8.1.2.11.6. Instance types

Instances of different editions, versions, and instance types each perform differently from one another.

ApsaraDB RDS for MySQL instance types

RDS edition	Instance family	Instance type	CPU and memory	Maximum connections	Maximum IOPS	Storage capacity	Zone-disaster recovery deployment

RDS edition	Instance family	Instance type	CPU and memory	Maximum connections	Maximum IOPS	Storage capacity	Zone-disaster recovery deployment
High-availability Edition	Dedicated (X8)	5.6, 5.7, and 8.0 mysql.x8.medium.2	2 cores, 16 GB	2,500	4,500	50–1,000 GB (in 5 GB increments)	Single-data center deployment and dual-data center deployment
		5.6, 5.7, and 8.0 mysql.x8.large.2	4 cores, 32 GB	5,000	9,000	50–1,000 GB (in 5 GB increments)	
		5.6, 5.7, and 8.0 mysql.x8.xlarge.2	8 cores, 64 GB	10,000	18,000	500–3,000 GB (in 5 GB increments)	
		5.6, 5.7, and 8.0 mysql.x8.2xlarge.2	16 cores, 128 GB	20,000	36,000	500–3,000 GB (in 5 GB increments)	
		5.6, 5.7, and 8.0 mysql.x8.4xlarge.2	32 cores, 256 GB	40,000	72,000	1,000–6,000 GB	
		5.6, 5.7, and 8.0 mysql.x8.8xlarge.2	64 cores, 512 GB	80,000	144,000		
	Dedicated	5.6, 5.7, and 8.0 mysql.x4.large.2	4 cores, 16 GB	2,500	4,500	50–1,000 GB (in 5 GB increments)	
		5.6, 5.7, and 8.0 mysql.x4.xlarge.2	8 cores, 32 GB	5,000	9,000	500–3,000 GB (in 5 GB increments)	

RDS edition	d (X4) Instance family	Instance type	CPU and memory	Maximum connections	Maximum IOPS	Storage capacity	Zone-disaster recovery deployment

9.Cloud Native Distributed Database PolarDB-X

9.1. Developer Guide (1.0)

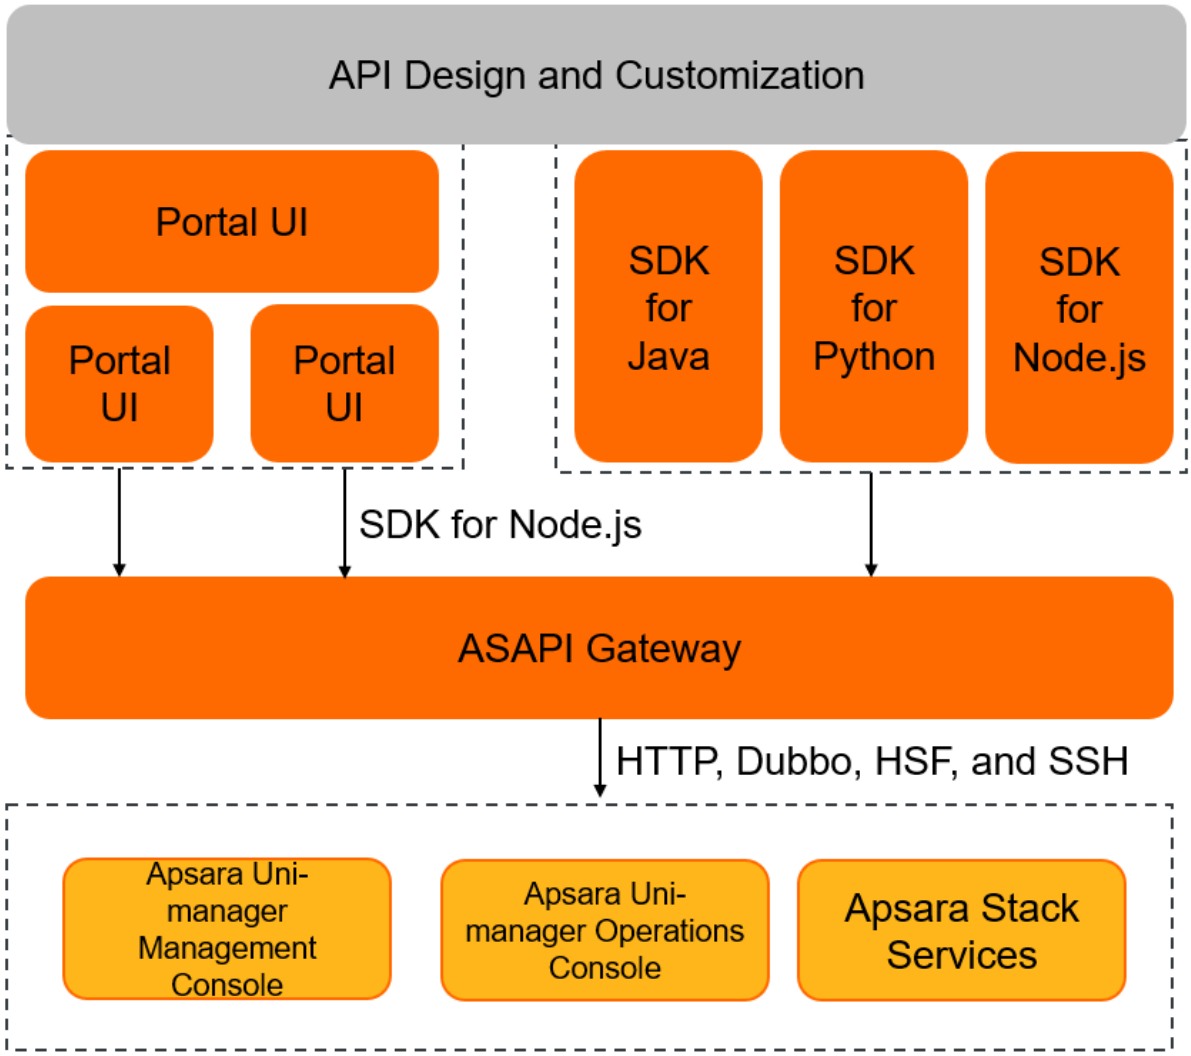
9.1.1. Call SDKs for cloud services by using ASAPI

9.1.1.1. 文档标题缺失，请补全后重新导出

9.1.1.1.1. ASAPI overview

This topic describes the architecture and features of the Apsara Stack API (ASAPI).

The ASAPI is a unified ingress gateway for Apsara Stack services and a main component of the Apsara Uni-manager Management Console. The ASAPI provides a unified method for you to manage and make API calls. You can use Apsara Stack SDK to centrally make API calls to Apsara Stack services, including Elastic Compute Service (ECS) and Virtual Private Cloud (VPC).



The ASAPI allows you to make API calls to manage and maintain Apsara Stack services.

- Make API calls to implement enterprise-grade management. For example, you can manage organizations, users, roles, resource sets, and logon policies. These operations are provided by the Apsara Uni-manager Management Console.
- Make API calls to manage operations. For example, you can manage quotas, usage statistics, specifications, and password policies. These operations are provided by the Apsara Uni-manager Management Console.
- Make API calls to manage resources. For example, you can create, delete, query, or modify cloud resources. These operations are provided by Apsara Stack services. If you call an API operation to create an ECS instance or a VPC, the API operation is provided by ECS or VPC.
- Make API calls to query monitoring metrics of Apsara Stack services. These operations are provided by the Apsara Uni-manager Management Console.
- Make API calls to perform O&M. For example, you can manage monitoring and alerting, inventories, tasks, and physical servers. These operations are provided by the Apsara Uni-manager Operations Console.

For more information, see the developer guide of the corresponding Apsara Stack service. For information about API operations used to manage organization users, see *Apsara Uni-manager Management Console Developer Guide*. For information about the API operation used to create an ECS instance, see *ECS Developer Guide*.

> **Note** If the "Use Apsara Stack SDK to make API calls" section is included in the developer guide of an Apsara Stack service, the ASAPI is supported by the Apsara Stack service. In this case, you can make API calls based on the developer guide.

9.1.1.1.2. Preparations

9.1.1.1.2.1. Log on to the API Tool console

You can log on to the API Tool console from the Apsara Uni-manager Management Console.

Prerequisites

- The URL of the Apsara Uni-manager Management Console is obtained from the deployment personnel before you log on to the Apsara Uni-manager Management Console.
- We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL of the Apsara Uni-manager Management Console. Press the Enter key.
2. Enter your username and password.

   Obtain the username and password that you can use to log on to the console from the operations administrator.

   > **Note** When you log on to the Apsara Uni-manager Management Console for the first time, you must change the password of your username. Your password must meet complexity requirements. The password must be 10 to 32 characters in length and must contain at least two of the following character types:
   >
   > - Uppercase or lowercase letters
   > - Digits
   > - Special characters, which include ! @ # $ %

3. Click **Log On**.
4. In the top navigation bar, choose **Products > Others > API Tool**.

9.1.1.1.2.2. View information about API operations

This topic describes how to view information about API operations. Before you use SDKs, obtain service names, API operation names, and API operation versions.

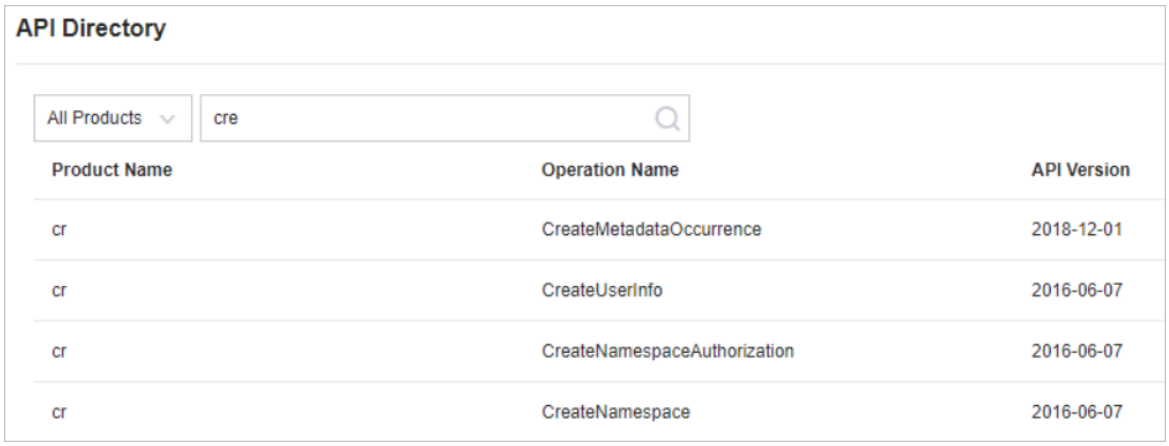
Context

The API operations on the API Directory page are only for reference. For information about how to call

API operations, see developer guides of the corresponding cloud services. If the information on the API Directory page is inconsistent with that in the developer guide of the corresponding cloud service, the information in the developer guide prevails.

Procedure

1. Go to the API Tool console. For more information, see Log on to the API Tool console.
2. In the left-side navigation pane, click **API Directory**.
3. On the **API Directory** page, select the desired service from the drop-down list, enter a keyword of an API operation name in the search box, and then click the search icon.



4. Then, you can view the service name, API operation name, and API operation version.

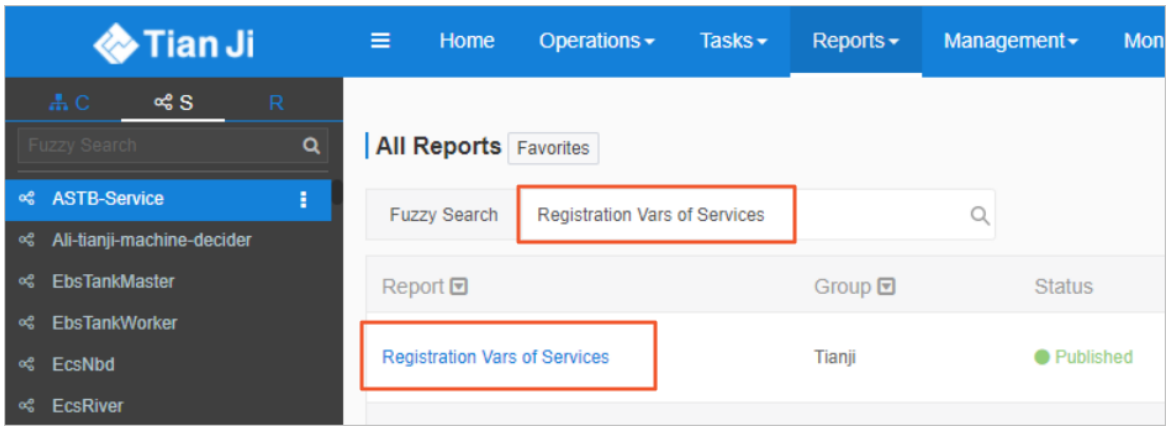
9.1.1.1.2.3. Generate an endpoint for the ASAPI

This topic describes three methods used to generate an endpoint for the Apsara Stack API (ASAPI).

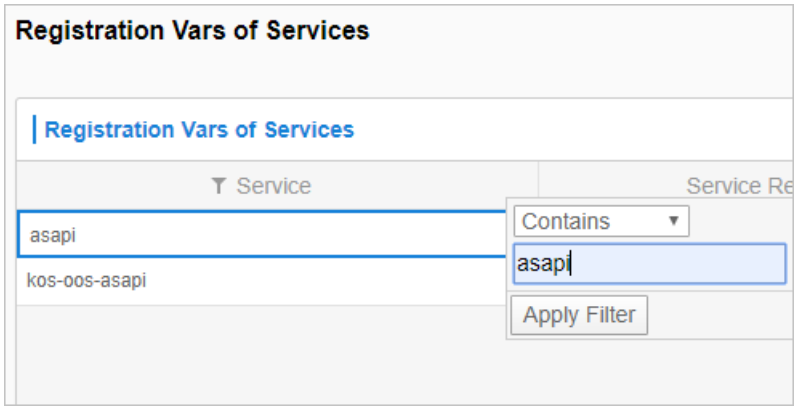
Method 1: Use Registration Vars of Services to generate an endpoint

1. Log on to Apsara Infrastructure Management Framework.
   i. Log on to the Apsara Uni-manager Operations Console.
   ii. In the top navigation bar, click **O&M**.
   iii. In the left-side navigation pane, choose **Product Management** > **Products**.
   iv. In the Apsara Stack O&M section, click **Apsara Infrastructure Management Framework**.
2. In the left-side navigation pane, click **Reports**.

3. On the **All Reports** page, search for `Registration Vars of Services` and click the report name.



4. On the **Registration Vars of Services** page, click the icon next to **Service** and search for `asapi`.



5. Find the asapi service, right-click in the **Service Registration** column, and then select **Show More** from the shortcut menu.

   In the **Details** dialog box, obtain the value of **asapi.public.endpoint**.

6. Generate an endpoint for the ASAPI based on the following format:

```
https://<asapi.public.endpoint>/asapi/v3
```

Method 2: Use cluster resources to generate an endpoint

1. Log on to Apsara Infrastructure Management Framework.
   i. Log on to the Apsara Uni-manager Operations Console.
   ii. In the top navigation bar, click **O&M**.
   iii. In the left-side navigation pane, choose **Product Management** > **Products**.
   iv. In the Apsara Stack O&M section, click **Apsara Infrastructure Management Framework**.
2. Go to the cluster operations page.
   i. In the left-side navigation pane, choose Operations > Cluster Operations.
   ii. In the **Cluster** search box, enter `ascm`.

iii. Find the cluster that you want to manage and click **Operations** in the **Actions** column.

3. Obtain the value of the domain parameter.
   i. Click the Cluster Resources tab.
   ii. In the **Name** field, search for `asapi_dns_public`.
   iii. Click **Details** in the **Application Parameter** column.

   In the **Application Parameter** message, obtain the value of the **domain** parameter.

4. Generate an endpoint for the ASAPI based on the following format:

```
https://<domain>/asapi/v3
```

Method 3: Concatenate strings to generate an endpoint

You can also concatenate strings to generate an endpoint based on the following format:

```
https://public.asapi.<region>.<internet-domain>/asapi/v3
```

> **Note**
>
> 1. Replace <region> with your actual region ID. For information about how to query a region ID, see Query a region ID.
> 2. Replace <internet-domain> with the root domain of your Apsara Stack service. To obtain the root domain, contact Apsara Stack O&M personnel. Take note of this point: Use the internet-domain parameter instead of the intranet-domain parameter.

If the **region** value is `cn-****-****-d01` and the **internet-domain** value is `inter.****.****.com`, the following endpoint can be generated:

```
https://public.asapi.cn-****-****-d01.inter.****.****.com/asapi/v3
```

9.1.1.1.2.4. Obtain Apsara Stack SDKs

The Apsara Stack API (ASAPI) is a unified portal provided by Apsara Stack. You can use the ASAPI to connect to all Apsara Stack services. Apsara Stack provides SDKs for API calls.

For more information about how to obtain Apsara Stack SDKs, see Apsara Stack documentation.

9.1.1.1.2.5. Obtain an AccessKey pair

An AccessKey pair that consists of an AccessKey ID and an AccessKey secret is used to implement symmetric encryption. This helps you verify the identity of a requester. The AccessKey ID is used to identify a user. The AccessKey secret is used to encrypt the signature string. This topic describes how to obtain an AccessKey pair.

Prerequisites

An account of the operations administrator or the level-1 organization administrator is obtained. Only an operations administrator or a level-1 organization administrator can obtain an AccessKey pair.

Context

If you need to make API calls to the Apsara Uni-manager Management Console or other Apsara Stack services, we recommend that you use the AccessKey pair of a personal account. If you use the AccessKey pair of a personal account, configure the request headers that are described in the following table for access control. Otherwise, an error that indicates insufficient permissions can occur.

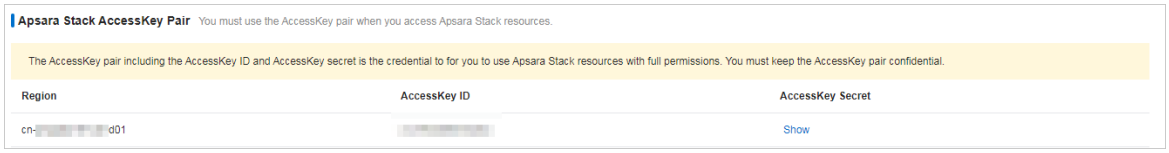
Parameter	Description
x-acs-regionid	The ID of the region, for example, cn-hangzhou-*.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console. For information about how to obtain an organization ID, see the "GetOrganizationList" section in Apsara Uni-manager Management Console Developer Guide.
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console. For information about how to obtain a resource set ID, see the "ListResourceGroup" section in Apsara Uni-manager Management Console Developer Guide.
x-acs-instanceid	The ID of the instance to which you make API calls. If you need to make API calls to an Elastic Compute Service (ECS) instance, obtain the ID of the ECS instance on the Instances page.

Warning The AccessKey pair of a personal account is managed and controlled by the permission system of the Apsara Uni-manage Management Console. If you need to obtain the AccessKey pair of an account that has permissions on an organization, make sure that your operation is allowed by an administrator. This ensures security. The account that has permissions on an organization is a privileged account.

Obtain the AccessKey pair of a personal account

To obtain the AccessKey pair of a personal account, perform the following operations:

1. Log on to the Apsara Uni-manager Management Console.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and click **User Information**.
3. In the **Apsara Stack AccessKey Pair** section, obtain the AccessKey pair.



> **Note** The AccessKey pair that consists of an AccessKey ID and an AccessKey secret is the credential for you to have full permissions on Apsara Stack resources. Keep your AccessKey pair confidential.

Obtain the AccessKey pair of an account that has permissions on an organization

To obtain the AccessKey pair of an account that has permissions on an organization, perform the following operations:

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Organizations**.
4. In the Organizations navigation tree, click the name of the organization that you want to manage.
5. On the right side of the page, click **Obtain AccessKey Pair**.
6. In the message that appears, obtain the AccessKey pair of the account that has permissions on the organization.

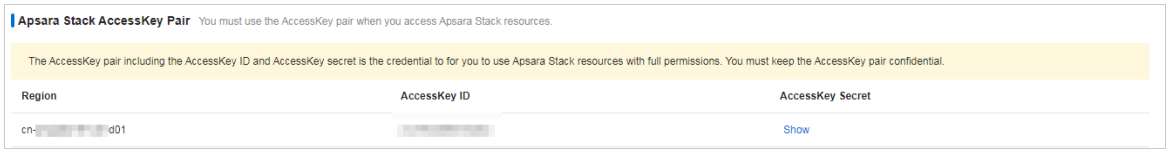
> **Note** The system automatically allocates an AccessKey pair to the account that has permissions on the level-1 organization. The same AccessKey pair is used by the accounts that have permissions on the subordinate organizations.

9.1.1.1.2.6. Query a region ID

When you use Apsara Stack SDK for Node.js to make API calls, specify a region ID. You can obtain a region ID in the Apsara Uni-manager Management Console.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and click **User Information**.
3. In the **Apsara Stack AccessKey Pair** section, view the region ID.



9.1.1.1.3. Common parameters

Common request parameters must be included in all API requests.

Sample common parameters

. .

The following table describes the common parameters that are used when you call API operations supported by the Apsara Stack API (ASAPI).

Parameter	Type	Required	Description
Action	String	Yes	The operation that you want to perform. For more information, see View information about API operations.
Product	String	Yes	The name of the service.
Version	String	Yes	The version of the API operation. For more information, see View information about API operations.
RegionId	String	Yes	The ID of the region. For more information, see Query a region ID.
AccessKeyId	String	Yes	The AccessKey ID used to connect to the service. For more information, see Obtain an AccessKey pair.
Signature	String	Yes	The signature string of the current request. For more information about how signatures are calculated, see Request signatures.
SignatureMethod	String	Yes	The encryption method of the signature string. Valid values: HMAC-SHA1 and HMAC-SHA256.

Parameter	Type	Required	Description
SignatureVersion	String	Yes	The version of the signature encryption algorithm. Valid values: 1.0 and 2.0.
SignatureNonce	String	Yes	A unique, random number used to prevent replay attacks. You must use different numbers for different requests.
Timestamp	String	Yes	The timestamp of the request. Specify the time in the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time must be in UTC. Sample value: 2018-01-01T12:00:00Z.
Format	String	Yes	The format in which to return the response. Set the value to JSON.

> **Note**
>
> The `Signature`, `SignatureMethod`, `SignatureVersion`, `SignatureNonce`, `Timestamp`, and `Format` parameters are encapsulated into Apsara Stack SDK. You do not need to configure these parameters.

9.1.1.1.4. SDK description

9.1.1.1.4.1. Use Apsara Stack SDK for Java to call API operations

This topic describes how to obtain and use Apsara Stack SDK for Java to call API operations.

Prerequisites

- An authorized account and an AccessKey pair are obtained. The AccessKey pair consists of an

AccessKey ID and an AccessKey secret. For more information about how to obtain an AccessKey pair in the Apsara Uni-manager Management Console, see Obtain an AccessKey pair.

- The endpoint of the Apsara Stack API (ASAPI) is obtained. For more information, see Generate an endpoint for the ASAPI.
- Apsara Stack SDK for Java 1.8 or later is installed.

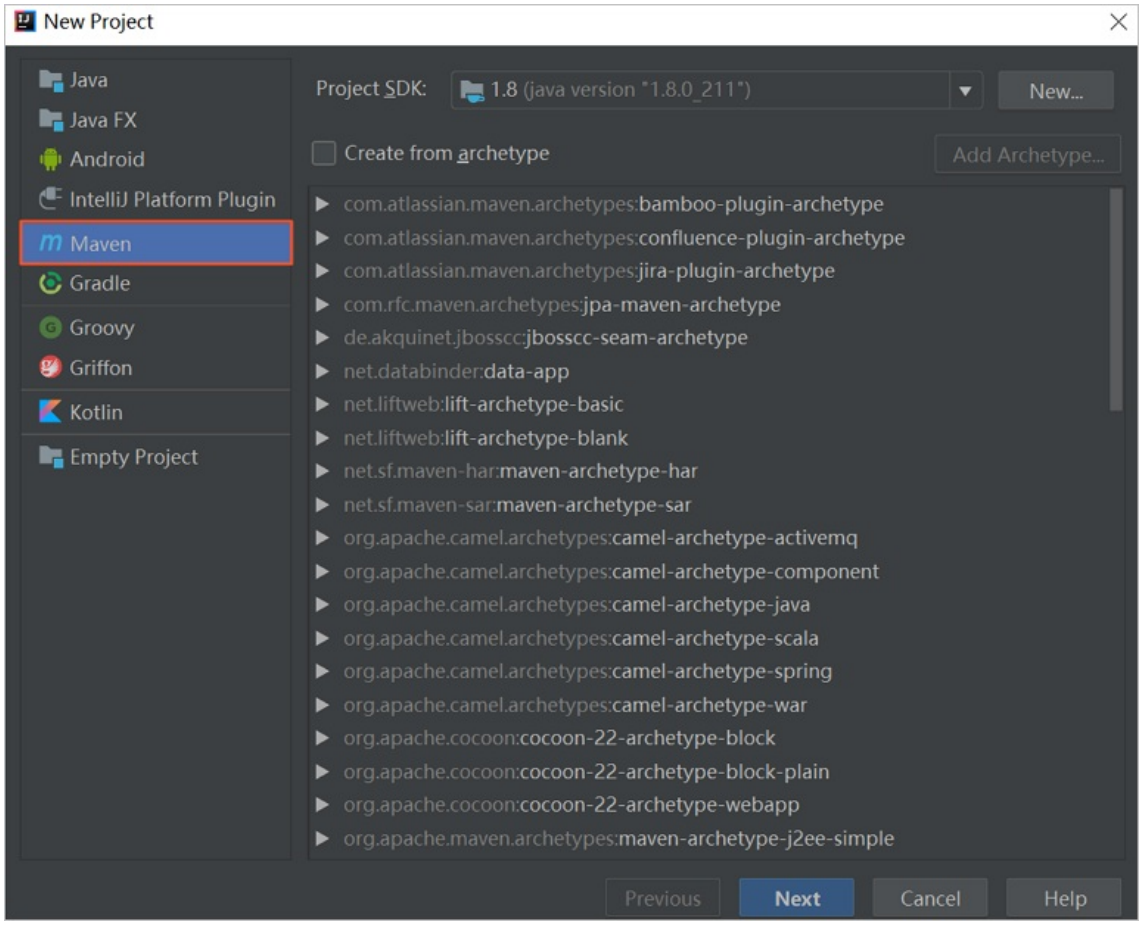
Background information

The help center of Apsara Stack provides Maven dependencies and JAR files for Apsara Stack SDK for Java. You can write code to use Apsara Stack SDK for Java to call API operations.

In this example, the Windows 10 64-bit OS and IntelliJ IDEA are used.

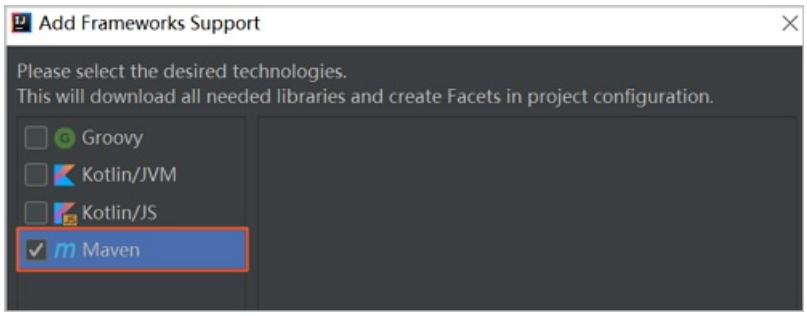
Procedure

1. Use one of the following methods to configure Maven in IntelliJ IDEA. Maven is a tool used for project management.
   - Use Maven that is integrated in IntelliJ IDEA.
   - Download Maven based on the OS that you are using from the official website and configure Maven. For more information, see Download Maven.
2. Obtain the Maven dependencies for Apsara Stack SDK for Java from the official website. For more information about how to obtain the dependencies, see Obtain the core package for ASAPI.
3. Use one of the following methods to create a Maven project:
   - Method 1: Create a Maven project in IntelliJ IDEA.

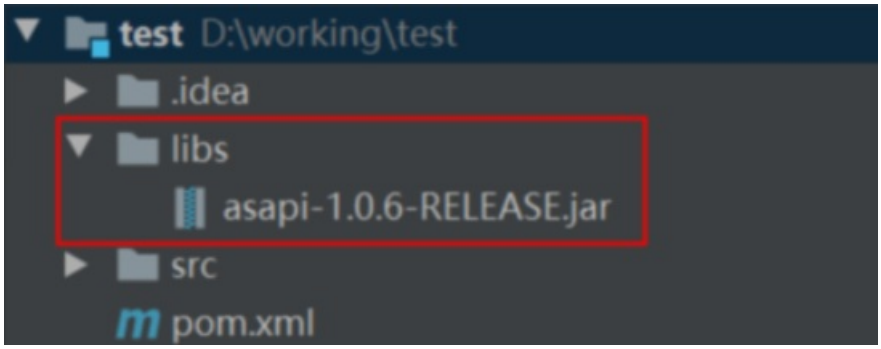


- Method 2: Convert an existing project to a Maven project.
  a. Right-click the project that you want to convert and select **Add Framework Support...**.

  b. Select **Maven** and click **OK**.



4. Create a folder named libs in the root directory of the project. Then, add the JAR file of Apsara Stack SDK for Java to the libs folder, as shown in the following figure.



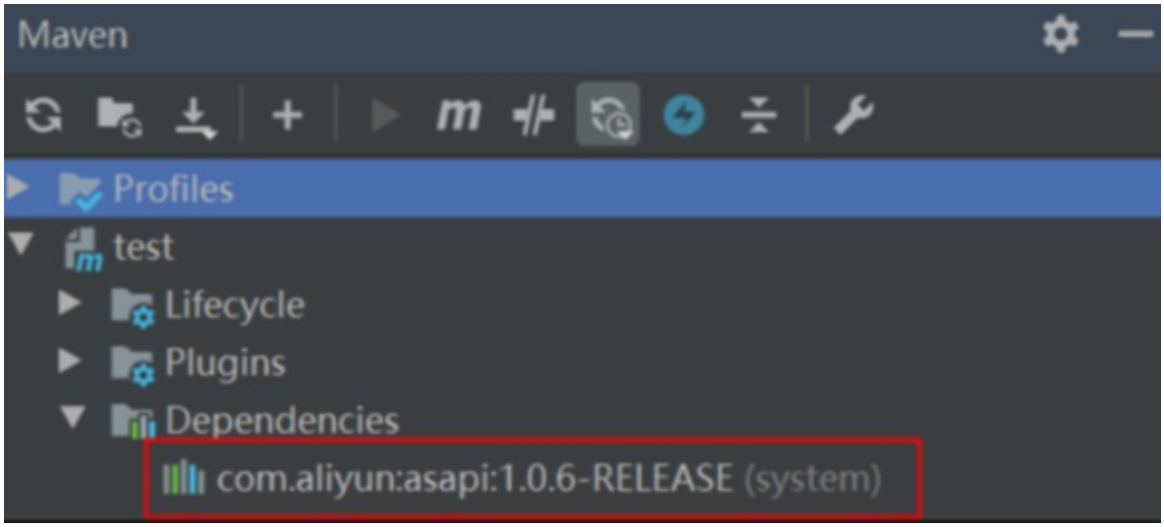
5. Add the dependencies of Apsara Stack SDK for Java to the pom.xml file in the project directory.

```
<dependencies>
    <dependency>
        <groupId>com.aliyun</groupId>
        <artifactId>asapi</artifactId>
        <version>1.0.6-RELEASE</version>
        <scope>system</scope>
        <systemPath>${project.basedir}/libs/asapi-1.0.6-RELEASE.jar</systemPath>
    </dependency>
  <dependency>
        <groupId>com.alibaba</groupId>
        <artifactId>alicrypto-java-aliyun</artifactId>
    <version>1.0.4</version>
    <systemPath>${project.basedir}/libs/alicrypto-java-aliyun-1.0.4.jar</systemPath>
  </dependency>
  <dependency>
    <groupId>com.aliyun</groupId>
    <artifactId>gmsse</artifactId>
    <version>1.1.0</version>
    <systemPath>${project.basedir}/libs/gmsse-1.1.0.jar</systemPath>
  </dependency>
</dependencies>
```

Note Replace `1.0.6-RELEASE` with the actual version of Apsara Stack SDK for Java.

6. On the right side of IntelliJ IDEA, view information in the Maven section.

   If the information in the following figure appears, the dependencies are added.



Use Apsara Stack SDK for Java

You can use the GET or POST method to call API operations provided by the ASAPI. The following sample code shows how to call API operations:

```
// 1. Create a connection to an ASClient object.
ASClient client = new ASClient();
// 2. Configure the identifier of the requester. This parameter is required and used only f
or identification. You can set this parameter to a random value.
client.setSdkSource("<The identifier of the requester>");
Map<String, Object> parameters = new HashMap<String, Object>();
// 3. Configure the parameters for authorization. The parameter values vary based on your e
nvironment.
// The AccessKey ID of your Apsara Stack tenant account.
parameters.put("AccessKeyId","<AccessKey ID>");
// The AccessKey secret of your Apsara Stack tenant account.
parameters.put("AccessKeySecret", "<AccessKey Secret>");
// The ID of the region.
parameters.put("RegionId", "<your RegionID>");
// 4. Configure parameters for an API call. In this example, the Product, Action, and Versi
on parameters are configured.
parameters.put("Product", "<The name of the service>");
parameters.put("Action", "<The name of the API operation>");
parameters.put("Version", "<The version of the API operation>");
// 5. Configure operation-specific parameters.
parameters.put("<The name of the operation-specific parameter>", "<The value of the operati
on-specific parameter>");
// 6. Configure request headers and the encryption method for the signature string. Valid v
alues of the SignatureMethod parameter: HMAC-SHA1 and HMAC-SHA256. By default, HMAC-SHA256
is used.
Map<String, String> headers = new HashMap<String, String>();
//headers.put("SignatureMethod", "HMAC-SHA1");
headers.put("x-acs-regionid", "<your-regionid>");
headers.put("x-acs-resourcegroupid", "<your-resourcegroupid>");
headers.put("x-acs-organizationid", "<your-organizationid>");
headers.put("x-acs-instanceid", "<your-instanceid>");
// 7. Make an API call. We recommend that you use the doPost() method.
// Configure the time-out period for a connection.
//client.setConnectTimeout(10000);
// Configure the time-out period for a request.
// client.setSocketTimeout(10000);
String result = client.doPost(endpoint, headers, parameters);
System.out.println(result);
```

Configure a proxy

If you need to use a proxy to make API calls, use the following sample code to configure the proxy:

```
Cloud cloud = new Cloud();
// Configure the IP address of the proxy.
cloud.setConfig("proxy_host", "<IP>");
// Configure the port used by the proxy.
cloud.setConfig("proxy_port", "<Port>");
// 1. Create a connection to an ASClient object.
ASClient client = new ASClient(cloud);
```

Request headers

Parameter	Description
x-acs-regionid	The ID of the region. For more information about how to obtain a region ID, see Query the region ID.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console.
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console.
x-acs-instanceid	The ID of the instance to which you make API calls.

9.1.1.1.4.2. Use Apsara Stack SDK for Python to call API operations

This topic describes how to use Apsara Stack SDK for Python to call API operations provided by the Apsara Stack API (ASAPI).

Preparations

- An authorized account and an AccessKey pair are obtained. The AccessKey pair consists of an AccessKey ID and an AccessKey secret. For more information about how to obtain an AccessKey pair in the Apsara Uni-manager Management Console, see Obtain an AccessKey pair.
- The endpoint of the ASAPI is obtained. For more information, see Generate an endpoint for the ASAPI.

Install Apsara Stack SDK for Python

1. Download the required version of Apsara Stack SDK for Python. For more information, see Obtain Apsara Stack SDKs.
2. Upload the compressed file of Apsara Stack SDK for Python to the host from which you want to send API requests and extract the file. Then, run the following code in the directory of the extracted files to install Apsara Stack SDK for Python:

```
# Install Apsara Stack SDK for Python 2.x.
pip install aliyun-python2-sdk-asapi-2.4.7.tar.gz
# Install Apsara Stack SDK for Python 3.x.
pip3 install aliyun-python3-sdk-asapi-2.4.7.tar.gz
```

> **Note**
>
> Replace `2.4.7` with the actual version of Apsara Stack SDK for Python.

Sample requests

You can use the GET or POST method to call API operations provided by the ASAPI.

```
    # 1. Import dependencies.
    from aliyunsdkasapi.ASClient import ASClient
    from aliyunsdkasapi.AsapiRequest import AsapiRequest

    if __name__ == '__main__':
     # 2. Create a request. The Product parameter specifies the name of the service. The Ver
sion parameter specifies the version of the API operation. The Action parameter specifies t
he operation that you want to perform. The asapi-endpoint parameter specifies the endpoint
of the ASAPI.
     req = AsapiRequest("<Product>", "<Version>", "<Action>", "<asapi-endpoint>")
     # 3. Configure operation-specific parameters.
     req.add_body_params("<key>", "<value>")
     # 4. Configure request headers.
     req.add_header("x-acs-resourcegroupid", "<your-resourcegroupid>");
     req.add_header("x-acs-organizationid", "<your-organizationid>");
     req.add_header("x-acs-regionid", "<your-regionid>");
     req.add_header("x-acs-instanceid", "<your-instanceid>");
     # 5. Configure a request method.
     req.set_method("POST")
     # 6. Configure initialization parameters for an ASClient object. The parameter values v
ary based on your environment. The timeout parameter specifies the time-out period for a re
quest. The cert_file parameter specifies the certificate. The verify parameter specifies wh
ether to verify the certificate.
     as_client = ASClient("<accesskeyid>", "<accesskeysecret>", "<regionid>",timeout=1000,
             cert_file=None,
             verify=False)
     # Configure the identifier of the requester. This parameter is required and used only f
or identification. You can set this parameter to a random value.
     as_client.setSdkSource("<The identifier of the requester>")
     response = as_client.do_request(req)
     print(response)
```

Request headers

Parameter	Description
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console.
x-acs-regionid	The ID of the region. For more information about how to obtain a region ID, see Query a region ID.
x-acs-instanceid	The ID of the instance to which you make API calls.

Configure a proxy

Perform the following steps to configure a proxy:

1. Import OS dependencies.

```
import os
```

2. Configure one or more proxies.

```
# Before you make an API call, configure one or more proxies.
os.environ['http_proxy'] = "http://x.x.x.x:xxxx"
os.environ['https_proxy'] = "https://x.x.x.x:xxxx"
```

9.1.1.1.4.3. Use Apsara Stack SDK for Node.js to call API operations

This topic describes how to obtain and use Apsara Stack SDK for Node.js to call API operations.

Preparations

- An authorized account and an AccessKey pair are obtained. The AccessKey pair consists of an AccessKey ID and an AccessKey secret. For more information about how to obtain an AccessKey pair in the Apsara Uni-manager Management Console, see Obtain an AccessKey pair.
- The endpoint of the Apsara Stack API (ASAPI) is obtained. For more information, see Generate an endpoint for the ASAPI.
- A region ID is obtained. For more information about how to obtain a region ID, see Query the region ID.

Add dependencies

Run the following command to install Apsara Stack SDK for Node.js:

```
tnpm install --save @ali/asapi-nodejs-sdk
```

Use Apsara Stack SDK for Node.js

The following sample code shows how to use Apsara Stack SDK for Node.js to make API calls:

```
// 1. Import the dependencies of Apsara Stack SDK for Node.js.
const Controller = require('egg').Controller;
const ASAPIClient = require('@ali/asapi-nodejs-sdk');
// 2. Configure the parameters.
const cnofig = {
    API_GATEWAY: '<The endpoint of the ASAPI>',
    regionId: '<The ID of the region in which the Apsara Stack service is deployed>',
    accessKeyId: '<The AccessKey ID of your Apsara Stack tenant account>',
    accessKeySecret: '<The AccessKey secret of your Apsara Stack tenant account>'
};
// 3. Initialize a client for API calls.
const AsapiClient = new ASAPIClient(cnofig, this.ctx);
// 4. Configure request parameters.
const params = {
    "Action": "<The name of the API operation>",
    "Product": "<The name of the service that provides the API operation>",
    "Version": "<The version of the API operation>",
    "regionId": '<The ID of the region in which the Apsara Stack service is deployed>',
      "<The name of the operation-specific parameter required by the API operation>": "<The
value of the operation-specific parameter>"
}
// 5. Configure request headers.
AsapiClient.addHeader('x-acs-caller-sdk-source', '<The identifier of the requester>')
AsapiClient.addHeader('x-acs-roleid', '<The ID of the role>')
AsapiClient.addHeader('x-acs-userid', '<The ID of the user>')
AsapiClient.addHeader('x-acs-organizationid', '<your-organizationid>')
AsapiClient.addHeadert("x-acs-regionid", "<your-regionid>");
AsapiClient.addHeader("x-acs-resourcegroupid", "<your-resourcegroupid>");
AsapiClient.addHeader("x-acs-instanceid", "<your-instanceid>");
// 6. Make an API call and obtain the response.
try {
  const res = await AsapiClient.doRequest(cnofig.API_GATEWAY, params, {
    method: 'POST', // The request method.
    formatParams: false, // Specifies whether to format parameters and capitalize the first
letter of each parameter.
    enableProxy: true, // Specifies whether to configure a proxy.
    proxy: 'http://x.x.x.x:xxxx',
    timeout: 10000, // The time-out period.
  // ca: , // The certificate issued by a certificate authority (CA). For more information,
visit https://nodejs.org/api/https.html#https_https_request_options_callback.
  })
  console.log(res)
} catch (e) {
  console.log(e)
}
```

Disable certificate validation

The following sample code shows how to disable certificate validation:

```
Configure the environment variable.
NODE_TLS_REJECT_UNAUTHORIZED=0
```

Request headers

Parameter	Description
x-acs-regionid	The ID of the region. For more information about how to obtain a region ID, see Query the region ID.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console.
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console.
x-acs-instanceid	The ID of the instance to which you make API calls.
x-acs-caller-sdk-source	The custom name of the requester or the system. This parameter is used to identify the source of the API request.
x-acs-roleid	The ID of the role.
x-acs-userid	The ID of the user.

9.1.1.1.4.4. SDK for POP

SDK for Java

Before you use Apsara Stack API (ASAPI) SDK for POP for Java to access ASAPI, you must know the remote procedure call (RPC) and resource-oriented architecture (ROA) styles that are supported for API calls. ASAPI is compatible with both styles. Their difference lies in the ASAPI endpoints that are used for API calls.

Prerequisites

- An Alibaba Cloud SDK package is downloaded for the service that you want to access. The required dependencies are installed.
- SSL certificate validation is ignored for requests over HTTPS.

Background information

ASAPI supports only the HTTPS request protocol.

Difference between two styles

When you use the RPC or ROA style to make API calls, take note that the two styles use different ASAPI endpoints.

```
# ASAPI endpoint for the RPC style:
public.asapi.<global:region>.<global:internet-domain>/asapi/v3
# ASAPI endpoint for the ROA style:
public.asapi.<global:region>.<global:internet-domain>/asapi/v3/roa
```

Call examples

The following sample code provides an example on how to use the RPC style to make an API call. In this example, the DescribeInstances operation of Elastic Compute Service (ECS) is called, and the API version is 2014-05-26.

Sample code:

```
package com.aliyuns.client.pop.ecs;

import com.aliyuncs.DefaultAcsClient;
import com.aliyuncs.ecs.model.v20140526.DescribeInstancesRequest;
import com.aliyuncs.ecs.model.v20140526.DescribeInstancesResponse;
import com.aliyuncs.http.HttpClientConfig;
import com.aliyuncs.http.ProtocolType;
import com.aliyuncs.profile.DefaultProfile;

import java.util.List;

public class DescribeInstancesTest {
    public static void main(String[] args) {
        // Specify the endpoint of ASAPI.
        String endpoint = "public.asapi.<global:region>.<global:internet-domain>/asapi/v3";
        // Specify the region where the ECS service resides.
        String region = "<global:region>";
        // Specify the name of the service that you want to access.
        String product = "ECS";
        // Specify your AccessKey pair.
        String ak = "<accessKeyId>";
        String sk = "<accessKeySecret>";
        try {
            DefaultProfile clientProfile = DefaultProfile.getProfile(region, ak, sk);
            // Ignore SSL certificate validation.
            HttpClientConfig clientConfig = HttpClientConfig.getDefault();
            clientConfig.setIgnoreSSLCerts(true);
            // Set the connection timeout period.
            clientConfig.setConnectionTimeoutMillis(3000L);
            // Set the read timeout period.
            clientConfig.setReadTimeoutMillis(10000L);
            clientProfile.setHttpClientConfig(clientConfig);
            // Create a connection.
            DefaultAcsClient acsClient = new DefaultAcsClient(clientProfile);
            // Create a request.
            DescribeInstancesRequest request = new DescribeInstancesRequest();
            // Specify the endpoint of ASAPI.
            request.setSysEndpoint(endpoint);
            // Specify the name of the service that you want to access and the region where
the service resides.
            request.setSysLocationProduct(product);
            request.setSysRegionId(region);
            // Set the request protocol to HTTPS.
            request.setSysProtocol(ProtocolType.HTTPS);
            DescribeInstancesResponse result =  acsClient.getAcsResponse(request);
            List<DescribeInstancesResponse.Instance> instances = result.getInstances();
            for (DescribeInstancesResponse.Instance instance: instances) {
                System.out.println(instance.getInstanceId());
                System.out.println(instance.getInstanceName());
```

```
            }

        } catch (Exception e) {
            e.printStackTrace();
        }
    }
}
```

The following sample code provides an example on how to use the ROA style to make an API call. In this example, the GetNamespaceList operation of Container Registry is called, and the API version is 2016-06-07.

Sample code:

```
package com.aliyuns.client.pop.cr;

import com.aliyuncs.CommonRequest;
import com.aliyuncs.CommonResponse;
import com.aliyuncs.DefaultAcsClient;
import com.aliyuncs.IAcsClient;
import com.aliyuncs.exceptions.ClientException;
import com.aliyuncs.exceptions.ServerException;
import com.aliyuncs.http.FormatType;
import com.aliyuncs.http.HttpClientConfig;
import com.aliyuncs.http.MethodType;
import com.aliyuncs.http.ProtocolType;
import com.aliyuncs.profile.DefaultProfile;

public class GetNamespaceListTest {
    public static void main(String[] args) {
        // Specify the endpoint of ASAPI.
        String endpoint = "public.asapi.<global:region>.<global:internet-domain>/asapi/v3/roa";
        // Specify the region where the Container Registry service resides.
        String region = "<global:region>";
        // Specify the name of the service that you want to access.
        String product = "cr";
        // Specify your AccessKey pair.
        String ak = "<accessKeyId>";
        String sk = "<accessKeySecret>";
        DefaultProfile profile = DefaultProfile.getProfile(region, ak, sk);
        // Ignore SSL certificate validation.
        HttpClientConfig clientConfig = HttpClientConfig.getDefault();
        clientConfig.setIgnoreSSLCerts(true);
        // Set the connection timeout period.
        clientConfig.setConnectionTimeoutMillis(3000L);
        // Set the read timeout period.
        clientConfig.setReadTimeoutMillis(10000L);
        profile.setHttpClientConfig(clientConfig);
        // Create a connection for the client.
        IAcsClient client = new DefaultAcsClient(profile);
        // Create a request.
        CommonRequest request = new CommonRequest();
        // Set the request protocol to HTTPS.
```

```
        request.setSysProtocol(ProtocolType.HTTPS);
        // Specify the request method.
        request.setSysMethod(MethodType.GET);
        // Specify the endpoint of ASAPI.
        request.setSysDomain(endpoint);
        // Specify the version of the API.
        request.setSysVersion("2016-06-07");
        // Specify the pattern of the uniform resource identifier (URI).
        request.setSysUriPattern("/namespace");
        // Specify the name of the service that you want to access and the region where the
service resides.
        request.setSysLocationProduct(product);

        request.putHeadParameter("Content-Type", "application/json");
        String requestBody = "" +
                "{}";
        request.setHttpContent(requestBody.getBytes(), "utf-8", FormatType.JSON);
        try {
            CommonResponse response = client.getCommonResponse(request);
            System.out.println(response.getData());
        } catch (ServerException e) {
            e.printStackTrace();
        } catch (ClientException e) {
            e.printStackTrace();
        }
    }
}
```

> **Notice**
>
> If you send a request over HTTPS, you must enable the request to ignore SSL certificate validation.

SDK for Go

This topic describes how to use Apsara Stack API (ASAPI) SDK for POP for Go.

Prerequisites

An Alibaba Cloud SDK package is downloaded for the service that you want to access. The required dependencies are installed.

Background information

Only the remote procedure call (RPC) style is supported for API calls.

Call examples

The following sample code provides an example on how to make an API call. In this example, the DescribeInstances operation of Elastic Compute Service (ECS) is called, and the API version is 2014-05-26.

Sample code:

```
package main
```

```
import (
 "fmt"
 "time"

 "github.com/aliyun/alibaba-cloud-sdk-go/sdk"
 "github.com/aliyun/alibaba-cloud-sdk-go/sdk/auth/credentials"
 "github.com/aliyun/alibaba-cloud-sdk-go/sdk/requests"
 "github.com/aliyun/alibaba-cloud-sdk-go/sdk/responses"
)

func getSdkConfig() *sdk.Config {
 return sdk.NewConfig().
  WithTimeout(time.Duration(30) * time.Second).
  WithEnableAsync(true).
  WithGoRoutinePoolSize(100).
  WithMaxTaskQueueSize(10000).
  WithDebug(false).
  WithScheme("HTTP")
}

func main(){
 ak := "<The AccessKey ID of your Apsara Stack tenant account.>"
 sk := "<The AccessKey secret of your Apsara Stack tenant account.>"
 regionId := "<The region where the ECS service resides.>"
 endpoint := "<The endpoint of ASAPI.>" // No network protocol.
 request := requests.NewCommonRequest()
  request.SetReadTimeout(10 * time.Second) // Set the read timeout period of the request to
10 seconds.
  request.SetConnectTimeout(5 * time.Second)  // Set the connection timeout period of the r
equest to 5 seconds.
 request.Method = requests.GET
 request.Domain = endpoint         // Location Service will not be enabled if the host is s
pecified. For example, the service with a certification type-bearer token must be specified
.
 request.Version = "2014-05-26"            // Specify the version of the API.
 request.Scheme = "https"                // Specify the request protocol. Default value: ht
tp.
 request.ApiName = "DescribeInstances"
 request.QueryParams["Product"] = "Ecs"  // Specify the name of the service that you want t
o access.
 request.TransToAcsRequest()
 client, err := sdk.NewClientWithOptions(regionId,getSdkConfig(),credentials.NewAccessKeyCr
edential(ak,sk))
 // If relevant parameters are not set for the request, the client settings are used.
  //client.SetReadTimeout(10 * time.Second)              // Set the read timeout period of
the client to 10 seconds.
 //client.SetConnectTimeout(5 * time.Second)            // Set the connection timeout perio
d of the client to 5 seconds.
  resp := responses.BaseResponse{}
  err = client.DoAction(request, &resp)
    if err != nil {
        panic(err)
    }
 fmt.Print(endpoint)
```

```
}
```

Configure proxies

You can configure proxies in one of the following ways:

- Configure proxies by using environment variables.

  Set the HTTP_PROXY and HTTPS_PROXY environment variables, or set the NO_PROXY environment variable.

  Sample code:

```
import (
    "os"
)
func main(){
 os.Setenv("HTTP_PROXY", "http://x.x.x.x:xxxx") // Set the HTTP_PROXY environment variable.
 os.Setenv("HTTPS_PROXY", "https://x.x.x.x:xxxx") // Set the HTTPS_PROXY environment variable.
}
```

- Configure proxies on the client.

  Sample code:

```
// The proxies that are configured on the client take precedence over those that are configured by using environment variables.
client.SetHttpProxy("http://x.x.x.x:xxxx")    // Configure the HTTP proxy.
client.GetHttpProxy()                           // Query the HTTP proxy.

client.SetHttpsProxy("https://x.x.x.x:xxxx")    // Configure the HTTPS proxy.
client.GetHttpsProxy()                            // Query the HTTPS proxy.

client.SetNoProxy("127.0.0.1,localhost")      // Configure the proxy whitelist.
client.GetNoProxy()                           // Query the proxy whitelist.
```

SDK for Python

This topic describes how to use Apsara Stack API (ASAPI) SDK for POP for Python.

Prerequisites

An Alibaba Cloud SDK package is downloaded for the service that you want to access. The required dependencies are installed.

Background information

Only the remote procedure call (RPC) style is supported for API calls.

Call examples

The following sample code provides an example on how to make an API call. In this example, the DescribeInstances operation of Elastic Compute Service (ECS) is called, and the API version is 2014-05-26.

Sample code:

```
from aliyunsdkcore.client import AcsClient
from aliyunsdkcore.acs_exception.exceptions import ClientException
from aliyunsdkcore.acs_exception.exceptions import ServerException
from aliyunsdkecs.request.v20140526 import DescribeInstancesRequest
import os

# Create an AcsClient instance.
client = AcsClient(
   "<your-access-key-id>",
   "<your-access-key-secret>",
   "<your-region-id>",

   timeout=1000,  # Set the timeout period.
    verify=False, # Ignore certificate validation. or verify='<The location where the certi
ficate is stored.>'
);
# Set the following parameters for the HTTPS request protocol:
# client.set_verify(False)
# os.environ["HTTPS_PROXY"] = "http://127.0.0.1:8080"

# os.environ["HTTP_PROXY"] = "http://127.0.0.1:8080"
def hello_ecs_instance():
    # Create a request and set the parameters.
    request = DescribeInstancesRequest.DescribeInstancesRequest()

    params = {"PageNumber":"1", "Product":"Ecs","Version": "2014-05-26","Action": "Describe
Instances"};
    request.set_body_params(params)
    # The endpoint that contains no network protocol is in the following format: ASAPI doma
in name/asapi/v3.
    request.set_endpoint('<The endpoint of ASAPI.>')
    # Set the following parameter if the endpoint contains no network protocol:
    request.set_protocol_type("https")

    request.set_PageSize(10)
    # Initiate the API request and obtain the response.
    response = client.do_action_with_exception(request)
    print(response)

if __name__ == '__main__':
    print("Hello Aliyun OpenApi!")
    hello_ecs_instance()
```

Configure proxies

Set the HTTP_PROXY and HTTPS_PROXY environment variables.

Sample code:

```
# Configure the HTTPS proxy.
os.environ["HTTPS_PROXY"] = "http://x.x.x.x:xxxx"

# Configure the HTTP proxy.
os.environ["HTTP_PROXY"] = "https://x.x.x.x:xxxx"
```

9.1.1.1.5. HTTP requests

9.1.1.1.5.1. Overview

This topic describes how to make API requests and is intended for users who use API URLs to initiate HTTP GET requests.

If you are using an SDK to initiate requests, you can skip this topic.

The request URL consists of different parameters and has a fixed syntax. The URL contains common request parameters, your signature, and operation-specific parameters. Sample request URLs are provided for each API operation. These URLs are not encoded to make them easy to read. Before you make a request, you must encode the request URL. After the authentication process is complete based on your signature, the results are returned to you. Response parameters are returned if the call is successful, whereas an error message is returned if the call fails. You can troubleshoot issues based on the error message.

9.1.1.1.5.2. Request syntax

The Apsara Stack API (ASAPI) allows you to call API operations by sending HTTP GET requests based on URLs. Each URL must include request parameters. This topic describes the syntax of HTTP GET requests and provides the endpoint of the ASAPI.

Sample request

GetOrganizationList is used in the following unencoded URL request:

```
https://public.asapi.aliyuns.com/asapi/v3?Action=GetOrganizationList&Product=ascm&Version=2019-05-10&Id=<Organization ID>&<Common parameters>
```

- `https`: the protocol used to transmit the request.
- `public.asapi.aliyuns.com/asapi/v3`: the endpoint of the ASAPI.
- `Action=GetOrganizationList Product=ascm Version=2019-05-10`: the API operation to call.
- `Id`: the ID of the organization.
- `<Common parameters>`: the common parameters specified in the system.

Protocol

The ASAPI supports only HTTPS.

Endpoint

For more information about how to obtain an endpoint, see Generate an endpoint for the ASAPI.

Parameter

To specify an API operation, use the `Action, Product, and Version` parameters. For example, set `Action` to GetOrganizationList, Product to ascm, and Version to 2019-05-10. You must also specify other operation-specific parameters and common parameters. For more information, see Common parameters.

9.1.1.1.5.3. Request signatures

This topic describes how to sign HTTP API requests. ASAPI uses the request signature to verify the identity of the request sender. ASAPI implements symmetric encryption by using an AccessKey pair to verify the identity of the request sender.

> **Note**
>
> - An AccessKey pair consists of an AccessKey ID and an AccessKey secret, which are issued to each user or organization in the Apsara Uni-manager Management Console.
> - The AccessKey ID is used to verify identities of users, and the AccessKey secret is used to encrypt and verify signature strings. You must keep your AccessKey secret confidential.
> - ASAPI provides SDKs for Node.js, Python, and Java to facilitate complex signature calculation. For more information, see Obtain the core package for ASAPI.

Step 1: Create a canonicalized query string

1. Arrange the request parameters in alphabetical order, including all common and operation-specific parameters except the `Signature` parameter.

   > **Note**
   >
   > If you use the GET method to send a request,these parameters are connected by ampersands (&) and included in the request URL. The first request parameter follows a question mark (?).

2. Encode the request parameters and their values in UTF-8 based on RFC 3986. The following rules apply in the encoding process:
   - Letters, digits, and special characters such as hyphens (`-`), underscores (`_`), and periods (`.`) do not need to be encoded.
   - Other characters must be percent encoded in the `%XY` format. `XY` represents the ASCII code of the characters in hexadecimal notation. For example, double quotation marks (`"`) are encoded as `%22` .

- Extended UTF-8 characters are encoded in the `%XY%ZA...` format.
- Spaces must be encoded as `%20`. Do not encode spaces as plus signs (`+`).

  This encoding method is similar to but different from the `application/x-www-form-urlencoded` MIME encoding algorithm.

  If you use `java.net.URLEncoder` from the Java standard library, use `percentEncode` to encode request parameters and their values. In the encoded query string, replace the plus signs (`+`) with `%20` , asterisks (`*`) with `%2A` , and `%7E` with tildes (`~`). This way, you can obtain an encoded string that matches the preceding encoding rules.

  ```
  private static final String ENCODING = "UTF-8";
  private static String percentEncode(String value) throws UnsupportedEncodingException
  {
      return value != null ? URLEncoder.encode(value, ENCODING).replace("+", "%20").rep
  lace("*", "%2A").replace("%7E", "~") : null;
  }
  ```

3. Use equal signs (`=`) to connect the encoded request parameters and their values.
4. Use ampersands (`&`) to connect the encoded request parameters. These parameters must be arranged in the same order as those in Step 1.

Then, a canonicalized query string that follows the request structure is obtained. For more information, see Request structure.

Step 2: Create a string-to-sign

1. Create a `string-to-sign` . You can also use `percentEncode` to encode the canonicalized query string created in Step 1 based on the following rules:

   ```
   StringToSign=
       HTTPMethod + "&" + //HTTPMethod: the HTTP method that is used to send a request, su
   ch as GET.
       percentEncode("/") + "&" + //percentEncode("/"): Encode the forward slash (/) in UT
   F-8 as %2F.
       percentEncode(CanonicalizedQueryString) // Encode the canonicalized query string cr
   eated in Step 1.
   ```

2. Calculate the RFC 2104-compliant HMAC-SHA1 or HMAC-256 value of `StringToSign` . In the following example, Java Base64 is used:

   ```
   String signature = Base64.getEncoder().encodeToString(signData);
   ```

> **Note**
>
> When you calculate the signature, the key value specified by RFC 2104 is your `AccessKey secret` plus an ampersand (&), which has an ASCII value of 38. For more information, see Obtain an AccessKey pair.

3. Encode the `Signature` parameter based on RFC 3986 and add it to the canonicalized query string.

Example 1: Concatenate parameters

`GetOrganizationList` is used in this example to query regions. For example, `AccessKeyID` is set to testid and `AccessKeySecret` is set to testsecret. Perform the following operations:

1. Construct a canonicalized query string.

```
https://public.asapi.aliyuns.com/asapi/v3/?AccessKeyId=testid&Action=GetOrganizationList&Format=JSON&Id=1&Product=ascm&RegionId=cn-region-test&SignatureMethod=HMAC-SHA1&SignatureNonce=43967c6e-e3ad-44fa-b06b-fcf3db5f39d2&SignatureVersion=1.0&Timestamp=2020-09-15T08%3A50%3A40Z&Version=2019-05-10
```

2. Create a `string-to-sign` .

```
GET&%2F&AccessKeyId%3Dtestid%26Action%3DGetOrganizationList%26Format%3DJSON%26Id%3D1%26Product%3Dascm%26RegionId%3Dcn-region-test%26SignatureMethod%3DHMAC-SHA1%26SignatureNonce%3D43967c6e-e3ad-44fa-b06b-fcf3db5f39d2%26SignatureVersion%3D1.0%26Timestamp%3D2020-09-15T08%253A50%253A40Z%26Version%3D2019-05-10
```

3. Calculate the signature.

   Calculate the signature. The key value used for calculation is `testsecret&` because `AccessKeySecret` is set to testsecret. The calculated signature is `OLeaidS1JvxuMvnyHOwuJ+uX5qY=` . Java Base64 is used in the following sample code:

   `String signature = Base64.getEncoder().encodeToString(signData);` Encode `Signature=hvqv9Ll5RE6kQ4YsQXFAf9VuRIY=` based on RFC 3986 and add it to the canonicalized query string.

```
https://public.asapi.aliyuns.com/asapi/v3/?AccessKeyId=testid&Action=GetOrganizationList&Format=JSON&Id=1&Product=ascm&RegionId=cn-region-test&SignatureMethod=HMAC-SHA1&SignatureNonce=43967c6e-e3ad-44fa-b06b-fcf3db5f39d2&SignatureVersion=1.0&Timestamp=2020-09-15T08%3A50%3A40Z&Version=2019-05-10
```

You can use browsers or tools such as cURL and Wget to initiate an HTTP request for calling the `DescribeRegions` operation to query the Alibaba Cloud region list.

Example 2: Use the standard library of the programming language

`GetOrganizationList` is used in this example to query regions. For example, `AccessKeyID` is set to testid, `AccessKeySecret` is set to testsecret, and all request parameters are stored in a Java `Map<String, String>` object.

1. Predefine an encoding method.

```
private static final String ENCODING = "UTF-8";
private static String percentEncode(String value) throws UnsupportedEncodingException {
        return value != null ? URLEncoder.encode(value, ENCODING).replace("+", "%20").r
eplace("*", "%2A").replace("%7E", "~") : null;
}
```

2. Predefine the time format for the `Timestamp` parameter. Specify the `Timestamp` parameter in the ISO 8601 format. The time must be in UTC+0.

```
private static final String ISO8601_DATE_FORMAT = "yyyy-MM-dd'T'HH:mm:ss'Z'";
private static String formatIso8601Date(Date date) {
    SimpleDateFormat df = new SimpleDateFormat(ISO8601_DATE_FORMAT);
    df.setTimeZone(new SimpleTimeZone(0, "GMT"));
    return df.format(date);
}
```

3. Create a request string.

```
final String HTTP_METHOD = "GET";
Map parameters = new HashMap();
// Specify request parameters.
parameters.put("Product", "ascm");
parameters.put("Action", "GetOrganizationList");
parameters.put("Version", "2019-05-10");
parameters.put("AccessKeyId", "testid");
parameters.put("RegionId", "cn-region-test");
parameters.put("Timestamp", formatIso8601Date(new Date()));
parameters.put("SignatureMethod", "HMAC-SHA1");
parameters.put("SignatureVersion", "1.0");
parameters.put("SignatureNonce", UUID.randomUUID().toString());
parameters.put("Format", "JSON");
parameters.put("Id", "1");
// Arrange request parameters.
String[] sortedKeys = parameters.keySet().toArray(new String[]{});
Arrays.sort(sortedKeys);
final String SEPARATOR = "&";
// Create a string-to-sign.
StringBuilder stringToSign = new StringBuilder();
stringToSign.append(HTTP_METHOD).append(SEPARATOR);
stringToSign.append(percentEncode("/")).append(SEPARATOR);
StringBuilder canonicalizedQueryString = new StringBuilder();
for(String key : sortedKeys) {
    // Encode the key and the value.
    canonicalizedQueryString.append("&")
    .append(percentEncode(key)).append("=")
    .append(percentEncode(parameters.get(key)));
}
//Encode the canonicalized query string.
stringToSign.append(percentEncode(
canonicalizedQueryString.toString().substring(1)));
```

4. The signature. The key value used for calculation is `testsecret&` because `AccessKeySecret` is set to testsecret. The calculated signature is `OLeaidS1JvxuMvnyHOwuJ%2BuX5qY%3D`.

```
// The following sample code shows how to calculate the signature:
final String ALGORITHM = "HmacSHA1";
final String ENCODING = "UTF-8";
key = "testsecret&";
Mac mac = Mac.getInstance(ALGORITHM);
mac.init(new SecretKeySpec(key.getBytes(ENCODING), ALGORITHM));
byte[] signData = mac.doFinal(stringToSign.getBytes(ENCODING));
String signature = Base64.getEncoder().encodeToString(signData);
```

Encode the Signature parameter based on RFC 3986 and add it to the canonicalized query string. The following URL is obtained:

```
https://public.asapi.aliyuns.com/asapi/v3/?AccessKeyId=testid&Action=GetOrganizationLis
t&Format=JSON&Id=1&Product=ascm&RegionId=cn-region-test&SignatureMethod=HMAC-SHA1&Signa
tureNonce=43967c6e-e3ad-44fa-b06b-fcf3db5f39d2&SignatureVersion=1.0&Timestamp=2020-09-1
5T08%3A50%3A40Z&Version=2019-05-10
```

5. Use browsers or tools such as cURL and Wget to initiate an HTTP request.

9.1.1.1.5.4. Response

Responses are returned only in the JSON format. If a return code is greater than or equal to 200 and less than 300, a success response is returned. Otherwise, an error response is returned.

Sample success response

If a request is successful, the request ID and operation-specific parameter values are returned. For more information, see the developer guide of the corresponding Apsara Stack service.

```
 {
    "eagleEyeTraceId": "xxx-xxx-xxx-xxx", // The trace ID provided by EagleEye.
    "asapiSuccess": true,
    "RequestId": "xxxxxxxxxx",
    "Regions": { // The regions returned after you call the DescribeRegions operation.
        "Region": [
            {
                "RegionId": "",
                "RegionEndpoint": "",
                "LocalName": ""
            }
        ]
    }
}
```

Sample error response

If a request fails, the following information is returned. For more information, see the developer guide of the corresponding Apsara Stack service.

```
{
    "code": "asapi.server.api.notfound",// The error code.
    "eagleEyeTraceId": "xxx-xxx-xxx-xxx", // The trace ID provided by EagleEye.
    "asapiSuccess": false, // Indicates whether the request is successful.
    "hostId": "xxxx", // The ID of the host.
    "message": "Failed to ....", // The message returned.
    "asapiErrorMessage": "Failed to ....", // The error message provided by the ASAPI.
    "asapiErrorCode": "asapi.server.api.notfound" // The error code provided by the ASAPI.
}
```

9.1.2. API reference

9.1.2.1. API overview

The following tables list API operations available for use in .

Database management

API	Description
ChangeAccountPassword	Resets the password of an account that is used to log on to a specified instance.
CheckDrdsDbName	Checks whether the name of a database is valid.
DescribeRdsPerformanceSummary	Queries the performance metrics of one or more ApsaraDB RDS for MySQL instances that are used by a PolarDB-X instance. These metrics include CPU utilization, input/output operations per second (IOPS), and active sessions.
DescribeRecycleBinStatus	Queries the status of the table recycle bin of a PolarDB-X database.
DescribeRecycleBinTables	Queries the tables that can be recycled for a PolarDB-X database.
DescribeRdsSuperAccountInstances	Queries the privileged accounts of one or more ApsaraDB RDS for MySQL instances that are used by a PolarDB-X instance.
DescribeDrdsSlowSqls	Queries the slow SQL statements that are executed on a database.
DescribeDrdsDbInstance	Queries the details about an ApsaraDB RDS for MySQL instance that is used by a database.
DescribeDrdsDbInstances	Queries the ApsaraDB RDS for MySQL instances that are used by a database.
DescribeDrdsDbRdsNameList	Queries the IDs of the storage instances for a database.
DescribeDrdsDbRdsRelationInfo	Queries the structure information about the storage instances for a database.
DescribeDrdsDbTasks	Queries incomplete tasks for a database.
DescribeDrdsInstanceDbMonitor	Queries the performance monitoring data of a database.
SubmitCleanTask	Submits a cleanup task for the smooth scale-out of a PolarDB-X database.
SubmitSmoothExpandPreCheckTask	Submits a precheck task for the smooth scale-out of a PolarDB-X database.
ValidateShardTask	Checks whether a sharding task is valid.
SubmitSmoothExpandPreCheck	Submits a precheck task for the smooth scale-out of a PolarDB-X database.

API	Description
StartRestore	Starts a backup-based restoration task.
RefreshDrdsAtomUrl	Refreshes the connection between a instance and an ApsaraDB RDS for MySQL instance whose network type is changed. This operation can ensure connectivity.
ModifyRdsReadWeight	Modifies the read/write weights of one or more ApsaraDB RDS for MySQL instances for a PolarDB-X database.
RemoveDrdsDbFailedRecord	Deletes the failure records of creating a database.
RemoveDrdsDb	Removes a database from a instance.
RemoveBackupsSet	Deletes a backup set.
RemoveRecycleBinTable	Clears the tables in the recycle bin of a PolarDB-X database.
DescribeBackMenu	Checks whether an instance supports backup and restoration.
DescribeDrdsSqlAuditStatus	Queries the SQL audit details for a instance.
DescribeTables	Queries the details about the tables in a PolarDB-X database.
DescribeBackupTimes	Queries the point in time to which a PolarDB-X instance can be restored.
DescribeGlobalBroadcastType	Checks whether the tables in a PolarDB-X database are broadcast tables.
DescribeHotDbList	Queries the available databases for a hot-spot scale-out operation.
DescribeExpandLogicTableInfoList	Queries the shard key of a PolarDB-X database.
DescribeTableListByType	Queries the tables of a PolarDB-X database based on types.
DisableSqlAudit	Disables the SQL audit feature for a PolarDB-X database.
DescribeShardTaskList	Queries the sharding tasks for a PolarDB-X database.
DescribeTable	Queries the table schema of a PolarDB-X database.
DescribeInstDbLogInfo	Queries the time range of historical SQL data that can be imported to a PolarDB-X database.

API	Description
ResetDrdsToRdsConnections	Resets the number of connections from a instance to ApsaraDB RDS for MySQL instances.
DatalinkReplicationPrecheck	Performs a precheck for a sharding task on a PolarDB-X database.
DescribeRDSPerformance	Queries the performance data of a specified ApsaraDB RDS for MySQL instance that is used by a PolarDB-X instance.
CreateShardTask	Creates a sharding task for a PolarDB-X database.
DescribeShardTaskInfo	Queries the details about a sharding task for a specified PolarDB-X database.
DescribeBackupDbs	Queries the databases that can be restored for a PolarDB-X instance.
DeleteShardTasks	Deletes sharding tasks from a PolarDB-X database.
ModifyDrdsIpWhiteList	Modifies the IP address whitelist of a PolarDB-X database.
DescribeSqlFlashbakTask	Queries the flashback tasks for a PolarDB-X database.
CheckExpandStatus	Checks whether scale-out operations such as smooth scale-outs can be performed on a database.
CheckSqlAuditEnableStatus	Checks whether the SQL audit feature is enabled for a logical database.
SetupBroadcastTables	Configures broadcast tables for a PolarDB-X database.
SetupRecycleBinStatus	Enables the table recycle bin for a PolarDB-X database.
SetupTable	Enables the full-table scan feature for a PolarDB-X database.
ModifyAccountPrivilege	Modifies the permissions of a specified account for a PolarDB-X instance.
DescribeDrdsShardingDbs	Queries the details about a horizontally split database.
CreateDrdsDB	Creates a database.
DescribeDbInstances	Queries the storage instances of a PolarDB-X instance.

API	Description
DescribeDrdsDB	Queries the details about the databases for a PolarDB-X instance.
DescribeDbInstanceDbs	Queries the databases on a storage instance that is used by a specified PolarDB-X instance.
SubmitSmoothExpandTask	Submits a smooth scale-out task for a PolarDB-X database.
SubmitSwitchTask	Submits a switchover task for the smooth scale-out of a PolarDB-X database.

Instance management

API	Description
DescribeDrdsDBs	Queries the details about the databases that are created in a instance.
DescribeDrdsInstance	Queries the details about a instance.
DescribeDrdsInstanceLevelTasks	Queries incomplete tasks for a instance.
DescribeDrdsInstanceMonitor	Queries the monitoring data of a instance.
DescribeDrdsInstances	Queries the instances that meet specific criteria in a region.
DescribeDrdsInstanceVersion	Queries the version information for a instance.
DescribeDrdsParams	Queries the parameters of a instance or database.
RollbackInstanceVersion	Rolls back the version of a instance.
UpgradeInstanceVersion	Upgrades the version of the instance.
SubmitRollbackTask	Submits a smooth scale-out rollback task for a PolarDB-X database.
SwitchGlobalBroadcastType	Switches the broadcast tables in a PolarDB-X database from the multi-write mode to the asynchronous link mode.
SubmitSqlFlashbackTask	Submits an SQL flashback task for a PolarDB-X instance.
RemoveDrdsInstance	Releases a instance.
DescribeDrdsTasks	Queries the change tasks for an instance.
RestartDrdsInstance	Restarts an instance.

API	Description
DescribePreCheckResult	Queries the precheck results of a PolarDB-X instance.
DescribeStorageInstanceSubDbInfo	Queries the details about a storage instance that is used by a specified PolarDB-X database.
RemoveInstanceAccount	Deletes a management account of a PolarDB-X instance.
DescribeInstanceMenuSwitch	Queries the switch configuration of a PolarDB-X instance.
DescribeInstanceAccounts	Queries the account information about a PolarDB-X instance.
DescribeInstDbSlsInfo	Queries the names of the Log Service project and the Logstore used by the SQL audit feature.
SetBackupPolicy	Configures the backup policy for a PolarDB-X instance.
EnableSqlAudit	Enables the SQL audit feature for a PolarDB-X database.
EnableSqlFlashbackMatchSwitch	Enables the SQL flashback matching feature for a PolarDB-X database. After this feature is enabled, the query information is added to the binary logs of the ApsaraDB RDS for MySQL instances that are used by the database. This helps restore data in a precise manner.
SetupDrdsParams	Configures parameters for a instance or database.
FlashbackRecycleBinTable	Restores a logical table in the recycle bin of a PolarDB-X database.
ModifyAccountDescription	Modifies the description of an account for a PolarDB-X instance.
ModifyDrdsInstanceDescription	Modifies the description of a PolarDB-X instance.
CreateInstanceAccount	Creates an account for a instance.

9.1.2.2. Database management

9.1.2.2.1. ChangeAccountPassword

Resets the password of a database.

Request parameters

Parameter	Type	Required	Example	Description
AccountName	String	Yes	test	The name of the account.
Action	String	Yes	ChangeAccountPassword	The operation that you want to perform. Set the value to ChangeAccountPassword.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxx	The ID of the instance.
Password	String	Yes	Test123	The new password.
AccessKeyId	String	No	sdfgssdsf	The AccessKey ID provided to you by Alibaba Cloud.

Response parameters

Parameter	Type	Example	Description
RequestId	String	DSSDF-SEWE-23ERW	The ID of the request.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=ChangeAccountPassword
&AccountName=test
&DrdsInstanceId=drdsxxxxxxxxxx
&Password=Test123
&<Common request parameters>
```

Sample success responses

XML format

```
<ChangeAccountPasswordResponse>
      <RequestId>DSSDF-SEWE-23ERW</RequestId>
      <Success>True</Success>
</ChangeAccountPasswordResponse>
```

JSON format

```
{
    "RequestId":"DSSDF-SEWE-23ERW",
    "Success":true
}
```

Error codes

HttpCode	Error code	Error message	Description
400	ActionUnauthorized	The specified action is not available for you	The error message returned because you are not authorized to perform this action. Perform RAM authorization first.

For a list of error codes, visit the API Error Center.

9.1.2.2.2. CheckDrdsDbName

Checks whether the name of a database is valid.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CheckDrdsDbName	The operation that you want to perform. Set the value to CheckDrdsDbName.
DbName	String	Yes	testdb	The name of the database.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxxx	The ID of the instance.

Response parameters

Parameter	Type	Example	Description
RequestId	String	DSSDF-SEWE-23ERW	The ID of the request.
Result	Boolean	true	Indicates whether the name of the PolarDB-X database is valid. Valid values: • true: valid • false: invalid

Parameter	Type	Example	Description
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=CheckDrdsDbName
&DbName=testdb
&DrdsInstanceId=drdsxxxxxxxxxxx
&<Common request parameters>
```

Sample success responses

XML format

```
<CheckDrdsDbNameResponse>
      <Result>true</Result>
      <RequestId>CF38538C-68BD-4278-B58F-EDE96FA8A5CE</RequestId>
      <Success>true</Success>
</CheckDrdsDbNameResponse>
```

JSON format

```
{
    "Result":true,
    "RequestId":"CF38538C-68BD-4278-B58F-EDE96FA8A5CE",
    "Success":true
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.2.3. CheckExpandStatus

Verifies whether scale-out operations such as smooth scale-out can be performed on a database.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CheckExpandStatus	The operation that you want to perform. Set the value to CheckExpandStatus.

Parameter	Type	Required	Example	Description
DbName	String	Yes	testdb	The name of the PolarDB-X database.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxxx	The ID of the instance.

Response parameters

Parameter	Type	Example	Description
Data	-	-	The verification result.
IsActive	Boolean	true	Indicates whether scale-out is supported. The value true indicates that scale-out is supported. The value false indicates that scale-out is not supported.
Msg	String	success	The additional information.
RequestId	String	drds_sample_request_id	The ID of the request.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=CheckExpandStatus
&DbName=testdb
&DrdsInstanceId=drdsxxxxxxxxxxx
&<Common request parameters>
```

Sample success responses

XML format

```
<CheckExpandStatus>
      <Data>
            <IsActive>true</IsActive>
            <Msg></Msg>
      </Data>
      <RequestId>7CDBA7D5-8D62-4D24-9C65-510D621278DB</RequestId>
      <Success>true</Success>
</CheckExpandStatus>
```

JSON format

```
{
    "Data":{
        "IsActive":true,
        "Msg":""
    },
    "RequestId":"7CDBA7D5-8D62-4D24-9C65-510D621278DB",
    "Success":true
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.2.4. CheckSqlAuditEnableStatus

Verifies whether SQL audit is enabled for a logical database.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CheckSqlAuditEnableStatus	The operation that you want to perform. Set the value to CheckSqlAuditEnableStatus.
DbName	String	Yes	drds_db	The name of the PolarDB-X database.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxxx	The ID of the instance.

Response parameters

Parameter	Type	Example	Description
RequestId	String	drds_sample_request_id	The ID of the request.
Status	String	enabled	Indicates whether SQL audit was enabled for the logical database. Valid values: enabled and disabled.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=CheckSqlAuditEnableStatus
&DbName=drds_db
&DrdsInstanceId=drdsxxxxxxxxxxx
&<Common request parameters>
```

Sample success responses

XML format

```
<CheckSqlAuditEnableStatus>
      <Status>"disabled"</Status>
      <RequestId>FF13E47D-4E38-4A5A-BA68-32A554E6FE10</RequestId>
      <Success>true</Success>
</CheckSqlAuditEnableStatus>
```

JSON format

```
{
    "Status":"\"disabled\"",
    "RequestId":"FF13E47D-4E38-4A5A-BA68-32A554E6FE10",
    "Success":true
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.2.5. CreateDrdsDB

Creates a database.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateDrdsDB	The operation that you want to perform. Set the value to CreateDrdsDB.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxxx	The ID of the instance.

Parameter	Type	Required	Example	Description
DbInstType	String	No	RDS	The type of the storage instance. Only ApsaraDB RDS for MySQL instances are supported.
DbInstanceIsCreating	Boolean	No	false	Indicates whether ApsaraDB RDS for MySQL instances involved in database creation are being created.
DbName	String	No	drds_db	The name of the PolarDB-X database.
Encode	String	No	drds_sample_encode	The database encoding.
Password	String	No	drds_sample_password	The logon password of the PolarDB-X database.
RdsInstance.N	RepeatList	No	["rds_id1", "rds_id2"]	This parameter is required only for horizontal partitioning. It is a JSON array string.
RdsSuperAccount.N.AccountName	String	No	rdsuser	The name of the ApsaraDB RDS for MySQL privileged account.
RdsSuperAccount.N.DbInstanceId	String	No	rds_id	The ID of the ApsaraDB RDS for MySQL instance.
RdsSuperAccount.N.Password	String	No	rds_password	The password of the ApsaraDB RDS for MySQL privileged account.
Type	String	No	HORIZONTAL	The partition mode of the database. Set the value to HORIZONTAL.

Response parameters

Parameter	Type	Example	Description
RequestId	String	drds_sample_request_id	The ID of the request.
Success	Boolean	true	Indicates whether the PolarDB-X database was created.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=CreateDrdsDB
&DrdsInstanceId=drdsxxxxxxxxxxx
&DbName=drds_db
&Encode=utf8mb4
&Password=drds_sample_password
&RdsInstance=["rds_id1", "rds_id2"]
&Type=HORIZONTAL
&DbInstType=RDS
&DbInstanceIsCreating=false
&<Common request parameters>
```

Sample success responses

XML format

```
<CreateDrdsDB>
      <RequestId>FF13E47D-4E38-4A5A-BA68-32A554E610EF</RequestId>
      <Success>true</Success>
</CreateDrdsDB>
```

JSON format

```
{
    "RequestId":"FF13E47D-4E38-4A5A-BA68-32A554E610EF",
    "Success":true
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.2.6. CreateShardTask

Creates a partitioning task for a PolarDB-X database.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateShardTask	The operation that you want to perform. Set the value to CreateShardTask.
DbName	String	Yes	test_db	The name of the PolarDB-X database.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxxx	The ID of the instance.
SourceTableName	String	Yes	student_tb1	The name of the source table.
TargetTableName	String	Yes	student_tb2	The name of the destination table.
TaskType	String	Yes	SINGLE_TO_SHARD	The type of the task. Valid values: SHARD_TO_SINGLE, SINGLE_TO_SHARD, and SHARD_TO_SHARD.
RegionId	String	No	cn-hangzhou	The region ID of the PolarDB-X instance.

Response parameters

Parameter	Type	Example	Description
Data	Boolean	true	Indicates whether the partitioning task was created.
RequestId	String	F8997D95-94AD-416A-AE70-E24D087045ED	The ID of the request.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=CreateShardTask
&DbName=test_db
&DrdsInstanceId=drdsxxxxxxxxxxx
&SourceTableName=student_tb1
&TargetTableName=student_tb2
&TaskType=SINGLE_TO_SHARD
&<Common request parameters>
```

Sample success responses

XML format

```
<CreateShardTaskResponse>
      <Data>true</Data>
      <RequestId>F8997D95-94AD-416A-AE70-E24D087045ED</RequestId>
      <Success>true</Success>
</CreateShardTaskResponse>
```

JSON format

```
{
    "Data":true,
    "RequestId":"F8997D95-94AD-416A-AE70-E24D087045ED",
    "Success":true
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.2.7. DatalinkReplicationPrecheck

Prechecks a partitioning task of a PolarDB-X database.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DatalinkReplicationPrecheck	The operation that you want to perform. Set the value to DatalinkReplicationPrecheck.
DbName	String	Yes	test_db	The name of the PolarDB-X database.
DrdsInstanceId	String	Yes	drdsxxxxxxxx	The ID of the instance.

Parameter	Type	Required	Example	Description
DstTableName	String	Yes	student_1	The name of the destination table.
SrcTableName	String	Yes	student_2	The name of the source table.
AccessKeyId	String	No	XXXXXX	The AccessKey ID provided to you by Alibaba Cloud.

Response parameters

Parameter	Type	Example	Description
Data	Long	20190886	The ID of the precheck task.
RequestId	String	F8997D95-94AD-416A-AE70-E24D087045ED	The ID of the request.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DatalinkReplicationPrecheck
&DbName=test_db
&DrdsInstanceId=drdsxxxxxxxx
&DstTableName=student_1
&SrcTableName=student_2
&<Common request parameters>
```

Sample success responses

JSON format

```
<DatalinkReplicationPrecheckResponse>
      <Data>20190886</Data>
      <RequestId>F8997D95-94AD-416A-AE70-E24D087045ED</RequestId>
      <Success>true</Success>
</DatalinkReplicationPrecheckResponse>
```

JSON format

```
{
    "Data":20190886,
    "RequestId":"F8997D95-94AD-416A-AE70-E24D087045ED",
    "Success":true
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.2.8. DeleteShardTasks

Deletes partitioning tasks from a PolarDB-X database.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteShardTasks	The operation that you want to perform. Set the value to DeleteShardTasks.
DbName	String	Yes	test_db	The name of the PolarDB-X database.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxx	The ID of the instance.
RegionId	String	No	cn-hangzhou	The region ID of the PolarDB-X instance.
TableName.N.SourceTableName	String	No	student_1	The name of the source table.
TableName.N.TargetTableName	String	No	student_2	The name of the destination table.

Response parameters

Parameter	Type	Example	Description
Data	Boolean	true	Indicates whether partitioning tasks were deleted.
RequestId	String	F8997D95-94AD-416A-AE70-E24D087045ED	The ID of the request.

Parameter	Type	Example	Description
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DeleteShardTasks
&DbName=test_db
&DrdsInstanceId=drdsxxxxxxxxxx
&<Common request parameters>
```

Sample success responses

XML format

```
<DeleteShardTasksResponse>
      <Data>true</Data>
      <RequestId>F8997D95-94AD-416A-AE70-E24D087045ED</RequestId>
      <Success>true</Success>
</DeleteShardTasksResponse>
```

JSON format

```
{
    "Data":true,
    "RequestId":"F8997D95-94AD-416A-AE70-E24D087045ED",
    "Success":true
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.2.9. DescribeBackMenu

Queries whether a PolarDB-X instance supports backup and recovery.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeBackMenu	The operation that you want to perform. Set the value to DescribeBackMenu.

Parameter	Type	Required	Example	Description
DrdsInstanceId	String	Yes	drdsxxxxxxxxxxxx	The ID of the instance.
AccessKeyId	String	No	xxxxxxxxx	The AccessKey ID provided to you by Alibaba Cloud.

Response parameters

Parameter	Type	Example	Description
List	-	-	The list of supported items.
list	-	-	The details about a supported item.
MenuName	String	phy	• The mode of the backup. Valid values: logic: logical backup • phy: physical backup
Support	Boolean	true	Indicates whether the PolarDB-X instance supports backup and recovery.
RequestId	String	60C21BE4-EDFE-454C-95ED-3A5C7493D74A	The ID of the request.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeBackMenu
&DrdsInstanceId=drdsxxxxxxxxxxxx
&<Common request parameters>
```

Sample success responses

XML format

```
<DescribeBackMenuResponse>
      <List>
            <MenuName>phy</MenuName>
            <Support>true</Support>
      </List>
      <List>
            <MenuName>logic</MenuName>
            <Support>true</Support>
      </List>
      <RequestId>60C21BE4-EDFE-454C-95ED-3A5C7493D74A</RequestId>
      <Success>true</Success>
</DescribeBackMenuResponse>
```

JSON format

```
{
    "RequestId":"60C21BE4-EDFE-454C-95ED-3A5C7493D74A",
    "Success":true,
    "List":[
        {
            "MenuName":"phy",
            "Support":true
        },
        {
            "MenuName":"logic",
            "Support":true
        }
    ]
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.2.10. DescribeBackupDbs

Queries the databases that can be restored for a PolarDB-X instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeBackupDbs	The operation that you want to perform. Set the value to DescribeBackupDbs.
DrdsInstanceId	String	Yes	drdsxxxxxxxxx	The ID of the instance.

Parameter	Type	Required	Example	Description
AccessKeyId	String	No	xxxxxxxxx	The AccessKey ID provided to you by Alibaba Cloud.
BackupId	String	No	201908367	Query by backup set.
PreferredRestoreTime	String	No	1568632541236	Query by restoration time.

Response parameters

Parameter	Type	Example	Description
DbNames	-	["db1","db2"]	The list of returned databases.
dbName	-	-	The details about a database.
RequestId	String	9EF10719-C34F-4E64-8260-D29C1A78B5DD	The ID of the request.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeBackupDbs
&DrdsInstanceId=drdsxxxxxxxxx
&<Common request parameters>
```

Sample success responses

XML format

```
<DescribeBackupDbsResponse>
      <DbNames></DbNames>
      <RequestId>9EF10719-C34F-4E64-8260-D29C1A78B5DD</RequestId>
      <Success>true</Success>
</DescribeBackupDbsResponse>
```

JSON format

```
{
    "RequestId":"9EF10719-C34F-4E64-8260-D29C1A78B5DD",
    "DbNames":{
        "dbName":[]
    },
    "Success":true
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.2.11. DescribeBackupTimes

Queries the point in time to which a PolarDB-X instance can be restored.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeBackupTimes	The operation that you want to perform. Set the value to DescribeBackupTimes.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxxx	The ID of the instance.
AccessKeyId	String	No	xxxxxxxxxxxxx	The AccessKey ID provided to you by Alibaba Cloud.

Response parameters

Parameter	Type	Example	Description
RequestId	String	4780A19F-5ECB-4C56-AD20-966A3FF99772	The ID of the request.
RestoreTime	-	-	The point in time to which the PolarDB-X instance can be restored.
EndTime	String	1568636922671	The timestamp that specifies the end of the time range to query.

Parameter	Type	Example	Description
StartTime	String	1568632853000	The timestamp that specifies the beginning of the time range to query.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeBackupTimes
&DrdsInstanceId=drdsxxxxxxxxxxx
&<Common request parameters>
```

Sample success responses

XML format

```
<DescribeBackupTimesResponse>
      <RequestId>4780A19F-5ECB-4C56-AD20-966A3FF99772</RequestId>
      <Success>true</Success>
      <RestoreTime>
            <EndTime>1568636922671</EndTime>
            <StartTime>1568632853000</StartTime>
      </RestoreTime>
</DescribeBackupTimesResponse>
```

JSON format

```
{
    "RestoreTime":{
        "EndTime":"1568636922671",
        "StartTime":"1568632853000"
    },
    "RequestId":"4780A19F-5ECB-4C56-AD20-966A3FF99772",
    "Success":true
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.2.12. DescribeBroadcastTables

Queries the broadcast tables in a PolarDB-X database.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeBroadcastTables	The operation that you want to perform. Set the value to DescribeBroadcastTables.
DbName	String	Yes	test_db	The name of the PolarDB-X database.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxx	The ID of the instance.
Query	String	Yes	tb1	The query content.
CurrentPage	Integer	No	1	The page number of the current page.
PageSize	Integer	No	10	The number of entries to return on each page.
RegionId	String	No	cn-hangzhou	The region ID of the PolarDB-X instance.

Response parameters

Parameter	Type	Example	Description
IsShard	Boolean	true	Indicates whether the table was partitioned.
List	-	-	The list of broadcast tables.
Broadcast	Boolean	true	Indicates whether the table is a broadcast table.
BroadcastType	String	1	The type of the broadcast table. Valid values: • 1: multi-write mode • 2: synchronous link mode

Parameter	Type	Example	Description
DbInstType	Integer	0	The type of the storage instance. The value 0 indicates RDS.
IsShard	Boolean	false	Indicates whether the table was partitioned.
Status	Integer	1	The status of the broadcast table. Valid values: • 1: activated • 2: activating • 3: activation exception
Table	String	nation	The name of the table.
PageNumber	Integer	1	The page number of the returned page.
PageSize	Integer	40	The number of entries returned per page.
RequestId	String	86E420ED-43F2-4788-A58C-9218491FFB09	The ID of the request.
Success	Boolean	true	Indicates whether the request was successful.
Total	Integer	2	The total number of entries.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeBroadcastTables
&DbName=test_db
&DrdsInstanceId=drdsxxxxxxxxxx
&Query=tb1
&<Common request parameters>
```

Sample success responses

XML format

```
<DescribeBroadcastTablesResponse>
      <PageSize>40</PageSize>
      <RequestId>86E420ED-43F2-4788-A58C-9218491FFB09</RequestId>
      <PageNumber>1</PageNumber>
      <Total>2</Total>
      <List>
            <Status>1</Status>
            <DbInstType>0</DbInstType>
            <IsShard>false</IsShard>
            <Table>nation</Table>
            <Broadcast>true</Broadcast>
            <BroadcastType>1</BroadcastType>
      </List>
      <List>
            <Status>1</Status>
            <DbInstType>0</DbInstType>
            <IsShard>false</IsShard>
            <Table>region</Table>
            <Broadcast>true</Broadcast>
            <BroadcastType>1</BroadcastType>
      </List>
      <Success>true</Success>
</DescribeBroadcastTablesResponse>
```

JSON format

```
{
    "PageNumber":1,
    "PageSize":40,
    "RequestId":"86E420ED-43F2-4788-A58C-9218491FFB09",
    "Success":true,
    "List":[
        {
            "Status":1,
            "IsShard":false,
            "BroadcastType":1,
            "Broadcast":true,
            "Table":"nation",
            "DbInstType":0
        },
        {
            "Status":1,
            "IsShard":false,
            "BroadcastType":1,
            "Broadcast":true,
            "Table":"region",
            "DbInstType":0
        }
    ],
    "Total":2
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.2.13. DescribeDbInstanceDbs

Queries the databases on a storage instance of a PolarDB-X instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeDbInstanceDbs	The operation that you want to perform. Set the value to DescribeDbInstanceDbs.
DbInstanceId	String	Yes	pc-bpxxxxxxxxxxxxxx	The ID of the storage instance.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxxxx	The ID of the instance.
AccessKeyId	String	No	xxxxxxxx	The AccessKey ID provided to you by Alibaba Cloud. For more information, see Common parameters.
AccountName	String	No	supper_account	The username of the privileged account. Leave this parameter blank if no privileged account exists.
DbInstType	String	No	RDS	The type of the storage instance. Valid values: POLARDB and RDS.
Password	String	No	Pass_123456	The password of the privileged account. Leave this parameter blank if no privileged account exists.

Response parameters

Parameter	Type	Example	Description
Databases	-	-	The list of returned databases.
Database	-	-	The details about a database.
DbName	String	db_newsudbv	The name of the database.
Description	String	Created by , do NOT change password	The description of the database.
Status	Integer	1	The status of the database. • 0: creating • 1: available • 3: deleting
RequestId	String	E9F3D991-08DE-4B74-BE0E-06B80958F5DC	The ID of the request.
Success	Boolean	true	Indicates whether the request was successful.
Total	String	1	The total number of databases.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeDbInstanceDbs
&DbInstanceId=pc-bpxxxxxxxxxxxxxx
&DrdsInstanceId=drdsxxxxxxxxxxxx
&<Common request parameters>
```

Sample success responses

XML format

```
<DescribeDbInstanceDbsResponse>
      <Databases>
            <Database>
                  <Status>1</Status>
                  <Description>Created by , do NOT change password</Description>
                  <DbName>db_newsudbv</DbName>
            </Database>
      </Databases>
      <total>1</total>
      <RequestId>E9F3D991-08DE-4B74-BE0E-06B80958F5DC</RequestId>
      <Success>true</Success>
</DescribeDbInstanceDbsResponse>
```

JSON format

```
{
    "total":1,
    "Databases":{
        "Database":[
            {
                "Status":1,
                "Description":"Created by , do NOT change password",
                "DbName":"db_newsudbv"
            }
        ]
    },
    "RequestId":"E9F3D991-08DE-4B74-BE0E-06B80958F5DC",
    "Success":true
}
```

Error codes

HttpCode	Error code	Error message	Description
400	ActionUnauthorized	The specified action is not available for you	The error message returned because you are not authorized to perform this action. Perform RAM authorization first.

For a list of error codes, visit the API Error Center.

9.1.2.2.14. DescribeDbInstances

Queries the storage instances, namely, ApsaraDB RDS for MySQL instances of a PolarDB-X instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeDbInstances	The operation that you want to perform. Set the value to DescribeDbInstances.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxxx	The ID of the instance.
AccessKeyId	String	Yes	testxxxxxxxxx	The AccessKey ID provided to you by Alibaba Cloud.
DbInstType	String	No	RDS	The type of the storage instance. Set the value to RDS.
PageNumber	Integer	No	1	The number of the page to return.
PageSize	Integer	No	10	The number of entries to return on each page.
Search	String	No	pc-bp1xxxxxxxxxxx	Query by storage instance ID.

Response parameters

Parameter	Type	Example	Description
Items	-	-	The list of returned storage instances.
DBInstance	-	-	The details about a storage instance.
DBInstanceDescription	String	pc-bp1xxxxxxxxxxxxx	The description of the storage instance.
DBInstanceId	String	pc-bp1xxxxxxxxxxxxx	The ID of the storage instance.

Parameter	Type	Example	Description
DBInstanceStatus	Integer	1	The status of the storage instance. Valid values: • 0: creating • 1: running • 3: deleting • 5: restarting • 6: changing specifications • 7: recovering • 8: switching between the classic network and VPC network
DBInstanceType	String	RDS	The type of the storage instance. Example: RDS.
Engine	String	mysql	The engine that the storage instance runs.
EngineVersion	String	5.6	The version of the engine that the storage instance runs.
InstanceNetworkType	String	CLASSIC	The network type of the storage instance. Valid values: • CLASSIC: classic network • VPC: Virtual Private Cloud (VPC) network **Note** Apsara Stack does not support VPC networks.
ReadOnlyDBInstanceId	-	[]	The list of read-only storage instances.
ReadOnlyDBInstanceId	-	-	The details about a read-only storage instance.
RegionId	String	cn-hangzhou	The ID of the region where the storage instance is located.

Parameter	Type	Example	Description
ZoneId	String	cn-hangzhou-a	The ID of the zone where the storage instance is located.
RequestId	String	05670C01-093E-4DF4-99FA-0C63FF60250D	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeDbInstances
&DrdsInstanceId=drdsxxxxxxxxxxx
&<Common request parameters>
```

Sample success responses

XML format

```

                "DBInstanceDescription":"pc-bp1xxxxxxxxxxxxx",
                "EngineVersion":"5.6",
                "DBInstanceStatus":1,
                "Engine":"POLARDB",
                "ReadOnlyDBInstanceId":{
                    "ReadOnlyDBInstanceId":[]
                }
            }
        ]
    },
    "RequestId":"05670C01-093E-4DF4-99FA-0C63FF60250D"
}
```

Error codes

HttpCode	Error code	Error message	Description
400	ActionUnauthorized	The specified action is not available for you	The error message returned because you are not authorized to perform this action. Perform RAM authorization first.

For a list of error codes, visit the API Error Center.

9.1.2.2.15. DescribeDrdsDB

Queries the details about a database on a PolarDB-X instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeDrdsDB	The operation that you want to perform. Set the value to DescribeDrdsDB.
DbName	String	Yes	db_test	The name of the PolarDB-X database.

Parameter	Type	Required	Example	Description
DrdsInstanceId	String	Yes	drdsxxxxxxxxxxxx	The ID of PolarDB-X instance.
AccessKeyId	String	No	xxxxxxxxxx	The AccessKey ID provided to you by Alibaba Cloud.

Response parameters

Parameter	Type	Example	Description
Data	-	-	The details about the database.
CreateTime	String	1568949855000	The timestamp when the database was created.
DbInstType	String	RDS	The type of the storage instance. Example: RDS.
DbName	String	db_0	The name of the database.
InstRole	String	MASTER	The type of the storage instance. Valid values: • MASTER: primary instance. • SLAVE: read-only instance.
Mode	String	HORIZONTAL	The partition mode of the database. Set the value to HORIZONTAL.
Schema	String	db_0_xxxxxxxxxxxxwpyh	The name of a physical database after partitioning.
Status	String	NORMAL	The status of the database. Valid values: • TO_BE_INIT: creating • NORMAL: running
RequestId	String	05203D07-8447-48D0-BED5-2F00BFD40630	The ID of the request.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeDrdsDB
&DbName=db_test
&DrdsInstanceId=drdsxxxxxxxxxxx
&<Common request parameters>
```

Sample success responses

XML format

```
<DescribeDrdsDBResponse>
      <RequestId>45203D07-8447-48D0-BED5-2F00BFD40630</RequestId>
      <Data>
            <Status>NORMAL</Status>
            <DbInstType>RDS</DbInstType>
            <InstRole>MASTER</InstRole>
            <Schema>db_0_xxxxxxxxxxxxwpyh</Schema>
            <CreateTime>1568949855000</CreateTime>
            <Mode>HORIZONTAL</Mode>
            <DbName>db_0</DbName>
      </Data>
      <Success>true</Success>
</DescribeDrdsDBResponse>
```

JSON format

```
{
    "Data":{
        "Status":"NORMAL",
        "DbName":"db_0",
        "CreateTime":1568949855000,
        "Schema":"db_0_xxxxxxxxxxxxwpyh",
        "DbInstType":"RDS",
        "Mode":"HORIZONTAL",
        "InstRole":"MASTER"
    },
    "RequestId":"45203D07-8447-48D0-BED5-2F00BFD40630",
    "Success":true
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.2.16. DescribeDrdsDbInstance

Queries the details about an ApsaraDB RDS for MySQL instance of a database.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeDrdsDbInstance	The operation that you want to perform. Set this parameter to DescribeDrdsDbInstance.
DbInstanceId	String	Yes	rm-bpxxxxxxxxxxx	The ID of ApsaraDB RDS for MySQL instance of the instance.
DbName	String	Yes	drds_test	The name of the database.
DrdsInstanceId	String	Yes	rm-drdsxxxxxxxx	The ID of the instance.
AccessKeyId	String	No	ASU678xxxxxxxxxxxxx	The AccessKey ID provided to you by Alibaba Cloud.

Response parameters

Parameter	Type	Example	Description
DbInstance	-	-	The details about the ApsaraDB RDS for MySQL instance of the database.
ConnectUrl	String	rm-bp1uxxxxxxxxxx.mysql.rds.aliyuncs.com	The connection URL.
DBInstanceId	String	rm-bp1xxxxxxxxxxxx	The ID of the ApsaraDB RDS for MySQL instance.
DBInstanceStatus	String	1	The status of the ApsaraDB RDS for MySQL instance.
DbInstType	String	Primary	The type of the ApsaraDB RDS for MySQL instance.
Engine	String	MySQL	The engine that the ApsaraDB RDS for MySQL instance runs.

Parameter	Type	Example	Description
EngineVersion	String	5.7	The version of the engine that the ApsaraDB RDS for MySQL instance runs.
ExpireTime	String	12341434315	The timestamp when the ApsaraDB RDS for MySQL instance expires.
NetworkType	String	VPC	The network type of the ApsaraDB RDS for MySQL instance.
PayType	String	Postpaid	The billing method of the ApsaraDB RDS for MySQL instance.
Port	Integer	3306	The port of the ApsaraDB RDS for MySQL instance.
RdsInstType	String	RDS	The type of the ApsaraDB RDS for MySQL instance.
ReadOnlyInstances	-	-	The list of read-only ApsaraDB RDS for MySQL instances.
ReadOnlyInstance	-	-	The details about a read-only ApsaraDB RDS for MySQL instance.
ConnectUrl	String	rm-bp1xxxxxxxxxxxx.mysql.rds.aliyuncs.com	The connection URL.
DBInstanceId	String	rm-bp1xxxxxxxxxxxx	The ID of the read-only ApsaraDB RDS for MySQL instance.
DBInstanceStatus	String	1	The status of the read-only ApsaraDB RDS for MySQL instance.
DbInstType	String	RDS	The type of the read-only ApsaraDB RDS for MySQL instance.
Engine	String	MySQL	The engine that the read-only ApsaraDB RDS for MySQL instance runs.

Parameter	Type	Example	Description
EngineVersion	String	5.7	The version of the engine that the read-only ApsaraDB RDS for MySQL instance runs.
ExpireTime	String	1823487328173	The timestamp when the read-only ApsaraDB RDS for MySQL instance expires.
NetworkType	String	VPC	The network type of the read-only ApsaraDB RDS for MySQL instance.
PayType	String	Postpaid	The billing method of the read-only ApsaraDB RDS for MySQL instance.
Port	Integer	3306	The port of the read-only ApsaraDB RDS for MySQL instance.
RdsInstType	String	RDS	The type of the read-only ApsaraDB RDS for MySQL instance.
ReadWeight	Integer	30	The read weight of the read-only ApsaraDB RDS for MySQL instance.
RemainDays	String	0	The remaining number of days before the read-only ApsaraDB RDS for MySQL instance expires.
VersionAction	Integer	0	An invalid parameter.
ReadWeight	Integer	70	The read weight of the read-only ApsaraDB RDS for MySQL instance.
RemainDays	String	0	The remaining number of days before the read-only ApsaraDB RDS for MySQL instance expires.
RequestId	String	2F7F8080-9132-4279-85D0-B7E5C4305162	The ID of the request.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeDrdsDbInstance
&DbInstanceId=rm-bp1xxxxxxxxxxxx
&DbName=drds_test
&DrdsInstanceId=rm-drdsxxxxxxxx
&<Common request parameters>
```

Sample success responses

XML format

```
<DescribeDrdsDbInstance>
      <RequestId>2F7F8080-9132-4279-85D0-B7E5C4305162</RequestId>
      <DbInstance>
            <DbInstType>RDS</DbInstType>
            <ReadOnlyInstances></ReadOnlyInstances>
            <EngineVersion>5.7</EngineVersion>
            <DBInstanceStatus>1</DBInstanceStatus>
            <Port>3306</Port>
            <PayType>Postpaid</PayType>
            <ReadWeight>100</ReadWeight>
            <ConnectUrl>rm-bp1xxxxxxxxxxxx.mysql.rds.aliyuncs.com</ConnectUrl>
            <DBInstanceId>rm-bp1xxxxxxxxxxxx</DBInstanceId>
            <NetworkType>VPC</NetworkType>
            <RdsInstType>Primary</RdsInstType>
            <ExpireTime></ExpireTime>
            <RemainDays>0</RemainDays>
            <Engine>MySQL</Engine>
      </DbInstance>
      <Success>true</Success>
</DescribeDrdsDbInstance>
```

JSON format

```
{
    "DbInstance":{
        "RemainDays":0,

        "DbInstType":"RDS",
        "ConnectUrl":"rm-bp1ub71ct9skc3y.mysql.rds.aliyuncs.com",
        "Engine":"MySQL",
        "NetworkType":"VPC",
        "Port":3306,
        "ExpireTime":"",
        "EngineVersion":"5.7",
        "DBInstanceStatus":1,
        "PayType":"Postpaid"
    },
    "RequestId":"2F7F8080-9132-4279-85D0-B7E5C4305162",
    "Success":true
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.2.17. DescribeDrdsDbInstances

Queries ApsaraDB RDS for MySQL instances in a database.

You can query primary ApsaraDB RDS for MySQL instances in a database. Each primary ApsaraDB RDS for MySQL instance has a ReadOnlyInstances attribute. This attribute specifies the read-only ApsaraDB RDS for MySQL instances that are used in the current database.

Request parameters

Parameter	Type	Required	Example	Description
DbName	String	Yes	dbname	The name of the database.
DrdsInstanceId	String	Yes	drdsxxxxxxxxx	The ID of the instance.
AccessKeyId	String	No	ASU6xxxxxxxxxxxxxxxx	The AccessKey ID provided by Alibaba Cloud for you to connect to services.

Parameter	Type	Required	Example	Description
PageNumber	Integer	No	1	The number of the page to return.
PageSize	Integer	No	30	The number of entries to return on each page.

Response parameters

Parameter	Type	Example	Description
DbInstances	-	-	The instances used for storage in the database.
DbInstance	-	-	The instances used for storage in the database.
ConnectUrl	String	rm-m5xxxxxxxxx82.mysql.rds.aliyuncs.com	The URL of the instance used for storage. The value is returned when you call API operations to connect to the instance used for storage. ApsaraDB RDS for MySQL instances can be used for storage.
DBInstanceId	String	rm-m5xxxxxxxxx82	The ID of the instance used for storage.

Parameter	Type	Example	Description
DBInstanceStatus	String	1	The running status of the instance: • 0: The instance is being created. • 1: The instance is running. • 3: The instance is being deleted. • 5: The instance is being restarted. • 6: The instance is being upgraded or downgraded. • 7: The instance is being backed up. • 8: The network type is being changed. • 9: The instance is being migrated. • 11: Data is being migrated. • 12: A disaster recovery instance is being generated. • 13: Data is being imported. • 14: Data is being imported from other ApsaraDB RDS for MySQL instances. • 15: A switchover is being performed. • 16: A temporary instance is being created. • 17: A network is being created. • 18: The instance is being cloned. • 19: The link is being changed. • 20: The read-only instance is being migrated.

Parameter	Type	Example	Description
DbInstType	String	RDS	The type of the instance used for storage. Only ApsaraDB RDS for MySQL instances are supported.
Engine	String	MySQL	The engine of the instance used for storage. For example, MySQL.
EngineVersion	String	5.7	The engine version of the instance used for storage. For example, MySQL 5.7, MySQL 5.6, and MySQL 5.5.
ExpireTime	String	1237486127634	The time when the instance used for storage expires.
NetworkType	String	VPC	The type of the network. **Note** Apsara Stack does not support virtual private clouds (VPCs).
Port	Integer	3306	The port number.
RdsInstType	String	Primary	Indicates whether the ApsaraDB RDS for MySQL instance is primary or read-only.
ReadOnlyInstances	-	-	The read-only instances used for storage.
ReadOnlyInstance	-	-	The read-only instances used for storage.

Parameter	Type	Example	Description
ConnectUrl	String	rm-m5xxxxxxxxx82.mysql.rds.aliyuncs.com	The URL of the instance used for storage. The value is returned when you call API operations to connect to the instance used for storage. ApsaraDB RDS for MySQL instances can be used for storage.
DBInstanceStatus	String	1	The status of the instance used for storage.
DbInstType	String	RDS	The type of the instance used for storage.
Engine	String	MySQL	The engine of the instance used for storage.
EngineVersion	String	5.7	The engine version of the instance used for storage.
ExpireTime	String	123421352351234	The timestamp when the instance used for storage expires.
InstanceName	String	rm-m5xxxxxxxxx82	The invalid field.
NetworkType	String	VPC	The network type of the instance.
PayType	String	Postpaid	The billing method.
Port	Integer	3306	The port used to connect to the instance.
RdsInstType	String	RDS	The type of the instance.
ReadWeight	Integer	70	The read ratio of the instance.
RemainDays	Integer	0	The number of remaining days before the instance expires.
ReadWeight	Integer	30	The weight of the read requests in the database.

Parameter	Type	Example	Description
RemainDays	Integer	0	The number of remaining days before the subscription instance expires.
PageNumber	String	1	The page number of the returned page.
PageSize	String	10	The number of entries returned on each page.
RequestId	String	2F7F8080-9132-4279-85D0-B7E5C4305162	The ID of the request.
Success	Boolean	true	Indicates whether the operation is successful.
Total	String	1	The total number of the primary ApsaraDB RDS for MySQL instances.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeDrdsDbInstances
&DbName=dbname
&DrdsInstanceId=drdsxxxxxxxxx
&<Common request parameters>
```

Sample success responses

XML format

```
<DescribeDrdsDbInstances>
      <PageSize>10</PageSize>
      <RequestId>658B6F25-442A-4996-8AAE-F77DAFBC9BAA</RequestId>
      <PageNumber>1</PageNumber>
      <Total>1</Total>
      <DbInstances>
            <DbInstance>
                  <DbInstType>RDS</DbInstType>
                  <ReadOnlyInstances></ReadOnlyInstances>
                  <EngineVersion>5.7</EngineVersion>
                  <DBInstanceStatus>1</DBInstanceStatus>
                  <Port>3306</Port>
                  <PayType>Postpaid</PayType>
                  <ReadWeight>100</ReadWeight>
                  <ConnectUrl>rm-m5xxxxxxxxx82.mysql.rds.aliyuncs.com</ConnectUrl>
                  <DBInstanceId>rm-m5xxxxxxxxx82</DBInstanceId>
                  <NetworkType>VPC</NetworkType>
                  <RdsInstType>Primary</RdsInstType>
                  <ExpireTime></ExpireTime>
                  <RemainDays>0</RemainDays>
                  <Engine>MySQL</Engine>
            </DbInstance>
      </DbInstances>
      <Success>true</Success>
</DescribeDrdsDbInstances>
```

JSON format

```
{
    "PageNumber":1,
    "PageSize":10,
    "RequestId":"658B6F25-442A-4996-8AAE-F77DAFBC9BAA",
    "DbInstances":{
        "DbInstance":[

                "RemainDays":0,
                "ReadOnlyInstances":{
                    "ReadOnlyInstance":[]
                },
                "DBInstanceId":"rm-m5xxxxxxxx82",
                "ReadWeight":100,
                "RdsInstType":"Primary",
                "DbInstType":"RDS",
                "ConnectUrl":"rm-m5xxxxxxxx82.mysql.rds.aliyuncs.com",
                "Engine":"MySQL",
                "NetworkType":"VPC",
                "Port":3306,
                "ExpireTime":"",
                "EngineVersion":"5.7",
                "DBInstanceStatus":1,
                "PayType":"Postpaid"
            }
        ]
    },
    "Success":true,
    "Total":1
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.2.18. DescribeDrdsDbRdsNameList

Queries the IDs of the storage instances of a database.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeDrdsDbRdsNameList	The operation that you want to perform. Set the value to DescribeDrdsDbRdsNameList.
DbName	String	Yes	drds_test	The name of the database.

Parameter	Type	Required	Example	Description
DrdsInstanceId	String	Yes	drdsxxxxxxxxx	The ID of the instance.
AccessKeyId	String	No	ASU67xxxxxxxxxxxxxxx	The AccessKey ID provided to you by Alibaba Cloud.

Response parameters

Parameter	Type	Example	Description
InstanceNameList	-	rm-m5xxxxxxxx82	The IDs of storage instances.
InstanceName	-	-	The ID of a storage instance.
RequestId	String	37537B38-A663-45CB-A81F-E3B202BB2415	The ID of the request.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeDrdsDbRdsNameList
&DbName=drds_test
&DrdsInstanceId=drdsxxxxxxxxx
&<Common request parameters>
```

Sample success responses

XML format

```
<DescribeDrdsDbRdsNameList>
      <RequestId>37537B38-A663-45CB-A81F-E3B202BB2415</RequestId>
      <InstanceNameList>
            <InstanceName>rm-m5xxxxxxxx82</InstanceName>
      </InstanceNameList>
      <Success>true</Success>
</DescribeDrdsDbRdsNameList>
```

JSON format

```
{
    "InstanceNameList":{
        "InstanceName":[
            "rm-m5xxxxxxxx82"
        ]
    },
    "RequestId":"37537B38-A663-45CB-A81F-E3B202BB2415",
    "Success":true
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.2.19. DescribeDrdsDbRdsRelationInfo

Queries the structure information of storage instances for a database.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeDrdsDbRdsRelationInfo	The operation that you want to perform. Set the value to DescribeDrdsDbRdsRelationInfo.
DbName	String	Yes	drds_test	The name of the database.
DrdsInstanceId	String	Yes	drdsxxxxxxxxx	The ID of the instance.
AccessKeyId	String	No	ASU67xxxxxxxxxxx	The AccessKey ID provided to you by Alibaba Cloud.

Response parameters

Parameter	Type	Example	Description
Data	-	-	The structure information about the storage instances of the database. Each item corresponds to a primary storage instance.

Parameter	Type	Example	Description
Data	-	-	The details about a primary storage instance of the database.
RdsInstanceId	String	rm-m5xxxxxxxxx82	The ID of the primary storage instance.
ReadOnlyInstanceInfo	-	rm-m5xxxxxxxxx82	The information about read-only storage instances of the primary storage instance.
ReadOnlyInstanceIds	-	-	The IDs of the read-only storage instances.
UsedInstanceId	String	rm-m5xxxxxxxxx82	The ID of the used storage instance. For the primary instance, the used storage instance is the primary storage instance. For the read-only instance, the used storage instance is the optional storage instance.
UsedInstanceType	String	RDS	The type of the used storage instance.
RequestId	String	2F7F8080-9132-4279-85D0-B7E5C4305162	The ID of the request.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeDrdsDbRdsRelationInfo
&DbName=drds_test
&DrdsInstanceId=drdsxxxxxxxxx
&<Common request parameters>
```

Sample success responses

XML format

```
<DescribeDrdsDbRdsRelationInfo>
      <RequestId>E827BEE8-A8BE-4E86-992A-E6400B263CB1</RequestId>
      <Data>
            <Data>
                  <ReadOnlyInstanceInfo>
                        <ReadOnlyInstanceIds>rm-m5xxxxxxxxx82</ReadOnlyInstanceIds>
                  </ReadOnlyInstanceInfo>
                  <UsedInstanceId>rm-m5xxxxxxxxx82</UsedInstanceId>
                  <UsedInstanceType>RDS</UsedInstanceType>
                  <RdsInstanceId>rm-m5xxxxxxxxx82</RdsInstanceId>

9.1.2.2.20. DescribeDrdsDbTasks

Queries incomplete tasks for a database.

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeDrdsDbTasks	The operation that you want to perform. Set the value to DescribeDrdsDbTasks.
DbName	String	Yes	drds_test	The name of the database.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxx	The ID of the instance.
AccessKeyId	String	No	ASU678Uxxxxxxxxxxxxx	The AccessKey ID provided to you by Alibaba Cloud.
TaskType	String	No	create_db	The type of the task. If this parameter is not specified, all types of tasks are queried.

Response parameters

Parameter	Type	Example	Description
RequestId	String	2F7F8080-9132-4279-85D0-B7E5C4305162	The ID of the request.
Success	Boolean	true	Indicates whether the request was successful.
Tasks	-	-	The list of returned tasks.
Task	-	-	The details about a task.
AllowCancel	Boolean	false	Indicates whether the task can be canceled.
ExpandType	String	hot_expand	The type of the scale-out task. Valid values: smooth_expand and hot_expand.
GmtCreate	Long	123978138412341	The timestamp when the task was created.
Label	String	create_db	The type of the task.

Parameter	Type	Example	Description
ParentJobId	String	123214	The ID of the parent task.
Progress	Integer	99	The task progress. Valid values: 0 to 100.
ShowProgress	Boolean	true	Indicates whether the task progress was displayed.
TargetId	Long	12312	The ID of the incomplete task.
TaskDetail	String	{}	The details about the task. Example: the details about a smooth scale-out task.
TaskName	String	Database creation task	The name of the incomplete task.
TaskPhase	String	1	The current phase of the incomplete task.
TaskStatus	Integer	1	The status of the incomplete task. Valid values: • 0: running • 1: success • 2: failed • 3: canceled
TaskType	Integer	8	The type of the incomplete task.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeDrdsDbTasks
&DbName=drds_test
&DrdsInstanceId=drdsxxxxxxxxxx
&<Common request parameters>
```

Sample success responses

XML format

```
<DescribeDrdsDbTasks>
      <Tasks>
            <Task>
                  <AllowCancel>false</AllowCancel>
                  <ExpandType></ExpandType>
                  <GmtCreate>1568696422000</GmtCreate>
                  <Label>create_db</Label>
                  <ParentJobId>123</ParentJobId>
                  <Progress>90</Progress>
                  <ShowProgress>true</ShowProgress>
                  <TargetId>154</TargetId>
                  <TaskDetail></TaskDetail>
                  <TaskName>Database creation task</TaskName>
                  <TaskPhase>1</TaskPhase>
                  <TaskStatus>0</TaskStatus>
                  <TaskType>8</TaskType>
            </Task>
      </Tasks>
      <RequestId>7E54C57C-DF5A-4FE8-8E25-DC888817B54D</RequestId>
      <Success>true</Success>
</DescribeDrdsDbTasks>
```

JSON format

```
{
    "RequestId":"7E54C57C-DF5A-4FE8-8E25-DC888817B54D",
    "Tasks":{
        "Task":[
            {
                "ParentJobId":123,
                "AllowCancel":false,
                "GmtCreate":1568696422000,
                "TaskName":"Database creation task",
                "Progress":90,
                "TargetId":154,
                "ExpandType":"",
                "ShowProgress":true,
                "TaskDetail":"",
                "TaskPhase":1,
                "TaskStatus":0,
                "Label":"create_db",
                "TaskType":8
            }
        ]
    },
    "Success":true
}
```

9.1.2.2.21. DescribeDrdsInstanceDbMonitor

Queries the performance monitoring data of a database.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeDrdsInstanceDbMonitor	The operation that you want to perform. Set the value to DescribeDrdsInstanceDbMonitor.
DbName	String	Yes	drds_test	The name of the database.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxxx	The ID of the instance.
EndTime	Long	Yes	1568705520000	The timestamp that specifies the end of the time range to query.
Key	String	Yes	qps	The monitoring metric.
StartTime	Long	Yes	1568701920000	The timestamp that specifies the beginning of the time range to query.
AccessKeyId	String	No	ASU67xxxxxxxxxxxxxxxxxx	The AccessKey ID provided to you by Alibaba Cloud.
RegionId	String	No	cn-hangzhou	The region ID of the PolarDB-X instance.

Response parameters

Parameter	Type	Example	Description
Data	-	-	The list of returned monitoring data.
Key	String	qps	The monitoring metric.

Parameter	Type	Example	Description
Unit	String	qps	The unit of the monitoring metric.
Values	-	-	The obtained values of the monitoring metric.
Date	Long	1568705520000	The timestamp when the value was obtained.
RequestId	String	2F7F8080-9132-4279-85D0-B7E5C4305162	The ID of the request.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeDrdsInstanceDbMonitor
&DbName=drds_test
&DrdsInstanceId=drdsxxxxxxxxxxx
&EndTime=1568705520000
&Key=qps
&StartTime=1568701920000
&<Common request parameters>
```

Sample success responses

XML format

```
<DescribeDrdsInstanceDbMonitor>
      <RequestId>D6A88429-BA1E-4294-BE37-E82167355122</RequestId>
      <Data>
            <Values>
                  <Date>1568705520000</Date>
                  <Value>10000</Value>
            </Values>
            <Unit>qps</Unit>
            <Key>qps</Key>
      </Data>
      <Success>true</Success>
</DescribeDrdsInstanceDbMonitor>
```

JSON format

```
{
    "Data":[
        {
            "Values":[
                {
                    "Value":10000,
                    "Date":1568705520000
                }
            ],
            "Key":"qps",
            "Unit":"qps"
        }
    ],
    "RequestId":"D6A88429-BA1E-4294-BE37-E82167355122",
    "Success":true
}
```

Error codes

HttpCode	Error code	Error message	Description
400	ActionUnauthorized	The specified action is not available for you	The error message returned because you are not authorized to perform this action. Perform RAM authorization first.

For a list of error codes, visit the API Error Center.

9.1.2.2.22. DescribeDrdsShardingDbs

Queries details about a horizontally partitioned database.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeDrdsShardingDbs	The operation that you want to perform. Set the value to DescribeDrdsShardingDbs.
DbName	String	Yes	drds_test	The name of the database.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxx	The ID of the instance.

Parameter	Type	Required	Example	Description
AccessKeyId	String	No	test	The AccessKey ID provided to you by Alibaba Cloud.
DbNamePattern	String	No	test	The matching pattern of the database name.

Response parameters

Parameter	Type	Example	Description
RequestId	String	509BDE17-505A-4B3B-854D-30D3F092502F	The ID of the request.
ShardingDbs	-	-	The list of database shards.
ShardingDb	-	-	The details about a database shard.
BlockingTimeout	Integer	5000	The length of time that a transaction waits to obtain a lock.
ConnectUrl	String	100.xx.xx.100:11569	The connection URL.
ConnectionProperties	String	connectTimeout=3000;autoReconnect=true;failOverReadOnly=false;socketTimeout=900000;rewriteBatchedStatements=true;characterEncoding=utf8	The properties of the connection string.
DbInstanceId	String	rm-bp1xxxxxxxxxx	The ID of the ApsaraDB RDS for MySQL instance to which the database shard belongs.
DbStatus	String	running	The status of the database shard.
DbType	String	mysql	The type of the database shard.
GroupName	String	TEMP1_1568171495522SABE_KUP4_0000	The name of the table shard.
IdleTimeOut	Integer	30	The idle connection timeout.

Parameter	Type	Example	Description
MaxPoolSize	Integer	60	The maximum size of the connection pool.
MinPoolSize	Integer	5	The minimum size of the connection pool.
PreparedStatementCacheSize	Integer	0	The size of the result cache.
ShardingDbName	String	temp1_zhk1_0000	The name of the database shard.
UserName	String	pg284mi8	The username used to connect to the ApsaraDB RDS for MySQL instance.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Request parameters

```
http(s)://[Endpoint]/? Action=DescribeDrdsShardingDbs
&DbName=drds_test
&DrdsInstanceId=drdsxxxxxxxxx
&<Common request parameters>
```

Sample success responses

XML format

```

Only=false;socketTimeout=900000;rewriteBatchedStatements=true;characterEncoding=utf8</Conne
ctionProperties>
            </ShardingDb>
      </ShardingDbs>
      <Success>true</Success>
</DescribeDrdsShardingDbsResponse>
```

Error codes

HttpCode	Error code	Error message	Description
400	ActionUnauthorized	The specified action is not available for you	The error message returned because you are not authorized to perform this action. Perform RAM authorization first.

For a list of error codes, visit the API Error Center.

9.1.2.2.23. DescribeDrdsSlowSqls

Queries slow SQL statements of a database.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeDrdsSlowSqls	The operation that you want to perform. Set the value to DescribeDrdsSlowSqls.
DbName	String	Yes	tempdb	The name of the PolarDB-X database.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxxx	The ID of the instance.

Parameter	Type	Required	Example	Description
EndTime	Long	Yes	1568289311	The end of the time range to query.
ExeTime	Long	Yes	1568289311	The SQL execution time.
StartTime	Long	Yes	1568267711	The beginning of the time range to query.
AccessKeyId	String	No	test	The AccessKey ID provided to you by Alibaba Cloud.
PageNumber	Integer	No	1	The number of the page to return.
PageSize	Integer	No	20	The number of entries to return on each page.

Response parameters

Parameter	Type	Example	Description
Items	-	-	The list of returned slow SQL statements.
Item	-	-	The details about a slow SQL statement.
Host	String	10.xx.xx.26	The IP address of the host where the slow SQL statement is executed.
ResponseTime	Long	1568267711	The response time.
Schema	String	user	The schema of the PolarDB-X database.
SendTime	Long	1568267711	The time when the slow SQL statement was sent.
Sql	String	SELECT count(1) from payment_order where order_status = '08';	The content of the slow SQL statement.

Parameter	Type	Example	Description
PageNumber	Integer	1	The page number of the returned page.
PageSize	Integer	20	The number of entries returned per page.
RequestId	String	509BDE17-505A-4B3B-854D-30D3F092502F	The ID of the request.
Success	Boolean	true	Indicates whether the request was successful.
Total	Integer	1	The total number of slow SQL statements.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeDrdsSlowSqls
&<Common request parameters>
```

Sample success responses

XML format

```
<DescribeDrdsSlowSqlsResponse>
      <Items>
            <Item>
                  <Host> 10.xx.xx.26 </Host>
                  <ResponseTime>2019-09-12 13:55:00</ResponseTime>
                  <Schema>user</Schema>
                  <SendTime>2019-09-12 13:55:00</SendTime>
                  <Sql>SELECT count(1) from  payment_order where  order_status = '08';</Sql
>
            </Item>
      </Items>
      <PageNumber>1</PageNumber>
      <PageSize>30</PageSize>
      <RequestId>B2493C08-AB69-44AB-8C1D-6AB17C2CF48F</RequestId>
      <Success>true</Success>
      <Total>0</Total>
</DescribeDrdsSlowSqlsResponse>
```

Error codes

HttpCode	Error code	Error message	Description

HttpCode	Error code	Error message	Description
400	ActionUnauthorized	The specified action is not available for you	The error message returned because you are not authorized to perform this action. Perform RAM authorization first.

For a list of error codes, visit the API Error Center.

9.1.2.2.24. DescribeDrdsSqlAuditStatus

Queries the details about SQL audit for a instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeDrdsSqlAuditStatus	The operation that you want to perform. Set the value to DescribeDrdsSqlAuditStatus.
DrdsInstanceId	String	Yes	drdsxxxxxxxx	The ID of the instance.
AccessKeyId	String	No	test	The AccessKey ID provided to you by Alibaba Cloud.

Response parameters

Parameter	Type	Example	Description
Data	-	-	The returned data set.
Data	-	-	The SQL audit details about a database.
DbName	String	table1	The name of the database.
Detailed	String	test	The details about SQL audit.
Enabled	String	true	Indicates whether SQL audit was enabled for the database.

Parameter	Type	Example	Description
RequestId	String	DC3ABA3E-0F8A-4596-9104-F5155C34315B	The ID of the request.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeDrdsSqlAuditStatus
&<Common request parameters>
```

Sample success responses

XML format

```
<DescribeGlobalBroadcastTypeResponse>
      <Data>
            <DbName>table1</DbName>
            <Detailed>test</Detailed>
            <Enabled>true</Enabled>
      </Data>
      <RequestId>DC3ABA3E-0F8A-4596-9104-F5155C34315B</RequestId>
      <Success>true</Success>
</DescribeGlobalBroadcastTypeResponse>
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.2.25. DescribeExpandLogicTableInfoList

Queries the shard keys of a PolarDB-X database.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeExpandLogicTableInfoList	The operation that you want to perform. Set the value to DescribeExpandLogicTableInfoList.
DbName	String	Yes	drds_db	The name of the PolarDB-X database.

Parameter	Type	Required	Example	Description
DrdsInstanceId	String	Yes	drdsxxxxxxxxxxxxx	The ID of the instance.
AccessKeyId	String	No	test	The AccessKey ID provided to you by Alibaba Cloud.

Response parameters

Parameter	Type	Example	Description
Data	-	-	The returned data set.
data	-	-	The details about shard keys.
ShardDbKey	String	id	The database shard key.
ShardTbKey	String	address	The table shard key.
TableName	String	employee_split2	The name of the table.
RequestId	String	0B6B7BDC-575D-4A77-A4F8-24B7EF027B75	The ID of the request.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeExpandLogicTableInfoList
&<Common request parameters>
```

Sample success responses

XML format

```
<DescribeExpandLogicTableInfoListResponse>
      <Data>
            <data>
                  <ShardDbKey>id</ShardDbKey>
                  <TableName>employee_split2</TableName>
                  <ShardTbKey>address</ShardTbKey>
            </data>
      </Data>
      <RequestId>0B6B7BDC-575D-4A77-A4F8-24B7EF027B75</RequestId>
      <Success>true</Success>
</DescribeExpandLogicTableInfoListResponse>
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.2.26. DescribeGlobalBroadcastType

Queries whether the table in a PolarDB-X database is a broadcast table.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeGlobalBroadcastType	The operation that you want to perform. Set the value to DescribeGlobalBroadcastType.
DbName	String	Yes	drds_db	The name of the PolarDB-X database.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxxxxx	The ID of the instance.
RegionId	String	No	cn-hangzhou	The region ID of the PolarDB-X instance.

Response parameters

Parameter	Type	Example	Description
Data	-	-	The returned data set.
IsSyncType	Boolean	false	Indicates whether the table is a broadcast table.
RequestId	String	DC3ABA3E-0F8A-4596-9104-F5155C34315B	The ID of the request.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeGlobalBroadcastType
&<Common request parameters>
```

Sample success responses

XML format

```
<DescribeGlobalBroadcastTypeResponse>
      <Data>
            <IsSyncType>false</IsSyncType>
      </Data>
      <RequestId>DC3ABA3E-0F8A-4596-9104-F5155C34315B</RequestId>
      <Success>true</Success>
</DescribeGlobalBroadcastTypeResponse>
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.2.27. DescribeHotDbList

Queries the available databases for hot-spot scale-out of a PolarDB-X database.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeHotDbList	The operation that you want to perform. Set the value to DescribeHotDbList.
DbName	String	Yes	test	The name of the PolarDB-X database.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxx	The ID of the instance.
AccessKeyId	String	No	test	The AccessKey ID provided to you by Alibaba Cloud.

Response parameters

Parameter	Type	Example	Description
Data	-	-	The returned data set.
List	-	-	The list of returned items.
InstanceDb	-	-	The details about an item.

Parameter	Type	Example	Description
HotDbList	-	test,test	The list of hot-spot databases.
data	-	-	The details about a hot-spot database.
RandomCode	String	989fdsf	The random code.
Msg	String	msg	The message.
RequestId	String	DSSDF-SEWE-23ERW	The ID of the request.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeHotDbList
&<Common request parameters>
```

Sample success responses

XML format

```
<DescribeHotDbListResponse>
      <RequestId>DSSDF-SEWE-23ERW</RequestId>
      <Success>True</Success>
      <Msg>msg</Msg>
      <RandomCode>msg</RandomCode>
      <Data>
            <List>
                  <HotDbList></HotDbList>
            </List>
      </Data>
</DescribeHotDbListResponse>
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.2.28. DescribeInstDbLogInfo

Queries the time range of historical SQL data that can be imported to a PolarDB-X database.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeInstDbLogInfo	The operation that you want to perform. Set the value to DescribeInstDbLogInfo.
DbName	String	Yes	drds_test	The name of the PolarDB-X database.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxxx	The ID of the instance.
AccessKeyId	String	No	test	The AccessKey ID provided to you by Alibaba Cloud.

Response parameters

Parameter	Type	Example	Description
LogTimeRange	-	-	The supported time range.
SupportLatestTime	Long	1568267711	The beginning of the time range.
SupportOldestTime	Long	1568267711	The end of the time range.
RequestId	String	DC3ABA3E-0F8A-4596-9104-F5155C34315B	The ID of the request.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeInstDbLogInfo
&<Common request parameters>
```

Sample success responses

XML format

```
<DescribeInstDbLogInfoResponse>
      <LogTimeRange>
            <SupportLatestTime>1568267711</SupportLatestTime>
            <SupportOldestTime>1568267711</SupportOldestTime>
      </LogTimeRange>
      <RequestId>DC3ABA3E-0F8A-4596-9104-F5155C34315B</RequestId>
      <Success>true</Success>
</DescribeInstDbLogInfoResponse>
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.2.29. DescribeRDSPerformance

Queries the performance data of ApsaraDB RDS for MySQL instances for a PolarDB-X instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeRDSPerformance	The operation that you want to perform. Set the value to DescribeRDSPerformance.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxxxx	The ID of the instance.
Keys	String	Yes	cpu	The performance metrics.
RdsInstanceId	String	Yes	rm-hbxxxxxxxxxxx	The ID of the ApsaraDB RDS for MySQL instance.
AccessKeyId	String	No	test	The AccessKey ID provided to you by Alibaba Cloud.
DbInstType	String	No	mysql	The type of the ApsaraDB RDS for MySQL database.
EndTime	Long	No	1568267711	The end of the time range to query.
StartTime	Long	No	1568267711	The beginning of the time range to query.

Response parameters

Parameter	Type	Example	Description
Data	-	-	The returned data set.
Key	String	cpuusage	The performance metric.
NodeName	String	cpu	The name of the performance metric.
NodeNum	Integer	1	The number of nodes.
Unit	String	%	The unit of the performance metric.
Values	-	-	The value set.
Date	Long	1568625038000	The time when the value was obtained.
Value	String	0.65	The value of the performance metric.
RequestId	String	F06B92ED-EF1B-4F8E-8ACA-ECEFD5E4271C	The ID of the request.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeRDSPerformance
&<Common request parameters>
```

Sample success responses

XML format

```
<DescribeRDSPerformanceResponse>
      <Data>
            <Key>cpuusage</Key>
            <NodeName>1</NodeName>
            <Unit>%</Unit>
            <Values>
              <Date>1568625038000</Date>
              <Value>0.65</Value>
            </Values>
      </Data>
      <RequestId>DC3ABA3E-0F8A-4596-9104-F5155C34315B</RequestId>
      <Success>true</Success>
</DescribeRDSPerformanceResponse>
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.2.30. DescribeRdsPerformanceSummary

Queries the performance metrics of ApsaraDB RDS for MySQL instances for a PolarDB-X instance, including CPU, input/output operations per second (IOPS), and active sessions.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeRdsPerformanceSummary	The operation that you want to perform. Set the value to DescribeRdsPerformanceSummary.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxxx	The ID of the instance.
RdsInstanceId.N	RepeatList	Yes	['rm-bp1xxxxxxxxxxx','rm-bp1xxxxxxxxxx']	The list of ApsaraDB RDS for MySQL instances.
RegionId	String	No	cn-hangzhou	The region ID of the PolarDB-X instance.

Response parameters

Parameter	Type	Example	Description

Parameter	Type	Example	Description
RdsPerformanceInfos	-	-	The collection of RdsPerformanceInfos objects.
ActiveSessions	Integer	0	The number of active sessions on the current ApsaraDB RDS for MySQL instance.
Cpu	Float	0.65	The CPU utilization of the ApsaraDB RDS for MySQL instance.
Iops	Float	10.56	The IOPS of the ApsaraDB RDS for MySQL instance.
RdsId	String	rm-bp1xxxxxxxxxxx	The ID of the ApsaraDB RDS for MySQL instance.
TotalSessions	Integer	241	The total number of sessions on the current ApsaraDB RDS for MySQL instance.
RequestId	String	5D64DE5944A1E541E0CB908A	The unique ID of the request. If any problem occurs, provide this request ID for troubleshooting.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeRdsPerformanceSummary
&DrdsInstanceId=drdsxxxxxxxxxxx
&RdsInstanceId.1=['rm-bp1xxxxxxxxxxx','rm-bp1xxxxxxxxxx']
&<Common request parameters>
```

Sample success responses

XML format

```
<DescribeRdsPerformanceSummaryResponse>
        <code>200</code>
        <data>
                <RequestId>395533CB-12E8-4FDC-8934-127FD2024C0A</RequestId>
                <RdsPerformanceInfos>
                        <TotalSessions>241</TotalSessions>
                        <Cpu>0.65</Cpu>
                        <Iops>10.56</Iops>
                        <RdsId>rm-bp1xxxxxxxxxxx</RdsId>
                        <ActiveSessions>0</ActiveSessions>
                </RdsPerformanceInfos>
                <Success>true</Success>
        </data>
        <requestId>395533CB-12E8-4FDC-8934-127FD2024C0A</requestId>
        <successResponse>true</successResponse>
</DescribeRdsPerformanceSummaryResponse>
```

JSON format

```
{
    "successResponse":true,
    "requestId":"395533CB-12E8-4FDC-8934-127FD2024C0A",
    "data":{
        "RequestId":"395533CB-12E8-4FDC-8934-127FD2024C0A",
        "RdsPerformanceInfos":[
            {
                "Cpu":0.65,

                "TotalSessions":241,
                "Iops":10.56,
                "ActiveSessions":0
            }
        ],
        "Success":true
    },
    "code":"200"
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.2.31. DescribeRdsSuperAccountInstances

Queries the privileged accounts of ApsaraDB RDS for MySQL instances for a PolarDB-X instance.

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeRdsSuperAccountInstances	The operation that you want to perform. Set the value to DescribeRdsSuperAccountInstances.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxx	The ID of the instance.
RdsInstance.N	RepeatList	Yes	['rm-bp1xxxxxxxxxx','rm-bp1xxxxxxxxx']	The list of ApsaraDB RDS for MySQL instances.
AccessKeyId	String	No	****	The AccessKey ID provided to you by Alibaba Cloud.
DbInstType	String	No	RDS	The type of the database instance. Default value: RDS.

Response parameters

Parameter	Type	Example	Description
DbInstances	-	rm-bp1xxxxxxxxxx	The ID of the ApsaraDB RDS for MySQL instance.
DbInstance	-	-	The list of privileged accounts.
RequestId	String	5D64DE5944A1E541E0CB908A	The unique ID of the request. If any problem occurs, provide this request ID for troubleshooting.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeRdsSuperAccountInstances
&DrdsInstanceId=drdsxxxxxxxxxx
&RdsInstance.1=['rm-bp1xxxxxxxxxx','rm-bp1xxxxxxxxx']
&<Common request parameters>
```

Sample success responses

XML format

```
<DescribeRdsSuperAccountInstancesResponse>
      <code>200</code>
      <data>
            <RequestId>62CA96F4-B94F-4059-B23E-A58CCF318D3E</RequestId>
            <DbInstances></DbInstances>
      </data>
      <requestId>62CA96F4-B94F-4059-B23E-A58CCF318D3E</requestId>
      <successResponse>true</successResponse>
</DescribeRdsSuperAccountInstancesResponse>
```

JSON format

```
{
    "successResponse":true,
    "requestId":"62CA96F4-B94F-4059-B23E-A58CCF318D3E",
    "data":{
        "RequestId":"62CA96F4-B94F-4059-B23E-A58CCF318D3E",
        "DbInstances":{
            "DbInstance":[]
        }
    },
    "code":"200"
}
```

Error codes

HttpCode	Error code	Error message	Description
400	ActionUnauthorized	The specified action is not available for you	The error message returned because you are not authorized to perform this action. Perform RAM authorization first.

For a list of error codes, visit the API Error Center.

9.1.2.2.32. DescribeRecycleBinStatus

Queries the status of the table recycle bin for a PolarDB-X database.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeRecycleBinStatus	The operation that you want to perform. Set the value to DescribeRecycleBinStatus.

Parameter	Type	Required	Example	Description
DbName	String	Yes	tpch_db	The name of database.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxxx	The ID of the instance.
RegionId	String	No	cn-hangzhou	The region ID of the PolarDB-X instance.

Response parameters

Parameter	Type	Example	Description
RequestId	String	5D64DE5944A1E541E0CB908A	The unique ID of the request. If any problem occurs, provide this request ID for troubleshooting.
Status	String	disable	The status of the table recycle bin. Valid values: • disable • enable
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeRecycleBinStatus
&DbName=tpch_db
&DrdsInstanceId=drdsxxxxxxxxxxx
&<Common request parameters>
```

Sample success responses

XML format

```
<DescribeRecycleBinStatusResponse>
      <code>200</code>
      <data>
            <Status>enable</Status>
            <RequestId>E7D9B458-2C2D-44E3-BD55-92AD2172303F</RequestId>
            <Success>true</Success>
      </data>
      <requestId>E7D9B458-2C2D-44E3-BD55-92AD2172303F</requestId>
      <successResponse>true</successResponse>
</DescribeRecycleBinStatusResponse>
```

JSON format

```
{
    "successResponse":true,
    "requestId":"E7D9B458-2C2D-44E3-BD55-92AD2172303F",
    "data":{
        "Status":"enable",
        "RequestId":"E7D9B458-2C2D-44E3-BD55-92AD2172303F",
        "Success":true
    },
    "code":"200"
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.2.33. DescribeRecycleBinTables

Queries the tables that can be recycled for a PolarDB-X database.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeRecycleBinTables	The operation that you want to perform. Set the value to DescribeRecycleBinTables.
DbName	String	Yes	drds_db	The name of the PolarDB-X database.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxxxx	The ID of the instance.

Parameter	Type	Required	Example	Description
RegionId	String	No	cn-hangzhou	The region ID of the PolarDB-X instance.

Response parameters

Parameter	Type	Example	Description
Data	-	-	The returned data set.
CreateTime	String	2019-09-16 14:42:06	The time when the table was created.
OriginalTableName	String	BIN_T4AG3CY5WWXPKHITCHJY	The original name of the table.
TableName	String	drds_params	The current name of the table.
RequestId	String	5D64DE5944A1E541E0CB908A	The unique ID of the request. If any problem occurs, provide this request ID for troubleshooting.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeRecycleBinTables
&<Common request parameters>
```

Sample success responses

XML format

```
<DescribeRecycleBinTablesResponse>
      <code>200</code>
      <data>

9.1.2.2.34. DescribeShardTaskInfo

Queries details about a partitioning task of a PolarDB-X database.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeShardTaskInfo	The operation that you want to perform. Set the value to DescribeShardTaskInfo.

Parameter	Type	Required	Example	Description
DbName	String	Yes	drds_db	The name of the PolarDB-X database.
DrdsInstanceId	String	Yes	drdsxxxxxxxxx	The ID of the instance.
SourceTableName	String	Yes	a1	The name of the source table.
TargetTableName	String	Yes	a2	The name of the destination table.
RegionId	String	No	cn-hangzhou	The region ID of the PolarDB-X instance.

Response parameters

Parameter	Type	Example	Description
Data	-	-	The returned data set.
Expired	String	0	The number of remaining days before the task expires.
Full	-	-	The full migration task.
Expired	Integer	0	The number of remaining days before the full migration task expires.
Progress	Integer	100	The full migration progress.
StartTime	String	2019-09-16 15:11:53	The start time of the full migration task.
Total	Integer	2	The total number of full migration tasks.
Tps	Integer	0	The current TPS of the full migration task.
FullCheck	-	-	The full check task.
Expired	Integer	0	The number of remaining days before the full check task expires.

Parameter	Type	Example	Description
Progress	Integer	0	The full check progress.
StartTime	String	2019-09-16 15:12:53	The start time of the full check task.
Total	Integer	0	The total number of full check tasks.
Tps	Integer	0	The current TPS of the full check task.
FullRevise	-	-	The full correction task.
Expired	Integer	0	The number of remaining days before the full correction task expires.
Progress	Integer	0	The full correction progress.
StartTime	String	2019-09-16 15:12:53	The start time of the full correction task.
Total	Integer	0	The total number of full correction tasks.
Tps	Integer	0	The current TPS of the full correction task.
Increment	-	-	The increment.
Delay	Integer	1568617906	The latency of the incremental synchronization.
StartTime	String	2019-09-16 15:12:53	The start time of the incremental synchronization.
Tps	Integer	0	The current TPS of the incremental synchronization.
Progress	String	0	The incremental synchronization progress.
Review	-	-	The review task.
Expired	Integer	0	The number of remaining days before the review task expires.

Parameter	Type	Example	Description
Progress	Integer	0	The review progress.
StartTime	String	2019-09-16 15:12:53	The start time of the review task.
Total	Integer	0	The total number of review tasks.
Tps	Integer	0	The current TPS of the review task.
SourceTableName	String	a1	The name of the source table.
Stage	String	2	The current stage of the task.
Status	String	Incremental synchronization	The status of the task.
TargetTableName	String	a2	The name of the destination table.
RequestId	String	5D64DE5944A1E541E0CB908A	The unique ID of the request. If any problem occurs, provide this request ID for troubleshooting.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

9.1.2.2.35. DescribeShardTaskList

Queries the partitioning tasks of a PolarDB-X database.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeShardTaskList	The operation that you want to perform. Set the value to DescribeShardTaskList.
DbName	String	Yes	testdb	The name of the PolarDB-X database.
DrdsInstanceId	String	Yes	drdsxxxxxxxxx	The ID of the instance.
Query	String	Yes	a1	The query criteria.
TaskType	String	Yes	SINGLE_TO_SHARD	The type of the task.
CurrentPage	Integer	No	1	The page number of the current page.
PageSize	Integer	No	10	The number of entries to return on each page.
RegionId	String	No	cn-hangzhou	The region ID of the PolarDB-X instance.

Response parameters

Parameter	Type	Example	Description
List	-	-	The list of returned objects.
Delay	Integer	0	The latency of the task.
Expired	String	0	The time when the task expired.

Parameter	Type	Example	Description
Expired	Long	0	The number of remaining days before the task expires.
Progress	Integer	0	The progress of the task.
SourceTableName	String	a1	The name of the source table.
Stage	Integer	1	The current stage of the task.
TargetTableName	String	a2	The name of the destination table.
PageNumber	Integer	1	The page number of the returned page.
PageSize	Integer	10	The number of entries returned per page.
RequestId	String	890BB376-5746-4145-A088-A455F8D359D0	The unique ID of the request. If any problem occurs, provide this request ID for troubleshooting.
Success	Boolean	true	Indicates whether the request was successful.
Total	Integer	1	The total number of tables.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeShardTaskList
&<Common request parameters>
```

9.1.2.2.36. DescribeSqlFlashbakTask

Queries the flashback tasks of a PolarDB-X database.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeSqlFlashbakTask	The operation that you want to perform. Set the value to DescribeSqlFlashbakTask.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxx	The ID of the instance.
AccessKeyId	String	No	*****	The AccessKey ID provided to you by Alibaba Cloud.

Response parameters

Parameter	Type	Example	Description
RequestId	String	5D64DE5944A1E541E0CB908A	The unique ID of the request. If any problem occurs, provide this request ID for troubleshooting.
SqlFlashbackTasks	-	-	The list of returned flashback tasks.
SqlFlashbackTask	-	-	The details about a flashback task.
DbName	String	drds_flashback	The name of the PolarDB-X database for the flashback task.
DownloadUrl	String	http://...	The download URL.
ExpireTime	Long	1569216270000	The time when the download URL expires.
GmtCreate	Long	1568611408000	The time when the task was created.
GmtModified	Long	1568611469000	The time when the task was modified.
Id	Long	238	The ID of the primary key.

Parameter	Type	Example	Description
InstId	String	drdsxxxxxxxxxxx	The ID of the instance.
RecallProgress	Integer	10	The progress of the reverse call.
RecallRestoreType	Integer	0	The recovery type. Valid values: image restoration and reverse restoration.
RecallStatus	Integer	1	The status of the data recall task.
RecallType	Integer	1	The recall type. Valid values: exact match and fuzzy match.
SearchEndTime	Long	1568609597000	The end time of the query.
SearchStartTime	Long	1568609597000	The start time of the query.
SqlCounter	Long	0	The number of restored data rows.
SqlPk	String	id	The value of the SQL primary key.
SqlType	String	Insert,Update,Delete	The type of the SQL statement.
TableName	String	drds_params	The name of the table to which data belongs.
TraceId	String	trace	The trace ID of the SQL statement.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeSqlFlashbakTask
&DrdsInstanceId=drdsxxxxxxxxxx
&<Common request parameters>
```

Sample success responses

XML format

```
<DescribeSqlFlashbakTaskResponse>
      <code>200</code>
      <data>
            <SqlFlashbackTasks>

9.1.2.2.37. DescribeTable

Queries the table schema of a PolarDB-X database.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeTable	The operation that you want to perform. Set the value to DescribeTable.

Parameter	Type	Required	Example	Description
DbName	String	Yes	drds_db	The name of the PolarDB-X database.
DrdsInstanceId	String	Yes	drdsxxxxxxxx	The ID of the instance.
TableName	String	Yes	employee_split	The name of the table.
RegionId	String	No	cn-hangzhou	The region ID of the PolarDB-X instance.

Response parameters

Parameter	Type	Example	Description
Data	-	-	The returned data set.
List	-	-	The details about the table structure.
ColumnName	String	Id	The name of the column.
ColumnType	String	bigint(20)	The type of the column.
Extra	String	auto_increment	The extra information.
Index	String	PRI	The primary key.
IsAllowNull	String	NO	Indicates whether the column can be empty.
IsPk	String	YES	Indicates whether it is a primary key.
RequestId	String	5DC75BC2-3F3F-4FE5-8DC9-2A808B9AA401	The unique ID of the request. If any problem occurs, provide this request ID for troubleshooting.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeTable

9.1.2.2.38. DescribeTableListByType

Queries type-specific tables of a PolarDB-X database.

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeTableListByType	The operation that you want to perform. Set the value to DescribeTableListByType.
DbName	String	Yes	drds_db	The name of the PolarDB-X database.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxxxx	The ID of the instance.
Query	String	Yes	drdsxxxxxxxxxxxx	The search field.
TableType	String	Yes	SINGLE	The type of the table.
CurrentPage	Integer	No	1	The page number of the current page.
PageSize	Integer	No	10	The number of entries to return on each page.
RegionId	String	No	cn-hangzhou	The region ID of the PolarDB-X instance.

Response parameters

Parameter	Type	Example	Description
List	-	-	The list of returned tables.
Property	String	single	The property.
TableName	String	employee_split	The name of the table.
PageNumber	Integer	1	The page number of the returned page.
PageSize	Integer	10	The number of entries returned per page.

Parameter	Type	Example	Description
RequestId	String	B360F47B-59E3-4D1C-BA03-6BFB1C993F88	The unique ID of the request. If any problem occurs, provide this request ID for troubleshooting.
Success	Boolean	true	Indicates whether the request was successful.
Total	Integer	1	The total number of tables.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeTableListByType
&<Common request parameters>
```

Sample success responses

XML format

```
<DescribeTableListByTypeResponse>
      <code>200</code>
      <data>
            <PageSize>10</PageSize>
            <RequestId>B360F47B-59E3-4D1C-BA03-6BFB1C993F88</RequestId>
            <PageNumber>1</PageNumber>
            <Total>1</Total>
            <List>
                  <TableName>employee_split</TableName>
                  <Property>single</Property>
            </List>
            <Success>true</Success>
      </data>
      <requestId>B360F47B-59E3-4D1C-BA03-6BFB1C993F88</requestId>
      <successResponse>true</successResponse>
</DescribeTableListByTypeResponse>
```

JSON format

```
{
    "successResponse":true,
    "requestId":"B360F47B-59E3-4D1C-BA03-6BFB1C993F88",
    "data":{
        "PageNumber":1,
        "PageSize":10,
        "RequestId":"B360F47B-59E3-4D1C-BA03-6BFB1C993F88",
        "Success":true,
        "List":[
            {
                "TableName":"employee_split",
                "Property":"single"
            }
        ],
        "Total":1
    },
    "code":"200"
}
```

9.1.2.2.39. DescribeTables

Queries the details about tables in a PolarDB-X database.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeTables	The operation that you want to perform. Set the value to DescribeTables.
DbName	String	Yes	drds_db	The name of the PolarDB-X database.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxxx	The ID of the instance.
Query	String	Yes	drdsxxxxxxxxxxx	The query criteria.
CurrentPage	Integer	No	1	The page number of the current page.
PageSize	Integer	No	10	The number of entries to return on each page.

Parameter	Type	Required	Example	Description
RegionId	String	No	cn-hangzhou	The region ID of the PolarDB-X instance.

Response parameters

Parameter	Type	Example	Description
List	-	-	The list of returned objects.
Broadcast	Boolean	false	Indicates whether the table is a broadcast table.
DbInstType	Integer	0	The type of the database instance.
IsLocked	Boolean	false	Indicates whether the table was locked.
IsShard	Boolean	false	Indicates whether the table was partitioned.
ShardKey	String	null	The shard key of the table.
Table	String	employee_split	The name of the table.
PageNumber	Integer	1	The page number of the returned page.
PageSize	Integer	10	The number of entries returned per page.
RequestId	String	83AC3D7E-461C-4D87-8ACD-6CC295178C6F	The unique ID of the request. If any problem occurs, provide this request ID for troubleshooting.
Success	Boolean	true	Indicates whether the request was successful.
Total	Integer	1	The total number of tables.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeTables
&<Common request parameters>
```

Sample success responses

XML format

```
<DescribeTablesResponse>
      <code>200</code>
      <data>
            <PageSize>40</PageSize>
            <RequestId>83AC3D7E-461C-4D87-8ACD-6CC295178C6F</RequestId>
            <PageNumber>1</PageNumber>
            <Total>2</Total>
            <List>
                  <DbInstType>0</DbInstType>
                  <IsShard>false</IsShard>
                  <Table>employee_split</Table>
                  <Broadcast>false</Broadcast>
                  <ShardKey>null</ShardKey>
                  <IsLocked>false</IsLocked>
                  <AllowFullTableScan>false</AllowFullTableScan>
            </List>
            <List>
                  <DbInstType>0</DbInstType>
                  <IsShard>true</IsShard>
                  <Table>employee_split2</Table>
                  <Broadcast>false</Broadcast>
                  <ShardKey>["id"]</ShardKey>
                  <IsLocked>false</IsLocked>
                  <AllowFullTableScan>true</AllowFullTableScan>
            </List>
            <Success>true</Success>
      </data>
      <requestId>83AC3D7E-461C-4D87-8ACD-6CC295178C6F</requestId>
      <successResponse>true</successResponse>
</DescribeTablesResponse>
```

JSON format

```
{
    "successResponse":true,

                "AllowFullTableScan":false
            },
            {
                "IsLocked":false,
                "IsShard":true,
                "ShardKey":"[\"id\"]",
                "Broadcast":false,
                "Table":"employee_split2",
                "DbInstType":0,
                "AllowFullTableScan":true
            }
        ],
        "Total":2
    },
    "code":"200"
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.2.40. DisableSqlAudit

Disables SQL audit for a PolarDB-X database.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DisableSqlAudit	The operation that you want to perform. Set the value to DisableSqlAudit.

Parameter	Type	Required	Example	Description
DbName	String	Yes	drds_db	The name of the database.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxxxx	The ID of the instance.
AccessKeyId	String	No	*****	The AccessKey ID provided to you by Alibaba Cloud.

Response parameters

Parameter	Type	Example	Description
RequestId	String	5D64DE5944A1E541E0CB908A	The unique ID of the request. If any problem occurs, provide this request ID for troubleshooting.
Result	Boolean	true	Indicates whether SQL audit was disabled for the PolarDB-X database.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DisableSqlAudit
&<Common request parameters>
```

Sample success responses

XML format

```
<DisableSqlAuditResponse>
      <code>200</code>
      <data>
            <RequestId>5F72CB0C-7A49-458E-AAC7-F53BCDAACEEF</RequestId>
            <Success>true</Success>
            <Result>true</Result>
      </data>
      <requestId>5F72CB0C-7A49-458E-AAC7-F53BCDAACEEF</requestId>
      <successResponse>true</successResponse>
</DisableSqlAuditResponse>
```

JSON format

```
{
    "successResponse":true,
    "requestId":"5F72CB0C-7A49-458E-AAC7-F53BCDAACEEF",
    "data":{
        "Result":true,
        "RequestId":"5F72CB0C-7A49-458E-AAC7-F53BCDAACEEF",
        "Success":true
    },
    "code":"200"
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.2.41. ModifyAccountPrivilege

Modifies account permissions for a PolarDB-X instance.

Request parameters

Parameter	Type	Required	Example	Description
AccountName	String	Yes	mytest@%	The name of the account.
Action	String	Yes	ModifyAccountPrivilege	The operation that you want to perform. Set the value to ModifyAccountPrivilege.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxxx	The ID of the instance.
AccessKeyId	String	No	2zAEvsxxxxxxxxxxx	The AccessKey ID provided to you by Alibaba Cloud.
DbPrivilege.N.DbName	String	No	ddltest	The name of the PolarDB-X database whose permissions will be changed.
DbPrivilege.N.Privilege	String	No	RW	The database permissions that the account has.

Response parameters

Parameter	Type	Example	Description
RequestId	String	40E313AD-3B7C-4E34-B3BF-58AD0174D638	The ID of the request.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=ModifyAccountPrivilege
&AccountName=mytest@%
&DrdsInstanceId=drdsxxxxxxxxxxxx
&<Common request parameters>
```

Sample success responses

XML format

```
<ModifyAccountPrivilegeResponse>
      <RequestId>40E313AD-3B7C-4E34-B3BF-58AD0174D638</RequestId>
      <Success>true</Success>
</ModifyAccountPrivilegeResponse>
```

JSON format

```
{
    "RequestId":"40E313AD-3B7C-4E34-B3BF-58AD0174D638",
    "Success":true
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.2.42. ModifyDrdsIpWhiteList

Modifies the IP address whitelist of a PolarDB-X database.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyDrdsIpWhiteList	The operation that you want to perform. Set the value to ModifyDrdsIpWhiteList.

Parameter	Type	Required	Example	Description
DbName	String	Yes	test	The name of the PolarDB-X database.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxx	The ID of the PolarDB-X instance.
IpWhiteList	String	Yes	127.xx.xx.1,10.xx.xx.1	The IP address whitelist after modification. **Note** Use commas (,) to separate multiple IP addresses.
AccessKeyId	String	No	LTAIxxxxxxxxxxxxxx	The AccessKey ID provided to you by Alibaba Cloud.
GroupAttribute	String	No	Group 1	The attribute of an IP address group in the whitelist.
GroupName	String	No	drds_group	The name of an IP address group in the whitelist.
Mode	Boolean	No	false	• The modification mode. Valid values: true: appending • false: overwriting

Response parameters

Parameter	Type	Example	Description
RequestId	String	5D64DE5944A1E541E0CB908A	The unique ID of the request. If any problem occurs, provide this request ID for troubleshooting.

Parameter	Type	Example	Description
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=ModifyDrdsIpWhiteList
&DbName=test
&DrdsInstanceId=drdsxxxxxxxxxx
&IpWhiteList=127.xx.xx.1,10.xx.xx.1
&<Common request parameters>
```

Sample success responses

JSON format

```
{
    "successResponse":true,
    "requestId":"CAC59657-4B81-478E-BB68-6C8FF8FFDF22",
    "data":{
        "RequestId":"CAC59657-4B81-478E-BB68-6C8FF8FFDF22",
        "Success":true
    },
    "code":"200"
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.2.43. ModifyRdsReadWeight

Modifies the read weights of ApsaraDB RDS for MySQL instances.

Request parameters

Parameter	Type	Required	Example	Description
DbName	String	Yes	db_test	The name of the PolarDB-X database.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxx	The ID of the instance.

Parameter	Type	Required	Example	Description
InstanceNames	String	Yes	rm-bp1xxxxxxxxxxxx,rm-bp1xxxxxxxxxxxx	The list of ApsaraDB RDS for MySQL instances. Use commas (,) to separate multiple RDS instances.
Weights	String	Yes	14,86	The weight of each ApsaraDB RDS for MySQL instance. Use commas (,) to separate multiple weights.
AccessKeyId	String	No	LTAI8Gxxxxxxxxxx	The AccessKey ID provided to you by Alibaba Cloud.

Response parameters

Parameter	Type	Example	Description
RequestId	String	5D64DE5944A1E541E0CB908A	The unique ID of the request. If any problem occurs, provide this request ID for troubleshooting.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=ModifyRdsReadWeight
&DbName=db_test
&DrdsInstanceId=drdsxxxxxxxxxx
&InstanceNames=rm-bp1qxxxxxxxxxx,rm-bp1xxxxxxxxxxx
&Weights=14,86
&<Common request parameters>
```

Sample success responses

XML format

```
<ModifyRdsReadWeightResponse>
      <RequestId>B12FC174-D5CE-4A6E-83C1-0F8F864FF70A</RequestId>
      <Success>true</Success>
</ModifyRdsReadWeightResponse>
```

JSON format

```
{
    "RequestId":"B12FC174-D5CE-4A6E-83C1-0F8F864FF70A",
    "Success":"true"
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.2.44. PutStartBackup

Submits a data backup task for a PolarDB-X instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	PutStartBackup	The operation that you want to perform. Set the value to PutStartBackup.
DrdsInstanceId	String	Yes	drdsxxxxxxxxx	The ID of the instance.
AccessKeyId	String	No	LTAI8Gxxxxxxxxxx	The AccessKey ID provided to you by Alibaba Cloud.
BackupDbNames	String	No	db_1, db_2	The names of the databases to be backed up. For database backups, you must specify the databases to be backed up. Use commas (,) to separate multiple database names.
BackupLevel	String	No	db	The level of the backup. Valid values: • instance • database

Parameter	Type	Required	Example	Description
BackupMode	String	No	phy	The mode of the backup. Valid values: • phy: the quick backup • logic: the consistent backup

Response parameters

Parameter	Type	Example	Description
RequestId	String	5D64DE5944A1E541E0CB908A	The unique ID of the request. If any problem occurs, provide this request ID for troubleshooting.
Result	String	success	Indicates whether the backup task was submitted.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=PutStartBackup
&DrdsInstanceId=drdsxxxxxxxxx
&<Common request parameters>
```

Sample success responses

JSON format

```
{
    "successResponse":true,
    "requestId":"07D9CC74-2707-4234-BC5A-1F11AEB9AD7C",
    "data":{
        "Result":"success",
        "RequestId":"07D9CC74-2707-4234-BC5A-1F11AEB9AD7C",
        "Success":true
    },
    "code":"200"
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.2.45. ReleaseHiStoreInstance

Releases a columnar storage instance, namely, a HiStore instance of a PolarDB-X instance.

Request parameters

Parameter	Type	Required	Example	Description
DrdsInstanceId	String	Yes	drdsxxxxxxxxxx	The ID of the instance.
HistoreInstanceId	String	Yes	hi-hbgxxxxxxxxx	The ID of the HiStore instance.
RegionId	String	No	cn-beijing	The region ID of the instance.

Response parameters

Parameter	Type	Example	Description
RequestId	String	5D64DE5944A1E541E0CB908A	The unique ID of the request. If any problem occurs, provide this request ID for troubleshooting.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=ReleaseHiStoreInstance
&DrdsInstanceId=drdsxxxxxxxxxx
&HistoreInstanceId=hi-hbgxxxxxxxxx
&<Common request parameters>
```

Sample success responses

XML format

```
<ReleaseHiStoreInstanceResponse>
      <RequestId>B12FC174-D5CE-4A6E-83C1-0F8F864FF70A</RequestId>
      <Success>true</Success>
</ReleaseHiStoreInstanceResponse>
```

JSON format

```
{
    "RequestId":"B12FC174-D5CE-4A6E-83C1-0F8F864FF70A",
    "Success":"true"
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.2.46. RemoveBackupsSet

Removes a backup set from a PolarDB-X instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	RemoveBackupsSet	The operation that you want to perform. Set the value to RemoveBackupsSet.
BackupId	String	Yes	c778036f-d464-11e9-8d45-7370dca6206b	The ID of the backup set.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxx	The ID of the instance.
AccessKeyId	String	No	LTAI8xxxxxxxxxx	The AccessKey ID provided to you by Alibaba Cloud.

Response parameters

Parameter	Type	Example	Description
RequestId	String	5D64DE5944A1E541E0CB908A	The unique ID of the request. If any problem occurs, provide this request ID for troubleshooting.
Result	String	success	Indicates whether the backup set was removed.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=RemoveBackupsSet
&BackupId=c778036f-d464-11e9-8d45-7370dca6206b
&DrdsInstanceId=drdsxxxxxxxxxx
&<Common request parameters>
```

Sample success responses

XML format

```
<RemoveBackupsSetResponse>
      <RequestId>B12FC174-D5CE-4A6E-83C1-0F8F864FF70A</RequestId>
      <Success>true</Success>
</RemoveBackupsSetResponse>
```

JSON format

```
{
    "RequestId":"B12FC174-D5CE-4A6E-83C1-0F8F864FF70A",
    "Success":"true"
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.2.47. RemoveDrdsDbFailedRecord

Removes database creation failure records from a PolarDB-X instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	RemoveDrdsDbFailedRecord	The operation that you want to perform. Set the value to RemoveDrdsDbFailedRecord.
DbName	String	Yes	db_test	The name of the PolarDB-X database.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxx	The ID of the PolarDB-X instance.

Parameter	Type	Required	Example	Description
AccessKeyId	String	No	LTAI8Gxxxxxxxxxx	The AccessKey ID provided to you by Alibaba Cloud.

Response parameters

Parameter	Type	Example	Description
RequestId	String	5D64DE5944A1E541E0CB908A	The ID of the request.
Result	Boolean	true	Indicates whether the database creation failure records were removed from the PolarDB-X instance.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=RemoveDrdsDbFailedRecord
&DbName=db_test
&DrdsInstanceId=drdsxxxxxxxxxx
&<Common request parameters>
```

Sample success responses

XML format

```
<RemoveDrdsDbFailedRecordResponseponse>
      <code>200</code>
      <data>
            <RequestId>B12FC174-D5CE-4A6E-83C1-0F8F864FF70A</RequestId>
            <Success>true</Success>
            <Result>true</Result>
      </data>
      <requestId>B12FC174-D5CE-4A6E-83C1-0F8F864FF70A</requestId>
      <successResponse>true</successResponse>
</RemoveDrdsDbFailedRecordResponseponse>
```

JSON format

```
{
    "successResponse":true,
    "requestId":"B12FC174-D5CE-4A6E-83C1-0F8F864FF70A",
    "data":{
        "Result":true,
        "RequestId":"B12FC174-D5CE-4A6E-83C1-0F8F864FF70A",
        "Success":true
    },
    "code":"200"
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.2.48. RemoveRecycleBinTable

Removes tables from the recycle bin for a PolarDB-X database.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	RemoveRecycleBinTable	The operation that you want to perform. Set the value to RemoveRecycleBinTable.
DbName	String	Yes	my_drds_db	The name of the database.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxx	The ID of the instance.
TableName	String	Yes	buy_order	The name of the logical table.
RegionId	String	No	cn-hangzhou	The region ID of the PolarDB-X instance.

Response parameters

Parameter	Type	Example	Description
Data	Boolean	true	Indicates whether tables were removed from the table recycle bin.

Parameter	Type	Example	Description
RequestId	String	6F70CE62-5077-4B7B-95BC-4DAC45614DBE	The ID of the request.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=RemoveRecycleBinTable
&DbName=my_drds_db
&DrdsInstanceId=drdsxxxxxxxxxx
&TableName=buy_order
&<Common request parameters>
```

Sample success responses

XML format

```
<RemoveRecycleBinTableResponse>
      <RequestId>A3140FC7-B78B-4D8E-B0C8-926D28669934</RequestId>
      <Success>true</Success>
      <Data>true</Data>
</RemoveRecycleBinTableResponse>
```

JSON format

```
{
    "Data":true,
    "RequestId":"A3140FC7-B78B-4D8E-B0C8-926D28669934",
    "Success":true
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.2.49. ResetDrdsToRdsConnections

Resets the number of connections from the instance to ApsaraDB RDS for MySQL instances.

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	ResetDrdsToRdsConnections	The operation that you want to perform. Set the value to ResetDrdsToRdsConnections.
DbName	String	Yes	test_my_db	The name of the database.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxxx	The ID of the instance.
AccessKeyId	String	No	fab3xxxxxxxxxxxx	The AccessKey ID provided to you by Alibaba Cloud.

Response parameters

Parameter	Type	Example	Description
RequestId	String	6F70CE62-5077-4B7B-95BC-4DAC45614DBE	The ID of the request.
Result	String	true	Indicates whether the number of connections from the PolarDB-X instance to ApsaraDB RDS for MySQL instances was reset.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=ResetDrdsToRdsConnections
&DbName=test_my_db
&DrdsInstanceId=drdsxxxxxxxxxxx
&<Common request parameters>
```

Sample success responses

XML format

```
<ResetDrdsToRdsConnectionsResponse>
      <RequestId>A3140FC7-B78B-4D8E-B0C8-926D28669934</RequestId>
      <Success>true</Success>
      <Result>true</Result>
</ResetDrdsToRdsConnectionsResponse>
```

JSON format

```
{
    "Result":true,
    "RequestId":"A3140FC7-B78B-4D8E-B0C8-926D28669934",
    "Success":true
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.2.50. SetupBroadcastTables

Configures a broadcast table for a PolarDB-X database.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	SetupBroadcastTables	The operation that you want to perform. Set the value to SetupBroadcastTables.
Active	Boolean	Yes	true	Specifies whether to turn on the broadcast table switch.
DbName	String	Yes	test_db	The name of the database.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxxxx	The ID of the instance.
TableName.N	RepeatList	Yes	tb1	The name of the table.
RegionId	String	No	cn-hangzhou	The region ID of the PolarDB-X instance.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=SetupBroadcastTables
&Active=true
&DbName=test_db
&DrdsInstanceId=drdsxxxxxxxxxxxx
&TableName.1=tb1
&<Common request parameters>
```

Sample success responses

XML format

```
<SetupBroadcastTablesResponse>
        <RequestId>A3140FC7-B78B-4D8E-B0C8-926D28669934</RequestId>
        <Success>true</Success>
        <Data>true</Data>
</SetupBroadcastTablesResponse>
```

JSON format

```
{
    "Data":true,
    "RequestId":"A3140FC7-B78B-4D8E-B0C8-926D28669934",
    "Success":true
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.2.51. SetupRecycleBinStatus

Enables the table recycle bin for a PolarDB-X database.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	SetupRecycleBinStatus	The operation that you want to perform. Set the value to SetupRecycleBinStatus.
DbName	String	Yes	db1	The name of the PolarDB-X database.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxxxx	The ID of the instance.

Parameter	Type	Required	Example	Description
StatusAction	String	Yes	enable	Specifies whether to enable the recycle bin. Valid values: • enable • disable
RegionId	String	No	cn-hangzhou	The region ID of the PolarDB-X instance.

Response parameters

Parameter	Type	Example	Description
Data	Boolean	true	The returned results.
RequestId	String	6F70CE62-5077-4B7B-95BC-4DAC45614DBE	The ID of the request.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=SetupRecycleBinStatus
&DbName=db1
&DrdsInstanceId=drdsxxxxxxxxxxxx
&StatusAction=enable
&<Common request parameters>
```

Sample success responses

XML format

```
<SetupRecycleBinStatusResponse>
        <RequestId>A3140FC7-B78B-4D8E-B0C8-926D28669934</RequestId>
        <Success>true</Success>
        <Data>true</Data>
</SetupRecycleBinStatusResponse>
```

JSON format

```
{
    "Data":"true",
    "RequestId":"A3140FC7-B78B-4D8E-B0C8-926D28669934",
    "Success":true
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.2.52. SetupTable

Enables full table scan for a PolarDB-X database.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	SetupTable	The operation that you want to perform. Set the value to SetupTable.
AllowFullTableScan	Boolean	Yes	true	Specifies whether to enable full table scan.
DbName	String	Yes	dbtest	The name of the PolarDB-X database.
DrdsInstanceId	String	Yes	drdsxxxxxxxxx	The ID of the instance.
TableName.N	RepeatList	Yes	tbtest	The name of the destination table.
RegionId	String	No	cn-hangzhou	The region ID of the PolarDB-X instance.

Response parameters

Parameter	Type	Example	Description
Data	Boolean	true	Indicates whether the full table scan was enabled.
RequestId	String	6F70CE62-5077-4B7B-95BC-4DAC45614DBE	The ID of the request.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=SetupTable
&AllowFullTableScan=true
&DbName=dbtest
&DrdsInstanceId=drdsxxxxxxxxx
&TableName.1=tbtest
&<Common request parameters>
```

Sample success responses

XML format

```
<SetupTableResponse>
        <RequestId>A3140FC7-B78B-4D8E-B0C8-926D28669934</RequestId>
        <Success>true</Success>
        <Data>true</Data>
</SetupTableResponse>
```

JSON format

```
{
    "Data":"true",
    "RequestId":"A3140FC7-B78B-4D8E-B0C8-926D28669934",
    "Success":true
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.2.53. StartRestore

Starts a backup-based recovery task for a PolarDB-X instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	StartRestore	The operation that you want to perform. Set the value to StartRestore.
DrdsInstanceId	String	Yes	drdsxxxxxxx	The ID of the instance.
AccessKeyId	String	No	sdj23xxxxxxx	The AccessKey ID provided to you by Alibaba Cloud.

Parameter	Type	Required	Example	Description
PreferredBackupTime	String	No	2019-09-10 20:18:! 8	The point in time to which the PolarDB-X instance is restored. It is in the yyyy-MM-dd HH:mm:ss format.
BackupLevel	String	No	-	The backup level.
BackupMode	String	No	-	The backup mode.
BackupDbNames	String	No	test1,test2	The names of databases to be restored. Use commas (,) to separate multiple names. If you do not configure this parameter, all databases on the PolarDB-X instance are restored by default.
BackupId	String	No	23443	The ID of the backup set. If this parameter is left blank, databases are restored based on PreferredBackupTime by default.

Response parameters

Parameter	Type	Example	Description
RequestId	String	721C71DD-D3D0-4327-BFDD-67832698F55B	The ID of the request.
Result	String	success	Indicates whether the recovery task was successful. If success was returned, the recovery task was successful. If an error message was returned, the recovery task failed.

Parameter	Type	Example	Description
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=StartRestore
&DrdsInstanceId=drds43dsaew1
&<Common request parameters>
```

Sample success responses

XML format

```
<StartRestoreResponse>
     <Result>success</Result>
     <RequestId>FE104D26-AC19-49B5-AC67-947F6915E07E</RequestId>
     <Success>true</Success>
</StartRestoreResponse>
```

JSON format

```
{
    "Result":"success",
    "RequestId":"721C71DD-D3D0-4327-BFDD-67832698F55B",
    "Success":true
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.2.54. SubmitCleanTask

Submits a cleanup task for smooth scale-out of a PolarDB-X database.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	SubmitCleanTask	The operation that you want to perform. Set the value to SubmitCleanTask.
DbName	String	Yes	test1	The name of the PolarDB-X database.

Parameter	Type	Required	Example	Description
DrdsInstanceId	String	Yes	drdsxxxxxxxxxxx	The ID of the instance.
ExpandType	String	Yes	smooth_expand	The scale-out type. Valid values: • smooth_expand: smooth scale-out. • hot_expand: hot-spot scale-out Note Apsara Stack Enterprise Edition does not support hot-spot scale-out.
JobId	String	Yes	123	The job ID of the smooth scale-out task. The value of this parameter is the same as that of the ParentJobId parameter.
ParentJobId	String	Yes	123	The ID of the smooth scale-out task. This parameter is returned when you send a request for the smooth scale-out task.
AccessKeyId	String	No	sejkxxxxxxxx	The AccessKey ID provided to you by Alibaba Cloud.

Response parameters

Parameter	Type	Example	Description
RequestId	String	DSSDF-SEWE-23ERW	The ID of the request.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=SubmitCleanTask
&DbName=test1
&DrdsInstanceId=drdsxxxxxxxxxx
&ExpandType=smooth_expand
&JobId=123
&ParentJobId=123
&<Common request parameters>
```

Sample success responses

XML format

```
<SubmitCleanTaskResponse>
      <RequestId>DSSDF-SEWE-23ERW</RequestId>
      <Success>True</Success>
</SubmitCleanTaskResponse>
```

JSON format

```
{
    "RequestId":"DSSDF-SEWE-23ERW",
    "Success":true
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.2.55. SubmitSmoothExpandPreCheck

Submits a precheck task for smooth scale-out of a PolarDB-X database.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	SubmitSmoothExpandPreCheck	The operation that you want to perform. Set the value to SubmitSmoothExpandPreCheck.
DbInstType	String	Yes	RDS	The type of the database instance. Set the value to ApsaraDB RDS for MySQL.

Parameter	Type	Required	Example	Description
DbName	String	Yes	test	The name of the database.
DrdsInstanceId	String	Yes	drdsxxxxxxxxx	The ID of the instance.
AccessKeyId	String	No	sdjwxxxxxxxx	The AccessKey ID provided to you by Alibaba Cloud.

Response parameters

Parameter	Type	Example	Description
Msg	String	true	Indicates whether the precheck task was submitted.
RequestId	String	DSSDF-SEWE-23ERW	The ID of the request.
Success	Boolean	true	Indicates whether the request was successful.
TaskId	Long	2321	The ID of the precheck task.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=SubmitSmoothExpandPreCheck
&DbInstType=RDS
&DbName=test
&DrdsInstanceId=drdsxxxxxxxxx
&<Common request parameters>
```

Sample success responses

XML format

```
<SubmitSmoothExpandPreCheckResponse>
      <Msg>success</Msg>
      <RequestId>FE104D26-AC19-49B5-AC67-947F6915E07E</RequestId>
      <Success>true</Success>
      <TaskId>97358</TaskId>
</SubmitSmoothExpandPreCheckResponse>
```

JSON format

```
{
    "RequestId":"FE104D26-AC19-49B5-AC67-947F6915E07E",
    "Msg":"success",
    "TaskId":97358,
    "Success":true
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.2.56. SubmitSmoothExpandPreCheckTask

Submits a precheck task for smooth scale-out of a PolarDB-X database.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	SubmitSmoothExpandPreCheckTask	The operation that you want to perform. Set the value to SubmitSmoothExpandPreCheckTask.
DbName	String	Yes	test	The name of the database.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxx	The ID of the instance.
AccessKeyId	String	No	kswxxxxxxxxxx	The AccessKey ID provided to you by Alibaba Cloud.

Response parameters

Parameter	Type	Example	Description
Msg	String	scucess	Indicates whether the precheck task was submitted.
RequestId	String	DSSDF-SEWE-23ERW	The ID of the request.
Success	Boolean	true	Indicates whether the request was successful.
TaskId	Long	2321	The ID of the precheck task.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=SubmitSmoothExpandPreCheckTask
&DbName=test
&DrdsInstanceId=drdsxxxxxxxxxx
&<Common request parameters>
```

Sample success responses

XML format

```
<SubmitSmoothExpandPreCheckTaskResponse>
      <Msg>success</Msg>
      <RequestId>FE104D26-AC19-49B5-AC67-947F6915E07E</RequestId>
      <Success>true</Success>
      <TaskId>97358</TaskId>
</SubmitSmoothExpandPreCheckTaskResponse>
```

JSON format

```
{
    "RequestId":"FE104D26-AC19-49B5-AC67-947F6915E07E",
    "Msg":"success",
    "TaskId":97358,
    "Success":true
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.2.57. SubmitSmoothExpandTask

Submits a smooth scale-out task for a PolarDB-X database.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	SubmitSmoothExpandTask	The operation that you want to perform. Set the value to SubmitSmoothExpandTask.
DbName	String	Yes	test	The name of the database.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxx	The ID of the instance.

Parameter	Type	Required	Example	Description
AccessKeyId	String	No	swdxxxxxxxxxx	The AccessKey ID provided to you by Alibaba Cloud.
DbInstanceIsCreating	Boolean	No	true	Specifies whether the target ApsaraDB RDS for MySQL instance is created in the console.
RdsSuperInstances.N.AccountName	String	No	test_drds	The privileged account of the ApsaraDB RDS for MySQL instance.
RdsSuperInstances.N.Password	String	No	Test1234	The password of the privileged account of the ApsaraDB RDS for MySQL instance.
RdsSuperInstances.N.RdsName	String	No	rm-s34xxxxxxxxx	The ID of the ApsaraDB RDS for MySQL instance in privileged mode.
TransferTaskInfos.N.DbName	String	No	test_abds_0001	The name of the physical database shard to be migrated.
TransferTaskInfos.N.DstInstanceName	String	No	rm-s34xxxxxxxxx	The ID of the destination instance.
TransferTaskInfos.N.InstanceType	String	No	RDS	The type of the instance to be migrated. Set the value to ApsaraDB RDS for MySQL.
TransferTaskInfos.N.SrcInstanceName	String	No	rm-m23xxxxxxxxx	The ID of the instance to be migrated.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=SubmitSmoothExpandTask
&DbName=test
&DrdsInstanceId=drdsxxxxxxxxxx
&<Common request parameters>
```

Sample success responses

XML format

```
<SubmitSmoothExpandTaskResponse>
     <RequestId>DSSDF-SEWE-23ERW</RequestId>
     <success>true</success>
</SubmitSmoothExpandTaskResponse>
```

JSON format

```
{
    "RequestId":"DSSDF-SEWE-23ERW",
    "success":true
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.2.58. SubmitSwitchTask

Submits a switchover task for smooth scale-out of a PolarDB-X database.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	SubmitSwitchTask	The operation that you want to perform. Set the value to SubmitSwitchTask.
DbName	String	Yes	test	The name of the database.
DrdsInstanceId	String	Yes	drdsxxxxxxxxx	The ID of the instance.

Parameter	Type	Required	Example	Description
ExpandType	String	Yes	smooth_expand	The scale-out type. Valid values: • smooth_expand: smooth scale-out. • hot_expand: hot-spot scale-out Note Apsara Stack does not support hot-spot scale-out.
JobId	String	Yes	123	The job ID of the smooth scale-out task. The value of this parameter is the same as that of the ParentJobId parameter.
ParentJobId	String	Yes	123	The parent job ID of the smooth scale-out task. The value of this parameter is the same as that of the JobId parameter.
AccessKeyId	String	No	sejkwxxxxxxxxx	The AccessKey ID provided to you by Alibaba Cloud.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=SubmitSwitchTask
&DbName=test
&DrdsInstanceId=drdsxxxxxxxxx
&ExpandType=smooth_expand
&JobId=123
&ParentJobId=123
&<Common request parameters>
```

Sample success responses

XML format

```
<SubmitSwitchTaskResponse>
      <RequestId>DSSDF-SEWE-23ERW</RequestId>
      <Success>True</Success>
</SubmitSwitchTaskResponse>
```

JSON format

```
{
    "RequestId":"DSSDF-SEWE-23ERW",
    "Success":true
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.2.59. ValidateShardTask

Verifies whether a partitioning task of a PolarDB-X database is valid.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ValidateShardTask	The operation that you want to perform. Set the value to ValidateShardTask.
DbName	String	Yes	test	The name of the database.
DrdsInstanceId	String	Yes	drdsxxxxxxx	The ID of the instance.
SourceTableName	String	Yes	buyer	The name of the source table.
TargetTableName	String	Yes	buyer_new	The name of the destination table.

Parameter	Type	Required	Example	Description
TaskType	String	Yes	SINGLE_TO_SHARD	The type of the task. Valid values: • SINGLE_TO_SHARD: converts a single table to a table shard. • SHARD_TO_SINGLE: converts a table shard to a single table. • SHARD_TO_SHARD: converts a table shard to another table shard.
RegionId	String	No	cn-hangzhou	The region ID of the PolarDB-X instance.

Response parameters

Parameter	Type	Example	Description
List	-	-	The list of returned check results.
Item	String	same_schema	The details about a check item.
Result	Integer	0	The check result. Valid values: • 0: passed. • 1: failed.
RequestId	String	DSSDF-SEWE-23ERW	The ID of the request.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=ValidateShardTask
&DbName=test
&DrdsInstanceId=drds23dser21
&SourceTableName=buyer
&TargetTableName=buyer_new
&TaskType=SINGLE_TO_SHARD
&<Common request parameters>
```

Sample success responses

XML format

```
<ValidateShardTaskResponse>
     <List>
          <element>
               <Item>has_data</Item>
               <Result>0</Result>
          </element>
          <element>
               <item>same_schema</item>
               <result>0</result>
          </element>
          <element>
               <item>uk_in_source_table</item>
               <result>0</result>
          </element>
          <element>
               <item>uk_in_target_table</item>
               <result>0</result>
          </element>
     </List>
     <RequestId>DSSDF-SEWE-23ERW</RequestId>
     <success>true</success>
</ValidateShardTaskResponse>
```

JSON format

```
{
    "RequestId":"DSSDF-SEWE-23ERW",
    "List":[
        {
            "Result":0,
            "Item":"has_data"
        },
        {
            "result":0,
            "item":"same_schema"
        },
        {
            "result":0,
            "item":"uk_in_source_table"
        },
        {
            "result":0,
            "item":"uk_in_target_table"
        }
    ],
    "success":true
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.2.60. RemoveDrdsDb

Deletes a database from a instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	RemoveDrdsDb	The operation that you want to perform. Set the value to RemoveDrdsDb.
DbName	String	Yes	db_test	The name of the database to be deleted.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxxx	The ID of the instance from which the database will be deleted.

Parameter	Type	Required	Example	Description
AccessKeyId	String	No	LTAI8xxxxxxxxxxxx	The AccessKey ID provided to you by Alibaba Cloud.

Response parameters

Parameter	Type	Example	Description
RequestId	String	5D64DE5944A1E541E0CB908A	The ID of the request.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=RemoveDrdsDb
&DbName=db_test
&DrdsInstanceId=drds****c6vxxyzd
&<Common request parameters>
```

Sample success responses

XML format

```
<RemoveDrdsDbResponse>
      <RequestId>B12FC174-D5CE-4A6E-83C1-0F8F864FF70A</RequestId>
      <Success>true</Success>
</RemoveDrdsDbResponse>
```

JSON format

```
{
    "RequestId":"B12FC174-D5CE-4A6E-83C1-0F8F864FF70A",
    "Success":true
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.2.61. RefreshDrdsAtomUrl

Refreshes the connection between the instance and the ApsaraDB RDS for MySQL instance whose network type is changed to ensure that the connection is smooth.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	RefreshDrdsAtomUrl	The operation that you want to perform. Set the value to RefreshDrdsAtomUrl.
DbName	String	Yes	db_test	The name of the PolarDB-X database.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxxxx	The ID of the instance.
AccessKeyId	String	No	LTAI8xxxxxxxxxx	The AccessKey ID provided to you by Alibaba Cloud.

Response parameters

Parameter	Type	Example	Description
RequestId	String	5D64DE5944A1E541E0CB908A	The unique ID of the request. If any problem occurs, provide this request ID for troubleshooting.
Result	Boolean	true	Indicates whether the connection after refresh was smooth.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=RefreshDrdsAtomUrl
&DbName=db_test
&DrdsInstanceId=drds****c6vxxyzd
&<Common request parameters>
```

Sample success responses

XML format

```
<RefreshDrdsAtomUrlResponse>
      <RequestId>B12FC174-D5CE-4A6E-83C1-0F8F864FF70A</RequestId>
      <Success>true</Success>
</RefreshDrdsAtomUrlResponse>
```

JSON format

```
{
    "RequestId":"B12FC174-D5CE-4A6E-83C1-0F8F864FF70A",
    "Success":"true"
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.3. Instance management

9.1.2.3.1. CreateInstanceAccount

Creates an account for a instance.

Request parameters

Parameter	Type	Required	Example	Description
AccountName	String	Yes	drds_sample_account	The name of the account.
Action	String	Yes	CreateInstanceAccount	The operation that you want to perform. Set the value to CreateInstanceAccount.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxxxxx	The ID of the instance.
Password	String	Yes	password	The password of the account.
DbPrivilege.N.DbName	String	No	testdb	The name of the PolarDB-X database.
DbPrivilege.N.Privilege	String	No	RW	The access permissions that the account has on the PolarDB-X database.

Response parameters

Parameter	Type	Example	Description
RequestId	String	drds_sample_request_id	The ID of the request.
Success	Boolean	true	Indicates whether the account was created.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=CreateInstanceAccount
&AccountName=drds_sample_account
&DrdsInstanceId=drdsxxxxxxxxxxxxx
&Password=password
&DbPrivilege=[{"DbName":"testdb", "Privilege":"RW"}]
&<Common request parameters>
```

Sample success responses

XML format

```
<CreateInstanceAccount>
      <RequestId>FF13E47D-4E38-4A5A-BA68-4E610EF35A25</RequestId>
      <Success>true</Success>
</CreateInstanceAccount>
```

JSON format

```
{
    "RequestId":"FF13E47D-4E38-4A5A-BA68-4E610EF35A25",
    "Success":true
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.3.2. DescribeDrdsDBs

Queries the details about databases on a instance.

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeDrdsDBs	The operation that you want to perform. Set the value to DescribeDrdsDBs.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxx	The ID of the instance.
AccessKeyId	String	No	DJKSJKF12831283	The AccessKey ID provided to you by Alibaba Cloud.
PageNumber	Integer	No	1	The number of the page to return. Pages start from page 1.
PageSize	Integer	No	20	The number of entries to return on each page.

Response parameters

Parameter	Type	Example	Description
Data	-	-	The returned data set.
Db	-	-	The details about a database.
CreateTime	String	1563773824000	The timestamp when the database was created.
DbInstType	String	RDS	The type of the database.
DbName	String	drds_test	The name of the database.
Mode	String	HORIZONTAL	The partition mode of the database.
Schema	String	drds_test_1563773871118kxqd	The partitioning configuration ID of the database.
Status	String	NORMAL	The status of the database.

Parameter	Type	Example	Description
PageNumber	String	1	The page number of the returned page.
PageSize	String	10	The number of entries returned on the page.
RequestId	String	006B7D19-8CDB-4AA6-AAE7-23C1075276E1	The ID of the request.
Success	Boolean	true	Indicates whether the request was successful.
Total	String	1	The total number of databases.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeDrdsDBs
&DrdsInstanceId=drdsxxxxxxxxxx
&<Common request parameters>
```

Sample success responses

XML format

```
<DescribeDrdsDBs>
      <PageSize>10</PageSize>
      <RequestId>006B7D19-8CDB-4AA6-AAE7-23C1075276E1</RequestId>
      <PageNumber>1</PageNumber>
      <Total>1</Total>
      <Data>
            <Db>
                  <Status>NORMAL</Status>
                  <DbInstType>RDS</DbInstType>
                  <Schema>george_1563773871118kxqd</Schema>
                  <CreateTime>1563773824000</CreateTime>
                  <Mode>HORIZONTAL</Mode>
                  <DbName>george</DbName>
            </Db>
      </Data>
      <Success>true</Success>
</DescribeDrdsDBs>
```

JSON format

```
{
    "Data":{
        "Db":[
            {
                "Status":"NORMAL",
                "DbName":"george",
                "CreateTime":1563773824000,
                "Schema":"george_1563773871118kxqd",
                "DbInstType":"RDS",
                "Mode":"HORIZONTAL"
            }
        ]
    },
    "PageNumber":1,
    "PageSize":10,
    "RequestId":"006B7D19-8CDB-4AA6-AAE7-23C1075276E1",
    "Success":true,
    "Total":1
}
```

Error codes

HttpCode	Error code	Error message	Description
400	ActionUnauthorized	The specified action is not available for you	The error message returned because you are not authorized to perform this action. Perform RAM authorization first.

For a list of error codes, visit the API Error Center.

9.1.2.3.3. DescribeDrdsInstance

Queries the details about a instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeDrdsInstance	The operation that you want to perform. Set the value to DescribeDrdsInstance.
DrdsInstanceId	String	Yes	drdssexxxxxxxx	The ID of the instance.

Parameter	Type	Required	Example	Description
AccessKeyId	String	No	ASU678xxxxxxxxxxxx	The AccessKey ID provided to you by Alibaba Cloud.

Response parameters

Parameter	Type	Example	Description
Data	-	-	The details about the instance.
CommodityCode	String	drdsPost	The commodity code.
CreateTime	Long	1568620311000	The timestamp when the PolarDB-X instance was created.
Description	String	drds_test	The description of the PolarDB-X instance.
DrdsInstanceId	String	drdsxxxxxxxxx	The ID of the PolarDB-X instance.
ExpireDate	Long	4724323200000	The timestamp when the PolarDB-X instance expires.
InstRole	String	MASTER	The role of the PolarDB-X instance. Valid values: • MASTER: the primary instance. • SLAVE: the analytic read-only instance. • SLAVE_FLOW: the concurrent read-only instance.
InstanceSeries	String	drds.sn2.4c16g	The instance type family.
InstanceSpec	String	drds.sn2.4c16g.8C32G	The specifications of the PolarDB-X instance.

Parameter	Type	Example	Description
Label	String	NORMAL	The label of the PolarDB-X instance. Valid values: • NORMAL: the normal instance. • HA: the high-availability instance. • VPC: the Virtual Private Cloud (VPC) instance. **Note** Apsara Stack does not support VPC instances.
MachineType	String	ecs	The type of the machine where the PolarDB-X instance is deployed. Set the value to ECS.
MasterInstanceId	String	drdsxxxxxxxxx	The ID of the primary instance. This parameter is returned only for read-only instances.
NetworkType	String	CLASSIC	The network type of the PolarDB-X instance. Valid values: • CLASSIC: the classic network. • VPC: the VPC network.
OrderInstanceId	String	drdsxxxxxxxxx	The ID of the purchased PolarDB-X instance.
ReadOnlyDBInstanceIds	-	drdsxxxxxxxxx	The list of read-only PolarDB-X instances.
ReadOnlyDBInstanceId	-	-	The details about of a read-only PolarDB-X instance.

Parameter	Type	Example	Description
RegionId	String	cn-hangzhou	The region of the PolarDB-X instance.
Status	String	RUN	The status of the PolarDB-X instance.
Type	String	PRIVATE	The type of the PolarDB-X instance. Valid values: • PRIVATE: the dedicated instance. • PUBLIC: the shared instance.
Version	Long	0	The version of the PolarDB-X instance. This parameter is empty.
VersionAction	String	Upgradeable	The available action for the PolarDB-X instance version.
Vips	-	-	The list of returned virtual IP addresses (VIPs).
Vip	-	-	The details about a VIP.
Dns	String	drdsxxxxxxxxx.drds.aliyuncs.com	The domain name bound to the VIP.
ExpireDays	Long	0	The number of days before the VIP expires.
Port	String	3306	The open port of the VIP.
Type	String	intranet	The type of the VIP. Valid values: • intranet • internet
VpcId	String	vpc-bpxxxxxxxxxxxy	The ID of the VPC network connected to the instance.
VswitchId	String	vsw-bpxxxxxxxxxxxxx96	The ID of the virtual switch (VSwitch).

Parameter	Type	Example	Description
VpcCloudInstanceId	String	drdsxxxxxxxxx	The ID of the PolarDB-X instance in the VPC cluster.
ZoneId	String	cn-hangzhou-e	The ID of the zone.
RequestId	String	B4F76641-BA45-4320-BE7C-9C62CFDAC9B2	The ID of the request.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeDrdsInstance
&DrdsInstanceId=drdsxxxxxxxxx
&<Common request parameters>
```

Sample success responses

XML format

```
<DescribeDrdsInstance>
      <RequestId>B4F76641-BA45-4320-BE7C-9C62CFDAC9B2</RequestId>
      <Data>
            <Status>RUN</Status>
            <Description>drds_test</Description>
            <InstanceSpec>drds.sn2.4c16g.8C32G</InstanceSpec>
            <ZoneId>cn-hangzhou-e</ZoneId>
            <ExpireDate>4724323200000</ExpireDate>
            <CreateTime>1568620311000</CreateTime>
            <MachineType>ecs</MachineType>
            <Label>NORMAL</Label>
            <InstanceSeries>drds.sn2.4c16g</InstanceSeries>
            <VersionAction>Can_Be_Rolled_Back</VersionAction>
            <Type>PRIVATE</Type>
            <DrdsInstanceId>drdsxxxxxxxxx</DrdsInstanceId>
            <OrderInstanceId>drdsxxxxxxxxx</OrderInstanceId>
            <InstRole>MASTER</InstRole>
            <NetworkType>CLASSIC</NetworkType>
            <CommodityCode>drdsPost</CommodityCode>
            <RegionId>cn-hangzhou</RegionId>
            <Vips>
                  <Vip>
                        <Type>intranet</Type>
                        <VpcId></VpcId>
                        <Port>3306</Port>
                        <Dns>drdsxxxxxxxxx.drds.aliyuncs.com</Dns>
                  </Vip>
            </Vips>
      </Data>
      <Success>true</Success>
</DescribeDrdsInstance>
```

JSON format

```
{
    "Data":{
        "MachineType":"ecs",
        "Description":"drds_test",

        "CreateTime":1568620311000,
        "InstanceSeries":"drds.sn2.4c16g",
        "Label":"NORMAL",
        "DrdsInstanceId":"drdsxxxxxxxxx"
    },
    "RequestId":"B4F76641-BA45-4320-BE7C-9C62CFDAC9B2",
    "Success":true
}
```

Error codes

HttpCode	Error code	Error message	Description
400	ActionUnauthorized	The specified action is not available for you	The error message returned because you are not authorized to perform this action. Perform RAM authorization first.

For a list of error codes, visit the API Error Center.

9.1.2.3.4. DescribeDrdsInstanceLevelTasks

Queries incomplete tasks for a instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeDrdsInstanceLevelTasks	The operation that you want to perform. Set the value to DescribeDrdsInstanceLevelTasks.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxx	The ID of the instance.
AccessKeyId	String	No	ASU67xxxxxxxxxxxx	The AccessKey ID provided to you by Alibaba Cloud.

Response parameters

Parameter	Type	Example	Description
RequestId	String	2F7F8080-9132-4279-85D0-B7E5C4305162	The ID of the request.
Success	Boolean	true	Indicates whether the request was successful.
Tasks	-	-	The list of returned incomplete tasks.
Task	-	-	The details about an incomplete task.
AllowCancel	Boolean	false	Indicates whether the task can be canceled.
ErrMsg	String	The status of the instance is abnormal.	The error message of the task.
GmtCreate	Long	1568705520000	The timestamp when the task was created.
Progress	Integer	99	The task progress. Valid values: 0 to 100.
ProgressDescription	String	Executing	The description of the task execution progress.
ShowProgress	Boolean	true	Indicates whether the progress was displayed.
TaskName	String	upgrade_instance	The name of the task.
TaskPhase	String	1	The phase of the task.

Parameter	Type	Example	Description
TaskStatus	Integer	0	The status of the task. Valid values: • 0: executing • 1: successful • 2: failed • 3: canceled
TaskType	Integer	11	The type of the task.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeDrdsInstanceLevelTasks
&DrdsInstanceId=drdsxxxxxxxxxx
&<Common request parameters>
```

Sample success responses

XML format

```
<DescribeDrdsInstanceLevelTasks>
      <Tasks>
            <Task>
                  <AllowCancel>false</AllowCancel>
                  <GmtCreate>1568696422000</GmtCreate>
                  <Progress>90</Progress>
                  <ShowProgress>true</ShowProgress>
                  <TargetId>154</TargetId>
                  <TaskDetail></TaskDetail>
                  <ProgressDescription>Executing</ProgressDescription>
                  <TaskName>Upgrade task</TaskName>
                  <TaskPhase>1</TaskPhase>
                  <TaskStatus>0</TaskStatus>
                  <TaskType>11</TaskType>
                  <ErrMsg></ErrMsg>
            </Task>
      </Tasks>
      <RequestId>1BEEBC05-437E-456D-94A4-CEE1F5676BCF</RequestId>
      <Success>true</Success>
</DescribeDrdsInstanceLevelTasks>
```

JSON format

```
{
    "RequestId":"1BEEBC05-437E-456D-94A4-CEE1F5676BCF",
    "Tasks":{
        "Task":[
            {
                "ShowProgress":true,
                "TaskPhase":1,
                "TaskDetail":"",
                "ErrMsg":"",
                "TaskStatus":0,
                "TaskType":11,
                "TaskName":"Upgrade task",
                "GmtCreate":1568696422000,
                "AllowCancel":false,
                "ProgressDescription":"Executing",
                "TargetId":154,
                "Progress":90
            }
        ]
    },
    "Success":true
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.3.5. DescribeDrdsInstanceMonitor

Queries the monitoring data of a instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeDrdsInstanceMonitor	The operation that you want to perform. Set the value to DescribeDrdsInstanceMonitor.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxx	The ID of the instance.
EndTime	Long	Yes	1568705520000	The timestamp that specifies the end of the time range to query.
Key	String	Yes	cpu	The monitoring metric.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-hangzhou	The region ID of the PolarDB-X instance.
StartTime	Long	Yes	1568701920000	The timestamp that specifies the beginning of the time range to query.
AccessKeyId	String	No	ASU6xxxxxxxxxxxxxxxxxxx	The AccessKey ID provided to you by Alibaba Cloud.
PeriodMultiple	Integer	No	1	The multiple of the monitoring data period. By default, the monitoring data period is 5 minutes.

Response parameters

Parameter	Type	Example	Description
Data	-	-	The list of returned monitoring data.
Key	String	cpu	The monitoring metric.
NodeNum	Integer	1	The number of the nodes.
Unit	String	%	The unit of the monitoring metric.
Values	-	-	The obtained values of the monitoring metric.
Date	Long	1568703720000	The timestamp when the value was obtained.
Value	String	1.00	The metric value.
RequestId	String	2F7F8080-9132-4279-85D0-B7E5C4305162	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeDrdsInstanceMonitor
&DrdsInstanceId=drdsxxxxxxxxxx
&EndTime=1568705520000
&Key=cpu
&RegionId=cn-hangzhou
&StartTime=1568701920000
&<Common request parameters>
```

Sample success responses

XML format

```
<DescribeDrdsInstanceMonitor>
      <RequestId>0EB04DD8-A3C8-4C40-A7DC-865BE490216B</RequestId>
      <Data>
            <NodeNum>1</NodeNum>
            <Values>
                  <Value>1.00</Value>
                  <Date>1568703720000</Date>
            </Values>
            <Values>
                  <Value>0.93</Value>
                  <Date>1568703780000</Date>
            </Values>
            <Values>
                  <Value>0.67</Value>
                  <Date>1568703840000</Date>
            </Values>
            <Unit>%</Unit>

Error codes

HttpCode	Error code	Error message	Description
400	ActionUnauthorized	The specified action is not available for you	The error message returned because you are not authorized to perform this action. Perform RAM authorization first.

For a list of error codes, visit the API Error Center.

9.1.2.3.6. DescribeDrdsInstances

Queries instances that meet specific criteria in a region.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeDrdsInstances	The operation that you want to perform. Set the value to DescribeDrdsInstances.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-hangzhou	The region ID of the PolarDB-X instance.
AccessKeyId	String	No	ASU678xxxxxxxxxxxxxxx	The AccessKey ID provided to you by Alibaba Cloud.
Description	String	No	drds_test	The description of the instance.
Expired	Boolean	No	false	Specifies whether the instance expires.
PageNumber	Integer	No	1	The number of the page to return.
PageSize	Integer	No	20	The number of entries to return on each page.
Tag.N.Key	String	No	acs:newretail:domain	The key of the Nth tag.
Tag.N.Value	String	No	NEW_RETAIL	The value of the Nth tag.
Type	String	No	1	The type of the PolarDB-X instance. Valid values: • 0: the shared instance. • 1: the dedicated instance.

Response parameters

Parameter	Type	Example	Description
Instances	-	-	The list of returned PolarDB-X instances.
Instance	-	-	The details about a PolarDB-X instance.
CommodityCode	String	drdsPost	The commodity code.

Parameter	Type	Example	Description
CreateTime	Long	1568620311000	The timestamp when the PolarDB-X instance was created.
Description	String	drds_test	The description of the PolarDB-X instance.
DrdsInstanceId	String	drdsxxxxxxxxxx	The ID of the PolarDB-X instance.
ExpireDate	Long	4724323200000	The timestamp when the PolarDB-X instance expires.
InstRole	String	MASTER	The role of the PolarDB-X instance. • MASTER: the primary instance. • SLAVE: the analytic read-only instance. • SLAVE_FLOW: the concurrent read-only instance.
InstanceSeries	String	drds.sn2.4c16g	The instance type family.
InstanceSpec	String	drds.sn2.4c16g.8C32G	The specifications of the PolarDB-X instance.
Label	String	NORMAL	The label of the PolarDB-X instance. Valid values: • NORMAL: the normal instance. • HA: the high-availability instance. • VPC: the Virtual Private Cloud (VPC) instance.
MachineType	String	ecs	The type of machine where the PolarDB-X instance is deployed. Set the value to ECS.

Parameter	Type	Example	Description
MasterInstanceId	String	drdsxxxxxxxxxx	The ID of the primary instance. This parameter is only available for read-only instances.
NetworkType	String	CLASSIC	The network type of the PolarDB-X instance. Valid values: • CLASSIC: the classic network. • VPC: the VPC network. **Note** Apsara Stack does not support VPC networks.
OrderInstanceId	String	drdsxxxxxxxxxx	The ID of the created PolarDB-X instance.
ReadOnlyDBInstanceIds	-	drdsxxxxxxxxxx	The list of read-only PolarDB-X instances.
ReadOnlyDBInstanceId	-	-	The details about of a read-only PolarDB-X instance.
RegionId	String	cn-hangzhou	The region ID of the PolarDB-X instance.
Status	String	RUN	The status of the PolarDB-X instance.
Type	String	PRIVATE	The type of the PolarDB-X instance. Valid values: • PUBLIC: the shared instance. • PRIVATE: the dedicated instance.
Version	Long	0	The version of the PolarDB-X instance.
VersionAction	String	Upgradable	The available actions for the PolarDB-X instance version.

Parameter	Type	Example	Description
Vips	-	-	The list of returned virtual IP addresses (VIPs).
Vip	-	-	The details about a VIP.
IP	String	10.xx.xx.51	The IP address.
Port	String	3306	The open port of the VIP.
Type	String	intranet	The type of the VIP. Valid values: • intranet • internet
VpcId	String	vpc-bpxxxxxxxxxxxy	The ID of the VPC network connected to the instance.
VswitchId	String	vsw-bpxxxxxxxxxxxxx96	The ID of the virtual switch (VSwitch).
VpcCloudInstanceId	String	drdsxxxxxxxxxx	The ID of the instance in the VPC cluster.
VpcId	String	vpc-bpxxxxxxxxxxxy	The ID of the VPC network connected to the instance.
ZoneId	String	vsw-bpxxxxxxxxxxxxx96	The ID of the VSwitch.
PageNumber	Integer	1	The page number of the returned page.
PageSize	Integer	20	The number of entries returned on the page.
RequestId	String	2F7F8080-9132-4279-85D0-B7E5C4305162	The ID of the request.
Total	Integer	1	The total number of PolarDB-X instances.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeDrdsInstances
&RegionId=cn-hangzhou
&<Common request parameters>
```

Sample success responses

XML format

```
<DescribeDrdsInstances>
      <Instances>
            <Instance>
                  <Status>RUN</Status>

                "InstanceSpec":"drds.sn2.4c16g.8C32G",
                "CreateTime":1568620311000,
                "InstanceSeries":"drds.sn2.4c16g",
                "Label":"NORMAL",
                "DrdsInstanceId":"drdsxxxxxxxxx"
            }
        ]
    },
    "Total":1
}
```

Error codes

HttpCode	Error code	Error message	Description
400	ActionUnauthorized	The specified action is not available for you	The error message returned because you are not authorized to perform this action. Perform RAM authorization first.

For a list of error codes, visit the API Error Center.

9.1.2.3.7. DescribeDrdsInstanceVersion

Queries the versions of a instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeDrdsInstanceVersion	The operation that you want to perform. Set the value to DescribeDrdsInstanceVersion.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxx	The ID of the instance.
AccessKeyId	String	No	ASU6xxxxxxxxxxxxxxxxxx	The AccessKey ID provided to you by Alibaba Cloud.

Response parameters

Parameter	Type	Example	Description
Data	-	-	The version data of the instance.
InstanceVersion	String	5.3.12-15682777	The current version of the PolarDB-X instance.
NewestVersion	String	5.3.12-15682777	The latest version of the PolarDB-X instance.
RequestId	String	2F7F8080-9132-4279-85D0-B7E5C4305162	The ID of the request.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeDrdsInstanceVersion
&DrdsInstanceId=drdsxxxxxxxxxx
&<Common request parameters>
```

Sample success responses

XML format

```
<DescribeDrdsInstanceVersion>
      <RequestId>88AFEF28-DF04-4E21-9CE9-277D3C19E3CD</RequestId>
      <Data>
            <InstanceVersion>5.3.12-15682777</InstanceVersion>
            <NewestVersion>5.3.12-15682777</NewestVersion>
      </Data>
      <Success>true</Success>
</DescribeDrdsInstanceVersion>
```

JSON format

```
{
    "Data":{
        "InstanceVersion":"5.3.12-15682777",
        "NewestVersion":"5.3.12-15682777"
    },
    "RequestId":"88AFEF28-DF04-4E21-9CE9-277D3C19E3CD",
    "Success":true
}
```

Error codes

HttpCode	Error code	Error message	Description
400	ActionUnauthorized	The specified action is not available for you	The error message returned because you are not authorized to perform this action. Perform RAM authorization first.

For a list of error codes, visit the API Error Center.

9.1.2.3.8. DescribeDrdsParams

Queries the parameters of a instance or database.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeDrdsParams	The operation that you want to perform. Set the value to DescribeDrdsParams.
DrdsInstanceId	String	Yes	DescribeDrdsParams	The ID of the instance.

Parameter	Type	Required	Example	Description
ParamLevel	String	Yes	INSTANCE	The parameter level. Valid values: • INSTANCE: the instance level. • DB: the database level.
DbName	String	No	drds_test	The name of the database.
RegionId	String	No	cn-hangzhou	The region ID of the PolarDB-X instance.

Response parameters

Parameter	Type	Example	Description
List	-	-	The details about the parameters that were queried.
DbName	String	drds_test	The name of the database.
NeedRestart	Boolean	true	Indicates whether to restart the database.
ParamDefaultValue	String	1000	The default value of the parameter.
ParamDesc	String	The slow SQL query threshold (unit: ms)	The description of the parameter.
ParamEnglishName	String	SLOW_SQL_TIME	The English name of the parameter.
ParamLevel	String	INSTANCE	The parameter level.
ParamName	String	SLOW_SQL_TIME	The name of the parameter.
ParamRanges	String	[1000-900000]	The value range of the parameter.
ParamType	String	CONFIG	The type of the parameter.
ParamValue	String	1000	The value of the parameter.

Parameter	Type	Example	Description
ParamVariableName	String	slowSqlTime	The name of the parameter variable.
RequestId	String	2F7F8080-9132-4279-85D0-B7E5C4305162	The ID of the request.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeDrdsParams
&DrdsInstanceId=DescribeDrdsParams
&ParamLevel=INSTANCE
&<Common request parameters>
```

Sample success responses

XML format

```
<DescribeDrdsParams>
      <RequestId>29D7422F-24DD-42D8-A04E-EBCE4B4A416A</RequestId>
      <List>
            <ParamLevel>INSTANCE</ParamLevel>
            <ParamRanges>[1000-900000]</ParamRanges>
            <ParamVariableName>slowSqlTime</ParamVariableName>
            <ParamEnglishName>SLOW_SQL_TIME</ParamEnglishName>
            <NeedRestart>false</NeedRestart>
            <ParamValue>1000</ParamValue>

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.3.9. DescribeDrdsTasks

Queries the change tasks of a PolarDB-X instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeDrdsTasks	The operation that you want to perform. Set the value to DescribeDrdsTasks.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxxx	The ID of the instance.
AccessKeyId	String	No	test	The AccessKey ID provided to you by Alibaba Cloud.
DbName	String	No	test	The name of the PolarDB-X database.
TaskType	String	No	test	The type of the task.

Response parameters

Parameter	Type	Example	Description
RequestId	String	CD412DF7-F21D-44CE-88FF-ED24917174A8	The ID of the request.
Success	Boolean	true	Indicates whether the request was successful.
Tasks	-	-	The list of returned tasks.
Task	-	-	The details about a task.
Content	String	upgrade_instance	The content of the task.
Id	Long	64148	The ID of the task.
State	String	FAILED	The status of the task.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeDrdsTasks
&<Common request parameters>
```

Sample success responses

```
<DescribeDrdsTasksResponse>
      <RequestId>CD412DF7-F21D-44CE-88FF-ED24917174A8</RequestId>
      <Tasks>
            <Task>
                  <State>FAILED</State>
                  <Id>64148</Id>
                  <Content>upgrade_instance</Content>
            </Task>
      </Tasks>
      <Success>true</Success>
</DescribeDrdsTasksResponse>
```

Error codes

HttpCode	Error code	Error message	Description
400	ActionUnauthorized	The specified action is not available for you	The error message returned because you are not authorized to perform this action. Perform RAM authorization first.

For a list of error codes, visit the API Error Center.

9.1.2.3.10. DescribeHiStoreInstanceInfo

Queries the details about a HiStore instance of a PolarDB-X instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeHiStoreInstanceInfo	The operation that you want to perform. Set the value to DescribeHiStoreInstanceInfo.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxxx	The ID of the instance.
HistoreInstanceId	String	Yes	hi-hbxxxxxxxxxxx	The ID of the HiStore instance.

Parameter	Type	Required	Example	Description
AccessKeyId	String	No	test	The AccessKey ID provided to you by Alibaba Cloud.

Response parameters

Parameter	Type	Example	Description
HiStoreInstanceInfo	-	-	The details about the HiStore instance.
RequestId	String	509BDE17-505A-4B3B-854D-30D3F092502F	The ID of the request.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeHiStoreInstanceInfo
&<Common request parameters>
```

Sample success responses

XML format

```
<DescribeHiStoreInstanceInfoResponse>
      <RequestId>509BDE17-505A-4B3B-854D-30D3F092502F</RequestId>
          <HiStoreInstanceInfo>
                <DiskSize>100</DiskSize>
                <GmtCreate>1568267711</GmtCreate>
                <HistoreInstanceId>test</HistoreInstanceId>
                <MachineSpec>4C8G</MachineSpec>
                <RpmVersion>1.0.15</RpmVersion>
          </HiStoreInstanceInfo>
      <Success>true</Success>
</DescribeHiStoreInstanceInfoResponse>
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.3.11. DescribeInstanceAccounts

Queries the account information of a PolarDB-X instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeInstanceAccounts	The operation that you want to perform. Set the value to DescribeInstanceAccounts.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxxxxxxxx	The ID of the instance.
AccessKeyId	String	No	ABCxxxxxxxxxxxxx	The AccessKey ID provided to you by Alibaba Cloud.

Response parameters

Parameter	Type	Example	Description
InstanceAccounts	-	-	The returned list of instance accounts.
InstanceAccount	-	-	The details about an instance account.
AccountName	String	drdsuser	The name of the account.
AccountType	Integer	1	The type of the account.
DbPrivileges	-	-	The database permissions that the account has.
DbPrivilege	-	-	The details about the database permission.
DbName	String	drdsdb	The name of the database.
Privilege	String	root	The permission.
Description	String	Permission	The description of the permission.
Host	String	%	The IP address of the instance.
RequestId	String	2D77B55F-50C4-4FC5-A89A-7746B7D5781D	The ID of the request.

Parameter	Type	Example	Description
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeInstanceAccounts
&<Common request parameters>
```

Sample success responses

XML format

```
<DescribeInstanceAccountsResponse>
      <InstanceAccounts>
            <InstanceAccount>
                  <Description>Created by DRDS</Description>
                  <DbPrivileges>
                        <DbPrivilege>
                              <DbName>drdsdb</DbName>
                              <Privilege>ROOT</Privilege>
                        </DbPrivilege>
                  </DbPrivileges>
                  <Host>%</Host>
                  <AccountName>drdsuser</AccountName>
                  <AccountType>0</AccountType>
            </InstanceAccount>
      </InstanceAccounts>
      <RequestId>2D77B55F-50C4-4FC5-A89A-7746B7D5781D</RequestId>
      <Success>true</Success>
</DescribeInstanceAccountsResponse>
```

Error codes

HttpCode	Error codes	Error message	Description
400	ActionUnauthorized	The specified action is not available for you	The error message returned because you are not authorized to perform this action. Perform RAM authorization first.

For a list of error codes, visit the API Error Center.

9.1.2.3.12. DescribeInstanceMenuSwitch

Queries the switch configuration of a PolarDB-X instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeInstanceMenuSwitch	The operation that you want to perform. Set the value to DescribeInstanceMenuSwitch.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeInstanceMenuSwitch
&<Common request parameters>
```

Sample success responses

XML format

```
<DescribeInstanceMenuSwitchResponse>
      <RequestId>DSSDF-SEWE-23ERW</RequestId>
      <Success>True</Success>
      <Config>Config</Config>
</DescribeInstanceMenuSwitchResponse>
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.3.13. DescribeInstDbSlsInfo

Queries the names of the Log Service project and Logstore used by SQL audit.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeInstDbSlsInfo	The operation that you want to perform. Set the value to DescribeInstDbSlsInfo.
DbName	String	Yes	drdsdb	The name of the PolarDB-X database.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxx	The ID of the instance.

Parameter	Type	Required	Example	Description
AccessKeyId	String	No	test	The AccessKey ID provided to you by Alibaba Cloud.

Response parameters

Parameter	Type	Example	Description
AuditInfo	-	-	The SQL audit details.
LogStore	String	test1	The Logstore used by SQL audit.
Project	String	test2	The Log Service project used by SQL audit.
RequestId	String	DC3ABA3E-0F8A-4596-9104-F5155C34315B	The ID of the request.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeInstDbSlsInfo
&<Common request parameters>
```

Sample success responses

XML format

```
<DescribeInstDbSlsInfoResponse>
      <AuditInfo>
            <LogStore>test</LogStore>
            <Project>test2</Project>
      </AuditInfo>
      <RequestId>DC3ABA3E-0F8A-4596-9104-F5155C34315B</RequestId>
      <Success>true</Success>
</DescribeInstDbSlsInfoResponse>
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.3.14. DescribePreCheckResult

Queries precheck results of a PolarDB-X instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribePreCheckResult	The operation that you want to perform. Set the value to DescribePreCheckResult.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxxx	The ID of the instance.
TaskId	String	Yes	4561	The ID of the precheck task.
RegionId	String	No	cn-hangzhou	The region ID of the PolarDB-X instance.

Response parameters

Parameter	Type	Example	Description
PreCheckResult	-	-	The precheck result.
PreCheckName	String	Does a unique key exist	The name of the precheck task.
State	String	FAIL	The status of the precheck task.
SubCheckItems	-	-	The details about a precheck item.
ErrorMsgCode	String	1004	The error code.
ErrorMsgParams	-	table1	The error parameter.
PreCheckItemName	String	Unique key	The name of the precheck item.
State	String	SUCCESS	The status of the precheck item.
RequestId	String	DSSDF-SEWE-23ERW	The ID of the request.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribePreCheckResult
&<Common request parameters>
```

Sample success responses

XML format

```
<DescribePreCheckResultResponse>
      <RequestId>DSSDF-SEWE-23ERW</RequestId>
      <Success>True</Success>
      <PreCheckResult>
        <PreCheckName>Whether a unique key exists</PreCheckName>
        <State>FAIL</State>
        <SubCheckItems>
              <ErrorMsgCode>1004</ErrorMsgCode>
              <ErrorMsgParams>table1</ErrorMsgParams>
              <PreCheckItemName>Shard key</PreCheckItemName>
              <State>SUCCESS</State>
        </SubCheckItems>
      </PreCheckResult>
      <PreCheckResult></PreCheckResult>
</DescribePreCheckResultResponse>
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.3.15. DescribeStorageInstanceSubDbInfo

Queries the details about a storage instance of a PolarDB-X database.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeStorageInstanceSubDbInfo	The operation that you want to perform. Set the value to DescribeStorageInstanceSubDbInfo.
DbName	String	Yes	drds_flashback	The name of the PolarDB-X database.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxxxxx	The ID of the instance.

Parameter	Type	Required	Example	Description
InstanceId	String	Yes	rm-bp1xxxxxxxxxxxxxx	The ID of the storage instance, namely, ApsaraDB RDS for MySQL instance.
AccessKeyId	String	No	******	The AccessKey ID provided to you by Alibaba Cloud.
InstType	String	No	null	The type of the instance. This parameter is currently unavailable.

Response parameters

Parameter	Type	Example	Description
Data	-	-	The returned data object.
Capacity	Long	194560	The capacity of the ApsaraDB RDS for MySQL instance.
RdsInstanceId	String	rm-bp1xxxxxxxxxxxxxx	The ID of the ApsaraDB RDS for MySQL instance.
SubDbList	-	-	The returned list of database shards.
SubDb	-	-	The details about a database shard.
SubDbName	String	drds_flashback_b8cd_0005	The name of the database shard.
Use	Long	0	Indicates whether the database shard was in use.
WarningLevel	Integer	0	The alert level.
TipsType	Integer	0	The type of the tip.
Use	Long	2293	The usage of the database shard.
WarningLevel	Integer	0	The alert level.

Parameter	Type	Example	Description
RequestId	String	78BA6289-5E03-4A31-8CB8-FC298DB63184	The unique ID of the request. If any problem occurs, provide this request ID for troubleshooting.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeStorageInstanceSubDbInfo
&<Common request parameters>
```

Sample success responses

XML format

```
<DescribeStorageInstanceSubDbInfoResponse>
      <code>200</code>
      <data>
            <RequestId>78BA6289-5E03-4A31-8CB8-FC298DB63184</RequestId>
            <Data>
                  <SubDbList>
                        <SubDb>

```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.3.16. EnableSqlAudit

Enables SQL audit for a PolarDB-X database.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	EnableSqlAudit	The operation that you want to perform. Set the value to EnableSqlAudit.
DbName	String	Yes	tpch_50g_4c32gx4	The name of the PolarDB-X database.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxxxx	The ID of the instance.
AccessKeyId	String	No	2zAEvxxxxxxxxxxx	The AccessKey ID provided to you by Alibaba Cloud.
IsRecall	Boolean	No	true	Specifies whether to backtrack historical SQL statements for auditing.
RecallEndTimestamp	String	No	1568875132000	The end time of the backtracking.
RecallStartTimestamp	String	No	1568875132000	The start time of the backtracking.

Response parameters

Parameter	Type	Example	Description
RequestId	String	463A5F0F-12AD-4544-A902-B2B983CD2C11	The ID of the request.
Result	Boolean	true	Indicates whether SQL audit was enabled for the database. Valid values: • true: enabled. • false: failed.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=EnableSqlAudit
&DbName=tpch_50g_4c32gx4
&DrdsInstanceId=drdsxxxxxxxxxxxx
&<Common request parameters>
```

Sample success responses

XML format

```
<EnableSqlAuditResponse>
      <Result>true</Result>
      <RequestId>463A5F0F-12AD-4544-A902-B2B983CD2C11</RequestId>
      <Success>true</Success>
</EnableSqlAuditResponse>
```

JSON format

```
{
    "Result":true,
    "RequestId":"463A5F0F-12AD-4544-A902-B2B983CD2C11",
    "Success":true
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.3.17. EnableSqlFlashbackMatchSwitch

Enables SQL flashback matching. After it is enabled, the query information is added to the ApsaraDB RDS for MySQL binary logs that are used by the database to precisely restore data.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	EnableSqlFlashbackMatchSwitch	The operation that you want to perform. Set the value to EnableSqlFlashbackMatchSwitch.
DbName	String	Yes	testdb	The name of the PolarDB-X database.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxxxx	The ID of the PolarDB-X instance.

Parameter	Type	Required	Example	Description
AccessKeyId	String	No	2zAEvsxxxxxxxxxx	The AccessKey ID provided to you by Alibaba Cloud.

Response parameters

Parameter	Type	Example	Description
RequestId	String	463A5F0F-12AD-4544-A902-B2B983CD2C11	The ID of the request.
Result	Boolean	true	Indicates whether SQL flashback matching was enabled for the database. Valid values: • true: enabled. • false: failed.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=EnableSqlFlashbackMatchSwitch
&DbName=testdb
&DrdsInstanceId=drdsxxxxxxxxxxxx
&<Common request parameters>
```

Sample success responses

XML format

```
<EnableSqlFlashbackMatchSwitchResponse>
      <Result>true</Result>
      <RequestId>463A5F0F-12AD-4544-A902-B2B983CD2C11</RequestId>
      <Success>true</Success>
</EnableSqlFlashbackMatchSwitchResponse>
```

JSON format

```
{
    "Result":true,
    "RequestId":"463A5F0F-12AD-4544-A902-B2B983CD2C11",
    "Success":true
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.3.18. FlashbackRecycleBinTable

Restores a logical table in the recycle bin.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	FlashbackRecycleBinTable	The operation that you want to perform. Set the value to FlashbackRecycleBinTable.
DbName	String	Yes	testdb	The name of the database where the target table is located.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxxxxx	The ID of the PolarDB-X instance where the target table is located.
TableName	String	Yes	test	The name of the logical table to be restored.
RegionId	String	No	cn-hangzhou	The region ID of the PolarDB-X instance.

Response parameters

Parameter	Type	Example	Description
Data	Boolean	true	Indicates whether the restoration was enabled. Valid values: • true: enabled. • false: failed.
RequestId	String	463A5F0F-12AD-4544-A902-B2B983CD2C11	The ID of the request.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=FlashbackRecycleBinTable
&DbName=testdb
&DrdsInstanceId=drdsxxxxxxxxxxxxx
&TableName=test
&<Common request parameters>
```

Sample success responses

XML format

```
<FlashbackRecycleBinTableResponse>
      <Result>true</Result>
      <RequestId>463A5F0F-12AD-4544-A902-B2B983CD2C11</RequestId>
      <Success>true</Success>
</FlashbackRecycleBinTableResponse>
```

JSON format

```
{
    "Result":true,
    "RequestId":"463A5F0F-12AD-4544-A902-B2B983CD2C11",
    "Success":true
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.3.19. ModifyAccountDescription

Modifies the account description of a PolarDB-X instance.

Request parameters

Parameter	Type	Required	Example	Description
AccountName	String	Yes	testuser	The name of the account.
Action	String	Yes	ModifyAccountDescription	The operation that you want to perform. Set the value to ModifyAccountDescription.
Description	String	Yes	Created by	The description of the account.

Parameter	Type	Required	Example	Description
DrdsInstanceId	String	Yes	drdsxxxxxxxxxxx	The ID of the PolarDB-X instance.
AccessKeyId	String	No	2zAEvxxxxxxxxxxx	The AccessKey ID provided to you by Alibaba Cloud.

Response parameters

Parameter	Type	Example	Description
RequestId	String	2F93CCD5-806F-4470-BBC7-20476AC48DC6	The ID of the request.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=ModifyAccountDescription
&AccountName=testuser
&Description=Created by
&DrdsInstanceId=drdsxxxxxxxxxxx
&<Common request parameters>
```

Sample success responses

XML format

```
<ModifyAccountDescriptionResponse>
      <RequestId>2F93CCD5-806F-4470-BBC7-20476AC48DC6</RequestId>
      <Success>true</Success>
</ModifyAccountDescriptionResponse>
```

JSON format

```
{
    "RequestId":"2F93CCD5-806F-4470-BBC7-20476AC48DC6",
    "Success":true
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.3.20. ModifyDrdsInstanceDescription

Modifies the description of a PolarDB-X instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyDrdsInstanceDescription	The operation that you want to perform. Set the value to ModifyDrdsInstanceDescription.
Description	String	Yes	Long occupied	The description of the PolarDB-X instance.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxxxxx	The ID of the instance.
AccessKeyId	String	No	2zAEvsxxxxxxxxxx	The AccessKey ID provided to you by Alibaba Cloud.

Response parameters

Parameter	Type	Example	Description
RequestId	String	C44CA24C-C7C4-4C0F-8AC9-1343F279B09C	The ID of the request.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=ModifyDrdsInstanceDescription
&Description=Long occupied
&DrdsInstanceId=drdsxxxxxxxxxxxxx
&<Common request parameters>
```

Sample success responses

XML format

```
<ModifyDrdsInstanceDescriptionResponse>
      <RequestId>C44CA24C-C7C4-4C0F-8AC9-1343F279B09C</RequestId>
      <Success>true</Success>
</ModifyDrdsInstanceDescriptionResponse>
```

JSON format

```
{
    "RequestId":"C44CA24C-C7C4-4C0F-8AC9-1343F279B09C",
    "Success":true
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.3.21. RemoveDrdsInstance

Releases a instance.

> **Note** You cannot release a PolarDB-X instance that is changing configuration or has associated databases.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	RemoveDrdsInstance	The operation that you want to perform. Set the value to RemoveDrdsInstance.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxxxxx	The ID of the instance.
AccessKeyId	String	No	f32safdxxxxxxxxxxxxxx	The AccessKey ID provided to you by Alibaba Cloud.

Response parameters

Parameter	Type	Example	Description
RequestId	String	6F70CE62-5077-4B7B-95BC-4DAC45614DBE	The ID of the request.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=RemoveDrdsInstance
&DrdsInstanceId=drdsxxxxxxxxxxxxx
&<Common request parameters>
```

Sample success responses

XML format

```
<RemoveDrdsInstanceResponse>
      <RequestId>A3140FC7-B78B-4D8E-B0C8-926D28669934</RequestId>
      <Success>true</Success>
</RemoveDrdsInstanceResponse>
```

JSON format

```
{
    "RequestId":"A3140FC7-B78B-4D8E-B0C8-926D28669934",
    "Success":true
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.3.22. RemoveInstanceAccount

Deletes the instance management account of a PolarDB-X instance.

Request parameters

Parameter	Type	Required	Example	Description
AccountName	String	Yes	testaccount	The name of the account.
Action	String	Yes	RemoveInstanceAccount	The operation that you want to perform. Set the value to RemoveInstanceAccount.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxxxxx	The ID of the instance.
AccessKeyId	String	No	f3d13xxxxxxxxxxxxxxxxxx	The AccessKey ID provided to you by Alibaba Cloud.

Response parameters

Parameter	Type	Example	Description
RequestId	String	6F70CE62-5077-4B7B-95BC-4DAC45614DBE	The ID of the request.

Parameter	Type	Example	Description
Success	Boolean	true	Indicates whether the instance management account was deleted.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=RemoveInstanceAccount
&AccountName=testaccount
&DrdsInstanceId=drdsxxxxxxxxxxxx
&<Common request parameters>
```

Sample success responses

XML format

```
<RemoveInstanceAccountResponse>
      <RequestId>A3140FC7-B78B-4D8E-B0C8-926D28669934</RequestId>
      <Success>true</Success>
</RemoveInstanceAccountResponse>
```

JSON format

```
{
    "RequestId":"A3140FC7-B78B-4D8E-B0C8-926D28669934",
    "Success":true
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.3.23. RestartDrdsInstance

Restarts a PolarDB-X instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	RestartDrdsInstance	The operation that you want to perform. Set the value to RestartDrdsInstance.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxxxx	The ID of the instance.

Parameter	Type	Required	Example	Description
AccessKeyId	String	No	fds14xxxxxxxxxxxxxx	The AccessKey ID provided to you by Alibaba Cloud.

Response parameters

Parameter	Type	Example	Description
RequestId	String	6F70CE62-5077-4B7B-95BC-4DAC45614DBE	The ID of the request.
Success	Boolean	true	Indicates whether the request was successful.
TaskId	Long	1	The ID of the task.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=RestartDrdsInstance
&DrdsInstanceId=drdsxxxxxxxxxxxxx
&<Common request parameters>
```

Sample success responses

XML format

```
<RestartDrdsInstanceResponse>
      <RequestId>A3140FC7-B78B-4D8E-B0C8-926D28669934</RequestId>
      <Success>true</Success>
      <TaskId>1</TaskId>
</RestartDrdsInstanceResponse>
```

JSON format

```
{
    "RequestId":"A3140FC7-B78B-4D8E-B0C8-926D28669934",
    "TaskId":1,
    "Success":true
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.3.24. RollbackInstanceVersion

Rolls back the version of a instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	RollbackInstanceVersion	The operation that you want to perform. Set the value to RollbackInstanceVersion.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxxx	The ID of the instance.
RegionId	String	No	cn-hangzhou	The region ID of the PolarDB-X instance.

Response parameters

Parameter	Type	Example	Description
Data	String	true	Indicates whether the request was successful.
RequestId	String	DSSDF-SEWE-23ERW	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=RollbackInstanceVersion
&DrdsInstanceId=drdsxxxxxxxxxxx
&<Common request parameters>
```

Sample success responses

XML format

```
<RollbackInstanceVersionResponse>
      <RequestId>DSSDF-SEWE-23ERW</RequestId>
      <Data>True</Data>
</RollbackInstanceVersionResponse>
```

JSON format

```
{
    "Data":"true",
    "RequestId":"DSSDF-SEWE-23ERW"
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.3.25. SetBackupPolicy

Configures a backup policy for a PolarDB-X instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	SetBackupPolicy	The operation that you want to perform. Set the value to SetBackupPolicy.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxxx	The ID of the instance.
AccessKeyId	String	No	fafdsxxxxxxxxxxx	The AccessKey ID provided to you by Alibaba Cloud.
BackupDbNames	String	No	db_test1,db_test2	The name of the database involved in the backup.
BackupLevel	String	No	db	The level of the backup. Valid values: • db: the database level. • instance: the instance level.
BackupLog	String	No	1	Specifies whether the backup log function is enabled. Valid values: • 1: enabled. • 0: disabled.
BackupMode	String	No	phy	The mode of the backup. Valid values: • logic: the logical backup. • phy: the physical backup.

Parameter	Type	Required	Example	Description
DataBackupRetentionPeriod	String	No	1	The retention period of the data backup. Unit: days.
LogBackupRetentionPeriod	String	No	1	The retention period of the data backup. Unit: days.
PreferredBackupEndTime	String	No	12:30:30	The end time of the backup.
PreferredBackupPeriod	String	No	0	The backup period. Valid values: • 0: Monday. • 1: Tuesday. • 2: Wednesday. • 3: Thursday. • 4: Friday. • 5: Saturday. • 6: Sunday.
PreferredBackupStartTime	String	No	11:30:30	The start time of the backup.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=SetBackupPolicy
&DrdsInstanceId=drdsxxxxxxxxxxx
&<Common request parameters>
```

Sample success responses

XML format

```
<SetBackupPolicyResponse>
        <RequestId>A3140FC7-B78B-4D8E-B0C8-926D28669934</RequestId>
        <Success>true</Success>
        <Result>success</Result>
</SetBackupPolicyResponse>
```

JSON format

```
{
    "Result":"success",
    "RequestId":"A3140FC7-B78B-4D8E-B0C8-926D28669934",
    "Success":true
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.3.26. SetupDrdsParams

Configures parameters for a instance or database.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	SetupDrdsParams	The operation that you want to perform. Set the value to SetupDrdsParams.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxxx	The ID of the instance.
ParamLevel	String	Yes	DB	The parameter level. Valid values: • INSTANCE: the instance level. • DB: the database level.
Data.N.DbName	String	No	test_db	The name of the database corresponding to the parameter. The database name is valid only for database-level parameters.
Data.N.ParamRanges	String	No	[true|false]	The valid values of the parameter.

Parameter	Type	Required	Example	Description
Data.N.ParamType	String	No	ATOM	The type of the parameter. Valid values: • ATOM: the configuration item in the layer-3 data source. • CONFIG: the configuration item in ConfigServer. • DIAMOND: the configuration item in Diamond.
Data.N.ParamValue	String	No	true	The value of the parameter.
Data.N.ParamVariableName	String	No	FORBID_EXECUTE_DML_ALL	The name of the variable, which is specific to the program.
RegionId	String	No	cn-hangzhou	The region ID of the PolarDB-X instance.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=SetupDrdsParams
&DrdsInstanceId=drdsxxxxxxxxxxx
&ParamLevel=DB
&<Common request parameters>
```

Sample success responses

XML format

```
<SetupDrdsParamsResponse>
        <RequestId>A3140FC7-B78B-4D8E-B0C8-926D28669934</RequestId>
        <Success>true</Success>
        <Data>true</Data>
</SetupDrdsParamsResponse>
```

JSON format

```
{
    "Data":true,
    "RequestId":"A3140FC7-B78B-4D8E-B0C8-926D28669934",
    "Success":true
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.3.27. SubmitRollbackTask

Submits a smooth scale-out rollback task for a PolarDB-X database.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	SubmitRollbackTask	The operation that you want to perform. Set the value to SubmitRollbackTask.
DbName	String	Yes	test	The name of the database.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxx	The ID of the instance.
ExpandType	String	Yes	smooth_expand	The scale-out type. Valid values: • smooth_expand: smooth scale-out. • hot_expand: hot-spot scale-out **Note** The hot-spot scale-out is not supported.

Parameter	Type	Required	Example	Description
JobId	String	Yes	123	The job ID of the smooth scale-out task. The value of this parameter is the same as that of the ParentJobId parameter.
ParentJobId	String	Yes	123	The parent job ID of the smooth scale-out task. The value of this parameter is the same as that of the JobId parameter.
AccessKeyId	String	No	sejkwe21234sd	The AccessKey ID provided to you by Alibaba Cloud.

Response parameters

Parameter	Type	Example	Description
RequestId	String	DSSDF-SEWE-23ERW	The ID of the request.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=SubmitRollbackTask
&DbName=test
&DrdsInstanceId=drdsxxxxxxxxxx
&ExpandType=smooth_expand
&JobId=123
&ParentJobId=123
&<Common request parameters>
```

Sample success responses

XML format

```
<SubmitRollbackTaskResponse>
      <RequestId>DSSDF-SEWE-23ERW</RequestId>
      <Success>True</Success>
</SubmitRollbackTaskResponse>
```

JSON format

```
{
    "RequestId":"DSSDF-SEWE-23ERW",
    "Success":true
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.3.28. SubmitSqlFlashbackTask

Submits an SQL flashback task for a PolarDB-X instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	SubmitSqlFlashbackTask	The operation that you want to perform. Set the value to SubmitSqlFlashbackTask.
DbName	String	Yes	testdb	The name of the database.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxx	The ID of the instance.
EndTime	String	Yes	2019-09-10 23:23:23	The time when the SQL flashback task ends.
RecallRestoreType	Integer	Yes	0	Specifies whether to implement exact match or fuzzy match. Valid values: • 0: the exact match. • 1: the fuzzy match.
StartTime	String	Yes	2019-09-10 20:23:23	The time when the SQL flashback task starts.
AccessKeyId	String	No	Accexxxxxxxxxxx	The AccessKey ID provided to you by Alibaba Cloud.

Parameter	Type	Required	Example	Description
RecallType	Integer	No	0	Specifies whether to implement exact match or fuzzy match. Valid values: • 0: the exact match. • 1: the fuzzy match.
SqlPk	String	No	23423	The primary key of the flashback SQL statement.
SqlType	String	No	INSERT,UPDATE	The type of the SQL statement. Valid values: INSERT, UPDATE, and DELETE. Separate multiple values with comma (,).
TableName	String	No	tb1	The name of the table on which you want to perform SQL flashback.
TraceId	String	No	asenw3sa	The trace ID of the flashback SQL statement. You can query it in the SQL audit results.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=SubmitSqlFlashbackTask
&DbName=testdb
&DrdsInstanceId=drdsxxxxxxxxxx
&EndTime=2019-09-10 23:23:23
&RecallRestoreType=0
&StartTime=2019-09-10 20:23:23
&<Common request parameters>
```

Sample success responses

XML format

```
<SubmitSqlFlashbackTaskResponse>
      <RequestId>DSSDF-SEWE-23ERW</RequestId>
      <Success>True</Success>
      <TaskId>2323</TaskId>
</SubmitSqlFlashbackTaskResponse>
```

JSON format

```
{
    "RequestId":"DSSDF-SEWE-23ERW",
    "TaskId":2323,
    "Success":true
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.3.29. SwitchGlobalBroadcastType

Switches the broadcast table in a PolarDB-X database from the multi-write mode to the asynchronous link mode.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	SwitchGlobalBroadcastType	The operation that you want to perform. Set the value to SwitchGlobalBroadcastType.
DbName	String	Yes	testdb	The name of the database.
DrdsInstanceId	String	Yes	drdsxxxxxxxxx	The ID of the instance.
RegionId	String	No	cn-hangzhou	The region ID of the PolarDB-X instance.

Response parameters

Parameter	Type	Example	Description

Parameter	Type	Example	Description
Data	Boolean	true	Indicates whether the broadcast table was switched from multi-write mode to asynchronous link mode.
RequestId	String	DSSDF-SEWE-23ERW	The ID of the request.
Success	Boolean	true	Indicates whether the request was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=SwitchGlobalBroadcastType
&DbName=testdb
&DrdsInstanceId=drdsxxxxxxxxx
&<Common request parameters>
```

Sample success responses

XML format

```
<ValidateShardTaskResponse>
     <RequestId>DSSDF-SEWE-23ERW</RequestId>
     <Success>true</Success>
     <Data>true</Data>
</ValidateShardTaskResponse>
```

JSON format

```
{
    "Data":true,
    "RequestId":"DSSDF-SEWE-23ERW",
    "success":true
}
```

Error codes

For a list of error codes, visit the API Error Center.

9.1.2.3.30. UpgradeInstanceVersion

Upgrades the version of the instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	UpgradeInstanceVersion	The operation that you want to perform. Set the value to UpgradeInstanceVersion.
DrdsInstanceId	String	Yes	drdsxxxxxxxxxx	The ID of the instance.
RegionId	String	No	cn-hangzhou	The region ID of the PolarDB-X instance.

Response parameters

Parameter	Type	Example	Description
Data	String	true	Indicates whether the request was successful.
RequestId	String	DSSDF-SEWE-23ERW	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=UpgradeInstanceVersion
&DrdsInstanceId=drdsxxxxxxxxxx
&<Common request parameters>
```

Sample success responses

XML format

```
<UpgradeInstanceVersionResponse>
      <RequestId>DSSDF-SEWE-23ERW</RequestId>
      <Data>True</Data>
</UpgradeInstanceVersionResponse>
```

JSON format

```
{
    "Data":"true",
    "RequestId":"DSSDF-SEWE-23ERW"
}
```

Error codes

For a list of error codes, visit the API Error Center.

10.AnalyticDB for PostgreSQL

10.1. Developer Guide

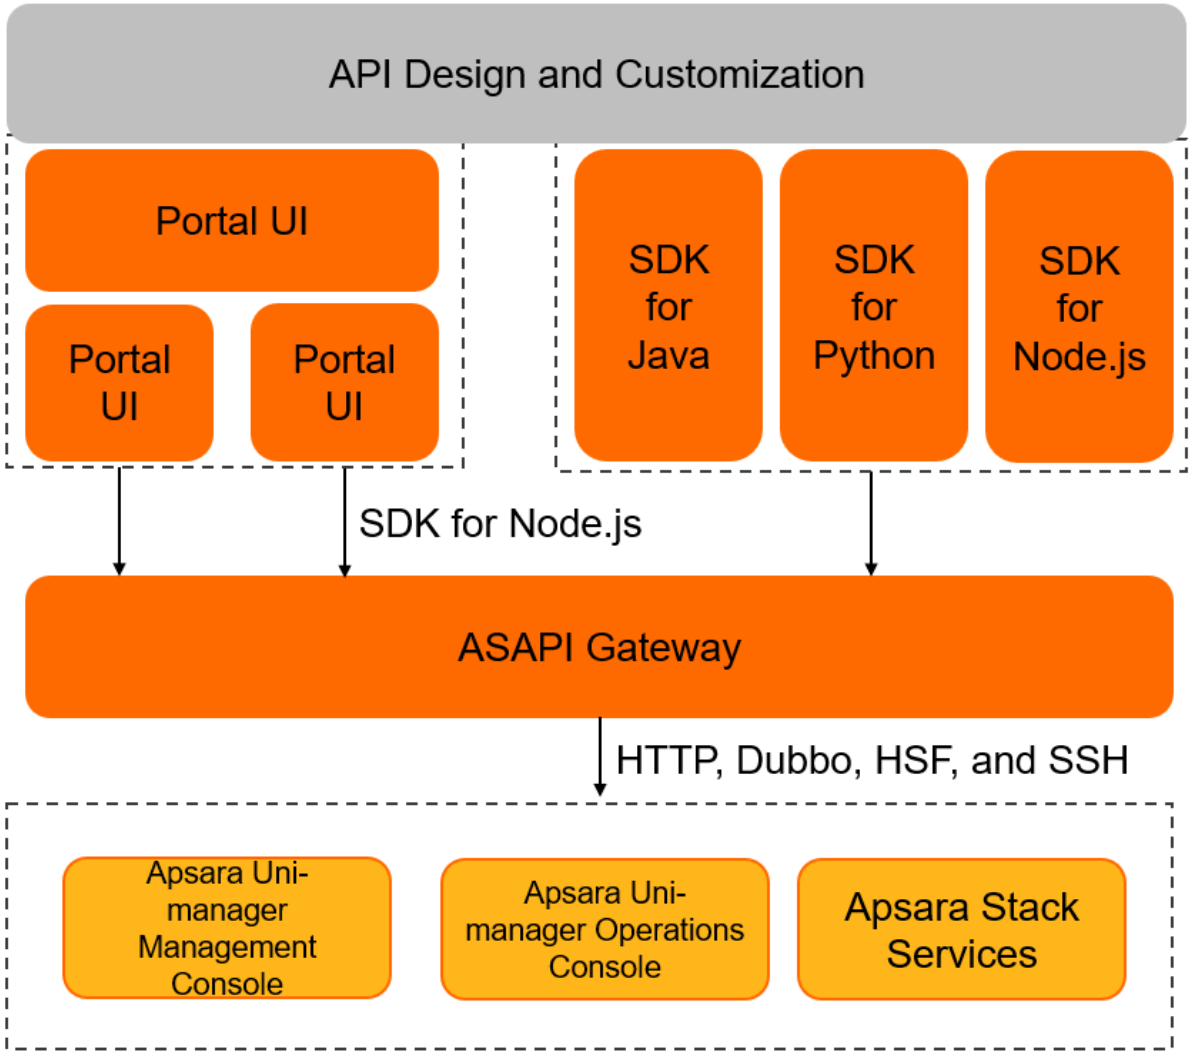
10.1.1. Call Apsara Stack SDK by using ASAPI

10.1.1.1. 文档标题缺失，请补全后重新导出

10.1.1.1.1. ASAPI overview

This topic describes the architecture and features of the Apsara Stack API (ASAPI).

The ASAPI is a unified ingress gateway for Apsara Stack services and a main component of the Apsara Uni-manager Management Console. The ASAPI provides a unified method for you to manage and make API calls. You can use Apsara Stack SDK to centrally make API calls to Apsara Stack services, including Elastic Compute Service (ECS) and Virtual Private Cloud (VPC).



The ASAPI allows you to make API calls to manage and maintain Apsara Stack services.

- Make API calls to implement enterprise-grade management. For example, you can manage organizations, users, roles, resource sets, and logon policies. These operations are provided by the Apsara Uni-manager Management Console.
- Make API calls to manage operations. For example, you can manage quotas, usage statistics, specifications, and password policies. These operations are provided by the Apsara Uni-manager Management Console.
- Make API calls to manage resources. For example, you can create, delete, query, or modify cloud resources. These operations are provided by Apsara Stack services. If you call an API operation to create an ECS instance or a VPC, the API operation is provided by ECS or VPC.
- Make API calls to query monitoring metrics of Apsara Stack services. These operations are provided by the Apsara Uni-manager Management Console.
- Make API calls to perform O&M. For example, you can manage monitoring and alerting, inventories, tasks, and physical servers. These operations are provided by the Apsara Uni-manager Operations Console.

For more information, see the developer guide of the corresponding Apsara Stack service. For information about API operations used to manage organization users, see *Apsara Uni-manager Management Console Developer Guide*. For information about the API operation used to create an ECS instance, see *ECS Developer Guide*.

> **Note** If the "Use Apsara Stack SDK to make API calls" section is included in the developer guide of an Apsara Stack service, the ASAPI is supported by the Apsara Stack service. In this case, you can make API calls based on the developer guide.

10.1.1.1.2. Preparations

10.1.1.1.2.1. Log on to the API Tool console

You can log on to the API Tool console from the Apsara Uni-manager Management Console.

Prerequisites

- The URL of the Apsara Uni-manager Management Console is obtained from the deployment personnel before you log on to the Apsara Uni-manager Management Console.
- We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL of the Apsara Uni-manager Management Console. Press the Enter key.
2. Enter your username and password.

   Obtain the username and password that you can use to log on to the console from the operations administrator.

> **Note** When you log on to the Apsara Uni-manager Management Console for the first time, you must change the password of your username. Your password must meet complexity requirements. The password must be 10 to 32 characters in length and must contain at least two of the following character types:
>
> - Uppercase or lowercase letters
> - Digits
> - Special characters, which include ! @ # $ %

3. Click **Log On**.
4. In the top navigation bar, choose **Products > Others > API Tool**.

10.1.1.1.2.2. View information about API operations

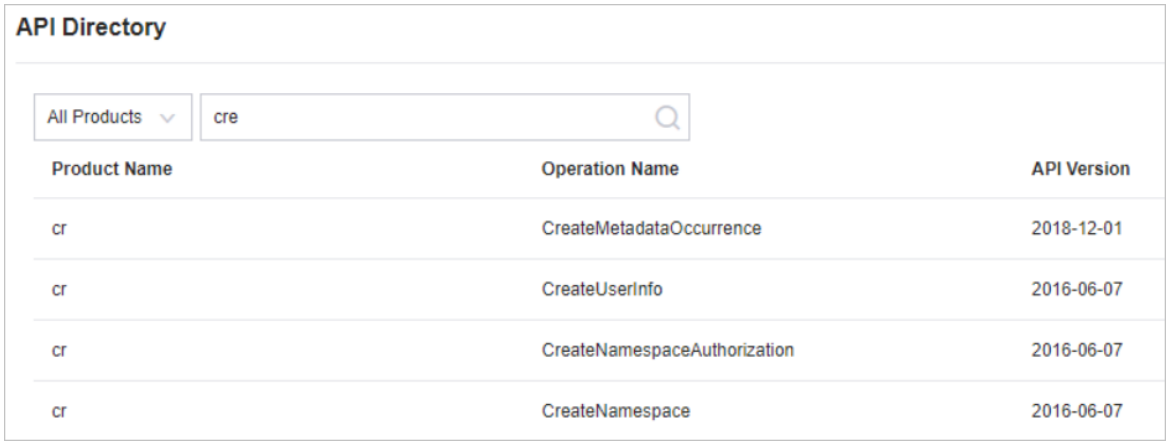
This topic describes how to view information about API operations. Before you use SDKs, obtain service names, API operation names, and API operation versions.

Context

The API operations on the API Directory page are only for reference. For information about how to call API operations, see developer guides of the corresponding cloud services. If the information on the API Directory page is inconsistent with that in the developer guide of the corresponding cloud service, the information in the developer guide prevails.

Procedure

1. Go to the API Tool console. For more information, see Log on to the API Tool console.
2. In the left-side navigation pane, click **API Directory**.
3. On the **API Directory** page, select the desired service from the drop-down list, enter a keyword of an API operation name in the search box, and then click the search icon.



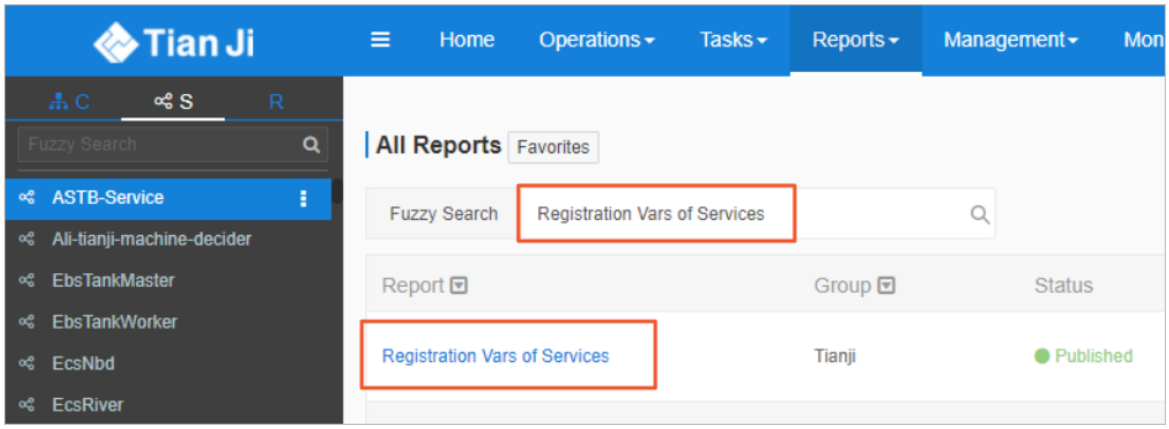
4. Then, you can view the service name, API operation name, and API operation version.

10.1.1.1.2.3. Generate an endpoint for the ASAPI

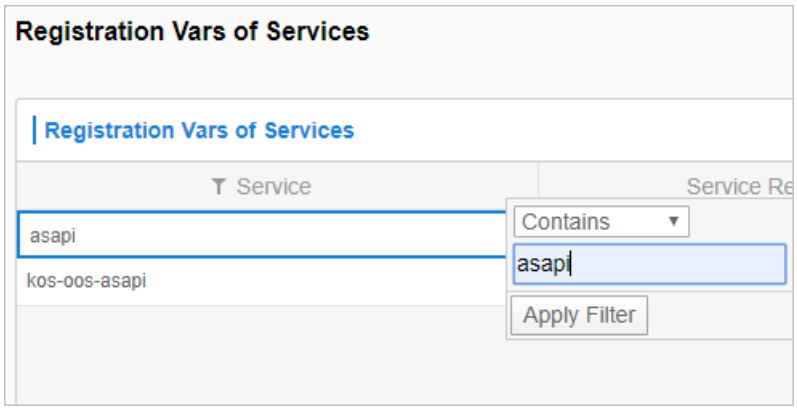
This topic describes three methods used to generate an endpoint for the Apsara Stack API (ASAPI).

Method 1: Use Registration Vars of Services to generate an endpoint

1. Log on to Apsara Infrastructure Management Framework.
   i. Log on to the Apsara Uni-manager Operations Console.
   ii. In the top navigation bar, click **O&M**.
   iii. In the left-side navigation pane, choose **Product Management** > **Products**.
   iv. In the Apsara Stack O&M section, click **Apsara Infrastructure Management Framework**.
2. In the left-side navigation pane, click **Reports**.
3. On the **All Reports** page, search for `Registration Vars of Services` and click the report name.



4. On the **Registration Vars of Services** page, click the icon next to **Service** and search for `asapi`.



5. Find the asapi service, right-click in the **Service Registration** column, and then select **Show More** from the shortcut menu.

   In the **Details** dialog box, obtain the value of **asapi.public.endpoint**.
6. Generate an endpoint for the ASAPI based on the following format:

```
https://<asapi.public.endpoint>/asapi/v3
```

Method 2: Use cluster resources to generate an endpoint

1. Log on to Apsara Infrastructure Management Framework.
   i. Log on to the Apsara Uni-manager Operations Console.

ii. In the top navigation bar, click **O&M**.

iii. In the left-side navigation pane, choose **Product Management** > **Products**.

iv. In the Apsara Stack O&M section, click **Apsara Infrastructure Management Framework**.

2. Go to the cluster operations page.

i. In the left-side navigation pane, choose Operations > Cluster Operations.

ii. In the **Cluster** search box, enter `ascm`.

iii. Find the cluster that you want to manage and click **Operations** in the **Actions** column.

3. Obtain the value of the domain parameter.

i. Click the Cluster Resources tab.

ii. In the **Name** field, search for `asapi_dns_public`.

iii. Click **Details** in the **Application Parameter** column.

In the **Application Parameter** message, obtain the value of the **domain** parameter.

4. Generate an endpoint for the ASAPI based on the following format:

```
https://<domain>/asapi/v3
```

Method 3: Concatenate strings to generate an endpoint

You can also concatenate strings to generate an endpoint based on the following format:

```
https://public.asapi.<region>.<internet-domain>/asapi/v3
```

> **Note**
>
> 1. Replace <region> with your actual region ID. For information about how to query a region ID, see Query a region ID.
> 2. Replace <internet-domain> with the root domain of your Apsara Stack service. To obtain the root domain, contact Apsara Stack O&M personnel. Take note of this point: Use the internet-domain parameter instead of the intranet-domain parameter.

If the **region** value is `cn-****-****-d01` and the **internet-domain** value is `inter.****.****.com`, the following endpoint can be generated:

```
https://public.asapi.cn-****-****-d01.inter.****.****.com/asapi/v3
```

10.1.1.1.2.4. Obtain Apsara Stack SDKs

The Apsara Stack API (ASAPI) is a unified portal provided by Apsara Stack. You can use the ASAPI to connect to all Apsara Stack services. Apsara Stack provides SDKs for API calls.

For more information about how to obtain Apsara Stack SDKs, see Apsara Stack documentation.

10.1.1.1.2.5. Obtain an AccessKey pair

An AccessKey pair that consists of an AccessKey ID and an AccessKey secret is used to implement symmetric encryption. This helps you verify the identity of a requester. The AccessKey ID is used to identify a user. The AccessKey secret is used to encrypt the signature string. This topic describes how to obtain an AccessKey pair.

Prerequisites

An account of the operations administrator or the level-1 organization administrator is obtained. Only an operations administrator or a level-1 organization administrator can obtain an AccessKey pair.

Context

If you need to make API calls to the Apsara Uni-manager Management Console or other Apsara Stack services, we recommend that you use the AccessKey pair of a personal account. If you use the AccessKey pair of a personal account, configure the request headers that are described in the following table for access control. Otherwise, an error that indicates insufficient permissions can occur.

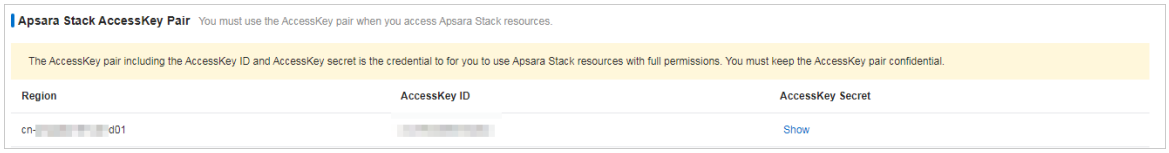
Parameter	Description
x-acs-regionid	The ID of the region, for example, cn-hangzhou-*.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console. For information about how to obtain an organization ID, see the "GetOrganizationList" section in Apsara Uni-manager Management Console Developer Guide.
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console. For information about how to obtain a resource set ID, see the "ListResourceGroup" section in Apsara Uni-manager Management Console Developer Guide.
x-acs-instanceid	The ID of the instance to which you make API calls. If you need to make API calls to an Elastic Compute Service (ECS) instance, obtain the ID of the ECS instance on the Instances page.

Warning The AccessKey pair of a personal account is managed and controlled by the permission system of the Apsara Uni-manage Management Console. If you need to obtain the AccessKey pair of an account that has permissions on an organization, make sure that your operation is allowed by an administrator. This ensures security. The account that has permissions on an organization is a privileged account.

Obtain the AccessKey pair of a personal account

To obtain the AccessKey pair of a personal account, perform the following operations:

1. Log on to the Apsara Uni-manager Management Console.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and click **User Information**.
3. In the **Apsara Stack AccessKey Pair** section, obtain the AccessKey pair.



> **Note** The AccessKey pair that consists of an AccessKey ID and an AccessKey secret is the credential for you to have full permissions on Apsara Stack resources. Keep your AccessKey pair confidential.

Obtain the AccessKey pair of an account that has permissions on an organization

To obtain the AccessKey pair of an account that has permissions on an organization, perform the following operations:

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Organizations**.
4. In the Organizations navigation tree, click the name of the organization that you want to manage.
5. On the right side of the page, click **Obtain AccessKey Pair**.
6. In the message that appears, obtain the AccessKey pair of the account that has permissions on the organization.

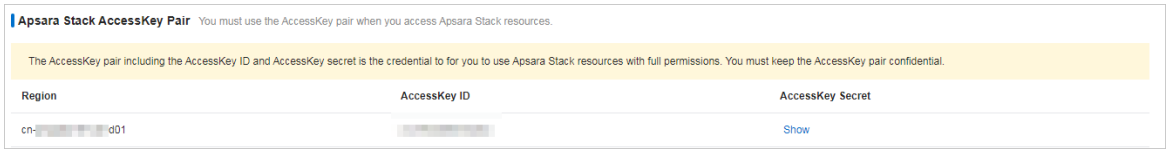
> **Note** The system automatically allocates an AccessKey pair to the account that has permissions on the level-1 organization. The same AccessKey pair is used by the accounts that have permissions on the subordinate organizations.

10.1.1.1.2.6. Query a region ID

When you use Apsara Stack SDK for Node.js to make API calls, specify a region ID. You can obtain a region ID in the Apsara Uni-manager Management Console.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and click **User Information**.
3. In the **Apsara Stack AccessKey Pair** section, view the region ID.



10.1.1.1.3. Common parameters

Common request parameters must be included in all API requests.

Sample common parameters

The following table describes the common parameters that are used when you call API operations supported by the Apsara Stack API (ASAPI).

Parameter	Type	Required	Description
Action	String	Yes	The operation that you want to perform. For more information, see View information about API operations.
Product	String	Yes	The name of the service.
Version	String	Yes	The version of the API operation. For more information, see View information about API operations.
RegionId	String	Yes	The ID of the region. For more information, see Query a region ID.
AccessKeyId	String	Yes	The AccessKey ID used to connect to the service. For more information, see Obtain an AccessKey pair.
Signature	String	Yes	The signature string of the current request. For more information about how signatures are calculated, see Request signatures.

Parameter	Type	Required	Description
SignatureMethod	String	Yes	The encryption method of the signature string. Valid values: HMAC-SHA1 and HMAC-SHA256.
SignatureVersion	String	Yes	The version of the signature encryption algorithm. Valid values: 1.0 and 2.0.
SignatureNonce	String	Yes	A unique, random number used to prevent replay attacks. You must use different numbers for different requests.
Timestamp	String	Yes	The timestamp of the request. Specify the time in the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time must be in UTC. Sample value: 2018-01-01T12:00:00Z.
Format	String	Yes	The format in which to return the response. Set the value to JSON.

Note

The `Signature`, `SignatureMethod`, `SignatureVersion`, `SignatureNonce`, `Timestamp`, and `Format` parameters are encapsulated into Apsara Stack SDK. You do not need to configure these parameters.

10.1.1.1.4. SDK description

10.1.1.1.4.1. Use Apsara Stack SDK for Java to call API operations

This topic describes how to obtain and use Apsara Stack SDK for Java to call API operations.

Prerequisites

- An authorized account and an AccessKey pair are obtained. The AccessKey pair consists of an AccessKey ID and an AccessKey secret. For more information about how to obtain an AccessKey pair in the Apsara Uni-manager Management Console, see Obtain an AccessKey pair.
- The endpoint of the Apsara Stack API (ASAPI) is obtained. For more information, see Generate an endpoint for the ASAPI.
- Apsara Stack SDK for Java 1.8 or later is installed.

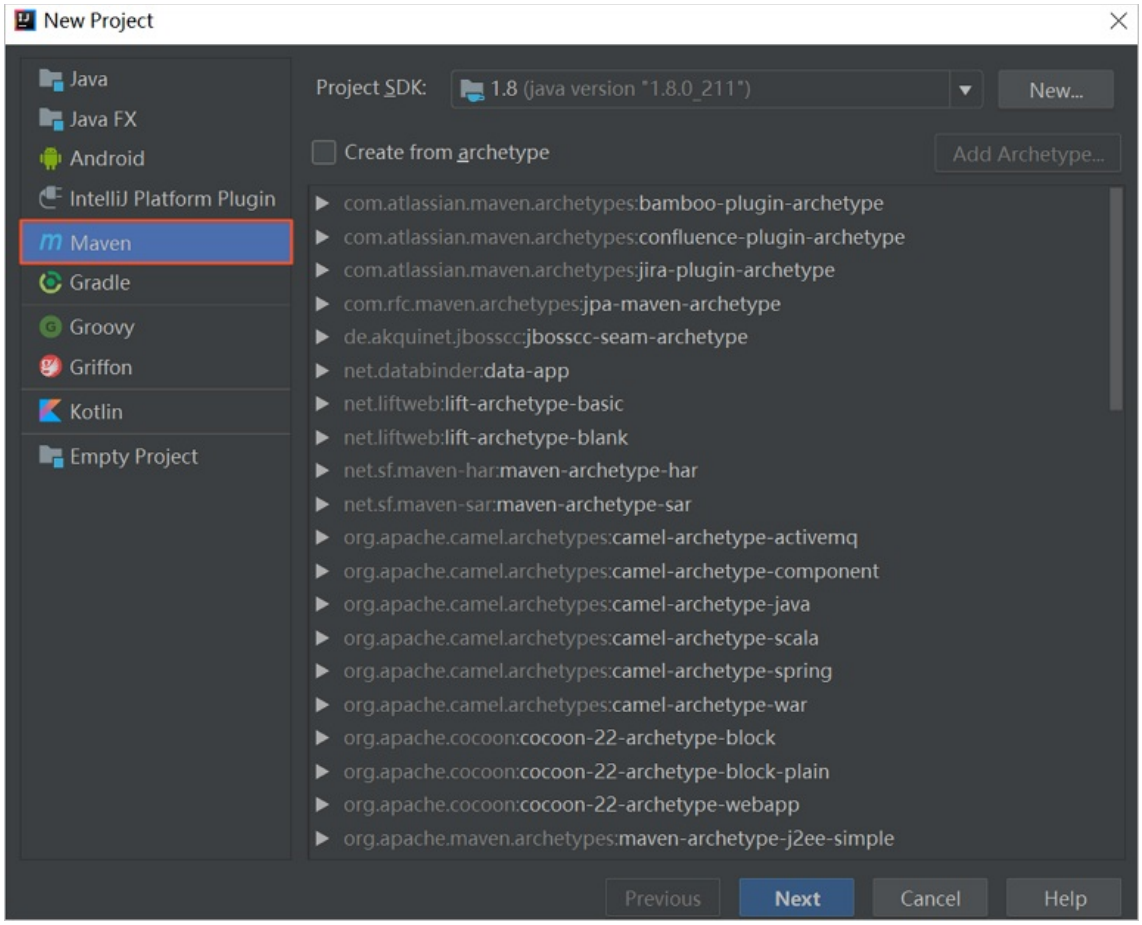
Background information

The help center of Apsara Stack provides Maven dependencies and JAR files for Apsara Stack SDK for Java. You can write code to use Apsara Stack SDK for Java to call API operations.

In this example, the Windows 10 64-bit OS and IntelliJ IDEA are used.

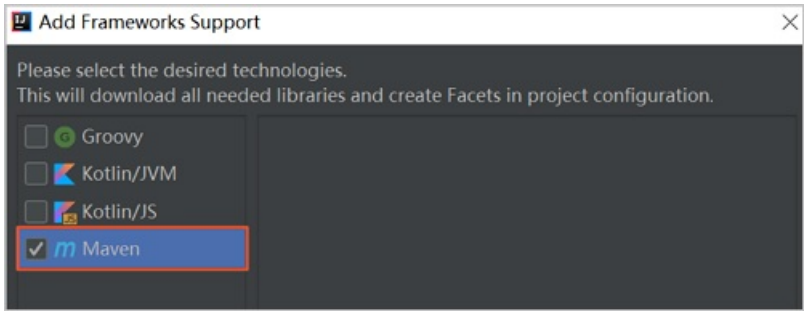
Procedure

1. Use one of the following methods to configure Maven in IntelliJ IDEA. Maven is a tool used for project management.
   - Use Maven that is integrated in IntelliJ IDEA.
   - Download Maven based on the OS that you are using from the official website and configure Maven. For more information, see Download Maven.
2. Obtain the Maven dependencies for Apsara Stack SDK for Java from the official website. For more information about how to obtain the dependencies, see Obtain the core package for ASAPI.
3. Use one of the following methods to create a Maven project:
   - Method 1: Create a Maven project in IntelliJ IDEA.

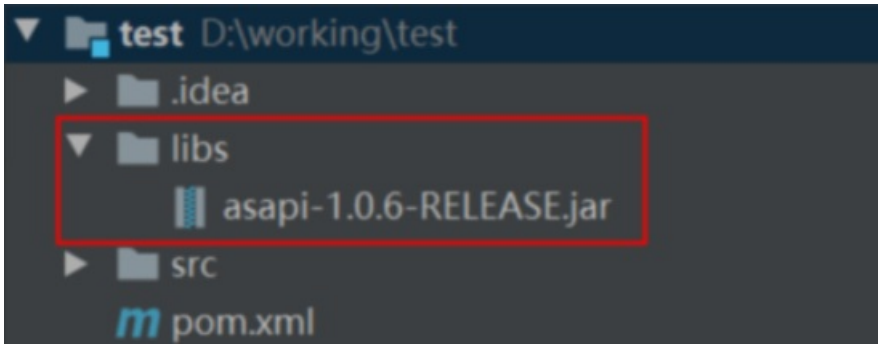


- Method 2: Convert an existing project to a Maven project.
  a. Right-click the project that you want to convert and select **Add Framework Support...**.

  b. Select **Maven** and click **OK**.



4. Create a folder named libs in the root directory of the project. Then, add the JAR file of Apsara Stack SDK for Java to the libs folder, as shown in the following figure.



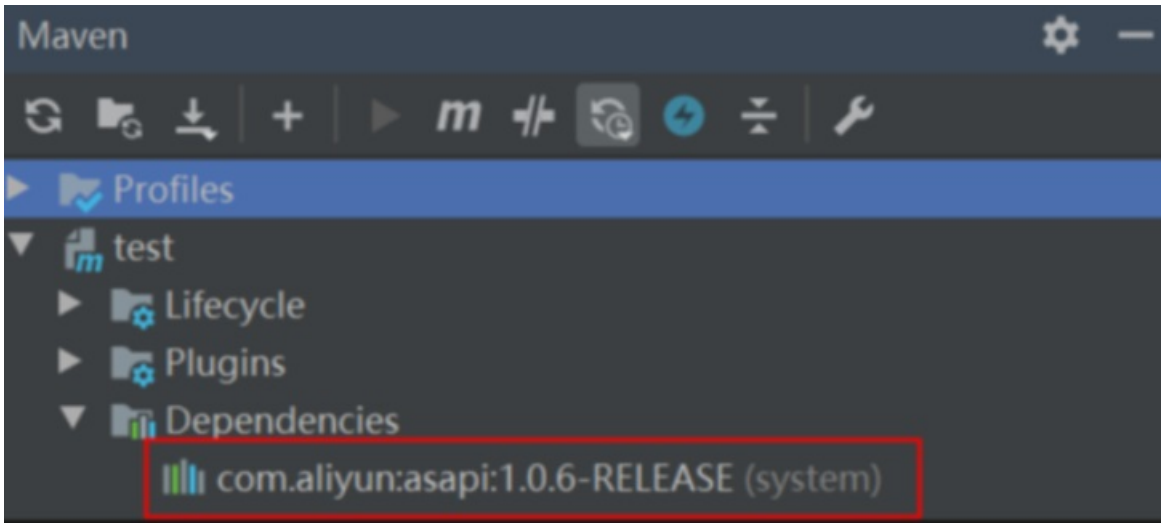
5. Add the dependencies of Apsara Stack SDK for Java to the pom.xml file in the project directory.

```
<dependencies>
    <dependency>
        <groupId>com.aliyun</groupId>
        <artifactId>asapi</artifactId>
        <version>1.0.6-RELEASE</version>
        <scope>system</scope>
        <systemPath>${project.basedir}/libs/asapi-1.0.6-RELEASE.jar</systemPath>
    </dependency>
  <dependency>
        <groupId>com.alibaba</groupId>
        <artifactId>alicrypto-java-aliyun</artifactId>
    <version>1.0.4</version>
    <systemPath>${project.basedir}/libs/alicrypto-java-aliyun-1.0.4.jar</systemPath>
  </dependency>
  <dependency>
    <groupId>com.aliyun</groupId>
    <artifactId>gmsse</artifactId>
    <version>1.1.0</version>
    <systemPath>${project.basedir}/libs/gmsse-1.1.0.jar</systemPath>
  </dependency>
</dependencies>
```

> **Note** Replace `1.0.6-RELEASE` with the actual version of Apsara Stack SDK for Java.

6. On the right side of IntelliJ IDEA, view information in the Maven section.

If the information in the following figure appears, the dependencies are added.



Use Apsara Stack SDK for Java

You can use the GET or POST method to call API operations provided by the ASAPI. The following sample code shows how to call API operations:

```
// 1. Create a connection to an ASClient object.
ASClient client = new ASClient();
// 2. Configure the identifier of the requester. This parameter is required and used only f
or identification. You can set this parameter to a random value.
client.setSdkSource("<The identifier of the requester>");
Map<String, Object> parameters = new HashMap<String, Object>();
// 3. Configure the parameters for authorization. The parameter values vary based on your e
nvironment.
// The AccessKey ID of your Apsara Stack tenant account.
parameters.put("AccessKeyId","<AccessKey ID>");
// The AccessKey secret of your Apsara Stack tenant account.
parameters.put("AccessKeySecret", "<AccessKey Secret>");
// The ID of the region.
parameters.put("RegionId", "<your RegionID>");
// 4. Configure parameters for an API call. In this example, the Product, Action, and Versi
on parameters are configured.
parameters.put("Product", "<The name of the service>");
parameters.put("Action", "<The name of the API operation>");
parameters.put("Version", "<The version of the API operation>");
// 5. Configure operation-specific parameters.
parameters.put("<The name of the operation-specific parameter>", "<The value of the operati
on-specific parameter>");
// 6. Configure request headers and the encryption method for the signature string. Valid v
alues of the SignatureMethod parameter: HMAC-SHA1 and HMAC-SHA256. By default, HMAC-SHA256
is used.
Map<String, String> headers = new HashMap<String, String>();
//headers.put("SignatureMethod", "HMAC-SHA1");
headers.put("x-acs-regionid", "<your-regionid>");
headers.put("x-acs-resourcegroupid", "<your-resourcegroupid>");
headers.put("x-acs-organizationid", "<your-organizationid>");
headers.put("x-acs-instanceid", "<your-instanceid>");
// 7. Make an API call. We recommend that you use the doPost() method.
// Configure the time-out period for a connection.
//client.setConnectTimeout(10000);
// Configure the time-out period for a request.
// client.setSocketTimeout(10000);
String result = client.doPost(endpoint, headers, parameters);
System.out.println(result);
```

Configure a proxy

If you need to use a proxy to make API calls, use the following sample code to configure the proxy:

```
Cloud cloud = new Cloud();
// Configure the IP address of the proxy.
cloud.setConfig("proxy_host", "<IP>");
// Configure the port used by the proxy.
cloud.setConfig("proxy_port", "<Port>");
// 1. Create a connection to an ASClient object.
ASClient client = new ASClient(cloud);
```

Request headers

Parameter	Description
x-acs-regionid	The ID of the region. For more information about how to obtain a region ID, see Query the region ID.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console.
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console.
x-acs-instanceid	The ID of the instance to which you make API calls.

10.1.1.1.4.2. Use Apsara Stack SDK for Python to call API operations

This topic describes how to use Apsara Stack SDK for Python to call API operations provided by the Apsara Stack API (ASAPI).

Preparations

- An authorized account and an AccessKey pair are obtained. The AccessKey pair consists of an AccessKey ID and an AccessKey secret. For more information about how to obtain an AccessKey pair in the Apsara Uni-manager Management Console, see Obtain an AccessKey pair.
- The endpoint of the ASAPI is obtained. For more information, see Generate an endpoint for the ASAPI.

Install Apsara Stack SDK for Python

1. Download the required version of Apsara Stack SDK for Python. For more information, see Obtain Apsara Stack SDKs.
2. Upload the compressed file of Apsara Stack SDK for Python to the host from which you want to send API requests and extract the file. Then, run the following code in the directory of the extracted files to install Apsara Stack SDK for Python:

```
# Install Apsara Stack SDK for Python 2.x.
pip install aliyun-python2-sdk-asapi-2.4.7.tar.gz
# Install Apsara Stack SDK for Python 3.x.
pip3 install aliyun-python3-sdk-asapi-2.4.7.tar.gz
```

> **Note**
>
> Replace `2.4.7` with the actual version of Apsara Stack SDK for Python.

Sample requests

You can use the GET or POST method to call API operations provided by the ASAPI.

```
    # 1. Import dependencies.
    from aliyunsdkasapi.ASClient import ASClient
    from aliyunsdkasapi.AsapiRequest import AsapiRequest

    if __name__ == '__main__':
     # 2. Create a request. The Product parameter specifies the name of the service. The Ver
sion parameter specifies the version of the API operation. The Action parameter specifies t
he operation that you want to perform. The asapi-endpoint parameter specifies the endpoint
of the ASAPI.
     req = AsapiRequest("<Product>", "<Version>", "<Action>", "<asapi-endpoint>")
     # 3. Configure operation-specific parameters.
     req.add_body_params("<key>", "<value>")
     # 4. Configure request headers.
     req.add_header("x-acs-resourcegroupid", "<your-resourcegroupid>");
     req.add_header("x-acs-organizationid", "<your-organizationid>");
     req.add_header("x-acs-regionid", "<your-regionid>");
     req.add_header("x-acs-instanceid", "<your-instanceid>");
     # 5. Configure a request method.
     req.set_method("POST")
     # 6. Configure initialization parameters for an ASClient object. The parameter values v
ary based on your environment. The timeout parameter specifies the time-out period for a re
quest. The cert_file parameter specifies the certificate. The verify parameter specifies wh
ether to verify the certificate.
     as_client = ASClient("<accesskeyid>", "<accesskeysecret>", "<regionid>",timeout=1000,
             cert_file=None,
             verify=False)
     # Configure the identifier of the requester. This parameter is required and used only f
or identification. You can set this parameter to a random value.
     as_client.setSdkSource("<The identifier of the requester>")
     response = as_client.do_request(req)
     print(response)
```

Request headers

Parameter	Description
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console.
x-acs-regionid	The ID of the region. For more information about how to obtain a region ID, see Query a region ID.
x-acs-instanceid	The ID of the instance to which you make API calls.

Configure a proxy

Perform the following steps to configure a proxy:

1. Import OS dependencies.

```
import os
```

2. Configure one or more proxies.

```
# Before you make an API call, configure one or more proxies.
os.environ['http_proxy'] = "http://x.x.x.x:xxxx"
os.environ['https_proxy'] = "https://x.x.x.x:xxxx"
```

10.1.1.1.4.3. Use Apsara Stack SDK for Node.js to call API operations

This topic describes how to obtain and use Apsara Stack SDK for Node.js to call API operations.

Preparations

- An authorized account and an AccessKey pair are obtained. The AccessKey pair consists of an AccessKey ID and an AccessKey secret. For more information about how to obtain an AccessKey pair in the Apsara Uni-manager Management Console, see Obtain an AccessKey pair.
- The endpoint of the Apsara Stack API (ASAPI) is obtained. For more information, see Generate an endpoint for the ASAPI.
- A region ID is obtained. For more information about how to obtain a region ID, see Query the region ID.

Add dependencies

Run the following command to install Apsara Stack SDK for Node.js:

```
tnpm install --save @ali/asapi-nodejs-sdk
```

Use Apsara Stack SDK for Node.js

The following sample code shows how to use Apsara Stack SDK for Node.js to make API calls:

```
// 1. Import the dependencies of Apsara Stack SDK for Node.js.
const Controller = require('egg').Controller;
const ASAPIClient = require('@ali/asapi-nodejs-sdk');
// 2. Configure the parameters.
const cnofig = {
    API_GATEWAY: '<The endpoint of the ASAPI>',
    regionId: '<The ID of the region in which the Apsara Stack service is deployed>',
    accessKeyId: '<The AccessKey ID of your Apsara Stack tenant account>',
    accessKeySecret: '<The AccessKey secret of your Apsara Stack tenant account>'
};
// 3. Initialize a client for API calls.
const AsapiClient = new ASAPIClient(cnofig, this.ctx);
// 4. Configure request parameters.
const params = {
    "Action": "<The name of the API operation>",
    "Product": "<The name of the service that provides the API operation>",
    "Version": "<The version of the API operation>",
    "regionId": '<The ID of the region in which the Apsara Stack service is deployed>',
      "<The name of the operation-specific parameter required by the API operation>": "<The
value of the operation-specific parameter>"
}
// 5. Configure request headers.
AsapiClient.addHeader('x-acs-caller-sdk-source', '<The identifier of the requester>')
AsapiClient.addHeader('x-acs-roleid', '<The ID of the role>')
AsapiClient.addHeader('x-acs-userid', '<The ID of the user>')
AsapiClient.addHeader('x-acs-organizationid', '<your-organizationid>')
AsapiClient.addHeadert("x-acs-regionid", "<your-regionid>");
AsapiClient.addHeader("x-acs-resourcegroupid", "<your-resourcegroupid>");
AsapiClient.addHeader("x-acs-instanceid", "<your-instanceid>");
// 6. Make an API call and obtain the response.
try {
  const res = await AsapiClient.doRequest(cnofig.API_GATEWAY, params, {
    method: 'POST', // The request method.
    formatParams: false, // Specifies whether to format parameters and capitalize the first
letter of each parameter.
    enableProxy: true, // Specifies whether to configure a proxy.
    proxy: 'http://x.x.x.x:xxxx',
    timeout: 10000, // The time-out period.
  // ca: , // The certificate issued by a certificate authority (CA). For more information,
visit https://nodejs.org/api/https.html#https_https_request_options_callback.
  })
  console.log(res)
} catch (e) {
  console.log(e)
}
```

Disable certificate validation

The following sample code shows how to disable certificate validation:

```
Configure the environment variable.
NODE_TLS_REJECT_UNAUTHORIZED=0
```

Request headers

Parameter	Description
x-acs-regionid	The ID of the region. For more information about how to obtain a region ID, see Query the region ID.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console.
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console.
x-acs-instanceid	The ID of the instance to which you make API calls.
x-acs-caller-sdk-source	The custom name of the requester or the system. This parameter is used to identify the source of the API request.
x-acs-roleid	The ID of the role.
x-acs-userid	The ID of the user.

10.1.1.1.4.4. SDK for POP

SDK for Java

Before you use Apsara Stack API (ASAPI) SDK for POP for Java to access ASAPI, you must know the remote procedure call (RPC) and resource-oriented architecture (ROA) styles that are supported for API calls. ASAPI is compatible with both styles. Their difference lies in the ASAPI endpoints that are used for API calls.

Prerequisites

- An Alibaba Cloud SDK package is downloaded for the service that you want to access. The required dependencies are installed.
- SSL certificate validation is ignored for requests over HTTPS.

Background information

ASAPI supports only the HTTPS request protocol.

Difference between two styles

When you use the RPC or ROA style to make API calls, take note that the two styles use different ASAPI endpoints.

```
# ASAPI endpoint for the RPC style:
public.asapi.<global:region>.<global:internet-domain>/asapi/v3
# ASAPI endpoint for the ROA style:
public.asapi.<global:region>.<global:internet-domain>/asapi/v3/roa
```

Call examples

The following sample code provides an example on how to use the RPC style to make an API call. In this example, the DescribeInstances operation of Elastic Compute Service (ECS) is called, and the API version is 2014-05-26.

Sample code:

```
package com.aliyuns.client.pop.ecs;

import com.aliyuncs.DefaultAcsClient;
import com.aliyuncs.ecs.model.v20140526.DescribeInstancesRequest;
import com.aliyuncs.ecs.model.v20140526.DescribeInstancesResponse;
import com.aliyuncs.http.HttpClientConfig;
import com.aliyuncs.http.ProtocolType;
import com.aliyuncs.profile.DefaultProfile;

import java.util.List;

public class DescribeInstancesTest {
    public static void main(String[] args) {
        // Specify the endpoint of ASAPI.
        String endpoint = "public.asapi.<global:region>.<global:internet-domain>/asapi/v3";
        // Specify the region where the ECS service resides.
        String region = "<global:region>";
        // Specify the name of the service that you want to access.
        String product = "ECS";
        // Specify your AccessKey pair.
        String ak = "<accessKeyId>";
        String sk = "<accessKeySecret>";
        try {
            DefaultProfile clientProfile = DefaultProfile.getProfile(region, ak, sk);
            // Ignore SSL certificate validation.
            HttpClientConfig clientConfig = HttpClientConfig.getDefault();
            clientConfig.setIgnoreSSLCerts(true);
            // Set the connection timeout period.
            clientConfig.setConnectionTimeoutMillis(3000L);
            // Set the read timeout period.
            clientConfig.setReadTimeoutMillis(10000L);
            clientProfile.setHttpClientConfig(clientConfig);
            // Create a connection.
            DefaultAcsClient acsClient = new DefaultAcsClient(clientProfile);
            // Create a request.
            DescribeInstancesRequest request = new DescribeInstancesRequest();
            // Specify the endpoint of ASAPI.
            request.setSysEndpoint(endpoint);
            // Specify the name of the service that you want to access and the region where
the service resides.
            request.setSysLocationProduct(product);
            request.setSysRegionId(region);
            // Set the request protocol to HTTPS.
            request.setSysProtocol(ProtocolType.HTTPS);
            DescribeInstancesResponse result =  acsClient.getAcsResponse(request);
            List<DescribeInstancesResponse.Instance> instances = result.getInstances();
            for (DescribeInstancesResponse.Instance instance: instances) {
                System.out.println(instance.getInstanceId());
                System.out.println(instance.getInstanceName());
```

```
            }

        } catch (Exception e) {
            e.printStackTrace();
        }
    }
}
```

The following sample code provides an example on how to use the ROA style to make an API call. In this example, the GetNamespaceList operation of Container Registry is called, and the API version is 2016-06-07.

Sample code:

```
package com.aliyuns.client.pop.cr;

import com.aliyuncs.CommonRequest;
import com.aliyuncs.CommonResponse;
import com.aliyuncs.DefaultAcsClient;
import com.aliyuncs.IAcsClient;
import com.aliyuncs.exceptions.ClientException;
import com.aliyuncs.exceptions.ServerException;
import com.aliyuncs.http.FormatType;
import com.aliyuncs.http.HttpClientConfig;
import com.aliyuncs.http.MethodType;
import com.aliyuncs.http.ProtocolType;
import com.aliyuncs.profile.DefaultProfile;

public class GetNamespaceListTest {
    public static void main(String[] args) {
        // Specify the endpoint of ASAPI.
        String endpoint = "public.asapi.<global:region>.<global:internet-domain>/asapi/v3/r
oa";
        // Specify the region where the Container Registry service resides.
        String region = "<global:region>";
        // Specify the name of the service that you want to access.
        String product = "cr";
        // Specify your AccessKey pair.
        String ak = "<accessKeyId>";
        String sk = "<accessKeySecret>";
        DefaultProfile profile = DefaultProfile.getProfile(region, ak, sk);
        // Ignore SSL certificate validation.
        HttpClientConfig clientConfig = HttpClientConfig.getDefault();
        clientConfig.setIgnoreSSLCerts(true);
        // Set the connection timeout period.
        clientConfig.setConnectionTimeoutMillis(3000L);
        // Set the read timeout period.
        clientConfig.setReadTimeoutMillis(10000L);
        profile.setHttpClientConfig(clientConfig);
        // Create a connection for the client.
        IAcsClient client = new DefaultAcsClient(profile);
        // Create a request.
        CommonRequest request = new CommonRequest();
        // Set the request protocol to HTTPS.
```

```
        request.setSysProtocol(ProtocolType.HTTPS);
        // Specify the request method.
        request.setSysMethod(MethodType.GET);
        // Specify the endpoint of ASAPI.
        request.setSysDomain(endpoint);
        // Specify the version of the API.
        request.setSysVersion("2016-06-07");
        // Specify the pattern of the uniform resource identifier (URI).
        request.setSysUriPattern("/namespace");
        // Specify the name of the service that you want to access and the region where the
service resides.
        request.setSysLocationProduct(product);

        request.putHeadParameter("Content-Type", "application/json");
        String requestBody = "" +
                "{}";
        request.setHttpContent(requestBody.getBytes(), "utf-8", FormatType.JSON);
        try {
            CommonResponse response = client.getCommonResponse(request);
            System.out.println(response.getData());
        } catch (ServerException e) {
            e.printStackTrace();
        } catch (ClientException e) {
            e.printStackTrace();
        }
    }
}
```

> **Notice**
>
> If you send a request over HTTPS, you must enable the request to ignore SSL certificate validation.

SDK for Go

This topic describes how to use Apsara Stack API (ASAPI) SDK for POP for Go.

Prerequisites

An Alibaba Cloud SDK package is downloaded for the service that you want to access. The required dependencies are installed.

Background information

Only the remote procedure call (RPC) style is supported for API calls.

Call examples

The following sample code provides an example on how to make an API call. In this example, the DescribeInstances operation of Elastic Compute Service (ECS) is called, and the API version is 2014-05-26.

Sample code:

```
package main
```

```
import (
 "fmt"
 "time"

 "github.com/aliyun/alibaba-cloud-sdk-go/sdk"
 "github.com/aliyun/alibaba-cloud-sdk-go/sdk/auth/credentials"
 "github.com/aliyun/alibaba-cloud-sdk-go/sdk/requests"
 "github.com/aliyun/alibaba-cloud-sdk-go/sdk/responses"
)

func getSdkConfig() *sdk.Config {
 return sdk.NewConfig().
  WithTimeout(time.Duration(30) * time.Second).
  WithEnableAsync(true).
  WithGoRoutinePoolSize(100).
  WithMaxTaskQueueSize(10000).
  WithDebug(false).
  WithScheme("HTTP")
}

func main(){
 ak := "<The AccessKey ID of your Apsara Stack tenant account.>"
 sk := "<The AccessKey secret of your Apsara Stack tenant account.>"
 regionId := "<The region where the ECS service resides.>"
 endpoint := "<The endpoint of ASAPI.>" // No network protocol.
 request := requests.NewCommonRequest()
  request.SetReadTimeout(10 * time.Second) // Set the read timeout period of the request to
10 seconds.
  request.SetConnectTimeout(5 * time.Second)  // Set the connection timeout period of the r
equest to 5 seconds.
 request.Method = requests.GET
 request.Domain = endpoint         // Location Service will not be enabled if the host is s
pecified. For example, the service with a certification type-bearer token must be specified
.
 request.Version = "2014-05-26"            // Specify the version of the API.
 request.Scheme = "https"                // Specify the request protocol. Default value: ht
tp.
 request.ApiName = "DescribeInstances"
 request.QueryParams["Product"] = "Ecs"  // Specify the name of the service that you want t
o access.
 request.TransToAcsRequest()
 client, err := sdk.NewClientWithOptions(regionId,getSdkConfig(),credentials.NewAccessKeyCr
edential(ak,sk))
 // If relevant parameters are not set for the request, the client settings are used.
  //client.SetReadTimeout(10 * time.Second)              // Set the read timeout period of
the client to 10 seconds.
 //client.SetConnectTimeout(5 * time.Second)            // Set the connection timeout perio
d of the client to 5 seconds.
  resp := responses.BaseResponse{}
  err = client.DoAction(request, &resp)
    if err != nil {
        panic(err)
    }
 fmt.Print(endpoint)
```

```
}
```

Configure proxies

You can configure proxies in one of the following ways:

- Configure proxies by using environment variables.

  Set the HTTP_PROXY and HTTPS_PROXY environment variables, or set the NO_PROXY environment variable.

  Sample code:

```
import (
    "os"
)
func main(){
 os.Setenv("HTTP_PROXY", "http://x.x.x.x:xxxx") // Set the HTTP_PROXY environment variabl
e.
 os.Setenv("HTTPS_PROXY", "https://x.x.x.x:xxxx") // Set the HTTPS_PROXY environment vari
able.
}
```

- Configure proxies on the client.

  Sample code:

```
// The proxies that are configured on the client take precedence over those that are conf
igured by using environment variables.
client.SetHttpProxy("http://x.x.x.x:xxxx")    // Configure the HTTP proxy.
client.GetHttpProxy()                           // Query the HTTP proxy.

client.SetHttpsProxy("https://x.x.x.x:xxxx")    // Configure the HTTPS proxy.
client.GetHttpsProxy()                            // Query the HTTPS proxy.

client.SetNoProxy("127.0.0.1,localhost")      // Configure the proxy whitelist.
client.GetNoProxy()                           // Query the proxy whitelist.
```

SDK for Python

This topic describes how to use Apsara Stack API (ASAPI) SDK for POP for Python.

Prerequisites

An Alibaba Cloud SDK package is downloaded for the service that you want to access. The required dependencies are installed.

Background information

Only the remote procedure call (RPC) style is supported for API calls.

Call examples

The following sample code provides an example on how to make an API call. In this example, the DescribeInstances operation of Elastic Compute Service (ECS) is called, and the API version is 2014-05-26.

Sample code:

```
from aliyunsdkcore.client import AcsClient
from aliyunsdkcore.acs_exception.exceptions import ClientException
from aliyunsdkcore.acs_exception.exceptions import ServerException
from aliyunsdkecs.request.v20140526 import DescribeInstancesRequest
import os

# Create an AcsClient instance.
client = AcsClient(
   "<your-access-key-id>",
   "<your-access-key-secret>",
   "<your-region-id>",

   timeout=1000,  # Set the timeout period.
    verify=False, # Ignore certificate validation. or verify='<The location where the certi
ficate is stored.>'
);
# Set the following parameters for the HTTPS request protocol:
# client.set_verify(False)
# os.environ["HTTPS_PROXY"] = "http://127.0.0.1:8080"

# os.environ["HTTP_PROXY"] = "http://127.0.0.1:8080"
def hello_ecs_instance():
    # Create a request and set the parameters.
    request = DescribeInstancesRequest.DescribeInstancesRequest()

    params = {"PageNumber":"1", "Product":"Ecs","Version": "2014-05-26","Action": "Describe
Instances"};
    request.set_body_params(params)
    # The endpoint that contains no network protocol is in the following format: ASAPI doma
in name/asapi/v3.
    request.set_endpoint('<The endpoint of ASAPI.>')
    # Set the following parameter if the endpoint contains no network protocol:
    request.set_protocol_type("https")

    request.set_PageSize(10)
    # Initiate the API request and obtain the response.
    response = client.do_action_with_exception(request)
    print(response)

if __name__ == '__main__':
    print("Hello Aliyun OpenApi!")
    hello_ecs_instance()
```

Configure proxies

Set the HTTP_PROXY and HTTPS_PROXY environment variables.

Sample code:

```
# Configure the HTTPS proxy.
os.environ["HTTPS_PROXY"] = "http://x.x.x.x:xxxx"

# Configure the HTTP proxy.
os.environ["HTTP_PROXY"] = "https://x.x.x.x:xxxx"
```

10.1.1.1.5. HTTP requests

10.1.1.1.5.1. Overview

This topic describes how to make API requests and is intended for users who use API URLs to initiate HTTP GET requests.

If you are using an SDK to initiate requests, you can skip this topic.

The request URL consists of different parameters and has a fixed syntax. The URL contains common request parameters, your signature, and operation-specific parameters. Sample request URLs are provided for each API operation. These URLs are not encoded to make them easy to read. Before you make a request, you must encode the request URL. After the authentication process is complete based on your signature, the results are returned to you. Response parameters are returned if the call is successful, whereas an error message is returned if the call fails. You can troubleshoot issues based on the error message.

10.1.1.1.5.2. Request syntax

The Apsara Stack API (ASAPI) allows you to call API operations by sending HTTP GET requests based on URLs. Each URL must include request parameters. This topic describes the syntax of HTTP GET requests and provides the endpoint of the ASAPI.

Sample request

GetOrganizationList is used in the following unencoded URL request:

```
https://public.asapi.aliyuns.com/asapi/v3?Action=GetOrganizationList&Product=ascm&Version=2019-05-10&Id=<Organization ID>&<Common parameters>
```

- `https`: the protocol used to transmit the request.
- `public.asapi.aliyuns.com/asapi/v3`: the endpoint of the ASAPI.
- `Action=GetOrganizationList Product=ascm Version=2019-05-10`: the API operation to call.
- `Id`: the ID of the organization.
- `<Common parameters>`: the common parameters specified in the system.

Protocol

The ASAPI supports only HTTPS.

Endpoint

For more information about how to obtain an endpoint, see Generate an endpoint for the ASAPI.

Parameter

To specify an API operation, use the `Action, Product, and Version` parameters. For example, set `Action` to GetOrganizationList, Product to ascm, and Version to 2019-05-10. You must also specify other operation-specific parameters and common parameters. For more information, see Common parameters.

10.1.1.1.5.3. Request signatures

This topic describes how to sign HTTP API requests. ASAPI uses the request signature to verify the identity of the request sender. ASAPI implements symmetric encryption by using an AccessKey pair to verify the identity of the request sender.

> **Note**
>
> - An AccessKey pair consists of an AccessKey ID and an AccessKey secret, which are issued to each user or organization in the Apsara Uni-manager Management Console.
> - The AccessKey ID is used to verify identities of users, and the AccessKey secret is used to encrypt and verify signature strings. You must keep your AccessKey secret confidential.
> - ASAPI provides SDKs for Node.js, Python, and Java to facilitate complex signature calculation. For more information, see Obtain the core package for ASAPI.

Step 1: Create a canonicalized query string

1. Arrange the request parameters in alphabetical order, including all common and operation-specific parameters except the `Signature` parameter.

   > **Note**
   >
   > If you use the GET method to send a request,these parameters are connected by ampersands (&) and included in the request URL. The first request parameter follows a question mark (?).

2. Encode the request parameters and their values in UTF-8 based on RFC 3986. The following rules apply in the encoding process:
   - Letters, digits, and special characters such as hyphens (`-`), underscores (`_`), and periods (`.`) do not need to be encoded.
   - Other characters must be percent encoded in the `%XY` format. `XY` represents the ASCII code of the characters in hexadecimal notation. For example, double quotation marks (`"`) are encoded as `%22` .

- Extended UTF-8 characters are encoded in the `%XY%ZA...` format.
- Spaces must be encoded as `%20`. Do not encode spaces as plus signs (`+`).

  This encoding method is similar to but different from the `application/x-www-form-urlencoded` MIME encoding algorithm.

  If you use `java.net.URLEncoder` from the Java standard library, use `percentEncode` to encode request parameters and their values. In the encoded query string, replace the plus signs (`+`) with `%20`, asterisks (`*`) with `%2A`, and `%7E` with tildes (`~`). This way, you can obtain an encoded string that matches the preceding encoding rules.

  ```
  private static final String ENCODING = "UTF-8";
  private static String percentEncode(String value) throws UnsupportedEncodingException
  {
      return value != null ? URLEncoder.encode(value, ENCODING).replace("+", "%20").rep
  lace("*", "%2A").replace("%7E", "~") : null;
  }
  ```

3. Use equal signs (`=`) to connect the encoded request parameters and their values.
4. Use ampersands (`&`) to connect the encoded request parameters. These parameters must be arranged in the same order as those in Step 1.

Then, a canonicalized query string that follows the request structure is obtained. For more information, see Request structure.

Step 2: Create a string-to-sign

1. Create a `string-to-sign`. You can also use `percentEncode` to encode the canonicalized query string created in Step 1 based on the following rules:

   ```
   StringToSign=
       HTTPMethod + "&" + //HTTPMethod: the HTTP method that is used to send a request, su
   ch as GET.
       percentEncode("/") + "&" + //percentEncode("/"): Encode the forward slash (/) in UT
   F-8 as %2F.
       percentEncode(CanonicalizedQueryString) // Encode the canonicalized query string cr
   eated in Step 1.
   ```

2. Calculate the RFC 2104-compliant HMAC-SHA1 or HMAC-256 value of `StringToSign`. In the following example, Java Base64 is used:

   ```
   String signature = Base64.getEncoder().encodeToString(signData);
   ```

> **Note**
>
> When you calculate the signature, the key value specified by RFC 2104 is your `AccessKey secret` plus an ampersand (&), which has an ASCII value of 38. For more information, see Obtain an AccessKey pair.

3. Encode the `Signature` parameter based on RFC 3986 and add it to the canonicalized query string.

Example 1: Concatenate parameters

`GetOrganizationList` is used in this example to query regions. For example, `AccessKeyID` is set to testid and `AccessKeySecret` is set to testsecret. Perform the following operations:

1. Construct a canonicalized query string.

```
https://public.asapi.aliyuns.com/asapi/v3/?AccessKeyId=testid&Action=GetOrganizationList&Format=JSON&Id=1&Product=ascm&RegionId=cn-region-test&SignatureMethod=HMAC-SHA1&SignatureNonce=43967c6e-e3ad-44fa-b06b-fcf3db5f39d2&SignatureVersion=1.0&Timestamp=2020-09-15T08%3A50%3A40Z&Version=2019-05-10
```

2. Create a `string-to-sign` .

```
GET&%2F&AccessKeyId%3Dtestid%26Action%3DGetOrganizationList%26Format%3DJSON%26Id%3D1%26Product%3Dascm%26RegionId%3Dcn-region-test%26SignatureMethod%3DHMAC-SHA1%26SignatureNonce%3D43967c6e-e3ad-44fa-b06b-fcf3db5f39d2%26SignatureVersion%3D1.0%26Timestamp%3D2020-09-15T08%253A50%253A40Z%26Version%3D2019-05-10
```

3. Calculate the signature.

   Calculate the signature. The key value used for calculation is `testsecret&` because `AccessKeySecret` is set to testsecret. The calculated signature is `OLeaidS1JvxuMvnyHOwuJ+uX5qY=` . Java Base64 is used in the following sample code:

   `String signature = Base64.getEncoder().encodeToString(signData);` Encode `Signature=hvqv9Ll5RE6kQ4YsQXFAf9VuRIY=` based on RFC 3986 and add it to the canonicalized query string.

```
https://public.asapi.aliyuns.com/asapi/v3/?AccessKeyId=testid&Action=GetOrganizationList&Format=JSON&Id=1&Product=ascm&RegionId=cn-region-test&SignatureMethod=HMAC-SHA1&SignatureNonce=43967c6e-e3ad-44fa-b06b-fcf3db5f39d2&SignatureVersion=1.0&Timestamp=2020-09-15T08%3A50%3A40Z&Version=2019-05-10
```

You can use browsers or tools such as cURL and Wget to initiate an HTTP request for calling the `DescribeRegions` operation to query the Alibaba Cloud region list.

Example 2: Use the standard library of the programming language

`GetOrganizationList` is used in this example to query regions. For example, `AccessKeyID` is set to testid, `AccessKeySecret` is set to testsecret, and all request parameters are stored in a Java `Map<String, String>` object.

1. Predefine an encoding method.

```
private static final String ENCODING = "UTF-8";
private static String percentEncode(String value) throws UnsupportedEncodingException {
        return value != null ? URLEncoder.encode(value, ENCODING).replace("+", "%20").r
eplace("*", "%2A").replace("%7E", "~") : null;
}
```

2. Predefine the time format for the `Timestamp` parameter. Specify the `Timestamp` parameter in the ISO 8601 format. The time must be in UTC+0.

```
private static final String ISO8601_DATE_FORMAT = "yyyy-MM-dd'T'HH:mm:ss'Z'";
private static String formatIso8601Date(Date date) {
    SimpleDateFormat df = new SimpleDateFormat(ISO8601_DATE_FORMAT);
    df.setTimeZone(new SimpleTimeZone(0, "GMT"));
    return df.format(date);
}
```

3. Create a request string.

```
final String HTTP_METHOD = "GET";
Map parameters = new HashMap();
// Specify request parameters.
parameters.put("Product", "ascm");
parameters.put("Action", "GetOrganizationList");
parameters.put("Version", "2019-05-10");
parameters.put("AccessKeyId", "testid");
parameters.put("RegionId", "cn-region-test");
parameters.put("Timestamp", formatIso8601Date(new Date()));
parameters.put("SignatureMethod", "HMAC-SHA1");
parameters.put("SignatureVersion", "1.0");
parameters.put("SignatureNonce", UUID.randomUUID().toString());
parameters.put("Format", "JSON");
parameters.put("Id", "1");
// Arrange request parameters.
String[] sortedKeys = parameters.keySet().toArray(new String[]{});
Arrays.sort(sortedKeys);
final String SEPARATOR = "&";
// Create a string-to-sign.
StringBuilder stringToSign = new StringBuilder();
stringToSign.append(HTTP_METHOD).append(SEPARATOR);
stringToSign.append(percentEncode("/")).append(SEPARATOR);
StringBuilder canonicalizedQueryString = new StringBuilder();
for(String key : sortedKeys) {
    // Encode the key and the value.
    canonicalizedQueryString.append("&")
    .append(percentEncode(key)).append("=")
    .append(percentEncode(parameters.get(key)));
}
//Encode the canonicalized query string.
stringToSign.append(percentEncode(
canonicalizedQueryString.toString().substring(1)));
```

4. The signature. The key value used for calculation is `testsecret&` because `AccessKeySecret` is set to testsecret. The calculated signature is `OLeaidS1JvxuMvnyHOwuJ%2BuX5qY%3D`.

```
// The following sample code shows how to calculate the signature:
final String ALGORITHM = "HmacSHA1";
final String ENCODING = "UTF-8";
key = "testsecret&";
Mac mac = Mac.getInstance(ALGORITHM);
mac.init(new SecretKeySpec(key.getBytes(ENCODING), ALGORITHM));
byte[] signData = mac.doFinal(stringToSign.getBytes(ENCODING));
String signature = Base64.getEncoder().encodeToString(signData);
```

Encode the Signature parameter based on RFC 3986 and add it to the canonicalized query string. The following URL is obtained:

```
https://public.asapi.aliyuns.com/asapi/v3/?AccessKeyId=testid&Action=GetOrganizationLis
t&Format=JSON&Id=1&Product=ascm&RegionId=cn-region-test&SignatureMethod=HMAC-SHA1&Signa
tureNonce=43967c6e-e3ad-44fa-b06b-fcf3db5f39d2&SignatureVersion=1.0&Timestamp=2020-09-1
5T08%3A50%3A40Z&Version=2019-05-10
```

5. Use browsers or tools such as cURL and Wget to initiate an HTTP request.

10.1.1.1.5.4. Response

Responses are returned only in the JSON format. If a return code is greater than or equal to 200 and less than 300, a success response is returned. Otherwise, an error response is returned.

Sample success response

If a request is successful, the request ID and operation-specific parameter values are returned. For more information, see the developer guide of the corresponding Apsara Stack service.

```
 {
    "eagleEyeTraceId": "xxx-xxx-xxx-xxx", // The trace ID provided by EagleEye.
    "asapiSuccess": true,
    "RequestId": "xxxxxxxxxx",
    "Regions": { // The regions returned after you call the DescribeRegions operation.
        "Region": [
            {
                "RegionId": "",
                "RegionEndpoint": "",
                "LocalName": ""
            }
        ]
    }
}
```

Sample error response

If a request fails, the following information is returned. For more information, see the developer guide of the corresponding Apsara Stack service.

```
{
    "code": "asapi.server.api.notfound",// The error code.
    "eagleEyeTraceId": "xxx-xxx-xxx-xxx", // The trace ID provided by EagleEye.
    "asapiSuccess": false, // Indicates whether the request is successful.
    "hostId": "xxxx", // The ID of the host.
    "message": "Failed to ....", // The message returned.
    "asapiErrorMessage": "Failed to ....", // The error message provided by the ASAPI.
    "asapiErrorCode": "asapi.server.api.notfound" // The error code provided by the ASAPI.
}
```

10.1.2. API reference

10.1.2.1. Request structure

To make an API call is to send an HTTP GET request to the API server with request parameters based on the description of the corresponding API operation. The processing results are returned in the response.

Endpoints

The endpoint of the AnalyticDB for PostgreSQL API is gpdb.example.com.

For more information about how to obtain the endpoint, see Generate the endpoint of ASAPI.

Protocols

You can send requests over HTTP or HTTPS. To ensure higher security, we recommend that you send operation requests over HTTPS. Some password-related operations only support HTTPS.

Methods

The system allows you to send HTTP GET requests. This requires request parameters to be included in the request URL.

Request parameters

When you make an API request, you must specify the Action parameter as the operation, such as CreateDBInstance, that you want to perform. You must also specify common request parameters and the request parameters specific to this operation.

Encoding

Requests and responses are encoded using the UTF-8 character set.

10.1.2.2. Common parameters

Common request parameters

Common request parameters must be included in all AnalyticDB for PostgreSQL API requests.

Sample common parameters

Parameter	Type	Required	Description
Format	String	No	The format in which to return the response. Valid values: JSON and XML. Default value: XML.
Version	String	Yes	The version number of the API. Specify the version in the YYYY-MM-DD format. The current version is 2018-07-23.
AccessKeyId	String	Yes	The AccessKey ID provided to you by Alibaba Cloud.
Signature	String	Yes	The signature string of the current request. For more information about how signatures are calculated, see Request signatures.
SignatureMethod	String	Yes	The encryption method of the signature string. Set the value to HMAC-SHA1.

Parameter	Type	Required	Description
Timestamp	String	Yes	The timestamp of the request. Specify the time in the ISO 8601 standard. The time must be in UTC. Specify the time in the following format: `YYYY-MM-DDThh:mm:ssZ` For example, 2013-08-15T12:00:00Z indicates 20:00:00 (UTC+8), August 15, 2013.
SignatureVersion	String	Yes	The version of the signature encryption algorithm. Set the value to 1.0.
SignatureNonce	String	Yes	A unique, random number that is used to prevent replay attacks. You must use different numbers for different requests.

Examples

```
https://gpdb.example.com/
?Format=xml
&Version=2013-08-15
&Signature=Pcxxxxxxxxxxxxxxxxxxxxx
&SignatureMethod=HMAC-SHA1
&SignatureNonce=15215528852396
&SignatureVersion=1.0
&AccessKeyId=key-test
&Timestamp=2013-06-01T12:00:00Z
```

Sample responses

Every response returns a unique RequestID regardless of whether the call is successful.

Example:

```
<?xml version="1.0" encoding="utf-8"?>
<!—Result Root Node-->
<Interface Name+Response>
 <!—Return Request Tag-->
 <RequestId>4C467B38-3910-447D-87BC-AC049166F216</RequestId>
 <!—Return Result Data-->
</Interface Name+Response>
```

10.1.2.3. Responses

API responses use the HTTP response format where a 2xx status code indicates a successful call and a 4xx or 5xx status code indicates a failed call.

Responses can be returned in either the JSON or XML format. You can specify the response format in the request. The default response format is XML. The response examples in this topic are formatted with line breaks or indents for a clear view. Actual response data is not formatted in the same manner as these examples.

Sample success responses

XML format

The XML response includes a message that indicates whether the request is successful and the specific service data. Example:

```
<? xml version="1.0" encoding="utf-8"? >
<!-The root node of the result-->
<API name+Response>
    <!-The returned request tag-->
 <RequestId>4C467B38-3910-447D-87BC-AC049166F216</RequestId>
    <!-The response data-->
</API name+Response>
```

JSON format

```
{
    "RequestId": "4C467B38-3910-447D-87BC-AC049166F216",
    /* The response data */
}
```

Sample error responses

No result is returned after the API call fails. You can locate the cause of the error by referring to the error codes in Appendix.

When a request fails, an HTTP response containing an HTTP status code (4xx or 5xx) is returned. The returned message body contains the specific error code and error message. The message body also contains a globally unique RequestId and the HostId of the site you request to access. If you are unable to find the error cause, you can contact Alibaba Cloud customer service and provide the HostId and RequestId to help solve the problem as quickly as possible.

XML format

```
<? xml version="1.0" encoding="UTF-8"? >
<Error>
   <RequestId>8906582E-6722-409A-A6C4-0E7863B733A5</RequestId>
   <HostId>gpdb.example.com</HostId>
   <Code>UnsupportedOperation</Code>
   <Message>The specified action is not supported. </Message>
</Error>
```

JSON format

```
{
    "RequestId": "7463B73D-35CC-4D19-A010-6B8D65D242EF",
    "HostId": "gpdb.example.com",
    "Code": "UnsupportedOperation",
    "Message": "The specified action is not supported."
}
```

10.1.2.4. Request signatures

authenticates each access request. Requests must contain signature information regardless of whether it is sent over HTTP or HTTPS. implements symmetric encryption with an AccessKey pair to verify the identity of the request sender. An AccessKey pair consists of an AccessKey ID and an AccessKey secret. The AccessKey ID and AccessKey secret are issued to you by Alibaba Cloud. You can apply for and manage them on the Alibaba Cloud official website. The AccessKey ID is used to verify the identity of the user, while the AccessKey secret is used to encrypt and verify the signature string. You must keep your AccessKey secret strictly confidential.

For more information about how to obtain the AccessKey pair, see .

To sign a request, perform the following steps:

1. Create a canonicalized query string by using request parameters.
   i. Create a canonicalized query string by arranging the request parameters (including all common and operation-specific parameters except Signature) in alphabetical order.

      > **Note** If you use the GET method to send a request, the request parameters are included in the request URL.The request parameters in the URL are placed after a question mark (?) and separated by ampersands (&).

   ii. Encode the name and value of each request parameter. The parameter names and values must be URL-encoded in UTF-8 based on the following encoding rules:
      - Uppercase letters, lowercase letters, digits, and some special characters such as hyphens (-), underscores (_), periods (.), and tildes (~) do not need to be encoded.
      - Other characters must be percent encoded in the %XY format. XY represents the ASCII code of the characters in hexadecimal notation. For example, double quotation marks (") are encoded as %22.
      - Extended UTF-8 characters are encoded in the %XY%ZA... format.
      - Spaces must be encoded as %20. Do not encode spaces as plus signs (+).

      > **Note** Most libraries that support URL encoding, such as java.net.URLEncoder, comply with the Multipurpose Internet Mail Extensions (MIME) encoding rules of "application/x-www-form-urlencoded". If this encoding method is used, replace the plus signs (+) in the encoded strings with %20, the asterisks (*) with %2A, and %7E with a tilde (~) to conform to the encoding rules.

   iii. Connect the encoded parameter names and values by using equal signs (=).
   iv. Sort the key-value pairs connected by equal signs (=) in alphabetical order and separate them with ampersands (&) to obtain the canonicalized query string.

2. Create a string-to-sign from the encoded canonicalized query string based on the following rules:

```
StringToSign= HTTPMethod + "&" + percentEncode("/") + "&" +
percentEncode(CanonicalizedQueryString)
```

HTTPMethod specifies an HTTP-style request such as GET.

percentEncode("/") specifies the encoded value of the character "/" based on the URL encoding rules described in Step 1.b. The encoded value is %2F.

percentEncode(CanonicalizedQueryString) specifies the encoded string of the canonicalized query string constructed in Step 1. The encoding follows the URL encoding rules described in Step 1.b.

3. As defined in RFC 2104, use the preceding string-to-sign to calculate the HMAC value of the signature.

> **Note** The key used for signature calculation is the combination of your AccessKey secret and an ampersand (&) (ASCII 38). Secure Hash Algorithm 1 (SHA1) is used as the hash algorithm.

4. Encode the HMAC value in Base64 to obtain the signature string.
5. Add the signature string to the request as the Signature parameter.

> **Note**
>
> The obtained signature string must be URL-encoded as defined by RFC 3986 like other parameters before it can be submitted to the AnalyticDB for PostgreSQL server as the final request parameter value. The following URL is the request URL without a signature for the DescribeDBInstances operation:
>
> ```
> http://gpdb.example.com/?Timestamp=2013-06-01T10:33:56Z&Format=XML&Acce ssKeyId=tes
> tid&Action=DescribeDBInstances&SignatureMethod=HMAC-SHA1&Regi onId=region1&Signatur
> eNonce=NwDAxvLU6tFE0DVb&Version=2014-08-15&Signatur eVersion=1.0
> ```
>
> The following string is the string-to-sign:
>
> ```
> GET&%2F&AccessKeyId%3Dtestid%26Action%DescribeDBInstances%26Format%3DXML %26RegionI
> d%3Dregion1%26SignatureMethod%3DHMAC-SHA1%26SignatureNonce%3DN wDAxvLU6tFE0DVb%26Si
> gnatureVersion%3D1.0%26Timestamp%3D2013-06-01T10%253 A33%253A56Z%26Version%3D2014-0
> 8-15
> ```
>
> Assume that the AccessKey ID is testid and the AccessKey secret is testsecret. Then, the key used to calculate the HMAC value of the signature is testsecret&. The calculated signature string is
>
> GfQRtWbwdE8sp7q9lBgZyutVht8=
>
> The following URL is the signed request URL after the signature string is added to the request as the Signature parameter:
>
> ```
> http://gpdb.example.com/?Timestamp=2012-12-26T10%3A33%3A56Z&Format=XML& AccessKeyId
> =testid&Action=DescribeDBInstances&SignatureMethod=HMAC-SHA1& RegionId=region1&Sign
> atureNonce=NwDAxvLU6tFE0DVb&Version=2012-09-13&Sign atureVersion=1.0&Signature= Gfx
> xxxxxxxxxxxxxxxxxx

10.1.2.5. RAM authorization

10.1.2.5.1. Use RAM to authorize resources

All instances created through an Apsara Stack tenant account are resources owned by that account. An account has the full operation permissions on resources under the account by default.

Resource Access Management (RAM) allows you to grant RAM users the access and management permissions on resources owned by an Apsara Stack tenant account.

> **Note** If you do not need to use RAM, skip this procedure.

10.1.2.5.2. Resources that can be authorized in RAM

Only one type of AnalyticDB for PostgreSQL resource can be authorized in RAM: DBInstance.

The following table lists the descriptions of resources when you use RAM to authorize access permissions to these resources.

Resource description

Resource	Resource description in the authorization policy
DBInstance	acs:gpdb:$regionid: $accountid:dbinstance/$dbinstanceid acs:gpdb:$regionid:$accountid:dbinstance/* acs:gpdb:* : *:dbinstance/*

> **Note**
> - $regionid: the ID of a region. Use an asterisk (*) to indicate the ID of any region.
> - $dbinstanceid: the ID of a DBInstance. Use an asterisk (*) to indicate the ID of any instance.
> - $accoutid: the userid of the resource owner. Use an asterisk (*) to indicate the ID of any account.

10.1.2.5.3. Operations that can be authorized in RAM

You can use Resource Access Management (RAM) to authorize access permissions on resources. All operations except the DescribeRegions operation can be authorized.

10.1.2.5.4. Authentication rules of API operations

When you call API operations to access resources as a Resource Access Management (RAM) user, checks with RAM whether the RAM user is granted the required permissions. The permissions to be checked are determined by the resources that are used by each API operation. For more information about authentication rules of each API operation, see Authentication rules of API operations.

Authentication rules of API operations

Operation	Authorization rule
CreateDBInstance	acs:gpdb:$regionid: dbinstance /$*
DeleteDBInstance	acs:gpdb:$regionid: $accountid:dbinstance/$dbinstanceid
DescribeDBInstanceAttribute	acs:gpdb:$regionid: $accountid:dbinstance/$dbinstanceid
DescribeDBInstances	acs:gpdb:$regionid: $accountid:dbinstance/$dbinstanceid
DescribeRegions	acs:gpdb:$regionid: $accountid:dbinstance/$dbinstanceid
DescribeResourceUsage	acs:gpdb:$regionid: $accountid:dbinstance/$dbinstanceid
ModifyDBInstanceConnectionMode	acs:gpdb:$regionid: $accountid:dbinstance/$dbinstanceid
ModifyDBInstanceDescription	acs:gpdb:$regionid: $accountid:dbinstance/$dbinstanceid
ModifyDBInstanceMaintainTime	acs:gpdb:$regionid: $accountid:dbinstance/$dbinstanceid
RestartDBInstance	acs:gpdb:$regionid: $accountid:dbinstance/$dbinstanceid
DeleteDatabase	acs:gpdb:$regionid: $accountid:dbinstance/$dbinstanceid
DescribeAccounts	acs:gpdb:$regionid: $accountid:dbinstance/$dbinstanceid
ModifyAccountDescription	acs:gpdb:$regionid: $accountid:dbinstance/$dbinstanceid
CreateAccount	acs:gpdb:$regionid: dbinstance /$*

10.1.2.6. Instance management

10.1.2.6.1. CreateDBInstance

You can call this operation to create an instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateDBInstance	The operation that you want to perform. Set the value to CreateDBInstance.

Parameter	Type	Required	Example	Description
ClientToken	String	Yes	0c593ea1-3bea-11e9-b96b-88e9fe637760	The client token that is used to ensure the idempotence of the request.
DBInstanceClass	String	Yes	gpdb.group.segsdx1	The instance type. For more information, see Instance types.
DBInstanceGroupCount	String	Yes	2	The number of compute nodes in the instance.
Engine	String	Yes	gpdb	The engine of the database. Set the value to gpdb.
EngineVersion	String	Yes	4.3	The version of the database engine. Set the value to 4.3.
RegionId	String	Yes	cn-hangzhou	The region ID of the instance, such as cn-hangzhou. You can call the DescribeRegions operation to query the most recent region list.
SecurityIPList	String	Yes	127.0.0.1	The list of one or more IP addresses that are allowed to access the instance. Default value: `127.0.0.1`.
ZoneId	String	Yes	cn-hangzhou-i	The zone ID of the instance, such as cn-hangzhou-d. You can call the DescribeRegions operation to query the most recent zone list.
DBInstanceDescription	String	No	gp-xxxxxx	The description of the instance. The description can be up to 256 characters in length.
PayType	String	No	Prepaid	The billing method of the instance. Default value: Postpaid. Valid values: • Postpaid: pay-as-you-go • Prepaid: subscription
Period	String	No	Month	The unit of the subscription period.
UsedTime	String	No	1	The subscription period.

Parameter	Type	Required	Example	Description
InstanceNetworkType	String	No	VPC	The network type of the instance. Valid values: Classic and VPC. Default value: Classic.
VPCId	String	No	vpc-xxxxxxx	The ID of the VPC. If you set InstanceNetworkType to VPC, you must also specify the VPCId parameter. The specified region of the VPC must be the same as the RegionId value.
VSwitchId	String	No	vsw-xxxxxxxx	If you set InstanceNetworkType to VPC, you must also specify the vSwitchId parameter. The specified zone of the vSwitch must be the same as the ZoneId value.
PrivateIpAddress	String	No	127.0.0.1	The private IP address of the instance.

Response parameters

Parameter	Type	Example	Description
ConnectionString	String	gp-xxxxxxx.gpdb.rds.aliyuncs.com	The endpoint of the instance.
DBInstanceId	String	gp-xxxxxxxxx	The ID of the instance.
OrderId	String	xxxxxxxx	The ID of the order.
Port	String	3432	The port used to connect to the instance.
RequestId	String	5414A4E5-4C36-4461-95FC-23757A20B5F8	The ID of the request.

Examples

Sample requests

```
https://gpdb.aliyuncs.com/?Action=CreateDBInstance
&ClientToken=0c593ea1-3bea-11e9-b96b-88e9fe637760
&Engine=gpdb
&EngineVersion=4.3
&RegionId=cn-hangzhou
&SecurityIPList=127.0.0.1
&ZoneId=cn-hangzhou-i
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreateDBInstanceResponse>
          <dbInstanceId>gp-xxxxxxx</dbInstanceId>
          <orderId>xxxxxxxx</orderId>
          <connectionString>gp-xxxxxxx.gpdb.rds.aliyuncs.com</connectionString>
          <port>3432</port>
          <RequestId>5414A4E5-4C36-4461-95FC-23757A20B5F8</RequestId>
</CreateDBInstanceResponse>
```

`JSON` format

```
{
    "dbInstanceId": "gp-xxxxxxx",
    "orderId": "xxxxxxxx",
    "connectionString": "gp-xxxxxxx.gpdb.rds.aliyuncs.com",
    "port": "3432",
    "RequestId": "5414A4E5-4C36-4461-95FC-23757A20B5F8"
}
```

10.1.2.6.2. DeleteDBInstance

You can call this operation to delete a pay-as-you-go instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteDBInstance	The operation that you want to perform. Set the value to DeleteDBInstance.
DBInstanceId	String	Yes	gp-xxxxxx	The name of the instance.

Parameter	Type	Required	Example	Description
ClientToken	String	No	0c593ea1-3bea-11e9-b96b-88e9fe637760	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must make sure that it is unique among different requests.

Response parameters

Parameter	Type	Example	Description
RequestId	String	65BDA532-28AF-4122-AA39-B382721EEE64	The ID of the request.

Examples

Sample requests

```
https://gpdb.aliyuncs.com/?Action=DeleteDBInstance
&DBInstanceId=gp-xxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteDBInstanceResponse>
       <RequestId>65BDA532-28AF-4122-AA39-B382721EEE64</RequestId>
</DeleteDBInstanceResponse>
```

`JSON` format

```
{
    "RequestId": "65BDA532-28AF-4122-AA39-B382721EEE64"
}
```

10.1.2.6.3. DescribeDBInstanceAttribute

You can call this operation to query the details of an instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeDBInstanceAttribute	The operation that you want to perform. Set the value to DescribeDBInstanceAttribute.

Parameter	Type	Required	Example	Description
DBInstanceId	String	Yes	gp-xxxxxxx	The ID of the instance.

Response parameters

Parameter	Type	Example	Description
Items	Array of DBInstanceAttribute	None	The information of the instance, which is an array of DBInstanceAttribut data.
DBInstanceAttribute	None	None	None
AvailabilityValue	String	100.0%	The availability of the instance. Unit: %.
ConnectionMode	String	Performance	The access mode of the instance. • Performance: standard mode • Safety: safe mode
ConnectionString	String	gp-xxxxxxx.gpdb.rds.aliyuncs.com	The endpoint of the instance.
CreationTime	String	2018-06-27T12:07:10Z	The time when the instance was created. The time follows the ISO 8601 standard in the `YYYY-MM-DDThh:mm:ssZ` format. The time is displayed in UTC. Example: 2019-05-30T12:11:4Z.
DBInstanceClass	String	gpdb.group.segsdx2	The instance type.
DBInstanceClassType	String	x	The instance family. Valid values: • s: shared instance • x: general-purpose instance • d: dedicated instance • h: dedicated host instance
DBInstanceCpuCores	Integer	2	The number of CPU cores.

Parameter	Type	Example	Description
DBInstanceDescription	String	gp-xxxxxxx	The description of the instance.
DBInstanceDiskMBPS	Long	300	The maximum disk throughput of a compute node. Unit: Mbit/s.
DBInstanceGroupCount	String	2	The number of compute nodes.
DBInstanceId	String	gp-xxxxxxx	The ID of the instance.
DBInstanceMemory	Long	16384	The memory capacity of the instance. Unit: MB.
DBInstanceNetType	String	Internet	The network type that is used by the instance. • Internet • Intranet
DBInstanceStatus	String	Running	The status of the instance. For more information, see Instance types.
DBInstanceStorage	Long	160	The disk space of the instance. Unit: GB.
Engine	String	gpdb	The engine of the database.
EngineVersion	String	4.3	The version of the database engine.
ExpireTime	String	2019-06-27T16:00:00Z	The expiration time of the instance.
HostType	String	1	The disk type of compute nodes. Valid values: • 0: SSD • 1: HDD
InstanceNetworkType	String	VPC	The network type of the instance. Valid values: • Classic • VPC

Parameter	Type	Example	Description
LockMode	String	Unlock	The locking mode of the instance. Valid values: • Unlock: The instance is not locked. • ManualLock: The instance is manually locked. • LockByExpiration: The instance is automatically locked after it expires. • LockByRestoration: The instance is automatically locked before a rollback. • LockByDiskQuota: The instance is automatically locked when the disk space is full.
LockReason	String	Unknow	The reason why the instance was locked.
MaintainEndTime	String	22:00Z	The end time of the maintenance window.
MaintainStartTime	String	18:00Z	The start time of the maintenance window.
MaxConnections	Integer	500	The maximum number of concurrent connections to an instance.
PayType	String	Prepaid	The billing method of the instance. Valid values: • Postpaid: pay-as-you-go • Prepaid: subscription
Port	String	3432	The port used to connect to the instance.
ReadDelayTime	String	2	The read latency of the instance.
RegionId	String	cn-hangzhou-e	The region ID of the instance.
SecurityIPList	String	127.0.0.1	The list of one or more IP addresses that are allowed to access the instance.
Tags	Array of Tag	None	The list of one or more tags. Each tag consists of a key-value pair.
Tag	None	None	None

Parameter	Type	Example	Description
Key	String	key1	The tag key of the instance.
Value	String	value1	The tag value of the instance.
VpcId	String	vpc-xxxxxxxx	The ID of the VPC where ClassicLink is enabled.
ZoneId	String	cn-hangzhou	The zone ID of the instance.
RequestId	String	B4CAF581-2AC7-41AD-8940-D56DF7AADF5B	The ID of the request.

Examples

Sample requests

```
https://gpdb.aliyuncs.com/?Action=DescribeDBInstanceAttribute
&DBInstanceId=gp-xxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<Items>
    <DBInstanceAttribute>
        <DBInstanceDiskMBPS>300</DBInstanceDiskMBPS>

```

10.1.2.6.4. DescribeDBInstances

You can call this operation to query the list of one or more instances.

Request parameters

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-hangzhou	The region ID of the instance.

Parameter	Type	Required	Example	Description
DBInstanceDescription	String	No	gp-xxxxxxxx	The description of the instance.
InstanceNetworkType	String	No	VPC	The network type of the instance. Valid values: • VPC • Classic • If this parameter is not specified, instances of all network types are returned.
DBInstanceIds	String	No	gp-xxxxxxxxx, gp-xxxxxxx	The ID of the instance. Separate multiple IDs with commas (,).
Tag.N.Key	String	No	key1	The tag key of the instance.
Tag.N.Value	String	No	value1	The tag value of the instance.
PageSize	Integer	No	50	The number of entries to return on each page. Valid values: 30, 50, and 100. Default value: 30
PageNumber	Integer	No	1	The number of the page to return. Valid values: any non-zero positive integer. Default value: 1.

Response parameters

Parameter	Type	Example	Description
Items	Array of DBInstance	None	The information of the instance, which is an array of DBInstance data.
DBInstance	None	None	None
ConnectionMode	String	Standard	The access mode of the instance. Valid values: • Standard • Safe
CreateTime	String	2019-09-08T16:00:00Z	The time when the instance was created.

Parameter	Type	Example	Description
DBInstanceDescription	String	gp-xxxxxxxxxx	The description of the instance.
DBInstanceId	String	gp-xxxxxxxx	The ID of the instance.
DBInstanceNetType	String	Internet	The network type that is used by the instance.
DBInstanceStatus	String	Running	The status of the instance. For more information, see Instance types.
Engine	String	gpdb	The engine of the database.
EngineVersion	String	4.3	The version of the database engine.
ExpireTime	String	2019-09-08T16:00:00Z	The time when the instance is scheduled to expire. Pay-as-you-go instances do not expire.
InstanceNetworkType	String	VPC	The network type of the instance. Valid values: • VPC • Classic
LockMode	String	Unlock	The locking mode of the instance. Valid values: • Unlock: The instance is not locked. • ManualLock: The instance is manually locked. • LockByExpiration: The instance is automatically locked after it expires. • LockByRestoration: The instance is automatically locked before a rollback. • LockByDiskQuota: The instance is automatically locked when the disk space is full.
LockReason	String	Unknow	The reason why the instance is locked.

Parameter	Type	Example	Description
PayType	String	Prepaid	The billing method of the instance. Valid values: • Postpaid: pay-as-you-go • Prepaid: subscription
RegionId	String	cn-hangzhou	The region ID of the instance.
Tags	Array of Tag	None	The tags of the instance.
Tag	None	None	None
Key	String	key1	The tag key of the instance.
Value	String	value1	The tag value of the instance.
VSwitchId	String	vsw-xxxxxxxxx	The ID of the vSwitch.
VpcId	String	vpc-xxxxxxxxxx	The ID of the VPC.
ZoneId	String	cn-hangzhou	The zone ID of the instance.
PageNumber	Integer	1	The page number of the current page.
PageRecordCount	Integer	2	The number of entries on the current page.
RequestId	String	BBE00C04-A3E8-4114-881D-0480A72CB92E	The ID of the request.
TotalRecordCount	Integer	2	The total number of entries.

10.1.2.6.5. DescribeRegions

You can call this operation to query available regions and zones. You must call the DescribeRegions operation to query the available regions before you call the CreateDBInstance operation.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeRegions	The operation that you want to perform. Set the value to DescribeRegions.
RegionId	String	No	cn-hangzhou	The region ID.
Region	String	No	cn-hangzhou	The information of the region, which is an array of region ID and zone ID.
ZoneId	String	No	cn-hangzhou-c	The zone ID.

Response parameters

Parameter	Type	Example	Description
Regions	Array of Region	None	The list of available regions, which is an array of Region data.
Region	None	None	None
RegionId	String	cn-hangzhou	The region ID.
Zones	Array of Zone	None	The list of available zones, which is an array of Zone data.
Zone	None	None	None
VpcEnabled	Boolean	true	Indicates whether the VPC in the zone is available.
ZoneId	String	cn-hangzhou-c	The zone ID.
RequestId	String	FF8EB261-5447-4B1B-9F14-294CEA008A9F	The ID of the request.

Examples

            }
        ]
    }
}
```

10.1.2.6.6. DescribeResourceUsage

You can call this operation to query the disk space that is used by an instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeResourceUsage	The operation that you want to perform. Set the value to DescribeResourceUsage.
DBInstanceId	String	Yes	gp-xxxxxxxxxx	The ID of the instance.

Response parameters

Parameter	Type	Example	Description
BackupSize	Long	26624	The disk space that is used to store backup files. Unit: bytes. -1 indicates no space is used.
DBInstanceId	String	gp-xxxxxxxx	The ID of the instance.
DataSize	Long	83886080	The disk space that is used to store data files. Unit: bytes. -1 indicates that no space is used.

Parameter	Type	Example	Description
DiskUsed	Long	285212672	The total space occupied by data and log files. Unit: bytes. -1 indicates that no space is used.
Engine	String	gpdb	The engine of the database.
LogSize	Long	201326592	The disk space that is used to store log files. Unit: bytes. -1 indicates that no space is used.
RequestId	String	860FBA9E-BFFD-493E-91A1-2349B9D74AE7	The ID of the request.

Examples

Sample requests

```
https://gpdb.aliyuncs.com/?Action=DescribeResourceUsage
&DBInstanceId=gp-xxxxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeResourceUsageResponse>
          <DBInstanceId>gp-xxxxxxx</DBInstanceId>
          <RequestId>860FBA9E-BFFD-493E-91A1-2349B9D74AE7</RequestId>
          <LogSize>201326592</LogSize>
          <DataSize>83886080</DataSize>
          <BackupSize>26624</BackupSize>
          <Engine>gpdb</Engine>
          <DiskUsed>285212672</DiskUsed>
</DescribeResourceUsageResponse>
```

`JSON` format

```
{
    "DBInstanceId":"gp-xxxxxxx",
    "RequestId":"860FBA9E-BFFD-493E-91A1-2349B9D74AE7",
    "LogSize":201326592,
    "DataSize":83886080,
    "BackupSize":26624,
    "Engine":"gpdb",
    "DiskUsed":285212672
}
```

10.1.2.6.7. ModifyDBInstanceConnectionMode

You can call this operation to change the access mode of an instance.

Request parameters

Parameter	Type	Required	Example	Description
ConnectionMode	String	Yes	Standard	The access mode of the instance. Valid values: • Standard • Safe
DBInstanceId	String	Yes	gp-xxxxxxxx	The ID of the instance.

Response parameters

Parameter	Type	Example	Description
RequestId	String	8361E350-4CCC-4D28-B020-55B4DCB75D3B	The ID of the request.

Examples

Sample requests

```
https://gpdb.aliyuncs.com/?Action=ModifyDBInstanceConnectionMode
&ConnectionMode=Standard
&DBInstanceId=gp-xxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyDBInstanceConnectionModeResponse>
          <RequestId>8361E350-4CCC-4D28-B020-55B4DCB75D3B</RequestId>
</ModifyDBInstanceConnectionModeResponse>
```

`JSON` format

```
{
    "RequestId":"8361E350-4CCC-4D28-B020-55B4DCB75D3B"
}
```

10.1.2.6.8. ModifyDBInstanceDescription

You can call this operation to modify the description of an instance.

Request parameters

Parameter	Type	Required	Example	Description
DBInstanceDescription	String	Yes	gp-xxxxxxxx	The description of the instance.
DBInstanceId	String	Yes	gp-xxxxxxxx	The ID of the instance.

Response parameters

Parameter	Type	Example	Description
RequestId	String	107BE202-D1A2-479E-98E0-A892B472562F	The ID of the request.

Examples

Sample requests

```
https://gpdb.aliyuncs.com/?Action=ModifyDBInstanceDescription
&DBInstanceDescription=gp-xxxxxxxx
&DBInstanceId=gp-xxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyDBInstanceDescriptionResponse>
          <RequestId>107BE202-D1A2-479E-98E0-A892B472562F</RequestId>
</ModifyDBInstanceDescriptionResponse>
```

`JSON` format

```
{
        "RequestId": "107BE202-D1A2-479E-98E0-A892B472562F"
}
```

10.1.2.6.9. ModifyDBInstanceMaintainTime

You can call this operation to modify the maintenance window of an instance.

Typically, the maintenance window is set to the off-peak hours to minimize the impact on services. Alibaba Cloud performs instance maintenance at the maintenance window that you specify.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyDBInstanceMaintainTime	The operation that you want to perform. Set the value to ModifyDBInstanceMaintainTime.
DBInstanceId	String	Yes	gp-xxxxxxxx	The ID of the instance.
EndTime	String	Yes	03:00Z	The end time of the maintenance window. Example: 03:00Z. The end time must be later than the start time.
StartTime	String	Yes	02:00Z	The start time of the maintenance window. Example: 02:00Z.

Response parameters

Parameter	Type	Example	Description
RequestId	String	CA9A34C8-AC95-413B-AC6A-CEBF67429CCA	The ID of the request.

Examples

Sample requests

```
https://gpdb.aliyuncs.com/?Action=ModifyDBInstanceMaintainTime
&DBInstanceId=gp-xxxxxxxx
&EndTime=03:00Z
&StartTime=02:00Z
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyDBInstanceMaintainTimeResponse>
          <RequestId>CA9A34C8-AC95-413B-AC6A-CEBF67429CCA</RequestId>
</ModifyDBInstanceMaintainTimeResponse>
```

`JSON` format

```
{
   "RequestId": "CA9A34C8-AC95-413B-AC6A-CEBF67429CCA"
}
```

10.1.2.6.10. RestartDBInstance

You can call this operation to restart an instance.

Request parameters

Parameter	Type	Required	Example	Description
DBInstanceId	String	Yes	gp-xxxxxxxxx	The ID of the instance.
ClientToken	String	No	0c593ea1-3bea-11e9-b96b-88e9fe637760	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must make sure that it is unique among different requests.

Response parameters

Parameter	Type	Example	Description
RequestId	String	A7356493-7141-4393-8951-CDA8AB5D67EC	The ID of the request.

Examples

Sample requests

```
https://gpdb.aliyuncs.com/?Action=RestartDBInstance
&DBInstanceId=gp-xxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<RestartDBInstance>
          <RequestId>A7356493-7141-4393-8951-CDA8AB5D67EC</RequestId>
</RestartDBInstance>
```

`JSON` format

```
{
  "RequestId":"A7356493-7141-4393-8951-CDA8AB5D67EC"
}
```

10.1.2.6.11. DescribeDBInstancePerformance

You can call this operation to query the specified performance metrics for an instance in a time range.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeDBInstancePerformance	The operation that you want to perform. Set the value to DescribeDBInstancePerformance.
DBInstanceId	String	Yes	gp-xxxxxxxx	The ID of the instance.
EndTime	String	Yes	2018-07-09T03:47Z	The end of the time range to query. Example: 2018-06-11T16:00Z.
Key	String	Yes	CpuUsage,MemoryUsage,Gpdb_SpaceUsage,Gpdb_IOPS,Gpdb_session	The performance metrics. Separate multiple performance metrics with commas (,). For more information, see Performance parameters.
StartTime	String	Yes	2018-07-08T03:47Z	The beginning of the time range to query. Example: 2018-06-11T15:00Z.

Response parameters

Parameter	Type	Example	Description
DBInstanceId	String	gp-xxxxxxxxxx	The ID of the instance.
EndTime	String	2018-07-09T03:47Z	The end of the time range within which the query is executed. The time follows the ISO 8601 standard in the `YYYY-MM-DDTHH:mmZ` format. The time is displayed in UTC. Example: 2018-05-30T03:29Z. The end time is later than the start time.
Engine	String	gpdb	The engine of the database.

Parameter	Type	Example	Description
PerformanceKeys	List	{ "Key": "MemoryUsage", "GroupValues": [{ "Name": "7198315-1530522046144-1", "Values": "" }, { "Name": "7198315-1530522046144-0", "Values": "" }, {"Values": "", "Name": "master" }], "Unit": "%", "ValueFormat": "mem_usage"}	An array that contains the performance metrics. It is in the {perf1, perf2, perf3, ...} format.
RequestId	String	5E85244A-AB47-46A3-A3AD-5F307DCB407E	The ID of the request.
StartTime	String	2018-07-08T03:47Z	The beginning of the time range within which the query is executed. The time follows the ISO 8601 standard in the `YYYY-MM-DDTHH:mmZ` format. The time is displayed in UTC. Example: 2018-05-30T03:29Z.

Examples

Sample requests

```
https://gpdb.aliyuncs.com/?Action=DescribeDBInstancePerformance
&DBInstanceId=gp-xxxxxxxx
&EndTime=2018-07-09T03:47Z
&Key=CpuUsage,MemoryUsage,Gpdb_SpaceUsage,Gpdb_IOPS,Gpdb_session
&StartTime=2018-07-08T03:47Z
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeDBInstancePerformanceResponse>
      <RequestId>5E85244A-AB47-46A3-A3AD-5F307DCB407E</RequestId>

        "Engine": "gpdb"
}
```

10.1.2.6.12. UpgradeDBVersion

You can call this operation to upgrade the minor version of a specified instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	UpgradeDBVersion	The operation that you want to perform. Set the value to UpgradeDBVersion.
DBInstanceId	String	Yes	gp-xxxxxxxxxxxx	The ID of the instance.
MajorVersion	String	Yes	6.0	The major version of the instance.
MinorVersion	String	Yes	6.0	The minor version of the instance.
RegionId	String	Yes	cn-hangzhou	The region ID of the instance.

Parameter	Type	Required	Example	Description
SwitchTimeMode	String	No	xxxxx	The upgrade method.
SwitchTime	String	No	2020-01-15T00:00:00Z	The upgrade time.

Response parameters

Parameter	Type	Example	Description
DBInstanceId	String	gp-xxxxxxxxxxxx	The ID of the instance.
DBInstanceName	String	gp-xxxxxxxxxxxx	The description of the instance.
RequestId	String	25C11EE5-B7E8-481A-A07C-BD619971A570	The ID of the request.
TaskId	String	101450956	The ID of the task.

Examples

Sample requests

```
https://gpdb.aliyuncs.com/?Action=UpgradeDBVersion
&DBInstanceId=gp-wz9kmr708m155j***
&<Common request parameters>
```

Sample success responses

`XML` format

```
<UpgradeDBVersionResponse>
          <requestId>25C11EE5-B7E8-481A-A07C-BD619971A570</requestId>
          <DBInstanceId>gp-wz9kmr708m155j***</DBInstanceId>
          <DBInstanceName>gp-wz9kmr708m155j***</DBInstanceName>
          <TaskId>101450956</TaskId>
</UpgradeDBVersionResponse>
```

`JSON` format

```
{
  "requestId": "25C11EE5-B7E8-481A-A07C-BD619971A570",
  "DBInstanceId": "gp-wz9kmr708m155j***",
  "DBInstanceName": "gp-wz9kmr708m155j***",
  "TaskId": "101450956"
}
```

10.1.2.6.13. UpgradeDBInstance

You can call this operation to change the instance type of an instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	UpgradeDBInstance	The operation that you want to perform. Set the value to UpgradeDBInstance.
DBInstanceClass	String	Yes	gpdb.group.segsdx1	The instance type. For more information, see Instance types.
DBInstanceGroupCount	String	Yes	2	The number of compute nodes of the instance.
DBInstanceId	String	Yes	gp-xxxxxxxx	The ID of the instance.
RegionId	String	Yes	cn-hangzhou	The region ID of the instance.
PayType	String	No	Prepaid	The billing method of the instance. Default value: Postpaid. Valid values: • Postpaid: pay-as-you-go • Prepaid: subscription

Response parameters

Parameter	Type	Example	Description
DBInstanceId	String	gp-xxxxxxxxxx	The ID of the instance.
OrderId	String	101450956	The order ID of the instance.
RequestId	String	25C11EE5-B7E8-481A-A07C-BD619971A570	The ID of the request.

Examples

Sample requests

```
https://gpdb.aliyuncs.com/?Action=UpgradeDBInstance
&DBInstanceClass=gpdb.group.segsdx1
&DBInstanceGroupCount=2
&DBInstanceId=gp-xxxxxxxx
&RegionId=cn-hangzhou
&<Common request parameters>
```

Sample success responses

`XML` format

```
<UpgradeDBInstanceResponse>
          <requestId>25C11EE5-B7E8-481A-A07C-BD619971A570</requestId>
          <DBInstanceId>gp-wz9kmr708m155j***</DBInstanceId>
          <OrderId>101450956</OrderId>
</UpgradeDBInstanceResponse>
```

`JSON` format

```
{
  "requestId": "25C11EE5-B7E8-481A-A07C-BD619971A570",
  "DBInstanceId": "gp-wz9kmr708m155j***",
  "OrderId": "101450956"
}
```

10.1.2.6.14. DescribeSpecification

You can call this operation to query the specifications of an instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeSpecification	The operation that you want to perform. Set the value to DescribeSpecification.
CpuCores	Integer	Yes	4	The number of CPU cores.
DBInstanceId	String	Yes	gp-xxxxxxx	The ID of the instance.
StorageType	String	Yes	ssd	The storage type of the instance. Valid values: ssd and hdd.
TotalNodeNum	Integer	Yes	4	The number of compute nodes.

Response parameters

Parameter	Type	Example	Description
DBInstanceClass	Array of DBInstanceClass	None	An array of instance specifications.
Text	String	1x1C SSD	The specification of the instance.
Value	String	gpdb.group.segsdx1	The instance type.
DBInstanceGroupCount	Array of DBInstanceGroupCount	None	An array of compute node specifications.
Text	String	4 CPU Cores	The number of CPU cores.
Value	String	2	The number of compute nodes.
RequestId	String	65BDA532-28AF-4122-AA39-B382721EEE64	The ID of the request.
StorageNotice	Array of StorageNotice	None	An array of storage specifications.
Text	String	1000GB	The storage capacity.
Value	String	8	The number of nodes.

Examples

Sample requests

```
http(s)://gpdb.aliyuncs.com/? Action=DescribeSpecification
&DBInstanceId=gp-xxxxxxx
&CpuCores=2
&StorageType=ssd
&TotalNodeNum=4
```

Sample success responses

`XML` format

```
<DescribeSpecificationResponse>
  <DBInstanceClass>
        <Text>1x1C SSD</Text>
        <Value>gpdb.group.segsdx1</Value>
  </DBInstanceClass>
  <DBInstanceGroupCount>
        <Text>2</Text>
        <Value>2</Value>
  </DBInstanceGroupCount>
  <StorageNotice>
        <Text>4 CPU Cores/32GB Memory/1000GB Storage</Text>
        <Value>2</Value>
  </StorageNotice>
</DescribeSpecificationResponse>
```

`JSON` format

```
{
    "DBInstanceClass": [
        {
            "Text": "1x1C SSD",
            "Value": "gpdb.group.segsdx1"
        }
    ],
    "DBInstanceGroupCount": [
        {
            "Text": "2",
            "Value": "2"
        }
    ],
    "StorageNotice": [
        {
        "Text": "4 CPU Cores/32GB Memory/1000GB Storage",
        "Value": "2"
        }
    ]
}
```

10.1.2.6.15. AddBuDBInstanceRelation

You call this operation to associate the BusinessUnit parameter to an instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	AddBuDBInstanceRelation	The operation that you want to perform. Set the value to AddBuDBInstanceRelation.

Parameter	Type	Required	Example	Description
BusinessUnit	String	Yes	BusinessUnit	The description of the business unit.
DBInstanceId	String	Yes	gp-xxxxxxx	The ID of the instance.

Response parameters

Parameter	Type	Example	Description
BusinessUnit	String	BusinessUnit	The description of the business unit.
DBInstanceName	String	gp-xxxxxx	The ID of the instance.
RequestId	String	B4CAF581-2AC7-41AD-8940-D56DF7AADF5B	The ID of the request.

Examples

Sample requests

```
http(s)://gpdb.aliyuncs.com/? Action=AddBuDBInstanceRelation
&DBInstanceId=gp-xxxxxx
&BusinessUnit=BusinessUnit
```

Sample success responses

`XML` format

```
<AddBuDBInstanceRelationResponse>
      <RequestId>D4D4BE8A-DD46-440A-BFCD-EE31DA81C9DD</RequestId>
      <BusinessUnit>BusinessUnit</BusinessUnit>
      <DBInstanceName>gp-xxxxxx</DBInstanceName>
</AddBuDBInstanceRelationResponse>
```

`JSON` format

```
{
  "RequestId":"D4D4BE8A-DD46-440A-BFCD-EE31DA81C9DD",
  "BusinessUnit": "BusinessUnit",
  "DBInstanceName": "gp-xxxxxx"
}
```

10.1.2.7. Database management

10.1.2.7.1. DeleteDatabase

You can call this operation to delete a database from an instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteDatabase	The operation that you want to perform. Set the value to DeleteDatabase.
DBInstanceId	String	Yes	gp-xxxxxxxxxx	The ID of the instance.
DBName	String	No	testdb01	The name of the database.

Response parameters

Parameter	Type	Example	Description
RequestId	String	07F6177E-6DE4-408A-BB4F-0723301340F3	The ID of the request.

Examples

Sample requests

```
https://gpdb.aliyuncs.com/?Action=DeleteDatabase
&DBName=testdb01
&DBInstanceId=gp-xxxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteDatabaseResponse>
       <RequestId>07F6177E-6DE4-408A-BB4F-0723301340F3</RequestId>
</DeleteDatabaseResponse>
```

`JSON` format

```
{
    "RequestId":"07F6177E-6DE4-408A-BB4F-0723301340F3"
}
```

10.1.2.8. Account management

10.1.2.8.1. CreateAccount

You can call this operation to create an account for a database.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateAccount	The operation that you want to perform. Set the value to CreateAccount.
AccountName	String	Yes	testacc02	The name of the account.
AccountPassword	String	Yes	pw1234	The password for the account.
DBInstanceId	String	Yes	gp-xxxxxxxx	The ID of the instance.
DatabaseName	String	No	test01	The name of the database.
AccountDescription	String	No	testacc02	The description of the account.

Response parameters

Parameter	Type	Example	Description
RequestId	String	D4D4BE8A-DD46-440A-BFCD-EE31DA81C9DD	The ID of the request.

Examples

Sample requests

```
https://gpdb.aliyuncs.com/?Action=CreateAccount
&AccountName=testacc02
&AccountPassword=pw1234
&DBInstanceId=gp-xxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreateAccountResponse>
          <RequestId>D4D4BE8A-DD46-440A-BFCD-EE31DA81C9DD</RequestId>
</CreateAccountResponse>
```

`JSON` format

```
{
  "RequestId":"D4D4BE8A-DD46-440A-BFCD-EE31DA81C9DD"
}
```

10.1.2.8.2. ResetAccountPassword

You can call this operation to reset the password for your account in an instance.

Before you call this operation, make sure that the following requirements are met:

- The instance is in the running state.
- The instance is not locked.

Request parameters

Parameter	Type	Required	Example	Description
AccountName	String	Yes	testaccount_1	The name of the account.
AccountPassword	String	Yes	Testaccount_1	The new password for the account. The password must be 8 to 32 characters in length and contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. Special characters include `! @ # $ % ^ & * ( ) _ + - =`
DBInstanceId	String	Yes	gp-xxxxxxxxx	The ID of the instance.

Response parameters

Parameter	Type	Example	Description
RequestId	String	187C80FC-75C4-477C-BBF2-A368A36D041C	The ID of the request.

Examples

Sample requests

```
https://gpdb.aliyuncs.com/?Action=ResetAccountPassword
&AccountName=testaccount_1
&AccountPassword=Testaccount_1
&DBInstanceId=gp-xxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ResetAccountPasswordResponse>
          <RequestId>187C80FC-75C4-477C-BBF2-A368A36D041C</RequestId>
</ResetAccountPasswordResponse>
```

`JSON` format

```
{
    "RequestId":"187C80FC-75C4-477C-BBF2-A368A36D041C"
}
```

10.1.2.8.3. DescribeAccounts

You can call this operation to query the information of a database account.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeAccounts	The operation that you want to perform. Set the value to DescribeAccounts.
DBInstanceId	String	Yes	gp-xxxxxxxxx	The ID of the instance.
AccountName	String	No	onlyreadacc	The name of the account.

Response parameters

Parameter	Type	Example	Description
Accounts	Array of DBInstanceAccount	None	The information of the account, which is an array of DBInstanceAccount data.
DBInstanceAccount	None	None	None

Parameter	Type	Example	Description
AccountDescription	String	testacc01	The description of the account.
AccountName	String	testacc01	The name of the account.
AccountStatus	String	1	The status of the account. Valid values: • 0: The account is being created. • 1: The account is in use. • 3: The account is being deleted.
DBInstanceId	String	gp-xxxxxxxx	The ID of the instance.
RequestId	String	7565770E-7C45-462D-BA4A-8A5396F2CAD1	The ID of the request.

Examples

Sample requests

```
https://gpdb.aliyuncs.com/?Action=DescribeAccounts
&DBInstanceId=gp-xxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeAccountsResponse>
          <RequestId>7565770E-7C45-462D-BA4A-8A5396F2CAD1</RequestId>
            <Accounts>
                  <DBInstanceAccount>
                        <AccountName>testaccount_1</AccountName>
                        <DBInstanceId>gp-xxxxxxx</DBInstanceId>
                        <AccountStatus>1</AccountStatus>
                        <AccountDescription></AccountDescription>
                  </DBInstanceAccount>
            </Accounts>
</DescribeAccountsResponse>
```

`JSON` format

```
{
    "Accounts": {
      "DBInstanceAccount": [
        {
          "AccountDescription": "",
          "DBInstanceId": "gp-xxxxxxx",
          "AccountStatus": "1",
          "AccountName": "testaccount_1"
        }
      ]
    },
    "RequestId": "7565770E-7C45-462D-BA4A-8A5396F2CAD1"
  }
```

10.1.2.8.4. ModifyAccountDescription

You can call this operation to modify the description of a database account in an instance.

Request parameters

Parameter	Type	Required	Example	Description
AccountDescription	String	Yes	testAccoutdescribe	The new description of the database account. The description must meet the following requirements: • The description must start with a letter. • The description cannot start with `http://` or `https://`. • The description can contain letters, underscores (_), hyphens (-), and digits. • The description must be 2 to 256 characters in length.
AccountName	String	Yes	testAccout	The name of the account. The account name must be unique and meet the following requirements: • The name must start with a letter. • The name can contain lowercase letters, digits, and underscores (_). • The name can be up to 16 characters in length. • The name cannot contain reserved keywords.
DBInstanceId	String	Yes	gp-xxxxxxxxx	The ID of the instance.

Response parameters

Parameter	Type	Example	Description
RequestId	String	99BBBD5E-B5D8-4FC8-B8BF-FB1A0A38BBA2	The ID of the request.

Examples

Sample requests

```
https://gpdb.aliyuncs.com/?Action=ModifyAccountDescription
&AccountDescription=testAccoutdescribe
&AccountName=testAccout
&DBInstanceId=gp-xxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyAccountDescriptionResponse>
          <RequestId>99BBBD5E-B5D8-4FC8-B8BF-FB1A0A38BBA2</RequestId>
</ModifyAccountDescriptionResponse>
```

`JSON` format

```
{
    "RequestId": "99BBBD5E-B5D8-4FC8-B8BF-FB1A0A38BBA2"
}
```

10.1.2.9. Security management

10.1.2.9.1. DescribeDBInstanceIPArrayList

You can call this operation to query the list of one or more IP addresses that are allowed to access an instance.

Request parameters

Parameter	Type	Required	Example	Description
DBInstanceId	String	Yes	gp-xxxxxxxxxx	The ID of the instance.

Response parameters

Parameter	Type	Example	Description
Items	Array of DBInstanceIPArray	None	The information of IP addresses that are allowed to access the instance, which is an array of DBInstanceIPArray data.
DBInstanceIPArray	None	None	None
DBInstanceIPArrayAttribute	String	hidden	This parameter is empty by default. You can use this parameter to specify an attribute for a whitelist. A whitelist with the `hidden` attribute does not appear in the console.
DBInstanceIPArrayName	String	default	The name of the whitelist.
SecurityIPList	String	127.0.0.1	The IP addresses listed in the whitelist. You can add up to 1,000 IP addresses to the whitelist. Separate multiple IP addresses with commas (,). The IP addresses must use one of the following formats: • 0.0.0.0/0 • 10.23.12.24. This is an IP address. • Classless Inter-Domain Routing (CIDR) blocks, such as 10.23.12.24/24, where `/24` indicates the prefix of the CIDR block is 24 bits in length. You can replace 24 with a value in the range of `1 to 32`.
RequestId	String	CB7AA0BF-BE41-480E-A3DC-C97BF85A391B	The ID of the request.

Examples

Sample requests

```
https://gpdb.aliyuncs.com/?Action=DescribeDBInstanceIPArrayList
&DBInstanceId=gp-xxxxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeDBInstanceIPArrayListResponse>
  <Items>
        <DBInstanceIPArray>
              <DBInstanceIPArrayName>default</DBInstanceIPArrayName>
              <DBInstanceIPArrayAttribute>hidden</DBInstanceIPArrayAttribute>
              <securityIPList>127.0.0.1</securityIPList>
        </DBInstanceIPArray>
  </Items>
  <RequestId>CB7AA0BF-BE41-480E-A3DC-C97BF85A391B</RequestId>
</DescribeDBInstanceIPArrayListResponse>
```

`JSON` format

```
{
    "Items":{
        "DBInstanceIPArray":[
            {
              "DBInstanceIPArrayName":"default",
              "DBInstanceIPArrayAttribute":"hidden",
              "securityIPList":"127.0.0.1"
            }
        ]
    },
    "RequestId":"CB7AA0BF-BE41-480E-A3DC-C97BF85A391B"
}
```

10.1.2.9.2. ModifySecurityIps

You can call this operation to modify the IP addresses that are allowed to access an instance.

Before you call this operation, make sure that the following requirements are met:

- The instance is in the Running state.
- The instance is not locked.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifySecurityIps	The operation that you want to perform. Set the value to ModifySecurityIps.
DBInstanceId	String	Yes	gp-xxxxxxxxx	The ID of the instance.

Parameter	Type	Required	Example	Description
SecurityIPList	String	Yes	127.0.0.1	The IP addresses listed in the whitelist. You can add up to 1,000 IP addresses to the whitelist. Separate multiple IP addresses with commas (,). The IP addresses must use one of the following formats: • 0.0.0.0/0 • 10.23.12.24. This is an IP address. • Classless Inter-Domain Routing (CIDR) blocks, such as 10.23.12.24/24, where `/24` indicates the prefix of the CIDR block is 24 bits in length. You can replace 24 with a value in the range of `1 to 32`.
DBInstanceIPArrayName	String	No	Default	The name of the whitelist. If you do not enter a name, IP addresses are added to the default whitelist. **Note** You can create up to 50 whitelists for an instance.
DBInstanceIPArrayAttribute	String	No	hidden	The attribute of the IP address whitelist. By default, this parameter is empty. You can use this parameter to distinguish whitelists that have different attributes. The console does not display whitelists that have the `hidden` attribute.

Response parameters

Parameter	Type	Example	Description
RequestId	String	871C698F-B43D-4D1D-ACD6-DF56B0F89978	The ID of the request.

Examples

Sample requests

```
https://gpdb.aliyuncs.com/?Action=ModifySecurityIps
&DBInstanceId=gp-xxxxxxxxx
&SecurityIPList=127.0.0.1
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifySecurityIpsResponse>
          <RequestId>871C698F-B43D-4D1D-ACD6-DF56B0F89978</RequestId>
</ModifySecurityIpsResponse>
```

`JSON` format

```
{
  "RequestId":"871C698F-B43D-4D1D-ACD6-DF56B0F89978"
}
```

10.1.2.10. Log management

10.1.2.10.1. DescribeSQLCollectorPolicy

You can call this operation to query whether the SQL collection feature is enabled for an instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeSQLCollectorPolicy	The operation that you want to perform. Set the value to DescribeSQLCollectorPolicy.
DBInstanceId	String	Yes	gp-xxxxxxxxx	The ID of the instance.

Response parameters

Parameter	Type	Example	Description
RequestId	String	ABB39CC3-4488-4857-905D-2E4A051D0521	The ID of the request.
SQLCollectorStatus	String	Enable	The status of SQL collection. • Enable: SQL collection is enabled. • Disabled: SQL collection is disabled.

Examples

Sample requests

```
https://gpdb.aliyuncs.com/?Action=DescribeSQLCollectorPolicy
&DBInstanceId=gp-xxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```

```

10.1.2.10.2. DescribeSlowLogRecords

You can call this operation to query slow SQL query details of a database in an instance in a specified time range.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeSlowLogRecords	The operation that you want to perform. Set the value to DescribeSlowLogRecords.
DBInstanceId	String	Yes	gp-xxxxxxx	The ID of the instance.
EndTime	String	Yes	2018-07-19T09:00:08Z	The end of the time range to query. Specify the time in the ISO 8601 standard in the `YYYY-MM-DDTHH:mmZ` format. The time must be in UTC. Example: 2011-06-11T15:00Z.

Parameter	Type	Required	Example	Description
StartTime	String	Yes	2018-07-09T09:00:08Z	The beginning of the time range to query. Specify the time in the `YYYY-MM-DDTHH:mmZ` format. The time must be in UTC. Example: 2011-06-11T15:00Z.
SQLId	Long	No	143242632	The ID of the SQL query.
DBName	String	No	test	The name of the database.
PageSize	Integer	No	30	The number of entries to return on each page. Valid values: 30, 50, and 100. Default value: 30.
PageNumber	Integer	No	1	The number of the page to return. Valid values: any non-zero positive integer. Default value: 1.

Response parameters

Parameter	Type	Example	Description
Engine	String	gpdb	The engine of the database.
Items	Array of SQLSlowRecord	None	The information of the slow SQL query, which is an array of SQLSlowRecord data.
SQLSlowRecord	None	None	None
DBName	String	test	The name of the database.
ExecutionStartTime	String	2018-07-09T09:00:08Z	The beginning of the time range within which the query is executed. The time follows the ISO 8601 standard in the YYYY-MM-DDTHH:mm:ssZ format. The time is displayed in UTC. Example: 2011-06-11T15:00:08Z.

Parameter	Type	Example	Description
HostAddress	String	127.0.0.1	The IP address of the host that is used to connect to the database.
LockTimes	Long	12	The lock duration of the query. Unit: seconds.
ParseRowCounts	Long	125	The number of parsed rows.
QueryTimes	Long	123	The execution duration of the query. Unit: seconds.
ReturnRowCounts	Long	1	The number of returned rows.
SQLText	String	update test.zxb set id=0 limit 1	The SQL query statement.
PageNumber	Integer	1	The page number of the returned page.
PageRecordCount	Integer	1	The number of slow SQL queries on the current page.
RequestId	String	542BB8D6-4268-45CC-A557-B03EFD7AB30A	The ID of the request.
TotalRecordCount	Integer	1	The total number of entries.

Examples

Sample requests

```
https://gpdb.aliyuncs.com/?Action=DescribeSlowLogRecords
&DBInstanceId=gp-xxxxxxx
&EndTime=2018-07-19T09:00:08Z
&StartTime=2018-07-09T09:00:08Z
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeSlowLogRecordsResponse>
      <RequestId>542BB8D6-4268-45CC-A557-B03EFD7AB30A</RequestId>
      <Engine>gpdb</Engine>
      <PageNumber>1</PageNumber>
      <PageRecordCount>1</PageRecordCount>
      <TotalRecordCount>1</TotalRecordCount>
      <Items>
            <SQLSlowRecord>
                  <HostAddress>127.0.0.1</HostAddress>
                  <DBName>test</DBName>
                  <SQLText> update test.zxb set id=0 limit 1</SQLText>
                  <QueryTimes>123</QueryTimes>
                  <LockTimes>12</LockTimes>
                  <ParseRowCounts>125</ParseRowCounts>
                  <ReturnRowCounts>1</ReturnRowCounts>
                  <ExecutionStartTime>2018-07-09T09:00:08Z</ExecutionStartTime>
            </SQLSlowRecord>
      </Items>
</DescribeSlowLogRecordsResponse>
```

`JSON` format

```
{
    "RequestId":"542BB8D6-4268-45CC-A557-B03EFD7AB30A",
    "Engine":"gpdb",
    "PageNumber":1,
    "PageRecordCount":1,
    "TotalRecordCount":1,
    "Items":{
        "SQLSlowRecord":[
            {
                "HostAddress":"127.0.0.1",
                "DBName":"test",
                "SQLText":" update test.zxb set id=0 limit 1",
                "QueryTimes":"123",
                "LockTimes":"12",
                "ParseRowCounts":"125",
                "ReturnRowCounts":"1",
                "ExecutionStartTime":"2018-07-09T09:00:08Z"
            }
        ]
    }
}
```

10.1.2.10.3. DescribeSQLLogFiles

You can call this operation to query the list of SQL audit log files.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeSQLLogFiles	The operation that you want to perform. Set the value to DescribeSQLLogFiles.
DBInstanceId	String	Yes	gp-xxxxxxxxxx	The ID of the instance.
FileName	String	No	log20200202	The name of the file.
PageSize	Integer	No	30	The number of entries to return on each page. Valid values: 30, 50, and 100. Default value: 30
PageNumber	Integer	No	1	The number of the page to return. Valid values: any non-zero positive integer. Default value: 1.

Response parameters

Parameter	Type	Example	Description
Items	Array of LogFile	None	The information of the log file, which is an array of LogFile data.
LogFile	None	None	None
FileID	String	1023423423	The ID of the file.
LogDownloadURL	String	xxxxxx	The URL that is used to download the file. If the URL is unavailable, an empty string is returned.
LogEndTime	String	2019-02-24T14:10Z	The end of the time range within which data is recorded in the file.
LogSize	String	100210	The size of the file. Unit: bytes.
LogStartTime	String	2019-02-24T12:10Z	The beginning of the time range within which data is recorded in the file.

Parameter	Type	Example	Description
LogStatus	String	Success	The status of the file. Valid values: • NoStart • Generating • Success • Failed
PageNumber	Integer	1	The page number of the returned page.
PageRecordCount	Integer	1	The number of entries on the current page.
RequestId	String	66E164C1-D7F2-4D85-849D-E2883FCFFBA5	The ID of the request.
TotalRecordCount	Integer	1	The total number of entries.

Examples

Sample requests

```
https://gpdb.aliyuncs.com/?Action=DescribeSQLLogFiles
&DBInstanceId=gp-xxxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeSQLLogFilesResponse>
  <Items>
        <LogFile>
              <FileID>1023423423</FileID>
              <LogDownloadURL>xxxxxxx</LogDownloadURL>
              <LogEndTime>2019-02-24T14:10Z</LogEndTime>
              <LogSize>100210</LogSize>
              <LogStartTime>2019-02-24T12:10Z</LogStartTime>
              <LogStatus>Success</LogStatus>
        </LogFile>
  </Items>
  <PageNumber>1</PageNumber>
  <TotalRecordCount>1</TotalRecordCount>
  <RequestId>66E164C1-D7F2-4D85-849D-E2883FCFFBA5</RequestId>
  <PageRecordCount>1</PageRecordCount>
</DescribeSQLLogFilesResponse>
```

`JSON` format

```
{
    "Items": {
        "LogFile": [
            {
                "FileID": "1023423423",
                "LogDownloadURL": "xxxxxxx",
                "LogEndTime": "2019-02-24T14:10Z",
                "LogSize":"100210",
                "LogStartTime": "2019-02-24T12:10Z",
                "LogStatus": "Success"
            }
        ]
    },
    "PageNumber": 1,
    "TotalRecordCount": 1,
    "RequestId": "66E164C1-D7F2-4D85-849D-E2883FCFFBA5",
    "PageRecordCount": 1
}
```

10.1.2.10.4. ModifySQLCollectorPolicy

You can call this operation to enable or disable the SQL collection feature for an instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifySQLCollectorPolicy	The operation that you want to perform. Set the value to ModifySQLCollectorPolicy.
DBInstanceId	String	Yes	gp-xxxxxxxx	The ID of the instance.
SQLCollectorStatus	String	Yes	Enable	Specifies whether to enable or disable SQL collection. • Enable: enables SQL collection. • Disabled: disables SQL collection.

Response parameters

Parameter	Type	Example	Description
RequestId	String	4FA1F1D1-50A6-4F60-9A78-5752F2076A53	The ID of the request.

Examples

Sample requests

```
https://gpdb.aliyuncs.com/?Action=ModifySQLCollectorPolicy
&DBInstanceId=gp-xxxxxxxx
&SQLCollectorStatus=Enable
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifySQLCollectorPolicyResponse>
          <RequestId>4FA1F1D1-50A6-4F60-9A78-5752F2076A53</RequestId>
</ModifySQLCollectorPolicyResponse>
```

`JSON` format

```
{
  "RequestId":"4FA1F1D1-50A6-4F60-9A78-5752F2076A53"
}
```

10.1.2.10.5. DescribeSQLLogRecords

You can call this operation to query the SQL audit logs generated for an instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeSQLLogRecords	The operation that you want to perform. Set the value to DescribeSQLLogRecords.
DBInstanceId	String	Yes	gp-xxxxxxxxxx	The ID of the instance.
EndTime	String	Yes	2018-07-09T08:50:20Z	The end of the time range to query. Specify the time in the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time must be in UTC. The end time must be later than the start time.
StartTime	String	Yes	2018-07-09T04:50:20Z	The beginning of the time range to query. Specify the time in the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time must be in UTC.

Parameter	Type	Required	Example	Description
QueryKeywords	String	No	keywords1	The keywords that are used for queries. Separate multiple keywords with spaces. The maximum number of keywords is 10.
Database	String	No	testdb	The name of the database to be queried. By default, all databases are queried.
User	String	No	testacc	The username of the database. By default, all users are selected.
Form	String	No	Stream	Specifies whether to generate SQL audit log files or return SQL audit log records. Default value: Stream. Valid values: • File: generates audit log files. If you set this parameter to File, only common response parameters are returned. Therefore, you need to call the DescribeSQLLogFiles operation to obtain the download URL of audit log files. • Stream: generates data streams.
PageSize	Integer	No	30	The number of entries to return on each page. Valid values: 30, 50, and 100. Default value: 30.
PageNumber	Integer	No	1	The number of the page to return. Valid values: any non-zero positive integer. Default value: 1.

Response parameters

Parameter	Type	Example	Description
Items	Array of SQLRecord	None	The information of SQL queries, which is an array of SQLRecord data.
SQLRecord	None	None	None

Parameter	Type	Example	Description
AccountName	String	testacc	The account name.
DBName	String	testdb	The name of the database.
ExecuteTime	String	2018-07-09T08:50:20Z	The time when the statement is executed. The time follows the ISO 8601 standard in the `yyyy-MM-ddTHH:mm:ssZ` format. The time is displayed in UTC. Example: 2011-05-30 T12:11:20Z.
HostAddress	String	127.0.0.1	The IP address of the client.
ReturnRowCounts	Long	122	The number of returned entries.
SQLText	String	update test.zxb set id=0 limit 1	The SQL statement that is recorded in the log.
ThreadID	String	723	The ID of the thread.
TotalExecutionTimes	Long	130	The execution duration of the SQL statement. Unit: microseconds.
PageNumber	Integer	1	The page number of the returned page.
PageRecordCount	Integer	1	The number of SQL audit log records on the current page.
RequestId	String	9B24F29F-BA7F-47A3-838E-C6A993888388	The ID of the request.
TotalRecordCount	Integer	1	The total number of entries.

Examples

Sample requests

```
https://gpdb.aliyuncs.com/?Action=DescribeSQLLogRecords
&DBInstanceId=gp-xxxxxxx
&StartTime=2018-07-09T04:50:20Z
&EndTime=2018-07-09T08:50:20Z
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeSQLLogRecords>
  <Items>
        <SQLRecord>
              <AccountName>testacc</AccountName>
              <DBName>testdb</DBName>
              <ExecuteTime>2018-07-09T08:50:20Z</ExecuteTime>
              <HostAddress>127.0.0.1</HostAddress>
              <ReturnRowCounts>122</ReturnRowCounts>
              <SQLText>update test.zxb set id=0 limit 1</SQLText>
              <ThreadID>723</ThreadID>
              <TotalExecutionTimes>130</TotalExecutionTimes>
        </SQLRecord>
  </Items>
  <TotalRecordCount>1</TotalRecordCount>
  <PageNumber>1</PageNumber>
  <RequestId>9B24F29F-BA7F-47A3-838E-C6A993888388</RequestId>
  <PageRecordCount>1</PageRecordCount>
</DescribeSQLLogRecords>
```

`JSON` format

```
{
    "Items": {
        "SQLRecord": [
            {
                "AccountName": "testacc",
                "DBName": "testdb",
                "ExecuteTime": "2018-07-09T08:50:20Z",
                "HostAddress": "127.0.0.1",
                "ReturnRowCounts": "122",
                "SQLText": "update test.zxb set id=0 limit 1",
                "ThreadID": "723",
                "TotalExecutionTimes": "130"
            }
        ]
    },
    "TotalRecordCount": 1,
    "PageNumber": 1,
    "RequestId": "9B24F29F-BA7F-47A3-838E-C6A993888388",
    "PageRecordCount": 1
}
```

10.1.2.11. Network management

10.1.2.11.1. AllocateInstancePublicConnection

You can call this operation to specify a public endpoint of the instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	No	AllocateInstancePublicConnection	The operation that you want to perform. Set the value to AllocateInstancePublicConnection.
ConnectionStringPrefix	String	Yes	gp-xxxxxxxx	The endpoint of the instance.
DBInstanceId	String	Yes	gp-xxxxxxxx	The ID of the instance.
Port	String	Yes	3432	The port associated with the endpoint. Valid values: 3200 to 3999.

Response parameters

Parameter	Type	Example	Description
RequestId	String	ADD6EA90-EECB-4C12-9F26-0B6DB58710EF	The ID of the request.

Examples

Sample requests

```
http(s)://gpdb.aliyuncs.com/? Action=AllocateInstancePublicConnection
&ConnectionStringPrefix=gp-xxxxxxxx
&DBInstanceId=gp-xxxxxxxx
&Port=3432
&<Common request parameters>
```

Sample success responses

`XML` format

```
<RequestId>ADD6EA90-EECB-4C12-9F26-0B6DB58710EF</RequestId>
```

`JSON` format

```
{
    "RequestId": "ADD6EA90-EECB-4C12-9F26-0B6DB58710EF"
}
```

10.1.2.11.2. DescribeDBInstanceNetInfo

You can call this operation to query the connection information of an instance.

Request parameters

Parameter	Type	Required	Example	Description
DBInstanceId	String	Yes	gp-xxxxxxxxxx	The ID of the instance.

Response parameters

Parameter	Type	Example	Description
DBInstanceNetInfos	Array of DBInstanceNetInfo	None	The connection information of the instance.
DBInstanceNetInfo	None	None	None
ConnectionString	String	gp-xxxxxxx.gpdb.rds.aliyuncs.com	The URL of the database.
IPAddress	String	127.0.0.1	The IP address of the instance.
IPType	String	Inner	The type of IP address. • Valid values for instances in the classic network: Inner and Public • Valid values for instances in a VPC: Private and Public
Port	String	3432	The port information.
VPCId	String	vpc-xxxxxxx	The ID of the VPC.
VSwitchId	String	vsw-xxxxxxxx	The ID of the vSwitch. Multiple IDs are separated by commas (,).

Parameter	Type	Example	Description
InstanceNetworkType	String	Classic	The network type of the instance. Valid values: • Classic • VPC
RequestId	String	7565770E-7C45-462D-BA4A-8A5396F2CAD1	The ID of the request.

Examples

Sample requests

```
https://gpdb.aliyuncs.com/?Action=DescribeDBInstanceNetInfo
&DBInstanceId=gp-xxxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeDBInstanceNetInfoResponse>
  <instanceNetworkType>Classic</instanceNetworkType>
  <DBInstanceNetInfos>
        <DBInstanceNetInfo>
              <DBInstanceNetType>1</DBInstanceNetType>
              <connectionString>gp-xxxxxxx.gpdb.rds.aliyuncs.com</connectionString>
              <ipAddress>127.0.0.1</ipAddress>
              <port>3432</port>
              <VPCId>vpc-xxxxxxxxx</VPCId>
              <VSwitchId>vsw-xxxxxxx</VSwitchId>
        </DBInstanceNetInfo>
  </DBInstanceNetInfos>
  <RequestId>7565770E-7C45-462D-BA4A-8A5396F2CAD1</RequestId>
</DescribeDBInstanceNetInfoResponse>
```

`JSON` format

```
{
    "instanceNetworkType": "Classic",
    "DBInstanceNetInfos": {
        "DBInstanceNetInfo": [
            {
                "DBInstanceNetType": "1",
                "connectionString": "gp-xxxxxxx.gpdb.rds.aliyuncs.com",
                "ipAddress": "127.0.0.1",
                "port": "3432",
                "VPCId": "vpc-xxxxxxxxx",
                "VSwitchId": "vsw-xxxxxxx"
            }
        ]
    },
    "RequestId": "7565770E-7C45-462D-BA4A-8A5396F2CAD1"
}
```

10.1.2.11.3. ModifyDBInstanceConnectionString

You can call this operation to modify the internal or public endpoint of an instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyDBInstanceConnectionString	The operation that you want to perform. Set this parameter to ModifyDBInstanceConnectionString.
ConnectionStringPrefix	String	Yes	gp-xxxxxxxx	The endpoint to be used by the instance.
CurrentConnectionString	String	Yes	gp-xxxxxxx.gpdb.rds.aliyuncs.com	The endpoint used by the instance.
DBInstanceId	String	Yes	gp-xxxxxxx	The ID of the instance.
Port	String	Yes	3432	The port to be used by the instance.

Response parameters

Parameter	Type	Example	Description
RequestId	String	29B0BF34-D069-4495-92C7-FA6D94528A9E	The ID of the request.

Examples

Sample requests

```
https://gpdb.aliyuncs.com/?Action=ModifyDBInstanceConnectionString
&ConnectionStringPrefix=gp-xxxxxxxx
&CurrentConnectionString=gp-xxxxxxx.gpdb.rds.aliyuncs.com
&DBInstanceId=gp-xxxxxxx
&Port=3432
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyDBInstanceConnectionStringResponse>
          <RequestId>29B0BF34-D069-4495-92C7-FA6D94528A9E</RequestId>
</ModifyDBInstanceConnectionStringResponse>
```

`JSON` format

```
{
 "RequestId": "29B0BF34-D069-4495-92C7-FA6D94528A9E"
}
```

10.1.2.11.4. ModifyDBInstanceNetworkType

You can call this operation to switch the network type of an instance between VPC and classic network.

Request parameters

Parameter	Type	Required	Example	Description
DBInstanceId	String	Yes	gp-xxxxxxxx	The ID of the instance.
InstanceNetworkType	String	Yes	VPC	The network type of the instance. Valid values: • VPC • Classic
VPCId	String	No	vpc-xxxxxxxx	The ID of the VPC.
VSwitchId	String	No	vsw-xxxxxxxx	The ID of the vSwitch. This parameter is required when the VPCId parameter is specified.

Parameter	Type	Required	Example	Description
PrivateIpAddress	String	No	192.168.0.10	The private IP address of the instance. You can specify an IP address of the VPC to which the vSwitch belongs. If no IP address is specified, the system assigns an IP address based on the VPC ID and vSwitch ID.

Response parameters

Parameter	Type	Example	Description
RequestId	String	2d0c35a9-f5da-44ba-852d-741e27b7eb0b	The ID of the request.

Examples

Sample requests

```
https://gpdb.aliyuncs.com/?Action=ModifyDBInstanceNetworkType
&DBInstanceId=gp-xxxxxxxx
&InstanceNetworkType=VPC
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyDBInstanceNetworkTypeResponse>
          <RequestId>2d0c35a9-f5da-44ba-852d-741e27b7eb0b</RequestId>
</ModifyDBInstanceNetworkTypeResponse>
```

`JSON` format

```
{
  "RequestId":"2d0c35a9-f5da-44ba-852d-741e27b7eb0b"
}
```

10.1.2.11.5. ReleaseInstancePublicConnection

You can call this operation to release the public endpoint of an instance.

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
CurrentConnectionString	String	Yes	gp-xxxxxxx.gpdb.rds.aliyuncs.com	The public endpoint of the instance.
DBInstanceId	String	Yes	gp-xxxxxxxx	The ID of the instance.

Response parameters

Parameter	Type	Example	Description
RequestId	String	9CEF7037-4158-4A65-BEC7-2A1541F6FE74	The ID of the request.

Examples

Sample requests

```
https://gpdb.aliyuncs.com/?Action=ReleaseInstancePublicConnection
&CurrentConnectionString=gp-xxxxxxx.gpdb.rds.aliyuncs.com
&DBInstanceId=gp-xxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ReleaseInstancePublicConnectionResponse>
          <RequestId>9CEF7037-4158-4A65-BEC7-2A1541F6FE74</RequestId>
</ReleaseInstancePublicConnectionResponse>
```

`JSON` format

```
{
   "RequestId": "9CEF7037-4158-4A65-BEC7-2A1541F6FE74"
}
```

10.1.2.11.6. SwitchDBInstanceNetType

You can call this operation to switch between internal and public endpoints.

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	SwitchDBInstanceNetType	The operation that you want to perform. Set the value to SwitchDBInstanceNetType.
ConnectionStringPrefix	String	Yes	test1234	The prefix of the custom endpoint. • The prefix can be up to 30 characters in length and can contain letters, digits, and hyphens (-). It must start with a letter. •
DBInstanceId	String	Yes	rm-uf6wjk5xxxxxxx	The ID of the instance.
Port	String	Yes	3306	The port associated with the endpoint. Valid values: 3001 to 3999.

Response parameters

Parameter	Type	Example	Description
RequestId	String	FA67B751-2A2D-470C-850B-D6B93699D35C	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=SwitchDBInstanceNetType
&ConnectionStringPrefix=test1234
&DBInstanceId=rm-uf6wjk5xxxxxxx
&Port=3306
&<Common request parameters>
```

Sample success responses

`XML` format

```
<RequestId>FA67B751-2A2D-470C-850B-D6B93699D35C</RequestId>
```

`JSON` format

```
{"RequestId":"FA67B751-2A2D-470C-850B-D6B93699D35C"}
```

10.1.2.12. Tag management

10.1.2.12.1. TagResources

You can call this operation to create tags and bind the tags to specific instances.

Request parameters

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-hangzhou	The region ID.
ResourceId.N	RepeatList	Yes	dbaudit-cn-78v1gcxxxxx	The ID of instance N. Valid values of N: 1 to 20.
ResourceType	String	Yes	INSTANCE	The type of the resource. Set the value to INSTANCE. INSTANCE indicates the reserved storage mode instance.
Tag.N.Key	String	No	test	The key of tag N. Valid values of N: 1 to 20. The tag key cannot be an empty string. The tag key can be up to 128 characters in length and cannot contain http:// or https://. It cannot start with acs: or aliyun.
Tag.N.Value	String	No	testapi	The value of tag N. Valid values of N: 1 to 20. The tag value can be an empty string. The tag key can be up to 128 characters in length and cannot contain http:// or https://. It cannot start with acs: or aliyun.

Response parameters

Parameter	Type	Example	Description
RequestId	String	23DD5EDB-EAC7-44A5-A68E-798BB085D27F	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=TagResources
&RegionId=cn-hangzhou
&ResourceId.1=dbaudit-cn-78v1gcxxxxx
&ResourceType=INSTANCE
&<Common request parameters>
```

Sample success responses

`XML` format

```
<RequestId>23DD5EDB-EAC7-44A5-A68E-798BB085D27F</RequestId>
```

`JSON` format

```
{"RequestId":"23DD5EDB-EAC7-44A5-A68E-798BB085D27F"}
```

10.1.2.12.2. ListTagResources

You can call this operation to query tags that are bound to one or more instances.

Request parameters

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-hangzhou	The region ID of the instance.
ResourceType	String	Yes	instance	The type of the resource. Valid values: • `instance`: reserved storage mode • `ALIYUN::GPDB::INSTANCE`: elastic storage mode
ResourceId.N	RepeatList	No	gp-xxxxxxxxxx	The ID of the instance.

Parameter	Type	Required	Example	Description
Tag.N.Key	String	No	TestKey	The key of tag N. The tag key can contain 1 to 128 characters in length. Valid values of N: 1 to 20. You can use `Tag.N` to query instances that have specific tags bound. Tag.N consists of Tag.N.Key and Tag.N.Value. • If you specify only `Tag.N.Key`, the instances that contain all the specified tag keys are returned. • If you specify only `Tag.N.Value`, `InvalidParameter.TagValue` is returned. • If you specify multiple tag key-value pairs at a time, the instances that contain all the specified tag keys are returned.
Tag.N.Value	String	No	TestValue	The value of tag N. The tag value can contain 1 to 128 characters in length. Valid values of N: 1 to 20.
NextToken	String	No	caeba0bbb2be03f84eb48b699f0a4883	The token used to perform the next query.

Response parameters

Parameter	Type	Example	Description
NextToken	String	caeba0bbb2be03f84eb48b699f0a4883	The token that was returned for the next query.
RequestId	String	5414A4E5-4C36-4461-95FC-23757A20B5F8	The ID of the request.
TagResources	Array of TagResource	None	The information of instances and tags, including the instance IDs,resource types, and tag key-value pairs, which is an array of TagResource data.
TagResource	None	None	None
ResourceId	String	gp-xxxxxxxxxx	The ID of the instance.

Parameter	Type	Example	Description
ResourceType	String	instance	The type of the resource.
TagKey	String	TestKey	The tag key of the instance.
TagValue	String	TestValue	The tag value of the instance.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=ListTagResources
&RegionId=cn-hangzhou
&ResourceType=instance
&<Common request parameters>
```

Sample success responses

`XML` format

```
<RequestId>5414A4E5-4C36-4461-95FC-23757A20B5F8</RequestId>
<NextToken>caeba0bbb2be03f84eb48b699f0a4883</NextToken>
<TagResources>
    <TagResource>
        <ResourceId>gp-xxxxxxxxxx</ResourceId>
        <TagKey>TestKey</TagKey>
        <ResourceType>instance</ResourceType>
        <TagValue>TestValue</TagValue>
    </TagResource>
</TagResources>
```

`JSON` format

```
{
    "RequestId": "5414A4E5-4C36-4461-95FC-23757A20B5F8",
    "NextToken": "caeba0bbb2be03f84eb48b699f0a4883",
    "TagResources": {
        "TagResource": {
            "ResourceId": "gp-xxxxxxxxxx",
            "TagKey": "TestKey",
            "ResourceType": "instance",
            "TagValue": "TestValue"
        }
    }
}
```

10.1.2.12.3. UntagResources

You can call this operation to unbind tags from specified instances and delete the tags at a time.

Request parameters

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-hangzhou	The region ID.
ResourceId.N	RepeatList	Yes	dbaudit-cn-test	The ID of instance N. Valid values of N: 1 to 20.
ResourceType	String	Yes	INSTANCE	The type of the resource. Set the value to INSTANCE. INSTANCE indicates reserved storage mode instance.
TagKey.N	RepeatList	No	456	The key of tag N. Valid values of N: 1 to 20.
All	Boolean	No	false	Specifies whether to unbind all tags from the instances. • When the TagKey.N parameter is specified, set the All parameter to false to unbind the specified tags from the instances. • When the TagKey.N parameter is not specified, set the All parameter to true to unbind all tags from the instance.

Response parameters

Parameter	Type	Example	Description
RequestId	String	8EC13467-A84C-401F-A4A0-AF893066FBA1	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=UntagResources
&RegionId=cn-hangzhou
&ResourceId.1=dbaudit-cn-test
&ResourceType=INSTANCE
&<Common request parameters>
```

Sample success responses

`XML` format

```
<RequestId>8EC13467-A84C-401F-A4A0-AF893066FBA1</RequestId>
```

`JSON` format

```
{"RequestId":"8EC13467-A84C-401F-A4A0-AF893066FBA1"}
```

10.1.2.12.4. DescribeTags

You can call this operation to query the tags of an instance.

Request parameters

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-hangzhou	The region ID of the instance.
ResourceType	String	Yes	instance	The type of the resource.

Response parameters

Parameter	Type	Example	Description
RequestId	String	65BDA532-28AF-4122-AA39-B382721EEE64	The ID of the request.
Tags	Array of Tag		The information of the tag, which is an array of tag key and tag value.
TagKey	String	user	The tag key of the instance.
TagValue	String	admin	The tag value of the instance.

Examples

Sample requests

```
http(s)://gpdb.aliyuncs.com/? Action=DescribeTags
&RegionId=cn-hangzhou
&ResourceType=instance
```

Sample success responses

`XML` format

```
<RequestId>65BDA532-28AF-4122-AA39-B382721EEE64</RequestId>
<Tags>
    <TagKey>test</TagKey>
    <TagValue>admin</TagValue>
</Tags>
```

`JSON` format

```
{
    "RequestId": "65BDA532-28AF-4122-AA39-B382721EEE64",
    "Tags": [
        {
            "TagKey": "test",
            "TagValue": "admin"
        }
    ]
}
```

10.1.2.13. Appendix

10.1.2.13.1. Error codes

10.1.2.13.1.1. Client error codes

Common errors

Error code	Description	HTTP status code
MissingParameter	The input parameter "parameter name" that is mandatory for processing this request is not supplied.	400
InvalidParameter	The specified parameter "Action or Version" is not valid.	400
InvalidAccessKeyId.NotFound	The Access Key ID provided does not exist in our records.	404
IncompleteSignature	The request signature does not conform to Aliyun standards.	400
IllegalTimestamp	The input parameter "Timestamp" that is mandatory for processing this request is not supplied.	400
InvalidOwnerId	The specified OwnerId is not valid.	400
InvalidOwnerAccount	The specified OwnerAccount is not valid.	400

Error code	Description	HTTP status code
InvalidOwner	OwnerId and OwnerAccount can't be used at one API access.	400
Throttling	Request was denied due to request throttling.	400
InvalidAction	The specified action is not valid.	403
ActionUnauthorized	The specified action is not available for you	403
UnsupportedHTTPMethod	This http method not supported.	403
UnsupportedParameter	The parameter "<parameter name>" is not supported.	400
Forbidden.InstanceNotFound	The specified DB instance does not exist.	404
Forbidden.RAM	The user is not authorized to operate the specified resource, or this operation does not support RAM.	403
Forbedden.NotSupportRAM	This action does not support accessed by RAM mode.	403
Forbidden.RiskControl	This operation is forbidden by Aliyun Risk Control system.	403
InsufficientBalance	Your account does not have enough balance.	400
Forbidden.Authentication	This operation is forbidden by Aliyun Realname Authentication system.	403
Invalid<parameter name>.ValueNotSupported	The specified parameter "parameter name" is not valid.	400
Invalid<parameter name>.Malformed	The specified parameter "parameter name n" is not valid.	400
InvalidParameter	The specified parameter "parameter name n" is not valid.	400

Specific errors

Error code	Description	HTTP status code
InvalidRegionId.NotFound	The DBInstanceId provided does not exist in our records.	404
InvalidSecurityIPList.Duplicate	The Security IP address is not in the available range or occupied.	400

Error code	Description	HTTP status code
InvalidSecurityIPListLength.Malformed	The security IP address is beyond the available range or is already used.	400
InvalidEngineVersionInRegion.NotAvailable	The EngineVersion in the Region is not available.	403
InvaildEngineInRegion.NotAvailable	The Engine in the Region is not available.	403
InvaildDBInstanceClassInRegion.NotAvailable	The DBInstanceClass in the Region is not available.	403
OperationDenied	The resource is out of usage.	403
RegionUnauthorized	There is no authority to create instance in the specified region.	403
QuotaExceeded.CreateInstance	The quota of create instance exceeds.	403
InvalidDBInstanceId.NotFound	The specified DBInstanceId does not exist.	404
MissingParameter	The input parameters "DBInstanceClass" and "DBInstanceStorage" all blank or no change.	400
OperationDenied.DBInstanceType	The operation is not permitted due to type of instance.	400
OperationDenied.DBInstanceStorageReduce	The operation is not permitted due to reduce storage.	403
OperationDenied.DBInstanceStatus	The operation is not permitted due to instance status.	403
DependencyViolation	The operation is not permitted due to instance mount read only or guard instance.	403
InvalidConnectionStringPrefix.Duplicate	The connection string is not in the available range or occupied.	400
QuotaExceeded.SwitchTime	The quota of switch time exceed.	400
OperationDenied.LockMode	The operation is not permitted due to lock of instance.	403
InvalidSecurityIps.Duplicate	The quota of security ip exceeds.	400
OperationDenied.CurrentEngineVersion	The operation is not permitted due to specified current version.	400

Error code	Description	HTTP status code
OperationDenied.ReadOnlyDBInstanceLower	The operation is not permitted due to higher read only instance version .	403
OperationDenied.GuardDBInstanceLower	The operation is not permitted due to higher guard instance version .	403
OperationDenied.MasterDBInstanceState	The status of the specified master instance does not support this operation.	403
QuotaExceeded.DBName	The quota of db exceeds.	400
InvalidDBName.Duplicate	The specified DB name is invalid or already exists.	400
InvalidParameter.Keyword	The specified DBName is a reserved keyword.	400
OperationDenied.DBStatus	The status of the database does not support this operation.	403
OperationDenied.DBInstanceEngine	The operation is not permitted due to engine of instance.	403
FTPServiceUnavailable	The service is unavailable now; wait several minutes and try again.	403
QuotaExceeded.Upload	The quota of file exceeds.	403
InvalidFileName.NotCompleted	The specified "FileName" is not completed .	404
InvalidFileName.NotAvailable	The specified "FileName" is not Available .	404
QuotaExceeded.FileSize	The quota of file size exceeds.	403
QuotaExceeded.DBInstanceStorage	The quota of instance storage exceeds.	403
InvalidDBInfo.Malformed	The specified parameter "DBInfo" is not valid or db not exist.	400
OperationDenied.Region	The operation is not permitted due to different region.	403
OperationDenied.Engine	The operation is not permitted due to different engine.	403
OperationDenied.DBInstanceId	The operation is not permitted due to DBInstanceId and SourceDBInstanceId is same.	403

Error code	Description	HTTP status code
InvalidTaskId.NotFound	The ImportId provided does not exist in our records.	400
OperationDenied.IncorrectTaskStatus	The operation is not permitted due to status of import.	403
InvalidAccountName.keyword	The specified AccountName is a reserved keyword.	400
InvalidAccountName.Duplicate	The specified AccountName already exists.	400
QuotaExceeded.AccountName	The quota of account exceeds.	403
OperationDenied.AccountStatus	The status of the account does not support this operation.	403
InvalidDBName.NotFound	The specified database does not exist.	404
OperationDenied.AccountType	The operation is not permitted due to type of account.	403
OperationDenied.BackupJobExists	You cannot perform this operation; a backup job exists.	403
OperationDenied.NoDatabase	The operation is not permitted due to no database.	403
InvalidStartTimeAndEndTime.Malformed	The EndTime must be later than or equal to the StartTime.	400
OperationDenied.BackupJobExists	You cannot perform this operation; a backup job exists.	403
InvalidBackupId.NotFound	The BackupId provided does not exist in our records.	404
OperationDenied.NotFoundBackup	The operation is not permitted due to no backup.	403
OperationDenied.BackupStatus	The operation is not permitted due to type of backup.	403
OperationDenied.BackupMethod	The operation is not permitted method of backup.	403
OperationDenied.TempDBInstanceExists	You cannot perform this operation; a temp instance exists.	403
Forbidden.Authentication	The operation is forbidden by Aliyun Realname Authentication System.	403

Error code	Description	HTTP status code
IncorrectDBInstanceConnType	Current DB instance conn type does not support this operation.	404
IncorrecttVpcId.Mismatch	The specified parameter "VpcId" is not valid.	400
IntranetNetTypeNotExists	Current DB instance net type does not support this operation.	404
InvalidDBInstanceName.NotFound	The DBInstanceId provided does not exist in our records.	403
InvalidConnectionMode.ValueNotSupported	The specified parameter "ConnectionMode" is not valid.	400
InvalidConnectionString.Duplicate Specified	connection string already exists in the Aliyun RDS.	403
InvalidConnectionString.Duplicate Specified	connection string or port want to be modified is the same with current net type.	400
InvalidConnectionStringPrefix.Duplicated	The specified connection string already exists.	403
InvalidCurrentConnectionString.NotFound	Specified current connection string doesn't exist.	400
InvalidDBInstanceId.NotFound	The specified DBInstanceId does not exist.	400
InvalidDBInstanceId.QuotaExceeded	The quota of instance id exceeds.	400
InvalidDBInstanceNetType.NotFound	The Specified DB instance net type is not found.	404
InvalidDBinstanceNetType.ValueNotSupport	The specified parameter "DBinstanceNetType" is not valid.	400
InvalidDBInstanceType.ValueNotSupport	The specified parameter "DBInstanceType" is not valid.	400
InvalidEngineVersion.Malformed	The specified parameter "EngineVersion" is not valid.	400
InvalidInstanceNetworkType.ValueNotSupported	The specified parameter "InstanceNetworkType" is not valid.	400
InvalidParameter	The specified parameter "dbInstanceId" is not valid.	400
InvalidPort.Malformed	Specified port is not valid.	400

Error code	Description	HTTP status code
InvalidPrivateIpAddress.Duplicated	Specified private IP address is duplicated.	400
InvalidPrivateIpAddress.Mismatch	Specified private IP address is not in the CIDR block of virtual switch.	400
InvalidVPCId.NotFound	The specified connection string or port does not match the current network type.	400
InvalidVSwitchId.Mismatch	Specified instance and virtual switch are not in the same zone.	400
InvalidVSwitchId.NotFound	Specified virtual switch is not found in specified VPC.	400
NetTypeExists	Specified net type already existed.	400
NetTypeExists	Specified public net type already existed.	403
OperationDenied.DBInstanceNetType	The network type of the specified instance does not support this operation.	403
OperationDenied.DBInstanceStatus	The specified connection string or port does not match the current network type.	403
OperationDenied.DBInstanceType	The operation is not permitted due to type of instance.	403
OperationDenied.LockMode	The instance is locked.	403
OperationDenied.Switch	Specified instance cannot be switched.	400
OperationDenied.Switch	Specified instance cannot be switched to VPC.	403
OperationDenied.SwitchToVPC	Specified instance cannot be switched to VPC.	403
OperationDenied	The requested resource is sold out in the specified zone; try other types of resources or other regions and zones.	403
OperationDenied	The vpc cloudinstanceIp is use, please check params.	406
OperationDenied	The vpc service is error, please check params.	400
PARAMETER_ERROR	The vpc request parameter may not be null.	406
PARAMETER_MUST_NOT_NULL	The parameter must not be null.	406

Error code	Description	HTTP status code
PublicConnectionExists	PublicConnection exists.	403
bpcIzNoNotEqualsRdsMultIzNo	Specified vpc IzNo not equal rds IzNo.	400
IncorrectDBInstanceState	CurrentDB instance state does not support this operation.	403
IncorrectDBInstanceType	CurrentDB instance type does not support this operation.	400
IncorrectDBInstanceLockMode	CurrentDB instance lock mode does not support this operation.	400
ParamNotSupportedForCurrentVersion	Parameteris not supported for current version.	400
InvalideStatus.Format	MigrateTask Status is not valid.	400
EngineVersionNotSupported	EngineVersion specified cannot be replicate with the source DB Instance.	400
EngineNotSupported	Engine specified cannot be supported the operation..	400
ConnectionModeNotSupported	ConnectionMode specified cannot be replicate with the source DB Instance.	400
InvalidConfigurationValue.Malformed	Specified ConfigurationValue is not valid.	403
InvalidConfigurationValueStatus.Malformed	Specified ProxyConfigurationValue (status) is not valid..	403
InvalidConfigurationValueOrther.Malformed	Specified ProxyConfigurationValue (check_interval_seconds or max_failed_login_attempts or blocking_seconds) is not valid.	403
ProxyConnectionPersistExists	Specified same ProxyConnectionPersist already exists.	400
ProxyConnectionPersist.NotFound	Specified same ProxyConnectionPersist already exists.	400
ProxyConnectionPersist.NotFound	Specified ProxyConnectionPersist is not found.	400
ProxyConnectionPersistParametersInvalid	ProxyConnectionPersist parameter out of range	400

Error code	Description	HTTP status code
InvalidConfigValue	ProxyConnectionPersist parameter config table not exits or data error.	400
InvalidDBInstance.NotFound	Specified instance does not exist or not support.	400
ProxyConnectionPersist.NotFound	Specified ProxyConnectionPersist is not found.	400
ProxyConnectionPersistParametersInvalid	ProxyConnectionPersist parameter out of range.	400
InvalidConfigValue	parameter config table not exits or data error.	400

10.1.2.13.1.2. Server error codes

Error code	Error message	HTTP status code
ServiceUnavailable	The request has failed due to a temporary failure of the server.	503
InternalError	The request processing has failed due to some unknown error, exception or failure. The request processing	500

10.1.2.13.2. Instance types

Instance types

Instance type	vCPU	Memory (MB)	Storage space (GB)	Storage space (Mbit/s)	Disk type
gpdb.group.segsdx1	1	8,192	80	150	SSD
gpdb.group.segsdx2	2	16,384	160	300	SSD
gpdb.group.segsdx16	16	131,072	1,280	2,400	SSD

10.1.2.13.3. Performance parameters

Performance parameters

API parameter	Description

API parameter	Description
Gpdb_IOPS	The input/output operations per second (IOPS) of the instance. It is in the data_iops&write_iops&read_iops format.
IOPSUsage	The IOPS usage rate of the instance.
CpuUsage	The CPU utilization of the instance.
ConnectionUsage	The connection usage rate of the instance.
Gpdb_session	The number of connections to the instance.
Gpdb_SpaceUsage	The disk usage of the instance. Unit: MB. It is in the ins_size&data_size&log_size&other_size format.
DiskUsage	The disk usage rate of the instance.
Gpdb_BPS	The bytes per second (BPS) size of the instance. Unit: byte. It is in the data_bps&write_bps&read_bps format.
BPSUsage	The BPS usage rate of the instance.
MemoryUsage	The memory usage rate of the instance.
Gpdb_memory	The memory usage of the instance. Unit: MB.

10.1.2.13.4. Instance states

Instance states

State	Description
Creating	The instance is being created.
Running	The instance is running.
Deleting	The instance is being deleted.
Rebooting	The instance is being restarted.
DBInstanceClassChanging	The instance specifications are being changed.
Transfering	The instance is being migrated.
EngineVersionUpgrading	The engine version is being upgraded.
TransferingToOtherInstance	The data is being migrated to other instances.
GuardDBInstanceCreating	The disaster recovery instance is being created.

State	Description
Restoring	The instance is being restored from a backup.
Importing	Data is being imported into the instance.
ImportingFromOtherInstance	Data is being imported into the instance from another instance.
DBInstanceNetTypeChanging	The network type is being changed.
GuardSwitching	The instance is undergoing a failover.

10.1.2.13.5. Terms

Terms

Term	Full name	Description
DBInstance	database instance	A database service process that takes up physical memory independently. You can configure different memory size and disk space. The memory size determines the performance of the instance, such as the IOPS and connections.
DBInstanceId	database instance ID	A globally unique name that identifies an instance.
Group	compute node	A compute node is the minimum computing and resource storage unit of an AnalyticDB for PostgreSQL database that you can purchase.
DBInstanceClass	compute node type	The types are as follows: • **gpdb.group.segsdx1**: 1 vCPU, 8 GB of memory, and 80 GB of SSD storage space. • **gpdb.group.segsdx2**: 2 vCPUs, 16 GB of memory, and 160 GB of SSD storage space. • **gpdb.group.segsdx16**: 16 vCPUs, 128 GB of memory, and 1.28 TB of SSD storage space. Each compute node consists of a primary node and a secondary node that have identical specifications.

Term	Full name	Description
DBInstanceGroupCount	node count	The number of compute nodes in the AnalyticDB for PostgreSQL instance that you have purchased. For example: If the value of DBInstanceClass is gpdb.group.segsdx2, the instance has two compute nodes. Total available resources: 4 vCPUs, 32 GB of memory, and 320 GB of SSD storage space. For resource and performance reasons, the valid value of DBInstanceGroupCount strictly corresponds to DBInstanceClass: • gpdb.group.segsdx1: 2 • gpdb.group.segsdx2: 2, 4, and 8 • gpdb.group.segsdx16: 2 and 4
DB Account	database account	An account identifies the access permissions on a database. A database can be created with multiple accounts, and an account can be associated with multiple databases.
AccountName	database account name	The name of a database account identifies the account. The name must be unique among all the database accounts that are in the same instance.
Region	region	The region indicates the data center in the specified region.

11.KVStore for Redis

11.1. Developer Guide

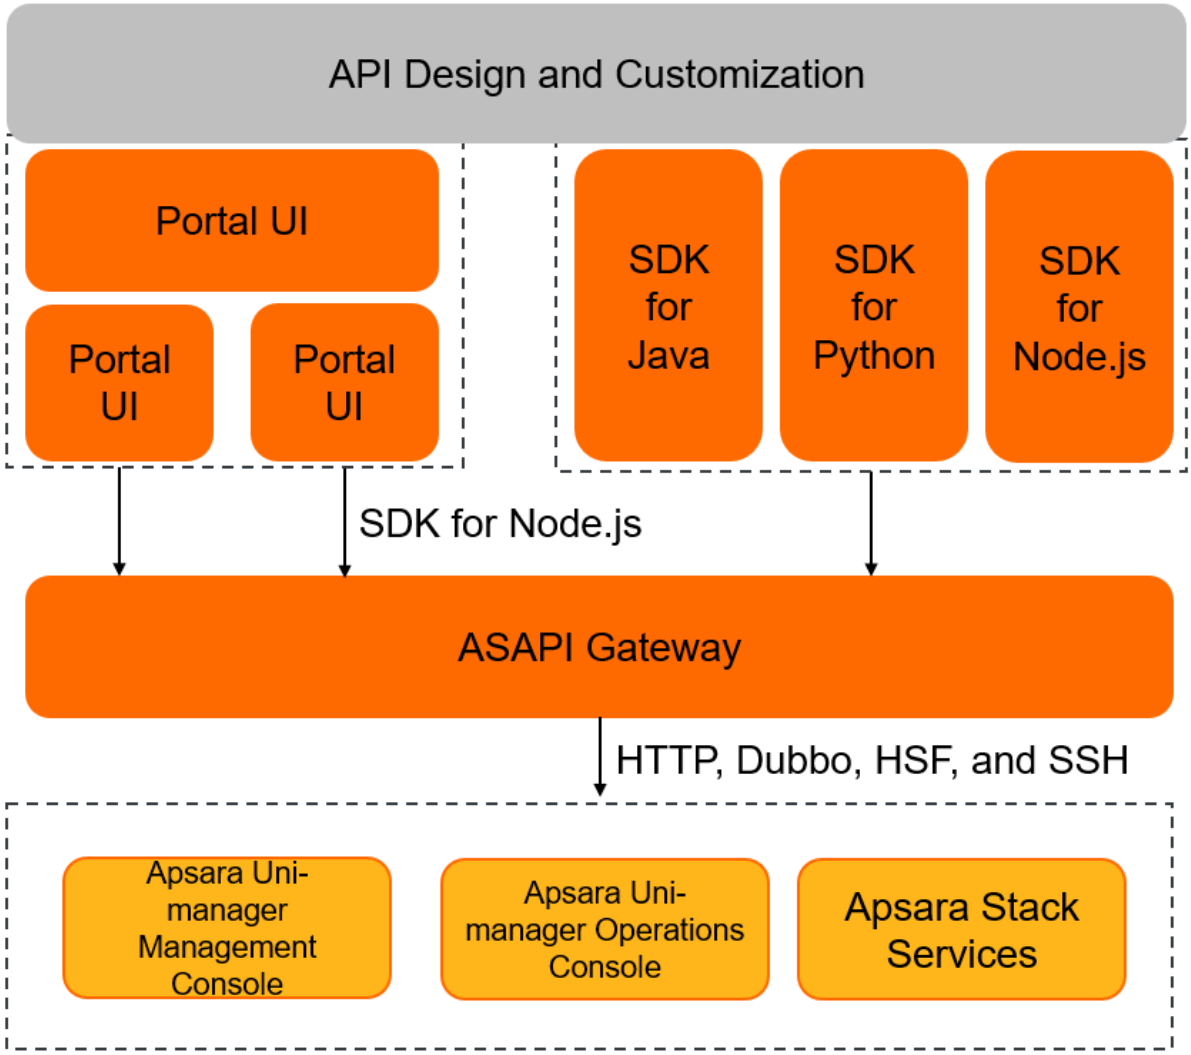
11.1.1. Call Apsara Stack SDK by using ASAPI

11.1.1.1. 文档标题缺失，请补全后重新导出

11.1.1.1.1. ASAPI overview

This topic describes the architecture and features of the Apsara Stack API (ASAPI).

The ASAPI is a unified ingress gateway for Apsara Stack services and a main component of the Apsara Uni-manager Management Console. The ASAPI provides a unified method for you to manage and make API calls. You can use Apsara Stack SDK to centrally make API calls to Apsara Stack services, including Elastic Compute Service (ECS) and Virtual Private Cloud (VPC).



The ASAPI allows you to make API calls to manage and maintain Apsara Stack services.

- Make API calls to implement enterprise-grade management. For example, you can manage organizations, users, roles, resource sets, and logon policies. These operations are provided by the Apsara Uni-manager Management Console.
- Make API calls to manage operations. For example, you can manage quotas, usage statistics, specifications, and password policies. These operations are provided by the Apsara Uni-manager Management Console.
- Make API calls to manage resources. For example, you can create, delete, query, or modify cloud resources. These operations are provided by Apsara Stack services. If you call an API operation to create an ECS instance or a VPC, the API operation is provided by ECS or VPC.
- Make API calls to query monitoring metrics of Apsara Stack services. These operations are provided by the Apsara Uni-manager Management Console.
- Make API calls to perform O&M. For example, you can manage monitoring and alerting, inventories, tasks, and physical servers. These operations are provided by the Apsara Uni-manager Operations Console.

For more information, see the developer guide of the corresponding Apsara Stack service. For information about API operations used to manage organization users, see *Apsara Uni-manager Management Console Developer Guide*. For information about the API operation used to create an ECS instance, see *ECS Developer Guide*.

> **Note** If the "Use Apsara Stack SDK to make API calls" section is included in the developer guide of an Apsara Stack service, the ASAPI is supported by the Apsara Stack service. In this case, you can make API calls based on the developer guide.

11.1.1.1.2. Preparations

11.1.1.1.2.1. Log on to the API Tool console

You can log on to the API Tool console from the Apsara Uni-manager Management Console.

Prerequisites

- The URL of the Apsara Uni-manager Management Console is obtained from the deployment personnel before you log on to the Apsara Uni-manager Management Console.
- We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL of the Apsara Uni-manager Management Console. Press the Enter key.
2. Enter your username and password.

   Obtain the username and password that you can use to log on to the console from the operations administrator.

> **Note** When you log on to the Apsara Uni-manager Management Console for the first time, you must change the password of your username. Your password must meet complexity requirements. The password must be 10 to 32 characters in length and must contain at least two of the following character types:
>
> - Uppercase or lowercase letters
> - Digits
> - Special characters, which include ! @ # $ %

3. Click **Log On**.
4. In the top navigation bar, choose **Products > Others > API Tool**.

11.1.1.1.2.2. View information about API operations

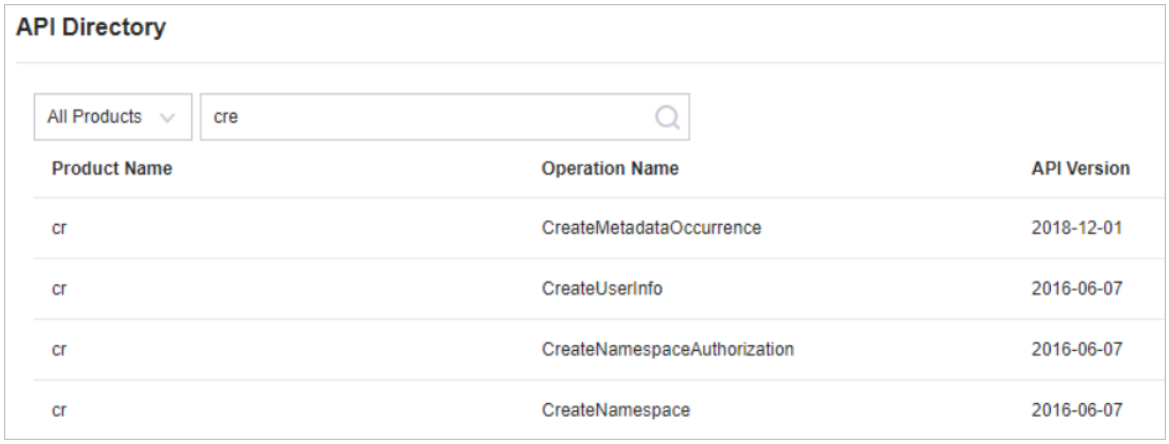
This topic describes how to view information about API operations. Before you use SDKs, obtain service names, API operation names, and API operation versions.

Context

The API operations on the API Directory page are only for reference. For information about how to call API operations, see developer guides of the corresponding cloud services. If the information on the API Directory page is inconsistent with that in the developer guide of the corresponding cloud service, the information in the developer guide prevails.

Procedure

1. Go to the API Tool console. For more information, see Log on to the API Tool console.
2. In the left-side navigation pane, click **API Directory**.
3. On the **API Directory** page, select the desired service from the drop-down list, enter a keyword of an API operation name in the search box, and then click the search icon.



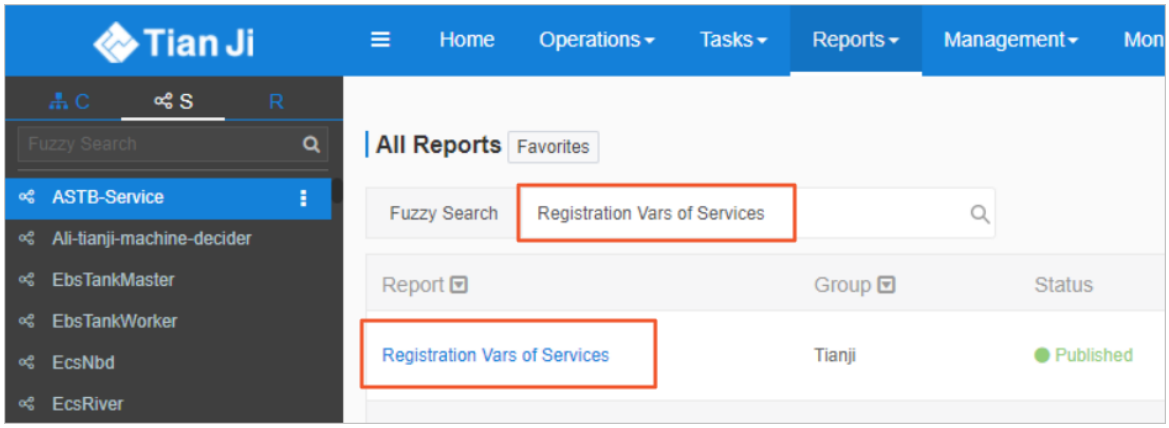
4. Then, you can view the service name, API operation name, and API operation version.

11.1.1.1.2.3. Generate an endpoint for the ASAPI

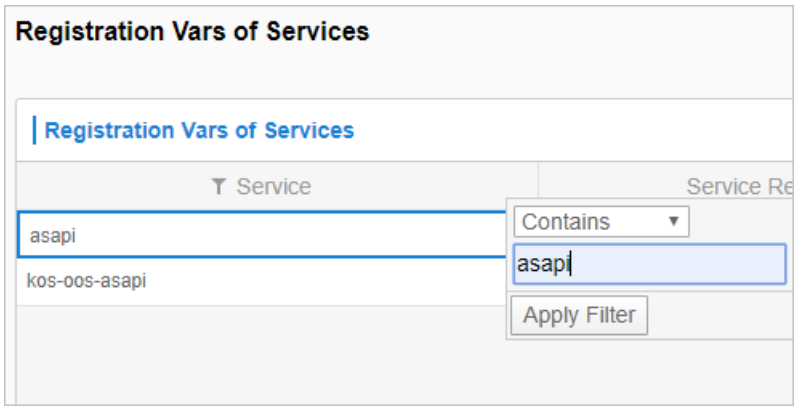
This topic describes three methods used to generate an endpoint for the Apsara Stack API (ASAPI).

Method 1: Use Registration Vars of Services to generate an endpoint

1. Log on to Apsara Infrastructure Management Framework.
   i. Log on to the Apsara Uni-manager Operations Console.
   ii. In the top navigation bar, click **O&M**.
   iii. In the left-side navigation pane, choose **Product Management** > **Products**.
   iv. In the Apsara Stack O&M section, click **Apsara Infrastructure Management Framework**.
2. In the left-side navigation pane, click **Reports**.
3. On the **All Reports** page, search for `Registration Vars of Services` and click the report name.



4. On the **Registration Vars of Services** page, click the icon next to **Service** and search for `asapi`.



5. Find the asapi service, right-click in the **Service Registration** column, and then select **Show More** from the shortcut menu.

   In the **Details** dialog box, obtain the value of **asapi.public.endpoint**.
6. Generate an endpoint for the ASAPI based on the following format:

```
https://<asapi.public.endpoint>/asapi/v3
```

Method 2: Use cluster resources to generate an endpoint

1. Log on to Apsara Infrastructure Management Framework.
   i. Log on to the Apsara Uni-manager Operations Console.

ii. In the top navigation bar, click **O&M**.

iii. In the left-side navigation pane, choose **Product Management** > **Products**.

iv. In the Apsara Stack O&M section, click **Apsara Infrastructure Management Framework**.

2. Go to the cluster operations page.

i. In the left-side navigation pane, choose Operations > Cluster Operations.

ii. In the **Cluster** search box, enter `ascm`.

iii. Find the cluster that you want to manage and click **Operations** in the **Actions** column.

3. Obtain the value of the domain parameter.

i. Click the Cluster Resources tab.

ii. In the **Name** field, search for `asapi_dns_public`.

iii. Click **Details** in the **Application Parameter** column.

In the **Application Parameter** message, obtain the value of the **domain** parameter.

4. Generate an endpoint for the ASAPI based on the following format:

```
https://<domain>/asapi/v3
```

Method 3: Concatenate strings to generate an endpoint

You can also concatenate strings to generate an endpoint based on the following format:

```
https://public.asapi.<region>.<internet-domain>/asapi/v3
```

> **Note**
>
> 1. Replace <region> with your actual region ID. For information about how to query a region ID, see Query a region ID.
> 2. Replace <internet-domain> with the root domain of your Apsara Stack service. To obtain the root domain, contact Apsara Stack O&M personnel. Take note of this point: Use the internet-domain parameter instead of the intranet-domain parameter.

If the **region** value is `cn-****-****-d01` and the **internet-domain** value is `inter.****.****.com`, the following endpoint can be generated:

```
https://public.asapi.cn-****-****-d01.inter.****.****.com/asapi/v3
```

11.1.1.1.2.4. Obtain Apsara Stack SDKs

The Apsara Stack API (ASAPI) is a unified portal provided by Apsara Stack. You can use the ASAPI to connect to all Apsara Stack services. Apsara Stack provides SDKs for API calls.

For more information about how to obtain Apsara Stack SDKs, see Apsara Stack documentation.

11.1.1.1.2.5. Obtain an AccessKey pair

An AccessKey pair that consists of an AccessKey ID and an AccessKey secret is used to implement symmetric encryption. This helps you verify the identity of a requester. The AccessKey ID is used to identify a user. The AccessKey secret is used to encrypt the signature string. This topic describes how to obtain an AccessKey pair.

Prerequisites

An account of the operations administrator or the level-1 organization administrator is obtained. Only an operations administrator or a level-1 organization administrator can obtain an AccessKey pair.

Context

If you need to make API calls to the Apsara Uni-manager Management Console or other Apsara Stack services, we recommend that you use the AccessKey pair of a personal account. If you use the AccessKey pair of a personal account, configure the request headers that are described in the following table for access control. Otherwise, an error that indicates insufficient permissions can occur.

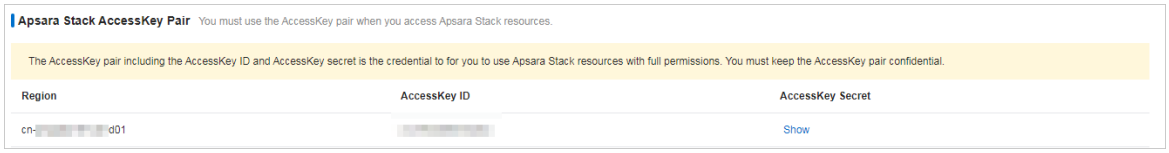
Parameter	Description
x-acs-regionid	The ID of the region, for example, cn-hangzhou-*.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console. For information about how to obtain an organization ID, see the "GetOrganizationList" section in Apsara Uni-manager Management Console Developer Guide.
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console. For information about how to obtain a resource set ID, see the "ListResourceGroup" section in Apsara Uni-manager Management Console Developer Guide.
x-acs-instanceid	The ID of the instance to which you make API calls. If you need to make API calls to an Elastic Compute Service (ECS) instance, obtain the ID of the ECS instance on the Instances page.

Warning The AccessKey pair of a personal account is managed and controlled by the permission system of the Apsara Uni-manage Management Console. If you need to obtain the AccessKey pair of an account that has permissions on an organization, make sure that your operation is allowed by an administrator. This ensures security. The account that has permissions on an organization is a privileged account.

Obtain the AccessKey pair of a personal account

To obtain the AccessKey pair of a personal account, perform the following operations:

1. Log on to the Apsara Uni-manager Management Console.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and click **User Information**.
3. In the **Apsara Stack AccessKey Pair** section, obtain the AccessKey pair.



> **Note** The AccessKey pair that consists of an AccessKey ID and an AccessKey secret is the credential for you to have full permissions on Apsara Stack resources. Keep your AccessKey pair confidential.

Obtain the AccessKey pair of an account that has permissions on an organization

To obtain the AccessKey pair of an account that has permissions on an organization, perform the following operations:

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Organizations**.
4. In the Organizations navigation tree, click the name of the organization that you want to manage.
5. On the right side of the page, click **Obtain AccessKey Pair**.
6. In the message that appears, obtain the AccessKey pair of the account that has permissions on the organization.

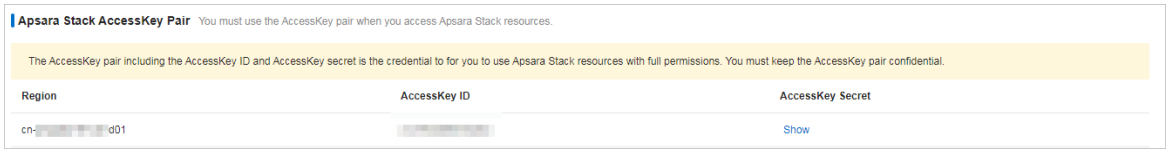
> **Note** The system automatically allocates an AccessKey pair to the account that has permissions on the level-1 organization. The same AccessKey pair is used by the accounts that have permissions on the subordinate organizations.

11.1.1.1.2.6. Query a region ID

When you use Apsara Stack SDK for Node.js to make API calls, specify a region ID. You can obtain a region ID in the Apsara Uni-manager Management Console.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and click **User Information**.
3. In the **Apsara Stack AccessKey Pair** section, view the region ID.



11.1.1.1.3. Common parameters

Common request parameters must be included in all API requests.

Sample common parameters

The following table describes the common parameters that are used when you call API operations supported by the Apsara Stack API (ASAPI).

Parameter	Type	Required	Description
Action	String	Yes	The operation that you want to perform. For more information, see View information about API operations.
Product	String	Yes	The name of the service.
Version	String	Yes	The version of the API operation. For more information, see View information about API operations.
RegionId	String	Yes	The ID of the region. For more information, see Query a region ID.
AccessKeyId	String	Yes	The AccessKey ID used to connect to the service. For more information, see Obtain an AccessKey pair.
Signature	String	Yes	The signature string of the current request. For more information about how signatures are calculated, see Request signatures.

Parameter	Type	Required	Description
SignatureMethod	String	Yes	The encryption method of the signature string. Valid values: HMAC-SHA1 and HMAC-SHA256.
SignatureVersion	String	Yes	The version of the signature encryption algorithm. Valid values: 1.0 and 2.0.
SignatureNonce	String	Yes	A unique, random number used to prevent replay attacks. You must use different numbers for different requests.
Timestamp	String	Yes	The timestamp of the request. Specify the time in the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time must be in UTC. Sample value: 2018-01-01T12:00:00Z.
Format	String	Yes	The format in which to return the response. Set the value to JSON.

Note

The `Signature`, `SignatureMethod`, `SignatureVersion`, `SignatureNonce`, `Timestamp`, and `Format` parameters are encapsulated into Apsara Stack SDK. You do not need to configure these parameters.

11.1.1.1.4. SDK description

11.1.1.1.4.1. Use Apsara Stack SDK for Java to call API operations

This topic describes how to obtain and use Apsara Stack SDK for Java to call API operations.

Prerequisites

- An authorized account and an AccessKey pair are obtained. The AccessKey pair consists of an AccessKey ID and an AccessKey secret. For more information about how to obtain an AccessKey pair in the Apsara Uni-manager Management Console, see Obtain an AccessKey pair.
- The endpoint of the Apsara Stack API (ASAPI) is obtained. For more information, see Generate an endpoint for the ASAPI.
- Apsara Stack SDK for Java 1.8 or later is installed.

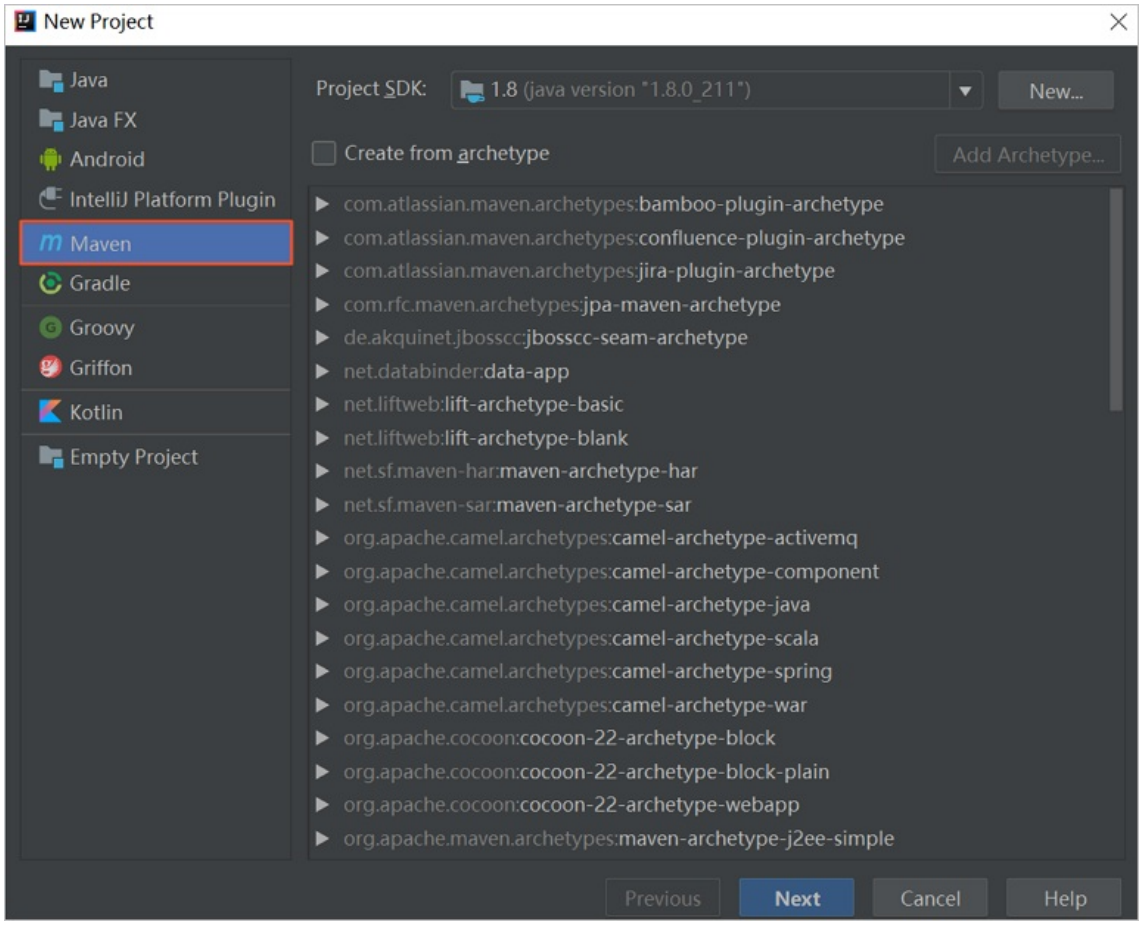
Background information

The help center of Apsara Stack provides Maven dependencies and JAR files for Apsara Stack SDK for Java. You can write code to use Apsara Stack SDK for Java to call API operations.

In this example, the Windows 10 64-bit OS and IntelliJ IDEA are used.

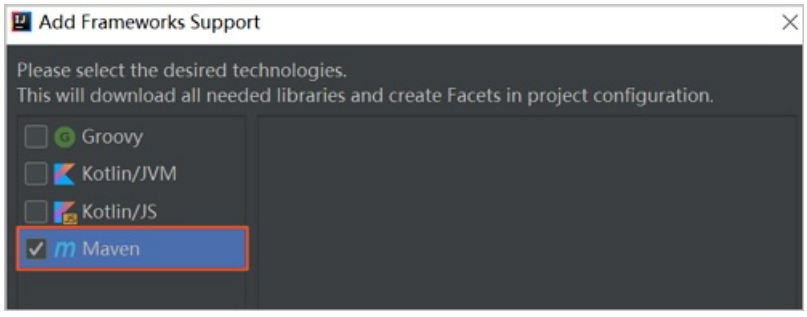
Procedure

1. Use one of the following methods to configure Maven in IntelliJ IDEA. Maven is a tool used for project management.
   - Use Maven that is integrated in IntelliJ IDEA.
   - Download Maven based on the OS that you are using from the official website and configure Maven. For more information, see Download Maven.
2. Obtain the Maven dependencies for Apsara Stack SDK for Java from the official website. For more information about how to obtain the dependencies, see Obtain the core package for ASAPI.
3. Use one of the following methods to create a Maven project:
   - Method 1: Create a Maven project in IntelliJ IDEA.

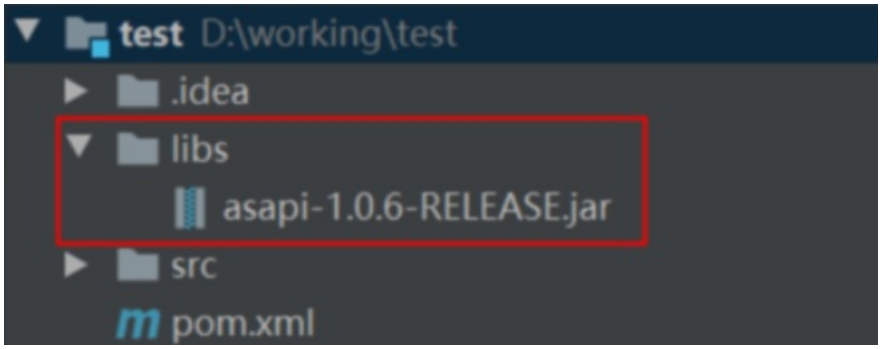


- Method 2: Convert an existing project to a Maven project.
  a. Right-click the project that you want to convert and select **Add Framework Support...**.

  b. Select **Maven** and click **OK**.



4. Create a folder named libs in the root directory of the project. Then, add the JAR file of Apsara Stack SDK for Java to the libs folder, as shown in the following figure.



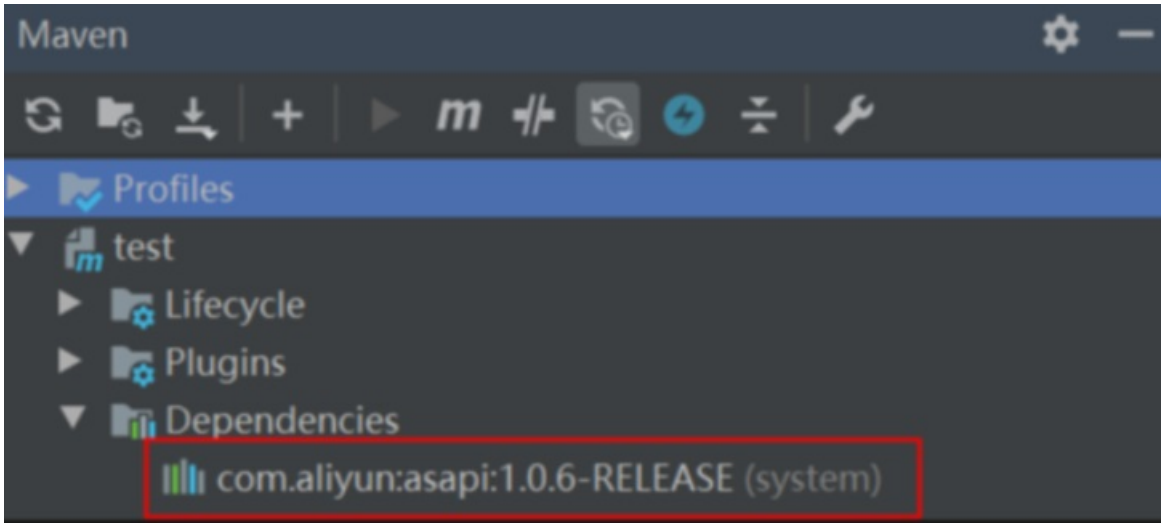
5. Add the dependencies of Apsara Stack SDK for Java to the pom.xml file in the project directory.

```
<dependencies>
    <dependency>
        <groupId>com.aliyun</groupId>
        <artifactId>asapi</artifactId>
        <version>1.0.6-RELEASE</version>
        <scope>system</scope>
        <systemPath>${project.basedir}/libs/asapi-1.0.6-RELEASE.jar</systemPath>
    </dependency>
  <dependency>
        <groupId>com.alibaba</groupId>
        <artifactId>alicrypto-java-aliyun</artifactId>
    <version>1.0.4</version>
    <systemPath>${project.basedir}/libs/alicrypto-java-aliyun-1.0.4.jar</systemPath>
  </dependency>
  <dependency>
    <groupId>com.aliyun</groupId>
    <artifactId>gmsse</artifactId>
    <version>1.1.0</version>
    <systemPath>${project.basedir}/libs/gmsse-1.1.0.jar</systemPath>
  </dependency>
</dependencies>
```

> **Note** Replace `1.0.6-RELEASE` with the actual version of Apsara Stack SDK for Java.

6. On the right side of IntelliJ IDEA, view information in the Maven section.

If the information in the following figure appears, the dependencies are added.



Use Apsara Stack SDK for Java

You can use the GET or POST method to call API operations provided by the ASAPI. The following sample code shows how to call API operations:

```
// 1. Create a connection to an ASClient object.
ASClient client = new ASClient();
// 2. Configure the identifier of the requester. This parameter is required and used only f
or identification. You can set this parameter to a random value.
client.setSdkSource("<The identifier of the requester>");
Map<String, Object> parameters = new HashMap<String, Object>();
// 3. Configure the parameters for authorization. The parameter values vary based on your e
nvironment.
// The AccessKey ID of your Apsara Stack tenant account.
parameters.put("AccessKeyId","<AccessKey ID>");
// The AccessKey secret of your Apsara Stack tenant account.
parameters.put("AccessKeySecret", "<AccessKey Secret>");
// The ID of the region.
parameters.put("RegionId", "<your RegionID>");
// 4. Configure parameters for an API call. In this example, the Product, Action, and Versi
on parameters are configured.
parameters.put("Product", "<The name of the service>");
parameters.put("Action", "<The name of the API operation>");
parameters.put("Version", "<The version of the API operation>");
// 5. Configure operation-specific parameters.
parameters.put("<The name of the operation-specific parameter>", "<The value of the operati
on-specific parameter>");
// 6. Configure request headers and the encryption method for the signature string. Valid v
alues of the SignatureMethod parameter: HMAC-SHA1 and HMAC-SHA256. By default, HMAC-SHA256
is used.
Map<String, String> headers = new HashMap<String, String>();
//headers.put("SignatureMethod", "HMAC-SHA1");
headers.put("x-acs-regionid", "<your-regionid>");
headers.put("x-acs-resourcegroupid", "<your-resourcegroupid>");
headers.put("x-acs-organizationid", "<your-organizationid>");
headers.put("x-acs-instanceid", "<your-instanceid>");
// 7. Make an API call. We recommend that you use the doPost() method.
// Configure the time-out period for a connection.
//client.setConnectTimeout(10000);
// Configure the time-out period for a request.
// client.setSocketTimeout(10000);
String result = client.doPost(endpoint, headers, parameters);
System.out.println(result);
```

Configure a proxy

If you need to use a proxy to make API calls, use the following sample code to configure the proxy:

```
Cloud cloud = new Cloud();
// Configure the IP address of the proxy.
cloud.setConfig("proxy_host", "<IP>");
// Configure the port used by the proxy.
cloud.setConfig("proxy_port", "<Port>");
// 1. Create a connection to an ASClient object.
ASClient client = new ASClient(cloud);
```

Request headers

Parameter	Description
x-acs-regionid	The ID of the region. For more information about how to obtain a region ID, see Query the region ID.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console.
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console.
x-acs-instanceid	The ID of the instance to which you make API calls.

11.1.1.1.4.2. Use Apsara Stack SDK for Python to call API operations

This topic describes how to use Apsara Stack SDK for Python to call API operations provided by the Apsara Stack API (ASAPI).

Preparations

- An authorized account and an AccessKey pair are obtained. The AccessKey pair consists of an AccessKey ID and an AccessKey secret. For more information about how to obtain an AccessKey pair in the Apsara Uni-manager Management Console, see Obtain an AccessKey pair.
- The endpoint of the ASAPI is obtained. For more information, see Generate an endpoint for the ASAPI.

Install Apsara Stack SDK for Python

1. Download the required version of Apsara Stack SDK for Python. For more information, see Obtain Apsara Stack SDKs.
2. Upload the compressed file of Apsara Stack SDK for Python to the host from which you want to send API requests and extract the file. Then, run the following code in the directory of the extracted files to install Apsara Stack SDK for Python:

```
# Install Apsara Stack SDK for Python 2.x.
pip install aliyun-python2-sdk-asapi-2.4.7.tar.gz
# Install Apsara Stack SDK for Python 3.x.
pip3 install aliyun-python3-sdk-asapi-2.4.7.tar.gz
```

> **Note**
>
> Replace `2.4.7` with the actual version of Apsara Stack SDK for Python.

Sample requests

You can use the GET or POST method to call API operations provided by the ASAPI.

```
    # 1. Import dependencies.
    from aliyunsdkasapi.ASClient import ASClient
    from aliyunsdkasapi.AsapiRequest import AsapiRequest

    if __name__ == '__main__':
     # 2. Create a request. The Product parameter specifies the name of the service. The Ver
sion parameter specifies the version of the API operation. The Action parameter specifies t
he operation that you want to perform. The asapi-endpoint parameter specifies the endpoint
of the ASAPI.
     req = AsapiRequest("<Product>", "<Version>", "<Action>", "<asapi-endpoint>")
     # 3. Configure operation-specific parameters.
     req.add_body_params("<key>", "<value>")
     # 4. Configure request headers.
     req.add_header("x-acs-resourcegroupid", "<your-resourcegroupid>");
     req.add_header("x-acs-organizationid", "<your-organizationid>");
     req.add_header("x-acs-regionid", "<your-regionid>");
     req.add_header("x-acs-instanceid", "<your-instanceid>");
     # 5. Configure a request method.
     req.set_method("POST")
     # 6. Configure initialization parameters for an ASClient object. The parameter values v
ary based on your environment. The timeout parameter specifies the time-out period for a re
quest. The cert_file parameter specifies the certificate. The verify parameter specifies wh
ether to verify the certificate.
     as_client = ASClient("<accesskeyid>", "<accesskeysecret>", "<regionid>",timeout=1000,
             cert_file=None,
             verify=False)
     # Configure the identifier of the requester. This parameter is required and used only f
or identification. You can set this parameter to a random value.
     as_client.setSdkSource("<The identifier of the requester>")
     response = as_client.do_request(req)
     print(response)
```

Request headers

Parameter	Description
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console.
x-acs-regionid	The ID of the region. For more information about how to obtain a region ID, see Query a region ID.
x-acs-instanceid	The ID of the instance to which you make API calls.

Configure a proxy

Perform the following steps to configure a proxy:

1. Import OS dependencies.

```
import os
```

2. Configure one or more proxies.

```
# Before you make an API call, configure one or more proxies.
os.environ['http_proxy'] = "http://x.x.x.x:xxxx"
os.environ['https_proxy'] = "https://x.x.x.x:xxxx"
```

11.1.1.1.4.3. Use Apsara Stack SDK for Node.js to call API operations

This topic describes how to obtain and use Apsara Stack SDK for Node.js to call API operations.

Preparations

- An authorized account and an AccessKey pair are obtained. The AccessKey pair consists of an AccessKey ID and an AccessKey secret. For more information about how to obtain an AccessKey pair in the Apsara Uni-manager Management Console, see Obtain an AccessKey pair.
- The endpoint of the Apsara Stack API (ASAPI) is obtained. For more information, see Generate an endpoint for the ASAPI.
- A region ID is obtained. For more information about how to obtain a region ID, see Query the region ID.

Add dependencies

Run the following command to install Apsara Stack SDK for Node.js:

```
tnpm install --save @ali/asapi-nodejs-sdk
```

Use Apsara Stack SDK for Node.js

The following sample code shows how to use Apsara Stack SDK for Node.js to make API calls:

```
// 1. Import the dependencies of Apsara Stack SDK for Node.js.
const Controller = require('egg').Controller;
const ASAPIClient = require('@ali/asapi-nodejs-sdk');
// 2. Configure the parameters.
const cnofig = {
    API_GATEWAY: '<The endpoint of the ASAPI>',
    regionId: '<The ID of the region in which the Apsara Stack service is deployed>',
    accessKeyId: '<The AccessKey ID of your Apsara Stack tenant account>',
    accessKeySecret: '<The AccessKey secret of your Apsara Stack tenant account>'
};
// 3. Initialize a client for API calls.
const AsapiClient = new ASAPIClient(cnofig, this.ctx);
// 4. Configure request parameters.
const params = {
    "Action": "<The name of the API operation>",
    "Product": "<The name of the service that provides the API operation>",
    "Version": "<The version of the API operation>",
    "regionId": '<The ID of the region in which the Apsara Stack service is deployed>',
      "<The name of the operation-specific parameter required by the API operation>": "<The
value of the operation-specific parameter>"
}
// 5. Configure request headers.
AsapiClient.addHeader('x-acs-caller-sdk-source', '<The identifier of the requester>')
AsapiClient.addHeader('x-acs-roleid', '<The ID of the role>')
AsapiClient.addHeader('x-acs-userid', '<The ID of the user>')
AsapiClient.addHeader('x-acs-organizationid', '<your-organizationid>')
AsapiClient.addHeadert("x-acs-regionid", "<your-regionid>");
AsapiClient.addHeader("x-acs-resourcegroupid", "<your-resourcegroupid>");
AsapiClient.addHeader("x-acs-instanceid", "<your-instanceid>");
// 6. Make an API call and obtain the response.
try {
  const res = await AsapiClient.doRequest(cnofig.API_GATEWAY, params, {
    method: 'POST', // The request method.
    formatParams: false, // Specifies whether to format parameters and capitalize the first
letter of each parameter.
    enableProxy: true, // Specifies whether to configure a proxy.
    proxy: 'http://x.x.x.x:xxxx',
    timeout: 10000, // The time-out period.
  // ca: , // The certificate issued by a certificate authority (CA). For more information,
visit https://nodejs.org/api/https.html#https_https_request_options_callback.
  })
  console.log(res)
} catch (e) {
  console.log(e)
}
```

Disable certificate validation

The following sample code shows how to disable certificate validation:

```
Configure the environment variable.
NODE_TLS_REJECT_UNAUTHORIZED=0
```

Request headers

Parameter	Description
x-acs-regionid	The ID of the region. For more information about how to obtain a region ID, see Query the region ID.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console.
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console.
x-acs-instanceid	The ID of the instance to which you make API calls.
x-acs-caller-sdk-source	The custom name of the requester or the system. This parameter is used to identify the source of the API request.
x-acs-roleid	The ID of the role.
x-acs-userid	The ID of the user.

11.1.1.1.4.4. SDK for POP

SDK for Java

Before you use Apsara Stack API (ASAPI) SDK for POP for Java to access ASAPI, you must know the remote procedure call (RPC) and resource-oriented architecture (ROA) styles that are supported for API calls. ASAPI is compatible with both styles. Their difference lies in the ASAPI endpoints that are used for API calls.

Prerequisites

- An Alibaba Cloud SDK package is downloaded for the service that you want to access. The required dependencies are installed.
- SSL certificate validation is ignored for requests over HTTPS.

Background information

ASAPI supports only the HTTPS request protocol.

Difference between two styles

When you use the RPC or ROA style to make API calls, take note that the two styles use different ASAPI endpoints.

```
# ASAPI endpoint for the RPC style:
public.asapi.<global:region>.<global:internet-domain>/asapi/v3
# ASAPI endpoint for the ROA style:
public.asapi.<global:region>.<global:internet-domain>/asapi/v3/roa
```

Call examples

The following sample code provides an example on how to use the RPC style to make an API call. In this example, the DescribeInstances operation of Elastic Compute Service (ECS) is called, and the API version is 2014-05-26.

Sample code:

```
package com.aliyuns.client.pop.ecs;

import com.aliyuncs.DefaultAcsClient;
import com.aliyuncs.ecs.model.v20140526.DescribeInstancesRequest;
import com.aliyuncs.ecs.model.v20140526.DescribeInstancesResponse;
import com.aliyuncs.http.HttpClientConfig;
import com.aliyuncs.http.ProtocolType;
import com.aliyuncs.profile.DefaultProfile;

import java.util.List;

public class DescribeInstancesTest {
    public static void main(String[] args) {
        // Specify the endpoint of ASAPI.
        String endpoint = "public.asapi.<global:region>.<global:internet-domain>/asapi/v3";
        // Specify the region where the ECS service resides.
        String region = "<global:region>";
        // Specify the name of the service that you want to access.
        String product = "ECS";
        // Specify your AccessKey pair.
        String ak = "<accessKeyId>";
        String sk = "<accessKeySecret>";
        try {
            DefaultProfile clientProfile = DefaultProfile.getProfile(region, ak, sk);
            // Ignore SSL certificate validation.
            HttpClientConfig clientConfig = HttpClientConfig.getDefault();
            clientConfig.setIgnoreSSLCerts(true);
            // Set the connection timeout period.
            clientConfig.setConnectionTimeoutMillis(3000L);
            // Set the read timeout period.
            clientConfig.setReadTimeoutMillis(10000L);
            clientProfile.setHttpClientConfig(clientConfig);
            // Create a connection.
            DefaultAcsClient acsClient = new DefaultAcsClient(clientProfile);
            // Create a request.
            DescribeInstancesRequest request = new DescribeInstancesRequest();
            // Specify the endpoint of ASAPI.
            request.setSysEndpoint(endpoint);
            // Specify the name of the service that you want to access and the region where
the service resides.
            request.setSysLocationProduct(product);
            request.setSysRegionId(region);
            // Set the request protocol to HTTPS.
            request.setSysProtocol(ProtocolType.HTTPS);
            DescribeInstancesResponse result =  acsClient.getAcsResponse(request);
            List<DescribeInstancesResponse.Instance> instances = result.getInstances();
            for (DescribeInstancesResponse.Instance instance: instances) {
                System.out.println(instance.getInstanceId());
                System.out.println(instance.getInstanceName());
```

```
            }

        } catch (Exception e) {
            e.printStackTrace();
        }
    }
}
```

The following sample code provides an example on how to use the ROA style to make an API call. In this example, the GetNamespaceList operation of Container Registry is called, and the API version is 2016-06-07.

Sample code:

```
package com.aliyuns.client.pop.cr;

import com.aliyuncs.CommonRequest;
import com.aliyuncs.CommonResponse;
import com.aliyuncs.DefaultAcsClient;
import com.aliyuncs.IAcsClient;
import com.aliyuncs.exceptions.ClientException;
import com.aliyuncs.exceptions.ServerException;
import com.aliyuncs.http.FormatType;
import com.aliyuncs.http.HttpClientConfig;
import com.aliyuncs.http.MethodType;
import com.aliyuncs.http.ProtocolType;
import com.aliyuncs.profile.DefaultProfile;

public class GetNamespaceListTest {
    public static void main(String[] args) {
        // Specify the endpoint of ASAPI.
        String endpoint = "public.asapi.<global:region>.<global:internet-domain>/asapi/v3/r
oa";
        // Specify the region where the Container Registry service resides.
        String region = "<global:region>";
        // Specify the name of the service that you want to access.
        String product = "cr";
        // Specify your AccessKey pair.
        String ak = "<accessKeyId>";
        String sk = "<accessKeySecret>";
        DefaultProfile profile = DefaultProfile.getProfile(region, ak, sk);
        // Ignore SSL certificate validation.
        HttpClientConfig clientConfig = HttpClientConfig.getDefault();
        clientConfig.setIgnoreSSLCerts(true);
        // Set the connection timeout period.
        clientConfig.setConnectionTimeoutMillis(3000L);
        // Set the read timeout period.
        clientConfig.setReadTimeoutMillis(10000L);
        profile.setHttpClientConfig(clientConfig);
        // Create a connection for the client.
        IAcsClient client = new DefaultAcsClient(profile);
        // Create a request.
        CommonRequest request = new CommonRequest();
        // Set the request protocol to HTTPS.
```

```
        request.setSysProtocol(ProtocolType.HTTPS);
        // Specify the request method.
        request.setSysMethod(MethodType.GET);
        // Specify the endpoint of ASAPI.
        request.setSysDomain(endpoint);
        // Specify the version of the API.
        request.setSysVersion("2016-06-07");
        // Specify the pattern of the uniform resource identifier (URI).
        request.setSysUriPattern("/namespace");
        // Specify the name of the service that you want to access and the region where the
service resides.
        request.setSysLocationProduct(product);

        request.putHeadParameter("Content-Type", "application/json");
        String requestBody = "" +
                "{}";
        request.setHttpContent(requestBody.getBytes(), "utf-8", FormatType.JSON);
        try {
            CommonResponse response = client.getCommonResponse(request);
            System.out.println(response.getData());
        } catch (ServerException e) {
            e.printStackTrace();
        } catch (ClientException e) {
            e.printStackTrace();
        }
    }
}
```

> **Notice**
>
> If you send a request over HTTPS, you must enable the request to ignore SSL certificate validation.

SDK for Go

This topic describes how to use Apsara Stack API (ASAPI) SDK for POP for Go.

Prerequisites

An Alibaba Cloud SDK package is downloaded for the service that you want to access. The required dependencies are installed.

Background information

Only the remote procedure call (RPC) style is supported for API calls.

Call examples

The following sample code provides an example on how to make an API call. In this example, the DescribeInstances operation of Elastic Compute Service (ECS) is called, and the API version is 2014-05-26.

Sample code:

```
package main
```

```
import (
 "fmt"
 "time"

 "github.com/aliyun/alibaba-cloud-sdk-go/sdk"
 "github.com/aliyun/alibaba-cloud-sdk-go/sdk/auth/credentials"
 "github.com/aliyun/alibaba-cloud-sdk-go/sdk/requests"
 "github.com/aliyun/alibaba-cloud-sdk-go/sdk/responses"
)

func getSdkConfig() *sdk.Config {
 return sdk.NewConfig().
  WithTimeout(time.Duration(30) * time.Second).
  WithEnableAsync(true).
  WithGoRoutinePoolSize(100).
  WithMaxTaskQueueSize(10000).
  WithDebug(false).
  WithScheme("HTTP")
}

func main(){
 ak := "<The AccessKey ID of your Apsara Stack tenant account.>"
 sk := "<The AccessKey secret of your Apsara Stack tenant account.>"
 regionId := "<The region where the ECS service resides.>"
 endpoint := "<The endpoint of ASAPI.>" // No network protocol.
 request := requests.NewCommonRequest()
  request.SetReadTimeout(10 * time.Second) // Set the read timeout period of the request to
10 seconds.
  request.SetConnectTimeout(5 * time.Second)  // Set the connection timeout period of the r
equest to 5 seconds.
 request.Method = requests.GET
 request.Domain = endpoint         // Location Service will not be enabled if the host is s
pecified. For example, the service with a certification type-bearer token must be specified
.
 request.Version = "2014-05-26"            // Specify the version of the API.
 request.Scheme = "https"                // Specify the request protocol. Default value: ht
tp.
 request.ApiName = "DescribeInstances"
 request.QueryParams["Product"] = "Ecs"  // Specify the name of the service that you want t
o access.
 request.TransToAcsRequest()
 client, err := sdk.NewClientWithOptions(regionId,getSdkConfig(),credentials.NewAccessKeyCr
edential(ak,sk))
 // If relevant parameters are not set for the request, the client settings are used.
  //client.SetReadTimeout(10 * time.Second)              // Set the read timeout period of
the client to 10 seconds.
 //client.SetConnectTimeout(5 * time.Second)            // Set the connection timeout perio
d of the client to 5 seconds.
  resp := responses.BaseResponse{}
  err = client.DoAction(request, &resp)
    if err != nil {
        panic(err)
    }
 fmt.Print(endpoint)
```

```
}
```

Configure proxies

You can configure proxies in one of the following ways:

- Configure proxies by using environment variables.

  Set the HTTP_PROXY and HTTPS_PROXY environment variables, or set the NO_PROXY environment variable.

  Sample code:

```
import (
    "os"
)
func main(){
 os.Setenv("HTTP_PROXY", "http://x.x.x.x:xxxx") // Set the HTTP_PROXY environment variabl
e.
 os.Setenv("HTTPS_PROXY", "https://x.x.x.x:xxxx") // Set the HTTPS_PROXY environment vari
able.
}
```

- Configure proxies on the client.

  Sample code:

```
// The proxies that are configured on the client take precedence over those that are conf
igured by using environment variables.
client.SetHttpProxy("http://x.x.x.x:xxxx")   // Configure the HTTP proxy.
client.GetHttpProxy()                          // Query the HTTP proxy.

client.SetHttpsProxy("https://x.x.x.x:xxxx")   // Configure the HTTPS proxy.
client.GetHttpsProxy()                           // Query the HTTPS proxy.

client.SetNoProxy("127.0.0.1,localhost")     // Configure the proxy whitelist.
client.GetNoProxy()                          // Query the proxy whitelist.
```

SDK for Python

This topic describes how to use Apsara Stack API (ASAPI) SDK for POP for Python.

Prerequisites

An Alibaba Cloud SDK package is downloaded for the service that you want to access. The required dependencies are installed.

Background information

Only the remote procedure call (RPC) style is supported for API calls.

Call examples

The following sample code provides an example on how to make an API call. In this example, the DescribeInstances operation of Elastic Compute Service (ECS) is called, and the API version is 2014-05-26.

Sample code:

```
from aliyunsdkcore.client import AcsClient
from aliyunsdkcore.acs_exception.exceptions import ClientException
from aliyunsdkcore.acs_exception.exceptions import ServerException
from aliyunsdkecs.request.v20140526 import DescribeInstancesRequest
import os

# Create an AcsClient instance.
client = AcsClient(
   "<your-access-key-id>",
   "<your-access-key-secret>",
   "<your-region-id>",

   timeout=1000,  # Set the timeout period.
    verify=False, # Ignore certificate validation. or verify='<The location where the certi
ficate is stored.>'
);
# Set the following parameters for the HTTPS request protocol:
# client.set_verify(False)
# os.environ["HTTPS_PROXY"] = "http://127.0.0.1:8080"

# os.environ["HTTP_PROXY"] = "http://127.0.0.1:8080"
def hello_ecs_instance():
    # Create a request and set the parameters.
    request = DescribeInstancesRequest.DescribeInstancesRequest()

    params = {"PageNumber":"1", "Product":"Ecs","Version": "2014-05-26","Action": "Describe
Instances"};
    request.set_body_params(params)
    # The endpoint that contains no network protocol is in the following format: ASAPI doma
in name/asapi/v3.
    request.set_endpoint('<The endpoint of ASAPI.>')
    # Set the following parameter if the endpoint contains no network protocol:
    request.set_protocol_type("https")

    request.set_PageSize(10)
    # Initiate the API request and obtain the response.
    response = client.do_action_with_exception(request)
    print(response)

if __name__ == '__main__':
    print("Hello Aliyun OpenApi!")
    hello_ecs_instance()
```

Configure proxies

Set the HTTP_PROXY and HTTPS_PROXY environment variables.

Sample code:

```
# Configure the HTTPS proxy.
os.environ["HTTPS_PROXY"] = "http://x.x.x.x:xxxx"

# Configure the HTTP proxy.
os.environ["HTTP_PROXY"] = "https://x.x.x.x:xxxx"
```

11.1.1.1.5. HTTP requests

11.1.1.1.5.1. Overview

This topic describes how to make API requests and is intended for users who use API URLs to initiate HTTP GET requests.

If you are using an SDK to initiate requests, you can skip this topic.

The request URL consists of different parameters and has a fixed syntax. The URL contains common request parameters, your signature, and operation-specific parameters. Sample request URLs are provided for each API operation. These URLs are not encoded to make them easy to read. Before you make a request, you must encode the request URL. After the authentication process is complete based on your signature, the results are returned to you. Response parameters are returned if the call is successful, whereas an error message is returned if the call fails. You can troubleshoot issues based on the error message.

11.1.1.1.5.2. Request syntax

The Apsara Stack API (ASAPI) allows you to call API operations by sending HTTP GET requests based on URLs. Each URL must include request parameters. This topic describes the syntax of HTTP GET requests and provides the endpoint of the ASAPI.

Sample request

GetOrganizationList is used in the following unencoded URL request:

```
https://public.asapi.aliyuns.com/asapi/v3?Action=GetOrganizationList&Product=ascm&Version=2019-05-10&Id=<Organization ID>&<Common parameters>
```

- `https`: the protocol used to transmit the request.
- `public.asapi.aliyuns.com/asapi/v3`: the endpoint of the ASAPI.
- `Action=GetOrganizationList Product=ascm Version=2019-05-10`: the API operation to call.
- `Id`: the ID of the organization.
- `<Common parameters>`: the common parameters specified in the system.

Protocol

The ASAPI supports only HTTPS.

Endpoint

For more information about how to obtain an endpoint, see Generate an endpoint for the ASAPI.

Parameter

To specify an API operation, use the `Action, Product, and Version` parameters. For example, set `Action` to GetOrganizationList, Product to ascm, and Version to 2019-05-10. You must also specify other operation-specific parameters and common parameters. For more information, see Common parameters.

11.1.1.1.5.3. Request signatures

This topic describes how to sign HTTP API requests. ASAPI uses the request signature to verify the identity of the request sender. ASAPI implements symmetric encryption by using an AccessKey pair to verify the identity of the request sender.

> **Note**
>
> - An AccessKey pair consists of an AccessKey ID and an AccessKey secret, which are issued to each user or organization in the Apsara Uni-manager Management Console.
> - The AccessKey ID is used to verify identities of users, and the AccessKey secret is used to encrypt and verify signature strings. You must keep your AccessKey secret confidential.
> - ASAPI provides SDKs for Node.js, Python, and Java to facilitate complex signature calculation. For more information, see Obtain the core package for ASAPI.

Step 1: Create a canonicalized query string

1. Arrange the request parameters in alphabetical order, including all common and operation-specific parameters except the `Signature` parameter.

   > **Note**
   >
   > If you use the GET method to send a request,these parameters are connected by ampersands (&) and included in the request URL. The first request parameter follows a question mark (?).

2. Encode the request parameters and their values in UTF-8 based on RFC 3986. The following rules apply in the encoding process:
   - Letters, digits, and special characters such as hyphens (`-`), underscores (`_`), and periods (`.`) do not need to be encoded.
   - Other characters must be percent encoded in the `%XY` format. `XY` represents the ASCII code of the characters in hexadecimal notation. For example, double quotation marks (`"`) are encoded as `%22` .

- Extended UTF-8 characters are encoded in the `%XY%ZA...` format.
- Spaces must be encoded as `%20`. Do not encode spaces as plus signs (`+`).

  This encoding method is similar to but different from the `application/x-www-form-urlencoded` MIME encoding algorithm.

  If you use `java.net.URLEncoder` from the Java standard library, use `percentEncode` to encode request parameters and their values. In the encoded query string, replace the plus signs (`+`) with `%20` , asterisks (`*`) with `%2A` , and `%7E` with tildes (`~`). This way, you can obtain an encoded string that matches the preceding encoding rules.

  ```
  private static final String ENCODING = "UTF-8";
  private static String percentEncode(String value) throws UnsupportedEncodingException
  {
      return value != null ? URLEncoder.encode(value, ENCODING).replace("+", "%20").rep
  lace("*", "%2A").replace("%7E", "~") : null;
  }
  ```

3. Use equal signs (`=`) to connect the encoded request parameters and their values.
4. Use ampersands (`&`) to connect the encoded request parameters. These parameters must be arranged in the same order as those in Step 1.

Then, a canonicalized query string that follows the request structure is obtained. For more information, see Request structure.

Step 2: Create a string-to-sign

1. Create a `string-to-sign` . You can also use `percentEncode` to encode the canonicalized query string created in Step 1 based on the following rules:

   ```
   StringToSign=
       HTTPMethod + "&" + //HTTPMethod: the HTTP method that is used to send a request, su
   ch as GET.
       percentEncode("/") + "&" + //percentEncode("/"): Encode the forward slash (/) in UT
   F-8 as %2F.
       percentEncode(CanonicalizedQueryString) // Encode the canonicalized query string cr
   eated in Step 1.
   ```

2. Calculate the RFC 2104-compliant HMAC-SHA1 or HMAC-256 value of `StringToSign` . In the following example, Java Base64 is used:

   ```
   String signature = Base64.getEncoder().encodeToString(signData);
   ```

> **Note**
>
> When you calculate the signature, the key value specified by RFC 2104 is your `AccessKey secret` plus an ampersand (&), which has an ASCII value of 38. For more information, see Obtain an AccessKey pair.

3. Encode the `Signature` parameter based on RFC 3986 and add it to the canonicalized query string.

Example 1: Concatenate parameters

`GetOrganizationList` is used in this example to query regions. For example, `AccessKeyID` is set to testid and `AccessKeySecret` is set to testsecret. Perform the following operations:

1. Construct a canonicalized query string.

```
https://public.asapi.aliyuns.com/asapi/v3/?AccessKeyId=testid&Action=GetOrganizationList&Format=JSON&Id=1&Product=ascm&RegionId=cn-region-test&SignatureMethod=HMAC-SHA1&SignatureNonce=43967c6e-e3ad-44fa-b06b-fcf3db5f39d2&SignatureVersion=1.0&Timestamp=2020-09-15T08%3A50%3A40Z&Version=2019-05-10
```

2. Create a `string-to-sign` .

```
GET&%2F&AccessKeyId%3Dtestid%26Action%3DGetOrganizationList%26Format%3DJSON%26Id%3D1%26Product%3Dascm%26RegionId%3Dcn-region-test%26SignatureMethod%3DHMAC-SHA1%26SignatureNonce%3D43967c6e-e3ad-44fa-b06b-fcf3db5f39d2%26SignatureVersion%3D1.0%26Timestamp%3D2020-09-15T08%253A50%253A40Z%26Version%3D2019-05-10
```

3. Calculate the signature.

   Calculate the signature. The key value used for calculation is `testsecret&` because `AccessKeySecret` is set to testsecret. The calculated signature is `OLeaidS1JvxuMvnyHOwuJ+uX5qY=` . Java Base64 is used in the following sample code:

   `String signature = Base64.getEncoder().encodeToString(signData);` Encode `Signature=hvqv9Ll5RE6kQ4YsQXFAf9VuRIY=` based on RFC 3986 and add it to the canonicalized query string.

```
https://public.asapi.aliyuns.com/asapi/v3/?AccessKeyId=testid&Action=GetOrganizationList&Format=JSON&Id=1&Product=ascm&RegionId=cn-region-test&SignatureMethod=HMAC-SHA1&SignatureNonce=43967c6e-e3ad-44fa-b06b-fcf3db5f39d2&SignatureVersion=1.0&Timestamp=2020-09-15T08%3A50%3A40Z&Version=2019-05-10
```

You can use browsers or tools such as cURL and Wget to initiate an HTTP request for calling the `DescribeRegions` operation to query the Alibaba Cloud region list.

Example 2: Use the standard library of the programming language

`GetOrganizationList` is used in this example to query regions. For example, `AccessKeyID` is set to testid, `AccessKeySecret` is set to testsecret, and all request parameters are stored in a Java `Map<String, String>` object.

1. Predefine an encoding method.

```
private static final String ENCODING = "UTF-8";
private static String percentEncode(String value) throws UnsupportedEncodingException {
        return value != null ? URLEncoder.encode(value, ENCODING).replace("+", "%20").r
eplace("*", "%2A").replace("%7E", "~") : null;
}
```

2. Predefine the time format for the `Timestamp` parameter. Specify the `Timestamp` parameter in the ISO 8601 format. The time must be in UTC+0.

```
private static final String ISO8601_DATE_FORMAT = "yyyy-MM-dd'T'HH:mm:ss'Z'";
private static String formatIso8601Date(Date date) {
    SimpleDateFormat df = new SimpleDateFormat(ISO8601_DATE_FORMAT);
    df.setTimeZone(new SimpleTimeZone(0, "GMT"));
    return df.format(date);
}
```

3. Create a request string.

```
final String HTTP_METHOD = "GET";
Map parameters = new HashMap();
// Specify request parameters.
parameters.put("Product", "ascm");
parameters.put("Action", "GetOrganizationList");
parameters.put("Version", "2019-05-10");
parameters.put("AccessKeyId", "testid");
parameters.put("RegionId", "cn-region-test");
parameters.put("Timestamp", formatIso8601Date(new Date()));
parameters.put("SignatureMethod", "HMAC-SHA1");
parameters.put("SignatureVersion", "1.0");
parameters.put("SignatureNonce", UUID.randomUUID().toString());
parameters.put("Format", "JSON");
parameters.put("Id", "1");
// Arrange request parameters.
String[] sortedKeys = parameters.keySet().toArray(new String[]{});
Arrays.sort(sortedKeys);
final String SEPARATOR = "&";
// Create a string-to-sign.
StringBuilder stringToSign = new StringBuilder();
stringToSign.append(HTTP_METHOD).append(SEPARATOR);
stringToSign.append(percentEncode("/")).append(SEPARATOR);
StringBuilder canonicalizedQueryString = new StringBuilder();
for(String key : sortedKeys) {
    // Encode the key and the value.
    canonicalizedQueryString.append("&")
    .append(percentEncode(key)).append("=")
    .append(percentEncode(parameters.get(key)));
}
//Encode the canonicalized query string.
stringToSign.append(percentEncode(
canonicalizedQueryString.toString().substring(1)));
```

4. The signature. The key value used for calculation is `testsecret&` because `AccessKeySecret` is set to testsecret. The calculated signature is `OLeaidS1JvxuMvnyHOwuJ%2BuX5qY%3D`.

```
// The following sample code shows how to calculate the signature:
final String ALGORITHM = "HmacSHA1";
final String ENCODING = "UTF-8";
key = "testsecret&";
Mac mac = Mac.getInstance(ALGORITHM);
mac.init(new SecretKeySpec(key.getBytes(ENCODING), ALGORITHM));
byte[] signData = mac.doFinal(stringToSign.getBytes(ENCODING));
String signature = Base64.getEncoder().encodeToString(signData);
```

Encode the Signature parameter based on RFC 3986 and add it to the canonicalized query string. The following URL is obtained:

```
https://public.asapi.aliyuns.com/asapi/v3/?AccessKeyId=testid&Action=GetOrganizationLis
t&Format=JSON&Id=1&Product=ascm&RegionId=cn-region-test&SignatureMethod=HMAC-SHA1&Signa
tureNonce=43967c6e-e3ad-44fa-b06b-fcf3db5f39d2&SignatureVersion=1.0&Timestamp=2020-09-1
5T08%3A50%3A40Z&Version=2019-05-10
```

5. Use browsers or tools such as cURL and Wget to initiate an HTTP request.

11.1.1.1.5.4. Response

Responses are returned only in the JSON format. If a return code is greater than or equal to 200 and less than 300, a success response is returned. Otherwise, an error response is returned.

Sample success response

If a request is successful, the request ID and operation-specific parameter values are returned. For more information, see the developer guide of the corresponding Apsara Stack service.

```
 {
    "eagleEyeTraceId": "xxx-xxx-xxx-xxx", // The trace ID provided by EagleEye.
    "asapiSuccess": true,
    "RequestId": "xxxxxxxxxx",
    "Regions": { // The regions returned after you call the DescribeRegions operation.
        "Region": [
            {
                "RegionId": "",
                "RegionEndpoint": "",
                "LocalName": ""
            }
        ]
    }
}
```

Sample error response

If a request fails, the following information is returned. For more information, see the developer guide of the corresponding Apsara Stack service.

```
{
    "code": "asapi.server.api.notfound",// The error code.
    "eagleEyeTraceId": "xxx-xxx-xxx-xxx", // The trace ID provided by EagleEye.
    "asapiSuccess": false, // Indicates whether the request is successful.
    "hostId": "xxxx", // The ID of the host.
    "message": "Failed to ....", // The message returned.
    "asapiErrorMessage": "Failed to ....", // The error message provided by the ASAPI.
    "asapiErrorCode": "asapi.server.api.notfound" // The error code provided by the ASAPI.
}
```

11.1.2. API reference

11.1.2.1. API overview

Instance lifecycle management API operations

Operation	Description
CreateInstance	Creates an instance.

Operation	Description
DeleteInstance	Releases an instance.
ModifyInstanceSpec	Changes the specifications of a specified instance.

Instance management API operations

Operation	Description
DescribeInstanceAttribute	Queries detailed information about instances.
DescribeInstances	Queries basic information about instances.
DescribeRegions	Queries available regions.
DescribeSecurityIps	Queries the IP whitelist that allows connections to a specified instance from specified IP addresses or CIDR blocks.
FlushInstance	Clears an instance.
ModifyInstanceAttribute	Sets the attribute for a specified instance.
ModifyInstanceMaintainTime	Changes maintenance time for a specified instance.
ModifySecurityIps	Changes the whitelist for a specified instance.
ModifyInstanceNetExpireTime	Changes the period for retaining a domain name of a specified classic network.
SwitchNetwork	Changes the type of a network.

Backup and recovery API operations

Operation	Description
CreateBackup	Creates a backup.
ModifyBackupPolicy	Changes a backup policy.
DescribeBackupPolicy	Queries backup policies.
DescribeBackups	Queries available backups.
RestoreInstance	Restore a specified instance based on a specified backup set.

Monitoring management API operations

Operation	Description
DescribeMonitorItems	Queries available monitoring metrics.

Operation	Description
DescribeHistoryMonitorValues	Queries historical monitoring data.

Parameter management API operations

Operation	Description
DescribeInstanceConfig	Queries parameters of a specified instance.
ModifyInstanceConfig	Changes parameters of a specified instance.

11.1.2.2. Request structures

Endpoint

The endpoint of the KVStore for Redis API is `r-kvstore.example.com`.

For more information about how to obtain an endpoint, see Generate the endpoint of ASAPI.

> **Note** *example.com* is a domain name that is customized for a project. You can obtain the domain name from the administrator.

Protocols

You can send requests over HTTP or HTTPS. To enhance data security, we recommend that you send API requests by using HTTPS.

Methods

You can send requests by using the HTTP GET method. This method requires that you specify request parameters in the request URL.

Request parameters

You must specify the Action parameter for each request. For example, you can specify CreateInstance. You must also specify common request parameters and specific request parameters that are required by each operation.

Encoding

Requests and responses are both encoded in UTF-8.

11.1.2.3. Common parameters

Common request parameters must be included in all API requests.

Common request parameters

Common request parameters

Parameter	Type	Required	Description
Format	String	Yes	The type of the returned value. Valid values: JSON and XML. Default value: XML
Version	String	Yes	The version of the API. Specify the version in the YYYY-MM-DD format. The current version is 2015-01-01.
AccessKeyId	String	Yes	The AccessKey ID provided by Alibaba Cloud.
Signature	String	Yes	The signature string of the current request. For more information about how signatures are calculated, see Request signatures.
SignatureMethod	String	Yes	The encryption method of the signature string. Set the value to HMAC-SHA1.
Timestamp	String	Yes	The timestamp of the request. Specify the time in the ISO 8601 standard in the `yyyy-MM-ddTHH:mm:ssZ` format. The time must be in UTC. For example, you can set the parameter to 2016-01-01T12:00:00Z. This specifies 20:00:00, January 1, 2016, UTC+08:00.
SignatureVersion	String	Yes	The version of the signature algorithm. The current version is 1.0.
SignatureNonce	String	Yes	The unique random number that is used to prevent replay attacks. You must use different random numbers for different requests.

```
https:// r-kvstore.example.com/
? Format=json
&Version=2015-01-01
&Signature=Pc5xxxxxxxxxxxxxxxxx
&SignatureMethod=HMAC-SHA1
&SignatureNonce=15215528852396
&SignatureVersion=1.0
&AccessKeyId=key-test
&Timestamp=2016-01-01T12:00:00Z
```

Common response parameters

Each time you call an API operation, the system returns a globally unique ID (RequestId). This is regardless of whether the request is successful.

```
<? xml version="1.0" encoding="utf-8"? >
<!-The root of the response-->
<Operation name+Response>
<!—The returned request tag-->
<RequestId>4C4fdsf38-3910-447D-87AD-AC078932216</RequestId>
<!—The returned result-->
</Operation name+Response>
```

11.1.2.4. Responses

After you call an API operation, KVStore for Redis returns data in the same format. In the response, an HTTP status code in the `2xx` format indicates that the call is successful. An HTTP status code in the `4xx` or `5xx` format indicates that the call failed. The system returns responses for successful calls in XML or JSON format. You can specify the response format in request parameters. The system uses the XML format by default.

Note The response examples in this topic have been formatted with line breaks or indents to provide a clear view. The responses in your actual running environments are not properly formatted as these examples.

Sample success response

The response in XML format includes a message that indicates whether the call is successful and the specific service data. An example is as follows:

```
<? xml version="1.0" encoding="utf-8"? >
<!—The root node of the response-->
<Operation name+Response>
<!—The request ID returned-->
<RequestId>4C4fdsf38-3910-447D-87AD-AC078932216</RequestId>
<!—The result data returned-->
</Operation name+Response>
```

JSON format

```
{
"RequestId": "4C4fdsf38-3910-447D-87AD-AC078932216",
/* The result data returned */
}
```

Sample error response

When an error occurs during an API call, no result data is returned. You can locate the cause of the error by referencing the attached list of error codes. If an error occurs when you call an operation over HTTP, an HTTP status code in the `4xx` or `5xx` format is returned. The returned message body includes the specific error code and error message. The message body also contains a globally unique request ID called RequestId and a target site ID called HostId. If you cannot locate the cause, request Apsara Stack customer service, and provide the HostId and RequestId for troubleshooting.

```
<? xml version="1.0" encoding="UTF-8"? >
<Error>
<RequestId>8906582E-6722-409A-A6C4-0E7863B733A5</RequestId>
<HostId> r-kvstore.example.com</HostId>
<Code>UnsupportedOperation</Code>
<Message>The specified action is not supported. </Message>
</Error>
```

JSON format

```
{
"RequestId": "7463B73D-35CC-4D19-A010-6B8D65D242EF",
"HostId": " r-kvstore.example.com",
"Code": "UnsupportedOperation",
"Message": "The specified action is not supported."
}
```

11.1.2.5. Request signatures

KVStore for Redis authenticates each access request. You need to include a signature when you submit an HTTP or HTTPS request. KVStore for Redis authenticates the request sender identity by using symmetric encryption based on an AccessKey pair that consists of an AccessKey ID and an AccessKey secret.

An AccessKey ID and an AccessKey secret are issued to you by Alibaba Cloud. You can apply for and manage them on the Alibaba Cloud website. The AccessKey ID is used to verify the identity of the user. The AccessKey secret is used to encrypt and verify the signature string. You must keep your AccessKey secret strictly confidential.

For more information about how to obtain the AccessKey pair, see Obtain an AccessKey pair.

Sign a request

Perform the following steps to sign an API request:

1. Create a canonicalized query string by using request parameters.
    i. To construct a canonicalized query string, sort all request parameters by name in alphabetic order. These parameters include common request parameters and customized API request parameters. However, this does not include the Signature parameter.

    > **Note** When you use the GET method to submit requests, you specify these parameters in the request URI that follow the question mark (?) and are connected with the ampersand (&).

ii. Encode the name and value of each request parameter.

Perform URL encoding on the names and values by using the UTF-8 character set. The following section shows the URL encoding rules:

- Uppercase letters (A-Z), lowercase letters (a-z), numbers (0-9), hyphens (-), underscores (_), periods (.), and tildes (~) are not encoded.
- Encode other characters in the `%XY` format, where `XY` specifies the ASCII code of the characters in the hexadecimal format. For example, double quotation marks (") are encoded as `%22`.
- Extended UTF-8 characters are encoded in the `%XY%ZA` format.
- Spaces must be encoded as `%20`. Do not encode spaces as plus signs (+).

> **Note** Libraries that support URL encoding, such as java.net.URLEncoder, follow the Multipurpose Internet Mail Extensions (MIME) encoding rules of `application/x-www-form-urlencoded`. If this encoding method is used, replace the plus signs (+) in the encoded strings with `%20`, the asterisks (*) with `%2A`, and `%7E` with a tilde (~) to conform to the encoding rules.

iii. Connect the encoded parameter name and value with an equal sign (=).

iv. Sort the key-value pairs connected by equal signs (=) in alphabetical order and separate them with ampersands (&).

2. Create a string-to-sign from the encoded canonicalized query string that is obtained in the preceding step based on the following rules:

```
StringToSign=
HTTPMethod + "&" +
percentEncode("/") + "&" +
percentEncode(CanonicalizedQueryString)
```

In this example,

- `HTTPMethod` specifies the HTTP method that is used to submit the request, such as GET.
- `percentEncode("/")` is the value (`%2F`) as the result of encoding the slash sign (/) based on the URL encoding rule described in Step 1.b.
- `percentEncode(CanonicalizedQueryString)` is the string that results from encoding the canonicalized query string described in Step 1 based on the URL encoding rules described in Step 1.b.

3. As defined in RFC 2104, use the preceding signature string to calculate the signature into an HMAC value.

> **Note** The key that is used for calculating the signature is your AccessKey secret followed by an ampersand (&) (ASCII:38). The SHA1 algorithm is used for the calculation.

4. Encode the HMAC value in Base64 to obtain the signature string.
5. Add the signature string to the request as the Signature parameter.

> **Note** When you submit the signature string to the KVStore for Redis instance as the final request parameter value, perform URL encoding on this parameter based on RFC 3986 rules. This is the same method that is used to process other parameters.

Example

DescribeDrdsInstances is used in this example. The following section shows the canonicalized query string:

```
http://r-kvstore.example.com/?Timestamp=2013-06-01T10:33:56Z&Format=XML&AccessKeyId=testid&
Action=DescribeInstances&SignatureMethod=HMAC-SHA1&RegionId=region1&SignatureNonce=NwDAxvLU
6tFE0DVb&Version=2015-01-01&SignatureVersion=1.0
```

The following section shows the calculated StringToSign:

```
GET&%2F&AccessKeyId%3Dtestid&Action%3DDescribeInstances&Format%3DXML&RegionId%3Dregion1&Sig
natureMethod%3DHMAC-SHA1&SignatureNonce%3DNwDAxvLU6tFE0DVb&SignatureVersion%3D1.0&Timestamp
%3D2013-06-01T10%253A33%253A56Z&Version%3D2015-01-01
```

In this example, if the AccessKey ID is `testid` and the AccessKey secret is `testsecret`, the key used for HMAC calculation is `testsecret&`. Therefore, the calculated signature value is `BIxxxxxxxxxxxxxxxxxxxxxx=`.

The following section shows the signed request URL that includes the Signature parameter:

```
http://r-kvstore.example.com/?Timestamp=2013-06-01T10%3A33%3A56Z&Format=XML&AccessKeyId=tes
tid&Action=DescribeInstances&SignatureMethod=HMAC-SHA1&RegionId=region1&SignatureNonce=NwDA
xvLU6tFE0DVb&SignatureVersion=1.0&Version=2015-01-01&Signature=BIPOMlxxxxxxxxxxxxxxxxxxxu8LX
BeZtLQkJTw6iFvw1E%3D
```

11.1.2.6. RAM-based authorization

11.1.2.6.1. Grant resource permissions to a RAM user

The instances that you create by using your Alibaba Cloud account are the resources owned by the account. An account has the full operation permissions on the resources under this account by default.

Alibaba Cloud Resource Access Management (RAM) allows you to grant the access and management permissions on resources under a cloud account to RAM users.

> **Note** Ignore this topic if you do not use Resource Access Management (RAM).

11.1.2.6.2. Authorized resource types in RAM

KVStore for Redis only supports RAM authorization for Redis instances.

The following table lists the description of resources when you use RAM to authorize access permissions to these resources.

Resource	Resource description in authorization policy
Instance	acs:kvstore:$regionid:$accountid:instance/$instanceid acs:kvstore:$regionid:$accountid:instance/ acs:kvstore:::instance/

All $regionids must be the ID of a region or an asterisk (*). All $instanceids must be the ID of an instance or an asterisk (*). Similarly, $account-id is the numerical ID of your Apsara Stack tenant account, which can be replaced by an asterisk (*).

11.1.2.6.3. Operation permissions granted to a RAM user

You are authorized to call the following API operations to manage the specified resource as a Resource Access Management (RAM) user:

- CreateInstance
- DeleteInstance
- ModifyInstanceSpec
- RenewInstance
- RenewMultiInstance
- TransformToPrePaid
- ModifyInstanceAttribute
- FlushInstance
- DescribeInstances
- DescribeInstanceAttribute
- ModifyInstanceMaintainTime
- ModifySecurityIps
- SwitchNetwork
- ModifyInstanceNetExpireTime
- CreateBackup
- ModifyBackupPolicy
- DescribeBackupPolicy
- DescribeBackups
- RestoreInstance
- DescribeHistoryMonitorValues
- DescribeInstanceConfig
- ModifyInstanceConfig

11.1.2.6.4. API authentication rules

When you use API operations to access resources as a Resource Access Management (RAM) user, the system queries the RAM service and checks whether the RAM user is granted the required permissions.

Each API operation determines the resources for permission check according to the involved resources and the semantics of the API operation. The following table lists the authentication rules corresponding to different API operations.

Authentication rules

Operation	Authentication rule
CreateDBInstance	acs:kvstore:$regionid:$accountid:instance/$instanceid
DeleteInstance	acs:kvstore:$regionid:$accountid:instance/$instanceid
ModifyInstanceSpec	acs:kvstore:$regionid:$accountid:instance/$instanceid
RenewInstance	acs:kvstore:$regionid:$accountid:instance/$instanceid
RenewMultiInstance	acs:kvstore:$regionid:$accountid:instance/$instanceid
TransformToPrePaid	acs:kvstore:$regionid:$accountid:instance/$instanceid
ModifyInstanceAttribute	acs:kvstore:$regionid:$accountid:instance/$instanceid
FlushInstance	acs:kvstore:$regionid:$accountid:instance/$instanceid
DescribeInstances	acs:kvstore:$regionid:$accountid:instance/$instanceid
DescribeInstanceAttribute	acs:kvstore:$regionid:$accountid:instance/$instanceid
ModifyInstanceMaintainTime	acs:kvstore:$regionid:$accountid:instance/$instanceid
ModifySecurityIps	acs:kvstore:$regionid:$accountid:instance/$instanceid
SwitchNetwork	acs:kvstore:$regionid:$accountid:instance/$instanceid
ModifyInstanceNetExpireTime	acs:kvstore:$regionid:$accountid:instance/$instanceid
CreateBackup	acs:kvstore:$regionid:$accountid:instance/$instanceid
ModifyBackupPolicy	acs:kvstore:$regionid:$accountid:instance/$instanceid

Operation	Authentication rule
DescribeBackupPolicy	acs:kvstore:$regionid:$accountid:instance/$instanceid
DescribeBackups	acs:kvstore:$regionid:$accountid:instance/$instanceid
RestoreInstance	acs:kvstore:$regionid:$accountid:instance/$instanceid
DescribeHistoryMonitorValues	acs:kvstore:$regionid:$accountid:instance/$instanceid
DescribeInstanceConfig	acs:kvstore:$regionid:$accountid:instance/$instanceid
ModifyInstanceConfig	acs:kvstore:$regionid:$accountid:instance/$instanceid

11.1.2.7. Manage the lifecycle

11.1.2.7.1. CreateInstance

Description

You can call this operation to create an instance. For more information, see Instance specifications.

Request parameters

Request parameters

Parameter	Type	Required	Description
<Common request parameters>	-	Yes	For more information, see Common parameters.
Action	String	Yes	The operation that you want to perform. Set this parameter to CreateInstance.

Parameter	Type	Required	Description
InstanceName	String	No	The name of the instance. The name must be 2 to 128 characters in length and must start with a letter. The name cannot contain special characters or spaces. Special characters include @ / : = " < > { } [ ]
Password	String	No	The password of the instance. The password must be a string of 8 to 30 characters in length and must contain uppercase letters, lowercase letters, and digits. **Note** Special characters are not supported, such as ! < > ( ) [ ] { } , ` ~ . - _ @ # $ % ^ & *
InstanceClass	String	Yes	The type of the requested KVStore for Redis instance. For more information, see Instance specifications.
RegionId	String	Yes	The region ID of the instance. You can query available data regions by calling the DescribeRegions operation.
ZoneId	String	No	The zone ID of the instance. You can call DescribeRegions to view available zones.

Parameter	Type	Required	Description
ChargeType	String	No	The billing method of the instance. Valid values: PrePaid and PostPaid. Default value: PostPaid.
Period	Long	No	The billing period of the instance. If you set the ChargeType parameter to PrePaid, you must also specify the Period parameter. Unit: month. Valid values: 1-9, 12, 24, and 36.
Token	String	No	The client token that is used to ensure the idempotence of requests. The value of this parameter is generated by the client and must be unique among different requests. The value is case-sensitive and can be up to 64 ASCII characters in length. For more information, see How to ensure idempotence.
NetworkType	String	No	The type of the network. Default value: Classic. Valid values: • Classic • VPC
VpcId	String	No	The ID of the VPC to which the instance belongs.
VSwitchId	String	No	The ID of the VSwitch.
PrivateIp	String	No	The private IP address of the instance.

Parameter	Type	Required	Description
SrcDBInstanceId	String	No	If an instance created based on a backup set generated by another instance is valid, specifies the ID of the instance that generates the backup set.
BackupId	String	No	If an instance created based on a backup set generated by another instance is valid, specifies the ID of the generated backup set. You can call DescribeBackups to query the value of BackupId.
InstanceType	String	No	The category of the instance. Valid values: Redis and Memcache. Default value: Redis.

Response parameters

Response parameters

Parameter	Type	Description
<Common response parameters>	-	For more information, see Common parameters.
InstanceId	String	The ID of the instance, which is globally unique.
InstanceName	String	The name of the instance.

Note Due to the compatibility with earlier versions, this topic does not describe some returned fields such as Config and Region for the operation. Alibaba Cloud will delete these fields as needed in the future.

Sample requests

```
https://r-kvstore.example.com
? <Common request parameters>
&Action=CreateInstance
&RegionId=cn-hangzhou
&Password=Qa123456
&InstanceClass= redis.master.small.default
```

Sample responses

```
{
"InstanceId":"73xxxxxxxxxx",
"InstanceName":"73xxxxxxxxxx"
}
```

11.1.2.7.2. DeleteInstance

Description

You can call this operation to delete a specified instance. This instance that you want to release must be in the following status:

- The instance is in the running state.
- The instance is not locked.

> **Note** You cannot delete a subscription instance until the instance expires.

Request parameters

Request parameters

Parameter	Type	Required	Description
<Common request parameters>	-	Yes	For more information, see Common parameters.
Action	String	Yes	The operation that you want to perform. Set this parameter to DeleteInstance.
InstanceId	String	Yes	The globally unique ID of the specified instance.

Response parameters

Response parameters

Parameter	Type	Description
<Common response parameters>	-	For more information, see Common parameters.

Sample request

```
https://r-kvstore.example.com
? <Common request parameters>
&Action=DeleteInstance
&InstanceId=657xxxxxxxxxxx
```

Sample response

```
{
"RequestId" : "C2225574-1D93-4F8A-B1D5-39FCBAA40660"
}
```

11.1.2.7.3. ModifyInstanceSpec

Description

You can call this operation to change the specifications of a specified instance. For more information about instance specifications, see Instance types.

Request parameters

Request parameters

Parameter	Type	Required	Description
<Common request parameters>	-	Yes	For more information, see Common parameters.
Action	String	Yes	The operation that you want to perform. Set this parameter to ModifyInstanceSpec.
InstanceId	String	Yes	The globally unique ID of the specified instance.
InstanceClass	String	Yes	The type of the specified instance. For more information, see Instance types.

Response parameters

Response parameters

Parameter	Type	Description
<Common request parameters>	-	For more information, see Common parameters.

Parameter	Type	Description
OrderId	String	The ID of the order that you have placed.

Sample request

```
https://r-kvstore.example.com
? <Common request parameters>
&Action=ModifyInstanceSpec
&InstanceId=736538d0a6894665
&InstanceClass= redis.master.mid.default
```

Sample response

```
{
"OrderId" : "201294900260011"
"RequestId" : "283746AF-82B3-4BFF-88CC-BF34CDE2732"
}
```

11.1.2.8. Manage instances

11.1.2.8.1. DescribeInstanceAttribute

Description

You can call this operation to query details of a specified instance.

Request parameters

Request parameters

Parameter	Type	Required	Description
<Common request parameters>	-	Yes	For more information, see Common requests.
Action	String	Yes	The operation that you want to perform. Set this parameter to DescribeInstanceAttribute.
InstanceId	String	Yes	The globally unique ID of the specified instance.

Response parameters

Response parameters

Parameter	Type	Description
Instances	List	The array that contains the DBInstanceAttribute values.

DBInstanceAttribute parameters

Parameter	Type	Description
InstanceId	String	The globally unique ID of the instance that was queried.
InstanceName	String	The name of the instance that was queried.
Capacity	Long	The capacity that you have requested for the instance that was queried, in MB.
InstanceClass	String	The type of the instance that was queried.
Bandwidth	Long	The bandwidth limit of the instance that was queried, in Mbit/s.
Connections	Long	The maximum number of connections to the instance that was queried.
ConnectionDomain	String	The domain name of the instance that was queried. This domain name only supports connections over an internal network.
Port	Int	The port of the instance that was queried.
RegionId	String	The region where the instance that was queried was located. For more information, see DescribeRegions.
ZoneId	String	The ID of the zone under the RegionId of the instance that was queried. For more information, see DescribeRegions.

Parameter	Type	Description
InstanceStatus	String	The status of the instance that was queried. Possible values: • Normal: the instance that was queried was normal. • Creating: the instance that was queried was being created. • Changing: the instance that was queried was being changed. • Inactive: the instance that was queried was disabled.
ChargeType	String	The billing method of the instance that was queried. Possible values: PrePaid and PostPaid.
CreateTime	String	The time when the instance that was queried was created. The time follows the ISO 8601 standard in the `YYYY-MM-DDThh:mm:ssZ` format. The time is displayed in UTC time format.
EndTime	String	The time when the subscription instance that was queried was about to expire. The time follows the ISO 8601 standard in the `YYYY-MM-DDThh:mm:ssZ` format. The time is displayed in UTC time format.
NetworkType	String	The type of the network where the instance that was queried was located. Possible values: CLASSIC or VPC.
VpcId	String	The ID of the VPC where the instance that was queried was located.
VSwitchId	String	The ID of the VSwitch for the instance that was queried.
PrivateIpAddress	String	The private IP address of the instance that was queried.

Parameter	Type	Description
MaintainStartTime	String	The time when maintenance can be started.
MaintainEndTime	String	The time when maintenance can be ended.
SecurityIPList	String	The IP whitelist for the instance that was queried.
AvailabilityValue	String	The availability metrics of the current month for the instance that was queried.

Note Due to the compatibility with earlier versions, this topic does not describe some returned fields such as Config and Region for the operation. Alibaba Cloud will delete these fields as needed in the future. In this case, do not rely on the returned fields that this topic has not described when you call this operation.

Sample request

```
https://r-kvstore.example.com
? <Common request parameters>
&Action=DescribeInstanceAttribute
&InstanceId=7xxxxxxxxxx
```

Sample response

```
{
{
    "Instances" : {
        " DBInstanceAttribute " : [{
                "Bandwidth" : 128,
                "Capacity" : 512,
                "ConnectionDomain" : "de5d88e34d004211.m.cnhzalicm10pub001.r-kvstore.exampl
e.com.com",
                "Connections" : 300,
                "ZoneId" : "cn-qingdao-b",
                "InstanceId" : "dexxxxxxxxxx",
                "InstanceName" : "xxxxxx",
                "InstanceStatus" : "Available",
                 "InstanceClass" : "redis.master.mid.default",
                "Port" : 11211,
                "QPS" : 4500,
                "RegionId" : "cn-qingdao",
                 "ChargType":"PostPaid",
                  "NetworkType":"ClASSSIC"
                "MaintainStartTime": "02:00Z",
                 "MaintainEndTime": "06:00Z",
                 "SecurityIPList":"192.168.0.1",
                  "AvailabilityValue":"100%"
        }]
  }
"RequestId" : "283746AF-82B3-4BFF-88CC-BF34CDE2732"
}
```

11.1.2.8.2. DescribeInstances

Description

You can call this operation to query one or more instances under a specified account.

Request parameters

Request parameters

Parameter	Type	Required	Description
<Common request parameters>	-	-	See Common parameters.
Action	String	Yes	The operation that you want to perform. Set this parameter to DescribeInstances.

Parameter	Type	Required	Description
InstanceIds	String	No	The globally unique ID of the target instance. This parameter is required when you specify an instance ID. To query multiple instances, separate the identifiers of these instances with commas (,). If the parameter value is left blank, the system queries all instances under the specified account by default.
InstanceStatus	String	No	The instance status of the specified instance: Valid values: • Normal: the specified instance is normal. • Creating: the specified instance is being created. • Changing: the specified instance is being changed. • Inactive: the specified instance is disabled.
ChargeType	String	No	The billing method of the specified instance. Valid values: • PrePaid: the subscription billing method. • PostPaid: the pay-as-you-go billing method.
RegionId	String	Yes	You can call the DescribeRegions operation to query the RegionId value.

Parameter	Type	Required	Description
InstanceType	String	No	The type of the engine for the specified instance. Valid values: • Memcache: specifies an instance of Memcache type. • Redis: specifies an instance of Redis type.
PageNumber	Integer	No	The number of the page to return. Pages start from page 1. Default value: 1.
PageSize	Integer	No	The number of entries to return on each page. Valid values: 1 to 50. Default value: 10.
NetworkType	String	No	The type of the network where the specified instance is located. Valid values: • CLASSIC: specifies an instance in a classic network. • VPC: specifies an instance in a VPC.

Response parameters

Response parameters

Parameter	Type	Description
<Common response parameters>	-	For more information, see Common parameters.
Instances	List	The array that contains the instances that were queried.
TotalCount	Integer	The total number of instances that were queried.
PageNumber	Integer	The number of the page returned.
PageSize	Integer	The number of entries returned on each page.

Instance parameters

Parameter	Type	Description
InstanceId	String	The globally unique ID of the instance that was queried.
InstanceName	String	The name of the instance that was queried.
Capacity	Long	The capacity that you have requested for the instance that was queried, in MB.
InstanceClass	String	The type of the instance that was queried.
Bandwidth	Long	The bandwidth limit of the instance that was queried, in Mbit/s.
Connections	Long	The maximum number of connections to the instance that was queried.
ConnectionDomain	String	The domain name of the instance that was queried. This domain name only supports connections over an internal network.
Port	Int	The port of the instance that was queried.
UserName	String	The username of the instance that was queried.
RegionId	String	The region where the instance that was queried was located.
ZoneId	String	The ID of the zone under the RegionId of the instance that was queried.

Parameter	Type	Description
InstanceStatus	String	The status of the instance that was queried. Possible values: • Normal: the instance that was queried was normal. • Creating: the instance that was queried was being created. • Changing: the instance that was queried was being changed. • Inactive: the instance that was queried was disabled. • Transforming: the instance that was queried was being transformed. • BackupRecovering: the instance that was queried was being backed up and restored. • MinorVersionUpgrading: the minor version of the instance that was queried was being upgraded.
ChargeType	String	The billing method of the instance that was queried. Possible values: PrePaid and PostPaid.
CreateTime	String	The time when the instance that was queried was created. The time follows the ISO 8601 standard in the `YYYY-MM-DDThh:mm:ssZ` format. The time is displayed in UTC time format.
EndTime	String	The time when the subscription instance that was queried was about to expire. The time follows the ISO 8601 standard in the `YYYY-MM-DDThh:mm:ssZ` format. The time is displayed in UTC time format.
NetworkType	String	The type of the network where the instance that was queried was located. Possible values: CLASSIC or VPC.

Parameter	Type	Description
VpcId	String	The ID of the VPC where the instance that was queried was located.
VSwitchId	String	The ID of the VSwitch for the instance that was queried.
PrivateIpAddr	String	The private IP address of the instance that was queried.

Note Due to the compatibility with earlier versions, this topic does not describe some returned fields such as Config for the operation. Alibaba Cloud will delete these fields as needed in the future. In this case, do not rely on the returned fields that this topic has not described when you call this operation.

Sample request

```
https://r-kvstore.example.com
? <Common request parameters>
&Action=DescribeInstances
&PageNumber=1
&PageSize=10
&InstanceId=dexxxxxxxxxx1
```

Sample response

```
{
    "Instances" : {
        "Instance" : [{
                "Bandwidth" : 128,
                "Capacity" : 512,
                "ConnectionDomain" : "de5d88e34d004211.m.cnhzalicm10pub001.r-kvstore.example.com",
                "Connections" : 300,
                "ZoneId" : "cn-qingdao-b",
                "InstanceId" : "dexxxxxxxxxx1",
                "InstanceName" : "xxxxxx",
                "InstanceStatus" : "Available",
                 "InstanceClass" : "redis.master.mid.default",

}
```

11.1.2.8.3. DescribeRegions

Description

You can call this operation to query regions where you can create instances.

Request parameters

Request parameters

Parameter	Type	Required	Description
<Common request parameters>	-	Yes	For more information, see Common parameters.
Action	String	Yes	The operation that you want to perform. Set this parameter to DescribeRegions.

Response parameters

Response parameters

Parameter	Type	Description
<Common response parameters>	-	For more information, see Common parameters.
RegionIds	List	The RegionIds parameter is a list. Every element in this list consists of the RegionId and ZoneIds. ZoneIds is a string, and multiple ZoneId values are separated with commas (,).

Sample request

```
https://r-kvstore.example.com
? <Common request parameters>
&Action=DescribeRegions
```

Sample response

```
{
    "RequestId":"535A88D3-5408-4B29-AFD4-07319D97EBC4",
    "RegionIds":
    {
            {
                "ZoneIds":"cn-qingdao-b",
                "RegionId":"cn-qingdao",
            },
            {
                "ZoneIds":"cn-shenzhen-a",
                "RegionId":"cn-shenzhen",
            },
            {
                "ZoneIds":"cn-hangzhou-d,cn-hangzhou-b",
                "RegionId":"cn-hangzhou"
            },
            {
                "ZoneIds":"cn-beijing-a",
                "RegionId":"cn-beijing"
            }
    }
}
```

11.1.2.8.4. DescribeSecurityIps

Description

You can call this operation to query the list of IP addresses or CIDR blocks that you can use to connect to an instance.

Request parameters

Request parameters

Parameter	Type	Required	Description
<Common request parameters>	-	Yes	For more information, see Common parameters.
Action	String	Yes	The operation that you want to perform. Set this parameter to DescribeSecurityIps.
InstanceId	String	Yes	The name of the specified instance.

Response parameters

Response parameters

Parameter	Type	Description
<Common response parameters>	-	For more information, see Common parameters.
SecurityIpGroups	List	The list of whitelisted IP addresses or CIDR blocks for the instance that was queried.

SecurityIpGroups parameters

SecurityIpGroups parameters

Parameter	Type	Description
SecurityIpGroupName	String	The name of the IP whitelist that was queried.

Parameter	Type	Description
SecurityIpList	String	The list of whitelisted IP addresses or CIDR blocks that were queried. A maximum of 1,000 IP addresses or CIDR blocks are displayed. IP addresses or CIDR blocks are separated with commas (,), such as `0.0.0.0/0,10.23.12.24` (IPv4 addresses) or `10.23.12.24/24` (Classless Inter-Domain Routing or CIDR notation). In the CIDR notation, 10.23.12.24 represents the IPv4 address 10.23.12.24. Its subnet mask is 255.255.255.0. The slash (/) and the following number 24 represent 24 leading 1 bits in the subnet mask and its associated routing prefix. The length of the routing prefix ranges from 1 to 32.

Sample request

```
https://r-kvstore.example.com/
? <Common request parameters>
&Action= DescribeSecurityIps
&InstanceId=6xxxxxxxxxxxxx
```

Sample response

```
{
" SecurityIpGroups " : {
" SecurityIpGroup" : [{
" SecurityIpGroupName" : "ipsecuritytest" ,
" SecurityIpList " : "10.xx.xx. 24"
}
]
},
"RequestId" : "969D0A1D-C91A-4837-9F70-49785DF9BDCE"
}
```

11.1.2.8.5. FlushInstance

Description

You can call this operation to clear data stored on an instance. The cleared data cannot be restored.

This is an asynchronous operation. After you call this operation, the system returns the result immediately. The system clears data in the background.

Request parameters

Request parameters

Parameter	Type	Required	Description
<Common request parameters>	-	-	For more information, see Common parameters.
Action	String	Yes	The operation that you want to perform. Set this parameter to FlushInstance.
InstanceId	String	Yes	The globally unique ID of the specified instance.

Response parameters

Response parameters

Parameter	Type	Description
<Common response parameters>	-	For more information, see Common parameters.

Sample request

```
https://r-kvstore.example.com
? <Common request parameters>
&Action= FlushInstance
&InstanceId=65xxxxxxxx
```

Sample response

```
{
"RequestId" : "96893674-E50C-495D-AB0E-2F12C1E0FD45"
}
```

11.1.2.8.6. ModifyInstanceAttribute

Description

You can call this operation to modify attributes of an instance, such as the name or the password of the instance.

Request parameters

Request parameters

Parameter	Type	Required	Description
<Common request parameters>	-	-	For more information, see Common parameters.
Action	String	Yes	The operation that you want to perform. Set this parameter to ModifyInstanceAttribute.
InstanceId	String	Yes	The globally unique ID of the specified instance.
InstanceName	String	No	The instance name that you want to change to. The name must be a string of 2 to 128 characters in length and must start with an uppercase or lowercase letter or Chinese character. Special characters, such as at signs (@), slashes (/), colons (:), equal signs (=), quotation marks ("), angle brackets (<>), braces ({}), brackets ([]), and spaces, are not supported.

Parameter	Type	Required	Description
NewPassword	String	No	The password of the specified instance. The password must be a string of 8 to 30 characters in length and must contain uppercase letters, lowercase letters, and numbers. **Note** Special characters, such as exclamation points (!), angle brackets (<>), parentheses (()), brackets ([]), braces ({}), commas (,), backticks (`), tildes (~), periods (.), hyphens (-), underscores (_), at signs (@), number signs (#), dollar signs ($), percent signs (%), carets (^), ampersands (&), and asterisks (*), are not supported.

Response parameters

Response parameters

Parameter	Type	Description
<Common response parameters>	-	For more information, see Common parameters.

Sample request

```
https://r-kvstore.example.com
? <Common request parameters>
&Action= ModifyInstanceAttribute
&InstanceId=65xxxxxxxxx
&NewPassword=Qa12345678
&InstanceName=TestInstance
```

Sample response

```
{
"RequestId" : "E3B35BEA-9EB0-402C-88CF-C46CCCC1EE59"
}
```

11.1.2.8.7. ModifyInstanceMaintainTime

Description

You can call this operation to modify maintenance time for an instance. Alibaba Cloud may perform routine maintenance for the instance during the specified maintenance time.

Request parameters

Request parameters

Parameter	Type	Required	Description
<Common request parameters>	-	Yes	For more information, see Common parameters.
Action	String	Yes	The operation that you want to perform. Set this parameter to ModifyInstanceMaintainTime.
InstanceId	String	Yes	The globally unique ID of the specified instance.
MaintainStartTime	String	Yes	The start time of the maintenance to be performed.
MaintainEndTime	String	Yes	The end time of the maintenance to be performed.

Response parameters

Response parameters

Parameter	Type	Description
<Common response parameters>	-	For more information, see Common parameters.

Sample request

```
https://r-kvstore.example.com
? <Common request parameters>
&Action=ModifyInstanceMaintainTime
&InstanceId=65xxxxxxxx
& MaintainStartTime=02:00Z
& MaintainEndTime=06:00Z
```

Sample response

```
{
"RequestId" : "A099747A-0826-499D-9422-381C07337F73"
}
```

11.1.2.8.8. ModifyInstanceNetExpireTime

Description

You can call this operation to prolong the maximum period where the IP address in a classic network is retained if you switch an instance from the classic network to a Virtual Private Cloud (VPC) and retain the IP address in the classic network.

Request parameters

Request parameters

Parameter	Type	Required	Description
<Common request parameters>	-	Yes	For more information, see Common parameters.
Action	String	Yes	The operation that you want to perform. Set this parameter to ModifyInstanceNetExpireTime.
InstanceId	String	Yes	The globally unique ID of the specified instance.
ConnectionString	String	Yes	The domain name of the specified classic network.
ClassicExpiredDays	String	Yes	The maximum number of days where the IP address in a specified classic network is retained. Valid values: 14, 30, 60, and 120.

Response parameters

Response parameters

Parameter	Type	Description
<Common response parameters>	-	For more information, see Common parameters.

Sample request

```
https://r-kvstore.example.com
? <Common request parameters>
&Action= ModifyInstanceNetExpireTime
&ConectionString= fdafas32323ed.redis.rds.aliyuncs.com
&InstanceId=fdxxxxxxxxxx
& ClassicExpiredDays=120
```

Sample response

```
{
"RequestId" : "AAAF99B1-69ED-4E80-8CD5-272C09E46ACF"
}
```

11.1.2.8.9. ModifySecurityIps

Description

You can call this operation to set the IP whitelist for an instance, so that only authorized ECS IP addresses or CIDR blocks can be used to connect to the instance.

Request parameters

Request parameters

Parameter	Type	Required	Description
<Common request parameters>	-	Yes	For more information, see Common parameters.
Action	String	Yes	The operation that you want to perform. Set this parameter to ModifySecurityIps.
InstanceId	String	Yes	The globally unique ID of the specified instance.

Parameter	Type	Required	Description
SecurityIps	String	Yes	The list of whitelisted IP addresses or CIDR blocks that you want to modify.
SecurityIpGroupName	String	Yes	The name of the specified whitelist group.

Response parameters

Response parameters

Parameter	Type	Description
<Common response parameters>	-	For more information, see Common parameters.

Sample request

```
https://r-kvstore.example.com
? <Common request parameters>
&Action= ModifySecurityIps
&InstanceId=65xxxxxxxxxx
&SecurityIps=1.x.x. 1,2.x.x. 2
&SecurityIpGroupName=testgroup
```

Sample response

```
{
"RequestId" : "AAAF99B1-69ED-4E80-8CD5-272C09E46ACF"
}
```

11.1.2.8.10. SwitchNetwork

Description

You can call this operation to switch the network type of an instance. You can switch an instance from a classic network to a Virtual Private Cloud (VPC).

Request parameters

Request parameters

Parameter	Type	Required	Description
<Common request parameters>	-	Yes	For more information, see Common parameters.

Parameter	Type	Required	Description
Action	String	Yes	The operation that you want to perform. Set this parameter to SwitchNetwork.
InstanceId	String	Yes	The globally unique ID of the specified instance.
TargetNetworkType	String	Yes	The type of the network that you want to switch to. • VPC • Classic You can only switch from a classic network to a VPC. In this case, set this parameter to VPC.
VpcId	String	No	The ID of the VPC that you want to switch to.
VSwitchId	String	No	The ID of the VSwitch ID for the VPC that you want to switch to. This parameter is required if you have set VpcId.
RetainClassic	String	No	Specifies whether to retain the IP address in the classic network. Valid values: • True: the classic network IP address is retained. • False: the classic network IP address is not retained. Default value: False.

Parameter	Type	Required	Description
ClassicExpiredDays	String	No	The maximum number of days where the IP address in the classic network are retained. Unit: days. Valid values: 14, 30, 60, and 120. This parameter is required if you have set RetainClassic to True.

Response parameters

Response parameters

Parameter	Type	Description
<Common response parameters>	-	For more information, see Common parameters.

Sample request

```
https://r-kvstore.example.com
? <Common request parameters>
&Action= SwitchNetwork
&InstanceId=fdaxxxxxxxxx
& TargetNetworkType=VPC
&VpcId=fadsfa
&VSwitchId=131ed
&RetainClassic=True
&ClassicExpiredDays=30
```

Sample response

```
{
"RequestId" : "AAAF99B1-69ED-4E80-8CD5-272C09E46ACF"
}
```

11.1.2.9. Backup and recovery

11.1.2.9.1. CreateBackup

Description

You can call this operation to create a backup. This is an asynchronous operation. After you call this operation, the system returns the result immediately. The system creates the backup in the background.

Request parameters

Request parameters

Parameter	Type	Required	Description
<Common request parameters>	-	Yes	For more information, see Common parameters.
Action	String	Yes	The operation that you want to perform. Set this parameter to CreateBackup.
InstanceId	String	Yes	The ID of the specified instance.

Response parameters

Response parameters

Parameter	Type	Description
<Common response parameters>	-	For more information, see Common parameters.

Sample request

```
https://r-kvstore.example.com
? <Common request parameters>
&Action= CreateBackup
&InstanceId= de5d8xxxxxxxxxx
```

Sample response

```
{
"RequestId" : "5C97648D-C85F-4D58-A71F-7B6750856BF7"
}
```

11.1.2.9.2. ModifyBackupPolicy

Description

You can call this operation to modify a backup policy.

Request parameters

Parameter	Type	Required	Description
<Common request parameters>	-	Yes	For more information, see Common parameters.
Action	String	Yes	The operation that you want to perform. Set the value to ModifyBackupPolicy.
InstanceId	String	Yes	The ID of the instance to which the backup file belongs.
PreferredBackupTime	String	Yes	The period of time to execute backup. Specify the time in the `HH:mmZ-HH:mmZ` format.
PreferredBackupPeriod	String	Yes	The period of data backup. Valid values: • Monday • Tuesday • Wednesday • Thursday • Friday • Saturday • Sunday

Response parameters

Response parameters

Parameter	Type	Description
<Common response parameters>	-	For more information, see Common parameters.

Sample requests

```
https://r-kvstore.example.com
? <Common request parameters>
&Action= ModifyBackupPolicy
&InstanceId= de5xxxxxxxxx
&PreferredBackupTime=00:00Z-04:00Z
&PreferredBackupPeriod= Saturday
```

Sample responses

```
{
"RequestId" : "5C97648D-C85F-4D58-A71F-7B6750856BF7"
}
```

11.1.2.9.3. DescribeBackupPolicy

Description

You can call this operation to query a backup policy that you have specified. You can query the backup details of an instance, such as the backup cycle and backup time.

Request parameters

Request parameters

Parameter	Type	Required	Description
<Common request parameters>	-	Yes	For more information, see Common parameters.
Action	String	Yes	The operation that you want to perform. Set this parameter to DescribeBackupPolicy.
InstanceId	String	Yes	The ID of the specified instance.

Response parameters

Response parameters

Parameter	Type	Description
<Common response parameters>	-	For more information, see Common parameters.
BackupRetentionPeriod	String	The maximum number of days where backups of the specified instance were retained.
PreferredBackupTime	String	The time of the backup for the specified instance in the HH:mmZ-HH:mm Z format.

Parameter	Type	Description
PreferredBackupPeriod	String	The backup cycle for the specified instance. Possible values: • Monday • Tuesday • Wednesday • Thursday • Friday • Saturday • Sunday
PreferredNextBackupTime	String	The time of the next backup for the specified instance.

Sample request

```
https://r-kvstore.example.com
? <Common request parameters>
&Action= DescribeBackupPolicy
&InstanceId= de5d8xxxxxxxxxxxxx
```

Sample response

```
{
"BackupRetentionPeriod":"7"
"PreferredBackupTime":"06:00Z-07:00Z"
"PreferredNextBackupTime":"2017-10-19T06:16Z"
"PreferredBackupPeriod":"Monday,Tuesday,Wednesday,Thursday,Friday,Saturday,Sunday"
"RequestId" : "5C97648D-C85F-4D58-A71F-7B6750856BF7"
}
```

11.1.2.9.4. DescribeBackups

Description

You can call this operation to query the details of a backup file, such as the backup start time, file size, backup mode, and download address.

Request parameters

Request parameters

Parameter	Type	Required	Description
<Common request parameters>	-	Yes	For more information, see Common parameters.

Parameter	Type	Required	Description
Action	String	Yes	The operation that you want to perform. Set the value to DescribeBackups.
InstanceId	String	Yes	The ID of the instance to which the backup file belongs.
BackupId	String	No	The ID of the backup set.
PageSize	String	Yes	The number of entries to return on each page. Valid values: 30, 50, and 100.
PageNumber	String	Yes	The number of the page to return. Valid values: any non-zero positive integer.
StartTime	String	Yes	The beginning of the time range to query.
End time.	String	Yes	The end of the time range to query.

Response parameters

Response parameters

Parameter	Type	Description
<Common response parameters>	-	For more information, see Common parameters.
Backups	List	An array consisting of Backup data.
PageNumber	Integer	The number of the returned page.
TotalCount	Integer	The total number of backups.
PageSize	Integer	The number of entries returned on each page.

Backup parameter structure

Backup parameter structure

Parameter	Type	Description
BackupId	String	The ID of the backup set.
BackupDBNames	String	The name of the database that is backed up.
BackupStatus	String	The status of the backup set. • Success • Failed
BackupStartTime	String	The beginning of the time range where the data was backed up.
BackupEndTime	String	The end of the time range where the data was backed up.
BackupType	String	The type of the backup. Valid values: • FullBackup • IncrementalBackup
BackupMode	String	The mode of the backup. Valid values: • Automated • Manual
BackupMethod	String	The method of the backup. Valid values: • Logical • Physical
BackupDownloadURL	String	The download URL of the backup file.
BackupSize	String	The size of the backup set.

Sample requests

```
https://r-kvstore.example.com
? <Common request parameters>
&Action= DescribeBackups
&InstanceId= de5xxxxxxxxxxxx
&PageNumber=1
&PageSize=10
&InstanceId=de5xxxxxxxxxxxx
```

Sample responses

```
{
{
    " Backups " : {
        "Backup " : [{
           "BackupId":"111111111",
           "BackupDBNames":"all",
          "BackupStatus":"Success",
         "BackupType":"FullBackup",
"BackupStartTime":"2017-10-18T10:34:52Z",
"BackupEndTime":"2017-10-18T10:36:06Z",
"BackupMode":"Manual",
"BackupMethod":"Physical",
"BackupDownloadURL":"https://rdsxxx-st-v2.oss-cn-shenzhen.example.com/custins11111111/xxxxx
xxxx_data_20171018183408.rdb",

}
        ]
    },
    "PageNumber" : 1,
    "PageSize" : 10,
    "TotalCount" : 1,
"RequestId" : "5C97648D-C85F-4D58-A71F-7111111111117"
}
```

11.1.2.9.5. RestoreInstance

Description

You can call this operation to restore data to a primary instance based on a backup set.

Note Calling this operation will cause overwriting data on the specified instance with backup data. Proceed with caution.

Request parameters

Request parameters

Parameter	Type	Required	Description
<Common request parameters>	-	Yes	For more information, see Common parameters.
Action	String	Yes	The operation that you want to perform. Set this parameter to RestoreInstance.
InstanceId	String	Yes	The ID of the specified instance.

Parameter	Type	Required	Description
BackupId	String	Yes	Backup set ID

Response parameters

Response parameters

Parameter	Type	Description
<Common response parameters>	-	For more information, see Common parameters.

Sample request

```
https://r-kvstore.example.com
? <Common request parameters>
&Action= RestoreInstance
&InstanceId= de5dxxxxxxxxxxx
&BackupId=fdaxxxxxx
```

Sample response

```
{
"RequestId" : "AFA391BF-808F-4DA6-80A2-A382108A0945"
}
```

11.1.2.10. Manage monitoring

11.1.2.10.1. DescribeMonitorItems

Description

You can call this operation to query available monitoring metrics. The result is returned in the <parameter:unit> format.

Request parameters

Request parameters

Parameter	Type	Required	Description
<Common request parameters>	-	Yes	For more information, see Common parameters.
Action	String	Yes	The operation that you want to perform. Set this parameter to DescribeMonitorItems.

Response parameters

Response parameters

Parameter	Type	Description
<Common response parameters>	-	For more information, see Common parameters.
MonitorItems	List	The list of monitoring metrics that were queried.

Sample request

```
https://r-kvstore.example.com
? <Common request parameters>
&Action=DescribeMonitorItems
```

Sample response

```
{
    "MonitorItems" : {
        "MonitorItem" : [{
                "MonitorKey" : "GetQ",
                "Unit" : "Counts/s"
            }, {
                "MonitorKey" : "Flush",
                "Unit" : "Counts/s"
            }, {
                "MonitorKey" : "UsedMemCache",
                "Unit" : "Bytes"
            }, {
                "MonitorKey" : "ReplaceQ",
                "Unit" : "Counts/s"
            }
        ]
    },
    "RequestId" : "B906A893-58A3-4644-AC2D-A2C9B08706C1"
}
```

11.1.2.10.2. DescribeHistoryMonitorValues

Description

You can call this operation to query historical monitoring data of an instance.

Request parameters

Request parameters

Parameter	Type	Required	Description
<Common request parameters>	-	Yes	For more information, see Common parameters.
Action	String	Yes	The operation that you want to perform. Set this parameter to DescribeHistoryMonitorValues.
InstanceId	String	Yes	The ID of the specified instance.
StartTime	String	Yes	The beginning of the time range where the historical monitoring data is queried. Specify the time in the ISO 8601 standard in the `YYYY-MM-DDThh:mm:ssZ` format. The time must be in UTC time format.
EndTime	String	Yes	The end of the time range where the historical monitoring data is queried. Specify the time in the ISO 8601 standard in the `YYYY-MM-DDThh:mm:ssZ` format. The time must be in UTC time format. The value of EndTime must be greater than or equal to that of StartTime.
IntervalForHistory	String	Yes	The interval for collecting monitoring data. Monitoring samples were collected every N minutes. Valid values: 01m, 05m, 15m, and 60m.
MonitorKeys	String	No	The key of the specified metric. You can call the DescribeMonitorItems operation to query the value of this parameter.

Response parameters

Response parameters

Parameter	Type	Description
<Common response parameters>	-	For more information, see Common parameters.
MonitorHistory	String	The monitoring data returned in the JSON format. For more information, see DescribeMonitorItems. **Note** To improve the data transmission efficiency, only metrics whose values are not 0 have been returned. All metrics that are not displayed have been set to the default value 0.

Sample request

```
https://r-kvstore.example.com
? <Common request parameters>
&Action= DescribeHistoryMonitorValues
&InstanceId= de5xxxxxxxxxxx
&EndTime=2014-11-27T12%3A02%3A00Z
&StartTime=2014-11-27T12%3A00%3A00Z
&IntervalForHistory=01m
```

Sample response

```
{
"MonitorHistory" :
"{"2014-11-27T12:00:00Z":{"IsConnectControl":false,"IsFlowControl":false,"ItemCount":1,"Quo
taConnection":500,"QuotaFlow":15360,"QuotaMemCache":1073741824,"QuotaQps":9000,"UsedMemCach
e":14},

}
```

11.1.2.11. Manage parameters

11.1.2.11.1. DescribeInstanceConfig

Description

You can call this operation to query parameters of an instance.

Request parameters

Request parameters

Parameter	Type	Required	Description
<Common request parameters>	-	Yes	For more information, see Common parameters.
Action	String	Yes	The operation that you want to perform. Set this parameter to DescribeInstanceConfig.
InstanceId	String	Yes	The ID of the specified instance.

Response parameters

Response parameters

Parameter	Type	Description
<Common response parameters>	-	For more information, see Common parameters.
Config	String	The parameters of the specified instance that was queried. For more information, see Instance configurations.

Sample request

```
https://r-kvstore.example.com
? <Common request parameters>
&Action= DescribeInstanceConfig
&InstanceId= de5dxxxxxxxxxxx
```

Sample response

```
{
"Config":"{"EvictionPolicy":"volatile-lru","hash-max-ziplist-entries":512,
"hash-max-ziplist-value":64,"list-max-ziplist-entries":512,
"list-max-ziplist-value":64,"set-max-intset-entries":512,
"zset-max-ziplist-entries":128,"zset-max-ziplist-value":64},
"RequestId":"59A58517-F8FF-44E5-B90F-F386DB3E4AB8"
}
```

11.1.2.11.2. ModifyInstanceConfig

Description

You can call this operation to modify a parameter of an instance.

Request parameters

Request parameters

Parameter	Type	Required	Description
<Common request parameters>	-	Yes	For more information, see Common parameters.
Action	String	Yes	The operation that you want to perform. Set this parameter to ModifyInstanceConfig.
InstanceId	String	Yes	The ID of the specified instance.
Config	String	Yes	The parameter of the specified instance that you want to modify. The value of this parameter must be in the JSON string format. For more information, see Instance configurations.

Response parameters

Response parameters

Parameter	Type	Description
<Common response parameters>	-	For more information, see Common parameters.

Sample request

```
https://r-kvstore.example.com
? <Common request parameters>
&Action= ModifyInstanceConfig
&InstanceId= de5xxxxxxxxxxx
&Config={"hash-max-ziplist-entries":"512"}
```

Sample response

```
{
"RequestId":"59A58517-F8FF-44E5-B90F-F386DB3E4AB8"
}
```

11.1.2.12. Appendixes

11.1.2.12.1. Instance specifications

KVStore for Redis provides instances of Community Edition and performance-enhanced instances of Enhanced Edition. These instance types support the standard architecture and the cluster architecture. This topic describes the specifications of different instance types, such as the memory capacity, maximum number of connections, and maximum bandwidth value.

Calculation rules for bandwidth values

- If network resources are sufficient, bandwidth is unlimited. However, if network resources are insufficient, the bandwidth is limited.
- The upper limit of the total bandwidth for a read/write splitting instance is 2,048 MB/s. After the upper limit is reached, the bandwidth cannot be increased even if you add more shards or nodes.
- The bandwidth value applies to the upstream and downstream bandwidths. For example, if the bandwidth of an instance is 10 MB/s, the upstream and downstream bandwidths of the instance are both 10 MB/s.
- The bandwidth in the preceding table is the internal bandwidth of the ApsaraDB for Redis instance. The Internet bandwidth is determined by the internal bandwidth and is limited by the bandwidth of the connection between the instance and a client. We recommend that you use an internal network to maximize the performance of the instance.

Performance-enhanced instances of KVStore for Redis Enhanced Edition (Tair)

Standard master-replica instances

Specification	Specification code	Number of I/O threads	Number of connections per second	Maximum number of concurrent connections	Total maximum bandwidth value (MB/s)
1 GB master-replica performance-enhanced instance	redis.amber.master.small.multithread	6	10000	30000	96
2 GB master-replica performance-enhanced instance	redis.amber.master.mid.multithread	6	10000	30000	96
4 GB master-replica performance-enhanced instance	redis.amber.master.stand.multithread	6	10000	30000	96
8 GB master-replica performance-enhanced instance	redis.amber.master.large.multithread	6	10000	30000	96
16 GB master-replica performance-enhanced instance	redis.amber.master.2xlarge.multithread	6	10000	30000	96
32 GB master-replica performance-enhanced instance	redis.amber.master.4xlarge.multithread	6	10000	30000	96
64 GB master-replica performance-enhanced instance	redis.amber.master.8xlarge.multithread	6	10000	30000	96

Cluster instances

Specification	Specification code	Number of I/O threads	Number of shards	Number of proxy servers	Number of connections per second	Maximum number of concurrent connections	Maximum bandwidth value per shard	Total maximum bandwidth value (MB/s)
2 GB cluster performance-enhanced instance (2 shards)	redis.amber.logic.sharding.1g.2db.0rodb.6proxy.multithread	6	2	4	50000	60000	96	192
4 GB cluster performance-enhanced instance (2 shards)	redis.amber.logic.sharding.2g.2db.0rodb.6proxy.multithread	6	2	4	50000	50000	96	192
8 GB cluster performance-enhanced instance (4 shards)	redis.amber.logic.sharding.2g.4db.0rodb.12proxy.multithread	6	4	4	50000	120000	96	384
16 GB cluster performance-enhanced instance (8 shards)	redis.amber.logic.sharding.2g.8db.0rodb.24proxy.multithread	6	8	8	50000	240000	96	768
32 GB cluster performance-enhanced instance (8 shards)	redis.amber.logic.sharding.4g.8db.0rodb.24proxy.multithread	6	8	8	50000	240000	96	768
64 GB cluster performance-enhanced instance (8 shards)	redis.amber.logic.sharding.8g.8db.0rodb.24proxy.multithread	6	8	8	50000	240000	96	768
32 GB cluster performance-enhanced instance (16 shards)	redis.amber.logic.sharding.2g.16db.0rodb.48proxy.multithread	6	16	16	50000	480000	96	1536
64 GB cluster performance-enhanced (16 shards)	redis.amber.logic.sharding.4g.16db.0rodb.48proxy.multithread	6	16	16	50000	480000	96	1536

Specification	Specification code	Number of I/O threads	Number of shards	Number of proxy servers	Number of connections per second	Maximum number of concurrent connections	Maximum bandwidth value per shard	Total maximum bandwidth value (MB/s)
128 GB cluster performance-enhanced instance (16 shards)	redis.amber.logic.sharding.8g.16db.0rodb.48proxy.multithread	6	16	16	50000	480000	96	1536
256 GB cluster performance-enhanced instance (16 shards)	redis.amber.logic.sharding.16g.16db.0rodb.48proxy.multithread	6	16	16	50000	480000	96	1536
512 GB cluster performance-enhanced instance (32 shards)	redis.amber.logic.sharding.16g.32db.0rodb.96proxy.multithread	6	32	32	50000	500000	96	2048
1,024 GB cluster performance-enhanced instance (64 shards)	redis.amber.logic.sharding.16g.64db.0rodb.192proxy.multithread	6	64	64	50000	500000	96	2048
2,048 GB cluster performance-enhanced instance (128 shards)	redis.amber.logic.sharding.16g.128db.0rodb.384proxy.multithread	6	128	128	50000	500000	96	2048
4,096 GB cluster performance-enhanced instance (256 shards)	redis.amber.logic.sharding.16g.256db.0rodb.768proxy.multithread	6	256	256	50000	500000	96	2048
8,192 GB cluster performance-enhanced instance (256 shards)	redis.amber.logic.sharding.32g.256db.0rodb.768proxy.multithread	6	256	256	50000	500000	96	2048

Community Edition instances

Standard master-replica instances

Specification	Service code	Maximum number of connections	Maximum bandwidth value (MB/s)	CPU
1GB master-replica instance	redis.master.small.default	20000	48	1 core
2 GB master-replica instance	redis.master.mid.default	20000	48	1 core
4 GB master-replica instance	redis.master.stand.default	20000	48	1 core
8 GB master-replica instance	redis.master.large.default	20000	48	1 core
16 GB master-replica instance	redis.master.2xlarge.default	20000	48	1 core
32 GB master-replica instance	redis.master.4xlarge.default	20000	48	1 core
64 GB master-replica instance	redis.master.8xlarge.default	20000	96	1 core

Cluster instances

Specification	Service code	Number of shards	Maximum number of connections	Maximum bandwidth value (MB/s)	CPU
16 GB cluster instance	redis.logic.sharding.2g.8db.0rodb.8proxy.default	8	80000	768	8 cores
32 GB cluster instance	redis.logic.sharding.4g.8db.0rodb.8proxy.default	8	80000	768	8 cores
64 GB cluster instance	redis.logic.sharding.8g.8db.0rodb.8proxy.default	8	80000	768	8 cores
128 GB cluster instance	redis.logic.sharding.8g.16db.0rodb.16proxy.default	16	160000	1536	16 cores
256 GB cluster instance	redis.logic.sharding.16g.16db.0rodb.16proxy.default	16	160000	1536	16 cores
512 GB cluster instance	redis.logic.sharding.16g.32db.0rodb.32proxy.default	32	320000	2048	32 cores
1 TB cluster instance	redis.logic.sharding.16g.64db.0rodb.64proxy.default	64	500000	2048	64 cores

Specification	Service code	Number of shards	Maximum number of connections	Maximum bandwidth value (MB/s)	CPU
2 TB cluster instance	redis.logic.sharding.16g.128db.0rodb.128proxy.default	128	500000	2048	128 cores
4 TB cluster instance	redis.logic.sharding.16g.256db.0rodb.256proxy.default	256	500000	2048	256 cores

11.1.2.12.2. Error codes

Description	Error code	Error message	HTTP status code
The error message returned because RAM users are not authorized to call the API operation.	Forbidden.RAM	User not authorized to operate on the specified resource, or this API doesn't support RAM.	403
The error message returned because the operation is unavailable for RAM users.	Forbedden.NotSupportRAM	This action does not support accessed by RAM mode.	403
The error message returned because an exception or error occurs on the server.	ServiceUnavailable	The request has failed due to a temporary failure of the server.	503
The error message returned because the instance status that you specified does not exist.	InvalidStatus.NotFound	The Status provided does not exist in our records.	404
The error message returned because the specified value of the parameter is invalid.	InvalidParameter	The specified parameter InstanceName is not valid.	400
The error message returned because you are not authorized to call the administrator-specific API operations.	Forbbiden.NotAdminUser	User not authorized to operate on the specified API as you are not the	403
The error message returned because the parameter is missing.	MissingParameter	Specified parameter is missing.	400

Description	Error code	Error message	HTTP status code
The error message returned because neither InstanceName nor NewPassword is specified.	MissingParameter	InstanceName/NewPassword at least one is mandatory for this action.	400
The error message returned because OwnerId is not specified for this operation.	MissingParameter	The input parameter OwnerId, OwnerAccount that is mandatory for processing this request	403
The error message returned because the specified Token parameter is invalid.	InvalidToken.Malformed	The Specified parameter "Token" is not valid.	400
The error message returned because the specified InstanceName parameter is invalid.	InvalidInstanceName.Malformed	The Specified parameter "InstanceName" is not valid.	400
The error message returned because the specified Password parameter is invalid.	InvalidPassword.Malformed	The Specified parameter "Password" is not valid."	400
The error message returned because the specified Instances parameter is invalid.	InvalidInstances.Malformed	The Specified parameter "Instances" is not valid.	400
The error message returned because the specified StartTime parameter is invalid.	InvalidStartTime.Malformed	The Specified parameter "StartTime" is not valid.	400
The error message returned because the specified EndTime parameter is invalid.	InvalidEndTime.Malformed	The Specified parameter "EndTime" is not valid.	400
The error message returned because the specified InstanceIds parameter is invalid.	InvalidInstanceIds.Malformed	The Specified parameter "InstanceIds" is not valid.	400
The error message returned because your balance is insufficient to perform the current operation.	InsufficientBalance	Your account does not have enough balance.	400

Description	Error code	Error message	HTTP status code
The error message returned because your account fails to pass the real-name authentication.	RealNameAuthenticationError	Your account has not passed the real-name authentication yet.	403
The error message returned because your instance quota has been exhausted.	QuotaExcee	Living afterpay instances quota exceeded.	400
The error message returned because the capacity configuration is invalid.	InvalidCapacity.NotFound	The Capacity provided does not exist in our records.	400
The error message returned because the ClientToken parameter used for this request has already been used for a different request.	IdempotentParameterMismatch	Request uses a client token in a previous request but is not identical to that request.	400
The error message returned because the inventory of instances in the specified zone is insufficient.	QuotaNotEnough	Quota not enough in this zone.	400
The error message returned because you are not authorized to call the order-class API operations.	Forbbiden.SubUser	The specified action is not available for you.	403
The error message returned because the Apsara Stack risk control system denies this access request.	Forbidden.RiskControl	This operation is forbidden by Aliyun Risk Control system.	403
The error message returned because the specified region does not exist.	InvalidRegion.NotFound	The RegionId or ZoneId provided does not exist in our records.	404
The error message returned because the specified ZoneId parameter is invalid.	InvalidZoneId.NotFound	The ZoneId provided is invalid.	400

Description	Error code	Error message	HTTP status code
The error message returned because the ID of the instance does not exist.	InvalidInstanceId.NotFound	The InstanceId provided does not exist in our records.	404
The error message returned because the password is incorrect.	IncorrectPassword	The Password provided is not correct.	400
The error message returned because the service is unavailable.	ServiceNotSupported	The specified service is not supported.	400
The error message returned because a renewal and configuration change order has not taken effect.	HasRenewChangeOrder	This instance has a renewChange order.	400
The error message returned because an internal error occured.	InternalError	The request processing has failed due to some unknown error.	500
The error message returned because the specified backup time is invalid.	InvalidPreferredBackupTime	Specified preferred backup time is not valid.	400
The error message returned because the specified backup type is invalid.	InvalidBackupType.Format	Specified backup type is not valid.	400
The error message returned because the specified backup method is invalid.	InvalidBackupMethod.Format	Specified backup method is not valid.	400
The error message returned because the backup task already exists.	BackupJobExists	A backup job already exists in the specified DB instance.	400
The error message returned because the maximum number of daily backup operations has been reached.	BackupTimesExceeded	Exceeding the daily backup times of this DB instance.	400

Description	Error code	Error message	HTTP status code
The error message returned because no parameters are specified.	ParameterLeastAssociate	Must input at least one optional parameter.	400
The error message returned because the specified backup period is invalid.	InvalidBackupRetentionPeriod.Malformed	Specified backup retention period is not valid.	400
The error message returned because the specified next backup time is invalid.	InvalidPreferredBackupTime.Format	Specified preferred backup time is not valid.	400
The error message returned because the specified backup period is invalid.	InvalidPreferredBackupPeriod.Malformed	Specified backup period is not valid.	400
The error message returned because the operation is not supported by the current instance type.	IncorrectDBInstanceType	Current DB instance type does not support this operation	400
The error message returned because the specified key is invalid.	InvalidKey.Malformed	Specified key is not valid.	400
The error message returned because the nonce signature is used and cannot be used again.	SignatureNonceUsed	Specified signature nonce was used already.	400
The error message returned because no virtual IP address can be assigned.	AllocateVpcIp.NotEnough	Ip resource is not enough	400
The error message returned because instances of the specified type cannot be created in the zone.	Zone.NotSupport	Specified zone does not support creating with instance class.	400
The error message returned because the code for the instance type is invalid.	MissingClassCode	Capacity or InstanceClass is mandatory for this action.	400

Description	Error code	Error message	HTTP status code
The error message returned because the specified instance type is not supported.	InvalidDBInstanceClass.NotFound	Specified DB instance class is not found.	404
The error message returned because the instance is locked.	IncorrectDBInstanceLockMode	Current DB instance lock mode does not support this operation.	400
The error message returned because the ID of the backup set does not exist.	InvalidBackupSetID.NotFound	Specified backup set ID does not exist.	400
The error message returned because the operation is not supported while the instance is in the current state.	IncorrectDBInstanceState	Current DB instance state does not support this operation.	400
The error message returned when the available resource capacity in the specified instance is insufficient.	InsufficientResourceCapacity	There is insufficient capacity available for the requested instance.	400
The error message returned because the specified end time is invalid.	InvalidEndTime.Format	Specified end time is not valid.	400
The error message returned because the specified duration for reserving a classic IP address is invalid.	InvalidClassicExpiredDays.Format	The specified classicExpiredDays format is not valid.	400
The error message returned because the operation is not supported while the backup set is in the current state.	IncorrectBackupSetState	Current backup set state does not support operations.	400
The error message returned when the specified whitelist is not correct in format.	InvalidSecurityIPList.Format	Specified security IP list format is not valid.	400

11.1.2.12.3. Instance configurations

KVStore for Redis instance configurations

Parameter	Description	Value
maxmemory-policy	The eviction policy that a KVStore for Redis instance uses to evict data when the memory exceeds the threshold. KVStore for Redis supports six data eviction policies.	• VolatileLRU: only evicts original data that has Time To Live (TTL) configured based on the Least Recently Used (LRU) algorithm. • VolatileTTL: only evicts data that has TTL configured based on the TTL values in ascending order. • AllKeysLRU: evicts original data based on the LRU algorithm. • VolatileRandom: only evicts original data that has TTL configured randomly. • AllKeysRandom: evicts original data randomly. • NoEviction: evicts no data, but returns an error message when you write new data to the instance.
hash-max-ziplist-entries	A hash object uses ziplist encoding only if the hash object meets both of the following conditions: • The number of key-value pairs stored in the hash object is smaller than or equal to the value of list-max-ziplist-entries. • The string lengths of keys and values in all key-value pairs stored in the hash object are smaller than or equal to the value of list-max-ziplist-value.	Default value: 512.

Parameter	Description	Value
hash-max-ziplist-value	A hash object uses ziplist encoding only if the hash object meets both of the following conditions: • The number of key-value pairs stored in the hash object is smaller than or equal to the value of list-max-ziplist-entries. • The string lengths of keys and values in all key-value pairs stored in the hash object are smaller than or equal to the value of list-max-ziplist-value.	Default value: 64.
list-max-ziplist-entries	A list object uses ziplist encoding only if the list object meets both of the following conditions: • The number of key-value pairs stored in the list object is smaller than or equal to the value of list-max-ziplist-entries. • The string lengths of keys and values in all key-value pairs stored in the list object are smaller than or equal to the value of list-max-ziplist-value.	Default value: 512.
list-max-ziplist-value	A list object uses ziplist encoding only if the list object meets both of the following conditions: • The number of key-value pairs stored in the list object is smaller than or equal to the value of list-max-ziplist-entries. • The string lengths of keys and values in all key-value pairs stored in the list object are smaller than or equal to the value of list-max-ziplist-value.	Default value: 64.
set-max-intset-entries	A set object uses intset encoding only if: the number of entries is smaller than or equal to the value of set-max-intset-entries and all entries are decimal integers.	Default value: 512.

Parameter	Description	Value
zset-max-ziplist-entries	A zset object uses ziplist encoding only if the zset object meets both of the following conditions: • The number of key-value pairs stored in the zset object is smaller than or equal to the value of zset-max-ziplist-entries. • The string lengths of keys and values in all key-value pairs stored in the zset object are smaller than or equal to the value of zset-max-ziplist-value.	Default value: 128.
zset-max-ziplist-value	A zset object uses ziplist encoding only if the zset object meets both of the following conditions: • The number of key-value pairs stored in the zset object is smaller than or equal to the value of zset-max-ziplist-entries. • The string lengths of keys and values in all key-value pairs stored in the zset object are smaller than or equal to the value of zset-max-ziplist-value.	Default value: 64.

Parameter	Description	Value
notify-keyspace-events	The keyspace notifications allow clients to subscribe to channels or modes to receive events where Redis datasets were modified in some way.	• K: the keyspace notifications. All notifications are prefixed with `\__keyspace\@_\_`. • E: the keyevent notifications. All notifications are prefixed with `__keyevent@__`. • g: the notifications about general commands that are non-type specific, such as DEL, EXPIRE, and RENAME. • $: the string command notifications. • l: the list command notifications. • s: the set command notifications. • h: the hash command notifications. • z: the sorted set command notifications. • x: the expiration events. The system sends an expiration event after the system deletes an expired key. • e: the eviction events. The system sends an eviction event after the system evicts a key according to the maxmemory policy. • A: the alias for g$lshzxe.

12.ApsaraDB for MongoDB

12.1. Developer Guide

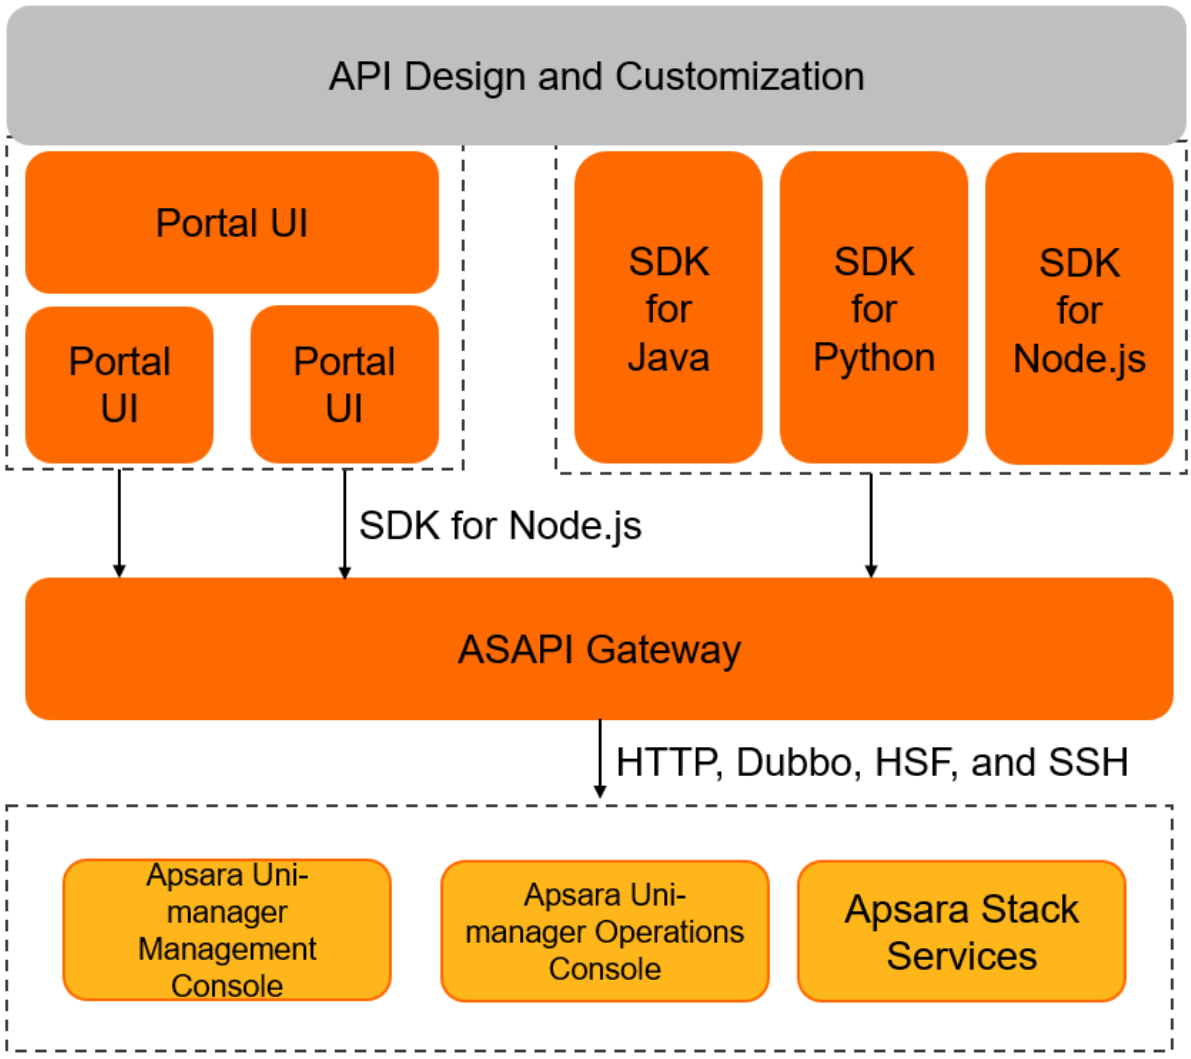
12.1.1. Use ASAPI to call Apsara Stack SDKs

12.1.1.1. 文档标题缺失，请补全后重新导出

12.1.1.1.1. ASAPI overview

This topic describes the architecture and features of the Apsara Stack API (ASAPI).

The ASAPI is a unified ingress gateway for Apsara Stack services and a main component of the Apsara Uni-manager Management Console. The ASAPI provides a unified method for you to manage and make API calls. You can use Apsara Stack SDK to centrally make API calls to Apsara Stack services, including Elastic Compute Service (ECS) and Virtual Private Cloud (VPC).



The ASAPI allows you to make API calls to manage and maintain Apsara Stack services.

- Make API calls to implement enterprise-grade management. For example, you can manage organizations, users, roles, resource sets, and logon policies. These operations are provided by the Apsara Uni-manager Management Console.
- Make API calls to manage operations. For example, you can manage quotas, usage statistics, specifications, and password policies. These operations are provided by the Apsara Uni-manager Management Console.
- Make API calls to manage resources. For example, you can create, delete, query, or modify cloud resources. These operations are provided by Apsara Stack services. If you call an API operation to create an ECS instance or a VPC, the API operation is provided by ECS or VPC.
- Make API calls to query monitoring metrics of Apsara Stack services. These operations are provided by the Apsara Uni-manager Management Console.
- Make API calls to perform O&M. For example, you can manage monitoring and alerting, inventories, tasks, and physical servers. These operations are provided by the Apsara Uni-manager Operations Console.

For more information, see the developer guide of the corresponding Apsara Stack service. For information about API operations used to manage organization users, see *Apsara Uni-manager Management Console Developer Guide*. For information about the API operation used to create an ECS instance, see *ECS Developer Guide*.

> **Note** If the "Use Apsara Stack SDK to make API calls" section is included in the developer guide of an Apsara Stack service, the ASAPI is supported by the Apsara Stack service. In this case, you can make API calls based on the developer guide.

12.1.1.1.2. Preparations

12.1.1.1.2.1. Log on to the API Tool console

You can log on to the API Tool console from the Apsara Uni-manager Management Console.

Prerequisites

- The URL of the Apsara Uni-manager Management Console is obtained from the deployment personnel before you log on to the Apsara Uni-manager Management Console.
- We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL of the Apsara Uni-manager Management Console. Press the Enter key.
2. Enter your username and password.

   Obtain the username and password that you can use to log on to the console from the operations administrator.

> **Note** When you log on to the Apsara Uni-manager Management Console for the first time, you must change the password of your username. Your password must meet complexity requirements. The password must be 10 to 32 characters in length and must contain at least two of the following character types:
>
> - Uppercase or lowercase letters
> - Digits
> - Special characters, which include ! @ # $ %

3. Click **Log On**.
4. In the top navigation bar, choose **Products > Others > API Tool**.

12.1.1.1.2.2. View information about API operations

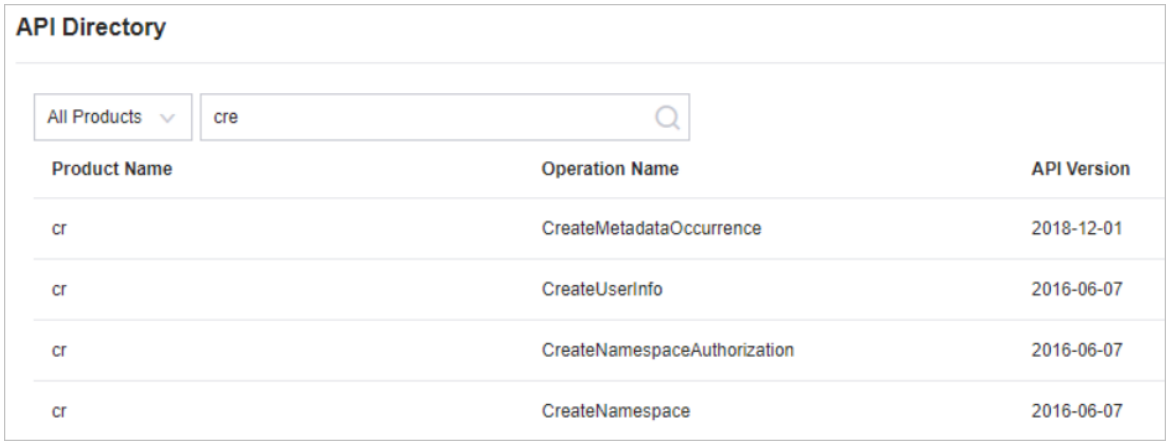
This topic describes how to view information about API operations. Before you use SDKs, obtain service names, API operation names, and API operation versions.

Context

The API operations on the API Directory page are only for reference. For information about how to call API operations, see developer guides of the corresponding cloud services. If the information on the API Directory page is inconsistent with that in the developer guide of the corresponding cloud service, the information in the developer guide prevails.

Procedure

1. Go to the API Tool console. For more information, see Log on to the API Tool console.
2. In the left-side navigation pane, click **API Directory**.
3. On the **API Directory** page, select the desired service from the drop-down list, enter a keyword of an API operation name in the search box, and then click the search icon.



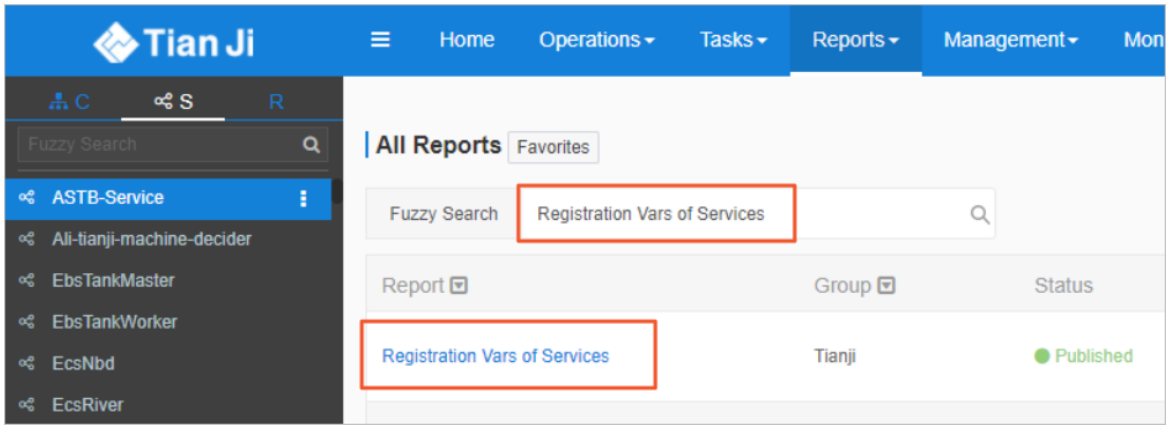
4. Then, you can view the service name, API operation name, and API operation version.

12.1.1.1.2.3. Generate an endpoint for the ASAPI

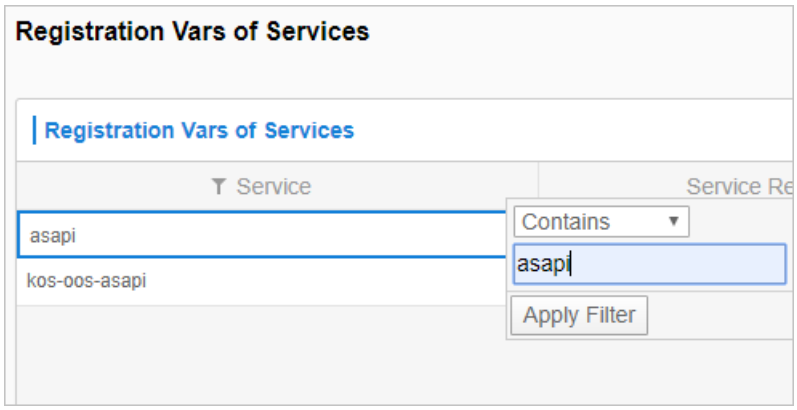
This topic describes three methods used to generate an endpoint for the Apsara Stack API (ASAPI).

Method 1: Use Registration Vars of Services to generate an endpoint

1. Log on to Apsara Infrastructure Management Framework.
   i. Log on to the Apsara Uni-manager Operations Console.
   ii. In the top navigation bar, click **O&M**.
   iii. In the left-side navigation pane, choose **Product Management** > **Products**.
   iv. In the Apsara Stack O&M section, click **Apsara Infrastructure Management Framework**.
2. In the left-side navigation pane, click **Reports**.
3. On the **All Reports** page, search for `Registration Vars of Services` and click the report name.



4. On the **Registration Vars of Services** page, click the icon next to **Service** and search for `asapi`.



5. Find the asapi service, right-click in the **Service Registration** column, and then select **Show More** from the shortcut menu.

   In the **Details** dialog box, obtain the value of **asapi.public.endpoint**.
6. Generate an endpoint for the ASAPI based on the following format:

```
https://<asapi.public.endpoint>/asapi/v3
```

Method 2: Use cluster resources to generate an endpoint

1. Log on to Apsara Infrastructure Management Framework.
   i. Log on to the Apsara Uni-manager Operations Console.

ii. In the top navigation bar, click **O&M**.

iii. In the left-side navigation pane, choose **Product Management** > **Products**.

iv. In the Apsara Stack O&M section, click **Apsara Infrastructure Management Framework**.

2. Go to the cluster operations page.

i. In the left-side navigation pane, choose Operations > Cluster Operations.

ii. In the **Cluster** search box, enter `ascm`.

iii. Find the cluster that you want to manage and click **Operations** in the **Actions** column.

3. Obtain the value of the domain parameter.

i. Click the Cluster Resources tab.

ii. In the **Name** field, search for `asapi_dns_public`.

iii. Click **Details** in the **Application Parameter** column.

In the **Application Parameter** message, obtain the value of the **domain** parameter.

4. Generate an endpoint for the ASAPI based on the following format:

```
https://<domain>/asapi/v3
```

Method 3: Concatenate strings to generate an endpoint

You can also concatenate strings to generate an endpoint based on the following format:

```
https://public.asapi.<region>.<internet-domain>/asapi/v3
```

> **Note**
>
> 1. Replace <region> with your actual region ID. For information about how to query a region ID, see Query a region ID.
> 2. Replace <internet-domain> with the root domain of your Apsara Stack service. To obtain the root domain, contact Apsara Stack O&M personnel. Take note of this point: Use the internet-domain parameter instead of the intranet-domain parameter.

If the **region** value is `cn-****-****-d01` and the **internet-domain** value is `inter.****.****.com`, the following endpoint can be generated:

```
https://public.asapi.cn-****-****-d01.inter.****.****.com/asapi/v3
```

12.1.1.1.2.4. Obtain Apsara Stack SDKs

The Apsara Stack API (ASAPI) is a unified portal provided by Apsara Stack. You can use the ASAPI to connect to all Apsara Stack services. Apsara Stack provides SDKs for API calls.

For more information about how to obtain Apsara Stack SDKs, see Apsara Stack documentation.

12.1.1.1.2.5. Obtain an AccessKey pair

An AccessKey pair that consists of an AccessKey ID and an AccessKey secret is used to implement symmetric encryption. This helps you verify the identity of a requester. The AccessKey ID is used to identify a user. The AccessKey secret is used to encrypt the signature string. This topic describes how to obtain an AccessKey pair.

Prerequisites

An account of the operations administrator or the level-1 organization administrator is obtained. Only an operations administrator or a level-1 organization administrator can obtain an AccessKey pair.

Context

If you need to make API calls to the Apsara Uni-manager Management Console or other Apsara Stack services, we recommend that you use the AccessKey pair of a personal account. If you use the AccessKey pair of a personal account, configure the request headers that are described in the following table for access control. Otherwise, an error that indicates insufficient permissions can occur.

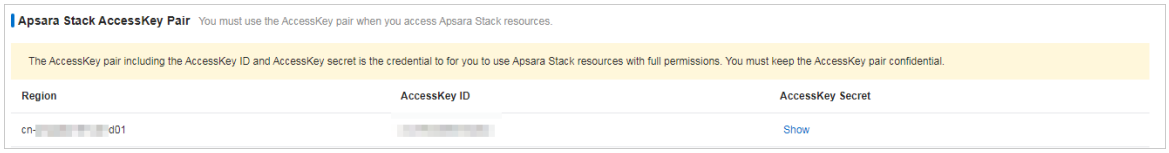
Parameter	Description
x-acs-regionid	The ID of the region, for example, cn-hangzhou-*.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console. For information about how to obtain an organization ID, see the "GetOrganizationList" section in Apsara Uni-manager Management Console Developer Guide.
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console. For information about how to obtain a resource set ID, see the "ListResourceGroup" section in Apsara Uni-manager Management Console Developer Guide.
x-acs-instanceid	The ID of the instance to which you make API calls. If you need to make API calls to an Elastic Compute Service (ECS) instance, obtain the ID of the ECS instance on the Instances page.

Warning The AccessKey pair of a personal account is managed and controlled by the permission system of the Apsara Uni-manage Management Console. If you need to obtain the AccessKey pair of an account that has permissions on an organization, make sure that your operation is allowed by an administrator. This ensures security. The account that has permissions on an organization is a privileged account.

Obtain the AccessKey pair of a personal account

To obtain the AccessKey pair of a personal account, perform the following operations:

1. Log on to the Apsara Uni-manager Management Console.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and click **User Information**.
3. In the **Apsara Stack AccessKey Pair** section, obtain the AccessKey pair.



> **Note** The AccessKey pair that consists of an AccessKey ID and an AccessKey secret is the credential for you to have full permissions on Apsara Stack resources. Keep your AccessKey pair confidential.

Obtain the AccessKey pair of an account that has permissions on an organization

To obtain the AccessKey pair of an account that has permissions on an organization, perform the following operations:

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Organizations**.
4. In the Organizations navigation tree, click the name of the organization that you want to manage.
5. On the right side of the page, click **Obtain AccessKey Pair**.
6. In the message that appears, obtain the AccessKey pair of the account that has permissions on the organization.

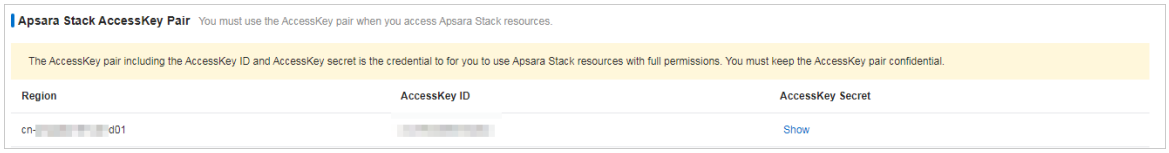
> **Note** The system automatically allocates an AccessKey pair to the account that has permissions on the level-1 organization. The same AccessKey pair is used by the accounts that have permissions on the subordinate organizations.

12.1.1.1.2.6. Query a region ID

When you use Apsara Stack SDK for Node.js to make API calls, specify a region ID. You can obtain a region ID in the Apsara Uni-manager Management Console.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and click **User Information**.
3. In the **Apsara Stack AccessKey Pair** section, view the region ID.



12.1.1.1.3. Common parameters

Common request parameters must be included in all API requests.

Sample common parameters

The following table describes the common parameters that are used when you call API operations supported by the Apsara Stack API (ASAPI).

Parameter	Type	Required	Description
Action	String	Yes	The operation that you want to perform. For more information, see View information about API operations.
Product	String	Yes	The name of the service.
Version	String	Yes	The version of the API operation. For more information, see View information about API operations.
RegionId	String	Yes	The ID of the region. For more information, see Query a region ID.
AccessKeyId	String	Yes	The AccessKey ID used to connect to the service. For more information, see Obtain an AccessKey pair.
Signature	String	Yes	The signature string of the current request. For more information about how signatures are calculated, see Request signatures.

Parameter	Type	Required	Description
SignatureMethod	String	Yes	The encryption method of the signature string. Valid values: HMAC-SHA1 and HMAC-SHA256.
SignatureVersion	String	Yes	The version of the signature encryption algorithm. Valid values: 1.0 and 2.0.
SignatureNonce	String	Yes	A unique, random number used to prevent replay attacks. You must use different numbers for different requests.
Timestamp	String	Yes	The timestamp of the request. Specify the time in the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time must be in UTC. Sample value: 2018-01-01T12:00:00Z.
Format	String	Yes	The format in which to return the response. Set the value to JSON.

Note

The `Signature`, `SignatureMethod`, `SignatureVersion`, `SignatureNonce`, `Timestamp`, and `Format` parameters are encapsulated into Apsara Stack SDK. You do not need to configure these parameters.

12.1.1.1.4. SDK description

12.1.1.1.4.1. Use Apsara Stack SDK for Java to call API operations

This topic describes how to obtain and use Apsara Stack SDK for Java to call API operations.

Prerequisites

- An authorized account and an AccessKey pair are obtained. The AccessKey pair consists of an AccessKey ID and an AccessKey secret. For more information about how to obtain an AccessKey pair in the Apsara Uni-manager Management Console, see Obtain an AccessKey pair.
- The endpoint of the Apsara Stack API (ASAPI) is obtained. For more information, see Generate an endpoint for the ASAPI.
- Apsara Stack SDK for Java 1.8 or later is installed.

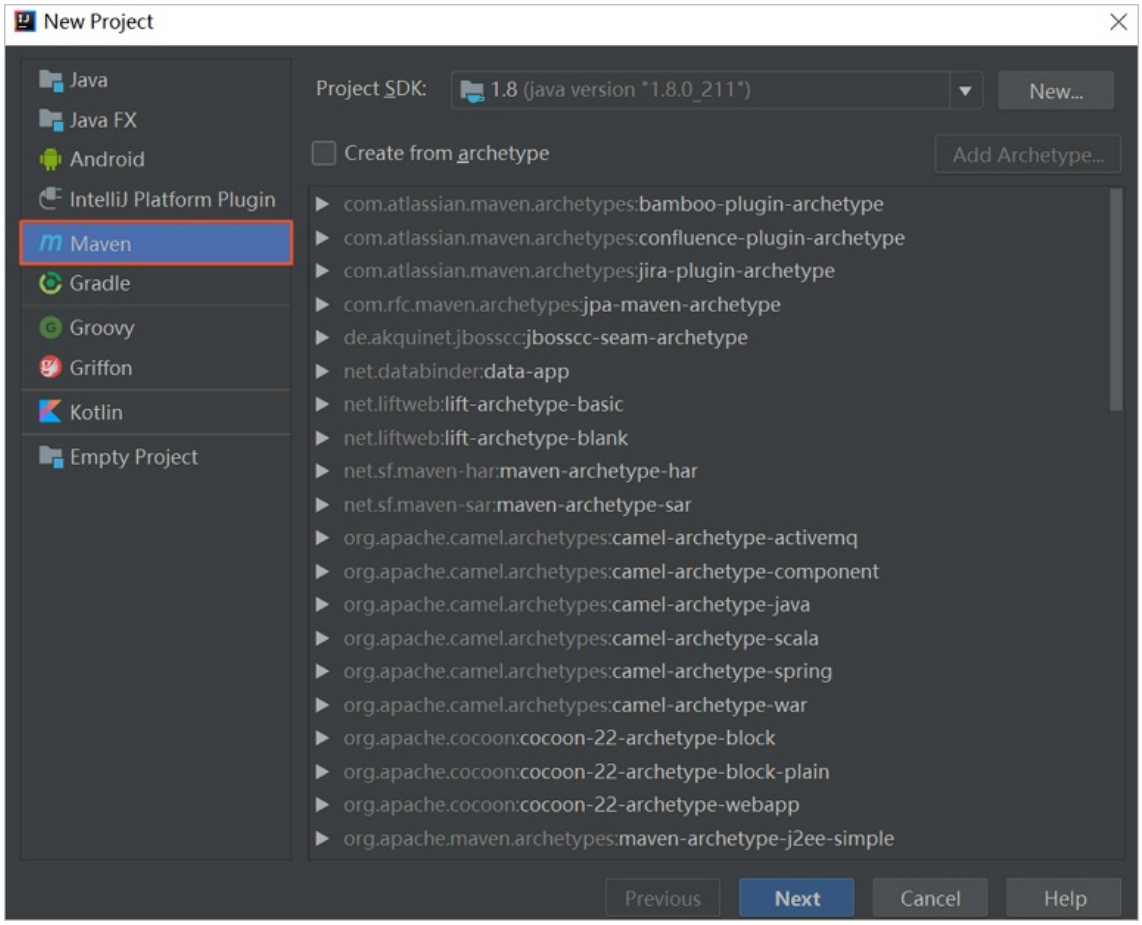
Background information

The help center of Apsara Stack provides Maven dependencies and JAR files for Apsara Stack SDK for Java. You can write code to use Apsara Stack SDK for Java to call API operations.

In this example, the Windows 10 64-bit OS and IntelliJ IDEA are used.

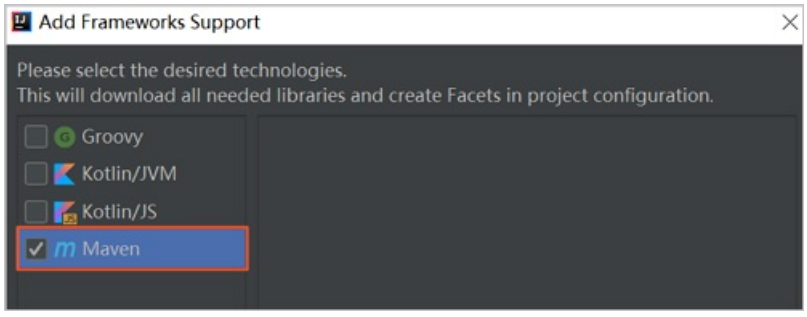
Procedure

1. Use one of the following methods to configure Maven in IntelliJ IDEA. Maven is a tool used for project management.
   - Use Maven that is integrated in IntelliJ IDEA.
   - Download Maven based on the OS that you are using from the official website and configure Maven. For more information, see Download Maven.
2. Obtain the Maven dependencies for Apsara Stack SDK for Java from the official website. For more information about how to obtain the dependencies, see Obtain the core package for ASAPI.
3. Use one of the following methods to create a Maven project:
   - Method 1: Create a Maven project in IntelliJ IDEA.

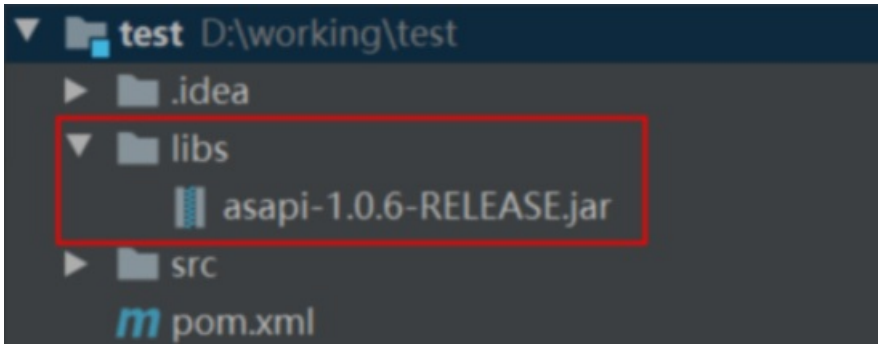


- Method 2: Convert an existing project to a Maven project.
  a. Right-click the project that you want to convert and select **Add Framework Support...**.

  b. Select **Maven** and click **OK**.



4. Create a folder named libs in the root directory of the project. Then, add the JAR file of Apsara Stack SDK for Java to the libs folder, as shown in the following figure.



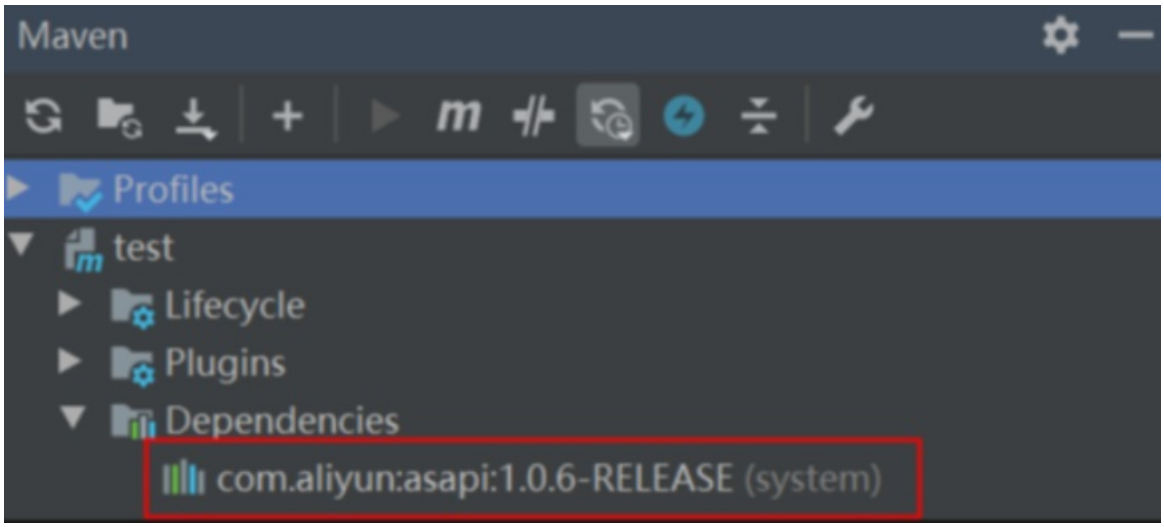
5. Add the dependencies of Apsara Stack SDK for Java to the pom.xml file in the project directory.

```
<dependencies>
    <dependency>
        <groupId>com.aliyun</groupId>
        <artifactId>asapi</artifactId>
        <version>1.0.6-RELEASE</version>
        <scope>system</scope>
        <systemPath>${project.basedir}/libs/asapi-1.0.6-RELEASE.jar</systemPath>
    </dependency>
  <dependency>
        <groupId>com.alibaba</groupId>
        <artifactId>alicrypto-java-aliyun</artifactId>
    <version>1.0.4</version>
    <systemPath>${project.basedir}/libs/alicrypto-java-aliyun-1.0.4.jar</systemPath>
  </dependency>
  <dependency>
    <groupId>com.aliyun</groupId>
    <artifactId>gmsse</artifactId>
    <version>1.1.0</version>
    <systemPath>${project.basedir}/libs/gmsse-1.1.0.jar</systemPath>
  </dependency>
</dependencies>
```

> **Note** Replace `1.0.6-RELEASE` with the actual version of Apsara Stack SDK for Java.

6. On the right side of IntelliJ IDEA, view information in the Maven section.

If the information in the following figure appears, the dependencies are added.



Use Apsara Stack SDK for Java

You can use the GET or POST method to call API operations provided by the ASAPI. The following sample code shows how to call API operations:

```
// 1. Create a connection to an ASClient object.
ASClient client = new ASClient();
// 2. Configure the identifier of the requester. This parameter is required and used only f
or identification. You can set this parameter to a random value.
client.setSdkSource("<The identifier of the requester>");
Map<String, Object> parameters = new HashMap<String, Object>();
// 3. Configure the parameters for authorization. The parameter values vary based on your e
nvironment.
// The AccessKey ID of your Apsara Stack tenant account.
parameters.put("AccessKeyId","<AccessKey ID>");
// The AccessKey secret of your Apsara Stack tenant account.
parameters.put("AccessKeySecret", "<AccessKey Secret>");
// The ID of the region.
parameters.put("RegionId", "<your RegionID>");
// 4. Configure parameters for an API call. In this example, the Product, Action, and Versi
on parameters are configured.
parameters.put("Product", "<The name of the service>");
parameters.put("Action", "<The name of the API operation>");
parameters.put("Version", "<The version of the API operation>");
// 5. Configure operation-specific parameters.
parameters.put("<The name of the operation-specific parameter>", "<The value of the operati
on-specific parameter>");
// 6. Configure request headers and the encryption method for the signature string. Valid v
alues of the SignatureMethod parameter: HMAC-SHA1 and HMAC-SHA256. By default, HMAC-SHA256
is used.
Map<String, String> headers = new HashMap<String, String>();
//headers.put("SignatureMethod", "HMAC-SHA1");
headers.put("x-acs-regionid", "<your-regionid>");
headers.put("x-acs-resourcegroupid", "<your-resourcegroupid>");
headers.put("x-acs-organizationid", "<your-organizationid>");
headers.put("x-acs-instanceid", "<your-instanceid>");
// 7. Make an API call. We recommend that you use the doPost() method.
// Configure the time-out period for a connection.
//client.setConnectTimeout(10000);
// Configure the time-out period for a request.
// client.setSocketTimeout(10000);
String result = client.doPost(endpoint, headers, parameters);
System.out.println(result);
```

Configure a proxy

If you need to use a proxy to make API calls, use the following sample code to configure the proxy:

```
Cloud cloud = new Cloud();
// Configure the IP address of the proxy.
cloud.setConfig("proxy_host", "<IP>");
// Configure the port used by the proxy.
cloud.setConfig("proxy_port", "<Port>");
// 1. Create a connection to an ASClient object.
ASClient client = new ASClient(cloud);
```

Request headers

Parameter	Description
x-acs-regionid	The ID of the region. For more information about how to obtain a region ID, see Query the region ID.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console.
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console.
x-acs-instanceid	The ID of the instance to which you make API calls.

12.1.1.1.4.2. Use Apsara Stack SDK for Python to call API operations

This topic describes how to use Apsara Stack SDK for Python to call API operations provided by the Apsara Stack API (ASAPI).

Preparations

- An authorized account and an AccessKey pair are obtained. The AccessKey pair consists of an AccessKey ID and an AccessKey secret. For more information about how to obtain an AccessKey pair in the Apsara Uni-manager Management Console, see Obtain an AccessKey pair.
- The endpoint of the ASAPI is obtained. For more information, see Generate an endpoint for the ASAPI.

Install Apsara Stack SDK for Python

1. Download the required version of Apsara Stack SDK for Python. For more information, see Obtain Apsara Stack SDKs.
2. Upload the compressed file of Apsara Stack SDK for Python to the host from which you want to send API requests and extract the file. Then, run the following code in the directory of the extracted files to install Apsara Stack SDK for Python:

```
# Install Apsara Stack SDK for Python 2.x.
pip install aliyun-python2-sdk-asapi-2.4.7.tar.gz
# Install Apsara Stack SDK for Python 3.x.
pip3 install aliyun-python3-sdk-asapi-2.4.7.tar.gz
```

> **Note**
>
> Replace `2.4.7` with the actual version of Apsara Stack SDK for Python.

Sample requests

You can use the GET or POST method to call API operations provided by the ASAPI.

```
    # 1. Import dependencies.
    from aliyunsdkasapi.ASClient import ASClient
    from aliyunsdkasapi.AsapiRequest import AsapiRequest

    if __name__ == '__main__':
     # 2. Create a request. The Product parameter specifies the name of the service. The Ver
sion parameter specifies the version of the API operation. The Action parameter specifies t
he operation that you want to perform. The asapi-endpoint parameter specifies the endpoint
of the ASAPI.
     req = AsapiRequest("<Product>", "<Version>", "<Action>", "<asapi-endpoint>")
     # 3. Configure operation-specific parameters.
     req.add_body_params("<key>", "<value>")
     # 4. Configure request headers.
     req.add_header("x-acs-resourcegroupid", "<your-resourcegroupid>");
     req.add_header("x-acs-organizationid", "<your-organizationid>");
     req.add_header("x-acs-regionid", "<your-regionid>");
     req.add_header("x-acs-instanceid", "<your-instanceid>");
     # 5. Configure a request method.
     req.set_method("POST")
     # 6. Configure initialization parameters for an ASClient object. The parameter values v
ary based on your environment. The timeout parameter specifies the time-out period for a re
quest. The cert_file parameter specifies the certificate. The verify parameter specifies wh
ether to verify the certificate.
     as_client = ASClient("<accesskeyid>", "<accesskeysecret>", "<regionid>",timeout=1000,
             cert_file=None,
             verify=False)
     # Configure the identifier of the requester. This parameter is required and used only f
or identification. You can set this parameter to a random value.
     as_client.setSdkSource("<The identifier of the requester>")
     response = as_client.do_request(req)
     print(response)
```

Request headers

Parameter	Description
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console.
x-acs-regionid	The ID of the region. For more information about how to obtain a region ID, see Query a region ID.
x-acs-instanceid	The ID of the instance to which you make API calls.

Configure a proxy

Perform the following steps to configure a proxy:

1. Import OS dependencies.

```
import os
```

2. Configure one or more proxies.

```
# Before you make an API call, configure one or more proxies.
os.environ['http_proxy'] = "http://x.x.x.x:xxxx"
os.environ['https_proxy'] = "https://x.x.x.x:xxxx"
```

12.1.1.1.4.3. Use Apsara Stack SDK for Node.js to call API operations

This topic describes how to obtain and use Apsara Stack SDK for Node.js to call API operations.

Preparations

- An authorized account and an AccessKey pair are obtained. The AccessKey pair consists of an AccessKey ID and an AccessKey secret. For more information about how to obtain an AccessKey pair in the Apsara Uni-manager Management Console, see Obtain an AccessKey pair.
- The endpoint of the Apsara Stack API (ASAPI) is obtained. For more information, see Generate an endpoint for the ASAPI.
- A region ID is obtained. For more information about how to obtain a region ID, see Query the region ID.

Add dependencies

Run the following command to install Apsara Stack SDK for Node.js:

```
tnpm install --save @ali/asapi-nodejs-sdk
```

Use Apsara Stack SDK for Node.js

The following sample code shows how to use Apsara Stack SDK for Node.js to make API calls:

```
// 1. Import the dependencies of Apsara Stack SDK for Node.js.
const Controller = require('egg').Controller;
const ASAPIClient = require('@ali/asapi-nodejs-sdk');
// 2. Configure the parameters.
const cnofig = {
    API_GATEWAY: '<The endpoint of the ASAPI>',
    regionId: '<The ID of the region in which the Apsara Stack service is deployed>',
    accessKeyId: '<The AccessKey ID of your Apsara Stack tenant account>',
    accessKeySecret: '<The AccessKey secret of your Apsara Stack tenant account>'
};
// 3. Initialize a client for API calls.
const AsapiClient = new ASAPIClient(cnofig, this.ctx);
// 4. Configure request parameters.
const params = {
    "Action": "<The name of the API operation>",
    "Product": "<The name of the service that provides the API operation>",
    "Version": "<The version of the API operation>",
    "regionId": '<The ID of the region in which the Apsara Stack service is deployed>',
      "<The name of the operation-specific parameter required by the API operation>": "<The
value of the operation-specific parameter>"
}
// 5. Configure request headers.
AsapiClient.addHeader('x-acs-caller-sdk-source', '<The identifier of the requester>')
AsapiClient.addHeader('x-acs-roleid', '<The ID of the role>')
AsapiClient.addHeader('x-acs-userid', '<The ID of the user>')
AsapiClient.addHeader('x-acs-organizationid', '<your-organizationid>')
AsapiClient.addHeadert("x-acs-regionid", "<your-regionid>");
AsapiClient.addHeader("x-acs-resourcegroupid", "<your-resourcegroupid>");
AsapiClient.addHeader("x-acs-instanceid", "<your-instanceid>");
// 6. Make an API call and obtain the response.
try {
  const res = await AsapiClient.doRequest(cnofig.API_GATEWAY, params, {
    method: 'POST', // The request method.
    formatParams: false, // Specifies whether to format parameters and capitalize the first
letter of each parameter.
    enableProxy: true, // Specifies whether to configure a proxy.
    proxy: 'http://x.x.x.x:xxxx',
    timeout: 10000, // The time-out period.
  // ca: , // The certificate issued by a certificate authority (CA). For more information,
visit https://nodejs.org/api/https.html#https_https_request_options_callback.
  })
  console.log(res)
} catch (e) {
  console.log(e)
}
```

Disable certificate validation

The following sample code shows how to disable certificate validation:

```
Configure the environment variable.
NODE_TLS_REJECT_UNAUTHORIZED=0
```

Request headers

Parameter	Description
x-acs-regionid	The ID of the region. For more information about how to obtain a region ID, see Query the region ID.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console.
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console.
x-acs-instanceid	The ID of the instance to which you make API calls.
x-acs-caller-sdk-source	The custom name of the requester or the system. This parameter is used to identify the source of the API request.
x-acs-roleid	The ID of the role.
x-acs-userid	The ID of the user.

12.1.1.1.4.4. SDK for POP

SDK for Java

Before you use Apsara Stack API (ASAPI) SDK for POP for Java to access ASAPI, you must know the remote procedure call (RPC) and resource-oriented architecture (ROA) styles that are supported for API calls. ASAPI is compatible with both styles. Their difference lies in the ASAPI endpoints that are used for API calls.

Prerequisites

- An Alibaba Cloud SDK package is downloaded for the service that you want to access. The required dependencies are installed.
- SSL certificate validation is ignored for requests over HTTPS.

Background information

ASAPI supports only the HTTPS request protocol.

Difference between two styles

When you use the RPC or ROA style to make API calls, take note that the two styles use different ASAPI endpoints.

```
# ASAPI endpoint for the RPC style:
public.asapi.<global:region>.<global:internet-domain>/asapi/v3
# ASAPI endpoint for the ROA style:
public.asapi.<global:region>.<global:internet-domain>/asapi/v3/roa
```

Call examples

The following sample code provides an example on how to use the RPC style to make an API call. In this example, the DescribeInstances operation of Elastic Compute Service (ECS) is called, and the API version is 2014-05-26.

Sample code:

```
package com.aliyuns.client.pop.ecs;

import com.aliyuncs.DefaultAcsClient;
import com.aliyuncs.ecs.model.v20140526.DescribeInstancesRequest;
import com.aliyuncs.ecs.model.v20140526.DescribeInstancesResponse;
import com.aliyuncs.http.HttpClientConfig;
import com.aliyuncs.http.ProtocolType;
import com.aliyuncs.profile.DefaultProfile;

import java.util.List;

public class DescribeInstancesTest {
    public static void main(String[] args) {
        // Specify the endpoint of ASAPI.
        String endpoint = "public.asapi.<global:region>.<global:internet-domain>/asapi/v3";
        // Specify the region where the ECS service resides.
        String region = "<global:region>";
        // Specify the name of the service that you want to access.
        String product = "ECS";
        // Specify your AccessKey pair.
        String ak = "<accessKeyId>";
        String sk = "<accessKeySecret>";
        try {
            DefaultProfile clientProfile = DefaultProfile.getProfile(region, ak, sk);
            // Ignore SSL certificate validation.
            HttpClientConfig clientConfig = HttpClientConfig.getDefault();
            clientConfig.setIgnoreSSLCerts(true);
            // Set the connection timeout period.
            clientConfig.setConnectionTimeoutMillis(3000L);
            // Set the read timeout period.
            clientConfig.setReadTimeoutMillis(10000L);
            clientProfile.setHttpClientConfig(clientConfig);
            // Create a connection.
            DefaultAcsClient acsClient = new DefaultAcsClient(clientProfile);
            // Create a request.
            DescribeInstancesRequest request = new DescribeInstancesRequest();
            // Specify the endpoint of ASAPI.
            request.setSysEndpoint(endpoint);
            // Specify the name of the service that you want to access and the region where
the service resides.
            request.setSysLocationProduct(product);
            request.setSysRegionId(region);
            // Set the request protocol to HTTPS.
            request.setSysProtocol(ProtocolType.HTTPS);
            DescribeInstancesResponse result =  acsClient.getAcsResponse(request);
            List<DescribeInstancesResponse.Instance> instances = result.getInstances();
            for (DescribeInstancesResponse.Instance instance: instances) {
                System.out.println(instance.getInstanceId());
                System.out.println(instance.getInstanceName());
```

```
            }

        } catch (Exception e) {
            e.printStackTrace();
        }
    }
}
```

The following sample code provides an example on how to use the ROA style to make an API call. In this example, the GetNamespaceList operation of Container Registry is called, and the API version is 2016-06-07.

Sample code:

```
package com.aliyuns.client.pop.cr;

import com.aliyuncs.CommonRequest;
import com.aliyuncs.CommonResponse;
import com.aliyuncs.DefaultAcsClient;
import com.aliyuncs.IAcsClient;
import com.aliyuncs.exceptions.ClientException;
import com.aliyuncs.exceptions.ServerException;
import com.aliyuncs.http.FormatType;
import com.aliyuncs.http.HttpClientConfig;
import com.aliyuncs.http.MethodType;
import com.aliyuncs.http.ProtocolType;
import com.aliyuncs.profile.DefaultProfile;

public class GetNamespaceListTest {
    public static void main(String[] args) {
        // Specify the endpoint of ASAPI.
        String endpoint = "public.asapi.<global:region>.<global:internet-domain>/asapi/v3/roa";
        // Specify the region where the Container Registry service resides.
        String region = "<global:region>";
        // Specify the name of the service that you want to access.
        String product = "cr";
        // Specify your AccessKey pair.
        String ak = "<accessKeyId>";
        String sk = "<accessKeySecret>";
        DefaultProfile profile = DefaultProfile.getProfile(region, ak, sk);
        // Ignore SSL certificate validation.
        HttpClientConfig clientConfig = HttpClientConfig.getDefault();
        clientConfig.setIgnoreSSLCerts(true);
        // Set the connection timeout period.
        clientConfig.setConnectionTimeoutMillis(3000L);
        // Set the read timeout period.
        clientConfig.setReadTimeoutMillis(10000L);
        profile.setHttpClientConfig(clientConfig);
        // Create a connection for the client.
        IAcsClient client = new DefaultAcsClient(profile);
        // Create a request.
        CommonRequest request = new CommonRequest();
        // Set the request protocol to HTTPS.
```

```
        request.setSysProtocol(ProtocolType.HTTPS);
        // Specify the request method.
        request.setSysMethod(MethodType.GET);
        // Specify the endpoint of ASAPI.
        request.setSysDomain(endpoint);
        // Specify the version of the API.
        request.setSysVersion("2016-06-07");
        // Specify the pattern of the uniform resource identifier (URI).
        request.setSysUriPattern("/namespace");
        // Specify the name of the service that you want to access and the region where the
service resides.
        request.setSysLocationProduct(product);

        request.putHeadParameter("Content-Type", "application/json");
        String requestBody = "" +
                "{}";
        request.setHttpContent(requestBody.getBytes(), "utf-8", FormatType.JSON);
        try {
            CommonResponse response = client.getCommonResponse(request);
            System.out.println(response.getData());
        } catch (ServerException e) {
            e.printStackTrace();
        } catch (ClientException e) {
            e.printStackTrace();
        }
    }
}
```

> **Notice**
>
> If you send a request over HTTPS, you must enable the request to ignore SSL certificate validation.

SDK for Go

This topic describes how to use Apsara Stack API (ASAPI) SDK for POP for Go.

Prerequisites

An Alibaba Cloud SDK package is downloaded for the service that you want to access. The required dependencies are installed.

Background information

Only the remote procedure call (RPC) style is supported for API calls.

Call examples

The following sample code provides an example on how to make an API call. In this example, the DescribeInstances operation of Elastic Compute Service (ECS) is called, and the API version is 2014-05-26.

Sample code:

```
package main
```

```
import (
 "fmt"
 "time"

 "github.com/aliyun/alibaba-cloud-sdk-go/sdk"
 "github.com/aliyun/alibaba-cloud-sdk-go/sdk/auth/credentials"
 "github.com/aliyun/alibaba-cloud-sdk-go/sdk/requests"
 "github.com/aliyun/alibaba-cloud-sdk-go/sdk/responses"
)

func getSdkConfig() *sdk.Config {
 return sdk.NewConfig().
  WithTimeout(time.Duration(30) * time.Second).
  WithEnableAsync(true).
  WithGoRoutinePoolSize(100).
  WithMaxTaskQueueSize(10000).
  WithDebug(false).
  WithScheme("HTTP")
}

func main(){
 ak := "<The AccessKey ID of your Apsara Stack tenant account.>"
 sk := "<The AccessKey secret of your Apsara Stack tenant account.>"
 regionId := "<The region where the ECS service resides.>"
 endpoint := "<The endpoint of ASAPI.>" // No network protocol.
 request := requests.NewCommonRequest()
  request.SetReadTimeout(10 * time.Second) // Set the read timeout period of the request to
10 seconds.
  request.SetConnectTimeout(5 * time.Second)  // Set the connection timeout period of the r
equest to 5 seconds.
 request.Method = requests.GET
 request.Domain = endpoint         // Location Service will not be enabled if the host is s
pecified. For example, the service with a certification type-bearer token must be specified
.
 request.Version = "2014-05-26"            // Specify the version of the API.
 request.Scheme = "https"                // Specify the request protocol. Default value: ht
tp.
 request.ApiName = "DescribeInstances"
 request.QueryParams["Product"] = "Ecs"  // Specify the name of the service that you want t
o access.
 request.TransToAcsRequest()
 client, err := sdk.NewClientWithOptions(regionId,getSdkConfig(),credentials.NewAccessKeyCr
edential(ak,sk))
 // If relevant parameters are not set for the request, the client settings are used.
  //client.SetReadTimeout(10 * time.Second)              // Set the read timeout period of
the client to 10 seconds.
 //client.SetConnectTimeout(5 * time.Second)            // Set the connection timeout perio
d of the client to 5 seconds.
  resp := responses.BaseResponse{}
  err = client.DoAction(request, &resp)
    if err != nil {
        panic(err)
    }
 fmt.Print(endpoint)
```

```
}
```

Configure proxies

You can configure proxies in one of the following ways:

- Configure proxies by using environment variables.

  Set the HTTP_PROXY and HTTPS_PROXY environment variables, or set the NO_PROXY environment variable.

  Sample code:

```
import (
    "os"
)
func main(){
 os.Setenv("HTTP_PROXY", "http://x.x.x.x:xxxx") // Set the HTTP_PROXY environment variable.
 os.Setenv("HTTPS_PROXY", "https://x.x.x.x:xxxx") // Set the HTTPS_PROXY environment variable.
}
```

- Configure proxies on the client.

  Sample code:

```
// The proxies that are configured on the client take precedence over those that are configured by using environment variables.
client.SetHttpProxy("http://x.x.x.x:xxxx")    // Configure the HTTP proxy.
client.GetHttpProxy()                           // Query the HTTP proxy.

client.SetHttpsProxy("https://x.x.x.x:xxxx")    // Configure the HTTPS proxy.
client.GetHttpsProxy()                            // Query the HTTPS proxy.

client.SetNoProxy("127.0.0.1,localhost")      // Configure the proxy whitelist.
client.GetNoProxy()                           // Query the proxy whitelist.
```

SDK for Python

This topic describes how to use Apsara Stack API (ASAPI) SDK for POP for Python.

Prerequisites

An Alibaba Cloud SDK package is downloaded for the service that you want to access. The required dependencies are installed.

Background information

Only the remote procedure call (RPC) style is supported for API calls.

Call examples

The following sample code provides an example on how to make an API call. In this example, the DescribeInstances operation of Elastic Compute Service (ECS) is called, and the API version is 2014-05-26.

Sample code:

```
from aliyunsdkcore.client import AcsClient
from aliyunsdkcore.acs_exception.exceptions import ClientException
from aliyunsdkcore.acs_exception.exceptions import ServerException
from aliyunsdkecs.request.v20140526 import DescribeInstancesRequest
import os

# Create an AcsClient instance.
client = AcsClient(
   "<your-access-key-id>",
   "<your-access-key-secret>",
   "<your-region-id>",

   timeout=1000,  # Set the timeout period.
    verify=False, # Ignore certificate validation. or verify='<The location where the certi
ficate is stored.>'
);
# Set the following parameters for the HTTPS request protocol:
# client.set_verify(False)
# os.environ["HTTPS_PROXY"] = "http://127.0.0.1:8080"

# os.environ["HTTP_PROXY"] = "http://127.0.0.1:8080"
def hello_ecs_instance():
    # Create a request and set the parameters.
    request = DescribeInstancesRequest.DescribeInstancesRequest()

    params = {"PageNumber":"1", "Product":"Ecs","Version": "2014-05-26","Action": "Describe
Instances"};
    request.set_body_params(params)
    # The endpoint that contains no network protocol is in the following format: ASAPI doma
in name/asapi/v3.
    request.set_endpoint('<The endpoint of ASAPI.>')
    # Set the following parameter if the endpoint contains no network protocol:
    request.set_protocol_type("https")

    request.set_PageSize(10)
    # Initiate the API request and obtain the response.
    response = client.do_action_with_exception(request)
    print(response)

if __name__ == '__main__':
    print("Hello Aliyun OpenApi!")
    hello_ecs_instance()
```

Configure proxies

Set the HTTP_PROXY and HTTPS_PROXY environment variables.

Sample code:

```
# Configure the HTTPS proxy.
os.environ["HTTPS_PROXY"] = "http://x.x.x.x:xxxx"

# Configure the HTTP proxy.
os.environ["HTTP_PROXY"] = "https://x.x.x.x:xxxx"
```

12.1.1.1.5. HTTP requests

12.1.1.1.5.1. Overview

This topic describes how to make API requests and is intended for users who use API URLs to initiate HTTP GET requests.

If you are using an SDK to initiate requests, you can skip this topic.

The request URL consists of different parameters and has a fixed syntax. The URL contains common request parameters, your signature, and operation-specific parameters. Sample request URLs are provided for each API operation. These URLs are not encoded to make them easy to read. Before you make a request, you must encode the request URL. After the authentication process is complete based on your signature, the results are returned to you. Response parameters are returned if the call is successful, whereas an error message is returned if the call fails. You can troubleshoot issues based on the error message.

12.1.1.1.5.2. Request syntax

The Apsara Stack API (ASAPI) allows you to call API operations by sending HTTP GET requests based on URLs. Each URL must include request parameters. This topic describes the syntax of HTTP GET requests and provides the endpoint of the ASAPI.

Sample request

GetOrganizationList is used in the following unencoded URL request:

```
https://public.asapi.aliyuns.com/asapi/v3?Action=GetOrganizationList&Product=ascm&Version=2019-05-10&Id=<Organization ID>&<Common parameters>
```

- `https`: the protocol used to transmit the request.
- `public.asapi.aliyuns.com/asapi/v3`: the endpoint of the ASAPI.
- `Action=GetOrganizationList Product=ascm Version=2019-05-10`: the API operation to call.
- `Id`: the ID of the organization.
- `<Common parameters>`: the common parameters specified in the system.

Protocol

The ASAPI supports only HTTPS.

Endpoint

For more information about how to obtain an endpoint, see Generate an endpoint for the ASAPI.

Parameter

To specify an API operation, use the `Action, Product, and Version` parameters. For example, set `Action` to GetOrganizationList, Product to ascm, and Version to 2019-05-10. You must also specify other operation-specific parameters and common parameters. For more information, see Common parameters.

12.1.1.1.5.3. Request signatures

This topic describes how to sign HTTP API requests. ASAPI uses the request signature to verify the identity of the request sender. ASAPI implements symmetric encryption by using an AccessKey pair to verify the identity of the request sender.

> **Note**
>
> - An AccessKey pair consists of an AccessKey ID and an AccessKey secret, which are issued to each user or organization in the Apsara Uni-manager Management Console.
> - The AccessKey ID is used to verify identities of users, and the AccessKey secret is used to encrypt and verify signature strings. You must keep your AccessKey secret confidential.
> - ASAPI provides SDKs for Node.js, Python, and Java to facilitate complex signature calculation. For more information, see Obtain the core package for ASAPI.

Step 1: Create a canonicalized query string

1. Arrange the request parameters in alphabetical order, including all common and operation-specific parameters except the `Signature` parameter.

   > **Note**
   >
   > If you use the GET method to send a request,these parameters are connected by ampersands (&) and included in the request URL. The first request parameter follows a question mark (?).

2. Encode the request parameters and their values in UTF-8 based on RFC 3986. The following rules apply in the encoding process:
   - Letters, digits, and special characters such as hyphens (`-`), underscores (`_`), and periods (`.`) do not need to be encoded.
   - Other characters must be percent encoded in the `%XY` format. `XY` represents the ASCII code of the characters in hexadecimal notation. For example, double quotation marks (`"`) are encoded as `%22` .

- Extended UTF-8 characters are encoded in the `%XY%ZA...` format.
- Spaces must be encoded as `%20`. Do not encode spaces as plus signs (`+`).

  This encoding method is similar to but different from the `application/x-www-form-urlencoded` MIME encoding algorithm.

  If you use `java.net.URLEncoder` from the Java standard library, use `percentEncode` to encode request parameters and their values. In the encoded query string, replace the plus signs (`+`) with `%20` , asterisks (`*`) with `%2A` , and `%7E` with tildes (`~`). This way, you can obtain an encoded string that matches the preceding encoding rules.

  ```
  private static final String ENCODING = "UTF-8";
  private static String percentEncode(String value) throws UnsupportedEncodingException
  {
      return value != null ? URLEncoder.encode(value, ENCODING).replace("+", "%20").rep
  lace("*", "%2A").replace("%7E", "~") : null;
  }
  ```

3. Use equal signs (`=`) to connect the encoded request parameters and their values.
4. Use ampersands (`&`) to connect the encoded request parameters. These parameters must be arranged in the same order as those in Step 1.

Then, a canonicalized query string that follows the request structure is obtained. For more information, see Request structure.

Step 2: Create a string-to-sign

1. Create a `string-to-sign` . You can also use `percentEncode` to encode the canonicalized query string created in Step 1 based on the following rules:

   ```
   StringToSign=
       HTTPMethod + "&" + //HTTPMethod: the HTTP method that is used to send a request, su
   ch as GET.
       percentEncode("/") + "&" + //percentEncode("/"): Encode the forward slash (/) in UT
   F-8 as %2F.
       percentEncode(CanonicalizedQueryString) // Encode the canonicalized query string cr
   eated in Step 1.
   ```

2. Calculate the RFC 2104-compliant HMAC-SHA1 or HMAC-256 value of `StringToSign` . In the following example, Java Base64 is used:

   ```
   String signature = Base64.getEncoder().encodeToString(signData);
   ```

> **Note**
>
> When you calculate the signature, the key value specified by RFC 2104 is your `AccessKey secret` plus an ampersand (&), which has an ASCII value of 38. For more information, see Obtain an AccessKey pair.

3. Encode the `Signature` parameter based on RFC 3986 and add it to the canonicalized query string.

Example 1: Concatenate parameters

`GetOrganizationList` is used in this example to query regions. For example, `AccessKeyID` is set to testid and `AccessKeySecret` is set to testsecret. Perform the following operations:

1. Construct a canonicalized query string.

```
https://public.asapi.aliyuns.com/asapi/v3/?AccessKeyId=testid&Action=GetOrganizationList&Format=JSON&Id=1&Product=ascm&RegionId=cn-region-test&SignatureMethod=HMAC-SHA1&SignatureNonce=43967c6e-e3ad-44fa-b06b-fcf3db5f39d2&SignatureVersion=1.0&Timestamp=2020-09-15T08%3A50%3A40Z&Version=2019-05-10
```

2. Create a `string-to-sign` .

```
GET&%2F&AccessKeyId%3Dtestid%26Action%3DGetOrganizationList%26Format%3DJSON%26Id%3D1%26Product%3Dascm%26RegionId%3Dcn-region-test%26SignatureMethod%3DHMAC-SHA1%26SignatureNonce%3D43967c6e-e3ad-44fa-b06b-fcf3db5f39d2%26SignatureVersion%3D1.0%26Timestamp%3D2020-09-15T08%253A50%253A40Z%26Version%3D2019-05-10
```

3. Calculate the signature.

   Calculate the signature. The key value used for calculation is `testsecret&` because `AccessKeySecret` is set to testsecret. The calculated signature is `OLeaidS1JvxuMvnyHOwuJ+uX5qY=` . Java Base64 is used in the following sample code:

   `String signature = Base64.getEncoder().encodeToString(signData);` Encode `Signature=hvqv9Ll5RE6kQ4YsQXFAf9VuRIY=` based on RFC 3986 and add it to the canonicalized query string.

```
https://public.asapi.aliyuns.com/asapi/v3/?AccessKeyId=testid&Action=GetOrganizationList&Format=JSON&Id=1&Product=ascm&RegionId=cn-region-test&SignatureMethod=HMAC-SHA1&SignatureNonce=43967c6e-e3ad-44fa-b06b-fcf3db5f39d2&SignatureVersion=1.0&Timestamp=2020-09-15T08%3A50%3A40Z&Version=2019-05-10
```

You can use browsers or tools such as cURL and Wget to initiate an HTTP request for calling the `DescribeRegions` operation to query the Alibaba Cloud region list.

Example 2: Use the standard library of the programming language

`GetOrganizationList` is used in this example to query regions. For example, `AccessKeyID` is set to testid, `AccessKeySecret` is set to testsecret, and all request parameters are stored in a Java `Map<String, String>` object.

1. Predefine an encoding method.

```
private static final String ENCODING = "UTF-8";
private static String percentEncode(String value) throws UnsupportedEncodingException {
        return value != null ? URLEncoder.encode(value, ENCODING).replace("+", "%20").r
eplace("*", "%2A").replace("%7E", "~") : null;
}
```

2. Predefine the time format for the `Timestamp` parameter. Specify the `Timestamp` parameter in the ISO 8601 format. The time must be in UTC+0.

```
private static final String ISO8601_DATE_FORMAT = "yyyy-MM-dd'T'HH:mm:ss'Z'";
private static String formatIso8601Date(Date date) {
    SimpleDateFormat df = new SimpleDateFormat(ISO8601_DATE_FORMAT);
    df.setTimeZone(new SimpleTimeZone(0, "GMT"));
    return df.format(date);
}
```

3. Create a request string.

```
final String HTTP_METHOD = "GET";
Map parameters = new HashMap();
// Specify request parameters.
parameters.put("Product", "ascm");
parameters.put("Action", "GetOrganizationList");
parameters.put("Version", "2019-05-10");
parameters.put("AccessKeyId", "testid");
parameters.put("RegionId", "cn-region-test");
parameters.put("Timestamp", formatIso8601Date(new Date()));
parameters.put("SignatureMethod", "HMAC-SHA1");
parameters.put("SignatureVersion", "1.0");
parameters.put("SignatureNonce", UUID.randomUUID().toString());
parameters.put("Format", "JSON");
parameters.put("Id", "1");
// Arrange request parameters.
String[] sortedKeys = parameters.keySet().toArray(new String[]{});
Arrays.sort(sortedKeys);
final String SEPARATOR = "&";
// Create a string-to-sign.
StringBuilder stringToSign = new StringBuilder();
stringToSign.append(HTTP_METHOD).append(SEPARATOR);
stringToSign.append(percentEncode("/")).append(SEPARATOR);
StringBuilder canonicalizedQueryString = new StringBuilder();
for(String key : sortedKeys) {
    // Encode the key and the value.
    canonicalizedQueryString.append("&")
    .append(percentEncode(key)).append("=")
    .append(percentEncode(parameters.get(key)));
}
//Encode the canonicalized query string.
stringToSign.append(percentEncode(
canonicalizedQueryString.toString().substring(1)));
```

4. The signature. The key value used for calculation is `testsecret&` because `AccessKeySecret` is set to testsecret. The calculated signature is `OLeaidS1JvxuMvnyHOwuJ%2BuX5qY%3D`.

```
// The following sample code shows how to calculate the signature:
final String ALGORITHM = "HmacSHA1";
final String ENCODING = "UTF-8";
key = "testsecret&";
Mac mac = Mac.getInstance(ALGORITHM);
mac.init(new SecretKeySpec(key.getBytes(ENCODING), ALGORITHM));
byte[] signData = mac.doFinal(stringToSign.getBytes(ENCODING));
String signature = Base64.getEncoder().encodeToString(signData);
```

Encode the Signature parameter based on RFC 3986 and add it to the canonicalized query string. The following URL is obtained:

```
https://public.asapi.aliyuns.com/asapi/v3/?AccessKeyId=testid&Action=GetOrganizationLis
t&Format=JSON&Id=1&Product=ascm&RegionId=cn-region-test&SignatureMethod=HMAC-SHA1&Signa
tureNonce=43967c6e-e3ad-44fa-b06b-fcf3db5f39d2&SignatureVersion=1.0&Timestamp=2020-09-1
5T08%3A50%3A40Z&Version=2019-05-10
```

5. Use browsers or tools such as cURL and Wget to initiate an HTTP request.

12.1.1.1.5.4. Response

Responses are returned only in the JSON format. If a return code is greater than or equal to 200 and less than 300, a success response is returned. Otherwise, an error response is returned.

Sample success response

If a request is successful, the request ID and operation-specific parameter values are returned. For more information, see the developer guide of the corresponding Apsara Stack service.

```
 {
    "eagleEyeTraceId": "xxx-xxx-xxx-xxx", // The trace ID provided by EagleEye.
    "asapiSuccess": true,
    "RequestId": "xxxxxxxxxx",
    "Regions": { // The regions returned after you call the DescribeRegions operation.
        "Region": [
            {
                "RegionId": "",
                "RegionEndpoint": "",
                "LocalName": ""
            }
        ]
    }
}
```

Sample error response

If a request fails, the following information is returned. For more information, see the developer guide of the corresponding Apsara Stack service.

```
{
    "code": "asapi.server.api.notfound",// The error code.
    "eagleEyeTraceId": "xxx-xxx-xxx-xxx", // The trace ID provided by EagleEye.
    "asapiSuccess": false, // Indicates whether the request is successful.
    "hostId": "xxxx", // The ID of the host.
    "message": "Failed to ....", // The message returned.
    "asapiErrorMessage": "Failed to ....", // The error message provided by the ASAPI.
    "asapiErrorCode": "asapi.server.api.notfound" // The error code provided by the ASAPI.
}
```

12.1.2. List of operations by function

The following tables list API operations available for use in ApsaraDB for MongoDB.

Lifecycle management

Operation	Description
CreateDBInstance	Creates and clones an ApsaraDB for MongoDB instance.

Operation	Description
ModifyDBInstanceSpec	Modifies the specifications or storage capacity of an ApsaraDB for MongoDB standalone or replica set instance.
DeleteDBInstance	Releases an ApsaraDB for MongoDB instance.
CreateShardingDBInstance	Creates or clones an ApsaraDB for MongoDB sharded cluster instance.
CreateNode	Creates a shard or mongos node for an ApsaraDB for MongoDB sharded cluster instance.
DeleteNode	Deletes a shard or mongos node in an ApsaraDB for MongoDB sharded cluster instance.
ModifyNodeSpec	Modifies the specifications or storage capacity of an ApsaraDB for MongoDB sharded cluster instance.

Region management

Operation	Description
MigrateToOtherZone	Migrates an ApsaraDB for MongoDB instance to another zone.
DescribeRegions	Views the regions and zones that an ApsaraDB for MongoDB instance can be created.
MigrateAvailableZone	Changes the zone of an ApsaraDB for MongoDB instance.

Resource management

Operation	Description
DescribeAvailableResource	Views the instances that can be created in a specified zone.

Connection management

Operation	Description
AllocatePublicNetworkAddress	Applies for a public endpoint of an ApsaraDB for MongoDB instance.
ReleasePublicNetworkAddress	Releases the public endpoint of an ApsaraDB for MongoDB instance.
ModifyInstanceVpcAuthMode	Enables or disables password-free access to an ApsaraDB for MongoDB instance from the same VPC.
DescribeShardingNetworkAddress	Views the connection information of an ApsaraDB for MongoDB sharded cluster instance.
ModifyDBInstanceConnectionString	Modifies the connection string of an ApsaraDB for MongoDB instance.

Operation	Description
ReleaseNodePrivateNetworkAddress	Releases the internal endpoint of the shard or Configserver node of a sharded cluster instance.

Instance information query

Operation	Description
DescribeReplicaSetRole	Views the roles of an ApsaraDB for MongoDB instance and their connection information.
DescribeKernelReleaseNotes	Views the release notes of the minor database engine versions of an ApsaraDB for MongoDB instance.
DescribeAvailableEngineVersion	Views the database engine versions that an ApsaraDB for MongoDB instance can be upgraded to.
DescribeDBInstances	Views the list of ApsaraDB for MongoDB instances.
DescribeDBInstanceAttribute	Views the details of an ApsaraDB for MongoDB instance.
DescribeRoleZoneInfo	Views the roles and zones of nodes in an ApsaraDB for MongoDB instance.

Instance management

Operation	Description
RestartDBInstance	Restarts an ApsaraDB for MongoDB instance.
ModifyDBInstanceMaintainTime	Modifies the maintenance window of an ApsaraDB for MongoDB instance.
ModifyDBInstanceDescription	Changes the name of an ApsaraDB for MongoDB instance.
SwitchDBInstanceHA	Switches between the primary and secondary nodes in an ApsaraDB for MongoDB instance.
UpgradeDBInstanceEngineVersion	Upgrades the database engine version of an ApsaraDB for MongoDB instance.
UpgradeDBInstanceKernelVersion	Upgrades the minor database engine version of an ApsaraDB for MongoDB instance.
ModifyDBInstanceNetExpireTime	Extends the retention period of the classic network endpoint of an ApsaraDB for MongoDB instance.

Account management

Operation	Description
DescribeAccounts	Views the database accounts of an ApsaraDB for MongoDB instance.
ResetAccountPassword	Resets the password of the root account of an ApsaraDB for MongoDB instance.
ModifyAccountDescription	Modifies the description of the root account of an ApsaraDB for MongoDB instance.

Whitelists and security groups

Operation	Description
DescribeSecurityGroupConfiguration	Views the ECS security groups to which an ApsaraDB RDS instance is added.
ModifySecurityGroupConfiguration	Modifies an ECS security group to which an ApsaraDB RDS instance is added.
DescribeSecurityIps	Views the IP whitelists of an ApsaraDB for MongoDB instance.
ModifySecurityIps	Modifies an IP whitelist of an ApsaraDB for MongoDB instance.

Key management

Operation	Description
DescribeDBInstanceTDEInfo	Views whether TDE is enabled for an ApsaraDB for MongoDB instance.
ModifyDBInstanceTDE	Modifies the transparent data encryption (TDE) status of an ApsaraDB for MongoDB instance.

SSL encryption

Operation	Description
ModifyDBInstanceSSL	Modifies the SSL settings of an ApsaraDB for MongoDB instance.
DescribeDBInstanceSSL	Views the SSL settings of an ApsaraDB for MongoDB instance.

Audit logs

Operation	Description
DescribeAuditRecords	View the audit log entries of an ApsaraDB for MongoDB instance.
DescribeAuditFiles	Views the audit log files of an ApsaraDB for MongoDB instance.
DescribeAuditPolicy	Views whether the audit log feature is enabled for an ApsaraDB for MongoDB instance.

Operation	Description
ModifyAuditLogFilter	Modifies the type of audit log entries that you want to collect for an ApsaraDB for MongoDB instance.
DescribeAuditLogFilter	Views the types of audit log entries collected for an ApsaraDB for MongoDB instance.
ModifyAuditPolicy	Enables or disables the audit log feature or set the log retention period for an ApsaraDB for MongoDB instance.

Log management

Operation	Description
DescribeSlowLogRecords	Views the slow query log entries of an ApsaraDB for MongoDB instance.
DescribeErrorLogRecords	Views the error log entries of an ApsaraDB for MongoDB instance.
DescribeRunningLogRecords	Views the operational log entries of an ApsaraDB for MongoDB instance.

Performance monitoring management

Operation	Description
DescribeDBInstancePerformance	Views the performance data of an ApsaraDB for MongoDB instance.
DescribeDBInstanceMonitor	Views the collection frequency of monitoring data for an ApsaraDB for MongoDB instance.

Parameter management

Operation	Description
DescribeParameterModificationHistory	Views the modification records of ApsaraDB for MongoDB instance parameters.
DescribeParameters	Views parameter configurations of an ApsaraDB for MongoDB instance.
ModifyParameters	Modifies the parameters of an AsparaDB for MongoDB instance.

Backup and recovery

Operation	Description
DescribeBackupPolicy	Views the backup policy of an ApsaraDB for MongoDB instance.
ModifyBackupPolicy	Modifies the backup policy of an ApsaraDB for MongoDB instance.
CreateBackup	Manually backs up an ApsaraDB for MongoDB instance.

Operation	Description
DescribeBackups	Views the backup sets of an ApsaraDB for MongoDB instance.
RestoreDBInstance	Restores data to the current ApsaraDB for MongoDB instance.
DescribeBackupDBs	Views the databases at a specified point in time or the databases in a specified backup set before you restore a database for an ApsaraDB for MongoDB instance.

12.1.3. API Reference

12.1.3.1. Lifecycle management

12.1.3.1.1. CreateDBInstance

You can call this operation to create or clone an ApsaraDB for MongoDB replica set instance.

For more information about instance types, see **Instance types** in *ApsaraDB for MongoDB Product Introduction*.

To create sharded cluster instances, you can call the **CreateShardingDBInstance** operation.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateDBInstance	The operation that you want to perform. Set the value to **CreateDBInstance**.
ClientToken	String	Yes	ETnLKlblzczshOTUbOCzxxxxxxxxxx	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must ensure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.

Parameter	Type	Required	Example	Description
Engine	String	Yes	MongoDB	The database engine. Set the value to **MongoDB**.
EngineVersion	String	Yes	4.0	The database engine version of the instance. Valid values: **3.2**, **3.4**, **4.0**, and **4.2**. **Note** To call this operation to clone an instance, set this value to the engine version of the source instance.
DBInstanceClass	String	Yes	dds.mongo.standard	The instance type. For more information, see **Instance types** in *ApsaraDB for MongoDB Product Introduction*.
DBInstanceStorage	Integer	Yes	10	The storage capacity of the instance. • Valid values: **10** to **3000**. Unit: GB. • The value must be a multiple of 10 GB. **Note** For more information about instance types, see **Instance types** in *ApsaraDB for MongoDB Product Introduction*.
ZoneId	String	No	cn-hangzhou-b	The zone ID of the instance. You can call the **DescribeRegions** operation to view the zones where the instance can be created.
DBInstanceDescription	String	No	Test database 1	The name of the instance. It must be 2 to 256 characters in length. The name must start with a letter, and can contain digits, letters, underscores (_), and hyphens (-).

Parameter	Type	Required	Example	Description
SecurityIPList	String	No	10.23.12.24/24	• The whitelist that contains the IP addresses that are allowed to access the instance. Separate multiple IP addresses with commas (,). Each IP address must be unique. A maximum of 1,000 IP addresses can be added. • You can enter IP addresses such as 10.23.12.24 and Classless Inter-Domain Routing (CIDR) blocks such as 10.23.12.24/24. /24 indicates the length of the IP address prefix in the CIDR block. An IP address prefix can contain 1 to 32 bits. You can also enter the percent sign (%) or 0.0.0.0/0. **Note** If you enter the percent sign (%) or 0.0.0.0/0, all IP addresses can access the instance. This may introduce security risks to the instance.
AccountPassword	String	No	Alitest! 159	The password of the root account. • The password must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. Special characters include ! # $ % ^ & * ( ) _ + - = #$%^&*()_+-= • The password must be 8 to 32 characters in length.

Parameter	Type	Required	Example	Description
ChargeType	String	No	PrePaid	The billing method of the instance. Valid values: • **Postpaid**: pay-as-you-go • **Prepaid**: subscription Default value: pay-as-you-go **Note** If you set this parameter to **PrePaid**, you must also specify the **Period** parameter.
Period	Integer	No	1	The subscription period of the instance. Unit: months. Valid values: **1** to **9**, **12**, **24**, and **36**. **Note** This parameter is valid and required only if you set the **ChargeType** parameter to **PrePaid**.
NetworkType	String	No	VPC	The network type of the new instance. Valid values: • **classic** • **vpc** Default value: classic. **Note** If you set this parameter to **VPC**, you must also specify the **VpcId** and **VSwitchId** parameters.
VpcId	String	No	vpc-bpxxxxxxxx	The ID of the VPC. **Note** This parameter is valid only if you set the **NetworkType** parameter to **VPC**.

Parameter	Type	Required	Example	Description
VSwitchId	String	No	vsw-bpxxxxxxxx	The ID of the vSwitch in the specified VPC. **Note** This parameter is valid only if you set the **NetworkType** parameter to **VPC**.
SrcDBInstanceId	String	No	dds-bpxxxxxxxx	The ID of the source instance. This parameter can only be specified when this operation is called to clone instances. You must also specify the **BackupId** parameter or **RestoreTime** parameter.
BackupId	String	No	32994xxxx	The ID of the specific backup set. This parameter can only be specified when this operation is called to clone instances. You must also specify the **SrcDBInstanceId** parameter. **Note** You can call **DescribeBackups** to view the backup ID.

Parameter	Type	Required	Example	Description
RestoreTime	String	No	2019-03-13T12:11:14Z	The point in time of the clone operation. After you set this parameter, the data of the source instance at the specified point in time is used to create an instance. Specify the time in the *yyyy-MM-dd*T*HH:mm:ss*Z format. The time must be in UTC. **Note** • This parameter can only be specified when this operation is called to clone instances. You must also specify the **SrcDBInstanceId** parameter and the **BackupId** parameter. • You can clone instances to any restore time in the past seven days.
BusinessInfo	String	No	{ “ActivityId":"00 0000000"}	The business information. It is an additional parameter.
CouponNo	String	No	youhuiquan_promotion_option_id_for_blank	The coupon code. Default value: **youhuiquan_promotion_option_id_for_blank**.
AutoRenew	String	No	true	Indicates whether automatic renewal is enabled for the instance. Valid values: • **true**: enables automatic renewal. • **false**: disables automatic renewal. You must renew the instance manually. Default value: false. **Note** This parameter is valid only if you set the ChargeType parameter to PrePaid.

Parameter	Type	Required	Example	Description
DatabaseNames	String	No	mongodbtest	The name of the database. **Note** When calling this operation to clone instances, you can set the database that is specified by this parameter for cloning. Otherwise, all the databases of the instances will be cloned.
StorageEngine	String	No	WiredTiger	The storage engine of the instance. It must be **WiredTiger**. **Note** If you do not specify this parameter, **WiredTiger** is used.
ReplicationFactor	String	No	3	The number of nodes in the replica set instance. Valid values: **3**, **5**, and **7**. Default value: **3**.
ReadonlyReplicas	String	No	1	The number of read-only nodes. Valid values: **1 to 5**. **Note** By default, this parameter is not specified and no read-only node is created.
ResourceGroupId	String	No	rg-axxxxxxxx	The ID of the resource group.

Response parameters

Parameter	Type	Example	Description
DBInstanceId	String	dds-bpxxxxxxxx	The ID of the instance.
OrderId	String	2033xxxxxxxxxxx	The ID of the order.
RequestId	String	D8F1D721-6439-4257-A89C-F1E8E9C9624D	The ID of the request.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=CreateDBInstance
&ClientToken=ETnLKlblzczshOTUbOCzxxxxxxxxxx
&Engine=MongoDB
&EngineVersion=4.0
&DBInstanceClass=dds.mongo.standard
&DBInstanceStorage=10
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreateDBInstanceResponse>
   <DBInstanceId>dds-bpxxxxxxxx</DBInstanceId>
   <OrderId>2033xxxxxxxxxxx</OrderId>
   <RequestId>D8F1D721-6439-4257-A89C-F1E8E9C9624D</RequestId>
</CreateDBInstanceResponse>
```

`JSON` format

```
{
 "DBInstanceId": "dds-bpxxxxxxxx",
 "OrderId": "2033xxxxxxxxxxx",
 "RequestId": "D8F1D721-6439-4257-A89C-F1E8E9C9624D"
}
```

Error codes

HttpCode	Error code	Error message	Description
400	InsufficientBalance	Your account does not have enough balance.	The error message returned when your account does not have sufficient balance. Top up and try again.
403	RealNameAuthenticationError	Your account has not passed the real-name authentication yet.	The error message returned when the specified user has not performed real-name authentication. Perform real-name authentication and try again.
400	InvalidCapacity.NotFound	The Capacity provided does not exist in our records.	The error message returned when the configured capacity is invalid. Check the specified parameter.

HttpCode	Error code	Error message	Description
400	IdempotentParameterMismatch	Request uses a client token in a previous request but is not identical to that request.	The error message returned because the two specified requests use the same ClientToken.

12.1.3.1.2. ModifyDBInstanceSpec

You can call this operation to modify the specifications or storage capacity of an ApsaraDB for MongoDB replica set instance.

This operation is applicable only to replica set instances. You can call the **ModifyNodeSpec**, **CreateNode**, or **DeleteNode** operation to modify the configurations of a sharded cluster instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyDBInstanceSpec	The operation that you want to perform. Set the value to**ModifyDBInstanceSpec**.
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance.
DBInstanceClass	String	No	dds.mongo.standard	The instance type. For more information, see **Instance types** in *ApsaraDB for MongoDB Product Introduction*. **Note** You must specify either this parameter or the **DBInstanceStorage** parameter.

Parameter	Type	Required	Example	Description
DBInstanceStorage	String	No	50	The storage capacity of the instance. • Valid values: **10** to **3000**. Unit: GB. The values of this parameter are dependent on the instance types. For more information, see **Instance types** in *ApsaraDB for MongoDB Product Introduction*. • The value must be a multiple of 10 GB. **Note** • You must specify either this parameter or the**DBInstanceStorage** parameter. • Storage capacity can be scaled down only on subscription replica set instances. The new storage capacity you specify must be greater than the used storage space.
OrderType	String	No	UPGRADE	The type of configuration changes performed. Default value: DOWNGRADE. Valid values: • **UPGRADE**: The specifications are upgraded. • **DOWNGRADE**: The specifications are downgraded. **Note** This parameter is only applicable to instances whose billing method is subscription.

Parameter	Type	Required	Example	Description
AutoPay	Boolean	No	true	Specifies whether automatic payment is enabled for the instance. Valid values: • **true**: enables automatic payment. Make sure that your account has sufficient balance. • **false**: Automatic payment is not enabled. You must make payments in the console. Payment instructions: Log on to the console. In the upper-right corner, click **Billing Management** and select **Billing Management** from the drop-down list. The Billing Management page appears. In the left-side navigation pane, click **Bills**. On the Unpaid tab, click Make a Payment in the Actions column corresponding to the bill you want to pay. Default value: **true**.
BusinessInfo	String	No	{ “ActivityId":"00 0000000"}	The business information.
ReplicationFactor	String	No	3	The number of nodes in the instance. • Valid values for a replica set instance: **3, 5, and 7**. • Valid values for a standalone instance: **1**.
CouponNo	String	No	youhuiquan_promotion_option_id_for_blank	The coupon code. Default value:**youhuiquan_promotion_option_id_for_blank**.
EffectiveTime	String	No	Immediately	The time when the modified configuration values take effect. Valid values: • **Immediately**: The settings take effect immediately. • **MaintainTime**: The settings will take effect during the maintenance period of the instance. Default value: **Immediately**.

Parameter	Type	Required	Example	Description
RegionId	String	No	cn-hangzhou	The region ID of the instance. You can call the **DescribeDBInstanceAttribute** operation to view the region ID of the instance.
ReadonlyReplicas	String	No	1	The number of read-only nodes. Valide values: **1** to **5**.

Response parameters

Parameter	Type	Example	Description
OrderId	String	2033xxxxxxxx	The ID of the order.
RequestId	String	C5662998-62BE-4C7F-961D-7DFE775DD813	The ID of the request.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=ModifyDBInstanceSpec
&DBInstanceId=dds-bpxxxxxxxx
&DBInstanceStorage=50
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyDBInstanceSpecResponse>
      <OrderId>2033xxxxxxxx</OrderId>
      <RequestId>C5662998-62BE-4C7F-961D-7DFE775DD813</RequestId>
</ModifyDBInstanceSpecResponse>
```

`JSON` format

```
{
    "OrderId": "2033xxxxxxxx",
    "RequestId": "C5662998-62BE-4C7F-961D-7DFE775DD813"
}
```

12.1.3.1.3. DeleteDBInstance

You can call this operation to release an ApsaraDB for MongoDB instance.

The instance must be in the running state when you call this operation.

> **Note** After an instance is released, all the data in the instance is lost and cannot be retrieved. Proceed with caution.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteDBInstance	The operation that you want to perform. Set the value to **DeleteDBInstance**.
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance.
ClientToken	String	No	ETnLKlblzczshOTUbOCzxxxxxxxxxx	The client token that is used to ensure idempotence of the request. You can use the client to generate the value, but you must make sure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	72651AF9-7897-41A7-8B67-6C15C7F26A0A	The ID of the request.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=DeleteDBInstance
&DBInstanceId=dds-bpxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteDBInstanceResponse>
   <RequestId>72651AF9-7897-41A7-8B67-6C15C7F26A0A</RequestId>
</DeleteDBInstanceResponse>
```

`JSON` format

```
{
 "RequestId": "72651AF9-7897-41A7-8B67-6C15C7F26A0A"
}
```

12.1.3.1.4. CreateShardingDBInstance

You can call this operation to create or clone a sharded cluster instance.

For more information about instance types, see **Instance types** in *ApsaraDB for MongoDB Product Introduction*.

To create replica set instances, you can call the **CreateDBInstance** operation.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateShardingDBInstance	The operation that you want to perform. Set the value to**CreateShardingDBInstance**.
AccountPassword	String	Yes	Alitest! 159	The password of the root account. • The password must contain at least three types of the following characters: uppercase letters, lowercase letters, digits, and special characters. Special characters include ! # $ % ^ & * ( ) _ + - = • The password must be 8 to 32 characters in length.
Engine	String	Yes	MongoDB	The database engine. Set the value to **MongoDB**.

Parameter	Type	Required	Example	Description
EngineVersion	String	Yes	4.0	The database engine version of the instance. Valid values: **3.0**, **3.4**, **4.0**, and **4.2**. **Note** To call this operation to clone an instance, set this value to the engine version of the source instance.
RegionId	String	Yes	cn-hangzhou	The region ID of the instance. You can call the **DescribeRegions** operation to view the region ID of the instance.
ZoneId	String	No	cn-hangzhou-b	The zone ID of the instance. You can call the **DescribeRegions** operation to view the zone ID of the instance.
Mongos.N.Class	String	No	dds.mongos.standard	The specifications of the mongos node. For more information, see **Instance types** in *ApsaraDB for MongoDB Product Introduction*. **N**: the specifications of the nth mongos node. For example, • **Mongos.1.Class** specifies the specifications of the first mongos node. • **Mongos.2.Class** specifies the specifications of the second mongos node. **Note** You can configure the specifications of 2 to 32 mongos nodes.

Parameter	Type	Required	Example	Description
ReplicaSet.N.Class	String	No	dds.shard.standard	The specifications of the shard node. For more information, see **Instance types** in *ApsaraDB for MongoDB Product Introduction*. **N**specifies the serial number of the shard for which the specifications are specified. For example, • **ReplicaSet.1.Class** specifies the specifications of the first shard. • **ReplicaSet.2.Class** specifies the specifications of the second shard. **Note** You can specify the specifications of 2 to 32 shards.
ReplicaSet.N.Storage	Integer	No	20	The storage space of shard N. • Valid values: **10** to **2000**. Unit: GB. • You can only specify this value in 10 GB increments. **Note** For more information about instance types, see **Instance types** in *ApsaraDB for MongoDB Product Introduction*. **N**specifies the serial number of the shard for which storage space is specified. For example, • **ReplicaSet.1.Storage** specifies the storage space of the first shard. • **ReplicaSet.2.Storage** specifies the storage space of the second shard.
ConfigServer.N.Class	String	No	dds.cs.mid	The specifications of the Configserver node. Valid value:**dds.cs.mid**. **Note** Set the specifications to one CPU core and 2 GB. You can specify the specifications of only one Configserver node. For example, set the **ConfigServer.1.Class** parameter to **dds.cs.mid**.

Parameter	Type	Required	Example	Description
ConfigServer.N.Storage	Integer	No	20	The storage space of the Configserver node. Set the value to **20**. **Note** You can set this parameter to 20 GB only. For example, set the **ConfigServer.1.Storage** parameter to **20**.
DBInstanceDescription	String	No	Test database 1	The name of the instance. It must be 2 to 256 characters in length. The name must start with a letter, and can contain digits, letters, underscores (_), and hyphens (-).
SecurityIPList	String	No	10.23.12.24/24	• The whitelist that contains the IP addresses that are allowed to access the instance. Separate multiple IP addresses with commas (,). Each IP address must be unique. A maximum of 1,000 IP addresses can be added. • You can enter IP addresses such as 10.23.12.24 and Classless Inter-Domain Routing (CIDR) blocks such as 10.23.12.24/24. /24 indicates the length of the CIDR block prefix. The prefix can be 1 to 32 bits in length. You can also enter the percent sign (%) or 0.0.0.0/0. **Note** If you enter the percent sign (%) or 0.0.0.0/0, all IP addresses can access the instance. This may introduce security risks to the instance.

Parameter	Type	Required	Example	Description
ChargeType	String	No	PrePaid	The billing method of the instance. Valid values: • **Postpaid**: pay-as-you-go • **Prepaid**: subscription Default value: pay-as-you-go **Note** If you specify this parameter to **PrePaid**, you must also specify the **Period** parameter.
Period	Integer	No	1	The subscription period of the instance. Unit: months. Valid values: **1** to **9**, **12**, **24**, and **36**. **Note** This parameter is valid and required only if you set the **ChargeType** parameter to **PrePaid**.
NetworkType	String	No	VPC	The network type of the instance. Valid values: Default value: CLASSIC. • **CLASSIC** • **VPC** **Note** If you specify this parameter to **VPC**, you must also specify the **VpcId** parameter and the**VSwitchId** parameter.
VpcId	String	No	vpc-bpxxxxxxxx	The ID of the VPC. **Note** This parameter is valid only if you set the**NetworkType** parameter to **VPC**.

Parameter	Type	Required	Example	Description
VSwitchId	String	No	vsw-bpxxxxxxxx	The ID of the vSwitch in the specified VPC. **Note** This parameter is valid only if you set the**NetworkType** parameter to **VPC**.
SrcDBInstanceId	String	No	dds-bpxxxxxxxx	The ID of the source instance. This parameter can only be specified when this operation is called to clone instances. You must also specify the **RestoreTime** parameter.
RestoreTime	String	No	2019-03-08T02:30:25Z	The point in time at which the instance to be cloned will be restored. After you set this parameter, the data of the source instance at the specified point in time is used to create an instance. Specify the time in the *yyyy-MM-dd*T*HH:mm:ss*Z format. The time must be in UTC. This parameter can be specified only if this operation is called to clone instances. You must also specify the**SrcDBInstanceId** parameter. **Note** You can clone instances to any restore time in the past seven days.
ClientToken	String	No	ETnLKlblzczshOTUbOCzxxxxxxxxxx	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must ensure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.

Parameter	Type	Required	Example	Description
StorageEngine	String	No	WiredTiger	The storage engine of the database. Only **WiredTiger** is supported.
AutoRenew	String	No	false	Specifies whether to enable automatic renewal for the instance. Valid values: • **true**: enables automatic renewal. • **false**: disables automatic renewal. You must renew the instance manually. Default value: **false**. **Note** This parameter is valid only if you set the ChargeType parameter to **PrePaid**.
ResourceGroupId	String	No	rg-axxxxxxxx	The ID of the resource group.

Response parameters

Parameter	Type	Example	Description
DBInstanceId	String	dds-bpxxxxxxxx	The ID of the instance.
OrderId	String	2033xxxxxxxxxxx	The ID of the order.
RequestId	String	D8F1D721-6439-4257-A89C-F1E8E9C9623D	The ID of the request.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=CreateShardingDBInstance
&Engine=MongoDB
&EngineVersion=4.0
&AccountPassword=Alitest! 159
&ZoneId=cn-hangzhou-b
&ClientToken=ETnLKlblzczshOTUbOCzxxxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreateDBInstanceResponse>
      <DBInstanceId>dds-bpxxxxxxxx</DBInstanceId>
      <OrderId>2033xxxxxxxxxxx</OrderId>
      <RequestId>D8F1D721-6439-4257-A89C-F1E8E9C9623D</RequestId>
</CreateDBInstanceResponse>
```

`JSON` format

```
{
    "DBInstanceId": "dds-bpxxxxxxxx",
    "OrderId": "2033xxxxxxxxxxx",
    "RequestId": "D8F1D721-6439-4257-A89C-F1E8E9C9623D"
}
```

12.1.3.1.5. CreateNode

You can call this operation to create the shard or mongos node for an ApsaraDB for MongoDB sharded cluster instances.

This operation is applicable only to sharded cluster instances.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateNode	The operation that you want to perform. Set the value to **CreateNode**.
NodeClass	String	Yes	dds.shard.mid	The specification of the shard or mongos node. For more information, see Instance types.
NodeType	String	Yes	shard	The type of the node. Valid values: • **shard** • **mongos**
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the sharded cluster instance.

Parameter	Type	Required	Example	Description
NodeStorage	Integer	No	10	The storage capacity of the node. You must specify this parameter if you set the **NodeType** parameter to **shard**. • Valid values: **10** to **2000**. Unit: GB. • The value must be a multiple of 10 GB.
ClientToken	String	No	ETnLKlblzczshOTUbOCzxxxxxxxxxx	The client token that is used to ensure idempotence of the request. You can use the client to generate the value, but you must ensure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.
FromApp	String	No	OpenApi	The source of the request. Valid values: • **OpenApi**: the ApsaraDB for MongoDB API • **mongo_buy**: the ApsaraDB for MongoDB console
AutoPay	Boolean	No	true	Specifies whether to enable automatic payment for the instance. Valid values: • **true**: enables automatic payment. Make sure that your account has sufficient balance. • **false**: disables automatic payment. You must perform the following operations to pay for the instance: Log on to the ApsaraDB for MongoDB console. In the top navigation bar, click Expenses. The Billing Management page appears. In the left-side navigation pane, click Bills. On the Unpaid tab, click Make a Payment in the Actions column for the bill that you want to pay. Default value: **true**.

Response parameters

Parameter	Type	Example	Description
NodeId	String	d-bpxxxxxxxxxxxxxx	The ID of the node.

Parameter	Type	Example	Description
OrderId	String	2034xxxxxxxx	The ID of the order.
RequestId	String	7D48FB19-20CA-4725-A870-3D8F5CE69F14	The ID of the request.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=CreateNode
&NodeClass=dds.shard.mid
&NodeType=shard
&DBInstanceId=dds-bpxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreateNodeResponse>
   <OrderId>2034xxxxxxxx</OrderId>
   <RequestId>7D48FB19-20CA-4725-A870-3D8F5CE69F14</RequestId>
</CreateNodeResponse>
```

`JSON` format

```
{
 "OrderId": "2034xxxxxxxx",
 "RequestId": "7D48FB19-20CA-4725-A870-3D8F5CE69F14"
}
```

12.1.3.1.6. DeleteNode

You can call this operation to delete a shard or mongos in an ApsaraDB for MongoDB sharded cluster instance.

Before you call this operation, make sure that the following requirements are met:

- The instance is in the running state.
- A sharded cluster instance is used.
- The number of shard or mongos nodes in the instance must be greater than two.

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteNode	The operation that you want to perform. Set the value to **DeleteNode**.
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance.
NodeId	String	Yes	s-bpxxxxxxxx	The ID of the shard or mongos node to be deleted. You can call the DescribeDBInstanceAttribute operation to view the ID.
ClientToken	String	No	ETnLKlblzczshOTUbOCzxxxxxxxxxx	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must make sure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
OrderId	String	2033xxxxxxxxxxx	The ID of the order.
RequestId	String	9F9BDE64-BF30-41F3-BD29-C19CE4AB3404	The ID of the request.
TaskId	Integer	111111111	The ID of the task.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=DeleteNode
&NodeId=s-bpxxxxxxxx
&DBInstanceId=dds-bpxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteNodeResponse>
   <RequestId>9F9BDE64-BF30-41F3-BD29-C19CE4AB3404</RequestId>
   <TaskId>111111111</TaskId>
</DeleteNodeResponse>
```

`JSON` format

```
{
    "RequestId": "9F9BDE64-BF30-41F3-BD29-C19CE4AB3404",
    "TaskId": 111111111
}
```

12.1.3.1.7. ModifyNodeSpec

You can call this operation to modify the specifications and storage capacity of the nodes in an ApsaraDB for MongoDB sharded cluster instance.

This operation is applicable only to sharded cluster instances.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyNodeSpec	The operation that you want to perform. Set the value to **ModifyNodeSpec**.
NodeId	String	Yes	d-bpxxxxxxxx	The ID of the shard or mongos node in the sharded cluster instance. You can call the **DescribeDBInstanceAttribute** operation to view the ID. **Note** If you set this parameter to the ID of a shard, you must also specify the **NodeStorage** parameter.
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance.

Parameter	Type	Required	Example	Description
NodeClass	String	No	dds.shard.standard	The specifications of the mongos node. For more information, see **Instance types** in *ApsaraDB for MongoDB Product Introduction*. **Note** You must specify this parameter or the **NodeStorage** parameter.
NodeStorage	Integer	No	20	The storage capacity for the shard node. • Valid values: **10** to **2000**. Unit: GB. • The value must be a multiple of 10 GB. **Note** • You must specify this parameter or the **NodeClass** parameter. • This parameter is valid only if you set the **NodeId** parameter to the ID of a shard.
ClientToken	String	No	ETnLKlblzczshOTUbOCzxxxxxxxxxx	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must ensure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.

Parameter	Type	Required	Example	Description
AutoPay	Boolean	No	true	Specifies whether to enable automatic payment for the instance. Valid values: • **true**: enables automatic payment. Make sure that your account has sufficient balance. • **false**: disables automatic payment. You must perform the following operations to pay for the instance: Log on to the ApsaraDB for MongoDB console. In the top navigation bar, click **Expenses**. The **Billing Management** page appears. In the left-side navigation pane, click **Bills**. On the Unpaid tab, click Make a Payment in the Actions column for the bill that you want to pay. Default value: **true**.
EffectiveTime	String	No	Immediately	The time when the new settings take effect. Valid values: • **Immediately**: The settings take effect immediately. • **MaintainTime**: The settings take effect during the maintenance period of the instance. Default value: **Immediately**.
FromApp	String	No	OpenApi	The source of the request. Valid values: • **OpenApi**: the ApsaraDB for MongoDB API • **mongo_buy**: the ApsaraDB for MongoDB console
OrderType	String	No	UPGRADE	The type of the order. Valid values: • **UPGRADE** • **DOWNGRADE**

Response parameters

Parameter	Type	Example	Description

Parameter	Type	Example	Description
OrderId	String	2033xxxxxxxxx	The ID of the order.
RequestId	String	EFFC5788-8BB5-41B5-9F15-9CFC5A0E8FCC	The ID of the request.

Examples

Sample requests

```
http(s)://mongodb.aliyuncs.com/? Action=ModifyNodeSpec
&NodeId=d-bpxxxxxxxx
&DBInstanceId=dds-bpxxxxxxxx
&NodeClass=dds.shard.standard
&NodeStorage=20
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyNodeSpecResponse>
   <OrderId>2033xxxxxxxxx</OrderId>
   <RequestId>EFFC5788-8BB5-41B5-9F15-9CFC5A0E8FCC</RequestId>
</ModifyNodeSpecResponse>
```

`JSON` format

```
{
    "OrderId": "2033xxxxxxxx",
    "RequestId": "EFFC5788-8BB5-41B5-9F15-9CFC5A0E8FCC"
}
```

12.1.3.2. Region management

12.1.3.2.1. MigrateToOtherZone

You can call this operation to migrate an ApsaraDB for MongoDB instance to another zone.

This operation is applicable only to replica set instances, but not to sharded cluster instances.

Note If you have applied for a public endpoint of the instance, you must first call the **ReleasePublicNetworkAddress** operation to release the public endpoint.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	MigrateToOtherZone	The operation that you want to perform. Set the value to **MigrateToOtherZone**.
InstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance. **Note** You must specify the **Vswitch** parameter if the network type of the instance is VPC.
ZoneId	String	Yes	cn-hangzhou-b	The ID of the destination zone to which you want to migrate the MongoDB instance. **Note** • The destination and source zones are in the same region. • You can call the **DescribeRegions** operation to query the zone IDs.
EffectiveTime	String	No	Immediately	The time when the instance is migrated to the destination zone. Valid values: • **Immediately** • **MaintainTime**: The instance will be migrated during the maintenance period of the instance. Default value: **Immediately**.
VSwitchId	String	No	vsw-bpxxxxxxxx	The ID of the vSwitch in the destination zone. **Note** This parameter can be used only when the network type of the instance is VPC.

Response parameters

Parameter	Type	Example	Description
RequestId	String	0FDDC511-7252-4A4A-ADDA-5CB1BF63873D	The ID of the request.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=MigrateToOtherZone
&DBInstanceId=dds-bpxxxxxxxx
&ZoneId=cn-hangzhou-b
&EffectiveTime=Immediately
&<Common request parameters>
```

Sample success responses

`XML` format

```
<RequestId>0FDDC511-7252-4A4A-ADDA-5CB1BF63873D</RequestId>
```

`JSON` format

```
{
 "RequestId": "0FDDC511-7252-4A4A-ADDA-5CB1BF63873D"
}
```

12.1.3.2.2. DescribeRegions

You can call this operation to view the regions and zones that an ApsaraDB for MongoDB instance can be created.

Before you call the CreateDBInstance or CreateShardingDBInstance operation to create an instance, you must call this operation to view the regions and zones that the that ApsaraDB for MongoDB instance can be created.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeRegions	The operation that you want to perform. Set the value to **DescribeRegions**.

Response parameters

Parameter	Type	Example	Description
Regions	Array of DdsRegion		An array that consists of the information of regions.
DdsRegion			
RegionId	String	cn-qingdao	The ID of the region.
Zones	Array of Zone		An array that consists of the information of zones.
Zone			
VpcEnabled	Boolean	true	Indicates whether VPC is supported. Valid values: • **true** • **false**
ZoneId	String	cn-hangzhou-b	The ID of the zone.
RequestId	String	4E46C22C-D3B7-4DB8-9C76-63851BE68E20	The ID of the request.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=DescribeRegions
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeRegionsResponse>
   <RequestId>4E46C22C-D3B7-4DB8-9C76-63851BE68E20</RequestId>
   <Regions>
      <DdsRegion>
         <RegionId>cn-hangzhou</RegionId>
         <Zones>
            <Zone>
               <VpcEnabled>true</VpcEnabled>
               <ZoneId>cn-hangzhou-i</ZoneId>
            </Zone>
            <Zone>
               <VpcEnabled>true</VpcEnabled>
               <ZoneId>cn-hangzhou-b</ZoneId>
            </Zone>
            <Zone>
               <VpcEnabled>true</VpcEnabled>
               <ZoneId>cn-hangzhou-d</ZoneId>
            </Zone>
            <Zone>
               <VpcEnabled>true</VpcEnabled>
               <ZoneId>cn-hangzhou-f</ZoneId>
            </Zone>
            <Zone>
               <VpcEnabled>true</VpcEnabled>
               <ZoneId>cn-hangzhou-MAZ5(b,e,f)</ZoneId>
            </Zone>
            <Zone>
               <VpcEnabled>true</VpcEnabled>
               <ZoneId>cn-hangzhou-g</ZoneId>
            </Zone>
         </Zones>
      </DdsRegion>
   </Regions>
</DescribeRegionsResponse>
```

`JSON` format

```
{
 "RequestId": "4E46C22C-D3B7-4DB8-9C76-63851BE68E20",
 "Regions": {
  "DdsRegion": [
   {
    "RegionId": "cn-hangzhou",
    "Zones": {
     "Zone": [
      {
       "VpcEnabled": true,
       "ZoneId": "cn-hangzhou-i"
      },
      {
       "VpcEnabled": true,
       "ZoneId": "cn-hangzhou-b"
      },
      {
       "VpcEnabled": true,
       "ZoneId": "cn-hangzhou-d"
      },
      {
       "VpcEnabled": true,
       "ZoneId": "cn-hangzhou-f"
      },
      {
       "VpcEnabled": true,
       "ZoneId": "cn-hangzhou-MAZ5(b,e,f)"
      },
      {
       "VpcEnabled": true,
       "ZoneId": "cn-hangzhou-g"
      }
     ]
    }
   }
  ]
 }
}
```

12.1.3.2.3. MigrateAvailableZone

You can call this operation to change the zone of an ApsaraDB for MongoDB instance.

This operation is applicable only to replica set instances, but not to sharded cluster instances.

> **Note** If you have applied for a public endpoint of the instance, you must first call **ReleasePublicNetworkAddress** to release the public endpoint.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	MigrateAvailableZone	The operation that you want to perform. Set the value to **MigrateAvailableZone**.
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance. **Note** You must specify the **Vswitch** parameter if the network type of the instance is VPC.
ZoneId	String	Yes	cn-hangzhou-b	The ID of the destination zone to which you want to migrate the ApsaraDB for MongoDB instance. **Note** • The destination zone must be in the same region as the current zone of the instance. • You can call the **DescribeRegions** operation to view the zone IDs.
Vswitch	String	No	vsw-bpxxxxxxxx	The ID of the vSwitch in the destination zone. **Note** This parameter can be used only when the network type of the instance is VPC.
EffectiveTime	String	No	Immediately	The time when the instance is migrated to the destination zone. Valid values: • **Immediately**: The instance will be migrated immediately. • **MaintainTime**: The instance will be migrated during the maintenance period of the instance. Default value: **Immediately**.

Response parameters

Parameter	Type	Example	Description
RequestId	String	0FDDC511-7252-4A4A-ADDA-5CB1BF63873D	The ID of the request.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=MigrateAvailableZone
&DBInstanceId=dds-bpxxxxxxxx
&ZoneId=cn-hangzhou-b
&EffectiveTime=Immediately
&<Common request parameters>
```

Sample success responses

`XML` format

```
<MigrateAvailableZoneResponse>
   <RequestId>0FDDC511-7252-4A4A-ADDA-5CB1BF63873D</RequestId>
</MigrateAvailableZoneResponse>
```

`JSON` format

```
{
 "RequestId": "0FDDC511-7252-4A4A-ADDA-5CB1BF63873D"
}
```

12.1.3.3. Resource management

12.1.3.3.1. DescribeAvailableResource

You can call this operation to view the ApsaraDB for MongoDB instances that can be created in a specified zone.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeAvailableResource	The operation that you want to perform. Set the value to **DescribeAvailableResource**.
RegionId	String	Yes	cn-hangzhou	The region ID. You can call the **DescribeRegions** operation to view the region IDs.

Parameter	Type	Required	Example	Description
ZoneId	String	No	cn-hangzhou-h	The zone ID of the instance. You can call the **DescribeRegions** operation to view the zone IDs.
InstanceChargeType	String	No	PrePaid	The billing method. Valid values: • PrePaid: subscription. • PostPaid: pay-as-you-go. **Note** Default value: PrePaid.

Response parameters

Parameter	Type	Example	Description
RequestId	String	344EE51D-8850-4935-B68B-58A8F4DCE3BD	The ID of the request.
SupportedDBTypes	Array of SupportedDBType		The database type supported.
SupportedDBType			
AvailableZones	Array of AvailableZone		The zone ID of the instance.
AvailableZone			
RegionId	String	cn-hangzhou	The region ID of the instance.
SupportedEngineVersions	Array of SupportedEngineVersion		The versions of the storage engine.
SupportedEngineVersion			
SupportedEngines	Array of SupportedEngine		The storage engine supported.
SupportedEngine			

Parameter	Type	Example	Description
Engine	String	WiredTiger	The storage engine of the instance.
SupportedNodeTypes	Array of SupportedNodeType		The instance types supported.
SupportedNodeType			
AvailableResources	Array of AvailableResource		The details of available resources.
AvailableResource			
InstanceClass	String	dds.mongo.2xlarge	The category of the instance.
InstanceClassRemark	String	8 vCPUs, 32 GiB (maximum connections: 8000 IOPS: 14000)	The instance type.
NetworkTypes	String	VPC	The network type of the instance.
NodeType	String	3	The number of nodes in the instance.
Version	String	4.0	The database engine version of the instance.
ZoneId	String	cn-hangzhou-h	The zone ID of the instance.
DbType	String	sharding	The database engine of the instance.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=DescribeAvailableResource
&RegionId=cn-hangzhou
&<Common request parameters>
```

Sample success responses

`XML` format

```
<RequestId>344EE51D-8850-4935-B68B-58A8F4DCE3BD</RequestId>
<SupportedDBTypes>
    <DbType>sharding</DbType>
</SupportedDBTypes>
<SupportedDBTypes>
    <AvailableZones>
        <ZoneId>cn-hangzhou-h</ZoneId>
        <RegionId>cn-hangzhou</RegionId>
    </AvailableZones>
    <AvailableZones>
        <SupportedEngineVersions>
            <Version>4.0</Version>
        </SupportedEngineVersions>
        <SupportedEngineVersions>
            <SupportedEngines>
                <Engine>WiredTiger</Engine>
            </SupportedEngines>
            <SupportedEngines>
                <SupportedNodeTypes>
                    <NetworkTypes>VPC</NetworkTypes>
                    <NodeType>3</NodeType>
                </SupportedNodeTypes>
                <SupportedNodeTypes>
                    <AvailableResources>
                        <InstanceClassRemark>8 vCPUs, 32 GiB (maximum connections: 8000 IOP
S: 14000)</InstanceClassRemark>
                        <InstanceClass>dds.mongo.2xlarge</InstanceClass>
                    </AvailableResources>
                </SupportedNodeTypes>
            </SupportedEngines>
        </SupportedEngineVersions>
    </AvailableZones>
</SupportedDBTypes>
```

`JSON` format

```
{
    "RequestId":"344EE51D-8850-4935-B68B-58A8F4DCE3BD",
    "SupportedDBTypes":[
        {
            "DbType":"sharding"
        },
        {
            "AvailableZones":[
                {
                    "ZoneId":"cn-hangzhou-h",
                    "RegionId":"cn-hangzhou"
                },
                {
                    "SupportedEngineVersions":[
                        {
                            "Version":"4.0"
                        },
                        {
                            "SupportedEngines":[
                                {
                                    "Engine":"WiredTiger"
                                },
                                {
                                    "SupportedNodeTypes":[
                                        {
                                            "NetworkTypes":"VPC",
                                            "NodeType":"3"
                                        },
                                        {
                                            "AvailableResources":[
                                                {
                                                    "InstanceClassRemark":"8 vCPUs, 32 GiB
(maximum connections: 8000 IOPS: 14000)",
                                                    "InstanceClass":"dds.mongo.2xlarge"
                                                }
                                            ]
                                        }
                                    ]
                                }
                            ]
                        }
                    ]
                }
            ]
        }
    ]
}
```

12.1.3.4. Connection management

12.1.3.4.1. AllocatePublicNetworkAddress

You can call this operation to assign a public endpoint to an ApsaraDB for MongoDB instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	AllocatePublicNetworkAddress	The operation that you want to perform. Set the value to **AllocatePublicNetworkAddress**.
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance. **Note** If you set this parameter to the ID of a sharded cluster instance, you must also specify the **NodeId** parameter.
NodeId	String	No	s-bpxxxxxxxx	The ID of the mongos, shard, or Configserver node in the sharded cluster instance. **Note** • This parameter is valid only if you set the **DBInstanceId** parameter to the ID of a sharded cluster instance. • You can call the DescribeDBInstanceAttribute operation to view the ID of the mongos, shard, or Configserver node.

Response parameters

Parameter	Type	Example	Description
RequestId	String	B6D17591-B48B-4D31-9CD6-9B9796B2270A	The ID of the request.

Examples

Sample requests

```
http(s)://mongodb.aliyuncs.com/? Action=AllocatePublicNetworkAddress
&DBInstanceId=dds-bpxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<AllocatePublicNetworkAddressResponse>
   <RequestId>B6D17591-B48B-4D31-9CD6-9B9796B2270A</RequestId>
</AllocatePublicNetworkAddressResponse>
```

`JSON` format

```
{
 "RequestId": "B6D17591-B48B-4D31-9CD6-9B9796B2270A"
}
```

12.1.3.4.2. ReleasePublicNetworkAddress

You can call this operation to release the public endpoint of an ApsaraDB for MongoDB instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ReleasePublicNetworkAddress	The operation that you want to perform. Set the value to **ReleasePublicNetworkAddress**.
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance. **Note** If you set this parameter to the ID of a sharded cluster instance, you must also specify the **NodeId** parameter.

Parameter	Type	Required	Example	Description
NodeId	String	No	s-bpxxxxxxxx	A sharded cluster instance consists of three components: mongos, shard, and Configserver. **Note** • This parameter is valid only if you set the **DBInstanceId** parameter to the ID of a sharded cluster instance. • You can call the **DescribeDBInstanceAttribute** operation to view the ID of the mongos, shard, or Configserver node.

Response parameters

Parameter	Type	Example	Description
RequestId	String	1D6AFE36-1AF5-4DE4-A954-672159D4CC69	The ID of the request.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=ReleasePublicNetworkAddress
&DBInstanceId=dds-bpxxxxxxxx
&s-bpxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ReleasePublicNetworkAddressResponse>
   <RequestId>B6D17591-B48B-4D31-9CD6-9B9796B2270A</RequestId>
</ReleasePublicNetworkAddressResponse>
```

`JSON` format

```
{
 "RequestId": "1D6AFE36-1AF5-4DE4-A954-672159D4CC69"
}
```

12.1.3.4.3. ModifyInstanceVpcAuthMode

You can call this operation to enable or disable password-free access from the same VPC as an ApsaraDB for MongoDB instance.

Before you call this operation, make sure that the following requirements are met:

- A replica set or sharded cluster instance is used.
- The database engine version of the instance is MongoDB 4.0 or 4.2. You can call the **DescribeDBInstanceAttribute** operation to view the database engine version of the instance. If necessary, you can call the **UpgradeDBInstanceEngineVersion** operation to upgrade the database engine.
- The network type of the instance must be VPC.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyInstanceVpcAuthMode	The operation that you want to perform. Set the value to **ModifyInstanceVpcAuthMode**.
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance.
RegionId	String	No	cn-hangzhou	The region ID of the instance. You can call the **DescribeDBInstanceAttribute** operation to view the region ID of the instance.
NodeId	String	No	s-bpxxxxxxxx	The ID of the mongos node in the sharded cluster instance. **Note** This parameter is valid only if you select a sharded cluster instance.
VpcAuthMode	String	No	Open	Specifies whether to enable password-free access within the VPC. Valid values: • **Open**: enables password-free access within the VPC. • **Close**: disables password-free access within the VPC.

Response parameters

Parameter	Type	Example	Description
RequestId	String	BA51E9D9-B14A-4542-B6E6-7DE00BECCB8C	The ID of the request.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=ModifyInstanceVpcAuthMode
&DBInstanceId=dds-bpxxxxxxxx
&VpcAuthMode=Open
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyInstanceVpcAuthModeResponse>
      <RequestId>BA51E9D9-B14A-4542-B6E6-7DE00BECCB8C</RequestId>
</ModifyInstanceVpcAuthModeResponse>
```

`JSON` format

```
{
    "RequestId": "BA51E9D9-B14A-4542-B6E6-7DE00BECCB8C"
}
```

12.1.3.4.4. DescribeShardingNetworkAddress

You can call this operation to view the connection information of an ApsaraDB for MongoDB sharded cluster instance.

This operation supports sharded cluster instances only.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeShardingNetworkAddress	The operation that you want to perform. Set the value to **DescribeShardingNetworkAddress**.
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance.

Parameter	Type	Required	Example	Description
NodeId	String	No	d-bpxxxxxxxx	The ID of the mongos, shard, and Configserver node in the sharded cluster instance. **Note** You can call the **DescribeDBInstanceAttribute** operation to view the ID of the mongos, shard, or Configserver node.

Response parameters

Parameter	Type	Example	Description
CompatibleConnections	Array of CompatibleConnection		An array that consists of the endpoints of DynamoDB instances.
CompatibleConnection			
ExpiredTime	String	2591963	The remaining period of the classic network endpoint. Unit: seconds.
IPAddress	String	10.140.xxx.xx	The IP address of the instance.
NetworkAddress	String	dds-bpxxxxxxxxxxxxxx.mongodb.rds.aliyuncs.com	The endpoint of the instance.
NetworkType	String	VPC	The network type of the endpoint. Valid values: • **VPC** • **Classic** • **Public**
Port	String	3717	The port number.
VPCId	String	vpc-bpxxxxxxxx	The ID of the VPC. **Note** This parameter is returned when the network type is VPC.

Parameter	Type	Example	Description
VswitchId	String	vsw-bpxxxxxxxx	The ID of the vSwitch in the specified VPC. **Note** This parameter is returned when the network type is VPC.
NetworkAddresses	Array of NetworkAddress		An array that consists of the endpoints of ApsaraDB for MongoDB instances.
NetworkAddress			
ExpiredTime	String	2591963	The remaining period of the classic network endpoint. Unit: seconds.
IPAddress	String	10.140.xxx.xx	The IP address of the instance.
NetworkAddress	String	s-bpxxxxxxxx.mongodb.rds.aliyuncs.com	The endpoint of the instance.
NetworkType	String	VPC	The network type of the endpoint. • **VPC** • **Classic** • **Public**
NodeId	String	s-bpxxxxxxxx	The ID of the mongos node.
NodeType	String	mongos	The type of the node. Valid values: • **mongos** • **shard** • **configserver**
Port	String	3717	The port number.
Role	String	Primary	The role of the node. Valid values: • Primary • Secondary

Parameter	Type	Example	Description
VPCId	String	vpc-bpxxxxxxxx	The ID of the VPC. **Note** This parameter is returned when the network type is **VPC**.
VswitchId	String	vsw-bpxxxxxxxx	The ID of the vSwitch in the specified VPC. **Note** This parameter is returned when the network type is **VPC**.
RequestId	String	18D8AAFD-6BEB-420F-8164-810CB0C0AA39	The ID of the request.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=DescribeShardingNetworkAddress
&DBInstanceId=dds-bpxxxxxxxx
&<Common request parameters>

    ]
}
```

12.1.3.4.5. ModifyDBInstanceConnectionString

You can call this operation to modify the connection string of an ApsaraDB for MongoDB instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyDBInstanceConnectionString	The operation that you want to perform. Set the value to **ModifyDBInstanceConnectionString**.
CurrentConnectionString	String	Yes	s-bpxxxxxxxx.mongodb.rds.aliyuncs.com	The current connection string, which is to be modified.

Parameter	Type	Required	Example	Description
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance. **Note** If you set this parameter to the ID of a sharded cluster instance, you must also specify the **NodeId** parameter.
NewConnectionString	String	Yes	aliyuntest111	The new connection string. It must be 8 to 64 characters in length and can contain letters and digits. It must start with a lowercase letter. **Note** You only need to specify the prefix of the connection string. The content other than the prefix cannot be modified.
NodeId	String	No	s-bpxxxxxxxx	The ID of the mongos node in the sharded cluster instance. Only one mongos ID can be specified in each call. **Note** This parameter is valid only if you set the **DBInstanceId** parameter to the ID of a sharded cluster instance.

Response parameters

Parameter	Type	Example	Description
RequestId	String	FF36A84C-0694-42D0-861D-C383E8E4FAAF	The ID of the request.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=ModifyDBInstanceConnectionString
&CurrentConnectionString=s-bpxxxxxxxx.mongodb.rds.aliyuncs.com
&NewConnectionString=aliyuntest111
&DBInstanceId=dds-bpxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyDBInstanceConnectionStringResponse>
   <RequestId>FF36A84C-0694-42D0-861D-C383E8E4FAAF</RequestId>
</ModifyDBInstanceConnectionStringResponse>
```

`JSON` format

```
{
 "RequestId": "FF36A84C-0694-42D0-861D-C383E8E4FAAF"
}
```

12.1.3.4.6. ReleaseNodePrivateNetworkAddress

You can call this operation to release the internal endpoint of the shard or Configserver node of a sharded cluster instance.

This operation is only applicable to sharded cluster instances. For more information, see Release endpoints of shard or Configserver nodes.

> **Note** This operation releases the internal endpoint of the node. If you have also applied for a public endpoint of the node and want to release it, you can call the ReleasePublicNetworkAddress operation to release the public endpoint.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ReleaseNodePrivateNetworkAddress	The operation that you want to perform. Set the value to **ReleaseNodePrivateNetworkAddress**.
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the sharded cluster instance.
NodeId	String	Yes	d-bpxxxxxxxx	The ID of the shard or Configserver node. **Note** You can call the DescribeDBInstanceAttribute operation to query the ID of the shard or Configserver node.

Parameter	Type	Required	Example	Description
NetworkType	String	Yes	VPC	The network type of the internal endpoint. Valid values: • **VPC** • **Classic** **Note** You can call the Describeshardingendpoint address operation to query the network type of the internal endpoint.

Response parameters

Parameter	Type	Example	Description
RequestId	String	0FDDC511-7252-4A4A-ADDA-5CB1BF63873D	The ID of the request.

Examples

Sample requests

```
http(s)://mongodb.aliyuncs.com/? Action=ReleaseNodePrivateNetworkAddress
&DBInstanceId=dds-bpxxxxxxxx
&NodeId=d-bpxxxxxxxx
&NetworkType=VPC
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ReleaseNodePrivateNetworkAddressResponse>
   <RequestId>EFD65226-08CC-4C4D-B6A4-CB3C382F67B0</RequestId>
</ReleaseNodePrivateNetworkAddressResponse>
```

`JSON` format

```
{
 "RequestId":"0FDDC511-7252-4A4A-ADDA-5CB1BF63873D"
}
```

12.1.3.5. Instance information query

12.1.3.5.1. DescribeReplicaSetRole

You can call this operation to view the role and connection information of an ApsaraDB for MongoDB instance.

This operation is applicable only to replica set instances, but not to sharded cluster instances.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeReplicaSetRole	The operation that you want to perform. Set the value to **DescribeReplicaSetRole**.
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance.

Response parameters

Parameter	Type	Example	Description
RequestId	String	DB4A0595-FCA9-437F-B2BB-25DBFC009D3E	The ID of the request.
DBInstanceId	String	dds-bpxxxxxxxx	The ID of the instance.
ReplicaSets	Array of ReplicaSet		An array that consists of the information of replica set instance roles.
ReplicaSet			
ConnectionDomain	String	dds-bpxxxxxxxx.mongodb.rds.aliyuncs.com	The endpoint of the node.
ConnectionPort	String	3717	The port of the node.
ExpiredTime	String	1209582	The remaining period of the classic network endpoint. Unit: seconds.
NetworkType	String	VPC	The network type of the endpoint. Valid values: • **VPC** • **Classic** • **Public**

Parameter	Type	Example	Description
ReplicaSetRole	String	Primary	The role of the node in the replica set instance. • **Primary** • **Secondary**
RoleId	String	651xxxxx	The role ID of the node.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=DescribeReplicaSetRole
&DBInstanceId=dds-bpxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeReplicaSetRoleResponse>
   <RequestId>7762D0FF-F34D-4DAF-9D06-6C1C28CC98CD</RequestId>
   <DBInstanceId>dds-bpxxxxxxxx</DBInstanceId>
   <ReplicaSets>
      <ReplicaSet>
         <NetworkType>Classic</NetworkType>
         <ConnectionPort>3717</ConnectionPort>
         <ReplicaSetRole>Primary</ReplicaSetRole>
         <ConnectionDomain>dds-bpxxxxxxxx.mongodb.rds.aliyuncs.com</ConnectionDomain>
         <ExpiredTime>12xxxxx</ExpiredTime>
         <RoleId>55xxxxx</RoleId>
      </ReplicaSet>
      <ReplicaSet>
         <NetworkType>Classic</NetworkType>
         <ConnectionPort>3717</ConnectionPort>
         <ReplicaSetRole>Secondary</ReplicaSetRole>
         <ConnectionDomain>dds-bpxxxxxxxx.mongodb.rds.aliyuncs.com</ConnectionDomain>
         <ExpiredTime>12xxxxx</ExpiredTime>
         <RoleId>55xxxxx</RoleId>
      </ReplicaSet>
      <ReplicaSet>
         <NetworkType>VPC</NetworkType>
         <ConnectionPort>3717</ConnectionPort>
         <ReplicaSetRole>Primary</ReplicaSetRole>
         <ConnectionDomain>dds-bpxxxxxxxx.mongodb.rds.aliyuncs.com</ConnectionDomain>
         <RoleId>55xxxxx</RoleId>
      </ReplicaSet>
      <ReplicaSet>
         <NetworkType>VPC</NetworkType>
         <ConnectionPort>3717</ConnectionPort>
         <ReplicaSetRole>Secondary</ReplicaSetRole>
         <ConnectionDomain>dds-bpxxxxxxxx.mongodb.rds.aliyuncs.com</ConnectionDomain>
         <RoleId>55xxxxx</RoleId>
      </ReplicaSet>
   </ReplicaSets>
</DescribeReplicaSetRoleResponse>
```

`JSON` format

```
{
 "RequestId": "7762D0FF-F34D-4DAF-9D06-6C1C28CC98CD",
 "DBInstanceId": "dds-bpxxxxxxxx",
 "ReplicaSets": {
  "ReplicaSet": [
   {
    "NetworkType": "Classic",
    "ConnectionPort": "3717",
    "ReplicaSetRole": "Primary",
    "ConnectionDomain": "dds-bpxxxxxxxx.mongodb.rds.aliyuncs.com",
    "ExpiredTime": "12xxxxx",
    "RoleId": "55xxxxx"
   },
   {
    "NetworkType": "Classic",
    "ConnectionPort": "3717",
    "ReplicaSetRole": "Secondary",
    "ConnectionDomain": "dds-bpxxxxxxxx.mongodb.rds.aliyuncs.com",
    "ExpiredTime": "12xxxxx",
    "RoleId": "55xxxxx"
   },
   {
    "NetworkType": "VPC",
    "ConnectionPort": "3717",
    "ReplicaSetRole": "Primary",
    "ConnectionDomain": "dds-bpxxxxxxxx.mongodb.rds.aliyuncs.com",
    "RoleId": "55xxxxx"
   },
   {
    "NetworkType": "VPC",
    "ConnectionPort": "3717",
    "ReplicaSetRole": "Secondary",
    "ConnectionDomain": "dds-bpxxxxxxxx.mongodb.rds.aliyuncs.com",
    "RoleId": "55xxxxx"
   }
  ]
 }
}
```

12.1.3.5.2. DescribeKernelReleaseNotes

You can call this operation to view the release notes of the minor database versions of an ApsaraDB for MongoDB instance.

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeKernelReleaseNotes	The operation that you want to perform. Set the value to **DescribeKernelReleaseNotes**.
KernelVersion	String	No	mongodb_20180522_0.4.8	The minor version of the database. Example: **mongodb_20180522_0.4.8**. • If you specify this parameter, a list of versions later than the version specified is returned. • If you do not specify this parameter, a list of all versions is returned.

Response parameters

Parameter	Type	Example	Description
ReleaseNotes	Array of ReleaseNote		An array that consists of the information of version release notes.
ReleaseNote			
KernelVersion	String	mongodb_20180619_0.4.9	The version of the database.
ReleaseNote	String	Released the balancer switch limit for a sharded set	The release notes.
RequestId	String	F01D4DDA-CB72-4083-B399-AF4642294FE6	The ID of the request.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=DescribeKernelReleaseNotes
&<Common request parameters>
```

Sample success responses

`XML` format

```
<RequestId>F01D4DDA-CB72-4083-B399-AF4642294FE6</RequestId>
<ReleaseNotes>
    <ReleaseNote>
        <KernelVersion>mongodb_20180619_0.4.9</KernelVersion>
        <ReleaseNote>Released the balancer switch limit for a sharded set</ReleaseNote>
    </ReleaseNote>
</ReleaseNotes>
```

`JSON` format

```
{
    "RequestId":"F01D4DDA-CB72-4083-B399-AF4642294FE6",
    "ReleaseNotes":
    {
        "ReleaseNote":[
            {
                "KernelVersion":"mongodb_20180619_0.4.9",
                "ReleaseNote":"Released the balancer limit for a sharded set"
            }
        ]
    }
}
```

12.1.3.5.3. DescribeAvailableEngineVersion

You can call this operation to view the database engine versions that an ApsaraDB for MongoDB instance can be upgraded to.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeAvailableEngineVersion	The operation that you want to perform. Set the value to **DescribeAvailableEngineVersion**.
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance.

Response parameters

Parameter	Type	Example	Description
RequestId	String	52507B6B-003B-47A3-A0A3-9FE992C7A243	The ID of the request.

Parameter	Type	Example	Description
EngineVersions	List	{"EngineVersion": ["4.0"]}	The databse engine versions that the ApsaraDB for MongoDB instance can be upgraded to. **Note** An empty string is returned if the latest version is being used.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=DescribeAvailableEngineVersion
&DBInstanceId=dds-bpxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeAvailableEngineVersionResponse>
   <EngineVersions>
      <EngineVersion>4.0</EngineVersion>
   </EngineVersions>
   <RequestId>52507B6B-003B-47A3-A0A3-9FE992C7A243</RequestId>
</DescribeAvailableEngineVersionResponse>
```

`JSON` format

```
{
 "EngineVersions": {
  "EngineVersion": [
   "4.0"
  ]
 },
 "RequestId": "52507B6B-003B-47A3-A0A3-9FE992C7A243"
}
```

12.1.3.5.4. DescribeDBInstances

You can call this operation to query the list of ApsaraDB for MongoDB instances.

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeDBInstances	The operation that you want to perform. Set the value to **DescribeDBInstances**.
PageNumber	Integer	No	1	The number of the page to return. The value must be a positive integer. Default value: **1**.
PageSize	Integer	No	30	The number of entries to return on each page. Valid values: **30, 50, and 100**. Default value: **30**.
ReplicationFactor	String	No	3	The number of nodes in a replica set instance. Valid values: **3, 5, and 7**.
DBInstanceType	String	No	replicate	The architecture type of the instance. Valid values: • **sharding**: sharded cluster instance • **replicate**: replica set or standalone instance Default value: **replicate**
Engine	String	No	MongoDB	The database engine. Valid value: **MongoDB**.
DBInstanceId	String	No	dds-bpxxxxxxxx	The ID of the instance.
DBInstanceDescription	String	No	Test database	The description of the instance.
ExpireTime	String	No	2019-12-26T16:00Z	The time when the instance expires.
DBInstanceStatus	String	No	ACTIVATION	The status of the instance. For more information, see **Instance states**.
DBInstanceClass	String	No	dds.mongo.mid	The instance type. For more information, see **Instance types** in *ApsaraDB for MongoDB Product Introduction*.

Parameter	Type	Required	Example	Description
EngineVersion	String	No	4.0	The database engine version of the instance. Valid values: • **3.2** • **3.4** • **4.0** • **4.2**
NetworkType	String	No	VPC	The network type of the instances. Valid values: • **Classic** • **VPC**
VpcId	String	No	vpc-bpxxxxxxxx	The ID of the VPC.
VSwitchId	String	No	vsw-bpxxxxxxxx	The ID of the vSwitch in the specified VPC.
ChargeType	String	No	PostPaid	The billing method of the instance. Valid values: • **PrePaid**: subscription • **PostPaid**: pay-as-you-go
ZoneId	String	No	cn-hangzhou-b	The zone ID of the instance. You can call the DescribeRegions operation to query the zone IDs.
Expired	String	No	true	Specifies whether the instance has expired. Valid values: • **true**: The instance has expired. • **false**: The instance has not expired.
ResourceGroupId	String	No	rg-axxxxxxxx	The ID of the resource group.

Parameter	Type	Required	Example	Description
Tag.N.Key	String	No	testdatabase	The key of the instance tag. Valid values of N: 1 to 20. The tag key can be up to 64 characters in length. It cannot start with `aliyun`, `acs:`, `http://`, or `https://`. **Note** It cannot be an empty string.
Tag.N.Value	String	No	apitest	The value of the instance tag. Valid values of N: 1 to 20. The tag value can be up to 128 characters in length. It cannot start with `aliyun`, `acs:`, `http://`, or `https://`. **Note** Tag.N.Value can be an empty string.

Response parameters

Parameter	Type	Example	Description
PageNumber	Integer	1	The page number of the returned page.
TotalCount	Integer	1	The number of the instances in the query results.
PageSize	Integer	30	The number of entries return on each page.
RequestId	String	A10B8ECB-0BA0-4EC6-93A5-C65FDEDA07CB	The ID of the request.
DBInstances	Array of DBInstance		An array that consists of the information of instances.
DBInstance			
ChargeType	String	PostPaid	The billing method of the instance. • **PrePaid**: subscription • **PostPaid**: pay-as-you-go

Parameter	Type	Example	Description
CreationTime	String	2018-09-25T06:33:07Z	The time when the instance was created. The time is in the *yyyy-MM-dd*T*HH:mm:ss*Z format. The time is displayed in UTC.
DBInstanceClass	String	dds.mongo.mid	The instance type
DBInstanceDescription	String	Test database	The description of the instance.
DBInstanceId	String	dds-bpxxxxxxxx	The ID of the instance.
DBInstanceStatus	String	Running	The status of the instance.
DBInstanceStorage	Integer	20	The storage capacity of the instance.
DBInstanceType	String	sharding	The architecture type of the instance. • **sharding**: sharded cluster instance • **replicate**: replica set instance
DestroyTime	String	2019-03-05T11:26:02Z	The time when the instance was released. The time is in the *yyyy-MM-dd*T*HH:mm:ss*Z format. The time is displayed in UTC. **Note** • Subscription instances are released seven days after expiration. After an instance is released, its data is deleted and cannot be restored. • Pay-as-you-go instances will be locked when the payment is overdue for more than 24 hours. The instance will be released when it is overdue for more than seven days. The data of released instances will be deleted and cannot be recovered.
Engine	String	MongoDB	The database engine of the instance

Parameter	Type	Example	Description
EngineVersion	String	4.0	The version of the database engine.
ExpireTime	String	2019-11-25T16:00Z	The time when the instance expires. The time is in the *yyyy-MM-dd*T*HH:mm*Z format. The time is displayed in UTC.
KindCode	String	1	The kind code of the instance. Valid values: • **0**: physical machine • **1**: Elastic Compute Service (ECS) • **2**: Docker cluster • **18**: Kubernetes cluster
LastDowngradeTime	String	20190308	The last time when the instance was downgraded.
LockMode	String	Unlock	Indicates whether the instance is locked. • **Unlock**: The instance is not locked. • **ManualLock**: The instance has been manually locked. • **LockByExpiration**: The instance has been locked upon expiration. • **LockByRestoration:** The instance has been locked for a rollback. • **LockByDiskQuota:** The instance has been automatically locked because its storage space is exhausted. • **Released:** The instance has been released. You cannot unlock a released instance. After an instance is released, you can only use a backup to restore the data of the instance to a new instance. This process requires a long time.
MongosList	Array of MongosAttribute		An array that consists of the information of mongos nodes. **Note** This parameter is returned if the instance is a sharded cluster instance.
MongosAttribute			

Parameter	Type	Example	Description
NodeClass	String	dds.mongos.mid	The specifications of the mongos node.
NodeDescription	String	Test mongos	The description of the mongos node.
NodeId	String	s-bpxxxxxxxx	The ID of the mongos node.
NetworkType	String	VPC	The network type of the instance. • **Classic** • **VPC**
RegionId	String	cn-hangzhou	The region ID of the instance.
ReplicationFactor	String	3	The number of the nodes in the instance. **Note** This parameter is returned if the instance is a replica set instance.
ResourceGroupId	String	rg-axxxxxxxx	The ID of the resource group.
ShardList	Array of ShardAttribute		An array that consists of the information of shard nodes. **Note** This parameter is returned if the instance is a sharded cluster instance.
ShardAttribute			
NodeClass	String	dds.shard.mid	The specifications of the shard node.
NodeDescription	String	Test shard	The description of the shard node.
NodeId	String	d-bpxxxxxxxx	The ID of the shard node.
NodeStorage	Integer	20	The storage capacity of the shard node. Unit: GB.

Parameter	Type	Example	Description
Tags	Array of Tag		An array that consists of the information of instance tags.
Tag			
Key	String	test	The key of the instance tag.
Value	String	api	The value of the instance tag.
VpcAuthMode	String	close	Indicates whether password-free access within the VPC is enabled. Valid values: • **Open**: Password-free access is enabled. • **Close**: Password-free access is disabled.
ZoneId	String	cn-hangzhou-b	The zone ID of the instance.

12.1.3.5.5. DescribeDBInstanceAttribute

You can call this operation to view the details of a MongoDB instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeDBInstanceAttribute	The operation that you want to perform. Set the value to **DescribeDBInstanceAttribute**.
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance.
Engine	String	No	MongoDB	The database engine. Set the value to **MongoDB**.
ResourceGroupId	String	No	rg-axxxxxxxx	The ID of the resource group.

Response parameters

Parameter	Type	Example	Description
RequestId	String	C373EED9-5125-4DD9-89DB-FB1ECD2C2B4F	The ID of the request.
DBInstances	Array of DBInstance		An array that consists of the information of the instance.
DBInstance			
ChargeType	String	PostPaid	The billing method of the instance. • **PrePaid**: subscription • **PostPaid**: pay-as-you-go
ConfigserverList	Array of ConfigserverAttribute		An array that consists of the information of Configserve nodes. **Note** This parameter is returned if the instance type is sharded cluster.
ConfigserverAttribute			
ConnectString	String	mongodb://root:****@dds-bpxxxxxxxxxxxxxx-cs1730-pub.mongodb.rds.aliyuncs.com:3717	The connection string URI of the Configserver node.

Parameter	Type	Example	Description
MaxConnections	Integer	0	The maximum number of connections of the Configserver node.
MaxIOPS	Integer	1000	The maximum input/output operations per second (IOPS) of the Configserver node.
NodeClass	String	dds.cs.mid	The specifications of the Configserver node.
NodeDescription	String	testConfigserver	The name of the Configserver node.
NodeId	String	dds-bpxxxxxxxxxxxxx-cs	The ID of the Configserver node.
NodeStorage	Integer	20	The storage capacity of the Configserver node.
Port	Integer	3717	The port of the Configserver node.
CreationTime	String	2018-11-21T05:10:00Z	The time when the instance was created. The time is in the *yyyy-MM-dd*T*HH:mm*Z format. The time is displayed in UTC.
CurrentKernelVersion	String	mongodb_20180914_1.1.5	The minor version of the current database of the instance.
DBInstanceClass	String	dds.mongo.mid	The instance type.
DBInstanceDescription	String	Test	The name of the instance.
DBInstanceId	String	dds-bpxxxxxxxx	The ID of the instance.
DBInstanceReleaseProtection	Boolean	true	Indicates whether release protection is enabled for the instance. Valid values: • **true**: Release protection is enabled. • **false**: Release protection is disabled.
DBInstanceStatus	String	Running	The status of the instance. For more information, see **Instance types** in *ApsaraDB for MongoDB Product Introduction*.

Parameter	Type	Example	Description
DBInstanceStorage	Integer	10	The storage capacity of the instance.
DBInstanceType	String	replicate	The architecture type of the instance. • **replicate**: replica set instance • **sharding**: sharded cluster instance
Engine	String	MongoDB	The database engine of the instance.
EngineVersion	String	3.4	The version of the database engine.
ExpireTime	String	2019-04-08T16:00Z	The time when the subscription instance expires. The time is in the *yyyy-MM-ddTHH:mmZ* format. The time is displayed in UTC. **Note** This parameter is returned if the instance billing method is subscription.
KindCode	String	1	The kind code of the instance. Valid values: • **0**: physical machine • **1**: Elastic Compute Service (ECS) • **2**: Docker cluster • **18**: Kubernetes cluster
LastDowngradeTime	String	2019-03-08	The last time when the instance was downgraded.

Parameter	Type	Example	Description
LockMode	String	Unlock	Indicates whether the instance is locked. Valid values: • **Unlock**: The instance is not locked. • **ManualLock**: The instance has been manually locked. • **LockByExpiration**: The instance has been locked upon expiration. • **LockByRestoration:** The instance has been locked for a rollback. • **LockByDiskQuota:** The instance has been automatically locked because its storage space is exhausted. • **Released:** The instance has been released. You cannot unlock a released instance. After an instance is released, you can only use a backup to restore the data of the instance to a new instance. This process requires a long time.
MaintainEndTime	String	03:00Z	The end time of the maintenance window. The time is in the *HH:mm*Z format. The time is displayed in UTC.
MaintainStartTime	String	02:00Z	The start time of the maintenance window. The time is in the *HH:mm*Z format. The time is displayed in UTC.
MaxConnections	Integer	500	The maximum number of connections of the instance.
MaxIOPS	Integer	1000	The maximum IOPS of the instance.
MongosList	Array of MongosAttribute		An array that consists of the information of mongos nodes. **Note** This parameter is returned if the instance type is sharded cluster.
MongosAttribute			
ConnectSting	String	s-bpxxxxxxxx.mongodb.rds.aliyuncs.com	The endpoint of the mongos node.

Parameter	Type	Example	Description
MaxConnections	Integer	1000	The maximum number of connections of the mongos node.
MaxIOPS	Integer	0	The maximum IOPS of the mongos node.
NodeClass	String	dds.mongos.mid	The specifications of the mongos node.
NodeDescription	String	mongos1	The name of the mongos node.
NodeId	String	s-bpxxxxxxxx	The ID of the mongos node.
Port	Integer	3717	The port of the mongos node.
VPCId	String	vpc-bp1xxxxxxxxxxxxxxxxxx	The VPC ID of the mongos node.
VSwitchId	String	vsw-bp1xxxxxxxxxxxxxxxxxx	The vSwitch ID of the mongos node.
VpcCloudInstanceId	String	s-bp1xxxxxxxxxxxx	The ID of the VPC instance for the mongos ID.
NetworkType	String	VPC	The network type of the instance. Valid values: • **Classic** • **VPC**
ProtocolType	String	mongodb	The access protocol type of the instance. Valid values: • **mongodb**: the MongoDB protocol • **dynamodb**: the DynamoDB protocol
ReadonlyReplicas	String	0	The number of read-only nodes in the instance.
RegionId	String	cn-hangzhou	The region ID of the instance.

Parameter	Type	Example	Description
ReplacateId	String	bls-mxxxxxxxx	The BLS channel ID of the instance.
ReplicaSetName	String	mgset-10xxxxxxxx	The name of the replica set instance. **Note** This parameter is returned if the instance type is replica set.
ReplicaSets	Array of ReplicaSet		The information list of the replica set. **Note** This parameter is returned if the instance type is replica set.
ReplicaSet			
ConnectionDomain	String	dds-bpxxxxxxxx.mongodb.rds.aliyuncs.com	The endpoint of the node.
ConnectionPort	String	ConnectionPort	The port of the node.
NetworkType	String	VPC	The network type of the node. Valid values: • **Classic** • **VPC**
ReplicaSetRole	String	Primary	The role of the node. • **Primary** • **Secondary**
VPCCloudInstanceId	String	vpc-xxxxxxxx	The ID of the VPC instance for the node.
VPCId	String	vpc-bpxxxxxxxx	The VPC ID of the node.
VSwitchId	String	vsw-bpxxxxxxxx	The vSwitch ID of the node.
ReplicationFactor	String	3	The number of nodes in the instance. **Note** This parameter is returned if the instance type is replica set.

Parameter	Type	Example	Description
ResourceGroupId	String	rg-axxxxxxxx	The ID of the resource group to which the instance belongs.
ShardList	Array of ShardAttribute		An array that consists of the information of shard nodes. **Note** This parameter is returned if the instance type is sharded cluster.
ShardAttribute			
ConnectString	String	d-bpxxxxxxxxxxxxxxxxx.mongodb.rds.aliyuncs.com	The endpoint of the shard node.
MaxConnections	Integer	8000	The maximum number of connections of the shard node.
MaxIOPS	Integer	8000	The maximum IOPS of the shard node.
NodeClass	String	dds.shard.mid	The specifications of the shard node.
NodeDescription	String	testshard	The name of the shard node.
NodeId	String	d-bpxxxxxxxx	The ID of the shard node.
NodeStorage	Integer	10	The storage capacity of the shard node.
Port	Integer	3717	The port of the shard node.
StorageEngine	String	WiredTiger	The storage engine of the instance.
Tags	Array of Tag		An array that consists of the information of instance tags.
Tag			
Key	String	test	The key of the instance tag.

Parameter	Type	Example	Description
Value	String	api	The value of the instance tag.
VPCCloudInstanceIds	String	s-bp1xxxxxxxxxxxx	The ID of the VPC instance for the instance.
VPCId	String	vpc-bpxxxxxxxx	The ID of the VPC.
VSwitchId	String	vsw-bpxxxxxxxx	The ID of the vSwitch in the specified VPC.
VpcAuthMode	String	Open	Indicates whether password-free access within the VPC is enabled. Valid values: • **Open**: Password-free access is enabled. • **Close**: Password-free access is disabled. • **NotSupport**: Password-free access is not supported.
ZoneId	String	cn-hangzhou-b	The zone ID of the instance.

Examples

12.1.3.5.6. DescribeRoleZoneInfo

You can call this operation to view the roles and zones of nodes in an ApsaraDB for MongoDB instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeRoleZoneInfo	The operation that you want to perform. Set the value to **DescribeRoleZoneInfo**.
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance.

Response parameters

Parameter	Type	Example	Description
RequestId	String	728B9A96-E262-4AE5-915E-3A51CCE2FDA9	The ID of the request.
ZoneInfos	Array of ZoneInfo		An array that consists of information of nodes in the zone.
ZoneInfo			
InsName	String	dds-bpxxxxxxxx	The ID of the node.

Parameter	Type	Example	Description
NodeType	String	normal	The type of the node. Valid values: • **normal** • **configServer** • **shard** • **mongos** **Note** Valid value for replica set instances: **normal**. Valid values for sharded cluster instances: **configServer**, **shard**, and **mongos**.
RoleId	String	83xxxxx	The ID of the role.
RoleType	String	Primary	The role of the node. Valid values: • **Primary** • **Secondary** • **Hidden**
ZoneId	String	cn-hangzhou-e	The zone ID.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=DescribeRoleZoneInfo
&DBInstanceId=dds-bpxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeRoleZoneInfoResponse>
   <ZoneInfos>
      <ZoneInfo>
         <RoleType>Primary</RoleType>
         <NodeType>normal</NodeType>
         <InsName>dds-bpxxxxxxxx</InsName>
         <ZoneId>cn-hangzhou-e</ZoneId>
         <RoleId>83xxxxx</RoleId>
      </ZoneInfo>
      <ZoneInfo>
         <RoleType>Secondary</RoleType>
         <NodeType>normal</NodeType>
         <InsName>dds-bpxxxxxxxx</InsName>
         <ZoneId>cn-hangzhou-f</ZoneId>
         <RoleId>83xxxxx</RoleId>
      </ZoneInfo>
      <ZoneInfo>
         <RoleType>Hidden</RoleType>
         <NodeType>normal</NodeType>
         <InsName>dds-bpxxxxxxxx</InsName>
         <ZoneId>cn-hangzhou-b</ZoneId>
         <RoleId>83xxxxx</RoleId>
      </ZoneInfo>
   </ZoneInfos>
   <RequestId>728B9A96-E262-4AE5-915E-3A51CCE2FDA9</RequestId>
</DescribeRoleZoneInfoResponse>
```

`JSON` format

```

}
```

12.1.3.6. Instance management

12.1.3.6.1. RestartDBInstance

You can call this operation to restart an ApsaraDB for MongoDB instance.

This operation can also be used to restart a shard or mongos node in a replica set instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	RestartDBInstance	The operation that you want to perform. Set the value to **RestartDBInstance**.
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance.

Parameter	Type	Required	Example	Description
NodeId	String	No	d-bpxxxxxxxx	The ID of the shard or mongos node in the sharded cluster instance. **Note** The sharded cluster instance will be restarted if this parameter is not specified.

Response parameters

Parameter	Type	Example	Description
RequestId	String	149C517D-B586-47BE-A107-8673E0ED77C6	The ID of the request.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=RestartDBInstance
&DBInstanceId=dds-bpxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<RestartDBInstanceResponse>
   <RequestId>149C517D-B586-47BE-A107-8673E0ED77C6</RequestId>
</RestartDBInstanceResponse>
```

`JSON` format

```
{
 "RequestId": "149C517D-B586-47BE-A107-8673E0ED77C6"
}
```

12.1.3.6.2. ModifyDBInstanceMaintainTime

You can call this operation to modify the maintenance window of an ApsaraDB for MongoDB instance.

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyDBInstanceMaintainTime	The operation that you want to perform. Set the value to **ModifyDBInstanceMaintainTime**.
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance.
MaintainEndTime	String	Yes	02:00Z	The end time of the maintenance window. Specify the time in the *HH:mmZ* format. The time must be in UTC. **Note** The difference between the start time and end time must be one hour. For example, if **MaintainStartTime** is **01:00Z**, **MaintainEndTime** must be **02:00Z**.
MaintainStartTime	String	Yes	01:00Z	The start time of the maintenance window. Specify the time in the *HH:mmZ* format. The time must be in UTC.

Response parameters

Parameter	Type	Example	Description
RequestId	String	A9310426-C763-42A2-A3AD-70A8DA204531	The ID of the request.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=ModifyDBInstanceMaintainTime
&MaintainStartTime=01:00Z
&MaintainEndTime=02:00Z
&DBInstanceId=dds-bpxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyDBInstanceMaintainTimeResponse>
   <RequestId>A9310426-C763-42A2-A3AD-70A8DA204531</RequestId>
</ModifyDBInstanceMaintainTimeResponse>
```

`JSON` format

```
{
 "RequestId": "A9310426-C763-42A2-A3AD-70A8DA204531"
}
```

12.1.3.6.3. ModifyDBInstanceDescription

You can call this operation to change the name of an ApsaraDB for MongoDB instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyDBInstanceDescription	The operation that you want to perform. Set the value to **ModifyDBInstanceDescription**.
DBInstanceDescription	String	Yes	testdata	The name of the instance. **Note** • The name cannot start with http:// or https://. • The name must start with a letter. • It can contain letters, underscores (_), hyphens (-), and digits. It must be 2 to 256 characters in length.

Parameter	Type	Required	Example	Description
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance. **Note** If you want to modify the name of a shard or mongos node in a sharded cluster instance, you must also specify the **NodeId** parameter.
NodeId	String	No	d-bpxxxxxxxx	The ID of the shard or mongos node in the sharded cluster instance. **Note** This parameter is valid only if you set the **DBInstanceId** parameter to the ID of a sharded cluster instance.

Response parameters

Parameter	Type	Example	Description
RequestId	String	06F8F642-4009-4FFC-80C4-9D67DBF7B74E	The ID of the request.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=ModifyDBInstanceDescription
&DBInstanceDescription=testdata
&DBInstanceId=dds-bpxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyDBInstanceDescriptionResponse>
   <RequestId>06F8F642-4009-4FFC-80C4-9D67DBF7B74E</RequestId>
</ModifyDBInstanceDescriptionResponse>
```

`JSON` format

```
{
 "RequestId": "06F8F642-4009-4FFC-80C4-9D67DBF7B74E"
}
```

12.1.3.6.4. SwitchDBInstanceHA

You can call this operation to switch between the primary and secondary nodes in an ApsaraDB for MongoDB instance.

The instance must be in the running state when you call this operation.

> **Note** On replica set instances, the switch is performed between primary and secondary instances. On sharded cluster instances, the switch is performed between primary and secondary shard nodes.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	SwitchDBInstanceHA	The operation that you want to perform. Set the value to **SwitchDBInstanceHA**.
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance.
NodeId	String	No	d-bpxxxxxxxx	The ID of the shard node in the sharded cluster instance. **Note** If you set the **DBInstanceId** parameter to the ID of a sharded cluster instance, you must specify this parameter.

Parameter	Type	Required	Example	Description
RoleIds	String	No	972xxxx,972xxxx	The IDs of the roles that you want to switch. You can call the **DescribeRoleZoneInfo** operation to view the IDs and information of roles of nodes. **Note** • Separate role IDs with commas (,). If this parameter is not specified, the primary and secondary nodes are switched. • If you set the **DBInstanceId** parameter to the ID of a sharded cluster instance, the roles to be switched must belong to one shard node.
SwitchMode	Integer	No	0	The time when roles of the primary and secondary nodes are switched. Valid values: • **0**: The roles are switched immediately. • **1**: The roles are switched during the maintenance period.

Response parameters

Parameter	Type	Example	Description
RequestId	String	26BD4E5F-BDB4-47BA-B232-413AA78CFA8F	The ID of the request.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=SwitchDBInstanceHA
&DBInstanceId=dds-bpxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<SwitchDBInstanceHAResponse>
   <RequestId>26BD4E5F-BDB4-47BA-B232-413AA78CFA8F</RequestId>
</SwitchDBInstanceHAResponse>
```

`JSON` format

```
{
 "RequestId": "26BD4E5F-BDB4-47BA-B232-413AA78CFA8F"
}
```

12.1.3.6.5. UpgradeDBInstanceEngineVersion

You can call this operation to upgrade the database version of an ApsaraDB for MongoDB instance.

The instance must be in the running state when you call this operation.

> **Note**
>
> - The available database versions are subject to the storage engine used by the instance. You can call the **DescribeAvailableEngineVersion** operation to view the available database versions.
> - The database version cannot be downgraded after it is upgraded.
> - The instance is automatically restarted for two to three times during the upgrade process. Make sure that you upgrade the instance during off-peak hours.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	UpgradeDBInstanceEngineVersion	The operation that you want to perform. Set the value to **UpgradeDBInstanceEngineVersion**.

Parameter	Type	Required	Example	Description
EngineVersion	String	Yes	4.2	The new database engine version of the instance. Valid values: **3.4**, **4.0**, and **4.2**. **Note** The new database engine version must be later than the current version.
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance.

Response parameters

Parameter	Type	Example	Description
RequestId	String	C4907B00-A208-4E0C-A636-AA85140E406C	The ID of the request.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=UpgradeDBInstanceEngineVersion
&EngineVersion=4.0
&DBInstanceId=dds-bpxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<UpgradeDBInstanceEngineVersionResponse>
   <RequestId>C4907B00-A208-4E0C-A636-AA85140E406C</RequestId>
</UpgradeDBInstanceEngineVersionResponse>
```

`JSON` format

```
{
 "RequestId": "C4907B00-A208-4E0C-A636-AA85140E406C"
}
```

12.1.3.6.6. UpgradeDBInstanceKernelVersion

You can call this operation to upgrade the minor database version of an ApsaraDB for MongoDB instance.

The instance must be in the running state when you call this operation.

> **Note** The instance will be restarted once during the upgrade. Perform this operation during off-peak hours.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	UpgradeDBInstanceKernelVersion	The operation that you want to perform. Set the value to **UpgradeDBInstanceKernelVersion**.
DBInstanceId	String	No	dds-bpxxxxxxxx	The ID of the instance.

Response parameters

Parameter	Type	Example	Description
RequestId	String	27B9A130-7C4B-40D9-84E8-2FC081097AAC	The ID of the request.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=UpgradeDBInstanceKernelVersion
&DBInstanceId=dds-bpxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<UpgradeDBInstanceKernelVersionResponse>
   <RequestId>27B9A130-7C4B-40D9-84E8-2FC081097AAC</RequestId>
</UpgradeDBInstanceKernelVersionResponse>
```

`JSON` format

```
{
 "RequestId": "27B9A130-7C4B-40D9-84E8-2FC081097AAC"
}
```

12.1.3.6.7. ModifyDBInstanceNetExpireTime

You can call this operation to extend the retention period of the classic network of an ApsaraDB for MongoDB instance.

Before you call this operation, make sure that the following requirements are met:

- The instance must be running.
- The network of the instance is in hybrid access mode.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyDBInstanceNetExpireTime	The operation that you want to perform. Set the value to **ModifyDBInstanceNetExpireTime**.
ClassicExpendExpiredDays	Integer	Yes	30	The retention period of the original classic network address. Valid values: **14**, **30**, **60**, and **120**. Unit: day.
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance.
ConnectionString	String	No	dds-bpxxxxxxxx.mongodb.rds.aliyuncs.com	The connection address of the instance

Response parameters

Parameter	Type	Example	Description
RequestId	String	459E7D5C-38DA-4E14-9C82-5B5AF693DBAB	The ID of the request.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=ModifyDBInstanceNetExpireTime
&ClassicExpendExpiredDays=30
&DBInstanceId=dds-bpxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyDBInstanceNetExpireTimeResponse>
   <RequestId>459E7D5C-38DA-4E14-9C82-5B5AF693DBAB</RequestId>
</ModifyDBInstanceNetExpireTimeResponse>
```

`JSON` format

```
{
 "RequestId": "459E7D5C-38DA-4E14-9C82-5B5AF693DBAB"
}
```

12.1.3.7. Account management

12.1.3.7.1. DescribeAccounts

You can call this operation to view the information of the database account of an ApsaraDB for MongoDB instance.

> **Note** This operation can display only the information of the root account.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeAccounts	The operation that you want to perform. Set the value to **DescribeAccounts**.
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance.
AccountName	String	No	root	The name of the account. Set the value to **root**.

Response parameters

Parameter	Type	Example	Description
Accounts	Array of Account		An array that consists of the information of accounts.
Account			
AccountDescription	String	Administrator	The description of the account.
AccountName	String	root	The name of the account.

Parameter	Type	Example	Description
AccountStatus	String	Available	The status of the account. • Unavailable • Available
CharacterType	String	normal	The role of the account. Valid values: • **db**: the shard node • **cs**: the Configserver node • **mongos**: the mongos node • **logic**: the sharded cluster instance • **normal**: the replica set instance
DBInstanceId	String	dds-bpxxxxxxxx	The name of the instance to which the account belongs.
RequestId	String	B562A65B-39AB-4EE8-8635-5A222054FB35	The ID of the request.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=DescribeAccounts
&DBInstanceId=dds-bpxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeAccountsResponse>
   <Accounts>
      <Account>
         <AccountStatus>Available</AccountStatus>
         <AccountDescription>Administrator</AccountDescription>
         <DBInstanceId>dds-bpxxxxxxxx</DBInstanceId>
         <AccountName>root</AccountName>
      </Account>
   </Accounts>
   <RequestId>A806B0FC-CFCC-48D8-8AEC-34C892806B40</RequestId>
</DescribeAccountsResponse>
```

`JSON` format

```
{
    "Accounts": {
        "Account": [
            {
                "AccountStatus": "Available",
                "AccountDescription": "Administrator",
                "DBInstanceId": "dds-bpxxxxxxxx",
                "AccountName": "root"
            }
        ]
    },
    "RequestId": "A806B0FC-CFCC-48D8-8AEC-34C892806B40"
}
```

12.1.3.7.2. ResetAccountPassword

You can call this operation to reset the password of the root account of an ApsaraDB for MongoDB instance.

Note This operation can reset only the password of the root account of an instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ResetAccountPassword	The operation that you want to perform. Set the value to **ResetAccountPassword**.
AccountName	String	Yes	root	The account for which you want to reset the password. Set the value to **root**.
AccountPassword	String	Yes	Ali! 123456	The new password. • The password must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. Special characters include `! # $ % ^ & * ( ) _ + - = #$%^&*()_+-=` • The password must be 8 to 32 characters in length.
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance.

Response parameters

Parameter	Type	Example	Description
RequestId	String	06CBD06E-ABC9-4121-AB93-3C3820B3E7E6	The ID of the request.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=ResetAccountPassword
&AccountName=root
&AccountPassword=Ali! 123456
&DBInstanceId=dds-bpxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ResetAccountPasswordResponse>
   <RequestId>06CBD06E-ABC9-4121-AB93-3C3820B3E7E6</RequestId>
</ResetAccountPasswordResponse>
```

`JSON` format

```
{
 "RequestId": "06CBD06E-ABC9-4121-AB93-3C3820B3E7E6"
}
```

12.1.3.7.3. ModifyAccountDescription

You can call this operation to modify the description of the root account of an ApsaraDB for MongoDB instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyAccountDescription	The operation that you want to perform. Set the value to **ModifyAccountDescription**.

Parameter	Type	Required	Example	Description
AccountDescription	String	Yes	superadmin	The description of the account. • It cannot start with http:// or https://. • The description must start with a letter. • It must be 2 to 256 characters in length and can contain letters, digits, underscores (_), and hyphens (-).
AccountName	String	Yes	root	The name of the account for which you want to modify the description.
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance.

Response parameters

Parameter	Type	Example	Description
RequestId	String	59DE9FC2-7B40-45CF-9011-7327A8A771A2	The ID of the request.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=ModifyAccountDescription
&AccountName=root
&AccountDescription=superadmin
&DBInstanceId=dds-bpxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<RestoreDBInstanceResponse>
   <RequestId>59DE9FC2-7B40-45CF-9011-7327A8A771A2</RequestId>
</RestoreDBInstanceResponse>
```

`JSON` format

```
{
 "RequestId": "59DE9FC2-7B40-45CF-9011-7327A8A771A2"
}
```

12.1.3.8. IP whitelists and security groups

12.1.3.8.1. DescribeSecurityGroupConfiguration

You can call this operation to view ECS security groups to which an ApsaraDB for MongoDB instance is added.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeSecurityGroupConfiguration	The operation that you want to perform. Set the value to **DescribeSecurityGroupConfiguration**.
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance.

Response parameters

Parameter	Type	Example	Description
Items	Array of RdsEcsSecurityGroupRel		The information list of the ECS security group.
RdsEcsSecurityGroupRel			
NetType	String	vpc	The network type of the ECS security group. Valid values: • **vpc** • **classic**
RegionId	String	cn-hangzhou	The region ID of the ECS security group.
SecurityGroupId	String	sg-bpxxxxxxxx	The ID of the ECS security group.
RequestId	String	3C4A2494-85C4-45C5-93CF-548DB3375193	The ID of the request.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=DescribeSecurityGroupConfiguration
&DBInstanceId=dds-bpxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<Items>
    <RdsEcsSecurityGroupRel>
        <SecurityGroupId>sg-bpxxxxxxxx</SecurityGroupId>
        <RegionId>cn-hangzhou</RegionId>
        <NetType>classic</NetType>
    </RdsEcsSecurityGroupRel>
</Items>
<RequestId>D18F5B88-ACA6-470E-9493-384412EDD902</RequestId>
```

`JSON` format

```
{
 "Items": {
  "RdsEcsSecurityGroupRel": [
   {
    "SecurityGroupId": "sg-bpxxxxxxxx",
    "RegionId": "cn-hangzhou",
    "NetType": "classic"
   }
  ]
 },
 "RequestId": "D18F5B88-ACA6-470E-9493-384412EDD902"
}
```

12.1.3.8.2. ModifySecurityGroupConfiguration

You can call this operation to modify the ECS Security group that is bound to an ApsaraDB for MongoDB instance.

Note For a sharded cluster instance, the bound ECS security group takes effect only for the mongos node.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifySecurityGroupConfiguration	The operation that you want to perform. Set the value to**ModifySecurityGroupConfiguration**.

Parameter	Type	Required	Example	Description
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance.
SecurityGroupId	String	Yes	sg-bpxxxxxxxx	The ID of the ECS security group. **Note** • Only one ECS Security Group can be bound to an instance. • You can view the security groups in the specified region by calling the**DescribeSecurityGroup** operation of ECS.

Response parameters

Parameter	Type	Example	Description
RequestId	String	E062C482-1A4B-469E-938C-96D28CFAE42E	The ID of the request.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=ModifySecurityGroupConfiguration
&DBInstanceId=dds-bpxxxxxxxx
&SecurityGroupId=sg-bpxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<RequestId>E062C482-1A4B-469E-938C-96D28CFAE42E</RequestId>
```

`JSON` format

```
{
    "RequestId": "E062C482-1A4B-469E-938C-96D28CFAE42E"
}
```

12.1.3.8.3. DescribeSecurityIps

You can call this operation to view the IP whitelist of an ApsaraDB for MongoDB instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeSecurityIps	The operation that you want to perform. Set the value to **DescribeSecurityIps**.
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance.

Response parameters

Parameter	Type	Example	Description
SecurityIpGroups	Array of SecurityIpGroup		An array that consists of the information of IP whitelists.
SecurityIpGroup			
SecurityIpGroupAttribute	String	hidden	The attribute of the IP whitelist. This parameter is empty by default.
SecurityIpGroupName	String	default	The name of the whitelist.
SecurityIpList	String	47.xxx.xxx.xx,100.xxx.xxx.0/24	The IP addresses in the whitelist.
SecurityIps	String	47.xxx.xxx.xx,100.xxx.xxx.0/24	The IP addresses in the default whitelist.
RequestId	String	FC724D23-2962-479E-ABB1-606C935AE7FD	The ID of the request.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=DescribeSecurityIps
&DBInstanceId=dds-bpxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeSecurityIpsResponse>
   <SecurityIpGroups>
      <SecurityIpGroup>
         <SecurityIpList>114.xxx.xxx.xx</SecurityIpList>
         <SecurityIpGroupAttribute></SecurityIpGroupAttribute>
         <SecurityIpGroupName>allowserver</SecurityIpGroupName>
      </SecurityIpGroup>
      <SecurityIpGroup>
         <SecurityIpList>47.xxx.xxx.xx,100.xxx.xxx.0/24</SecurityIpList>
         <SecurityIpGroupAttribute></SecurityIpGroupAttribute>
         <SecurityIpGroupName>default</SecurityIpGroupName>
      </SecurityIpGroup>
   </SecurityIpGroups>
   <SecurityIps>47.xxx.xxx.xx,100.xxx.xxx.0/24</SecurityIps>
   <RequestId>FC724D23-2962-479E-ABB1-606C935AE7FD</RequestId>
</DescribeSecurityIpsResponse>
```

`JSON` format

```
{
 "SecurityIpGroups": {
  "SecurityIpGroup": [
   {
    "SecurityIpList": "114.xxx.xxx.xx",
    "SecurityIpGroupAttribute": "",
    "SecurityIpGroupName": "allowserver"
   },
   {
    "SecurityIpList": "47.xxx.xxx.xx,100.xxx.xxx.0/24",
    "SecurityIpGroupAttribute": "",
    "SecurityIpGroupName": "default"
   }
  ]
 },
 "SecurityIps": "47.xxx.xxx.xx,100.xxx.xxx.0/24",
 "RequestId": "FC724D23-2962-479E-ABB1-606C935AE7FD"
}
```

12.1.3.8.4. ModifySecurityIps

You can call this operation to modify the IP whitelist of an ApsaraDB for MongoDB instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifySecurityIps	The operation that you want to perform. Set the value to **ModifySecurityIps**.
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance.
SecurityIps	String	Yes	10.23.12.24/24,10.22.22.22	The IP addresses in an IP whitelist. Separate multiple IP addresses with commas (,). You can add a maximum of 1,000 different IP addresses to a whitelist. You can add IP addresses in one of the following two formats: • IP addresses. Example: 10.23.12.24. • Classless Inter-Domain Routing (CIDR) blocks, such as 10.23.12.24/24. /24 indicates the length of the IP address prefix in the CIDR block. An IP address prefix can contain 1 to 32 bits.
ModifyMode	String	No	Append	The method of modification. Valid values: • **Cover**: overwrites the whitelist. • **Append**: appends data to the whitelist. • **Delete**: deletes the whitelist. The default value is **Cover**.
SecurityIpGroupName	String	No	allowserver	The name of the IP whitelist to be modified. The default value is **default**.
SecurityIpGroupAttribute	String	No	test	The attributes of an IP whitelist. It can contain a maximum of 120 characters in length and can contain uppercase letters, lowercase letters, and digits. This parameter is empty by default.

Response parameters

Parameter	Type	Example	Description

Parameter	Type	Example	Description
RequestId	String	61B05CCF-EBAB-4BF3-BA67-D77256A721E2	The ID of the request.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=ModifySecurityIps
&SecurityIps=10.23.12.24/24,10.22.22.22
&DBInstanceId=dds-bpxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifySecurityIpsResponse>
   <RequestId>61B05CCF-EBAB-4BF3-BA67-D77256A721E2</RequestId>
</ModifySecurityIpsResponse>
```

`JSON` format

```
{
 "RequestId": "61B05CCF-EBAB-4BF3-BA67-D77256A721E2"
}
```

12.1.3.9. Key management

12.1.3.9.1. DescribeDBInstanceTDEInfo

You can call this operation to view whether TDE is enabled for an ApsaraDB for MongoDB instance.

Before you call this operation, make sure that the following requirements are met:

- A replica set or sharded cluster instance is used.
- The storage engine of the instance is WiredTiger.
- The database engine version of the instance is 4.0 or 4.2. If the database engine version of your instance is earlier than 4.0, you can call the **UpgradeDBInstanceEngineVersion** operation to upgrade the database engine.

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeDBInstanceTDEInfo	The operation that you want to perform. Set the value to **DescribeDBInstanceTDEInfo**.
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance.

Response parameters

Parameter	Type	Example	Description
RequestId	String	F4DD0E29-361B-42F2-9301-B0048CCCE5D6	The ID of the request.
TDEStatus	String	enabled	The TDE status. Valid values: • **enabled** • **disabled**

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=DescribeDBInstanceTDEInfo
&DBInstanceId=dds-bpxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<TDEStatus>enabled</TDEStatus>
<RequestId>F4DD0E29-361B-42F2-9301-B0048CCCE5D6</RequestId>
```

`JSON` format

```
{
    "TDEStatus":"enabled",
    "RequestId":"F4DD0E29-361B-42F2-9301-B0048CCCE5D6"
}
```

12.1.3.9.2. ModifyDBInstanceTDE

You can call this operation to modify the transparent data encryption (TDE) status of an ApsaraDB for MongoDB instance.

Before data files are written to disks, transparent data encryption (TDE) encrypts the data files. When data files are loaded from disks to the memory, TDE decrypts the data files.

> **Note** After TDE is enabled, it cannot be disabled.

Before you call this operation, make sure that the following requirements are met:

- A replica set or sharded cluster instance is used.
- The storage engine of the instance is WiredTiger.
- The database engine version of the instance is 4.0 or 4.2. If the database engine version is earlier than 4.0, you can call the **UpgradeDBInstanceEngineVersion** operation to upgrade the database engine.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyDBInstanceTDE	The operation that you want to perform. Set the value to **ModifyDBInstanceTDE**.
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance.
TDEStatus	String	Yes	enabled	The TDE status. Set the value to **Enabled**. **Note** After TDE is enabled, it cannot be disabled. Proceed with caution.
EncryptorName	String	No	aes-256-cbc	The encryption method. Set the value to **aes-256-cbc**. **Note** This parameter is valid only when you set the **TEDStatus** parameter to **enabled**.
EncryptionKey	String	No	749c1df7-xxxx-xxxx-xxxx-xxxxxxxxxxx	The custom key.

Parameter	Type	Required	Example	Description
RoleARN	String	No	acs:ram::123456789012****:role/adminrole	The ARN of the role. It is in the format of `acs:ram::$accountID:role/$roleName`. **Note** • `$accountID`: indicates the ID of the Alibaba Cloud account that owns the RAM role. To view the account ID, log on to the Alibaba Cloud Management Console, move your pointer over your profile picture in the upper-right corner, and then click Security Settings. • `$roleName`: indicates the name of the RAM role. To view the RAM role name, perform the following steps: Log on to the RAM console. In the left-side navigation pane, click RAM Roles. In the RAM Role Name column on the page that appears, you can view the name of the RAM role.

Response parameters

Parameter	Type	Example	Description
RequestId	String	434D7127-6229-4355-BA50-7A3685A725DF	The ID of the request.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=ModifyDBInstanceTDE
&DBInstanceId=dds-bpxxxxxxxx
&TDEStatus=enabled
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyDBInstanceTDEResponse>
   <RequestId>434D7127-6229-4355-BA50-7A3685A725DF</RequestId>
</ModifyDBInstanceTDEResponse>
```

`JSON` format

```
{
 "RequestId": "434D7127-6229-4355-BA50-7A3685A725DF"
}
```

Error codes

HttpCode	Error code	Error message	Description
403	IncorrectDBInstanceState	Current DB instance state does not support this operation.	The error message returned because the operation is not supported while the instance is in its current state. Check whether the specified parameters are correct.
403	IncorrectDBInstanceLockMode	Current DB instance lock mode does not support this operation.	The error message returned because the instance is locked.

12.1.3.10. SSL encryption

12.1.3.10.1. ModifyDBInstanceSSL

You can call this operation to modify the SSL settings of an ApsaraDB for MongoDB instance.

Before you call this operation, make sure that the following requirements are met:

- The instance is in the running state.
- A replica set instance is used.
- The database engine version of the instance is 3.4, 4.0, or 4.2.

Note Whenever you enable or disable SSL encryption, or update the SSL certificate, the instance will restart. We recommend that you call this operation during off-peak hours.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyDBInstanceSSL	The operation that you want to perform. Set the value to **DescribeDBInstanceSSL**.
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance.

Parameter	Type	Required	Example	Description
SSLAction	String	Yes	Open	The operation that you perform for the SSL feature. Valid values: • **Open**: enables SSL encryption. • **Close**: disables SSL encryption. • **Update**: updates the SSL certificate.

Response parameters

Parameter	Type	Example	Description
RequestId	String	6D806B11-078F-4154-BF9F-844F56D08964	The ID of the request.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=ModifyDBInstanceSSL
&DBInstanceId=dds-bpxxxxxxxx
&SSLAction=Open
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyDBInstanceSSLResponse>
   <RequestId>6D806B11-078F-4154-BF9F-844F56D08964</RequestId>
</ModifyDBInstanceSSLResponse>
```

`JSON` format

```
{
 "RequestId": "6D806B11-078F-4154-BF9F-844F56D08964"
}
```

Error codes

HttpCode	Error code	Error message	Description

HttpCode	Error code	Error message	Description
403	IncorrectDBInstanceState	Current DB instance state does not support this operation.	The error message returned because the operation is not supported while the instance is in its current state. Check whether the specified parameters are correct.
403	IncorrectDBInstanceLockMode	Current DB instance lock mode does not support this operation.	The error message returned because the instance is locked.

12.1.3.10.2. DescribeDBInstanceSSL

You can call this operation to view the SSL settings of an ApsaraDB for MongoDB instance.

Before you call this operation, make sure that the following requirements are met:

- The primary instance must be in the Running state.
- A replica set instance is used.
- The database engine version of the instance is 3.4, 4.0, or 4.2.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeDBInstanceSSL	The operation that you want to perform. Set the value to **DescribeDBInstanceSSL**.
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance.

Response parameters

Parameter	Type	Example	Description
SSLExpiredTime	String	2020-03-11T02:28:25Z	The time when the SSL certificate expires. The time is in the *yyyy-MM-dd*T*HH:mm:ss*Z format. The time is displayed in UTC.
RequestId	String	36BB1BC2-789C-4BBA-A519-C5B388E4B0D4	The ID of the request.
SSLStatus	String	Open	The status of the SSL feature. Valid values: • **Open**: The SSL feature is enabled. • **Closed**: The SSL feature is disabled.

Parameter	Type	Example	Description
CertCommonName	String	dds-bpxxxxxxxx.mongodb.rds.example.com	The name of the SSL certificate.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=DescribeDBInstanceSSL
&DBInstanceId=dds-bpxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeDBInstanceSSLResponse>
   <SSLExpiredTime>2020-03-11T02:28:25Z</SSLExpiredTime>
   <RequestId>36BB1BC2-789C-4BBA-A519-C5B388E4B0D4</RequestId>
   <SSLStatus>Open</SSLStatus>
   <CertCommonName>dds-bpxxxxxxxx.mongodb.rds.aliyuncs.com</CertCommonName>
</DescribeDBInstanceSSLResponse>
```

`JSON` format

```
{
    "SSLExpiredTime":"2020-03-11T02:28:25Z",
    "SSLStatus":"Open",
    "RequestId":"36BB1BC2-789C-4BBA-A519-C5B388E4B0D4",
    "CertCommonName":"dds-bpxxxxxxxx.mongodb.rds.example.com"
}
```

12.1.3.11. Audit logs

12.1.3.11.1. DescribeAuditRecords

You can call this operation to view the audit logs of ApsaraDB for MongoDB instances.

When you call this operation, ensure that the audit log feature of the instance is enabled. Otherwise, the operation returns an empty audit log.

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeAuditRecords	The operation that you want to perform. Set the value to **DescribeAuditRecords**.
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance. **Note** If you set this parameter to the ID of a sharded cluster instance, you must also specify the **NodeId** parameter.
EndTime	String	Yes	2019-03-13T13:11:14Z	The end of the time range to query. The end time must be later than the start time. Specify the time in the yyyy-MM-ddTHH:mm:ssZ format. The time must be in UTC.
StartTime	String	Yes	2019-03-13T12:11:14Z	The beginning of the time range to query. Specify the time in the yyyy-MM-ddTHH:mm:ssZ format. The time must be in UTC.
NodeId	String	No	d-bpxxxxxxxx	The ID of the mongos or shard node in the sharded cluster instance. **Note** This parameter is valid only if you set the **DBInstanceId** parameter to the ID of a sharded cluster instance.
Database	String	No	testdatabase	The name of the database. If you do not specify this parameter, this operation returns audit logs of all databases.
User	String	No	root	The account of the database. If you do not specify this parameter, this operation returns audit logs of all accounts.

Parameter	Type	Required	Example	Description
Form	String	No	Stream	The form of the audit log entry returend. Valid values: • **File**: returns a log file. If this parameter is set to File, only common parameters are returned. In this case, you must call the **DescribeAuditFiles** operation to view the download URL of the log file. • **Stream**: returns data streams. Default value: **Stream**.
QueryKeywords	String	No	slow	The keywords used for a query. Separate multiple keywords with spaces. You can specify a maximum of 10 keywords.
PageSize	Integer	No	30	The number of entries to return on each page. Valid values: **30**, **50**, and **100**. Default value: **30**.
PageNumber	Integer	No	1	The number of the page to return. The value must be a positive integer. Default value: **1**.
OrderType	String	No	asc	The order of time in which the log entries to return are sorted. Valid values: • **asc**: The log entries are sorted by time in ascending order. • **desc**: The log entries are sorted by time in descending order.

Response parameters

Parameter	Type	Example	Description
Items	Array of SQLRecord		An array that consists of the information of the audit log entries.
SQLRecord			
AccountName	String	root	The account of the database.

Parameter	Type	Example	Description
DBName	String	test123	The name of the database.
ExecuteTime	String	2019-03-11T03:30:27Z	The time when the statement was executed. The time is in the *yyyy-MM-dd*T*HH:mm:ss*Z format. The time is displayed in UTC.
HostAddress	String	11.xxx.xxx.xxx	The IP address of the client.
ReturnRowCounts	Long	2	The number of entries returned.
Syntax	String	{ \"atype\" : \"createCollection\" , \"param\" : { \"ns\" : \"123.test1\" }, \"result\": \"OK\" }	The statement that was executed.
TableName	String	C1	The name of the collection.
ThreadID	String	140682188297984	The ID of the thread.
TotalExecutionTimes	Long	700	The duration of the statement execution. Unit: microseconds.
PageNumber	Integer	1	The page number of the returned page.
PageRecordCount	Integer	30	The maximum number of records on the current page.
RequestId	String	3278BEB8-503B-4E46-8F7E-D26E040C9769	The ID of the request.
TotalRecordCount	Integer	40	The total number of entries.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=DescribeAuditRecords
&StartTime=2019-03-13T12:11:14Z
&EndTime=2019-03-13T13:11:14Z
&DBInstanceId=dds-bpxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<TotalRecordCount>40</TotalRecordCount>
<PageRecordCount>30</PageRecordCount>
<RequestId>3278BEB8-503B-4E46-8F7E-D26E040C9769</RequestId>
<PageNumber>1</PageNumber>
<Items>
    <TableName>C1</TableName>
    <ThreadID>140682188297984</ThreadID>
    <ExecuteTime>2019-03-11T03:30:27Z</ExecuteTime>
    <ReturnRowCounts>2</ReturnRowCounts>
    <DBName>test123</DBName>
    <TotalExecutionTimes>700</TotalExecutionTimes>
    <Syntax>{ \"atype\" : \"createCollection\", \"param\" : { \"ns\" : \"123.test1\" }, \"r
esult\": \"OK\" }</Syntax>
    <HostAddress>11.xxx.xxx.xxx</HostAddress>
    <AccountName>root</AccountName>
</Items>
```

`JSON` format

```
{
    "TotalRecordCount":"40",
    "PageRecordCount":"30",
    "RequestId":"3278BEB8-503B-4E46-8F7E-D26E040C9769",
    "PageNumber":"1",
    "Items":[
        {
            "TableName":"C1",
            "ThreadID":"140682188297984",
            "ExecuteTime":"2019-03-11T03:30:27Z",
            "ReturnRowCounts":"2",
            "DBName":"test123",
            "TotalExecutionTimes":"700",
            "Syntax":"{ \\\"atype\\\" : \\\"createCollection\\\", \\\"param\\\" : { \\\"ns\
\\" : \\\"123.test1\\\" }, \\\"result\\\": \\\"OK\\\" }",
            "HostAddress":"11.xxx.xxx.xxx",
            "AccountName":"root"
        }
    ]
}
```

Error codes

HttpCode	Error code	Error message	Description
400	InvalidEndTime.Format	Specified end time is not valid.	The error message returned when the end time is invalid. Check the format of the specified time.

12.1.3.11.2. DescribeAuditFiles

You can call this operation to view the audit log files of an ApsaraDB for MongoDB instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeAuditFiles	The operation that you want to perform. Set the value to **DescribeAuditFiles**.
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance.
NodeId	String	No	d-bpxxxxxxxx	The ID of the mongos or shard node in the specified cluster instance. **Note** If you do not specify this parameter, the audit logs of all mongos and shard nodes will be returned.
PageSize	Integer	No	30	The number of entries to return on each page. Valid values: **30**, **50**, and **100**. Default value: **30**.
PageNumber	Integer	No	1	The number of the page to return. The value must be a positive integer. Default value: **1**.

Response parameters

Parameter	Type	Example	Description
DBInstanceId	String	dds-bpxxxxxxxx	The ID of the instance.

Parameter	Type	Example	Description
Items	Array of LogFile		An array that consists of the information of audit log files.
LogFile			
FileID	Integer	406505	The ID of the file.
LogDownloadURL	String	http://xxxxxxxx.oss-cn-hangzhou.aliyuncs.com/custinsxxxxxx/custinsxxxxxx_xxxxxx.csv	The download URL for audit log files. **Note** If the download URL is unavailable, this parameter is empty.
LogEndTime	String	2019-03-12T09:23:15Z	The end of the time range for the audit log files displayed. The time is in the *yyyy-MM-dd*T*HH:mm*Z format. The time is displayed in UTC.
LogSize	Long	98	The size of the audit log file. Unit: bytes.
LogStartTime	String	2019-03-11T08:19:29Z	The beginning of the time range for the audit log files displayed. The time is in the *yyyy-MM-dd*T*HH:mm*Z format. The time is displayed in UTC.
LogStatus	String	Success	The status of the audit log file. • **Success**: The audit log file is archived. • **Failed**: The audit log file failed to be archived. • **Generating**: The audit log file is being archived. • **Initializing**: Archiving is not started.
PageNumber	Integer	1	The page number of the page returned.
PageRecordCount	Integer	1	The number of entries on the current page.
RequestId	String	F8CA8312-530A-413A-9129-F2BB32A8D404	The ID of the request.

Parameter	Type	Example	Description
TotalRecordCount	Integer	1	The total number of entries.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=DescribeAuditFiles
&DBInstanceId=dds-bpxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeAuditFilesResponse>
   <Items>
      <LogFile>
         <LogStartTime>2019-03-11T08:19:29Z</LogStartTime>
         <LogEndTime>2019-03-12T09:23:15Z</LogEndTime>
         <LogStatus>Success</LogStatus>
         <FileID>406505</FileID>
         <LogDownloadURL>http://xxxxxxxx.oss-cn-hangzhou.aliyuncs.com/custinsxxxxxx/custins
xxxxxx_xxxxxx.csv</LogDownloadURL>
         <LogSize>98</LogSize>
      </LogFile>
   </Items>
   <PageNumber>1</PageNumber>
   <TotalRecordCount>1</TotalRecordCount>
   <RequestId>F8CA8312-530A-413A-9129-F2BB32A8D404</RequestId>
   <PageRecordCount>1</PageRecordCount>
</DescribeAuditFilesResponse>
```

`JSON` format

```
{
 "Items": {

}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidDBInstanceClass.NotFound	Specified DB instance class is not found.	The error message returned because the specified instance type does not exist. Verify the specified instance type.
403	IncorrectDBInstanceType	Current DB instance type does not support this operation.	The error message returned because the operation is not supported by the current instance type.

12.1.3.11.3. DescribeAuditPolicy

You can call this operation to view whether the log audit feature is enabled for an ApsaraDB for MongoDB instance.

The instance must be in the running state when you call this operation.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeAuditPolicy	The operation that you want to perform. Set the value to **DescribeAuditPolicy**.
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance.

Response parameters

Parameter	Type	Example	Description
LogAuditStatus	String	Enable	The status of the log audit feature. Valid values: • Enable • Disabled Default value: Disabled.
RequestId	String	111E7B16-0A87-4CBA-B271-F34AD61E099F	The ID of the request.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=DescribeAuditPolicy
&DBInstanceId=dds-bpxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeAuditPolicyResponse>
   <LogAuditStatus>Enable</LogAuditStatus>
   <RequestId>111E7B16-0A87-4CBA-B271-F34AD61E099F</RequestId>
</DescribeAuditPolicyResponse>
```

`JSON` format

```
{
 "LogAuditStatus": "Enable",
 "RequestId": "111E7B16-0A87-4CBA-B271-F34AD61E099F"
}
```

12.1.3.11.4. ModifyAuditLogFilter

You can call this operation to modify the type of audit logs to be collected from ApsaraDB for MongoDB instances.

The instance must be in the running state when you call this operation.

This operation is applicable only to replica set instances, but not to sharded cluster instances.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyAuditLogFilter	The operation that you want to perform. Set the value to **ModifyAuditLogFilter**.
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance.
Filter	String	Yes	insert,query,update,delete	The type of the audit log entries to be collected. Valid values: • **admin**: O&M and management operations • **slow**: slow queries • **query**: query operations • **insert**: insert operations • **update**: update operations • **delete**: delete operations • **command**: protocol commands such as the aggregate method
RoleType	String	No	primary	The role of the node in the instance. Valid values: • **primary** • **secondary**

Response parameters

Parameter	Type	Example	Description
RequestId	String	E209BE2B-F264-4B9D-81F6-A5A5FB1FBF28	The ID of the request.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=ModifyAuditLogFilter
&Filter=insert,query,update,delete
&DBInstanceId=dds-bpxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyAuditLogFilterResponse>
   <RequestId>E209BE2B-F264-4B9D-81F6-A5A5FB1FBF28</RequestId>
</ModifyAuditLogFilterResponse>
```

`JSON` format

```
{
 "RequestId": "E209BE2B-F264-4B9D-81F6-A5A5FB1FBF28"
}
```

12.1.3.11.5. DescribeAuditLogFilter

You can call this operation to view the types of audit logs collected from ApsaraDB for MongoDB instances.

The instance must be in the running state when you call this operation.

Note This operation is applicable only to replica set instances, but not to sharded cluster instances.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeAuditLogFilter	The operation that you want to perform. Set the value to **DescribeAuditLogFilter**.
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance.
RoleType	String	No	primary	The role of the node in the instance. Valid values: • **primary** • **secondary**

Response parameters

Parameter	Type	Example	Description

Parameter	Type	Example	Description
Filter	String	admin,slow,insert,query,update,delete,command	The type of the audit log entries. Valid values: • **admin**: O&M and management operations • **slow**: slow queries • **query**: query operations • **insert**: insert operations • **update**: update operations • **delete**: delete operations • **command**: protocol commands such as the aggregate method
RequestId	String	D7C8BA0C-9350-487D-9B70-D69AF27FB1EB	The ID of the request.
RoleType	String	primary	The role of the node.

Examples

Sample requests

```
http(s)://mongodb.aliyuncs.com/? Action=DescribeAuditLogFilter
&DBInstanceId=dds-bpxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeAuditLogFilterResponse>
   <Filter>admin,slow,insert,query,update,delete,command</Filter>
   <RoleType></RoleType>
   <RequestId>D7C8BA0C-9350-487D-9B70-D69AF27FB1EB</RequestId>
</DescribeAuditLogFilterResponse>
```

`JSON` format

```
{
 "Filter": "admin,slow,insert,query,update,delete,command",
 "RoleType": "",
 "RequestId": "D7C8BA0C-9350-487D-9B70-D69AF27FB1EB"
}
```

12.1.3.11.6. ModifyAuditPolicy

You can call this operation to enable or disable the audit log feature or set the retention period of audit logs for an ApsaraDB for MongoDB instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyAuditPolicy	The operation that you want to perform. Set the value to **ModifyAuditPolicy**.
AuditStatus	String	Yes	enable	The status of the audit log feature. Valid values: • **enable** • **disabled**
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance.
StoragePeriod	Integer	No	30	The retention period of audit logs. Unit: day. Valid values: **1** to **30**. Default value: **30**.

Response parameters

Parameter	Type	Example	Description
RequestId	String	DC04D812-F18D-4568-9B88-F260D9590116	The ID of the request.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=ModifyAuditPolicy
&AuditStatus=enable
&DBInstanceId=dds-bpxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyAuditPolicyResponse>
   <RequestId>DC04D812-F18D-4568-9B88-F260D9590116</RequestId>
</ModifyAuditPolicyResponse>
```

`JSON` format

```
{
 "RequestId": "DC04D812-F18D-4568-9B88-F260D9590116"
}
```

12.1.3.12. Log management

12.1.3.12.1. DescribeSlowLogRecords

You can call this operation to view the slow operation log details of the ApsaraDB for MongoDB instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeSlowLogRecords	The operation that you want to perform. Set the value to **DescribeSlowLogRecords**.
StartTime	String	Yes	2019-02-24T12:10Z	The beginning of the time range to query. Specify the time in the *yyyy-MM-dd*T*HH:mm*Z format. The time must be in UTC.
EndTime	String	Yes	2019-02-26T12:10Z	The end of the time range to query. The end time must be later than the start time. Specify the time in the *yyyy-MM-dd*T*HH:mm*Z format. The time must be in UTC.
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance. **Note** If you set this parameter to the ID of a sharded cluster instance, you must also specify the **NodeId** parameter.
NodeId	String	No	d-bpxxxxxxxx	The ID of the shard. **Note** This parameter is only valid when you set the **DBInstanceId** parameter to the ID of a sharded cluster instance.

Parameter	Type	Required	Example	Description
DBName	String	No	mongodbtest	The name of the database.
PageSize	Integer	No	30	The number of entries to return on each page. Valid values: **30** to **100**.
PageNumber	Integer	No	1	The number of the page to return. The value must be a positive integer. Default value: **1**.
OrderType	String	No	asc	The order of time in which the log entries to return are sorted. Valid values: • **asc**: The log entries are sorted by time in ascending order. • **desc**: The log entries are sorted by time in descending order.
ResourceGroupId	String	No	rg-axxxxxxxx	The ID of the resource group.

Response parameters

Parameter	Type	Example	Description
Engine	String	MongoDB	The database engine.
Items	Array of LogRecords		An array that consists of the information of operational log entries.
LogRecords			
AccountName	String	root	The name of the user who performed the operation.
DBName	String	mongodbtest	The name of the database.
DocsExamined	Long	1000000	The number of documents scanned during the operation.

Parameter	Type	Example	Description
ExecutionStartTime	String	2019-02-25T01:41:28Z	The start time of the operation. Specify the time in the *yyyy-MM-dd*T*HH:mm:ss*Z format. The time must be in UTC.
HostAddress	String	47.xxx.xxx.xx	The host IP address that you use to connect to a database.
KeysExamined	Long	0	The data records that are scanned during indexing.
QueryTimes	String	600	The execution duration of the statement. Unit: milliseconds.
ReturnRowCounts	Long	0	The number of entries returned.
SQLText	String	{\"op\":\"query\",\"ns\":\"mongodbtest.customer\",\"query\":{\"find\":\"customer\",\"filter\":{\"name\":\"jack\"}}}	The SQL statement that is executed during the slow query operation.
TableName	String	C1	The name of the collection.
PageNumber	Integer	1	The page number of the returned page.
PageRecordCount	Integer	1	The number of slow query log entries returned on the page.
RequestId	String	414A4E5-4C36-4461-95FC-23757A20B5F8	The ID of the request.
TotalRecordCount	Integer	1	The total number of entries.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=DescribeSlowLogRecords
&StartTime=2019-02-24T12:10Z
&EndTime=2019-02-26T12:10Z
&DBInstanceId=dds-bpxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<TotalRecordCount>1</TotalRecordCount>
<PageRecordCount>1</PageRecordCount>
<RequestId>414A4E5-4C36-4461-95FC-23757A20B5F8</RequestId>
<PageNumber>1</PageNumber>
<Items>
    <LogRecords>
        <TableName>C1</TableName>
        <QueryTimes>600</QueryTimes>
        <ExecutionStartTime>2019-02-25T01:41:28Z</ExecutionStartTime>
        <ReturnRowCounts>0</ReturnRowCounts>
        <KeysExamined>0</KeysExamined>
        <DBName>mongodbtest</DBName>
        <DocsExamined>1000000</DocsExamined>
        <HostAddress>47.xxx.xxx.xx</HostAddress>
        <AccountName>root</AccountName>
        <SQLText>{\"op\":\"query\",\"ns\":\"mongodbtest.customer\",\"query\":{\"find\":\"cu
stomer\",\"filter\":{\"name\":\"jack\"}}}</SQLText>
    </LogRecords>
</Items>
<Engine>MongoDB</Engine>
```

`JSON` format

```
{
 "TotalRecordCount": "1",
 "PageRecordCount": "1",
 "RequestId": "414A4E5-4C36-4461-95FC-23757A20B5F8",
 "PageNumber": "1",
 "Items": {
  "LogRecords": [{
   "TableName": "C1",
   "QueryTimes": "600",
   "ExecutionStartTime": "2019-02-25T01:41:28Z",
   "ReturnRowCounts": "0",
   "KeysExamined": "0",
   "DBName": "mongodbtest",
   "DocsExamined": "1000000",
   "HostAddress": "47.xxx.xxx.xx",
   "AccountName": "root",
   "SQLText": "{\\\"op\\\":\\\"query\\\",\\\"ns\\\":\\\"mongodbtest.customer\\\",\\\"query\
\\":{\\\"find\\\":\\\"customer\\\",\\\"filter\\\":{\\\"name\\\":\\\"jack\\\"}}}"
  }]
 },
 "Engine": "MongoDB"
}
```

12.1.3.12.2. DescribeErrorLogRecords

You can call this operation to view the error logs of an ApsaraDB for MongoDB instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeErrorLogRecords	The operation that you want to perform. Set the value to **DescribeErrorLogRecords**.
StartTime	String	Yes	2019-01-01T12:10Z	The beginning of the time range to query. Specify the time in the *yyyy-MM-dd*T*HH:mm*Z format. The time must be in UTC.
EndTime	String	Yes	2019-01-02T12:10Z	The end of the time range to query. The end time must be later than the start time. Specify the time in the *yyyy-MM-dd*T*HH:mm*Z format. The time must be in UTC.

Parameter	Type	Required	Example	Description
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance. **Note** If you specify this parameter to the ID of a sharded cluster instance, you must also specify the **NodeId** parameter.
NodeId	String	No	d-bpxxxxxxxx	The ID of the mongos or shard node in the sharded cluster instance. **Note** This parameter is valid only if you set the **DBInstanceId** parameter to the ID of a sharded cluster instance.
RoleType	String	No	primary	The role of the node in the instance. Valid values: • **primary** • **secondary** **Note** If you set **NodeId** to the ID of a mongos node, the value of this parameter must be **primary**.
DBName	String	No	mongodbtest	The name of the database.
PageSize	Integer	No	30	The number of entries to return on each page. Valid values: **30** to **100**
PageNumber	Integer	No	1	The number of the page to return. The value must be a positive integer. Default value: **1**.
ResourceGroupId	String	No	rg-axxxxxxxx	The ID of the resource group.

Response parameters

Parameter	Type	Example	Description

Parameter	Type	Example	Description
Engine	String	MongoDB	The database engine.
Items	Array of LogRecords		An array that consists of the information of log entries.
LogRecords			
Category	String	NETWORK	The category of the log entry.
ConnInfo	String	conn18xxxxxx	The log connection information.
Content	String	xxxxxxxx	The content of the log entry.
CreateTime	String	2019-02-26T12:09:34Z	The time when the log entry was generated. The time is in the *yyyy-MM-dd*T*HH:mm:ss*Z format. The time is displayed in UTC.
Id	Integer	1111111111	The ID of the log entry.
PageNumber	Integer	1	The page number of the returned page.
PageRecordCount	Integer	1	The number of entries returned on each page.
RequestId	String	68BCBEC2-1E66-471F-A1A8-E3C60C0A80B0	The ID of the request.
TotalRecordCount	Integer	1	The total number of entries.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=DescribeErrorLogRecords
&StartTime=2019-01-01T12:10Z
&EndTime=2019-01-02T12:10Z
&DBInstanceId=dds-bpxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeErrorLogRecordsResponse>
   <Items>
      <LogRecords>
         <Category>NETWORK</Category>
         <CreateTime>2019-02-26T12:09:34Z</CreateTime>
         <ConnInfo>conn18xxxxxx</ConnInfo>
         <Content>xxxxxxxx</Content>
      </LogRecords>
   </Items>
   <PageNumber>1</PageNumber>
   <TotalRecordCount>2</TotalRecordCount>
   <RequestId>68BCBEC2-1E66-471F-A1A8-E3C60C0A80B0</RequestId>
</DescribeErrorLogRecordsResponse>
```

`JSON` format

```
{
    "TotalRecordCount":"1",
    "PageRecordCount":"1",
    "RequestId":"68BCBEC2-1E66-471F-A1A8-E3C60C0A80B0",
    "PageNumber":"1",
    "Items":{
        "LogRecords":[
            {
                "ConnInfo":"conn18xxxxxx",
                "Category":"NETWORK",
                "Id":"1111111111",
                "Content":"xxxxxxxx",
                "CreateTime":"2019-02-26T12:09:34Z"
            }
        ]
    },"Engine":"MongoDB"
}
```

12.1.3.12.3. DescribeRunningLogRecords

You can call this operation to view the operational logs of an ApsaraDB for MongoDB instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeRunningLogRecords	The operation that you want to perform. Set the value to **DescribeRunningLogRecords**.

Parameter	Type	Required	Example	Description
StartTime	String	Yes	2019-01-01T12:10Z	The beginning of the time range to query. Specify the time in the *yyyy-MM-dd*T*HH:mm*Z format. The time must be in UTC.
EndTime	String	Yes	2019-01-02T12:10Z	The end of the time range to query. The end time must be later than the start time. Specify the time in the *yyyy-MM-dd*T*HH:mm*Z format. The time must be in UTC.
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance. **Note** If you set this parameter to the ID of a sharded cluster instance, you must also specify the **NodeId** parameter.
NodeId	String	No	d-bpxxxxxxxx	The ID of the mongos or shard node in the sharded cluster instance. **Note** This parameter is valid only if you set the **DBInstanceId** parameter to the ID of a sharded cluster instance.
DBName	String	No	mongodbtest	The name of the database.
RoleType	String	No	primary	The role of the node in the instance. Valid values: • **primary** • **secondary** **Note** If you set **NodeId** to the ID of a mongos node, the value of **RoleType** must be **primary**.
PageSize	Integer	No	30	The number of entries to return on each page. Valid values: **30** to **100**

Parameter	Type	Required	Example	Description
PageNumber	Integer	No	1	The number of the page to return. The value must be a positive integer. Default value: **1**.
OrderType	String	No	asc	The order of time in which the log entries to return are sorted. Valid values: • **asc**: The log entries are sorted by time in ascending order. • **desc**: The log entries are sorted by time in descending order.
ResourceGroupId	String	No	rg-axxxxxxx	The ID of the resource group.

Response parameters

Parameter	Type	Example	Description
Engine	String	MongoDB	The database engine.
Items	Array of LogRecords		An array that consists of the information of log entries.
LogRecords			
Category	String	NETWORK	The category of the log entry.
ConnInfo	String	conn18xxxxxx	The log connection information.
Content	String	end connection 11.xxx.xxx.xx:3xxxx (0 connections now open)\n	The content of the log entry.
CreateTime	String	2019-02-26T12:09:34Z	The time when the log entry was generated. The time is in the *yyyy-MM-dd*T*HH:mm:ss*Z format. The time is displayed in UTC.
Id	Integer	1111111111	The ID of the log entry.

Parameter	Type	Example	Description
PageNumber	Integer	1	The page number of the page returned.
PageRecordCount	Integer	30	The number of entries returned on each page.
RequestId	String	45D2B592-DEBA-4347-BBF3-47FF6C97DBBC	The ID of the request.
TotalRecordCount	Integer	2	The total number of entries.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=DescribeRunningLogRecords
&StartTime=2019-01-01T12:10Z
&EndTime=2019-01-02T12:10Z
&DBInstanceId=dds-bpxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeRunningLogRecordsResponse>
   <Items>
      <LogRecords>
         <Category>-</Category>
         <CreateTime>2019-02-26T12:09:34Z</CreateTime>
         <ConnInfo>conn18xxxxxx</ConnInfo>
         <Content>
    end connection 11.xxx.xxx.xx:3xxxx (0 connections now open)

```

12.1.3.13. Performance monitoring management

12.1.3.13.1. DescribeDBInstancePerformance

You can call this operation to view the performance data of an ApsaraDB for MongoDB instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeDBInstancePerformance	The operation that you want to perform. Set the value to **DescribeDBInstancePerformance**.

Parameter	Type	Required	Example	Description
Key	String	Yes	MongoDB_DetailedSpaceUsage	The performance metric. Valid values: • **CpuUsage**: the CPU utilization percentage • **MemoryUsage**: the memory usage percentage • **MongoDB_IOPS**: the IOPS usage • **IOPSUsage**: the IOPS usage percentage. • **MongoDB_DetailedSpaceUsage**: the disk usage. • **DiskUsage** : the disk usage percentage • **MongoDB_Opcounters** : the operation QPS • **MongoDB_Connections** : the number of connections • **MongoDB_Cursors** : the number of cursors • **MongoDB_Network** : the network traffic • **MongoDB_Global_Lock_Current_Queue** : the global lock waiting queues • **MongoDB_Wt_Cache** : the WiredTiger storage **Note** Separate multiple metrics with commas (,).
StartTime	String	Yes	2019-03-11T12:30Z	The beginning of the time range to query. Specify the time in the *yyyy-MM-dd*T*HH:mm*Z format. The time must be in UTC.
EndTime	String	Yes	2019-03-11T12:30Z	The end of the time range to query. Specify the time in the *yyyy-MM-dd*T*HH:mm*Z format. The time must be in UTC. The end time must be later than the start time.

Parameter	Type	Required	Example	Description
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance. **Note** If you set this parameter to the ID of a sharded cluster instance, you must also specify the **NodeId** parameter.
NodeId	String	No	d-bpxxxxxxxx	The ID of the mongos or shard node in a sharded cluster instance. You can specify this parameter to view the performance of a single node. **Note** This parameter is valid only if you set the **DBInstanceId** parameter to the ID of a sharded cluster instance.
ReplicaSetRole	String	No	Primary	The role of the node. Valid values: • Primary • Secondary **Note** If you set the **DBInstanceId** parameter to the ID of a standalone instance, the value of this parameter can only be **Primary**.
RoleId	String	No	60xxxxx	The role ID of a node in a instance. You can call the **DescribeReplicaSetRole** operation to view role IDs. **Note** This parameter is valid only if you set the DBInstanceId parameter to the ID of a sharded cluster instance.

Response parameters

Parameter	Type	Example	Description
RequestId	String	267F98DC-367D-4F20-B137-8B5B664D1C5D	The ID of the request.

Parameter	Type	Example	Description
StartTime	String	2019-03-11T12:20Z	The beginning of the time range to query. The time is in the *yyyy-MM-dd*T*HH:mm*Z format. The time is displayed in UTC.
EndTime	String	2019-03-11T12:30Z	The beginning of the time range to query. The time is in the *yyyy-MM-dd*T*HH:mm*Z format. The time is displayed in UTC.
PerformanceKeys	Array of PerformanceKey		An array that consists of the information of performance metrics.
PerformanceKey			
Key	String	MongoDB_DetailedSpaceUsage	Performance metric.
PerformanceValues	Array of PerformanceValue		An array that consists of the values of performance metrics.
PerformanceValue			
Date	String	2019-03-11T12:21:51Z	The date and time when the value is generated.
Value	String	0.6	The value of a performance metric.
Unit	String	MB	The unit of the performance metric.
ValueFormat	String	cpu_usage	The format of the performance metric value. If the performance metric contains multiple fields, the fields are separated with ampersands (**&**). For example, if you query disk usage, the returned ValueFormat is **ins_size&data_size&log_size**.
DBInstanceId	String	dds-bpxxxxxxxx	The ID of the request.

Parameter	Type	Example	Description
Engine	String	MongoDB	The database engine. It is fixed to **MongoDB**.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=DescribeDBInstancePerformance
&Key=MongoDB_DetailedSpaceUsage
&StartTime=2019-03-11T12:30Z
&EndTime=2019-03-11T12:30Z
&DBInstanceId=dds-bpxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<PerformanceKeys>
    <ValueFormat>cpu_usage</ValueFormat>
    <Unit>MB</Unit>
    <Key>MongoDB_DetailedSpaceUsage</Key>
</PerformanceKeys>
<PerformanceKeys>
    <PerformanceValues>
        <Value>0.6</Value>
        <Date>2019-03-11T12:21:51Z</Date>
    </PerformanceValues>
</PerformanceKeys>
<EndTime>2019-03-11T12:30Z</EndTime>
<RequestId>267F98DC-367D-4F20-B137-8B5B664D1C5D</RequestId>
<DBInstanceId>dds-bpxxxxxxxx</DBInstanceId>
<StartTime>2019-03-11T12:20Z</StartTime>
<Engine>MongoDB</Engine>
```

`JSON` format

```
{
    "PerformanceKeys":[
        {
            "ValueFormat":"cpu_usage",
            "Unit":"MB",
            "Key":"MongoDB_DetailedSpaceUsage"
        },
        {
            "PerformanceValues":[
                {
                    "Value":"0.6",
                    "Date":"2019-03-11T12:21:51Z"
                }
            ]
        }
    ],
    "EndTime":"2019-03-11T12:30Z",
    "RequestId":"267F98DC-367D-4F20-B137-8B5B664D1C5D",
    "DBInstanceId":"dds-bpxxxxxxxx",
    "StartTime":"2019-03-11T12:20Z",
    "Engine":"MongoDB"
}
```

12.1.3.13.2. DescribeDBInstanceMonitor

You can call this operation to set the collection frequency of monitoring data for an ApsaraDB for MongoDB instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeDBInstanceMonitor	The operation that you want to perform. Set the value to **DescribeDBInstanceMonitor**.
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance.

Response parameters

Parameter	Type	Example	Description
Granularity	String	300	The collection frequency of monitoring data. The value is fixed to **300** . Unit: seconds.
RequestId	String	EFD65226-08CC-4C4D-B6A4-CB3C382F67B0	The ID of the request.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=DescribeDBInstanceMonitor
&DBInstanceId=dds-bpxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<Granularity>300</Granularity>
<RequestId>EFD65226-08CC-4C4D-B6A4-CB3C382F67B0</RequestId>
```

`JSON` format

```
{
 "Granularity": 300,
 "RequestId": "EFD65226-08CC-4C4D-B6A4-CB3C382F67B0"
}
```

12.1.3.14. Parameter management

12.1.3.14.1. DescribeParameterModificationHistory

You can call this operation to view the parameter modification records of an ApsaraDB for MongoDB instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeParameterModificationHistory	The operation that you want to perform. Set the value to **DescribeParameterModificationHistroy**.
StartTime	String	Yes	2019-01-01T12:10Z	The beginning of the time range to query. Specify the time in the *yyyy-MM-dd*T*HH:mm*Z format. The time must be in UTC.
EndTime	String	Yes	2019-01-02T12:10Z	The end of the time range to query. Specify the time in the *yyyy-MM-dd*T*HH:mm*Z format. The time must be in UTC. The end time must be later than the start time.

Parameter	Type	Required	Example	Description
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance. **Note** If you set this parameter to the ID of a sharded cluster instance, you must also specify the **NodeId** parameter.
CharacterType	String	Yes	db	The role of the instance. Valid values: • **db**: the shard node • **cs**: the Configserver node • **mongos**: the mongos node • **logic**: the sharded cluster instance
NodeId	String	No	d-bpxxxxxxxx	The ID of the mongos or shard in the specified sharded cluster instance. **Note** This parameter is valid only if you set the **DBInstanceId** parameter to the ID of a sharded cluster instance.
RegionId	String	No	cn-hangzhou	The region ID of the instance. You can call the **DescribeDBInstanceAttribute** operation to query the region ID of the instance.

Response parameters

Parameter	Type	Example	Description
HistoricalParameters	Array of HistoricalParameter		An array that consists of the information of parameter modification records.
HistoricalParameter			
ModifyTime	String	2019-03-12T07:58:24Z	The time when the parameter was modified. The time is in the *yyyy-MM-dd*T*HH:mm:ss*Z format. The time is displayed in UTC.
NewParameterValue	String	200	The parameter value after modification.

Parameter	Type	Example	Description
OldParameterValue	String	100	The parameter value before modification.
ParameterName	String	operationProfiling.slowOpThresholdMs	The name of the modified parameter.
RequestId	String	B1BB6E0E-B4EF-4145-81FA-A07719860248	The ID of the request.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=DescribeParameterModificationHistory
&StartTime=2019-01-01T12:10Z
&EndTime=2019-01-02T12:10Z
&DBInstanceId=dds-bpxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeParameterModificationHistoryResponse>
   <HistoricalParameters>
      <HistoricalParameter>
         <OldParameterValue>100</OldParameterValue>
         <ModifyTime>2019-03-12T07:58:24Z</ModifyTime>
         <NewParameterValue>200</NewParameterValue>
         <ParameterName>operationProfiling.slowOpThresholdMs</ParameterName>
      </HistoricalParameter>
   </HistoricalParameters>
   <RequestId>B1BB6E0E-B4EF-4145-81FA-A07719860248</RequestId>
</DescribeParameterModificationHistoryResponse>
```

`JSON` format

```
{
 "HistoricalParameters": {
  "HistoricalParameter": [
   {
    "OldParameterValue": "100",
    "ModifyTime": "2019-03-12T07:58:24Z",
    "NewParameterValue": "200",
    "ParameterName": "operationProfiling.slowOpThresholdMs"
   }
  ]
 },
 "RequestId": "B1BB6E0E-B4EF-4145-81FA-A07719860248"
}
```

12.1.3.14.2. DescribeParameters

You can call this operation to view parameter configurations of an ApsaraDB for MongoDB instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeParameters	The operation that you want to perform. Set the value to**DescribeParameters**.
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance. **Note** If you set this parameter to the ID of a sharded cluster instance, you must also specify the **NodeId** parameter.
NodeId	String	No	d-bpxxxxxxxx	The ID of the mongos or shard in the specified sharded cluster instance. **Note** This parameter is only valid when you set the**DBInstanceId**parameter to the ID of a sharded cluster instance.

Parameter	Type	Required	Example	Description
CharacterType	String	No	mongos	The type of the database account. Valid values: • **mongos**: The account that can be used to log on to a mongos node • **shard**: The account that can be used to log on to a shard node

Response parameters

Parameter	Type	Example	Description
ConfigParameters	Array of Parameter		An array that consists of the information of configured parameters.
Parameter			
CheckingCode	String	[0-65536]	The valid values of the parameter.
ForceRestart	Boolean	true	Indicates whether a restart is required for parameter modifications to take effect. • **false**: A restart is not required. Modifications take effect immediately after they are made. • **true**: A restart is required for modifications to take effect.
ModifiableStatus	Boolean	true	Indicates whether the parameter is modifiable. • **false** • **true**
ParameterDescription	String	The threshold in milliseconds at which the database profiler considers a query slow, default is 100.	The description of the parameter.
ParameterName	String	operationProfiling.slowOpThresholdMs	The name of the parameter.
ParameterValue	String	200	The value of the parameter.

Parameter	Type	Example	Description
RequestId	String	3ADD0C7D-2D2A-4F15-88FF-E7AC9B9FDCC8	The ID of the request.
RunningParameters	Array of Parameter		An array that consists of the information of instance parameters that have taken effect.
Parameter			
CheckingCode	String	[33554432-268435456]	The valid values of the parameter.
ForceRestart	String	false	Indicates whether a restart is required for parameter modifications to take effect. • **false**: A restart is not required. Modifications take effect immediately after they are made. • **true**: A restart is required for modifications to take effect.
ModifiableStatus	String	true	Indicates whether the parameter is modifiable. • **false** • **true**
ParameterDescription	String	The maximum memory bytes that sort stage may use, default is 33554432(i.e. 32MB)	The description of the parameter.
ParameterName	String	setParameter.internalQueryExecMaxBlockingSortBytes	The name of the parameter.
ParameterValue	String	33554432	The value of the parameter.
EngineVersion	String	4.0	The engine version of the instance.
Engine	String	mongodb	The database engine of the instance. Default value: **mongodb**.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=DescribeParameters
&DBInstanceId=dds-bpxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeParametersResponse>
      <ConfigParameters>
            <Parameter>
                  <ParameterDescription>The threshold in milliseconds at which the database
profiler considers a query slow, default is 100. </ParameterDescription>
                  <ParameterValue>200</ParameterValue>
                  <CheckingCode>[0-65536]</CheckingCode>
                  <ForceRestart>false</ForceRestart>
                  <ModifiableStatus>true</ModifiableStatus>

```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidDBInstanceClass.NotFound	Specified DB instance class is not found.	The error message returned when the specified instance type does not exists. Verify the specified instance type.
403	IncorrectDBInstanceType	Current DB instance type does not support this operation.	The error message returned when the current operation is not supported by the instance type of the specified instance.

12.1.3.14.3. ModifyParameters

You can call this operation to modify the parameters of an AsparaDB for MongoDB instance.

The instance must be in the running state when you call this operation.

> **Note** If some of the modified parameters take effect only after the instance is restarted, the instance is automatically restarted after the operation is complete. You can call the **DescribeParameterTemplates** operation to query the parameters that take effect only after the instance is restarted.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyParameters	The operation that you want to perform. Set the value to**ModifyParameters**.
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance. **Note** If you set this parameter to the ID of a sharded cluster instance, you must also specify the **NodeId** parameter.
Parameters	String	Yes	{"operationProfiling.slowOpThresholdMs":"300"}	The parameters to be modified and their new values. Set this parameter to a JSON string. For example, set the parameter in the {"name":"value","name":"value2"} format.
NodeId	String	No	d-bpxxxxxxxx	The ID of the mongos or shard node in the specified sharded cluster instance. **Note** This parameter is only valid when you set the **DBInstanceId** parameter to the ID of a sharded cluster instance.

Parameter	Type	Required	Example	Description
CharacterType	String	No	db	The role of the instance. Valid values: • **db**: the shard node • **cs**: the Configserver node • **mongos**: the mongos node • **logic**: the sharded cluster instance

Response parameters

Parameter	Type	Example	Description
RequestId	String	36923CC2-DDAB-4B48-A144-DA92C1E19537	The ID of the request.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=ModifyParameters
&DBInstanceId=dds-bpxxxxxxxx
&Parameters={"operationProfiling.slowOpThresholdMs":"300"}
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyParametersResponse>
      <RequestId>36923CC2-DDAB-4B48-A144-DA92C1E19537</RequestId>
</ModifyParametersResponse>
```

`JSON` format

```
{
    "RequestId": "36923CC2-DDAB-4B48-A144-DA92C1E19537"
}
```

12.1.3.15. Backup and recovery

12.1.3.15.1. DescribeBackupPolicy

You can call this operation to view the backup policy of an ApsaraDB for MongoDB instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeBackupPolicy	The operation that you want to perform. Set the value to **DescribeBackupPolicy**.
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance.

Response parameters

Parameter	Type	Example	Description
BackupRetentionPeriod	String	7	The backup retention period. Unit: days.
PreferredBackupPeriod	String	Monday,Wednesday,Friday,Sunday	The period of backup. Valid values: • **Monday** • **Tuesday** • **Thursday** • **Friday** • **Saturday** • **Sunday**
PreferredBackupTime	String	20:00Z-21:00Z	The time when the data was backed up. The time is in the *HH:mm*Z-*HH:mm*Z format. The time is displayed in UTC.
PreferredNextBackupTime	String	2020-05-13T22:56Z	The next backup time. The time is in the *yyyy-MM-dd*T*HH:mm*Z format. The time is displayed in UTC.
RequestId	String	C2C283A1-1CC4-4DD9-B985-3811E0244A45	The ID of the request.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=DescribeBackupPolicy
DBInstanceId=dds-bpxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<PreferredBackupPeriod>Monday,Wednesday,Friday,Sunday</PreferredBackupPeriod>
<RequestId>C2C283A1-1CC4-4DD9-B985-3811E0244A45</RequestId>
<PreferredBackupTime>20:00Z-21:00Z</PreferredBackupTime>
<PreferredNextBackupTime>2020-05-13T22:56Z</PreferredNextBackupTime>
<BackupRetentionPeriod>7</BackupRetentionPeriod>
```

`JSON` format

```
{
    "PreferredBackupPeriod":"Monday,Wednesday,Friday,Sunday",
    "RequestId":"C2C283A1-1CC4-4DD9-B985-3811E0244A45",
    "PreferredBackupTime":"20:00Z-21:00Z",
    "PreferredNextBackupTime":"2020-05-13T22:56Z",
    "BackupRetentionPeriod":"7"
}
```

12.1.3.15.2. ModifyBackupPolicy

You can call this operation to modify the backup policy of an ApsaraDB for MongoDB instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyBackupPolicy	The operation that you want to perform. Set the value to **ModifyBackupPolicy**.
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance.
PreferredBackupPeriod	String	Yes	Monday,Wednesday,Friday,Sunday	The period of backup. Valid values: • **Monday** • **Tuesday** • **Wednesday** • **Thursday** • **Friday** • **Saturday** • **Sunday** **Note** Separate multiple values with commas (,).

Parameter	Type	Required	Example	Description
PreferredBackupTime	String	Yes	03:00Z-04:00Z	The time to back up data. Specify the time in the *HH:mm*Z-*HH:mm*Z format. The time must be in UTC. **Note** The maximum period is 1 hour.

Response parameters

Parameter	Type	Example	Description
RequestId	String	644A359C-B871-4DD3-97B5-ED91EF5809C2	The ID of the request.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=ModifyBackupPolicy
&DBInstanceId=dds-bpxxxxxxxx
&PreferredBackupPeriod=Monday,Wednesday,Friday,Sunday
&PreferredBackupTime=03:00Z-04:00Z
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyBackupPolicyResponse>
   <RequestId>644A359C-B871-4DD3-97B5-ED91EF5809C2</RequestId>
</ModifyBackupPolicyResponse>
```

`JSON` format

```
{
 "RequestId": "644A359C-B871-4DD3-97B5-ED91EF5809C2"
}
```

12.1.3.15.3. CreateBackup

You can call this operation to manually back up an ApsaraDB for MongoDB instance.

The instance must be in the running state when you call this operation.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateBackup	The operation that you want to perform. Set the value to **CreateBackup**.
DBInstanceId	String	Yes	d-bpxxxxxxxx	The ID of the instance.
BackupMethod	String	No	Logical	The backup method of the instance. Default value: Physical. Valid values: • **Logical** • **Physical**

Response parameters

Parameter	Type	Example	Description
BackupId	String	5664xxxx	The ID of the backup set.
RequestId	String	7016B12F-7F64-40A4-BAFF-013F02AC82FC	The ID of the request.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=CreateBackup
DBInstanceId=dds-bpxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreateBackupResponse>
   <RequestId>7016B12F-7F64-40A4-BAFF-013F02AC82FC</RequestId>
   <BackupId>5664xxxx</BackupId>
</CreateBackupResponse>
```

`JSON` format

```
{
    "RequestId": "7016B12F-7F64-40A4-BAFF-013F02AC82FC",
    "BackupId": "5664xxxx"
}
```

12.1.3.15.4. DescribeBackups

You can call this operation to view the backups of an ApsaraDB for MongoDB instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeBackups	The operation that you want to perform. Set the value to **DescribeBackups**.
StartTime	String	Yes	2019-03-12T12:00Z	The beginning of the time range to query. Specify the time in the *yyyy-MM-dd*T*HH:mm*Z format. The time must be in UTC.
EndTime	String	Yes	2019-03-13T12:00Z	The end of the time range to query. Specify the time in the *yyyy-MM-dd*T*HH:mm*Z format. The time must be in UTC. The end time must be later than the start time.
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance. **Note** If you set this parameter to the ID of a sharded cluster instance, you must also specify the **NodeId** parameter.
NodeId	String	No	d-bpxxxxxxxx	The ID of the shard node in the sharded cluster instance. **Note** This parameter is valid only if you set the **DBInstanceId** parameter to the ID of a sharded cluster instance.
BackupId	String	No	12345678	The ID of the backup set.
PageNumber	Integer	No	1	The number of the page to return. The value must be a positive integer. Default value: **1**.

Parameter	Type	Required	Example	Description
PageSize	Integer	No	30	The number of entries to return on each page. Valid values: **30, 50, and 100**. Default value: **30**.

Response parameters

Parameter	Type	Example	Description
PageNumber	Integer	1	The page number of the returned page.
PageSize	Integer	30	The number of entries returned per page.
RequestId	String	8925E66F-1971-4C8C-90A7-F93BF1867E25	The ID of the request.
TotalCount	Integer	1	The total number of backup sets.
Backups	Array of Backup		An array that consists of the information of backup sets.
Backup			
BackupDBNames	String	mongodbtest,new,test	The name of the database that has been backed up.
BackupDownloadURL	String	http://xxxxx.oss-cn-hangzhou.aliyuncs.com/xxxxx/hinsxxxxx_data_xxxxx.tar.gz	The Internet download URL of the backup file. If the download URL is unavailable, this parameter is an empty string.
BackupEndTime	String	2019-03-13T04:34:57Z	The end of the backup time range. The time is in the *yyyy-MM-dd*T*HH:mm:ss*Z format. The time is displayed in UTC.
BackupId	Integer	11111111	The ID of the backup set.

Parameter	Type	Example	Description
BackupIntranetDownloadURL	String	http://xxxxx.oss-cn-hangzhou-internal.example.com/xxxxx/xxxxx.tar.gz	The internal download URL of the backup file. **Note** You can download the backup file by using this URL on the Elastic Compute Service (ECS) instance that is connected to the ApsaraDB for MongoDB instance. The ECS instance and ApsaraDB for MongoDB instance must be in the classic network of the same region or in the same virtual private cloud (VPC).
BackupMethod	String	Physical	The backup method. Valid values: • **Snapshot** • **Physical** • **Logical**
BackupMode	String	Automated	The backup mode. Valid values: • **Automated** • **Manual**
BackupSize	Long	335520510	The size of the backup file. Unit: bytes.
BackupStartTime	String	2019-03-13T04:32:42Z	The beginning of the backup time range. The time is in the *yyyy-MM-dd*T*HH:mm:ss*Z format. The time is displayed in UTC.
BackupStatus	String	Success	The status of the backup. Valid values: • **Success**: The backup task is successful. • **Failed**: The backup task failed.
BackupType	String	FullBackup	The backup type. Valid values: • **FullBackup**: full backup. • **IncrementalBackup**: incremental backup.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=DescribeBackups
&StartTime=2019-03-12T12:00Z
&EndTime=2019-03-13T12:00Z
&DBInstanceId=dds-bpxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<TotalCount>1</TotalCount>
<PageSize>30</PageSize>
<RequestId>8925E66F-1971-4C8C-90A7-F93BF1867E25</RequestId>
<PageNumber>1</PageNumber>
<Backups>
    <BackupMethod>Physical</BackupMethod>
    <BackupDownloadURL>http://xxxxx.oss-cn-hangzhou.aliyuncs.com/xxxxx/hinsxxxxx_data_xxxxx
.tar.gz</BackupDownloadURL>
    <BackupIntranetDownloadURL>http://xxxxx.oss-cn-hangzhou-internal.example.com/xxxxx/xxxx
x.tar.gz</BackupIntranetDownloadURL>
    <BackupSize>335520510</BackupSize>
    <BackupMode>Automated</BackupMode>
    <BackupEndTime>2019-03-13T04:34:57Z</BackupEndTime>
    <BackupStartTime>2019-03-13T04:32:42Z</BackupStartTime>
    <BackupType>FullBackup</BackupType>
    <BackupId>11111111</BackupId>
    <BackupDBNames>mongodbtest,new,test</BackupDBNames>
    <BackupStatus>Success</BackupStatus>
</Backups>
```

`JSON` format

```
{
    "TotalCount":"1",
    "PageSize":"30",
    "RequestId":"8925E66F-1971-4C8C-90A7-F93BF1867E25",
    "PageNumber":"1",
    "Backups":[
        {
            "BackupMethod":"Physical",
            "BackupDownloadURL":"http://xxxxx.oss-cn-hangzhou.aliyuncs.com/xxxxx/hinsxxxxx_
data_xxxxx.tar.gz",
            "BackupIntranetDownloadURL":"http://xxxxx.oss-cn-hangzhou-internal.example.com/
xxxxx/xxxxx.tar.gz",
            "BackupSize":"335520510",
            "BackupMode":"Automated",
            "BackupEndTime":"2019-03-13T04:34:57Z",
            "BackupStartTime":"2019-03-13T04:32:42Z",
            "BackupType":"FullBackup",
            "BackupId":"11111111",
            "BackupDBNames":"mongodbtest,new,test",
            "BackupStatus":"Success"
        }
    ]
}
```

12.1.3.15.5. RestoreDBInstance

You can call this operation to restore data to the current ApsaraDB for MongoDB instance.

This operation is applicable only to replica set instances, but not to standalone instances or sharded cluster instances. You also can use the following methods to clone an instance: Create an instance from a backup to clone a standalone instance. Call the CreateShardingDBInstance operation to clone a sharded cluster instance.

> **Note** This operation overwrites the data of the current instance, and the data cannot be recovered. Proceed with caution.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	RestoreDBInstance	The operation that you want to perform. Set the value to **RestoreDBInstance**.

Parameter	Type	Required	Example	Description
BackupId	Integer	Yes	11111111	The ID of the backup set. **Note** You can call the **DescribeBackups** operation to view the backup ID.
DBInstanceId	String	Yes	dds-bpxxxxxxxx	The ID of the instance.

Response parameters

Parameter	Type	Example	Description
RequestId	String	973DCB8F-56B3-4102-8777-3A90495927F7	The ID of the request.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=RestoreDBInstance
&BackupId=11111111
&DBInstanceId=dds-bpxxxxxxxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<RestoreDBInstanceResponse>
   <RequestId>973DCB8F-56B3-4102-8777-3A90495927F7</RequestId>
</RestoreDBInstanceResponse>
```

`JSON` format

```
{
 "RequestId": "973DCB8F-56B3-4102-8777-3A90495927F7"
}
```

12.1.3.15.6. DescribeBackupDBs

You can call this operation to view the databases at a specified time or the databases in a specified backup set before you restore a database for an ApsaraDB for MongoDB instance.

> **Note** You can call the **CreateDBInstance** operation to restore a database for an ApsaraDB for MongoDB instance.

Before you call this operation, make sure that the following requirements are met:

- A replica set instance is used.
- The database engine version of the instance must be **3.0**, **3.4**, **4.0**, or **4.2**.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeBackupDBs	The operation that you want to perform. Set the value to **DescribeBackupDBs**.
SourceDBInstance	String	Yes	dds-bpxxxxxxxx	The ID of the source instance.
PageNumber	Integer	No	1	The number of the page to return. The value must be a positive integer. Default value: **1**.
PageSize	Integer	No	30	The number of entries to return on each page. Valid values: **30**, **50**, and **100**. Default value: **30**.
RestoreTime	String	No	2019-08-22T12:00:00Z	The point in time at which the instance will be restored. Specify the time in the *yyyy-MM-dd*T*HH:mm:ss*Z format. The time must be in UTC. **Note** • It can be any time within the past seven days. The time must be earlier than the current time, but later than the time when the database was created. • You must specify either this parameter or the **BackupId** parameter.

Parameter	Type	Required	Example	Description
BackupId	String	No	5664xxxx	The ID of the backup set. **Note** • You can call the **DescribeBackups** operation to view the backup ID. • You must specify this parameter or the **RestoreTime** parameter.
ResourceGroupId	String	No	rg-axxxxxxxx	The ID of the resource group.

Response parameters

Parameter	Type	Example	Description
Databases	Array of Database		An array that consists of inforamtion of databases.
Database			
DBName	String	mongodbtest	The name of the database.
PageNumber	Integer	1	The page number of the returned page.
TotalCount	Integer	5	The number of databases.
PageSize	Integer	30	The number of entries returned on each page.
RequestId	String	1AF0AD89-ED4F-44AD-B65F-BFC1D5CD9455	The ID of the request.

Examples

Sample requests

```
http(s)://mongodb.example.com/? Action=DescribeBackupDBs
&SourceDBInstance=dds-bpxxxxxxxx
&RestoreTime=2019-08-22T12:00:00Z
&<Common request parameters>
```

Sample success responses

`XML` format

```
<TotalCount>5</TotalCount>
<Databases>
    <DBName>mongodbtest</DBName>
</Databases>
<PageSize>30</PageSize>
<RequestId>1AF0AD89-ED4F-44AD-B65F-BFC1D5CD9455</RequestId>
<PageNumber>1</PageNumber>
```

`JSON` format

```
{
    "TotalCount":"5",
    "Databases":[
        {
            "DBName":"mongodbtest"
        }
    ],
    "PageSize":"30",
    "RequestId":"1AF0AD89-ED4F-44AD-B65F-BFC1D5CD9455",
    "PageNumber":"1"
}
```

Error codes

HttpCode	Error code	Error message	Description
403	IncorrectDBInstanceType	Current DB instance type does not support this operation.	The error message returned when the current operation is not supported by the instance type of the specified instance.

12.1.3.16. Instance states

This topic descries the instance states of ApsaraDB for MongoDB instances.

State	Description
Creating	The instance is being created.
DBInstanceClassChanging	The instance specifications are being changed.

State	Description
DBInstanceNetTypeChanging	The network type of the instance is being changed.
Deleting	The instance is being deleted.
EngineVersionUpgrading	The database engine version of the instance is being upgraded.
GuardSwitching	The instance is undergoing a disaster-triggered failover.
HASwitching	The instance is undergoing a primary/secondary switching.
Importing	Data is being imported into the instance.
ImportingFromOthers	A database is being imported into the instance.
LinkSwitching	The instance is undergoing a link switching.
MinorVersionUpgrading	The minor version of the instance is being upgraded.
NET_CREATING	A network connection to the instance is being created.
NET_DELETING	A network connection to the instance is being deleted.
NodeCreating	A node is being created in the instance.
NodeDeleting	A node is being deleted in the instance.
Rebooting	The instance is being restarted.
Restoring	The cluster is being restored from the backup.
Running	The cluster is running.
SSLModifying	The SSL status of the instance is changing.
TempDBInstanceCreating	A node is being deleted in the instance.
Transing	The instance is being migrated.
TransingToOthers	A database in the instance is being migrated.

13.Data Management (DMS)

13.1. Developer Guide

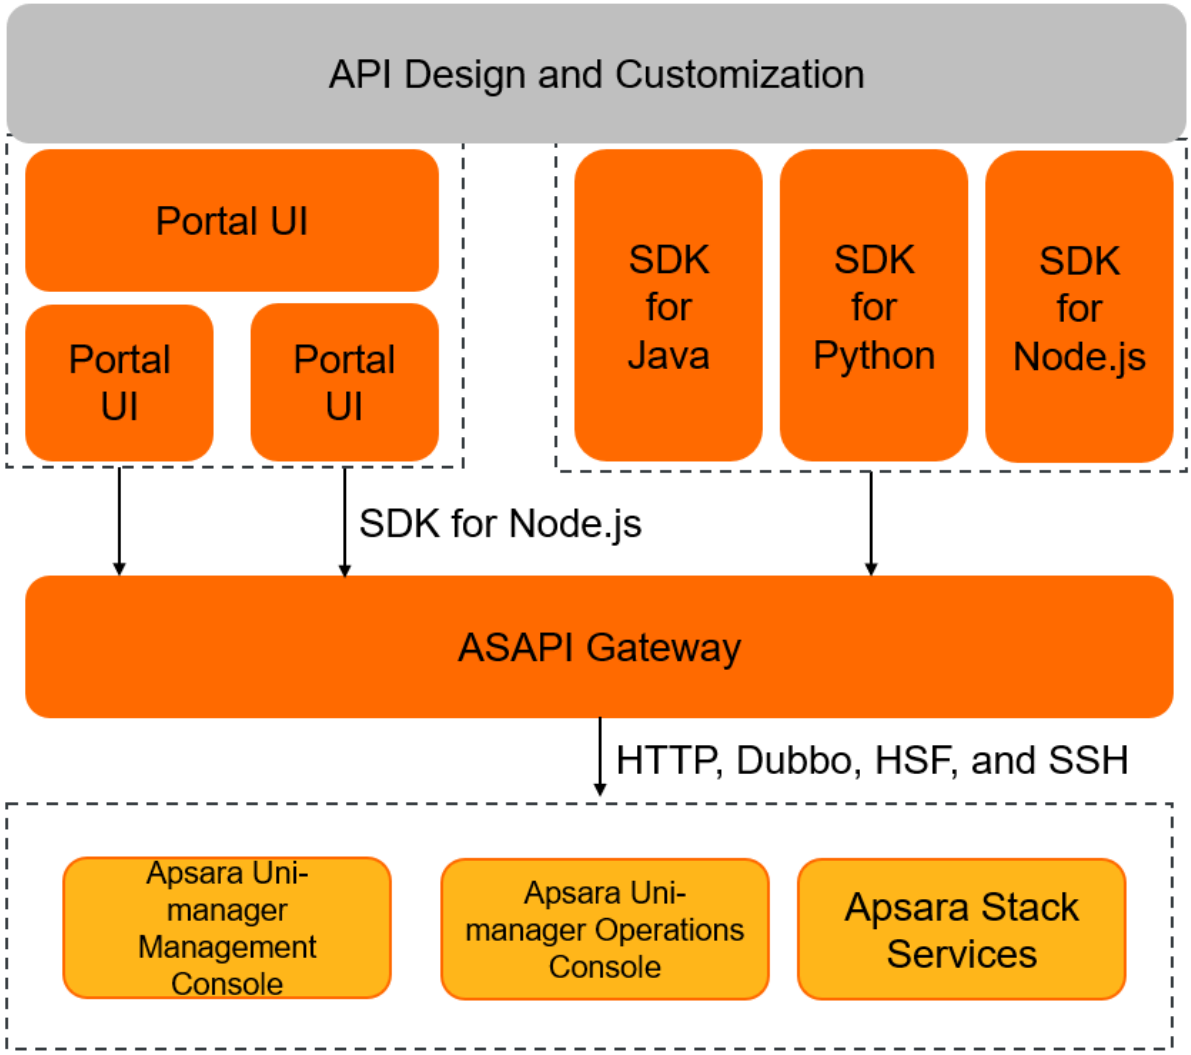
13.1.1. Use ASAPI to call Apsara Stack SDKs

13.1.1.1. 文档标题缺失，请补全后重新导出

13.1.1.1.1. ASAPI overview

This topic describes the architecture and features of the Apsara Stack API (ASAPI).

The ASAPI is a unified ingress gateway for Apsara Stack services and a main component of the Apsara Uni-manager Management Console. The ASAPI provides a unified method for you to manage and make API calls. You can use Apsara Stack SDK to centrally make API calls to Apsara Stack services, including Elastic Compute Service (ECS) and Virtual Private Cloud (VPC).



The ASAPI allows you to make API calls to manage and maintain Apsara Stack services.

- Make API calls to implement enterprise-grade management. For example, you can manage organizations, users, roles, resource sets, and logon policies. These operations are provided by the Apsara Uni-manager Management Console.
- Make API calls to manage operations. For example, you can manage quotas, usage statistics, specifications, and password policies. These operations are provided by the Apsara Uni-manager Management Console.
- Make API calls to manage resources. For example, you can create, delete, query, or modify cloud resources. These operations are provided by Apsara Stack services. If you call an API operation to create an ECS instance or a VPC, the API operation is provided by ECS or VPC.
- Make API calls to query monitoring metrics of Apsara Stack services. These operations are provided by the Apsara Uni-manager Management Console.
- Make API calls to perform O&M. For example, you can manage monitoring and alerting, inventories, tasks, and physical servers. These operations are provided by the Apsara Uni-manager Operations Console.

For more information, see the developer guide of the corresponding Apsara Stack service. For information about API operations used to manage organization users, see *Apsara Uni-manager Management Console Developer Guide*. For information about the API operation used to create an ECS instance, see *ECS Developer Guide*.

> **Note** If the "Use Apsara Stack SDK to make API calls" section is included in the developer guide of an Apsara Stack service, the ASAPI is supported by the Apsara Stack service. In this case, you can make API calls based on the developer guide.

13.1.1.1.2. Preparations

13.1.1.1.2.1. Log on to the API Tool console

You can log on to the API Tool console from the Apsara Uni-manager Management Console.

Prerequisites

- The URL of the Apsara Uni-manager Management Console is obtained from the deployment personnel before you log on to the Apsara Uni-manager Management Console.
- We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL of the Apsara Uni-manager Management Console. Press the Enter key.
2. Enter your username and password.

   Obtain the username and password that you can use to log on to the console from the operations administrator.

> **Note** When you log on to the Apsara Uni-manager Management Console for the first time, you must change the password of your username. Your password must meet complexity requirements. The password must be 10 to 32 characters in length and must contain at least two of the following character types:
>
> - Uppercase or lowercase letters
> - Digits
> - Special characters, which include ! @ # $ %

3. Click **Log On**.
4. In the top navigation bar, choose **Products > Others > API Tool**.

13.1.1.1.2.2. View information about API operations

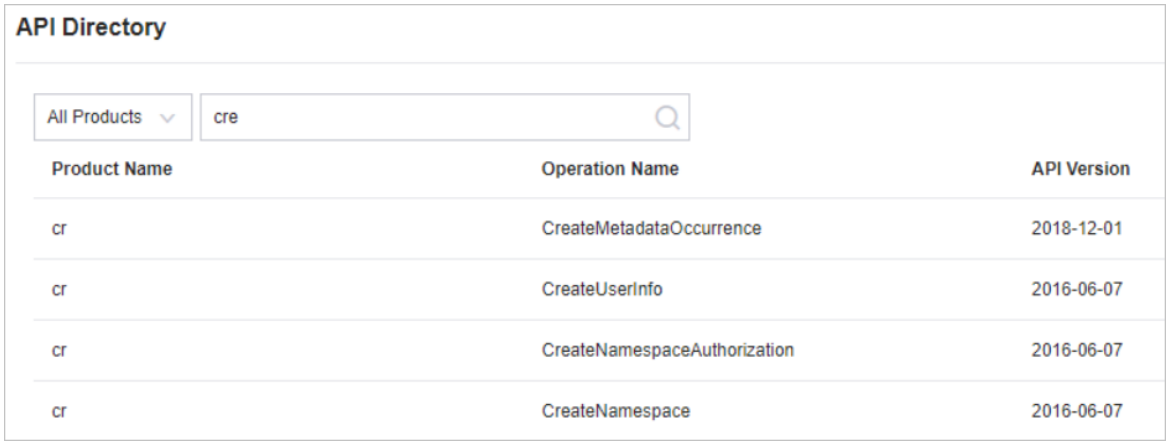
This topic describes how to view information about API operations. Before you use SDKs, obtain service names, API operation names, and API operation versions.

Context

The API operations on the API Directory page are only for reference. For information about how to call API operations, see developer guides of the corresponding cloud services. If the information on the API Directory page is inconsistent with that in the developer guide of the corresponding cloud service, the information in the developer guide prevails.

Procedure

1. Go to the API Tool console. For more information, see Log on to the API Tool console.
2. In the left-side navigation pane, click **API Directory**.
3. On the **API Directory** page, select the desired service from the drop-down list, enter a keyword of an API operation name in the search box, and then click the search icon.



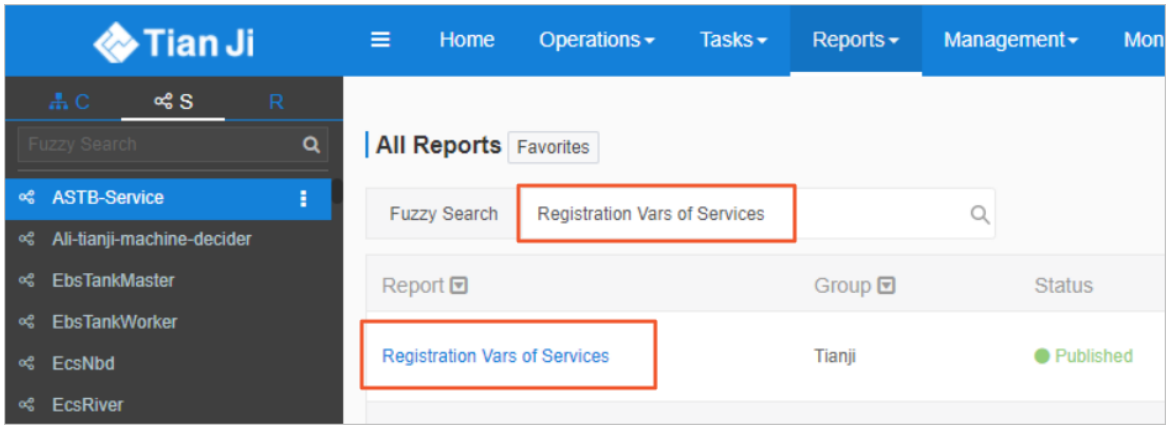
4. Then, you can view the service name, API operation name, and API operation version.

13.1.1.1.2.3. Generate an endpoint for the ASAPI

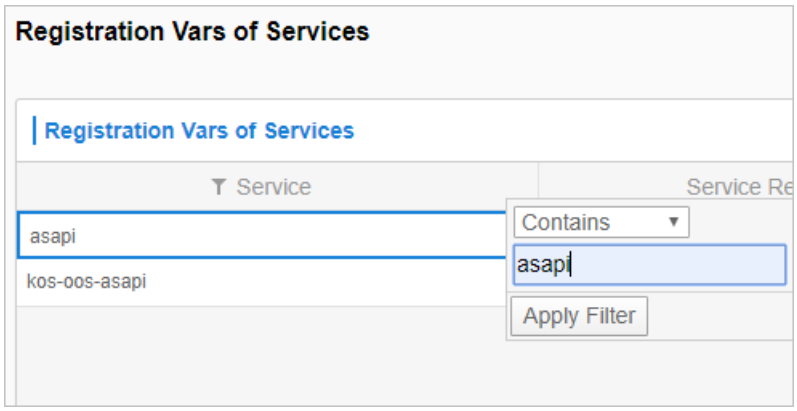
This topic describes three methods used to generate an endpoint for the Apsara Stack API (ASAPI).

Method 1: Use Registration Vars of Services to generate an endpoint

1. Log on to Apsara Infrastructure Management Framework.
   i. Log on to the Apsara Uni-manager Operations Console.
   ii. In the top navigation bar, click **O&M**.
   iii. In the left-side navigation pane, choose **Product Management** > **Products**.
   iv. In the Apsara Stack O&M section, click **Apsara Infrastructure Management Framework**.
2. In the left-side navigation pane, click **Reports**.
3. On the **All Reports** page, search for `Registration Vars of Services` and click the report name.



4. On the **Registration Vars of Services** page, click the icon next to **Service** and search for `asapi`.



5. Find the asapi service, right-click in the **Service Registration** column, and then select **Show More** from the shortcut menu.

   In the **Details** dialog box, obtain the value of **asapi.public.endpoint**.
6. Generate an endpoint for the ASAPI based on the following format:

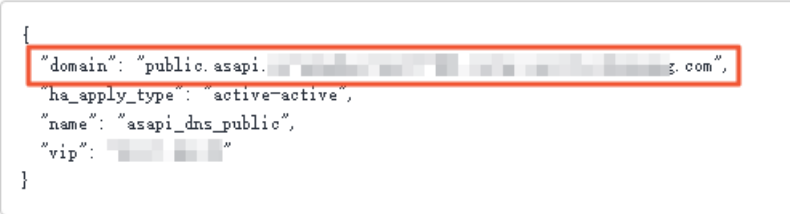
```
https://<asapi.public.endpoint>/asapi/v3
```

Method 2: Use cluster resources to generate an endpoint

1. Log on to Apsara Infrastructure Management Framework.
   i. Log on to the Apsara Uni-manager Operations Console.

ii. In the top navigation bar, click **O&M**.
iii. In the left-side navigation pane, choose **Product Management** > **Products**.
iv. In the Apsara Stack O&M section, click **Apsara Infrastructure Management Framework**.

2. Go to the cluster operations page.
   i. In the left-side navigation pane, choose Operations > Cluster Operations.
   ii. In the **Cluster** search box, enter `ascm`.
   iii. Find the cluster that you want to manage and click **Operations** in the **Actions** column.
3. Obtain the value of the domain parameter.
   i. Click the Cluster Resources tab.
   ii. In the **Name** field, search for `asapi_dns_public`.
   iii. Click **Details** in the **Application Parameter** column.
   In the **Application Parameter** message, obtain the value of the **domain** parameter.



4. Generate an endpoint for the ASAPI based on the following format:

```
https://<domain>/asapi/v3
```

Method 3: Concatenate strings to generate an endpoint

You can also concatenate strings to generate an endpoint based on the following format:

```
https://public.asapi.<region>.<internet-domain>/asapi/v3
```

> **Note**
> 1. Replace <region> with your actual region ID. For information about how to query a region ID, see Query a region ID.
> 2. Replace <internet-domain> with the root domain of your Apsara Stack service. To obtain the root domain, contact Apsara Stack O&M personnel. Take note of this point: Use the internet-domain parameter instead of the intranet-domain parameter.

If the **region** value is `cn-****-****-d01` and the **internet-domain** value is `inter.****.****.com`, the following endpoint can be generated:

```
https://public.asapi.cn-****-****-d01.inter.****.****.com/asapi/v3
```

13.1.1.1.2.4. Obtain Apsara Stack SDKs

The Apsara Stack API (ASAPI) is a unified portal provided by Apsara Stack. You can use the ASAPI to connect to all Apsara Stack services. Apsara Stack provides SDKs for API calls.

For more information about how to obtain Apsara Stack SDKs, see Apsara Stack documentation.

13.1.1.1.2.5. Obtain an AccessKey pair

An AccessKey pair that consists of an AccessKey ID and an AccessKey secret is used to implement symmetric encryption. This helps you verify the identity of a requester. The AccessKey ID is used to identify a user. The AccessKey secret is used to encrypt the signature string. This topic describes how to obtain an AccessKey pair.

Prerequisites

An account of the operations administrator or the level-1 organization administrator is obtained. Only an operations administrator or a level-1 organization administrator can obtain an AccessKey pair.

Context

If you need to make API calls to the Apsara Uni-manager Management Console or other Apsara Stack services, we recommend that you use the AccessKey pair of a personal account. If you use the AccessKey pair of a personal account, configure the request headers that are described in the following table for access control. Otherwise, an error that indicates insufficient permissions can occur.

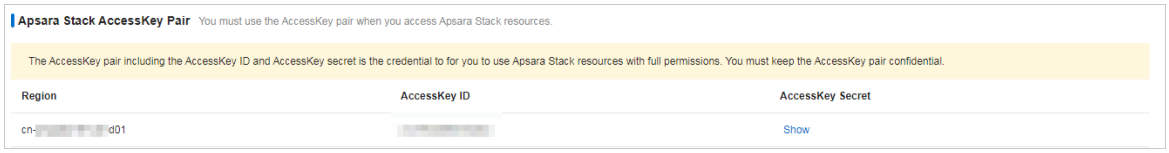
Parameter	Description
x-acs-regionid	The ID of the region, for example, cn-hangzhou-*.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console. For information about how to obtain an organization ID, see the "GetOrganizationList" section in Apsara Uni-manager Management Console Developer Guide.
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console. For information about how to obtain a resource set ID, see the "ListResourceGroup" section in Apsara Uni-manager Management Console Developer Guide.
x-acs-instanceid	The ID of the instance to which you make API calls. If you need to make API calls to an Elastic Compute Service (ECS) instance, obtain the ID of the ECS instance on the Instances page.

Warning The AccessKey pair of a personal account is managed and controlled by the permission system of the Apsara Uni-manage Management Console. If you need to obtain the AccessKey pair of an account that has permissions on an organization, make sure that your operation is allowed by an administrator. This ensures security. The account that has permissions on an organization is a privileged account.

Obtain the AccessKey pair of a personal account

To obtain the AccessKey pair of a personal account, perform the following operations:

1. Log on to the Apsara Uni-manager Management Console.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and click **User Information**.
3. In the **Apsara Stack AccessKey Pair** section, obtain the AccessKey pair.



> **Note** The AccessKey pair that consists of an AccessKey ID and an AccessKey secret is the credential for you to have full permissions on Apsara Stack resources. Keep your AccessKey pair confidential.

Obtain the AccessKey pair of an account that has permissions on an organization

To obtain the AccessKey pair of an account that has permissions on an organization, perform the following operations:

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Organizations**.
4. In the Organizations navigation tree, click the name of the organization that you want to manage.
5. On the right side of the page, click **Obtain AccessKey Pair**.
6. In the message that appears, obtain the AccessKey pair of the account that has permissions on the organization.

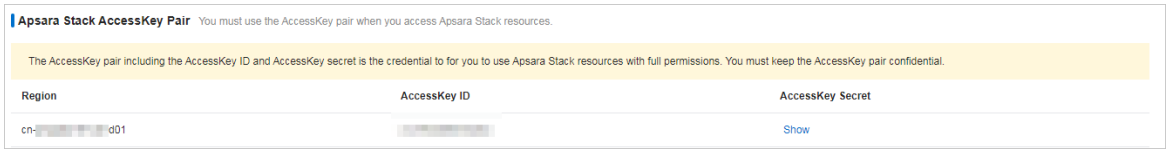
> **Note** The system automatically allocates an AccessKey pair to the account that has permissions on the level-1 organization. The same AccessKey pair is used by the accounts that have permissions on the subordinate organizations.

13.1.1.1.2.6. Query a region ID

When you use Apsara Stack SDK for Node.js to make API calls, specify a region ID. You can obtain a region ID in the Apsara Uni-manager Management Console.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and click **User Information**.
3. In the **Apsara Stack AccessKey Pair** section, view the region ID.



13.1.1.1.3. Common parameters

Common request parameters must be included in all API requests.

Sample common parameters

The following table describes the common parameters that are used when you call API operations supported by the Apsara Stack API (ASAPI).

Parameter	Type	Required	Description
Action	String	Yes	The operation that you want to perform. For more information, see View information about API operations.
Product	String	Yes	The name of the service.
Version	String	Yes	The version of the API operation. For more information, see View information about API operations.
RegionId	String	Yes	The ID of the region. For more information, see Query a region ID.
AccessKeyId	String	Yes	The AccessKey ID used to connect to the service. For more information, see Obtain an AccessKey pair.
Signature	String	Yes	The signature string of the current request. For more information about how signatures are calculated, see Request signatures.

Parameter	Type	Required	Description
SignatureMethod	String	Yes	The encryption method of the signature string. Valid values: HMAC-SHA1 and HMAC-SHA256.
SignatureVersion	String	Yes	The version of the signature encryption algorithm. Valid values: 1.0 and 2.0.
SignatureNonce	String	Yes	A unique, random number used to prevent replay attacks. You must use different numbers for different requests.
Timestamp	String	Yes	The timestamp of the request. Specify the time in the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time must be in UTC. Sample value: 2018-01-01T12:00:00Z.
Format	String	Yes	The format in which to return the response. Set the value to JSON.

Note

The `Signature`, `SignatureMethod`, `SignatureVersion`, `SignatureNonce`, `Timestamp`, and `Format` parameters are encapsulated into Apsara Stack SDK. You do not need to configure these parameters.

13.1.1.1.4. SDK description

13.1.1.1.4.1. Use Apsara Stack SDK for Java to call API operations

This topic describes how to obtain and use Apsara Stack SDK for Java to call API operations.

Prerequisites

- An authorized account and an AccessKey pair are obtained. The AccessKey pair consists of an AccessKey ID and an AccessKey secret. For more information about how to obtain an AccessKey pair in the Apsara Uni-manager Management Console, see Obtain an AccessKey pair.
- The endpoint of the Apsara Stack API (ASAPI) is obtained. For more information, see Generate an endpoint for the ASAPI.
- Apsara Stack SDK for Java 1.8 or later is installed.

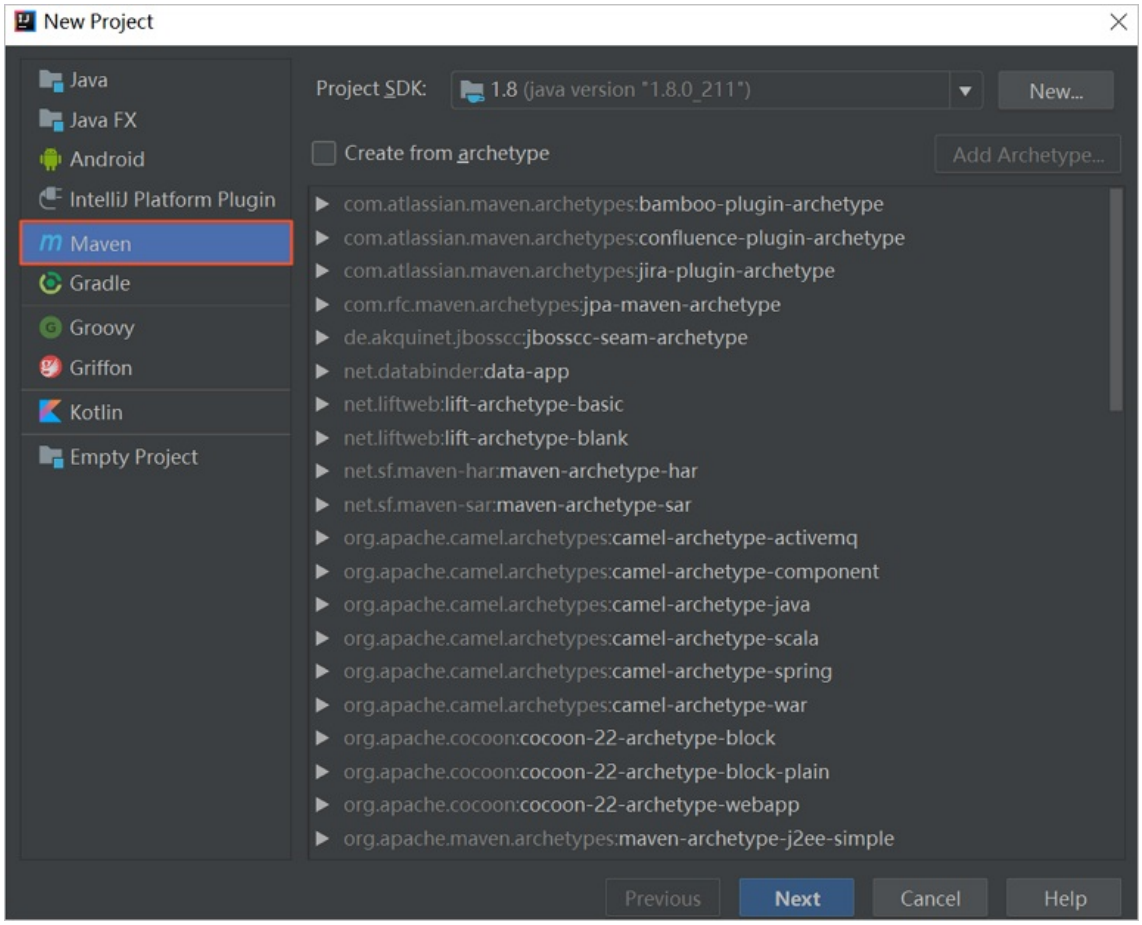
Background information

The help center of Apsara Stack provides Maven dependencies and JAR files for Apsara Stack SDK for Java. You can write code to use Apsara Stack SDK for Java to call API operations.

In this example, the Windows 10 64-bit OS and IntelliJ IDEA are used.

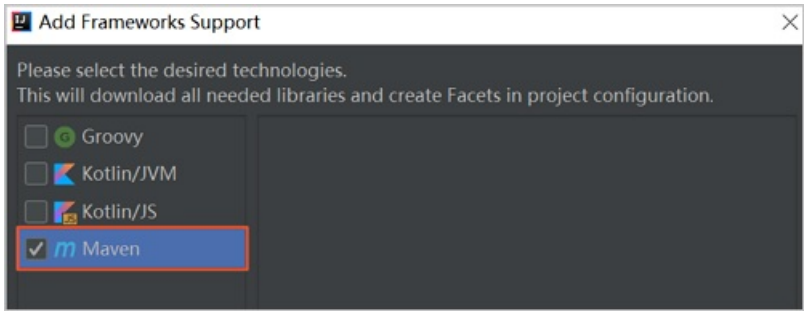
Procedure

1. Use one of the following methods to configure Maven in IntelliJ IDEA. Maven is a tool used for project management.
   - Use Maven that is integrated in IntelliJ IDEA.
   - Download Maven based on the OS that you are using from the official website and configure Maven. For more information, see Download Maven.
2. Obtain the Maven dependencies for Apsara Stack SDK for Java from the official website. For more information about how to obtain the dependencies, see Obtain the core package for ASAPI.
3. Use one of the following methods to create a Maven project:
   - Method 1: Create a Maven project in IntelliJ IDEA.

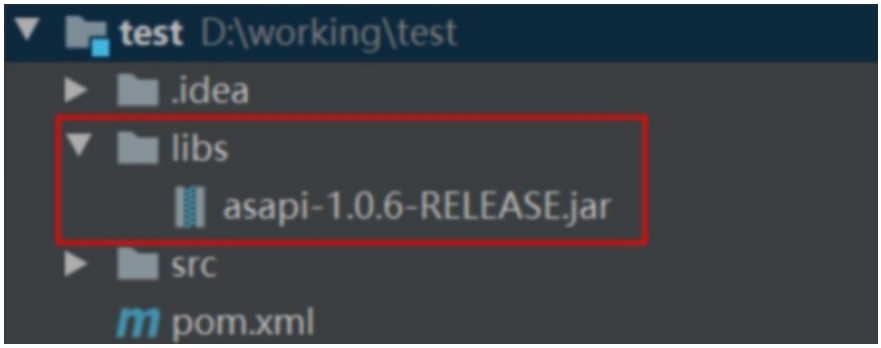


- Method 2: Convert an existing project to a Maven project.
  a. Right-click the project that you want to convert and select **Add Framework Support...**.

  b. Select **Maven** and click **OK**.



4. Create a folder named libs in the root directory of the project. Then, add the JAR file of Apsara Stack SDK for Java to the libs folder, as shown in the following figure.



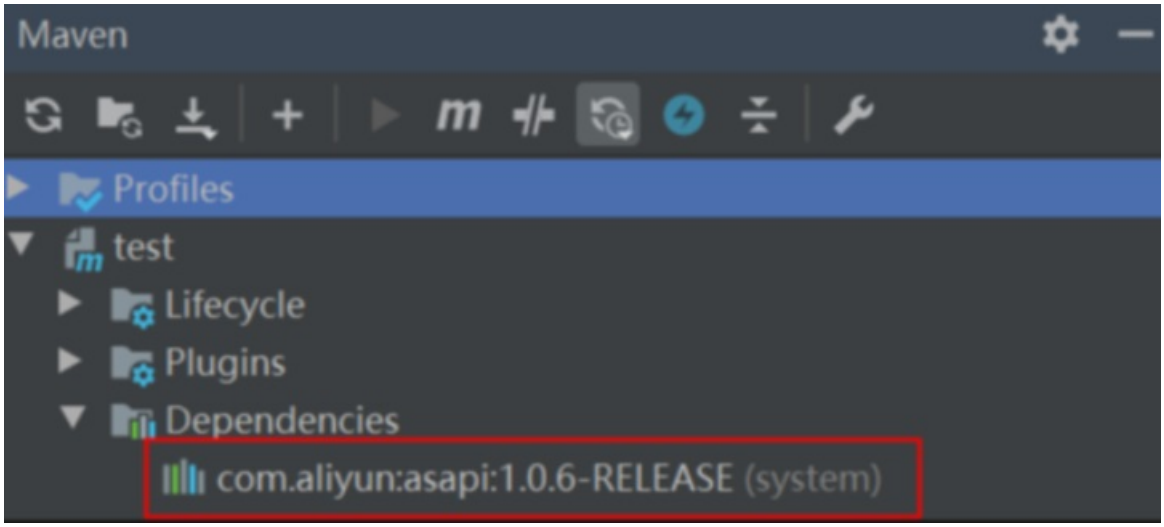
5. Add the dependencies of Apsara Stack SDK for Java to the pom.xml file in the project directory.

```
<dependencies>
    <dependency>
        <groupId>com.aliyun</groupId>
        <artifactId>asapi</artifactId>
        <version>1.0.6-RELEASE</version>
        <scope>system</scope>
        <systemPath>${project.basedir}/libs/asapi-1.0.6-RELEASE.jar</systemPath>
    </dependency>
  <dependency>
        <groupId>com.alibaba</groupId>
        <artifactId>alicrypto-java-aliyun</artifactId>
    <version>1.0.4</version>
    <systemPath>${project.basedir}/libs/alicrypto-java-aliyun-1.0.4.jar</systemPath>
  </dependency>
  <dependency>
    <groupId>com.aliyun</groupId>
    <artifactId>gmsse</artifactId>
    <version>1.1.0</version>
    <systemPath>${project.basedir}/libs/gmsse-1.1.0.jar</systemPath>
  </dependency>
</dependencies>
```

> **Note** Replace `1.0.6-RELEASE` with the actual version of Apsara Stack SDK for Java.

6. On the right side of IntelliJ IDEA, view information in the Maven section.

If the information in the following figure appears, the dependencies are added.



Use Apsara Stack SDK for Java

You can use the GET or POST method to call API operations provided by the ASAPI. The following sample code shows how to call API operations:

```
// 1. Create a connection to an ASClient object.
ASClient client = new ASClient();
// 2. Configure the identifier of the requester. This parameter is required and used only f
or identification. You can set this parameter to a random value.
client.setSdkSource("<The identifier of the requester>");
Map<String, Object> parameters = new HashMap<String, Object>();
// 3. Configure the parameters for authorization. The parameter values vary based on your e
nvironment.
// The AccessKey ID of your Apsara Stack tenant account.
parameters.put("AccessKeyId","<AccessKey ID>");
// The AccessKey secret of your Apsara Stack tenant account.
parameters.put("AccessKeySecret", "<AccessKey Secret>");
// The ID of the region.
parameters.put("RegionId", "<your RegionID>");
// 4. Configure parameters for an API call. In this example, the Product, Action, and Versi
on parameters are configured.
parameters.put("Product", "<The name of the service>");
parameters.put("Action", "<The name of the API operation>");
parameters.put("Version", "<The version of the API operation>");
// 5. Configure operation-specific parameters.
parameters.put("<The name of the operation-specific parameter>", "<The value of the operati
on-specific parameter>");
// 6. Configure request headers and the encryption method for the signature string. Valid v
alues of the SignatureMethod parameter: HMAC-SHA1 and HMAC-SHA256. By default, HMAC-SHA256
is used.
Map<String, String> headers = new HashMap<String, String>();
//headers.put("SignatureMethod", "HMAC-SHA1");
headers.put("x-acs-regionid", "<your-regionid>");
headers.put("x-acs-resourcegroupid", "<your-resourcegroupid>");
headers.put("x-acs-organizationid", "<your-organizationid>");
headers.put("x-acs-instanceid", "<your-instanceid>");
// 7. Make an API call. We recommend that you use the doPost() method.
// Configure the time-out period for a connection.
//client.setConnectTimeout(10000);
// Configure the time-out period for a request.
// client.setSocketTimeout(10000);
String result = client.doPost(endpoint, headers, parameters);
System.out.println(result);
```

Configure a proxy

If you need to use a proxy to make API calls, use the following sample code to configure the proxy:

```
Cloud cloud = new Cloud();
// Configure the IP address of the proxy.
cloud.setConfig("proxy_host", "<IP>");
// Configure the port used by the proxy.
cloud.setConfig("proxy_port", "<Port>");
// 1. Create a connection to an ASClient object.
ASClient client = new ASClient(cloud);
```

Request headers

Parameter	Description
x-acs-regionid	The ID of the region. For more information about how to obtain a region ID, see Query the region ID.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console.
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console.
x-acs-instanceid	The ID of the instance to which you make API calls.

13.1.1.1.4.2. Use Apsara Stack SDK for Python to call API operations

This topic describes how to use Apsara Stack SDK for Python to call API operations provided by the Apsara Stack API (ASAPI).

Preparations

- An authorized account and an AccessKey pair are obtained. The AccessKey pair consists of an AccessKey ID and an AccessKey secret. For more information about how to obtain an AccessKey pair in the Apsara Uni-manager Management Console, see Obtain an AccessKey pair.
- The endpoint of the ASAPI is obtained. For more information, see Generate an endpoint for the ASAPI.

Install Apsara Stack SDK for Python

1. Download the required version of Apsara Stack SDK for Python. For more information, see Obtain Apsara Stack SDKs.
2. Upload the compressed file of Apsara Stack SDK for Python to the host from which you want to send API requests and extract the file. Then, run the following code in the directory of the extracted files to install Apsara Stack SDK for Python:

```
# Install Apsara Stack SDK for Python 2.x.
pip install aliyun-python2-sdk-asapi-2.4.7.tar.gz
# Install Apsara Stack SDK for Python 3.x.
pip3 install aliyun-python3-sdk-asapi-2.4.7.tar.gz
```

> **Note**
>
> Replace `2.4.7` with the actual version of Apsara Stack SDK for Python.

Sample requests

You can use the GET or POST method to call API operations provided by the ASAPI.

```
    # 1. Import dependencies.
    from aliyunsdkasapi.ASClient import ASClient
    from aliyunsdkasapi.AsapiRequest import AsapiRequest

    if __name__ == '__main__':
     # 2. Create a request. The Product parameter specifies the name of the service. The Ver
sion parameter specifies the version of the API operation. The Action parameter specifies t
he operation that you want to perform. The asapi-endpoint parameter specifies the endpoint
of the ASAPI.
     req = AsapiRequest("<Product>", "<Version>", "<Action>", "<asapi-endpoint>")
     # 3. Configure operation-specific parameters.
     req.add_body_params("<key>", "<value>")
     # 4. Configure request headers.
     req.add_header("x-acs-resourcegroupid", "<your-resourcegroupid>");
     req.add_header("x-acs-organizationid", "<your-organizationid>");
     req.add_header("x-acs-regionid", "<your-regionid>");
     req.add_header("x-acs-instanceid", "<your-instanceid>");
     # 5. Configure a request method.
     req.set_method("POST")
     # 6. Configure initialization parameters for an ASClient object. The parameter values v
ary based on your environment. The timeout parameter specifies the time-out period for a re
quest. The cert_file parameter specifies the certificate. The verify parameter specifies wh
ether to verify the certificate.
     as_client = ASClient("<accesskeyid>", "<accesskeysecret>", "<regionid>",timeout=1000,
             cert_file=None,
             verify=False)
     # Configure the identifier of the requester. This parameter is required and used only f
or identification. You can set this parameter to a random value.
     as_client.setSdkSource("<The identifier of the requester>")
     response = as_client.do_request(req)
     print(response)
```

Request headers

Parameter	Description
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console.
x-acs-regionid	The ID of the region. For more information about how to obtain a region ID, see Query a region ID.
x-acs-instanceid	The ID of the instance to which you make API calls.

Configure a proxy

Perform the following steps to configure a proxy:

1. Import OS dependencies.

```
import os
```

2. Configure one or more proxies.

```
# Before you make an API call, configure one or more proxies.
os.environ['http_proxy'] = "http://x.x.x.x:xxxx"
os.environ['https_proxy'] = "https://x.x.x.x:xxxx"
```

13.1.1.1.4.3. Use Apsara Stack SDK for Node.js to call API operations

This topic describes how to obtain and use Apsara Stack SDK for Node.js to call API operations.

Preparations

- An authorized account and an AccessKey pair are obtained. The AccessKey pair consists of an AccessKey ID and an AccessKey secret. For more information about how to obtain an AccessKey pair in the Apsara Uni-manager Management Console, see Obtain an AccessKey pair.
- The endpoint of the Apsara Stack API (ASAPI) is obtained. For more information, see Generate an endpoint for the ASAPI.
- A region ID is obtained. For more information about how to obtain a region ID, see Query the region ID.

Add dependencies

Run the following command to install Apsara Stack SDK for Node.js:

```
tnpm install --save @ali/asapi-nodejs-sdk
```

Use Apsara Stack SDK for Node.js

The following sample code shows how to use Apsara Stack SDK for Node.js to make API calls:

```
// 1. Import the dependencies of Apsara Stack SDK for Node.js.
const Controller = require('egg').Controller;
const ASAPIClient = require('@ali/asapi-nodejs-sdk');
// 2. Configure the parameters.
const cnofig = {
    API_GATEWAY: '<The endpoint of the ASAPI>',
    regionId: '<The ID of the region in which the Apsara Stack service is deployed>',
    accessKeyId: '<The AccessKey ID of your Apsara Stack tenant account>',
    accessKeySecret: '<The AccessKey secret of your Apsara Stack tenant account>'
};
// 3. Initialize a client for API calls.
const AsapiClient = new ASAPIClient(cnofig, this.ctx);
// 4. Configure request parameters.
const params = {
    "Action": "<The name of the API operation>",
    "Product": "<The name of the service that provides the API operation>",
    "Version": "<The version of the API operation>",
    "regionId": '<The ID of the region in which the Apsara Stack service is deployed>',
      "<The name of the operation-specific parameter required by the API operation>": "<The
value of the operation-specific parameter>"
}
// 5. Configure request headers.
AsapiClient.addHeader('x-acs-caller-sdk-source', '<The identifier of the requester>')
AsapiClient.addHeader('x-acs-roleid', '<The ID of the role>')
AsapiClient.addHeader('x-acs-userid', '<The ID of the user>')
AsapiClient.addHeader('x-acs-organizationid', '<your-organizationid>')
AsapiClient.addHeadert("x-acs-regionid", "<your-regionid>");
AsapiClient.addHeader("x-acs-resourcegroupid", "<your-resourcegroupid>");
AsapiClient.addHeader("x-acs-instanceid", "<your-instanceid>");
// 6. Make an API call and obtain the response.
try {
  const res = await AsapiClient.doRequest(cnofig.API_GATEWAY, params, {
    method: 'POST', // The request method.
    formatParams: false, // Specifies whether to format parameters and capitalize the first
letter of each parameter.
    enableProxy: true, // Specifies whether to configure a proxy.
    proxy: 'http://x.x.x.x:xxxx',
    timeout: 10000, // The time-out period.
  // ca: , // The certificate issued by a certificate authority (CA). For more information,
visit https://nodejs.org/api/https.html#https_https_request_options_callback.
  })
  console.log(res)
} catch (e) {
  console.log(e)
}
```

Disable certificate validation

The following sample code shows how to disable certificate validation:

```
Configure the environment variable.
NODE_TLS_REJECT_UNAUTHORIZED=0
```

Request headers

Parameter	Description
x-acs-regionid	The ID of the region. For more information about how to obtain a region ID, see Query the region ID.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console.
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console.
x-acs-instanceid	The ID of the instance to which you make API calls.
x-acs-caller-sdk-source	The custom name of the requester or the system. This parameter is used to identify the source of the API request.
x-acs-roleid	The ID of the role.
x-acs-userid	The ID of the user.

13.1.1.1.4.4. SDK for POP

SDK for Java

Before you use Apsara Stack API (ASAPI) SDK for POP for Java to access ASAPI, you must know the remote procedure call (RPC) and resource-oriented architecture (ROA) styles that are supported for API calls. ASAPI is compatible with both styles. Their difference lies in the ASAPI endpoints that are used for API calls.

Prerequisites

- An Alibaba Cloud SDK package is downloaded for the service that you want to access. The required dependencies are installed.
- SSL certificate validation is ignored for requests over HTTPS.

Background information

ASAPI supports only the HTTPS request protocol.

Difference between two styles

When you use the RPC or ROA style to make API calls, take note that the two styles use different ASAPI endpoints.

```
# ASAPI endpoint for the RPC style:
public.asapi.<global:region>.<global:internet-domain>/asapi/v3
# ASAPI endpoint for the ROA style:
public.asapi.<global:region>.<global:internet-domain>/asapi/v3/roa
```

Call examples

The following sample code provides an example on how to use the RPC style to make an API call. In this example, the DescribeInstances operation of Elastic Compute Service (ECS) is called, and the API version is 2014-05-26.

Sample code:

```
package com.aliyuns.client.pop.ecs;

import com.aliyuncs.DefaultAcsClient;
import com.aliyuncs.ecs.model.v20140526.DescribeInstancesRequest;
import com.aliyuncs.ecs.model.v20140526.DescribeInstancesResponse;
import com.aliyuncs.http.HttpClientConfig;
import com.aliyuncs.http.ProtocolType;
import com.aliyuncs.profile.DefaultProfile;

import java.util.List;

public class DescribeInstancesTest {
    public static void main(String[] args) {
        // Specify the endpoint of ASAPI.
        String endpoint = "public.asapi.<global:region>.<global:internet-domain>/asapi/v3";
        // Specify the region where the ECS service resides.
        String region = "<global:region>";
        // Specify the name of the service that you want to access.
        String product = "ECS";
        // Specify your AccessKey pair.
        String ak = "<accessKeyId>";
        String sk = "<accessKeySecret>";
        try {
            DefaultProfile clientProfile = DefaultProfile.getProfile(region, ak, sk);
            // Ignore SSL certificate validation.
            HttpClientConfig clientConfig = HttpClientConfig.getDefault();
            clientConfig.setIgnoreSSLCerts(true);
            // Set the connection timeout period.
            clientConfig.setConnectionTimeoutMillis(3000L);
            // Set the read timeout period.
            clientConfig.setReadTimeoutMillis(10000L);
            clientProfile.setHttpClientConfig(clientConfig);
            // Create a connection.
            DefaultAcsClient acsClient = new DefaultAcsClient(clientProfile);
            // Create a request.
            DescribeInstancesRequest request = new DescribeInstancesRequest();
            // Specify the endpoint of ASAPI.
            request.setSysEndpoint(endpoint);
            // Specify the name of the service that you want to access and the region where
the service resides.
            request.setSysLocationProduct(product);
            request.setSysRegionId(region);
            // Set the request protocol to HTTPS.
            request.setSysProtocol(ProtocolType.HTTPS);
            DescribeInstancesResponse result =  acsClient.getAcsResponse(request);
            List<DescribeInstancesResponse.Instance> instances = result.getInstances();
            for (DescribeInstancesResponse.Instance instance: instances) {
                System.out.println(instance.getInstanceId());
                System.out.println(instance.getInstanceName());
```

```
            }

        } catch (Exception e) {
            e.printStackTrace();
        }
    }
}
```

The following sample code provides an example on how to use the ROA style to make an API call. In this example, the GetNamespaceList operation of Container Registry is called, and the API version is 2016-06-07.

Sample code:

```
package com.aliyuns.client.pop.cr;

import com.aliyuncs.CommonRequest;
import com.aliyuncs.CommonResponse;
import com.aliyuncs.DefaultAcsClient;
import com.aliyuncs.IAcsClient;
import com.aliyuncs.exceptions.ClientException;
import com.aliyuncs.exceptions.ServerException;
import com.aliyuncs.http.FormatType;
import com.aliyuncs.http.HttpClientConfig;
import com.aliyuncs.http.MethodType;
import com.aliyuncs.http.ProtocolType;
import com.aliyuncs.profile.DefaultProfile;

public class GetNamespaceListTest {
    public static void main(String[] args) {
        // Specify the endpoint of ASAPI.
        String endpoint = "public.asapi.<global:region>.<global:internet-domain>/asapi/v3/roa";
        // Specify the region where the Container Registry service resides.
        String region = "<global:region>";
        // Specify the name of the service that you want to access.
        String product = "cr";
        // Specify your AccessKey pair.
        String ak = "<accessKeyId>";
        String sk = "<accessKeySecret>";
        DefaultProfile profile = DefaultProfile.getProfile(region, ak, sk);
        // Ignore SSL certificate validation.
        HttpClientConfig clientConfig = HttpClientConfig.getDefault();
        clientConfig.setIgnoreSSLCerts(true);
        // Set the connection timeout period.
        clientConfig.setConnectionTimeoutMillis(3000L);
        // Set the read timeout period.
        clientConfig.setReadTimeoutMillis(10000L);
        profile.setHttpClientConfig(clientConfig);
        // Create a connection for the client.
        IAcsClient client = new DefaultAcsClient(profile);
        // Create a request.
        CommonRequest request = new CommonRequest();
        // Set the request protocol to HTTPS.
```

```
        request.setSysProtocol(ProtocolType.HTTPS);
        // Specify the request method.
        request.setSysMethod(MethodType.GET);
        // Specify the endpoint of ASAPI.
        request.setSysDomain(endpoint);
        // Specify the version of the API.
        request.setSysVersion("2016-06-07");
        // Specify the pattern of the uniform resource identifier (URI).
        request.setSysUriPattern("/namespace");
        // Specify the name of the service that you want to access and the region where the
service resides.
        request.setSysLocationProduct(product);

        request.putHeadParameter("Content-Type", "application/json");
        String requestBody = "" +
                "{}";
        request.setHttpContent(requestBody.getBytes(), "utf-8", FormatType.JSON);
        try {
            CommonResponse response = client.getCommonResponse(request);
            System.out.println(response.getData());
        } catch (ServerException e) {
            e.printStackTrace();
        } catch (ClientException e) {
            e.printStackTrace();
        }
    }
}
```

Notice

If you send a request over HTTPS, you must enable the request to ignore SSL certificate validation.

SDK for Go

This topic describes how to use Apsara Stack API (ASAPI) SDK for POP for Go.

Prerequisites

An Alibaba Cloud SDK package is downloaded for the service that you want to access. The required dependencies are installed.

Background information

Only the remote procedure call (RPC) style is supported for API calls.

Call examples

The following sample code provides an example on how to make an API call. In this example, the DescribeInstances operation of Elastic Compute Service (ECS) is called, and the API version is 2014-05-26.

Sample code:

```
package main
```

```
import (
 "fmt"
 "time"

 "github.com/aliyun/alibaba-cloud-sdk-go/sdk"
 "github.com/aliyun/alibaba-cloud-sdk-go/sdk/auth/credentials"
 "github.com/aliyun/alibaba-cloud-sdk-go/sdk/requests"
 "github.com/aliyun/alibaba-cloud-sdk-go/sdk/responses"
)

func getSdkConfig() *sdk.Config {
 return sdk.NewConfig().
  WithTimeout(time.Duration(30) * time.Second).
  WithEnableAsync(true).
  WithGoRoutinePoolSize(100).
  WithMaxTaskQueueSize(10000).
  WithDebug(false).
  WithScheme("HTTP")
}

func main(){
 ak := "<The AccessKey ID of your Apsara Stack tenant account.>"
 sk := "<The AccessKey secret of your Apsara Stack tenant account.>"
 regionId := "<The region where the ECS service resides.>"
 endpoint := "<The endpoint of ASAPI.>" // No network protocol.
 request := requests.NewCommonRequest()
  request.SetReadTimeout(10 * time.Second) // Set the read timeout period of the request to
10 seconds.
  request.SetConnectTimeout(5 * time.Second)  // Set the connection timeout period of the r
equest to 5 seconds.
 request.Method = requests.GET
 request.Domain = endpoint         // Location Service will not be enabled if the host is s
pecified. For example, the service with a certification type-bearer token must be specified
.
 request.Version = "2014-05-26"            // Specify the version of the API.
 request.Scheme = "https"                // Specify the request protocol. Default value: ht
tp.
 request.ApiName = "DescribeInstances"
 request.QueryParams["Product"] = "Ecs"  // Specify the name of the service that you want t
o access.
 request.TransToAcsRequest()
 client, err := sdk.NewClientWithOptions(regionId,getSdkConfig(),credentials.NewAccessKeyCr
edential(ak,sk))
 // If relevant parameters are not set for the request, the client settings are used.
  //client.SetReadTimeout(10 * time.Second)              // Set the read timeout period of
the client to 10 seconds.
 //client.SetConnectTimeout(5 * time.Second)            // Set the connection timeout perio
d of the client to 5 seconds.
  resp := responses.BaseResponse{}
  err = client.DoAction(request, &resp)
    if err != nil {
        panic(err)
    }
 fmt.Print(endpoint)
```

```
}
```

Configure proxies

You can configure proxies in one of the following ways:

- Configure proxies by using environment variables.

  Set the HTTP_PROXY and HTTPS_PROXY environment variables, or set the NO_PROXY environment variable.

  Sample code:

```
import (
    "os"
)
func main(){
 os.Setenv("HTTP_PROXY", "http://x.x.x.x:xxxx") // Set the HTTP_PROXY environment variabl
e.
 os.Setenv("HTTPS_PROXY", "https://x.x.x.x:xxxx") // Set the HTTPS_PROXY environment vari
able.
}
```

- Configure proxies on the client.

  Sample code:

```
// The proxies that are configured on the client take precedence over those that are conf
igured by using environment variables.
client.SetHttpProxy("http://x.x.x.x:xxxx")    // Configure the HTTP proxy.
client.GetHttpProxy()                           // Query the HTTP proxy.

client.SetHttpsProxy("https://x.x.x.x:xxxx")    // Configure the HTTPS proxy.
client.GetHttpsProxy()                            // Query the HTTPS proxy.

client.SetNoProxy("127.0.0.1,localhost")      // Configure the proxy whitelist.
client.GetNoProxy()                           // Query the proxy whitelist.
```

SDK for Python

This topic describes how to use Apsara Stack API (ASAPI) SDK for POP for Python.

Prerequisites

An Alibaba Cloud SDK package is downloaded for the service that you want to access. The required dependencies are installed.

Background information

Only the remote procedure call (RPC) style is supported for API calls.

Call examples

The following sample code provides an example on how to make an API call. In this example, the DescribeInstances operation of Elastic Compute Service (ECS) is called, and the API version is 2014-05-26.

Sample code:

```
from aliyunsdkcore.client import AcsClient
from aliyunsdkcore.acs_exception.exceptions import ClientException
from aliyunsdkcore.acs_exception.exceptions import ServerException
from aliyunsdkecs.request.v20140526 import DescribeInstancesRequest
import os

# Create an AcsClient instance.
client = AcsClient(
   "<your-access-key-id>",
   "<your-access-key-secret>",
   "<your-region-id>",

   timeout=1000,  # Set the timeout period.
    verify=False, # Ignore certificate validation. or verify='<The location where the certi
ficate is stored.>'
);
# Set the following parameters for the HTTPS request protocol:
# client.set_verify(False)
# os.environ["HTTPS_PROXY"] = "http://127.0.0.1:8080"

# os.environ["HTTP_PROXY"] = "http://127.0.0.1:8080"
def hello_ecs_instance():
    # Create a request and set the parameters.
    request = DescribeInstancesRequest.DescribeInstancesRequest()

    params = {"PageNumber":"1", "Product":"Ecs","Version": "2014-05-26","Action": "Describe
Instances"};
    request.set_body_params(params)
    # The endpoint that contains no network protocol is in the following format: ASAPI doma
in name/asapi/v3.
    request.set_endpoint('<The endpoint of ASAPI.>')
    # Set the following parameter if the endpoint contains no network protocol:
    request.set_protocol_type("https")

    request.set_PageSize(10)
    # Initiate the API request and obtain the response.
    response = client.do_action_with_exception(request)
    print(response)

if __name__ == '__main__':
    print("Hello Aliyun OpenApi!")
    hello_ecs_instance()
```

Configure proxies

Set the HTTP_PROXY and HTTPS_PROXY environment variables.

Sample code:

```
# Configure the HTTPS proxy.
os.environ["HTTPS_PROXY"] = "http://x.x.x.x:xxxx"

# Configure the HTTP proxy.
os.environ["HTTP_PROXY"] = "https://x.x.x.x:xxxx"
```

13.1.1.1.5. HTTP requests

13.1.1.1.5.1. Overview

This topic describes how to make API requests and is intended for users who use API URLs to initiate HTTP GET requests.

If you are using an SDK to initiate requests, you can skip this topic.

The request URL consists of different parameters and has a fixed syntax. The URL contains common request parameters, your signature, and operation-specific parameters. Sample request URLs are provided for each API operation. These URLs are not encoded to make them easy to read. Before you make a request, you must encode the request URL. After the authentication process is complete based on your signature, the results are returned to you. Response parameters are returned if the call is successful, whereas an error message is returned if the call fails. You can troubleshoot issues based on the error message.

13.1.1.1.5.2. Request syntax

The Apsara Stack API (ASAPI) allows you to call API operations by sending HTTP GET requests based on URLs. Each URL must include request parameters. This topic describes the syntax of HTTP GET requests and provides the endpoint of the ASAPI.

Sample request

GetOrganizationList is used in the following unencoded URL request:

```
https://public.asapi.aliyuns.com/asapi/v3?Action=GetOrganizationList&Product=ascm&Version=2019-05-10&Id=<Organization ID>&<Common parameters>
```

- `https`: the protocol used to transmit the request.
- `public.asapi.aliyuns.com/asapi/v3`: the endpoint of the ASAPI.
- `Action=GetOrganizationList Product=ascm Version=2019-05-10`: the API operation to call.
- `Id`: the ID of the organization.
- `<Common parameters>`: the common parameters specified in the system.

Protocol

The ASAPI supports only HTTPS.

Endpoint

For more information about how to obtain an endpoint, see Generate an endpoint for the ASAPI.

Parameter

To specify an API operation, use the `Action, Product, and Version` parameters. For example, set `Action` to GetOrganizationList, Product to ascm, and Version to 2019-05-10. You must also specify other operation-specific parameters and common parameters. For more information, see Common parameters.

13.1.1.1.5.3. Request signatures

This topic describes how to sign HTTP API requests. ASAPI uses the request signature to verify the identity of the request sender. ASAPI implements symmetric encryption by using an AccessKey pair to verify the identity of the request sender.

> **Note**
>
> - An AccessKey pair consists of an AccessKey ID and an AccessKey secret, which are issued to each user or organization in the Apsara Uni-manager Management Console.
> - The AccessKey ID is used to verify identities of users, and the AccessKey secret is used to encrypt and verify signature strings. You must keep your AccessKey secret confidential.
> - ASAPI provides SDKs for Node.js, Python, and Java to facilitate complex signature calculation. For more information, see Obtain the core package for ASAPI.

Step 1: Create a canonicalized query string

1. Arrange the request parameters in alphabetical order, including all common and operation-specific parameters except the `Signature` parameter.

   > **Note**
   >
   > If you use the GET method to send a request,these parameters are connected by ampersands (&) and included in the request URL. The first request parameter follows a question mark (?).

2. Encode the request parameters and their values in UTF-8 based on RFC 3986. The following rules apply in the encoding process:
   - Letters, digits, and special characters such as hyphens (`-`), underscores (`_`), and periods (`.`) do not need to be encoded.
   - Other characters must be percent encoded in the `%XY` format. `XY` represents the ASCII code of the characters in hexadecimal notation. For example, double quotation marks (`"`) are encoded as `%22` .

- Extended UTF-8 characters are encoded in the `%XY%ZA...` format.
- Spaces must be encoded as `%20`. Do not encode spaces as plus signs (`+`).

  This encoding method is similar to but different from the `application/x-www-form-urlencoded` MIME encoding algorithm.

  If you use `java.net.URLEncoder` from the Java standard library, use `percentEncode` to encode request parameters and their values. In the encoded query string, replace the plus signs (`+`) with `%20` , asterisks (`*`) with `%2A` , and `%7E` with tildes (`~`). This way, you can obtain an encoded string that matches the preceding encoding rules.

```
private static final String ENCODING = "UTF-8";
private static String percentEncode(String value) throws UnsupportedEncodingException
{
    return value != null ? URLEncoder.encode(value, ENCODING).replace("+", "%20").rep
lace("*", "%2A").replace("%7E", "~") : null;
}
```

3. Use equal signs (`=`) to connect the encoded request parameters and their values.
4. Use ampersands (`&`) to connect the encoded request parameters. These parameters must be arranged in the same order as those in Step 1.

Then, a canonicalized query string that follows the request structure is obtained. For more information, see Request structure.

Step 2: Create a string-to-sign

1. Create a `string-to-sign` . You can also use `percentEncode` to encode the canonicalized query string created in Step 1 based on the following rules:

```
StringToSign=
    HTTPMethod + "&" + //HTTPMethod: the HTTP method that is used to send a request, su
ch as GET.
    percentEncode("/") + "&" + //percentEncode("/"): Encode the forward slash (/) in UT
F-8 as %2F.
    percentEncode(CanonicalizedQueryString) // Encode the canonicalized query string cr
eated in Step 1.
```

2. Calculate the RFC 2104-compliant HMAC-SHA1 or HMAC-256 value of `StringToSign` . In the following example, Java Base64 is used:

```
String signature = Base64.getEncoder().encodeToString(signData);
```

> **Note**
>
> When you calculate the signature, the key value specified by RFC 2104 is your `AccessKey secret` plus an ampersand (&), which has an ASCII value of 38. For more information, see Obtain an AccessKey pair.

3. Encode the `Signature` parameter based on RFC 3986 and add it to the canonicalized query string.

Example 1: Concatenate parameters

`GetOrganizationList` is used in this example to query regions. For example, `AccessKeyID` is set to testid and `AccessKeySecret` is set to testsecret. Perform the following operations:

1. Construct a canonicalized query string.

```
https://public.asapi.aliyuns.com/asapi/v3/?AccessKeyId=testid&Action=GetOrganizationList&Format=JSON&Id=1&Product=ascm&RegionId=cn-region-test&SignatureMethod=HMAC-SHA1&SignatureNonce=43967c6e-e3ad-44fa-b06b-fcf3db5f39d2&SignatureVersion=1.0&Timestamp=2020-09-15T08%3A50%3A40Z&Version=2019-05-10
```

2. Create a `string-to-sign` .

```
GET&%2F&AccessKeyId%3Dtestid%26Action%3DGetOrganizationList%26Format%3DJSON%26Id%3D1%26Product%3Dascm%26RegionId%3Dcn-region-test%26SignatureMethod%3DHMAC-SHA1%26SignatureNonce%3D43967c6e-e3ad-44fa-b06b-fcf3db5f39d2%26SignatureVersion%3D1.0%26Timestamp%3D2020-09-15T08%253A50%253A40Z%26Version%3D2019-05-10
```

3. Calculate the signature.

   Calculate the signature. The key value used for calculation is `testsecret&` because `AccessKeySecret` is set to testsecret. The calculated signature is `OLeaidS1JvxuMvnyHOwuJ+uX5qY=` . Java Base64 is used in the following sample code:

   `String signature = Base64.getEncoder().encodeToString(signData);` Encode `Signature=hvqv9Ll5RE6kQ4YsQXFAf9VuRIY=` based on RFC 3986 and add it to the canonicalized query string.

```
https://public.asapi.aliyuns.com/asapi/v3/?AccessKeyId=testid&Action=GetOrganizationList&Format=JSON&Id=1&Product=ascm&RegionId=cn-region-test&SignatureMethod=HMAC-SHA1&SignatureNonce=43967c6e-e3ad-44fa-b06b-fcf3db5f39d2&SignatureVersion=1.0&Timestamp=2020-09-15T08%3A50%3A40Z&Version=2019-05-10
```

You can use browsers or tools such as cURL and Wget to initiate an HTTP request for calling the `DescribeRegions` operation to query the Alibaba Cloud region list.

Example 2: Use the standard library of the programming language

`GetOrganizationList` is used in this example to query regions. For example, `AccessKeyID` is set to testid, `AccessKeySecret` is set to testsecret, and all request parameters are stored in a Java `Map<String, String>` object.

1. Predefine an encoding method.

```
private static final String ENCODING = "UTF-8";
private static String percentEncode(String value) throws UnsupportedEncodingException {
        return value != null ? URLEncoder.encode(value, ENCODING).replace("+", "%20").r
eplace("*", "%2A").replace("%7E", "~") : null;
}
```

2. Predefine the time format for the `Timestamp` parameter. Specify the `Timestamp` parameter in the ISO 8601 format. The time must be in UTC+0.

```
private static final String ISO8601_DATE_FORMAT = "yyyy-MM-dd'T'HH:mm:ss'Z'";
private static String formatIso8601Date(Date date) {
    SimpleDateFormat df = new SimpleDateFormat(ISO8601_DATE_FORMAT);
    df.setTimeZone(new SimpleTimeZone(0, "GMT"));
    return df.format(date);
}
```

3. Create a request string.

```
final String HTTP_METHOD = "GET";
Map parameters = new HashMap();
// Specify request parameters.
parameters.put("Product", "ascm");
parameters.put("Action", "GetOrganizationList");
parameters.put("Version", "2019-05-10");
parameters.put("AccessKeyId", "testid");
parameters.put("RegionId", "cn-region-test");
parameters.put("Timestamp", formatIso8601Date(new Date()));
parameters.put("SignatureMethod", "HMAC-SHA1");
parameters.put("SignatureVersion", "1.0");
parameters.put("SignatureNonce", UUID.randomUUID().toString());
parameters.put("Format", "JSON");
parameters.put("Id", "1");
// Arrange request parameters.
String[] sortedKeys = parameters.keySet().toArray(new String[]{});
Arrays.sort(sortedKeys);
final String SEPARATOR = "&";
// Create a string-to-sign.
StringBuilder stringToSign = new StringBuilder();
stringToSign.append(HTTP_METHOD).append(SEPARATOR);
stringToSign.append(percentEncode("/")).append(SEPARATOR);
StringBuilder canonicalizedQueryString = new StringBuilder();
for(String key : sortedKeys) {
    // Encode the key and the value.
    canonicalizedQueryString.append("&")
    .append(percentEncode(key)).append("=")
    .append(percentEncode(parameters.get(key)));
}
//Encode the canonicalized query string.
stringToSign.append(percentEncode(
canonicalizedQueryString.toString().substring(1)));
```

4. The signature. The key value used for calculation is `testsecret&` because `AccessKeySecret` is set to testsecret. The calculated signature is `OLeaidS1JvxuMvnyHOwuJ%2BuX5qY%3D`.

```
// The following sample code shows how to calculate the signature:
final String ALGORITHM = "HmacSHA1";
final String ENCODING = "UTF-8";
key = "testsecret&";
Mac mac = Mac.getInstance(ALGORITHM);
mac.init(new SecretKeySpec(key.getBytes(ENCODING), ALGORITHM));
byte[] signData = mac.doFinal(stringToSign.getBytes(ENCODING));
String signature = Base64.getEncoder().encodeToString(signData);
```

Encode the Signature parameter based on RFC 3986 and add it to the canonicalized query string. The following URL is obtained:

```
https://public.asapi.aliyuns.com/asapi/v3/?AccessKeyId=testid&Action=GetOrganizationLis
t&Format=JSON&Id=1&Product=ascm&RegionId=cn-region-test&SignatureMethod=HMAC-SHA1&Signa
tureNonce=43967c6e-e3ad-44fa-b06b-fcf3db5f39d2&SignatureVersion=1.0&Timestamp=2020-09-1
5T08%3A50%3A40Z&Version=2019-05-10
```

5. Use browsers or tools such as cURL and Wget to initiate an HTTP request.

13.1.1.1.5.4. Response

Responses are returned only in the JSON format. If a return code is greater than or equal to 200 and less than 300, a success response is returned. Otherwise, an error response is returned.

Sample success response

If a request is successful, the request ID and operation-specific parameter values are returned. For more information, see the developer guide of the corresponding Apsara Stack service.

```
 {
    "eagleEyeTraceId": "xxx-xxx-xxx-xxx", // The trace ID provided by EagleEye.
    "asapiSuccess": true,
    "RequestId": "xxxxxxxxxx",
    "Regions": { // The regions returned after you call the DescribeRegions operation.
        "Region": [
            {
                "RegionId": "",
                "RegionEndpoint": "",
                "LocalName": ""
            }
        ]
    }
}
```

Sample error response

If a request fails, the following information is returned. For more information, see the developer guide of the corresponding Apsara Stack service.

```
{
    "code": "asapi.server.api.notfound",// The error code.
    "eagleEyeTraceId": "xxx-xxx-xxx-xxx", // The trace ID provided by EagleEye.
    "asapiSuccess": false, // Indicates whether the request is successful.
    "hostId": "xxxx", // The ID of the host.
    "message": "Failed to ....", // The message returned.
    "asapiErrorMessage": "Failed to ....", // The error message provided by the ASAPI.
    "asapiErrorCode": "asapi.server.api.notfound" // The error code provided by the ASAPI.
}
```

13.1.2. API Reference

13.1.2.1. List of operations by function

The following tables describe the API operations available for use in Data Management (DMS).

User management

API	Description
RegisterUser	Adds a user.
DisableUser	Disables a user.
EnableUser	Enables a user.
UpdateUser	Updates the information about a user.
DeleteUser	Deletes a user.
ListUsers	Queries the details about users.
ListUserTenants	Queries tenants.
GetUserActiveTenant	Queries the details about a tenant.
GetUser	Queries the details about a user.

Instance management

API	Description
RegisterInstance	Adds a database instance.
ListInstances	Queries the details about instances.
GetInstance	Queries the details about an instance.
UpdateInstance	Updates the information about an instance and checks the connectivity of the instance.
DeleteInstance	Deletes instances that are managed by DMS.

Operation logs

API	Description
GetOpLog	Queries the details about operation logs that are generated in a specified period of time.

Approval processes

API	Description
ListWorkFlowTemplates	Queries approval templates.
ListWorkFlowNodes	Queries approval nodes.

Metadata of databases and tables

API	Description
SearchDatabase	Queries the details about a database.
SearchTable	Queries the details about a table.
ListDatabases	Queries the details about databases in an instance.
ListLogicDatabases	Queries the details about logical databases.
ListTables	Queries the details about tables in a database.
ListLogicTables	Queries the details about logical tables in a logical database.
ListColumns	Queries the details about columns in a table.
ListIndexes	Queries the details about indexes in a table.
GetDatabase	Queries the details about a database.
GetLogicDatabase	Queries the details about a logic database.
GetMetaTableDetailInfo	Queries the details about fields and indexes in a table.
GetTableDBTopology	Queries the topology of a table.
GetMetaTableColumn	Queries the details about fields in a table.
SyncDatabaseMeta	Synchronizes the metadata of a database dictionary.
SyncInstanceMeta	Synchronizes the metadata of all database dictionaries in an instance.

Ticket operations

Category	API	Description
General	ApproveOrder	Reviews a ticket.
	CloseOrder	Closes a ticket.
	GetApprovalDetail	Queries the details about an approval process for a ticket.
	GetOrderBaseInfo	Queries the basic information about a ticket.
	ListOrders	Queries the details about tickets.
	SubmitOrderApproval	Submits a ticket for approval.
	CreateOrder	Creates a ticket.

Category	API	Description
Data change	ExecuteDataCorrect	Executes a ticket that is used to modify data.
	GetDataCorrectBackupFiles	Queries the download URL of an attachment that includes the backup files of data changes.
	GetDataCorrectOrderDetail	Queries the details about a ticket that is used to modify data.
Schema design	CreatePublishGroupTask	Executes a ticket that is used to modify the schema design of a database.
Data export	ExecuteDataExport	Executes a ticket that is used to export data.
	GetDataExportDownloadURL	Queries the download URL of an attachment that includes the exported data.
	GetDataExportOrderDetail	Queries the details about a ticket that is used to export data.

Permission management

API	Description
RevokeUserPermission	Revokes the permissions of a user.
ListDatabaseUserPermssions	Queries the details about user permissions on the resources of a database.
SetOwners	Sets the owners of a database or table.
ListUserPermissions	Queries the permissions of a user on databases and tables.
GrantUserPermission	Grants a user the permissions on a database or table.

Security management

API	Description
ListSensitiveColumns	Queries sensitive columns.
ListSensitiveColumnsDetail	Queries the details about sensitive columns.

Data query

API	Description
ExecuteScript	Executes an SQL script.

13.1.2.2. User management

13.1.2.2.1. RegisterUser

Adds a user to your enterprise.

The **administrator** of Data Management (DMS) Enterprise can call this operation to add users to DMS Enterprise. To check the users that assume the administrator role, perform the following steps: Log on to the DMS Enterprise console and choose System Management > User Management.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	RegisterUser	The operation that you want to perform. Set the value to **RegisterUser**.
Tid	Long	Yes	-1	The ID of the tenant.
Uid	String	Yes	12345678	The ID of the Apsara Stack tenant account of the user that you want to add.
UserNick	String	No	dmstest	The name of the user.
RoleNames	String	No	USER,DBA	The roles that the user assumes. Valid values: • **USER**: a common user • **DBA**: a database administrator (DBA) • **ADMIN**: an administrator • **SECURITY_ADMIN**: a security administrator **Note** Default value: USER. You can specify one or more roles for the user. Separate multiple roles with commas (,).
Mobile	String	No	130000000xx	The contact number of the user.
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
ErrorCode	String	403	The returned error code.
ErrorMessage	String	The specified user already exists.	The returned error message.
RequestId	String	34E01EDD-6A16-4CF0-9541-C644D1BE01AA	The ID of the request.
Success	Boolean	true	Indicates whether the request succeeded.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=RegisterUser
&Tid=-1
&Uid=12345678
&UserNick=dmstest
&<Common request parameters>
```

Sample success responses

`XML` format

```
<RegisterUserResponse>
      <RequestId>ADE24A7C-DB8B-4D32-94AD-E50E3B921197</RequestId>
      <Success>true</Success>
</RegisterUserResponse>
```

`JSON` format

```
{
    "RequestId": "34E01EDD-6A16-4CF0-9541-C644D1BE01AA",
    "Success": true
}
```

13.1.2.2.2. DisableUser

Disables an Apsara Stack tenant account.

This operation is related to the disable user feature of Data Management (DMS). To use this feature, perform the following steps: Log on to the DMS console, choose System Management > User Management. The administrator of DMS Enterprise can call this operation to disable an Apsara Stack tenant account that is temporarily not used in DMS Enterprise. After an Apsara Stack tenant account is disabled, the permissions that are granted to the Apsara Stack tenant account are revoked. The data owner configurations and database administrator (DBA) configurations are also disabled.

> **Note** This operation only stops an Apsara Stack tenant account from logging on to your DMS Enterprise console. The Apsara Stack tenant account is not disabled After an Apsara Stack tenant account is disabled, you cannot use the account to log on to your DMS Enterprise console until the account is enabled again. However, the disabled account still exists in DMS Enterprise.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DisableUser	The operation that you want to perform. Set the value to **DisableUser**.
Tid	Long	Yes	-1	The ID of the tenant.
Uid	String	Yes	12345	The ID of the Apsara Stack tenant account.
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
ErrorCode	String	403	The error code that is returned.
ErrorMessage	String	The specified user not exists.	The error message that is returned.
RequestId	String	34E01EDD-6A16-4CF0-9541-C644D1BE01AA	The ID of the request.
Success	Boolean	true	Indicates whether the request succeeds.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DisableUser
&Tid=-1
&Uid=12345
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DisableUserResponse>
    <RequestId>ADE24A7C-DB8B-4D32-94AD-E50E3B921197</RequestId>
    <Success>true</Success>
</DisableUserResponse>
```

`JSON` format

```
{
    "RequestId":"34E01EDD-6A16-4CF0-9541-C644D1BE01AA",
    "Success":true
}
```

13.1.2.2.3. EnableUser

Enables a disabled Apsara Stack tenant account.

This operation is related to the enable user feature of Data Management (DMS) Enterprise. To use this feature, perform the following steps: Log on to the DMS Enterprise console, choose System Management > User Management. The administrator of DMS Enterprise can call this operation to enable an Apsara Stack tenant account that is disabled in DMS Enterprise. After an Apsara Stack tenant account is enabled, you can use the account to log on to the DMS Enterprise console and perform the required operations.

Note This operation only removes the limit of a disabled Apsara Stack tenant account that cannot be used to log on to the DMS Enterprise console. Other operations that can be performed by the Apsara Stack tenant account are not affected.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	EnableUser	The operation that you want to perform. Set the value to **EnableUser**.
Tid	Long	Yes	-1	The ID of the tenant.
Uid	String	Yes	12345	The ID of the Apsara Stack tenant account.
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
ErrorCode	String	403	The returned error code.
ErrorMessage	String	The specified user not exists.	The returned error message.
RequestId	String	34E01EDD-6A16-4CF0-9541-C644D1BE01AA	The ID of the request.
Success	Boolean	true	Indicates whether the request succeeded.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=EnableUser
&Tid=-1
&Uid=12345
&<Common request parameters>
```

Sample success responses

`XML` format

```
<EnableUserResponse>
    <RequestId>ADE24A7C-DB8B-4D32-94AD-E50E3B921197</RequestId>
    <Success>true</Success>
</EnableUserResponse>
```

`JSON` format

```
{
    "RequestId": "34E01EDD-6A16-4CF0-9541-C644D1BE01AA",
    "Success": true
}
```

13.1.2.2.4. UpdateUser

Updates the information of a user.

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	UpdateUser	The operation that you want to perform. Set the value to **UpdateUser**.
Tid	Long	Yes	-1	The ID of the tenant.
Uid	Long	Yes	123456789	The ID of the user.
UserNick	String	No	test	The name of the user.
RoleNames	String	No	ADMIN,DBA	The roles that the user assumes. For more information about the valid values, see the **RegisterUser** operation.
Mobile	String	No	188xxxxxxxx	The DingTalk ID or mobile number of the user.
MaxExecuteCount	Long	No	1000	The maximum number of queries that can be performed each day.
MaxResultCount	Long	No	1000	The maximum number of rows that can be queried each day.
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
ErrorCode	String	UnknownError	The error code that is returned.
ErrorMessage	String	UnknownError	The error message that is returned.
RequestId	String	E9BEBF41-4F69-4605-A5D5-A67955173941	The ID of the request.
Success	Boolean	false	Indicates whether the request succeeded.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=UpdateUser
&Tid=-1
&Uid=123456789
&UserNick=test
&<Common request parameters>
```

Sample success responses

`XML` format

```
<RequestId>E9BEBF41-4F69-4605-A5D5-A67955173941</RequestId>
<Success>true</Success>
```

`JSON` format

```
{
  "RequestId": "E9BEBF41-4F69-4605-A5D5-A67955173941",
  "Success": true
}
```

13.1.2.2.5. DeleteUser

Deletes an Apsara Stack tenant account.

This operation is related to the delete user feature of Data Management (DMS). To use this feature, perform the following steps: Log on to the DMS console, choose System Management > User Management. The administrator of DMS Enterprise can call this operation to delete an Apsara Stack tenant account that is no longer used in DMS Enterprise. After an Apsara Stack tenant account is deleted, the permissions that are granted to the Apsara Stack tenant account are revoked. The data owner configurations and database administrator (DBA) configurations are disabled.

Note This operation only removes the relationship between an Apsara Stack tenant account and your DMS Enterprise. The Apsara Stack tenant account is not deleted. After you delete an Apsara Stack tenant account, you cannot use this account to log on to DMS Enterprise until the account is recreated.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteUser	The operation that you want to perform. Set the value to **DeleteUser**.
Tid	Long	Yes	-1	The ID of the tenant.

Parameter	Type	Required	Example	Description
Uid	String	Yes	12345	The ID of the Apsara Stack tenant account.
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
ErrorCode	String	403	The error code that is returned.
ErrorMessage	String	The specified user not exists.	The error message that is returned.
RequestId	String	34E01EDD-6A16-4CF0-9541-C644D1BE01AA	The ID of the request.
Success	Boolean	true	Indicates whether the request succeeds.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DeleteUser
&Tid=-1
&Uid=12345
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteUserResponse>
    <RequestId>ADE24A7C-DB8B-4D32-94AD-E50E3B921197</RequestId>
    <Success>true</Success>
</DeleteUserResponse>
```

`JSON` format

```
{
    "RequestId":"34E01EDD-6A16-4CF0-9541-C644D1BE01AA",
    "Success":true
}
```

13.1.2.2.6. ListUsers

Queries the details about users.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ListUsers	The operation that you want to perform. Set the value to **ListUsers**.
Tid	Long	Yes	-1	The ID of the tenant.
Role	String	No	DBA	The role of users. For more information, see the description of the **RegisterUser** operation.
UserState	String	No	NORMAL	The status of users. Valid values: • NORMAL: Users are normal. • DISABLE: Users are disabled. • DELETE: Uses are deleted.
SearchKey	String	No	test	The keyword that is used to search for users.
PageNumber	Integer	No	1	The number of the page to return.
PageSize	Integer	No	50	The number of entries to return on each page.
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
ErrorCode	String	UnknownError	The returned error code.
ErrorMessage	String	UnknownError	The returned error message.

Parameter	Type	Example	Description
RequestId	String	98D35416-2B92-4CE5-8FD2-B1E61E165536	The ID of the request.
Success	Boolean	true	Indicates whether the request succeeded.
TotalCount	Long	1	The total number of entries that are returned.
UserList	Array of User		The details about users.
User			
CurExecuteCount	Long	0	The number of queries that are performed on the current day.
CurResultCount	Long	0	The number of rows that are queried on the current day.
LastLoginTime	String	2020-02-02 00:00:00	The last logon time.
MaxExecuteCount	Long	1000	The maximum number of queries that can be performed on the current day.
MaxResultCount	Long	1000	The maximum number of rows that can be queried on the current day.
Mobile	String	188xxxxx	The DingTalk ID or mobile phone number of the user.
NickName	String	test	The name of the user.
ParentUid	String	143214352	The ID of the parent Apsara Stack tenant account of the user.
RoleIdList	List	1	The IDs of roles.
RoleNameList	List	ADMIN	The names of roles.

Parameter	Type	Example	Description
State	String	NORMAL	The status of the user.
Uid	String	14324321533	The ID of the Apsara Stack tenant account of the user.
UserId	String	1	The ID of the user.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ListUsers
&Tid=-1
&<Common request parameters>
```

Sample success responses

`XML` format

```
<UserList>
    <User>
        <RoleIdList>
            <RoleIds>3</RoleIds>
            <RoleIds>1</RoleIds>
        </RoleIdList>
        <State>NORMAL</State>

13.1.2.2.7. ListUserTenants

Queries tenants.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ListUserTenants	The operation that you want to perform. Set the value to **ListUserTenants**.
RegionId	String	Yes	cn-hangzhou	The ID of the region where DMS resides. This parameter is used to call the operation. **Note** Set this parameter to the ID of the region that is in proximity to your applications.

Response parameters

Parameter	Type	Example	Description
ErrorCode	String	UnknownError	The returned error code.
ErrorMessage	String	UnknownError	The returned error message.
RequestId	String	CA1F4A4D-EE49-472F-8DF9-F537101E263A	The ID of the request.
Success	Boolean	true	Indicates whether the request succeeded.
TenantList	Array of Tenant		The tenants.
Status	String	ACTIVE	The status of the tenant. Valid values: • ACTIVE: active. All users belong to this tenant. • IN_ACTIVE: inactive
TenantName	String	test	The name of the tenant.
Tid	Long	-1	The ID of the tenant.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ListUserTenants
&RegionId=cn-hangzhou
&<Common Request Parameters>
```

Sample success responses

`XML` format

```
<RequestId>CA1F4A4D-EE49-472F-8DF9-F537101E263A</RequestId>
<TenantList>
    <Status>ACTIVE</Status>
    <TenantName>test1</TenantName>
    <Tid>-1</Tid>
</TenantList>
<TenantList>
    <Status>IN_ACTIVE</Status>
    <TenantName>test2</TenantName>
    <Tid>-2</Tid>
</TenantList>
<TenantList>
    <Status>IN_ACTIVE</Status>
    <TenantName>tes</TenantName>
    <Tid>-3</Tid>
</TenantList>
```

`JSON` format

```
{
  "RequestId": "CA1F4A4D-EE49-472F-8DF9-F537101E263A",
  "TenantList": [
    {
      "Status": "ACTIVE",
      "TenantName": "test1",
      "Tid": -1
    },
    {
      "Status": "IN_ACTIVE",
      "TenantName": "test2",
      "Tid": -2
    },
    {
      "Status": "IN_ACTIVE",
      "TenantName": "tes",
      "Tid": -3
    }
  ]
}
```

13.1.2.2.8. GetUserActiveTenant

Queries the details about a tenant.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	GetUserActiveTenant	The operation that you want to perform. Set the value to **GetUserActiveTenant**.
RegionId	String	No	cn-hangzhou	The ID of the region where Data Management (DMS) resides. **Note** Set this parameter to the ID of the region that is in proximity to your applications.

Response parameters

Parameter	Type	Example	Description
ErrorCode	String	UnknownError	The returned error code.
ErrorMessage	String	UnknownError	The returned error message.
RequestId	String	E20EAB9F-A3DB-42EC-BD0C-102A886340F5	The ID of the request.
Success	Boolean	true	Indicates whether the request succeeded.
Tenant	Struct		The details about the tenant.
Status	String	ACTIVE	The status of the tenant. Valid values: • ACTIVE: active • IN_ACTIVE: inactive
TenantName	String	test	The name of the tenant.
Tid	Long	-1	The ID of the tenant.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=GetUserActiveTenant
&<Common request parameters>
```

Sample success responses

`XML` format

```
<Tenant>
    <Status>ACTIVE</Status>
    <TenantName>test</TenantName>
    <Tid>-1</Tid>
</Tenant>
<RequestId>E20EAB9F-A3DB-42EC-BD0C-102A886340F5</RequestId>
<Success>true</Success>
```

`JSON` format

```
{
  "Tenant": {
    "Status": "ACTIVE",
    "TenantName": "test",
    "Tid": -1
  },
  "RequestId": "E20EAB9F-A3DB-42EC-BD0C-102A886340F5",
  "Success": true
}
```

13.1.2.2.9. GetUser

Queries the details of a user.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	GetUser	The operation that you want to perform. Set the value to **GetUser**.
Tid	Long	Yes	-1	The ID of the tenant.
Uid	String	No	123344235	The ID of the Apsara Stack tenant account of the user.
UserId	String	No	1343	The ID of the user.
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
ErrorCode	String	UnknownError	The returned error code.
ErrorMessage	String	UnknownError	The returned error message.
RequestId	String	CFF30064-5985-4ACB-B3F9-9557596913C8	The ID of the request.
Success	Boolean	true	Indicates whether the request succeeded.
User	Struct		The information about the user.
CurExecuteCount	Long	0	The number of queries that were issued on the current day.
CurResultCount	Long	0	The number of rows that were queried on the current day.
LastLoginTime	String	2020-02-02 00:00:00	The last logon time.
MaxExecuteCount	Long	1000	The maximum number of queries that can be performed on the current day.
MaxResultCount	Long	1000	The maximum number of rows that can be queried on the current day.
Mobile	String	138xxxxxxxx	The mobile phone number of the user.
NickName	String	nickName	The name of the user.
ParentUid	Long	12345352	The ID of the Apsara Stack tenant account.
RoleIdList	List	1	The IDs of the roles.
RoleNameList	List	Common user	The names of the roles.

Parameter	Type	Example	Description
State	String	NORMAL	The status of the user.
Uid	String	1243215435	The ID of the Apsara Stack tenant account of the user.
UserId	String	122	The ID of the user.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=GetUser
&Tid=-1
&<Common request parameters>
```

Sample success responses

`XML` format

```
<User>
    <RoleIdList>
        <RoleIds>1</RoleIds>
        <RoleIds>4</RoleIds>
        <RoleIds>3</RoleIds>
        <RoleIds>2</RoleIds>
    </RoleIdList>
    <State>NORMAL</State>
    <RoleNameList>
        <RoleNames>Common user</RoleNames>
        <RoleNames>Security administrator</RoleNames>
        <AccountDescription>Administrator</AccountDescription>
        <RoleNames>DBA</RoleNames>
    </RoleNameList>
    <NickName>xxx</NickName>
    <ParentUid>114324325</ParentUid>
    <UserId>432143</UserId>
    <Uid>41234234324</Uid>
</User>
<RequestId>CFF30064-5985-4ACB-B3F9-9557596913C8</RequestId>
<Success>true</Success>
```

`JSON` format

```
{
  "User": {
    "RoleIdList": {
      "RoleIds": [
        1,
        4,
        3,
        2
      ]
    },
    "State": "NORMAL",
    "RoleNameList": {
      "RoleNames": [
        "Common user",
        "Security administrator",
        "Administrator",
        "DBA"
      ]
    },
    "NickName": "xxx",
    "ParentUid": "114324325",
    "UserId": 432143,
    "Uid": "41234234324"
  },
  "RequestId": "CFF30064-5985-4ACB-B3F9-9557596913C8",
  "Success": true
}
```

13.1.2.3. Instance management

13.1.2.3.1. RegisterInstance

Adds a database instance to your enterprise.

The **administrator and database administrator (DBA)** of Data Management (DMS) Enterprise can call this operation to add database instances to DMS Enterprise. To check users who assume the administrator or DBA role, perform the following steps: Log on to the DMS Enterprise console and choose System Management > User Management.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	RegisterInstance	The operation that you want to perform. Set the value to **RegisterInstance**.
Tid	Long	Yes	-1	The ID of the tenant.

Parameter	Type	Required	Example	Description
InstanceType	String	Yes	MySQL	The type of the database instance. Valid values: • MySQL • SQLServer • PostgreSQL • Oracle • DRDS • OceanBase • Mongo • Redis
InstanceSource	String	Yes	RDS	The source of the database instance. Valid values: • **PUBLIC_OWN**: a self-managed database that is created in the public network. • **RDS**: an ApsaraDB RDS instance. • **ECS_OWN**: a self-managed database that is created on an Elastic Compute Service (ECS) instance. • **VPC_IDC**: a self-managed database that is created in the Internet data center (IDC) of a virtual private cloud (VPC).
NetworkType	String	Yes	VPC	The type of the network.
EnvType	String	Yes	product	The type of the environment. Valid values: • product: production environment • dev: development environment • pre: staging environment • test: test environment • sit: SIT environment • uat: UAT environment • pet: stress testing environment • stag: STAG environment
Host	String	Yes	dmstest.rds.aliyun.com	The host address of the required database.

Parameter	Type	Required	Example	Description
Port	Integer	Yes	3306	The number of the port that is used to connect to the required database.
DatabaseUser	String	Yes	dmstest	The username of the account that is used to log on to the database.
DatabasePassword	String	Yes	password	The password of the account.
InstanceAlias	String	Yes	Test instance	The name of the instance. Specify a name that can help you identify and locate the instance.
DbaUid	Long	Yes	12345678	The ID of the Apsara Stack tenant account for the database administrator (DBA) of the instance.
SafeRule	String	Yes	Test	The name of the security rule that belongs to your enterprise.
QueryTimeout	Integer	Yes	60	The timeout period for the query. Unit: seconds.
ExportTimeout	Integer	Yes	600	The timeout period for the export. Unit: seconds.
EcsInstanceId	String	No	i-xxxxxxxxx	The ID of the ECS instance. **Note** This parameter is required if the **InstanceSource** parameter is set to ECS_OWN.
VpcId	String	No	vpc-xxxxxxxxxxxxxxxxxxxxx	The ID of the VPC. **Note** This parameter is required if the **InstanceSource** parameter is set to VPC_IDC.

Parameter	Type	Required	Example	Description
EcsRegion	String	No	cn-hangzhou	The region where the instance resides. **Note** This parameter is required if the **InstanceSource** parameter is set to RDS, ECS_OWN, or VPC_IDC.
Sid	String	No	dmstest	The system identifier (SID) of the database. **Note** This parameter is required if the **InstanceType** parameter is set to PostgreSQL or Oracle.
DataLinkName	String	No	dblink_test	The name of the data link for cross-database queries.
DdlOnline	Integer	No	2	Specifies whether to enable the online data description language (DDL) service. This service is available only for the MySQL and PolarDB databases. • 0: The service is disabled. • 1: The native online DDL service takes precedence. • 2: Data changes for the schema of lock-free DMS tables take precedence.
UseDsql	Integer	No	1	Specifies whether to enable the cross-database query feature for the instance. Valid values: • 0: Disable the feature. • 1: Enable the feature.
SkipTest	Boolean	No	true	Specifies whether to skip the connection test. Valid values: • **true**: Skip the connection test. • **false**: Perform the connection test.

Parameter	Type	Required	Example	Description
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
ErrorCode	String	404	The returned error code.
ErrorMessage	String	The specified instance already exists.	The returned error message.
RequestId	String	F4E2A94B-604F-43FF-93E7-F4EE3DCF412E	The ID of the request. Each request has a unique ID.
Success	Boolean	true	• **true**: The request succeeded. • **false**: The request failed.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=RegisterInstance
&Tid=-1
&InstanceType=MySQL
&InstanceSource=RDS
&NetworkType=VPC
&EnvType=product
&Host=dmstest.rds.aliyun.com
&Port=3306
&DatabaseUser=dmstest
&DatabasePassword=password
&InstanceAlias=Test instance
&DbaUid=12345678
&SafeRule=Test
&QueryTimeout=60
&ExportTimeout=600
&<Common request parameters>
```

Sample success responses

`XML` format

```
<RegisterInstanceResponse>
      <RequestId>D4F02899-CE79-4DFD-9893-5217DA70B363</RequestId>
      <Success>true</Success>
</RegisterInstanceResponse>
```

`JSON` format

```
{
    "RequestId": "F4E2A94B-604F-43FF-93E7-F4EE3DCF412E",
    "Success": true
}
```

SDK for Python example

The following example shows how to add an instance that resides in VPC.

```
#coding=utf-8
from aliyunsdkcore.client import AcsClient
from aliyunsdkdms_enterprise.request.v20181101.RegisterInstanceRequest import RegisterInsta
nceRequest
client = AcsClient(
    "<your-access-key-id>",
    "<your-access-key-secret>",
    "<your-region-id>"
)
# Example
request = RegisterInstanceRequest()
# The ID of the tenant.
request.set_Tid(1)
# The endpoint of the instance.
request.set_Host("192.168.16.113")
# The number of the port that is used to connect to the instance.
request.set_Port(3314)
# The type of the database, for example, MySQL.
request.set_InstanceType("MySQL")
# The source of the instance, for example, VPC_IDC.
request.set_InstanceSource("VPC_IDC")
# The network type, for example, VPC.
request.set_NetworkType("VPC")
request.set_EnvType("PRODUCT")
# request.set_EcsInstanceId()
# The ID of the VPC to which the instance belongs.
request.set_VpcId("VPC ID of the instance")
# The region ID of the ECS instance in which the database resides, for example, cn-hangzhou
.
request.set_EcsRegion("Region ID of the ECS instance")
# request.set_Sid();
# The username of the account that is used to log on to the database.
request.set_DatabaseUser("Logon username of the database")
# The password of the account.
request.set_DatabasePassword("Logon password of the database")
# The alias of the instance. Specify an alias that helps you identify the related instance
in DMS Enterprise.
request.set_InstanceAlias("Alias of the instance")
# The ID of the Apsara Stack tenant account for the database administrator (DBA) of the ins
tance. The user must first be added to DMS Enterprise by using the console or the required
API operation.
request.set_DbaUid(-1)
request.set_SafeRule("Name of the security rule that is configured in DMS Enterprise")
request.set_QueryTimeout(60)
request.set_ExportTimeout(600)
response = client.do_action_with_exception(request)
print response
```

13.1.2.3.2. ListInstances

Queries the details about instances.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ListInstances	The operation that you want to perform. Set the value to **ListInstances**.
Tid	Long	No	-1	The ID of the tenant.
SearchKey	String	No	test	The keyword that is used to search for instances.
DbType	String	No	MySQL	The type of databases.
EnvType	String	No	product	The type of the environment to which instances belong.
InstanceSource	String	No	RDS	The source of instances.
NetType	String	No	VPC	The network environment of instances. For more information, see the description of the **RegisterInstance** operation.
InstanceState	String	No	NORMAL	The status of instances. Valid values: • NORMAL: Instances functions as expected. • DISABLE: Instances are disabled.
PageNumber	Integer	No	1	The number of the page to return.
PageSize	Integer	No	50	The number of entries to return on each page. Maximum value: 100.
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description

Parameter	Type	Example	Description
ErrorCode	String	UnknownError	The error code that is returned.
ErrorMessage	String	UnknownError	The error message that is returned.
InstanceList	Array of Instance		The instances.
Instance			
DataLinkName	String	dblink_test	The name of the data link for the instance.
DatabasePassword	String	******	The password of the account that is used to log on to the database.
DatabaseUser	String	dbUser	The username of the account that is used to log on to the database.
DbaId	String	1	The ID of the database administrator (DBA) for the instance.
DbaNickName	String	dbaName	The name of the DBA.
DdlOnline	Integer	1	The configuration of the online data description language (DDL) feature for the instance.
EcsInstanceId	String	xxx	The ID of the ECS instance.
EcsRegion	String	cn-hangzhou	The region to which the ECS instance belongs.
EnvType	String	product	The type of the environment to which the instance belongs.
ExportTimeout	Integer	600	The timeout period to export the instance.
Host	String	xxx.xxx.xxx.xxx	The endpoint of the instance.
InstanceAlias	String	test	The alias of the instance.

Parameter	Type	Example	Description
InstanceId	String	1	The ID of the instance.
InstanceSource	String	RDS	The source of the instance.
InstanceType	String	mysql	The type of the database for the instance.
OwnerIdList	List	1	The IDs of the owners of the database.
OwnerNameList	List	11	The names of the owners of the database.
Port	Integer	3306	The number of the port that is used to connect to the instance.
QueryTimeout	Integer	60	The timeout period to query the instance.
SafeRuleId	String	1	The ID of the security rule for the instance.
Sid	String	test	The system identifier (SID) of the instance.
State	String	NORMAL	The status of the instance.
UseDsql	Integer	1	Indicates whether the cross-database query feature is enabled for the instance.
VpcId	String	xxx	The ID of the virtual private cloud (VPC) to which the instance belongs.
RequestId	String	B4B07137-F6AE-4756-8474-7F92BB6C4E04	The ID of the request.
Success	Boolean	true	Indicates whether the request succeeded.
TotalCount	Long	0	The total number of entries that are returned.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ListInstances
&<Common request parameters>
```

Sample success responses

`XML` format

```
<TotalCount>7</TotalCount>
<RequestId>98D35416-2B92-4CE5-8FD2-B1E61E165536</RequestId>
<Success>true</Success>
<InstanceList>
</InstanceList>
```

`JSON` format

```
{
  "TotalCount": 7,
  "RequestId": "98D35416-2B92-4CE5-8FD2-B1E61E165536",
  "Success": true,
  "InstanceList": {
    "Instance": [
    ]
  }
}
```

13.1.2.3.3. GetInstance

Queries the details about an instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	GetInstance	The operation that you want to perform. Set the value to **GetInstance**.
Host	String	Yes	xxxx.mysql.rds.aliyuncs.com	The endpoint of the instance.
Port	Integer	Yes	3306	The number of the port that is used to connect to the instance.
Tid	Long	Yes	-1	The ID of the tenant.
Sid	String	No	test	The system identifier (SID) of the instance.

Parameter	Type	Required	Example	Description
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
ErrorCode	String	UnknownError	The error code that is returned.
ErrorMessage	String	UnknownError	The error message that is returned.
Instance	Struct		The details about the instance.
DataLinkName	String	test	The name of the data link for the instance.
DatabasePassword	String	******	The logon password of the instance.
DatabaseUser	String	dbuser	The logon username of the instance.
DbaId	String	1	The ID of the database administrator (DBA) for the instance. You can call the ListUsers operation to obtain the ID.
DbaNickName	String	dbaname	The name of the DBA for the instance.
DdlOnline	Integer	1	Indicates whether the online data description language (DDL) service is enabled for the instance.
EcsInstanceId	String	xxx	The ID of the ECS instance.
EcsRegion	String	cn-hangzhou	The ID of the region in which the instance resides.
EnvType	String	test	The type of the environment to which the instance belongs.
ExportTimeout	Integer	600	The timeout period to export the instance.

Parameter	Type	Example	Description
Host	String	xxx.rwlb.rds.aliyuncs.com	The endpoint of the instance.
InstanceAlias	String	test	The alias of the instance.
InstanceId	String	1	The ID of the instance.
InstanceSource	String	RDS	The source of the instance.
InstanceType	String	polardb	The database type of the instance.
OwnerIdList	List	88656	The IDs of the owners of the instance.
OwnerNameList	List	xxx	The names of the owners of the instance.
Port	Integer	3306	The number of the port that is used to connect to the instance.
QueryTimeout	Integer	60	The timeout period to query the instance.
SafeRuleId	String	1	The ID of the security rule of the instance.
Sid	String	test	The SID of the instance.
State	String	NORMAL	The status of the instance.
UseDsql	Integer	1	Indicates whether the cross-database query feature is enabled for the instance.
VpcId	String	xxx	The ID of the VPC to which the instance belongs.
RequestId	String	8BE73E78-76E2-46AA-970D-A4579A16CD4A	The ID of the request.
Success	Boolean	true	Indicates whether the request succeeded.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=GetInstance
&Host=xxxx.mysql.rds.aliyuncs.com
&Port=3306
&Tid=-1
&<Common request parameters>
```

Sample success responses

`XML` format

```
<Instance>
    <SafeRuleId>1037</SafeRuleId>
    <UseDsql>1</UseDsql>
    <EcsInstanceId>pc-xxx</EcsInstanceId>
    <QueryTimeout>80</QueryTimeout>
    <Host>xxx.rwlb.rds.aliyuncs.com</Host>
    <InstanceAlias>test</InstanceAlias>
    <InstanceSource>RDS</InstanceSource>
    <InstanceId>24710</InstanceId>
    <DataLinkName>dblink_test</DataLinkName>
    <EnvType>dev</EnvType>
    <DdlOnline>0</DdlOnline>
    <VpcId>vpc-xxx</VpcId>
    <InstanceType>polardb</InstanceType>
    <DbaId>104442</DbaId>
    <Port>3306</Port>
    <DbaNickName>test[RAM user]</DbaNickName>
    <State>NORMAL</State>
    <DatabaseUser>dmstest</DatabaseUser>

13.1.2.3.4. UpdateInstance

Updates the information about a database instance and checks the connectivity of the instance.

Before you call this operation to update the information about an instance, we recommend that you call the GetInstance operation to obtain the complete information about the instance. Then, you can set the required parameters based on the information that you obtain.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	UpdateInstance	The operation that you want to perform. Set the value to **UpdateInstance**.
DatabasePassword	String	Yes	******	The password of the database account.

Parameter	Type	Required	Example	Description
DatabaseUser	String	Yes	dbuser	The username of the database account.
DbaId	String	Yes	1	The ID of the database administrator (DBA) for the instance. You can call the **ListUsers** operation to query the ID.
EnvType	String	Yes	test	The type of the environment to which the instance belongs.
ExportTimeout	Integer	Yes	600	The timeout period to export of the instance.
Host	String	Yes	xxxx.mysql.rds.aliyuncs.com	The endpoint of the instance.
InstanceAlias	String	Yes	test	The alias of the instance.
InstanceId	String	Yes	1	The ID of the instance. You can call the **GetInstance** operation to query the ID.
InstanceSource	String	Yes	RDS	The source of the instance. You can call the **RegisterInstance** operation to query the source.
InstanceType	String	Yes	MySQL	The type of the instance. You can call the **RegisterInstance** operation to query the type.
Port	Integer	Yes	3306	The port of the instance.
QueryTimeout	Integer	Yes	60	The timeout period to query the instance.
SafeRuleId	String	Yes	1	The ID of the security rule of the instance.
Tid	Long	Yes	-1	The ID of the tenant.

Parameter	Type	Required	Example	Description
EcsInstanceId	String	No	xxx	The ID of the ECS instance.
VpcId	String	No	xxx	The ID of the VPC to which the instance belongs.
EcsRegion	String	No	cn-hangzhou	The ID of the region in which the instance resides.
Sid	String	No	xxx	The system identifier (SID) of the instance.
DataLinkName	String	No	datalink_test	The name of the data link for the instance.
DdlOnline	Integer	No	1	Specifies whether to enable the online data description language (DDL) service for the instance. For more information about the valid values, see the description of the **RegisterInstance** operation.
UseDsql	Integer	No	1	Specifies whether to enable the cross-database query feature for the instance.
SkipTest	Boolean	No	true	Specifies whether to skip the connectivity check. Valid values: • true: Skip the connectivity check. • false: Perform the connectivity check.
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
ErrorCode	String	UnknownError	The error code that is returned.

Parameter	Type	Example	Description
ErrorMessage	String	UnknownError	The error message that is returned.
RequestId	String	E9BEBF41-4F69-4605-A5D5-A67955173941	The ID of the request.
Success	Boolean	false	Indicates whether the request succeeded.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=UpdateInstance
&<Common request parameters>
```

Sample success responses

`XML` format

```
<RequestId>E9BEBF41-4F69-4605-A5D5-A67955173941</RequestId>
<Success>true</Success>
```

`JSON` format

```
{
  "RequestId": "E9BEBF41-4F69-4605-A5D5-A67955173941",
  "Success": true
}
```

13.1.2.3.5. DeleteInstance

Removes a database instance from Data Management (DMS) Enterprise.

This operation only removes a database instance from the DMS Enterprise console. The database instance is not disabled.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteInstance	The operation that you want to perform. Set the value to **DeleteInstance**.

Parameter	Type	Required	Example	Description
Host	String	Yes	xxx.mysql.rds.aliyuncs.com	The endpoint of the database instance to be removed.
Port	Integer	Yes	3306	The connection port of the database instance to be removed.
Tid	Long	Yes	-1	The ID of the tenant.
Sid	String	No	testSid	The SID of the database instance to be removed.
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
ErrorCode	String	UnknownError	The returned error code.
ErrorMessage	String	UnknownError	The returned error message.
RequestId	String	B4B07137-F6AE-4756-8474-7F92BB6C4E04	The ID of the request.
Success	Boolean	true	Indicates whether the request succeeded.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DeleteInstance
&Host=xxx.mysql.rds.aliyuncs.com
&Port=3306
&Tid=-1
&<Common request parameters>
```

Sample success responses

`XML` format

```
<RequestId>B4B07137-F6AE-4756-8474-7F92BB6C4E04</RequestId>
<ErrorCode>UnknownError</ErrorCode>
<ErrorMessage>UnknownError</ErrorMessage>
<Success>true</Success>
```

`JSON` format

```
{"RequestId":"B4B07137-F6AE-4756-8474-7F92BB6C4E04","ErrorCode":"UnknownError","ErrorMessage":"UnknownError","Success":"true"}
```

13.1.2.4. Operation logs

13.1.2.4.1. GetOpLog

Queries the details about operation logs that are generated in a specified period.

The **administrator** and **security administrator** roles of an account can all this operation. For more information about account roles, see User management.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	GetOpLog	The operation that you want to perform. Set the value to **GetOpLog**.
Tid	Long	Yes	-1	The ID of the tenant.
StartTime	String	Yes	2018-11-01 10:00:00	The start of the time range to query. The time must be specified in the yyyy-MM-ddTHH:mm:ssZ format.
EndTime	String	Yes	2018-11-01 11:00:00	The end of the time range to query. The time must be specified in the yyyy-MM-ddTHH:mm:ssZ format.
PageNumber	Integer	Yes	3	The number of the page to return. Pages start from page 1.
PageSize	Integer	Yes	30	The number of entries to return on each page. Valid values: • 30 • 50 • 100

Parameter	Type	Required	Example	Description
Module	String	No	PERMISSION	The function module that specifies the type of operation logs that you want to return. If you do not set this parameter, all operation logs that are generated in the specified time range are returned. Valid values: • **PERMISSION**: permissions • **OWNER**: data owner • **SQL_CONSOLE**: data query • **SQL_CONSOLE_EXPORT**: query result export • **DATA_CHANGE**: data change • **DATA_EXPORT**: data export • **SQL_REVIEW**: SQL review • **DT_SYNC**: database and table synchronization • **DT_DETAIL**: database and table details • **DB_TASK**: task management • **INSTANCE_MANAGE**: instance management • **USER_MANAGE**: user management • **SECURITY_RULE**: security rules • **CONFIG_MANAGE**: configuration management • **RESOURCE_AUTH**: resource authorization • **ACCESS_WHITE_IP**: access to IP whitelists
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
ErrorCode	String	403	The returned error code.
ErrorMessage	String	The specified request parameter is invalid.	The error message that is returned.

Parameter	Type	Example	Description
OpLogDetails	Array of OpLogDetail		The details about operation logs.
OpLogDetail			
Database	String	dmstest_prod_database@dmstest.rds... [Test instance]	The endpoint of the database. A value is returned for this parameter only when the database type is set to **LocalInstance**. Note
Module	String	PERMISSION	The function module.
OpContent	String	Apply for permissions	The details about the operation.
OpTime	String	2018-11-01 10:00:00	The time when the operation was performed.
OrderId	Long	1	The ID of the ticket or task. Note
UserId	Long	12345678	The ID of the Apsara Stack tenant account.
UserNick	String	dmstest	The name of the user.
RequestId	String	47D56208-DB1D-4FD3-BE32-300E43185488	The ID of the request. Each request has a unique ID.
Success	Boolean	true	Indicates whether the request succeeded.
TotalCount	Long	22	The total number of operation logs.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=GetOpLog
&Tid=-1
&StartTime=2018-11-01 10:00:00
&EndTime=2018-11-01 11:00:00
&PageNumber=3
&PageSize=30
&<Common request parameters>
```

Sample success response

`XML` format

```

SDK example

For more information about how to use the SDK, see the Alibaba Cloud SDK for Python.

Example:

```
from aliyunsdkcore.client import AcsClient
from aliyunsdkdms_enterprise.request.v20181101.GetOpLogRequest import GetOpLogRequest
client = AcsClient(
    "<your-access-key-id>",
   "<your-access-key-secret>",
   "<your-region-id>"
)
request = GetOpLogRequest()
request.set_Tid("Enter the tenant ID of your enterprise")
request.set_StartTime("2018-11-20 00:00:00")
request.set_EndTime("2018-11-23 00:00:00")
request.set_PageNumber(1)
request.set_PageSize(50)
response = client.do_action_with_exception(request)
print response
```

13.1.2.5. Approval processes

13.1.2.5.1. ListWorkFlowTemplates

Queries the details about approval templates.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ListWorkFlowTemplates	The operation that you want to perform. Set the value to **ListWorkFlowTemplates**.
Tid	Long	Yes	-1	The ID of the tenant.
SearchName	String	No	Admin	The name that is used to search for approval templates.
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
ErrorCode	String	UnknownError	The returned error code.
ErrorMessage	String	UnknownError	The returned error message.

Parameter	Type	Example	Description
RequestId	String	41067071-0243-4AAB-B3CF-4DE6D54F53B4	The ID of the request.
Success	Boolean	true	Indicates whether the request succeeded.
WorkFlowTemplates	Array of WorkFlowTemplate		The approval templates.
WorkFlowTemplate			
Comment	String	test	The remarks.
CreateUserId	Long	1234	The ID of the creator.
Enabled	String	Y	Indicates whether the approval template is enabled. Valid values: • Y: enabled • N: disabled
IsSystem	Integer	1	Indicates whether the approval template is predefined by the system. Valid values: • 1: The approval template is predefined by the system. • 0: The approval template is not predefined by the system.
TemplateId	Long	12345	The ID of the approval template.
TemplateName	String	Admin	The name of the approval template.
WorkflowNodes	Array of WorkflowNode		The details about approval nodes.
WorkflowNode			
Comment	String	test	The remarks.

Parameter	Type	Example	Description
CreateUserId	Long	1234	The ID of the creator.
NodeId	Long	123	The ID of the approval node.
NodeName	String	test	The name of the approval node.
NodeType	String	SYS	The type of the approval node. Valid values: • SYS: The approval node is predefined by the system. • USER_LIST: The approval node is created by a user.
Position	Integer	1	The order.
TemplateId	Long	12345	The ID of the approval template.

13.1.2.5.2. ListWorkFlowNodes

Queries the details about approval nodes.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ListWorkFlowNodes	The operation that you want to perform. Set the value to **ListWorkFlowNodes**.
Tid	Long	Yes	-1	The ID of the tenant.
SearchName	String	No	admin	The name that is used to search for approval nodes.
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
ErrorCode	String	UnknownError	The returned error code.
ErrorMessage	String	UnknownError	The returned error message.
RequestId	String	CFD8FE00-36D9-4C1B-940D-65A7B73D9066	The ID of the request.
Success	Boolean	true	Indicates whether the request succeeded.
WorkflowNodes	Array of WorkflowNode		The details about approval nodes.
WorkflowNode			

Parameter	Type	Example	Description
AuditUsers	Array of AuditUser		The details about approvers.
AuditUser			
NickName	String	test	The name of the approver.
RealName	String	test	The real name of the approver.
UserId	Long	123	The ID of the approver. The ID is different from the ID of the Apsara Stack tenant account of the approver.
Comment	String	test	The remarks.
CreateUserId	Long	123	The ID of the creator. The ID is different from the ID of the Apsara Stack tenant account of the creator.
CreateUserNickName	String	test	The name of the creator.
NodeId	Long	123	The ID of the node.
NodeName	String	test	The name of the node.
NodeType	String	SYS	The type of the node. Valid values: • SYS: The node is pre-defined by the system. • USER_LIST: The node is created by a user.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ListWorkFlowNodes
&Tid=-1
&<Common request parameters>
```

Sample success responses

`XML` format

```
<WorkFlowNodes>
    <WorkflowNode>

  "Success": true
}
```

13.1.2.6. Metadata of databases and tables

13.1.2.6.1. SearchDatabase

Queries the details about databases.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	SearchDatabase	The operation that you want to perform. Set the value to **SearchDatabase**.

Parameter	Type	Required	Example	Description
PageNumber	Integer	Yes	1	The number of the page to return.
SearchKey	String	Yes	testdb	The keyword that is used to search for databases.
Tid	Long	Yes	1	The ID of the tenant.
PageSize	Integer	No	10	The number of entries to return on each page.
EnvType	String	No	product	The environment of the database.
SearchRange	String	No	HAS_PERMSSION	The range of databases. Valid values: • **HAS_PERMSSION**: databases on which the current user has permissions • **OWNER**: databases that are owned by the current user • **MY_FOCUS**: databases that are followed by the current user • **UNKNOWN**: all databases
SearchTarget	String	No	SINGLE_DB	The category of databases. Valid values: • **DB**: all databases. • **SINGLE_DB**: single databases. • **LOGIC_DB**: logical databases.
DbType	String	No	MySQL	The type of databases. Valid values: • **MySQL** • **SQLServer** • **PostgreSQL** • **Oracle** • **DRDS** • **OceanBase** • **Mongo** • **Redis**
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
ErrorCode	String	UnknownError	The returned error code.
ErrorMessage	String	UnknownError	The returned error message.
RequestId	String	E0D21075-CD3E-4D98-8264-FD8AD04A63B6	The ID of the request.
SearchDatabaseList	Array of SearchDatabase		The details about databases.
SearchDatabase			
Alias	String	test	The alias of the database.
DatabaseId	String	1	The ID of the database.
DatalinkName	String	datalink_name	The name of the data link for the database.
DbType	String	mysql	The type of the database. Valid values: • **MySQL** • **SQLServer** • **PostgreSQL** • **Oracle** • **DRDS** • **OceanBase** • **Mongo** • **Redis**
DbaId	String	1	The ID of the database administrator (DBA) for the database.
Encoding	String	utf8	The encoding of the database.
EnvType	String	product	The type of the environment to which the database belongs.

Parameter	Type	Example	Description
Host	String	xxx.xxx.xxx.xxx	The endpoint of the instance to which the database belongs.
Logic	Boolean	false	Indicates whether the database is a logical database. Valid values: • **true**: The database is a logical database. • **false**: The database is not a logical database.
OwnerIdList	List	1	The IDs of the owners of the database.
OwnerNameList	List	user1	The names of the owners of the database.
Port	Integer	3306	The port number of the instance to which the database belongs.
SchemaName	String	test	The name of the database.
SearchName	String	test@xxx.xxx.xxx.xxx:3306	The name that is used to search for the database.
Sid	String	testSid	The system identifier (SID) of the instance to which the database belongs.
TotalCount	Long	1	The total number of entries that are returned.
Success	Boolean	true	Indicates whether the request succeeded.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=SearchDatabase

13.1.2.6.2. SearchTable

Queries the details about tables.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	SearchTable	The operation that you want to perform. Set the value to **SearchTable**.

Parameter	Type	Required	Example	Description
Tid	Long	No	1	The ID of the tenant.
SearchKey	String	No	test	The keyword that is used to search for tables.
PageNumber	Integer	No	1	The number of the page to return.
PageSize	Integer	No	10	The number of entries to return on each page.
EnvType	String	No	PRODUCT	The type of the environment to which the database belongs.
SearchTarget	String	No	LOGIC_TABLE	The type of tables to be queried. Valid values: • **TABLE**: all tables • **SINGLE_TABLE**: physical tables • **LOGIC_TABLE**: logical tables
SearchRange	String	No	OWNER	The permission that is required on tables to be queried. Valid values: • **HAS_PERMSSION**: tables on which the current user has permissions. • **OWNER**: tables that are owned by the current user. • **MY_FOCUS**: tables that are followed by the current user. • **UNKNOWN**: all tables.
DbType	String	No	MySQL	The type of the database. Valid values: • **MySQL** • **SQLServer** • **PostgreSQL** • **Oracle** • **DRDS** • **OceanBase** • **Mongo** • **Redis**

Parameter	Type	Required	Example	Description
ReturnGuid	Boolean	No	false	Specifies whether to return the globally unique identifier (GUID) of each table.
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
ErrorCode	String	UnknownError	The returned error code.
ErrorMessage	String	UnknownError	The returned error message.
RequestId	String	1489257F-1B5D-4B5B-89EF-923C12CEEBD1	The ID of the request.
SearchTableList	Array of SearchTable		The details about the tables.
SearchTable			
DBSearchName	String	test	The name that is used to search for the database to which the table belongs.
DatabaseId	String	1	The ID of the database to which the table belongs.
DbName	String	test	The name of the database.
DbType	String	mysql	The type of the database. Valid values: • **MySQL** • **SQLServer** • **PostgreSQL** • **Oracle** • **DRDS** • **OceanBase** • **Mongo** • **Redis**

Parameter	Type	Example	Description
Description	String	test	The description.
Encoding	String	utf8	The encoding of the table.
Engine	String	innodb	The engine of the table.
EnvType	String	test	The type of the environment.
Logic	Boolean	false	Indicates whether the table is a logical table. Valid values: • **true**: The table is a logical table. • **false**: The table is not a logical table.
OwnerIdList	List	1	The IDs of the owners of the table.
OwnerNameList	List	user	The names of the owners of the table.
TableGuid	String	IDB_L_9032.db-test.yuyang_test	The GUID of the table.
TableId	String	1	The ID of the table.
TableName	String	test_table	The name of the table.
TableSchemaName	String	test@xxx.xxx.xxx.xxx:3306	The name of the database to which the table belongs.
Success	Boolean	true	Indicates whether the request succeeded.
TotalCount	Long	1	The total number of entries that are returned.

Examples

13.1.2.6.3. ListDatabases

Queries the details of databases in an instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ListDatabases	The operation that you want to perform. Set the value to **ListDatabases**.

Parameter	Type	Required	Example	Description
InstanceId	String	Yes	1	The instance ID. You can obtain the instance ID from the instance information that is returned by the **ListInstances** operation. The instance ID is different from the ID of an ApsaraDB RDS instance.
PageNumber	Integer	Yes	1	The number of the page to return.
Tid	Long	Yes	-1	The ID of the tenant.
PageSize	Integer	No	10	The number of entries to return on each page.
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
DatabaseList	Array of Database		The details of databases.
Database			
CatalogName	String	1	The name of the database catalog. **Note** If the database type is PostgreSQL, the value indicates the name of the PostgreSQL database.
DatabaseId	String	1	The ID of the database.
DbType	String	mysql	The type of the database.
DbaId	String	1	The ID of the DBA to which the database belongs.
DbaName	String	dba_user	The name of the DBA to which the database belongs.

Parameter	Type	Example	Description
Encoding	String	utf-8	The encoding of the database.
EnvType	String	dev	The type of the environment to which the database belongs.
Host	String	xxx.xxx.xxx.xxx	The endpoint of the instance.
InstanceId	String	1	The ID of the instance to which the database belongs.
OwnerIdList	List	1	The IDs of database owners.
OwnerNameList	List	owner_name	The names of database owners.
Port	Integer	3306	The connection port of the instance.
SchemaName	String	test	The name of the database.
SearchName	String	test@xxx.xxx.xxx.xxx:3306	The name that is used to search for the database.
Sid	String	test	The ID of the instance to which the database belongs.
State	String	NORMAL	The status of the database. Valid values: • NORMAL: The database is normal. • DISABLE: The database is disabled. • OFFLINE: The database is unpublished. • NOT_EXIST: The database does not exist.
ErrorCode	String	UnknownError	The error code that is returned.
ErrorMessage	String	UnknownError	The error message that is returned.
RequestId	String	5541CDA6-F674-435C-81BD-40C2FB926CE3	The ID of the request.

Parameter	Type	Example	Description
Success	Boolean	true	Indicates whether the request succeeds.
TotalCount	Long	1	The total number of databases that belong to the instance.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ListDatabases
&InstanceId=1
&PageNumber=1
&Tid=-1
&<Common request parameters>
```

Sample success responses

`XML` format

```
<TotalCount>1</TotalCount>
<RequestId>5541CDA6-F674-435C-81BD-40C2FB926CE3</RequestId>
<Success>true</Success>

          "OwnerIds": [
            88653
          ]
        },
        "DbaId": 104442,
        "OwnerNameList": {
          "OwnerNames": [
            "dmstest"
          ]
        },
        "Port": 3306,
        "DatabaseId": 116366,
        "State": "NORMAL",
        "SearchName": "xxx_test@pc-xxx.rwlb.rds.aliyuncs.com:3306【xxx_test】",
        "DbaName": "xxx[RAM user]",
        "SchemaName": "xxx_test"
      }
    ]
  }
}
```

13.1.2.6.4. ListLogicDatabases

Queries the details about logical databases.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ListLogicDatabases	The operation that you want to perform. Set the value to **ListLogicDatabases**.
PageNumber	Integer	Yes	1	The number of the page to return.

Parameter	Type	Required	Example	Description
Tid	Long	Yes	-1	The ID of the tenant.
PageSize	Integer	No	50	The number of entries to return on each page.
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
ErrorCode	String	UnknownError	The error code that is returned.
ErrorMessage	String	UnknownError	The error message that is returned.
LogicDatabaseList	Array of LogicDatabase		The details about logical databases.
LogicDatabase			
DatabaseId	String	1	The ID of the logical database.
DbType	String	mysql	The type of the logical database.
EnvType	String	test	The type of the environment to which the logical database belongs.
Logic	Boolean	true	Indicates whether the database is a logical database. The value is set to true.
OwnerIdList	List	1	The IDs of the owners of the logical database.
OwnerNameList	List	owner_name	The names of the owners of the logical database.
SchemaName	String	logic_db	The name of the logical database.

Parameter	Type	Example	Description
SearchName	String	loigc_db	The name that is used to search for the logical database.
RequestId	String	BAD154C0-DA38-48FA-97AB-E72912EEAA24	The ID of the request.
Success	Boolean	true	Indicates whether the request succeeded.
TotalCount	Long	13	The total number of logical databases.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ListLogicDatabases
&PageNumber=1
&Tid=-1
&<Common request parameters>
```

Sample success responses

`XML` format

```
<TotalCount>13</TotalCount>

  },
  "Success": true
}
```

13.1.2.6.5. ListTables

Queries the details of tables in a database.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ListTables	The operation that you want to perform. Set the value to **ListTables**.
DatabaseId	String	Yes	1	The ID of the database.
PageNumber	Integer	Yes	1	The number of the page to return.
Tid	Long	Yes	-1	The ID of the tenant.
PageSize	Integer	No	10	The number of entries to return on each page.
SearchName	String	No	test	The keyword that is used to query tables. Prefix match is used.
ReturnGuid	Boolean	No	true	Specifies whether to return the GUID of the table.
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
ErrorCode	String	UnknownError	The returned error code.
ErrorMessage	String	UnknownError	The returned error message.
RequestId	String	B16FB618-5E96-4FFD-BB0D-490C890A4030	The ID of the request.
Success	Boolean	true	Indicates whether the call succeeded.
TableList	Array of Table		The details about the tables.

Parameter	Type	Example	Description
Table			
DatabaseId	String	1	The ID of the database.
Description	String	test	The description of the table.
Encoding	String	utf8	The encoding of the table.
Engine	String	innodb	The engine of the table.
NumRows	Long	1	The number of rows in the table. This is a statistical value and does not indicate the actual number of rows.
OwnerIdList	List	1	The IDs of the table owners.
OwnerNameList	List	owner_name	The nicknames of the table owners.
StoreCapacity	Long	1024	The storage space that is occupied by the table. This is a statistical value and does not indicate the accurate storage space.
TableGuid	String	IDB_308302.yuyang_test.test_ch	The GUID of the table.
TableId	String	1	The ID of the table.
TableName	String	test	The name of the table.
TableSchemaName	String	test_db	The name of the database to which the table belongs.
TableType	String	NORMAL	The type of the table. Default value: NORMAL.
TotalCount	Long	12	The total number of tables that meet the query conditions.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ListTables
&DatabaseId=1
&PageNumber=1
&Tid=-1
&<Common request parameters>
```

Sample success responses

`XML` format

```
<TableList>
    <Table>
        <TableSchemaName>yuyang_test</TableSchemaName>
        <OwnerNameList>
            <OwnerNames>xxx</OwnerNames>
            <OwnerNames>xxx</OwnerNames>
        </OwnerNameList>
        <DatabaseId>116367</DatabaseId>
        <Encoding>utf8mb4</Encoding>
        <NumRows>3</NumRows>
        <StoreCapacity>1</StoreCapacity>
        <TableName>base_user</TableName>
        <TableGuid>IDB_18396363.yuyang_test.base_user</TableGuid>
        <TableType>NORMAL</TableType>
        <OwnerIdList>
            <OwnerIds>88653</OwnerIds>
            <OwnerIds>104442</OwnerIds>
        </OwnerIdList>
        <Engine>InnoDB</Engine>
        <TableId>18396363</TableId>
    </Table>
    <Table>
        <TableSchemaName>yuyang_test</TableSchemaName>
        <OwnerNameList>
            <OwnerNames>xxx</OwnerNames>

13.1.2.6.6. ListLogicTables

Queries the details of logical tables in a logical database.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ListLogicTables	The operation that you want to perform. Set the value to **ListLogicTables**.
DatabaseId	String	Yes	1	The ID of the logical database.
PageNumber	Integer	Yes	1	The number of the page to return.
Tid	Long	Yes	-1	The ID of the tenant.
PageSize	Integer	No	10	The number of entries to return on each page.
SearchName	String	No	test	The keyword that is used to query logical tables. Prefix match is used.
ReturnGuid	Boolean	No	true	Specifies whether to return the GUID of the table.
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
ErrorCode	String	UnknownError	The returned error code.
ErrorMessage	String	UnknownError	The returned error message.
LogicTableList	Array of LogicTable		The details of logical tables.
LogicTable			
DatabaseId	String	1	The ID of the logical database.

Parameter	Type	Example	Description
Logic	Boolean	true	Indicates whether the table is a logical table. Default value: true.
OwnerIdList	List	1	The IDs of owners for the logical table.
OwnerNameList	List	owner_name	The nicknames of owners for the logical table.
SchemaName	String	yuyang_test	The logical database to which the logical table belongs.
TableCount	String	4	The number of subtables.
TableExpr	String	test[1-4]	The expression of the logical table.
TableGuid	String	IDB_L_308302.yuyang_test.test_ch	The GUID of the logical table.
TableId	String	1	The ID of the logical table.
TableName	String	test	The name of the logical table.
RequestId	String	F1E6484F-9DF1-4406-9BDE-0861C4629B69	The ID of the request.
Success	Boolean	true	Indicates whether the call succeeded.
TotalCount	Long	1	The total number of logical tables that meet the query conditions.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ListLogicTables
&DatabaseId=1
&PageNumber=1
&Tid=-1
&<Common request parameters>
```

Sample success responses

`XML` format

```
<TotalCount>1</TotalCount>
<RequestId>F1E6484F-9DF1-4406-9BDE-0861C4629B69</RequestId>
<LogicTableList>
    <LogicTable>
        <Logic>true</Logic>
        <OwnerNameList>
            <OwnerNames>xxx</OwnerNames>
            <OwnerNames>xxx</OwnerNames>
        </OwnerNameList>
        <TableExpr>t[1-4]</TableExpr>
        <DatabaseId>267</DatabaseId>
        <SchemaName>yuyang_test</SchemaName>
        <TableName>t</TableName>
        <TableGuid>IDB_L_3057.yuyang_test.t</TableGuid>
        <TableCount>4</TableCount>
        <OwnerIdList>
            <OwnerIds>88653</OwnerIds>
            <OwnerIds>104442</OwnerIds>
        </OwnerIdList>
        <TableId>3057</TableId>
    </LogicTable>
</LogicTableList>
<Success>true</Success>
```

`JSON` format

```
{
  "TotalCount": 1,
  "RequestId": "F1E6484F-9DF1-4406-9BDE-0861C4629B69",
  "LogicTableList": {
    "LogicTable": [
      {
        "Logic": true,
        "OwnerNameList": {
          "OwnerNames": [
            "xxx",
            "xxx"
          ]
        },
        "TableExpr": "t[1-4]",
        "DatabaseId": 267,
        "SchemaName": "yuyang_test",
        "TableName": "t",
        "TableGuid": "IDB_L_3057.yuyang_test.t",
        "TableCount": 4,
        "OwnerIdList": {
          "OwnerIds": [
            88653,
            104442
          ]
        },
        "TableId": 3057
      }
    ]
  },
  "Success": true
}
```

13.1.2.6.7. ListColumns

Queries the details about columns in a table.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ListColumns	The operation that you want to perform. Set the value to **ListColumns**.
Logic	Boolean	Yes	false	Specifies whether the table is a logical table.

Parameter	Type	Required	Example	Description
TableId	String	Yes	1	The ID of the table.
Tid	Long	Yes	0	The ID of the tenant.
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
ColumnList	Array of Column		The details about columns.
Column			
AutoIncrement	Boolean	false	Indicates whether the column is an auto-increment column. Valid values: • true: The column is an auto-increment column. • false: The column is not an auto-increment column.
ColumnId	String	1	The ID of the column.
ColumnName	String	name	The name of the column.
ColumnType	String	varchar	The type of the column.
DataLength	Long	32	The length of the column.
DataPrecision	Integer	0	The precision of the column.
DataScale	Integer	0	The scale of the column.
DefaultValue	String	def_value	The default value of the column.
Description	String	test	The description of the column.

Parameter	Type	Example	Description
FunctionType	String	default	The type of the masking algorithm that is used for the column. Valid values: • null: No masking algorithm is used. • DEFAULT: A full masking algorithm is used. • FIX_POS: The fixed position is masked. • FIX_CHAR: The fixed characters are replaced.
Nullable	Boolean	true	Indicates whether the column can be null.
SecurityLevel	String	INNER	The security level of the field. Valid values: • INNER • SENSITIVE • CONFIDENTIAL
Sensitive	Boolean	false	Indicates whether the field is a sensitive field.
ErrorCode	String	UnknownError	The returned error code.
ErrorMessage	String	UnknownError	The returned error message.
RequestId	String	0AD9AC55-5873-474A-9F33-4285806A3619	The ID of the request.
Success	Boolean	true	Indicates whether the request succeeded.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ListColumns
&Logic=false
&TableId=1
&Tid=0
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ColumnList>
    <Column>
        <ColumnId>314036829</ColumnId>
        <DataScale>0</DataScale>
        <Sensitive>false</Sensitive>
        <Description>Primary key ID</Description>
        <DataPrecision>20</DataPrecision>
        <ColumnType>bigint(20) unsigned</ColumnType>
        <ColumnName>id</ColumnName>
        <SecurityLevel>INNER</SecurityLevel>
        <AutoIncrement>true</AutoIncrement>
        <Nullable>false</Nullable>
    </Column>
    <Column>
        <ColumnId>314036830</ColumnId>
        <Sensitive>false</Sensitive>
        <Description>Creation time</Description>
        <DefaultValue>CURRENT_TIMESTAMP</DefaultValue>
        <ColumnType>datetime</ColumnType>
        <ColumnName>gmt_create</ColumnName>
        <SecurityLevel>INNER</SecurityLevel>
        <AutoIncrement>false</AutoIncrement>
        <Nullable>false</Nullable>
    </Column>
    <Column>
        <ColumnId>314036831</ColumnId>
        <Sensitive>false</Sensitive>
        <Description>Modification time</Description>
        <DefaultValue>CURRENT_TIMESTAMP</DefaultValue>
        <ColumnType>datetime</ColumnType>
        <ColumnName>gmt_modified</ColumnName>
        <SecurityLevel>INNER</SecurityLevel>
        <AutoIncrement>false</AutoIncrement>
        <Nullable>false</Nullable>
    </Column>
    <Column>
        <ColumnId>314036832</ColumnId>
        <Sensitive>false</Sensitive>
        <Description>base_user</Description>
        <ColumnType>varchar(64)</ColumnType>
        <DataLength>64</DataLength>
        <ColumnName>user_name</ColumnName>
        <SecurityLevel>INNER</SecurityLevel>
        <AutoIncrement>false</AutoIncrement>
        <Nullable>true</Nullable>
    </Column>
</ColumnList>
<RequestId>0AD9AC55-5873-474A-9F33-4285806A3619</RequestId>
<Success>true</Success>
```

`JSON` format

```

    ]
  },
  "RequestId": "0AD9AC55-5873-474A-9F33-4285806A3619",
  "Success": true
}
```

13.1.2.6.8. ListIndexes

Queries the details of indexes for a table.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ListIndexes	The operation that you want to perform. Set the value to **ListIndexes**.
Logic	Boolean	Yes	false	Specifies whether the table is a logical table.
TableId	String	Yes	1	The ID of the table.
Tid	Long	Yes	0	The ID of the tenant.
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
ErrorCode	String	UnknownError	The error code that is returned.
ErrorMessage	String	UnknownError	The error message that is returned.
IndexList	Array of Index		The details of indexes.
Index			
IndexComment	String	test	The description of each index.
IndexId	String	1	The ID of the index.
IndexName	String	idx_test	The name of the index.

Parameter	Type	Example	Description
IndexType	String	Primary	The type of the index. Valid values: • Primary • Unique • Normal • FullText • Spatial
TableId	String	1	The ID of the table.
RequestId	String	1F4DE2F1-5B47-462A-A973-E02EB7AF386B	The ID of the request.
Success	Boolean	true	Indicates whether the request succeeds.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ListIndexes
&Logic=false
&TableId=1
&Tid=0
&<Common request parameters>
```

Sample success responses

`XML` format

```
<RequestId>1F4DE2F1-5B47-462A-A973-E02EB7AF386B</RequestId>
<IndexList>
    <Index>
        <IndexComment/>
        <IndexType>Primary</IndexType>
        <IndexName>PRIMARY</IndexName>
        <IndexId>49331416</IndexId>
        <TableId>18396274</TableId>
    </Index>
</IndexList>
<Success>true</Success>
```

`JSON` format

```
{
  "RequestId": "1F4DE2F1-5B47-462A-A973-E02EB7AF386B",
  "IndexList": {
    "Index": [
      {
        "IndexComment": "",
        "IndexType": "Primary",
        "IndexName": "PRIMARY",
        "IndexId": 49331416,
        "TableId": 18396274
      }
    ]
  },
  "Success": true
}
```

13.1.2.6.9. GetDatabase

Queries the details about a database.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	GetDatabase	The operation that you want to perform. Set the value to **GetDatabase**.
Host	String	Yes	xxx.xxx.xxx.xxx	The endpoint of the instance.
Port	Integer	Yes	3306	The port that is used to connect to the instance.
SchemaName	String	Yes	test_db	The name of the database.
Tid	Long	Yes	-1	The ID of the tenant.
Sid	String	No	test_sid	The system identifier (SID) of the instance.
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
Database	Struct		The details about the database.
CatalogName	String	def	The name of the database catalog. **Note** If the database type is PostgreSQL, the value indicates the name of the PostgreSQL database.
DatabaseId	String	1	The ID of the database.
DbType	String	mysql	The type of the database.
DbaId	String	1	The ID of the database administrator (DBA).
DbaName	String	dba_name	The name of the DBA.
Encoding	String	utf8mb4	The encoding of the database.
EnvType	String	test	The type of the environment to which the database belongs.
Host	String	xxx.xxx.xxx.xxx	The endpoint of the instance.
InstanceId	String	1	The ID of the instance.
OwnerIdList	List	1	The IDs of the owners of the database.
OwnerNameList	List	test	The names of the owners of the database.
Port	Integer	3306	The number of the port that is used to connect to the instance.
SchemaName	String	test_db	The name of the schema.

Parameter	Type	Example	Description
SearchName	String	test_db@xxx.xxx.xxx.xxx:3306	The name that is used to search for the database.
Sid	String	test_sid	The system identifier (SID) of the instance.
State	String	NORMAL	The status of the database. For more information about the valid values, see the **ListDatabases** operation.
ErrorCode	String	UnknownError	The returned error code.
ErrorMessage	String	UnknownError	The returned error message.
RequestId	String	3CDB8601-AD74-4A47-8114-08E08CD6319D	The ID of the request.
Success	Boolean	true	Indicates whether the request succeeded.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=GetDatabase
&Host=xxx.xxx.xxx.xxx
&Port=3306
&SchemaName=test_db
&Tid=-1
&<Common request parameters>
```

Sample success responses

`XML` format

```
<Database>
    <Encoding>utf8mb4</Encoding>
    <Host>pc-xxx.rwlb.rds.aliyuncs.com</Host>
    <InstanceId>24710</InstanceId>
    <DbType>polardb</DbType>
    <OwnerIdList>
        <OwnerIds>88653</OwnerIds>
        <OwnerIds>104442</OwnerIds>
    </OwnerIdList>
    <EnvType>product</EnvType>
    <DbaId>104442</DbaId>
    <OwnerNameList>
        <OwnerNames>xxx</OwnerNames>
        <OwnerNames>xxx[RAM user]</OwnerNames>
    </OwnerNameList>

}
```

13.1.2.6.10. GetLogicDatabase

Queries the details about a logical database.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	GetLogicDatabase	The operation that you want to perform. Set the value to **GetLogicDatabase**.
DbId	String	Yes	1	The ID of the logical database.

Parameter	Type	Required	Example	Description
Tid	Long	Yes	0	The ID of the tenant.
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
ErrorCode	String	UnknownError	The returned error code.
ErrorMessage	String	UnknownError	The returned error message.
LogicDatabase	Struct		The details about the logical database.
DatabaseId	String	1	The ID of the logical database.
DbType	String	mysql	The type of the database.
EnvType	String	dev	The type of the environment to which the database belongs.
Logic	Boolean	true	Indicates whether the database is a logical database. The value is fixed to true.
OwnerIdList	List	1	The IDs of the owners of the database.
OwnerNameList	List	owner_name	The names of the owners of the database.
SchemaName	String	test_logic_db	The name of the logical database.
SearchName	String	test_logic_db[xxx]	The name that is used to search for the logical database.
RequestId	String	90260530-565C-42B9-A6E8-893481FE6AB6	The ID of the request.
Success	Boolean	true	Indicates whether the request succeeded.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=GetLogicDatabase
&DbId=1
&Tid=0
&<Common request parameters>
```

Sample success responses

`XML` format

```
<LogicDatabase>
    <Logic>true</Logic>
    <OwnerNameList>
        <OwnerNames>xxx</OwnerNames>
        <OwnerNames>xxx</OwnerNames>
        <OwnerNames>xxx</OwnerNames>
    </OwnerNameList>
    <DatabaseId>265</DatabaseId>
    <SearchName>test_logic_db(xxx)</SearchName>
    <DbType>mysql</DbType>
    <OwnerIdList>
        <OwnerIds>88653</OwnerIds>
        <OwnerIds>97787</OwnerIds>
        <OwnerIds>88654</OwnerIds>
    </OwnerIdList>
    <EnvType>dev</EnvType>
    <SchemaName>test_logic_db</SchemaName>
</LogicDatabase>
<RequestId>90260530-565C-42B9-A6E8-893481FE6AB6</RequestId>
<Success>true</Success>
```

`JSON` format

```

  "Success": true
}
```

13.1.2.6.11. GetMetaTableDetailInfo

Queries the details of a table. These details include columns and indexes.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	GetMetaTableDetailInfo	The operation that you want to perform. Set the value to **GetMetaTableDetailInfo**.

Parameter	Type	Required	Example	Description
TableGuid	String	Yes	IDB_L_9032.db-test.yuyang_test	The globally unique identifier (GUID) of the table in DMS. **Note** • To obtain the GUID of a logical database, set the **ReturnGuid** parameter to **true** when you call the **ListLogicTables** operation. • To obtain the GUID of a logical database, set the **ReturnGuid** parameter to **true** when you call the **ListTables** operation.
Tid	Long	No	123	The ID of the tenant.
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
DetailInfo	Struct		The details of the table.
ColumnList	Array of Column		The columns.
AutoIncrement	Boolean	true	Indicates whether the column is an auto-increment column. Valid values: • true: The column is an auto-increment column. • false: The column is not an auto-increment column.
ColumnId	String	191234849	The ID of the column.
ColumnName	String	id	The name of the column.

Parameter	Type	Example	Description
ColumnType	String	bigint(20) unsigned	The data type of the column. Example: **Bigint**,**Int**, or **Varchar**.
DataLength	Integer	0	The length of the column.
DataPrecision	Integer	0	The precision of the column.
DataScale	Integer	0	The scale of the column.
Description	String	test	The description of the column.
Nullable	Boolean	false	Indicates whether the column is nullable. Valid values: • true: The column is nullable. • false: The column is not nullable.
Position	String	1	The position of the column in the table.
IndexList	Array of Index		The indexes.
IndexColumns	List	id,name	The indexed columns.
IndexId	String	123	The ID of the index.
IndexName	String	PRIMARY	The name of the index.
IndexType	String	Primary	The type of the index. Example: **Primary**, **Unique**, or **Normal**.
Unique	Boolean	false	Indicates whether the index is unique. Valid values: • true: The index is unique. • false: The index is not unique.
ErrorCode	String	UnknownError	The error code that is returned.

Parameter	Type	Example	Description
ErrorMessage	String	UnknownError	The error message that is returned.
RequestId	String	E881CB2F-DE42-42E5-90EB-8B3173DCB9B9	The ID of the request.
Success	Boolean	true	Indicates whether the request succeeds.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=GetMetaTableDetailInfo
&TableGuid=IDB_L_9032.db-test.yuyang_test
&<Common request parameters>
```

Sample success responses

`XML` format

```
<RequestId>E881CB2F-DE42-42E5-90EB-8B3173DCB9B9</RequestId>
<DetailInfo>
    <ColumnList>
        <ColumnId>191234849</ColumnId>
        <ColumnName>id</ColumnName>
        <Description>test</Description>
        <ColumnType>bigint(20) unsigned</ColumnType>
        <Position>1</Position>
        <AutoIncrement>true</AutoIncrement>
        <DataScale>0</DataScale>
        <DataPrecision>20</DataPrecision>
        <Nullable>false</Nullable>
    </ColumnList>
    <ColumnList>
        <ColumnId>191234850</ColumnId>
        <ColumnName>gmt_create</ColumnName>
        <Description>test</Description>
        <ColumnType>datetime</ColumnType>
        <Position>2</Position>
        <AutoIncrement>false</AutoIncrement>
        <Nullable>false</Nullable>
    </ColumnList>
    <ColumnList>
        <ColumnId>191234851</ColumnId>
        <ColumnName>gmt_modified</ColumnName>
        <Description>test</Description>
        <ColumnType>datetime</ColumnType>
        <Position>3</Position>
        <AutoIncrement>false</AutoIncrement>
        <Nullable>false</Nullable>
    </ColumnList>
    <IndexList>
        <IndexName>PRIMARY</IndexName>
        <IndexId>33008763</IndexId>
        <IndexColumns>id</IndexColumns>
        <Unique>false</Unique>
        <IndexType>Primary</IndexType>
    </IndexList>
</DetailInfo>
<Success>true</Success>
```

`JSON` format

```

    ]
  },
  "Success": true
}
```

13.1.2.6.12. GetTableDBTopology

Queries the topology of a table.

This operation is available only for logical databases.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	GetTableDBTopology	The operation that you want to perform. Set the value to **GetTableDBTopology**.
TableGuid	String	Yes	IDB_L_9032.db-test.yuyang_test	The globally unique identifier (GUID) of a table in Data Management (DMS). **Note** • To obtain the GUID of a table in a logical database, set the **ReturnGuid** parameter to **true** when you call the **ListLogicTables** operation. • To obtain the GUID of a table in a physical database, set the **ReturnGuid** parameter to **true** when you call the **ListTables** operation.
Tid	Long	No	123	The ID of the tenant.
RegionId	String	No	cn-hangzhou	The ID of the region where Data Management (DMS) resides. **Note** Set this parameter to the ID of the region that is in proximity to your applications.

Response parameters

Parameter	Type	Example	Description
DBTopology	Struct		The topology information about the database.
DataSourceList	Array of DataSource		The data sources.

Parameter	Type	Example	Description
DatabaseList	Array of Database		The physical databases.
DbId	String	489347	The ID of the database.
DbName	String	db-test	The name of the database.
DbType	String	mysql	The type of the database.
EnvType	String	pre	The type of the environment. Valid values: • product: production environment • dev: development environment • pre: staging environment • test: test environment • sit: SIT environment • uat: UAT environment • pet: stress testing environment • stag: STAG environment
TableList	Array of Table		The physical tables.
TableId	String	151977812	The ID of the table.
TableName	String	yuyang_test_0000	The name of the table.
TableType	String	NORMAL	The type of the table. This is a reserved parameter.
DbType	String	mysql	The type of the database.
Host	String	xxx.mysql.polardb.rds.aliyuncs.com	The endpoint of the data source.
Port	Integer	3306	The port that is used to connect to the data source.
Sid	String	def	The system identifier (SID) of the data source.

Parameter	Type	Example	Description
TableGuid	String	IDB_L_9032.db-test.yuyang_test	The GUID of the table in DMS.
TableName	String	yuyang_test	The name of the table. **Note** • If a logical table is queried, the name of the logical table is returned. • If a physical table is queried, the name of the physical table is returned.
ErrorCode	String	UnknownError	The returned error code.
ErrorMessage	String	UnknownError	The returned error message.
RequestId	String	853F7FD4-D922-4EFB-931C-D253EF159E06	The ID of the request.
Success	Boolean	true	Indicates whether the request succeeded.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=GetTableDBTopology
&TableGuid=IDB_L_9032.db-test.yuyang_test
&<Common request parameters>
```

Sample success responses

`XML` format

```
<RequestId>55B7CF50-4610-4707-B2B2-5EF2BE000367</RequestId>
<DBTopology>
    <TableName>yuyang_test</TableName>
    <TableGuid>IDB_L_9032.db-test.yuyang_test</TableGuid>
    <DataSourceList>
        <DatabaseList>
            <DbId>489347</DbId>
            <DbName>db-test</DbName>
            <TableList>

  },
  "Success": true
}
```

13.1.2.6.13. GetMetaTableColumn

Queries the details about columns in a table.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	GetMetaTableColumn	The operation that you want to perform. Set the value to **GetMetaTableColumn**.
TableGuid	String	Yes	IDB_L_11345.yuyang_test.base_user	The globally unique identifier (GUID) of a table in Data Management (DMS). **Note** • To obtain the GUID of a table in a logical database, set the **ReturnGuid** parameter to **true** when you call the **ListLogicTables** operation. • To obtain the GUID of a table in a physical database, set the **ReturnGuid** parameter to **true** when you call the **ListTables** operation.
Tid	Long	No	123	The ID of the tenant.
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
ColumnList	Array of Column		The columns.
AutoIncrement	Boolean	true	Indicates whether the column is an auto-increment column. Valid values: • **true**: The column is an auto-increment column. • **false**: The column is not an auto-increment column.
ColumnId	String	191234849	The ID of the column.

Parameter	Type	Example	Description
ColumnName	String	id	The name of the column.
ColumnType	String	bigint(20) unsigned	The data type of the column. Examples: **Bigint** , **Int**, and **Varchar**.
DataLength	Integer	0	The length of the column.
DataPrecision	Integer	0	The precision of data in the column.
DataScale	Integer	0	The scale of data in the column.
Description	String	test	The description of the column.
Nullable	Boolean	false	Indicates whether the column is empty. Valid values: • **true**: The column is empty. • **false**: The column is not empty.
Position	Integer	1	The order of the column in the table.
PrimaryKey	String	true	Indicates whether the column is the primary key. • **true**: The column is the primary key. • **false**: The column is not the primary key.
SecurityLevel	String	INNER	The sensitivity level of the column. Valid values: • **INNER** • **SENSITIVE** • **CONFIDENTIAL**
ErrorCode	String	UnknownError	The returned error code.
ErrorMessage	String	UnknownError	The returned error message.
RequestId	String	2B581A5E-D4FE-4F77-BADE-DD944D7BEBE2	The ID of the request.

Parameter	Type	Example	Description
Success	Boolean	true	Indicates whether the request succeeded.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=GetMetaTableColumn
&TableGuid=IDB_L_11345.yuyang_test.base_user
&<Common request parameters>
```

Sample success responses

`XML` format

```
<GetMetaTableColumnResponse>
      <RequestId>2B581A5E-D4FE-4F77-BADE-DD944D7BEBE2</RequestId>
      <ErrorCode>UnknownError</ErrorCode>
      <ColumnList>
            <ColumnId>191234849</ColumnId>
            <ColumnName>id</ColumnName>
            <Description>test</Description>
            <ColumnType>bigint(20) unsigned</ColumnType>
            <Position>1</Position>
            <AutoIncrement>true</AutoIncrement>
            <SecurityLevel>INNER</SecurityLevel>
            <DataScale>0</DataScale>
            <DataLength>0</DataLength>
            <DataPrecision>0</DataPrecision>
            <PrimaryKey>true</PrimaryKey>
            <Nullable>false</Nullable>
      </ColumnList>
      <ErrorMessage>UnknownError</ErrorMessage>
      <Success>true</Success>
</GetMetaTableColumnResponse>
```

`JSON` format

```
{
 "RequestId": "2B581A5E-D4FE-4F77-BADE-DD944D7BEBE2",
 "ErrorCode": "UnknownError",
 "ColumnList": [{
  "ColumnId": "191234849",
  "ColumnName": "id",
  "Description": "test",
  "ColumnType": "bigint(20) unsigned",
  "Position": "1",
  "AutoIncrement": "true",
  "SecurityLevel": "INNER",
  "DataScale": "0",
  "DataLength": "0",
  "DataPrecision": "0",
  "PrimaryKey": "true",
  "Nullable": "false"
 }],
 "ErrorMessage": "UnknownError",
 "Success": "true"
}
```

13.1.2.6.14. SyncDatabaseMeta

Synchronizes the metadata of a database dictionary.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	SyncDatabaseMeta	The operation that you want to perform. Set the value to **SyncDatabaseMeta**.
DbId	String	Yes	123	The ID of the database.
Tid	Long	Yes	-1	The ID of the tenant.
Logic	Boolean	No	false	Specifies whether the database is a logical database.
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
ErrorCode	String	UnknownError	The error code that is returned.
ErrorMessage	String	UnknownError	The error message that is returned.
RequestId	String	A99CD576-1E18-4E86-931E-C3CCE56DC030	The ID of the request.
Success	Boolean	true	Indicates whether the request succeeded.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=SyncDatabaseMeta
&DbId=123
&Tid=-1
&<Common request parameters>
```

Sample success responses

`XML` format

```
<RequestId>A99CD576-1E18-4E86-931E-C3CCE56DC030</RequestId>
<Success>true</Success>
```

`JSON` format

```
{
  "RequestId": "A99CD576-1E18-4E86-931E-C3CCE56DC030",
  "Success": true
}
```

13.1.2.6.15. SyncInstanceMeta

Synchronizes the metadata of all database dictionaries in an instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	SyncInstanceMeta	The operation that you want to perform. Set the value to **SyncInstanceMeta**.

Parameter	Type	Required	Example	Description
InstanceId	String	Yes	1234	The ID of the instance.
Tid	Long	Yes	-1	The ID of the tenant.
IgnoreTable	Boolean	No	true	Specifies whether to skip synchronization for the metadata of table dictionaries. Valid values: • true • false
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
ErrorCode	String	UnknownError	The returned error code.
ErrorMessage	String	UnknownError	The returned error message.
RequestId	String	A99CD576-1E18-4E86-931E-C3CCE56DC030	The ID of the request.
Success	Boolean	true	Indicates whether the request succeeded.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=SyncInstanceMeta
&<Common request parameters>
```

Sample success responses

`XML` format

```
<RequestId>A99CD576-1E18-4E86-931E-C3CCE56DC030</RequestId>
<Success>true</Success>
```

`JSON` format

```
{
  "RequestId": "A99CD576-1E18-4E86-931E-C3CCE56DC030",
  "Success": true
}
```

13.1.2.7. Ticket operations

13.1.2.7.1. General

13.1.2.7.1.1. ApproveOrder

Reviews a ticket.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ApproveOrder	The operation that you want to perform. Set the value to **ApproveOrder**.
ApprovalType	String	Yes	agree	The action that you want to perform on the ticket. Valid values: • AGREE • CANCEL • REJECT
Tid	Long	Yes	-1	The ID of the tenant. **Note** To view the ID of the tenant, perform the following steps: Log on to the Data Management (DMS) console. Move the pointer over the profile picture in the upper-right corner of the page.
WorkflowInstanceId	Long	Yes	1234	The ID of the approval process. You can call the **GetOrderBaseInfo** operation to obtain the ID. The ID is available only for a ticket that is pending approval. The value of this parameter is an integer that is greater than zero.

Parameter	Type	Required	Example	Description
RegionId	String	No	cn-hangzhou	The region ID.
Comment	String	No	test	The remarks.

Response parameters

Parameter	Type	Example	Description
ErrorCode	String	UnknownError	The returned error code.
ErrorMessage	String	UnknownError	The returned error message.
RequestId	String	427688B8-ADFB-4C4E-9D45-EF5C1FD6E23D	The ID of the request.
Success	Boolean	true	Indicates whether the request succeeded.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ApproveOrder
&ApprovalType=agree
&Tid=-1
&WorkflowInstanceId=1234
&<Common request parameters>
```

Sample success responses

`XML` format

```
<RequestId>427688B8-ADFB-4C4E-9D45-EF5C1FD6E23D</RequestId>
<Success>true</Success>
```

`JSON` format

```
{
  "RequestId": "427688B8-ADFB-4C4E-9D45-EF5C1FD6E23D",
  "Success": true
}
```

13.1.2.7.1.2. CloseOrder

Closes a ticket.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CloseOrder	The operation that you want to perform. Set the value to **CloseOrder**.
CloseReason	String	Yes	close reason	The reason why the ticket is closed.
OrderId	Long	Yes	1343	The ID of the ticket.
Tid	Long	Yes	-1	The ID of the tenant.
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
ErrorCode	String	UnknownError	The error code that is returned.
ErrorMessage	String	UnknownError	The error message that is returned.
RequestId	String	427688B8-ADFB-4C4E-9D45-EF5C1FD6E23D	The ID of the request.
Success	Boolean	true	Indicates whether the call succeeds.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=CloseOrder
&CloseReason=close reason
&OrderId=1343
&Tid=-1
&<Common request parameters>
```

Sample success responses

`XML` format

```
<RequestId>427688B8-ADFB-4C4E-9D45-EF5C1FD6E23D</RequestId>
<Success>true</Success>
```

`JSON` format

```
{
  "RequestId": "427688B8-ADFB-4C4E-9D45-EF5C1FD6E23D",
  "Success": true
}
```

13.1.2.7.1.3. GetApprovalDetail

Queries the approval details of a ticket.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	GetApprovalDetail	The operation that you want to perform. Set the value to **GetApprovalDetail**.
Tid	Long	Yes	-1	The ID of the tenant.
WorkflowInstanceId	Long	Yes	12345	The ID of the approval process. You can call the **GetOrderBaseInfo** operation to obtain the ID. The ID is available only for a ticket that is pending approval. The value of this parameter is an integer that is greater than zero.
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
ApprovalDetail	Struct		The details of the approval process.
AuditId	Long	277	The ID of the approval process.
CurrentHandlers	Array of CurrentHandler		The information of the reviewer.

Parameter	Type	Example	Description
CurrentHandler			
Id	Long	1	The ID of the user.
NickName	String	nickName	The name of the user.
Description	String	test	The description of the approval process.
OrderId	Long	1234	The ID of the ticket.
OrderType	String	DATA_EXPORT	The type of the ticket.
ReasonList	List	["reason1"]	The reason for the review result.
Title	String	Data export ticket-1234	The title of the approval process.
WorkflowInsCode	String	APPROVED	The status code of the approval process.
WorkflowNodes	Array of WorkflowNode		The details of approval nodes.
WorkflowNode			
AuditUserIdList	List	104442	The IDs of reviewers.
NodeName	String	DBA	The name of the approval node.
OperateComment	String	Reason: approved	The remarks of the review.
OperateTime	String	2019-10-15 13:47:54	The time when the ticket was reviewed.
OperatorId	Long	13434	The ID of the reviewer.
WorkflowInsCode	String	APPROVED	The status code of the approval process.
ErrorCode	String	UnknownError	The returned error code.

Parameter	Type	Example	Description
ErrorMessage	String	UnknownError	The returned error message.
RequestId	String	427688B8-ADFB-4C4E-9D45-EF5C1FD6E23D	The ID of the request.
Success	Boolean	true	Indicates whether the request succeeded.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=GetApprovalDetail
&Tid=-1
&WorkflowInstanceId=12345
&<Common request parameters>
```

Sample success responses

`XML` format

```

```

13.1.2.7.1.4. GetOrderBaseInfo

Queries the basic information about a ticket.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	GetOrderBaseInfo	The operation that you want to perform. Set the value to **GetOrderBaseInfo**.

Parameter	Type	Required	Example	Description
OrderId	Long	Yes	12345	The ID of the ticket.
Tid	Long	Yes	-1	The ID of the tenant.
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
ErrorCode	String	UnknownError	The returned error code.
ErrorMessage	String	UnknownError	The returned error message.
OrderBaseInfo	Struct		The basic information about the ticket.
Comment	String	test	The remarks.
Committer	String	xxx	The applicant.
CommitterId	Long	1	The ID of the applicant. Note: The ID is different from the Apsara Stack tenant account ID of the applicant.
CreateTime	String	2019-10-10 00:00:00	The time when the ticket was created.
LastModifyTime	String	2019-10-10 00:00:00	The last time when the ticket was modified.
OrderId	Long	12345	The ID of the ticket.
PluginType	String	DC_COMMON	The type of the ticket. For more information, see the "Request parameters" section of the **CreateOrder** topic.
RelatedUserList	List	1,2,3	The IDs of the operators that are related to the ticket.

Parameter	Type	Example	Description
RelatedUserNickList	List	a,b,c	The names of the operators that are related to the ticket.
StatusCode	String	success	The status code of the ticket. Valid values: • new: The ticket is created. • toaudit: The ticket is being reviewed. • Approved: The ticket is approved. • reject: The ticket is rejected. • processing: The request to create the ticket is being processed. • success: The request to create the ticket is processed. • closed: The ticket is closed.
StatusDesc	String	success	The description of the status.
WorkflowInstanceId	Long	1	The ID of the approval process.
WorkflowStatusDesc	String	approved	The description of the approval process.
RequestId	String	7133DF67-5B25-460F-8285-C4CC93472C2F	The ID of the request.
Success	Boolean	true	Indicates whether the request succeeded.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=GetOrderBaseInfo
&OrderId=12345
&Tid=-1
&<Common request parameters>
```

Sample success responses

`XML` format

```
<OrderBaseInfo>
    <Comment>test</Comment>
    <CreateTime>2019-10-10 00:00:00</CreateTime>
    <LastModifyTime>2019-10-10 00:00:00</LastModifyTime>
    <OrderId>12345</OrderId>
    <CommitterId>1</CommitterId>
    <PluginType>DC_COMMON</PluginType>
    <StatusCode>success</StatusCode>
    <RelatedUserNickList>
        <UserNicks>a,b,c</UserNicks>
    </RelatedUserNickList>
    <StatusDesc>success</StatusDesc>
    <WorkflowStatusDesc>approved</WorkflowStatusDesc>
    <WorkflowInstanceId>1</WorkflowInstanceId>
    <Committer>xxx</Committer>
    <RelatedUserList>
        <UserIds>1,2,3</UserIds>
    </RelatedUserList>
</OrderBaseInfo>
<RequestId>7133DF67-5B25-460F-8285-C4CC93472C2F</RequestId>
<ErrorCode>UnknownError</ErrorCode>
<ErrorMessage>UnknownError</ErrorMessage>
<Success>true</Success>
```

`JSON` format

```
{"OrderBaseInfo":{"Comment":"test","CreateTime":"2019-10-10 00:00:00","LastModifyTime":"2019-10-10 00:00:00","OrderId":"12345","CommitterId":"1","PluginType":"DC_COMMON","StatusCode":"success","RelatedUserNickList":{"UserNicks":"a,b,c"},"StatusDesc":"success","WorkflowStatusDesc":"approved","WorkflowInstanceId":"1","Committer":"xxx","RelatedUserList":{"UserIds":"1,2,3"}},"RequestId":"7133DF67-5B25-460F-8285-C4CC93472C2F","ErrorCode":"UnknownError","ErrorMessage":"UnknownError","Success":"true"}
```

13.1.2.7.1.5. ListOrders

Queries the details of tickets.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ListOrders	The operation that you want to perform. Set the value to **ListOrders**.
Tid	Long	No	-1	The ID of the tenant.

Parameter	Type	Required	Example	Description
PluginType	String	No	DC_COMMON	The type of tickets. Valid values: • PERM_APPLY: the tickets that are used to apply for permissions. • OWNER_APPLY: the tickets that are used to assume the ownership of resources. • DATA_CORRECT: the tickets that are used to change data. • NDDL: the tickets that are used to change the schema design of databases. • DATA_TRACK: the tickets that are used to trace data. • TABLE_SYNC: the tickets that are used to synchronize databases or tables. • DATA_EXPORT: the tickets that are used to export data. • SENSITIVITY: the tickets that are used to change the level of sensitive columns.
OrderResultType	String	No	AS_ADMIN	The range of tickets to be queried. Valid values: • AS_ADMIN: all tickets. • AS_COMMITTER: the tickets that are submitted by the current user. • AS_HANDLER: the tickets to be processed by the current user. • AS_OWNER: the tickets that are processed by the current user. • AS_Related: the tickets that are related to the current user.
SearchDateType	String	No	CREATE_TIME	The time condition. Valid values: • CREATE_TIME: the time when tickets are created. • MODIFY_TIME: the time when tickets are modified.
StartTime	String	No	2019-10-10 00:00:00	The start of the time range.
EndTime	String	No	2019-10-10 00:00:00	The end of the time range.

Parameter	Type	Required	Example	Description
SearchContent	String	No	test	The keyword that is used to search for tickets.
OrderStatus	String	No	ALL	The status of tickets. Valid values: • ALL: The tickets of all statuses are included. • FINISHED: The tickets are completed. • RUNNING: The tickets are being processed.
PageSize	Integer	No	10	The number of entries to return on each page.
PageNumber	Integer	No	1	The number of the page to return.
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
ErrorCode	String	UnknownError	The returned error code.
ErrorMessage	String	UnknownError	The returned error message.
Orders	Array of Order		The details about the tickets.
Order			
Comment	String	test	The remarks of the ticket.
Committer	String	test	The user who submitted the ticket.
CommitterId	Long	1	The ID of the user who submitted the ticket.
CreateTime	String	2019-10-10 00:00:00	The time when the ticket was created.
LastModifyTime	String	2019-10-10 00:00:00	The last time when the ticket was modified.

Parameter	Type	Example	Description
OrderId	Long	1432	The ID of the ticket.
PluginType	String	DC_COMMON	The type of the ticket.
StatusCode	String	success	The status of the ticket.
StatusDesc	String	success	The status description of the ticket.
RequestId	String	427688B8-ADFB-4C4E-9D45-EF5C1FD6E23D	The ID of the request.
Success	Boolean	true	Indicates whether the request succeeded.
TotalCount	Long	100	The total number of entries that are returned.

Examples

13.1.2.7.1.6. SubmitOrderApproval

Submits a ticket for approval.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	SubmitOrderApproval	The operation that you want to perform. Set the value to **SubmitOrderApproval**.
OrderId	Long	Yes	12345	The ID of the ticket.
Tid	Long	Yes	-1	The ID of the tenant.
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
ErrorCode	String	UnknownError	The error code that is returned.
ErrorMessage	String	UnknownError	The error message that is returned.
RequestId	String	427688B8-ADFB-4C4E-9D45-EF5C1FD6E23D	The ID of the request.
Success	Boolean	true	Indicates whether the request succeeded.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=SubmitOrderApproval
&OrderId=12345
&Tid=-1
&<Common request parameters>
```

Sample success responses

`XML` format

```
<RequestId>7AC17A86-9E6F-484B-AE8D-F9416986A108</RequestId>
<Success>true</Success>
```

`JSON` format

```
{
  "RequestId": "7AC17A86-9E6F-484B-AE8D-F9416986A108",
  "Success": true
}
```

13.1.2.7.1.7. CreateOrder

Creates a ticket.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateOrder	The operation that you want to perform. Set the value to **CreateOrder**.
Comment	String	Yes	test	The description of the ticket.
PluginParam	Json	Yes	{}	The parameter that is used to create a ticket. This parameter consists of a set of parameters that are included in a JSON string. The settings of these parameters are subject to the type of the ticket. For more information, see the "Instructions for the PluginParam parameter" section.

Parameter	Type	Required	Example	Description
PluginType	String	Yes	DATA_EXPORT	The type of the ticket. Valid values: • DC_COMMON: a ticket that is used to change common data. • DC_CHUNK: a ticket that is used to change lock-free data. • DC_CRON_CLEAR: a ticket that is used to change historical data. • NDDL: a ticket that is used to change the schema design. • DATA_EXPORT: a ticket that is used to export data. • PERM_APPLY: a ticket that is used to request a permission. • OWNER_APPLY: a ticket that is used to request the ownership of a resource.
RelatedUserList	String	Yes	1,2,3	The IDs of the operators that are related to the ticket. Separate multiple IDs with commas (,).
Tid	Long	No	-1	The ID of the tenant.
RegionId	String	No	cn-hangzhou	The region ID.

Instructions for the PluginParam parameter

```
json
# Change common data
"pluginParam" : {
    "classify" : "Test", // The classification of the reason.
    "estimateAffectRows" : 1, // The estimated number of affected rows.
    "execSql" : "update base_op_log set id=1 where id=1;", // The SQL statement to be execu
ted.
    "dbItemList" : [ { // The details of databases on which the operation is performed.
      "dbId" : 179694,
      "logic" : false
    } ],
    "rbSQL" : "update base_op_log set id=1 where id=1;", // The SQL statement to run for ro
llback.
    "rbAttachmentName" : null, // The attachment of the SQL statement to run for rollback.
    "sqlType" : "TEXT", // The type of the SQL file to run for data change. Valid values: T
EXT and ATTACHMENT.
    "rbSQLType" : "TEXT", // The type of the SQL file to run for rollback. Valid values: TE
XT and ATTACHMENT.
    "attachmentName" : // The attachment of the SQL statement to run for data change.
  }
# Change lock-free data
"pluginParam" : {
    "Classify":"Test"
    "execSQL" : "update base_op_log set op_type=op_type where 1=1;", // The SQL statement t
o be executed.
    "dbItemList" : [ {
      "dbId": 179719, // The ID of the database from which data is exported.
      "logic" : false
    } ]
  }
# Clear historical data
"pluginParam" : {
    "duration" : 10, // The duration. Unit: hours. Default value: 0.
    "specifyDuration" : true, // Specifies whether to set a duration. Valid values: true (y
es) and false (no). Default value: false.
    "Classify":"Test"
    "cronFormat" : "0 1 21 * * ?", // The expression that is used to schedule the execution
of the operation.
    "execSql" : null,
    "dbItemList" : [ {
      "dbId": 179719, // The ID of the database on which the operation is performed.
      "logic" : false
    } ],
    "cronClearItemList" : [ {
      "filterSQL" : null, // The filter conditions.
      "columnName" : "gmt_create", // The time field.
      "remainDays" : 60, // The retention period.
      "tableName" : "base_app" // The table name.
    } ]
  }
```

```
json
# Change the schema design
"pluginParam": {
    "title": "test", // The title.

    "dbId": 118989, // The ID of the required database.
    "logic": false, // Specifies whether the database is a logical database.
    "relatedIds": [], // The IDs of operators that are related to the change.
  }
```

```
json
# Export data
"pluginParam" : {
  "classify": "Classification of the reason", // The classification of the reason.
  "dbId": 179719, // The ID of the database from which data is exported.
  "exeSQL": "select 1", // Export data by using the SQL statement.
  "logic": false, // Specifies whether the database is a logical database.
  "ignoreAffectRows": false, // Specifies whether to ignore the affected rows.
  "affectRows": 1, // The estimated number of affected rows.
  "ignoreAffectRowsReason": "" // Specifies whether to ignore the affected rows.
 }
```

Response parameters

Parameter	Type	Example	Description
CreateOrderResult	List	123	The ID of the ticket that is created.
ErrorCode	String	UnknownError	The returned error code.
ErrorMessage	String	UnknownError	The returned error message.
RequestId	String	427688B8-ADFB-4C4E-9D45-EF5C1FD6E23D	The ID of the request.
Success	Boolean	true	Indicates whether the call succeeded.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=CreateOrder
&Comment=test
&PluginParam={}
&PluginType=DATA_EXPORT
&RelatedUserList=1,2,3
&<Common request parameters>
```

Sample success responses

`XML` format

```
<RequestId>427688B8-ADFB-4C4E-9D45-EF5C1FD6E23D</RequestId>
<CreateOrderResult>
    <OrderIds>123</OrderIds>
</CreateOrderResult>
<Success>true</Success>
```

`JSON` format

```
{
  "RequestId": "427688B8-ADFB-4C4E-9D45-EF5C1FD6E23D",
  "CreateOrderResult": {
    "OrderIds": [123]
  },
  "Success": true
}
```

13.1.2.7.2. Data changes

13.1.2.7.2.1. ExecuteDataCorrect

Creates a ticket to modify data.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ExecuteDataCorrect	The operation that you want to perform. Set the value to **ExecuteDataCorrect**.
OrderId	Long	Yes	123	The ID of the ticket.
Tid	String	No	-1	The ID of the tenant.

Parameter	Type	Required	Example	Description

ActionDetail	Json	No	{ "startTime" : null, "endTime" : null, "transaction" : false, "backupData" : true }	The parameters that are required to perform the operation.
				json
				"actionDetail" : {
				"startTime" : null, // The start of the required time range. If you want to immediately modify data , you do not need to set the parameter.
				"endTime" : null, // The end of the required time range. If you want to immediately modify data , you do not need to set the parameter.
				"transaction" : false, // Specifies whether to run the modification task as a transaction.
				"backupData" : true // Specifies whether to back up data.
				}

RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
ErrorCode	String	UnknownError	The error code that is returned.
ErrorMessage	String	UnknownError	The error message that is returned.
RequestId	String	427688B8-ADFB-4C4E-9D45-EF5C1FD6E23D	The ID of the request.
Success	Boolean	true	Indicates whether the request succeeded.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ExecuteDataCorrect
&OrderId=123
&<Common request parameters>
```

Sample success responses

`XML` format

```
<RequestId>7133DF67-5B25-460F-8285-C4CC93472C2F</RequestId>
<Success>true</Success>
```

`JSON` format

```
{
  "RequestId": "7133DF67-5B25-460F-8285-C4CC93472C2F",
  "Success": true
}
```

13.1.2.7.2.2. GetDataCorrectBackupFiles

Queries the download URL of an attachment that includes the backup files of data changes.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	GetDataCorrectBackupFiles	The operation that you want to perform. Set the value to **GetDataCorrectBackupFiles**.

Parameter	Type	Required	Example	Description
OrderId	Long	Yes	12345	The ID of the ticket.
Tid	Long	No	-1	The ID of the tenant.
ActionDetail	Json	No	{}	The parameters that are required to perform the operation. You do not need to specify this parameter.
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
DataCorrectBackupFiles	List	xxx	The download URL of the attachment that includes backup files.
ErrorCode	String	UnknownError	The returned error code.
ErrorMessage	String	UnknownError	The returned error message.
RequestId	String	427688B8-ADFB-4C4E-9D45-EF5C1FD6E23D	The ID of the request.
Success	Boolean	true	Indicates whether the request succeeded.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=GetDataCorrectBackupFiles
&OrderId=12345
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DataCorrectBackupFiles>
    <FileUrl>https://xxx.oss-cn-hangzhou.aliyuncs.com/xxx.zip?Expires=1574382979&amp;OSSAcc
essKeyId=wSa97B52GzF4fGqu&amp;Signature=ykWSysajKcQjXjG0X4ApOQvlIXQ%3D</FileUrl>
</DataCorrectBackupFiles>
<RequestId>4AFF4109-FEFB-44E8-96A3-923B1FA8C46E</RequestId>
<Success>true</Success>
```

`JSON` format

```
{
  "DataCorrectBackupFiles": {
    "FileUrl": [
      "https://xxx.oss-cn-hangzhou.aliyuncs.com/xxx.zip?Expires=1574382979&OSSAccessKeyId=w
Sa97B52GzF4fGqu&Signature=ykWSysajKcQjXjG0X4ApOQvlIXQ%3D"
    ]
  },
  "RequestId": "4AFF4109-FEFB-44E8-96A3-923B1FA8C46E",
  "Success": true
}
```

13.1.2.7.2.3. GetDataCorrectOrderDetail

Queries the details about a ticket that is used to modify data.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	GetDataCorrectOrderDetail	The operation that you want to perform. Set the value to **GetDataCorrectOrderDetail**.
OrderId	Long	Yes	12345	The ID of the ticket.
Tid	Long	No	-1	The ID of the tenant.
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
DataCorrectOrderDetail	Struct		The details about the ticket.

Parameter	Type	Example	Description
DatabaseList	Array of Database		The details about the database whose data is modified.
Database			
DbId	Integer	123456	The ID of the database.
DbType	String	mysql	The type of the database.
EnvType	String	product	The type of the environment to which the database belongs.
Logic	Boolean	false	Indicates whether the database is a logical database.
SearchName	String	xxx@xxx:3306	The name that is used to search for the logical database.
OrderDetail	Struct		The details about the ticket.
ActualAffectRows	Long	100	The number of rows that are affected by the system check.
AttachmentName	String	xxx	The attachment that includes the executed SQL statement.
Classify	String	test	The category of the reason for the data change.
EstimateAffectRows	Long	100	The estimated number of affected rows.
ExeSQL	String	update t1 set name = 'xxx' where id <= 100	The SQL statement that is executed.
IgnoreAffectRows	Boolean	false	Indicates whether the pre-check is ignored.
IgnoreAffectRowsReason	String	test	The reason why the pre-check is ignored.

Parameter	Type	Example	Description
RbAttachmentName	String	test	The attachment that includes the SQL statement used to roll back the updated data.
RbSQL	String	empty	The SQL statement that is specified to roll back the updated data.
RbSQLType	String	text	The type of the attachment file. Valid values: • TEXT • ATTACHMENT
SqlType	String	text	The type of the SQL statement. Valid values: • TEXT • ATTACHMENT
PreCheckDetail	Array of TaskCheckDO		The details about the precheck task.
TaskCheckDO			
CheckStatus	String	SUCCESS	The status of the precheck task. Valid values: • WAITING: The ticket is pending check. • RUNNING: The ticket is being checked. • SUCCESS: The ticket is checked. • FAIL: The ticket fails to be checked.
CheckStep	String	PERMISSION_CHECK	The check step. Valid values: • SQL_PARSE: The system parses the SQL statement. • SQL_TYPE_CHECK: The system checks the type of the SQL statement. • PERMISSION_CHECK: The system checks the permissions of the SQL statement. • ROW_CHECK: The system checks the number of rows.
UserTip	String	tip messsage	The message that appears when a check step is executed.

Parameter	Type	Example	Description
ErrorCode	String	UnknownError	The returned error code.
ErrorMessage	String	UnknownError	The returned error message.
RequestId	String	427688B8-ADFB-4C4E-9D45-EF5C1FD6E23D	The ID of the request.
Success	Boolean	true	Indicates whether the request succeeded.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=GetDataCorrectOrderDetail
&OrderId=12345
&<Common request parameters>
```

Sample success responses

`XML` format

```
<RequestId>ACE263E5-CF5F-44DD-A7B1-42C5E78E9650</RequestId>
<DataCorrectOrderDetail>
    <PreCheckDetail>
        <TaskCheckDO>
            <CheckStatus>SUCCESS</CheckStatus>
            <CheckStep>SQL_PARSE</CheckStep>
        </TaskCheckDO>
        <TaskCheckDO>
            <CheckStatus>SUCCESS</CheckStatus>
            <CheckStep>SQL_TYPE_CHECK</CheckStep>
        </TaskCheckDO>
        <TaskCheckDO>
            <CheckStatus>SUCCESS</CheckStatus>
            <CheckStep>PERMISSION_CHECK</CheckStep>
        </TaskCheckDO>
        <TaskCheckDO>
            <CheckStatus>SUCCESS</CheckStatus>
            <UserTip>This is a statistical value that is generated by the system. The actua
l number of affected rows is subject to the SQL statement that is executed.</UserTip>
            <CheckStep>ROW_CHECK</CheckStep>
        </TaskCheckDO>
    </PreCheckDetail>
    <OrderDetail>
        <ActualAffectRows>0</ActualAffectRows>
        <RbSQLType>TEXT</RbSQLType>
        <ExeSQL>update base_user set id = 1 where id = 1;</ExeSQL>
        <EstimateAffectRows>1</EstimateAffectRows>
        <SqlType>TEXT</SqlType>
        <Classify>test</Classify>
        <IgnoreAffectRowsReason/>
    </OrderDetail>
</DataCorrectOrderDetail>
<Success>true</Success>
```

`JSON` format

```
{
  "RequestId": "ACE263E5-CF5F-44DD-A7B1-42C5E78E9650",

          "CheckStatus": "SUCCESS",
          "CheckStep": "SQL_TYPE_CHECK"
        },
        {
          "CheckStatus": "SUCCESS",
          "CheckStep": "PERMISSION_CHECK"
        },
        {
          "CheckStatus": "SUCCESS",
          "UserTip": "This is a statistical value that is generated by the system. The actu
al number of affected rows is subject to the SQL statement that is executed.",
          "CheckStep": "ROW_CHECK"
        }
      ]
    },
    "OrderDetail": {
      "ActualAffectRows": 0,
      "RbSQLType": "TEXT",
      "ExeSQL": "update base_user set id = 1 where id = 1;",
      "EstimateAffectRows": 1,
      "SqlType": "TEXT",
      "Classify": "test",
      "IgnoreAffectRowsReason": ""
    }
  },
  "Success": true
}
```

13.1.2.7.3. Schema design

13.1.2.7.3.1. CreatePublishGroupTask

Creates a ticket to modify the schema design of a database.

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	CreatePublishGroupTask	The operation that you want to perform. Set the value to **CreatePublishGroupTask**.
DbId	Integer	Yes	12345	The ID of the database for which you want to modify the schema design.
Logic	Boolean	Yes	false	Specifies whether the database is a logical database.
OrderId	Long	Yes	142435	The ID of the ticket.
PublishStrategy	String	Yes	IMMEDIATELY	The policy to modify the schema design. Valid values: • IMMEDIATELY: immediately modifies the schema design. • REGULARLY: modifies the schema design at a scheduled time.
Tid	Long	Yes	-1	The ID of the tenant.
PlanTime	String	No	2019-10-10 00:00:00	The time to modify the schema design.
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
ErrorCode	String	UnknownError	The error code that is returned.
ErrorMessage	String	UnknownError	The error message that is returned.
RequestId	String	427688B8-ADFB-4C4E-9D45-EF5C1FD6E23D	The ID of the request.
Success	Boolean	true	Indicates whether the request succeeded.

Parameter	Type	Example	Description
TaskId	Long	413452	The ID of the task.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=CreatePublishGroupTask
&DbId=12345
&Logic=false
&OrderId=142435
&PublishStrategy=IMMEDIATELY
&Tid=-1
&<Common request parameters>
```

Sample success responses

`XML` format

```
<RequestId>78C93646-D9B1-4E6E-B5FD-C69F94A7905A</RequestId>
<Success>true</Success>
<TaskId>13424</TaskId>
```

`JSON` format

```
{
  "RequestId": "78C93646-D9B1-4E6E-B5FD-C69F94A7905A",
  "Success": true,
  "TaskId": 13424
}
```

13.1.2.7.4. Data export

13.1.2.7.4.1. ExecuteDataExport

Executes a ticket to export data.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ExecuteDataExport	The operation that you want to perform. Set the value to **ExecuteDataExport**.

Parameter	Type	Required	Example	Description

ActionDetail	Json	Yes	{"fileType": "CSV", "encoding": ""}	The parameters that are required to perform the operation:
				json
				{
				"fileType": "CSV", // The format of the file to which the data is exported.
				"encoding": "" // The encoding of the file.
				}

OrderId	Long	Yes	1234	The ID of the ticket.
Tid	Long	Yes	-1	The ID of the tenant.
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
ErrorCode	String	UnknownError	The returned error code.
ErrorMessage	String	UnknownError	The returned error message.
RequestId	String	FE8EE2F1-4880-46BC-A704-5CF63EAF9A04	The ID of the request.
Success	Boolean	true	Indicates whether the request succeeded.

Examples

Sample requests

```
http(s)://[Endpoint]/?ActionDetail={    "fileType": "CSV",    "encoding": ""  }
&OrderId=1234
&Tid=-1
&<Common request parameters>
```

Sample success responses

`XML` format

```
<RequestId>FE8EE2F1-4880-46BC-A704-5CF63EAF9A04</RequestId>
<Success>true</Success>
```

`JSON` format

```
{
  "RequestId": "FE8EE2F1-4880-46BC-A704-5CF63EAF9A04",
  "Success": true
}
```

13.1.2.7.4.2. GetDataExportDownloadURL

Queries the download URL of the file that includes export results for a data export ticket.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	GetDataExportDownloadURL	The operation that you want to perform. Set the value to **GetDataExportDownloadURL**.
OrderId	Long	Yes	12345	The ID of the ticket.
Tid	Long	Yes	-1	The ID of the tenant.
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
DownloadURLResult	Struct		The details about the file that includes export results.
HasResult	Boolean	true	Indicates whether a file is available for download.
TipMessage	String	tip message	The message that indicates an exception.
URL	String	xxx	The download URL of the file that includes export results.

Parameter	Type	Example	Description
ErrorCode	String	UnknownError	The error code that is returned.
ErrorMessage	String	UnknownError	The error message that is returned.
RequestId	String	427688B8-ADFB-4C4E-9D45-EF5C1FD6E23D	The ID of the request.
Success	Boolean	true	Indicates whether the request succeeded.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=GetDataExportDownloadURL
&OrderId=12345
&Tid=-1
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DownloadURLResult>
    <URL>https://dms-idb-hangzhou.oss-cn-hangzhou.aliyuncs.com/xxx.zip?Expires=1574384313&amp;OSSAccessKeyId=wSa97B52GzF4fGqu&amp;Signature=HQQWBRSKiVV6cupugh1/eAVSqXg%3D</URL>
    <HasResult>true</HasResult>
</DownloadURLResult>
<RequestId>4BF24EA5-9013-4C85-AE68-6C23AF5E0097</RequestId>
<Success>true</Success>
```

`JSON` format

```
{
  "DownloadURLResult": {
    "URL": "https://dms-idb-hangzhou.oss-cn-hangzhou.aliyuncs.com/xxx.zip?Expires=1574384313&OSSAccessKeyId=wSa97B52GzF4fGqu&Signature=HQQWBRSKiVV6cupugh1/eAVSqXg%3D",
    "HasResult": true
  },
  "RequestId": "4BF24EA5-9013-4C85-AE68-6C23AF5E0097",
  "Success": true
}
```

13.1.2.7.4.3. GetDataExportOrderDetail

Queries the details about a ticket that is used to export data.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	GetDataExportOrderDetail	The operation that you want to perform. Set the value to **GetDataExportOrderDetail**.
OrderId	Long	Yes	123456	The ID of the ticket.
Tid	Long	Yes	-1	The ID of the tenant.
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
DataExportOrderDetail	Struct		The details about the ticket.
KeyInfo	Struct		The status information.

Parameter	Type	Example	Description
JobStatus	String	EXPORT_SUCCESS	The status of the ticket. Valid values: • PRE_CHECKING: The ticket is being pre-checked. • PRE_CHECK_SUCCESS: The ticket is pre-checked. • PRE_CHECK_FAIL: The ticket fails to be pre-checked. • WAITING_APPLY_AUDIT: The ticket is being submitted for approval. • APPLY_AUDIT_SUCESS: The ticket is submitted for approval. • ENABLE_EXPORT: The ticket is approved. Data can be exported. • WAITING_EXPORT: The data is pending export. • DOING_EXPORT: The data is being exported. • EXPORT_FAIL: The data fails to be exported. • EXPORT_SUCCESS: The data is exported.
PreCheckId	Long	123	The ID of the precheck task.
OrderDetail	Struct		The details about the ticket.
ActualAffectRows	Long	1	The number of rows that are affected by the system check.
Classify	String	text	The category of the reason for the data export.
Database	String	xxx@xxx:3306	The database from which data is exported.
DbId	Integer	123	The ID of the database.
EnvType	String	test	The type of the environment to which the database belongs.
ExeSQL	String	select 1	The SQL statement that is executed to export data.

Parameter	Type	Example	Description
IgnoreAffectRows	Boolean	false	Indicates whether the affected rows are skipped.
IgnoreAffectRowsReason	String	empty	The reason why the pre-check is skipped.
Logic	Boolean	false	Indicates whether the database is a logical database.
ErrorCode	String	UnknownError	The returned error code.
ErrorMessage	String	UnknownError	The returned error message.
RequestId	String	427688B8-ADFB-4C4E-9D45-EF5C1FD6E23D	The ID of the request.
Success	Boolean	true	Indicates whether the request succeeded.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=GetDataExportOrderDetail
&OrderId=123456
&Tid=-1
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DataExportOrderDetail>
    <KeyInfo>
        <PreCheckId>15544</PreCheckId>
        <JobStatus>EXPORT_SUCCESS</JobStatus>
    </KeyInfo>
    <OrderDetail>
        <Logic>false</Logic>
        <ActualAffectRows>1</ActualAffectRows>
        <ExeSQL>select 1;</ExeSQL>
        <Database>yuyang_test@xxx:3306[yuyang_test_xxx]China (Hangzhou) non-modular databas
e</Database>
        <IgnoreAffectRows>false</IgnoreAffectRows>
        <DbId>116367</DbId>
        <Classify>Test</Classify>
        <EnvType>product</EnvType>
    </OrderDetail>
</DataExportOrderDetail>
<RequestId>78C93646-D9B1-4E6E-B5FD-C69F94A7905A</RequestId>
<Success>true</Success>
```

`JSON` format

```
{
  "DataExportOrderDetail": {
    "KeyInfo": {
      "PreCheckId": 15544,
      "JobStatus": "EXPORT_SUCCESS"
    },
    "OrderDetail": {
      "Logic": false,
      "ActualAffectRows": 1,
      "ExeSQL": "select 1;",
      "Database": <Database>yuyang_test@xxx:3306[yuyang_test_xxx]China (Hangzhou) non-modul
ar database</Database>
      "IgnoreAffectRows": false,
      "DbId": 116367,
      "Classify": "Test",
      "EnvType": "product"
    }
  },
  "RequestId": "78C93646-D9B1-4E6E-B5FD-C69F94A7905A",
  "Success": true
}
```

13.1.2.8. Permission management

13.1.2.8.1. RevokeUserPermission

Revokes the permissions on a specified resource from a user.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	RevokeUserPermission	The operation that you want to perform. Set the value to **RevokeUserPermission**.
DbId	String	Yes	142345	The ID of the database.
DsType	String	Yes	DATABASE	The type of resources. For more information, see the description of the **GrantUserPermission** operation.
PermTypes	String	Yes	QUERY	The type of permissions. For more information, see the description of the **GrantUserPermission** operation.
Tid	Long	Yes	-1	The ID of the tenant.
UserAccessId	String	Yes	123	The ID of the user permission.
UserId	String	Yes	1234	The ID of the user. You can call the **GetUser** operation to obtain the ID. **Note** The ID is different from the ID of the Apsara Stack tenant account of the user.
Logic	Boolean	No	false	Specifies whether the database is a logical database. Valid values: • true • false
TableId	String	No	1342345	The ID of the table. This parameter is required if you grant permissions on a table to a user.
TableName	String	No	table_name	The name of the table. This parameter is required if you grant permissions on a table to a user.
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
ErrorCode	String	UnknownError	The error code that is returned.
ErrorMessage	String	UnknownError	The error message that is returned.
RequestId	String	A99CD576-1E18-4E86-931E-C3CCE56DC030	The ID of the request.
Success	Boolean	true	Indicates whether the request succeeded.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=RevokeUserPermission
&<Common request parameters>
```

Sample success responses

`XML` format

```
<RequestId>A99CD576-1E18-4E86-931E-C3CCE56DC030</RequestId>
<Success>true</Success>
```

`JSON` format

```
{
  "RequestId": "A99CD576-1E18-4E86-931E-C3CCE56DC030",
  "Success": true
}
```

13.1.2.8.2. ListDatabaseUserPermssions

Queries the permissions of users on a database.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ListDatabaseUserPermssions	The operation that you want to perform. Set the value to **ListDatabaseUserPermssions**.

Parameter	Type	Required	Example	Description
DbId	String	Yes	123	The ID of the database.
PermType	String	Yes	DATABASE	The type of the permission. Valid values: • DATABASE: permissions on databases. • TABLE: permissions on tables. • COLUMN: permissions on columns.
Tid	Long	Yes	-1	The ID of the tenant.
Logic	Boolean	No	false	Specifies whether the database is a logical database.
UserName	String	No	search_user_name	The nickname of the user.
PageNumber	Integer	No	1	The number of the page to return.
PageSize	Integer	No	10	The number of entries to return on each page.
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
ErrorCode	String	UnknownError	The error code that is returned.
ErrorMessage	String	UnknownError	The error message that is returned.
RequestId	String	68075D06-7406-4887-83A7-F558A4D28C13	The ID of the request.
Success	Boolean	true	Indicates whether the request succeeds.

Parameter	Type	Example	Description
TotalCount	Long	1	The total number of entries that meet the query conditions.
UserPermissions	Array of UserPermission		The details of user permissions.
UserPermission			
Alias	String	instance_alias	The alias of the instance.
ColumnName	String	column_name	The name of the field.
DbId	String	1234	The ID of the database.
DbType	String	mysql	The type of the database.
DsType	String	DATABASE	The type of resources on which the user has permissions.
EnvType	String	product	The type of the environment to which the database belongs.
InstanceId	String	1443	The ID of the instance.
Logic	Boolean	false	Specifies whether the database is a logical database.
PermDetails	Array of PermDetail		The details of permissions.
PermDetail			
CreateDate	String	2019-12-12 00:00:00	The time when the permission was created.
ExpireDate	String	2020-12-12 00:00:00	The time when the permission expires.
ExtraData	String	DEFAULT	The extra information. This parameter is reserved.
OriginFrom	String	xxx grant	The entity that authorizes the permission.

Parameter	Type	Example	Description
PermType	String	QUERY	The type of the permission. Valid values: • QUERY: the query permission. • EXPORT: the export permission. • CORRECT: the change permission.
UserAccessId	String	13434	The ID of the authorization record.
SchemaName	String	xxx@xxxx:3306	The name of the schema.
SearchName	String	xxx	The name that is used to search for the database.
TableId	String	42345	The ID of the table.
TableName	String	table_name	The name of the table.
UserId	String	14324	The ID of the user.
UserNickName	String	user_nick_name	The name of the user.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ListDatabaseUserPermssions
&DbId=123
&PermType=DATABASE
&Tid=-1
&<Common request parameters>
```

Sample success responses

`XML` format

```
<UserPermissions>
    <UserPermission>
        <Logic>false</Logic>
        <UserNickName>xxx</UserNickName>
        <DsType>DATABASE</DsType>
        <Alias>beihe_ent_prod</Alias>

```

13.1.2.8.3. SetOwners

Sets the owners of a database or a table.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	SetOwners	The operation that you want to perform. Set the value to **SetOwners**.
OwnerIds	String	Yes	123, 456	The IDs of the owners. Separate multiple IDs with commas (,).
OwnerType	String	Yes	DATABASE	The type of the owner. Valid values: • DATABASE: an owner of physical databases. • LOGIC_DATABASE: an owner of logical databases. • TABLE: an owner of physical tables. • LOGIC_TABLE: an owner of logical tables.
ResourceId	String	Yes	123	The ID of the resource. The ID is based on the value of the **OwnerType** parameter. Valid values for the **OwnerType** parameter: • DATABASE: physical databases. • LOGIC_DATABASE: logical databases. • TABLE: physical tables. • LOGIC_TABLE: logical tables.
Tid	Long	Yes	-1	The ID of the tenant.
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
ErrorCode	String	UnknownError	The returned error code.
ErrorMessage	String	UnknownError	The returned error message.
RequestId	String	A99CD576-1E18-4E86-931E-C3CCE56DC030	The ID of the request.

Parameter	Type	Example	Description
Success	Boolean	true	Indicates whether the request succeeded.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=SetOwners
&OwnerIds=123, 456
&OwnerType=DATABASE
&ResourceId=123
&Tid=-1
&<Common request parameters>
```

Sample success responses

`XML` format

```
<RequestId>A99CD576-1E18-4E86-931E-C3CCE56DC030</RequestId>
<Success>true</Success>
```

`JSON` format

```
{
  "RequestId": "A99CD576-1E18-4E86-931E-C3CCE56DC030",
  "Success": true
}
```

13.1.2.8.4. ListUserPermissions

Queries the permissions of a user on databases and tables.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ListUserPermissions	The operation that you want to perform. Set the value to **ListUserPermissions**.
PermType	String	Yes	DATABASE	The type of resources on which the user has permissions. For more information, see **ListDatabaseUserPermssions**.
Tid	Long	Yes	-1	The ID of the tenant.

Parameter	Type	Required	Example	Description
UserId	String	Yes	13435	The ID of the user. The user ID is the same as the user ID that is specfied in the **GetUser** operation. The user ID is different from the ID of your Apsara Stack tenant account.
DatabaseName	String	No	db_name	The name of the database.
Logic	Boolean	No	false	Specifies whether the database is a logical database. Valid values: • true • false
EnvType	String	No	dev	The type of the environment to which the database belongs.
DbType	String	No	MySQL	The type of the database.
PageNumber	Integer	No	1	The number of the page to return
PageSize	Integer	No	1	The number of entries to return on each page.
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
ErrorCode	String	UnknownError	The returned error code.
ErrorMessage	String	UnknownError	The returned error message.
RequestId	String	C51420E3-144A-4A94-B473-8662FCF4AD10	The ID of the request.
Success	Boolean	true	Indicates whether the call succeeded.

Parameter	Type	Example	Description
TotalCount	Long	6	The total number of entries that meet the query conditions.
UserPermissions	Array of UserPermission		The details of user permissions.
UserPermission			
Alias	String	instance_alias	The alias of the instance.
ColumnName	String	column_name	The name of the field.
DbId	String	1324	The ID of the database.
DbType	String	mysql	The type of the database.
DsType	String	DATABASE	The type of resources on which the user has permissions.
EnvType	String	dev	The type of the environment to which the database belongs.
InstanceId	String	134	The ID of the instance.
Logic	Boolean	false	Indicates whether the database is a logical database. Valid values: • true • false
PermDetails	Array of PermDetail		The details of permissions.
PermDetail			
CreateDate	String	2019-12-12 00:00:00	The time when the permission was authorized.
ExpireDate	String	2020-12-12 00:00:00	The time when the permission expires.

Parameter	Type	Example	Description
ExtraData	String	xxx	The additional data. This parameter is reserved.
OriginFrom	String	xxx	The entity that authorizes the permission.
PermType	String	QUERY	The type of the permission.
UserAccessId	String	1345	The ID of the authorization record.
SchemaName	String	test_db	The name of a database.
SearchName	String	test_db@xxx:3306	The name that is used to search for the database.
TableId	String	13434	The ID of the table.
TableName	String	test_table	The name of the table.
UserId	String	423245	The ID of the user.
UserNickName	String	nick_name	The name of the user.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ListUserPermissions
&PermType=DATABASE
&Tid=-1
&UserId=13435
&<Common request parameters>
```

Sample success responses

`XML` format

```
<UserPermissions>
    <UserPermission>
        <Logic>false</Logic>
        <UserNickName>xxx</UserNickName>
        <DsType>DATABASE</DsType>
        <Alias>xxx_ent_dev</Alias>
        <PermDetails>
            <PermDetail>
                <ExpireDate>2020-10-31 00:00:00</ExpireDate>
                <UserAccessId>390913</UserAccessId>
                <PermType>EXPORT</PermType>
                <OriginFrom>xxx</OriginFrom>
                <CreateDate>2019-11-21 15:07:45</CreateDate>

  "Success": true
}
```

13.1.2.8.5. GrantUserPermission

Grants permissions on a database or a table to a user.

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	GrantUserPermission	The operation that you want to perform. Set the value to **GrantUserPermission**.
DbId	String	Yes	1234	The ID of the database.
DsType	String	Yes	DATABASE	The type of the permissions. Valid values: • DATABASE: permissions on physical databases • LOGIC_DATABASE: permissions on logical databases • TABLE: permissions on physical databases • LOGIC_TABLE: permissions on logical tables
ExpireDate	String	Yes	2019-12-12 00:00:00	The time when the permissions expire.
PermTypes	String	Yes	QUERY, EXPORT, CORRECT	The type of the permission. Separate multiple permission types with commas (,). Valid values: • QUERY: the query permission • EXPORT: the export permission • CORRECT: the change permission
Tid	Long	Yes	-1	The ID of the tenant.
UserId	String	Yes	12345	The ID of the user. You can call the **GetUser** operation to obtain the user ID. The user ID is different from the Apsara Stack tenant account ID of the user.
Logic	Boolean	No	false	Specifies whether the database is a logical database.
TableId	String	No	1324245	The ID of the table. This parameter is required when you grant permissions on a table.

Parameter	Type	Required	Example	Description
TableName	String	No	table_name	The name of the table. This parameter is required when you grant permissions on a table.
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
ErrorCode	String	UnknownError	The returned error code.
ErrorMessage	String	UnknownError	The returned error message.
RequestId	String	A99CD576-1E18-4E86-931E-C3CCE56DC030	The ID of the request.
Success	Boolean	true	Indicates whether the request succeeded.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=GrantUserPermission
&DbId=1234
&DsType=DATABASE
&ExpireDate=2019-12-12 00:00:00
&PermTypes=QUERY, EXPORT, CORRECT
&Tid=-1
&UserId=12345
&<Common request parameters>
```

Sample success responses

`XML` format

```
<RequestId>A99CD576-1E18-4E86-931E-C3CCE56DC030</RequestId>
<Success>true</Success>
```

`JSON` format

```
{
  "RequestId": "A99CD576-1E18-4E86-931E-C3CCE56DC030",
  "Success": true
}
```

13.1.2.9. Security management

13.1.2.9.1. ListSensitiveColumns

Queries sensitive columns.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ListSensitiveColumns	The operation that you want to perform. Set the value to **ListSensitiveColumns**.
Tid	Long	Yes	-1	The ID of the tenant.
SchemaName	String	No	test	The name of the database.
TableName	String	No	test	The name of the table.
ColumnName	String	No	test	The name of the column.
SecurityLevel	String	No	SENSITIVE	The sensitivity level of the column. Valid values: • INNER • SENSITIVE • CONFIDENTIAL
PageNumber	Integer	No	1	The number of the page to return.
PageSize	Integer	No	10	The number of entries to return on each page.
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
ErrorCode	String	UnknownError	The returned error code.
ErrorMessage	String	UnknownError	The returned error message.
RequestId	String	0E714EF1-E617-4BBC-A3D2-9552063BA942	The ID of the request.
SensitiveColumnList	Array of SensitiveColumn		The sensitive columns.
SensitiveColumn			
ColumnCount	Long	1	The number of columns.
ColumnName	String	test	The name of the column.
FunctionType	String	DEFAULT	The type of the desensitization algorithm. Valid values: • DEFAULT: All characters are masked. This is the default value. • FIX_POS: The fixed position is masked. • FIX_CHAR: The fixed characters are masked.
SchemaName	String	test	The name of the database.
SecurityLevel	String	SENSITIVE	The sensitivity level of the column.
TableName	String	test	The name of the table.
Success	Boolean	true	Indicates whether the request succeeded.
TotalCount	Long	10	The total number of entries that are returned.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ListSensitiveColumns
&Tid=-1
&<Common request parameters>
```

Sample success responses

`XML` format

```
<TotalCount>5</TotalCount>
<RequestId>0E714EF1-E617-4BBC-A3D2-9552063BA942</RequestId>
<SensitiveColumnList>
    <SensitiveColumn>

        "SecurityLevel": "CONFIDENTIAL",
        "SchemaName": "test_demo"
      }
    ]
  },
  "Success": true
}
```

13.1.2.9.2. ListSensitiveColumnsDetail

Queries the details of sensitive fields.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ListSensitiveColumnsDetail	The operation that you want to perform. Set the value to **ListSensitiveColumnsDetail**.
ColumnName	String	Yes	test	The name of the field.
SchemaName	String	Yes	test	The name of the database.
TableName	String	Yes	test	The name of the table.
Tid	Long	Yes	1	The ID of the tenant.
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
ErrorCode	String	UnknownError	The returned error code.
ErrorMessage	String	UnknownError	The returned error message.
RequestId	String	7629888F-C9FB-4D16-A7D3-B443FE06FBD4	The ID of the request.
SensitiveColumnsDetailList	Array of SensitiveColumnsDetail		The details about the sensitive fields.
SensitiveColumnsDetail			
ColumnDescription	String	test	The description of the field.
ColumnName	String	test	The name of the field.
ColumnType	String	varchar(32)	The data type of the field.
DbId	Long	124	The ID of the database.

Parameter	Type	Example	Description
DbType	String	mysql	The type of the database.
EnvType	String	product	The type of the environment to which the database belongs.
Logic	Boolean	false	Indicates whether the database is a logical database.
SchemaName	String	test	The name of the database.
SearchName	String	test@xxx:3306	The name that is used to search for the database.
TableName	String	test	The name of the table.
Success	Boolean	true	Indicates whether the request succeeded.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ListSensitiveColumnsDetail
&<Common request parameters>
```

Sample success responses

`XML` format

```
<RequestId>7629888F-C9FB-4D16-A7D3-B443FE06FBD4</RequestId>
<SensitiveColumnsDetailList>
    <SensitiveColumnsDetail>
        <TableName>king_info</TableName>
        <ColumnName>mobile</ColumnName>
        <ColumnType>varchar(64)</ColumnType>
        <SearchName>poc_prod@xxx.mysql.rds.aliyuncs.com:3306【xxx】</SearchName>
        <ColumnDescription>mobile</ColumnDescription>
        <DbId>8511149</DbId>
        <Logic>false</Logic>
        <SchemaName>poc_prod</SchemaName>
        <EnvType>product</EnvType>
        <DbType>mysql</DbType>
    </SensitiveColumnsDetail>
</SensitiveColumnsDetailList>
<Success>true</Success>
```

`JSON` format

```
{
  "RequestId": "7629888F-C9FB-4D16-A7D3-B443FE06FBD4",
  "SensitiveColumnsDetailList": {
    "SensitiveColumnsDetail": [
      {
        "TableName": "king_info",
        "ColumnName": "mobile",
        "ColumnType": "varchar(64)",
        "SearchName": "poc_prod@xxx.mysql.rds.aliyuncs.com:3306【xxx】",
        "ColumnDescription": "mobile",
        "DbId": 8511149,
        "Logic": false,
        "SchemaName": "poc_prod",
        "EnvType": "product",
        "DbType": "mysql"
      }
    ]
  },
  "Success": true
}
```

13.1.2.10. Data query

13.1.2.10.1. ExecuteScript

Executes SQL statements.

This operation is available only for instances that are managed in the security collaboration mode.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ExecuteScript	The operation that you want to perform. Set the value to **ExecuteScript**.
DbId	Integer	Yes	123	The ID of the database. **Note** You can obtain the database ID from the **DatabaseId** parameter that is returned by the **GetDatabase** operation.

Parameter	Type	Required	Example	Description
Logic	Boolean	Yes	false	A Boolean value that indicates whether the database to be affected is a logical database.
Script	String	Yes	select dt from report_daily	The SQL statements to be executed. Data query language (DQL) statements, data definition language (DDL) statements, and data manipulation language (DML) statements are supported. The control mode of the instance that you want to query determines whether you can execute DDL and DML statements.
Tid	Long	No	234	The ID of the tenant.
RegionId	String	No	cn-hangzhou	The region ID.

Response parameters

Parameter	Type	Example	Description
ErrorCode	String	UnknownError	The error code that is returned.
ErrorMessage	String	UnknownError	The error message that is returned.
RequestId	String	FE8EE2F1-4880-46BC-A704-5CF63EAF9A04	The ID of the request.
Results	Array of Result		The results that are returned by the SQL statements in the format of an array. Each entry in the array indicates the result of an SQL statement.
ColumnNames	List	["col1", "col2"]	The fields that are returned by the SQL statement.
Message	String	UnknownError	The error message that is returned if the call fails.

Parameter	Type	Example	Description
RowCount	Long	1	The total number of entries that are returned.
Rows	List	[{"col1": "value1", "col2":"value2"}]	The rows that are returned by the SQL statement.
Success	Boolean	true	Indicates whether the SQL statement is executed.
Success	Boolean	true	Indicates whether the call succeeded.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ExecuteScript
&DbId=123
&Logic=false
&Script=select dt from report_daily
&<Common request parameters>
```

Sample success responses

`XML` format

```
<RequestId>FE8EE2F1-4880-46BC-A704-5CF63EAF9A04</RequestId>
<Results>
    <Message>UnknownError</Message>
    <RowCount>1</RowCount>
    <Success>true</Success>
</Results>
<Results>
    <ColumnNames>["col1", "col2"]</ColumnNames>
    <Rows>[{"col1": "value1", "col2":"value2"}]</Rows>
</Results>
<ErrorCode>UnknownError</ErrorCode>
<ErrorMessage>UnknownError</ErrorMessage>
<Success>true</Success>
```

`JSON` format

```
{"RequestId":"FE8EE2F1-4880-46BC-A704-5CF63EAF9A04","Results":[{"Message":"UnknownError","R
owCount":"1","Success":"true"},{"ColumnNames":"[\"col1\", \"col2\"]","Rows":"[{\"col1\": \"
value1\", \"col2\":\"value2\"}]"}],"ErrorCode":"UnknownError","ErrorMessage":"UnknownError"
,"Success":"true"}
```

14.Server Load Balancer (SLB)

14.1. Developer Guide

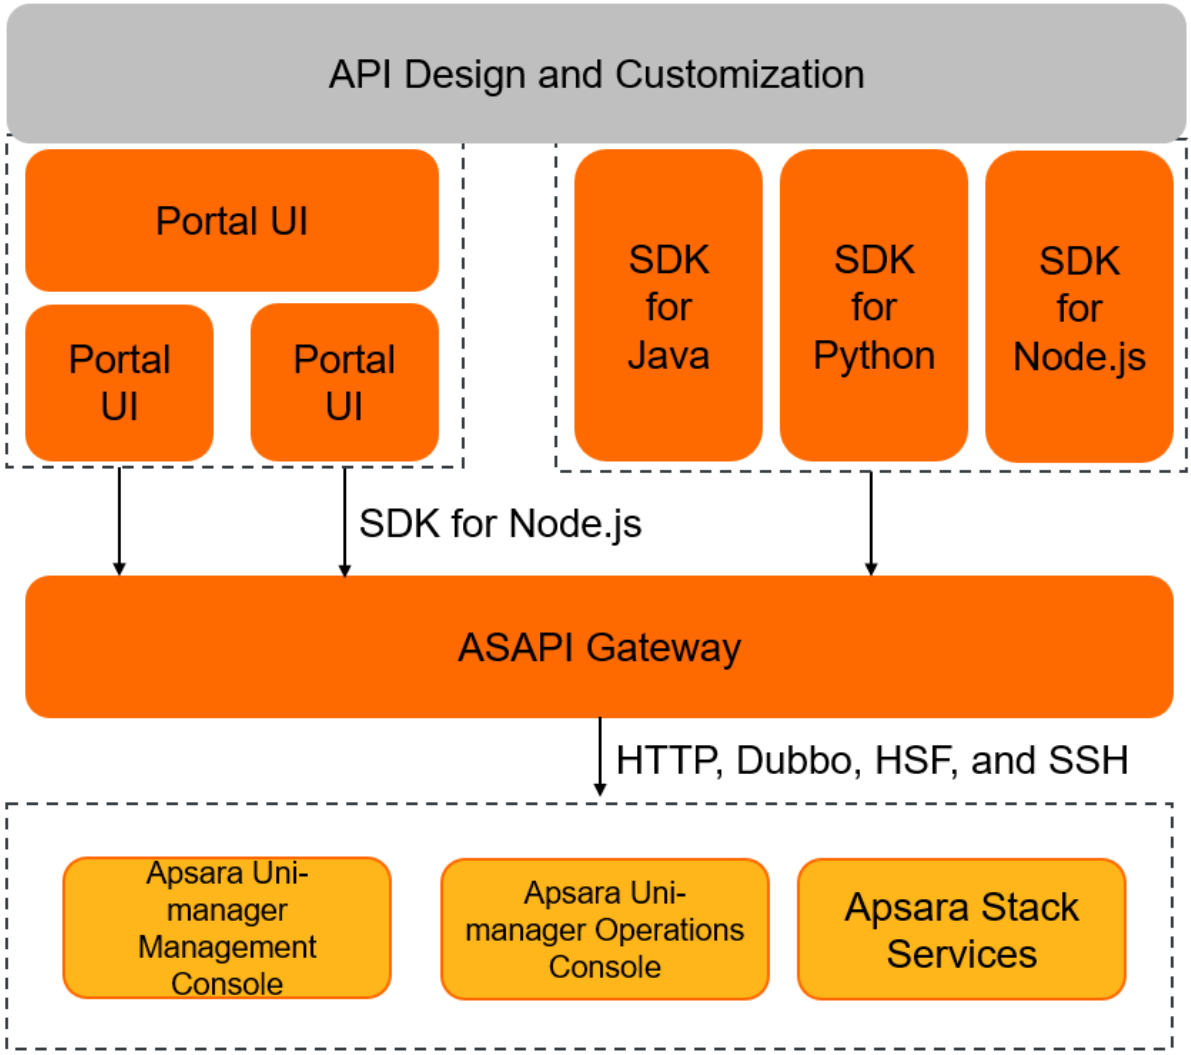
14.1.1. Make SDK calls by using ASAPI

14.1.1.1. 文档标题缺失，请补全后重新导出

14.1.1.1.1. ASAPI overview

This topic describes the architecture and features of the Apsara Stack API (ASAPI).

The ASAPI is a unified ingress gateway for Apsara Stack services and a main component of the Apsara Uni-manager Management Console. The ASAPI provides a unified method for you to manage and make API calls. You can use Apsara Stack SDK to centrally make API calls to Apsara Stack services, including Elastic Compute Service (ECS) and Virtual Private Cloud (VPC).



The ASAPI allows you to make API calls to manage and maintain Apsara Stack services.

- Make API calls to implement enterprise-grade management. For example, you can manage organizations, users, roles, resource sets, and logon policies. These operations are provided by the Apsara Uni-manager Management Console.
- Make API calls to manage operations. For example, you can manage quotas, usage statistics, specifications, and password policies. These operations are provided by the Apsara Uni-manager Management Console.
- Make API calls to manage resources. For example, you can create, delete, query, or modify cloud resources. These operations are provided by Apsara Stack services. If you call an API operation to create an ECS instance or a VPC, the API operation is provided by ECS or VPC.
- Make API calls to query monitoring metrics of Apsara Stack services. These operations are provided by the Apsara Uni-manager Management Console.
- Make API calls to perform O&M. For example, you can manage monitoring and alerting, inventories, tasks, and physical servers. These operations are provided by the Apsara Uni-manager Operations Console.

For more information, see the developer guide of the corresponding Apsara Stack service. For information about API operations used to manage organization users, see *Apsara Uni-manager Management Console Developer Guide*. For information about the API operation used to create an ECS instance, see *ECS Developer Guide*.

> **Note** If the "Use Apsara Stack SDK to make API calls" section is included in the developer guide of an Apsara Stack service, the ASAPI is supported by the Apsara Stack service. In this case, you can make API calls based on the developer guide.

14.1.1.1.2. Preparations

14.1.1.1.2.1. Log on to the API Tool console

You can log on to the API Tool console from the Apsara Uni-manager Management Console.

Prerequisites

- The URL of the Apsara Uni-manager Management Console is obtained from the deployment personnel before you log on to the Apsara Uni-manager Management Console.
- We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL of the Apsara Uni-manager Management Console. Press the Enter key.
2. Enter your username and password.

   Obtain the username and password that you can use to log on to the console from the operations administrator.

> **Note** When you log on to the Apsara Uni-manager Management Console for the first time, you must change the password of your username. Your password must meet complexity requirements. The password must be 10 to 32 characters in length and must contain at least two of the following character types:
>
> - Uppercase or lowercase letters
> - Digits
> - Special characters, which include ! @ # $ %

3. Click **Log On**.
4. In the top navigation bar, choose **Products > Others > API Tool**.

14.1.1.1.2.2. View information about API operations

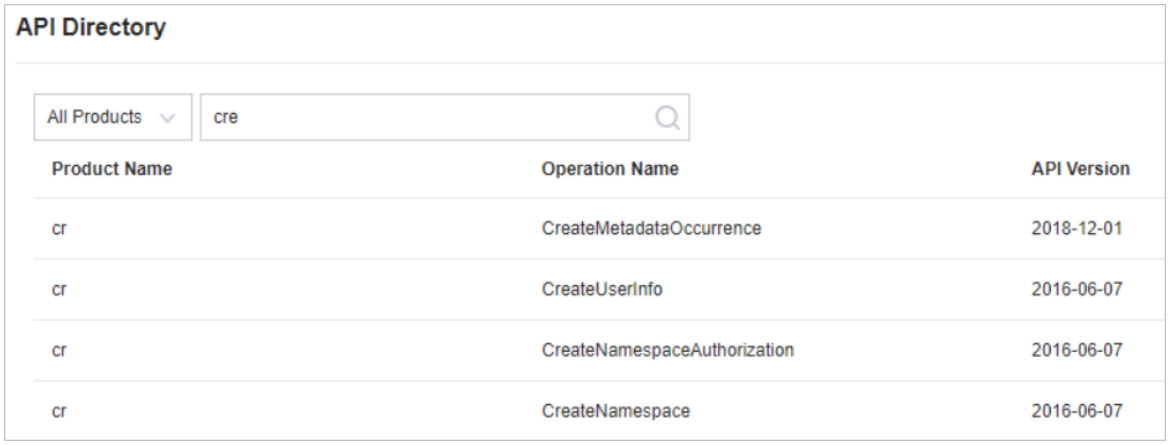
This topic describes how to view information about API operations. Before you use SDKs, obtain service names, API operation names, and API operation versions.

Context

The API operations on the API Directory page are only for reference. For information about how to call API operations, see developer guides of the corresponding cloud services. If the information on the API Directory page is inconsistent with that in the developer guide of the corresponding cloud service, the information in the developer guide prevails.

Procedure

1. Go to the API Tool console. For more information, see Log on to the API Tool console.
2. In the left-side navigation pane, click **API Directory**.
3. On the **API Directory** page, select the desired service from the drop-down list, enter a keyword of an API operation name in the search box, and then click the search icon.



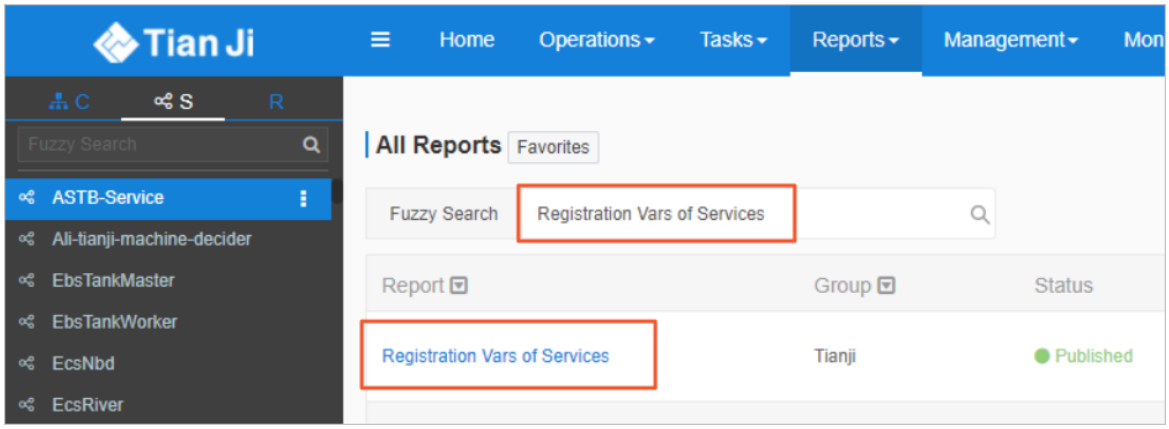
4. Then, you can view the service name, API operation name, and API operation version.

14.1.1.1.2.3. Generate an endpoint for the ASAPI

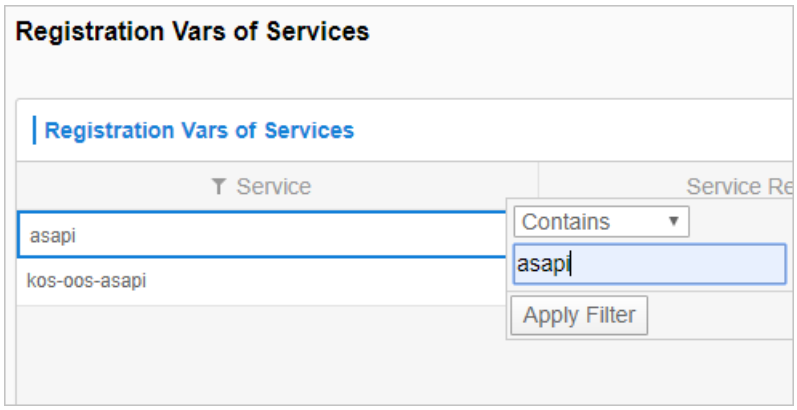
This topic describes three methods used to generate an endpoint for the Apsara Stack API (ASAPI).

Method 1: Use Registration Vars of Services to generate an endpoint

1. Log on to Apsara Infrastructure Management Framework.
   i. Log on to the Apsara Uni-manager Operations Console.
   ii. In the top navigation bar, click **O&M**.
   iii. In the left-side navigation pane, choose **Product Management** > **Products**.
   iv. In the Apsara Stack O&M section, click **Apsara Infrastructure Management Framework**.
2. In the left-side navigation pane, click **Reports**.
3. On the **All Reports** page, search for `Registration Vars of Services` and click the report name.



4. On the **Registration Vars of Services** page, click the icon next to **Service** and search for `asapi`.



5. Find the asapi service, right-click in the **Service Registration** column, and then select **Show More** from the shortcut menu.

   In the **Details** dialog box, obtain the value of **asapi.public.endpoint**.
6. Generate an endpoint for the ASAPI based on the following format:

```
https://<asapi.public.endpoint>/asapi/v3
```

Method 2: Use cluster resources to generate an endpoint

1. Log on to Apsara Infrastructure Management Framework.
   i. Log on to the Apsara Uni-manager Operations Console.

ii. In the top navigation bar, click **O&M**.

iii. In the left-side navigation pane, choose **Product Management** > **Products**.

iv. In the Apsara Stack O&M section, click **Apsara Infrastructure Management Framework**.

2. Go to the cluster operations page.

i. In the left-side navigation pane, choose Operations > Cluster Operations.

ii. In the **Cluster** search box, enter `ascm`.

iii. Find the cluster that you want to manage and click **Operations** in the **Actions** column.

3. Obtain the value of the domain parameter.

i. Click the Cluster Resources tab.

ii. In the **Name** field, search for `asapi_dns_public`.

iii. Click **Details** in the **Application Parameter** column.

In the **Application Parameter** message, obtain the value of the **domain** parameter.

4. Generate an endpoint for the ASAPI based on the following format:

```
https://<domain>/asapi/v3
```

Method 3: Concatenate strings to generate an endpoint

You can also concatenate strings to generate an endpoint based on the following format:

```
https://public.asapi.<region>.<internet-domain>/asapi/v3
```

> **Note**
>
> 1. Replace <region> with your actual region ID. For information about how to query a region ID, see Query a region ID.
> 2. Replace <internet-domain> with the root domain of your Apsara Stack service. To obtain the root domain, contact Apsara Stack O&M personnel. Take note of this point: Use the internet-domain parameter instead of the intranet-domain parameter.

If the **region** value is `cn-****-****-d01` and the **internet-domain** value is `inter.****.****.com`, the following endpoint can be generated:

```
https://public.asapi.cn-****-****-d01.inter.****.****.com/asapi/v3
```

14.1.1.1.2.4. Obtain Apsara Stack SDKs

The Apsara Stack API (ASAPI) is a unified portal provided by Apsara Stack. You can use the ASAPI to connect to all Apsara Stack services. Apsara Stack provides SDKs for API calls.

For more information about how to obtain Apsara Stack SDKs, see Apsara Stack documentation.

14.1.1.1.2.5. Obtain an AccessKey pair

An AccessKey pair that consists of an AccessKey ID and an AccessKey secret is used to implement symmetric encryption. This helps you verify the identity of a requester. The AccessKey ID is used to identify a user. The AccessKey secret is used to encrypt the signature string. This topic describes how to obtain an AccessKey pair.

Prerequisites

An account of the operations administrator or the level-1 organization administrator is obtained. Only an operations administrator or a level-1 organization administrator can obtain an AccessKey pair.

Context

If you need to make API calls to the Apsara Uni-manager Management Console or other Apsara Stack services, we recommend that you use the AccessKey pair of a personal account. If you use the AccessKey pair of a personal account, configure the request headers that are described in the following table for access control. Otherwise, an error that indicates insufficient permissions can occur.

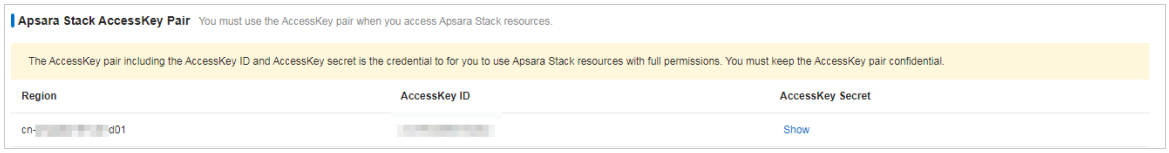
Parameter	Description
x-acs-regionid	The ID of the region, for example, cn-hangzhou-*.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console. For information about how to obtain an organization ID, see the "GetOrganizationList" section in Apsara Uni-manager Management Console Developer Guide.
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console. For information about how to obtain a resource set ID, see the "ListResourceGroup" section in Apsara Uni-manager Management Console Developer Guide.
x-acs-instanceid	The ID of the instance to which you make API calls. If you need to make API calls to an Elastic Compute Service (ECS) instance, obtain the ID of the ECS instance on the Instances page.

Warning The AccessKey pair of a personal account is managed and controlled by the permission system of the Apsara Uni-manage Management Console. If you need to obtain the AccessKey pair of an account that has permissions on an organization, make sure that your operation is allowed by an administrator. This ensures security. The account that has permissions on an organization is a privileged account.

Obtain the AccessKey pair of a personal account

To obtain the AccessKey pair of a personal account, perform the following operations:

1. Log on to the Apsara Uni-manager Management Console.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and click **User Information**.
3. In the **Apsara Stack AccessKey Pair** section, obtain the AccessKey pair.



> **Note** The AccessKey pair that consists of an AccessKey ID and an AccessKey secret is the credential for you to have full permissions on Apsara Stack resources. Keep your AccessKey pair confidential.

Obtain the AccessKey pair of an account that has permissions on an organization

To obtain the AccessKey pair of an account that has permissions on an organization, perform the following operations:

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Organizations**.
4. In the Organizations navigation tree, click the name of the organization that you want to manage.
5. On the right side of the page, click **Obtain AccessKey Pair**.
6. In the message that appears, obtain the AccessKey pair of the account that has permissions on the organization.

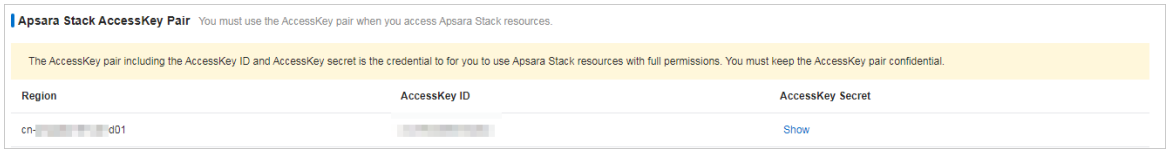
> **Note** The system automatically allocates an AccessKey pair to the account that has permissions on the level-1 organization. The same AccessKey pair is used by the accounts that have permissions on the subordinate organizations.

14.1.1.1.2.6. Query a region ID

When you use Apsara Stack SDK for Node.js to make API calls, specify a region ID. You can obtain a region ID in the Apsara Uni-manager Management Console.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and click **User Information**.
3. In the **Apsara Stack AccessKey Pair** section, view the region ID.



14.1.1.1.3. Common parameters

Common request parameters must be included in all API requests.

Sample common parameters

The following table describes the common parameters that are used when you call API operations supported by the Apsara Stack API (ASAPI).

Parameter	Type	Required	Description
Action	String	Yes	The operation that you want to perform. For more information, see View information about API operations.
Product	String	Yes	The name of the service.
Version	String	Yes	The version of the API operation. For more information, see View information about API operations.
RegionId	String	Yes	The ID of the region. For more information, see Query a region ID.
AccessKeyId	String	Yes	The AccessKey ID used to connect to the service. For more information, see Obtain an AccessKey pair.
Signature	String	Yes	The signature string of the current request. For more information about how signatures are calculated, see Request signatures.

Parameter	Type	Required	Description
SignatureMethod	String	Yes	The encryption method of the signature string. Valid values: HMAC-SHA1 and HMAC-SHA256.
SignatureVersion	String	Yes	The version of the signature encryption algorithm. Valid values: 1.0 and 2.0.
SignatureNonce	String	Yes	A unique, random number used to prevent replay attacks. You must use different numbers for different requests.
Timestamp	String	Yes	The timestamp of the request. Specify the time in the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time must be in UTC. Sample value: 2018-01-01T12:00:00Z.
Format	String	Yes	The format in which to return the response. Set the value to JSON.

Note

The `Signature`, `SignatureMethod`, `SignatureVersion`, `SignatureNonce`, `Timestamp`, and `Format` parameters are encapsulated into Apsara Stack SDK. You do not need to configure these parameters.

14.1.1.1.4. SDK description

14.1.1.1.4.1. Use Apsara Stack SDK for Java to call API operations

This topic describes how to obtain and use Apsara Stack SDK for Java to call API operations.

Prerequisites

- An authorized account and an AccessKey pair are obtained. The AccessKey pair consists of an AccessKey ID and an AccessKey secret. For more information about how to obtain an AccessKey pair in the Apsara Uni-manager Management Console, see Obtain an AccessKey pair.
- The endpoint of the Apsara Stack API (ASAPI) is obtained. For more information, see Generate an endpoint for the ASAPI.
- Apsara Stack SDK for Java 1.8 or later is installed.

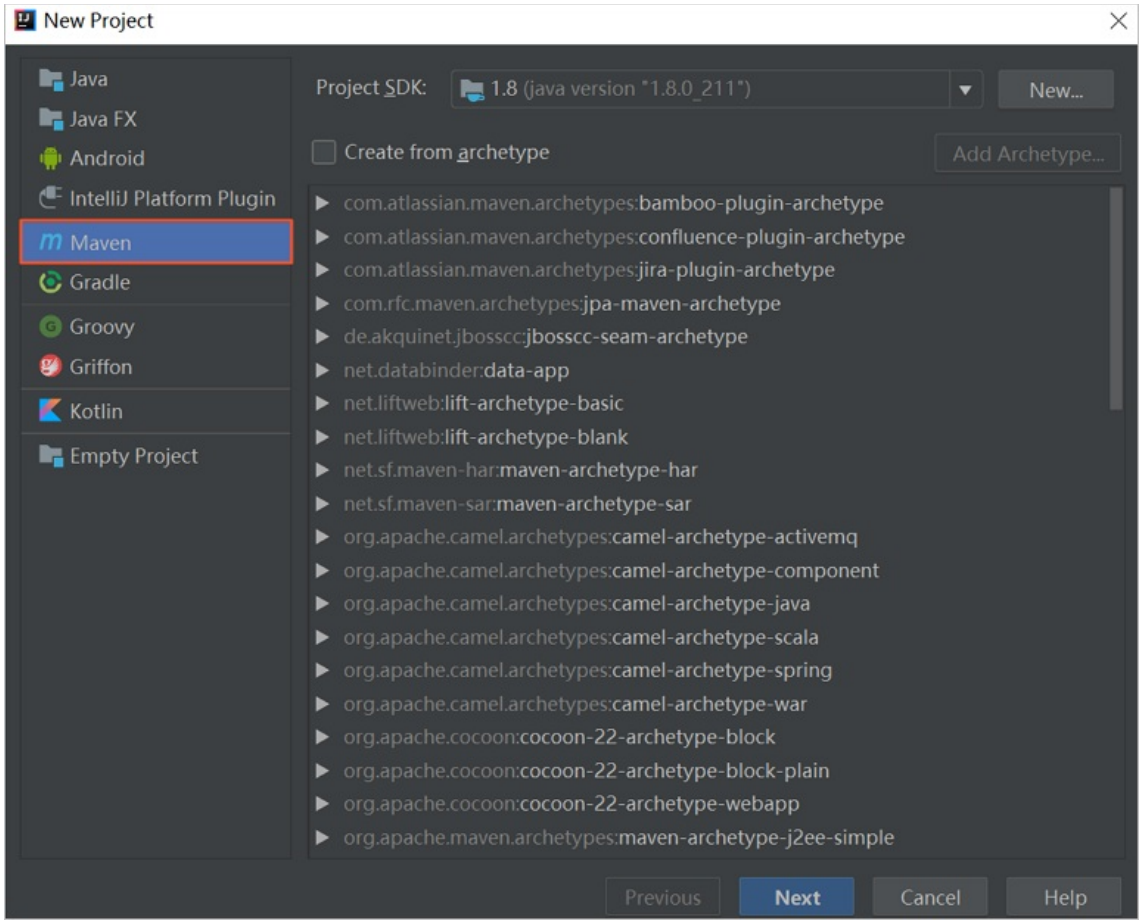
Background information

The help center of Apsara Stack provides Maven dependencies and JAR files for Apsara Stack SDK for Java. You can write code to use Apsara Stack SDK for Java to call API operations.

In this example, the Windows 10 64-bit OS and IntelliJ IDEA are used.

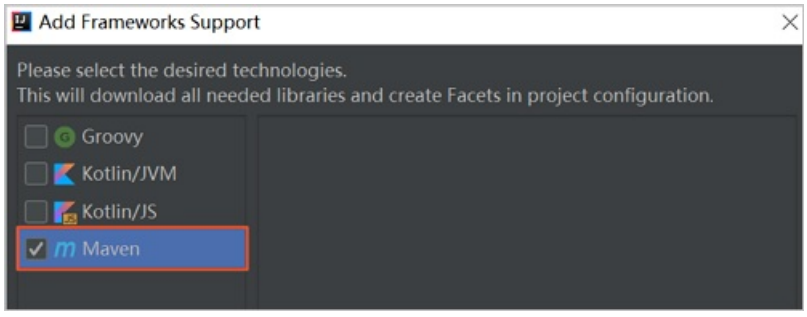
Procedure

1. Use one of the following methods to configure Maven in IntelliJ IDEA. Maven is a tool used for project management.
   - Use Maven that is integrated in IntelliJ IDEA.
   - Download Maven based on the OS that you are using from the official website and configure Maven. For more information, see Download Maven.
2. Obtain the Maven dependencies for Apsara Stack SDK for Java from the official website. For more information about how to obtain the dependencies, see Obtain the core package for ASAPI.
3. Use one of the following methods to create a Maven project:
   - Method 1: Create a Maven project in IntelliJ IDEA.

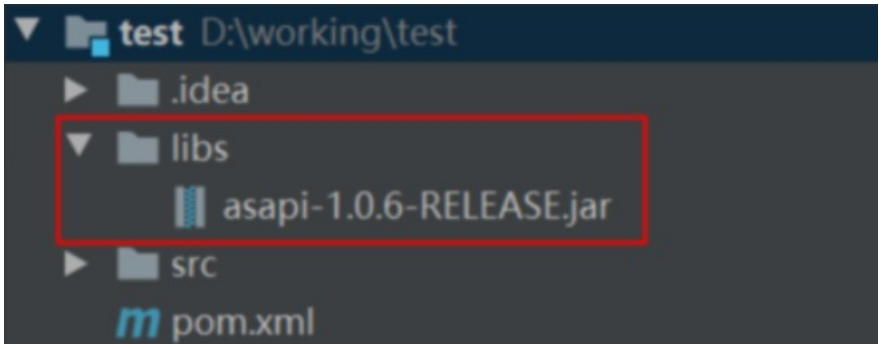


- Method 2: Convert an existing project to a Maven project.
  a. Right-click the project that you want to convert and select **Add Framework Support...**.

  b. Select **Maven** and click **OK**.



4. Create a folder named libs in the root directory of the project. Then, add the JAR file of Apsara Stack SDK for Java to the libs folder, as shown in the following figure.



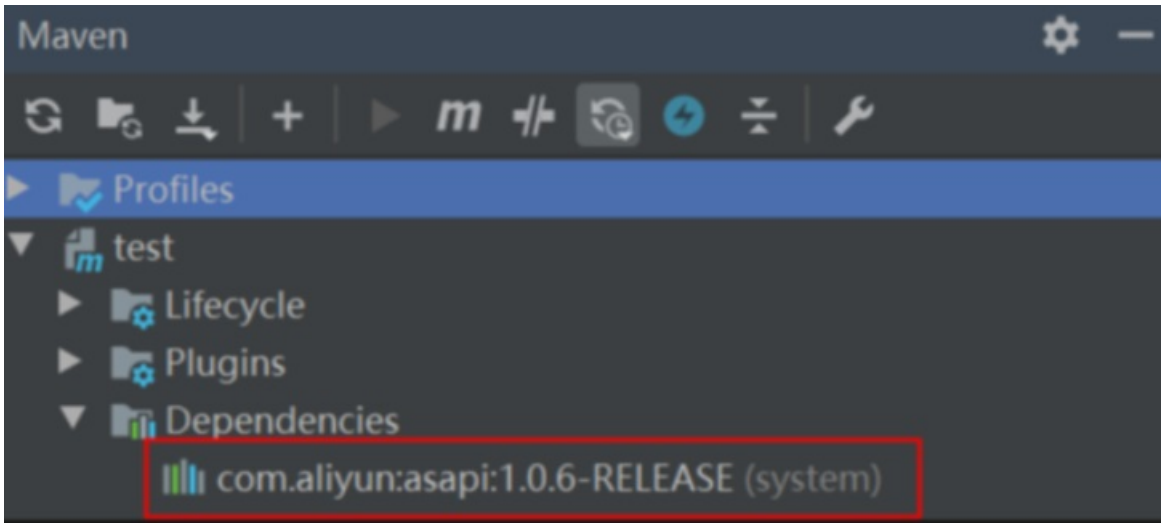
5. Add the dependencies of Apsara Stack SDK for Java to the pom.xml file in the project directory.

```
<dependencies>
    <dependency>
        <groupId>com.aliyun</groupId>
        <artifactId>asapi</artifactId>
        <version>1.0.6-RELEASE</version>
        <scope>system</scope>
        <systemPath>${project.basedir}/libs/asapi-1.0.6-RELEASE.jar</systemPath>
    </dependency>
  <dependency>
        <groupId>com.alibaba</groupId>
        <artifactId>alicrypto-java-aliyun</artifactId>
    <version>1.0.4</version>
    <systemPath>${project.basedir}/libs/alicrypto-java-aliyun-1.0.4.jar</systemPath>
  </dependency>
  <dependency>
    <groupId>com.aliyun</groupId>
    <artifactId>gmsse</artifactId>
    <version>1.1.0</version>
    <systemPath>${project.basedir}/libs/gmsse-1.1.0.jar</systemPath>
  </dependency>
</dependencies>
```

> **Note** Replace `1.0.6-RELEASE` with the actual version of Apsara Stack SDK for Java.

6. On the right side of IntelliJ IDEA, view information in the Maven section.

If the information in the following figure appears, the dependencies are added.



Use Apsara Stack SDK for Java

You can use the GET or POST method to call API operations provided by the ASAPI. The following sample code shows how to call API operations:

```
// 1. Create a connection to an ASClient object.
ASClient client = new ASClient();
// 2. Configure the identifier of the requester. This parameter is required and used only f
or identification. You can set this parameter to a random value.
client.setSdkSource("<The identifier of the requester>");
Map<String, Object> parameters = new HashMap<String, Object>();
// 3. Configure the parameters for authorization. The parameter values vary based on your e
nvironment.
// The AccessKey ID of your Apsara Stack tenant account.
parameters.put("AccessKeyId","<AccessKey ID>");
// The AccessKey secret of your Apsara Stack tenant account.
parameters.put("AccessKeySecret", "<AccessKey Secret>");
// The ID of the region.
parameters.put("RegionId", "<your RegionID>");
// 4. Configure parameters for an API call. In this example, the Product, Action, and Versi
on parameters are configured.
parameters.put("Product", "<The name of the service>");
parameters.put("Action", "<The name of the API operation>");
parameters.put("Version", "<The version of the API operation>");
// 5. Configure operation-specific parameters.
parameters.put("<The name of the operation-specific parameter>", "<The value of the operati
on-specific parameter>");
// 6. Configure request headers and the encryption method for the signature string. Valid v
alues of the SignatureMethod parameter: HMAC-SHA1 and HMAC-SHA256. By default, HMAC-SHA256
is used.
Map<String, String> headers = new HashMap<String, String>();
//headers.put("SignatureMethod", "HMAC-SHA1");
headers.put("x-acs-regionid", "<your-regionid>");
headers.put("x-acs-resourcegroupid", "<your-resourcegroupid>");
headers.put("x-acs-organizationid", "<your-organizationid>");
headers.put("x-acs-instanceid", "<your-instanceid>");
// 7. Make an API call. We recommend that you use the doPost() method.
// Configure the time-out period for a connection.
//client.setConnectTimeout(10000);
// Configure the time-out period for a request.
// client.setSocketTimeout(10000);
String result = client.doPost(endpoint, headers, parameters);
System.out.println(result);
```

Configure a proxy

If you need to use a proxy to make API calls, use the following sample code to configure the proxy:

```
Cloud cloud = new Cloud();
// Configure the IP address of the proxy.
cloud.setConfig("proxy_host", "<IP>");
// Configure the port used by the proxy.
cloud.setConfig("proxy_port", "<Port>");
// 1. Create a connection to an ASClient object.
ASClient client = new ASClient(cloud);
```

Request headers

Parameter	Description
x-acs-regionid	The ID of the region. For more information about how to obtain a region ID, see Query the region ID.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console.
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console.
x-acs-instanceid	The ID of the instance to which you make API calls.

14.1.1.1.4.2. Use Apsara Stack SDK for Python to call API operations

This topic describes how to use Apsara Stack SDK for Python to call API operations provided by the Apsara Stack API (ASAPI).

Preparations

- An authorized account and an AccessKey pair are obtained. The AccessKey pair consists of an AccessKey ID and an AccessKey secret. For more information about how to obtain an AccessKey pair in the Apsara Uni-manager Management Console, see Obtain an AccessKey pair.
- The endpoint of the ASAPI is obtained. For more information, see Generate an endpoint for the ASAPI.

Install Apsara Stack SDK for Python

1. Download the required version of Apsara Stack SDK for Python. For more information, see Obtain Apsara Stack SDKs.
2. Upload the compressed file of Apsara Stack SDK for Python to the host from which you want to send API requests and extract the file. Then, run the following code in the directory of the extracted files to install Apsara Stack SDK for Python:

```
# Install Apsara Stack SDK for Python 2.x.
pip install aliyun-python2-sdk-asapi-2.4.7.tar.gz
# Install Apsara Stack SDK for Python 3.x.
pip3 install aliyun-python3-sdk-asapi-2.4.7.tar.gz
```

> **Note**
>
> Replace `2.4.7` with the actual version of Apsara Stack SDK for Python.

Sample requests

You can use the GET or POST method to call API operations provided by the ASAPI.

```
    # 1. Import dependencies.
    from aliyunsdkasapi.ASClient import ASClient
    from aliyunsdkasapi.AsapiRequest import AsapiRequest

    if __name__ == '__main__':
     # 2. Create a request. The Product parameter specifies the name of the service. The Ver
sion parameter specifies the version of the API operation. The Action parameter specifies t
he operation that you want to perform. The asapi-endpoint parameter specifies the endpoint
of the ASAPI.
     req = AsapiRequest("<Product>", "<Version>", "<Action>", "<asapi-endpoint>")
     # 3. Configure operation-specific parameters.
     req.add_body_params("<key>", "<value>")
     # 4. Configure request headers.
     req.add_header("x-acs-resourcegroupid", "<your-resourcegroupid>");
     req.add_header("x-acs-organizationid", "<your-organizationid>");
     req.add_header("x-acs-regionid", "<your-regionid>");
     req.add_header("x-acs-instanceid", "<your-instanceid>");
     # 5. Configure a request method.
     req.set_method("POST")
     # 6. Configure initialization parameters for an ASClient object. The parameter values v
ary based on your environment. The timeout parameter specifies the time-out period for a re
quest. The cert_file parameter specifies the certificate. The verify parameter specifies wh
ether to verify the certificate.
     as_client = ASClient("<accesskeyid>", "<accesskeysecret>", "<regionid>",timeout=1000,
             cert_file=None,
             verify=False)
     # Configure the identifier of the requester. This parameter is required and used only f
or identification. You can set this parameter to a random value.
     as_client.setSdkSource("<The identifier of the requester>")
     response = as_client.do_request(req)
     print(response)
```

Request headers

Parameter	Description
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console.
x-acs-regionid	The ID of the region. For more information about how to obtain a region ID, see Query a region ID.
x-acs-instanceid	The ID of the instance to which you make API calls.

Configure a proxy

Perform the following steps to configure a proxy:

1. Import OS dependencies.

```
import os
```

2. Configure one or more proxies.

```
# Before you make an API call, configure one or more proxies.
os.environ['http_proxy'] = "http://x.x.x.x:xxxx"
os.environ['https_proxy'] = "https://x.x.x.x:xxxx"
```

14.1.1.1.4.3. Use Apsara Stack SDK for Node.js to call API operations

This topic describes how to obtain and use Apsara Stack SDK for Node.js to call API operations.

Preparations

- An authorized account and an AccessKey pair are obtained. The AccessKey pair consists of an AccessKey ID and an AccessKey secret. For more information about how to obtain an AccessKey pair in the Apsara Uni-manager Management Console, see Obtain an AccessKey pair.
- The endpoint of the Apsara Stack API (ASAPI) is obtained. For more information, see Generate an endpoint for the ASAPI.
- A region ID is obtained. For more information about how to obtain a region ID, see Query the region ID.

Add dependencies

Run the following command to install Apsara Stack SDK for Node.js:

```
tnpm install --save @ali/asapi-nodejs-sdk
```

Use Apsara Stack SDK for Node.js

The following sample code shows how to use Apsara Stack SDK for Node.js to make API calls:

```
// 1. Import the dependencies of Apsara Stack SDK for Node.js.
const Controller = require('egg').Controller;
const ASAPIClient = require('@ali/asapi-nodejs-sdk');
// 2. Configure the parameters.
const cnofig = {
    API_GATEWAY: '<The endpoint of the ASAPI>',
    regionId: '<The ID of the region in which the Apsara Stack service is deployed>',
    accessKeyId: '<The AccessKey ID of your Apsara Stack tenant account>',
    accessKeySecret: '<The AccessKey secret of your Apsara Stack tenant account>'
};
// 3. Initialize a client for API calls.
const AsapiClient = new ASAPIClient(cnofig, this.ctx);
// 4. Configure request parameters.
const params = {
    "Action": "<The name of the API operation>",
    "Product": "<The name of the service that provides the API operation>",
    "Version": "<The version of the API operation>",
    "regionId": '<The ID of the region in which the Apsara Stack service is deployed>',
      "<The name of the operation-specific parameter required by the API operation>": "<The
value of the operation-specific parameter>"
}
// 5. Configure request headers.
AsapiClient.addHeader('x-acs-caller-sdk-source', '<The identifier of the requester>')
AsapiClient.addHeader('x-acs-roleid', '<The ID of the role>')
AsapiClient.addHeader('x-acs-userid', '<The ID of the user>')
AsapiClient.addHeader('x-acs-organizationid', '<your-organizationid>')
AsapiClient.addHeadert("x-acs-regionid", "<your-regionid>");
AsapiClient.addHeader("x-acs-resourcegroupid", "<your-resourcegroupid>");
AsapiClient.addHeader("x-acs-instanceid", "<your-instanceid>");
// 6. Make an API call and obtain the response.
try {
  const res = await AsapiClient.doRequest(cnofig.API_GATEWAY, params, {
    method: 'POST', // The request method.
    formatParams: false, // Specifies whether to format parameters and capitalize the first
letter of each parameter.
    enableProxy: true, // Specifies whether to configure a proxy.
    proxy: 'http://x.x.x.x:xxxx',
    timeout: 10000, // The time-out period.
  // ca: , // The certificate issued by a certificate authority (CA). For more information,
visit https://nodejs.org/api/https.html#https_https_request_options_callback.
  })
  console.log(res)
} catch (e) {
  console.log(e)
}
```

Disable certificate validation

The following sample code shows how to disable certificate validation:

```
Configure the environment variable.
NODE_TLS_REJECT_UNAUTHORIZED=0
```

Request headers

Parameter	Description
x-acs-regionid	The ID of the region. For more information about how to obtain a region ID, see Query the region ID.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console.
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console.
x-acs-instanceid	The ID of the instance to which you make API calls.
x-acs-caller-sdk-source	The custom name of the requester or the system. This parameter is used to identify the source of the API request.
x-acs-roleid	The ID of the role.
x-acs-userid	The ID of the user.

14.1.1.1.4.4. SDK for POP

SDK for Java

Before you use Apsara Stack API (ASAPI) SDK for POP for Java to access ASAPI, you must know the remote procedure call (RPC) and resource-oriented architecture (ROA) styles that are supported for API calls. ASAPI is compatible with both styles. Their difference lies in the ASAPI endpoints that are used for API calls.

Prerequisites

- An Alibaba Cloud SDK package is downloaded for the service that you want to access. The required dependencies are installed.
- SSL certificate validation is ignored for requests over HTTPS.

Background information

ASAPI supports only the HTTPS request protocol.

Difference between two styles

When you use the RPC or ROA style to make API calls, take note that the two styles use different ASAPI endpoints.

```
# ASAPI endpoint for the RPC style:
public.asapi.<global:region>.<global:internet-domain>/asapi/v3
# ASAPI endpoint for the ROA style:
public.asapi.<global:region>.<global:internet-domain>/asapi/v3/roa
```

Call examples

The following sample code provides an example on how to use the RPC style to make an API call. In this example, the DescribeInstances operation of Elastic Compute Service (ECS) is called, and the API version is 2014-05-26.

Sample code:

```
package com.aliyuns.client.pop.ecs;

import com.aliyuncs.DefaultAcsClient;
import com.aliyuncs.ecs.model.v20140526.DescribeInstancesRequest;
import com.aliyuncs.ecs.model.v20140526.DescribeInstancesResponse;
import com.aliyuncs.http.HttpClientConfig;
import com.aliyuncs.http.ProtocolType;
import com.aliyuncs.profile.DefaultProfile;

import java.util.List;

public class DescribeInstancesTest {
    public static void main(String[] args) {
        // Specify the endpoint of ASAPI.
        String endpoint = "public.asapi.<global:region>.<global:internet-domain>/asapi/v3";
        // Specify the region where the ECS service resides.
        String region = "<global:region>";
        // Specify the name of the service that you want to access.
        String product = "ECS";
        // Specify your AccessKey pair.
        String ak = "<accessKeyId>";
        String sk = "<accessKeySecret>";
        try {
            DefaultProfile clientProfile = DefaultProfile.getProfile(region, ak, sk);
            // Ignore SSL certificate validation.
            HttpClientConfig clientConfig = HttpClientConfig.getDefault();
            clientConfig.setIgnoreSSLCerts(true);
            // Set the connection timeout period.
            clientConfig.setConnectionTimeoutMillis(3000L);
            // Set the read timeout period.
            clientConfig.setReadTimeoutMillis(10000L);
            clientProfile.setHttpClientConfig(clientConfig);
            // Create a connection.
            DefaultAcsClient acsClient = new DefaultAcsClient(clientProfile);
            // Create a request.
            DescribeInstancesRequest request = new DescribeInstancesRequest();
            // Specify the endpoint of ASAPI.
            request.setSysEndpoint(endpoint);
            // Specify the name of the service that you want to access and the region where
the service resides.
            request.setSysLocationProduct(product);
            request.setSysRegionId(region);
            // Set the request protocol to HTTPS.
            request.setSysProtocol(ProtocolType.HTTPS);
            DescribeInstancesResponse result =  acsClient.getAcsResponse(request);
            List<DescribeInstancesResponse.Instance> instances = result.getInstances();
            for (DescribeInstancesResponse.Instance instance: instances) {
                System.out.println(instance.getInstanceId());
                System.out.println(instance.getInstanceName());
```

```
            }

        } catch (Exception e) {
            e.printStackTrace();
        }
    }
}
```

The following sample code provides an example on how to use the ROA style to make an API call. In this example, the GetNamespaceList operation of Container Registry is called, and the API version is 2016-06-07.

Sample code:

```
package com.aliyuns.client.pop.cr;

import com.aliyuncs.CommonRequest;
import com.aliyuncs.CommonResponse;
import com.aliyuncs.DefaultAcsClient;
import com.aliyuncs.IAcsClient;
import com.aliyuncs.exceptions.ClientException;
import com.aliyuncs.exceptions.ServerException;
import com.aliyuncs.http.FormatType;
import com.aliyuncs.http.HttpClientConfig;
import com.aliyuncs.http.MethodType;
import com.aliyuncs.http.ProtocolType;
import com.aliyuncs.profile.DefaultProfile;

public class GetNamespaceListTest {
    public static void main(String[] args) {
        // Specify the endpoint of ASAPI.
        String endpoint = "public.asapi.<global:region>.<global:internet-domain>/asapi/v3/r
oa";
        // Specify the region where the Container Registry service resides.
        String region = "<global:region>";
        // Specify the name of the service that you want to access.
        String product = "cr";
        // Specify your AccessKey pair.
        String ak = "<accessKeyId>";
        String sk = "<accessKeySecret>";
        DefaultProfile profile = DefaultProfile.getProfile(region, ak, sk);
        // Ignore SSL certificate validation.
        HttpClientConfig clientConfig = HttpClientConfig.getDefault();
        clientConfig.setIgnoreSSLCerts(true);
        // Set the connection timeout period.
        clientConfig.setConnectionTimeoutMillis(3000L);
        // Set the read timeout period.
        clientConfig.setReadTimeoutMillis(10000L);
        profile.setHttpClientConfig(clientConfig);
        // Create a connection for the client.
        IAcsClient client = new DefaultAcsClient(profile);
        // Create a request.
        CommonRequest request = new CommonRequest();
        // Set the request protocol to HTTPS.
```

```
        request.setSysProtocol(ProtocolType.HTTPS);
        // Specify the request method.
        request.setSysMethod(MethodType.GET);
        // Specify the endpoint of ASAPI.
        request.setSysDomain(endpoint);
        // Specify the version of the API.
        request.setSysVersion("2016-06-07");
        // Specify the pattern of the uniform resource identifier (URI).
        request.setSysUriPattern("/namespace");
        // Specify the name of the service that you want to access and the region where the
service resides.
        request.setSysLocationProduct(product);

        request.putHeadParameter("Content-Type", "application/json");
        String requestBody = "" +
                "{}";
        request.setHttpContent(requestBody.getBytes(), "utf-8", FormatType.JSON);
        try {
            CommonResponse response = client.getCommonResponse(request);
            System.out.println(response.getData());
        } catch (ServerException e) {
            e.printStackTrace();
        } catch (ClientException e) {
            e.printStackTrace();
        }
    }
}
```

Notice

If you send a request over HTTPS, you must enable the request to ignore SSL certificate validation.

SDK for Go

This topic describes how to use Apsara Stack API (ASAPI) SDK for POP for Go.

Prerequisites

An Alibaba Cloud SDK package is downloaded for the service that you want to access. The required dependencies are installed.

Background information

Only the remote procedure call (RPC) style is supported for API calls.

Call examples

The following sample code provides an example on how to make an API call. In this example, the DescribeInstances operation of Elastic Compute Service (ECS) is called, and the API version is 2014-05-26.

Sample code:

```
package main
```

```
import (
 "fmt"
 "time"

 "github.com/aliyun/alibaba-cloud-sdk-go/sdk"
 "github.com/aliyun/alibaba-cloud-sdk-go/sdk/auth/credentials"
 "github.com/aliyun/alibaba-cloud-sdk-go/sdk/requests"
 "github.com/aliyun/alibaba-cloud-sdk-go/sdk/responses"
)

func getSdkConfig() *sdk.Config {
 return sdk.NewConfig().
  WithTimeout(time.Duration(30) * time.Second).
  WithEnableAsync(true).
  WithGoRoutinePoolSize(100).
  WithMaxTaskQueueSize(10000).
  WithDebug(false).
  WithScheme("HTTP")
}

func main(){
 ak := "<The AccessKey ID of your Apsara Stack tenant account.>"
 sk := "<The AccessKey secret of your Apsara Stack tenant account.>"
 regionId := "<The region where the ECS service resides.>"
 endpoint := "<The endpoint of ASAPI.>" // No network protocol.
 request := requests.NewCommonRequest()
  request.SetReadTimeout(10 * time.Second) // Set the read timeout period of the request to
10 seconds.
  request.SetConnectTimeout(5 * time.Second)  // Set the connection timeout period of the r
equest to 5 seconds.
 request.Method = requests.GET
 request.Domain = endpoint         // Location Service will not be enabled if the host is s
pecified. For example, the service with a certification type-bearer token must be specified
.
 request.Version = "2014-05-26"            // Specify the version of the API.
 request.Scheme = "https"                // Specify the request protocol. Default value: ht
tp.
 request.ApiName = "DescribeInstances"
 request.QueryParams["Product"] = "Ecs"  // Specify the name of the service that you want t
o access.
 request.TransToAcsRequest()
 client, err := sdk.NewClientWithOptions(regionId,getSdkConfig(),credentials.NewAccessKeyCr
edential(ak,sk))
 // If relevant parameters are not set for the request, the client settings are used.
  //client.SetReadTimeout(10 * time.Second)              // Set the read timeout period of
the client to 10 seconds.
 //client.SetConnectTimeout(5 * time.Second)            // Set the connection timeout perio
d of the client to 5 seconds.
  resp := responses.BaseResponse{}
  err = client.DoAction(request, &resp)
    if err != nil {
        panic(err)
    }
 fmt.Print(endpoint)
```

```
}
```

Configure proxies

You can configure proxies in one of the following ways:

- Configure proxies by using environment variables.

  Set the HTTP_PROXY and HTTPS_PROXY environment variables, or set the NO_PROXY environment variable.

  Sample code:

```
import (
    "os"
)
func main(){
 os.Setenv("HTTP_PROXY", "http://x.x.x.x:xxxx") // Set the HTTP_PROXY environment variabl
e.
 os.Setenv("HTTPS_PROXY", "https://x.x.x.x:xxxx") // Set the HTTPS_PROXY environment vari
able.
}
```

- Configure proxies on the client.

  Sample code:

```
// The proxies that are configured on the client take precedence over those that are conf
igured by using environment variables.
client.SetHttpProxy("http://x.x.x.x:xxxx")    // Configure the HTTP proxy.
client.GetHttpProxy()                           // Query the HTTP proxy.

client.SetHttpsProxy("https://x.x.x.x:xxxx")    // Configure the HTTPS proxy.
client.GetHttpsProxy()                            // Query the HTTPS proxy.

client.SetNoProxy("127.0.0.1,localhost")      // Configure the proxy whitelist.
client.GetNoProxy()                           // Query the proxy whitelist.
```

SDK for Python

This topic describes how to use Apsara Stack API (ASAPI) SDK for POP for Python.

Prerequisites

An Alibaba Cloud SDK package is downloaded for the service that you want to access. The required dependencies are installed.

Background information

Only the remote procedure call (RPC) style is supported for API calls.

Call examples

The following sample code provides an example on how to make an API call. In this example, the DescribeInstances operation of Elastic Compute Service (ECS) is called, and the API version is 2014-05-26.

Sample code:

```
from aliyunsdkcore.client import AcsClient
from aliyunsdkcore.acs_exception.exceptions import ClientException
from aliyunsdkcore.acs_exception.exceptions import ServerException
from aliyunsdkecs.request.v20140526 import DescribeInstancesRequest
import os

# Create an AcsClient instance.
client = AcsClient(
   "<your-access-key-id>",
   "<your-access-key-secret>",
   "<your-region-id>",

   timeout=1000,  # Set the timeout period.
    verify=False, # Ignore certificate validation. or verify='<The location where the certi
ficate is stored.>'
);
# Set the following parameters for the HTTPS request protocol:
# client.set_verify(False)
# os.environ["HTTPS_PROXY"] = "http://127.0.0.1:8080"

# os.environ["HTTP_PROXY"] = "http://127.0.0.1:8080"
def hello_ecs_instance():
    # Create a request and set the parameters.
    request = DescribeInstancesRequest.DescribeInstancesRequest()

    params = {"PageNumber":"1", "Product":"Ecs","Version": "2014-05-26","Action": "Describe
Instances"};
    request.set_body_params(params)
    # The endpoint that contains no network protocol is in the following format: ASAPI doma
in name/asapi/v3.
    request.set_endpoint('<The endpoint of ASAPI.>')
    # Set the following parameter if the endpoint contains no network protocol:
    request.set_protocol_type("https")

    request.set_PageSize(10)
    # Initiate the API request and obtain the response.
    response = client.do_action_with_exception(request)
    print(response)

if __name__ == '__main__':
    print("Hello Aliyun OpenApi!")
    hello_ecs_instance()
```

Configure proxies

Set the HTTP_PROXY and HTTPS_PROXY environment variables.

Sample code:

```
# Configure the HTTPS proxy.
os.environ["HTTPS_PROXY"] = "http://x.x.x.x:xxxx"

# Configure the HTTP proxy.
os.environ["HTTP_PROXY"] = "https://x.x.x.x:xxxx"
```

14.1.1.1.5. HTTP requests

14.1.1.1.5.1. Overview

This topic describes how to make API requests and is intended for users who use API URLs to initiate HTTP GET requests.

If you are using an SDK to initiate requests, you can skip this topic.

The request URL consists of different parameters and has a fixed syntax. The URL contains common request parameters, your signature, and operation-specific parameters. Sample request URLs are provided for each API operation. These URLs are not encoded to make them easy to read. Before you make a request, you must encode the request URL. After the authentication process is complete based on your signature, the results are returned to you. Response parameters are returned if the call is successful, whereas an error message is returned if the call fails. You can troubleshoot issues based on the error message.

14.1.1.1.5.2. Request syntax

The Apsara Stack API (ASAPI) allows you to call API operations by sending HTTP GET requests based on URLs. Each URL must include request parameters. This topic describes the syntax of HTTP GET requests and provides the endpoint of the ASAPI.

Sample request

GetOrganizationList is used in the following unencoded URL request:

```
https://public.asapi.aliyuns.com/asapi/v3?Action=GetOrganizationList&Product=ascm&Version=2019-05-10&Id=<Organization ID>&<Common parameters>
```

- `https` : the protocol used to transmit the request.
- `public.asapi.aliyuns.com/asapi/v3` : the endpoint of the ASAPI.
- `Action=GetOrganizationList Product=ascm Version=2019-05-10` : the API operation to call.
- `Id` : the ID of the organization.
- `<Common parameters>` : the common parameters specified in the system.

Protocol

The ASAPI supports only HTTPS.

Endpoint

For more information about how to obtain an endpoint, see Generate an endpoint for the ASAPI.

Parameter

To specify an API operation, use the `Action, Product, and Version` parameters. For example, set `Action` to GetOrganizationList, Product to ascm, and Version to 2019-05-10. You must also specify other operation-specific parameters and common parameters. For more information, see Common parameters.

14.1.1.1.5.3. Request signatures

This topic describes how to sign HTTP API requests. ASAPI uses the request signature to verify the identity of the request sender. ASAPI implements symmetric encryption by using an AccessKey pair to verify the identity of the request sender.

> **Note**
>
> - An AccessKey pair consists of an AccessKey ID and an AccessKey secret, which are issued to each user or organization in the Apsara Uni-manager Management Console.
> - The AccessKey ID is used to verify identities of users, and the AccessKey secret is used to encrypt and verify signature strings. You must keep your AccessKey secret confidential.
> - ASAPI provides SDKs for Node.js, Python, and Java to facilitate complex signature calculation. For more information, see Obtain the core package for ASAPI.

Step 1: Create a canonicalized query string

1. Arrange the request parameters in alphabetical order, including all common and operation-specific parameters except the `Signature` parameter.

   > **Note**
   >
   > If you use the GET method to send a request,these parameters are connected by ampersands (&) and included in the request URL. The first request parameter follows a question mark (?).

2. Encode the request parameters and their values in UTF-8 based on RFC 3986. The following rules apply in the encoding process:
   - Letters, digits, and special characters such as hyphens (`-`), underscores (`_`), and periods (`.`) do not need to be encoded.
   - Other characters must be percent encoded in the `%XY` format. `XY` represents the ASCII code of the characters in hexadecimal notation. For example, double quotation marks (`"`) are encoded as `%22` .

- Extended UTF-8 characters are encoded in the `%XY%ZA...` format.
- Spaces must be encoded as `%20`. Do not encode spaces as plus signs (`+`).

  This encoding method is similar to but different from the `application/x-www-form-urlencoded` MIME encoding algorithm.

  If you use `java.net.URLEncoder` from the Java standard library, use `percentEncode` to encode request parameters and their values. In the encoded query string, replace the plus signs (`+`) with `%20` , asterisks (`*`) with `%2A` , and `%7E` with tildes (`~`). This way, you can obtain an encoded string that matches the preceding encoding rules.

  ```
  private static final String ENCODING = "UTF-8";
  private static String percentEncode(String value) throws UnsupportedEncodingException
  {
      return value != null ? URLEncoder.encode(value, ENCODING).replace("+", "%20").rep
  lace("*", "%2A").replace("%7E", "~") : null;
  }
  ```

3. Use equal signs (`=`) to connect the encoded request parameters and their values.
4. Use ampersands (`&`) to connect the encoded request parameters. These parameters must be arranged in the same order as those in Step 1.

Then, a canonicalized query string that follows the request structure is obtained. For more information, see Request structure.

Step 2: Create a string-to-sign

1. Create a `string-to-sign` . You can also use `percentEncode` to encode the canonicalized query string created in Step 1 based on the following rules:

   ```
   StringToSign=
       HTTPMethod + "&" + //HTTPMethod: the HTTP method that is used to send a request, su
   ch as GET.
       percentEncode("/") + "&" + //percentEncode("/"): Encode the forward slash (/) in UT
   F-8 as %2F.
       percentEncode(CanonicalizedQueryString) // Encode the canonicalized query string cr
   eated in Step 1.
   ```

2. Calculate the RFC 2104-compliant HMAC-SHA1 or HMAC-256 value of `StringToSign` . In the following example, Java Base64 is used:

   ```
   String signature = Base64.getEncoder().encodeToString(signData);
   ```

> **Note**
>
> When you calculate the signature, the key value specified by RFC 2104 is your `AccessKey secret` plus an ampersand (&), which has an ASCII value of 38. For more information, see Obtain an AccessKey pair.

3. Encode the `Signature` parameter based on RFC 3986 and add it to the canonicalized query string.

Example 1: Concatenate parameters

`GetOrganizationList` is used in this example to query regions. For example, `AccessKeyID` is set to testid and `AccessKeySecret` is set to testsecret. Perform the following operations:

1. Construct a canonicalized query string.

```
https://public.asapi.aliyuns.com/asapi/v3/?AccessKeyId=testid&Action=GetOrganizationList&Format=JSON&Id=1&Product=ascm&RegionId=cn-region-test&SignatureMethod=HMAC-SHA1&SignatureNonce=43967c6e-e3ad-44fa-b06b-fcf3db5f39d2&SignatureVersion=1.0&Timestamp=2020-09-15T08%3A50%3A40Z&Version=2019-05-10
```

2. Create a `string-to-sign` .

```
GET&%2F&AccessKeyId%3Dtestid%26Action%3DGetOrganizationList%26Format%3DJSON%26Id%3D1%26Product%3Dascm%26RegionId%3Dcn-region-test%26SignatureMethod%3DHMAC-SHA1%26SignatureNonce%3D43967c6e-e3ad-44fa-b06b-fcf3db5f39d2%26SignatureVersion%3D1.0%26Timestamp%3D2020-09-15T08%253A50%253A40Z%26Version%3D2019-05-10
```

3. Calculate the signature.

   Calculate the signature. The key value used for calculation is `testsecret&` because `AccessKeySecret` is set to testsecret. The calculated signature is `OLeaidS1JvxuMvnyHOwuJ+uX5qY=` . Java Base64 is used in the following sample code:

   `String signature = Base64.getEncoder().encodeToString(signData);` Encode `Signature=hvqv9Ll5RE6kQ4YsQXFAf9VuRIY=` based on RFC 3986 and add it to the canonicalized query string.

```
https://public.asapi.aliyuns.com/asapi/v3/?AccessKeyId=testid&Action=GetOrganizationList&Format=JSON&Id=1&Product=ascm&RegionId=cn-region-test&SignatureMethod=HMAC-SHA1&SignatureNonce=43967c6e-e3ad-44fa-b06b-fcf3db5f39d2&SignatureVersion=1.0&Timestamp=2020-09-15T08%3A50%3A40Z&Version=2019-05-10
```

You can use browsers or tools such as cURL and Wget to initiate an HTTP request for calling the `DescribeRegions` operation to query the Alibaba Cloud region list.

Example 2: Use the standard library of the programming language

`GetOrganizationList` is used in this example to query regions. For example, `AccessKeyID` is set to testid, `AccessKeySecret` is set to testsecret, and all request parameters are stored in a Java `Map<String, String>` object.

1. Predefine an encoding method.

```
private static final String ENCODING = "UTF-8";
private static String percentEncode(String value) throws UnsupportedEncodingException {
        return value != null ? URLEncoder.encode(value, ENCODING).replace("+", "%20").r
eplace("*", "%2A").replace("%7E", "~") : null;
}
```

2. Predefine the time format for the `Timestamp` parameter. Specify the `Timestamp` parameter in the ISO 8601 format. The time must be in UTC+0.

```
private static final String ISO8601_DATE_FORMAT = "yyyy-MM-dd'T'HH:mm:ss'Z'";
private static String formatIso8601Date(Date date) {
    SimpleDateFormat df = new SimpleDateFormat(ISO8601_DATE_FORMAT);
    df.setTimeZone(new SimpleTimeZone(0, "GMT"));
    return df.format(date);
}
```

3. Create a request string.

```
final String HTTP_METHOD = "GET";
Map parameters = new HashMap();
// Specify request parameters.
parameters.put("Product", "ascm");
parameters.put("Action", "GetOrganizationList");
parameters.put("Version", "2019-05-10");
parameters.put("AccessKeyId", "testid");
parameters.put("RegionId", "cn-region-test");
parameters.put("Timestamp", formatIso8601Date(new Date()));
parameters.put("SignatureMethod", "HMAC-SHA1");
parameters.put("SignatureVersion", "1.0");
parameters.put("SignatureNonce", UUID.randomUUID().toString());
parameters.put("Format", "JSON");
parameters.put("Id", "1");
// Arrange request parameters.
String[] sortedKeys = parameters.keySet().toArray(new String[]{});
Arrays.sort(sortedKeys);
final String SEPARATOR = "&";
// Create a string-to-sign.
StringBuilder stringToSign = new StringBuilder();
stringToSign.append(HTTP_METHOD).append(SEPARATOR);
stringToSign.append(percentEncode("/")).append(SEPARATOR);
StringBuilder canonicalizedQueryString = new StringBuilder();
for(String key : sortedKeys) {
    // Encode the key and the value.
    canonicalizedQueryString.append("&")
    .append(percentEncode(key)).append("=")
    .append(percentEncode(parameters.get(key)));
}
//Encode the canonicalized query string.
stringToSign.append(percentEncode(
canonicalizedQueryString.toString().substring(1)));
```

4. The signature. The key value used for calculation is `testsecret&` because `AccessKeySecret` is set to testsecret. The calculated signature is `OLeaidS1JvxuMvnyHOwuJ%2BuX5qY%3D` .

```
// The following sample code shows how to calculate the signature:
final String ALGORITHM = "HmacSHA1";
final String ENCODING = "UTF-8";
key = "testsecret&";
Mac mac = Mac.getInstance(ALGORITHM);
mac.init(new SecretKeySpec(key.getBytes(ENCODING), ALGORITHM));
byte[] signData = mac.doFinal(stringToSign.getBytes(ENCODING));
String signature = Base64.getEncoder().encodeToString(signData);
```

Encode the Signature parameter based on RFC 3986 and add it to the canonicalized query string. The following URL is obtained:

```
https://public.asapi.aliyuns.com/asapi/v3/?AccessKeyId=testid&Action=GetOrganizationLis
t&Format=JSON&Id=1&Product=ascm&RegionId=cn-region-test&SignatureMethod=HMAC-SHA1&Signa
tureNonce=43967c6e-e3ad-44fa-b06b-fcf3db5f39d2&SignatureVersion=1.0&Timestamp=2020-09-1
5T08%3A50%3A40Z&Version=2019-05-10
```

5. Use browsers or tools such as cURL and Wget to initiate an HTTP request.

14.1.1.1.5.4. Response

Responses are returned only in the JSON format. If a return code is greater than or equal to 200 and less than 300, a success response is returned. Otherwise, an error response is returned.

Sample success response

If a request is successful, the request ID and operation-specific parameter values are returned. For more information, see the developer guide of the corresponding Apsara Stack service.

```
 {
    "eagleEyeTraceId": "xxx-xxx-xxx-xxx", // The trace ID provided by EagleEye.
    "asapiSuccess": true,
    "RequestId": "xxxxxxxxxx",
    "Regions": { // The regions returned after you call the DescribeRegions operation.
        "Region": [
            {
                "RegionId": "",
                "RegionEndpoint": "",
                "LocalName": ""
            }
        ]
    }
}
```

Sample error response

If a request fails, the following information is returned. For more information, see the developer guide of the corresponding Apsara Stack service.

```
{
    "code": "asapi.server.api.notfound",// The error code.
    "eagleEyeTraceId": "xxx-xxx-xxx-xxx", // The trace ID provided by EagleEye.
    "asapiSuccess": false, // Indicates whether the request is successful.
    "hostId": "xxxx", // The ID of the host.
    "message": "Failed to ....", // The message returned.
    "asapiErrorMessage": "Failed to ....", // The error message provided by the ASAPI.
    "asapiErrorCode": "asapi.server.api.notfound" // The error code provided by the ASAPI.
}
```

14.1.2. API Reference

14.1.2.1. Make API requests

To call a Server Load Balancer (SLB) API operation, you must send an HTTP GET request to the endpoint of the SLB API. You must add the request parameters that correspond to the API operation being called. After you call the API operation, the system returns a response. The request and response are encoded in UTF-8.

Request syntax

SLB API operations use the RPC protocol. You can call SLB API operations by sending HTTP GET requests.

The request syntax is:

```
http://Endpoint/?Action=xx&Parameters
```

where:

- Endpoint: the endpoint of the SLB API is `slb.example.com`.

  > **Note** `example.com` is a custom domain name. To obtain the domain name, contact an administrator. For more information, see Generate the Apsara Stack API (ASAPI) endpoint.

- Action: the name of the operation being performed. For example, to query SLB instances, you must set the Action parameter to DescribeLoadBalancers.
- Version: is the version of the API that you want to use. The current SLB API version is *2014-05-15*.
- Parameters: the request parameters for the operation. Separate multiple parameters with ampersands (&).

  Request parameters include both common parameters and operation-specific parameters. Common parameters include the API version and authentication information. For more information, see Common parameters.

The following example demonstrates how to call the DescribeLoadBalancers operation in SLB.

> **Note** The sample requests are formatted to improve readability.

```
https://slb.example.com/?Action=DescribeLoadBalancers
&Format=xml
&Version=2014-05-15
&Signature=xxxx%xxxx%3D
&SignatureMethod=HMAC-SHA1
&SignatureNonce=15215528852396
&SignatureVersion=1.0
&AccessKeyId=key-test
&TimeStamp=2016-02-23T12:46:24Z
...
```

API authorization

To ensure the security of your account, we recommend that you call APIs as a Resource Access Management (RAM) user. To call the SLB API as a RAM user, you must create and add a permission policy to the RAM user.

For more information about the resources and operations that can be authorized to a RAM user, see RAM authentication.

Request signatures

You must sign all API requests to ensure security. Apsara Stack uses the request signature to verify the identity of the API caller.

SLB implements symmetric encryption with an AccessKey pair to verify the identity of the request sender. An AccessKey pair is an identity credential issued to Apsara Stack tenant accounts and RAM users. An AccessKey pair is similar to a logon username and password. An AccessKey pair consists of an AccessKey ID and an AccessKey secret. The AccessKey ID is used to verify the identity of the user, while the AccessKey secret is used to encrypt and verify the signature string. You must keep your AccessKey secret strictly confidential. For more information, see Obtain an AccessKey pair.

You must add the signature to the SLB API request in the following format:

`https://endpoint/?SignatureVersion=1.0&SignatureMethod=HMAC-SHA1&Signature=xxxx%xxxx%3D&SignatureNonce=3ee8c1b8-83d3-44af-a94f-4e0ad82fd6cf`

Take the DescribeLoadBalancers operation as an example. If the AccessKey ID is `testid` and the AccessKey secret is `testsecret`, the pre-signed request URL is:

```
http://slb.example.com/?Action=DescribeLoadBalancers
&TimeStamp=2016-02-23T12:46:24Z
&Format=XML
&AccessKeyId=testid
&SignatureMethod=HMAC-SHA1
&SignatureNonce=3ee8c1b8-83d3-44af-a94f-4e0ad82fd6cf
&Version=2014-05-26
&SignatureVersion=1.0
```

Perform the following operations to calculate the signature:

1. Use the request parameters to create a query string for the signature.

   ```
   GET&%2F&AccessKeyId%3Dtestid&Action%3DDescribeLoadBalancers&Format%3DXML&SignatureMethod%3DHMAC-SHA1&SignatureNonce%3D3ee8c1b8-83d3-44af-a94f-4e0ad82fd6cf&SignatureVersion%3D1.0&TimeStamp%3D2016-02-23T12%253A46%253A24Z&Version%3D2014-05-15
   ```

2. Calculate the hash-based message authentication code (HMAC) value of the string-to-sign.

   Append an ampersand (&) to the AccessKey secret as the key for calculating the HMAC value. In this example, the key is `testsecret&`.

   ```
   CT9X0VtwR86fNWSnsc6v8YG****E=
   ```

3. Add the signature to the request parameters:

   ```
   http://slb.example.com/?Action=DescribeLoadBalancers
   &TimeStamp=2016-02-23T12:46:24Z
   &Format=XML
   &AccessKeyId=testid
   &SignatureMethod=HMAC-SHA1
   &SignatureNonce=3ee8c1b8-83d3-44af-a94f-4e0ad82fd6cf
   &Version=2014-05-15
   &SignatureVersion=1.0
   &Signature=xxxx%xxxx%3D
   ```

14.1.2.2. RAM authentication

Before calling an SLB API as a RAM user, you must use an Alibaba Cloud account to create an authorization policy to assign permissions to the RAM user. In the authorization policy, you must use an Alibaba Cloud Resource Name (ARN) as the unique identifier of the resource.

Available SLB resources

The following table describes the ARN format for different types of SLB resources.

Resource type	ARN format
LoadBalancer	`acs:slb:$regionid:$accountid:loadbalancer/$loadbalancerid`
	`acs:slb:$regionid:$accountid:loadbalancer/*`
	`acs:slb:*:$accountid:loadbalancer/*`
	`acs:slb:*:*:loadbalancer/*`
Certificate	`acs:slb:$regionid:$accountid:certificate/$servercertificateId`
	`acs:slb:$regionid:$accountid:certificate/*`

`$regionid/accoutid/servercertificateId` is the resource ID. `*` indicates the corresponding resources.

SLB APIs

The following table lists the APIs that can be authorized and their corresponding ARN formats.

API	ARN format
CreateLoadBalancer	`acs:slb:$regionid:$accountid:loadbalancer/*`
ModifyLoadBalancerInternetSpec	`acs:slb:$regionid:$accountid:loadbalancer/$loadbalancerid`
DeleteLoadBalancer	`acs:slb:$regionid:$accountid:loadbalancer/$loadbalancerid`
SetLoadBalancerStatus	`acs:slb:$regionid:$accountid:loadbalancer/$loadbalancerid`
SetLoadBalancerName	`acs:slb:$regionid:$accountid:loadbalancer/$loadbalancerid`
DescribeLoadBalancers	`acs:slb:$regionid:$accountid:loadbalancer/*`
DescribeLoadBalancerAttribute	`acs:slb:$regionid:$accountid:loadbalancer/$loadbalancerid`
DescribeRegions	`acs:slb:*:$accountid:*`
UploadServerCertificate	`acs:slb:%s:%s:certificate/*`

API	ARN format
DeleteServerCertificate	`acs:slb:%s:%s:certificate/%`
DescribeServerCertificate	`acs:slb:%s:%s:certificate/%`
SetServerCertificateName	`acs:slb:%s:%s:certificate/%`
DescribeServerCertificates	`acs:slb:%s:%s:certificate/*`
CreateLoadBalancerHTTPListener	`acs:slb:$regionid:$accountid:loadbalancer/$loadbalancerid`
CreateLoadBalancerHTTPSListener	`acs:slb:$regionid:$accountid:loadbalancer/$loadbalancerid` `acs:slb:%s:%s:certificate/%`
CreateLoadBalancerTCPListener	`acs:slb:$regionid:$accountid:loadbalancer/$loadbalancerid`
CreateLoadBalancerUDPListener	`acs:slb:$regionid:$accountid:loadbalancer/$loadbalancerid`
DeleteLoadBalancerListener	`acs:slb:$regionid:$accountid:loadbalancer/$loadbalancerid`
StartLoadBalancerListener	`acs:slb:$regionid:$accountid:loadbalancer/$loadbalancerid`
StopLoadBalancerListener	`acs:slb:$regionid:$accountid:loadbalancer/$loadbalancerid`
SetLoadBalancerHTTPListenerAttribute	`acs:slb:$regionid:$accountid:loadbalancer/$loadbalancerid`
SetLoadBalancerHTTPSListenerAttribute	`acs:slb:$regionid:$accountid:loadbalancer/$loadbalancerid` `acs:slb:%s:%s:certificate/%`
SetLoadBalancerTCPListenerAttribute	`acs:slb:$regionid:$accountid:loadbalancer/$loadbalancerid`
SetLoadBalancerUDPListenerAttribute	`acs:slb:$regionid:$accountid:loadbalancer/$loadbalancerid`
DescribeLoadBalancerHTTPListenerAttribute	`acs:slb:$regionid:$accountid:loadbalancer/$loadbalancerid`
DescribeLoadBalancerHTTPSListenerAttribute	`acs:slb:$regionid:$accountid:loadbalancer/$loadbalancerid`

API	ARN format
DescribeLoadBalancerTCPListenerAttribute	`acs:slb:$regionid:$accountid:loadbalancer/$loadbalancerid`
DescribeLoadBalancerUDPListenerAttribute	`acs:slb:$regionid:$accountid:loadbalancer/$loadbalancerid`
AddBackendServers	`acs:slb:$regionid:$accountid:loadbalancer/$loadbalancerid` `acs:ecs:$regionid:$accountid:instance/$instanceid`
RemoveBackendServers	`acs:slb:$regionid:$accountid:loadbalancer/$loadbalancerid` `acs:ecs:$regionid:$accountid:instance/$instanceid`
SetBackendServers	`acs:slb:$regionid:$accountid:loadbalancer/$loadbalancerid` `acs:ecs:$regionid:$accountid:instance/$instanceid`
DescribeHealthStatus	`acs:slb:$regionid:$accountid:loadbalancer/$loadbalancerid`
CreateVServerGroup	`acs:slb:$regionid:$accountid:loadbalancer/$loadbalancerid` `acs:ecs:$regionid:$accountid:instance/$instanceid`
SetVServerGroupAttribute	`acs:slb:$regionid:$accountid:loadbalancer/$loadbalancerid`
DeleteVServerGroup	`acs:slb:$regionid:$accountid:loadbalancer/$loadbalancerid`
DescribeVServerGroups	`acs:slb:$regionid:$accountid:loadbalancer/$loadbalancerid`
DescribeVServerGroupAttribute	`acs:slb:$regionid:$accountid:loadbalancer/$loadbalancerid`
AddVServerGroupBackendServers	`acs:slb:$regionid:$accountid:loadbalancer/$loadbalancerid` `acs:ecs:$regionid:$accountid:instance/$instanceid`
RemoveVServerGroupBackendServers	`acs:slb:$regionid:$accountid:loadbalancer/$loadbalancerid` `acs:ecs:$regionid:$accountid:instance/$instanceid`

API	ARN format
ModifyVServerGroupBackendServers	`acs:slb:$regionid:$accountid:loadbalancer/$loadbalancerid`
	`acs:ecs:$regionid:$accountid:instance/$instanceid`

14.1.2.3. Common parameters

Common request parameters

Common request parameters are request parameters that you must use when you call any API.

Common request parameters

Name	Type	Required	Description
Format	String	No	The format of the response. Valid values: *JSON (default) | XML*
Version	String	Yes	The API version in the format of `YYYY-MM-DD`. Valid values: *2014-05-15*
AccessKeyId	String	Yes	The AccessKey ID that is used to access a service.
Signature	String	Yes	The signature result string.
SignatureMethod	String	Yes	The algorithm used to create the request signature. Valid values: *HMAC-SHA1*
Timestamp	String	Yes	The request timestamp. The timestamp uses UTC and it complies with the ISO 8601 standard. The timestamp format is `YYYY-MM-DDThh:mm:ssZ`. For example, 20:00:00 on January 1st, 2013 in China Standard Time (UTC +8) would be written as 2013-01-10T12:00:00Z.
SignatureVersion	String	Yes	The signature algorithm version. Valid value: 1.0
SignatureNonce	String	Yes	A unique random number that is used to prevent network replay attacks. You must use different random numbers for different requests.

Example

```
http://slb.example.com/?Action=DescribeLoadBalancers
&TimeStamp=2014-05-19T10%3A33%3A56Z
&Format=xml
&AccessKeyId=testid
&Action=DescribeLoadBalancerAttribute
&SignatureMethod=Hmac-SHA1
&LoadBalancerId=loadBalancerID
&SignatureNonce=NwDAxvLU6tFE0DVb
&Version=2014-05-15
&SignatureVersion=1.0
&Signature=Signature
```

Common response parameters

API responses use a unified format. The 2xx HTTP status code indicates a successful invocation. The 4xx or 5xx HTTP status code indicates a failed invocation. The responses can be returned in JSON or XML format. The XML format is used by default. You can specify the format when calling an API.

Each time a request is sent to call an API, the system returns a unique identifier RequestId, regardless of whether the invocation is successful.

- XML format

```
<? xml version="1.0" encoding="utf-8"? >
    <!—Result root node-->
    <API name+Response>
        <!—Returned request tag-->
        <RequestId>4C467B38-3910-447D-87BC-AC049166F216</RequestId>
        <!—Returned result-->
    </API name+Response>
```

- JSON format

```
{
    "RequestId": "4C467B38-3910-447D-87BC-AC049166F216",
    /*Returned result*/
    }
```

14.1.2.4. SLB instance

14.1.2.4.1. CreateLoadBalancer

Creates a Server Load Balancer (SLB) instance.

Before you call this operation, take note of the following items:

- Before you create an SLB instance, call the DescribeAvailableResource operation to query the resources available for purchase in the zone where you want to create the SLB instance.
- You are charged for the SLB instances that you create. For more information, see Create an SLB instance.
- If you do not set **LoadBalancerSpec**, a shared-resource SLB instance is created. We recommend that you set the **LoadBalancerSpec** parameter to specify the specification of the SLB instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateLoadBalancer	The operation that you want to perform. Set the value to **CreateLoadBalancer**.
RegionId	String	Yes	cn-east-hangzhou-01	The ID of the region where you want to create the SLB instance. You can call the DescribeRegions operation to query region IDs.
AddressType	String	No	internet	The network type of the SLB instance. Valid values: **internet** and **intranet**. • **internet**: After an Internet-facing SLB instance is created, the system allocates a public IP address to the SLB instance. Then, the SLB instance can forward requests from the Internet. • **intranet**: After an internal-facing SLB instance is created, the system allocates a private IP address to the SLB instance. Then, the SLB instance can forward only internal requests.
InternetChargeType	String	No	paybytraffic	The billing method of the Internet-facing SLB instance. Set the value to paybytraffic. • **paybytraffic**: pay-by-data-transfer

Parameter	Type	Required	Example	Description
Bandwidth	Integer	No	10	The bandwidth limit of the listener. Unit: Mbit/s. Valid values: **1 to 5120** and **-1**. • **-1**: For a pay-by-data-transfer Internet-facing SLB instance, you can set the value to **-1**. If you set the value to -1, the bandwidth is unlimited. • **1 to 5120**: For a pay-by-bandwidth Internet-facing SLB instance, you can specify the bandwidth limit for each listener. The sum of bandwidth limit values that you set for all listeners cannot exceed the bandwidth limit of the SLB instance. For more information, see Bandwidth of a shared-resource SLB instance.
ClientToken	String	No	5A2CFF0E-5718-45B5-9D4D-70B3FF3898	This parameter is used to ensure the idempotence of the request. You can use the client to generate the value, but you must ensure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.
LoadBalancerName	String	No	abc	The name of the SLB instance. The name must be 1 to 80 characters in length, and can contain digits, periods (.), underscores (_), and hyphens (-). It must start with a letter. If this parameter is not set, the system automatically creates a name for the SLB instance.
VpcId	String	No	vpc-bp1aevy8sofi8mh1*****	The ID of the virtual private cloud (VPC) to which the SLB instance belongs.

Parameter	Type	Required	Example	Description
VSwitchId	String	No	vsw-bp12mw1f8k3jgy*****	The ID of the vSwitch to which the internal-facing SLB instance belongs. The vSwitch must be deployed in a VPC. To create an internal-facing SLB instance that is deployed in a VPC, you must set this parameter. If this parameter is set, the value of the **AddessType** parameter is set to **intranet** by default.
MasterZoneId	String	No	cn-hangzhou-b	The ID of the primary zone to which the SLB instance belongs. You can call the DescribeZone operation to query information about the primary and secondary zones in a region.
SlaveZoneId	String	No	cn-hangzhou-d	The ID of the secondary zone to which the SLB instance belongs. You can call the DescribeZone operation to query information about the primary and secondary zones in a region.
access_key_id	String	No	111	The AccessKey ID.
Tags	String	No	test	The tags that you want to add to the SLB instance.
EnableVpcVipFlow	String	No	1	The flow log.

Parameter	Type	Required	Example	Description
LoadBalancerSpec	String	No	slb.s2.small	Apsara Stack provides two types of SLB instance: shared-resource SLB instances and high-performance SLB instances. You can create high-performance SLB instances of different specifications. Valid values: • slb.s1.small • slb.s2.small • slb.s3.small • slb.s2.medium For more information about the specifications of high-performance SLB instances, see High-performance SLB instances.
AddressIPVersion	String	No	ipv4	The IP version that is used by the SLB instance. Valid values: ipv4 and ipv6.

Response parameters

Parameter	Type	Example	Description
LoadBalancerId	String	lb-hddhfjg*******	The ID of the SLB instance.
Address	String	42.250.**.**	The IP address that is allocated to the SLB instance.
VpcId	String	vpc-25dvzy9*****	The ID of the VPC to which the SLB instance belongs.
VSwitchId	String	vsw-255ecr***	The ID of the vSwitch to which the SLB instance belongs.
LoadBalancerName	String	abc	The name of the SLB instance.
AddressIPVersion	String	ipv4	The IP version that is used by the SLB instance.

Parameter	Type	Example	Description
NetworkType	String	classic	The type of network where the SLB instance is deployed. Valid values: • **vpc**: a VPC • **classic**: a classic network
RequestId	String	365F4154-92F6-4AE4-92F8-7FF34B540710	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=CreateLoadBalancer
&RegionId=cn-east-hangzhou-01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreateLoadBalancerResponse>
    <NetworkType>vpc</NetworkType>
      <LoadBalancerName>abc</LoadBalancerName>
      <Address>192.168.0.**</Address>
      <ResourceGroupId>rg-acfmxazb***</ResourceGroupId>
      <RequestId>AB197CF0-D9E9-4475-A89D-35DBCCF13BBE</RequestId>
      <AddressIPVersion>ipv4</AddressIPVersion>
      <LoadBalancerId>lb-bp1b6c719dfa0***</LoadBalancerId>
      <VSwitchId>vsw-bp12mw1f8k3jgygk9****</VSwitchId>
      <VpcId>vpc-bp1aevy8sofi8mh1q***</VpcId>
</CreateLoadBalancerResponse>
```

`JSON` format

```
{"LoadBalancerName":"abc",
"VpcId":"vpc-25dvzy9*****",
"Address":"42.250.**.**",
"RequestId":"365F4154-92F6-4AE4-92F8-7FF34B540710",
"NetworkType":"classic",
"AddressIPVersion":"ipv4",
"VSwitchId":"vsw-255ecr***",
"LoadBalancerId":"lb-hddhfjg*******"}
```

14.1.2.4.2. DeleteLoadBalancer

Deletes a pay-as-you-go Server Load Balancer (SLB) instance.

Note After you delete an SLB instance, the listeners configured for the SLB instance and the tags added to the SLB instance are deleted.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteLoadBalancer	The operation that you want to perform. Set the value to **DeleteLoadBalancer**.
LoadBalancerId	String	Yes	lb-bp1h66tp5uat8****	The ID of the SLB instance.

Response parameters

Parameter	Type	Example	Description
RequestId	String	CEF72CEB-54B6-4AE8-B225-F876FF7BA984	The ID of the request.

If the SLB instance that you want to delete has deletion protection enabled, the system reports an error in the following formats:

- JSON format

```
   {
"RequestId": "7B7AB375-1EA6-4A18-9D1C-F258F2D57638",
"HostId": "slb.aliyuncs.com",
"Code": "OperationDenied.DeleteProtectionIsOn",
"Message": "The loadbalancer can't be deleted due to DeleteProtection is enabled."
    }
```

- XML format

```
  <?xml version="1.0" encoding="UTF-8" ?>
      <DeleteLoadBabalancerResponse>
<RequestId>7B7AB375-1EA6-4A18-9D1C-F258F2D57638</RequestId>
<HostId>slb.aliyuncs.com</HostId>
<Code>OperationDenied.DeleteProtectionIsOn</Code>
<Message>The loadbalancer can't be deleted due to DeleteProtection is enabled.</Message>
     </DeleteLoadBabalancerResponse>
```

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DeleteLoadBalancer
&LoadBalancerId=lb-bp1h66tp5uat8********
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteLoadBabalancerResponse>

```

14.1.2.4.3. ModifyLoadBalancerInstanceSpec

Modifies the specification of a Server Load Balancer (SLB) instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyLoadBalancerInstanceSpec	The operation that you want to perform. Set the value to **ModifyLoadBalancerInstanceSpec**.
LoadBalancerId	String	Yes	lb-bp1b6c719df****	The ID of the SLB instance.

Parameter	Type	Required	Example	Description
LoadBalancerSpec	String	Yes	slb.s1.small	The specification of the SLB instance. Valid values: • **slb.s1.small** • **slb.s2.small** • **slb.s2.medium** • **slb.s3.small** • **slb.s3.medium** • **slb.s3.large** The supported specifications vary by region. For more information, see `Instance types` . **Note** When you change a shared-resource SLB instance to a high-performance SLB instance, your service may be temporarily interrupted for 10 to 30 seconds. Therefore, we recommend that you modify the specification during off-peak hours. In addition, you can use Alibaba Cloud DNS (DNS) to schedule your workloads to another SLB instance before you modify the specification.

Response parameters

Parameter	Type	Example	Description
RequestId	String	365F4154-92F6-4AE4-92F8-7FF34B540710	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ModifyLoadBalancerInstanceSpec
&LoadBalancerId=lb-bp1b6c719df****
&LoadBalancerSpec=slb.s2.small
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyLoadBalancerInstanceSpecResponse>
     <RequestId>D456A34A-6E40-4379-8DAF-9175760FE215</RequestId>
  </ModifyLoadBalancerInstanceSpecResponse>
```

`JSON` format

```
{
    "ModifyLoadBalancerInstanceSpecResponse": {
        "RequestId": "D456A34A-6E40-4379-8DAF-9175760FE215"
    }
}
```

14.1.2.4.4. ModifyLoadBalancerInternetSpec

Modifies the billing method of an Internet-facing Server Load Balancer (SLB) instance.

You can modify the billing method of an Internet-facing SLB instance in the following ways:

- Change the bandwidth limit of a pay-by-bandwidth SLB instance. The new bandwidth limit immediately takes effect.
- Change the billing method of an SLB instance from pay-by-data-transfer to pay-by-bandwidth. The new billing method takes effect at 00:00 the following day.
- Change the billing method of an SLB instance from pay-by-bandwidth to pay-by-data-transfer. The new billing method takes effect at 00:00 the following day.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyLoadBalancerInternetSpec	The operation that you want to perform. Set the value to **ModifyLoadBalancerInternetSpec**.
LoadBalancerId	String	Yes	lb-bp1b6c719dfa08ex****	The ID of the SLB instance.

Parameter	Type	Required	Example	Description
Bandwidth	Integer	No	10	The bandwidth limit of the Internet-facing SLB instance that is billed on a pay-by-bandwidth basis. Unit: Mbit/s. Valid values: **1 to 5000**. The bandwidth limit varies based on the region where the SLB instance is created. **Note** You do not need to set this parameter for pay-by-data-transfer SLB instances. In this case, the value of **InternetChargeType** is **paybytraffic**.

Response parameters

Parameter	Type	Example	Description
RequestId	String	CEF72CEB-54B6-4AE8-B225-F876FF7BA984	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ModifyLoadBalancerInternetSpec
&LoadBalancerId=lb-bp1b6c719dfa08ex****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyLoadBalancerInternetSpecResponse>
      <RequestId>E4DD2D80-8DC0-4A2E-BFBA-BE983A31AFED</RequestId>
</ModifyLoadBalancerInternetSpecResponse>
```

`JSON` format

```
{
    "RequestId": "E4DD2D80-8DC0-4A2E-BFBA-BE983A31AFED"
}
```

14.1.2.4.5. SetLoadBalancerName

Modifies the name of a Server Load Balancer (SLB) instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	SetLoadBalancerName	The operation that you want to perform. Set the value to **SetLoadBalancerName**.
LoadBalancerId	String	Yes	lb-bp1b6c719dfa08e****	The ID of the SLB instance.
LoadBalancerName	String	Yes	lb-instance-test	The name of the SLB instance. The name must be 2 to 128 characters in length, and can contain letters, digits, periods (.), underscores (_), and hyphens (-).

Response parameters

Parameter	Type	Example	Description
RequestId	String	CEF72CEB-54B6-4AE8-B225-F876FF7BA984	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=SetLoadBalancerName
&LoadBalancerId=lb-bp1b6c719dfa08e****
&LoadBalancerName=abc1
&<Common request parameters>
```

Sample success responses

`XML` format

```
<SetLoadBalancerStatusResponse>
   <RequestId>3C7F675E-9F82-4806-BA47-FF57E3ACC850</RequestId>
</SetLoadBalancerStatusResponse>
```

`JSON` format

```
{
    "RequestId": "3C7F675E-9F82-4806-BA47-FF57E3ACC850"
}
```

14.1.2.4.6. SetLoadBalancerStatus

Sets the state of a Server Load Balancer (SLB) instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	SetLoadBalancerStatus	The operation that you want to perform. Set the value to **SetLoadBalancerStatus**.
LoadBalancerId	String	Yes	lb-bp1b6c719dfa08e****	The ID of the SLB instance.
LoadBalancerStatus	String	Yes	active	The state of the SLB instance. Valid values: **active** and **inactive**. • **active** (default) When an SLB instance is in the Active state, listeners of the SLB instance can forward inbound traffic based on forwarding rules. • **inactive** When an SLB instance is in the **inactive** state, listeners of the SLB instance do not forward inbound traffic. **Note** If all listeners of an SLB instance are deleted, the SLB instance automatically switches to the **inactive** state.

Parameter	Type	Required	Example	Description
access_key_id	String	No	acc-hp34s2h0xx1ht4nwo****	The AccessKey ID.
Tags	String	No	{"tagKey":"Key1","tagValue":"Value1"}	The key and value of the tag.

Response parameters

Parameter	Type	Example	Description
RequestId	String	CEF72CEB-54B6-4AE8-B225-F876FF7BA984	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=SetLoadBalancerStatus
&LoadBalancerId=lb-bp1b6c719dfa08e******
&LoadBalancerStatus=active
&<Common request parameters>
```

Sample success responses

`XML` format

```
<SetLoadBalancerStatusResponse>
     <RequestId>E6DDFE22-F019-4F34-B8DD-FD14973450A6</RequestId>
  </SetLoadBalancerStatusResponse>
```

`JSON` format

```
{
    "RequestId": "E6DDFE22-F019-4F34-B8DD-FD14973450A6"
}
```

14.1.2.4.7. DescribeLoadBalancerAttribute

Queries detailed information about a specified Server Load Balancer (SLB) instance.

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeLoadBalancerAttribute	The operation that you want to perform. Set the value to **DescribeLoadBalancerAttribute**.
LoadBalancerId	String	Yes	lb-bp1b6c719dfa08ex****	The ID of the SLB instance.

Response parameters

Parameter	Type	Example	Description
LoadBalancerId	String	lb-dhhd****	The ID of the SLB instance.
RegionId	String	cn-qingdao-env17-d01	The ID of the region where the SLB instance is deployed.
RegionIdAlias	String	cn-qingdao-env17-d01	The alias of the region where the SLB instance is deployed.
LoadBalancerName	String	abc	The name of the SLB instance.
LoadBalancerStatus	String	active	The state of the SLB instance. Valid values: • **inactive**: The SLB instance is stopped. SLB instances in the inactive state do not forward traffic. • **active**: The SLB instance runs as expected. Newly created SLB instances are in the **active** state by default. • **locked**: The SLB instance is locked. SLB instances may be locked due to overdue payments or other reasons.
Address	String	42.XX.XX.6	The IP address that the SLB instance uses to provide services.
AddressType	String	internet	The type of IP address that the SLB instance uses to provide services.
NetworkType	String	vpc	The type of network where the SLB instance is deployed.

Parameter	Type	Example	Description
VpcId	String	vpc-25dvzy9f8****	The ID of the virtual private cloud (VPC) where the internal-facing SLB instance is deployed.
Bandwidth	Integer	5	The bandwidth limit of the Internet-facing SLB instance that is billed on a pay-by-bandwidth basis.
CreateTime	String	2017-08-31T02:49:05Z	The time when the SLB instance was created.
ListenerPorts	List	80	The list of frontend ports that are used by the SLB instance.
ListenerPortsAndProtocol	Array of ListenerPortAndProtocol		The list of frontend ports and protocols that are used by the SLB instance.
ListenerPortAndProtocol			
ListenerPort	Integer	443	The frontend port that is used by the SLB instance.
ListenerProtocol	String	https	The frontend protocol that is used by the SLB instance.
BackendServers	Array of BackendServer		The list of backend servers that are added to the SLB instance.
BackendServer			
ServerId	String	i-djghr2****	The ID of the backend server.
Weight	Integer	90	The weight of the backend server.
ServerIp	String	192.168.0.1	The IP address of the backend server.
Type	String	ecs	The type of the backend server.
MasterZoneId	String	cn-hangzhou-b	The ID of the primary zone to which the SLB instance belongs.

Parameter	Type	Example	Description
AutoReleaseTime	Long	1513947075	The timestamp that indicates when the SLB instance was released.
CreateTimeStamp	Long	1504147745000	The timestamp that indicates when the SLB instance was created.
EndTime	String	2999-09-08T16:00:00Z	The time when the SLB instance was suspended.
EndTimeStamp	Long	32493801600000	The timestamp that indicates when the SLB instance was suspended.
InternetChargeType	String	paybybandwidth	The billing method of the Internet-facing SLB instance. Valid values: **paybybandwidth** and **paybytraffic**. • **paybybandwidth**: pay-by-bandwidth • **paybytraffic** (default): pay-by-data-transfer
ListenerPortsAndProtocal	Array of ListenerPortAndProtocal		The port and protocol of the listener.
ListenerPortAndProtocal			
ListenerPort	Integer	443	The frontend port that is used by the SLB instance.
ListenerProtocal	String	http	The frontend protocol that is used by the SLB instance.
LoadBalancerSpec	String	slb.s2.small	The specification of the SLB instance.
PayType	String	PrePay	The billing method of the SLB instance. Valid values: **PayOnDemand** and **PrePay**.
RequestId	String	365F4154-92F6-4AE4-92F8-7FF34B540710	The ID of the request.

Parameter	Type	Example	Description
SlaveZoneId	String	cn-hangzhou-d	The ID of the secondary zone to which the SLB instance belongs.
VSwitchId	String	vsw-255ecrwq5****	The ID of the vSwitch to which the internal-facing SLB instance belongs.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeLoadBalancerAttribute
&LoadBalancerId=lb-bp1b6c719dfa08ex****
&<Common request parameters>
```

Sample success responses

`XML` format

```

14.1.2.4.8. DescribeLoadBalancers

Queries Server Load Balancer (SLB) instances.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeLoadBalancers	The operation that you want to perform. Set the value to **DescribeLoadBalancers**.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the SLB instance is deployed. You can query the region ID from the Regions and zones list or by calling the DescribeRegions operation.
ServerId	String	No	vm-23****	The ID of the backend server that is added to the SLB instance.
LoadBalancerId	String	No	lb-bp1b6c719dfa****	The ID of the SLB instance. You can specify at most 10 IDs in each request. Separate multiple IDs with commas (,).
LoadBalancerName	String	No	abc1	The name of the SLB instance. You can specify at most 10 names in each request. Separate multiple names with commas (,).
ServerIntranetAddress	String	No	10.XX.XX.6	The private IP address of the backend server that is added to the SLB instance. You can specify multiple IP addresses to query SLB instances. Separate multiple IP addresses with commas (,).

Parameter	Type	Required	Example	Description
AddressType	String	No	intranet	The type of network where the SLB instance is deployed. Valid values: **intranet** and **internet**. • **internet**: After an Internet-facing SLB instance is created, the system allocates a public IP address to the SLB instance. Then, the SLB instance can forward requests from the Internet. • **intranet**: After an internal-facing SLB instance is created, the system allocates a private IP address to the SLB instance. Then, the SLB instance can forward only internal requests.
InternetChargeType	String	No	paybybandwidth	The billing method of the Internet-facing SLB instance. Valid values: **paybybandwidth** and **paybytraffic**. • **paybybandwidth**: pay-by-bandwidth • **paybytraffic**: pay-by-data-transfer. **Note** If you do not specify this parameter, the billing method of the SLB instance remains unchanged.
VpcId	String	No	vpc-bp1aevy8sof****	The ID of the virtual private cloud (VPC) to which the SLB instance belongs.
VSwitchId	String	No	vsw-bp12mw1f8k3****	The ID of the vSwitch to which the SLB instance belongs.
NetworkType	String	No	vpc	The type of network where the internal-facing SLB instance is deployed. Valid values: **vpc** and **classic**. • **vpc**: a VPC • **classic**: a classic network

Parameter	Type	Required	Example	Description
Address	String	No	192.168.0.1	The IP address that the SLB instance uses to provide services.
MasterZoneId	String	No	cn-hangzhou-b	The ID of the primary zone to which the SLB instance belongs.
SlaveZoneId	String	No	cn-hangzhou-d	The ID of the secondary zone to which the SLB instance belongs. Multiple zones are not supported for users whose workloads are deployed on Alibaba Finance Cloud.
Tags	String	No	{"tagKey":"Key1", "tagValue":"Value1"}	The list of tags that are added to the SLB instances. The tags must be key-value pairs in a JSON dictionary. You can specify at most 10 tags in each request.
PayType	String	No	PayOnDemand	The billing method of the SLB instance. Valid values: **PayOnDemand** and **PrePay**. • **PayOnDemand**: pay-as-you-go • **PrePay**: subscription
AddressIPVersion	String	No	ipv4	The IP version. Valid values: **ipv4** and **ipv6**. **Note** You can create high-performance IPv6 SLB instances only in the following zones: Hangzhou Zone E and Hangzhou Zone F in the China (Hangzhou) region, Beijing Zone F and Beijing Zone G in the China (Beijing) region, Nantong Zone D and Nantong Zone E in the China (Nantong) region, Zhangjiakou Zone A and Zhangjiakou Zone B in the China (Zhangjiakou) region, and Shenzhen Zone D and Shenzhen Zone E in the China (Shenzhen) region.

Response parameters

Parameter	Type	Example	Description
LoadBalancers	Array of LoadBalancer		The list of SLB instances.
LoadBalancer			
LoadBalancerId	String	lb-hjfng****	The ID of the SLB instance.
LoadBalancerName	String	def	The name of the SLB instance.
LoadBalancerStatus	String	active	The state of the SLB instance. Valid values: • **inactive**: Listeners do not forward requests. • **active**: Newly created SLB instances are in the active state by default. • **locked**: The SLB instance is locked.
Address	String	100.XX.XX.28	The IP address of the SLB instance.
RegionId	String	cn-qingdao-env17-d01	The ID of the region where the SLB instance is deployed.
RegionIdAlias	String	cn-qingdao-env17-d01	The name of the region where the SLB instance is deployed.
AddressType	String	intranet	The type of network where the SLB instance is deployed.
VSwitchId	String	vsw-255ecr****	The ID of the vSwitch to which the internal-facing SLB instance belongs.
VpcId	String	vpc-25dvzy9f8****	The ID of the VPC to which the internal-facing SLB instance belongs.
NetworkType	String	vpc	The type of network where the internal-facing SLB instance is deployed. Valid values: • **vpc**: a VPC • **classic**: a classic network
CreateTime	String	2017-08-31T02:49:05Z	The time when the SLB instance was created.

Parameter	Type	Example	Description
MasterZoneId	String	cn-hangzhou-b	The ID of the primary zone where the SLB instance is deployed.
SlaveZoneId	String	cn-hangzhou-d	The ID of the secondary zone where the SLB instance is deployed.
AddressIPVersion	String	ipv4	The IP version. Valid values: ipv4 and ipv6.
CreateTimeStamp	Long	1504147745000	The timestamp generated when the SLB instance was created.
InternetChargeType	String	paybybandwidth	The billing method of the Internet-facing SLB instance. Set the value to paybytraffic. • **paybybandwidth**，按带宽计费。 • **paybytraffic** (default): pay-by-data-transfer **Note** If the value of the PayType parameter is set to PrePay, only pay-by-bandwidth is supported.
PayType	String	PrePay	The billing method of the SLB instance. Valid values: **PayOnDemand** and **PrePay**.
RequestId	String	365F4154-92F6-4AE4-92F8-7FF34B540710	The ID of the request.

    }
}
```

14.1.2.4.9. DescribeRegions

Queries regions.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeRegions	The operation that you want to perform. Set the value to **DescribeRegions**.

Response parameters

Parameter	Type	Example	Description
Regions	Array of Region		The list of regions.

Parameter	Type	Example	Description
Region			
RegionId	String	cn-qingdao-env17-d01	The ID of the region.
LocalName	String	China (Qingdao)	The name of the region.
RequestId	String	1651FBB6-4FBF-49FF-A9F5-DF5D696C7EC6	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeRegions
&<Common request parameters>
```

Sample success responses

`XML` format

```
<RequestId>1651FBB6-4FBF-49FF-A9F5-DF5D696C7EC6</RequestId>
<Regions>
    <Region>
        <RegionId>cn-beijing</RegionId>
        <LocalName>China (Beijing)</LocalName>
    </Region>
</Regions>
```

`JSON` format

```
{
    "RequestId": "1651FBB6-4FBF-49FF-A9F5-DF5D696C7EC6",
    "Regions": {
        "Region": {
            "RegionId": "cn-beijing",
            "LocalName": "China (Beijing)"
        }
    }
}
```

Error codes

HttpCode	Error code	Error message	Description

HttpCode	Error code	Error message	Description
400	InvalidParameter	Illegal parameter, query.namespace is not auth.	The error message returned because you are unauthorized to perform the operation. Acquire the permissions and try again.

14.1.2.4.10. DescribeZones

Queries zones in a specified region.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeZones	The operation that you want to perform. Set the value to **DescribeZones**.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the Server Load Balancer (SLB) instance is deployed.

Response parameters

Parameter	Type	Example	Description
Zones	Array of Zone		The list of zones.
Zone			
ZoneId	String	cn-hangzhou-b	The ID of the zone.
LocalName	String	Hangzhou Zone	The name of the zone.
SlaveZones	Array of SlaveZone		The list of secondary zones.
SlaveZone			
ZoneId	String	cn-hangzhou-g	The ID of the secondary zone.
LocalName	String	Hangzhou Zone G	The name of the secondary zone.

Parameter	Type	Example	Description
RequestId	String	A48D35FF-440A-4BC0-A4A2-A9BF69B7E43A	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeZones
&RegionId=cn-east-hangzhou-01
&<Common request parameters>
```

Sample success responses

`XML` format

```

                }
            ]
        }
    }
}
```

Error codes

HttpCode	Error code	Error message	Description
400	InvalidParameter	Illegal parameter, query.namespace is not auth.	The error message returned because you are unauthorized to perform the operation. Request the permissions and try again.

14.1.2.5. Listeners

14.1.2.5.1. TCP listeners

14.1.2.5.1.1. CreateLoadBalancerTCPListener

Creates a TCP listener.

Note Newly created listeners are in the Stopped state. After a listener is created, you can call the `StartLoadBalancerListener` operation to enable the listener to forward traffic.

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateLoadBalancerTCPListener	The operation that you want to perform. Set the value to **CreateLoadBalancerTCPListener**.
Bandwidth	Integer	Yes	-1	The bandwidth limit of the listener. Unit: Mbit/s. Valid values: **1 to 5120** and **-1**. • **-1**: For a pay-by-data-transfer Internet-facing Server Load Balancer (SLB) instance, you can set the value to **-1**. If you set the value to -1, the bandwidth is unlimited. • **1 to 5120**: For a pay-by-bandwidth Internet-facing SLB instance, you can specify the bandwidth limit of each listener. The sum of bandwidth limit values that you set for all listeners cannot exceed the bandwidth limit of the SLB instance.
ListenerPort	Integer	Yes	80	The frontend port that is used by the SLB instance. Valid values: **1 to 65535**.
LoadBalancerId	String	Yes	lb-bp1b6c719dfa08ex****	The ID of the SLB instance.
BackendServerPort	Integer	No	80	The backend port that is used by the SLB instance. Valid values: **1 to 65535**. If the **VServerGroupId** parameter is not set, this parameter is required.

Parameter	Type	Required	Example	Description
Scheduler	String	No	wrr	The scheduling algorithm. Valid values: • **wrr** (default): Backend servers that have higher weights receive more requests than backend servers that have lower weights. • **wlc**: Requests are distributed based on the weights and number of connections to backend servers. If two backend servers have the same weight, the backend server that has fewer connections receives more requests. • **rr**: Requests are distributed to backend servers in sequence. • **sch**: specifies consistent hashing that is based on source IP addresses. Requests from the same source IP address are distributed to the same backend server. • **tch**: specifies consistent hashing that is based on four factors: source IP address, destination IP address, source port, and destination port. Requests that contain the same preceding information are distributed to the same backend server. **Note** Only high-performance SLB instances support the sch and tch consistent hashing algorithms.
PersistenceTimeout	Integer	No	0	The timeout period of session persistence. Valid values: **0 to 3600**. Unit: seconds. Default value: **0**. By default, session persistence is disabled.

Parameter	Type	Required	Example	Description
HealthyThreshold	Integer	No	4	The number of health checks that an unhealthy backend server must consecutively pass before it can be declared healthy (from **fail** to **success**). Valid values: **2 to 10**.
UnhealthyThreshold	Integer	No	4	The number of health checks that a healthy backend server must consecutively fail before it can be declared unhealthy (from **success** to **fail**). Valid values: **2 to 10**.
HealthCheckConnectTimeout	Integer	No	100	The timeout period of a health check response. Valid values: **1 to 300**. Unit: seconds. Default value: **5**.
HealthCheckConnectPort	Integer	No	80	The port that is used for health checks. Valid values: **1 to 65535**. If you do not set this parameter, the port of the backend server is used for health checks.
healthCheckInterval	Integer	No	3	The interval between two consecutive health checks. Valid values: **1 to 50**. Unit: seconds.

Parameter	Type	Required	Example	Description
HealthCheckDomain	String	No	172.XX.XX.6	The domain name that is used for health checks. Valid values: • **$_ip**: The private IP address of the backend server. If the $_ip parameter is set or the HealthCheckDomain parameter is not set, SLB uses the private IP addresses of backend servers as the domain names for health checks. • **domain**: The domain name must be 1 to 80 characters in length, and can contain only letters, digits, periods (.),and hyphens (-).
HealthCheckURI	String	No	/test/index.html	The URL that is used for health checks. The value must be 1 to 80 characters in length, and can contain letters, digits, hyphens (-), forward slashes (/), periods (.), percent signs (%), number signs (#), and ampersands (&). The URL must not be a single forward slash (/). However, it must start with a forward slash (/). You can set this parameter to enable HTTP health checks for the TCP listener. If this parameter is not set, TCP health checks are performed.
HealthCheckHttpCode	String	No	http_2xx,http_3xx	The HTTP status code that indicates a successful health check. Separate multiple HTTP status codes with commas (,). Valid values: **http_2xx**, **http_3xx**, **http_4xx**, and **http_5xx**. Default value: http_2xx.
HealthCheckType	String	No	tcp	The type of health checks. Valid values: **tcp** and **http**. Default value: tcp.
VServerGroupId	String	No	rsp-cige6j****	The ID of the vServer group.

Parameter	Type	Required	Example	Description
MasterSlaveServerGroupId	String	No	rsp-0bfucw****	The ID of the primary/secondary server group. **Note** You cannot specify both VServerGroupId and MasterSlaveServerGroupId.
EstablishedTimeout	Integer	No	500	The timeout period of a connection. Valid values: **10 to 900**. Unit: seconds.
Description	String	No	CreateListeners.	The description of the listener. The description must be 1 to 80 characters in length, and can contain letters, digits, hyphens (-), forward slashes (/), periods (.),and underscores (_). It can also contain Chinese characters.

Response parameters

Parameter	Type	Example	Description
RequestId	String	CEF72CEB-54B6-4AE8-B225-F876FF7BA984	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=CreateLoadBalancerTCPListener
&Bandwidth=-1
&ListenerPort=80
&LoadBalancerId=lb-bp1b6c719dfa08ex******
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreateLoadBalancerTCPListenerResponse>
     <RequestId>CEF72CEB-54B6-4AE8-B225-F876FF7BA984</RequestId>
</CreateLoadBalancerTCPListenerResponse>
```

`JSON` format

```
{"RequestId":" CEF72CEB-54B6-4AE8-B225-F876FF7BA984"}
```

Error codes

HttpCode	Error code	Error message	Description
400	Abs.VServerGroupIdAndMasterSlaveServerGroupId.MissMatch	The parameters VServerGroupId or MasterSlaveServerGroupId miss match.	The error message returned because the VServerGroupId parameter or the MasterSlaveServerGroupId parameter does not match.

14.1.2.5.1.2. SetLoadBalancerTCPListenerAttribute

Modifes the configurations of a TCP listener.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	SetLoadBalancerTCPListenerAttribute	The operation that you want to perform. Set the value to **SetLoadBalancerTCPListenerAttribute**.
ListenerPort	Integer	Yes	80	The frontend port that is used by the Server Load Balancer (SLB) instance. Valid values: **1** to **65535**.
LoadBalancerId	String	Yes	lb-bp1ygod3yctvg1y****	The ID of the SLB instance.

Parameter	Type	Required	Example	Description
Bandwidth	Integer	No	43	The bandwidth limit of the listener. Unit: Mbit/s. Valid values: **-1** and **1 to 5120**. • **-1**: For a pay-by-data-transfer Internet-facing SLB instance, you can set the value to **-1**. If you set the value to -1, the bandwidth is unlimited. • **1 to 5120**: For a pay-by-bandwidth Internet-facing SLB instance, you can specify the bandwidth limit of each listener. The sum of bandwidth limit values that you set for all listeners cannot exceed the bandwidth limit of the SLB instance.

Parameter	Type	Required	Example	Description
Scheduler	String	No	wrr	The scheduling algorithm. Valid values: • **wrr**: Backend servers that have higher weights receive more requests than backend servers that have lower weights. • **wlc**: Requests are distributed based on the weights and number of connections to backend servers. If two backend servers have the same weight, the backend server that has fewer connections receives more requests. • **rr**: Requests are distributed to backend servers in sequence. • **sch**: specifies consistent hashing that is based on source IP addresses. Requests from the same source IP address are distributed to the same backend server. • **tch**: specifies consistent hashing that is based on four factors: source IP address, destination IP address, source port, and destination port. Requests that contain the same preceding information are distributed to the same backend server. **Note** Only high-performance SLB instances support the sch and tch consistent hashing algorithms.
PersistenceTimeout	Integer	No	0	The timeout period of session persistence. Valid values: **0** to **3600**. Unit: seconds. Default value: **0**. If you set the value to 0, session persistence is disabled.
HealthyThreshold	Integer	No	4	The number of health checks that an unhealthy backend server must consecutively pass before it can be declared healthy (from **fail** to **success**). Valid values: **2** to **10**.

Parameter	Type	Required	Example	Description
UnhealthyThreshold	Integer	No	4	The number of health checks that a healthy backend server must consecutively fail before it can be declared unhealthy (from **success** to **fail**). Valid values: **2** to **10**.
HealthCheckConnectTimeout	Integer	No	100	The timeout period for a health check response. If a backend server does not respond within the specified timeout period, the health check fails. Valid values: **1** to **300**. Unit: seconds. **Note** If the value of the **HealthCheckConnectTimeout** parameter is smaller than that of the **HealthCheckInterval** parameter, the value of the **HCTimeout** parameter is ignored and the value of the **HealthCheckInterval** parameter is used as the timeout period.
HealthCheckConnectPort	Integer	No	8080	The port that is used for health checks. Valid values: **1** to **65535**. If this parameter is not set, the port specified in **BackendServerPort** is used for health checks.
HealthCheckInterval	Integer	No	5	The interval between two consecutive health checks. Valid values: **1** to **50**. Unit: seconds.

Parameter	Type	Required	Example	Description
HealthCheckDomain	String	No	172.XX.XX.6	The domain name that is used for health checks. You can set this parameter when the TCP listener requires HTTP health checks. If you do not set this parameter, TCP health checks are performed. • **$_ip**: The private IP address of the backend server. If you do not set this parameter or set the parameter to $_ip, the SLB instance uses the private IP address of each backend server as the domain name for health checks. • **domain**: The domain name must be 1 to 80 characters in length. It can contain only letters, digits, periods (.),and hyphens (-).
HealthCheckURI	String	No	/test/index.html	The URL that is used for health checks. The URL must be 1 to 80 characters in length, and can contain letters, digits, hyphens (-), forward slashes (/), periods (.), percent signs (%), question marks (?), number signs (#), and ampersands (&). The URL must not be a single forward slash (/). However, it must start with a forward slash (/). You can set this parameter when the TCP listener requires HTTP health checks. If you do not set this parameter, TCP health checks are performed.)
HealthCheckHttpCode	String	No	http_2xx	The HTTP status code that indicates a successful health check. Separate multiple HTTP status codes with commas (,). Valid values: **http_2xx**, **http_3xx**, **http_4xx**, and **http_5xx**.
HealthCheckType	String	No	tcp	The type of health checks. Valid values: **tcp** and **http**.

Parameter	Type	Required	Example	Description
SynProxy	String	No	enable	Specifies whether to enable SynProxy to protect backend servers against attacks. We recommend that you use the default value for this parameter. Valid values: **enable** and **disable**.
MaxConnection	Integer	No	20	The maximum number of connections.
Tags	String	No	{"tagKey":"Key1", "tagValue":"Value1"}	The key and value of the tag.
VServerGroup	String	No	on	Specifies whether to use a vServer group. Valid values: **on** and **off**. You cannot set both **VserverGroup** and **MasterSlaveServerGroup** to **on**.
VServerGroupId	String	No	rsp-cige6j5****	The ID of the vServer group.
MasterSlaveServerGroupId	String	No	rsp-cige****	The ID of the primary/secondary server group. **Note** You cannot specify both VServerGroupId and MasterSlaveServerGroupId.
MasterSlaveServerGroup	String	No	on	Specifies whether to use a primary/secondary server group. Valid values: **on** and **off**. You cannot set both **VserverGroup** and **MasterSlaveServerGroup** to **on**.
EstablishedTimeout	Integer	No	500	The timeout period of connections. Valid values: **10** to **900**. Unit: seconds.
Description	String	No	test	The description of the TCP listener.

Response parameters

Parameter	Type	Example	Description
RequestId	String	CEF72CEB-54B6-4AE8-B225-F876FF7BA984	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=SetLoadBalancerTCPListenerAttribute
&ListenerPort=80
&LoadBalancerId=lb-bp1ygod3yctvg1y****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<SetLoadBalancerTCPListenerAttributeResponse>
     <RequestId>59B41B53-BC4B-481A-9D8D-2A0D20B3FCD1</RequestId>
</SetLoadBalancerTCPListenerAttributeResponse>
```

`JSON` format

```
{
    "RequestId": "59B41B53-BC4B-481A-9D8D-2A0D20B3FCD1"
}
```

14.1.2.5.1.3. DescribeLoadBalancerTCPListenerAttribute

Queries the configurations of a TCP listener.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeLoadBalancerTCPListenerAttribute	The operation that you want to perform. Set the value to **DescribeLoadBalancerTCPListenerAttribute**.
ListenerPort	Integer	Yes	80	The frontend port that is used by the Server Load Balancer (SLB) instance. Valid values: **1 to 65535**.

Parameter	Type	Required	Example	Description
LoadBalancerId	String	Yes	lb-bp1ygod3yctvg1y****	The ID of the SLB instance.

Response parameters

Parameter	Type	Example	Description
ListenerPort	Integer	80	The frontend port that is used by the SLB instance.
BackendServerPort	Integer	80	The backend port that is used by the SLB instance. **Note** When the SLB instance uses a vServer group, this parameter is not displayed.
Bandwidth	Integer	-1	The bandwidth limit of the listener. Unit: Mbit/s. Valid values: • **-1**: For a pay-by-data-transfer Internet-facing SLB instance, this value is set to -1. This indicates that the bandwidth is unlimited. • **1** to **5120**: For a pay-by-bandwidth Internet-facing SLB instance, a bandwidth limit is set for each listener. The sum of bandwidth limit values that are set for all listeners of an SLB instance does not exceed the bandwidth limit of the SLB instance.
Status	String	stopped	The state of the listener. Valid values: **running** and **stopped**. • **running**: indicates that the listener runs as expected. • **stopped**: indicates that the listener is stopped.

Parameter	Type	Example	Description
SynProxy	String	enable	Indicates whether SynProxy is enabled. SynProxy is a feature that protects SLB from attacks. We recommend that you use the default value for this parameter. Valid values: • **Enable**: SynProxy is enabled. • **Disable**: SynProxy is disabled.
Scheduler	String	wrr	The scheduling algorithm. Valid values: • **wrr** (default): Backend servers that have higher weights receive more requests than backend servers that have lower weights. • **wlc**: Requests are distributed based on the weights and number of connections to backend servers. If two backend servers have the same weight, the backend server that has fewer connections receives more requests. • **rr**: Requests are distributed to backend servers in sequence.
PersistenceTimeout	Integer	0	Indicates whether session persistence is enabled. If the value is set to **0**, it indicates that session persistence is disabled.
HealthCheckType	String	tcp	The health check method that is used by the TCP listener. Valid values: **tcp** and **http**.
HealthCheck	String	on	Indicates whether health checks are enabled. Valid values: **on** and **off**.
HealthyThreshold	Integer	4	The healthy threshold.
UnhealthyThreshold	Integer	4	The unhealthy threshold.
HealthCheckConnectPort	Integer	8080	The port that is used for health checks.

Parameter	Type	Example	Description
HealthCheckInterval	Integer	5	The interval between two consecutive health checks. Unit: seconds.
HealthCheckDomain	String	www.domain.com	The domain name that is used for health checks.
HealthCheckURI	String	/test/index.html	The URL that is used for health checks. The value must be 1 to 80 characters in length, and can contain letters, digits, `hyphens (-), forward slashes (/), periods (.),%?number signs (#), and ampersands (&)`. The URL must not be a single forward slash (/) and it must start with a forward slash (/).
HealthCheckHttpCode	String	http_2xx	The HTTP status code that indicates a successful health check. Valid values: **http_2xx**, **http_3xx**, **http_4xx**, and **http_5xx**. Default value: http_2xx.
VServerGroupId	String	rsp-cige6******8	The ID of the associated vServer group.
Description	String	Description.	The description of the listener. The description must be 1 to 80 characters in length, and can contain letters, digits, hyphens (-), forward slashes (/), periods (.),and underscores (_). It can also contain Chinese characters.
EstablishedTimeout	Integer	500	The timeout period of connections. Valid values: **10 to 900**. Unit: seconds.
HealthCheckConnectTimeout	Integer	100	The timeout period of a health check response.
MasterSlaveServerGroupId	String	rsp-0bfucw****	The ID of the primary/secondary server group that is associated with the listener.
MaxConnection	Integer	10	The maximum number of connections.

Parameter	Type	Example	Description
RequestId	String	365F4154-92F6-4AE4-92F8-7FF34B540710	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeLoadBalancerTCPListenerAttribute
&ListenerPort=80
&LoadBalancerId=lb-bp1ygod3yctvg1y******
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeLoadBalancerTCPListenerAttributeResponse>
     <HealthCheckHttpCode>http_2xx,http_3xx</HealthCheckHttpCode>
   <PersistenceTimeout>0</PersistenceTimeout>
   <HealthCheckType>tcp</HealthCheckType>
   <HealthyThreshold>3</HealthyThreshold>
   <Scheduler>wrr</Scheduler>
   <UnhealthyThreshold>3</UnhealthyThreshold>
   <Bandwidth>-1</Bandwidth>
   <Description>tcp_80</Description>
   <AclStatus>off</AclStatus>
   <HealthCheckURI>/</HealthCheckURI>
   <HealthCheck>on</HealthCheck>
   <HealthCheckConnectTimeout>5</HealthCheckConnectTimeout>
   <ListenerPort>80</ListenerPort>
   <Status>running</Status>
   <EstablishedTimeout>900</EstablishedTimeout>
   <HealthCheckDomain></HealthCheckDomain>
   <HealthCheckInterval>2</HealthCheckInterval>
   <RequestId>9A113A8C-BB8F-475E-9533-7819ECA2FFC1</RequestId>
   <BackendServerPort>80</BackendServerPort>
    </DescribeLoadBalancerTCPListenerAttributeResponse>
```

`JSON` format

```
{
    "HealthCheckHttpCode": "http_2xx,http_3xx",

}
```

14.1.2.5.2. UDP listeners

14.1.2.5.2.1. CreateLoadBalancerUDPListener

Creates a UDP listener.

> **Note** You cannot view the source IP addresses of network traffic if you create UDP listeners for a Server Load Balancer (SLB) instance that is deployed in a classic network. In addition, newly created listeners are in the **stopped** state. After a listener is created, you must call the StartLoadBalancerListener operation to enable the listener. This way, the listener can forward network traffic.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateLoadBalancerUDPListener	The operation that you want to perform. Set the value to **CreateLoadBalancerUDPListener**.

Parameter	Type	Required	Example	Description
Bandwidth	Integer	Yes	34	The bandwidth limit of the listener. Unit: Mbit/s. Set the value to **-1**.For a pay-by-data-transfer Internet-facing SLB instance, you can set the value to **-1**. If you set the value to -1, the bandwidth is unlimited.
ListenerPort	Integer	Yes	80	The frontend port that is used by the SLB instance. Valid values: **1 to 65535**.
LoadBalancerId	String	Yes	lb-bp1ygod3yctvg1y7****	The ID of the SLB instance.
BackendServerPort	Integer	No	80	The backend port that is used by the SLB instance. Valid values: **1 to 65535**. If the **VServerGroupId** parameter is not set, this parameter is required.

Parameter	Type	Required	Example	Description
Scheduler	String	No	wrr	The scheduling algorithm. Valid values: • **wrr** (default): Backend servers that have higher weights receive more requests than backend servers that have lower weights. • **wlc**: Requests are distributed based on the weights and number of connections to backend servers. If two backend servers have the same weight, the backend server that has fewer connections receives more requests. • **rr**: Requests are distributed to backend servers in sequence. • **sch**: specifies consistent hashing that is based on source IP addresses. Requests from the same source IP address are distributed to the same backend server. • **tch**: specifies consistent hashing that is based on four factors: source IP address, destination IP address, source port, and destination port. Requests that contain the same preceding information are distributed to the same backend server. • **qch**: specifies consistent hashing that is based on QUIC connection IDs. Requests that contain the same QUIC connection ID are distributed to the same backend server. **Note** Only high-performance SLB instances support the sch, tch, and qch consistent hashing algorithms.
HealthyThreshold	Integer	No	4	The number of health checks that an unhealthy backend server must consecutively pass before it can be declared healthy (from **fail** to **success**). Valid values: **2 to 10**.

Parameter	Type	Required	Example	Description
UnhealthyThreshold	Integer	No	4	The number of health checks that a healthy backend server must consecutively fail before it can be declared unhealthy (from **success** to **fail**). Valid values: **2 to 10**.
HealthCheckConnectTimeout	Integer	No	100	The timeout period for a health check response. If a backend server does not respond within the specified timeout period, the backend server is declared unhealthy. Valid values: **1 to 300**. Unit: seconds.
HealthCheckConnectPort	Integer	No	80	The port that is used for health checks. Valid values: **1 to 65535**. If you do not specify this parameter, the backend port is used to send health check probes.
healthCheckInterval	Integer	No	3	The interval between two consecutive health checks. Valid values: **1 to 50**. Unit: seconds.
healthCheckReq	String	No	hello	Specifies the request string for UDP listener health checks. The request string must be 1 to 500 characters in length, and can contain only letters and digits.
healthCheckExp	String	No	ok	Specifies the response string for UDP listener health checks. The response string must be 1 to 500 characters in length, and can contain only letters and digits.
VServerGroupId	String	No	rsp-cige6j****8	The ID of the vServer group.

Parameter	Type	Required	Example	Description
MasterSlaveServerGroupId	String	No	rsp-0bfucwu****	The ID of the primary/secondary server group. **Note** You cannot specify both VServerGroupId and MasterSlaveServerGroupId.
Description	String	No	test	The description of the listener. The description must be 1 to 80 characters in length, and can contain letters, digits, hyphens (-), forward slashes (/), periods (.),and underscores (_). It can also contain Chinese characters.

Response parameters

Parameter	Type	Example	Description
RequestId	String	CEF72CEB-54B6-4AE8-B225-F876FF7BA984	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=CreateLoadBalancerUDPListener
&Bandwidth=34
&ListenerPort=80
&LoadBalancerId=lb-bp1ygod3yctvg1y7******
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreateLoadBalancerUDPListenerResponse>
      <RequestId>06F00FBB-3D9E-4CCE-9D43-1A6946A75456</RequestId>
</CreateLoadBalancerUDPListenerResponse>
```

`JSON` format

```
{
    "RequestId": "06F00FBB-3D9E-4CCE-9D43-1A6946A75456"
}
```

Error codes

HttpCode	Error code	Error message	Description
400	Abs.VServerGroupId AndMasterSlaveServ erGroupId.MissMatch	The parameters VServerGroupId or MasterSlaveServerGroupId miss match.	The error message returned because the VServerGroupId parameter or the MasterSlaveServerGroupId parameter does not match.

14.1.2.5.2.2. SetLoadBalancerUDPListenerAttribute

Modifies the configurations of a UDP listener.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	SetLoadBalancer UDPListenerAttrib ute	The operation that you want to perform. Set the value to **SetLoadBalancerUDPListenerAttrib ute**.
ListenerPort	Integer	Yes	80	The frontend port that is used by the Server Load Balancer (SLB) instance. Valid values: **1** to **65535**.
LoadBalancerId	String	Yes	lb-bp1rtfnodmywb4 3ecu4sf-c****	The ID of the SLB instance.

Parameter	Type	Required	Example	Description
Bandwidth	Integer	No	-1	The bandwidth limit of the listener. Unit: Mbit/s. Valid values: **1 to 5120** and **-1**. • **-1**: For a pay-by-data-transfer Internet-facing SLB instance, you can set the value to **-1**. If you set the value to -1, the bandwidth is unlimited. • **1 to 5120**: For a pay-by-bandwidth Internet-facing SLB instance, you can specify a value as the bandwidth limit for each listener. The sum of maximum bandwidth values that you set for all listeners cannot exceed the bandwidth limit of the SLB instance. For more information, see Bandwidth limit of a shared-resource SLB instance.

Parameter	Type	Required	Example	Description
Scheduler	String	No	wrr	The scheduling algorithm. Valid values: • **wrr**: Backend servers that have higher weights receive more requests than backend servers that have lower weights. • **wlc**: Requests are distributed based on the weights and number of connections to backend servers. If two backend servers have the same weight, the backend server that has fewer connections receives more requests. • **rr**: Requests are distributed to backend servers in sequence. • **sch**: specifies consistent hashing that is based on source IP addresses. Requests from the same source IP address are distributed to the same backend server. • **tch**: specifies consistent hashing that is based on four factors: source IP address, destination IP address, source port, and destination port. Requests that contain the same preceding information are distributed to the same backend server. • **qch**: specifies consistent hashing that is based on QUIC connection IDs. Requests that contain the same QUIC connection ID are distributed to the same backend server. **Note** Only high-performance SLB instances support the sch, tch, and qch consistent hashing algorithms.
HealthyThreshold	Integer	No	4	The number of health checks that an unhealthy backend server must consecutively pass before it can be declared healthy (from **fail** to **success**). Valid values: **2** to **10**.

Parameter	Type	Required	Example	Description
UnhealthyThreshold	Integer	No	4	The number of health checks that a healthy backend server must consecutively fail before it can be declared unhealthy (from **success** to **fail**). Valid values: **2** to **10**.
HealthCheckConnectTimeout	Integer	No	100	The timeout period for a health check response. If a backend server does not respond within the specified timeout period, the backend server is declared unhealthy. Valid values: **1** to **300**. **Note** If the value of the **HealthCheckConnectTimeout** parameter is smaller than that of the **HealthCheckInterval** parameter, the value of the **HealthCheckConnectTimeout** parameter is ignored and the value of the **HealthCheckInterval** parameter is regarded as the timeout period.
HealthCheckConnectPort	Integer	No	80	The port that is used for health checks. Valid values: **1** to **65535**.
HealthCheckInterval	Integer	No	5	The interval between two consecutive health checks. Valid values: **1** to **50**. Unit: seconds.
healthCheckReq	String	No	hello	The request string for UDP listener health checks. The string must be 1 to 500 characters in length and can contain only letters and digits.

Parameter	Type	Required	Example	Description
healthCheckExp	String	No	ok	The response string for UDP listener health checks. The string must be 1 to 500 characters in length and can contain only letters and digits.
MaxConnection	Integer	No	10	The maximum number of connections.
Tags	String	No	{"tagKey":"Key1", "tagValue":"Value1"}	The key and value of the tag.
VServerGroup	String	No	on	Specifies whether to use a vServer group. Valid values: **on** and **off**. **Note** You cannot set both **VserverGroup** and **MasterSlaveServerGroup** to **on**.
VServerGroupId	String	No	rsp-cige6****	The ID of the vServer group.
MasterSlaveServerGroupId	String	No	rsp-0bfuc****	The ID of the primary/secondary server group. **Note** You cannot specify both VServerGroupId and MasterSlaveServerGroupId.
MasterSlaveServerGroup	String	No	on	Specifies whether to use a primary/secondary server group. Valid values: **on** and **off**. You cannot set both **VserverGroup** and **MasterSlaveServerGroup** to **on**.
Description	String	No	test	The description of the listener.

Response parameters

Parameter	Type	Example	Description

Parameter	Type	Example	Description
RequestId	String	CEF72CEB-54B6-4AE8-B225-F876FF7BA984	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=SetLoadBalancerUDPListenerAttribute
&ListenerPort=80
&LoadBalancerId=lb-bp1rtfnodmywb43ecu4sf-c****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<SetLoadBalancerUDPListenerAttributeResponse>
     <RequestId>A0F0643E-D653-4F6F-A67F-205B2A92BE18</RequestId>
</SetLoadBalancerUDPListenerAttributeResponse>
```

`JSON` format

```
{
    "RequestId": "A0F0643E-D653-4F6F-A67F-205B2A92BE18"
}
```

14.1.2.5.2.3. DescribeLoadBalancerUDPListenerAttribute

Queries the configurations of a UDP listener.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeLoadBalancerUDPListenerAttribute	The operation that you want to perform. Set the value to **DescribeLoadBalancerUDPListenerAttribute**.
ListenerPort	Integer	Yes	80	The frontend port that is used by the Server Load Balancer (SLB) instance. Valid values: **1 to 65535**.

Parameter	Type	Required	Example	Description
LoadBalancerId	String	Yes	lb-bp1rtfnodmywb43e****	The ID of the SLB instance.

Response parameters

Parameter	Type	Example	Description
ListenerPort	Integer	80	The frontend port that is used by the SLB instance.
BackendServerPort	Integer	53	The backend port that is used by the SLB instance. **Note** If the listener is associated with a vServer group, this parameter is not returned.
Bandwidth	Integer	-1	The bandwidth limit of the listener. Unit: Mbit/s. Valid values: • **-1**: For a pay-by-data-transfer Internet-facing SLB instance, this value is set to -1. This indicates that the bandwidth is unlimited. • **1** to **5120**: For a pay-by-bandwidth Internet-facing SLB instance, each listener has a bandwidth limit. The sum of bandwidth limit values that are set for all listeners of an SLB instance does not exceed the bandwidth limit of the SLB instance.
Status	String	stopped	The state of the listener. Valid values: **running** and **stopped**. • **running**: indicates that the listener runs as expected. • **stopped**: indicates that the listener is stopped.

Parameter	Type	Example	Description
Scheduler	String	wrr	The scheduling algorithm. Valid values: • **wrr** (default): Backend servers that have higher weights receive more requests than backend servers that have lower weights. • **wlc**: Requests are distributed based on weights and number of connections to backend servers. If two backend servers have the same weight, the backend server that has fewer connections receives more requests. • **rr**: Requests are distributed to backend servers in sequence.
HealthCheck	String	on	Indicates whether health checks are enabled. Valid values: **on** and **off**.
HealthyThreshold	Integer	4	The healthy threshold.
UnhealthyThreshold	Integer	4	The unhealthy threshold.
HealthCheckConnectTimeout	Integer	100	The timeout period for a health check response.
HealthCheckConnectPort	Integer	8080	The port that is used for health checks. **Note** This parameter takes effect only when the **HealthCheck** parameter is set to **on**.
HealthCheckInterval	Integer	5	The interval between two consecutive health checks. Unit: seconds.
VServerGroupId	String	rsp-cige6j****	The ID of the vServer group that is associated with the listener.
Description	String	AccessControlDescription.	The description of access control.
HealthCheckExp	String	ok	The response string for UDP listener health checks.

Parameter	Type	Example	Description
HealthCheckReq	String	hello	The request string for UDP listener health checks.
MasterSlaveServerGroupId	String	rsp-0bfucw****	The ID of the primary/secondary server group that is associated with the listener.
MaxConnection	Integer	10	The maximum number of connections.
PersistenceTimeout	Integer	0	The timeout period of session persistence.
RequestId	String	365F4154-92F6-4AE4-92F8-7FF34B540710	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeLoadBalancerUDPListenerAttribute
&ListenerPort=80
&LoadBalancerId=lb-bp1rtfnodmywb43e****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeLoadBalancerUDPListenerAttributeResponse>
    <AclStatus>off</AclStatus>
    <HealthCheck>on</HealthCheck>
    <HealthCheckConnectTimeout>5</HealthCheckConnectTimeout>
    <PersistenceTimeout>0</PersistenceTimeout>
    <ListenerPort>80</ListenerPort>
    <Status>stopped</Status>
    <Scheduler>wrr</Scheduler>
    <HealthyThreshold>3</HealthyThreshold>
    <HealthCheckInterval>2</HealthCheckInterval>

}
```

14.1.2.5.3. HTTP listeners

14.1.2.5.3.1. CreateLoadBalancerHTTPListener

Creates an HTTP listener.

> **Note** Newly created listeners are in the **stopped** state.

After a listener is created, you can call the `StartLoadBalancerListener` operation to enable the listener to forward traffic.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateLoadBalancerHTTPListener	The operation that you want to perform. Set the value to **CreateLoadBalancerHTTPListener**.

Parameter	Type	Required	Example	Description
Bandwidth	Integer	Yes	-1	The bandwidth limit of the listener. Unit: Mbit/s. Valid values: • **-1**: If you set the value to -1, the bandwidth of the listener is unlimited. • **1 to 5120**: If you set a value from 1 to 5120, the value that you specify equals the bandwidth limit of the listener. The sum of bandwidth limit values that you specify for all listeners of the Server Load Balancer (SLB) instance cannot exceed the bandwidth limit of the SLB instance. **Note** This parameter applies only to mainland China.
HealthCheck	String	Yes	on	Specifies whether to enable health checks. Valid values: **on** and **off**.
ListenerPort	Integer	Yes	80	The frontend port that is used by the SLB instance. Valid values: **1 to 65535**.
LoadBalancerId	String	Yes	lb-bp1c9vixxjh92q83tw****	The ID of the SLB instance.
StickySession	String	Yes	off	Specifies whether to enable session persistence. Valid values: **on** and **off**.
BackendServerPort	Integer	No	80	The backend port that is used by the SLB instance. Valid values: **1 to 65535**. **Note** If the VServerGroupId parameter is not set, this parameter is required.

Parameter	Type	Required	Example	Description
XForwardedFor	String	No	on	Specifies whether to use the `X-Forwarded-For` header to obtain the real IP address of the client. Set the value to **on**.
Scheduler	String	No	wrr	The scheduling algorithm. Valid values: • **wrr** (default): Backend servers that have higher weights receive more requests than backend servers that have lower weights. • **wlc**: Requests are distributed based on the weights and number of connections to backend servers. If two backend servers have the same weight, the backend server that has fewer connections receives more requests. • **rr**: Requests are distributed to backend servers in sequence.

Parameter	Type	Required	Example	Description
StickySessionType	String	No	insert	The method that is used to handle a cookie. Valid values: • **insert**: inserts a cookie. SLB inserts a cookie (SERVERID) into the first HTTP or HTTPS response that is sent to a client. The next request from the client will contain this cookie, and the listener will forward this request to the recorded backend server. • **server**: rewrites a cookie. When SLB detects a user-defined cookie, it overwrites the original cookie with the user-defined cookie. The next request from the client will contain the user-defined cookie, and the listener will forward the request to the recorded backend server. **Note** If you set the **StickySession** parameter to **on**, this parameter is required.
CookieTimeout	Integer	No	500	The timeout period of a cookie. Valid values: **1 to 86400**. Unit: seconds. **Note** If you set the **StickySession** parameter to **on** and the **StickySessionType** parameter to **insert**, this parameter is required.

Parameter	Type	Required	Example	Description
Cookie	String	No	B490B5EBF6F3CD402E515D22BCDA1598	The cookie to be configured on the backend server. The value must be 1 to 200 characters in length, and can contain only ASCII characters and digits. It cannot contain commas (,), semicolons (;), or space characters. It cannot start with a dollar sign ($). **Note** If you set the **StickySession** parameter to **on** and the **StickySessionType** parameter to **server**, this parameter is required.
HealthCheckDomain	String	No	172.XX.XX.6	The domain name that is used for health checks. Valid values: • **$_ip**: The private IP address of the backend server. If the $_ip parameter is set or the HealthCheckDomain parameter is not set, SLB uses the private IP addresses of backend servers as the domain names for health checks. • **domain**: The domain name must be 1 to 80 characters in length. It can contain only letters, digits, periods (.),and hyphens (-). **Note** This parameter takes effect only when the **HealthCheck** parameter is set to **on**.

Parameter	Type	Required	Example	Description
HealthCheckURI	String	No	/test/index.html	The URL that is used for health checks. The value must be 1 to 80 characters in length, and can contain letters, digits, `hyphens (-), forward slashes (/), periods (.),%?number signs (#), and ampersands (&)`. The URL must not be a single forward slash (/) and it must start with a forward slash (/). **Note** This parameter takes effect only when the **HealthCheck** parameter is set to **on**.
HealthyThreshold	Integer	No	4	The number of health checks that an unhealthy backend server must consecutively pass before it can be declared healthy (from **fail** to **success**). Valid values: **2 to 10**. **Note** This parameter takes effect only when the **HealthCheck** parameter is set to **on**.

Parameter	Type	Required	Example	Description
UnhealthyThreshold	Integer	No	4	The number of health checks that a healthy backend server must consecutively fail before it can be declared unhealthy (from **success** to **fail**). Valid values: **2 to 10**. **Note** This parameter takes effect only when the **HealthCheck** parameter is set to **on**.
HealthCheckTimeout	Integer	No	3	The timeout period of a health check response. If a backend server does not respond within the specified timeout period, the backend server is declared unhealthy. This parameter takes effect only when the **HealthCheck** parameter is set to **on**. Valid values: **1 to 300**. Unit: seconds. **Note** If the value of the **HealthCHeckTimeout** parameter is smaller than that of the **HealthCheckInterval** parameter, the value of the **HealthCHeckTimeout** parameter is invalid and the value of the **HealthCheckInterval** parameter is used as the timeout period.
HealthCheckConnectPort	Integer	No	80	The backend port that is used for health checks. Valid values: **1 to 65535**. **Note** This parameter takes effect only when the **HealthCheck** parameter is set to **on**.

Parameter	Type	Required	Example	Description
HealthCheckInterval	Integer	No	5	The interval between two consecutive health checks. Valid values: **1 to 50**. Unit: seconds. **Note** This parameter takes effect only when the **HealthCheck** parameter is set to **on**.
HealthCheckHttpCode	String	No	http_2xx,http_3xx	The HTTP status code that indicates a successful health check. Separate multiple HTTP status codes with commas (,). Default value: **http_2xx**. Valid values: **http_2xx**, **http_3xx**, **http_4xx**, and **http_5xx**. **Note** This parameter takes effect only when the **HealthCheck** parameter is set to **on**.
VServerGroupId	String	No	rsp-cige6j****	The ID of the vServer group.
XForwardedFor_SLBIP	String	No	on	Specifies whether to use the `SLB-IP` header to obtain the real IP address of the client. Valid values: **on** and **off**. Default value: off.
XForwardedFor_SLBID	String	No	on	Specifies whether to use the `SLB-ID` header to obtain the ID of the SLB instance. Valid values: **on** and **off**. Default value: off.

Parameter	Type	Required	Example	Description
XForwardedFor_proto	String	No	on	Specifies whether to use the `X-Forwarded-Proto` header to obtain the listener protocol of the SLB instance. Valid values: **on** and **off**. Default value: off.
Gzip	String	No	on	Specifies whether to enable gzip compression to compress specific types of files. Default value: **on**. Valid values: **on** and **off**. Default value: off.
IdleTimeout	Integer	No	3	The timeout period of an idle connection. Unit: seconds. Valid values: 1 to 60. Default value: 15. If no request is received during the specified timeout period, the SLB instance closes the connection. When another request is received, the SLB instance establishes a new connection.
RequestTimeout	Integer	No	6	The timeout period of a request. Unit: seconds. Valid values: 1 to 180. Default value: 60. If no response is received from the backend server within the specified timeout period, SLB sends an `HTTP 504` error code to the client.
ListenerForward	String	No	off	Specifies whether to enable HTTP-to-HTTPS redirection. Valid values: **on** and **off**.
ForwardPort	Integer	No	443	The listening port that is used to redirect HTTP requests to HTTPS.

Parameter	Type	Required	Example	Description
Description	String	No	ListenerDescription	The description of the listener. The description must be 1 to 80 characters in length, and can contain letters, digits, hyphens (-), forward slashes (/), periods (.),and underscores (_). It can also contain Chinese characters.

Response parameters

Parameter	Type	Example	Description
RequestId	String	CEF72CEB-54B6-4AE8-B225-F876FF7BA984	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=CreateLoadBalancerHTTPListener
&HealthCheck=off
&ListenerPort=80
&LoadBalancerId=lb-bp1c9vixxjh92q83tw*****
&StickySession=off
&BackendServerPort=80
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreateLoadBalancerHTTPListenerResponse>
   <RequestId>1FF504CB-BFFF-4508-A51A-58A416604FC8</RequestId>
</CreateLoadBalancerHTTPListenerResponse>
```

`JSON` format

```
{
    "RequestId": "1FF504CB-BFFF-4508-A51A-58A416604FC8"
}
```

14.1.2.5.3.2. SetLoadBalancerHTTPListenerAttribute

Modifies the configurations of an HTTP listener.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	SetLoadBalancerHTTPListenerAttribute	The operation that you want to perform. Set the value to **SetLoadBalancerHTTPListenerAttribute**.
ListenerPort	Integer	Yes	80	The frontend port that is used by the Server Load Balancer (SLB) instance. Valid values: **1** to **65535**.
LoadBalancerId	String	Yes	lb-bp1qjwo61pqz3ah****	The ID of the SLB instance.
Bandwidth	Integer	No	-1	The bandwidth limit of the listener. Unit: Mbit/s. Valid values: **-1**: For a pay-by-data-transfer Internet-facing SLB instance, you can set the value to **-1**. If you set the value to -1, the bandwidth is unlimited.
XForwardedFor	String	No	on	Specifies whether to use the **X-Forwarded-For** header to obtain the real IP address of the client. Set the value to **on**.
Scheduler	String	No	wrr	The scheduling algorithm. Valid values: • **wrr**: Backend servers that have higher weights receive more requests than backend servers that have lower weights. • **wlc**: Requests are distributed based on the weights and number of connections to backend servers. If two backend servers have the same weight, the backend server that has fewer connections receives more requests. • **rr**: Requests are distributed to backend servers in sequence.
StickySession	String	No	on	Specifies whether to enable session persistence. Valid values: **on** and **off**.

Parameter	Type	Required	Example	Description
StickySessionType	String	No	insert	The method that is used to handle a cookie. Valid values: • **insert**: inserts a cookie. SLB inserts a cookie (SERVERID) into the first HTTP or HTTPS response that is sent to a client. The next request from the client will contain this cookie, and the listener will forward this request to the recorded backend server. • **server**: rewrites a cookie. When SLB detects a user-defined cookie, it overwrites the original cookie with the user-defined cookie. The next request from the client will contain the user-defined cookie, and the listener will forward the request to the recorded backend server. **Note** If you set the **StickySession** parameter to **on**, this parameter is required.
CookieTimeout	Integer	No	500	The timeout period of a cookie. Valid values: **1** to **86400**. Unit: seconds. **Note** If you set the **StickySession** parameter to **on** and the **StickySessionType** parameter to **insert**, this parameter is required.

Parameter	Type	Required	Example	Description
Cookie	String	No	B490B5EBF6F3CD402E515D22BCDA1598	The cookie to be configured on the backend server. The value must be **1** to **200** characters in length, and can contain only ASCII letters and digits. It cannot contain commas (,), semicolons (;), or space characters. It cannot start with a dollar sign ($). **Note** If you set the **StickySession** parameter to **on** and the **StickySessionType** parameter to **server**, this parameter is required.
HealthCheck	String	No	on	Specifies whether to enable health checks. Valid values: **on** and **off**.
HealthCheckDomain	String	No	172.XX.XX.6	The domain name that is used for health checks. Valid values: • **$_ip**: The private IP address of the backend server. If the $_ip parameter is specified or the HealthCheckDomain parameter is not specified, the SLB instance uses the private IP address of the backend server as the domain name for health checks. • **domain**: The domain name must be 1 to 80 characters in length. It can contain only letters, digits, periods (.),and hyphens (-). **Note** This parameter takes effect only when the **HealthCheck** parameter is set to **on**.

Parameter	Type	Required	Example	Description
HealthCheckURI	String	No	/test/index.html	The URL that is used for health checks. The value must be 1 to 80 characters in length, and can contain only letters, digits, hyphens (-), forward slashes (/), periods (.), percent signs (%), question marks (?), number signs (#), and ampersands (&). The URL must not be a single forward slash (/). However, it must start with a forward slash (/). **Note** This parameter takes effect only when the **HealthCheck** parameter is set to **on**.
HealthyThreshold	Integer	No	4	The number of health checks that an unhealthy backend server must consecutively pass before it can be declared healthy (from **fail** to **success**). Valid values: **2** to **10**. **Note** This parameter takes effect only when the **HealthCheck** parameter is set to **on**.
UnhealthyThreshold	Integer	No	4	The number of health checks that a healthy backend server must consecutively fail before it can be declared unhealthy (from **success** to **fail**). Valid values: **2** to **10**. **Note** This parameter takes effect only when the **HealthCheck** parameter is set to **on**.

Parameter	Type	Required	Example	Description
HealthCheckTimeout	Integer	No	3	The timeout period of a health check response. If a backend server does not respond within the specified timeout period, the health check fails. This parameter takes effect only when the **HealthCheck** parameter is set to **on**. Valid values: **1** to **300**. Unit: seconds. **Note** If the value of the **HealthCHeckTimeout** parameter is smaller than that of the **HealthCheckInterval** parameter, the value of the **HealthCHeckTimeout** parameter is invalid and the value of the **HealthCheckInterval** parameter is used as the timeout period.
HealthCheckInterval	Integer	No	5	The interval between two consecutive health checks. Valid values: **1** to **50**. Unit: seconds. **Note** This parameter takes effect only when the **HealthCheck** parameter is set to **on**.
HealthCheckConnectPort	Integer	No	8080	The port that is used for health checks. Valid values: **1** to **65535**. **Note** This parameter takes effect only when the **HealthCheck** parameter is set to **on**.

Parameter	Type	Required	Example	Description
HealthCheckHttpCode	String	No	http_2xx	The HTTP status code that indicates a successful health check. Separate multiple HTTP status codes with commas (,). Valid values: **http_2xx**, **http_3xx**, **http_4xx**, and **http_5xx**. **Note** This parameter takes effect only when the **HealthCheck** parameter is set to **on**.
MaxConnection	Integer	No	10	The maximum number of connections.
VServerGroup	String	No	on	Specifies whether to use a vServer group. Valid values: **on** and **off**.
VServerGroupId	String	No	rsp-cige6j****	The ID of the server group.
Tags	String	No	{"tagKey":"Key1","tagValue":"Value1"}	The key and value of the tag.
XForwardedFor_SLBIP	String	No	on	Specifies whether to use the `SLB-IP` header to obtain the real IP address of the client. Valid values: **on** and **off**.
XForwardedFor_SLBID	String	No	on	Specifies whether to use the `SLB-ID` header to obtain the ID of the SLB instance. Valid values: **on** and **off**.

Parameter	Type	Required	Example	Description
XForwardedFor_proto	String	No	on	Specifies whether to use the `X-Forwarded-Proto` header to obtain the listener protocol of the SLB instance. Valid values: **on** and **off**.
Gzip	String	No	on	Specifies whether to enable gzip compression to compress specific types of files. Valid values: **on** and **off**.
IdleTimeout	Integer	No	12	The timeout period of an idle connection. Unit: seconds. Valid values: **1** to **60**. Default value: **15**. If no request is received within the specified timeout period, SLB closes the connection. When another request is received, SLB establishes a new connection.
RequestTimeout	Integer	No	3	The timeout period of a request. Unit: seconds. Valid values: **1** to **180**. Default value: **60**. If no response is received from the backend server within the specified timeout period, SLB sends an `HTTP 504` error code to the client.
Description	String	No	test	The description of the listener.

Response parameters

Parameter	Type	Example	Description
RequestId	String	CEF72CEB-54B6-4AE8-B225-F876FF7BA984	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=SetLoadBalancerHTTPListenerAttribute
&ListenerPort=80
&LoadBalancerId=lb-bp1qjwo61pqz3ah****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<SetLoadBalancerHTTPListenerAttributeResponse>
      <RequestId>CEF72CEB-54B6-4AE8-B225-F876FF7BA984</RequestId>
</SetLoadBalancerHTTPListenerAttributeResponse>
```

`JSON` format

```
{"RequestId":" CEF72CEB-54B6-4AE8-B225-F876FF7BA984"
        }
```

14.1.2.5.3.3. DescribeLoadBalancerHTTPListenerAttribute

Queries the configurations of an HTTP listener.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeLoadBalancerHTTPListenerAttribute	The operation that you want to perform. Set the value to **DescribeLoadBalancerHTTPListenerAttribute**.
ListenerPort	Integer	Yes	80	The frontend port that is used by the Server Load Balancer (SLB) instance. Valid values: **1 to 65535**.
LoadBalancerId	String	Yes	lb-bp1o94dp5****	The ID of the SLB instance.
Tags	String	No	{"tagKey":"Key1", "tagValue":"Value1"}	The key and value of the tag.

Response parameters

Parameter	Type	Example	Description

Parameter	Type	Example	Description
ListenerPort	Integer	80	The frontend port that is used by the SLB instance.
Bandwidth	Integer	-1	The bandwidth limit of the listener. Unit: Mbit/s. Valid values: • **-1**: If the value is set to -1, this indicates that the bandwidth of the listener is unlimited. • **1 to 5120**: If a value from 1 to 5120 is set, the specified value indicates the bandwidth limit of the listener. The sum of bandwidth limit values that are specified for all listeners of the SLB instance must not exceed the bandwidth limit of the SLB instance. **Note** This parameter applies only to mainland China.
Status	String	stopped	The state of the listener. Valid values: **running** and **stopped**. • **running**: The listener runs as expected. • **stopped**: The listener is stopped.
XForwardedFor	String	on	Indicates whether the X-Forwarded-For header is added to obtain the real IP address of the client. Valid values: **on** and **off**.

Parameter	Type	Example	Description
Scheduler	String	wrr	The scheduling algorithm. Valid values: **wrr**, **wlc**, and **rr**. • **wrr**: Backend servers that have higher weights receive more requests than backend servers that have lower weights. This is the default value. • **wlc**: Requests are distributed based on the weights and number of connections to backend servers. If two backend servers have the same weight, the backend server that has fewer connections receives more requests. • **rr**: Requests are distributed to backend servers in sequence.
StickySession	String	on	Indicates whether session persistence is enabled. Valid values: **on** and **off**. Default value: off.
StickySessionType	String	insert	The method that is used to handle a cookie. Valid values: **insert** and **server**. • **insert**: inserts a cookie into the response. SLB inserts a cookie (SERVERID) into the first HTTP or HTTPS response that is sent to a client. The next request from the client will contain this cookie, and the listener will forward this request to the recorded backend server. • **server**: rewrites the original cookie. When SLB detects a user-defined cookie, it overwrites the original cookie with the user-defined cookie. The next request from the client will contain the user-defined cookie, and the listener will distribute the request to the recorded backend server. **Note** If the **StickySession** parameter is set to **on**, this parameter is required.
CookieTimeout	Integer	500	The timeout period of a cookie.

Parameter	Type	Example	Description
Cookie	String	B490B5EBF6F3CD402E515D22BCDA1598	The cookie that is configured on the backend server. The value is 1 to 200 characters in length, and can contain only ASCII letters and digits. It cannot contain commas (,), semicolons (;), or space characters. It cannot start with a dollar sign ($).
HealthCheck	String	on	Indicates whether health checks are enabled. Valid values: **on** and **off**.
HealthCheckDomain	String	www.domain.com	The domain name that is used for health checks.
HealthCheckURI	String	/test/index.html	The URL that is used for health checks. The URL is 1 to 80 characters in length, and can contain letters, digits, hyphens (-), forward slashes (/), periods (.), percent signs (%), question marks (?), number signs (#), and ampersands (&). The URL must not be a single forward slash (/). However, it must start with a forward slash (/).)
HealthyThreshold	Integer	4	The healthy threshold.
UnhealthyThreshold	Integer	4	The unhealthy threshold.
HealthCheckTimeout	Integer	3	The timeout period of a health check response. Valid values: 1 to 300. Unit: seconds.
HealthCheckInterval	Integer	5	The interval between two consecutive health checks. Valid values: 1 to 50. Unit: seconds.

Parameter	Type	Example	Description
HealthCheckHttpCode	String	http_2xx	The HTTP status code that indicates a successful health check. Multiple HTTP status codes are separated by commas (,). Valid values: **http_2xx**, **http_3xx**, **http_4xx**, and **http_5xx**. Default value: http_2xx. **Note** This parameter takes effect only when the **HealthCheck** parameter is set to **on**.
HealthCheckConnectPort	Integer	8080	The port that is used for health checks. **Note** This parameter takes effect only when the **HealthCheck** parameter is set to **on**.
VServerGroupId	String	rsp-cige6j****	The ID of the associated vServer group.
Gzip	String	on	Indicates whether gzip compression is enabled to compress specific types of files. Valid values: **on** and **off**.
BackendServerPort	Integer	80	The backend port that is used by the SLB instance.
Description	String	test	The description of the HTTP listener. The description is 1 to 80 characters in length, and can contain letters, digits, hyphens (-), forward slashes (/), periods (.),and underscores (_).
ForwardPort	Integer	80	The listening port that is used to redirect HTTP requests to HTTPS. **Note** If the value of the **ListenerForward** parameter is set to **off**, this parameter is not displayed.

Parameter	Type	Example	Description
IdleTimeout	Integer	2	The timeout period of an idle connection. Valid values: **1 to 60**. Unit: seconds. Default value: **15**. If no request is received within the specified timeout period, SLB closes the connection. SLB starts a new connection when it receives a new connection request.
ListenerForward	String	on	Indicates whether HTTP-to-HTTPS redirection is enabled. Valid values: • **on**: enabled • **off**: disabled
MaxConnection	Integer	10	The maximum number of connections.
RequestId	String	365F4154-92F6-4AE4-92F8-7FF34B540710	The ID of the request.
RequestTimeout	Integer	34	The timeout period of a request. Valid values: **1 to 180**. Unit: seconds. Default value: **60**. If no response is received from the backend server within the timeout period, SLB returns an HTTP 504 error to the client.
SecurityStatus	String	on	The security status. Valid values: **on** and **off**.
XForwardedFor_SLBID	String	on	Indicates whether the `SLB-ID` header is added to obtain the ID of the SLB instance.
XForwardedFor_SLBIP	String	on	Indicates whether the `SLB-IP` header is added to obtain the real IP address of the client.
XForwardedFor_proto	String	on	Indicates whether the `X-Forwarded-Proto` header is added to obtain the listener protocol of the SLB instance.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeLoadBalancerHTTPListenerAttribute
&ListenerPort=80
&LoadBalancerId=lb-bp1o94dp5*********
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeLoadBalancerHTTPListenerAttributeResponse>
    <ForwardPort>443</ForwardPort>
    <ListenerPort>80</ListenerPort>
    <Status>stopped</Status>
    <RequestId>99439CEF-192C-4B01-A45A-2D5BD5BCDA62</RequestId>
    <ListenerForward>on</ListenerForward>
</DescribeLoadBalancerHTTPListenerAttributeResponse>
```

`JSON` format

```
{
    "ForwardPort": 443,
    "ListenerPort": 80,
    "Status": "stopped",
    "RequestId": "99439CEF-192C-4B01-A45A-2D5BD5BCDA62",
    "ListenerForward": "on"
}
```

14.1.2.5.4. HTTPS listeners

14.1.2.5.4.1. CreateLoadBalancerHTTPSListener

Creates an HTTPS listener.

Note Newly created listeners are in the Stopped state. After a listener is created, you can call the `StartLoadBalancerListener` operation to enable the listener to forward traffic.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateLoadBalancerHTTPSListener	The operation that you want to perform. Set the value to **CreateLoadBalancerHTTPSListener**.

Parameter	Type	Required	Example	Description
Bandwidth	Integer	Yes	-1	The bandwidth limit of the listener. Unit: Mbit/s. Valid values: **-1** and **1 to 5120**. • **-1**: For a pay-by-data-transfer Internet-facing Server Load Balancer (SLB) instance, you can set the value to **-1**. If you set the value to -1, the bandwidth is unlimited. • **1** to **5120**: For a pay-by-bandwidth Internet-facing SLB instance, you can specify a value as the bandwidth limit for each listener. The sum of maximum bandwidth values that you set for all listeners cannot exceed the bandwidth limit of the SLB instance.
HealthCheck	String	Yes	on	Specifies whether to enable health checks. Valid values: **on** and **off**.
ListenerPort	Integer	Yes	80	The frontend port that is used by the SLB instance. Valid values: **1 to 65535**.
LoadBalancerId	String	Yes	lb-bp1o94dp5i6earr****	The ID of the SLB instance.
StickySession	String	Yes	on	Specifies whether to enable session persistence. Valid values: **on** and **off**.
BackendServerPort	Integer	No	80	The backend port that is used by the SLB instance. Valid values: **1 to 65535**. If the VServerGroupId parameter is not set, this parameter is required.
XForwardedFor	String	No	on	Specifies whether to use the `X-Forwarded-For` header to obtain the real IP address of the client. Set the value to **on**.

Parameter	Type	Required	Example	Description
Scheduler	String	No	wrr	The scheduling algorithm. Valid values: • **wrr** (default): Backend servers that have higher weights receive more requests than backend servers that have lower weights. • **wlc**: Requests are distributed based on the weights and number of connections to backend servers. If two backend servers have the same weight, the backend server that has fewer connections receives more requests. • **rr**: Requests are distributed to backend servers in sequence.
StickySessionType	String	No	insert	The method that is used to handle a cookie. If you set the StickySession parameter to **on**, you must specify this parameter. Valid values: **insert** and **server**. • **insert**: inserts a cookie. SLB inserts a cookie (SERVERID) into the first HTTP or HTTPS response that is sent to a client. The next request from the client will contain this cookie, and the listener will distribute this request to the recorded backend server. • **server**:rewrites a cookie. When the SLB instance detects a user-defined cookie, it rewrites the original cookie with the user-defined cookie. The next request from the client contains the user-defined cookie, and the listener distributes the request to the recorded backend server.

Parameter	Type	Required	Example	Description
CookieTimeout	Integer	No	500	The timeout period of a cookie. Valid values: **1 to 86400**. Unit: seconds. **Note** If you set the **StickySession** parameter to **on** and the **StickySessionType** parameter to **insert**, this parameter is required.
Cookie	String	No	B490B5EBF6F3CD402E515D22BCDA1598	The cookie to be configured on the backend server. The value must be 1 to 200 characters in length, and can contain only ASCII characters and digits. It cannot contain commas (,), semicolons (;), or spaces. It cannot start with a dollar sign ($). **Note** If you set the **StickySession** parameter to **on** and the **StickySessionType** parameter to **server**, this parameter is required.
HealthCheckDomain	String	No	172.XX.XX.6	The domain name that is used for health checks. Valid values: • **$_ip**: The private IP address of the backend server. If you do not set this parameter or set the parameter to $_ip, the SLB instance uses the private IP address of each backend server as the domain name for health checks. • **domain**: The domain name must be 1 to 80 characters in length and can contain only letters, digits, periods (.),and hyphens (-). **Note** This parameter takes effect only when the **HealthCheck** parameter is set to **on**.

Parameter	Type	Required	Example	Description
HealthCheckURI	String	No	/test/index.html	The URL that is used for health checks. The value must be 1 to 80 characters in length, and can contain only letters, digits, `hyphens (-), forward slashes (/), periods (.),%? number signs (#), and ampersands (&)`. The URL must not be a single forward slash (/) and it must start with a forward slash (/). **Note** This parameter takes effect only when the **HealthCheck** parameter is set to **on**.
HealthyThreshold	Integer	No	4	The number of health checks that an unhealthy backend server must consecutively pass before it can be declared healthy (from **fail** to **success**). Valid values: **2 to 10**. **Note** This parameter takes effect only when the **HealthCheck** parameter is set to **on**.
UnhealthyThreshold	Integer	No	4	The number of health checks that a healthy backend server must consecutively fail before it can be declared unhealthy. (from **success** to **fail**). Valid values: **2 to 10**. **Note** This parameter takes effect only when the **HealthCheck** parameter is set to **on**.

Parameter	Type	Required	Example	Description
HealthCheckTimeout	Integer	No	3	The timeout period of a health check response. If a backend server does not respond within the specified timeout period, the health check fails. This parameter takes effect only when the **HealthCheck** parameter is set to **on**. Valid values: **1 to 300**. Unit: seconds. If the value of the **HealthCHeckTimeout** parameter is smaller than that of the **HealthCheckInterval** parameter, the value of the **HealthCHeckTimeout** parameter is invalid and the value of the **HealthCheckInterval** parameter is used as the timeout period. **Note** This parameter takes effect only when the **HealthCheck** parameter is set to **on**.
HealthCheckConnectPort	Integer	No	8080	The port that is used for health checks. Valid values: **1 to 65535**. **Note** This parameter takes effect only when the **HealthCheck** parameter is set to **on**.

Parameter	Type	Required	Example	Description
HealthCheckInterval	Integer	No	5	The interval between two consecutive health checks. Valid values: **1 to 50** . Unit: seconds. **Note** This parameter takes effect only when the **HealthCheck** parameter is set to **on**.
HealthCheckHttpCode	String	No	http_2xx	The HTTP status code that indicates a successful health check. Separate multiple HTTP status codes with commas (,). Default value: **http_2xx**. Valid values: **http_2xx**, **http_3xx**, **http_4xx**, and **http_5xx**. **Note** This parameter takes effect only when the **HealthCheck** parameter is set to **on**.
ServerCertificateId	String	No	idkp-123-cn-test-****	The ID of the server certificate.
VServerGroupId	String	No	rsp-cige6j5e7p****	The ID of the vServer group.
CACertificateId	String	No	139a00604ad-cn-east-hangzh****	The ID of the CA certificate. • Two-factor authentication: upload a CA certificate and a server certificate. • Single-factor authentication: upload only a server certificate.
XForwardedFor_SLBIP	String	No	on	Specifies whether to use the `SLB-IP` header to obtain the real IP address of the client. Valid values: **on** and **off**. Default value: off.

Parameter	Type	Required	Example	Description
XForwardedFor_SLBID	String	No	on	Specifies whether to use the `SLB-ID` header to obtain the ID of the SLB instance. Valid values: **on** and **off**. Default value: off.
XForwardedFor_proto	String	No	on	Specifies whether to use the `X-Forwarded-Proto` header to obtain the listener protocol of the SLB instance. Valid values: **on** and **off**. Default value: off.
Gzip	String	No	on	Specifies whether to enable gzip compression to compress specific types of files. Valid values: **on** and **off**. Default value: off.
IdleTimeout	Integer	No	12	The timeout period of an idle connection. Valid values: **1 to 60**. Default value: **15**. Unit: seconds. If no request is received during the specified timeout period, the SLB instance closes the connection. When another request is received, the SLB instance establishes a new connection.
RequestTimeout	Integer	No	23	The timeout period of a request. Valid values: **1 to 180**. Default value: **60**. Unit: seconds. If no response is received from the backend server during the timeout period, SLB sends an HTTP 504 error code to the client.
				You can specify the TLSCipherPolicy parameter only for a high-performance SLB instance. Each security policy includes TLS protocol versions and cipher suites available for HTTPS. The following security policies are supported. For more information about the differences, see Differences in TLS security policies.

Parameter	Type	Required	Example	Description
TLSCipherPolicy	String	No	tls_cipher_policy_1_1	• **tls_cipher_policy_1_0**: ◦ Supported TLS versions: TLSv1.0, TLSv1.1, and TLSv1.2. ◦ Supported cipher suites: ECDHE-RSA-AES128-GCM-SHA256, ECDHE-RSA-AES256-GCM-SHA384, ECDHE-RSA-AES128-SHA256, ECDHE-RSA-AES256-SHA384, AES128-GCM-SHA256, AES256-GCM-SHA384, AES128-SHA256, AES256-SHA256, ECDHE-RSA-AES128-SHA, ECDHE-RSA-AES256-SHA, AES128-SHA, AES256-SHA, and DES-CBC3-SHA. • **tls_cipher_policy_1_1**: ◦ Supported TLS versions: TLSv1.1 and TLSv1.2. ◦ Supported cipher suites: ECDHE-RSA-AES128-GCM-SHA256, ECDHE-RSA-AES256-GCM-SHA384, ECDHE-RSA-AES128-SHA256, ECDHE-RSA-AES256-SHA384, AES128-GCM-SHA256, AES256-GCM-SHA384, AES128-SHA256, AES256-SHA256, ECDHE-RSA-AES128-SHA, ECDHE-RSA-AES256-SHA, AES128-SHA, AES256-SHA, and DES-CBC3-SHA. • **tls_cipher_policy_1_2** ◦ Supported TLS version: TLSv1.2. ◦ Supported cipher suites: ECDHE-RSA-AES128-GCM-SHA256, ECDHE-RSA-AES256-GCM-SHA384, ECDHE-RSA-AES128-SHA256, ECDHE-RSA-AES256-SHA384, AES128-GCM-SHA256, AES256-GCM-SHA384, AES128-SHA256, AES256-SHA256, ECDHE-RSA-AES128-SHA, ECDHE-RSA-AES256-SHA, AES128-SHA, AES256-SHA, and DES-CBC3-SHA. • **tls_cipher_policy_1_2_strict** ◦ Supported TLS version: TLSv1.2. ◦ Supported cipher suites: ECDHE-RSA-AES128-GCM-SHA256, ECDHE-RSA-AES256-GCM-SHA384, ECDHE-RSA-AES128-SHA256, ECDHE-RSA-AES256-SHA384, ECDHE-RSA-AES128-SHA, and ECDHE-RSA-AES256-SHA.

Parameter	Type	Required	Example	Description
Description	String	No	CreateListeners	The description of the listener. The description must be 1 to 80 characters in length, and can contain letters, digits, hyphens (-), forward slashes (/), periods (.),and underscores (_).

Response parameters

Parameter	Type	Example	Description
RequestId	String	CEF72CEB-54B6-4AE8-B225-F876FF7BA984	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=CreateLoadBalancerHTTPSListener
&Bandwidth=-1
&HealthCheck=on
&ListenerPort=80
&LoadBalancerId=lb-bp1o94dp5i6earr*****
&StickySession=on
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreateLoadBalancerHTTPSListenerResponse>
   <RequestId>CEF72CEB-54B6-4AE8-B225-F876FF7BA984</RequestId>
</CreateLoadBalancerHTTPSListenerResponse>
```

`JSON` format

```
{"RequestId":" CEF72CEB-54B6-4AE8-B225-F876FF7BA984"
  }
```

14.1.2.5.4.2. SetLoadBalancerHTTPSListenerAttribute

Modifies the configurations of an HTTPS listener.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	SetLoadBalancerHTTPSListenerAttribute	The operation that you want to perform. Set the value to **SetLoadBalancerHTTPSListenerAttribute**.
ListenerPort	Integer	Yes	80	The frontend port that is used by the Server Load Balancer (SLB) instance. Valid values: **1 to 65535**.
LoadBalancerId	String	Yes	lb-sjhfdji****	The ID of the SLB instance.
Bandwidth	Integer	No	-1	Specify the bandwidth limit of the listener. Valid values: **1 to 5120** and **-1**. • **-1**: If you set the value to -1, the bandwidth is unlimited. • **1 to 5120**: If you set a value from 1 to 5120, the value that you specify equals the bandwidth limit of the listener. The sum of bandwidth limit values that you specify for all listeners of the SLB instance cannot exceed the bandwidth limit of the SLB instance.
XForwardedFor	String	No	on	Specifies whether to use the X-Forwarded-For header to obtain the real IP address of the client. Valid values: **on** and **off**.

Parameter	Type	Required	Example	Description
Scheduler	String	No	wrr	The scheduling algorithm. Valid values: • **wrr** (default): Backend servers that have higher weights receive more requests than backend servers that have lower weights. • **wlc**: Requests are distributed based on the weights and number of connections to backend servers. If two backend servers have the same weight, the backend server that has fewer connections receives more requests. • **rr**: Requests are distributed to backend servers in sequence.
StickySession	String	No	on	Specifies whether to enable session persistence. Valid values: **on** and **off**.
StickySessionType	String	No	insert	The method that is used to handle a cookie. Valid values: • **insert**: inserts a cookie. SLB inserts a cookie (SERVERID) into the first HTTP or HTTPS response that is sent to a client. The next request from the client will contain this cookie, and the listener will forward this request to the recorded backend server. • **server**: rewrites the original cookie. When SLB detects a user-defined cookie, it overwrites the original cookie with the user-defined cookie. The next request from the client will contain the user-defined cookie, and the listener will distribute the request to the recorded backend server. **Note** If you set the **StickySession** parameter to **on**, this parameter is required.

Parameter	Type	Required	Example	Description
CookieTimeout	Integer	No	500	The timeout period of a cookie. Valid values: **1 to 86400**. Unit: seconds. **Note** If you set the **StickySession** parameter to **on** and the **StickySessionType** parameter to **insert**, this parameter is required.
Cookie	String	No	B490B5EBF6F3CD402E515D22BCDA1598	The cookie that is configured on the backend server. The value must be 1 to 200 characters in length, and can contain only ASCII characters and digits. It cannot contain commas (,), semicolons (;), or spaces. It cannot start with a dollar sign ($). **Note** If you set the **StickySession** parameter to **on** and the **StickySessionType** parameter to **server**, this parameter is required.
HealthCheck	String	No	on	Specifies whether to enable health checks. Valid values: **on** and **off**.

Parameter	Type	Required	Example	Description
HealthCheckDomain	String	No	172.XX.XX.6	The domain name that is used for health checks. Valid values: • **$_ip**: The private IP address of the backend server. If the $_ip parameter is set or the HealthCheckDomain parameter is not set, SLB uses the private IP addresses of backend servers as the domain names for health checks. • **domain**: The domain name must be 1 to 80 characters in length, and can contain only letters, digits, periods (.),and hyphens (-). **Note** This parameter takes effect only when the **HealthCheck** parameter is set to **on**.
HealthCheckURI	String	No	/test/index.html	The URL that is used for health checks. The URL must be 1 to 80 characters in length and can contain only letters, digits, hyphens (-), forward slashes (/), periods (.), percent signs (%), question marks (?), number signs (#), and ampersands (&). The URL must not be a single forward slash (/). However, it must start with a forward slash (/). **Note** This parameter takes effect only when the **HealthCheck** parameter is set to **on**.

Parameter	Type	Required	Example	Description
HealthyThreshold	Integer	No	4	The number of health checks that an unhealthy backend server must consecutively pass before it can be declared healthy (from **fail** to **success**). Valid values: **2 to 10**. **Note** This parameter takes effect only when the **HealthCheck** parameter is set to **on**.
UnhealthyThreshold	Integer	No	4	The number of health checks that a healthy backend server must consecutively fail before it can be declared unhealthy (from **success** to **fail**). Valid values: **2 to 10**. **Note** This parameter takes effect only when the **HealthCheck** parameter is set to **on**.

Parameter	Type	Required	Example	Description
HealthCheckTimeout	Integer	No	3	The timeout period of a health check response. If a backend server does not respond within the specified timeout period, the backend server is declared unhealthy. Valid values: **1 to 300**. Unit: seconds. **Note** • If the value of the **HealthCheckTimeout** parameter is smaller than that of the **HealthCheckInterval** parameter, the value of the **HealthCheckTimeout** parameter is ignored and the value of the **HealthCheckInterval** parameter is used as the timeout period. • This parameter takes effect only when the **HealthCheck** parameter is set to **on**.
HealthCheckInterval	Integer	No	5	The interval between two consecutive health checks. Valid values: **1 to 50**. Unit: seconds. **Note** This parameter takes effect only when the **HealthCheck** parameter is set to **on**.
HealthCheckConnectPort	Integer	No	8080	The port that is used for health checks. Valid values: **1 to 65535**. **Note** This parameter takes effect only when the **HealthCheck** parameter is set to **on**.

Parameter	Type	Required	Example	Description
HealthCheckHttpCode	String	No	http_2xx,http_3xx	The HTTP status code that indicates a successful health check. Separate multiple HTTP status codes with commas (,). Valid values: **http_2xx**, **http_3xx**, **http_4xx**, and **http_5xx**. **Note** This parameter takes effect only when the **HealthCheck** parameter is set to **on**.
ServerCertificateId	String	No	idkp-123-cn-te****	The ID of the server certificate.
CACertificateId	String	No	139a00604ad-cn-east-****	The ID of the CA certificate. • If both the CA certificate and the server certificate are uploaded, two-factor authentication is used. • If you upload only the server certificate, single-factor authentication is used.
VServerGroup	String	No	on	Specifies whether to use a vServer group. Valid values: **on** and **off**.
VServerGroupId	String	No	rsp-cige6j****	The ID of the vServer group.
Tags	String	No	loadbalancerhttps****	The tags.
XForwardedFor_SLBIP	String	No	on	Specifies whether to use the `SLB-IP` header to obtain the real IP address of the client. Valid values: **on** and **off**.
XForwardedFor_SLBID	String	No	on	Specifies whether to use the `SLB-ID` header to obtain the ID of the SLB instance. Valid values: **on** and **off**.

Parameter	Type	Required	Example	Description
XForwardedFor_proto	String	No	on	Specifies whether to use the `X-Forwarded-Proto` header to obtain the listener protocol of the SLB instance. Valid values: **on** and **off**.
Gzip	String	No	on	Specifies whether to enable gzip compression to compress specific types of files. Valid values: **on** and **off**.
IdleTimeout	Integer	No	23	The timeout period of an idle connection. Unit: seconds. Valid values: **1 to 60**. Default value: **15**. If no request is received during the specified timeout period, the SLB instance closes the connection. When another request is received, the SLB instance establishes a new connection.
RequestTimeout	Integer	No	223	The timeout period of a request. Unit: seconds. Valid values: **1 to 180**. Default value: **60**. If no response is received from the backend server during the specified timeout period, SLB sends an HTTP 504 error code to the client.
				You can specify the TLSCipherPolicy parameter only for a high-performance SLB instance. Each security policy includes TLS protocol versions and cipher suites that are available for HTTPS. You can select a security policy based on your requirements. The following security policies are supported: • **tls_cipher_policy_1_0**: ◦ Supported TLS versions: TLSv1.0, TLSv1.1, and TLSv1.2.

Parameter	Type	Required	Example	Description
TLSCipherPolicy	String	No	tls_cipher_policy_1_2	◦ Supported cipher suites: ECDHE-RSA-AES128-GCM-SHA256, ECDHE-RSA-AES256-GCM-SHA384, ECDHE-RSA-AES128-SHA256, ECDHE-RSA-AES256-SHA384, AES128-GCM-SHA256, AES256-GCM-SHA384, AES128-SHA256, AES256-SHA256, ECDHE-RSA-AES128-SHA, ECDHE-RSA-AES256-SHA, AES128-SHA, AES256-SHA, and DES-CBC3-SHA. • **tls_cipher_policy_1_1**: ◦ Supported TLS versions: TLSv1.1 and TLSv1.2. ◦ Supported cipher suites: ECDHE-RSA-AES128-GCM-SHA256, ECDHE-RSA-AES256-GCM-SHA384, ECDHE-RSA-AES128-SHA256, ECDHE-RSA-AES256-SHA384, AES128-GCM-SHA256, AES256-GCM-SHA384, AES128-SHA256, AES256-SHA256, ECDHE-RSA-AES128-SHA, ECDHE-RSA-AES256-SHA, AES128-SHA, AES256-SHA, and DES-CBC3-SHA. • **tls_cipher_policy_1_2** ◦ Supported TLS version: TLSv1.2. ◦ Supported cipher suites: ECDHE-RSA-AES128-GCM-SHA256, ECDHE-RSA-AES256-GCM-SHA384, ECDHE-RSA-AES128-SHA256, ECDHE-RSA-AES256-SHA384, AES128-GCM-SHA256, AES256-GCM-SHA384, AES128-SHA256, AES256-SHA256, ECDHE-RSA-AES128-SHA, ECDHE-RSA-AES256-SHA, AES128-SHA, AES256-SHA, and DES-CBC3-SHA. • **tls_cipher_policy_1_2_strict** ◦ Supported TLS version: TLSv1.2. ◦ Supported cipher suites: ECDHE-RSA-AES128-GCM-SHA256, ECDHE-RSA-AES256-GCM-SHA384, ECDHE-RSA-AES128-SHA256, ECDHE-RSA-AES256-SHA384, AES128-GCM-SHA256, AES256-GCM-SHA384, AES128-SHA256, AES256-SHA256, ECDHE-RSA-AES128-SHA, ECDHE-RSA-AES256-SHA, AES128-SHA, AES256-SHA, and DES-CBC3-SHA.
Description	String	No	ListenerDescription	The description of the listener. The description must be 2 to 256 characters in length. It can contain only characters in the following string: `^([^\x00-\xff]|[\w.,;/@-]){2,256}$`.

Response parameters

Parameter	Type	Example	Description
RequestId	String	CEF72CEB-54B6-4AE8-B225-F876FF7BA984	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=SetLoadBalancerHTTPSListenerAttribute
&ListenerPort=80
&LoadBalancerId=lb-sjhfdji****************
&<Common request parameters>
```

Sample success responses

`XML` format

```
<SetLoadBalancerHTTPSListenerAttributeResponse>
    <RequestId>CEF72CEB-54B6-4AE8-B225-F876FF7BA984</RequestId>
</SetLoadBalancerHTTPSListenerAttributeResponse>
```

`JSON` format

```
{
 "RequestId":" CEF72CEB-54B6-4AE8-B225-F876FF7BA984"
}
```

14.1.2.5.4.3.

DescribeLoadBalancerHTTPSListenerAttribute

Queries the configurations of an HTTPS listener.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeLoadBalancerHTTPSListenerAttribute	The operation that you want to perform. Set the value to **DescribeLoadBalancerHTTPSListenerAttribute**.
ListenerPort	Integer	Yes	80	The frontend port that is used by the Server Load Balancer (SLB) instance. Valid values: **1 to 65535**.

Parameter	Type	Required	Example	Description
LoadBalancerId	String	Yes	lb-bp1mxu5r8lau****	The ID of the SLB instance.

Response parameters

Parameter	Type	Example	Description
ListenerPort	Integer	80	The frontend port that is used by the SLB instance.
BackendServerPort	Integer	80	The backend port that is used by the SLB instance.
Bandwidth	Integer	-1	The bandwidth limit of the listener.
Status	String	stopped	The state of the listener. Valid values: **running** and **stopped**.
XForwardedFor	String	on	Indicates whether the X-Forwarded-For header is used to obtain the real IP address of the client. Valid values: **on** and **off**.
Scheduler	String	wrr	The scheduling algorithm. Valid values: **wrr**, **wlc**, and **rr**. • **wrr** (default): Backend servers that have higher weights receive more requests than backend servers that have lower weights. • **wlc**: Requests are distributed based on the weights and number of connections to backend servers. If two backend servers have the same weight, the backend server that has fewer connections receives more requests. • **rr**: Requests are distributed to backend servers in sequence.
StickySession	String	on	Indicates whether session persistence is enabled. Valid values: **on** and **off**.

Parameter	Type	Example	Description
StickySessionType	String	insert	The method that is used to handle a cookie. If you set the StickySession parameter to **on**, this parameter is required. Valid values: **insert** and **server**. • **insert**: inserts a cookie into the response. SLB inserts a cookie (SERVERID) into the first HTTP or HTTPS response that is sent to a client. The next request from the client will contain this cookie, and the listener will forward this request to the recorded backend server. • **server**: rewrites the original cookie. When SLB detects a user-defined cookie, it overwrites the original cookie with the user-defined cookie. The next request from the client will contain the user-defined cookie, and the listener will distribute the request to the recorded backend server. **Note** If you set the **StickySession** parameter to **on**, this parameter is required.
CookieTimeout	Integer	500	The timeout period of a cookie.
Cookie	String	B490B5EBF6F3CD402E515D22BCDA1598	The cookie configured on the backend server.
HealthCheck	String	on	Indicates whether health checks are enabled. Valid values: **on** and **off**.
HealthCheckDomain	String	www.test.com	The domain name that is used for health checks.

Parameter	Type	Example	Description
HealthCheckURI	String	/test/index.html	The URL that is used for health checks. The URL must be 1 to 80 characters in length and can contain only letters, digits, hyphens (-), forward slashes (/), periods (.), percent signs (%), question marks (?), number signs (#), and ampersands (&). The URL must start with a forward slash (/) but cannot contain only a forward slash (/).
HealthyThreshold	Integer	4	The healthy threshold.
UnhealthyThreshold	Integer	4	The unhealthy threshold.
HealthCheckTimeout	Integer	3	The timeout period of a health check response. Unit: seconds.
HealthCheckInterval	Integer	5	The time interval between two consecutive health checks. Unit: seconds. Valid values: **1 to 50**.
HealthCheckHttpCode	String	http_2xx	The HTTP status code that indicates a successful health check. Multiple status codes are separated with commas (,). Valid values: **http_2xx** (default), **http_3xx**, **http_4xx**, and **http_5xx**.
HealthCheckConnectPort	Integer	8080	The port that is used for health checks. **Note** This parameter takes effect only when the **HealthCheck** parameter is set to **on**.
ServerCertificateId	String	idkp-123-cn-test-****	The ID of the server certificate.
CACertificateId	String	idkp-234-cn-test-****	The ID of the CA certificate.
VServerGroupId	String	rsp-cige6j5e****	The ID of the associated vServer group.

Parameter	Type	Example	Description
Gzip	String	on	Indicates whether gzip compression is enabled. Valid values: **on** and **off**.
Description	String	ListenerDescription	The description of the listener. The description must be 2 to 256 characters in length. It can contain only Chinese characters and characters in the following string: /^([^\x00-\xff]|[\w.,;/@-]){2,256}$/.
IdleTimeout	Integer	23	The timeout period of an idle connection. Unit: seconds. Valid values: 1 to 60. Default value: 15. If no request is received during the specified timeout period, SLB closes the connection. When another request is received, SLB establishes a new connection.
MaxConnection	Integer	10	
RequestId	String	365F4154-92F6-4AE4-92F8-7FF34B540710	The ID of the request.
RequestTimeout	Integer	43	The timeout period of a request. Unit: seconds. Valid values: 1 to 180. Default value: 60. If the backend server does not respond within the specified timeout period, SLB returns the HTTP 504 error code to the client.
SecurityStatus	String	on	The security status. Valid values: **on** and **off**.
			The security policy. You can specify the TLSCipherPolicy parameter only for a high-performance SLB instance. Each security policy includes different TLS protocol versions and cipher suites for HTTPS.

Parameter	Type	Example	Description
TLSCipherPolicy	String	tls_cipher_policy_1_0	The following security policies are supported. For more information about the differences, see Differences in TLS security policies. You can specify a security policy based on your requirements. Valid values: • **tls_cipher_policy_1_0**: Supported TLS versions: TLSv1.0, TLSv1.1, and TLSv1.2. Supported cipher suites: ECDHE-RSA-AES128-GCM-SHA256, ECDHE-RSA-AES256-GCM-SHA384, ECDHE-RSA-AES128-SHA256, ECDHE-RSA-AES256-SHA384, AES128-GCM-SHA256, AES256-GCM-SHA384, AES128-SHA256, AES256-SHA256, ECDHE-RSA-AES128-SHA, ECDHE-RSA-AES256-SHA, AES128-SHA, AES256-SHA, and DES-CBC3-SHA. • **tls_cipher_policy_1_1**: Supported TLS versions: TLSv1.1 and TLSv1.2. Supported cipher suites: ECDHE-RSA-AES128-GCM-SHA256, ECDHE-RSA-AES256-GCM-SHA384, ECDHE-RSA-AES128-SHA256, ECDHE-RSA-AES256-SHA384, AES128-GCM-SHA256, AES256-GCM-SHA384, AES128-SHA256, AES256-SHA256, ECDHE-RSA-AES128-SHA, ECDHE-RSA-AES256-SHA, AES128-SHA, AES256-SHA, and DES-CBC3-SHA. • **tls_cipher_policy_1_2** Supported TLS version: TLSv1.2. Supported cipher suites: ECDHE-RSA-AES128-GCM-SHA256, ECDHE-RSA-AES256-GCM-SHA384, ECDHE-RSA-AES128-SHA256, ECDHE-RSA-AES256-SHA384, AES128-GCM-SHA256, AES256-GCM-SHA384, AES128-SHA256, AES256-SHA256, ECDHE-RSA-AES128-SHA, ECDHE-RSA-AES256-SHA, AES128-SHA, AES256-SHA, and DES-CBC3-SHA. • **tls_cipher_policy_1_2_strict** Supported TLS version: TLSv1.2. Supported cipher suites: ECDHE-RSA-AES128-GCM-SHA256, ECDHE-RSA-AES256-GCM-SHA384, ECDHE-RSA-AES128-SHA256, ECDHE-RSA-AES256-SHA384, ECDHE-RSA-AES128-SHA, and ECDHE-RSA-AES256-SHA.

Parameter	Type	Example	Description
XForwardedFor_SLBID	String	on	Indicates whether the `SLB-ID` header is used to obtain the ID of the SLB instance. Valid values: **on** and **off**.
XForwardedFor_SLBIP	String	on	Indicates whether the `SLB-IP` header is used to obtain the real IP address of the client. Valid values: **on** and **off**.
XForwardedFor_proto	String	on	Indicates whether the `X-Forwarded-Proto` header is used to obtain the listener protocol of the SLB instance. Valid values: **on** and **off**.

Examples

Sample requests

14.1.2.5.4.4. DescribeHealthStatus

Queries the health status of backend servers.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeHealthStatus	The operation that you want to perform. Set the value to **DescribeHealthStatus**.
LoadBalancerId	String	Yes	lb-bp1qjwo61pqz3ah****	The ID of the Server Load Balancer (SLB) instance.
ListenerPort	Integer	No	80	The frontend port that is used by the SLB instance. Valid values: **1 to 65535**. **Note** If you do not specify this parameter, the health status of all ports is returned.
RegionId	String	Yes	cn-hangzhou	The ID of the region where the SLB instance is deployed.

Response parameters

Parameter	Type	Example	Description
BackendServers	Array of BackendServer		The list of backend servers.
BackendServer			
ServerId	String	i-bp1h5u3fv54ytf****	The ID of the Elastic Compute Service (ECS) instance or elastic network interface (ENI).

Parameter	Type	Example	Description
ServerHealthStatus	String	abnormal	The health status of the backend server: • **normal**: The backend server is healthy. • **abnormal**: The backend server is unhealthy. • **unavailable**: The health check is not completed.
ListenerPort	Integer	80	The frontend port that is used by the SLB instance.
port	Integer	80	
RequestId	String	365F4154-92F6-4AE4-92F8-7FF34B540710	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeHealthStatus
&LoadBalancerId=lb-bp1qjwo61pqz3ah****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeHealthStatusResponse>
  <RequestId>E69BA4CE-2B55-45EC-94CA-E47B16759459</RequestId>
  <BackendServers>

```

14.1.2.5.5. Access control

14.1.2.5.5.1. SetListenerAccessControlStatus

Enables or disables the whitelist of a specified listener.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	SetListenerAccessControlStatus	The operation that you want to perform. Set the value to **SetListenerAccessControlStatus**.
AccessControlStatus	String	Yes	open_white_list	Specifies whether to enable the whitelist. Valid values: • **open_white_list**: enables the whitelist. • **close**: disables the whitelist. **Note** After the whitelist is enabled, if no IP address is added to the whitelist, the Server Load Balancer (SLB) instance does not distribute network traffic.
ListenerPort	Integer	Yes	80	The frontend port that is used by the SLB instance. Valid values: **1 to 65535**.
LoadBalancerId	String	Yes	lb-bp1b6c719dfa08ex****	The ID of the SLB instance.
access_key_id	String	No	acc-hp34s2h0xx1ht4nwo****	The AccessKey ID.
Tags	String	No	{"tagKey":"Key1","tagValue":"Value1"}	The key and value of the tag.

Response parameters

Parameter	Type	Example	Description

Parameter	Type	Example	Description
RequestId	String	CEF72CEB-54B6-4AE8-B225-F876FF7BA984	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=SetListenerAccessControlStatus
&AccessControlStatus=open_white_list
&ListenerPort=80
&LoadBalancerId=lb-bp1b6c719dfa08ex****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<SetListenerAccessControlStatusResponse>
    <RequestId>CEF72CEB-54B6-4AE8-B225-F876FF7BA984</RequestId>
</SetListenerAccessControlStatusResponse>
```

`JSON` format

```
{"RequestId":" CEF72CEB-54B6-4AE8-B225-F876FF7BA984"}
```

14.1.2.5.5.2. DescribeListenerAccessControlAttribute

Queries the whitelist configurations of a listener.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeListenerAccessControlAttribute	The operation that you want to perform. Set the value to **DescribeListenerAccessControlAttribute**.
ListenerPort	Integer	Yes	80	The frontend port that is used by the Server Load Balancer (SLB) instance. Valid values: **1 to 65535**.

Parameter	Type	Required	Example	Description
LoadBalancerId	String	Yes	lb-8vb86hxixo8******6jaz	The ID of the SLB instance.
Tags	String	No	listeneraccesscontrolslb****	The tags.

Response parameters

Parameter	Type	Example	Description
AccessControlStatus	String	open_white_list	Indicates whether the whitelist is enabled. Valid values: • **open_white_list**: the whitelist is enabled. • **close**: the whitelist is disabled.
SourceItems	String	192.168.0.1	The IP addresses or CIDR blocks that are added to the whitelist.
RequestId	String	365F4154-92F6-4AE4-92F8-7FF34B540710	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeListenerAccessControlAttribute
&ListenerPort=80
&LoadBalancerId=lb-8vb86hxixo8*******6jaz
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeListenerAccessControlAttributeResponse>
   <RequestId>365F4154-92F6-4AE4-92F8-7FF34B540710</RequestId>
   <AccessControlStatus>open_white_list</AccessControlStatus>
   <SourceItems>192.168.0.1</SourceItems>
</DescribeListenerAccessControlAttributeResponse>
```

`JSON` format

```
{"AccessControlStatus":"open_white_list",
"RequestId":"365F4154-92F6-4AE4-92F8-7FF34B540710",
"SourceItems":"192.168.0.1"}
```

14.1.2.5.5.3. AddListenerWhiteListItem

Adds IP addresses to the whitelist of a listener.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	AddListenerWhiteListItem	The operation that you want to perform. Set the value to **AddListenerWhiteListItem**.
ListenerPort	Integer	Yes	80	The frontend port that is used by the Server Load Balancer (SLB) instance. Valid values: **1 to 65535**.
LoadBalancerId	String	Yes	139a00604ad-cn-east-hangzhou-01	The ID of the SLB instance.
SourceItems	String	Yes	1.XX.XX.1,1.XX.XX.0/21	The IP addresses or CIDR blocks that you want to add to the whitelist. This parameter takes effect only when **AccessControlStatus** of the listener is set to **open_white_list**. Separate multiple IP addresses or CIDR blocks with commas (,). You cannot enter 0.0.0.0 or 0.0.0.0/0. You can call the `SetListenerAccessControlStatus` operation to set the value of the **AccessControlStatus** parameter to **close**. This indicates that access control is disabled.

Response parameters

Parameter	Type	Example	Description
RequestId	String	CEF72CEB-54B6-4AE8-B225-F876FF7BA984	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=AddListenerWhiteListItem
&ListenerPort=80
&LoadBalancerId=139a00604ad-cn-east-hangzhou-01
&SourceItems=1.XX.XX.1,XX.XX.1.0/21
&<Common request parameters>
```

Sample success responses

`XML` format

```
<AddListenerWhiteListItemResponse>
      <RequestId>CEF72CEB-54B6-4AE8-B225-F876FF7BA984</RequestId>
</AddListenerWhiteListItemResponse>
```

`JSON` format

```
{
    "AddListenerWhiteListItemResponse": {
        "RequestId": "CEF72CEB-54B6-4AE8-B225-F876FF7BA984"
    }
}
```

14.1.2.5.5.4. RemoveListenerWhiteListItem

Removes IP addresses from the whitelist of a listener.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	RemoveListenerWhiteListItem	The operation that you want to perform. Set the value to **RemoveListenerWhiteListItem**.
ListenerPort	Integer	Yes	80	The listener port. Valid values: **1 to 65535**.
LoadBalancerId	String	Yes	lb-bp1b6c719dfa08ex****	The ID of the Server Load Balancer (SLB) instance.

Parameter	Type	Required	Example	Description
SourceItems	String	Yes	192.168.0.1/24	The IP addresses or CIDR blocks to be removed. Separate multiple IP addresses or CIDR blocks with commas (,). **Note** If all IP addresses are removed from the whitelist, the listener does not forward requests.

Response parameters

Parameter	Type	Example	Description
RequestId	String	CEF72CEB-54B6-4AE8-B225-F876FF7BA984	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=RemoveListenerWhiteListItem
&ListenerPort=80
&LoadBalancerId=lb-bp1b6c719dfa08ex****
&SourceItems=192.168.0.1
&<Common request parameters>
```

Sample success responses

`XML` format

```
<RemoveListenerWhiteListItemResponse>
    <RequestId>CEF72CEB-54B6-4AE8-B225-F876FF7BA984</RequestId>
</RemoveListenerWhiteListItemResponse>
```

`JSON` format

```
{"RequestId":" CEF72CEB-54B6-4AE8-B225-F876FF7BA984"}
```

14.1.2.5.6. DeleteLoadBalancerListener

Deletes a listener.

Note You can delete only listeners that are in the **stopped** or **running** state.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteLoadBalancerListener	The operation that you want to perform. Set the value to **DeleteLoadBalancerListener**.
ListenerPort	Integer	Yes	80	The frontend port that is used by the Server Load Balancer (SLB) instance. Valid values: **1 to 65535**.
LoadBalancerId	String	Yes	lb-bp13jaf5qli5xm****	The ID of the SLB instance.

Response parameters

Parameter	Type	Example	Description
RequestId	String	CEF72CEB-54B6-4AE8-B225-F876FF7BA984	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DeleteLoadBalancerListener
&ListenerPort=80
&LoadBalancerId=lb-bp13jaf5qli5xm****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteLoadBalancerListenerResponse>
     <RequestId>791D8B68-AE0F-4174-AF54-088C8B3C5D54</RequestId>
  </DeleteLoadBalancerListenerResponse>
```

`JSON` format

```
{
    "RequestId": "791D8B68-AE0F-4174-AF54-088C8B3C5D54"
}
```

14.1.2.5.7. StopLoadBalancerListener

Disables a listener.

When you call this operation, take note of the following items:

- If the operation is successful, the listener switches to the Stopped state.
- You cannot perform the operation when the Server Load Balancer (SLB) instance to which the listener belongs is in the Locked state.

> **Note** After a listener is disabled, it stops forwarding requests to the associated backend servers. This may cause service interruptions. Proceed with caution.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	StopLoadBalancerListener	The operation that you want to perform. Set the value to **StopLoadBalancerListener**.
ListenerPort	Integer	Yes	80	The frontend port that is used by the SLB instance. Valid values: **1** to **65535**.
LoadBalancerId	String	Yes	lb-bp13jaf5qli5xmgl****	The ID of the SLB instance.
Tags	String	No	null	The key and value of the tag.

Response parameters

Parameter	Type	Example	Description
RequestId	String	CEF72CEB-54B6-4AE8-B225-F876FF7BA984	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=StopLoadBalancerListener
&ListenerPort=80
&LoadBalancerId=lb-bp13jaf5qli5xmgl****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<StopLoadBalancerListenerResponse>
     <RequestId>21D2B318-650E-4B0B-A3B5-693D462247B3</RequestId>
  </StopLoadBalancerListenerResponse>
```

`JSON` format

```
{
    "RequestId": "21D2B318-650E-4B0B-A3B5-693D462247B3"
}
```

14.1.2.5.8. StartLoadBalancerListener

Enables a listener.

When you call this operation, take note of the following items:

- You can call the operation only when the listener is in the Stopped state.
- If the operation is successful, the state of the listener changes to Starting.
- You cannot call the operation when the Server Load Balancer (SLB) instance to which the listener belongs is in the Locked state.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	StartLoadBalancerListener	The operation that you want to perform. Set the value to **StartLoadBalancerListener**.
ListenerPort	Integer	Yes	80	The frontend port that is used by the SLB instance. Valid values: **1** to **65535**.
LoadBalancerId	String	Yes	lb-bp13jaf5qli5****	The ID of the SLB instance.
Tags	String	No	{"tagKey":"Key1", "tagValue":"Value1"}	The key and value of the tag.

Response parameters

Parameter	Type	Example	Description
RequestId	String	CEF72CEB-54B6-4AE8-B225-F876FF7BA984	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=StartLoadBalancerListener
&ListenerPort=80
&LoadBalancerId=lb-bp13jaf5qli5****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<StartLoadBalancerListenerResponse>
     <RequestId>CC000321-00F2-49B8-9BCA-60D822414960</RequestId>
  </StartLoadBalancerListenerResponse>
```

`JSON` format

```
{
    "RequestId": "CC000321-00F2-49B8-9BCA-60D822414960"
}
```

14.1.2.6. Server certificates

14.1.2.6.1. UploadServerCertificate

Uploads a server certificate.

You can upload only one server certificate and its private key in each request.

The request is successful only when the server certificate and its private key are both uploaded. If the server certificate or its private key is not uploaded, the request fails. After a server certificate and its private key are uploaded, the fingerprints of all server certificates that belong to your account are returned.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	UploadServerCertificate	The operation that you want to perform. Set the value to **UploadServerCertificate**.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the server certificate is created. You can call the `DescribeRegions` operation to query region IDs.
AliCloudCertificateId	String	No	730912673******_15d97e7709a_71445759hr_7892********	The ID of the server certificate that is provided by Apsara Stack SSL Certificates Service. This parameter is required if you use a server certificate that is provided by Apsara Stack SSL Certificates Service.
AliCloudCertificateName	String	No	testcertkey	The name of the server certificate that is provided by Apsara Stack SSL Certificates Service.
ServerCertificate	String	No	test	The public key certificate that you want to upload. **Note** This parameter is required if you use a server certificate that is provided by a third party.
PrivateKey	String	No	wmsa****	The private key that you want to upload. **Note** This parameter is required if you use a server certificate that provided by a third party.
ServerCertificateName	String	No	mycert01	The name of the server certificate that you want to upload. The name must be 1 to 80 characters in length and can contain digits, periods (.), underscores (_), and hyphens (-). It must start with a letter.
Tags	String	No	ServerCertificate*****	The tag that you want to add to the server certificate.

Parameter	Type	Required	Example	Description
StandardType	String	No	ServerCertificate	The type of the server certificate.

Response parameters

Parameter	Type	Example	Description
ServerCertificateId	String	xxxxidkp-123-cn-test****	The ID of the server certificate.
ServerCertificateName	String	mycert01	The name of the server certificate.
Fingerprint	String	01:DF:AB:**	The fingerprint of the server certificate.
AliCloudCertificateId	String	730912xxxxx_15d97e7709a_71445759hr_7****	The ID of the server certificate if the server certificate is provided by Apsara Stack SSL Certificates Service.
AliCloudCertificateName	String	testcert****	The name of the server certificate if the server certificate is provided by Apsara Stack SSL Certificates Service.
IsAliCloudCertificate	Integer	0	Indicates whether the server certificate is provided by Apsara Stack SSL Certificates Service. Valid values: • 0: The server certificate is provided by a third-party CA. • 1: The server certificate is provided by Apsara Stack SSL Certificates Service.
RegionId	String	cn-qingdao-env17-d01	The ID of the region where the server certificate is created.
RegionIdAlias	String	hangzhou	The name of the region where the server certificate is created.
RequestId	String	365F4154-92F6-4AE4-92F8-7FF34B540710	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=UploadServerCertificate
&RegionId=cn-east-hangzhou-01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<UploadServerCertificateResponse>
      <RegionIdAlias>cn-east-hangzhou-01</RegionIdAlias>
      <Fingerprint>01:DF:AB:**</Fingerprint>
      <AliCloudCertificateName>testcert***</AliCloudCertificateName>
      <RequestId>365F4154-92F6-4AE4-92F8-7FF34B540710</RequestId>
      <IsAliCloudCertificate>0</IsAliCloudCertificate>
      <ServerCertificateId>xxxxidkp-123-cn-test******</ServerCertificateId>
      <ServerCertificateName>mycert01</ServerCertificateName>
      <RegionId>cn-hangzhou</RegionId>
      <AliCloudCertificateId>730912xxxxx_15d97e7709a_71445759hr_7*******</AliCloudCertificateId>
</UploadServerCertificateResponse>
```

`JSON` format

```
{
    "UploadServerCertificateResponse": {
        "RegionIdAlias": "cn-east-hangzhou-01",
        "Fingerprint": "01:DF:AB:**",
        "AliCloudCertificateName": "testcert***",
        "RequestId": "365F4154-92F6-4AE4-92F8-7FF34B540710",
        "IsAliCloudCertificate": 0,
        "ServerCertificateId": "xxxxidkp-123-cn-test******",
        "ServerCertificateName": "mycert01",
        "RegionId": "cn-hangzhou",
        "AliCloudCertificateId": "730912xxxxx_15d97e7709a_71445759hr_7*******"
    }
}
```

14.1.2.6.2. DeleteServerCertificate

Deletes a server certificate.

> **Note** You cannot delete a server certificate that is in use.

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteServerCertificate	The operation that you want to perform. Set the value to **DeleteServerCertificate**.
ServerCertificateId	String	Yes	123157****_166f8204689_1714763408_7099****	The ID of the server certificate.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the Server Load Balancer (SLB) instance is deployed. You can call the `DescribeRegions` operation to query region IDs.

Response parameters

Parameter	Type	Example	Description
RequestId	String	CEF72CEB-54B6-4AE8-B225-F876FF7BA984	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DeleteServerCertificate
&ServerCertificateId=123157****_166f8204689_1714763408_7099****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteServerCertificateResponse>
      <RequestId>CEF72CEB-54B6-4AE8-B225-F876FF7BA984</RequestId>
</DeleteServerCertificateResponse>
```

`JSON` format

```
{
    "DeleteServerCertificateResponse": {
        "RequestId": "CEF72CEB-54B6-4AE8-B225-F876FF7BA984"
    }
}
```

14.1.2.6.3. DescribeServerCertificates

Queries server certificates in a specified region.

Note For security reasons, only fingerprints and names of the server certificates are returned. The content of the server certificates and private keys is not returned.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeServerCertificates	The operation that you want to perform. Set the value to **DescribeServerCertificates**.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the Server Load Balancer (SLB) instance is deployed. You can call the `DescribeRegions` operation to query region IDs.
ServerCertificateId	String	No	12315790xxxxxxx_166f8204689_1714763408_709*****	The ID of the server certificate.

Response parameters

Parameter	Type	Example	Description
ServerCertificates	Array of ServerCertificate		The list of server certificates.
ServerCertificate			
ServerCertificateId	String	123157xxxxxxxx_166f8204689_1714763408_709981430-cn-east-hangz******	The ID of the server certificate.
ServerCertificateName	String	slb	The name of the server certificate.
RegionId	String	cn-qingdao-env17-d01	The ID of the region where the server certificate is created.

Parameter	Type	Example	Description
Fingerprint	String	68:08:1a:f8:2c:97:69:a3:a1:e6:16:41:4b:ca:4f:5d:ee:a5:ef:0d	The fingerprint of the server certificate.
AliCloudCertificateId	String	7309xxxxxxxx_15d97e7709a_71445759hr_78928*****	The ID of the server certificate from Apsara Stack SSL Certificates Service.
AliCloudCertificateName	String	testcertkey	The name of the server certificate from Apsara Stack SSL Certificates Service.
IsAliCloudCertificate	Integer	0	Indicates whether the server certificate is from Apsara Stack SSL Certificates Service. Valid values: • **1**: yes • **0**: no
RegionIdAlias	String	cn-qingdao-env17-d01	The name of the region where the SLB instance is deployed.
StandardType	String	ServerCertificate	The type of the server certificate.
RequestId	String	365F4154-92F6-4AE4-92F8-7FF34B540710	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeServerCertificates
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeServerCertificatesResponse>

14.1.2.6.4. SetServerCertificateName

Sets the name of a server certificate.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	SetServerCertificateName	The operation that you want to perform. Set the value to **SetServerCertificateName**.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the Server Load Balancer (SLB) instance is deployed. You can call the `DescribeRegions` operation to query region IDs.
ServerCertificateId	String	Yes	139a****-cn-qingdao-env17-d01	The ID of the server certificate.
ServerCertificateName	String	Yes	slb-servercertificate-cn-east-hangzhou****	The name of the server certificate. The name must be 1 to 80 characters in length and can contain digits, periods (.), underscores (_), and hyphens (-). It must start with a letter.

Response parameters

Parameter	Type	Example	Description
RequestId	String	CEF72CEB-54B6-4AE8-B225-F876FE7BA984	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=SetServerCertificateName
&RegionId=cn-east-hangzhou-01
&ServerCertificateId=139a****-cn-east-hangzhou-01
&ServerCertificateName=slb-servercertificate-cn-east-hangzhou****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<SetServerCertificateNameResponse>
      <RequestId>CEF72CEB-54B6-4AE8-B225-F876FE7BA984</RequestId>
</SetServerCertificateNameResponse>
```

`JSON` format

```
{
    "SetServerCertificateNameResponse": {
        "RequestId": "CEF72CEB-54B6-4AE8-B225-F876FE7BA984"
    }
}
```

14.1.2.6.5. UploadCACertificate

Uploads a CA certificate.

You can upload only one CA certificate in each call. After a CA certificate is uploaded, the ID, name, and fingerprint of the certificate are returned.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	UploadCACertificate	The operation that you want to perform. Set the value to **UploadCACertificate**.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the Server Load Balancer (SLB) instance is deployed. You can call the `DescribeRegions` operation to query region IDs.
CACertificate	String	Yes	test	The content of the CA certificate that you want to upload.
CACertificateName	String	No	mycacert01	The name of the CA certificate.

Response parameters

Parameter	Type	Example	Description
CACertificateId	String	139a00604ad-cn-east-hangzh****	The ID of the CA certificate.
CACertificateName	String	mycacert01	The name of the CA certificate.
Fingerprint	String	02:DF:AB:ED	The fingerprint of the CA certificate.

Parameter	Type	Example	Description
RequestId	String	365F4154-92F6-4AE4-92F8-7FF34B540710	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=UploadCACertificate
&RegionId=cn-qingdao-env17-d01
&CACertificate=test
&<Common request parameters>
```

Sample success responses

`XML` format

```
<UploadCACertificateResponse>
      <Fingerprint>02:DF:AB:ED</Fingerprint>
      <RequestId>365F4154-92F6-4AE4-92F8-7FF34B540710</RequestId>
      <CACertificateId>139a00604ad-cn-east-hangzh*****</CACertificateId>
      <CACertificateName>mycacert01</CACertificateName>
</UploadCACertificateResponse>
```

`JSON` format

```
{
    "UploadCACertificateResponse": {
        "Fingerprint": "02:DF:AB:ED",
        "RequestId": "365F4154-92F6-4AE4-92F8-7FF34B540710",
        "CACertificateId": "139a00604ad-cn-east-hangzh*****",
        "CACertificateName": "mycacert01"
    }
}
```

14.1.2.6.6. DeleteCACertificate

Deletes a CA certificate.

> **Note** You cannot delete a CA certificate that is in use.

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteCACertificate	The operation that you want to perform. Set the value to **DeleteCACertificate**.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the Server Load Balancer (SLB) instance is created. You can call the `DescribeRegions` operation to query region IDs.
CACertificateId	String	Yes	123157908****_15c73d77203_-986300114_-2110544****	The ID of the CA certificate.

Response parameters

Parameter	Type	Example	Description
RequestId	String	CEF72CEB-54B6-4AE8-B225-F876FF7BA984	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DeleteCACertificate
&RegionId=cn-east-hangzhou-01
&CACertificateId=123157908****_15c73d77203_-986300114_-211054****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteCACertificateResponse>
      <RequestId>CEFxxxxx72CEB-54B6-4AE8-B225-F876FF7BA984</RequestId>
</DeleteCACertificateResponse>
```

`JSON` format

```
{
    "DeleteCACertificateResponse": {
        "RequestId": "CEFxxxxx72CEB-54B6-4AE8-B225-F876FF7BA984"
    }
}
```

14.1.2.6.7. DescribeCACertificates

Queries CA certificates.

Note For security reasons, only fingerprints and names of the CA certificates are returned, the content of the CA certificates is not returned.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeCACertificates	The operation that you want to perform. Set the value to **DescribeCACertificates**.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the CA certificate is created. You can call the `DescribeRegions` operation to query region IDs.
CACertificateId	String	No	139a006****-cn-qingdao-env17-d01	The ID of the CA certificate.

Response parameters

Parameter	Type	Example	Description
CACertificates	Array of CACertificate		Information about the CA certificate.
CACertificate			
CACertificateId	String	139a006****-cn-qingdao-env17-d01	The ID of the CA certificate.
CACertificateName	String	test	The name of the CA certificate.
RegionId	String	cn-qingdao-env17-d01	The ID of the region where the CA certificate is created.
Fingerprint	String	AC:BE:FD	The fingerprint of the CA certificate.

Parameter	Type	Example	Description
RequestId	String	365F4154-92F6-4AE4-92F8-7FF34B540710	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeCACertificates
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeCACertificateResponse>
      <RequestId>365F4154-92F6-4AE4-92F8-7FF34B540710</RequestId>
      <CACertificates>
            <CACertificateName>test</CACertificateName>
            <Fingerprint>AC:BE:FD</Fingerprint>
            <RegionId>cn-east-hangzhou-01</RegionId>
            <CACertificateId>139a006****-cn-east-hangzhou-02</CACertificateId>
      </CACertificates>
</DescribeCACertificateResponse>
```

`JSON` format

```
{
    "DescribeCACertificateResponse": {
        "RequestId": "365F4154-92F6-4AE4-92F8-7FF34B540710",
        "CACertificates": {
            "CACertificateName": "test",
            "Fingerprint": "AC:BE:FD",
            "RegionId": "cn-east-hangzhou-01",
            "CACertificateId": "139a006****-cn-east-hangzhou-02"
        }
    }
}
```

14.1.2.6.8. SetCACertificateName

Sets the name of a CA certificate.

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	SetCACertificateName	The operation that you want to perform. Set the value to **SetCACertificateName**.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the Server Load Balancer (SLB) instance is deployed. You can call the `DescribeRegions` operation to query region IDs.
CACertificateId	String	Yes	139a0****-cn-qingdao-env17-d01	The ID of the CA certificate.
CACertificateName	String	Yes	mycacert02	The name of the CA certificate. The name must be 1 to 80 characters in length, and can contain digits, periods (.), underscores (_), and hyphens (-). It must start with a letter.
access_key_id	String	No	acc-hp34s2h0xx1ht4nwo****	The AccessKey ID.

Response parameters

Parameter	Type	Example	Description
RequestId	String	CEF72CEB-54B6-4AE8-B225-F876FE7BA984	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=SetCACertificateName
&RegionId=cn-qingdao-env17-d01
&CACertificateId=139a0****-cn-qingdao-env17-d01
&CACertificateName=mycacert02
&<Common request parameters>
```

Sample success responses

`XML` format

```
<SetCACertificateNameResponse>
      <RequestId>CEF72CEB-54B6-4AE8-B225-F876FE7BA984</RequestId>
</SetCACertificateNameResponse>
```

`JSON` format

```
{
    "SetCACertificateNameResponse": {
        "RequestId": "CEF72CEB-54B6-4AE8-B225-F876FE7BA984"
    }
}
```

14.1.2.7. Backend servers

14.1.2.7.1. AddBackendServers

Adds backend servers.

Note If multiple identical Elastic Compute Service (ECS) instances are specified in a request, only the first ECS instance is added. The other ECS instances are ignored. If the backend server that you add is the same as one of the existing backend servers that are already associated with the listener, an error message is returned.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	AddBackendServers	The operation that you want to perform. Set the value to **AddBackendServers**.
LoadBalancerId	String	Yes	lb-2ze7o5h52g02kkzz****	The ID of the Server Load Balancer (SLB) instance.
				The list of backend servers that you want to add to the SLB instance. The following parameters are used to specify the backend servers: • **ServerId**: Required. Specify the ID of the backend server. This parameter must be of the STRING type. You can specify the ID of an ECS instance or an elastic network interface (ENI). If **ServerId** is set to the ID of an ENI, the **Type** parameter is required. • **Weight**: The weight of the backend

Parameter	Type	Required	Example	Description
BackendServers	String	Yes	[{ "ServerId": "eni-xxxxxxxxx", "Weight": "100", "Type": "eni", "ServerIp": "192.XX.XX.6", "Port":"80","Description":"test-112" },{ "ServerId": "eni-xxxxxxxxx", "Weight": "100", "Type": "eni", "ServerIp": "172.XX.XX.6", "Port":"80","Description":"test-113" }]	server. ○ Valid values: **0 to 100**. ○ Default value: **100**. **Note** If the weight is set to 0, no requests are forwarded to the backend server. • **Description**: Optional. This parameter must be of the STRING type. The description must be 1 to 80 characters in length, and can contain letters, digits, hyphens (-), forward slashes (/), periods (.),and underscores (_). It can also contain Chinese characters. • **Type**: Specify the type of backend server. Valid values: ○ **ecs** (default): an ECS instance. ○ **eni**: an ENI. • **ServerIp**: Specify the IP address of the ECS instance or ENI. Examples: • ECS: `[{ "ServerId": "i-xxxxxxxxx", "Weight": "100", "Type": "ecs", "Port":"80","Description":"test-112" }]` • ENI: `[{ "ServerId": "eni-xxxxxxxxx", "Weight": "100", "Type": "eni", "ServerIp": "192.168.**.**", "Port":"80","Description":"test-112" }]` • ENI with multiple IP addresses: `[{ "ServerId": "eni-xxxxxxxxx", "Weight": "100", "Type": "eni", "ServerIp": "192.168.**.**", "Port":"80","Description":"test-112" },{ "ServerId": "eni-xxxxxxxxx", "Weight": "100", "Type": "eni", "ServerIp": "172.166.**.**", "Port":"80","Description":"test-113" }]`

Parameter	Type	Required	Example	Description
				Only backend servers that are in the Running state can be added to an SLB instance. You can add at most 20 backend servers in each call. • You can specify ENIs as backend servers only for high-performance SLB instances.

Response parameters

Parameter	Type	Example	Description
LoadBalancerId	String	lb-2ze7o5h52g02kkzz****	The ID of the SLB instance.
BackendServers	Array of BackendServer		The list of backend servers.
BackendServer			
ServerId	String	i-2zej4lxhjoq1icu****	The ID of the ECS instance or ENI.
Weight	String	100	The weight of the backend server. Valid values: **0 to 100**. Default value: **100**. If the value is set to **0**, the SLB instance does not forward requests to the backend server.
Description	String	BackendServer	The description of the backend server.
RequestId	String	34B82C81-F13B-4EEB-99F6-A048C67CC830	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=AddBackendServers
&LoadBalancerId=lb-2ze7o5h52g02kkzz****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<AddBackendServersResponse>
    <BackendServers>
        <BackendServer>
            <ServerId>i-2zej4lxhjoq1icu*****</ServerId>
            <Weight>100</Weight>
            <Type>ecs</Type>
        </BackendServer>
        <BackendServer>
            <ServerId>i-2ze1u9ywulp5pbv*****</ServerId>
            <Weight>100</Weight>
            <Type>ecs</Type>
        </BackendServer>
    </BackendServers>
    <RequestId>34B82C81-F13B-4EEB-99F6-A048C67CC830</RequestId>
    <LoadBalancerId>lb-2ze7o5h52g02kkzz*****</LoadBalancerId>
</AddBackendServersResponse>
```

`JSON` format

```
{
    "AddBackendServersResponse": {
        "BackendServers": {
            "BackendServer": [
                {
                    "ServerId": "i-2zej4lxhjoq1icu*****",
                    "Weight": 100,
                    "Type": "ecs"
                },
                {
                    "ServerId": "i-2ze1u9ywulp5pbv*****",
                    "Weight": 100,
                    "Type": "ecs"
                }
            ]
        },
        "RequestId": "34B82C81-F13B-4EEB-99F6-A048C67CC830",
        "LoadBalancerId": "lb-2ze7o5h52g02kkzz*****"
    }
}
```

14.1.2.7.2. RemoveBackendServers

Removes backend servers.

Note If the backend server that you want to remove does not belong to the specified Server Load Balancer (SLB) instance, the request fails. However, the system does not report an error.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	RemoveBackendServers	The operation that you want to perform. Set the value to **RemoveBackendServers**.

BackendServers	String	Yes	[{"ServerId":"i-2zej4lxhjoq****", "Type": "ecs","Weight":"100"}]	The backend servers to be removed. Valid values:
				• **ServerId**: Required. Specify the ID of the backend server. This parameter must be of the STRING type.
				• **Weight**: Required. Specify the weight of the backend server. This parameter must be of the INTEGER type. Valid values: **0 to 100**.
				• **Type**: Specify the type of the backend server. Valid values:
				  ○ **ecs**: an Elastic Compute Service (ECS) instance. This is the default value.
				  ○ **eni**: an elastic network interface (ENI).
				Note You can remove up to 20 backend servers in each call.
				Examples:
				• ECS: `[{"ServerId":"i- 2zej 4lx hjoq ***", "Type": "ecs","Weight":"100"}]`
				• ENI: `[{"ServerId":"eni- 2ze 1s dp 5***","Type": "eni","Weight":"100"}]`

LoadBalancerId	String	Yes	lb-bp1qjwo61pqz3ahl****	The ID of the SLB instance.

Response parameters

Parameter	Type	Example	Description
LoadBalancerId	String	lb-bp1vjkb671z53****	The ID of the SLB instance.
BackendServers	Array of BackendServer		The list of backend servers.

Parameter	Type	Example	Description
BackendServer			
ServerId	String	i-jjgjgjgggd****	The ID of the backend server.
Weight	Integer	100	The weight of the backend server. Valid values: **0 to 100**.
RequestId	String	365F4154-92F6-4AE4-92F8-7FF34B540710	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=RemoveBackendServers
&BackendServers=[{"ServerId":"i-2zej4lxhjoq****", "Type": "ecs","Weight":"100"}]
&LoadBalancerId=lb-bp1qjwo61pqz3ahl****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<RemoveBackendServersResponse>
  <RequestId>365F4154-92F6-4AE4-92F8-7FF34B540710</RequestId>
  <LoadBalancerId>lb-bp1vjkb671z53cy******</LoadBalancerId>
  <BackendServers>
        <BackendServer>
              <ServerId>i-jjgjgjg*****</ServerId>
              <Weight>100</Weight>
        </BackendServer>
        <BackendServer>
              <ServerId>i-jjgjgituitu****</ServerId>
              <Weight>100</Weight>
        </BackendServer>
  </BackendServers>
</RemoveBackendServersResponse>
```

    }
}
```

14.1.2.7.3. SetBackendServers

Sets the weights of backend servers.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	SetBackendServers	The operation that you want to perform. Set the value to **SetBackendServers**.
LoadBalancerId	String	Yes	lb-bp1qjwo61pqz3a****	The ID of the Server Load Balancer (SLB) instance.
				The list of backend servers that you want to add to the SLB instance. The value of this parameter must be a STRING list in the JSON format. You can specify at most 20 elements for this parameter in each request. • **ServerId**: Required. Specify the ID of the backend server. This parameter must be of the STRING type. • **Port**: Required. Specify the port that is used by the backend server. This parameter must be of the INTEGER type. Valid values: **1** to **65535**.

Parameter	Type	Required	Example	Description

BackendServers	String	Yes	[{ "ServerId": "i-xxxxxxxxx", "Weight": "100", "Type": "ecs", "Port":"80","Description":"test-112" }]	• **Weight**: Required. Specify the weight of the backend server. This parameter must be of the INTEGER type. Valid values: **0** to **100**.
				• **Description**: Optional. The description of the backend server. This parameter must be of the STRING type. The description must be 1 to 80 characters in length and can contain letters, digits, hyphens (-), forward slashes (/), periods (.),and underscores (_). It can also contain Chinese characters.
				• **Type**: Specify the type of backend server. This parameter must be of the STRING type. Valid values:
				  ○ **ecs** (default): an Elastic Compute Service (ECS) instance
				  ○ **eni**: an elastic network interface (ENI)
				• **ServerIp**: Specify the IP address of the ECS instance or ENI.
				Examples:
				• ECS: `[{ "ServerId": "i-xxxxxxxxx", "Weight": "100", "Type": "ecs", "Port":"80","Description":"test-112" }]`
				• ENI: `[{ "ServerId": "eni-xxxxxxxxx", "Weight": "100", "Type": "eni", "ServerIp": "192.168.**.**", "Port":"80","Description":"test-112" }]`
				• ENI with multiple IP addresses: `[{ "ServerId": "eni-xxxxxxxxx", "Weight": "100", "Type": "eni", "ServerIp": "192.168.**.**", "Port":"80","Description":"test-112" },{ "ServerId": "eni-xxxxxxxxx", "Weight": "100", "Type": "eni", "ServerIp": "172.166.**.**", "Port":"80","Description":"test-113" }]`

Parameter	Type	Required	Example	Description

> **Note** The backend servers that you add to an SLB instance must be in the Running state. You can add at most 20 backend servers to an SLB instance in each call. In addition, you can specify ENIs as backend servers only for high-performance SLB instances.

Response parameters

Parameter	Type	Example	Description
LoadBalancerId	String	lb-bp1qjwo61pqz3a****	The ID of the SLB instance.
BackendServers	Array of BackendServer		The list of backend servers.
BackendServer			
ServerId	String	eni-hg231****	The ID of the ECS instance.
Weight	String	100	The weight of the backend server.
Description	String	BackendServer	The description of the backend server.
Type	String	ecs	The type of backend server. Valid values: • **ecs** (default): an ECS instance • **eni**: an ENI
RequestId	String	365F4154-92F6-4AE4-92F8-7FF34B540710	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=SetBackendServers
&LoadBalancerId=lb-bp1qjwo61pqz3a****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<SetBackendServersResponse>
      <RequestId>365F4154-92F6-4AE4-92F8-7FF34B540710</RequestId>
      <LoadBalancerId>lb-dhf13*******</LoadBalancerId>
      <BackendServers>
            <BackendServer>
                  <ServerId>eni-hg231**</ServerId>
                  <Weight>100</Weight>
                              <Type>eni</Type>
            </BackendServer>
            <BackendServer>
                  <ServerId>eni-hfhf***</ServerId>
                  <Weight>100</Weight>
                              <Type>eni</Type>
            </BackendServer>
      </BackendServers>
</SetBackendServersResponse>
```

`JSON` format

```
{
    "SetBackendServersResponse": {
        "RequestId": "365F4154-92F6-4AE4-92F8-7FF34B540710",
        "LoadBalancerId": "lb-dhf13*******",
        "BackendServers": {
            "BackendServer": [
                {
                    "ServerId": "eni-hg231**",
                    "Weight": 100,
                    "Type": "eni"
                },
                {
                    "ServerId": "eni-hfhf***",
                    "Weight": 100,
                    "Type": "eni"
                }
            ]
        }
    }
}
```

14.1.2.8. vServer groups

14.1.2.8.1. CreateVServerGroup

Creates a vServer group and adds backend servers to the vServer group.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateVServerGroup	The operation that you want to perform. Set the value to **CreateVServerGroup**.
LoadBalancerId	String	Yes	lb-bp1qjwo61pqz3ahl****	The ID of the Server Load Balancer (SLB) instance.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the SLB instance is deployed.
VServerGroupName	String	No	Group1	The name of the vServer group. The name must be 1 to 80 characters in length and can contain letters, digits, hyphens (-), forward slashes (/), periods (.),and underscores (_).
			[{ "ServerId": "eni-xxxxxxxxx", "Weight": "100", "Type": "eni", "ServerIp": "192.XX.XX.6", "Port":"80","Description":"test-	The list of backend servers to be added. The value of this parameter must be a STRING list in the JSON format. You can specify at most 20 elements in a list for each request. • **ServerId**: Required. Specify the ID of an Elastic Compute Service (ECS) instance or an elastic network interface (ENI). This parameter must be of the STRING type. • **Port**: Required. Specify the port that is used by the backend server. This parameter must be of the INTEGER type. Valid values: **1** to **65535**. • **Weight**: Required. Specify the weight of the backend server. This parameter must be of the INTEGER type. Valid values: **0** to **100**. • **Description**: Optional. The description of the backend server. This parameter must be of the STRING type. The description must be 1 to 80 characters in length and can contain letters, digits, hyphens (-), forward slashes (/), periods (.),and underscores (_). It can also contain Chinese characters.

Parameter	Type	Required	Example	Description

BackendServers	String	No	112" } { "ServerId": "eni-xxxxxxxxx", "Weight": "100", "Type": "eni", "ServerIp": "192.XX.XX.6", "Port":"80","Description":"test-112" }]	• **Type**: Required. Specify the type of the backend server. This parameter must be of the STRING type. Valid values:
				  ○ **ecs** (default): an ECS instance
				  ○ **eni**: an ENI.
				• **ServerIp**: The IP address of the ECS instance or ENI.
				Examples:
				• ECS: `[{ "ServerId": "i-xxxxxxxxx", "Weight": "100", "Type": "ecs", "Port":"80","Description":"test-112" }]`
				• ENI: `[{ "ServerId": "eni-xxxxxxxxx", "Weight": "100", "Type": "eni", "ServerIp": "192.168.**.**", "Port":"80","Description":"test-112" }]`
				• ENI with multiple IP addresses: `[{ "ServerId": "eni-xxxxxxxxx", "Weight": "100", "Type": "eni", "ServerIp": "192.168.**.**", "Port":"80","Description":"test-112" },{ "ServerId": "eni-xxxxxxxxx", "Weight": "100", "Type": "eni", "ServerIp": "172.166.**.**", "Port":"80","Description":"test-113" }]`

Response parameters

Parameter	Type	Example	Description
VServerGroupId	String	rsp-cige6****	The ID of the vServer group.
BackendServers	Array of BackendServer		The list of backend servers.
BackendServer			
ServerId	String	vm-2****	The ID of the ECS instance or ENI.
Port	Integer	70	The port that is used by the backend server.
Weight	Integer	100	The weight of the backend server.

Parameter	Type	Example	Description
Description	String	vServerGroup	The description of the vServer group.
ServerType	String	ECS	
Type	String	Type	The type of backend server. Valid values: • **ecs** (default): an ECS instance • **eni**: an ENI
RequestId	String	9DEC9C28-AB05-4DDF-9A78-6B08EC9CE18C	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=CreateVServerGroup
&LoadBalancerId=lb-bp1qjwo61pqz3ahl****
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreateVServerGroupResponse>
  <VServerGroupId>rsp-bp1i4c******</VServerGroupId>
  <RequestId>3EBBDBAE-8E8B-438F-A109-95C2FDB2C333</RequestId>
  <BackendServers>
        <BackendServer>
              <Type>ecs</Type>
              <ServerId>i-bp1ds2yjlk66********</ServerId>
              <Description>test-11244</Description>
              <Port>80</Port>
              <Weight>100</Weight>
        </BackendServer>
  </BackendServers>
</CreateVServerGroupResponse>
```

`JSON` format

```
{
  "VServerGroupId": "rsp-bp1i4c3******",
  "RequestId": "3EBBDBAE-8E8B-438F-A109-95C2FDB2C333",
  "BackendServers": {
    "BackendServer": [
      {
        "Type": "ecs",
        "ServerId": "i-bp1ds2yjlk666******",
        "Description": "test-11244",
        "Port": 80,
        "Weight": 100
      }
    ]
  }
}
```

14.1.2.8.2. SetVServerGroupAttribute

Modifies the configurations of a vServer group.

You can call the operation to modify only configurations such as the weight and port of a backend server.

- If you want to modify backend servers in a specified vServer group, call the `ModifyVServerGroupBackendServers` operation.
- If you want to add backend servers, call the `AddVServerGroupBackendServers` operation.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	SetVServerGroupAttribute	The operation that you want to perform. Set the value to **SetVServerGroupAttribute**.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the Server Load Balancer (SLB) instance is deployed.
VServerGroupId	String	Yes	rsp-cige6****	The ID of the vServer group.
VServerGroupName	String	No	vserver-group-test	The name of the vServer group.
				The backend servers in the vServer group.

Parameter	Type	Required	Example	Description

BackendServers	String	No	[{ "ServerId": "eni-xxxxxxxxx", "Weight": "100", "Type": "eni", "ServerIp": "192.XX.XX.6", "Port":"80","Description":"test-112" },{ "ServerId": "eni-xxxxxxxxx", "Weight": "100", "Type": "eni", "ServerIp": "172.XX.XX.6", "Port":"80","Description":"test-113" }]	You can add up to 20 backend servers in each call.
				• **ServerId**: Required. Specify the ID of the backend server. This parameter must be of the STRING type.
				• **Port**: Required. Specify the port that is used by the backend server. This parameter must be of the INTEGER type. Valid values: **1** to **65535**.
				• **Weight**: Required. Specify the weight of the backend server. This parameter must be of the INTEGER type. Valid values: **0** to **100**.
				• **Description**: Optional. The description of the backend server. This parameter must be of the STRING type. The description must be 1 to 80 characters in length, and can contain letters, digits, hyphens (-), forward slashes (/), periods (.),and underscores (_). It can also contain Chinese characters.
				• **Type**: The type of the backend server. This parameter must be of the STRING type. Valid values:
				  ○ **ecs** (default): an Elastic Compute Service (ECS) instance
				  ○ **eni**: an elastic network interface (ENI)
				• **ServerIp**: The IP address of the ECS instance or ENI.
				Examples:
				• ECS: `[{ "ServerId": "i-xxxxxxxxx", "Weight": "100", "Type": "ecs", "Port":"80","Description":"test-112" }]`
				• ENI: `[{ "ServerId": "eni-xxxxxxxxx", "Weight": "100", "Type": "eni", "ServerIp": "192.168.**.**", "Port":"80","Description":"test-112" }]`
				• ENI with multiple IP addresses: `[{ "ServerId": "eni-xxxxxxxxx", "Weight": "100", "Type": "eni", "ServerIp": "192.168.**.**", "Port":"80","Description":"test-112" },{ "ServerId": "eni-xxxxxxxxx", "Weight": "100", "Type": "eni", "ServerIp": "172.16`

Parameter	Type	Required	Example	Description
				6.**.**", "Port":"80","Description":"test-113" }]

Response parameters

Parameter	Type	Example	Description
VServerGroupId	String	rsp-cige6****	The ID of the vServer group.
VServerGroupName	String	Group1	The name of the vServer group.
BackendServers	Array of BackendServer		The list of backend servers.
BackendServer			
ServerId	String	i-bp1ek6yd7jvkx****	The ID of the ECS instance or ENI.
Port	Integer	70	The port that is used by the backend server.
Weight	Integer	100	The weight of the backend server.
Description	String	vServerGroupDescription.	The description of the vServer group.
Type	String	ecs	The type of backend server. Valid values: • **ecs** (default): an ECS instance • **eni**: an ENI
RequestId	String	9DEC9C28-AB05-4DDF-9A78-6B08EC9CE18C	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=SetVServerGroupAttribute
&RegionId=cn-qingdao-env17-d01
&VServerGroupId=rsp-cige6****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<SetVServerGroupAttributeResponse>
  <BackendServers>
        <BackendServer>
              <ServerId>i-bp1ek6yd7jvkx*****</ServerId>
              <Port>80</Port>
              <Weight>100</Weight>
              <Type>ecs</Type>
        </BackendServer>
  </BackendServers>
  <RequestId>A4FDF333-F904-4540-88FC-ED6F87AEFFCB</RequestId>
  <VServerGroupId>rsp-bp1d2e3*****</VServerGroupId>
  <VServerGroupName>test1</VServerGroupName>
</SetVServerGroupAttributeResponse>
```

`JSON` format

```
{
    "SetVServerGroupAttributeResponse": {
        "BackendServers": {
            "BackendServer": {
                "ServerId": "i-bp1ek6yd7jvkx*****",
                "Port": 80,
                "Weight": 100,
                "Type": "ecs"
            }
        },
        "RequestId": "A4FDF333-F904-4540-88FC-ED6F87AEFFCB",
        "VServerGroupId": "rsp-bp1d2e3*****",
        "VServerGroupName": "test1"
    }
}
```

14.1.2.8.3. AddVServerGroupBackendServers

Adds backend servers to a specified vServer group.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	AddVServerGroupBackendServers	The operation that you want to perform. Set the value to **AddVServerGroupBackendServers**.
				The list of backend servers that you want to add to the vServer group. You can specify up to 20 backend servers in each request.

Parameter	Type	Required	Example	Description

BackendServers	String	Yes	[{ "ServerId": "eni-xxxxxxxxx", "Weight": "100", "Type": "eni", "ServerIp": "192.XX.XX.6*", "Port":"80","Description":"test-112" },{ "ServerId": "eni-xxxxxxxxx", "Weight": "100", "Type": "eni", "ServerIp": "172.XX.XX.6", "Port":"80","Description":"test-113" }]	The following parameters are used to specify the backend servers:
				• **ServerId**: The ID of the backend server. You can specify the ID of an Elastic Compute Service (ECS) instance or an elastic network interface (ENI).
				• **Port**: Required. The port that is used by the backend server. Valid values: **1 to 65535**.
				• **Weight**: The weight of the backend server. Valid values: **0 to 100**. Default value: 100. If the value is set to 0, no requests are forwarded to the backend server.
				• **Type**: The type of backend server. Valid values:
				  ○ **ecs**: an ECS instance. This is the default value.
				  ○ **eni**: an ENI.
				• **Description**: Optional. The description of the backend server. This parameter must be of the STRING type. The description must be 1 to 80 characters in length, and can contain letters, digits, hyphens (-), forward slashes (/), periods (.),and underscores (_). It can also contain Chinese characters.
				• **ServerIp**: The IP address of the ECS instance or ENI.
				Examples:
				• ECS: `[{ "ServerId": "i-xxxxxxxxx", "Weight": "100", "Type": "ecs", "Port":"80","Description":"test-112" }]`
				• ENI: `[{ "ServerId": "eni-xxxxxxxxx", "Weight": "100", "Type": "eni", "ServerIp": "192.168.**.**", "Port":"80","Description":"test-112" }]`
				• ENI with multiple IP addresses: `[{ "ServerId": "eni-xxxxxxxxx", "Weight": "100", "Type": "eni", "ServerIp": "192.168.**.**", "Port":"80","Description":"test-112" },{ "ServerId": "eni-xxxxxxxxx", "Weight": "100", "Type": "eni", "ServerIp": "172.166.**.**", "Port":"80","Descrip`

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the Server Load Balancer (SLB) instance is deployed.
VServerGroupId	String	Yes	rsp-cige6****	The ID of the vServer group.

Response parameters

Parameter	Type	Example	Description
VServerGroupId	String	rsp-cige6j****	The ID of the vServer group.
BackendServers	Array of BackendServer		The list of backend servers.
BackendServer			
ServerId	String	vm-231	The ID of the ECS instance or ENI.
Port	Integer	70	The port that is used by the backend server.
Weight	Integer	100	The weight of the backend server.
Description	String	test	The description of the vServer group.
Type	String	ecs	The type of backend server. Valid values: • **ecs** (default): an ECS instance • **eni**: an ENI
RequestId	String	9DEC9C28-AB05-4DDF-9A78-6B08EC9CE18C	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=AddVServerGroupBackendServers
&BackendServers=[{ "ServerId": "eni-xxxxxxxxx", "Weight": "100", "Type": "eni", "ServerIp":
"192.XX.XX.6", "Port":"80","Description":"test-112" },{ "ServerId": "eni-xxxxxxxxx", "Weigh
t": "100", "Type": "eni", "ServerIp": "172.XX.XX.6", "Port":"80","Description":"test-113" }
]
&RegionId=cn-qingdao-env17-d01
&VServerGroupId=rsp-cige6****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<AddVServerGroupBackendServersResponse>
  <VServerGroupId>rsp-cige6j******</VServerGroupId>
  <RequestId>9DEC9C28-AB05-4DDF-9A78-6B08EC9CE18C</RequestId>
  <BackendServers>
        <Type>ecs</Type>
        <Description>test</Description>
        <ServerId>vm-231</ServerId>
        <Weight>100</Weight>
        <Port>70</Port>
  </BackendServers>
</AddVServerGroupBackendServersResponse>
```

`JSON` format

```
{"VServerGroupId":"rsp-cige6j******",
"RequestId":"9DEC9C28-AB05-4DDF-9A78-6B08EC9CE18C",
"BackendServers":[
    {"Type":"ecs","Description":"test","ServerId":"vm-231","Weight":"100","Port":"70"}
    ]
    }
```

14.1.2.8.4. RemoveVServerGroupBackendServers

Removes a backend server from a specified vServer group.

Note If one or more backend servers specified by **BackendServers** do not exist in the vServer group, the backend servers are ignored and no error message is returned.

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	RemoveVServerGroupBackendServers	The operation that you want to perform. Set the value to **RemoveVServerGroupBackendServers**.

BackendServers	String	Yes	[{ "ServerId": "eni-xxxxxxxxx", "Weight": "100", "Type": "eni", "ServerIp": "192.XX.XX.6", "Port":"80","Description":"test-112" },{ "ServerId": "eni-xxxxxxxxx", "Weight": "100", "Type": "eni", "ServerIp": "172.XX.XX.6", "Port":"80","Description":"test-113" }]	The list of backend servers that you want to remove from the vServer group.
				You can specify at most 20 backend servers for a vServer group in each call.
				The value of this parameter must be a STRING list in the JSON format. You can specify at most 20 elements for this parameter in each request.
				• **ServerId**: Required. Specify the ID of an Elastic Compute Service (ECS) instance or an elastic network interface (ENI). This parameter must be of the STRING type.
				• **Port**: Required. Specify the port that is used by the backend server. This parameter must be of the INTEGER type. Valid values: **1 to 65535**.
				• **Weight**: Required. Specify the weight of the backend server. This parameter must be of the INTEGER type. Valid values: **0 to 100**.
				• **Description**: Optional. The description of the backend server. This parameter must be of the STRING type. The description must be 1 to 80 characters in length and can contain letters, digits, hyphens (-), forward slashes (/), periods (.),and underscores (_). It can also contain Chinese characters.
				• **Type**: Specify the type of backend server. This parameter must be of the STRING type. Valid values:
				  ○ **ecs**: an ECS instance. This is the default value.
				  ○ **eni**: an ENI.
				• **ServerIp**: Specify the IP address of the ECS instance or ENI.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the Server Load Balancer (SLB) instance is deployed.
VServerGroupId	String	Yes	rsp-cige6****	The ID of the vServer group.

Response parameters

Parameter	Type	Example	Description
VServerGroupId	String	rsp-cige6j****	The ID of the vServer group.
BackendServers	Array of BackendServer		The list of backend servers.
BackendServer			
ServerId	String	vm-230	The ID of the ECS instance or ENI.
Port	Integer	80	The port that is used by the backend server.
Weight	Integer	100	The weight of the backend server.
RequestId	String	9DEC9C28-AB05-4DDF-9A78-6B08EC9CE18C	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=RemoveVServerGroupBackendServers
&BackendServers=[{ "ServerId": "eni-xxxxxxxxx", "Weight": "100", "Type": "eni", "ServerIp":
"192.XX.XX.6", "Port":"80","Description":"test-112" },{ "ServerId": "eni-xxxxxxxxx", "Weigh
t": "100", "Type": "eni", "ServerIp": "172.XX.XX.6", "Port":"80","Description":"test-113" }
]
&RegionId=cn-qingdao-env17-d01
&VServerGroupId=rsp-cige6****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<RemoveVServerGroupBackendServersResponse>
   <RequestId>9DEC9C28-AB05-4DDF-9A78-6B08EC9CE18C</RequestId>
   <VServerGroupId>rsp-cige6******</VServerGroupId>
   <BackendServers>
      <BackendServer>
         <ServerId>vm-231</ServerId>
         <Port>70</Port>
         <Weight>100</Weight>
                              <Type>ecs</Type>
      </BackendServer>
   </BackendServers>
</RemoveVServerGroupBackendServersResponse>
```

`JSON` format

```
{
  "RemoveVServerGroupBackendServersResponse": {
    "RequestId": "9DEC9C28-AB05-4DDF-9A78-6B08EC9CE18C",
    "VServerGroupId": "rsp-cige6******",
    "BackendServers": {
      "BackendServer": {
        "ServerId": "vm-231",
        "Port": "70",
        "Weight": "100",
        "Type": "ecs"
      }
    }
  }
}
```

14.1.2.8.5. ModifyVServerGroupBackendServers

Replaces backend servers in a specified vServer group.

You can call this operation to replace the backend servers in a specified vServer group. To modify the configurations of the backend servers, such as their weights, you can call the `SetVServerGroupAttribute` operation.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyVServerGroupBackendServers	The operation that you want to perform. Set the value to **ModifyVServerGroupBackendServers**.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the Server Load Balancer (SLB) instance is deployed.
VServerGroupId	String	Yes	rsp-cige6j****	The ID of the vServer group.

OldBackendServers	String	No	[{ "ServerId": "i-xxxxxxxxx", "Weight": "100", "Type": "ecs", "Port":"80","Description":"test-112" }]	The list of backend servers to be replaced.
				The value of this parameter must be a STRING list in the JSON format. You can specify at most 20 elements for this parameter in each request.
				• **ServerId**: Required. Specify the ID of the backend server. This parameter must be of the STRING type.
				• **Port**: Required. Specify the port that is used by the backend server. This parameter must be of the INTEGER type. Valid values: **1 to 65535**.
				• **Weight**: Required. Specify the weight of the backend server. This parameter must be of the INTEGER type. Valid values: **0 to 100**.
				• **Description**: Optional. Specify the description of the backend server. This parameter must be of the STRING type. The description must be 1 to 80 characters in length, and can contain letters, digits, hyphens (-), forward slashes (/), periods (.),and underscores (_). It can also contain Chinese characters.
				• **Type**: Specify the type of backend server. This parameter must be of the STRING type. Valid values:
				  ○ **ecs** (default): an Elastic Compute Service (ECS) instance
				  ○ **eni**: an ENI
				• **ServerIp**: Specify the IP address of the ECS instance or ENI
				Examples:
				• ECS: `[{ "ServerId": "i-xxxxxxxxx", "Weight": "100", "Type": "ecs", "Port":"80","Description":"test-112" }]`

Parameter	Type	Required	Example	Description
				• ENI: `[{ "ServerId": "eni-xxxxxxxxx", "Weight": "100", "Type": "eni", "ServerIp": "192.168.**.**", "Port":"80","Description":"test-112" }]` • ENI with multiple IP addresses: `[{ "ServerId": "eni-xxxxxxxxx", "Weight": "100", "Type": "eni", "ServerIp": "192.168.**.**", "Port":"80","Description":"test-112" },{ "ServerId": "eni-xxxxxxxxx", "Weight": "100", "Type": "eni", "ServerIp": "172.16.6.**.**", "Port":"80","Description":"test-113" }]`
NewBackendServers	String	No	[{ "ServerId": "eni-xxxxxxxxx", "Weight": "100", "Type": "eni", "ServerIp": "192.XX.XX.6", "Port":"80","Description":"test-112" },{ "ServerId": "eni-xxxxxxxxx", "Weight": "100", "Type": "eni", "ServerIp": "172.XX.XX.6", "Port":"80" "Desc	The list of backend servers to be added. You can specify at most 20 backend servers for a vServer group in each call. The value of this parameter must be a STRING list in the JSON format. You can specify at most 20 elements for this parameter in each request. • **ServerId**: Required. Specify the ID of the backend server. This parameter must be of the STRING type. • **Port**: Required. Specify the port that is used by the backend server. This parameter must be of the INTEGER type. Valid values: **1 to 65535**. • **Weight**: Required. Specify the weight of the backend server. This parameter must be of the INTEGER type. Valid values: **0 to 100**. • **Description**: Optional. The description of the backend server. This parameter must be of the STRING type. It can contain letters, digits, hyphens (-), forward slashes (/), periods (.),and underscores (_). It can also contain Chinese characters. • **Type**: The type of the backend server. This parameter must be of the STRING type. Valid values: ○ **ecs** (default): an ECS instance ○ **eni**: an ENI • **ServerIp**: the IP address of the ECS

Parameter	Type	Required	Example	Description
			"Description":"test-113" }]	instance or ENI Examples: • ECS: `[{ "ServerId": "i-xxxxxxxxx", "Weight": "100", "Type": "ecs", "Port":"80","Description":"test-112" }]` • ENI: `[{ "ServerId": "eni-xxxxxxxxx", "Weight": "100", "Type": "eni", "ServerIp": "192.168.**.**", "Port":"80","Description":"test-112" }]` • ENI with multiple IP addresses: `[{ "ServerId": "eni-xxxxxxxxx", "Weight": "100", "Type": "eni", "ServerIp": "192.168.**.**", "Port":"80","Description":"test-112" },{ "ServerId": "eni-xxxxxxxxx", "Weight": "100", "Type": "eni", "ServerIp": "172.166.**.**", "Port":"80","Description":"test-113" }]`

Response parameters

Parameter	Type	Example	Description
VServerGroupId	String	rsp-cige6j****	The ID of the vServer group.
BackendServers	Array of BackendServer		The list of backend servers.
BackendServer			
ServerId	String	vm-236	The ID of the ECS instance or ENI.
Port	Integer	70	The port that is used by the backend server.
Weight	Integer	100	The weight of the backend server.
RequestId	String	9DEC9C28-AB05-4DDF-9A78-6B08EC9CE18C	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ModifyVServerGroupBackendServers
&RegionId=cn-qingdao-env17-d01
&VServerGroupId=rsp-cige6j****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyVServerGroupBackendServersResponse>
      <VServerGroupId>rsp-cige6j******</VServerGroupId>
      <RequestId>9DEC9C28-AB05-4DDF-9A78-6B08EC9CE18C</RequestId>
      <BackendServers>
            <ServerId>vm-236</ServerId>
            <Weight>100</Weight>
            <Port>70</Port>
      </BackendServers>
</ModifyVServerGroupBackendServersResponse>
```

`JSON` format

```
{
    "ModifyVServerGroupBackendServersResponse": {
        "VServerGroupId": "rsp-cige6j******",
        "RequestId": "9DEC9C28-AB05-4DDF-9A78-6B08EC9CE18C",
        "BackendServers": {
            "ServerId": "vm-236",
            "Weight": 100,
            "Port": 70
        }
    }
}
```

14.1.2.8.6. DeleteVServerGroup

Deletes a vServer group.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteVServerGroup	The operation that you want to perform. Set the value to **DeleteVServerGroup**.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the Server Load Balancer (SLB) instance is deployed.
VServerGroupId	String	Yes	rsp-cige6j****	The ID of the vServer group. **Note** You cannot delete a vServer group that is in use.

Response parameters

Parameter	Type	Example	Description
RequestId	String	9DEC9C28-AB05-4DDF-9A78-6B08EC9CE18C	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DeleteVServerGroup
&RegionId=cn-qingdao-env17-d01
&VServerGroupId=rsp-cige6j****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteVServerGroupResponse>
   <RequestId>9DEC9C28-AB05-4DDF-9A78-6B08EC9CE18C</RequestId>
</DeleteVServerGroupResponse>
```

`JSON` format

```
{
"RequestId":"9DEC9C28-AB05-4DDF-9A78-6B08EC9CE18C"
}
```

14.1.2.8.7. DescribeVServerGroups

Queries the vServer groups of a Server Load Balancer (SLB) instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeVServerGroups	The operation that you want to perform. Set the value to **DescribeVServerGroups**.
LoadBalancerId	String	Yes	lb-bp1o94dp5i6ea****	The ID of the SLB instance.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the SLB instance is deployed.

Response parameters

Parameter	Type	Example	Description
VServerGroups	Array of VServerGroup		The list of backend servers.
VServerGroup			
VServerGroupId	String	rsp-bp1oygn****	The ID of the vServer group.
VServerGroupName	String	k8s/31065/nginx-ingress-lb/kube-system/clust****"	The name of the vServer group.
RequestId	String	9DEC9C28-AB05-4DDF-9A78-6B08EC9CE18C	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeVServerGroups
&LoadBalancerId=lb-bp1o94dp5i6ea****
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeVServerGroupsResponse>
  <VServerGroups>
        <VServerGroup>
              <VServerGroupId>rsp-bp1oygn******</VServerGroupId>

14.1.2.8.8. DescribeVServerGroupAttribute

Queries detailed information about a vServer group.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeVServerGroupAttribute	The operation that you want to perform. Set the value to **DescribeVServerGroupAttribute**.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the Server Load Balancer (SLB) instance is deployed.
VServerGroupId	String	Yes	rsp-cige6****	The ID of the vServer group.

Response parameters

Parameter	Type	Example	Description
VServerGroupId	String	rsp-cige6****	The ID of the vServer group.
VServerGroupName	String	Group1	The name of the vServer group. The name is 1 to 80 characters in length, and can contain Chinese characters, letters, digits, hyphens (-), forward slashes (/), periods (.),and underscores (_).
BackendServers	Array of BackendServer		The list of backend servers.
BackendServer			
ServerId	String	vm-233	The ID of the Elastic Compute Service (ECS) instance.
Port	Integer	90	The port that is used by the backend server.
Weight	Integer	100	The weight of the backend server.
Description	String	vServerGroupDescription.	The description of the vServer group.
ServerType	String	ecs	

Parameter	Type	Example	Description
Type	String	ecs	The type of backend server. Valid values: • **ecs** (default): an Elastic Compute Service (ECS) instance • **eni**: an elastic network interface (ENI)
RequestId	String	9DEC9C28-AB05-4DDF-9A78-6B08EC9CE18C	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeVServerGroupAttribute
&RegionId=cn-qingdao-env17-d01
&VServerGroupId=rsp-cige6****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeVServerGroupAttributeResponse>
   <RequestId>9DEC9C28-AB05-4DDF-9A78-6B08EC9CE18C</RequestId>
   <VServerGroupId>rsp-cige6******</VServerGroupId>
   <VServerGroupName>Group1</VServerGroupName>
   <BackendServers>
      <BackendServer>
         <ServerId>vm-232</ServerId>
         <Port>80</Port>
         <Weight>100</Weight>
      </BackendServer>
      <BackendServer>
         <ServerId>vm-233</ServerId>
         <Port>90</Port>
         <Weight>100</Weight>
      </BackendServer>
   </BackendServers>
</DescribeVServerGroupAttributeResponse>
```

`JSON` format

```
{"VServerGroupId":"rsp-cige6*****","RequestId":"9DEC9C28-AB05-4DDF-9A78-6B08EC9CE18C","VSer
verGroupName":"Group1","BackendServers":[{"ServerType":"ecs","Type":"ecs","ServerId":"vm-23
3","Description":"vServerGroupDescription.","VpcId":"vpc-**","Port":"90","ServerIp":"192.16
8.*.*","Weight":"100"}]}
```

14.1.2.9. Primary/secondary server groups

14.1.2.9.1. CreateMasterSlaveServerGroup

Creates a primary/secondary server group. A primary/secondary server group contains only two Elastic Compute Service (ECS) instances. One of the ECS instances serves as the primary server. The other ECS instance serves as the secondary server.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateMasterSlaveServerGroup	The operation that you want to perform. Set the value to **CreateMasterSlaveServerGroup**.
LoadBalancerId	String	Yes	lb-bp1hv944r69al4j****	The ID of the Server Load Balancer (SLB) instance.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the SLB instance is deployed.
MasterSlaveServerGroupName	String	No	sg-atstuj3rtopty****	The name of the primary/secondary server group.
				The list of backend servers in the primary/secondary server group. The value of this parameter must be a STRING list in the JSON format. You can specify at most 20 elements for this parameter in each call. • **ServerId**: Required. Specify the ID of the backend server. This parameter must be of the STRING type. • **Port**: Required. Specify the port that is used by the backend server. This parameter must be of the INTEGER type. Valid values: **1 to 65535**. • **Weight**: Required. Specify the weight of the backend server. This parameter must be of the INTEGER type. Valid values: **0 to 100**. • **Description**: Optional. The description of the backend server. This parameter must be of the

Parameter	Type	Required	Example	Description

MasterSlaveBackendServers	String	No	[{ "ServerId": "i-xxxxxxxxx", "Weight": "100", "Type": "ecs", "Port":"80","ServerType":"Master","Description":"test-112" }, { "ServerId": "i-xxxxxxxxx", "Weight": "100", "Type": "ecs", "Port":"80","ServerType":"Slave","Description":"test-112" }]	STRING type. The description must be 1 to 80 characters in length and can contain letters, digits, hyphens (-), forward slashes (/), periods (.),and underscores (_). The description can contain Chinese characters.
				• **ServerType**: Specify the type of the backend server. This parameter must be of the STRING type. Valid values:
				  ○ **Master**: primary server
				  ○ **Slave**: secondary server
				• **Type**: The type of the backend server. This parameter must be of the STRING type. Valid values:
				  ○ **ecs** (default): an ECS instance
				  ○ **eni**: an elastic network interface (ENI)
				• **ServerIp**: the IP address of the ECS instance or ENI.
				A primary/secondary server group can contain at most two backend servers.
				If you do not set this parameter, an empty primary/secondary server group is created.
				Examples:
				• ECS: `[{ "ServerId": "i-xxxxxxxxx", "Weight": "100", "Type": "ecs", "Port":"80","ServerType":"Master","Description":"test-112" }, { "ServerId": "i-xxxxxxxxx", "Weight": "100", "Type": "ecs", "Port":"80","ServerType":"Slave","Description":"test-112" }]`
				• ENI: `[{ "ServerId": "eni-xxxxxxxxx", "Weight": "100", "Type": "eni", "Port":"80","ServerType":"Master","Description":"test-112" }, { "ServerId": "eni-xxxxxxxxx", "Weight": "100", "Type": "eni", "ServerIp": "192.168.**.**", "Port":"80","ServerType":"Slave","Description": "test-112" }]`
				• ENI with multiple IP addresses: `[{ "ServerId": "eni-xxxxxxxxx", "`
				  ○ **Master**: primary server
				  ○ **Slave**: secondary server
				• **Type**: The type of the backend server. This parameter must be of the STRING type. Valid values:
				  ○ **ecs** (default): an ECS instance
				  ○ **eni**: an elastic network interface (ENI)
				• **ServerIp**: the IP address of the ECS instance or ENI.
				A primary/secondary server group can contain at most two backend servers.
				If you do not set this parameter, an empty primary/secondary server group is created.
				Examples:
				• ECS: `[{ "ServerId": "i-xxxxxxxxx", "Weight": "100", "Type": "ecs", "Port":"80","ServerType":"Master","Description":"test-112" }, { "ServerId": "i-xxxxxxxxx", "Weight": "100", "Type": "ecs", "Port":"80","ServerType":"Slave","Description":"test-112" }]`
				• ENI: `[{ "ServerId": "eni-xxxxxxxxx", "Weight": "100", "Type": "eni", "Port":"80","ServerType":"Master","Description":"test-112" }, { "ServerId": "eni-xxxxxxxxx", "Weight": "100", "Type": "eni", "ServerIp": "192.168.**.**", "Port":"80","ServerType":"Slave","Description": "test-112" }]`
				• ENI with multiple IP addresses: `[{ "ServerId": "eni-xxxxxxxxx", "`

Parameter	Type	Required	Example	Description
				Weight": "100", "Type": "eni", "ServerIp": "192.168.**.**", "Port":"80","ServerType":"Master","Description":"test-112" }, { "ServerId": "eni-xxxxxxxxx", "Weight": "100", "Type": "eni","ServerIp": "192.168.**.**", "Port":"80","ServerType":"Slave","Description":"test-112" }]

Response parameters

Parameter	Type	Example	Description
MasterSlaveServerGroupId	String	rsp-cige6j****	The ID of the primary/secondary server group.
MasterSlaveBackendServers	Array of MasterSlaveBackendServer		The list of backend servers in the primary/secondary server group.
MasterSlaveBackendServer			
ServerId	String	vm-2h****	The ID of the ECS instance or ENI that is added.
Port	Integer	90	The port that is used by the backend server.
Weight	Integer	100	The weight of the backend server.
ServerType	String	Slave	Indicates whether the backend server is a primary or secondary server. Valid values: **Master** and **Slave**. Default value: Master.
Description	String	Primary/SecondaryServerGroupDescription.	The description of the primary/secondary server group. The description is 1 to 80 characters in length and can contain letters, digits, hyphens (-), forward slashes (/), periods (.),and underscores (_).
Type	String	ecs	The type of backend server. Valid values: • **ecs** (default): an ECS instance • **eni**: an ENI

Parameter	Type	Example	Description
RequestId	String	9DEC9C28-AB05-4DDF-9A78-6B08EC9CE18C	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=CreateMasterSlaveServerGroup
&LoadBalancerId=lb-bp1hv944r69al4j****
&RegionId=cn-qingdao-env17-d01

            "MasterSlaveBackendServers": [
                {
                    "ServerId": "vm-gtgt***",
                    "Port": 80,
                    "Weight": 100,
                    "ServerType": "Master"
                },
                {
                    "ServerId": "vm-tygtyg****",
                    "Port": 90,
                    "Weight": 100,
                    "ServerType": "Slave"
                }
            ]
        }
    }
}
```

Error codes

HttpCode	Error code	Error message	Description
400	BACKEND_SERVERS_NUM_MUST_BE_TWO	Backend servers num must be 2.	The error message returned because two backend servers must be specified.
400	BACKEND_SERVERS_HAVE_SAME_PORT_AND_SERVERID	Backend servers have same port and serverId.	The error message returned because a backend server with the same port and ID is already specified in the server group.
400	BACKEND_SERVERS_CAN_ONLY_CONTAIN_ONE_MASTER_AND_ONE_SLAVE	Backend servers can only contain one master and one slave.	The error message returned because a primary/secondary server group can contain only one primary server and one secondary server.
400	BACKEND_SERVER_ID_CAN_NOT_EMPTY	Backend server id can not empty.	The error message returned because the ID of the backend server is not specified.
400	INVALID_SERVER_TYPE	Invalid server type.	The error message returned because the specified type of backend server is invalid.
400	BACKEND_SERVER_PORT_CAN_NOT_EMPTY	Backend server port can not empty.	The error message returned because the port of the backend server is not specified.

HttpCode	Error code	Error message	Description
400	RealServerPortNotSupport	Real server port not support.	The error message returned because the specified port of the backend server is invalid.

14.1.2.9.2. DeleteMasterSlaveServerGroup

Deletes a specified primary/secondary server group.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteMasterSlaveServerGroup	The operation that you want to perform. Set the value to **DeleteMasterSlaveServerGroup**.
MasterSlaveServerGroupId	String	Yes	rsp-cige6****	The ID of the primary/secondary server group. **Note** You cannot delete a primary/secondary server group that is in use.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the Server Load Balancer (SLB) instance is deployed.

Response parameters

Parameter	Type	Example	Description
RequestId	String	9DEC9C28-AB05-4DDF-9A78-6B08EC9CE18C	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DeleteMasterSlaveServerGroup
&MasterSlaveServerGroupId=rsp-cige6****
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteMasterSlaveServerGroupResponse>
   <RequestId>9DEC9C28-AB05-4DDF-9A78-6B08EC9CE18C</RequestId>
</DeleteMasterSlaveServerGroupResponse>
```

`JSON` format

```
{
"RequestId":"9DEC9C28-AB05-4DDF-9A78-6B08EC9CE18C"
}
```

14.1.2.9.3. DescribeMasterSlaveServerGroups

Queries backend servers in a primary/secondary server group.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeMasterSlaveServerGroups	The operation that you want to perform. Set the value to **DescribeMasterSlaveServerGroups**.
LoadBalancerId	String	Yes	lb-bp14zi0n66zpg6o****	The ID of the Server Load Balancer (SLB) instance.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the SLB instance is deployed.

Response parameters

Parameter	Type	Example	Description
MasterSlaveServerGroups	Array of MasterSlaveServerGroup		The list of backend servers in the primary/secondary server group.
MasterSlaveServerGroup			
MasterSlaveServerGroupId	String	rsp-0bfuc****	The ID of the primary/secondary server group.

Parameter	Type	Example	Description
MasterSlaveServerGroupName	String	Group3	The name of the primary/secondary server group.
RequestId	String	9DEC9C28-AB05-4DDF-9A78-6B08EC9CE18C	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeMasterSlaveServerGroups
&LoadBalancerId=lb-bp14zi0n66zpg6o****
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeMasterSlaveServerGroupsResponse>
      <RequestId>2631BB5E-B576-4925-BDED-07A66D23E5DE</RequestId>
      <MasterSlaveServerGroups>
     <MasterSlaveServerGroup>
        <MasterSlaveServerGroupId>rsp-bp1ro3mw******</MasterSlaveServerGroupId>
        <MasterSlaveServerGroupName>test</MasterSlaveServerGroupName>
     </MasterSlaveServerGroup>
      </MasterSlaveServerGroups>
</DescribeMasterSlaveServerGroupsResponse>
```

`JSON` format

```
{
    "RequestId": "265989FE-136B-4D6A-B549-FD40E7",
    "MasterSlaveServerGroups": {
        "MasterSlaveServerGroup": [
            {
                "MasterSlaveServerGroupId": "rsp-bp1nly******",
                "MasterSlaveServerGroupName": "primary/secondary1",
                "AssociatedObjects": {
                    "Listeners": {
                        "Listener": [ ]
                    }
                }
            }
        ]
    }
}
```

14.1.2.9.4. DescribeMasterSlaveServerGroupAttribute

Queries detailed information about a primary/secondary server group.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeMasterSlaveServerGroupAttribute	The operation that you want to perform. Set the value to **DescribeMasterSlaveServerGroupAttribute**.
MasterSlaveServerGroupId	String	Yes	rsp-cige6j****	The ID of the primary/secondary server group.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the Server Load Balancer (SLB) instance is created.

Response parameters

Parameter	Type	Example	Description
MasterSlaveServerGroupId	String	rsp-cige6****	The ID of the primary/secondary server group.
MasterSlaveServerGroupName	String	Group1	The name of the primary/secondary server group.
MasterSlaveBackendServers	Array of MasterSlaveBackendServer		The list of backend servers in the primary/secondary server group.
MasterSlaveBackendServer			
ServerId	String	vm-hrf****	The ID of the Elastic Compute Service (ECS) instance or elastic network interface (ENI).
Port	Integer	90	The port that is used by the backend server.
Weight	Integer	100	The weight of the backend server.

Parameter	Type	Example	Description
ServerType	String	Slave	The type of backend server. Valid values: **Master** and **Slave**. Default value: Master.
Description	String	Primary/SecondaryServerGroupDescription.	The description of the primary/secondary server group.
Type	String	ecs	The type of backend server. Valid values: • **ecs**: an ECS instance. This is the default value. • **eni**: an ENI.
RequestId	String	9DEC9C28-AB05-4DDF-9A78-6B08EC9CE18C	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeMasterSlaveServerGroupAttribute
&MasterSlaveServerGroupId=rsp-cige6j****
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeMasterSlaveServerGroupAttributeResponse>
    <RequestId>9DEC9C28-AB05-4DDF-9A78-6B08EC9CE18C</RequestId>
    <MasterSlaveServerGroupId>rsp-cige6******</MasterSlaveServerGroupId>
    <MasterSlaveBackendServers>
          <MasterSlaveBackendServers>
                <ServerId>vm-sshssh****</ServerId>
                <Port>80</Port>
                <Weight>100</Weight>
                <ServerType>Master</ServerType>
          </MasterSlaveBackendServers>
          <MasterSlaveBackendServers>
                <ServerId>vm-ffff*****</ServerId>
                <Port>90</Port>
                <Weight>100</Weight>
                <ServerType>Slave</ServerType>
          </MasterSlaveBackendServers>
    </MasterSlaveBackendServers>
</DescribeMasterSlaveServerGroupAttributeResponse>
```

`JSON` format

```
{
  "DescribeMasterSlaveServerGroupAttributeResponse": {
    "RequestId": "9DEC9C28-AB05-4DDF-9A78-6B08EC9CE18C",
    "MasterSlaveServerGroupId": "rsp-cige6******",
    "MasterSlaveBackendServers": {
      "MasterSlaveBackendServers": [
        {
          "ServerId": "vm-sshssh****",
          "Port": "80",
          "Weight": "100",
          "ServerType": "Master"
        },
        {
          "ServerId": "vm-ffff*****",
          "Port": "90",
          "Weight": "100",
          "ServerType": "Slave"
        }
      ]
    }
  }
}
```

14.1.2.10. Tags

14.1.2.10.1. AddTags

Adds tags to a Server Load Balancer (SLB) instance.

When you call this operation, take note of the following items:

- You can add at most 10 tags to an SLB instance.
- You can specify at most five tags in each request.
- All tags and keys added to an SLB instance must be unique.
- If you add a tag that has the same key as an existing tag but with a different value, the new tag overwrites the existing tag.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	AddTags	The operation that you want to perform. Set the value to **AddTags**.
LoadBalancerId	String	Yes	lb-bp1b6c719dfa08ex****	The ID of the SLB instance.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the SLB instance is deployed.
Tags	String	Yes	[{"TagKey":"Key1","TagValue":"Value1"},{"TagKey":"Key2","TagValue":"Value2"}]	The list of tags to be added.

Response parameters

Parameter	Type	Example	Description
RequestId	String	365F4154-92F6-4AE4-92F8-7FF34B540710	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=AddTags
&LoadBalancerId=lb-bp1b6c719dfa08ex****
&RegionId=cn-qingdao-env17-d01
&Tags=[{"TagKey":"Key1","TagValue":"Value1"},{"TagKey":"Key2","TagValue":"Value2"}]
&<Common request parameters>
```

Sample success responses

`XML` format

```
<AddTagsResponse>
   <RequestId>365F4154-92F6-4AE4-92F8-7FF34B540710</RequestId>
</AddTagsResponse>
```

`JSON` format

```
{
  "RequestId":"365F4154-92F6-4AE4-92F8-7FF34B540710"
}
```

14.1.2.10.2. DescribeTags

Queries a list of tags.

When you call this operation, take note of the following items:

- You can query tags by instance ID, tag key, and tag value. If the operation is successful, the system

returns all tags that match the specified conditions.

- If the logical relationship among the specified conditions is `AND`, only tags that match all of the specified conditions are returned.
- If the Tagkey parameter is specified and the Tagvalue parameter is not specified, all tags that contain the specified tag key are returned.
- If you have specified the Tagvalue parameter in a request, you must also specify the Tagkey parameter in this request.
- If you specify both the Tagkey and Tagvalue parameters, tags with the specified key-value pair are returned.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeTags	The operation that you want to perform. Set the value to **DescribeTags**.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the Server Load Balancer (SLB) instance is deployed.
LoadBalancerId	String	No	lb-bp1b6c719dfa08ex****	The ID of the SLB instance.
Tags	String	No	[{"TagKey":"Key1","TagValue":"Value1"},{"TagKey":"Key2","TagValue":"Value2"}]	The list of tags to be queried.
DistinctKey	Boolean	No	false	Specifies whether the tag is DistinctKey. Valid values: **true** and **false**.
PageSize	Integer	No	50	The number of entries to return on each page. Default value: **50**. Maximum value: **100**.
PageNumber	Integer	No	1	The number of the page to return. Minimum value: **1**. Default value: **1**.

Response parameters

Parameter	Type	Example	Description
TagSets	Array of TagSet		The list of tags.
TagSet			
TagKey	String	test	The key of the tag.
TagValue	String	api	The value of the tag.
InstanceCount	Integer	10	The number of instances to which the tag is added.
PageSize	Integer	50	The number of entries returned on each page. Default value: **50**. Maximum value: **100**.
PageNumber	Integer	1	The number of the returned page. Minimum value: **1**. Default value: **1**.
TotalCount	Integer	1	The total number of instances that are returned after the tags are matched against the specified conditions.
RequestId	String	365F4154-92F6-4AE4-92F8-7FF34B540710	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeTags
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeTagsResponse>
   <RequestId>365F4154-92F6-4AE4-92F8-7FF34B540710</RequestId>
    <TagSets>
            <TagSet>
                  <TagKey>test</TagKey>
                  <TagValue>api</TagValue>
            </TagSet>
      </TagSets>
   <PageSize>50</PageSize>
   <PageNumber>1</PageNumber>
   <TotalCount>1</TotalCount>
</DescribeTagsResponse>
```

`JSON` format

```
{
    "RequestId": "365F4154-92F6-4AE4-92F8-7FF34B540710",
    "TagSets": {
        "TagSet": [
            {
                "TagKey": "test",
                "TagValue": "api"
            }
        ],
        "PageNumber": 1,
        "PageSize": 50,
        "TotalCount": 1
    }
}
```

14.1.2.10.3. RemoveTags

Removes tags from a Server Load Balancer (SLB) instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	RemoveTags	The operation that you want to perform. Set the value to **RemoveTags**.
LoadBalancerId	String	Yes	lb-bp1b6c719dfa08ex****	The ID of the SLB instance.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the SLB instance is deployed.

Parameter	Type	Required	Example	Description
Tags	String	Yes	[{"TagKey":"Key1","TagValue":"Value1"}, {"TagKey":"Key2","TagValue":"Value2"}]	The list of tags that you want to remove.

Response parameters

Parameter	Type	Example	Description
RequestId	String	365F4154-92F6-4AE4-92F8-7FF34B540710	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=RemoveTags
&LoadBalancerId=lb-bp1b6c719dfa08ex****
&RegionId=cn-qingdao-env17-d01
&Tags=[{"TagKey":"Key1","TagValue":"Value1"},{"TagKey":"Key2","TagValue":"Value2"}]
&<Common request parameters>
```

Sample success responses

`XML` format

```
<RemoveTagsResponse>
   <RequestId>365F4154-92F6-4AE4-92F8-7FF34B540710</RequestId>
</RemoveTagsResponse>
```

`JSON` format

```
{ "RequestId": "365F4154-92F6-4AE4-92F8-7FF34B540710" }
```

14.1.2.11. Error codes

Error code	Error message	HTTP status code	Description
CertificateAndPrivateKeyIsRefered	Certificate and PrivateKey Is Refered.	400	The error message returned because the certificate is used by other resources.

Error code	Error message	HTTP status code	Description
CertificateNotMatchPrivateKey	Certificate and key does not match.	400	The error message returned because the certificate and the private key do not match.
CheckedListenerNotFound	No health-checked Listener to the specified port of the Load Balancer.	404	The error message returned because health checks are disabled.
Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	403	The error message returned because you are unauthorized to perform the operation.
Forbidden	User not authorized to operate on the specified resource.	403	The error message returned because you are unauthorized to perform the operation.
IncorrectListenerAccessControlStatusStatus	Current listener access control status does not support this operation.	500	The error message returned because the access control configuration of the listener is in a state that does not support the operation.
InternalError	The request processing has failed due to backend service exception.	400	The error message returned because an internal error occurred.
InternalInvokeError	The request processing has failed due to some unknown error, exception or failure.	500	The error message returned because an internal error occurred.

Error code	Error message	HTTP status code	Description
InvalidBackendServers.Inconsistent	Specified LoadBalancer instance's addresstype is private, so it is forbidden to add ecs vpc backendservers for now.	400	The error message returned because the network types of the Elastic Compute Service (ECS) instances and that of the Server Load Balancer (SLB) instance do not match.
InvalidBackendServers.Inconsistent	All BackendServers on one Specified LoadBalancer have to be in the same vpc or all classic	400	The error message returned because you cannot specify both ECS instances in a classic network and ECS instances in a virtual private cloud (VPC) as the backend servers of an SLB instance.
InvalidIdentity	The request identity was not allowed operated.	400	The error message returned because you are unauthorized to perform the operation.
InvalidLoadBalancerId.NotFound	LoadBalancerId does not exist.	404	The error message returned because the specified SLB instance is invalid.
InvalidParameter	The specified parameter ServerCertificate format is error.	404	The error message returned because the specified certificate is invalid.
InvalidParameter	The specified parameter ServerCertificateId is empty.	404	The error message returned because the certificate is not specified.
InvalidParameter	The specified parameter ServerCertificateId is not support.	404	The error message returned because the ID of the server certificate is invalid.
InvalidParameter	The specified parameter ServerCertificate or Key is empty.	404	The error message returned because the certificate and the private key are not specified.

Error code	Error message	HTTP status code	Description
InvalidParameter	The specified parameter key format is error.	404	The error message returned because the specified private key is invalid.
InvalidParameter	Specified region does not supported.	404	The error message returned because the specified region does not support the operation.
InvalidParameter	Port is not Integer.	400	The error message returned because the specified port is invalid. Valid values: 1 to 65535.
InvalidParameter	The specified port is not valid.	400	The error message returned because the specified port is invalid. Valid values: 1 to 65535.
InvalidParameter	The specified bandwidth is not valid.	400	The error message returned because the specified bandwidth limit is invalid.
InvalidParameter	Specified parameter Check is not valid.	400	The error message returned because a specified parameter is invalid.
InvalidParameter	The specified parameter HealthCheckHttpCode is not valid.	400	The error message returned because the specified value of HealthCheckHttpCode is invalid.
InvalidParameter	The specified parameter bandwidth is not valid, out of the instance total bandwidth.	400	The error message returned because the specified value of Bandwidth exceeds the bandwidth limit of the instance.
InvalidParameter	The specified parameter bandwidth is not valid.	400	The error message returned because the specified value of Bandwidth is invalid.
InvalidParameter	The specified parameter HealthCheck is not valid.	400	The error message returned because the specified health check configuration is invalid.

Error code	Error message	HTTP status code	Description
InvalidParameter	The specified parameter SourceItem is not valid.	400	The error message returned because the specified value of SourceItem is invalid.
InvalidParameter	The specified protocol is not valid.	400	The error message returned because the specified protocol type is invalid.
InvalidParameter	RS Pool is empty.	400	The error message returned because no backend server is available.
InvalidParameter	RS Pool doesn't exist.	400	The error message returned because no backend server is available.
InvalidParameter	Illegal user ID.	400	The error message returned because the user ID is invalid.
InvalidParameter	User ID is null	400	The error message returned because the user ID is not specified.
InvalidParameter	The specified parameter lb_type is not valid.	400	The error message returned because the specified type of SLB instance is invalid.
InvalidParameter	The specified parameter mode is not valid..	400	The error message returned because the specified value of Mode is invalid.
InvalidParameter	The specified parameter AccessControlStatus is not valid.	400	The error message returned because the specified value of AccessControlStatus is invalid.
InvalidParameter	The specified parameter SourceItems is not valid.	400	The error message returned because the specified value of SourceItem is invalid.
InvalidParameter	The specified parameter BackendServers is not valid.	404	The error message returned because the specified value of BackendServers is invalid.
InvalidParameter	Specified parameter is not valid.	400	The error message returned because a specified parameter is invalid.

Error code	Error message	HTTP status code	Description
InvalidParameter	The specified parameter Domain is not valid.	400	The error message returned because the specified value of Domain is invalid.
InvalidParameter	The specified parameter URI is not valid.	400	The error message returned because the specified value of URI is invalid.
InvalidParameter	The specified parameter Scheduler is not valid.	400	The error message returned because the specified value of Scheduler is invalid.
InvalidParameter	The specified parameter ListenerStatus is not valid.	400	The error message returned because the specified value of ListenerStatus is invalid.
InvalidParameter	The specified parameter PersistenceTimeout is not valid.	400	The error message returned because the specified value of PersistenceTimeout is invalid.
InvalidParameter	The specified parameter ConnectPort is not valid.	400	The error message returned because the specified value of ConnectPort is invalid.
InvalidParameter	The specified parameter ConnectTimeou is not valid.	400	The error message returned because the specified value of ConnectTimeout is invalid.
InvalidParameter	The specified parameter StickySessionType is not valid.	400	The error message returned because the specified value of StickySessionType is invalid.
InvalidParameter	The specified parameter HealthyThreshold is not valid.	400	The error message returned because the specified value of HealthyThreshold is invalid.
InvalidParameter	The specified parameter UnhealthyThreshold is not valid.	400	The error message returned because the specified value of UnhealthyThreshold is invalid.

Error code	Error message	HTTP status code	Description
InvalidParameter	The specified parameter Interval is not valid.	400	The error message returned because the specified value of Interval is invalid.
InvalidParameter	The specified parameter XForwardedFor is not valid.	400	The error message returned because the specified value of XForwardedFor is invalid.
InvalidParameter	The specified parameter IsPublicAddress is not valid.	400	The error message returned because the specified value of IsPublicAddress is invalid.
InvalidRegionId.NotFound	Specified region does not exist.	404	The error message returned because the specified region is invalid.
InvalidServerId.Malformed	A specified server ID is not valid, flush control ip chain fail.	400	The error message returned because the ID of the backend server is invalid.
InvalidServerId.NotFound	The specified server is not found.	400	The error message returned because the specified backend server is invalid.
InvalidWeight.Malformed	A specified weight is not valid.	400	The error message returned because the specified value of weight is invalid.
IpNotAvailable	The specified parameter Address is not valid.	400	The error message returned because the specified value of Address is invalid.
ListenerAlreadyExists	There is already a listener bound to the port on the specified load balancer.	400	The error message returned because the specified listener already exists.
ListenerNotFound	No Listener to the specified port of the Load Balancer.	404	The error message returned because the specified listener is invalid.

Error code	Error message	HTTP status code	Description
MissingParameter	The input parameter Cookie that is mandatory for processing this request is not supplied.	400	The error message returned because the Cookie parameter is not specified.
MissingParameter	The input parameter BackendServerPort that is mandatory for processing this request is not supplied.	400	The error message returned because the BackendServerPort parameter is not specified.
MissingParameter	The input parameter LoadBalancerId that is mandatory for processing this request is not supplied.	400	The error message returned because the LoadBalancerId parameter is not specified.
MissingParameter	The input parameter RegionId that is mandatory for processing this request is not supplied.	400	The error message returned because the RegionId parameter is not specified.
MissingParameter	The combination of some parameters violates the spec.	400	The error message returned because a required parameter is not specified.
MissingParameter	The input parameter OwnerId,OwnerAccount that is mandatory for processing this request is not supplied.	403	The error message returned because OwnerAccount and OwnerId are not specified.
PrivateKeyEncryption	Key has Encrypted .	400	The error message returned because the private key is encrypted.

Error code	Error message	HTTP status code	Description
ProcessingSameRequest	The same request is being processed. Please try later.	400	The error message returned because the same request is being processed. Try again later.
ServerCertificateId.NotFound	Specified ServerCertificateId does not exist.	404	The error message returned because the specified certificate is invalid.
ServiceUnavailable	The request has failed due to a temporary failure of the server.	503	The error message returned because the service is unavailable.
ServiceUnavailable	The specified loadbalancer name has been used.	503	The error message returned because the specified name already exists.
TcpNotSupportForHybridLb	Hybrid type loadbalancer doesn't support TCP type listener.	400	The error message returned because you cannot create TCP listeners.
TooManyBackendServers	The total number of input real servers exceeds max supported number: 20.	400	The error message returned because you cannot add more than 20 backend servers in each call.
TooManyBackendServers	The backend server parameter has too many entries.	400	The error message returned because the number of backend servers exceeds the limit.
UnsupportedOperation	The Loadbalancer doesn't support this function.	400	The error message returned because the specified type of SLB instance does not support the operation.
UnsupportedOperation	The specified action is not supported.	400	The error message returned because you cannot perform the operation.

Error code	Error message	HTTP status code	Description
UnsupportedOperationonfixedprotocalport	The specified port has been assigned one type of protocal, and this protocal doesn't support this operation.	400	The error message returned because the protocol of the specified port does not support the operation.
UnsupportedParameter	The input parameter is not unsupported.	400	The error message returned because a specified parameter is invalid.
VipNotMatchRspool	The vip protocol is not match with Rspool.	400	The error message returned because the protocol type of the listener and the protocol type of the backend server do not match.
VipTooManyListeners	The total number of input listeners exceeds max supported number: 50.	400	The error message returned because you cannot add more than 50 listeners in each call.
InvalidParameter	The specified resource does not exist.	400	The error message returned because the specified resource does not exist.
ServiceUnavailable	The specified loadbalancer is configuring, please retry later.	503	The error message returned because the specified instance is being configured. Try again later.
ServiceUnavailable	Obtain Ip Fail, please make sure the ECS exists and the status is running.	503	The error message returned because the system fails to obtain the IP address. Check whether the specified ECS instance exists and is in the Running state.
ServiceUnavailable	The specified region not support VPC.	503	The error message returned because the specified region does not support VPCs.
InvalidParameter	The specified vpc cloud instance has deleted.	400	The error message returned because the specified VPC is deleted.

15.Virtual Private Cloud (VPC)

15.1. Developer Guide

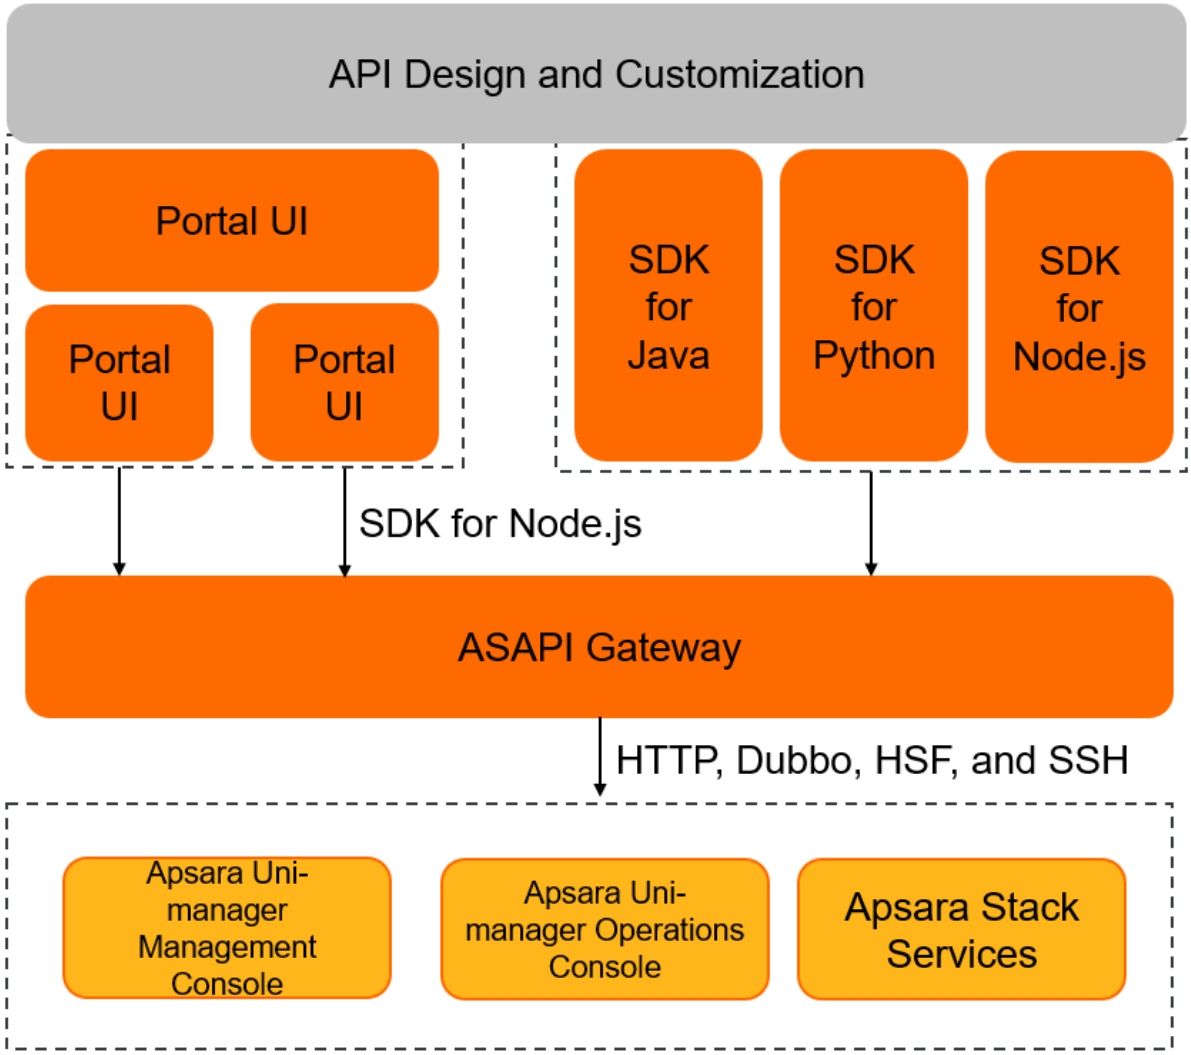
15.1.1. Call VPC SDK by using ASAPI

15.1.1.1. 文档标题缺失，请补全后重新导出

15.1.1.1.1. ASAPI overview

This topic describes the architecture and features of the Apsara Stack API (ASAPI).

The ASAPI is a unified ingress gateway for Apsara Stack services and a main component of the Apsara Uni-manager Management Console. The ASAPI provides a unified method for you to manage and make API calls. You can use Apsara Stack SDK to centrally make API calls to Apsara Stack services, including Elastic Compute Service (ECS) and Virtual Private Cloud (VPC).



The ASAPI allows you to make API calls to manage and maintain Apsara Stack services.

- Make API calls to implement enterprise-grade management. For example, you can manage organizations, users, roles, resource sets, and logon policies. These operations are provided by the Apsara Uni-manager Management Console.
- Make API calls to manage operations. For example, you can manage quotas, usage statistics, specifications, and password policies. These operations are provided by the Apsara Uni-manager Management Console.
- Make API calls to manage resources. For example, you can create, delete, query, or modify cloud resources. These operations are provided by Apsara Stack services. If you call an API operation to create an ECS instance or a VPC, the API operation is provided by ECS or VPC.
- Make API calls to query monitoring metrics of Apsara Stack services. These operations are provided by the Apsara Uni-manager Management Console.
- Make API calls to perform O&M. For example, you can manage monitoring and alerting, inventories, tasks, and physical servers. These operations are provided by the Apsara Uni-manager Operations Console.

For more information, see the developer guide of the corresponding Apsara Stack service. For information about API operations used to manage organization users, see *Apsara Uni-manager Management Console Developer Guide*. For information about the API operation used to create an ECS instance, see *ECS Developer Guide*.

> **Note** If the "Use Apsara Stack SDK to make API calls" section is included in the developer guide of an Apsara Stack service, the ASAPI is supported by the Apsara Stack service. In this case, you can make API calls based on the developer guide.

15.1.1.1.2. Preparations

15.1.1.1.2.1. Log on to the API Tool console

You can log on to the API Tool console from the Apsara Uni-manager Management Console.

Prerequisites

- The URL of the Apsara Uni-manager Management Console is obtained from the deployment personnel before you log on to the Apsara Uni-manager Management Console.
- We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL of the Apsara Uni-manager Management Console. Press the Enter key.
2. Enter your username and password.

   Obtain the username and password that you can use to log on to the console from the operations administrator.

> **Note** When you log on to the Apsara Uni-manager Management Console for the first time, you must change the password of your username. Your password must meet complexity requirements. The password must be 10 to 32 characters in length and must contain at least two of the following character types:
>
> - Uppercase or lowercase letters
> - Digits
> - Special characters, which include ! @ # $ %

3. Click **Log On**.
4. In the top navigation bar, choose **Products > Others > API Tool**.

15.1.1.1.2.2. View information about API operations

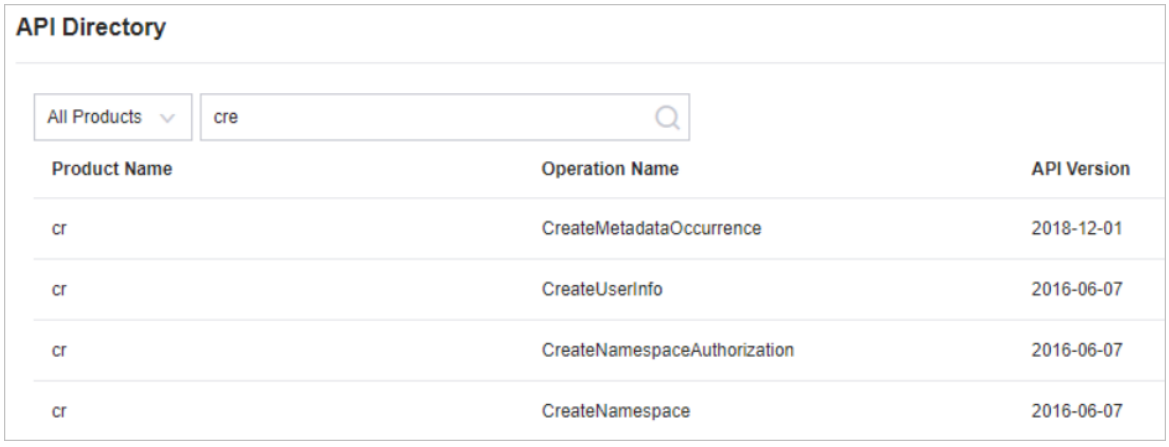
This topic describes how to view information about API operations. Before you use SDKs, obtain service names, API operation names, and API operation versions.

Context

The API operations on the API Directory page are only for reference. For information about how to call API operations, see developer guides of the corresponding cloud services. If the information on the API Directory page is inconsistent with that in the developer guide of the corresponding cloud service, the information in the developer guide prevails.

Procedure

1. Go to the API Tool console. For more information, see Log on to the API Tool console.
2. In the left-side navigation pane, click **API Directory**.
3. On the **API Directory** page, select the desired service from the drop-down list, enter a keyword of an API operation name in the search box, and then click the search icon.



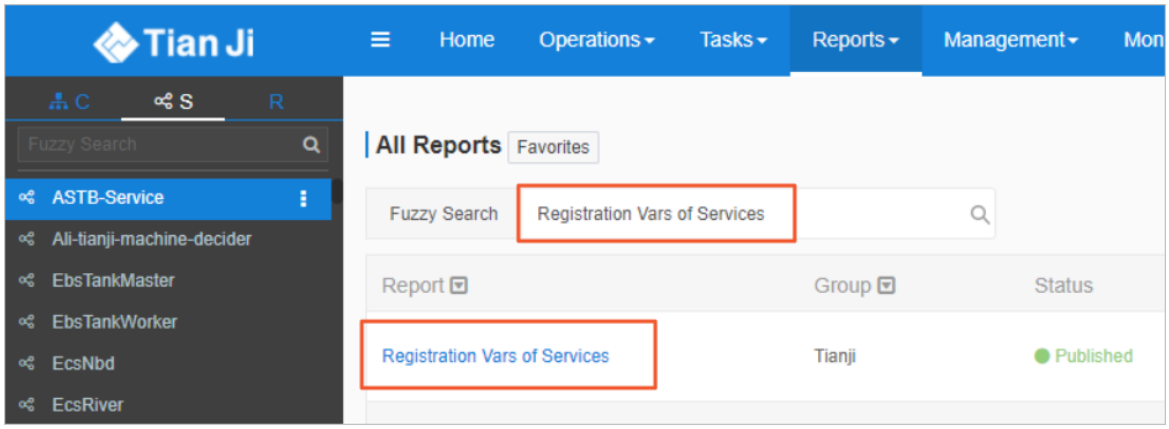
4. Then, you can view the service name, API operation name, and API operation version.

15.1.1.1.2.3. Generate an endpoint for the ASAPI

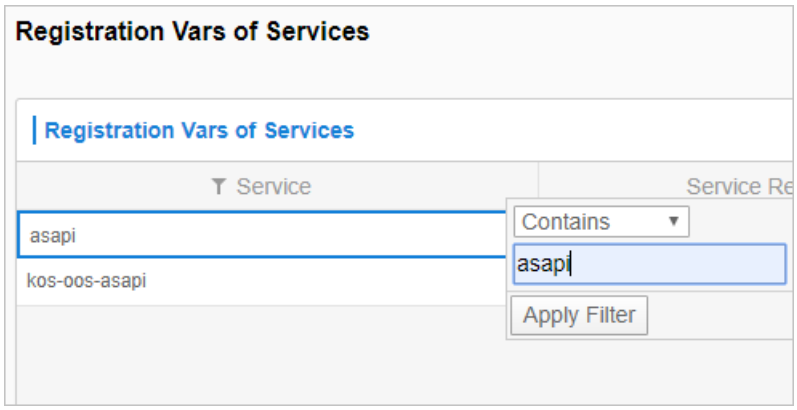
This topic describes three methods used to generate an endpoint for the Apsara Stack API (ASAPI).

Method 1: Use Registration Vars of Services to generate an endpoint

1. Log on to Apsara Infrastructure Management Framework.
   i. Log on to the Apsara Uni-manager Operations Console.
   ii. In the top navigation bar, click **O&M**.
   iii. In the left-side navigation pane, choose **Product Management** > **Products**.
   iv. In the Apsara Stack O&M section, click **Apsara Infrastructure Management Framework**.
2. In the left-side navigation pane, click **Reports**.
3. On the **All Reports** page, search for `Registration Vars of Services` and click the report name.



4. On the **Registration Vars of Services** page, click the icon next to **Service** and search for `asapi`.



5. Find the asapi service, right-click in the **Service Registration** column, and then select **Show More** from the shortcut menu.

   In the **Details** dialog box, obtain the value of **asapi.public.endpoint**.
6. Generate an endpoint for the ASAPI based on the following format:

```
https://<asapi.public.endpoint>/asapi/v3
```

Method 2: Use cluster resources to generate an endpoint

1. Log on to Apsara Infrastructure Management Framework.
   i. Log on to the Apsara Uni-manager Operations Console.

ii. In the top navigation bar, click **O&M**.

iii. In the left-side navigation pane, choose **Product Management** > **Products**.

iv. In the Apsara Stack O&M section, click **Apsara Infrastructure Management Framework**.

2. Go to the cluster operations page.

i. In the left-side navigation pane, choose Operations > Cluster Operations.

ii. In the **Cluster** search box, enter `ascm`.

iii. Find the cluster that you want to manage and click **Operations** in the **Actions** column.

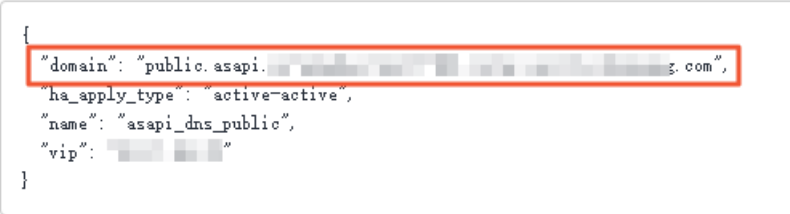
3. Obtain the value of the domain parameter.

i. Click the Cluster Resources tab.

ii. In the **Name** field, search for `asapi_dns_public`.

iii. Click **Details** in the **Application Parameter** column.

In the **Application Parameter** message, obtain the value of the **domain** parameter.



4. Generate an endpoint for the ASAPI based on the following format:

```
https://<domain>/asapi/v3
```

Method 3: Concatenate strings to generate an endpoint

You can also concatenate strings to generate an endpoint based on the following format:

```
https://public.asapi.<region>.<internet-domain>/asapi/v3
```

> **Note**
>
> 1. Replace <region> with your actual region ID. For information about how to query a region ID, see Query a region ID.
> 2. Replace <internet-domain> with the root domain of your Apsara Stack service. To obtain the root domain, contact Apsara Stack O&M personnel. Take note of this point: Use the internet-domain parameter instead of the intranet-domain parameter.

If the **region** value is `cn-****-****-d01` and the **internet-domain** value is `inter.****.****.com`, the following endpoint can be generated:

```
https://public.asapi.cn-****-****-d01.inter.****.****.com/asapi/v3
```

15.1.1.1.2.4. Obtain Apsara Stack SDKs

The Apsara Stack API (ASAPI) is a unified portal provided by Apsara Stack. You can use the ASAPI to connect to all Apsara Stack services. Apsara Stack provides SDKs for API calls.

For more information about how to obtain Apsara Stack SDKs, see Apsara Stack documentation.

15.1.1.1.2.5. Obtain an AccessKey pair

An AccessKey pair that consists of an AccessKey ID and an AccessKey secret is used to implement symmetric encryption. This helps you verify the identity of a requester. The AccessKey ID is used to identify a user. The AccessKey secret is used to encrypt the signature string. This topic describes how to obtain an AccessKey pair.

Prerequisites

An account of the operations administrator or the level-1 organization administrator is obtained. Only an operations administrator or a level-1 organization administrator can obtain an AccessKey pair.

Context

If you need to make API calls to the Apsara Uni-manager Management Console or other Apsara Stack services, we recommend that you use the AccessKey pair of a personal account. If you use the AccessKey pair of a personal account, configure the request headers that are described in the following table for access control. Otherwise, an error that indicates insufficient permissions can occur.

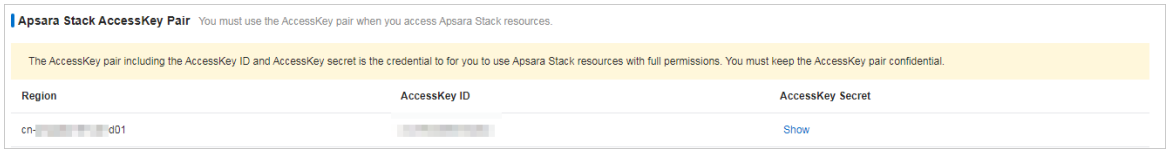
Parameter	Description
x-acs-regionid	The ID of the region, for example, cn-hangzhou-*.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console. For information about how to obtain an organization ID, see the "GetOrganizationList" section in Apsara Uni-manager Management Console Developer Guide.
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console. For information about how to obtain a resource set ID, see the "ListResourceGroup" section in Apsara Uni-manager Management Console Developer Guide.
x-acs-instanceid	The ID of the instance to which you make API calls. If you need to make API calls to an Elastic Compute Service (ECS) instance, obtain the ID of the ECS instance on the Instances page.

Warning The AccessKey pair of a personal account is managed and controlled by the permission system of the Apsara Uni-manage Management Console. If you need to obtain the AccessKey pair of an account that has permissions on an organization, make sure that your operation is allowed by an administrator. This ensures security. The account that has permissions on an organization is a privileged account.

Obtain the AccessKey pair of a personal account

To obtain the AccessKey pair of a personal account, perform the following operations:

1. Log on to the Apsara Uni-manager Management Console.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and click **User Information**.
3. In the **Apsara Stack AccessKey Pair** section, obtain the AccessKey pair.



> **Note** The AccessKey pair that consists of an AccessKey ID and an AccessKey secret is the credential for you to have full permissions on Apsara Stack resources. Keep your AccessKey pair confidential.

Obtain the AccessKey pair of an account that has permissions on an organization

To obtain the AccessKey pair of an account that has permissions on an organization, perform the following operations:

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Organizations**.
4. In the Organizations navigation tree, click the name of the organization that you want to manage.
5. On the right side of the page, click **Obtain AccessKey Pair**.
6. In the message that appears, obtain the AccessKey pair of the account that has permissions on the organization.

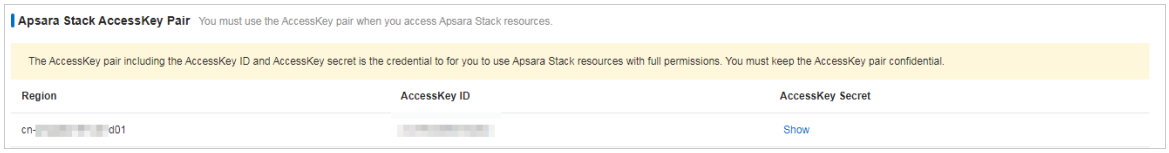
> **Note** The system automatically allocates an AccessKey pair to the account that has permissions on the level-1 organization. The same AccessKey pair is used by the accounts that have permissions on the subordinate organizations.

15.1.1.1.2.6. Query a region ID

When you use Apsara Stack SDK for Node.js to make API calls, specify a region ID. You can obtain a region ID in the Apsara Uni-manager Management Console.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and click **User Information**.
3. In the **Apsara Stack AccessKey Pair** section, view the region ID.



15.1.1.1.3. Common parameters

Common request parameters must be included in all API requests.

Sample common parameters

The following table describes the common parameters that are used when you call API operations supported by the Apsara Stack API (ASAPI).

Parameter	Type	Required	Description
Action	String	Yes	The operation that you want to perform. For more information, see View information about API operations.
Product	String	Yes	The name of the service.
Version	String	Yes	The version of the API operation. For more information, see View information about API operations.
RegionId	String	Yes	The ID of the region. For more information, see Query a region ID.
AccessKeyId	String	Yes	The AccessKey ID used to connect to the service. For more information, see Obtain an AccessKey pair.
Signature	String	Yes	The signature string of the current request. For more information about how signatures are calculated, see Request signatures.

Parameter	Type	Required	Description
SignatureMethod	String	Yes	The encryption method of the signature string. Valid values: HMAC-SHA1 and HMAC-SHA256.
SignatureVersion	String	Yes	The version of the signature encryption algorithm. Valid values: 1.0 and 2.0.
SignatureNonce	String	Yes	A unique, random number used to prevent replay attacks. You must use different numbers for different requests.
Timestamp	String	Yes	The timestamp of the request. Specify the time in the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time must be in UTC. Sample value: 2018-01-01T12:00:00Z.
Format	String	Yes	The format in which to return the response. Set the value to JSON.

Note

The `Signature`, `SignatureMethod`, `SignatureVersion`, `SignatureNonce`, `Timestamp`, and `Format` parameters are encapsulated into Apsara Stack SDK. You do not need to configure these parameters.

15.1.1.1.4. SDK description

15.1.1.1.4.1. Use Apsara Stack SDK for Java to call API operations

This topic describes how to obtain and use Apsara Stack SDK for Java to call API operations.

Prerequisites

- An authorized account and an AccessKey pair are obtained. The AccessKey pair consists of an AccessKey ID and an AccessKey secret. For more information about how to obtain an AccessKey pair in the Apsara Uni-manager Management Console, see Obtain an AccessKey pair.
- The endpoint of the Apsara Stack API (ASAPI) is obtained. For more information, see Generate an endpoint for the ASAPI.
- Apsara Stack SDK for Java 1.8 or later is installed.

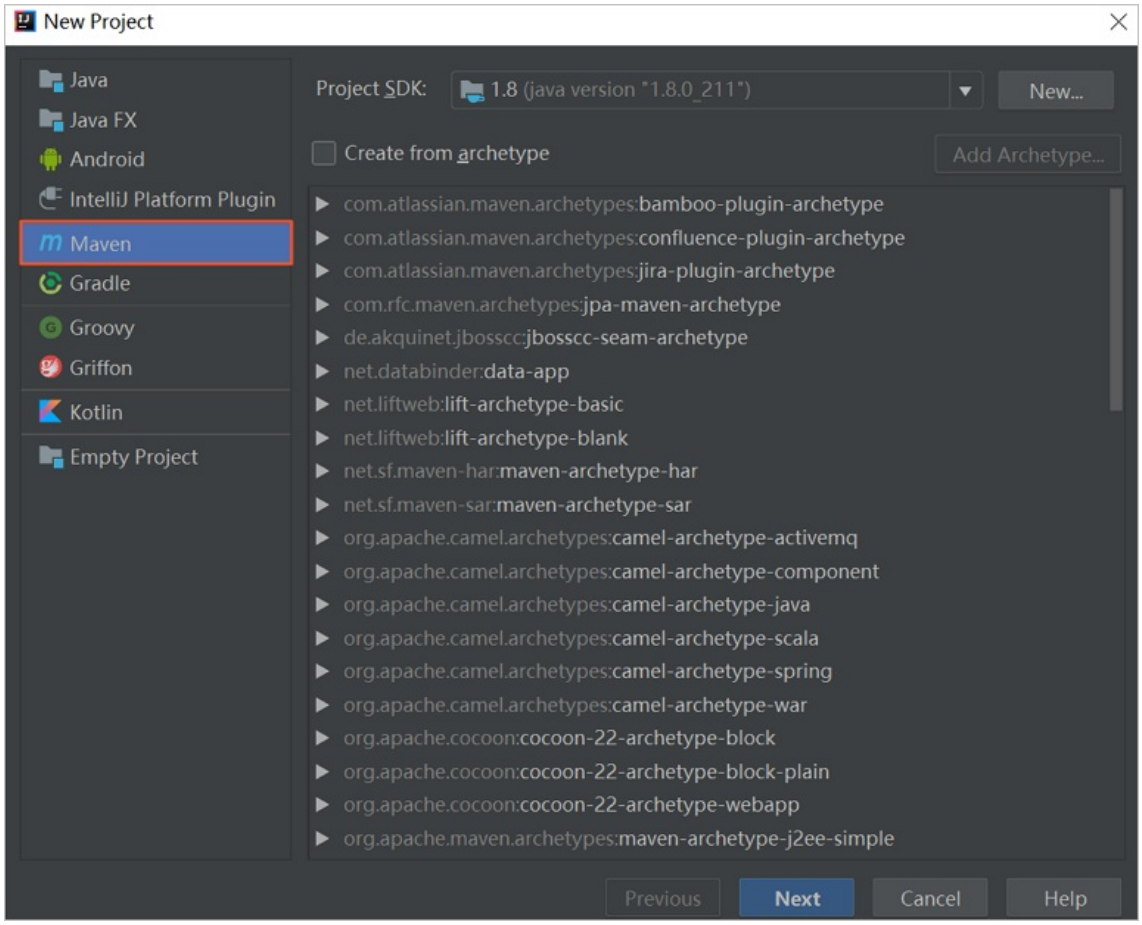
Background information

The help center of Apsara Stack provides Maven dependencies and JAR files for Apsara Stack SDK for Java. You can write code to use Apsara Stack SDK for Java to call API operations.

In this example, the Windows 10 64-bit OS and IntelliJ IDEA are used.

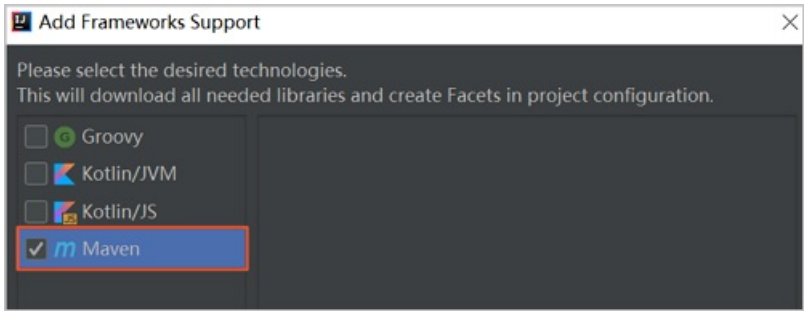
Procedure

1. Use one of the following methods to configure Maven in IntelliJ IDEA. Maven is a tool used for project management.
   - Use Maven that is integrated in IntelliJ IDEA.
   - Download Maven based on the OS that you are using from the official website and configure Maven. For more information, see Download Maven.
2. Obtain the Maven dependencies for Apsara Stack SDK for Java from the official website. For more information about how to obtain the dependencies, see Obtain the core package for ASAPI.
3. Use one of the following methods to create a Maven project:
   - Method 1: Create a Maven project in IntelliJ IDEA.

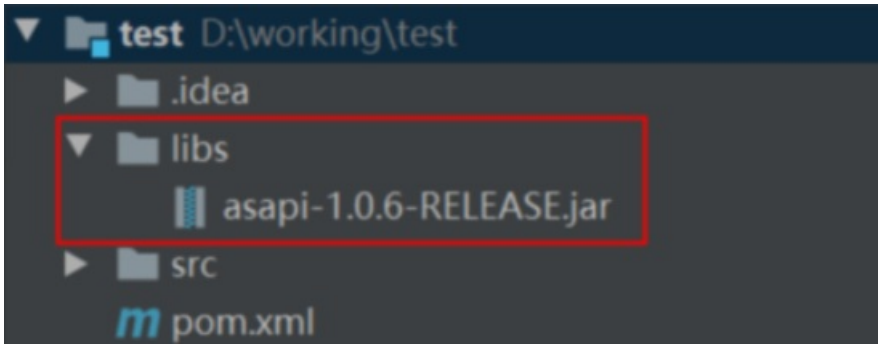


- Method 2: Convert an existing project to a Maven project.
  a. Right-click the project that you want to convert and select **Add Framework Support...**.

  b. Select **Maven** and click **OK**.



4. Create a folder named libs in the root directory of the project. Then, add the JAR file of Apsara Stack SDK for Java to the libs folder, as shown in the following figure.



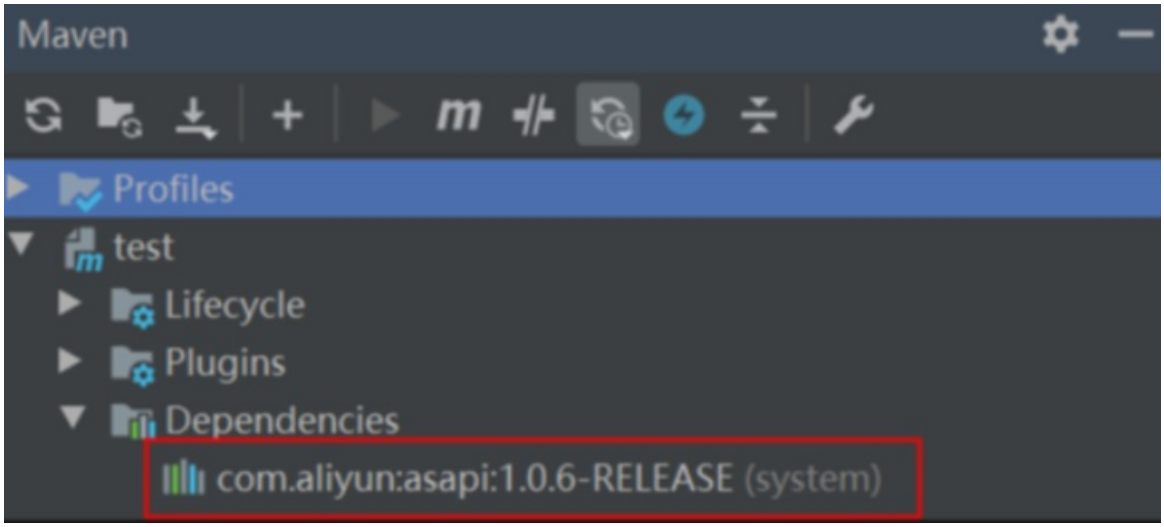
5. Add the dependencies of Apsara Stack SDK for Java to the pom.xml file in the project directory.

```
<dependencies>
    <dependency>
        <groupId>com.aliyun</groupId>
        <artifactId>asapi</artifactId>
        <version>1.0.6-RELEASE</version>
        <scope>system</scope>
        <systemPath>${project.basedir}/libs/asapi-1.0.6-RELEASE.jar</systemPath>
    </dependency>
  <dependency>
        <groupId>com.alibaba</groupId>
        <artifactId>alicrypto-java-aliyun</artifactId>
    <version>1.0.4</version>
    <systemPath>${project.basedir}/libs/alicrypto-java-aliyun-1.0.4.jar</systemPath>
  </dependency>
  <dependency>
    <groupId>com.aliyun</groupId>
    <artifactId>gmsse</artifactId>
    <version>1.1.0</version>
    <systemPath>${project.basedir}/libs/gmsse-1.1.0.jar</systemPath>
  </dependency>
</dependencies>
```

> **Note** Replace `1.0.6-RELEASE` with the actual version of Apsara Stack SDK for Java.

6. On the right side of IntelliJ IDEA, view information in the Maven section.

If the information in the following figure appears, the dependencies are added.



Use Apsara Stack SDK for Java

You can use the GET or POST method to call API operations provided by the ASAPI. The following sample code shows how to call API operations:

```
// 1. Create a connection to an ASClient object.
ASClient client = new ASClient();
// 2. Configure the identifier of the requester. This parameter is required and used only f
or identification. You can set this parameter to a random value.
client.setSdkSource("<The identifier of the requester>");
Map<String, Object> parameters = new HashMap<String, Object>();
// 3. Configure the parameters for authorization. The parameter values vary based on your e
nvironment.
// The AccessKey ID of your Apsara Stack tenant account.
parameters.put("AccessKeyId","<AccessKey ID>");
// The AccessKey secret of your Apsara Stack tenant account.
parameters.put("AccessKeySecret", "<AccessKey Secret>");
// The ID of the region.
parameters.put("RegionId", "<your RegionID>");
// 4. Configure parameters for an API call. In this example, the Product, Action, and Versi
on parameters are configured.
parameters.put("Product", "<The name of the service>");
parameters.put("Action", "<The name of the API operation>");
parameters.put("Version", "<The version of the API operation>");
// 5. Configure operation-specific parameters.
parameters.put("<The name of the operation-specific parameter>", "<The value of the operati
on-specific parameter>");
// 6. Configure request headers and the encryption method for the signature string. Valid v
alues of the SignatureMethod parameter: HMAC-SHA1 and HMAC-SHA256. By default, HMAC-SHA256
is used.
Map<String, String> headers = new HashMap<String, String>();
//headers.put("SignatureMethod", "HMAC-SHA1");
headers.put("x-acs-regionid", "<your-regionid>");
headers.put("x-acs-resourcegroupid", "<your-resourcegroupid>");
headers.put("x-acs-organizationid", "<your-organizationid>");
headers.put("x-acs-instanceid", "<your-instanceid>");
// 7. Make an API call. We recommend that you use the doPost() method.
// Configure the time-out period for a connection.
//client.setConnectTimeout(10000);
// Configure the time-out period for a request.
// client.setSocketTimeout(10000);
String result = client.doPost(endpoint, headers, parameters);
System.out.println(result);
```

Configure a proxy

If you need to use a proxy to make API calls, use the following sample code to configure the proxy:

```
Cloud cloud = new Cloud();
// Configure the IP address of the proxy.
cloud.setConfig("proxy_host", "<IP>");
// Configure the port used by the proxy.
cloud.setConfig("proxy_port", "<Port>");
// 1. Create a connection to an ASClient object.
ASClient client = new ASClient(cloud);
```

Request headers

Parameter	Description
x-acs-regionid	The ID of the region. For more information about how to obtain a region ID, see Query the region ID.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console.
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console.
x-acs-instanceid	The ID of the instance to which you make API calls.

15.1.1.1.4.2. Use Apsara Stack SDK for Python to call API operations

This topic describes how to use Apsara Stack SDK for Python to call API operations provided by the Apsara Stack API (ASAPI).

Preparations

- An authorized account and an AccessKey pair are obtained. The AccessKey pair consists of an AccessKey ID and an AccessKey secret. For more information about how to obtain an AccessKey pair in the Apsara Uni-manager Management Console, see Obtain an AccessKey pair.
- The endpoint of the ASAPI is obtained. For more information, see Generate an endpoint for the ASAPI.

Install Apsara Stack SDK for Python

1. Download the required version of Apsara Stack SDK for Python. For more information, see Obtain Apsara Stack SDKs.
2. Upload the compressed file of Apsara Stack SDK for Python to the host from which you want to send API requests and extract the file. Then, run the following code in the directory of the extracted files to install Apsara Stack SDK for Python:

```
# Install Apsara Stack SDK for Python 2.x.
pip install aliyun-python2-sdk-asapi-2.4.7.tar.gz
# Install Apsara Stack SDK for Python 3.x.
pip3 install aliyun-python3-sdk-asapi-2.4.7.tar.gz
```

> **Note**
>
> Replace `2.4.7` with the actual version of Apsara Stack SDK for Python.

Sample requests

You can use the GET or POST method to call API operations provided by the ASAPI.

```
    # 1. Import dependencies.
    from aliyunsdkasapi.ASClient import ASClient
    from aliyunsdkasapi.AsapiRequest import AsapiRequest

    if __name__ == '__main__':
     # 2. Create a request. The Product parameter specifies the name of the service. The Ver
sion parameter specifies the version of the API operation. The Action parameter specifies t
he operation that you want to perform. The asapi-endpoint parameter specifies the endpoint
of the ASAPI.
     req = AsapiRequest("<Product>", "<Version>", "<Action>", "<asapi-endpoint>")
     # 3. Configure operation-specific parameters.
     req.add_body_params("<key>", "<value>")
     # 4. Configure request headers.
     req.add_header("x-acs-resourcegroupid", "<your-resourcegroupid>");
     req.add_header("x-acs-organizationid", "<your-organizationid>");
     req.add_header("x-acs-regionid", "<your-regionid>");
     req.add_header("x-acs-instanceid", "<your-instanceid>");
     # 5. Configure a request method.
     req.set_method("POST")
     # 6. Configure initialization parameters for an ASClient object. The parameter values v
ary based on your environment. The timeout parameter specifies the time-out period for a re
quest. The cert_file parameter specifies the certificate. The verify parameter specifies wh
ether to verify the certificate.
     as_client = ASClient("<accesskeyid>", "<accesskeysecret>", "<regionid>",timeout=1000,
             cert_file=None,
             verify=False)
     # Configure the identifier of the requester. This parameter is required and used only f
or identification. You can set this parameter to a random value.
     as_client.setSdkSource("<The identifier of the requester>")
     response = as_client.do_request(req)
     print(response)
```

Request headers

Parameter	Description
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console.
x-acs-regionid	The ID of the region. For more information about how to obtain a region ID, see Query a region ID.
x-acs-instanceid	The ID of the instance to which you make API calls.

Configure a proxy

Perform the following steps to configure a proxy:

1. Import OS dependencies.

```
import os
```

2. Configure one or more proxies.

```
# Before you make an API call, configure one or more proxies.
os.environ['http_proxy'] = "http://x.x.x.x:xxxx"
os.environ['https_proxy'] = "https://x.x.x.x:xxxx"
```

15.1.1.1.4.3. Use Apsara Stack SDK for Node.js to call API operations

This topic describes how to obtain and use Apsara Stack SDK for Node.js to call API operations.

Preparations

- An authorized account and an AccessKey pair are obtained. The AccessKey pair consists of an AccessKey ID and an AccessKey secret. For more information about how to obtain an AccessKey pair in the Apsara Uni-manager Management Console, see Obtain an AccessKey pair.
- The endpoint of the Apsara Stack API (ASAPI) is obtained. For more information, see Generate an endpoint for the ASAPI.
- A region ID is obtained. For more information about how to obtain a region ID, see Query the region ID.

Add dependencies

Run the following command to install Apsara Stack SDK for Node.js:

```
tnpm install --save @ali/asapi-nodejs-sdk
```

Use Apsara Stack SDK for Node.js

The following sample code shows how to use Apsara Stack SDK for Node.js to make API calls:

```
// 1. Import the dependencies of Apsara Stack SDK for Node.js.
const Controller = require('egg').Controller;
const ASAPIClient = require('@ali/asapi-nodejs-sdk');
// 2. Configure the parameters.
const cnofig = {
    API_GATEWAY: '<The endpoint of the ASAPI>',
    regionId: '<The ID of the region in which the Apsara Stack service is deployed>',
    accessKeyId: '<The AccessKey ID of your Apsara Stack tenant account>',
    accessKeySecret: '<The AccessKey secret of your Apsara Stack tenant account>'
};
// 3. Initialize a client for API calls.
const AsapiClient = new ASAPIClient(cnofig, this.ctx);
// 4. Configure request parameters.
const params = {
    "Action": "<The name of the API operation>",
    "Product": "<The name of the service that provides the API operation>",
    "Version": "<The version of the API operation>",
    "regionId": '<The ID of the region in which the Apsara Stack service is deployed>',
      "<The name of the operation-specific parameter required by the API operation>": "<The
value of the operation-specific parameter>"
}
// 5. Configure request headers.
AsapiClient.addHeader('x-acs-caller-sdk-source', '<The identifier of the requester>')
AsapiClient.addHeader('x-acs-roleid', '<The ID of the role>')
AsapiClient.addHeader('x-acs-userid', '<The ID of the user>')
AsapiClient.addHeader('x-acs-organizationid', '<your-organizationid>')
AsapiClient.addHeadert("x-acs-regionid", "<your-regionid>");
AsapiClient.addHeader("x-acs-resourcegroupid", "<your-resourcegroupid>");
AsapiClient.addHeader("x-acs-instanceid", "<your-instanceid>");
// 6. Make an API call and obtain the response.
try {
  const res = await AsapiClient.doRequest(cnofig.API_GATEWAY, params, {
    method: 'POST', // The request method.
    formatParams: false, // Specifies whether to format parameters and capitalize the first
letter of each parameter.
    enableProxy: true, // Specifies whether to configure a proxy.
    proxy: 'http://x.x.x.x:xxxx',
    timeout: 10000, // The time-out period.
  // ca: , // The certificate issued by a certificate authority (CA). For more information,
visit https://nodejs.org/api/https.html#https_https_request_options_callback.
  })
  console.log(res)
} catch (e) {
  console.log(e)
}
```

Disable certificate validation

The following sample code shows how to disable certificate validation:

```
Configure the environment variable.
NODE_TLS_REJECT_UNAUTHORIZED=0
```

Request headers

Parameter	Description
x-acs-regionid	The ID of the region. For more information about how to obtain a region ID, see Query the region ID.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console.
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console.
x-acs-instanceid	The ID of the instance to which you make API calls.
x-acs-caller-sdk-source	The custom name of the requester or the system. This parameter is used to identify the source of the API request.
x-acs-roleid	The ID of the role.
x-acs-userid	The ID of the user.

15.1.1.1.4.4. SDK for POP

SDK for Java

Before you use Apsara Stack API (ASAPI) SDK for POP for Java to access ASAPI, you must know the remote procedure call (RPC) and resource-oriented architecture (ROA) styles that are supported for API calls. ASAPI is compatible with both styles. Their difference lies in the ASAPI endpoints that are used for API calls.

Prerequisites

- An Alibaba Cloud SDK package is downloaded for the service that you want to access. The required dependencies are installed.
- SSL certificate validation is ignored for requests over HTTPS.

Background information

ASAPI supports only the HTTPS request protocol.

Difference between two styles

When you use the RPC or ROA style to make API calls, take note that the two styles use different ASAPI endpoints.

```
# ASAPI endpoint for the RPC style:
public.asapi.<global:region>.<global:internet-domain>/asapi/v3
# ASAPI endpoint for the ROA style:
public.asapi.<global:region>.<global:internet-domain>/asapi/v3/roa
```

Call examples

The following sample code provides an example on how to use the RPC style to make an API call. In this example, the DescribeInstances operation of Elastic Compute Service (ECS) is called, and the API version is 2014-05-26.

Sample code:

```
package com.aliyuns.client.pop.ecs;

import com.aliyuncs.DefaultAcsClient;
import com.aliyuncs.ecs.model.v20140526.DescribeInstancesRequest;
import com.aliyuncs.ecs.model.v20140526.DescribeInstancesResponse;
import com.aliyuncs.http.HttpClientConfig;
import com.aliyuncs.http.ProtocolType;
import com.aliyuncs.profile.DefaultProfile;

import java.util.List;

public class DescribeInstancesTest {
    public static void main(String[] args) {
        // Specify the endpoint of ASAPI.
        String endpoint = "public.asapi.<global:region>.<global:internet-domain>/asapi/v3";
        // Specify the region where the ECS service resides.
        String region = "<global:region>";
        // Specify the name of the service that you want to access.
        String product = "ECS";
        // Specify your AccessKey pair.
        String ak = "<accessKeyId>";
        String sk = "<accessKeySecret>";
        try {
            DefaultProfile clientProfile = DefaultProfile.getProfile(region, ak, sk);
            // Ignore SSL certificate validation.
            HttpClientConfig clientConfig = HttpClientConfig.getDefault();
            clientConfig.setIgnoreSSLCerts(true);
            // Set the connection timeout period.
            clientConfig.setConnectionTimeoutMillis(3000L);
            // Set the read timeout period.
            clientConfig.setReadTimeoutMillis(10000L);
            clientProfile.setHttpClientConfig(clientConfig);
            // Create a connection.
            DefaultAcsClient acsClient = new DefaultAcsClient(clientProfile);
            // Create a request.
            DescribeInstancesRequest request = new DescribeInstancesRequest();
            // Specify the endpoint of ASAPI.
            request.setSysEndpoint(endpoint);
            // Specify the name of the service that you want to access and the region where
the service resides.
            request.setSysLocationProduct(product);
            request.setSysRegionId(region);
            // Set the request protocol to HTTPS.
            request.setSysProtocol(ProtocolType.HTTPS);
            DescribeInstancesResponse result =  acsClient.getAcsResponse(request);
            List<DescribeInstancesResponse.Instance> instances = result.getInstances();
            for (DescribeInstancesResponse.Instance instance: instances) {
                System.out.println(instance.getInstanceId());
                System.out.println(instance.getInstanceName());
```

```
            }

        } catch (Exception e) {
            e.printStackTrace();
        }
    }
}
```

The following sample code provides an example on how to use the ROA style to make an API call. In this example, the GetNamespaceList operation of Container Registry is called, and the API version is 2016-06-07.

Sample code:

```
package com.aliyuns.client.pop.cr;

import com.aliyuncs.CommonRequest;
import com.aliyuncs.CommonResponse;
import com.aliyuncs.DefaultAcsClient;
import com.aliyuncs.IAcsClient;
import com.aliyuncs.exceptions.ClientException;
import com.aliyuncs.exceptions.ServerException;
import com.aliyuncs.http.FormatType;
import com.aliyuncs.http.HttpClientConfig;
import com.aliyuncs.http.MethodType;
import com.aliyuncs.http.ProtocolType;
import com.aliyuncs.profile.DefaultProfile;

public class GetNamespaceListTest {
    public static void main(String[] args) {
        // Specify the endpoint of ASAPI.
        String endpoint = "public.asapi.<global:region>.<global:internet-domain>/asapi/v3/roa";
        // Specify the region where the Container Registry service resides.
        String region = "<global:region>";
        // Specify the name of the service that you want to access.
        String product = "cr";
        // Specify your AccessKey pair.
        String ak = "<accessKeyId>";
        String sk = "<accessKeySecret>";
        DefaultProfile profile = DefaultProfile.getProfile(region, ak, sk);
        // Ignore SSL certificate validation.
        HttpClientConfig clientConfig = HttpClientConfig.getDefault();
        clientConfig.setIgnoreSSLCerts(true);
        // Set the connection timeout period.
        clientConfig.setConnectionTimeoutMillis(3000L);
        // Set the read timeout period.
        clientConfig.setReadTimeoutMillis(10000L);
        profile.setHttpClientConfig(clientConfig);
        // Create a connection for the client.
        IAcsClient client = new DefaultAcsClient(profile);
        // Create a request.
        CommonRequest request = new CommonRequest();
        // Set the request protocol to HTTPS.
```

```
        request.setSysProtocol(ProtocolType.HTTPS);
        // Specify the request method.
        request.setSysMethod(MethodType.GET);
        // Specify the endpoint of ASAPI.
        request.setSysDomain(endpoint);
        // Specify the version of the API.
        request.setSysVersion("2016-06-07");
        // Specify the pattern of the uniform resource identifier (URI).
        request.setSysUriPattern("/namespace");
        // Specify the name of the service that you want to access and the region where the
service resides.
        request.setSysLocationProduct(product);

        request.putHeadParameter("Content-Type", "application/json");
        String requestBody = "" +
                "{}";
        request.setHttpContent(requestBody.getBytes(), "utf-8", FormatType.JSON);
        try {
            CommonResponse response = client.getCommonResponse(request);
            System.out.println(response.getData());
        } catch (ServerException e) {
            e.printStackTrace();
        } catch (ClientException e) {
            e.printStackTrace();
        }
    }
}
```

> **Notice**
>
> If you send a request over HTTPS, you must enable the request to ignore SSL certificate validation.

SDK for Go

This topic describes how to use Apsara Stack API (ASAPI) SDK for POP for Go.

Prerequisites

An Alibaba Cloud SDK package is downloaded for the service that you want to access. The required dependencies are installed.

Background information

Only the remote procedure call (RPC) style is supported for API calls.

Call examples

The following sample code provides an example on how to make an API call. In this example, the DescribeInstances operation of Elastic Compute Service (ECS) is called, and the API version is 2014-05-26.

Sample code:

```
package main
```

```
import (
 "fmt"
 "time"

 "github.com/aliyun/alibaba-cloud-sdk-go/sdk"
 "github.com/aliyun/alibaba-cloud-sdk-go/sdk/auth/credentials"
 "github.com/aliyun/alibaba-cloud-sdk-go/sdk/requests"
 "github.com/aliyun/alibaba-cloud-sdk-go/sdk/responses"
)

func getSdkConfig() *sdk.Config {
 return sdk.NewConfig().
  WithTimeout(time.Duration(30) * time.Second).
  WithEnableAsync(true).
  WithGoRoutinePoolSize(100).
  WithMaxTaskQueueSize(10000).
  WithDebug(false).
  WithScheme("HTTP")
}

func main(){
 ak := "<The AccessKey ID of your Apsara Stack tenant account.>"
 sk := "<The AccessKey secret of your Apsara Stack tenant account.>"
 regionId := "<The region where the ECS service resides.>"
 endpoint := "<The endpoint of ASAPI.>" // No network protocol.
 request := requests.NewCommonRequest()
  request.SetReadTimeout(10 * time.Second) // Set the read timeout period of the request to
10 seconds.
  request.SetConnectTimeout(5 * time.Second)  // Set the connection timeout period of the r
equest to 5 seconds.
 request.Method = requests.GET
 request.Domain = endpoint         // Location Service will not be enabled if the host is s
pecified. For example, the service with a certification type-bearer token must be specified
.
 request.Version = "2014-05-26"            // Specify the version of the API.
 request.Scheme = "https"                // Specify the request protocol. Default value: ht
tp.
 request.ApiName = "DescribeInstances"
 request.QueryParams["Product"] = "Ecs"  // Specify the name of the service that you want t
o access.
 request.TransToAcsRequest()
 client, err := sdk.NewClientWithOptions(regionId,getSdkConfig(),credentials.NewAccessKeyCr
edential(ak,sk))
 // If relevant parameters are not set for the request, the client settings are used.
  //client.SetReadTimeout(10 * time.Second)              // Set the read timeout period of
the client to 10 seconds.
 //client.SetConnectTimeout(5 * time.Second)            // Set the connection timeout perio
d of the client to 5 seconds.
  resp := responses.BaseResponse{}
  err = client.DoAction(request, &resp)
    if err != nil {
        panic(err)
    }
 fmt.Print(endpoint)
```

```
}
```

Configure proxies

You can configure proxies in one of the following ways:

- Configure proxies by using environment variables.

  Set the HTTP_PROXY and HTTPS_PROXY environment variables, or set the NO_PROXY environment variable.

  Sample code:

```
import (
    "os"
)
func main(){
 os.Setenv("HTTP_PROXY", "http://x.x.x.x:xxxx") // Set the HTTP_PROXY environment variabl
e.
 os.Setenv("HTTPS_PROXY", "https://x.x.x.x:xxxx") // Set the HTTPS_PROXY environment vari
able.
}
```

- Configure proxies on the client.

  Sample code:

```
// The proxies that are configured on the client take precedence over those that are conf
igured by using environment variables.
client.SetHttpProxy("http://x.x.x.x:xxxx")   // Configure the HTTP proxy.
client.GetHttpProxy()                          // Query the HTTP proxy.

client.SetHttpsProxy("https://x.x.x.x:xxxx")   // Configure the HTTPS proxy.
client.GetHttpsProxy()                           // Query the HTTPS proxy.

client.SetNoProxy("127.0.0.1,localhost")     // Configure the proxy whitelist.
client.GetNoProxy()                          // Query the proxy whitelist.
```

SDK for Python

This topic describes how to use Apsara Stack API (ASAPI) SDK for POP for Python.

Prerequisites

An Alibaba Cloud SDK package is downloaded for the service that you want to access. The required dependencies are installed.

Background information

Only the remote procedure call (RPC) style is supported for API calls.

Call examples

The following sample code provides an example on how to make an API call. In this example, the DescribeInstances operation of Elastic Compute Service (ECS) is called, and the API version is 2014-05-26.

Sample code:

```
from aliyunsdkcore.client import AcsClient
from aliyunsdkcore.acs_exception.exceptions import ClientException
from aliyunsdkcore.acs_exception.exceptions import ServerException
from aliyunsdkecs.request.v20140526 import DescribeInstancesRequest
import os

# Create an AcsClient instance.
client = AcsClient(
   "<your-access-key-id>",
   "<your-access-key-secret>",
   "<your-region-id>",

   timeout=1000,  # Set the timeout period.
    verify=False, # Ignore certificate validation. or verify='<The location where the certi
ficate is stored.>'
);
# Set the following parameters for the HTTPS request protocol:
# client.set_verify(False)
# os.environ["HTTPS_PROXY"] = "http://127.0.0.1:8080"

# os.environ["HTTP_PROXY"] = "http://127.0.0.1:8080"
def hello_ecs_instance():
    # Create a request and set the parameters.
    request = DescribeInstancesRequest.DescribeInstancesRequest()

    params = {"PageNumber":"1", "Product":"Ecs","Version": "2014-05-26","Action": "Describe
Instances"};
    request.set_body_params(params)
    # The endpoint that contains no network protocol is in the following format: ASAPI doma
in name/asapi/v3.
    request.set_endpoint('<The endpoint of ASAPI.>')
    # Set the following parameter if the endpoint contains no network protocol:
    request.set_protocol_type("https")

    request.set_PageSize(10)
    # Initiate the API request and obtain the response.
    response = client.do_action_with_exception(request)
    print(response)

if __name__ == '__main__':
    print("Hello Aliyun OpenApi!")
    hello_ecs_instance()
```

Configure proxies

Set the HTTP_PROXY and HTTPS_PROXY environment variables.

Sample code:

```
# Configure the HTTPS proxy.
os.environ["HTTPS_PROXY"] = "http://x.x.x.x:xxxx"

# Configure the HTTP proxy.
os.environ["HTTP_PROXY"] = "https://x.x.x.x:xxxx"
```

15.1.1.1.5. HTTP requests

15.1.1.1.5.1. Overview

This topic describes how to make API requests and is intended for users who use API URLs to initiate HTTP GET requests.

If you are using an SDK to initiate requests, you can skip this topic.

The request URL consists of different parameters and has a fixed syntax. The URL contains common request parameters, your signature, and operation-specific parameters. Sample request URLs are provided for each API operation. These URLs are not encoded to make them easy to read. Before you make a request, you must encode the request URL. After the authentication process is complete based on your signature, the results are returned to you. Response parameters are returned if the call is successful, whereas an error message is returned if the call fails. You can troubleshoot issues based on the error message.

15.1.1.1.5.2. Request syntax

The Apsara Stack API (ASAPI) allows you to call API operations by sending HTTP GET requests based on URLs. Each URL must include request parameters. This topic describes the syntax of HTTP GET requests and provides the endpoint of the ASAPI.

Sample request

GetOrganizationList is used in the following unencoded URL request:

```
https://public.asapi.aliyuns.com/asapi/v3?Action=GetOrganizationList&Product=ascm&Version=2019-05-10&Id=<Organization ID>&<Common parameters>
```

- `https`: the protocol used to transmit the request.
- `public.asapi.aliyuns.com/asapi/v3`: the endpoint of the ASAPI.
- `Action=GetOrganizationList Product=ascm Version=2019-05-10`: the API operation to call.
- `Id`: the ID of the organization.
- `<Common parameters>`: the common parameters specified in the system.

Protocol

The ASAPI supports only HTTPS.

Endpoint

For more information about how to obtain an endpoint, see Generate an endpoint for the ASAPI.

Parameter

To specify an API operation, use the `Action, Product, and Version` parameters. For example, set `Action` to GetOrganizationList, Product to ascm, and Version to 2019-05-10. You must also specify other operation-specific parameters and common parameters. For more information, see Common parameters.

15.1.1.1.5.3. Request signatures

This topic describes how to sign HTTP API requests. ASAPI uses the request signature to verify the identity of the request sender. ASAPI implements symmetric encryption by using an AccessKey pair to verify the identity of the request sender.

> **Note**
>
> - An AccessKey pair consists of an AccessKey ID and an AccessKey secret, which are issued to each user or organization in the Apsara Uni-manager Management Console.
> - The AccessKey ID is used to verify identities of users, and the AccessKey secret is used to encrypt and verify signature strings. You must keep your AccessKey secret confidential.
> - ASAPI provides SDKs for Node.js, Python, and Java to facilitate complex signature calculation. For more information, see Obtain the core package for ASAPI.

Step 1: Create a canonicalized query string

1. Arrange the request parameters in alphabetical order, including all common and operation-specific parameters except the `Signature` parameter.

   > **Note**
   >
   > If you use the GET method to send a request,these parameters are connected by ampersands (&) and included in the request URL. The first request parameter follows a question mark (?).

2. Encode the request parameters and their values in UTF-8 based on RFC 3986. The following rules apply in the encoding process:
   - Letters, digits, and special characters such as hyphens (`-`), underscores (`_`), and periods (`.`) do not need to be encoded.
   - Other characters must be percent encoded in the `%XY` format. `XY` represents the ASCII code of the characters in hexadecimal notation. For example, double quotation marks (`"`) are encoded as `%22` .

- Extended UTF-8 characters are encoded in the `%XY%ZA...` format.
- Spaces must be encoded as `%20`. Do not encode spaces as plus signs (`+`).

  This encoding method is similar to but different from the `application/x-www-form-urlencoded` MIME encoding algorithm.

  If you use `java.net.URLEncoder` from the Java standard library, use `percentEncode` to encode request parameters and their values. In the encoded query string, replace the plus signs (`+`) with `%20` , asterisks (`*`) with `%2A` , and `%7E` with tildes (`~`). This way, you can obtain an encoded string that matches the preceding encoding rules.

```
private static final String ENCODING = "UTF-8";
private static String percentEncode(String value) throws UnsupportedEncodingException
{
    return value != null ? URLEncoder.encode(value, ENCODING).replace("+", "%20").rep
lace("*", "%2A").replace("%7E", "~") : null;
}
```

3. Use equal signs (`=`) to connect the encoded request parameters and their values.
4. Use ampersands (`&`) to connect the encoded request parameters. These parameters must be arranged in the same order as those in Step 1.

Then, a canonicalized query string that follows the request structure is obtained. For more information, see Request structure.

Step 2: Create a string-to-sign

1. Create a `string-to-sign` . You can also use `percentEncode` to encode the canonicalized query string created in Step 1 based on the following rules:

```
StringToSign=
    HTTPMethod + "&" + //HTTPMethod: the HTTP method that is used to send a request, su
ch as GET.
    percentEncode("/") + "&" + //percentEncode("/"): Encode the forward slash (/) in UT
F-8 as %2F.
    percentEncode(CanonicalizedQueryString) // Encode the canonicalized query string cr
eated in Step 1.
```

2. Calculate the RFC 2104-compliant HMAC-SHA1 or HMAC-256 value of `StringToSign` . In the following example, Java Base64 is used:

```
String signature = Base64.getEncoder().encodeToString(signData);
```

> **Note**
> When you calculate the signature, the key value specified by RFC 2104 is your `AccessKey secret` plus an ampersand (&), which has an ASCII value of 38. For more information, see Obtain an AccessKey pair.

3. Encode the `Signature` parameter based on RFC 3986 and add it to the canonicalized query string.

Example 1: Concatenate parameters

`GetOrganizationList` is used in this example to query regions. For example, `AccessKeyID` is set to testid and `AccessKeySecret` is set to testsecret. Perform the following operations:

1. Construct a canonicalized query string.

```
https://public.asapi.aliyuns.com/asapi/v3/?AccessKeyId=testid&Action=GetOrganizationList&Format=JSON&Id=1&Product=ascm&RegionId=cn-region-test&SignatureMethod=HMAC-SHA1&SignatureNonce=43967c6e-e3ad-44fa-b06b-fcf3db5f39d2&SignatureVersion=1.0&Timestamp=2020-09-15T08%3A50%3A40Z&Version=2019-05-10
```

2. Create a `string-to-sign` .

```
GET&%2F&AccessKeyId%3Dtestid%26Action%3DGetOrganizationList%26Format%3DJSON%26Id%3D1%26Product%3Dascm%26RegionId%3Dcn-region-test%26SignatureMethod%3DHMAC-SHA1%26SignatureNonce%3D43967c6e-e3ad-44fa-b06b-fcf3db5f39d2%26SignatureVersion%3D1.0%26Timestamp%3D2020-09-15T08%253A50%253A40Z%26Version%3D2019-05-10
```

3. Calculate the signature.

   Calculate the signature. The key value used for calculation is `testsecret&` because `AccessKeySecret` is set to testsecret. The calculated signature is `OLeaidS1JvxuMvnyHOwuJ+uX5qY=` . Java Base64 is used in the following sample code:

   `String signature = Base64.getEncoder().encodeToString(signData);` Encode `Signature=hvqv9Ll5RE6kQ4YsQXFAf9VuRIY=` based on RFC 3986 and add it to the canonicalized query string.

```
https://public.asapi.aliyuns.com/asapi/v3/?AccessKeyId=testid&Action=GetOrganizationList&Format=JSON&Id=1&Product=ascm&RegionId=cn-region-test&SignatureMethod=HMAC-SHA1&SignatureNonce=43967c6e-e3ad-44fa-b06b-fcf3db5f39d2&SignatureVersion=1.0&Timestamp=2020-09-15T08%3A50%3A40Z&Version=2019-05-10
```

You can use browsers or tools such as cURL and Wget to initiate an HTTP request for calling the `DescribeRegions` operation to query the Alibaba Cloud region list.

Example 2: Use the standard library of the programming language

`GetOrganizationList` is used in this example to query regions. For example, `AccessKeyID` is set to testid, `AccessKeySecret` is set to testsecret, and all request parameters are stored in a Java `Map<String, String>` object.

1. Predefine an encoding method.

```
private static final String ENCODING = "UTF-8";
private static String percentEncode(String value) throws UnsupportedEncodingException {
        return value != null ? URLEncoder.encode(value, ENCODING).replace("+", "%20").r
eplace("*", "%2A").replace("%7E", "~") : null;
}
```

2. Predefine the time format for the `Timestamp` parameter. Specify the `Timestamp` parameter in the ISO 8601 format. The time must be in UTC+0.

```
private static final String ISO8601_DATE_FORMAT = "yyyy-MM-dd'T'HH:mm:ss'Z'";
private static String formatIso8601Date(Date date) {
    SimpleDateFormat df = new SimpleDateFormat(ISO8601_DATE_FORMAT);
    df.setTimeZone(new SimpleTimeZone(0, "GMT"));
    return df.format(date);
}
```

3. Create a request string.

```
final String HTTP_METHOD = "GET";
Map parameters = new HashMap();
// Specify request parameters.
parameters.put("Product", "ascm");
parameters.put("Action", "GetOrganizationList");
parameters.put("Version", "2019-05-10");
parameters.put("AccessKeyId", "testid");
parameters.put("RegionId", "cn-region-test");
parameters.put("Timestamp", formatIso8601Date(new Date()));
parameters.put("SignatureMethod", "HMAC-SHA1");
parameters.put("SignatureVersion", "1.0");
parameters.put("SignatureNonce", UUID.randomUUID().toString());
parameters.put("Format", "JSON");
parameters.put("Id", "1");
// Arrange request parameters.
String[] sortedKeys = parameters.keySet().toArray(new String[]{});
Arrays.sort(sortedKeys);
final String SEPARATOR = "&";
// Create a string-to-sign.
StringBuilder stringToSign = new StringBuilder();
stringToSign.append(HTTP_METHOD).append(SEPARATOR);
stringToSign.append(percentEncode("/")).append(SEPARATOR);
StringBuilder canonicalizedQueryString = new StringBuilder();
for(String key : sortedKeys) {
    // Encode the key and the value.
    canonicalizedQueryString.append("&")
    .append(percentEncode(key)).append("=")
    .append(percentEncode(parameters.get(key)));
}
//Encode the canonicalized query string.
stringToSign.append(percentEncode(
canonicalizedQueryString.toString().substring(1)));
```

4. The signature. The key value used for calculation is `testsecret&` because `AccessKeySecret` is set to testsecret. The calculated signature is `OLeaidS1JvxuMvnyHOwuJ%2BuX5qY%3D`.

```
// The following sample code shows how to calculate the signature:
final String ALGORITHM = "HmacSHA1";
final String ENCODING = "UTF-8";
key = "testsecret&";
Mac mac = Mac.getInstance(ALGORITHM);
mac.init(new SecretKeySpec(key.getBytes(ENCODING), ALGORITHM));
byte[] signData = mac.doFinal(stringToSign.getBytes(ENCODING));
String signature = Base64.getEncoder().encodeToString(signData);
```

Encode the Signature parameter based on RFC 3986 and add it to the canonicalized query string. The following URL is obtained:

```
https://public.asapi.aliyuns.com/asapi/v3/?AccessKeyId=testid&Action=GetOrganizationLis
t&Format=JSON&Id=1&Product=ascm&RegionId=cn-region-test&SignatureMethod=HMAC-SHA1&Signa
tureNonce=43967c6e-e3ad-44fa-b06b-fcf3db5f39d2&SignatureVersion=1.0&Timestamp=2020-09-1
5T08%3A50%3A40Z&Version=2019-05-10
```

5. Use browsers or tools such as cURL and Wget to initiate an HTTP request.

15.1.1.1.5.4. Response

Responses are returned only in the JSON format. If a return code is greater than or equal to 200 and less than 300, a success response is returned. Otherwise, an error response is returned.

Sample success response

If a request is successful, the request ID and operation-specific parameter values are returned. For more information, see the developer guide of the corresponding Apsara Stack service.

```
 {
    "eagleEyeTraceId": "xxx-xxx-xxx-xxx", // The trace ID provided by EagleEye.
    "asapiSuccess": true,
    "RequestId": "xxxxxxxxxx",
    "Regions": { // The regions returned after you call the DescribeRegions operation.
        "Region": [
            {
                "RegionId": "",
                "RegionEndpoint": "",
                "LocalName": ""
            }
        ]
    }
}
```

Sample error response

If a request fails, the following information is returned. For more information, see the developer guide of the corresponding Apsara Stack service.

```
{
    "code": "asapi.server.api.notfound",// The error code.
    "eagleEyeTraceId": "xxx-xxx-xxx-xxx", // The trace ID provided by EagleEye.
    "asapiSuccess": false, // Indicates whether the request is successful.
    "hostId": "xxxx", // The ID of the host.
    "message": "Failed to ....", // The message returned.
    "asapiErrorMessage": "Failed to ....", // The error message provided by the ASAPI.
    "asapiErrorCode": "asapi.server.api.notfound" // The error code provided by the ASAPI.
}
```

15.1.2. API reference

15.1.2.1. API reference

15.1.2.1.1. List of operations by function

The following tables list the API operations available for use in Virtual Private Cloud (VPC).

VPC API

API	Description
CreateVpc	Creates a VPC.
DeleteVpc	Deletes a VPC.
ModifyVpcAttribute	Modifies the name and description of a VPC.
DescribeVpcs	Queries VPCs.
AssociateVpcCidrBlock	Adds a secondary IPv4 CIDR block to a VPC.
UnassociateVpcCidrBlock	Deletes a secondary IPv4 CIDR block from a VPC.

vSwitch API

API	Description
CreateVSwitch	Creates a vSwitch.
DeleteVSwitch	Deletes a vSwitch.
ModifyVSwitchAttribute	Modifies the name and description of a vSwitch.
DescribeVSwitches	Queries vSwitches.

vRouter API

API	Description
ModifyVRouterAttribute	Modifies the name and description of a vRouter.
DescribeVRouters	Queries vRouters in a specified region.

Route table API

API	Description
CreateRouteTable	Creates a custom route table.
CreateRouteEntry	Creates a custom route entry in the vRouter or virtual border router (VBR) of a VPC.
DeleteRouteEntry	Deletes a custom route entry.
DescribeRouteEntryList	Queries route entries.
ModifyRouteEntry	Modifies the name and description of a custom route entry.

API	Description
AssociateRouteTable	Associates a custom route table with a vSwitch in the same VPC.
DeleteRouteTable	Deletes a custom route table.
DescribeRouteTableList	Queries route tables.
UnassociateRouteTable	Disassociates a route table from a vSwitch.

Region API

API	Description
DescribeRegions	Queries available regions.
DescribeZones	Queries zones in a specified region.

Tag API

API	Description
TagResources	Creates and adds tags to a specified resource.
ListTagResources	Queries tags that are added to instances.
UnTagResources	Removes tags from a specified resource.

BGP API

API	Description
DescribeBgpGroups	Queries Border Gateway Protocol (BGP) groups in a specified region.
ModifyBgpGroupAttribute	Modifies configurations of BGP groups.
DeleteBgpGroup	Deletes a specified BGP group.
DescribeBgpPeers	Queries BGP peers in a specified region.
DeleteBgpPeer	Deletes a specified BGP peer.
AddBgpNetwork	Advertises BGP networks.
DeleteBgpNetwork	Deletes advertised BGP networks.
DescribeBgpNetworks	Queries advertised BGP networks.

VBR API

API	Description
CreateVirtualBorderRouter	Creates a VBR.
DeleteVirtualBorderRouter	Deletes a VBR.
DescribeVirtualBorderRouters	Queries VBRs.
TerminateVirtualBorderRouter	Disables a VBR.
RecoverVirtualBorderRouter	Enables a disabled VBR.
UnassociatePhysicalConnectionFromVirtualBorderRouter	Disassociate a VBR from an Express Connect circuit.

Express Connect API

API	Description
CancelPhysicalConnection	Cancels an Express Connect circuit before it is enabled. After you perform this operation, the Express Connect circuit enters the Canceled state.
DescribePhysicalConnections	Queries Express Connect circuits in a specified region.
ModifyPhysicalConnectionAttribute	Modifies the configuration of an Express Connect circuit.
TerminatePhysicalConnection	Disables an Express Connect circuit after it is enabled.
EnablePhysicalConnection	Enables an Express Connect circuit that is in the Confirmed state. After you perform this operation, the Express Connect circuit enters the Enabled state.
DeletePhysicalConnection	Deletes an Express Connect circuit.
CreatePhysicalConnectionOccupancyOrder	Creates an order for resource occupation.
ApplyPhysicalConnectionLOA	Applies for a letter of authorization (LOA).
CreatePhysicalConnectionSetupOrder	Creates an order for initial installation.
CompletePhysicalConnectionLOA	Completes construction.
DescribePhysicalConnectionLOA	Queries LOA information about an Express Connect.

VPN Gateway API

API	Description
CreateVpnGateway	Creates a VPN gateway.

API	Description
DescribeVpnGateways	Queries VPN gateways.
DescribeVpnGateway	Queries detailed information about a specified VPN gateway.
DeleteVpnGateway	Deletes a specified VPN gateway.
ModifyVpnGatewayAttribute	Modifies the name and description of a VPN gateway.
CreateCustomerGateway	Creates a customer gateway.
DescribeCustomerGateways	Queries customer gateways.
DescribeCustomerGateway	Queries details about a customer gateway.
DeleteCustomerGateway	Deletes a specified customer gateway.
ModifyCustomerGatewayAttribute	Modifies the name and description of a customer gateway.
DeleteVpnPbrRouteEntry	Deletes a policy-based route entry of a VPN gateway.
DeleteVpnRouteEntry	Deletes a destination-based route entry of a VPN gateway.
DescribeVpnRouteEntries	Queries destination-based route entries of a VPN gateway.
ModifyVpnRouteEntryWeight	Modifies the weight of a destination-based route entry of a VPN gateway.
CreateVpnRouteEntry	Creates a destination-based route entry for a VPN gateway.
ModifyVpnPbrRouteEntryWeight	Modifies the weight of a policy-based route entry of a VPN gateway.
DescribeVpnPbrRouteEntries	Queries policy-based route entries of a VPN gateway.
PublishVpnRouteEntry	Advertises a route entry of a VPN gateway to a VPC.
CreateVpnPbrRouteEntry	Creates a policy-based route entry for a VPN gateway.
DescribeVpnConnection	Queries details about an IPsec-VPN connection.
DeleteVpnConnection	Deletes a specified IPsec-VPN connection.

API	Description
DownloadVpnConnectionConfig	Queries configuration information about an IPsec-VPN connections.
CreateVpnConnection	Creates an IPsec-VPN connection.
DescribeVpnConnections	Queries IPsec-VPN connections in a specified region.
ModifyVpnConnectionAttribute	Modifies the configuration of an IPsec-VPN connection.
CreateSslVpnServer	Creates an SSL-VPN server.
DeleteSslVpnServer	Deletes an SSL-VPN server.
ModifySslVpnServer	Modifies the configuration of an SSL-VPN server.
DeleteSslVpnClientCert	Deletes an SSL-VPN client certificate.
ModifySslVpnClientCert	Modifies the name of an SSL-VPN client certificate.
CreateSslVpnClientCert	Creates an SSL-VPN client certificate.
DescribeSslVpnClientCerts	Queries SSL-VPN client certificates.
DescribeSslVpnClientCert	Queries details about an SSL-VPN client certificate.
DescribeSslVpnServers	Queries SSL-VPN servers.
DescribeVpnSslServerLogs	Queries the logs of an SSL-VPN server.

NAT Gateway API

API	Description
ModifyNatGatewayAttribute	Modifies the configuration of a NAT gateway.
ModifyNatGatewaySpec	Resizes a NAT gateway.
DeleteNatGateway	Deletes a specified NAT gateway.
CreateForwardEntry	Adds DNAT entries to a DNAT table.
DescribeForwardTableEntries	Queries DNAT entries in a specified DNAT table.
ModifyForwardEntry	Modifies a specified DNAT entry.
DeleteForwardEntry	Deletes a specified DNAT entry.
CreateSnatEntry	Adds SNAT entries to an SNAT table.
DescribeSnatTableEntries	Queries SNAT entries.

API	Description
ModifySnatEntry	Modifies a specified SNAT entry.
DeleteSnatEntry	Deletes a specified SNAT entry.
ModifyBandwidthPackageSpec	Modifies the bandwidth of a NAT service plan.
DeleteBandwidthPackage	Deletes a specified NAT service plan.
CreateBandwidthPackage	Creates a NAT service plan.
DescribeBandwidthPackages	Queries NAT service plans in a specified region.
ModifyBandwidthPackageAttribute	Modifies the name and description of a specified NAT service plan.
AddBandwidthPackageIps	Adds public IP addresses to a NAT service plan.

EIP API

API	Description
AllocateEipAddress	Applies for an elastic IP address (EIP).
AllocateEipAddressPro	Applies for a specified EIP.
AssociateEipAddress	Associates an EIP with a cloud service in the same region.
ModifyEipAddressAttribute	Modifies the name, description, and maximum bandwidth of an EIP.
UnassociateEipAddress	Disassociates an EIP from a cloud resource.
ReleaseEipAddress	Releases a specified EIP.
DescribeEipGatewayInfo	Queries information about the subnet mask and gateway of an EIP.

HAVIP API

API	Description
CreateHaVip	Creates a high-availability virtual IP address (HAVIP).
DescribeHaVips	Queries HAVIPs in a specified region.
ModifyHaVipAttribute	Modifies the description of an HAVIP.
AssociateHaVip	Associates an HAVIP with an Elastic Compute Service (ECS) instance.

API	Description
UnassociateHaVip	Disassociates an HAVIP from an ECS instance.
DeleteHaVip	Deletes an HAVIP.

Network ACL API

API	Description
CreateNetworkAcl	Creates a network access control list (ACL).
AssociateNetworkAcl	Associates a network ACL with a vSwitch.
ModifyNetworkAclAttributes	Modifies the attributes of a network ACL.
UpdateNetworkAclEntries	Updates rules of a network ACL.
UnassociateNetworkAcl	Disassociates a network ACL from a vSwitch.
CopyNetworkAclEntries	Copies rules of a network ACL.
DeleteNetworkAcl	Deletes a network ACL.
DescribeNetworkAcls	Queries network ACLs.
DescribeNetworkAclAttributes	Queries details about a network ACL.

IPv6 Gateway API

API	Description
CreateIpv6Gateway	Creates an IPv6 gateway.
DeleteIpv6Gateway	Deletes an IPv6 gateway.
DescribeIpv6Gateways	Queries IPv6 gateways.
ModifyIpv6GatewaySpec	Modifies the specification of an IPv6 gateway.
DescribeIpv6EgressOnlyRules	Queries egress-only rules.
CreateIpv6EgressOnlyRule	Adds an egress-only rule to an IPv6 address.
DeleteIpv6EgressOnlyRule	Deletes an egress-only rule.
DeleteIpv6InternetBandwidth	Deletes an IPv6 Internet bandwidth plan.
DescribeIpv6GatewayAttribute	Queries detailed information about an IPV6 gateway.
DescribeIpv6Addresses	Queries IPv6 addresses.

API	Description
ModifyIpv6InternetBandwidth	Modifies the Internet bandwidth plan of an IPv6 address.
AllocateIpv6InternetBandwidth	Purchases an Internet bandwidth plan for an IPv6 address.
ModifyIpv6AddressAttribute	Modifies the name and description of an IPv6 address.
ModifyIpv6GatewayAttribute	Modifies the information about an IPv6 gateway.

15.1.2.1.2. Call VPC APIs

15.1.2.1.2.1. Request syntax

To call a Virtual Private Cloud (VPC) API operation, you must send an HTTP GET request to the endpoint of the VPC API. You must add the request parameters that correspond to the API operation being called. After you call the API, the system returns a response. The request and response are encoded in UTF-8.

VPC API operations use the RPC protocol. You can call VPC API operations by sending HTTP GET requests.

The following example shows the syntax of a VPC API request:

```
http://Endpoint/?Action=xx&Parameters
```

where:

- Endpoint: the endpoint of the API. The endpoint of the VPC API is `vpc.example.com`.

  > **Note** `example.com` is a custom domain name. You can obtain the endpoint in the Apsara Uni-manager Operations Console. For more information, see Generate the ASAPI endpoint.

- Action: the operation that you want to perform. For example, to query VPCs, you must set the Action parameter to DescribeVpcs.
- Version: the version of the API that you want to call. The current VPC API version is *2016-04-28*.
- Parameters: the request parameters for the operation. Separate multiple parameters with ampersands (&).

  Request parameters include both common request parameters and operation-specific parameters. Common parameters include the API version and authentication information. For more information about common parameters, see Common parameters.

The following example describes how to call the DescribeVpcs operation.

> **Note** The example in this topic is formatted to improve readability.

```
https://vpc.example.com/?Action=DescribeVpcs
&Format=xml
&Version=2016-04-28
&Signature=xxxx%xxxx%3D
&SignatureMethod=HMAC-SHA1
&SignatureNonce=15215528852396
&SignatureVersion=1.0
&AccessKeyId=key-test
&Timestamp=2012-06-01T12:00:00Z
```

15.1.2.1.2.2. API authorization

To ensure the security of your account, we recommend that you call VPC APIs as a RAM user. Before you can use a RAM account to call a VPC API, you must create a RAM account and assign corresponding permissions to it.

For more information about VPC resources and APIs you can assign permissions on, see RAM authentication.

15.1.2.1.2.3. Request signatures

You must sign all API requests to ensure security. Virtual Private Cloud (VPC) uses the request signature to verify the identity of the API caller.

VPC implements symmetric encryption with an AccessKey pair to verify the identity of the request sender. An AccessKey pair is an identity credential issued to Alibaba Cloud accounts and RAM users that is similar to a logon username and password. An AccessKey pair consists of an AccessKey ID and an AccessKey secret. The AccessKey ID is used to verify the identity of the user, while the AccessKey secret is used to encrypt and verify the signature string. You must keep your AccessKey secret strictly confidential. For more information about how to create an AccessKey pair, see Obtain an AccessKey pair.

You must add the signature to an RPC API request in the following format:

`https://endpoint/?SignatureVersion=1.0&SignatureMethod=HMAC-SHA1&Signature=xxxx%xxxx%3D&SignatureNonce=3ee8c1b8-83d3-44af-a94f-4e0ad82fd6cf`

Take DescribeVpcs as an example. Assume that the AccessKey ID is `testid` and the AccessKey secret is `testsecret`. The original request URL is formatted as the following example:

```
http://vpc.example.com/?Action=DescribeVpcs
&Timestamp=2016-02-23T12:46:24Z
&Format=XML
&AccessKeyId=testid
&SignatureMethod=HMAC-SHA1
&SignatureNonce=3ee8c1b8-83d3-44af-a94f-4e0ad82fd6cf
&Version=2016-04-28
&SignatureVersion=1.0
```

Perform the following operations to calculate the signature:

1. Create a string-to-sign by using the request parameters:

```
GET&%2F&AccessKeyId%3Dtestid&Action%3DDescribeVpcs&Format%3DXML&SignatureMethod%3DHMAC-SHA1&SignatureNonce%3D3ee8c1b8-83d3-44af-a94f-4e0ad82fd6cf&SignatureVersion%3D1.0&TimeStamp%3D2016-02-23T12%253A46%253A24Z&Version%3D2014-05-15
```

2. Calculate the HMAC value of the string-to-sign.

   Add an ampersand (&) after the AccessKey secret as the key to calculate the HMAC value. In this example, the key is `testsecret&` .

```
CT9X0VtwR86fNWSnsc6v8YGOjuE=
```

3. Add the signature string to the request as the Signature parameter:

```
http://vpc.example.com/?Action=DescribeVpcs
&Timestamp=2016-02-23T12:46:24Z
&Format=XML
&AccessKeyId=testid
&SignatureMethod=HMAC-SHA1
&SignatureNonce=3ee8c1b8-83d3-44af-a94f-4e0ad82fd6cf
&Version=2016-04-28
&SignatureVersion=1.0
&Signature=xxxx%xxxx%3D
```

15.1.2.1.3. RAM authentication

Before calling a VPC API using a RAM user, you must use an Apsara Stack tenant account to create an authorization policy to assign permissions to the RAM user. In the authorization policy, an Alibaba Cloud Resource Name (ARN) is used as the unique identifier of the resource to authorize.

VPC resources

The following table lists the VPC resources that can be authorized and their corresponding ARN formats.

Resource type	ARN format
Virtual Private Cloud (VPC)	`acs:vpc:$regionid:$accountid:vpc/$vpcid`
	`acs:vpc:$regionid:$accountid:vpc/*`
	`acs:vpc:*:$accountid:vpc/*`
VRouter	`acs:vpc:$regionid:$accountid:vrouter/$vrouterid`
	`acs:vpc:$regionid:$accountid:vrouter/*`
	`acs:vpc:*:$accountid:vrouter/*`
VSwitch	`acs:vpc:$regionid:$accountid:vswitch/$vswitchid`
	`acs:vpc:$regionid:$accountid:vswitch/*`
	`acs:vpc:*:$accountid:vswitch/*`

Resource type	ARN format
Routing table	acs:vpc:$regionid:$accountid:routetable/$routetableid
	acs:vpc:$regionid:$accountid:routetable/*
	acs:vpc:*:$accountid:routetable/*
Elastic IP Address (EIP)	acs:vpc:$regionid:$accountid:eip/$allocationid
	acs:vpc:$regionid:$accountid:eip/*
	acs:vpc:*:$accountid:eip/*
NAT Gateway	acs:vpc:$regionid:$accountid:natgateway/$natgatewayid
	acs:vpc:$regionid:$accountid:natgateway/*
	acs:vpc*:$accountid:vpc/*
NAT Gateway service plan	acs:vpc:$regionid:$accountid:bandwidthpackage/$bandwidthpackageid
	acs:vpc:$regionid:$accountid:bandwidthpackage/*
	aacs:vpc:*:$accountid:vpc/*
Forwarding table	acs:vpc:$regionid:$accountid:forwardtable/$forwardtableid
	acs:vpc:$regionid:$accountid:forwardtable/*
	acs:vpc:*:$accountid:vpc/*
SNAT table	acs:vpc:$regionid:$accountid:snattable/$snattableid
	acs:vpc:$regionid:$accountid:snattable/*
	acs:vpc:*:$accountid:vpc/*
General resource	acs:vpc:$regionid:$accountid:*
	acs:vpc:*:$accountid:*

$regionid/accoutid/vrouterid are IDs of the specific resources, * represents all resources.

VPC API operations

The following table lists the API operations that can be authorized and their corresponding ARN formats.

Operation	ARN format
vpc:CreateVpc	acs:vpc:$regionid:$accountid:vpc/*

Operation	ARN format
vpc:DeleteVpc	`acs:vpc:$regionid:$accountid:vpc/$vpcid`
vpc:DescribeVpcs	`vpc:$regionid:$accountid:vpc/*`
vpc:ModifyVpcAttribute	`acs:vpc:$regionid:$accountid:vpc/$vpcid`

vpc:DescribeVRouters	`acs:vpc:$regionid:$accountid:vrouter/*`
	The VRouter ID is specified:
	`"vpc:Vpc":"acs:vpc:$regionid:$accountid:vpc/$vpcid"`
	The VRouter ID is not specified:
	`"vpc:Vpc":"acs:vpc:$regionid:$accountid:vpc/*"`

vpc:ModifyVRouterAttribute	`acs:vpc:$regionid:$accountid:vrouter/$vrouterid`
vpc:CreateVSwitch	`acs:vpc:$regionid:$accountid:vswitch/*` `acs:vpc:$regionid:$accountid:vpc/$vpcid`
vpc:DeleteVSwitch	`acs:vpc:$regionid:$accountid:vswitch/$vswitchid`
vpc:DescribeVSwitches	`acs:vpc:$regionid:$accountid:vswitch/*` `"vpc:Vpc":"acs:vpc:$regionid:$accountid:vpc/$vpcid"`
vpc:ModifyVSwitchAttribute	`acs:vpc:$regionid:$accountid:vswitch/$vswitchid`
vpc:CreateRouteEntry	`acs:vpc:$regionid:$accountid:routetable/$routetableid`
vpc:DeleteRouteEntry	`acs:vpc:$regionid:$accountid:routetable/$routetableid`
vpc:DescribeRouteTables	`acs:vpc:$regionid:$accountid:routetable/*` `"vpc:VRouter":"acs:vpc$regionid:$accountid:vrouter/$vrouterid"`
vpc:AllocateEipAddress	`acs:vpc:$regionid:$accountid:eip/*`

vpc:AssociateEipAddres	`acs:vpc:$regionid:$accountid:eip/*`
	Bind an ECS instance
	`acs:vpc:$regionid:$accountid:eip/$allocationid`
	`acs:ecs:$regionid:$accountid:instance/$instanceid`

vpc:DescribeEipAddresses	`acs:vpc:$regionid:$accountid:eip/*`

Operation	ARN format

vpc:UnassociateEipAddress	Bind an ECS instance
	`acs:vpc:$regionid:$accountid:eip/$allocationid`
	`acs:ecs:$regionid:$accountid:instance/$instanceid`

vpc:ReleaseEipAddress	`acs:vpc:$regionid:$accountid:eip/$allocationid`
vpc:DescribeEipMonitorData	`acs:vpc:$regionid:$accountid:eip/$allocationid` `acs:ecs:$regionid:$accountid:instance/$instanceid`
vpc:CreateNatGateway	`acs:vpc:$regionid:$accountid:natgateway/*`
vpc:DescribeNatGateways	`acs:vpc:$regionid:$accountid:natgateway/$natgatewayid` `acs:vpc:$regionid:$accountid:natgateway/*`
vpc:ModifyNatGatewaySpec	`acs:vpc:$regionid:$accountid:natgateway/$natgatewayid`
vpc:ModifyNatGatewayAttribute	`acs:vpc:$regionid:$accountid:natgateway/$natgatewayid` `acs:ecs:$regionid:$accountid:instance/$instanceid`
vpc:DeleteNatGateway	`acs:vpc:$regionid:$accountid:natgateway/$natgatewayid` `acs:ecs:$regionid:$accountid:instance/$instanceid`
vpc:CreateBandwidthPackage	`acs:vpc:$regionid:$accountid:bandwidthpackage/*`
vpc:DescribeBandwidthPackages	`acs:vpc:$regionid:$accountid:bandwidthpackage/$bandwidthpackageid` `acs:vpc:$regionid:$accountid:bandwidthpackage/*`
vpc:ModifyBandwidthPackageSpec	`acs:vpc:$regionid:$accountid:bandwidthpackage/$bandwidthpackageid`
vpc:ModifyBandwidthPackageAttribute	`acs:vpc:$regionid:$accountid:bandwidthpackage/$bandwidthpackageid`
vpc:AddBandwidthPackageIps	`acs:vpc:$regionid:$accountid:bandwidthpackage/$bandwidthpackageid`
vpc:RemoveBandwidthPackageIps	`acs:vpc:$regionid:$accountid:bandwidthpackage/$bandwidthpackageid`
vpc:DeleteBandwidthPackage	`acs:vpc:$regionid:$accountid:bandwidthpackage/$bandwidthpackageid`

Operation	ARN format
vpc:CreateForwardEntry	`acs:vpc:$regionid:$accountid:forwardtable/$forwardtableid`
vpc:DeleteForwardEntry	`acs:vpc:$regionid:$accountid:forwardtable/$forwardtableid`
vpc:ModifyForwardEntry	`acs:vpc:$regionid:$accountid:forwardtable/$forwardtableid`
vpc:DescribeForwardTableEntries	`acs:vpc:$regionid:$accountid:forwardtable/$forwardtableid`
vpc:CreateSnatEntry	`acs:vpc:$regionid:$accountid:snattable/*`
vpc:ModifySnatEntry	`acs:vpc:$regionid:$accountid:snattable/$snattableid`
vpc:DescribeSnatTableEntries	`acs:vpc:$regionid:$accountid:snattable/$snattableid`
vpc:DeleteSnatEntry	`acs:vpc:$regionid:$accountid:snattable/$snattableid`

15.1.2.1.4. Common parameters

Common request parameters

Common request parameters are request parameters that you must use when you call each API.

Common request parameters

Name	Type	Required	Description
Format	String	No	The format of the response. Valid values: *JSON (default) | XML*
Version	String	Yes	The API version in the format of `YYYY-MM-DD`. Valid value: *2016-04-28*
AccessKeyId	String	Yes	The AccessKey ID that you use to call an API.
Signature	String	Yes	The signature result string.
SignatureMethod	String	Yes	The algorithm used to create the request signature. Valid value: *HMAC-SHA1*

Name	Type	Required	Description
Timestamp	String	Yes	The timestamp of the request. The timestamp uses UTC and it complies with the ISO 8601 standard. Its format is `YYYY-MM-DDThh:mm:ssZ`. For example, 20:00:00 on January 10, 2013 in China Standard Time (UTC +8) is written as 2013-01-10T12:00:00Z.
SignatureVersion	String	Yes	The version of the signature algorithm. Valid value: 1.0
SignatureNonce	String	Yes	A unique random number that is used to prevent network replay attacks. You must use different random numbers for different requests.

Example

```
http://vpc.example.com/?Action=DescribeVpcs
&Timestamp=2016-02-23T12:46:24Z
&Format=XML
&AccessKeyId=testid
&SignatureMethod=HMAC-SHA1
&SignatureNonce=3ee8c1b8-83d3-44af-a94f-4e0ad82fd6cf
&Version=2016-04-28
&SignatureVersion=1.0
```

Common response parameters

API responses use a unified format. 2xx HTTP status codes indicate a successful invocation. 4xx or 5xx HTTP status codes indicate a failed invocation. The responses can be returned in JSON or XML format. The XML format is used by default. You can specify the format when calling an API.

Each time you send a request to call an API, the system returns a unique identifier RequestId, regardless of whether the invocation is successful or not.

- XML format

```
<? xml version="1.0" encoding="utf-8"? >
      <!—Result root node-->
      <API name+Response>
      <!—Returned request tag-->
      <RequestId>4C467B38-3910-447D-87BC-AC049166F216</RequestId>
      <!—Returned results-->
      </API name+Response>
```

- JSON format

```
{
      "RequestId":"4C467B38-3910-447D-87BC-AC049166F216",
      /*Returned results*/
  }
```

15.1.2.1.5. VPC

15.1.2.1.5.1. CreateVpc

Deletes a virtual private cloud (VPC).

Descriptions

When you call this operation, take note of the following rules:

- You can specify only one CIDR block for a VPC. The CIDR block must be 172.16.0.0/16, 192.168.0.0/16, or their subnets, and the subnet mask must be 8 to 24 bits in length. The default CIDR block is 192.168.0.0/16.
- After you create a VPC, you cannot modify its CIDR block.
- In each VPC, cloud services can use a maximum of 60,000 private IP addresses. You cannot increase the quota.
- After you create a VPC, a vRouter and a route table are automatically created.
- At most three customer-side CIDR blocks can be added to a VPC. If a user CIDR block includes another user CIDR block, the one with the shorter subnet mask takes effect. For example, if 192.168.0.0/16 and 192.168.0.0/24 are specified, only 192.168.0.0/16 takes effect.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateVpc	The operation that you want to perform. Set the value to **CreateVpc**.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region to which the VPC belongs. You can call the `DescribeRegions` operation to query the most recent region list.
CidrBlock	String	No	172.16.0.0/16	The CIDR block of the VPC. You can use one of the following CIDR blocks or their subnets as the CIDR block of your VPC: • **172.16.0.0/16**. • **192.168.0.0/16** (default).
Ipv6CidrBlock	String	No	1007:XXXX:0:40::/56	The IPv6 CIDR block of the VPC.

Parameter	Type	Required	Example	Description
EnableIpv6	Boolean	No	false	Specifies whether to enable the IPv6 CIDR block. Valid values: • **false** (default): disables the IPv6 CIDR block. • **true**: enables the IPv6 CIDR block.
VpcName	String	No	abc	The name of the VPC. The name must be 2 to 128 characters in length, and can contain digits, periods (.), underscores (_), and hyphens (-). It must start with a letter and cannot start with `http://` or `https://`.
Description	String	No	This is my first Vpc.	The description of the VPC. The description must be 2 to 256 characters in length. It must start with a letter and cannot start with `http://` or `https://`.
ResourceGroupId	String	No	rg-acfmxazb4ph6aiy****	The ID of the resource group.
DryRun	Boolean	No	false	Specifies whether to precheck this request. Valid values: • **true**: sends a check request without creating a VPC. The system checks the required parameters, request format and service limits. An error message is returned if the request fails the precheck. If the request passes the precheck, the `DryRunOperation` error code is returned. • **false**: sends the request. This is the default value. If the request passes the precheck, a 2XX HTTP status code is returned and the a VPC is created.

Parameter	Type	Required	Example	Description
ClientToken	String	No	123e4567-e89b-12d3-a456-426655440000	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must make sure that it is unique among different requests. **ClientToken** can contain only ASCII characters and cannot exceed 64 characters in length.
UserCidr	String	No	189.XX.XX.0/12	The user CIDR block. Separate multiple CIDR blocks with commas (,). At most three CIDR blocks are supported.

Response parameters

Parameter	Type	Example	Description
VpcId	String	vpc-bp15zckdt37pq72zv****	The ID of the created VPC.
VRouterId	String	vrt-bp1lhl0taikrteen8****	The ID of the vRouter that is automatically created by the system after the VPC is created.
RouteTableId	String	vtb-bp145q7glnuzdv****	The ID of the route table that is automatically created by the system after the VPC is created.
RequestId	String	0ED8D006-F706-4D23-88ED-E11ED28DCAC0	The ID of the request.
ResourceGroupId	String	rg-acfmxazb4ph6aiy****	The ID of the resource group to which the EIP belongs.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=CreateVpc
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreateVpcResponse>
      <ResourceGroupId>rg-acfmxazb4ph****</ResourceGroupId>
      <RequestId>8B2F5262-6B57-43F2-97C4-971425462DFE</RequestId>
      <RouteTableId>vtb-bp1krxxzp0c2****</RouteTableId>
      <VRouterId>vrt-bp1jcg5cmxjbl9xgc****</VRouterId>
      <VpcId>vpc-bp1qpo0kug3a20qqe****</VpcId>
</CreateVpcResponse>
```

`JSON` format

```
{
    "CreateVpcResponse": {
        "ResourceGroupId": "rg-acfmxazb4ph****",
        "RequestId": "8B2F5262-6B57-43F2-97C4-971425462DFE",
        "RouteTableId": "vtb-bp1krxxzp0c2****",
        "VRouterId": "vrt-bp1jcg5cmxjbl9xgc****",
        "VpcId": "vpc-bp1qpo0kug3a20qqe****"
    }
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	Specified value of "regionId" is not supported.	The error message returned because the specified region ID does not exist. Check whether the region ID is valid.
400	InvalidParameter	Specified CIDR block is not valid	The error message returned because the specified CIDR block is invalid.
400	ResourceNotAvailable	Resource you requested is not available in this region or zone.	The error message returned because you cannot create a vSwitch in the current region or zone.
400	InvalidVpcName.Malformed	Specified VPC name is not valid.	The error message returned because the format of the VPC name is invalid. Enter a valid VPC name and try again.
400	InvalidVpcDiscription.Malformed	Specified VPC description is not valid.	The error message returned because the format of the VPC description is invalid.
403	Forbbiden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the permissions and try again.

HttpCode	Error code	Error message	Description
400	QuotaExceeded.Vpc	VPC quota exceeded.	The error message returned because the number of VPCs that belong to the Apsara Stack tenant account has reached the upper limit. You can submit a ticket to request a quota increase.
400	ResourceNotAvailable.Vpc	Resource you requested is not available in this region or zone.	The error message returned because the resource you requested is not available in this region or zone.
400	InvalidParameter	Specified UserCidr invalid format.	The error message returned because the format of the user CIDR block is invalid.
400	InvalidParameter	Specified UserCidr Subnet mask is not valid .	The error message returned because the subnet mask of the user CIDR block is invalid.
400	InvalidUserCidr.Quota	Specified UserCidr number is greater than 3.	The error message returned because the UserCidr value has reached the upper limit.
400	InvalidUserCidr.Malformed	Specified UserCidr overlapping in of 100.64.0.0/10.	The error message returned because the UserCidr value overlaps with 100.64.0.0/10.
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an unknown error occurred.
400	InvalidResourceGroupId	The specified ResourceGroupId does not exist.	The error message returned because the specified resource group ID is invalid.
400	OperationUnsupported.ResourceGroupId	ResourceGroup is not supported in this region.	The error message returned because the resource group feature is not enabled.

15.1.2.1.5.2. DeleteVpc

Deletes a virtual private cloud (VPC).

Descriptions

When you call this operation, take note of the following limits:

- Before you delete a VPC, make sure that you have released or removed all resources deployed in the VPC, such as vSwitches, instances, and high-availability virtual IP addresses (HAVIPs).
- You can delete only a VPC that is in the **Available** state.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteVpc	The operation that you want to perform. Set the value to **DeleteVpc**.
VpcId	String	Yes	vpc-bp1m7v25emi1h5mtc****	The ID of the VPC that you want to delete.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the VPC is deployed.

Response parameters

Parameter	Type	Example	Description
RequestId	String	0ED8D006-F706-4D23-88ED-E11ED28DCAC0	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DeleteVpc
&VpcId=vpc-bp1m7v25emi1h5mtc****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteVpcResponse>
      <RequestId>0ED8D006-F706-4D23-88ED-E11ED28DCAC0</RequestId>
</DeleteVpcResponse>
```

`JSON` format

```
{
    "RequestId": "0ED8D006-F706-4D23-88ED-E11ED28DCAC0"
}
```

Error codes

HttpCode	Error code	Error message	Description
403	OperationDenied	The operation is not supported in this status.	The error message returned because the state of the VPC is invalid and the operation cannot be performed.
403	OperationDenied	The snapshot creation for the specified disk is not finished yet.	The error message returned because the snapshot of the specified disk is being created.
400	IncorrectVpcStatus	Current VPC status does not support this operation.	The error message returned because the state of the VPC does not support this operation.
400	DependencyViolation.RouteEntry	Specified object has dependent resources	The error message returned because custom route entries exist in the VPC and the VPC cannot be deleted.
400	DependencyViolation.Instance	Specified object has dependent resources	The error message returned because the VPC is associated with a resource.
400	DependencyViolation.VSwitch	Specified object has dependent resources	The error message returned because vSwitches exist in the VPC and the VPC cannot be deleted. Delete the vSwitches and try again.
400	DependencyViolation.SecurityGroup	Specified object has dependent resources	The error message returned because security groups exist in the VPC and the VPC cannot be deleted. Delete the security groups and try again.
404	InvalidVpcId.NotFound	Specified VPC does not exist.	The error message returned because the specified VPC does not exist.
400	DependencyViolation.RouteInterface	Specified object has dependent route interface .	The error message returned because the vSwitch is associated with a router interface and cannot be deleted.
400	DependencyViolation.Tunnel	Specified object has dependent tunnel.	The error message returned because the VPC is associated with a tunnel.

HttpCode	Error code	Error message	Description
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an unknown error occurred.
400	DependencyViolation.NatGateway	Specified object has dependent resources NatGateway.	The error message returned because NAT gateways exist in the VPC and the VPC cannot be deleted. Delete the NAT gateways and try again.
400	DependencyViolation.RouterInterface	Specified object has dependent resources RouterInterface.	The error message returned because the VPC is associated with a router interface.
400	DependencyViolation.SecurityGroup	Specified object has dependent resources SecurityGroup.	The error message returned because security groups exist in the VPC and the VPC cannot be deleted. Delete the security groups and try again.
400	Forbidden.VpcNotFound	Specified VPC can not found.	The error message returned because the specified VPC does not exist. Check whether the specified VPC ID is valid.
400	Forbbiden	Active custom route in vpc.	The error message returned because you must add a custom route entry to the VPC.
400	DependencyViolation.DhcpOptionsSet	The VPC cannot be deleted when it is associated with dhcpOptionsSet.	The error message returned because DHCP options sets exist in the VPC and the VPC cannot be deleted. Delete the DHCP options sets and try again.

15.1.2.1.5.3. ModifyVpcAttribute

Modifies the name and description of a virtual private cloud (VPC).

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyVpcAttribute	The operation that you want to perform. Set the value to **ModifyVpcAttribute**.
VpcId	String	Yes	vpc-bp1qtbach57ywecf****	The ID of the VPC that you want to modify.

Parameter	Type	Required	Example	Description
Description	String	No	This is my VPC.	The description of the VPC. The description must be 2 to 256 characters in length. It must start with a letter but cannot start with `http://` or `https://`.
VpcName	String	No	Vpc-1	The new name of the VPC. The name must be 2 to 128 characters in length, and can contain digits, periods (.), underscores (_), and hyphens (-). It must start with a letter and cannot start with `http://` or `https://`.
CidrBlock	String	No	192.XX.XX.0/24	The IPv4 CIDR block of the VPC. The CIDR block can be 172.16.0.0/16, 192.168.0.0/16, and one of their subnets. The subnet mask must be 8 to 24 bits in length.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the VPC is deployed. You can call the `DescribeRegions` operation to the most recent region list.
EnableIPv6	Boolean	No	true	Specifies whether to enable IPv6 CIDR blocks. Valid values: • **true**: enables IPv6 CIDR blocks. • **false**: disables IPv6 CIDR blocks.
Ipv6CidrBlock	String	No	1007:XXXX:0:40::/61	Specifies whether to enable IPv6 CIDR blocks. Valid values: • **true**: enables IPv6 CIDR blocks. • **false**: disables IPv6 CIDR blocks.

Response parameters

Parameter	Type	Example	Description
RequestId	String	0ED8D006-F706-4D23-88ED-E11ED28DCAC0	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ModifyVpcAttribute
&VpcId=vpc-bp1qtbach57ywecf****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyVpcAttributeResponse>
      <RequestId>0ED8D006-F706-4D23-88ED-E11ED28DCAC0</RequestId>
</ModifyVpcAttributeResponse>
```

`JSON` format

```
{
    "ModifyVpcAttributeResponse": {
        "RequestId": "0ED8D006-F706-4D23-88ED-E11ED28DCAC0"
    }
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidVpcId.NotFound	Specified VPC does not exist.	The error message returned because the specified VPC does not exist.
400	InvalidVpcName.Malformed	Specified VPC name is not valid.	The error message returned because the format of the VPC name is invalid. Enter a valid VPC name and try again.
400	InvalidVpcDiscription.Malformed	Specified VPC description is not valid.	The error message returned because the format of the VPC description is invalid.
400	InvalidParameter	Specified UserCidr invalid format.	The error message returned because the format of the user CIDR block is invalid.
400	InvalidParameter	Specified UserCidr Subnet mask is not valid .	The error message returned because the subnet mask of the user CIDR block is invalid.
400	InvalidUserCidr.Quota	Specified UserCidr number is greater than 3.	The error message returned because the UserCidr value has reached the upper limit.

HttpCode	Error code	Error message	Description
400	InvalidUserCidr.Malformed	Specified UserCidr overlapping in of 100.64.0.0/10.	The error message returned because the UserCidr value overlaps with 100.64.0.0/10.
400	IncorrectVpcStatus	Current VPC status does not support this operation.	The error message returned because the state of the VPC does not support this operation.
400	InvalidCidrBlock.Malformed	Specified CIDR block is not valid.	The error message returned because the format of the specified CIDR block is invalid.

15.1.2.1.5.4. DescribeVpcAttribute

Queries detailed information about a virtual private cloud (VPC).

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeVpcAttribute	The operation that you want to perform. Set the value to **DescribeVpcAttribute**.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the VPC is deployed. You can call the `DescribeRegions` operation to query the most recent region list.
VpcId	String	Yes	vpc-bp18sth14qii3pnv****	The ID of the VPC that you want to query.

Parameter	Type	Required	Example	Description
DryRun	Boolean	No	false	Specifies whether to precheck the request. • **true**: prechecks the API request. Resources are not queried. The system checks whether your AccessKey pair is valid, whether the RAM user is authorized, and whether required parameters are set. If the request fails the precheck, the corresponding error message is returned. If the request passes the precheck, the `DryRunOperation` error code is returned. • **false**: sends the request. This is the default value. If the request passes the precheck, a 2XX HTTP status code is returned and the resource is queried.
IsDefault	Boolean	No	false	Specifies whether the VPC is the default one. Valid values: • **false**: no • **true** (default): yes

Response parameters

Parameter	Type	Example	Description
AssociatedCens	Array of AssociatedCen		The list of Cloud Enterprise Network (CEN) instances that are associated with the VPC. If the VPC is not associated with a CEN instance, no value is returned.
AssociatedCen			
CenId	String	cen-7qthudw0ll6jmc****	The ID of the CEN instance that is associated with the VPC.
CenOwnerId	Long	111111111111	The ID of the Apsara Stack tenant account to which the CEN instance belongs.
CenStatus	String	Attached	The state of the associated CEN instance. **Attached** is returned only when the VPC is associated with a CEN instance.

Parameter	Type	Example	Description
CidrBlock	String	192.168.0.0/16	The IPv4 CIDR block of the VPC.
ClassicLinkEnabled	Boolean	false	Indicates whether the ClassicLink feature is enabled. Valid values: • **true**: enabled • **false**: disabled
CloudResources	Array of CloudResourceSetType		The list of resources deployed in the VPC.
CloudResourceSetType			
ResourceCount	Integer	1	The number of resources deployed in the VPC.
ResourceType	String	VSwitch	The type of resources deployed in the VPC. Valid values: • **VSwitch**: vSwitches • **VRouter**: vRouters • **RouteTable**: route tables
CreationTime	String	2018-10-16T07:31:09Z	The time when the VPC was created.
Description	String	VPC	The description of the VPC.
DhcpOptionsSetId	String	dopt-o6w0df4epg9zo8isy****	The ID of the DHCP options set.
DhcpOptionsSetStatus	String	Available	The state of the DHCP options set. Valid values: • **Available**: The DHCP options set is available for use. • **InUse**: The DHCP options set is being used. • **Deleted**:The DHCP options set is deleted. • **Pending**: The DHCP options set is being configured.
Ipv6CidrBlock	String	2408:XXXX:0:a600::/56	The IPv6 CIDR block of the VPC.

Parameter	Type	Example	Description
IsDefault	Boolean	false	Indicates whether the VPC is the default one. Valid values: • **true**: The VPC is the default one. • **false**: The VPC is not the default one.
OwnerId	Long	3253532535	The ID of the owner.
RegionId	String	cn-qingdao-env17-d01	The ID of the region where the VPC is deployed. You can call the `DescribeRegions` operation to query the most recent region list.
RequestId	String	7486AE4A-129D-43DB-A714-2432C074BA04	The ID of the request.
ResourceGroupId	String	rg-acfmxazbvgb4ph****	The ID of the resource group to which the EIPs belong.
SecondaryCidrBlocks	List	192.168.20.0/24	The IPv4 CIDR block of the VPC.
Status	String	Available	The state of the VPC. Valid values: • **Available**: The VPC is available. • **Pending**: The VPC is being configured.
UserCidrs	List	172.16.0.1/24	The user CIDR block. Separate multiple CIDR blocks with commas (,). You can specify at most three CIDR blocks.
VRouterId	String	vrt-bp1jso6ng1at0ajsc****	The ID of the vRouter that belongs to the VPC.
VSwitchIds	List	vsw-bp1nhbnpv2blyz8dl****	The list of vSwitches deployed in the VPC.
VpcId	String	vpc-bp18sth14qii3pnvo****	The ID of the VPC.
VpcName	String	doctest2	The name of the VPC.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeVpcAttribute
&RegionId=cn-qingdao-env17-d01
&VpcId=vpc-bp18sth14qii3pnv****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeVpcAttributeResponse>
      <VpcName>doctest2</VpcName>
      <Description></Description>
      <IsDefault>false</IsDefault>
      <ResourceGroupId>rg-acfmxazb4ph****</ResourceGroupId>
      <UserCidrs></UserCidrs>
      <ClassicLinkEnabled>false</ClassicLinkEnabled>
      <AssociatedCens>
            <AssociatedCen>
                  <CenStatus>Attached</CenStatus>
                  <CenOwnerId>12315790855****</CenOwnerId>
                  <CenId>cen-7qthudw0ll6jmc****</CenId>
            </AssociatedCen>
      </AssociatedCens>
      <VRouterId>vrt-bp1jso6ng1at0ajs****</VRouterId>
      <VpcId>vpc-bp18sth14qii3pnvo****</VpcId>

            ]
        }
    }
}
```

Error codes

HttpCode	Error code	Error message	Description

HttpCode	Error code	Error message	Description
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an unknown error occurred.
400	IncorrectVpcStatus	Current VPC status does not support this operation.	The error message returned because the state of the VPC does not support this operation.
404	InvalidVpcId.NotFound	Specified VPC does not exist.	The error message returned because the specified VPC does not exist.

15.1.2.1.5.5. AssociateVpcCidrBlock

Adds a secondary IPv4 CIDR block to a virtual private cloud (VPC).

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	AssociateVpcCidrBlock	The operation that you want to perform. Set the value to **AssociateVpcCidrBlock**.
RegionId	String	Yes	ch-qingdao-env17-d01	The ID of the region where the VPC is deployed. You can call the `DescribeRegions` operation to the most recent region list.
VpcId	String	Yes	vpc-o6wrloqsdqc9io3mg****	The ID of the VPC to which you want to add a secondary IPv4 CIDR block.

Parameter	Type	Required	Example	Description
SecondaryCidrBlock	String	No	192.168.0.0/16	The secondary IPv4 CIDR block. You can specify one of the following standard IPv4 CIDR blocks or their subnets as the secondary IPv4 CIDR block: 192.168.0.0/16, 172.16.0.0/12, and 10.0.0.0/8. To use a public CIDR block as the secondary IPv4 CIDR block, submit a ticket. When you add a secondary IPv4 CIDR block, take note of the following rules: • The CIDR block cannot start with 0. The subnet mask must be 8 to 24 bits in length. • The secondary CIDR block cannot overlap with the primary CIDR block or an existing secondary CIDR block.

Response parameters

Parameter	Type	Example	Description
RequestId	String	C1221A1F-2ACD-4592-8F27-474E02883159	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=AssociateVpcCidrBlock
&RegionId=ch-qingdao-env17-d01
&VpcId=vpc-o6wrloqsdqc9io3mg****
&<Common request parameters>
```

Sample success response

`XML` format

```
<AssociateVpcCidrBlockResponse>
        <RequestId>C1221A1F-2ACD-4592-8F27-474E02883159</RequestId>
</AssociateVpcCidrBlockResponse>
```

`JSON` format

```
{
 "RequestId":"C1221A1F-2ACD-4592-8F27-474E02883159"
}
```

Error codes

HttpCode	Error code	Error message	Description
400	InvalidCidrBlock.Malformed	Specified CIDR block is not valid.	The error message returned because the format of the specified CIDR block is invalid.
403	Forbbiden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the permissions and try again.
400	MissingParam.SecondaryCidrBlockOrIpv6CidrBlock	Either SecondaryCidrBlock or Ipv6CidrBlock must be specified.	The error message returned because the secondary IPv4 CIDR block or the IPv6 CIDR block is not set.
400	MissingParam.VpcId	You must specify VpcId.	The error message returned because VpcId is not set.

15.1.2.1.5.6. UnassociateVpcCidrBlock

Deletes a secondary IPv4 CIDR block from a virtual private cloud (VPC).

Descriptions

Before you delete a secondary IPv4 CIDR block from a VPC, delete the vSwitch which is created with the IPv4 CIDR block. For more information, see `DeleteVSwitch`.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	UnassociateVpcCidrBlock	The operation that you want to perform. Set the value to **UnassociateVpcCidrBlock**.
RegionId	String	Yes	ch-qingdao-env17-d01	The ID of the region to which the secondary IPv4 CIDR block to be deleted belongs. You can call the `DescribeRegions` operation to query the most recent region list.

Parameter	Type	Required	Example	Description
VpcId	String	Yes	vpc-o6wrloqsdqc9io3mg****	The ID of the VPC from which you want to delete a secondary IPv4 CIDR block.
SecondaryCidrBlock	String	No	192.XX.XX.0/16	The secondary IPv4 CIDR block.

Response parameters

Parameter	Type	Example	Description
RequestId	String	C1221A1F-2ACD-4592-8F27-474E02883159	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=UnassociateVpcCidrBlock
&RegionId=ch-qingdao-env17-d01
&VpcId=vpc-o6wrloqsdqc9io3mg****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<UnassociateVpcCidrBlockResponse>
        <RequestId>C1221A1F-2ACD-4592-8F27-474E02883159</RequestId>
</UnassociateVpcCidrBlockResponse>
```

`JSON` format

```
{
 "RequestId":"C1221A1F-2ACD-4592-8F27-474E02883159"
}
```

15.1.2.1.6. vSwitch

15.1.2.1.6.1. CreateVSwitch

Creates a vSwitch.

Descriptions

When you call this operation, take note of the following limits:

- You can create at most 24 vSwitches in a virtual private cloud (VPC).

- The first IP address and last three IP addresses of each vSwitch CIDR block are reserved. For example, if the CIDR block of a vSwitch is 192.168.1.0/24, the IP addresses 192.168.1.0, 192.168.1.253, 192.168.1.254, and 192.168.1.255 are reserved.
- The number of instances in a vSwitch cannot exceed the remaining capacity of the VPC. The remaining capacity is the difference between 15,000 and the current number of instances.
- Each instance can belong to only one vSwitch.
- vSwitches do not support multicasting or broadcasting.
- After you create a vSwitch, you cannot modify its CIDR block.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateVSwitch	The operation that you want to perform. Set the value to **CreateVSwitch**.
CidrBlock	String	Yes	172.XX.XX.0/24	The CIDR block of the vSwitch. Take note of the following limits: • The subnet mask must be 16 to 29 bits in length. • The CIDR block of the vSwitch must fall within the range of the CIDR block of the VPC to which the vSwitch belongs. • The CIDR block of a vSwitch cannot be the same as the destination CIDR block in a route entry of the VPC. However, it can be a subset of the destination CIDR block.
VpcId	String	Yes	vpc-257gqcdfvx6n****	The ID of the VPC where you want to create the vSwitch.
ZoneId	String	Yes	cn-qingdao-env-amtest11001-a	The ID of the zone where you want to create the vSwitch. You can call the `DescribeZones` operation to query the most recent zone list.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where you want to create the vSwitch. You can call the `DescribeRegions` operation to query the most recent region list.

Parameter	Type	Required	Example	Description
Ipv6CidrBlock	Integer	No	12	The last eight bits of the IPv6 CIDR block of the vSwitch. Valid values: **0** to **255**.
Description	String	No	This is my vswitch.	The description of the vSwitch. The description must be 2 to 256 characters in length. It must start with a letter but cannot start with `http://` or `https://`.
VSwitchName	String	No	VSwitch-1	The name of the vSwitch. The name must be 2 to 128 characters in length and must start with a letter. The description cannot start with `http://` or `https://`.
ClientToken	String	No	0c593ea1-3bea-11e9-b96b-88e9fe637760	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must make sure that it is unique among different requests. **ClientToken** can contain only ASCII characters. It must be 1 to 64 characters in length.
IsCgw	Boolean	No	true	Specifies whether the gateway is a customer gateway. Valid values: • **true**: yes • **false**: no

Response parameters

Parameter	Type	Example	Description
VSwitchId	String	vsw-25navfgbue4g****	The ID of the vSwitch.
RequestId	String	861E6630-AEC0-4B2D-B214-6CB5E44B7F04	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=CreateVSwitch
&CidrBlock=172.XX.XX.0/24
&VpcId=vpc-257gqcdfvx6n****
&ZoneId=cn-qingdao-env-amtest11001-a
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreateVSwitchResponse>
      <RequestId>0ED8D006-F706-4D23-88ED-E11ED28DCAC0</RequestId>
      <VSwitchId>vsw-25naue4cdvf****</VSwitchId>
</CreateVSwitchResponse>
```

`JSON` format

```
{
    "CreateVSwitchResponse": {
        "RequestId": "0ED8D006-F706-4D23-88ED-E11ED28DCAC0",
        "VSwitchId": "vsw-25naue4cdvf****"
    }
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidZoneId.NotFound	Specified zone does not exist.	The error message returned because the ID of the zone is invalid.
404	InvalidVpcId.NotFound	Specified VPC does not exist.	The error message returned because the specified VPC does not exist.
400	InvalidVSwitchName.Malformed	Specified virtual switch name is not valid.	The error message returned because the format of the vSwitch name is invalid.
400	InvalidVSwitchDiscription.Malformed	Specified virtual switch description is not valid.	The error message returned because the description of the vSwitch is invalid.
400	ResourceNotAvailable	Resource you requested is not available in this region or zone.	The error message returned because you cannot create a vSwitch in the current region or zone.

HttpCode	Error code	Error message	Description
400	InvalidParameter	Specified CIDR block is not valid in VPC.	The error message returned because the vSwitch CIDR block does not fall within the VPC CIDR block.
400	InvalidCidrBlock.Overlapped	Specified CIDR block overlapped with other subnets.	The error message returned because the vSwitch CIDR block overlaps with another vSwitch CIDR block or the destination CIDR block of a custom route entry. Make sure that the vSwitch CIDR block does not overlap with another vSwitch CIDR block or the destination CIDR block of a route entry.
400	InvalidCidrBlock.Overlapped	Specified CIDR block overlapped with other entry.	The error message returned because the vSwitch CIDR block overlaps with another vSwitch CIDR block or the destination CIDR block of a custom route entry. Make sure that the vSwitch CIDR block does not overlap with another vSwitch CIDR block or the destination CIDR block of a route entry.
400	QuotaExceeded.VSwitch	Virtual switch quota exceeded.	The error message returned because the number of vSwitches has reached the quota. Reduce the number of vSwitches and try again later.
400	IncorrectRouteEntryStatus	Some route entry status blocked this operation.	The error message returned because one or more route entries in the current route table are in the Pending or Modifying state.
400	IncorrectVSwitchStatus	Some virtual switch is modifying within the same VPC.	The error message returned because multiple vSwitches are in the Modifying state in the same VPC. Try again later.
400	InvalidCirdrBlock.MaskLength	Specified CIDR block is not valid .	The error message returned because the format of the CIDR block is invalid.
400	IncorrectVpcStatus	Current VPC status does not support this operation.	The error message returned because the state of the VPC does not support this operation.

HttpCode	Error code	Error message	Description
400	InvalidCidrBlock.Malformed	Specified CIDR block is not valid.	The error message returned because the format of the specified CIDR block is invalid.
400	MissingParameter	Miss mandatory parameter.	The error message returned because required parameters are not set. Check whether you have set all the required parameters before you call this operation.
400	IncorrectVSwitchStatus	VSwitch Creation simultaneously is not supported.	The error message returned because the system failed to create the vSwitch and one or more vSwitches that belong to the VPC are in the Creating state.
400	Forbidden.VpcNotFound	Specified VPC can not found.	The error message returned because the specified VPC does not exist. Check whether the specified VPC ID is valid.

15.1.2.1.6.2. DeleteVSwitch

Deletes a vSwitch.

Descriptions

When you call this operation, take note of the following limits:

- Before you delete a vSwitch, delete all the resources that are deployed in the vSwitch first, including Elastic Compute Service (ECS) instances, Server Load Balancer (SLB) instances, and ApsaraDB RDS instances.
- If Source Network Address Translation (SNAT) entries and high-availability virtual IP addresses (HAVIPs) are configured in the vSwitch, delete them before you delete the vSwitch.
- You can delete only vSwitches that are in the **Available** state.
- You cannot delete a vSwitch from a virtual private cloud (VPC) where a vSwitch or a route entry is being created or deleted.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteVSwitch	The operation that you want to perform. Set the value to **DeleteVSwitch**.

Parameter	Type	Required	Example	Description
VSwitchId	String	Yes	vsw-asdfjcdvflna****	The ID of the vSwitch that you want to delete.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the vSwitch is deployed.

Response parameters

Parameter	Type	Example	Description
RequestId	String	0ED8D006-F706-4D23-88ED-E11ED28DCAC0	The ID of the request.

Examples

Sample requests

```
http(s)://vpc.aliyuncs.com/?Action=DeleteVSwitch
&VSwitchId=vsw-asdfjcdvflna****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteVSwitchResponse>
      <RequestId>0ED8D006-F706-4D23-88ED-E11ED28DCAC0</RequestId>
</DeleteVSwitchResponse>
```

`JSON` format

```
{
    "RequestId": "0ED8D006-F706-4D23-88ED-E11ED28DCAC0"
}
```

Error codes

HttpCode	Error code	Error message	Description
400	IncorrectVSwitchStatus	The current virtual switch status does not support this operation.	The error message returned because the vSwitch is in the Pending state and cannot be deleted.

HttpCode	Error code	Error message	Description
400	DependencyViolation	Specified object has dependent resources.	The error message returned because resources deployed in the vSwitch are not deleted and the vSwitch cannot be deleted. Delete the resources deployed in the VPC first before you delete the VPC.
400	DependencyViolation	Some route entry status blocked this operation.	The error message returned because one or more route entries in the current route table are in the Pending or Modifying state.
400	IncorrectRouteEntryStatus	Some route entry status blocked this operation.	The error message returned because one or more route entries in the current route table are in the Pending or Modifying state.
400	DependencyViolation.HaVip	VSwitch cannot be deleted when there are some HaVip dependent with it.	The error message returned because the vSwitch is associated with an HAVIP and the vSwitch cannot be deleted.
400	MissingParameter	Miss mandatory parameter.	The error message returned because the required parameters values are missing. Check whether you have set all the required parameters before you call this operation.
404	InvalidVSwitchId.NotFound	VSwitch not exist.	The error message returned because the specified vSwitch does not exist. Check whether you specify a valid vSwitch.
404	IncorrectStatus	Vswtich status not stable.	The error message returned because the vSwitch is in the Pending or Modifying state. Try again later.

15.1.2.1.6.3. ModifyVSwitchAttribute

Modifies the name and description of a vSwitch.

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyVSwitchAttribute	The operation that you want to perform. Set the value to **ModifyVSwitchAttribute**.
VSwitchId	String	Yes	vsw-25nacdfvue4****	The ID of the vSwitch.
VSwitchName	String	No	VSwitch-1	The new name for the vSwitch. The name must be 2 to 128 characters in length, and can contain, digits, periods (.), underscores (_), and hyphens (-). It must start with a letter The name cannot start with `http://` or `https://` .
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the vSwitch is deployed. You can call the `DescribeRegions` operation to the most recent region list.
Description	String	No	This is my vswitch.	The description of the vSwitch. The description must be 2 to 256 characters in length. It must start with a letter but cannot start with `http://` or `https://` .
Ipv6CidrBlock	Integer	No	10	The last eight bits of the IPv6 CIDR block of the vSwitch. Valid values: **0** to **255**. You can set this parameter only when the VPC to which the vSwitch belongs has the IPv6 feature enabled.

Response parameters

Parameter	Type	Example	Description
RequestId	String	0ED8D006-F706-4D23-88ED-E11ED28DCAC0	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ModifyVSwitchAttribute
&VSwitchId=vsw-25nacdfvue4****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyVSwitchAttributeResponse>
      <RequestId>0ED8D006-F706-4D23-88ED-E11ED28DCAC0</RequestId>
</ModifyVSwitchAttributeResponse>
```

`JSON` format

```
{
    "RequestId": "0ED8D006-F706-4D23-88ED-E11ED28DCAC0"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidVSwitchId.NotFound	The specified virtual switch does not exists.	The error message returned because the specified vSwitch does not exist. Check whether the specified ID is valid.
400	InvalidVSwitchName.Malformed	Specified virtual switch name is not valid.	The error message returned because the format of the specified vSwitch name is invalid. Check whether the specified name is valid.
400	InvalidVSwitchDiscription.Malformed	Specified virtual switch description is not valid.	The error message returned because the format of the specified vSwitch description is invalid. Check whether the specified description is valid.
400	InvalidVSwitchDiscription.Malformed	Specified virtual switch description is not valid.	The error message returned because the specified description of the vSwitch is invalid.

15.1.2.1.6.4. DescribeVSwitchAttributes

Queries detailed information about a vSwitch.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeVSwitchAttributes	The operation that you want to perform. Set the value to **DescribeVSwitchAttributes**.
VSwitchId	String	Yes	vsw-25naue4g****	The ID of the vSwitch that you want to query.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the vSwitch is deployed. You can call the `DescribeRegions` operation to query the most recent region list.
DryRun	Boolean	No	false	Specifies whether to precheck this request. Valid values: • **true**: prechecks the API request. Resources are not queried. The system checks whether your AccessKey pair is valid, whether the RAM user is authorized, and whether required parameters are set. If the request fails the precheck, an error message is returned. If the request passes the precheck, the `DryRunOperation` error code is returned. • **false**: sends the request. This is the default value. If the request passes the precheck, a 2XX HTTP status code is returned and the resource is queried.

Response parameters

Parameter	Type	Example	Description
AvailableIpAddressCount	Long	12	The number of available IP addresses.
CidrBlock	String	192.168.0.1/24	The IPv4 CIDR block of the vSwitch.
CloudResources	Array of CloudResourceSetType		The list of resources deployed in the VPC.
CloudResourceSetType			

Parameter	Type	Example	Description
ResourceCount	Integer	1	The number of resources deployed in the VPC.
ResourceType	String	VSwitch	The types of resources deployed in the VPC. Valid values: • **VSwitch**: vSwitches • **VRouter**: vRouters • **RouteTable**: route tables
CreationTime	String	2017-08-22T10:40:25Z	The time when the vSwitch was created.
Description	String	abc	The description of the vSwitch.
Ipv6CidrBlock	String	2408:XXXX:0:2900::/64	The IPv6 CIDR block of the vSwitch.
IsCgw	Boolean	false	Indicates whether the gateway is a customer gateway. Valid values: • **true**: yes • **false** (default): no
IsDefault	Boolean	false	Indicates whether the vSwitch is the default vSwitch. Valid values: • **true**: yes • **false** (default): no
NetworkAclId	String	nacl-2zesich96aa37rl29****	The ID of the network ACL that is associated with the vSwitch.
OwnerId	Long	12345678	The ID of the Alibaba Cloud account to which the vSwitch belongs.
RequestId	String	7B48B4B9-1EAD-469F-B488-594DAB4B6A1A	The ID of the request.
ResourceGroupId	String	rg-acfmxazb4pbgfh****	The ID of the resource group.
RouteTable	Struct		The information about the route table that is associated with the vSwitch.

Parameter	Type	Example	Description
RouteTableId	String	vtb-bp145q7glnuzdv****	The ID of the route table that is associated with the vSwitch.
RouteTableType	String	System	The type of the route table. • **System** : a system route table • **Custom**: a custom route table
Status	String	Pending	The state of the vSwitch. Valid values: • **Pending**: The vSwitch is being configured. • **Available**: The vSwitch is available.
VSwitchId	String	vsw-25b7pcdfvv15t****	The ID of the vSwitch.
VSwitchName	String	test	The name of the vSwitch.
VpcId	String	vpc-257gqcfv642n****	The ID of the VPC to which the vSwitch belongs.
ZoneId	String	cn-qingdao-env17-amtest11001-a	The ID of the zone to which the vSwitch belongs.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeVSwitchAttributes
&VSwitchId=vsw-25naue4g****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeVSwitchAttributesResponse>
  <IsDefault>false</IsDefault>
  <Status>Pending</Status>
  <Description>abc</Description>
  <NetworkAclId>nacl-2zesich96aa37rl29****</NetworkAclId>

}
```

15.1.2.1.7. vRouter

15.1.2.1.7.1. ModifyVRouterAttribute

Modifies the name and description of a vRouter.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyVRouterAttribute	The operation that you want to perform. Set the value to **ModifyVRouterAttribute**.
VRouterId	String	Yes	vrt-bp1lhl0taikrteen8****	The ID of the vRouter.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the vRouter is deployed.

Parameter	Type	Required	Example	Description
VRouterName	String	No	VRouter-1	The name of the vRouter to be modified. The name must be 2 to 128 characters in length, and can contain digits, periods (.), underscores (_), and hyphens (-). It must start with a letter but cannot start with `http://` or `https://`.
Description	String	No	My VRouter	The description of the vRouter to be modified. The description must be 2 to 256 characters in length. It must start with a letter but cannot start with `http://` or `https://`.

Response parameters

Parameter	Type	Example	Description
RequestId	String	0ED8D006-F706-4D23-88ED-E11ED28DCAC0	The ID of the request.

Examples

Sample requests

```
https://vpc.aliyuncs.com/?Action=ModifyVRouterAttribute
&VRouterId=vrt-bp1lhl0taikrteen8****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyVRouterAttributeResponse>
      <RequestId>0ED8D006-F706-4D23-88ED-E11ED28DCAC0</RequestId>
</ModifyVRouterAttributeResponse>
```

`JSON` format

```
{
    "ModifyVRouterAttributeResponse": {
        "RequestId": "0ED8D006-F706-4D23-88ED-E11ED28DCAC0"
    }
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidVRouterId.NotFound	Specified virtual router does not exist.	The error message returned because the specified vRouter does not exist. Check whether the specified vRouter is valid.
400	InvalidVRouterName.Malformed	Specified virtual router name is not valid.	The error message returned because the name format of the specified vRouter is invalid.
400	InvalidVRouterDiscription.Malformed	Specified virtual router description is not valid.	The error message returned because the description format of the specified vRouter is invalid.
400	MissingParameter	Miss mandatory parameter.	The error message returned because required parameters are not set. Check whether you have set all the required parameters before you call this operation.

15.1.2.1.7.2. DescribeVRouters

Queries vRouters in a region.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeVRouters	The operation that you want to perform. Set the value to **DescribeVRouters**.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where you want to query vRouters. You can call the `DescribeRegions` operation to query the most recent region list.
VRouterId	String	No	vrt-bp1lhl0taikrteen*****	The ID of the vRouter.

Parameter	Type	Required	Example	Description
PageNumber	Integer	No	1	The number of the page to return. Default value: **1**.
PageSize	Integer	No	10	The number of entries to return on each page. Maximum value: **50**. Default value: **10**.

Response parameters

Parameter	Type	Example	Description
VRouters	Array of VRouter		Details about the vRouter.
VRouter			
CreationTime	String	2018-03-22T07:46:20Z	The time when the vRouter was created.
Description	String	abc	The description of the vRouter.
RegionId	String	cn-hangzhou	The region to which the vRouter belongs.
RouteTableIds	List	{ "RouteTableId": ["vtb-rj9ybe3y0u41mmjsp****"] }	The ID of the route table in the vRouter.
VRouterId	String	vrt-rj98khsezfqpjrxmv****	The ID of the vRouter.
VRouterName	String	doctest	The name of the vRouter.
VpcId	String	vpc-rj905wotv6y030t1****	The ID of the virtual private cloud (VPC) to which the vRouter belongs.
TotalCount	Integer	1	The total number of entries to return.
PageNumber	Integer	1	The number of the page to return.
PageSize	Integer	10	The number of entries to return on each page.

Parameter	Type	Example	Description
RequestId	String	0ED8D006-F706-4D23-88ED-E11ED28DCAC0	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeVRouters
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeVRoutersResponse>
    <PageNumber>1</PageNumber>
    <TotalCount>2</TotalCount>
    <VRouters>
        <VRouter>
            <VRouterName></VRouterName>
            <RouteTableIds>
                <RouteTableId>vtb-bp1krxxzp0c29fmo****</RouteTableId>
            </RouteTableIds>
            <CreationTime>2018-12-06T06:11:55Z</CreationTime>
            <Description></Description>
            <RegionId>cn-hangzhou</RegionId>
            <VRouterId>vrt-bp1jcg5cmxjbl9xgc****</VRouterId>
            <VpcId>vpc-bp1qpo0kug3a20qqe****</VpcId>

15.1.2.1.8. Route table

15.1.2.1.8.1. CreateRouteTable

Creates a custom route table.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateRouteTable	The operation that you want to perform. Set the value to **CreateRouteTable**.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the virtual private cloud (VPC) to which the custom route table belongs. You can call the `DescribeRegions` operation to query the most recent region list.
VpcId	String	Yes	vpc-bp1qpo0kug3a20qqe****	The ID of the VPC to which the custom route table belongs.

Parameter	Type	Required	Example	Description
RouteTableName	String	No	myRouteTable	The name of the route table. The name must be 2 to 128 characters in length and must start with a letter. The name can contain digits, periods (.), underscores (_), and hyphens (-). It cannot start with `http://` or `https://`.
Description	String	No	abc	The description of the route table. The description must be 2 to 256 characters in length. It must start with a letter but cannot start with `http://` or `https://`.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-0016e04****	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must make sure that it is unique among different requests. `ClientToken` can contain only ASCII characters. It cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	62172DD5-6BAC-45DF-8D44-E11ED28DCAC0	The ID of the instance.
RouteTableId	String	vtb-bp145q7glnuzdvzu2****	The ID of the route table.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=CreateRouteTable
&RegionId=cn-qingdao-env17-d01
&VpcId=vpc-bp1qpo0kug3a20qqe****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreateRouteTableResponse>
      <RequestId>62172DD5-6BAC-45DF-8D44-E11ED28DCAC0</RequestId>
      <RouteTableId>vtb-bp145q7glnuzdvzu2****</RouteTableId>
</CreateRouteTableResponse>
```

`JSON` format

```
{
    "RequestId": "62172DD5-6BAC-45DF-8D44-E11ED28DCAC0",
    "RouteTableId": "vtb-bp145q7glnuzdvzu2****"
}
```

Error codes

HttpCode	Error code	Error message	Required
400	InvalidParameter.Description.Malformed	The specified Description is not valid.	The error message returned because the specified description is invalid.
404	InvalidVpcId.NotFound	Specified VPC does not exist.	The error message returned because the specified VPC does not exist.

15.1.2.1.8.2. CreateRouteEntry

Adds a custom route entry to the route table of a vRouter or a virtual border router (VBR) in a virtual private cloud (VPC).

Descriptions

When you call this operation, take note of the following limits:

- The number of custom route entries in a route table cannot exceed 48.
- The destination CIDR block of a custom route entry cannot be the same as or overlap with the CIDR block of a VPC vSwitch.
- The destination CIDR block of a custom route entry cannot be 100.64.0.0/10 or a subset of 100.64.0.0/10.
- The destination CIDR blocks of route entries in the same route table must be unique.
- If the specified destination CIDR block is an IP address, a 32-bit subnet mask is used.
- Multiple custom route entries can point to the same next hop.
- The next hop of a custom route entry and the route table must belong to the same VPC.
- You can configure equal-cost multi-path (ECMP) route entries by setting the NextHopList parameter.
  - When you add non-ECMP route entries, you must set DestinationCidrBlock, NextHopType, and NextHopId. NextHopList is not supported.
  - When you add ECMP route entries, you must set DestinationCidrBlock and NextHopList. NextHopType and NextHopId are not supported.

When you call this operation, take note of the following limits:

- The number of custom route entries in a route table cannot exceed 48.
- The NextHopList parameter is not supported.
- The destination CIDR block of a custom route entry cannot be 100.64.0.0/10 or a subset of 100.64.0.0/10.
- The destination CIDR blocks of route entries in the same route table must be unique.
- If the specified destination CIDR block is an IP address, a 32-bit subnet mask is used.
- Multiple route entries can point to the same next hop.
- The next hop of a custom route entry must be a vRouter interface associated with the VBR.
- You can add route entries only when the VBR is in the Active state, and the physical connection associated with the VBR is enabled and unlocked.
- You can add only non-ECMP route entries. To create such an entry, you must set DestinationCidrBlock, NextHopType, and NextHopId. NextHopList is not supported.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateRouteEntry	The operation that you want to perform. Set the value to **CreateRouteEntry**.
DestinationCidrBlock	String	Yes	192.168.0.0/24	The destination CIDR block of the custom route entry. Both IPv4 and IPv6 CIDR blocks are supported. Make sure that the destination CIDR block meets the following requirements: • The destination CIDR block is not 100.64.0.0/10 or a subset of 100.64.0.0/10. • The destination CIDR block of the custom route entry is different from the destination CIDR blocks of other route entries in the same route table. • If the specified destination CIDR block is an IPv4 address, a 32-bit subnet mask is used. • If the specified destination CIDR block is an IPv6 address, a 128-bit subnet mask is used.
RouteTableId	String	Yes	vtb-bp145q7glnuzd****	The ID of the route table to which you want to add a custom route entry.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region to which the route table belongs. You can call the `DescribeRegions` operation to query the most recent region list.
NextHopId	String	No	ri-2zeo3xzyf38r4****	The ID of the next hop.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-001****	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must make sure that it is unique among different requests. **ClientToken** can contain only ASCII characters and cannot exceed 64 characters in length.
RouteEntryName	String	No	test	The name of the custom route entry that you want to add. The name must be 2 to 128 characters in length and can contain letters, digits, underscores (_), and hyphens (-). The name must start with a letter.
Description	String	No	abc	The description of the router entry.
NextHopType	String	No	RouterInterface	The type of next hop. Valid values: • **Instance**: The next hop is an ECS instance. This is the default value. • **HaVip**: The next hop is a high-availability virtual IP address (HAVIP). • **RouterInterface**: The next hop is a router interface. • **NetworkInterface**: The next hop is an elastic network interface (ENI). • **VpnGateway**: The next hop is a VPN gateway. • **IPv6Gateway**: The next hop is an IPv6 gateway.
NextHopList.N.NextHopType	String	No	RouterInterface	The next hop type of the equal-cost multi-path routing (ECMP) route. Set the value to **RouterInterface**.

Parameter	Type	Required	Example	Description
NextHopList.N.NextHopId	String	No	ri-2zeo3xzyf3cd8r4****	The ID of the next hop of the ECMP route.
NextHopList.N.Weight	Integer	No	10	The route weight of the next hop of the ECMP route. Valid values: **0** to **100**.

Response parameters

Parameter	Type	Example	Description
RequestId	String	0ED8D006-F706-4D23-88ED-E11ED28DCAC0	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=CreateRouteEntry
&DestinationCidrBlock=192.168.0.0/24
&RouteTableId=vtb-bp145q7glnuzd****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreateRouteEntryResponse>
<RequestId>0ED8D006-F706-4D23-88ED-E11ED28DCAC0</RequestId>
<CreateRouteEntryResponse>
```

`JSON` format

```
{
    "RequestId": "0ED8D006-F706-4D23-88ED-E11ED28DCAC0"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidInstanId.NotFound	Specified instance does not exist.	The error message returned because the specified instance does not exist. Check whether the instance ID is valid.

HttpCode	Error code	Error message	Description
400	MissingParameter	Miss mandatory parameter.	The error message returned because required parameters are not set. Check whether you have set all the required parameters before you call this operation.
400	InvalidCidrBlock.Malformed	Specified CIDR block is not valid.	The error message returned because the format of the specified CIDR block is invalid.
404	InvalidNextHopId.NotFound	Specified next hop does not exist.	The error message returned because the specified next hop does not exist.
404	InvalidRouteTableId.NotFound	Specified route table does not exist.	The error message returned because the specified route table does not exist.
400	InvalidCIDRBlock.Duplicate	Specified CIDR block is already exists.	The error message returned because the specified CIDR block already exists in the route table.
400	IncorrectVpcStatus	Current VPC status does not support this operation.	The error message returned because the state of the VPC does not support this operation.
400	IncorrectInstanceStatus	Current instance status does not support this operation.	The error message returned because this operation cannot be performed while the instance is in the current state.
400	QuotaExceeded	Route entry quota exceeded in this route table.	The error message returned because the number of route entries in the route table has reached the upper limit.
400	IncorrectRouteEntryStatus	Some route entry status blocked this operation.	The error message returned because one or more route entries in the current route table are in the Pending or Modifying state.

HttpCode	Error code	Error message	Description
400	InvalidCidrBlock	Specified CIDR block is not valid.	The error message returned because: 1.The error message returned because you are unauthorized to use the 10.0.0.0/8 CIDR block. 2.The error message returned because the destination CIDR block cannot be a subset of the CIDR blocks of the vSwitches in the VPC. 3.The error message returned because the CIDR block cannot be 100.64.0.0/10.
400	InvalidNextHopType	Specified parameter "NextHopType" is not valid	The error message returned because the specified next hop type is invalid.
400	InvalidNextHop.NotFound	Specified next hop does not exist.	The error message returned because the IP address of the specified next hop does not exist.
400	InvalidVRouter.NotFound	vRouter not exists.	The error message returned because the specified vRouter does not exist. Check whether the specified vRouter is valid.
400	InvalidVPC.NotFound	vpc not exists.	The error message returned because the specified VPC does not exist. Check whether the configuration of the VPC is valid.
400	InvalidNexthopTypeAndList.BothNull	both nexthopType and nextHopList are null.	The error message returned because the NextHopType and NextHopList parameters are not specified.
400	InvalidNexthopTypeAndList.BothNotNull	both nexthopType and nextHopList are not null.	The error message returned because you cannot leave both the NextHopType and the NextHopList parameters empty.
400	InvalidRouterInterface	invalid router interface.	The error message returned because the specified router interface does not exist.
400	InvalidOppositeRouterType	nexthop list cannot only contain router interface whose opposite router interface is on vbr.	The error message returned because the specified next hop is invalid. The peer router of the router interface that you specify as the next hop must be a VBR.

HttpCode	Error code	Error message	Description
400	InvalidNexthopListSize	nexthop size is illegal. Must be between 2 and 4.	The error message returned because you must specify two to four router interfaces as next hops.
400	InvalidEntryRuleQuota.NotFound	Route entry quota rule not exists.	The error message returned because the number of route entries that you create has reached the upper limit.
400	Forbidden.CheckEntryRuleQuota	Route entry quota rule check error.	The error message returned because an error occurs when the system checks the quota of route entries.
400	InvalidVBRStatus	invalid virtual border router status.	The error message returned because the VBR is in a state that does not support the operation.
400	InvalidPhysicalConnectionBusinessStatus	invalid physical connection business status.	The error message returned because the Express Connect circuit is in a state that does not support the operation.
404	InvalidHaVipId.NotFound	The specified HaVip does not exist in the specified VPC.	The error message returned because the specified HAVIP does not exist in the VPC.
400	IncorrectHaVipStatus	This operation is denied because satus of the specified HaVip is neither Available nor InUse.	The error message returned because you cannot perform the operation when the specified HAVIP is in the Available or InUse state.
400	CountLimitExceed.HaVipRouteEntry	There can be 5 route entry to HaVip at most in one route table.	The error message returned because the number of route entries that point to the HAVIP reaches the upper limit.
400	InvalidRouteEntry.Duplicate	The route entry already exist.	The error message returned because the specified route entry already exists.
403	IncorrectInstanceStatus	The current status of the resource does not support this operation.	The error message returned because the specified resource is in a state that does not support the operation.

HttpCode	Error code	Error message	Description
400	IncorrectRouteEntryStatus	Specified routeEntry status error.	The error message returned because one or more route entries in the current route table are in the Pending or Modifying state.
400	IncorrectRouteEntryStatus	VBR has NotStable route entry.	The error message returned because one or more route entries in the current virtual border router (VBR) are in the Pending or Modifying state.
400	InvalidParam	The Ecmp routerEntry with router interfaces local vgw vip not match.	The error message returned because the route entry does not match the gateway IP address of the router interface.
400	INVALID_WEIGHT_PARAM	Specified value of weight invalid	The error message returned because the specified weight is invalid.
400	FORBIDDEN_USE_VPC_AS_INTERNET_GATEWAY	The Specified CIDR must be in vpc CIDR.	The error message returned because the specified CIDR block must be a subset of the VPC CIDR block.
400	INVALID_VPC_ID	The Specified VpcId not match.	The error message returned because the specified VPC does not exist. Check whether the specified VPC ID is valid.
400	InvalidRouteEntrySize	The Specified routerEntry size not legal.	The error message returned because you must specify two to four router interfaces as next hops if you want to configure ECMP routing.
400	InvalidRouteEntry	Specified routeEntry not exist.	The error message returned because the specified route entry does not exist.

15.1.2.1.8.3. DeleteRouteEntry

Deletes a custom route entry from a route table.

Descriptions

When you call this operation, take note of the following rules:

- You can delete only a custom route entry that is in the Available state.
- You cannot delete a custom route entry from a VPC where a vSwitch or a route entry is being created or deleted.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteRouteEntry	The operation that you want to perform. Set the value to **DeleteRouteEntry**.
DestinationCidrBlock	String	Yes	10.0.0.0/16	The destination CIDR block of the route entry. IPv4 and IPv6 CIDR blocks are supported.
RouteTableId	String	Yes	vtb-hp37isva36oj7839j****	The ID of the route table to which the route entry belongs.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the route table to which the route entry belongs. You can call the `DescribeRegions` operation to query the most recent region list.
RouteEntryId	String	No	rte-bp1mnnr2al0naomn****	The ID of the route entry that you want to delete.
NextHopId	String	No	ngw-bp1vpo4l2vd7zef8o****	The ID of the next hop.
NextHopList.N.NextHopType	String	No	RouterInterface	The next hop type of the equal-cost multi-path routing (ECMP) route. Set the value to **RouterInterface**.
NextHopList.N.NextHopId	String	No	ri-2zeo3xzyf38r43cd****	The ID of the next hop of the ECMP route.

Response parameters

Parameter	Type	Example	Description
RequestId	String	0ED8D006-F706-4D23-88ED-E11ED28DCAC0	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DeleteRouteEntry
&DestinationCidrBlock=10.0.0.0/16
&RouteTableId=vtb-hp37isva36oj7839j****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteRouteEntryResponse>
      <RequestId>0ED8D006-F706-4D23-88ED-E11ED28DCAC0</RequestId>
</DeleteRouteEntryResponse>
```

`JSON` format

```
{
    "RequestId": "0ED8D006-F706-4D23-88ED-E11ED28DCAC0"
}
```

Error codes

HttpCode	Error code	Error message	Description
400	MissingParameter	Either nexthopId or nextHopList should be specified	The error message returned because nexthopId or nextHopList is not set.
400	MissingParameter	Miss mandatory parameter.	The error message returned because required parameters are not set. Check whether you have set all the required parameters before you call this operation.
400	IncorrcetRouteEntryStatus	Some route entry status blocked this operation.	The error message returned because one or more route entries in the route table are in the Pending or Modifying state.
400	InvalidCidrBlock.Malformed	Specified CIDR block is not valid.	The error message returned because the format of the specified CIDR block is invalid.
404	InvalidRouteTableId.NotFound	Specified route table does not exist.	The error message returned because the specified route table does not exist.
400	OperationDenied	Specified operation is denied as route entry type is system.	The error message returned because the specified route entry is a system route entry.

HttpCode	Error code	Error message	Description
400	InvalidRouteEntry.NotFound	Route entry not exists.	The error message returned because the specified route entry does not exist. Check whether the specified route entry is valid.
400	InvalidVRouter.NotFound	vRouter not exists.	The error message returned because the specified vRouter does not exist. Check whether the specified vRouter is valid.
400	IncorrectRouteEntryStatus	Some route entry status blocked this operation.	The error message returned because one or more route entries in the current route table are in the Pending or Modifying state.
400	IncorrectRouteEntryStatus	VBR has NotStable route entry.	The error message returned because one or more route entries in the current virtual border router (VBR) are in the Pending or Modifying state.
404	InvalidVpcId.NotFound	Specified value of VpcId is not found in our record.	The error message returned because the specified VPC does not exist. Check whether the specified VPC is valid.
400	IncorrectRouteEntryStatus	Specified routeEntry status error.	The error message returned because one or more route entries in the current route table are in the Pending or Modifying state.
400	Forbbiden	Specified RouteEntry cannot allowed delete by openApi.	The error message returned because you cannot call this operation to delete the specified route entry.
400	InvalidNextHop	Specified nexthop and nexthop list cannot both null.	The error message returned because the next hop type and next hop list cannot be empty at the same time.
400	InvalidRouteEntry	Specified routeEntry not exist.	The error message returned because the specified route entry does not exist.
400	IncorrectVpcStatus	Current VPC status does not support this operation.	The error message returned because the state of the VPC does not support this operation.

15.1.2.1.8.4. DescribeRouteEntryList

Queries information about route entries in a route table.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeRouteEntryList	The operation that you want to perform. Set the value to **DescribeRouteEntryList**.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the route table to which the route entries belong. You can call the `DescribeRegions` operation to query the most recent region list.
RouteTableId	String	Yes	vtb-bp1r9pvl4xen8s9ju****	The ID of the route table that you want to query.
RouteEntryId	String	No	rte-bp1mnnr2al0naomnp****	The ID of the route entry that you want to query.
DestinationCidrBlock	String	No	192.168.2.0/24	The destination CIDR block of the route entry. IPv4 and IPv6 CIDR blocks are supported. **Note** Only Apsara Stack China Site supports IPv6 CIDR blocks.
RouteEntryName	String	No	abc	The name of the route entry.
IpVersion	String	No	IPv4	The IP version. Valid values: • **IPv4**: IPv4 • **IPv6**: IPv6 **Note** Only Apsara Stack China Site supports IPv6.

Parameter	Type	Required	Example	Description
RouteEntryType	String	No	System	The type of the route entry. Valid values: • **Custom**: a custom route entry • **System** : a system route entry
NextHopId	String	No	vpn-bp10zyaph5cc8b7c7****	The ID of the next hop.
NextHopType	String	No	Instance	The type of the next hop. Valid values: • **Instance**: an Elastic Compute Service (ECS) instance • **HaVip**: a high-availability virtual IP address (HAVIP) • **VpnGateway**: a VPN gateway • **NatGateway**: a NAT gateway • **NetworkInterface**: a secondary elastic network interface (ENI) • **RouterInterface**: a router interface • **IPv6Gateway**: an IPv6 gateway **Note** Only Apsara Stack China Site supports IPv6 gateways as next hops.
MaxResult	Integer	No	50	The number of entries to return on each page. Valid values: **20** to **100**. Default value: **50**.
NextToken	String	No	caeba0bbb2be03f84eb48b699f0a4****	The token used to start the next query.

Response parameters

Parameter	Type	Example	Description
NextToken	String	caeba0bbb2be03f84eb48b699f0a4883	The token used to start the next query.
RequestId	String	14A07460-EBE7-47CA-9757-12CC4761D47A	The ID of the request.

Parameter	Type	Example	Description
RouteEntrys	Array of RouteEntry		The information about the route entry.
RouteEntry			
Description	String	RouteEntryDescription	The description of the vRouter.
DestinationCidrBlock	String	10.0.0.0/24	The destination CIDR block of the route entry.
IpVersion	String	IPv4	The IP version. Valid values: • **IPv4** : IPv4 • **IPv6**: IPv6
NextHops	Array of NextHop		The information about the next hop.
NextHop			
Enabled	Integer	0	Indicates whether the route entry is available. Valid values: • **0**: unavailable • **1**: available
NextHopId	String	vpn-bp10zyaph5cc8b7c7****	The ID of the next hop.
NextHopRegionId	String	cn-qingdao-env17-d01	The ID of the region where the next hop is deployed.
NextHopRelatedInfo	Struct		The information about the next hop.
InstanceId	String	vpc-bp1t36rn9l53iwbsf****	The ID of the instance associated with the next hop.
InstanceType	String	VPC	The type of the instance associated with the next hop. Valid values: • **VPC**: a virtual private cloud (VPC) • **VBR**: a virtual border router (VBR)

Parameter	Type	Example	Description
RegionId	String	ch-qingdao-env17-d01	The ID of the region where the next hop is deployed.
NextHopType	String	Instance	The type of the next hop. Valid values: • **Instance**: an ECS instance • **HaVip**: an HAVIP • **VpnGateway**: a VPN gateway • **NatGateway**: a NAT gateway • **NetworkInterface**: a secondary ENI • **RouterInterface**: a router interface • **IPv6Gateway**: an IPv6 gateway **Note** Only Alibaba Cloud China Site supports IPv6 gateways as next hops.
Weight	Integer	100	The weight of the route entry.
RouteEntryId	String	rte-bp1mnnr2al0naomnp****	The ID of the route entry.
RouteEntryName	String	aaa	The name of the route entry.
RouteTableId	String	vtb-bp15w5q90d2rk3bww****	The ID of the route table.
Status	String	Available	The state of the route entry. Valid values: • **Pending**: being configured • **Available**: available • **Modifying**: being modified
Type	String	Custom	The type of the route entry. Valid values: • **Custom**: a custom route entry • **System** : a system route entry

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeRouteEntryList
&RegionId=cn-qingdao-env17-d01
&RouteTableId=vtb-bp1r9pvl4xen8s9ju****
&<Common request parameters>
```

Sample success responses

    }
}
```

Error codes

HttpCode	Error code	Error message	Required
400	OperationFailed.QueryCenEntry	Operation is denied because getting CEN route entry has failed.	The error message returned because the system cannot obtain the Cloud Enterprise Network (CEN) routes.

15.1.2.1.8.5. ModifyRouteEntry

Modifies the name and description of a custom route entry.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyRouteEntry	The operation that you want to perform. Set the value to **ModifyRouteEntry**.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region to which the route entry belongs. You can call the `DescribeRegions` operation to query the most recent region list.
RouteEntryId	String	Yes	rte-acfvgfsghfdd****	The ID of the custom route entry.
RouteEntryName	String	No	EntryName	The name of the route entry. The name must be 2 to 128 characters in length, and can contain digits, periods (.), underscores (_), and hyphens (-). It must start with a letter but cannot start with `http://` or `https://`.
Description	String	No	EntryDescription	The description of the route entry. The description must be 2 to 256 characters in length. The description must start with a letter but cannot start with `http://` or `https://`.

Response parameters

Parameter	Type	Example	Description
RequestId	String	861E6630-AEC0-4B2D-B214-6CB5E44B7F04	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ModifyRouteEntry
&RegionId=cn-qingdao-env17-d01
&RouteEntryId=rte-acfvgfsghfdd****
&<Common request parameters>
```

Sample success response

`XML` format

```
<ModifyRouteEntryResponse>
    <RequestId>861E6630-AEC0-4B2D-B214-6CB5E44B7F04</RequestId>
</ModifyRouteEntryResponse>
```

`JSON` format

```
{
 "RequestId": "861E6630-AEC0-4B2D-B214-6CB5E44B7F04"
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the permissions and try again.
400	InvalidRouteEntryId.NotFound	The specified routeEntry does not exist.	The error message returned because the specified route entry does not exist.

15.1.2.1.8.6. AssociateRouteTable

Associates a custom route table with a vSwitch in the same virtual private cloud (VPC).

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	AssociateRouteTable	The operation that you want to perform. Set the value to **AssociateRouteTable**.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the VPC to which the route table belongs. You can call the `DescribeRegions` operation to the most recent region list.
RouteTableId	String	Yes	vtb-bp145q7glnuzdvzu2****	The ID of the route table.
VSwitchId	String	Yes	vsw-25ncdvfaue4****	The ID of the vSwitch.

Parameter	Type	Required	Example	Description
ClientToken	String	No	02fb3da4-130e-11e9-8e44-0016e04115b	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must make sure that it is unique among different requests. `ClientToken` can contain only ASCII characters. It cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	DC668356-BCB4-42FD-9BC3-FA2B2E04B634	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=AssociateRouteTable
&RegionId=cn-qingdao-env17-d01
&RouteTableId=vtb-bp145q7glnuzdvzu2****
&VSwitchId=vsw-25ncdvfaue4****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<AssociateRouteTableResponse>
  <RequestId>DC668356-BCB4-42FD-9BC3-FA2B2E04B634</RequestId>
</AssociateRouteTableResponse>
```

`JSON` format

```
{"RequestId":"DC668356-BCB4-42FD-9BC3-FA2B2E04B634"}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRouteTableId.NotFound	Specified route table does not exist.	The error message returned because the specified route table does not exist.

15.1.2.1.8.7. DeleteRouteTable

Deletes a custom route table.

Descriptions

Before you delete a custom route table, disassociate the vSwitch that is associated with the custom route table.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteRouteTable	The operation that you want to perform. Set the value to **DeleteRouteTable**.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the virtual private cloud (VPC) to which the route table belongs. You can call the `DescribeRegions` operation to query the most recent region list.
RouteTableId	String	Yes	vtb-bp145q7glnuzdvzu2****	The ID of the route table to be deleted.

Response parameters

Parameter	Type	Example	Description
RequestId	String	DC668356-BCB4-42FD-9BC3-FA2B2E04B634	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DeleteRouteTable
&RegionId=cn-qingdao-env17-d01
&RouteTableId=vtb-bp145q7glnuzdvzu2****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteRouteTableResponse>
      <RequestId>DC668356-BCB4-42FD-9BC3-FA2B2E04B634</RequestId>
</DeleteRouteTableResponse>
```

`JSON` format

```
{
  "RequestId": "DC668356-BCB4-42FD-9BC3-FA2B2E04B634"
}
```

Error codes

HttpCode	Error code	Error message	Required
400	IncorrectVSwitchStatus	The current virtual switch status does not support this operation.	The error message returned because the vSwitch is in the Pending state and cannot be deleted.

15.1.2.1.8.8. DescribeRouteTableList

Queries the list of route tables.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeRouteTableList	The operation that you want to perform. Set the value to **DescribeExporterRuleList**.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the virtual private cloud (VPC) to which the route table belongs. You can call the `DescribeRegions` operation to query the most recent region list.
RouterType	String	No	VBR	The ID of the vRouter to which the route table belongs. Set the value to: • **VRouter** (default): a vRouter • **VBR**: a virtual border router (VBR)
RouterId	String	No	vrt-bp1lhl0taikrteen8****	The ID of the vRouter to which the route table belongs.

Parameter	Type	Required	Example	Description
VpcId	String	No	vpc-bp15zckdt37pq72****	The ID of the vRouter to which the route table belongs. After you set this parameter, **RouterType** is automatically set to **VRouter**.
RouteTableId	String	No	vtb-bp145q7glnuzdvzu2****	The ID of the route table that you want to query.
RouteTableName	String	No	doctest	The name of the route table that you want to query.
PageNumber	Integer	No	1	The number of the page to return. Default value: **1**.
PageSize	Integer	No	10	The number of entries to return on each page. Maximum value: **50**. Default value: **10**.
ResourceGroupId	String	No	rg-acfmxazb4ph****	The ID of the resource group to which the route table to be queried belongs.
Tag.N.Key	String	No	Key1	The key of the tag.
Tag.N.Value	String	No	Value1	The value of the tag.

Response parameters

Parameter	Type	Example	Description
Code	String	200	The response code. **Note** The HTTP status code 200 indicates that the call was successful.
Message	String	The Request is not authorization.	The returned message.

Parameter	Type	Example	Description
PageNumber	Integer	1	The page number of the returned page.
PageSize	Integer	10	The number of entries returned per page.
RequestId	String	DC668356-BCB4-42FD-9BC3-FA2B2E04B634	The ID of the instance.
RouterTableList	Array of RouterTableListType		The list of route tables.
RouterTableListType			
CreationTime	String	2017-08-22T10:40:25Z	The time when the route table was created.
Description	String	This is Route Table.	The description of the route table.
OwnerId	Long	12345678	The ID of the Apsara Stack tenant account to which the route table belongs.
ResourceGroupId	String	rg-acfmxazb4ph****	The ID of the resource group to which the route table belongs.
RouteTableId	String	vtb-bp145q7glnuzdvzu2****	The ID of the route table.
RouteTableName	String	doctest	The name of the route table.
RouteTableType	String	System	The type of the route table. • **Custom**: a custom route table • **System** : a system route table
RouterId	String	vrt-bp1lhl0taikrteen8****	The ID of the router to which the route table belongs.

Parameter	Type	Example	Description
RouterType	String	VBR	The type of the router to which the route table belongs. Valid values: • **VRouter**: a vRouter • **VBR**: a virtual border router (VBR)
Status	String	Available	The state of the route table. • **Pending**: The route table is being configured. • **Available**: The route table is available.
Tags	Array of Tag		The tag of the route table.
Tag			
Key	String	type	The key of the tag that is added to the route table.
Value	String	ingress	The value of the tag that is added to the route table.
VSwitchIds	List	vsw-bp12mw1f8k3jgygk9****	The list of vSwitches deployed in the VPC.
VpcId	String	vpc-bp15zckdt37pq72****	The ID of the VPC to which the route table belongs.
Success	Boolean	true	Indicates whether the call is successful. Valid values: • **true**: The call is successful. • **false**: The call fails.
TotalCount	Integer	1	The number of entries to return.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeRouteTableList
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeRouteTableListResponse>
  <TotalCount>1</TotalCount>
  <PageSize>10</PageSize>
  <Message>The Request is not authorization.</Message>
  <RequestId>DC668356-BCB4-42FD-9BC3-FA2B2E04B634</RequestId>
  <PageNumber>1</PageNumber>
  <RouterTableList>
        <Status>Available</Status>
        <Description>This is Route Table.</Description>
        <RouteTableId>vtb-bp145q7glnuzdvzu2****</RouteTableId>
        <OwnerId>12345678</OwnerId>
        <ResourceGroupId>rg-acfmxazb4ph****</ResourceGroupId>

    },
    "Code": 200,
    "Success": true
}
```

Error codes

HttpCode	Error code	Error message	Description.
403	Forbbiden	User not authorized to operate on the specified resource.	The error message returned because you are not authorized to perform this operation on the specified resource. You can apply for the permissions and try again.

15.1.2.1.8.9. UnassociateRouteTable

Disassociates a route table from a vSwitch.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	UnassociateRouteTable	The operation that you want to perform. Set the value to **UnassociateRouteTable**.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the virtual private cloud (VPC) to which the route table belongs. You can call the `DescribeRegions` operation to query the most recent region list.
RouteTableId	String	Yes	vtb-bp145q7glnuzdvzu2****	The ID of the route table.
VSwitchId	String	Yes	vsw-25naucfvfbgte4****	The ID of the vSwitch from which you want to disassociate the route table.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-0016e04115b	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must make sure that it is unique among different requests. `ClientToken` can contain only ASCII characters. It cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	62172DD5-6BAC-45DF-8D44-62172DD5	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=UnassociateRouteTable
&RegionId=cn-qingdao-env17-d01
&RouteTableId=vtb-bp145q7glnuzdvzu2****
&VSwitchId=vsw-25naucfvfbgte4****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<UnassociateRouteTableResponse>
      <RequestId>62172DD5-6BAC-45DF-8D44-62172DD5</RequestId>
</UnassociateRouteTableResponse>
```

`JSON` format

```
{
  "RequestId": "62172DD5-6BAC-45DF-8D44-62172DD5"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRouteTableId.NotFound	Specified route table does not exist.	The error message returned because the specified route table does not exist.

15.1.2.1.9. Region

15.1.2.1.9.1. DescribeRegions

Queries the most recent region list.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeRegions	The operation that you want to perform. Set the value to **DescribeRegions**.
ProductType	String	No	ECS	The type of the cloud service.
AcceptLanguage	String	No	zh-CN	The language of the response. Valid values: • **zh-CN**: Chinese. This is the default value. • **en-US**: English

Response parameters

Parameter	Type	Example	Description
Regions	Array of Region		The list of regions.
Region			
LocalName	String	China (Qingdao)	The name of the region.

Parameter	Type	Example	Description
RegionEndpoint	String	vpc.aliyuncs.com	The endpoint of the region.
RegionId	String	cn-qingdao-env17-d01	The ID of the region.
RequestId	String	611CB80C-B6A9-43DB-9E38-0B0AC3D9B58F	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeRegions
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeRegionsResponse>
  <RequestId>611CB80C-B6A9-43DB-9E38-0B0AC3D9B58F</RequestId>
  <Regions>
        <RegionId>cn-qingdao-env17-d01</RegionId>
        <RegionEndpoint>vpc.aliyuncs.com</RegionEndpoint>
        <LocalName>China (Qingdao)</LocalName>
  </Regions>
</DescribeRegionsResponse>
```

`JSON` format

```
{
    "RequestId": "611CB80C-B6A9-43DB-9E38-0B0AC3D9B58F",
    "Regions": {
        "RegionId": "cn-qingdao-env17-d01",
        "RegionEndpoint": "vpc.aliyuncs.com",
        "LocalName": "China (Qingdao)"
    }
}
```

15.1.2.1.9.2. DescribeZones

Queries zones in a specified region.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeZones	The operation that you want to perform. Set the value to **DescribeZones**.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where zones are queried. You can call the `DescribeRegions` operation to the most recent region list.

Response parameters

Parameter	Type	Example	Description
Zones	Array of Zone		The zones that are returned.
Zone			
LocalName	String	Hangzhou Zone	The name of the zone.
ZoneId	String	cn-cn-qingdao-env17-amtest11001-a	The ID of the zone.
RequestId	String	6FEA0CF3-D3B9-43E5-A304-D217037876A8	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeZones
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeZonesResponse>
  <RequestId>6FEA0CF3-D3B9-43E5-A304-D217037876A8</RequestId>
  <Zones>
        <ZoneId>cn-cn-qingdao-env17-amtest11001-a</ZoneId>
        <LocalName>Hangzhou Zone B</LocalName>
  </Zones>
</DescribeZonesResponse>
```

`JSON` format

```
{
    "RequestId": "6FEA0CF3-D3B9-43E5-A304-D217037876A8",
    "Zones": {
        "ZoneId": "cn-cn-qingdao-env17-amtest11001-a",
        "LocalName": "Hangzhou Zone B"
    }
}
```

15.1.2.1.10. Tag

15.1.2.1.10.1. TagResources

Creates tags and adds the tags to resources at a time.

Descriptions

Tags are used to classify instances. Each tag consists of a key and a value. To use tags, make sure that the following requirements are met:

- The keys of tags that are added to the same instance must be unique.
- You cannot create tags without adding them to instances. All tags must be added to instances.
- Tag information is not shared across regions.
- Virtual private clouds (VPCs), route tables, vSwitches, and elastic IP addresses (EIPs) that belong to the same Apsara Stack tenant account and in the same region share tag information with each other.

  For example, if you have added a tag to a VPC, the tag is available to vSwitches, route tables, and EIPs that belong to the same account and in the same region where the VPC is created. You can select this tag from the editing page without the need to enter the tag again. You can modify the key and value of a tag or remove a tag from an instance. After you delete an instance, all tags that are added to the instance are deleted.
- You can add up to 20 tags to each instance. Before you add a tag to an instance, the system automatically checks the number of existing tags. An error message is returned if the maximum number of tags is reached.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	TagResources	The operation that you want to perform. Set the value to **TagResources**.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region to which the resource belongs.

Parameter	Type	Required	Example	Description
ResourceId.N	RepeatList	Yes	vpc-bp16qjewdsunr41m1****	The ID of the resource. Valid values of N: 1 to 20.
ResourceType	String	Yes	VPC	The type of the resource. Valid values: • **VPC**: a VPC • **VSWITCH**: a vSwitch • **ROUTETABLE**: a route table • **EIP**: an elastic IP address (EIP)
Tag.N.Key	String	No	FinanceDept	The key of the tag that is added to the resource. Valid values of N: **1** to **20**. This parameter value cannot be an empty string. The key can be up to 64 characters in length, and can contain digits, periods (.), underscores (_), and hyphens (-). It must start with a letter but cannot start with `aliyun` or `acs:`. It cannot contain `http://` or `https://`.
Tag.N.Value	String	No	FinanceJoshua	The value of tag N that is added to the resource. Valid values of N: **1** to **20**. The key can be an empty string. The tag value must be up to 128 characters in length, and start with a letter. It can contain digits, periods (.), underscores (_), and hyphens (-). It cannot start with `aliyun` or `acs:`. It cannot contain `http://` or `https://`.

Response parameters

Parameter	Type	Example	Description
RequestId	String	C46FF5A8-C5F0-4024-8262-B16B639225A0	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=TagResources
&RegionId=cn-qingdao-env17-d01
&ResourceId.1=vpc-bp16qjewdsunr41m1****
&ResourceType=VPC
&<Common request parameters>
```

Sample success responses

`XML` format

```
<TagResourcesResponse>
      <RequestId>C46FF5A8-C5F0-4024-8262-B16B639225A0</RequestId>
</TagResourcesResponse>
```

`JSON` format

```
{
 "RequestId":"C46FF5A8-C5F0-4024-8262-B16B639225A0"
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform this operation on the specified resource. To obtain the required permissions, submit a ticket.

15.1.2.1.10.2. ListTagResources

Queries tags that are added to one or more instances.

Descriptions

- Set **ResourceId.N** or **Tag.N that consists of Tag.N.Key and Tag.N.Value** in the request to specify the object to be queried.
- **Tag.N** is a resource tag that consists of a key-value pair. If you set only **Tag.N.Key**, all tag values that are associated with the specified key are returned. If you set only **Tag.N.Value**, an error message is returned.
- If you set **Tag.N** and **ResourceId.N** to filter tags, **ResourceId.N** must match all specified key-value pairs.
- If you specify multiple key-value pairs, resources that contain these key-value pairs are returned.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ListTagResources	The operation that you want to perform. Set the value to **ListTagResources**.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region to which the resource belongs.
ResourceType	String	Yes	VPC	The type of the resource. Valid values: • **VPC**: a VPC • **VSWITCH**: a vSwitch • **ROUTETABLE**: a route table • **EIP**: an elastic IP address (EIP)
ResourceId.N	RepeatList	No	vpc-bp16qjewdsunr41m1****	The ID of the resource. Valid values of N: 1 to 20.
Tag.N.Key	String	No	FinanceDept	The key of the tag that is added to the resource. Valid values of N: 1 to 20. It cannot be an empty string. The key can be up to 64 characters in length, and can contain digits, periods (.), underscores (_), and hyphens (-). It must start with a letter but cannot start with `aliyun` or `acs:`. It cannot contain `http://` or `https://`.

Parameter	Type	Required	Example	Description
Tag.N.Value	String	No	FinanceJoshua	The value of tag N that is added to the resource. Valid values of N: 1 to 20. The tag value can be an empty string. The tag value must be up to 128 characters in length, and start with a letter or Chinese character. It can contain digits, periods (.), underscores (_), and hyphens (-) and cannot start with `aliyun` or `acs:`. It cannot contain `http://` or `https://`.
NextToken	String	No	caeba0bbb2be03f84eb48b699f0a****	The query token. Set this parameter to the NextToken value that is returned in the last API call. If no subsequent request is sent, you do not need to set this parameter.
MaxResults	Integer	No	10	The maximum number of entries to return.

Response parameters

Parameter	Type	Example	Description
NextToken	String	caeba0bbb2be03f84eb48b699f0****	The token that is required for the next query. If the **NextToken** parameter is empty, no subsequent request will be sent.
RequestId	String	DE65F6B7-7566-4802-9007-96F2494AC512	The ID of the request.
TagResources	Array of TagResource		The resources to which the tags are added.
TagResource			
ResourcId	String	vpc-bp16qjewdsunr41m1****	The ID of the resource.
ResourceId	String	2zebd226fxed6h4i****	The ID of the resource.
ResourceType	String	VPC	The type of the resource.

Parameter	Type	Example	Description
TagKey	String	FinanceDept	The key of the tag.
TagValue	String	FinanceJoshua	The value of the tag.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ListTagResources
&RegionId=cn-qingdao-env17-d01
&ResourceType=VPC
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ListTagResourcesResponse>
  <NextToken>caeba0bbb2be03f84eb48b699f0****</NextToken>
  <RequestId>DE65F6B7-7566-4802-9007-96F2494AC512</RequestId>
  <TagResources>
        <ResourceId>2zebd226fxed6h4i****</ResourceId>
        <TagKey>FinanceDept</TagKey>
        <ResourceType>VPC</ResourceType>
        <ResourcId>vpc-bp16qjewdsunr41m1****</ResourcId>
        <TagValue>FinanceJoshua</TagValue>
  </TagResources>
</ListTagResourcesResponse>
```

`JSON` format

```
{
    "NextToken": "caeba0bbb2be03f84eb48b699f0****",
    "RequestId": "DE65F6B7-7566-4802-9007-96F2494AC512",
    "TagResources": {
        "ResourceId": "2zebd226fxed6h4i****",
        "TagKey": "FinanceDept",
        "ResourceType": "VPC",
        "ResourcId": "vpc-bp16qjewdsunr41m1****",
        "TagValue": "FinanceJoshua"
    }
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform this operation on the specified resource. To obtain the required permissions, submit a ticket.

15.1.2.1.10.3. UnTagResources

Removes tags from specified resources.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	UnTagResources	The operation that you want to perform. Set the value to **UntagResources**.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region to which the resource belongs.
ResourceId.N	RepeatList	Supported	vpc-bp16qjewdsunr41m1****	The ID of the resource. Valid values of N: **1** to **20**.
ResourceType	String	Yes	VPC	The type of the resource. Valid values: • **VPC**: a virtual private cloud (VPC) • **VSWITCH**: a vSwitch • **ROUTETABLE**: a route table • **EIP**: an elastic IP address (EIP)
TagKey.N	RepeatList	No	FinanceDept	The key of the tag that you want to remove. Valid values of N: **1** to **20**. The key can be an empty string. The key can be up to 64 characters in length, and can contain digits, periods (.), underscores (_), and hyphens (-). It must start with a letter but cannot start with `aliyun` or `acs:`. It cannot contain `http://` or `https://`.

Parameter	Type	Required	Example	Description
All	Boolean	No	false	Specifies whether to remove all tags from the resource. This parameter takes effect only when the **TagKey.N** parameter is not set in the request. Valid values: • **true**: removes all tags from the resource. • **false**(default): does not remove tags.

Response parameters

Parameter	Type	Example	Description
RequestId	String	C46FF5A8-C5F0-4024-8262-B16B639225A0	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=UnTagResources
&RegionId=cn-qingdao-env17-d01
&ResourceId.1=vpc-bp16qjewdsunr41m1****
&ResourceType=VPC
&<Common request parameters>
```

Sample success responses

`XML` format

```
<UntagResourcesResponse>
      <RequestId>C46FF5A8-C5F0-4024-8262-B16B639225A0</RequestId>
</UntagResourcesResponse>
```

`JSON` format

```
{
 "RequestId":"C46FF5A8-C5F0-4024-8262-B16B639225A0"
}
```

Error codes

HttpCode	Error code	Error message	Description

HttpCode	Error code	Error message	Description
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform this operation on the specified resource. To obtain the required permissions, submit a ticket.

15.1.2.1.11. BGP

15.1.2.1.11.1. DescribeBgpGroups

Queries Border Gateway Protocol (BGP) groups in a region.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeBgpGroups	The operation that you want to perform. Set the value to **DescribeBgpGroups**.
RegionId	String	Yes	cn-shanghai	The region to which the BGP group belongs. You can call the DescribeRegions operation to query region IDs.
RouterId	String	No	vrt-kojok19x3j0q6kx	The ID of the virtual border router (VBR) that is associated with the BGP group.
BgpGroupId	String	No	bgpg-wz9f62v4fbg2gxxxxxxx	The ID of the BGP group.
IsDefault	Boolean	No	false	Specifies whether the specified BGP group is the default one.
PageNumber	Integer	No	1	The number of the page to return. Default value: 1.

Parameter	Type	Required	Example	Description
PageSize	Integer	No	1	The number of entries to return on each page. Maximum value: **50**. Default value: **10**.

Response parameters

Parameter	Type	Example	Description
TotalCount	Integer	10	The total number of entries.
PageNumber	Integer	1	The page number of the returned page.
PageSize	Integer	5	The number of entries returned per page.
BgpGroups	Array of BgpGroup		The detailed information about the BGP group.
BgpGroup			
AuthKey	String	! PWZ2wsq	The key used by the BGP group.
BgpGroupId	String	bgp-wz977wcrmb69axxxxxxxx	The ID of the BGP group.
Description	String	The description of the BGP group.	The description of the BGP group
Hold	String	30	The hold time of the BGP connection. If no message is received within the hold time, the BGP peer is considered disconnected.
IpVersion	String	IPv4	
IsFake	String	true	Whether the autonomous system (AS) number is valid.
Keepalive	String	10	The keepalive time.
LocalAsn	String	45104	The local AS number.

Parameter	Type	Example	Description
Name	String	The name of the BGP group	The name of the BGP group.
PeerAsn	String	1111	The AS number of the BGP peer.
RegionId	String	cn-shanghai	The ID of the region to which the BGP group belongs. For more information about region IDs, see Regions and zones.
RouteLimit	String	99	Routing limits.
RouterId	String	vrt-bp1lhl0taikrteen****	The ID of the VBR.
Status	String	active	The status of the BGP peer.
RequestId	String	1D0971B2-A35A-42C1-A44C-E91360C36C0B	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeBgpGroups
&RegionId=cn-shanghai
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeBgpGroupsResponse>
   <TotalCount>1</TotalCount>
   <PageSize>10</PageSize>
   <RequestId>09E2C0FD-37FF-4737-80DF-517AC36D43DB</RequestId>
   <BgpGroups>
      <BgpGroup>
         <BgpGroupId>bgpg-2zev8h2wo4******</BgpGroupId>
         <LocalAsn>45104</LocalAsn>
         <Hold>30</Hold>
         <Description></Description>
         <AuthKey></AuthKey>
         <IsFake>true</IsFake>
         <PeerAsn>234</PeerAsn>
         <Keepalive>10</Keepalive>
         <RouteLimit>99</RouteLimit>
         <Name>Group1</Name>
         <Status>Pending</Status>
         <RouterId>vbr-2zecmmvg5gvu8i4******</RouterId>
         <RegionId>cn-beijing</RegionId>
      </BgpGroup>
   </BgpGroups>
</DescribeBgpGroupsResponse>
```

`JSON` format

```
{
    "TotalCount": 1,
    "PageSize": 10,
    "RequestId": "09E2C0FD-37FF-4737-80DF-517AC36D43DB",
    "BgpGroups": {
        "BgpGroup": [
            {
                "BgpGroupId": "bgpg-2zev8h2wo******",
                "LocalAsn": 45104,
                "Hold": 30,
                "Description": "",
                "AuthKey": "",
                "IsFake": true,
                "PeerAsn": 234,
                "Keepalive": 10,
                "RouteLimit": 99,
                "Name": "Group1",
                "Status": "Pending",
                "RouterId": "vbr-2zecmmvg5gvu8i4*****",
                "RegionId": "cn-beijing"
            }
        ]
    }
}
```

Error codes

HttpCode	Error code	Error message	Description
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because unknown errors occur.
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because the specified region ID does not exist. Check whether the region ID is valid.

15.1.2.1.11.2. ModifyBgpGroupAttribute

Modifies the configuration of a Border Gateway Protocol (BGP) group.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyBgpGroupAttribute	The operation that you want to perform. Set the value to **ModifyBgpGroupAttribute**.
BgpGroupId	String	Yes	bgpg-wz9f62v4fbg2g******	The ID of the BGP group.
RegionId	String	Yes	cn-shanghai	The ID of the region where the BGP group is deployed. You can call the DescribeRegions operation to query region IDs.
Name	String	No	test	The name of the BGP group. The name must be 2 to 128 characters in length and can contain digits, periods (.), underscores (_), and hyphens (-). It must start with a letter and cannot start with `http://` or `https://`.
Description	String	No	BGP	The description of the BGP group. The description must be 2 to 256 characters in length. It must start with a letter and cannot start with `http://` or `https://`.

Parameter	Type	Required	Example	Description
LocalAsn	Long	No	23	The autonomous system (AS) number of the device on the cloud side.
PeerAsn	Long	No	1111	The AS number of the local device.
AuthKey	String	No	! PWZ2wsq	The authentication key of the BGP group.
IsFakeAsn	Boolean	No	true	A router that runs BGP typically belongs to only one AS. In some cases, for example, the AS needs to be migrated or is merged with another AS, a new AS number replaces of the original one.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-001*******	The client token is used to ensure the idempotence of the request. You can use the client to generate the value, but you must ensure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	8C3C6D7C-A1CE-4FD8-BC57-DC493A55F76F	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=ModifyBgpGroupAttribute
&BgpGroupId=bgpg-wz9f62v4fbg2g********
&RegionId=cn-shanghai
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyBgpGroupAttributeResponse>
      <RequestId>C1221A1F-2ACD-4592-8F27-474E02883159</RequestId>
</ModifyBgpGroupAttributeResponse>
```

`JSON` format

```
{
  "RequestId": "C1221A1F-2ACD-4592-8F27-474E02883159"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	Specified value of "regionId" is not supported.	The error message returned because the specified region ID does not exist. Check whether the region ID is valid.
400	QuotaExceeded.Bgp	bgp peer count per vbr quota exceed.	The error message returned because the number of BGP groups in the virtual border router (VBR) has reached the upper limit.
400	QuotaExceeded.Nqa	nqa count per vbr quota exceed.	The error message returned because the Network Quality Analyzer (NQA) number has exceeded the upper limit.
400	QuotaExceeded.BgpNetwork	bgp network count per vbr quota exceed.	The error message returned because the number of BGP networks in the VBR has reached the upper limit.
400	InvalidPeerIpAddress	multi pconn peer ip can not be null.	The error message returned because the IP addresses of multiple physical connections cannot be empty.
400	InvalidVbrNetwork	vbr netowrk not exists	The error message returned because the specified VBR does not exist. Check whether the specified VBR ID is valid.
400	InvalidBgpGroup	bgp group not exists	The error message returned because the BGP group does not exist.
400	InvalidBgpName.Malformed	Specified Bgp Group name is not valid.	The error message returned because the name of the BGP group is invalid.

HttpCode	Error code	Error message	Description
400	InvalidBgpDiscription.Malformed	Specified Bgp Group description is not valid.	The error message returned because the description of the BGP group is invalid.
400	InvalidBgpAuthkey.Malformed	Specified Bgp Group authkey is not valid.	The error message returned because the verification key of the BGP group is invalid.
400	InvalidIP.Malformed	Ip malformed.	The error message returned because the format of the IP address is invalid.
400	InvalidPeerAsn.Malformed	invalid peer asn cannot equals aliyun asn:45104	The error message returned because the autonomous system (AS) number cannot be the same as that of Apsara Stack.
400	InvalidParams.NotFound	instance not found	The error message returned because the instance does not exist.
400	InvalidParams.NotFound	vpc instance not found	The error message returned because the specified VPC does not exist. Check whether the specified VPC ID is valid.
400	InvalidParams.AlreadyExists	bgp network already exists	The error message returned because the BGP network already exists.
400	InvalidStatus.CannotOperate	invalid status cannot operate	The error message returned because the state is invalid and the operation cannot be performed.

15.1.2.1.11.3. DeleteBgpGroup

Deletes a Border Gateway Protocol (BGP) group.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteBgpGroup	The operation that you want to perform. Set the value to **DeleteBgpGroup**.

Parameter	Type	Required	Example	Description
BgpGroupId	String	Yes	bgpg-wz9f62v4fbg2gxxxxxxx	The ID of the BGP group.
RegionId	String	Yes	cn-shanghai	The region to which the BGP group belongs. You can call the DescribeRegions operation to query region IDs.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-0016e04115b	The client token is used to ensure the idempotence of the request. You can use the client to generate the value, but you must ensure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	97E2E97F-968C-48AF-A310-AC4D068854DB	The ID of the request.

Examples

Sample requests

```
https://vpc.aliyuncs.com/?Action=DeleteBgpGroup
&BgpGroupId=bgpg-wz9f62v4fbg2gxxxxxxxx
&RegionId=cn-shanghai
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteBgpGroupResponse>
      <RequestId>0ED8D006-F706-4D23-88ED-E11ED28DCAC0</RequestId>
</DeleteBgpGroupResponse>
```

`JSON` format

```
{
    "RequestId": "0ED8D006-F706-4D23-88ED-E11ED28DCAC0"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	Specified value of "regionId" is not supported.	The error message returned because the specified region ID does not exist. Check whether the region ID is valid.
400	QuotaExceeded.Bgp	bgp peer count per vbr quota exceed.	The error message returned because the number of BGP groups in the virtual border router (VBR) has reached the upper limit.
400	QuotaExceeded.Nqa	nqa count per vbr quota exceed.	The Network Quality Analyzer (NQA) number has exceeded the quota of the VBR.
400	QuotaExceeded.BgpNetwork	bgp network count per vbr quota exceed.	The number of BGP networks in the VBR has reached the upper limit.
400	InvalidPeerIpAddress	multi pconn peer ip can not be null.	The IP addresses of multiple physical connections cannot be empty.
400	InvalidVbrNetwork	vbr netowrk not exists	The error message returned because the specified vRouter does not exist. Check whether the specified VBR is valid.
400	InvalidBgpGroup	bgp group not exists	The error message returned because the BGP group does not exist.
400	InvalidBgpName.Malformed	Specified Bgp Group name is not valid.	The error message returned because the name of the BGP group is invalid.
400	InvalidBgpDiscription.Malformed	Specified Bgp Group description is not valid.	The error message returned because the description of the BGP group is invalid.
400	InvalidBgpAuthkey.Malformed	Specified Bgp Group authkey is not valid.	The error message returned because the verification key of the BGP group is invalid.
400	InvalidIP.Malformed	Ip malformed.	The error message returned because the format of the IP address is invalid.

HttpCode	Error code	Error message	Description
400	InvalidPeerAsn.Malformed	invalid peer asn cannot equals aliyun asn:45104	The error message returned because the autonomous system (AS) number cannot be the same as that of Apsara Stack.
400	InvalidParams.NotNull	invalid peer asn cannot equals aliyun asn:45104	The error message returned because the autonomous system (AS) number cannot be the same as that of Apsara Stack.
400	InvalidParams.NotFound	instance not found	The error message returned because the instance does not exist.
400	InvalidParams.NotFound	vpc instance not found	The error message returned because the specified VPC does not exist. Check whether the specified VPC ID is valid.
400	InvalidParams.AlreadyExists	bgp network already exists	The error message returned because the BGP network already exists.
400	InvalidStatus.CannotOperate	invalid status cannot operate	The error message returned because the state is invalid and the operation cannot be performed.

15.1.2.1.11.4. DescribeBgpPeers

Queries BGP peers in a specified region.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeBgpPeers	The operation that you want to perform. Set the value to **DescribeBgpPeers**.
RegionId	String	Yes	cn-shanghai	The ID of the region to which the BGP group belongs. You can call the DescribeRegions operation to query region IDs.

Parameter	Type	Required	Example	Description
RouterId	String	No	vbr-2zecmmvg5gvu8i4te****	The ID of the router.
BgpPeerId	String	No	bgp-2ze3un0ft1jd1xd*****	The ID of the BGP peer.
BgpGroupId	String	No	bgpg-2zev8h2wo414sfh******	The ID of the BGP group.
IsDefault	Boolean	No	false	Specifies whether the BGP group is the default one. • **true**: yes • **false**: no
PageNumber	Integer	No	1	The number of the page to return. Default value: **1**.
PageSize	Integer	No	1	The number of entries to return on each page. Maximum value: **50**. Default value: **10**.

Response parameters

Parameter	Type	Example	Description
BgpPeers	Array of BgpPeer		The detailed information about the BGP peer.
BgpPeer			
Name	String	test	The name of the BGP peer.
PeerIpAddress	String	116.62.**. **	The IP address of the BGP peer.
AuthKey	String	! PWZ2wsq******	The authentication key of the BGP group.
RouterId	String	vbr-2zecmmvg5gvu8i4te****w	The ID of the router.

Parameter	Type	Example	Description
Status	String	active	The state of the BGP peer. Valid values: • **Pending**: pending. • **Available**: available. • **Modifying**: being modified. • **Deleting**: being deleted. • **Deleted**: deleted.
BfdMultiHop	Integer	3	
BgpGroupId	String	bgp-wz977wcrmb69********	The ID of the BGP group.
BgpPeerId	String	bgp-wz977wcrmb69agdb******	The ID of the BGP peer.
BgpStatus	String	deleted	The state of the BGP connection. Valid values: • **creating**: being created. • **working**: being used. • **modifying**: being modified. • **deleting**: being deleted. • **Deleted**: deleted.
Description	String	xxxxxxxxx	The description of the BGP group.
EnableBfd	Boolean	true	Indicates whether the Bidirectional Forwarding Detection (BFD) protocol is enabled.
Hold	String	30	The hold time of the BGP connection.
IpVersion	String	IPv4	
IsFake	String	true	Indicates whether a fake autonomous system (AS) number is used.
Keepalive	String	10	The hold time of the BGP connection.
LocalAsn	String	45104	The local AS number.

Parameter	Type	Example	Description
PeerAsn	String	active	The AS number of the BGP peer.
RegionId	String	cn-shanghai	The ID of the region to which the BGP group belongs.
RouteLimit	String	99	Routing limits.
TotalCount	Integer	10	The number of entries returned.
PageNumber	Integer	1	The page number of the returned page.
PageSize	Integer	2	The number of entries returned per page.
RequestId	String	DE77A7F3-3B74-41C0-A5BC-CAFD188C28B6	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeBgpPeers
&RegionId=cn-shanghai
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeBgpPeersResponse>
  <TotalCount>10</TotalCount>
  <BgpPeers>
        <Status>active</Status>
        <Description>xxxxxxxxx</Description>
        <IpVersion>IPv4</IpVersion>
        <PeerIpAddress>116.62. **. **</PeerIpAddress>
        <Keepalive>10</Keepalive>
        <RouterId>vbr-2zecmmvg5gvu8i4te****w</RouterId>
        <PeerAsn>active</PeerAsn>
        <Name>test</Name>
        <BgpPeerId>bgp-wz977wcrmb69agdb******</BgpPeerId>
        <LocalAsn>45104</LocalAsn>
        <BfdMultiHop>3</BfdMultiHop>
        <EnableBfd>true</EnableBfd>
        <BgpStatus>deleted</BgpStatus>
        <IsFake>true</IsFake>
        <AuthKey>! PWZ2wsq******</AuthKey>
        <RouteLimit>99</RouteLimit>
        <RegionId>cn-shanghai</RegionId>
        <Hold>30</Hold>

Error codes

HttpCode	Error code	Error message	Description
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because unknown errors occur.
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because the specified region ID does not exist. Check whether the region ID is valid.

15.1.2.1.11.5. DeleteBgpPeer

Deletes a specific Border Gateway Protocol (BGP) peer.

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteBgpPeer	The operation that you want to perform. Set the value to **DeleteBgpPeer**.
BgpPeerId	String	Yes	bgp-wz977wcrmb69a********	The ID of the BGP peer.
RegionId	String	Yes	cn-shanghai	The region to which the BGP group belongs. You can call the DescribeRegions operation to query region IDs.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-001xxxxxxxx	The client token that is used to ensure the idempotence of the request. The value of this parameter is generated by a client. The value must be unique among different requests and must be 1 to 64 ASCII characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	AEBB1EB6-3C15-4A35-B4CE-03485200C143	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DeleteBgpPeer
&BgpPeerId=bgp-wz977wcrmb69a********
&RegionId=cn-shanghai
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteBgpPeerResponse>
      <RequestId>0ED8D006-F706-4D23-88ED-E11ED28DCAC0</RequestId>
</DeleteBgpPeerResponse>
```

`JSON` format

```
{
    "RequestId": "0ED8D006-F706-4D23-88ED-E11ED28DCAC0"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	Specified value of "regionId" is not supported.	The error message returned because the specified region ID does not exist. Check whether the region ID is valid.
400	QuotaExceeded.Bgp	bgp peer count per vbr quota exceed.	The error message returned because the number of BGP groups has reached the upper limit.
400	QuotaExceeded.Nqa	nqa count per vbr quota exceed.	The Network Quality Analyzer (NQA) number exceeds the virtual border router (VBR) quota.
400	QuotaExceeded.BgpNetwork	bgp network count per vbr quota exceed.	The number of BGP networks in the VBR has reached the quota.
400	InvalidPeerIpAddress	multi pconn peer ip can not be null.	The IP addresses of multiple physical connections cannot be empty.
400	InvalidVbrNetwork	vbr netowrk not exists	The error message returned because the specified VBR does not exist. Check whether the parameter is set to a valid value.
400	InvalidBgpGroup	bgp group not exists	The error message returned because the BGP group does not exist.
400	InvalidBgpName.Malformed	Specified Bgp Group name is not valid.	The error message returned because the name of the BGP group is invalid.
400	InvalidBgpDiscription.Malformed	Specified Bgp Group description is not valid.	The error message returned because the description of the BGP group is invalid.
400	InvalidBgpAuthkey.Malformed	Specified Bgp Group authkey is not valid.	The error message returned because the verification key of the BGP group is invalid.
400	InvalidIP.Malformed	Ip malformed.	The error message returned because the format of the IP address is invalid.

HttpCode	Error code	Error message	Description
400	InvalidPeerAsn.Malformed	invalid peer asn cannot equals aliyun asn:45104	The error message returned because the autonomous system (AS) number cannot be the same as that of Apsara Stack.
400	InvalidParams.NotNull	invalid peer asn cannot equals aliyun asn:45104	The error message returned because the AS number cannot be the same as that of Apsara Stack.
400	InvalidParams.NotFound	instance not found	The error message returned because the instance does not exist.
400	InvalidParams.NotFound	vpc instance not found	The error message returned because the specified VPC does not exist. Check whether the specified VPC ID is valid.
400	InvalidParams.AlreadyExists	bgp network already exists	The error message returned because the BGP network already exists.
400	InvalidStatus.CannotOperate	invalid status cannot operate	The error message returned because the state is invalid and the operation cannot be performed.

15.1.2.1.11.6. AddBgpNetwork

Advertises a Border Gateway Protocol (BGP) network.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	AddBgpNetwork	The operation that you want to perform. Set the value to **AddBgpNetwork**.
DstCidrBlock	String	Yes	10.10.**. **/32	The CIDR block of the virtual private cloud (VPC) or vSwitch that you want to connect to a data center.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-shanghai	The ID of the region where the virtual border router (VBR) is deployed. You can call the DescribeRegions operation to query region IDs.
RouterId	String	Yes	vrt-2zeo3xzyf38r4u********	The ID of the vRouter associated with the router interface.
VpcId	String	No	vpc-bp1qpo0kug3a2********	The ID of the VPC.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-0016e04115b	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must ensure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	9C7FA9D6-72E0-48A9-A9C3-2DA8569CD5EB	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=AddBgpNetwork
&DstCidrBlock=10.10. **. **/32
&RegionId=cn-shanghai
&RouterId=vrt-2zeo3xzyf38r4u******
&<Common request parameters>
```

Sample success responses

`XML` format

```
<AddBgpNetworkResponse>
      <RequestId>0ED8D006-F706-4D23-88ED-E11ED28DCAC0</RequestId>
</AddBgpNetworkResponse>
```

`JSON` format

```
{
    "RequestId": "0ED8D006-F706-4D23-88ED-E11ED28DCAC0"
}
```

Error codes

HttpCode	Error code	Error message	Description
400	QuotaExceeded.Bgp	bgp peer count per vbr quota exceed.	The error message returned because the number of BGP groups in the VBR has reached the quota.
400	QuotaExceeded.Nqa	nqa count per vbr quota exceed.	The error message returned because the Network Quality Analyzer (NQA) number exceeds the VBR quota.
400	QuotaExceeded.BgpNetwork	bgp network count per vbr quota exceed.	The error message returned because the number of BGP networks in the VBR has reached the quota.
400	InvalidPeerIpAddress	multi pconn peer ip can not be null.	The error message returned because the IP addresses of multiple physical connections cannot be empty.
400	InvalidVbrNetwork	vbr netowrk not exists	The error message returned because the specified vRouter does not exist. Check whether the ID of the VBR is valid.
400	InvalidBgpGroup	bgp group not exists	The error message returned because the BGP group does not exist.
400	InvalidBgpName.Malformed	Specified Bgp Group name is not valid.	The error message returned because the name of the BGP group is invalid.
400	InvalidBgpDiscription.Malformed	Specified Bgp Group description is not valid.	The error message returned because the description of the BGP group is invalid.

HttpCode	Error code	Error message	Description
400	InvalidBgpAuthkey.Malformed	Specified Bgp Group authkey is not valid.	The error message returned because the verification key of the BGP group is invalid.
400	InvalidIP.Malformed	Ip malformed.	The error message returned because the format of the IP address is invalid.
400	InvalidPeerAsn.Malformed	invalid peer asn cannot equals aliyun asn:45104	The error message returned because the autonomous system (AS) number cannot be the same as that of Apsara Stack.
400	InvalidParams.NotNull	parameter must not null.	The error message returned because a required parameter is not set.
400	InvalidParams.NotFound	instance not found	The error message returned because the specified instance does not exist.
400	InvalidParams.NotFound	vpc instance not found	The error message returned because the specified VPC does not exist. Check whether the specified VPC ID is valid.
400	InvalidParams.AlreadyExists	bgp network already exists	The error message returned because the BGP network already exists.
400	InvalidStatus.CannotOperate	invalid status cannot operate	The error message returned because the state is invalid and the operation cannot be performed.
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because the specified region ID does not exist. Check whether the region ID is valid.
400	QuotaExceeded.Bgp	bgp group count per vbr quota exceed.	The error message returned because the number of BGP groups in the VBR has reached the quota.

15.1.2.1.11.7. DeleteBgpNetwork

Deletes an advertised Border Gateway Protocol (BGP) network.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteBgpNetwork	The operation that you want to perform. Set the value to **DeleteBgpNetwork**.
DstCidrBlock	String	Yes	10.110.192.12/32	The CIDR block of the virtual private cloud (VPC) or vSwitch that you want to connect to a data center.
RegionId	String	Yes	cn-hangzhou	The ID of the region where the BGP group is deployed. You can call the DescribeRegions operation to query region IDs.
RouterId	String	Yes	vrt-bp1lhl0taikrteen80oxx	The ID of the virtual border router (VBR).
ClientToken	String	No	02fb3da4-130e-11e9-8e44-0016e04115b	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must ensure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	22F4C006-D3BB-4F96-9FF9-4C8335276D70	The ID of the request.

Examples

Sample requests

```
https://vpc.aliyuncs.com/?Action=DeleteBgpNetwork
&DstCidrBlock=10.110.192.12/32
&RegionId=cn-hangzhou
&RouterId=vrt-bp1lhl0taikrteen80oxx
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteBgpNetworkResponse>
      <RequestId>0ED8D006-F706-4D23-88ED-E11ED28DCAC0</RequestId>
</DeleteBgpNetworkResponse>
```

`JSON` format

```
{
    "RequestId": "0ED8D006-F706-4D23-88ED-E11ED28DCAC0"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	Specified value of "regionId" is not supported.	The error message returned because the specified region ID is invalid. Check whether the service is available in the specified region.
400	QuotaExceeded.Bgp	bgp peer count per vbr quota exceed.	The error message returned because the number of BGP groups in the VBR has reached the upper limit.
400	QuotaExceeded.Nqa	nqa count per vbr quota exceed.	The error message returned because the Network Quality Analyzer (NQA) number has exceeded the upper limit.
400	QuotaExceeded.BgpNetwork	bgp network count per vbr quota exceed.	The error message returned because the number of BGP networks in the VBR has reached the upper limit.
400	InvalidPeerIpAddress	multi pconn peer ip can not be null.	The error message returned because the IP addresses of multiple physical connections cannot be empty.
400	InvalidVbrNetwork	vbr netowrk not exists	The error message returned because the specified VBR does not exist. Check whether the specified VBR ID is valid.
400	InvalidBgpGroup	bgp group not exists	The error message returned because the BGP group does not exist.
400	InvalidBgpName.Malformed	Specified Bgp Group name is not valid.	The error message returned because the name of the BGP group is invalid.

HttpCode	Error code	Error message	Description
400	InvalidBgpDiscription.Malformed	Specified Bgp Group description is not valid.	The error message returned because the description of the BGP group is invalid.
400	InvalidBgpAuthkey.Malformed	Specified Bgp Group authkey is not valid.	The error message returned because the verification key of the BGP group is invalid.
400	InvalidIP.Malformed	Ip malformed.	The error message returned because the format of the IP address is invalid.
400	InvalidPeerAsn.Malformed	invalid peer asn cannot equals aliyun asn:45104	The error message returned because the AS number cannot be the same as that of Apsara Stack.
400	InvalidParams.NotNull	invalid peer asn cannot equals aliyun asn:45104	The error message returned because the AS number cannot be the same as that of Apsara Stack.
400	InvalidParams.NotFound	instance not found	The error message returned because the instance does not exist.
400	InvalidParams.NotFound	vpc instance not found	The error message returned because the specified VPC does not exist. Check whether the specified VPC ID is valid.
400	InvalidParams.AlreadyExists	bgp network already exists	The error message returned because the BGP network already exists.
400	InvalidStatus.CannotOperate	invalid status cannot operate	The error message returned because the state is invalid and the operation cannot be performed.

15.1.2.1.11.8. DescribeBgpNetworks

Queries advertised Border Gateway Protocol (BGP) networks.

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeBgpNetworks	The operation that you want to perform. Set the value to **DescribeBgpNetworks**.
RegionId	String	Yes	cn-hangzhou	The ID of the region where the BGP group is deployed. You can call the DescribeRegions operation to query region IDs.
RouterId	String	No	vrt-2zeazning6tb**********	The ID of the vRouter to which the route table belongs.
PageNumber	Integer	No	2	The number of the page to return. Default value: 1.
PageSize	Integer	No	10	The number of entries to return on each page. Maximum value: 50. Default value: 10.

Response parameters

Parameter	Type	Example	Description
BgpNetworks	Array of BgpNetwork		BGP networks.
BgpNetwork			
DstCidrBlock	String	10.1.**. **/24	The advertised BGP network.
RouterId	String	vrt-bp1el837xkkak********	The ID of the vRouter.
Status	String	Enabled	The state of the advertised BGP network.
VpcId	String	vpc-bp1qpo0kug3a********	The ID of the virtual private cloud (VPC).
PageNumber	Integer	2	The page number of the returned page.

Parameter	Type	Example	Description
PageSize	Integer	12	The number of entries returned per page.
RequestId	String	6F513A15-669F-419D-B511-08A85292059B	The ID of the request.
TotalCount	Integer	2	The total number of advertised BGP networks.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeBgpNetworks
&RegionId=cn-hangzhou
&RouterId=vrt-2zeazning6tb********
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeBgpNetworksResponse>
      <BgpNetworks>
            <BgpNetwork>
                  <DstCidrBlock>192.168. **. **/24</DstCidrBlock>
                  <VpcId></VpcId>
            </BgpNetwork>
      </BgpNetworks>
      <RequestId>6F513A15-669F-419D-B511-08A85292059B</RequestId>
      <PageSize>10</PageSize>
      <TotalCount>1</TotalCount>
</DescribeBgpNetworksResponse>
```

`JSON` format

```
{
  "BgpNetworks": {
    "BgpNetwork": [
      {
        "DstCidrBlock": "192.168. **. **/24",
        "VpcId": ""
      }
    ]
  },
  "RequestId": "6F513A15-669F-419D-B511-08A85292059B",
  "PageSize": 10,
  "TotalCount": 1
}
```

Error codes

HttpCode	Error code	Error message	Description
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because unknown errors have occurred.
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because the specified region ID does not exist. Check whether the region ID is valid.

15.1.2.1.12. VBR

15.1.2.1.12.1. CreateVirtualBorderRouter

Creates a virtual border router (VBR).

If you create a VBR for the current Apsara Stack tenant account, the state of the VBR becomes **Enabled** after it is created. If you create a VBR for another Apsara Stack tenant account, the state of the VBR becomes **Unconfirmed** after it is created. The Unconfirmed state indicates that the other Apsara Stack tenant account must confirm the operation.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateVirtualBorderRouter	The operation that you want to perform. Set the value to **CreateVirtualBorderRouter**.
PhysicalConnectionId	String	Yes	pc-xxxxxxxxx	The ID of the physical connection.
RegionId	String	Yes	cn-shanghai	The ID of the region where the physical connection is deployed. You can call the DescribeRegions operation to query region IDs.

Parameter	Type	Required	Example	Description
VlanId	Integer	Yes	10	The VLAN ID of the VBR. Valid values: **1 to 2999**. **Note** Only the owner of the physical connection can set this parameter. The VLAN IDs of two VBRs of the same physical connection must be different.
VbrOwnerId	Long	No	10	The ID of the Apsara Stack tenant account that owns the VBR. The default value is the ID of the current Apsara Stack tenant account, which is the owner of the physical connection.
CircuitCode	String	No	longtel001	The circuit code provided by the Internet service provider (ISP) of the physical connection. **Note** Only the owner of the physical connection can set this parameter.
LocalGatewayIp	String	No	116.62.222.XX	The IP address of the local VBR on the Apsara Stack side.
PeerGatewayIp	String	No	116.62.222.XX	The IP address of the VBR peer. This parameter can be set only in the following scenario: The owner of the physical connection is creating a VBR for the current Apsara Stack tenant account.
PeeringSubnetMask	String	No	255.255.255.252	The subnet mask of the IP address on the Apsara Stack side and the IP address on the client side. The two IP addresses must belong to the same subnet.

Parameter	Type	Required	Example	Description
Description	String	No	The description of the VBR	The description of the VBR. The description must be 2 to 256 characters in length. It must start with a letter but cannot start with `http://` or `https://`.
Name	String	No	test	The name of the VBR. The name must be 2 to 128 characters in length and can contain digits, periods (.), underscores (_), and hyphens (-). It must start with a letter and cannot start with `http://` or `https://`.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-0016e04115b	The client token that is used to ensure the idempotence of the request. You can use the client to generate a token, but you must ensure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
VbrId	String	vbr-bp1jcg5cmxjbl9xgc****	The ID of the VBR.
RequestId	String	4EC47282-1B74-4534-BD0E-403F3EE64CAF	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=CreateVirtualBorderRouter
&PhysicalConnectionId=pc-xxxxxxxxx
&RegionId=cn-shanghai
&VlanId=10
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreateRouterInterfaceResponse>
      <RequestId>980960B0-2969-40BF-8542-EBB34FD358AB</RequestId>
      <VbrId>vbr-2zecmmvg5gvu8i4t****</VbrId>
</CreateRouterInterfaceResponse>
```

`JSON` format

```
{
    "CreateRouterInterfaceResponse": {
        "RequestId": "980960B0-2969-40BF-8542-EBB34FD358AB",
        "VbrId": "vbr-2zecmmvg5gvu8i4te****"
    }
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId is not found.	The error message returned because the specified region ID is invalid. Check whether the service is available in the specified region.
400	InvalidPhysicalConnectionId.NotFound	The specified PhysicalConnectionId is not found.	The error message returned because the ID of the physical connection does not exist.
400	InvalidVlanId.Used	The specified VlanId has been used.	The error message returned because the VLAN ID is being used.
400	MissingParameter	The input parameter 'PhysicalConnectionId' that is mandatory for processing this request is not supplied.	The error message returned because PhysicalConnectionId is not set.
400	InvalidPhysicalConnectionId.NotEnabled	The specified PhysicalConnectionId is not in Enabled state.	The error message returned because the state of the physical connection is invalid. Check the physical connection and try again.
404	InvalidVbrOwnerId.NotFound	The specified VbrOwnerId is not valid.	The error message returned because VbrOwnerId is set to an invalid value.
400	InvalidVlanId.Malformed	The specified VlanId is not valid.	The error message returned because VlanId is set to an invalid value.

HttpCode	Error code	Error message	Description
400	InvalidCircuitCode.Malformed	The specified CircuitCode is not valid.	The error message returned because CircuitCode is set to an invalid value.
400	MissingParameter	The input parameter 'LocalGatewayIp' that is mandatory for processing this request is not supplied.	The error message returned because LocalGatewayIp is not set.
400	InvalidLocalGatewayIp.Malformed	The specified LocalGatewayIp is not valid.	The error message returned because the IP address of the local gateway is invalid.
400	MissingParameter	The input parameter 'PeerGatewayIp' that is mandatory for processing this request is not supplied.	The error message returned because PeerGatewayIp is not set.
400	MissingParameter	The input parameter 'PeeringSubnetMask' that is mandatory for processing this request is not supplied.	The error message returned because PeeringSubnetMask is not set.
400	InvalidPeeringSubnetMask.Malformed	The specified PeeringSubnetMask is not valid.	The error message returned because PeeringSubnetMask is set to an invalid value. Check whether PeeringSubnetMask is set to a valid value.
403	Forbidden.LocalGatewayIpNotAllowedByCaller	The caller is not allowed to specify the LocalGatewayIp parameter.	The error message returned because you are not allowed to set LocalGatewayIp.
403	Forbidden.PeerGatewayIpNotAllowedByCaller	The caller is not allowed to specify the PeerGatewayIp parameter.	The error message returned because you are not allowed to set PeerGatewayIp.
403	Forbidden.PeeringSubnetMaskNotAllowedByCaller	The caller is not allowed to specify the PeeringSubnetMask parameter.	The error message returned because you are not allowed to set PeeringSubnetMask.
403	Forbidden.NameNotAllowedByCaller	The caller is not allowed to specify the Name parameter.	The error message returned because you are not allowed to set Name.
403	Forbidden.DescriptionNotAllowedByCaller	The caller is not allowed to specify the Description parameter.	The error message returned because you are not allowed to set Description.
400	InvalidName.Malformed	The specified ? Name? is not valid.	The error message returned because the format of the name is invalid.

HttpCode	Error code	Error message	Description
400	InvalidDescription.Malformed	The specifid ? Description? is not valid.	The error message returned because the specified resource description is invalid. The description must be 2 to 256 characters in length and cannot start with http:// or https://.
400	QuotaExceeded.vbrPerpConn	Virtual boarder router per PhysicalConnection quota exceed.	The error message returned because the number of VBRs of the current physical connection has reached the upper limit. Reduce the number of VBRs and try again.
400	QuotaExceeded.freevbr	Free virtual boarder router quota exceed.	The error message returned because the VBR quota is exhausted.
400	InvalidIp.NotSameSubnet	Local gateway ip and peer gateway ip are not in the same subnet.	The error message returned because the IP addresses of the local gateway and the peer gateway do not fall within the same subnet.
404	CROSS_BID.FORBIDDEN	Create VBR across bid is illegal	The error message returned because you are not allowed to create a VBR for a user of another site.

15.1.2.1.12.2. DeleteVirtualBorderRouter

Deletes a virtual border router (VBR).

When you call this operation, take note of the following rules:

- Before you delete a VBR, you must delete all router interfaces on the VBR.
- You can delete only a VBR that is in the Unconfirmed, Enabled, or Terminated state.
- If the owner of a physical connection wants to delete a VBR that belongs to another Apsara Stack tenant account, the VBR must be in the Unconfirmed state.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteVirtualBorderRouter	The operation that you want to perform. Set the value to **DeleteVirtualBorderRouter**.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-shanghai	The ID of the region where the VBR is deployed. You can call the DescribeRegions operation to query region IDs.
VbrId	String	Yes	vbr-bp12mw1f8k3jgygk9****	The ID of the VBR.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-0016e04115b	The client token is used to ensure the idempotence of the request. You can use the client to generate the value, but you must ensure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	F8BF7D24-F3EB-4E23-9208-B77C6EB78E75	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DeleteVirtualBorderRouter
&RegionId=cn-shanghai
&VbrId=vbr-bp12mw1f8k3jgygk9****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteVirtualBorderRouterResponse>
      <RequestId>0ED8D006-F706-4D23-88ED-E11ED28DCAC0</RequestId>
</DeleteVirtualBorderRouterResponse>
```

`JSON` format

```
{
    "RequestId": "0ED8D006-F706-4D23-88ED-E11ED28DCAC0"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidVbrId.NotFound	The specified VirutalBorderRouter does not exist in our records.	The error message returned because the specified vRouter does not exist. Check whether the ID of the VBR is valid.
400	InvalidOperation.RouterInterfaceNotDeleted	The specified VirutalBorderRouter still has routerInterface.	The error message returned because the VBR is associated with router interfaces.
400	InvalidOperation.OperationNotAllowedInState	The specified VirutalBorderRouter is in invalid state.	The error message returned because the state of the VBR is invalid. Check the state of the VBR.
403	Forbidden.OperationNotAllowedByUser	The caller is not allowed to delete the specified VirtualBorderRouter.	The error message returned because you are not allowed to delete the VBR.
403	Forbidden.MultiVlanRi	Multiple vlan router interfaces are found.	The error message returned because multiple VLAN router interfaces exist.
403	Forbidden.NoRiFound	No vlan router interfaces are found.	The error message returned because no VLAN router interface is available.
400	InvalidStatus.NotAllowed	The virtual border has been associated by physicalConnection.	The error message returned because the VBR is associated with a physical connection.

15.1.2.1.12.3. DescribeVirtualBorderRouters

Queries virtual border routers (VBRs) that you have created.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeVirtualBorderRouters	The operation that you want to perform. Set the value to**DescribeVirtualBorderRouters**.
RegionId	String	Yes	cn-shanghai	The ID of the region where the VBR is deployed. You can call the DescribeRegions operation to query region IDs.

Parameter	Type	Required	Example	Description
PageNumber	Integer	No	1	The number of the page to return. Default value: **1**
PageSize	Integer	No	10	The number of entries to return on each page. Maximum value: **50**. Default value: **10**.
Filter.N.Key	String	No	1	The key of filter condition N. Valid values of N:**1 to 5**. Valid values of filter conditions: • **PhysicalConnectionId**: Filter by physical connection ID. • **VbrId**: Filter by VBR ID. • **Status**: Filter by VBR status. • **Name**: Filter by VBR name. • **AccessPointId**: Filter by access point ID. • • **type**: Filter by physical connection type.
Filter.N.Value.N	RepeatList	No	1	The value of filter condition N. Valid values of N:**1 to 5**.

Response parameters

Parameter	Type	Example	Description
VirtualBorderRouterSet	Array of VirtualBorderRouterType		The information about the queried VBR.
VirtualBorderRouterType			
AccessPointId	String	ap-cn-kojok1xxxxxxxx	The ID of the access point that is associated with the physical connection.
ActivationTime	String	2017-06-08T12:20:55	The first time when the VBR was activated.

Parameter	Type	Example	Description
AssociatedCens	Array of AssociatedCen		Cloud Enterprise Network (CEN).
AssociatedCen			
CenId	String	cen-kojok19xxxxxxxx	The ID of the CEN instance.
CenOwnerId	Long	1086496381294461	The user ID (UID) of the Apsara Stack tenant account to which the CEN instance belongs.
CenStatus	String	Attached	The status of the CEN instance.
AssociatedPhysicalConnections	Array of AssociatedPhysicalConnection		The associated physical connection.
AssociatedPhysicalConnection			
CircuitCode	String	12	The circuit code of the Internet service provider (ISP) that corresponds to the router interface of the VBR.
EnableIpv6	Boolean	false	
LocalGatewayIp	String	116.62.xx.xx	The IP address of the on-premises router interface of the VBR.
LocalIpv6GatewayIp	String	2408:****:cc:400::*	
PeerGatewayIp	String	116.62.xx.xx	The IP address of the peer router interface of the VBR.
PeerIpv6GatewayIp	String	2408:****:cc:400::*	
PeeringIpv6SubnetMask	String	2408:****:cc:400::/*	
PeeringSubnetMask	String	255.255.255.252	The subnet mask of the connection between the on-premises router interface and the peer router interface of the VBR.

Parameter	Type	Example	Description
PhysicalConnectionBusinessStatus	String	Normal	The business status of the physical connection.
PhysicalConnectionId	String	pc-119mfjzm7xxxxxxxx	The ID of the physical connection.
PhysicalConnectionOwnerUid	String	qfrgrgs	The UID of the Apsara Stack tenant account to which the physical connection belongs.
PhysicalConnectionStatus	String	Normal	The status of the physical connection.
Status	String	Active	
VlanId	String	0	The VLAN ID of the VBR.
VlanInterfaceId	String	ri-kojok19x3j0q6kxxxxxxxxx	The ID of the router interface of the VBR. This ID can be used as the next hop of a route entry of the VBR.
CircuitCode	String	longtel001	The circuit code provided by the ISP for the physical connection.
CreationTime	String	2017-06-08T12:20:55	The time when the VBR was created.
Description	String	VBR	The description of the VBR.
DetectMultiplier	Long	3	The multiple of the detection time. This value indicates the maximum number of dropped packets that is allowed by the receiver when the sender transmits packets. This value can be used to check whether the connection functions as expected. Valid values:**3 to 10**.
EccId	String	ecc-h*********	
EnableIpv6	Boolean	false	
LocalGatewayIp	String	116.62.**. **	The IP address configured on the Apsara Stack side.

Parameter	Type	Example	Description
LocalIpv6GatewayIp	String	2408:****:cc:400::*	
MinRxInterval	Long	100	The time interval to receive Bidirectional Forwarding Detection (BFD) packets. Valid values: 200 to 1000. Unit: milliseconds.
MinTxInterval	Long	100	The time interval to send BFD packets. Valid values: 200 to 1000. Unit: milliseconds.
Name	String	test	The name of the VBR.
PConnVbrExpireTime	String	2017-06-08T12:20:55	The time when the VBR expires.
PeerGatewayIp	String	116.62.**. **	The IP address configured on the user side.
PeerIpv6GatewayIp	String	2408:****:cc:400::*	
PeeringIpv6SubnetMask	String	2408:****:cc:400::/*	
PeeringSubnetMask	String	255.255.255.252	The subnet mask of the connection between the Apsara Stack-side IP address and the user-side IP address.
PhysicalConnectionBusinessStatus	String	Normal	The service status of the physical connection.
PhysicalConnectionId	String	pc-119mfjzm7x******	The ID of the physical connection to which the VBR connects.
PhysicalConnectionOwnerUid	String	usdgbh123f******	The UID of the Apsara Stack tenant account to which the physical connection belongs.
PhysicalConnectionStatus	String	Normal	The status of the physical connection.
RecoveryTime	String	2017-06-08T12:20:55	The last time when the VBR was recovered from the Terminated state to the Active state.

Parameter	Type	Example	Description
RouteTableId	String	rtb-bp1nxxxxxxxx*******	The ID of the route table of the VBR.
Status	String	active	The status of the physical connection. Valid values: • **Initial**: Application is being reviewed. • **Approved**: Application is approved. • **Allocating**: Resources are being allocated. • **Allocated**: The leased line is under construction. • **Confirmed**: waiting for user confirmation. • **Enabled**: The physical connection is enabled. • **Rejected**: The application is rejected. • **Canceled**: The application is canceled. • **Allocation Failed**: The system failed to allocate resources. • **Terminated**: The physical connection is terminated.
TerminationTime	String	2017-06-08T12:20:55	The last time when the VBR was terminated.
Type	String	ecc	The type of the physical connection.
VbrId	String	vbr-kojok19xx******	The ID of the VBR.
VlanId	Integer	10	The VLAN ID of the VBR.
VlanInterfaceId	String	ri-2zeo3xzyf38r4xx********	The ID of the router interface of the VBR.
TotalCount	Integer	1	The total number of entries returned.
PageNumber	Integer	1	The page number of the returned page.
PageSize	Integer	10	The number of entries returned per page.

Parameter	Type	Example	Description
RequestId	String	DE77A7F3-3B74-41C0-A5BC-CAFD188C28B6	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeVirtualBorderRouters
&RegionId=cn-shanghai
&<Common request parameters>
```

Sample success responses

`XML` format

```

}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidFilterKey.ValueNotSupported	Specified filter key is not supported: Filter.X.key	The error message returned because Filter.X.key is not supported.

15.1.2.1.12.4. TerminateVirtualBorderRouter

Disables a virtual border router (VBR).

After you call this operation, the state of the VBR changes from **Enabled** to **Terminating**. After the VBR is disabled, its state changes to **Terminated**.

> **Note** Only the owner of the physical connection to which the VBR connects can call this operation.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	TerminateVirtualBorderRouter	The operation that you want to perform. Set the value to **TerminateVirtualBorderRouter**.
RegionId	String	Yes	cn-shanghai	The region where the VBR is deployed. You can call the DescribeRegions operation to query the most recent region list.
VbrId	String	Yes	vbr-bp15zckdt37pq72****	The ID of the VBR that you want to disable.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-00****	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must ensure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	4EC47282-1B74-4534-BD0E-403F3EE64CAF	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=TerminateVirtualBorderRouter
&RegionId=cn-shanghai
&VbrId=vbr-bp15zckdt37pq72****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<TerminateVirtualBorderRouterResponse>
      <RequestId>0ED8D006-F706-4D23-88ED-E11ED28DCAC0</RequestId>
</TerminateVirtualBorderRouterResponse>
```

`JSON` format

```
{
    "RequestId": "0ED8D006-F706-4D23-88ED-E11ED28DCAC0"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidVbrId.NotFound	The specified VirutalBorderRouter is not found.	The error message returned because the specified VBR does not exist. Check whether the specified VBR ID is valid.
400	InvalidOperation.OperationNotAllowedInState	The specified VirutalBorderRouter is in invalid state.	The error message returned because the state of the specified VBR is invalid. Check the state of the VBR.
403	Forbidden.OperationTerminateNotAllowedByUser	The caller is not allowed to terminate the specified VirtualBorderRouter.	The error message returned because you are not authorized to disable the specified VBR.

15.1.2.1.12.5. RecoverVirtualBorderRouter

Enables a disabled VBR.

After you call the operation, the state of the VBR changes from **Terminated** to **Recovering**. When the VBR is enabled, its state changes to **Enabled**.

When you call this operation, take note of the following items:

- Only the owner of the physical connection can call this operation.
- The physical connection to which the VBR belongs must be in the **Enabled** state.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	RecoverVirtualBorderRouter	The operation that you want to perform. Set the value to **RecoverVirtualBorderRouter**.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-shanghai	The ID of the region where the VBR is deployed. You can call the DescribeRegions operation to query region IDs.
VbrId	String	Yes	vbr-bp1lhl0taikrte****	The ID of the VBR.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-0016e04115b	The client token is used to ensure the idempotence of the request. You can use the client to generate the value, but you must ensure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	4EC47282-1B74-4534-BD0E-403F3EE64CAF	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=RecoverVirtualBorderRouter
&RegionId=cn-shanghai
&VbrId=vbr-bp1lhl0taikrte****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<RecoverVirtualBorderRouterResponse>
      <RequestId>0ED8D006-F706-4D23-88ED-E11ED28DCAC0</RequestId>
</RecoverVirtualBorderRouterResponse>
```

`JSON` format

```
{
    "RequestId": "0ED8D006-F706-4D23-88ED-E11ED28DCAC0"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidVbrId.NotFound	The specified VirutalBorderRouter is not found.	The error message returned because the specified VBR does not exist. Check whether the parameter is set to a valid value.
400	InvalidOperation.OperationNotAllowedInState	The specified VirutalBorderRouter is in invalid state	The error message returned because the status of the VBR interface is invalid.
400	OperationFailed.VlanIdAlreadyInUse	The specifed vlanId has been used.	The error message returned because the VLAN interface is being used.
403	Forbidden.OperationRecoverNotAllowedByUser	The caller is not allowed to recover the specified VirtualBorderRouter.	The error message returned because you do not have the permissions to recover the VBR.

15.1.2.1.12.6. UnassociatePhysicalConnectionFromVirtualBorderRouter

Disassociates a virtual border router (VBR) from a physical connection.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	UnassociatePhysicalConnectionFromVirtualBorderRouter	The operation that you want to perform. Set the value to**UnassociatePhysicalConnectionFromVirtualBorderRouter**.
PhysicalConnectionId	String	Yes	pc-bp1qrb3044eqixog****	The ID of the physical connection.
RegionId	String	Yes	cn-hangzhou	The ID of the region where the physical connection is deployed.

Parameter	Type	Required	Example	Description
VbrId	String	Yes	vbr-bp16ksp61j7e0tkn*****	The VLAN ID of the VBR. Valid values: 1 to 2999. **Note** Only the owner of the physical connection can set this parameter. The VLAN IDs of two VBRs of the same physical connection must be different.
ClientToken	String	No	longtel001	The circuit code provided by the Internet service provider (ISP) of the physical connection. **Note** Only the owner of the physical connection can set this parameter.

Response parameters

Parameter	Type	Example	Description
RequestId	String	980960B0-2969-40BF-8542-EBB34FD358AB	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=UnassociatePhysicalConnectionFromVirtualBorderRouter
&PhysicalConnectionId=pc-bp1qrb3044eqixog****
&RegionId=cn-hangzhou
&VbrId=vbr-bp16ksp61j7e0tkn*****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<UnassociatePhysicalConnectionFromVirtualBorderRouterResponse>
      <RequestId>980960B0-2969-40BF-8542-EBB34FD358AB</RequestId>
    </UnassociatePhysicalConnectionFromVirtualBorderRouterResponse>
```

`JSON` format

```
{
    "RequestId": "980960B0-2969-40BF-8542-EBB34FD358AB"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidVbrId.NotFound	The specified VirutalBorderRouter does not exist in our records.	The error message returned because the specified VBR does not exist. Check whether the parameter is set to a valid value.
404	InvalidVbrId.NotFound	The specified VirutalBorderRouter or PhysicalConnection does not exist in our records.	The error message returned because the VBR or physical connection does not exist.
400	PARAMETER_MUST_NOT_NULL	The specified physical connection id or vbrId must not be null.	The error message returned because the VbrId and PhysicalConnectionId parameters are not set.
400	PHYSICAL_NOT_ASSOCIATE_TO_VBR	The specified PhysicalConnection have not associate to the vbr.	The error message returned because no VBR is created for the physical connection.
400	ROUTER_INTERFACE_REFERED_BY_ROUTEENTRY	The specified VlanInterface has been used by routeEntry.	The error message returned because the VLAN interface is being used by a route entry.
400	InvalidStatus.NotAllowed	Invalid virtual border router status.	The error message returned because the status of the VBR is invalid.
400	PHYSICAL_NOT_ALLOW_ASSOCIATE_VBR	The specified operation not allow.	The error message returned because the physical connection is associated with a VBR and the operation cannot be performed.

15.1.2.1.13. Physical connections

15.1.2.1.13.1. CancelPhysicalConnection

Cancels a physical connection before it is enabled. After you cancel a physical connection, its state becomes Canceled.

You can cancel only a physical connection that is in the Initial, Approved, Allocated, or Confirmed state.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CancelPhysicalConnection	The operation that you want to perform. Set the value to **CancelPhysicalConnection**.
PhysicalConnectionId	String	Yes	pc-119mfjzm7	The ID of the physical connection.
RegionId	String	Yes	cn-shanghai	The ID of the region where the physical connection is deployed. You can call the DescribeRegions operation to query region IDs.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-0016e04115b	The client token is used to ensure the idempotence of the request. You can use the client to generate the value, but you must ensure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	4EC47282-1B74-4534-BD0E-403F3EE64CAF	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=CancelPhysicalConnection
&PhysicalConnectionId=pc-119mfjzm7
&RegionId=cn-shanghai
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CancelPhysicalConnectionResponse>
   <RequestId>BE36E95A-F83E-4127-A29E-F2F35D4C999A</RequestId>
    </CancelPhysicalConnectionResponse>
```

`JSON` format

```
{
    "RequestId": "BE36E95A-F83E-4127-A29E-F2F35D4C999A"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidPhysicalConnectionId.NotFound	The PhysicalConnectionId provided does not exist in our records.	The error message returned because the specified physical connection does not exist.
400	Forbidden.NotAllowedInState	The request does not allow in this state.	The error message returned because the state is invalid and the operation cannot be performed.

15.1.2.1.13.2. DescribePhysicalConnections

Queries physical connections in a region.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribePhysicalConnections	The operation that you want to perform. Set the value to **DescribePhysicalConnections** .
RegionId	String	Yes	cn-hangzhou	The ID of the region where the physical connection is deployed. You can call the DescribeRegions operation to query region IDs.
PageNumber	Integer	No	10	The number of the page to return. Default value: 1.
PageSize	Integer	No	1	The number of entries to return on each page. Maximum value: **50**. Default value: **10**.

Parameter	Type	Required	Example	Description
Filter.N.Key	String	No	1	The filter condition. Valid values of N: 1, 2, 3, 4, and 5. The following filter conditions are supported: • **PhysicalConnectionId**: the ID of the physical connection. • **AccessPointId**: the ID of the access point. • **Type**: the type of the physical connection. • **LineOperator**: the Internet service provider (ISP) of the physical connection. • **Spec**: the specifications of the physical connection. • **Status**: the status of the physical connection. • **Name**: the name of the physical connection. The logical operator between multiple values in a filter condition is OR. In this case, the filter condition is met if one of the values is met. The logical operator between filter conditions is AND. In this case, the result is returned only when all conditions are met.
Filter.N.Value.N	RepeatList	No	1	The value of the filter condition. Valid values of N: **1 to 5**.
IncludeReservationData	Boolean	No	false	Specifies whether to return the orders that have not taken effect. Valid values: **true and false**. • **true**: returns the orders that have not taken effect. • **false**: does not return the orders that have not taken effect.

Parameter	Type	Required	Example	Description
ClientToken	String	No	23243242rggy****	A unique token generated by the client to ensure the idempotency of the request. You can use the client to generate the value, but you must ensure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
PhysicalConnectionSet	Array of PhysicalConnectionType		The description of the physical connection.
PhysicalConnectionType			
AccessPointId	String	eip-2zeerraiwb7uj6i0********	The ID of the access point.
AdLocation	String	Room Ax-x Bxx, building xx, xxx Avenue, Nanshan District, Shenzhen, Guangdong	The geographical location of the access device.
Bandwidth	Long	10	The bandwidth of the physical connection.
BusinessStatus	String	Normal	The payment state of the physical connection. Valid values: • **Normal**: The physical connection is functioning as expected. • **FinancialLocked**: The physical connection is locked due to overdue payments. • **SecurityLocked**: The physical connection is locked due to security reasons.
ChargeType	String	Prepaid	The billing method. Valid values: • **Prepaid**: subscription.
CircuitCode	String	longtel001	The circuit code provided by the ISP.

Parameter	Type	Example	Description
CreationTime	String	2017-06-08T12:20:55	The time when the physical connection was created.
Description	String	The physical connection	The description of the physical connection.
EnabledTime	String	2017-06-08T12:20:55	The time when the physical connection was created.
EndTime	String	2019-02-25T11:01:04Z	The time when the physical connection expires.
HasReservationData	String	true	Indicates whether you have subscription messages. Valid values: **true and false**. • **true** : yes. • **false**: no.
LineOperator	String	CT	The ISP of the physical connection. Valid values: • CT: China Telecom. • CU: China Unicom. • CM: China Mobile. • CO: other ISPs in China. • Equinix: Equinix. • Other: Other ISPs outside China.
LoaStatus	String	Available	The status of the LOA.
Name	String	name	The name of the physical connection.
PeerLocation	String	Building XX, XX Avenue, XX District, Hangzhou, Zhejiang	The geographical location of the data center.
PhysicalConnectionId	String	pc-119mfjzm*****	The ID of the physical connection.
PortNumber	String	80	The port number of the access device.

Parameter	Type	Example	Description
PortType	String	1000Base-T	The port type of the physical connection. Valid values: • **100Base-T**: 100M copper port. • **1000Base-T** (default): GE electrical port. • **1000Base-LX**: GE single-mode fiber port (10 kilometers). • **10GBase-T**: 10GE electrical port. • **10GBase-LR**: 10GE single-mode optical port (10 kilometers).
RedundantPhysicalConnectionId	String	pc-119mfjzm*******	The ID of the backup physical connection.
ReservationActiveTime	String	2019-02-25T11:01:04Z	The time when the renewal takes effect.
ReservationInternetChargeType	String	PayByBandwidth	The renewal type.
ReservationOrderType	String	RENEW	The type of the renewal order.
Spec	String	Large	The specifications of the physical connection.
Status	String	Initial	The state of the physical connection. Valid values: • **Initial**: application in progress. • **Approved**: approved. • **Allocating**: resource allocation in progress. • **Allocated**: under construction. • **Confirmed**: waiting for user confirmation. • **Enabled**: enabled. • **Rejected**: rejected. • **Canceled**: canceled. • **Allocation Failed**: resource allocation failed. • **Terminated**: terminated.
Type	String	VPC	The type of the physical connection. Default value: **VPC**.

Parameter	Type	Example	Description
TotalCount	Integer	10	The total number of entries returned.
PageNumber	Integer	10	The page number of the returned page.
PageSize	Integer	10	The number of entries returned per page.
RequestId	String	EEC8EAB1-F299-4F5C-8E54-0A3129164C27	The ID of the request.

Examples

```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidFilterKey.ValueNotSupported	Specified filter key is not supported: Filter.X.key	The error message returned because Filter.X.key is not supported.

15.1.2.1.13.3. ModifyPhysicalConnectionAttribute

Modifies the configuration of a physical connection.

When you call this operation, take note of the following limits:

- You can only modify the configuration of a physical connection that is in the **Initial**, **Enabled**, or **Rejected** state.
- You cannot modify the configurations of a physical connection that is in the **Canceled**, **Allocating**, **AllocationFailed**, or **Terminated** state.
- After you modify the configurations of a physical connection that is in the **Rejected** state, its state becomes **Initial**.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyPhysicalConnectionAttribute	The operation that you want to perform. Set the value to **ModifyPhysicalConnectionAttribute**.
PhysicalConnectionId	String	Yes	pc-119mfjzm******	The ID of the physical connection.
RegionId	String	Yes	cn-shanghai	The ID of the region where the physical connection is deployed. You can call the DescribeRegions operation to query region IDs.
LineOperator	String	No	CT	The Internet service provider (ISP). Valid values: • CT: China Telecom • CU: China Unicom • CM: China Mobile • CO: other ISPs in China • Equinix: Equinix • Other: other ISPs outside China
bandwidth	Integer	No	5	The bandwidth of the physical connection. Unit: Mbit/s. Valid values: 2 to 10240.
PeerLocation	String	No	Building XX, XX Avenue, XX District, Hangzhou, Zhejiang	The geographical location of the data center.

Parameter	Type	Required	Example	Description
PortType	String	No	1000Base-LX	The port type of the physical connection. Default value: 1000Base-T. Valid values: • 100Base-T: a copper port that supports 100 Mbit/s. • 1000Base-T: a copper port that supports 1,000 Mbit/s. • 1000Base-LX: a single-mode fiber port that supports 1,000 Mbit/s (10 kilometers). • 10GBase-T: a copper port that supports 10,000 Mbit/s. • 10GBase-LR: a single-mode fiber port that supports 10,000 Mbit/s (10 kilometers).
RedundantPhysicalConnectionId	String	No	pc-119mfjzm7	The ID of the standby physical connection. The standby physical connection must be in the **Allocated**, **Confirmed**, or **Enabled** state.
Description	String	No	The description of the physical connection	The description of the physical connection. The description must be 2 to 256 characters in length. It must start with a letter and cannot start with `http://` or `https://`.
Name	String	No	The name of the physical connection	The name of the physical connection. The name must be 2 to 128 characters in length, and can contain digits, periods (.), underscores (_), and hyphens (-). The name cannot start with `http://` or `https://`.

Parameter	Type	Required	Example	Description
ClientToken	String	No	efefe566754h	The client token that is used to guarantee the idempotency of the request. You can use the client to generate a token, but you must ensure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.
CircuitCode	String	No	longtel001	The circuit code provided by the ISP for the physical connection.

Response parameters

Parameter	Type	Example	Description
RequestId	String	013EE132-A109-4247-91B0-099A8FF49AD7	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=ModifyPhysicalConnectionAttribute
&PhysicalConnectionId=pc-119mfjzm******
&RegionId=cn-shanghai
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyPhysicalConnectionAttributeResponse>
      <RequestId>8A6A5EC5-6F6C-4906-9689-56ACE58A13E0</RequestId>
</ModifyPhysicalConnectionAttributeResponse>
```

`JSON` format

```
{
  "RequestId": "8A6A5EC5-6F6C-4906-9689-56ACE58A13E0"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidPhysicalConnectionId.NotFound	The PhysicalConnectionId provided does not exist in our records.	The error message returned because the physical connection does not exist.
400	InvalidLineOperator.Malformd	The LineOperator provided was invalid.	The error message returned because the value of the LineOperator parameter is invalid.
400	InvalidPeerLocation.Malformd	The PeerLocation provided was invalid.	The error message returned because the value of the PeerLocation parameter is invalid.
400	InvalidPortType.Malformd	The PortType provided was invalid.	The error message returned because the type of the port is invalid.
400	InvalidDescription.Malformed	The specifid ? Description? is not valid.	The error message returned because the format of the resource description is invalid. The value must be 2 to 256 characters in length and cannot start with http:// or https://.
400	InvalidName.Malformed	The specified ? Name? is not valid.	The error message returned because the format of the name is invalid.
400	InvalidStatus	invalid physical connection status.	The error message returned because the state of the specified physical connection is invalid.
400	InvalidBandwidth	invalid physical connection banwidth.	The error message returned because the maximum bandwidth of the physical connection is invalid.
400	InvalidRedundantPhysicalConnection	redundant physical connection doesn't belong to current user.	The error message returned because the backup connection does not belong to your Apsara Stack tenant account.
400	InvalidRedundantPhysicalConnectionStatus	invalid redundant physical connection status.	The error message returned because the state of the backup physical connection is invalid.
400	InvalidCircuitCode.Malformed	circuitCode is illegal.	The error message returned because the value of the CircuitCode parameter is invalid.

15.1.2.1.13.4. TerminatePhysicalConnection

Terminates a physical connection after it is enabled.

After you call this operation, the state of the physical connection becomes Terminating. After the physical connection is terminated, its state becomes Terminated.

When you call this operation, take note of the following limits:

- You can only terminate a physical connection in the **Enabled** state.
- Before you terminate a physical connection, you must delete the virtual border routers (VBRs) that are associated with it.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	TerminatePhysicalConnection	The operation that you want to perform. Set the value to **TerminatePhysicalConnection**.
PhysicalConnectionId	String	Yes	pc-119mfjzm****	The ID of the physical connection.
RegionId	String	Yes	cn-hangzhou	The ID of the region where the physical connection is deployed. You can call the DescribeRegions operation to query region IDs.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-0016e04115b	The client token is used to ensure the idempotence of the request. You can use the client to generate the value, but you must ensure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	4EC47282-1B74-4534-BD0E-403F3EE64CAF	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=TerminatePhysicalConnection
&PhysicalConnectionId=pc-119mfjzm****
&RegionId=cn-hangzhou
&<Common request parameters>
```

Sample success responses

`XML` format

```
<TerminatePhysicalConnectionResponse>
    <RequestId>513E0A50-4F2D-4CBE-BF35-40559DF65D79</RequestId>
</TerminatePhysicalConnectionResponse>
```

`JSON` format

```
{
  "RequestId": "513E0A50-4F2D-4CBE-BF35-40559DF65D79"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidPhysicalConnectionId.NotFound	The PhysicalConnectionId provided does not exist in our records.	The error message returned because the physical connection does not exist.
400	Forbidden.NotAllowedInState	The request does not allow in this state.	The error message returned because the state is invalid.

15.1.2.1.13.5. EnablePhysicalConnection

Enables a physical connection that is in the Confirmed state. After you enable the physical connection, its state becomes Enabled.

When you call this operation, take note of the following limits:

- You can enable only a physical connection that is in the **Confirmed** state.
- After a physical connection is enabled, its state becomes **Enabled**.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	EnablePhysicalConnection	The operation that you want to perform. Set the value to **EnablePhysicalConnection**.

Parameter	Type	Required	Example	Description
PhysicalConnectionId	String	Yes	pc-119mfjz****	The ID of the physical connection.
RegionId	String	Yes	cn-shanghai	The ID of the region where the physical connection is deployed. You can call the DescribeRegions operation to query region IDs.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-0016e04115b	The client token that is used to guarantee the idempotence of the request. You can use the client to generate the value, but you must ensure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	API-20365164-5b0d-460a-83c2-2189972b3349	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=EnablePhysicalConnection
&PhysicalConnectionId=pc-119mfjz****
&RegionId=cn-shanghai
&<Common request parameters>
```

Sample success responses

`XML` format

```
<EnablePhysicalConnectionResponse>
      <RequestId>0ED8D006-F706-4D23-88ED-E11ED28DCAC0</RequestId>
</EnablePhysicalConnectionResponse>
```

`JSON` format

```
{
    "RequestId": "0ED8D006-F706-4D23-88ED-E11ED28DCAC0"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidPhysicalConnectionId.NotFound	The PhysicalConnectionId provided does not exist in our records.	The error message returned because the specified physical connection does not exist.
400	Forbidden.NotAllowedInState	The request does not allow in this state.	The error message returned because the state is invalid and the operation cannot be performed.

15.1.2.1.13.6. DeletePhysicalConnection

Deletes a physical connection.

> **Note** You can delete only physical connections that are in the following states:**Rejected**,**Canceled**,**AllocationFailed**, and**Terminated**.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeletePhysicalConnection	The operation that you want to perform. Set the value to **DeletePhysicalConnection**.
PhysicalConnectionId	String	Yes	pc-119mfjzm7********	The ID of the physical connection.
RegionId	String	Yes	cn-shanghai	The ID of the region where the physical connection is deployed. You can call the DescribeRegions operation to query region IDs.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-0016e04115b	The client token is used to ensure the idempotence of the request. You can use the client to generate the value, but you must ensure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	2B3670CD-670E-4540-8C13-6DE929AEDD3B	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DeletePhysicalConnection
&PhysicalConnectionId=pc-119mfjzm7*********
&RegionId=cn-shanghai
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeletePhysicalConnectionResponse>
      <RequestId>0ED8D006-F706-4D23-88ED-E11ED28DCAC0</RequestId>
</DeletePhysicalConnectionResponse>
```

`JSON` format

```
{
    "RequestId": "0ED8D006-F706-4D23-88ED-E11ED28DCAC0"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidPhysicalConnectionId.NotFound	The PhysicalConnectionId provided does not exist in our records.	The error message returned because the specified physical connection does not exist.
400	Forbidden.NotAllowedInState	The request does not allow in this state.	The error message returned because the state is invalid and the operation cannot be performed.
400	InvalidPhysicalConnectionId.NotMatched	instance id not matched.	The error message returned because the instance ID does not match.
400	Forbidden.VBRExists	physical connection owner's vbr still exists.	The error message returned because the virtual border router (VBR) of the physical connection still exists.

HttpCode	Error code	Error message	Description
400	Forbidden.VBRExists	vbr owner's vbr still exists.	The error message returned because the VBR still exists.
400	Forbidden.AssociateToVBR	The physical connection still associate to VBR.	The error message returned because the physical connection is already associated with a VBR.

15.1.2.1.13.7. CreatePhysicalConnectionOccupancyOrder

Creates an order for resource occupation of one or more physical connections.

Note You can perform this operation only for a physical connection that is in the **Complete** state.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreatePhysicalConnectionOccupancyOrder	The operation that you want to perform. Set the value to **CreatePhysicalConnectionOccupancyOrder**.
PhysicalConnectionId	String	Yes	pc-bp1hp0wr072f6********	The ID of the physical connection.
RegionId	String	Yes	cn-hangzhou	The region where the physical connection is deployed.
Period	Integer	No	1	The subscription duration.
InstanceChargeType	String	No	PostPaid	The billing method of the physical connection. Valid values: • **PrePaid**: subscription. If you select this billing method, make sure that your Apsara Stack tenant account supports balance payment or credit payment. • **PostPaid**: pay-as-you-go. This is the default value.

Parameter	Type	Required	Example	Description
AutoPay	Boolean	No	true	Specifies whether automatic payment is enabled. Valid values: • **true**: enables automatic payment. This is the default value. Make sure that you have sufficient balance in your account. Otherwise, your order becomes invalid and must be canceled. • **false**: An order is generated but no payment is made.
PricingCycle	String	No	Month	The unit of the subscription cycle. • **Year**: by year. • **Month**: by month.
ClientToken	String	No	CBCE910E-D396-4944-8764-B4047838B2D1	The client token that is used for authentication.

Response parameters

Parameter	Type	Example	Description
RequestId	String	9B9300FE-11E2-4E3B-949C-BED3B44DD26D	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=CreatePhysicalConnectionOccupancyOrder
&PhysicalConnectionId=pc-bp1hp0wr072f6******
&RegionId=cn-hangzhou
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreatePhysicalConnectionOccupancyOrder>
    <RequestId>9B9300FE-11E2-4E3B-949C-BED3B44DD26D</RequestId>
</CreatePhysicalConnectionOccupancyOrder>
```

`JSON` format

```
{
 "RequestId": "9B9300FE-11E2-4E3B-949C-BED3B44DD26D"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidPhysicalConnectionId.NotFound	The PhysicalConnectionId provided does not exist in our records.	The error message returned because the physical connection does not exist.
400	Forbidden.NotAllowedInState	The request does not allow in this state.	The error message returned because the state is invalid.

15.1.2.1.13.8. ApplyPhysicalConnectionLOA

Requests a letter of authorization (LOA) for a physical connection.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ApplyPhysicalConnectionLOA	The operation that you want to perform. Set the value to**ApplyPhysicalConnectionLOA**.
CompanyName	String	Yes	company	The name of the customer company that requires the physical connection.
ConstructionTime	String	Yes	2019-02-28T16:00:00.000Z	The time when construction started.
InstanceId	String	Yes	pc-bp1qrb3044eqixxxxxxx	The ID of the physical connection.
LineType	String	Yes	SDH	The type of the physical connection.
RegionId	String	Yes	cn-hangzhou	The ID of the region where the physical connection is deployed.
Si	String	Yes	Alibaba	The construction company.

Parameter	Type	Required	Example	Description
ClientToken	String	No	A47BD386-7FDE-4xxx4-8D22-C62xxxxxxx	Client authentication.
Bandwidth	Integer	No	3	The bandwidth of the physical connection.
PeerLocation	String	No	Hangzhou	The geographical location where the physical connection is deployed.
PMInfo.N.PMName	String	No	Tom	The name of the construction personnel. N is a natural number. Replace N with a value when you call this operation.
PMInfo.N.PMContactInfo	String	No	1320000****	The contact information about the construction personnel. N is a natural number. Replace N with a value when you call this operation.
PMInfo.N.PMCertificateType	String	No	IDCard	The identity type of the construction personnel. N is a natural number. Replace N with a value when you call this operation.
PMInfo.N.PMCertificateNo	String	No	3210xxxxxxxxxxxxx	The identity number of the construction personnel. N is a natural number. Replace N with a value when you call this operation.
PMInfo.N.PMGender	String	No	Male	The gender of the construction personnel. N is a natural number. Replace N with a value when you call this operation.

Response parameters

Parameter	Type	Example	Description
RequestId	String	A47BD386-7FDE-42C4-8D22-C6223D18AA1C	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=ApplyPhysicalConnectionLOA
&CompanyName=company
&ConstructionTime=2019-02-28T16:00:00.000Z
&InstanceId=pc-bp1qrb3044eqixxxxxxxx
&LineType=SDH
&RegionId=cn-hangzhou
&Si=Alibaba
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ApplyPhysicalConnectionLOAResponse>
      <RequestId>A47BD386-7FDE-42C4-8D22-C6223D18AA1C</RequestId>
    </ApplyPhysicalConnectionLOAResponse>
```

`JSON` format

```
{
    "RequestId":"A47BD386-7FDE-42C4-8D22-C6223D18AA1C"
    }
```

15.1.2.1.13.9. CreatePhysicalConnectionSetupOrder

Creates an order for initial installation of a physical connection.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreatePhysicalConnectionSetupOrder	The operation that you want to perform. Set the value to**CreatePhysicalConnectionSetupOrder**.
AccessPointId	String	Yes	ap-cn-beijing-ft-A	The ID of the access point.

Parameter	Type	Required	Example	Description
LineOperator	String	Yes	CT	The Internet service provider (ISP). Valid values: • CT: China Telecom. • CU: China Unicom. • CM: China Mobile. • CO: other ISPs in China. • Equinix: Equinix. • Other: other ISPs outside China.
RegionId	String	Yes	cn-shanghai	The region where the physical connection is deployed.
PortType	String	No	100Base-T	The port type of the physical connection. Default value: 1000Base-T. Valid values: • **100Base-T**: a copper port that supports 100 Mbit/s. • **1000Base-T**: a copper port that supports 1,000 Mbit/s. • **1000Base-LX**: a single-mode fiber port that supports 1,000 Mbit/s (10 kilometers). • **10GBase-T**: a copper port that supports 10,000 Mbit/s. • **10GBase-LR**: a single-mode fiber port that supports 10,000 Mbit/s (10 kilometers).
RedundantPhysicalConnectionId	String	No	pc-bp10zsv5ntp**********	The ID of the standby physical connection. The standby physical connection must be in the **Allocated**, **Confirmed**, or **Enabled** state.
AutoPay	Boolean	No	true	Indicates whether automatic payment is enabled. Valid values: **true** and **false**.
ClientToken	String	No	318BB676-0A2B-43A0-9AD8-F1D34E93750F	The client token that is used for authentication.

Response parameters

Parameter	Type	Example	Description
OrderId	String	202844382740728	The ID of the order.
PhysicalConnectionId	String	pc-2zegmc02v7ss4******	The ID of the physical connection.
RequestId	String	F7A6301A-64BA-41EC-8284-8F4838C15D1F	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=CreatePhysicalConnectionSetupOrder
&AccessPointId=ap-cn-beijing-ft-A
&LineOperator=CT
&RegionId=cn-shanghai
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreatePhysicalConnectionSetupOrderResponse>
     <OrderId>205226815210296</OrderId>
     <RequestId>76CCB7F1-C141-4BD1-8106-63987D12BEF4</RequestId>

}
```

15.1.2.1.13.10. CompletePhysicalConnectionLOA

Generates a report for an installed physical connection.

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	CompletePhysicalConnectionLOA	The operation that you want to perform. Set the value to **CompletePhysicalConnectionLOA**.
InstanceId	String	Yes	pc-bp10tvlhnwkwxxxxxxxxx	The ID of the physical connection.
LineCode	String	Yes	aaa111	The circuit code provided by the Internet service provider (ISP).
LineLabel	String	Yes	bbb222	The label of the cable in the data center.
RegionId	String	Yes	cn-hangzhou	The ID of the region where the physical connection is deployed.
ClientToken	String	No	F8983C74-E068-4509-B442-89xxxxxC8F43B	The client token that is used for authentication.

Response parameters

Parameter	Type	Example	Description
RequestId	String	F8983C74-E068-4509-B442-89BD82C8F43B	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=CompletePhysicalConnectionLOA
&InstanceId=pc-bp10tvlhnwkwxxxxxxxxxx
&LineCode=aaa111
&LineLabel=bbb222
&RegionId=cn-hangzhou
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CompletePhysicalConnectionLOAResponse>
      <code>200</code>
   <message>successful</message>
   <requestId>5FA3B04E-AEA0-4F89-BF0D-3FD71ED69BF7</requestId>
   <success>true</success>
    </CompletePhysicalConnectionLOAResponse>
```

`JSON` format

```
{
    "code":"200",
    "message":"successful",
    "requestId":"5FA3B04E-AEA0-4F89-BF0D-3FD71ED69BF7",
    "success":true
}
```

15.1.2.1.13.11. DescribePhysicalConnectionLOA

Queries letter of authorization (LOA) information about a physical connection.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribePhysicalConnectionLOA	The operation that you want to perform. Set the value to**DescribePhysicalConnectionLOA**.
InstanceId	String	Yes	pc-bp1ca4wca27ex*****	The ID of the physical connection.
RegionId	String	Yes	cn-hangzhou	The region where the physical connection is deployed.
ClientToken	String	No	318BB676-0A2B-43A0-9AD8-F1D34E93750F	The client token that is used for authentication.

Response parameters

Parameter	Type	Example	Description
PhysicalConnectionLOAType	Struct		The LOA information about the physical connection.

Parameter	Type	Example	Description
CompanyLocalizedName	String	company	The name of the construction company.
CompanyName	String	AppCompany****	The name of the organization that requires the physical connection.
ConstructionTime	String	2019-02-26T08:00:00Z	The time when construction started.
InstanceId	String	pc-bp1ca4wca27******	The ID of the physical connection.
LineCode	String	lincode****	The line code of the Internet service provider (ISP).
LineLabel	String	linetest****	The label of the cable in the data center.
LineType	String	MSTP	The type of the physical connection. Valid values: • **MSTP** • **Other**. • **SDH**. • **MPLSVPN**. • **FIBRE**.
LoaUrl	String	http://******	The download URL of the LOA file.
PMInfo	Array of PMInfo		The information about construction personnel.
PMInfo			
PMCertificateNo	String	engineer****	The identity number of the construction personnel.
PMCertificateType	String	Other	The type of the identity number. Valid values: • IDCard: the national identification number. • Other: other identity numbers. • Passport: the passport number.

Parameter	Type	Example	Description
PMContactInfo	String	18910010******	The phone number of the construction personnel.
PMGender	String	Male	The gender of the construction personnel.
PMName	String	name	The name of the construction personnel.
SI	String	ctcu	The construction company.
Status	String	Available	The state of the physical connection.
RequestId	String	318BB676-0A2B-43A0-9AD8-F1D34E93750F	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribePhysicalConnectionLOA
&InstanceId=pc-bp1ca4wca27e******
&RegionId=cn-hangzhou
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribePhysicalConnectionLOAResponse>
      <code>200</code>
      <data>
            <companyName>test1234</companyName>

15.1.2.1.14. VPN gateways

15.1.2.1.14.1. VPN gateway

CreateVpnGateway

Creates a VPN gateway.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateVpnGateway	The operation that you want to perform. Set the value to: **CreateVpnGateway**.
Bandwidth	Integer	Yes	5	The public bandwidth of the VPN gateway. Unit: Mbit/s. Valid values: **5, 10, 20, 50, and 100**.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where you want to create the VPN gateway. You can call the DescribeRegions operation to query the most recent region list.
VpcId	String	Yes	vpc-bp1ub1yt9cvakoelj****	The ID of the virtual private cloud (VPC) where the VPN gateway is deployed.
EnableIpsec	Boolean	No	true	Specifies whether to enable the IPsec-VPN feature. Valid values: • **true**: enables the IPsec-VPN feature. • **false**: disables the IPsec-VPN feature. This is the default value.
EnableSsl	Boolean	No	true	Specifies whether to enable the SSL-VPN feature. Valid values: • **true**: enables the SSL-VPN feature. • **false**: disables the SSL-VPN feature. This is the default value.

Parameter	Type	Required	Example	Description
Name	String	No	MYVPN	The name of the VPN gateway. The default value is the ID of the VPN gateway. The name must be 2 to 128 characters in length, and can contain letters, digits, underscores (_), and hyphens (-). The name must start with a letter, and cannot start with `http://` or `https://`.
SslConnections	Integer	No	5	The maximum number of concurrent connections. Valid values: **5**, **10**, and **20**.
VSwitchId	String	No	vsw-bp1j5miw2bae9s2vt****	The ID of the vSwitch to which the VPN gateway belongs.

Response parameters

Parameter	Type	Example	Description
Name	String	myVpn	The name of the VPN gateway.
RequestId	String	54B48E3D-DF70-471B-AA93-08E683A1B457	The ID of the request.
VpnGatewayId	String	vpn-bp1q8bgx4xnkm2ogj****	The ID of the VPN gateway.

Examples

Sample requests

```
http(s)://vpc.example.com/?Action=CreateVpnGateway &Bandwidth=5 &RegionId=cn-qingdao-env66-d01 &VpcId=vpc-bp1ub1yt9cvakoelj**** &
```

Sample success responses

`XML` format

```
<CreateVpnGatewayResponse>
      <Name>myVpn</Name>
      <VpnGatewayId>vpn-bp1q8bgx4xnkm2ogj****</VpnGatewayId>
      <RequestId>54B48E3D-DF70-471B-AA93-08E683A1B457</RequestId>
</CreateVpnGatewayResponse>
```

`JSON` format

```
{ "CreateVpnGatewayResponse":{ "Name":"myVpn", "VpnGatewayId":"vpn-bp1q8bgx4xnkm2ogj****",
"RequestId":"54B48E3D-DF70-471B-AA93-08E683A1B457" } }
```

DescribeVpnGateways

Queries one or more VPN gateways.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeVpnGateways	The operation that you want to perform. Set the value to **DescribeVpnGateways**.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the VPN gateway is created. You can call the `DescribeRegions` operation to query the most recent region list.
VpcId	String	No	vpc-bp1ub1yt9cvakoelj****	The ID of the virtual private cloud (VPC) to which the VPN gateway belongs.
VpnGatewayId	String	No	vpn-bp1q8bgx4xnkm2ogj****	The ID of the VPN gateway.
Status	String	No	init	The status of the VPN gateway. Valid values: • **init**: The VPN gateway is being initialized. • **provisioning**: The VPN gateway is being prepared. • **active**: The VPN gateway is running as expected. • **updating**: The VPN gateway is being updated. • **Deleting**: The VPN gateway is being deleted.

Parameter	Type	Required	Example	Description
BusinessStatus	String	No	Normal	The payment status of the VPN gateway. Valid values: • **Normal**: The VPN gateway is running as expected. • **FinancialLocked**: The VPN gateway is locked due to overdue payments.
PageNumber	Integer	No	1	The number of the page to return. Default value: **1**.
PageSize	Integer	No	10	The number of entries to return on each page. Maximum value: **50**. Default value: **10**.

Response parameters

Parameter	Type	Example	Description
VpnGateways	Array of VpnGateway		Detailed information about the VPN gateways.
VpnGateway			
VpnGatewayId	String	vpn-bp1q8bgx4xnkm2ogj****	The ID of the VPN gateway.
VpcId	String	vpc-bp1ub1yt9cvakoelj*****	The ID of the VPC to which the VPN gateway belongs.
VSwitchId	String	vsw-bp1y9ovl1cu9ou4tv*****	The ID of the vSwitch to which the VPN gateway is attached.
InternetIp	String	116.XX.XX.69	The public IP address of the VPN gateway.
CreateTime	Long	1515383700000	The timestamp generated when the VPN gateway was created.
EndTime	Long	1518105600000	The timestamp to be generated when the VPN gateway expires.

Parameter	Type	Example	Description
Spec	String	5 Mbps	The maximum bandwidth of the VPN gateway. Unit: Mbit/s.
Name	String	test	The name of the VPN gateway.
Description	String	test	The description of the VPN gateway.
Status	String	active	The status of the VPN gateway.
BusinessStatus	String	Normal	The payment status of the VPN gateway.
ChargeType	String	Prepay	The billing type. Valid value: **PostpayByFlow**.
IpsecVpn	String	enable	Indicates whether the IPsec-VPN feature is enabled. • **enable**: IPsec-VPN is enabled. • **disable** : IPsec-VPN is disabled.
SslMaxConnections	Long	5	The maximum number of concurrent SSL-VPN connections.
SslVpn	String	enable	Indicates whether the SSL-VPN feature is enabled. • **enable**: SSL-VPN is enabled. • **disable** : SSL-VPN is disabled.
Tag	String	1	The tag of the VPN gateway.
TotalCount	Integer	1	The number of entries returned.
PageNumber	Integer	1	The page number of the returned page.
PageSize	Integer	10	The number of entries returned on the current page.

Parameter	Type	Example	Description
RequestId	String	DF11D6F6-E35A-41C3-9B20-6FC8A901FE65	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeVpnGateways
&RegionId=cn-qingdao-env66-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```

```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.

DescribeVpnGateway

Queries the details of a specified VPN gateway.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeVpnGateway	The operation that you want to perform. Set the value to **DescribeVpnGateway**.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the VPN gateway is created. You can call the `DescribeRegions` operation to query the most recent region list.
VpnGatewayId	String	Yes	vpn-bp1q8bgx4xnkm2ogj****	The ID of the VPN gateway.

Response parameters

Parameter	Type	Example	Description
VpnGatewayId	String	vpn-bp1q8bgx4xnkm2ogj****	The ID of the VPN gateway.
VpcId	String	vpc-bp1ub1yt9cvakoelj*****	The ID of the VPC for which the VPN gateway is created.
VSwitchId	String	vsw-bp1y9ovl1cu9ou4tv*****	The ID of the vSwitch to which the VPN gateway is attached.
InternetIp	String	116.XX.XX.222	The public IP address of the VPN gateway.
CreateTime	Long	1495382400000	The timestamp generated when the VPN gateway was created.
EndTime	Long	1495382400000	The timestamp to be generated when the VPN gateway expires.
Spec	String	5 M	The maximum bandwidth of the VPN gateway. Unit: Mbit/s.
Name	String	vpngatewayname	The name of the VPN gateway.
Description	String	vpngatewaydescription	The description of the VPN gateway.

Parameter	Type	Example	Description
Status	String	init	The status of the VPN gateway. • **init**: The VPN gateway is being initialized. • **provisioning** : The VPN gateway is being prepared. • **active**: The VPN gateway is running as expected. • **updating**: The VPN gateway is being updated. • **Deleting**: The VPN gateway is being deleted.
BusinessStatus	String	Normal	The payment status of the VPN gateway. • **Normal**: The VPN gateway is running as expected. • **FinancialLocked**: The VPN gateway is locked due to overdue payments.
ChargeType	String	PostpayByFlow	The billing method of the VPN gateway. Valid value: **PostpayByFlow**.
IpsecVpn	String	enable	Indicates whether the IPsec-VPN feature is enabled. • **enable**: IPsec-VPN is enabled. • **disable** : IPsec-VPN is disabled.
RequestId	String	E98A9651-7098-40C7-8F85-C818D1EBBA85	The ID of the request.
SslMaxConnections	Long	5	The maximum number of concurrent SSL-VPN connections.
SslVpn	String	enable	Indicates whether the SSL-VPN feature is enabled. • **enable**: SSL-VPN is enabled. • **disable** : SSL-VPN is disabled.
Tag	String	tag1	The tag of the VPN gateway.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeVpnGateway
&RegionId=cn-qingdao-env66-d01
&VpnGatewayId=vpn-bp1q8bgx4xnkm2ogj****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeVpnGatewayResponse>
      <Status>active</Status>
      <VpnGatewayId>vpn-bp1q8bgx4xnkm2ogj****</VpnGatewayId>
      <Spec>5M</Spec>

    "VSwitchId": "vsw-bp1y9ovl1cu9ou4tv****",
    "VpcId": "vpc-bp1ub1yt9cvakoelj****"
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.

HttpCode	Error code	Error message	Description
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.
404	InvalidVpnGatewayInstanceId.NotFound	The specified vpn gateway instance id does not exist.	The error message returned because the specified VPN gateway does not exist. Check whether the configuration of the VPN gateway is valid.

DeleteVpnGateway

Deletes a specified VPN gateway.

Note You cannot delete a VPN gateway that is associated with an IPsec-VPN connection.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteVpnGateway	The operation that you want to perform. Set the value to **DeleteVpnGateway**.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the VPN gateway is created. You can call the `DescribeRegions` operation to query the most recent region list.
VpnGatewayId	String	Yes	vpn-bp1q8bgx4xnkm2ogj****	The ID of the VPN gateway.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-0016e04115b	The client token that is used to ensure the idempotence of the request. You can use the client to generate a token, but you must make sure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	0ED8D006-F706-4D23-88ED-E11ED28DCAC0	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DeleteVpnGateway
&RegionId=cn-qingdao-env66-d01
&VpnGatewayId=vpn-bp1q8bgx4xnkm2ogj****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteNatGatewayResponse>
      <RequestId>0ED8D006-F706-4D23-88ED-E11ED28DCAC0</RequestId>
</DeleteNatGatewayResponse>
```

`JSON` format

```
{
    "RequestId": "0ED8D006-F706-4D23-88ED-E11ED28DCAC0"
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.

HttpCode	Error code	Error message	Description
404	InvalidVpnGatewayInstanceId.NotFound	The specified vpn gateway instance id does not exist.	The error message returned because the specified VPN gateway does not exist. Check whether the configuration of the VPN gateway is valid.
403	ForbiddenRelease	Forbidden to release a prepaid instance within validity period	The error message returned because you cannot release a subscription VPN gateway within the subscription duration.
400	VpnGateway.Configuring	The specified service is configuring.	The error message returned because the operation is not allowed when the specified service is being configured. Try again later.
400	VpnGateway.Configuring	The specified VPN gateway is being configured.	The error message returned because the VPN gateway is being configured.

ModifyVpnGatewayAttribute

Modifies the name and description of a VPN gateway.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyVpnGatewayAttribute	The operation that you want to perform. Set the value to **ModifyVpnGatewayAttribute**.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the VPN gateway is created. You can call the DescribeRegions operation to query the most recent region list.
VpnGatewayId	String	Yes	vpn-bp1q8bgx4xnkm2ogj****	The ID of the VPN gateway.

Parameter	Type	Required	Example	Description
ClientToken	String	No	02fb3da4-130e-11e9-8e44-0016e04115b	The client token that is used to ensure the idempotence of the request. You can use the client to generate a token, but you must make sure that it is unique among different requests. The token can only contain ASCII characters and cannot exceed 64 characters in length.
Description	String	No	vpngateway	The description of the VPN gateway. The description must be 2 to 256 characters in length. It must start with a letter and cannot start with `http://` or `https://`.
Name	String	No	myvpn	The name of the VPN gateway. The name must be 2 to 128 characters in length, and can contain digits, periods (.), underscores (_), and hyphens (-). It must start with a letter, and cannot start with `http://` or `https://`.

Response parameters

Parameter	Type	Example	Description
VpnGatewayId	String	vpn-bp1q8bgx4xnkm2ogj****	The ID of the VPN gateway.
VpcId	String	vpc-bp1ub1yt9cvakoel*****	The ID of the virtual private cloud (VPC) to which the VPN gateway belongs.
VSwitchId	String	vsw-bp1y9ovl1cu9ou4tv*****	The ID of the vSwitch to which the VPN gateway belongs.
InternetIp	String	116.XX.XX.69	The public IP address of the VPN gateway.
CreateTime	Long	1492753580000	The timestamp generated when the VPN gateway was created.

Parameter	Type	Example	Description
EndTime	Long	1495382400000	The timestamp to be generated when the VPN gateway expires.
Spec	String	5 Mbps	The specification of the VPN gateway.
Name	String	test	The name of the VPN gateway.
Description	String	test	The description of the VPN gateway.
Status	String	active	The status of the VPN gateway.
IntranetIp	String	172.XX.XX.104	The private IP address of the VPN gateway.
RequestId	String	54B48E3D-DF70-471B-AA93-08E683A1B457	The ID of the request.

15.1.2.1.14.2. Customer gateway

CreateCustomerGateway

Creates a customer gateway.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateCustomerGateway	The operation that you want to perform. Set the value to **CreateCustomerGateway**.
IpAddress	String	Yes	116.XX.XX.222	The IP address of the customer gateway.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where you want to create the customer gateway. You can call the `DescribeRegions` operation to query the most recent region list.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-0016e04115b	The client token is used to ensure the idempotence of the request. You can use the client to generate a token, but you must make sure that the token is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.

Parameter	Type	Required	Example	Description
Name	String	No	Gateway	The name of the customer gateway. The name must be 2 to 128 characters in length and can contain digits, periods (.), underscores (_), and hyphens (-). It must start with a letter. However, the name cannot start with `http://` or `https://`.
Description	String	No	Gateway	The description of the customer gateway. The description must be 2 to 256 characters in length, and contain digits, hyphens (-), underscores (_), full width periods (。), full width commas (，), and full width colons (：). The description cannot start with `http://` or `https://`.

Response parameters

Parameter	Type	Example	Description
CustomerGatewayId	String	cgw-bp1aw0a5nfff03xp1****	The ID of the customer gateway.
IpAddress	String	100.XX.XX.1	The IP address of the customer gateway.
Name	String	test	The name of the customer gateway.
Description	String	test	The description of the customer gateway.
CreateTime	Long	1493363486000	The timestamp generated when the customer gateway was created.
RequestId	String	cgw-bp1aw0a5nfff03xp1pcqc	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=CreateCustomerGateway
&IpAddress=116.XX.XX.222
&RegionId=cn-qingdao-env66-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreateCustomerGatewayResponse>
      <CustomerGatewayId>cgw-bp1aw0a5nfff03xp****</CustomerGatewayId>
      <RequestId>185E81B1-3916-4667-B48F-C52409B33F2B</RequestId>
      <CreateTime>1493363486000</CreateTime>
      <IpAddress>100.XX.XX.1</IpAddress>
</CreateCustomerGatewayResponse>
```

`JSON` format

```
{
    "CustomerGatewayId": "cgw-bp1jrawp82av6bws9****",
    "CreateTime": 1493363599000,
    "RequestId": "D32B3C26-6C6C-4988-93E9-D2A6444CE6AE",
    "IpAddress": "100.XX.XX.1"
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.
400	InvalidIpAddress.AlreadyExist	Specified IpAddress is already exist.	The error message returned because the specified IP address already exists. The IP addresses must be unique in the same region.
400	InvalidIpAddress.WrongFormat	Specified IpAddress is invalid.	The error message returned because the specified IP address is invalid.

HttpCode	Error code	Error message	Description
400	InvalidName	The name is not valid	The error message returned because the specified name is in an invalid format.
400	InvalidDescription	The description is not valid	The error message returned because the description format of the specified parameter is invalid.
400	Resource.QuotaFull	The quota of resource is full	The error message returned because the resource quota is reached.

DescribeCustomerGateways

Queries customer gateways in a specified region.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeCustomerGateways	The operation that you want to perform. Set the value to **DescribeCustomerGateways**.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the customer gateways are created. You can call the `DescribeRegions` operation to query the most recent region list.
CustomerGatewayId	String	No	vpn-bp1q8bgx4xnkm2ogj****	The ID of the customer gateway.
PageNumber	Integer	No	1	The number of the page to return. Default value: **1**.
PageSize	Integer	No	10	The number of entries to return on each page. Maximum value: **50**. Default value: **10**.

Response parameters

Parameter	Type	Example	Description
CustomerGateways	Array of CustomerGateway		Detailed information about the customer gateways.
CustomerGateway			
CustomerGatewayId	String	cgw-bp1pvpl9r9adju6l5****	The ID of the customer gateway.
Name	String	test	The name of the customer gateway.
Description	String	test	The description of the customer gateway.
IpAddress	String	139.XX.XX.55	The IP address of the customer gateway.
CreateTime	Long	1492747187000	The timestamp generated when the customer gateway was created.
TotalCount	Integer	1	The number of entries returned.
PageNumber	Integer	1	The page number of the returned page.
PageSize	Integer	10	The number of entries returned on each page.
RequestId	String	5BE01CD7-5A50-472D-AC14-CA181C5C03BE	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeCustomerGateways
&RegionId=cn-qingdao-env66-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeCustomerGatewaysResponse>
      <PageNumber>1</PageNumber>
      <TotalCount>1</TotalCount>
      <PageSize>10</PageSize>
      <RequestId>5BE01CD7-5A50-472D-AC14-CA181C5C03BE</RequestId>
      <CustomerGateways>
            <CustomerGateway>
                  <Name>test</Name>
                  <CustomerGatewayId>cgw-bp1pvpl9r9adju6l5****</CustomerGatewayId>
                  <CreateTime>1492747187000</CreateTime>
                  <IpAddress>139.XX.XX.55</IpAddress>
            </CustomerGateway>
      </CustomerGateways>
</DescribeCustomerGatewaysResponse>
```

`JSON` format

                "CustomerGatewayId": "cgw-bp1pvpl9r9adju6l5****",
                "CreateTime": 1492747187000,
                "IpAddress": "139.XX.XX.55"
            }
        ]
    }
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.

DescribeCustomerGateway

Queries details of a specified customer gateway.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeCustomerGateway	The operation that you want to perform. Set the value to **DescribeCustomerGateway**.
CustomerGatewayId	String	Yes	vpn-bp1q8bgx4xnkm2ogj****	The ID of the customer gateway.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the customer gateway is created. You can call the `DescribeRegions` operation to query the most recent region list.

Response parameters

Parameter	Type	Example	Description
CustomerGatewayId	String	cgw-bp1pvpl9r9adju6l5****	The ID of the customer gateway.
Name	String	test	The name of the customer gateway.
Description	String	test	The description of the customer gateway.
IpAddress	String	139.XX.XX.32	The IP address of the customer gateway.
RequestId	String	99506ECB-218F-45A5-AE8E-79518451F615	The ID of the request.
CreateTime	Long	1492747187000	The timestamp generated when the customer gateway was created.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeCustomerGateway
&CustomerGatewayId=vpn-bp1q8bgx4xnkm2ogj****
&RegionId=cn-qingdao-env66-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeCustomerGatewayResponse>
      <Name>test</Name>
      <CustomerGatewayId>cgw-bp1pvpl9r9adju6l5****</CustomerGatewayId>
      <CreateTime>1492747187000</CreateTime>
      <RequestId>99506ECB-218F-45A5-AE8E-79518451F615</RequestId>
      <IpAddress>139.XX.XX.32</IpAddress>
</DescribeCustomerGatewayResponse>
```

`JSON` format

```
{
    "CustomerGatewayId": "cgw-bp1pvpl9r9adju6l5****",
    "Name": "test",
    "RequestId": "A0457BC9-6C0F-4437-AB9D-FB2EABC1D6A2",
    "CreateTime": 1492747187000,
    "IpAddress": "139.XX.XX.32"
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.
404	InvalidCustomerGatewayInstanceId.NotFound	The specified customer gateway instance id does not exist.	The error message returned because the specified instance ID does not exist.

DeleteCustomerGateway

Deletes a specified customer gateway.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteCustomerGateway	The operation that you want to perform. Set the value to **DeleteCustomerGateway**.
CustomerGatewayId	String	Yes	cgw-2zllmw9lqrcdis3bd****	The ID of the customer gateway.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the customer gateway is created. You can call the `DescribeRegions` operation to query the most recent region list.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-0016e04115b	The client token is used to ensure the idempotence of the request. You can use the client to generate a token, but you must make sure that the token is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	606998F0-B94D-48FE-8316-ACA81BB230DA	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DeleteCustomerGateway
&CustomerGatewayId=vpn-bp1q8bgx4xnkm2ogj****
&RegionId=cn-qingdao-env66-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteCustomerGatewayResesponse>
      <RequestId>606998F0-B94D-48FE-8316-ACA81BB230DA</RequestId>
</DeleteCustomerGatewayResesponse>
```

`JSON` format

```
{
  "RequestId":"606998F0-B94D-48FE-8316-ACA81BB230DA"
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.
404	InvalidCustomerGatewayInstanceId.NotFound	The specified customer gateway instance id does not exist.	The error message returned because the specified instance ID does not exist.

ModifyCustomerGatewayAttribute

Modifies the name and description of a customer gateway.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyCustomerGatewayAttribute	The operation that you want to perform. Set the value to **ModifyCustomerGatewayAttribute**.
CustomerGatewayId	String	Yes	vpn-bp1q8bgx4xnkm2ogj****	The ID of the customer gateway.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the customer gateway is created. You can call the `DescribeRegions` operation to query the most recent region list.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-0016e04115b	The client token is used to ensure the idempotence of the request. You can use the client to generate a token, but you must make sure that the token is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.
Name	String	No	test	The name of the customer gateway. The name must be 2 to 128 characters in length, and can contain letters, digits, periods (.), underscores (_), and hyphens (-). The name must start with a letter, but cannot start with `http://` or `https://`.
Description	String	No	test	The description of the customer gateway. The description must be 2 to 256 characters in length, and can contain letters, digits, hyphens (-), underscores (_), full width periods (。), full width commas (，), and full width colons (：). The description must start with a letter, but cannot start with `http://` or `https://`.

Response parameters

Parameter	Type	Example	Description
CustomerGatewayId	String	cgw-bp1pvpl9r9adju6l5****	The ID of the customer gateway.
Name	String	test	The name of the customer gateway.

Parameter	Type	Example	Description
Description	String	test	The description of the customer gateway.
IpAddress	String	139.XX.XX.55	The IP address of the customer gateway.
CreateTime	Long	1492747187000	The timestamp generated when the customer gateway was created.
RequestId	String	E61293C8-AF07-4E87-A272-542680038F93	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ModifyCustomerGatewayAttribute
&CustomerGatewayId=vpn-bp1q8bgx4xnkm2ogj****
&RegionId=cn-qingdao-env66-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyCustomerGatewayAttributeResponse>
      <CustomerGatewayId>cgw-bp1pvpl9r9adju6l5****</CustomerGatewayId>
      <RequestId>E61293C8-AF07-4E87-A272-542680038F93</RequestId>
      <CreateTime>1492747187000</CreateTime>
      <IpAddress>139.XX.XX.55</IpAddress>
      <Description>modify</Description>
</ModifyCustomerGatewayAttributeResponse>
```

`JSON` format

```
{
    "CustomerGatewayId": "cgw-bp1pvpl9r9adju6l5****",
    "RequestId": "8AA5CE21-2E6A-4530-BDF5-F055849476E6",
    "CreateTime": 1492747187000,
    "IpAddress": "139.XX.XX.55",
    "Description": "modify"
    }
```

Error codes

HttpCode	Error code	Error message	Required

HttpCode	Error code	Error message	Required
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform this operation on the specified resource. To acquire the required permissions, submit a ticket.
404	InvalidCustomerGatewayInstanceId.NotFound	The specified customer gateway instance id does not exist.	The error message returned because the specified instance ID does not exist.
400	InvalidName	The name is not valid	The error message returned because the specified name is in an invalid format.
400	InvalidDescription	The description is not valid	The error message returned because the format of the specified description is invalid.

15.1.2.1.14.3. Routes for VPN gateways

DeleteVpnPbrRouteEntry

Deletes a policy-based route from a VPN gateway.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteVpnPbrRouteEntry	The operation that you want to perform. Set the value to **DeleteVpnPbrRouteEntry**.
NextHop	String	Yes	vco-bp15oes1py4i66rmd****	The next hop of the policy-based route.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the policy-based route is created. You can call the `DescribeRegions` operation to query the most recent region list.

Parameter	Type	Required	Example	Description
RouteDest	String	Yes	10.0.0.0/24	The destination CIDR block of the policy-based route.
RouteSource	String	Yes	192.168.1.0/24	The source CIDR block of the policy-based route.
VpnGatewayId	String	Yes	vpn-bp1a3kqjiiq9legfx****	The ID of the VPN gateway.
Weight	Integer	Yes	0	The weight of the policy-based route. Valid values: • **0**: specifies a low priority for the route. • **100**: specifies a high priority for the route entry. **Note** If two policy-based route entries are configured with the same destination CIDR block, you cannot set the weights of both route entries to 100.
ClientToken	String	No	d7d24a21-f4ba-4454-9173-b3828dae492b	The client token that is used to ensure the idempotence of the request. You can use the client to generate a token, but you must make sure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.
OverlayMode	String	No	Ipsec	The overlay mode. Set the value to **Ipsec** (IPsec tunneling).

Response parameters

Parameter	Type	Example	Description
RequestId	String	5BE01CD7-5A50-472D-AC14-CA181C5C03BE	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DeleteVpnPbrRouteEntry
&NextHop=vco-bp15oes1py4i66rmd****
&RegionId=cn-qingdao-env66-d01
&RouteDest=10.0.0.0/24
&RouteSource=192.168.1.0/24
&VpnGatewayId=vpn-bp1a3kqjiiq9legfx****
&Weight=0
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteVpnPbrRouteEntryResponse>
      <RequestId>5BE01CD7-5A50-472D-AC14-CA181C5C03BE</RequestId>
</DeleteVpnPbrRouteEntryResponse>
```

`JSON` format

```
{
 "RequestId":"E82612A9-CB90-4D7E-B394-1DB7F6509B29"
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.
400	Resource.QuotaFull	The quota of resource is full	The error message returned because the resource quota is reached.
404	InvalidVpnGatewayInstanceId.NotFound	The specified vpn gateway instance id does not exist.	The error message returned because the specified VPN gateway does not exist. Check whether the configuration of the VPN gateway is valid.

HttpCode	Error code	Error message	Description
400	VpnGateway.Configuring	The specified service is configuring.	The error message returned because the operation is not allowed when the specified service is being configured. Try again later.
400	VpnGateway.FinancialLocked	The specified service is financial locked.	The error message returned because the service is suspended due to overdue payments. Top up your account first.

DeleteVpnRouteEntry

Deletes a destination-based route from a VPN gateway.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteVpnRouteEntry	The operation that you want to perform. Set the value to **DeleteVpnRouteEntry**.
NextHop	String	Yes	vco-bp15oes1py4i66rmd****	The next hop of the destination-based route.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the destination-based route is created. You can call the `DescribeRegions` operation to query the most recent region list.
RouteDest	String	Yes	10.0.0.0/24	The destination CIDR block of the destination-based route.
VpnGatewayId	String	Yes	vpn-bp1a3kqjiiq9legfx****	The ID of the VPN gateway.

Parameter	Type	Required	Example	Description
Weight	Integer	Yes	0	The weight of the destination-based route. Valid values: • **0:**: specifies a low priority for the route entry. • **100**: specifies a high priority for the route entry. **Note** If two destination-based route entries are configured with the same destination CIDR block, you cannot set the weights of both route entries to 100.
ClientToken	String	No	d7d24a21-f4ba-4454-9173-b3828dae492b	The client token that is used to ensure the idempotence of the request. You can use the client to generate a token, but you must make sure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.
OverlayMode	String	No	Ipsec	The overlay mode. Set the value to **Ipsec** (IPsec tunneling).

Response parameters

Parameter	Type	Example	Description
RequestId	String	5BE01CD7-5A50-472D-AC14-CA181C5C03BE	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DeleteVpnRouteEntry
&NextHop=vco-bp15oes1py4i66rmd****
&RegionId=cn-qingdao-env66-d01
&RouteDest=10.0.0.0/24
&VpnGatewayId=vpn-bp1a3kqjiiq9legfx****
&Weight=0
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteVpnRouteEntryResponse>
        <RequestId>5BE01CD7-5A50-472D-AC14-CA181C5C03BE</RequestId>
</DeleteVpnRouteEntryResponse>
```

`JSON` format

```
{
 "RequestId":"E82612A9-CB90-4D7E-B394-1DB7F6509B29"
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.
400	Resource.QuotaFull	The quota of resource is full	The error message returned because the resource quota is reached.
404	InvalidVpnGatewayInstanceId.NotFound	The specified vpn gateway instance id does not exist.	The error message returned because the specified VPN gateway does not exist. Check whether the configuration of the VPN gateway is valid.

HttpCode	Error code	Error message	Description
400	VpnGateway.Configuring	The specified service is configuring.	The error message returned because the operation is not allowed when the specified service is being configured. Try again later.
400	VpnGateway.FinancialLocked	The specified service is financial locked.	The error message returned because the service is suspended due to overdue payments. Top up your account first.

DescribeVpnRouteEntries

Queries destination-based routes of a VPN gateway.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeVpnRouteEntries	The operation that you want to perform. Set the value to **DescribeVpnRouteEntries**.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the destination-based routes are created. You can call the `DescribeRegions` operation to query the most recent region list.
VpnGatewayId	String	Yes	vpn-bp1a3kqjiiq9legfx****	The ID of the VPN gateway.
PageNumber	Integer	No	1	The number of the page to return. Default value: **1**.
PageSize	Integer	No	10	The number of entries to return on each page. Maximum value: **50**. Default value: **10**.

Response parameters

Parameter	Type	Example	Description
PageNumber	Integer	10	The page number of the returned page.

Parameter	Type	Example	Description
PageSize	Integer	10	The number of entries returned per page.
RequestId	String	0ED8D006-F706-4D23-88ED-E11ED28DCAC0	The ID of the request.
TotalCount	Integer	10	The number of returned entries.
VpnRouteEntries	Array of VpnRouteEntry		The detailed information about the destination-based routes.
VpnRouteEntry			
CreateTime	Long	1492747187000	The timestamp generated when the destination-based route was created.
NextHop	String	vco-bp15oes1py4i66rmd****	The next hop of the destination-based route.
RouteDest	String	10.0.0.0/24	The destination CIDR block of the destination-based route.
State	String	published	The status of the destination-based route. • **published**: The route is advertised. • **normal**: The route is not advertised.
VpnInstanceId	String	vpn-bp1cmw7jh1nfe43m9****	The ID of the VPN gateway.
Weight	Integer	0	The weight of the destination-based route. Valid values: • **0**: indicates that the priority of the route entry is low. • **100**: indicates that the priority of the route entry is high.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeVpnRouteEntries
&RegionId=cn-qingdao-env66-d01
&VpnGatewayId=vpn-bp1a3kqjiiq9legfx****
&<Common request parameters>
```

Sample success responses

`XML` format

```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.

ModifyVpnRouteEntryWeight

Modifies the weight of a destination-based route for a VPN gateway.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyVpnRouteEntryWeight	The operation that you want to perform. Set the value to **ModifyVpnRouteEntryWeight**.
NewWeight	Integer	Yes	100	The new weight you want to set for the destination-based route. • **0**: specifies a low priority for the route entry. • **100**: specifies a high priority for the route entry. **Note** If two destination-based route entries are configured with the same destination CIDR block, you cannot set the weights of both route entries to 100.
NextHop	String	Yes	vco-bp15oes1py4i66rmd****	The next hop of the destination-based route.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the destination-based route is created. You can call the `DescribeRegions` operation to query the most recent region list.

Parameter	Type	Required	Example	Description
RouteDest	String	Yes	10.0.0.0/24	The destination CIDR block of the destination-based route.
VpnGatewayId	String	Yes	vpn-bp1a3kqjiiq9legfx****	The ID of the VPN gateway.
Weight	Integer	Yes	0	The current weight of the destination-based route. Valid values: **0** and **100**.
ClientToken	String	No	d7d24a21-f4ba-4454-9173-b3828dae492b	The client token that is used to ensure the idempotence of the request. You can use the client to generate a token, but you must make sure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.
OverlayMode	String	No	Ipsec	The overlay mode. Set the value to **Ipsec** (IPsec tunneling).

Response parameters

Parameter	Type	Example	Description
RequestId	String	5BE01CD7-5A50-472D-AC14-CA181C5C03BE	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ModifyVpnRouteEntryWeight
&NewWeight=100
&NextHop=vco-bp15oes1py4i66rmd****
&RegionId=cn-qingdao-env66-d01
&RouteDest=10.0.0.0/24
&VpnGatewayId=vpn-bp1a3kqjiiq9legfx****
&Weight=0
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyVpnRouteEntryWeightResponse>
        <RequestId>5BE01CD7-5A50-472D-AC14-CA181C5C03BE</RequestId>
</ModifyVpnRouteEntryWeightResponse>
```

`JSON` format

```
{
    "RequestId": "E82612A9-CB90-4D7E-B394-1DB7F6509B29"
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.
400	Resource.QuotaFull	The quota of resource is full	The error message returned because the resource quota is reached.
404	InvalidVpnGatewayInstanceId.NotFound	The specified vpn gateway instance id does not exist.	The error message returned because the specified VPN gateway does not exist. Check whether the configuration of the VPN gateway is valid.
400	VpnGateway.Configuring	The specified service is configuring.	The error message returned because the operation is not allowed when the specified service is being configured. Try again later.
400	VpnGateway.FinancialLocked	The specified service is financial locked.	The error message returned because the service is suspended due to overdue payments. Top up your account first.

CreateVpnRouteEntry

Creates a destination-based route on a VPN gateway.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateVpnRouteEntry	The operation that you want to perform. Set the value to **CreateVpnRouteEntry**.
NextHop	String	Yes	vco-bp15oes1py4i66rmd****	The next hop of the destination-based route.
PublishVpc	Boolean	Yes	true	Specifies whether to advertise the destination-based route to the route table of the associated virtual private cloud (VPC). • **true**: advertises the destination-based route to the route table of the associated VPC. • **false**: does not advertise the destination-based route to the route table of the associated VPC.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the destination-based route is created. You can call the `DescribeRegions` operation to query the most recent region list.
RouteDest	String	Yes	10.0.0.0/24	The destination CIDR block of the destination-based route.
VpnGatewayId	String	Yes	vpn-bp1a3kqjiiq9legfx****	The ID of the VPN gateway.

Parameter	Type	Required	Example	Description
Weight	Integer	Yes	0	The weight of the destination-based route. Valid values: • **0**: specifies a low priority for the route. • **100**:specifies a high priority for the route. **Note** If two destination-based route entries are configured with the same destination CIDR block, you cannot set the weights of both route entries to 100.
ClientToken	String	No	d7d24a21-f4ba-4454-9173-b3828dae492b	The client token that is used to ensure the idempotence of the request. You can use the client to generate a token, but you must make sure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.
Description	String	No	mytest	The description of the destination-based route.
OverlayMode	String	No	Ipsec	The overlay mode.

Response parameters

Parameter	Type	Example	Description
CreateTime	Long	1492747187000	The timestamp generated when the destination-based route was created.
Description	String	mytest	The description of the destination-based route.
NextHop	String	vco-bp15oes1py4i66rmd****	The next hop of the destination-based route.
OverlayMode	String	Ipsec	The overlay mode.

Parameter	Type	Example	Description
RequestId	String	5BE01CD7-5A50-472D-AC14-CA181C5C03BE	The ID of the request.
RouteDest	String	10.0.0.0/24	The destination CIDR block of the destination-based route.
State	String	published	The status of the destination-based route. • **published**: The route is advertised. • **normal**: The route is not advertised.
VpnInstanceId	String	vpn-bp1cmw7jh1nfe43m9****	The ID of the VPN gateway.
Weight	Integer	0	The weight of the destination-based route. Valid values: **0** and **100**.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=CreateVpnRouteEntry
&NextHop=vco-bp15oes1py4i66rmd****
&PublishVpc=true
&RegionId=cn-qingdao-env66-d01
&RouteDest=10.0.0.0/24
&VpnGatewayId=vpn-bp1a3kqjiiq9legfx****
&Weight=0
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreateVpnRouteEntryResponse>
   <RouteDest>10.0.0.0/24</RouteDest>
   <VpnInstanceId>vpn-bp1cmw7jh1nfe43m9****</VpnInstanceId>
   <OverlayMode>Ipsec</OverlayMode>
   <State>published</State>
   <Weight>100</Weight>
   <CreateTime>1563873294331</CreateTime>
   <NextHop>vco-bp1tui07ob10fmuro****</NextHop>
      <RequestId>EE4C2417-9437-4333-BDEB-8493F7AA7258</RequestId>
</CreateVpnRouteEntryResponse>
```

`JSON` format

```
{
    "RouteDest": "10.0.0.0/24",
    "VpnInstanceId": "vpn-bp1cmw7jh1nfe43m9****",
    "OverlayMode": "Ipsec",
    "State": "published",
    "Weight": 100,
    "CreateTime": 1563873294331,
    "NextHop": "vco-bp1tui07ob10fmuro****",
    "RequestId":"CB2793A8-845F-444C-8E93-76F1BBDF9C78"
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.
400	Resource.QuotaFull	The quota of resource is full	The error message returned because the resource quota is reached.
404	InvalidVpnGatewayInstanceId.NotFound	The specified vpn gateway instance id does not exist.	The error message returned because the specified VPN gateway does not exist. Check whether the configuration of the VPN gateway is valid.
400	VpnGateway.Configuring	The specified service is configuring.	The error message returned because the operation is not allowed when the specified service is being configured. Try again later.
400	VpnGateway.FinancialLocked	The specified service is financial locked.	The error message returned because the service is suspended due to overdue payments. Top up your account first.

ModifyVpnPbrRouteEntryWeight

Modifies the weight of a policy-based route of a VPN gateway.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyVpnPbrRouteEntryWeight	The operation that you want to perform. Set the value to **ModifyVpnPbrRouteEntryWeight**.
NewWeight	Integer	Yes	100	The new weight you want to set for the policy-based route. • **0**: specifies a low priority for the route entry. • **100**: specifies a high priority for the route entry. **Note** If two policy-based route entries are configured with the same destination CIDR block, you cannot set the weights of both route entries to 100.
NextHop	String	Yes	vco-bp15oes1py4i66rmd****	The next hop of the policy-based route.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the policy-based route is created. You can call the `DescribeRegions` operation to query the most recent region list.
RouteDest	String	Yes	10.0.0.0/24	The destination CIDR block of the policy-based route.
RouteSource	String	Yes	192.168.1.0/24	The source CIDR block of the policy-based route.
VpnGatewayId	String	Yes	vpn-bp1a3kqjiiq9legfx****	The ID of the VPN gateway.
Weight	Integer	Yes	0	The original weight of the policy-based route. Valid values: **0** and **100**.

Parameter	Type	Required	Example	Description
ClientToken	String	No	d7d24a21-f4ba-4454-9173-b3828dae492b	The client token that is used to ensure the idempotence of the request. You can use the client to generate a token, but you must make sure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.
OverlayMode	String	No	Ipsec	The overlay mode. Set the value to **Ipsec** (IPsec tunneling).

Response parameters

Parameter	Type	Example	Description
RequestId	String	5BE01CD7-5A50-472D-AC14-CA181C5C03BE	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ModifyVpnPbrRouteEntryWeight
&NewWeight=100
&NextHop=vco-bp15oes1py4i66rmd****
&RegionId=cn-qingdao-env66-d01
&RouteDest=10.0.0.0/24
&RouteSource=192.168.1.0/24
&VpnGatewayId=vpn-bp1a3kqjiiq9legfx****
&Weight=0
&<Common request parameters>
```

`XML` format

```
<ModifyVpnPbrRouteEntryWeightResponse>
        <RequestId>5BE01CD7-5A50-472D-AC14-CA181C5C03BE</RequestId>
</ModifyVpnPbrRouteEntryWeightResponse>
```

`JSON` format

```
{
 "RequestId":"E82612A9-CB90-4D7E-B394-1DB7F6509B29"
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.
400	Resource.QuotaFull	The quota of resource is full	The error message returned because the resource quota is reached.
404	InvalidVpnGatewayInstanceId.NotFound	The specified vpn gateway instance id does not exist.	The error message returned because the specified VPN gateway does not exist. Check whether the configuration of the VPN gateway is valid.
400	VpnGateway.Configuring	The specified service is configuring.	The error message returned because the operation is not allowed when the specified service is being configured. Try again later.
400	VpnGateway.FinancialLocked	The specified service is financial locked.	The error message returned because the service is suspended due to overdue payments. Top up your account first.

DescribeVpnPbrRouteEntries

Queries policy-based routes of a VPN gateway.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeVpnPbrRouteEntries	The operation that you want to perform. Set the value to **DescribeVpnPbrRouteEntries**.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the policy-based routes are created. You can call the `DescribeRegions` operation to query the most recent region list.
VpnGatewayId	String	Yes	vpn-bp1a3kqjiiq9legfx****	The ID of the VPN gateway.
PageNumber	Integer	No	10	The number of the page to return. Default value: **1**.
PageSize	Integer	No	10	The number of entries to return on each page. Maximum value: **50**. Default value: **10**.

Response parameters

Parameter	Type	Example	Description
PageNumber	Integer	1	The page number of the returned page.
PageSize	Integer	10	The number of entries returned per page.
RequestId	String	5BE01CD7-5A50-472D-AC14-CA181C5C03BE	The ID of the request.
TotalCount	Integer	12	The number of returned entries.
VpnPbrRouteEntries	Array of VpnPbrRouteEntry		The detailed information about the policy-based routes.
VpnPbrRouteEntry			
CreateTime	Long	1492747187000	The timestamp generated when the policy-based route was created.
NextHop	String	vco-bp15oes1py4i66rmd****	The next hop of the policy-based route.

Parameter	Type	Example	Description
RouteDest	String	10.0.0.0/24	The destination CIDR block of the policy-based route.
RouteSource	String	192.xx.0.0/24	The source CIDR block of the policy-based route.
State	String	published	The status of the policy-based route. Valid values: • **published**: The route is advertised. • **normal**: The route is not advertised.
VpnInstanceId	String	vpn-bp1cmw7jh1nfe43m9****	The ID of the VPN gateway.
Weight	Integer	0	The weight of the policy-based route. Valid values: • **0**: indicates that the priority of the route entry is low. • **100**: indicates that the priority of the route entry is high.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeVpnPbrRouteEntries
&RegionId=cn-qingdao-env66-d01
&VpnGatewayId=vpn-bp1a3kqjiiq9legfx****
&<Common request parameters>

            }
        ]
    }
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.

HttpCode	Error code	Error message	Description
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.

PublishVpnRouteEntry

Advertises a route of a VPN gateway to the route table of the associated virtual private cloud (VPC).

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	PublishVpnRouteEntry	The operation that you want to perform. Set the value to **PublishVpnRouteEntry**.
NextHop	String	Yes	vco-bp15oes1py4i66rmd****	The next hop of the route.
PublishVpc	Boolean	Yes	true	Specifies whether to advertise the route of the VPN gateway to the route table of the associated VPC. • **true**: advertises the route to the route table of the associated VPC. • **false**: does not advertise the route to the route table of the associated VPC.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the route of the VPN gateway is deployed. You can call the `DescribeRegions` operation to query the most recent region list.
RouteDest	String	Yes	10.0.0.0/24	The destination CIDR block of the route of the VPN gateway.
RouteType	String	Yes	pbr	The type of the route of the VPN gateway. Valid values: • **pbr**: policy-based route. • **dbr**: destination-based route.

Parameter	Type	Required	Example	Description
VpnGatewayId	String	Yes	vpn-bp1a3kqjiiq9legfx****	The ID of the VPN gateway.
ClientToken	String	No	d7d24a21-f4ba-4454-9173-b3828dae492b	The client token that is used to ensure the idempotence of the request. You can use the client to generate a token, but you must make sure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	5BE01CD7-5A50-472D-AC14-CA181C5C03BE	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=PublishVpnRouteEntry
&NextHop=vco-bp15oes1py4i66rmd****
&PublishVpc=true
&RegionId=cn-qingdao-env66-d01
&RouteDest=10.0.0.0/24
&RouteType=pbr
&VpnGatewayId=vpn-bp1a3kqjiiq9legfx****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<PublishVpnRouteEntryResponse>
      <RequestId>EE4C2417-9437-4333-BDEB-8493F7AA7258</RequestId>
</PublishVpnRouteEntryResponse>
```

`JSON` format

{
    "RequestId":"CB2793A8-845F-444C-8E93-76F1BBDF9C78"
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.
400	Resource.QuotaFull	The quota of resource is full	The error message returned because the resource quota is reached.
404	InvalidVpnGatewayInstanceId.NotFound	The specified vpn gateway instance id does not exist.	The error message returned because the specified VPN gateway does not exist. Check whether the configuration of the VPN gateway is valid.
400	VpnGateway.Configuring	The specified service is configuring.	The error message returned because the operation is not allowed when the specified service is being configured. Try again later.
400	VpnGateway.FinancialLocked	The specified service is financial locked.	The error message returned because the service is suspended due to overdue payments. Top up your account first.

CreateVpnPbrRouteEntry

Creates a policy-based route for a VPN gateway.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateVpnPbrRouteEntry	The operation that you want to perform. Set the value to **CreateVpnPbrRouteEntry**.

Parameter	Type	Required	Example	Description
NextHop	String	Yes	vco-bp15oes1py4i66rmd****	The next hop of the policy-based route.
PublishVpc	Boolean	Yes	true	Specifies whether to advertise the policy-based route to the route table of the associated virtual private cloud (VPC). Valid values: • **true**: advertises the policy-based route to the route table of the associated VPC . • **false**: does not advertise the policy-based route to the route table of the associated VPC.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where you want to create the policy-based route for the VPN gateway. You can call the `DescribeRegions` operation to query the most recent region list.
RouteDest	String	Yes	10.0.0.0/24	The destination CIDR block of the policy-based route.
RouteSource	String	Yes	192.168.1.0/24	The source CIDR block of the policy-based route.
VpnGatewayId	String	Yes	vpn-bp1a3kqjiiq9legfx****	The ID of the VPN gateway.
Weight	Integer	Yes	0	The weight of the policy-based route. Valid values: • **0**: specifies a low priority for the route entry. • **100**: specifies a high priority for the route entry. **Note** If two policy-based route entries are configured with the same destination CIDR block, you cannot set the weights of both route entries to 100.

Parameter	Type	Required	Example	Description
ClientToken	String	No	d7d24a21-f4ba-4454-9173-b3828dae492b	The client token that is used to ensure the idempotence of the request. You can use the client to generate a token, but you must make sure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.
Description	String	No	vpnroute1	The description of the policy-based route.
OverlayMode	String	No	Ipsec	The overlay mode.

Response parameters

Parameter	Type	Example	Description
CreateTime	Long	1492747187000	The timestamp generated when the policy-based route was created.
Description	String	vpnroute1	The description of the policy-based route.
NextHop	String	vco-bp15oes1py4i66rmd****	The next hop of the policy-based route.
OverlayMode	String	Ipsec	The overlay mode.
RequestId	String	5BE01CD7-5A50-472D-AC14-CA181C5C03BE	The ID of the request.
RouteDest	String	10.0.0.0/24	The destination CIDR block of the policy-based route.
RouteSource	String	192.168.1.0/24	The source CIDR block of the policy-based route.

Parameter	Type	Example	Description
State	String	normal	The status of the policy-based route. Valid values: • **published**: The route is advertised. • **normal**: The route is not advertised.
VpnInstanceId	String	vpn-bp1cmw7jh1nfe43m9****	The ID of the VPN gateway.
Weight	Integer	0	The weight of the policy-based route. Valid values: **0** and **100**.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=CreateVpnPbrRouteEntry
&NextHop=vco-bp15oes1py4i66rmd****
&PublishVpc=true

15.1.2.1.14.4. IPsec-VPN

DescribeVpnConnection

Queries the details of an IPsec-VPN connection.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeVpnConnection	The operation that you want to perform. Set the value to **DescribeVpnConnection**.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the IPsec-VPN connection is created. You can call the `DescribeRegions` operation to query the most recent region list.
VpnConnectionId	String	Yes	vco-bp1bbi27hojx80nck****	The ID of the IPsec-VPN connection.

Response parameters

Parameter	Type	Example	Description
VpnConnectionId	String	vco-bp1bbi27hojx80nck****	The ID of the IPsec-VPN connection.
CustomerGatewayId	String	cgw-bp1mvj4g9kogwwcxk****	The ID of the customer gateway.
VpnGatewayId	String	vpn-bp1q8bgx4xnkm2ogj****	The ID of the VPN gateway.
Name	String	ipsec1	The name of the IPsec-VPN connection.
LocalSubnet	String	10.1.1.0/24,10.1.2.0/24	The CIDR block of the VPC.
RemoteSubnet	String	10.10.1.0/24,10.10.2.0/24	The CIDR block of the data center.
CreateTime	Long	1492753817000	The time when the IPsec-VPN connection was created.

Parameter	Type	Example	Description
Status	String	ike_sa_not_established	The status of the IPsec-VPN connection. Valid values: • **ike_sa_not_established**: indicates that Phase 1 negotiations failed. • **ike_sa_established**: indicates that Phase 1 negotiations succeeded. • **ipsec_sa_not_established**: indicates that Phase 2 negotiations failed. • **ipsec_sa_established**: indicates that Phase 2 negotiations succeeded.
EffectImmediately	Boolean	true	Indicates whether the IPsec-VPN connection immediately takes effect. Valid values: • **true**: Negotiations are reinitiated when the configuration is changed. • **false**: Negotiations are reinitiated when traffic is detected. When negotiations are reinitiated, transient connections may occur.
IkeConfig	Struct		The configuration of Phase 1 negotiations.
IkeAuthAlg	String	sha1	The IKE authentication algorithm.
IkeEncAlg	String	aes	The IKE encryption algorithm.
IkeLifetime	Long	86400	The IKE lifetime.
IkeMode	String	main	The IKE mode. Both **main** and **aggressive** modes are supported. The main mode provides higher security. If NAT traversal is enabled, we recommend that you select the **aggressive** mode.
IkePfs	String	group2	The DH group.
IkeVersion	String	ikev1	The IKE version.

Parameter	Type	Example	Description
LocalId	String	116.XX.XX.69	The local ID. The default value is the IP address of the VPN gateway. Both fully qualified domain names (FQDNs) and IP addresses are supported.
Psk	String	pgw6dy7d1i8in7x5	The pre-shared key.
RemoteId	String	139.XX.XX.32	The peer ID. The default value is the IP address of the customer gateway. Both FQDNs and IP addresses are supported.
IpsecConfig	Struct		The configuration of Phase 2 negotiations.
IpsecAuthAlg	String	sha1	The IPsec authentication algorithm.
IpsecEncAlg	String	aes	The IPsec encryption algorithm.
IpsecLifetime	Long	86400	The IPsec lifetime.
IpsecPfs	String	group2	The DH group.
RequestId	String	F2310D45-BCF6-4E2E-9082-B4503844BA4C	The ID of the request.
VcoHealthCheck	Struct		The information about health checks.
Dip	String	10.XX.XX.1	The destination IP address.
Enable	String	true	Indicates whether health checks are enabled. Valid values: • **false**: Health checks are disabled. • **true**: Health checks are enabled.
Interval	Integer	3	The interval between two consecutive health checks. Unit: seconds.

Parameter	Type	Example	Description
Retry	Integer	3	The maximum number of health check retries.
Sip	String	192.XX.XX.2	The source IP address for health checks.
Status	String	failed	The status of the health check.

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.

HttpCode	Error code	Error message	Description
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.
404	InvalidVpnConnectionInstanceId.NotFound	The specified vpn connection instance id does not exist.	The error message returned because the specified IPsec-VPN connection does not exist. Check whether the ID of the IPsec-VPN connection is valid.

DeleteVpnConnection

Deletes a specified IPsec-VPN connection.

Note After an IPsec-VPN connection between a virtual private cloud (VPC) and a data center is deleted, the communication between the VPC and data center is interrupted.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteVpnConnection	The operation that you want to perform. Set the value to **DeleteVpnConnection**.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the IPsec-VPN connection is created. You can call the `DescribeRegions` operation to query the most recent region list.
VpnConnectionId	String	Yes	vco-bp1bbi27hojx80nck****	The ID of the IPsec-VPN connection.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-0016e04115b	The client token is used to ensure the idempotence of the request. You can use the client to generate a token, but you must make sure that the token is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	606998F0-B94D-48FE-8316-ACA81BB230DA	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DeleteVpnConnection
&RegionId=cn-qingdao-env66-d01
&VpnConnectionId=vco-bp1bbi27hojx80nck****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteVpnConnectionResponse>
      <RequestId>606998F0-B94D-48FE-8316-ACA81BB230DA</RequestId>
</DeleteVpnConnectionResponse>
```

`JSON` format

```
{
  "RequestId":"606998F0-B94D-48FE-8316-ACA81BB230DA"
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.

HttpCode	Error code	Error message	Description
404	InvalidVpnConnectionInstanceId.NotFound	The specified vpn connection instance id does not exist.	The error message returned because the specified IPsec-VPN connection does not exist. Check whether the ID of the IPsec-VPN connection is valid.
400	VpnGateway.Configuring	The specified service is configuring.	The error message returned because the operation is not allowed when the specified service is being configured. Try again later.

DownloadVpnConnectionConfig

Queries the configuration of an IPsec-VPN connection.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DownloadVpnConnectionConfig	The operation that you want to perform. Set the value to **DownloadVpnConnectionConfig**.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the IPsec-VPN connection is created. You can call the `DescribeRegions` operation to query the most recent region list.
VpnConnectionId	String	Yes	vco-bp1bbi27hojx80nck****	The ID of the IPsec-VPN connection.

Response parameters

Parameter	Type	Example	Description
RequestId	String	0C68048B-0F70-40DA-B8AE-1B79B5CF62E3	The ID of the request.
VpnConnectionConfig	Struct		The configuration of the IPsec-VPN connection.

Parameter	Type	Example	Description
IkeConfig	Struct		The IKE configuration.
IkeAuthAlg	String	sha1	The IKE authentication algorithm. Valid values: **sha1** and **md5**.
IkeEncAlg	String	aes	The IKE encryption algorithm.
IkeLifetime	Long	86400	The IKE lifetime. Unit: seconds.
IkeMode	String	main	The IKE mode. Valid values: **main** and **aggressive**. The main mode offers higher security. If NAT traversal is enabled, we recommend that you select the **aggressive** mode.
IkePfs	String	group2	The DH group.
IkeVersion	String	ikev1	The IKE version.
LocalId	String	116.XX.XX.69	The local ID. The default value is the IP address of the VPN gateway. Both fully qualified domain names (FQDNs) and IP addresses are supported.
Psk	String	pgw6dy7d1i8i****	The pre-shared key.
RemoteId	String	139.XX.XX.32	The peer ID. The default value is the IP address of the customer gateway. Both FQDNs and IP addresses are supported.
IpsecConfig	Struct		The configuration of the IPsec-VPN connection.
IpsecAuthAlg	String	sha1	The IPsec authentication algorithm. Valid values: **sha1** and **md5**.
IpsecEncAlg	String	aes	The IPsec encryption algorithm.
IpsecLifetime	Long	86400	The IPsec lifetime. Unit: seconds.

Parameter	Type	Example	Description
IpsecPfs	String	group2	The DH group.
Local	String	139.XX.XX.32	The ID of the VPN gateway.
LocalSubnet	String	10.1.1.0/24,10.1.2.0/24	The CIDR block of the VPC.
Remote	String	116.XX.XX.69	The ID of the customer gateway.
RemoteSubnet	String	10.10.1.0/24,10.10.2.0/24	The CIDR block of the data center.

Examples

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.
404	InvalidVpnConnectionInstanceId.NotFound	The specified vpn connection instance id does not exist.	The error message returned because the specified IPsec-VPN connection does not exist. Check whether the ID of the IPsec-VPN connection is valid.

CreateVpnConnection

Creates an IPsec-VPN connection.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateVpnConnection	The operation that you want to perform. Set the value to **CreateVpnConnection**.
CustomerGatewayId	String	Yes	vpn-bp1q8bgx4xnk****	The ID of the customer gateway.
LocalSubnet	String	Yes	10.1.1.0/24,10.1.2.0/24	The CIDR block of the virtual private cloud (VPC) that is used to connect with the data center. This CIDR block is used in Phase 2 negotiations. Separate multiple CIDR blocks with commas (,). Example: 192.168.1.0/24,192.168.2.0/24.
RegionId	String	Yes	cn-qingdao-env66-d01	The region ID of the IPsec-VPN connection. You can call the `DescribeRegions` operation to query the most recent region list.
RemoteSubnet	String	Yes	10.10.1.0/24,10.10.2.0/24	The CIDR block of the data center. The peer CIDR block is used in Phase 2 negotiations. Separate multiple CIDR blocks with commas (,). Example: 192.168.3.0/24,192.168.4.0/24.
VpnGatewayId	String	Yes	vpn-bp1q8bgx4xnkm****	The ID of the VPN gateway.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-001****	The client token that is used to ensure the idempotence of the request. You can use the client to generate a token, but you must make sure that the token is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.

Parameter	Type	Required	Example	Description
Name	String	No	IPsec	The name of the IPsec-VPN connection. The name must be 2 to 128 characters in length, and can contain digits, periods (.), underscores (_), and hyphens (-). It must start with a letter and cannot start with `http://` or `https://`.
EffectImmediately	Boolean	No	false	Specifies whether to delete the current IPsec tunnel and reinitiate negotiations. Valid values: • **true**: initiates negotiations after the configuration is completed. • **false**: initiates negotiations when inbound traffic is detected. This is the default value.

Parameter	Type	Required	Example	Description
IkeConfig	String	No	{"IkeVersion":"ikev1","IkeMode":"main","IkeEncAlg":"aes","IkeAuthAlg":"sha1","IkePfs":"group2","IkeLifetime":86400}	The configuration of Phase 1 negotiations: • **IkeConfig.Psk**: the pre-shared key that is used to authenticate the VPN gateway and the customer gateway. By default, a random value is generated. You can also specify a pre-shared key. The description cannot exceed 100 characters in length. • **IkeConfig.IkeVersion**: The version of the IKE protocol. Valid values: **ikev1** and **ikev2**. Default value: **ikev1**. • **IkeConfig.IkeMode**: the negotiation mode of IKE V1. Valid values: **main** and **aggressive**. Default value: **main**. • **IkeConfig.IkeEncAlg**: The encryption algorithm used in Phase 1 negotiations. Valid values: **aes**, **aes192**, **aes256**, **des**, and **3des**. Default value: **aes**. • **IkeConfig.IkeAuthAlg**: The authentication algorithm used in Phase 1 negotiations. Valid values: **md5** and **sha1**. Default value: **md5**. • **IkeConfig.IkePfs**: The Diffie-Hellman key exchange algorithm used in Phase 1 negotiations. Valid values: **group1**, **group2**, **group5**, **group14**, and **group24**. Default value: **group2**. • **IkeConfig.IkeLifetime**: the SA lifetime as a result of Phase 1 negotiations. Valid values: **0 to 86400**. Unit: seconds. Default value: **86400**. • **IkeConfig.LocalIdIPsec**: the identifier of the VPN gateway. This parameter can contain up to 100 characters. The default value is the public IP address of the VPN gateway. • **IkeConfig.RemoteId**: the identifier of the customer gateway. This parameter can contain up to 100 characters. By default, it is the public IP address of the customer gateway.

Parameter	Type	Required	Example	Description
IpsecConfig	String	No	{"IpsecEncAlg":"aes","IpsecAuthAlg":"sha1","IpsecPfs":"group2","IpsecLifetime":86400}	The configuration of Phase 2 negotiations: • **IpsecConfig.IpsecEncAlg**: The encryption algorithm used in Phase 2 negotiations. Valid values: **aes**, **aes192**, **aes256**, **des**, and **3des**. Default value: **aes**. • **IpsecConfig. IpsecAuthAlg**: The authentication algorithm used in Phase 2 negotiations. Valid values: **md5** and **sha1**. Default value: **md5**. • **IpsecConfig. IpsecPfs**: the Diffie-Hellman group for perfect forward secrecy (PFS). If you set this parameter, the system forwards packets of all protocols. The Diffie-Hellman key exchange algorithm used in Phase 2 negotiations. Valid values: **group1**, **group2**, **group5**, **group14**, and **group24**. Default value: **group2**. • **IpsecConfig. IpsecLifetime**: the SA lifetime as a result of Phase 2 negotiations. Valid values: **0 to 86400**. Unit: seconds. Default value: **86400**.
HealthCheckConfig	String	No	{"enable":"true","dip":"192.168.xx.2","sip":"192.168.xx.2","interval":"3","retry":"3"}	The health check configuration: • **HealthCheckConfig.enable**: specifies whether to enable health checks. Valid values: **true and false**. Default value: false. • **HealthCheckConfig.dip**: the destination IP address configured for health checks. • **HealthCheckConfig.sip**: the source IP address configured for health checks. • **HealthCheckConfig.interval**: the time interval of health check retries. Unit: seconds. • **HealthCheckConfig.retry**: the maximum number of health check retries.

Parameter	Type	Required	Example	Description
AutoConfigRoute	Boolean	No	true	Specifies whether to automatically configure routes. Valid values: • **true**: enables automatic configuration. • **false**: disables automatic configuration. This is the default value.

Response parameters

Parameter	Type	Example	Description
VpnConnectionId	String	vco-bp15oes1py4i6****	The ID of the IPsec-VPN connection.
CreateTime	Long	1544666102000	The timestamp generated when the IPsec-VPN connection was created.
Name	String	test	The name of the IPsec-VPN connection.
RequestId	String	082AD562-B8DB-4BB2-861F-DA1FCA01FD76	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=CreateVpnConnection
&CustomerGatewayId=vpn-bp1q8bgx4xnk****
&LocalSubnet=10.1.1.0/24,10.1.2.0/24
&RegionId=cn-qingdao-env66-d01
&RemoteSubnet=10.10.1.0/24,10.10.2.0/24
&VpnGatewayId=vpn-bp1q8bgx4xnkm****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreateVpnConnectionResponse>
      <VpnConnectionId>vco-bp1bbi27hojx8****</VpnConnectionId>
      <CreateTime>1493363928000</CreateTime>
</CreateVpnConnectionResponse>
```

`JSON` format

```
{
    "CreateTime": 1544666102000,
    "VpnConnectionId": "vco-bp15oes1py4i6****"
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.
400	Resource.QuotaFull	The quota of resource is full	The error message returned because the resource quota is reached.
404	InvalidCustomerGatewayInstanceId.NotFound	The specified customer gateway instance id does not exist.	The error message returned because the specified instance ID does not exist.
404	InvalidVpnGatewayInstanceId.NotFound	The specified vpn gateway instance id does not exist.	The error message returned because the specified VPN gateway does not exist. Check whether the configuration of the VPN gateway is valid.
400	InvalidVpnConnection.AlreadyExists	Vpn connection already exists.	The error message returned because the IPsec-VPN connection already exists.
400	VpnGateway.Configuring	The specified service is configuring.	The error message returned because the operation is not allowed when the specified service is being configured. Try again later.
400	VpnGateway.FinancialLocked	The specified service is financial locked.	The error message returned because the service is suspended due to overdue payments. Top up your account first.

DescribeVpnConnections

Queries one or more IPsec-VPN connections.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeVpnConnections	The operation that you want to perform. Set the value to **DescribeVpnConnections**.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the IPsec-VPN connections are created. You can call the `DescribeRegions` operation to query the most recent region list.
VpnGatewayId	String	No	vpn-bp1q8bgx4xnkx****	The ID of the VPN gateway.
CustomerGatewayId	String	No	cgw-bp1mvj4g9kogw*****	The ID of the customer gateway.
PageNumber	Integer	No	1	The number of the page to return. Default value: **1**.
PageSize	Integer	No	10	The number of entries to return on each page. Maximum value: **50**. Default value: **10**.
VpnConnectionId	String	No	vco-bp15oes1py4i6****	The ID of the IPsec-VPN connection.

Response parameters

Parameter	Type	Example	Description
VpnConnections	Array of VpnConnection		The detailed information about the IPsec-VPN connections.
VpnConnection			
IkeConfig	Struct		The configuration of Phase 1 negotiations.

Parameter	Type	Example	Description
IkeAuthAlg	String	sha1	The IKE authentication algorithm. Valid values: **sha1** and **MD5**.
IkeEncAlg	String	aes	The IKE encryption algorithm.
IkeLifetime	Long	86400	The IKE lifetime. Unit: seconds.
IkeMode	String	main	The IKE mode. Valid values: **main** and **aggressive** . The **main** mode offers higher security. If NAT traversal is enabled, we recommend that you select the **aggressive** mode.
IkePfs	String	group2	The DH group. Valid values: **group1**, **group2**, **group5**, **group14**, and **group24**.
IkeVersion	String	ikev1	The IKE version.
LocalId	String	116.XX.XX.64	The local ID. The default value is the IP address of the VPN gateway. Both fully qualified domain names (FQDNs) and IP addresses are supported.
Psk	String	pgw6dy7d****	The pre-shared key.
RemoteId	String	139.XX.XX.167	The peer ID. The default value is the IP address of the customer gateway. Both FQDNs and IP addresses are supported.
IpsecConfig	Struct		The configuration of Phase 2 negotiations.
IpsecAuthAlg	String	sha1	The IPsec authentication algorithm.Valid values: **sha1** and **md5**.
IpsecEncAlg	String	aes	The IPsec encryption algorithm.
IpsecLifetime	Long	86400	The IPsec lifetime.

Parameter	Type	Example	Description
IpsecPfs	String	group2	The DH group.
VpnConnectionId	String	vco-bp10lz7aejumd****	The ID of the IPsec-VPN connection.
CustomerGatewayId	String	cgw-bp1mvj4g9kogw****	The ID of the customer gateway.
VpnGatewayId	String	vpn-bp1q8bgx4xnkm****	The ID of the VPN gateway.
Name	String	name	The name of the IPsec-VPN connection.
LocalSubnet	String	10.1.1.0/24,10.1.2.0/24	The CIDR block of the VPC.
RemoteSubnet	String	10.10.1.0/24,10.10.2.0/24	The CIDR block of the data center.
CreateTime	Long	1492753817000	The timestamp generated when the IPsec-VPN connection was created.
Status	String	ipsec_sa_established	The status of the IPsec-VPN connection. Valid values: • **ike_sa_not_established**: indicates that Phase 1 negotiations failed. • **ike_sa_established**: indicates that Phase 1 negotiations succeeded. • **ipsec_sa_not_established**: indicates that Phase 2 negotiations failed. • **ipsec_sa_established**: indicates that Phase 2 negotiations succeeded.
EffectImmediately	Boolean	true	Indicates whether IPsec-VPN negotiations are initiated immediately. Valid values: • **true**: Negotiations are reinitiated when the configuration is changed. • **false**: Negotiations are reinitiated when traffic is detected. When negotiations are reinitiated, transient connections may occur.
VcoHealthCheck	Struct		The configuration of health checks.

Parameter	Type	Example	Description
Dip	String	8.XX.XX.8	The destination IP address.
Enable	String	true	Indicates whether health checks are enabled. Valid values: • **true**: Health checks are enabled. • **false**: Health checks are disabled.
Interval	Integer	2	The interval between two consecutive health checks. Unit: seconds.
Retry	Integer	1	The maximum number of health check retries.
Sip	String	192.XX.XX.66	The source IP address that is used for health checks.
Status	String	failed	The status of the health check. Valid values: • **failed**: The health check failed. • **success**: The health check was successful.
TotalCount	Integer	10	The number of entries.
PageNumber	Integer	1	The page number of the returned page.
PageSize	Integer	10	The number of entries returned on each page.
RequestId	String	54A4B3D0-DF4D-4C54-B8DC-5DC8DD49C939	The ID of the request.

ModifyVpnConnectionAttribute

Modifies the configuration of an IPsec-VPN connection.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyVpnConnectionAttribute	The operation that you want to perform. Set the value to **ModifyVpnConnectionAttribute**.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the IPsec-VPN connection is created. You can call the `DescribeRegions` operation to query the most recent region list.
VpnConnectionId	String	Yes	vco-bp1bbi27hojx80nck****	The ID of the IPsec-VPN connection.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-0016e04115b	The client token is used to ensure the idempotence of the request. You can use the client to generate a token, but you must make sure that the token is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.
Name	String	No	IPsec	The name of the IPsec-VPN connection. The name must be 2 to 128 characters in length, and can contain digits, periods (.), underscores (_), and hyphens (-). It must start with a letter. However, the name cannot start with `http://` or `https://`.

Parameter	Type	Required	Example	Description
LocalSubnet	String	No	10.1.1.0/24,10.1.2.0/24	The CIDR block of the virtual private cloud (VPC) that is used to connect with the data center. This CIDR block is used in Phase 2 negotiations. Separate multiple CIDR blocks with commas (,). Example: 192.168.1.0/24,192.168.2.0/24.
RemoteSubnet	String	No	10.10.1.0/24,10.10.2.0/24	The CIDR block of the data center. This CIDR block is used in Phase 2 negotiations. Separate multiple CIDR blocks with commas (,). Example: 192.168.3.0/24,192.168.4.0/24.
EffectImmediately	Boolean	No	false	Specifies whether to delete the current IPsec tunnel and reinitiate negotiations. Valid values: • **true**: initiates negotiations after the configuration is completed. • **false**: initiates negotiations when inbound traffic is detected. This is the default value.

Parameter	Type	Required	Example	Description
IkeConfig	String	No	{"IkeVersion":"ikev1","IkeMode":"main","IkeEncAlg":"aes","IkeAuthAlg":"sha1","IkePfs":"group2","IkeLifetime":86400}	The configuration of Phase 1 negotiations: • **IkeConfig.Psk**: the pre-shared key that is used to authenticate the VPN gateway and the customer gateway. You can specify a key or use the default key that is randomly generated by the system. The key must be 1 to 100 characters in length. • **IkeConfig.IkeVersion**: the version of the IKE protocol. Valid values: **ikev1** and **ikev2**. Default value: **ikev1**. • **IkeConfig.IkeMode**: the negotiation mode of IKE V1. Valid values: **main** and **aggressive**. Default value: **main**. • **IkeConfig.IkeEncAlg**: The encryption algorithm of Phase 1 negotiations. Valid values: **aes**, **aes192**, **aes256**, **des**, and **3des**. Default value: **aes**. • **IkeConfig.IkeAuthAlg**: The authentication algorithm of Phase 1 negotiations. Valid values: **md5** and **sha1**. Default value: **sha1**. IkeConfig.IkePfs: The Diffie-Hellman key exchange algorithm of Phase 1 negotiations. Valid values: **group1**, **group2**, **group5**, **group14**, and **group24**. Default value: **group2**. • **IkeConfig.IkeLifetime**: the SA lifetime as a result of Phase 1 negotiations. Valid values: **0** to **86400**. Unit: seconds. Default value: **86400**. • **IkeConfig.LocalIdIPsec**: the identifier of the VPN gateway. This parameter can contain up to 100 characters. By default, it is the public IP address of the VPN gateway. • **IkeConfig.RemoteId**: the identifier of the customer gateway. This parameter can contain up to 100 characters. By default, it is the public IP address of the customer gateway.

Parameter	Type	Required	Example	Description
IpsecConfig	String	No	{"IpsecEncAlg":"aes","IpsecAuthAlg":"sha1","IpsecPfs":"group2","IpsecLifetime":86400}	The configuration of Phase 2 negotiations: • **IpsecConfig.IpsecEncAlg**: The encryption algorithm of Phase 2 negotiations. Valid values: **aes**, **aes192**, **aes256**, **des**, and **3des**. Default value: **aes**. • **IpsecConfig. IpsecAuthAlg**: The authentication algorithm of Phase 2 negotiations. Valid values: **md5** and **sha1**. Default value: **sha1**. • **IpsecConfig. IpsecPfs**: the Diffie-Hellman group for perfect forward secrecy (PFS). If you set this parameter, the system forwards packets of all protocols. The Diffie-Hellman key exchange algorithm of Phase 2 negotiations. Valid values: **group1**, **group2**, **group5**, **group14**, and **group24**. Default value: **group2**. • **IpsecConfig. IpsecLifetime**: the SA lifetime as a result of Phase 2 negotiations. Valid values: **0** to **86400**. Unit: seconds. Default value: **86400**.
HealthCheckConfig	String	No	{"enable":"true","dip":"192.168.xx.2","sip":"192.168.xx.2","interval":"3","retry":"3"}	The health check configuration: • **HealthCheckConfig.enable**: specifies whether to enable health checks. Valid values: **true and false**. Default value: false. • **HealthCheckConfig.dip**: the destination IP address configured for the health check. • **HealthCheckConfig.sip**: the source IP address configured for the health check. • **HealthCheckConfig.interval**: the time interval of health check retries. Unit: seconds. • **HealthCheckConfig.retry**: the maximum number of health check retries.

Parameter	Type	Required	Example	Description
AutoConfigRoute	Boolean	No	true	Specifies whether to automatically advertise routes. Valid values: • **true**: enables automatic advertising. • **false**: disables automatic advertising. This is the default value.

Response parameters

Parameter	Type	Example	Description
VpnConnectionId	String	vco-bp1bbi27hojx80nck****	The ID of the IPsec-VPN connection.
CustomerGatewayId	String	vpn-bp1q8bgx4xnkm2ogj****	The ID of the customer gateway.
VpnGatewayId	String	vpn-bp1q8bgx4xnkm2ogj****	The ID of the VPN gateway.
Name	String	test	The name of the IPsec-VPN connection.
LocalSubnet	String	10.1.1.0/24,10.1.2.0/24	The CIDR block of the VPC.
RemoteSubnet	String	10.10.1.0/24,10.10.2.0/24	The CIDR block of the data center.
CreateTime	Long	1492753817000	The timestamp generated when the IPsec-VPN connection was created.
Description	String	description	The description of the IPsec-VPN connection.
EffectImmediately	Boolean	false	Indicates whether IPsec-VPN negotiations are initiated immediately. Valid values: • **true**: initiates negotiations after the configuration is completed. • **false**: initiates negotiations when inbound traffic is detected.
IkeConfig	Struct		The configuration of Phase 1 negotiations.

Parameter	Type	Example	Description
IkeAuthAlg	String	sha1	The IKE authentication algorithm.
IkeEncAlg	String	aes	The IKE encryption algorithm.
IkeLifetime	Long	86400	The IKE lifetime.
IkeMode	String	main	The IKE mode.
IkePfs	String	group2	The DH group.
IkeVersion	String	ikev1	The IKE version.
LocalId	String	116.XX.XX.64	The local ID. The default value is the IP address of the VPN gateway. Both fully qualified domain names (FQDNs) and IP addresses are supported.
Psk	String	pgw6dy7d1i8i****	The pre-shared key.
RemoteId	String	139.XX.XX.167	The peer ID. The default value is the IP address of the customer gateway. Both FQDNs and IP addresses are supported.
IpsecConfig	Struct		The configuration of Phase 2 negotiations.
IpsecAuthAlg	String	sha1	The IPsec authentication algorithm.
IpsecEncAlg	String	aes	The IPsec encryption algorithm.
IpsecLifetime	Long	86400	The IPsec lifetime.
IpsecPfs	String	group2	The DH group.
RequestId	String	7DB79D0C-5F27-4AB5-995B-79BE55102F90	The ID of the request.
VcoHealthCheck	Struct		The health check configuration.

Parameter	Type	Example	Description
Dip	String	1.XX.XX.1	The destination IP address.
Enable	String	true	Indicates whether health checks are enabled. Valid values: • **true**: Health checks are enabled. • **false**: Health checks are disabled.
Interval	Integer	3	The interval between two consecutive health checks. Unit: seconds.
Retry	Integer	1	The maximum number of health check retries.
Sip	String	2.XX.XX.2	The source IP address.

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.
404	InvalidVpnConnectionInstanceId.NotFound	The specified vpn connection instance id does not exist.	The error message returned because the specified IPsec-VPN connection does not exist. You can check whether the configuration of the connection is valid.

HttpCode	Error code	Error message	Description
400	VpnGateway.Configuring	The specified service is configuring.	The error message returned because the operation is not allowed when the specified service is being configured. Try again later.
400	VpnGateway.FinancialLocked	The specified service is financial locked.	The error message returned because the service is suspended due to overdue payments. Top up your account first.
400	InvalidName	The name is not valid	The error message returned because the specified name is in an invalid format.

15.1.2.1.14.5. SSL-VPN

CreateSslVpnServer

Creates an SSL-VPN server.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateSslVpnServer	The operation that you want to perform. Set the value to **CreateSslVpnServer**.
ClientIpPool	String	Yes	192.168.1.0/24	The CIDR block that is allocated to the virtual network interface of the client. It is not the CIDR block where the client resides. When the client accesses the server through an SSL-VPN connection, the VPN gateway selects an IP address from the specified CIDR block and assigns it to the client. This CIDR block must not conflict with the value of **LocalSubnet**.

Parameter	Type	Required	Example	Description
LocalSubnet	String	Yes	10.0.0.0/8	The CIDR block to be accessed by the client through the SSL-VPN connection. You can set the value to the CIDR block of a VPC, a vSwitch, a data center that is connected to the VPC through an Express Connect circuit, or an Alibaba Cloud service, such as ApsaraDB RDS or OSS.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the VPN gateway is created. You can call the `DescribeRegions` operation to query the most recent region list.
VpnGatewayId	String	Yes	vpn-bp1hgim8by0kc9nga****	The ID of the VPN gateway.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-0016e04115b	The client token that is used to ensure the idempotence of the request. You can use the client to generate a token, but you must make sure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.
Name	String	No	sslvpnname	The name of the SSL-VPN server. The name must be 2 to 128 characters in length and can contain digits, periods (.), underscores (_), and hyphens (-). It must start with a letter, but cannot start with `http://` or `https://`.
Proto	String	No	UDP	The protocol that is used by the SSL-VPN server. Valid values: • **TCP**: TCP. • **UDP** : UDP. This is the default value.

Parameter	Type	Required	Example	Description
Cipher	String	No	AES-128-CBC	The encryption algorithm that is used in the SSL-VPN connection. Valid values: • **AES-128-CBC**: the AES-128-CBC algorithm. This is the default value. • **AES-192-CBC**: the AES-192-CBC algorithm. • **AES-256-CBC**: the AES-256-CBC algorithm. • **none**: If the parameter is set to this value, no encryption algorithm is used.
Port	Integer	No	1194	The port that is used by the SSL-VPN server. Default value: **1194**. The following ports cannot be used: **22, 2222, 22222, 9000, 9001, 9002, 7505, 80, 443, 53, 68, 123, 4510, 4560, 500, and 4500**.
Compress	Boolean	No	false	Specifies whether to enable data compression. Valid values: • **true**: enables data compression. • **false**: disables data compression. This is the default value.

Response parameters

Parameter	Type	Example	Description
Name	String	test	The name of the SSL-VPN server.
RequestId	String	E98A9651-7098-40C7-8F85-C818D1EBBA85	The ID of the request.
SslVpnServerId	String	vss-bp18q7hzj6largv4v****	The ID of the SSL-VPN server.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=CreateSslVpnServer
&ClientIpPool=192.168.1.0/24
&LocalSubnet=10.0.0.0/8
&RegionId=cn-qingdao-env66-d01
&VpnGatewayId=vpn-bp1hgim8by0kc9nga****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreateSslVpnServerResponse>
      <RequestId>E98A9651-7098-40C7-8F85-C818D1EBBA85</RequestId>
      <SslVpnServerId>vss-bp18q7hzj6largv4v****</SslVpnServerId>
      <Name>test</Name>
</CreateSslVpnServerResponse>
```

`JSON` format

```
{
    "RequestId": "E98A9651-7098-40C7-8F85-C818D1EBBA85",
    "SslVpnServerId": "vss-bp18q7hzj6largv4v****",
    "Name": "test"
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.
400	Resource.QuotaFull	The quota of resource is full	The error message returned because the resource quota is reached.
400	InvalidName	The name is not valid	The error message returned because the format of the specified name is invalid.

HttpCode	Error code	Error message	Description
404	InvalidVpnGatewayInstanceId.NotFound	The specified vpn gateway instance id does not exist.	The error message returned because the specified VPN gateway does not exist. Check whether the configuration of the VPN gateway is valid.
400	VpnGateway.Configuring	The specified service is configuring.	The error message returned because the operation is not allowed when the specified service is being configured. Try again later.
400	VpnGateway.FinancialLocked	The specified service is financial locked.	The error message returned because the service is suspended due to overdue payments. Top up your account first.

DeleteSslVpnServer

Deletes an SSL-VPN server.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteSslVpnServer	The operation that you want to perform. Set the value to **DeleteSslVpnServer**.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the SSL-VPN server is created. You can call the `DescribeRegions` operation to query the most recent region list.
SslVpnServerId	String	Yes	vss-bp18q7hzj6largv4v****	The ID of the SSL-VPN server.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-0016e04115b	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must make sure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	606998F0-B94D-48FE-8316-ACA81BB230DA	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DeleteSslVpnServer
&RegionId=cn-qingdao-env66-d01
&SslVpnServerId=vss-bp18q7hzj6largv4v****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteSslVpnServerResponse>
      <RequestId>606998F0-B94D-48FE-8316-ACA81BB230DA</RequestId>
</DeleteSslVpnServerResponse>
```

`JSON` format

```
{
  "RequestId":"606998F0-B94D-48FE-8316-ACA81BB230DA"
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.

HttpCode	Error code	Error message	Description
400	VpnGateway.Configuring	The specified service is configuring.	The error message returned because the operation is not allowed when the specified service is being configured. Try again later.
400	VpnGateway.FinancialLocked	The specified service is financial locked.	The error message returned because the service is suspended due to overdue payments. Top up your account first.

ModifySslVpnServer

Modifies the configuration of an SSL-VPN server.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifySslVpnServer	The operation that you want to perform. Set the value to **ModifySslVpnServer**.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the VPN gateway is created. You can call the `DescribeRegions` operation to query the most recent region list.
SslVpnServerId	String	Yes	vss-bp18q7hzj6largv4v****	The ID of the SSL-VPN server.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-0016e04115b	The client token that is used to ensure the idempotence of the request. You can use the client to generate a token, but you must make sure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.

Parameter	Type	Required	Example	Description
Name	String	No	test	The name of the SSL-VPN server. The name must be 2 to 128 characters in length and can contain digits, periods (.), underscores (_), and hyphens (-). It must start with a letter, and cannot start with `http://` or `https://`.
ClientIpPool	String	No	10.30.30.0/24	The client IP address pool.
LocalSubnet	String	No	10.20.20.0/24	The CIDR block of the VPC.
Proto	String	No	UDP	The protocol that is used by the SSL-VPN server. Valid values: • **TCP**: TCP • **UDP**: UDP. This is the default value.
Cipher	String	No	AES-128-CBC	The encryption algorithm that is used in the SSL-VPN connection. Valid values: • **AES-128-CBC**: the AES-128-CBC algorithm. This is the default value. • **AES-192-CBC**: the AES-192-CBC algorithm. • **AES-256-CBC**: the AES-256-CBC algorithm. • **none**: If the parameter is set to this value, no encryption algorithm is used.
Port	Integer	No	1194	The port that is used by the SSL-VPN server. Default value: **1194**. The following ports cannot be used: **22, 2222, 22222, 9000, 9001, 9002, 7505, 80, 443, 53, 68, 123, 4510, 4560, 500, and 4500**.
Compress	Boolean	No	false	Specifies whether to enable data compression. Valid values: • **true**: enables data compression. • **false**: disables data compression. This is the default value.

Response parameters

Parameter	Type	Example	Description
Cipher	String	AES-128-CBC	The encryption algorithm.
ClientIpPool	String	10.30.30.0/24	The client IP address pool.
Compress	Boolean	false	Indicates whether data compression is enabled.
Connections	Integer	0	The total number of current connections.
CreateTime	Long	1492753580000	The time when the SSL-VPN server was created.
InternetIp	String	47.XX.XX.98	The public IP address.
LocalSubnet	String	10.20.20.0/24	The CIDR block of the VPC.
MaxConnections	Integer	5	The maximum number of connections.
Name	String	test	The name of the SSL-VPN server.
Port	Integer	1194	The port that is used by the SSL-VPN server.
Proto	String	UDP	The protocol that is used by the SSL-VPN server.
RegionId	String	cn-qingdao-env66-d01	The region ID of the SSL-VPN server.
RequestId	String	DF11D6F6-E35A-41C3-9B20-6FC8A901FE65	The ID of the request.
SslVpnServerId	String	vss-bp18q7hzj6largv4v****	The ID of the SSL-VPN server.
VpnGatewayId	String	vpn-bp1q8bgx4xnkm2ogj****	The ID of the VPN gateway.

Examples

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.
400	InvalidName	The name is not valid	The error message returned because the specified name is in an invalid format.
400	VpnGateway.Configuring	The specified service is configuring.	The error message returned because the operation is not allowed when the specified service is being configured. Try again later.

HttpCode	Error code	Error message	Description
400	VpnGateway.FinancialLocked	The specified service is financial locked.	The error message returned because the service is suspended due to overdue payments. Top up your account first.

DeleteSslVpnClientCert

Deletes an SSL-VPN client certificate.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteSslVpnClientCert	The operation that you want to perform. Set the value to **DeleteSslVpnClientCert**.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the SSL-VPN client certificate is created. You can call the `DescribeRegions` operation to query the most recent region list.
SslVpnClientCertId	String	Yes	vsc-bp1n8wcf134yl0osr****	The ID of the SSL-VPN client certificate.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-0016e04115b	The client token that is used to ensure the idempotence of the request. You can use the client to generate a token, but you must make sure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	606998F0-B94D-48FE-8316-ACA81BB230DA	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DeleteSslVpnClientCert
&RegionId=cn-qingdao-env66-d01
&SslVpnClientCertId=vsc-bp1n8wcf134yl0osr****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteSslVpnClientCertResponse>
      <RequestId>606998F0-B94D-48FE-8316-ACA81BB230DA</RequestId>
</DeleteSslVpnClientCertResponse>
```

`JSON` format

```
{
  "RequestId":"606998F0-B94D-48FE-8316-ACA81BB230DA"
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.
400	VpnGateway.Configuring	The specified service is configuring.	The error message returned because the operation is not allowed when the specified service is being configured. Try again later.

ModifySslVpnClientCert

Modifies the name of an SSL-VPN client certificate.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifySslVpnClientCert	The operation that you want to perform. Set the value to **ModifySslVpnClientCert**.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the SSL-VPN client certificate is created. You can call the `DescribeRegions` operation to query the most recent region list.
SslVpnClientCertId	String	Yes	vsc-bp1n8wcf134yl0osrc****	The ID of the SSL-VPN client certificate.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-0016e04115b	The client token that is used to ensure the idempotence of the request. You can use the client to generate a token, but you must make sure that the token is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.
Name	String	No	cert2	The name of the SSL-VPN client certificate. The name must be 2 to 128 characters in length and can contain digits, periods (.), underscores (_), and hyphens (-). It must start with a letter. However, the name cannot start with `http://` or `https://`.

Response parameters

Parameter	Type	Example	Description
Name	String	cert2	The name of the SSL-VPN client certificate.
RequestId	String	606998F0-B94D-48FE-8316-ACA81BB230DA	The ID of the request.

Parameter	Type	Example	Description
SslVpnClientCertId	String	vsc-bp1n8wcf134yl0osr****	The ID of the SSL-VPN client certificate.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ModifySslVpnClientCert
&RegionId=cn-qingdao-env66-d01
&SslVpnClientCertId=vsc-bp1n8wcf134yl0osrc****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifySslVpnClientCertResponse>
      <SslVpnClientCertId>vsc-bp1n8wcf134yl0osr****</SslVpnClientCertId>
      <Name>cert2</Name>
      <RequestId>606998F0-B94D-48FE-8316-ACA81BB230DA</RequestId>
</ModifySslVpnClientCertResponse>
```

`JSON` format

```
{
    "SslVpnClientCertId": "vsc-bp1n8wcf134yl0osr****",
    "Name": "cert2",
    "RequestId": "606998F0-B94D-48FE-8316-ACA81BB230DA"
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.

HttpCode	Error code	Error message	Description
400	InvalidName	The name is not valid	The error message returned because the specified name is in an invalid format.

CreateSslVpnClientCert

Creates an SSL-VPN client certificate.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateSslVpnClientCert	The operation that you want to perform. Set the value to **CreateSslVpnClientCert**.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the VPN gateway is created. You can call the `DescribeRegions` operation to query the most recent region list.
SslVpnServerId	String	Yes	vss-m5et0q3iy1qex328w****	The ID of the SSL-VPN server.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-0016e04115b	The client token that is used to ensure the idempotence of the request. You can use the client to generate a token, but you must make sure that it is unique among different requests. The token can only contain ASCII characters and cannot exceed 64 characters in length.
Name	String	No	SslVpnClientCert1	The name of the SSL-VPN client certificate. The name must be 2 to 128 characters in length, and can contain digits, periods (.), underscores (_), and hyphens (-). It must start with a letter, and cannot start with `http://` or `https://`.

Response parameters

Parameter	Type	Example	Description
Name	String	SslVpnClientCert	The name of the SSL-VPN client certificate.
RequestId	String	079874CD-AEC1-43E6-AC03-ADD96B6E4907	The ID of the request.
SslVpnClientCertId	String	vsc-m5euof6s5jy8vs5kd****	The ID of the SSL-VPN client certificate.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=CreateSslVpnClientCert
&RegionId=cn-qingdao-env66-d01
&SslVpnServerId=vss-m5et0q3iy1qex328w****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreateSslVpnClientCertResponse>
      <SslVpnClientCertId>vsc-bp1n8wcf134yl0osr****</SslVpnClientCertId>
      <RequestId>606998F0-B94D-48FE-8316-ACA81BB230DA</RequestId>
</CreateSslVpnClientCertResponse>
```

`JSON` format

```
{
    "SslVpnClientCertId": "vsc-bp1n8wcf134yl0osr****",
    "RequestId": "606998F0-B94D-48FE-8316-ACA81BB230DA"
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.

HttpCode	Error code	Error message	Description
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.
400	Resource.QuotaFull	The quota of resource is full	The error message returned because the resource quota is reached.
400	VpnGateway.Configuring	The specified service is configuring.	The error message returned because the operation is not allowed when the specified service is being configured. Try again later.
400	VpnGateway.FinancialLocked	The specified service is financial locked.	The error message returned because the service is suspended due to overdue payments. Top up your account first.
400	InvalidName	The name is not valid	The error message returned because the specified name is in an invalid format.

DescribeSslVpnClientCerts

Queries one or more SSL-VPN client certificates.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeSslVpnClientCerts	The operation that you want to perform. Set the value to **DescribeSslVpnClientCerts**.
RegionId	String	Yes	cn-qingdao-env66-d01	The region ID of the SSL-VPN client certificates to be queried. You can call the `DescribeRegions` operation to query the most recent region list.
SslVpnServerId	String	No	vss-bp18q7hzj6largv4v****	The ID of the SSL-VPN server.

Parameter	Type	Required	Example	Description
SslVpnClientCertId	String	No	vsc-bp1n8wcf134yl0osr****	The ID of the SSL-VPN client certificate.
Name	String	No	cert1	The name of the SSL-VPN client certificate.
PageNumber	Integer	No	1	The number of the page to return. Default value: **1**.
PageSize	Integer	No	10	The number of entries to return on each page. Maximum value: **50**. Default value: **10**.

Response parameters

Parameter	Type	Example	Description
PageNumber	Integer	1	The page number of the returned page.
PageSize	Integer	10	The number of entries returned per page.
RequestId	String	5BE01CD7-5A50-472D-AC14-CA181C5C03BE	The ID of the request.
SslVpnClientCertKeys	Array of SslVpnClientCertKey		The detailed information about the queried SSL client certificates.
SslVpnClientCertKey			
CreateTime	Long	1492747187000	The timestamp generated when the SSL client certificate was created.
EndTime	Long	1494966335000	The time to be generated when the SSL client certificate expires.
Name	String	cert1	The name of the SSL-VPN client certificate.

Parameter	Type	Example	Description
RegionId	String	cn-qingdao-env66-d01	The region ID of the SSL-VPN client certificate.
SslVpnClientCertId	String	vsc-bp1n8wcf134yl0osr****	The ID of the SSL-VPN client certificate.
SslVpnServerId	String	vss-bp18q7hzj6largv4v****	The ID of the SSL-VPN server.
Status	String	normal	The status of the SSL-VPN client certificate. Valid values: • **expiring-soon**: The SSL-VPN client certificate expires in one week. • **normal**: The certificate is normal. • **expired**: The certificate has expired.
TotalCount	Integer	1	The number of returned entries.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeSslVpnClientCerts
&RegionId=cn-qingdao-env66-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.

DescribeSslVpnClientCert

Queries a specified SSL-VPN client certificate.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeSslVpnClientCert	The operation that you want to perform. Set the value to **DescribeSslVpnClientCert**.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the SSL-VPN client certificate that you want to query is created. You can call the `DescribeRegions` operation to query the most recent region list.
SslVpnClientCertId	String	Yes	vsc-bp17r58rjf5r1gjyr****	The ID of the SSL-VPN client certificate that you want to query.

Response parameters

Parameter	Type	Example	Description
CaCert	String	The CA certificate	The CA certificate.
ClientCert	String	The SSL-VPN client certificate	The SSL-VPN client certificate.
ClientConfig	String	The configuration of the client	The configuration of the client.
ClientKey	String	The key of the client	The key of the client.
CreateTime	Long	1552550980000	The timestamp generated when the SSL-VPN client certificate was created.
EndTime	Long	1647158980000	The timestamp to be generated when the SSL-VPN client certificate expires.
Name	String	abc	The name of the SSL-VPN client certificate.
RegionId	String	cn-qingdao-env66-d01	The ID of the region where the SSL-VPN client certificate is created.
RequestId	String	5BE01CD7-5A50-472D-AC14-CA181C5C03BE	The ID of the request.

Parameter	Type	Example	Description
SslVpnClientCertId	String	vsc-bp13k5mp4tg8v3z9b****	The ID of the SSL-VPN client certificate.
SslVpnServerId	String	vss-bp155e9yclsg1xgq4****	The ID of the SSL-VPN server.
Status	String	normal	The status of the SSL-VPN client certificate. Valid values: • **expiring-soon**: The SSL-VPN client certificate expires in one week. • **normal**: The certificate is normal. • **expired**: The certificate has expired.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeSslVpnClientCert

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.

DescribeSslVpnServers

Queries one or more SSL-VPN servers.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeSslVpnServers	The operation that you want to perform. Set the value to **DescribeSslVpnServers**.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the SSL-VPN servers are created. You can call the `DescribeRegions` operation to query the most recent region list.
SslVpnServerId	String	No	vss-bp15j3du13gq1dgey****	The ID of the SSL-VPN server.
VpnGatewayId	String	No	vpn-bp1on0xae9d771ggi****	The ID of the VPN gateway.
Name	String	No	test	The name of the SSL-VPN server.
PageNumber	Integer	No	1	The number of the page to return. Default value: **1**.
PageSize	Integer	No	10	The number of entries to return on each page. Maximum value: **50**. Default value: **10**.

Response parameters

Parameter	Type	Example	Description
PageNumber	Integer	1	The page number of the returned page.
PageSize	Integer	10	The number of entries returned on each page.
RequestId	String	085CA5EA-1E76-43A8-981B-E0208DECA0CB	The ID of the request.
SslVpnServers	Array of SslVpnServer		The detailed information about the SSL-VPN servers.
SslVpnServer			
Cipher	String	AES-128-CBC	The encryption algorithm.

Parameter	Type	Example	Description
ClientIpPool	String	10.10.1.0/24	The client IP address pool.
Compress	Boolean	false	Indicates whether the transmitted data is compressed.
Connections	Integer	0	The total number of current connections.
CreateTime	Long	1544668844000	The timestamp generated when the SSL-VPN server was created.
InternetIp	String	47.XX.XX.167	The public IP address.
LocalSubnet	String	192.168.0.0/24	The CIDR block of the client.
MaxConnections	Integer	5	The maximum number of connections.
Name	String	test	The name of the SSL-VPN server.
Port	Integer	1194	The port that is used by the SSL-VPN server.
Proto	String	UDP	The protocol that is used by the SSL-VPN server.
RegionId	String	cn-qingdao-env66-d01	The ID of the region where the SSL-VPN server is created.
SslVpnServerId	String	vss-bp15j3du13gq1dgey****	The ID of the SSL-VPN server.
VpnGatewayId	String	vpn-bp1on0xae9d771ggi****	The ID of the VPN gateway.
TotalCount	Integer	1	The total number of entries returned.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeSslVpnServers
&RegionId=cn-qingdao-env66-d01

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.

DescribeVpnSslServerLogs

Queries the logs of an SSL-VPN server.

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeVpnSslServerLogs	The operation that you want to perform. Set the value to **DescribeVpnSslServerLogs**.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the SSL-VPN server is created. You can call the `DescribeRegions` operation to query the most recent region list.
VpnSslServerId	String	Yes	vss-bp155e9yclsg1xgq4****	The name of the SSL-VPN server.
From	Integer	No	2018020201	The beginning of the time range to query. Specify the time in the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. If the **From** parameter is set, you must set the **To** or **MinutePeriod** parameter.
To	Integer	No	2018020206	The end of the time range to query. Specify the time in the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. If the **From** parameter is set, you must set the **To** or **MinutePeriod** parameter.
MinutePeriod	Integer	No	10	The cycle of the logs. If the **From** and **To** parameters are not set, you must set the **MinutePeriod** parameter.
PageNumber	Integer	No	1	The number of the page to return. Default value: **1**.

Parameter	Type	Required	Example	Description
PageSize	Integer	No	10	The number of entries to return on each page. Maximum value: **50**. Default value: **10**.

Response parameters

Parameter	Type	Example	Description
Count	Integer	10	The number of log entries.
Data	List	test	An array of log entries. Each item in the array indicates a log entry.
IsCompleted	Boolean	true	Indicates whether the log data is accurate. Valid values: • **true**: accurate • **false**: inaccurate
PageNumber	Integer	1	The page number of the returned page.
PageSize	Integer	1	The number of entries returned per page.
RequestId	String	5BE01CD7-5A50-472D-AC14-CA181C5C03BE	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeVpnSslServerLogs
&RegionId=cn-qingdao-env66-d01
&VpnSslServerId=vss-bp155e9yclsg1xgq4****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeVpnSslServerLogsResponse>
   <Data></Data>
   <PageNumber>1</PageNumber>
   <Count>0</Count>
   <PageSize>10</PageSize>

 "IsCompleted": true,
 "RequestId": "26641E42-66C7-4942-9FEC-F99213914F8F"
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.

15.1.2.1.15. NAT gateways

15.1.2.1.15.1. ModifyNatGatewayAttribute

Modifies the name and description of a NAT gateway.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyNatGatewayAttribute	The operation that you want to perform. Set the value to **ModifyNatGatewayAttribute**.
NatGatewayId	String	Yes	ngw-2ze0dcn4mq31qx2jc****	The ID of the NAT gateway that you want to modify.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the NAT gateway is deployed. You can call the `DescribeRegions` operation to query the most recent region list.
Name	String	No	nat123	The name of the NAT gateway that you want to modify. The name must be 2 to 128 characters in length and can contain digits, periods (.), underscores (_), and hyphens (-). It must start with a letter. The name cannot start with `http://` or `https://`. **Note** You must specify at least one of the following parameters: **Name** and **Description**.
Description	String	No	fortest	The description of the NAT gateway. The description must be 2 to 256 characters in length, and must start with a letter. It cannot start with `http://` or `https://`. **Note** You must specify at least one of the following parameters: **Name** and **Description**.

Response parameters

Parameter	Type	Example	Description

Parameter	Type	Example	Description
RequestId	String	AB5F62CF-2B60-4458-A756-42C9DFE108D1	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ModifyNatGatewayAttribute
&NatGatewayId=ngw-2ze0dcn4mq31qx2jc****
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyNatGatewayAttributeResponse>
  <RequestId>AB5F62CF-2B60-4458-A756-42C9DFE108D1</RequestId>
</ModifyNatGatewayAttributeResponse>
```

`JSON` format

```
{"RequestId":"AB5F62CF-2B60-4458-A756-42C9DFE108D1"}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because the specified region ID does not exist.
404	InvalidNatGatewayId.NotFound	The specified NatGatewayId does not exist in our records.	The error message returned because the specified NAT gateway ID does not exist. Check whether the NAT gateway ID is valid.
400	InvalidParameter.Name.Malformed	The specified Name is not valid.	The error message returned because the specified name is invalid.
400	InvalidParameter.Description.Malformed	The specified Description is not valid.	The error message returned because the specified description is invalid.

15.1.2.1.15.2. ModifyNatGatewaySpec

Resizes a NAT gateway.

Description

NAT gateways are available in different sizes. The size of a NAT gateway determines the Source Network Address Translation (SNAT) performance of the gateway, such as the maximum number of connections and the number of new connections per second. However, the data throughput is not affected.

The following table describes the correlations between different sizes of NAT gateways and SNAT performance metrics.

Size	Maximum connection	Number of new connections per second
Small	10,000	1,000
Medium	50,000	5,000
Large	200,000	10,000

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyNatGatewaySpec	The operation that you want to perform. Set the value to **ModifyNatGatewaySpec**.
NatGatewayId	String	Yes	ngw-bp1uewa15k4iy5770****	The ID of the NAT gateway.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the NAT gateway is deployed.
Spec	String	Yes	Small	The size of the NAT gateway. Valid values: • **Small**: a small-sized NAT gateway • **Middle**: a middle-sized NAT gateway • **Large**: a large-sized NAT gateway

Parameter	Type	Required	Example	Description
AutoPay	Boolean	No	false	Specifies whether to enable automatic payment. Valid values: • **true**: enables automatic payment. • **false**: disables automatic payment. This is the default value.
ClientToken	String	No	SHA234js121223*****	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must make sure that it is unique among different requests. The token can contain only ASCII characters, and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	DBD4E4A2-786E-4BD2-8EB6-107FFC2B5B7D	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ModifyNatGatewaySpec
&NatGatewayId=ngw-bp1uewa15k4iy5770****
&RegionId=cn-qingdao-env17-d01
&Spec=Small
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyNatGatewaySpecResponse>
      <RequestId>DBD4E4A2-786E-4BD2-8EB6-107FFC2B5B7D</RequestId>
</ModifyNatGatewaySpecResponse>
```

`JSON` format

```
{
    "RequestId":"DBD4E4A2-786E-4BD2-8EB6-107FFC2B5B7D"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because the specified region ID does not exist.
404	InvalidNatGatewayId.NotFound	The specified NatGatewayId does not exist in our records.	The error message returned because the specified NAT gateway ID does not exist. Check whether the NAT gateway ID is valid.
400	NATGW_MODIFY_SPEC_SAME	The specified Spec is same with now.	The error message returned because the specified gateway size is the same as the current one.
400	InvalidParameter.Spec.ValueNotSupported	The specified Spec is not valid.	The error message returned because the specified gateway size is invalid.

15.1.2.1.15.3. DeleteNatGateway

Deletes a specified NAT gateway.

> **Note** Before you delete a NAT gateway, you must disassociate NAT service plans from the NAT gateway.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteNatGateway	The operation that you want to perform. Set the value to **DeleteNatGateway**.
NatGatewayId	String	Yes	ngw-bp1uewa15k4iy5770****	The ID of the NAT gateway.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the NAT gateway is deployed. You can call the `DescribeRegions` operation to query the most recent region list.
Force	Boolean	No	false	Specifies whether to forcibly delete the NAT gateway. Valid values: • **true**: forcibly deletes the NAT gateway. • **false**: does not forcibly delete the NAT gateway.

Response parameters

Parameter	Type	Example	Description
RequestId	String	4EC47282-1B74-4534-BD0E-403F3EE64CAF	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DeleteNatGateway
&NatGatewayId=ngw-bp1uewa15k4iy5770****
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteNatGatewayResponse>
  <RequestId>4EC47282-1B74-4534-BD0E-403F3EE64CAF</RequestId>
</DeleteNatGatewayResponse>
```

`JSON` format

```
{
    "RequestId": "4EC47282-1B74-4534-BD0E-403F3EE64CAF"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because the specified region ID does not exist.
404	InvalidNatGatewayId.NotFound	The specified NatGatewayId does not exist in our records.	The error message returned because the specified NAT gateway ID does not exist. Check whether the NAT gateway ID is valid.
400	DependencyViolation.BandwidthPackages	There are BandwidthPackages on specified NatGateway not deleted.	The error message returned because one or more NAT service plans are associated with the NAT gateway. Disassociate all NAT service plans from the NAT gateway and try again.

15.1.2.1.15.4. CreateForwardEntry

Adds a DNAT entry to a DNAT table.

Description

Each DNAT entry consists of the following parameters: ExternalIp, ExternalPort, Protocol, InternalIp, and InternalPort. After you add a DNAT entry, the NAT gateway forwards packets of the specified protocol from [ExternalIp: ExternalPort] to [InternalIp: InternalPort] and sends responses back over the same route.

When you call this operation, take note of the following limits:

- The combinations of ExternalIp, ExternalPort, and Protocol used in DNAT entries must be unique. Requests cannot be distributed to more than one Elastic Compute Service (ECS) instance if these requests are originated from the same source IP address, received on the same port, and use the same protocol.
- The combinations of Protocol, InternalIp, and InternalPort used in DNAT entries must be unique.
- If one or more DNAT entries in the DNAT table are in the Pending or Modifying state, you cannot add DNAT entries to the DNAT table.
- The public IP address (ExternalIp) in the DNAT entry, which is used to access the Internet, must meet the following requirements:
  - If you have purchased a NAT service plan before November 3, 2017, the ExternalIp must be a public IP address in the NAT service plan.
  - If you have not purchased a NAT service plan before November 3, 2017, the ExternalIp must be an elastic IP address (EIP) associated with the NAT service plan.
  - You cannot specify the same EIP in both a DNAT entry and an SNAT entry.
- The private IP address (InternalIp) in the DNAT entry must meet the following requirements:
  - The private IP address must belong to the CIDR block of the virtual private cloud (VPC) where the NAT gateway is deployed.

- The DNAT entry takes effect only when the private IP address is allocated to an ECS instance and the ECS instance is not assigned an EIP. If the private IP address is allocated to a resource other than an ECS instance, such as a high-availability virtual IP addresses (HAVIPs), Server Load Balancer (SLB) instance, or RDS instance, the DNAT entry does not take effect. Consequently, inbound traffic cannot be forwarded to the private IP address.
- You cannot specify the same EIP in both a DNAT entry and an SNAT entry.

- You can add up to 100 DNAT entries to a DNAT table.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateForwardEntry	The operation that you want to perform. Set the value to **CreateForwardEntry**.
ExternalIp	String	Yes	116.XX.XX.28	The public IP address of the NAT gateway.
ExternalPort	String	Yes	8080	The public port. Valid values: **1 to 65535**.
ForwardTableId	String	Yes	ftb-bp1mbjubq34hlcqpa****	The ID of the DNAT table.
InternalIp	String	Yes	192.XX.XX.1	The destination private IP address.
InternalPort	String	Yes	80	The destination private port. Valid values: **1 to 65535**.
IpProtocol	String	Yes	TCP	The protocol that is used by the ports. Valid values: • **TCP**: forwards TCP packets. • **UDP**: forwards UDP packets. • **Any**: forwards packets of all protocols.
RegionId	String	Yes	cn-qingdao-env17-d0	The ID of the region where the NAT gateway is created. You can call the `DescribeRegions` operation to query the most recent region list.

Parameter	Type	Required	Example	Description
ForwardEntryName	String	No	ForwardEntry-1	The name of the DNAT entry. The name must be 2 to 128 characters in length, and start with a letter. It cannot start with `http://` or `https://`.
ClientToken	String	No	0c593ea1-3bea-11e9-b96b-88e9fe637****	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must make sure that it is unique among different requests. The ClientToken value can contain only **ASCII** characters and cannot exceed 64 characters in length.
PortBreak	Boolean	No	false	Specifies whether to remove limits on the port range. Valid values: **true**: removes limits on the port range. **false** (default): sets limits on the port range. **Note** When an SNAT entry and a DNAT entry use the same public IP address, and you want to specify a port number greater than 1024, set **PortBreak** to **true**.

Response parameters

Parameter	Type	Example	Description
ForwardEntryId	String	fwd-119smw5tkasdf****	The ID of the DNAT entry.
RequestId	String	A4AEE536-A97A-40EB-9EBE-53A6948A6928	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=CreateForwardEntry
&ExternalIp=116.XX.XX.28
&ExternalPort=8080
&ForwardTableId=ftb-bp1mbjubq34hlcqpa****
&InternalIp=192.XX.XX.1
&InternalPort=80
&IpProtocol=TCP
&RegionId=cn-qingdao-env17-d0
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreateForwardEntryResponse>
  <RequestId>A4AEE536-A97A-40EB-9EBE-53A6948A6928</RequestId>
  <ForwardEntryId>fwd-119smw5tkasdf****</ForwardEntryId>
</CreateForwardEntryResponse>
```

`JSON` format

```
{
    "CreateForwardEntryResponse": {
        "RequestId": "A4AEE536-A97A-40EB-9EBE-53A6948A6928",
        "ForwardEntryId": "fwd-119smw5tkasdf****"
    }
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because the specified region ID does not exist.
400	InvalidExternalIp.Malformed	The specified ExternalIp is not a valid IP address.	The error message returned because the specified IP address is invalid.
400	InvalidInternalIp.Malformed	The specified InternalIp is not a valid IP address.	The error message returned because the specified private IP address is invalid.
400	InvalidExternalPort.Malformed	The specified ExternalPort is not a valid port.	The error message returned because the specified public port is invalid.
400	InvalidInternalPort.Malformed	The specified InternalPort is not a valid port.	The error message returned because the specified private port is invalid.

HttpCode	Error code	Error message	Description
400	Forbidden.DestnationIpOutOfVpcCIDR	The specified Internal Ip is Out of VPC CIDR.	The error message returned because the specified private IP address does not fall within the CIDR block of the VPC. Enter a private IP address that falls within the CIDR block of the VPC.
400	InvalidProtocal.ValueNotSupported	The specified IpProtocol does not support.	The error message returned because the specified protocol is not supported.
400	IncorretForwardEntryStatus	Some Forward entry status blocked this operation..	The error message returned because you are not authorized to perform the specified operation. The error message returned because one or more DNAT entries in the DNAT table are in the Pending or Modifying state.
404	InvalidForwardTableId.NotFound	Specified forward table does not exist.	The error message returned because the specified DNAT table does not exist. Check the parameter value and try again.
404	InvalidExternalIp.NotFound	Specified External Ip address does not found on the VRouter	The error message returned because the specified public IP address does not exist.
400	Forbidden.ExternalIp.UsedInSnatTable	The specified ExternalIp is already used in SnatTable	The error message returned because the specified public IP address is already used by an SNAT entry. Select a different IP address or delete the SNAT entry.
400	Forbindden	The specified Instance already bind eip	The error message returned because the ECS instance is associated with an EIP. Disassociate the EIP from the ECS instance before you create forwarding rules.
400	Forbidden.InternalIpOutOfVpcCIDR	The specified Internal Ip is Out of VPC CIDR.	The error message returned because the private IP address does not fall within the CIDR block of the VPC.
400	Invalid.natgwNotExist	The specified natgateway not exist.	The error message returned because the specified NAT gateway does not exist.

HttpCode	Error code	Error message	Description
400	InvalidIp.NotInNatgw	The specified Ip not belong to natgateway.	The error message returned because the specified IP address is not associated with the NAT gateway.
400	MissingParameter	Missing mandatory parameter	The error message returned because one or more required parameters are not set. Check whether you have set all required parameters.
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an unknown error occurred.
400	InvalidParameter.Name.Malformed	The specified Name is not valid.	The error message returned because the specified name is invalid.

15.1.2.1.15.5. DescribeForwardTableEntries

Queries DNAT entries.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeForwardTableEntries	The operation that you want to perform. Set the value to **DescribeForwardTableEntries**.
ForwardTableId	String	Yes	ftb-bp1mbjubq34hlcqpa****	The ID of the DNAT table.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the NAT gateway is created. You can call the `DescribeRegions` operation to query the most recent region list.
ForwardEntryId	String	No	fwd-8vbn3bc8roygjp0gy****	The ID of the DNAT entry that is automatically assigned.
ExternalIp	String	No	116.XX.XX.28	The public IP address of the NAT gateway.

Parameter	Type	Required	Example	Description
ExternalPort	String	No	8080	The public port. Valid values: **1** to **65535**.
InternalIp	String	No	192.XX.XX.1	The destination private IP address.
InternalPort	String	No	80	The destination private port. Valid values: **1** to **65535**.
IpProtocol	String	No	TCP	The protocol type. Valid values: • **TCP**: forwards TCP packets. • **UDP**: forwards UDP packets. • **Any**: forwards packets of all protocols.
ForwardEntryName	String	No	ForwardEntry-1	The name of the DNAT entry. The name must be 2 to 128 characters in length. It must start with a letter and cannot start with `http://` or `https://`.
PageNumber	Integer	No	1	The number of the page to return. Default value: **1**.
PageSize	Integer	No	10	The number of entries to return on each page. Maximum value: **50**. Default value: **10**.

Response parameters

Parameter	Type	Example	Description
ForwardTableEntries	Array of ForwardTableEntry		The details of the DNAT entries.
ForwardTableEntry			
ExternalIp	String	116.XXX.XX.28	The public IP address of the NAT gateway.
ExternalPort	String	80	The public port.

Parameter	Type	Example	Description
ForwardEntryId	String	fwd-119smw5tk****	The ID of the DNAT entry.
ForwardEntryName	String	ForwardEntry-1	The name of the DNAT entry.
ForwardTableId	String	ftb-11tc6xgmv****	The ID of the DNAT table to which the DNAT entry belongs.
InternalIp	String	192.XX.XX.1	The private IP address.
InternalPort	String	25	The destination private port. Valid values: **1** to **65535**.
IpProtocol	String	TCP	The protocol type.
Status	String	Available	The state of the DNAT entry.
TotalCount	Integer	5	The total number of entries returned.
PageNumber	Integer	1	The page number of the returned page.
PageSize	Integer	10	The number of entries returned per page.
RequestId	String	A6C4A8B1-7561-4509-949C-20DEB40D71E6	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeForwardTableEntries
&ForwardTableId=ftb-bp1mbjubq34hlcqpa****
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeForwardTableEntriesResponse>
  <TotalCount>5</TotalCount>

        "IpProtocol": "TCP",
        "InternalPort": 25,
        "ForwardEntryName": "ForwardEntry-1",
        "InternalIp": "192.XX.XX.1",
        "ForwardTableId": "ftb-11tc6xgmv****"
    }
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because the specified region ID does not exist.
400	IncorretForwardEntryStatus	Some Forward entry status blocked this operation..	The error message returned because you are not authorized to perform the specified operation. One or more DNAT entries in the DNAT table are in the Pending or Modifying state.

HttpCode	Error code	Error message	Description
404	InvalidForwardTableId.NotFound	Specified forwardTableId does not exist	The error message returned because the specified DNAT table does not exist. Check the parameter value and try again.

15.1.2.1.15.6. ModifyForwardEntry

Modifies a DNAT entry.

> **Note** You cannot modify DNAT entries if one or more DNAT entries in the DNAT table are in the **Pending** or **Modifying** state.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyForwardEntry	The operation that you want to perform. The operation that you want to perform. Set the value to **ModifyForwardEntry**.
ForwardEntryId	String	Yes	fwd-8vbn3bc8roygjp0gy3xk7	The ID of the DNAT entry.
ForwardTableId	String	Yes	ftb-8vbx8xu2lqj9qb334h0ow	The ID of the DNAT table.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the NAT gateway is created. You can call the `DescribeRegions` operation to query the most recent region list.
ExternalIp	String	No	116.XX.XX.28	The public IP address of the NAT gateway.
ExternalPort	String	No	80	The public port. Valid values: **1** to **65535**.
InternalIp	String	No	10.XX.XX.78	The destination private IP address.

Parameter	Type	Required	Example	Description
InternalPort	String	No	80	The destination private port. Valid values: **1** to **65535**.
IpProtocol	String	No	TCP	The protocol type. Valid values: • **TCP**: forwards Transmission Control Protocol (TCP) packets. • **UDP**: forwards User Datagram Protocol (UDP) packets. • **Any**: forwards packets of all protocols.
ForwardEntryName	String	No	ForwardEntry-1	The name of the DNAT entry. The description must be 2 to 128 characters in length, and start with a letter. It cannot start with `http://` or `https://`.
ClientToken	String	No	123e4567-e89b-12d3-a456-42665544****	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must make sure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	24CC85DC-7700-4F09-9624-99E988C7DD03	The ID of the request.

Examples

Sample requests

```
https://vpc.aliyuncs.com/?Action=ModifyForwardEntry
&ForwardEntryId=fwd-8vbn3bc8roygjp0gy3xk7
&ForwardTableId=ftb-8vbx8xu2lqj9qb334h0ow
&RegionId= cn-hangzhou
&<Common request parameters>
```

Sample success responses

`XML` format

```
</ModifyForwardEntryResponse>
<RequestId>24CC85DC-7700-4F09-9624-99E988C7DD03</RequestId>
</ModifyForwardEntryResponse>
```

`JSON` format

```
{
    "RequestId": "24CC85DC-7700-4F09-9624-99E988C7DD03"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because the specified region ID does not exist.
400	InvalidExternalIp.Malformed	The specified ExternalIp is not a valid IP address.	The error message returned because the specified IP address is invalid.
400	InvalidInternalIp.Malformed	The specified InternalIp is not a valid IP address.	The error message returned because the specified private IP address is invalid.
400	InvalidExternalPort.Malformed	The specified ExternalPort is not a valid port.	The error message returned because the specified public port is invalid.
400	InvalidInternalPort.Malformed	The specified InternalPort is not a valid port.	The error message returned because the specified private port is invalid.
400	Forbidden.DestnationIpOutOfVpcCIDR	The specified Destination Ip is Out of VPC CIDR.	The error message returned because the specified private IP address does not fall within the CIDR block of the VPC. Enter a private IP address that falls within the CIDR block of the VPC.
400	InvalidProtocal.ValueNotSupported	The specified IpProtocol does not support.	The error message returned because the specified protocol is not supported.

HttpCode	Error code	Error message	Description
400	IncorretForwardEntryStatus	Some Forward entry status blocked this operation..	The error message returned because the operation cannot be performed. The error message returned because one or more DNAT entries in the DNAT table are in the Pending or Modifying state.
400	QuotaExceeded	Forward entry quota exceeded in this route table.	The error message returned because one route table cannot contain more than 48 custom routes to a route table. You can submit a ticket to increase the quota.
404	InvalidForwardEntryId.NotFound	Specified forward entry ID does not exist	The error message returned because the specified DNAT entry does not exist.
404	InvalidExternalIp.NotFound	Specified External Ip address does not found on the VRouter	The error message returned because the specified public IP address does not exist.
404	InvalidForwardTableId.NotFound	Specified forward table does not exist.	The error message returned because the specified DNAT table does not exist. Check the parameter value and try again.
400	Forbidden.ExternalIp.UsedInSnatTable	The specified ExternalIp is already used in SnatTable	The error message returned because the specified public IP address is already used by an SNAT entry. Select a different IP address or delete the SNAT entry.
400	Forbidden.Already.Bounded	The specified instance already bounded	The error message returned because the specified instance is already associated with another DNAT entry.
400	InvalidParameter.Name.Malformed	The specified Name is not valid.	The error message returned because the format of the specified name is invalid.

15.1.2.1.15.7. DeleteForwardEntry

Deletes a DNAT entry.

> **Note** You cannot delete DNAT entries if one or more DNAT entries in the DNAT table are in the **Pending** or **Modifying** state.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteForwardEntry	The operation that you want to perform. Set the value to **DeleteForwardEntry**.
ForwardEntryId	String	Yes	fwd-8vbn3bc8roygjp0g****	The ID of the DNAT entry.
ForwardTableId	String	Yes	ftb-8vbx8xu2lqj9qb334****	The ID of the DNAT table.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the NAT gateway is deployed. You can call the `DescribeRegions` operation to query the most recent region list.
ClientToken	String	No	123e4567-e89b-12d3-a456-42665544****	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must make sure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	0ED8D006-F706-4D23-88ED-E11ED28DCAC0	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DeleteForwardEntry
&ForwardEntryId=fwd-8vbn3bc8roygjp0g****
&ForwardTableId=ftb-8vbx8xu2lqj9qb334****
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteForwardEntryResponse>
  <RequestId>0ED8D006-F706-4D23-88ED-E11ED28DCAC0</RequestId>
</DeleteForwardEntryResponse>
```

`JSON` format

```
{"RequestId":"0ED8D006-F706-4D23-88ED-E11ED28DCAC0"}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because the specified region ID does not exist.
400	IncorretForwardEntryStatus	Some Forward entry status blocked this operation..	The error message returned because you are not authorized to perform the specified operation. The error message returned because one or more DNAT entries in the DNAT table are in the Pending or Modifying state.
404	InvalidForwardEntryId.NotFound	Specified forward entry ID does not exist	The error message returned because the specified DNAT entry does not exist.
404	InvalidForwardTableId.NotFound	Specified forward table does not exist.	The error message returned because the specified DNAT table does not exist. Check the parameter value and try again.
400	IncorretForwardEntryStatus	The Specified forwardEntry is not exist	The error message returned because the specified DNAT entry does not exist.
400	MissingParameter	Missing mandatory parameter	The error message returned because one or more required parameters are not set. Check whether you have set all required parameters.

15.1.2.1.15.8. CreateSnatEntry

Adds an SNAT entry to an SNAT table.

Description

When you call this operation, take note of the following limits:

- The vSwitch and the Elastic Compute Service (ECS) instance specified in the SNAT entry must belong to the virtual private cloud (VPC) where the NAT gateway is deployed.
- Each vSwitch or ECS instance can be specified in only one SNAT entry.
- If a high-availability virtual IP address (HAVIP) exists in the vSwitch, you cannot create SNAT entries.
- You cannot specify the same EIP in both a DNAT entry and an SNAT entry.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateSnatEntry	The operation that you want to perform. Set the value to **CreateSnatEntry**.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the NAT gateway is deployed. You can call the `DescribeRegions` operation to query the most recent region list.
SnatIp	String	Yes	47.XX.XX.98	The public IP addresses. Separate multiple IP addresses with commas (,).
SnatTableId	String	Yes	stb-bp190wu8io1vgev****	The ID of the SNAT table.
SourceVSwitchId	String	No	vsw-bp1nhx2s9ui5o****	The ID of the vSwitch that requires to access the Internet.

Parameter	Type	Required	Example	Description
SourceCIDR	String	No	10.1.1.0/24	The CIDR block of the vSwitch or the IP address of the ECS instance. • vSwitch granularity: specifies the CIDR block of the vSwitch, for example, 192.168.1.0/24. When an ECS instance of a vSwitch requires to access the Internet, the NAT gateway provides the SNAT service for the ECS instance. If you specify only one public IP address in the **SnatIp** parameter, the ECS instance uses the specified public IP address to access the Internet. If you specify multiple public IP addresses in the **SnatIp** parameter, the ECS instance randomly selects a public IP address from **SnatIp** to access the Internet. • ECS granularity: specifies the IP address of the ECS instance, for example, 192.168.1.0/32. When the ECS instance requires to access the Internet, the NAT gateway provides the SNAT service for the ECS instance. If you specify only one public IP address in the **SnatIp** parameter, the ECS instance uses the specified public IP address to access the Internet. If you specify multiple public IP addresses in the **SnatIp** parameter, the ECS instance randomly selects a public IP address from **SnatIp** to access the Internet. This parameter and the **SourceVSwtichId** parameter cannot be set at the same time. If the **SourceVSwitchId** parameter is set, you cannot set the **SourceCIDR** parameter. If the **SourceCIDR** parameter is set, you cannot set the **SourceVSwitchId** parameter.
SnatEntryName	String	No	SnatEntry-1	The name of the SNAT entry. The name must be 2 to 128 characters in length, and must start with a letter. It cannot start with `http://` or `https://`.

Parameter	Type	Required	Example	Description
ClientToken	String	No	02fb3da4-130e-11e9-8e44-001****	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must make sure that it is unique among different requests. `ClientToken` can contain only ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
SnatEntryId	String	snat-kmd6nv8fy****	The ID of the SNAT entry.
RequestId	String	2315DEB7-5E92-423A-91F7-4C1EC9AD97C3	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=CreateSnatEntry
&RegionId=cn-qingdao-env17-d01
&SnatIp=47.XX.XX.98
&SnatTableId=stb-bp190wu8io1vgev****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreateSnatEntryResponse>
      <RequestId>2315DEB7-5E92-423A-91F7-4C1EC9AD97C3</RequestId>
      <SnatEntryId>snat-119smw5tkx****</SnatEntryId>
</CreateSnatEntryResponse>
```

`JSON` format

```
{
    "SnatEntryId": "snat-kmd6nv8fyx****",
    "RequestId": "2315DEB7-5E92-423A-91F7-4C1EC9AD97C3"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because the specified region ID does not exist.
404	InvalidSnatTableId.NotFound	Specified SNAT table does not exist.	The error message returned because the specified SNAT table does not exist. Check whether the ID of the SNAT table is valid.
400	Forbidden.SourceVSwitchId.IncludeHaVip	There is some HaVips under specified VSwitch	The error message returned because the specified vSwitch is associated with HAVIPs.
400	InvalidSnatIp.Malformed	The specified SnatIp is not a valid IP address.	The error message returned because the specified public IP address is invalid.
400	SNAT_IP_POOL_COUNT_TOO_MANY	The Snat pool ip too many.	The error message returned because the number of IP addresses in the SNAT IP address pool has reached the upper limit.
400	Forbidden.SnatEntryCountLimited	SNAT entry in the specified SNAT table reach it?s limit.	The error message returned because the number of SNAT entries has reached the upper limit.
400	NOT_ALLOW_USE_SOURCECIDR	The User not in nat_scope_unlimited white list. Cannot use SourceCidr param.	The error message returned because the specified private IP address does not fall within the CIDR block of the VPC.
404	InvalidVSwitchId.NotFound	The specified virtual switch does not exists.	The error message returned because the specified vSwitch does not exist. Check whether the specified ID is valid.
400	INVALID_PARAMETER	The parameter invalid.	The error message returned because the specified parameter is invalid.
400	Forbidden.SourceVSwitchId.Duplicated	The specified SourceCIDRis duplicated.	The error message returned because an SNAT entry is already created for the specified vSwitch.
404	InvalidSnatIp.NotFound	Specified SnatIp does not found on the NAT Gateway	The error message returned because the specified public IP address is not found on the NAT gateway.

HttpCode	Error code	Error message	Description
400	Forbidden.IpUsedInForwardTable	The specified SnatIp already used in forward table	The error message returned because the specified public IP address is already used by a DNAT entry. Select another public IP address or delete the DNAT entry.
400	Forbindden	The specified Instance already bind eip	The error message returned because the ECS instance is associated with an EIP. Disassociate the EIP from the ECS instance before you create forwarding rules.
400	OperationUnsupported.CidrConflict	The specified CIDR block conflicts with an existing SNAT entry.	The error message returned because the specified CIDR block conflicts with those in existing SNAT entries.
400	InvalidParameter.Name.Malformed	The specified Name is not valid.	The error message returned because the specified name is invalid.

15.1.2.1.15.9. DescribeSnatTableEntries

Queries SNAT entries.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeSnatTableEntries	The operation that you want to perform. Set the value to **DescribeSnatTableEntries**.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the NAT gateway is deployed. You can call the `DescribeRegions` operation to query the most recent region list.
SnatTableId	String	Yes	stb-8vbczigrhop8x5u3t****	The ID of the SNAT table.

Parameter	Type	Required	Example	Description
SnatEntryId	String	No	snat-8vbae8uqh7rjpk7d2****	The ID of the SNAT entry.
SourceVSwitchId	String	No	vsw-3xb****	The ID of the vSwitch that can access the Internet through SNAT.
SourceCIDR	String	No	116.XX.XX.0/28	The source CIDR block of the SNAT entry.
SnatIp	String	No	116.XX.XX.28	The public IP address in the SNAT entry.
SnatEntryName	String	No	SnatEntry-1	The name of the SNAT entry. The name must be 2 to 128 characters in length, and start with a letter. The name cannot start with `http://` or `https://`.
PageNumber	Integer	No	1	The number of the page to return. Default value: **1**.
PageSize	Integer	No	10	The number of entries to return on each page. Maximum value: **50**. Default value: **10**.

Response parameters

Parameter	Type	Example	Description
SnatTableEntries	Array of SnatTableEntry		The detailed information about the SNAT entries.
SnatTableEntry			
SnatEntryId	String	snat-8vbae8uqh7rjpk7d2****	The ID of the SNAT entry.
SnatEntryName	String	SnatEntry-1	The name of the SNAT entry.
SnatIp	String	116.XX.XX.28	The public IP address in the SNAT entry.

Parameter	Type	Example	Description
SnatTableId	String	stb-8vbczigrhop8x5u3t****	The ID of the SNAT table to which the SNAT entry belongs.
SourceCIDR	String	116.XX.XX.0/28	The source CIDR block of the SNAT entry.
SourceVSwitchId	String	vsw-3xb****	The ID of the vSwitch that can access the Internet through SNAT.
Status	String	Pending	The state of the SNAT entry.
TotalCount	Integer	1	The number of entries returned.
PageNumber	Integer	1	The page number of the returned page.
PageSize	Integer	5	The number of entries returned on each page.
RequestId	String	6D7E89B1-1C5B-412B-8585-4908E222EED5	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeSnatTableEntries
&RegionId=cn-qingdao-env17-d01
&SnatTableId=stb-8vbczigrhop8x5u3t****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeSnatTableEntriesResponse>

        "SourceCIDR": "116.XX.XX.0/28",
        "SnatEntryId": "snat-8vbae8uqh7rjpk7d2****",
        "SnatIp": "116.XX.XX.28",
        "SnatTableId": "stb-8vbczigrhop8x5u3t****"
    }
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because the specified region ID does not exist.
404	InvalidSnatTableId.NotFound	Specified SNAT table does not exist.	The error message returned because the specified SNAT table does not exist. Check whether the ID of the SNAT table is valid.

15.1.2.1.15.10. ModifySnatEntry

Modifies a specified SNAT entry.

> **Note** You cannot modify SNAT entries if one or more SNAT entries in the SNAT table are in the **Pending** or **Modifying** state.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifySnatEntry	The operation that you want to perform. Set the value to **ModifySnatEntry**.
RegionId	String	Yes	cn-qingdao-env17-d0	The ID of the region where the NAT gateway is deployed.
SnatEntryId	String	Yes	snat-bp1vcgcf8tm0plqcg****	The ID of the SNAT entry.
SnatTableId	String	Yes	stb-8vbczigrhop8x5u3t****	The ID of the SNAT table to which the SNAT entry belongs.
SnatIp	String	Yes	47.XX.XX.98	The public IP address in the SNAT entry. If multiple IP addresses are specified, separate them with commas (,).
SnatEntryName	String	No	SnatEntry-1	The name of the SNAT entry. The description must be 2 to 128 characters in length, and start with a letter. It cannot start with `http://` or `https://`.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-001****	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must make sure that it is unique among different requests. Only ASCII characters are allowed. It can contain up to 64 ASCII characters.

Response parameters

Parameter	Type	Example	Description

Parameter	Type	Example	Description
RequestId	String	2315DEB7-5E92-423A-91F7-4C1EC9AD97C3	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ModifySnatEntry
&RegionId=cn-qingdao-env17-d0
&SnatEntryId=snat-bp1vcgcf8tm0plqcg****
&SnatTableId=stb-8vbczigrhop8x5u3t****
&SnatIp=47.XX.XX.98
&<Common request parameters>
```

Successful response examples

`XML` format

```

</ModifySnatEntryResponse>
```

`JSON` format

```
{
  "RequestId": "2315DEB7-5E92-423A-91F7-4C1EC9AD97C3"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because the specified region ID is invalid. Check whether the service is available in the specified region.
404	InvalidSnatTableId.NotFound	Specified SNAT table does not exist.	The error message returned because the specified SNAT table does not exist. Check whether the ID of the SNAT table is valid.
400	InvalidSnatIp.Malformed	The specified SnatIp is not a valid IP address.	The error message returned because the specified public IP address is invalid.

HttpCode	Error code	Error message	Description
404	InvalidSnatEntryId.NotFound	Specified SNAT entry does not exist.	The error message returned because the specified SNAT entry does not exist. Check whether the SNAT entry is valid.
400	Forbidden.SourceVSwitchId.Duplicated	The specified SourceCIDRis duplicated.	The error message returned because an SNAT entry is already configured for the specified vSwitch.
404	InvalidSnatIp.NotFound	Specified SnatIp does not found on the NAT Gateway	The error message returned because the specified public IP address does not exist in the NAT gateway.
400	Forbidden.IpUsedInForwardTable	The specified SnatIp already used in forward table	The error message returned because the specified public IP address is already used by a DNAT entry. Select another IP address or delete the DNAT rule that uses the public IP address.
400	InvalidParameter.Name.Malformed	The specified Name is not valid.	The error message returned because the specified name format is invalid.

15.1.2.1.15.11. DeleteSnatEntry

Deletes a specified SNAT entry.

Note You cannot delete SNAT entries if one or more SNAT entries in the SNAT table are in the **Pending** or **Modifying** state.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteSnatEntry	The operation that you want to perform. Set the value to **DeleteSnatEntry**.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the NAT gateway is deployed. You can call the `DescribeRegions` operation to query the most recent region list.

Parameter	Type	Required	Example	Description
SnatEntryId	String	Yes	snat-bp1vcgcf8tm0plqc****	The ID of the SNAT entry.
SnatTableId	String	Yes	stb-bp190wu8io1vgev80****	The ID of the SNAT table.
ClientToken	String	No	123e4567-e89b-12d3-a456-42665544****	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must make sure that it is unique among different requests. The token can only contain ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	47B80B6A-759A-479C-A565-76D04BDA29F3	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DeleteSnatEntry
&RegionId=cn-qingdao-env17-d01
&SnatEntryId=snat-bp1vcgcf8tm0plqc****
&SnatTableId=stb-bp190wu8io1vgev80****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteSnatEntryResponse>
  <RequestId>47B80B6A-759A-479C-A565-76D04BDA29F3</RequestId>
</DeleteSnatEntryResponse>
```

`JSON` format

```
{"RequestId":"47B80B6A-759A-479C-A565-76D04BDA29F3"}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because the specified region ID does not exist.
400	IncorretSnatEntryStatus	Some Snat entry status blocked this operation..	The error message returned because you are not authorized to perform the specified operation. The error message returned because one or more SNAT entries in the SNAT table are in the Pending or Modifying state.
404	InvalidSnatEntryId.NotFound	Specified Snat entry ID does not exist	The error message returned because the specified SNAT entry does not exist. Check whether the SNAT entry is valid.
404	InvalidSnatTableId.NotFound	Specified SNAT table does not exist.	The error message returned because the specified SNAT table does not exist. Check whether the ID of the SNAT table is valid.
404	InvalidSnatEntryId.NotFound	Specified SNAT entry does not exist.	The error message returned because the specified SNAT entry does not exist. Check whether the SNAT entry is valid.

15.1.2.1.15.12. ModifyBandwidthPackageSpec

Modifies the bandwidth value of a specified NAT service plan.

This operation can be performed by only Apsara Stack accounts that have purchased NAT service plans before January 26, 2018. If you have not purchased a NAT service plan before January 26, 2018, associate elastic IP addresses (EIPs) with your NAT gateways.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyBandwidthPackageSpec	The operation that you want to perform. Set the value to **ModifyBandwidthPackageSpec**.
Bandwidth	String	Yes	5	The maximum bandwidth of the NAT service plan. Valid values: **5** to **1000**.

Parameter	Type	Required	Example	Description
BandwidthPackageId	String	Yes	bwp-s6lmotmkk****	The ID of the NAT service plan.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the NAT service plan. You can call the `DescribeRegions` operation to query the most recent region list.

Response parameters

Parameter	Type	Example	Description
RequestId	String	079874CD-AEC1-43E6-AC03-ADD96B6E4907	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ModifyBandwidthPackageSpec
&Bandwidth=5
&BandwidthPackageId=bwp-s6lmotmkk****
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyBandwidthPackageSpecResponse>
  <RequestId>079874CD-AEC1-43E6-AC03-ADD96B6E4907</RequestId>
</ModifyBandwidthPackageSpecResponse>
```

`JSON` format

```
{

```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because the specified region ID does not exist.

HttpCode	Error code	Error message	Description
404	InvalidBandwidth.ValueNotSupported	The specified value of Bandwidth not supported.	The error message returned because the specified maximum bandwidth value is invalid.
404	BandwidthPackage.FinancialLocked	The specified BandwidthPackage has been Financail Lock.	The error message returned because the specified NAT service plan is locked due to overdue payments.

15.1.2.1.15.13. DeleteBandwidthPackage

Deletes a specified NAT service plan.

This operation can be performed by only Apsara Stack accounts that have purchased NAT service plans before January 26, 2018. If you have not purchased a NAT service plan before January 26, 2018, associate elastic IP addresses (EIPs) with your NAT gateways.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteBandwidthPackage	The operation that you want to perform. Set the value to **DeleteBandwidthPackage**.
BandwidthPackageId	String	Yes	bwp-bp1arsrmca9kp****	The ID of the NAT service plan.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the NAT gateway is deployed. You can call the `DescribeRegions` operation to query the most recent region list.
Force	Boolean	No	false	Specifies whether to forcibly delete the NAT service plan. • **false**(default): no • **true**: yes

Response parameters

Parameter	Type	Example	Description

Parameter	Type	Example	Description
RequestId	String	7D275A59-1EB0-4775-8A20-2A47055EAC5C	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DeleteBandwidthPackage
&BandwidthPackageId=bwp-bp1arsrmca9kp****
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteBandwidthPackageResponse>
  <RequestId>7D275A59-1EB0-4775-8A20-2A47055EAC5C</RequestId>
</DeleteBandwidthPackageResponse>
```

`JSON` format

```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because the specified region ID does not exist.
400	DependencyViolation.ForwardEntry	The specified BandwidthPackageId has dependent resource.	The error message returned because the NAT service plan contains SNAT or DNAT entries. Delete them and try again.
400	DependencyViolation.SnatEntry	The specified BandwidthPackageId has dependent resource.	The error message returned because the NAT service plan contains SNAT or DNAT entries. Delete them and try again.

15.1.2.1.15.14. CreateBandwidthPackage

Creates a NAT service plan.

Description

A NAT service plan consists of bandwidth resources and one or more public IP addresses. You can associate up to four NAT service plans with a NAT gateway.

A NAT service plan includes:

- Bandwidth resources
- One or more public IP addresses

> **Note** This operation can be performed by only Apsara Stack accounts that have purchased NAT service plans before November 3, 2017. If you have not purchased a NAT service plan before November 3, 2017, you can apply for public IP addresses by associating elastic IP addresses (EIPs).

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateBandwidthPackage	The operation that you want to perform. Set the value to **CreateBandwidthPackage**.
Bandwidth	Integer	Yes	5	The maximum bandwidth of the NAT service plan. Valid values: **5** to **1000**. Unit: Mbit/s.
IpCount	Integer	Yes	2	The number of public IP addresses in the NAT service plan. Valid values: **1** to **50**.
NatGatewayId	String	Yes	ngw-7mwb327j1****	The ID of the NAT gateway.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the NAT service plan. You can call the `DescribeRegions` operation to query the most recent region list.
Name	String	No	The name of the NAT service plan.	The name of the NAT service plan. The name must be 2 to 128 characters in length and can contain digits, periods (.), underscores (_), and hyphens (-). It must start with a letter. The name cannot start with `http://` or `https://`.

Parameter	Type	Required	Example	Description
Description	String	No	The description of the NAT service plan.	The description of the NAT service plan. The name must be 2 to 256 characters in length, and start with a letter. It cannot start with `http://` or `https://`.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-001****	The client token that is used to ensure the idempotence of the request. You can use the client to generate a token, but you must make sure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.
ISP	String	No	BGP	Only **BGP** is supported.
Zone	String	No	cn-qingdao-env17-amtest11001-a	The zone to which the NAT service plan belongs. If you do not set this parameter, the service plan is randomly allocated to a zone. **Note** Connectivity is not affected when the IP addresses provided by the NAT service plan and the backend Elastic Compute Service (ECS) instances belong to different zones. However, when the IP addresses and ECS instances belong to the same zone, latency can be reduced.
InternetChargeType	String	No	PayByBandwidth	The metering method of the NAT service plan. Valid values: • **PayByTraffic**: pay-by-data-transfer • **PayByBandwidth**：按带宽计费。

Response parameters

Parameter	Type	Example	Description
BandwidthPackageId	String	bwp-s6lmotmkk****	The ID of the NAT service plan.

Parameter	Type	Example	Description
RequestId	String	54ED4074-3F89-4F11-B166-837DD3E20FE3	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=CreateBandwidthPackage
&Bandwidth=5
&IpCount=2
&NatGatewayId=ngw-7mwb327j1****
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreateBandwidthPackageResponse>
  <RequestId>54ED4074-3F89-4F11-B166-837DD3E20FE3</RequestId>
  <BandwidthPackageId>bwp-s6lmotmkk****</BandwidthPackageId>
</CreateBandwidthPackageResponse>
```

`JSON` format

```
{
    "RequestId": "54ED4074-3F89-4F11-B166-837DD3E20FE3",
    "BandwidthPackageId": "bwp-s6lmotmkk****"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because the specified region ID does not exist.
404	InvalidVpcId.NotFound	Specified value of VpcId is not found in our record.	The error message returned because the specified VPC does not exist. Check whether the specified VPC ID is valid.
400	MissingParameter	Miss mandatory parameter.	The error message returned because one or more required parameters are not set. Check whether you have set all the required parameters before you call this operation.

HttpCode	Error code	Error message	Description
404	InvalidZoneId.NotFound	Specified value of ZoneId is not exists.	The error message returned because the specified zone does not exist.
404	InvalidZoneId.NotFound	Can not find ZoneId for allocated ip.	The error message returned because the zone of the specified IP address is invalid.
400	QuotaExceeded.BandwidthPackageIps	The specified ipCount exceeded quota.	The error message returned because the number of IP addresses has reached the upper limit. Submit a ticket to increase the quota.
400	QuotaExceeded.BandwidthPackageCountOnNatGateway	BandwidthPackage count limit on one NatGateway exceeded.	The error message returned because the number of NAT service plans has reached the upper limit. You can associate up to four NAT service plans with a NAT gateway.
400	InvalidParameter.Name.Malformed	The specified Name is not valid.	The error message returned because the specified name is invalid.
400	InvalidParameter.Description.Malformed	The specified Description is not valid.	The error message returned because the specified description is invalid.
400	InvalidParameter.BandwidthPackage.n.ISP.ValueNotSupport	The specified ISP of BandwidthPackage is not valid.	The error message returned because the specified Internet service provider (ISP) of the EIP bandwidth plan is invalid.
400	ZONE_NO_AVAILABLE_IP	The Zone have no available ip.	The error message returned because no IP address is available in the zone.

15.1.2.1.15.15. DescribeBandwidthPackages

Queries NAT service plans in a specified region.

This operation can be performed by only Apsara Stack accounts that have purchased NAT service plans before January 26, 2018. If you have not purchased a NAT service plan before January 26, 2018, associate elastic IP addresses (EIPs) with your NAT gateways.

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeBandwidthPackages	The operation that you want to perform. Set the value to **DescribeBandwidthPackages**.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the NAT gateway is deployed. You can call the `DescribeRegions` operation to query the most recent region list.
BandwidthPackageId	String	No	bwp-bp1xea10o8qxwdfs****	The ID of the NAT service plan.
NatGatewayId	String	No	ngw-bp1uewa15k4iydfre****	The ID of the NAT gateway.
PageNumber	Integer	No	10	The number of the page to return. Default value: **1**.
PageSize	Integer	No	10	The number of entries to return on each page. Maximum value: **50**. Default value: **10**.

Response parameters

Parameter	Type	Example	Description
BandwidthPackages	Array of BandwidthPackage		The detailed description of the NAT service plan.
BandwidthPackage			
Bandwidth	String	5	The bandwidth value of the NAT service plan. Valid values: **5** to **5000**. Unit: Mbit/s.
BandwidthPackageId	String	bwp-xxoo123sfwr****	The ID of the NAT service plan.

Parameter	Type	Example	Description
BusinessStatus	String	Normal	The state of the NAT service plan. Valid values: • **Normal**: The NAT service plan working as expected. • **FinancialLocked**: The NAT service plan is locked due to overdue payments. • **SecurityLocked**: The NAT service plan is locked due to security reasons.
CreationTime	String	2017-06-08T12:20:55	The time when the NAT service plan was created. The time follows the ISO 8601 standard in YYYY-MM-DDThh:mmZ format. It must be in UTC.
Description	String	test123	The description of the NAT service plan. The description must be 2 to 256 characters in length. The description is displayed in the console. This parameter is empty by default. It cannot start with `http://` or `https://`.
ISP	String	BGP	Only **BGP** is supported.
InstanceChargeType	String	PostPaid	The billing method of the NAT service plan. Only **PostPaid** (pay-as-you-go) is supported.
InternetChargeType	String	PayByBandwidth	The metering method of the NAT service plan. • **PayByTraffic**: pay-by-data-transfer • **PayByBandwidth**: 按带宽计费。
IpCount	String	1	The number of public IP addresses in the NAT service plan. Valid values: **1** to **50**.
Name	String	abc	The name of the NAT service plan.
NatGatewayId	String	ngw-xxoo123ggtf****	The ID of the NAT gateway.

Parameter	Type	Example	Description
PublicIpAddresses	Array of PublicIpAddress		The IP address in the NAT service plan.
PublicIpAddress			
AllocationId	String	eip-2zeerraiwb7ujdeds*****	The ID that is allocated.
ApAccessEnabled	Boolean	true	
IpAddress	String	116.XX.XX.28	The IP address.
UsingStatus	String	Available	The state of the NAT service plan.
RegionId	String	cn-qingdao-env17-d01	The region ID of the NAT service plan.
Status	String	Available	The state of the bandwidth plan.
ZoneId	String	cn-qingdao-env17-amtest11001-a	The ID of the zone to which the NAT service plan belongs.
TotalCount	Integer	10	The number of entries returned.
PageNumber	Integer	10	The page number of the returned page.
PageSize	Integer	10	The number of entries returned per page.
RequestId	String	4EC47282-1B74-4534-BD0E-403F3EE64CAF"	The ID of the request.

Examples

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because the specified region ID does not exist.

15.1.2.1.15.16. ModifyBandwidthPackageAttribute

Modifies the name and description of a specified NAT service plan.

This operation can be performed by only Apsara Stack accounts that have purchased NAT service plans before January 26, 2018. If you have not purchased a NAT service plan before January 26, 2018, associate elastic IP addresses (EIPs) with your NAT gateways.

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyBandwidthPackageAttribute	The operation that you want to perform. Set the value to **ModifyBandwidthPackageAttribute**.
BandwidthPackageId	String	Yes	bwp-s6lmotmkk****	The ID of the NAT service plan.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the NAT service plan. You can call the `DescribeRegions` operation to query the most recent region list.
Name	String	No	NATABC	The name of the NAT service plan. The name must be 2 to 128 characters in length and can contain letters, digits, periods (.), underscores (_), and hyphens (-). The name cannot start with `http://` or `https://`.
Description	String	No	This is NAT.	The description of the NAT service plan. The description must be 2 to 256 characters in length. It must start with a letter and cannot start with `http://` or `https://`.

Response parameters

Parameter	Type	Example	Description
RequestId	String	DFDDD35D-3F29-4E15-AA28-53F5341F9599	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ModifyBandwidthPackageAttribute
&BandwidthPackageId=bwp-s6lmotmkk****
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because the specified region ID does not exist.
404	InvalidBandwidthPackageId.NotFound	The specified bandwidthPackageId does not exist in our records.	The error message returned because the ID of the specified NAT service plan does not exist.
400	InvalidParameter.Name.Malformed	The specified Name is not valid.	The error message returned because the specified name is invalid.
400	InvalidParameter.Description.Malformed	The specified Description is not valid.	The error message returned because the specified description is invalid.

15.1.2.1.15.17. AddBandwidthPackageIps

Adds one or more public IP addresses to a NAT service plan.

This operation can be performed by only Apsara Stack accounts that have purchased NAT service plans before November 3, 2017. Before November 03, 2017, no NAT bandwidth plan exists under the account. Bind an EIP.

This operation can be performed by only Apsara Stack accounts that have purchased NAT service plans before January 26, 2018. If you have not purchased a NAT service plan before January 26, 2018, associate elastic IP addresses (EIPs) with your NAT gateways.

This operation can be performed by only Apsara Stack accounts that have purchased NAT service plans before January 26, 2018. If you have not purchased a NAT service plan before January 26, 2018, associate EIPs with your NAT gateways.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	AddBandwidthPackageIps	The operation that you want to perform. Valid values: **AddBandwidthPackageIps** .
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the NAT bandwidth plan resides. You can call `DescribeRegions` interface to obtain the region ID.
IpCount	String	Yes	2	The number of public IP addresses in the NAT bandwidth plan. Valid values: **1 ~ 50** .
BandwidthPackageId	String	Yes	bwp-s6lmotmkk****	The ID of the NAT service plan.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-0016e0****	The client token that is used to ensure the idempotence of the request. You can use the client to generate a token, but you must make sure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	EC0B5C51-7F40-44D6-A642-1DE764B547EC	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=AddBandwidthPackageIps
&RegionId=cn-qingdao-env17-d01
&IpCount=2
&BandwidthPackageId=bwp-s6lmotmkk****
&<Public request parameters>
```

Sample success responses

`XML` format

```
<AddBandwidthPackageIpsResponse>
  <RequestId>EC0B5C51-7F40-44D6-A642-1DE764B547EC</RequestId>
</AddBandwidthPackageIpsResponse>
```

`JSON` format

```
{
  "RequestId": "EC0B5C51-7F40-44D6-A642-1DE764B547EC"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because the specified region ID does not exist.
400	InvalidIpCount.ValueNotSupported	The specified value of IpCount not supported.	The error message returned because the value of the IpCount parameter is invalid.
400	QuotaExceeded.BandwidthPackageIps	The specified ipCount exceeded quota.	The error message returned because the number of IP addresses has reached the upper limit. Submit a ticket to increase the quota.
404	BandwidthPackage.FinancialLocked	The specified BandwidthPackage has been Financail Lock.	The error message returned because the specified NAT service plan is locked due to overdue payments.

15.1.2.1.16. Elastic IP addresses

15.1.2.1.16.1. AllocateEipAddress

Applies for an elastic IP address (EIP).

Description

After you call this operation, the system randomly allocates an EIP that is in the **Available** state in the specified region. EIPs support only the ICMP, TCP, and UDP transport layer protocols. The IGMP and SCTP protocols are not supported.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	AllocateEipAddress	The operation that you want to perform. Set the value to **AllocateEipAddress**.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where you want to apply for an EIP. You can call the `DescribeRegions` operation to query region IDs.
Bandwidth	String	No	1	The bandwidth limit of the EIP. Valid values: **1** to **200**. Unit: Mbit/s. Default value: **1**.
Period	Integer	No	1	The subscription duration of the EIP. When **PricingCycle** is set to **Month**, **Period** can be set from **1 to 9**. When **PricingCycle** is set to **Year**, **Period** can be set from **1 to 3**. This parameter is required when **InstanceChargeType** is set to **PrePaid**. When **InstanceChargeType** is set to **PostPaid**, ignore this parameter. **Note** This parameter is unavailable for EIPs that are purchased on the Alibaba Cloud International site.
ISP	String	No	BGP	The line type. Default value: **BGP**. • If your account is in the single-path BGP whitelist, you can set the parameter to **ChinaTelecom**, **ChinaUnicom**, or **ChinaMobile**. • This parameter is required if your workloads are deployed in the China East 1 Finance region. In this case, set the value to **BGP_FinanceCloud**.
ActivityId	Long	No	111111	The promotion code. You can leave this parameter empty.

Parameter	Type	Required	Example	Description
Netmode	String	No	public	The type of network. Set the value to **public** (Internet).
AutoPay	Boolean	No	false	Specifies whether to enable automatic payment. Valid values: **false**: disables automatic payment. After an order is generated, you must go to the order center to complete the payment. **true**: enables automatic payment. After an order is generated, the system automatically deducts fees from your account balance to pay for the order. This parameter is required when **InstanceChargeType** is set to **PrePaid**. When **InstanceChargeType** is set to **PostPaid**, this parameter is not required. **Note** This parameter is unavailable for EIPs that are purchased on the Alibaba Cloud International site.
PricingCycle	String	No	Month	The billing cycle of the subscription EIP. Valid values: **Month**: billed on a monthly basis. This is the default value. **Year**: billed on an annual basis. This parameter is required when **InstanceChargeType** is set to **PrePaid**. When **InstanceChargeType** is set to **PostPaid**, this parameter is not required. **Note** This parameter is unavailable for EIPs that are purchased on the Alibaba Cloud International site.

Parameter	Type	Required	Example	Description
InstanceChargeType	String	No	PostPaid	The billing method of the EIP. Valid values: **PrePaid**: subscription. **PostPaid**: pay-as-you-go. This is the default value. When **InstanceChargeType** is set to **PrePaid**, you must set **InternetChargeType** to **PayByBandwidth**. When **InstanceChargeType** is set to **PostPaid**, you can set **InternetChargeType** to **PayByBandwidth** or **PayByTraffic**. **Note** If you want to purchase an EIP from the Alibaba Cloud International site, you must set this parameter to **PostPaid** (pay-as-you-go).
InternetChargeType	String	No	PayByTraffic	The metering method of the EIP. Valid values: **PayByBandwidth**: pay-by-bandwidth. This is the default value. **PayByTraffic**: pay-by-data-transfer. When **InstanceChargeType** is set to **PrePaid**, **InternetChargeType** must be set to **PayByBandwidth**. When **InstanceChargeType** is set to **PostPaid**, **InternetChargeType** can be set to **PayByBandwidth** or **PayByTraffic**.
ResourceGroupId	String	No	rg-acfmxazffggds****	The ID of the enterprise resource group.

Parameter	Type	Required	Example	Description
ClientToken	String	No	0c593ea1-3bea-11e9-b96b-88e9fe637760	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must ensure that it is unique among different requests. **ClientToken** can contain only ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
EipAddress	String	10.XX.XX.78	The allocated EIP.
AllocationId	String	eip-25877c70gddh****	The ID of the EIP.
OrderId	Long	10	The order number. This parameter is returned only when **InstanceChargeType** is set to **PrePaid**.
RequestId	String	4EC47282-1B74-4534-BD0E-403F3EE64CAF	The ID of the request.
ResourceGroupId	String	rg-acfmxazfdgdg****	The ID of the enterprise resource group.

Examples

Sample requests

        "AllocationId": "eip-25877c70gddh****",
        "EipAddress": "10.XX.XX.78",
        "OrderId": 10
    }
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. Apply for permissions and try again.
400	QuotaExceeded.Eip	Elastic IP address quota exceeded	The error message returned because the number of EIPs reaches the quota. You can submit a ticket to request a quota increase. We recommend that you use NAT gateways.
400	InvalidParameter	Specified value of "InternetChargeType" is not valid	The error message returned because InternetChargeType is set to an invalid value.
400	InvalidParameter	Specified value of "Bandwidth" is not valid.	The error message returned because the specified bandwidth limit is invalid.
400	InsufficientBalance	Your account does not have enough balance.	The error message returned because the balance in your account is insufficient. Top up your account and try again.
400	QuotaExceeded.Eip	Elastic IP address quota exceeded.	The error message returned because the number of EIPs reaches the quota. You can submit a ticket to request a quota increase. We recommend that you use NAT gateways.
400	ReserveIpFail	Reserve eip failed.	The error message returned because the system failed to reserve the EIP.

HttpCode	Error code	Error message	Description
400	InvalidRegion.NotSupport	The specified region does not support.	The error message returned because the specified region does not support this operation.
400	InvalidResourceGroupId	The specified ResourceGroupId does not exist.	The error message returned because the specified resource group ID does not exist.
409	OperationConflict	Request was denied due to conflict with a previos request.	The error message returned because a request conflict occurs. Try again later or submit a ticket to report the problem.

15.1.2.1.16.2. AllocateEipAddressPro

Applies for a specified elastic IP address (EIP).

Request parameters

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where you want to apply for a specified EIP. You can call the `DescribeRegions` operation to query region IDs.
IpAddress	String	No	12.XX.XX.23	The IP address of the specified EIP. Specify **IpAddress** or **InstanceId**. If you leave both parameters empty, the system randomly allocates an EIP to your account.
InstanceId	String	No	eip-25877c70gddh****	The ID of the specified EIP. Specify **IpAddress** or **InstanceId**. If you leave both parameters empty, the system randomly allocates an EIP to your account.
Bandwidth	String	No	5	The bandwidth limit of the specified EIP. Unit: Mbit/s. Default value: **1**. Unit: Mbit/s.

Parameter	Type	Required	Example	Description
Period	Integer	No	1	The subscription duration of the specified EIP. When **PricingCycle** is set to **Month**, **Period** can be set from **1** to **9**. When **PricingCycle** is set to Year, **Period** can be set from **1** to **3**. When **InstanceChargeType** is set to **PrePaid**, this parameter is required. When **InstanceChargeType** is set to **PostPaid**, ignore this parameter.
ISP	String	No	BGP	The line type. Default value: **BGP**. If your account is in the single-path BGP whitelist, you can set the parameter to **ChinaTelecom**, **ChinaUnicom**, or **ChinaMobile**. This parameter is required if your workloads are deployed in the China East 1 Finance region. In this case, set the value to **BGP_FinanceCloud**.
Netmode	String	No	public	The type of network. Set the value to **public** (Internet). Default value: **public** (Internet).
AutoPay	Boolean	No	true	Specifies whether to enable automatic payment. Valid values: **false**: disables automatic payment. After an order is generated, you must go to the order center to complete the payment. **true**: enables automatic payment. After an order is generated, the system automatically deducts fees from your account balance to pay for the order. When **InstanceChargeType** is set to **PrePaid**, this parameter is required. When **InstanceChargeType** is set to **PostPaid**, ignore this parameter.

Parameter	Type	Required	Example	Description
InstanceChargeType	String	No	PostPaid	The billing method of the specified EIP. Valid values: **PrePaid**: subscription. **PostPaid**: pay-as-you-go. This is the default value. When **InstanceChargeType** is set to **PrePaid**, **InternetChargeType** must be set to **PayByBandwidth**. When **InstanceChargeType** is set to **PostPaid**, **InternetChargeType** can be set to **PayByBandwidth** or **PayByTraffic**.
InternetChargeType	String	No	PayByBandwidth	The metering method of the specified EIP. Valid values: **PayByBandwidth** (default): pay-by-bandwidth **PayByTraffic**: pay-by-data-transfer. When **InstanceChargeType** is set to **PrePaid**, **InternetChargeType** must be set to **PayByBandwidth**. When **InstanceChargeType** is set to **PostPaid**, **InternetChargeType** can be set to **PayByBandwidth** or **PayByTraffic**.
ResourceGroupId	String	No	rg-resourcegroup****	The ID of the resource group to which the EIP belongs.
ClientToken	String	No	0c593ea1-3bea-11e9-b96b-88e9fe637760	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must ensure that it is unique among different requests. **ClientToken** can contain only ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
AllocationId	String	eip-25877c70gddh****	The ID of the specified EIP.

Parameter	Type	Example	Description
EipAddress	String	12.XX.XX.23	The IP address of the specified EIP.
OrderId	Long	20190000	The ID of the order.
RequestId	String	4EC47282-1B74-4534-BD0E-403F3EE64CAF	The ID of the request.
ResourceGroupId	String	rg-resourcegroup****	The ID of the resource group to which the EIP belongs.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=AllocateEipAddressPro
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<AllocateEipAddressProResponse>
  <ResourceGroupId>rg-resourcegroup****</ResourceGroupId>
  <RequestId>4EC47282-1B74-4534-BD0E-403F3EE64CAF</RequestId>
  <AllocationId>eip-25877c70gddh****</AllocationId>
  <EipAddress>12.XX.XX.23</EipAddress>
  <OrderId>20190000</OrderId>
</AllocateEipAddressProResponse>
```

`JSON` format

```
{
    "ResourceGroupId": "rg-resourcegroup****",
    "RequestId": "4EC47282-1B74-4534-BD0E-403F3EE64CAF",
    "AllocationId": "eip-25877c70gddh****",
    "EipAddress": "12.XX.XX.23",
    "OrderId": 20190000
}
```

HttpCode	Error code	Error message	Description

HttpCode	Error code	Error message	Description
403	Forbbiden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. Apply for permissions and try again.
400	QuotaExceeded.Eip	Elastic IP address quota exceeded	The error message returned because the number of EIPs reaches the quota. You can submit a ticket to request a quota increase. We recommend that you use NAT gateways.
400	InvalidParameter	Specified value of "InternetChargeType" is not valid	The error message returned because InternetChargeType is set to an invalid value.
400	InvalidParameter	Specified value of "Bandwidth" is not valid.	The error message returned because the specified bandwidth limit is invalid.
400	InsufficientBalance	Your account does not have enough balance.	The error message returned because the balance in your account is insufficient. Top up your account and try again.
400	QuotaExceeded.Eip	Elastic IP address quota exceeded.	The error message returned because the number of EIPs reaches the quota. You can submit a ticket to request a quota increase. We recommend that you use NAT gateways.
400	ReserveIpFail	Reserve eip failed.	The error message returned because the system failed to reserve the specified EIP.
400	InvalidRegion.NotSupport	The specified region does not support.	The error message returned because the specified region does not support this operation.
400	InvalidResourceGroupId	The specified ResourceGroupId does not exist.	The error message returned because the specified resource group ID does not exist.

15.1.2.1.16.3. AssociateEipAddress

Associates an elastic IP address (EIP) with an instance that belongs to the same region as the EIP.

Description

When you call the operation, take note of the following items:

- You can associate an EIP with an Elastic Compute Service (ECS) instance, a Server Load Balancer (SLB) instance, a secondary elastic network interface (ENI), or a NAT gateway that is deployed in a virtual private cloud (VPC). The EIP and the instance with which you want to associate the EIP must belong to the same region.
- To associate an EIP with a NAT gateway, make sure that no NAT service plan that was purchased before November 3, 2017 exists in your account.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	AssociateEipAddress	The operation that you want to perform. Set the value to **AssociateEipAddress**.
AllocationId	String	Yes	eip-2zeerraiwb7ujsxdc****	The ID of the EIP that you want to associate with an instance.
InstanceId	String	Yes	i-2zebb08phyczzawe****	The ID of the instance with which you want to associate the EIP. NAT gateways, SLB instances, ECS instances, secondary ENIs, and high-availability virtual IP addresses (HAVIPs) are supported.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region to which the EIP belongs.
InstanceType	String	No	EcsInstance	The type of instance with which you want to associate the EIP. Valid values: • **Nat**: a NAT gateway • **SlbInstance**: an SLB instance • **EcsInstance**: an ECS instance • **NetworkInterface**: a secondary ENI • **HaVip**: an HAVIP
InstanceRegionId	String	No	cn-hangzhou	The ID of the region where the instance to be associated with the EIP is deployed. **Note** This parameter is required only when the EIP is associated with a shared-bandwidth Global Accelerator (GA) instance.

Parameter	Type	Required	Example	Description
PrivateIpAddress	String	No	192.XX.XX.4	An IP address that belongs to the CIDR block of a vSwitch. If you do not set this parameter, the system allocates a private IP address based on the VPC ID and vSwitch ID.
Mode	String	No	NAT	The mode in which you associate the EIP. Valid values: • **NAT** (default): NAT mode • **MULTI_BINDED**: multi-EIP to ENI mode • **BINDED**: cut-through mode Note This parameter does not support **BINDED**. Log on to the console to set the cut-through mode. This parameter is required only when **InstanceType** is set to **NetworkInterface**.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-001sdfg	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must ensure that it is unique among different requests. **ClientToken** can contain only ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	C0FD0EED-F90D-4479-803D-DD62335357E5	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=AssociateEipAddress
&AllocationId=eip-2zeerraiwb7ujsxdc****
&InstanceId=i-2zebb08phyczzawe****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<AssociateEipAddressResponse>
  <RequestId>C0FD0EED-F90D-4479-803D-DD62335357E5</RequestId>
</AssociateEipAddressResponse>
```

`JSON` format

```
{
    "RequestId": "C0FD0EED-F90D-4479-803D-DD62335357E5"
}
```

Error codes

HttpCode	Error code	Error message	Description
400	InvalidAssociation.Duplicated	Specified instance already is associated.	The error message returned because an EIP or a GA instance is already associated with the specified instance. You must disassociate the EIP or GA instance from the specified instance before you can perform the operation.
400	OperationDenied	Specified instance is not in VPC.	The error message returned because the specified instance does not exist in the VPC.
400	InvalidParameter.Mismatch	Specified elastic IP address and ECS instance are not in the same region.	The error message returned because the specified EIP and ECS instance do not belong to the same region.
400	IncorrectEipStatus	Current elastic IP status does not support this operation	The error message returned because the state of the EIP does not support the operation.
404	InvalidInstanId.NotFound	Specified instance does not exist.	The error message returned because the specified instance does not exist. Check whether the ID is valid.

HttpCode	Error code	Error message	Description
400	IncorrectInstanceStatus	Current instance status does not support this operation.	The error message returned because the state of the instance does not support the operation.
400	InvalidInstanceType.ValueNotSupported	The specified value of InstanceType is not supported.	The error message returned because InstanceType is set to an invalid value.
400	IncorrectHaVipStatus	HaVip can be operated by this action only when it's status is Available or InUse.	The error message returned because the state of the HAVIP does not support the operation. You can perform the operation only when the HAVIP is in the Available or InUse state.
400	InvalidParameter	The specified parameter is not valid.	The error message returned because the parameter is set to an invalid value.
400	OperationDenied	Eip of default vpc not allow this operation	The error message returned because EIPs in the default VPC do not support the operation.
400	Forbbiden	The eip instance owener error	The error message returned because you are unauthorized to perform the operation on the EIP.
400	InvalidBindingStatus	The eip binding status invalid.	The error message returned because the binding mode of the EIP is invalid.
400	BIND_INSTANCE_HAVE_PORTMAP_OR_BIND_EIP	The instance may have portMap or already bind eip.	The error message returned because a port forwarding rule is configured for the ECS instance. Delete the port forwarding rule and try again.
400	BIND_INSTANCE_OWENER_ERROR	Cannot operate the eip.	The error message returned because you are unauthorized to manage the specified EIP.
404	InvalidAllocationId.NotFound	Specified allocation ID is not found	The error message returned because the specified EIP does not exist. Check whether the value of the parameter is valid.
400	InvalidParams.NotFound	instance not found	The error message returned because the specified instance does not exist.

HttpCode	Error code	Error message	Description
503	ServiceUnavailable	The request has failed due to a temporary failure of the server.	The error message returned because the request failed due to a temporary malfunction of the server.

15.1.2.1.16.4. ModifyEipAddressAttribute

Modifies the name, description, and bandwidth limit of a specified elastic IP address (EIP).

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyEipAddressAttribute	The operation that you want to perform. Set the value to **ModifyEipAddressAttribute**.
AllocationId	String	Yes	eip-2zeerraiwb7uj6i0d****	The ID of the EIP that you want to modify.
Bandwidth	String	No	100	The bandwidth limit of the EIP. Valid values: **1** to **200**. Unit: Mbit/s.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region to which the EIP belongs.
Name	String	No	Test123	The name of the EIP. The name must be 2 to 128 characters in length, and can contain, digits, periods (.), underscores (_), and hyphens (-). It must start with a letter. The name cannot start with `http://` or `https://`.
Description	String	No	abc	The description of the EIP. The description must be 2 to 256 characters in length. It must start with a letter but cannot start with `http://` or `https://`.

Response parameters

Parameter	Type	Example	Description
RequestId	String	4EC47282-1B74-4534-BD0E-403F3EE64CAF	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ModifyEipAddressAttribute
&AllocationId=eip-2zeerraiwb7uj6i0d****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyEipAddressAttributeResponse>
      <RequestId>0ED8D006-F706-4D23-88ED-E11ED28DCAC0</RequestId>
</ModifyEipAddressAttributeResponse>
```

`JSON` format

```
{
    "ModifyEipAddressAttributeResponse": {
        "RequestId": "0ED8D006-F706-4D23-88ED-E11ED28DCAC0"
    }
}
```

Error codes

HttpCode	Error code	Error message	Description
400	InsufficientBalance.Eip	Your account does not have enough balance.	The error message returned because the balance in your account is insufficient. Top up your account and try again.
404	InvalidAllocationId.NotFound	Specified allocation ID is not found	The error message returned because the specified EIP does not exist. Check whether the value of the parameter is valid.
400	InvalidParameter	Specified value of "Bandwidth" is not supported.	The error message returned because the specified bandwidth limit is invalid.
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an unknown error occurred.

HttpCode	Error code	Error message	Description
400	IncorrectEipStatus	Current elastic IP status does not support this operation.	The error message returned because the state of the EIP does not support this operation.
404	InvalidAllocationId.NotFound	Specified allocation ID is not found..	The error message returned because the specified EIP does not exist. Check whether the value of the parameter is valid.
400	InvalidParameter	The parameter is invalid.	The error message returned because the parameter is set to an invalid value.
404	Forbidden.RegionNotFound	Specified region is not found during access authentication.	The error message returned because the specified region does not exist. Check whether the specified region ID is valid.

15.1.2.1.16.5. UnassociateEipAddress

Disassociates an elastic IP address (EIP) from an instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	UnassociateEipAddress	The operation that you want to perform. Set the value to **UnassociateEipAddress**.
AllocationId	String	Yes	eip-2zeerraiwb7uj6i0d****	The ID of the EIP that you want to disassociate.
InstanceId	String	Yes	i-hp3akk9irtd69jad****	The ID of the instance from which you want to disassociate the EIP.
Force	Boolean	No	false	Specifies whether to disassociate the EIP from a NAT gateway if a DNAT or SNAT entry is added to the NAT gateway. Valid values: • **false** (default): does not disassociate the EIP from a NAT gateway if a DNAT or SNAT entry is added to the NAT gateway. • **true**: disassociates the EIP from a NAT gateway if a DNAT or SNAT entry is added to the NAT gateway.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region to which the EIP belongs.
InstanceType	String	No	EcsInstance	The type of instance from which you want to disassociate the EIP. Valid values: • **EcsInstance** (default): an Elastic Compute Service (ECS) instance that is deployed in a virtual private cloud (VPC) • **SlbInstance**: a Server Load Balancer (SLB) instance that is deployed in a VPC • **NetworkInterface**: a secondary elastic network interface (ENI) that is deployed in a VPC • **Nat**: a NAT gateway • **HaVip** a high-availability virtual IP address (HAVIP)
PrivateIpAddress	String	No	192.XX.XX.2	The private IP address of the ECS instance or the secondary ENI from which you want to disassociate the EIP.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-001***	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must ensure that it is unique among different requests. ClientToken can contain only ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	0ED8D006-F706-4D23-88ED-E11ED28DCAC0	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=UnassociateEipAddress
&AllocationId=eip-2zeerraiwb7uj6i0d****
&InstanceId=i-hp3akk9irtd69jad****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<UnassociateEipAddressResponse>
   <RequestId>0ED8D006-F706-4D23-88ED-E11ED28DCAC0</RequestId>
</UnassociateEipAddressResponse>
```

`JSON` format

```
{
    "RequestId": "0ED8D006-F706-4D23-88ED-E11ED28DCAC0"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidAllocationId.NotFound	Specified allocation ID is not found	The error message returned because the specified EIP does not exist. Check whether the value of the parameter is valid.
400	IncorrectEipStatus	Current elastic IP status does not support this operation.	The error message returned because the state of the EIP does not support this operation.
400	InvalidInstanceId.NotFound	Specified instance does not exist.	The error message returned because the specified instance does not exist. Check whether the specified instance is valid.
400	IncorrectInstanceStatus	The current status of instance does not support this operation.	The error message returned because the state of the instance does not support the operation.
400	InvalidInstanceType.ValueNotSupported	The specified value of InstanceType is not supported.	The error message returned because InstanceType is set to an invalid value.
400	IncorrectHaVipStatus	This operation is denied because satus of the specified HaVip is neither Available nor InUse.	The error message returned because you cannot perform the operation when the specified HAVIP is in the Available or InUse state.

HttpCode	Error code	Error message	Description
400	OperationDenied	Eip of default vpc not allow this operation	The error message returned because EIPs in the default VPC do not support the operation.
404	Forbidden.RegionNotFound	Specified region is not found during access authentication.	The error message returned because the specified region does not exist. Check whether the specified region ID is valid.
400	InvalidParameter	The specified parameter is not valid.	The error message returned because the parameter is set to an invalid value.
400	Forbbiden	The eip instance owener error	The error message returned because you are unauthorized to perform the operation on the EIP.
400	InvalidBindingStatus	The eip binding status invalid.	The error message returned because the binding mode of the EIP is invalid.

15.1.2.1.16.6. ReleaseEipAddress

Releases a specified elastic IP address (EIP).

Description

Before you release an EIP, make sure that the EIP meets the following requirements:

- You can release only EIPs that are in the **Available** state.
- You can release only EIPs that are billed on a pay-as-you-go basis. You cannot release subscription EIPs.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ReleaseEipAddress	The operation that you want to perform. Set the value to **ReleaseEipAddress**.
AllocationId	String	Yes	eip-2zeerraiwb7uj6i0d****	The ID of the EIP that you want to release.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region to which the EIP belongs. You can call the `DescribeRegions` operation to query region IDs.

Response parameters

Parameter	Type	Example	Description
RequestId	String	748C38F6-9A3D-482E-83FB-DB6C39C68AEA	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ReleaseEipAddress
&AllocationId=eip-2zeerraiwb7uj6i0d****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ReleaseEipAddressResponse>
      <RequestId>748C38F6-9A3D-482E-83FB-DB6C39C68AEA</RequestId>
</ReleaseEipAddressResponse>
```

`JSON` format

```
{
  "RequestId": "748C38F6-9A3D-482E-83FB-DB6C39C68AEA"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidAllocationId.NotFound	Specified allocation ID is not found	The error message returned because the specified EIP does not exist. Check whether the value of the parameter is valid.
400	IncorrectEipStatus	Current elastic IP status does not support this operation.	The error message returned because the state of the EIP does not support this operation.

HttpCode	Error code	Error message	Description
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an unknown error occurred.
404	Forbidden.RegionNotFound	Specified region is not found during access authentication.	The error message returned because the specified region does not exist. Check whether the specified region ID is valid.
400	Forbidden.ChargeTypeIsPrepaid	It's forbidden to release a prepaid EIP	The error message returned because you cannot release subscription EIPs.
400	Forbbiden	The eip instance owener error	The error message returned because you are unauthorized to perform the operation on the EIP.
400	TaskConflict.AssociateGlobalAccelerationInstance	Operate too frequent.	The error message returned because the number of requests that you send exceeds the upper limit.

15.1.2.1.16.7. DescribeEipGatewayInfo

Queries information about the gateway and subnet mask of an elastic IP address (EIP).

Description

You can query only EIPs that are associated with secondary elastic network interfaces (ENIs) in multi-EIP to ENI mode.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeEipGatewayInfo	The operation that you want to perform. Set the value to **DescribeEipGatewayInfo**.
InstanceId	String	Yes	eni-bp1d66qjxb3qoin3****	The ID of the secondary ENI that is associated with the EIP.
RegionId	String	Yes	cn-qingdao-env17-d01	The region to which the EIP that you want to query belongs. You can call the `DescribeRegions` operation to query region IDs.

Response parameters

Parameter	Type	Example	Description
Code	String	200	The status code of the operation.
EipInfos	Array of EipInfo		Detailed information about the EIP.
EipInfo			
Ip	String	47.XX.XX.236	The IP address of the EIP.
IpGw	String	47.XX.XX.1	The IP address of the gateway that is associated with the EIP.
IpMask	String	255.255.255.0	The subnet mask of the EIP.
Message	String	successful	The result of the operation.
RequestId	String	C0FD0EED-F90D-4479-803D-DD62335357E5	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeEipGatewayInfo
&InstanceId=eni-bp1d66qjxb3qoin3****
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeEipGatewayInfoResponse>
  <Message>successful</Message>
  <RequestId>C0FD0EED-F90D-4479-803D-DD62335357E5    </RequestId>
  <Code>200</Code>
  <EipInfos>
        <IpMask>255.255.255.0</IpMask>
        <IpGw>47.XX.XX.1</IpGw>
        <Ip>47.XX.XX.236</Ip>
  </EipInfos>
</DescribeEipGatewayInfoResponse>
```

`JSON` format

```
{
    "Message": "successful",
    "RequestId": "C0FD0EED-F90D-4479-803D-DD62335357E5",
    "Code": 200,
    "EipInfos": {
        "IpMask": "255.255.255.0",
        "IpGw": "47.XX.XX.1",
        "Ip": "47.XX.XX.236"
    }
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. Apply for permissions and try again.

15.1.2.1.17. HAVIPs

15.1.2.1.17.1. CreateHaVip

Creates a high-availability virtual IP address (HAVIP).

Descriptions

When you call this operation, take note of the following rules:

- You can create a maximum of five HAVIPs for a virtual private cloud (VPC).
- Before you delete a VPC, you must delete the HAVIPs that you have created for it.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateHaVip	The operation that you want to perform. Set the value to **CreateHaVip**.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where you want to create an HAVIP. You can call the `DescribeRegions` operation to the most recent region list.
VSwitchId	String	Yes	vsw-asdfjlnau****	The ID of the vSwitch to which the HAVIP belongs.
Name	String	No	test	The name of the HAVIP. The name must be 2 to 128 characters in length and can contain letters, digits, underscores (_), and hyphens (-). The name must start with a letter.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-001s****	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must make sure that it is unique among different requests. ClientToken can contain only ASCII characters. It cannot exceed 64 characters in length.
IpAddress	String	No	192.XX.XX.10	The IP address of the HAVIP. If this parameter is not set, an idle IP address of the specified vSwitch is randomly allocated to the HAVIP.
Description	String	No	This is my HaVip.	The description of the HAVIP. The description must be 2 to 256 characters in length. It must start with a letter but cannot start with `http://` or `https://`.

Response parameters

Parameter	Type	Example	Description
HaVipId	String	havip-2zeo05qre24nhrqp*****	The ID of the HAVIP.

Parameter	Type	Example	Description
IpAddress	String	192.XX.XX.10	The IP address of the HAVIP.
RequestId	String	C44F62BE-9CE7-4277-B117-69243F3988BF	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=CreateHaVip
&RegionId=cn-qingdao-env17-d01
&VSwitchId=vsw-asdfjlnau****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreateHaVipResponse>
  <RequestId>C44F62BE-9CE7-4277-B117-69243F3988BF</RequestId>
  <IpAddress>192.XX.XX.10</IpAddress>
  <HaVipId>havip-2zeo05qre24nhrqp****</HaVipId>
</CreateHaVipResponse>
```

`JSON` format

```
{
    "RequestId": "C44F62BE-9CE7-4277-B117-69243F3988BF",
    "IpAddress": "192.XX.XX.10",
    "HaVipId": "havip-2zeo05qre24nhrqp****"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	Specified value of "regionId" is not supported.	The error message returned because the specified region ID is invalid. Check whether the service is available in the specified region.
404	InvalidVSwitchId.NotFound	The specified VSwitch does not exist in the specified region.	The error message returned because the specified vSwitch does not exist in the specified region.

HttpCode	Error code	Error message	Description
400	InvalidDescription.Malformed	The specified Description is wrongly formed.	The error message returned because the format of the specified description is invalid. The description must be 2 to 256 characters in length. It cannot start with http:// or https://.
403	CountLimitExceed.HaVipInVpc	Specified Vpc exceeds the quota of max number of ha-vip count.	The error message returned because the number of HAVIPs in the VPC has reached the upper limit.
403	QuotaExceeded.HaVip	Living HaVip quota exceeded.	The error message returned because the number of active HAVIPs has reached the upper limit.
400	InvalidIPAddress.OutOfRange	The specified IPAddress is out of VSwitch CIDR.	The error message returned because the specified IP address does not fall within the CIDR block of the vSwitch.
400	InvalidIPAddress.NotAvailable	The specified IPAddress is not available because it is a system reserved IPAddress.	The error message returned because the specified IP address is reserved by the system and cannot be used.
400	InvalidIPAddress.AlreadyUsed	The specified IPAddress is already used by other resource.	The error message returned because the specified IP address is already used by another resource.

15.1.2.1.17.2. DescribeHaVips

Queries high-availability virtual IP addresses (HAVIPs) in a specified region.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeHaVips	The operation that you want to perform. Set the value to **DescribeHaVips**.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where you want to create an HAVIP. You can call the **DescribeRegions** operation to query the most recent region list.
PageNumber	Integer	No	1	The number of the page to return. Pages start from page 1. Default value: **1**.
PageSize	Integer	No	10	The number of entries to return on each page. Maximum value: **50**. Default value: **10**.
Filter.N.Key	String	No	HaVipId.havip-bp149uyvut73dpldu****	Specifies filter conditions. You can specify at most five filter conditions. Valid values of **n**: **1 to 5**. You can specify multiple values for each filter condition. The logical operator among multiple values is OR. If one value is matched, the filter condition is met. The logical operator among multiple filter conditions is AND, in which case all the filter conditions must be met for an HAVIP to be included in the result. The following filter conditions are available: • **VpcId**: the ID of the virtual private cloud (VPC). • **VSwitchId**: the ID of the vSwitch. • **Status**: the status of the HAVIP. • **HaVipId**: the ID of the HAVIP. • **HaVipAddress**: the IP address of the HAVIP.
Filter.N.Value.N	RepeatList	No	1	Specifies the value of the filter condition. Valid values of **N**: **1 to 5**.

Response parameters

Parameter	Type	Example	Description
HaVips	Array of HaVip		The details about the HAVIP.
HaVip			
AssociatedEipAddresses	List	121.XX.XX.1	The list of elastic IP addresses (EIPs) that are associated with the HAVIP.
AssociatedInstanceType	String	EcsInstance	The type of the instance that is associated with the HAVIP.
AssociatedInstances	List	i-bp145q7glnuzdvzu21****	The Elastic Compute Service (ECS) instances that are associated with the HAVIP.
ChargeType	String	none	The parameter is invalid. No value is returned.
CreateTime	String	2018-07-03T14:25:26Z	The time when the HAVIP was created.
Description	String	My HaVip	The description of the HAVIP.
HaVipId	String	havip-bp149uyvut73dpld****	The ID of the HAVIP.
IpAddress	String	192.XX.XX.27	The private IP address of the HAVIP.
MasterInstanceId	String	i-bp145q7glnuzdvz****	The ID of the instance that has obtained the private IP address of the HAVIP.
Name	String	test	The name of the HAVIP.
RegionId	String	cn-qingdao-env17-d01	The ID of the region where the HAVIP is deployed.
Status	String	Available	The status of the HAVIP.
VSwitchId	String	vsw-bp1pkt1fba8e824ez****	The ID of the vSwitch to which the HAVIP belongs.

Parameter	Type	Example	Description
VpcId	String	vpc-bp1kcm36tevkpms9****	The ID of the VPC to which the HAVIP belongs.
PageNumber	Integer	1	The page number of the returned page.
PageSize	Integer	10	The number of entries returned per page.
RequestId	String	33E480C5-B46F-4CA5-B6FD-D77C746E86AB	The ID of the request.
TotalCount	Integer	1	The total number of entries returned.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeHaVips
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeHaVipsResponse>
  <TotalCount>1</TotalCount>
  <HaVips>
        <Status>Available</Status>
        <Description>My HaVip</Description>
        <VpcId>vpc-bp1kcm36tevkpms9****</VpcId>
        <MasterInstanceId>i-bp145q7glnuzdvz****</MasterInstanceId>
        <ChargeType>none</ChargeType>
        <CreateTime>2018-07-03T14:25:26Z</CreateTime>
        <VSwitchId>vsw-bp1pkt1fba8e824ez****</VSwitchId>
        <IpAddress>192.XX.XX.27</IpAddress>
        <RegionId>cn-qingdao-env17-d01</RegionId>
        <HaVipId>havip-bp149uyvut73dpld****</HaVipId>
        <AssociatedInstanceType>EcsInstance</AssociatedInstanceType>
        <Name>test</Name>
        <AssociatedInstances>i-bp145q7glnuzdvzu21****</AssociatedInstances>
        <AssociatedEipAddresses>121.XX.XX.1</AssociatedEipAddresses>
  </HaVips>
  <PageSize>10</PageSize>
  <RequestId>33E480C5-B46F-4CA5-B6FD-D77C746E86AB</RequestId>
  <PageNumber>1</PageNumber>
</DescribeHaVipsResponse>
```

`JSON` format

```

        "PageNumber": 1
    }
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidFilterKey.ValueNotSupported	Specified filter key is not supported: Filter.X.key	The error message returned because Filter.X.key is not supported.

15.1.2.1.17.3. ModifyHaVipAttribute

Modifies the description of a high-availability virtual IP address (HAVIP).

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyHaVipAttribute	The operation that you want to perform. Set the value to: **ModifyHaVipAttribute**.
HaVipId	String	Yes	havip-2zeo05qre24nhrqp****	The ID of the HAVIP that you want to modify.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region to which the HAVIP belongs. You can call the `DescribeRegions` operation to query the most recent region list.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-0016e0****	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must make sure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.
Description	String	No	This is my HaVip.	The description of the HAVIP.
Name	String	No	test	The name of the HAVIP. The name must be 2 to 128 characters in length and can contain letters, digits, underscores (_), and hyphens (-). The name must start with a letter.

Response parameters

Parameter	Type	Example	Description
RequestId	String	C44F62BE-9CE7-4277-B117-69243F3988BF	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ModifyHaVipAttribute
&HaVipId=havip-2zeo05qre24nhrqp****
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyHaVipAttributeResponse>
  <RequestId>C44F62BE-9CE7-4277-B117-69243F3988BF</RequestId>
</ModifyHaVipAttributeResponse>
```

`JSON` format

```
{
"RequestId": "C44F62BE-9CE7-4277-B117-69243F3988BF"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidHaVipId.NotFound	The specified HaVip does not exist in the specified region.	The error message returned because the HAVIP does not exist in the specified region. Specify another region ID and try again.
400	IncorrectStatus	HaVip can be deleted only when it's status is Available or InUse.	The error message returned because the HAVIP is unavailable and failed to be deleted.
400	InvalidDescription.Malformed	The specified Description is wrongly formed.	The error message returned because the format of the specified description is invalid. The description must be 2 to 256 characters in length. It cannot start with http:// or https://.

15.1.2.1.17.4. AssociateHaVip

Associates a high-availability virtual IP address (HAVIP) with an Elastic Compute Service (ECS) instance.

Descriptions

When you call this operation, take note of the following limits:

- The HAVIP takes effect immediately after it is associated with an ECS instance in a VPC. You do not need to restart the ECS instance. However, you must associate the HAVIP with the elastic network interface (ENI) of the ECS instance.
- The HAVIP and ECS instance must belong to the same vSwitch.
- You can associate an HAVIP with at most two ECS instances.
- The ECS instance must be in the Running or Stopped state.
- The HAVIP must be in the **Available** or **InUse** state.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	AssociateHaVip	The operation that you want to perform. Set the value to **AssociateHaVip**.
HaVipId	String	Yes	havip-2zeo05qre24nhrqpyf***	The ID of the HAVIP.
InstanceId	String	Yes	i-faf344422ffsfa*****	The ID of the ECS instance that you want to associate.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region to which the HAVIP belongs. You can call the `DescribeRegions` to query the most recent region list.
ClientToken	String	No	0c593ea1-3bea-11e9-b96b-88e9fe63****	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must make sure that it is unique among different requests. ClientToken can contain only ASCII characters. It cannot exceed 64 characters in length.
InstanceType	String	No	ecs.g6.large	The instance type.

Response parameters

Parameter	Type	Example	Description
RequestId	String	C44F62BE-9CE7-4277-B117-69243F3988BF	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=AssociateHaVip
&HaVipId=havip-2zeo05qre24nhrqpyf***
&InstanceId=i-faf344422ffsfa****
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<AssociateHaVipResponse>
  <RequestId>C44F62BE-9CE7-4277-B117-69243F3988BF</RequestId>
</AssociateHaVipResponse>
```

`JSON` format

```
{
"RequestId": "C44F62BE-9CE7-4277-B117-69243F3988BF"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidHaVipId.NotFound	The specified HaVip does not exist in the specified region.	The error message returned because the specified HAVIP does not exist in the specified region. Check the region.
404	InvalidInstanceId.NotFound	The specified Instance does not exist in the specified region.	The error message returned because the instance does not exist in the specified region.
400	IncorrectHaVipStatus	HaVip can be operated by this action only when it's status is Available or InUse.	The error message returned because this operation can be performed only when the HAVIP is in the Available or InUse state.
400	CountLimitExceed.HaVipOnInstance	The amount of HaVip associated with the specified Instance reach its limits.	The error message returned because the number of HAVIPs has reached the upper limit.
400	CountLimitExceeded.HaVipOnECSInstance	The amount of Instance associated with the specified HaVip reach its limits.	The error message returned because the number of HAVIPs has reached the upper limit.
400	InvalidNetworkInterfaceId.NotFound	The network interface is not found.	The error message returned because the specified ENI does not exist.

15.1.2.1.17.5. UnassociateHaVip

Disassociates a high-availability virtual IP address (HAVIP) from an Elastic Compute Service (ECS) instance in a virtual private cloud (VPC).

Descriptions

When you call this operation, take note of the following limits:

- The ECS instance must be in the Running or Stopped state.
- The HAVIP must be in the **Available** or **InUse** state.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	UnassociateHaVip	The operation that you want to perform. Set the value to **UnassociateHaVip**.
HaVipId	String	Yes	havip-2zeo05qre24nhrqpyf****	The ID of the HAVIP.
InstanceId	String	Yes	i-faf344422ffsfa******	The ID of the ECS instance that you want to disassociate.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the HAVIP. You can call the `DescribeRegions` operation to query the most recent region list.
ClientToken	String	No	0c593ea1-3bea-11e9-b96b-88e9fe63****	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must make sure that it is unique among different requests. ClientToken can contain only ASCII characters. It cannot exceed 64 characters in length.
InstanceType	String	No	ecs.g5.large	The type of the ECS instance.
Force	String	No	True	Specifies whether to forcibly disassociate the HAVIP from the ECS instance. Valid values: **True** and **False** (default). **Note** If you set this parameter to **False**, you cannot disassociate the HAVIP from a primary ECS instance.

Response parameters

Parameter	Type	Example	Description
RequestId	String	C44F62BE-9CE7-4277-B117-69243F3988BF	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=UnassociateHaVip
&HaVipId=havip-2zeo05qre24nhrqpyf****
&InstanceId=i-faf344422ffsfa****
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<UnassociateHaVipResponse>
  <RequestId>C44F62BE-9CE7-4277-B117-69243F3988BF</RequestId>
</UnassociateHaVipResponse>
```

`JSON` format

```
{
"RequestId": "C44F62BE-9CE7-4277-B117-69243F3988BF"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidHaVipId.NotFound	The specified HaVip does not exist in the specified region.	The error message returned because the specified HAVIP does not exist in the specified region. Check whether the region is correct.
404	InvalidInstanceId.NotFound	The specified Instance does not exist in the specified region.	The error message returned because the instance does not exist in the specified region.
400	IncorrectHaVipStatus	HaVip can be operated by this action only when it's status is InUse.	The error message returned because the operation can be performed only when the HAVIP is in the InUse state.

HttpCode	Error code	Error message	Description
400	IncorrectInstanceStatus	ECS instance can be operated by this action only when it's status is Running or Stopped.	The error message returned because the operation can be performed only when the ECS instance is in the Running or Stopped state.
400	ResourceNotAssociated	The HaVip and ECS instance are not associated.	The error message returned because the HAVIP is not associated with the ECS instance.
400	Forbidden.UnassociateMaster	Unassociating a master instance is not allowed unless the parameter Force is True.	The error message returned because the Force parameter is set to False.
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an unknown error occurred.
400	InvalidNetworkInterfaceId.NotFound	The network interface is not found.	The error message returned because the specified elastic network interface (ENI) does not exist.
