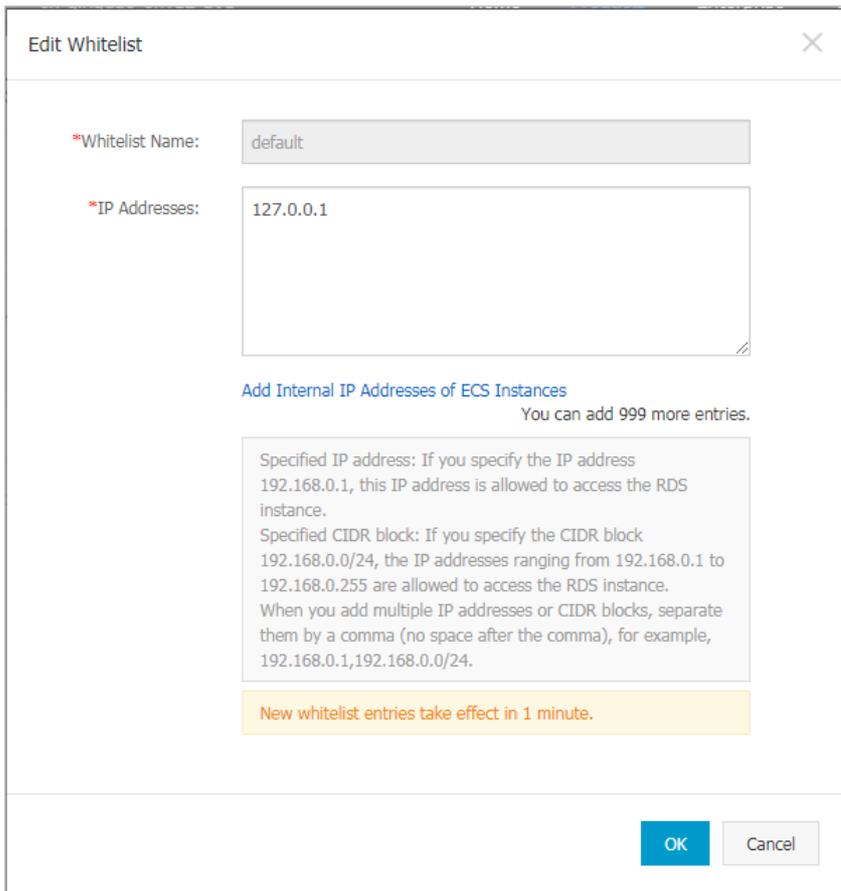

Note

- If you want to connect an ECS instance to an ApsaraDB for RDS instance by using an internal endpoint, you must make sure that the two instances are in the same region and have the same network type. Otherwise, the connection fails.
- You can click **Create Whitelist** to create a new whitelist.

- In the **Edit Whitelist** dialog box, enter the IP addresses or CIDR blocks used to access the instance, and then click **OK**.
 - If you enter the CIDR block 10.10.10.0/24 in the IP Addresses field, all IP addresses in the 10.10.10.X format are granted access to your RDS instance.
 - If you enter more than one IP address or CIDR block, you must separate them with commas (,). Do not add spaces before or after the commas. Example: 192.168.0.1,172.16.213.9.
 - After you click **Add Internal IP Addresses of ECS Instances**, the IP addresses of all the ECS instances under your Apsara Stack account are displayed. You can select the required IP addresses and add them to the whitelist.

Note If you add a new IP address or CIDR block to the default whitelist, the default address 127.0.0.1 is automatically deleted.

9.3.4.2. Create an account

After you create an ApsaraDB for RDS instance and configure its whitelist, you must create a database and an account in the instance. This topic describes how to create privileged and standard accounts.

Context

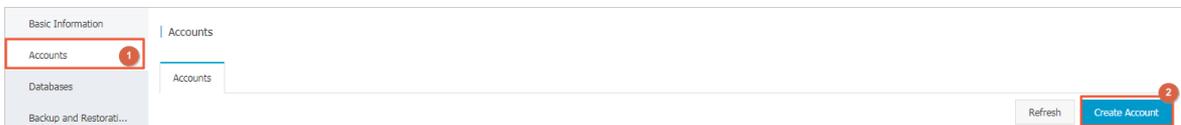

ApsaraDB RDS for MySQL supports two types of database accounts: privileged and standard. You can manage all your accounts and databases in the ApsaraDB for RDS console. For more information about permissions that can be granted to each type of account, see [Account permissions](#).

Account type	Description
Privileged account	<ul style="list-style-type: none"> You can create and manage privileged accounts by using the ApsaraDB for RDS console or API operations. You can create only one privileged account on each RDS instance. The privileged account can be used to manage all standard accounts and databases on the instance. A privileged account allows you to manage permissions to a fine level. For example, you can grant each standard account the permissions to query specific tables. A privileged account has permissions to disconnect all standard accounts on the instance.
Standard account	<ul style="list-style-type: none"> You can create and manage standard accounts by using the ApsaraDB for RDS console, API operations, or SQL statements. You can create up to 500 standard accounts for an instance. You must manually grant standard accounts the specific database permissions. You cannot use a standard account to create, manage, or disconnect other accounts from databases.

Account type	Number of databases	Number of tables	Number of accounts
Privileged account	Unlimited	< 200,000	Varies based on the kernel parameter settings of the instance.
Standard account	500	< 200,000	Varies based on the kernel parameter settings of the instance.

Create a privileged account

1. Log on to the ApsaraDB for RDS console.
2. On the Instances page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Accounts**.
5. Click **Create Account**.

6. Configure the following parameters.

Parameter	Description
Database Account	Enter the account name. The account name must meet the following requirements: <ul style="list-style-type: none"> ◦ The name must be 1 to 16 characters in length. ◦ The name must start with a letter and end with a letter or digit. ◦ The name can contain lowercase letters, digits, and underscores (_).
Account Type	Select Privileged Account.
Password	Enter the password of the standard account. The password must meet the following requirements: <ul style="list-style-type: none"> ◦ The password must be 8 to 32 characters in length. ◦ The password must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. ◦ Special characters include ! @ # \$ % ^ & * () _ + - =
Re-enter Password	Enter the password of the privileged account again.
Description	Optional. Enter information about the account to facilitate subsequent management. The description can be up to 256 characters in length.

7. Click **Create**.

Reset the permissions of a privileged account

If an issue occurs on the privileged account, for example, permissions are unexpectedly revoked, you can enter the password of the privileged account to reset permissions.

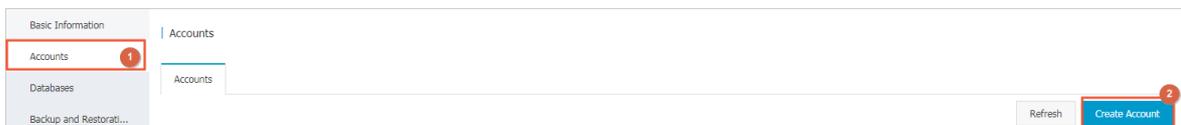

1. Log on to the ApsaraDB for RDS console.
2. On the Instances page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic**

Information page.

4. In the left-side navigation pane, click **Accounts**.
5. Find the privileged account, and click **Reset Permissions** in the **Actions** column.
6. Enter the password of the privileged account and click **OK**.

Create a standard account

1. **Log on to the ApsaraDB for RDS console.**
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Accounts**.
5. Click **Create Account**.

6. Configure the following parameters.

Parameter	Description
Database Account	<p>Enter the account name. The account name must meet the following requirements:</p> <ul style="list-style-type: none"> ◦ The name must be 1 to 16 characters in length. ◦ The name must start with a letter and end with a letter or digit. ◦ The name can contain lowercase letters, digits, and underscores (_).
Account Type	Select Standard Account.
Authorized Databases	<p>Select one or more databases on which you want to grant permissions to the account. You do not have to configure this parameter at this time. You can authorize databases after the account is created.</p> <ol style="list-style-type: none"> i. Select one or more databases from the Unauthorized Databases section and click Add to add them to the Authorized Databases box. ii. In the Authorized Databases section, select the Read/Write, Read-only, DDL Only, or DML Only permissions on each authorized database. <p>If you want to grant the same permissions on multiple databases to the account, click the button in the upper-right corner of the section. The button may appear as Set All to Read/Write.</p>
Password	<p>Enter the password of the standard account. The password must meet the following requirements:</p> <ul style="list-style-type: none"> ◦ The password must be 8 to 32 characters in length. ◦ The password must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. ◦ Special characters include ! @ # \$ % ^ & * () _ + - =
Re-enter Password	Enter the password of the standard account again.
Description	Optional. Enter information about the account to facilitate subsequent management. The description can be up to 256 characters in length.

7. Click **Create**.

Account permissions

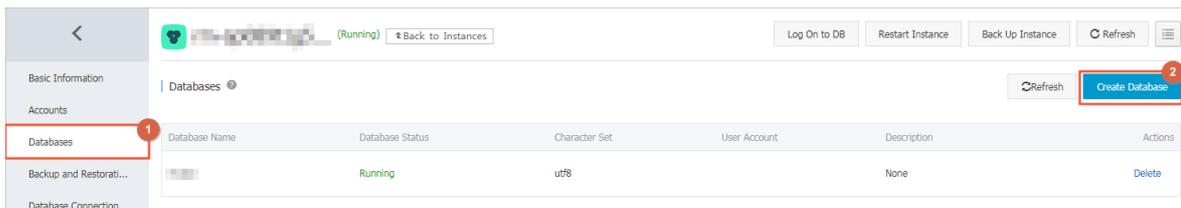

Account type	Authorization type	Permission				
Privileged account	-	SELECT	INSERT	UPDATE	DELETE	CREATE
		DROP	RELOAD	PROCESS	REFERENCES	INDEX
		ALTER	CREATE TEMPORARY TABLES	LOCK TABLES	EXECUTE	REPLICATION SLAVE
		REPLICATION CLIENT	CREATE VIEW	SHOW VIEW	CREATE ROUTINE	ALTER ROUTINE
		CREATE USER	EVENT	TRIGGER	-	-
Standard account	Read-only	SELECT	LOCK TABLES	SHOW VIEW	PROCESS	REPLICATION SLAVE
		REPLICATION CLIENT	-	-	-	-
	Read/write	SELECT	INSERT	UPDATE	DELETE	CREATE
		DROP	REFERENCES	INDEX	ALTER	CREATE TEMPORARY TABLES
		LOCK TABLES	EXECUTE	CREATE VIEW	SHOW VIEW	CREATE ROUTINE
		ALTER ROUTINE	EVENT	TRIGGER	PROCESS	REPLICATION SLAVE
		REPLICATION CLIENT	-	-	-	-
	DDL-only	CREATE	DROP	INDEX	ALTER	CREATE TEMPORARY TABLES
		LOCK TABLES	CREATE VIEW	SHOW VIEW	CREATE ROUTINE	ALTER ROUTINE
		PROCESS	REPLICATION SLAVE	REPLICATION CLIENT	-	-
	DML-only	SELECT	INSERT	UPDATE	DELETE	CREATE TEMPORARY TABLES
		LOCK TABLES	EXECUTE	SHOW VIEW	EVENT	TRIGGER
		PROCESS	REPLICATION SLAVE	REPLICATION CLIENT	-	-

9.3.4.3. Create a database

After you create an ApsaraDB for RDS instance and configure its whitelist, you must create a database and an account in the instance.

Procedure

1. Log on to the [ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Databases**.
5. Click **Create Database**.

6. Configure the following parameters.

Parameter	Description
Database Name	<ul style="list-style-type: none"> ◦ The name must be 1 to 64 characters in length. ◦ The name must start with a letter and end with a letter or digit. ◦ The name can contain lowercase letters, digits, underscores (_), and hyphens (-). ◦ Each database name must be unique in an instance.
Supported Character Set	Select utf8, gbk, latin1, utf8mb4, or all. If you want to use other character sets, select all, and then select the required character set from the list.
Description	Optional. Enter information about the database to facilitate subsequent management. The description can be up to 256 characters in length.

7. Click **Create**.

9.3.5. Connect to an ApsaraDB RDS for MySQL instance

After you complete the initial configuration of your ApsaraDB RDS for MySQL instance, you can connect to it from an Elastic Compute Service (ECS) instance or an on-premises client.

Context

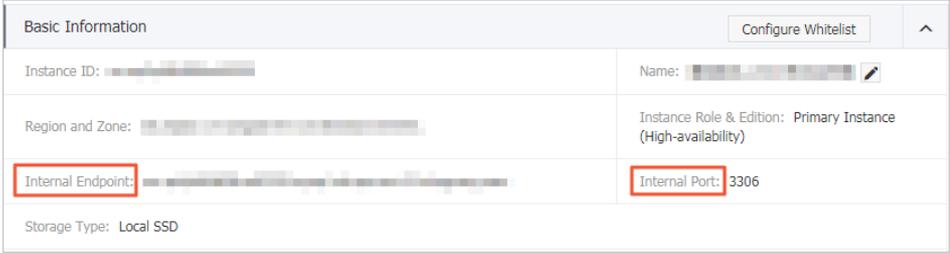

After you perform operations such as [Create an instance](#), [Configure a whitelist](#), and [Create an account](#), you can use a general database client or configure the endpoint, port number, and account information in an application to connect to the MySQL instance.

If you need to connect an ECS instance to an ApsaraDB for RDS instance, you must make sure that both instances are in classic networks or in the same VPC, and the IP address of the ECS instance is correctly configured in the RDS whitelist.

Connect to an instance from a client

ApsaraDB RDS for MySQL is fully compatible with open source MySQL. You can connect to an ApsaraDB RDS for MySQL instance from a database client by using a similar method that you use to connect to an open source MySQL database. In the following example, the [HeidiSQL](#) client is used.

1. Start the HeidiSQL client.
2. In the lower-left corner of the Session manager dialog box, click **New**.
3. Enter information about the RDS instance that you want to connect. The following table describes the required parameters.

Parameter	Description
Network type	Select the network type of the RDS instance that you want to connect. For this example, select MariaDB or MySQL (TCP/IP).
Hostname / IP	<p>Enter the internal or public endpoint of the RDS instance.</p> <ul style="list-style-type: none"> ◦ If your client is deployed on an ECS instance that is in the same region and has the same network type as the RDS instance, use the internal endpoint. For example, if your ECS and RDS instances are both in a VPC located in the China (Hangzhou) region, you can use the internal endpoint of the RDS instance to create a secure connection. ◦ In other scenarios, use the public endpoint. <p>To view the internal and public endpoints and port numbers of the RDS instance, follow these steps:</p> <ol style="list-style-type: none"> Log on to the ApsaraDB for RDS console. Find the target RDS instance and click its ID. In the Basic Information section, view the internal endpoint and internal port number of the instance. 
User	Enter the username of the account that you use to connect to the RDS instance.
Password	Enter the password of the account.
Port	If you connect to the instance over an internal network, enter the internal port number of the instance. If you connect to the instance over the Internet, enter the public port number of the instance.

4. Click **Open**. If the connection information is correct, you can connect to the instance.

9.4. Instances

9.4.1. Create an instance

This topic describes how to create an instance in the ApsaraDB for RDS console.

Prerequisites

An Apsara Stack tenant account is obtained.

Procedure

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, click **Create Instance** in the upper-right corner.

3. Configure the following parameters.

Section	Parameter	Description
Basic Settings	Organization	The organization to which the instance belongs.
	Resource Set	The resource set to which the instance belongs.
Region	Region	The region where the instance resides. Services in different regions cannot communicate over the internal network. After a region is selected, it cannot be changed.
	Zone	The zone where the instance resides.
Specifications	Instance Name	The name of the instance. <ul style="list-style-type: none"> ◦ The name must be 2 to 64 characters in length. ◦ The name must start with a letter. ◦ The name can contain digits and special characters. Special characters include _ - : ◦ The name cannot start with http:// or https://.
	Database Engine	The engine of the database, which varies with regions. The available database engines are displayed on the Create ApsaraDB for RDS Instance page.
	Engine Version	The version of the database engine. Set the value to 5.6 or 5.7.
	Edition	The edition of ApsaraDB for RDS. The actual values are displayed in the console.
	Storage Type	The storage type of the instance. The actual values are displayed in the console.
	Instance Type	The type of the instance. Memory size determines the maximum number of connections and IOPS. The actual values are displayed in the console. Use the following path to navigate the guide: Product Introduction > Instance type in the <i>ApsaraDB for RDS documentation</i> .
	Storage	The storage capacity of the instance, including the space to store data, system files, binary log files, and transaction files. The actual values are displayed in the console.
	Network Type	The network type of the instance. RDS instances support the following network types: <ul style="list-style-type: none"> ◦ <i>Classic Network</i>: Cloud services on the classic network are not isolated. Unauthorized access to a cloud service is blocked only by the security group or whitelist policy of the service. ◦ <i>VPC</i>: A Virtual Private Cloud (VPC) helps you to build an isolated network environment on Alibaba Cloud. You can customize route tables, CIDR blocks, and gateways in a VPC. We recommend that you select VPC for enhanced security. <div style="border: 1px solid #ccc; background-color: #e6f2ff; padding: 5px; margin-top: 10px;"> ? Note After you select VPC as the network type, you must also select the corresponding VPC and VSwitch. </div>
IP Whitelist	The IP addresses that are allowed to connect to the ApsaraDB for RDS instance.	

Section	Parameter	Description
Access Mode	Access Mode	<p>The access mode of the instance, which is automatically set to Standard.</p> <p> Note Standard: ApsaraDB for RDS uses SLB to eliminate the impact of instance high-availability switchover on the application layer. This mode reduces the response time, but slightly increases the probability of network interruptions and disables SQL interception.</p>

4. After you configure the preceding parameters, click **Submit**.

9.4.2. Create an ApsaraDB RDS for MySQL instance with standard SSDs or enhanced SSDs

Disks are block-level data storage products provided by Alibaba Cloud for ECS. They feature low latency and high performance, durability, and reliability. This topic describes how to create an instance with standard or enhanced SSDs in the ApsaraDB for RDS console.

Prerequisites

The instance runs MySQL 5.7 on RDS High-availability Edition.

Context

An RDS instance with standard or enhanced SSDs uses a distributed triplicate mechanism to ensure 99.9999999% data reliability. If service disruptions occur (for example, due to hardware failure) within a zone, data in that zone is copied to an unaffected disk in another zone to ensure data availability.

Procedure

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, click **Create Instance** in the upper-right corner.
3. Configure the following parameters.

Section	Parameter	Description
Basic Settings	Organization	The organization to which the instance belongs.
	Resource Set	The resource set to which the instance belongs.
Region	Region	The region where the instance resides. Services in different regions cannot communicate over the internal network. After a region is selected, it cannot be changed.
	Zone	The zone where the instance resides.
	Instance Name	<p>The name of the instance.</p> <ul style="list-style-type: none"> ◦ The name must be 2 to 64 characters in length. ◦ The name must start with a letter. ◦ The name can contain digits and special characters. Special characters include <code>_</code> and <code>:</code>. ◦ The name cannot start with <code>http://</code> or <code>https://</code>.
	Database Engine	The engine of the database, which varies with regions. The available database engines are displayed on the Create ApsaraDB for RDS Instance page.

Section Specification	Parameter	Description
5	Engine Version	The version of the database engine. Select 5.7.
	Edition	The edition of the database. Select High-availability Edition.
	Storage Type	The storage type of the database. Select cloud ssd.
	Instance Type	The type of the instance. Memory size determines the maximum number of connections and IOPS. The actual values are displayed on the console. For more information, see Product Introduction > Instance type in the <i>ApsaraDB for RDS documentation</i> .
	Storage	The storage space of the instance, including the space for data, system files, binary log files, and transaction files.
Network Type	Network Type	<p>The network type of the instance, which is automatically set to VPC.</p> <p>Note VPC: A Virtual Private Cloud (VPC) helps you build an isolated network environment on Alibaba Cloud. You can customize route tables, CIDR blocks, and gateways within a VPC. We recommend that you select VPC for improved security.</p> <p>After you select VPC as the network type, you must also select the corresponding VPC and VSwitch.</p>
	IP Whitelist	The IP addresses that are allowed to connect to the ApsaraDB for RDS instance.
Access Mode	Access Mode	<p>The access mode of the instance, which is automatically set to Standard.</p> <p>Note Standard: RDS uses Server Load Balancer (SLB) to eliminate the impact of instance high-availability switching on the application layer. This mode reduces the response time, but slightly increases the probability of network interruptions and disables SQL interception.</p>

4. Click Submit.

9.4.3. View basic information of an instance

This topic describes how to view the details of an ApsaraDB for RDS instance, such as basic information, internal network connection information, status, and configurations.

Procedure

1. [Log on to the ApsaraDB for RDS console](#).
2. Use one of the following methods to go to the **Basic Information** page of an instance:
 - On the **Instances** page, find the target instance and click the instance ID. The **Basic Information** page appears.
 - On the **Instances** page, find the target instance and click **Manage** in the corresponding **Actions** column. The **Basic Information** page appears.

9.4.4. Restart an instance

This topic describes how to manually restart an ApsaraDB RDS for MySQL instance. This applies if the number of connections exceeds the specified threshold or if an instance has any performance issues.

Prerequisites

The target instance is in the **Running** state.

Procedure

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. Click **Restart Instance** in the upper-right corner.

 **Note** A restart will disconnect the instance. We recommend that you make appropriate service arrangements before you restart an instance. Proceed with caution.

5. In the message that appears, click **Confirm**.

9.4.5. Change the specifications of an instance

This topic describes how to change specifications of your instance, such as the instance type and storage space, if the specifications do not meet the requirements of your application.

Procedure

1. [Log on to the ApsaraDB for RDS console.](#)
2. Find your RDS instance and click its ID.
3. In the **Configure Information** section of the **Basic Information** page, click **Change Specifications**.

Configuration Information			Change Specifications	^
Instance Family: Dedicated Instance	Database Engine: MySQL 5.6	CPU: 2 Cores		
Memory: 16384MB	Maximum IOPS: 4500	Maximum Connections: 2500		
Maintenance Window: 02:00-06:00 Configure	Instance Type: mysql.x8.medium.2			

4. In the **Upgrade** dialog box that appears, click **Next**.
5. On the **Change Specifications** page, set **Edition**, **Instance Type**, and **Storage**.
6. After you configure the preceding parameters, click **Submit**.

9.4.6. Set a maintenance window

You can set a maintenance window for an ApsaraDB for RDS instance as needed.

Context

To ensure the stability of ApsaraDB for RDS instances, the backend system performs maintenance of the instances at irregular intervals. The default maintenance window is from 02:00 to 06:00. You can set the maintenance window to the off-peak period of your business to avoid impact on business.

Precautions

- To ensure the stability of the maintenance process, the instance will enter the **Maintaining Instance** state before the maintenance time. When the instance is in this state, access to data in the database and query operations such as performance monitoring are not affected. However, apart from account and database management and IP address whitelist configuration, modification operations such as upgrade, downgrade, and restart are temporarily unavailable.
- During the maintenance window, the instance is disconnected once or twice. Make sure that you configure automatic reconnection policies for your applications to avoid service disruptions.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. Click the ID of an instance or click **Manage** in the Actions column corresponding to the instance.
3. In the **Configuration Information** section, click **Configure** to the right of **Maintenance Window**.

The screenshot displays the configuration page for an ApsaraDB for RDS instance. It is divided into several sections:

- Basic Information:** Shows Instance ID, Name, Region and Zone, Internal Endpoint, Internal Port (3306), Storage Type (Local SSD), and Read/Write Splitting Endpoint. A note indicates that the preceding endpoint should be used for connection, with a requirement to change the VIP in the endpoint to the one used in the environment.
- Status:** Shows the instance is **Running** and was created on Dec 31, 2019, at 10:22:37.
- Configuration Information:** Shows Instance Family (Dedicated Instance), Database Engine (MySQL 5.6), CPU (2 Cores), Memory (16384MB), Maximum IOPS (4500), Maximum Connections (2500), and Instance Type (mysql.x8.medium.2). The **Maintenance Window** is set to 02:00-06:00, and a **Configure** link is visible next to it.
- Usage Statistics:** Shows Storage Capacity (Used 3.16G, Capacity 50.00G) and Space Used for Backup (Data Size: 15.72M, Log Size: 43.42M).

4. Select a maintenance window and click **Save**.

Note The maintenance window is in UTC+8.

9.4.7. Change the data replication mode

You can set the data replication mode between primary and secondary ApsaraDB for RDS instances to improve database availability.

Context

- **Semi-synchronous**

After an application-initiated update is completed on the primary instance, logs are synchronized to all secondary instances. This transaction is considered committed after at least one secondary instance has received the logs, no matter whether the secondary instance finishes executing the updates specified in the logs.

If the secondary instances are unavailable or a network exception occurs between the primary and secondary instances, semi-synchronous replication will degrade to the Asynchronous mode.

- **Asynchronous**

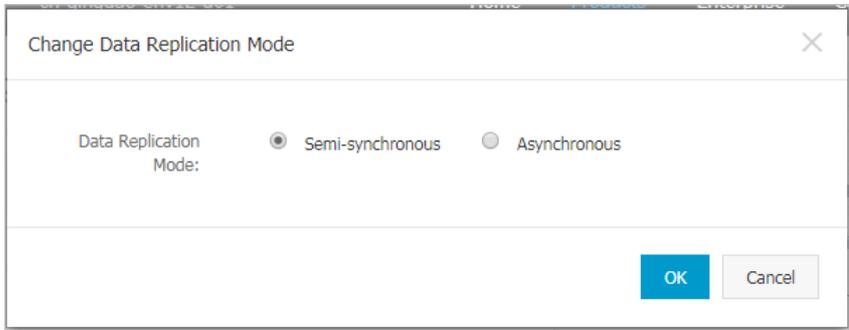

When your application initiates a request to add, delete, or modify data, the primary instance responds to your application immediately after it completes the operation. At the same time, the primary instance starts to asynchronously replicate data to its secondary instances. During asynchronous data replication, the unavailability of secondary instances does not affect the operations on the primary instance. Data remains consistent even if the primary instance is unavailable.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. Find your RDS instance and click its ID.
3. In the left-side navigation pane, click **Service Availability**.
4. Click **Change Data Replication Mode**.

5. In the dialog box that appears, select a data replication mode and click **OK**.

9.4.8. Release an instance

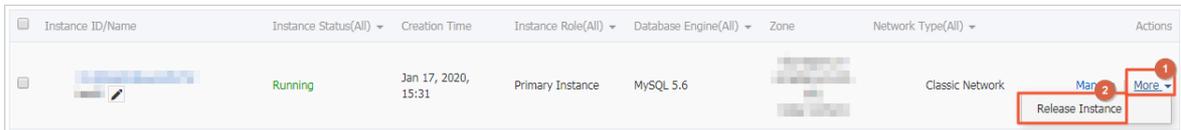

You can manually release instances as needed.

Precautions

- You can manually release only instances that are in the running state.
- After an instance is released, the instance data is immediately cleared. We recommend that you back up your data before you release an instance.

Procedure

1. [Log on to the ApsaraDB for RDS console](#).
2. In the Actions column corresponding to the instance you want to release, choose **More > Release Instance**.

3. In the Release Instance message that appears, click **Confirm**.

9.4.9. Upgrade the kernel version of an instance

ApsaraDB RDS for MySQL supports automatic and manual updates of the kernel version. These updates increase performance, unveil new features, and fix known issues.

Introduction

ApsaraDB RDS for MySQL automatically upgrades the kernel version by default. You can log on to the ApsaraDB for RDS console, navigate to the **Basic Information** page of your RDS instance, and then view the current **Minor Version Upgrade Mode** in the Configuration Information section.

- **Auto:** When a new kernel version is released, the system automatically upgrades the kernel version of your RDS instance during the specified maintenance window. For more information, see [Set a maintenance window](#).
- **Manual:** You can manually upgrade the kernel version on the **Basic Information** page. For more information, see [Manually upgrade the kernel version](#).

Precautions

- While you upgrade the kernel version of your RDS instance, a 30-second network interruption may occur. We

recommend that you upgrade the kernel version during off-peak hours or make sure that your applications are configured with automatic reconnection policies.

- The kernel version of your RDS instance cannot be downgraded after it is upgraded.
- After you upgrade the specifications of your RDS instance, the kernel version of your RDS instance is upgraded accordingly.

Configure the kernel version upgrade mode

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the **Configuration Information** section of the **Basic Information** page, click **Configure** to the right of **Minor Version Upgrade Mode**.
5. Select **Auto** or **Manual**, and click **OK**.

Manually upgrade the kernel version

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the **Configuration Information** section of the page, click **Upgrade Minor Version**.

 **Note** The **Upgrade Minor Version** button is displayed only when a new kernel version is available.

5. In the dialog box that appears, specify the upgrade time and click **OK**.

FAQ

- **Q:** After I upgraded the kernel version of my RDS instance, why does the `SELECT @@version` statement still return the source kernel version that I used before the upgrade?
A: The kernel version that you upgraded is the kernel version of Alibaba Cloud instead of the kernel version of MySQL. You need to execute the `show variables like '%rds_release_date%'` statement to view the kernel version of your RDS instance.
- **Q:** Is each upgrade targeted only for the next kernel version?
A: No, each upgrade is targeted for the latest kernel version.

9.4.10. Modify parameters of an instance

This topic describes how to view and modify the values of some parameters and query parameter modification records in the console.

Precautions

- To ensure instance stability, you can select specific parameters to modify in the ApsaraDB for RDS console.
- When you modify parameters on the **Editable Parameters** tab, refer to the **Value Range** column corresponding to each parameter.
- After some parameters are modified, you must restart your RDS instance for the changes to take effect. For more information, see the **Force Restart** column on the **Editable Parameters** tab. We recommend that you modify the parameters of an instance during off-peak hours and make sure that your applications are configured with automatic reconnection policies.

Modify parameters

1. [Log on to the ApsaraDB for RDS console.](#)

2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Parameters**.
5. You can perform the following operations: Export the parameter settings of the RDS instance to your computer.

On the **Editable Parameters** tab, click **Export Parameters**. The parameter settings of the RDS instance are exported as a TXT file to your computer.

Modify and import the parameter settings.

- i. After you have modified parameters in the exported parameter file, click **Import Parameters** and copy the parameter settings to the field.
- ii. Click **OK**.
- iii. In the upper-right corner of the page, click **Apply Changes**.

 **Note**

- If the new parameter value takes effect only after an instance restart, the system will prompt you to restart the RDS instance. We recommend that you restart the RDS instance during off-peak hours and make sure that your applications are configured with automatic reconnection policies.
- Before the new parameter values are applied, you can click **Cancel Changes** to cancel them.

Modify a single parameter.

- i. On the **Editable Parameters** tab, find the parameter that you want to reconfigure, and click the  icon in the **Actual Value** column.
- ii. Enter a new value based on the prompted value range.
- iii. Click **Confirm**.
- iv. In the upper-right corner of the page, click **Apply Changes**.

 **Note**

- If the new parameter value takes effect only after an instance restart, the system will prompt you to restart the RDS instance. We recommend that you restart the RDS instance during off-peak hours and make sure that your applications are configured with automatic reconnection policies.
- Before the new parameter value is applied, you can click **Cancel Changes** to cancel it.

View the parameter modification history

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Parameters**.
5. On the page that appears, click the **Edit History** tab.
6. Select a time range and then click **Search**.

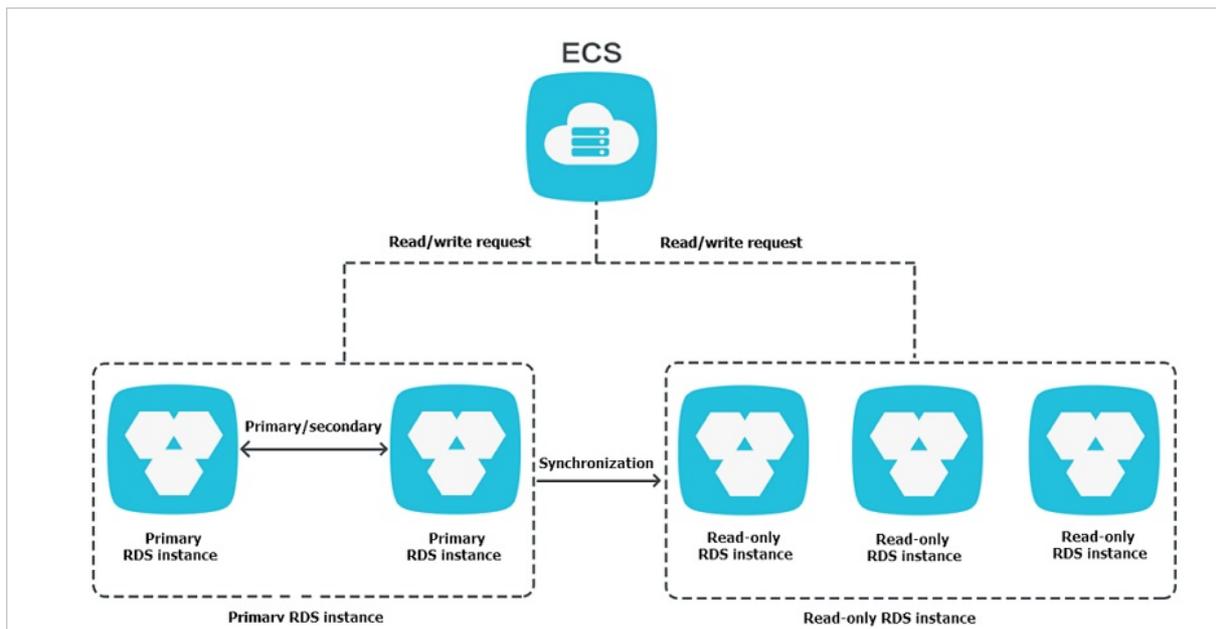

9.4.11. Read-only instances

9.4.11.1. Overview of read-only instances

ApsaraDB RDS for MySQL allows you to create read-only instances. In scenarios where RDS has a small number of write requests but a large number of read requests, you can create read-only instances to distribute database access loads away from the primary instance. This topic describes the features and limits of read-only instances.

To scale the reading capability and distribute database access loads, you can create one or more read-only instances in a region. Read-only instances allow RDS to increase the application throughput when a large amount of data is being read.

A read-only instance with a single physical node and no backup node uses the native replication capability of MySQL to synchronize changes from the primary instance to all its read-only instances. Read-only instances must be in the same region as the primary instance but do not have to be in the same zone as the primary instance. The following figure shows the topology of read-only instances.

Read-only instances have the following features:

- Specifications of a read-only instance can be different from those of the primary instance and can be changed at any time, which facilitates elastic scaling.
- Read-only instances do not require account or database maintenance. Account and database information is synchronized from the primary instance.
- The whitelists of read-only instances can be configured independently.
- System performance monitoring is provided.

RDS provides up to 20 system performance monitoring views, including those for disk capacity, IOPS, connections, CPU utilization, and network traffic. You can view the load of instances.

- RDS provides a variety of optimization recommendations, such as storage engine check, primary key check, large table check, and check for excessive indexes and missing indexes. You can optimize your databases based on the optimization recommendations and specific applications.

9.4.11.2. Create a read-only instance

You can create read-only instances of different specifications based on your business requirements.

Prerequisites

The RDS instance runs High-availability Edition (with local SSDs) or Enterprise Edition.

Precautions

- A maximum of five read-only instances can be created for a primary instance.

- Backup settings and temporary backup are not supported.
- Instance restoration is not supported.
- Data migration to read-only instances is not supported.
- Database creation and deletion are not supported.
- Account creation, deletion, authorization, and password changes are not supported.
- After a read-only instance is created, you cannot restore data by directly overwriting the primary instance with a backup set.

Procedure

1. **Log on to the ApsaraDB for RDS console.**
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. On the **Basic Information** page, click **Create Read-only Instance** on the right side of the page.
5. On the **Create Read-only RDS Instance** page, configure the read-only instance parameters.

Section	Parameter	Description
Region	Region	The region where the ApsaraDB for RDS instance resides.
Specifications	Database Engine	The database engine of the read-only instance, which is the same as that of the primary instance and cannot be modified.
	Engine Version	The engine version of the read-only instance, which is the same as that of the primary instance and cannot be modified.
	Edition	Set the value to Read-only Instance .
	Instance Type	The instance type of the read-only instance. The type of the read-only instance can be different from that of the primary instance, and can be modified at any time to facilitate flexible upgrade and downgrade.
	Storage	The storage space of the read-only instance. To ensure sufficient I/O throughput for data synchronization, we recommend that you select at least the same instance type and storage space as the primary instance for the read-only instance.
Network Type	Network Type	The network type of the read-only instance, which is the same as that of the primary instance and cannot be modified.
	VPC	Select a VPC if the network type is set to VPC.
	VSwitch	Select a VSwitch if the network type is set to VPC.

6. After you configure the preceding parameters, click **Submit**.

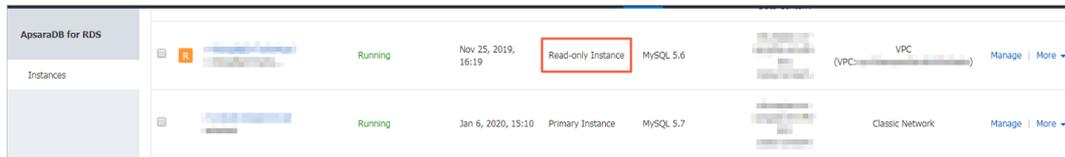

9.4.11.3. View details of read-only instances

This topic describes how to view details of read-only instances. You can go to the **Basic Information** page of a read-only instance from the **Instances** page or the read-only instance list of the primary instance. Read-only instances are managed in the same way as primary instances. The read-only instance management page shows the management operations that can be performed.

View instance details by using a read-only instance

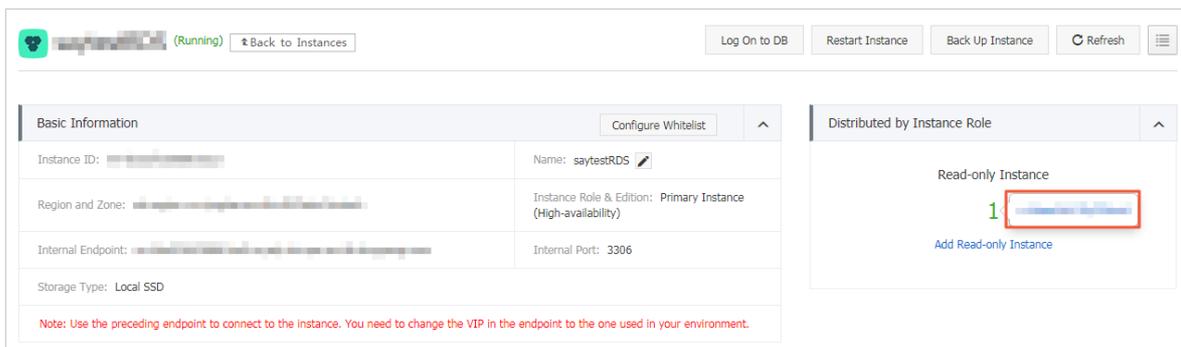

1. Log on to the ApsaraDB for RDS console.
2. On the Instances page, click the ID of a read-only instance. The Basic Information page appears. In the instance list, Instance Role of read-only instances is displayed as Read-only Instance, as shown in [View a read-only instance](#).

View a read-only instance

View instance details by using the primary instance

1. Log on to the ApsaraDB for RDS console.
2. On the Instances page, find the target instance.
3. Click the instance ID or click Manage in the Actions column corresponding to the instance to go to the Basic Information page.
4. On the Basic Information page, move the pointer over the number below Read-only Instance in the Distributed by Instance Role section. The ID of the read-only instance is displayed.

5. Click the ID of the read-only instance to go to the read-only instance management page.

9.5. Accounts

9.5.1. Create an account

After you create an ApsaraDB for RDS instance and configure its whitelist, you must create a database and an account in the instance. This topic describes how to create privileged and standard accounts.

Context

ApsaraDB RDS for MySQL supports two types of database accounts: privileged and standard. You can manage all your accounts and databases in the ApsaraDB for RDS console. For more information about permissions that can be granted to each type of account, see [Account permissions](#).

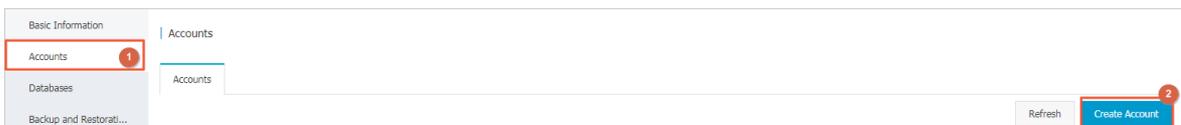

Account type	Description
--------------	-------------

Account type	Description
Privileged account	<ul style="list-style-type: none"> You can create and manage privileged accounts by using the ApsaraDB for RDS console or API operations. You can create only one privileged account on each RDS instance. The privileged account can be used to manage all standard accounts and databases on the instance. A privileged account allows you to manage permissions to a fine level. For example, you can grant each standard account the permissions to query specific tables. A privileged account has permissions to disconnect all standard accounts on the instance.
Standard account	<ul style="list-style-type: none"> You can create and manage standard accounts by using the ApsaraDB for RDS console, API operations, or SQL statements. You can create up to 500 standard accounts for an instance. You must manually grant standard accounts the specific database permissions. You cannot use a standard account to create, manage, or disconnect other accounts from databases.

Account type	Number of databases	Number of tables	Number of accounts
Privileged account	Unlimited	< 200,000	Varies based on the kernel parameter settings of the instance.
Standard account	500	< 200,000	Varies based on the kernel parameter settings of the instance.

Create a privileged account

- Log on to the ApsaraDB for RDS console.
- On the Instances page, find the target instance.
- Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
- In the left-side navigation pane, click **Accounts**.
- Click **Create Account**.

- Configure the following parameters.

Parameter	Description
Database Account	Enter the account name. The account name must meet the following requirements: <ul style="list-style-type: none"> The name must be 1 to 16 characters in length. The name must start with a letter and end with a letter or digit. The name can contain lowercase letters, digits, and underscores (_).
Account Type	Select Privileged Account.

Parameter	Description
Password	<p>Enter the password of the standard account. The password must meet the following requirements:</p> <ul style="list-style-type: none"> ○ The password must be 8 to 32 characters in length. ○ The password must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. ○ Special characters include ! @ # \$ % ^ & * () _ + - =
Re-enter Password	Enter the password of the privileged account again.
Description	Optional. Enter information about the account to facilitate subsequent management. The description can be up to 256 characters in length.

7. Click **Create**.

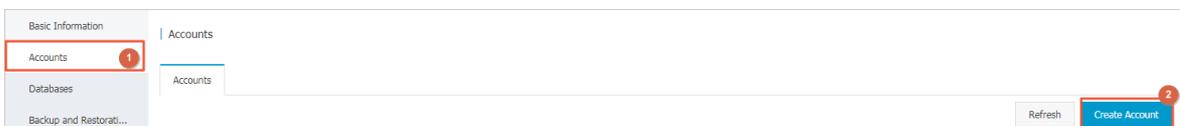

Reset the permissions of a privileged account

If an issue occurs on the privileged account, for example, permissions are unexpectedly revoked, you can enter the password of the privileged account to reset permissions.

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Accounts**.
5. Find the privileged account, and click **Reset Permissions** in the **Actions** column.
6. Enter the password of the privileged account and click **OK**.

Create a standard account

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Accounts**.
5. Click **Create Account**.

6. Configure the following parameters.

Parameter	Description
Database Account	<p>Enter the account name. The account name must meet the following requirements:</p> <ul style="list-style-type: none"> ○ The name must be 1 to 16 characters in length. ○ The name must start with a letter and end with a letter or digit. ○ The name can contain lowercase letters, digits, and underscores (_).
Account Type	Select Standard Account.

Parameter	Description
Authorized Databases	<p>Select one or more databases on which you want to grant permissions to the account. You do not have to configure this parameter at this time. You can authorize databases after the account is created.</p> <ol style="list-style-type: none"> i. Select one or more databases from the Unauthorized Databases section and click Add to add them to the Authorized Databases box. ii. In the Authorized Databases section, select the Read/Write, Read-only, DDL Only, or DML Only permissions on each authorized database. <p>If you want to grant the same permissions on multiple databases to the account, click the button in the upper-right corner of the section. The button may appear as Set All to Read/Write.</p>
Password	<p>Enter the password of the standard account. The password must meet the following requirements:</p> <ul style="list-style-type: none"> ◦ The password must be 8 to 32 characters in length. ◦ The password must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. ◦ Special characters include ! @ # \$ % ^ & * () _ + - =
Re-enter Password	Enter the password of the standard account again.
Description	Optional. Enter information about the account to facilitate subsequent management. The description can be up to 256 characters in length.

7. Click **Create**.

Account permissions

Account type	Authorization type	Permission				
		SELECT	INSERT	UPDATE	DELETE	CREATE
Privileged account	-	DROP	RELOAD	PROCESS	REFERENCES	INDEX
		ALTER	CREATE TEMPORARY TABLES	LOCK TABLES	EXECUTE	REPLICATION SLAVE
		REPLICATION CLIENT	CREATE VIEW	SHOW VIEW	CREATE ROUTINE	ALTER ROUTINE
		CREATE USER	EVENT	TRIGGER	-	-
		SELECT	LOCK TABLES	SHOW VIEW	PROCESS	REPLICATION SLAVE
Read-only	-	REPLICATION CLIENT	-	-	-	-
		SELECT	INSERT	UPDATE	DELETE	CREATE

Account type	Authorization type	Permission				
	Standard account	Read/write	DROP	REFERENCES	INDEX	ALTER
LOCK TABLES			EXECUTE	CREATE VIEW	SHOW VIEW	CREATE ROUTINE
ALTER ROUTINE			EVENT	TRIGGER	PROCESS	REPLICATION SLAVE
REPLICATION CLIENT			-	-	-	-
DDL-only		CREATE	DROP	INDEX	ALTER	CREATE TEMPORARY TABLES
		LOCK TABLES	CREATE VIEW	SHOW VIEW	CREATE ROUTINE	ALTER ROUTINE
		PROCESS	REPLICATION SLAVE	REPLICATION CLIENT	-	-
DML-only		SELECT	INSERT	UPDATE	DELETE	CREATE TEMPORARY TABLES
		LOCK TABLES	EXECUTE	SHOW VIEW	EVENT	TRIGGER
		PROCESS	REPLICATION SLAVE	REPLICATION CLIENT	-	-

9.5.2. Reset the password

You can use the ApsaraDB for RDS console to reset the password of your database account.

Prerequisites

The instance is in the **Running** state.

Procedure

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Accounts**.
5. Find the target account and click **Reset Password** in the **Actions** column.
6. In the dialog box that appears, enter and confirm the new password, and then click **OK**.

Note The password must meet the following requirements:

- The password must be 8 to 32 characters in length.
- The password must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters.
- Special characters include ! @ # \$ % ^ & * () _ + - =

9.5.3. Modify account permissions

You can modify the account permissions of your ApsaraDB for RDS instance at any time.

Prerequisites

You can modify the permissions of a standard account. The permissions of privileged accounts can only be reset to the default settings and cannot be changed to a specific set of permissions.

Procedure

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Accounts**.
5. Find the target account and click **Edit Permissions** in the **Actions** column.
6. Configure the following parameters.

Parameter	Description
Authorized Databases	In the Unauthorized Databases section, select a database and click Add to authorize the database. In the Authorized Databases section, select a database and click Remove to remove permissions from the database.
Authorized Databases	You can set permissions on each database in the Authorized Database section. You can also click the button such as Set All to Read/Write in the upper-right corner to set the permissions of the account on all authorized databases. <ul style="list-style-type: none"> ○ Read-only: grants the database read-only permissions to the account. ○ Read/Write: grants the database read/write permissions to the account. ○ DDL Only: grants the database permissions of DDL operations to the account. ○ DML Only: grants the database permissions of DML operations to the account.

7. Click **OK**.

9.5.4. Delete an account

You can delete a database account in the ApsaraDB for RDS console.

Prerequisites

You can use the console to delete privileged and standard accounts that are no longer used.

Procedure

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic**

Information page.

4. In the left-side navigation pane, click **Accounts**.
5. Find the account you want to delete and click **Delete** in the **Actions** column.
6. In the message that appears, click **Confirm**.

? **Note** Accounts in the Processing state cannot be deleted.

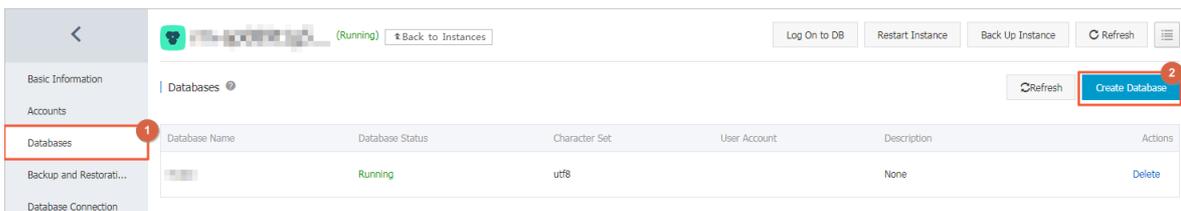

9.6. Databases

9.6.1. Create a database

After you create an ApsaraDB for RDS instance and configure its whitelist, you must create a database and an account in the instance.

Procedure

1. **Log on to the ApsaraDB for RDS console.**
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Databases**.
5. Click **Create Database**.

6. Configure the following parameters.

Parameter	Description
Database Name	<ul style="list-style-type: none"> ◦ The name must be 1 to 64 characters in length. ◦ The name must start with a letter and end with a letter or digit. ◦ The name can contain lowercase letters, digits, underscores (_), and hyphens (-). ◦ Each database name must be unique in an instance.
Supported Character Set	Select utf8, gbk, latin1, utf8mb4, or all. If you want to use other character sets, select all, and then select the required character set from the list.
Description	Optional. Enter information about the database to facilitate subsequent management. The description can be up to 256 characters in length.

7. Click **Create**.

9.6.2. Delete a database

You can delete databases that are no longer used in the ApsaraDB for RDS console.

Procedure

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Databases**.
5. Find the database you want to delete and click **Delete** in the **Actions** column.
6. In the message that appears, click **Confirm**.

9.7. Database connection

9.7.1. Change the endpoint and port number of an instance

This topic describes how to view and change the endpoint and port number of an instance.

View the endpoint and port number

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Connection**.
You can view the **Internal Endpoint** and **Internal Port** of the instance in the **Database Connection** section.

Change the endpoint and port number

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Connection**.
5. In the upper-right corner of the **Database Connection** section, click **Change Endpoint**.
6. In the dialog box that appears, set **Connection Type**, **Endpoint**, and **Port**, and click **OK**.

Note

- The prefix of the endpoint must be 8 to 64 characters in length and can contain letters, digits, and hyphens (-). It must start with a lowercase letter.
- The port number must be in the range of 1000 to 65534.

9.7.2. Log on to an ApsaraDB for RDS instance by using DMS

This topic describes how to log on to an ApsaraDB for RDS instance by using Data Management (DMS).

Prerequisites

The IP address whitelist is configured. For more information about how to configure an IP address whitelist, see [Configure a whitelist](#).

Procedure

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.

4. In the upper-right corner of the page, click **Log On to DB** to go to the Database Logon page.
5. On the logon page, set the following parameters:

- ①: The endpoint and port number that are used to connect to your RDS instance. The endpoint and port number are in the `<Internal endpoint>:<Internal port number>` format. Example: `rm-bpxxxxxxx.rds.aliyuncs.com:3433`. For more information, see [Change the endpoint of an instance](#).
 - ②: The account that is used to access the RDS database.
 - ③: The password of the account that is used to access the RDS database.
6. Click **Login**.

Note If you want the browser to remember the password, select **Remember your password** and click **Login**.

9.7.3. Switch the access mode

ApsaraDB for RDS supports two access modes: Standard Mode and Database Proxy (Safe Mode). This topic describes the differences between the two access modes and their configuration methods.

Prerequisites

The RDS instance runs MySQL 5.6.

Context

The Standard Mode and Database Proxy (Safe Mode) have the following differences:

- **Standard Mode:** RDS uses SLB to eliminate the impact of instance high-availability switching on the application layer. This mode reduces the response time, but slightly increases the probability of network interruptions and disables SQL interception.
- **Database Proxy (Safe Mode):** This mode prevents 90% of network interruptions and intercepts SQL injection attacks based on semantic analysis. However, it increases the response time by over 20%.

Procedure

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.

4. In the left-side navigation pane, click Database Connection.
5. On the right side of the page, click Switch Access Mode.
6. In the message that appears, click OK.

Note When the access mode change is in progress, Status of the instance changes to Switching Links. When Status changes to Running, the access mode is changed.

9.7.4. Hybrid access from both the classic network and VPCs

This topic describes how to use the hybrid access solution of ApsaraDB for RDS to change the network type of an instance from classic network to Virtual Private Network (VPC) without network interruptions.

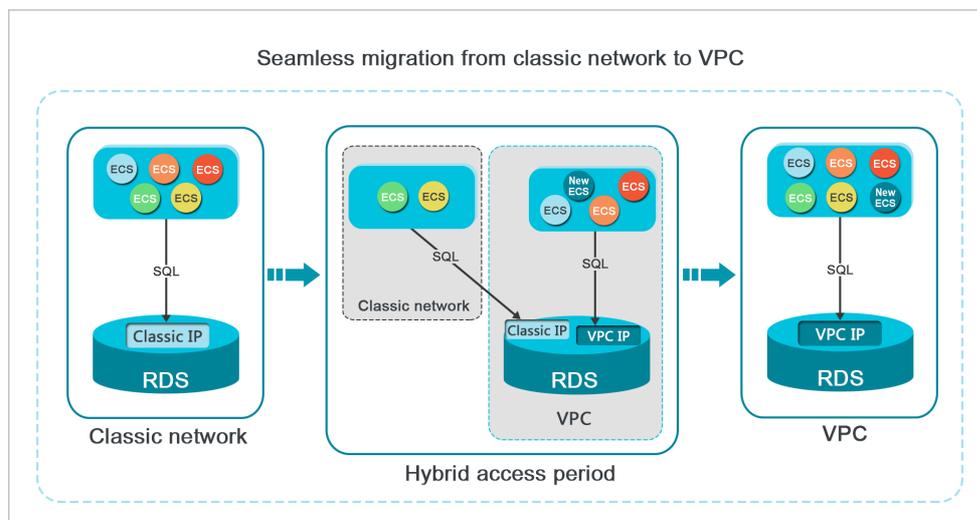

Background

In the past, when you changed the network type of an RDS instance from classic network to VPC, the internal endpoint of the RDS instance would remain the same but the IP address bound to the endpoint would change to the corresponding IP address in the VPC. This change would cause a 30-second network interruption, and ECS instances within the classic network would not be able to access the RDS instance through the internal endpoint within this period. To smoothly change the network type, ApsaraDB for RDS provides the hybrid access solution.

Hybrid access refers to the ability of an RDS instance to be accessed by ECS instances in both the classic network and VPCs. During the hybrid access period, the RDS instance reserves the original internal endpoint of the classic network and adds the internal endpoint of VPCs. This prevents network interruptions during the network type switchover.

For better security and performance, we recommend that you use the internal endpoint of VPCs. Hybrid access is available for a limited period of time. The internal endpoint of the classic network is released when the hybrid access period expires. In that case, your applications cannot access the RDS database by using the internal endpoint of the classic network. You must configure the internal endpoint of VPCs in all your applications during the hybrid access period. This ensures smooth network switchover and minimize the impact on your services.

For example, your company wants to use the hybrid access solution to change the network type from classic network to VPC. During the hybrid access period, some applications can access the database through the internal endpoint of VPCs, and the other applications can access the database through the original internal endpoint of the classic network. When all the applications access the database through the internal endpoint of VPCs, the internal endpoint of the classic network can be released. The following figure illustrates the scenario.

Limits

During the hybrid access period, the instance has the following limits:

- Changing to the classic network is not supported.
- Migrating the RDS instance to another zone is not supported.

Prerequisites

- The network type of the instance is classic network.
- Available VPCs and VSwitches exist in the zone where the instance resides.

Change the network type from classic network to VPC

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Connection**.
5. Click **Switch to VPC**.
6. In the dialog box that appears, select a VPC and a VSwitch and specify whether to retain the endpoint used in the classic network.

Determine whether to select the **Reserve Original Classic Network Endpoint** option. The following table describes the details.

Operation	Description
Clear the Reserve Original Classic Network Endpoint option	The endpoint used in the classic network is replaced with an endpoint in the VPC. When you change the network type, a 30-second network interruption may occur, and connections between ECS instances in the classic network and the RDS instance are interrupted.
Select the Reserve Original Classic Network Endpoint option	The endpoint used in the classic network is retained, and a new endpoint to be used in the VPC is generated. In such cases, the RDS instance runs in hybrid access mode. ECS instances in both the classic network and a VPC can connect to the RDS instance over the internal network. When you change the network type, no network interruptions occur. Connections between ECS instances in the classic network and the RDS instance will be available until the endpoint used in the classic network expires. Specify the expiration time of the classic network endpoint. You must add the new VPC endpoint to the ECS instance before the endpoint in the classic network expires. This ensures smooth network switchover.

7. Add the internal IP addresses of ECS instances in the selected VPC to a VPC whitelist. This allows the ECS instances to access the RDS instance over the internal network. If no VPC whitelists are available, create a whitelist. For more information, see [Configure a whitelist](#).

Change the expiration time for the original internal endpoint of the classic network

During the period in which your instance can be connected over the classic network or VPCs, you can specify the expiration time for the endpoint of the classic network. The setting takes effect immediately. For example, if the endpoint of the classic network is about to expire on August 18, 2017 and you change the expiration time to 14 days later on August 15, 2017, the endpoint of the classic network is released on August 29, 2017.

Follow these steps to change the expiration time:

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the **Instances** page, find the target instance.

3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Connection**.
5. Click **Change Expiration Time**.
6. In the **Change Expiration Time** dialog box, select an expiration time and click **OK**.

9.7.5. Change the network type of an instance

This topic describes how to change the network type of an ApsaraDB for RDS instance between classic network and VPC.

Context

- **Classic network:** RDS instances in the classic network are not isolated. Unauthorized access to these instances can be blocked only by whitelists.
- **VPC:** Each Virtual Private Cloud (VPC) is an isolated network. We recommend that you select the VPC network type because it is more secure than the classic network.

You can configure route tables, CIDR blocks, and gateways in a VPC. To smoothly migrate applications to the cloud, you can use leased lines or VPNs to connect on-premises data center to a VPC to create a virtual data center.

Change the network type from VPC to classic network

Precautions

- After you change the network type from VPC to classic network, the internal endpoint of the RDS instance remains unchanged, but the IP address bound to the internal endpoint changes.
 - After you change the network type from VPC to classic network, ECS instances in the same VPC as the RDS instance can no longer connect to the RDS instance by using the internal endpoint. You must update the endpoint for the applications deployed on the ECS instances.
 - When you change the network type, a 30-second network interruption may occur. To avoid business interruption, change the network type during off-peak hours or make sure that your applications are configured with automatic reconnection policies.
1. [Log on to the ApsaraDB for RDS console](#).
 2. On the **Instances** page, find the target instance.
 3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
 4. In the left-side navigation pane, click **Database Connection**.
 5. In the upper-right corner of the **Database Connection** section, click **Switch to Classic Network**.
 6. In the message that appears, click **OK**.

Change the network type from classic network to VPC

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Connection**.
5. In the upper-right corner of the **Database Connection** section, click **Switch to VPC**.
6. In the **Switch to VPC** dialog box, select a VPC and VSwitch and specify whether to **Reserve Original Classic Network Endpoint**. Click **OK**. For more information about **Reserve Original Classic Network Endpoint**, see [Hybrid access from both the classic network and VPCs](#).

9.8. Database proxy

9.8.1. Database proxy

The database proxy is a high-performance database middleware provided by ApsaraDB for RDS. It is secure, stable, fully compatible with database protocols, and transparent to clients.

Prerequisites

The RDS instance runs MySQL 5.6 High-availability Edition.

Principle

The database proxy sits between a client and the database engine, and is automatically maintained by ApsaraDB for RDS. All database requests and responses are processed by the proxy.

Features

The database proxy supports the read/write splitting function. You do not need to modify code of the client. Queries are distributed to read-only RDS instances to reduce the load on the primary instance. For more information, see [Enable read/write splitting](#).

Enable the database proxy feature

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Proxy**.
5. On the **Database Proxy** tab, turn on the **Disabled** switch to the right of **Database Proxy Status**.
6. In the message that appears, click **Confirm**.

9.8.2. Dedicated proxy

This topic describes the dedicated proxy feature of ApsaraDB RDS for MySQL. This feature provides advanced functions such as read/write splitting, connection pool, and transaction splitting.

Prerequisites

Your RDS instance runs one of the following MySQL versions and RDS editions:

- MySQL 5.7 on RDS Enterprise Edition
- MySQL 5.7 on RDS High-availability Edition (with local SSDs)

Context

The dedicated proxy feature uses dedicated computing resources. It has the following benefits:

- A unified proxy endpoint is provided to connect to all of the dedicated proxies that are enabled on the primary RDS instance. This reduces maintenance costs by relieving you from updating the endpoints on your application. The proxy endpoint remains valid unless you release the dedicated proxy instance. For example, you may enable read/write splitting during peak hours, but then release read-only instances and disable read/write splitting after peak hours. In such cases, you do not need to update the endpoints on your application because the proxy endpoint is still connected.
- Dedicated proxies exclusively serve the primary RDS instance and its read-only RDS instances. This ensures service stability by relieving you from competing with other users for resources.
- Dedicated proxies support scaling. You can add dedicated proxies based on your business requirements to handle more workloads.

Limits

- Dedicated proxies do not support SSL encryption.

- Dedicated proxies do not support compression protocols.

Precautions

- While you change the specifications of the primary RDS instance or its read-only RDS instances, a network interruption may occur.
- If you connect your application to the proxy endpoint without enabling the transaction splitting function, all requests encapsulated in transactions are routed to the primary RDS instance.
- If you use the proxy endpoint to implement read/write splitting, the read consistency of the requests that are not encapsulated in transactions cannot be guaranteed. If you require this read consistency, you must encapsulate these requests in transactions.
- If you connect your application to the proxy endpoint, the `SHOW PROCESSLIST` statement returns a combination of results from the primary RDS instance and all of its read-only RDS instances.
- If you execute **multi-statements** or run stored procedures, the read/write splitting function is disabled and all subsequent requests over the current connection are routed to the primary RDS instance. To enable the read/write splitting function again, you must close the current connection and establish a new one.
- The dedicated proxy feature supports the `/*FORCE_MASTER*/` and `/*FORCE_SLAVE*/` hints. However, requests that contain hints have the highest route priorities, and therefore they are not constrained by consistency or transaction limits. You must check whether these hints are suitable for your workloads before you use them. In addition, these hints cannot contain statements such as `/*FORCE_SLAVE*/ set names utf8;` . Such statements can change environment variables. If you include such statements in these hints, errors may occur when you process your subsequent workloads.
- After you enable the dedicated proxy feature, each connection is replicated to the primary RDS instance and all of its read-only RDS instances in compliance with the 1:N connection model. We recommend that you specify the same connection specifications for these instances. If these instances have different connection specifications, the number of connections allowed is subject to the lowest connection specifications among these instances.
- If you create or reboot a read-only RDS instance after you enable the dedicated proxy feature, only the requests over new connections are routed to the new or rebooted read-only RDS instance.
- The `max_prepared_stmt_count` parameter must be set to the same value for the primary RDS instance and all of its read-only RDS instances.

Enable the dedicated proxy feature

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Proxy**.
5. Click **Enable now**.

Overview of the Database Proxy page

After the dedicated proxy feature is enabled, you can use the generated proxy endpoint to implement functions such as read/write splitting, connection pool, and transaction splitting.

The screenshot shows the configuration page for a Proxy Service. It has tabs for 'Proxy Service', 'Read/Write Splitting', and 'Monitoring Data'. A 'Disable Proxy Service' button is in the top right. The 'Proxy Endpoint' section shows: Status: Running; Endpoint: [redacted] Copy Address; Port: 3306; Instance ID: [redacted]; Read/Write Splitting: Disabled; Transaction Splitting: Enabled Disable; Endpoint Type: Internal (Classic Network); Instances Associated with Proxy: 1; Short-Lived Connection Optimization: Disabled Enable. The 'Proxy Instance' section shows a table with columns: Proxy Type, CPU and Memory, Instances Associated, Adjusted Instances, and Adjustment Plan. The table contains one row: Dedicated Proxy, 2 Cores, 4 GB, 1, - 1 +, and buttons for Apply and Cancel.

Section	Parameter	Description
Proxy Endpoint	Instance ID	The ID of the proxy instance.
	Instances Associated with Proxy	The number of dedicated proxies that are enabled on the primary RDS instance. You can add dedicated proxies to process more queries. After the public preview phase ends, you must pay for added proxy instances.
	Read/Write Splitting	Specifies whether to enable read/write splitting for the proxy endpoint. For more information, see Read/write splitting .
	Short-Lived Connection Optimization	Specifies to enable or disable connection pool for the proxy endpoint. This function is suitable for scenarios that PHP short-lived connections are established. For more information, see Short-lived connection optimization . Note You can click Enable or Disable to the right of Short-Lived Connection Optimization to enable or disable this function.
	Transaction Splitting	Specifies whether to enable the transaction splitting function for the proxy endpoint. For more information, see Transaction splitting . Note You can click Enable or Disable to the right of Transaction Splitting to enable or disable this feature.
	Endpoint	The proxy endpoint that is generated after the dedicated proxy feature is enabled. This endpoint connects to all of the dedicated proxies that are enabled on the primary RDS instance. The read/write splitting function is also bound to this endpoint. Note You can click Copy Address to the right of Endpoint to copy the endpoint.
	Port	The port that is associated with the proxy endpoint.
	Endpoint Type	The network type of the proxy endpoint.
	Proxy Type	The type of proxy that is enabled on the primary RDS instance. Only the Dedicated Proxy type is supported.

Section	Parameter	Description
Proxy Instance	CPU and Memory	The CPU and memory of proxy instances. Only 2 Cores, 4 GB is supported.
	Instances Associated	<p>The total number of dedicated proxies that are enabled on the primary RDS instance. Up to 60 dedicated proxies are supported.</p> <p> Note We recommend that you specify the number of dedicated proxies as the rounded-up integer of the total number of CPU cores of the primary and read-only RDS instances divided by 8.</p> <p>For example, if the primary RDS instance has eight CPU cores and its read-only RDS instances have four CPU cores, the recommended number of dedicated proxies is 2 based on the following formula: $(8 + 4)/8 = 1.5$ (rounded up to 2).</p>

Adjust the number of dedicated proxies

 **Note** While you adjust the number of dedicated proxies, a network interruption will occur. Make sure that your applications are configured with automatic reconnection policies.

1. Log on to the [ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Proxy**.
5. In the **Proxy Instance** section of the **Proxy Service** tab, change the number in the **Adjusted Instances** column and click **Apply** in the **Adjustment Plan** column.
6. In the dialog box that appears, you can click **Switch Now** to apply the changes. You can also click **Switch Within Maintenance Window** to set a time point for the change to take effect. Click **OK**.

View the monitoring data of dedicated proxies

1. Log on to the [ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Proxy**.
5. Click the **Monitoring Data** tab.
6. Select a time range and view the **CPU Utilization (%)** metric within that time range.

Disable the dedicated proxy feature

1. Log on to the [ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Proxy**.
5. In the upper-right corner of the page, click **Disable Proxy Service**.
6. In the message that appears, click **OK**.

9.8.3. Short-lived connection optimization

This topic introduces the short-lived connection optimization function provided by ApsaraDB RDS for MySQL in its dedicated proxy feature.

Prerequisites

- The primary RDS instance runs one of the following MySQL versions and RDS editions:
 - MySQL 5.7 on RDS Enterprise Edition
 - MySQL 5.7 on RDS High-availability Edition (with local SSDs)
- The database proxy is enabled for the instance. For more information, see [Dedicated proxy](#).

Context

The short-lived connection optimization function is used to reduce workloads on the RDS instance caused by frequent short-lived connections. If a client is disconnected from a connection, the system determines whether the connection is idle. If the connection is idle, the proxy retains the connection in the connection pool for a short period. When the client initiates a connection request again, the proxy matches the request with idle connections retained in the connection pool based on the values of the user, clientip, and dbname fields. If an idle connection in the connection pool is matched, the proxy uses this idle connection. If no idle connection is matched, a new connection is established with the database. This reduces the overheads of database connections.

 **Note** The short-lived connection optimization function does not reduce concurrent connections with the database. It reduces the frequency to establish connections between the application and database and workloads of the primary MySQL thread. This improves efficiency to process business requests. However, idle connections in the connection pool still occupy the database threads for a short period of time.

Precautions

You cannot configure different permissions for the same account with different source IP addresses. Otherwise, errors may occur when connections in the connection pool are reused. For example, if the user account has permissions on database_a when its source IP address is 192.168.1.1 but does not have permissions on database_a when its source IP address is 192.168.1.2, the short-lived connection optimization function may encounter permission errors.

Enable short-lived connection optimization

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Proxy**.
5. On the **Proxy Service** tab, click **Enable** on the right of **Short-Lived Connection Optimization**.

9.8.4. Transaction splitting

This topic introduces the transaction splitting function provided by the database proxy of ApsaraDB for RDS. This function identifies and distributes read requests initiated before write requests within a transaction to read-only instances. This reduces workloads on the primary instance.

Prerequisites

- The primary RDS instance runs one of the following MySQL versions and RDS editions:
 - MySQL 5.7 on RDS Enterprise Edition
 - MySQL 5.7 on RDS High-availability Edition (with local SSDs)

- The database proxy is enabled for the instance. For more information, see [Dedicated proxy](#).

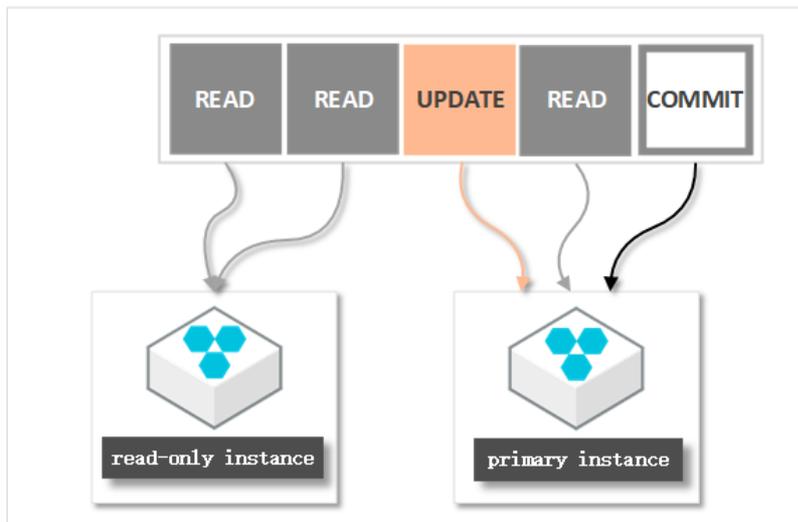

Context

By default, the dedicated proxy sends all requests in transactions to the primary instance to ensure the correctness of the transactions. If the framework used encapsulates all requests in transactions, the primary instance becomes heavily loaded. In this case, you can enable the transaction splitting function.

When transaction splitting is enabled and the default isolation level READ COMMITTED is used, the RDS instance starts a transaction only for write requests when autocommit is disabled (set autocommit=0). Read requests that arrive before the transaction is started are distributed to read-only instances by the load balancer.

Note

- Explicit transactions do not support splitting, such as transactions started by using the BEGIN or START statement.
- After transaction splitting is enabled, global consistency cannot be ensured. If your business requires global consistency, we recommend that you evaluate whether you can enable transaction splitting.

Procedure

1. [Log on to the ApsaraDB for RDS console](#).
2. On the Instances page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Proxy**.
5. On the **Proxy Service** tab, click **Enable** on the right of **Transaction Splitting**.

Note

- When you no longer need transaction splitting, you can click **Disable** on the right of **Transaction Splitting**.
- The operation to enable or disable transaction splitting takes effect only on new connections.

9.8.5. Read/write splitting

9.8.5.1. Enable read/write splitting

This topic describes the read/write splitting function of ApsaraDB RDS for MySQL in its dedicated proxy feature and how to enable this function.

Prerequisites

- The RDS instance runs one of the following MySQL versions and RDS editions:
 - MySQL 5.6
 - MySQL 5.7 on RDS Enterprise Edition
 - MySQL 5.7 on RDS High-availability Edition (with local SSDs)
- You have enabled the database proxy or dedicated database proxy. For more information, see [Enable the database proxy feature](#) and [Enable the dedicated proxy feature](#).
- At least one read-only instance is created. For more information about how to create a read-only instance, see [Create a read-only instance](#).

Context

If your primary instance needs to process a large number of read requests but only a small number of write requests, you can create one or more read-only instances to offload read requests from your primary instance. This allows you to ensure service stability. For more information, see [Create a read-only instance](#).

After you create read-only instances, you can enable read/write splitting. In this case, a read/write splitting endpoint is provided. After you add the endpoint to your application, write requests are routed to the primary instance and read requests are routed to the read-only instances.

□

Differences between the read/write splitting endpoint and the internal and public endpoints

After you enable read/write splitting and add the read/write splitting endpoint to your application, all requests are routed to this endpoint, and then to the primary and read-only instances based on the request types and the read weights of these instances.

If the internal or public endpoint of the primary instance is added to your application, all requests are routed to the primary instance. In this case, you must add the endpoints and read weights of the primary and read-only instances to your application to implement read/write splitting.

Logic to route requests

- The following requests are routed only to the primary instance:
 - Data manipulation language (DML) statements, which are INSERT, UPDATE, DELETE, and SELECT FOR UPDATE
 - All data definition language (DDL) statements used to perform operations such as creating databases or tables, deleting databases or tables, and changing schemas or permissions
 - All requests that are encapsulated in transactions
 - Requests for user-defined functions
 - Requests for stored procedures
 - Requests for EXECUTE statements
 - Requests for [multi-statements](#)
 - Requests that involve temporary tables
 - Requests for SELECT last_insert_id() statements
 - All requests to query or modify user environment variables
 - Requests for SHOW PROCESSLIST statements
 - All requests for KILL statements in SQL (Note that these are not KILL commands in Linux.)
- The following requests are routed to the primary instance or its read-only instances:

- Read requests that are not encapsulated in transactions
- Requests for `COM_STMT_EXECUTE` statements
- The following requests are routed to all of the primary and read-only instances:
 - All requests to modify system environment variables
 - Requests for `USE` statements
 - Requests for `COM_STMT_PREPARE` statements
 - Requests for `COM_CHANGE_USER`, `COM_QUIT`, and `COM_SET_OPTION` statements

Benefits

- Easier maintenance with a unified endpoint

If you do not enable read/write splitting, you must add the endpoints of the primary and read-only instances to your application. This makes write requests routed to the primary instance and read requests routed to the read-only instances.

If you enable read/write splitting, the endpoint of the dedicated proxy is used for read/write splitting. After your application is connected to this endpoint, requests are routed to the primary and read-only instances based on the read weights of these instances. This reduces maintenance costs.

In addition, you can scale up the read capability of your database system by creating read-only instances. This relieves you from the need to modify the configuration data on your application.

- Higher performance and lower maintenance cost with a native RDS link

If you build a separate proxy layer on the cloud to implement read/write splitting, statements need to be parsed and forwarded by a number of components before they reach your database system. This increases response latency. The read/write splitting function provided with ApsaraDB for RDS shortens response latency, increases processing speed, and reduces maintenance costs.

- Ideal in various use scenarios with configurable read weights and thresholds

You can specify the read weights of the primary and read-only instances. You can also specify a latency threshold for each read-only instance.

- Highly available with instance-level health check

The read/write splitting module actively performs health checks on the primary and read-only instances. If an instance breaks down or its latency exceeds the specified threshold, the read/write splitting module stops routing requests to the instance and redirects the requests that were destined for the instance to other healthy instances. This allows you to ensure service availability in the event of faults on a single instance. After the instance is recovered, the read/write splitting module resumes routing read requests to it.

 **Note** To avoid single points of failure (SPOFs), we recommend that you create at least two read-only instances.

Precautions

- A network interruption may occur while you change the specifications of the primary instance or its read-only instances.
- After you create a read-only instance, only the requests over new connections can be routed to the read-only instance.
- The endpoint of the dedicated proxy does not support SSL encryption.
- The endpoint of the dedicated proxy does not support compression.
- If the endpoint of the dedicated proxy is used for connection, all of the requests encapsulated in transactions are routed to the primary instance.
- If the endpoint of the dedicated proxy is used for read/write splitting, the read consistency of the requests that are not encapsulated in transactions cannot be ensured. If you require the read consistency, encapsulate the requests in transactions.

- If the endpoint of the dedicated proxy is used for connection, the `SHOW PROCESSLIST` statement combines the results from the primary and read-only instances and returns a result set.
- If short-lived connection optimization is enabled, the `SHOW PROCESSLIST` statement may return idle connections.
- If you execute **multi-statements** or stored procedures, read/write splitting is disabled and all of the subsequent requests over the current connection are routed to the primary instance. To enable read/write splitting again, you must terminate the current connection and establish a new one.
- The `/*FORCE_MASTER*/` and `/*FORCE_SLAVE*/` hints are supported. However, requests that contain hints have higher route priorities. These requests are not constrained by consistency or transaction limits. You must check whether these hints are suitable for your business before you use them. A hint cannot contain statements that change environment variables. An example is `/*FORCE_SLAVE*/ set names utf8;`. Otherwise, an error may occur in the subsequent procedure.

Prerequisites

A read-only instance is created for the primary instance. For more information, see [Create a read-only instance](#).

Enable read/write splitting

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Proxy**.
5. On the **Read/Write Splitting** tab, click **Enable now**.
6. Configure the following parameters.

Parameter	Description
Latency Threshold	<p>The maximum latency that is allowed for data replication from the primary instance to its read-only instances. If the replication latency for a read-only instance exceeds the specified threshold, the read/write splitting module stops routing read requests to the read-only instance. This applies even if the read-only instance has a high read weight.</p> <p>Valid values: 0 to 7200. Unit: seconds. The read-only instances may replicate data from the primary instance at a certain latency due to SQL statement execution limits. We recommend that you set this parameter to a value that is greater than or equal to 30.</p>
Read Weight Distribution	<p>The read weight of each instance in your database system. A higher read weight indicates more read requests to process. For example, the primary instance is attached with three read-only instances, and the read weights of the primary and read-only instances are 0, 100, 200, and 200. In this situation, the primary instance only processes write requests, and the three read-only instances process all of the read requests at the 1:2:2 ratio.</p> <ul style="list-style-type: none"> ◦ Automatic Distribution: Your database system assigns a read weight to each instance based on the instance specifications. After you create a read-only instance, your database system assigns a read weight to the read-only instance and adds the read-only instance to the read/write splitting link. ◦ Customized Distribution: You must manually specify the read weight of each instance. Valid values: 0 to 10000. After you create a read-only instance, its read weight defaults to 0. You must manually specify the read weight of the read-only instance.

7. Click **OK**.

9.8.5.2. Set the read/write splitting parameters

This topic describes how to configure the latency threshold and specify read weights for an ApsaraDB for RDS instance in the RDS console.

Prerequisites

- The RDS instance runs one of the following MySQL versions and RDS editions:
 - MySQL 5.6
 - MySQL 5.7 on RDS Enterprise Edition
 - MySQL 5.7 on RDS High-availability Edition (with local SSDs)
- Read/write splitting is enabled. For more information, see [Enable read/write splitting](#).

Procedure

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Proxy**.
5. On the **Read/Write Splitting** tab, click **Configure Read/Write Splitting**.
6. Configure the following parameters.

Parameter	Description
Latency Threshold	<p>The maximum latency that is allowed for data replication from the primary instance to its read-only instances. If the replication latency for a read-only instance exceeds the specified threshold, the read/write splitting module stops routing read requests to the read-only instance. This applies even if the read-only instance has a high read weight.</p> <p>Valid values: 0 to 7200. Unit: seconds. The read-only instances may replicate data from the primary instance at a certain latency due to SQL statement execution limits. We recommend that you set this parameter to a value that is greater than or equal to 30.</p>
Read Weight Distribution	<p>The read weight of each instance in your database system. A higher read weight indicates more read requests to process. For example, the primary instance is attached with three read-only instances, and the read weights of the primary and read-only instances are 0, 100, 200, and 200. In this situation, the primary instance only processes write requests, and the three read-only instances process all of the read requests at the 1:2:2 ratio.</p> <ul style="list-style-type: none"> ◦ Automatic Distribution: Your database system assigns a read weight to each instance based on the instance specifications. After you create a read-only instance, your database system assigns a read weight to the read-only instance and adds the read-only instance to the read/write splitting link. ◦ Customized Distribution: You must manually specify the read weight of each instance. Valid values: 0 to 10000. After you create a read-only instance, its read weight defaults to 0. You must manually specify the read weight of the read-only instance.

7. Click **OK**.

9.8.5.3. Disable read/write splitting

This topic describes how to disable the read/write splitting feature of an ApsaraDB for RDS instance in the RDS console.

Prerequisites

- The RDS instance runs one of the following MySQL versions and RDS editions:
 - MySQL 5.6
 - MySQL 5.7 on RDS Enterprise Edition
 - MySQL 5.7 on RDS High-availability Edition (with local SSDs)
- You have enabled read/write splitting. For more information, see [Enable read/write splitting](#).

Procedure

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the Instances page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Proxy**.
5. On the **Read/Write Splitting** tab, click **Disable Read/Write Splitting**.
6. Click **OK**.

9.9. Monitoring and alerts

9.9.1. View resource and engine monitoring data

The ApsaraDB for RDS console provides a variety of performance metrics to monitor the status of your instances.

Prerequisites

The RDS instance runs one of the following MySQL versions and RDS editions:

- MySQL 5.6
- MySQL 5.7 on RDS High-availability Edition (with local SSDs)
- MySQL 5.7 on RDS Enterprise Edition

Procedure

1. [Log on to the ApsaraDB for RDS console.](#)
2. Find the target instance and click the instance ID.
3. In the left-side navigation pane, click **Monitoring and Alerts**.
4. On the **Monitoring and Alerts** page, select **Resource Monitoring** or **Engine Monitoring**, and select a time range to view the corresponding monitoring data. The following table describes the metrics.

Category	Metric	Description
Resource Monitoring	Disk Space (MB)	<p>The disk space usage of the instance. It consists of the following parts:</p> <ul style="list-style-type: none"> ◦ Instance size ◦ Data usage ◦ Log size ◦ Temporary file size ◦ Other system file size <p>Unit: MB.</p>
	IOPS	The number of I/O requests per second for the instance.
	Total Connections	The total number of current connections to the instance, including the number of active connections and the total number of connections.
	CPU Utilization and Memory Usage (%)	The CPU utilization and memory usage of the RDS instance. These metrics do not include the CPU utilization and memory usage for the operating system.

Category	Metric	Description
	Network Traffic (KB)	The inbound and outbound traffic of the instance per second. Unit: KB.
Engine Monitoring	TPS/QPS	The average number of transactions per second and the average number of SQL statements executed per second.
	InnoDB Buffer Pool Read Hit Ratio, Usage Ratio, and Dirty Block Ratio (%)	The read hit ratio, usage ratio, and dirty block ratio of the InnoDB buffer pool.
	InnoDB Read/Write Volume (KB)	The amount of data that InnoDB reads and writes per second. Unit: KB.
	InnoDB Buffer Pool Read/Write Frequency	The number of read and write operations that InnoDB performs per second.
	InnoDB Log Read/Write/fsync	The average frequency of physical writes to log files per second by InnoDB, the log write request frequency, and the average frequency of fsync writes to log files.
	Temporary Tables Automatically Created on Hard Disk when MySQL Statements Are Executed	The number of temporary tables that are automatically created on the hard disk when the database executes SQL statements.
	MySQL_COMDML	The number of SQL statements that the database executes per second. The following SQL statements are included: <ul style="list-style-type: none"> ◦ Insert ◦ Delete ◦ Insert_Select ◦ Replace ◦ Replace_Select ◦ Select ◦ Update
	MySQL_RowDML	The numbers of operations that InnoDB performs per second. The following items are included: <ul style="list-style-type: none"> ◦ The number of physical writes to log files per second ◦ The number of rows that are read, updated, deleted, and inserted from InnoDB tables per second
	MyISAM Read/Write Frequency	The numbers of operations that MyISAM performs per second. The following items are included: <ul style="list-style-type: none"> ◦ The number of MyISAM reads and writes from the buffer pool per second ◦ The number of MyISAM reads and writes from the hard disk per second
MyISAM Key Buffer Read/Write/Usage Ratio (%)	The read hit ratio, write hit ratio, and usage of the MyISAM key buffer per second.	

9.9.2. Set a monitoring frequency

The ApsaraDB for RDS console provides a variety of performance metrics for which you can set a monitoring frequency.

Prerequisites

The RDS instance runs one of the following MySQL versions and RDS editions:

- MySQL 5.6
- MySQL 5.7 on RDS High-availability Edition (with local SSDs)
- MySQL 5.7 on RDS Enterprise Edition

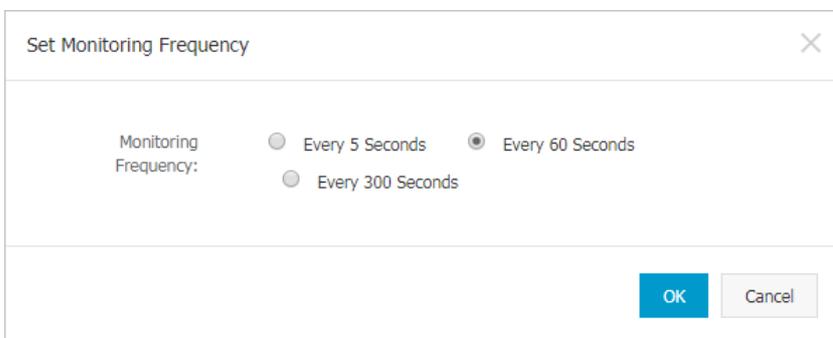

Context

ApsaraDB for RDS provides the following monitoring frequencies:

- Every 5 seconds for the first seven days. After the seventh day, performance metrics are monitored every minute.
- Every 60 seconds.
- Every 300 seconds.

Procedure

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Monitoring and Alerts**.
5. On the **Resource Monitoring** page, click **Set Monitoring Frequency**.
6. In the **Set Monitoring Frequency** dialog box, select a new monitoring frequency.

7. Click **OK**.

Note If your instance does not support the selected monitoring frequency, a prompt appears in the Set Monitoring Frequency dialog box. Select a monitoring frequency supported by the instance.

9.10. Data security

9.10.1. Configure a whitelist

To ensure database security and reliability, you must modify the whitelist of an ApsaraDB for RDS instance before you enable the instance. You must add the IP addresses or CIDR blocks that are used for database access to the whitelist.

Context

The whitelist improves the access security of your ApsaraDB for RDS instance. We recommend that you maintain the whitelist on a regular basis. The whitelist configuration process does not affect the normal operations of the ApsaraDB for RDS instance.

To configure a whitelist, perform the following operations:

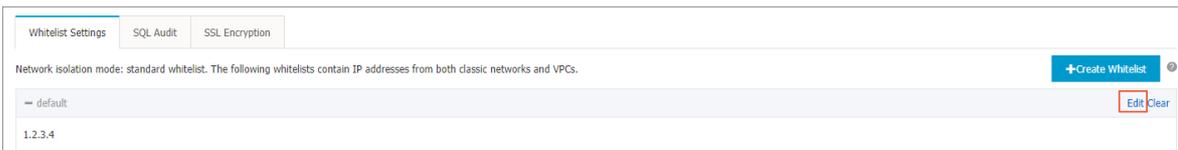

- Configure a whitelist: Add IP addresses to allow them to connect to the RDS instance.
- Configure an ECS security group: Add an ECS security group for the RDS instance to allow ECS instances in the group to connect to the RDS instance.

Precautions

- The default whitelist can be modified or cleared, but cannot be deleted.
- You can add up to 1,000 IP addresses or CIDR blocks to a whitelist. If you want to add a large number of IP addresses, we recommend that you merge them into CIDR blocks, such as 192.168.1.0/24.

Configure a standard IP address whitelist

1. Log on to the ApsaraDB for RDS console.
2. On the Instances page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Data Security**.
5. On the **Whitelist Settings** tab, click **Edit** corresponding to the default whitelist.

Note

- If you want to connect an ECS instance to an ApsaraDB for RDS instance by using an internal endpoint, you must make sure that the two instances are in the same region and have the same network type. Otherwise, the connection fails.
- You can click **Create Whitelist** to create a new whitelist.

6. In the **Edit Whitelist** dialog box, enter the IP addresses or CIDR blocks used to access the instance, and then click **OK**.
 - If you enter the CIDR block 10.10.10.0/24 in the IP Addresses field, all IP addresses in the 10.10.10.X format are granted access to your RDS instance.
 - If you enter more than one IP address or CIDR block, you must separate them with commas (,). Do not add spaces before or after the commas. Example: 192.168.0.1,172.16.213.9.
 - After you click **Add Internal IP Addresses of ECS Instances**, the IP addresses of all the ECS instances under your Apsara Stack account are displayed. You can select the required IP addresses and add them to the whitelist.

Note If you add a new IP address or CIDR block to the default whitelist, the default address 127.0.0.1 is automatically deleted.

9.10.2. Configure SSL encryption

This topic describes how to enhance endpoint security. You can enable Secure Sockets Layer (SSL) encryption and install SSL certificates issued by certificate authorities (CAs) on the required application services. SSL is used at the transport layer to encrypt network connections and enhance the security and integrity of communication data. SSL also increases the response time.

Prerequisites

The RDS instance runs one of the following MySQL versions and RDS editions:

- MySQL 5.6
- MySQL 5.7 on RDS High-availability Edition

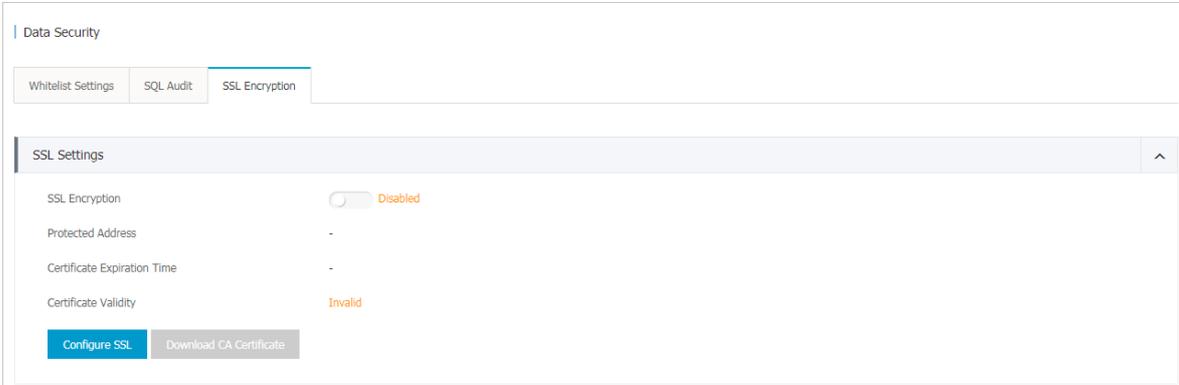

Precautions

- An SSL CA certificate is valid for one year. You must update the validity period of the certificate and then download and configure the certificate again. Otherwise, clients that use encrypted connections cannot connect to the RDS instance.
- SSL encryption may cause a significant increase in CPU utilization. We recommend that you enable SSL encryption only when you want to encrypt connections from the Internet. In most cases, connections that use an internal endpoint do not require SSL encryption.
- Read/write splitting endpoints do not support SSL encryption.
- If you disable SSL encryption, the RDS instance restarts. Proceed with caution.

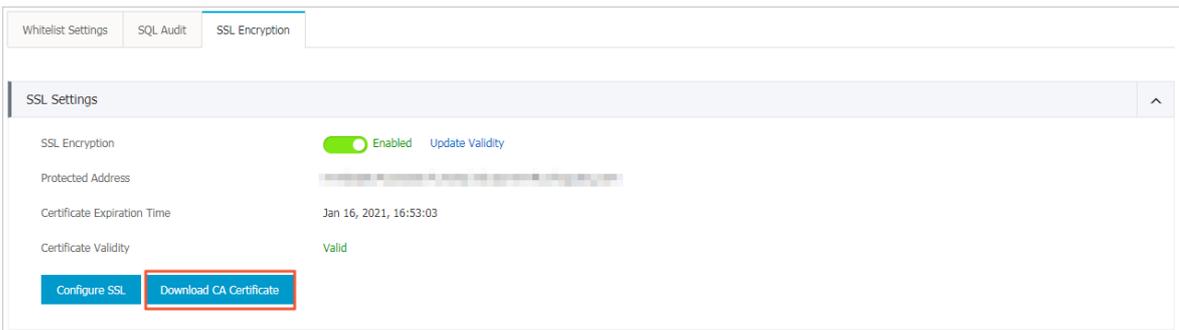

Enable SSL encryption

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the **Instances** page, find the target instance.

3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Data Security**.
5. Click the **SSL Encryption** tab.

6. Turn on the switch next to **Disabled**.
7. In the **Configure SSL** dialog box, select the endpoint for which you want to enable SSL encryption and click **OK**.
8. Click **Download CA Certificate** to download the SSL CA certificate files in a compressed package.

The downloaded package contains the following files:

- **P7B file:** used to import CA certificates to the Windows operating system.
- **PEM file:** used to import CA certificates to other operating systems or applications.
- **JKS file:** the Java truststore file. The password is `apsaradb`. It is used to import the CA certificate chain to Java programs.

Note When the JKS file is used in Java, you must modify the default JDK security configuration in JDK 7 and JDK 8. Open the `/jre/lib/security/java.security` file on the host where your application resides, and modify the following configurations:

```
jdk.tls.disabledAlgorithms=SSLv3, RC4, DH keySize < 224
jdk.certpath.disabledAlgorithms=MD2, RSA keySize < 1024
```

If you do not modify the JDK security configuration, the following error is reported. Similar errors are also caused by the Java security configuration.

```
javax.net.ssl.SSLHandshakeException: DHPublicKey does not comply to algorithm constraints
```

Configure an SSL CA certificate

After you enable SSL encryption, configure the SSL CA certificate on your application or client before they can connect to the RDS instance. This section uses MySQL Workbench and Navicat as examples to describe how to configure an SSL CA certificate. For more information, see the instructions for the other applications or clients.

Configure a certificate on MySQL Workbench

1. Start MySQL Workbench.
2. Choose **Database > Manage Connections**.
3. Enable **Use SSL** and import the SSL CA certificate files.

Configure a certificate on Navicat

1. Start Navicat.
2. Right-click the target database and select **Edit Connection**.
3. Click the **SSL** tab. Select the path of the SSL CA certificate file in the .pem format.
4. Click **OK**.

 **Note** If the `connection is being used` error is reported, the previous session is still connected. Restart Navicat.

5. Double-click the target database to test whether the database is connected.

Update the validity period of an SSL CA certificate

 **Note** Update Validity causes the RDS instance to restart. Proceed with caution.

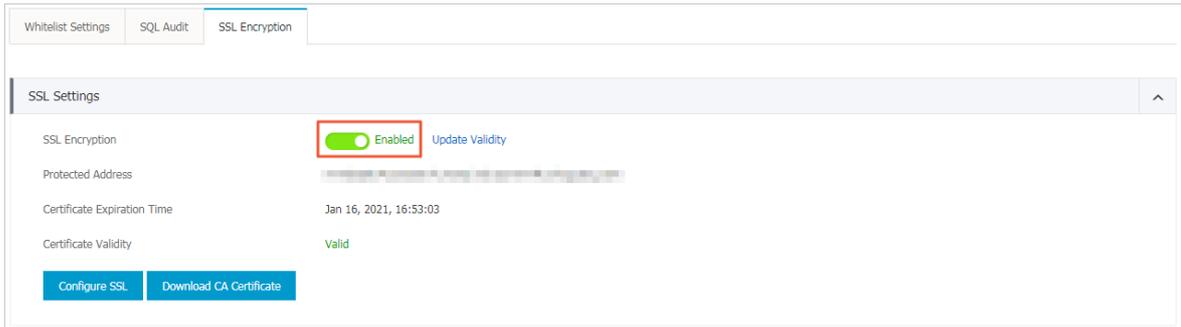

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Data Security**.
5. Click the **SSL Encryption** tab.
6. Click **Update Validity**.

Disable SSL encryption

 **Note**

- If you disable SSL encryption, the RDS instance restarts. To reduce the impact on your business, the system triggers a primary/secondary switchover. We recommend that you disable SSL encryption during off-peak hours.
- Database access features higher performance but lower security after SSL encryption is disabled. We recommend that you disable SSL encryption only in secure environments.

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Data Security**.
5. Click the **SSL Encryption** tab.
6. Turn off the switch next to **Enabled**. In the message that appears, click **OK**.

9.10.3. Configure TDE

Transparent data encryption (TDE) encrypts and decrypts data files in real time. It encrypts data files when they are written to disks, and decrypts data files when they are loaded to the memory from disks. TDE does not increase the size of data files. You can use TDE without making changes to applications.

Prerequisites

- Your RDS instance runs one of the following MySQL versions and RDS editions:
 - MySQL 5.7 on RDS High-availability Edition (with local SSDs)
 - MySQL 5.6
- Key Management Service (KMS) is activated. If KMS is not activated, you can activate it as prompted when you enable TDE.

Context

Encryption keys are created and managed by KMS. RDS does not provide the keys and certificates that are required for encryption. For specific zones, you can use the keys that are automatically generated by Alibaba Cloud or use your own key materials to generate data keys, and then authorize your RDS instance to use these keys.

Precautions

- Enabling TDE restarts your RDS instance and terminates all of its connections. Make appropriate service arrangements before you enable TDE. Proceed with caution.
- After TDE is enabled, it cannot be disabled.
- After TDE is enabled, you cannot change the key.
- After TDE is enabled, if you want to restore data to your computer, you must **decrypt data** on your RDS instance.
- After TDE is enabled, CPU utilization significantly increases.
- If you use an existing custom key, note the following points:
 - If you disable a key, set a key deletion plan, or delete the key materials, the key becomes unavailable.
 - After you revoke the key that is authorized for an RDS instance, the RDS instance becomes unavailable after the instance is restarted.
 - You must use an Apsara Stack account or an account that has the AliyunSTSAssumeRoleAccess permission.

 **Note** Use the following path to navigate the key management guide: *Key Management Service > User Guide*.

Use a key that is automatically generated by Alibaba Cloud

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic**

Information page.

- In the left-side navigation pane, click **Data Security**.
- Click the **TDE** tab. Then, turn on **TDE Status**.

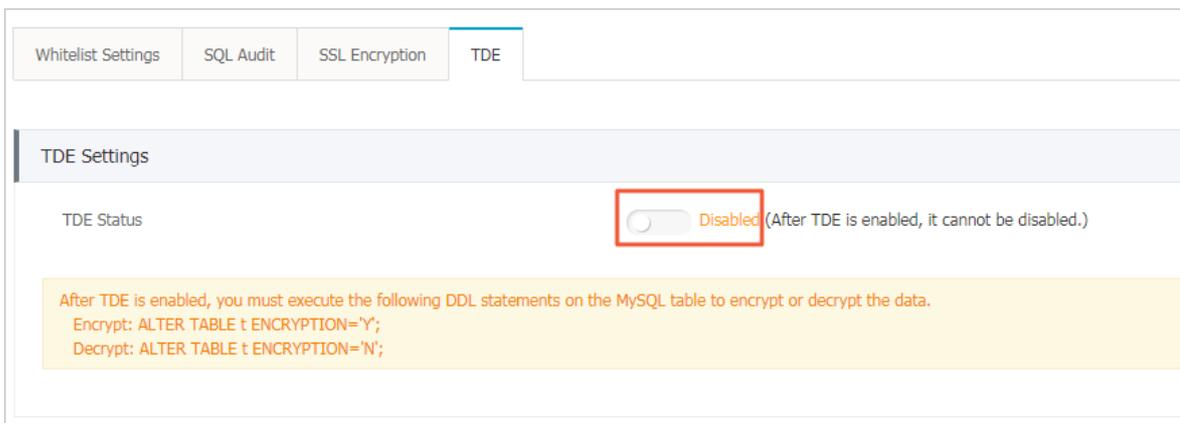

- In the dialog box that appears, select **Use an Automatically Generated Key** and click **OK**.

Note If the instance runs MySQL 5.7 on RDS High-availability Edition, you can select one of the following encryption methods:

- SM4 Encryption
- AES_256_CBC Encryption

Use an existing custom key

- Log on to the **ApsaraDB for RDS console**.
- On the **Instances** page, find the target instance.
- Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
- In the left-side navigation pane, click **Data Security**.
- Click the **TDE** tab. Then, turn on **TDE Status**.

- In the dialog box that appears, select **Use an Existing Custom Key** and click **OK**.

Note If you do not have a custom key, click **create a key** to go to the KMS console and import the key materials. Use the following path to navigate the guide: *Key Management Service > User Guide > Create a key*.

Encrypt a table

Log on to the target database and execute the following statement to encrypt a table:

- MySQL 5.6

```
alter table <tablename> engine=innodb,block_format=encrypted;
```

- MySQL 5.7

```
alter table <tablename> engine=innodb,encryption='Y';
```

Decrypt a table

Execute the following statement to decrypt a table that is encrypted with TDE:

- MySQL 5.6

```
alter table <tablename> engine=innodb,block_format=default;
```

- MySQL 5.7

```
alter table <tablename> engine=innodb,encryption='N';
```

FAQ

- Q: Can common database tools such as Navicat be used after TDE is enabled?

A: Yes, common database tools such as Navicat can be used after TDE is enabled.

- Q: Why is data still in plaintext after it is encrypted?

A: Data is stored in ciphertext. However, when you query it, the data is decrypted and then loaded into memory in plaintext. After TDE is enabled, data is not leaked even if backup files are disclosed. The backup files are encrypted and cannot be used to restore data to your computer. If you want to restore data to your computer, you must first [decrypt data](#).

9.10.4. SQL audit

You can use the SQL audit feature to audit SQL executions and check the details. SQL audit does not affect instance performance.

Context

 **Note** You cannot view the logs that are generated before you enable SQL audit.

You can view the incremental data of your ApsaraDB RDS for MySQL instance in SQL audit logs or binlogs. However, these two methods differ in the following aspects:

- SQL audit logs are similar to audit logs in MySQL and record all DML and DDL operations by using network protocol analysis. SQL audit does not parse the actual parameter values. Therefore, a small amount of information may be lost if a large number of SQL statements are executed to query data. The incremental data obtained using this method may be inaccurate.
- Binlogs record all add, delete, and modify operations and the incremental data used for data restoration. Binlogs are temporarily stored in your ApsaraDB for RDS instance after they are generated. The system transfers full binlog files to OSS on a regular basis. OSS then stores the files for seven days. However, a binlog file cannot be transferred if data is being written to it. Such binlog files will fail to be uploaded to OSS after you click **Upload Binlogs** on the **Backup and Restoration** page. Binlogs are not generated in real time, but you can obtain accurate incremental data from them.

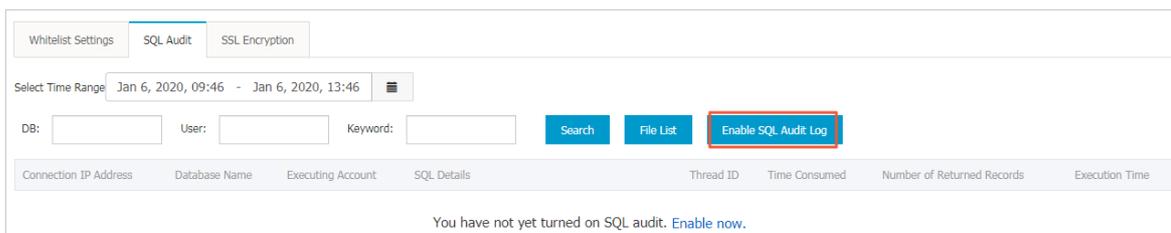

Precautions

- SQL audit is disabled by default. SQL audit does not affect instance performance.
- SQL audit logs are retained for 30 days.

- Log files exported from SQL audit are retained for two days. The system clears files that are retained for more than two days.

Enable SQL audit

1. Log on to the [ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Data Security**.
5. Click the **SQL Audit** tab.

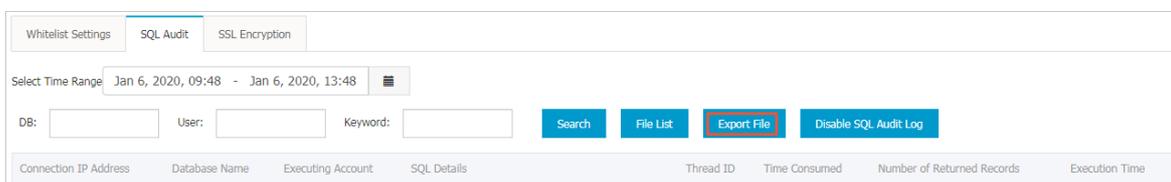

6. Click **Enable SQL Audit**.
7. In the message that appears, click **Confirm**.
After SQL audit is enabled, you can query SQL information based on conditions such as the time range, database, user, and keyword.

Disable SQL audit

Note If SQL audit is disabled, all SQL audit logs are deleted. We recommend that you export and store audit logs locally before you disable SQL audit.

You can disable SQL audit to avoid charges when you do not need it. To disable SQL audit, perform the following operations:

1. Log on to the [ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Data Security**.
5. Click the **SQL Audit** tab.

6. Click **Export File** to export and store the SQL audit content to your computer.
7. After the file is exported, click **Disable SQL Audit**.
8. In the message that appears, click **Confirm**.

9.11. Service availability

9.11.1. Automatically or manually switch over services between primary and secondary instances

This topic describes how to automatically or manually switch over services between primary and secondary instances. After the switchover, the original primary instance becomes a secondary instance.

Context

- **Automatic switchover:** the default switchover mode. If the primary instance experiences a fault, your RDS services are automatically switched over to the secondary instance.

 **Note** You can click **Switch Primary/Secondary Instance** on the **Service Availability** page of an ApsaraDB RDS for MySQL instance with standard SSDs or enhanced SSDs to disable automatic switchover. This ensures you to troubleshoot errors of the primary instance.

- **Manual switchover:** allows you to manually switch over services between primary and secondary instances.

 **Note** Data is synchronized between the primary and secondary instances in real time. You can only connect to the primary instance. The secondary instance serves only as a backup and does not allow external access.

Precautions

- Services may be disconnected during a switchover. Make sure that your applications are configured with automatic reconnection policies to avoid service disruptions.
- If the primary instance is attached with read-only instances, data on the read-only RDS instances shows a latency of a few minutes after a switchover. This is because it takes time to re-establish replication connections and synchronize incremental data.

Manually switch over services between primary and secondary instances

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Service Availability**.
5. Click **Switch Primary/Secondary Instance** on the right side of the page.

 **Note** Services may be disconnected once or twice during the switchover. Make sure that your applications are configured with automatic reconnection policies to avoid service disruptions.

6. In the message that appears, click **OK**.

FAQ

Q: Can I connect to secondary instances?

A: No, you cannot connect to secondary instances. You can only connect to primary instances. Secondary instances only serve as a backup and do not allow external access.

9.11.2. Change the data replication mode

You can set the data replication mode between primary and secondary ApsaraDB for RDS instances to improve database availability.

Prerequisites

The RDS instance runs one of the following MySQL versions and RDS editions:

- MySQL 5.6
- MySQL 5.7 on RDS High-availability Edition (with local SSDs)

Data replication mode

- Semi-synchronous

After an update that is initiated by your application is completed on the primary instance, the log is synchronized to all of the secondary instances. The transaction that is used to perform the update is considered committed after the secondary instances receive the log. Your database system does not need to wait for the log to be replayed.

If the secondary instances are unavailable or a network exception occurs between the primary and secondary instances, semi-synchronous replication will degrade to the Asynchronous mode.

- Asynchronous

When your application initiates a request to add, delete, or modify data, the primary instance responds to your application immediately after it completes the operation. At the same time, the primary instance starts to asynchronously replicate data to its secondary instances. During asynchronous data replication, the unavailability of secondary instances does not affect the operations on the primary instance. Data remains consistent even if the primary instance is unavailable.

Procedure

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Service Availability**.
5. Click **Change Data Replication Mode** on the right side of the page.
6. In the dialog box that appears, select a data replication mode and click **OK**.

FAQ

Q: Which data replication mode is recommended?

A: You can select a data replication mode based on your business requirements. If you require quick responses, we recommend that you select the asynchronous mode. In other scenarios, you can select the semi-synchronous mode.

9.12. Database backup and restoration

9.12.1. Automatic backup

Automatic backup supports full physical backups. ApsaraDB for RDS automatically backs up data based on pre-configured policies. This topic describes how to configure a policy for automatic backup.

Procedure

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Backup and Restoration**.
5. Click the **Backup Settings** tab.
6. Click **Edit**.

Note To ensure data security, the system compares the new backup cycle and time with the original settings, and selects the most recent time point to back up the data. Therefore, the next backup may still be performed based on the original backup cycle and time. For example, if the backup time is set to 19:00-20:00 every Wednesday and you modify the time to 19:00-20:00 every Thursday before 19:00 this Wednesday, the system will still back up data during 19:00-20:00 this Wednesday.

The screenshot shows a 'Backup Settings' dialog box with the following configuration:

- Data Retention Period:** 7 Days
- Backup Cycle:** Tuesday, Thursday, Saturday (checked)
- Backup Time:** 15:00-16:00
- Log Backup:** Enable (selected)
- Log Retention Period:** 7 Days

7. Configure the following parameters.

Parameter	Description
Data Retention Period	The number of days for which data backup files are retained. Valid values: 7 to 730. Default value: 7.
Backup Cycle	The backup cycle. You can select one or multiple days within a week.
Backup Time	Any period of time within a day. Unit: hours. We recommend that you back up data during off-peak hours.
Log Backup	Specifies whether to enable log backup. <div style="border: 1px solid #ccc; background-color: #e6f2ff; padding: 5px;"> <p>Notice If you disable log backup, all the log backup files are deleted, and you cannot restore data to a saved point in time.</p> </div>
Log Retention Period	The number of days for which log backup files are retained. Valid values: 7 to 730. Default value: 7.

8. After you configure the preceding parameters, click **OK**.

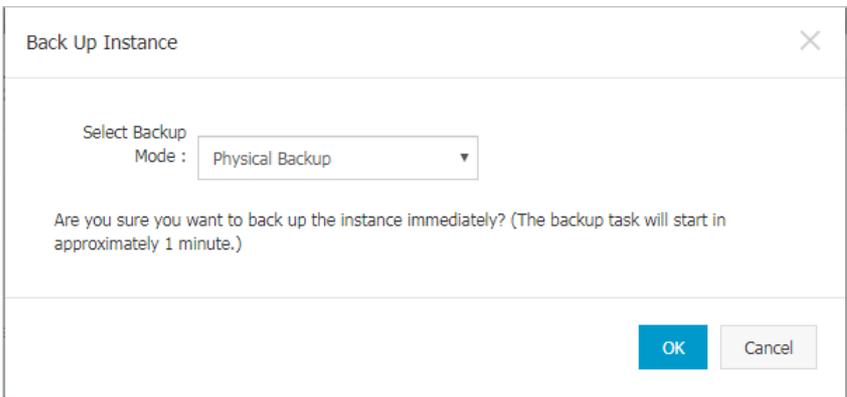

9.12.2. Manual backup

Manual backup supports both full physical backups and full logical backups. This topic describes how to manually back up ApsaraDB for RDS data.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the Instances page, find the target instance.

3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. Click **Back Up Instance** in the upper-right corner.

5. Set the backup mode and backup policy, and click **OK**.

Note Two backup methods are available:

- Physical backup: directly backs up all files in all databases.
- Logical backup: extracts data from the databases through SQL and backs up the data in the text format. If you select logical backup, you must select a backup policy:
 - Instance Backup: backs up the entire instance.
 - Single-Database Backup: backs up one of the databases in the instance.

9.12.3. Download data and log backup files

This topic describes how to download unencrypted data and log backup files in the ApsaraDB for RDS console to archive the files and restore data to an on-premises database.

Limits

Database engine	Download of data backup files	Download of binary log files
MySQL	<ul style="list-style-type: none"> • MySQL 5.6 and MySQL 5.7 with local SSDs (in the RDS High-availability or Enterprise Editions) support the download of full physical or logical data backup files. • MySQL 5.7 with standard SSDs or enhanced SSDs does not support snapshot download. 	All MySQL versions support the download of log files.

Procedure

1. **Log on to the ApsaraDB for RDS console.**
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Backup and Restoration**.
5. Click the **Data Backup** or **Log Backup** tab.
 - To download data backup files, click the **Data Backup** tab.
 - To download log backup files, click the **Log Backup** tab.

6. Select a time range to which you want to restore the instance.
7. Find the data backup or log file you want to download, and click **Download** in the **Actions** column.

Note

- If the **Download** button is unavailable, see the **Limits** section in this topic.
- If you want to use a data backup file to restore data, select the backup file that is the closest to the time for restoration.
- If you want to use a log file to restore data to an on-premises database, note the following items:
 - The Instance ID on the Log Backup tab is the same as the Instance No. on the Data Backup tab.
 - The start time of the file is later than the start time of the specified time range. It must also be earlier than the point in time to which you want to restore data.

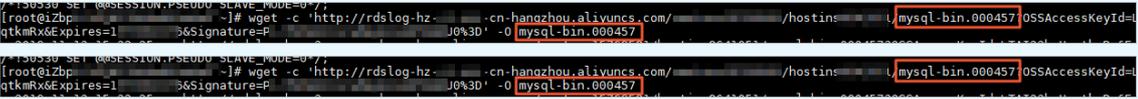

8. In the download message that appears, click **Download**.

Download method	Description
Download	Use a browser to download the backup file.
Copy Internal Endpoint	Copy the internal endpoint to download the file. If your ECS and RDS instances reside within the same region, you can log on to the ECS instance and use the internal endpoint to download the file. This method is fast and secure.
Copy Public Endpoint	Copy the public endpoint to download the file. If you want to use other tools to download the file, use the public endpoint.

Note If you use a Linux operating system, you can run the following command to download the file:

```
wget -c '<Public endpoint of the backup file, which is the download URL>' -O <File name>
```

- The **-c** option enables resumable download.
- The **-O** option saves the downloaded file by using a specified name. We recommend that you use the file name contained in the download URL.
- If the URL contains more than one parameter, enclose the download URL in a pair of single quotation marks (').

9.12.4. Upload binlogs

Context

This topic describes how to upload binary log files to OSS.

Procedure

1. **Log on to the ApsaraDB for RDS console.**
2. On the **Instances** page, find the target instance.

3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Backup and Restoration** to go to the **Backup and Restoration** page.
5. In the upper-right corner of the page, click **Upload Binlogs**.
6. In the message that appears, click **Confirm**.

9.12.5. Restore data to a new instance (formerly known as cloning an instance)

A cloned instance is a new instance with the same content as the primary instance, including data and settings. This feature allows you to restore data of the primary instance or create multiple instances that are the same as the primary instance.

Prerequisites

The following requirements must be met:

- The primary instance is in the running state.
- The primary instance does not have an ongoing migration task.
- Data backup and log backup are enabled.
- The primary instance has at least one completed backup set before you clone the instance by backup set.

Context

You can specify a backup set or any point in time within the backup retention period to clone an instance.

Note

- A cloned instance copies only the content of the primary instance, but not the content of read-only instances. The copied content includes database information, account information, and instance settings such as whitelist settings, backup settings, parameter settings, and alert threshold settings.
- The database engine of a cloned instance must be the same as that of the primary instance. Other settings can be different, such as the instance edition, zone, network type, instance type, and storage space. If you want to clone an instance to restore the data of a primary instance, we recommend that you select an instance type that has higher specifications and more storage space than those of the primary instance to speed up the data restoration process.
- The account type of a cloned instance must be the same as that of the primary instance. The account password of the cloned instance can be changed.

Procedure

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Backup and Restoration**.
5. In the backup list, find the target backup and click **Restore** in the **Actions** column.
6. In the dialog box that appears, select **Restore Database** and click **OK**.
7. On the **Restore RDS Instance** page, configure the following parameters.

Category	Parameter	Description
Region	Region	The region where the ApsaraDB for RDS instance resides.

Category	Parameter	Description
Database Restoration	Restore Mode	The data restore mode of the primary instance. Valid values: <ul style="list-style-type: none"> By Time By Backup Set
	Time	The point in time to which you want to restore the database. <p>Note When Restore Mode is set to By Time, you must specify this parameter.</p>
	Backup Set	The backup set for restoration. <p>Note When Restore Mode is set to By Backup Set, you must specify this parameter.</p>
Specifications	Instance Name	The name of the cloned instance.
	Database Engine	The engine of the database, which cannot be modified.
	Engine Version	The version of the database engine, which cannot be modified.
	Edition	The edition of the database. The actual values are displayed in the console.
	Storage Type	The storage type of the database. The actual values are displayed in the console.
	Instance Type	The type of the cloned instance. <p>Note We recommend that you select an instance type and storage space that are higher than those of the primary instance to speed up the data restoration process.</p>
	Storage	The storage space of the instance, including the space for data, system files, binary log files, and transaction files. The available storage capacity is displayed in the console. <p>Note RDS instances with local SSDs in the dedicated instance family occupy exclusive resources. The storage capacities are based on instance types.</p>

Category	Parameter	Description
Network Type	Network Type	<p>The network type of the instance. RDS instances support the following network types:</p> <ul style="list-style-type: none"> ◦ <i>Classic Network</i>: Cloud services on the classic network are not isolated. Unauthorized access to a cloud service is blocked only by the security group or whitelist policy of the service. ◦ <i>VPC</i>: A Virtual Private Cloud (VPC) helps you to build an isolated network environment on Alibaba Cloud. You can customize route tables, IP address ranges, and gateways within a VPC. We recommend that you select VPC for improved security.
	VPC	<p>Select a VPC.</p> <p> Note When Network Type is set to VPC, you must specify this parameter.</p>
	VSwitch	<p>Select a VSwitch.</p> <p> Note When Network Type is set to VPC, you must specify this parameter.</p>

8. After you configure the preceding parameters, click **Submit**.

9.13. CloudDBA

9.13.1. Introduction to CloudDBA

CloudDBA is a cloud service for database self-detection, self-repair, self-optimization, self-maintenance, and self-security ensuring based on machine learning and expert experience. CloudDBA helps you ensure stable, secure, and efficient databases without worrying about the management complexity and services failures caused by manual operations.

Features

In ApsaraDB RDS for MySQL, CloudDBA provides the following features:

- **Diagnostics**
You can use this feature to diagnose your instance and visualize diagnostic results.
- **Instance sessions**
You can view sessions, collect session statistics, analyze SQL statements, and optimize the execution of SQL statements.
- **Real-time monitoring**
You can view the real-time information of your instance, such as the queries per second (QPS), transactions per second (TPS), number of connections, and network traffic.
- **Storage analysis**
You can view the space utilization, trends, exceptions, tablespaces, and data spaces.
- **Deadlock analysis**
You can view and analyze the last deadlock in a database.
- **Dashboard**

You can view and compare performance trends, customize monitoring dashboards, check exceptions, and view instance topologies.

- **Slow query logs**

You can view the trends and statistics of slow queries.

- **Diagnostic reports**

You can use this feature to generate diagnostics reports or view automatically generated reports about instance health, alerts, and slow query logs.

9.13.2. Diagnostics

In ApsaraDB RDS for MySQL, CloudDBA provides the diagnostics feature. This feature diagnoses your ApsaraDB RDS for MySQL instance and visualizes the results.

Open the Diagnostics page

1. **Log on to the ApsaraDB for RDS console.**
2. On the Instances page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, choose **CloudDBA > One-click diagnostics**.
5. Click the **Diagnostics** tab.

 **Note** Use the following path to navigate the guide: *Database Autonomy Service > User Guide > Diagnostics*.

9.13.3. Instance sessions

In ApsaraDB RDS for MySQL, CloudDBA provides the instance sessions feature. This feature allows you to view and manage sessions of an instance.

Open the Instance Sessions page

1. **Log on to the ApsaraDB for RDS console.**
2. On the Instances page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, choose **CloudDBA > One-click diagnostics**.
5. Click the **Instance Sessions** tab.

 **Note** Use the following path to navigate the guide: *Database Autonomy Service > User Guide > Instance sessions*.

9.13.4. Real-time monitoring

In ApsaraDB RDS for MySQL, CloudDBA provides the real-time monitoring feature. This feature allows you to view the real-time performance of your ApsaraDB RDS for MySQL instance.

Open the Real-time Monitoring page

1. **Log on to the ApsaraDB for RDS console.**
2. On the Instances page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.

4. In the left-side navigation pane, choose **CloudDBA > One-click diagnostics**.
5. Click the **Real-time Monitoring** tab.

 **Note** Use the following path to navigate the guide: *Database Autonomy Service > User Guide > Real-time monitoring*.

9.13.5. Storage analysis

In ApsaraDB RDS for MySQL, CloudDBA provides the storage analysis feature. This feature allows you to check and resolve storage exceptions in a timely manner to ensure database stability.

Context

You can use the storage analysis feature of CloudDBA to view the disk space usage of your RDS instance and the number of remaining days when disk space is available. It also provides information about the space usage, fragmentation, and exception diagnostic results of a table.

Open the Storage Analysis page

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, choose **CloudDBA > One-click diagnostics**.
5. Click the **Storage Analysis** tab.

 **Note** Use the following path to navigate the guide: *Database Autonomy Service > User Guide > Storage analysis*.

9.13.6. Deadlock analysis

In ApsaraDB RDS for MySQL, CloudDBA provides the deadlock analysis feature. This feature allows you to view and analyze the last deadlock in a database.

Open the Deadlock Analysis page

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, choose **CloudDBA > One-click diagnostics**.
5. Click the **Deadlock Analysis** tab.

 **Note** Use the following path to navigate the guide: *Database Autonomy Service > User Guide > Deadlock analysis*.

9.13.7. Dashboard

In ApsaraDB RDS for MySQL, CloudDBA provides the dashboard feature. This feature allows you to view performance trends in specific ranges, compare performance trends, and customize charts to view performance trends.

Open the Dashboard page

1. [Log on to the ApsaraDB for RDS console](#).

2. On the Instances page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, choose **CloudDBA > Dashboard**.

 **Note** Use the following path to navigate the guide: *Database Autonomy Service > User Guide > Dashboard*.

9.13.8. Slow query logs

In ApsaraDB RDS for MySQL, CloudDBA provides the slow query logs feature. This feature allows you to view the trends and execution details of slow queries and obtain optimization suggestions for your ApsaraDB RDS for MySQL instance.

Open the Slow Query Logs page

1. **Log on to the ApsaraDB for RDS console.**
2. On the Instances page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, choose **CloudDBA > Slow Query Logs**.

 **Note** Use the following path to navigate the guide: *Database Autonomy Service > User Guide > Slow query logs*.

9.13.9. Diagnostic reports

In ApsaraDB RDS for MySQL, CloudDBA provides the diagnostic reports feature. This feature allows you to create and view diagnostic reports.

Open the Report page

1. **Log on to the ApsaraDB for RDS console.**
2. On the Instances page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, choose **CloudDBA > Report**.

 **Note** Use the following path to navigate the guide: *Database Autonomy Service > User Guide > Diagnostic reports*.

9.14. Logs

All ApsaraDB for RDS instances support log management. You can query details about the error logs and slow query logs of an ApsaraDB for RDS instance through the ApsaraDB for RDS console. The logs help you locate faults.

Procedure

1. **Log on to the ApsaraDB for RDS console.**
2. On the Instances page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.

- In the left-side navigation pane, click **Logs**.
- On the **Logs** page that appears, click the **Error Logs**, **Slow Query Logs**, **Slow Query Log Summary**, or **Primary/Secondary Switching Logs** tab, select a time range, and click **Search**.

Log type	Description
Error Logs	Records database running errors that occurred within the last month.
Slow Log Details	Records SQL statements within the last month that took longer than one second to execute. Duplicated SQL statements are removed. <div style="border: 1px solid #add8e6; padding: 5px; background-color: #e6f2ff;"> <p> Note Slow query logs in the ApsaraDB for RDS console are updated once every minute. However, you can query real-time slow query logs from the <code>mysql.slow_log</code> table.</p> </div>
Slow Query Log Summary	Records and analyzes SQL statements within the last month that took longer than one second to execute. Analysis reports of slow query logs are provided.
Primary/Secondary Switching Logs	Records the primary/secondary instance switching logs. This feature is suitable for ApsaraDB RDS for MySQL High-availability Edition instances.

9.15. Use mysqldump to migrate MySQL data

This topic describes how to use `mysqldump` to migrate local data to RDS for MySQL.

Prerequisites

An ECS instance has been activated.

Context

`mysqldump` is easy to use but has long downtimes. The tool is suitable for scenarios where the amount of data is small or long downtimes are allowed.

RDS for MySQL is fully compatible with the native database service. The procedure to migrate the original database to an RDS for MySQL instance is similar to that of migrating data from one MySQL server to another.

Before you migrate data, create a migration account in the local database, and grant the read and write permissions on the database to the migration account.

Procedure

- Run the following command to create a migration account in the local database: `CREATE USER 'username'@'host' IDENTIFIED BY 'password';`

Parameter description:

- `username`: specifies the name of the account to be created.
- `host`: specifies the database host to which the account logs on. As a local user, you can use `localhost` to log on to the database. To enable the account to log on to any host, you can use wildcard `%`.
- `password`: specifies the password that is used to log on to the account.

The following example creates an account named William with password Changme123, which is allowed to log on to the local database from any host.

```
CREATE USER 'William'@'%' IDENTIFIED BY 'Changme123';
```

- Run the following command to authorize the migration account of the local database: `GRANT SELECT ON database.tablename TO 'username'@'host' WITH GRANT OPTION; GRANT REPLICATION SLAVE ON database.tablename TO 'username'@'host' WITH GRANT OPTION; GRANT REPLICATION SLAVE ON database.tablename TO 'us`

```
username'@'host' WITH GRANT OPTION;
```

Parameter description:

- **privileges:** specifies the operation permissions of the account, such as SELECT, INSERT, and UPDATE. To grant all permissions to the account, use ALL.
- **dbname:** specifies the database name. To grant all database permissions to the account, use wildcard *.
- **tablename:** specifies the table name. To grant all table permissions to the account, use wildcard *.
- **username:** specifies the name of the account to be granted permissions.
- **host:** specifies the host, from which the account is authorized to log on to the database. As a local user, you can use localhost to log on to the database. To log on from any host, you can use wildcard %.
- **WITH GRANT OPTION:** specifies an optional parameter that enables the account to use the GRANT command.

In the following command, the account named William is granted all database and table permissions, and allowed to log on to the local database from any host:

```
GRANT ALL ON *. * TO 'William'@'%';
```

3. Use the data export tool of mysqldump to export data from the database as data files.

 **Notice** Do not update data during the data export. This step exports data only. It does not export stored procedures, triggers, or functions.

```
mysqldump -h localhost -u userName -p --opt --default-character-set=utf8 --hex-blob dbName --skip-triggers > /tmp/dbName.sql
```

Parameter description:

- **localhost:** specifies the IP address of the local database server.
- **userName:** specifies the migration account of the local database.
- **dbName:** specifies the name of the database to be migrated.
- **/tmp/dbName.sql:** specifies the name of the backup file.

4. Use mysqldump to export stored procedures, triggers, and functions.

 **Notice** Skip this step if no stored procedures, triggers, or functions are used in the database. When you export stored procedures, triggers, or functions, you must remove the definer to be compatible with RDS.

```
mysqldump -h localhost -u userName -p --opt --default-character-set=utf8 --hex-blob dbName -R | sed -e 's/DEFINER[ ]*=[ ]*[^\]*\*/\*/' > /tmp/triggerProcedure.sql
```

Parameter description:

- **localhost:** specifies the IP address of the local database server.
- **userName:** specifies the migration account of the local database.
- **dbName:** specifies the name of the database to be migrated.
- **/tmp/triggerProcedure.sql:** specifies the name of the backup file.

5. Upload the data files and stored procedure files to ECS. The example in this topic describes how to upload files to the following path:

```
/tmp/dbName.sql
```

```
/tmp/triggerProcedure.sql
```

6. Log on to ECS and import the data files and stored procedure files to the target RDS for MySQL instance.

```
mysql -h intranet4example.mysql.rds.aliyuncs.com -u userName -p dbName < /tmp/dbName.sql
```

```
mysql -h intranet4example.mysql.rds.aliyuncs.com -u userName -p dbName < /tmp/triggerProcedure.sql
```

Parameter description:

- `intranet4example.mysql.rds.aliyuncs.com`: specifies the IP address that is used to connect to the RDS for MySQL instance. In this example, an intranet IP address is used.
- `userName`: specifies the migration account of the RDS for MySQL database.
- `dbName`: specifies the name of the database to be imported.
- `/tmp/dbName.sql`: specifies the name of the data file to be imported.
- `/tmp/triggerProcedure.sql`: specifies the name of the stored procedure file to be imported.

10. ApsaraDB RDS for SQL Server

10.1. What is ApsaraDB for RDS?

ApsaraDB for RDS is a stable, reliable, and scalable online database service. Based on the distributed file system and high-performance storage of Alibaba Cloud, ApsaraDB for RDS allows you to easily perform database operations and maintenance with its set of solutions for disaster recovery, backup, restoration, monitoring, and migration.

ApsaraDB RDS for SQL Server provides strong support for a variety of enterprise applications under the high-availability architecture, is capable of restoring data to any point in time.

ApsaraDB RDS for SQL Server provides basic features such as whitelist configuration, backup and restoration, transparent data encryption, data migration, and management for instances, accounts, and databases.

10.2. Log on to the ApsaraDB for RDS console

This topic describes how to log on to the ApsaraDB for RDS console.

Prerequisites

- Before logging on to the ASCM console, make sure that you have obtained the IP address or domain name of the ASCM console from the deployment personnel. The URL used to access the ASCM console is in the following format: `https://[IP address or domain name of the ASCM console]`.
- We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL used to access the ASCM console. Press the Enter key.
2. Enter your username and password.

Obtain the username and password for logging on to the console from the operations administrator.

Note When you log on to the ASCM console for the first time, you must change the password of your username as prompted. Due to security concerns, your password must meet the minimum complexity requirements: The password must be 8 to 20 characters in length and must contain at least two of the following character types: uppercase letters, lowercase letters, digits, and special characters such as exclamation points (!), at signs (@), number signs (#), dollar signs (\$), and percent signs (%).

3. Click **Login** to go to the ASCM console homepage.
4. In the top navigation bar, choose **Products > Database Services > ApsaraDB for RDS**.

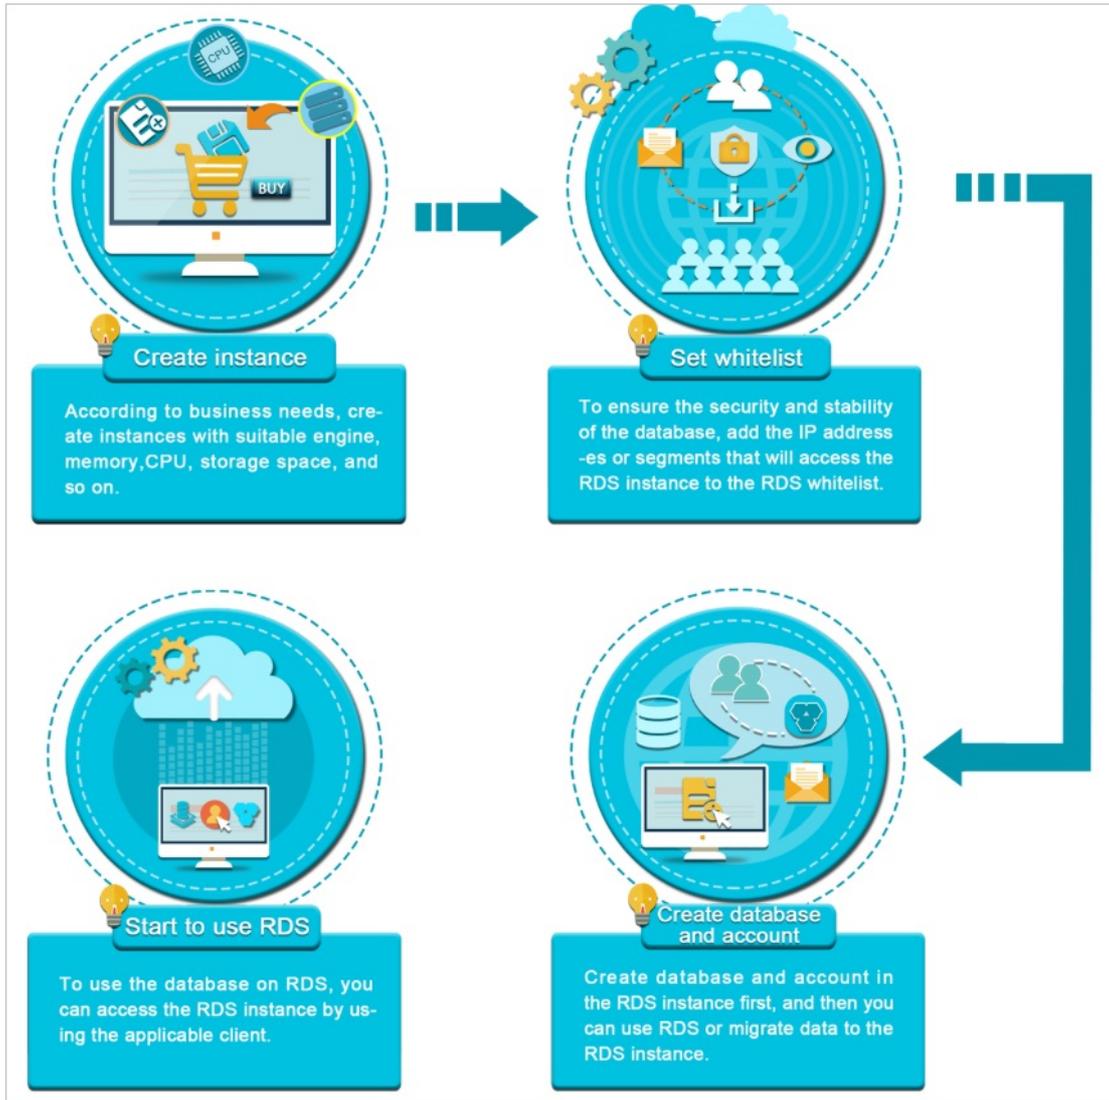

10.3. Quick Start

10.3.1. Procedure

ApsaraDB for RDS quick start covers the following topics: creating an RDS instance, configuring a whitelist, creating a database, creating an account, and connecting to the instance.

You must complete several operations after instance creation to make it ready for use, as shown in the following figure.

Quick start flowchart

10.3.2. Create an instance

This topic describes how to create an instance in the ApsaraDB for RDS console.

Prerequisites

Before you create an RDS instance, you must apply for an Apsara Stack account.

Procedure

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the Instances page, click **Create Instance** in the upper-right corner.
3. Configure the following parameters.

Section	Parameter	Description
Basic Settings	Organization	The organization to which the instance belongs.
	Resource Set	The resource set to which the instance belongs.

Section	Parameter	Description
Region	Region	The region where the instance resides. Services in different regions are not interconnected over the internal network. After the instance is created, the region cannot be changed.
	Zone	The ID of the zone where the instance resides.
Specifications	Instance Name	<p>The name of the instance.</p> <ul style="list-style-type: none"> ◦ The name must be 2 to 64 characters in length. ◦ The name must start with a letter. ◦ The name can contain special characters. Special characters include underscores (_), hyphens (-), and colons (:). ◦ The name cannot start with http:// or https://.
	Database Engine	The engine of the database, which varies with regions. The available database engines are displayed on the Create ApsaraDB for RDS Instance page.
	Engine Version	The version of the database engine.
	Edition	The edition of the instance. Select one from the drop-down list.
	Instance Type	The type of the instance. Memory size determines the maximum number of connections and IOPS. The actual values are displayed in the console. For more information, see Product Introduction > Instance type in the <i>ApsaraDB for RDS documentation</i> .
	Storage	The storage capacity of the instance, including the space to store data, system files, binary log files, and transaction files.
Network Type	Network Type	<p>The network type of the instance. RDS instances support the following network types:</p> <ul style="list-style-type: none"> ◦ <i>Classic Network</i>: Cloud services on a classic network are not isolated from each other. Unauthorized access to a cloud service is blocked only by the security group or whitelist policy of the service. ◦ <i>VPC</i>: A virtual private cloud (VPC) helps you build an isolated network environment on Apsara Stack. You can customize route tables, CIDR blocks, and gateways in a VPC. We recommend that you select VPC for improved security. <div style="background-color: #e6f2ff; padding: 5px; margin-top: 10px;"> <p> Note After you select a VPC, you must specify a VPC and a VSwitch.</p> </div>
	IP Whitelist	You can add IP addresses to allow them to connect to the ApsaraDB for RDS instance.
Access Mode	<p>The access mode of the instance, which is automatically set to Standard.</p> <div style="background-color: #e6f2ff; padding: 5px; margin-top: 10px;"> <p> Note Standard: RDS uses SLB to eliminate the impact of instance high-availability switching on the application layer. This mode reduces the response time, but slightly increases the probability of network interruptions and disables SQL interception.</p> </div>	

4. After you configure the preceding parameters, click **Submit**.

10.3.3. Configure a whitelist

To ensure database security and reliability, you must modify the whitelist of an ApsaraDB for RDS instance before you enable the instance. You must add the IP addresses or CIDR blocks that are used for database access to the whitelist.

Context

The whitelist improves the access security of your ApsaraDB for RDS instance. We recommend that you maintain the whitelist on a regular basis. The whitelist configuration process does not affect the normal operations of the ApsaraDB for RDS instance.

Procedure

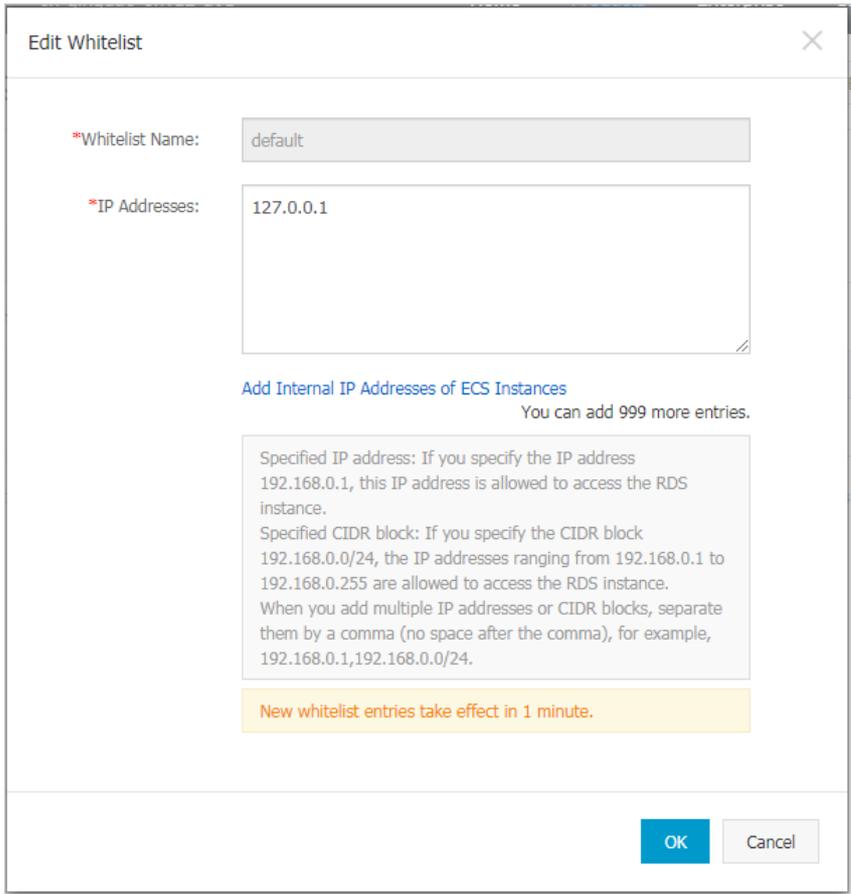

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Data Security**.
5. On the **Whitelist Settings** tab, click **Edit** corresponding to the default whitelist.

Note

- If you want to connect an ECS instance to an ApsaraDB for RDS instance by using an internal endpoint, you must make sure that the two instances are in the same region and have the same network type. Otherwise, the connection fails.
- You can click **Create Whitelist** to create a new whitelist.

6. In the **Edit Whitelist** dialog box, enter the IP addresses or CIDR blocks used to access the instance, and then click **OK**.
 - If you enter the CIDR block 10.10.10.0/24 in the **IP Addresses** field, all IP addresses in the 10.10.10.X format are granted access to your RDS instance.
 - If you enter more than one IP address or CIDR block, you must separate them with commas (,). Do not add spaces before or after the commas. Example: 192.168.0.1,172.16.213.9.
 - After you click **Add Internal IP Addresses of ECS Instances**, the IP addresses of all the ECS instances under your Apsara Stack account are displayed. You can select the required IP addresses and add them to the whitelist.

 **Note** If you add a new IP address or CIDR block to the default whitelist, the default address 127.0.0.1 is automatically deleted.

10.3.4. Connect to an instance

This topic describes how to use Data Management (DMS) to connect to an ApsaraDB for RDS instance.

Procedure

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the upper-right corner of the page, click **Log On to DB** to go to the RDS Database Logon page.
5. On the logon page, check the endpoint and port number. If the information is correct, enter the database account and password.

Note For more information about how to create an account, refer to the following topic:

- [Create an account for an ApsaraDB for RDS instance running SQL Server 2016 or 2012](#)

6. Click **Login**.

Note

- If you want the web browser to remember the password, select **Remember Password** before you click **Login**.
- If the system prompts you to add the CIDR block of the DMS server to an IP address whitelist of your RDS instance, click **Configure Whitelist**. For more information about how to manually configure a whitelist, see [Configure a whitelist](#).

10.3.5. Create an account

This topic describes how to create an account.

Prerequisites

The instance is in the **Running** state.

Procedure

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Accounts**.
5. On the right side of the page, click **Create Account**.
6. Enter the information of the account to be created.

Parameter	Description
Database Account	Enter the name of the account. The name must be 2 to 16 characters in length and can contain lowercase letters, digits, and underscores (_). It must start with a letter and end with a letter or digit.
Account Type	<ul style="list-style-type: none"> ◦ Privileged Account: You can select the Privileged Account option only if this is the first time that you create an account for your RDS instance. Each RDS instance can have only one privileged account. The privileged account of an RDS instance cannot be deleted. ◦ Standard Account: You can select the Standard Account option only after a privileged account is created for your RDS instance. Each RDS instance can have more than one standard account. You must manually grant the permissions on databases to each standard account.
Authorized Databases	<p>Select the authorized databases of the account when you have selected the Standard Account type. If no databases are created, you can leave this parameter empty.</p> <p>You can follow these steps to grant the permissions on more than one database to the account:</p> <ol style="list-style-type: none"> i. In the Unauthorized Databases section, select the databases on which you want to grant permissions to the account. ii. Click the > icon to add the selected databases to the Authorized Databases section. iii. In the Authorized Databases section, specify the permissions that the account will gain on each authorized database. The permissions are Read/Write, Read-only, or Owner. You can also click Set All to Read/Write, Set All to Read-only, or Set All to Owner to set the permissions of the account on all authorized databases. <div style="background-color: #e1f5fe; padding: 10px; margin-top: 10px;"> <p> Note</p> <ul style="list-style-type: none"> ▪ The account is authorized to create tables, delete tables, and modify schemas in a database only when it has the Owner permission on the database. ▪ The account has permissions on all databases and does not require authorization if you have selected the Privileged Account type. </div>
Password	<p>Enter the password of the account. The password must meet the following requirements:</p> <ul style="list-style-type: none"> ◦ The password must be 8 to 32 characters in length. ◦ The password must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. ◦ Special characters include ! @ # \$ % ^ & * () _ + - =
Re-enter Password	Enter the password of the account again.
Description	Enter a description that helps identify the account. The description can be up to 256 characters in length.

7. Click **Create**.

10.3.6. Create a database

This topic describes how to create a database in an ApsaraDB RDS for SQL Server instance in the RDS console.

Procedure

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.

3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Databases**.
5. In the upper-right corner of the page, click **Create Database**.
6. Set the parameters for the database that you want to create.

Parameter	Description
Database Name	Enter the name of the database. The name must be 2 to 64 characters in length. It can contain lowercase letters, digits, underscores (_), and hyphens (-). It must start with a letter and end with a letter or digit.
Supported Character Sets	Select the character set that is supported by the database. You can also select all and then select a character set from the drop-down list that appears.
Description	Enter a description of the database to facilitate subsequent management. The description can be up to 256 characters in length.

7. Click **Create**.

10.4. Instances

10.4.1. Create an instance

This topic describes how to create an instance in the ApsaraDB for RDS console.

Prerequisites

Before you create an RDS instance, you must apply for an Apsara Stack account.

Procedure

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, click **Create Instance** in the upper-right corner.
3. Configure the following parameters.

Section	Parameter	Description
Basic Settings	Organization	The organization to which the instance belongs.
	Resource Set	The resource set to which the instance belongs.
Region	Region	The region where the instance resides. Services in different regions are not interconnected over the internal network. After the instance is created, the region cannot be changed.
	Zone	The ID of the zone where the instance resides.
	Instance Name	The name of the instance. <ul style="list-style-type: none"> ◦ The name must be 2 to 64 characters in length. ◦ The name must start with a letter. ◦ The name can contain special characters. Special characters include underscores (_), hyphens (-), and colons (:). ◦ The name cannot start with http:// or https://.

Section	Parameter	Description
Specifications	Database Engine	The engine of the database, which varies with regions. The available database engines are displayed on the Create ApsaraDB for RDS Instance page.
	Engine Version	The version of the database engine.
	Edition	The edition of the instance. Select one from the drop-down list.
	Instance Type	The type of the instance. Memory size determines the maximum number of connections and IOPS. The actual values are displayed in the console. For more information, see Product Introduction > Instance type in the <i>ApsaraDB for RDS documentation</i> .
	Storage	The storage capacity of the instance, including the space to store data, system files, binary log files, and transaction files.
Network Type	Network Type	<p>The network type of the instance. RDS instances support the following network types:</p> <ul style="list-style-type: none"> ◦ Classic Network: Cloud services on a classic network are not isolated from each other. Unauthorized access to a cloud service is blocked only by the security group or whitelist policy of the service. ◦ VPC: A virtual private cloud (VPC) helps you build an isolated network environment on Apsara Stack. You can customize route tables, CIDR blocks, and gateways in a VPC. We recommend that you select VPC for improved security. <p> Note After you select a VPC, you must specify a VPC and a VSwitch.</p>
	IP Whitelist	You can add IP addresses to allow them to connect to the ApsaraDB for RDS instance.
Access Mode	Access Mode	<p>The access mode of the instance, which is automatically set to Standard.</p> <p> Note Standard: RDS uses SLB to eliminate the impact of instance high-availability switching on the application layer. This mode reduces the response time, but slightly increases the probability of network interruptions and disables SQL interception.</p>

4. After you configure the preceding parameters, click **Submit**.

10.4.2. View basic information of an instance

This topic describes how to view the details of an ApsaraDB for RDS instance, such as basic information, internal network connection information, status, and configurations.

Procedure

1. [Log on to the ApsaraDB for RDS console](#).
2. Use one of the following methods to go to the **Basic Information** page of an instance:
 - On the **Instances** page, find the target instance and click the instance ID. The **Basic Information** page appears.
 - On the **Instances** page, find the target instance and click **Manage** in the corresponding **Actions** column. The **Basic Information** page appears.

10.4.3. Restart an instance

This topic describes how to manually restart an ApsaraDB RDS for MySQL instance. This applies if the number of connections exceeds the specified threshold or if an instance has any performance issues.

Prerequisites

The target instance is in the **Running** state.

Procedure

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. Click **Restart Instance** in the upper-right corner.

 **Note** A restart will disconnect the instance. We recommend that you make appropriate service arrangements before you restart an instance. Proceed with caution.

5. In the message that appears, click **Confirm**.

10.4.4. Change the specifications of an instance

This topic describes how to change specifications such as the instance type and storage space if they do not meet the requirements of your application. When the specification changes take effect, a 30-second network interruption may occur. Business operations that involve databases, accounts, and networks are interrupted. We recommend that you change the specifications during off-peak hours or make sure that your applications are configured with automatic reconnection policies.

Procedure

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the **Configuration Information** section, click **Change Specifications**.
5. On the **Change Specifications** page, specify **Instance Type** and **Storage**.
6. After you configure the preceding parameters, click **Submit**.

10.4.5. Set the maintenance window of an instance

This topic describes how to set the maintenance window of an ApsaraDB RDS for SQL Server instance. The backend system performs maintenance on the RDS instance during the maintenance window. This ensures the stability of the RDS instance. The default maintenance window is from 02:00 (UTC+8) to 06:00 (UTC+8). We recommend that you set the maintenance window to off-peak hours of your business to avoid impacts on your business.

Context

- To ensure the stability of the maintenance process, the instance will enter the **Maintaining Instance** state before the maintenance time. While the instance is in this state, access to data in the database and query operations such as performance monitoring are not affected. However, modification operations such as upgrade, downgrade, and restart (except for account and database management and IP address whitelist configuration) will be unavailable.
- During the maintenance window, one or two network interruptions may occur. Make sure that your

applications are configured with automatic reconnection policies.

Procedure

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the **Configuration Information** section, click **Configure** to the right of **Maintenance Window**.
5. Select a maintenance window and click **Save**.

 **Note** The maintenance window is displayed in UTC+8.

10.4.6. Switch over services between a primary RDS instance and its secondary instance

ApsaraDB for RDS provides the primary/secondary switchover feature to ensure the high availability of databases. The primary/secondary switchover is performed when the primary instance becomes unavailable. You can also manually switch your business to the secondary instance.

Prerequisites

The instance is in the **Running** state.

Context

Each ApsaraDB RDS for SQL Server instance has a secondary instance. Data between the primary and secondary instances is synchronized in real time. You can access only the primary instance. The secondary instance is a backup instance and cannot be accessed. If the primary instance cannot be accessed, your business automatically switches over to the secondary instance. After the switchover, the primary instance becomes the secondary instance.

Notice

- During a switchover, a network interruption may occur. Make sure that your applications are configured with automatic reconnection policies.
- During a switchover, a one-minute data quality protection mechanism is enabled for data synchronization. If the primary and secondary database states are incorrect or if the latency for data synchronization exceeds one minute due to SQL Server errors, the HA system does not automatically perform the primary/secondary switchover. You must determine whether to perform the switchover.
- If an instance is intermittently unavailable due to excessive mirroring event waits, the switchover is not performed. The instance will be automatically available again.

Procedure

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Service Availability**.
5. In the **Availability Information** section, click **Switch Primary/Secondary Instance**.
6. In the dialog box that appears, click **OK**.

Result

After the switchover is complete, the original primary instance becomes the secondary instance for the next primary/secondary switchover.

10.4.7. Release an instance

This topic describes how to manually release an ApsaraDB RDS for SQL Server instance.

Context

- Only instances in the running state can be manually released.
- After an instance is released, the instance data is immediately deleted. We recommend that you back up your data before you release an instance.

Procedure

1. [Log on to the ApsaraDB for RDS console](#).
2. In the Actions column corresponding to the instance you want to release, click **More** and select **Release Instance** from the drop-down list.
3. In the **Release Instance** message, click **Confirm**.

10.5. Accounts

10.5.2. Create an account

This topic describes how to create an account.

Prerequisites

The instance is in the **Running** state.

Procedure

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Accounts**.
5. On the right side of the page, click **Create Account**.
6. Enter the information of the account to be created.

Parameter	Description
Database Account	Enter the name of the account. The name must be 2 to 16 characters in length and can contain lowercase letters, digits, and underscores (_). It must start with a letter and end with a letter or digit.
Account Type	<ul style="list-style-type: none">◦ Privileged Account: You can select the Privileged Account option only if this is the first time that you create an account for your RDS instance. Each RDS instance can have only one privileged account. The privileged account of an RDS instance cannot be deleted.◦ Standard Account: You can select the Standard Account option only after a privileged account is created for your RDS instance. Each RDS instance can have more than one standard account. You must manually grant the permissions on databases to each standard account.

Parameter	Description
Authorized Databases	<p>Select the authorized databases of the account when you have selected the Standard Account type. If no databases are created, you can leave this parameter empty.</p> <p>You can follow these steps to grant the permissions on more than one database to the account:</p> <ol style="list-style-type: none"> i. In the Unauthorized Databases section, select the databases on which you want to grant permissions to the account. ii. Click the > icon to add the selected databases to the Authorized Databases section. iii. In the Authorized Databases section, specify the permissions that the account will gain on each authorized database. The permissions are Read/Write, Read-only, or Owner. You can also click Set All to Read/Write, Set All to Read-only, or Set All to Owner to set the permissions of the account on all authorized databases. <div style="background-color: #e1f5fe; padding: 10px; margin-top: 10px;"> <p> Note</p> <ul style="list-style-type: none"> ▪ The account is authorized to create tables, delete tables, and modify schemas in a database only when it has the Owner permission on the database. ▪ The account has permissions on all databases and does not require authorization if you have selected the Privileged Account type. </div>
Password	<p>Enter the password of the account. The password must meet the following requirements:</p> <ul style="list-style-type: none"> ◦ The password must be 8 to 32 characters in length. ◦ The password must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. ◦ Special characters include ! @ # \$ % ^ & * () _ + - =
Re-enter Password	Enter the password of the account again.
Description	Enter a description that helps identify the account. The description can be up to 256 characters in length.

7. Click **Create**.

10.5.3. Reset the password

You can use the ApsaraDB for RDS console to reset the password of your database account.

Prerequisites

The instance is in the **Running** state.

Procedure

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Accounts**.
5. Find the target account and click **Reset Password** in the **Actions** column.
6. In the dialog box that appears, enter and confirm the new password, and then click **OK**.

-  **Note** The password must meet the following requirements:
- The password must be 8 to 32 characters in length.
 - The password must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters.
 - Special characters include ! @ # \$ % ^ & * () _ + - =

10.6. Databases

10.6.1. Create a database

This topic describes how to create a database for an ApsaraDB RDS for SQL Server instance.

Terms

- **Instance:** a virtualized database server, on which you can create and manage more than one database.
- **Database:** a set of data that is stored together in a certain way and can be shared by multiple users. A database provides the smallest redundancy. It is a data warehouse independent of applications.
- **Character set:** a collection of letters and special characters and their encoding rules used in a database.

Prerequisites

An ApsaraDB RDS for SQL Server instance is created. For more information, see [Create an instance](#).

Procedure

For more information, see [Create a database](#).

What to do next

For more information, see [Connect to an instance](#).

10.6.2. Delete a database

This topic describes how to delete a database from an instance in the console or by using SQL statements based on the instance type.

Use the console to delete a database

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Databases**.
5. Find the target database and click **Delete** in the **Actions** column.
6. In the message that appears, click **Confirm**.

Execute an SQL statement to delete a database

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the upper-right corner of the page, click **Log On to DB** to go to the RDS Database Logon page.
5. On the **Data Management (DMS)** logon page that appears, check the endpoint and port number displayed

on the page. If the information is correct, enter the database account and password in the fields.

-  **Note** For more information about how to create an account, see
- [Create an account for an ApsaraDB for RDS instance running SQL Server 2016 or 2012.](#)

6. Click **Login**.

-  **Note**
- If you want the browser to remember the password, select **Remember your password** and click **Login**.
 - If the system prompts you to add the Classless Inter-Domain Routing (CIDR) block of the DMS server to an IP address whitelist of the RDS instance, click **Configure Whitelist**. For more information about how to manually configure the whitelist, see [Configure a whitelist](#).

7. In the top navigation bar, choose **SQL Operations > SQL Window**.

8. Enter the following statement and click **execute** to delete the database.

```
drop database <database name>;
```

-  **Note** For high-availability instances of ApsaraDB RDS for SQL Server 2012 and later, you can also use the following stored procedure. This stored procedure deletes the specified database, removes the associated image, and kills connections to the database.

```
EXEC sp_rds_drop_database 'database name'
```

10.6.3. Change the character set collation and the time zone of system databases

This topic describes how to change the character set collation and the time zone of system databases. System databases include master, msdb, tempdb, and model.

Prerequisites

- The instance runs ApsaraDB RDS for SQL Server 2012 on Standard Edition.
- No database other than system databases exists in the instance.

-  **Note** If you have just deleted databases from the instance, the deletion task may be pending in the secondary instance. Before you change the character set collation and the time zone, make sure that neither the primary instance nor the secondary instance contains databases.

Precautions

- The default character set collation is Chinese_PRC_CI_AS.
- The default time zone is China Standard Time.
- You can view the available character set collations and time zones in the console.
- The instance is in the unavailable state during the change process. It takes about one minute to change the time zone, and 2 to 10 minutes to change the character set collation.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the Instances page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Databases**.
5. On the Databases page, click **Change Character Set Collation and Time Zone**.

 **Note** If you fail to find this button on the page, make sure that requirements in **Prerequisites** are met.

6. In the dialog box that appears, select a **Time Zone**, **Character Set Collation**, or both of them, and click **OK**.

UTC offsets of time zones

Time zone	UTC offset	Description
Afghanistan Standard Time	(UTC+04:30)	Kabul

10.7. Database connection

10.7.1. Change the endpoint and port number of an instance

This topic describes how to view and change the endpoint and port number of an instance.

View the endpoint and port number

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Connection**.
You can view the **Internal Endpoint** and **Internal Port** of the instance in the **Database Connection** section.

Change the endpoint and port number

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Connection**.
5. In the upper-right corner of the **Database Connection** section, click **Change Endpoint**.
6. In the dialog box that appears, set **Connection Type**, **Endpoint**, and **Port**, and click **OK**.

Note

- The prefix of the endpoint must be 8 to 64 characters in length and can contain letters, digits, and hyphens (-). It must start with a lowercase letter.
- The port number must be in the range of 1000 to 65534.

10.7.2. Connect to an instance

This topic describes how to use Data Management (DMS) to connect to an ApsaraDB for RDS instance.

Procedure

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the upper-right corner of the page, click **Log On to DB** to go to the RDS Database Logon page.
5. On the logon page, check the endpoint and port number. If the information is correct, enter the database account and password.

 **Note** For more information about how to create an account, refer to the following topic:

- [Create an account for an ApsaraDB for RDS instance running SQL Server 2016 or 2012](#)

6. Click **Login**.

 **Note**

- If you want the web browser to remember the password, select **Remember Password** before you click **Login**.
- If the system prompts you to add the CIDR block of the DMS server to an IP address whitelist of your RDS instance, click **Configure Whitelist**. For more information about how to manually configure a whitelist, see [Configure a whitelist](#).

10.8. Monitoring and alerting

10.8.1. Set a monitoring frequency

The ApsaraDB for RDS console provides a variety of performance metrics for which you can set a monitoring frequency.

Context

ApsaraDB for RDS provides the following monitoring frequencies:

- Every 60 seconds
- Every 300 seconds

Procedure

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Monitoring and Alerts**.
5. On the **Resource Monitoring** tab, click **Set Monitoring Frequency**.
6. In the **Set Monitoring Frequency** dialog box, select the monitoring frequency you want.
7. Click **OK**.

10.8.2. View resource and engine monitoring data

The ApsaraDB for RDS console provides a variety of performance metrics to monitor the status of your instances.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the Instances page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Monitoring and Alerts**.
5. On the **Monitoring and Alerts** page, select **Resource Monitoring** or **Engine Monitoring**, and select a time range to view the corresponding monitoring data. The following table describes the metrics.

Monitoring type	Metric	Description
Resource Monitoring	Disk Space (unit: MB)	The disk usage of the RDS instance, including: <ul style="list-style-type: none"> ◦ Instance Size ◦ Data Usage ◦ Log Size ◦ Temporary File Size ◦ Other System File Size
	IOPS (unit: times/second)	The number of input/output operations per second (IOPS) for the RDS instance.
	Total Connections	The total number of current connections of the instance.
	MSSQL Instance CPU Utilization (percentage in the operating system: %)	The CPU utilization of the RDS instance. This includes the CPU utilization for the operating system. Unit: %.
	SQLServer Average Input/Output Traffic	The inbound and outbound traffic of the instance per second. Unit: KB.
Engine Monitoring	Average Transaction Frequency	The number of transactions processed per second.
	Average QPS	The number of SQL statements executed per second.
	Buffer Hit Ratio (%)	The read hit ratio of the buffer pool.
	Page Write Frequency at Check Point	The number of checkpoints written to pages per second.
	Login Frequency	The number of logons to the RDS instance per second.
	Average Frequency of Whole Table Scans	The number of full table scans per second.
	SQL Compilations per Second	The number of SQL statements compiled per second.
	Lock Timeout Times	The number of lock timeouts on the RDS instance per second.
	Deadlock Frequency	The number of deadlocks on the RDS instance per second.
	Lock Wait Frequency	The number of lock waits on the RDS instance per second.

10.9. Data security

10.9.1. Configure a whitelist

To ensure database security and reliability, you must modify the whitelist of an ApsaraDB for RDS instance before you enable the instance. You must add the IP addresses or CIDR blocks that are used for database access to the whitelist.

Context

The whitelist improves the access security of your ApsaraDB for RDS instance. We recommend that you maintain the whitelist on a regular basis. The whitelist configuration process does not affect the normal operations of the ApsaraDB for RDS instance.

Procedure

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Data Security**.
5. On the **Whitelist Settings** tab, click **Edit** corresponding to the default whitelist.

Note

- If you want to connect an ECS instance to an ApsaraDB for RDS instance by using an internal endpoint, you must make sure that the two instances are in the same region and have the same network type. Otherwise, the connection fails.
- You can click **Create Whitelist** to create a new whitelist.

6. In the **Edit Whitelist** dialog box, enter the IP addresses or CIDR blocks used to access the instance, and then click **OK**.
 - If you enter the CIDR block 10.10.10.0/24 in the **IP Addresses** field, all IP addresses in the 10.10.10.X format are granted access to your RDS instance.
 - If you enter more than one IP address or CIDR block, you must separate them with commas (,). Do not add spaces before or after the commas. Example: 192.168.0.1,172.16.213.9.
 - After you click **Add Internal IP Addresses of ECS Instances**, the IP addresses of all the ECS instances under your Apsara Stack account are displayed. You can select the required IP addresses and add them to the whitelist.

 **Note** If you add a new IP address or CIDR block to the default whitelist, the default address 127.0.0.1 is automatically deleted.

Whitelist Name: default

IP Addresses: 127.0.0.1

[Add Internal IP Addresses of ECS Instances](#)
You can add 999 more entries.

Specified IP address: If you specify the IP address 192.168.0.1, this IP address is allowed to access the RDS instance.
Specified CIDR block: If you specify the CIDR block 192.168.0.0/24, the IP addresses ranging from 192.168.0.1 to 192.168.0.255 are allowed to access the RDS instance.
When you add multiple IP addresses or CIDR blocks, separate them by a comma (no space after the comma), for example, 192.168.0.1,192.168.0.0/24.

New whitelist entries take effect in 1 minute.

OK Cancel

10.9.2. Configure SSL encryption for an instance

This topic describes how to enhance endpoint security. You can enable Secure Sockets Layer (SSL) encryption and install SSL certificates issued by certificate authorities (CAs) on the required application services. SSL is used at the transport layer to encrypt network connections and enhance the security and integrity of communication data. SSL also increases the response time.

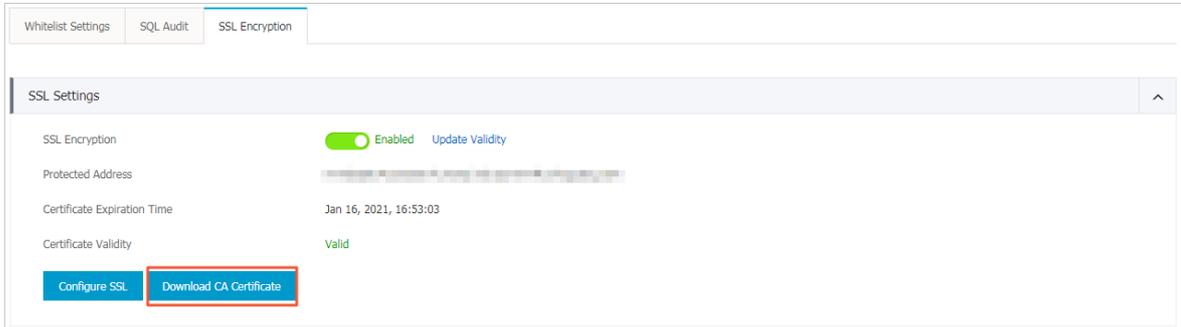

Precautions

- An SSL CA certificate is valid for one year. You must update the validity period of the SSL CA certificate in your application or client within one year. Otherwise, your application or client that uses an encrypted network connections cannot connect the RDS instance.
- SSL encryption may cause a significant increase in CPU utilization. We recommend that you enable SSL encryption only when you want to encrypt connections from the Internet. In most cases, connections that use an internal endpoint do not require SSL encryption.
- Read/write splitting endpoints do not support SSL encryption.
- If you enable SSL encryption, you cannot disable it. Proceed with caution.

Enable SSL encryption

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the Instances page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.

4. In the left-side navigation pane, click **Data Security**.
5. Click the **SSL Encryption** tab.
6. In the **SSL Settings** section, turn on **SSL Encryption**.
7. In the **Configure SSL** dialog box, select the endpoint for which you want to enable SSL encryption and click **OK**.
8. Click **Download CA Certificate** to download the SSL CA certificate files in a compressed package.

The downloaded package contains three files:

- **P7B file:** used to import CA certificates to the Windows operating system.
- **PEM file:** used to import CA certificates to other operating systems or applications.
- **JKS file:** the Java truststore file. The password is `apsaradb`. It is used to import the CA certificate chain to Java programs.

Note When the JKS file is used in Java, you must modify the default JDK security configuration in JDK 7 and JDK 8. Open the `/jre/lib/security/java.security` file on the host where your application resides, and modify the following configurations:

```
jdk.tls.disabledAlgorithms=SSLv3, RC4, DH keySize < 224
jdk.certpath.dis
```

```
abledAlgorithms=MD2, RSA keySize < 1024
```

If you do not modify the JDK security configuration, the following error is reported. Similar errors are also caused by the Java security configuration.

```
javax.net.ssl.SSLHandshakeException: DHPublicKey does not comply to algorithm constraints
```

Configure an SSL CA certificate

After you enable SSL encryption, configure the SSL CA certificate on your application or client before they can connect to the RDS instance. This section describes how to configure an SSL CA certificate. MySQL Workbench and Navicat are used in the example. For more information, see the instructions for the other applications or clients.

Configure a certificate on MySQL Workbench

1. Start MySQL Workbench.
2. Choose **Database > Manage Connections**.
3. Enable **Use SSL** and import the SSL CA certificate files.

Configure a certificate on Navicat

1. Start Navicat.

2. Right-click the target database and select **Edit Connection**.
3. Click the **SSL** tab. Select the path of the PEM-formatted CA certificate.
4. Click **OK**.

Note If the connection is being used error is reported, the previous session is still connected. Restart Navicat.

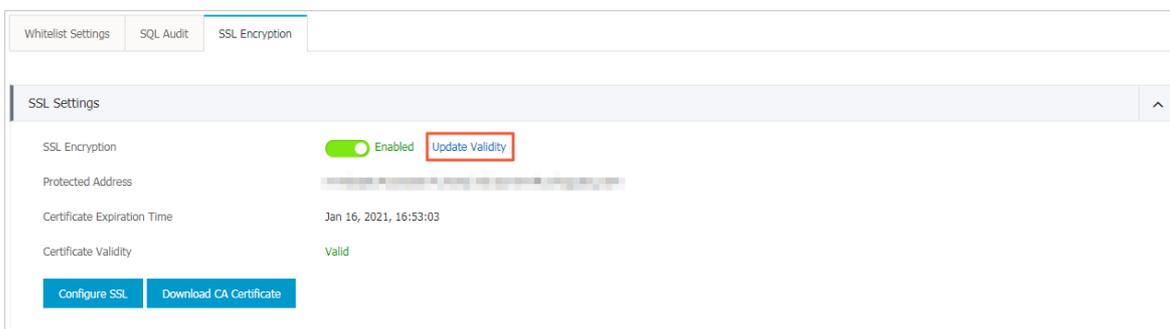

5. Double-click the target database to test whether the database is connected.

Update the validity period of an SSL CA certificate

Note

- **Update Validity** causes the RDS instance to restart. Proceed with caution.
- After you update the validity period, you must download and configure the SSL CA certificate again.

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Data Security**.
5. Click the **SSL Encryption** tab.
6. Click **Update Validity**.

10.9.3. Configure TDE

Transparent data encryption (TDE) encrypts and decrypts data files in real time. It encrypts data files when they are written to disks, and decrypts data files when they are loaded to the memory from disks. TDE does not increase the sizes of data files. When you use TDE, you do not need to modify the application that uses the ApsaraDB for RDS instance.

Precautions

- Instance-level TDE can be enabled but cannot be disabled. Database-level TDE can be enabled or disabled.
- The keys used for data encryption are generated and managed by Key Management Service (KMS). ApsaraDB for RDS does not provide the keys or certificates used for data encryption. If you want to restore data to your computer after TDE is enabled, you must decrypt the data on your RDS instance. For more information, see [Decrypt data](#).
- TDE increases CPU utilization.

Prerequisites

- Your RDS instance runs SQL Server EE.
- You have logged on to the ApsaraDB for RDS console by using your Apsara Stack account.

- KMS is activated. If KMS is not activated, you can activate it as prompted when you enable TDE.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the Instances page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Data Security**.
5. Click the **TDE** tab.
6. Click the switch next to **Disabled** to turn on TDE.
7. In the dialog box that appears, click **Confirm**.

 **Note** If you have not enabled KMS, you will be prompted to do so when you enable TDE. After you enable KMS, you can click **Not activated** to enable TDE.

8. Click **Configure TDE**. In the Database TDE Settings dialog box, select the databases you want to encrypt from the **Unselected Databases** list, click the  icon to add them to the **Selected Databases** list, and click **OK**.

Decrypt data

If you want to decrypt a database that is encrypted by TDE, you only need to remove the database from the **Selected Databases** list in the **Database TDE Settings** dialog box.

10.11. Database backup and restoration

10.11.1. Configure an automatic backup policy

Automatic backup supports full physical backups. ApsaraDB for RDS automatically backs up data based on pre-configured policies. This topic describes how to configure a policy for automatic backup.

Procedure

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Backup and Restoration**.
5. On the **Backup and Restoration** page, click the **Backup Setting** tab.
6. Click **Edit**.
7. In the dialog box that appears, configure the automatic backup policy.

Parameter	Description
Data Retention Period	The number of days for which you want to retain data backup files. Valid values: 7 to 730. Default value: 7. Unit: days.
Backup Cycle	The backup cycle. You can select multiple days within a week. <div style="border: 1px solid #add8e6; padding: 5px; background-color: #e6f2ff;"> ? Note To ensure data security, we recommend that you back up your RDS instance at least twice a week. </div>
Backup Time	The hour at which you want to create a backup.
Backup Frequency	<ul style="list-style-type: none"> ◦ Same as Data Backup ◦ Every 30 Minutes <p>The total size of log backup files remains the same no matter which backup frequency you select.</p>

8. Click **OK**.

10.11.2. Manually back up an instance

This topic describes how to manually back up an ApsaraDB for RDS instance.

Procedure

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. On the **Basic Information** page, click **Back Up Instance** in the upper-right corner.
5. In the **Back Up Instance** dialog box, select **Automatic Backup** or **Full Backup** from the **Select Backup Mode** drop-down list.

-  **Note** ApsaraDB for RDS supports the following backup methods:
- **Automatic Backup:** After you select **Automatic Backup**, the system immediately performs an incremental backup or full backup based on the instance.
 - **Full Backup:** After you select **Full Backup**, the system immediately performs a full backup.

6. Click **OK**.

Result

After the backup is complete, you can view the backup task on the **Data Backup** tab of the **Backup and Restoration** page.

10.11.3. Shrink transaction logs

ApsaraDB RDS for SQL Server allows you to shrink transaction logs to reduce the log file size.

Prerequisites

The instance is in the **Running** state.

Procedure

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Backup and Restoration**.
5. In the upper-right corner of the page, click **Shrink Transaction Log**.

-  **Note** The shrinkage takes about 20 minutes to complete. ApsaraDB RDS for SQL Server shrinks transaction logs during each backup.

10.12. Migrate full backup data to ApsaraDB RDS for SQL Server

This topic describes how to migrate full backup files of an on-premises database from Object Storage Service (OSS) to ApsaraDB RDS for SQL Server.

Prerequisites

- Your ApsaraDB for RDS instance has sufficient storage space. If the space is insufficient, you must increase it before you migrate data to the instance.
- The destination database on your ApsaraDB for RDS instance has a different name from the on-premises database.
- A privileged account is created on your ApsaraDB for RDS instance. For more information, see [Create an account](#).
- An Object Storage Service (OSS) bucket is created in the region where your ApsaraDB for RDS instance is created. For more information, see [Create buckets in the OSS User Guide](#).
- The DBCC CHECKDB statement is executed, and the execution result indicates that no allocation or consistency errors occur.

 **Note** If no allocation or consistency errors occur, the following execution result is returned:

```
...  
CHECKDB found 0 allocation errors and 0 consistency errors in database 'xxx'.  
DBCC execution completed. If DBCC printed error messages, contact your system administrator.
```

Precautions

- Full backup files cannot be migrated to an ApsaraDB for RDS instance of an earlier SQL Server version. For example, if the on-premises database runs SQL Server 2016 and your ApsaraDB for RDS instance runs SQL Server 2012, you cannot migrate full backup files of the on-premises database to your ApsaraDB for RDS instance.
- Differential or log backup files are not supported.
- The names of full backup files cannot contain special characters, such as `@` and vertical bars (`|`). If the file names contain special characters, the migration fails.
- After the service account of your ApsaraDB for RDS instance is granted the access permission on the OSS bucket, the system creates a role named **AliyunRDSImportRole** in RAM. Do not modify or delete this role. Otherwise, you cannot download full backup files when you migrate data to your ApsaraDB for RDS instance. In this case, you must re-authorize the service account of your ApsaraDB for RDS instance.
- Before the migration is complete, do not delete the backup files from the OSS bucket. Otherwise, the migration fails.
- The names of backup files can be suffixed only with bak, diff, tm, or log. If you do not use the script in this topic to generate a backup file, you must name the backup file by using one of the following suffixes:
 - bak: indicates a full backup file.

- diff: indicates a differential backup file.
- trn or log: indicates a log backup file.

Back up the on-premises database

 **Note** Before you perform a full backup, stop writing data to the on-premises database. The data written during the backup process is not backed up.

1. Download the [backup script](#). Double-click the backup script to open it by using the Microsoft SQL Server Management Studio (SSMS) client.
2. Configure the following parameters.

Parameter	Description
@backup_databases_list	The databases that you want to back up. Separate them with semicolons (;) or commas (,).
@backup_type	The backup type. Valid values: <ul style="list-style-type: none"> ○ FULL: full backup ○ DIFF: differential backup ○ LOG: log backup
@backup_folder	The directory in which you want to store the backup files on your computer. If the specified directory does not exist, the system creates a directory.
@is_run	Specifies whether to perform a backup. Valid values: <ul style="list-style-type: none"> ○ 1: performs a backup. ○ 0: performs no backup but a check.

3. Run the backup script.

Upload full backup files to the OSS bucket

After the on-premises database is backed up, you must upload full backup files to the OSS bucket. You can use one of the following methods:

- Use the OSS console

If the size of backup files is smaller than 5 GB, you can upload the files in the OSS console. For more information, see [Upload objects](#) in the *OSS User Guide*.

- Call an OSS API operation

You can call an OSS API operation to upload the full backup files in resumable mode. For more information, see [Multipart upload-relevant operations](#) in the *OSS Developer Guide*.

Create a migration task

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to

the **Basic Information** page.

4. In the left-side navigation pane, click **Backup and Restoration**.
5. In the upper-right corner of the page, click **Migrate OSS Backup Data to RDS**.
6. Click **Next** twice until the **Import Data** step appears.
7. Configure the following parameters.

Parameter	Description
Database Name	Enter the name of the destination database on your ApsaraDB for RDS instance.  Note The name of the database must meet the requirements of SQL Server.
OSS Bucket	Select the OSS bucket that stores the backup files.
OSS Subfolder Name	Enter the name of the OSS subfolder that stores the backup files.
OSS File	Click the search icon to search for backup files by using the prefix-based fuzzy match. The system displays the name, size, and update time of each backup file. Select the backup file that you want to migrate to your ApsaraDB for RDS instance.
Cloud Migration Method	One-time Full Backup File Migration: uploads full backup data to your ApsaraDB for RDS instance. Select this option if you want to migrate only a single full backup file.

8. Click **OK**.

Wait for the migration task to complete. You can click **Refresh** to view the latest status of the migration task. If the migration fails, fix the error based on the message displayed in the **Task Description** column. For more information, see [Common errors](#).

View the migration task

In the left-side navigation pane, click **Backup and Restoration**. Click the **Backup Data Upload History** tab. The system displays the migration tasks in the last week.

Common errors

Each record of a migration task contains a task description, which helps you identify the error cause and fix the error. The following list describes common errors:

- A database with the same name as the on-premises database exists on your ApsaraDB for RDS instance.
 - Error message: The database (xxx) is already exist on RDS, please backup and drop it, then try again.
 - Cause: The on-premises database is named the same as an existing database on your ApsaraDB for RDS instance. For data security purposes, ApsaraDB RDS for SQL Server does not allow such a database to be migrated.

- Solution: If you need to overwrite the database in your ApsaraDB for RDS instance with the on-premises database, you must back up the database, delete it from your ApsaraDB for RDS instance, and then migrate the on-premises database to your ApsaraDB for RDS instance.
- A differential backup file is used.
 - Error message: Backup set (xxx.bak) is a Database Differential backup, we only accept a FULL Backup.
 - Cause: The file that you uploaded is a differential backup file, but not a full backup file. The migration solution for full backup data supports only full backup files.
- A log backup file is used.
 - Error message: Backup set (xxx.trn) is a Transaction Log backup, we only accept a FULL Backup.
 - Cause: The file that you uploaded is a log backup file, but not a full backup file. The migration solution for full backup data supports only full backup files.
- The backup file fails the verification.
 - Error message: Failed to verify xxx.bak, backup file was corrupted or newer edition than RDS.
 - Cause: The backup file is damaged, or the on-premises database runs an SQL Server version later than your ApsaraDB for RDS instance. For example, if the on-premises database runs SQL Server 2016 and your ApsaraDB for RDS instance runs SQL Server 2012, the error message is returned.
 - Solution: If the backup file is damaged, perform a full backup on the on-premises database again. If the database engine version does not meet the requirements, select an ApsaraDB for RDS instance that runs the same version as or a later version than the on-premises database.
- DBCC CHECKDB fails to be executed.
 - Error message: DBCC checkdb failed.
 - Cause: Allocation or consistency errors occurred in the on-premises database.
 - Solution: Execute the following statement in the on-premises database.

 **Note** Data loss may occur when you use this statement to fix errors.

```
DBCC CHECKDB (DBName, REPAIR_ALLOW_DATA_LOSS) WITH NO_INFOMSGS, ALL_ERRORMSGS
```

- The remaining storage space of your ApsaraDB for RDS instance is insufficient. (1)
 - Error message: Not Enough Disk Space for restoring, space left (xxx MB) < needed (xxx MB).
 - Cause: The remaining storage space of your ApsaraDB for RDS instance does not meet the migration requirements.
 - Solution: Increase the storage space of your ApsaraDB for RDS instance.
- The remaining storage space of your ApsaraDB for RDS instance is insufficient. (2)
 - Error message: Not Enough Disk Space, space left xxx MB < bak file xxx MB.
 - Cause: The remaining storage space of your ApsaraDB for RDS instance is smaller than the size of the backup file.
 - Solution: Increase the storage space of your ApsaraDB for RDS instance.
- No privileged account exists.
 - Error message: Your RDS doesn't have any init account yet, please create one and grant permissions on RDS console to this migrated database (XXX).

- Cause: No privileged account is created on your ApsaraDB for RDS instance, and the database permissions are not granted to accounts. However, when this error message is returned, the backup file has been restored to your ApsaraDB for RDS instance, and the migration task is successful.
- Solution: Create a privileged account. For more information, see [Create an account](#).

11.PolarDB

11.1. What is ApsaraDB for RDS?

ApsaraDB for RDS is a stable, reliable, and scalable online database service. Based on the distributed file system and high-performance storage, ApsaraDB for RDS allows you to easily perform database operations and maintenance with its set of solutions for disaster recovery, backup, restoration, monitoring, and migration.

PolarDB

PolarDB is a stable, secure, and scalable enterprise-grade relational database that provides one of the database engines that ApsaraDB for RDS runs. Based on PostgreSQL, the most advanced open source database in the world, PolarDB enhances performance, application solutions, and compatibility. It also provides the capability of directly running Oracle applications. You can run enterprise-grade applications on PolarDB to implement stable and cost-effective services.

11.2. Limits on PolarDB

Before you use PolarDB, you must understand its limits and take necessary precautions.

The following table describes the limits on PolarDB.

Operation	Limit
Database parameter modification	Not supported.
Root privilege of databases	Superuser permissions are not provided.
Database replication	<ul style="list-style-type: none"> The system automatically builds HA databases based on PolarDB streaming replication without user input. PolarDB standby nodes are hidden and cannot be accessed directly.
ApsaraDB for RDS instance restart	PolarDB instances must be restarted using the ApsaraDB for RDS console or API operations.

11.3. Log on to the ApsaraDB for RDS console

This topic describes how to log on to the ApsaraDB for RDS console.

Prerequisites

- Before logging on to the ASCM console, make sure that you have obtained the IP address or domain name of the ASCM console from the deployment personnel. The URL used to access the ASCM console is in the following format: `https://[IP address or domain name of the ASCM console]`.
- We recommend that you use the Google Chrome browser.

Procedure

- In the address bar, enter the URL used to access the ASCM console. Press the Enter key.
- Enter your username and password.

Obtain the username and password for logging on to the console from the operations administrator.

Note When you log on to the ASCM console for the first time, you must change the password of your username as prompted. Due to security concerns, your password must meet the minimum complexity requirements: The password must be 8 to 20 characters in length and must contain at least two of the following character types: uppercase letters, lowercase letters, digits, and special characters such as exclamation points (!), at signs (@), number signs (#), dollar signs (\$), and percent signs (%).

3. Click **Login** to go to the ASCM console homepage.
4. In the top navigation bar, choose **Products > Database Services > ApsaraDB for RDS**.

11.4. Quick Start

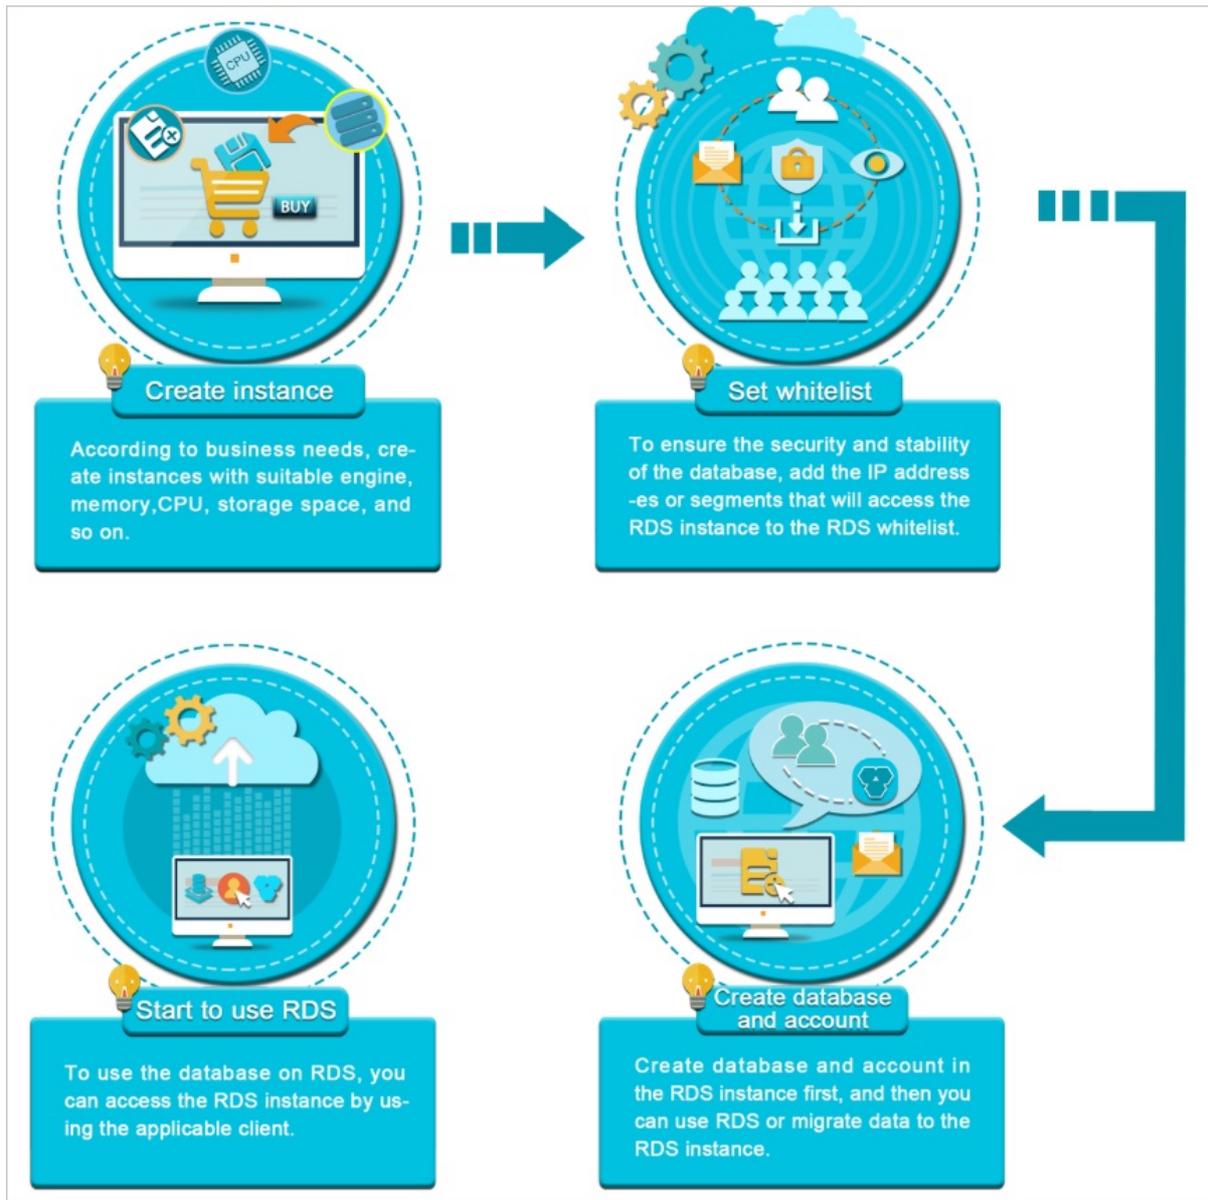

11.4.1. Procedure

This topic describes how to create a PolarDB instance, specify basic configurations, and connect to the instance. It allows you to familiarize yourself with the entire process about how to purchase and use a PolarDB instance.

Quick start flowchart

If you are using ApsaraDB for RDS for the first time, you can start with [Limits](#).

The following figure shows the operations that you must perform before you use a PolarDB instance.

11.4.2. Create an instance

This topic describes how to create a PolarDB instance in the console.

Procedure

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the **Instances** page, click **Create Instance** in the upper-right corner.
3. Configure the following parameters.

Section	Parameter	Description
Basic Settings	Organization	The organization to which the instance belongs.
	Resource Set	The resource set to which the instance belongs.
Region	Region	The region where the instance resides.
	Zone	The zone ID of the instance.

Region Section	Parameter	Description
Specifications	Instance Name	<p>The name of the instance.</p> <ul style="list-style-type: none"> The name must be 2 to 64 characters in length. The name must start with a letter. The name can contain digits and special characters. Special characters include underscores (_), hyphens (-), and colons (:). The name cannot start with http:// or https://.
	Database Engine	The database engine of the instance. Set the value to PolarDB.
	Engine Version	The version of the database engine. Set the value to 11.
	Edition	The edition of the instance. The drop-down list displays supported instance editions.
	Instance Type	The type of the instance. The memory size determines the maximum number of connections and IOPS. The actual values are displayed in the console. For more information, see Product introduction > Instance type in the <i>ApsaraDB for RDS documentation</i> .
	Storage	The storage capacity of the instance, including the capacity to store data, system files, binary log files, and transaction files. The available storage capacity is displayed in the console.
Network Type	Network Type	<p>The network type of the instance. RDS instances support the following network types:</p> <ul style="list-style-type: none"> Classic Network: Cloud services on a classic network are not isolated from each other. Unauthorized access to a cloud service is blocked only by the security group or whitelist policy of the service. VPC: A Virtual Private Cloud (VPC) helps you build an isolated network environment on Alibaba Cloud. You can customize route tables, CIDR blocks, and gateways in a VPC. We recommend that you select VPC for improved security. <p> Note After you select VPC, you must select a VPC and a VSwitch.</p>
	IP Whitelist	An IP address whitelist contains the IP addresses of devices that require access to your RDS instance. For more information, see Configure an IP whitelist .
Access Mode	Access Mode	<p>RDS instances support two access modes: Standard and Database Proxy.</p> <ul style="list-style-type: none"> Standard: RDS uses Server Load Balancer (SLB) to eliminate the impact of instance high-availability switching on the application layer. This mode reduces the response time, but slightly increases the probability of network interruptions and disables SQL interception. Database Proxy: This mode prevents 90% of network interruptions and intercepts SQL injection attacks based on semantic analysis. However, it increases the response time by over 20%. <p> Note PolarDB supports the Standard mode.</p>

4. After you configure the preceding parameters, click **Submit**.

11.4.3. Configure an IP whitelist

This topic describes how to configure a whitelist for an ApsaraDB for RDS instance. Only devices that are listed in a whitelist can access your RDS instance.

Context

Whitelists make your RDS instance more secure and do not interrupt the operations of your RDS instance during configuration. We recommend that you update the IP address whitelists and security groups configured for your RDS instance on a regular basis.

You can use one of the following methods to configure a whitelist.

- **Configure a whitelist:** Add IP addresses to grant them access to the RDS instance.

 **Note** The default IP address whitelist contains only the IP address 127.0.0.1. This indicates that no devices are allowed to access the RDS instance.

- **Configure an ECS security group:** Add an ECS security group for the RDS instance to allow ECS instances in the group to access the RDS instance.

Procedure

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Data Security**. On the page that appears, click the **Whitelist Settings** tab.
5. On the **Whitelist Settings** tab, click **Edit** corresponding to the default whitelist.

 **Note** You can also click **Create Whitelist** to create a whitelist.

6. In the **Edit Whitelist** dialog box, enter the IP addresses or CIDR blocks that are allowed to access the instance and click **OK**. The following section describes the rules:
 - If you enter the CIDR block 10.10.10.0/24 in the **IP Addresses** field, all IP addresses in the 10.10.10.X format can access your RDS instance.
 - If you enter more than one IP address or CIDR block, you must separate them with commas (,). Do not add spaces before or after the commas. Example: 192.168.0.1,172.16.213.9.
 - If you click **Add Internal IP Addresses of ECS Instances**, the IP addresses of all created ECS instances within your Alibaba Cloud account are displayed. You can select the required IP addresses to add to the whitelist.

11.4.4. Create a database and an account

Before you start to use ApsaraDB for RDS, you must create a database and an account for an ApsaraDB for RDS instance. This topic describes how to create a database and an account for a PolarDB instance.

Create an account

You can create initial and standard accounts for a PolarDB instance. The following section describes how to create an initial account.

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic**

Information page.

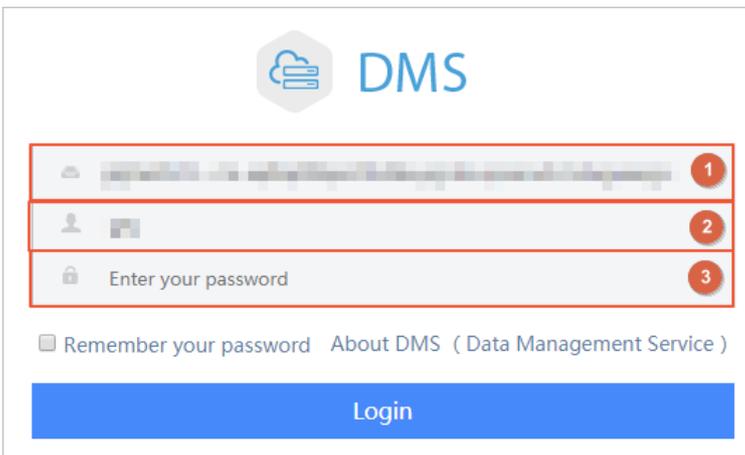

4. In the left-side navigation pane, click **Accounts**.
5. Click **Create Initial Account** and configure the following parameters.

Parameter	Description
Database Account	<ul style="list-style-type: none"> ◦ The name of the account must be 2 to 16 characters in length. ◦ The name of the account can contain lowercase letters, digits, and underscores (_). ◦ The name of the account must start with a letter and end with a letter or digit.
Password	<ul style="list-style-type: none"> ◦ The password must be 8 to 32 characters in length. ◦ The password must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. ◦ Special characters include ! @ # \$ % ^ & * () _ + - =
Re-enter Password	Enter the same password again.

6. Click **Create**.

Create a database and a standard account

1. **Log on to the ApsaraDB for RDS console.**
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. Click **Log On to DB** in the upper-right corner of the page.
5. On the **Data Management (DMS)** logon page that appears, check the endpoint and port number displayed on the page. If the information is correct, enter the username and password of the database.

Parameter	Description
IP Address:Port	This parameter is marked with ① in the figure. Enter the endpoint and port number of the instance.
Database Username	This parameter is marked with ② in the figure. Enter the name of the account used to access the database.
Enter your password	This parameter is marked with ③ in the figure. Enter the password of the account used to access the database.

6. Click **Login**.

 **Note** If a message prompts you that the connection fails, the problem may be caused by an improperly configured whitelist. Reconfigure the whitelist in the console. For more information, see [Configure an IP whitelist](#).

7. In the top navigation bar, choose **SQL Operations > SQL Window** after you have logged on to the RDS instance.

8. In the SQL window, execute the following statement to create a database:

```
CREATE DATABASE name
[ [ WITH ] [ OWNER [=] user_name ]
  [ TEMPLATE [=] template ]
  [ ENCODING [=] encoding ]
  [ LC_COLLATE [=] lc_collate ]
  [ LC_CTYPE [=] lc_ctype ]
  [ TABLESPACE [=] tablespace_name ]
  [ CONNECTION LIMIT [=] connlimit ] ]
```

For example, if you want to create a database named test, execute the following statement:

```
create database test;
```

9. Click **execute**.

10. In the SQL window, execute the following statement to create a standard account:

```
CREATE USER name [ [ WITH ] option [ ... ] ]
where option can be:
  SUPERUSER | NOSUPERUSER
  | CREATEDB | NOCREATEDB
  | CREATEROLE | NOCREATEROLE
  | CREATEUSER | NOCREATEUSER
  | INHERIT | NOINHERIT
  | LOGIN | NOLOGIN
  | REPLICATION | NOREPLICATION
  | CONNECTION LIMIT connlimit
  | [ ENCRYPTED | UNENCRYPTED ] PASSWORD 'password'
  | VALID UNTIL 'timestamp'
  | IN ROLE role_name [, ...]
  | IN GROUP role_name [, ...]
  | ROLE role_name [, ...]
  | ADMIN role_name [, ...]
  | USER role_name [, ...]
  | SYSID uid
```

For example, if you want to create a user account named test2 whose password is 123456, execute the following statement:

```
create user test2 password '123456';
```

11. Click **execute**.

11.4.5. Connect to a PolarDB instance

This topic describes how to use Data Management (DMS) or the pgAdmin 4 client to connect to an ApsaraDB for RDS instance.

Context

You can log on to DMS from the ApsaraDB for RDS console and then connect to an RDS instance.

Data Management (DMS) is an integrated database for data, schema, and server management, access security, BI charts, data trends, data tracking, and performance optimization. DMS can be used to manage relational databases and non-relational databases, such as MySQL, SQL Server, and PostgreSQL. It can also be used to manage Linux servers.

You can also use a database client to connect to an RDS instance. ApsaraDB for RDS is fully compatible with native database engines. You can connect to RDS instances in the similar manner as you would connect to an on-premises database. This topic describes how to use the pgAdmin 4 client to connect to an RDS instance.

Use DMS to connect to an RDS instance

For more information about how to connect an RDS instance through DMS, see [Log on to an ApsaraDB for RDS instance by using DMS](#).

Use the pgAdmin 4 client to connect to an RDS instance

1. Add the IP address that requires access to the RDS instance to a whitelist of the RDS instance. For more information about how to configure a whitelist, see [Configure an IP whitelist](#).
2. Start the pgAdmin 4 client.

 **Note** For more information about how to download the pgAdmin 4 client, visit [pgAdmin 4 \(Windows\)](#).

3. Right-click **Servers** and choose **Create > Server**.
4. On the **General** tab of the **Create - Server** dialog box that appears, enter the name of the server.
5. Click the **Connection** tab and enter the information of the destination instance.

Parameter	Description
Host name/address	The internal endpoint of the RDS instance. For more information about how to view the internal endpoint, see View and modify the internal endpoint and port number .
Port	The internal port number that is used to connect to the RDS instance. For more information about how to view the internal port number, see View and modify the internal endpoint and port number .
Username	The name of the initial account for the RDS instance. For more information about how to create an initial account, see Create a database and an account .
Password	The password of the initial account.

6. Click **Save**.
7. If the connection information is correct, choose **Servers > Server Name > Databases > postgres**.

 **Notice** The postgres database is the default system database of the RDS instance. Do not perform operations on this database.

11.5. Instances

11.5.1. Create an instance

This topic describes how to create a PolarDB instance in the console.

Procedure

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the **Instances** page, click **Create Instance** in the upper-right corner.
3. Configure the following parameters.

Section	Parameter	Description
Basic Settings	Organization	The organization to which the instance belongs.
	Resource Set	The resource set to which the instance belongs.
Region	Region	The region where the instance resides.
	Zone	The zone ID of the instance.
Specifications	Instance Name	The name of the instance. <ul style="list-style-type: none"> ◦ The name must be 2 to 64 characters in length. ◦ The name must start with a letter. ◦ The name can contain digits and special characters. Special characters include underscores (_), hyphens (-), and colons (:). ◦ The name cannot start with http:// or https://.
	Database Engine	The database engine of the instance. Set the value to PolarDB.
	Engine Version	The version of the database engine. Set the value to 11.
	Edition	The edition of the instance. The drop-down list displays supported instance editions.
	Instance Type	The type of the instance. The memory size determines the maximum number of connections and IOPS. The actual values are displayed in the console. For more information, see Product introduction > Instance type in the <i>ApsaraDB for RDS documentation</i> .
	Storage	The storage capacity of the instance, including the capacity to store data, system files, binary log files, and transaction files. The available storage capacity is displayed in the console.

Section	Parameter	Description
Network Type	Network Type	<p>The network type of the instance. RDS instances support the following network types:</p> <ul style="list-style-type: none"> ◦ <i>Classic Network</i>: Cloud services on a classic network are not isolated from each other. Unauthorized access to a cloud service is blocked only by the security group or whitelist policy of the service. ◦ <i>VPC</i>: A Virtual Private Cloud (VPC) helps you build an isolated network environment on Alibaba Cloud. You can customize route tables, CIDR blocks, and gateways in a VPC. We recommend that you select VPC for improved security. <p> Note After you select VPC, you must select a VPC and a VSwitch.</p>
	IP Whitelist	<p>An IP address whitelist contains the IP addresses of devices that require access to your RDS instance. For more information, see Configure an IP whitelist.</p>
Access Mode	Access Mode	<p>RDS instances support two access modes: Standard and Database Proxy.</p> <ul style="list-style-type: none"> ◦ <i>Standard</i>: RDS uses Server Load Balancer (SLB) to eliminate the impact of instance high-availability switching on the application layer. This mode reduces the response time, but slightly increases the probability of network interruptions and disables SQL interception. ◦ <i>Database Proxy</i>: This mode prevents 90% of network interruptions and intercepts SQL injection attacks based on semantic analysis. However, it increases the response time by over 20%. <p> Note PolarDB supports the Standard mode.</p>

4. After you configure the preceding parameters, click **Submit**.

11.5.2. Restart an instance

This topic describes how to manually restart an ApsaraDB for RDS instance. This applies if the number of connections exceeds the specified threshold or a performance issue occurs.

Procedure

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the upper-right corner of the page, click **Restart Instance**.

 **Notice** When you restart an instance, a network interruption will occur. We recommend that you make appropriate arrangements for your workloads and make sure that your applications are configured with automatic reconnection policies.

5. In the message that appears, click **OK**.

11.5.3. Set the maintenance window

This topic describes how to set the maintenance window of an ApsaraDB for RDS instance. The backend system performs maintenance on the RDS instance during the maintenance window. This ensures the stability of the RDS instance. The default maintenance window is from 02:00 (UTC+8) to 06:00 (UTC+8). We recommend that you set the maintenance window to the off-peak hours of your business to avoid impacts on your business.

Procedure

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the **Configuration Information** section, click **Configure** to the right of **Maintenance Window**.
5. Select a maintenance window and click **Save**.

Note

- The maintenance window is displayed in UTC+8.
- Before the maintenance starts, ApsaraDB for RDS sends text messages and emails to the contacts that are associated with your Alibaba Cloud account.
- To ensure the stability of the maintenance process, the instance will enter the **Maintaining Instance** state before the maintenance time. Access to data in the database and query operations such as performance monitoring are not affected while the instance is in this state. However, apart from account and database management and IP address whitelist configuration, modification operations such as upgrade, downgrade, and restart will be temporarily unavailable.
- During a maintenance window, one or two network interruptions may occur. Make sure that your applications are configured with automatic reconnection policies.

11.5.4. Configure primary/secondary switchover

ApsaraDB for RDS provides the primary/secondary switchover feature to ensure the high availability of databases. The primary/secondary switchover is performed when the primary instance becomes unavailable. You can also manually switch your business to the secondary instance. This topic describes how to manually switch over services between a primary instance and its secondary instance.

Context

Data is synchronized in real time between the primary and secondary instances. You can access only the primary instance. The secondary instance serves only as a backup instance and does not allow external access. After the switchover, the original primary instance becomes the secondary instance.

 **Note** Network interruptions may occur during a switchover. Make sure that your applications are configured with automatic reconnection policies.

Procedure

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Service Availability**.
5. In the **Availability Information** section, click **Switch Primary/Secondary Instance**.
6. In the **Switch Primary/Secondary Instance** message, click **OK**.

Note

- During the switchover, operations such as managing databases and accounts and changing network types cannot be performed. Therefore, we recommend that you select Switch Within Maintenance Window.
- For more information about how to set a maintenance window, see [Set the maintenance window](#).

11.5.5. Change the network type

This topic describes how to change the network type of an ApsaraDB for RDS instance between classic network and VPC.

Context

- **Classic network:** RDS instances in the classic network are not isolated. Unauthorized access to these instances can be blocked only by whitelists.
- **VPC:** Each Virtual Private Cloud (VPC) is an isolated network. We recommend that you select the VPC network type because it is more secure than the classic network.

You can configure route tables, CIDR blocks, and gateways in a VPC. To smoothly migrate applications to the cloud, you can connect your own data center to a VPC by using leased lines or VPNs. This allows you to build a virtual data center on the cloud.

Change the network type from VPC to classic network

Precautions

- After you change the network type from VPC to classic network, the internal endpoint of the RDS instance remains unchanged, but the IP address bound to the internal endpoint changes.
- After the network type is changed, ECS instances in the same VPC as the RDS instance can no longer be able to connect to the RDS instance by using the internal endpoint. You must update the endpoint for the applications deployed on the ECS instances.
- Changing the network type may result in a network interruption of 30 seconds. To avoid interruptions to your business, we recommend that you change the network type during off-peak hours or configure automatic reconnection policies for your applications.

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Connection**.
5. In the upper-right corner of the Database Connection section, click **Switch to Classic Network**.
6. In the dialog box that appears, click **OK**.

Note After the network type is changed to classic network, only ECS instances in the classic network can access your RDS instance over an internal network. Configure the internal endpoint for these ECS instances.

7. Configure a whitelist of your RDS instance to allow access from the ECS instance over the internal network.

Note

- If the network isolation mode of the RDS instance is standard whitelist, add the internal IP addresses of the ECS instances to a whitelist of your RDS instance.
- If the network isolation mode of the RDS instance is **enhanced whitelist**, add the internal IP addresses of the ECS instances to a classic network whitelist. If no classic network whitelists are available, create a whitelist.

Change the network type from classic network to VPC

1. Log on to the **ApsaraDB for RDS console**.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Connection**.
5. In the upper-right corner of the **Database Connection** section, click **Switch to VPC**.
6. In the **Switch to VPC** dialog box, select a VPC and VSwitch and specify whether to retain the endpoint used in the classic network.

Note

- Select a VPC. We recommend that you select the VPC where your ECS instances reside. Otherwise, the ECS instances cannot communicate with the RDS instance over the internal network.
- Select a VSwitch. If no VSwitches are available in the selected VPC, create one in the same zone where the RDS instance resides. Use the following path to navigate the guide: *Virtual Private Cloud > User Guide > Quick Start > Create a VSwitch*.
- Determine whether to select the **Reserve Original Classic Endpoint** option. The following table describes the details.

Operation	Description
Not selected	<p>The endpoint used in the classic network is replaced with an endpoint in the VPC.</p> <p>When you change the network type, a 30-second network interruption may occur, and connections between ECS instances in the classic network and the RDS instance are interrupted.</p>
Selected	<p>The endpoint used in the classic network is retained, and a new endpoint to be used in the VPC is generated. In such cases, the RDS instance runs in hybrid access mode. ECS instances in both the classic network and a VPC can connect to the RDS instance over the internal network.</p> <p>When you change the network type, no network interruptions occur. Connections between ECS instances in the classic network and the RDS instance will be available until the endpoint used in the classic network expires.</p> <p>To migrate your business to the VPC without interruption, you must add the new endpoint used in the VPC to access the ECS instances before the endpoint used in the classic network expires. Seven days before the endpoint used in the classic network expires, the system will send a text message to the phone number bound to your Alibaba Cloud account every day.</p> <p>For more information, see Hybrid access from both the classic network and VPCs.</p>

7. Add the internal IP addresses of ECS instances in the selected VPC to a VPC whitelist. This allows the ECS instances to access the RDS instance over the internal network. If no VPC whitelists are available, create a

whitelist.

Note

- If you have retained the classic network endpoint, add the VPC endpoint to the ECS instances before the classic network endpoint expires.
- If you have not retained the classic network endpoint, connections between ECS instances in the classic network and the RDS instance over the internal network are interrupted. You must add the new endpoint to ECS instances in the VPC immediately after the network type is changed.

11.5.6. Release an instance

This topic describes how to manually release an ApsaraDB for RDS instance to meet your business needs.

Procedure

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. In the **Actions** column corresponding to the target instance, click **More** and select **Release Instance** from the drop-down list.

Note After an instance is released, the instance data is immediately deleted. We recommend that you back up the data and download the backup file before you release an instance. For more information, see [Back up data](#) and [Download backup files](#).

4. In the message that appears, click **Confirm**.

11.5.7. Change the specifications of an instance

This topic describes how to change the instance type and storage space of an ApsaraDB for RDS instance.

Procedure

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the **Configuration Information** section of the **Basic Information** page, click **Change Specifications**.

Notice While you change specifications of an instance, a network interruption of about 30 seconds may occur, and most of the operations related to databases, accounts, and network operations cannot be performed. We recommend that you make appropriate arrangements for you workloads before you change specifications.

5. Change specifications based on your business requirement and click **Submit**.

11.5.8. Modify parameters of an instance

This topic describes how to view and modify the values of some parameters and query the parameter modification records in the console.

Modify parameters

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic**

Information page.

4. In the left-side navigation pane, click **Parameters**.
5. You can perform the following operations: Export the parameter settings of the RDS instance to your computer.

On the **Editable Parameters** tab, click **Export Parameters**. The parameter settings of the RDS instance are exported as a TXT file to your computer.

Modify and import the parameter settings.

- i. After you have modified parameters in the exported parameter file, click **Import Parameters** and copy the parameter settings to the field.
- ii. Click **OK**.
- iii. In the upper-right corner of the page, click **Apply Changes**.

 **Note**

- If the new parameter value takes effect only after an instance restart, the system will prompt you to restart the RDS instance. We recommend that you restart the RDS instance during off-peak hours and make sure that your applications are configured with automatic reconnection policies.
- Before the new parameter values are applied, you can click **Cancel Changes** to cancel them.

Modify a single parameter.

- i. On the **Editable Parameters** tab, find the parameter that you want to reconfigure, and click the  icon in the **Actual Value** column.
- ii. Enter a new value based on the prompted value range.
- iii. Click **Confirm**.
- iv. In the upper-right corner of the page, click **Apply Changes**.

 **Note**

- If the new parameter value takes effect only after an instance restart, the system will prompt you to restart the RDS instance. We recommend that you restart the RDS instance during off-peak hours and make sure that your applications are configured with automatic reconnection policies.
- Before the new parameter value is applied, you can click **Cancel Changes** to cancel it.

View the parameter modification history

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Parameters**.
5. On the page that appears, click the **Edit History** tab.
6. Select a time range and then click **Search**.

11.6. Database connection

11.6.1. Connect to a PolarDB instance

This topic describes how to use Data Management (DMS) or the pgAdmin 4 client to connect to an ApsaraDB for RDS instance.

Context

You can log on to DMS from the ApsaraDB for RDS console and then connect to an RDS instance.

Data Management (DMS) is an integrated database for data, schema, and server management, access security, BI charts, data trends, data tracking, and performance optimization. DMS can be used to manage relational databases and non-relational databases, such as MySQL, SQL Server, and PostgreSQL. It can also be used to manage Linux servers.

You can also use a database client to connect to an RDS instance. ApsaraDB for RDS is fully compatible with native database engines. You can connect to RDS instances in the similar manner as you would connect to an on-premises database. This topic describes how to use the pgAdmin 4 client to connect to an RDS instance.

Use DMS to connect to an RDS instance

For more information about how to connect an RDS instance through DMS, see [Log on to an ApsaraDB for RDS instance by using DMS](#).

Use the pgAdmin 4 client to connect to an RDS instance

1. Add the IP address that requires access to the RDS instance to a whitelist of the RDS instance. For more information about how to configure a whitelist, see [Configure an IP whitelist](#).
2. Start the pgAdmin 4 client.

 **Note** For more information about how to download the pgAdmin 4 client, visit [pgAdmin 4 \(Windows\)](#).

3. Right-click **Servers** and choose **Create > Server**.
4. On the **General** tab of the **Create - Server** dialog box that appears, enter the name of the server.
5. Click the **Connection** tab and enter the information of the destination instance.

Parameter	Description
Host name/address	The internal endpoint of the RDS instance. For more information about how to view the internal endpoint, see View and modify the internal endpoint and port number .
Port	The internal port number that is used to connect to the RDS instance. For more information about how to view the internal port number, see View and modify the internal endpoint and port number .
Username	The name of the initial account for the RDS instance. For more information about how to create an initial account, see Create a database and an account .
Password	The password of the initial account.

6. Click **Save**.
7. If the connection information is correct, choose **Servers > Server Name > Databases > postgres**.

 **Notice** The postgres database is the default system database of the RDS instance. Do not perform operations on this database.

11.6.2. Hybrid access from both the classic network and VPCs

This topic describes how to use the hybrid access solution of ApsaraDB for RDS to change the network type of an instance from classic network to Virtual Private Network (VPC) without network interruptions.

Prerequisites

- The network type of the instance is classic network.
- Available VPCs and VSwitches exist in the zone where the instance resides.

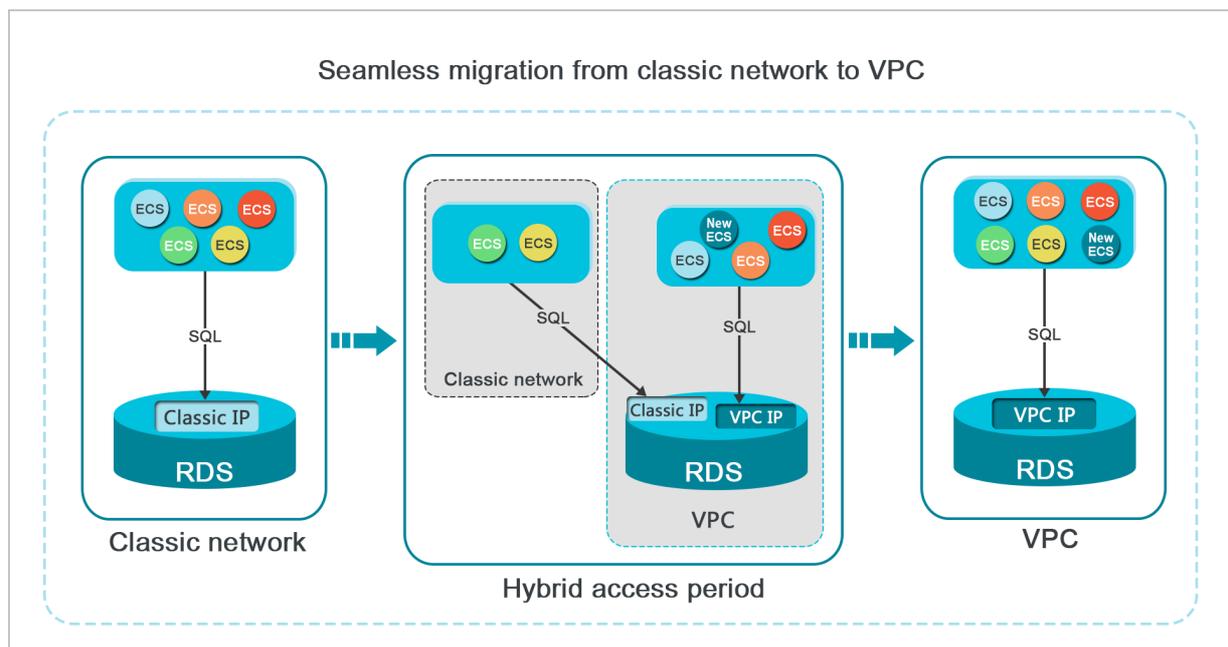

Context

In the past, when you changed the network type of an RDS instance from classic network to VPC, the internal endpoint of the RDS instance would remain the same but the IP address bound to the endpoint would change to the corresponding IP address in the VPC. This change would cause a 30-second network interruption, and ECS instances within the classic network would not be able to access the RDS instance through the internal endpoint within this period. To smoothly change the network type, ApsaraDB for RDS provides the hybrid access solution.

Hybrid access refers to the ability of an RDS instance to be accessed by ECS instances in both the classic network and VPCs. During the hybrid access period, the RDS instance reserves the original internal endpoint of the classic network and adds the internal endpoint of VPCs. This prevents network interruptions during the network type switchover.

For better security and performance, we recommend that you use the internal endpoint of VPCs. Hybrid access is available for a limited period of time. The internal endpoint of the classic network is released when the hybrid access period expires. In that case, your applications cannot access the RDS database by using the internal endpoint of the classic network. You must configure the internal endpoint of VPCs in all your applications during the hybrid access period. This ensures smooth network switchover and minimize the impact on your services.

For example, your company wants to use the hybrid access solution to change the network type from classic network to VPC. During the hybrid access period, some applications can access the database through the internal endpoint of VPCs, and the other applications can access the database through the original internal endpoint of the classic network. When all the applications access the database through the internal endpoint of VPCs, the internal endpoint of the classic network can be released. The following figure illustrates the scenario.

Limits

During the hybrid access period, the instance has the following limits:

- Changing to the classic network is not supported.
- Migrating the RDS instance to another zone is not supported.

Change the network type from classic network to VPC

For more information, see [Change the network type from classic network to VPC](#).

Change the expiration time for the original internal endpoint of the classic network

During the period in which your instance can be connected over the classic network or VPCs, you can specify the expiration time for the endpoint of the classic network. The setting takes effect immediately. For example, if the endpoint of the classic network is about to expire on August 18, 2017 and you change the expiration time to 14 days later on August 15, 2017, the endpoint of the classic network is released on August 29, 2017.

Follow these steps to change the expiration time:

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Connection**.
5. On the Instance Connection tab, click **Change Expiration Time**.
6. On the **Change Expiration Time** dialog box that appears, select an expiration time and click **OK**.

11.6.3. Log on to an ApsaraDB for RDS instance by using

DMS

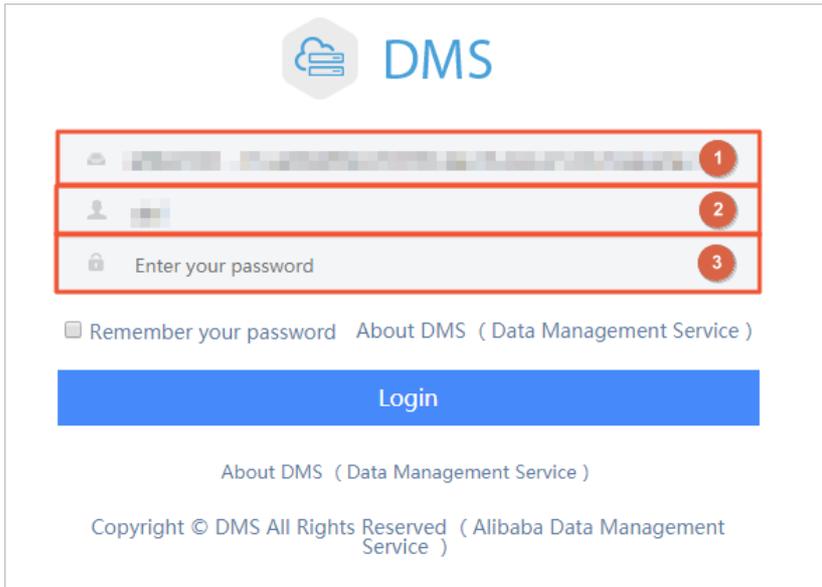

This topic describes how to log on to an ApsaraDB for RDS instance by using Data Management (DMS).

Prerequisites

The IP address whitelist is configured. For more information about how to configure an IP address whitelist, see [Configure an IP whitelist](#).

Procedure

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the upper-right corner of the page, click **Log On to DB** to go to the RDS Database Logon page.
5. On the logon page, set the following parameters:

- ①: The endpoint and port number that are used to connect to your RDS instance. The endpoint and port number are in the `<Internal endpoint>:<Internal port number>` format. Example: `rm-bpxxxxxx.rds.aliyuncs.com:3433`. For more information about how to view the internal endpoint and port number of an instance, see [View and modify the internal endpoint and port number](#).
 - ②: The account that is used to access the RDS database.
 - ③: The password of the account that is used to access the RDS database.
6. Click **Login**.

Note If you want the browser to remember the password, select **Remember your password** and click **Login**.

11.6.4. View and modify the internal endpoint and port number

You must use the internal endpoint and port number to access an RDS instance. This topic describes how to view and modify the internal endpoint and port number of an ApsaraDB for RDS instance in the ApsaraDB for RDS console.

View the internal endpoint and port number

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the **Basic Information** section, view the internal and public endpoints and port numbers.

Note The endpoints and port numbers are displayed only after you configure an [IP address whitelist or security group](#) for the RDS instance.

The screenshot shows the 'Basic Information' tab of an instance. The 'Internal Endpoint' field is highlighted with a red box, and the 'Internal Port' field is also highlighted with a red box. Other visible fields include Instance ID, Name, Region and Zone, Instance Role & Edition (Primary Instance (High-availability)), and Storage Type (Local SSD).

Modify the internal endpoint and port number

1. Log on to the [ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Connection**.
5. On the right side of the page, click **Change Endpoint**.
6. In the dialog box that appears, set **Connection Type** to **Internal Endpoint**.
7. Modify the endpoint prefix and port number and then click **OK**.

Note

- The prefix of the endpoint must be 8 to 64 characters in length and can contain letters, digits, and hyphens (-). It must start with a lowercase letter.
- The port number must be within the range of 1000 to 5999.

The 'Change Endpoint' dialog box is shown. The 'Connection Type' dropdown is set to 'Internal Endpoint'. The 'Endpoint' field has a placeholder and a note: 'Starts with a lower-case letter, consists of 8 to 64 characters, including letters, digits, or hyphen (-)'. The 'Port' field contains '3433' and a note: 'Port Range: 1000 to 5999'. There are 'OK' and 'Cancel' buttons at the bottom.

FAQ

- **Q:** Do I need to modify the endpoint or port number in my application after I modify the endpoint or port number of an instance?
A: Yes, you must modify the endpoint or port number in the application after you have modified them. Otherwise, the application cannot connect to databases of the instance.
- **Q:** Does the modification of the endpoint take effect immediately? Do I need to restart the instance?
A: No, you do not need to restart the instance. The modification takes effect immediately.

11.7. Accounts

11.7.1. Create an account

Before you start to use ApsaraDB for RDS, you must create an account for the RDS instance. This topic describes how to create an account for a PolarDB instance.

Precautions

- Databases within the same instance share all of the resources that belong to the instance. Each RDS instance supports one initial account and multiple standard accounts. You can execute SQL statements to create and manage standard accounts and databases.
- To migrate an on-premises database to an RDS instance, you must create a database and an account with the same names on the RDS instance.
- Follow the least privilege principle to create accounts and grant them appropriate read-only and read/write permissions on databases based on the required roles. When necessary, you can create more than one account and allow each account to access only the data within its authorized workloads. If an account does not need to write data to a database, assign read-only permissions to the account.
- For security purposes, we recommend that you configure strong passwords for the accounts that you create and change the passwords on a regular basis.
- The initial account cannot be deleted after it is created.

Create an initial account

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Accounts**.
5. Click **Create Initial Account** and configure the following parameters.

Parameter	Description
Database Account	<ul style="list-style-type: none"> ◦ The name of the account must be 2 to 16 characters in length. ◦ The name of the account can contain lowercase letters, digits, and underscores (_). ◦ The name of the account must start with a letter and end with a letter or digit.
Password	<ul style="list-style-type: none"> ◦ The password must be 8 to 32 characters in length. ◦ The password must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. ◦ Special characters include ! @ # \$ % ^ & * () _ + - =
Re-enter Password	Enter the same password again.

6. Click **Create**.

Create a standard account

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. Click **Log On to DB** in the upper-right corner of the page.
5. On the **Data Management (DMS) logon** page that appears, check the endpoint and port number displayed on the page. If the information is correct, enter the username and password of the database.

The screenshot shows the DMS login page. At the top is the DMS logo. Below it are three input fields, each with a red circle containing a number: 1, 2, and 3. Field 1 is for IP Address:Port, field 2 is for Database Username, and field 3 is for the password. Below the fields is a checkbox for 'Remember your password' and a link for 'About DMS (Data Management Service)'. At the bottom is a blue 'Login' button.

Parameter	Description
IP Address:Port	This parameter is marked with ① in the figure. Enter the endpoint and port number of the instance.
Database Username	This parameter is marked with ② in the figure. Enter the name of the account used to access the database.
Enter your password	This parameter is marked with ③ in the figure. Enter the password of the account used to access the database.

6. Click **Login**.

Note If a message prompts you that the connection fails, the problem may be caused by an improperly configured whitelist. Reconfigure the whitelist in the console. For more information, see [Configure an IP whitelist](#).

- In the top navigation bar, choose **SQL Operations > SQL Window** after you have logged on to the RDS instance.
- In the SQL window, execute the following statement to create a standard account:

```
CREATE USER name [ [ WITH ] option [ ... ]
where option can be:
    SUPERUSER | NOSUPERUSER
    | CREATEDB | NOCREATEDB
    | CREATEROLE | NOCREATEROLE
    | CREATEUSER | NOCREATEUSER
    | INHERIT | NOINHERIT
    | LOGIN | NOLOGIN
    | REPLICATION | NOREPLICATION
    | CONNECTION LIMIT connlimit
    | [ ENCRYPTED | UNENCRYPTED ] PASSWORD 'password'
    | VALID UNTIL 'timestamp'
    | IN ROLE role_name [, ...]
    | IN GROUP role_name [, ...]
    | ROLE role_name [, ...]
    | ADMIN role_name [, ...]
    | USER role_name [, ...]
    | SYSID uid
```

For example, if you want to create a user account named test2 whose password is 123456, execute the following statement:

```
create user test2 password '123456';
```

9. Click **execute**.

11.7.2. Reset the password

This topic describes how to reset the password of your database account in the ApsaraDB for RDS console.

Procedure

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Accounts**.
5. In the **Actions** column corresponding to the target account, click **Reset Password**.
6. In the **Reset Account Password** dialog box, enter a new password and click **OK**.

-  **Note** The password must meet the following requirements:
- The password must be 8 to 32 characters in length.
 - The password must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters.
 - Special characters include ! @ # \$ % ^ & * () _ + - =

11.8. Databases

11.8.1. Create a database

Before you start to use ApsaraDB for RDS, you must create a database for an RDS instance. This topic describes how to create a database for a PolarDB instance.

Prerequisites

A PolarDB instance has been created. For more information about how to create an instance, see [Create an instance](#).

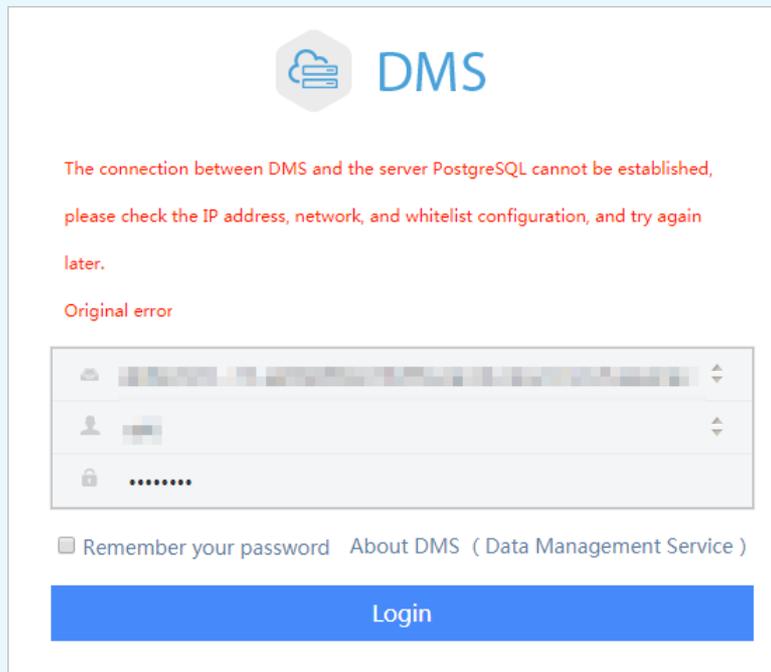

Procedure

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. Click **Log On to DB** in the upper-right corner of the page.
5. On the **Data Management (DMS)** logon page that appears, check the endpoint and port number displayed on the page. If the information is correct, enter the username and password of the database.

Parameter	Description
IP Address:Port	This parameter is marked with ① in the figure. Enter the endpoint and port number of the instance.
Database Username	This parameter is marked with ② in the figure. Enter the name of the account used to access the database.
Enter your password	This parameter is marked with ③ in the figure. Enter the password of the account used to access the database.

6. Click **Login**.

Note If a message prompts you that the connection fails, the problem may be caused by an improperly configured whitelist. Reconfigure the whitelist in the console. For more information, see [Configure an IP whitelist](#).

7. In the top navigation bar, choose **SQL Operations > SQL Window** after you have logged on to the RDS instance.
8. In the SQL window, execute the following statement to create a database:

```
CREATE DATABASE name
[ [ WITH ] [ OWNER [=] user_name ]
  [ TEMPLATE [=] template ]
  [ ENCODING [=] encoding ]
  [ LC_COLLATE [=] lc_collate ]
  [ LC_CTYPE [=] lc_ctype ]
  [ TABLESPACE [=] tablespace_name ]
  [ CONNECTION LIMIT [=] connlimit ] ]
```

For example, if you want to create a database named test, execute the following statement:

```
create database test;
```

9. Click **execute**.

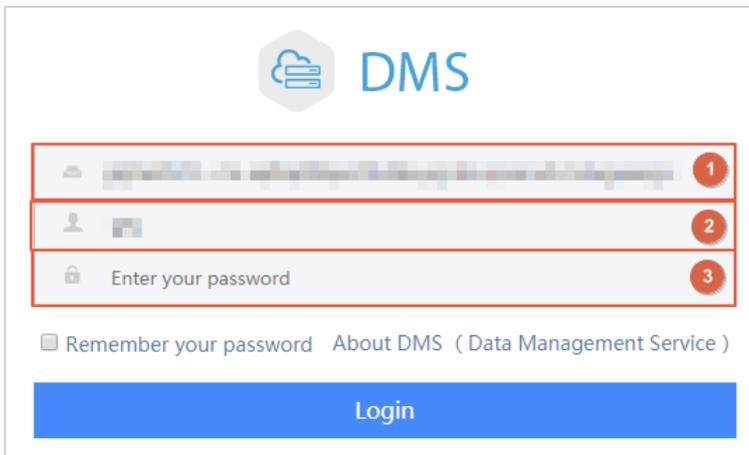

11.8.2. Delete a database

This topic describes how to delete a database from a PolarDB instance.

Procedure

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.

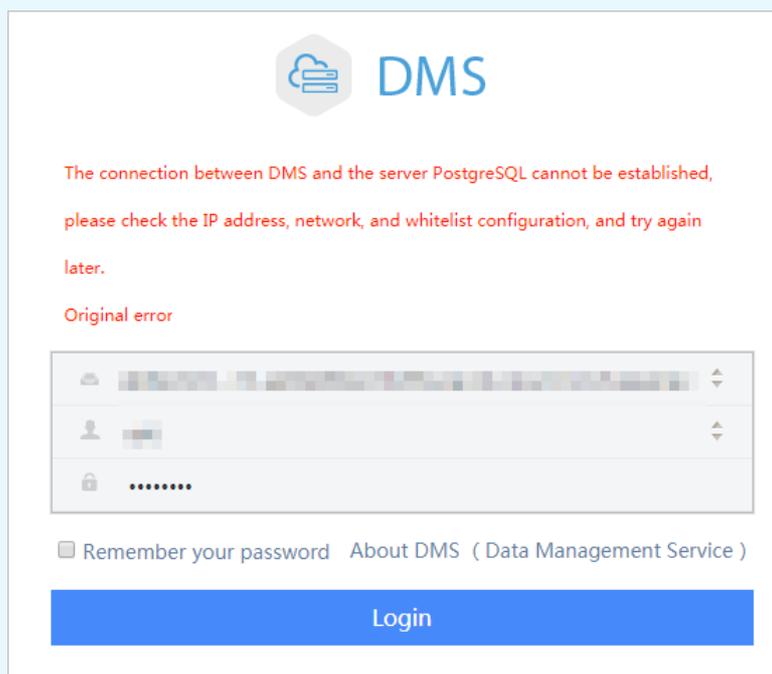

- Click **Log On to DB** in the upper-right corner of the page.
- On the Data Management (DMS) logon page that appears, check the endpoint and port number displayed on the page. If the information is correct, enter the username and password of the database.

Parameter	Description
IP Address:Port	This parameter is marked with ① in the figure. Enter the endpoint and port number of the instance.
Database Username	This parameter is marked with ② in the figure. Enter the name of the account used to access the database.
Enter your password	This parameter is marked with ③ in the figure. Enter the password of the account used to access the database.

- Click **Login**.

Note If a message prompts you that the connection fails, the problem may be caused by an improperly configured whitelist. Reconfigure the whitelist in the console. For more information, see [Configure an IP whitelist](#).

7. In the top navigation bar, choose **SQL Operations > SQL Window** after you have logged on to the RDS instance.
8. Execute the following statement to delete the database:

```
drop database <database name>;
```

9. Click **execute**.

11.9. Network, VPC, and VSwitch

11.9.1. Change the network type

This topic describes how to change the network type of an ApsaraDB for RDS instance between classic network and VPC.

Context

- **Classic network:** RDS instances in the classic network are not isolated. Unauthorized access to these instances can be blocked only by whitelists.
- **VPC:** Each Virtual Private Cloud (VPC) is an isolated network. We recommend that you select the VPC network type because it is more secure than the classic network.

You can configure route tables, CIDR blocks, and gateways in a VPC. To smoothly migrate applications to the cloud, you can connect your own data center to a VPC by using leased lines or VPNs. This allows you to build a virtual data center on the cloud.

Change the network type from VPC to classic network

Precautions

- After you change the network type from VPC to classic network, the internal endpoint of the RDS instance remains unchanged, but the IP address bound to the internal endpoint changes.
- After the network type is changed, ECS instances in the same VPC as the RDS instance can no longer connect to the RDS instance by using the internal endpoint. You must update the endpoint for the applications deployed on the ECS instances.
- Changing the network type may result in a network interruption of 30 seconds. To avoid interruptions to your business, we recommend that you change the network type during off-peak hours or configure automatic reconnection policies for your applications.

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Connection**.
5. In the upper-right corner of the **Database Connection** section, click **Switch to Classic Network**.
6. In the dialog box that appears, click **OK**.

 **Note** After the network type is changed to classic network, only ECS instances in the classic network can access your RDS instance over an internal network. Configure the internal endpoint for these ECS instances.

7. Configure a whitelist of your RDS instance to allow access from the ECS instances over the internal network.

Note

- If the network isolation mode of the RDS instance is standard whitelist, add the internal IP addresses of the ECS instances to a whitelist of your RDS instance.
- If the network isolation mode of the RDS instance is **enhanced whitelist**, add the internal IP addresses of the ECS instances to a classic network whitelist. If no classic network whitelists are available, create a whitelist.

Change the network type from classic network to VPC

1. **Log on to the ApsaraDB for RDS console.**
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Connection**.
5. In the upper-right corner of the Database Connection section, click **Switch to VPC**.
6. In the **Switch to VPC** dialog box, select a VPC and VSwitch and specify whether to **Reserve Original Classic Network Endpoint**.

Note

- Select a VPC. We recommend that you select the VPC where your ECS instances reside. Otherwise, the ECS instances cannot communicate with the RDS instance over the internal network.
- Select a VSwitch. If no VSwitches are available in the selected VPC, create one in the same zone where the RDS instance resides. Use the following path to navigate the guide: *Virtual Private Cloud User Guide > Quick Start > Create a VSwitch*.
- Determine whether to select the **Reserve Original Classic Endpoint** option. The following table describes the details.

Operation	Description
Not selected	<p>The endpoint used in the classic network is replaced with an endpoint in the VPC.</p> <p>When you change the network type, a 30-second network interruption may occur, and connections between ECS instances in the classic network and the RDS instance are interrupted.</p>
Selected	<p>The endpoint used in the classic network is retained, and a new endpoint to be used in the VPC is generated. In such cases, the RDS instance runs in hybrid access mode. ECS instances in both the classic network and a VPC can connect to the RDS instance over the internal network.</p> <p>When you change the network type, no network interruptions occur. Connections between ECS instances in the classic network and the RDS instance will be available until the endpoint used in the classic network expires.</p> <p>To migrate your business to the VPC without interruption, you must add the new endpoint used in the VPC to access the ECS instances before the endpoint used in the classic network expires. Seven days before the endpoint used in the classic network expires, the system will send a text message to the phone number bound to your Alibaba Cloud account every day.</p> <p>For more information, see Hybrid access from both the classic network and VPCs.</p>

7. Add the internal IP addresses of ECS instances in the selected VPC to a VPC whitelist. This allows the ECS instances to access the RDS instance over the internal network. If no VPC whitelists are available, create a

whitelist.

 **Note**

- If you have retained the classic network endpoint, add the VPC endpoint to the ECS instances before the classic network endpoint expires.
- If you have not retained the classic network endpoint, connections between ECS instances in the classic network and the RDS instance over the internal network are interrupted. You must add the new endpoint to ECS instances in the VPC immediately after the network type is changed.

11.9.2. Hybrid access from both the classic network and VPCs

This topic describes how to use the hybrid access solution of ApsaraDB for RDS to change the network type of an instance from classic network to Virtual Private Network (VPC) without network interruptions.

Prerequisites

- The network type of the instance is classic network.
- Available VPCs and VSwitches exist in the zone where the instance resides.

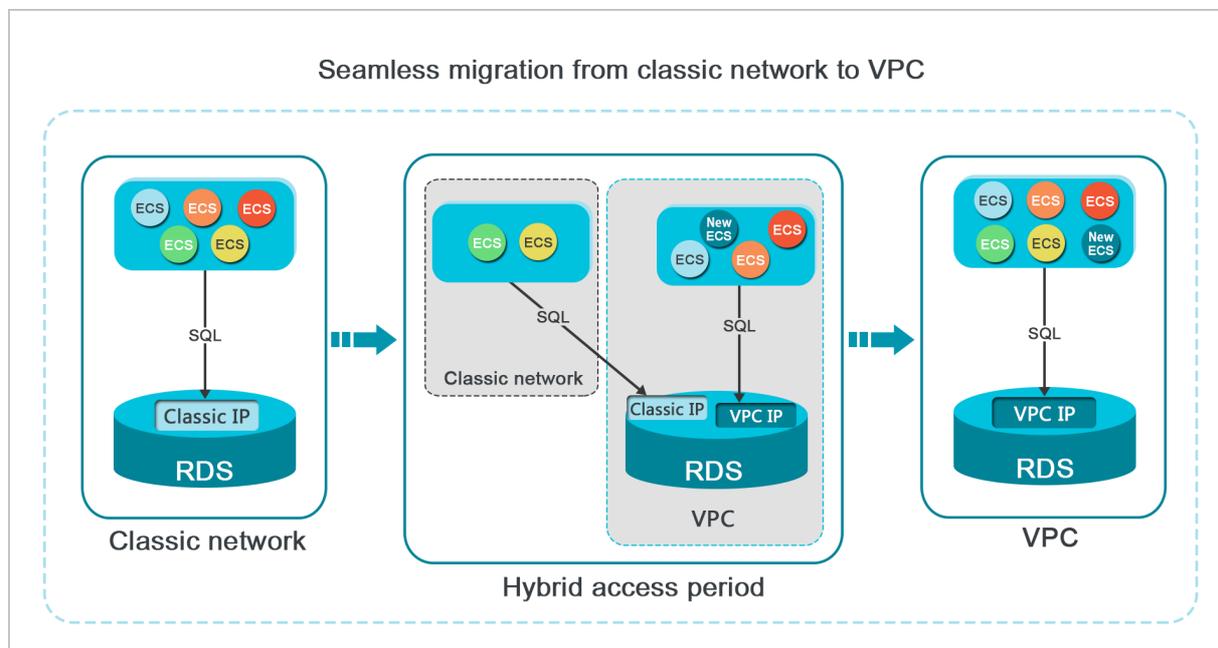

Context

In the past, when you changed the network type of an RDS instance from classic network to VPC, the internal endpoint of the RDS instance would remain the same but the IP address bound to the endpoint would change to the corresponding IP address in the VPC. This change would cause a 30-second network interruption, and ECS instances within the classic network would not be able to access the RDS instance through the internal endpoint within this period. To smoothly change the network type, ApsaraDB for RDS provides the hybrid access solution.

Hybrid access refers to the ability of an RDS instance to be accessed by ECS instances in both the classic network and VPCs. During the hybrid access period, the RDS instance reserves the original internal endpoint of the classic network and adds the internal endpoint of VPCs. This prevents network interruptions during the network type switchover.

For better security and performance, we recommend that you use the internal endpoint of VPCs. Hybrid access is available for a limited period of time. The internal endpoint of the classic network is released when the hybrid access period expires. In that case, your applications cannot access the RDS database by using the internal endpoint of the classic network. You must configure the internal endpoint of VPCs in all your applications during the hybrid access period. This ensures smooth network switchover and minimize the impact on your services.

For example, your company wants to use the hybrid access solution to change the network type from classic network to VPC. During the hybrid access period, some applications can access the database through the internal endpoint of VPCs, and the other applications can access the database through the original internal endpoint of the classic network. When all the applications access the database through the internal endpoint of VPCs, the internal endpoint of the classic network can be released. The following figure illustrates the scenario.

Limits

During the hybrid access period, the instance has the following limits:

- Changing to the classic network is not supported.
- Migrating the RDS instance to another zone is not supported.

Change the network type from classic network to VPC

For more information, see [Change the network type from classic network to VPC](#).

Change the expiration time for the original internal endpoint of the classic network

During the period in which your instance can be connected over the classic network or VPCs, you can specify the expiration time for the endpoint of the classic network. The setting takes effect immediately. For example, if the endpoint of the classic network is about to expire on August 18, 2017 and you change the expiration time to 14 days later on August 15, 2017, the endpoint of the classic network is released on August 29, 2017.

Follow these steps to change the expiration time:

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Connection**.
5. On the **Instance Connection** tab, click **Change Expiration Time**.
6. On the **Change Expiration Time** dialog box that appears, select an expiration time and click **OK**.

11.10. Monitoring

11.10.1. View monitoring data

ApsaraDB for RDS provides a wide range of performance metrics. You can view the resource monitoring data in the ApsaraDB for RDS console.

Procedure

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Monitoring and Alerts**.
5. On the **Monitoring** tab, select the time range to query the corresponding monitoring data. The following table lists the specific monitored metrics.

Monitoring metric	Description
Disk Space	The disk space usage of the instance. Unit: MB.
IOPS	The number of I/O requests of the data and log disks per second.
Memory Usage	The memory usage of the instance.
CPU Utilization	The CPU utilization of the instance.

11.10.2. Set the monitoring frequency

This topic describes how to set the monitoring frequency of a PolarDB instance.

Context

PolarDB supports the following monitoring frequencies:

- Every 5 seconds
- Every 60 seconds
- Every 300 seconds

Procedure

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Monitoring and Alerts**.
5. In the upper-right corner of the **Monitoring** tab, click **Set Monitoring Frequency**.
6. In the **Set Monitoring Frequency** dialog box, select the required monitoring frequency and click **OK**.

11.11. Data security

11.11.1. Switch to the enhanced whitelist mode

This topic describes how to switch from the standard whitelist mode to the enhanced whitelist mode for a PolarDB instance. The enhanced whitelist mode provides higher security.

Network isolation modes

RDS instances support the following network isolation modes:

- **Standard whitelist mode**

IP addresses from both the classic network and VPCs are added to the same whitelist. However, the standard whitelist mode may incur security risks. Therefore, we recommend that you use the enhanced whitelist mode.

- **Enhanced whitelist mode**

An enhanced IP address whitelist can contain only IP addresses from the classic network or VPCs. When you create an IP address whitelist, you must specify its network type.

Changes after you switch to the enhanced whitelist mode

- If the network type of the instance is VPC, a new whitelist is created and contains the same IP addresses as the original whitelists. The new IP whitelist only applies to VPCs.
- If the network type of the instance is classic network, a new whitelist is created and contains the same IP addresses as the original whitelists. The new IP whitelist only applies to the classic network.
- If the instance supports **access from both the classic network and VPCs**, two new whitelists are created, and each contains the same IP addresses as the original whitelists. One whitelist applies to VPCs, and the other applies to the classic network.

 **Note** Switching to enhanced whitelist mode does not affect the ECS instances that are in the security group.

Precautions

- You can switch from standard whitelist mode to enhanced whitelist mode, but not the other way around.
- In enhanced whitelist mode, a classic network whitelist also allows access from the Internet. If you want to access an RDS instance from a host over the Internet, you can add the public IP address of the host to a classic network whitelist.

Procedure

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Data Security**.
5. On the **Whitelist Settings** tab, click **Switch to Enhanced Whitelist (Recommended)**.
6. In the **Enable Enhanced Whitelist** dialog box, click **Confirm**.

11.11.2. Configure an IP whitelist

This topic describes how to configure a whitelist for an ApsaraDB for RDS instance. Only devices that are listed in a whitelist can access your RDS instance.

Context

Whitelists make your RDS instance more secure and do not interrupt the operations of your RDS instance during configuration. We recommend that you update the IP address whitelists and security groups configured for your RDS instance on a regular basis.

You can use one of the following methods to configure a whitelist.

- **Configure a whitelist:** Add IP addresses to grant them access to the RDS instance.

 **Note** The default IP address whitelist contains only the IP address 127.0.0.1. This indicates that no devices are allowed to access the RDS instance.

- Configure an ECS security group: Add an ECS security group for the RDS instance to allow ECS instances in the group to access the RDS instance.

Procedure

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Data Security**. On the page that appears, click the **Whitelist Settings** tab.
5. On the **Whitelist Settings** tab, click **Edit** corresponding to the default whitelist.

 **Note** You can also click **Create Whitelist** to create a whitelist.

6. In the **Edit Whitelist** dialog box, enter the IP addresses or CIDR blocks that are allowed to access the instance and click **OK**. The following section describes the rules:
 - If you enter the CIDR block 10.10.10.0/24 in the **IP Addresses** field, all IP addresses in the 10.10.10.X format can access your RDS instance.
 - If you enter more than one IP address or CIDR block, you must separate them with commas (,). Do not add spaces before or after the commas. Example: 192.168.0.1,172.16.213.9.
 - If you click **Add Internal IP Addresses of ECS Instances**, the IP addresses of all created ECS instances within your Alibaba Cloud account are displayed. You can select the required IP addresses to add to the whitelist.

11.12. Backup

11.12.1. Back up data

This topic describes how to back up a PolarDB instance. You can configure a backup policy that is used to automatically back up your PolarDB instance. If you do not configure a backup policy, the default backup policy is used. You can also manually back up your PolarDB instance.

Precautions

- Do not execute data definition language (DDL) statements during a backup. If you do so, the backup may fail due to table locks.
- We recommend that you back up your instance during off-peak hours.
- If the amount of data is large, it may take a long time to back up your RDS instance.
- Backup files are retained for a specified retention period. We recommend that you download the required backup files to your computer before they are deleted.

Overview of data and log backups

Database engine	Data backup	Log backup
PolarDB	Supports full physical backup.	Write-ahead logs (WALs) are compressed and uploaded immediately after they are generated. Each log takes up 16 MB of storage space. On-premises logs are deleted within 24 hours.

Configure a backup policy to automatically back up your PolarDB instance

ApsaraDB for RDS automatically backs up your instance based on the specified backup policy.

1. [Log on to the ApsaraDB for RDS console.](#)

2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Backup and Restoration**.
5. On the **Backup and Restoration** page, click the **Backup Settings** tab and then click the **Edit** button.
6. In the dialog box that appears, configure the following parameters, and then click **OK**. The following table lists the parameters.

Parameter	Description
Data Retention Period	The number of days for which you want to retain data backup files. Valid values: 7 to 730. Unit: days. Default value: 7.
Backup Cycle	The cycle to create backups. You can select one or more days of a week. <div style="border: 1px solid #ccc; background-color: #e6f2ff; padding: 5px;"> ? Note To ensure data security, we recommend that you back up your RDS instance at least twice a week. </div>
Backup Time	The hour at which you want to create a backup.
Log Backup	The switch to enable or disable the log backup function. <div style="border: 1px solid #ccc; background-color: #e6f2ff; padding: 5px;"> 🔊 Notice If you disable this function, all log backup files are deleted and your instance cannot be restored to previous points in time. </div>
Log Retention Period	<ul style="list-style-type: none"> ○ The period of time for which you want to retain log backup files. Valid values: 7 to 730. Unit: days. Default value: 7. ○ The log retention period must be less than or equal to the data retention period.

Back up data manually

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the upper-right corner of the page, click **Back Up Instance**.
5. Select the backup mode and backup policy, and click **OK**.

? **Note** The backup mode is **Full Backup** and the backup policy is **Instance Backup**.

6. In the upper-right corner, click the  icon to view the task progress displayed in the **Task Progress** list.

? **Note** You cannot download backup files to your computer.

FAQ

1. Q: Can I disable data backup for a PolarDB instance?

A: No, you cannot disable the data backup function of your PolarDB instance. However, you can reduce the backup frequency to as low as twice a week. The data retention period must be within the range of 7 days to 730 days.

2. Q: Can I disable log backup for a PolarDB instance?

A: Yes, you can disable the log backup function of your PolarDB instance. You can log on to the ApsaraDB for RDS console and navigate to the Backup Settings tab to disable the log backup function of your instance.

11.12.2. Download backup files

This topic describes how to download unencrypted log backup files of a PolarDB instance.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the Instances page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Backup and Restoration**. The **Backup and Restoration** page appears.
5. Select the **Archived Logs** tab, specify the time range, find the target log backup file, and click **Download** in the Actions column.

Note If you want to download a log backup file that is used to restore data to an on-premises database, make sure that the file meets the following requirements:

- The Instance ID of the log file on the Archived Logs tab must be the same as the Instance No. displayed on the Data Backup tab.
- The start time of the file must be later than the start time of the specified time range. It must also be earlier than the point in time to which you want to restore data.

6. In the **Download Binary Log** dialog box, select the download method.

Download method	Description
Download	Download the backup file.
Copy Internal Endpoint	Copy the internal endpoint that is used to download the backup file. If your ECS and RDS instances reside in the same region, you can log on to the ECS instance. Then, you can use the internal endpoint to download the backup file. This method is fast and secure.
Copy Public Endpoint	Copy the public endpoint that is used to download the backup file. If you want to use other tools to download the backup file, copy the public endpoint.

Note If you are using a Linux operating system, you can run the following command to download the backup file:

```
wget -c '<The endpoint from which you can download the backup file>' -O <The name of the backup file>
```

- The **-c** option enables resumable download.
- The **-O** option saves the downloaded file by using a specified name. We recommend that you use the file name contained in the download URL.
- If the endpoint contains more than one parameter, enclose the endpoint in a pair of single quotation marks (').

```
[root@i-06Expres=1576Signature=Y8%3D' -O hins8641051_data_20191112155605_qp.xb]# wget -c 'http://rdsbak-ou.aliyuncs.com/xxxxx/hins8641051_data_20191112155605_qp.xb?OSSAc
```

11.13. Logs

The primary/secondary switching logs of a PolarDB instance can be used for troubleshooting. This topic describes how to manage logs of a PolarDB instance in the ApsaraDB for RDS console.

Procedure

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Logs**.
5. On the **Logs** page, click the **Slow Query Logs** or **Primary/Secondary Switching Logs** tab, select a time range, and click **Search**.

Log type	Description
Slow query log	Records SQL statements that took more than one second to execute in the last month. Duplicated SQL statements are removed.
Primary/secondary switching log	Records switchovers between the primary and secondary instances in the last month.

11.14. Plug-ins supported

This topic lists the plug-ins and plug-in versions supported by PolarDB.

Plug-ins and versions supported by PolarDB

Plug-in	Version
btree_gin	1.3
btree_gist	1.5
citext	1.5
cube	1.4
dict_int	1.0
earthdistance	1.1
fuzzystrmatch	1.1
hstore	1.5
intagg	1.1
intarray	1.2
isn	1.2
ltree	1.1
pg_buffercache	1.3
pg_pathman	1.5

Plug-in	Version
pg_prewarm	1.2
pg_stat_statements	1.6
pg_trgm	1.4
pg_wait_sampling	1.1
pgcrypto	1.3
pgrowlocks	1.2
pgstattuple	1.5
plpgsql	1.0
sslinfo	1.2
tablefunc	1.0
unaccent	1.1
uuid-oss	1.1
zhparser	1.0
ganos_geometry	2.3
ganos_raster	2.3
ganos_geometry_sfcgal	2.3
ganos_geometry_topology	2.3
ganos_tiger_geocode	2.3
ganos_address_standardizer	2.3
ganos_address_standardizer_data_us	2.3
ganos_networking	2.3
ganos_pointcloud	2.3
ganos_trajectory	2.3
plperl	1.0
pltcl	1.0

 **Note** PolarDB updates its kernel to support new plug-ins or plug-in versions. To view the supported plug-ins, execute the following statement:

```
show polar_supported_extensions;
```

11.15. PolarDB development driver

This topic describes how to configure the PolarDB development driver.

The PolarDB development driver provides a variety of driver interfaces for application development:

- For Linux applications, the interfaces include Java interfaces, Oracle Call Interface (OCI), and Open Database Connectivity (ODBC).
- For Windows applications, the interfaces include .Net interfaces, Java interfaces, OCI, and ODBC.

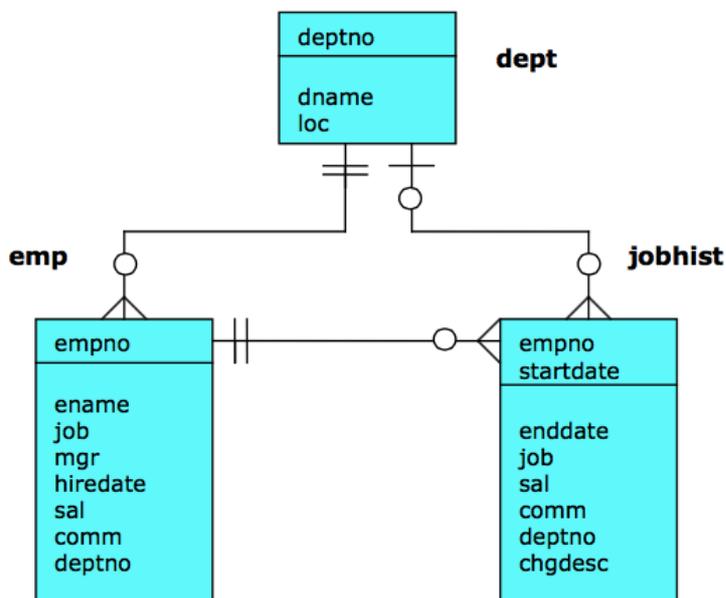

Click [here](#) to download the PolarDB development driver.

- The driver contains the following files:
 - edb_connectors-9.3.5.14-3-linux-x64.run
 - edb_connectors-9.3.5.14-3-linux.run
 - edb_connectors-9.3.5.14-3-windows-x64.exe
 - edb_connectors-9.3.5.14-3-windows.exe
- By default, the driver is installed to the following path:
 - Linux: `/opt/PostgresPlus/9.3AS/connectors`
 - Windows: `C:/Program Files/PostgresPlus/9.3AS/connectors`

11.16. Compatibility for Oracle

This topic helps you understand terms and concepts that are used in PolarDB by examples. You can effectively develop PolarDB databases and migrate data from Oracle to PolarDB databases.

The operations described in this topic are built on a data model that displays basic PolarDB operations, such as database creation, table creation, and user management. The following figure shows the data model:

To simulate an environment similar to Oracle, the following example creates a database named `orcl_polardb`, a role named `scott` in the `orcl_polardb` database, and a schema named `scott`.

Use `psql` to connect to a database

```
psql -h polardbaddress.polaradb.rds.aliyuncs.com -p 3433 -U myuser -d template1
Enter the password of the myuser user:
psql.bin (9.4.1.3, server 9.3.5.14)
Enter help to obtain help information.
template1=>
```

CREATE DATABASE

```
template1=> CREATE DATABASE orcl_polardb;  
CREATE DATABASE  
template1=> \c orcl_polardb  
psql.bin (9.4.1.3, server 9.3.5.14)
```

CREATE ROLE

```
orcl_polardb=> CREATE ROLE scott LOGIN PASSWORD 'scott123';  
CREATE ROLE
```

CREATE SCHEMA

```
orcl_polardb=> CREATE SCHEMA scott;  
CREATE SCHEMA  
orcl_polardb=> GRANT scott TO myuser;  
GRANT ROLE  
orcl_polardb=> ALTER SCHEMA scott OWNER TO scott;  
ALTER SCHEMA  
orcl_polardb=> REVOKE scott FROM myuser;  
REVOKE ROLE
```

Note

- If you have not granted the permissions owned by the scott role to the myuser user when you execute the `ALTER SCHEMA scott OWNER TO scott` statement, the `ERROR:must be member of role "scott"` permission error is displayed.
- For security reasons, revoke the scott permissions from the myuser user after the statement is executed. This provides improved security.

Connect to the orcl_polardb database

 **Note** The following operations must be performed under the scott account. Otherwise, the created tables and objects do not belong to scott and permission errors may occur.

```
[root@localhost bin]# ./psql -h polardbaddress.polardb.rds.aliyuncs.com -p 3433 -U scott -d orcl_polardb  
Enter the password of the user scott:  
psql.bin (9.4.1.3, server 9.3.5.14)  
Enter help to obtain help information.  
orcl_polardb=>
```

CREATE TABLE

```

CREATE TABLE dept (
  deptno    NUMBER(2) NOT NULL CONSTRAINT dept_pk PRIMARY KEY,
  dname     VARCHAR2(14) CONSTRAINT dept_dname_uq UNIQUE,
  lock      VARCHAR2(13)
);
CREATE TABLE emp (
  empno     NUMBER(4) NOT NULL CONSTRAINT emp_pk PRIMARY KEY,
  ename     VARCHAR2(10),
  job       VARCHAR2(9),
  mgr       NUMBER(4),
  hiredate  DATE,
  sal       NUMBER(7,2) CONSTRAINT emp_sal_ck CHECK (sal > 0),
  comm      NUMBER(7,2),
  deptno    NUMBER(2) CONSTRAINT emp_ref_dept_fk
            REFERENCES dept(deptno)
);
CREATE TABLE jobhist (
  empno     NUMBER(4) NOT NULL,
  startdate DATE NOT NULL,
  enddate   DATE,
  job       VARCHAR2(9),
  sal       NUMBER(7,2),
  comm      NUMBER(7,2),
  deptno    NUMBER(2),
  chgdesc   VARCHAR2(80),
  CONSTRAINT jobhist_pk PRIMARY KEY (empno, startdate),
  CONSTRAINT jobhist_ref_emp_fk FOREIGN KEY (empno)
            REFERENCES emp(empno) ON DELETE CASCADE,
  CONSTRAINT jobhist_ref_dept_fk FOREIGN KEY (deptno)
            REFERENCES dept (deptno) ON DELETE SET NULL,
  CONSTRAINT jobhist_date_chk CHECK (startdate <= enddate)
);

```

CREATE OR REPLACE VIEW

```

CREATE OR REPLACE VIEW salesemp AS
  SELECT empno, ename, hiredate, sal, comm FROM emp WHERE job = 'SALESMAN';

```

CREATE SEQUENCE

```

CREATE SEQUENCE next_empno START WITH 8000 INCREMENT BY 1;

```

INSERT INTO

```

INSERT INTO dept VALUES (10,'ACCOUNTING','NEW YORK');
INSERT INTO dept VALUES (20,'RESEARCH','DALLAS');
INSERT INTO dept VALUES (30,'SALES','CHICAGO');
INSERT INTO dept VALUES (40,'OPERATIONS','BOSTON');
INSERT INTO emp VALUES (7369,'SMITH','CLERK',7902,'17-DEC-80',800,NULL,20);
INSERT INTO emp VALUES (7499,'ALLEN','SALESMAN',7698,'20-FEB-81',1600,300,30);

11.17. Management functions

You cannot use superuser accounts to manage database objects of PolarDB. Therefore, PolarDB provides management functions to help you use various PolarDB features. This topic describes how to use the management functions.

Rules of management functions

You must use the root account of ApsaraDB for RDS to run management functions. The root account is a management account specified when an instance is created and has the CREATEDB, CREATEROLE, and LOGIN permissions.

- **rds_manage_extension**

This function enables you to manage plug-ins. You can use this function to create and delete plug-ins supported by PolarDB.

```
rds_manage_extension(operation text, pname text, schema text default NULL, logging bool default false)
```

operation: The parameter value is create or drop.

pname: the name of the supported plugin.

schema: the target plug-in mode.

logging: the log information when the plug-in is created.

The following plug-ins are supported:

pg_stat_statements

btree_gin

btree_gist

chkpass

citext

cube

dblink

dict_int

earthdistance

hstore

intagg

intarray

isn

ltree

pgcrypto

pgrowlocks

pg_prewarm

pg_trgm

postgres_fdw

sslinfo

tablefunc

tsearch2

unaccent

postgis

postgis_topology

fuzzystrmatch

postgis_tiger_geocoder

plperl

pltcl

plv8

"uuid-oss"p

plpgsql

oss_fdw

Examples:

1. Create the dblink plug-in.

```
select rds_manage_extension('create','dblink');
```

2. Delete the dblink plug-in.

```
select rds_manage_extension('drop','dblink');
```

- rds_pg_stat_activity()

This function returns the information of all connected sessions, which is similar to the `pg_stat_activity` view.

- `rds_pg_stat_statements()`

This function encapsulates the `pg_stat_statements` view. You can use this function to view slow SQL statements within your permissions.

- Performance analysis functions

The functions enable you to analyze the real-time performance of PolarDB instances and are similar to Automatic Workload Repository (AWR) of Oracle.

1. `rds_truncsnap()`

Description: The function is used to delete stored snapshots.

2. `rds_get_snaps()`

Description: The function is used to obtain the information of stored snapshots.

3. `rds_snap()`

Description: The function is used to generate a real-time snapshot.

4. `rds_report(beginsnap bigint, endsnap bigint)`

Description: The function is used to generate a performance analysis report based on snapshots that you specify.

Example: The following statements generates a performance analysis report based on snapshots.

```
SELECT * FROM rds_truncsnap(); // Delete stored snapshots.
```

```
SELECT * from rds_snap(); // Generate a snapshot.
```

```
SELECT * from rds_snap(); // Generate a snapshot.
```

```
SELECT * from rds_snap(); // Generate a snapshot.
```

```
SELECT * FROM rds_get_snaps(); // Obtain the IDs of the generated snapshots, which are 1, 2, and 3.
```

```
SELECT * FROM edbreport(1, 3); // Generate a performance analysis report based on the snapshot 1 and snapshot
```

```
3.
```

- Session termination functions

```
rds_pg_terminate_backend(upid int)
```

```
rds_pg_cancel_backend(upid int)
```

The functions are similar to the native `pg_terminate_backend` and `pg_cancel_backend` functions. The functions provided by Alibaba Cloud cannot manage sessions established by the superuser account.

Example: The following statement terminates the session 123456:

```
select rds_pg_cancel_backend(123456);
```

- VPD functions

Virtual Private Database (VPD) is an encapsulation that is compatible with the `DBMS_RLS` package and uses the same parameters as `DBMS_RLS` uses.

1. `rds_drop_policy` is similar to `DBMS_RLS.DROP_POLICY`.

2. `rds_enable_policy` is similar to `DBMS_RLS.ENABLE_POLICY`.

3. `rds_add_policy` is similar to `DBMS_RLS.ADD_POLICY`.

References of VPD

12. ApsaraDB RDS for PostgreSQL

12.1. What is ApsaraDB for RDS?

ApsaraDB for RDS is a stable, reliable, and scalable online database service. Based on the distributed file system and high-performance storage of Alibaba Cloud, ApsaraDB for RDS allows you to easily perform database operations and maintenance with its set of solutions for disaster recovery, backup, restoration, monitoring, and migration.

ApsaraDB RDS for PostgreSQL

ApsaraDB RDS for PostgreSQL is the most advanced open source database. It is fully compatible with SQL and supports a diverse range of data formats such as JSON, IP, and geometric data. In addition to features such as transactions, subqueries, multi-version concurrency control (MVCC), and data integrity check, ApsaraDB RDS for PostgreSQL integrates a series of features including high availability, backup, and restoration to ease operation and maintenance loads.

12.2. Limits

To ensure instance stability and security, ApsaraDB RDS for PostgreSQL has some service limits.

The following table lists the limits.

Operation	Limit
Root privilege of databases	Superuser permissions are not provided.
Database backup	Data can only be backed up by using <code>pg_dump</code> .
Database replication	ApsaraDB RDS for PostgreSQL provides a primary/secondary replication architecture (except in the Basic Edition). The secondary instance in the architecture is hidden and cannot be accessed by your applications.
RDS instance restart	You must restart an ApsaraDB RDS for PostgreSQL instance in the ApsaraDB for RDS console or by using OpenAPI Explorer.

12.3. Log on to the ApsaraDB for RDS console

This topic describes how to log on to the ApsaraDB for RDS console.

Prerequisites

- Before logging on to the ASCM console, make sure that you have obtained the IP address or domain name of the ASCM console from the deployment personnel. The URL used to access the ASCM console is in the following format: `https://[IP address or domain name of the ASCM console]`.
- We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL used to access the ASCM console. Press the Enter key.
2. Enter your username and password.

Obtain the username and password for logging on to the console from the operations administrator.

Note When you log on to the ASCM console for the first time, you must change the password of your username as prompted. Due to security concerns, your password must meet the minimum complexity requirements: The password must be 8 to 20 characters in length and must contain at least two of the following character types: uppercase letters, lowercase letters, digits, and special characters such as exclamation points (!), at signs (@), number signs (#), dollar signs (\$), and percent signs (%).

3. Click **Login** to go to the ASCM console homepage.
4. In the top navigation bar, choose **Products > Database Services > ApsaraDB for RDS**.

12.4. Quick Start

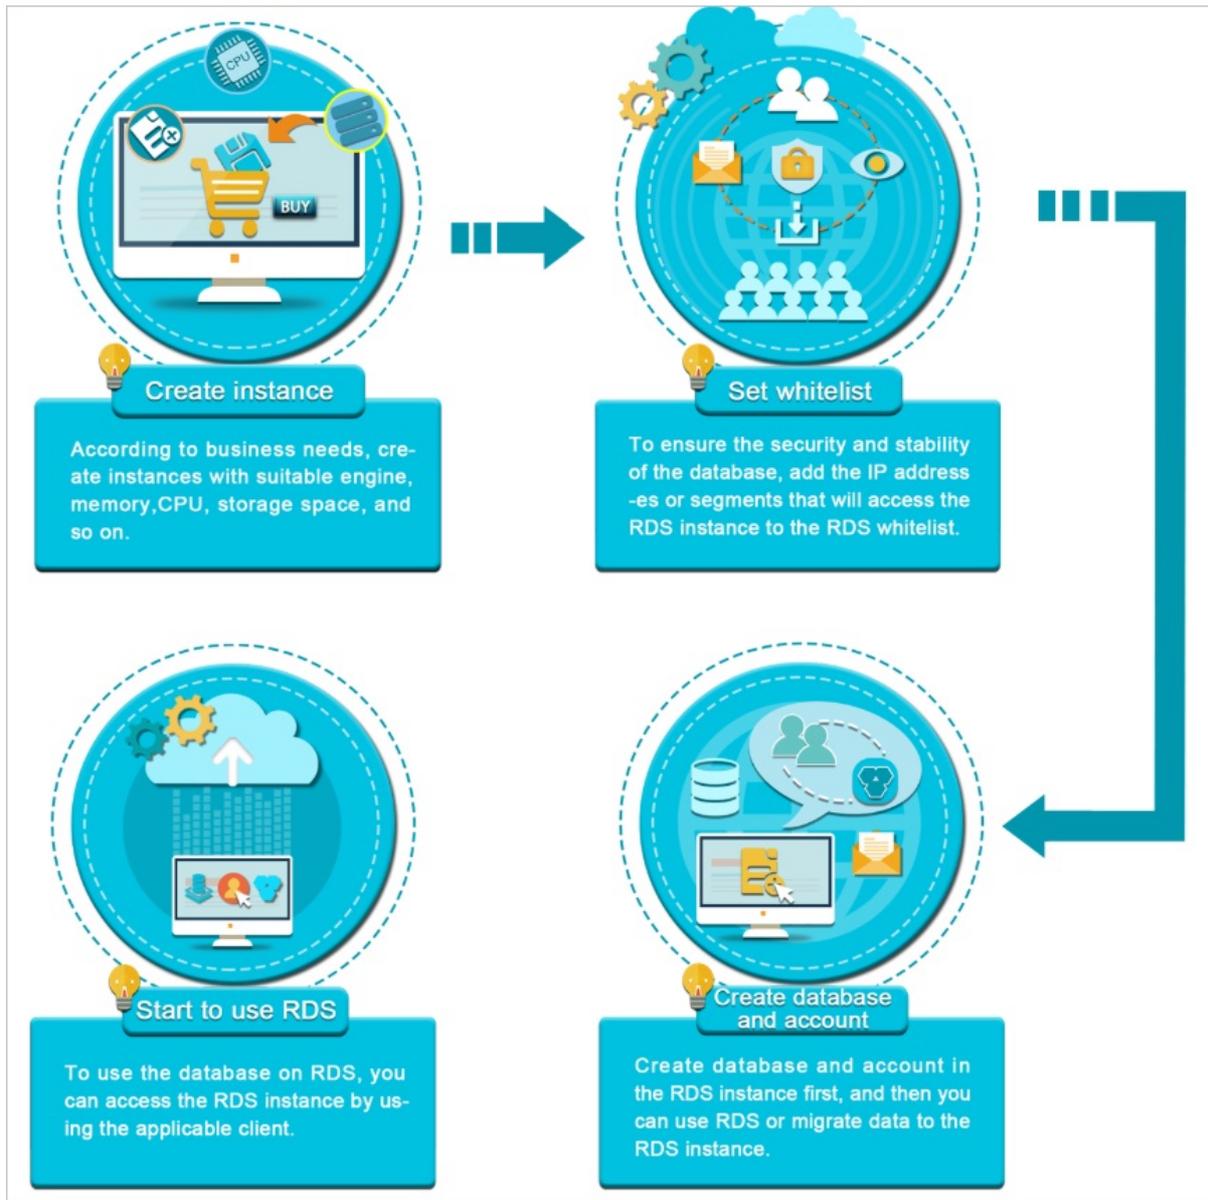

12.4.1. Procedure

This topic describes how to create and use an ApsaraDB RDS for PostgreSQL instance. The following topics describe how to create an instance, configure basic settings, and connect to an instance in details.

Flowchart for an ApsaraDB RDS for PostgreSQL instance

If you are using ApsaraDB for RDS for the first time, you can start with [Limits](#).

To purchase an ApsaraDB RDS for PostgreSQL instance and use the instance, follow these steps:

12.4.2. Create an instance

This topic describes how to create an ApsaraDB RDS for PostgreSQL instance in the ApsaraDB for RDS console.

Procedure

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the **Instances** page, click **Create Instance** in the upper-right corner.
3. Configure the following parameters.

Section	Parameter	Description
Basic Settings	Organization	The organization to which the instance belongs.
	Resource Set	The resource set to which the instance belongs.
Region	Region	The region where the instance resides.
	Zone	The zone where the instance resides.

Region Section	Parameter	Description
Specifications	Instance Name	The name of the instance. <ul style="list-style-type: none"> The name must be 2 to 64 characters in length. The name must start with a letter. The name can contain special characters. Special characters include _ - : The name cannot start with http:// or https://.
	Database Engine	The engine of the database, which varies with regions. The available database engines are displayed on the Create ApsaraDB for RDS Instance page. Select PostgreSQL.
	Engine Version	The version of the database engine. Valid values: 9.4 and 10.0.
	Edition	The edition of the database. Select one from the drop-down list.
	Instance Type	The type of the instance. Memory size determines the maximum number of connections and IOPS. The actual values are displayed on the console.
	Storage	The storage capacity of the instance, including the space to store data, system files, binary log files, and transaction files. The minimum storage capacity is 20 GB. You can adjust the storage capacity.
Network Type	Network Type	The network type of the instance. RDS instances support the following network types: <ul style="list-style-type: none"> Classic Network: Cloud services on the classic network are not isolated. Unauthorized access to a cloud service is blocked only by the security group or whitelist policy of the service. VPC: A Virtual Private Cloud (VPC) helps you to build an isolated network environment on Alibaba Cloud. You can customize the route table, IP address range, and gateway within a VPC. We recommend that you select VPC for improved security. <div style="border: 1px solid #ccc; background-color: #e6f2ff; padding: 5px; margin-top: 10px;"> ? Note After you select VPC as the network type, you must also select the corresponding VPC and VSwitch. </div>
	IP Whitelist	An IP address whitelist contains the IP addresses of entities that are allowed to access to your RDS instance. For more information, see Configure an IP address whitelist .
Access Mode	Access Mode	RDS instances support two access modes: Standard and Database Proxy . <ul style="list-style-type: none"> Standard: RDS uses Server Load Balancer (SLB) to eliminate the impact of instance high-availability switching on the application layer. This mode reduces the response time, but slightly increases the probability of network interruptions and disables SQL interception. Database Proxy: This mode prevents 90% of network interruptions and intercepts SQL injection attacks based on semantic analysis. However, it increases the response time by over 20%. <div style="border: 1px solid #ccc; background-color: #e6f2ff; padding: 5px; margin-top: 10px;"> ? Note ApsaraDB RDS for PostgreSQL supports the Standard access mode. </div>

4. After you configure the preceding parameters, click **Submit**.

12.4.3. Configure an IP address whitelist

This topic describes how to configure a whitelist for an ApsaraDB RDS for PostgreSQL instance. Only entities that are listed in a whitelist can access your RDS instance.

Context

Whitelists make your RDS instance more secure without interrupting the operation of your RDS instance during configuration. We recommend that you perform maintenance on your whitelists on a regular basis.

To configure a whitelist, perform the following operations:

- Configure a whitelist: Add IP addresses to allow them to connect to the RDS instance.

 **Note** The IP address whitelist labeled default contains only the default IP address 0.0.0.0/0, which allows all entities access to your RDS instance.

- Configure an ECS security group: Add an ECS security group for the RDS instance to allow ECS instances in the group to connect to the RDS instance.

Procedure

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, select **Data Security** and click the **Whitelist Settings** tab on the page that appears.
5. On the **Whitelist Settings** tab, click **Edit** corresponding to the default whitelist.

 **Note** You can also click **Create Whitelist** to create a new whitelist.

6. In the **Edit Whitelist** dialog box that appears, enter the IP addresses or CIDR blocks used to access the instance, and then click **OK**. The following section describes the rules:
 - If you enter the CIDR block 10.10.10.0/24 in the **IP Addresses** field, all IP addresses in the 10.10.10.X format are granted access to your RDS instance.
 - If you enter more than one IP address or CIDR block, you must separate them with commas (,). Do not add spaces before or after the commas. Example: 192.168.0.1,172.16.213.9.
 - If you click **Add Internal IP Addresses of ECS Instances**, the IP addresses of all created ECS instances within your Alibaba Cloud account are displayed. You can select the required IP addresses to add to the whitelist.

12.4.4. Create a database and an account

Before you start to use ApsaraDB for RDS, you must create a database and an account for an ApsaraDB for RDS instance. This topic describes how to create a database and an account for an ApsaraDB RDS for PostgreSQL instance.

Create a privileged account

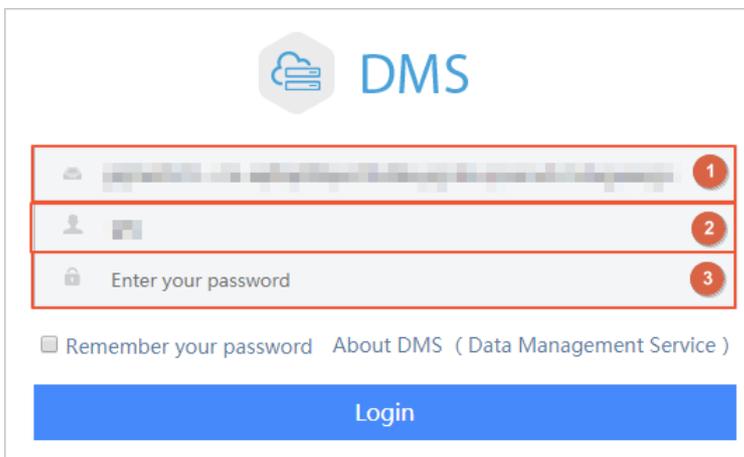

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Accounts**.
5. On the **Accounts** page that appears, click **Create Initial Account** and configure the following parameters.

Parameter	Description
Database Account	<ul style="list-style-type: none"> The name of the account must be 2 to 16 characters in length. The name can contain lowercase letters, digits, and underscores (_). The name must start with a letter and end with a letter or digit.
Password	<ul style="list-style-type: none"> The password of the account must be 8 to 32 characters in length. The password must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. Special characters include ! @ # \$ % ^ & * () _ + - =
Re-enter Password	Enter the same password again.

6. Click **Create**.

Create a database and a standard account

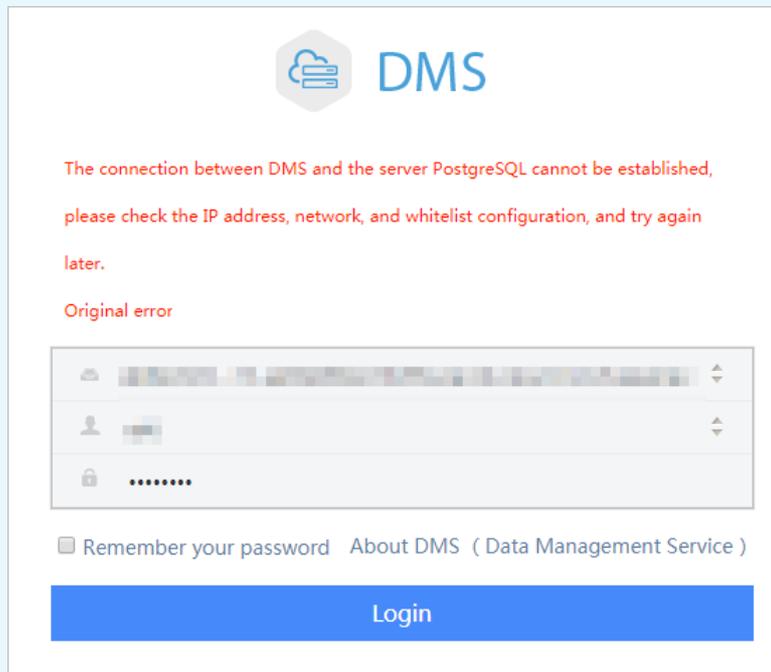

1. Log on to the **ApsaraDB for RDS console**.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. Click **Log On to DB** in the upper-right corner of the page.
5. On the **Data Management (DMS)** logon page that appears, check the endpoint and port number displayed on the page. If the information is correct, enter the username and password of the database.

Parameter	Description
IP address:Port	This parameter is marked with ① in the figure. Enter the endpoint and port number of the instance.
Database Username	This parameter is marked with ② in the figure. Enter the username of the account that is used to access the database.
Enter your password	This parameter is marked with ③ in the figure. Enter the password of the account that is used to access the database.

6. Click **Login**.

Note If a message prompts you that the connection fails, the problem may be caused by an improperly configured whitelist. Reconfigure the whitelist in the console. For more information, see [Configure an IP address whitelist](#).

7. In the top navigation bar, choose **SQL Operations > SQL Window** after you have logged on to the RDS instance.
8. In the SQL window, execute the following statement to create a database:

```
CREATE DATABASE name
[ [ WITH ] [ OWNER [=] user_name ]
  [ TEMPLATE [=] template ]
  [ ENCODING [=] encoding ]
  [ LC_COLLATE [=] lc_collate ]
  [ LC_CTYPE [=] lc_ctype ]
  [ TABLESPACE [=] tablespace_name ]
  [ CONNECTION LIMIT [=] connlimit ] ]
```

For example, if you want to create a database named test, execute the following statement:

```
create database test;
```

9. Click **execute**.
10. In the SQL window, execute the following statement to create a standard account:

```
CREATE USER name [ [ WITH ] option [ ... ] ]
where option can be:
    SUPERUSER | NOSUPERUSER
    | CREATEDB | NOCREATEDB
    | CREATEROLE | NOCREATEROLE
    | CREATEUSER | NOCREATEUSER
    | INHERIT | NOINHERIT
    | LOGIN | NOLOGIN
    | REPLICATION | NOREPLICATION
    | CONNECTION LIMIT connlimit
    | [ ENCRYPTED | UNENCRYPTED ] PASSWORD 'password'
    | VALID UNTIL 'timestamp'
    | IN ROLE role_name [, ...]
    | IN GROUP role_name [, ...]
    | ROLE role_name [, ...]
    | ADMIN role_name [, ...]
    | USER role_name [, ...]
    | SYSID uid
```

For example, if you want to create a user account named test2 whose password is 123456, execute the following statement:

```
create user test2 password '123456';
```

11. Click **execute**.

12.4.5. Connect to an ApsaraDB RDS for PostgreSQL instance

This topic describes how to use Data Management (DMS) or the pgAdmin 4 client to connect to an ApsaraDB for RDS instance.

Context

You can log on to DMS from the ApsaraDB for RDS console and then connect to an RDS instance.

Data Management (DMS) is an integrated database for data, schema, and server management, access security, BI charts, data trends, data tracking, and performance optimization. DMS can be used to manage relational and non-relational databases, such as MySQL, SQL Server, PostgreSQL, MongoDB, and Redis. It can also be used to manage Linux servers.

You can also use a database client to connect to an RDS instance. ApsaraDB RDS for PostgreSQL is fully compatible with PostgreSQL. You can connect to an ApsaraDB RDS for PostgreSQL instance in a similar manner as you would connect to an on-premises PostgreSQL instance. This topic describes how to use the pgAdmin 4 client to connect to an RDS instance.

Use DMS to connect to an RDS instance

For more information about how to connect an RDS instance through DMS, see [Log on to an ApsaraDB for RDS instance by using DMS](#).

Use the pgAdmin 4 client to connect to an RDS instance

1. Add the IP address that requires access to the RDS instance to a whitelist of the RDS instance. For more information about how to configure a whitelist, see [Configure an IP address whitelist](#).

2. Start the pgAdmin 4 client.

 **Note** For more information about how to download the pgAdmin 4 client, visit [pgAdmin 4 \(Windows\)](#).

3. Right-click **Servers** and choose **Create > Server**.
4. On the **General** tab of the **Create - Server** dialog box that appears, enter the name of the server.
5. Click the **Connection** tab and enter the information of the destination instance.

Parameter	Description
Host name/address	The internal endpoint of the RDS instance. For more information about how to view the internal endpoint, see View and modify the internal endpoint and port number .
Port	The internal port number that is used to connect to the RDS instance. For more information about how to view the internal port number, see View and modify the internal endpoint and port number .
Username	The name of the privileged account for the RDS instance. For more information about how to obtain a privileged account, see Create a database and an account .
Password	The password of the privileged account of the RDS instance.

6. Click **Save**.
7. If the connection information is correct, choose **Servers > Server Name > Databases > postgres**.

 **Notice** The postgres database is the default system database of the RDS instance. Do not perform operations on this database.

12.5. Instances

12.5.1. Create an instance

This topic describes how to create an ApsaraDB RDS for PostgreSQL instance in the ApsaraDB for RDS console.

Procedure

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, click **Create Instance** in the upper-right corner.
3. Configure the following parameters.

Section	Parameter	Description
Basic Settings	Organization	The organization to which the instance belongs.
	Resource Set	The resource set to which the instance belongs.
Region	Region	The region where the instance resides.
	Zone	The zone where the instance resides.

Section	Parameter	Description
Specifications	Instance Name	<p>The name of the instance.</p> <ul style="list-style-type: none"> The name must be 2 to 64 characters in length. The name must start with a letter. The name can contain special characters. Special characters include _ - : The name cannot start with http:// or https://.
	Database Engine	The engine of the database, which varies with regions. The available database engines are displayed on the Create ApsaraDB for RDS Instance page. Select PostgreSQL.
	Engine Version	The version of the database engine. Valid values: 9.4 and 10.0.
	Edition	The edition of the database. Select one from the drop-down list.
	Instance Type	The type of the instance. Memory size determines the maximum number of connections and IOPS. The actual values are displayed on the console.
	Storage	The storage capacity of the instance, including the space to store data, system files, binary log files, and transaction files. The minimum storage capacity is 20 GB. You can adjust the storage capacity.
Network Type	Network Type	<p>The network type of the instance. RDS instances support the following network types:</p> <ul style="list-style-type: none"> Classic Network: Cloud services on the classic network are not isolated. Unauthorized access to a cloud service is blocked only by the security group or whitelist policy of the service. VPC: A Virtual Private Cloud (VPC) helps you to build an isolated network environment on Alibaba Cloud. You can customize the route table, IP address range, and gateway within a VPC. We recommend that you select VPC for improved security. <p> Note After you select VPC as the network type, you must also select the corresponding VPC and VSwitch.</p>
	IP Whitelist	An IP address whitelist contains the IP addresses of entities that are allowed to access to your RDS instance. For more information, see Configure an IP address whitelist .
Access Mode	Access Mode	<p>RDS instances support two access modes: Standard and Database Proxy.</p> <ul style="list-style-type: none"> Standard: RDS uses Server Load Balancer (SLB) to eliminate the impact of instance high-availability switching on the application layer. This mode reduces the response time, but slightly increases the probability of network interruptions and disables SQL interception. Database Proxy: This mode prevents 90% of network interruptions and intercepts SQL injection attacks based on semantic analysis. However, it increases the response time by over 20%. <p> Note ApsaraDB RDS for PostgreSQL supports the Standard access mode.</p>

4. After you configure the preceding parameters, click **Submit**.

12.5.2. View basic information of an instance

This topic describes how to view the details of an ApsaraDB for RDS instance, such as basic information, internal network connection information, status, and configurations.

Procedure

1. [Log on to the ApsaraDB for RDS console.](#)
2. Use one of the following methods to go to the **Basic Information** page of an instance:
 - On the **Instances** page, find the target instance and click the instance ID. The **Basic Information** page appears.
 - On the **Instances** page, find the target instance and click **Manage** in the corresponding **Actions** column. The **Basic Information** page appears.

12.5.3. Restart an instance

This topic describes how to manually restart an ApsaraDB RDS for PostgreSQL instance. This applies if the number of connections exceeds the specified threshold or if an instance has any performance issues.

Prerequisites

The target instance is in the **Running** state.

Procedure

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the upper-right corner of the page, click **Restart Instance**.

 **Note** A restart will disconnect the instance. We recommend that you make appropriate service arrangements before you restart an instance. Proceed with caution.

5. In the message that appears, click **Confirm**.

12.5.4. Change the specifications of an instance

This topic describes how to change specifications of your instance, such as the instance type and storage space, if the specifications do not meet the requirements of your application.

Procedure

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the **Configure Information** section of the **Basic Information** page, click **Change Specifications**.
5. On the **Change Specifications** page, set **Edition**, **Instance Type**, and **Storage**.
6. After you configure the preceding parameters, click **Submit**.

12.5.5. Set a maintenance window

This topic describes how to set a maintenance window for an ApsaraDB for RDS instance.

Context

To ensure the stability of ApsaraDB for RDS instances, the backend system performs maintenance of the instances at irregular intervals. The default maintenance window is from 02:00 (UTC+8) to 06:00 (UTC+8). We recommend that you set the maintenance window to off-peak hours of your business to avoid impacts on your business.

Precautions

- To ensure the stability of the maintenance process, the instance will enter the **Maintaining Instance** state before the maintenance time. Access to data in the database and query operations such as performance monitoring are not affected while the instance is in this state. However, apart from account and database management and IP address whitelist configuration, modification operations such as upgrade, downgrade, and restart will be temporarily unavailable.
- Network interruptions may occur during a maintenance window. Make sure that your application is configured with automatic reconnection policies.

Procedure

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the **Configuration Information** section, click **Configure** to the right of **Maintenance Window**.
5. Select a maintenance window and click **Save**.

 **Note** The maintenance window is displayed in UTC+8.

12.5.6. Configure primary/secondary switchover

ApsaraDB for RDS provides the primary/secondary switchover feature to ensure the high availability of databases. The primary/secondary switchover is performed when the primary instance becomes unavailable. You can also manually switch your business to the secondary instance. This topic describes how to manually switch over services between a primary instance and its secondary instance.

Context

Data is synchronized in real time between the primary and secondary instances. You can access only the primary instance. The secondary instance serves only as a backup instance and does not allow external access. After the switchover, the original primary instance becomes the secondary instance.

 **Note** Network interruptions may occur during a switchover. Make sure that your application is configured with automatic reconnection policies.

Procedure

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Service Availability**.
5. In the **Availability Information** section, click **Switch Primary/Secondary Instance**.
6. In the **Switch Primary/Secondary Instance** message that appears, click **OK**.

Note

- During the switchover, operations such as managing databases and accounts and changing network types cannot be performed. Therefore, we recommend that you select Switch Within Maintenance Window.
- For more information about how to set a maintenance window, see [Set a maintenance window](#).

12.5.7. Release an instance

This topic describes how to manually release an instance.

Precautions

- Only instances in the running state can be released.
- After an instance is released, the instance data is immediately deleted. We recommend that you back up instance data before you release the instance.

Procedure

1. [Log on to the ApsaraDB for RDS console](#).
2. In the Actions column corresponding to the instance you want to release, click **More**, and select **Release Instance** from the drop-down list.
3. In the Release Instance message that appears, click **Confirm**.

12.5.8. Modify parameters of an instance

This topic describes how to view and modify the values of some parameters and query parameter modification records in the console.

Precautions

- To ensure instance stability, you can select specific parameters to modify in the ApsaraDB for RDS console.
- When you modify parameters on the **Editable Parameters** tab, refer to the **Value Range** column corresponding to each parameter.
- After certain parameters are modified, you must restart your RDS instance for the changes to take effect. For more information, see the **Force Restart** column on the **Editable Parameters** tab. We recommend that you modify the parameters of an instance during off-peak hours and make sure that your application is configured with automatic reconnection policies.

Modify parameters

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Parameters**.
5. You can perform the following operations: Export the parameter settings of the RDS instance to your computer.

On the **Editable Parameters** tab, click **Export Parameters**. The parameter settings of the RDS instance are exported as a TXT file to your computer.

Modify and import the parameter settings.

- i. After you have modified parameters in the exported parameter file, click **Import Parameters** and copy the parameter settings to the field.
- ii. Click **OK**.

- iii. In the upper-right corner of the page, click **Apply Changes**.

 **Note**

- If the new parameter value takes effect only after an instance restart, the system will prompt you to restart the RDS instance. We recommend that you restart the RDS instance during off-peak hours and make sure that your application is configured with automatic reconnection policies.
- Before the new parameter values are applied, you can click **Cancel Changes** to cancel them.

Modify a single parameter.

- i. On the **Editable Parameters** tab, find the parameter that you want to reconfigure, and click the  icon in the **Actual Value** column.
- ii. Enter a new value based on the prompted value range.
- iii. Click **Confirm**.
- iv. In the upper-right corner of the page, click **Apply Changes**.

 **Note**

- If the new parameter value takes effect only after an instance restart, the system will prompt you to restart the RDS instance. We recommend that you restart the RDS instance during off-peak hours and make sure that your application is configured with automatic reconnection policies.
- Before the new parameter value is applied, you can click **Cancel Changes** to cancel it.

View the parameter modification history

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Parameters**.
5. On the page that appears, click the **Edit History** tab.
6. Select a time range and then click **Search**.

12.5.9. Read-only instances

12.5.9.1. Overview of read-only ApsaraDB RDS for PostgreSQL

instances

This topic provides an overview of read-only ApsaraDB RDS for PostgreSQL instances. If a large number of read requests overwhelm the primary instance, your business may be interrupted. In this situation, you can create one or more read-only instances to offload read requests from the primary instance and increase the throughput of your application.

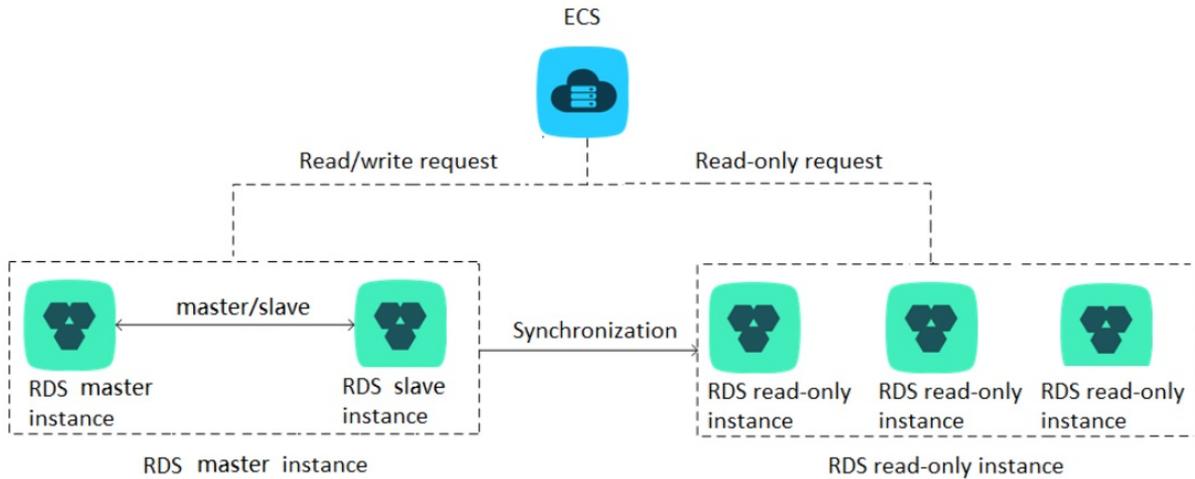

Overview

When a read-only instance is created, the data is replicated from the secondary instance. The data is consistent with that of the primary instance. Data updates of the primary instance are automatically synchronized to all read-only instances immediately after the primary instance completes operations.

Note

- Only ApsaraDB for RDS instances that run PostgreSQL 10.0 support read-only instances.
- The specifications of the primary instance must be at least eight CPU cores and 32 GB of memory.
- Each read-only instance works in a single-node architecture with no backup instances.

The following figure shows the topology of read-only instances.

Features

- **Region and zone:** Read-only instances reside within the same region as the primary instance, but possibly in different zones.
- **Specifications and storage space:** The specifications and storage space of read-only instances cannot be lower than that of the primary instance.
- **Network type:** The network type of a read-only instance can differ from that of the primary instance.
- **Account and database management:** Read-only instances do not require database or account maintenance, because their database and account information is synchronized with the primary instance.
- **Whitelist:** A read-only instance automatically replicates the whitelists of the primary instance. However, the whitelists for the read-only instance are independent of those of the primary instance. For information about how to modify the whitelists of a read-only instance, see [Configure an IP address whitelist](#).
- **Monitoring and alerts:** You can monitor system performance metrics, such as the disk capacity, IOPS, number of connections, and CPU utilization.

Limits

- **Number of read-only instances:** A maximum of five read-only instances can be created for a primary instance.
- **Instance backup:** Read-only instances do not support backup settings or manual backups because backups have been configured or created on the primary instance.
- **Data migration:** You cannot migrate data to read-only instances.
- **Database management:** You cannot create or delete databases on read-only instances.
- **Account management:** You cannot create or delete accounts, authorize accounts, or change the passwords of accounts on read-only instances.

FAQ

Q: Can I manage accounts created in the primary instance from its read-only instances?

A: No, although accounts created on the primary instance are replicated to its read-only instances, you cannot manage the accounts on the read-only instances. The accounts have only read permissions on the read-only instances.

12.5.9.2. Create a read-only ApsaraDB RDS for PostgreSQL instance

This topic describes how to create a read-only instance for your primary ApsaraDB RDS for PostgreSQL instance. This allows your database system to process a large number of read requests and increases the throughput of your application. The data on each read-only instance is a copy of that of the primary instance. Data updates to the primary instance are synchronized to all of its read-only instances.

Prerequisites

- The primary ApsaraDB for RDS instance runs PostgreSQL 10.0.
- The specifications of the primary instance must be at least eight CPU cores and 32 GB of memory.

Precautions

- You can only create read-only instances for your primary instance. You cannot change existing instances to read-only instances.
- When you create a read-only instance, the system replicates data from a secondary instance. Therefore, operations on your primary instance are not interrupted.
- A read-only instance does not inherit the parameter settings of the primary instance. The system generates default parameter settings for the read-only instance, and you can modify the settings in the ApsaraDB for RDS console.
- The specifications and storage space of a read-only instance cannot be lower than that of the primary instance.
- You can create up to five read-only instances.

Create a read-only instance

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the **Distributed by Instance Role** section of the **Basic Information** page, click **Create Read-only Instance**.
5. On the **Create Read-only RDS Instance** page that appears, set the parameters of the read-only instance according to the following table, and click **Submit**.

Section	Parameter	Description
Region	Region	The region where the ApsaraDB for RDS instance resides.
Specifications	Database Engine	The database engine of the read-only instance, which is the same as that of the primary instance and cannot be modified.
	Engine Version	The engine version of the read-only instance, which is the same as that of the primary instance and cannot be modified.
	Edition	The edition of the read-only instance, which is the same as that of the primary instance and cannot be modified.

Section	Parameter	Description
	Instance Type	The instance type of the read-only instance. The type of the read-only instance can be different from that of the primary instance, and can be modified at any time to facilitate flexible upgrade and downgrade. To ensure sufficient I/O throughput for data synchronization, we recommend that you select at least the same memory as the primary instance for the read-only instance.
	Storage	The storage space of the read-only instance. To ensure sufficient I/O throughput for data synchronization, we recommend that you select at least the same instance type and storage space as the primary instance for the read-only instance.
Network Type	Network Type	The network type of the read-only instance, which is the same as that of the primary instance and cannot be modified.
	VPC	Select a VPC if the network type is set to VPC.
	VSwitch	Select a VSwitch if the network type is set to VPC.

12.5.9.3. View a read-only ApsaraDB RDS for PostgreSQL instance

This topic describes how to view details of a read-only ApsaraDB RDS for PostgreSQL instance. You can go to the Basic Information page of a read-only instance from the Instances page or the read-only instance list of the primary instance. Read-only instances are managed in the same manner as primary instances. The Basic Information page shows the management operations that can be performed.

View instance details of a read-only instance through its ID

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the Instances page, find the target instance.
3. Click the ID of the target instance or click **Manage** in the corresponding Actions column to go to the Basic Information page.

View details of a read-only instance through the primary instance

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the Instances page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the Basic Information page.
4. On the Basic Information page, move the pointer over the number below **Read-only Instance** in the **Distributed by Instance Role** section. The ID of the read-only instance is displayed.
5. Click the ID of the read-only instance to go to the Basic Information page of the read-only instance.

View the latency of a read-only instance

When a read-only instance synchronizes data from its primary instance, latency may occur. You can navigate to the Basic Information page of a read-only instance to view the latency of data synchronization to the instance.

Delay for Read-only Instance			
Delay for Sending Write-Ahead Logging Data: 0MB	Delay for Writing Write-Ahead Logging Data: 0MB	Delay for Syncing Write-Ahead Logging Data: 0MB	Delay for Applying Write-Ahead Logging Data: 0MB
	Delay for Writing Write-Ahead Logging Data: 0.000103Second	Delay for Syncing Write-Ahead Logging Data: 0.000152Second	Delay for Applying Write-Ahead Logging Data: 0.0002Second

12.6. Database connection

12.6.1. Connect to an ApsaraDB RDS for PostgreSQL instance

This topic describes how to use Data Management (DMS) or the pgAdmin 4 client to connect to an ApsaraDB for RDS instance.

Context

You can log on to DMS from the ApsaraDB for RDS console and then connect to an RDS instance.

Data Management (DMS) is an integrated database for data, schema, and server management, access security, BI charts, data trends, data tracking, and performance optimization. DMS can be used to manage relational and non-relational databases, such as MySQL, SQL Server, PostgreSQL, MongoDB, and Redis. It can also be used to manage Linux servers.

You can also use a database client to connect to an RDS instance. ApsaraDB RDS for PostgreSQL is fully compatible with PostgreSQL. You can connect to an ApsaraDB RDS for PostgreSQL instance in a similar manner as you would connect to an on-premises PostgreSQL instance. This topic describes how to use the pgAdmin 4 client to connect to an RDS instance.

Use DMS to connect to an RDS instance

For more information about how to connect an RDS instance through DMS, see [Log on to an ApsaraDB for RDS instance by using DMS](#).

Use the pgAdmin 4 client to connect to an RDS instance

1. Add the IP address that requires access to the RDS instance to a whitelist of the RDS instance. For more information about how to configure a whitelist, see [Configure an IP address whitelist](#).
2. Start the pgAdmin 4 client.

Note For more information about how to download the pgAdmin 4 client, visit [pgAdmin 4 \(Windows\)](#).

3. Right-click **Servers** and choose **Create > Server**.
4. On the **General** tab of the **Create - Server** dialog box that appears, enter the name of the server.
5. Click the **Connection** tab and enter the information of the destination instance.

Parameter	Description
Host name/address	The internal endpoint of the RDS instance. For more information about how to view the internal endpoint, see View and modify the internal endpoint and port number .
Port	The internal port number that is used to connect to the RDS instance. For more information about how to view the internal port number, see View and modify the internal endpoint and port number .
Username	The name of the privileged account for the RDS instance. For more information about how to obtain a privileged account, see Create a database and an account .
Password	The password of the privileged account of the RDS instance.

6. Click **Save**.

7. If the connection information is correct, choose **Servers > Server Name > Databases > postgres**.

 **Notice** The postgres database is the default system database of the RDS instance. Do not perform operations on this database.

12.6.2. Log on to an ApsaraDB for RDS instance by using DMS

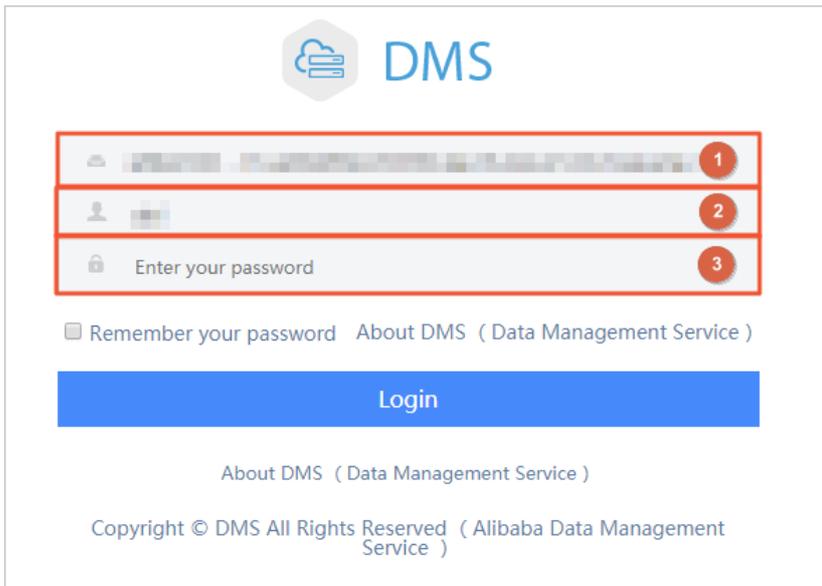

This topic describes how to log on to an ApsaraDB for RDS instance by using Data Management (DMS).

Prerequisites

The IP address whitelist is configured. For more information about how to configure an IP address whitelist, see [Configure an IP address whitelist](#).

Procedure

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the upper-right corner of the page, click **Log On to DB** to go to the RDS Database Logon page.
5. On the logon page, set the following parameters:

- ①: The endpoint and port number that are used to connect to your RDS instance. The endpoint and port number are in the `<Internal endpoint>:<Internal port number>` format. Example: `rm-bpxxxxxx.rds.aliyuncs.com:3433`. For more information about how to view the internal endpoint and port number of an instance, see [View and modify the internal endpoint and port number](#).
 - ②: The account that is used to access the RDS database.
 - ③: The password of the account that is used to access the RDS database.
6. Click **Login**.

Note If you want the browser to remember the password, select **Remember your password** and click **Login**.

12.6.3. View and modify the internal endpoint and port number

You must use the internal endpoint and port number to access an RDS instance. This topic describes how to view and modify the internal endpoint and port number of an ApsaraDB for RDS instance in the ApsaraDB for RDS console.

View the internal endpoint and port number

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the **Basic Information** section, view the internal endpoint and internal port number of the instance.

Modify the internal endpoint and port number

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Connection**.
5. On the right side of the page, click **Change Endpoint**.

6. In the dialog box that appears, set **Connection Type** to **Internal Endpoint**.
7. Modify the endpoint prefix and port number and then click **OK**.

FAQ

- **Q:** Do I need to modify the endpoint or port number in my application after I modify the endpoint or port number of an instance?
A: Yes, you must modify the endpoint or port number in the application after you have modified them. Otherwise, the application cannot connect to databases of the instance.
- **Q:** Does the modification of the endpoint take effect immediately? Do I need to restart the instance?
A: No, you do not need to restart the instance. The modification takes effect immediately.

12.7. Accounts

12.7.1. Create an account

Before you start to use ApsaraDB for RDS, you must create an account for an RDS instance. This topic describes how to create an account for an ApsaraDB RDS for PostgreSQL instance.

Precautions

- Databases within the same instance share all resources that belong to the instance. You can create a privileged account and multiple standard accounts for each ApsaraDB RDS for PostgreSQL instance. You can also use SQL statements to create and manage accounts.
- To migrate data from an on-premises database to an RDS instance, you must create databases and accounts on the RDS instance. Make sure that each database or account on the on-premises instance has a counterpart with an identical name on the RDS instance.
- Follow the least privilege principle to create accounts and grant them appropriate read-only and read/write permissions on databases. When necessary, you can create multiple accounts and grant them only the permissions on specific databases. If an account does not need to write data to a database, grant only the read-only permissions on the database to the account.
- To ensure database security, set strong passwords for accounts and change the passwords on a regular basis.
- A privileged account cannot be deleted after it is created.

Create a privileged account

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Accounts**.
5. On the **Accounts** page that appears, click **Create Initial Account** and configure the following parameters.

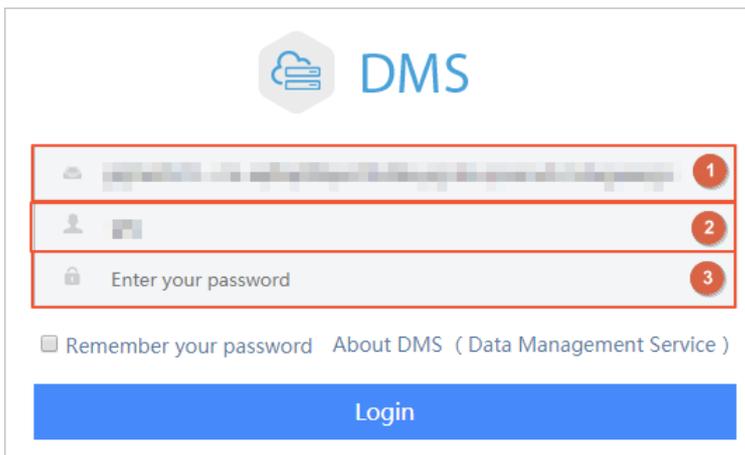

Parameter	Description
Database Account	<ul style="list-style-type: none"> ◦ The database account must be 2 to 16 characters in length. ◦ The account can contain lowercase letters, digits, and underscores (_). ◦ The account must start with a letter and end with a letter or digit.

Parameter	Description
Password	<ul style="list-style-type: none"> ◦ The password must be 8 to 32 characters in length. ◦ The password must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. ◦ Special characters include ! @ # \$ % ^ & * () _ + - =
Re-enter Password	Enter the same password again.

6. Click **Create**.

Create a standard account

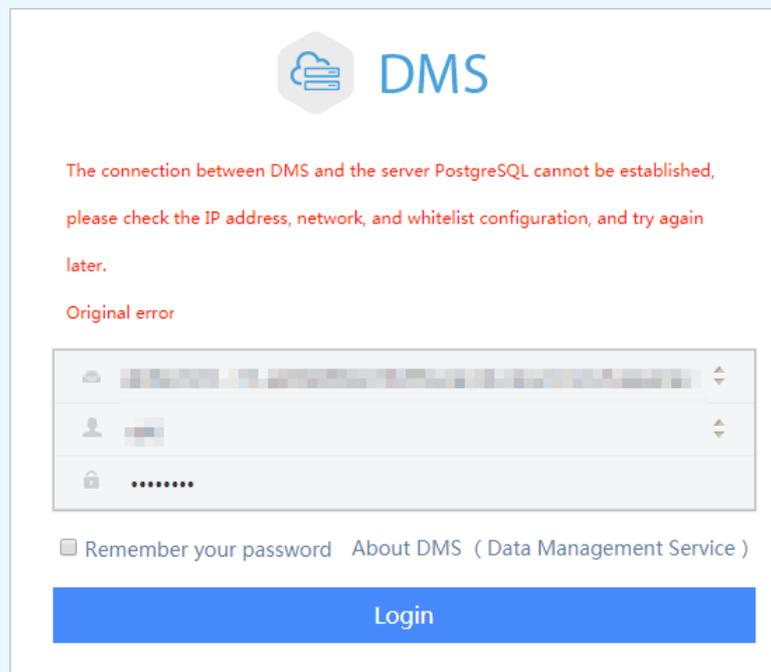

1. **Log on to the ApsaraDB for RDS console.**
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. Click **Log On to DB** in the upper-right corner of the page.
5. On the **Data Management (DMS)** logon page that appears, check the endpoint and port number displayed on the page. If the information is correct, enter the username and password of the database.

Parameter	Description
IP address:Port	This parameter is marked with ① in the figure. Enter the endpoint and port number of the instance.
Database Username	This parameter is marked with ② in the figure. Enter the username of the account that is used to access the database.
Enter your password	This parameter is marked with ③ in the figure. Enter the password of the account that is used to access the database.

6. Click **Login**.

Note If a message prompts you that the connection fails, the problem may be caused by an improperly configured whitelist. Reconfigure the whitelist in the console. For more information, see [Configure an IP address whitelist](#).

7. In the top navigation bar, choose **SQL Operations > SQL Window** after you have logged on to the RDS instance.
8. In the SQL window, execute the following statement to create a standard account:

```
CREATE USER name [ [ WITH ] option [ ... ] ]
where option can be:
  SUPERUSER | NOSUPERUSER
  | CREATEDB | NOCREATEDB
  | CREATEROLE | NOCREATEROLE
  | CREATEUSER | NOCREATEUSER
  | INHERIT | NOINHERIT
  | LOGIN | NOLOGIN
  | REPLICATION | NOREPLICATION
  | CONNECTION LIMIT connlimit
  | [ ENCRYPTED | UNENCRYPTED ] PASSWORD 'password'
  | VALID UNTIL 'timestamp'
  | IN ROLE role_name [, ...]
  | IN GROUP role_name [, ...]
  | ROLE role_name [, ...]
  | ADMIN role_name [, ...]
  | USER role_name [, ...]
  | SYSID uid
```

For example, if you want to create a user account named test2 whose password is 123456, execute the following statement:

```
create user test2 password '123456';
```

9. Click execute.

12.7.2. Reset the password

This topic describes how to use the RDS console to reset the password of your database account if you forget the password.

Procedure

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Accounts**.
5. In the **Actions** column corresponding to the target account, click **Reset Password**.
6. In the dialog box that appears, enter a new password, and click **OK**.

-  **Note** The password must meet the following requirements:
- The password must be 8 to 32 characters in length.
 - The password must contain at least three of the following characters: uppercase letters, lowercase letters, digits, and special characters.
 - Special characters include ! @ # \$ % ^ & * () _ + - =

12.8. Databases

12.8.1. Create a database

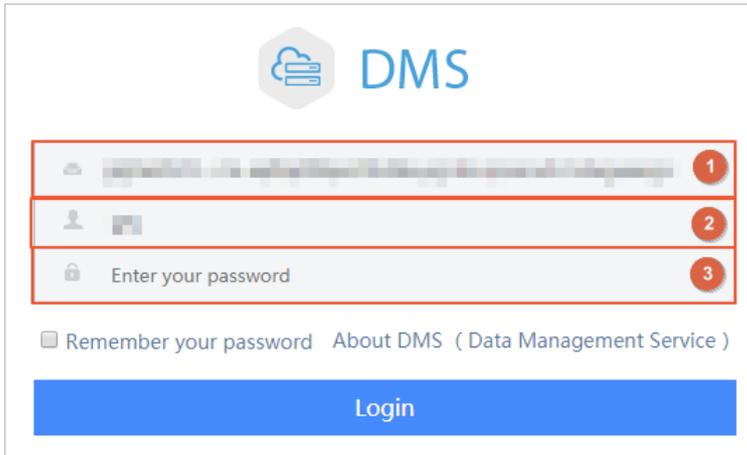

Before you start to use ApsaraDB for RDS, you must create a database and account for an RDS instance. This topic describes how to create a database for an ApsaraDB RDS for PostgreSQL instance.

Prerequisites

- An ApsaraDB RDS for PostgreSQL instance is created. For more information, see [Connect to an ApsaraDB RDS for PostgreSQL instance](#).
- An account is created. For more information, see [Create an account](#).

Procedure

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. Click **Log On to DB** in the upper-right corner of the page.
5. On the **Data Management (DMS) logon** page that appears, check the endpoint and port number displayed on the page.

Parameter	Description
IP address:Port	This parameter is marked with ① in the figure. Enter the endpoint and port number of the instance. For more information, see View and modify the internal endpoint and port number .
Database Username	This parameter is marked with ② in the figure. Enter the username of the account that is used to access the database.
Enter your password	This parameter is marked with ③ in the figure. Enter the password of the account that is used to access the database.

6. Click **Login**.

Note If a message prompts you that the connection fails, the problem may be caused by an improperly configured whitelist. Reconfigure the whitelist in the console. For more information, see [Configure an IP address whitelist](#).

7. In the top navigation bar, choose **SQL Operations > SQL Window** after you have logged on to the RDS instance.

8. In the SQL window, execute the following statement to create a database:

```
CREATE DATABASE name
[ [ WITH ] [ OWNER [=] user_name ]
  [ TEMPLATE [=] template ]
  [ ENCODING [=] encoding ]
  [ LC_COLLATE [=] lc_collate ]
  [ LC_CTYPE [=] lc_ctype ]
  [ TABLESPACE [=] tablespace_name ]
  [ CONNECTION LIMIT [=] connlimit ] ]
```

For example, if you want to create a database named test, execute the following statement:

```
create database test;
```

9. Click **execute**.

12.8.2. Delete a database

This topic describes how to delete a database in the ApsaraDB RDS for PostgreSQL console.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the Instances page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. Click **Log On to DB** in the upper-right corner of the page.
5. On the Data Management (DMS) logon page that appears, check the endpoint and port number displayed on the page.

Parameter	Description
IP address:Port	This parameter is marked with ① in the figure. Enter the endpoint and port number of the instance. For more information, see View and modify the internal endpoint and port number .
Database Username	This parameter is marked with ② in the figure. Enter the username of the account that is used to access the database.
Enter your password	This parameter is marked with ③ in the figure. Enter the password of the account that is used to access the database.

6. Click **Login**.

Note If a message prompts you that the connection fails, the problem may be caused by an improperly configured whitelist. Reconfigure the whitelist in the console. For more information, see [Configure an IP address whitelist](#).

7. In the top navigation bar, choose **SQL Operations > SQL Window** after you have logged on to the RDS instance.
8. Execute the following statement to delete the database:

```
drop database <database name>;
```

9. Click **execute**.

12.9. Network, VPC, and VSwitch

12.9.1. Change the network type of an ApsaraDB RDS for PostgreSQL instance

This topic describes how to change the network type of an ApsaraDB RDS for PostgreSQL instance between classic network and VPC.

Context

- **Classic network:** RDS instances in the classic network are not isolated. Unauthorized access to these instances can be blocked only by whitelists.
- **VPC:** Each Virtual Private Cloud (VPC) is an isolated network. We recommend that you use the VPC network type because it provides a higher security level.

You can configure route tables, CIDR blocks, and gateways in a VPC. To smoothly migrate applications to the cloud, you can use leased lines or VPNs to connect on-premises data center to a VPC to create a virtual data center.

Change the network type from VPC to classic network

Precautions

- After you change the network type from VPC to classic network, the IP address bound to the internal endpoint will change but the internal endpoint of the RDS instance will remain unchanged.
- After the network type is changed, ECS instances in the same VPC as the RDS instance will no longer be able to connect to the RDS instance by using the internal endpoint. You must update the endpoint for the applications deployed on the ECS instances.
- When you change the network type, a 30-second network interruption may occur. To avoid business interruption, change the network type during off-peak hours or make sure that your application is configured with automatic reconnection policies.

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Connection**.
5. In the upper-right corner of the **Database Connection** section, click **Switch to Classic Network**.
6. In the dialog box that appears, click **OK**.

 **Note** After the network type is changed to classic network, only ECS instances within the classic network can connect to the RDS instance by using the internal endpoint. You must configure the internal endpoint for the ECS instances.

7. Configure a whitelist to allow ECS instances within the classic network to connect to the RDS instance by using the internal endpoint.

 **Note**

- If the network isolation mode of the RDS instance is standard whitelist mode, add the private IP addresses of the ECS instances to a whitelist of your RDS instance.
- If the network isolation mode of the RDS instance is enhanced whitelist mode, add the internal IP addresses of the ECS instances to a classic network whitelist. If no classic network whitelists are available, create a whitelist. For more information about the enhanced whitelist mode, see [Switch to the enhanced whitelist mode](#).

Change the network type from classic network to VPC

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.

4. In the left-side navigation pane, click **Database Connection**.
5. In the upper-right corner of the Database Connection section, click **Switch to VPC**.
6. In the Switch to VPC dialog box, select a VPC and VSwitch and specify whether to retain the endpoint used in the classic network.

 **Note**

- Select a VPC. We recommend that you select the VPC where your ECS instances reside. Otherwise, the ECS instances cannot communicate with the RDS instance over the internal network.
- Select a VSwitch. If no VSwitches are available in the selected VPC, create one in the same zone where the RDS instance resides. Use the following path to navigate the guide: *Virtual Private Cloud > User Guide > Quick Start > Create a VSwitch*.
- Determine whether to select the **Reserve Original Classic Endpoint** option. The following table describes the details.

Operation	Description
Not selected	<p>The endpoint used in the classic network is replaced with an endpoint in the VPC.</p> <p>When you change the network type, a 30-second network interruption may occur, and connections between ECS instances in the classic network and the RDS instance are interrupted.</p>
Selected	<p>The endpoint used in the classic network is retained, and a new endpoint to be used in the VPC is generated. In such cases, the RDS instance runs in hybrid access mode. ECS instances in both the classic network and a VPC can connect to the RDS instance over the internal network. For more information, see Hybrid network access mode.</p> <p>When you change the network type, no network interruptions occur. Connections between ECS instances in the classic network and the RDS instance will be available until the endpoint used in the classic network expires.</p> <p>To migrate your business to the VPC without interruption, you must add the new endpoint used in the VPC to access the ECS instances before the endpoint used in the classic network expires. Seven days before the endpoint used in the classic network expires, the system will send a text message to the phone number bound to your Alibaba Cloud account every day.</p> <p>For more information, see Hybrid access from both the classic network and VPCs.</p>

7. Add the internal IP addresses of ECS instances in the selected VPC to a VPC whitelist. This allows the ECS instances to access the RDS instance over the internal network. If no VPC whitelists are available, create a whitelist.

 **Note**

- If you have retained the classic network endpoint, add the VPC endpoint to the ECS instances before the classic network endpoint expires.
- If you have not retained the classic network endpoint, connections between ECS instances in the classic network and the RDS instance over the internal network are interrupted. You must add the new endpoint to ECS instances in the VPC immediately after the network type is changed.

12.9.2. Hybrid access from both the classic network and VPCs

This topic describes how to use the hybrid access solution of ApsaraDB for RDS to change the network type of an instance from classic network to Virtual Private Network (VPC) without network interruptions.

Prerequisites

- The network type of the RDS instance is classic network.
- Available VPCs and VSwitches exist in the zone where the RDS instance resides.

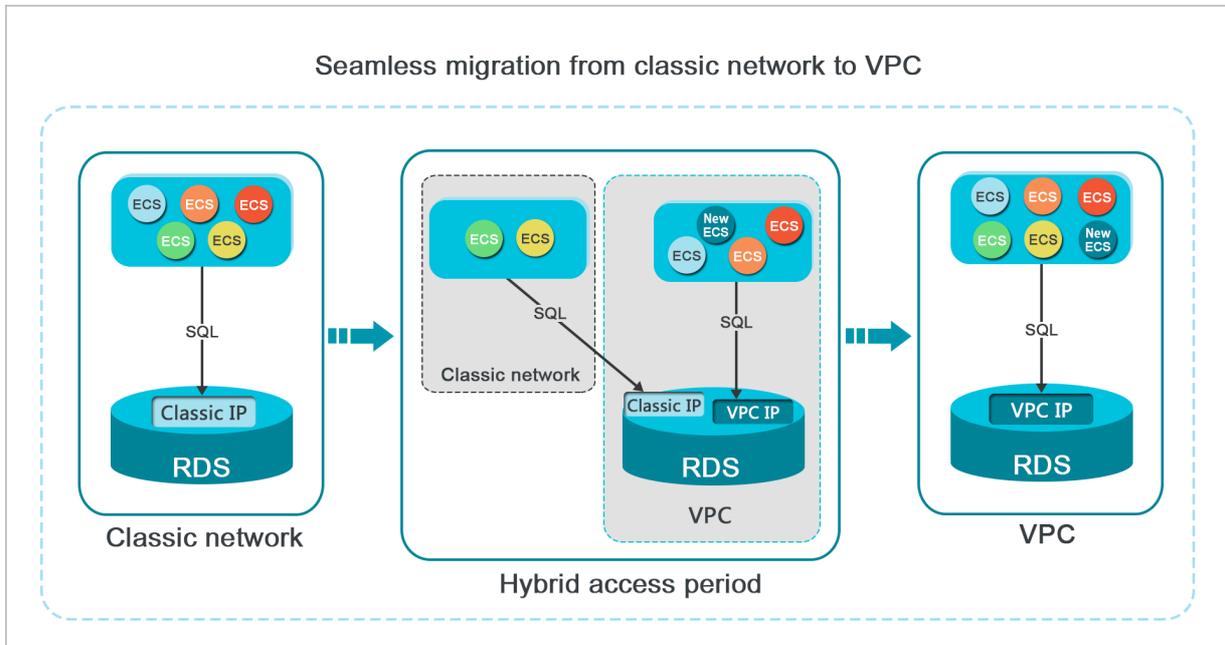

Context

In the past, when you changed the network type of an RDS instance from classic network to VPC, the internal endpoint of the RDS instance would remain the same but the IP address bound to the endpoint would change to the corresponding IP address in the VPC. This change would cause a 30-second network interruption, and ECS instances within the classic network would not be able to access the RDS instance through the internal endpoint within this period. To smoothly change the network type, ApsaraDB for RDS provides the hybrid access solution.

Hybrid access refers to the ability of an RDS instance to be accessed by ECS instances in both the classic network and VPCs. During the hybrid access period, the RDS instance reserves the original internal endpoint of the classic network and adds the internal endpoint of VPCs. This prevents network interruptions during the network type switchover.

For better security and performance, we recommend that you use the internal endpoint of VPCs. Hybrid access is available for a limited period of time. The internal endpoint of the classic network is released when the hybrid access period expires. In that case, your applications cannot access the RDS database by using the internal endpoint of the classic network. You must configure the internal endpoint of VPCs in all your applications during the hybrid access period. This ensures smooth network switchover and minimize the impact on your services.

For example, your company wants to use the hybrid access solution to change the network type from classic network to VPC. During the hybrid access period, some applications can access the database through the internal endpoint of VPCs, and the other applications can access the database through the original internal endpoint of the classic network. When all the applications access the database through the internal endpoint of VPCs, the internal endpoint of the classic network can be released. The following figure illustrates the scenario.

Limits

During the hybrid access period, the instance has the following limits:

- Changing to the classic network is not supported.

- Migrating the RDS instance to another zone is not supported.

Change the network type from classic network to VPC

For more information, see [Change the network type from classic network to VPC](#).

Change the expiration time for the original internal endpoint of the classic network

During the period in which your instance can be connected over the classic network or VPCs, you can specify the expiration time for the endpoint of the classic network. The setting takes effect immediately. For example, if the endpoint of the classic network is about to expire on August 18, 2017 and you change the expiration time to 14 days later on August 15, 2017, the endpoint of the classic network is released on August 29, 2017.

Follow these steps to change the expiration time:

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Connection**.
5. On the **Instance Connection** tab, click **Change Expiration Time**.
6. On the **Change Expiration Time** dialog box that appears, select an expiration time and click **OK**.

12.10. Monitoring

12.10.1. View monitored resources

ApsaraDB for RDS provides a wide range of performance metrics. This topic describes how to view resource monitoring data in the ApsaraDB for RDS console.

Procedure

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Monitoring and Alerts**.
5. On the **Monitoring** tab, select the time range to query the corresponding monitoring data. The following table lists the specific monitoring metrics.

Monitoring metric	Description
Disk Space	The used disk space of the instance. Unit: MB.
IOPS	The number of I/O requests of the data disk and log disk per second.
Memory Usage	The memory usage of the instance.
CPU Utilization	The CPU utilization of the instance.
Total Connections	The total number of current connections of the instance.

 **Note** You can click **Refresh** in the upper-right corner of the **Monitoring** tab to refresh the monitoring information.

12.10.2. Set the monitoring frequency

This topic describes how to set the monitoring frequency of an ApsaraDB RDS for PostgreSQL instance.

Context

ApsaraDB RDS for PostgreSQL provides three monitoring frequencies.

- Every 5 seconds
- Every 60 seconds
- Every 300 seconds

Procedure

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Monitoring and Alerts**.
5. On the **Monitoring** tab, click **Set Monitoring Frequency**.
6. In the **Set Monitoring Frequency** dialog box that appears, select a monitoring frequency and click **OK**.

12.11. Data security and encryption

12.11.1. Switch to the enhanced whitelist mode

This topic describes how to switch from the standard whitelist mode to the enhanced whitelist mode for an ApsaraDB RDS for PostgreSQL instance. The enhanced whitelist mode offers higher security.

Network isolation modes

RDS instances support the following network isolation modes:

- **Standard whitelist mode**
IP addresses from both the classic network and VPCs are added to the same whitelist. However, standard whitelist mode may incur security risks. We recommend that you switch the network isolation mode to enhanced whitelist.
- **Enhanced whitelist mode**
IP addresses from the classic network and VPCs are added to different whitelists. When you create an enhanced IP address whitelist, you must specify its network type.

Changes after you switch to the enhanced whitelist mode

- If the network type of the instance is VPC, a new whitelist is created and contains the same IP addresses as the original whitelists. The new whitelist only applies to VPCs.
- If the network type of the instance is classic network, a new whitelist is created and contains the same IP addresses as the original whitelists. The new IP whitelist only applies to the classic network.
- If the instance supports [access from both the classic network and VPCs](#), two new whitelists are created, and each contains the same IP addresses as the original whitelists. One whitelist applies to VPCs, and the other applies to the classic network.

 **Note** Switching to the enhanced whitelist mode does not affect ECS security groups in the whitelist.

Precautions

- You can switch from standard whitelist mode to enhanced whitelist mode, but not the other way around.
- In the enhanced whitelist mode, a classic network whitelist also allows access from the Internet. If you want to access the RDS instance from a host over the Internet, you can add the public IP address of the host to a

classic network whitelist.

Procedure

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Data Security**.
5. On the **Whitelist Settings** tab, click **Enable Enhanced Whitelist (Recommended)**.
6. In the Enable Enhanced Whitelist message, click **Confirm**.

12.11.2. Configure an IP address whitelist

This topic describes how to configure a whitelist for an ApsaraDB RDS for PostgreSQL instance. Only entities that are listed in a whitelist can access your RDS instance.

Context

Whitelists make your RDS instance more secure without interrupting the operation of your RDS instance during configuration. We recommend that you perform maintenance on your whitelists on a regular basis.

To configure a whitelist, perform the following operations:

- **Configure a whitelist:** Add IP addresses to allow them to connect to the RDS instance.

 **Note** The IP address whitelist labeled default contains only the default IP address 0.0.0.0/0, which allows all entities access to your RDS instance.

- **Configure an ECS security group:** Add an ECS security group for the RDS instance to allow ECS instances in the group to connect to the RDS instance.

Procedure

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, select **Data Security** and click the **Whitelist Settings** tab on the page that appears.
5. On the **Whitelist Settings** tab, click **Edit** corresponding to the default whitelist.

 **Note** You can also click **Create Whitelist** to create a new whitelist.

6. In the **Edit Whitelist** dialog box that appears, enter the IP addresses or CIDR blocks used to access the instance, and then click **OK**. The following section describes the rules:
 - If you enter the CIDR block 10.10.10.0/24 in the IP Addresses field, all IP addresses in the 10.10.10.X format are granted access to your RDS instance.
 - If you enter more than one IP address or CIDR block, you must separate them with commas (,). Do not add spaces before or after the commas. Example: 192.168.0.1,172.16.213.9.
 - If you click **Add Internal IP Addresses of ECS Instances**, the IP addresses of all created ECS instances within your Alibaba Cloud account are displayed. You can select the required IP addresses to add to the whitelist.

12.12. Log and audit

12.12.1. SQL audit (database audit)

You can use the SQL audit feature to audit SQL executions and check the details. SQL audit does not affect instance performance.

Precautions

- SQL audit does not affect instance performance.
- SQL audit logs are retained for 30 days.
- Log files exported from SQL audit are retained for two days. The system deletes files that are retained for longer than two days.
- SQL audit is disabled by default. You must manually enable it.
- You cannot view logs that are generated before SQL audit is enabled.

Enable SQL audit

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Data Security**.
5. Click the **SQL Audit** tab.
6. Click **Enable SQL audit** or **Enable now**.
7. In the message that appears, click **Confirm**.

 **Note** After enabling SQL audit, you can query SQL information based on conditions such as the time, database, user, and keyword.

Disable SQL audit

You can disable SQL audit when it is no longer needed. To disable SQL audit, follow these steps:

 **Notice** If SQL audit is disabled, all SQL audit logs are deleted. We recommend that you export and store audit logs locally before you disable SQL audit.

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Data Security**.
5. Click the **SQL Audit** tab, click **Export File**, and then store the exported file locally.
6. Click **Disable SQL Audit**.
7. In the message that appears, click **Confirm**.

12.12.2. Manage logs

You can view logs for errors, slow queries, and primary/secondary instance switching for ApsaraDB RDS for PostgreSQL instances in the ApsaraDB for RDS console or by executing SQL statements. These logs help you troubleshoot errors. This topic describes how to manage logs in the console.

Procedure

1. [Log on to the ApsaraDB for RDS console.](#)

2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Logs**.
5. On the **Logs** page that appears, click the **Error Logs**, **Slow Query Logs**, or **Primary/Secondary Switching Logs** tab, select a time range, and click **Search**.

Tab	Description
Error Logs	Records database running errors that occurred within the last month.
Slow Log Details	Records SQL statements within the last month that took longer than one second to execute. Duplicated SQL statements are removed.
Primary/Secondary Instance Switching Log	Records switchovers between the primary and secondary instances within the last month.

12.13. Backup

12.13.1. Back up an ApsaraDB RDS for PostgreSQL instance

This topic describes how to back up an ApsaraDB RDS for PostgreSQL instance. You can configure a backup policy that is used to automatically back up your RDS instance. If you do not configure a backup policy, the default backup policy is used. You can also manually back up your RDS instance.

Precautions

- Do not perform data definition language (DDL) operations during a backup. If you do so, the backup may fail due to table locks.
- We recommend that you back up your RDS instance during off-peak hours.
- If the amount of data is large, it may take a long time to back up your RDS instance.
- Backups are retained for a specified retention period. We recommend that you download the required backups to your computer before they are deleted.

Overview of data and log backups

Database engine	Data backup	Log backup
PostgreSQL	Supports full physical backup.	These are backups of the archived log files of your RDS instance.

Configure a backup policy to automatically back up your RDS instance

ApsaraDB for RDS automatically backs up your RDS instance based on the specified backup policy.

1. [Log on to the ApsaraDB for RDS console](#).
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Backup and Restoration**.
5. On the **Backup and Restoration** page, click the **Backup Settings** tab, and then click the **Edit** button.
6. In the dialog box that appears, configure the following parameters, and then click **OK**. The following table lists the parameters.

Parameter	Description
Data Retention Period	The number of days for which you want to retain data backup files. Valid values: 7 to 730. Unit: days. Default value: 7.
Backup Cycle	The cycle to create backups. You can select one or more days of the week. <div style="border: 1px solid #add8e6; padding: 5px;"> ? Note To ensure data security, we recommend that you back up your RDS instance at least twice a week. </div>
Backup Time	The hour at which you want to create a backup.
Log Backup	The switch to enable or disable the log backup function. <div style="border: 1px solid #add8e6; padding: 5px;"> 🔊 Notice If you disable this function, all log backup files are deleted and your RDS instance will not be able to restored to previous points in time. </div>
Log Retention Period	<ul style="list-style-type: none"> ◦ The period of time for which you want to retain log backup files. Valid values: 7 to 730. Unit: days. Default value: 7. ◦ The log retention period must be less than or equal to the data retention period.

Manually back up your RDS instance

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the upper-right corner of the page, click **Back Up Instance** to go to the **Back Up Instance** dialog box.
5. Select the backup mode and backup policy, and click **OK**.

? **Note** The backup mode is **Full Backup** and the backup policy is **Instance Backup**.

What's next

You can click the  icon in the upper-right corner of the page to view the task progress displayed in the **Task Progress** list.

12.13.2. Download data and log backup files

This topic describes how to download unencrypted data and log backup files in the ApsaraDB for RDS console to archive the files and restore data to an on-premises database.

Procedure

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Backup and Restoration** to go to the **Backup and Restoration** page.
5. Click the **Data Backup** or **Archived Logs** tab.
 - To download data backup files, click the **Data Backup** tab.

- To download log backup files, click the **Archived Logs** tab.
- 6. Select a time range to which you want to restore the instance.
- 7. Find the data backup or log file that you want to download, and click **Download** in the **Actions** column.

Note

- If you want to use a data backup file to restore data, select the backup file that is the closest to the time for restoration.
- If you want to use a log file to restore data to an on-premises database, note the following items:
 - The instance No. of the log file must be the same as that of the data backup file.
 - The start time of the log file must be later than the data backup time and earlier than the time when you want to restore data.

- 8. In the download message that appears, select a download method.

Download method	Description
Download	Download the file by using the public endpoint.
Copy Internal Endpoint	Copy the internal endpoint to download the file. If your ECS and RDS instances reside within the same region, you can log on to the ECS instance and use the internal endpoint to download the file. This method is fast and secure.
Copy Public Endpoint	Copy the public endpoint to download the file. If you want to use other tools to download the file, use the public endpoint.

Note If you use a Linux operating system, you can run the following command to download the file:

```
wget -c '<Public endpoint of the backup file, which is the download URL>' -O <File name>
```

- The `-c` option enables resumable download.
- The `-O` option saves the downloaded file by using a specified name. We recommend that you use the file name contained in the download URL.
- If the URL contains more than one parameter, enclose the download URL in a pair of single quotation marks (').

```
root@izbp:~# wget -c 'http://rdslog-hz-...-cn-hangzhou.aliyuncs.com/.../hostins=...mysql-bin.000457' -O mysql-bin.000457
```

12.13.3. Create a logical backup for an ApsaraDB RDS for PostgreSQL instance

This topic describes how to use `pg_dump` to create a logical backup for an ApsaraDB RDS for PostgreSQL instance and export the backup file to your computer.

Context

The `pg_dump` utility provided with PostgreSQL is used to back up individual databases. For more information, visit [pg_dump](#).

In this example, an ApsaraDB RDS for PostgreSQL instance that runs Linux 7 and PostgreSQL 10 is used.

Prerequisites

- The IP address of your ECS instance or on-premises host is added to a whitelist of your ApsaraDB RDS for PostgreSQL instance. For more information, see [Configure an IP address whitelist](#).
- Your ECS instance or on-premises host runs the same version of PostgreSQL as your ApsaraDB RDS for PostgreSQL instance.

Precautions

We recommend that you use the privileged account of the ApsaraDB RDS for PostgreSQL instance to ensure that you have all the required permissions.

Back up a database

1. Log on to your ECS instance or on-premises host. Then, run the following command to back up a database from the ApsaraDB RDS for PostgreSQL instance:

```
pg_dump -h '<hostname>' -U <username> -p <port> -Fc <dbname> > <dumpdir>
```

Parameter	Description
hostname	The endpoint of the ApsaraDB RDS for PostgreSQL instance. <div style="border: 1px solid #ccc; background-color: #e6f2ff; padding: 5px;"> <p> Note If your ECS instance connects to the ApsaraDB RDS for PostgreSQL instance by using an internal endpoint, make sure that the ECS and RDS instances have the same network type. If both instances use the VPC network type, make sure that both instances reside within the same VPC. For more information about how to view the internal endpoint, see View and modify the internal endpoint and port number.</p> </div>
username	The username of the privileged account of the ApsaraDB RDS for PostgreSQL instance.
port	The port number of the ApsaraDB RDS for PostgreSQL instance.
-Fc	The output file format. <code>-Fc</code> specifies to use the custom format, which is ideal when you use <code>pg_restore</code> to import logical backup files and restore databases. For more information, visit pg_dump .
dbname	The name of the database that you want to back up.
dumpdir	The directory and name of the logical backup file to export.

Example:

```
pg_dump -h 'pgm-bpxxxxxx.pg.rds.aliyuncs.com' -U test123 -p 3433 -Fc testdb > /tmp/testdb.dump
```

2. When `Password:` appears, enter the password of the privileged account of the RDS instance and press Enter.

```
[root@izbp... etc]# pg_dump -h 'pgm-... pg.rds.aliyuncs.com' -U l... -p 3433 -Fc testdb > /tmp/testdb.dump
Password:
[root@izbp... etc]# ll /tmp/testdb.dump
-rw-r--r-- 1 root root 2006 Nov  5 16:05 /tmp/testdb.dump
[root@izbp... etc]#
```

Back up one or more tables

1. Log on to your ECS instance or on-premises host. Then, run the following command to back up one or more tables from a database in the ApsaraDB RDS for PostgreSQL instance:

```
pg_dump -h '<hostname>' -U <username> -p <port> -t <table> -Fc <dbname> > <dumpdir>
```

Parameter	Description
hostname	The endpoint of the ApsaraDB RDS for PostgreSQL instance. <div style="border: 1px solid #add8e6; padding: 5px;"> <p>? Note If your ECS instance connects to the ApsaraDB RDS for PostgreSQL instance by using an internal endpoint, make sure that the ECS instance and the RDS instance have the same network type. If both instances use the VPC network type, make sure that both instances reside within the same VPC. For more information about how to view the internal endpoint, see View and modify the internal endpoint and port number.</p> </div>
username	The username of the privileged account of the ApsaraDB RDS for PostgreSQL instance.
port	The port number of the ApsaraDB RDS for PostgreSQL instance.
table	The name of the table you want to back up. You can use <code>-t <table></code> to specify more than one table.
-Fc	The output file format. <code>-Fc</code> specifies to use the custom format, which is ideal when you use <code>pg_restore</code> to import logical backup files and restore databases. For more information, visit pg_dump .
dbname	The name of the database that you want to back up.
dumpdir	The directory and name of the logical backup file to export.

Example:

```
pg_dump -h 'pgm-bpxxxxxx.pg.rds.aliyuncs.com' -U test123 -p 3433 -t products1 -Fc testdb2 > /tmp/testdb2.dump
```

- When `Password:` appears, enter the password of the privileged account of the RDS instance and press Enter.

```
[root@iZ... ~]# pg_dump -h 'pgm-bpxxxxxx.pg.rds.aliyuncs.com' -U test123 -p 3433 -t products1 -Fc testdb2 > /tmp/testdb2.d
ump
Password:
[root@iZ... ~]#
```

Back up a database with one or more tables excluded

- Log on to your ECS instance or on-premises host. Then, run the following command to back up a database from the ApsaraDB RDS for PostgreSQL instance with one or more tables excluded:

```
pg_dump -h '<hostname>' -U <username> -p <port> -T <table> -Fc <dbname> > <dumpdir>
```

Parameter	Description
-----------	-------------

Parameter	Description
hostname	<p>The endpoint of the ApsaraDB RDS for PostgreSQL instance.</p> <div style="border: 1px solid #add8e6; padding: 5px; background-color: #e6f2ff;"> <p>? Note If your ECS instance connects to the ApsaraDB RDS for PostgreSQL instance by using an internal endpoint, make sure that the ECS and RDS instances have the same network type. If both instances use the VPC network type, make sure that both instances reside within the same VPC. For more information about how to view the internal endpoint, see View and modify the internal endpoint and port number.</p> </div>
username	The username of the privileged account of the ApsaraDB RDS for PostgreSQL instance.
port	The port number of the ApsaraDB RDS for PostgreSQL instance.
table	The name of the table you want to exclude. You can use <code>-T <table></code> to specify more than one table.
-Fc	The output file format. <code>-Fc</code> specifies to use the custom format, which is ideal when you use <code>pg_restore</code> to import logical backup files and restore databases. For more information, visit pg_dump .
dbname	The name of the database that you want to back up.
dumpdir	The directory and name of the logical backup file to export.

Example:

```
pg_dump -h 'pgm-bpxxxx.pg.rds.aliyuncs.com' -U test123 -p 3433 -T products1 -Fc testdb2 > /tmp/testdb2.dump
```

- When `Password:` appears, enter the password of the privileged account of your RDS instance and press Enter.

```
[root@iZL... ~]# pg_dump -h 'pgm-bp...pg.rds.aliyuncs.com' -U test123 -p 3433 -T products1 -Fc testdb2 > /tmp/testdb2.d
ump
Password:
```

Back up the schema of a database with data excluded

- Log on to your ECS instance or on-premises host. Then, run the following command to back up the schema of a database from the ApsaraDB RDS for PostgreSQL instance.

```
pg_dump -h '<hostname>' -U <username> -p <port> -s -Fc <dbname> > <dumpdir>
```

Parameter	Description
-----------	-------------

Parameter	Description
hostname	<p>The endpoint of the ApsaraDB RDS for PostgreSQL instance.</p> <p>Note If your ECS instance connects to the ApsaraDB RDS for PostgreSQL instance by using an internal endpoint, make sure that the ECS and RDS instances have the same network type. If both instances use the VPC network type, make sure that both instances reside within the same VPC. For more information about how to view the internal endpoint, see View and modify the internal endpoint and port number.</p>
username	The username of the privileged account of the ApsaraDB RDS for PostgreSQL instance.
port	The port number of the ApsaraDB RDS for PostgreSQL instance.
-s	Specifies to only back up the schema of the database. The data of the database is not backed up. For more information, visit pg_dump .
-Fc	The output file format. <code>-Fc</code> specifies to use the custom format, which is ideal when you use <code>pg_restore</code> to import logical backup files and restore databases. For more information, visit pg_dump .
dbname	The name of the database that you want to back up.
dumpdir	The directory and name of the logical backup file to export.

Example:

```
pg_dump -h 'pgm-bpxxxx.pg.rds.aliyuncs.com' -U test123 -p 3433 -s -Fc testdb2 > /tmp/testdb2.dump
```

- When `Password:` appears, enter the password of the privileged account of your RDS instance and press Enter.

```
[root@izb1-20130101020 ~]# pg_dump -h 'pgm-bpxxxx.pg.rds.aliyuncs.com' -U test123 -p 3433 -s -Fc testdb2 > /tmp/testdb2.dump
Password:
[root@izb1-20130101020 ~]# ll /tmp/
total 16
srwxr-xr-x 1 root root 0 Nov 5 15:28 Aegis-...
-rw-r--r-- 1 root root 4 Nov 5 15:27 CmsGoAgent.pid
drwx----- 3 root root 4096 Nov 5 15:27 systemd-private-...
-rw-r--r-- 1 root root 2013 Nov 7 14:43 testdb2.dump
```

12.13.4. Create a full backup of an ApsaraDB RDS for PostgreSQL instance

This topic describes how to use the `pg_basebackup` utility provided by open source PostgreSQL to create a full backup of your ApsaraDB RDS for PostgreSQL instance and export the backup files to your computer.

Prerequisites

- The IP address of your ECS instance or on-premises host is added to a whitelist of your ApsaraDB RDS for PostgreSQL instance. For more information, see [Configure an IP address whitelist](#).

- Your ECS instance or on-premises host runs the same version of PostgreSQL as your ApsaraDB RDS for PostgreSQL instance.

Context

pg_basebackup backs up all data of a PostgreSQL instance. Backup files can be used for point-in-time recovery. For more information, see [pg_basebackup](#).

In this example, CentOS 7 and PostgreSQL 12 are used to create a full backup.

Precautions

We recommend that you use the privileged account of the ApsaraDB RDS for PostgreSQL instance to ensure that you have all the required permissions.

Procedure

Note pg_basebackup cannot back up a single database or database object. For more information about how to back up a single database or database object, see [Create a logical backup for an ApsaraDB RDS for PostgreSQL instance](#).

1. Log on to your ECS instance or on-premises host. Then, run the following command to back up a database from your RDS instance:

```
pg_basebackup -Ft -Pv -Xf -z -D <backupdir> -Z5 -h '<hostname>' -p <port> -U <username> -W
```

The following table describes parameters in this command. For more information, visit [pg_basebackup](#).

Parameter	Description
backupdir	The directory of backup files that are exported. The system automatically creates this directory. However, if this directory already exists and is not empty, the system reports an error.
hostname	The endpoint that you use to connect to your ApsaraDB RDS for PostgreSQL instance. For more information about how to view the internal endpoint, see View and modify the internal endpoint and port number .
port	The port that you use to connect to your ApsaraDB RDS for PostgreSQL instance.
username	A username of your ApsaraDB RDS for PostgreSQL instance.

Example:

```
pg_basebackup -Ft -Pv -Xf -z -D /pg12/backup1/ -Z5 -h pgm-bpxxxxx.pg.rds.aliyuncs.com -p 1433 -U test1 -W
```

2. When `Password:` appears, enter the password of the username of your RDS instance and press Enter.

```
[root@izbp-... ~]# pg_basebackup -Ft -Pv -Xf -z -D /pg12/backup/ -Z5 -h pgm-bpxxxxx.pg.rds.aliyuncs.com -p 1433 -U test1 -W
Password:
pg_basebackup: initiating base backup, waiting for checkpoint to complete
WARNING: skipping special file "/.s.PGSQL.3002"
pg_basebackup: checkpoint completed
pg_basebackup: write-ahead log start point: 14/8F000028 on timeline 1
WARNING: skipping special file "/.s.PGSQL.3002"/base.tar.gz
49065/49065 kB (100%), 1/1 tablespace
pg_basebackup: write-ahead log end point: 14/8F0003A0
pg_basebackup: syncing data to disk ...
pg_basebackup: base backup completed
[root@izbp-... jqz ~]# ll /pg12/backup/
total 3956
-rw----- 1 root root 4047901 Apr 13 14:04 base.tar.gz
[root@izbp-... ~]#
```

12.14. Restoration

12.14.1. Restore data of an ApsaraDB RDS for PostgreSQL instance

This topic describes how to use the backup data of an ApsaraDB RDS for PostgreSQL instance to restore data.

Precautions

- The new instance must have the same whitelist, backup, and parameter settings as the original instance.
- The new instance must have the same data and account information as the backup set or instance at the time point.

Prerequisites

The original instance must meet the following conditions:

- The instance is in the Running state and is not locked.
- The original RDS instance does not have an ongoing migration task.
- If you want to restore an instance to a point in time, the log backup function is enabled for the original RDS instance.
- If you want to restore an instance from a backup set, the original RDS instance has at least one backup set.

Restore data of an ApsaraDB RDS for PostgreSQL instance

1. [Log on to the ApsaraDB for RDS console.](#)
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Backup and Restoration**.
5. In the upper-right corner of the page, click **Restore Database (Previously Clone Database)**.
6. Configure the following parameters.

Section	Parameter	Description
Region	Region	The region where the instance resides.
Database Restoration	Restore Mode	<ul style="list-style-type: none"> ◦ By Time: You can restore data to any point in time within the retention period of the log backup. For more information about how to view or change the retention period of log backups, see Back up an ApsaraDB RDS for PostgreSQL instance. ◦ By Backup Set <div style="border: 1px solid #add8e6; padding: 5px; margin-top: 10px;"> ? Note By Time is displayed only when the log backup feature is enabled. </div>
	Time	The time to which the database is restored. This parameter is displayed when you set Restore Mode to By Time.
	Backup Set	The backup set used to restore the database. This parameter is displayed when you set Restore Mode to By Backup Set.
	Instance Name	The name of the instance.
	Database Engine	The engine of the database, which varies with regions. The available database engines are displayed on the Restore RDS Instance page. The value of this parameter is set to PostgreSQL and cannot be changed.

Section	Parameter	Description
Specifications	Engine Version	The version of the database engine.
	Edition	The edition of the database. Select one from the drop-down list.
	Storage Type	None.
	Instance Type	The type of the instance. Memory size determines the maximum number of connections and IOPS. The actual values are displayed on the console.
	Storage	The storage capacity of the instance, including the space to store data, system files, binary log files, and transaction files. The minimum storage capacity is 20 GB. You can adjust the storage capacity.
Network Type	Network Type	<p>The network type of the instance. RDS instances support the following network types:</p> <ul style="list-style-type: none"> ◦ Classic Network: Cloud services on a classic network are not isolated from each other. Unauthorized access to a cloud service is blocked only by the security group or whitelist policy of the service. ◦ VPC: A Virtual Private Cloud (VPC) helps you to build an isolated network environment on Alibaba Cloud. You can customize the route table, IP address range, and gateway within a VPC. We recommend that you select VPC for improved security. <div style="border: 1px solid #ccc; background-color: #e6f2ff; padding: 5px; margin-top: 10px;"> <p> Note After you select VPC as the network type, you must also select the corresponding VPC and VSwitch.</p> </div>

7. Click **Submit**.

12.14.2. Restore data from a logical backup file

This topic describes how to restore data from a logical backup file to an ApsaraDB RDS for PostgreSQL instance or an on-premises PostgreSQL database.

Context

A logical backup file is used to restore a small amount of data, such as data in a table. For a large amount of data, we recommend that you restore it from a full physical backup file to a new RDS instance and then use Alibaba Cloud Data Transmission Service (DTS) to migrate data to the original RDS instance.

Prerequisites

Data in the ApsaraDB RDS for PostgreSQL instance has been logically backed up. For more information, see [Create a logical backup for an ApsaraDB RDS for PostgreSQL instance](#).

Precautions

- We recommend that you do not restore data to the default postgres database.
- When you restore the data of a specific table, the system does not restore the database objects on which the table depends. Restoring a database may fail.

Restore the data of a database

1. Log on to the ECS instance or on-premises host that houses the logical backup file and run the following command to restore the data of a database:

```
pg_restore -h '<hostname>' -U <username> -p <port> -d <dbname> <dumpdir>
```

Parameter	Description
hostname	The endpoint of the ApsaraDB RDS for PostgreSQL instance. <div style="border: 1px solid #add8e6; padding: 5px;"> <p>Note If your ECS instance connects to the ApsaraDB RDS for PostgreSQL instance by using an internal endpoint, make sure that the ECS and RDS instances have the same network type. If both instances use the VPC network type, make sure that both instances reside within the same VPC. For more information about how to view the internal endpoint, see View and modify the internal endpoint and port number.</p> </div>
username	The username of the privileged account of the ApsaraDB RDS for PostgreSQL instance.
port	The port number of the ApsaraDB RDS for PostgreSQL instance.
dbname	The name of the database whose data you want to restore.
dumpdir	The directory and name of the logical backup file to use.

Example:

```
pg_restore -h 'pgm-bpxxxx.pg.rds.aliyuncs.com' -U test123 -p 3433 -d testdb2 /tmp/testdb.dump
```

2. When **Password:** appears, enter the password of the privileged account of your RDS instance and press Enter.

Note You can ignore alerts generated by the embedded plpgsql plug-in.

```
[root@iZbj... ~]# pg_restore -h 'pgm-bp...pg.rds.aliyuncs.com' -U ... -p 3433 -d testdb4 /tmp/testdb2.dump
Password:
pg_restore: [archiver (db)] Error while PROCESSING TOC:
pg_restore: [archiver (db)] Error from TOC entry 3076; 0 0 COMMENT EXTENSION plpgsql
pg_restore: [archiver (db)] could not execute query: ERROR: must be owner of extension plpgsql
Command was: COMMENT ON EXTENSION plpgsql IS 'PL/pgSQL procedural language';

WARNING: errors ignored on restore: 1
[...]
```

Restore the data of a table

1. Log on to the ECS instance or on-premises host that houses the logical backup file and run the following command to restore the data of a table:

```
pg_restore -h '<hostname>' -U <username> -p <port> -d <dbname> -t <table> -c <dumpdir>
```

Parameter	Description
-----------	-------------

Parameter	Description
hostname	<p>The endpoint of the ApsaraDB RDS for PostgreSQL instance.</p> <div style="border: 1px solid #add8e6; padding: 5px; background-color: #e6f2ff;"> <p>? Note If your ECS instance connects to the ApsaraDB RDS for PostgreSQL instance by using an internal endpoint, make sure that the ECS and RDS instances have the same network type. If both instances use the VPC network type, make sure that both instances reside within the same VPC. For more information about how to view the internal endpoint, see View and modify the internal endpoint and port number.</p> </div>
username	The username of the privileged account of the ApsaraDB RDS for PostgreSQL instance.
port	The port number of the ApsaraDB RDS for PostgreSQL instance.
dbname	The name of the database whose data you want to restore.
table	The name of the table whose data you want to restore.
-c	-c : specifies to delete the database objects on which the table depends before data restoration. For more information, visit pg_restore .
dumpdir	The directory and name of the logical backup file to use.

Example:

```
pg_restore -h 'pgm-bpxxxxx.pg.rds.aliyuncs.com' -U test123 -p 3433 -d testdb2 -t products -c /tmp/testdb.dump
```

- When `Password:` appears, enter the password of the privileged account of your RDS instance and press **Enter**.

Restore the schema of a database with data excluded

- Log on to the ECS instance or on-premises host that houses the logical backup file and run the following command to only restore the schema of a database:

```
pg_restore -h '<hostname>' -U <username> -p <port> -d <dbname> -s <dumpdir>
```

Parameter	Description
-----------	-------------

Parameter	Description
hostname	<p>The endpoint of the ApsaraDB RDS for PostgreSQL instance.</p> <p>Note If your ECS instance connects to the ApsaraDB RDS for PostgreSQL instance by using an internal endpoint, make sure that the ECS and RDS instances have the same network type. If both instances use the VPC network type, make sure that both instances reside within the same VPC. For more information about how to view the internal endpoint, see View and modify the internal endpoint and port number.</p>
username	The username of the privileged account of the ApsaraDB RDS for PostgreSQL instance.
port	The port number of the ApsaraDB RDS for PostgreSQL instance.
dbname	The name of the database whose schema you want to restore.
-s	<code>-s</code> : specifies to restore only the schema of the database. The data of the database is not restored. For more information, visit pg_restore .
dumpdir	The directory and name of the logical backup file to use.

Example:

```
pg_restore -h 'pgm-bpxxxxx.pg.rds.aliyuncs.com' -U test123 -p 3433 -d testdb4 -s /tmp/testdb2.dump
```

- When `Password:` appears, enter the password of the privileged account of your RDS instance and press Enter.

Note You can ignore alerts generated by the embedded plpgsql plug-in.

```
[root@iZbp... ~]# pg_restore -h 'pgm-bp...pg.rds.aliyuncs.com' -U ... -p 3433 -d testdb4 -s /tmp/testdb2.dump
Password:
pg_restore: [archiver (db)] Error while PROCESSING TOC:
pg_restore: [archiver (db)] Error from TOC entry 3075; 0 0 COMMENT EXTENSION plpgsql
pg_restore: [archiver (db)] could not execute query: ERROR: must be owner of extension plpgsql
Command was: COMMENT ON EXTENSION plpgsql IS 'PL/pgSQL procedural language';

WARNING: errors ignored on restore: 1
```

12.15. Plug-ins

12.15.1. Plug-ins supported

This topic lists the plug-ins that are supported by ApsaraDB RDS for PostgreSQL and their available versions.

PostgreSQL 10

Plug-in	Version
pg_stat_statements	1.6

Plug-in	Version
btree_gin	1.2
btree_gist	1.5
chkpass	1
citext	1.4
cube	1.2
dblink	1.2
dict_int	1
earthdistance	1.1
hstore	1.4
intagg	1.1
intarray	1.2
isn	1.1
ltree	1.1
pgcrypto	1.3
pgrowlocks	1.2
pg_prewarm	1.1
pg_trgm	1.3
postgres_fdw	1
sslinfo	1.2
tablefunc	1
unaccent	1.1
postgis_sfcgal	2.5.1
postgis_topology	2.5.1
fuzzystrmatch	1.1
postgis_tiger_geocoder	2.5.1
address_standardizer	2.5.1
address_standardizer_data_us	2.5.1
ogr_fdw	1
plperl	1

12.15.2. Use mysql_fdw to read and write data from and to a MySQL database

This topic describes how to use the `mysql_fdw` plug-in of ApsaraDB RDS for PostgreSQL to read and write data from and to a database on an ApsaraDB RDS for MySQL instance or a user-created MySQL database.

Prerequisites

- Your RDS instance runs PostgreSQL 10.
- Communication between your ApsaraDB RDS for PostgreSQL instance and the target MySQL database is normal.

Context

PostgreSQL 9.6 and later support parallel computing. PostgreSQL 11 can use joins on up to a billion data records to complete queries in seconds. A number of users prefer to use PostgreSQL to build small sized data warehouses and process highly concurrent access requests. PostgreSQL 13 is under development. It will support columnar storage engines that further improve analysis capabilities.

The `mysql_fdw` plug-in establishes a connection to synchronize data from a MySQL database to your ApsaraDB RDS for PostgreSQL instance.

Procedure

1. Create the `mysql_fdw` plug-in.

```
postgres=> create extension mysql_fdw;  
CREATE EXTENSION
```

2. Define a MySQL server.

```
postgres=> CREATE SERVER <The name of the MySQL server>  
postgres-> FOREIGN DATA WRAPPER mysql_fdw  
postgres-> OPTIONS (host '<The endpoint used to connect to the MySQL server>', port '<The port used to connect the MySQL server>');  
CREATE SERVER
```

Example:

```
postgres=> CREATE SERVER mysql_server  
postgres-> FOREIGN DATA WRAPPER mysql_fdw  
postgres-> OPTIONS (host 'rm-xxx.mysql.rds.aliyuncs.com', port '3306');  
CREATE SERVER
```

3. Map the MySQL server to an account created on your ApsaraDB RDS for PostgreSQL instance. The account can then be used to read and write data to the target MySQL database on the MySQL server.

```
postgres=> CREATE USER MAPPING FOR <The username of the account to which the MySQL server is mapped>  
SERVER <The name of the MySQL server>  
OPTIONS (username '<The username used to log on to the target MySQL database>', password '<The password used to log on to the target MySQL database>');  
CREATE USER MAPPING
```

Example:

```
postgres=> CREATE USER MAPPING FOR pgtest  
SERVER mysql_server  
OPTIONS (username 'mysqltest', password 'Test1234!');  
CREATE USER MAPPING
```

4. Create a foreign MySQL table by using the account that you mapped to the MySQL server in the previous

step.

Note The field names in the foreign MySQL table must be the same as those in the target table of the target MySQL database. You can choose to create only the fields you want to query. For example, if the target table in the target MySQL database contains three fields, ID, NAME, and AGE, you only need to create two fields, ID and NAME, in the foreign MySQL table.

```
postgres=> CREATE FOREIGN TABLE <The name of the foreign MySQL table> (<The name of Field 1> <The data type of Field 1>,<The name of Field 2> <The data type of Field 2>...) server <The name of the MySQL server> options (dbname '<The name of the target MySQL database>', table_name '<The name of the target table in the target MySQL database>');
```

CREATE FOREIGN TABLE

Example:

```
postgres=> CREATE FOREIGN TABLE ft_test (id1 int, name1 text) server mysql_server options (dbname 'test123', table_name 'test');
```

CREATE FOREIGN TABLE

What to do next

You can use the foreign MySQL table to test the performance of reading and writing data from and to the target MySQL database.

Note Data can be written to the target table in the target MySQL database only when the target table is assigned a primary key. If the target table is not assigned a primary key, the following error is displayed:

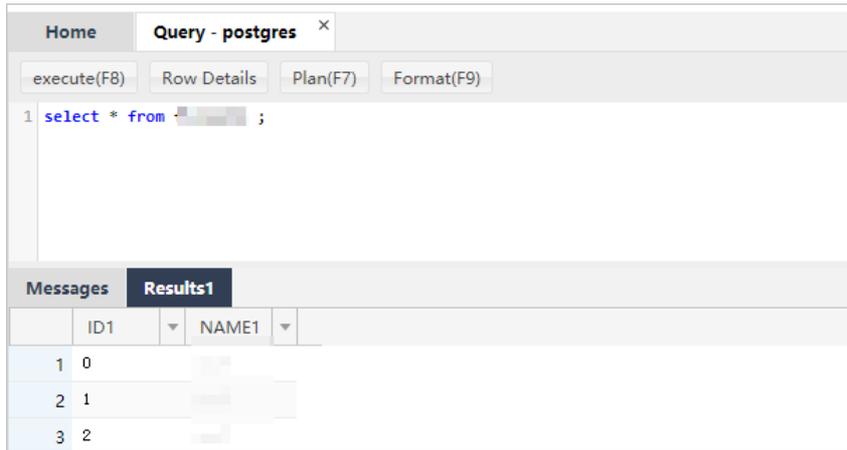

```
ERROR: first column of remote table must be unique for INSERT/UPDATE/DELETE operation.
```

```
postgres=> select * from ft_test ;

postgres=> insert into ft_test values (2,'abc');
INSERT 0 1

postgres=> insert into ft_test select generate_series(3,100),'abc';
INSERT 0 98

postgres=> select count(*) from ft_test ;
count
-----
    99
(1 row)
```

Check query plans to find out how the requests sent from your ApsaraDB RDS for PostgreSQL instance are executed to query data from the target MySQL database.

```
postgres=> explain verbose select count(*) from ft_test ;
                QUERY PLAN
-----
Aggregate  (cost=1027.50..1027.51 rows=1 width=8)
  Output: count(*)
  -> Foreign Scan on public.ft_test (cost=25.00..1025.00 rows=1000 width=0)
    Output: id, info
    Remote server startup cost: 25
    Remote query: SELECT NULL FROM `test123`.`test`
(6 rows)

postgres=> explain verbose select id from ft_test where id=2;
                QUERY PLAN
-----
Foreign Scan on public.ft_test (cost=25.00..1025.00 rows=1000 width=4)
  Output: id
  Remote server startup cost: 25
  Remote query: SELECT `id` FROM `test123`.`test` WHERE ((`id` = 2))
(4 rows)
```

12.15.3. Read and write foreign data files by using oss_fdw

This topic describes how to use the oss_fdw plug-in to load data between Object Storage Service (OSS) and PostgreSQL or PPAS databases.

oss_fdw parameters

The oss_fdw plug-in uses a method similar to other Foreign Data Wrapper (FDW) interfaces to encapsulate foreign data stored in OSS. You can use oss_fdw to read data stored in OSS. This process is similar to reading data tables. oss_fdw provides unique parameters to connect and parse file data in OSS.

Note

- `oss_fdw` can read and write files of the following types in OSS: TEXT and CSV files as well as GZIP-compressed TEXT and CSV files.
- The value of each parameter must be enclosed in double quotation marks (") and cannot contain unnecessary spaces.

CREATE SERVER parameters

- `ossendpoint`: the endpoint used to access OSS through the internal network, also known as the host.
- `id oss`: the AccessKey ID of the OSS account.
- `key oss`: the AccessKey secret of the OSS account.
- `bucket`: the bucket where the data you want to access is stored. You must create an OSS account before you specify this parameter.

The following fault tolerance parameters can be used for data import and export. If network connectivity is poor, you can adjust these parameters as necessary to ensure successful import and export.

- `oss_connect_timeout`: indicates the connection timeout period. Default value: 10. Unit: seconds.
- `oss_dns_cache_timeout`: indicates the DNS timeout period. Default value: 60. Unit: seconds.
- `oss_speed_limit`: indicates the minimum data transmission rate. Default value: 1024. Unit: byte/s.
- `oss_speed_time`: the maximum waiting period during which the data transmission rate is lower than its minimum value. Default value: 15. Unit: seconds.

If the default values of `oss_speed_limit` and `oss_speed_time` are used, a timeout error occurs when the transmission rate is lower than 1,024 byte/s for 15 consecutive seconds.

CREATE FOREIGN TABLE parameters

- `filepath`: a file name that contains a path in OSS.
 - The file name specified by this parameter contains the directory name but not the bucket name.
 - This parameter matches multiple files in the corresponding path in OSS. You can load multiple files to a database.
 - You can import files that adhere to the `filepath` or `filepath.x` format to a database. The values of `x` must be consecutive numbers starting from 1.

For example, among the files named `filepath`, `filepath.1`, `filepath.2`, `filepath.3`, and `filepath.5`, the first four files are matched and imported. The `filepath.5` file is not imported.

- `dir`: the virtual file directory in OSS.
 - The specified directory must end with a forward slash (/).
 - All files (excluding subfolders and files in subfolders) in the virtual file directory specified by `dir` will be matched and imported to a database.
- `prefix`: the prefix of the path name corresponding to the data file. The prefix does not support regular expressions. The `prefix`, `filepath`, and `dir` parameters are mutually exclusive, so only one of them can be specified at a time.
- `format`: the file format, which can only be `csv`.
- `encoding`: the file data encoding format. It supports common PostgreSQL encoding formats, such as UTF-8.
- `parse_errors`: the fault-tolerant parsing mode. If an error occurs during the parsing process, the entire row of data is ignored.
- `delimiter`: the string used to delimit columns.
- `quote`: the quote character for files.
- `escape`: the escape character for files.
- `null`: sets the column matching a specified string to null. For example, `null 'test'` is used to set the value of the `'test'` column to null.

- **force_not_null**: sets the value of a column to a non-null value. For example, `force_not_null 'id'` is used to set the value of the 'id' column to empty strings.
- **compressiontype**: specifies the format of the files to be read or written in OSS.
 - **none**: The files are uncompressed. This is the default value.
 - **gzip**: The files are compressed in the GZIP format.
- **compressionlevel**: specifies the degree to which data files written to OSS are compressed. Valid values: 1 to 9. Default value: 6.

 **Note**

- You must specify `filepath` and `dir` in the `OPTIONS` parameter.
- You must specify either `filepath` or `dir`.
- Export mode only supports `dir`.

Export mode parameters for CREATE FOREIGN TABLE

- **oss_flush_block_size**: the buffer size for the data written to OSS at a time. Default value: 32 MB. Valid values: 1 MB to 128 MB.
- **oss_file_max_size**: the maximum size of a data file allowed to be written to OSS. If a data file reaches the maximum size, the remaining data is written to another data file. Default value: 1024. Valid values: 8 to 4000. Unit: MB.
- **num_parallel_worker**: the maximum number of threads that are allowed to run in parallel to compress the data written to OSS. Valid values: 1 to 8. Default value: 3.

Auxiliary functions

`FUNCTION oss_fdw_list_file (relname text, schema text DEFAULT 'public')`

- This function obtains the name and size of the OSS file that a foreign table matches.
- The unit of file size is byte.

```
select * from oss_fdw_list_file('t_oss');
      name      | size
-----+-----
oss_test/test.gz.1 | 739698350
oss_test/test.gz.2 | 739413041
oss_test/test.gz.3 | 739562048
(3 rows)
```

Auxiliary features

`oss_fdw.rds_read_one_file`: In read mode, this feature is used to specify a file to match the foreign table. The foreign table matches only the specified file during data import.

Example: `set oss_fdw.rds_read_one_file = 'oss_test/example16.csv.1';`

```
set oss_fdw.rds_read_one_file = 'oss_test/test.gz.2';
select * from oss_fdw_list_file('t_oss');
      name      | size
-----+-----
oss_test/test.gz.2 | 739413041
(1 rows)
```

oss_fdw example

```
# Create the plug-in for a PostgreSQL database.
create extension oss_fdw; --- For a PPAS database, execute select rds_manage_extension('create','oss_fdw');
# Create a server.
CREATE SERVER ossserver FOREIGN DATA WRAPPER oss_fdw OPTIONS
  (host 'oss-cn-hangzhou.aliyuncs.com', id 'xxx', key 'xxx', bucket 'mybucket');
# Create an OSS foreign table.
CREATE FOREIGN TABLE ossexample
  (date text, time text, open float,
   high float, low float, volume int);
SERVER ossserver
OPTIONS ( filepath 'osstest/example.csv', delimiter ',',
          format 'csv', encoding 'utf8', PARSE_ERRORS '100');
# Create a table named example to which to import data.
create table example
  (date text, time text, open float,
   high float, low float, volume int);
# Load data from ossexample to example.
insert into example select * from ossexample;
# Result
# oss_fdw estimates the file size in OSS and formulates a query plan.
explain insert into example select * from ossexample;
          QUERY PLAN
-----
Insert on example (cost=0.00..1.60 rows=6 width=92)
-> Foreign Scan on ossexample (cost=0.00..1.60 rows=6 width=92)
    Foreign OssFile: osstest/example.csv.0
    Foreign OssFile Size: 728
(4 rows)
# Write the data in the example table to OSS.
insert into ossexample select * from example;
explain insert into ossexample select * from example;
          QUERY PLAN
-----
Insert on ossexample (cost=0.00..16.60 rows=660 width=92)
-> Seq Scan on example (cost=0.00..16.60 rows=660 width=92)
(2 rows)
```

Additional considerations

- `oss_fdw` is a foreign table plug-in developed based on the PostgreSQL FOREIGN TABLE framework.
- The data import performance is subject to the PostgreSQL cluster resources (CPU, I/O, and memory) and OSS.
- To ensure data import performance, the ApsaraDB RDS for PostgreSQL instance must be in the same region as the OSS bucket.
- If the error `ERROR: oss endpoint userendpoint not in aliyun white list` is reported during foreign table reading, use the endpoints listed in [Regions and endpoints](#). If the problem persists, submit a ticket.

Troubleshooting

When an import or export error occurs, the log displays the following error information:

- **code**: the HTTP status code of the request that has failed.
- **error_code**: the error code returned by OSS.
- **error_msg**: the error message returned by OSS.
- **req_id**: the universally unique identifier (UUID) that identifies the request. If you require assistance in solving a problem, you can submit a ticket containing the req_id of the failed request to OSS developers.

For more information about errors, see the following references. Timeout errors can be handled by using `oss_ext` parameters.

- [Object Storage Service](#)
- [PostgreSQL CREATE FOREIGN TABLE manual](#)
- [OSS error response](#)

ID and key encryption

If the id and key parameters for `CREATE SERVER` are not encrypted, the `select * from pg_foreign_server` statement execution result will display the information. Your AccessKey ID and AccessKey secret will be exposed. You can use symmetric encryption to hide your AccessKey ID and AccessKey secret. Use different AccessKey pairs for different instances to further protect your information. However, to avoid incompatibility with earlier versions, do not add data types as you would in Greenplum.

Encrypted information:

```
postgres=# select * from pg_foreign_server ;
  srvname | srvowner | srvfdw | srvtype | srvversion | srvacl |                                srvoptions
-----+-----+-----+-----+-----+-----+-----
ossserver |    10 | 16390 |         |           |        |  |{host=oss-cn-hangzhou-zmf.aliyuncs.com,id=MD5xxxxxxxx,key=MD5xxxxx
xxx,bucket=067862}
```

The encrypted information is preceded by the MD5 hash value. The remainder of the total length divided by 8 is 3. Therefore, encryption is not performed again when the exported data is imported. You cannot create an AccessKey pair that is preceded by MD5.

12.16. Use Pgpool for read/write splitting in ApsaraDB RDS for PostgreSQL

This topic describes how to use the Pgpool tool of PostgreSQL installed on an ECS instance to implement read/write splitting for your primary and read-only ApsaraDB RDS for PostgreSQL instances.

Context

If you do not use Pgpool to ensure high availability, Pgpool is stateless. The decrease in performance can be ignored. Additionally, Pgpool supports horizontal scaling of your database system. You can use Pgpool with the high availability architecture of ApsaraDB RDS for PostgreSQL to implement read/write splitting.

Set up a test environment

If you have purchased a primary RDS instance that runs PostgreSQL 10 and have attached read-only instances to the primary instance, the only thing you need to do is to [install Pgpool](#) . For more information, see [Create an instance](#) and [Create a read-only ApsaraDB RDS for PostgreSQL instance](#). After you install Pgpool, go to [Configure Pgpool](#).

1. Modify the sysctl.conf file.

```
vi /etc/sysctl.conf

# add by digoyal.zhou
fs.aio-max-nr = 1048576
fs.file-max = 76724600

# Optional. Set the kernel.core_pattern parameter to /data01/corefiles/core_%e_%u_%t_%s.%p.
# The /data01/corefiles directory that is used to store core dumps is created with the 777 permission before testing. If a symbolic link is used, change the directory to 777.

kernel.sem = 4096 2147483647 2147483646 512000
# Specify the semaphore. You can run the ipcs -l or -u command to obtain the semaphore count. Each group of 16 processes requires a semaphore with a count of 17.

kernel.shmall = 107374182
# Specify the total size of shared memory segments. Recommended value: 80% of the memory capacity. Unit: pages.
kernel.shmmax = 274877906944
# Specify the maximum size of a single shared memory segment. Recommended value: 50% of the memory capacity. Unit: bytes. In PostgreSQL versions later than 9.2, the use of shared memory significantly drops.
kernel.shmni = 819200
# Specify the total number of shared memory segments that can be generated. At least two shared memory segments must be generated within each PostgreSQL cluster.

net.core.netdev_max_backlog = 10000
net.core.rmem_default = 262144
# The default setting of the socket receive buffer in bytes.
net.core.rmem_max = 4194304
# The maximum receive socket buffer size in bytes
net.core.wmem_default = 262144
# The default setting (in bytes) of the socket send buffer.
net.core.wmem_max = 4194304
# The maximum send socket buffer size in bytes.
net.core.somaxconn = 4096
net.ipv4.tcp_max_syn_backlog = 4096
net.ipv4.tcp_keepalive_intvl = 20
net.ipv4.tcp_keepalive_probes = 3
net.ipv4.tcp_keepalive_time = 60
net.ipv4.tcp_mem = 8388608 12582912 16777216
net.ipv4.tcp_fin_timeout = 5
net.ipv4.tcp_synack_retries = 2
net.ipv4.tcp_syncookies = 1
# Enable SYN cookies. If an SYN waiting queue overflows, you can enable SYN cookies to defend against a small number of SYN attacks.
net.ipv4.tcp_timestamps = 1
```

```
# Reduce the time after which a network socket enters the TIME-WAIT state.
net.ipv4.tcp_tw_recycle = 0
# If you set this parameter to 1 to enable the recycle function, network sockets in the TIME-WAIT state over TCP c
onnections are recycled. However, if network address translation (NAT) is used, TCP connections may fail. We rec
ommend that you set this parameter to 0 on the database server.
net.ipv4.tcp_tw_reuse = 1
# Enable the reuse function. This function enables network sockets in the TIME-WAIT state to be reused over new
TCP connections.
net.ipv4.tcp_max_tw_buckets = 262144
net.ipv4.tcp_rmem = 8192 87380 16777216
net.ipv4.tcp_wmem = 8192 65536 16777216

net.nf_contrack_max = 1200000
net.netfilter.nf_contrack_max = 1200000

vm.dirty_background_bytes = 409600000
# If the size of dirty pages reaches the specified limit, a background scheduling process (for example, pdflush) is i
nvoked to flush the dirty pages to disks. These are the pages that are generated n seconds earlier. The value of
n is calculated by using the following formula: n = The value of the dirty_expire_centisecs parameter/100.

# The default limit is 10% of the memory capacity. If the memory capacity is large, we recommend that you specify
the limit in bytes.

vm.dirty_expire_centisecs = 3000
# Specify the maximum period to retain dirty pages. Dirty pages are flushed to disks after the time period specifie
d by this parameter elapses. A value of 3000 indicates 30 seconds.
vm.dirty_ratio = 95
# The processes that users call to write data onto disks must actively flush dirty pages to disks. This applies whe
n the background scheduling process to flush dirty pages is slow and the size of dirty pages exceeds 95% of the
memory capacity. These processes include fsync and fdatasync.
# Set this parameter properly to prevent user-called processes from flushing dirty pages to disks. This allows you
to create multiple RDS instances on a single server and use control groups to limit the input/output operations pe
r second (IOPS) per instance.

vm.dirty_writeback_centisecs = 100
# Specify the time interval at which the background scheduling process (such as pdflush) flushes dirty pages to di
sks. The value 100 indicates 1 second.

vm.swappiness = 0
# Disable the swap function.

vm.mmap_min_addr = 65536
vm.overcommit_memory = 0
# Specify whether you can allocate more memory space than the physical host has available. If you set this param
eter to 1, the system always considers the available memory space sufficient. If the memory capacity provided in t
he test environment is low, we recommend that you set this parameter to 1.
```

```

vm.overcommit_ratio = 90
# Specify the memory capacity that can be allocated when the overcommit_memory parameter is set to 2.
vm.swappiness = 0
# Disable the swap function.
vm.zone_reclaim_mode = 0
# Disable non-uniform memory access (NUMA). You can also disable NUMA in the vmlinux file.
net.ipv4.ip_local_port_range = 40000 65535
# Specify the range of TCP or UDP port numbers for the physical host to allocate.
fs.nr_open=20480000
# Specify the maximum number of file handles that a single process can open.

# Note the following parameters:
#vm.extra_free_kbytes = 4096000 # If the physical host provides a low memory capacity, do not specify a large value such as 4096000. If you specify a large value, the physical host may not start.
#vm.min_free_kbytes = 6291456 # We recommend that you increase the value of the vm.min_free_kbytes parameter by 1 GB for every 32 GB of memory.
# If the physical host does not provide much memory, we recommend that you do not configure vm.extra_free_kbytes and vm.min_free_kbytes.
# vm.nr_hugepages = 66536
# If the size of the shared buffer exceeds 64 GB, we recommend that you use huge pages. You can specify the page size by setting the Hugepagesize parameter in the /proc/meminfo file.
#vm.lowmem_reserve_ratio = 1 1 1
# If the memory capacity exceeds 64 GB, we recommend that you set this parameter. Otherwise, we recommend that you retain the default value 256 256 32.

```

2. Modify the limits.conf file.

```

vi /etc/security/limits.conf

* soft nfile 1024000
* hard nfile 1024000
* soft nproc unlimited
* hard nproc unlimited
* soft core unlimited
* hard core unlimited
* soft memlock unlimited
* hard memlock unlimited

# Comment out the other parameters in the limits.conf file.
# Comment out the /etc/security/limits.d/20-nproc.conf file.

```

3. Disable transparent huge pages, configure huge pages, and start PostgreSQL.

```

chmod +x /etc/rc.d/rc.local

vi /etc/rc.local

# Disable transparent huge pages.
if test -f /sys/kernel/mm/transparent_hugepage/enabled; then
    echo never > /sys/kernel/mm/transparent_hugepage/enabled
fi

# Configure huge pages for two instances. Each instance has a shared buffer of 16 GB.
#sysctl -w vm.nr_hugepages=17000

# Start the two instances.
su - postgres -c "pg_ctl start -D /data01/pg12_3389/pg_root"
su - postgres -c "pg_ctl start -D /data01/pg12_8002/pg_root"

```

4. Create a file system.

 **Warning** If you use a new disk, you must verify that the new disk belongs to the vdb partition instead of the vda partition. If the new disk belongs to the vda partition, data may be deleted from the new disk.

```

parted -a optimal -s /dev/vdb mklabel gpt mkpart primary 1MiB 100%FREE
mkfs.ext4 /dev/vdb1 -m 0 -O extent,uninit_bg -E lazy_itable_init=1 -b 4096 -T largefile -L vdb1
vi /etc/fstab
LABEL=vdb1 /data01 ext4 defaults,noatime,nodiratime,nodelalloc,barrier=0,data=writeback 0 0

mkdir /data01
mount -a

```

5. Start the irqbalance command line tool.

```

systemctl status irqbalance
systemctl enable irqbalance
systemctl start irqbalance
systemctl status irqbalance

```

6. Install PostgreSQL 10 and Pgpool.

```

yum install -y https://dl.fedoraproject.org/pub/epel/epel-release-latest-7.noarch.rpm
yum install -y https://download.postgresql.org/pub/repos/yum/repopms/EL-7-x86_64/pgdg-redhat-repo-latest.noarch.rpm
yum search all postgresql
yum search all pgpool

yum install -y postgresql12*
yum install -y pgpool-II-12-extensions

```

7. Initialize the data directory of your database system.

```
mkdir /data01/pg12_3389
chown postgres:postgres /data01/pg12_3389
```

8. Configure environment variables for the postgres user.

```
su - postgres
vi .bash_profile

# Append the following parameters:
export PS1="$USER@`/bin/hostname -s`-> "
export PGPORT=3389
export PGDATA=/data01/pg12_${PGPORT}/pg_root

export LANG=en_US.utf8
export PGHOME=/usr/pgsql-12

```

9. Initialize your primary RDS instance.

```
initdb -D $PGDATA -U postgres -E UTF8 --lc-collate=C --lc-ctype=en_US.utf8
```

10. Modify the postgresql.conf file.

```
listen_addresses = '0.0.0.0'
port = 3389
max_connections = 1500
superuser_reserved_connections = 13
unix_socket_directories = '., /var/run/postgresql, /tmp'
tcp_keepalives_idle = 60
tcp_keepalives_interval = 10
tcp_keepalives_count = 10
shared_buffers = 16GB
huge_pages = on
work_mem = 8MB
maintenance_work_mem = 1GB
dynamic_shared_memory_type = posix
vacuum_cost_delay = 0
bgwriter_delay = 10ms
bgwriter_lru_maxpages = 1000
bgwriter_lru_multiplier = 10.0
```

```
bgwriter_wal_multiplier = 100  
bgwriter_flush_after = 512kB  
effective_io_concurrency = 0  
max_worker_processes = 128  
max_parallel_maintenance_workers = 3  
max_parallel_workers_per_gather = 4  
parallel_leader_participation = off  
max_parallel_workers = 8  
backend_flush_after = 256  
wal_level = replica  
synchronous_commit = off  
full_page_writes = on  
wal_compression = on  
wal_buffers = 16MB  
wal_writer_delay = 10ms  
wal_writer_flush_after = 1MB  
checkpoint_timeout = 15min  
max_wal_size = 64GB  
min_wal_size = 8GB  
checkpoint_completion_target = 0.2  
checkpoint_flush_after = 256kB  
random_page_cost = 1.1  
effective_cache_size = 48GB  
log_destination = 'csvlog'  
logging_collector = on  
log_directory = 'log'  
log_filename = 'postgresql-%a.log'  
log_truncate_on_rotation = on  
log_rotation_age = 1d  
log_rotation_size = 0  
log_min_duration_statement = 1s  
log_checkpoints = on  
log_connections = on  
log_disconnections = on  
log_line_prefix = '%m [%p] '  
log_statement = 'ddl'  
log_timezone = 'Asia/Shanghai'

autovacuum_vacuum_scale_factor = 0.1  
autovacuum_analyze_scale_factor = 0.05  
autovacuum_freeze_max_age = 800000000  
autovacuum_multixact_freeze_max_age = 900000000  
autovacuum_vacuum_cost_delay = 0  
vacuum_freeze_table_age = 750000000  
vacuum_multixact_freeze_table_age = 750000000  
datestyle = 'iso, mdy'
```

```

timezone = 'Asia/Shanghai'
lc_messages = 'en_US.utf8'
lc_monetary = 'en_US.utf8'
lc_numeric = 'en_US.utf8'
lc_time = 'en_US.utf8'
default_text_search_config = 'pg_catalog.english'

```

11. Modify the pg_hba.conf file.

 **Note** Pgpool-II is installed on the same ECS instance as the database server where PostgreSQL resides. If you specify the 127.0.0.1 IP address in the pg_hba.conf file, you must enter the correct password to ensure a successful logon.

```

# "local" is for Unix domain socket connections only
local all all trust
# IPv4 local connections:
host all all 127.0.0.1/32 md5
# IPv6 local connections:
host all all ::1/128 trust
# Allow replication connections from localhost, by a user with the
# replication privilege.
local replication all trust
host replication all 127.0.0.1/32 trust
host replication all ::1/128 trust
host db123 digoal 0.0.0.0/0 md5

```

12. Create a user authorized with streaming replication permissions. Example:

```

db1=# create role rep123 login replication encrypted password 'xxxxxxx';
CREATE ROLE

```

13. Create a user and authorize them to manage your RDS instances. Example:

```

db1=# create role digoal login encrypted password 'xxxxxxx';
CREATE ROLE

db1=# create database db123 owner digoal;
CREATE DATABASE

```

14. Create a user who is authorized to check the health heartbeats between Pgpool and your read-only RDS instances. With the parameters of Pgpool properly configured, this user can check the write-ahead logging (WAL) replay latency on each read-only RDS instance. Example:

```

create role nobody login encrypted password 'xxxxxxx';

```

Create a secondary RDS instance

To simplify the test procedure, follow these steps to create a secondary RDS instance on the same ECS instance as your primary RDS instance.

1. Use the pg_basebackup tool to create an online secondary RDS instance. Example:

```

pg_basebackup -D /data01/pg12_8002/pg_root -F p --checkpoint=fast -P -h 127.0.0.1 -p 3389 -U rep123

```

2. Modify the postgresql.conf file of the secondary RDS instance.

```
cd /data01/pg12_8002/pg_root

vi postgresql.conf

# The secondary RDS instance has the following configuration different from the primary RDS instance:
port = 8002
primary_conninfo = 'hostaddr=127.0.0.1 port=3389 user=rep123' # You do not need to set the password. This is because trust relationships are configured on the primary RDS instance.
hot_standby = on
wal_receiver_status_interval = 1s
wal_receiver_timeout = 10s
recovery_target_timeline = 'latest'
```

3. Configure the standby.signal file of the secondary RDS instance.

```
cd /data01/pg12_8002/pg_root

touch standby.signal
```

4. Check whether the data synchronization between the primary and secondary RDS instances is normal.

```
db1=# select * from pg_stat_replication ;
-[ RECORD 1 ]-----+-----
pid          | 21065
usesysid     | 10
username     | postgres
application_name | walreceiver
client_addr  | 127.0.0.1
client_hostname |
client_port  | 47064
backend_start | 2020-02-29 00:26:28.485427+08
backend_xmin  |
state        | streaming
sent_lsn     | 0/52000060
write_lsn    | 0/52000060

flush_lag    |
replay_lag   |
sync_priority | 0
sync_state   | async
reply_time   | 2020-02-29 01:32:40.635183+08
```

Configure Pgpool

1. Query the location where Pgpool is installed.

```
# rpm -qa|grep pgpool
pgpool-II-12-extensions-4.1.1-1.rhel7.x86_64
pgpool-II-12-4.1.1-1.rhel7.x86_64

# rpm -ql pgpool-II-12-4.1.1
```

2. Modify the pgpool.conf file.

```
# cd /etc/pgpool-II-12/

cp pgpool.conf.sample-stream pgpool.conf

vi pgpool.conf

# -----
# pgPool-II configuration file
# -----
#
# This file consists of lines of the form:
#
# name = value
#
# Whitespace may be used. Comments are introduced with "#" anywhere on a line.
# The complete list of parameter names and allowed values can be found in the
# pgPool-II documentation.
#
# This file is read on server startup and when the server receives a SIGHUP
# signal. If you edit the file on a running system, you have to SIGHUP the
# server for the changes to take effect, or use "pgpool reload". Some
# parameters, which are marked below, require a server shutdown and restart to
# take effect.
#

#-----
# CONNECTIONS
#-----

# - pgpool Connection Settings -

    # error and disconnect the session.

relcache_expire = 0 # After the configuration file is restructured, we recommend that you set this parameter to 1,
reload the configuration file, and then set this parameter to 0 again. You can also set this parameter to a specific
point in time.
    # Life time of relation cache in seconds.
    # 0 means no cache expiration(the default).
    # The relation cache is used for cache the
    # query result against PostgreSQL system
    # catalog to obtain various information
    # including table structures or if it's a
    # temporary table or not. The cache is
    # maintained in a pgpool child local memory
    # and being kept as long as it survives.
```

```

# If someone modify the table by using
# ALTER TABLE or some such, the relcache is
# not consistent anymore.
# For this purpose, cache_expiration
# controls the life time of the cache.

relcache_size = 8192

# Number of relation cache
# entry. If you see frequently:
# "pool_search_relcache: cache replacement happend"
# in the pgpool log, you might want to increate this number.

```

3. Configure the pool_passwd file.

Note If you connect to your RDS instances by using Pgpool, you must configure the pool_passwd file. This is because Pgpool supports the authentication protocol of PostgreSQL.

```

cd /etc/pgpool-II-12

# Run the following command:
#pg_md5 --md5auth --username=username password
# Generate the passwords of the digoyal and nobody users. The passwords are automatically written into the pool
_passwd file.
pg_md5 --md5auth --username=digoal "xxxxxxx"
pg_md5 --md5auth --username=nobody "xxxxxxx"

```

4. Use the system to automatically generate the pool_passwd file.

```

cd /etc/pgpool-II-12
# cat pool_passwd
digoal:md54dd55116da69d3d03bf2e3a1470564f9
nobody:md54240e76623e2511d607f431043a5d1c1

```

5. Configure the pgpool_hba file.

```

cd /etc/pgpool-II-12
cp pool_hba.conf.sample pool_hba.conf
vi pool_hba.conf

host all all 0.0.0.0/0 md5

```

6. Configure the pcp.conf file.

Note The pcp.conf file is used to manage the users and passwords of Pgpool. It is not related to the users and passwords of your RDS instances.

```
cd /etc/pgpool-II-12

# pg_md5 abc # In this command, you set the password to abc and encrypt it by using the MD5 encryption algorithm.
900150983cd24fb0d6963f7d28e17f72

cp pcp.conf.sample pcp.conf

vi pcp.conf

# USERID:MD5PASSWD
manage:900150983cd24fb0d6963f7d28e17f72 # In this command, the manage user is used to manage PCP.
```

7. Start Pgpool.

```
cd /etc/pgpool-II-12
pgpool -f ./pgpool.conf -a ./pool_hba.conf -F ./pcp.conf
```

Note If you want to view the logs of Pgpool, run the following command:

```
less /var/log/messages
```

8. Use Pgpool to connect to your RDS instances.

```
psql -h 127.0.0.1 -p 8001 -U digoal postgres
```

```
[root@izbp1grrvgf11g1hmd8992Z pgpool-II-12]# psql -h pgm-bp1grrvgf11g1hmd8992Z.pg.rds.aliyuncs.com -p 3433 -U digoal postgres
Password for user digoal:
psql (12.2, server 10.10)
Type "help" for help.
postgres=>
```

FAQ

- **Q:** How do I test whether read/write splitting is enabled?
A: You can connect to your RDS instances by using Pgpool and call the `pg_is_in_recovery()` function. Then, close the connection, establish a connection again, and call the `pg_is_in_recovery()` function again. If you receive a value of false and then a value of true, it indicates that Pgpool routes requests to your primary RDS instance and then to your read-only RDS instances and that read/write splitting is enabled.
- **Q:** Does Pgpool increase the latency?
A: Pgpool increases the latency slightly. In the test environment you set up in this topic, the latency increases by about 0.12 milliseconds.
- **Q:** How does Pgpool check the latency and health on my read-only RDS instances?
 - **A:** If the WAL replay latency on a read-only RDS instance exceeds the specified limit, Pgpool stops routing SQL requests to the read-only instance. Pgpool resumes routing SQL requests to the read-only instance only after it detects that the WAL replay latency on the read-only instance falls below the specified limit.

Note Connect to your primary RDS instance and query the location where the current WAL data record is written. This location is referred to as log sequence number (LSN) 1. Then, connect to a read-only RDS instance and query the location where the current WAL data record is replayed. This location is referred to as LSN 2. You can obtain the number of bytes between LSN 1 and LSN 2. This number indicates the latency.

- Pgpool monitors the health of your read-only RDS instances. If a read-only instance is unhealthy, Pgpool stops routing requests to the read-only instance.

- **Q: How do I stop Pgpool and reload the configuration of Pgpool?**

A: Run the `pgpool --help` command to obtain more information about the commands used in Pgpool.

Example:

```
cd /etc/pgpool-II-12
pgpool -f ./pgpool.conf -m fast stop
```

- **Q: How do I configure Pgpool if more than one read-only RDS instance is attached to my primary RDS instance?**

A: Add the configurations of all the attached read-only RDS instances to the `pgpool.conf` file. **Example:**

```
backend_hostname1 = 'xx.xx.xxx.xx'
backend_port1 = 8002
backend_weight1 = 1
backend_data_directory1 = '/data01/pg12_8002/pg_root'
backend_flag1 = 'DISALLOW_TO_FAILOVER'
backend_application_name1 = 'server1'

backend_hostname2 = 'xx.xx.xx.xx'
backend_port1 = 8002
backend_weight1 = 1
backend_data_directory1 = '/data01/pg12_8002/pg_root'
backend_flag1 = 'DISALLOW_TO_FAILOVER'
backend_application_name1 = 'server1'
```

- **Q: How do I use `pcp` commands to view the status of my read-only RDS instances?**

A: To obtain the status of your read-only RDS instances by using `pcp` commands, run the following command:

```
# pcp_node_info -U manage -h /tmp -p 9898 -n 1 -v
Password: Enter the password.

Hostname      : 127.0.0.1
Port          : 8002
Status        : 2
Weight        : 0.500000
Status Name   : up
Role          : standby
Replication Delay : 0
Replication State :
Replication Sync State :
Last Status Change : 2020-02-29 00:20:29
```

- **Q: Which listening ports are used by Pgpool for read/write splitting?**

A: The following listening ports are used by Pgpool for read/write splitting:

- Primary RDS instance: Port 3389
- Secondary RDS instance: Port 8002

- Pgpool: Port 8001
- PCP: Port 9898

12.17. Use ShardingSphere to develop ApsaraDB RDS for PostgreSQL

ShardingSphere is an open source ecosystem that consists of a set of distributed database middleware solutions.

Prerequisites

All PostgreSQL versions used with ApsaraDB for RDS support ShardingSphere.

Context

ApsaraDB RDS for PostgreSQL supports database-integrated sharding plug-ins (such as Citus, Postgres-XC, and AntDB) and massively parallel processing (MPP) products. It also supports sharding middleware products that are similar to those widely used in MySQL, such as ShardingSphere.

ShardingSphere is suitable for services that run in databases with thorough, well-organized logical sharding. It offers the following features:

- Data sharding
 - Database sharding and table sharding
 - Read/write splitting
 - Sharding strategy customization
 - Decentralized distributed primary key
- Distributed transaction
 - Unified transaction API
 - XA transaction
 - BASE transaction
- Database orchestration
 - Dynamic configuration
 - Orchestration and governance
 - Data encryption
 - Tracing and observability
 - Elastic scaling out (planning)

For more information, visit the [ShardingSphere documentation](#).

ShardingSphere products

ShardingSphere includes three independent products. You can choose the product that best suits your business requirements. The following table describes these products.

Parameter	Sharding-JDBC	Sharding-Proxy	Sharding-Sidecar
Supported database engine	All JDBC-compatible database engines such as MySQL, PostgreSQL, Oracle, and SQL Server	MySQL and PostgreSQL	MySQL and PostgreSQL
Connections consumed	High	Low	High
Supported heterogeneous language	Java	All	All

Parameter	Sharding-JDBC	Sharding-Proxy	Sharding-Sidecar
Performance	Low consumption	Moderate consumption	Low consumption
Decentralized	Yes	No	Yes
Stateless API	No	Yes	No

Prepare configuration templates

1. On your ECS instance, run the following commands to go to the directory where configuration templates are stored:

```
cd apache-shardingsphere-incubating-4.0.0-sharding-proxy-bin
cd conf
```

2. Run the following command to view all files stored in the directory:

```
# ll
total 24
-rw-r--r-- 1 501 games 3019 Jul 30 2019 config-encrypt.yaml
-rw-r--r-- 1 501 games 3582 Apr 22 2019 config-master_slave.yaml
-rw-r--r-- 1 501 games 4278 Apr 22 2019 config-sharding.yaml
-rw-r--r-- 1 501 games 1918 Jul 30 2019 server.yaml
```

Note

- config-encrypt.yaml: the data encryption configuration file.
- config-master_slave.yaml: the read/write splitting configuration file.
- config-sharding.yaml: the data sharding configuration file.
- server.yaml: the common configuration file.

3. Modify the configuration files.

 **Note** For more information about the configuration files, visit the [ShardingSphere documentation](#). In this example, the data sharding and common configuration files are used.

- Example of a data sharding configuration file:

schemaName: # The name of the logical data source.

dataSources: # The configuration of the data source. You can configure more than one data source by using the data_source_name variable.

<data_source_name>: # You do not need to configure a database connection pool. This is different in Sharding-JDBC.

url: # The URL used to connect to your database.

username: # The username used to log on to the database.

password: # The password used to log on to the database.

connectionTimeoutMilliseconds: 30000 # The connection timeout duration in milliseconds.

idleTimeoutMilliseconds: 60000 # The idle-connection reclaiming timeout duration in milliseconds.

maxLifetimeMilliseconds: 1800000 # The maximum connection time to live (TTL) in milliseconds.

maxPoolSize: 65 # The maximum number of connections allowed.

shardingRule: # You do not need to configure a sharding rule, because it is the same in Sharding-JDBC.

- Example of a common configuration file:

Proxy properties

You do not need to configure proxy properties that are the same in Sharding-JDBC.

props:

acceptor.size: # The number of worker threads that receive requests from the client. The default number is equal to the number of CPU cores multiplied by 2.

proxy.transaction.type: # The type of transaction processed by the proxy. Valid values: LOCAL | XA | BASE. Default value: LOCAL. Value XA specifies to use Atomikos as the transaction manager. Value BASE specifies to copy the .jar package that implements the ShardingTransactionManager API to the lib directory.

proxy.opentracing.enabled: # Specifies whether to enable link tracing. Link tracing is disabled by default.

check.table.metadata.enabled: # Specifies whether to check the consistency of metadata among sharding tables during startup. Default value: false.

proxy.frontend.flush.threshold: # The number of packets returned in a batch during a complex query.

Permission verification

This part of the configuration is used to verify your permissions when you attempt to log on to Sharding-Proxy. After you configure the username, password, and authorized databases, you must use the correct username and password to log on to Sharding-Proxy from the authorized databases.

authentication:

users:

root: # The username of the root user.

password: root# The password of the root user.

sharding: # The username of the sharding user.

password: sharding# The password of the sharding user.

authorizedSchemas: sharding_db, masterslave_db # The databases in which the specified user is authorized. If you want to specify more than one database, separate them with commas (.). You are granted the permissions of the root user by default. This means that you can access all databases.

Set up a test environment

- On your ECS instance, install Java.

```
yum install -y java
```

- Configure an ApsaraDB for RDS instance that runs PostgreSQL 10.
 - Create an account with username r1.
 - Set the password of the account to "PW123321!".
 - Creates the following databases whose owners are user r1: db0, db1, db2, and db3.
 - Add the IP address of your ECS instance to an IP address whitelist of the ApsaraDB RDS for PostgreSQL instance.

 Note

- For more information about how to create an ApsaraDB RDS for PostgreSQL instance, database, and account, see [Create an instance](#) and [Create a database and an account](#).
- For information about how to configure an IP address whitelist, see [Configure an IP address whitelist](#).

- Configure the common configuration file.

```
vi /root/apache-shardingsphere-incubating-4.0.0-sharding-proxy-bin/conf/server.yaml

authentication:
  users:
    r1:
      password: PW123321!
      authorizedSchemas: db0,db1,db2,db3
  props:
    executor.size: 16
    sql.show: false
```

Test horizontal sharding

1. Modify the data sharding configuration file.

```
vi /root/apache-shardingsphere-incubating-4.0.0-sharding-proxy-bin/conf/config-sharding.yaml

schemaName: sdb

dataSources:
  db0:
    url: jdbc:postgresql://pgm-bpxxxxx.pg.rds.aliyuncs.com:1433/db0
    username: r1
    password: PW123321!
    connectionTimeoutMilliseconds: 30000
    idleTimeoutMilliseconds: 60000
    maxLifetimeMilliseconds: 1800000
    maxPoolSize: 65
  db1:
    url: jdbc:postgresql://pgm-bpxxxxx.pg.rds.aliyuncs.com:1433/db1
    username: r1
    password: PW123321!
    connectionTimeoutMilliseconds: 30000
    idleTimeoutMilliseconds: 60000
    maxLifetimeMilliseconds: 1800000
    maxPoolSize: 65
  db2:
    url: jdbc:postgresql://pgm-bpxxxxx.pg.rds.aliyuncs.com:1433/db2
    username: r1
    password: PW123321!
```

```
connectionTimeoutMilliseconds: 30000
idleTimeoutMilliseconds: 60000
maxLifetimeMilliseconds: 1800000
maxPoolSize: 65
db3:
url: jdbc:postgresql://pgm-bpxxxx.pg.rds.aliyuncs.com:1433/db3
username: r1
password: PW123321!
connectionTimeoutMilliseconds: 30000
idleTimeoutMilliseconds: 60000
maxLifetimeMilliseconds: 1800000
maxPoolSize: 65

shardingRule:
tables:
t_order:
actualDataNodes: db${0..3}.t_order${0..7}
databaseStrategy:
inline:
shardingColumn: user_id
algorithmExpression: db${user_id % 4}
tableStrategy:
inline:
shardingColumn: order_id
algorithmExpression: t_order${order_id % 8}
keyGenerator:
type: SNOWFLAKE
column: order_id
t_order_item:
actualDataNodes: db${0..3}.t_order_item${0..7}
databaseStrategy:
inline:
shardingColumn: user_id
algorithmExpression: db${user_id % 4}
tableStrategy:
inline:
shardingColumn: order_id
algorithmExpression: t_order_item${order_id % 8}
keyGenerator:
type: SNOWFLAKE
column: order_item_id
bindingTables:
- t_order,t_order_item
defaultTableStrategy:
none:
```

2. Start ShardingSphere and listen to Port 8001.

```
cd ~/apache-shardingsphere-incubating-4.0.0-sharding-proxy-bin/bin/  
./start.sh 8001
```

3. Connect to the destination database.

```
psql -h 127.0.0.1 -p 8001 -U r1 sdb
```

4. Create a table.

```
create table t_order(order_id int8 primary key, user_id int8, info text, c1 int, crt_time timestamp);  
create table t_order_item(order_item_id int8 primary key, order_id int8, user_id int8, info text, c1 int, c2 int, c3 int, c  
4 int, c5 int, crt_time timestamp);
```

 **Note** When you create a table, the system automatically creates horizontal shards in the destination database based on the sharding strategy that you specify.

FAQ

- If you want to know the SQL parsing and routing statements used in ShardingSphere, run the following command:

```
vi /root/apache-shardingsphere-incubating-4.0.0-sharding-proxy-bin/conf/server.yaml  
  
authentication:  
  users:  
    r1:  
      password: PW123321!  
      authorizedSchemas: db0,db1,db2,db3  
  props:  
    executor.size: 16  
    sql.show: true # Specifies to log parsed SQL statements.
```

- If you want to test writes and queries, run the following commands:

```
sdb=> insert into t_order (user_id, info, c1, crt_time) values (0,'a',1,now());
```

```
sdb=> insert into t_order (user_id, info, c1, crt_time) values (1,'b',2,now());
```

```
sdb=> insert into t_order (user_id, info, c1, crt_time) values (2,'c',3,now());
```

```
sdb=> insert into t_order (user_id, info, c1, crt_time) values (3,'c',4,now());
```

```
sdb=> select * from t_order;
```

order_id	user_id	info	c1	crt_time
433352561047633921	0	a	1	2020-02-09 19:48:21.856555
433352585668198400	1	b	2	2020-02-09 19:48:27.726815
433352610813050881	2	c	3	2020-02-09 19:48:33.721754
433352628370407424	3	c	4	2020-02-09 19:48:37.907683

(4 rows)

```
sdb=> select * from t_order where user_id=1;
```

order_id	user_id	info	c1	crt_time
433352585668198400	1	b	2	2020-02-09 19:48:27.726815

(1 row)

- If you want to view ShardingSphere logs, find the logs from the following path:

```
/root/apache-shardingsphere-incubating-4.0.0-sharding-proxy-bin/logs/stdout.log
```

- If you want to use pgbench for stress testing, run the following commands:

```
vi test.sql
\set user_id random(1,100000000)
\set order_id random(1,200000000)
\set order_item_id random(1,200000000)
insert into t_order (user_id, order_id, info, c1 , crt_time) values (:user_id, :order_id,random()::text, random()*1000, now()) on conflict (order_id) do update set info=excluded.info,c1=excluded.c1,crt_time=excluded.crt_time;
insert into t_order_item (order_item_id, user_id, order_id, info, c1,c2,c3,c4,c5,crt_time) values (:order_item_id, :user_id, :order_id,random()::text, random()*1000,random()*1000,random()*1000,random()*1000,random()*1000, now()) on conflict(order_item_id) do nothing;

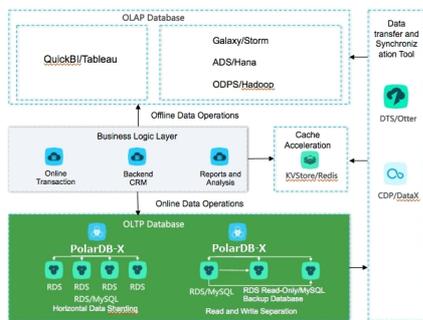

pgbench -M simple -n -r -P 1 -f ./test.sql -c 24 -j 24 -h 127.0.0.1 -p 8001 -U r1 sdb -T 120
progress: 1.0 s, 1100.9 tps, lat 21.266 ms stddev 6.349
progress: 2.0 s, 1253.0 tps, lat 18.779 ms stddev 7.913
progress: 3.0 s, 1219.0 tps, lat 20.083 ms stddev 13.212
```

13. Cloud Native Distributed Database PolarDB-X

13.1. What is PolarDB-X?

Cloud Native Distributed Database PolarDB-X is a middleware service independently developed by Alibaba Group for scale-out of single-instance relational databases. It is compatible with Distributed Relational Database Service (DRDS). Compatible with the MySQL protocol, PolarDB-X supports most MySQL data manipulation language (DML) and data definition language (DDL) syntax. It provides the core capabilities of distributed databases, such as database sharding, table sharding, smooth scale-out, configuration changing, and transparent read/write splitting. PolarDB-X features lightweight (stateless), flexibility, stability, and high efficiency, and provides you with O&M capabilities throughout the lifecycle of distributed databases.

PolarDB-X is mainly used for operations on large-scale online data. By partitioning data in specific business scenarios, PolarDB-X maximizes the operation efficiency, meeting the requirements of online businesses on relational databases.

Problems solved

- **Capacity bottleneck of single-instance databases:** As the data volume and access volume increase, traditional single-instance databases encounter great challenges that cannot be completely solved by hardware upgrades. Distributed solutions use multiple instances to work jointly, effectively resolving the bottlenecks of data storage capacity and access volumes.
- **Difficult scale-out of relational databases:** Due to the inherent attributes of distributed databases, data can be stored to different shards through smooth data migration, supporting the dynamic scale-out of relational databases.

13.2. Quick start

This topic describes how to get started with Cloud Native Distributed Database PolarDB-X.

A PolarDB-X instance is physically a distributed cluster that consists of multiple PolarDB-X server nodes and underlying storage instances. A PolarDB-X database is a logical concept and only contains metadata. Specific data is stored in the physical database of the underlying storage instance. To get started with PolarDB-X, follow these steps:

1. **Create a PolarDB-X instance.**
2. **Create a database.**

To create a database in a PolarDB-X instance, you must select one or more ApsaraDB RDS for MySQL instances as the data storage nodes. If no RDS instance exists, create one first. For more information about how to create and manage ApsaraDB RDS for MySQL instances, see *User Guide of RDS*.

3. After a PolarDB-X database is created, you also need to create tables in the PolarDB-X database like in a single-instance database. However, the syntax is different, mainly in the expression of data partitioning information in the PolarDB-X table creation statement. For more information about how to create a table, see [Table creation syntax](#).

13.3. Log on to the PolarDB-X console

This topic describes how to log on to the Cloud Native Distributed Database PolarDB-X console by using Google Chrome.

Prerequisites

- The domain name of the ASCM console is obtained from the deployment personnel before you log on to the ASCM console.
- A browser is available. We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL used to log on to the ASCM console. Press the Enter key.
2. Enter your username and password.

Obtain the username and password used to log on to the console from the operations administrator.

Note When you log on to the ASCM console for the first time, you must change the password of your username. For security reasons, your password must meet the minimum complexity requirements. The password must be 8 to 20 characters in length and must contain at least two of the following character types:

- Uppercase or lowercase letters.
- Digits.
- Special characters. Special characters include exclamation points (!), at signs (@), number signs (#), dollar signs (\$), and percent signs (%).

3. Click **Login** to go to the ASCM console homepage.
4. In the top navigation bar, choose **Products > Distributed Relational Database Service**.

13.4. Instance management

13.4.1. Create a PolarDB-X instance

To use PolarDB-X, you must first create an instance. This topic describes how to create a PolarDB-X instance.

1. [Log on to the PolarDB-X console](#).
2. On the page that appears, click **Create Instance** in the upper-right corner.
3. On the **Create DRDS Instance** page, set parameters as required.

[Parameters for creating a PolarDB-X instance](#) describes the parameters.

Parameters for creating a PolarDB-X instance

Type	Parameter	Description
Region	Organization	The organization to which the instance belongs.
	Resource Set	The resource set to which the instance belongs.
	Region	The region where the instance resides. Services in different regions are not interconnected over the internal network. After the instance is created, the region cannot be changed.
	Zone	The zone where the instance resides.

Type	Parameter	Description
Basic Settings	Instance Type	The type of the instance. Select an instance type from the options available on the page.
	Instance Edition	The edition of the instance. Valid values: <ul style="list-style-type: none"> ◦ Standard ◦ Enterprise ◦ Starter
	Instance Specifications	The specifications of the instance. The rules vary with instance editions. Select the instance specifications from the options available on the page.
Network Type	Network Type	<p>The network type of the instance. PolarDB-X instances support the following network types:</p> <ul style="list-style-type: none"> ◦ Classic Network: Cloud services on a classic network are not isolated from each other. Unauthorized access to a cloud service is blocked only by the security group or whitelist policy of the service. ◦ VPC: A virtual private cloud (VPC) helps you build an isolated network environment on Apsara Stack. You can customize routing tables, IP address ranges, and gateways in a VPC. We recommend that you select VPC for higher security. Select VPC for Network Type, and then set VPC and VSwitch. <div style="border: 1px solid #ccc; background-color: #e6f2ff; padding: 5px; margin-top: 10px;"> <p> Note Make sure that the PolarDB-X instance has the same network type as the Elastic Compute Service (ECS) instance to which you want to connect. If the PolarDB-X and ECS instances have different network types, they cannot communicate over an internal network.</p> </div>

4. Click **Submit**.

After the instance is created, it appears in the instance list and its status changes to **Running**. An instance name uniquely identifies a PolarDB-X instance.

13.4.2. Change specifications

When you use PolarDB-X, you can change the specifications of a PolarDB-X instance as needed.

Procedure

1. [Log on to the PolarDB-X console](#).
2. Find the target instance in the instance list.
3. Click the target instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. On the Basic Information page, click **Upgrade** or **Downgrade** in the **Common Operations** section to access the **Change Specifications** page.

 **Note** Alternatively, on the **DRDS Instance Management** page, choose **More > Downgrade** from the Actions column of the target instance.

5. On the **Change Specifications** page, set **Instance Edition** and **Instance Specifications**, and then click **Submit**. After a few minutes, you can view the new specifications of the instance in the instance list.

 **Note** Specifications downgrade leads to transient disconnections between applications and PolarDB-X within a short period of time. Make sure that your applications can be automatically reconnected.

13.4.3. Read-only PolarDB-X instances

13.4.3.1. Overview

Read-only PolarDB-X instances are extension and supplement to primary PolarDB-X instances and are compatible with SQL query syntax of primary PolarDB-X instances.

Features

Read-only and primary PolarDB-X instances can share the same replica of data. You can perform complex data query and analysis directly on read-only or primary ApsaraDB RDS for MySQL instances. Multiple instance types are provided to handle highly concurrent access requests and reduce the response time (RT) for complex queries. Resource isolation alleviates the load pressure on the primary instances and reduces the link complexity of the business architecture. It reduces the O&M and budget costs, eliminating the need for additional data synchronization.

Instance type

Concurrent read-only instances: For high-concurrency and high-traffic simple queries or offline data extraction, resource isolation protects you against highly concurrent queries, ensuring the stability of online business links.

 **Note** For the businesses with primary PolarDB-X instances, concurrent read-only instances can be used in the following scenarios:

- High-concurrency and high-traffic simple queries are performed.
- Data is extracted offline.

Limits

- Primary and read-only PolarDB-X instances must be in the same region, but they can be in different zones.
- A read-only PolarDB-X instance must belong to a primary PolarDB-X instance. Before creating a read-only instance, you must create a primary instance. After you create a database on the primary instance, the database is replicated to the read-only instance. If you delete the database from the primary instance, the corresponding database on the read-only instance is also deleted.
- You are not allowed to migrate data to read-only PolarDB-X instances.
- You are not allowed to create or delete databases in PolarDB-X read-only instances.
- PolarDB-X read-only instances cannot be cloned.
- PolarDB-X read-only instances support data definition language (DDL) statements but do not support data manipulation language (DML) statements for data modification.

13.4.3.3. Create a read-only PolarDB-X instance

This topic describes how to create a read-only Cloud Native Distributed Database PolarDB-X (PolarDB-X) instance.

Procedure

1. [Log on to the PolarDB-X console](#).
2. Find the target instance in the instance list.
3. Click the target instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.

4. On the Basic Information page, click **Create DRDS Read-only Instance** in the Related Instances section.
5. Set Region, Basic Settings, and Network Type, and then click **Submit**.

Parameters for creating a read-only PolarDB-X instance

Type	Parameter	Description
Region	Region	The region where the read-only instance resides. Services in different regions are not interconnected over the internal network. After the instance is created, the region cannot be changed.
	Zone	The zone where the read-only instance resides.
Basic Settings	Instance Type	The type of the read-only instance. Select an instance type from the options available on the page.
	Instance Edition	The edition of the read-only instance. Valid values: <ul style="list-style-type: none"> ◦ Starter ◦ Standard ◦ Enterprise
	Instance Specifications	The specifications of the read-only instance. The rules vary with instance editions. Select the instance specifications from the options available on the page.
	Description	The description of the read-only instance. We recommend that you provide an informative description to simplify future management operations.
Network Type	Network Type	<p>The network type of the read-only instance. PolarDB-X instances support the following network types:</p> <ul style="list-style-type: none"> ◦ Classic Network: Cloud services on a classic network are not isolated from each other. Unauthorized access to a cloud service is blocked only by the security group or whitelist policy of the service. ◦ VPC: A virtual private cloud (VPC) helps you build an isolated network environment on Apsara Stack. You can customize routing tables, IP address ranges, and gateways in a VPC. We recommend that you select VPC for higher security. Select VPC for Network Type, and then set VPC and VSwitch. <div style="border: 1px solid #ccc; background-color: #e6f2ff; padding: 5px; margin-top: 10px;"> <p> Note Make sure that the PolarDB-X instance has the same network type as the Elastic Compute Service (ECS) instance to which you want to connect. If the PolarDB-X and ECS instances have different network types, they cannot communicate over an internal network.</p> </div>

6. It takes several minutes to create the instance. Please wait. After the instance is created, it appears in the instance list in the PolarDB-X console.

13.4.3.4. Manage a read-only PolarDB-X instance

Read-only PolarDB-X instances are managed in a similar way as primary instances. However, databases cannot be created or deleted on the read-only instance management page. Databases on read-only instances are created or deleted with databases on primary instances. In the PolarDB-X console, you can go to the read-only instance management page in two ways.

Manage a read-only PolarDB-X instance by its ID

1. [Log on to the PolarDB-X console](#).
2. On the **DRDS Instance Management** page, find the target read-only instance.

3. Click the target instance ID or choose **More > Manage** from the Actions column of the target read-only instance to access the **Basic Information** page.

Manage a read-only PolarDB-X instance by the ID of its primary instance

1. **Log on to the PolarDB-X console.**
2. On the **DRDS Instance Management** page, find the target primary instance.
3. Click the target instance ID or choose **More > Manage** from the Actions column of the target primary instance to access the **Basic Information** page.
4. On the **Basic Information** page, move the pointer over the number of read-only instances in the **Related Instances** section to view the ID of the read-only PolarDB-X instance.
5. Click the ID of the target read-only PolarDB-X instance. The **Basic Information** page of the read-only instance appears.

13.4.3.5. Release a read-only PolarDB-X instance

If you no longer need a read-only PolarDB-X instance, you can release it.

Prerequisites

The read-only instance must be in the **Running** state.

Procedure

1. **Log on to the PolarDB-X console.**
2. Find the target instance in the instance list.
3. In the PolarDB-X instance list, find the target instance, and choose **More > Release** from the Actions column.

 **Notice** You cannot recover the PolarDB-X instances that have been released. Exercise caution when you perform this operation.

4. In the **Release DRDS Instance** dialog box, click **OK**.

13.4.4. Restart a PolarDB-X instance

This topic describes how to restart a PolarDB-X instance.

Prerequisites

The PolarDB-X instance must be in the **Running** state.

Procedure

1. **Log on to the PolarDB-X console.**
2. Find the target instance in the instance list.
3. Click the target instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. Click **Restart Instance** in the upper-right corner.
5. In the **Restart Instance** dialog box, click **OK**.

 **Notice** Restarting a PolarDB-X instance terminates all its connections. Make appropriate service arrangements before you restart a PolarDB-X instance. Exercise caution when you perform this operation.

13.4.5. Release a PolarDB-X instance

This topic describes how to release a running PolarDB-X instance in the PolarDB-X console.

Prerequisites

- All databases on the PolarDB-X instance have been deleted.
- The PolarDB-X instance must be in the Running state.

Procedure

1. [Log on to the PolarDB-X console](#).
2. Find the target instance in the instance list.
3. In the PolarDB-X instance list, find the target instance, and choose **More > Release** from the Actions column.
4. In the Release DRDS Instance dialog box, click **OK**.

 **Warning** After the PolarDB-X instance is released, data is not deleted from its attached ApsaraDB RDS for MySQL instances. However, a released PolarDB-X instance cannot be restored. Exercise caution when you perform this operation.

13.4.6. Recover data

13.4.6.1. Backup and recovery

PolarDB-X allows you to back up data of instances and databases and recover them by using the backup data. Instances can be automatically and manually backed up in a quick or consistent manner. The instance recovery capability restores data to the new PolarDB-X and ApsaraDB RDS for MySQL instances based on the existing backup set.

Backup methods

For different scenarios, PolarDB-X provides quick backup and consistent backup, as well as corresponding recovery capabilities. The following table compares the two backup methods.

Method	Scenario	Advantage	Disadvantage
Quick backup	It applies to routine backup and recovery scenarios.	<ul style="list-style-type: none"> • It provides faster data backup and recovery. • It supports recovery at any time based on backup sets. • It supports all PolarDB-X instance versions. 	It ensures data consistency only at a single ApsaraDB RDS for MySQL instance but not global data consistency in database and table sharding scenarios.

Method	Scenario	Advantage	Disadvantage
Consistent backup	It applies to backup and recovery for online core transaction businesses and the financial industry with a high-consistency requirement.	It ensures global data consistency in database and table sharding scenarios.	<ul style="list-style-type: none"> • It provides slower backup and recovery. • It supports recovery based on backup sets but not at any time. • It is supported only for PolarDB-X 5.3.8 and later. • During the backup, distributed transactions are locked within seconds for PolarDB-X instances. During the locking process, SQL execution response time (RT) may vary by milliseconds. Therefore, we recommend that you perform consistent backup during off-peak hours.

Limits

- The PolarDB-X automatic backup policy is disabled by default. You must manually enable it.
- The log backup capability of PolarDB-X depends on underlying ApsaraDB RDS for MySQL instances. Therefore, the log backup policy configured in the PolarDB-X console is automatically synchronized to all underlying ApsaraDB RDS for MySQL instances. After the policy is configured, do not modify it in the ApsaraDB for RDS console.
- The backup and recovery feature of PolarDB-X depends on log backups. We recommend that you enable the log backup policy by default to avoid invalid backup sets.
- Data definition language (DDL) operations cannot be performed during the backup process.
- During the backup, the underlying ApsaraDB RDS for MySQL instances of the PolarDB-X instance must be normal to avoid a backup failure.
- Consistent backup and recovery is only supported by PolarDB-X 5.3.8 and later versions.
- All tables must have primary keys to ensure data accuracy during data backup and recovery.
- During consistent backup, distributed transactions are locked within seconds for PolarDB-X instances. During the locking process, the execution of non-transactional SQL statements and single-instance transactions are not affected, but the committing of distributed transactions is blocked and the SQL execution RT may vary by milliseconds. We recommend that you perform consistent backup during off-peak hours.
- Due to the inventory of PolarDB-X and ApsaraDB RDS for MySQL, PolarDB-X automatically adjusts the instance type and zone during instance recovery. We recommend that you confirm and adjust the instance type and zone after recovery.

13.4.6.2. Configure an automatic backup policy

PolarDB-X provides the automatic backup feature. This topic describes how to configure an automatic backup policy.

Procedure

1. [Log on to the PolarDB-X console.](#)
2. Find the target instance in the instance list.
3. Click the target instance ID or choose **More > Manage** from the Actions column of the instance to access the

Basic Information page.

4. In the left-side navigation pane, choose **Data Recovery > Backup and Recovery**.
5. On the page that appears, choose **Backup Policy > Edit**.
6. In the **Backup Policy** dialog box, set parameters as needed, and click **OK**.

13.4.6.3. Configure local logs

You can use local logs with the backup and recovery feature or the SQL flashback feature of PolarDB-X to accurately recover an instance or a database to the desired time point. This topic describes how to configure local logs.

Procedure

1. [Log on to the PolarDB-X console](#).
2. Find the target instance in the instance list.
3. Click the target instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. In the left-side navigation pane, choose **Data Recovery > Backup and Recovery**.
5. On the page that appears, click the **Local Log Settings** tab and then click **Edit**.
6. In the **Local Binlog Settings** dialog box, set parameters as needed, and click **OK**.

 **Notice** The local log settings are applied to all underlying ApsaraDB RDS for MySQL instances.

13.4.6.4. Manual backup

PolarDB-X also provides the manual backup capability, so that you can back up data at any time. This topic describes how to manually back up instances and databases.

Procedure

1. [Log on to the PolarDB-X console](#).
2. Find the target instance in the instance list.
3. Click the target instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. In the left-side navigation pane, choose **Data Recovery > Backup and Recovery**.
5. On the page that appears, click **Data Backup** on the right.
6. In the dialog box that appears, set **Backup Method** and **Backup Level**.
 - **Backup Method** can be set to **Fast Backup** and **Consistent Backup**. For more information about differences between the two methods, see [Backup methods](#).

 **Notice** If you select **Consistent Backup**, distributed transactions are locked within seconds and the response time (RT) may vary by sub-seconds. Therefore, we recommend that you perform this operation during off-peak hours.

- **Backup Level** can be set to **Instance Backup** or **Database Backup**. You can select **Instance Backup** to back up the entire instance, or select **Database Backup** to back up a database as needed.
7. Click **OK**.

13.4.6.5. Recover data

You can use the data recovery feature of PolarDB-X to recover an instance or a database to the time when the backup is created. You can perform this operation at any time. This topic describes how to recover the data of an instance or a database to a specific point in time.

Procedure

1. [Log on to the PolarDB-X console](#).
2. Find the target instance in the instance list.
3. Click the target instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. In the left-side navigation pane, choose **Data Recovery > Backup and Recovery**.
5. On the page that appears, click **Data Recovery (Original Clone Instance)** on the right.
6. Select a recovery method
 - **By Time:** Recover data to the selected point in time. You must set **Restoration Time** and **Recovery Level**.
 - **By Backup Set:** Recover data from the selected backup file.

 **Note** You can also click **Recover** in the Actions column of the target backup set to recover data by backup set

7. Click **Precheck** to check whether a valid backup set is available for data recovery. If the precheck fails, the data cannot be restored.
8. Click **Enable** to access the order confirmation page.
9. Confirm the order details and then click **Enable** to recover the data. You can view the data recovery progress in **Task Progress** in the upper-right corner of the page.

13.4.6.6. SQL flashback

13.4.6.6.1. Overview

PolarDB-X provides the SQL flashback feature to recover data of particular rows.

When you mistakenly run an SQL statement such as **INSERT**, **UPDATE**, or **DELETE** on PolarDB-X, provide the relevant SQL information to match the event in the binary log file and generate the corresponding recovery file. You can download the file and recover data as needed. SQL flashback automatically chooses **fuzzy match** or **exact match** to locate lost data caused by the error. For more information, see [Exact match and fuzzy match](#) and [Rollback SQL statements and original SQL statements](#).

Features

- **Easy-to-use:** SQL flashback allows you to retrieve the lost data by entering required information about the corresponding SQL statement.
- **Fast and lightweight:** Regardless of the backup policy of ApsaraDB RDS for MySQL instances, you only need to enable log backup before an SQL statement error occurs.
- **Flexible recovery:** Rollback SQL statements and original SQL statements are available for different scenarios.
- **Exact match:** SQL flashback supports exact match of data about the corresponding SQL statement, which improves precision of data recovery.

Limits

- SQL flashback depends on the binary log retention time and the log backup feature of ApsaraDB RDS for MySQL must be enabled. Binary log files can be retained only for a certain period. Use SQL flashback to generate files for recovery as soon as possible when an error occurs.
- The recovery files generated by SQL flashback are retained for seven days by default, and you need to download these files as soon as possible.
- The following conditions must be met for SQL flashback exact match:
 - The PolarDB-X instance version is 5.3.4-15378085 or later.
 - The version of the ApsaraDB RDS for MySQL instance used by the PolarDB-X database is 5.6 or later.
 - SQL flashback exact match is enabled before the error SQL statement is executed.

- The TRACE_ID information for the error SQL statement is provided.
- To ensure the precision of data recovery, the exact match feature is enabled by default for the database created in a PolarDB-X instance of 5.3.4-15378085 or later. After this feature is enabled, SQL execution information is included in the binary log file by default, which requires more storage space for ApsaraDB RDS for MySQL instances. If you need to use the exact match feature, we recommend that you upgrade PolarDB-X before enabling the feature. For more information, see [Enable exact match](#).

13.4.6.6.2. Generate a recovery file

Procedure

1. [Log on to the PolarDB-X console](#).
2. Find the target instance in the instance list.
3. Click the target instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. In the left-side navigation pane, choose **Data Recovery > SQL Flashback**. The **SQL Flashback** page appears.
5. On the **SQL Flashback** page, enter the basic information about a mistaken SQL statement, including Database, Time Range, Table Name, TRACE_ID, and SQL Statement Type. The following table describes the parameters.

Parameter	Description
Database	The database where the mistaken SQL statement was executed.
Time Range	The time range during which the mistaken SQL statement was executed. The start time is earlier than the start time when the mistaken SQL statement was executed, whereas the end time is later than the time when the execution of the mistaken SQL statement ended. To ensure efficient recovery, we recommend that you limit the time range to five minutes.
Table Name	The name of the table on which the mistaken SQL statement was executed. This parameter is optional.
TRACE_ID	The unique TRACE_ID that PolarDB-X allocates for each executed SQL statement. You can obtain the TRACE_ID of the mistaken SQL statement by using the SQL audit feature of PolarDB-X.
SQL Statement Type	The type of the mistaken SQL statement. Valid values: <ul style="list-style-type: none"> ◦ INSERT ◦ UPDATE ◦ DELETE

6. Click **Precheck**. The system checks whether a binary log file exists within the specified time range. For more information about binary log files, see [Configure local logs](#).

 **Note**

- If no binary log file exists within specified the time range, the precheck fails and the system cannot recover the data for you.
- If a binary log file exists within the specified time range, the precheck is successful and you can go to the next step.

7. Set **SQL Statement Type for Recovery** to **Rollback SQL** or **Original SQL Statement**. For more information about differences between the two methods, see [Rollback SQL statements and original SQL statements](#).
8. Click **Generate SQL** to generate an SQL flashback task. The statuses of the SQL flashback tasks that are running on the current instance appear at the bottom of the page.

What's next

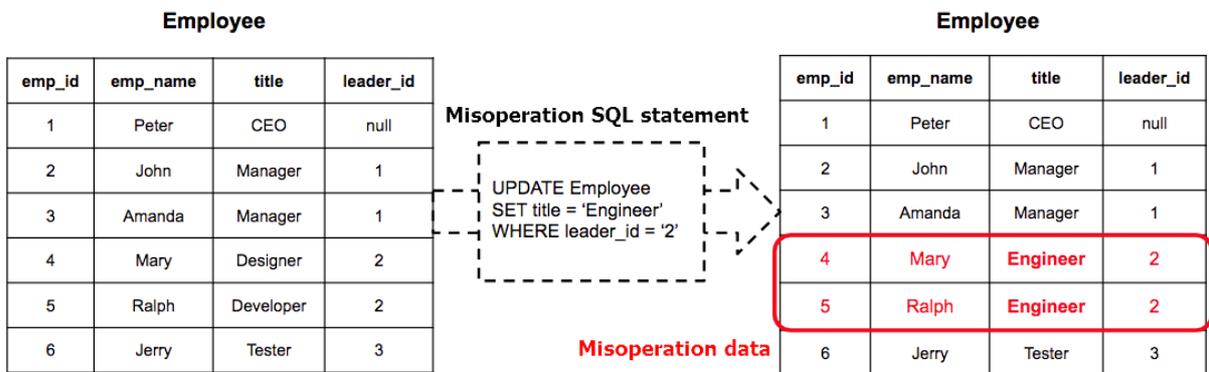

After an SQL flashback task is completed, the task information such as the exact match status and the number of recovered rows appears. You can click **Download** next to the target SQL flashback task to download the corresponding recovery file.

 **Notice** By default, the recovery file is retained for seven days. Download it as soon as possible.

13.4.6.6.3. Rollback SQL statements and original SQL statements

To support different business scenarios, PolarDB-X SQL flashback provides rollback SQL statements and original SQL statements. Before generating an SQL statement for recovering data, you must select a corresponding recovery method based on your scenario.

Recovery methods

Recovery method	Description	Example
Rollback SQL statement	<p>Traverses the events in the binary log file in reverse order to reverse the INSERT, UPDATE, and DELETE events.</p> <ul style="list-style-type: none"> The reverse of INSERT is equivalent to DELETE. The reverse of DELETE is equivalent to INSERT. The reverse of UPDATE is equivalent to the value before UPDATE. 	<pre>UPDATE Employee SET title = 'Developer' WHERE emp_id = '5' UPDATE Employee SET title = 'Designer' WHERE emp_id = '4'</pre>
Original SQL statement	<p>Traverses the events in the binary log file in order to mirror all records of the INSERT, UPDATE, and DELETE events.</p> <ul style="list-style-type: none"> An INSERT mirror is equivalent to INSERT. A DELETE mirror is equivalent to INSERT. An UPDATE mirror is equivalent to the value before INSERT. 	<pre>INSERT INTO Employee(emp_id,emp_name,title,leader_id) values('4','Mary','Designer','2') INSERT INTO Employee(emp_id,emp_name,title,leader_id) values('5','Ralph','Developer','2')</pre>

13.4.6.6.4. Exact match and fuzzy match

SQL flashback supports **exact match** and **fuzzy match** for binary log events. You do not need to select a match policy. SQL flashback automatically detects and selects the optimal match policy, and notifies you when the flashback task is completed.

Match mode	Description	Advantage	Disadvantage
Exact match	The system performs exact match on the event of a mistaken SQL statement in the binary log file and generates a recovery file.	The recovery file contains only data that is deleted or modified by the mistaken SQL statement. You can use the file directly to ensure the precision and efficiency of data recovery.	<p>The following requirements must be met:</p> <ul style="list-style-type: none"> The PolarDB-X instance is Version 5.3.4-15378085 or later. The version of the ApsaraDB RDS for MySQL instance used by the PolarDB-X database is Version 5.6 or later. You have enabled exact match of SQL flashback before the mistaken SQL statement is executed. You must provide the TRACE_ID of the mistaken SQL statement.
Fuzzy match	The system matches the information about the mistaken SQL statement in the binary log file, including the time range, table name, and SQL statement type. Then, the system generates a recovery file.	Fuzzy match is supported for all instances, regardless of the instance version or parameter settings.	Data that is deleted or modified by the mistaken SQL statement cannot be accurately matched. The recovery file contains data changes made by other business SQL operations. You must filter the required data.

Enable exact match

 **Note** Fuzzy match is enabled by default.

1. Log on to PolarDB-Xconsole, and go to the parameter settings page of the specified instance. For more information, see [Set parameters](#).
2. Change the value of `ENABLE_SQL_FLASHBACK_EXACT_MATCH` to `ON`.

13.4.6.7. Table recycle bin

13.4.6.7.1. Overview

The table recycle bin of PolarDB-X allows you to recover mistakenly deleted tables.

After the table recycle bin is enabled for your PolarDB-X database, the tables that are deleted by using the `DROP TABLE` statement are moved to the recycle bin and are no longer visible to you. After the tables are moved to the recycle bin for two hours, they are automatically cleared and cannot be recovered. You can view, recover, and clear the deleted tables in the recycle bin.

Limits and notes

- The table recycle bin feature is only supported by PolarDB-X 5.3.3-1670435 and later. For more information, see [View the instance version](#).
- The table recycle bin is disabled for your PolarDB-X database by default. For more information about how to enable it, see [Enable the table recycle bin](#).
- The table recycle bin of PolarDB-X does not support the recovery of tables deleted by the TRUNCATE TABLE command.
- Tables in the recycle bin still occupy the storage space of ApsaraDB RDS for MySQL before they are automatically cleared. To release the storage space as soon as possible, you can access the recycle bin to manually delete them.

13.4.6.7.2. Enable the table recycle bin

This topic describes how to enable the table recycle bin.

Prerequisites

An ApsaraDB RDS for MySQL database has been created in the PolarDB-X instance. For more information, see [Create a database](#).

Procedure

1. [Log on to the PolarDB-X console](#).
2. Find the target instance in the instance list.
3. Click the target instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. In the left-side navigation pane, choose **Data Recovery > Table Recycle Bin**. The **Table Recycle Bin** page appears.
5. At the top of the **Table Recycle Bin** page, click the tab of the database for which the table recycle bin needs to be enabled.
6. Click **Enabled**.
7. In the dialog box that appears, click **OK**.

13.4.6.7.3. Recover tables

This topic describes how to recover your tables from the table recycle bin.

Procedure

1. [Log on to the PolarDB-X console](#).
2. Find the target instance in the instance list.
3. Click the target instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. In the left-side navigation pane, choose **Data Recovery > Table Recycle Bin**. The **Table Recycle Bin** page appears.
5. At the top of the **Table Recycle Bin** page, click the tab of the database for which you want to recover a table.
6. Click **Recover** in the Actions column of the target table.

13.4.6.7.4. Delete tables from the recycle bin

This topic describes how to delete unnecessary tables from the table recycle bin.

Procedure

1. [Log on to the PolarDB-X console.](#)
2. Find the target instance in the instance list.
3. Click the target instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. In the left-side navigation pane, choose **Data Recovery > Table Recycle Bin**. The **Table Recycle Bin** page appears.
5. At the top of the **Table Recycle Bin** page, click the tab of the database in which you want to clear a table.
6. Click **Delete** in the Actions column of the target table.

 **Note** To clear all tables from the table recycle bin, click **Empty Recycle Bin** on the tab of the corresponding database.

13.4.6.7.5. Disable the table recycle bin

If you no longer need the table recycle bin, you can disable it. This topic describes how to disable the table recycle bin.

Procedure

1. [Log on to the PolarDB-X console.](#)
2. Find the target instance in the instance list.
3. Click the target instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. In the left-side navigation pane, choose **Data Recovery > Table Recycle Bin**. The **Table Recycle Bin** page appears.
5. At the top of the **Table Recycle Bin** page, click the tab of the database for which the table recycle bin needs to be disabled.
6. Click **Disable** to disable the table recycle bin for the database.

13.4.7. Set parameters

PolarDB-X allows you to set parameters for instances and databases. You can view and modify parameter values in the PolarDB-X console as needed.

 **Note** You cannot set parameters for read-only instances.

Procedure

1. [Log on to the PolarDB-X console.](#)
2. On the **DRDS Instance Management** page, find the target instance.
3. Click the target instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. In the left-side navigation pane, choose **Diagnostics and Optimization > Parameter Settings**. Click the **Instance** or **Database** tab to view parameters that you can modify for instances and databases, respectively. For more information about the parameters, see [Description](#).
5. Click  next to the parameter you want to modify, enter the target value, and then click **OK**.
6. Click **Submit** in the upper-right corner to commit the new value.

 **Note** To undo parameter modification, click **Cancel** in the upper-right corner.

Description

Parameter	Level	Description
Slow SQL threshold	Instance	The threshold for slow SQL statements. SQL statements whose thresholds exceed this threshold are recorded in logical slow SQL logs.
Logical idle link timeout	Instance	The logical timeout period of the idle connection between user applications and PolarDB-X (unit: ms).
Maximum package size	Instance	The maximum network packet for the interaction between user applications and PolarDB-X (unit: byte).
Instance memory pool size limit	Instance	The maximum size of the memory pool for an instance. If the memory usage on an instance exceeds the value, an error is reported and the query ends.
Whether to prohibit all table deletion/update	Database	Specifies whether to disable all table deletion or update.
Whether to open the recycle bin	Database	Specifies whether to enable the recycle bin for storing deleted logical tables of PolarDB-X.
Temporary table size	Database	The size of the temporary table used during distributed queries in PolarDB-X (unit: row).
Number of join tables	Database	The maximum number of table shards that can be combined by JOIN when you query multiple table shards in a database.
Physical SQL timeout	Database	The timeout period of SQL statements for interaction between PolarDB-X and ApsaraDB RDS for MySQL (unit: ms). The value 0 indicates the timeout period is not limited.
SQL exact flashback switch	Database	Specifies whether to support SQL flashback exact match. It is disabled by default. After it is enabled, information about query execution is added to the binary log file used by the PolarDB-X database.
Whether to enable logical INFORMATION_SCHEMA query	Database	Specifies whether to enable logical INFORMATION_SCHEMA query (not relying on the shadow database but returning the aggregation results of logical databases and tables). When it is disabled, the original status is restored (relying on the shadow database and returning the physical database and table information).
Transaction log cleanup start time period	Database	The period during which transaction log cleanup starts at a random time.
Library-level memory pool size limit	Database	The maximum size of the database-level memory pool. When the memory usage of a PolarDB-X database exceeds this value, an error is reported and the query terminates. The value -1 indicates no limit.
Query-level memory pool size limit	Database	The maximum size of the query-level memory pool. When the memory usage of a query exceeds this value, an error is reported and the query terminates. The value -1 indicates no limit.
Whether CBO is enabled	Database	Specifies whether to enable the cost-based optimizer (CBO), including features such as Join Reorder and Hash Join.

Parameter	Level	Description
Default degree of parallelism	Database	It controls whether to start Parallel Query, and the degree of parallelism after Parallel Query is started. This parameter takes effect only when CBO is enabled. The value -1 indicates that the policy is automatically selected. The value 0 indicates that the policy is disabled.
Whether to enable the asynchronous DDL engine	Database	Specifies whether to enable the data definition language (DDL) engine. If you disable it, the execution logic of the original DDL engine remains.
Whether to enable pure asynchronous-mode under asynchronous DDL engine	Database	Specifies whether to enable the asynchronous-only mode when the asynchronous DDL engine is enabled. <ul style="list-style-type: none"> • Enabled: The execution status is returned immediately after the client connects to PolarDB-X and executes the DDL statement. Only asynchronous DDL management statements can be used to view the execution status. • Disabled: The synchronous mode remains. Specifically, the execution status is returned only after the client completes executing the DDL statement.
Maximum number of physical tables allowed to be created in a single physical database	Database	The maximum number of table shards that can be created in a database shard. If both database shards and table shards exist, the number of table shards cannot exceed this value.
INFORMATION_SCHEMA.TABLES queries whether statistics are aggregated	Database	Specifies whether to aggregate statistics of INFORMATION_SCHEMA.TABLES queries. To ensure the performance, the statistics are not aggregated by default.
Maximum number of physical sharding links	Database	The maximum number of connections between PolarDB-X and a single ApsaraDB RDS for MySQL database shard.
Minimum number of physical sharding links	Database	The minimum number of connections between PolarDB-X and a single ApsaraDB RDS for MySQL database shard.
Physical idle link timeout	Database	The idle time of the connection between PolarDB-X and ApsaraDB RDS for MySQL (unit: minute).

13.4.8. SQL audit and analysis

13.4.8.1. Description

Cloud Native Distributed Database PolarDB-X (PolarDB-X) combines the SQL audit and analysis feature with Log Service (SLS). This feature not only audits historical SQL records, but also provides real-time diagnosis and analysis of SQL execution status, performance metrics, and security risks. You can enable SQL audit and analysis in the PolarDB-X console.

Benefits

- **Easy operation:** SQL audit and analysis can be enabled with easy configuration to help you audit and analyze SQL logs in real time.
- **Lossless performance:** Pulling SQL log files from PolarDB-X nodes and uploading these logs to SLS in real time does not affect instance performance.

- **Trace to historical issues:** This feature supports importing historical SQL logs to trace issues.
- **Real-time analysis:** This feature provides real-time SQL analysis and an out-of-the-box report center based on SLS. This feature also supports custom reports and drill-down analysis, and helps you understand the execution status, performance, and security risks of databases.
- **Real-time alerts:** This feature supports real-time monitoring and alerts based on customized metrics to ensure timely response to critical business exceptions.

Limits and instructions

- You must activate Alibaba Cloud SLS to use the SQL audit and analysis feature.
- SQL audit logs are saved for 30 days by default. You can modify the log storage time as needed.
- Do not delete or modify the default settings for the project, Logstore, index, or dashboard that are created by SLS. SLS updates and upgrades the SQL log audit feature from time to time. The indexes and default reports of the exclusive Logstore are also automatically updated.
- The maximum length of a single SQL statement is 5 MB.

Scenarios

- **Troubleshoot SQL problems**

After the SQL audit and analysis feature is enabled, you can quickly search SQL logs to locate and troubleshoot problems. For example, to check whether a DROP operation is performed, you can perform the following query:

```
sql_type: Drop
```

The query result contains information such as the SQL execution time, user, and IP address of the client that runs the SQL statement.

- **Analyze costly SQL templates**

In most applications, SQL statements are dynamically generated based on several templates, with different parameters. The real-time analysis feature of SLS allows you to obtain the list of costly SQL statements in the current database.

For example, execute the following query:

```
| SELECT sql_code as "SQL template ID",
round(total_time * 1.0 /sum(total_time) over() * 100,2) as "execution time share (%)",
execute_times as "number of execution times",
round(avg_time) as "average execution time",
round(avg_rows) as "average number of affected rows",
CASE WHEN length(sql) > 200 THEN concat(substr(sql, 1, 200), '.....') ELSE trim(lpad(sql, 200,$) end as "sample SQL" F
ROM (SELECT sql_code, count(1) as execute_times,
sum(response_time) as total_time,
avg(response_time) as avg_time,
avg(affect_rows) as avg_rows,
arbitrary(sql) as sql FROM log GROUP BY sql_code) ORDER BY "execution time share (%)" desc limit 10
```

The search result contains the SQL template ID, ratio of response time of the statement generated from the template in the total response time of SQL statements, number of executions, average execution time, average number of affected rows, and sample SQL statement. You can find and optimize the most costly SQL templates in the application based on the analysis result.

- **Collect log statistics**

To help you analyze issues, PolarDB-X combines the SQL audit and analysis feature with SLS and provides out-of-the-box reports. You can diagnose and analyze the running status, performance, and potential security risks of databases in real time.

13.4.8.2. Enable SQL audit and analysis

The SQL audit and analysis feature is disabled by default. You can manually enable it in the PolarDB-X console. By default, you can perform only audit and analysis on the log data generated after the SQL audit and analysis feature is enabled. You can also import a portion of historical data.

Prerequisites

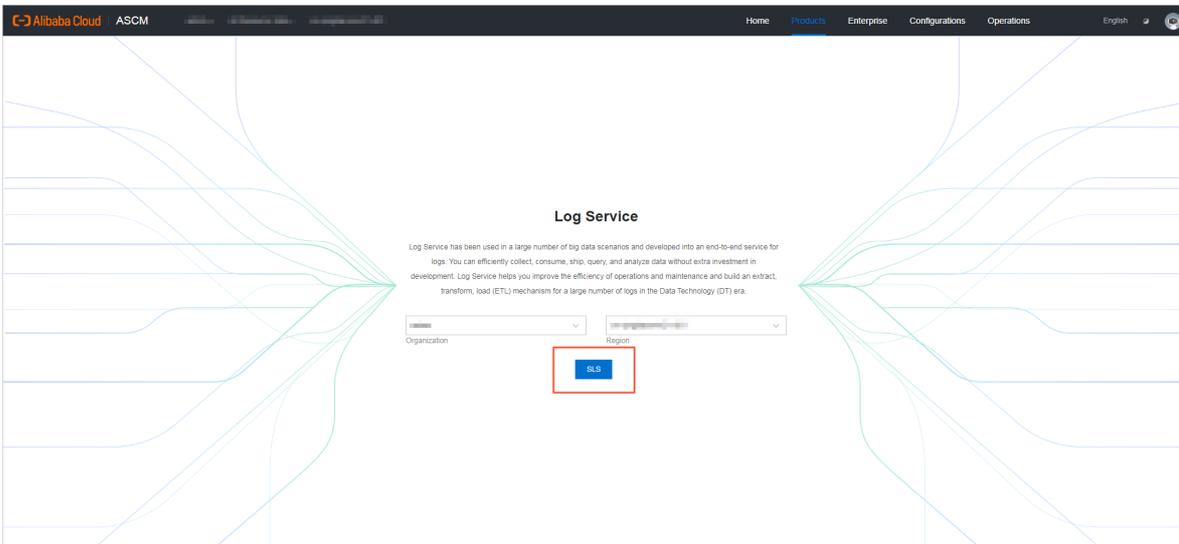

The SQL audit and analysis feature depends on Log Service (SLS). You must activate SLS before you use this feature.

Procedure

1. Log on to the SLS console. For more information, see *Log Service User Guide > Quick Start > Log on to the Log Service console*.
2. Select the organization to which the PolarDB-X instance belongs.

? **Note** The logon account must be consistent with the logon account of PolarDB-X.

3. Click SLS to go to the Log Service page.

4. Log on to the PolarDB-X console.
5. Find the target instance in the instance list.
6. Click the target instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
7. In the left-side navigation pane, choose **Diagnostics and Optimization > SQL Audit and Analysis**.
8. In the left-side section, select the database for which you want to enable the SQL audit and analysis feature.
9. On the SQL Audit and Analysis page, turn on the switch next to **SQL Audit Log Status of Current Database** on the right.

? **Note** On the SQL Audit and Analysis page, you can also turn on the switch of **SQL Audit and Analysis** next to the target database in the left-side section.

10. Confirm whether to import historical data.

Note By default, you can analyze and audit only the logs that are generated after the SQL audit and analysis feature is enabled. If you find the historical data of the PolarDB-X database is modified but the SQL audit and analysis feature is not enabled, you can import historical data and include historical logs in the audit and analysis scope to trace data tampering. PolarDB-X dynamically checks the scope of historical data that can be imported based on the log storage on the PolarDB-X instance. Logs within seven days can be imported.

- If you need to import historical data, enable **Import Historical Data or Not**, specify the backtrace start time and end time, and then click **Enable**.
- If you do not need to import historical data, click **Enable**.

What's next

Every time you use the SQL audit and analysis feature, you must repeat the preceding steps.

13.4.8.3. Log fields

This topic describes the log fields in SQL audit and analysis.

Field	Description	Supported version
<code>__topic__</code>	The log topic in the format of <code>drds_audit_log_{instance_id name_{db_name}}</code> , such as <code>drds_audit_log_drdsxyzabcd_demo_drds_db</code> .	All versions
<code>instance_id</code>	The ID of the PolarDB-X instance.	All versions
<code>db_name</code>	The name of the PolarDB-X database	All versions
<code>user</code>	The user name used to run the SQL statement.	All versions
<code>client_ip</code>	The IP address of the client that accessed the PolarDB-X instance.	All versions
<code>client_port</code>	The port of the client that accessed the PolarDB-X instance.	All versions
<code>sql</code>	The executed SQL statement.	All versions
<code>trace_id</code>	The trace ID of the SQL statement when it was executed. If a transaction was executed, it is tracked by an ID that consists of the trace ID, a hyphen, and a number, for example, <code>drdsabcdxyz-1</code> and <code>drdsabcdxyz-2</code> .	All versions
<code>sql_code</code>	The hash value of the template SQL statement.	All versions
<code>hint</code>	The hint that was used to execute the SQL statement.	All versions

Field	Description	Supported version
table_name	The name of the table involved in the query. Separate multiple tables by commas (,).	All versions
sql_type	The type of the SQL statement. Valid values: SELECT, INSERT, UPDATE, DELETE, SET, ALTER, CREATE, DROP, TRUNCATE, REPLACE, and Other.	All versions
sql_type_detail	The name of the SQL parser.	All versions
sql_time	The start time for the execution of the SQL statement. The time follows the <code>yyyy-MM-dd HH:mm:ss.SSS</code> format.	All versions
response_time	The response time. Unit: milliseconds.	Version 5.3.4-15378085 and later
affect_rows	The number of rows returned when the SQL statement was executed. The number of rows affected when the INSERT, DELETE, or UPDATE statement was executed.	Version 5.3.4-15378085 and later
fail	Indicates whether an error occurred in the execution of the SQL statement. Valid values: <ul style="list-style-type: none"> • 0: successful • 1: failed 	Version 5.3.4-15378085 and later

13.4.8.4. Log analysis

The SQL audit and analysis feature is based on Log Service (SLS) and provides powerful log analytics capabilities. This topic describes SQL statements for log analysis in common scenarios and provides relevant examples.

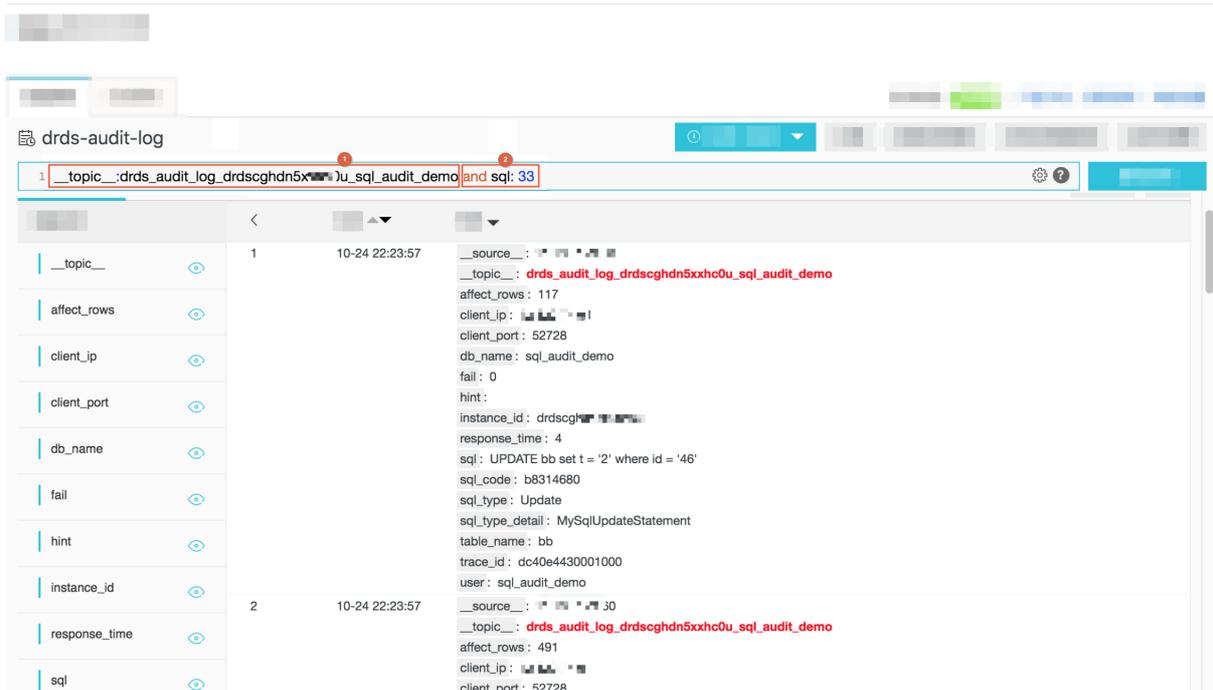

After the SQL audit and analysis feature is enabled, you can perform audit and analysis on SQL log files by using the query and analysis syntax of SLS on the SQL Audit and Analysis page. Based on the query and analysis syntax of SLS, you can find problematic SQL statements on the Log Analysis tab and analyze the SQL statement execution status, performance metrics, and security issues of PolarDB-X. For more information about the query and analysis syntax of SLS, see *Log Service User Guide > Query and Analysis > Query Syntax and Functions > Query Syntax*.

Precautions

All the audit logs of PolarDB-X databases in the same region are written to the same Logstore in SLS. Therefore, by default, the SQL Audit and Analysis page provides the filter conditions based on `__topic__`, to ensure that the searched SQL log files are from PolarDB-X. Therefore, all the statements provided in this topic must be used after the existing filter conditions.

An example is shown in the following figure:

- The ① part is the default filter condition.
- The ② part is the additional filter condition.

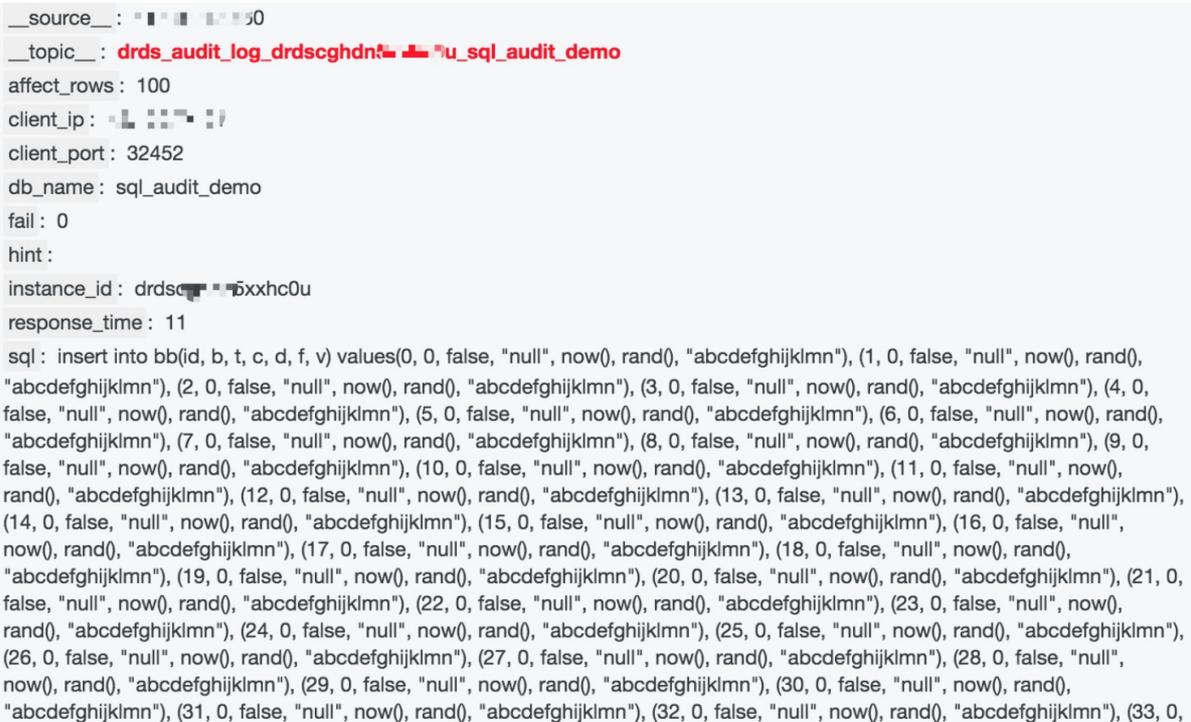

Find problematic SQL statements

- Fuzzy search

For example, to query SQL statements that contain the "34" keyword, enter the following content in the search box:

```
and sql: 34
```

The result is shown in the following figure.

- Field search

Based on built-in index fields, the SQL audit and analysis feature also supports field-based search.

For example, to query SQL statements of the Drop type, execute the following statement:

```
and sql_type:Drop
```

The result is shown in the following figure.

```
__source__: ...
__topic__: drds_audit_log_drdschdr...0u_sql_audit_demo
affect_rows: 0
client_ip: ...
client_port: 36085
db_name: sql_audit_demo
fail: 0
hint:
instance_id: drdschdr...0u
response_time: 3172
sql: drop table if exists bb
sql_code: 0cfc96e8
sql_type: Drop
sql_type_detail: SQLDropTableStatement
table_name: bb
trace_id: dc408feedc00000
user: sql_audit_demo
```

- Multi-condition search

You can use the "and" and "or" keywords to perform a multi-condition search.

For example, you can query the delete operation on the rows whose id is 34:

```
and sql:34 and sql_type: Delete
```

- Search based on numeric comparison

affect_rows and response_time in the index filed are numeric values and support comparison operators.

For example, you can query the SQL INSERT statements whose response_time is greater than 1s.

```
and response_time > 1507 and sql_type: Insert
```

For example, you can query the SQL statement that deletes more than 100 rows of data:

```
and affect_rows > 100 and sql_type: Delete
```

Analysis of the SQL statement execution status

This section introduces the statements used to query the SQL statement execution status in PolarDB-X.

- Failure rate of SQL statement execution

Execute the following statement to query the failure rate of SQL statement execution:

```
| SELECT sum(case when fail = 1 then 1 else 0 end) * 1.0 / count(1) as fail_ratio
```

The result is shown in the following figure.

fail_ratio +

0.0010322901477612633

If your business is sensitive to the error rate of SQL statement execution, you can customize the alert information based on the query result. Click **Save as Alert** in the upper-right corner of the page.

In the alert settings shown in the preceding figure, the number of log entries that have an error rate of SQL statement execution greater than 0.01 within 15 minutes is checked within every 15 minutes. You can also customize alerts as needed.

- Total number of rows returned by SELECT statements

Execute the following statement to query the cumulative number of rows queried by SELECT statements:

```
and sql_type: Select | SELECT sum(affect_rows)
```

- SQL statement type distribution

Execute the following statement to query the SQL statement type distribution:

```
| SELECT sql_type, count(sql) as times GROUP BY sql_type
```

- IP address distribution of SQL independent users

Execute the following statement to query the distribution of IP addresses of independent users who execute SQL statements:

```
| SELECT user, client_ip, count(sql) as times GROUP BY user, client_ip
```

SQL performance analysis

This section describes typical SQL statements for SQL performance analysis.

- Average response time of SELECT statements

Execute the following statement to query the average response time of SELECT statements:

```
and sql_type: Select | SELECT avg(response_time)
```

- Distribution of SQL statement response time

Execute the following statement to query the distribution of SQL statement response time:

```
and response_time > 0 | select case when response_time <=10 then '<=10 ms when response_time > 10 and response_time <= 100 then '10~100 ms when response_time > 100 and response_time <= 1000 then '100 ms ~ 1s 'When response_time > 1000 and response_time <= 10000 then '1s ~ 10s' when response_time > 10000 and response_time <= 60000 then '10s ~ 1 min'> 1 min' end as latency_type, count(1) as cnt group by latency_type order by latency_type DESC
```

The preceding query shows the distribution of SQL statement execution time based on a given time range. You can adjust the time range to obtain finer-grained results.

- Top 50 slow SQL statements

Execute the following statement to query slow SQL statements:

```
| SELECT date_format(from_unixtime(__time__), '%m/%d %H:%i:%s') as time, user, client_ip, client_port, sql_type, affect_rows, response_time, sql ORDER BY response_time desc LIMIT 50
```

The following figure shows the result, which includes the SQL statement execution time, user name, IP address, port number, SQL statement type, number of affected rows, response time, and text of SQL statements.

time	user	client_ip	client_port	sql_type	affect_rows	response_time	sql
09/28 14:04:05	sql_audit_demo	192.168.1.101	477	Drop	0	9583	drop table if exists bb
09/28 14:04:05	sql_audit_demo	192.168.1.101	477	Drop	0	9583	drop table if exists bb
09/28 14:04:05	sql_audit_demo	192.168.1.101	477	Drop	0	9583	drop table if exists bb
09/27 17:38:18	sql_audit_demo	192.168.1.101	473	Drop	0	7200	drop table if exists bb

• Top 10 costly SQL templates

In most applications, SQL statements are dynamically generated based on several templates, and only the parameters are different. You can find, analyze, and optimize the costly SQL templates based on template IDs. Enter the following query statement:

```
| SELECT sql_code as "SQL template ID", round(total_time * 1.0 /sum(total_time) over() * 100, 2) as "response time share (%)" ,execute_times as "number of executions", round(avg_time) as "average response time", round(avg_rows) as "average number of affected rows", CASE WHEN length(sql) > 200 THEN concat(substr(sql, 1, 200), '.....') ELSE trim(lpad(sql, 200,'hour') end as "sample SQL" FROM (SELECT sql_code, count(1) as execute_times, sum(response_time) as total_time, avg(response_time) as avg_time, avg(affect_rows) as avg_rows, arbitrary(sql) as sql FROM log GROUP BY sql_code) ORDER BY "execution time share (%)" desc limit 10
```

The statistics include the SQL template ID, percentage of response time of the statement generated from the template in the total response time of SQL statements, number of executions, average response time, average number of affected rows, and sample SQL statement. For better display effect, each page displays 200 entries. In the preceding query result, statements are ranked by the response time share. However, you can rank the statements by the average response time or the number of executions to troubleshoot relevant issues.

• Average transaction response time

For SQL statements within the same transaction, the preset trace_id field prefixes are the same, and the suffixes are '-' followed by sequence numbers. trace_id of non-transactional SQL statements does not contain '-'. Based on this, you can analyze the performance of transactions.

Note Transaction analysis is less efficient than other query operations because it involves prefix matching.

For example, execute the following statement to query the average response time of transactions:

```
| SELECT sum(response_time) / COUNT(DISTINCT substr(trace_id, 1, strpos(trace_id, '-') - 1)) where strpos(trace_id, '-') > 0
```

• Top 10 slow transactions

You can query the list of slow transactions by response time of transactions. Use the following statement:

```
| SELECT substr(trace_id, 1, strpos(trace_id, '-') - 1) as "transaction ID" , sum(response_time) as "response time" where strpos(trace_id, '-') > 0 GROUP BY substr(trace_id, 1, strpos(trace_id, '-') - 1) ORDER BY "response time" DESC LIMIT 10
```

Based on this, you can use the transaction ID to search for all the SQL statements under the transaction and analyze the specific causes of slow execution. Use the following statement:

```
and trace_id: db3226a20402000*
```

- Top 10 transactions with batch operations

Based on the number of rows affected by SQL statements in a transaction, you can obtain the list of transactions that contain batch operations. Use the following statement:

```
| SELECT substr(trace_id, 1, strpos(trace_id, '-') - 1) as "transaction ID" , sum(affect_rows) as "number of affected rows" where strpos(trace_id, '-') > 0 GROUP BY substr(trace_id, 1, strpos(trace_id, '-') - 1) ORDER BY "number of affected rows" DESC LIMIT 10
```

SQL security analysis

This section provides typical query statements for SQL security analysis.

- Distribution of types of failed SQL statements

```
and fail > 0 | select sql_type, count(1) as "number of errors" group by sql_type
```

- High-risk SQL statements

High-risk SQL statements are of the Drop or Truncate type. You can also add more conditions as needed.

```
and sql_type: Drop OR sql_type: Truncate
```

- SQL batch delete events

```
and affect_rows > 100 and sql_type: Delete | SELECT date_format(from_unixtime(__time__), '%m/%d %H:%i:%s') as time, user, client_ip, client_port, affect_rows, sql ORDER BY affect_rows desc LIMIT 50
```

13.4.8.5. Log reports

Based on Log Service (SLS), the SQL audit and analysis feature of PolarDB-X provides out-of-the-box report centers, including the Operation Center, Performance Center, and Security Center. This feature allows you to fully understand the performance status, performance metrics, and potential security risks of your PolarDB-X databases.

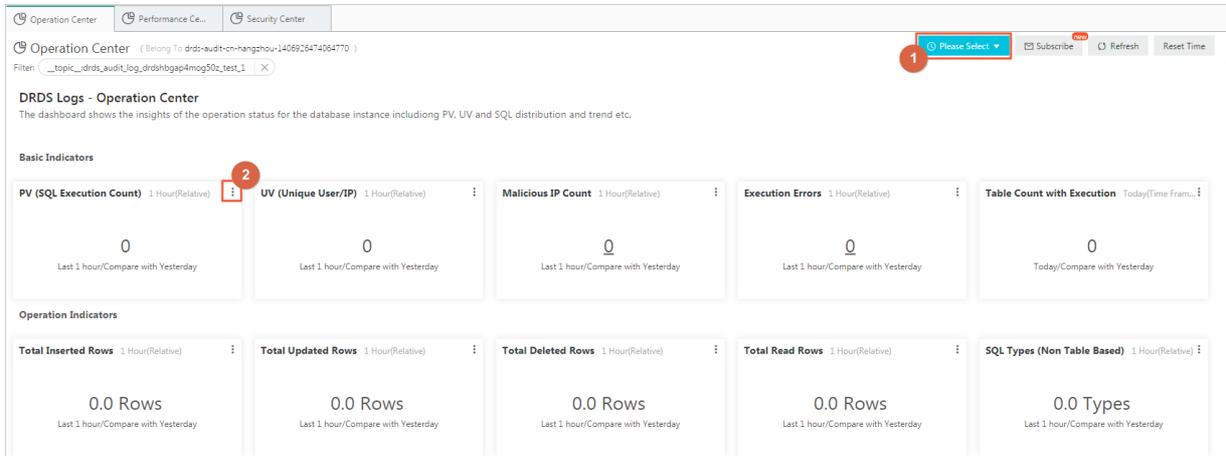

After [Enable SQL audit and analysis](#), click the **Log Reports** tab on the current page. You can view the reports pages provided by SLS, including **Operation Center**, **Performance Center**, and **Security Center**.

Note

- All the audit logs of PolarDB-X databases in the same region are written to the same Logstore in SLS. Therefore, when you view the reports of the current PolarDB-X database, filter conditions based on the `__topic__:drds_audit_log_instance id_database` name are added by default, which indicates that you are viewing the data of the current database. For example, `drds_audit_log_drdsxyzabcd_demo_drds_db`.
- If the version of the PolarDB-X instance is earlier than Version 5.3.4-15378085, the relevant fields are missing from SQL logs. For more information about log fields, see [Log fields](#). The Log Reports tab provides only a simplified version of Operation Center. To use a full version of reports, upgrade the instance to the latest version.

View reports

Statistics in the charts on the Log Reports tab are generated for different time periods. You can change the time range as needed. You can change the time range for all charts or a single chart.

- Click the time selector (position ① in the figure). In the dialog box that appears, you can change the time range of all the charts on the current page.
- Click the time selector of a chart (position ② in the figure) to modify the time range of the chart.

Operation Center

Operation Center shows the metrics, distribution, and trends of SQL statement execution in PolarDB-X databases.

Item	Type	Default time range	Description
PV (SQL Execution Count)	Single value	1 Hour (Relative)	The number of SQL statement executions
UV (Unique User/IP)	Single value	1 Hour (Relative)	The number of unique user-IP groups
Malicious IP Count	Single value	1 Hour (Relative)	The number of malicious IP addresses. For more information about the definition of malicious IP addresses, see security detection functions.
Execution Errors	Single value	1 Hour (Relative)	The number of SQL statements with execution errors
Table Count with Execution	Single value	1 Hour (Relative)	The total number of tables operated by SQL statements
Total Inserted Rows	Single value	1 Hour (Relative)	The total number of rows inserted by INSERT statements
Total Updated Rows	Single value	1 Hour (Relative)	The total number of rows updated by UPDATE statements

Item	Type	Default time range	Description
Total Deleted Rows	Single value	1 Hour (Relative)	The total number of rows deleted by DELETE statements
Total Read Rows	Single value	1 Hour (Relative)	The total number of rows returned by SELECT statements
SQL Types (Non Table Based)	Single value	1 Hour (Relative)	The types of SQL statements used for non-table operations, such as SHOW VARIABLES LIKE
SQL Execution Trend	Column chart	1 Hour (Relative)	The distribution trend of SQL statement executions and the distribution trend of failed SQL statements
Operated Tables	Flow diagram	1 Hour (Relative)	The distribution of tables operated by SQL statements
SQL Type	Flow diagram	1 Hour (Relative)	The distribution of SQL statement types by time
User Distribution	Pie chart	1 Hour (Relative)	The distribution of users who execute SQL statements
SQL Type Distribution	Area chart	1 Hour (Relative)	The percentage of SQL statement types in the current time range
Tables with Most Operations (Top 50)	Table	1 Hour (Relative)	The list of top tables by the number of operations, including table names and the number of operations such as read, delete, update, and insert
SQL Type (World)	Map	1 Hour (Relative)	The distribution of IP addresses of clients that execute the SQL statements, on the world map
SQL Type (China)	Map	1 Hour (Relative)	The distribution of IP addresses of clients that execute the SQL statements, on the map of China

Performance Center

Performance Center shows performance metrics, the distribution of slow and fast SQL statements, and the distribution and sources of costly SQL statements in PolarDB-X databases.

Item	Data type	Default time range	Description
------	-----------	--------------------	-------------

Item	Data type	Default time range	Description
Peak SQL Execution Traffic	Single value	1 Hour (Relative)	The maximum number of SQL statements executed per second
Peak Select Traffic	Single value	1 Hour (Relative)	The maximum number of rows returned by SELECT statements per second
Peak Insert Traffic	Single value	1 Hour (Relative)	The maximum number of rows inserted by INSERT statements per second
Peak Update Traffic	Single value	1 Hour (Relative)	The maximum number of rows updated by UPDATE statements per second
Peak Delete Traffic	Single value	1 Hour (Relative)	The maximum number of rows deleted by DELETE statements per second
Average Response Time	Single value	1 Hour (Relative)	The average response time of SQL statements
Select SQL	Single value	1 Hour (Relative)	The average number of SELECT statements executed per second
Insert SQL	Single value	1 Hour (Relative)	The average number of INSERT statements executed per second
Update SQL	Single value	1 Hour (Relative)	The average number of UPDATE statements executed per second
Delete SQL	Single value	1 Hour (Relative)	The average number of DELETE statements executed per second
Select/Update Traffic Trend	Line chart	1 Hour (Relative)	The distribution of rows affected by the SELECT and UPDATE statements over time
SQL Execution Time Distribution	Pie chart	1 Hour (Relative)	The distribution of execution time of SQL statements
Slow SQL Table Distribution	Pie chart	1 Hour (Relative)	The distribution of tables targeted by slow SQL statements whose response time exceeds 1s
Slow SQL User Distribution	Pie chart	1 Hour (Relative)	The distribution of users who execute slow SQL statements with response time of more than 1s

Item	Data type	Default time range	Description
Slow SQL Type Distribution	Pie chart	1 Hour (Relative)	The distribution of types of slow SQL statements whose response time exceeds 1s
Slow SQL (Top 50)	Table	1 Hour (Relative)	The table of slow SQL statements whose response time exceeds 1s, including the time, client, response time, PolarDB-X instance, database, table, user, affected rows, SQL type, and SQL text
SQL Template Execution Time Top 20	Table	1 Hour (Relative)	Statistics of the execution status of the SQL statements in the template based on the specified SQL template, including the SQL template ID, response time share, number of executions, average response time, average number of affected rows, and sample SQL statement
Transaction Affected Rows Top 20	Table	1 Hour (Relative)	The table of top 20 transaction-by the number of affected rows, including the transaction ID and the number of affected rows
Transaction Executed Time Top 20	Table	1 Hour (Relative)	The table of top 20 transactions by response time, including the transaction ID and the number of affected rows

Security Center

Security Center shows failed and malicious SQL statement executions in PolarDB-X databases, and the details, distribution, and trends of malicious SQL batch delete and update events.

Item	Type	Default time range	Description
Error Count	Single value	1 Hour (Relative)	The number of failed SQL statement executions
Batch Delete Events	Single value	1 Hour (Relative)	The number of SQL statements for batch delete events (more than 100 rows)
Batch Update Events	Single value	1 Hour (Relative)	The number of SQL statements for batch update events (more than 100 rows)

Item	Type	Default time range	Description
Malicious SQL Executions	Single value	1 Hour (Relative)	The number of malicious SQL statement executions (Drop and Truncate)
Malicious IP Count	Single value	1 Hour (Relative)	The number of malicious IP addresses. For more information about the definition of malicious IP addresses, see security detection functions.
Error Distribution	Area chart	1 Hour (Relative)	The distribution of types of failed SQL statements
Distribution of Client with Errors	Map	1 Hour (Relative)	The distribution of clients for failed SQL statements on the map of China
Client with Most Errors	Table	1 Hour (Relative)	The table of clients on which the execution of SQL statements failed, including the IP address, number of errors, type of failed SQL statement, and sample failed SQL statement
Malicious SQL Executions	Table	1 Hour (Relative)	The table of malicious SQL statement executions, including the time, IP address, SQL, PolarDB-X instance ID, database, table, and user
Batch Delete Events (Top 50)	Table	1 Hour (Relative)	The table of top SQL batch delete events, including the earliest execution time, most recent execution time, PolarDB-X instance ID, database, table, number of executions, average number of deleted rows, average response time, and sample SQL statement
Batch Update Events (Top 50)	Table	1 Hour (Relative)	The table of top SQL batch update events, including the earliest execution time, most recent execution time, PolarDB-X instance ID, database, table, number of executions, average number of updated rows, average response time, and sample SQL statement

13.4.9. Monitor PolarDB-X instances

13.4.9.1. View monitoring information

PolarDB-X provides multi-dimensional monitoring. This topic describes how to view monitoring information in the PolarDB-X console.

Procedure

1. [Log on to the PolarDB-X console.](#)
2. Find the target instance in the instance list.
3. Click the target instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. On the **Basic Information** page, choose **Monitoring and Alerts > Instance Monitoring** in the left-side navigation pane.
5. On the **Instance Monitoring** page, select a monitoring dimension and the corresponding metrics to view details. For more information about metrics, see [Monitoring metrics](#).

13.4.9.2. Monitoring metrics

Instance monitoring is divided into resource monitoring and engine monitoring. Engine monitoring metrics are classified into metrics at the PolarDB-X instance level and metrics at the PolarDB-X database level. When some engine monitoring metrics are abnormal, you can directly check the metrics of each database to locate the database with performance problems. The following table describes the metrics of these two types in details.

Monitoring item	Category	Description	Data collection cycle	Data retention period	Description
CPU Utilization (%)	Resource monitoring	The average CPU utilization of PolarDB-X server nodes.	1 minute	3 days	-
Memory Usage (%)	Resource monitoring	The memory usage of JVM Old Generation on PolarDB-X server nodes.	1 minute	3 days	Memory usage fluctuations are normal.
Inbound Traffic (Kbps)	Resource monitoring	The total inbound network traffic of PolarDB-X server nodes.	1 minute	3 days	Inbound network traffic is generated when ApsaraDB RDS for MySQL returns data to PolarDB-X.

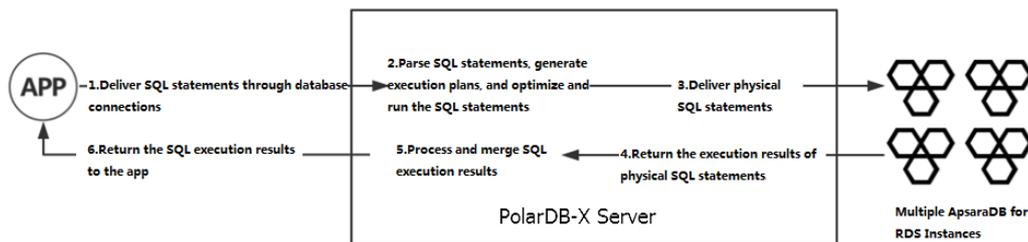

Monitoring item	Category	Description	Data collection cycle	Data retention period	Description
Outbound Traffic (Kbps)	Resource monitoring	The total outbound network traffic of PolarDB-X server nodes.	1 minute	3 days	Outbound network traffic is generated when a PolarDB-X instance sends a physical SQL statement to an ApsaraDB RDS for MySQL instance or a PolarDB-X instance returns data to an application.
Logical QPS	Engine monitoring	The total number of SQL statements processed per second on PolarDB-X server nodes.	5 seconds	7 days	-
Physical QPS	Engine monitoring	The total number of SQL operations sent from PolarDB-X server nodes to ApsaraDB RDS for MySQL per second.	5 seconds	7 days	One logical SQL statement can be partitioned into multiple physical SQL statements.
Logical RT (ms)	Engine monitoring	The average response time (RT) for processing each SQL statement by PolarDB-X.	5 seconds	7 days	If a logical SQL statement is partitioned into physical SQL statements for delivery, the logical RT of the SQL statement contains the RT of the physical SQL statements.
Physical RT (ms)	Engine monitoring	The average RT for transmitting SQL statements from PolarDB-X to ApsaraDB RDS for MySQL.	5 seconds	7 days	-
Connections	Engine monitoring	The total number of connections established between an application and PolarDB-X.	5 seconds	7 days	The connections from PolarDB-X to ApsaraDB RDS for MySQL are not included.

Monitoring item	Category	Description	Data collection cycle	Data retention period	Description
Active Threads	Engine monitoring	The number of threads that are used by PolarDB-X to run SQL statements.	5 seconds	7 days	-

13.4.9.3. How metrics work

Before analyzing metrics, you need to understand the execution process of SQL statements on PolarDB-X.

PolarDB-X SQL execution flowchart

In the entire SQL execution process, the execution status of steps 2 through 4 is reflected in various metrics of PolarDB-X.

- In step 2, SQL parsing, optimization, and execution consume CPU resources. A more complex SQL statement (with a complex structure or ultra-long length) consumes more CPU resources. You can run the **TRACE** command to trace the SQL execution process. You can see the time consumed by an SQL statement during optimization. The longer time consumed indicates a higher CPU utilization.
- In step 3, the delivery and execution of physical SQL statements consume I/O resources. You can analyze the execution status of physical SQL statements based on metrics such as logical queries per second (QPS), physical QPS, logical response time (RT), and physical RT. For example, if the physical QPS is low and the physical RT is high, the current ApsaraDB RDS for MySQL instance is processing SQL statements very slowly. You need to check the performance of the ApsaraDB RDS for MySQL instance.
- In step 5, the SQL execution results are processed and integrated. These operations convert the execution results of physical SQL statements. In most cases, only SQL metadata is converted, which consumes few resources. However, the CPU utilization is high for steps such as `heap sort`. For more information about how to determine the consumption of SQL statements at this stage, see [Details about a low SQL statement](#).

13.4.9.4. Prevent performance problems

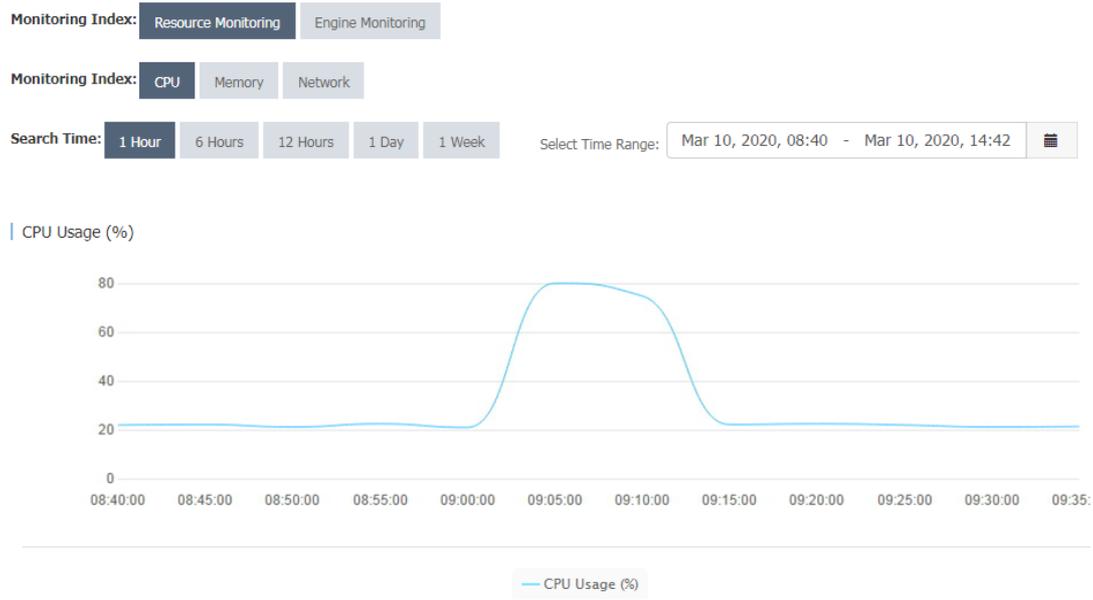

13.4.9.4.1. Example 1: PolarDB-X CPU utilization

Performance metrics change with the system business traffic.

The following describes the CPU utilization in two common cases:

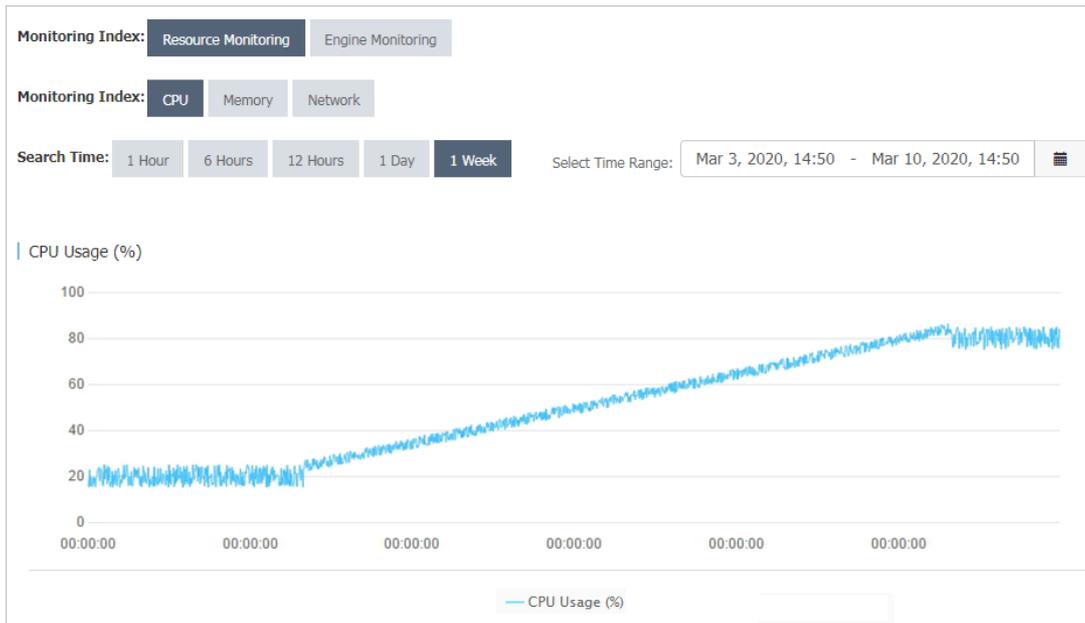

- An application has a shopping spree activity at 09:00 every morning. Therefore, the traffic of the system increases significantly at this time point. According to the monitoring data, the CPU utilization of the PolarDB-X instance increased from 20% to about 80% from about 09:00, with the traffic peak lasting about 10 minutes.

CPU utilization-1

- The system traffic keeps increasing with an application until it reaches a plateau. The monitored CPU utilization of the PolarDB-X instance also reflects this change.

CPU utilization-2

When the load on the PolarDB-X instance changes with the business, you must pay close attention to the changes in metrics. If the CPU utilization exceeds the threshold, you must upgrade the PolarDB-X specifications to alleviate the performance pressure.

You can set alert rules for instances in the PolarDB-X console. When the average CPU utilization exceeds the preset threshold, the system sends short messages to the corresponding contacts. You can set the CPU utilization threshold as needed. We recommend that you set it to 80%.

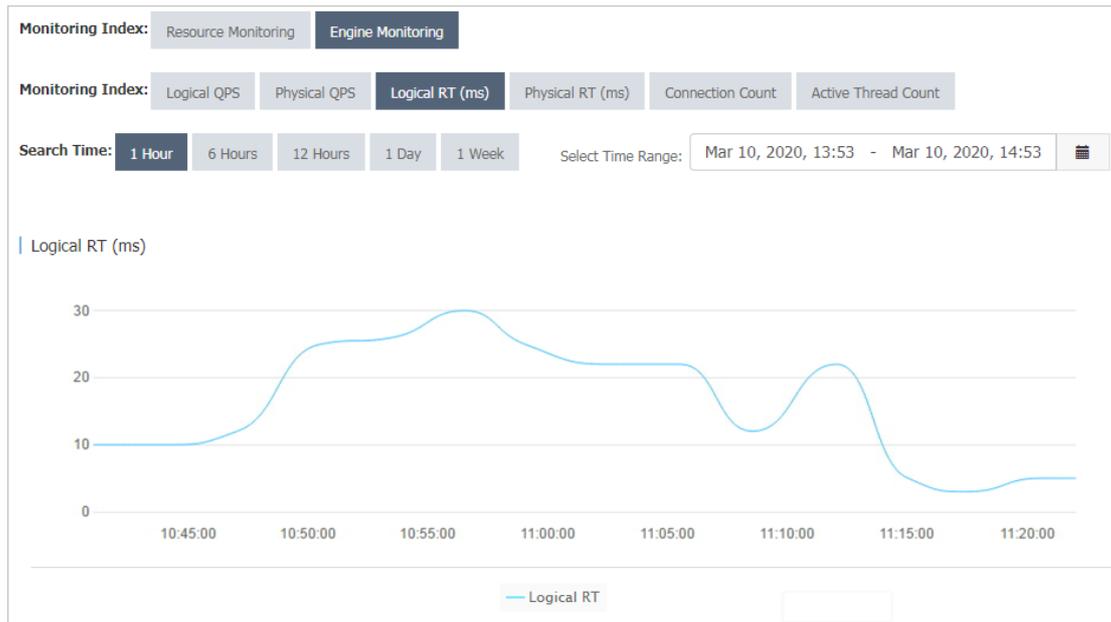

13.4.9.4.2. Example 2: Logical RT and physical RT

You can observe the difference between the logical response time (RT) and physical RT.

Logical RT refers to the time from when a PolarDB-X instance receives a logical SQL statement to when it returns data to an application. Physical RT refers to the time from when a PolarDB-X instance sends a physical SQL statement to an ApsaraDB RDS for MySQL instance to when it receives the data returned by the ApsaraDB RDS for MySQL instance.

If a logical SQL statement is partitioned into one or more physical SQL statements, the logical RT is greater than or equal to the physical RT. Ideally, PolarDB-X performs only a few operations on the data returned by ApsaraDB RDS for MySQL. Therefore, logical RT is slightly longer than physical RT. Under special circumstances, physical SQL queries are run fast, while logical SQL queries take a long time to run. In this case, the logical RT and physical RT are as follows.

Logical RT

Physical RT

As shown in the preceding figures, the change trends of logical RT and physical RT in the two monitoring charts are basically the same, while logical RT fluctuates between 10 ms and 20 ms and physical RT fluctuates between 2 ms and 5 ms. This means that PolarDB-X has a heavy load, which can be solved by upgrading the PolarDB-X configuration. If both the logical RT and physical RT are high, you can upgrade the ApsaraDB RDS for MySQL configuration or optimize SQL statements on the ApsaraDB RDS for MySQL instance.

13.4.9.4.3. Example 3: Logical QPS and physical QPS

You can observe the difference between the logical queries per second (QPS) and physical QPS.

According to the monitoring data, the logical QPS and physical QPS have the same trends, but the difference between the two is relatively large and in a certain proportion.

Logical QPS

Physical QPS

As shown in the preceding figures, logical QPS fluctuates between 80 and 150, and physical QPS fluctuates between 700 and 1,200.

The reason is that PolarDB-X generates physical SQL statements based on logical SQL statements. The ratio of logical SQL statements to physical SQL statements is not necessarily 1:1. For example, a PolarDB-X logical table is created by using the following statement:

```
CREATE TABLE drds_user
(id int,
name varchar(30))
dbpartition by hash(id);
```

When the query condition contains the database shard key, PolarDB-X pushes the logical SQL statement down to the ApsaraDB RDS for MySQL instance for execution. According to the execution plan, the number of physical SQL statements is 1:

```
mysql> explain select name from drds_user where id = 1;
+-----+-----+-----+
| GROUP_NAME | SQL | PARAMS |
+-----+-----+-----+
| SANGUAN_BSQT_0001_RDS | select `drds_user`.`name` from `drds_user` where (`drds_user`.`id` = 1) | {} |
+-----+-----+-----+
```

When the query does not contain the database shard key, PolarDB-X partitions the logical SQL statement into multiple physical SQL statements. The following execution plan shows that there are eight physical SQL statements:

```
mysql> explain select name from drds_user where name = 'LiLei';
+-----+-----+-----+
| GROUP_NAME | SQL | PARAMS |
+-----+-----+-----+
| SANGUAN_BSQT_0001_RDS | select `drds_user`.`name` from `drds_user` where (`drds_user`.`name` = 'LiLei') | {} |
| SANGUAN_BSQT_0001_RDS | select `drds_user`.`name` from `drds_user` where (`drds_user`.`name` = 'LiLei') | {} |
| SANGUAN_BSQT_0001_RDS | select `drds_user`.`name` from `drds_user` where (`drds_user`.`name` = 'LiLei') | {} |
| SANGUAN_BSQT_0001_RDS | select `drds_user`.`name` from `drds_user` where (`drds_user`.`name` = 'LiLei') | {} |
| SANGUAN_BSQT_0001_RDS | select `drds_user`.`name` from `drds_user` where (`drds_user`.`name` = 'LiLei') | {} |
| SANGUAN_BSQT_0001_RDS | select `drds_user`.`name` from `drds_user` where (`drds_user`.`name` = 'LiLei') | {} |
| SANGUAN_BSQT_0001_RDS | select `drds_user`.`name` from `drds_user` where (`drds_user`.`name` = 'LiLei') | {} |
| SANGUAN_BSQT_0001_RDS | select `drds_user`.`name` from `drds_user` where (`drds_user`.`name` = 'LiLei') | {} |
+-----+-----+-----+
8 rows in set (0.06 sec)
```

Logical or physical QPS indicates the total number of logical or physical SQL statements processed per unit of time. When most SQL statements in the system contain the shard key, the ratio of logical QPS to physical QPS is close to 1:1. If the difference between the logical and physical QPS is too large, many SQL statements of the current application do not contain the shard key. In this case, check the SQL statements of the application to improve performance.

13.4.9.4.4. Example 4: High memory usage

The overly high memory usage of the PolarDB-X instance is mostly caused by the large number of SQL queries in your application and the overlarge result set that is returned. If the memory usage of your PolarDB-X instance remains at about 100%, perform the [Restart a PolarDB-X instance](#) operations to locate and optimize the slow SQL queries of your application.

13.4.10. View the instance version

This topic describes two ways that you can use to view the version of a PolarDB-X instance.

View the instance version in the console

1. [Log on to the PolarDB-X console](#).
2. Find the target instance in the instance list.
3. Click the target instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. In the **Configuration Information** section, view the value of **Current Version**.

View the instance version by using the `version()` function

Connect to the PolarDB-X instance by using the MySQL command line and execute the `SELECT version()` statement to view the version of the PolarDB-X instance.

```
mysql> select version();
+-----+
| VERSION()          |
+-----+
| 5.6.29-TDDL-5.1.28-1320920 |
+-----+
1 row in set (0.00 sec)
```

In the preceding statement, 5.1.28-1320920 indicates the version of the PolarDB-X instance.

13.5. Account management

13.5.1. Basic concepts

This topic describes the terms of the PolarDB-X account and permission system.

The usage of the account and permission system in PolarDB-X is the same as in MySQL. PolarDB-X supports statements such as `GRANT`, `REVOKE`, `SHOW GRANTS`, `CREATE USER`, `DROP USER`, and `SET PASSWORD`. PolarDB-X allows you to grant permissions at the database and table levels, but does not allow you to grant permissions at the global or column level.

For more information about the MySQL account and permission system, see [MySQL Documentation](#).

Notice Accounts created by using `CREATE USER` in PolarDB-X exist only in the PolarDB-X instance and will not be synchronized to the backend ApsaraDB RDS for MySQL instances.

Account

An account is specified by the user name and hostname in the `username@'host'` format. Accounts with the same user name but different hostnames are different accounts. For example, `lily@30.9.73.96` and `lily@30.9.73.100` are two different accounts, and their passwords and permissions may be different.

After a database is created in the PolarDB-X console, the system automatically creates two system accounts for the database: the administrator account and read-only account. These two accounts are built-in accounts. You cannot delete them or modify their permissions.

- The administrator account name is the same as the database name. For example, if the database name is `easydb`, the administrator account name is also `easydb`.
- The read-only account name is the database name suffixed with `_RO`. For example, if the database name is `easydb`, the read-only account name is `easydb_RO`.

Assume that the `dreamdb` and `andoradb` databases are available. Based on the preceding rules, the `dreamdb` database contains the administrator account named `dreamdb` and the read-only account named `dreamdb_RO`, while the `andoradb` database contains the administrator account named `andoradb` and the read-only account named `andoradb_RO`.

Account rules

- Each administrator account has all permissions.
- Only the administrator account can create accounts and grant permissions. Other accounts can only be created and granted permissions by the administrator account.
- The administrator account is bound to a database and does not have permissions on other databases. It can access only the bound database, and cannot grant permissions of other databases to an account. For example, the `easydb` administrator account can connect only to the `easydb` database, and can grant only the permissions of the `easydb` database or tables in the `easydb` database to an account.
- A read-only account has only the `SELECT` permission.

User name rules

- User names are case-insensitive.
- A user name must be 4 to 20 characters in length.
- A user name must start with a letter.
- A user name can contain uppercase letters, lowercase letters, and digits.

Password rules

- A password must be 6 to 20 characters in length.
- A password can contain letters, digits, and special characters that include the at sign (`@`), number sign (`#`), dollar sign (`$`), percent sign (`%`), caret (`^`), ampersand (`&`), plus sign (`+`), equal sign (`=`).

Hostname matching rules

- A hostname must be an IP address. It can contain underscores (`_`) and wildcards (`%`). An underscore (`_`) indicates a character and a wildcard (`%`) indicates zero or more characters. Hostnames that contain wildcards must be quoted with single quotation marks (`'`), for example, `'lily@'30.9.%.%'` and `'david@'%'`.
- If two user names in the system can be used to log on to the database, the user name with the longest prefix (the longest IP segment excluding wildcards) prevails. For example, if the `'david@'30.9.12_.234'` and `'david@'30.9.1%.234'` user names are available in the system, use `'david@'30.9.12_.234'` to log on from the `30.9.127.234` host as `david`.
- When you enable the virtual private cloud (VPC) access feature for a host, the IP address of the host changes. To avoid invalid configurations in the account and permission system, set the hostname to `'%'` to match an IP address.

Permissions

Permission support by level

- Global permission (not supported)
- Database-level permission (supported)
- Table-level permission (supported)
- Column-level permission (not supported)

- Subprogram-level permission (not supported)

Permissions

Eight table-associated basic permissions are supported: `CREATE` , `DROP` , `ALTER` , `INDEX` , `INSERT` , `DELETE` , `UPDATE` , and `SELECT` .

- The `TRUNCATE` statement requires the table-level `DROP` permission.
- The `REPLACE` statement requires the table-level `INSERT` and `DELETE` permissions.
- The `CREATE INDEX` and `DROP INDEX` statements require the table-level `INDEX` permission.
- The `CREATE SEQUENCE` statement requires the database-level `CREATE` permission.
- The `DROP SEQUENCE` statement requires the database-level `DROP` permission.
- The `ALTER SEQUENCE` statement requires the database-level `ALTER` permission.
- The `INSERT ON DUPLICATE UPDATE` statement requires the table-level `INSERT` and `UPDATE` permissions.

Permission rules

- Permissions are bound to an account (`username@'host'`) rather than a user name (`username`).
- An error occurs if the table does not exist during authorization.
- The database permissions are listed by level in descending order: global permissions (not supported), database-level permissions, table-level permissions, and column-level permissions (not supported). A granted higher-level permission overwrites a lower-level permission. If you remove the higher-level permission, the lower-level permission is also removed.
- `USAGE` authorization is not supported.

13.5.2. Create an account

This topic describes how to create a PolarDB-X account in the PolarDB-X console and by using SQL statements.

Prerequisites

You have created or added a database. For more information, see [Create a database](#).

Create an account in the console

1. [Log on to the PolarDB-X console](#).
2. Find the target instance in the instance list.
3. Click the target instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. In the left-side navigation pane, choose **Configuration and Management > Account Management**.
5. On the **Account Management** page, click **Create Account** in the upper-right corner.
6. Set the following parameters.

Parameter	Description
Database Account	Enter a name for the account. The account name must meet the following requirements: <ul style="list-style-type: none"> ◦ The name must be 4 to 20 characters in length. ◦ The name must start with a letter and end with a letter or digit. ◦ The name can contain uppercase letters, lowercase letters, digits, and underscores (_).

Parameter	Description
New Password	<p>Enter a password for the account. The password must meet the following requirements:</p> <ul style="list-style-type: none"> ○ The password must be 8 to 32 characters in length. ○ The password must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. ○ Special characters include exclamation marks (!). @#\$%^&*()_+ -=
Confirm New Password	Enter the password again.
Authorize Databases	<p>You can grant permissions on one or more databases to the account.</p> <ol style="list-style-type: none"> From the left-side section, select one or more databases. Then click Add to add them to the right-side section. In the right-side section, select Read/Write, Read-only, DDL Only, or DML Only for the specified database. <div style="background-color: #e6f2ff; padding: 10px; margin-top: 10px;"> <p> Note You can also grant permissions on multiple added databases by clicking Set All to Read-only, Set All to DDL Only, Set All to DML Only, or Set All to Read/Write in the upper-right corner of the right-side section.</p> <p>The buttons in the upper-right corner change after you click them. For example, after you click Set All to Read-only, this button is changed to Set All to DDL Only.</p> </div>

Create an account by using the command line

Use the following syntax rule:

```
CREATE USER user_specification [, user_specification] ...
user_specification: user [ auth_option ]
auth_option: IDENTIFIED BY 'auth_string'
```

For example:

Create an account whose name is lily and password is 123456 and which can be used to log on only from 30.xx.xx.96.

```
CREATE USER lily@30.xx.xx.96 IDENTIFIED BY '123456';
```

Create an account that is named david, has no password, and can be used to log on from all hosts.

```
CREATE USER david@'%';
```

13.5.3. Reset password

When you use PolarDB-X, you can reset the password of your database account in the PolarDB-X console or by using the command line.

Note

- Accounts that have root permissions cannot be deleted or modified.
- For data security, we recommend that you change your password on a regular basis.

Reset the password in the console

1. [Log on to the PolarDB-X console](#).
2. Find the target instance in the instance list.
3. Click the target instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. In the left-side navigation pane, choose **Configuration and Management > Account Management**.
5. Find the target account and click **Reset Password**.
6. In the **Reset Account Password** dialog box, set **New Password** and **Confirm New Password**.

 **Note** The password must meet the following requirements:

- The password must be 8 to 32 characters in length.
- The password must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters.
- Special characters include the following characters:
!@#%&^*()_+~

7. After you confirm that the password is correct, click **OK**.

Reset the password by using the command line

Use the following syntax rule:

```
SET PASSWORD FOR user = password_option
password_option: {
  PASSWORD('auth_string')
}
```

For example:

Change the password of the lily@30.xx.xx.96 account to 123456.

```
SET PASSWORD FOR lily@30.xx.xx.96 = PASSWORD('123456')
```

13.5.4. Modify account permissions

You can modify the account permissions of your instances at any time when you use PolarDB-X.

Precautions

- Privileged accounts cannot be modified.
- In the console, you can grant only DML, DDL, read-only, and read/write permissions to standard accounts. If you need more fine-grained authorization, use the command line.

Modify account permissions in the console

1. [Log on to the PolarDB-X console](#).
2. Find the target instance in the instance list.
3. Click the target instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. In the left-side navigation pane, choose **Configuration and Management > Account Management**.
5. Find the target account and click **Modify Permission**.

6. In the **Modify Permissions** dialog box, grant or remove the permissions on one or more databases to or from the account.

- Add databases:

From the left-side section, select one or more databases. Then click **Add** to add them to the right-side section.

- Remove databases:

From the right-side section, select one or more databases. Then click **Remove** to move the databases to the left-side section.

- Modify permissions on added databases:

In the right-side section, select **Read/Write**, **Read-only**, **DDL Only** or **DML Only** for the specified database.

 **Note** You can also grant permissions on multiple added databases by clicking **Set All to Read-only**, **Set All to DDL Only**, **Set All to DML Only**, or **Set All to Read/Write** in the upper-right corner of the right-side section.

The buttons in the upper-right corner change after you click them. For example, after you click **Set All to Read-only**, this button is changed to **Set All to DDL Only**.

7. After the configuration is complete, click **OK**.

GRANT statement

Use the following syntax rule:

```
GRANT
  priv_type[, priv_type] ...
  ON priv_level
  TO user_specification [, user_specification] ...
  [WITH GRANT OPTION]
priv_level: {
  | db_name.*
  | db_name.tbl_name
  | tbl_name
}
user_specification:
  user [ auth_option ]
auth_option: {
  IDENTIFIED BY 'auth_string'
}
```

Notice

- If the account in the GRANT statement does not exist and no IDENTIFIED BY information is provided, an error message is returned, which indicates that the account does not exist.
- If the account specified in the GRANT statement does not exist but the IDENTIFIED BY information is provided, the account is created and granted with the specified permission.

For example, in the easydb database, create an account named david, which can be used to log on from all hosts and has all the permissions on easydb.

Method 1: Create an account and then grant permissions to the account.

```
CREATE USER david@%' IDENTIFIED BY 'your#password';
GRANT ALL PRIVILEGES ON easydb.* to david@%';
```

Method 2: Create an account and grant permissions to the account by executing a statement.

```
GRANT ALL PRIVILEGES ON easydb.* to david@%' IDENTIFIED BY 'your#password';
```

In the easydb database, create an account named hanson, which can be used to log on from all hosts and has all the permissions on the easydb.employees table.

```
GRANT ALL PRIVILEGES ON easydb.employees to hanson@%' IDENTIFIED BY 'your#password';
```

In the easydb database, create an account named hanson, which can be used to log on only from 192.xx.xx.10 and has the INSERT and SELECT permissions on the easydb.emp table.

```
GRANT INSERT,SELECT ON easydb.emp to hanson@'192.xx.xx.10' IDENTIFIED BY 'your#password';
```

In the easydb database, create a read-only account named actro, which can be used to log on from all hosts.

```
GRANT SELECT ON easydb.* to actro@%' IDENTIFIED BY 'your#password';
```

REVOKE statement

Use the following syntax rule:

- Delete specific permissions from an account: Delete the permissions at a certain level from an account. The permission level is specified by `priv_level`.

```
REVOKE
  priv_type
  [, priv_type] ...
  ON priv_level
  FROM user [, user] ...
```

- Delete all permissions from an account: Delete all permissions from the account at the database and table levels.

```
REVOKE ALL PRIVILEGES, GRANT OPTION
  FROM user [, user] ...
```

For example:

Delete the CREATE, DROP, and INDEX permissions from `hanson@'%'` on the `easydb.emp` table.

```
REVOKE CREATE,DROP,INDEX ON easydb.emp FROM hanson@%';
```

Delete all permissions from the `lily@30.xx.xx.96` account.

```
REVOKE ALL PRIVILEGES,GRANT OPTION FROM lily@30.xx.xx.96;
```

Notice GRANT OPTION must be added to the statement for compatibility with MySQL.

SHOW GRANTS statement

Use the following syntax rule:

```
SHOW GRANTS[FOR user@host];
```

Query all permissions:

```
SHOW GRANTS;
```

Query the permissions of an account:

```
SHOW GRANTS FOR user@host;
```

13.5.5. Delete an account

You can delete an account in the Cloud Native Distributed Database PolarDB-X (PolarDB-X) console or by using the command line.

Delete an account in the PolarDB-X console

 **Note** You can delete only standard accounts that are created in the console.

1. [Log on to the PolarDB-X console](#).
2. Find the target instance in the instance list.
3. Click the target instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. In the left-side navigation pane, choose **Configuration and Management > Account Management**.
5. Find the target account and click **Delete**.
6. In the **Delete Account** dialog box, click **OK**.

Delete an account by using the command line

Use the following syntax rule:

```
DROP USER user [, user] ...
```

For example:

Delete the lily@30.xx.xx.96 account.

```
DROP USER lily@30.xx.xx.96;
```

13.6. Database management

13.6.1. Create a database

After you create a PolarDB-X instance, you must create a database that contains one or more ApsaraDB RDS for MySQL instances. You can create a database in four steps.

Prerequisites

- You have created an ApsaraDB RDS for MySQL instance in the same department of PolarDB-X.
- You have granted the Resource Access Management (RAM) permission. For more information, see *ASCM Console User Guide* for the *RAM* topic.

1. [Log on to the PolarDB-X console.](#)
2. Find the target instance in the instance list.
3. Click the target instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. On the **Basic Information** page, click **Create Database** in the upper-right corner.
5. In the **Enter Basic Information** step, enter the following information.

Parameter	Description
Partition Mode	Select Horizontal Partitioning .
Database Name	Specify a name for the PolarDB-X database. The name must meet the following requirements: <ul style="list-style-type: none"> ◦ It must be 2 to 24 characters in length. ◦ It must start with a letter and end with a letter or digit. ◦ It can contain lowercase letters, digits, and underscores (_). ◦ It must be unique on the PolarDB-X instance.
Character Set	Select utf8, gbk, latin1, or utf8mb4 .
DRDS Link Password	Set the connection password for the PolarDB-X database. The rules are listed in the following content: <ul style="list-style-type: none"> ◦ The password must be 8 to 30 characters in length. ◦ The password must contain at least three of the following types: uppercase letters, lowercase letters, numbers, and underscores (_).
Confirm Password	Enter the password again.

6. Click **Next**.
7. In the **Select RDS Instance** step, you can click the **Buy New RDS Instance** or **Use Existing RDS Instance** tab.
 - i. **Buy New RDS Instance:** Click the **Buy New RDS Instance** tab.
 - ii. Select **Storage Type, Edition, Instance Specifications, Storage Capacity, Zone, and Quantity**.
 - iii. Click **Next**.
 - i. **Use Existing RDS Instance:** Click the **Use Existing RDS Instance** tab.
 - ii. In the left-side section, click the **ApsaraDB RDS for MySQL** instances to be added.
 - iii. Click to move the selected instances to the **Selected RDS Instances** section on the right.
 - iv. Click **Next**.
8. After all prechecks are passed in the **Precheck** step, click **Next**.

 **Note** If a precheck fails, rectify the configuration as prompted.

9. In the **Preview** step, click **Next**. Wait until the database is created.

13.6.2. View a database

After the database is created, you can view the basic information of the database on the **Database Management** page in the console.

Procedure

1. [Log on to the PolarDB-X console.](#)
2. Find the target instance in the instance list.

3. Click the target instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. In the left-side navigation pane, choose **Configuration and Management > Database Management**.
5. Find the target database, and click **Manage** in the Actions column. The **Basic Information** page of the database appears.

 **Note** On the **Basic Information** page, you can delete the database or reset the password.

What's next

PolarDB-X is fully compatible with the MySQL protocol. You can use **Command Line URL** on the MySQL client to connect to the PolarDB-X instance and enter the user name and password to log on to the PolarDB-X database. When you use the MySQL client, note the following points:

Note

- MySQL clients of some earlier versions have limits on the user name length, which cannot exceed 16 characters. The PolarDB-X database name and user name are the same. If the database name exceeds 16 characters in length, an error is reported.
- When you use the MySQL client, you must add the `-c` parameter to the HINT command. In PolarDB-X, an annotation is used to implement HINT. If the `-c` parameter is not added, the annotation is lost and the HINT of PolarDB-X is lost.

13.6.3. Perform smooth scale-out

When the underlying storage of the logical database reaches the physical bottleneck, for example, when the remaining disk space is about 30%, you can smoothly scale it out to improve the performance. The smooth scale-out process is divided into four steps: configuration > migration > switchover > cleanup.

Configuration

 **Note** In smooth scale-out, ApsaraDB RDS for MySQL instances are added, and some source database shards are migrated to the new ApsaraDB RDS for MySQL instances. In this way, the overall data storage capacity is increased and the number of requests that a single ApsaraDB RDS for MySQL instance needs to process is reduced.

1. **Log on to the PolarDB-X console.**
2. Find the target instance in the instance list.
3. Click the target instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. In the left-side navigation pane, choose **Configuration and Management > Database Management**.
5. Find the target database, and click **Manage**. in the Actions column The **Basic Information** page of the database appears.
6. In the left-side navigation pane, choose **Configuration and Management > Scale-out Management**.
7. In the upper-right corner of the **Scale-out Management** page, click **Scale Out**.
8. Select **Smooth Scale-out**, and then click **Next**.
9. After all prechecks are passed in the **Precheck** step, click **Next**.

 **Note** If a precheck fails, rectify the configuration as prompted.

10. In the **Select RDS Instance** step, you can click the **Buy New RDS Instance** or **Use Existing RDS Instance** tab.
 - i. **Buy New RDS Instance:** Click the **Buy New RDS Instance** tab.

- ii. Select **Storage Type, Edition, Instance Specifications, Storage Capacity, Zone, and Quantity**.
 - iii. Click **Next**.
 - i. **Use Existing RDS Instance:** Click the **Use Existing RDS Instance** tab.
 - ii. In the left-side section, click the **ApsaraDB RDS for MySQL** instances to be added.
 - iii. Click  to move the selected instances to the **Selected RDS Instances** section on the right.
 - iv. Click **Next**.
11. In the **Preview** step, click **Start Scale-out**.

 **Note** By default, the console evenly distributes the physical database shards to the ApsaraDB RDS for MySQL instances you added. You can also manually add or delete physical database shards to or from the new ApsaraDB RDS for MySQL instances.

12. Click the  icon in the upper-right corner to view the progress of the scale-out task.

Migration

Some physical database shards are migrated during smooth scale-out.

The migration does not change the data in the source database and therefore does not affect online services. Before the switchover, you can cancel the smooth scale-out operation by using a rollback.

Note

- This is because before the switchover, the current scale-out operation does not have a real impact on the data in the source database.
- During scale-out, the binary log files of the source RDS instance are not cleaned, which may result in insufficient disk space. Therefore, you must reserve sufficient disk space on the source ApsaraDB RDS for MySQL instance. Generally, the remaining disk space needs to be more than 30%. If the disk space cannot be guaranteed, you can submit a ticket to expand the storage space of the ApsaraDB RDS for MySQL instance.
- To reduce the pressure of read operations on the source RDS instance, perform scale-out when the load on the source ApsaraDB RDS for MySQL instance is low.
- During the scale-out, do not submit data description language (DDL) tasks in the console or connect to the PolarDB-X instance to directly run DDL statements. Otherwise, the scale-out task may fail.
- Make sure that all tables in the source database have primary keys before scale-out.

After historical data and incremental data are migrated, the migration progress reaches 100%. Then, you can switch the read/write traffic to the new ApsaraDB RDS for MySQL instance or roll back to cancel this scale-out.

Switchover

The switchover task switches the read/write traffic to the new ApsaraDB RDS for MySQL instance. The whole process takes three to five minutes. During the switchover process, the service is not affected except for one or two transient disconnections. Perform the switchover during off-peak hours.

1. In the upper-right corner of the **Basic Information** page, click the  icon. The **Task Progress** dialog box appears.
2. In the **Task Progress** dialog box, click **Switch Over** and then click **OK**.
During the switchover process, a switchover task is generated and appears in the task progress.
3. After the switchover is completed, the **Clean Up** button appears in the **Task Progress** dialog box.

Cleanup

In this step, the migrated database shards are deleted from the source ApsaraDB RDS for MySQL instance.

1. After switchover is completed, click **Clean Up** next to the target task.
2. Click **OK**. A cleanup task appears in the Task Progress dialog box.

 **Note**

- The cleanup task is an asynchronous task. You can view the execution status in the Task Progress dialog box.
- After the cleanup task is completed, the smooth scale-out process ends. The new ApsaraDB RDS for MySQL instance becomes the storage node of the PolarDB-X logical database.
- You can implement smooth scale-out by migrating physical database shards. If no further scale-out is allowed after the number of database shards exceeds the capacity of a single ApsaraDB RDS for MySQL instance, you can submit a ticket to apply for increasing the number of database shards and scaling out the database. In this case, calculation based on the hash algorithm is performed again to reallocate data.
- The cleanup task deletes database shards that are no longer used after the current scale-out. You can back up the database shards before you run the cleanup task.
- The cleanup operation brings pressure to databases. We recommend that you perform this operation during off-peak hours.

13.6.4. View database monitoring information

PolarDB-X displays the historical monitoring information of a PolarDB-X database in two dimensions: data metrics and query time.

Procedure

1. [Log on to the PolarDB-X console](#).
2. Find the target instance in the instance list.
3. Click the target instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. In the left-side navigation pane, choose **Monitoring and Alerts > Database Monitoring**.
5. Select the target database, and then set **Data Indexes** and **Query Time**. You can see the corresponding monitoring information.

 **Note** For more information about instance-level monitoring, see [View monitoring information](#).

13.6.5. Set the IP address whitelist

PolarDB-X provides the access control feature. Only IP addresses in the whitelist of a database can be used to access the database.

Procedure

1. [Log on to the PolarDB-X console](#).
2. Find the target instance in the instance list.
3. Click the target instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. In the left-side navigation pane, choose **Configuration and Management > Database Management**.
5. Find the target database, and click **Manage** in the Actions column. The **Basic Information** page of the database appears.
6. On the **Basic Information** page of the database, choose **Data Security > Whitelist Settings** in the left-side navigation pane.

7. On the Whitelist Settings page, click **Manually Modify**.
8. Enter the IP addresses that are allowed to access the database, and click **OK**.

 **Note**

- The following formats are supported in the whitelist:
 - Single IP addresses, for example, 192.168.1.1.
 - IP addresses in CIDR format, for example, 192.168.1.1/24.
 - IP addresses that includes an asterisk (*) as a wildcard, for example, 192.168.1.*. This example indicates that access is allowed from a host with an IP address in the range from 192.168.1.1 to 192.168.1.254.
 - IP range, for example, 192.168.1.1-192.168.1.254.
- If you need to add multiple IP addresses or IP ranges, separate them with commas (,) and do not use spaces before and after the commas, for example, 192.168.0.1,172.16.213.9.

13.6.6. Delete a database

This topic describes how to delete a database in the Cloud Native Distributed Database PolarDB-X (PolarDB-X) console.

Procedure

1. [Log on to the PolarDB-X console](#).
2. Find the target instance in the instance list.
3. Click the target instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. In the left-side navigation pane, choose **Configuration and Management > Database Management**.
5. Find the target database and click **Delete**.

 **Warning** You cannot recover databases that have been deleted. Exercise caution when you perform this operation.

6. In the **Delete Database** dialog box, click **OK**.

13.6.7. Fix database shard connections

Context

When you use a PolarDB-X instance, you must access ApsaraDB RDS for MySQL. If the network configuration of the connected ApsaraDB RDS for MySQL instance changes, for example, if the zone is switched or the network type is changed from classic network to VPC, the network connection between the PolarDB-X instance and the ApsaraDB RDS for MySQL instance is broken. As a result, the PolarDB-X instance cannot access the ApsaraDB RDS for MySQL instance. In this case, you must manually fix the database shard link in the PolarDB-X console to restore the network connection from the PolarDB-X instance to the ApsaraDB RDS for MySQL instance.

Procedure

1. [Log on to the PolarDB-X console](#).
2. Find the target instance in the instance list.
3. Click the target instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. In the left-side navigation pane, choose **Configuration and Management > Database Management**.
5. Find the target database, and click **Manage** in the Actions column. The **Basic Information** page of the

database appears.

6. In the **Shortcuts** section, click **Fix Database Shard Connections**.

7. In the dialog box that appears, click **OK**.

13.7. Custom control commands

PolarDB-X provides a series of auxiliary SQL commands to help you conveniently use PolarDB-X.

13.7.1. Overview

PolarDB-X provides unique auxiliary statements for you to use and maintain PolarDB-X.

Syntax description: The identifier provided by the user is in [] and optional content is in (). In addition, this document applies to the current version. If some statements are unavailable, the version is earlier than required.

13.7.2. Help statements

This topic describes all the auxiliary SQL commands of PolarDB-X and their descriptions.

SHOW HELP statements:

```
mysql> show help;
+-----+
| STATEMENT          | DESCRIPTION                               | EXAMPLE                               |
+-----+
| show rule          | Report all table rule                     |                                       |
| show rule from TABLE | Report table rule                         | show rule from user                   |
| show full rule from TABLE | Report table full rule                   | show full rule from user             |
| show topology from TABLE | Report table physical topology           | show topology from user              |
|
| show partitions from TABLE | Report table dbPartition or tbPartition columns | show partitions from user            |
|
| show broadcasts    | Report all broadcast tables               |                                       |
| show datasources   | Report all partition db threadPool info  |                                       |
| show node          | Report master/slave read status          |                                       |
| show slow          | Report top 100 slow sql                  |                                       |
| show physical_slow | Report top 100 physical slow sql         |                                       |
| clear slow         | Clear slow data                          |                                       |
| trace SQL          | Start trace sql, use show trace to print profiling data | trace select count(*) from user; show trace |
| show trace         | Report sql execute profiling info        |                                       |
| explain SQL        | Report sql plan info                     | explain select count(*) from user    |
| explain detail SQL | Report sql detail plan info              | explain detail select count(*) from user |
| explain execute SQL | Report sql on physical db plan info      | explain execute select count(*) from user |
| show sequences     | Report all sequences status              |                                       |
| create sequence NAME [start with COUNT] | Create sequence                               | create sequence test start with 0    |
| alter sequence NAME [start with COUNT] | Alter sequence                               | alter sequence test start with 1000  |
| drop sequence NAME | Drop sequence                             | drop sequence test                   |

```

13.7.3. Statements for viewing rules and node topologies

SHOW RULE [FROM tablename]

Usage notes:

- `show rule` : shows the partitioning status of each logical table in a database.
- `show rule from tablename` : shows the partitioning status of a specified logical table in a database.

The following describes the meanings of important columns:

- **BROADCAST**: indicates whether the table is a broadcast table. 0 indicates "No" and 1 indicates "Yes".

- **DB_PARTITION_KEY**: indicates the database shard key. If no database shards exist, the parameter value is NULL.
- **DB_PARTITION_POLICY**: indicates the database sharding policy. Options are Hash and date policies such as YYYYMM, YYYYDD, and YYYYWEEK.
- **DB_PARTITION_COUNT**: indicates the number of database shards.
- **TB_PARTITION_KEY**: indicates the table shard key. If no table shards exist, the parameter value is NULL.
- **TB_PARTITION_POLICY**: indicates the table sharding policy. Options are Hash and date policies such as MM, DD, MMDD, and WEEK.
- **TB_PARTITION_COUNT**: indicates the number of table shards.

```
mysql> show rule;
+-----+-----+-----+-----+-----+-----+-----+-----+
+-----+
| ID | TABLE_NAME | BROADCAST | DB_PARTITION_KEY | DB_PARTITION_POLICY | DB_PARTITION_COUNT | TB_PARTITION_
KEY | TB_PARTITION_POLICY | TB_PARTITION_COUNT |
+-----+-----+-----+-----+-----+-----+-----+-----+
+-----+
| 0 | dept_manager | 0 | NULL | 1 | NULL | 1 | | |
| 1 | emp | 0 | emp_no | hash | 8 | id | hash | 2 |
| 2 | example | 0 | shard_key | hash | 8 | NULL | NULL | 1 |
+-----+-----+-----+-----+-----+-----+-----+-----+
+-----+
3 rows in set (0.01 sec)
```

SHOW FULL RULE [FROM tablename]

You can run this SQL statement to view the sharding rules of logical tables in a database. It displays more detailed information than the SHOW RULE command.

The following describes the meanings of important columns:

- **BROADCAST**: indicates whether the table is a broadcast table. 0 indicates "No" and 1 indicates "Yes".
- **JOIN_GROUP**: a reserved field.
- **ALLOW_FULL_TABLE_SCAN**: indicates whether to allow data querying when no table shard key is specified for database or table sharding. If this parameter is set to True, each physical table is scanned to find data that meets the condition, which is a full table scan.
- **DB_NAME_PATTERN**: The value 0 between {} in DB_NAME_PATTERN is a placeholder. When the SQL statement is run, this value is replaced by the value of DB_RULES_STR, with the number of digits unchanged. For example, if the value of DB_NAME_PATTERN is SEQ_{0000}_RDS and the value of DB_RULES_STR is [1,2,3,4], four DB_NAME values are generated: SEQ_0001_RDS, SEQ_0002_RDS, SEQ_0003_RDS, and SEQ_0004_RDS.
- **DB_RULES_STR**: indicates the database sharding rule.
- **TB_NAME_PATTERN**: The value 0 between {} in TB_NAME_PATTERN is a placeholder. When the SQL statement is run, this value is replaced by the value of TB_RULES_STR, with the number of digits unchanged. For example, if the value of TB_NAME_PATTERN is table_{00} and the value of TB_RULES_STR is [1,2,3,4,5,6,7,8], eight tables are generated: table_01, table_02, table_03, table_04, table_05, table_06, table_07, and table_08.
- **TB_RULES_STR**: indicates the table sharding rule.
- **PARTITION_KEYS**: indicates a set of database and table shard keys. When database sharding and table sharding coexist, the database shard key is placed before the table shard key.
- **DEFAULT_DB_INDEX**: indicates the database shard in which a single database and a single table are stored.

```
mysql> show full rule;
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| ID | TABLE_NAME | BROADCAST | JOIN_GROUP | ALLOW_FULL_TABLE_SCAN | DB_NAME_PATTERN | D
B_RULES_STR | TB_NAME_PATTERN | TB_RULES_STR | PARTITION_KEYS | DEFAULT_DB_I

+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
3 rows in set (0.01 sec)
```

SHOW TOPOLOGY FROM tablename

You can run this SQL statement to view the topology of a specified logical table, that is, the database shards to which data in the logical table is partitioned and the table shards in each database shard.

```
mysql> show topology from emp;
+-----+-----+
| ID | GROUP_NAME          | TABLE_NAME |
+-----+-----+
| 0 | SEQ_TEST_1487767780814RGKKSEQ_TEST_WNJG_0000_RDS | emp_0 |
| 1 | SEQ_TEST_1487767780814RGKKSEQ_TEST_WNJG_0000_RDS | emp_1 |
| 2 | SEQ_TEST_1487767780814RGKKSEQ_TEST_WNJG_0001_RDS | emp_0 |
| 3 | SEQ_TEST_1487767780814RGKKSEQ_TEST_WNJG_0001_RDS | emp_1 |
| 4 | SEQ_TEST_1487767780814RGKKSEQ_TEST_WNJG_0002_RDS | emp_0 |
| 5 | SEQ_TEST_1487767780814RGKKSEQ_TEST_WNJG_0002_RDS | emp_1 |
| 6 | SEQ_TEST_1487767780814RGKKSEQ_TEST_WNJG_0003_RDS | emp_0 |
| 7 | SEQ_TEST_1487767780814RGKKSEQ_TEST_WNJG_0003_RDS | emp_1 |
| 8 | SEQ_TEST_1487767780814RGKKSEQ_TEST_WNJG_0004_RDS | emp_0 |
| 9 | SEQ_TEST_1487767780814RGKKSEQ_TEST_WNJG_0004_RDS | emp_1 |
| 10 | SEQ_TEST_1487767780814RGKKSEQ_TEST_WNJG_0005_RDS | emp_0 |
| 11 | SEQ_TEST_1487767780814RGKKSEQ_TEST_WNJG_0005_RDS | emp_1 |
| 12 | SEQ_TEST_1487767780814RGKKSEQ_TEST_WNJG_0006_RDS | emp_0 |
| 13 | SEQ_TEST_1487767780814RGKKSEQ_TEST_WNJG_0006_RDS | emp_1 |
| 14 | SEQ_TEST_1487767780814RGKKSEQ_TEST_WNJG_0007_RDS | emp_0 |
| 15 | SEQ_TEST_1487767780814RGKKSEQ_TEST_WNJG_0007_RDS | emp_1 |
+-----+-----+
16 rows in set (0.01 sec)
```

SHOW PARTITIONS FROM tablename

You can run this SQL statement to view the set of database shard keys and table shard keys, which are separated by commas (.). If the final result contains two values, both database sharding and table sharding are performed. The first value is the database shard key and the second value is the table shard key. If only one value is returned, only database sharding is performed. This value is the database shard key.

```
mysql> show partitions from emp;
+-----+
| KEYS |
+-----+
| emp_no,id |
+-----+
1 row in set (0.00 sec)
```

SHOW BROADCASTS

You can run this SQL statement to view the list of broadcast tables.

```
mysql> show broadcasts;
+-----+-----+
| ID | TABLE_NAME |
+-----+-----+
| 0 | brd2 |
| 1 | brd_tbl |
+-----+-----+
2 rows in set (0.01 sec)
```

SHOW DATASOURCES

You can run this SQL statement to view the information about the underlying storage, including the database name, database group name, connection URL, user name, storage type, read/write weight, and connection pool information.

The following describes the meanings of important columns:

- **SCHEMA:** indicates the database name.
- **GROUP:** indicates the database group name. Grouping aims to manage multiple groups of databases that have identical data, such as the primary and secondary databases after data replication through ApsaraDB RDS for MySQL. It is mainly used for read/write splitting and primary/secondary switchovers.
- **URL:** indicates the connection information of the underlying ApsaraDB RDS for MySQL instance.
- **TYPE:** indicates the type of the underlying storage. Currently, only ApsaraDB RDS for MySQL instances are supported.
- **READ_WEIGHT:** indicates the read weight of the database. When the primary ApsaraDB RDS for MySQL instance is under a heavy load of many read requests, you can use the read/write splitting function of PolarDB-X to distribute the read traffic. PolarDB-X automatically identifies the read and write traffic. It directs the write traffic to the primary ApsaraDB RDS for MySQL instance and the read traffic to all ApsaraDB RDS for MySQL instances based on the configured weight.
- **WRITE_WEIGHT:** indicates the write weight. For more information, see **READ_WEIGHT**.

```
mysql> show datasources;
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| ID | SCHEMA          | NAME                               | GROUP          | URL
| USER | TYPE | INIT | MIN | MAX | IDLE_TIMEOUT | MAX_WAIT | ACTIVE_COUNT | POOLING_COUNT | ATOM

SHOW NODE

You can run this SQL statement to view the accumulative number of read and write operations and accumulative read/write weights of a physical database.

The following describes the meanings of important columns:

- **MASTER_READ_COUNT**: indicates the accumulative number of read-only queries processed by the primary ApsaraDB RDS for MySQL instance.
- **SLAVE_READ_COUNT**: indicates the accumulative number of read-only queries processed by the secondary ApsaraDB RDS for MySQL instances.
- **MASTER_READ_PERCENT**: indicates the actual percentage of read-only queries processed by the primary ApsaraDB RDS for MySQL instance, not the configured percentage.
- **SLAVE_READ_PERCENT**: indicates the actual percentage of read-only queries processed by the secondary ApsaraDB RDS for MySQL instances, not the configured percentage.

Note

- Read-only queries in transactions are sent to the primary ApsaraDB RDS for MySQL instance.
- The `MASTER_READ_PERCENT` and `SLAVE_READ_PERCENT` fields indicate the accumulative historical data. After the read/write weight ratio has been changed, these values do not immediately reflect the latest read/write weight ratio, which appears after a long period of time has passed.

```
mysql> show node;
+-----+-----+-----+-----+-----+-----+
--+
| ID | NAME                               | MASTER_READ_COUNT | SLAVE_READ_COUNT | MASTER_READ_PERCENT | SLAVE_READ_PERCENT |
+-----+-----+-----+-----+-----+-----+
--+
| 0 | SEQ_TEST_1487767780814RGKKSEQ_TEST_WNJG_0000_RDS |          12 |           0 | 100%                | 0%                 |

13.7.4. SQL tuning statements

SHOW [FULL] SLOW [WHERE expr] [limit expr]

SQL statements that take more than 1 second to execute are slow SQL statements. Slow logical SQL statements are the slow SQL statements sent from an application to a PolarDB-X instance.

- **SHOW SLOW**: You can run this SQL statement to view the 100 slowest logical SQL queries that are recorded since the PolarDB-X instance is started or the last time when `CLEAR SLOW` is executed.

 **Note** The recorded 100 slowest SQL queries are stored in the PolarDB-X system. When the PolarDB-X instance is restarted or executes `CLEAR SLOW`, these queries will be discarded.

- **SHOW FULL SLOW** : You can run this SQL statement to view all the slow logical SQL queries that are recorded and persisted to the built-in database of the PolarDB-X instance since the PolarDB-X instance is started. The upper limit for the number of records is specified in the specifications of the PolarDB-X instance. The PolarDB-X instance scrolls to delete the earliest slow SQL statements. If the specifications of the PolarDB-X instance is 4-core 4 GB, a maximum of 10,000 slow SQL statements can be recorded, including slow logical and physical SQL statements. If the specifications of the PolarDB-X instance is 8-core 8 GB, a maximum of 20,000 slow SQL statements can be recorded, including slow logical and physical SQL statements. The same rule applies to other specifications.

The following describes the meanings of important columns:

- **HOST**: the IP address of the host from which the SQL statement is sent.
- **START_TIME**: the time when the SQL statement starts to be executed.
- **EXECUTE_TIME**: the time when the SQL statement is executed.
- **AFFECT_ROW**: For data manipulation language (DML) statements, this parameter indicates the number of affected rows. For query statements, this parameter indicates the number of returned records.

```
mysql> show slow where execute_time > 1000 limit 1;
+-----+-----+-----+-----+-----+
| HOST   | START_TIME   | EXECUTE_TIME | AFFECT_ROW | SQL   |
+-----+-----+-----+-----+-----+
| 127.0.0.1 | 2016-03-16 13:02:57 | 2785 | 7 | show rule |
+-----+-----+-----+-----+-----+
1 row in set (0.02 sec)
```

SHOW [FULL] PHYSICAL_SLOW [WHERE expr] [limit expr]

SQL statements that take more than 1 second to execute are slow SQL statements. Slow logical SQL statements are the slow SQL statements sent from an application to a PolarDB-X instance.

- **SHOW SLOW** : You can run this SQL statement to view the 100 slowest logical SQL queries that are recorded since the PolarDB-X instance is started or the last time when `CLEAR SLOW` is executed.

 **Note** The recorded 100 slowest SQL queries are stored in the PolarDB-X system. When the PolarDB-X instance is restarted or executes `CLEAR SLOW`, these queries will be discarded.

- **SHOW FULL SLOW** : You can run this SQL statement to view all the slow logical SQL queries that are recorded and persisted to the built-in database of the PolarDB-X instance since the PolarDB-X instance is started. The upper limit for the number of records is specified in the specifications of the PolarDB-X instance. The PolarDB-X instance scrolls to delete the earliest slow SQL statements. If the specifications of the PolarDB-X instance is 4-core 4 GB, a maximum of 10,000 slow SQL statements can be recorded, including slow logical and physical SQL statements. If the specifications of the PolarDB-X instance is 8-core 8 GB, a maximum of 20,000 slow SQL statements can be recorded, including slow logical and physical SQL statements. The same rule applies to other specifications.

The following describes the meanings of important columns:

- **GROUP_NAME**: the name of the group to which the database that executes the SQL statement belongs.
- **START_TIME**: the time when the SQL statement starts to be executed.
- **EXECUTE_TIME**: the time when the SQL statement is executed.
- **AFFECT_ROW**: For data manipulation language (DML) statements, this parameter indicates the number of affected rows. For query statements, this parameter indicates the number of returned records.

```
mysql> show physical_slow;
+-----+-----+-----+-----+-----+-----+
| GROUP_NAME | DBKEY_NAME          | START_TIME      | EXECUTE_TIME | SQL_EXECUTE_TIME | GETLOCK_CONNE  
CTION_TIME | CREATE_CONNECTION_TIME | AFFECT_ROW | SQL      |
+-----+-----+-----+-----+-----+-----+
| TDDL5_00_GROUP | db218249098_sqa_zmf_tddl5_00_3309 | 2016-03-16 13:05:38 | 1057 | 1011 | 0 |
0 | 1 | select sleep(1) |
+-----+-----+-----+-----+-----+-----+
1 row in set (0.01 sec)
```

CLEAR SLOW

You can run this SQL statement to clear the 100 slowest logical SQL queries and the 100 slowest physical SQL queries that are recorded since the PolarDB-X instance is started or the last time when `CLEAR SLOW` is executed.

 **Note** Both `SHOW SLOW` and `SHOW PHYSICAL_SLOW` can be executed to display the 100 slowest SQL statements. If `CLEAR SLOW` has not been executed for a long time, these SQL statements may have been recorded a long time ago. Therefore, after SQL tuning statements are executed, we recommend that you execute `CLEAR SLOW`. After the system runs for a while, check the tuning results of slow SQL statements.

```
mysql> clear slow;
Query OK, 0 rows affected (0.00 sec)
```

EXPLAIN SQL

You can run this SQL statement to view the execution plan of a specified SQL statement in the PolarDB-X. Note that this SQL statement is not truly executed.

Example:

You can run this SQL statement to view the execution plan of the SQL `select * from doctest` statement. The `doctest` table is stored in database shards according to values in the `id` column. According to the execution plan, the SQL statement will be routed to each database shard for execution, and the execution results will be aggregated.

```
mysql> explain select * from doctest;
+-----+-----+-----+
| GROUP_NAME          | SQL                                | PARAMS |
+-----+-----+-----+
| DOCTEST_1488704345426RCUPDOCTEST_CAET_0000_RDS | select `doctest`.`id` from `doctest` | {} |
| DOCTEST_1488704345426RCUPDOCTEST_CAET_0001_RDS | select `doctest`.`id` from `doctest` | {} |
| DOCTEST_1488704345426RCUPDOCTEST_CAET_0002_RDS | select `doctest`.`id` from `doctest` | {} |
| DOCTEST_1488704345426RCUPDOCTEST_CAET_0003_RDS | select `doctest`.`id` from `doctest` | {} |
| DOCTEST_1488704345426RCUPDOCTEST_CAET_0004_RDS | select `doctest`.`id` from `doctest` | {} |
| DOCTEST_1488704345426RCUPDOCTEST_CAET_0005_RDS | select `doctest`.`id` from `doctest` | {} |
| DOCTEST_1488704345426RCUPDOCTEST_CAET_0006_RDS | select `doctest`.`id` from `doctest` | {} |
| DOCTEST_1488704345426RCUPDOCTEST_CAET_0007_RDS | select `doctest`.`id` from `doctest` | {} |
+-----+-----+-----+
8 rows in set (0.00 sec)
```

You can run this SQL statement to view the execution plan of the SQL `select * from doctest where id = 1` statement. The doctest table is stored in database shards according to values in the id column. According to the execution plan, the PolarDB-X instance will calculate a specified database shard based on the shard key, which is id, directly route the SQL statement to the database shard, and aggregate the execution results.

```
mysql> explain select * from doctest where id = 1;
+-----+-----+-----+
| GROUP_NAME          | SQL                                | PARAMS |
+-----+-----+-----+
| DOCTEST_1488704345426RCUPDOCTEST_CAET_0001_RDS | select `doctest`.`id` from `doctest` where (`doctest`.`id` = 1) | {} |
+-----+-----+-----+
1 row in set (0.01 sec)
```

EXPLAIN DETAIL SQL

You can run this SQL statement to view the execution plan of a specified SQL statement in the PolarDB-X. Note that this SQL statement is not truly executed.

```
mysql> explain detail select * from doctest where id = 1;
+-----+-----+-----+-----+-----+-----+-----+-----+
| GROUP_NAME          | SQL                                     |
| PARAMS              |
+-----+-----+-----+-----+-----+-----+-----+
| DOCTEST_1488704345426RCUPDOCTEST_CAET_0001_RDS | Query from doctest as doctest
  keyFilter:doctest.id = 1
  queryConcurrency:SEQUENTIAL
  columns:[doctest.id]
  tableName:doctest
  executeOn:DOCTEST_1488704345426RCUPDOCTEST_CAET_0001_RDS
| NULL |
+-----+-----+-----+-----+-----+-----+-----+
1 row in set (0.02 sec)
```

EXPLAIN EXECUTE SQL

You can run this SQL statement to view the execution plan of underlying storage. This statement is equivalent to the MySQL EXPLAIN statement.

```
mysql> explain execute select * from tddl_mgr_log limit 1;
+-----+-----+-----+-----+-----+-----+-----+-----+
| id | select_type | table      | type | possible_keys | key | key_len | ref | rows | Extra |
+-----+-----+-----+-----+-----+-----+-----+-----+
| 1 | SIMPLE     | tddl_mgr_log | ALL | NULL          | NULL | NULL    | NULL | 1 | NULL |
+-----+-----+-----+-----+-----+-----+-----+-----+
1 row in set (0.07 sec)
```

TRACE SQL and SHOW TRACE

You can run these SQL statements to view the execution results of an SQL statement. Note that you must use TRACE SQL and SHOW TRACE together. The difference between TRACE SQL and EXPLAIN SQL is that TRACE SQL is truly executed.

For example, you can run these statements to view the execution results of the select 1 statement.

```
mysql> trace select 1;
+---+
| 1 |
+---+
| 1 |
+---+
1 row in set (0.03 sec)
mysql> show trace;
+-----+-----+-----+-----+-----+-----+-----+-----+
-----+
| ID | TYPE | GROUP_NAME | DBKEY_NAME | TIME_COST(MS) | CONNECTION_TIME_COST(MS) | ROWS | STATEMENT | PARAMS |
+-----+-----+-----+-----+-----+-----+-----+-----+
-----+
| 0 | Optimize | DRDS | DRDS | 3 | 0.00 | 0 | select 1 | NULL |
| 1 | Query | TDDL5_00_GROUP | db218249098_sqa_zmf_tddl5_00_3309 | 7 | 0.15 | 1 | select 1 | NULL |
+-----+-----+-----+-----+-----+-----+-----+-----+
-----+
2 rows in set (0.01 sec)
```

CHECK TABLE tablename

You can run this SQL statement to check a data table. This SQL statement is mainly used when a table failed to be created by using a data definition language (DDL) statement.

- If the data table is a table shard, this SQL statement allows you to check whether any underlying physical table shard is missing and whether the columns and indexes of the underlying physical table are consistent.
- If the data table is a single-database non-partition table, this SQL statement allows you to check whether this table exists.

```
mysql> check table tddl_mgr_log;
+-----+-----+-----+-----+
| TABLE | OP | MSG_TYPE | MSG_TEXT |
+-----+-----+-----+-----+
| TDDL5_APP.tddl_mgr_log | check | status | OK |
+-----+-----+-----+-----+
1 row in set (0.56 sec)
mysql> check table tddl_mg;
+-----+-----+-----+-----+
| TABLE | OP | MSG_TYPE | MSG_TEXT |
+-----+-----+-----+-----+
| TDDL5_APP.tddl_mg | check | Error | Table 'tddl5_00.tddl_mg' doesn't exist |
+-----+-----+-----+-----+
1 row in set (0.02 sec)
```

SHOW TABLE STATUS [LIKE 'pattern' | WHERE expr]

You can run this SQL statement to obtain the information about a table. This command aggregates the data of all underlying physical table shards.

The following describes the meanings of important columns:

- **NAME:** indicates the name of the table.
- **ENGINE:** indicates the storage engine of the table.
- **VERSION:** indicates the version of the storage engine of the table.
- **ROW_FORMAT:** indicates the format of the rows in the table. Valid values include Dynamic, Fixed, and Compressed. The value Dynamic indicates that the row length is variable, for example, is a VARCHAR or BLOB field. The value Fixed indicates that the row length is constant, for example, is a CHAR or INTEGER field.
- **ROWS:** indicates the number of rows in the table.
- **AVG_ROW_LENGTH:** indicates the average number of bytes in each row.
- **DATA_LENGTH:** indicates the data volume of the entire table, in bytes.
- **MAX_DATA_LENGTH:** indicates the maximum volume of data that can be stored in the table.
- **INDEX_LENGTH:** indicates the size of the disk space occupied by indexes.
- **CREATE_TIME:** indicates the time when the table was created.
- **UPDATE_TIME:** indicates the time when the table was last updated.
- **COLLATION:** indicates the default character set and character sorting rule of the table.
- **CREATE_OPTIONS:** indicates all the other options specified when the table was created.

```
mysql> show table status like 'multi_db_multi_tbl';
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| NAME          | ENGINE | VERSION | ROW_FORMAT | ROWS | AVG_ROW_LENGTH | DATA_LENGTH | MAX_DATA_LENGTH | INDEX_LENGTH | DATA_FREE | AUTO_INCREMENT | CREATE_TIME          | UPDATE_TIME | CHECK_TIME | COLLATION      | CHECKS |
UM | CREATE_OPTIONS | COMMENT |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| multi_db_multi_tbl | InnoDB | 10 | Compact | 2 | 16384 | 16384 | 0 | 16384 | 0 | 100000 | 2017-03-27 17:43:57.0 | NULL | NULL | utf8_general_ci | NULL |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
1 row in set (0.03 sec)
```

The combination of the SHOW TABLE STATUS statement and the PolarDB-X SCAN hint allows you to view the data volume of each physical table shard.

```
mysql> /*! TDDL:SCAN='multi_db_multi_tbl'*/show table status like 'multi_db_multi_tbl';
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
---+
| Name          | Engine | Version | Row_format | Rows | Avg_row_length | Data_length | Max_data_length | Index_length
| Data_free | Auto_increment | Create_time   | Update_time | Check_time | Collation   | Checksum | Create_options |
Comment | Block_format |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+

13.7.5. Statistics query statements

SHOW [FULL] STATS

You can run this SQL statement to view the overall statistics. The statistics are instantaneous values. Note that the results of `SHOW FULL STATS` vary with the version.

The following describes the meanings of important columns:

- **QPS**: the number of queries per second (QPS) sent from an application to the PolarDB-X instance. These queries are usually called logical QPS.
- **RDS_QPS**: the number of QPS sent from the PolarDB-X instance to an ApsaraDB RDS for MySQL instance. These queries are usually called physical QPS.
- **ERROR_PER_SECOND**: the total number of errors that occur on the PolarDB-X instance per second. These errors include SQL syntax errors, primary key conflicts, system errors, and connectivity errors.
- **VIOLATION_PER_SECOND**: the number of conflicts that occur on primary keys or unique keys per second.
- **MERGE_QUERY_PER_SECOND**: the number of queries processed on multiple tables through database sharding and table sharding per second.
- **ACTIVE_CONNECTIONS**: the number of active connections to the PolarDB-X instance.
- **CONNECTION_CREATE_PER_SECOND**: the number of connections that are created for the PolarDB-X instance per second.
- **RT(MS)**: the time to respond to an SQL query sent from an application to the PolarDB-X instance. This response time (RT) is usually called logical RT.
- **RDS_RT(MS)**: the time to respond to an SQL query sent from the PolarDB-X instance to an ApsaraDB RDS for MySQL instance. This RT is usually called physical RT.
- **NET_IN(KB/S)**: the amount of inbound traffic of the PolarDB-X instance per second.
- **NET_OUT(KB/S)**: the amount of outbound traffic of the PolarDB-X instance per second.
- **THREAD_RUNNING**: the number of threads that are running in the PolarDB-X instance.
- **HINT_USED_PER_SECOND**: the number of SQL queries that contain hints and are processed by the PolarDB-X instance per second.
- **HINT_USED_COUNT**: the total number of SQL queries that contain hints and have been processed by the PolarDB-X instance since startup.
- **AGGREGATE_QUERY_PER_SECOND**: the number of aggregate SQL queries processed by the PolarDB-X instance per second.
- **AGGREGATE_QUERY_COUNT**: the total number of aggregate SQL queries that have been processed by the PolarDB-X instance.
- **TEMP_TABLE_CREATE_PER_SECOND**: the number of temporary tables created in the PolarDB-X instance per second.
- **TEMP_TABLE_CREATE_COUNT**: the total number of temporary tables that have been created in the PolarDB-X instance since startup.
- **MULTI_DB_JOIN_PER_SECOND**: the number of multi-database JOIN queries processed by the PolarDB-X instance per second.
- **MULTI_DB_JOIN_COUNT**: the number of multi-database JOIN queries that have been processed by the PolarDB-X instance since startup.

```
mysql> show stats;
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| QPS | RDS_QPS | SLOW_QPS | PHYSICAL_SLOW_QPS | ERROR_PER_SECOND | MERGE_QUERY_PER_SECOND | ACTIVE_CONNECTIONS | RT(MS) | RDS_RT(MS) | NET_IN(KB/S) | NET_OUT(KB/S) | THREAD_RUNNING |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| 1.77 | 1.68 | 0.03 | 0.03 | 0.02 | 0.00 | 7 | 157.13 | 51.14 | 134.49 | 1.48 |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
1 row in set (0.01 sec)

mysql> show full stats;
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| QPS | RDS_QPS | SLOW_QPS | PHYSICAL_SLOW_QPS | ERROR_PER_SECOND | VIOLATION_PER_SECOND | MERGE_QUERY_PER_SECOND | ACTIVE_CONNECTIONS | CONNECTION_CREATE_PER_SECOND | RT(MS) | RDS_RT(MS) | NET_IN(KB/S) | NET_OUT(KB/S) | THREAD_RUNNING | HINT_USED_PER_SECOND | HINT_USED_COUNT | AGGREGATE_QUERY_PER_SECOND | AGGREGATE_QUERY_COUNT | TEMP_TABLE_CREATE_PER_SECOND | TEMP_TABLE_CREATE_COUNT | MULTI_DB_JOIN_PER_SECOND | MULTI_DB_JOIN_COUNT | CPU | FREEMEM | FULLGCCOUNT | FULLGCTIME |

+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
1 row in set (0.01 sec)
```

SHOW DB STATUS

You can run this SQL statement to view the capacity and performance information of a physical database. All the returned values indicate the real-time information. The capacity information is obtained from the ApsaraDB RDS for MySQL system table, and therefore may be different from the actual capacity information.

The following describes the meanings of important columns:

- **NAME:** the PolarDB-X internal tag that represents a logical PolarDB-X database corresponding to the database shard. The value is different from the name of the logical PolarDB-X database.
- **CONNECTION_STRING:** the information about a connection from the PolarDB-X instance to the database shard.
- **PHYSICAL_DB:** the name of the database shard. The **TOTAL** row indicates the total amount of capacity of all the database shards corresponding to the logical PolarDB-X database.

- **SIZE_IN_MB**: the size of the space occupied by the data in the database shard. Unit: MB.
- **RATIO**: the ratio of the data volume of the database shard to the total data volume of the current logical PolarDB-X database.
- **THREAD_RUNNING**: the number of threads that are running in the ApsaraDB RDS for MySQL instance to which the physical database belongs. The meaning of this parameter is the same as that of the **THREAD_RUNNING** parameter returned by the MySQL `SHOW GLOBAL STATUS` command. For more information, see [MySQL official documentation](#).

```
mysql> show db status;
+-----+-----+-----+-----+-----+-----+-----+
| ID | NAME                | CONNECTION_STRING | PHYSICAL_DB | SIZE_IN_MB | RATIO | THREAD_RUNNING |
+-----+-----+-----+-----+-----+-----+-----+
| 1 | drds_db_1516187088365dau | 100.100.64.1:59077 | TOTAL      | 13.109375 | 100% | 3              |
| 2 | drds_db_1516187088365dau | 100.100.64.1:59077 | drds_db_xzip_0000 | 1.578125 | 12.04% |                |
| 3 | drds_db_1516187088365dau | 100.100.64.1:59077 | drds_db_xzip_0001 | 1.4375 | 10.97% |                |
| 4 | drds_db_1516187088365dau | 100.100.64.1:59077 | drds_db_xzip_0002 | 1.4375 | 10.97% |                |
| 5 | drds_db_1516187088365dau | 100.100.64.1:59077 | drds_db_xzip_0003 | 1.4375 | 10.97% |                |
| 6 | drds_db_1516187088365dau | 100.100.64.1:59077 | drds_db_xzip_0004 | 1.734375 | 13.23% |                |
| 7 | drds_db_1516187088365dau | 100.100.64.1:59077 | drds_db_xzip_0005 | 1.734375 | 13.23% |                |
| 8 | drds_db_1516187088365dau | 100.100.64.1:59077 | drds_db_xzip_0006 | 2.015625 | 15.38% |                |
| 9 | drds_db_1516187088365dau | 100.100.64.1:59077 | drds_db_xzip_0007 | 1.734375 | 13.23% |                |
+-----+-----+-----+-----+-----+-----+-----+
```

SHOW FULL DB STATUS [LIKE {tablename}]

You can run this SQL statement to view the capacity and performance information of a table shard in a physical database, which is also called a database shard. All the returned values indicate the real-time information. The capacity information is obtained from the ApsaraDB RDS for MySQL system table, and therefore may be different from the actual capacity information.

The following describes the meanings of important columns:

- **NAME**: the PolarDB-X internal tag that represents a logical PolarDB-X database corresponding to the database shard. The value is different from the name of the logical PolarDB-X database.
- **CONNECTION_STRING**: the information about a connection from the PolarDB-X instance to the database shard.
- **PHYSICAL_DB**: the name of the database shard. If the **LIKE** keyword is used for filtering in the statement, the **TOTAL** row indicates the total amount of capacity of the database shard. If the **LIKE** keyword is not used for filtering in the statement, the **TOTAL** row indicates the total amount of capacity of all database shards.
- **PHYSICAL_TABLE**: the name of the table shard in the database shard. If the **LIKE** keyword is used for filtering in the statement, the **TOTAL** row indicates the total amount of capacity of the table shard. If the **LIKE** keyword is not used for filtering in the statement, the **TOTAL** row indicates the total amount of capacity of all table shards in the database shard.
- **SIZE_IN_MB**: the size of the space occupied by the data in the database shard. Unit: MB.
- **RATIO**: the ratio of the data volume of the table shard to the total data volume of all the table shards obtained through filtering.
- **THREAD_RUNNING**: the number of threads that are running in the ApsaraDB RDS for MySQL instance to which the physical database belongs. The meaning of this parameter is the same as that of the **THREAD_RUNNING** parameter returned by the MySQL `SHOW GLOBAL STATUS` command. For more information, see [MySQL official documentation](#).

```
mysql> show full db status like hash_tb;
```

ID	NAME	CONNECTION_STRING	PHYSICAL_DB	PHYSICAL_TABLE	SIZE_IN_MB	RATIO	THREAD_RUNNING
1	drds_db_1516187088365dai	100.100.64.1:59077	TOTAL		19.875	100%	3

25	drds_db_1516187088365dai	100.100.64.1:59077	drds_db_xzip_0007	hash_tb_15	0.359375	1.81%	

13.7.6. SHOW PROCESSLIST and KILL commands

Note

- If the version of PolarDB-X is 5.1.28-1408022 or later, PolarDB-X support the SHOW PROCESSLIST and KILL commands for both logical and physical connections. For more information, see this topic.
- If the version of PolarDB-X is earlier than 5.1.28-1408022, PolarDB-X support the SHOW PROCESSLIST and KILL commands only for physical connections. For more information, see [SHOW PROCESSLIST and KILL commands in earlier versions](#).

SHOW PROCESSLIST command

In a PolarDB-X instance, you can run the `SHOW PROCESSLIST` command to view information such as connections to the PolarDB-X instance and SQL statements that are being executed in the PolarDB-X instance.

Syntax

```
SHOW [FULL] PROCESSLIST
```

Examples

```
mysql> SHOW PROCESSLIST\G
  ID: 1971050
  USER: admin
  HOST: 111.111.111.111:4303
  DB: drds_test
  COMMAND: Query
  TIME: 0
  STATE:
  INFO: show processlist
1 row in set (0.01 sec)
```

The following describes the meanings of the fields in the result set:

- **ID:** the ID of the connection. The value is a long-type number.
- **USER:** the name of the user who sets up the connection.
- **HOST:** the IP address and port number of the host that sets up the connection.
- **DB:** the name of the database accessed by the connection.
- **COMMAND:** the usage state of the connection. Currently, this field can be set to the following values:
 - **Query:** the current connection is executing an SQL statement.
 - **Sleep:** the current connection is idle.
- **TIME:** the duration when the connection is in the current state:
 - When the value of **COMMAND** is **Query**, this field indicates how long the SQL statement has been being executed on the connection.
 - When the value of **COMMAND** is **Sleep**, this field indicates how long the connection has been in the idle state.
- **STATE:** currently, no meaning has been assigned for this field. The value is constantly empty.
- **INFO:**
 - When the value of **COMMAND** is **Query**, this field indicates the content of the SQL statement that is being executed on the connection. If the **FULL** parameter is not specified, a maximum of the first 30 characters of the SQL statement are returned. If the **FULL** parameter is specified, a maximum of the first 1000 characters of the SQL statement are returned.
 - When the value of **COMMAND** is other values, this field is meaningless and left empty.

SHOW PHYSICAL_PROCESSLIST command

In a PolarDB-X instance, you can run the `SHOW PHYSICAL_PROCESSLIST` command to view information about all the SQL statements that are being executed on underlying ApsaraDB RDS for MySQL instances.

Syntax

```
SHOW [FULL] PHYSICAL_PROCESSLIST
```

When an SQL statement is excessively long, the responses of the `SHOW PHYSICAL_PROCESSLIST` command may be truncated. In this case, you can run the `SHOW FULL PHYSICAL_PROCESSLIST` command to obtain the complete SQL statement.

The meaning of each column in the responses is equivalent to that in the responses of the `SHOW PROCESSLIST` command. For more information, see [SHOW PROCESSLIST Syntax](#).

 **Note** Different from ApsaraDB RDS for MySQL, the PolarDB-X instance returns a string instead of a number in the ID column of a physical connection.

```
mysql> SHOW PHYSICAL_PROCESSLIST\G
***** 1. row *****
      ID: 0-0-521414
      USER: tddl5
      DB: tddl5_00
      COMMAND: Query
      TIME: 0
      STATE: init
      INFO: show processlist
***** 2. row *****
      ID: 0-0-521570
      USER: tddl5
      DB: tddl5_00
      COMMAND: Query
      TIME: 0
      STATE: User sleep
      INFO: /*DRDS /88.88.88.88/b67a0e4d880000/ */ select sleep(1000)
2 rows in set (0.01 sec)
```

KILL command

The `KILL` command is used to terminate an SQL statement that is being executed.

The PolarDB-X instance connects to an ApsaraDB RDS for MySQL instance by using the username created by the PolarDB-X instance on the ApsaraDB RDS for MySQL instance. Therefore, if you directly connect to the ApsaraDB RDS for MySQL instance, you do not have the permission to run the `KILL` command on a request initiated by the PolarDB-X instance.

To terminate an SQL statement that is being executed on the PolarDB-X instance, you must use tools such as the MySQL command line and to connect to the PolarDB-X instance, and then run the `KILL` command on the PolarDB-X instance.

Syntax

```
KILL PROCESS_ID | 'PHYSICAL_PROCESS_ID' | 'ALL'
```

The KILL command can be used in the following ways:

- Run `KILL PROCESS_ID` to terminate a specified logical SQL statement.

The `PROCESS_ID` parameter is obtained from the `ID` column in the responses of the `SHOW [FULL] PROCESSLIST` command.

Running the `KILL PROCESS_ID` command in the PolarDB-X instance will terminate both logical and physical SQL statements that are being executed on this connection, and disconnect this connection.

The PolarDB-X instance does not support the `KILL QUERY` command.

- Run `KILL 'PHYSICAL_PROCESS_ID'` to terminate a specified physical SQL statement.

The `PHYSICAL_PROCESS_ID` parameter is obtained from the `ID` column in the responses of the `SHOW PHYSICAL_PROCESS_ID` command.

 **Note** The `PHYSICAL_PROCESS_ID` column is a string instead of a number. Therefore, the `PHYSICAL_PROCESS_ID` parameter must be enclosed in single quotation marks (' ') in the KILL command.

Examples:

```
mysql> KILL '0-0-521570';
Query OK, 0 rows affected (0.01 sec)
```

- Run `KILL 'ALL'` to terminate all the physical SQL statements that are executed by the PolarDB-X instance in the current logical database.

When the underlying ApsaraDB RDS for MySQL instance is overloaded due to some SQL statements, you can use the `KILL 'ALL'` command to terminate all the physical SQL statements that are being executed in the current logical PolarDB-X database.

All physical SQL statements indicated by `PROCESS` that meet the following conditions can be terminated by running `KILL 'ALL'` :

- The value of the `User` parameter for the physical SQL statement indicated by `PROCESS` is a username created by the PolarDB-X instance in the ApsaraDB RDS for MySQL instance.
- The physical SQL statement indicated by `PROCESS` is executing a query. In other words, the value of `COMMAND` is `Query`.

13.7.7. SHOW PROCESSLIST and KILL commands in earlier versions

 **Note**

- If the version of PolarDB-X is 5.1.28-1408022 or later, PolarDB-X support the `SHOW PROCESSLIST` and `KILL` commands for both logical and physical connections. For more information, see [SHOW PROCESSLIST and KILL commands](#).
- If the version of PolarDB-X is earlier than 5.1.28-1408022, PolarDB-X only supports the `SHOW PROCESSLIST` and `KILL` commands for physical connections. For more information, see this topic.

SHOW PROCESSLIST command

In a PolarDB-X instance, you can run the `SHOW PROCESSLIST` command to view information about all the SQL statements that are being executed on the ApsaraDB RDS for MySQL instances.

Syntax

```
SHOW [FULL] PROCESSLIST
```

When an SQL statement is excessively long, the responses of the `SHOW PROCESSLIST` command may be truncated. In this case, you can run the `SHOW FULL PROCESSLIST` command to obtain the complete SQL statement.

The meaning of each column in the responses is equivalent to that in the responses of the `SHOW PROCESSLIST` command. For more information, see [SHOW PROCESSLIST Syntax](#).

```
mysql> SHOW PROCESSLIST\G
***** 1. row *****
      ID: 0-0-521414
      USER: tddl5
      DB: tddl5_00
      COMMAND: Query
      TIME: 0
      STATE: init
      INFO: show processlist
      ROWS_SENT: NULL
      ROWS_EXAMINED: NULL
      ROWS_READ: NULL
***** 2. row *****
      ID: 0-0-521570
      USER: tddl5
      DB: tddl5_00
      COMMAND: Query
      TIME: 0
      STATE: User sleep
      INFO: /*DRDS /88.88.88.88/b67a0e4d8800000/ */ select sleep(1000)
      ROWS_SENT: NULL
      ROWS_EXAMINED: NULL
      ROWS_READ: NULL
2 rows in set (0.01 sec)
```

KILL command

The KILL command is used to terminate an SQL statement that is being executed.

The PolarDB-X instance connects to an ApsaraDB RDS for MySQL instance by using the username created by the PolarDB-X instance on the ApsaraDB RDS for MySQL instance. Therefore, if you directly connect to the ApsaraDB RDS for MySQL instance, you do not have the permission to run the KILL command on a request initiated by the PolarDB-X instance.

To terminate an SQL statement that is being executed on the PolarDB-X instance, you must use tools such as the MySQL command line and to connect to the PolarDB-X instance, and then run the KILL command on the PolarDB-X instance.

Syntax

```
KILL 'PROCESS_ID' | 'ALL'
```

The KILL command can be used in the following ways:

- Run `KILL 'PROCESS_ID'` to terminate a specified SQL statement.

The `PROCESS_ID` parameter is obtained from the `ID` column in the responses of the `SHOW PROCESSLIST` command.

 **Note** Different from ApsaraDB RDS for MySQL, the PolarDB-X instance returns a string instead of a number in the `ID` column. Therefore, the `PROCESS_ID` parameter must be enclosed in single quotation marks (`'`) in the `KILL` command.

Examples

```
mysql> KILL '0-0-521570';
Query OK, 0 rows affected (0.01 sec)
```

- Run `KILL 'ALL'` to terminate all the SQL statements executed by the PolarDB-X instance in the current logical database.

When the underlying ApsaraDB RDS for MySQL instance is overloaded due to several SQL statements, you can use the `KILL 'ALL'` command to terminate all the SQL statements that are being executed in the current logical PolarDB-X database.

All SQL statements indicated by `PROCESS` that meet the following conditions can be terminated by running `KILL 'ALL'` :

- The value of the `User` parameter for the physical SQL statement indicated by `PROCESS` is a username created by the PolarDB-X instance in the ApsaraDB RDS for MySQL instance.
- The physical SQL statement indicated by `PROCESS` is executing a query. In other words, the value of `COMMAND` is `Query`.

PolarDB-X instances in earlier versions do not support the `KILL 'ALL'` command. An error will be reported if this command is being executed in these instances. To resolve this problem, you can upgrade the version of the PolarDB-X instance.

13.8. Custom hints

 **Note** This topic is applicable to PolarDB-X 5.3 and later. For earlier versions, see [PolarDB-X 5.2 hints](#).

13.8.1. Introduction to hints

As a supplement to the SQL syntax, hints play a critical role in relational databases. They allow you to influence execution plans of SQL statements by using relevant syntax, to specially optimize the SQL statements. PolarDB-X also provides special hint syntax.

For example, if you know the target data is stored in table shards in certain database shards and you need to route the SQL statement directly to the database shards for execution, you can use custom hints provided by PolarDB-X.

```
SELECT /*+TDDL:node('node_name')*/ * FROM table_name;
```

In the preceding SQL statement, the part between `/*` and `*/`, namely, `+TDDL:node('node_name')`, is a PolarDB-X hint. The hint specifies the ApsaraDB RDS for MySQL database shard where the SQL statement is to be executed.

Note

- PolarDB-X hints can be in the formats of `/*+TDDL:hint_command*/` and `/*!+TDDL:hint_command*/`.
- In the MySQL command-line client, if you need to run an SQL statement that contains a PolarDB-X hint in the format of `/*+TDDL:hint_command*/`, add the `-c` parameter to the logon command, because PolarDB-X hints are based on the [MySQL Comment Syntax](#). Otherwise, the client deletes the PolarDB-X hint and then sends the SQL statement to the server for execution, which causes the hint to fail to take effect. For more information, see [MySQL Client Options](#).

PolarDB-X hint syntax

Basic syntax

```
/*+TDDL: hint_command [hint_command ...] */
/*!+TDDL: hint_command [hint_command ...] */
```

PolarDB-X hints are based on the [MySQL Comment Syntax](#). The hint statements are located between `/*` and `*/` or between `/*!` and `*/`, and must begin with `+TDDL:`. The `hint_command` parameter indicates a PolarDB-X hint command related to the specific operation. Multiple `hint_command` parameters are separated by spaces.

Examples

```
# Query the names of physical tables in each database shard.
/*+TDDL:scan()*/SHOW TABLES;
# Route the query to database shard 0000 of a read-only ApsaraDB RDS for MySQL instance.
/*+TDDL:node(0) slave()*/SELECT * FROM t1;
```

In the example, `/*+TDDL:scan()*/` and `/*+TDDL:node(0) slave()*/` are PolarDB-X hints that begin with `+TDDL:`. The `scan()`, `node(0)`, and `slave()` functions are PolarDB-X hint commands. Hint commands are separated by spaces.

- Use one hint in an SQL statement:

PolarDB-X allows you to use hints in data manipulation language (DML), data definition language (DDL), and data access language (DAL) statements. The following describes the syntax in detail.

- For all statements that support hints, you can specify a hint at the beginning of the statements, for example:

```
/*+TDDL: ... */ SELECT ...
/*+TDDL: ... */ INSERT ...
/*+TDDL: ... */ REPLACE ...
/*+TDDL: ... */ UPDATE ...
/*+TDDL: ... */ DELETE ...
/*+TDDL: ... */ CREATE TABLE ...
/*+TDDL: ... */ ALTER TABLE ...
/*+TDDL: ... */ DROP TABLE ...
/*+TDDL: ... */ SHOW ...
...
```

- For DML statements, you can specify a hint behind the first keyword of the statements, for example:

```
SELECT /*+TDDL: ... */ ...
INSERT /*+TDDL: ... */ ...
REPLACE /*+TDDL: ... */ ...
UPDATE /*+TDDL: ... */ ...
DELETE /*+TDDL: ... */ ...
...
```

 **Note** Different hints may be applicable to different syntaxes. For more information about the applicable syntaxes, see the documentation of hint commands.

- Use multiple hint commands in an SQL statement:

PolarDB-X allows you to use multiple hint commands in SQL statements that contain hints.

```
SELECT /*+TDDL:node(0) slave()*/ ... ;
```

PolarDB-X has the following limitations on the use of multiple hint commands:

```
# A single SQL statement cannot contain multiple hint statements.
SELECT /*+TDDL:node(0)*/ /*+TDDL:slave()*/ ... ;
# An SQL statement that contains a hint cannot contain duplicate hint commands.
SELECT /*+TDDL:node(0) node(1)*/ ... ;
```

PolarDB-X hint classification

PolarDB-X hints are classified into the following major categories according to operation types:

- [Read/write splitting](#)
- [Specify a timeout period for an SQL statement](#)
- [Specify a database shard to run an SQL statement](#)
- [Scan all or some of database shards and table shards](#)

13.8.2. Read/write splitting

PolarDB-X provides transparent read/write splitting at the application layer. Data synchronization between primary and read-only ApsaraDB RDS for MySQL instances has a delay of several milliseconds. If you need to read changed data immediately after the primary ApsaraDB RDS for MySQL instance is changed, you must ensure that the SQL statement for reading data is routed to the primary ApsaraDB RDS for MySQL instance. To meet this demand, PolarDB-X provides custom hints for read/write splitting, to route SQL statements to a specified primary or read-only ApsaraDB RDS for MySQL instance.

 **Note** This topic is applicable to PolarDB-X 5.3 and later. For earlier versions, see [Read/write splitting](#).

Syntax

```
/*+TDDL:
  master()
  | slave()
*/
```

With this custom hint, you can specify whether to run an SQL statement on a primary or read-only ApsaraDB RDS for MySQL instance. With the custom hint `/*+TDDL:slave()*/`, if a primary ApsaraDB RDS for MySQL instance is configured with multiple read-only ApsaraDB RDS for MySQL instances, the PolarDB-X instance randomly selects a read-only ApsaraDB RDS for MySQL instance based on its weight, to run the SQL statement.

Note

- PolarDB-X hints can be in the formats of `/*+TDDL:hint_command*/` and `/*!+TDDL:hint_command*/`.
- In the MySQL command-line client, if you need to run an SQL statement that contains a PolarDB-X hint in the format of `/*+TDDL:hint_command*/`, add the `-c` parameter to the logon command, because PolarDB-X hints are based on the [MySQL Comment Syntax](#). Otherwise, the client deletes the PolarDB-X hint and then sends the SQL statement to the server for execution, which causes the hint to fail to take effect. For more information, see [MySQL Client Options](#).

Examples

- Specify a primary ApsaraDB RDS for MySQL instance to run an SQL statement:

```
SELECT /*+TDDL:master()*/ * FROM table_name;
```

After the custom hint `/*+TDDL:master()*/` is added behind the first keyword in the SQL statement, this SQL statement is routed to the primary ApsaraDB RDS for MySQL instance for execution.

- Specify a read-only ApsaraDB RDS for MySQL instance to run an SQL statement:

```
SELECT /*+TDDL:slave()*/ * FROM table_name;
```

After the custom hint `/*+TDDL:slave()*/` is added behind the first keyword in the SQL statement, this SQL statement is randomly routed to a read-only ApsaraDB RDS for MySQL instance based on the allocated weight.

Note

- The custom hints for read-write splitting are only applicable to read SQL statements for non-transactional data. SQL statements for transactional data and write SQL statements are still routed to the primary ApsaraDB RDS for MySQL instance for execution.
- The PolarDB-X hint `/*+TDDL:slave()*/` allows you to route the SQL statement randomly to a read-only ApsaraDB RDS for MySQL instance based on the configured weight for execution. If no read-only ApsaraDB RDS for MySQL instance is available, no error is reported. Instead, the primary ApsaraDB RDS for MySQL instance is selected to run the SQL statement.

13.8.3. Specify a timeout period for an SQL statement

In PolarDB-X, the SQL statements for PolarDB-X instances and ApsaraDB RDS for MySQL instances are timed out after 900 seconds (which can be adjusted) by default. However, for some slow SQL statements, the execution duration may exceed 900 seconds. For these slow SQL statements, PolarDB-X provides a custom hint to adjust their timeout periods. You can use this custom hint to adjust the SQL execution duration as needed.

 Note This topic is applicable to PolarDB-X 5.3 and later. For earlier versions, see [Specify a timeout period for an SQL statement](#).

Syntax

The syntax of the PolarDB-X hint for specifying a timeout period for an SQL statement is as follows:

```
/*+TDDL:SOCKET_TIMEOUT(time)*/
```

The `SOCKET_TIMEOUT` parameter is measured in milliseconds. With this custom hint, you can adjust the timeout period for the SQL statement based on business requirements.

Note

- PolarDB-X hints can be in the formats of `/*+TDDL:hint_command*/` and `/*!+TDDL:hint_command*/` .
- In the MySQL command-line client, if you need to run an SQL statement that contains a PolarDB-X hint in the format of `/*+TDDL:hint_command*/` , add the `-c` parameter to the logon command, because PolarDB-X hints are based on the [MySQL Comment Syntax](#). Otherwise, the client deletes the PolarDB-X hint and then sends the SQL statement to the server for execution, which causes the hint to fail to take effect. For more information, see [MySQL Client Options](#).

Examples

Set the timeout period of an SQL statement to 40 seconds:

```
/*+TDDL:SOCKET_TIMEOUT(40000)*/SELECT * FROM t_item;
```

Note A longer timeout period causes database resources to be occupied for a longer period of time. If excessive SQL statements are executed over a long time within the same period, a large number of database resources may be consumed. This will make users unable to use PolarDB-X properly. In this case, we need to use this custom hint to optimize the SQL statements that take a long time to execute.

13.8.4. Specify a database shard to run an SQL statement

When running SQL commands in a PolarDB-X instance, you may find that some SQL statements are not supported by the PolarDB-X instance. In this case, you can use the `NODE HINT` provided by PolarDB-X, to route the SQL statements to one or more database shards for execution. In addition, if you need to query the data in a specified database shard or the data in a specified table shard in a known database shard, you can use the `NODE HINT` to directly route the SQL statement to the database shard for execution.

Note This topic is applicable to PolarDB-X 5.3 and later. For earlier versions, see [Specify a database shard to run an SQL statement](#).

Syntax

The `NODE HINT` allows you to specify a database shard by using a shard name, to run the SQL statement in the database shard. A shard name uniquely identifies a database shard in a PolarDB-X instance. You can run the `SHOW NODE` statement to obtain the shard name.

Specify a database shard by using a shard name, to run an SQL statement

This custom hint allows you to specify one or more database shards to run an SQL statement.

Note If the hint for specifying a database shard is used in an `INSERT` statement that contains a sequence for the target table, the sequence will not take effect. For more information, see [Limits and precautions for sequences](#).

- Specify one database shard to run an SQL statement:

```
/*+TDDL:node('node_name')*/
```

Specifically, `node_name` indicates the shard name. This PolarDB-X hint enables you to route the SQL statement to the database shard specified by `node_name` .

- Specify multiple database shards to run an SQL statement:

```
/*+TDDL:node('node_name','node_name1','node_name2')*/
```

You can specify multiple shard names in the parameters and route the SQL statement to multiple database shards for execution. Separate multiple shard names with commas (,).

Note

- When this custom hint is used, the PolarDB-X instance directly routes the SQL statement to the specified database shards for execution. Therefore, the specified shard names in the SQL statement must correspond to existing database shards.
- The `NODE HINT` can be used in data manipulation language (DML), data definition language (DDL), and data access language (DAL) statements.
- PolarDB-X hints can be in the formats of `/*+TDDL:hint_command*/` and `/*!+TDDL:hint_command*/`.
- In the MySQL command-line client, if you need to run an SQL statement that contains a PolarDB-X hint in the format of `/*+TDDL:hint_command*/`, add the `-c` parameter to the logon command, because PolarDB-X hints are based on the [MySQL Comment Syntax](#). Otherwise, the client deletes the PolarDB-X hint and then sends the SQL statement to the server for execution, which causes the hint to fail to take effect. For more information, see [MySQL Client Options](#).

Examples

The following shows the responses of the `SHOW NODE` statement for a logical database named `drds_test` in a PolarDB-X instance.

```
mysql> SHOW NODE\G
***** 1. row *****
      ID: 0
      NAME: DRDS_TEST_1473471355140LRPRDRDS_TEST_VTLA_0000_RDS
      MASTER_READ_COUNT: 212
      SLAVE_READ_COUNT: 0
      MASTER_READ_PERCENT: 100%
      SLAVE_READ_PERCENT: 0%
***** 2. row *****
      ID: 1
      NAME: DRDS_TEST_1473471355140LRPRDRDS_TEST_VTLA_0001_RDS
      MASTER_READ_COUNT: 29
      SLAVE_READ_COUNT: 0
      MASTER_READ_PERCENT: 100%
      SLAVE_READ_PERCENT: 0%
***** 3. row *****
      ID: 2
      NAME: DRDS_TEST_1473471355140LRPRDRDS_TEST_VTLA_0002_RDS
      MASTER_READ_COUNT: 29
      SLAVE_READ_COUNT: 0
      MASTER_READ_PERCENT: 100%
      SLAVE_READ_PERCENT: 0%
***** 4. row *****
      ID: 3
      NAME: DRDS_TEST_1473471355140LRPRDRDS_TEST_VTLA_0003_RDS
```

```

MASTER_READ_COUNT: 29
SLAVE_READ_COUNT: 0
MASTER_READ_PERCENT: 100%
SLAVE_READ_PERCENT: 0%
***** 5. row *****
      ID: 4
      NAME: DRDS_TEST_1473471355140LRPRDRDS_TEST_VTLA_0004_RDS
MASTER_READ_COUNT: 29
SLAVE_READ_COUNT: 0
MASTER_READ_PERCENT: 100%
SLAVE_READ_PERCENT: 0%
***** 6. row *****
      ID: 5
      NAME: DRDS_TEST_1473471355140LRPRDRDS_TEST_VTLA_0005_RDS
MASTER_READ_COUNT: 29
SLAVE_READ_COUNT: 0
MASTER_READ_PERCENT: 100%
SLAVE_READ_PERCENT: 0%
***** 7. row *****
      ID: 6
      NAME: DRDS_TEST_1473471355140LRPRDRDS_TEST_VTLA_0006_RDS
MASTER_READ_COUNT: 29
SLAVE_READ_COUNT: 0
MASTER_READ_PERCENT: 100%
SLAVE_READ_PERCENT: 0%
***** 8. row *****
      ID: 7
      NAME: DRDS_TEST_1473471355140LRPRDRDS_TEST_VTLA_0007_RDS
MASTER_READ_COUNT: 29
SLAVE_READ_COUNT: 0
MASTER_READ_PERCENT: 100%
SLAVE_READ_PERCENT: 0%
8 rows in set (0.02 sec)

```

As you can see, each database shard has the `NAME` attribute, which indicates the shard name corresponding to the database shard. Each shard name uniquely corresponds to one database shard name. For example, the shard name `DRDS_TEST_1473471355140LRPRDRDS_TEST_VTLA_0003_RDS` corresponds to the database shard name `drds_test_vtla_0003`. Therefore, after obtaining the shard name, you can use the PolarDB-X hint to specify the corresponding database shard to run the SQL statement.

- Specify database shard 0 to run an SQL statement:

```
SELECT /*TDDL:node('DRDS_TEST_1473471355140LRPRDRDS_TEST_VTLA_0000_RDS')*/ * FROM table_name;
```

- Specify multiple database shards to run an SQL statement:

```
SELECT /*TDDL:node('DRDS_TEST_1473471355140LRPRDRDS_TEST_VTLA_0000_RDS','DRDS_TEST_1473471355140LRPRDRDS_TEST_VTLA_0006_RDS')*/ * FROM table_name;
```

This SQL statement will be executed in the database shards whose shard names are `DRDS_TEST_1473471355140LRPRDRDS_TEST_VTLA_0000_RDS` and `DRDS_TEST_1473471355140LRPRDRDS_TEST_VTLA_0006_RDS` .

- View the execution plan of an SQL statement in database shard 0:

```
/*TDDL:node('DRDS_TEST_1473471355140LRPRDRDS_TEST_VTLA_0000_RDS')*/ EXPLAIN SELECT * FROM table_name;
```

13.8.5. Scan all or some of database shards and table shards

In addition to routing an SQL statement to one or more database shards for execution, PolarDB-X provides the `SCAN HINT` to scan all or some of database shards and table shards. With the `SCAN HINT` , you can route an SQL statement to each database shard at a time. For example, you can view all the table shards in a specified database shard or view the data volume of each physical table of a specified logical table.

 **Note** This topic is applicable to PolarDB-X 5.3 and later. For earlier versions, see [Scan all database shards and table shards](#).

With the `SCAN HINT`, you can specify the following SQL execution manners:

- Run an SQL statement in all table shards in all database shards.
- Run an SQL statement in all table shards in a specified database shard.
- Run an SQL statement in the specified table shard in the specified database shard by calculating the name of the physical table based on conditions.
- Run an SQL statement in the specified table shard in the specified database shard by explicitly specifying the name of the physical table.

The `SCAN HINT` can be used in data manipulation language (DML) statements, data definition language (DDL) statements, and some data access language (DAL) statements.

 **Note**

- PolarDB-X hints can be in the formats of `/*+TDDL:hint_command*/` and `/*!+TDDL:hint_command*/` .
- In the MySQL command-line client, if you need to run an SQL statement that contains a PolarDB-X hint in the format of `/*+TDDL:hint_command*/` , add the `-c` parameter to the logon command, because PolarDB-X hints are based on the [MySQL Comment Syntax](#). Otherwise, the client deletes the PolarDB-X hint and then sends the SQL statement to the server for execution, which causes the hint to fail to take effect. For more information, see [MySQL Client Options](#).

Syntax

```

# SCAN HINT
# Route an SQL statement to all table shards in all database shards.
SCAN()
# Route an SQL statement to all table shards in a specified database shard.
SCAN(NODE="node_list")      # Specify the database shard.
# Route an SQL statement to the specified table shard in the specified database shard by calculating the name of the
physical table based on conditions.
SCAN(
  [TABLE="table_name_list"    # Specify the name of the logical table.
  , CONDITION="condition_string" # Calculate the names of physical databases based on the content of TABLE and C
ONDITION.
  [, NODE="node_list"])      # Filter the results obtained based on the content of CONDITION, to retain only the resul
ts of the specified physical database.
# Route an SQL statement to the specified table shard in the specified database shard by explicitly specifying the nam
e of the physical table.
SCAN(
  [TABLE="table_name_list"    # Specify the name of the logical table.
  , REAL_TABLE=("table_name_list") # Specify the name of the physical table. The same physical table names are appli
ed to all physical databases.
  [, NODE="node_list"])      # Filter the results obtained based on the content of CONDITION, to retain only the resul
ts of the specified physical database.
# Specify physical table names or logical table names.
table_name_list:
  table_name [, table_name]...
# Specify physical databases by using GROUP_KEY and GROUP_INDEX, which can be obtained by running the SHOW NO
DE statement.
node_list:
  {group_key | group_index} [, {group_key | group_index}]...
# Run an SQL WHERE statement. When using this syntax, you must specify conditions for each table, for example, t1.id
= 2 and t2.id = 2.
condition_string:
  where_condition

```

Examples

- Run the following SQL statement in all table shards in all database shards:

```
SELECT /*+TDDL:scan()*/ COUNT(1) FROM t1
```

After this statement is executed, the SQL statement is routed to all the physical tables corresponding to the logical table `t1`, and the result sets are merged and returned.

- Run the following SQL statement in all table shards in specified database shards:

```
SELECT /*+TDDL:scan(node='0,1,2')*/ COUNT(1) FROM t1
```

After this statement is executed, all physical tables corresponding to the logical table `t1` in database shards 0000, 0001, and 0002 are calculated, the SQL statement is routed to the physical tables, and the result sets are merged and returned.

- Run the following SQL statement in specified table shards based on conditions:

```
SELECT /*+TDDL:scan('t1', condition='t1.id = 2')*/ COUNT(1) FROM t1
```

After this statement is executed, all physical tables that correspond to the logical table `t1` and meet the conditions are calculated, the SQL statement is routed to the physical tables, and the result sets are merged and returned.

- Run the following SQL JOIN statement in the specified table shards based on conditions:

```
SELECT /*+TDDL:scan('t1, t2', condition='t1.id = 2 and t2.id = 2')*/ * FROM t1 a JOIN t2 b ON a.id = b.id WHERE b.name = "test"
```

After this statement is executed, all physical tables that correspond to the logical tables `t1` and `t2` and meet the conditions are calculated, the SQL statement is routed to the physical tables, and the result sets are merged and returned.

 **Notice** Before using this custom hint, you must ensure that the logical tables `t1` and `t2` are partitioned into the same number of database shards and the same number of table shards. Otherwise, the database shards calculated by the PolarDB-X instance based on the conditions are different, and an error will be returned.

- Run the following SQL statement in the specified table shards in database shards by explicitly specifying the names of the physical tables:

```
SELECT /*+TDDL:scan('t1', real_table=('t1_00', 't1_01'))*/ COUNT(1) FROM t1
```

After this statement is executed, the SQL statement is routed to the table shards `t1_00`t1_01` in all database shards, and the result sets are merged and returned.

- Run the following SQL JOIN statement in the specified table shards in database shards by explicitly specifying the names of the physical tables:

```
SELECT /*+TDDL:scan('t1, t2', real_table=('t1_00,t2_00', 't1_01,t2_01'))*/ * FROM t1 a JOIN t2 b ON a.id = b.id WHERE b.name = "test";
```

After this statement is executed, the SQL statement is routed to the table shards `t1_00` , `t2_00` , `t1_01` , and `t2_01` in all database shards, and the result sets are merged and returned.

13.8.6. INDEX HINT

- PolarDB-X supports global secondary indexes. The `INDEX` hint allows you to obtain query results from a specified GSI.
- The `INDEX` hint takes effect only for SQL `SELECT` statements.

 **Note** This custom hint is applicable to only MySQL 5.7 and later and PolarDB-X 5.4.1 and later.

Syntax

```
# FORCE INDEX
tbl_name [[AS] alias] [index_hint]
index_hint:
    FORCE INDEX({index_name})
# INDEX()
/*+TDDL:
    INDEX({table_name | table_alias}, {index_name})
*/
```

PolarDB-X INDEX hint can be used in two ways:

- `FORCE INDEX()` : This syntax is the same as that of [MySQL FORCE INDEX](#).
- `INDEX()` : In this syntax, a global secondary index is specified using a table name (or alias) and an index name. This hint does not take effect in the following cases:
 - The query does not contain the specified table name or alias.
 - The specified global secondary index is not in the specified table.

Note

- PolarDB-X hints can be in the formats of `/*+TDDL:hint_command*/` and `/*!+TDDL:hint_command*/` .
- In the MySQL command-line client, if you need to run an SQL statement that contains a PolarDB-X hint in the format of `/*+TDDL:hint_command*/` , add the `-c` parameter to the logon command, because PolarDB-X hints are based on the [MySQL Comment Syntax](#). Otherwise, the client deletes the PolarDB-X hint and then sends the SQL statement to the server for execution, which causes the hint to fail to take effect. For more information, see [MySQL Client Options](#).

Examples

```
CREATE TABLE t_order (
  `id` bigint(11) NOT NULL AUTO_INCREMENT,
  `order_id` varchar(20) DEFAULT NULL,
  `buyer_id` varchar(20) DEFAULT NULL,
  `seller_id` varchar(20) DEFAULT NULL,
  `order_snapshot` longtext DEFAULT NULL,
  `order_detail` longtext DEFAULT NULL,
  PRIMARY KEY (`id`),
  GLOBAL INDEX `g_i_seller` (`seller_id`) dbpartition by hash(`seller_id`),
  UNIQUE GLOBAL INDEX `g_i_buyer` (`buyer_id`) COVERING(`seller_id`, `order_snapshot`)
  dbpartition by hash(`buyer_id`) tpartition by hash(`buyer_id`) tpartitions 3
) ENGINE=InnoDB DEFAULT CHARSET=utf8 dbpartition by hash(`order_id`);
```

Specify the global secondary index `g_i_seller` by using `FORCE INDEX` in the `FROM` clause:

```
SELECT a.*, b.order_id
FROM t_seller a
JOIN t_order b FORCE INDEX(g_i_seller) ON a.seller_id = b.seller_id
WHERE a.seller_nick="abc";
```

Specify the global secondary index `g_i_buyer` by using `INDEX+table alias`:

```
/*+TDDL:index(a, g_i_buyer)*/ SELECT * FROM t_order a WHERE a.buyer_id = 123
```

13.9. PolarDB-X 5.2 hints

13.9.1. Introduction to hints

As a supplement to the SQL syntax, hints play a critical role in relational databases. They allow you to affect execution plans of SQL statements by using relevant syntax, to specially optimize the SQL statements.

Overview of PolarDB-X hints

PolarDB-X provides special hint syntax.

For example, if you know the target data is stored in table shards in certain database shards and you need to route the SQL statement directly to the database shards for execution, you can use custom hints provided by PolarDB-X.

```
/*! TDDL:NODE IN('node_name', ...) */SELECT * FROM table_name;
```

In the preceding SQL statement, the part between `/*!` and `*/`, namely, `TDDL:node in('node_name', ...)`, is a PolarDB-X hint. The hint specifies the ApsaraDB RDS for MySQL database shard where the SQL statement is to be executed.

Note

- PolarDB-X hints can be in the formats of `/*+TDDL:hint_command*/` and `/*! +TDDL:hint_command*/`.
- In the MySQL command-line client, if you need to run an SQL statement that contains a PolarDB-X hint in the format of `/*+TDDL:hint_command*/`, add the `-c` parameter to the logon command, because PolarDB-X hints are based on the [MySQL Comment Syntax](#). Otherwise, the client deletes the PolarDB-X hint and then sends the SQL statement to the server for execution, which causes the hint to fail to take effect. For more information, see [MySQL Client Options](#).

PolarDB-X hint syntax

Basic syntax:

```
/*! TDDL:hint command*/
```

PolarDB-X hints are based on [MySQL Comment Syntax](#). Therefore, an SQL statement that contains a PolarDB-X hint is located between `/*!` and `*/`, and must begin with `TDDL: .` The `hint command` indicates a PolarDB-X hint command related to the specific operation. For example, a PolarDB-X hint is added to the following SQL statement to display the name of each database shard.

```
/*! TDDL:SCAN*/SHOW TABLES;
```

In this SQL statement, `/*! TDDL:SCAN*/` is the PolarDB-X hint that begins with `TDDL: .`, and `SCAN` is a PolarDB-X hint command.

13.9.2. Read/write splitting

PolarDB-X provides transparent read/write splitting at the application layer. Data synchronization between primary and read-only ApsaraDB RDS for MySQL instances has a delay of several milliseconds. If you need to read changed data immediately after the primary ApsaraDB RDS for MySQL instance is changed, you must ensure that the SQL statement for reading data is routed to the primary ApsaraDB RDS for MySQL instance. To meet this demand, PolarDB-X provides custom hints for read/write splitting, to route SQL statements to a specified primary or read-only ApsaraDB RDS for MySQL instance.

Syntax

```
/*! TDDL:MASTER|SLAVE*/
```

With this custom hint, you can specify whether to run an SQL statement on a primary or read-only ApsaraDB RDS for MySQL instance. With the custom hint `/*!TDDL:SLAVE*/`, if a primary ApsaraDB RDS for MySQL instance is configured with multiple read-only ApsaraDB RDS for MySQL instances, the PolarDB-X instance randomly selects a read-only ApsaraDB RDS for MySQL instance based on its weight, to run the SQL statement.

Note

- PolarDB-X hints can be in the formats of `/*+TDDL:hint_command*/` and `/*!+TDDL:hint_command*/`.
- In the MySQL command-line client, if you need to run an SQL statement that contains a PolarDB-X hint in the format of `/*+TDDL:hint_command*/`, add the `-c` parameter to the logon command, because PolarDB-X hints are based on the [MySQL Comment Syntax](#). Otherwise, the client deletes the PolarDB-X hint and then sends the SQL statement to the server for execution, which causes the hint to fail to take effect. For more information, see [MySQL Client Options](#).

Examples

- Specify a primary ApsaraDB RDS for MySQL instance to run an SQL statement:

```
/*! TDDL:MASTER*/SELECT * FROM table_name;
```

After the custom hint `/*! TDDL:MASTER*/` is added at the beginning of the SQL statement, this SQL statement is routed to the primary ApsaraDB RDS for MySQL instance for execution.

- Specify a read-only ApsaraDB RDS for MySQL instance to run an SQL statement:

```
/*! TDDL:SLAVE*/SELECT * FROM table_name;
```

After the custom hint `/*! TDDL:SLAVE*/` is added at the beginning of the SQL statement, this SQL statement is randomly routed to a read-only ApsaraDB RDS for MySQL instance based on the allocated weight.

Note

- The custom hints for read-write splitting are only applicable to read SQL statements for non-transactional data. SQL statements for transactional data and write SQL statements are still routed to the primary ApsaraDB RDS for MySQL instance for execution.
- The PolarDB-X hint `/*+TDDL:slave()*/` allows you to route the SQL statement randomly to a read-only ApsaraDB RDS for MySQL instance based on the configured weight for execution. If no read-only ApsaraDB RDS for MySQL instance is available, no error is reported. Instead, the primary ApsaraDB RDS for MySQL instance is selected to run the SQL statement.

13.9.3. Prevent the delay from a read-only ApsaraDB RDS for MySQL instance

Normally, if you have configured a read-only ApsaraDB for RDS instance for the primary ApsaraDB RDS for MySQL instance of a logical database in a PolarDB-X instance and set read traffic for both the primary and read-only ApsaraDB RDS for MySQL instances, PolarDB-X routes SQL statements to the primary and read-only ApsaraDB RDS for MySQL instances based on the read/write ratio. However, if asynchronous data replication between the primary and read-only ApsaraDB RDS for MySQL instances has a high delay, an error is reported or error results are returned when PolarDB-X routes the SQL statements to the read-only ApsaraDB RDS for MySQL instance.

To address this issue, the PolarDB-X instance provides a custom hint to cut off the delay of the read-only instance. Specifically, based on the maximum delay of primary/secondary replication, PolarDB-X determines whether to route the SQL statement to the primary or the read-only ApsaraDB RDS for MySQL instance.

Syntax

```
/*! TDDL:SQL_DELAY_CUTOFF=time*/
```

With this custom hint, you can specify the value of `SQL_DELAY_CUTOFF`. When the value of `SQL_DELAY` (primary/secondary replication delay of ApsaraDB RDS for MySQL) for the read-only ApsaraDB RDS for MySQL instance reaches or exceeds the value of `time` (which is measured in seconds), the SQL statement is routed to the primary ApsaraDB RDS for MySQL instance.

Note

- PolarDB-X hints can be in the formats of `/*+TDDL:hint_command*/` and `/*!+TDDL:hint_command*/`.
- In the MySQL command-line client, if you need to run an SQL statement that contains a PolarDB-X hint in the format of `/*+TDDL:hint_command*/`, add the `-c` parameter to the logon command, because PolarDB-X hints are based on the [MySQL Comment Syntax](#). Otherwise, the client deletes the PolarDB-X hint and then sends the SQL statement to the server for execution, which causes the hint to fail to take effect. For more information, see [MySQL Client Options](#).

Examples

- Set the primary/secondary replication delay to 5 seconds:

```
/*! TDDL:SQL_DELAY_CUTOFF=5*/SELECT * FROM table_name;
```

In this SQL statement, the value of `SQL_DELAY_CUTOFF` is set to 5. Therefore, when the value of `SQL_DELAY` for the read-only ApsaraDB RDS for MySQL instance reaches or exceeds 5 seconds, the SQL statement is routed to the primary ApsaraDB RDS for MySQL instance.

- Use the custom hint for delay cutoff with other custom hints:

```
/*! TDDL:SLAVE AND SQL_DELAY_CUTOFF=5*/SELECT * FROM table_name;
```

The custom hint for cutting off the delay of the read-only ApsaraDB RDS for MySQL instance can be used with other hints. By default, the SQL query request is routed to a read-only ApsaraDB RDS for MySQL instance. However, when the primary/secondary replication delay reaches or exceeds 5 seconds, the SQL query request is routed to the primary ApsaraDB RDS for MySQL instance.

13.9.4. Specify a timeout period for an SQL statement

In PolarDB-X, the SQL statements for PolarDB-X instances and ApsaraDB RDS for MySQL instances are timed out after 900 seconds (which can be adjusted) by default. However, for some slow SQL statements, the execution duration may exceed 900 seconds. For these slow SQL statements, PolarDB-X provides a custom hint to adjust their timeout periods. You can use this custom hint to adjust the SQL execution duration as needed.

Syntax

The syntax of the PolarDB-X hint for specifying a timeout period for an SQL statement is as follows:

```
/*! TDDL:SOCKET_TIMEOUT=time*/
```

The `SOCKET_TIMEOUT` parameter is measured in milliseconds. With this custom hint, you can adjust the timeout period for the SQL statement based on business requirements.

Note

- PolarDB-X hints can be in the formats of `/*+TDDL:hint_command*/` and `/*! +TDDL:hint_command*/`.
- In the MySQL command-line client, if you need to run an SQL statement that contains a PolarDB-X hint in the format of `/*+TDDL:hint_command*/`, add the `-c` parameter to the logon command, because PolarDB-X hints are based on the [MySQL Comment Syntax](#). Otherwise, the client deletes the PolarDB-X hint and then sends the SQL statement to the server for execution, which causes the hint to fail to take effect. For more information, see [MySQL Client Options](#).

Examples

Set the timeout period of an SQL statement to 40 seconds:

```
/*! TDDL:SOCKET_TIMEOUT=40000*/SELECT * FROM t_item;
```

Note A longer timeout period causes database resources to be occupied for a longer period of time. If excessive SQL statements are executed over a long time within the same period, a large number of database resources may be consumed. This will make users unable to use PolarDB-X properly. In this case, we need to use this custom hint to optimize the SQL statements that take a long time to execute.

13.9.5. Specify a database shard to run an SQL statement

When running SQL commands in a PolarDB-X instance, you may find that some SQL statements are not supported by the PolarDB-X instance. In this case, you can use the custom hint provided by PolarDB-X to route the SQL statements to one or more database shards for execution. In addition, if you need to query the data in a specified database shard or the data in a specified table shard, you can use the custom hint to directly route the SQL statement to the database shard for execution.

Syntax

This custom hint allows you to specify a database shard by using a shard name or the value of the database shard key, to run an SQL statement in the database shard. A shard name uniquely identifies a database shard in a PolarDB-X instance. You can run the `SHOW NODE` command to obtain the shard name.

Note If the hint for specifying a database shard is used in an INSERT statement that contains a sequence for the target table, the sequence will not take effect. For more information, see [Limits and precautions for sequences](#).

- Specify a database shard by using a shard name, to run an SQL statement

This custom hint allows you to specify one or more database shards to run an SQL statement.

- Specify one database shard to run an SQL statement:

```
/*! TDDL:NODE='node_name'*/
```

Specifically, `node_name` indicates the shard name. This PolarDB-X hint enables you to route the SQL statement to the database shard specified by `node_name`.

- Specify multiple database shards to run an SQL statement:

```
/*! TDDL:NODE IN ('node_name','node_name1','node_name2')*/
```

The `IN` keyword is used to specify multiple shard names. This custom hint allows you to route the SQL statement to multiple database shards. Separate multiple shard names with commas (,).

Note When this custom hint is used, the PolarDB-X instance directly routes the SQL statement to the specified database shards for execution. Therefore, the specified shard names in the SQL statement must correspond to existing database shards.

- Specify a database shard by using the value of the database shard key, to run an SQL statement

```
/*! TDDL:table_name.partition_key=value [and table_name1.partition_key=value1]*/
```

In this PolarDB-X hint, `table_name` indicates the name of a logical table, and this table is a partitioned table. In addition, `partition_key` indicates a shard key, and `value` indicates the value specified for the shard key. In this custom hint, you can use the `and` keyword to specify the shard keys of multiple partitioned tables. When this PolarDB-X hint is used, the PolarDB-X instance calculates the database shards and table shards where the SQL statement is to be executed, and routes the SQL statement to the corresponding database shards.

Note

- PolarDB-X hints can be in the formats of `/*+TDDL:hint_command*/` and `/*!+TDDL:hint_command*/`.
- In the MySQL command-line client, if you need to run an SQL statement that contains a PolarDB-X hint in the format of `/*+TDDL:hint_command*/`, add the `-c` parameter to the logon command, because PolarDB-X hints are based on the [MySQL Comment Syntax](#). Otherwise, the client deletes the PolarDB-X hint and then sends the SQL statement to the server for execution, which causes the hint to fail to take effect. For more information, see [MySQL Client Options](#).

Examples

The following shows the responses of the `SHOW NODE` statement for a logical database named `drds_test` in a PolarDB-X instance.

```
mysql> SHOW NODE\G
***** 1. row *****
      ID: 0
      NAME: DRDS_TEST_1473471355140LRPRDRDS_TEST_VTLA_0000_RDS
      MASTER_READ_COUNT: 212
      SLAVE_READ_COUNT: 0
      MASTER_READ_PERCENT: 100%
      SLAVE_READ_PERCENT: 0%
***** 2. row *****
      ID: 1
      NAME: DRDS_TEST_1473471355140LRPRDRDS_TEST_VTLA_0001_RDS
      MASTER_READ_COUNT: 29
      SLAVE_READ_COUNT: 0
      MASTER_READ_PERCENT: 100%
      SLAVE_READ_PERCENT: 0%
***** 3. row *****
      ID: 2
```

```
NAME: DRDS_TEST_1473471355140LRPRDRDS_TEST_VTLA_0002_RDS
MASTER_READ_COUNT: 29
SLAVE_READ_COUNT: 0
MASTER_READ_PERCENT: 100%
SLAVE_READ_PERCENT: 0%
***** 4. row *****
ID: 3
NAME: DRDS_TEST_1473471355140LRPRDRDS_TEST_VTLA_0003_RDS
MASTER_READ_COUNT: 29
SLAVE_READ_COUNT: 0
MASTER_READ_PERCENT: 100%
SLAVE_READ_PERCENT: 0%
***** 5. row *****
ID: 4
NAME: DRDS_TEST_1473471355140LRPRDRDS_TEST_VTLA_0004_RDS
MASTER_READ_COUNT: 29
SLAVE_READ_COUNT: 0
MASTER_READ_PERCENT: 100%
SLAVE_READ_PERCENT: 0%
***** 6. row *****
ID: 5
NAME: DRDS_TEST_1473471355140LRPRDRDS_TEST_VTLA_0005_RDS
MASTER_READ_COUNT: 29
SLAVE_READ_COUNT: 0
MASTER_READ_PERCENT: 100%
SLAVE_READ_PERCENT: 0%
***** 7. row *****
ID: 6
NAME: DRDS_TEST_1473471355140LRPRDRDS_TEST_VTLA_0006_RDS
MASTER_READ_COUNT: 29
SLAVE_READ_COUNT: 0
MASTER_READ_PERCENT: 100%
SLAVE_READ_PERCENT: 0%
***** 8. row *****
ID: 7
NAME: DRDS_TEST_1473471355140LRPRDRDS_TEST_VTLA_0007_RDS
MASTER_READ_COUNT: 29
SLAVE_READ_COUNT: 0
MASTER_READ_PERCENT: 100%
SLAVE_READ_PERCENT: 0%
8 rows in set (0.02 sec)
```

As you can see, each database shard has the `NAME` attribute, which indicates the shard name corresponding to the database shard. Each shard name uniquely corresponds to one database shard name. For example, the shard name `DRDS_TEST_1473471355140LRPRDRDS_TEST_VTLA_0003_RDS` corresponds to the database shard name `drds_test_vtla_0003`. Therefore, after obtaining the shard name, you can use the PolarDB-X hint to specify the corresponding database shard to run the SQL statement.

- Specify database shard 0 to run an SQL statement:

```
/*! TDDL:NODE='DRDS_TEST_1473471355140LRPRDRDS_TEST_VTLA_0000_RDS'*/SELECT * FROM table_name;
```

- Specify multiple database shards to run an SQL statement:

```
/*! TDDL:NODE IN('DRDS_TEST_1473471355140LRPRDRDS_TEST_VTLA_0000_RDS','DRDS_TEST_1473471355140LRPRDRDS_TEST_VTLA_0006_RDS')*/SELECT * FROM table_name;
```

This SQL statement will be executed in the database shards whose shard names are `DRDS_TEST_1473471355140LRPRDRDS_TEST_VTLA_0000_RDS` and `DRDS_TEST_1473471355140LRPRDRDS_TEST_VTLA_0006_RDS`.

- View the execution plan of an SQL statement in a specified database shard:

```
/*! TDDL:NODE='DRDS_TEST_1473471355140LRPRDRDS_TEST_VTLA_0000_RDS'*/EXPLAIN SELECT * FROM table_name;
```

After this SQL statement is executed, the execution plan of the `SELECT` statement in the database shard corresponding to the shard name `DRDS_TEST_1473471355140LRPRDRDS_TEST_VTLA_0000_RDS` will be returned.

- Specify a database shard by using the value of the database shard key, to run an SQL statement:

PolarDB-X does not support subqueries in the `SET` clause of an `UPDATE` statement, because a shard key must be specified for `UPDATE` statements in PolarDB-X. To address this issue, PolarDB-X provides a custom hint to route the statement to a database shard for execution.

For example, the following shows the `CREATE TABLE` statement for creating two logical tables `t1` and `t2`, which are partitioned into table shards in database shards:

```
CREATE TABLE `t1` (
  `id` bigint(20) NOT NULL,
  `name` varchar(20) NOT NULL,
  `val` varchar(20) DEFAULT NULL,
  PRIMARY KEY (`id`)
) ENGINE=InnoDB DEFAULT CHARSET=utf8 dbpartition by hash(`id`) tpartition by hash(`name`) tpartitions 3
CREATE TABLE `t2` (
  `id` bigint(20) NOT NULL,
  `name` varchar(20) NOT NULL,
  `val` varchar(20) DEFAULT NULL,
  PRIMARY KEY (`id`)
) ENGINE=InnoDB DEFAULT CHARSET=utf8 dbpartition by hash(`id`) tpartition by hash(`name`) tpartitions 3
```

The following SQL statement is to be executed for the two tables:

```
UPDATE t1 SET val=(SELECT val FROM t2 WHERE id=1) WHERE id=1;
```

If this statement is directly executed in a PolarDB-X instance, an error will be returned indicating that this statement is not supported. In this case, you can add the PolarDB-X hint to this SQL statement before submitting it to the PolarDB-X instance for execution. The SQL statements are as follows:

```
/*! TDDL:t1.id=1 and t2.id=1*/UPDATE t1 SET val=(SELECT val FROM t2 WHERE id=1) WHERE id=1;
```

This statement will be routed to database shards of `t1`, with the `id` of the database shards being 1. You can run the following `EXPLAIN` command to view the execution plan of this SQL statement:

```
mysql> explain /*! TDDL:t1.id=1 and t2.id=1*/UPDATE t1 SET val=(SELECT val FROM t2 WHERE id=1) WHERE id=1\G
***** 1. row *****
GROUP_NAME: TEST_DRDS_1485327111630IXLWTEST_DRDS_IGHF_0001_RDS
  SQL: UPDATE `t1_2` AS `t1` SET `val` = (SELECT val FROM `t2_2` AS `t2` WHERE `id` = 1) WHERE `id` = 1
  PARAMS: {}
***** 2. row *****
GROUP_NAME: TEST_DRDS_1485327111630IXLWTEST_DRDS_IGHF_0001_RDS
  SQL: UPDATE `t1_1` AS `t1` SET `val` = (SELECT val FROM `t2_1` AS `t2` WHERE `id` = 1) WHERE `id` = 1
  PARAMS: {}
***** 3. row *****
GROUP_NAME: TEST_DRDS_1485327111630IXLWTEST_DRDS_IGHF_0001_RDS
  SQL: UPDATE `t1_0` AS `t1` SET `val` = (SELECT val FROM `t2_0` AS `t2` WHERE `id` = 1) WHERE `id` = 1
  PARAMS: {}
3 rows in set (0.00 sec)
```

According to the result set of the `EXPLAIN` command, the SQL statement is rewritten into three statements, which are then routed to the database shards for execution. You can further specify a table shard by using the value of the table shard key, to narrow the execution scope of the SQL statement to a specified table shard.

```
mysql> explain /*! TDDL:t1.id=1 and t2.id=1 and t1.name='1'*/UPDATE t1 SET val=(SELECT val FROM t2 WHERE id=1) W
HERE id=1\G
***** 1. row *****
GROUP_NAME: TEST_DRDS_1485327111630IXLWTEST_DRDS_IGHF_0001_RDS
  SQL: UPDATE `t1_1` AS `t1` SET `val` = (SELECT val FROM `t2_1` AS `t2` WHERE `id` = 1) WHERE `id` = 1
  PARAMS: {}
1 row in set (0.00 sec)
```

Note Before using this custom hint, you must ensure that the logical tables `t1` and `t2` are partitioned into the same number of database shards and the same number of table shards. Otherwise, the database shards calculated by the PolarDB-X instance based on the conditions are different, and an error will be returned.

13.9.6. Scan all database shards and table shards

In addition to routing an SQL statement to one or more database shards for execution, PolarDB-X provides a custom hint to allow you to scan all database shards and table shards. With this custom hint, you can route an SQL statement to each database shard at a time. For example, you can use this custom hint to view all the table shards in a specified database shard. In addition, you can use this custom hint to view the data volume of table shards in each database shard corresponding to a specified logical table.

Syntax

With this PolarDB-X hint, you can route an SQL statement to all database shards for execution and route an SQL statement to all database shards to perform an operation on a specified logical table.

- Route an SQL statement to all database shards for execution:

```
/*! TDDL:SCAN*/
```

- Perform an operation on a specified logical table:

```
/*! TDDL:SCAN='table_name'*/
```

The `table_name` parameter indicates the name of a logical table in the logical database of a PolarDB-X instance. This custom hint is provided for table shards in database shards. Ensure that the value of `table_name` is the name of a table shard in database shards.

Note

- PolarDB-X hints can be in the formats of `/*+TDDL:hint_command*/` and `/*! +TDDL:hint_command*/`.
- In the MySQL command-line client, if you need to run an SQL statement that contains a PolarDB-X hint in the format of `/*+TDDL:hint_command*/`, add the `-c` parameter to the logon command, because PolarDB-X hints are based on the [MySQL Comment Syntax](#). Otherwise, the client deletes the PolarDB-X hint and then sends the SQL statement to the server for execution, which causes the hint to fail to take effect. For more information, see [MySQL Client Options](#).

Examples

- View the data volume of a specified broadcast table in each database shard:

```
/*! TDDL:SCAN*/SELECT COUNT(1) FROM table_name
```

In this SQL statement, `table_name` indicates a broadcast table. This hint causes the PolarDB-X instance to route the SQL statement to each database shard for execution. Therefore, the result sets include the total data volume of the broadcast table `table_name` in all database shards. This statement allows you to conveniently check whether the data of a broadcast table is normal.

- Scan a single-database non-partition logical table:

```
/*! TDDL:SCAN*/SELECT COUNT(1) FROM table_name
```

This hint causes the PolarDB-X instance to route the SQL `select count(1) from table_name` statement to each database shard for execution. The `table_name` parameter indicates a logical table in a logical database of a PolarDB-X instance. Before using this hint, ensure that each database shard contains the table shard `table_name`. In other words, the table shard `table_name` is a logical table that is only partitioned into database shards, but not partitioned into table shards. Otherwise, an error that indicates that the table is not found will be returned.

- Scan a partitioned logical table in database shards:

```
/*! TDDL:SCAN='table_name'*/SELECT COUNT(1) FROM table_name
```

When executing this statement, the PolarDB-X instance first calculates all the database shards and table shards corresponding to the logical table `table_name`, and then generates a COUNT clause for each table shard in each database shard.

- View the execution plans of all database shards:

```
/*! TDDL:SCAN='table_name'*/EXPLAIN SELECT * FROM table_name;
```

13.10. Distributed transactions

13.10.1. Distributed transactions based on MySQL 5.7

Note

- When you use MySQL 5.7 or later and PolarDB-X 5.3.4 or later, XA distributed transactions are automatically enabled. The user experience of the XA distributed transactions is the same as that of single-database transactions in MySQL. No special commands are required to enable XA distributed transactions.
- When you use MySQL and a PolarDB-X instance in other versions, see [Distributed transactions based on MySQL 5.6](#).

How it works

When you use MySQL 5.7 or later, the PolarDB-X instance processes distributed transactions based on the XA protocol by default.

Use method

The user experience of distributed transactions in a PolarDB-X instance is the same as that of single-database transactions in MySQL, for example, in terms of the following commands:

- `SET AUTOCOMMIT=0` : Start a transaction.
- `COMMIT` : Commit the current transaction.
- `ROLLBACK` : Roll back the current transaction.

If the SQL statement in a transaction involves only a single shard, the PolarDB-X instance routes the transaction directly to the ApsaraDB RDS for MySQL instance as a single-database transaction. If the SQL statement in the transaction is to modify the data of multiple shards, the PolarDB-X instance automatically upgrades the current transaction to a distributed transaction.

13.10.2. Distributed transactions based on MySQL 5.6

How it works

The XA protocol for MySQL 5.6 is not mature. Therefore, the PolarDB-X instance independently implements two-phase commit (2PC) transaction policies for distributed transactions. When you use MySQL 5.7 or later, we recommend that you use XA transaction policies.

Note The distributed transactions described in this topic are intended for users who use MySQL 5.6 or PolarDB-X earlier than 5.3.4. When you use MySQL 5.7 or later and a PolarDB-X instance in 5.3.4 or later, see [Distributed transactions based on MySQL 5.7](#).

Use method

If a transaction involves multiple database shards, you must declare the current transaction as a distributed transaction. If a transaction involves only a single database shard, you do not need to enable distributed transactions, but can process the transaction as a single-database transaction in MySQL. No additional operations are required.

To enable distributed transactions, do as follows:

After transactions are enabled, run `SET drds_transaction_policy = '...'`.

To enable 2PC transactions in the MySQL command-line client, run the following statements:

```
SET AUTOCOMMIT=0;
SET drds_transaction_policy = '2PC'; -- We recommend that you use MySQL 5.6 to run this command.
.... -- Here, you can run your business SQL statement.
COMMIT; -- You can alternatively write ROLLBACK.
```

To enable 2PC transactions by using the Java database connectivity (JDBC) API, write the code as follows:

```
conn.setAutoCommit(false);
try (Statement stmt = conn.createStatement()) {
    stmt.execute("SET drds_transaction_policy = '2PC'");
}
// ... Here, you can run your business SQL statement.
conn.commit(); // You can alternatively write rollback().
```

FAQ

Q: How can I use PolarDB-X distributed transactions in the Spring framework?

A: If you enable transactions by using the Spring `@Transactional` annotation, you can enable PolarDB-X distributed transactions by extending the transaction manager.

Sample code:

```
import org.springframework.jdbc.datasource.DataSourceTransactionManager;
import org.springframework.transaction.TransactionDefinition;
import javax.sql.DataSource;
import java.sql.Connection;
import java.sql.SQLException;
import java.sql.Statement;

public class DrdsTransactionManager extends DataSourceTransactionManager {
    public DrdsTransactionManager(DataSource dataSource) {
        super(dataSource);
    }
    @Override
    protected void prepareTransactionalConnection(Connection con, TransactionDefinition definition) throws SQLException {
        try (Statement stmt = con.createStatement()) {
            stmt.executeUpdate("SET drds_transaction_policy = '2PC'"); // A 2PC transaction is used as an example.
        }
    }
}
```

After that, instantiate the preceding class in the Spring configuration. For example, you can write the code as follows:

```
<bean id="drdsTransactionManager" class="my.app.DrdsTransactionManager">
    <property name="dataSource" ref="yourDataSource" />
</bean>
```

To enable PolarDB-X distributed transactions for a class, you can add the `@Transactional("drdsTransactionManager")` annotation.

13.11. DDL operations

13.11.1. DDL statements

The data definition language (DDL) statement `CREATE TABLE` in a PolarDB-X instance is similar to that in a MySQL database, and is extended based on the syntax in a MySQL database. To create a table shard in a PolarDB-X instance, you must specify the table sharding manner and the database sharding manner in the `drds_partition_options` parameter. The valid values include `DBPARTITION BY`, `TBPARTITION BY`, `TBPARTITIONS`, and `BROADCAST`.

Currently, you can run a DDL statement in the following ways:

- Run the DDL statement through the MySQL command-line client, for example, by using MySQL command lines, Navicat, or MySQL Workbench.
- Connect to the specified PolarDB-X instance by using program code and then call the DDL statement for execution.

For the syntax of the `CREATE TABLE` statement in a MySQL database, see [MySQL CREATE TABLE Statement](#).

13.11.2. CREATE TABLE statement

13.11.2.1. Overview

This topic describes the syntax, clauses, parameters, and basic methods for creating a table by using a data definition language (DDL) statement.

 **Note** PolarDB-X instances do not allow you to directly create a database by using a DDL statement. To create a database, you can [Log on to the PolarDB-X console](#). For the information about how to create a database, see [Create a database](#).

Syntax

```
CREATE [TEMPORARY] TABLE [IF NOT EXISTS] tbl_name
  (create_definition,...)
  [table_options]
  [drds_partition_options]
  [partition_options]
drds_partition_options:
  DBPARTITION BY
    HASH([column])
  [TBPARTITION BY
    { HASH(column)
    | {MM|DD|WEEK|MMDD}(column)}
  [TBPARTITIONS num]
]
```

Clauses and parameters for database and table sharding

- `DBPARTITION BY hash(partition_key)` : This parameter specifies the shard key and the sharding algorithm for database sharding. Database sharding by time is not supported.
- `TBPARTITION BY { HASH(column) | {MM|DD|WEEK|MMDD}(column)}` : (Optional) This parameter specifies the method of mapping data to a physical table. The value is the same as that of `DBPARTITION BY` by default.
- `TBPARTITIONS num` : (Optional) This parameter specifies the number of physical tables to be created in each database shard. The default value is 1. If no table sharding is required, you do not need to specify this parameter.

13.11.2.2. Create a single-database non-partition table

This topic describes how to create a single-database non-partition table.

Create a single-database non-partition table

```
CREATE TABLE single_tbl(
  id int,
  name varchar(30),
  primary key(id)
);
```

According to the node topology of the logical table, you can see that a single-database non-partition logical table is created in database 0.

```
mysql> show topology from single_tbl;
+-----+-----+-----+-----+
| ID | GROUP_NAME | TABLE_NAME |
+-----+-----+-----+-----+
| 0 | SANGUAN_TEST_123_1488766060743ACTJSANGUAN_TEST_123_WVVP_0000_RDS | single_tbl |
+-----+-----+-----+-----+
1 row in set (0.01 sec)
```

Specify parameters

You can also specify the `select_statement` parameter when creating a single-database non-partition table. If you need to create table shards, you cannot specify this parameter.

```
CREATE [TEMPORARY] TABLE [IF NOT EXISTS] tbl_name
  [(create_definition,...)]
  [table_options]
  [partition_options]
  select_statement
```

For example, you can run the following statement to create a single-database non-partition table `single_tbl2` to store the data from the `single_tbl` table. In this case, no sharding is required.

```
CREATE TABLE single_tbl2(
  id int,
  name varchar(30),
  primary key(id)
) select * from single_tbl;
```

13.11.2.3. Create a non-partition table in database shards

This topic describes how to create a non-partition table in database shards.

Assume that eight database shards have been created. You can run the following command to create a non-partition table in the database shards by calculating the hash function based on the `userId` shard key.

```
CREATE TABLE multi_db_single_tbl(
  id int,
  name varchar(30),
  primary key(id)
) dbpartition by hash(id);
```

According to the node topology of the logical table, you can see that a table shard is created in each database shard. In other words, the table is only distributed to database shards.

```
mysql> show topology from multi_db_single_tbl;
+-----+-----+-----+-----+
| ID | GROUP_NAME | TABLE_NAME |
+-----+-----+-----+
| 0 | SANGUAN_TEST_123_1488766060743ACTJSANGUAN_TEST_123_WVVP_0000_RDS | multi_db_single_tbl |
| 1 | SANGUAN_TEST_123_1488766060743ACTJSANGUAN_TEST_123_WVVP_0001_RDS | multi_db_single_tbl |
| 2 | SANGUAN_TEST_123_1488766060743ACTJSANGUAN_TEST_123_WVVP_0002_RDS | multi_db_single_tbl |
| 3 | SANGUAN_TEST_123_1488766060743ACTJSANGUAN_TEST_123_WVVP_0003_RDS | multi_db_single_tbl |
| 4 | SANGUAN_TEST_123_1488766060743ACTJSANGUAN_TEST_123_WVVP_0004_RDS | multi_db_single_tbl |
| 5 | SANGUAN_TEST_123_1488766060743ACTJSANGUAN_TEST_123_WVVP_0005_RDS | multi_db_single_tbl |
| 6 | SANGUAN_TEST_123_1488766060743ACTJSANGUAN_TEST_123_WVVP_0006_RDS | multi_db_single_tbl |
| 7 | SANGUAN_TEST_123_1488766060743ACTJSANGUAN_TEST_123_WVVP_0007_RDS | multi_db_single_tbl |
+-----+-----+-----+-----+
8 rows in set (0.01 sec)
```

13.11.2.4. Create table shards in database shards

This topic describes how to create table shards in database shards in different sharding manners.

- Use HASH for sharding
- Use RANGE_HASH for sharding
- Use date functions for sharding

In the following examples, it is assumed that eight database shards have been created.

Use HASH for sharding

Create a table that is partitioned into table shards in database shards, with each database shard containing three physical tables. The database sharding process calculates the hash by using id as the shard key, and the table sharding process calculates the hash by using bid as the shard key. Specifically, a hash operation is performed on the data of the table based on the id column, to distribute the data to multiple database shards. Then, a hash operation is performed on the data in each database shard based on the bid column, to distribute the data to the three physical tables.

```
CREATE TABLE multi_db_multi_tbl(
  id int auto_increment,
  bid int,
  name varchar(30),
  primary key(id)
) dbpartition by hash(id) tpartition by hash(bid) tpartitions 3;
```
