15.1.2.1.17.6. DeleteHaVip

Deletes a high-availability virtual IP address (HAVIP).

When you call this operation, take note of the following rules:

- You can delete only HAVIPs that are in the **Available** state.
- Make sure that no routes are destined for the HAVIP that you want to delete.
- Make sure that no elastic IP addresses (EIPs) are associated with the HAVIP that you want to delete.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteHaVip	The operation that you want to perform. Set the value to **DeleteHaVip**.
HaVipId	String	Yes	havip-2zeo05qre24nhrqpyf****	The ID of the HAVIP that you want to delete.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where you want to create an HAVIP. You can call the `DescribeRegions` operation to query the most recent region list.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-001****	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must make sure that it is unique among different requests. ClientToken can contain only ASCII characters. It cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	C44F62BE-9CE7-4277-B117-69243F3988BF	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DeleteHaVip
&HaVipId=havip-2zeo05qre24nhrqpyf****
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteHaVipResponse>
  <RequestId>C44F62BE-9CE7-4277-B117-69243F3988BF</RequestId>
</DeleteHaVipResponse>
```

`JSON` format

```
{
"RequestId": "C44F62BE-9CE7-4277-B117-69243F3988BF"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidHaVipId.NotFound	The specified HaVip does not exist in the specified region.	The error message returned because the specified HAVIP does not exist in the specified region. Check the region.
400	IncorrectStatus	HaVip can be deleted only when it is status is Available.	The error message returned because the HAVIP cannot be deleted. The error message returned because the HAVIP is not in the Available state.
400	DependencyViolation.HaVipReferedByRouteEntry	HaVip cannot be deleted when it is refered by a route table entry as next hop.	The error message returned because the HAVIP functions as the next hop of a route entry and cannot be deleted. You must delete the route entry before you can delete the HAVIP.
400	DependencyViolation.HaVipAssociatedWithEIP	HaVip cannot be deleted when it is associated with EIP.	The error message returned because the HAVIP is associated with an elastic IP address (EIP) and cannot be deleted.

15.1.2.1.18. ACLs

15.1.2.1.18.1. CreateNetworkAcl

Creates a network access control list (ACL).

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateNetworkAcl	The operation that you want to perform. Set the value to **CreateNetworkAcl**.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region to which the network ACL belongs. You can call the `DescribeRegions` operation to the most recent region list.
VpcId	String	Yes	vpc-dsfd34356vdf****	The ID of the virtual private cloud (VPC) to which you want to apply the network ACL.

Parameter	Type	Required	Example	Description
NetworkAclName	String	No	acl-1	The name of the network ACL. The name must be 2 to 128 characters in length, and can contain letters, digits, underscores (_), and hyphens (-). The name must start with a letter and cannot start with `http://` or `https://`.
Description	String	No	This is my NetworkAcl.	The description of the network ACL. The description must be 2 to 256 characters in length. The description must start with a letter but cannot start with `http://` or `https://`.
ClientToken	String	No	0c593ea1-3bea-11e9-b96b-88e9fe637760	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must make sure that it is unique among different requests. `ClientToken` can contain only ASCII characters. It cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
NetworkAclAttribute	Struct		The attributes of the network ACL.
CreationTime	String	2019-04-25 11:33:27	The time when the network ACL was created.
Description	String	This is my NetworkAcl.	The description of the network ACL.
EgressAclEntries	Array of EgressAclEntry		The outbound rules.
EgressAclEntry			
Description	String	This is EgressAclEntries.	The description of the outbound rule.
DestinationCidrIp	String	10.0.0.0/24	The destination CIDR block.

Parameter	Type	Example	Description
EntryType	String	custom	The type of the rule. Valid values: • **custom**: a custom rule. • **system**: a system rule.
NetworkAclEntryId	String	nae-a2d447uw4tillxsdc****	The ID of the outbound rule.
NetworkAclEntryName	String	acl-2	The name of the outbound rule.
Policy	String	accept	The action to be performed on network traffic that matches the rule. Valid values: • **accept**: allows the network traffic. • **drop**: blocks the network traffic.
Port	String	-1/-1	The destination ports.
Protocol	String	all	The transport layer protocols. Valid values: • **icmp** • **gre** • **tcp** • **udp** • **all**: all protocols supported
IngressAclEntries	Array of IngressAclEntry		The inbound rules.
IngressAclEntry			
Description	String	This is IngressAclEntries.	The description of the inbound rule.
EntryType	String	custom	The type of the rule. Valid values: • **custom**: a custom rule. • **system**: a system rule.
NetworkAclEntryId	String	nae-a2dk86arlydmexscd****	The ID of the inbound rule.

Parameter	Type	Example	Description
NetworkAclEntryName	String	acl-3	The name of the inbound rule.
Policy	String	accept	The action to be performed on network traffic that matches the rule. Valid values: • **accept**: allows the network traffic. • **drop**: blocks the network traffic.
Port	String	-1/-1	The source ports.
Protocol	String	all	The transport layer protocols. Valid values: • **icmp** • **gre** • **tcp** • **udp** • **all**: all protocols supported
SourceCidrIp	String	10.0.0.0/24	The source CIDR block.
NetworkAclId	String	nacl-a2do9e413e0spdefr****	The description of the network ACL.
NetworkAclName	String	acl-1	The name of the network ACL.
RegionId	String	cn-qingdao-env17-d01	The region where the network ACL is deployed.
Resources	Array of Resource		The resources that are associated with the network ACL.
Resource			
ResourceId	String	vsw-bp1de348lntdwgthy****	The ID of the associated resource.
ResourceType	String	VSwitch	The type of the associated resource.

Parameter	Type	Example	Description
Status	String	BINDED	The state of the associated resource. Valid values: • **BINDED**: The resource is associated with the network ACL. • **BINDING**: The resource is being associated with the network ACL. • **UNBINDING**: The resource is disassociated from the network ACL.
Status	String	Modifying	The state of the network ACL. Valid values: • **Available**: The network ACL is available for use. • **Modifying**: The network ACL is being configured.
VpcId	String	vpc-a2d33rfpl72k5xsscd****	The ID of the VPC to which the network ACL applies.
NetworkAclId	String	nacl-a2do9e413e0spzasx****	The description of the network ACL.
RequestId	String	0ED8D006-F706-4D23-88ED-E11ED28DCAC0	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=CreateNetworkAcl
&RegionId=cn-qingdao-env17-d01
&VpcId=vpc-dsfd34356vdf****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreateNetworkAclResponse>
  <NetworkAclId>nacl-a2do9e413e0spzasx****</NetworkAclId>
  <RequestId>0ED8D006-F706-4D23-88ED-E11ED28DCAC0</RequestId>
  <NetworkAclAttribute>
        <Status>Modifying</Status>
        <Description>This is my NetworkAcl.</Description>
        <VpcId>vpc-a2d33rfpl72k5xsscd****</VpcId>
        <NetworkAclId>nacl-a2do9e413e0spdefr****</NetworkAclId>
        <CreationTime>2019-04-25 11:33:27</CreationTime>
        <NetworkAclName>acl-1 </NetworkAclName>
        <RegionId>cn-qingdao-env17-d01</RegionId>
        <IngressAclEntries>
              <Policy>accept</Policy>
              <Description>This is IngressAclEntries. </Description>
              <EntryType>custom</EntryType>
              <Port>-1/-1 </Port>
              <SourceCidrIp>10.0.0.0/24 </SourceCidrIp>
              <NetworkAclEntryName>acl-3 </NetworkAclEntryName>
              <Protocol>all</Protocol>
              <NetworkAclEntryId>nae-a2dk86arlydmexscd****</NetworkAclEntryId>
        </IngressAclEntries>
        <EgressAclEntries>
              <Policy>accept</Policy>
              <Description>This is EgressAclEntries.</Description>
              <EntryType>custom</EntryType>
              <DestinationCidrIp>10.0.0.0/24</DestinationCidrIp>

        }
    }
}
```

15.1.2.1.18.2. AssociateNetworkAcl

Associates a network access control list (ACL) with a vSwitch.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	AssociateNetworkAcl	The operation that you want to perform. Set the value to **AssociateNetworkAcl**.

Parameter	Type	Required	Example	Description
NetworkAclId	String	Yes	nacl-a2do9e413e0spxscd****	The ID of the network ACL.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region to which the network ACL belongs. You can call the `DescribeRegions` operation to query the most recent region list.
Resource.N.ResourceType	String	No	VSwitch	The type of the resource with which you want to associate the network ACL. Set the value to **VSwitch**.
Resource.N.ResourceId	String	No	vsw-bp1de348lntdwbgnh****	The ID of the resource with which you want to associate the network ACL.
ClientToken	String	No	123e4567-e89b-12d3-a456-426655440000	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must make sure that it is unique among different requests. `ClientToken` can contain only ASCII characters. It cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	4CF20CC7-D1FC-425B-A15B-DF7C8E2131A7	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=AssociateNetworkAcl
&NetworkAclId=nacl-a2do9e413e0spxscd****
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<AssociateNetworkAclResponse>
     <RequestId>4CF20CC7-D1FC-425B-A15B-DF7C8E2131A7</RequestId>
</AssociateNetworkAclResponse>
```

`JSON` format

```
{
    "RequestId":"4CF20CC7-D1FC-425B-A15B-DF7C8E2131A7"
}
```

15.1.2.1.18.3. ModifyNetworkAclAttributes

Modifies the attributes of a network access control list (ACL).

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyNetworkAclAttributes	The operation that you want to perform. Set the value to **ModifyNetworkAclAttributes**.
NetworkAclId	String	Yes	acl-bp1lhl0taik****	The ID of the network ACL.
RegionId	String	Yes	cn-qingdao-env17-d01	The region where to which the network ACL belongs. You can call the `DescribeRegions` operation to query the most recent region list.
NetworkAclName	String	No	acl-1	The name of the network ACL. The name must be 2 to 128 characters in length, and can contain letters, digits, underscores (_), and hyphens (-). The name must start with a letter and cannot start with `http://` or `https://`.
Description	String	No	This is my NetworkAcl.	The description of the network ACL. The description must be 2 to 256 characters in length. The description must start with a letter but cannot start with `http://` or `https://`.

Parameter	Type	Required	Example	Description
ClientToken	String	No	123e4567-e89b-12d3-a456-426655440000	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must make sure that it is unique among different requests. `ClientToken` can contain only ASCII characters. It must be 1 to 64 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	8F76C3E4-B39F-465D-B8B3-50BAF03CA833	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ModifyNetworkAclAttributes
&NetworkAclId=acl-bp1lhl0taik****
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success response

`XML` format

```
<ModifyNetworkAclAttributesResponse>
     <RequestId>8F76C3E4-B39F-465D-B8B3-50BAF03CA833</RequestId>
</ModifyNetworkAclAttributesResponse>
```

`JSON` format

```
{
    "RequestId": "8F76C3E4-B39F-465D-B8B3-50BAF03CA833"
    }
```

15.1.2.1.18.4. UpdateNetworkAclEntries

Updates the rules of a network access control list (ACL).

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	UpdateNetworkAclEntries	The operation that you want to perform. Set the value to **UpdateNetworkAclEntries**.
NetworkAclId	String	Yes	nacl-bp1lhl0taikrzxsc****	The ID of the network ACL.
RegionId	String	Yes	cn-qingdao-env17-d01	The region to which the network ACL belongs. You can call the **DescribeRegions** operation to query the most recent region list.
IngressAclEntries.N.NetworkAclEntryName	String	No	acl-3	The name of the inbound rule.
IngressAclEntries.N.NetworkAclEntryId	String	No	nae-2zepn32de59j8m4****	The ID of the inbound rule.
IngressAclEntries.N.Policy	String	No	accept	The action to be performed on network traffic that matches the rule. Valid values: • **accept**: allows the network traffic. • **drop**: blocks the network traffic.
IngressAclEntries.N.Protocol	String	No	all	The transport layer protocols. Valid values: • **icmp**: Internet Control Message Protocol (ICMP) • **gre**: Generic Routing Encapsulation (GRE) • **tcp**: TCP • **udp**: UDP • **all**: All protocols are supported.
IngressAclEntries.N.SourceCidrIp	String	No	10.0.0.0/24	The source CIDR block.
IngressAclEntries.N.Port	String	No	-1/-1	The source ports.

Parameter	Type	Required	Example	Description
IngressAclEntries.N.EntryType	String	No	custom	The type of the rule. Valid values: • **custom** (default): a custom rule. • **system**: a system rule.
IngressAclEntries.N.Description	String	No	This is IngressAclEntries.	The description of the inbound rule.
EgressAclEntries.N.NetworkAclEntryName	String	No	acl-2	The name of the outbound rule.
EgressAclEntries.N.NetworkAclEntryId	String	No	nae-2zecs97e0brcge46****	The ID of the outbound rule.
EgressAclEntries.N.Policy	String	No	accept	The action to be performed on network traffic that matches the rule. Valid values: • **accept**: allows the network traffic. • **drop**: blocks the network traffic.
EgressAclEntries.N.Protocol	String	No	all	The transport layer protocols. Valid values: • **icmp**: ICMP • **gre**: GRE • **tcp**: TCP • **udp**: UDP • **all**: All protocols are supported.
EgressAclEntries.N.DestinationCidrIp	String	No	10.0.0.0/24	The destination CIDR block.
EgressAclEntries.N.Port	String	No	-1/-1	The destination ports.
EgressAclEntries.N.EntryType	String	No	custom	The type of the rule. Valid values: • **custom** (default): a custom rule • **system**: a system rule
EgressAclEntries.N.Description	String	No	This is EgressAclEntries.	The description of the outbound rule.

Parameter	Type	Required	Example	Description
UpdateIngressAclEntries	Boolean	No	false	Specifies whether to update the inbound rule. Valid rules: • **true**: updates the inbound rule. • **false** (default): does not update the inbound rule.
UpdateEgressAclEntries	Boolean	No	false	Specifies whether to update the outbound rule. Valid rules: • **true**: updates the outbound rule. • **false** (default): does not update the outbound rule.
ClientToken	String	No	0c593ea1-3bea-11e9-b96b-88e9fe637760	The client token that is used to guarantee the idempotence of the request. You can use the client to generate the value, but you must make sure that it is unique among different requests. `ClientToken` can contain only ASCII characters. It cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	1170A5A0-E760-4331-9133-A7D38D973215	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=UpdateNetworkAclEntries
&NetworkAclId=nacl-bp1lhl0taikrzxsc****
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<UpdateNetworkAclEntriesResponse>
     <RequestId>1170A5A0-E760-4331-9133-A7D38D973215</RequestId>
</UpdateNetworkAclEntriesResponse>
```

`JSON` format

```
{
    "RequestId": "1170A5A0-E760-4331-9133-A7D38D973215"
}
```

15.1.2.1.18.5. UnassociateNetworkAcl

Disassociates a network access control list (ACL) from a vSwitch.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	UnassociateNetworkAcl	The operation that you want to perform. Set the value to **UnassociateNetworkAcl**.
NetworkAclId	String	Yes	nacl-a2do9e413e0sp****	The ID of the network ACL.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the network ACL is deployed. You can call the `DescribeRegions` operation to query the most recent region list.
Resource.N.ResourceType	String	No	VSwitch	The type of the resource associated with the network ACL.
Resource.N.ResourceId	String	No	vsw-bp1de348lntdw****	The ID of the associated resource.
ClientToken	String	No	123e4567-e89b-12d3-a456-426655440000	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must make sure that it is unique among different requests. `ClientToken` can contain only ASCII characters. It cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	AD024BAA-2D91-48FD-810B-8FB7489B6EE6	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=UnassociateNetworkAcl
&NetworkAclId=nacl-a2do9e413e0sp****
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success response

`XML` format

```
<UnassociateNetworkAclResponse>
     <RequestId>AD024BAA-2D91-48FD-810B-8FB7489B6EE6</RequestId>
</UnassociateNetworkAclResponse>
```

`JSON` format

```
{
    "RequestId": "AD024BAA-2D91-48FD-810B-8FB7489B6EE6"
    }
```

15.1.2.1.18.6. CopyNetworkAclEntries

Copies rules of a network access control list (ACL).

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CopyNetworkAclEntries	The operation that you want to perform. Set the value to **CopyNetworkAclEntries**.
NetworkAclId	String	Yes	nacl-a2do9e413e0sp****	The ID of the network ACL.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region to which the network ACL belongs. You can call the `DescribeRegions` operation to query the most recent region list.
SourceNetworkAclId	String	Yes	nacl-ghuo9ehg3e0sp*****	The ID of the network ACL whose rules you want to copy.

Response parameters

Parameter	Type	Example	Description
RequestId	String	6608E72F-F276-440F-ABEF-419971CEC4D1	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=CopyNetworkAclEntries
&NetworkAclId=nacl-a2do9e413e0sp****
&RegionId=cn-qingdao-env17-d01
&SourceNetworkAclId=nacl-ghuo9ehg3e0sp****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CopyNetworkAclEntriesResponse>
     <RequestId>6608E72F-F276-440F-ABEF-419971CEC4D1</RequestId>
</CopyNetworkAclEntriesResponse>
```

`JSON` format

```
{
    "RequestId": "6608E72F-F276-440F-ABEF-419971CEC4D1"
    }
```

15.1.2.1.18.7. DeleteNetworkAcl

Deletes a network access control list (ACL).

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteNetworkAcl	The operation that you want to perform. Set the value to **DeleteNetworkAcl**.
NetworkAclId	String	Yes	nacl-bp1q8bgx4xnkm****	The ID of the network ACL.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region to which the network ACL belongs. You can call the `DescribeRegions` operation to query the most recent region list.
ClientToken	String	No	123e4567-e89b-12d3-a456-426655440000	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must make sure that it is unique among different requests. `ClientToken` can contain only ASCII characters. It cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	34F1206D-04B0-4A05-9D8A-80521E288BD1	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DeleteNetworkAcl
&NetworkAclId=nacl-bp1q8bgx4xnkm****
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteNetworkAclResponse>
     <RequestId>34F1206D-04B0-4A05-9D8A-80521E288BD1</RequestId>
</DeleteNetworkAclResponse>
```

`JSON` format

```
{
    "RequestId": "34F1206D-04B0-4A05-9D8A-80521E288BD1"
    }
```

15.1.2.1.18.8. DescribeNetworkAcls

Queries network ACLs.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeNetworkAcls	The operation that you want to perform. Set the value to **DescribeNetworkAcls**.
RegionId	String	Yes	cn-qingdao-env17-d01	The region where the network ACL is deployed. You can call the `DescribeRegions` operation to query the most recent region list.
NetworkAclId	String	No	nacl-bp1lhl0taikrbgnh****	The description of the network ACL.
NetworkAclName	String	No	acl-1	The name of the network ACL. The name must be 2 to 128 characters in length, and can contain letters, digits, underscores (_), and hyphens (-). The name must start with a letter and cannot start with `http://` or `https://`.
VpcId	String	No	vpc-1234****	The ID of the VPC to which the network ACL applies.
ResourceType	String	No	VSwitch	The type of the associated instance. Set the value to **VSwitch**. This parameter is valid only when `ResourceType` and `ResourceId` are both set.
ResourceId	String	No	vsw-bp1de348lntdwnhbg****	The ID of the associated instance. This parameter is valid only when `ResourceType` and `ResourceId` are both set.

Parameter	Type	Required	Example	Description
PageNumber	Integer	No	1	The number of the page to return. Pages start from page 1. Default value: **1**.
PageSize	Integer	No	10	The number of entries to return on each page. Maximum value: **50**. Default value: **10**.
ClientToken	String	No	0c593ea1-3bea-11e9-b96b-88e9fe63****	The token used to ensure idempotence. You can use the client to generate the value, but you must make sure that it is unique among different requests. ClientToken can contain only ASCII characters. It cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
NetworkAcls	Array of NetworkAcl		The details about the network ACL.
NetworkAcl			
CreationTime	String	2019-04-25 11:44:17	The time when the network ACL was created.
Description	String	This is my NetworkAcl.	The description of the network ACL.
EgressAclEntries	Array of EgressAclEntry		The outbound rules.
EgressAclEntry			
Description	String	This is EgressAclEntries.	The description of the outbound rule.
DestinationCidrIp	String	10.0.0.0/24	The destination CIDR block.
EntryType	String	custom	The type of the rule. Valid values: • **custom**: a custom rule • **system**: a system rule

Parameter	Type	Example	Description
NetworkAclEntryId	String	nae-a2d447uw4tillfvgb****	The ID of the outbound rule.
NetworkAclEntryName	String	acl-2	The name of the outbound rule.
Policy	String	accept	The action to be performed on network traffic that matches the rule. Valid values: • **accept**: allows the network traffic. • **drop**: blocks the network traffic.
Port	String	-1/-1	The destination ports.
Protocol	String	all	The transport layer protocols. Valid values: • **icmp**: Internet Control Message Protocol (ICMP) • **gre**: Generic Routing Encapsulation (GRE) • **tcp**: TCP • **udp**: UDP • **all**: All protocols are supported.
IngressAclEntries	Array of IngressAclEntry		Information about inbound rules.
IngressAclEntry			
Description	String	This is IngressAclEntries.	The description of the inbound rule.
EntryType	String	custom	The type of the rule. Valid values: • **custom**: a custom rule • **system**: a system rule
NetworkAclEntryId	String	nae-a2dk86arlydmezasw****	The ID of the inbound rule.
NetworkAclEntryName	String	acl-3	The name of the inbound rule.

Parameter	Type	Example	Description
Policy	String	accept	The action to be performed on network traffic that matches the rule. Valid values: • **accept**: allows the network traffic. • **drop**: blocks the network traffic.
Port	String	-1/-1	The source ports.
Protocol	String	all	The transport layer protocols. Valid values: • **icmp**: ICMP • **gre**: GRE • **tcp**: TCP • **udp**: UDP • **all**: All protocols are supported.
SourceCidrIp	String	10.0.0.0/24	The source CIDR block.
NetworkAclId	String	nacl-a2do9e413e0spxscd****	The ID of the network ACL.
NetworkAclName	String	acl-8	The name of the network ACL.
OwnerId	Long	12345678	The ID of the Apsara Stack tenant account to which the network ACL belongs.
RegionId	String	cn-qingdao-env17-d01	The ID of the region to which the network ACL belongs.
Resources	Array of Resource		The resources that are associated with the network ACL.
Resource			
ResourceId	String	vsw-bp1de348lntdwcdf*****	The ID of the resource with which you want to associate the network ACL.
ResourceType	String	VSwitch	The type of the associated resource.

Parameter	Type	Example	Description
Status	String	BINDED	The status of the associated resource. Valid values: • **BINDED**: The resource is associated with the network ACL. • **BINDING**: The resource is being associated with the network ACL. • **UNBINDING**: The resource is disassociated from the network ACL.
Status	String	Available	The status of the network ACL. Valid values: • **Available**: The network ACL is available for use. • **Modifying**: The network ACL is being configured.
VpcId	String	vpc-a2d33rfpl72k5defr****	The ID of the associated VPC.
PageNumber	String	1	The page number of the returned page.
PageSize	String	10	The number of entries on the current page.
RequestId	String	F7DDDC17-FA06-4AC2-8F35-59D2470FCFC1	The ID of the request.
TotalCount	String	2	The total number of entries returned.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeNetworkAcls
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeNetworkAclsResponse>
  <TotalCount>2</TotalCount>

15.1.2.1.18.9. DescribeNetworkAclAttributes

Queries details about a network ACL.

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeNetworkAclAttributes	The operation that you want to perform. Set the value to **DescribeNetworkAclAttributes**.
NetworkAclId	String	Yes	nacl-a2do9e413e0spzasx****	The ID of the network ACL.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region to which the network ACL belongs. You can call the `DescribeRegions` operation to query the most recent region list.
ClientToken	String	No	0c593ea1-3bea-11e9-b96b-88e9fe****	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must make sure that it is unique among different requests. ClientToken can contain only ASCII characters. It cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
NetworkAclAttribute	Struct		The details about the network ACL.
CreationTime	String	2019-04-25 11:33:27	The time when the network ACL was created.
Description	String	This is my NetworkAcl.	The description of the network ACL.
EgressAclEntries	Array of EgressAclEntry		The information about outbound rules of the network ACL.
EgressAclEntry			
Description	String	This is EgressAclEntries.	The description of the outbound rule.

Parameter	Type	Example	Description
DestinationCidrIp	String	10.0.0.0/24	The destination CIDR block.
EntryType	String	custom	The type of the rule. Valid values: • **custom**: a custom rule • **system**: a system rule
NetworkAclEntryId	String	nae-a2d447uw4tillxdcv****	The ID of the outbound rule.
NetworkAclEntryName	String	acl-2	The name of the outbound rule.
Policy	String	accept	The action to be performed on network traffic that matches the rule. Valid values: • **accept**: allows the network traffic. • **drop**: blocks the network traffic.
Port	String	-1/-1	The range of destination ports.
Protocol	String	all	The transport layer protocols. Valid values: • **icmp**: Internet Control Message Protocol (ICMP) • **gre**: Generic Routing Encapsulation (GRE) • **tcp**: TCP • **udp**: UDP • **all**: all protocols supported
IngressAclEntries	Array of IngressAclEntry		The information about inbound rules of the network ACL.
IngressAclEntry			
Description	String	This is IngressAclEntries.	The description of the inbound rule.
EntryType	String	custom	The type of the rule. Valid values: • **custom**: a custom rule • **system**: a system rule

Parameter	Type	Example	Description
NetworkAclEntryId	String	nae-a2dk86arlydmevfbg****	The ID of the inbound rule.
NetworkAclEntryName	String	acl-3	The name of the inbound rule.
Policy	String	accept	The action to be performed on network traffic that matches the rule. Valid values: • **accept**: allows the network traffic. • **drop**: blocks the network traffic.
Port	String	-1/-1	The range of source ports.
Protocol	String	all	The transport layer protocols. Valid values: • **icmp**: ICMP • **gre**: GRE • **tcp**: TCP • **udp**: UDP • **all**: All protocols are supported.
SourceCidrIp	String	10.0.0.0/24	The CIDR block of the source address.
NetworkAclId	String	nacl-a2do9e413e0spnhmj****	The ID of the network ACL.
NetworkAclName	String	acl-1	Enter a name for the network ACL.
OwnerId	Long	12345678	The ID of the Alibaba Cloud account to which the network ACL belongs.
RegionId	String	cn-qingdao-env17-d01	The ID of the region to which the network ACL belongs.
Resources	Array of Resource		The resources that are associated with the network ACL.
Resource			
ResourceId	String	vsw-bp1de348lntdwxscd****	The ID of the associated resource.

Parameter	Type	Example	Description
ResourceType	String	VSwitch	The type of the associated resource.
Status	String	BINDED	The state of the associated resource. Valid values: • **BINDED**: The resource is associated with the network ACL. • **BINDING**: The resource is being associated with the network ACL. • **UNBINDING**: The resource is disassociated from the network ACL.
Status	String	Available	The state of the associated resource. Valid values: • **Available**: The network ACL is available for use. • **Modifying**: The network ACL is being configured.
VpcId	String	vpc-a2d33rfpl72k5defr****	The ID of the VPC to which the network ACL applies.
RequestId	String	F5905F9C-0161-4E72-9CB1-1F3F3CF6268A	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeNetworkAclAttributes

```

15.1.2.1.19. IPv6 gateways

15.1.2.1.19.1. CreateIpv6Gateway

You can call this operation to create an IPv6 gateway.

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateIpv6Gateway	The operation that you want to perform. Valid values: **CreateIpv6Gateway** .
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the IPv6 gateway. You can call `DescribeRegions` interface to obtain the region ID.
VpcId	String	Yes	vpc-123sedrfswd23****	The ID of the virtual private cloud (VPC) for which you want to create the IPv6 gateway.
Spec	String	No	Small	The specification that you want to set for the IPv6 gateway. Valid values: • **Small** (Default value): Free edition. • **Medium** : Enterprise Edition. • **Large** : Enterprise enhanced edition. IPv6 gateways of different specifications have different forwarding capabilities. For more information, see the `IPv6 Gateway Specifications` .
Name	String	No	ipv6GW	The name of the IPv6 gateway. The name must be 2 to 128 characters in length and can contain digits, periods (.), underscores (_), and hyphens (-). It must start with a letter, but cannot start with `http://` or `https://` The beginning.
Description	String	No	ipv6gatewayforVPC1	The description of the IPv6 gateway. The name must be 2 to 256 characters in length and can contain digits, periods (.), underscores (_), and hyphens (-). It must start with a letter, but cannot start with `http://` or `https://` The beginning.

Parameter	Type	Required	Example	Description
ClientToken	String	No	123456	The client token that is used to ensure the idempotence of the request. The value of this parameter is generated by a client. The value must be unique among different requests and must be 1 to 64 ASCII characters in length.

Response parameters

Parameter	Type	Example	Description
Ipv6GatewayId	String	ipv6gw-hp3y0l3ln89j8cdvf****	The ID of the IPv6 gateway.
RequestId	String	0ED8D006-F706-4D23-88ED-E11ED28DCAC	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=CreateIpv6Gateway
&RegionId=cn-qingdao-env17-d01
&VpcId=vpc-123sedrfswd23****
&<Public request parameters>
```

Sample success responses

`XML` format

```
<CreateIpv6GatewayResponse>
        <RequestId>0ED8D006-F706-4D23-88ED-E11ED28DCAC0</RequestId>
        <Ipv6GatewayId>ipv6gw-hp3y0l3ln89j8cdvf****</Ipv6GatewayId>
</CreateIpv6GatewayResponse>
```

`JSON` format

```
{
    "RequestId": "0ED8D006-F706-4D23-88ED-E11ED28DCAC0",
    "Ipv6GatewayId": "ipv6gw-hp3y0l3ln89j8cdvf****"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because the specified region ID does not exist.
404	InvalidVpcId.NotFound	Specified VPC does not exist.	The error message returned because the specified VPC does not exist.

15.1.2.1.19.2. DeleteIpv6Gateway

Deletes an IPv6 gateway.

Before you delete an IPv6 gateway of the Enterprise Edition and Enterprise Enhanced Edition, you must delete the outbound-only rule. For more information, see the DeleteIpv6EgressOnlyRule .

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteIpv6Gateway	The operation that you want to perform. Valid values: **DeleteIpv6Gateway** .
Ipv6GatewayId	String	Yes	ipv6gw-hp3y0l3ln89j8xxxxxxxx	The ID of the IPv6 gateway that you want to delete.
RegionId	String	Yes	cn-huhehaote	The ID of the region to which the IPv6 gateway belongs. You can call DescribeRegions interface to obtain the region ID.

Response parameters

Parameter	Type	Example	Description
RequestId	String	E9A8AABE-A84B-4AF2-A68A-8E2EA190E7AE	The ID of the request.

Examples

Sample requests

```
https://vpc.aliyuncs.com/?Action=DeleteIpv6Gateway
&Ipv6 GatewayId=ipv6gw-hp3y0l3ln89j8xxxxxxxx
&RegionId=cn-huhehaote
&<Public request parameters>
```

Sample success responses

`XML` format

```
<DeleteIpv6GatewayResponse>
  <RequestId>E9A8AABE-A84B-4AF2-A68A-8E2EA190E7AE</RequestId>
</DeleteIpv6GatewayResponse>
```

`JSON` format

```
{
   "RequestId": "E9A8AABE-A84B-4AF2-A68A-8E2EA190E7AE"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because RegionId is set to an invalid value. Check whether the service is available in the specified region.

15.1.2.1.19.3. DescribeIpv6Gateways

Queries IPv6 gateways that you have created.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeIpv6Gateways	The operation that you want to perform. Valid values: **DescribeIpv6GateWays** .
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region to which the IPv6 gateway belongs. You can call `DescribeRegions` interface to obtain the region ID.
Ipv6GatewayId	String	No	ipv6gw-123456****	The ID of the IPv6 gateway.
VpcId	String	No	vpc-123456****	The ID of the virtual private cloud (VPC) to which the IPv6 gateway belongs.
Name	String	No	ipv6GW****	The name of the IPv6 gateway.

Parameter	Type	Required	Example	Description
PageNumber	Integer	No	1	The number of the page to query.
PageSize	Integer	No	10	The number of entries to return on each page.

Response parameters

Parameter	Type	Example	Description
Ipv6Gateways	Array of Ipv6Gateway		The details about the IPv6 gateways.
Ipv6Gateway			
BusinessStatus	String	Normal	The status of the IPv6 gateway. Valid values: • **Normal** : normal. • **FinancialLocked** : The overdue payment is locked.
CreationTime	String	2018-12-20T14:51:23Z	The time when the IPv6 gateway was created.
Description	String	descriptionforIPv6GW	The description of the IPv6 gateway.
ExpiredTime	String	2018-12-20T14:51:23Z	The time when the IPv6 gateway expires.
InstanceChargeType	String	PostPaid	The metering method of the IPv6 gateway.
Ipv6GatewayId	String	ipv6gw-hp3rwmtmfhgis****	The ID of the IPv6 gateway.
Name	String	name	The name of the IPv6 gateway.
RegionId	String	cn-qingdao-env17-d01	The region ID of the IPv6 gateway to which the IPv6 address belongs.
Spec	String	Small	The specification of the IPv6 gateway.

Parameter	Type	Example	Description
Status	String	Available	The status of the IPv6 gateway.
VpcId	String	vpc-123456****	The ID of the virtual private cloud (VPC) to which the IPv6 gateway belongs.
PageNumber	Integer	1	The number of the page to query.
PageSize	Integer	19	The number of entries returned per page.
RequestId	String	E3A06196-3E7C-490D-8F39-CB4B5A0CE8AD	The ID of the request.
TotalCount	Integer	2	The total number of entries returned.

```

15.1.2.1.19.4. ModifyIpv6GatewaySpec

Changes the specification of an IPv6 gateway.

Different specifications have different forwarding capabilities and bandwidths. For more information, see `IPv6 Gateway Specifications` .

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyIpv6GatewaySpec	The operation that you want to perform. Valid values: **ModifyIpv6GatewaySpec** .
Ipv6GatewayId	String	Yes	ipv6gw-123456****	The ID of the IPv6 gateway with which the egress-only rules are configured.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the IPv6 gateway. You can call `DescribeRegions` interface to obtain the region ID.
Spec	String	Yes	Middle	The new specification that you want to set for the IPv6 gateway. Valid values: • **Small** (Default value): Free edition. • **Middle** : Enterprise Edition. • **Large** : Enterprise enhanced edition.
ClientToken	String	No	123456	The client token that is used to ensure the idempotence of the request. The value of this parameter is generated by a client. The value must be unique among different requests and must be 1 to 64 ASCII characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	9DFEDBEE-E5AB-49E8-A2DC-CC114C67AF75	The ID of the request.

Examples

Sample requests

```
https://vpc.aliyuncs.com/?Action=ModifyIpv6GatewaySpec
&RegionId=cn-huhehaote
&Ipv6GatewayId=ipv6gw-123456xxxxxxxx
&Spec=Middle
&Common request parameter
```

Sample success responses

`XML` format

```
<ModifyIpv6GatewaySpecResponse>
      <RequestId>9DFEDBEE-E5AB-49E8-A2DC-CC114C67AF75</RequestId>
</ModifyIpv6GatewaySpecResponse>
```

`JSON` format

```
{
    "RequestId": "9DFEDBEE-E5AB-49E8-A2DC-CC114C67AF75"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because the specified region ID does not exist.

15.1.2.1.19.5. DescribeIpv6EgressOnlyRules

You can call this operation to query the egress-only rules that match specific conditions.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeIpv6EgressOnlyRules	The operation that you want to perform. Valid values: **DescribeIpv6EgressOnlyRules** .
Ipv6GatewayId	String	Yes	ipv6gw-123456********	The ID of the IPv6 gateway with which the egress-only rules are configured.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the IPv6 gateway. You can call `DescribeRegions` interface to obtain the region ID.
Ipv6EgressOnlyRuleId	String	No	ipv6gwpy-123456********	The ID of the egress-only rule that you want to query.
Name	String	No	rulename	The name of the egress-only rule.

Parameter	Type	Required	Example	Description
InstanceType	String	No	Ipv6Address	The type of the instance to which you want to apply the egress-only rule. Set the value to: **Ipv6Address** : an IPv6 address.
InstanceId	String	No	i-123456********	The ID of the instance that is associated with the IPv6 address to which the egress-only rule is applied.
PageNumber	Integer	No	1	The page number of the list. Default value: **1** .
PageSize	Integer	No	10	The number of rows per page in a paged query. The maximum value is **50** , the default value is **10** .

Response parameters

Parameter	Type	Example	Description
Ipv6EgressOnlyRules	Array of Ipv6EgressOnlyRule		The details about the egress-only rule.
Ipv6EgressOnlyRule			
Description	String	ruledescription	The description of the egress-only rule.
InstanceId	String	i-123456********	The ID of the instance to which the egress-only rule is applied.
InstanceType	String	Ipv6Address	The type of the instance to which the egress-only rule is applied.
Ipv6EgressOnlyRuleId	String	ipv6gwpy-123456********	The ID of the egress-only rule.
Name	String	rulename	The name of the egress-only rule.
Status	String	Available	The status of the egress-only rule.

Parameter	Type	Example	Description
PageNumber	Integer	1	The page number of the list. Default value: **1** .
PageSize	Integer	10	The number of rows per page in a paged query. The maximum value is **50** , the default value is **10** .
RequestId	String	E16671B7-DEA6-48E0-8E9C-41913DAD44DD	The ID of the request.
TotalCount	Integer	1	The number of returned entries.

Examples

Sample requests

```
https://vpc.aliyuncs.com/?Action=DescribeIpv6EgressOnlyRules
&RegionId=cn-huhehaote
&Ipv6GatewayId=ipv6gw-123456xxxxxxxx
&Common request parameter
```

Sample success responses

`XML` format

```
<DescribeIpv6EgressOnlyRulesResponse>
      <Ipv6EgressOnlyRules>
            <Ipv6EgressOnlyRule>
                  <Name></Name>
                  <Status>Available</Status>
                  <Description></Description>
                  <InstanceId>ipv6-hp3b5a8t12ihyxxxxxxxx</InstanceId>
                  <Ipv6EgressOnlyRuleId>ipv6py-hp3w98rmlbqp0xxxxxxxx</Ipv6EgressOnlyRuleId>
                  <InstanceType>Ipv6Address</InstanceType>
            </Ipv6EgressOnlyRule>
      </Ipv6EgressOnlyRules>
      <PageNumber>1</PageNumber>
      <TotalCount>1</TotalCount>
      <PageSize>10</PageSize>
      <RequestId>D1FFB517-D1A7-49BA-9169-C7E7194A9B55</RequestId>
</DescribeIpv6EgressOnlyRulesResponse>
```

`JSON` format

```
{
    "Ipv6EgressOnlyRules": {
        "Ipv6EgressOnlyRule": [
            {
                "Name": "",
                "Status": "Available",
                "Description": "",
                "InstanceId": "ipv6-hp3b5a8t12ihyxxxxxxxx",
                "Ipv6EgressOnlyRuleId": "ipv6py-hp3w98rmlbqp0xxxxxxxx",
                "InstanceType": "Ipv6Address"
            }
        ]
    },
    "PageNumber": 1,
    "TotalCount": 1,
    "PageSize": 10,

}
```

15.1.2.1.19.6. CreateIpv6EgressOnlyRule

Creates an egress-only rule for an IPv6 address.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateIpv6EgressOnlyRule	The operation that you want to perform. Valid values: **CreateIpv6EgressOnlyRule** .
InstanceId	String	Yes	ipv6-hp3nxjkfxn5pnhgl5****	The ID of the IPv6 address with which the egress-only rule will be configured.
Ipv6GatewayId	String	Yes	ipv6gw-hp3c2paq0ywauasza****	The ID of the IPv6 gateway to which the specified IPv6 address belongs.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the IPv6 gateway. You can call `DescribeRegions` interface to obtain the region ID.
InstanceType	String	No	IPv6Address	The type of the instance that will be configured with the egress-only rule. Set the value to: **Ipv6Address** (Default),IPv6 address.

Parameter	Type	Required	Example	Description
Name	String	No	rulename	The name of the egress-only rule. The name must be 2 to 128 characters in length and can contain digits, periods (.), underscores (_), and hyphens (-). It must start with a letter, but cannot start with `http://` or `https://` The beginning.
Description	String	No	ruledescription	The description of the egress-only rule. The name must be 2 to 256 characters in length and can contain digits, periods (.), underscores (_), and hyphens (-). It must start with a letter, but cannot start with `http://` or `https://` The beginning.
ClientToken	String	No	123456	The client token that is used to ensure the idempotence of the request. The value of this parameter is generated by a client. The value must be unique among different requests and must be 1 to 64 ASCII characters in length.

Response parameters

Parameter	Type	Example	Description
Ipv6EgressRuleId	String	ipv6py-hp3w98rmlbqp01245****	The ID of the egress-only rule.
RequestId	String	9DFEDBEE-E5AB-49E8-A2DC-CC114C67AF75	The ID of the request.

Examples

Sample requests

```
https://vpc.aliyuncs.com/?Action=CreateIpv6EgressOnlyRule
&RegionId=cn-huhehaote
&InstanceId=ipv6-hp3nxjkfxn5pnhgl5****
&Ipv6GatewayId=ipv6gw-hp3c2paq0ywauasza****
&Common request parameter
```

Sample success responses

`XML` format

```
<CreateIpv6EgressOnlyRuleResponse>
      <RequestId>9DFEDBEE-E5AB-49E8-A2DC-CC114C67AF75</RequestId>
      <Ipv6EgressRuleId>ipv6py-hp3w98rmlbqp01245****</Ipv6EgressRuleId>
</CreateIpv6EgressOnlyRuleResponse>
```

`JSON` format

```
    { "CreateIpv6EgressOnlyRuleResponse": { "Ipv6EgressRuleId": "ipv6py-hp3w98rmlbqp01245*
***", "RequestId": "9DFEDBEE-E5AB-49E8-A2DC-CC114C67AF75" } }
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because the specified region ID does not exist.

15.1.2.1.19.7. DeleteIpv6EgressOnlyRule

Deletes an egress-only rule.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteIpv6EgressOnlyRule	The operation that you want to perform. Set the value to **DeleteIpv6EgressOnlyRule**.
Ipv6EgressOnlyRuleId	String	Yes	ipv6py-hp3w98rmlbqp0xxxxxxx	The ID of the egress-only rule that you want to delete.
RegionId	String	Yes	cn-huhehaote	The ID of the IPv6 gateway.
ClientToken	String	No	123456	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must ensure that it is unique among different requests. The token can only contain ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	9DFEDBEE-E5AB-49E8-A2DC-CC114C67AF75	The ID of the request.

Examples

Sample requests

```
https://vpc.aliyuncs.com/?Action=DeleteIpv6EgressOnlyRule
&RegionId=cn-huhehaote
&Ipv6GatewayId=ipv6gw-123456
&Ipv6EgressOnlyRuleId=ipv6py-hp3w98rmlbqp0xxxxxxxx
&Common request parameter
```

Sample success responses

`XML` format

```
<DeleteIpv6EgressOnlyRuleResponse>
   <RequestId>9DFEDBEE-E5AB-49E8-A2DC-CC114C67AF75</RequestId>
</DeleteIpv6EgressOnlyRuleResponse>
```

`JSON` format

```
{
 "RequestId": "4E40EAF1-783D-4C05-948D-DA0426C398C1"
}
```

15.1.2.1.19.8. DeleteIpv6InternetBandwidth

Sets the Internet bandwidth value of an IPv6 address to zero.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteIpv6InternetBandwidth	The operation that you want to perform. Set the value to **DeleteIpv6InternetBandwidth**.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-huhehaote	The ID of the region where the IPv6 gateway is deployed. You can call the DescribeRegions operation to query the most recent region list.
Ipv6AddressId	String	No	ipv6-123456xxxxxxxx	The ID of the IPv6 address.
Ipv6InternetBandwidthId	String	No	2	The Internet bandwidth value of the IPv6 address.

Response parameters

Parameter	Type	Example	Description
RequestId	String	E07E0FE6-5C21-405F-AF82-7613AA81EF92	The ID of the request.

Examples

Sample requests

```
https://vpc.aliyuncs.com/?Action=DeleteIpv6InternetBandwidth
&RegionId=cn-huhehaote
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteIpv6InternetBandwidthResponse>
   <RequestId>6972A26E-99B1-4367-9890-FBDEBB0F5E7D</RequestId>
</DeleteIpv6InternetBandwidthResponse>
```

`JSON` format

```
{
 "RequestId": "E07E0FE6-5C21-405F-AF82-7613AA81EF92"
}
```

Error codes

HttpCode	Error code	Error message	Description

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because the specified region ID does not exist. Check whether the region ID is valid.

15.1.2.1.19.9. DescribeIpv6GatewayAttribute

You can call this operation to query the details of an IPV6 gateway.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeIpv6GatewayAttribute	The operation that you want to perform. Valid values: **DescribeIpv6GatewayAttribute** .
Ipv6GatewayId	String	Yes	ipv6gw-123456********	The ID of the IPv6 gateway to query.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the IPv6 gateway. You can call `DescribeRegions` interface to obtain the region ID.

Response parameters

Parameter	Type	Example	Description
BusinessStatus	String	Normal	The status of the IPv6 gateway. Valid values: • **Normal** : normal. • **FinacialLocked** : The overdue payment is locked. • **SecurityLocked** : Security locked.
CreationTime	String	2018-12-05T09:21:35Z	The time when the IPv6 gateway was created.
Description	String	test	The description of the IPv6 gateway.
ExpiredTime	String	2018-12-05T09:21:35Z	The time when the IPv6 gateway expires.
InstanceChargeType	String	PostPaid	The metering method of the IPv6 gateway.

Parameter	Type	Example	Description
Ipv6GatewayId	String	ipv6gw-123456********	The ID of the IPv6 gateway.
Name	String	test	The name of the IPv6 gateway.
RegionId	String	cn-qingdao-env17-d01	The ID of the region where the IPv6 gateway is deployed.
RequestId	String	ipv6gw-hp33p10bdbt77**********	The ID of the request.
Spec	String	Medium	The specification of the IPv6 gateway.
Status	String	Available	The status of the IPv6 gateway.
VpcId	String	vpc-123456********	The ID of the virtual private cloud (VPC) to which the IPv6 gateway belongs.

Examples

Sample requests

```
https://vpc.cn-huhehaote.aliyuncs.com/?Action=DescribeIpv6GatewayAttribute
&Ipv6GatewayId=ipv6gw-hp33p10bdbt77xxxxxxxx
&RegionId=cn-huhehaote
&Common request parameter
```

Sample success responses

`XML` format

```
<DescribeIpv6GatewayAttributeResponse>
      <Name>ipv6gateway</Name>
      <CreationTime>2018-12-05T09:21:35Z</CreationTime>
      <Status>Available</Status>
      <Description></Description>
      <BusinessStatus>Normal</BusinessStatus>
      <Spec>Medium</Spec>
      <RequestId>F4517005-A716-40EB-8B80-F6AF8508B25F</RequestId>
      <RegionId>cn-huhehaote</RegionId>
      <InstanceChargeType>PostPaid</InstanceChargeType>
      <ExpiredTime></ExpiredTime>
      <VpcId>vpc-hp3kzilwd9yflxxxxxxxx</VpcId>
      <Ipv6GatewayId>ipv6gw-hp33p10bdbt77xxxxxxxx</Ipv6GatewayId>
</DescribeIpv6GatewayAttributeResponse>
```

`JSON` format

```
{ "DescribeIpv6GatewayAttributeResponse": { "Status": "Available", "Description": "test", "RequestId": "ipv6gw-hp33p10bdbt77********", "InstanceChargeType": "PostPaid", "Ipv6GatewayId": "ipv6gw-123456********", "BusinessStatus": "Normal", "Name": "test", "VpcId": "vpc-123456********", "ExpiredTime": "2018-12-05T09:21:35Z", "CreationTime": "2018-12-05T09:21:35Z", "RegionId": "cn-qingdao-env17-d01", "Spec": "Medium" } }
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because the specified region ID does not exist.

15.1.2.1.19.10. DescribeIpv6Addresses

You can call this operation to query one or more IPv6 addresses.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeIpv6Addresses	The operation that you want to perform. Valid values: **DescribeIpv6Addresses** .
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the IPv6 address resides. You can call `DescribeRegions` interface to obtain the region ID.
Ipv6AddressId	String	No	ipv6gw-hp33of4uz4k4k**********	The ID of the IPv6 address. You can enter up to 20 instance IDs for each call, separated by commas (,).
Ipv6Address	String	No	2408:xxxx:180:1701:94c7:bc38:3bfa:d2c	The IPv6 address that you want to query.
Name	String	No	test	The name of the IPv6 address.
AssociatedInstanceId	String	No	i-123456********	The ID of the instance that is assigned the IPv6 address.

Parameter	Type	Required	Example	Description
AssociatedInstanceType	String	No	EcsInstance	The type of the instance that is assigned the IPv6 address. Valid value: **EcsInstance** (Default):VPC-type ECS.
NetworkType	String	No	Public	The type of connection supported by the IPv6 address. Valid values: • **Private** : the private network communication type. • **Public** : the Internet communication type.
VpcId	String	No	vpc-123456********	The ID of the VPC to which the IPv6 address belongs.
VSwitchId	String	No	vsw-123456********	The ID of the vSwitch to which the IPv6 address belongs.
Ipv6InternetBandwidthId	String	No	1	The Internet bandwidth of the IPv6 address.
PageNumber	Integer	No	1	The page number of the list. Default value: **1** .
PageSize	Integer	No	10	The number of rows per page in a paged query. The maximum value is **50** , the default value is **10** .

Response parameters

Parameter	Type	Example	Description
Ipv6Addresses	Array of Ipv6Address		The details about the IPv6 addresses.
Ipv6Address			
AllocationTime	String	2018-12-20T14:56:09Z	The time when the IPv6 address was created.
AssociatedInstanceId	String	i-hp325kt6307888********	The ID of the instance that is assigned the IPv6 address.

Parameter	Type	Example	Description
AssociatedInstanceType	String	EcsInstance	The type of the instance associated with the IPv6 address.
Ipv6Address	String	2408:xxxx:0:2900:2901:3c61:9ff0:xxxx	The IPv6 address.
Ipv6AddressId	String	ipv6-hp32vv2klzw4*******	The ID of the IPv6 address.
Ipv6AddressName	String	test	The name of the IPv6 address.
Ipv6GatewayId	String	ipv6gw-hp38x2x0fz7********	The ID of the IPv6 gateway to which the IPv6 address belongs.
Ipv6InternetBandwidth	Struct		The information about the Internet bandwidth of the IPv6 address.
Bandwidth	Integer	2	The exclusive Internet bandwidth of the IPv6 address. Unit: Mbit/s.
BusinessStatus	String	Normal	The status of the exclusive bandwidth of the IPv6 address. Valid values: • **Normal** : normal. • **FinacialLocked** : The overdue payment is locked. • **SecurityLocked** : Security locked.
InstanceChargeType	String	PostPaid	The billing method of the IPv6 gateway. Valid values: **PostPaid** : Pay-as-you-go.
InternetChargeType	String	PayByTraffic	The metering method of the IPv6 gateway. Valid values: • **PayByTraffic** : pay-by-data-transfer. • **PayByBandwidth** : pay-by-bandwidth.
Ipv6InternetBandwidthId	String	ipv6bw-hp3b35oq1fj50kbvmxxx	The ID of the Internet bandwidth.

Parameter	Type	Example	Description
NetworkType	String	Public	The type of connection supported by the IPv6 address. Valid values: • **Private** : the private network communication type. • **Public** : the Internet communication type.
RealBandwidth	Integer	2	The peak bandwidth value of the IPv6 address. Valid value: • If the EIP Bandwidth Plan is added, then **RealBandwidth** The value of is the peak EIP Bandwidth Plan. • If not joined, then **RealBandwidth** is the Internet bandwidth of IPv6 itself. • If the IPv6 address is not added to the EIP Bandwidth Plan and no public bandwidth is purchased, **RealBandwidth** and **Bandwidth** The values of are all zero.
Status	String	Available	The status of the IPv6 address. Valid values: • **Pending** : is being configured. • **Available** : available.
VSwitchId	String	vsw-hp3123456********	The ID of the vSwitch to which the IPv6 address belongs.
VpcId	String	vpc-123456********	The ID of the VPC to which the IPv6 address belongs.
PageNumber	Integer	1	The page number of the list. Default value: **1** .
PageSize	Integer	10	The number of rows per page in a paged query. The maximum value is **50** , the default value is **10** .
RequestId	String	AA4486A8-B6AE-469E-AB09-820EF8ECFA2B	The ID of the request.
TotalCount	Integer	2	The number of returned entries.

Examples

Sample requests

```
https://vpc.aliyuncs.com/?Action=DescribeIpv6Addresses
&RegionId=cn-huhehaote
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeIpv6AddressesResponse>
      <PageNumber>1</PageNumber>
      <TotalCount>2</TotalCount>
      <Ipv6Addresses>
            <Ipv6Address>

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because the specified region ID does not exist.

15.1.2.1.19.11. ModifyIpv6InternetBandwidth

You can call this operation to modifiy the public network bandwidth of an IPv6 address.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyIpv6InternetBandwidth	The operation that you want to perform. Valid values: **ModifyIpv6InternetBandwidth** .

Parameter	Type	Required	Example	Description
Bandwidth	Long	Yes	4	The public bandwidth of the IPv6 address. Unit: Mbit /s. Valid values: **1~5000** . • When **InternetChargeType** For **PayByBandwidth** , the public bandwidth of the IPv6 address is 1 to 5000. • When **InternetChargeType** For **PayByTraffic** , the public bandwidth range of IPv6 addresses is also restricted by the IPv6 gateway specifications. ◦ **Small** (Default free edition). The public bandwidth ranges from 1 to 500. ◦ **Medium** (Enterprise Edition). The Internet bandwidth ranges from 1 to 1000. ◦ **Large** (Enterprise Enhanced Edition). The Internet bandwidth ranges from 1 to 2000.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the IPv6 gateway. You can call `DescribeRegions` interface to obtain the region ID.
Ipv6AddressId	String	No	ipv5-1233456********	The ID of the IPv6 address.
ClientToken	String	No	123456	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must make sure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	D560AF68-4CE8-4A5C-B3FE-469F558094D0	The ID of the request.

Examples

Sample requests

```
https://vpc.cn-huhehaote.aliyuncs.com/?Action=ModifyIpv6InternetBandwidth
&Bandwidth=3
&Ipv6AddressId=ipv6-hp351bytt9inrxxxxxxxx
&RegionId=cn-huhehaote
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyIpv6InternetBandwidthResponse>
      <RequestId>D560AF68-4CE8-4A5C-B3FE-469F558094D0</RequestId>
</ModifyIpv6InternetBandwidthResponse>
```

`JSON` format

```
{
    "RequestId": "D560AF68-4CE8-4A5C-B3FE-469F558094D0"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because the specified region ID does not exist.

15.1.2.1.19.12. AllocateIpv6InternetBandwidth

Purchases Internet bandwidth resources for an IPv6 address.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	AllocateIpv6InternetBandwidth	The operation that you want to perform. Set the value to **AllocateIpv6InternetBandwidth**.

Parameter	Type	Required	Example	Description

Bandwidth	Integer	Yes	2	The amount of Internet bandwidth resources of the IPv6 address, in Mbit/s. Valid values: **1 to 5000**.
				• If **InternetChargeType** is set to **PayByBandwidth**, the Internet bandwidth of the IPv6 address is from 1 to 5,000 Mbit/s.
				• If **InternetChargeType** is set to **PayByTraffic**, the amount of Internet bandwidth resources of the IPv6 address is limited by the specification of the IPv6 gateway.
				  ○ Small (default) specifies the Free edition and the Internet bandwidth is from 1 to 500 Mbit/s.
				  ○ Medium specifies the Medium edition and the Internet bandwidth is from 1 to 1,000 Mbit/s.
				  ○ Large specifies the Large edition and the Internet bandwidth is from 1 to 2,000 Mbit/s.

Ipv6AddressId	String	Yes	ipv6-123456xxxxxxxx	The ID of the IPv6 address.
Ipv6GatewayId	String	Yes	ipv5gw-123456xxxxxxxx	The ID of the IPv6 gateway.
RegionId	String	Yes	cn-huhehaote	The ID of the region where the IPv6 gateway is deployed. You can call the DescribeRegions operation to query the most recent region list.
InternetChargeType	String	No	PayByTraffic	The metering method of the Internet bandwidth resources of the IPv6 gateway. Valid values: • **PayByTraffic**: pay-by-data-transfer • **PayByBandwidth** (default): pay-by-bandwidth

Parameter	Type	Required	Example	Description
ClientToken	String	No	123456	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must ensure that it is unique among different requests. The token can only contain ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
InternetBandwidthId	String	2	The amount of Internet bandwidth resources purchased for the IPv6 gateway.
Ipv6AddressId	String	ipv6-hp352ungkzcknxxxxxxxx	The ID of the IPv6 address.
RequestId	String	6972A26E-99B1-4367-9890-FBDEBB0F5E7D	The ID of the request.

Examples

Sample requests

```
https://vpc.aliyuncs.com/?AllocateIpv6InternetBandwidth
&Ipv6AddressId=ipv6-123456xxxxxxxx
&Ipv6GatewayId=ipv6gw-123456xxxxxxxx
&RegionId=cn-huhehaote
&<Common request parameters>
```

Sample success responses

`XML` format

```
<AllocateIpv6InternetBandwidthResponse>
   <RequestId>6972A26E-99B1-4367-9890-FBDEBB0F5E7D</RequestId>
   <InternetBandwidthId>2</InternetBandwidthId>
   <Ipv6AddressId>ipv6-hp352ungkzcknxxxxxxxx</Ipv6AddressId>
</AllocateIpv6InternetBandwidthResponse>
```

`JSON` format

```
{
    "RequestId": "6972A26E-99B1-4367-9890-FBDEBB0F5E7D",
    "InternetBandwidthId": 2,
    "Ipv6AddressId": "ipv6-hp352ungkzcknxxxxxxxx"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because the specified region ID does not exist. Check whether the region ID is valid.

15.1.2.1.19.13. ModifyIpv6AddressAttribute

You can call this operation to modify the name and description of an IPv6 address.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyIpv6AddressAttribute	The operation that you want to perform. Valid values: **ModifyIpv6AddressAttribute** .
Ipv6AddressId	String	Yes	ipv6-hp32vv2klzw4yerdf****	The ID of the IPv6 address.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the IPv6 address resides. You can call `DescribeRegions` Obtain the region ID.
Name	String	No	test	The name of the IPv6 address. The name must be 2 to 128 characters in length and can contain digits, periods (.), underscores (_), and hyphens (-). It must start with a letter or Chinese character. But not with `http://` or `https://` The beginning.

Parameter	Type	Required	Example	Description
Description	String	No	test	The description of the IPv6 address. The name must be 2 to 256 characters in length and can contain digits, periods (.), underscores (_), and hyphens (-). It must start with a letter or Chinese character. But not with `http://` or `https://` The beginning.

Response parameters

Parameter	Type	Example	Description
RequestId	String	D560AF68-4CE8-4A5C-B3FE-469F558094D0	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=ModifyIpv6AddressAttribute
&Ipv6AddressId=ipv6-hp32vv2klzw4yerdf****
&RegionId=cn-huhehaote
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyIpv6AddressAttributeResponse>
      <RequestId>D560AF68-4CE8-4A5C-B3FE-469F558094D0</RequestId>
</ModifyIpv6AddressAttributeResponse>
```

`JSON` format

```
    { "ModifyIpv6AddressAttributeResponse": { "RequestId": "D560AF68-4CE8-4A5C-B3FE-469F55
8094D0" } }
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because the specified region ID does not exist.

15.1.2.1.19.14. ModifyIpv6GatewayAttribute

Modifies the name and description of an IPv6 gateway.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyIpv6GatewayAttribute	The operation that you want to perform. Set the value to **ModifyIpv6GatewayAttribute**.
Ipv6GatewayId	String	Yes	ipv6gw-hp39kh1ya51yzp2lu****	The ID of the IPv6 gateway that you want to modify.
RegionId	String	Yes	cn-huhehaote	The ID of the region where the IPv6 gateway is deployed. You can call the DescribeRegions operation to query the most recent region list.
Name	String	No	ipv6name	The name of the IPv6 gateway.
Description	String	No	ipv6description	The description of the IPv6 gateway.

Response parameters

Parameter	Type	Example	Description
RequestId	String	9DFEDBEE-E5AB-49E8-A2DC-CC114C67AF75	The ID of the request.

Examples

Sample requests

```
https://vpc.aliyuncs.com/?Action=ModifyIpv6GatewayAttribute
&RegionId=cn-huhehaote
&Ipv6GatewayId=ipv6gw-hp39kh1ya51yzp2lu****
&Common request parameter
```

Sample success responses

`XML` format

```
<ModifyIpv6GatewayAttributeResponse>
   <RequestId>9DFEDBEE-E5AB-49E8-A2DC-CC114C67AF75</RequestId>
</ModifyIpv6GatewayAttributeResponse>
```

`JSON` format

```
{
 "RequestId": "9DFEDBEE-E5AB-49E8-A2DC-CC114C67AF75"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because the specified region ID does not exist. Check whether the region ID is valid.

16.NAT Gateway

16.1. Developer Guide

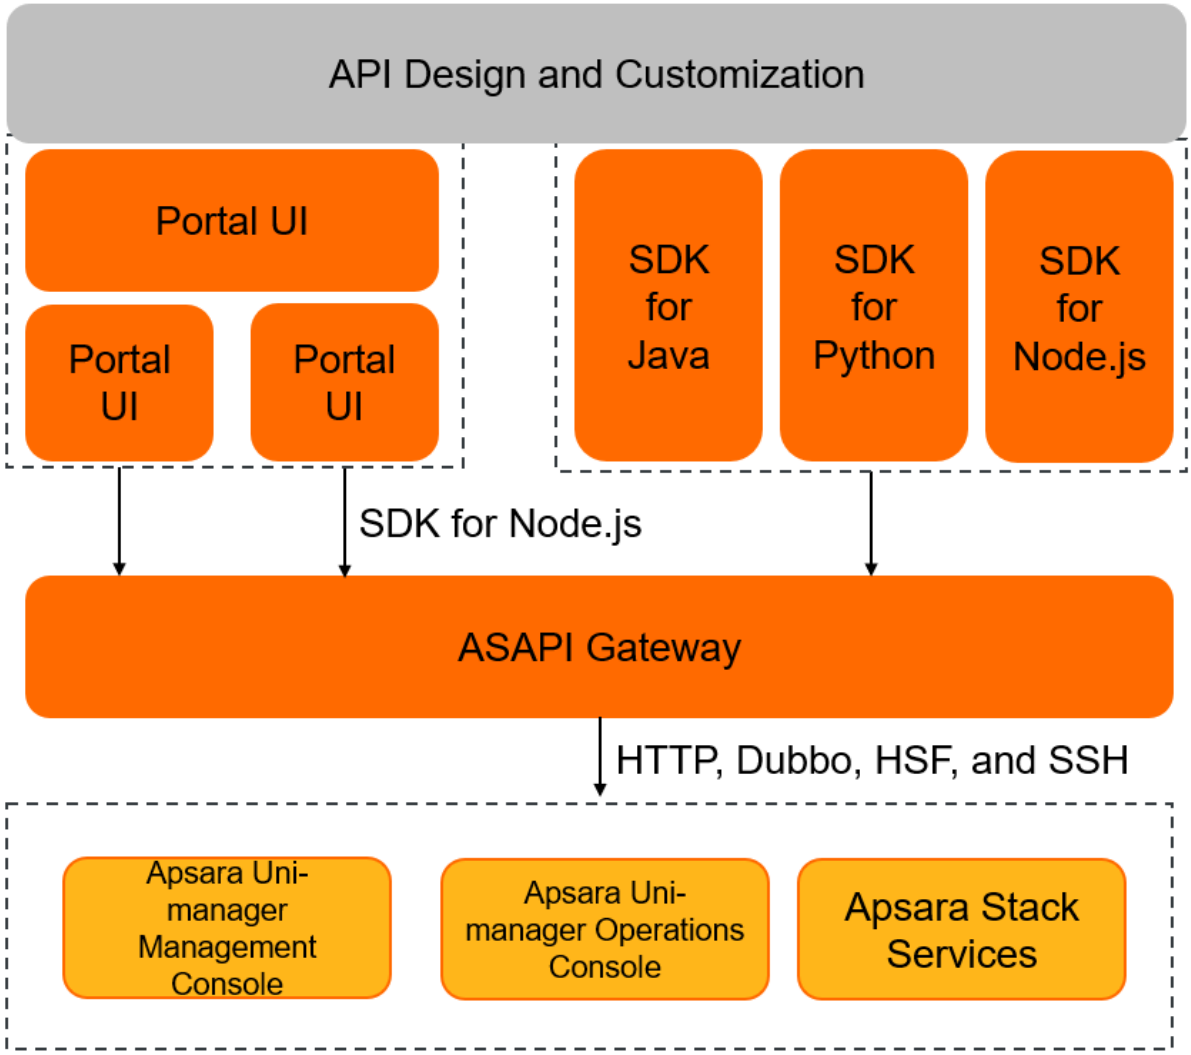
16.1.1. Make SDK calls by using ASAPI

16.1.1.1. 文档标题缺失，请补全后重新导出

16.1.1.1.1. ASAPI overview

This topic describes the architecture and features of the Apsara Stack API (ASAPI).

The ASAPI is a unified ingress gateway for Apsara Stack services and a main component of the Apsara Uni-manager Management Console. The ASAPI provides a unified method for you to manage and make API calls. You can use Apsara Stack SDK to centrally make API calls to Apsara Stack services, including Elastic Compute Service (ECS) and Virtual Private Cloud (VPC).



The ASAPI allows you to make API calls to manage and maintain Apsara Stack services.

- Make API calls to implement enterprise-grade management. For example, you can manage organizations, users, roles, resource sets, and logon policies. These operations are provided by the Apsara Uni-manager Management Console.
- Make API calls to manage operations. For example, you can manage quotas, usage statistics, specifications, and password policies. These operations are provided by the Apsara Uni-manager Management Console.
- Make API calls to manage resources. For example, you can create, delete, query, or modify cloud resources. These operations are provided by Apsara Stack services. If you call an API operation to create an ECS instance or a VPC, the API operation is provided by ECS or VPC.
- Make API calls to query monitoring metrics of Apsara Stack services. These operations are provided by the Apsara Uni-manager Management Console.
- Make API calls to perform O&M. For example, you can manage monitoring and alerting, inventories, tasks, and physical servers. These operations are provided by the Apsara Uni-manager Operations Console.

For more information, see the developer guide of the corresponding Apsara Stack service. For information about API operations used to manage organization users, see *Apsara Uni-manager Management Console Developer Guide*. For information about the API operation used to create an ECS instance, see *ECS Developer Guide*.

> **Note** If the "Use Apsara Stack SDK to make API calls" section is included in the developer guide of an Apsara Stack service, the ASAPI is supported by the Apsara Stack service. In this case, you can make API calls based on the developer guide.

16.1.1.1.2. Preparations

16.1.1.1.2.1. Log on to the API Tool console

You can log on to the API Tool console from the Apsara Uni-manager Management Console.

Prerequisites

- The URL of the Apsara Uni-manager Management Console is obtained from the deployment personnel before you log on to the Apsara Uni-manager Management Console.
- We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL of the Apsara Uni-manager Management Console. Press the Enter key.
2. Enter your username and password.

   Obtain the username and password that you can use to log on to the console from the operations administrator.

> **Note** When you log on to the Apsara Uni-manager Management Console for the first time, you must change the password of your username. Your password must meet complexity requirements. The password must be 10 to 32 characters in length and must contain at least two of the following character types:
>
> - Uppercase or lowercase letters
> - Digits
> - Special characters, which include ! @ # $ %

3. Click **Log On**.
4. In the top navigation bar, choose **Products > Others > API Tool**.

16.1.1.1.2.2. View information about API operations

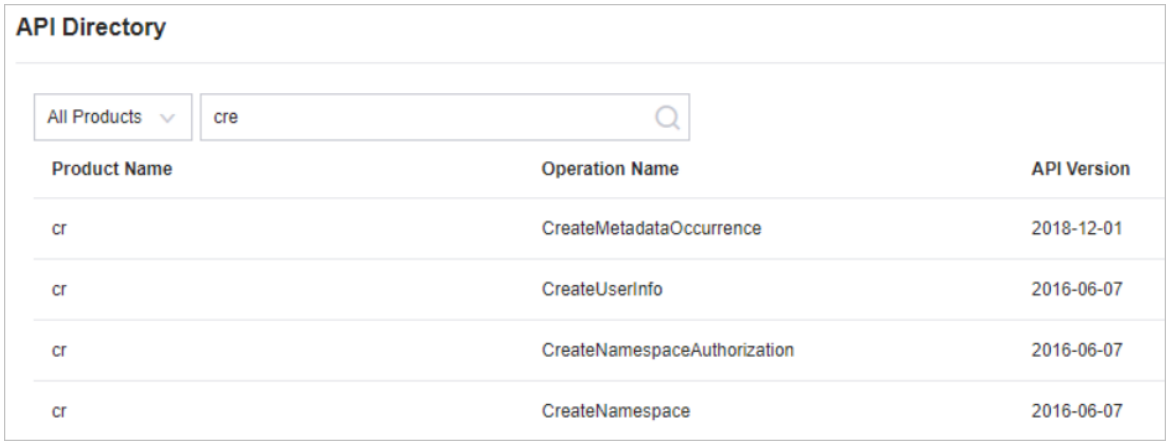
This topic describes how to view information about API operations. Before you use SDKs, obtain service names, API operation names, and API operation versions.

Context

The API operations on the API Directory page are only for reference. For information about how to call API operations, see developer guides of the corresponding cloud services. If the information on the API Directory page is inconsistent with that in the developer guide of the corresponding cloud service, the information in the developer guide prevails.

Procedure

1. Go to the API Tool console. For more information, see Log on to the API Tool console.
2. In the left-side navigation pane, click **API Directory**.
3. On the **API Directory** page, select the desired service from the drop-down list, enter a keyword of an API operation name in the search box, and then click the search icon.



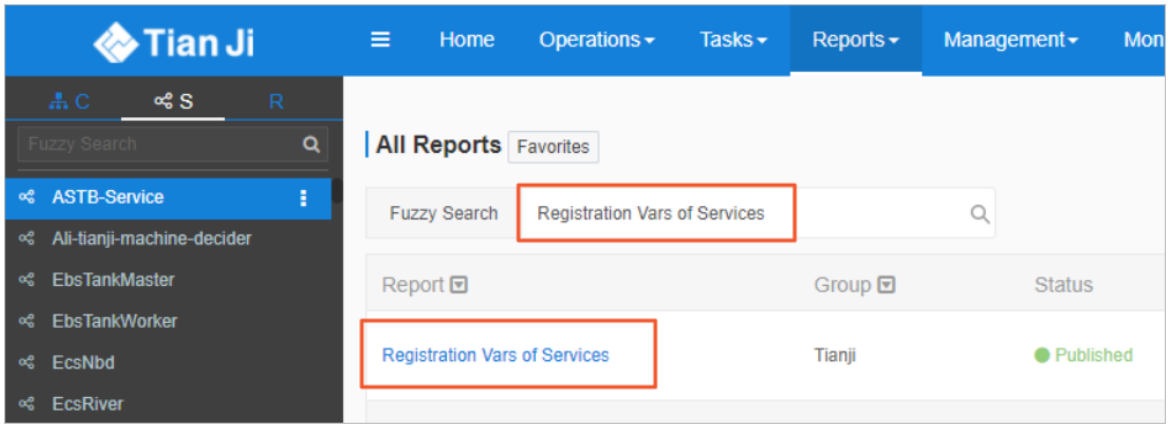
4. Then, you can view the service name, API operation name, and API operation version.

16.1.1.1.2.3. Generate an endpoint for the ASAPI

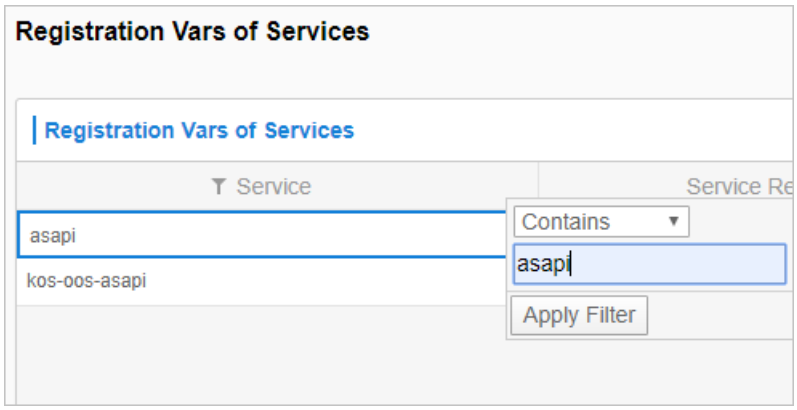
This topic describes three methods used to generate an endpoint for the Apsara Stack API (ASAPI).

Method 1: Use Registration Vars of Services to generate an endpoint

1. Log on to Apsara Infrastructure Management Framework.
   i. Log on to the Apsara Uni-manager Operations Console.
   ii. In the top navigation bar, click **O&M**.
   iii. In the left-side navigation pane, choose **Product Management** > **Products**.
   iv. In the Apsara Stack O&M section, click **Apsara Infrastructure Management Framework**.
2. In the left-side navigation pane, click **Reports**.
3. On the **All Reports** page, search for `Registration Vars of Services` and click the report name.



4. On the **Registration Vars of Services** page, click the icon next to **Service** and search for `asapi`.



5. Find the asapi service, right-click in the **Service Registration** column, and then select **Show More** from the shortcut menu.

   In the **Details** dialog box, obtain the value of **asapi.public.endpoint**.
6. Generate an endpoint for the ASAPI based on the following format:

```
https://<asapi.public.endpoint>/asapi/v3
```

Method 2: Use cluster resources to generate an endpoint

1. Log on to Apsara Infrastructure Management Framework.
   i. Log on to the Apsara Uni-manager Operations Console.

ii. In the top navigation bar, click **O&M**.

iii. In the left-side navigation pane, choose **Product Management** > **Products**.

iv. In the Apsara Stack O&M section, click **Apsara Infrastructure Management Framework**.

2. Go to the cluster operations page.

i. In the left-side navigation pane, choose Operations > Cluster Operations.

ii. In the **Cluster** search box, enter `ascm`.

iii. Find the cluster that you want to manage and click **Operations** in the **Actions** column.

3. Obtain the value of the domain parameter.

i. Click the Cluster Resources tab.

ii. In the **Name** field, search for `asapi_dns_public`.

iii. Click **Details** in the **Application Parameter** column.

In the **Application Parameter** message, obtain the value of the **domain** parameter.

4. Generate an endpoint for the ASAPI based on the following format:

```
https://<domain>/asapi/v3
```

Method 3: Concatenate strings to generate an endpoint

You can also concatenate strings to generate an endpoint based on the following format:

```
https://public.asapi.<region>.<internet-domain>/asapi/v3
```

> **Note**
>
> 1. Replace <region> with your actual region ID. For information about how to query a region ID, see Query a region ID.
> 2. Replace <internet-domain> with the root domain of your Apsara Stack service. To obtain the root domain, contact Apsara Stack O&M personnel. Take note of this point: Use the internet-domain parameter instead of the intranet-domain parameter.

If the **region** value is `cn-****-****-d01` and the **internet-domain** value is `inter.****.****.com`, the following endpoint can be generated:

```
https://public.asapi.cn-****-****-d01.inter.****.****.com/asapi/v3
```

16.1.1.1.2.4. Obtain Apsara Stack SDKs

The Apsara Stack API (ASAPI) is a unified portal provided by Apsara Stack. You can use the ASAPI to connect to all Apsara Stack services. Apsara Stack provides SDKs for API calls.

For more information about how to obtain Apsara Stack SDKs, see Apsara Stack documentation.

16.1.1.1.2.5. Obtain an AccessKey pair

An AccessKey pair that consists of an AccessKey ID and an AccessKey secret is used to implement symmetric encryption. This helps you verify the identity of a requester. The AccessKey ID is used to identify a user. The AccessKey secret is used to encrypt the signature string. This topic describes how to obtain an AccessKey pair.

Prerequisites

An account of the operations administrator or the level-1 organization administrator is obtained. Only an operations administrator or a level-1 organization administrator can obtain an AccessKey pair.

Context

If you need to make API calls to the Apsara Uni-manager Management Console or other Apsara Stack services, we recommend that you use the AccessKey pair of a personal account. If you use the AccessKey pair of a personal account, configure the request headers that are described in the following table for access control. Otherwise, an error that indicates insufficient permissions can occur.

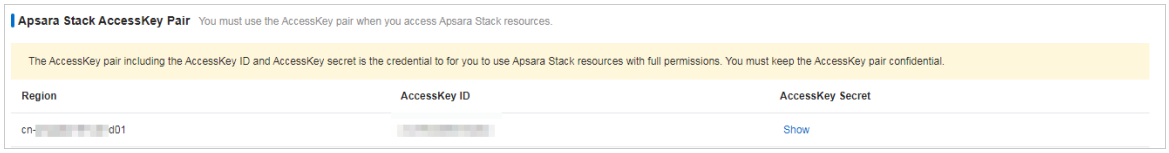
Parameter	Description
x-acs-regionid	The ID of the region, for example, cn-hangzhou-*.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console. For information about how to obtain an organization ID, see the "GetOrganizationList" section in Apsara Uni-manager Management Console Developer Guide.
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console. For information about how to obtain a resource set ID, see the "ListResourceGroup" section in Apsara Uni-manager Management Console Developer Guide.
x-acs-instanceid	The ID of the instance to which you make API calls. If you need to make API calls to an Elastic Compute Service (ECS) instance, obtain the ID of the ECS instance on the Instances page.

Warning The AccessKey pair of a personal account is managed and controlled by the permission system of the Apsara Uni-manage Management Console. If you need to obtain the AccessKey pair of an account that has permissions on an organization, make sure that your operation is allowed by an administrator. This ensures security. The account that has permissions on an organization is a privileged account.

Obtain the AccessKey pair of a personal account

To obtain the AccessKey pair of a personal account, perform the following operations:

1. Log on to the Apsara Uni-manager Management Console.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and click **User Information**.
3. In the **Apsara Stack AccessKey Pair** section, obtain the AccessKey pair.



> **Note** The AccessKey pair that consists of an AccessKey ID and an AccessKey secret is the credential for you to have full permissions on Apsara Stack resources. Keep your AccessKey pair confidential.

Obtain the AccessKey pair of an account that has permissions on an organization

To obtain the AccessKey pair of an account that has permissions on an organization, perform the following operations:

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Organizations**.
4. In the Organizations navigation tree, click the name of the organization that you want to manage.
5. On the right side of the page, click **Obtain AccessKey Pair**.
6. In the message that appears, obtain the AccessKey pair of the account that has permissions on the organization.

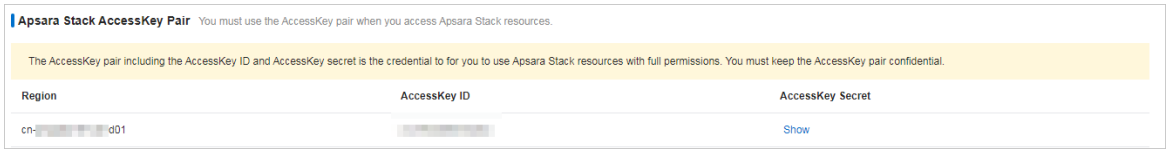
> **Note** The system automatically allocates an AccessKey pair to the account that has permissions on the level-1 organization. The same AccessKey pair is used by the accounts that have permissions on the subordinate organizations.

16.1.1.1.2.6. Query a region ID

When you use Apsara Stack SDK for Node.js to make API calls, specify a region ID. You can obtain a region ID in the Apsara Uni-manager Management Console.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and click **User Information**.
3. In the **Apsara Stack AccessKey Pair** section, view the region ID.



16.1.1.1.3. Common parameters

Common request parameters must be included in all API requests.

Sample common parameters

The following table describes the common parameters that are used when you call API operations supported by the Apsara Stack API (ASAPI).

Parameter	Type	Required	Description
Action	String	Yes	The operation that you want to perform. For more information, see View information about API operations.
Product	String	Yes	The name of the service.
Version	String	Yes	The version of the API operation. For more information, see View information about API operations.
RegionId	String	Yes	The ID of the region. For more information, see Query a region ID.
AccessKeyId	String	Yes	The AccessKey ID used to connect to the service. For more information, see Obtain an AccessKey pair.
Signature	String	Yes	The signature string of the current request. For more information about how signatures are calculated, see Request signatures.

Parameter	Type	Required	Description
SignatureMethod	String	Yes	The encryption method of the signature string. Valid values: HMAC-SHA1 and HMAC-SHA256.
SignatureVersion	String	Yes	The version of the signature encryption algorithm. Valid values: 1.0 and 2.0.
SignatureNonce	String	Yes	A unique, random number used to prevent replay attacks. You must use different numbers for different requests.
Timestamp	String	Yes	The timestamp of the request. Specify the time in the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time must be in UTC. Sample value: 2018-01-01T12:00:00Z.
Format	String	Yes	The format in which to return the response. Set the value to JSON.

Note

The `Signature`, `SignatureMethod`, `SignatureVersion`, `SignatureNonce`, `Timestamp`, and `Format` parameters are encapsulated into Apsara Stack SDK. You do not need to configure these parameters.

16.1.1.1.4. SDK description

16.1.1.1.4.1. Use Apsara Stack SDK for Java to call API operations

This topic describes how to obtain and use Apsara Stack SDK for Java to call API operations.

Prerequisites

- An authorized account and an AccessKey pair are obtained. The AccessKey pair consists of an AccessKey ID and an AccessKey secret. For more information about how to obtain an AccessKey pair in the Apsara Uni-manager Management Console, see Obtain an AccessKey pair.
- The endpoint of the Apsara Stack API (ASAPI) is obtained. For more information, see Generate an endpoint for the ASAPI.
- Apsara Stack SDK for Java 1.8 or later is installed.

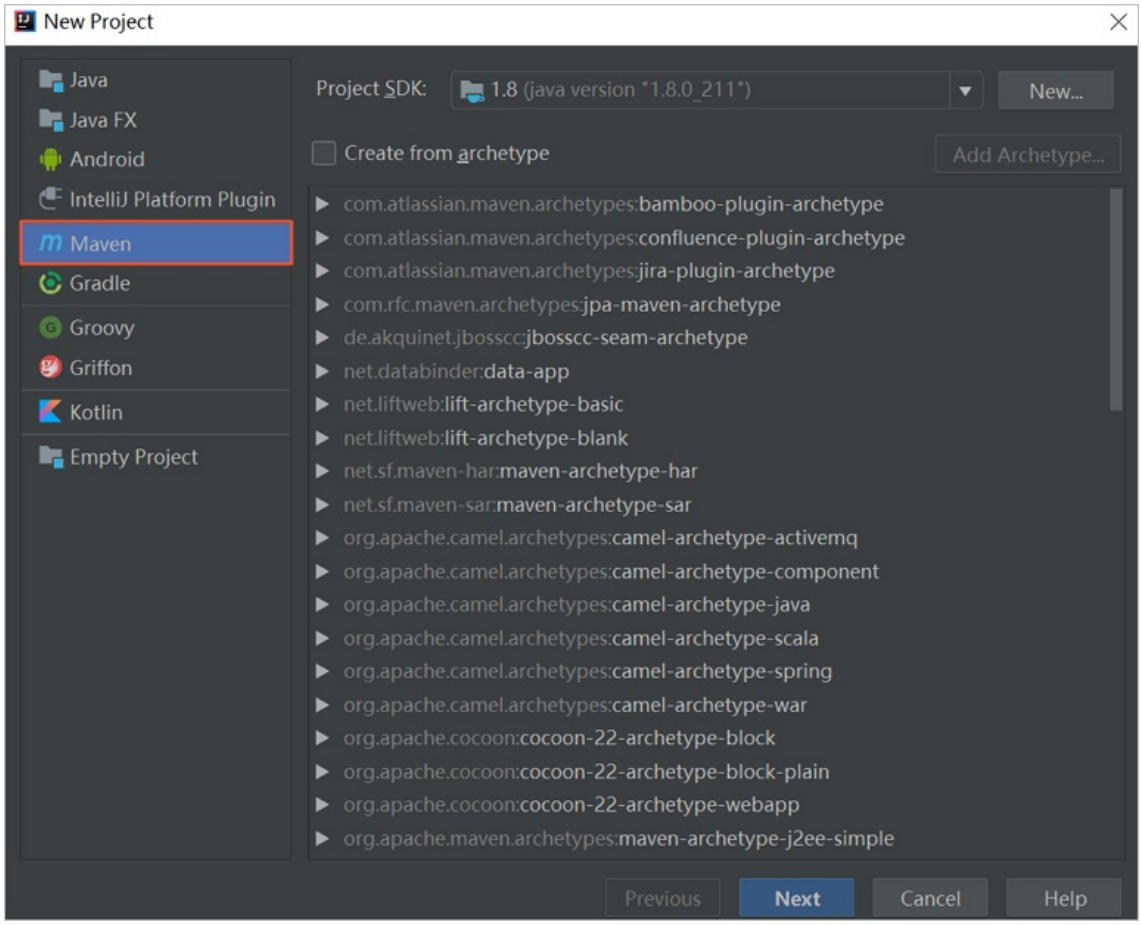
Background information

The help center of Apsara Stack provides Maven dependencies and JAR files for Apsara Stack SDK for Java. You can write code to use Apsara Stack SDK for Java to call API operations.

In this example, the Windows 10 64-bit OS and IntelliJ IDEA are used.

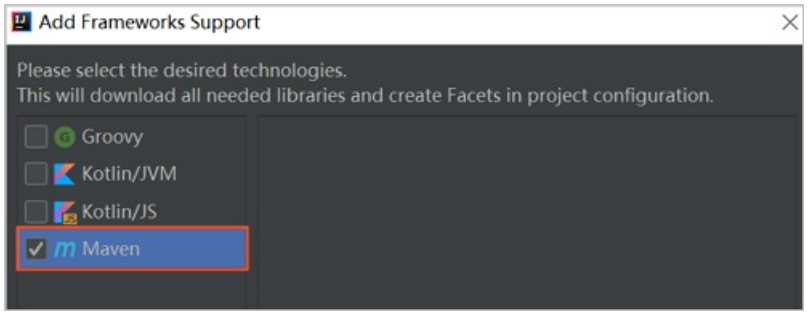
Procedure

1. Use one of the following methods to configure Maven in IntelliJ IDEA. Maven is a tool used for project management.
   - Use Maven that is integrated in IntelliJ IDEA.
   - Download Maven based on the OS that you are using from the official website and configure Maven. For more information, see Download Maven.
2. Obtain the Maven dependencies for Apsara Stack SDK for Java from the official website. For more information about how to obtain the dependencies, see Obtain the core package for ASAPI.
3. Use one of the following methods to create a Maven project:
   - Method 1: Create a Maven project in IntelliJ IDEA.

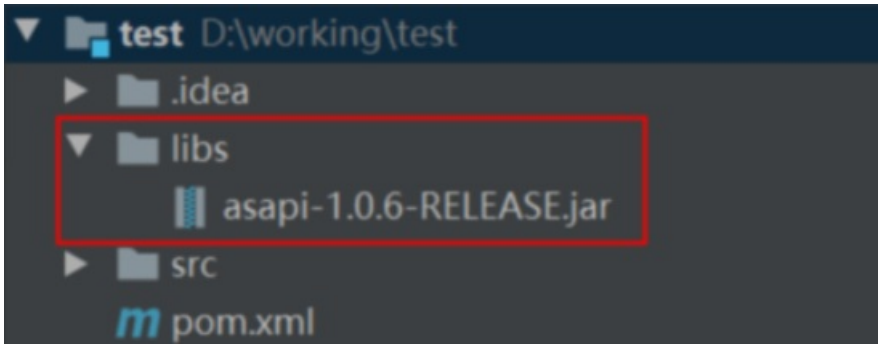


- Method 2: Convert an existing project to a Maven project.
  a. Right-click the project that you want to convert and select **Add Framework Support...**.

  b. Select **Maven** and click **OK**.



4. Create a folder named libs in the root directory of the project. Then, add the JAR file of Apsara Stack SDK for Java to the libs folder, as shown in the following figure.



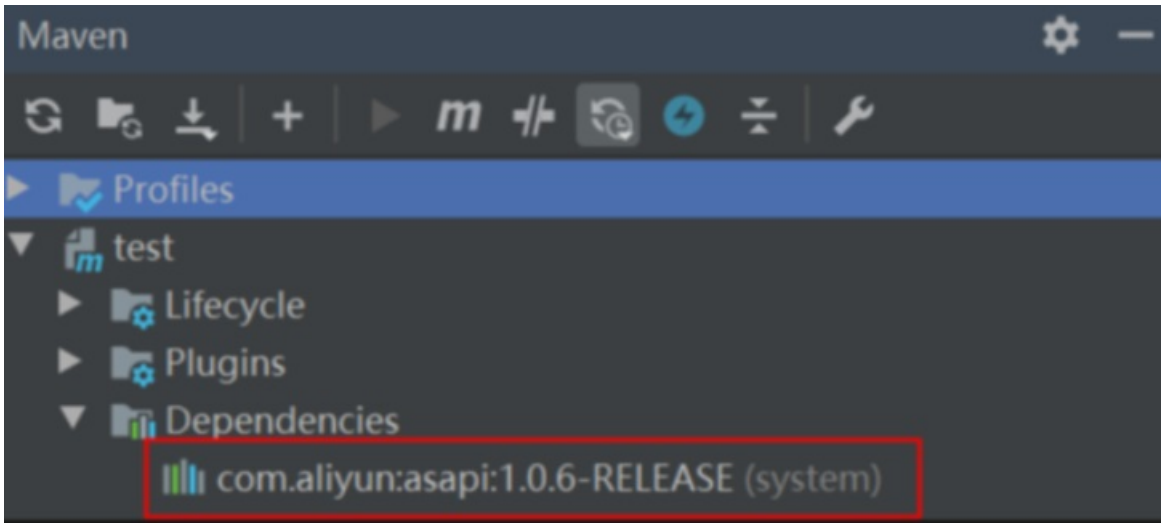
5. Add the dependencies of Apsara Stack SDK for Java to the pom.xml file in the project directory.

```
<dependencies>
    <dependency>
        <groupId>com.aliyun</groupId>
        <artifactId>asapi</artifactId>
        <version>1.0.6-RELEASE</version>
        <scope>system</scope>
        <systemPath>${project.basedir}/libs/asapi-1.0.6-RELEASE.jar</systemPath>
    </dependency>
  <dependency>
        <groupId>com.alibaba</groupId>
        <artifactId>alicrypto-java-aliyun</artifactId>
    <version>1.0.4</version>
    <systemPath>${project.basedir}/libs/alicrypto-java-aliyun-1.0.4.jar</systemPath>
  </dependency>
  <dependency>
    <groupId>com.aliyun</groupId>
    <artifactId>gmsse</artifactId>
    <version>1.1.0</version>
    <systemPath>${project.basedir}/libs/gmsse-1.1.0.jar</systemPath>
  </dependency>
</dependencies>
```

> **Note** Replace `1.0.6-RELEASE` with the actual version of Apsara Stack SDK for Java.

6. On the right side of IntelliJ IDEA, view information in the Maven section.

If the information in the following figure appears, the dependencies are added.



Use Apsara Stack SDK for Java

You can use the GET or POST method to call API operations provided by the ASAPI. The following sample code shows how to call API operations:

```
// 1. Create a connection to an ASClient object.
ASClient client = new ASClient();
// 2. Configure the identifier of the requester. This parameter is required and used only f
or identification. You can set this parameter to a random value.
client.setSdkSource("<The identifier of the requester>");
Map<String, Object> parameters = new HashMap<String, Object>();
// 3. Configure the parameters for authorization. The parameter values vary based on your e
nvironment.
// The AccessKey ID of your Apsara Stack tenant account.
parameters.put("AccessKeyId","<AccessKey ID>");
// The AccessKey secret of your Apsara Stack tenant account.
parameters.put("AccessKeySecret", "<AccessKey Secret>");
// The ID of the region.
parameters.put("RegionId", "<your RegionID>");
// 4. Configure parameters for an API call. In this example, the Product, Action, and Versi
on parameters are configured.
parameters.put("Product", "<The name of the service>");
parameters.put("Action", "<The name of the API operation>");
parameters.put("Version", "<The version of the API operation>");
// 5. Configure operation-specific parameters.
parameters.put("<The name of the operation-specific parameter>", "<The value of the operati
on-specific parameter>");
// 6. Configure request headers and the encryption method for the signature string. Valid v
alues of the SignatureMethod parameter: HMAC-SHA1 and HMAC-SHA256. By default, HMAC-SHA256
is used.
Map<String, String> headers = new HashMap<String, String>();
//headers.put("SignatureMethod", "HMAC-SHA1");
headers.put("x-acs-regionid", "<your-regionid>");
headers.put("x-acs-resourcegroupid", "<your-resourcegroupid>");
headers.put("x-acs-organizationid", "<your-organizationid>");
headers.put("x-acs-instanceid", "<your-instanceid>");
// 7. Make an API call. We recommend that you use the doPost() method.
// Configure the time-out period for a connection.
//client.setConnectTimeout(10000);
// Configure the time-out period for a request.
// client.setSocketTimeout(10000);
String result = client.doPost(endpoint, headers, parameters);
System.out.println(result);
```

Configure a proxy

If you need to use a proxy to make API calls, use the following sample code to configure the proxy:

```
Cloud cloud = new Cloud();
// Configure the IP address of the proxy.
cloud.setConfig("proxy_host", "<IP>");
// Configure the port used by the proxy.
cloud.setConfig("proxy_port", "<Port>");
// 1. Create a connection to an ASClient object.
ASClient client = new ASClient(cloud);
```

Request headers

Parameter	Description
x-acs-regionid	The ID of the region. For more information about how to obtain a region ID, see Query the region ID.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console.
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console.
x-acs-instanceid	The ID of the instance to which you make API calls.

16.1.1.1.4.2. Use Apsara Stack SDK for Python to call API operations

This topic describes how to use Apsara Stack SDK for Python to call API operations provided by the Apsara Stack API (ASAPI).

Preparations

- An authorized account and an AccessKey pair are obtained. The AccessKey pair consists of an AccessKey ID and an AccessKey secret. For more information about how to obtain an AccessKey pair in the Apsara Uni-manager Management Console, see Obtain an AccessKey pair.
- The endpoint of the ASAPI is obtained. For more information, see Generate an endpoint for the ASAPI.

Install Apsara Stack SDK for Python

1. Download the required version of Apsara Stack SDK for Python. For more information, see Obtain Apsara Stack SDKs.
2. Upload the compressed file of Apsara Stack SDK for Python to the host from which you want to send API requests and extract the file. Then, run the following code in the directory of the extracted files to install Apsara Stack SDK for Python:

```
# Install Apsara Stack SDK for Python 2.x.
pip install aliyun-python2-sdk-asapi-2.4.7.tar.gz
# Install Apsara Stack SDK for Python 3.x.
pip3 install aliyun-python3-sdk-asapi-2.4.7.tar.gz
```

> **Note**
>
> Replace `2.4.7` with the actual version of Apsara Stack SDK for Python.

Sample requests

You can use the GET or POST method to call API operations provided by the ASAPI.

```
    # 1. Import dependencies.
    from aliyunsdkasapi.ASClient import ASClient
    from aliyunsdkasapi.AsapiRequest import AsapiRequest

    if __name__ == '__main__':
     # 2. Create a request. The Product parameter specifies the name of the service. The Ver
sion parameter specifies the version of the API operation. The Action parameter specifies t
he operation that you want to perform. The asapi-endpoint parameter specifies the endpoint
of the ASAPI.
     req = AsapiRequest("<Product>", "<Version>", "<Action>", "<asapi-endpoint>")
     # 3. Configure operation-specific parameters.
     req.add_body_params("<key>", "<value>")
     # 4. Configure request headers.
     req.add_header("x-acs-resourcegroupid", "<your-resourcegroupid>");
     req.add_header("x-acs-organizationid", "<your-organizationid>");
     req.add_header("x-acs-regionid", "<your-regionid>");
     req.add_header("x-acs-instanceid", "<your-instanceid>");
     # 5. Configure a request method.
     req.set_method("POST")
     # 6. Configure initialization parameters for an ASClient object. The parameter values v
ary based on your environment. The timeout parameter specifies the time-out period for a re
quest. The cert_file parameter specifies the certificate. The verify parameter specifies wh
ether to verify the certificate.
     as_client = ASClient("<accesskeyid>", "<accesskeysecret>", "<regionid>",timeout=1000,
             cert_file=None,
             verify=False)
     # Configure the identifier of the requester. This parameter is required and used only f
or identification. You can set this parameter to a random value.
     as_client.setSdkSource("<The identifier of the requester>")
     response = as_client.do_request(req)
     print(response)
```

Request headers

Parameter	Description
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console.
x-acs-regionid	The ID of the region. For more information about how to obtain a region ID, see Query a region ID.
x-acs-instanceid	The ID of the instance to which you make API calls.

Configure a proxy

Perform the following steps to configure a proxy:

1. Import OS dependencies.

```
import os
```

2. Configure one or more proxies.

```
# Before you make an API call, configure one or more proxies.
os.environ['http_proxy'] = "http://x.x.x.x:xxxx"
os.environ['https_proxy'] = "https://x.x.x.x:xxxx"
```

16.1.1.1.4.3. Use Apsara Stack SDK for Node.js to call API operations

This topic describes how to obtain and use Apsara Stack SDK for Node.js to call API operations.

Preparations

- An authorized account and an AccessKey pair are obtained. The AccessKey pair consists of an AccessKey ID and an AccessKey secret. For more information about how to obtain an AccessKey pair in the Apsara Uni-manager Management Console, see Obtain an AccessKey pair.
- The endpoint of the Apsara Stack API (ASAPI) is obtained. For more information, see Generate an endpoint for the ASAPI.
- A region ID is obtained. For more information about how to obtain a region ID, see Query the region ID.

Add dependencies

Run the following command to install Apsara Stack SDK for Node.js:

```
tnpm install --save @ali/asapi-nodejs-sdk
```

Use Apsara Stack SDK for Node.js

The following sample code shows how to use Apsara Stack SDK for Node.js to make API calls:

```
// 1. Import the dependencies of Apsara Stack SDK for Node.js.
const Controller = require('egg').Controller;
const ASAPIClient = require('@ali/asapi-nodejs-sdk');
// 2. Configure the parameters.
const cnofig = {
    API_GATEWAY: '<The endpoint of the ASAPI>',
    regionId: '<The ID of the region in which the Apsara Stack service is deployed>',
    accessKeyId: '<The AccessKey ID of your Apsara Stack tenant account>',
    accessKeySecret: '<The AccessKey secret of your Apsara Stack tenant account>'
};
// 3. Initialize a client for API calls.
const AsapiClient = new ASAPIClient(cnofig, this.ctx);
// 4. Configure request parameters.
const params = {
    "Action": "<The name of the API operation>",
    "Product": "<The name of the service that provides the API operation>",
    "Version": "<The version of the API operation>",
    "regionId": '<The ID of the region in which the Apsara Stack service is deployed>',
      "<The name of the operation-specific parameter required by the API operation>": "<The
value of the operation-specific parameter>"
}
// 5. Configure request headers.
AsapiClient.addHeader('x-acs-caller-sdk-source', '<The identifier of the requester>')
AsapiClient.addHeader('x-acs-roleid', '<The ID of the role>')
AsapiClient.addHeader('x-acs-userid', '<The ID of the user>')
AsapiClient.addHeader('x-acs-organizationid', '<your-organizationid>')
AsapiClient.addHeadert("x-acs-regionid", "<your-regionid>");
AsapiClient.addHeader("x-acs-resourcegroupid", "<your-resourcegroupid>");
AsapiClient.addHeader("x-acs-instanceid", "<your-instanceid>");
// 6. Make an API call and obtain the response.
try {
  const res = await AsapiClient.doRequest(cnofig.API_GATEWAY, params, {
    method: 'POST', // The request method.
    formatParams: false, // Specifies whether to format parameters and capitalize the first
letter of each parameter.
    enableProxy: true, // Specifies whether to configure a proxy.
    proxy: 'http://x.x.x.x:xxxx',
    timeout: 10000, // The time-out period.
  // ca: , // The certificate issued by a certificate authority (CA). For more information,
visit https://nodejs.org/api/https.html#https_https_request_options_callback.
  })
  console.log(res)
} catch (e) {
  console.log(e)
}
```

Disable certificate validation

The following sample code shows how to disable certificate validation:

```
Configure the environment variable.
NODE_TLS_REJECT_UNAUTHORIZED=0
```

Request headers

Parameter	Description
x-acs-regionid	The ID of the region. For more information about how to obtain a region ID, see Query the region ID.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console.
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console.
x-acs-instanceid	The ID of the instance to which you make API calls.
x-acs-caller-sdk-source	The custom name of the requester or the system. This parameter is used to identify the source of the API request.
x-acs-roleid	The ID of the role.
x-acs-userid	The ID of the user.

16.1.1.1.4.4. SDK for POP

SDK for Java

Before you use Apsara Stack API (ASAPI) SDK for POP for Java to access ASAPI, you must know the remote procedure call (RPC) and resource-oriented architecture (ROA) styles that are supported for API calls. ASAPI is compatible with both styles. Their difference lies in the ASAPI endpoints that are used for API calls.

Prerequisites

- An Alibaba Cloud SDK package is downloaded for the service that you want to access. The required dependencies are installed.
- SSL certificate validation is ignored for requests over HTTPS.

Background information

ASAPI supports only the HTTPS request protocol.

Difference between two styles

When you use the RPC or ROA style to make API calls, take note that the two styles use different ASAPI endpoints.

```
# ASAPI endpoint for the RPC style:
public.asapi.<global:region>.<global:internet-domain>/asapi/v3
# ASAPI endpoint for the ROA style:
public.asapi.<global:region>.<global:internet-domain>/asapi/v3/roa
```

Call examples

The following sample code provides an example on how to use the RPC style to make an API call. In this example, the DescribeInstances operation of Elastic Compute Service (ECS) is called, and the API version is 2014-05-26.

Sample code:

```
package com.aliyuns.client.pop.ecs;

import com.aliyuncs.DefaultAcsClient;
import com.aliyuncs.ecs.model.v20140526.DescribeInstancesRequest;
import com.aliyuncs.ecs.model.v20140526.DescribeInstancesResponse;
import com.aliyuncs.http.HttpClientConfig;
import com.aliyuncs.http.ProtocolType;
import com.aliyuncs.profile.DefaultProfile;

import java.util.List;

public class DescribeInstancesTest {
    public static void main(String[] args) {
        // Specify the endpoint of ASAPI.
        String endpoint = "public.asapi.<global:region>.<global:internet-domain>/asapi/v3";
        // Specify the region where the ECS service resides.
        String region = "<global:region>";
        // Specify the name of the service that you want to access.
        String product = "ECS";
        // Specify your AccessKey pair.
        String ak = "<accessKeyId>";
        String sk = "<accessKeySecret>";
        try {
            DefaultProfile clientProfile = DefaultProfile.getProfile(region, ak, sk);
            // Ignore SSL certificate validation.
            HttpClientConfig clientConfig = HttpClientConfig.getDefault();
            clientConfig.setIgnoreSSLCerts(true);
            // Set the connection timeout period.
            clientConfig.setConnectionTimeoutMillis(3000L);
            // Set the read timeout period.
            clientConfig.setReadTimeoutMillis(10000L);
            clientProfile.setHttpClientConfig(clientConfig);
            // Create a connection.
            DefaultAcsClient acsClient = new DefaultAcsClient(clientProfile);
            // Create a request.
            DescribeInstancesRequest request = new DescribeInstancesRequest();
            // Specify the endpoint of ASAPI.
            request.setSysEndpoint(endpoint);
            // Specify the name of the service that you want to access and the region where
the service resides.
            request.setSysLocationProduct(product);
            request.setSysRegionId(region);
            // Set the request protocol to HTTPS.
            request.setSysProtocol(ProtocolType.HTTPS);
            DescribeInstancesResponse result =  acsClient.getAcsResponse(request);
            List<DescribeInstancesResponse.Instance> instances = result.getInstances();
            for (DescribeInstancesResponse.Instance instance: instances) {
                System.out.println(instance.getInstanceId());
                System.out.println(instance.getInstanceName());
```

```
            }

        } catch (Exception e) {
            e.printStackTrace();
        }
    }
}
```

The following sample code provides an example on how to use the ROA style to make an API call. In this example, the GetNamespaceList operation of Container Registry is called, and the API version is 2016-06-07.

Sample code:

```
package com.aliyuns.client.pop.cr;

import com.aliyuncs.CommonRequest;
import com.aliyuncs.CommonResponse;
import com.aliyuncs.DefaultAcsClient;
import com.aliyuncs.IAcsClient;
import com.aliyuncs.exceptions.ClientException;
import com.aliyuncs.exceptions.ServerException;
import com.aliyuncs.http.FormatType;
import com.aliyuncs.http.HttpClientConfig;
import com.aliyuncs.http.MethodType;
import com.aliyuncs.http.ProtocolType;
import com.aliyuncs.profile.DefaultProfile;

public class GetNamespaceListTest {
    public static void main(String[] args) {
        // Specify the endpoint of ASAPI.
        String endpoint = "public.asapi.<global:region>.<global:internet-domain>/asapi/v3/r
oa";
        // Specify the region where the Container Registry service resides.
        String region = "<global:region>";
        // Specify the name of the service that you want to access.
        String product = "cr";
        // Specify your AccessKey pair.
        String ak = "<accessKeyId>";
        String sk = "<accessKeySecret>";
        DefaultProfile profile = DefaultProfile.getProfile(region, ak, sk);
        // Ignore SSL certificate validation.
        HttpClientConfig clientConfig = HttpClientConfig.getDefault();
        clientConfig.setIgnoreSSLCerts(true);
        // Set the connection timeout period.
        clientConfig.setConnectionTimeoutMillis(3000L);
        // Set the read timeout period.
        clientConfig.setReadTimeoutMillis(10000L);
        profile.setHttpClientConfig(clientConfig);
        // Create a connection for the client.
        IAcsClient client = new DefaultAcsClient(profile);
        // Create a request.
        CommonRequest request = new CommonRequest();
        // Set the request protocol to HTTPS.
```

```
        request.setSysProtocol(ProtocolType.HTTPS);
        // Specify the request method.
        request.setSysMethod(MethodType.GET);
        // Specify the endpoint of ASAPI.
        request.setSysDomain(endpoint);
        // Specify the version of the API.
        request.setSysVersion("2016-06-07");
        // Specify the pattern of the uniform resource identifier (URI).
        request.setSysUriPattern("/namespace");
        // Specify the name of the service that you want to access and the region where the
service resides.
        request.setSysLocationProduct(product);

        request.putHeadParameter("Content-Type", "application/json");
        String requestBody = "" +
                "{}";
        request.setHttpContent(requestBody.getBytes(), "utf-8", FormatType.JSON);
        try {
            CommonResponse response = client.getCommonResponse(request);
            System.out.println(response.getData());
        } catch (ServerException e) {
            e.printStackTrace();
        } catch (ClientException e) {
            e.printStackTrace();
        }
    }
}
```

Notice

If you send a request over HTTPS, you must enable the request to ignore SSL certificate validation.

SDK for Go

This topic describes how to use Apsara Stack API (ASAPI) SDK for POP for Go.

Prerequisites

An Alibaba Cloud SDK package is downloaded for the service that you want to access. The required dependencies are installed.

Background information

Only the remote procedure call (RPC) style is supported for API calls.

Call examples

The following sample code provides an example on how to make an API call. In this example, the DescribeInstances operation of Elastic Compute Service (ECS) is called, and the API version is 2014-05-26.

Sample code:

```
package main
```

```
import (
 "fmt"
 "time"

 "github.com/aliyun/alibaba-cloud-sdk-go/sdk"
 "github.com/aliyun/alibaba-cloud-sdk-go/sdk/auth/credentials"
 "github.com/aliyun/alibaba-cloud-sdk-go/sdk/requests"
 "github.com/aliyun/alibaba-cloud-sdk-go/sdk/responses"
)

func getSdkConfig() *sdk.Config {
 return sdk.NewConfig().
  WithTimeout(time.Duration(30) * time.Second).
  WithEnableAsync(true).
  WithGoRoutinePoolSize(100).
  WithMaxTaskQueueSize(10000).
  WithDebug(false).
  WithScheme("HTTP")
}

func main(){
 ak := "<The AccessKey ID of your Apsara Stack tenant account.>"
 sk := "<The AccessKey secret of your Apsara Stack tenant account.>"
 regionId := "<The region where the ECS service resides.>"
 endpoint := "<The endpoint of ASAPI.>" // No network protocol.
 request := requests.NewCommonRequest()
  request.SetReadTimeout(10 * time.Second) // Set the read timeout period of the request to
10 seconds.
  request.SetConnectTimeout(5 * time.Second)  // Set the connection timeout period of the r
equest to 5 seconds.
 request.Method = requests.GET
 request.Domain = endpoint         // Location Service will not be enabled if the host is s
pecified. For example, the service with a certification type-bearer token must be specified
.
 request.Version = "2014-05-26"            // Specify the version of the API.
 request.Scheme = "https"                // Specify the request protocol. Default value: ht
tp.
 request.ApiName = "DescribeInstances"
 request.QueryParams["Product"] = "Ecs"  // Specify the name of the service that you want t
o access.
 request.TransToAcsRequest()
 client, err := sdk.NewClientWithOptions(regionId,getSdkConfig(),credentials.NewAccessKeyCr
edential(ak,sk))
 // If relevant parameters are not set for the request, the client settings are used.
  //client.SetReadTimeout(10 * time.Second)              // Set the read timeout period of
the client to 10 seconds.
 //client.SetConnectTimeout(5 * time.Second)            // Set the connection timeout perio
d of the client to 5 seconds.
  resp := responses.BaseResponse{}
  err = client.DoAction(request, &resp)
    if err != nil {
        panic(err)
    }
 fmt.Print(endpoint)
```

```
}
```

Configure proxies

You can configure proxies in one of the following ways:

- Configure proxies by using environment variables.

  Set the HTTP_PROXY and HTTPS_PROXY environment variables, or set the NO_PROXY environment variable.

  Sample code:

```
import (
    "os"
)
func main(){
 os.Setenv("HTTP_PROXY", "http://x.x.x.x:xxxx") // Set the HTTP_PROXY environment variabl
e.
 os.Setenv("HTTPS_PROXY", "https://x.x.x.x:xxxx") // Set the HTTPS_PROXY environment vari
able.
}
```

- Configure proxies on the client.

  Sample code:

```
// The proxies that are configured on the client take precedence over those that are conf
igured by using environment variables.
client.SetHttpProxy("http://x.x.x.x:xxxx")   // Configure the HTTP proxy.
client.GetHttpProxy()                          // Query the HTTP proxy.

client.SetHttpsProxy("https://x.x.x.x:xxxx")   // Configure the HTTPS proxy.
client.GetHttpsProxy()                           // Query the HTTPS proxy.

client.SetNoProxy("127.0.0.1,localhost")     // Configure the proxy whitelist.
client.GetNoProxy()                          // Query the proxy whitelist.
```

SDK for Python

This topic describes how to use Apsara Stack API (ASAPI) SDK for POP for Python.

Prerequisites

An Alibaba Cloud SDK package is downloaded for the service that you want to access. The required dependencies are installed.

Background information

Only the remote procedure call (RPC) style is supported for API calls.

Call examples

The following sample code provides an example on how to make an API call. In this example, the DescribeInstances operation of Elastic Compute Service (ECS) is called, and the API version is 2014-05-26.

Sample code:

```
from aliyunsdkcore.client import AcsClient
from aliyunsdkcore.acs_exception.exceptions import ClientException
from aliyunsdkcore.acs_exception.exceptions import ServerException
from aliyunsdkecs.request.v20140526 import DescribeInstancesRequest
import os

# Create an AcsClient instance.
client = AcsClient(
   "<your-access-key-id>",
   "<your-access-key-secret>",
   "<your-region-id>",

   timeout=1000,  # Set the timeout period.
    verify=False, # Ignore certificate validation. or verify='<The location where the certi
ficate is stored.>'
);
# Set the following parameters for the HTTPS request protocol:
# client.set_verify(False)
# os.environ["HTTPS_PROXY"] = "http://127.0.0.1:8080"

# os.environ["HTTP_PROXY"] = "http://127.0.0.1:8080"
def hello_ecs_instance():
    # Create a request and set the parameters.
    request = DescribeInstancesRequest.DescribeInstancesRequest()

    params = {"PageNumber":"1", "Product":"Ecs","Version": "2014-05-26","Action": "Describe
Instances"};
    request.set_body_params(params)
    # The endpoint that contains no network protocol is in the following format: ASAPI doma
in name/asapi/v3.
    request.set_endpoint('<The endpoint of ASAPI.>')
    # Set the following parameter if the endpoint contains no network protocol:
    request.set_protocol_type("https")

    request.set_PageSize(10)
    # Initiate the API request and obtain the response.
    response = client.do_action_with_exception(request)
    print(response)

if __name__ == '__main__':
    print("Hello Aliyun OpenApi!")
    hello_ecs_instance()
```

Configure proxies

Set the HTTP_PROXY and HTTPS_PROXY environment variables.

Sample code:

```
# Configure the HTTPS proxy.
os.environ["HTTPS_PROXY"] = "http://x.x.x.x:xxxx"

# Configure the HTTP proxy.
os.environ["HTTP_PROXY"] = "https://x.x.x.x:xxxx"
```

16.1.1.1.5. HTTP requests

16.1.1.1.5.1. Overview

This topic describes how to make API requests and is intended for users who use API URLs to initiate HTTP GET requests.

If you are using an SDK to initiate requests, you can skip this topic.

The request URL consists of different parameters and has a fixed syntax. The URL contains common request parameters, your signature, and operation-specific parameters. Sample request URLs are provided for each API operation. These URLs are not encoded to make them easy to read. Before you make a request, you must encode the request URL. After the authentication process is complete based on your signature, the results are returned to you. Response parameters are returned if the call is successful, whereas an error message is returned if the call fails. You can troubleshoot issues based on the error message.

16.1.1.1.5.2. Request syntax

The Apsara Stack API (ASAPI) allows you to call API operations by sending HTTP GET requests based on URLs. Each URL must include request parameters. This topic describes the syntax of HTTP GET requests and provides the endpoint of the ASAPI.

Sample request

GetOrganizationList is used in the following unencoded URL request:

```
https://public.asapi.aliyuns.com/asapi/v3?Action=GetOrganizationList&Product=ascm&Version=2019-05-10&Id=<Organization ID>&<Common parameters>
```

- `https`: the protocol used to transmit the request.
- `public.asapi.aliyuns.com/asapi/v3`: the endpoint of the ASAPI.
- `Action=GetOrganizationList Product=ascm Version=2019-05-10`: the API operation to call.
- `Id`: the ID of the organization.
- `<Common parameters>`: the common parameters specified in the system.

Protocol

The ASAPI supports only HTTPS.

Endpoint

For more information about how to obtain an endpoint, see Generate an endpoint for the ASAPI.

Parameter

To specify an API operation, use the `Action, Product, and Version` parameters. For example, set `Action` to GetOrganizationList, Product to ascm, and Version to 2019-05-10. You must also specify other operation-specific parameters and common parameters. For more information, see Common parameters.

16.1.1.1.5.3. Request signatures

This topic describes how to sign HTTP API requests. ASAPI uses the request signature to verify the identity of the request sender. ASAPI implements symmetric encryption by using an AccessKey pair to verify the identity of the request sender.

> **Note**
>
> - An AccessKey pair consists of an AccessKey ID and an AccessKey secret, which are issued to each user or organization in the Apsara Uni-manager Management Console.
> - The AccessKey ID is used to verify identities of users, and the AccessKey secret is used to encrypt and verify signature strings. You must keep your AccessKey secret confidential.
> - ASAPI provides SDKs for Node.js, Python, and Java to facilitate complex signature calculation. For more information, see Obtain the core package for ASAPI.

Step 1: Create a canonicalized query string

1. Arrange the request parameters in alphabetical order, including all common and operation-specific parameters except the `Signature` parameter.

   > **Note**
   >
   > If you use the GET method to send a request,these parameters are connected by ampersands (&) and included in the request URL. The first request parameter follows a question mark (?).

2. Encode the request parameters and their values in UTF-8 based on RFC 3986. The following rules apply in the encoding process:
   - Letters, digits, and special characters such as hyphens (`-`), underscores (`_`), and periods (`.`) do not need to be encoded.
   - Other characters must be percent encoded in the `%XY` format. `XY` represents the ASCII code of the characters in hexadecimal notation. For example, double quotation marks (`"`) are encoded as `%22` .

- Extended UTF-8 characters are encoded in the `%XY%ZA...` format.
- Spaces must be encoded as `%20`. Do not encode spaces as plus signs (`+`).

  This encoding method is similar to but different from the `application/x-www-form-urlencoded` MIME encoding algorithm.

  If you use `java.net.URLEncoder` from the Java standard library, use `percentEncode` to encode request parameters and their values. In the encoded query string, replace the plus signs (`+`) with `%20` , asterisks (`*`) with `%2A` , and `%7E` with tildes (`~`). This way, you can obtain an encoded string that matches the preceding encoding rules.

  ```
  private static final String ENCODING = "UTF-8";
  private static String percentEncode(String value) throws UnsupportedEncodingException
  {
      return value != null ? URLEncoder.encode(value, ENCODING).replace("+", "%20").rep
  lace("*", "%2A").replace("%7E", "~") : null;
  }
  ```

3. Use equal signs (`=`) to connect the encoded request parameters and their values.
4. Use ampersands (`&`) to connect the encoded request parameters. These parameters must be arranged in the same order as those in Step 1.

Then, a canonicalized query string that follows the request structure is obtained. For more information, see Request structure.

Step 2: Create a string-to-sign

1. Create a `string-to-sign` . You can also use `percentEncode` to encode the canonicalized query string created in Step 1 based on the following rules:

   ```
   StringToSign=
       HTTPMethod + "&" + //HTTPMethod: the HTTP method that is used to send a request, su
   ch as GET.
       percentEncode("/") + "&" + //percentEncode("/"): Encode the forward slash (/) in UT
   F-8 as %2F.
       percentEncode(CanonicalizedQueryString) // Encode the canonicalized query string cr
   eated in Step 1.
   ```

2. Calculate the RFC 2104-compliant HMAC-SHA1 or HMAC-256 value of `StringToSign` . In the following example, Java Base64 is used:

   ```
   String signature = Base64.getEncoder().encodeToString(signData);
   ```

> **Note**
>
> When you calculate the signature, the key value specified by RFC 2104 is your `AccessKey secret` plus an ampersand (&), which has an ASCII value of 38. For more information, see Obtain an AccessKey pair.

3. Encode the `Signature` parameter based on RFC 3986 and add it to the canonicalized query string.

Example 1: Concatenate parameters

`GetOrganizationList` is used in this example to query regions. For example, `AccessKeyID` is set to testid and `AccessKeySecret` is set to testsecret. Perform the following operations:

1. Construct a canonicalized query string.

```
https://public.asapi.aliyuns.com/asapi/v3/?AccessKeyId=testid&Action=GetOrganizationList&Format=JSON&Id=1&Product=ascm&RegionId=cn-region-test&SignatureMethod=HMAC-SHA1&SignatureNonce=43967c6e-e3ad-44fa-b06b-fcf3db5f39d2&SignatureVersion=1.0&Timestamp=2020-09-15T08%3A50%3A40Z&Version=2019-05-10
```

2. Create a `string-to-sign` .

```
GET&%2F&AccessKeyId%3Dtestid%26Action%3DGetOrganizationList%26Format%3DJSON%26Id%3D1%26Product%3Dascm%26RegionId%3Dcn-region-test%26SignatureMethod%3DHMAC-SHA1%26SignatureNonce%3D43967c6e-e3ad-44fa-b06b-fcf3db5f39d2%26SignatureVersion%3D1.0%26Timestamp%3D2020-09-15T08%253A50%253A40Z%26Version%3D2019-05-10
```

3. Calculate the signature.

   Calculate the signature. The key value used for calculation is `testsecret&` because `AccessKeySecret` is set to testsecret. The calculated signature is `OLeaidS1JvxuMvnyHOwuJ+uX5qY=` . Java Base64 is used in the following sample code:

   `String signature = Base64.getEncoder().encodeToString(signData);` Encode `Signature=hvqv9Ll5RE6kQ4YsQXFAf9VuRIY=` based on RFC 3986 and add it to the canonicalized query string.

```
https://public.asapi.aliyuns.com/asapi/v3/?AccessKeyId=testid&Action=GetOrganizationList&Format=JSON&Id=1&Product=ascm&RegionId=cn-region-test&SignatureMethod=HMAC-SHA1&SignatureNonce=43967c6e-e3ad-44fa-b06b-fcf3db5f39d2&SignatureVersion=1.0&Timestamp=2020-09-15T08%3A50%3A40Z&Version=2019-05-10
```

You can use browsers or tools such as cURL and Wget to initiate an HTTP request for calling the `DescribeRegions` operation to query the Alibaba Cloud region list.

Example 2: Use the standard library of the programming language

`GetOrganizationList` is used in this example to query regions. For example, `AccessKeyID` is set to testid, `AccessKeySecret` is set to testsecret, and all request parameters are stored in a Java `Map<String, String>` object.

1. Predefine an encoding method.

```
private static final String ENCODING = "UTF-8";
private static String percentEncode(String value) throws UnsupportedEncodingException {
        return value != null ? URLEncoder.encode(value, ENCODING).replace("+", "%20").r
eplace("*", "%2A").replace("%7E", "~") : null;
}
```

2. Predefine the time format for the `Timestamp` parameter. Specify the `Timestamp` parameter in the ISO 8601 format. The time must be in UTC+0.

```
private static final String ISO8601_DATE_FORMAT = "yyyy-MM-dd'T'HH:mm:ss'Z'";
private static String formatIso8601Date(Date date) {
    SimpleDateFormat df = new SimpleDateFormat(ISO8601_DATE_FORMAT);
    df.setTimeZone(new SimpleTimeZone(0, "GMT"));
    return df.format(date);
}
```

3. Create a request string.

```
final String HTTP_METHOD = "GET";
Map parameters = new HashMap();
// Specify request parameters.
parameters.put("Product", "ascm");
parameters.put("Action", "GetOrganizationList");
parameters.put("Version", "2019-05-10");
parameters.put("AccessKeyId", "testid");
parameters.put("RegionId", "cn-region-test");
parameters.put("Timestamp", formatIso8601Date(new Date()));
parameters.put("SignatureMethod", "HMAC-SHA1");
parameters.put("SignatureVersion", "1.0");
parameters.put("SignatureNonce", UUID.randomUUID().toString());
parameters.put("Format", "JSON");
parameters.put("Id", "1");
// Arrange request parameters.
String[] sortedKeys = parameters.keySet().toArray(new String[]{});
Arrays.sort(sortedKeys);
final String SEPARATOR = "&";
// Create a string-to-sign.
StringBuilder stringToSign = new StringBuilder();
stringToSign.append(HTTP_METHOD).append(SEPARATOR);
stringToSign.append(percentEncode("/")).append(SEPARATOR);
StringBuilder canonicalizedQueryString = new StringBuilder();
for(String key : sortedKeys) {
    // Encode the key and the value.
    canonicalizedQueryString.append("&")
    .append(percentEncode(key)).append("=")
    .append(percentEncode(parameters.get(key)));
}
//Encode the canonicalized query string.
stringToSign.append(percentEncode(
canonicalizedQueryString.toString().substring(1)));
```

4. The signature. The key value used for calculation is `testsecret&` because `AccessKeySecret` is set to testsecret. The calculated signature is `OLeaidS1JvxuMvnyHOwuJ%2BuX5qY%3D` .

```
// The following sample code shows how to calculate the signature:
final String ALGORITHM = "HmacSHA1";
final String ENCODING = "UTF-8";
key = "testsecret&";
Mac mac = Mac.getInstance(ALGORITHM);
mac.init(new SecretKeySpec(key.getBytes(ENCODING), ALGORITHM));
byte[] signData = mac.doFinal(stringToSign.getBytes(ENCODING));
String signature = Base64.getEncoder().encodeToString(signData);
```

Encode the Signature parameter based on RFC 3986 and add it to the canonicalized query string. The following URL is obtained:

```
https://public.asapi.aliyuns.com/asapi/v3/?AccessKeyId=testid&Action=GetOrganizationLis
t&Format=JSON&Id=1&Product=ascm&RegionId=cn-region-test&SignatureMethod=HMAC-SHA1&Signa
tureNonce=43967c6e-e3ad-44fa-b06b-fcf3db5f39d2&SignatureVersion=1.0&Timestamp=2020-09-1
5T08%3A50%3A40Z&Version=2019-05-10
```

5. Use browsers or tools such as cURL and Wget to initiate an HTTP request.

16.1.1.1.5.4. Response

Responses are returned only in the JSON format. If a return code is greater than or equal to 200 and less than 300, a success response is returned. Otherwise, an error response is returned.

Sample success response

If a request is successful, the request ID and operation-specific parameter values are returned. For more information, see the developer guide of the corresponding Apsara Stack service.

```
 {
    "eagleEyeTraceId": "xxx-xxx-xxx-xxx", // The trace ID provided by EagleEye.
    "asapiSuccess": true,
    "RequestId": "xxxxxxxxxx",
    "Regions": { // The regions returned after you call the DescribeRegions operation.
        "Region": [
            {
                "RegionId": "",
                "RegionEndpoint": "",
                "LocalName": ""
            }
        ]
    }
}
```

Sample error response

If a request fails, the following information is returned. For more information, see the developer guide of the corresponding Apsara Stack service.

```
{
    "code": "asapi.server.api.notfound",// The error code.
    "eagleEyeTraceId": "xxx-xxx-xxx-xxx", // The trace ID provided by EagleEye.
    "asapiSuccess": false, // Indicates whether the request is successful.
    "hostId": "xxxx", // The ID of the host.
    "message": "Failed to ....", // The message returned.
    "asapiErrorMessage": "Failed to ....", // The error message provided by the ASAPI.
    "asapiErrorCode": "asapi.server.api.notfound" // The error code provided by the ASAPI.
}
```

16.1.2. API reference

16.1.2.1. List of operations by function

The following table lists API operations available for use in NAT Gateway.

API	Description

API	Description
ModifyNatGatewayAttribute	Modifies the name and description of a NAT gateway.
ModifyNatGatewaySpec	Resizes a NAT gateway.
DeleteNatGateway	Deletes a specified NAT gateway.
CreateForwardEntry	Adds DNAT entries to a DNAT table.
DeleteForwardEntry	Deletes a specified DNAT entry.
ModifyForwardEntry	Modifies a specified DNAT entry.
DescribeForwardTableEntries	Queries DNAT entries in a specified DNAT table.
CreateSnatEntry	Adds SNAT entries to an SNAT table.
DeleteSnatEntry	Deletes a specified SNAT entry from an SNAT table.
ModifySnatEntry	Modifies the value of SnatIp (public IP address) in a specified SNAT entry.
DescribeSnatTableEntries	Queries SNAT entries in a specified SNAT table.
CreateBandwidthPackage	Creates a NAT service plan.
ModifyBandwidthPackageSpec	Modifies the bandwidth value of a NAT service plan.
ConvertBandwidthPackage	Converts a NAT service plan to an EIP bandwidth plan.
DescribeBandwidthPackages	Queries NAT service plans in a specified region.
ModifyBandwidthPackageAttribute	Modifies the name and description of a specified NAT service plan.
DeleteBandwidthPackage	Deletes a NAT service plan.
RemoveBandwidthPackageIps	Removes a public IP address from a NAT service plan.

16.1.2.2. Make API requests

16.1.2.2.1. Request syntax

To send a NAT Gateway API request, you must send an HTTP GET request to the NAT Gateway endpoint. You must add the request parameters that correspond to the API operation being called. After you call the API operation, the system returns a response. The request and response are encoded in UTF-8.

NAT Gateway API operations use the RPC protocol. You can call NAT Gateway API operations by sending HTTP GET requests.

The following example shows the syntax of a NAT Gateway API request:

```
http://Endpoint/?Action=xx&Parameters
```

where:

- Endpoint: the endpoint of the NAT Gateway API. The endpoint of the NAT Gateway API is `vpc.example.com`.

  > **Note** `example.com` is a custom domain name. You can obtain the endpoint in the Apsara Uni-manager Operations Console. For more information, see Generate the ASAPI endpoint.

- Action: the name of the operation that you want to perform. For example, to query NAT gateways, you must set the Action parameter to DescribeNatGateways.
- Version: the version of the API that you want to call. The current NAT Gateway API version is *2016-04-28*.
- Parameters: the request parameters for the operation. Separate multiple parameters with ampersands (&).

  Request parameters include common parameters and operation-specific parameters. Common parameters include the API version and authentication information. For more information about common parameters, see Common parameters.

The following example demonstrates how to call the DescribeNatGateways operation to query NAT gateways:

> **Note** The sample requests are formatted to improve readability.

```
https://vpc.example.com/?Action=DescribeNatGateways
&Format=xml
&Version=2016-04-28
&Signature=xxxx%xxxx%3D
&SignatureMethod=HMAC-SHA1
&SignatureNonce=15215528852396
&SignatureVersion=1.0
&AccessKeyId=key-test
&Timestamp=2012-06-01T12:00:00Z
```

16.1.2.2.2. API authorization

To ensure the security of your account, we recommend that you call NAT Gateway API operations as a RAM user. To call NAT Gateway API operations as a RAM user, you must create and attach authorization policies to the RAM user.

For more information about the NAT Gateway resources and API operations that allow the authorization, see RAM authentication.

16.1.2.2.3. Request signatures

You must sign all API requests to ensure security. Apsara Stack uses the request signature to verify the identity of the API caller.

NAT Gateway implements symmetric encryption with an AccessKey pair to verify the identity of the request sender. An AccessKey pair is an identity credential issued to Apsara Stack accounts and RAM users that is similar to a logon username and password. An AccessKey pair consists of an AccessKey ID and an AccessKey secret. The AccessKey ID is used to verify the identity of the user, while the AccessKey secret is used to encrypt and verify the signature string. You must keep your AccessKey secret strictly confidential. For more information about how to create an AccessKey pair, see Obtain an AccessKey pair.

You must add the signature to an RPC API request in the following format:

`https://endpoint/?SignatureVersion=1.0&SignatureMethod=HMAC-SHA1&Signature=xxxx%xxxx%3D&SignatureNonce=3ee8c1b8-83d3-44af-a94f-4e0ad82fd6cf`

Take DescribeNatGateways as an example. Assume that the AccessKey ID is `testid` and the AccessKey secret is `testsecret`, the following code shows the original request URL:

```
http://vpc.example.com/?Action=DescribeNatGateways
&Timestamp=2016-02-23T12:46:24Z
&Format=XML
&AccessKeyId=testid
&SignatureMethod=HMAC-SHA1
&SignatureNonce=3ee8c1b8-83d3-44af-a94f-4e0ad82fd6cf
&Version=2016-04-28
&SignatureVersion=1.0
```

Perform the following operations to calculate the signature:

1. Create a string-to-sign by using the request parameters:

   ```
   GET&%2F&AccessKeyId%3Dtestid&Action%3DDescribeNatGateways&Format%3DXML&SignatureMethod%
   3DHMAC-SHA1&SignatureNonce%3D3ee8c1b8-83d3-44af-a94f-4e0ad82fd6cf&SignatureVersion%3D1.
   0&TimeStamp%3D2016-02-23T12%253A46%253A24Z&Version%3D2014-05-15
   ```

2. Calculate the HMAC value of the string-to-sign.

   Add an ampersand (&) after the AccessKey secret as the key to calculate the HMAC value. In this example, the key is `testsecret&`.

   ```
   CT9X0VtwR86fNWSnsc6v8YGOjuE=
   ```

3. Add the signature string to the request as the Signature parameter:

```
http://vpc.example.com/?Action=DescribeNatGateways
&Timestamp=2016-02-23T12:46:24Z
&Format=XML
&AccessKeyId=testid
&SignatureMethod=HMAC-SHA1
&SignatureNonce=3ee8c1b8-83d3-44af-a94f-4e0ad82fd6cf
&Version=2016-04-28
&SignatureVersion=1.0
&Signature=xxxx%xxxx%3D
```

16.1.2.3. RAM authentication

Before you call a NAT Gateway operation as a RAM user, you must use an Apsara Stack tenant account to create an authorization policy to grant permissions to the RAM user. In the authorization policy, an Alibaba Cloud Resource Name (ARN) is used to specify a resource.

NAT Gateway resources that allow authorized access

The following table lists the NAT Gateway resources that allow authorized access and their ARNs.

Resource type	ARN
NAT gateways	`acs:vpc:$regionid:$accountid:natgateway/$natgatewayid`
	`acs:vpc:$regionid:$accountid:natgateway/*`
	`acs:vpc*:$accountid:vpc/*`
NAT bandwidth packages	`acs:vpc:$regionid:$accountid:bandwidthpackage/$bandwidthpackageid`
	`acs:vpc:$regionid:$accountid:bandwidthpackage/*`
	`aacs:vpc:*:$accountid:vpc/*`
Forwarding tables	`acs:vpc:$regionid:$accountid:forwardtable/$forwardtableid`
	`acs:vpc:$regionid:$accountid:forwardtable/*`
	`acs:vpc:*:$accountid:vpc/*`
SNAT tables	`acs:vpc:$regionid:$accountid:snattable/$snattableid`
	`acs:vpc:$regionid:$accountid:snattable/*`
	`acs:vpc:*:$accountid:vpc/*`
General resources	`acs:vpc:$regionid:$accountid:*`
	`acs:vpc:*:$accountid:*`

`$regionid/accoutid/vrouterid` are IDs of the specific resources, `*` represents all resources.

NAT Gateway API operations that allow authorized access

The following table lists the NAT Gateway API operations that allow authorized access and their ARNs.

Operation	ARN
CreateNatGateway	`acs:vpc:$regionid:$accountid:natgateway/*`
DescribeNatGateways	`acs:vpc:$regionid:$accountid:natgateway/$natgatewayid` `acs:vpc:$regionid:$accountid:natgateway/*`
ModifyNatGatewaySpec	`acs:vpc:$regionid:$accountid:natgateway/$natgatewayid`
ModifyNatGatewayAttribute	`acs:vpc:$regionid:$accountid:natgateway/$natgatewayid` `acs:ecs:$regionid:$accountid:instance/$instanceid`

16.1.2.4. Common parameters

This topic describes common parameters, including common request parameters and common response parameters. Common parameters are required in all API operations, regardless of the operation being called.

Common request parameters

Common request parameters must be included in all EIP API requests.

Common request parameters

Parameter	Type	Required	Description
Format	String	No	The format in which to return the response. Valid values: *JSON and XML. Default value: JSON.*
Version	String	Yes	The version number of the API. Format: `YYYY-MM-DD`. Set the value to *2016-04-28*
AccessKeyId	String	Yes	The AccessKey ID provided to you by Apsara Stack.
Signature	String	Yes	The signature string of the current request.
SignatureMethod	String	Yes	The encryption method of the signature string. Set the value to *HMAC-SHA1*
Timestamp	String	Yes	The timestamp of the request. Specify the time in the ISO 8601 standard in the `YYYY-MM-DDThh:mm:ssZ` format. The time must be in UTC. For example, 2013-01-10T12:00:00Z.

Parameter	Type	Required	Description
SignatureVersion	String	Yes	The version of the signature encryption algorithm. Set the value to 1.0
SignatureNonce	String	Yes	A unique, random number used to prevent replay attacks. You must use different numbers for different requests.

Examples

```
http://vpc.example.com/?Action=DescribeEipAddresses
&Timestamp=2016-02-23T12:46:24Z
&Format=XML
&AccessKeyId=testid
&SignatureMethod=HMAC-SHA1
&SignatureNonce=3ee8c1b8-83d3-44af-a94f-4e0ad82fd6cf
&Version=2016-04-28
&SignatureVersion=1.0
```

Common response parameters

API responses use the HTTP response format where a 2XX status code indicates a successful call and a 4XX or 5XX status code indicates a failed call. Responses can be returned in either the JSON or XML format. You can specify the response format in the request. The default response format is XML.

Every response returns a unique RequestId regardless of whether the call is successful.

- XML format

```
<? xml version="1.0" encoding="utf-8"? >
      <!—Result Root Node-->
      <Interface Name+Response>
      <!—Return Request Tag-->
      <RequestId>4C467B38-3910-447D-87BC-AC049166F216</RequestId>
      <!—Return Result Data-->
      </Interface Name+Response>
```

- JSON format

```
{
      "RequestId":"4C467B38-3910-447D-87BC-AC049166F216",
      /*Return Result Data*/
  }
```

16.1.2.5. NAT gateways

16.1.2.5.1. ModifyNatGatewayAttribute

Modifies the name and description of a NAT gateway.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyNatGatewayAttribute	The operation that you want to perform. Set the value to **ModifyNatGatewayAttribute**.
NatGatewayId	String	Yes	ngw-2ze0dcn4mq31qx2jc****	The ID of the NAT gateway that you want to modify.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the NAT gateway is deployed. You can call the `DescribeRegions` operation to query the most recent region list.
Name	String	No	nat123	The name of the NAT gateway that you want to modify. The name must be 2 to 128 characters in length and can contain digits, periods (.), underscores (_), and hyphens (-). It must start with a letter. The name cannot start with `http://` or `https://`. **Note** You must specify at least one of the following parameters: **Name** and **Description**.
Description	String	No	fortest	The description of the NAT gateway. The description must be 2 to 256 characters in length, and must start with a letter. It cannot start with `http://` or `https://`. **Note** You must specify at least one of the following parameters: **Name** and **Description**.

Response parameters

Parameter	Type	Example	Description
RequestId	String	AB5F62CF-2B60-4458-A756-42C9DFE108D1	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ModifyNatGatewayAttribute
&NatGatewayId=ngw-2ze0dcn4mq31qx2jc****
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyNatGatewayAttributeResponse>
  <RequestId>AB5F62CF-2B60-4458-A756-42C9DFE108D1</RequestId>
</ModifyNatGatewayAttributeResponse>
```

`JSON` format

```
{"RequestId":"AB5F62CF-2B60-4458-A756-42C9DFE108D1"}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because the specified region ID does not exist.
404	InvalidNatGatewayId.NotFound	The specified NatGatewayId does not exist in our records.	The error message returned because the specified NAT gateway ID does not exist. Check whether the NAT gateway ID is valid.
400	InvalidParameter.Name.Malformed	The specified Name is not valid.	The error message returned because the specified name is invalid.
400	InvalidParameter.Description.Malformed	The specified Description is not valid.	The error message returned because the specified description is invalid.

16.1.2.5.2. ModifyNatGatewaySpec

Resizes a NAT gateway.

Description

NAT gateways are available in different sizes. The size of a NAT gateway determines the Source Network Address Translation (SNAT) performance of the gateway, such as the maximum number of connections and the number of new connections per second. However, the data throughput is not affected.

The following table describes the correlations between different sizes of NAT gateways and SNAT performance metrics.

Size	Maximum connection	Number of new connections per second
Small	10,000	1,000
Medium	50,000	5,000
Large	200,000	10,000

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyNatGatewaySpec	The operation that you want to perform. Set the value to **ModifyNatGatewaySpec**.
NatGatewayId	String	Yes	ngw-bp1uewa15k4iy5770****	The ID of the NAT gateway.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the NAT gateway is deployed.
Spec	String	Yes	Small	The size of the NAT gateway. Valid values: • **Small**: a small-sized NAT gateway • **Middle**: a middle-sized NAT gateway • **Large**: a large-sized NAT gateway

Parameter	Type	Required	Example	Description
AutoPay	Boolean	No	false	Specifies whether to enable automatic payment. Valid values: • **true**: enables automatic payment. • **false**: disables automatic payment. This is the default value.
ClientToken	String	No	SHA234js121223*****	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must make sure that it is unique among different requests. The token can contain only ASCII characters, and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	DBD4E4A2-786E-4BD2-8EB6-107FFC2B5B7D	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ModifyNatGatewaySpec
&NatGatewayId=ngw-bp1uewa15k4iy5770****
&RegionId=cn-qingdao-env17-d01
&Spec=Small
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyNatGatewaySpecResponse>
      <RequestId>DBD4E4A2-786E-4BD2-8EB6-107FFC2B5B7D</RequestId>
</ModifyNatGatewaySpecResponse>
```

`JSON` format

```
{
    "RequestId":"DBD4E4A2-786E-4BD2-8EB6-107FFC2B5B7D"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because the specified region ID does not exist.
404	InvalidNatGatewayId.NotFound	The specified NatGatewayId does not exist in our records.	The error message returned because the specified NAT gateway ID does not exist. Check whether the NAT gateway ID is valid.
400	NATGW_MODIFY_SPEC_SAME	The specified Spec is same with now.	The error message returned because the specified gateway size is the same as the current one.
400	InvalidParameter.Spec.ValueNotSupported	The specified Spec is not valid.	The error message returned because the specified gateway size is invalid.

16.1.2.5.3. DeleteNatGateway

Deletes a specified NAT gateway.

Note Before you delete a NAT gateway, you must disassociate NAT service plans from the NAT gateway.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteNatGateway	The operation that you want to perform. Set the value to **DeleteNatGateway**.
NatGatewayId	String	Yes	ngw-bp1uewa15k4iy5770****	The ID of the NAT gateway.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the NAT gateway is deployed. You can call the `DescribeRegions` operation to query the most recent region list.
Force	Boolean	No	false	Specifies whether to forcibly delete the NAT gateway. Valid values: • **true**: forcibly deletes the NAT gateway. • **false**: does not forcibly delete the NAT gateway.

Response parameters

Parameter	Type	Example	Description
RequestId	String	4EC47282-1B74-4534-BD0E-403F3EE64CAF	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DeleteNatGateway
&NatGatewayId=ngw-bp1uewa15k4iy5770****
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteNatGatewayResponse>
  <RequestId>4EC47282-1B74-4534-BD0E-403F3EE64CAF</RequestId>
</DeleteNatGatewayResponse>
```

`JSON` format

```
{
    "RequestId": "4EC47282-1B74-4534-BD0E-403F3EE64CAF"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because the specified region ID does not exist.
404	InvalidNatGatewayId.NotFound	The specified NatGatewayId does not exist in our records.	The error message returned because the specified NAT gateway ID does not exist. Check whether the NAT gateway ID is valid.
400	DependencyViolation.BandwidthPackages	There are BandwidthPackages on specified NatGateway not deleted.	The error message returned because one or more NAT service plans are associated with the NAT gateway. Disassociate all NAT service plans from the NAT gateway and try again.

16.1.2.6. DNAT tables

16.1.2.6.1. CreateForwardEntry

Adds a DNAT entry to a DNAT table.

Description

Each DNAT entry consists of the following parameters: ExternalIp, ExternalPort, Protocol, InternalIp, and InternalPort. After you add a DNAT entry, the NAT gateway forwards packets of the specified protocol from [ExternalIp: ExternalPort] to [InternalIp: InternalPort] and sends responses back over the same route.

When you call this operation, take note of the following limits:

- The combinations of ExternalIp, ExternalPort, and Protocol used in DNAT entries must be unique. Requests cannot be distributed to more than one Elastic Compute Service (ECS) instance if these requests are originated from the same source IP address, received on the same port, and use the same protocol.
- The combinations of Protocol, InternalIp, and InternalPort used in DNAT entries must be unique.
- If one or more DNAT entries in the DNAT table are in the Pending or Modifying state, you cannot add DNAT entries to the DNAT table.
- The public IP address (ExternalIp) in the DNAT entry, which is used to access the Internet, must meet the following requirements:
  - If you have purchased a NAT service plan before November 3, 2017, the ExternalIp must be a public IP address in the NAT service plan.
  - If you have not purchased a NAT service plan before November 3, 2017, the ExternalIp must be an elastic IP address (EIP) associated with the NAT service plan.
  - You cannot specify the same EIP in both a DNAT entry and an SNAT entry.
- The private IP address (InternalIp) in the DNAT entry must meet the following requirements:

- The private IP address must belong to the CIDR block of the virtual private cloud (VPC) where the NAT gateway is deployed.
- The DNAT entry takes effect only when the private IP address is allocated to an ECS instance and the ECS instance is not assigned an EIP. If the private IP address is allocated to a resource other than an ECS instance, such as a high-availability virtual IP addresses (HAVIPs), Server Load Balancer (SLB) instance, or RDS instance, the DNAT entry does not take effect. Consequently, inbound traffic cannot be forwarded to the private IP address.
- You cannot specify the same EIP in both a DNAT entry and an SNAT entry.

- You can add up to 100 DNAT entries to a DNAT table.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateForwardEntry	The operation that you want to perform. Set the value to **CreateForwardEntry**.
ExternalIp	String	Yes	116.XX.XX.28	The public IP address of the NAT gateway.
ExternalPort	String	Yes	8080	The public port. Valid values: **1 to 65535**.
ForwardTableId	String	Yes	ftb-bp1mbjubq34hlcqpa****	The ID of the DNAT table.
InternalIp	String	Yes	192.XX.XX.1	The destination private IP address.
InternalPort	String	Yes	80	The destination private port. Valid values: **1 to 65535**.
IpProtocol	String	Yes	TCP	The protocol that is used by the ports. Valid values: • **TCP**: forwards TCP packets. • **UDP**: forwards UDP packets. • **Any**: forwards packets of all protocols.
RegionId	String	Yes	cn-qingdao-env17-d0	The ID of the region where the NAT gateway is created. You can call the `DescribeRegions` operation to query the most recent region list.

Parameter	Type	Required	Example	Description
ForwardEntryName	String	No	ForwardEntry-1	The name of the DNAT entry. The name must be 2 to 128 characters in length, and start with a letter. It cannot start with `http://` or `https://`.
ClientToken	String	No	0c593ea1-3bea-11e9-b96b-88e9fe637****	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must make sure that it is unique among different requests. The ClientToken value can contain only **ASCII** characters and cannot exceed 64 characters in length.
PortBreak	Boolean	No	false	Specifies whether to remove limits on the port range. Valid values: **true**: removes limits on the port range. **false** (default): sets limits on the port range. **Note** When an SNAT entry and a DNAT entry use the same public IP address, and you want to specify a port number greater than 1024, set **PortBreak** to **true**.

Response parameters

Parameter	Type	Example	Description
ForwardEntryId	String	fwd-119smw5tkasdf****	The ID of the DNAT entry.
RequestId	String	A4AEE536-A97A-40EB-9EBE-53A6948A6928	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=CreateForwardEntry
&ExternalIp=116.XX.XX.28
&ExternalPort=8080
&ForwardTableId=ftb-bp1mbjubq34hlcqpa****
&InternalIp=192.XX.XX.1
&InternalPort=80
&IpProtocol=TCP
&RegionId=cn-qingdao-env17-d0
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreateForwardEntryResponse>
  <RequestId>A4AEE536-A97A-40EB-9EBE-53A6948A6928</RequestId>
  <ForwardEntryId>fwd-119smw5tkasdf****</ForwardEntryId>
</CreateForwardEntryResponse>
```

`JSON` format

```
{
    "CreateForwardEntryResponse": {
        "RequestId": "A4AEE536-A97A-40EB-9EBE-53A6948A6928",
        "ForwardEntryId": "fwd-119smw5tkasdf****"
    }
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because the specified region ID does not exist.
400	InvalidExternalIp.Malformed	The specified ExternalIp is not a valid IP address.	The error message returned because the specified IP address is invalid.
400	InvalidInternalIp.Malformed	The specified InternalIp is not a valid IP address.	The error message returned because the specified private IP address is invalid.
400	InvalidExternalPort.Malformed	The specified ExternalPort is not a valid port.	The error message returned because the specified public port is invalid.
400	InvalidInternalPort.Malformed	The specified InternalPort is not a valid port.	The error message returned because the specified private port is invalid.

HttpCode	Error code	Error message	Description
400	Forbidden.DestnationIpOutOfVpcCIDR	The specified Internal Ip is Out of VPC CIDR.	The error message returned because the specified private IP address does not fall within the CIDR block of the VPC. Enter a private IP address that falls within the CIDR block of the VPC.
400	InvalidProtocal.ValueNotSupported	The specified IpProtocol does not support.	The error message returned because the specified protocol is not supported.
400	IncorretForwardEntryStatus	Some Forward entry status blocked this operation..	The error message returned because you are not authorized to perform the specified operation. The error message returned because one or more DNAT entries in the DNAT table are in the Pending or Modifying state.
404	InvalidForwardTableId.NotFound	Specified forward table does not exist.	The error message returned because the specified DNAT table does not exist. Check the parameter value and try again.
404	InvalidExternalIp.NotFound	Specified External Ip address does not found on the VRouter	The error message returned because the specified public IP address does not exist.
400	Forbidden.ExternalIp.UsedInSnatTable	The specified ExternalIp is already used in SnatTable	The error message returned because the specified public IP address is already used by an SNAT entry. Select a different IP address or delete the SNAT entry.
400	Forbindden	The specified Instance already bind eip	The error message returned because the ECS instance is associated with an EIP. Disassociate the EIP from the ECS instance before you create forwarding rules.
400	Forbidden.InternalIpOutOfVpcCIDR	The specified Internal Ip is Out of VPC CIDR.	The error message returned because the private IP address does not fall within the CIDR block of the VPC.
400	Invalid.natgwNotExist	The specified natgateway not exist.	The error message returned because the specified NAT gateway does not exist.

HttpCode	Error code	Error message	Description
400	InvalidIp.NotInNatgw	The specified Ip not belong to natgateway.	The error message returned because the specified IP address is not associated with the NAT gateway.
400	MissingParameter	Missing mandatory parameter	The error message returned because one or more required parameters are not set. Check whether you have set all required parameters.
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an unknown error occurred.
400	InvalidParameter.Name.Malformed	The specified Name is not valid.	The error message returned because the specified name is invalid.

16.1.2.6.2. DeleteForwardEntry

Deletes a DNAT entry.

Note You cannot delete DNAT entries if one or more DNAT entries in the DNAT table are in the **Pending** or **Modifying** state.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteForwardEntry	The operation that you want to perform. Set the value to **DeleteForwardEntry**.
ForwardEntryId	String	Yes	fwd-8vbn3bc8roygjp0g****	The ID of the DNAT entry.
ForwardTableId	String	Yes	ftb-8vbx8xu2lqj9qb334****	The ID of the DNAT table.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the NAT gateway is deployed. You can call the `DescribeRegions` operation to query the most recent region list.

Parameter	Type	Required	Example	Description
ClientToken	String	No	123e4567-e89b-12d3-a456-42665544****	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must make sure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	0ED8D006-F706-4D23-88ED-E11ED28DCAC0	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DeleteForwardEntry
&ForwardEntryId=fwd-8vbn3bc8roygjp0g****
&ForwardTableId=ftb-8vbx8xu2lqj9qb334****
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteForwardEntryResponse>
  <RequestId>0ED8D006-F706-4D23-88ED-E11ED28DCAC0</RequestId>
</DeleteForwardEntryResponse>
```

`JSON` format

```
{"RequestId":"0ED8D006-F706-4D23-88ED-E11ED28DCAC0"}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because the specified region ID does not exist.

HttpCode	Error code	Error message	Description
400	IncorretForwardEntryStatus	Some Forward entry status blocked this operation..	The error message returned because you are not authorized to perform the specified operation. The error message returned because one or more DNAT entries in the DNAT table are in the Pending or Modifying state.
404	InvalidForwardEntryId.NotFound	Specified forward entry ID does not exist	The error message returned because the specified DNAT entry does not exist.
404	InvalidForwardTableId.NotFound	Specified forward table does not exist.	The error message returned because the specified DNAT table does not exist. Check the parameter value and try again.
400	IncorretForwardEntryStatus	The Specified forwardEntry is not exist	The error message returned because the specified DNAT entry does not exist.
400	MissingParameter	Missing mandatory parameter	The error message returned because one or more required parameters are not set. Check whether you have set all required parameters.

16.1.2.6.3. ModifyForwardEntry

Modifies a DNAT entry.

> **Note** You cannot modify DNAT entries if one or more DNAT entries in the DNAT table are in the **Pending** or **Modifying** state.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyForwardEntry	The operation that you want to perform. The operation that you want to perform. Set the value to **ModifyForwardEntry**.

Parameter	Type	Required	Example	Description
ForwardEntryId	String	Yes	fwd-8vbn3bc8roygjp0gy3xk7	The ID of the DNAT entry.
ForwardTableId	String	Yes	ftb-8vbx8xu2lqj9qb334h0ow	The ID of the DNAT table.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the NAT gateway is created. You can call the `DescribeRegions` operation to query the most recent region list.
ExternalIp	String	No	116.XX.XX.28	The public IP address of the NAT gateway.
ExternalPort	String	No	80	The public port. Valid values: **1** to **65535**.
InternalIp	String	No	10.XX.XX.78	The destination private IP address.
InternalPort	String	No	80	The destination private port. Valid values: **1** to **65535**.
IpProtocol	String	No	TCP	The protocol type. Valid values: • **TCP**: forwards Transmission Control Protocol (TCP) packets. • **UDP**: forwards User Datagram Protocol (UDP) packets. • **Any**: forwards packets of all protocols.
ForwardEntryName	String	No	ForwardEntry-1	The name of the DNAT entry. The description must be 2 to 128 characters in length, and start with a letter. It cannot start with `http://` or `https://`.

Parameter	Type	Required	Example	Description
ClientToken	String	No	123e4567-e89b-12d3-a456-42665544****	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must make sure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	24CC85DC-7700-4F09-9624-99E988C7DD03	The ID of the request.

Examples

Sample requests

```
https://vpc.aliyuncs.com/?Action=ModifyForwardEntry
&ForwardEntryId=fwd-8vbn3bc8roygjp0gy3xk7
&ForwardTableId=ftb-8vbx8xu2lqj9qb334h0ow
&RegionId= cn-hangzhou
&<Common request parameters>
```

Sample success responses

`XML` format

```
</ModifyForwardEntryResponse>
<RequestId>24CC85DC-7700-4F09-9624-99E988C7DD03</RequestId>
</ModifyForwardEntryResponse>
```

`JSON` format

```
{
    "RequestId": "24CC85DC-7700-4F09-9624-99E988C7DD03"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because the specified region ID does not exist.

HttpCode	Error code	Error message	Description
400	InvalidExternalIp.Malformed	The specified ExternalIp is not a valid IP address.	The error message returned because the specified IP address is invalid.
400	InvalidInternalIp.Malformed	The specified InternalIp is not a valid IP address.	The error message returned because the specified private IP address is invalid.
400	InvalidExternalPort.Malformed	The specified ExternalPort is not a valid port.	The error message returned because the specified public port is invalid.
400	InvalidInternalPort.Malformed	The specified InternalPort is not a valid port.	The error message returned because the specified private port is invalid.
400	Forbidden.DestnationIpOutOfVpcCIDR	The specified Destination Ip is Out of VPC CIDR.	The error message returned because the specified private IP address does not fall within the CIDR block of the VPC. Enter a private IP address that falls within the CIDR block of the VPC.
400	InvalidProtocal.ValueNotSupported	The specified IpProtocol does not support.	The error message returned because the specified protocol is not supported.
400	IncorretForwardEntryStatus	Some Forward entry status blocked this operation..	The error message returned because the operation cannot be performed. The error message returned because one or more DNAT entries in the DNAT table are in the Pending or Modifying state.
400	QuotaExceeded	Forward entry quota exceeded in this route table.	The error message returned because one route table cannot contain more than 48 custom routes to a route table. You can submit a ticket to increase the quota.
404	InvalidForwardEntryId.NotFound	Specified forward entry ID does not exist	The error message returned because the specified DNAT entry does not exist.
404	InvalidExternalIp.NotFound	Specified External Ip address does not found on the VRouter	The error message returned because the specified public IP address does not exist.

HttpCode	Error code	Error message	Description
404	InvalidForwardTableId.NotFound	Specified forward table does not exist.	The error message returned because the specified DNAT table does not exist. Check the parameter value and try again.
400	Forbidden.ExternalIp.UsedInSnatTable	The specified ExternalIp is already used in SnatTable	The error message returned because the specified public IP address is already used by an SNAT entry. Select a different IP address or delete the SNAT entry.
400	Forbidden.Already.Bounded	The specified instance already bounded	The error message returned because the specified instance is already associated with another DNAT entry.
400	InvalidParameter.Name.Malformed	The specified Name is not valid.	The error message returned because the format of the specified name is invalid.

16.1.2.6.4. DescribeForwardTableEntries

Queries DNAT entries.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeForwardTableEntries	The operation that you want to perform. Set the value to **DescribeForwardTableEntries**.
ForwardTableId	String	Yes	ftb-bp1mbjubq34hlcqpa****	The ID of the DNAT table.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the NAT gateway is created. You can call the `DescribeRegions` operation to query the most recent region list.
ForwardEntryId	String	No	fwd-8vbn3bc8roygjp0gy****	The ID of the DNAT entry that is automatically assigned.
ExternalIp	String	No	116.XX.XX.28	The public IP address of the NAT gateway.

Parameter	Type	Required	Example	Description
ExternalPort	String	No	8080	The public port. Valid values: **1** to **65535**.
InternalIp	String	No	192.XX.XX.1	The destination private IP address.
InternalPort	String	No	80	The destination private port. Valid values: **1** to **65535**.
IpProtocol	String	No	TCP	The protocol type. Valid values: • **TCP**: forwards TCP packets. • **UDP**: forwards UDP packets. • **Any**: forwards packets of all protocols.
ForwardEntryName	String	No	ForwardEntry-1	The name of the DNAT entry. The name must be 2 to 128 characters in length. It must start with a letter and cannot start with `http://` or `https://`.
PageNumber	Integer	No	1	The number of the page to return. Default value: **1**.
PageSize	Integer	No	10	The number of entries to return on each page. Maximum value: **50**. Default value: **10**.

Response parameters

Parameter	Type	Example	Description
ForwardTableEntries	Array of ForwardTableEntry		The details of the DNAT entries.
ForwardTableEntry			
ExternalIp	String	116.XXX.XX.28	The public IP address of the NAT gateway.
ExternalPort	String	80	The public port.

Parameter	Type	Example	Description
ForwardEntryId	String	fwd-119smw5tk****	The ID of the DNAT entry.
ForwardEntryName	String	ForwardEntry-1	The name of the DNAT entry.
ForwardTableId	String	ftb-11tc6xgmv****	The ID of the DNAT table to which the DNAT entry belongs.
InternalIp	String	192.XX.XX.1	The private IP address.
InternalPort	String	25	The destination private port. Valid values: **1** to **65535**.
IpProtocol	String	TCP	The protocol type.
Status	String	Available	The state of the DNAT entry.
TotalCount	Integer	5	The total number of entries returned.
PageNumber	Integer	1	The page number of the returned page.
PageSize	Integer	10	The number of entries returned per page.
RequestId	String	A6C4A8B1-7561-4509-949C-20DEB40D71E6	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeForwardTableEntries
&ForwardTableId=ftb-bp1mbjubq34hlcqpa****
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeForwardTableEntriesResponse>
  <TotalCount>5</TotalCount>
  <PageSize>10</PageSize>
  <RequestId>A6C4A8B1-7561-4509-949C-20DEB40D71E6</RequestId>
  <PageNumber>1</PageNumber>
  <ForwardTableEntries>
        <Status>Available</Status>
        <ExternalPort>80</ExternalPort>
        <ExternalIp>116.XXX.XX.28</ExternalIp>
        <ForwardEntryId>fwd-119smw5tk****</ForwardEntryId>
        <IpProtocol>TCP</IpProtocol>
        <InternalPort>25</InternalPort>
        <ForwardEntryName>ForwardEntry-1</ForwardEntryName>
        <InternalIp>192.XX.XX.1</InternalIp>
        <ForwardTableId>ftb-11tc6xgmv****</ForwardTableId>
  </ForwardTableEntries>
</DescribeForwardTableEntriesResponse>
```

`JSON` format

```
{
    "TotalCount": 5,
    "PageSize": 10,
    "RequestId": "A6C4A8B1-7561-4509-949C-20DEB40D71E6",
    "PageNumber": 1,

        "IpProtocol": "TCP",
        "InternalPort": 25,
        "ForwardEntryName": "ForwardEntry-1",
        "InternalIp": "192.XX.XX.1",
        "ForwardTableId": "ftb-11tc6xgmv****"
    }
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because the specified region ID does not exist.
400	IncorretForwardEntryStatus	Some Forward entry status blocked this operation..	The error message returned because you are not authorized to perform the specified operation. One or more DNAT entries in the DNAT table are in the Pending or Modifying state.

HttpCode	Error code	Error message	Description
404	InvalidForwardTableId.NotFound	Specified forwardTableId does not exist	The error message returned because the specified DNAT table does not exist. Check the parameter value and try again.

16.1.2.7. SNAT tables

16.1.2.7.1. CreateSnatEntry

Adds an SNAT entry to an SNAT table.

Description

When you call this operation, take note of the following limits:

- The vSwitch and the Elastic Compute Service (ECS) instance specified in the SNAT entry must belong to the virtual private cloud (VPC) where the NAT gateway is deployed.
- Each vSwitch or ECS instance can be specified in only one SNAT entry.
- If a high-availability virtual IP address (HAVIP) exists in the vSwitch, you cannot create SNAT entries.
- You cannot specify the same EIP in both a DNAT entry and an SNAT entry.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateSnatEntry	The operation that you want to perform. Set the value to **CreateSnatEntry**.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the NAT gateway is deployed. You can call the `DescribeRegions` operation to query the most recent region list.
SnatIp	String	Yes	47.XX.XX.98	The public IP addresses. Separate multiple IP addresses with commas (,).
SnatTableId	String	Yes	stb-bp190wu8io1vgev****	The ID of the SNAT table.
SourceVSwitchId	String	No	vsw-bp1nhx2s9ui5o****	The ID of the vSwitch that requires to access the Internet.

Parameter	Type	Required	Example	Description
SourceCIDR	String	No	10.1.1.0/24	The CIDR block of the vSwitch or the IP address of the ECS instance. • vSwitch granularity: specifies the CIDR block of the vSwitch, for example, 192.168.1.0/24. When an ECS instance of a vSwitch requires to access the Internet, the NAT gateway provides the SNAT service for the ECS instance. If you specify only one public IP address in the **SnatIp** parameter, the ECS instance uses the specified public IP address to access the Internet. If you specify multiple public IP addresses in the **SnatIp** parameter, the ECS instance randomly selects a public IP address from **SnatIp** to access the Internet. • ECS granularity: specifies the IP address of the ECS instance, for example, 192.168.1.0/32. When the ECS instance requires to access the Internet, the NAT gateway provides the SNAT service for the ECS instance. If you specify only one public IP address in the **SnatIp** parameter, the ECS instance uses the specified public IP address to access the Internet. If you specify multiple public IP addresses in the **SnatIp** parameter, the ECS instance randomly selects a public IP address from **SnatIp** to access the Internet. This parameter and the **SourceVSwtichId** parameter cannot be set at the same time. If the **SourceVSwitchId** parameter is set, you cannot set the **SourceCIDR** parameter. If the **SourceCIDR** parameter is set, you cannot set the **SourceVSwitchId** parameter.
SnatEntryName	String	No	SnatEntry-1	The name of the SNAT entry. The name must be 2 to 128 characters in length, and must start with a letter. It cannot start with `http://` or `https://`.

Parameter	Type	Required	Example	Description
ClientToken	String	No	02fb3da4-130e-11e9-8e44-001****	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must make sure that it is unique among different requests. `ClientToken` can contain only ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
SnatEntryId	String	snat-kmd6nv8fy****	The ID of the SNAT entry.
RequestId	String	2315DEB7-5E92-423A-91F7-4C1EC9AD97C3	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=CreateSnatEntry
&RegionId=cn-qingdao-env17-d01
&SnatIp=47.XX.XX.98
&SnatTableId=stb-bp190wu8io1vgev****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreateSnatEntryResponse>
      <RequestId>2315DEB7-5E92-423A-91F7-4C1EC9AD97C3</RequestId>
      <SnatEntryId>snat-119smw5tkx****</SnatEntryId>
</CreateSnatEntryResponse>
```

`JSON` format

```
{
    "SnatEntryId": "snat-kmd6nv8fyx****",
    "RequestId": "2315DEB7-5E92-423A-91F7-4C1EC9AD97C3"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because the specified region ID does not exist.
404	InvalidSnatTableId.NotFound	Specified SNAT table does not exist.	The error message returned because the specified SNAT table does not exist. Check whether the ID of the SNAT table is valid.
400	Forbidden.SourceVSwitchId.IncludeHaVip	There is some HaVips under specified VSwitch	The error message returned because the specified vSwitch is associated with HAVIPs.
400	InvalidSnatIp.Malformed	The specified SnatIp is not a valid IP address.	The error message returned because the specified public IP address is invalid.
400	SNAT_IP_POOL_COUNT_TOO_MANY	The Snat pool ip too many.	The error message returned because the number of IP addresses in the SNAT IP address pool has reached the upper limit.
400	Forbidden.SnatEntryCountLimited	SNAT entry in the specified SNAT table reach it?s limit.	The error message returned because the number of SNAT entries has reached the upper limit.
400	NOT_ALLOW_USE_SOURCECIDR	The User not in nat_scope_unlimited white list. Cannot use SourceCidr param.	The error message returned because the specified private IP address does not fall within the CIDR block of the VPC.
404	InvalidVSwitchId.NotFound	The specified virtual switch does not exists.	The error message returned because the specified vSwitch does not exist. Check whether the specified ID is valid.
400	INVALID_PARAMETER	The parameter invalid.	The error message returned because the specified parameter is invalid.
400	Forbidden.SourceVSwitchId.Duplicated	The specified SourceCIDRis duplicated.	The error message returned because an SNAT entry is already created for the specified vSwitch.
404	InvalidSnatIp.NotFound	Specified SnatIp does not found on the NAT Gateway	The error message returned because the specified public IP address is not found on the NAT gateway.

HttpCode	Error code	Error message	Description
400	Forbidden.IpUsedInForwardTable	The specified SnatIp already used in forward table	The error message returned because the specified public IP address is already used by a DNAT entry. Select another public IP address or delete the DNAT entry.
400	Forbindden	The specified Instance already bind eip	The error message returned because the ECS instance is associated with an EIP. Disassociate the EIP from the ECS instance before you create forwarding rules.
400	OperationUnsupported.CidrConflict	The specified CIDR block conflicts with an existing SNAT entry.	The error message returned because the specified CIDR block conflicts with those in existing SNAT entries.
400	InvalidParameter.Name.Malformed	The specified Name is not valid.	The error message returned because the specified name is invalid.

16.1.2.7.2. DeleteSnatEntry

Deletes a specified SNAT entry.

Note You cannot delete SNAT entries if one or more SNAT entries in the SNAT table are in the **Pending** or **Modifying** state.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteSnatEntry	The operation that you want to perform. Set the value to **DeleteSnatEntry**.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the NAT gateway is deployed. You can call the `DescribeRegions` operation to query the most recent region list.
SnatEntryId	String	Yes	snat-bp1vcgcf8tm0plqc****	The ID of the SNAT entry.

Parameter	Type	Required	Example	Description
SnatTableId	String	Yes	stb-bp190wu8io1vgev80****	The ID of the SNAT table.
ClientToken	String	No	123e4567-e89b-12d3-a456-42665544****	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must make sure that it is unique among different requests. The token can only contain ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	47B80B6A-759A-479C-A565-76D04BDA29F3	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DeleteSnatEntry
&RegionId=cn-qingdao-env17-d01
&SnatEntryId=snat-bp1vcgcf8tm0plqc****
&SnatTableId=stb-bp190wu8io1vgev80****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteSnatEntryResponse>
  <RequestId>47B80B6A-759A-479C-A565-76D04BDA29F3</RequestId>
</DeleteSnatEntryResponse>
```

`JSON` format

```
{"RequestId":"47B80B6A-759A-479C-A565-76D04BDA29F3"}
```

Error codes

HttpCode	Error code	Error message	Description

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because the specified region ID does not exist.
400	IncorretSnatEntryStatus	Some Snat entry status blocked this operation..	The error message returned because you are not authorized to perform the specified operation. The error message returned because one or more SNAT entries in the SNAT table are in the Pending or Modifying state.
404	InvalidSnatEntryId.NotFound	Specified Snat entry ID does not exist	The error message returned because the specified SNAT entry does not exist. Check whether the SNAT entry is valid.
404	InvalidSnatTableId.NotFound	Specified SNAT table does not exist.	The error message returned because the specified SNAT table does not exist. Check whether the ID of the SNAT table is valid.
404	InvalidSnatEntryId.NotFound	Specified SNAT entry does not exist.	The error message returned because the specified SNAT entry does not exist. Check whether the SNAT entry is valid.

16.1.2.7.3. ModifySnatEntry

Modifies a specified SNAT entry.

> **Note** You cannot modify SNAT entries if one or more SNAT entries in the SNAT table are in the **Pending** or **Modifying** state.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifySnatEntry	The operation that you want to perform. Set the value to **ModifySnatEntry**.
RegionId	String	Yes	cn-qingdao-env17-d0	The ID of the region where the NAT gateway is deployed.

Parameter	Type	Required	Example	Description
SnatEntryId	String	Yes	snat-bp1vcgcf8tm0plqcg****	The ID of the SNAT entry.
SnatTableId	String	Yes	stb-8vbczigrhop8x5u3t****	The ID of the SNAT table to which the SNAT entry belongs.
SnatIp	String	Yes	47.XX.XX.98	The public IP address in the SNAT entry. If multiple IP addresses are specified, separate them with commas (,).
SnatEntryName	String	No	SnatEntry-1	The name of the SNAT entry. The description must be 2 to 128 characters in length, and start with a letter. It cannot start with `http://` or `https://` .
ClientToken	String	No	02fb3da4-130e-11e9-8e44-001****	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must make sure that it is unique among different requests. Only ASCII characters are allowed. It can contain up to 64 ASCII characters.

Response parameters

Parameter	Type	Example	Description
RequestId	String	2315DEB7-5E92-423A-91F7-4C1EC9AD97C3	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ModifySnatEntry
&RegionId=cn-qingdao-env17-d0
&SnatEntryId=snat-bp1vcgcf8tm0plqcg****
&SnatTableId=stb-8vbczigrhop8x5u3t****
&SnatIp=47.XX.XX.98
&<Common request parameters>
```

Successful response examples

`XML` format

```
<ModifySnatEntryResponse>
      <RequestId>2315DEB7-5E92-423A-91F7-4C1EC9AD97C3</RequestId>
</ModifySnatEntryResponse>
```

`JSON` format

```
{
  "RequestId": "2315DEB7-5E92-423A-91F7-4C1EC9AD97C3"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because the specified region ID is invalid. Check whether the service is available in the specified region.
404	InvalidSnatTableId.NotFound	Specified SNAT table does not exist.	The error message returned because the specified SNAT table does not exist. Check whether the ID of the SNAT table is valid.
400	InvalidSnatIp.Malformed	The specified SnatIp is not a valid IP address.	The error message returned because the specified public IP address is invalid.
404	InvalidSnatEntryId.NotFound	Specified SNAT entry does not exist.	The error message returned because the specified SNAT entry does not exist. Check whether the SNAT entry is valid.
400	Forbidden.SourceVSwitchId.Duplicated	The specified SourceCIDRis duplicated.	The error message returned because an SNAT entry is already configured for the specified vSwitch.
404	InvalidSnatIp.NotFound	Specified SnatIp does not found on the NAT Gateway	The error message returned because the specified public IP address does not exist in the NAT gateway.

HttpCode	Error code	Error message	Description
400	Forbidden.IpUsedInForwardTable	The specified SnatIp already used in forward table	The error message returned because the specified public IP address is already used by a DNAT entry. Select another IP address or delete the DNAT rule that uses the public IP address.
400	InvalidParameter.Name.Malformed	The specified Name is not valid.	The error message returned because the specified name format is invalid.

16.1.2.7.4. DescribeSnatTableEntries

Queries SNAT entries.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeSnatTableEntries	The operation that you want to perform. Set the value to **DescribeSnatTableEntries**.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the NAT gateway is deployed. You can call the `DescribeRegions` operation to query the most recent region list.
SnatTableId	String	Yes	stb-8vbczigrhop8x5u3t****	The ID of the SNAT table.
SnatEntryId	String	No	snat-8vbae8uqh7rjpk7d2****	The ID of the SNAT entry.
SourceVSwitchId	String	No	vsw-3xb****	The ID of the vSwitch that can access the Internet through SNAT.
SourceCIDR	String	No	116.XX.XX.0/28	The source CIDR block of the SNAT entry.

Parameter	Type	Required	Example	Description
SnatIp	String	No	116.XX.XX.28	The public IP address in the SNAT entry.
SnatEntryName	String	No	SnatEntry-1	The name of the SNAT entry. The name must be 2 to 128 characters in length, and start with a letter. The name cannot start with `http://` or `https://`.
PageNumber	Integer	No	1	The number of the page to return. Default value: **1**.
PageSize	Integer	No	10	The number of entries to return on each page. Maximum value: **50**. Default value: **10**.

Response parameters

Parameter	Type	Example	Description
SnatTableEntries	Array of SnatTableEntry		The detailed information about the SNAT entries.
SnatTableEntry			
SnatEntryId	String	snat-8vbae8uqh7rjpk7d2****	The ID of the SNAT entry.
SnatEntryName	String	SnatEntry-1	The name of the SNAT entry.
SnatIp	String	116.XX.XX.28	The public IP address in the SNAT entry.
SnatTableId	String	stb-8vbczigrhop8x5u3t****	The ID of the SNAT table to which the SNAT entry belongs.
SourceCIDR	String	116.XX.XX.0/28	The source CIDR block of the SNAT entry.
SourceVSwitchId	String	vsw-3xb****	The ID of the vSwitch that can access the Internet through SNAT.

Parameter	Type	Example	Description
Status	String	Pending	The state of the SNAT entry.
TotalCount	Integer	1	The number of entries returned.
PageNumber	Integer	1	The page number of the returned page.
PageSize	Integer	5	The number of entries returned on each page.
RequestId	String	6D7E89B1-1C5B-412B-8585-4908E222EED5	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeSnatTableEntries
&RegionId=cn-qingdao-env17-d01

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because the specified region ID does not exist.
404	InvalidSnatTableId.NotFound	Specified SNAT table does not exist.	The error message returned because the specified SNAT table does not exist. Check whether the ID of the SNAT table is valid.

16.1.2.8. NAT bandwidth packages

16.1.2.8.1. CreateBandwidthPackage

Creates a NAT service plan.

Description

A NAT service plan consists of bandwidth resources and one or more public IP addresses. You can associate up to four NAT service plans with a NAT gateway.

A NAT service plan includes:

- Bandwidth resources
- One or more public IP addresses

> **Note** This operation can be performed by only Apsara Stack accounts that have purchased NAT service plans before November 3, 2017. If you have not purchased a NAT service plan before November 3, 2017, you can apply for public IP addresses by associating elastic IP addresses (EIPs).

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateBandwidthPackage	The operation that you want to perform. Set the value to **CreateBandwidthPackage**.
Bandwidth	Integer	Yes	5	The maximum bandwidth of the NAT service plan. Valid values: **5** to **1000**. Unit: Mbit/s.
IpCount	Integer	Yes	2	The number of public IP addresses in the NAT service plan. Valid values: **1 to 50**.
NatGatewayId	String	Yes	ngw-7mwb327j1****	The ID of the NAT gateway.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the NAT service plan. You can call the `DescribeRegions` operation to query the most recent region list.
Name	String	No	The name of the NAT service plan.	The name of the NAT service plan. The name must be 2 to 128 characters in length and can contain digits, periods (.), underscores (_), and hyphens (-). It must start with a letter. The name cannot start with `http://` or `https://`.
Description	String	No	The description of the NAT service plan.	The description of the NAT service plan. The name must be 2 to 256 characters in length, and start with a letter. It cannot start with `http://` or `https://`.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-001****	The client token that is used to ensure the idempotence of the request. You can use the client to generate a token, but you must make sure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.

Parameter	Type	Required	Example	Description
ISP	String	No	BGP	Only **BGP** is supported.
Zone	String	No	cn-qingdao-env17-amtest11001-a	The zone to which the NAT service plan belongs. If you do not set this parameter, the service plan is randomly allocated to a zone. **Note** Connectivity is not affected when the IP addresses provided by the NAT service plan and the backend Elastic Compute Service (ECS) instances belong to different zones. However, when the IP addresses and ECS instances belong to the same zone, latency can be reduced.
InternetChargeType	String	No	PayByBandwidth	The metering method of the NAT service plan. Valid values: • **PayByTraffic**: pay-by-data-transfer • **PayByBandwidth**：按带宽计费。

Response parameters

Parameter	Type	Example	Description
BandwidthPackageId	String	bwp-s6lmotmkk****	The ID of the NAT service plan.
RequestId	String	54ED4074-3F89-4F11-B166-837DD3E20FE3	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=CreateBandwidthPackage
&Bandwidth=5
&IpCount=2
&NatGatewayId=ngw-7mwb327j1****
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreateBandwidthPackageResponse>
  <RequestId>54ED4074-3F89-4F11-B166-837DD3E20FE3</RequestId>
  <BandwidthPackageId>bwp-s6lmotmkk****</BandwidthPackageId>
</CreateBandwidthPackageResponse>
```

`JSON` format

```
{
    "RequestId": "54ED4074-3F89-4F11-B166-837DD3E20FE3",
    "BandwidthPackageId": "bwp-s6lmotmkk****"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because the specified region ID does not exist.
404	InvalidVpcId.NotFound	Specified value of VpcId is not found in our record.	The error message returned because the specified VPC does not exist. Check whether the specified VPC ID is valid.
400	MissingParameter	Miss mandatory parameter.	The error message returned because one or more required parameters are not set. Check whether you have set all the required parameters before you call this operation.
404	InvalidZoneId.NotFound	Specified value of ZoneId is not exists.	The error message returned because the specified zone does not exist.
404	InvalidZoneId.NotFound	Can not find ZoneId for allocated ip.	The error message returned because the zone of the specified IP address is invalid.
400	QuotaExceeded.BandwidthPackageIps	The specified ipCount exceeded quota.	The error message returned because the number of IP addresses has reached the upper limit. Submit a ticket to increase the quota.

HttpCode	Error code	Error message	Description
400	QuotaExceeded.BandwidthPackageCountOnNatGateway	BandwidthPackage count limit on one NatGateway exceeded.	The error message returned because the number of NAT service plans has reached the upper limit. You can associate up to four NAT service plans with a NAT gateway.
400	InvalidParameter.Name.Malformed	The specified Name is not valid.	The error message returned because the specified name is invalid.
400	InvalidParameter.Description.Malformed	The specified Description is not valid.	The error message returned because the specified description is invalid.
400	InvalidParameter.BandwidthPackage.n.ISP.ValueNotSupport	The specified ISP of BandwidthPackage is not valid.	The error message returned because the specified Internet service provider (ISP) of the EIP bandwidth plan is invalid.
400	ZONE_NO_AVAILABLE_IP	The Zone have no available ip.	The error message returned because no IP address is available in the zone.

16.1.2.8.2. ModifyBandwidthPackageSpec

Modifies the bandwidth value of a specified NAT service plan.

This operation can be performed by only Apsara Stack accounts that have purchased NAT service plans before January 26, 2018. If you have not purchased a NAT service plan before January 26, 2018, associate elastic IP addresses (EIPs) with your NAT gateways.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyBandwidthPackageSpec	The operation that you want to perform. Set the value to **ModifyBandwidthPackageSpec**.
Bandwidth	String	Yes	5	The maximum bandwidth of the NAT service plan. Valid values: **5** to **1000**.
BandwidthPackageId	String	Yes	bwp-s6lmotmkk****	The ID of the NAT service plan.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the NAT service plan. You can call the `DescribeRegions` operation to query the most recent region list.

Response parameters

Parameter	Type	Example	Description
RequestId	String	079874CD-AEC1-43E6-AC03-ADD96B6E4907	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ModifyBandwidthPackageSpec
&Bandwidth=5
&BandwidthPackageId=bwp-s6lmotmkk****
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyBandwidthPackageSpecResponse>
  <RequestId>079874CD-AEC1-43E6-AC03-ADD96B6E4907</RequestId>
</ModifyBandwidthPackageSpecResponse>
```

`JSON` format

```
{
    "RequestId": "079874CD-AEC1-43E6-AC03-ADD96B6E4907"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because the specified region ID does not exist.
404	InvalidBandwidth.ValueNotSupported	The specified value of Bandwidth not supported.	The error message returned because the specified maximum bandwidth value is invalid.

HttpCode	Error code	Error message	Description
404	BandwidthPackage.FinancialLocked	The specified BandwidthPackage has been Financail Lock.	The error message returned because the specified NAT service plan is locked due to overdue payments.

16.1.2.8.3. ConvertBandwidthPackage

Converts a NAT service plan to an EIP bandwidth plan.

Description

Before you convert a NAT service plan to an EIP bandwidth plan, take note of the following limits:

- You are not charged for the conversion.
- When you convert a NAT service plan to an EIP bandwidth plan, you can continue to use the SNAT and DNAT features of the NAT gateway, and your workloads are not affected. However, we recommend that you convert your NAT service plan during off-peak hours.
- After the NAT service plan is converted to an EIP bandwidth plan, the public IP addresses in the NAT service plan are converted to elastic IP addresses (EIPs). The maximum bandwidth and billing method of the EIP bandwidth plan are the same as those of the NAT service plan.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ConvertBandwidthPackage	The operation that you want to perform. Set the value to **CreateBandwidthPackage**.
BandwidthPackageId	String	Yes	bwp-bp1xea10o8qxw4f****	The ID of the NAT service plan.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the NAT gateway is created. You can call the `DescribeRegions` operation to query the most recent region list.
ClientToken	String	No	123e4567-e89b-12d3-a456-426655440000	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must make sure that it is unique among different requests. `ClientToken` can contain only ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
ConvertInstanceId	String	cbwp-s6lmotmkkf567b****	The ID of the EIP bandwidth plan.
RequestId	String	0C2EE7A8-74D4-4081-8236-CEBDE3BBCF50	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ConvertBandwidthPackage
&BandwidthPackageId=bwp-bp1xea10o8qxw4f****
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ConvertBandwidthPackageResponse>
   <RequestId>0C2EE7A8-74D4-4081-8236-CEBDE3BBCF50</RequestId>
   <ConvertInstanceId>cbwp-s6lmotmkkf567b****</ConvertInstanceId>
</ConvertBandwidthPackageResponse>
```

`JSON` format

```
{
    "ConvertBandwidthPackageResponse": {
        "RequestId": "0C2EE7A8-74D4-4081-8236-CEBDE3BBCF50",
        "ConvertInstanceId": "cbwp-s6lmotmkkf567b****"
    }
}
```

16.1.2.8.4. DescribeBandwidthPackages

Queries NAT service plans in a specified region.

This operation can be performed by only Apsara Stack accounts that have purchased NAT service plans before January 26, 2018. If you have not purchased a NAT service plan before January 26, 2018, associate elastic IP addresses (EIPs) with your NAT gateways.

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeBandwidthPackages	The operation that you want to perform. Set the value to **DescribeBandwidthPackages**.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the NAT gateway is deployed. You can call the `DescribeRegions` operation to query the most recent region list.
BandwidthPackageId	String	No	bwp-bp1xea10o8qxwdfs****	The ID of the NAT service plan.
NatGatewayId	String	No	ngw-bp1uewa15k4iydfre****	The ID of the NAT gateway.
PageNumber	Integer	No	10	The number of the page to return. Default value: **1**.
PageSize	Integer	No	10	The number of entries to return on each page. Maximum value: **50**. Default value: **10**.

Response parameters

Parameter	Type	Example	Description
BandwidthPackages	Array of BandwidthPackage		The detailed description of the NAT service plan.
BandwidthPackage			
Bandwidth	String	5	The bandwidth value of the NAT service plan. Valid values: **5** to **5000**. Unit: Mbit/s.
BandwidthPackageId	String	bwp-xxoo123sfwr****	The ID of the NAT service plan.

Parameter	Type	Example	Description
BusinessStatus	String	Normal	The state of the NAT service plan. Valid values: • **Normal**: The NAT service plan working as expected. • **FinancialLocked**: The NAT service plan is locked due to overdue payments. • **SecurityLocked**: The NAT service plan is locked due to security reasons.
CreationTime	String	2017-06-08T12:20:55	The time when the NAT service plan was created. The time follows the ISO 8601 standard in YYYY-MM-DDThh:mmZ format. It must be in UTC.
Description	String	test123	The description of the NAT service plan. The description must be 2 to 256 characters in length. The description is displayed in the console. This parameter is empty by default. It cannot start with `http://` or `https://`.
ISP	String	BGP	Only **BGP** is supported.
InstanceChargeType	String	PostPaid	The billing method of the NAT service plan. Only **PostPaid** (pay-as-you-go) is supported.
InternetChargeType	String	PayByBandwidth	The metering method of the NAT service plan. • **PayByTraffic**: pay-by-data-transfer • **PayByBandwidth**: 按带宽计费。
IpCount	String	1	The number of public IP addresses in the NAT service plan. Valid values: **1** to **50**.
Name	String	abc	The name of the NAT service plan.
NatGatewayId	String	ngw-xxoo123ggtf****	The ID of the NAT gateway.

Parameter	Type	Example	Description
PublicIpAddresses	Array of PublicIpAddress		The IP address in the NAT service plan.
PublicIpAddress			
AllocationId	String	eip-2zeerraiwb7ujdeds****	The ID that is allocated.
ApAccessEnabled	Boolean	true	
IpAddress	String	116.XX.XX.28	The IP address.
UsingStatus	String	Available	The state of the NAT service plan.
RegionId	String	cn-qingdao-env17-d01	The region ID of the NAT service plan.
Status	String	Available	The state of the bandwidth plan.
ZoneId	String	cn-qingdao-env17-amtest11001-a	The ID of the zone to which the NAT service plan belongs.
TotalCount	Integer	10	The number of entries returned.
PageNumber	Integer	10	The page number of the returned page.
PageSize	Integer	10	The number of entries returned per page.
RequestId	String	4EC47282-1B74-4534-BD0E-403F3EE64CAF"	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeBandwidthPackages
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeBandwidthPackagesResponse>
  <TotalCount>10</TotalCount>
  <PageSize>10</PageSize>
  <RequestId>4EC47282-1B74-4534-BD0E-403F3EE64CAF"</RequestId>
  <PageNumber>10</PageNumber>
  <BandwidthPackages>
        <Status>Available</Status>
        <IpCount>1</IpCount>
        <Description>test123</Description>
        <ZoneId>cn-qingdao-env17-amtest11001-a</ZoneId>
        <InstanceChargeType>PostPaid</InstanceChargeType>
        <ISP>BGP</ISP>
        <BusinessStatus>Normal</BusinessStatus>
        <InternetChargeType>PayByBandwidth</InternetChargeType>
        <Name>abc</Name>
        <Bandwidth>5</Bandwidth>
        <CreationTime>2017-06-08T12:20:55</CreationTime>

            "IpAddress": "116.XX.XX.28"
        }
    }
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because the specified region ID does not exist.

16.1.2.8.5. ModifyBandwidthPackageAttribute

Modifies the name and description of a specified NAT service plan.

This operation can be performed by only Apsara Stack accounts that have purchased NAT service plans before January 26, 2018. If you have not purchased a NAT service plan before January 26, 2018, associate elastic IP addresses (EIPs) with your NAT gateways.

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyBandwidthPackageAttribute	The operation that you want to perform. Set the value to **ModifyBandwidthPackageAttribute**.
BandwidthPackageId	String	Yes	bwp-s6lmotmkk****	The ID of the NAT service plan.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the NAT service plan. You can call the `DescribeRegions` operation to query the most recent region list.
Name	String	No	NATABC	The name of the NAT service plan. The name must be 2 to 128 characters in length and can contain letters, digits, periods (.), underscores (_), and hyphens (-). The name cannot start with `http://` or `https://`.
Description	String	No	This is NAT.	The description of the NAT service plan. The description must be 2 to 256 characters in length. It must start with a letter and cannot start with `http://` or `https://`.

Response parameters

Parameter	Type	Example	Description
RequestId	String	DFDDD35D-3F29-4E15-AA28-53F5341F9599	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ModifyBandwidthPackageAttribute
&BandwidthPackageId=bwp-s6lmotmkk****
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyBandwidthPackageAttributeResponse>
  <RequestId>DFDDD35D-3F29-4E15-AA28-53F5341F9599</RequestId>
</ModifyBandwidthPackageAttributeResponse>
```

`JSON` format

```
{
    "RequestId": "DFDDD35D-3F29-4E15-AA28-53F5341F9599"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because the specified region ID does not exist.
404	InvalidBandwidthPackageId.NotFound	The specified bandwidthPackageId does not exist in our records.	The error message returned because the ID of the specified NAT service plan does not exist.
400	InvalidParameter.Name.Malformed	The specified Name is not valid.	The error message returned because the specified name is invalid.
400	InvalidParameter.Description.Malformed	The specified Description is not valid.	The error message returned because the specified description is invalid.

16.1.2.8.6. DeleteBandwidthPackage

Deletes a specified NAT service plan.

This operation can be performed by only Apsara Stack accounts that have purchased NAT service plans before January 26, 2018. If you have not purchased a NAT service plan before January 26, 2018, associate elastic IP addresses (EIPs) with your NAT gateways.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteBandwidthPackage	The operation that you want to perform. Set the value to **DeleteBandwidthPackage**.
BandwidthPackageId	String	Yes	bwp-bp1arsrmca9kp****	The ID of the NAT service plan.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where the NAT gateway is deployed. You can call the `DescribeRegions` operation to query the most recent region list.
Force	Boolean	No	false	Specifies whether to forcibly delete the NAT service plan. • **false**(default): no • **true**: yes

Response parameters

Parameter	Type	Example	Description
RequestId	String	7D275A59-1EB0-4775-8A20-2A47055EAC5C	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DeleteBandwidthPackage
&BandwidthPackageId=bwp-bp1arsrmca9kp****
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteBandwidthPackageResponse>
  <RequestId>7D275A59-1EB0-4775-8A20-2A47055EAC5C</RequestId>
</DeleteBandwidthPackageResponse>
```

`JSON` format

```
{
    "RequestId": "7D275A59-1EB0-4775-8A20-2A47055EAC5C"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist in our records.	The error message returned because the specified region ID does not exist.
400	DependencyViolation.ForwardEntry	The specified BandwidthPackageId has dependent resource.	The error message returned because the NAT service plan contains SNAT or DNAT entries. Delete them and try again.
400	DependencyViolation.SnatEntry	The specified BandwidthPackageId has dependent resource.	The error message returned because the NAT service plan contains SNAT or DNAT entries. Delete them and try again.

16.1.2.8.7. RemoveBandwidthPackageIps

Removes public IP addresses from a NAT service plan.

Description

When you call this operation, take note of the following:

- You cannot remove all public IP addresses from a NAT service plan.
- You cannot remove an IP address that is not included in the specified NAT service plan.
- You cannot remove an IP address that is listed in the DNAT table or the SNAT table.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	RemoveBandwidthPackageIps	The operation that you want to perform. Set the value to *RemoveBandwidthPackageIps*.
RegionId	String	Yes	cn-hangzhou	The region ID of the NAT service plan. You can call the DescribeRegions operation to query the most recent region list.
BandwidthPackageId	String	Yes	bwp-s6lmotmkkza1w****	The ID of the NAT bandwidth package.
RemovedIpAddresses.n	String	No	nateip-1110a2l1ad2****	The ID of public IP address n to be removed. n must start from 1 and cannot exceed 20.

Response parameters

Parameter	Type	Example	Description
RequestId	String	7D275A59-1EB0-4775-8A20-2A47055EAC5C	The ID of the request.

Examples

Sample requests

```
https://vpc.example.com/?Action=RemoveBandwidthPackageIps
&RemovedIpAddresses.1=nateip-1110a2l1ad2****
&BandwidthPackageId=bwp-s6lmotmkkza1w****
&amp;RegionId=cn-hangzhou
&<Common request parameters>
```

Sample responses

- XML format

```
<? xml version="1.0" encoding="UTF-8" ? >
<RemoveBandwidthPackageIpsResponse>
       <RequestId>2315DEB7-5E92-423A-91F7-4C1EC9AD97C3</RequestId>
</RemoveBandwidthPackageIpsResponse>
```

- JSON format

```
{
     "RequestId": "2315DEB7-5E92-423A-91F7-4C1EC9AD97C3"
 }
```

17.VPN Gateway

17.1. Developer Guide

17.1.1. List of operations by function

The following tables list the API operations that are available for use in VPN Gateway.

VPN gateway management

API	Description
CreateVpnGateway	Creates a VPN gateway.
ModifyVpnGatewayAttribute	Modifies the name and description of a VPN gateway.
DescribeVpnGateways	Queries VPN gateways.
DescribeVpnGateway	Queries the details about a VPN gateway.
DeleteVpnGateway	Deletes a VPN gateway.

Customer gateway

API	Description
CreateCustomerGateway	Creates a customer gateway.
ModifyCustomerGatewayAttribute	Modifies the name and description of a customer gateway.
DescribeCustomerGateways	Queries customer gateways.
DescribeCustomerGateway	Queries the details about a customer gateway.
DeleteCustomerGateway	Deletes a customer gateway.

Routes for VPN gateways

API	Description
CreateVpnRouteEntry	Creates a destination-based route entry for a VPN gateway.
CreateVpnPbrRouteEntry	Creates a policy-based route entry for a VPN gateway.
PublishVpnRouteEntry	Publishes a route entry of a VPN gateway to the route table of the associated VPC network.

API	Description
DescribeVpnRouteEntries	Queries destination-based route entries of a VPN gateway.
DescribeVpnPbrRouteEntries	Queries policy-based route entries of a VPN gateway.
ModifyVpnRouteEntryWeight	Modifies the weight of a destination-based route entry for a VPN gateway.
ModifyVpnPbrRouteEntryWeight	Modifies the weight of a policy-based route entry for a VPN gateway.
DeleteVpnRouteEntry	Deletes a destination-based route entry of a VPN gateway.
DeleteVpnPbrRouteEntry	Deletes a policy-based route entry of a VPN gateway.

IPsec-VPN

API	Description
CreateVpnConnection	Creates an IPsec-VPN connection.
ModifyVpnConnectionAttribute	Modifies the configuration of an IPsec-VPN connection.
DescribeVpnConnections	Queries IPsec-VPN connections.
DescribeVpnConnection	Queries the details about an IPsec-VPN connection.
DownloadVpnConnectionConfig	Downloads the configuration of an IPsec-VPN connection.
DeleteVpnConnection	Deletes an IPsec-VPN connection.

SSL-VPN

API	Description
CreateSslVpnServer	Creates an SSL-VPN server.
ModifySslVpnServer	Modifies the configuration of an SSL-VPN server.
DescribeSslVpnServers	Queries SSL-VPN servers.
DescribeVpnSslServerLogs	Queries the logs of an SSL-VPN server.
DeleteSslVpnServer	Deletes an SSL-VPN server.
CreateSslVpnClientCert	Creates an SSL-VPN client certificate.

API	Description
ModifySslVpnClientCert	Modifies the name of an SSL-VPN client certificate.
DescribeSslVpnClientCerts	Queries SSL-VPN client certificates.
DescribeSslVpnClientCert	Queries the details about an SSL-VPN client certificate.
DeleteSslVpnClientCert	Deletes an SSL-VPN client certificate.

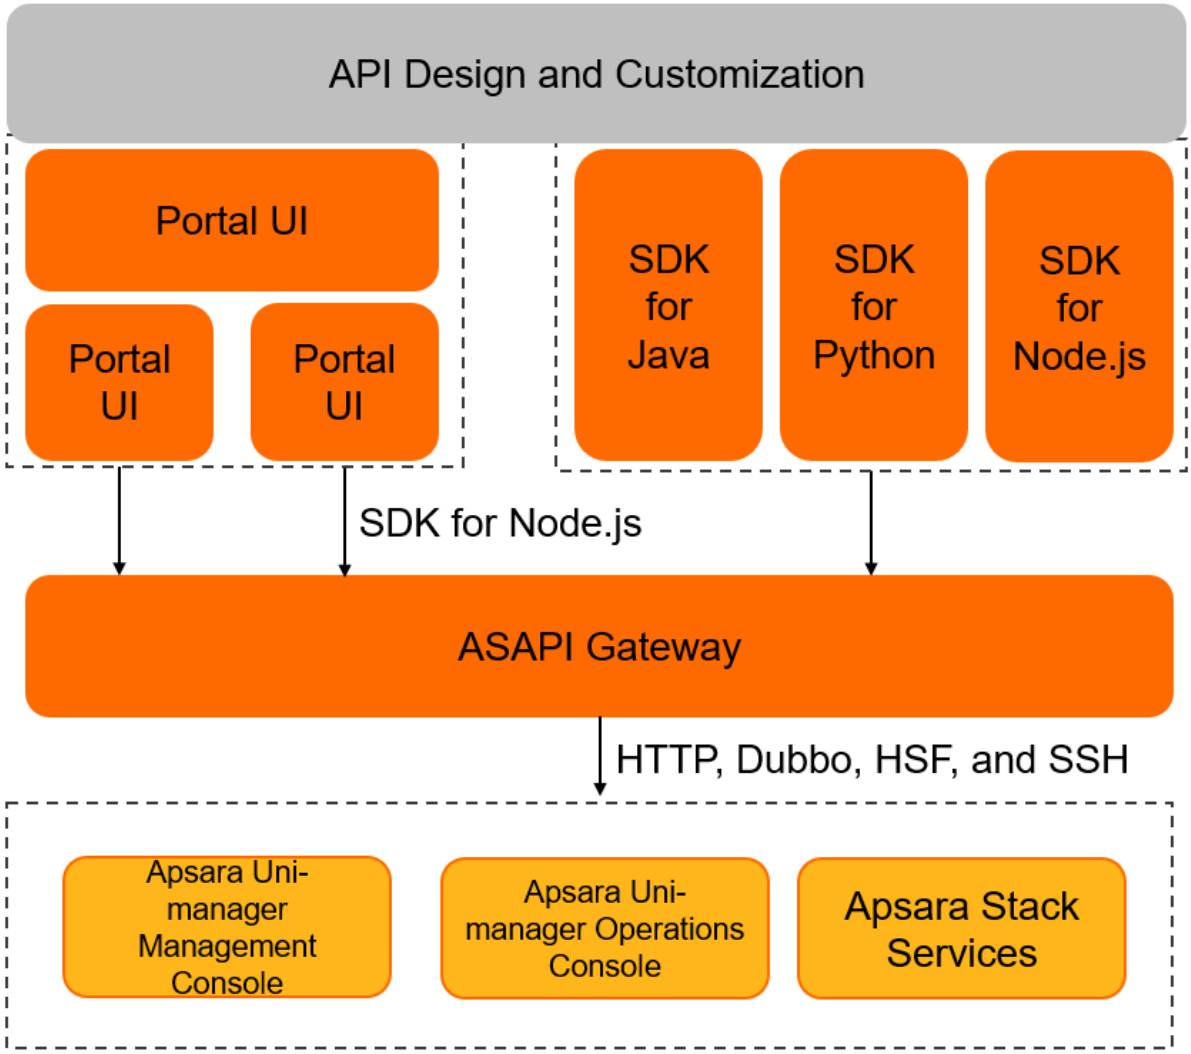
17.1.2. Call VPC SDK by using ASAPI

17.1.2.1. 文档标题缺失，请补全后重新导出

17.1.2.1.1. ASAPI overview

This topic describes the architecture and features of the Apsara Stack API (ASAPI).

The ASAPI is a unified ingress gateway for Apsara Stack services and a main component of the Apsara Uni-manager Management Console. The ASAPI provides a unified method for you to manage and make API calls. You can use Apsara Stack SDK to centrally make API calls to Apsara Stack services, including Elastic Compute Service (ECS) and Virtual Private Cloud (VPC).



The ASAPI allows you to make API calls to manage and maintain Apsara Stack services.

- Make API calls to implement enterprise-grade management. For example, you can manage organizations, users, roles, resource sets, and logon policies. These operations are provided by the Apsara Uni-manager Management Console.
- Make API calls to manage operations. For example, you can manage quotas, usage statistics, specifications, and password policies. These operations are provided by the Apsara Uni-manager Management Console.
- Make API calls to manage resources. For example, you can create, delete, query, or modify cloud resources. These operations are provided by Apsara Stack services. If you call an API operation to create an ECS instance or a VPC, the API operation is provided by ECS or VPC.
- Make API calls to query monitoring metrics of Apsara Stack services. These operations are provided by the Apsara Uni-manager Management Console.
- Make API calls to perform O&M. For example, you can manage monitoring and alerting, inventories, tasks, and physical servers. These operations are provided by the Apsara Uni-manager Operations Console.

For more information, see the developer guide of the corresponding Apsara Stack service. For information about API operations used to manage organization users, see *Apsara Uni-manager Management Console Developer Guide*. For information about the API operation used to create an ECS instance, see *ECS Developer Guide*.

> **Note** If the "Use Apsara Stack SDK to make API calls" section is included in the developer guide of an Apsara Stack service, the ASAPI is supported by the Apsara Stack service. In this case, you can make API calls based on the developer guide.

17.1.2.1.2. Preparations

17.1.2.1.2.1. Log on to the API Tool console

You can log on to the API Tool console from the Apsara Uni-manager Management Console.

Prerequisites

- The URL of the Apsara Uni-manager Management Console is obtained from the deployment personnel before you log on to the Apsara Uni-manager Management Console.
- We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL of the Apsara Uni-manager Management Console. Press the Enter key.
2. Enter your username and password.

   Obtain the username and password that you can use to log on to the console from the operations administrator.

   > **Note** When you log on to the Apsara Uni-manager Management Console for the first time, you must change the password of your username. Your password must meet complexity requirements. The password must be 10 to 32 characters in length and must contain at least two of the following character types:
   >
   > - Uppercase or lowercase letters
   > - Digits
   > - Special characters, which include ! @ # $ %

3. Click **Log On**.
4. In the top navigation bar, choose **Products > Others > API Tool**.

17.1.2.1.2.2. View information about API operations

This topic describes how to view information about API operations. Before you use SDKs, obtain service names, API operation names, and API operation versions.

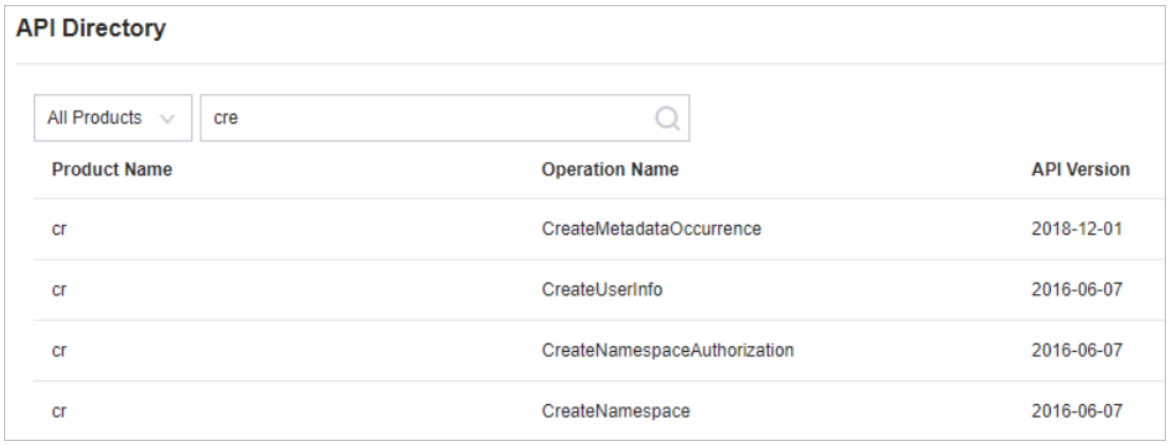
Context

The API operations on the API Directory page are only for reference. For information about how to call

API operations, see developer guides of the corresponding cloud services. If the information on the API Directory page is inconsistent with that in the developer guide of the corresponding cloud service, the information in the developer guide prevails.

Procedure

1. Go to the API Tool console. For more information, see Log on to the API Tool console.
2. In the left-side navigation pane, click **API Directory**.
3. On the **API Directory** page, select the desired service from the drop-down list, enter a keyword of an API operation name in the search box, and then click the search icon.



4. Then, you can view the service name, API operation name, and API operation version.

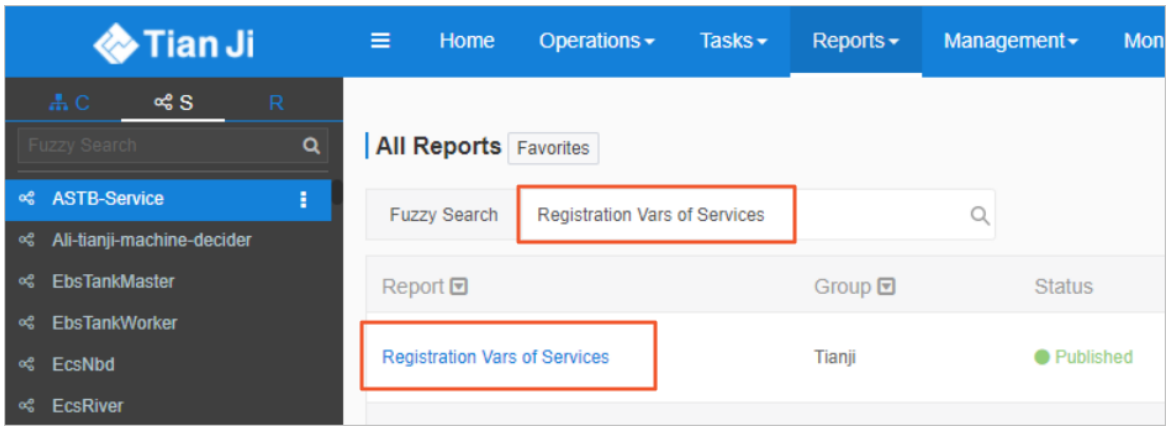
17.1.2.1.2.3. Generate an endpoint for the ASAPI

This topic describes three methods used to generate an endpoint for the Apsara Stack API (ASAPI).

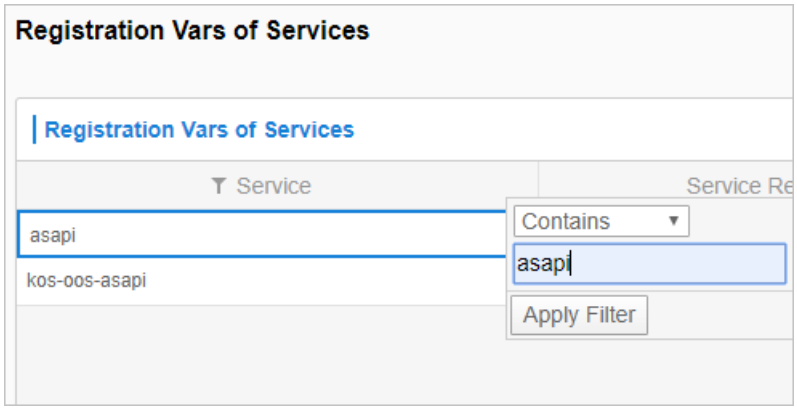
Method 1: Use Registration Vars of Services to generate an endpoint

1. Log on to Apsara Infrastructure Management Framework.
   i. Log on to the Apsara Uni-manager Operations Console.
   ii. In the top navigation bar, click **O&M**.
   iii. In the left-side navigation pane, choose **Product Management** > **Products**.
   iv. In the Apsara Stack O&M section, click **Apsara Infrastructure Management Framework**.
2. In the left-side navigation pane, click **Reports**.

3. On the **All Reports** page, search for `Registration Vars of Services` and click the report name.



4. On the **Registration Vars of Services** page, click the icon next to **Service** and search for `asapi`.



5. Find the asapi service, right-click in the **Service Registration** column, and then select **Show More** from the shortcut menu.

   In the **Details** dialog box, obtain the value of **asapi.public.endpoint**.

6. Generate an endpoint for the ASAPI based on the following format:

```
https://<asapi.public.endpoint>/asapi/v3
```

Method 2: Use cluster resources to generate an endpoint

1. Log on to Apsara Infrastructure Management Framework.
   i. Log on to the Apsara Uni-manager Operations Console.
   ii. In the top navigation bar, click **O&M**.
   iii. In the left-side navigation pane, choose **Product Management** > **Products**.
   iv. In the Apsara Stack O&M section, click **Apsara Infrastructure Management Framework**.
2. Go to the cluster operations page.
   i. In the left-side navigation pane, choose Operations > Cluster Operations.
   ii. In the **Cluster** search box, enter `ascm`.

iii. Find the cluster that you want to manage and click **Operations** in the **Actions** column.

3. Obtain the value of the domain parameter.
   i. Click the Cluster Resources tab.
   ii. In the **Name** field, search for `asapi_dns_public`.
   iii. Click **Details** in the **Application Parameter** column.
   In the **Application Parameter** message, obtain the value of the **domain** parameter.

4. Generate an endpoint for the ASAPI based on the following format:

```
https://<domain>/asapi/v3
```

Method 3: Concatenate strings to generate an endpoint

You can also concatenate strings to generate an endpoint based on the following format:

```
https://public.asapi.<region>.<internet-domain>/asapi/v3
```

> **Note**
>
> 1. Replace <region> with your actual region ID. For information about how to query a region ID, see Query a region ID.
> 2. Replace <internet-domain> with the root domain of your Apsara Stack service. To obtain the root domain, contact Apsara Stack O&M personnel. Take note of this point: Use the internet-domain parameter instead of the intranet-domain parameter.

If the **region** value is `cn-****-****-d01` and the **internet-domain** value is `inter.****.****.com`, the following endpoint can be generated:

```
https://public.asapi.cn-****-****-d01.inter.****.****.com/asapi/v3
```

17.1.2.1.2.4. Obtain Apsara Stack SDKs

The Apsara Stack API (ASAPI) is a unified portal provided by Apsara Stack. You can use the ASAPI to connect to all Apsara Stack services. Apsara Stack provides SDKs for API calls.

For more information about how to obtain Apsara Stack SDKs, see Apsara Stack documentation.

17.1.2.1.2.5. Obtain an AccessKey pair

An AccessKey pair that consists of an AccessKey ID and an AccessKey secret is used to implement symmetric encryption. This helps you verify the identity of a requester. The AccessKey ID is used to identify a user. The AccessKey secret is used to encrypt the signature string. This topic describes how to obtain an AccessKey pair.

Prerequisites

An account of the operations administrator or the level-1 organization administrator is obtained. Only an operations administrator or a level-1 organization administrator can obtain an AccessKey pair.

Context

If you need to make API calls to the Apsara Uni-manager Management Console or other Apsara Stack services, we recommend that you use the AccessKey pair of a personal account. If you use the AccessKey pair of a personal account, configure the request headers that are described in the following table for access control. Otherwise, an error that indicates insufficient permissions can occur.

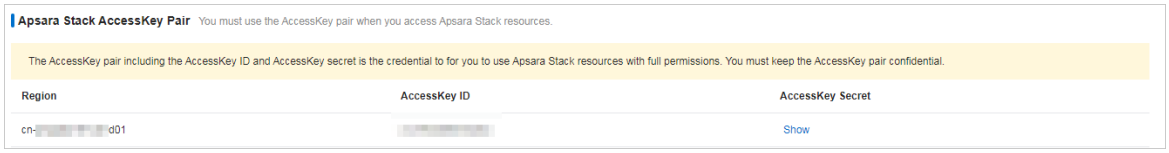
Parameter	Description
x-acs-regionid	The ID of the region, for example, cn-hangzhou-*.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console. For information about how to obtain an organization ID, see the "GetOrganizationList" section in Apsara Uni-manager Management Console Developer Guide.
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console. For information about how to obtain a resource set ID, see the "ListResourceGroup" section in Apsara Uni-manager Management Console Developer Guide.
x-acs-instanceid	The ID of the instance to which you make API calls. If you need to make API calls to an Elastic Compute Service (ECS) instance, obtain the ID of the ECS instance on the Instances page.

Warning The AccessKey pair of a personal account is managed and controlled by the permission system of the Apsara Uni-manage Management Console. If you need to obtain the AccessKey pair of an account that has permissions on an organization, make sure that your operation is allowed by an administrator. This ensures security. The account that has permissions on an organization is a privileged account.

Obtain the AccessKey pair of a personal account

To obtain the AccessKey pair of a personal account, perform the following operations:

1. Log on to the Apsara Uni-manager Management Console.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and click **User Information**.
3. In the **Apsara Stack AccessKey Pair** section, obtain the AccessKey pair.



> **Note** The AccessKey pair that consists of an AccessKey ID and an AccessKey secret is the credential for you to have full permissions on Apsara Stack resources. Keep your AccessKey pair confidential.

Obtain the AccessKey pair of an account that has permissions on an organization

To obtain the AccessKey pair of an account that has permissions on an organization, perform the following operations:

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Organizations**.
4. In the Organizations navigation tree, click the name of the organization that you want to manage.
5. On the right side of the page, click **Obtain AccessKey Pair**.
6. In the message that appears, obtain the AccessKey pair of the account that has permissions on the organization.

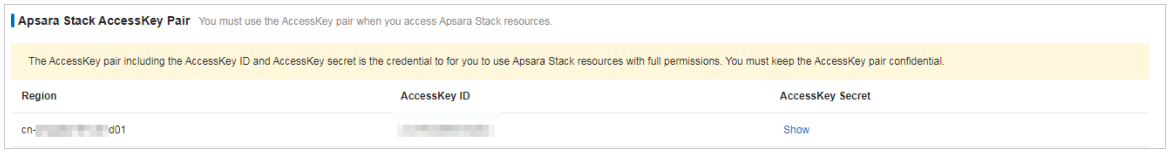
> **Note** The system automatically allocates an AccessKey pair to the account that has permissions on the level-1 organization. The same AccessKey pair is used by the accounts that have permissions on the subordinate organizations.

17.1.2.1.2.6. Query a region ID

When you use Apsara Stack SDK for Node.js to make API calls, specify a region ID. You can obtain a region ID in the Apsara Uni-manager Management Console.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and click **User Information**.
3. In the **Apsara Stack AccessKey Pair** section, view the region ID.



17.1.2.1.3. Common parameters

Common request parameters must be included in all API requests.

Sample common parameters

. .

The following table describes the common parameters that are used when you call API operations supported by the Apsara Stack API (ASAPI).

Parameter	Type	Required	Description
Action	String	Yes	The operation that you want to perform. For more information, see View information about API operations.
Product	String	Yes	The name of the service.
Version	String	Yes	The version of the API operation. For more information, see View information about API operations.
RegionId	String	Yes	The ID of the region. For more information, see Query a region ID.
AccessKeyId	String	Yes	The AccessKey ID used to connect to the service. For more information, see Obtain an AccessKey pair.
Signature	String	Yes	The signature string of the current request. For more information about how signatures are calculated, see Request signatures.
SignatureMethod	String	Yes	The encryption method of the signature string. Valid values: HMAC-SHA1 and HMAC-SHA256.

Parameter	Type	Required	Description
SignatureVersion	String	Yes	The version of the signature encryption algorithm. Valid values: 1.0 and 2.0.
SignatureNonce	String	Yes	A unique, random number used to prevent replay attacks. You must use different numbers for different requests.
Timestamp	String	Yes	The timestamp of the request. Specify the time in the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time must be in UTC. Sample value: 2018-01-01T12:00:00Z.
Format	String	Yes	The format in which to return the response. Set the value to JSON.

Note

The `Signature`, `SignatureMethod`, `SignatureVersion`, `SignatureNonce`, `Timestamp`, and `Format` parameters are encapsulated into Apsara Stack SDK. You do not need to configure these parameters.

17.1.2.1.4. SDK description

17.1.2.1.4.1. Use Apsara Stack SDK for Java to call API operations

This topic describes how to obtain and use Apsara Stack SDK for Java to call API operations.

Prerequisites

- An authorized account and an AccessKey pair are obtained. The AccessKey pair consists of an

AccessKey ID and an AccessKey secret. For more information about how to obtain an AccessKey pair in the Apsara Uni-manager Management Console, see Obtain an AccessKey pair.

- The endpoint of the Apsara Stack API (ASAPI) is obtained. For more information, see Generate an endpoint for the ASAPI.
- Apsara Stack SDK for Java 1.8 or later is installed.

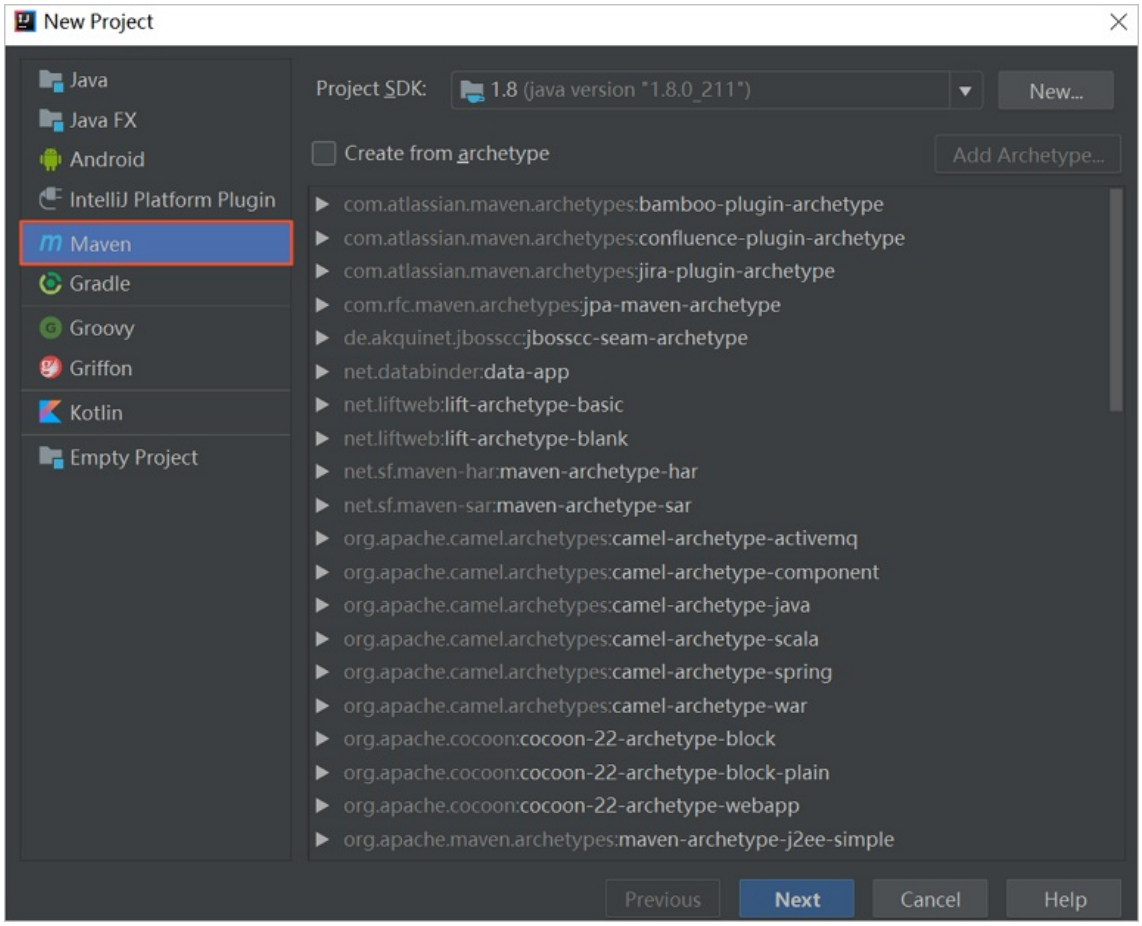
Background information

The help center of Apsara Stack provides Maven dependencies and JAR files for Apsara Stack SDK for Java. You can write code to use Apsara Stack SDK for Java to call API operations.

In this example, the Windows 10 64-bit OS and IntelliJ IDEA are used.

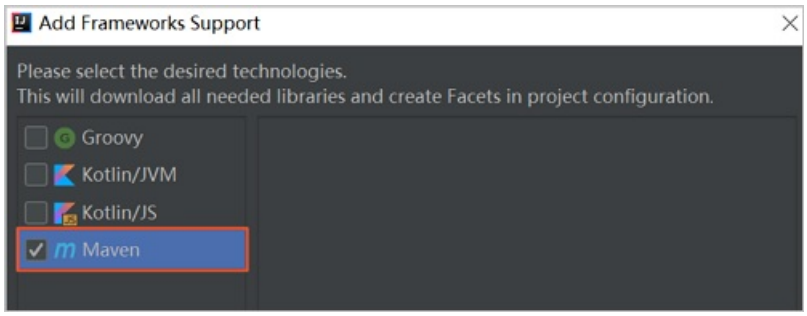
Procedure

1. Use one of the following methods to configure Maven in IntelliJ IDEA. Maven is a tool used for project management.
   - Use Maven that is integrated in IntelliJ IDEA.
   - Download Maven based on the OS that you are using from the official website and configure Maven. For more information, see Download Maven.
2. Obtain the Maven dependencies for Apsara Stack SDK for Java from the official website. For more information about how to obtain the dependencies, see Obtain the core package for ASAPI.
3. Use one of the following methods to create a Maven project:
   - Method 1: Create a Maven project in IntelliJ IDEA.

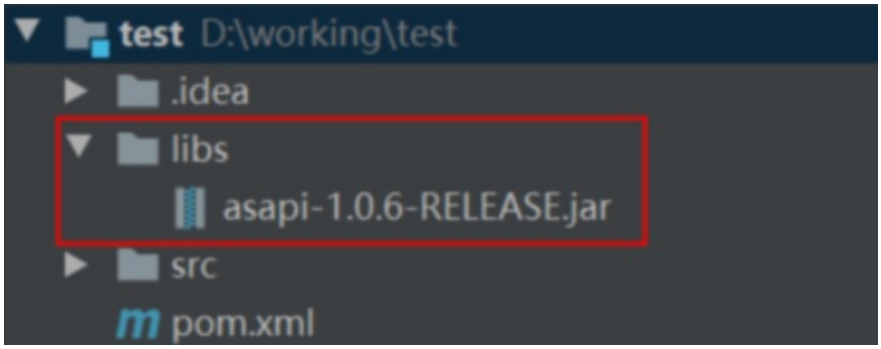


- Method 2: Convert an existing project to a Maven project.
  a. Right-click the project that you want to convert and select **Add Framework Support...**.

  b. Select **Maven** and click **OK**.



4. Create a folder named libs in the root directory of the project. Then, add the JAR file of Apsara Stack SDK for Java to the libs folder, as shown in the following figure.



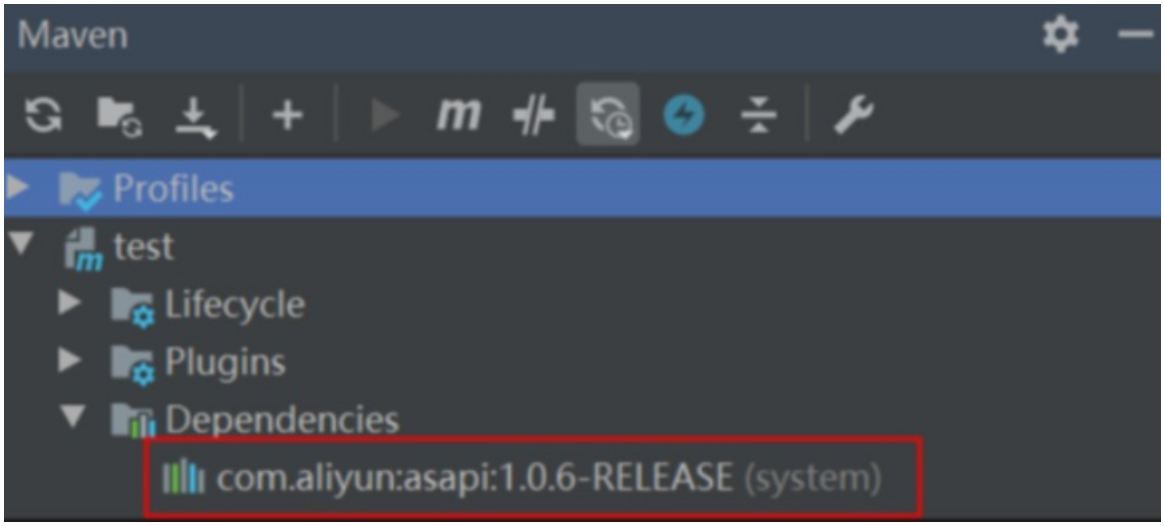
5. Add the dependencies of Apsara Stack SDK for Java to the pom.xml file in the project directory.

```
<dependencies>
    <dependency>
        <groupId>com.aliyun</groupId>
        <artifactId>asapi</artifactId>
        <version>1.0.6-RELEASE</version>
        <scope>system</scope>
        <systemPath>${project.basedir}/libs/asapi-1.0.6-RELEASE.jar</systemPath>
    </dependency>
  <dependency>
        <groupId>com.alibaba</groupId>
        <artifactId>alicrypto-java-aliyun</artifactId>
    <version>1.0.4</version>
    <systemPath>${project.basedir}/libs/alicrypto-java-aliyun-1.0.4.jar</systemPath>
  </dependency>
  <dependency>
    <groupId>com.aliyun</groupId>
    <artifactId>gmsse</artifactId>
    <version>1.1.0</version>
    <systemPath>${project.basedir}/libs/gmsse-1.1.0.jar</systemPath>
  </dependency>
</dependencies>
```

Note Replace `1.0.6-RELEASE` with the actual version of Apsara Stack SDK for Java.

6. On the right side of IntelliJ IDEA, view information in the Maven section.

   If the information in the following figure appears, the dependencies are added.



Use Apsara Stack SDK for Java

You can use the GET or POST method to call API operations provided by the ASAPI. The following sample code shows how to call API operations:

```
// 1. Create a connection to an ASClient object.
ASClient client = new ASClient();
// 2. Configure the identifier of the requester. This parameter is required and used only f
or identification. You can set this parameter to a random value.
client.setSdkSource("<The identifier of the requester>");
Map<String, Object> parameters = new HashMap<String, Object>();
// 3. Configure the parameters for authorization. The parameter values vary based on your e
nvironment.
// The AccessKey ID of your Apsara Stack tenant account.
parameters.put("AccessKeyId","<AccessKey ID>");
// The AccessKey secret of your Apsara Stack tenant account.
parameters.put("AccessKeySecret", "<AccessKey Secret>");
// The ID of the region.
parameters.put("RegionId", "<your RegionID>");
// 4. Configure parameters for an API call. In this example, the Product, Action, and Versi
on parameters are configured.
parameters.put("Product", "<The name of the service>");
parameters.put("Action", "<The name of the API operation>");
parameters.put("Version", "<The version of the API operation>");
// 5. Configure operation-specific parameters.
parameters.put("<The name of the operation-specific parameter>", "<The value of the operati
on-specific parameter>");
// 6. Configure request headers and the encryption method for the signature string. Valid v
alues of the SignatureMethod parameter: HMAC-SHA1 and HMAC-SHA256. By default, HMAC-SHA256
is used.
Map<String, String> headers = new HashMap<String, String>();
//headers.put("SignatureMethod", "HMAC-SHA1");
headers.put("x-acs-regionid", "<your-regionid>");
headers.put("x-acs-resourcegroupid", "<your-resourcegroupid>");
headers.put("x-acs-organizationid", "<your-organizationid>");
headers.put("x-acs-instanceid", "<your-instanceid>");
// 7. Make an API call. We recommend that you use the doPost() method.
// Configure the time-out period for a connection.
//client.setConnectTimeout(10000);
// Configure the time-out period for a request.
// client.setSocketTimeout(10000);
String result = client.doPost(endpoint, headers, parameters);
System.out.println(result);
```

Configure a proxy

If you need to use a proxy to make API calls, use the following sample code to configure the proxy:

```
Cloud cloud = new Cloud();
// Configure the IP address of the proxy.
cloud.setConfig("proxy_host", "<IP>");
// Configure the port used by the proxy.
cloud.setConfig("proxy_port", "<Port>");
// 1. Create a connection to an ASClient object.
ASClient client = new ASClient(cloud);
```

Request headers

Parameter	Description
x-acs-regionid	The ID of the region. For more information about how to obtain a region ID, see Query the region ID.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console.
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console.
x-acs-instanceid	The ID of the instance to which you make API calls.

17.1.2.1.4.2. Use Apsara Stack SDK for Python to call API operations

This topic describes how to use Apsara Stack SDK for Python to call API operations provided by the Apsara Stack API (ASAPI).

Preparations

- An authorized account and an AccessKey pair are obtained. The AccessKey pair consists of an AccessKey ID and an AccessKey secret. For more information about how to obtain an AccessKey pair in the Apsara Uni-manager Management Console, see Obtain an AccessKey pair.
- The endpoint of the ASAPI is obtained. For more information, see Generate an endpoint for the ASAPI.

Install Apsara Stack SDK for Python

1. Download the required version of Apsara Stack SDK for Python. For more information, see Obtain Apsara Stack SDKs.
2. Upload the compressed file of Apsara Stack SDK for Python to the host from which you want to send API requests and extract the file. Then, run the following code in the directory of the extracted files to install Apsara Stack SDK for Python:

```
# Install Apsara Stack SDK for Python 2.x.
pip install aliyun-python2-sdk-asapi-2.4.7.tar.gz
# Install Apsara Stack SDK for Python 3.x.
pip3 install aliyun-python3-sdk-asapi-2.4.7.tar.gz
```

> **Note**
>
> Replace `2.4.7` with the actual version of Apsara Stack SDK for Python.

Sample requests

You can use the GET or POST method to call API operations provided by the ASAPI.

```
    # 1. Import dependencies.
    from aliyunsdkasapi.ASClient import ASClient
    from aliyunsdkasapi.AsapiRequest import AsapiRequest

    if __name__ == '__main__':
     # 2. Create a request. The Product parameter specifies the name of the service. The Ver
sion parameter specifies the version of the API operation. The Action parameter specifies t
he operation that you want to perform. The asapi-endpoint parameter specifies the endpoint
of the ASAPI.
     req = AsapiRequest("<Product>", "<Version>", "<Action>", "<asapi-endpoint>")
     # 3. Configure operation-specific parameters.
     req.add_body_params("<key>", "<value>")
     # 4. Configure request headers.
     req.add_header("x-acs-resourcegroupid", "<your-resourcegroupid>");
     req.add_header("x-acs-organizationid", "<your-organizationid>");
     req.add_header("x-acs-regionid", "<your-regionid>");
     req.add_header("x-acs-instanceid", "<your-instanceid>");
     # 5. Configure a request method.
     req.set_method("POST")
     # 6. Configure initialization parameters for an ASClient object. The parameter values v
ary based on your environment. The timeout parameter specifies the time-out period for a re
quest. The cert_file parameter specifies the certificate. The verify parameter specifies wh
ether to verify the certificate.
     as_client = ASClient("<accesskeyid>", "<accesskeysecret>", "<regionid>",timeout=1000,
             cert_file=None,
             verify=False)
     # Configure the identifier of the requester. This parameter is required and used only f
or identification. You can set this parameter to a random value.
     as_client.setSdkSource("<The identifier of the requester>")
     response = as_client.do_request(req)
     print(response)
```

Request headers

Parameter	Description
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console.
x-acs-regionid	The ID of the region. For more information about how to obtain a region ID, see Query a region ID.
x-acs-instanceid	The ID of the instance to which you make API calls.

Configure a proxy

Perform the following steps to configure a proxy:

1. Import OS dependencies.

```
import os
```

2. Configure one or more proxies.

```
# Before you make an API call, configure one or more proxies.
os.environ['http_proxy'] = "http://x.x.x.x:xxxx"
os.environ['https_proxy'] = "https://x.x.x.x:xxxx"
```

17.1.2.1.4.3. Use Apsara Stack SDK for Node.js to call API operations

This topic describes how to obtain and use Apsara Stack SDK for Node.js to call API operations.

Preparations

- An authorized account and an AccessKey pair are obtained. The AccessKey pair consists of an AccessKey ID and an AccessKey secret. For more information about how to obtain an AccessKey pair in the Apsara Uni-manager Management Console, see Obtain an AccessKey pair.
- The endpoint of the Apsara Stack API (ASAPI) is obtained. For more information, see Generate an endpoint for the ASAPI.
- A region ID is obtained. For more information about how to obtain a region ID, see Query the region ID.

Add dependencies

Run the following command to install Apsara Stack SDK for Node.js:

```
tnpm install --save @ali/asapi-nodejs-sdk
```

Use Apsara Stack SDK for Node.js

The following sample code shows how to use Apsara Stack SDK for Node.js to make API calls:

```
// 1. Import the dependencies of Apsara Stack SDK for Node.js.
const Controller = require('egg').Controller;
const ASAPIClient = require('@ali/asapi-nodejs-sdk');
// 2. Configure the parameters.
const cnofig = {
    API_GATEWAY: '<The endpoint of the ASAPI>',
    regionId: '<The ID of the region in which the Apsara Stack service is deployed>',
    accessKeyId: '<The AccessKey ID of your Apsara Stack tenant account>',
    accessKeySecret: '<The AccessKey secret of your Apsara Stack tenant account>'
};
// 3. Initialize a client for API calls.
const AsapiClient = new ASAPIClient(cnofig, this.ctx);
// 4. Configure request parameters.
const params = {
    "Action": "<The name of the API operation>",
    "Product": "<The name of the service that provides the API operation>",
    "Version": "<The version of the API operation>",
    "regionId": '<The ID of the region in which the Apsara Stack service is deployed>',
      "<The name of the operation-specific parameter required by the API operation>": "<The
value of the operation-specific parameter>"
}
// 5. Configure request headers.
AsapiClient.addHeader('x-acs-caller-sdk-source', '<The identifier of the requester>')
AsapiClient.addHeader('x-acs-roleid', '<The ID of the role>')
AsapiClient.addHeader('x-acs-userid', '<The ID of the user>')
AsapiClient.addHeader('x-acs-organizationid', '<your-organizationid>')
AsapiClient.addHeadert("x-acs-regionid", "<your-regionid>");
AsapiClient.addHeader("x-acs-resourcegroupid", "<your-resourcegroupid>");
AsapiClient.addHeader("x-acs-instanceid", "<your-instanceid>");
// 6. Make an API call and obtain the response.
try {
  const res = await AsapiClient.doRequest(cnofig.API_GATEWAY, params, {
    method: 'POST', // The request method.
    formatParams: false, // Specifies whether to format parameters and capitalize the first
letter of each parameter.
    enableProxy: true, // Specifies whether to configure a proxy.
    proxy: 'http://x.x.x.x:xxxx',
    timeout: 10000, // The time-out period.
  // ca: , // The certificate issued by a certificate authority (CA). For more information,
visit https://nodejs.org/api/https.html#https_https_request_options_callback.
  })
  console.log(res)
} catch (e) {
  console.log(e)
}
```

Disable certificate validation

The following sample code shows how to disable certificate validation:

```
Configure the environment variable.
NODE_TLS_REJECT_UNAUTHORIZED=0
```

Request headers

Parameter	Description
x-acs-regionid	The ID of the region. For more information about how to obtain a region ID, see Query the region ID.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console.
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console.
x-acs-instanceid	The ID of the instance to which you make API calls.
x-acs-caller-sdk-source	The custom name of the requester or the system. This parameter is used to identify the source of the API request.
x-acs-roleid	The ID of the role.
x-acs-userid	The ID of the user.

17.1.2.1.4.4. SDK for POP

SDK for Java

Before you use Apsara Stack API (ASAPI) SDK for POP for Java to access ASAPI, you must know the remote procedure call (RPC) and resource-oriented architecture (ROA) styles that are supported for API calls. ASAPI is compatible with both styles. Their difference lies in the ASAPI endpoints that are used for API calls.

Prerequisites

- An Alibaba Cloud SDK package is downloaded for the service that you want to access. The required dependencies are installed.
- SSL certificate validation is ignored for requests over HTTPS.

Background information

ASAPI supports only the HTTPS request protocol.

Difference between two styles

When you use the RPC or ROA style to make API calls, take note that the two styles use different ASAPI endpoints.

```
# ASAPI endpoint for the RPC style:
public.asapi.<global:region>.<global:internet-domain>/asapi/v3
# ASAPI endpoint for the ROA style:
public.asapi.<global:region>.<global:internet-domain>/asapi/v3/roa
```

Call examples

The following sample code provides an example on how to use the RPC style to make an API call. In this example, the DescribeInstances operation of Elastic Compute Service (ECS) is called, and the API version is 2014-05-26.

Sample code:

```
package com.aliyuns.client.pop.ecs;

import com.aliyuncs.DefaultAcsClient;
import com.aliyuncs.ecs.model.v20140526.DescribeInstancesRequest;
import com.aliyuncs.ecs.model.v20140526.DescribeInstancesResponse;
import com.aliyuncs.http.HttpClientConfig;
import com.aliyuncs.http.ProtocolType;
import com.aliyuncs.profile.DefaultProfile;

import java.util.List;

public class DescribeInstancesTest {
    public static void main(String[] args) {
        // Specify the endpoint of ASAPI.
        String endpoint = "public.asapi.<global:region>.<global:internet-domain>/asapi/v3";
        // Specify the region where the ECS service resides.
        String region = "<global:region>";
        // Specify the name of the service that you want to access.
        String product = "ECS";
        // Specify your AccessKey pair.
        String ak = "<accessKeyId>";
        String sk = "<accessKeySecret>";
        try {
            DefaultProfile clientProfile = DefaultProfile.getProfile(region, ak, sk);
            // Ignore SSL certificate validation.
            HttpClientConfig clientConfig = HttpClientConfig.getDefault();
            clientConfig.setIgnoreSSLCerts(true);
            // Set the connection timeout period.
            clientConfig.setConnectionTimeoutMillis(3000L);
            // Set the read timeout period.
            clientConfig.setReadTimeoutMillis(10000L);
            clientProfile.setHttpClientConfig(clientConfig);
            // Create a connection.
            DefaultAcsClient acsClient = new DefaultAcsClient(clientProfile);
            // Create a request.
            DescribeInstancesRequest request = new DescribeInstancesRequest();
            // Specify the endpoint of ASAPI.
            request.setSysEndpoint(endpoint);
            // Specify the name of the service that you want to access and the region where
the service resides.
            request.setSysLocationProduct(product);
            request.setSysRegionId(region);
            // Set the request protocol to HTTPS.
            request.setSysProtocol(ProtocolType.HTTPS);
            DescribeInstancesResponse result =  acsClient.getAcsResponse(request);
            List<DescribeInstancesResponse.Instance> instances = result.getInstances();
            for (DescribeInstancesResponse.Instance instance: instances) {
                System.out.println(instance.getInstanceId());
                System.out.println(instance.getInstanceName());
```

```
            }

        } catch (Exception e) {
            e.printStackTrace();
        }
    }
}
```

The following sample code provides an example on how to use the ROA style to make an API call. In this example, the GetNamespaceList operation of Container Registry is called, and the API version is 2016-06-07.

Sample code:

```
package com.aliyuns.client.pop.cr;

import com.aliyuncs.CommonRequest;
import com.aliyuncs.CommonResponse;
import com.aliyuncs.DefaultAcsClient;
import com.aliyuncs.IAcsClient;
import com.aliyuncs.exceptions.ClientException;
import com.aliyuncs.exceptions.ServerException;
import com.aliyuncs.http.FormatType;
import com.aliyuncs.http.HttpClientConfig;
import com.aliyuncs.http.MethodType;
import com.aliyuncs.http.ProtocolType;
import com.aliyuncs.profile.DefaultProfile;

public class GetNamespaceListTest {
    public static void main(String[] args) {
        // Specify the endpoint of ASAPI.
        String endpoint = "public.asapi.<global:region>.<global:internet-domain>/asapi/v3/r
oa";
        // Specify the region where the Container Registry service resides.
        String region = "<global:region>";
        // Specify the name of the service that you want to access.
        String product = "cr";
        // Specify your AccessKey pair.
        String ak = "<accessKeyId>";
        String sk = "<accessKeySecret>";
        DefaultProfile profile = DefaultProfile.getProfile(region, ak, sk);
        // Ignore SSL certificate validation.
        HttpClientConfig clientConfig = HttpClientConfig.getDefault();
        clientConfig.setIgnoreSSLCerts(true);
        // Set the connection timeout period.
        clientConfig.setConnectionTimeoutMillis(3000L);
        // Set the read timeout period.
        clientConfig.setReadTimeoutMillis(10000L);
        profile.setHttpClientConfig(clientConfig);
        // Create a connection for the client.
        IAcsClient client = new DefaultAcsClient(profile);
        // Create a request.
        CommonRequest request = new CommonRequest();
        // Set the request protocol to HTTPS.
```

```
        request.setSysProtocol(ProtocolType.HTTPS);
        // Specify the request method.
        request.setSysMethod(MethodType.GET);
        // Specify the endpoint of ASAPI.
        request.setSysDomain(endpoint);
        // Specify the version of the API.
        request.setSysVersion("2016-06-07");
        // Specify the pattern of the uniform resource identifier (URI).
        request.setSysUriPattern("/namespace");
        // Specify the name of the service that you want to access and the region where the
service resides.
        request.setSysLocationProduct(product);

        request.putHeadParameter("Content-Type", "application/json");
        String requestBody = "" +
                "{}";
        request.setHttpContent(requestBody.getBytes(), "utf-8", FormatType.JSON);
        try {
            CommonResponse response = client.getCommonResponse(request);
            System.out.println(response.getData());
        } catch (ServerException e) {
            e.printStackTrace();
        } catch (ClientException e) {
            e.printStackTrace();
        }
    }
}
```

> **Notice**
>
> If you send a request over HTTPS, you must enable the request to ignore SSL certificate validation.

SDK for Go

This topic describes how to use Apsara Stack API (ASAPI) SDK for POP for Go.

Prerequisites

An Alibaba Cloud SDK package is downloaded for the service that you want to access. The required dependencies are installed.

Background information

Only the remote procedure call (RPC) style is supported for API calls.

Call examples

The following sample code provides an example on how to make an API call. In this example, the DescribeInstances operation of Elastic Compute Service (ECS) is called, and the API version is 2014-05-26.

Sample code:

```
package main
```

```
import (
 "fmt"
 "time"

 "github.com/aliyun/alibaba-cloud-sdk-go/sdk"
 "github.com/aliyun/alibaba-cloud-sdk-go/sdk/auth/credentials"
 "github.com/aliyun/alibaba-cloud-sdk-go/sdk/requests"
 "github.com/aliyun/alibaba-cloud-sdk-go/sdk/responses"
)

func getSdkConfig() *sdk.Config {
 return sdk.NewConfig().
  WithTimeout(time.Duration(30) * time.Second).
  WithEnableAsync(true).
  WithGoRoutinePoolSize(100).
  WithMaxTaskQueueSize(10000).
  WithDebug(false).
  WithScheme("HTTP")
}

func main(){
 ak := "<The AccessKey ID of your Apsara Stack tenant account.>"
 sk := "<The AccessKey secret of your Apsara Stack tenant account.>"
 regionId := "<The region where the ECS service resides.>"
 endpoint := "<The endpoint of ASAPI.>" // No network protocol.
 request := requests.NewCommonRequest()
  request.SetReadTimeout(10 * time.Second) // Set the read timeout period of the request to
10 seconds.
  request.SetConnectTimeout(5 * time.Second)  // Set the connection timeout period of the r
equest to 5 seconds.
 request.Method = requests.GET
 request.Domain = endpoint         // Location Service will not be enabled if the host is s
pecified. For example, the service with a certification type-bearer token must be specified
.
 request.Version = "2014-05-26"            // Specify the version of the API.
 request.Scheme = "https"                // Specify the request protocol. Default value: ht
tp.
 request.ApiName = "DescribeInstances"
 request.QueryParams["Product"] = "Ecs"  // Specify the name of the service that you want t
o access.
 request.TransToAcsRequest()
 client, err := sdk.NewClientWithOptions(regionId,getSdkConfig(),credentials.NewAccessKeyCr
edential(ak,sk))
 // If relevant parameters are not set for the request, the client settings are used.
  //client.SetReadTimeout(10 * time.Second)              // Set the read timeout period of
the client to 10 seconds.
 //client.SetConnectTimeout(5 * time.Second)            // Set the connection timeout perio
d of the client to 5 seconds.
  resp := responses.BaseResponse{}
  err = client.DoAction(request, &resp)
    if err != nil {
        panic(err)
    }
 fmt.Print(endpoint)
```

```
}
```

Configure proxies

You can configure proxies in one of the following ways:

- Configure proxies by using environment variables.

  Set the HTTP_PROXY and HTTPS_PROXY environment variables, or set the NO_PROXY environment variable.

  Sample code:

```
import (
    "os"
)
func main(){
 os.Setenv("HTTP_PROXY", "http://x.x.x.x:xxxx") // Set the HTTP_PROXY environment variabl
e.
 os.Setenv("HTTPS_PROXY", "https://x.x.x.x:xxxx") // Set the HTTPS_PROXY environment vari
able.
}
```

- Configure proxies on the client.

  Sample code:

```
// The proxies that are configured on the client take precedence over those that are conf
igured by using environment variables.
client.SetHttpProxy("http://x.x.x.x:xxxx")   // Configure the HTTP proxy.
client.GetHttpProxy()                          // Query the HTTP proxy.

client.SetHttpsProxy("https://x.x.x.x:xxxx")   // Configure the HTTPS proxy.
client.GetHttpsProxy()                           // Query the HTTPS proxy.

client.SetNoProxy("127.0.0.1,localhost")     // Configure the proxy whitelist.
client.GetNoProxy()                          // Query the proxy whitelist.
```

SDK for Python

This topic describes how to use Apsara Stack API (ASAPI) SDK for POP for Python.

Prerequisites

An Alibaba Cloud SDK package is downloaded for the service that you want to access. The required dependencies are installed.

Background information

Only the remote procedure call (RPC) style is supported for API calls.

Call examples

The following sample code provides an example on how to make an API call. In this example, the DescribeInstances operation of Elastic Compute Service (ECS) is called, and the API version is 2014-05-26.

Sample code:

```
from aliyunsdkcore.client import AcsClient
from aliyunsdkcore.acs_exception.exceptions import ClientException
from aliyunsdkcore.acs_exception.exceptions import ServerException
from aliyunsdkecs.request.v20140526 import DescribeInstancesRequest
import os

# Create an AcsClient instance.
client = AcsClient(
   "<your-access-key-id>",
   "<your-access-key-secret>",
   "<your-region-id>",

   timeout=1000,  # Set the timeout period.
    verify=False, # Ignore certificate validation. or verify='<The location where the certi
ficate is stored.>'
);
# Set the following parameters for the HTTPS request protocol:
# client.set_verify(False)
# os.environ["HTTPS_PROXY"] = "http://127.0.0.1:8080"

# os.environ["HTTP_PROXY"] = "http://127.0.0.1:8080"
def hello_ecs_instance():
    # Create a request and set the parameters.
    request = DescribeInstancesRequest.DescribeInstancesRequest()

    params = {"PageNumber":"1", "Product":"Ecs","Version": "2014-05-26","Action": "Describe
Instances"};
    request.set_body_params(params)
    # The endpoint that contains no network protocol is in the following format: ASAPI doma
in name/asapi/v3.
    request.set_endpoint('<The endpoint of ASAPI.>')
    # Set the following parameter if the endpoint contains no network protocol:
    request.set_protocol_type("https")

    request.set_PageSize(10)
    # Initiate the API request and obtain the response.
    response = client.do_action_with_exception(request)
    print(response)

if __name__ == '__main__':
    print("Hello Aliyun OpenApi!")
    hello_ecs_instance()
```

Configure proxies

Set the HTTP_PROXY and HTTPS_PROXY environment variables.

Sample code:

```
# Configure the HTTPS proxy.
os.environ["HTTPS_PROXY"] = "http://x.x.x.x:xxxx"

# Configure the HTTP proxy.
os.environ["HTTP_PROXY"] = "https://x.x.x.x:xxxx"
```

17.1.2.1.5. HTTP requests

17.1.2.1.5.1. Overview

This topic describes how to make API requests and is intended for users who use API URLs to initiate HTTP GET requests.

If you are using an SDK to initiate requests, you can skip this topic.

The request URL consists of different parameters and has a fixed syntax. The URL contains common request parameters, your signature, and operation-specific parameters. Sample request URLs are provided for each API operation. These URLs are not encoded to make them easy to read. Before you make a request, you must encode the request URL. After the authentication process is complete based on your signature, the results are returned to you. Response parameters are returned if the call is successful, whereas an error message is returned if the call fails. You can troubleshoot issues based on the error message.

17.1.2.1.5.2. Request syntax

The Apsara Stack API (ASAPI) allows you to call API operations by sending HTTP GET requests based on URLs. Each URL must include request parameters. This topic describes the syntax of HTTP GET requests and provides the endpoint of the ASAPI.

Sample request

GetOrganizationList is used in the following unencoded URL request:

```
https://public.asapi.aliyuns.com/asapi/v3?Action=GetOrganizationList&Product=ascm&Version=2019-05-10&Id=<Organization ID>&<Common parameters>
```

- `https`: the protocol used to transmit the request.
- `public.asapi.aliyuns.com/asapi/v3`: the endpoint of the ASAPI.
- `Action=GetOrganizationList Product=ascm Version=2019-05-10`: the API operation to call.
- `Id`: the ID of the organization.
- `<Common parameters>`: the common parameters specified in the system.

Protocol

The ASAPI supports only HTTPS.

Endpoint

For more information about how to obtain an endpoint, see Generate an endpoint for the ASAPI.

Parameter

To specify an API operation, use the `Action, Product, and Version` parameters. For example, set `Action` to GetOrganizationList, Product to ascm, and Version to 2019-05-10. You must also specify other operation-specific parameters and common parameters. For more information, see Common parameters.

17.1.2.1.5.3. Request signatures

This topic describes how to sign HTTP API requests. ASAPI uses the request signature to verify the identity of the request sender. ASAPI implements symmetric encryption by using an AccessKey pair to verify the identity of the request sender.

> **Note**
>
> - An AccessKey pair consists of an AccessKey ID and an AccessKey secret, which are issued to each user or organization in the Apsara Uni-manager Management Console.
> - The AccessKey ID is used to verify identities of users, and the AccessKey secret is used to encrypt and verify signature strings. You must keep your AccessKey secret confidential.
> - ASAPI provides SDKs for Node.js, Python, and Java to facilitate complex signature calculation. For more information, see Obtain the core package for ASAPI.

Step 1: Create a canonicalized query string

1. Arrange the request parameters in alphabetical order, including all common and operation-specific parameters except the `Signature` parameter.

   > **Note**
   >
   > If you use the GET method to send a request,these parameters are connected by ampersands (&) and included in the request URL. The first request parameter follows a question mark (?).

2. Encode the request parameters and their values in UTF-8 based on RFC 3986. The following rules apply in the encoding process:
   - Letters, digits, and special characters such as hyphens (`-`), underscores (`_`), and periods (`.`) do not need to be encoded.
   - Other characters must be percent encoded in the `%XY` format. `XY` represents the ASCII code of the characters in hexadecimal notation. For example, double quotation marks (`"`) are encoded as `%22` .

- Extended UTF-8 characters are encoded in the `%XY%ZA...` format.
- Spaces must be encoded as `%20`. Do not encode spaces as plus signs (`+`).

  This encoding method is similar to but different from the `application/x-www-form-urlencoded` MIME encoding algorithm.

  If you use `java.net.URLEncoder` from the Java standard library, use `percentEncode` to encode request parameters and their values. In the encoded query string, replace the plus signs (`+`) with `%20` , asterisks (`*`) with `%2A` , and `%7E` with tildes (`~`). This way, you can obtain an encoded string that matches the preceding encoding rules.

  ```
  private static final String ENCODING = "UTF-8";
  private static String percentEncode(String value) throws UnsupportedEncodingException
  {
      return value != null ? URLEncoder.encode(value, ENCODING).replace("+", "%20").rep
  lace("*", "%2A").replace("%7E", "~") : null;
  }
  ```

3. Use equal signs (`=`) to connect the encoded request parameters and their values.
4. Use ampersands (`&`) to connect the encoded request parameters. These parameters must be arranged in the same order as those in Step 1.

Then, a canonicalized query string that follows the request structure is obtained. For more information, see Request structure.

Step 2: Create a string-to-sign

1. Create a `string-to-sign` . You can also use `percentEncode` to encode the canonicalized query string created in Step 1 based on the following rules:

   ```
   StringToSign=
       HTTPMethod + "&" + //HTTPMethod: the HTTP method that is used to send a request, su
   ch as GET.
       percentEncode("/") + "&" + //percentEncode("/"): Encode the forward slash (/) in UT
   F-8 as %2F.
       percentEncode(CanonicalizedQueryString) // Encode the canonicalized query string cr
   eated in Step 1.
   ```

2. Calculate the RFC 2104-compliant HMAC-SHA1 or HMAC-256 value of `StringToSign` . In the following example, Java Base64 is used:

   ```
   String signature = Base64.getEncoder().encodeToString(signData);
   ```

> **Note**
>
> When you calculate the signature, the key value specified by RFC 2104 is your `AccessKey secret` plus an ampersand (&), which has an ASCII value of 38. For more information, see Obtain an AccessKey pair.

3. Encode the `Signature` parameter based on RFC 3986 and add it to the canonicalized query string.

Example 1: Concatenate parameters

`GetOrganizationList` is used in this example to query regions. For example, `AccessKeyID` is set to testid and `AccessKeySecret` is set to testsecret. Perform the following operations:

1. Construct a canonicalized query string.

```
https://public.asapi.aliyuns.com/asapi/v3/?AccessKeyId=testid&Action=GetOrganizationList&Format=JSON&Id=1&Product=ascm&RegionId=cn-region-test&SignatureMethod=HMAC-SHA1&SignatureNonce=43967c6e-e3ad-44fa-b06b-fcf3db5f39d2&SignatureVersion=1.0&Timestamp=2020-09-15T08%3A50%3A40Z&Version=2019-05-10
```

2. Create a `string-to-sign` .

```
GET&%2F&AccessKeyId%3Dtestid%26Action%3DGetOrganizationList%26Format%3DJSON%26Id%3D1%26Product%3Dascm%26RegionId%3Dcn-region-test%26SignatureMethod%3DHMAC-SHA1%26SignatureNonce%3D43967c6e-e3ad-44fa-b06b-fcf3db5f39d2%26SignatureVersion%3D1.0%26Timestamp%3D2020-09-15T08%253A50%253A40Z%26Version%3D2019-05-10
```

3. Calculate the signature.

   Calculate the signature. The key value used for calculation is `testsecret&` because `AccessKeySecret` is set to testsecret. The calculated signature is `OLeaidS1JvxuMvnyHOwuJ+uX5qY=` . Java Base64 is used in the following sample code:

   `String signature = Base64.getEncoder().encodeToString(signData);` Encode `Signature=hvqv9Ll5RE6kQ4YsQXFAf9VuRIY=` based on RFC 3986 and add it to the canonicalized query string.

```
https://public.asapi.aliyuns.com/asapi/v3/?AccessKeyId=testid&Action=GetOrganizationList&Format=JSON&Id=1&Product=ascm&RegionId=cn-region-test&SignatureMethod=HMAC-SHA1&SignatureNonce=43967c6e-e3ad-44fa-b06b-fcf3db5f39d2&SignatureVersion=1.0&Timestamp=2020-09-15T08%3A50%3A40Z&Version=2019-05-10
```

You can use browsers or tools such as cURL and Wget to initiate an HTTP request for calling the `DescribeRegions` operation to query the Alibaba Cloud region list.

Example 2: Use the standard library of the programming language

`GetOrganizationList` is used in this example to query regions. For example, `AccessKeyID` is set to testid, `AccessKeySecret` is set to testsecret, and all request parameters are stored in a Java `Map<String, String>` object.

1. Predefine an encoding method.

```
private static final String ENCODING = "UTF-8";
private static String percentEncode(String value) throws UnsupportedEncodingException {
        return value != null ? URLEncoder.encode(value, ENCODING).replace("+", "%20").r
eplace("*", "%2A").replace("%7E", "~") : null;
}
```

2. Predefine the time format for the `Timestamp` parameter. Specify the `Timestamp` parameter in the ISO 8601 format. The time must be in UTC+0.

```
private static final String ISO8601_DATE_FORMAT = "yyyy-MM-dd'T'HH:mm:ss'Z'";
private static String formatIso8601Date(Date date) {
    SimpleDateFormat df = new SimpleDateFormat(ISO8601_DATE_FORMAT);
    df.setTimeZone(new SimpleTimeZone(0, "GMT"));
    return df.format(date);
}
```

3. Create a request string.

```
final String HTTP_METHOD = "GET";
Map parameters = new HashMap();
// Specify request parameters.
parameters.put("Product", "ascm");
parameters.put("Action", "GetOrganizationList");
parameters.put("Version", "2019-05-10");
parameters.put("AccessKeyId", "testid");
parameters.put("RegionId", "cn-region-test");
parameters.put("Timestamp", formatIso8601Date(new Date()));
parameters.put("SignatureMethod", "HMAC-SHA1");
parameters.put("SignatureVersion", "1.0");
parameters.put("SignatureNonce", UUID.randomUUID().toString());
parameters.put("Format", "JSON");
parameters.put("Id", "1");
// Arrange request parameters.
String[] sortedKeys = parameters.keySet().toArray(new String[]{});
Arrays.sort(sortedKeys);
final String SEPARATOR = "&";
// Create a string-to-sign.
StringBuilder stringToSign = new StringBuilder();
stringToSign.append(HTTP_METHOD).append(SEPARATOR);
stringToSign.append(percentEncode("/")).append(SEPARATOR);
StringBuilder canonicalizedQueryString = new StringBuilder();
for(String key : sortedKeys) {
    // Encode the key and the value.
    canonicalizedQueryString.append("&")
    .append(percentEncode(key)).append("=")
    .append(percentEncode(parameters.get(key)));
}
//Encode the canonicalized query string.
stringToSign.append(percentEncode(
canonicalizedQueryString.toString().substring(1)));
```

4. The signature. The key value used for calculation is `testsecret&` because `AccessKeySecret` is set to testsecret. The calculated signature is `OLeaidS1JvxuMvnyHOwuJ%2BuX5qY%3D`.

```
// The following sample code shows how to calculate the signature:
final String ALGORITHM = "HmacSHA1";
final String ENCODING = "UTF-8";
key = "testsecret&";
Mac mac = Mac.getInstance(ALGORITHM);
mac.init(new SecretKeySpec(key.getBytes(ENCODING), ALGORITHM));
byte[] signData = mac.doFinal(stringToSign.getBytes(ENCODING));
String signature = Base64.getEncoder().encodeToString(signData);
```

Encode the Signature parameter based on RFC 3986 and add it to the canonicalized query string. The following URL is obtained:

```
https://public.asapi.aliyuns.com/asapi/v3/?AccessKeyId=testid&Action=GetOrganizationLis
t&Format=JSON&Id=1&Product=ascm&RegionId=cn-region-test&SignatureMethod=HMAC-SHA1&Signa
tureNonce=43967c6e-e3ad-44fa-b06b-fcf3db5f39d2&SignatureVersion=1.0&Timestamp=2020-09-1
5T08%3A50%3A40Z&Version=2019-05-10
```

5. Use browsers or tools such as cURL and Wget to initiate an HTTP request.

17.1.2.1.5.4. Response

Responses are returned only in the JSON format. If a return code is greater than or equal to 200 and less than 300, a success response is returned. Otherwise, an error response is returned.

Sample success response

If a request is successful, the request ID and operation-specific parameter values are returned. For more information, see the developer guide of the corresponding Apsara Stack service.

```
 {
    "eagleEyeTraceId": "xxx-xxx-xxx-xxx", // The trace ID provided by EagleEye.
    "asapiSuccess": true,
    "RequestId": "xxxxxxxxxx",
    "Regions": { // The regions returned after you call the DescribeRegions operation.
        "Region": [
            {
                "RegionId": "",
                "RegionEndpoint": "",
                "LocalName": ""
            }
        ]
    }
}
```

Sample error response

If a request fails, the following information is returned. For more information, see the developer guide of the corresponding Apsara Stack service.

```
{
    "code": "asapi.server.api.notfound",// The error code.
    "eagleEyeTraceId": "xxx-xxx-xxx-xxx", // The trace ID provided by EagleEye.
    "asapiSuccess": false, // Indicates whether the request is successful.
    "hostId": "xxxx", // The ID of the host.
    "message": "Failed to ....", // The message returned.
    "asapiErrorMessage": "Failed to ....", // The error message provided by the ASAPI.
    "asapiErrorCode": "asapi.server.api.notfound" // The error code provided by the ASAPI.
}
```

17.1.3. Make API requests

17.1.3.1. Request syntax

To call a VPN Gateway API operation, you must send an HTTP GET request to the endpoint of the VPN Gateway API. Before you send a request, you must specify the request parameters for the operation. A response is returned for each request. Requests and responses are encoded by using UTF-8.

VPN Gateway API operations use the RPC protocol. You can call VPN Gateway API operations by sending HTTP GET requests.

The requests use the following syntax:

```
http://Endpoint/?Action=xx&Parameters
```

where:

- Endpoint: the endpoint of the API. The endpoint of the VPN Gateway API is `vpc.example.com`.

  > **Note** `example.com` is a custom domain name. You can obtain the endpoint in the Apsara Uni-manager Operations Console. For more information, see Generate the ASAPI endpoint.

- Action: the operation that you want to perform. For example, you can call DescribeVpnGateways to query VPN gateways.
- Version: the version of the API that you want to call. The current version of the VPN Gateway API is *2016-04-28*.
- Parameters: the request parameters for the operation. Separate multiple parameters with ampersands (&).

  Request parameters include common parameters and operation-specific parameters. Common parameters include the API version and authentication information. For more information about common parameters, see Common parameters.

The following example shows how to call the DescribeVpnGateways operation to query VPN gateways.

> **Note** The sample requests are formatted to improve readability.

```
https://vpc.example.com/?Action=DescribeVpnGateways
&Format=xml
&Version=2016-04-28
&Signature=xxxx%xxxx%3D
&SignatureMethod=HMAC-SHA1
&SignatureNonce=15215528852396
&SignatureVersion=1.0
&AccessKeyId=key-test
&Timestamp=2012-06-01T12:00:00Z
```

17.1.3.2. API authorization

To ensure the security of your account, we recommend that you call API operations as a Resource Access Management (RAM) user. Before you call the VPN Gateway API as a RAM user, you must create a RAM user and grant the RAM user the required permissions.

For more information about VPN resources and API operations that you can authorize a RAM user to use, see RAM authentication.

17.1.3.3. Request signatures

You must sign all API requests to ensure security. Alibaba Cloud uses the request signature to verify the identity of the API caller.

VPN Gateway implements symmetric encryption with an AccessKey pair to verify the identity of the request sender. An AccessKey pair is an identity credential issued to Alibaba Cloud accounts and RAM users that is similar to a pair of username and password. An AccessKey pair consists of an AccessKey ID and an AccessKey secret. The AccessKey ID is used to verify the identity of the user, while the AccessKey secret is used to encrypt and verify the signature string. You must keep your AccessKey secret confidential. For more information about how to create an AccessKey pair, see Obtain an AccessKey pair.

You must add the signature to an RPC API request in the following format:

```
https://endpoint/?SignatureVersion=1.0&SignatureMethod=HMAC-SHA1&Signature=xxxx%xxxx%3D&SignatureNonce=3ee8c1b8-83d3-44af-a94f-4e0ad82fd6cf
```

For example, you want to call the DescribeVpcs operation. The AccessKey ID is `testid` and the AccessKey secret is `testsecret`. The following code block shows the URL of the request before the request is signed

```
http://vpc.example.com/?Action=DescribeVpnGateways
&Timestamp=2016-02-23T12:46:24Z
&Format=XML
&AccessKeyId=testid
&SignatureMethod=HMAC-SHA1
&SignatureNonce=3ee8c1b8-83d3-44af-a94f-4e0ad82fd6cf
&Version=2016-04-28
&SignatureVersion=1.0
```

Perform the following operations to calculate the signature:

1. Use the request parameters to compose a string-to-sign.

   ```
   GET&%2F&AccessKeyId%3Dtestid&Action%3DDescribeVpnGateways&Format%3DXML&SignatureMethod%3DHMAC-SHA1&SignatureNonce%3D3ee8c1b8-83d3-44af-a94f-4e0ad82fd6cf&SignatureVersion%3D1.0&TimeStamp%3D2016-02-23T12%253A46%253A24Z&Version%3D2016-04-28
   ```

2. Calculate the HMAC value of the string-to-sign.

   Append an ampersand (&) to the end of the AccessKey secret as the key to calculate the HMAC value. In this example, the key is `testsecret&`.

   ```
   CT9X0VtwR86fNWSnsc6v8YGOjuE=
   ```

3. Add the signature string to the request as the Signature parameter.

   ```
   http://vpc.example.com/?Action=DescribeVpnGateways
   &Timestamp=2016-02-23T12:46:24Z
   &Format=XML
   &AccessKeyId=testid
   &SignatureMethod=HMAC-SHA1
   &SignatureNonce=3ee8c1b8-83d3-44af-a94f-4e0ad82fd6cf
   &Version=2016-04-28
   &SignatureVersion=1.0
   &Signature=xxxx%xxxx%3D
   ```

17.1.3.4. RAM authentication

Before you call the VPN Gateway API as a RAM user, you must use an Apsara Stack tenant account to create a permission policy to assign permissions to the RAM user. In the permission policy, you must use an Alibaba Cloud Resource Name (ARN) to specify the resource that you want this RAM user to access.

Resources types of VPN Gateway that can be authorized

The following table lists the VPN Gateway resources that can be authorized and the ARNs of these resources.

Resource type	ARN
VPN gateway	`acs:vpc:$regionid:$accountid:vpngateway/$vpngatewayid`
	`acs:vpc:$regionid:$accountid:vpngateway/*`
	`acs:vpc:*:$accountid:vpngateway/*`
Customer gateway	`acs:vpc:$regionid:$accountid:customergateway/$customergatewayid`
	`acs:vpc:$regionid:$accountid:customergateway/*`
	`acs:vpc:*:$accountid:customergateway/*`
IPsec-VPN connection	`acs:vpc:$regionid:$accountid:vpnconnection/$vpnconnectionid`
	`acs:vpc:$regionid:$accountid:vpnconnection/*`
	`acs:vpc:*:$accountid:vpnconnection/*`
SSL-VPN server	`acs:vpc:$regionid:$accountid:sslvpnserver/$sslvpnserverid`
	`acs:vpc:$regionid:$accountid:sslvpnserver/*`
	`acs:vpc:*:$accountid:sslvpnserver/*`
SSL-VPN client certificate	`acs:vpc:$regionid:$accountid:sslvpnclientcert/$sslvpnclientcertid`
	`acs:vpc:$regionid:$accountid:sslvpnclientcert/*`
	`acs:vpc:*:$accountid:sslvpnclientcert/*`
General-purpose resource	`acs:vpc:$regionid:$accountid:*`
	`acs:vpc:*:$accountid:*`

`$regionid/accoutid/vrouterid` are the IDs of specific resources. `*` represents all resources.

VPN Gateway API operations that can be authorized

The following table lists the VPN Gateway API operations that can be authorized and the ARNs of these API operations.

API	ARN
ModifyVpnGatewayAttribute	acs:vpc:$regionid:$accountid:vpngateway/$vpngatewayid
DescribeVpnGateways	acs:vpc:$regionid:$accountid:vpngateway/*
DescribeVpnGateway	acs:vpc:$regionid:$accountid:vpngateway/$vpngatewayid
DeleteVpnGateway	acs:vpc:$regionid:$accountid:vpngateway/$vpngatewayid
CreateCustomerGateway	acs:vpc:$regionid:$accountid:customergateway/*
DeleteCustomerGateway	acs:vpc:$regionid:$accountid:customergateway/$customergatewayid
DescribeCustomerGateway	acs:vpc:$regionid:$accountid:customergateway/$customergatewayid
DescribeCustomerGateways	acs:vpc:$regionid:$accountid:customergateway/*
ModifyCustomerGatewayAttribute	acs:vpc:$regionid:$accountid:customergateway/$customergatewayid
CreateVpnConnection	acs:vpc:$regionid:$accountid:vpnconnection/*
DeleteVpnConnection	acs:vpc:$regionid:$accountid:vpnconnection/$vpnconnectionid
DescribeVpnConnection	acs:vpc:$regionid:$accountid:vpnconnection/$vpnconnectionid
DescribeVpnConnections	acs:vpc:$regionid:$accountid:vpnconnection/*
ModifyVpnConnectionAttribute	acs:vpc:$regionid:$accountid:vpnconnection/$vpnconnectionid
DownloadVpnConnectionConfig	acs:vpc:$regionid:$accountid:vpnconnection/$vpnconnectionid

17.1.3.5. Common parameters

Common request parameters

Common request parameters are required by all API operations.

Common request parameters

Parameter	Type	Required	Description

Parameter	Type	Required	Description
Format	String	No	The format in which the response is returned. Valid values: *JSON and XML. Default value: JSON.*
Version	String	Yes	The version number of the API, which is in the `YYYY-MM-DD` format. Valid values: *2016-04-28*.
AccessKeyId	String	Yes	The AccessKey ID provided to you by Alibaba Cloud
Signature	String	Yes	The signature string in the API request.
SignatureMethod	String	Yes	The encryption method of the signature string. Valid value: *HMAC-SHA1*.
Timestamp	String	Yes	The timestamp of the request. Specify the time in the ISO 8601 standard in the `YYYY-MM-DDThh:mm:ssZ` format. The time must be in UTC. For example, 2013-01-10T12:00:00Z indicates 20:00:00 on January 10, 2013 (UTC+8).
SignatureVersion	String	Yes	The version of the signature encryption algorithm. Valid value: *1.0*.
SignatureNonce	String	Yes	A unique, random number used to prevent replay attacks. You must use different random numbers for different requests.

Common response parameters

API responses use the HTTP response format where a 2XX status code indicates a successful call and a 4XX or 5XX status code indicates a failed call. Responses can be returned in either the JSON or XML format. You can specify the response format in the request. The default response format is JSON.

Every response returns a unique RequestId regardless of whether the call is successful.

- XML format

```
<? xml version="1.0" encoding="utf-8"? >
    <!—Result Root Node-->
    <Interface Name+Response>
        <!—Return Request Tag-->
        <RequestId>4C467B38-3910-447D-87BC-AC049166F216</RequestId>
        <!—Return Result Data-->
    </Interface Name+Response>
```

- JSON format

```
{
    "RequestId":"4C467B38-3910-447D-87BC-AC049166F216",
    /*Return Result Data*/
    }
```

17.1.4. VPN gateway

17.1.4.1. CreateVpnGateway

Creates a VPN gateway.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateVpnGateway	The operation that you want to perform. Set the value to: **CreateVpnGateway**.
Bandwidth	Integer	Yes	5	The public bandwidth of the VPN gateway. Unit: Mbit/s. Valid values: **5, 10, 20, 50, and 100**.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where you want to create the VPN gateway. You can call the DescribeRegions operation to query the most recent region list.
VpcId	String	Yes	vpc-bp1ub1yt9cvakoelj****	The ID of the virtual private cloud (VPC) where the VPN gateway is deployed.
EnableIpsec	Boolean	No	true	Specifies whether to enable the IPsec-VPN feature. Valid values: • **true**: enables the IPsec-VPN feature. • **false**: disables the IPsec-VPN feature. This is the default value.
EnableSsl	Boolean	No	true	Specifies whether to enable the SSL-VPN feature. Valid values: • **true**: enables the SSL-VPN feature. • **false**: disables the SSL-VPN feature. This is the default value.

Parameter	Type	Required	Example	Description
Name	String	No	MYVPN	The name of the VPN gateway. The default value is the ID of the VPN gateway. The name must be 2 to 128 characters in length, and can contain letters, digits, underscores (_), and hyphens (-). The name must start with a letter, and cannot start with `http://` or `https://`.
SslConnections	Integer	No	5	The maximum number of concurrent connections. Valid values: **5**, **10**, and **20**.
VSwitchId	String	No	vsw-bp1j5miw2bae9s2vt****	The ID of the vSwitch to which the VPN gateway belongs.

Response parameters

Parameter	Type	Example	Description
Name	String	myVpn	The name of the VPN gateway.
RequestId	String	54B48E3D-DF70-471B-AA93-08E683A1B457	The ID of the request.
VpnGatewayId	String	vpn-bp1q8bgx4xnkm2ogj****	The ID of the VPN gateway.

Examples

Sample requests

```
http(s)://vpc.example.com/?Action=CreateVpnGateway &Bandwidth=5 &RegionId=cn-qingdao-env66-d01 &VpcId=vpc-bp1ub1yt9cvakoelj**** &
```

Sample success responses

`XML` format

```
<CreateVpnGatewayResponse>
      <Name>myVpn</Name>
      <VpnGatewayId>vpn-bp1q8bgx4xnkm2ogj****</VpnGatewayId>
      <RequestId>54B48E3D-DF70-471B-AA93-08E683A1B457</RequestId>
</CreateVpnGatewayResponse>
```

`JSON` format

```
{ "CreateVpnGatewayResponse":{ "Name":"myVpn", "VpnGatewayId":"vpn-bp1q8bgx4xnkm2ogj****",
"RequestId":"54B48E3D-DF70-471B-AA93-08E683A1B457" } }
```

17.1.4.2. ModifyVpnGatewayAttribute

Modifies the name and description of a VPN gateway.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyVpnGatewayAttribute	The operation that you want to perform. Set the value to **ModifyVpnGatewayAttribute**.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the VPN gateway is created. You can call the DescribeRegions operation to query the most recent region list.
VpnGatewayId	String	Yes	vpn-bp1q8bgx4xnkm2ogj****	The ID of the VPN gateway.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-0016e04115b	The client token that is used to ensure the idempotence of the request. You can use the client to generate a token, but you must make sure that it is unique among different requests. The token can only contain ASCII characters and cannot exceed 64 characters in length.
Description	String	No	vpngateway	The description of the VPN gateway. The description must be 2 to 256 characters in length. It must start with a letter and cannot start with `http://` or `https://`.

Parameter	Type	Required	Example	Description
Name	String	No	myvpn	The name of the VPN gateway. The name must be 2 to 128 characters in length, and can contain digits, periods (.), underscores (_), and hyphens (-). It must start with a letter, and cannot start with `http://` or `https://`.

Response parameters

Parameter	Type	Example	Description
VpnGatewayId	String	vpn-bp1q8bgx4xnkm2ogj****	The ID of the VPN gateway.
VpcId	String	vpc-bp1ub1yt9cvakoel*****	The ID of the virtual private cloud (VPC) to which the VPN gateway belongs.
VSwitchId	String	vsw-bp1y9ovl1cu9ou4tv*****	The ID of the vSwitch to which the VPN gateway belongs.
InternetIp	String	116.XX.XX.69	The public IP address of the VPN gateway.
CreateTime	Long	1492753580000	The timestamp generated when the VPN gateway was created.
EndTime	Long	1495382400000	The timestamp to be generated when the VPN gateway expires.
Spec	String	5 Mbps	The specification of the VPN gateway.
Name	String	test	The name of the VPN gateway.
Description	String	test	The description of the VPN gateway.
Status	String	active	The status of the VPN gateway.
IntranetIp	String	172.XX.XX.104	The private IP address of the VPN gateway.

Parameter	Type	Example	Description
RequestId	String	54B48E3D-DF70-471B-AA93-08E683A1B457	The ID of the request.

Examples

Sample requests

```
https://vpc.example.com/?Action=ModifyVpnGatewayAttribute
&RegionId=cn-qingdao-env66-d01
&VpnGatewayId=vpn-bp1q8bgx4xnkm2ogj****
&<公共请求参数>
```

Sample success responses

`XML` format

```
<ModifyVpnGatewayAttributeResponse>
      <Name>aaa</Name>
      <Status>active</Status>
      <VpnGatewayId>vpn-bp1q8bgx4xnkm2ogj****</VpnGatewayId>
      <Spec>5M</Spec>
      <CreateTime>1492753580000</CreateTime>
      <IntranetIp>172.XX.XX.104</IntranetIp>
      <RequestId>54B48E3D-DF70-471B-AA93-08E683A1B457</RequestId>
      <InternetIp>116.XX.XX.69</InternetIp>
      <EndTime>1495382400000</EndTime>
      <VSwitchId>vsw-bp1y9ovl1cu9ou4tv****</VSwitchId>
      <VpcId>vpc-bp1ub1yt9cvakoelj****</VpcId>
</ModifyVpnGatewayAttributeResponse>
```

`JSON` format

```
{
 "Name":"aaa",
 "Status":"active",
 "VpnGatewayId":"vpn-bp1q8bgx4xnkm2ogj****",
 "Spec":"5M",
 "RequestId":"BA56EAF8-E3A9-4BE6-8511-8F03512153E2",
 "IntranetIp":"172.XX.XX.104",
 "CreateTime":1492753580000,
 "InternetIp":"116.XX.XX.69",
 "EndTime":1495382400000,
 "VSwitchId":"vsw-bp1y9ovl1cu9ou4tv****",
 "VpcId":"vpc-bp1ub1yt9cvakoelj****"
}
```

17.1.4.3. DescribeVpnGateways

Queries one or more VPN gateways.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeVpnGateways	The operation that you want to perform. Set the value to **DescribeVpnGateways**.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the VPN gateway is created. You can call the `DescribeRegions` operation to query the most recent region list.
VpcId	String	No	vpc-bp1ub1yt9cvakoelj****	The ID of the virtual private cloud (VPC) to which the VPN gateway belongs.
VpnGatewayId	String	No	vpn-bp1q8bgx4xnkm2ogj****	The ID of the VPN gateway.
Status	String	No	init	The status of the VPN gateway. Valid values: • **init**: The VPN gateway is being initialized. • **provisioning**: The VPN gateway is being prepared. • **active**: The VPN gateway is running as expected. • **updating**: The VPN gateway is being updated. • **Deleting**: The VPN gateway is being deleted.
BusinessStatus	String	No	Normal	The payment status of the VPN gateway. Valid values: • **Normal**: The VPN gateway is running as expected. • **FinancialLocked**: The VPN gateway is locked due to overdue payments.
PageNumber	Integer	No	1	The number of the page to return. Default value: **1**.

Parameter	Type	Required	Example	Description
PageSize	Integer	No	10	The number of entries to return on each page. Maximum value: **50**. Default value: **10**.

Response parameters

Parameter	Type	Example	Description
VpnGateways	Array of VpnGateway		Detailed information about the VPN gateways.
VpnGateway			
VpnGatewayId	String	vpn-bp1q8bgx4xnkm2ogj****	The ID of the VPN gateway.
VpcId	String	vpc-bp1ub1yt9cvakoelj*****	The ID of the VPC to which the VPN gateway belongs.
VSwitchId	String	vsw-bp1y9ovl1cu9ou4tv*****	The ID of the vSwitch to which the VPN gateway is attached.
InternetIp	String	116.XX.XX.69	The public IP address of the VPN gateway.
CreateTime	Long	1515383700000	The timestamp generated when the VPN gateway was created.
EndTime	Long	1518105600000	The timestamp to be generated when the VPN gateway expires.
Spec	String	5 Mbps	The maximum bandwidth of the VPN gateway. Unit: Mbit/s.
Name	String	test	The name of the VPN gateway.
Description	String	test	The description of the VPN gateway.
Status	String	active	The status of the VPN gateway.

Parameter	Type	Example	Description
BusinessStatus	String	Normal	The payment status of the VPN gateway.
ChargeType	String	Prepay	The billing type. Valid value: **PostpayByFlow**.
IpsecVpn	String	enable	Indicates whether the IPsec-VPN feature is enabled. • **enable**: IPsec-VPN is enabled. • **disable** : IPsec-VPN is disabled.
SslMaxConnections	Long	5	The maximum number of concurrent SSL-VPN connections.
SslVpn	String	enable	Indicates whether the SSL-VPN feature is enabled. • **enable**: SSL-VPN is enabled. • **disable** : SSL-VPN is disabled.
Tag	String	1	The tag of the VPN gateway.
TotalCount	Integer	1	The number of entries returned.
PageNumber	Integer	1	The page number of the returned page.
PageSize	Integer	10	The number of entries returned on the current page.
RequestId	String	DF11D6F6-E35A-41C3-9B20-6FC8A901FE65	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeVpnGateways
&RegionId=cn-qingdao-env66-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeVpnGatewaysResponse>
      <PageNumber>1</PageNumber>
      <TotalCount>1</TotalCount>
      <PageSize>10</PageSize>
      <VpnGateways>
            <VpnGateway>
                  <Status>active</Status>
                  <VpnGatewayId>vpn-bp1q8bgx4xnkm2ogj****</VpnGatewayId>
                  <BusinessStatus>Normal</BusinessStatus>
                  <Spec>5M</Spec>
                  <CreateTime>1492753580000</CreateTime>
                  <InternetIp>116.XX.XX.69</InternetIp>
                  <EndTime>1495382400000</EndTime>
                  <VSwitchId>vsw-bp1y9ovl1cu9ou4tv****</VSwitchId>
                  <VpcId>vpc-bp1ub1yt9cvakoelj****</VpcId>
            </VpnGateway>
      </VpnGateways>
      <RequestId>DF11D6F6-E35A-41C3-9B20-6FC8A901FE65</RequestId>
</DescribeVpnGatewaysResponse>
```

`JSON` format

```

```

Error codes

HttpCode	Error code	Error message	Description

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.

17.1.4.4. DescribeVpnGateway

Queries the details of a specified VPN gateway.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeVpnGateway	The operation that you want to perform. Set the value to **DescribeVpnGateway**.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the VPN gateway is created. You can call the `DescribeRegions` operation to query the most recent region list.
VpnGatewayId	String	Yes	vpn-bp1q8bgx4xnkm2ogj****	The ID of the VPN gateway.

Response parameters

Parameter	Type	Example	Description
VpnGatewayId	String	vpn-bp1q8bgx4xnkm2ogj****	The ID of the VPN gateway.
VpcId	String	vpc-bp1ub1yt9cvakoelj****	The ID of the VPC for which the VPN gateway is created.

Parameter	Type	Example	Description
VSwitchId	String	vsw-bp1y9ovl1cu9ou4tv****	The ID of the vSwitch to which the VPN gateway is attached.
InternetIp	String	116.XX.XX.222	The public IP address of the VPN gateway.
CreateTime	Long	1495382400000	The timestamp generated when the VPN gateway was created.
EndTime	Long	1495382400000	The timestamp to be generated when the VPN gateway expires.
Spec	String	5 M	The maximum bandwidth of the VPN gateway. Unit: Mbit/s.
Name	String	vpngatewayname	The name of the VPN gateway.
Description	String	vpngatewaydescription	The description of the VPN gateway.
Status	String	init	The status of the VPN gateway. • **init**: The VPN gateway is being initialized. • **provisioning** : The VPN gateway is being prepared. • **active**: The VPN gateway is running as expected. • **updating**: The VPN gateway is being updated. • **Deleting**: The VPN gateway is being deleted.
BusinessStatus	String	Normal	The payment status of the VPN gateway. • **Normal**: The VPN gateway is running as expected. • **FinancialLocked**: The VPN gateway is locked due to overdue payments.
ChargeType	String	PostpayByFlow	The billing method of the VPN gateway. Valid value: **PostpayByFlow**.

Parameter	Type	Example	Description
IpsecVpn	String	enable	Indicates whether the IPsec-VPN feature is enabled. • **enable**: IPsec-VPN is enabled. • **disable** : IPsec-VPN is disabled.
RequestId	String	E98A9651-7098-40C7-8F85-C818D1EBBA85	The ID of the request.
SslMaxConnections	Long	5	The maximum number of concurrent SSL-VPN connections.
SslVpn	String	enable	Indicates whether the SSL-VPN feature is enabled. • **enable**: SSL-VPN is enabled. • **disable** : SSL-VPN is disabled.
Tag	String	tag1	The tag of the VPN gateway.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeVpnGateway
&RegionId=cn-qingdao-env66-d01
&VpnGatewayId=vpn-bp1q8bgx4xnkm2ogj****
&<Common request parameters>
```

Sample success responses

`XML` format

```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.
404	InvalidVpnGatewayInstanceId.NotFound	The specified vpn gateway instance id does not exist.	The error message returned because the specified VPN gateway does not exist. Check whether the configuration of the VPN gateway is valid.

17.1.4.5. DeleteVpnGateway

Deletes a specified VPN gateway.

> **Note** You cannot delete a VPN gateway that is associated with an IPsec-VPN connection.

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteVpnGateway	The operation that you want to perform. Set the value to **DeleteVpnGateway**.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the VPN gateway is created. You can call the `DescribeRegions` operation to query the most recent region list.
VpnGatewayId	String	Yes	vpn-bp1q8bgx4xnkm2ogj****	The ID of the VPN gateway.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-0016e04115b	The client token that is used to ensure the idempotence of the request. You can use the client to generate a token, but you must make sure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	0ED8D006-F706-4D23-88ED-E11ED28DCAC0	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DeleteVpnGateway
&RegionId=cn-qingdao-env66-d01
&VpnGatewayId=vpn-bp1q8bgx4xnkm2ogj****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteNatGatewayResponse>
      <RequestId>0ED8D006-F706-4D23-88ED-E11ED28DCAC0</RequestId>
</DeleteNatGatewayResponse>
```

`JSON` format

```
{
    "RequestId": "0ED8D006-F706-4D23-88ED-E11ED28DCAC0"
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.
404	InvalidVpnGatewayInstanceId.NotFound	The specified vpn gateway instance id does not exist.	The error message returned because the specified VPN gateway does not exist. Check whether the configuration of the VPN gateway is valid.
403	ForbiddenRelease	Forbidden to release a prepaid instance within validity period	The error message returned because you cannot release a subscription VPN gateway within the subscription duration.
400	VpnGateway.Configuring	The specified service is configuring.	The error message returned because the operation is not allowed when the specified service is being configured. Try again later.
400	VpnGateway.Configuring	The specified VPN gateway is being configured.	The error message returned because the VPN gateway is being configured.

17.1.5. Customer gateway

17.1.5.1. CreateCustomerGateway

Creates a customer gateway.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateCustomerGateway	The operation that you want to perform. Set the value to **CreateCustomerGateway**.
IpAddress	String	Yes	116.XX.XX.222	The IP address of the customer gateway.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where you want to create the customer gateway. You can call the `DescribeRegions` operation to query the most recent region list.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-0016e04115b	The client token is used to ensure the idempotence of the request. You can use the client to generate a token, but you must make sure that the token is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.
Name	String	No	Gateway	The name of the customer gateway. The name must be 2 to 128 characters in length and can contain digits, periods (.), underscores (_), and hyphens (-). It must start with a letter. However, the name cannot start with `http://` or `https://`.
Description	String	No	Gateway	The description of the customer gateway. The description must be 2 to 256 characters in length, and contain digits, hyphens (-), underscores (_), full width periods (。), full width commas (，), and full width colons (：). The description cannot start with `http://` or `https://`.

Response parameters

Parameter	Type	Example	Description
CustomerGatewayId	String	cgw-bp1aw0a5nfff03xp1****	The ID of the customer gateway.
IpAddress	String	100.XX.XX.1	The IP address of the customer gateway.
Name	String	test	The name of the customer gateway.
Description	String	test	The description of the customer gateway.
CreateTime	Long	1493363486000	The timestamp generated when the customer gateway was created.
RequestId	String	cgw-bp1aw0a5nfff03xp1pcqc	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=CreateCustomerGateway
&IpAddress=116.XX.XX.222
&RegionId=cn-qingdao-env66-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreateCustomerGatewayResponse>
      <CustomerGatewayId>cgw-bp1aw0a5nfff03xp****</CustomerGatewayId>
      <RequestId>185E81B1-3916-4667-B48F-C52409B33F2B</RequestId>
      <CreateTime>1493363486000</CreateTime>
      <IpAddress>100.XX.XX.1</IpAddress>
</CreateCustomerGatewayResponse>
```

`JSON` format

```
{
    "CustomerGatewayId": "cgw-bp1jrawp82av6bws9****",
    "CreateTime": 1493363599000,
    "RequestId": "D32B3C26-6C6C-4988-93E9-D2A6444CE6AE",
    "IpAddress": "100.XX.XX.1"
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.
400	InvalidIpAddress.AlreadyExist	Specified IpAddress is already exist.	The error message returned because the specified IP address already exists. The IP addresses must be unique in the same region.
400	InvalidIpAddress.WrongFormat	Specified IpAddress is invalid.	The error message returned because the specified IP address is invalid.
400	InvalidName	The name is not valid	The error message returned because the specified name is in an invalid format.
400	InvalidDescription	The description is not valid	The error message returned because the description format of the specified parameter is invalid.
400	Resource.QuotaFull	The quota of resource is full	The error message returned because the resource quota is reached.

17.1.5.2. ModifyCustomerGatewayAttribute

Modifies the name and description of a customer gateway.

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyCustomerGatewayAttribute	The operation that you want to perform. Set the value to **ModifyCustomerGatewayAttribute**.
CustomerGatewayId	String	Yes	vpn-bp1q8bgx4xnkm2ogj****	The ID of the customer gateway.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the customer gateway is created. You can call the `DescribeRegions` operation to query the most recent region list.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-0016e04115b	The client token is used to ensure the idempotence of the request. You can use the client to generate a token, but you must make sure that the token is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.
Name	String	No	test	The name of the customer gateway. The name must be 2 to 128 characters in length, and can contain letters, digits, periods (.), underscores (_), and hyphens (-). The name must start with a letter, but cannot start with `http://` or `https://`.
Description	String	No	test	The description of the customer gateway. The description must be 2 to 256 characters in length, and can contain letters, digits, hyphens (-), underscores (_), full width periods (。), full width commas (，), and full width colons (：). The description must start with a letter, but cannot start with `http://` or `https://`.

Response parameters

Parameter	Type	Example	Description
CustomerGatewayId	String	cgw-bp1pvpl9r9adju6l5****	The ID of the customer gateway.
Name	String	test	The name of the customer gateway.
Description	String	test	The description of the customer gateway.
IpAddress	String	139.XX.XX.55	The IP address of the customer gateway.
CreateTime	Long	1492747187000	The timestamp generated when the customer gateway was created.
RequestId	String	E61293C8-AF07-4E87-A272-542680038F93	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ModifyCustomerGatewayAttribute
&CustomerGatewayId=vpn-bp1q8bgx4xnkm2ogj****
&RegionId=cn-qingdao-env66-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyCustomerGatewayAttributeResponse>
      <CustomerGatewayId>cgw-bp1pvpl9r9adju6l5****</CustomerGatewayId>
      <RequestId>E61293C8-AF07-4E87-A272-542680038F93</RequestId>
      <CreateTime>1492747187000</CreateTime>
      <IpAddress>139.XX.XX.55</IpAddress>
      <Description>modify</Description>
</ModifyCustomerGatewayAttributeResponse>
```

`JSON` format

```
{
    "CustomerGatewayId": "cgw-bp1pvpl9r9adju6l5****",
    "RequestId": "8AA5CE21-2E6A-4530-BDF5-F055849476E6",
    "CreateTime": 1492747187000,
    "IpAddress": "139.XX.XX.55",
    "Description": "modify"
    }
```

Error codes

HttpCode	Error code	Error message	Required
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform this operation on the specified resource. To acquire the required permissions, submit a ticket.
404	InvalidCustomerGatewayInstanceId.NotFound	The specified customer gateway instance id does not exist.	The error message returned because the specified instance ID does not exist.
400	InvalidName	The name is not valid	The error message returned because the specified name is in an invalid format.
400	InvalidDescription	The description is not valid	The error message returned because the format of the specified description is invalid.

17.1.5.3. DescribeCustomerGateways

Queries customer gateways in a specified region.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeCustomerGateways	The operation that you want to perform. Set the value to **DescribeCustomerGateways**.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the customer gateways are created. You can call the `DescribeRegions` operation to query the most recent region list.

Parameter	Type	Required	Example	Description
CustomerGatewayId	String	No	vpn-bp1q8bgx4xnkm2ogj****	The ID of the customer gateway.
PageNumber	Integer	No	1	The number of the page to return. Default value: **1**.
PageSize	Integer	No	10	The number of entries to return on each page. Maximum value: **50**. Default value: **10**.

Response parameters

Parameter	Type	Example	Description
CustomerGateways	Array of CustomerGateway		Detailed information about the customer gateways.
CustomerGateway			
CustomerGatewayId	String	cgw-bp1pvpl9r9adju6l5****	The ID of the customer gateway.
Name	String	test	The name of the customer gateway.
Description	String	test	The description of the customer gateway.
IpAddress	String	139.XX.XX.55	The IP address of the customer gateway.
CreateTime	Long	1492747187000	The timestamp generated when the customer gateway was created.
TotalCount	Integer	1	The number of entries returned.
PageNumber	Integer	1	The page number of the returned page.
PageSize	Integer	10	The number of entries returned on each page.

Parameter	Type	Example	Description
RequestId	String	5BE01CD7-5A50-472D-AC14-CA181C5C03BE	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeCustomerGateways
&RegionId=cn-qingdao-env66-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeCustomerGatewaysResponse>
      <PageNumber>1</PageNumber>
      <TotalCount>1</TotalCount>
      <PageSize>10</PageSize>
      <RequestId>5BE01CD7-5A50-472D-AC14-CA181C5C03BE</RequestId>
      <CustomerGateways>
            <CustomerGateway>
                  <Name>test</Name>
                  <CustomerGatewayId>cgw-bp1pvpl9r9adju6l5****</CustomerGatewayId>
                  <CreateTime>1492747187000</CreateTime>
                  <IpAddress>139.XX.XX.55</IpAddress>
            </CustomerGateway>
      </CustomerGateways>
</DescribeCustomerGatewaysResponse>
```

`JSON` format

```
{
    "PageNumber": 1,
    "TotalCount": 1,
    "PageSize": 10,
    "RequestId": "E82612A9-CB90-4D7E-B394-1DB7F6509B29",
    "CustomerGateways": {
        "CustomerGateway": [
            {
                "Name": "test",
                "CustomerGatewayId": "cgw-bp1pvpl9r9adju6l5****",
                "CreateTime": 1492747187000,
                "IpAddress": "139.XX.XX.55"
            }
        ]
    }
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.

17.1.5.4. DescribeCustomerGateway

Queries details of a specified customer gateway.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeCustomerGateway	The operation that you want to perform. Set the value to **DescribeCustomerGateway**.
CustomerGatewayId	String	Yes	vpn-bp1q8bgx4xnkm2ogj****	The ID of the customer gateway.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the customer gateway is created. You can call the `DescribeRegions` operation to query the most recent region list.

Response parameters

Parameter	Type	Example	Description
CustomerGatewayId	String	cgw-bp1pvpl9r9adju6l5****	The ID of the customer gateway.

Parameter	Type	Example	Description
Name	String	test	The name of the customer gateway.
Description	String	test	The description of the customer gateway.
IpAddress	String	139.XX.XX.32	The IP address of the customer gateway.
RequestId	String	99506ECB-218F-45A5-AE8E-79518451F615	The ID of the request.
CreateTime	Long	1492747187000	The timestamp generated when the customer gateway was created.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeCustomerGateway
&CustomerGatewayId=vpn-bp1q8bgx4xnkm2ogj****
&RegionId=cn-qingdao-env66-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeCustomerGatewayResponse>
      <Name>test</Name>
      <CustomerGatewayId>cgw-bp1pvpl9r9adju6l5****</CustomerGatewayId>
      <CreateTime>1492747187000</CreateTime>
      <RequestId>99506ECB-218F-45A5-AE8E-79518451F615</RequestId>
      <IpAddress>139.XX.XX.32</IpAddress>
</DescribeCustomerGatewayResponse>
```

`JSON` format

```
{
    "CustomerGatewayId": "cgw-bp1pvpl9r9adju6l5****",
    "Name": "test",
    "RequestId": "A0457BC9-6C0F-4437-AB9D-FB2EABC1D6A2",
    "CreateTime": 1492747187000,
    "IpAddress": "139.XX.XX.32"
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.
404	InvalidCustomerGatewayInstanceId.NotFound	The specified customer gateway instance id does not exist.	The error message returned because the specified instance ID does not exist.

17.1.5.5. DeleteCustomerGateway

Deletes a specified customer gateway.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteCustomerGateway	The operation that you want to perform. Set the value to **DeleteCustomerGateway**.
CustomerGatewayId	String	Yes	cgw-2zllmw9lqrcdis3bd****	The ID of the customer gateway.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the customer gateway is created. You can call the `DescribeRegions` operation to query the most recent region list.

Parameter	Type	Required	Example	Description
ClientToken	String	No	02fb3da4-130e-11e9-8e44-0016e04115b	The client token is used to ensure the idempotence of the request. You can use the client to generate a token, but you must make sure that the token is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	606998F0-B94D-48FE-8316-ACA81BB230DA	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DeleteCustomerGateway
&CustomerGatewayId=vpn-bp1q8bgx4xnkm2ogj****
&RegionId=cn-qingdao-env66-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteCustomerGatewayResesponse>
      <RequestId>606998F0-B94D-48FE-8316-ACA81BB230DA</RequestId>
</DeleteCustomerGatewayResesponse>
```

`JSON` format

```
{
  "RequestId":"606998F0-B94D-48FE-8316-ACA81BB230DA"
}
```

Error codes

HttpCode	Error code	Error message	Description

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.
404	InvalidCustomerGatewayInstanceId.NotFound	The specified customer gateway instance id does not exist.	The error message returned because the specified instance ID does not exist.

17.1.6. Routes for VPN gateways

17.1.6.1. CreateVpnRouteEntry

Creates a destination-based route on a VPN gateway.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateVpnRouteEntry	The operation that you want to perform. Set the value to **CreateVpnRouteEntry**.
NextHop	String	Yes	vco-bp15oes1py4i66rmd****	The next hop of the destination-based route.
PublishVpc	Boolean	Yes	true	Specifies whether to advertise the destination-based route to the route table of the associated virtual private cloud (VPC). • **true**: advertises the destination-based route to the route table of the associated VPC. • **false**: does not advertise the destination-based route to the route table of the associated VPC.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the destination-based route is created. You can call the `DescribeRegions` operation to query the most recent region list.
RouteDest	String	Yes	10.0.0.0/24	The destination CIDR block of the destination-based route.
VpnGatewayId	String	Yes	vpn-bp1a3kqjiiq9legfx****	The ID of the VPN gateway.
Weight	Integer	Yes	0	The weight of the destination-based route. Valid values: • **0**: specifies a low priority for the route. • **100**:specifies a high priority for the route. **Note** If two destination-based route entries are configured with the same destination CIDR block, you cannot set the weights of both route entries to 100.
ClientToken	String	No	d7d24a21-f4ba-4454-9173-b3828dae492b	The client token that is used to ensure the idempotence of the request. You can use the client to generate a token, but you must make sure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.
Description	String	No	mytest	The description of the destination-based route.
OverlayMode	String	No	Ipsec	The overlay mode.

Response parameters

Parameter	Type	Example	Description
CreateTime	Long	1492747187000	The timestamp generated when the destination-based route was created.
Description	String	mytest	The description of the destination-based route.
NextHop	String	vco-bp15oes1py4i66rmd****	The next hop of the destination-based route.
OverlayMode	String	Ipsec	The overlay mode.
RequestId	String	5BE01CD7-5A50-472D-AC14-CA181C5C03BE	The ID of the request.
RouteDest	String	10.0.0.0/24	The destination CIDR block of the destination-based route.
State	String	published	The status of the destination-based route. • **published**: The route is advertised. • **normal**: The route is not advertised.
VpnInstanceId	String	vpn-bp1cmw7jh1nfe43m9****	The ID of the VPN gateway.
Weight	Integer	0	The weight of the destination-based route. Valid values: **0** and **100**.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=CreateVpnRouteEntry
&NextHop=vco-bp15oes1py4i66rmd****
&PublishVpc=true
&RegionId=cn-qingdao-env66-d01
&RouteDest=10.0.0.0/24
&VpnGatewayId=vpn-bp1a3kqjiiq9legfx****
&Weight=0
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreateVpnRouteEntryResponse>
   <RouteDest>10.0.0.0/24</RouteDest>
   <VpnInstanceId>vpn-bp1cmw7jh1nfe43m9****</VpnInstanceId>
   <OverlayMode>Ipsec</OverlayMode>
   <State>published</State>
   <Weight>100</Weight>
   <CreateTime>1563873294331</CreateTime>
   <NextHop>vco-bp1tui07ob10fmuro****</NextHop>
      <RequestId>EE4C2417-9437-4333-BDEB-8493F7AA7258</RequestId>
</CreateVpnRouteEntryResponse>
```

`JSON` format

```
{
    "RouteDest": "10.0.0.0/24",
    "VpnInstanceId": "vpn-bp1cmw7jh1nfe43m9****",
    "OverlayMode": "Ipsec",
    "State": "published",
    "Weight": 100,
    "CreateTime": 1563873294331,
    "NextHop": "vco-bp1tui07ob10fmuro****",
    "RequestId":"CB2793A8-845F-444C-8E93-76F1BBDF9C78"
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.
400	Resource.QuotaFull	The quota of resource is full	The error message returned because the resource quota is reached.
404	InvalidVpnGatewayInstanceId.NotFound	The specified vpn gateway instance id does not exist.	The error message returned because the specified VPN gateway does not exist. Check whether the configuration of the VPN gateway is valid.

HttpCode	Error code	Error message	Description
400	VpnGateway.Configuring	The specified service is configuring.	The error message returned because the operation is not allowed when the specified service is being configured. Try again later.
400	VpnGateway.FinancialLocked	The specified service is financial locked.	The error message returned because the service is suspended due to overdue payments. Top up your account first.

17.1.6.2. ModifyVpnRouteEntryWeight

Modifies the weight of a destination-based route for a VPN gateway.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyVpnRouteEntryWeight	The operation that you want to perform. Set the value to **ModifyVpnRouteEntryWeight**.
NewWeight	Integer	Yes	100	The new weight you want to set for the destination-based route. • **0**: specifies a low priority for the route entry. • **100**: specifies a high priority for the route entry. **Note** If two destination-based route entries are configured with the same destination CIDR block, you cannot set the weights of both route entries to 100.
NextHop	String	Yes	vco-bp15oes1py4i66rmd****	The next hop of the destination-based route.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the destination-based route is created. You can call the `DescribeRegions` operation to query the most recent region list.

Parameter	Type	Required	Example	Description
RouteDest	String	Yes	10.0.0.0/24	The destination CIDR block of the destination-based route.
VpnGatewayId	String	Yes	vpn-bp1a3kqjiiq9legfx****	The ID of the VPN gateway.
Weight	Integer	Yes	0	The current weight of the destination-based route. Valid values: **0** and **100**.
ClientToken	String	No	d7d24a21-f4ba-4454-9173-b3828dae492b	The client token that is used to ensure the idempotence of the request. You can use the client to generate a token, but you must make sure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.
OverlayMode	String	No	Ipsec	The overlay mode. Set the value to **Ipsec** (IPsec tunneling).

Response parameters

Parameter	Type	Example	Description
RequestId	String	5BE01CD7-5A50-472D-AC14-CA181C5C03BE	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ModifyVpnRouteEntryWeight
&NewWeight=100
&NextHop=vco-bp15oes1py4i66rmd****
&RegionId=cn-qingdao-env66-d01
&RouteDest=10.0.0.0/24
&VpnGatewayId=vpn-bp1a3kqjiiq9legfx****
&Weight=0
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyVpnRouteEntryWeightResponse>
        <RequestId>5BE01CD7-5A50-472D-AC14-CA181C5C03BE</RequestId>
</ModifyVpnRouteEntryWeightResponse>
```

`JSON` format

```
{
    "RequestId": "E82612A9-CB90-4D7E-B394-1DB7F6509B29"
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.
400	Resource.QuotaFull	The quota of resource is full	The error message returned because the resource quota is reached.
404	InvalidVpnGatewayInstanceId.NotFound	The specified vpn gateway instance id does not exist.	The error message returned because the specified VPN gateway does not exist. Check whether the configuration of the VPN gateway is valid.
400	VpnGateway.Configuring	The specified service is configuring.	The error message returned because the operation is not allowed when the specified service is being configured. Try again later.
400	VpnGateway.FinancialLocked	The specified service is financial locked.	The error message returned because the service is suspended due to overdue payments. Top up your account first.

17.1.6.3. DeleteVpnRouteEntry

Deletes a destination-based route from a VPN gateway.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteVpnRouteEntry	The operation that you want to perform. Set the value to **DeleteVpnRouteEntry**.
NextHop	String	Yes	vco-bp15oes1py4i66rmd****	The next hop of the destination-based route.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the destination-based route is created. You can call the `DescribeRegions` operation to query the most recent region list.
RouteDest	String	Yes	10.0.0.0/24	The destination CIDR block of the destination-based route.
VpnGatewayId	String	Yes	vpn-bp1a3kqjiiq9legfx****	The ID of the VPN gateway.
Weight	Integer	Yes	0	The weight of the destination-based route. Valid values: • **0:**: specifies a low priority for the route entry. • **100**: specifies a high priority for the route entry. **Note** If two destination-based route entries are configured with the same destination CIDR block, you cannot set the weights of both route entries to 100.

Parameter	Type	Required	Example	Description
ClientToken	String	No	d7d24a21-f4ba-4454-9173-b3828dae492b	The client token that is used to ensure the idempotence of the request. You can use the client to generate a token, but you must make sure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.
OverlayMode	String	No	Ipsec	The overlay mode. Set the value to **Ipsec** (IPsec tunneling).

Response parameters

Parameter	Type	Example	Description
RequestId	String	5BE01CD7-5A50-472D-AC14-CA181C5C03BE	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DeleteVpnRouteEntry
&NextHop=vco-bp15oes1py4i66rmd****
&RegionId=cn-qingdao-env66-d01
&RouteDest=10.0.0.0/24
&VpnGatewayId=vpn-bp1a3kqjiiq9legfx****
&Weight=0
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteVpnRouteEntryResponse>
        <RequestId>5BE01CD7-5A50-472D-AC14-CA181C5C03BE</RequestId>
</DeleteVpnRouteEntryResponse>
```

`JSON` format

```
{
 "RequestId":"E82612A9-CB90-4D7E-B394-1DB7F6509B29"
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.
400	Resource.QuotaFull	The quota of resource is full	The error message returned because the resource quota is reached.
404	InvalidVpnGatewayInstanceId.NotFound	The specified vpn gateway instance id does not exist.	The error message returned because the specified VPN gateway does not exist. Check whether the configuration of the VPN gateway is valid.
400	VpnGateway.Configuring	The specified service is configuring.	The error message returned because the operation is not allowed when the specified service is being configured. Try again later.
400	VpnGateway.FinancialLocked	The specified service is financial locked.	The error message returned because the service is suspended due to overdue payments. Top up your account first.

17.1.6.4. DescribeVpnRouteEntries

Queries destination-based routes of a VPN gateway.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeVpnRouteEntries	The operation that you want to perform. Set the value to **DescribeVpnRouteEntries**.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the destination-based routes are created. You can call the `DescribeRegions` operation to query the most recent region list.
VpnGatewayId	String	Yes	vpn-bp1a3kqjiiq9legfx****	The ID of the VPN gateway.
PageNumber	Integer	No	1	The number of the page to return. Default value: **1**.
PageSize	Integer	No	10	The number of entries to return on each page. Maximum value: **50**. Default value: **10**.

Response parameters

Parameter	Type	Example	Description
PageNumber	Integer	10	The page number of the returned page.
PageSize	Integer	10	The number of entries returned per page.
RequestId	String	0ED8D006-F706-4D23-88ED-E11ED28DCAC0	The ID of the request.
TotalCount	Integer	10	The number of returned entries.
VpnRouteEntries	Array of VpnRouteEntry		The detailed information about the destination-based routes.
VpnRouteEntry			
CreateTime	Long	1492747187000	The timestamp generated when the destination-based route was created.
NextHop	String	vco-bp15oes1py4i66rmd****	The next hop of the destination-based route.

Parameter	Type	Example	Description
RouteDest	String	10.0.0.0/24	The destination CIDR block of the destination-based route.
State	String	published	The status of the destination-based route. • **published**: The route is advertised. • **normal**: The route is not advertised.
VpnInstanceId	String	vpn-bp1cmw7jh1nfe43m9****	The ID of the VPN gateway.
Weight	Integer	0	The weight of the destination-based route. Valid values: • **0**: indicates that the priority of the route entry is low. • **100**: indicates that the priority of the route entry is high.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeVpnRouteEntries
&RegionId=cn-qingdao-env66-d01
&VpnGatewayId=vpn-bp1a3kqjiiq9legfx****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeVpnRouteEntriesResponse>
   <PageNumber>1</PageNumber>
   <TotalCount>1</TotalCount>
   <VpnRouteEntries>
      <VpnRouteEntry>
         <RouteDest>10.0.0.0/24</RouteDest>
         <VpnInstanceId>vpn-bp1cmw7jh1nfe43m9****</VpnInstanceId>
         <State>normal</State>
         <Weight>100</Weight>
         <CreateTime>1563874074000</CreateTime>
         <NextHop>vco-bp1tui07ob10fmuro****</NextHop>
      </VpnRouteEntry>
   </VpnRouteEntries>
   <PageSize>10</PageSize>
   <RequestId>BF3995A6-FA4F-4C74-B90F-89ECF4BFF4D5</RequestId>
</DescribeVpnRouteEntriesResponse>
```

`JSON` format

```
{
 "PageNumber": 1,
 "TotalCount": 1,
 "VpnRouteEntries": {
  "VpnRouteEntry": [
   {
    "RouteDest": "10.0.0.0/24",
    "VpnInstanceId": "vpn-bp1cmw7jh1nfe43m9****",
    "State": "normal",
    "Weight": 100,
    "CreateTime": 1563874074000,
    "NextHop": "vco-bp1tui07ob10fmuro****"
   }
  ]
 },
 "PageSize": 10,
 "RequestId": "BF3995A6-FA4F-4C74-B90F-89ECF4BFF4D5"
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.

17.1.6.5. PublishVpnRouteEntry

Advertises a route of a VPN gateway to the route table of the associated virtual private cloud (VPC).

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	PublishVpnRouteEntry	The operation that you want to perform. Set the value to **PublishVpnRouteEntry**.

Parameter	Type	Required	Example	Description
NextHop	String	Yes	vco-bp15oes1py4i66rmd****	The next hop of the route.
PublishVpc	Boolean	Yes	true	Specifies whether to advertise the route of the VPN gateway to the route table of the associated VPC. • **true**: advertises the route to the route table of the associated VPC. • **false**: does not advertise the route to the route table of the associated VPC.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the route of the VPN gateway is deployed. You can call the `DescribeRegions` operation to query the most recent region list.
RouteDest	String	Yes	10.0.0.0/24	The destination CIDR block of the route of the VPN gateway.
RouteType	String	Yes	pbr	The type of the route of the VPN gateway. Valid values: • **pbr**: policy-based route. • **dbr**: destination-based route.
VpnGatewayId	String	Yes	vpn-bp1a3kqjiiq9legfx****	The ID of the VPN gateway.
ClientToken	String	No	d7d24a21-f4ba-4454-9173-b3828dae492b	The client token that is used to ensure the idempotence of the request. You can use the client to generate a token, but you must make sure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description

Parameter	Type	Example	Description
RequestId	String	5BE01CD7-5A50-472D-AC14-CA181C5C03BE	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=PublishVpnRouteEntry
&NextHop=vco-bp15oes1py4i66rmd****
&PublishVpc=true
&RegionId=cn-qingdao-env66-d01
&RouteDest=10.0.0.0/24
&RouteType=pbr
&VpnGatewayId=vpn-bp1a3kqjiiq9legfx****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<PublishVpnRouteEntryResponse>
      <RequestId>EE4C2417-9437-4333-BDEB-8493F7AA7258</RequestId>
</PublishVpnRouteEntryResponse>
```

`JSON` format

```
{
    "RequestId":"CB2793A8-845F-444C-8E93-76F1BBDF9C78"
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.

HttpCode	Error code	Error message	Description
400	Resource.QuotaFull	The quota of resource is full	The error message returned because the resource quota is reached.
404	InvalidVpnGatewayInstanceId.NotFound	The specified vpn gateway instance id does not exist.	The error message returned because the specified VPN gateway does not exist. Check whether the configuration of the VPN gateway is valid.
400	VpnGateway.Configuring	The specified service is configuring.	The error message returned because the operation is not allowed when the specified service is being configured. Try again later.
400	VpnGateway.FinancialLocked	The specified service is financial locked.	The error message returned because the service is suspended due to overdue payments. Top up your account first.

17.1.6.6. CreateVpnPbrRouteEntry

Creates a policy-based route for a VPN gateway.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateVpnPbrRouteEntry	The operation that you want to perform. Set the value to **CreateVpnPbrRouteEntry**.
NextHop	String	Yes	vco-bp15oes1py4i66rmd****	The next hop of the policy-based route.
PublishVpc	Boolean	Yes	true	Specifies whether to advertise the policy-based route to the route table of the associated virtual private cloud (VPC). Valid values: • **true**: advertises the policy-based route to the route table of the associated VPC . • **false**: does not advertise the policy-based route to the route table of the associated VPC.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where you want to create the policy-based route for the VPN gateway. You can call the `DescribeRegions` operation to query the most recent region list.
RouteDest	String	Yes	10.0.0.0/24	The destination CIDR block of the policy-based route.
RouteSource	String	Yes	192.168.1.0/24	The source CIDR block of the policy-based route.
VpnGatewayId	String	Yes	vpn-bp1a3kqjiiq9legfx****	The ID of the VPN gateway.
Weight	Integer	Yes	0	The weight of the policy-based route. Valid values: • **0**: specifies a low priority for the route entry. • **100**: specifies a high priority for the route entry. **Note** If two policy-based route entries are configured with the same destination CIDR block, you cannot set the weights of both route entries to 100.
ClientToken	String	No	d7d24a21-f4ba-4454-9173-b3828dae492b	The client token that is used to ensure the idempotence of the request. You can use the client to generate a token, but you must make sure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.
Description	String	No	vpnroute1	The description of the policy-based route.
OverlayMode	String	No	Ipsec	The overlay mode.

Response parameters

Parameter	Type	Example	Description
CreateTime	Long	1492747187000	The timestamp generated when the policy-based route was created.
Description	String	vpnroute1	The description of the policy-based route.
NextHop	String	vco-bp15oes1py4i66rmd****	The next hop of the policy-based route.
OverlayMode	String	Ipsec	The overlay mode.
RequestId	String	5BE01CD7-5A50-472D-AC14-CA181C5C03BE	The ID of the request.
RouteDest	String	10.0.0.0/24	The destination CIDR block of the policy-based route.
RouteSource	String	192.168.1.0/24	The source CIDR block of the policy-based route.
State	String	normal	The status of the policy-based route. Valid values: • **published**: The route is advertised. • **normal**: The route is not advertised.
VpnInstanceId	String	vpn-bp1cmw7jh1nfe43m9****	The ID of the VPN gateway.
Weight	Integer	0	The weight of the policy-based route. Valid values: **0** and **100**.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=CreateVpnPbrRouteEntry
&NextHop=vco-bp15oes1py4i66rmd****
&PublishVpc=true
&RegionId=cn-qingdao-env66-d01
&RouteDest=10.0.0.0/24
&RouteSource=192.168.1.0/24
&VpnGatewayId=vpn-bp1a3kqjiiq9legfx****
&Weight=0
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreateVpnPbrRouteEntryResponse>
   <RouteDest>10.0.0.0/24</RouteDest>
   <RouteSource>192.168.1.0/24</RouteSource>
   <VpnInstanceId>vpn-bp1cmw7jh1nfe43m9****</VpnInstanceId>
   <OverlayMode>Ipsec</OverlayMode>
   <State>published</State>
   <Weight>100</Weight>
   <CreateTime>1563873294331</CreateTime>
   <NextHop>vco-bp1tui07ob10fmuro****</NextHop>
</CreateVpnPbrRouteEntryResponse>
```

`JSON` format

```
{
    "RouteDest": "10.0.0.0/24",
    "RouteSource": "192.168.1.0/24",
    "VpnInstanceId": "vpn-bp1cmw7jh1nfe43m9****",
    "OverlayMode": "Ipsec",
    "State": "published",
    "Weight": 100,
    "CreateTime": 1563873294331,
    "NextHop": "vco-bp1tui07ob10fmuro****"
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.

HttpCode	Error code	Error message	Description
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.
400	Resource.QuotaFull	The quota of resource is full	The error message returned because the resource quota is reached.
404	InvalidVpnGatewayInstanceId.NotFound	The specified vpn gateway instance id does not exist.	The error message returned because the specified VPN gateway does not exist. Check whether the configuration of the VPN gateway is valid.
400	VpnGateway.Configuring	The specified service is configuring.	The error message returned because the operation is not allowed when the specified service is being configured. Try again later.
400	VpnGateway.FinancialLocked	The specified service is financial locked.	The error message returned because the service is suspended due to overdue payments. Top up your account first.

17.1.6.7. ModifyVpnPbrRouteEntryWeight

Modifies the weight of a policy-based route of a VPN gateway.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyVpnPbrRouteEntryWeight	The operation that you want to perform. Set the value to **ModifyVpnPbrRouteEntryWeight**.

Parameter	Type	Required	Example	Description
NewWeight	Integer	Yes	100	The new weight you want to set for the policy-based route. • **0**: specifies a low priority for the route entry. • **100**: specifies a high priority for the route entry. **Note** If two policy-based route entries are configured with the same destination CIDR block, you cannot set the weights of both route entries to 100.
NextHop	String	Yes	vco-bp15oes1py4i66rmd****	The next hop of the policy-based route.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the policy-based route is created. You can call the `DescribeRegions` operation to query the most recent region list.
RouteDest	String	Yes	10.0.0.0/24	The destination CIDR block of the policy-based route.
RouteSource	String	Yes	192.168.1.0/24	The source CIDR block of the policy-based route.
VpnGatewayId	String	Yes	vpn-bp1a3kqjiiq9legfx****	The ID of the VPN gateway.
Weight	Integer	Yes	0	The original weight of the policy-based route. Valid values: **0** and **100**.
ClientToken	String	No	d7d24a21-f4ba-4454-9173-b3828dae492b	The client token that is used to ensure the idempotence of the request. You can use the client to generate a token, but you must make sure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.

Parameter	Type	Required	Example	Description
OverlayMode	String	No	Ipsec	The overlay mode. Set the value to **Ipsec** (IPsec tunneling).

Response parameters

Parameter	Type	Example	Description
RequestId	String	5BE01CD7-5A50-472D-AC14-CA181C5C03BE	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ModifyVpnPbrRouteEntryWeight
&NewWeight=100
&NextHop=vco-bp15oes1py4i66rmd****
&RegionId=cn-qingdao-env66-d01
&RouteDest=10.0.0.0/24
&RouteSource=192.168.1.0/24
&VpnGatewayId=vpn-bp1a3kqjiiq9legfx****
&Weight=0
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyVpnPbrRouteEntryWeightResponse>
        <RequestId>5BE01CD7-5A50-472D-AC14-CA181C5C03BE</RequestId>
</ModifyVpnPbrRouteEntryWeightResponse>
```

`JSON` format

```
{
 "RequestId":"E82612A9-CB90-4D7E-B394-1DB7F6509B29"
}
```

Error codes

HttpCode	Error code	Error message	Description

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.
400	Resource.QuotaFull	The quota of resource is full	The error message returned because the resource quota is reached.
404	InvalidVpnGatewayInstanceId.NotFound	The specified vpn gateway instance id does not exist.	The error message returned because the specified VPN gateway does not exist. Check whether the configuration of the VPN gateway is valid.
400	VpnGateway.Configuring	The specified service is configuring.	The error message returned because the operation is not allowed when the specified service is being configured. Try again later.
400	VpnGateway.FinancialLocked	The specified service is financial locked.	The error message returned because the service is suspended due to overdue payments. Top up your account first.

17.1.6.8. DeleteVpnPbrRouteEntry

Deletes a policy-based route from a VPN gateway.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteVpnPbrRouteEntry	The operation that you want to perform. Set the value to **DeleteVpnPbrRouteEntry**.

Parameter	Type	Required	Example	Description
NextHop	String	Yes	vco-bp15oes1py4i66rmd****	The next hop of the policy-based route.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the policy-based route is created. You can call the `DescribeRegions` operation to query the most recent region list.
RouteDest	String	Yes	10.0.0.0/24	The destination CIDR block of the policy-based route.
RouteSource	String	Yes	192.168.1.0/24	The source CIDR block of the policy-based route.
VpnGatewayId	String	Yes	vpn-bp1a3kqjiiq9legfx****	The ID of the VPN gateway.
Weight	Integer	Yes	0	The weight of the policy-based route. Valid values: • **0**: specifies a low priority for the route. • **100**: specifies a high priority for the route entry. **Note** If two policy-based route entries are configured with the same destination CIDR block, you cannot set the weights of both route entries to 100.
ClientToken	String	No	d7d24a21-f4ba-4454-9173-b3828dae492b	The client token that is used to ensure the idempotence of the request. You can use the client to generate a token, but you must make sure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.
OverlayMode	String	No	Ipsec	The overlay mode. Set the value to **Ipsec** (IPsec tunneling).

Response parameters

Parameter	Type	Example	Description
RequestId	String	5BE01CD7-5A50-472D-AC14-CA181C5C03BE	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DeleteVpnPbrRouteEntry
&NextHop=vco-bp15oes1py4i66rmd****
&RegionId=cn-qingdao-env66-d01
&RouteDest=10.0.0.0/24
&RouteSource=192.168.1.0/24
&VpnGatewayId=vpn-bp1a3kqjiiq9legfx****
&Weight=0
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteVpnPbrRouteEntryResponse>
      <RequestId>5BE01CD7-5A50-472D-AC14-CA181C5C03BE</RequestId>
</DeleteVpnPbrRouteEntryResponse>
```

`JSON` format

```
{
 "RequestId":"E82612A9-CB90-4D7E-B394-1DB7F6509B29"
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.

HttpCode	Error code	Error message	Description
400	Resource.QuotaFull	The quota of resource is full	The error message returned because the resource quota is reached.
404	InvalidVpnGatewayInstanceId.NotFound	The specified vpn gateway instance id does not exist.	The error message returned because the specified VPN gateway does not exist. Check whether the configuration of the VPN gateway is valid.
400	VpnGateway.Configuring	The specified service is configuring.	The error message returned because the operation is not allowed when the specified service is being configured. Try again later.
400	VpnGateway.FinancialLocked	The specified service is financial locked.	The error message returned because the service is suspended due to overdue payments. Top up your account first.

17.1.6.9. DescribeVpnPbrRouteEntries

Queries policy-based routes of a VPN gateway.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeVpnPbrRouteEntries	The operation that you want to perform. Set the value to **DescribeVpnPbrRouteEntries**.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the policy-based routes are created. You can call the `DescribeRegions` operation to query the most recent region list.
VpnGatewayId	String	Yes	vpn-bp1a3kqjiiq9legfx****	The ID of the VPN gateway.
PageNumber	Integer	No	10	The number of the page to return. Default value: **1**.

Parameter	Type	Required	Example	Description
PageSize	Integer	No	10	The number of entries to return on each page. Maximum value: **50**. Default value: **10**.

Response parameters

Parameter	Type	Example	Description
PageNumber	Integer	1	The page number of the returned page.
PageSize	Integer	10	The number of entries returned per page.
RequestId	String	5BE01CD7-5A50-472D-AC14-CA181C5C03BE	The ID of the request.
TotalCount	Integer	12	The number of returned entries.
VpnPbrRouteEntries	Array of VpnPbrRouteEntry		The detailed information about the policy-based routes.
VpnPbrRouteEntry			
CreateTime	Long	1492747187000	The timestamp generated when the policy-based route was created.
NextHop	String	vco-bp15oes1py4i66rmd****	The next hop of the policy-based route.
RouteDest	String	10.0.0.0/24	The destination CIDR block of the policy-based route.
RouteSource	String	192.xx.0.0/24	The source CIDR block of the policy-based route.

Parameter	Type	Example	Description
State	String	published	The status of the policy-based route. Valid values: • **published**: The route is advertised. • **normal**: The route is not advertised.
VpnInstanceId	String	vpn-bp1cmw7jh1nfe43m9****	The ID of the VPN gateway.
Weight	Integer	0	The weight of the policy-based route. Valid values: • **0**: indicates that the priority of the route entry is low. • **100**: indicates that the priority of the route entry is high.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeVpnPbrRouteEntries
&RegionId=cn-qingdao-env66-d01
&VpnGatewayId=vpn-bp1a3kqjiiq9legfx****
&<Common request parameters>
```

Sample success responses

                "RouteSource": "11.0.0.0/32"
            }
        ]
    }
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.

17.1.7. IPsec-VPN

17.1.7.1. CreateVpnConnection

Creates an IPsec-VPN connection.

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateVpnConnection	The operation that you want to perform. Set the value to **CreateVpnConnection**.
CustomerGatewayId	String	Yes	vpn-bp1q8bgx4xnk****	The ID of the customer gateway.
LocalSubnet	String	Yes	10.1.1.0/24,10.1.2.0/24	The CIDR block of the virtual private cloud (VPC) that is used to connect with the data center. This CIDR block is used in Phase 2 negotiations. Separate multiple CIDR blocks with commas (,). Example: 192.168.1.0/24,192.168.2.0/24.
RegionId	String	Yes	cn-qingdao-env66-d01	The region ID of the IPsec-VPN connection. You can call the `DescribeRegions` operation to query the most recent region list.
RemoteSubnet	String	Yes	10.10.1.0/24,10.10.2.0/24	The CIDR block of the data center. The peer CIDR block is used in Phase 2 negotiations. Separate multiple CIDR blocks with commas (,). Example: 192.168.3.0/24,192.168.4.0/24.
VpnGatewayId	String	Yes	vpn-bp1q8bgx4xnkm****	The ID of the VPN gateway.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-001****	The client token that is used to ensure the idempotence of the request. You can use the client to generate a token, but you must make sure that the token is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.

Parameter	Type	Required	Example	Description
Name	String	No	IPsec	The name of the IPsec-VPN connection. The name must be 2 to 128 characters in length, and can contain digits, periods (.), underscores (_), and hyphens (-). It must start with a letter and cannot start with `http://` or `https://`.
EffectImmediately	Boolean	No	false	Specifies whether to delete the current IPsec tunnel and reinitiate negotiations. Valid values: • **true**: initiates negotiations after the configuration is completed. • **false**: initiates negotiations when inbound traffic is detected. This is the default value.

Parameter	Type	Required	Example	Description
IkeConfig	String	No	{"IkeVersion":"ikev1","IkeMode":"main","IkeEncAlg":"aes","IkeAuthAlg":"sha1","IkePfs":"group2","IkeLifetime":86400}	The configuration of Phase 1 negotiations: • **IkeConfig.Psk**: the pre-shared key that is used to authenticate the VPN gateway and the customer gateway. By default, a random value is generated. You can also specify a pre-shared key. The description cannot exceed 100 characters in length. • **IkeConfig.IkeVersion**: The version of the IKE protocol. Valid values: **ikev1** and **ikev2**. Default value: **ikev1**. • **IkeConfig.IkeMode**: the negotiation mode of IKE V1. Valid values: **main** and **aggressive**. Default value: **main**. • **IkeConfig.IkeEncAlg**: The encryption algorithm used in Phase 1 negotiations. Valid values: **aes**, **aes192**, **aes256**, **des**, and **3des**. Default value: **aes**. • **IkeConfig.IkeAuthAlg**: The authentication algorithm used in Phase 1 negotiations. Valid values: **md5** and **sha1**. Default value: **md5**. • **IkeConfig.IkePfs**: The Diffie-Hellman key exchange algorithm used in Phase 1 negotiations. Valid values: **group1**, **group2**, **group5**, **group14**, and **group24**. Default value: **group2**. • **IkeConfig.IkeLifetime**: the SA lifetime as a result of Phase 1 negotiations. Valid values: **0 to 86400**. Unit: seconds. Default value: **86400**. • **IkeConfig.LocalIdIPsec**: the identifier of the VPN gateway. This parameter can contain up to 100 characters. The default value is the public IP address of the VPN gateway. • **IkeConfig.RemoteId**: the identifier of the customer gateway. This parameter can contain up to 100 characters. By default, it is the public IP address of the customer gateway.

Parameter	Type	Required	Example	Description
IpsecConfig	String	No	{"IpsecEncAlg":"aes","IpsecAuthAlg":"sha1","IpsecPfs":"group2","IpsecLifetime":86400}	The configuration of Phase 2 negotiations: • **IpsecConfig.IpsecEncAlg**: The encryption algorithm used in Phase 2 negotiations. Valid values: **aes**, **aes192**, **aes256**, **des**, and **3des**. Default value: **aes**. • **IpsecConfig. IpsecAuthAlg**: The authentication algorithm used in Phase 2 negotiations. Valid values: **md5** and **sha1**. Default value: **md5**. • **IpsecConfig. IpsecPfs**: the Diffie-Hellman group for perfect forward secrecy (PFS). If you set this parameter, the system forwards packets of all protocols. The Diffie-Hellman key exchange algorithm used in Phase 2 negotiations. Valid values: **group1**, **group2**, **group5**, **group14**, and **group24**. Default value: **group2**. • **IpsecConfig. IpsecLifetime**: the SA lifetime as a result of Phase 2 negotiations. Valid values: **0 to 86400**. Unit: seconds. Default value: **86400**.
HealthCheckConfig	String	No	{"enable":"true","dip":"192.168.xx.2","sip":"192.168.xx.2","interval":"3","retry":"3"}	The health check configuration: • **HealthCheckConfig.enable**: specifies whether to enable health checks. Valid values: **true and false**. Default value: false. • **HealthCheckConfig.dip**: the destination IP address configured for health checks. • **HealthCheckConfig.sip**: the source IP address configured for health checks. • **HealthCheckConfig.interval**: the time interval of health check retries. Unit: seconds. • **HealthCheckConfig.retry**: the maximum number of health check retries.

Parameter	Type	Required	Example	Description
AutoConfigRoute	Boolean	No	true	Specifies whether to automatically configure routes. Valid values: • **true**: enables automatic configuration. • **false**: disables automatic configuration. This is the default value.

Response parameters

Parameter	Type	Example	Description
VpnConnectionId	String	vco-bp15oes1py4i6****	The ID of the IPsec-VPN connection.
CreateTime	Long	1544666102000	The timestamp generated when the IPsec-VPN connection was created.
Name	String	test	The name of the IPsec-VPN connection.
RequestId	String	082AD562-B8DB-4BB2-861F-DA1FCA01FD76	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=CreateVpnConnection
&CustomerGatewayId=vpn-bp1q8bgx4xnk****
&LocalSubnet=10.1.1.0/24,10.1.2.0/24
&RegionId=cn-qingdao-env66-d01
&RemoteSubnet=10.10.1.0/24,10.10.2.0/24
&VpnGatewayId=vpn-bp1q8bgx4xnkm****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreateVpnConnectionResponse>
      <VpnConnectionId>vco-bp1bbi27hojx8****</VpnConnectionId>
      <CreateTime>1493363928000</CreateTime>
</CreateVpnConnectionResponse>
```

`JSON` format

```
{
    "CreateTime": 1544666102000,
    "VpnConnectionId": "vco-bp15oes1py4i6****"
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.
400	Resource.QuotaFull	The quota of resource is full	The error message returned because the resource quota is reached.
404	InvalidCustomerGatewayInstanceId.NotFound	The specified customer gateway instance id does not exist.	The error message returned because the specified instance ID does not exist.
404	InvalidVpnGatewayInstanceId.NotFound	The specified vpn gateway instance id does not exist.	The error message returned because the specified VPN gateway does not exist. Check whether the configuration of the VPN gateway is valid.
400	InvalidVpnConnection.AlreadyExists	Vpn connection already exists.	The error message returned because the IPsec-VPN connection already exists.
400	VpnGateway.Configuring	The specified service is configuring.	The error message returned because the operation is not allowed when the specified service is being configured. Try again later.
400	VpnGateway.FinancialLocked	The specified service is financial locked.	The error message returned because the service is suspended due to overdue payments. Top up your account first.

17.1.7.2. ModifyVpnConnectionAttribute

Modifies the configuration of an IPsec-VPN connection.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyVpnConnectionAttribute	The operation that you want to perform. Set the value to **ModifyVpnConnectionAttribute**.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the IPsec-VPN connection is created. You can call the `DescribeRegions` operation to query the most recent region list.
VpnConnectionId	String	Yes	vco-bp1bbi27hojx80nck****	The ID of the IPsec-VPN connection.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-0016e04115b	The client token is used to ensure the idempotence of the request. You can use the client to generate a token, but you must make sure that the token is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.
Name	String	No	IPsec	The name of the IPsec-VPN connection. The name must be 2 to 128 characters in length, and can contain digits, periods (.), underscores (_), and hyphens (-). It must start with a letter. However, the name cannot start with `http://` or `https://`.
LocalSubnet	String	No	10.1.1.0/24,10.1.2.0/24	The CIDR block of the virtual private cloud (VPC) that is used to connect with the data center. This CIDR block is used in Phase 2 negotiations. Separate multiple CIDR blocks with commas (,). Example: 192.168.1.0/24,192.168.2.0/24.

Parameter	Type	Required	Example	Description
RemoteSubnet	String	No	10.10.1.0/24,10.10.2.0/24	The CIDR block of the data center. This CIDR block is used in Phase 2 negotiations. Separate multiple CIDR blocks with commas (,). Example: 192.168.3.0/24,192.168.4.0/24.
EffectImmediately	Boolean	No	false	Specifies whether to delete the current IPsec tunnel and reinitiate negotiations. Valid values: • **true**: initiates negotiations after the configuration is completed. • **false**: initiates negotiations when inbound traffic is detected. This is the default value.

Parameter	Type	Required	Example	Description
IkeConfig	String	No	{"IkeVersion":"ikev1","IkeMode":"main","IkeEncAlg":"aes","IkeAuthAlg":"sha1","IkePfs":"group2","IkeLifetime":86400}	The configuration of Phase 1 negotiations: • **IkeConfig.Psk**: the pre-shared key that is used to authenticate the VPN gateway and the customer gateway. You can specify a key or use the default key that is randomly generated by the system. The key must be 1 to 100 characters in length. • **IkeConfig.IkeVersion**: the version of the IKE protocol. Valid values: **ikev1** and **ikev2**. Default value: **ikev1**. • **IkeConfig.IkeMode**: the negotiation mode of IKE V1. Valid values: **main** and **aggressive**. Default value: **main**. • **IkeConfig.IkeEncAlg**: The encryption algorithm of Phase 1 negotiations. Valid values: **aes**, **aes192**, **aes256**, **des**, and **3des**. Default value: **aes**. • **IkeConfig.IkeAuthAlg**: The authentication algorithm of Phase 1 negotiations. Valid values: **md5** and **sha1**. Default value: **sha1**. IkeConfig.IkePfs: The Diffie-Hellman key exchange algorithm of Phase 1 negotiations. Valid values: **group1**, **group2**, **group5**, **group14**, and **group24**. Default value: **group2**. • **IkeConfig.IkeLifetime**: the SA lifetime as a result of Phase 1 negotiations. Valid values: **0** to **86400**. Unit: seconds. Default value: **86400**. • **IkeConfig.LocalIdIPsec**: the identifier of the VPN gateway. This parameter can contain up to 100 characters. By default, it is the public IP address of the VPN gateway. • **IkeConfig.RemoteId**: the identifier of the customer gateway. This parameter can contain up to 100 characters. By default, it is the public IP address of the customer gateway.

Parameter	Type	Required	Example	Description
IpsecConfig	String	No	{"IpsecEncAlg":"aes","IpsecAuthAlg":"sha1","IpsecPfs":"group2","IpsecLifetime":86400}	The configuration of Phase 2 negotiations: • **IpsecConfig.IpsecEncAlg**: The encryption algorithm of Phase 2 negotiations. Valid values: **aes**, **aes192**, **aes256**, **des**, and **3des**. Default value: **aes**. • **IpsecConfig. IpsecAuthAlg**: The authentication algorithm of Phase 2 negotiations. Valid values: **md5** and **sha1**. Default value: **sha1**. • **IpsecConfig. IpsecPfs**: the Diffie-Hellman group for perfect forward secrecy (PFS). If you set this parameter, the system forwards packets of all protocols. The Diffie-Hellman key exchange algorithm of Phase 2 negotiations. Valid values: **group1**, **group2**, **group5**, **group14**, and **group24**. Default value: **group2**. • **IpsecConfig. IpsecLifetime**: the SA lifetime as a result of Phase 2 negotiations. Valid values: **0** to **86400**. Unit: seconds. Default value: **86400**.
HealthCheckConfig	String	No	{"enable":"true","dip":"192.168.xx.2","sip":"192.168.xx.2","interval":"3","retry":"3"}	The health check configuration: • **HealthCheckConfig.enable**: specifies whether to enable health checks. Valid values: **true and false**. Default value: false. • **HealthCheckConfig.dip**: the destination IP address configured for the health check. • **HealthCheckConfig.sip**: the source IP address configured for the health check. • **HealthCheckConfig.interval**: the time interval of health check retries. Unit: seconds. • **HealthCheckConfig.retry**: the maximum number of health check retries.

Parameter	Type	Required	Example	Description
AutoConfigRoute	Boolean	No	true	Specifies whether to automatically advertise routes. Valid values: • **true**: enables automatic advertising. • **false**: disables automatic advertising. This is the default value.

Response parameters

Parameter	Type	Example	Description
VpnConnectionId	String	vco-bp1bbi27hojx80nck****	The ID of the IPsec-VPN connection.
CustomerGatewayId	String	vpn-bp1q8bgx4xnkm2ogj****	The ID of the customer gateway.
VpnGatewayId	String	vpn-bp1q8bgx4xnkm2ogj****	The ID of the VPN gateway.
Name	String	test	The name of the IPsec-VPN connection.
LocalSubnet	String	10.1.1.0/24,10.1.2.0/24	The CIDR block of the VPC.
RemoteSubnet	String	10.10.1.0/24,10.10.2.0/24	The CIDR block of the data center.
CreateTime	Long	1492753817000	The timestamp generated when the IPsec-VPN connection was created.
Description	String	description	The description of the IPsec-VPN connection.
EffectImmediately	Boolean	false	Indicates whether IPsec-VPN negotiations are initiated immediately. Valid values: • **true**: initiates negotiations after the configuration is completed. • **false**: initiates negotiations when inbound traffic is detected.
IkeConfig	Struct		The configuration of Phase 1 negotiations.

Parameter	Type	Example	Description
IkeAuthAlg	String	sha1	The IKE authentication algorithm.
IkeEncAlg	String	aes	The IKE encryption algorithm.
IkeLifetime	Long	86400	The IKE lifetime.
IkeMode	String	main	The IKE mode.
IkePfs	String	group2	The DH group.
IkeVersion	String	ikev1	The IKE version.
LocalId	String	116.XX.XX.64	The local ID. The default value is the IP address of the VPN gateway. Both fully qualified domain names (FQDNs) and IP addresses are supported.
Psk	String	pgw6dy7d1i8i****	The pre-shared key.
RemoteId	String	139.XX.XX.167	The peer ID. The default value is the IP address of the customer gateway. Both FQDNs and IP addresses are supported.
IpsecConfig	Struct		The configuration of Phase 2 negotiations.
IpsecAuthAlg	String	sha1	The IPsec authentication algorithm.
IpsecEncAlg	String	aes	The IPsec encryption algorithm.
IpsecLifetime	Long	86400	The IPsec lifetime.
IpsecPfs	String	group2	The DH group.
RequestId	String	7DB79D0C-5F27-4AB5-995B-79BE55102F90	The ID of the request.
VcoHealthCheck	Struct		The health check configuration.

Parameter	Type	Example	Description
Dip	String	1.XX.XX.1	The destination IP address.
Enable	String	true	Indicates whether health checks are enabled. Valid values: • **true**: Health checks are enabled. • **false**: Health checks are disabled.
Interval	Integer	3	The interval between two consecutive health checks. Unit: seconds.
Retry	Integer	1	The maximum number of health check retries.
Sip	String	2.XX.XX.2	The source IP address.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ModifyVpnConnectionAttribute
&RegionId=cn-qingdao-env66-d01
&VpnConnectionId=vco-bp1bbi27hojx80nck****
&<Common request parameters>
```

Sample success responses

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.
404	InvalidVpnConnectionInstanceId.NotFound	The specified vpn connection instance id does not exist.	The error message returned because the specified IPsec-VPN connection does not exist. You can check whether the configuration of the connection is valid.

HttpCode	Error code	Error message	Description
400	VpnGateway.Configuring	The specified service is configuring.	The error message returned because the operation is not allowed when the specified service is being configured. Try again later.
400	VpnGateway.FinancialLocked	The specified service is financial locked.	The error message returned because the service is suspended due to overdue payments. Top up your account first.
400	InvalidName	The name is not valid	The error message returned because the specified name is in an invalid format.

17.1.7.3. DescribeVpnConnections

Queries one or more IPsec-VPN connections.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeVpnConnections	The operation that you want to perform. Set the value to **DescribeVpnConnections**.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the IPsec-VPN connections are created. You can call the `DescribeRegions` operation to query the most recent region list.
VpnGatewayId	String	No	vpn-bp1q8bgx4xnkx****	The ID of the VPN gateway.
CustomerGatewayId	String	No	cgw-bp1mvj4g9kogw****	The ID of the customer gateway.
PageNumber	Integer	No	1	The number of the page to return. Default value: **1**.

Parameter	Type	Required	Example	Description
PageSize	Integer	No	10	The number of entries to return on each page. Maximum value: **50**. Default value: **10**.
VpnConnectionId	String	No	vco-bp15oes1py4i6****	The ID of the IPsec-VPN connection.

Response parameters

Parameter	Type	Example	Description
VpnConnections	Array of VpnConnection		The detailed information about the IPsec-VPN connections.
VpnConnection			
IkeConfig	Struct		The configuration of Phase 1 negotiations.
IkeAuthAlg	String	sha1	The IKE authentication algorithm. Valid values: **sha1** and **MD5**.
IkeEncAlg	String	aes	The IKE encryption algorithm.
IkeLifetime	Long	86400	The IKE lifetime. Unit: seconds.
IkeMode	String	main	The IKE mode. Valid values: **main** and **aggressive** . The **main** mode offers higher security. If NAT traversal is enabled, we recommend that you select the **aggressive** mode.
IkePfs	String	group2	The DH group. Valid values: **group1**, **group2**, **group5**, **group14**, and **group24**.
IkeVersion	String	ikev1	The IKE version.
LocalId	String	116.XX.XX.64	The local ID. The default value is the IP address of the VPN gateway. Both fully qualified domain names (FQDNs) and IP addresses are supported.

Parameter	Type	Example	Description
Psk	String	pgw6dy7d****	The pre-shared key.
RemoteId	String	139.XX.XX.167	The peer ID. The default value is the IP address of the customer gateway. Both FQDNs and IP addresses are supported.
IpsecConfig	Struct		The configuration of Phase 2 negotiations.
IpsecAuthAlg	String	sha1	The IPsec authentication algorithm.Valid values: **sha1** and **md5**.
IpsecEncAlg	String	aes	The IPsec encryption algorithm.
IpsecLifetime	Long	86400	The IPsec lifetime.
IpsecPfs	String	group2	The DH group.
VpnConnectionId	String	vco-bp10lz7aejumd****	The ID of the IPsec-VPN connection.
CustomerGatewayId	String	cgw-bp1mvj4g9kogw****	The ID of the customer gateway.
VpnGatewayId	String	vpn-bp1q8bgx4xnkm****	The ID of the VPN gateway.
Name	String	name	The name of the IPsec-VPN connection.
LocalSubnet	String	10.1.1.0/24,10.1.2.0/24	The CIDR block of the VPC.
RemoteSubnet	String	10.10.1.0/24,10.10.2.0/24	The CIDR block of the data center.
CreateTime	Long	1492753817000	The timestamp generated when the IPsec-VPN connection was created.

Parameter	Type	Example	Description
Status	String	ipsec_sa_established	The status of the IPsec-VPN connection. Valid values: • **ike_sa_not_established**: indicates that Phase 1 negotiations failed. • **ike_sa_established**: indicates that Phase 1 negotiations succeeded. • **ipsec_sa_not_established**: indicates that Phase 2 negotiations failed. • **ipsec_sa_established**: indicates that Phase 2 negotiations succeeded.
EffectImmediately	Boolean	true	Indicates whether IPsec-VPN negotiations are initiated immediately. Valid values: • **true**: Negotiations are reinitiated when the configuration is changed. • **false**: Negotiations are reinitiated when traffic is detected. When negotiations are reinitiated, transient connections may occur.
VcoHealthCheck	Struct		The configuration of health checks.
Dip	String	8.XX.XX.8	The destination IP address.
Enable	String	true	Indicates whether health checks are enabled. Valid values: • **true**: Health checks are enabled. • **false**: Health checks are disabled.
Interval	Integer	2	The interval between two consecutive health checks. Unit: seconds.
Retry	Integer	1	The maximum number of health check retries.
Sip	String	192.XX.XX.66	The source IP address that is used for health checks.

Parameter	Type	Example	Description
Status	String	failed	The status of the health check. Valid values: • **failed**: The health check failed. • **success**: The health check was successful.
TotalCount	Integer	10	The number of entries.
PageNumber	Integer	1	The page number of the returned page.
PageSize	Integer	10	The number of entries returned on each page.
RequestId	String	54A4B3D0-DF4D-4C54-B8DC-5DC8DD49C939	The ID of the request.

17.1.7.4. DescribeVpnConnection

Queries the details of an IPsec-VPN connection.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeVpnConnection	The operation that you want to perform. Set the value to **DescribeVpnConnection**.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the IPsec-VPN connection is created. You can call the `DescribeRegions` operation to query the most recent region list.
VpnConnectionId	String	Yes	vco-bp1bbi27hojx80nck****	The ID of the IPsec-VPN connection.

Response parameters

Parameter	Type	Example	Description
VpnConnectionId	String	vco-bp1bbi27hojx80nck****	The ID of the IPsec-VPN connection.
CustomerGatewayId	String	cgw-bp1mvj4g9kogwwcxk****	The ID of the customer gateway.
VpnGatewayId	String	vpn-bp1q8bgx4xnkm2ogj****	The ID of the VPN gateway.
Name	String	ipsec1	The name of the IPsec-VPN connection.

Parameter	Type	Example	Description
LocalSubnet	String	10.1.1.0/24,10.1.2.0/24	The CIDR block of the VPC.
RemoteSubnet	String	10.10.1.0/24,10.10.2.0/24	The CIDR block of the data center.
CreateTime	Long	1492753817000	The time when the IPsec-VPN connection was created.
Status	String	ike_sa_not_established	The status of the IPsec-VPN connection. Valid values: • **ike_sa_not_established**: indicates that Phase 1 negotiations failed. • **ike_sa_established**: indicates that Phase 1 negotiations succeeded. • **ipsec_sa_not_established**: indicates that Phase 2 negotiations failed. • **ipsec_sa_established**: indicates that Phase 2 negotiations succeeded.
EffectImmediately	Boolean	true	Indicates whether the IPsec-VPN connection immediately takes effect. Valid values: • **true**: Negotiations are reinitiated when the configuration is changed. • **false**: Negotiations are reinitiated when traffic is detected. When negotiations are reinitiated, transient connections may occur.
IkeConfig	Struct		The configuration of Phase 1 negotiations.
IkeAuthAlg	String	sha1	The IKE authentication algorithm.
IkeEncAlg	String	aes	The IKE encryption algorithm.
IkeLifetime	Long	86400	The IKE lifetime.
IkeMode	String	main	The IKE mode. Both **main** and **aggressive** modes are supported. The main mode provides higher security. If NAT traversal is enabled, we recommend that you select the **aggressive** mode.

Parameter	Type	Example	Description
IkePfs	String	group2	The DH group.
IkeVersion	String	ikev1	The IKE version.
LocalId	String	116.XX.XX.69	The local ID. The default value is the IP address of the VPN gateway. Both fully qualified domain names (FQDNs) and IP addresses are supported.
Psk	String	pgw6dy7d1i8in7x5	The pre-shared key.
RemoteId	String	139.XX.XX.32	The peer ID. The default value is the IP address of the customer gateway. Both FQDNs and IP addresses are supported.
IpsecConfig	Struct		The configuration of Phase 2 negotiations.
IpsecAuthAlg	String	sha1	The IPsec authentication algorithm.
IpsecEncAlg	String	aes	The IPsec encryption algorithm.
IpsecLifetime	Long	86400	The IPsec lifetime.
IpsecPfs	String	group2	The DH group.
RequestId	String	F2310D45-BCF6-4E2E-9082-B4503844BA4C	The ID of the request.
VcoHealthCheck	Struct		The information about health checks.
Dip	String	10.XX.XX.1	The destination IP address.
Enable	String	true	Indicates whether health checks are enabled. Valid values: • **false**: Health checks are disabled. • **true**: Health checks are enabled.

Parameter	Type	Example	Description
Interval	Integer	3	The interval between two consecutive health checks. Unit: seconds.
Retry	Integer	3	The maximum number of health check retries.
Sip	String	192.XX.XX.2	The source IP address for health checks.
Status	String	failed	The status of the health check.

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.

HttpCode	Error code	Error message	Description
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.
404	InvalidVpnConnectionInstanceId.NotFound	The specified vpn connection instance id does not exist.	The error message returned because the specified IPsec-VPN connection does not exist. Check whether the ID of the IPsec-VPN connection is valid.

17.1.7.5. DownloadVpnConnectionConfig

Queries the configuration of an IPsec-VPN connection.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DownloadVpnConnectionConfig	The operation that you want to perform. Set the value to **DownloadVpnConnectionConfig**.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the IPsec-VPN connection is created. You can call the `DescribeRegions` operation to query the most recent region list.
VpnConnectionId	String	Yes	vco-bp1bbi27hojx80nck****	The ID of the IPsec-VPN connection.

Response parameters

Parameter	Type	Example	Description
RequestId	String	0C68048B-0F70-40DA-B8AE-1B79B5CF62E3	The ID of the request.
VpnConnectionConfig	Struct		The configuration of the IPsec-VPN connection.

Parameter	Type	Example	Description
IkeConfig	Struct		The IKE configuration.
IkeAuthAlg	String	sha1	The IKE authentication algorithm. Valid values: **sha1** and **md5**.
IkeEncAlg	String	aes	The IKE encryption algorithm.
IkeLifetime	Long	86400	The IKE lifetime. Unit: seconds.
IkeMode	String	main	The IKE mode. Valid values: **main** and **aggressive**. The main mode offers higher security. If NAT traversal is enabled, we recommend that you select the **aggressive** mode.
IkePfs	String	group2	The DH group.
IkeVersion	String	ikev1	The IKE version.
LocalId	String	116.XX.XX.69	The local ID. The default value is the IP address of the VPN gateway. Both fully qualified domain names (FQDNs) and IP addresses are supported.
Psk	String	pgw6dy7d1i8i****	The pre-shared key.
RemoteId	String	139.XX.XX.32	The peer ID. The default value is the IP address of the customer gateway. Both FQDNs and IP addresses are supported.
IpsecConfig	Struct		The configuration of the IPsec-VPN connection.
IpsecAuthAlg	String	sha1	The IPsec authentication algorithm. Valid values: **sha1** and **md5**.
IpsecEncAlg	String	aes	The IPsec encryption algorithm.
IpsecLifetime	Long	86400	The IPsec lifetime. Unit: seconds.

Parameter	Type	Example	Description
IpsecPfs	String	group2	The DH group.
Local	String	139.XX.XX.32	The ID of the VPN gateway.
LocalSubnet	String	10.1.1.0/24,10.1.2.0/24	The CIDR block of the VPC.
Remote	String	116.XX.XX.69	The ID of the customer gateway.
RemoteSubnet	String	10.10.1.0/24,10.10.2.0/24	The CIDR block of the data center.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DownloadVpnConnectionConfig
&RegionId=cn-qingdao-env66-d01

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.
404	InvalidVpnConnectionInstanceId.NotFound	The specified vpn connection instance id does not exist.	The error message returned because the specified IPsec-VPN connection does not exist. Check whether the ID of the IPsec-VPN connection is valid.

17.1.7.6. DeleteVpnConnection

Deletes a specified IPsec-VPN connection.

> **Note** After an IPsec-VPN connection between a virtual private cloud (VPC) and a data center is deleted, the communication between the VPC and data center is interrupted.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteVpnConnection	The operation that you want to perform. Set the value to **DeleteVpnConnection**.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the IPsec-VPN connection is created. You can call the `DescribeRegions` operation to query the most recent region list.
VpnConnectionId	String	Yes	vco-bp1bbi27hojx80nck****	The ID of the IPsec-VPN connection.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-0016e04115b	The client token is used to ensure the idempotence of the request. You can use the client to generate a token, but you must make sure that the token is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	606998F0-B94D-48FE-8316-ACA81BB230DA	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DeleteVpnConnection
&RegionId=cn-qingdao-env66-d01
&VpnConnectionId=vco-bp1bbi27hojx80nck****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteVpnConnectionResponse>
      <RequestId>606998F0-B94D-48FE-8316-ACA81BB230DA</RequestId>
</DeleteVpnConnectionResponse>
```

`JSON` format

```
{
  "RequestId":"606998F0-B94D-48FE-8316-ACA81BB230DA"
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.
404	InvalidVpnConnectionInstanceId.NotFound	The specified vpn connection instance id does not exist.	The error message returned because the specified IPsec-VPN connection does not exist. Check whether the ID of the IPsec-VPN connection is valid.
400	VpnGateway.Configuring	The specified service is configuring.	The error message returned because the operation is not allowed when the specified service is being configured. Try again later.

17.1.8. SSL-VPN

17.1.8.1. CreateSslVpnServer

Creates an SSL-VPN server.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateSslVpnServer	The operation that you want to perform. Set the value to **CreateSslVpnServer**.
ClientIpPool	String	Yes	192.168.1.0/24	The CIDR block that is allocated to the virtual network interface of the client. It is not the CIDR block where the client resides. When the client accesses the server through an SSL-VPN connection, the VPN gateway selects an IP address from the specified CIDR block and assigns it to the client. This CIDR block must not conflict with the value of **LocalSubnet**.
LocalSubnet	String	Yes	10.0.0.0/8	The CIDR block to be accessed by the client through the SSL-VPN connection. You can set the value to the CIDR block of a VPC, a vSwitch, a data center that is connected to the VPC through an Express Connect circuit, or an Alibaba Cloud service, such as ApsaraDB RDS or OSS.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the VPN gateway is created. You can call the `DescribeRegions` operation to query the most recent region list.
VpnGatewayId	String	Yes	vpn-bp1hgim8by0kc9nga****	The ID of the VPN gateway.

Parameter	Type	Required	Example	Description
ClientToken	String	No	02fb3da4-130e-11e9-8e44-0016e04115b	The client token that is used to ensure the idempotence of the request. You can use the client to generate a token, but you must make sure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.
Name	String	No	sslvpnname	The name of the SSL-VPN server. The name must be 2 to 128 characters in length and can contain digits, periods (.), underscores (_), and hyphens (-). It must start with a letter, but cannot start with `http://` or `https://`.
Proto	String	No	UDP	The protocol that is used by the SSL-VPN server. Valid values: • **TCP**: TCP. • **UDP** : UDP. This is the default value.
Cipher	String	No	AES-128-CBC	The encryption algorithm that is used in the SSL-VPN connection. Valid values: • **AES-128-CBC**: the AES-128-CBC algorithm. This is the default value. • **AES-192-CBC**: the AES-192-CBC algorithm. • **AES-256-CBC**: the AES-256-CBC algorithm. • **none**: If the parameter is set to this value, no encryption algorithm is used.
Port	Integer	No	1194	The port that is used by the SSL-VPN server. Default value: **1194**. The following ports cannot be used: **22, 2222, 22222, 9000, 9001, 9002, 7505, 80, 443, 53, 68, 123, 4510, 4560, 500, and 4500**.

Parameter	Type	Required	Example	Description
Compress	Boolean	No	false	Specifies whether to enable data compression. Valid values: • **true**: enables data compression. • **false**: disables data compression. This is the default value.

Response parameters

Parameter	Type	Example	Description
Name	String	test	The name of the SSL-VPN server.
RequestId	String	E98A9651-7098-40C7-8F85-C818D1EBBA85	The ID of the request.
SslVpnServerId	String	vss-bp18q7hzj6largv4v****	The ID of the SSL-VPN server.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=CreateSslVpnServer
&ClientIpPool=192.168.1.0/24
&LocalSubnet=10.0.0.0/8
&RegionId=cn-qingdao-env66-d01
&VpnGatewayId=vpn-bp1hgim8by0kc9nga****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreateSslVpnServerResponse>
      <RequestId>E98A9651-7098-40C7-8F85-C818D1EBBA85</RequestId>
      <SslVpnServerId>vss-bp18q7hzj6largv4v****</SslVpnServerId>
      <Name>test</Name>
</CreateSslVpnServerResponse>
```

`JSON` format

```
{
    "RequestId": "E98A9651-7098-40C7-8F85-C818D1EBBA85",
    "SslVpnServerId": "vss-bp18q7hzj6largv4v****",
    "Name": "test"
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.
400	Resource.QuotaFull	The quota of resource is full	The error message returned because the resource quota is reached.
400	InvalidName	The name is not valid	The error message returned because the format of the specified name is invalid.
404	InvalidVpnGatewayInstanceId.NotFound	The specified vpn gateway instance id does not exist.	The error message returned because the specified VPN gateway does not exist. Check whether the configuration of the VPN gateway is valid.
400	VpnGateway.Configuring	The specified service is configuring.	The error message returned because the operation is not allowed when the specified service is being configured. Try again later.
400	VpnGateway.FinancialLocked	The specified service is financial locked.	The error message returned because the service is suspended due to overdue payments. Top up your account first.

17.1.8.2. ModifySslVpnServer

Modifies the configuration of an SSL-VPN server.

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifySslVpnServer	The operation that you want to perform. Set the value to **ModifySslVpnServer**.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the VPN gateway is created. You can call the `DescribeRegions` operation to query the most recent region list.
SslVpnServerId	String	Yes	vss-bp18q7hzj6largv4v****	The ID of the SSL-VPN server.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-0016e04115b	The client token that is used to ensure the idempotence of the request. You can use the client to generate a token, but you must make sure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.
Name	String	No	test	The name of the SSL-VPN server. The name must be 2 to 128 characters in length and can contain digits, periods (.), underscores (_), and hyphens (-). It must start with a letter, and cannot start with `http://` or `https://`.
ClientIpPool	String	No	10.30.30.0/24	The client IP address pool.
LocalSubnet	String	No	10.20.20.0/24	The CIDR block of the VPC.
Proto	String	No	UDP	The protocol that is used by the SSL-VPN server. Valid values: • **TCP**: TCP • **UDP**: UDP. This is the default value.

Parameter	Type	Required	Example	Description
Cipher	String	No	AES-128-CBC	The encryption algorithm that is used in the SSL-VPN connection. Valid values: • **AES-128-CBC**: the AES-128-CBC algorithm. This is the default value. • **AES-192-CBC**: the AES-192-CBC algorithm. • **AES-256-CBC**: the AES-256-CBC algorithm. • **none**: If the parameter is set to this value, no encryption algorithm is used.
Port	Integer	No	1194	The port that is used by the SSL-VPN server. Default value: **1194**. The following ports cannot be used: **22, 2222, 22222, 9000, 9001, 9002, 7505, 80, 443, 53, 68, 123, 4510, 4560, 500, and 4500**.
Compress	Boolean	No	false	Specifies whether to enable data compression. Valid values: • **true**: enables data compression. • **false**: disables data compression. This is the default value.

Response parameters

Parameter	Type	Example	Description
Cipher	String	AES-128-CBC	The encryption algorithm.
ClientIpPool	String	10.30.30.0/24	The client IP address pool.
Compress	Boolean	false	Indicates whether data compression is enabled.
Connections	Integer	0	The total number of current connections.
CreateTime	Long	1492753580000	The time when the SSL-VPN server was created.

Parameter	Type	Example	Description
InternetIp	String	47.XX.XX.98	The public IP address.
LocalSubnet	String	10.20.20.0/24	The CIDR block of the VPC.
MaxConnections	Integer	5	The maximum number of connections.
Name	String	test	The name of the SSL-VPN server.
Port	Integer	1194	The port that is used by the SSL-VPN server.
Proto	String	UDP	The protocol that is used by the SSL-VPN server.
RegionId	String	cn-qingdao-env66-d01	The region ID of the SSL-VPN server.
RequestId	String	DF11D6F6-E35A-41C3-9B20-6FC8A901FE65	The ID of the request.
SslVpnServerId	String	vss-bp18q7hzj6largv4v****	The ID of the SSL-VPN server.
VpnGatewayId	String	vpn-bp1q8bgx4xnkm2ogj****	The ID of the VPN gateway.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ModifySslVpnServer
&RegionId=cn-qingdao-env66-d01

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.
400	InvalidName	The name is not valid	The error message returned because the specified name is in an invalid format.
400	VpnGateway.Configuring	The specified service is configuring.	The error message returned because the operation is not allowed when the specified service is being configured. Try again later.
400	VpnGateway.FinancialLocked	The specified service is financial locked.	The error message returned because the service is suspended due to overdue payments. Top up your account first.

17.1.8.3. DescribeSslVpnServers

Queries one or more SSL-VPN servers.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeSslVpnServers	The operation that you want to perform. Set the value to **DescribeSslVpnServers**.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the SSL-VPN servers are created. You can call the `DescribeRegions` operation to query the most recent region list.
SslVpnServerId	String	No	vss-bp15j3du13gq1dgey****	The ID of the SSL-VPN server.
VpnGatewayId	String	No	vpn-bp1on0xae9d771ggi****	The ID of the VPN gateway.
Name	String	No	test	The name of the SSL-VPN server.
PageNumber	Integer	No	1	The number of the page to return. Default value: **1**.
PageSize	Integer	No	10	The number of entries to return on each page. Maximum value: **50**. Default value: **10**.

Response parameters

Parameter	Type	Example	Description
PageNumber	Integer	1	The page number of the returned page.
PageSize	Integer	10	The number of entries returned on each page.
RequestId	String	085CA5EA-1E76-43A8-981B-E0208DECA0CB	The ID of the request.
SslVpnServers	Array of SslVpnServer		The detailed information about the SSL-VPN servers.
SslVpnServer			
Cipher	String	AES-128-CBC	The encryption algorithm.

Parameter	Type	Example	Description
ClientIpPool	String	10.10.1.0/24	The client IP address pool.
Compress	Boolean	false	Indicates whether the transmitted data is compressed.
Connections	Integer	0	The total number of current connections.
CreateTime	Long	1544668844000	The timestamp generated when the SSL-VPN server was created.
InternetIp	String	47.XX.XX.167	The public IP address.
LocalSubnet	String	192.168.0.0/24	The CIDR block of the client.
MaxConnections	Integer	5	The maximum number of connections.
Name	String	test	The name of the SSL-VPN server.
Port	Integer	1194	The port that is used by the SSL-VPN server.
Proto	String	UDP	The protocol that is used by the SSL-VPN server.
RegionId	String	cn-qingdao-env66-d01	The ID of the region where the SSL-VPN server is created.
SslVpnServerId	String	vss-bp15j3du13gq1dgey****	The ID of the SSL-VPN server.
VpnGatewayId	String	vpn-bp1on0xae9d771ggi****	The ID of the VPN gateway.
TotalCount	Integer	1	The total number of entries returned.

Examples

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.

17.1.8.4. DescribeVpnSslServerLogs

Queries the logs of an SSL-VPN server.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeVpnSslServerLogs	The operation that you want to perform. Set the value to **DescribeVpnSslServerLogs**.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the SSL-VPN server is created. You can call the `DescribeRegions` operation to query the most recent region list.
VpnSslServerId	String	Yes	vss-bp155e9yclsg1xgq4****	The name of the SSL-VPN server.
From	Integer	No	2018020201	The beginning of the time range to query. Specify the time in the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. If the **From** parameter is set, you must set the **To** or **MinutePeriod** parameter.
To	Integer	No	2018020206	The end of the time range to query. Specify the time in the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. If the **From** parameter is set, you must set the **To** or **MinutePeriod** parameter.
MinutePeriod	Integer	No	10	The cycle of the logs. If the **From** and **To** parameters are not set, you must set the **MinutePeriod** parameter.
PageNumber	Integer	No	1	The number of the page to return. Default value: **1**.
PageSize	Integer	No	10	The number of entries to return on each page. Maximum value: **50**. Default value: **10**.

Response parameters

Parameter	Type	Example	Description
Count	Integer	10	The number of log entries.
Data	List	test	An array of log entries. Each item in the array indicates a log entry.
IsCompleted	Boolean	true	Indicates whether the log data is accurate. Valid values: • **true**: accurate • **false**: inaccurate
PageNumber	Integer	1	The page number of the returned page.
PageSize	Integer	1	The number of entries returned per page.
RequestId	String	5BE01CD7-5A50-472D-AC14-CA181C5C03BE	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeVpnSslServerLogs
&RegionId=cn-qingdao-env66-d01
&VpnSslServerId=vss-bp155e9yclsg1xgq4****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeVpnSslServerLogsResponse>
   <Data></Data>
   <PageNumber>1</PageNumber>
   <Count>0</Count>
   <PageSize>10</PageSize>
   <IsCompleted>true</IsCompleted>
   <RequestId>26641E42-66C7-4942-9FEC-F99213914F8F</RequestId>
</DescribeVpnSslServerLogsResponse>
```

`JSON` format

```
{
 "Data": {
  "Logs": []
 },
 "PageNumber": 1,
 "Count": 0,
 "PageSize": 10,
 "IsCompleted": true,
 "RequestId": "26641E42-66C7-4942-9FEC-F99213914F8F"
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.

17.1.8.5. DeleteSslVpnServer

Deletes an SSL-VPN server.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteSslVpnServer	The operation that you want to perform. Set the value to **DeleteSslVpnServer**.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the SSL-VPN server is created. You can call the `DescribeRegions` operation to query the most recent region list.

Parameter	Type	Required	Example	Description
SslVpnServerId	String	Yes	vss-bp18q7hzj6largv4v****	The ID of the SSL-VPN server.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-0016e04115b	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must make sure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	606998F0-B94D-48FE-8316-ACA81BB230DA	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DeleteSslVpnServer
&RegionId=cn-qingdao-env66-d01
&SslVpnServerId=vss-bp18q7hzj6largv4v****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteSslVpnServerResponse>
      <RequestId>606998F0-B94D-48FE-8316-ACA81BB230DA</RequestId>
</DeleteSslVpnServerResponse>
```

`JSON` format

```
{
  "RequestId":"606998F0-B94D-48FE-8316-ACA81BB230DA"
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.
400	VpnGateway.Configuring	The specified service is configuring.	The error message returned because the operation is not allowed when the specified service is being configured. Try again later.
400	VpnGateway.FinancialLocked	The specified service is financial locked.	The error message returned because the service is suspended due to overdue payments. Top up your account first.

17.1.8.6. CreateSslVpnClientCert

Creates an SSL-VPN client certificate.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateSslVpnClientCert	The operation that you want to perform. Set the value to **CreateSslVpnClientCert**.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the VPN gateway is created. You can call the `DescribeRegions` operation to query the most recent region list.
SslVpnServerId	String	Yes	vss-m5et0q3iy1qex328w****	The ID of the SSL-VPN server.

Parameter	Type	Required	Example	Description
ClientToken	String	No	02fb3da4-130e-11e9-8e44-0016e04115b	The client token that is used to ensure the idempotence of the request. You can use the client to generate a token, but you must make sure that it is unique among different requests. The token can only contain ASCII characters and cannot exceed 64 characters in length.
Name	String	No	SslVpnClientCert1	The name of the SSL-VPN client certificate. The name must be 2 to 128 characters in length, and can contain digits, periods (.), underscores (_), and hyphens (-). It must start with a letter, and cannot start with `http://` or `https://`.

Response parameters

Parameter	Type	Example	Description
Name	String	SslVpnClientCert	The name of the SSL-VPN client certificate.
RequestId	String	079874CD-AEC1-43E6-AC03-ADD96B6E4907	The ID of the request.
SslVpnClientCertId	String	vsc-m5euof6s5jy8vs5kd****	The ID of the SSL-VPN client certificate.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=CreateSslVpnClientCert
&RegionId=cn-qingdao-env66-d01
&SslVpnServerId=vss-m5et0q3iy1qex328w****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreateSslVpnClientCertResponse>
      <SslVpnClientCertId>vsc-bp1n8wcf134yl0osr****</SslVpnClientCertId>
      <RequestId>606998F0-B94D-48FE-8316-ACA81BB230DA</RequestId>
</CreateSslVpnClientCertResponse>
```

`JSON` format

```
{
    "SslVpnClientCertId": "vsc-bp1n8wcf134yl0osr****",
    "RequestId": "606998F0-B94D-48FE-8316-ACA81BB230DA"
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.
400	Resource.QuotaFull	The quota of resource is full	The error message returned because the resource quota is reached.
400	VpnGateway.Configuring	The specified service is configuring.	The error message returned because the operation is not allowed when the specified service is being configured. Try again later.
400	VpnGateway.FinancialLocked	The specified service is financial locked.	The error message returned because the service is suspended due to overdue payments. Top up your account first.
400	InvalidName	The name is not valid	The error message returned because the specified name is in an invalid format.

17.1.8.7. ModifySslVpnClientCert

Modifies the name of an SSL-VPN client certificate.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifySslVpnClientCert	The operation that you want to perform. Set the value to **ModifySslVpnClientCert**.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the SSL-VPN client certificate is created. You can call the `DescribeRegions` operation to query the most recent region list.
SslVpnClientCertId	String	Yes	vsc-bp1n8wcf134yl0osrc****	The ID of the SSL-VPN client certificate.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-0016e04115b	The client token that is used to ensure the idempotence of the request. You can use the client to generate a token, but you must make sure that the token is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.
Name	String	No	cert2	The name of the SSL-VPN client certificate. The name must be 2 to 128 characters in length and can contain digits, periods (.), underscores (_), and hyphens (-). It must start with a letter. However, the name cannot start with `http://` or `https://`.

Response parameters

Parameter	Type	Example	Description
Name	String	cert2	The name of the SSL-VPN client certificate.

Parameter	Type	Example	Description
RequestId	String	606998F0-B94D-48FE-8316-ACA81BB230DA	The ID of the request.
SslVpnClientCertId	String	vsc-bp1n8wcf134yl0osr****	The ID of the SSL-VPN client certificate.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ModifySslVpnClientCert
&RegionId=cn-qingdao-env66-d01
&SslVpnClientCertId=vsc-bp1n8wcf134yl0osrc****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifySslVpnClientCertResponse>
      <SslVpnClientCertId>vsc-bp1n8wcf134yl0osr****</SslVpnClientCertId>
      <Name>cert2</Name>
      <RequestId>606998F0-B94D-48FE-8316-ACA81BB230DA</RequestId>
</ModifySslVpnClientCertResponse>
```

`JSON` format

```
{
    "SslVpnClientCertId": "vsc-bp1n8wcf134yl0osr****",
    "Name": "cert2",
    "RequestId": "606998F0-B94D-48FE-8316-ACA81BB230DA"
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.

HttpCode	Error code	Error message	Description
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.
400	InvalidName	The name is not valid	The error message returned because the specified name is in an invalid format.

17.1.8.8. DescribeSslVpnClientCerts

Queries one or more SSL-VPN client certificates.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeSslVpnClientCerts	The operation that you want to perform. Set the value to **DescribeSslVpnClientCerts**.
RegionId	String	Yes	cn-qingdao-env66-d01	The region ID of the SSL-VPN client certificates to be queried. You can call the `DescribeRegions` operation to query the most recent region list.
SslVpnServerId	String	No	vss-bp18q7hzj6largv4v****	The ID of the SSL-VPN server.
SslVpnClientCertId	String	No	vsc-bp1n8wcf134yl0osr****	The ID of the SSL-VPN client certificate.
Name	String	No	cert1	The name of the SSL-VPN client certificate.
PageNumber	Integer	No	1	The number of the page to return. Default value: **1**.
PageSize	Integer	No	10	The number of entries to return on each page. Maximum value: **50**. Default value: **10**.

Response parameters

Parameter	Type	Example	Description
PageNumber	Integer	1	The page number of the returned page.
PageSize	Integer	10	The number of entries returned per page.
RequestId	String	5BE01CD7-5A50-472D-AC14-CA181C5C03BE	The ID of the request.
SslVpnClientCertKeys	Array of SslVpnClientCertKey		The detailed information about the queried SSL client certificates.
SslVpnClientCertKey			
CreateTime	Long	1492747187000	The timestamp generated when the SSL client certificate was created.
EndTime	Long	1494966335000	The time to be generated when the SSL client certificate expires.
Name	String	cert1	The name of the SSL-VPN client certificate.
RegionId	String	cn-qingdao-env66-d01	The region ID of the SSL-VPN client certificate.
SslVpnClientCertId	String	vsc-bp1n8wcf134yl0osr****	The ID of the SSL-VPN client certificate.
SslVpnServerId	String	vss-bp18q7hzj6largv4v****	The ID of the SSL-VPN server.
Status	String	normal	The status of the SSL-VPN client certificate. Valid values: • **expiring-soon**: The SSL-VPN client certificate expires in one week. • **normal**: The certificate is normal. • **expired**: The certificate has expired.
TotalCount	Integer	1	The number of returned entries.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeSslVpnClientCerts
&RegionId=cn-qingdao-env66-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeSslVpnServersResponse>
      <PageNumber>1</PageNumber>

    }
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.

17.1.8.9. DescribeSslVpnClientCert

Queries a specified SSL-VPN client certificate.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeSslVpnClientCert	The operation that you want to perform. Set the value to **DescribeSslVpnClientCert**.
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the SSL-VPN client certificate that you want to query is created. You can call the `DescribeRegions` operation to query the most recent region list.
SslVpnClientCertId	String	Yes	vsc-bp17r58rjf5r1gjyr****	The ID of the SSL-VPN client certificate that you want to query.

Response parameters

Parameter	Type	Example	Description
CaCert	String	The CA certificate	The CA certificate.
ClientCert	String	The SSL-VPN client certificate	The SSL-VPN client certificate.
ClientConfig	String	The configuration of the client	The configuration of the client.
ClientKey	String	The key of the client	The key of the client.
CreateTime	Long	1552550980000	The timestamp generated when the SSL-VPN client certificate was created.
EndTime	Long	1647158980000	The timestamp to be generated when the SSL-VPN client certificate expires.
Name	String	abc	The name of the SSL-VPN client certificate.
RegionId	String	cn-qingdao-env66-d01	The ID of the region where the SSL-VPN client certificate is created.
RequestId	String	5BE01CD7-5A50-472D-AC14-CA181C5C03BE	The ID of the request.

Parameter	Type	Example	Description
SslVpnClientCertId	String	vsc-bp13k5mp4tg8v3z9b****	The ID of the SSL-VPN client certificate.
SslVpnServerId	String	vss-bp155e9yclsg1xgq4****	The ID of the SSL-VPN server.
Status	String	normal	The status of the SSL-VPN client certificate. Valid values: • **expiring-soon**: The SSL-VPN client certificate expires in one week. • **normal**: The certificate is normal. • **expired**: The certificate has expired.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeSslVpnClientCert
&RegionId=cn-qingdao-env66-d01
&SslVpnClientCertId=vsc-bp17r58rjf5r1gjyr****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeSslVpnServersResponse>
      <Name>df</Name>

 "SslVpnServerId": "vss-bp155e9yclsg1xgq4****"
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.

17.1.8.10. DeleteSslVpnClientCert

Deletes an SSL-VPN client certificate.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteSslVpnClientCert	The operation that you want to perform. Set the value to **DeleteSslVpnClientCert**.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-qingdao-env66-d01	The ID of the region where the SSL-VPN client certificate is created. You can call the `DescribeRegions` operation to query the most recent region list.
SslVpnClientCertId	String	Yes	vsc-bp1n8wcf134yl0osr****	The ID of the SSL-VPN client certificate.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-0016e04115b	The client token that is used to ensure the idempotence of the request. You can use the client to generate a token, but you must make sure that it is unique among different requests. The token can contain only ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	606998F0-B94D-48FE-8316-ACA81BB230DA	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DeleteSslVpnClientCert
&RegionId=cn-qingdao-env66-d01
&SslVpnClientCertId=vsc-bp1n8wcf134yl0osr****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteSslVpnClientCertResponse>
      <RequestId>606998F0-B94D-48FE-8316-ACA81BB230DA</RequestId>
</DeleteSslVpnClientCertResponse>
```

`JSON` format

```
{
  "RequestId":"606998F0-B94D-48FE-8316-ACA81BB230DA"
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden.SubUser	User not authorized to operate on the specified resource as your account is created by another user.	The error message returned because you are unauthorized to perform this operation on the specified resource. You can apply for the required permissions and try again.
403	Forbidden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. To acquire the required permissions, submit a ticket.
400	VpnGateway.Configuring	The specified service is configuring.	The error message returned because the operation is not allowed when the specified service is being configured. Try again later.

18.Elastic IP Address

18.1. Developer Guide

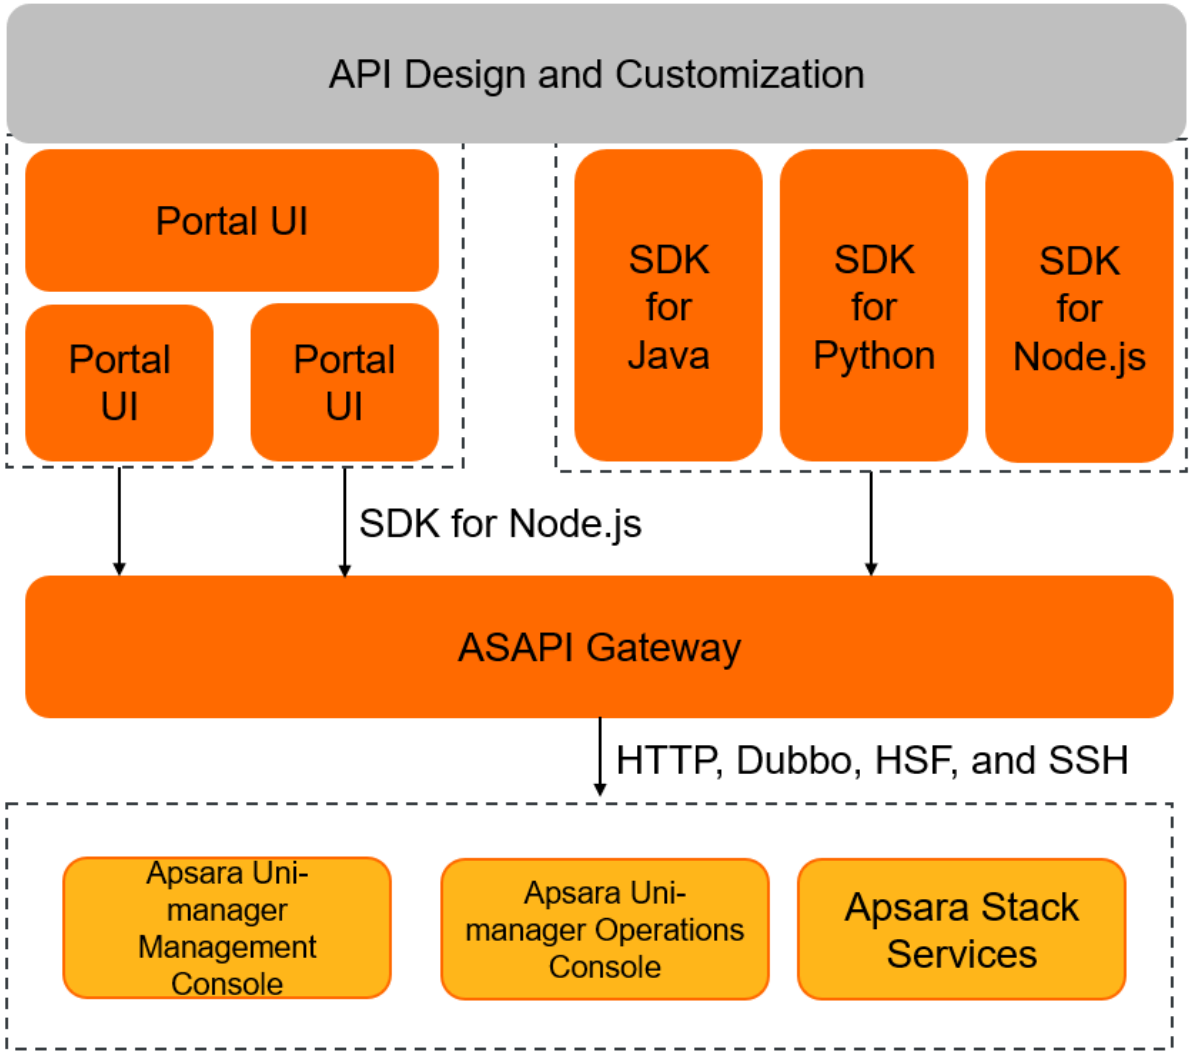
18.1.1. Make SDK calls by using ASAPI

18.1.1.1. 文档标题缺失，请补全后重新导出

18.1.1.1.1. ASAPI overview

This topic describes the architecture and features of the Apsara Stack API (ASAPI).

The ASAPI is a unified ingress gateway for Apsara Stack services and a main component of the Apsara Uni-manager Management Console. The ASAPI provides a unified method for you to manage and make API calls. You can use Apsara Stack SDK to centrally make API calls to Apsara Stack services, including Elastic Compute Service (ECS) and Virtual Private Cloud (VPC).



The ASAPI allows you to make API calls to manage and maintain Apsara Stack services.

- Make API calls to implement enterprise-grade management. For example, you can manage organizations, users, roles, resource sets, and logon policies. These operations are provided by the Apsara Uni-manager Management Console.
- Make API calls to manage operations. For example, you can manage quotas, usage statistics, specifications, and password policies. These operations are provided by the Apsara Uni-manager Management Console.
- Make API calls to manage resources. For example, you can create, delete, query, or modify cloud resources. These operations are provided by Apsara Stack services. If you call an API operation to create an ECS instance or a VPC, the API operation is provided by ECS or VPC.
- Make API calls to query monitoring metrics of Apsara Stack services. These operations are provided by the Apsara Uni-manager Management Console.
- Make API calls to perform O&M. For example, you can manage monitoring and alerting, inventories, tasks, and physical servers. These operations are provided by the Apsara Uni-manager Operations Console.

For more information, see the developer guide of the corresponding Apsara Stack service. For information about API operations used to manage organization users, see *Apsara Uni-manager Management Console Developer Guide*. For information about the API operation used to create an ECS instance, see *ECS Developer Guide*.

> **Note** If the "Use Apsara Stack SDK to make API calls" section is included in the developer guide of an Apsara Stack service, the ASAPI is supported by the Apsara Stack service. In this case, you can make API calls based on the developer guide.

18.1.1.1.2. Preparations

18.1.1.1.2.1. Log on to the API Tool console

You can log on to the API Tool console from the Apsara Uni-manager Management Console.

Prerequisites

- The URL of the Apsara Uni-manager Management Console is obtained from the deployment personnel before you log on to the Apsara Uni-manager Management Console.
- We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL of the Apsara Uni-manager Management Console. Press the Enter key.
2. Enter your username and password.

   Obtain the username and password that you can use to log on to the console from the operations administrator.

> **Note** When you log on to the Apsara Uni-manager Management Console for the first time, you must change the password of your username. Your password must meet complexity requirements. The password must be 10 to 32 characters in length and must contain at least two of the following character types:
>
> - Uppercase or lowercase letters
> - Digits
> - Special characters, which include ! @ # $ %

3. Click **Log On**.
4. In the top navigation bar, choose **Products > Others > API Tool**.

18.1.1.1.2.2. View information about API operations

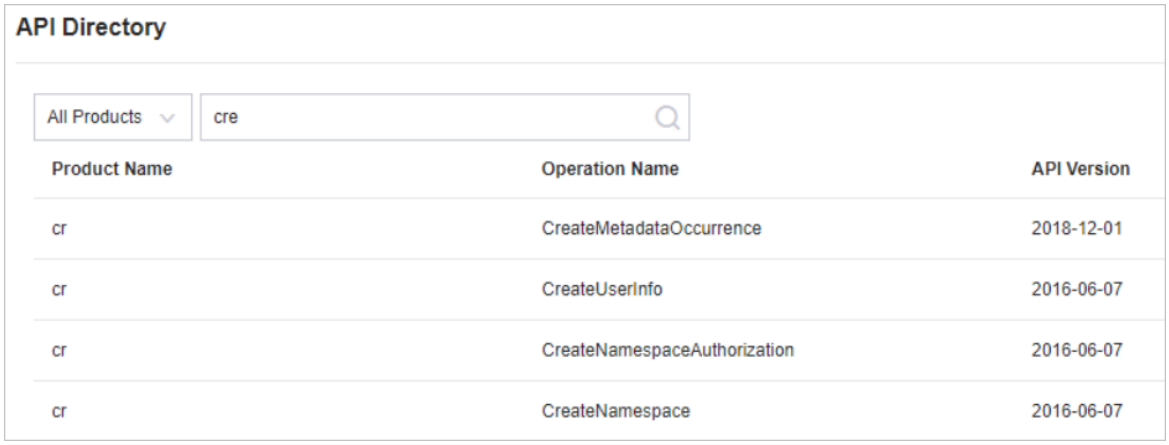
This topic describes how to view information about API operations. Before you use SDKs, obtain service names, API operation names, and API operation versions.

Context

The API operations on the API Directory page are only for reference. For information about how to call API operations, see developer guides of the corresponding cloud services. If the information on the API Directory page is inconsistent with that in the developer guide of the corresponding cloud service, the information in the developer guide prevails.

Procedure

1. Go to the API Tool console. For more information, see Log on to the API Tool console.
2. In the left-side navigation pane, click **API Directory**.
3. On the **API Directory** page, select the desired service from the drop-down list, enter a keyword of an API operation name in the search box, and then click the search icon.



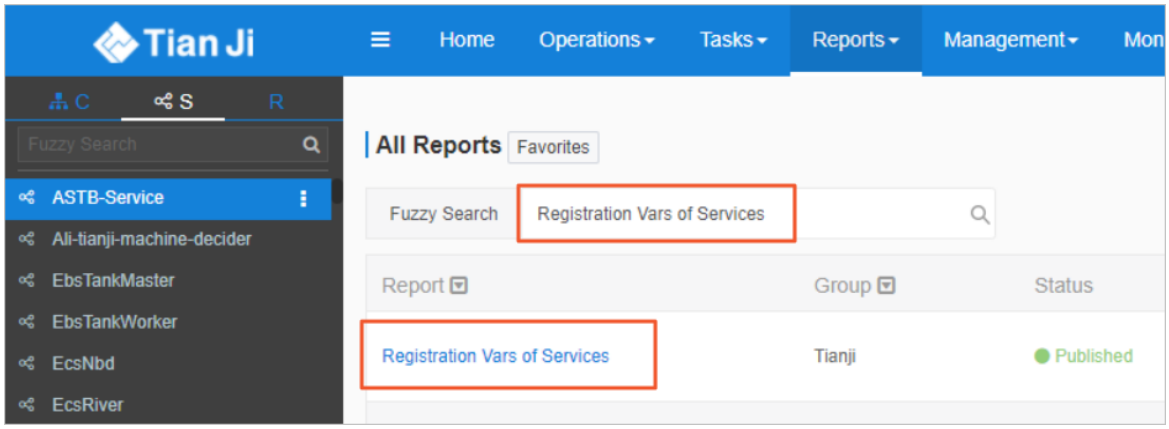
4. Then, you can view the service name, API operation name, and API operation version.

18.1.1.1.2.3. Generate an endpoint for the ASAPI

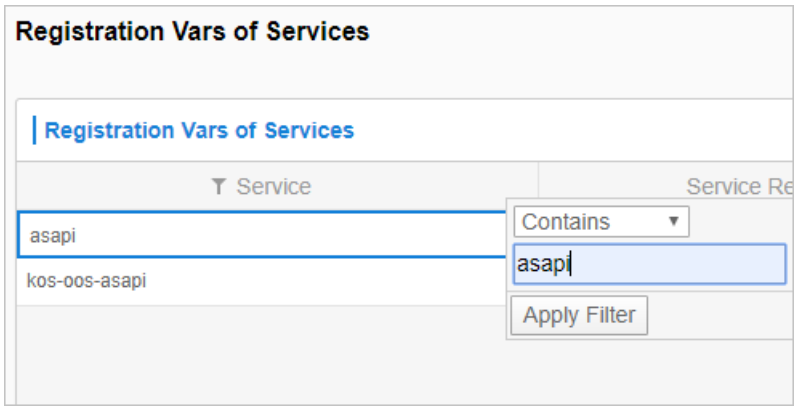
This topic describes three methods used to generate an endpoint for the Apsara Stack API (ASAPI).

Method 1: Use Registration Vars of Services to generate an endpoint

1. Log on to Apsara Infrastructure Management Framework.
   i. Log on to the Apsara Uni-manager Operations Console.
   ii. In the top navigation bar, click **O&M**.
   iii. In the left-side navigation pane, choose **Product Management** > **Products**.
   iv. In the Apsara Stack O&M section, click **Apsara Infrastructure Management Framework**.
2. In the left-side navigation pane, click **Reports**.
3. On the **All Reports** page, search for `Registration Vars of Services` and click the report name.



4. On the **Registration Vars of Services** page, click the icon next to **Service** and search for `asapi`.



5. Find the asapi service, right-click in the **Service Registration** column, and then select **Show More** from the shortcut menu.

   In the **Details** dialog box, obtain the value of **asapi.public.endpoint**.
6. Generate an endpoint for the ASAPI based on the following format:

```
https://<asapi.public.endpoint>/asapi/v3
```

Method 2: Use cluster resources to generate an endpoint

1. Log on to Apsara Infrastructure Management Framework.
   i. Log on to the Apsara Uni-manager Operations Console.

ii. In the top navigation bar, click **O&M**.

iii. In the left-side navigation pane, choose **Product Management** > **Products**.

iv. In the Apsara Stack O&M section, click **Apsara Infrastructure Management Framework**.

2. Go to the cluster operations page.

i. In the left-side navigation pane, choose Operations > Cluster Operations.

ii. In the **Cluster** search box, enter `ascm`.

iii. Find the cluster that you want to manage and click **Operations** in the **Actions** column.

3. Obtain the value of the domain parameter.

i. Click the Cluster Resources tab.

ii. In the **Name** field, search for `asapi_dns_public`.

iii. Click **Details** in the **Application Parameter** column.

In the **Application Parameter** message, obtain the value of the **domain** parameter.

4. Generate an endpoint for the ASAPI based on the following format:

```
https://<domain>/asapi/v3
```

Method 3: Concatenate strings to generate an endpoint

You can also concatenate strings to generate an endpoint based on the following format:

```
https://public.asapi.<region>.<internet-domain>/asapi/v3
```

> **Note**
>
> 1. Replace <region> with your actual region ID. For information about how to query a region ID, see Query a region ID.
> 2. Replace <internet-domain> with the root domain of your Apsara Stack service. To obtain the root domain, contact Apsara Stack O&M personnel. Take note of this point: Use the internet-domain parameter instead of the intranet-domain parameter.

If the **region** value is `cn-****-****-d01` and the **internet-domain** value is `inter.****.****.com`, the following endpoint can be generated:

```
https://public.asapi.cn-****-****-d01.inter.****.****.com/asapi/v3
```

18.1.1.1.2.4. Obtain Apsara Stack SDKs

The Apsara Stack API (ASAPI) is a unified portal provided by Apsara Stack. You can use the ASAPI to connect to all Apsara Stack services. Apsara Stack provides SDKs for API calls.

For more information about how to obtain Apsara Stack SDKs, see Apsara Stack documentation.

18.1.1.1.2.5. Obtain an AccessKey pair

An AccessKey pair that consists of an AccessKey ID and an AccessKey secret is used to implement symmetric encryption. This helps you verify the identity of a requester. The AccessKey ID is used to identify a user. The AccessKey secret is used to encrypt the signature string. This topic describes how to obtain an AccessKey pair.

Prerequisites

An account of the operations administrator or the level-1 organization administrator is obtained. Only an operations administrator or a level-1 organization administrator can obtain an AccessKey pair.

Context

If you need to make API calls to the Apsara Uni-manager Management Console or other Apsara Stack services, we recommend that you use the AccessKey pair of a personal account. If you use the AccessKey pair of a personal account, configure the request headers that are described in the following table for access control. Otherwise, an error that indicates insufficient permissions can occur.

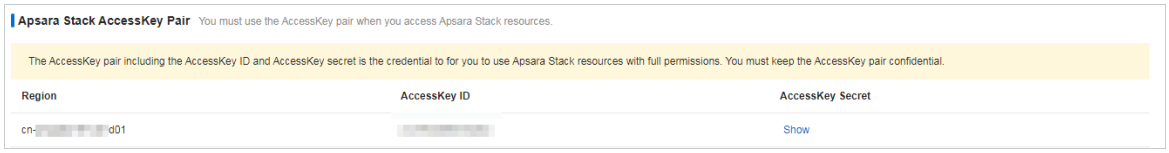
Parameter	Description
x-acs-regionid	The ID of the region, for example, cn-hangzhou-*.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console. For information about how to obtain an organization ID, see the "GetOrganizationList" section in Apsara Uni-manager Management Console Developer Guide.
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console. For information about how to obtain a resource set ID, see the "ListResourceGroup" section in Apsara Uni-manager Management Console Developer Guide.
x-acs-instanceid	The ID of the instance to which you make API calls. If you need to make API calls to an Elastic Compute Service (ECS) instance, obtain the ID of the ECS instance on the Instances page.

Warning The AccessKey pair of a personal account is managed and controlled by the permission system of the Apsara Uni-manage Management Console. If you need to obtain the AccessKey pair of an account that has permissions on an organization, make sure that your operation is allowed by an administrator. This ensures security. The account that has permissions on an organization is a privileged account.

Obtain the AccessKey pair of a personal account

To obtain the AccessKey pair of a personal account, perform the following operations:

1. Log on to the Apsara Uni-manager Management Console.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and click **User Information**.
3. In the **Apsara Stack AccessKey Pair** section, obtain the AccessKey pair.



> **Note** The AccessKey pair that consists of an AccessKey ID and an AccessKey secret is the credential for you to have full permissions on Apsara Stack resources. Keep your AccessKey pair confidential.

Obtain the AccessKey pair of an account that has permissions on an organization

To obtain the AccessKey pair of an account that has permissions on an organization, perform the following operations:

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Organizations**.
4. In the Organizations navigation tree, click the name of the organization that you want to manage.
5. On the right side of the page, click **Obtain AccessKey Pair**.
6. In the message that appears, obtain the AccessKey pair of the account that has permissions on the organization.

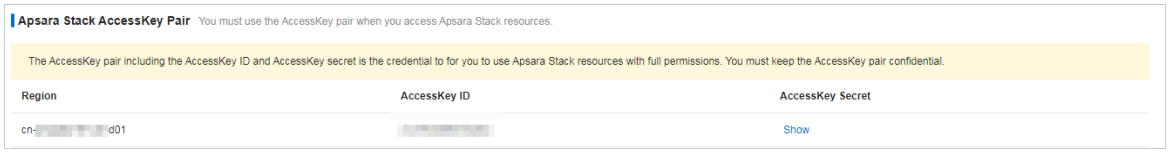
> **Note** The system automatically allocates an AccessKey pair to the account that has permissions on the level-1 organization. The same AccessKey pair is used by the accounts that have permissions on the subordinate organizations.

18.1.1.1.2.6. Query a region ID

When you use Apsara Stack SDK for Node.js to make API calls, specify a region ID. You can obtain a region ID in the Apsara Uni-manager Management Console.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and click **User Information**.
3. In the **Apsara Stack AccessKey Pair** section, view the region ID.



18.1.1.1.3. Common parameters

Common request parameters must be included in all API requests.

Sample common parameters

The following table describes the common parameters that are used when you call API operations supported by the Apsara Stack API (ASAPI).

Parameter	Type	Required	Description
Action	String	Yes	The operation that you want to perform. For more information, see View information about API operations.
Product	String	Yes	The name of the service.
Version	String	Yes	The version of the API operation. For more information, see View information about API operations.
RegionId	String	Yes	The ID of the region. For more information, see Query a region ID.
AccessKeyId	String	Yes	The AccessKey ID used to connect to the service. For more information, see Obtain an AccessKey pair.
Signature	String	Yes	The signature string of the current request. For more information about how signatures are calculated, see Request signatures.

Parameter	Type	Required	Description
SignatureMethod	String	Yes	The encryption method of the signature string. Valid values: HMAC-SHA1 and HMAC-SHA256.
SignatureVersion	String	Yes	The version of the signature encryption algorithm. Valid values: 1.0 and 2.0.
SignatureNonce	String	Yes	A unique, random number used to prevent replay attacks. You must use different numbers for different requests.
Timestamp	String	Yes	The timestamp of the request. Specify the time in the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time must be in UTC. Sample value: 2018-01-01T12:00:00Z.
Format	String	Yes	The format in which to return the response. Set the value to JSON.

Note

The `Signature`, `SignatureMethod`, `SignatureVersion`, `SignatureNonce`, `Timestamp`, and `Format` parameters are encapsulated into Apsara Stack SDK. You do not need to configure these parameters.

18.1.1.1.4. SDK description

18.1.1.1.4.1. Use Apsara Stack SDK for Java to call API operations

This topic describes how to obtain and use Apsara Stack SDK for Java to call API operations.

Prerequisites

- An authorized account and an AccessKey pair are obtained. The AccessKey pair consists of an AccessKey ID and an AccessKey secret. For more information about how to obtain an AccessKey pair in the Apsara Uni-manager Management Console, see Obtain an AccessKey pair.
- The endpoint of the Apsara Stack API (ASAPI) is obtained. For more information, see Generate an endpoint for the ASAPI.
- Apsara Stack SDK for Java 1.8 or later is installed.

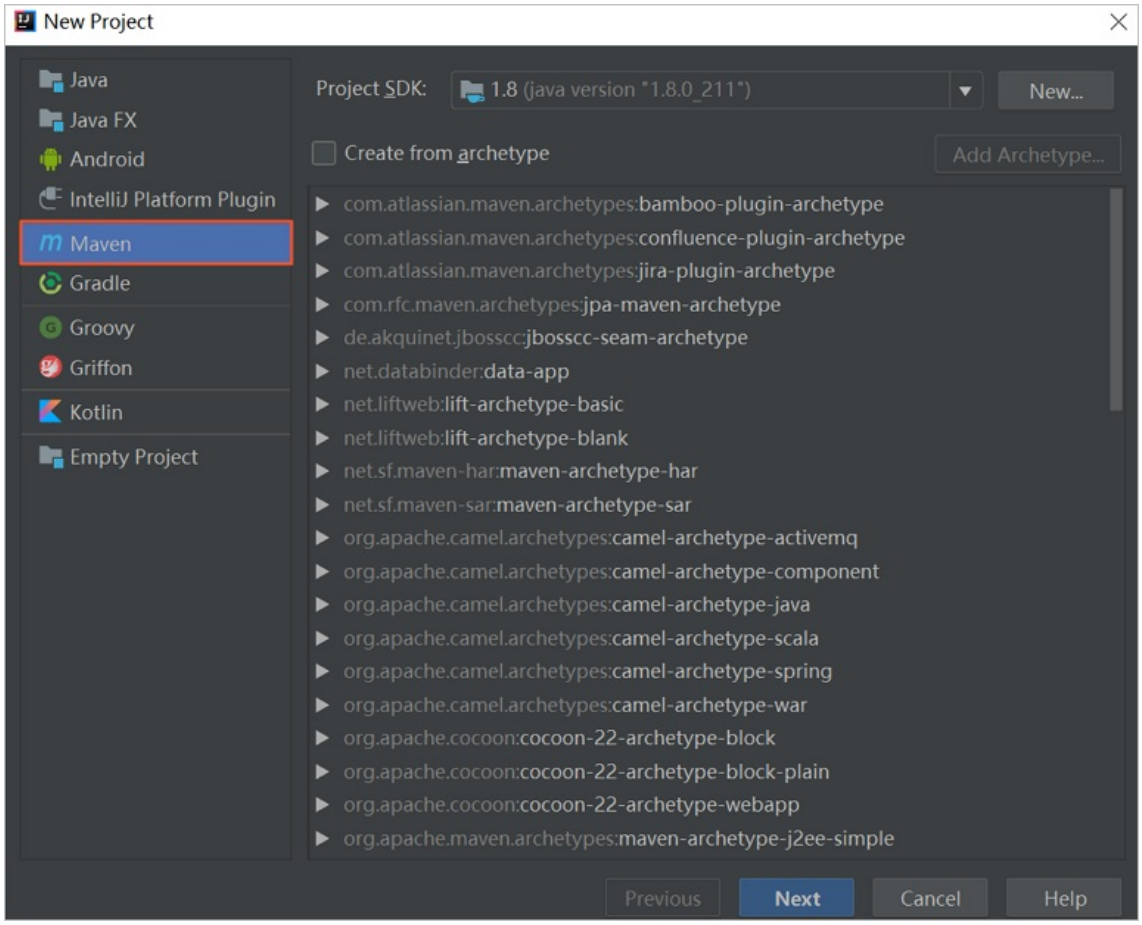
Background information

The help center of Apsara Stack provides Maven dependencies and JAR files for Apsara Stack SDK for Java. You can write code to use Apsara Stack SDK for Java to call API operations.

In this example, the Windows 10 64-bit OS and IntelliJ IDEA are used.

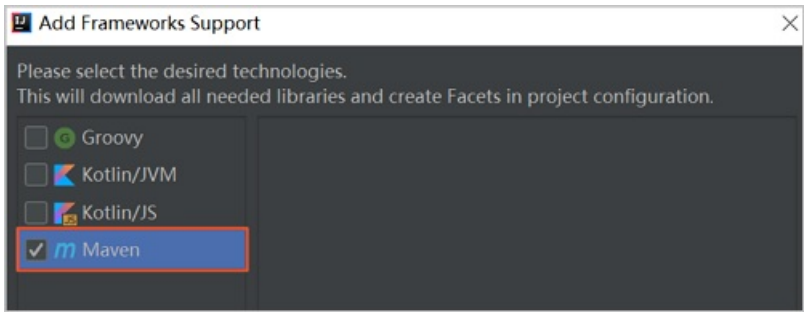
Procedure

1. Use one of the following methods to configure Maven in IntelliJ IDEA. Maven is a tool used for project management.
   - Use Maven that is integrated in IntelliJ IDEA.
   - Download Maven based on the OS that you are using from the official website and configure Maven. For more information, see Download Maven.
2. Obtain the Maven dependencies for Apsara Stack SDK for Java from the official website. For more information about how to obtain the dependencies, see Obtain the core package for ASAPI.
3. Use one of the following methods to create a Maven project:
   - Method 1: Create a Maven project in IntelliJ IDEA.

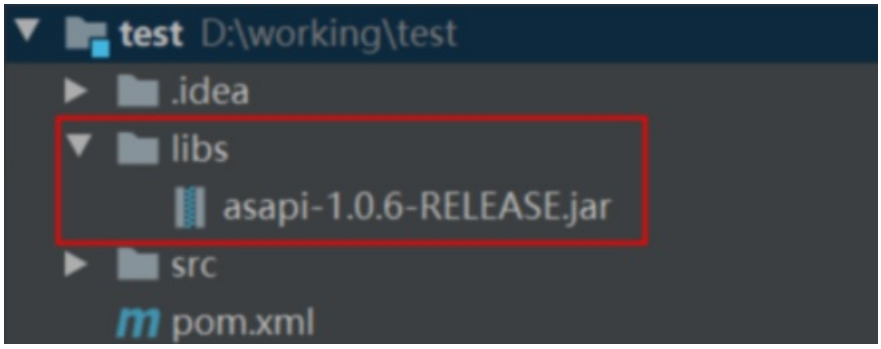


- Method 2: Convert an existing project to a Maven project.
  a. Right-click the project that you want to convert and select **Add Framework Support...**.

  b. Select **Maven** and click **OK**.



4. Create a folder named libs in the root directory of the project. Then, add the JAR file of Apsara Stack SDK for Java to the libs folder, as shown in the following figure.



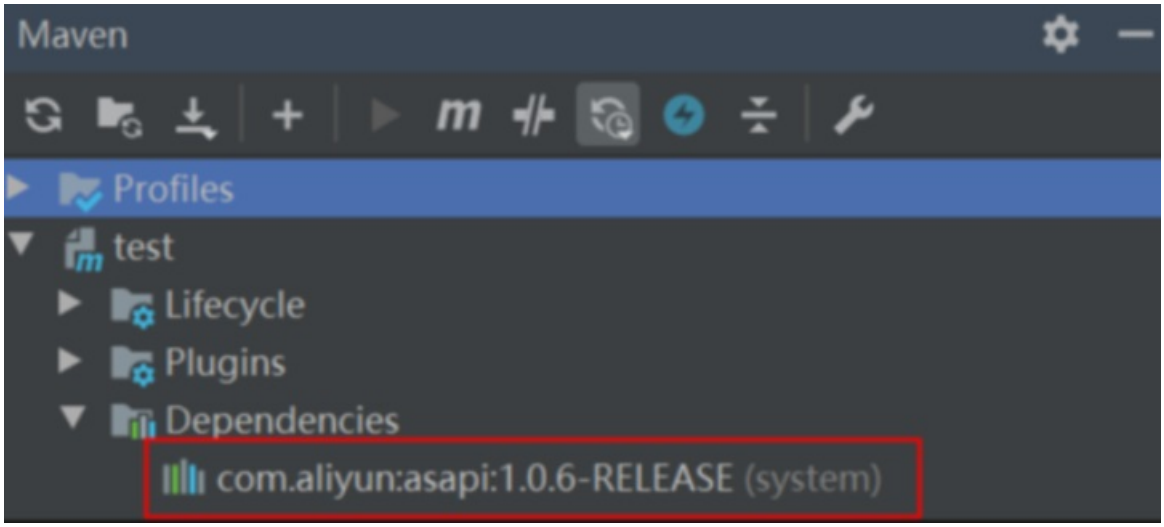
5. Add the dependencies of Apsara Stack SDK for Java to the pom.xml file in the project directory.

```
<dependencies>
    <dependency>
        <groupId>com.aliyun</groupId>
        <artifactId>asapi</artifactId>
        <version>1.0.6-RELEASE</version>
        <scope>system</scope>
        <systemPath>${project.basedir}/libs/asapi-1.0.6-RELEASE.jar</systemPath>
    </dependency>
  <dependency>
        <groupId>com.alibaba</groupId>
        <artifactId>alicrypto-java-aliyun</artifactId>
    <version>1.0.4</version>
    <systemPath>${project.basedir}/libs/alicrypto-java-aliyun-1.0.4.jar</systemPath>
  </dependency>
  <dependency>
    <groupId>com.aliyun</groupId>
    <artifactId>gmsse</artifactId>
    <version>1.1.0</version>
    <systemPath>${project.basedir}/libs/gmsse-1.1.0.jar</systemPath>
  </dependency>
</dependencies>
```

> **Note** Replace `1.0.6-RELEASE` with the actual version of Apsara Stack SDK for Java.

6. On the right side of IntelliJ IDEA, view information in the Maven section.

If the information in the following figure appears, the dependencies are added.



Use Apsara Stack SDK for Java

You can use the GET or POST method to call API operations provided by the ASAPI. The following sample code shows how to call API operations:

```
// 1. Create a connection to an ASClient object.
ASClient client = new ASClient();
// 2. Configure the identifier of the requester. This parameter is required and used only f
or identification. You can set this parameter to a random value.
client.setSdkSource("<The identifier of the requester>");
Map<String, Object> parameters = new HashMap<String, Object>();
// 3. Configure the parameters for authorization. The parameter values vary based on your e
nvironment.
// The AccessKey ID of your Apsara Stack tenant account.
parameters.put("AccessKeyId","<AccessKey ID>");
// The AccessKey secret of your Apsara Stack tenant account.
parameters.put("AccessKeySecret", "<AccessKey Secret>");
// The ID of the region.
parameters.put("RegionId", "<your RegionID>");
// 4. Configure parameters for an API call. In this example, the Product, Action, and Versi
on parameters are configured.
parameters.put("Product", "<The name of the service>");
parameters.put("Action", "<The name of the API operation>");
parameters.put("Version", "<The version of the API operation>");
// 5. Configure operation-specific parameters.
parameters.put("<The name of the operation-specific parameter>", "<The value of the operati
on-specific parameter>");
// 6. Configure request headers and the encryption method for the signature string. Valid v
alues of the SignatureMethod parameter: HMAC-SHA1 and HMAC-SHA256. By default, HMAC-SHA256
is used.
Map<String, String> headers = new HashMap<String, String>();
//headers.put("SignatureMethod", "HMAC-SHA1");
headers.put("x-acs-regionid", "<your-regionid>");
headers.put("x-acs-resourcegroupid", "<your-resourcegroupid>");
headers.put("x-acs-organizationid", "<your-organizationid>");
headers.put("x-acs-instanceid", "<your-instanceid>");
// 7. Make an API call. We recommend that you use the doPost() method.
// Configure the time-out period for a connection.
//client.setConnectTimeout(10000);
// Configure the time-out period for a request.
// client.setSocketTimeout(10000);
String result = client.doPost(endpoint, headers, parameters);
System.out.println(result);
```

Configure a proxy

If you need to use a proxy to make API calls, use the following sample code to configure the proxy:

```
Cloud cloud = new Cloud();
// Configure the IP address of the proxy.
cloud.setConfig("proxy_host", "<IP>");
// Configure the port used by the proxy.
cloud.setConfig("proxy_port", "<Port>");
// 1. Create a connection to an ASClient object.
ASClient client = new ASClient(cloud);
```

Request headers

Parameter	Description
x-acs-regionid	The ID of the region. For more information about how to obtain a region ID, see Query the region ID.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console.
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console.
x-acs-instanceid	The ID of the instance to which you make API calls.

18.1.1.1.4.2. Use Apsara Stack SDK for Python to call API operations

This topic describes how to use Apsara Stack SDK for Python to call API operations provided by the Apsara Stack API (ASAPI).

Preparations

- An authorized account and an AccessKey pair are obtained. The AccessKey pair consists of an AccessKey ID and an AccessKey secret. For more information about how to obtain an AccessKey pair in the Apsara Uni-manager Management Console, see Obtain an AccessKey pair.
- The endpoint of the ASAPI is obtained. For more information, see Generate an endpoint for the ASAPI.

Install Apsara Stack SDK for Python

1. Download the required version of Apsara Stack SDK for Python. For more information, see Obtain Apsara Stack SDKs.
2. Upload the compressed file of Apsara Stack SDK for Python to the host from which you want to send API requests and extract the file. Then, run the following code in the directory of the extracted files to install Apsara Stack SDK for Python:

```
# Install Apsara Stack SDK for Python 2.x.
pip install aliyun-python2-sdk-asapi-2.4.7.tar.gz
# Install Apsara Stack SDK for Python 3.x.
pip3 install aliyun-python3-sdk-asapi-2.4.7.tar.gz
```

> **Note**
>
> Replace `2.4.7` with the actual version of Apsara Stack SDK for Python.

Sample requests

You can use the GET or POST method to call API operations provided by the ASAPI.

```
    # 1. Import dependencies.
    from aliyunsdkasapi.ASClient import ASClient
    from aliyunsdkasapi.AsapiRequest import AsapiRequest

    if __name__ == '__main__':
     # 2. Create a request. The Product parameter specifies the name of the service. The Ver
sion parameter specifies the version of the API operation. The Action parameter specifies t
he operation that you want to perform. The asapi-endpoint parameter specifies the endpoint
of the ASAPI.
     req = AsapiRequest("<Product>", "<Version>", "<Action>", "<asapi-endpoint>")
     # 3. Configure operation-specific parameters.
     req.add_body_params("<key>", "<value>")
     # 4. Configure request headers.
     req.add_header("x-acs-resourcegroupid", "<your-resourcegroupid>");
     req.add_header("x-acs-organizationid", "<your-organizationid>");
     req.add_header("x-acs-regionid", "<your-regionid>");
     req.add_header("x-acs-instanceid", "<your-instanceid>");
     # 5. Configure a request method.
     req.set_method("POST")
     # 6. Configure initialization parameters for an ASClient object. The parameter values v
ary based on your environment. The timeout parameter specifies the time-out period for a re
quest. The cert_file parameter specifies the certificate. The verify parameter specifies wh
ether to verify the certificate.
     as_client = ASClient("<accesskeyid>", "<accesskeysecret>", "<regionid>",timeout=1000,
             cert_file=None,
             verify=False)
     # Configure the identifier of the requester. This parameter is required and used only f
or identification. You can set this parameter to a random value.
     as_client.setSdkSource("<The identifier of the requester>")
     response = as_client.do_request(req)
     print(response)
```

Request headers

Parameter	Description
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console.
x-acs-regionid	The ID of the region. For more information about how to obtain a region ID, see Query a region ID.
x-acs-instanceid	The ID of the instance to which you make API calls.

Configure a proxy

Perform the following steps to configure a proxy:

1. Import OS dependencies.

```
import os
```

2. Configure one or more proxies.

```
# Before you make an API call, configure one or more proxies.
os.environ['http_proxy'] = "http://x.x.x.x:xxxx"
os.environ['https_proxy'] = "https://x.x.x.x:xxxx"
```

18.1.1.1.4.3. Use Apsara Stack SDK for Node.js to call API operations

This topic describes how to obtain and use Apsara Stack SDK for Node.js to call API operations.

Preparations

- An authorized account and an AccessKey pair are obtained. The AccessKey pair consists of an AccessKey ID and an AccessKey secret. For more information about how to obtain an AccessKey pair in the Apsara Uni-manager Management Console, see Obtain an AccessKey pair.
- The endpoint of the Apsara Stack API (ASAPI) is obtained. For more information, see Generate an endpoint for the ASAPI.
- A region ID is obtained. For more information about how to obtain a region ID, see Query the region ID.

Add dependencies

Run the following command to install Apsara Stack SDK for Node.js:

```
tnpm install --save @ali/asapi-nodejs-sdk
```

Use Apsara Stack SDK for Node.js

The following sample code shows how to use Apsara Stack SDK for Node.js to make API calls:

```
// 1. Import the dependencies of Apsara Stack SDK for Node.js.
const Controller = require('egg').Controller;
const ASAPIClient = require('@ali/asapi-nodejs-sdk');
// 2. Configure the parameters.
const cnofig = {
    API_GATEWAY: '<The endpoint of the ASAPI>',
    regionId: '<The ID of the region in which the Apsara Stack service is deployed>',
    accessKeyId: '<The AccessKey ID of your Apsara Stack tenant account>',
    accessKeySecret: '<The AccessKey secret of your Apsara Stack tenant account>'
};
// 3. Initialize a client for API calls.
const AsapiClient = new ASAPIClient(cnofig, this.ctx);
// 4. Configure request parameters.
const params = {
    "Action": "<The name of the API operation>",
    "Product": "<The name of the service that provides the API operation>",
    "Version": "<The version of the API operation>",
    "regionId": '<The ID of the region in which the Apsara Stack service is deployed>',
      "<The name of the operation-specific parameter required by the API operation>": "<The
value of the operation-specific parameter>"
}
// 5. Configure request headers.
AsapiClient.addHeader('x-acs-caller-sdk-source', '<The identifier of the requester>')
AsapiClient.addHeader('x-acs-roleid', '<The ID of the role>')
AsapiClient.addHeader('x-acs-userid', '<The ID of the user>')
AsapiClient.addHeader('x-acs-organizationid', '<your-organizationid>')
AsapiClient.addHeadert("x-acs-regionid", "<your-regionid>");
AsapiClient.addHeader("x-acs-resourcegroupid", "<your-resourcegroupid>");
AsapiClient.addHeader("x-acs-instanceid", "<your-instanceid>");
// 6. Make an API call and obtain the response.
try {
  const res = await AsapiClient.doRequest(cnofig.API_GATEWAY, params, {
    method: 'POST', // The request method.
    formatParams: false, // Specifies whether to format parameters and capitalize the first
letter of each parameter.
    enableProxy: true, // Specifies whether to configure a proxy.
    proxy: 'http://x.x.x.x:xxxx',
    timeout: 10000, // The time-out period.
  // ca: , // The certificate issued by a certificate authority (CA). For more information,
visit https://nodejs.org/api/https.html#https_https_request_options_callback.
  })
  console.log(res)
} catch (e) {
  console.log(e)
}
```

Disable certificate validation

The following sample code shows how to disable certificate validation:

```
Configure the environment variable.
NODE_TLS_REJECT_UNAUTHORIZED=0
```

Request headers

Parameter	Description
x-acs-regionid	The ID of the region. For more information about how to obtain a region ID, see Query the region ID.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console.
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console.
x-acs-instanceid	The ID of the instance to which you make API calls.
x-acs-caller-sdk-source	The custom name of the requester or the system. This parameter is used to identify the source of the API request.
x-acs-roleid	The ID of the role.
x-acs-userid	The ID of the user.

18.1.1.1.4.4. SDK for POP

SDK for Java

Before you use Apsara Stack API (ASAPI) SDK for POP for Java to access ASAPI, you must know the remote procedure call (RPC) and resource-oriented architecture (ROA) styles that are supported for API calls. ASAPI is compatible with both styles. Their difference lies in the ASAPI endpoints that are used for API calls.

Prerequisites

- An Alibaba Cloud SDK package is downloaded for the service that you want to access. The required dependencies are installed.
- SSL certificate validation is ignored for requests over HTTPS.

Background information

ASAPI supports only the HTTPS request protocol.

Difference between two styles

When you use the RPC or ROA style to make API calls, take note that the two styles use different ASAPI endpoints.

```
# ASAPI endpoint for the RPC style:
public.asapi.<global:region>.<global:internet-domain>/asapi/v3
# ASAPI endpoint for the ROA style:
public.asapi.<global:region>.<global:internet-domain>/asapi/v3/roa
```

Call examples

The following sample code provides an example on how to use the RPC style to make an API call. In this example, the DescribeInstances operation of Elastic Compute Service (ECS) is called, and the API version is 2014-05-26.

Sample code:

```
package com.aliyuns.client.pop.ecs;

import com.aliyuncs.DefaultAcsClient;
import com.aliyuncs.ecs.model.v20140526.DescribeInstancesRequest;
import com.aliyuncs.ecs.model.v20140526.DescribeInstancesResponse;
import com.aliyuncs.http.HttpClientConfig;
import com.aliyuncs.http.ProtocolType;
import com.aliyuncs.profile.DefaultProfile;

import java.util.List;

public class DescribeInstancesTest {
    public static void main(String[] args) {
        // Specify the endpoint of ASAPI.
        String endpoint = "public.asapi.<global:region>.<global:internet-domain>/asapi/v3";
        // Specify the region where the ECS service resides.
        String region = "<global:region>";
        // Specify the name of the service that you want to access.
        String product = "ECS";
        // Specify your AccessKey pair.
        String ak = "<accessKeyId>";
        String sk = "<accessKeySecret>";
        try {
            DefaultProfile clientProfile = DefaultProfile.getProfile(region, ak, sk);
            // Ignore SSL certificate validation.
            HttpClientConfig clientConfig = HttpClientConfig.getDefault();
            clientConfig.setIgnoreSSLCerts(true);
            // Set the connection timeout period.
            clientConfig.setConnectionTimeoutMillis(3000L);
            // Set the read timeout period.
            clientConfig.setReadTimeoutMillis(10000L);
            clientProfile.setHttpClientConfig(clientConfig);
            // Create a connection.
            DefaultAcsClient acsClient = new DefaultAcsClient(clientProfile);
            // Create a request.
            DescribeInstancesRequest request = new DescribeInstancesRequest();
            // Specify the endpoint of ASAPI.
            request.setSysEndpoint(endpoint);
            // Specify the name of the service that you want to access and the region where
the service resides.
            request.setSysLocationProduct(product);
            request.setSysRegionId(region);
            // Set the request protocol to HTTPS.
            request.setSysProtocol(ProtocolType.HTTPS);
            DescribeInstancesResponse result =  acsClient.getAcsResponse(request);
            List<DescribeInstancesResponse.Instance> instances = result.getInstances();
            for (DescribeInstancesResponse.Instance instance: instances) {
                System.out.println(instance.getInstanceId());
                System.out.println(instance.getInstanceName());
```

```
            }

        } catch (Exception e) {
            e.printStackTrace();
        }
    }
}
```

The following sample code provides an example on how to use the ROA style to make an API call. In this example, the GetNamespaceList operation of Container Registry is called, and the API version is 2016-06-07.

Sample code:

```
package com.aliyuns.client.pop.cr;

import com.aliyuncs.CommonRequest;
import com.aliyuncs.CommonResponse;
import com.aliyuncs.DefaultAcsClient;
import com.aliyuncs.IAcsClient;
import com.aliyuncs.exceptions.ClientException;
import com.aliyuncs.exceptions.ServerException;
import com.aliyuncs.http.FormatType;
import com.aliyuncs.http.HttpClientConfig;
import com.aliyuncs.http.MethodType;
import com.aliyuncs.http.ProtocolType;
import com.aliyuncs.profile.DefaultProfile;

public class GetNamespaceListTest {
    public static void main(String[] args) {
        // Specify the endpoint of ASAPI.
        String endpoint = "public.asapi.<global:region>.<global:internet-domain>/asapi/v3/r
oa";
        // Specify the region where the Container Registry service resides.
        String region = "<global:region>";
        // Specify the name of the service that you want to access.
        String product = "cr";
        // Specify your AccessKey pair.
        String ak = "<accessKeyId>";
        String sk = "<accessKeySecret>";
        DefaultProfile profile = DefaultProfile.getProfile(region, ak, sk);
        // Ignore SSL certificate validation.
        HttpClientConfig clientConfig = HttpClientConfig.getDefault();
        clientConfig.setIgnoreSSLCerts(true);
        // Set the connection timeout period.
        clientConfig.setConnectionTimeoutMillis(3000L);
        // Set the read timeout period.
        clientConfig.setReadTimeoutMillis(10000L);
        profile.setHttpClientConfig(clientConfig);
        // Create a connection for the client.
        IAcsClient client = new DefaultAcsClient(profile);
        // Create a request.
        CommonRequest request = new CommonRequest();
        // Set the request protocol to HTTPS.
```

```
        request.setSysProtocol(ProtocolType.HTTPS);
        // Specify the request method.
        request.setSysMethod(MethodType.GET);
        // Specify the endpoint of ASAPI.
        request.setSysDomain(endpoint);
        // Specify the version of the API.
        request.setSysVersion("2016-06-07");
        // Specify the pattern of the uniform resource identifier (URI).
        request.setSysUriPattern("/namespace");
        // Specify the name of the service that you want to access and the region where the
service resides.
        request.setSysLocationProduct(product);

        request.putHeadParameter("Content-Type", "application/json");
        String requestBody = "" +
                "{}";
        request.setHttpContent(requestBody.getBytes(), "utf-8", FormatType.JSON);
        try {
            CommonResponse response = client.getCommonResponse(request);
            System.out.println(response.getData());
        } catch (ServerException e) {
            e.printStackTrace();
        } catch (ClientException e) {
            e.printStackTrace();
        }
    }
}
```

> **Notice**
>
> If you send a request over HTTPS, you must enable the request to ignore SSL certificate validation.

SDK for Go

This topic describes how to use Apsara Stack API (ASAPI) SDK for POP for Go.

Prerequisites

An Alibaba Cloud SDK package is downloaded for the service that you want to access. The required dependencies are installed.

Background information

Only the remote procedure call (RPC) style is supported for API calls.

Call examples

The following sample code provides an example on how to make an API call. In this example, the DescribeInstances operation of Elastic Compute Service (ECS) is called, and the API version is 2014-05-26.

Sample code:

```
package main
```

```
import (
 "fmt"
 "time"

 "github.com/aliyun/alibaba-cloud-sdk-go/sdk"
 "github.com/aliyun/alibaba-cloud-sdk-go/sdk/auth/credentials"
 "github.com/aliyun/alibaba-cloud-sdk-go/sdk/requests"
 "github.com/aliyun/alibaba-cloud-sdk-go/sdk/responses"
)

func getSdkConfig() *sdk.Config {
 return sdk.NewConfig().
  WithTimeout(time.Duration(30) * time.Second).
  WithEnableAsync(true).
  WithGoRoutinePoolSize(100).
  WithMaxTaskQueueSize(10000).
  WithDebug(false).
  WithScheme("HTTP")
}

func main(){
 ak := "<The AccessKey ID of your Apsara Stack tenant account.>"
 sk := "<The AccessKey secret of your Apsara Stack tenant account.>"
 regionId := "<The region where the ECS service resides.>"
 endpoint := "<The endpoint of ASAPI.>" // No network protocol.
 request := requests.NewCommonRequest()
  request.SetReadTimeout(10 * time.Second) // Set the read timeout period of the request to
10 seconds.
  request.SetConnectTimeout(5 * time.Second)  // Set the connection timeout period of the r
equest to 5 seconds.
 request.Method = requests.GET
 request.Domain = endpoint         // Location Service will not be enabled if the host is s
pecified. For example, the service with a certification type-bearer token must be specified
.
 request.Version = "2014-05-26"            // Specify the version of the API.
 request.Scheme = "https"                // Specify the request protocol. Default value: ht
tp.
 request.ApiName = "DescribeInstances"
 request.QueryParams["Product"] = "Ecs"  // Specify the name of the service that you want t
o access.
 request.TransToAcsRequest()
 client, err := sdk.NewClientWithOptions(regionId,getSdkConfig(),credentials.NewAccessKeyCr
edential(ak,sk))
 // If relevant parameters are not set for the request, the client settings are used.
  //client.SetReadTimeout(10 * time.Second)              // Set the read timeout period of
the client to 10 seconds.
 //client.SetConnectTimeout(5 * time.Second)            // Set the connection timeout perio
d of the client to 5 seconds.
  resp := responses.BaseResponse{}
  err = client.DoAction(request, &resp)
    if err != nil {
        panic(err)
    }
 fmt.Print(endpoint)
```

```
}
```

Configure proxies

You can configure proxies in one of the following ways:

- Configure proxies by using environment variables.

  Set the HTTP_PROXY and HTTPS_PROXY environment variables, or set the NO_PROXY environment variable.

  Sample code:

```
import (
    "os"
)
func main(){
 os.Setenv("HTTP_PROXY", "http://x.x.x.x:xxxx") // Set the HTTP_PROXY environment variabl
e.
 os.Setenv("HTTPS_PROXY", "https://x.x.x.x:xxxx") // Set the HTTPS_PROXY environment vari
able.
}
```

- Configure proxies on the client.

  Sample code:

```
// The proxies that are configured on the client take precedence over those that are conf
igured by using environment variables.
client.SetHttpProxy("http://x.x.x.x:xxxx")   // Configure the HTTP proxy.
client.GetHttpProxy()                          // Query the HTTP proxy.

client.SetHttpsProxy("https://x.x.x.x:xxxx")   // Configure the HTTPS proxy.
client.GetHttpsProxy()                           // Query the HTTPS proxy.

client.SetNoProxy("127.0.0.1,localhost")     // Configure the proxy whitelist.
client.GetNoProxy()                          // Query the proxy whitelist.
```

SDK for Python

This topic describes how to use Apsara Stack API (ASAPI) SDK for POP for Python.

Prerequisites

An Alibaba Cloud SDK package is downloaded for the service that you want to access. The required dependencies are installed.

Background information

Only the remote procedure call (RPC) style is supported for API calls.

Call examples

The following sample code provides an example on how to make an API call. In this example, the DescribeInstances operation of Elastic Compute Service (ECS) is called, and the API version is 2014-05-26.

Sample code:

```
from aliyunsdkcore.client import AcsClient
from aliyunsdkcore.acs_exception.exceptions import ClientException
from aliyunsdkcore.acs_exception.exceptions import ServerException
from aliyunsdkecs.request.v20140526 import DescribeInstancesRequest
import os

# Create an AcsClient instance.
client = AcsClient(
   "<your-access-key-id>",
   "<your-access-key-secret>",
   "<your-region-id>",

   timeout=1000,  # Set the timeout period.
    verify=False, # Ignore certificate validation. or verify='<The location where the certi
ficate is stored.>'
);
# Set the following parameters for the HTTPS request protocol:
# client.set_verify(False)
# os.environ["HTTPS_PROXY"] = "http://127.0.0.1:8080"

# os.environ["HTTP_PROXY"] = "http://127.0.0.1:8080"
def hello_ecs_instance():
    # Create a request and set the parameters.
    request = DescribeInstancesRequest.DescribeInstancesRequest()

    params = {"PageNumber":"1", "Product":"Ecs","Version": "2014-05-26","Action": "Describe
Instances"};
    request.set_body_params(params)
    # The endpoint that contains no network protocol is in the following format: ASAPI doma
in name/asapi/v3.
    request.set_endpoint('<The endpoint of ASAPI.>')
    # Set the following parameter if the endpoint contains no network protocol:
    request.set_protocol_type("https")

    request.set_PageSize(10)
    # Initiate the API request and obtain the response.
    response = client.do_action_with_exception(request)
    print(response)

if __name__ == '__main__':
    print("Hello Aliyun OpenApi!")
    hello_ecs_instance()
```

Configure proxies

Set the HTTP_PROXY and HTTPS_PROXY environment variables.

Sample code:

```
# Configure the HTTPS proxy.
os.environ["HTTPS_PROXY"] = "http://x.x.x.x:xxxx"

# Configure the HTTP proxy.
os.environ["HTTP_PROXY"] = "https://x.x.x.x:xxxx"
```

18.1.1.1.5. HTTP requests

18.1.1.1.5.1. Overview

This topic describes how to make API requests and is intended for users who use API URLs to initiate HTTP GET requests.

If you are using an SDK to initiate requests, you can skip this topic.

The request URL consists of different parameters and has a fixed syntax. The URL contains common request parameters, your signature, and operation-specific parameters. Sample request URLs are provided for each API operation. These URLs are not encoded to make them easy to read. Before you make a request, you must encode the request URL. After the authentication process is complete based on your signature, the results are returned to you. Response parameters are returned if the call is successful, whereas an error message is returned if the call fails. You can troubleshoot issues based on the error message.

18.1.1.1.5.2. Request syntax

The Apsara Stack API (ASAPI) allows you to call API operations by sending HTTP GET requests based on URLs. Each URL must include request parameters. This topic describes the syntax of HTTP GET requests and provides the endpoint of the ASAPI.

Sample request

GetOrganizationList is used in the following unencoded URL request:

```
https://public.asapi.aliyuns.com/asapi/v3?Action=GetOrganizationList&Product=ascm&Version=2019-05-10&Id=<Organization ID>&<Common parameters>
```

- `https`: the protocol used to transmit the request.
- `public.asapi.aliyuns.com/asapi/v3`: the endpoint of the ASAPI.
- `Action=GetOrganizationList Product=ascm Version=2019-05-10`: the API operation to call.
- `Id`: the ID of the organization.
- `<Common parameters>`: the common parameters specified in the system.

Protocol

The ASAPI supports only HTTPS.

Endpoint

For more information about how to obtain an endpoint, see Generate an endpoint for the ASAPI.

Parameter

To specify an API operation, use the `Action, Product, and Version` parameters. For example, set `Action` to GetOrganizationList, Product to ascm, and Version to 2019-05-10. You must also specify other operation-specific parameters and common parameters. For more information, see Common parameters.

18.1.1.1.5.3. Request signatures

This topic describes how to sign HTTP API requests. ASAPI uses the request signature to verify the identity of the request sender. ASAPI implements symmetric encryption by using an AccessKey pair to verify the identity of the request sender.

> **Note**
>
> - An AccessKey pair consists of an AccessKey ID and an AccessKey secret, which are issued to each user or organization in the Apsara Uni-manager Management Console.
> - The AccessKey ID is used to verify identities of users, and the AccessKey secret is used to encrypt and verify signature strings. You must keep your AccessKey secret confidential.
> - ASAPI provides SDKs for Node.js, Python, and Java to facilitate complex signature calculation. For more information, see Obtain the core package for ASAPI.

Step 1: Create a canonicalized query string

1. Arrange the request parameters in alphabetical order, including all common and operation-specific parameters except the `Signature` parameter.

   > **Note**
   >
   > If you use the GET method to send a request,these parameters are connected by ampersands (&) and included in the request URL. The first request parameter follows a question mark (?).

2. Encode the request parameters and their values in UTF-8 based on RFC 3986. The following rules apply in the encoding process:
   - Letters, digits, and special characters such as hyphens (`-`), underscores (`_`), and periods (`.`) do not need to be encoded.
   - Other characters must be percent encoded in the `%XY` format. `XY` represents the ASCII code of the characters in hexadecimal notation. For example, double quotation marks (`"`) are encoded as `%22` .

- Extended UTF-8 characters are encoded in the `%XY%ZA...` format.
- Spaces must be encoded as `%20`. Do not encode spaces as plus signs (`+`).

  This encoding method is similar to but different from the `application/x-www-form-urlencoded` MIME encoding algorithm.

  If you use `java.net.URLEncoder` from the Java standard library, use `percentEncode` to encode request parameters and their values. In the encoded query string, replace the plus signs (`+`) with `%20` , asterisks (`*`) with `%2A` , and `%7E` with tildes (`~`). This way, you can obtain an encoded string that matches the preceding encoding rules.

```
private static final String ENCODING = "UTF-8";
private static String percentEncode(String value) throws UnsupportedEncodingException
{
    return value != null ? URLEncoder.encode(value, ENCODING).replace("+", "%20").rep
lace("*", "%2A").replace("%7E", "~") : null;
}
```

3. Use equal signs (`=`) to connect the encoded request parameters and their values.
4. Use ampersands (`&`) to connect the encoded request parameters. These parameters must be arranged in the same order as those in Step 1.

Then, a canonicalized query string that follows the request structure is obtained. For more information, see Request structure.

Step 2: Create a string-to-sign

1. Create a `string-to-sign` . You can also use `percentEncode` to encode the canonicalized query string created in Step 1 based on the following rules:

```
StringToSign=
    HTTPMethod + "&" + //HTTPMethod: the HTTP method that is used to send a request, su
ch as GET.
    percentEncode("/") + "&" + //percentEncode("/"): Encode the forward slash (/) in UT
F-8 as %2F.
    percentEncode(CanonicalizedQueryString) // Encode the canonicalized query string cr
eated in Step 1.
```

2. Calculate the RFC 2104-compliant HMAC-SHA1 or HMAC-256 value of `StringToSign` . In the following example, Java Base64 is used:

```
String signature = Base64.getEncoder().encodeToString(signData);
```

> **Note**
>
> When you calculate the signature, the key value specified by RFC 2104 is your `AccessKey secret` plus an ampersand (&), which has an ASCII value of 38. For more information, see Obtain an AccessKey pair.

3. Encode the `Signature` parameter based on RFC 3986 and add it to the canonicalized query string.

Example 1: Concatenate parameters

`GetOrganizationList` is used in this example to query regions. For example, `AccessKeyID` is set to testid and `AccessKeySecret` is set to testsecret. Perform the following operations:

1. Construct a canonicalized query string.

```
https://public.asapi.aliyuns.com/asapi/v3/?AccessKeyId=testid&Action=GetOrganizationList&Format=JSON&Id=1&Product=ascm&RegionId=cn-region-test&SignatureMethod=HMAC-SHA1&SignatureNonce=43967c6e-e3ad-44fa-b06b-fcf3db5f39d2&SignatureVersion=1.0&Timestamp=2020-09-15T08%3A50%3A40Z&Version=2019-05-10
```

2. Create a `string-to-sign` .

```
GET&%2F&AccessKeyId%3Dtestid%26Action%3DGetOrganizationList%26Format%3DJSON%26Id%3D1%26Product%3Dascm%26RegionId%3Dcn-region-test%26SignatureMethod%3DHMAC-SHA1%26SignatureNonce%3D43967c6e-e3ad-44fa-b06b-fcf3db5f39d2%26SignatureVersion%3D1.0%26Timestamp%3D2020-09-15T08%253A50%253A40Z%26Version%3D2019-05-10
```

3. Calculate the signature.

   Calculate the signature. The key value used for calculation is `testsecret&` because `AccessKeySecret` is set to testsecret. The calculated signature is `OLeaidS1JvxuMvnyHOwuJ+uX5qY=` . Java Base64 is used in the following sample code:

   `String signature = Base64.getEncoder().encodeToString(signData);` Encode `Signature=hvqv9Ll5RE6kQ4YsQXFAf9VuRIY=` based on RFC 3986 and add it to the canonicalized query string.

```
https://public.asapi.aliyuns.com/asapi/v3/?AccessKeyId=testid&Action=GetOrganizationList&Format=JSON&Id=1&Product=ascm&RegionId=cn-region-test&SignatureMethod=HMAC-SHA1&SignatureNonce=43967c6e-e3ad-44fa-b06b-fcf3db5f39d2&SignatureVersion=1.0&Timestamp=2020-09-15T08%3A50%3A40Z&Version=2019-05-10
```

You can use browsers or tools such as cURL and Wget to initiate an HTTP request for calling the `DescribeRegions` operation to query the Alibaba Cloud region list.

Example 2: Use the standard library of the programming language

`GetOrganizationList` is used in this example to query regions. For example, `AccessKeyID` is set to testid, `AccessKeySecret` is set to testsecret, and all request parameters are stored in a Java `Map<String, String>` object.

1. Predefine an encoding method.

```
private static final String ENCODING = "UTF-8";
private static String percentEncode(String value) throws UnsupportedEncodingException {
        return value != null ? URLEncoder.encode(value, ENCODING).replace("+", "%20").r
eplace("*", "%2A").replace("%7E", "~") : null;
}
```

2. Predefine the time format for the `Timestamp` parameter. Specify the `Timestamp` parameter in the ISO 8601 format. The time must be in UTC+0.

```
private static final String ISO8601_DATE_FORMAT = "yyyy-MM-dd'T'HH:mm:ss'Z'";
private static String formatIso8601Date(Date date) {
    SimpleDateFormat df = new SimpleDateFormat(ISO8601_DATE_FORMAT);
    df.setTimeZone(new SimpleTimeZone(0, "GMT"));
    return df.format(date);
}
```

3. Create a request string.

```
final String HTTP_METHOD = "GET";
Map parameters = new HashMap();
// Specify request parameters.
parameters.put("Product", "ascm");
parameters.put("Action", "GetOrganizationList");
parameters.put("Version", "2019-05-10");
parameters.put("AccessKeyId", "testid");
parameters.put("RegionId", "cn-region-test");
parameters.put("Timestamp", formatIso8601Date(new Date()));
parameters.put("SignatureMethod", "HMAC-SHA1");
parameters.put("SignatureVersion", "1.0");
parameters.put("SignatureNonce", UUID.randomUUID().toString());
parameters.put("Format", "JSON");
parameters.put("Id", "1");
// Arrange request parameters.
String[] sortedKeys = parameters.keySet().toArray(new String[]{});
Arrays.sort(sortedKeys);
final String SEPARATOR = "&";
// Create a string-to-sign.
StringBuilder stringToSign = new StringBuilder();
stringToSign.append(HTTP_METHOD).append(SEPARATOR);
stringToSign.append(percentEncode("/")).append(SEPARATOR);
StringBuilder canonicalizedQueryString = new StringBuilder();
for(String key : sortedKeys) {
    // Encode the key and the value.
    canonicalizedQueryString.append("&")
    .append(percentEncode(key)).append("=")
    .append(percentEncode(parameters.get(key)));
}
//Encode the canonicalized query string.
stringToSign.append(percentEncode(
canonicalizedQueryString.toString().substring(1)));
```

4. The signature. The key value used for calculation is `testsecret&` because `AccessKeySecret` is set to testsecret. The calculated signature is `OLeaidS1JvxuMvnyHOwuJ%2BuX5qY%3D`.

```
// The following sample code shows how to calculate the signature:
final String ALGORITHM = "HmacSHA1";
final String ENCODING = "UTF-8";
key = "testsecret&";
Mac mac = Mac.getInstance(ALGORITHM);
mac.init(new SecretKeySpec(key.getBytes(ENCODING), ALGORITHM));
byte[] signData = mac.doFinal(stringToSign.getBytes(ENCODING));
String signature = Base64.getEncoder().encodeToString(signData);
```

Encode the Signature parameter based on RFC 3986 and add it to the canonicalized query string. The following URL is obtained:

```
https://public.asapi.aliyuns.com/asapi/v3/?AccessKeyId=testid&Action=GetOrganizationLis
t&Format=JSON&Id=1&Product=ascm&RegionId=cn-region-test&SignatureMethod=HMAC-SHA1&Signa
tureNonce=43967c6e-e3ad-44fa-b06b-fcf3db5f39d2&SignatureVersion=1.0&Timestamp=2020-09-1
5T08%3A50%3A40Z&Version=2019-05-10
```

5. Use browsers or tools such as cURL and Wget to initiate an HTTP request.

18.1.1.1.5.4. Response

Responses are returned only in the JSON format. If a return code is greater than or equal to 200 and less than 300, a success response is returned. Otherwise, an error response is returned.

Sample success response

If a request is successful, the request ID and operation-specific parameter values are returned. For more information, see the developer guide of the corresponding Apsara Stack service.

```
 {
    "eagleEyeTraceId": "xxx-xxx-xxx-xxx", // The trace ID provided by EagleEye.
    "asapiSuccess": true,
    "RequestId": "xxxxxxxxxx",
    "Regions": { // The regions returned after you call the DescribeRegions operation.
        "Region": [
            {
                "RegionId": "",
                "RegionEndpoint": "",
                "LocalName": ""
            }
        ]
    }
}
```

Sample error response

If a request fails, the following information is returned. For more information, see the developer guide of the corresponding Apsara Stack service.

```
{
    "code": "asapi.server.api.notfound",// The error code.
    "eagleEyeTraceId": "xxx-xxx-xxx-xxx", // The trace ID provided by EagleEye.
    "asapiSuccess": false, // Indicates whether the request is successful.
    "hostId": "xxxx", // The ID of the host.
    "message": "Failed to ....", // The message returned.
    "asapiErrorMessage": "Failed to ....", // The error message provided by the ASAPI.
    "asapiErrorCode": "asapi.server.api.notfound" // The error code provided by the ASAPI.
}
```

18.1.2. API reference

18.1.2.1. List of operations by function

The following table describes API operations available for use in Elastic IP Address (EIP).

API	Description
AllocateEipAddress	Applies for an EIP.

API	Description
AllocateEipAddressPro	Applies for a specified EIP.
AssociateEipAddress	Associates an EIP with a cloud resource.
ModifyEipAddressAttribute	Modifies the name, description, and bandwidth limit of a specified EIP.
UnassociateEipAddress	Disassociates an EIP from a cloud resource.
ReleaseEipAddress	Releases a specified EIP.
DescribeEipGatewayInfo	Queries the gateway and subnet mask information about a specified EIP.

18.1.2.2. Make API requests

18.1.2.2.1. Request syntax

To call an Elastic IP Address (EIP) API operation, you must send an HTTP GET request to the endpoint of the EIP API. You must add the request parameters that correspond to the API operation being called. After you call the API operation, the system returns a response. The request and response are encoded in UTF-8.

EIP API operations use the RPC protocol. You can call EIP API operations by sending HTTP GET requests.

The request syntax is:

```
http://Endpoint/?Action=xx&Parameters
```

where:

- Endpoint: the endpoint of the API. The endpoint of the EIP API is `vpc.example.com`.

  > **Note** `example.com` is a custom domain name. You can obtain the endpoint in the Apsara Uni-manager Operations Console. For more information, see Generate the ASAPI endpoint.

- Action: the name of the operation that you want to perform. For example, to query EIPs, you must set the Action parameter to DescribeEipAddresses.
- Version: the version of the API that you want to call. The current EIP API version is *2016-04-28*.
- Parameters: the request parameters for the operation. Separate multiple parameters with ampersands (&).

  Request parameters include common parameters and operation-specific parameters. Common parameters include the API version and authentication information. For more information, see Common parameters.

The following example describes how to call the DescribeEipAddresses operation to query EIPs.

> **Note** The sample requests are formatted to improve readability.

```
https://vpc.example.com/?Action=DescribeEipAddresses
&Format=xml
&Version=2016-04-28
&Signature=xxxx%xxxx%3D
&SignatureMethod=HMAC-SHA1
&SignatureNonce=15215528852396
&SignatureVersion=1.0
&AccessKeyId=key-test
&Timestamp=2012-06-01T12:00:00Z
```

18.1.2.2.2. API authorization

To ensure the security of your account, we recommend that you call EIP API operations as a RAM user. To call the EIP API as a RAM user, you must create and add an authorization policy that grants permissions to call specific API operations.

For more information about the EIP resources and API operations that allow the authorization, see RAM authentication.

18.1.2.2.3. Request signatures

You must sign all API requests to ensure security. Apsara Stack uses the request signature to verify the identity of the API caller.

Elastic IP Address (EIP) implements symmetric encryption with an AccessKey pair to verify the identity of the request sender. An AccessKey pair is an identity credential issued to Apsara Stack tenant accounts and RAM users. An AccessKey pair is similar to a logon username and password. An AccessKey pair consists of an AccessKey ID and an AccessKey secret. The AccessKey ID is used to verify the identity of the user, while the AccessKey secret is used to encrypt and verify the signature string. You must keep your AccessKey secret strictly confidential. For more information about how to obtain an AccessKey pair, see Obtain an AccessKey pair.

You must add the signature to the EIP API request in the following format:

`https://endpoint/?SignatureVersion=1.0&SignatureMethod=HMAC-SHA1&Signature=xxxx%xxxx%3D&SignatureNonce=3ee8c1b8-83d3-44af-a94f-4e0ad82fd6cf`

Take DescribeEipAddresses as an example. If the AccessKey ID is `testid` and the AccessKey secret is `testsecret`, the pre-signed request URL is:

```
http://vpc.example.com/?Action=DescribeEipAddresses
&Timestamp=2016-02-23T12:46:24Z
&Format=XML
&AccessKeyId=testid
&SignatureMethod=HMAC-SHA1
&SignatureNonce=3ee8c1b8-83d3-44af-a94f-4e0ad82fd6cf
&Version=2016-04-28
&SignatureVersion=1.0
```

Perform the following operations to calculate the signature:

1. Use the request parameters to create a string-to-sign.

```
GET&%2F&AccessKeyId%3Dtestid&Action%3DDescribeEipAddresses&Format%3DXML&SignatureMethod
%3DHMAC-SHA1&SignatureNonce%3D3ee8c1b8-83d3-44af-a94f-4e0ad82fd6cf&SignatureVersion%3D1
.0&TimeStamp%3D2016-02-23T12%253A46%253A24Z&Version%3D2014-05-15
```

2. Calculate the HMAC value of the string-to-sign.

   Add an ampersand (&) after the AccessKey secret as the key to calculate the HMAC value. In this example, the key is `testsecret&` .

```
CT9X0VtwR86fNWSnsc6v8YGOjuE=
```

3. Add the signature string to the request as the Signature parameter.

```
http://vpc.example.com/?Action=DescribeEipAddresses
&Timestamp=2016-02-23T12:46:24Z
&Format=XML
&AccessKeyId=testid
&SignatureMethod=HMAC-SHA1
&SignatureNonce=3ee8c1b8-83d3-44af-a94f-4e0ad82fd6cf
&Version=2016-04-28
&SignatureVersion=1.0
&Signature=xxxx%xxxx%3D
```

18.1.2.3. RAM authentication

Before you call an EIP operation as a RAM user, you must use an Apsara Stack tenant account to create an authorization policy to grant permissions to the RAM account. In the authorization policy, an Alibaba Cloud Resource Name (ARN) is used to specify a resource.

EIP resources that allow authorized access

The following table lists the EIP resources that allow authorized access and their ARNs.

Resource type	ARN
EIPs	`acs:vpc:$regionid:$accountid:eip/$allocationid`
	`acs:vpc:$regionid:$accountid:eip/*`
	`acs:vpc:*:$accountid:eip/*`
General resources	`acs:vpc:$regionid:$accountid:*`
	`acs:vpc:*:$accountid:*`

`$regionid/accoutid/vrouterid` are IDs of the specific resources, `*` represents all resources.

EIP API operations that allow authorized access

The following table lists the EIP API operations that allow authorized access and their ARNs.

API	ARN
AllocateEipAddress	`acs:vpc:$regionid:$accountid:eip/*`
AllocateEipAddressPro	`acs:vpc:$regionid:$accountid:eip/*`

AssociateEipAddres	`acs:vpc:$regionid:$accountid:eip/*`
	Associate an Elastic Compute Service (ECS) instance
	`acs:vpc:$regionid:$accountid:eip/$allocationid`
	`acs:ecs:$regionid:$accountid:instance/$instanceid`

DescribeEipAddresses	`acs:vpc:$regionid:$accountid:eip/*`

UnassociateEipAddress	Associate an ECS instance
	`acs:vpc:$regionid:$accountid:eip/$allocationid`
	`acs:ecs:$regionid:$accountid:instance/$instanceid`

ReleaseEipAddress	`acs:vpc:$regionid:$accountid:eip/$allocationid`
DescribeEipMonitorData	`acs:vpc:$regionid:$accountid:eip/$allocationid` `acs:ecs:$regionid:$accountid:instance/$instanceid`

18.1.2.4. Common parameters

This topic describes common parameters, including common request parameters and common response parameters. Common parameters are required in all API operations, regardless of the operation being called.

Common request parameters

Common request parameters must be included in all EIP API requests.

Common request parameters

Parameter	Type	Required	Description
Format	String	No	The format in which to return the response. Valid values: *JSON and XML. Default value: JSON.*
Version	String	Yes	The version number of the API. Format: `YYYY-MM-DD`. Set the value to *2016-04-28*
AccessKeyId	String	Yes	The AccessKey ID provided to you by Apsara Stack.

Parameter	Type	Required	Description
Signature	String	Yes	The signature string of the current request.
SignatureMethod	String	Yes	The encryption method of the signature string. Set the value to *HMAC-SHA1*
Timestamp	String	Yes	The timestamp of the request. Specify the time in the ISO 8601 standard in the `YYYY-MM-DDThh:mm:ssZ` format. The time must be in UTC. For example, 2013-01-10T12:00:00Z.
SignatureVersion	String	Yes	The version of the signature encryption algorithm. Set the value to 1.0
SignatureNonce	String	Yes	A unique, random number used to prevent replay attacks. You must use different numbers for different requests.

Examples

```
http://vpc.example.com/?Action=DescribeEipAddresses
&Timestamp=2016-02-23T12:46:24Z
&Format=XML
&AccessKeyId=testid
&SignatureMethod=HMAC-SHA1
&SignatureNonce=3ee8c1b8-83d3-44af-a94f-4e0ad82fd6cf
&Version=2016-04-28
&SignatureVersion=1.0
```

Common response parameters

API responses use the HTTP response format where a 2XX status code indicates a successful call and a 4XX or 5XX status code indicates a failed call. Responses can be returned in either the JSON or XML format. You can specify the response format in the request. The default response format is XML.

Every response returns a unique RequestId regardless of whether the call is successful.

- XML format

```
<? xml version="1.0" encoding="utf-8"? >
      <!—Result Root Node-->
      <Interface Name+Response>
      <!—Return Request Tag-->
      <RequestId>4C467B38-3910-447D-87BC-AC049166F216</RequestId>
      <!—Return Result Data-->
      </Interface Name+Response>
```

- JSON format

```
{
      "RequestId":"4C467B38-3910-447D-87BC-AC049166F216",
      /*Return Result Data*/
  }
```

18.1.2.5. Elastic IP addresses

18.1.2.5.1. AllocateEipAddress

Applies for an elastic IP address (EIP).

Description

After you call this operation, the system randomly allocates an EIP that is in the **Available** state in the specified region. EIPs support only the ICMP, TCP, and UDP transport layer protocols. The IGMP and SCTP protocols are not supported.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	AllocateEipAddress	The operation that you want to perform. Set the value to **AllocateEipAddress**.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where you want to apply for an EIP. You can call the `DescribeRegions` operation to query region IDs.
Bandwidth	String	No	1	The bandwidth limit of the EIP. Valid values: **1** to **200**. Unit: Mbit/s. Default value: **1**.

Parameter	Type	Required	Example	Description
Period	Integer	No	1	The subscription duration of the EIP. When **PricingCycle** is set to **Month**, **Period** can be set from **1 to 9**. When **PricingCycle** is set to **Year**, **Period** can be set from **1 to 3**. This parameter is required when **InstanceChargeType** is set to **PrePaid**. When **InstanceChargeType** is set to **PostPaid**, ignore this parameter. **Note** This parameter is unavailable for EIPs that are purchased on the Alibaba Cloud International site.
ISP	String	No	BGP	The line type. Default value: **BGP**. • If your account is in the single-path BGP whitelist, you can set the parameter to **ChinaTelecom**, **ChinaUnicom**, or **ChinaMobile**. • This parameter is required if your workloads are deployed in the China East 1 Finance region. In this case, set the value to **BGP_FinanceCloud**.
ActivityId	Long	No	111111	The promotion code. You can leave this parameter empty.
Netmode	String	No	public	The type of network. Set the value to **public** (Internet).

Parameter	Type	Required	Example	Description
AutoPay	Boolean	No	false	Specifies whether to enable automatic payment. Valid values: **false**: disables automatic payment. After an order is generated, you must go to the order center to complete the payment. **true**: enables automatic payment. After an order is generated, the system automatically deducts fees from your account balance to pay for the order. This parameter is required when **InstanceChargeType** is set to **PrePaid**. When **InstanceChargeType** is set to **PostPaid**, this parameter is not required. **Note** This parameter is unavailable for EIPs that are purchased on the Alibaba Cloud International site.
PricingCycle	String	No	Month	The billing cycle of the subscription EIP. Valid values: **Month**: billed on a monthly basis. This is the default value. **Year**: billed on an annual basis. This parameter is required when **InstanceChargeType** is set to **PrePaid**. When **InstanceChargeType** is set to **PostPaid**, this parameter is not required. **Note** This parameter is unavailable for EIPs that are purchased on the Alibaba Cloud International site.

Parameter	Type	Required	Example	Description
InstanceChargeType	String	No	PostPaid	The billing method of the EIP. Valid values: **PrePaid**: subscription. **PostPaid**: pay-as-you-go. This is the default value. When **InstanceChargeType** is set to **PrePaid**, you must set **InternetChargeType** to **PayByBandwidth**. When **InstanceChargeType** is set to **PostPaid**, you can set **InternetChargeType** to **PayByBandwidth** or **PayByTraffic**. **Note** If you want to purchase an EIP from the Alibaba Cloud International site, you must set this parameter to **PostPaid** (pay-as-you-go).
InternetChargeType	String	No	PayByTraffic	The metering method of the EIP. Valid values: **PayByBandwidth**: pay-by-bandwidth. This is the default value. **PayByTraffic**: pay-by-data-transfer. When **InstanceChargeType** is set to **PrePaid**, **InternetChargeType** must be set to **PayByBandwidth**. When **InstanceChargeType** is set to **PostPaid**, **InternetChargeType** can be set to **PayByBandwidth** or **PayByTraffic**.
ResourceGroupId	String	No	rg-acfmxazffggds****	The ID of the enterprise resource group.
ClientToken	String	No	0c593ea1-3bea-11e9-b96b-88e9fe637760	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must ensure that it is unique among different requests. **ClientToken** can contain only ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
EipAddress	String	10.XX.XX.78	The allocated EIP.
AllocationId	String	eip-25877c70gddh****	The ID of the EIP.
OrderId	Long	10	The order number. This parameter is returned only when **InstanceChargeType** is set to **PrePaid**.
RequestId	String	4EC47282-1B74-4534-BD0E-403F3EE64CAF	The ID of the request.
ResourceGroupId	String	rg-acfmxazfdgdg****	The ID of the enterprise resource group.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=AllocateEipAddress
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<AllocateEipAddressrResponse>
  <ResourceGroupId>rg-acfmxazfdgdg****</ResourceGroupId>
  <RequestId>4EC47282-1B74-4534-BD0E-403F3EE64CAF</RequestId>
  <AllocationId>eip-25877c70gddh****</AllocationId>
  <EipAddress>10.XX.XX.78</EipAddress>
  <OrderId>10</OrderId>
</AllocateEipAddressrResponse>
```

`JSON` format

```
{
    "AllocateEipAddressrResponse": {
        "ResourceGroupId": "rg-acfmxazfdgdg****",
        "RequestId": "4EC47282-1B74-4534-BD0E-403F3EE64CAF",
        "AllocationId": "eip-25877c70gddh****",
        "EipAddress": "10.XX.XX.78",
        "OrderId": 10
    }
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. Apply for permissions and try again.
400	QuotaExceeded.Eip	Elastic IP address quota exceeded	The error message returned because the number of EIPs reaches the quota. You can submit a ticket to request a quota increase. We recommend that you use NAT gateways.
400	InvalidParameter	Specified value of "InternetChargeType" is not valid	The error message returned because InternetChargeType is set to an invalid value.
400	InvalidParameter	Specified value of "Bandwidth" is not valid.	The error message returned because the specified bandwidth limit is invalid.
400	InsufficientBalance	Your account does not have enough balance.	The error message returned because the balance in your account is insufficient. Top up your account and try again.
400	QuotaExceeded.Eip	Elastic IP address quota exceeded.	The error message returned because the number of EIPs reaches the quota. You can submit a ticket to request a quota increase. We recommend that you use NAT gateways.
400	ReserveIpFail	Reserve eip failed.	The error message returned because the system failed to reserve the EIP.
400	InvalidRegion.NotSupport	The specified region does not support.	The error message returned because the specified region does not support this operation.

HttpCode	Error code	Error message	Description
400	InvalidResourceGroupId	The specified ResourceGroupId does not exist.	The error message returned because the specified resource group ID does not exist.
409	OperationConflict	Request was denied due to conflict with a previos request.	The error message returned because a request conflict occurs. Try again later or submit a ticket to report the problem.

18.1.2.5.2. AllocateEipAddressPro

Applies for a specified elastic IP address (EIP).

Request parameters

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region where you want to apply for a specified EIP. You can call the `DescribeRegions` operation to query region IDs.
IpAddress	String	No	12.XX.XX.23	The IP address of the specified EIP. Specify **IpAddress** or **InstanceId**. If you leave both parameters empty, the system randomly allocates an EIP to your account.
InstanceId	String	No	eip-25877c70gddh****	The ID of the specified EIP. Specify **IpAddress** or **InstanceId**. If you leave both parameters empty, the system randomly allocates an EIP to your account.
Bandwidth	String	No	5	The bandwidth limit of the specified EIP. Unit: Mbit/s. Default value: **1**. Unit: Mbit/s.

Parameter	Type	Required	Example	Description
Period	Integer	No	1	The subscription duration of the specified EIP. When **PricingCycle** is set to **Month**, **Period** can be set from **1** to **9**. When **PricingCycle** is set to Year, **Period** can be set from **1** to **3**. When **InstanceChargeType** is set to **PrePaid**, this parameter is required. When **InstanceChargeType** is set to **PostPaid**, ignore this parameter.
ISP	String	No	BGP	The line type. Default value: **BGP**. If your account is in the single-path BGP whitelist, you can set the parameter to **ChinaTelecom**, **ChinaUnicom**, or **ChinaMobile**. This parameter is required if your workloads are deployed in the China East 1 Finance region. In this case, set the value to **BGP_FinanceCloud**.
Netmode	String	No	public	The type of network. Set the value to **public** (Internet). Default value: **public** (Internet).
AutoPay	Boolean	No	true	Specifies whether to enable automatic payment. Valid values: **false**: disables automatic payment. After an order is generated, you must go to the order center to complete the payment. **true**: enables automatic payment. After an order is generated, the system automatically deducts fees from your account balance to pay for the order. When **InstanceChargeType** is set to **PrePaid**, this parameter is required. When **InstanceChargeType** is set to **PostPaid**, ignore this parameter.

Parameter	Type	Required	Example	Description
InstanceChargeType	String	No	PostPaid	The billing method of the specified EIP. Valid values: **PrePaid**: subscription. **PostPaid**: pay-as-you-go. This is the default value. When **InstanceChargeType** is set to **PrePaid**, **InternetChargeType** must be set to **PayByBandwidth**. When **InstanceChargeType** is set to **PostPaid**, **InternetChargeType** can be set to **PayByBandwidth** or **PayByTraffic**.
InternetChargeType	String	No	PayByBandwidth	The metering method of the specified EIP. Valid values: **PayByBandwidth** (default): pay-by-bandwidth **PayByTraffic**: pay-by-data-transfer. When **InstanceChargeType** is set to **PrePaid**, **InternetChargeType** must be set to **PayByBandwidth**. When **InstanceChargeType** is set to **PostPaid**, **InternetChargeType** can be set to **PayByBandwidth** or **PayByTraffic**.
ResourceGroupId	String	No	rg-resourcegroup****	The ID of the resource group to which the EIP belongs.
ClientToken	String	No	0c593ea1-3bea-11e9-b96b-88e9fe637760	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must ensure that it is unique among different requests. **ClientToken** can contain only ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
AllocationId	String	eip-25877c70gddh****	The ID of the specified EIP.

Parameter	Type	Example	Description
EipAddress	String	12.XX.XX.23	The IP address of the specified EIP.
OrderId	Long	20190000	The ID of the order.
RequestId	String	4EC47282-1B74-4534-BD0E-403F3EE64CAF	The ID of the request.
ResourceGroupId	String	rg-resourcegroup****	The ID of the resource group to which the EIP belongs.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=AllocateEipAddressPro
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<AllocateEipAddressProResponse>
  <ResourceGroupId>rg-resourcegroup****</ResourceGroupId>
  <RequestId>4EC47282-1B74-4534-BD0E-403F3EE64CAF</RequestId>
  <AllocationId>eip-25877c70gddh****</AllocationId>
  <EipAddress>12.XX.XX.23</EipAddress>
  <OrderId>20190000</OrderId>
</AllocateEipAddressProResponse>
```

`JSON` format

```
{
    "ResourceGroupId": "rg-resourcegroup****",
    "RequestId": "4EC47282-1B74-4534-BD0E-403F3EE64CAF",
    "AllocationId": "eip-25877c70gddh****",
    "EipAddress": "12.XX.XX.23",
    "OrderId": 20190000
}
```

Error codes

HttpCode	Error code	Error message	Description

HttpCode	Error code	Error message	Description
403	Forbbiden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. Apply for permissions and try again.
400	QuotaExceeded.Eip	Elastic IP address quota exceeded	The error message returned because the number of EIPs reaches the quota. You can submit a ticket to request a quota increase. We recommend that you use NAT gateways.
400	InvalidParameter	Specified value of "InternetChargeType" is not valid	The error message returned because InternetChargeType is set to an invalid value.
400	InvalidParameter	Specified value of "Bandwidth" is not valid.	The error message returned because the specified bandwidth limit is invalid.
400	InsufficientBalance	Your account does not have enough balance.	The error message returned because the balance in your account is insufficient. Top up your account and try again.
400	QuotaExceeded.Eip	Elastic IP address quota exceeded.	The error message returned because the number of EIPs reaches the quota. You can submit a ticket to request a quota increase. We recommend that you use NAT gateways.
400	ReserveIpFail	Reserve eip failed.	The error message returned because the system failed to reserve the specified EIP.
400	InvalidRegion.NotSupport	The specified region does not support.	The error message returned because the specified region does not support this operation.
400	InvalidResourceGroupId	The specified ResourceGroupId does not exist.	The error message returned because the specified resource group ID does not exist.

18.1.2.5.3. AssociateEipAddress

Associates an elastic IP address (EIP) with an instance that belongs to the same region as the EIP.

Description

When you call the operation, take note of the following items:

- You can associate an EIP with an Elastic Compute Service (ECS) instance, a Server Load Balancer (SLB) instance, a secondary elastic network interface (ENI), or a NAT gateway that is deployed in a virtual private cloud (VPC). The EIP and the instance with which you want to associate the EIP must belong to the same region.
- To associate an EIP with a NAT gateway, make sure that no NAT service plan that was purchased before November 3, 2017 exists in your account.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	AssociateEipAddress	The operation that you want to perform. Set the value to **AssociateEipAddress**.
AllocationId	String	Yes	eip-2zeerraiwb7ujsxdc****	The ID of the EIP that you want to associate with an instance.
InstanceId	String	Yes	i-2zebb08phyczzawe****	The ID of the instance with which you want to associate the EIP. NAT gateways, SLB instances, ECS instances, secondary ENIs, and high-availability virtual IP addresses (HAVIPs) are supported.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region to which the EIP belongs.
InstanceType	String	No	EcsInstance	The type of instance with which you want to associate the EIP. Valid values: • **Nat**: a NAT gateway • **SlbInstance**: an SLB instance • **EcsInstance**: an ECS instance • **NetworkInterface**: a secondary ENI • **HaVip**: an HAVIP
InstanceRegionId	String	No	cn-hangzhou	The ID of the region where the instance to be associated with the EIP is deployed. **Note** This parameter is required only when the EIP is associated with a shared-bandwidth Global Accelerator (GA) instance.

Parameter	Type	Required	Example	Description
PrivateIpAddress	String	No	192.XX.XX.4	An IP address that belongs to the CIDR block of a vSwitch. If you do not set this parameter, the system allocates a private IP address based on the VPC ID and vSwitch ID.
Mode	String	No	NAT	The mode in which you associate the EIP. Valid values: • **NAT** (default): NAT mode • **MULTI_BINDED**: multi-EIP to ENI mode • **BINDED**: cut-through mode Note This parameter does not support **BINDED**. Log on to the console to set the cut-through mode. This parameter is required only when **InstanceType** is set to **NetworkInterface**.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-001sdfg	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must ensure that it is unique among different requests. **ClientToken** can contain only ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	C0FD0EED-F90D-4479-803D-DD62335357E5	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=AssociateEipAddress
&AllocationId=eip-2zeerraiwb7ujsxdc****
&InstanceId=i-2zebb08phyczzawe****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<AssociateEipAddressResponse>
  <RequestId>C0FD0EED-F90D-4479-803D-DD62335357E5</RequestId>
</AssociateEipAddressResponse>
```

`JSON` format

```
{
    "RequestId": "C0FD0EED-F90D-4479-803D-DD62335357E5"
}
```

Error codes

HttpCode	Error code	Error message	Description
400	InvalidAssociation.Duplicated	Specified instance already is associated.	The error message returned because an EIP or a GA instance is already associated with the specified instance. You must disassociate the EIP or GA instance from the specified instance before you can perform the operation.
400	OperationDenied	Specified instance is not in VPC.	The error message returned because the specified instance does not exist in the VPC.
400	InvalidParameter.Mismatch	Specified elastic IP address and ECS instance are not in the same region.	The error message returned because the specified EIP and ECS instance do not belong to the same region.
400	IncorrectEipStatus	Current elastic IP status does not support this operation	The error message returned because the state of the EIP does not support the operation.
404	InvalidInstanId.NotFound	Specified instance does not exist.	The error message returned because the specified instance does not exist. Check whether the ID is valid.

HttpCode	Error code	Error message	Description
400	IncorrectInstanceStatus	Current instance status does not support this operation.	The error message returned because the state of the instance does not support the operation.
400	InvalidInstanceType.ValueNotSupported	The specified value of InstanceType is not supported.	The error message returned because InstanceType is set to an invalid value.
400	IncorrectHaVipStatus	HaVip can be operated by this action only when it's status is Available or InUse.	The error message returned because the state of the HAVIP does not support the operation. You can perform the operation only when the HAVIP is in the Available or InUse state.
400	InvalidParameter	The specified parameter is not valid.	The error message returned because the parameter is set to an invalid value.
400	OperationDenied	Eip of default vpc not allow this operation	The error message returned because EIPs in the default VPC do not support the operation.
400	Forbbiden	The eip instance owener error	The error message returned because you are unauthorized to perform the operation on the EIP.
400	InvalidBindingStatus	The eip binding status invalid.	The error message returned because the binding mode of the EIP is invalid.
400	BIND_INSTANCE_HAVE_PORTMAP_OR_BIND_EIP	The instance may have portMap or already bind eip.	The error message returned because a port forwarding rule is configured for the ECS instance. Delete the port forwarding rule and try again.
400	BIND_INSTANCE_OWENER_ERROR	Cannot operate the eip.	The error message returned because you are unauthorized to manage the specified EIP.
404	InvalidAllocationId.NotFound	Specified allocation ID is not found	The error message returned because the specified EIP does not exist. Check whether the value of the parameter is valid.
400	InvalidParams.NotFound	instance not found	The error message returned because the specified instance does not exist.

HttpCode	Error code	Error message	Description
503	ServiceUnavailable	The request has failed due to a temporary failure of the server.	The error message returned because the request failed due to a temporary malfunction of the server.

18.1.2.5.4. ModifyEipAddressAttribute

Modifies the name, description, and bandwidth limit of a specified elastic IP address (EIP).

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyEipAddressAttribute	The operation that you want to perform. Set the value to **ModifyEipAddressAttribute**.
AllocationId	String	Yes	eip-2zeerraiwb7uj6i0d****	The ID of the EIP that you want to modify.
Bandwidth	String	No	100	The bandwidth limit of the EIP. Valid values: **1** to **200**. Unit: Mbit/s.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region to which the EIP belongs.
Name	String	No	Test123	The name of the EIP. The name must be 2 to 128 characters in length, and can contain, digits, periods (.), underscores (_), and hyphens (-). It must start with a letter. The name cannot start with `http://` or `https://`.
Description	String	No	abc	The description of the EIP. The description must be 2 to 256 characters in length. It must start with a letter but cannot start with `http://` or `https://`.

Response parameters

Parameter	Type	Example	Description
RequestId	String	4EC47282-1B74-4534-BD0E-403F3EE64CAF	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ModifyEipAddressAttribute
&AllocationId=eip-2zeerraiwb7uj6i0d****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyEipAddressAttributeResponse>
      <RequestId>0ED8D006-F706-4D23-88ED-E11ED28DCAC0</RequestId>
</ModifyEipAddressAttributeResponse>
```

`JSON` format

```
{
    "ModifyEipAddressAttributeResponse": {
        "RequestId": "0ED8D006-F706-4D23-88ED-E11ED28DCAC0"
    }
}
```

Error codes

HttpCode	Error code	Error message	Description
400	InsufficientBalance.Eip	Your account does not have enough balance.	The error message returned because the balance in your account is insufficient. Top up your account and try again.
404	InvalidAllocationId.NotFound	Specified allocation ID is not found	The error message returned because the specified EIP does not exist. Check whether the value of the parameter is valid.
400	InvalidParameter	Specified value of "Bandwidth" is not supported.	The error message returned because the specified bandwidth limit is invalid.
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an unknown error occurred.

HttpCode	Error code	Error message	Description
400	IncorrectEipStatus	Current elastic IP status does not support this operation.	The error message returned because the state of the EIP does not support this operation.
404	InvalidAllocationId.NotFound	Specified allocation ID is not found..	The error message returned because the specified EIP does not exist. Check whether the value of the parameter is valid.
400	InvalidParameter	The parameter is invalid.	The error message returned because the parameter is set to an invalid value.
404	Forbidden.RegionNotFound	Specified region is not found during access authentication.	The error message returned because the specified region does not exist. Check whether the specified region ID is valid.

18.1.2.5.5. UnassociateEipAddress

Disassociates an elastic IP address (EIP) from an instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	UnassociateEipAddress	The operation that you want to perform. Set the value to **UnassociateEipAddress**.
AllocationId	String	Yes	eip-2zeerraiwb7uj6i0d****	The ID of the EIP that you want to disassociate.
InstanceId	String	Yes	i-hp3akk9irtd69jad****	The ID of the instance from which you want to disassociate the EIP.
Force	Boolean	No	false	Specifies whether to disassociate the EIP from a NAT gateway if a DNAT or SNAT entry is added to the NAT gateway. Valid values: • **false** (default): does not disassociate the EIP from a NAT gateway if a DNAT or SNAT entry is added to the NAT gateway. • **true**: disassociates the EIP from a NAT gateway if a DNAT or SNAT entry is added to the NAT gateway.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region to which the EIP belongs.
InstanceType	String	No	EcsInstance	The type of instance from which you want to disassociate the EIP. Valid values: • **EcsInstance** (default): an Elastic Compute Service (ECS) instance that is deployed in a virtual private cloud (VPC) • **SlbInstance**: a Server Load Balancer (SLB) instance that is deployed in a VPC • **NetworkInterface**: a secondary elastic network interface (ENI) that is deployed in a VPC • **Nat**: a NAT gateway • **HaVip** a high-availability virtual IP address (HAVIP)
PrivateIpAddress	String	No	192.XX.XX.2	The private IP address of the ECS instance or the secondary ENI from which you want to disassociate the EIP.
ClientToken	String	No	02fb3da4-130e-11e9-8e44-001***	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must ensure that it is unique among different requests. ClientToken can contain only ASCII characters and cannot exceed 64 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	0ED8D006-F706-4D23-88ED-E11ED28DCAC0	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=UnassociateEipAddress
&AllocationId=eip-2zeerraiwb7uj6i0d****
&InstanceId=i-hp3akk9irtd69jad****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<UnassociateEipAddressResponse>
   <RequestId>0ED8D006-F706-4D23-88ED-E11ED28DCAC0</RequestId>
</UnassociateEipAddressResponse>
```

`JSON` format

```
{
    "RequestId": "0ED8D006-F706-4D23-88ED-E11ED28DCAC0"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidAllocationId.NotFound	Specified allocation ID is not found	The error message returned because the specified EIP does not exist. Check whether the value of the parameter is valid.
400	IncorrectEipStatus	Current elastic IP status does not support this operation.	The error message returned because the state of the EIP does not support this operation.
400	InvalidInstanceId.NotFound	Specified instance does not exist.	The error message returned because the specified instance does not exist. Check whether the specified instance is valid.
400	IncorrectInstanceStatus	The current status of instance does not support this operation.	The error message returned because the state of the instance does not support the operation.
400	InvalidInstanceType.ValueNotSupported	The specified value of InstanceType is not supported.	The error message returned because InstanceType is set to an invalid value.
400	IncorrectHaVipStatus	This operation is denied because satus of the specified HaVip is neither Available nor InUse.	The error message returned because you cannot perform the operation when the specified HAVIP is in the Available or InUse state.

HttpCode	Error code	Error message	Description
400	OperationDenied	Eip of default vpc not allow this operation	The error message returned because EIPs in the default VPC do not support the operation.
404	Forbidden.RegionNotFound	Specified region is not found during access authentication.	The error message returned because the specified region does not exist. Check whether the specified region ID is valid.
400	InvalidParameter	The specified parameter is not valid.	The error message returned because the parameter is set to an invalid value.
400	Forbbiden	The eip instance owener error	The error message returned because you are unauthorized to perform the operation on the EIP.
400	InvalidBindingStatus	The eip binding status invalid.	The error message returned because the binding mode of the EIP is invalid.

18.1.2.5.6. ReleaseEipAddress

Releases a specified elastic IP address (EIP).

Description

Before you release an EIP, make sure that the EIP meets the following requirements:

- You can release only EIPs that are in the **Available** state.
- You can release only EIPs that are billed on a pay-as-you-go basis. You cannot release subscription EIPs.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ReleaseEipAddress	The operation that you want to perform. Set the value to **ReleaseEipAddress**.
AllocationId	String	Yes	eip-2zeerraiwb7uj6i0d****	The ID of the EIP that you want to release.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region to which the EIP belongs. You can call the `DescribeRegions` operation to query region IDs.

Response parameters

Parameter	Type	Example	Description
RequestId	String	748C38F6-9A3D-482E-83FB-DB6C39C68AEA	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ReleaseEipAddress
&AllocationId=eip-2zeerraiwb7uj6i0d****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ReleaseEipAddressResponse>
      <RequestId>748C38F6-9A3D-482E-83FB-DB6C39C68AEA</RequestId>
</ReleaseEipAddressResponse>
```

`JSON` format

```
{
  "RequestId": "748C38F6-9A3D-482E-83FB-DB6C39C68AEA"
}
```

Error codes

HttpCode	Error code	Error message	Description
404	InvalidAllocationId.NotFound	Specified allocation ID is not found	The error message returned because the specified EIP does not exist. Check whether the value of the parameter is valid.
400	IncorrectEipStatus	Current elastic IP status does not support this operation.	The error message returned because the state of the EIP does not support this operation.

HttpCode	Error code	Error message	Description
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an unknown error occurred.
404	Forbidden.RegionNotFound	Specified region is not found during access authentication.	The error message returned because the specified region does not exist. Check whether the specified region ID is valid.
400	Forbidden.ChargeTypeIsPrepaid	It's forbidden to release a prepaid EIP	The error message returned because you cannot release subscription EIPs.
400	Forbbiden	The eip instance owener error	The error message returned because you are unauthorized to perform the operation on the EIP.
400	TaskConflict.AssociateGlobalAccelerationInstance	Operate too frequent.	The error message returned because the number of requests that you send exceeds the upper limit.

18.1.2.5.7. DescribeEipGatewayInfo

Queries information about the gateway and subnet mask of an elastic IP address (EIP).

Description

You can query only EIPs that are associated with secondary elastic network interfaces (ENIs) in multi-EIP to ENI mode.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeEipGatewayInfo	The operation that you want to perform. Set the value to **DescribeEipGatewayInfo**.
InstanceId	String	Yes	eni-bp1d66qjxb3qoin3****	The ID of the secondary ENI that is associated with the EIP.
RegionId	String	Yes	cn-qingdao-env17-d01	The region to which the EIP that you want to query belongs. You can call the `DescribeRegions` operation to query region IDs.

Response parameters

Parameter	Type	Example	Description
Code	String	200	The status code of the operation.
EipInfos	Array of EipInfo		Detailed information about the EIP.
EipInfo			
Ip	String	47.XX.XX.236	The IP address of the EIP.
IpGw	String	47.XX.XX.1	The IP address of the gateway that is associated with the EIP.
IpMask	String	255.255.255.0	The subnet mask of the EIP.
Message	String	successful	The result of the operation.
RequestId	String	C0FD0EED-F90D-4479-803D-DD62335357E5	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeEipGatewayInfo
&InstanceId=eni-bp1d66qjxb3qoin3****
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeEipGatewayInfoResponse>
  <Message>successful</Message>
  <RequestId>C0FD0EED-F90D-4479-803D-DD62335357E5    </RequestId>
  <Code>200</Code>
  <EipInfos>
        <IpMask>255.255.255.0</IpMask>
        <IpGw>47.XX.XX.1</IpGw>
        <Ip>47.XX.XX.236</Ip>
  </EipInfos>
</DescribeEipGatewayInfoResponse>
```

`JSON` format

```
{
    "Message": "successful",
    "RequestId": "C0FD0EED-F90D-4479-803D-DD62335357E5",
    "Code": 200,
    "EipInfos": {
        "IpMask": "255.255.255.0",
        "IpGw": "47.XX.XX.1",
        "Ip": "47.XX.XX.236"
    }
}
```

Error codes

HttpCode	Error code	Error message	Description
403	Forbbiden	User not authorized to operate on the specified resource.	The error message returned because you are unauthorized to perform the operation on the specified resource. Apply for permissions and try again.

19.Apsara Stack Security

19.1. Developer Guide

19.1.1. Apsara Stack Security Console

19.1.1.1. List of operations

This topic introduces all of the Apsara Stack Security console operations that you can call. For more information, see the corresponding operation description.

Operation	Description
DescribeAliyunAccounts	Queries Alibaba Cloud accounts.
ModifyAliyunAccount	Modifies the information of an Alibaba Cloud account.
DescribeFeatures	Queries the deployed Apsara Stack Security features.

19.1.1.2. Make API requests

19.1.1.2.1. Request structure

Apsara Stack Security API operations use the RPC protocol. This topic describes the structure of API requests.

Description

You can call Apsara Stack Security API operations by sending HTTP requests. The request syntax is as follows:

```
http://endpoint/?Action=xx&parameters
```

where:

- `endpoint`: the endpoint used to call a cloud service. The endpoint for the Apsara Stack Security console is `yundunprivate.[ RegionId].example.com`.

  > **Note** example.com indicates the domain name of Apsara Stack.

- `Action`: the name of the operation being performed.

  For example, to obtain Apsara Stack Security features that have been deployed, you must set the Action parameter to DescribeFeatures.

- `parameters`: the request parameters for the operation. Separate multiple parameters with ampersands (&). Request parameters include both common parameters and operation-specific parameters.

- Common parameters include information such as the API version and authentication information.
- For more information about operation-specific parameters, see the corresponding operation description.

Example

Call the DescribeFeatures operation to query the Apsara Stack Security features that are deployed.

```
https://yundunprivate.[ RegionId].example.com/?Action=DescribeFeatures&AccessKeyId=key-test
&Format=JSON&SecureTransport=true&SignatureMethod=HMAC-SHA1&SignatureNonce=15215528852396&S
ignatureVersion=1.0&SourceIp=1xxxx6&Timestamp=2018-03-02Txxxxxxx&Version=2018-01-16&Signatu
re=xxxx%xxxx%3D
```

API requests are presented in the following easy-to-read format in this document:

```
https://yundunprivate.[ RegionId].example.com/?Action=DescribeFeatures
&Format=JSON
&Version=2018-01-16
&Signature=xxxx%xxxx%3D
&SignatureMethod=HMAC-SHA1
&SignatureNonce=15215528852396
&SignatureVersion=1.0
&AccessKeyId=key-test
&Timestamp=2012-06-01T12:00:00Z
```

19.1.1.2.2. Request signatures

Apsara Stack Security authenticates each access request. You need to include a signature for the submitted HTTP or HTTPS request.

Authorization

To ensure the security of your account, we recommend that you use a Resource Access Management (RAM) user to call operations. Before you use a RAM user to call an API operation, you must grant the RAM user the corresponding permission to call the operation by creating an authorization policy and attaching the policy to the RAM user.

Signature

You must sign all API requests to ensure security. Alibaba Cloud uses the request signature to verify the identity of the API caller. When you manually make an API request, you need to use the AccessKey Secret to calculate the signature, that is, the hash-based message authentication code (HMAC) value, based on the encoded and sorted request string. For more information, see the definition in RFC 2104.

This section uses the raw access parameters in the following table to describe how to create an operation signature.

Parameter	Description
Access point	`http://tds.[ RegionId].example.com/?`
Operation-specific parameters	`Action=DescribeFeatures`

Parameter	Description
Common parameters except Signature	&Timestamp=2018-12-24T12:46:24Z &Format=JSON &AccessKeyId=<yourAccessKeyId> &SignatureMethod=HMAC-SHA1 &SignatureNonce=3ee8c1b8-83d3-44af-a94f-4e0ad82fd6cf &Version=2018-12-03 &SignatureVersion=1.0
AccessKey Secret	<yourAccessKeySecret>

1. Create a canonicalized query string by arranging the request parameters.

   > **Note** The request parameters include operation-specific parameters and all common request parameters except Signature.

   i. Sort the parameters.

   Sort the request parameters in alphabetical order.

   ii. Encode the parameters.

   Use UTF-8 to URL-encode the parameter names and values. The encoding rules are as follows:

   - Uppercase letters, lowercase letters, digits, and some special characters such as hyphens (-), underscores (_), periods (.), and tildes (~) do not need to be encoded.
   - Other characters must be percent encoded in %XY format. XY represents the ASCII code of the characters in hexadecimal notation. For example, double quotation marks (") are encoded as %22.
   - Extended UTF-8 characters are encoded in %XY%ZA... format.
   - Spaces must be encoded as %20. Do not encode spaces as plus signs (+).

   iii. Connect the encoded parameter names and values with equal signs (=).

   iv. Then, sort the parameter name and value pairs connected by equal signs in alphabetical order. Connect them with ampersands (&) to canonicalize a query string.

2. Use the canonicalized query string to construct the string for signature calculation based on the following rules:

   ```
   StringToSign=HTTPMethod + "&" + percentEncode("/") + "&" +
   percentEncode(CanonicalizedQueryString)
   ```

3. Calculate the HMAC value of the StringToSign based on the definition in RFC 2104.

   > **Note** The key used for signature calculation is your AccessKey Secret jointed with an ampersand (&) (ASCII 38). Secure Hash Algorithm 1 (SHA1) is used as the hash algorithm.

4. Encode the HMAC value in Base64 to obtain the signature string.

   ```
   LEW8N4y7Uasop******
   ```

5. Add the signature string to the request as the Signature parameter.

19.1.1.2.3. Common parameters

Common request parameters must be included in all Apsara Stack Security API requests, such as the API version number and authentication information.

Parameter	Type	Required	Description
Version	String	Yes	The version number of the API. The value is in the format of YYYY-MM-DD. Set the value to *2018-01-16*.
AccessKeyId	String	Yes	The AccessKey ID provided to you by Alibaba Cloud.
Signature	String	Yes	The signature string of the current request.
SignatureMethod	String	Yes	The encryption method of the signature string. Set the value to *HMAC-SHA1*.
Timestamp	String	Yes	The timestamp of the request. Specify the time in the ISO 8601 standard in the `YYYY-MM-DDThh:mm:ssZ` format. The time must be in UTC. For example, 2014-05-26T12:00:00Z indicates 20:00:00 on May 26, 2014 (UTC+8).
SignatureVersion	String	Yes	The version of the signature encryption algorithm. Set the value to *1.0*.
SignatureNonce	String	Yes	A unique, random number used to prevent replay attacks. You must use different numbers for different requests.
ResourceOwnerAccount	String	No	The owner account (the logon username) of the resource you want to access by using this API request.
Format	String	No	The format of the response. Valid values: *JSON and XML*. Default value: XML.

19.1.1.2.4. Response structure

Apsara Stack Security API responses can be returned in either the XML or JSON format. Every response returns a unique ID (indicated by RequestId) regardless of whether the call is successful.

Sample responses (XML format)

```
<? xml version="1.0" encoding="UTF-8"? >
<! --The root node of the result-->
<Operation name+Response>
    <! --Returned request ID-->
    <RequestId>4C467B38-3910-447D-87BC-AC049166F216</RequestId>
    <! --Returned data-->
</Operation name+Response>
```

Sample responses (JSON format)

```
{
"RequestId": "4C467B38-3910-447D-87BC-AC049166F216",
/* Returned data */
}
```

19.1.1.3. APIs

19.1.1.3.1. DescribeAliyunAccounts

Description

You can call this operation to query Alibaba Cloud accounts.

Request parameters

Parameter	Type	Required	Description
Action	String	Yes	The operation that you want to perform. Set this parameter to *DescribeAliyunAccounts*.
CurrentPage	Integer	Yes	The number of the page to return.
PageSize	Integer	Yes	The number of records to return on each page.

Response parameters

Parameter	Type	Description
RequestId	String	The ID of the request.
CurrentPage	Integer	The number of the current page returned.

Parameter	Type	Description
PageSize	Integer	The number of records returned on each page.
TotalCount	Integer	The total number of returned pages.
HttpStatusCode	Integer	The HTTP status code returned.
AliyunAccounts	Array	The Alibaba Cloud accounts. For more information, see the following descriptions.
Id	Integer	The account record ID.
Aliuid	Long	The ID of the Alibaba Cloud account.
Account	String	The name of the Alibaba Cloud account.
AccessKey	String	The AccessKey ID of the Alibaba Cloud account.
AccessSecret	String	The AccessKey secret of the Alibaba Cloud account.
DataSecret	String	The DataSecret of the Alibaba Cloud account.
LicenseAegisNum	Integer	The number of Server Guard licenses.
LicenseTime	Long	The time when the licenses expire, in timestamp format.

Error codes

For more information about the error codes that this operation can return, see Error codes.

Examples

- Sample request

```
https://yundunprivate.[ RegionId].example.com/?Action=DescribeAliyunAccounts
&CurrentPage=1
&PageSize=10
&<Common request parameters>
```

- Sample response (JSON format)

```
{
 "TotalCount":1,
 "PageSize":30,
 "RequestId":"7E33A454-20AA-49B1-8A9B-8979EFBDEDFC",
 "CurrentPage":1,
 "AliyunAccounts":[
  {
   "Account":"1113454564",
   "AccessSecret":"*****",
   "AccessKey":"<yourAccessKeyId>",
   "Id":2,
   "LicenseAegisNum":0,
   "Aliuid":1441871509587522,
   "LicenseTime":1589596257000,
   "DataSecret":"*****"
  }
 ],
 "HttpStatusCode":200
}
```

19.1.1.3.2. ModifyAliyunAccount

Description

You can call this operation to modify the information of an Alibaba Cloud account with a specified account record ID.

Request parameters

Parameter	Type	Required	Description
Action	String	Yes	The operation that you want to perform. Set this parameter to *ModifyAliyunAccount*.
Id	Integer	Yes	The account record ID.
Aliuid	Long	No	The ID of the Alibaba Cloud account.
Account	String	No	The name of the Alibaba Cloud account.
AccessKey	String	No	The AccessKey ID of the Alibaba Cloud account.
AccessSecret	String	No	The AccessKey secret of the Alibaba Cloud account.

Response parameters

Parameter	Type	Description
RequestId	String	The ID of the request.

Error codes

For more information about the error codes that this operation can return, see Error codes.

Examples

- Sample request

```
https://yundunprivate.[ RegionId].example.com/?Action=ModifyAliyunAccount
&Id=2
&Account=1113454564
&Aliuid=1441871509587522
&AccessKey=<yourAccessKeyId>
&AccessSecret=xxxxxxxxx
&<Common request parameters>
```

- Sample response (JSON format)

```
{
 "RequestId":"C92B6187-603B-4E01-B0D7-74817F43852D"
}
```

19.1.1.3.3. DescribeFeatures

Description

You can call this operation to obtain a list of the deployed Apsara Stack Security features.

Request parameters

Name	Type	Required	Description
Action	String	Yes	The operation that you want to perform. Set the value to *DescribeFeatures*.

Response parameters

Name	Type	Description
RequestId	String	The GUID generated by Alibaba Cloud for the request.
Features	List	The list of the deployed Apsara Stack Security features.

Error codes

For more information about the error codes that this operation can return, see Error codes.

Examples

- Sample requests

```
https://yundunprivate.[ RegionId].example.com/?Action=DescribeFeatures
&<Common request parameters>
```

- Sample responses (JSON format)

```
{
 "RequestId":"BAEF6CE3-9990-4BDA-A056-4D269A724817",
 "Features":[
  "Basic",
  "Audit",
  "Sas",
  "Waf"
 ]
}
```

19.1.2. Threat Detection Service (TDS)

19.1.2.1. List of operations by function

The following tables list API operations available for use in Threat Detection Service.

- Configuration assessment
- Security alerts
- Vulnerability management
- Baseline checks
- Asset management
- Asset fingerprints
- Notifications

Configuration assessment

API	Description
DescribeRiskItemType	Queries the types of check items in configuration assessment.
StartBaselineSecurityCheck	Starts the baseline check.
DescribeRiskCheckSummary	Queries check results.
ModifyRiskCheckStatus	Modifies the status of a check result.
DescribeRiskCheckResult	Queries the result of a check item.
DescribeSecurityCheckScheduleConfig	Queries the custom check cycle and time period.
ModifyRiskSingleResultStatus	Modifies the status of an asset affected by a check item.

Security alerts

API	Description
DescribeAlarmEventDetail	Queries the details of an alert.
DescribeSuspEventDetail	Queries the details of an exception.
DescribeAlarmEventList	Queries alerts of the security alert module.
DescribeSuspEvents	Queries exceptions.

Vulnerability management

API	Description
DescribeVulList	Queries vulnerabilities.
DescribeEmgVulGroup	Queries urgent vulnerabilities by group.
DescribeVulWhitelist	Queries the vulnerability whitelist by page.
DescribeConcernNecessity	Queries the priority of a vulnerability.
DescribeGroupedVul	Queries vulnerabilities by group.
ModifyCreateVulWhitelist	Creates a vulnerability whitelist.
DescribeAutoDelConfig	Queries the configurations of automatic vulnerability deletion.
ModifyOperateVul	Manages a detected vulnerability. For example, you can verify, ignore, or fix a vulnerability.

Baseline checks

API	Description
DescribeWarningMachines	Queries information about servers where baseline checks are performed.
DescribeStrategyExecDetail	Queries the detailed results of the last baseline check.
DescribeCheckWarnings	Queries specific risk items and check items on a specific server.
DescribeCheckWarningDetail	Queries the details of a specific check item.
DescribeCheckWarningSummary	Queries the statistics of baseline check results.
DescribeStratety	Queries the configurations of baseline check policies.

Asset management

API	Description
DescribeFieldStatistics	Queries assets.
DescribeGroupedTags	Queries tag statistics.
DescribeAllGroups	Queries information about all asset groups.
DeleteGroup	Deletes a server group.
CreateOrUpdateAssetGroup	Modifies the relationship between an asset and an asset group.
ModifyTagWithUuid	Modifies the relationship between a tag and a server or a cloud service.
DescribeInstanceStatistics	Queries the statistics of an asset.
DescribeCloudProductFieldStatistics	Queries the statistics of a cloud service.
DescribeDomainCount	Queries the number of domain assets.
DescribeDomainList	Queries domain assets.
DescribeDomainDetail	Queries the details of a domain asset.
DescribeCloudCenterInstances	Queries the asset information on the Assets page, such as the name and region of an asset.
DescribeSummaryInfo	Queries the security score of assets, the number of protected assets, and the number of unprotected assets.

Asset fingerprints

API	Description
DescribePropertyCount	Queries asset fingerprints. You can query the following types of asset fingerprints: process, port, software, and account.
DescribePropertyPortDetail	Queries the details of a specific port.
DescribePropertyProcDetail	Queries the details of a specific process.
DescribePropertyProcItem	Queries port information.
DescribePropertyProcItem	Queries process information.
DescribePropertySoftwareDetail	Queries the details of a software asset.
DescribePropertySoftwareItem	Queries software assets.
DescribePropertyUserDetail	Queries the details of a specific account.
DescribePropertyUserItem	Queries account information.

19.1.2.2. Make API requests

19.1.2.2.1. Request structure

Apsara Stack Security API operations use the RPC protocol. This topic describes the structure of API requests.

Description

You can call Apsara Stack Security API operations by sending HTTP requests. The request syntax is as follows:

```
http://endpoint/?Action=xx&parameters
```

where:

- `endpoint`: the endpoint of the Threat Detection Service API is `tds.[ RegionId].example.com`.
- `Action`: the name of the operation being performed.

  For example, to query the Apsara Stack Security features that are deployed, you must set the Action parameter to DescribeFeatures.
- `parameters`: the request parameters for the operation. Separate multiple parameters with ampersands (&). Request parameters include both common parameters and operation-specific parameters.
  - Common parameters include information such as the API version and identity authentication.
  - For more information about operation-specific parameters, see the corresponding operation description.

Examples

The following example demonstrates how to call the DescribeFeatures operation to query the Apsara Stack Security features that are deployed.

```
https://tds.[RegionId].example.com/?Action=DescribeFeatures&AccessKeyId=key-test&Format=JSON&SecureTransport=true&SignatureMethod=HMAC-SHA1&SignatureNonce=15215528852396&SignatureVersion=1.0&SourceIp=1xxxx6&Timestamp=2018-03-02Txxxxxxx&Version=2018-01-16&Signature=xxxx%xxxx%3D
```

API requests are presented in the following easy-to-read format in this document:

```
https://tds.[RegionId].example.com/?Action=DescribeFeatures
&Format=JSON
&Version=2018-01-16
&Signature=xxxx%xxxx%3D
&SignatureMethod=HMAC-SHA1
&SignatureNonce=15215528852396
&SignatureVersion=1.0
&AccessKeyId=key-test
&Timestamp=2012-06-01T12:00:00Z
```

19.1.2.2.2. Request signatures

Apsara Stack Security authenticates each access request. You need to include a signature for the submitted HTTP or HTTPS request.

Authorization

To ensure the security of your account, we recommend that you use a Resource Access Management (RAM) user to call operations. Before you use a RAM user to call an API operation, you must grant the RAM user the corresponding permission to call the operation by creating an authorization policy and attaching the policy to the RAM user.

Signature

You must sign all API requests to ensure security. Alibaba Cloud uses the request signature to verify the identity of the API caller. When you manually make an API request, you need to use the AccessKey Secret to calculate the signature, that is, the hash-based message authentication code (HMAC) value, based on the encoded and sorted request string. For more information, see the definition in RFC 2104.

This section uses the raw access parameters in the following table to describe how to create an operation signature.

Parameter	Description
Access point	`http://tds.[ RegionId].example.com/?`
Operation-specific parameters	`Action=DescribeFeatures`

Common parameters except Signature	`&Timestamp=2018-12-24T12:46:24Z`
	`&Format=JSON`
	`&AccessKeyId=<yourAccessKeyId>`
	`&SignatureMethod=HMAC-SHA1`
	`&SignatureNonce=3ee8c1b8-83d3-44af-a94f-4e0ad82fd6cf`
	`&Version=2018-12-03`
	`&SignatureVersion=1.0`

AccessKey Secret	`<yourAccessKeySecret>`

1. Create a canonicalized query string by arranging the request parameters.

   > **Note** The request parameters include operation-specific parameters and all common request parameters except Signature.

   i. Sort the parameters.

   Sort the request parameters in alphabetical order.

ii. Encode the parameters.

Use UTF-8 to URL-encode the parameter names and values. The encoding rules are as follows:

- Uppercase letters, lowercase letters, digits, and some special characters such as hyphens (-), underscores (_), periods (.), and tildes (~) do not need to be encoded.
- Other characters must be percent encoded in %XY format. XY represents the ASCII code of the characters in hexadecimal notation. For example, double quotation marks (") are encoded as %22.
- Extended UTF-8 characters are encoded in %XY%ZA... format.
- Spaces must be encoded as %20. Do not encode spaces as plus signs (+).

iii. Connect the encoded parameter names and values with equal signs (=).

iv. Then, sort the parameter name and value pairs connected by equal signs in alphabetical order. Connect them with ampersands (&) to canonicalize a query string.

2. Use the canonicalized query string to construct the string for signature calculation based on the following rules:

```
StringToSign=HTTPMethod + "&" + percentEncode("/") + "&" +
percentEncode(CanonicalizedQueryString)
```

3. Calculate the HMAC value of the StringToSign based on the definition in RFC 2104.

> **Note** The key used for signature calculation is your AccessKey Secret jointed with an ampersand (&) (ASCII 38). Secure Hash Algorithm 1 (SHA1) is used as the hash algorithm.

4. Encode the HMAC value in Base64 to obtain the signature string.

```
LEW8N4y7Uasop******
```

5. Add the signature string to the request as the Signature parameter.

19.1.2.2.3. Common request parameters

The following table describes the common request parameters that are used to indicate information such as the API version and authentication information.

Name	Type	Required	Description
Version	String	Yes	The API version in the format of YYYY-MM-DD. Set the value to *2018-01-16*.
AccessKeyId	String	Yes	The key ID that Alibaba Cloud assigns to a user for service access.
Signature	String	Yes	The signature string.
SignatureMethod	String	Yes	The signature method. Set the value to *HMAC-SHA1*.

Name	Type	Required	Description
Timestamp	String	Yes	The timestamp of the request. Follow the ISO 8601 standard to specify the date and use the offset from Coordinated Universal Time (UTC) to specify the time zone. The format is `YYYY-MM-DDThh:mm:ssZ`. For example, 2014-05-26T12:00:00Z indicates 20:00:00 on May 26, 2014, Beijing time.
SignatureVersion	String	Yes	The signature algorithm version. Set the value to *1.0*.
SignatureNonce	String	Yes	The unique random number used to prevent network replay attacks. You must use different random numbers for different requests.
ResourceOwnerAccount	String	No	The owner account of the resource to be accessed through this API request, that is, the logon username.
Format	String	No	The format of the response. Set the value to *JSON or XML*. **Note** Default value: XML.

19.1.2.2.4. Response structure

Apsara Stack Security API responses support both the XML and JSON formats. The system always returns a unique identification code RequestId each time you send a request to call an operation, no matter whether the call is successful or not.

Sample responses (XML format)

```
<? xml version="1.0" encoding="UTF-8"? >
<! -- The root node of the result -->
<Operation name+Response>
    <! -- Returned request ID -->
    <RequestId>4C467B38-3910-447D-87BC-AC049166F216</RequestId>
    <! -- Returned data -->
</Operation name+Response>
```

Sample responses (JSON format)

```
{
"RequestId": "4C467B38-3910-447D-87BC-AC049166F216",
/* Returned data */
}
```

19.1.2.3. Brute-force attacks protection

19.1.2.3.1. CreateAntiBruteForceRule

Creates a defense rule against brute-force attacks protection.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateAntiBruteForceRule	The operation that you want to perform. Set the value to **CreateAntiBruteForceRule**.
SourceIp	String	No	1.2.3.4	The source IP address of the request.
Name	String	No	The defense rules against brute-force attacks protection.	The name of the defense rule.
Span	Integer	No	15	The time period during which the number of logon attempts are calculated.
FailCount	Integer	No	10	The maximum number of logon attempts specified in the defense rule.
ForbiddenTime	Integer	No	10	The time period during which logons from the blocked IP address are blocked.
UuidList.N	RepeatList	No	uuid-1312133-ssas,uuid-1234-qwer-dss	The list of servers to which the defense rule is applied.

Parameter	Type	Required	Example	Description
DefaultRule	Boolean	No	true	Specifies whether to set the defense rule as the default rule. Valid values: • **true**: The defense rule is set as the default rule. • **false**: The defense rule is not set as the default rule.

Response parameters

Parameter	Type	Example	Description
CreateAntiBruteForceRule	Struct		The returned result of the defense rule.
RuleId	Long	6363	The ID of the defense rule.
RequestId	String	FB3E435F-4116-46F9-A5DE-C338DDA04F47	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=CreateAntiBruteForceRule
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreateAntiBruteForceRuleResponse>
  <CreateAntiBruteForceRule>
        <RuleId>6363</RuleId>
  </CreateAntiBruteForceRule>
  <requestId>FB3E435F-4116-46F9-A5DE-C338DDA04F47</requestId>
</CreateAntiBruteForceRuleResponse>
```

`JSON` format

```
{
    "CreateAntiBruteForceRule": {
        "RuleId": 6363
    },
    "requestId": "FB3E435F-4116-46F9-A5DE-C338DDA04F47"
}
```

Error codes

For a list of error codes, see Error codes.

19.1.2.3.2. ModifyAntiBruteForceRule

Modifies the defense rule against brute-force attacks protection.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyAntiBruteForceRule	The operation that you want to perform. Set the value to ModifyAntiBruteForceRule.
SourceIp	String	No	1.2.3.4	The source IP address of the request.
Id	Long	No	6263	The ID of the defense rule.
Name	String	No	Best practices	The name of the defense rule.
Span	Integer	No	10	The time period during which the number of logon attempts are calculated.
FailCount	Integer	No	10	The maximum number of logon attempts specified in the defense rule.
ForbiddenTime	Integer	No	12	The time period during which logons from the blocked IP address are blocked.
UuidList.N	RepeatList	No	uuid-13213-dasda	The list of servers to which the defense rule is applied.
DefaultRule	Boolean	No	true	Specifies whether to set the defense rule as the default rule. • **true**: The defense rule is set as the default rule. • **false**: The defense rule is not set as the default rule.

Response parameters

Parameter	Type	Example	Description
RequestId	String	F35F45B0-5D6B-4238-BE02-A62D0760E840	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ModifyAntiBruteForceRule
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyAntiBruteForceRuleResponse>
  <requestId>F35F45B0-5D6B-4238-BE02-A62D0760E840</requestId>
</ModifyAntiBruteForceRuleResponse>
```

`JSON` format

```
{
    "requestId": "F35F45B0-5D6B-4238-BE02-A62D0760E840"
}
```

19.1.2.4. Notifications

19.1.2.4.1. DescribeDingTalk

Queries DingTalk notifications.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeDingTalk	The operation that you want to perform. Set the value to DescribeDingTalk.
RuleActionName	String	No	Vulnerability notification	The name of the notification.
PageSize	Integer	No	20	The number of entries to return on each page.

Parameter	Type	Required	Example	Description
CurrentPage	Integer	No	1	The page number of the current page.

Response parameters

Parameter	Type	Example	Description
RequestId	String	B256A525-7E42-4BB9-A27C-9017FDDFF1A2	The ID of the request.
ActionList	Array		The list of notifications.
GmtModified	Long	1550828400000	The timestamp when the notification was modified.
Id	Integer	1	The ID of the notification.
AliUid	Long	12312412341	The UID of the user.
GmtCreate	Long	1550828400000	The timestamp when the notification was created.
Url	String	https://oapi.dingtalk.com/robot/send	The parameters of the notification.
IntervalTime	Integer	1000	The notification interval.
ActionName	String	Alert notification	The name of the notification.
Status	Integer	1	The status of the notification. Valid values: • **0**: disabled • **1**: enabled
ConfigList	String	[{\"type\":\"vul\",\"configItemList\":[{\"key\":\"key\",\"valueList\":\"123\"}]}]	The list of notification settings.
GroupIdList	String	"123,456"	GroupidList.

Parameter	Type	Example	Description
DingTalkLang	String	zh	The natural language of notifications. Valid values: • **zh**: Chinese • **en**: English
PageInfo	Struct		The page information.
PageSize	Integer	20	The number of entries returned per page.
TotalCount	Integer	1	The number of notifications.
CurrentPage	Integer	1	The page number of the current page.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeDingTalk
&<Common request parameters>
```

Sample success responses

`XML` format

```
<data >
    <PageInfo>
        <PageSize>20</PageSize>
        <CurrentPage>1</CurrentPage>
        <TotalCount>1</TotalCount>
    </PageInfo>
    <ActionList>
        <ActionName>Alert notification</ActionName>
        <GmtCreate>1550828400000</GmtCreate>
        <GmtModified>1550828400000</GmtModified>
        <IntervalTime>1000</IntervalTime>
        <Id>1</Id>
        <Url>https://oapi.dingtalk.com/robot/send</Url>
        <AliUid>12312412341</AliUid>
        <configList>[{"type":"vul","configItemList":[{"key":"key", "valueList":"123"}]}]</c
onfigList>
        <groupIdList>123,456</groupIdList>
    </ActionList>
</data >
<requestId>B256A525-7E42-4BB9-A27C-9017FDDFF1A2</requestId>
```

`JSON` format

```
{
  "data ": {
    "PageInfo": {
      "PageSize": 20,
      "CurrentPage": 1,
      "TotalCount":1
    },
    "ActionList": [{
      "ActionName": "Alert notification",
      "GmtCreate": "1550828400000",
      "GmtModified": "1550828400000",
      "IntervalTime": 1000,
      "Id": 1,
      "Url": "https://oapi.dingtalk.com/robot/send",
      "AliUid": 12312412341,
      "configList":"[{\"type\":\"vul\",\"configItemList\":[{\"key\":\"key\", \"valueList\":
\"123\"}]}]",
      "groupIdList":"123,456"
    }]
  },
  "requestId": "B256A525-7E42-4BB9-A27C-9017FDDFF1A2"
}
```

Error codes

For a list of error codes, see Error codes.

19.1.2.4.2. DescribeNoticeConfig

Queries the notification settings.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeNoticeConfig	The operation that you want to perform. Set the value to DescribeNoticeConfig.
SourceIp	String	No	1.2.3.4	The source IP address of the request.

Response parameters

Parameter	Type	Example	Description
RequestId	String	D185B7FF-E24C-422D-83D3-C2A25C7A2727	The ID of the request.

Parameter	Type	Example	Description
NoticeConfigList	Array		Details of the notification settings.
TimeLimit	Integer	1	The time period during which notifications can be sent to the recipients. Valid values: • **0**: any time • **1**: 08:00 to 22:00
Route	Integer	7	The notification method.
Project	String	sas_suspicious	The project identifier.
AliUid	Long	121234141424	The UID of the user.
CurrentPage	Integer	1	The page number of the current page.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=DescribeNoticeConfig
&<Common request parameters>
```

Sample success responses

`XML` format

```
<code>200</code>
<data>
    <RequestId>D185B7FF-E24C-422D-83D3-C2A25C7A2727</RequestId>
    <NoticeConfigList>
        <Project>sas_suspicious</Project>
        <CurrentPage>1</CurrentPage>
        <TimeLimit>1</TimeLimit>
        <Route>7</Route>
        <AliUid>1049769453489698</AliUid>
    </NoticeConfigList>
    <NoticeConfigList>
        <Project>sas_healthcheck</Project>
        <CurrentPage>1</CurrentPage>
        <TimeLimit>1</TimeLimit>
        <Route>7</Route>
        <AliUid>1049769453489698</AliUid>
    </NoticeConfigList>
</data>
```

`JSON` format

```
{
  "code": 200,
  "data": {
  "RequestId":"D185B7FF-E24C-422D-83D3-C2A25C7A2727",
  "NoticeConfigList":[
    {
      "Project":"sas_suspicious",
      "CurrentPage":1,
      "TimeLimit":1,
      "Route":7,
      "AliUid":10497611111111
    },
    {
      "Project":"sas_healthcheck",
      "CurrentPage":1,
      "TimeLimit":1,
      "Route":7,
      "AliUid":10422222222
    }
  ]
}
}
```

Error codes

For a list of error codes, see Error codes.

19.1.2.5. Agent client

19.1.2.5.1. SasInstallCode

Queries the verification key used to run the agent installation command.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	SasInstallCode	The operation that you want to perform. Set the value to SasInstallCode.
SourceIp	String	No	1.2.3.4	The source IP address of the request.

Response parameters

Parameter	Type	Example	Description
RequestId	String	B256A525-7E42-4BB9-A27C-9017FDDFF1A2	The ID of the request.
data	String	eDkhGP	The verification key used to run the installation command when you manually install the Threat Detection Service agent.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=SasInstallCode
&<Common request parameters>
```

Sample success responses

`XML` format

```
<SasInstallCodeResponse>
  <requestId>B256A525-7E42-4BB9-A27C-9017FDDFF1A2</requestId>
  <data>eDkhGP</data>
</SasInstallCodeResponse>
```

`JSON` format

```
{
  "requestId": "B256A525-7E42-4BB9-A27C-9017FDDFF1A2",
  "data":"eDkhGP"
}
```

Error codes

For a list of error codes, see Error codes.

19.1.2.5.2. PauseClient

Enables or disables the Threat Detection Service agent.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	PauseClient	The operation that you want to perform. Set the value to **PauseClient**.

Parameter	Type	Required	Example	Description
Uuids	String	Yes	uuid-1211-sadsd-2131	The UUIDs of servers for which the Threat Detection Service agent needs to be enabled or disabled.
Value	String	Yes	1	The status of the Threat Detection Service agent. Valid values: • 0: disabled • 1: enabled

Response parameters

Parameter	Type	Example	Description
RequestId	String	6673D49C-A9AB-40DD-B4A2-B92306701AE7	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=PauseClient
&Uuids=uuid-1211-sadsd-2131
&Value=1
&<Common request parameters>
```

Sample success responses

`XML` format

```
<PauseClientResponse>
  <requestId>6673D49C-A9AB-40DD-B4A2-B92306701AE7</requestId>
</PauseClientResponse>
```

`JSON` format

```
{
 "requestId": "6673D49C-A9AB-40DD-B4A2-B92306701AE7"
}
```

Error codes

For a list of error codes, see Error codes.

19.1.2.6. Export check results

19.1.2.6.1. ExportRecord

Exports baseline check, asset fingerprint check, and AccessKey leak check results to Excel files.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ExportRecord	The operation that you want to perform. Set the value to **ExportRecord**.
ExportType	String	Yes	accessKey	The type of the check whose result can be exported. Valid values: • **baseline**: Alibaba Cloud service baseline • **assetInstance**: assets • **attack**: attack analysis • **accessKey**: AccessKey pair leaks • **user**: the accounts covered by asset fingerprints • **port**: the ports covered by asset fingerprints • **process**: the processes covered by asset fingerprints • **software**: the software covered by asset fingerprints
Lang	String	No	zh	The natural language of the request and response. Valid values: • **zh**: Chinese • **en**: English
Params	String	No	{"level":"high"}	The conditions to filter check results in the files to which the check results are exported.

Response parameters

Parameter	Type	Example	Description
FileName	String	cms_20171101.xlsx	The name of the exported file.
Id	Long	131231	The ID of the exported file.

Parameter	Type	Example	Description
RequestId	String	6673D49C-A9AB-40DD-B4A2-B92306701AE7	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ExportRecord
&ExportType=accessKey
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ExportRecordResponse>
  <Id>131231</Id>
  <FileName>cms_20171101.xlsx</FileName>
  <requestId>6673D49C-A9AB-40DD-B4A2-B92306701AE7</requestId>
</ExportRecordResponse>
```

`JSON` format

```
{
    "Id": 131231,
    "FileName" : "cms_20171101.xlsx",
    "requestId": "6673D49C-A9AB-40DD-B4A2-B92306701AE7"
}
```

Error codes

For a list of error codes, see Error codes.

19.1.2.7. Virus detection

19.1.2.7.1. OperateSuspiciousTargetConfig

Configures virus detection.

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	OperateSuspiciousTargetConfig	The operation that you want to perform. Set the value to **OperateSuspiciousTargetConfig**.
TargetOperations	String	Yes	"[{\"targetType\":\"uuid\",\"target\":\"0585f81a-dd84-4ddf-9971-f59d12345678\",\"flag\":\"add\"},{\"targetType\":\"uuid\",\"target\":\"01acfd9d-e6a4-4e61-b9eb-aae012345678\",\"flag\":\"add\"},{\"targetType\":\"uuid\",\"target\":\"04a0e735-ad32-4835-b635-045812345678\",\"flag\":\"add\"}]"	The parameters required to configure virus detection for the server. Set the following parameters: • **targetType**: the dimension on which viruses are blocked. UUIDs are supported. Set the value to uuid. • **target**: the UUID of the server on which you want to configure virus detection. • **flag**: enables or disables virus detection for the server. Valid values: **add** and **del**. add specifies to enable the feature and del specifies to disable the feature.
TargetType	String	Yes	uuid	The operating dimension on which you manage virus detection. You can manage virus detection only by UUID. Set the value to **uuid**.
Type	String	Yes	auto_breaking	The method of virus detection. Set the value to **auto_breaking**, which specifies that the system automatically blocks viruses.
SourceIp	String	No	1.2.3.4	The source IP address of the request.
Lang	String	No	zh	The natural language of the request and response. Valid values: • **zh**: Chinese • **en**: English

Response parameters

Parameter	Type	Example	Description
RequestId	String	ABCD-PSD2-5256-1DSA-4222-JHBN	The ID of the request.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=OperateSuspiciousTargetConfig
&TargetOperations="[{\"targetType\":\"uuid\",\"target\":\"0585f81a-dd84-4ddf-9971-f59d12345
678\",\"flag\":\"add\"},{\"targetType\":\"uuid\",\"target\":\"01acfd9d-e6a4-4e61-b9eb-aae01
2345678\",\"flag\":\"add\"},{\"targetType\":\"uuid\",\"target\":\"04a0e735-ad32-4835-b635-0
45812345678\",\"flag\":\"add\"}]"
&TargetType=uuid
&Type=auto_breaking
&<Common request parameters>
```

Sample success responses

`XML` format

```
<OperateSuspiciousTargetConfigResponse>
  <RequestId>ABCD-PSD2-5256-1DSA-4222-JHBN</RequestId>
</OperateSuspiciousTargetConfigResponse>
```

`JSON` format

```
{
    "RequestId":"ABCD-PSD2-5256-1DSA-4222-JHBN"
}
```

Error codes

For a list of error codes, see Error codes.

19.1.3. Anti-DDoS

19.1.3.1. List of operations

This topic introduces all the Apsara Stack Security Anti-DDoS operations that you can call. For more information, see the corresponding operation description.

Operation	Description
CheckIpSegment	Checks whether a CIDR block to be added for monitoring is valid.

Operation	Description
DescribeRegionName	Queries the regions of the CIDR blocks where traffic data collection and analysis is performed.
CreateIpSegment	Adds a specified CIDR block to be monitored.
DescribeIpSegment	Obtains a list of CIDR blocks under traffic monitoring.
DeleteIpSegment	Deletes a CIDR block whose traffic is collected and monitored based on the CIDR block record ID.
ModifyIpSegment	Modifies a monitored CIDR block with a specified record ID.
CreateDdosPolicy	Adds an anti-DDoS policy for a specified IP address or CIDR block.
DescribeDdosPolicies	Queries the configured DDoS protection policies.
DeleteDdosPolicy	Deletes an anti-DDoS policy for a specified CIDR block.
ModifyDdosPolicy	Modifies a specified anti-DDoS policy.
DescribeBlockSwitchs	Queries the status of the traffic block switch in anti-DDoS.
ModifyBlockSwitchs	Changes the status of the block switch in DDoS settings.
DescribeDdosEvents	Obtains the list of DDoS events that meet the specified search criteria.
DescribeFlowAnalysisResult	Queries the analysis result of the traffic sent to an IP address.
DescribeFlowDetails	Queries the detailed traffic information for a specified IP address.
CancelCleanStatus	Disables DDoS traffic scrubbing for a specified IP address.
CreateWhiteList	Adds a whitelist of trusted IP addresses that are exempt from traffic security monitoring.
DescribeWhiteList	Queries the IP addresses that have been added to a whitelist.
DeleteWhiteList	Deletes multiple risks from the whitelist for baseline check.
DescribeConsoleDdosPolicies	Obtains the records of anti-DDoS policies, including the system default policies.

19.1.3.2. Make API requests

19.1.3.2.1. Request structure

Apsara Stack Security API is based on Remote Procedure Call (RPC). This topic describes the structure of the API requests.

Description

You can send an HTTP request to call an API operation. The URL of the request must be in the following format:

```
http://endpoint/?Action=xx&parameters
```

Where:

- `endpoint`: the endpoint used to call a cloud service. The endpoint for the Anti-DDoS service is `ddosprivate.[ RegionId].example.com`.
- `Action`: the operation that you want to perform.

  For example, you can set this parameter to DescribeFeatures to query the deployed Apsara Stack Security features.
- `parameters`: the request parameters. Request parameters include common request parameters and custom request parameters. Request parameters must be separated with ampersands (&).
  - Common request parameters include information such as the API version and authentication information.
  - For more information about the custom request parameters, see the corresponding operation description.

Example

Call the DescribeFeatures operation to query the deployed Apsara Stack Security features.

```
https://yundunprivate.[ RegionId].example.com/?Action=DescribeFeatures&AccessKeyId=key-test
&Format=JSON&SecureTransport=true&SignatureMethod=HMAC-SHA1&SignatureNonce=15215528852396&S
ignatureVersion=1.0&SourceIp=1xxxx6&Timestamp=2018-03-02Txxxxxxx&Version=2018-01-16&Signatu
re=xxxx%xxxx%3D
```

API requests are presented in the following easy-to-read format in this document:

```
https://yundunprivate.[ RegionId].example.com/?Action=DescribeFeatures
&Format=JSON
&Version=2018-01-16
&Signature=xxxx%xxxx%3D
&SignatureMethod=HMAC-SHA1
&SignatureNonce=15215528852396
&SignatureVersion=1.0
&AccessKeyId=key-test
&Timestamp=2012-06-01T12:00:00Z
```

19.1.3.2.2. Signature mechanism

Apsara Stack Security authenticates each access request. You need to include a signature for the submitted HTTP or HTTPS request.

API authorization

To ensure the security of your account, we recommend that you use a Resource Access Management (RAM) user to call API operations. Before using a RAM user to call an API operation, you must grant the RAM user the corresponding permission to call the API by creating an authorization policy and attaching the policy to the RAM user.

API signature

To ensure secure calls to the API, Alibaba Cloud authenticates each API request through the signature. When you manually make an API request, you need to use AccessKey Secret to calculate the signature, that is, the hash-based message authentication code (HMAC) value, based on the encoded and sorted request string. For more information, see the definition in RFC 2104.

This topic uses the raw access parameters in the following table to describe how to create an API signature.

Parameter	Description
Access point	`http://semawaf.[ RegionId].example.com/?`
API-specific parameters	`Action=DescribeFeatures`

Common parameters (excluding the Signature parameter)	`&Timestamp=2016-02-23T12:46:24Z`
	`&Format=JSON`
	`&AccessKeyId=<yourAccessKeyId>`
	`&SignatureMethod=HMAC-SHA1`
	`&SignatureNonce=3ee8c1b8-83d3-44af-a94f-4e0ad82fd6cf`
	`&Version=2018-01-16`
	`&SignatureVersion=1.0`

AccessKey secret	`<yourAccessKeySecret>`

1. Use the request parameters to construct a canonicalized query string.

   > **Note** The request parameters include common request parameters (excluding the Signature parameter) and API-specific parameters.

   i. Sort the parameters.

   Sort the request parameters in alphabetical order.

   ii. Encode the parameters.

   Use UTF-8 to URL-encode the parameter names and values. The encoding rules are as follows:

   - Letters, digits, hyphens (-), underscores (_), periods (.), and tildes (~) are not encoded.
   - Other characters are encoded in the %XY format, where XY is the hexadecimal representation of the character in ASCII. For example, the double quotation mark (") is encoded as %22.
   - Extended UTF-8 characters are encoded in the %XY%ZA... format.
   - Note that a space is encoded as %20, instead of a plus sign (+).

iii. Connect the encoded parameter names and values with equal signs (=).

iv. Then, sort the parameter name and value pairs connected by equal signs in alphabetical order, and connect them with ampersands (&) to produce the canonicalized query string.

2. Use the canonicalized query string to construct the string for signature calculation based on the following rules:

```
StringToSign=HTTPMethod + "&" + percentEncode("/") + "&" +
percentEncode(CanonicalizedQueryString)
```

3. Calculate the HMAC value of the StringToSign string according to the definition in RFC 2104.

> **Note** The key used for signature calculation is your AccessKey secret adding the ampersand (&) (ASCII 38). Secure Hash Algorithm 1 (SHA1) is used as the hash algorithm.

4. Encode the preceding HMAC value into a string based on Base64 encoding rules to obtain the signature value.

```
LEW8N4y7Uasop******
```

5. Set the Signature parameter in the request parameters to this signature value to sign the request.

19.1.3.2.3. Common request parameters

The following table describes the common request parameters that are used to indicate information such as the API version and authentication information.

Name	Type	Required	Description
Version	String	Yes	The API version in the format of YYYY-MM-DD. Set the value to *2018-01-16*.
AccessKeyId	String	Yes	The key ID that Alibaba Cloud assigns to a user for service access.
Signature	String	Yes	The signature string.
SignatureMethod	String	Yes	The signature method. Set the value to *HMAC-SHA1*.

Name	Type	Required	Description
Timestamp	String	Yes	The timestamp of the request. Follow the ISO 8601 standard to specify the date and use the offset from Coordinated Universal Time (UTC) to specify the time zone. The format is `YYYY-MM-DDThh:mm:ssZ`. For example, 2014-05-26T12:00:00Z indicates 20:00:00 on May 26, 2014, Beijing time.
SignatureVersion	String	Yes	The signature algorithm version. Set the value to *1.0*.
SignatureNonce	String	Yes	The unique random number used to prevent network replay attacks. You must use different random numbers for different requests.
ResourceOwnerAccount	String	No	The owner account of the resource to be accessed through this API request, that is, the logon username.
Format	String	No	The format of the response. Set the value to *JSON or XML*. **Note** Default value: XML.

19.1.3.2.4. Response structure

Apsara Stack Security API responses support both the XML and JSON formats. The system always returns a unique identification code RequestId each time you send a request to call an operation, no matter whether the call is successful or not.

Sample responses (XML format)

```
<? xml version="1.0" encoding="UTF-8"? >
<! -- The root node of the result -->
<Operation name+Response>
    <! -- Returned request ID -->
    <RequestId>4C467B38-3910-447D-87BC-AC049166F216</RequestId>
    <! -- Returned data -->
</Operation name+Response>
```

Sample responses (JSON format)

```
{
"RequestId": "4C467B38-3910-447D-87BC-AC049166F216",
/* Returned data */
}
```

19.1.3.3. APIs

19.1.3.3.1. CheckIpSegment

Description

You can call this operation to check whether a CIDR block to be added for monitoring is valid. If a success result is returned through this API, the CIDR block specified in the request can be added.

Request parameters

Name	Type	Required	Description
Action	String	Yes	The operation that you want to perform. Set the value to *CheckIpSegment*.
IpSegmentName	String	Yes	The CIDR block to be checked, in x.x.x.x/x format. For example, 172.21.23.222/24.
InfoType	String	No	The CIDR block information type. For example, a value of distribution indicates the region information.
InfoName	String	No	The information describing the CIDR block based on the value of the InfoType parameter. For example, if the InfoType parameter is set to distribution, you can set the InfoName parameter to DXJF, indicating that the CIDR block belongs to the region where the Daxing IDC is located.

Response parameters

Name	Type	Description
RequestId	String	The GUID generated by Alibaba Cloud for the request.

Error codes

For more information about the error codes that this operation can return, see Error codes.

Examples

- Sample requests

```
https://ddosprivate.[ RegionId].example.com/?Action=CheckIpSegment
&IpSegmentName=192.1.1.1/24
&InfoType=distribution
&InfoName=DXJF
&<Common request parameters>
```

- Sample responses (JSON format)

```
{
 "RequestId":"71064826-726F-4ADA-B879-05D8055476FB"
}
```

19.1.3.3.2. DescribeRegionName

Description

You can call this operation to query the regions of the CIDR blocks where traffic data collection and analysis is performed.

Request parameters

Name	Type	Required	Description
Action	String	Yes	The operation that you want to perform. Set the value to *DescribeRegionName*.

Response parameters

Name	Type	Description
RequestId	String	The GUID generated by Alibaba Cloud for the request.
RegionNameList	Array	A list of regions. For more information, see the following parameter descriptions.
Id	Integer	The ID of the region.
Description	String	The region of the CIDR block.
CodeType	String	The type of the CIDR block information. For example, distribution indicates the region information.

Name	Type	Description
Code	String	This parameter is used with the CodeType parameter to specify the code of the corresponding information. For example, if the CodeType parameter is set to distribution and the Code parameter is set to DXJF, this indicates that the CIDR block belongs to the region where the Daxing data center is located.
CodeName	String	This parameter is used with the CodeType parameter to specify the name of the corresponding information.
GmtCreate	String	The time when the CIDR block was created.
GmtModified	String	The latest time when the CIDR block was modified.
Seq	Integer	The sequence number of the region record.

Error codes

For more information about the error codes that this operation can return, see Error codes.

Examples

- Sample requests

```
https://ddosprivate.[ RegionId].example.com/?Action=DescribeRegionName
&<Common request parameters>
```

- Sample responses (JSON format)

```
{
 "RegionNameList":[
  {
   "GmtCreate":1463367238000,
   "Description":"Hybrid cloud data center list",
   "CodeName":"Daxing data center",
   "GmtModified":1463367238000,
   "CodeType":"distribution",
   "Id":17,
   "Code":"am1",
   "Seq":1
  },
  {
   "GmtCreate":1463367238000,
   "Description":"Hybrid cloud data center list",
   "CodeName":"Not specified",
   "GmtModified":1463367238000,
   "CodeType":"distribution",
   "Id":32,
   "Code":"UNKNOWN",
   "Seq":4
  },
```

```
  {
   "GmtCreate":1485069049000,
   "Description": "Data center list",
   "CodeName":"Beijing data center",
   "GmtModified":1485069049000,
   "CodeType":"distribution",
   "Id":50,
   "RegionId": "cn-beijing-btc-a01",
   "Seq":2
  },
  {
   "GmtCreate":1485069106000,
   "Description": "Data center list",
   "CodeName":"Hangzhou data center",
   "GmtModified":1485069104000,
   "CodeType":"distribution",
   "Id":51,
   "Code":"cn-hangzhou-dg-a01",
   "Seq":3
  },
  {
   "GmtCreate":1463367238000,
   "Description":"Hybrid cloud data center list",
   "CodeName":"Daxing data center",
   "GmtModified":1463367238000,
   "CodeType":"distribution",
   "Id":52,
   "Code":"DD_DXJF",
   "Seq":1
  }
 ],
 "RequestId":"26738B34-6680-4BD7-BBF8-EF8DE53D52F6"
}
```

19.1.3.3.3. CreateIpSegment

Description

You can call this operation to add a specified CIDR block to be monitored.

Request parameters

Name	Type	Required	Description
Action	String	Yes	The operation that you want to perform. Set the value to *CreateIpSegment*.
IpSegmentName	String	Yes	The CIDR block to be added for monitoring, in x.x.x.x/x format. For example, 172.21.23.222/24.

Name	Type	Required	Description
InfoType	String	No	The CIDR block information type. For example, a value of distribution indicates the region information.
InfoName	String	No	The information describing the CIDR block based on the value of the InfoType parameter. For example, if the InfoType parameter is set to distribution, you can set the InfoName parameter to DXJF, indicating that the CIDR block belongs to the region where the Daxing data center is located.

Response parameters

Name	Type	Description
RequestId	String	The GUID generated by Alibaba Cloud for the request.

Error codes

For more information about the error codes that this operation can return, see Error codes.

Examples

- Sample requests

```
https://ddosprivate.[ RegionId].example.com/?Action=CreateIpSegment
&IpSegmentName=172.21.13.222/24
&InfoType=distribution
&InfoName=DXJF
&<Common request parameters>
```

- Sample responses (JSON format)

```
{
 "RequestId":"6C91B447-DAA5-40DB-B818-E10820D99DEC"
}
```

19.1.3.3.4. DescribeIpSegment

Description

You can call this operation to query Classless Inter-Domain Routing (CIDR) blocks under traffic monitoring.

Request parameters

Parameter	Type	Required	Description
Action	String	Yes	The operation that you want to perform. Set this parameter to *DescribeIpSegment*.
CurrentPage	Integer	No	The number of the page to return.
PageSize	Integer	No	The number of records to return on each page.
InfoType	String	No	The type of the CIDR block information. For example, a value of distribution indicates the region information.
Distribution	String	No	The ID of the region. For example, a value of DXJF indicates the region where the Daxing IDC is located.
IpSegment	String	No	The CIDR block, in x.x.x.x/x format.

Response parameters

Parameter	Type	Description
RequestId	String	The ID of the request.
CurrentPage	Integer	The number of the current page returned.
PageSize	Integer	The number of records returned on each page.
TotalCount	Integer	The total number of returned pages.
IpSegmentList	Array	The CIDR blocks for traffic collection. For more information, see the following descriptions.
GmtCreate	Long	The time when the CIDR block for traffic collection was created.
GmtModified	Long	The time when the CIDR block for traffic collection was last modified.
Id	Integer	The ID of the CIDR block for traffic collection.
RegionName	String	The region name of the CIDR block.
InfoType	String	The type of the CIDR block information. For example, a value of distribution indicates the region information.

Parameter	Type	Description
InfoName	String	The information describing the CIDR block based on the value of the InfoType parameter. For example, if the value of the InfoType parameter is distribution, the value of the InfoName parameter can be DXJF, indicating that the CIDR block belongs to the region where the Daxing IDC is located.
IpExpressions	String	The CIDR block for traffic collection, in x.x.x.x/x format.

Error codes

For more information about the error codes that this operation can return, see Error codes.

Examples

- Sample request

```
https://ddosprivate.[ RegionId].example.com/?Action=DescribeIpSegment
&CurrentPage=1
&Distribution=DXJF
&InfoType=distribution
&IpSegment=x.x.x.x/x
&PageSize=20
&<Common request parameters>
```

- Sample response (JSON format)

```
{
    "TotalCount":1,
    "PageSize":20,
    "RequestId":"AC51224B-3730-4C6B-B444-2307C7F73E84",
    "IpSegmentList":[
        {
            "IpExpressions":"192.168.x.x/24",
            "GmtCreate":1520565939000,
            "RegionName":"Daxing IDC",
            "GmtModified":1520565939000,
            "InfoName":"****",
            "Id":9,
            "InfoType":"distribution1"
        }
    ],
    "CurrentPage":1
}
```

19.1.3.3.5. DeleteIpSegment

Description

You can call this operation to delete a CIDR block whose traffic is collected and monitored based on the CIDR block record ID.

> **Note** You must obtain the record ID of the monitored CIDR block to be deleted before calling this operation.

Request parameters

Name	Type	Required	Description
Action	String	Yes	The operation that you want to perform. Set the value to *DeleteIpSegment*.
IpId	String	Yes	The record ID of the monitored CIDR block to be deleted.

Response parameters

Name	Type	Description
RequestId	String	The GUID generated by Alibaba Cloud for the request.

Error codes

For more information about the error codes that this operation can return, see Error codes.

Examples

- Sample requests

```
https://ddosprivate.[ RegionId].example.com/?Action=DeleteIpSegment
&IpId=1
&<Common request parameters>
```

- Sample responses (JSON format)

```
{
 "RequestId":"9C40FE9D-EE39-4162-8E94-7C0A32F276D8"
}
```

19.1.3.3.6. ModifyIpSegment

Description

You can call this operation to modify a monitored Classless Inter-Domain Routing (CIDR) block with a specified record ID.

> **Note** You must know the record ID of the monitored CIDR block to be modified before calling this operation.

Request parameters

Parameter	Type	Required	Description
Action	String	Yes	The operation that you want to perform. Set this parameter to *ModifyIpSegment*.
IpId	Integer	Yes	The record ID of the monitored CIDR block to be modified.
InfoName	String	Yes	The region to which the CIDR block belongs. For example, a value of DXJF indicates that the CIDR block belongs to the region where the Daxing IDC is located.
IpSegmentName	String	Yes	The CIDR block, in x.x.x.x/x format.

Response parameters

Parameter	Type	Description
RequestId	String	The ID of the request.

Error codes

For more information about the error codes that this operation can return, see Error codes.

Examples

- Sample request

```
https://ddosprivate.[ RegionId].example.com/?Action=ModifyIpSegment
&InfoName=****
&InfoType=distribution
&IpId=11
&IpSegmentName=192.168.x.x/24
&<Common request parameters>
```

- Sample response (JSON format)

```
{
    "RequestId":"5FFE58AA-355B-4E0E-A742-0BB5554BA959"
}
```

19.1.3.3.7. CreateDdosPolicy

Description

You can call this operation to add an anti-DDoS policy for a specified IP address or Classless Inter-Domain Routing (CIDR) block.

Request parameters

Parameter	Type	Required	Description
Action	String	Yes	The operation that you want to perform. Set this parameter to *CreateDdosPolicy*.
ExternalServiceIP	String	Yes	The IP address or CIDR block to which the anti-DDoS policy applies, in x.x.x.x or x.x.x.x/x format.
FlowRate	Integer	Yes	The traffic rate threshold. Unit: Mbit/s. **Note** The value of this parameter must be greater than 0.
HttpRate	Integer	Yes	The HTTP request rate threshold. Unit: queries per second (QPS). **Note** The value of this parameter must be greater than 50.
PackageRate	Integer	Yes	The packet rate threshold. Unit: packets per second (PPS). **Note** The value of this parameter must be greater than 0.
UserId	Long	No	The user ID of the request sender. The parameter is automatically set by the system.
UserName	String	Yes	The username of the request sender. The parameter is automatically set by the system.

Response parameters

Parameter	Type	Description
RequestId	String	The ID of the request.

Error codes

For more information about the error codes that this operation can return, see Error codes.

Examples

- Sample request

```
https://ddosprivate.[ RegionId].example.com/?Action=CreateDdosPolicy
&ExternalServiceIP=192.168.x.x/32
&FlowRate=1
&HttpRate=60
&PackageRate=1
&<Common request parameters>
```

- Sample response (JSON format)

```
{
    "RequestId":"CA179B61-DD6D-4FE3-A410-CC16AC705DF4"
}
```

19.1.3.3.8. DescribeDdosPolicies

Description

You can call this operation to query the configured DDoS protection policies.

Request parameters

Name	Type	Required	Description
Action	String	Yes	The operation that you want to perform. Set the value to *DescribeDdosPolicies*.
CurrentPage	Integer	No	The current page number.
PageSize	Integer	No	The maximum number of records displayed on a page.

Response parameters

Name	Type	Description
RequestId	String	The GUID generated by Alibaba Cloud for the request.
CurrentPage	Integer	The current page number.
PageSize	Integer	The maximum number of records displayed on a page.
TotalCount	Integer	The total number of pages returned.

Name	Type	Description
DdosPolicies	Array	A list of DDoS protection policies. For more information, see the following parameter descriptions.
Code	String	The region code of the CIDR block that the DDoS protection policy is applied to.
CodeName	String	The region name of the CIDR block that the DDoS protection policy is applied to.
DepartmentName	String	The department of the user AliUID that created the DDoS protection policy.
ExternalServiceIP	String	The IP address or CIDR block that the DDoS protection policy is applied to.
FlowRate	Integer	The bandwidth threshold. Unit: Mbit/s.
HttpRate	Integer	The HTTP request threshold. Unit: QPS.
PackageRate	Integer	The packet threshold. Unit: PPS.

Error codes

For more information about the error codes that this operation can return, see Error codes.

Examples

- Sample requests

```
https://ddosprivate.[ RegionId].example.com/?Action=DescribeDdosPolicies
&CurrentPage=1
&PageSize=10
&<Common request parameters>
```

- Sample responses (JSON format)

```
{
    "TotalCount":1,
    "PageSize": 10,
    "RequestId": "179E1AA9-1BC2-4A66-9E4B-1640EDDE7D1C",
    "CurrentPage": 1,
    "DdosPolicies": [
        {
            "PackageRate": 200,
            "HttpRate": 0,
            "CodeName":"Daxing data center",
            "ExternalServiceIP": "x.x.x.x/x",
            "DepartmentName": "Department 1",
            "Code": "DD_DXJF",
            "FlowRate": 900,
            "AliUid": 0
        }
    ]
}
```

19.1.3.3.9. DeleteDdosPolicy

Description

You can call this operation to delete an anti-DDoS policy for a specified Classless Inter-Domain Routing (CIDR) block.

Request parameters

Parameter	Type	Required	Description
Action	String	Yes	The operation that you want to perform. Set this parameter to *DeleteDdosPolicy*.
RegionCode	String	Yes	The ID of the region. For example, cn-hangzhou-env6-d01.
ExternalServiceIP	String	Yes	The IP address or CIDR block to which the anti-DDoS policy applies, in x.x.x.x or x.x.x.x/x format.
FlowRate	Integer	No	The traffic rate threshold. Unit: Mbit/s. **Note** The value of this parameter must be greater than 0.

Parameter	Type	Required	Description
HttpRate	Integer	No	The HTTP request rate threshold. Unit: queries per second (QPS). **Note** The value of this parameter must be greater than 50.
PackageRate	Integer	No	The packet rate threshold. Unit: packets per second (PPS). **Note** The value of this parameter must be greater than 0.

Response parameters

Parameter	Type	Description
RequestId	String	The ID of the request.

Error codes

For more information about the error codes that this operation can return, see Error codes.

Examples

- Sample request

```
https://ddosprivate.[ RegionId].example.com/?Action=DeleteDdosPolicy
&ExternalServiceIP=192.168.x.x/24
&RegionCode=cn-****-env6-d01
&FlowRate=55
&HttpRate=55
&PackageRate=55
&<Common request parameters>
```

- Sample response (JSON format)

```
{
    "RequestId":"8C9B8735-18BA-451B-AE9D-1428554CA360"
}
```

19.1.3.3.10. ModifyDdosPolicy

Description

You can call this operation to modify a specified anti-DDoS policy.

Request parameters

Parameter	Type	Required	Description
Action	String	Yes	The operation that you want to perform. Set this parameter to *ModifyDdosPolicy*.
Distribution	String	Yes	The ID of the region. For example, a value of DXJF indicates the region where the Daxing IDC is located.
ExternalServiceIP	String	Yes	The IP address or Classless Inter-Domain Routing (CIDR) block to which the anti-DDoS policy applies, in x.x.x.x or x.x.x.x/x format.
FlowRate	Integer	Yes	The traffic rate threshold. Unit: Mbit/s. **Note** The value of this parameter must be greater than 0.
HttpRate	Integer	Yes	The HTTP request rate threshold. Unit: queries per second (QPS). **Note** The value of this parameter must be greater than 50.
PackageRate	Integer	Yes	The packet rate threshold. Unit: packets per second (PPS). **Note** The value of this parameter must be greater than 0.

Response parameters

Parameter	Type	Description
RequestId	String	The ID of the request.

Error codes

For more information about the error codes that this operation can return, see Error codes.

Examples

- Sample request

```
https://ddosprivate.[ RegionId].example.com/?Action=ModifyDdosPolicy
&Distribution=****
&ExternalServiceIP=192.168.x.x/32
&FlowRate=1
&HttpRate=60
&PackageRate=1
&<Common request parameters>
```

- Sample response (JSON format)

```
{
    "RequestId":"CA179B61-DD6D-4FE3-A410-CC16AC705DF4"
}
```

19.1.3.3.11. DescribeBlockSwitchs

Description

You can call this operation to query the status of the traffic block switch in anti-DDoS.

Request parameters

Name	Type	Required	Description
Action	String	Yes	The operation that you want to perform. Set the value to *DescribeBlockSwitchs*.
CurrentPage	Integer	No	The current page number.
PageSize	Integer	No	The maximum number of records displayed on a page.

Response parameters

Name	Type	Description
RequestId	String	The GUID generated by Alibaba Cloud for the request.
CurrentPage	Integer	The current page number.
PageSize	Integer	The maximum number of records displayed on a page.
TotalCount	Integer	The total number of pages returned.
BlockSwitchs	Array	The traffic block switch information. For more information, see the following parameter descriptions.

Name	Type	Description
Code	String	The code of the block switch, which uniquely identifies a block switch.
Description	String	The brief description of the block switch.
Id	Integer	The ID of the block switch.
Mode	Integer	The status of the block switch. Valid values: • *0*: indicates disabled. • *1*: indicates enabled.
ModeName	String	The status name of the block switch. Valid values: • *Disabled* • *Enabled*
Name	String	The name of the block switch.

Error codes

For more information about the error codes that this operation can return, see Error codes.

Examples

- Sample requests

```
https://ddosprivate.[ RegionId].example.com/?Action=DescribeBlockSwitchs
&CurrentPage=1
&PageSize=20
&<Common request parameters>
```

- Sample responses (JSON format)

```
{
 "PageSize": 10,
 "RequestId":"95F2F4C8-7623-48B7-A976-30B48F3A25EB",
 "CurrentPage":1,
 "BlockSwitchs":[
  {
   "Description": "test",
   "Mode":0,
   "ModeName":"Disabled",
   "id": 1,
   "Code":"UPGRADE_SWITCH",
   "Name":"Upgrade channel switch"
  },
  {
   "Description":"Automatic upgrade switch",
   "Mode":1,
   "ModeName":"Enabled",
   "Id":2,
   "Code":"AUTO_UPGRADE_SWITH",
   "Name":"Automatic upgrade switch"
  }
 ]
}
```

19.1.3.3.12. ModifyBlockSwitchs

Description

You can call this operation to change the status of the block switch in DDoS settings.

Request parameters

Name	Type	Required	Description
Action	String	Yes	The operation that you want to perform. Set the value to *ModifyBlockSwitch*.
Id	Integer	Yes	The ID of the block switch.
Mode	Integer	Yes	The status of the block switch. Valid values: • *0*: indicates disabled. • *1*: indicates enabled.

Response parameters

Name	Type	Description
RequestId	String	The GUID generated by Alibaba Cloud for the request.

Error codes

For more information about the error codes that this operation can return, see Error codes.

Examples

- Sample requests

```
https://ddosprivate.[ RegionId].example.com/?Action=ModifyBlockSwitch
&Id=1
&Mode=1
&<Common request parameters>
```

- Sample responses (JSON format)

```
{
 "RequestId":"B7FA97F0-082D-4611-A3C4-867011E2A106"
}
```

19.1.3.3.13. DescribeDdosEvents

Description

You can call this operation to query distributed denial of service (DDoS) events that meet the specified search criteria.

Request parameters

Parameter	Type	Required	Description
Action	String	Yes	The operation that you want to perform. Set this parameter to *DescribeDdosEvents*.
CurrentPage	Integer	No	The number of the page to return.
PageSize	Integer	No	The number of records to return on each page.
StartRow	Integer	No	The sequence number of the first record to return on the current page.
Distribution	String	No	The ID of the region. For example, a value of DXJF indicates the region where the Daxing IDC is located.
VmIP	String	No	The IP address of the victim server.
StartDay	Long	No	The beginning of the time range where data is queried.
EndDay	Long	No	The end of the time range where data is queried.

Parameter	Type	Required	Description
SearchReason	String	No	The reason why the DDoS event is triggered. Valid values: *bps*, *pps*, and *qps*. You can query events triggered by multiple reasons. For example, you can enter "bps,pps" to query the DDoS events that are triggered when the traffic rate threshold or the packet transmission rate threshold is exceeded.
SelectStatus	String	No	The status of the DDoS event. Valid values: • *Scrubbing* • *Scrubbing completed*

Response parameters

Parameter	Type	Description
RequestId	String	The ID of the request.
CurrentPage	Integer	The number of the current page returned.
PageSize	Integer	The number of records returned on each page.
TotalCount	Integer	The total number of returned pages.
DdosEvents	Array	The DDoS events. For more information, see the following descriptions.
Id	Long	The ID of the event.
GmtCreate	Long	The time when the event was created.
GmtModified	Long	The time when the event was updated.
Aliuid	Long	The AliUid of the asset owner.
AttackType	String	The type of the attack. **Note** In the current version, only the value of *defence* is supported.

Parameter	Type	Description
Caller	String	The name of the system that calls the operation. **Note** Currently, the fixed value is *beaver_dj*, indicating Network Traffic Monitoring System.
Category	Integer	The number of the security event category.
CategoryName	String	The name of the security event category.
VmIp	String	The IP address of the victim server.
Code	String	The scrubbing status of the event. Valid values: • *Scrubbing* • *Scrubbing completed*
Bps	Long	The traffic rate threshold. Unit: Mbit/s.
Pps	Long	The packet rate threshold. Unit: packets per second (PPS).
Qps	Long	The HTTP request rate threshold. Unit: queries per second (QPS).
Conn	Integer	The threshold of concurrent connections. **Note** This response parameter has been deprecated.
NewConn	Integer	The threshold of new connections. **Note** This response parameter has been deprecated.
Reason	String	The reason why the event was reported.
Distribution	String	The ID of the region.
DistributionDisplay	String	The name of the region.

Parameter	Type	Description
IsFinished	Boolean	Indicates whether the attack has finished. Valid values: • *true*: indicates that the attack has finished. • *false*: indicates that the attack has not finished.
OccurrenceTime	Long	The time when the event occurred.
EndTime	Long	The time when the attack finished.
LocationAdd	String	The location where the event was added. **Note** This response parameter is invalid in Apsara Stack.
LocationDel	String	The location where the event was canceled. **Note** This response parameter is invalid in Apsara Stack.
Status	Integer	The status of the IP address where the DDoS event occurred. Valid values: • *0*: indicates that the IP address has not expired. • *1*: indicates that the IP address has expired.
Successful	Integer	Indicates whether the attack succeeds. Valid values: • *0*: indicates that the attack has failed. • *1*: indicates that the attack succeeded.
NeedIgnore	Integer	Indicates whether you need to ignore the event. Valid values: • *0*: indicates that you do not need to ignore the event. • *1*: indicates that the event has been reported repeatedly and you need to ignore the event.

Error codes

For more information about the error codes that this operation can return, see Error codes.

Examples

- Sample request

```
https://ddosprivate.[ RegionId].example.com/?Action=DescribeDdosEvents
&CurrentPage=1
&Distribution=DXJF
$StartDay=1381079107176
$EndDay=1481079107176
&PageSize=10
&<Common request parameters>
```

- Sample response (JSON format)

```
{
 "TotalCount":1,
 "RequestId":"AD525B06-F5F7-4319-94F4-45154D5B0750",
 "DdosEvents":[
  {
   "NewConn":0,
   "Status":0,
   "LocationDel":"nulllocal",
   "Category":21,
   "Bps":5,
   "EndTime":1573233588000,
   "Zone":"default",
   "GmtModified":1484372333000,
   "AttackType":"0",
   "Conn":0,
   "Code":"Scrubbing",
   "DistributionDisplay":"Daxing IDC",
   "Reason":"bps",
   "OccurrenceTime":1473233588000,
   "GmtCreate":1484369068000,
   "Pps":450,
   "Caller":"beaver_dj",
   "Qps":0,
   "Distribution":"am1",
   "LocationAdd":"local",
   "CategoryName":"DDOS_DEFENSE",
   "Id":3,
   "IsFinished":false,
   "NeedIgnore":0
  }
 ],
 "CurrentPage":1
}
```

19.1.3.3.14. DescribeFlowAnalysisResult

Description

You can call this operation to query the analysis result of the traffic sent to an IP address.

Request parameters

Parameter	Type	Required	Description
Action	String	Yes	The operation that you want to perform. Set this parameter to *DescribeFlowAnalysisResult*.
Distribution	String	Yes	The ID of the region. For example, a value of DXJF indicates the region where the Daxing IDC is located.
VmIP	String	Yes	The IP address of the victim server.
StartDate	Long	Yes	The beginning of the time range where traffic is analyzed.
SearchReason	String	No	The reason why the distributed denial of service (DDoS) event is triggered. Valid values: *bps*, *pps*, and *qps*. You can query events triggered by multiple reasons. For example, you can enter "bps,pps" to query the DDoS events that are triggered when the traffic rate threshold or the packet transmission rate threshold is exceeded.
SelectStatus	String	No	The status of the DDoS event. Valid values: • *Scrubbing* • *Scrubbing completed*

Response parameters

Parameter	Type	Description
RequestId	String	The ID of the request.
TopAttackers	Array	The analysis on the top 10 attackers. For more information, see the following descriptions.
Ip	String	The IP address of the attacker.
Count	Float	The percentage of attacks launched to the IP address compared to the total attacks.

Parameter	Type	Description
TopProtocols	Array	The analysis on the composition of the attack traffic. For more information, see the following descriptions. **Note** The traffic composition analysis shows traffic of different protocols, including TCP, ICMP, and UDP.
Protocol	String	The protocol.
Count	Float	The percentage of the traffic of the specified protocol compared to the total amount of traffic.

Error codes

For more information about the error codes that this operation can return, see Error codes.

Examples

- Sample request

```
https://ddosprivate.[ RegionId].example.com/?Action=DescribeFlowAnalysisResult
&Distribution=DD_DXJF
&startDate=123123312000
&VmIp=x.x.x.x
&<Common request parameters>
```

- Sample response (JSON format)

```
{
    "TopAttackers":["Ip":"x.x.x.x","Count":"1.00"],
    "RequestId":"B2488F1F-930D-4906-AC76-61045B4F1EF2",
    "TopProtocols":["Protocol":"tcp","Count":"1.00"]
}
```

19.1.3.3.15. DescribeFlowDetails

Description

You can call this operation to query the detailed traffic information for a specified IP address.

Request parameters

Parameter	Type	Required	Description

Parameter	Type	Required	Description
Action	String	Yes	The operation that you want to perform. Set this parameter to *DescribeFlowDetails*.
Distribution	String	Yes	The ID of the region. For example, a value of DXJF indicates the region where the Daxing IDC is located.
VmIP	String	Yes	The IP address of the victim server.

Response parameters

Parameter	Type	Description
RequestId	String	The ID of the request.
HttpStatusCode	Integer	The HTTP status code.
FlowDetail	Struct	The detailed traffic information. For more information, see the following descriptions.
AliUid	Long	The ID of the Alibaba Cloud account.
Distribution	String	The ID of the region.
DistributionDisplay	String	The name of the region.
ExternalServiceIp	String	The IP address or Classless Inter-Domain Routing (CIDR) block.
FlowRate	Integer	The flow rate. Unit: Mbit/s.
HttpRate	Integer	The HTTP request rate. Unit: queries per second (QPS).
PackageRate	Integer	The packet rate. Unit: packets per second (PPS).

Error codes

For more information about the error codes that this operation can return, see Error codes.

Examples

- Sample request

```
https://ddosprivate.[ RegionId].example.com/?Action=DescribeFlowDetails
&Distribution=****
&VmIp=10.0.x.x
&<Common request parameters>
```

- Sample response (JSON format)

```
{
    "RequestId":"8491DBFD-48C0-4E11-B6FC-6F38921244A9",
    "FlowDetail":{
        "PackageRate":200,
        "HttpRate":0,
        "ExternalServiceIP":"10.0.x.x/32",
        "Distribution":"DXJF",
        "DistributionDisplay":"Daxing IDC",
        "FlowRate":900,
        "AliUid":0
    },
    "HttpStatusCode":200
}
```

19.1.3.3.16. CancelCleanStatus

Description

You can call this operation to disable DDoS traffic scrubbing for a specified IP address.

Request parameters

Parameter	Type	Required	Description
Action	String	Yes	The operation that you want to perform. Set this parameter to *CancelCleanStatus*.
Distribution	String	Yes	The ID of the region. For example, a value of DXJF indicates the region where the Daxing IDC is located.
VmIp	String	Yes	The IP address of the instance, in x.x.x.x format.

Response parameters

Parameter	Type	Description
RequestId	String	The ID of the request.

Error codes

For more information about the error codes that this operation can return, see Error codes.

Examples

- Sample request

```
https://ddosprivate.[ RegionId].example.com/?Action=CancelCleanStatus
&Distribution=DXJF
&SourceIp=10.0.x.x
&VmIp=172.16.x.x
&<Common request parameters>
```

- Sample response (JSON format)

```
{
    "RequestId":"208B016D-4CB9-4A85-96A5-0B8ED1EBF271"
}
```

19.1.3.3.17. CreateWhiteList

Description

You can call this operation to add a whitelist of trusted IP addresses that are exempt from traffic security monitoring.

Request parameters

Parameter	Type	Required	Description
Action	String	Yes	The operation that you want to perform. Set this parameter to *CreateWhiteList*.
Type	Integer	Yes	The type of the whitelist. Valid values: • *6*: indicates a server brute-force attack whitelist. • *12*: indicates a BWAF source IP address whitelist. • *15*: indicates an application attack whitelist.
Username	String	No	The username used to add the whitelist.
DestinationIp	String	No	The destination IP address. **Note** When you add a BWAF source IP address whitelist (that is, the Type parameter is set to 12), the DestinationIp parameter must be set to the default value 0.0.0.0.
SourceIpStr	String	No	The source IP address.

Response parameters

Parameter	Type	Description
RequestId	String	The ID of the request.

Error codes

For more information about the error codes that this operation can return, see Error codes.

Examples

- Sample request

```
https://ddosprivate.[ RegionId].example.com/?Action=CreateWhiteList
&Type=15
&DestinationIp=192.168.xx.xx
&SourceIpStr=192.168.xx.xx
&Username=test
&<Common request parameters>
```

- Sample response (JSON format)

```
{
    "RequestId":"208B016D-4CB9-4A85-96A5-0B8ED1EBF271"
}
```

19.1.3.3.18. DescribeWhiteList

Description

You can call this operation to query the IP addresses that have been added to a whitelist.

Request parameters

Parameter	Type	Required	Description
Action	String	Yes	The operation that you want to perform. Set this parameter to *DescribeWhiteList*.
DestinationIp	String	No	The destination IP address.
SourceIpStr	String	No	The source IP address.

Parameter	Type	Required	Description
Type	Integer	No	The type of the whitelist. Valid values: • *6*: indicates a server brute-force attack whitelist. • *12*: indicates a BWAF source IP address whitelist. • *15*: indicates an application attack whitelist.
Username	String	No	The username.

Response parameters

Parameter	Type	Description
RequestId	String	The ID of the request.
CurrentPage	Integer	The number of the current page returned.
PageSize	Integer	The number of records returned on each page.
TotalCount	Integer	The total number of returned pages.
WhiteLists	List	The whitelist records. For more information, see the following descriptions.
SourceIp	String	The source IP address.
Id	Integer	The ID of the whitelist record.
Type	Integer	The type of the whitelist. Valid values: • *6*: indicates a server brute-force attack whitelist. • *12*: indicates a BWAF source IP address whitelist. • *15*: indicates an application attack whitelist.
Username	String	The username.
DestinationIp	String	The destination IP address.

Error codes

For more information about the error codes that this operation can return, see Error codes.

Examples

- Sample request

```
https://ddosprivate.[ RegionId].example.com/?Action=DescribeWhiteList
&Type=15
&DestinationIp=172.16.xx.xx
&SourceIpStr=172.17.xx.xx
&Username=test
&<Common request parameters>
```

- Sample response (JSON format)

```
{
    "CurrentPage":1,
    "PageSize":20,
    "RequestId":"430A3687-B9EC-4F71-B472-EE24ED609863",
    "Success":true,
    "TotalCount":0,
    "WhiteLists":[{
        "DestinationIp":"172.16.xx.xx",
        "Id":6,
        "SourceIp":"172.17.xx.xx",
        "Type":15,
        "Username":"****"
    }]
}
```

19.1.3.3.19. DeleteWhiteList

Description

You can call this operation to delete a specified whitelist entry.

Request parameters

Name	Type	Required	Description
Action	String	Yes	The operation that you want to perform. Set the value to *DeleteWhiteList*.
Id	Integer	Yes	The ID of the whitelist entry.

Response parameters

Name	Type	Description
RequestId	String	The GUID generated by Alibaba Cloud for the request.

Error codes

For more information about the error codes that this operation can return, see Error codes.

Examples

- Sample requests

```
https://ddosprivate.[ RegionId].example.com/?Action=DeleteWhiteList
&Id=15
&<Common request parameters>
```

- Sample responses (JSON format)

```
{
 "RequestId":"208B016D-4CB9-4A85-96A5-0B8ED1EBF271"
}
```

19.1.3.3.20. DescribeConsoleDdosPolicies

Description

You can call this operation to obtain the records of anti-DDoS policies, including the system default policies.

Request parameters

Parameter	Type	Required	Description
Action	String	Yes	The operation that you want to perform. Set this parameter to *DescribeConsoleDdosPolicies*.
AliUid	Long	Yes	The ID of the Alibaba Cloud account.
CurrentPage	Integer	No	The number of the page to return.
PageSize	Integer	No	The number of records to return on each page.
StartRow	Integer	No	The start row to return.

Response parameters

Parameter	Type	Description
RequestId	String	The ID of the request.
CurrentPage	Integer	The number of the current page returned.
PageSize	Integer	The number of records returned on each page.
TotalCount	Integer	The total number of returned pages.
ThresholdList	List	The anti-DDoS policies. For more information, see the following descriptions.
DepartmentName	String	The department name of the current user.

Parameter	Type	Description
ExternalServiceIP	String	The IP address or Classless Inter-Domain Routing (CIDR) block. **Note** A value of default is returned if the system default policy is used.
Code	String	The IDC ID corresponding to the CIDR block.
CodeName	Sting	The IDC name corresponding to the CIDR block.
FlowRate	Integer	The threshold for the traffic rate. Unit: Mbit/s.
HttpRate	Integer	The threshold for the HTTP request rate. Unit: queries per second (QPS).
PackageRate	Integer	The threshold for the packet rate. Unit: packets per second (PPS).
AliUid	Long	The Alibaba Cloud account ID corresponding to the policy.

Error codes

For more information about the error codes that this operation can return, see Error codes.

Examples

- Sample request

```
https://ddosprivate.[ RegionId].example.com/?Action=DescribeConsoleDdosPolicies
&AliUid=****
&CurrentPage=1
&PageSize=10
&SourceIp=xx.xx.xx.xx
&<Common request parameters>
```

- Sample response (JSON format)

```
{
    "CurrentPage":1,
    "HttpStatusCode":200,

19.1.4. Web Application Firewall

19.1.4.1. List of operations by function

The following tables list API operations available for use in Web Application Firewall (WAF).

Website protection

Operation	Description
DescribeWebsite	Queries the information about the websites that are protected by WAF.

Operation	Description
CreateWebsite	Adds a website.
EditWebsite	Modifies the information about a specific website.
ToggleWebsite	Enables or disables WAF protection for a specific website.
QueryAsyncTaskStatus	Queries the status of an asynchronous task.
UploadResponsePage	Uploads a response page file.
DescribeInvalidWebsite	Queries the information about the invalid websites that are discovered by the upgrade detection feature.
DeleteInvalidWebsite	Deletes a specific invalid website.
DescribeInternetVip	Queries the information about the virtual IP addresses (VIPs) on the Internet.
CreateInternetVip	Creates a VIP on the Internet.
DeleteInternetVip	Deletes a VIP on the Internet.
DescribeVpc	Queries the information about virtual private clouds (VPCs).
DescribeVSwitch	Queries the information about the vSwitches in a specific VPC.
DescribeVpcVip	Queries the information about the VIPs in a specific VPC.
CreateVpcVip	Creates a VIP in a specific VPC.
DeleteVpcVip	Deletes a VIP in a specific VPC.
DescribeEcs	Queries the information about the Elastic Compute Service (ECS) instances in a specific VPC.
DescribeSlb	Queries the information about the Server Load Balancer (SLB) instances in a specific VPC.

HTTP flood protection rules

Operation	Description
DescribeCCRuleTemplate	Queries the information about HTTP flood protection rules.
CreateCCRuleTemplate	Creates an HTTP flood protection rule.
EditCCRuleTemplate	Modifies a specific HTTP flood protection rule.
ToggleCCRuleTemplate	Enables or disables a specific HTTP flood protection rule.
DeleteCCRuleTemplate	Deletes a specific HTTP flood protection rule.

Operation	Description
ClearCCRestrictionList	Removes the restricted users in a specific HTTP flood protection rule.
DescribeCCWhitelist	Queries the information about HTTP flood protection whitelists.
CreateCCWhitelist	Creates an HTTP flood protection whitelist.
DeleteCCWhitelist	Deletes a specific HTTP flood protection whitelist.

Custom rules

Operation	Description
DescribePolicyRule	Queries the information about custom rules.
CreatePolicyRule	Creates a custom rule to deny, allow, or monitor requests.
EditPolicyRule	Modifies a specific custom rule.
TogglePolicyRule	Enables or disables a specific custom rule.
DeletePolicyRule	Deletes a specific custom rule.
EditPolicyRulePriority	Modifies the priorities of custom rules for a specific website. The rules in PolicyRuleIdList are prioritized in descending order.
GenerateFalsePositiveRuleCorrection	Generates correction rules based on false positives.
CreateDetectionModuleRule	Creates a rule for detection module control.
EditDetectionModuleRule	Modifies a specific rule for detection module control.
EditPolicyRuleWebsiteBinding	Modifies the binding relationship between a specific website and its custom rules.
DeletePolicyRuleWebsiteBinding	Deletes the binding relationship between a specific website and specific custom rules.

Protection policies

Operation	Description
DescribePolicyGroup	Queries the information about protection policies.
CreatePolicyGroup	Creates a protection policy.
EditPolicyGroup	Modifies a specific protection policy.
DeletePolicyGroup	Deletes a specific protection policy.

Protection logs

Operation	Description
QueryAsyncTaskStatus	Queries the status of an asynchronous task.
QueryAttackDetectionLog	Queries attack detection logs.
QueryAttackDetectionDetailLog	Queries the details of a specific attack detection log.
QueryAuditLog	Queries system operations logs.
QueryCCRuleExecutionLog	Queries the logs on the execution of HTTP flood protection rules.
QueryFullAccessLog	Queries full access logs.
QueryFullAccessDetailLog	Queries the details of a specific full access log.
QueryPerformanceStatistics	Queries historical performance data.

SSL certificate management

Operation	Description
DescribeSSLCert	Queries the information about SSL certificates.
UploadSSLCert	Uploads an SSL certificate.
EditSSLCert	Modifies the name of a specific SSL certificate.
DeleteSSLCert	Deletes a specific SSL certificate.

System information

Operation	Description
DescribeMetrics	Queries the monitoring metrics of physical WAF nodes.
DescribeNodeStatus	Queries the status information about physical WAF nodes.
DescribeRealTimeAccess	Queries the monitoring information about access status.
DescribeAttackDetectionAggregation	Queries the statistics on attack detection aggregation.
DescribeAttackDetectionAggregationConfig	Queries the configurations of attack detection aggregation.
ToggleAttackDetectionAggregation	Enables or disables the attack detection aggregation feature.

19.1.4.2. Make API requests

19.1.4.2.1. Request structure

Apsara Stack Security API operations use the RPC protocol. This topic describes the structure of API requests.

Description

You can call Apsara Stack Security API operations by sending HTTP requests. The request syntax is as follows:

```
http://endpoint/?Action=xx&parameters
```

where:

- `endpoint`: the endpoint of the Threat Detection Service API is `semawaf.[ RegionId].example.com`.
- `Action`: the name of the operation being performed.

  For example, to query the Apsara Stack Security features that are deployed, you must set the Action parameter to DescribeFeatures.
- `parameters`: the request parameters for the operation. Separate multiple parameters with ampersands (&). Request parameters include both common parameters and operation-specific parameters.
  - Common parameters include information such as the API version and identity authentication.
  - For more information about operation-specific parameters, see the corresponding operation description.

Example

The following example demonstrates how to call the DescribeFeatures operation to query the Apsara Stack Security features that are deployed:

```
https://semawaf.[RegionId].example.com/?Action=DescribeFeatures&AccessKeyId=key-test&Format=JSON&SecureTransport=true&SignatureMethod=HMAC-SHA1&SignatureNonce=15215528852396&SignatureVersion=1.0&SourceIp=1xxxx6&Timestamp=2018-03-02Txxxxxxx&Version=2018-01-16&Signature=xxxx%xxxx%3D
```

API requests are presented in the following easy-to-read format in this document:

```
https://semawaf.[RegionId].example.com/?Action=DescribeFeatures
&Format=JSON
&Version=2018-01-16
&Signature=xxxx%xxxx%3D
&SignatureMethod=HMAC-SHA1
&SignatureNonce=15215528852396
&SignatureVersion=1.0
&AccessKeyId=key-test
&Timestamp=2012-06-01T12:00:00Z
```

19.1.4.2.2. Request signatures

Apsara Stack Security authenticates each access request. You need to include a signature for the submitted HTTP or HTTPS request.

Authorization

To ensure the security of your account, we recommend that you use a Resource Access Management (RAM) user to call operations. Before you use a RAM user to call an API operation, you must grant the RAM user the corresponding permission to call the operation by creating an authorization policy and attaching the policy to the RAM user.

Signature

You must sign all API requests to ensure security. Alibaba Cloud uses the request signature to verify the identity of the API caller. When you manually make an API request, you need to use the AccessKey Secret to calculate the signature, that is, the hash-based message authentication code (HMAC) value, based on the encoded and sorted request string. For more information, see the definition in RFC 2104.

This section uses the raw access parameters in the following table to describe how to create an operation signature.

Parameter	Description
Access point	`http://tds.[ RegionId].example.com/?`
Operation-specific parameters	`Action=DescribeFeatures`

Common parameters except Signature	`&Timestamp=2018-12-24T12:46:24Z`
	`&Format=JSON`
	`&AccessKeyId=<yourAccessKeyId>`
	`&SignatureMethod=HMAC-SHA1`
	`&SignatureNonce=3ee8c1b8-83d3-44af-a94f-4e0ad82fd6cf`
	`&Version=2018-12-03`
	`&SignatureVersion=1.0`

AccessKey Secret	`<yourAccessKeySecret>`

1. Create a canonicalized query string by arranging the request parameters.

   > **Note** The request parameters include operation-specific parameters and all common request parameters except Signature.

   i. Sort the parameters.

   Sort the request parameters in alphabetical order.

ii. Encode the parameters.

Use UTF-8 to URL-encode the parameter names and values. The encoding rules are as follows:

- Uppercase letters, lowercase letters, digits, and some special characters such as hyphens (-), underscores (_), periods (.), and tildes (~) do not need to be encoded.
- Other characters must be percent encoded in %XY format. XY represents the ASCII code of the characters in hexadecimal notation. For example, double quotation marks (") are encoded as %22.
- Extended UTF-8 characters are encoded in %XY%ZA... format.
- Spaces must be encoded as %20. Do not encode spaces as plus signs (+).

iii. Connect the encoded parameter names and values with equal signs (=).

iv. Then, sort the parameter name and value pairs connected by equal signs in alphabetical order. Connect them with ampersands (&) to canonicalize a query string.

2. Use the canonicalized query string to construct the string for signature calculation based on the following rules:

```
StringToSign=HTTPMethod + "&" + percentEncode("/") + "&" +
percentEncode(CanonicalizedQueryString)
```

3. Calculate the HMAC value of the StringToSign based on the definition in RFC 2104.

> **Note** The key used for signature calculation is your AccessKey Secret jointed with an ampersand (&) (ASCII 38). Secure Hash Algorithm 1 (SHA1) is used as the hash algorithm.

4. Encode the HMAC value in Base64 to obtain the signature string.

```
LEW8N4y7Uasop******
```

5. Add the signature string to the request as the Signature parameter.

19.1.4.2.3. Common request parameters

The following table describes the common request parameters that are used to indicate information such as the API version and authentication information.

Name	Type	Required	Description
Version	String	Yes	The API version in the format of YYYY-MM-DD. Set the value to *2018-01-16*.
AccessKeyId	String	Yes	The key ID that Alibaba Cloud assigns to a user for service access.
Signature	String	Yes	The signature string.
SignatureMethod	String	Yes	The signature method. Set the value to *HMAC-SHA1*.

Name	Type	Required	Description
Timestamp	String	Yes	The timestamp of the request. Follow the ISO 8601 standard to specify the date and use the offset from Coordinated Universal Time (UTC) to specify the time zone. The format is `YYYY-MM-DDThh:mm:ssZ`. For example, 2014-05-26T12:00:00Z indicates 20:00:00 on May 26, 2014, Beijing time.
SignatureVersion	String	Yes	The signature algorithm version. Set the value to *1.0*.
SignatureNonce	String	Yes	The unique random number used to prevent network replay attacks. You must use different random numbers for different requests.
ResourceOwnerAccount	String	No	The owner account of the resource to be accessed through this API request, that is, the logon username.
Format	String	No	The format of the response. Set the value to *JSON or XML*. **Note** Default value: XML.

19.1.4.2.4. Response structure

Apsara Stack Security API responses support both the XML and JSON formats. The system always returns a unique identification code RequestId each time you send a request to call an operation, no matter whether the call is successful or not.

Sample responses (XML format)

```
<? xml version="1.0" encoding="UTF-8"? >
<! -- The root node of the result -->
<Operation name+Response>
    <! -- Returned request ID -->
    <RequestId>4C467B38-3910-447D-87BC-AC049166F216</RequestId>
    <! -- Returned data -->
</Operation name+Response>
```

Sample responses (JSON format)

```
{
"RequestId": "4C467B38-3910-447D-87BC-AC049166F216",
/* Returned data */
}
```

19.1.4.3. Website protection

19.1.4.3.1. DescribeWebsite

Queries the information about the websites that are protected by WAF.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeWebsite	The operation that you want to perform. Set the value to DescribeWebsite.
RegionId	String	Yes	cn-hangzhou	The ID of the region.
Id	Integer	No	1	The ID of the website.
PageSize	Integer	No	20	The number of entries to return on each page. Default value: 10.
PageNumber	Integer	No	1	The number of the page to return. Default value: 1.
IsVpcWebsite	Boolean	No	true	Specifies whether the websites to query are in a virtual private cloud (VPC). Default value: **false**. Valid values: • **true** • **false**
WebsiteNameFilter	RepeatList	No	["website-1", "website-2"]	The name of the website to query. You can enter multiple names.
ServerNameFilter	RepeatList	No	["www.taobao.com", "www.aliyun.com"]	The domain name of the website to query. You can enter multiple domain names.

Response parameters

Parameter	Type	Example	Description

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
Result	String	{"items": [{"id": 1, "ip": ["0.0.XX.XX"], "session_method": {"type": "off"}, "policy_rules": [], "health_check_status": "", "backend_config": {"type": "proxy", "load_balance_policy": "Round Robin", "servers": [{"protocol": "http", "attr": "slb", "host": "192.168.XX.XX", "port": 80, "weight": 1}], "x_forwarded_for_action": "append", "header_config": [], "health_check_config": {"is_enabled": false, "check_http_expect_alive": ["http_2xx", "http_3xx"], "check_type": "http", "interval": 30000, "fall": 5, "rise": 2, "timeout": 1000, "port": null, "host": "", "method": "GET", "path": "/"}, "proxy_ssl_protocols": [], "proxy_ssl_ciphers": ""}, "vpc": "vpc-tx9isq1jrry8k3h9q****", "vpc_name": "tongquesingle****", "vip": ["42.36.XX.XX"], "ports": [{"port": 80, "ssl": false, "http2": false}], "is_vpc_website": false, "operation_mode": "Software Reverse Proxy", "interface": "virtual", "server_names": ["www.taobao.com"], "ssl_protocols": [], "ssl_ciphers": "", "name": "www.taobao.com", "create_time": "1594371049", "last_update_time": "1594374794", "is_enabled": false, "detector_ip_source": ["Socket"], "proxy_ip_list": [], "proxy_ip_groups": [], "access_log": {"is_enabled": true, "log_request_header": false, "log_response_header": false, "log_request_body": false, "log_payload": false, "log_dest_ip": true, "is_enable_full_access_log": false, "log_src_port": true, "log_event_id": true, "log_proxy_name": true}, "proxy_bind_config": {"enable": false, "hash_select_ip_method": "remote_addr_and_port", "proxy_bind_ip_list": null}, "remark": "", "ssl_cert": null, "policy_group": 6}], "total": 1}	The information about the websites.

Examples

Sample requests

```
https://semawaf.[ RegionId].aliyuncs.com/?Action=DescribeWebsite
&RegionId=cn-hangzhou
&Id=1
&PageSize=20
&PageNumber=1
&IsVpcWebsite=true
&WebsiteNameFilter.1=website-1
&ServerNameFilter.1=www.taobao.com
```

Sample success responses

`XML` format

```
<DescribeWebsiteResponse>
    <RequestId>53e59af3-3209-452a-853c-ac10ad815929</RequestId>

```

Error codes

For a list of error codes, see Error codes.

19.1.4.3.2. CreateWebsite

Adds a website.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateWebsite	The operation that you want to perform. Set the value to CreateWebsite.
RegionId	String	Yes	cn-hangzhou	The ID of the region.
Name	String	Yes	test-website-1	The name of the website.
ServerNameList	RepeatList	Yes	["www.aliyun.com", "www.taobao.com"]	The domain name of the website. You can enter multiple domain names.

Parameter	Type	Required	Example	Description
PortList	RepeatList	Yes	[{"port":80,"ssl":false,"http2":false}, {"port":443,"ssl":true,"http2":true}]	The port information about the website. This parameter is a string consisting of JSON arrays. Each element in a JSON array is a JSON struct that includes the following fields: • **port**: the port number of the website. This field is required. Data type: integer. Valid values: 1 to 65535. • **ssl**: specifies whether to enable an SSL certificate. This field is required. Data type: Boolean. • **http2**: specifies whether to enable HTTP/2. This field is required. Data type: Boolean.
SSLCertId	Integer	No	3	The ID of the SSL certificate. If ssl of a port specified in PortList is set to **true**, this field is required. You can call the DescribeSSLCert operation to query the IDs of SSL certificates.

				The configurations of the website. This parameter is a string consisting of JSON structs. A JSON struct includes the following fields:
				• **type**: the method to respond to requests. This field is required. Data type: string. Valid values:
				  ◦ **proxy**: forwards requests to the backend server.
				  ◦ **redirect**: redirects requests.
				  ◦ **response**: returns specific content.
				• **servers**: the information about the backend server. This field is a string consisting of JSON arrays. Each element in a JSON array is a JSON struct that includes the following fields:
				  ◦ **path**: the destination address for redirection. Data type: string. If **type** in BackendConfig is set to **redirect** or **response**, this field is required.

Parameter	Type	Required	Example	Description
BackendConfig	Json	Yes	{"type": "proxy", "servers": [{"host": "192.168.XX.XX", "port": 80, "protocol": "http", "attr": "ecs", "weight": 1}], "load_balance_policy": "Round Robin", "x_forwarded_for_action": "append", "header_config": []}	◦ **status_code**: the status code in the responses. Data type: integer. If **type** in BackendConfig is set to **redirect** or **response**, this field is required. ◦ **host**: the IP address of the backend server. This field is required. Data type: string. If the backend server is an Elastic Compute Service (ECS) or Server Load Balancer (SLB) instance, you can call the DescribeEcs or DescribeSlb operation to query the IP addresses (values of the **host** field) of backend servers. ◦ **port**: the port number of the backend server. This field is required. Data type: integer. Valid values: 1 to 65535. ◦ **protocol** :the protocol of the backend server. This field is required. Data type: string. Valid values: **http** and **https**. ◦ **attr**: the type of the backend server. This field is required. Data type: string. If you do not need to forward requests destined for the website to a specific backend server, set the value to **normal**. If you need to forward requests destined for the website to a specific backend server, set the value to **ecs** or **slb**. ◦ **weight**: the weight of the backend server. This field is required. Data type: integer. Valid values: any non-zero positive integer. • **load_balance_policy**: the scheduling algorithm. This field is required. Data type: string. Valid values: ◦ **Round Robin**: weighted round-robin ◦ **Least Connected**: least connection scheduling ◦ **IP Hash**: source IP hash • **x_forwarded_for_action**: the action on the X-Forwarded-For field in the HTTP request header. To identify the actual IP addresses of the clients that access your website by using HTTP proxies or load

Parameter	Type	Required	Example	Description
				balancing servers, you can specify this field. This field is required. Data type: string. Valid values: ○ **append**: appends the last-hop IP address to the X-Forwarded-For field. ○ **cover**: overwrites the original value of the X-Forwarded-For field with the last-hop IP address. ○ **no_action**: retains the original value of the X-Forwarded-For field. • **header_config**: the HTTP header configurations. This field is required. Data type: list. If you do not need to configure the HTTP header, set the field to an empty array. This field is a string consisting of JSON arrays. Each element in a JSON array is a JSON struct that includes the following fields: ○ **name**: the name of the HTTP header. This field is required. Data type: string. ○ **context**: the type of the HTTP header. This field is required. Data type: string. Valid values: **request** and **response**. ○ **action**: the action on the HTTP header. This field is required. Data type: string. Valid values: **set** and **hide**. ○ **name**: the value of the HTTP header. This field is required. Data type: string.
PolicyGroupId	Integer	No	6	The ID of the protection policy. If type in BackendConfig is set to **proxy**, this field is required. You can call the DescribePolicyGroup operation to query the IDs of protection policies.

Parameter	Type	Required	Example	Description

SessionMethod	Json	Yes	{"param":"userId","type":"url_query"}	The method to identify users. This parameter is a string consisting of JSON structs. A JSON struct includes the following fields:
				• **param**: the ID of the user.
				• **type**: the method to identify users. This field is required. Data type: string. Valid values:
				  ○ **off**: does not identify users.
				  ○ **custom**: identifies users based on their IDs that are extracted from requests.
				  ○ **cookie**: identifies users based on the Cookie field.
				  ○ **url_query**: identifies users based on the GET parameters.
				  ○ **body_form**: identifies users based on the POST parameters.
				  ○ **header**: identifies users based on the HTTP header.
				  ○ **internal_session**: identifies users based on their systems.

Remark	String	No	Test site-1	The remarks.
Vpc	String	No	vpc-RSABVqbNiS****	The ID of the virtual private cloud (VPC). You can call the DescribeVpc operation to query the IDs of VPCs.
VpcName	String	No	csw	The name of the VPC. You can call the DescribeVpc operation to query the names of VPCs.
IsVpcWebsite	Boolean	No	true	Specifies whether the website is in a VPC. Default value: **false**. Valid values: • **true** • **false**
VipList	RepeatList	Yes	["192.168.XX.XX", "192.168.XX.XX"]	The virtual IP address (VIP). You can enter multiple VIPs. You can call the DescribeInternetVip operation to query the VIPs on the Internet and the DescribeVpcVip operation to query the VIPs in VPCs.

Parameter	Type	Required	Example	Description
IpSourceMethod	RepeatList	No	["Socket"]	The method to obtain the actual IP address. You can enter multiple methods. To obtain the actual IP address from **a field** in the HTTP request header, set the value to *XYZ/X-Forwarded-For:-n*. To obtain the socket information about the *last nth proxy* from **X-Forwarded-For**, append **Socket** to the end of the parameter value.

Parameter	Type	Required	Example	Description
AccessLogConfig	Json	No	{"is_enabled": true, "log_request_header": false, "log_response_header": false, "log_request_body": false, "log_payload": false, "log_dest_ip": true, "is_enable_full_access_log": false, "log_src_port": true, "log_event_id": true, "log_proxy_name": true}	The configurations for access logs. This parameter is a string consisting of JSON structs. A JSON struct includes the following fields: • **is_enabled**: specifies whether to record HTTP access logs. This parameter is required. Data type: Boolean. • **log_request_header**: specifies whether to record the HTTP request header. This parameter is required. Data type: Boolean. • **log_response_header**: specifies whether to record the HTTP response header. This parameter is required. Data type: Boolean. • **log_request_body**: specifies whether to record the HTTP request body. This parameter is required. Data type: Boolean. The maximum size of the HTTP request body that can be logged is 4 KB. • **log_payload**: specifies whether to record the payload. This parameter is required. Data type: Boolean. • **log_dest_ip**: specifies whether to record the destination IP address. This parameter is required. Data type: Boolean. • **is_enable_full_access_log**: specifies whether to record the full access logs. This parameter is required. Data type: Boolean. • **log_src_port**: specifies whether to record the source port. This parameter is required. Data type: Boolean. • **log_event_id**: specifies whether to record the ID of the event. This parameter is required. Data type: Boolean. • **log_proxy_name**: specifies whether to record the name of the proxy. This parameter is required. Data type: Boolean.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
TaskStatus	Struct		
└TaskId	String	c68646a1-58f8-4b75-828a-a2d3b19b382a	The ID of the task.
└Time	String	1593593692	The time when the task status message was generated. This value is a UNIX timestamp representing the number of seconds that have elapsed since the epoch time January 1, 1970, 00:00:00 UTC.
└TaskList	String	["Website-related configuration generation", "Policy-related configuration generation"]	The descriptions of the task. This value is returned only for asynchronous tasks.
└StatusMessage	String	The configuration is in effect.	The status message of the task. You can ignore this reserved parameter.
└SuccessCode	String	1	The status code of the task. Valid values: • **0**: The task fails. • **1**: The task is successful. • **2**: The task is not started.
		{"id": 7, "ip": ["0.0.XX.XX"], "session_method": {"type": "off"}, "policy_rules": [], "health_check_status": "", "backend_config": {"type": "proxy", "load_balance_policy": "Round Robin", "servers": [{"protocol": "http", "attr": "normal", "host": "10.10.XX.XX", "port": 15334, "weight": 1}], "x_forwarded_for_action": "append",

Error codes

For a list of error codes, see Error codes.

19.1.4.3.3. EditWebsite

Modifies the information about a specific website.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	EditWebsite	The operation that you want to perform. Set the value to EditWebsite.
RegionId	String	Yes	cn-hangzhou	The ID of the region.
Id	Integer	Yes	1	The ID of the website.
Name	String	Yes	test-website-1	The name of the website.

Parameter	Type	Required	Example	Description
ServerNameList	RepeatList	Yes	["www.aliyun.com", "www.taobao.com"]	The domain name of the website. You can enter multiple domain names.
PortList	RepeatList	Yes	[{"port":80,"ssl":false,"http2":false}, {"port":443,"ssl":true,"http2":true}]	The port information about the website. This parameter is a string consisting of JSON arrays. Each element in a JSON array is a JSON struct that includes the following fields: • **port**: the port number of the website. This field is required. Data type: integer. Valid values: 1 to 65535. • **ssl**: specifies whether to enable an SSL certificate. This field is required. Data type: Boolean. • **http2**: specifies whether to enable HTTP/2. This field is required. Data type: Boolean.
SSLCertId	Integer	No	3	The ID of the SSL certificate. If ssl of a port specified in PortList is set to **true**, this field is required. You can call the DescribeSSLCert operation to query the IDs of SSL certificates.

				The configurations of the website. This parameter is a string consisting of JSON structs. A JSON struct includes the following fields:
				• **type**: the method to respond to requests. This field is required. Data type: string. Valid values:
				  ◦ **proxy**: forwards requests to the backend server.
				  ◦ **redirect**: redirects requests.
				  ◦ **response**: returns specific content.
				• **servers**: the information about the backend server. This field is a string consisting of JSON arrays. Each element in a JSON array is a JSON struct that includes the following fields:

Parameter	Type	Required	Example	Description
BackendConfig	Json	Yes	{"type": "proxy", "servers": [{"host": "192.168.XX.XX", "port": 80, "protocol": "http", "attr": "ecs", "weight": 1}], "load_balance_policy": "Round Robin", "x_forwarded_for_action": "append", "header_config": []}	◦ **path**: the destination address for redirection. Data type: string. If **type** in BackendConfig is set to **redirect** or **response**, this field is required. ◦ **status_code**: the status code in the responses. Data type: integer. If **type** in BackendConfig is set to **redirect** or **response**, this field is required. ◦ **host**: the IP address of the backend server. This field is required. Data type: string. If the backend server is an Elastic Compute Service (ECS) or Server Load Balancer (SLB) instance, you can call the DescribeEcs or DescribeSlb operation to query the IP addresses (values of the **host** field) of backend servers. ◦ **port**: the port number of the backend server. This field is required. Data type: integer. Valid values: 1 to 65535. ◦ **protocol** :the protocol of the backend server. This field is required. Data type: string. Valid values: **http** and **https**. ◦ **attr**: the type of the backend server. This field is required. Data type: string. If you do not need to forward requests destined for the website to a specific backend server, set the value to **normal**. If you need to forward requests destined for the website to a specific backend server, set the value to **ecs** or **slb**. ◦ **weight**: the weight of the backend server. This field is required. Data type: integer. Valid values: any non-zero positive integer. • **load_balance_policy**: the scheduling algorithm. This field is required. Data type: string. Valid values: ◦ **Round Robin**: weighted round-robin ◦ **Least Connected**: least connection scheduling ◦ **IP Hash**: source IP hash

Parameter	Type	Required	Example	Description

				• **x_forwarded_for_action**: the action on the X-Forwarded-For field in the HTTP request header. To identify the actual IP addresses of the clients that access your website by using HTTP proxies or load balancing servers, you can specify this field. This field is required. Data type: string. Valid values:
				  ○ **append**: appends the last-hop IP address to the X-Forwarded-For field.
				  ○ **cover**: overwrites the original value of the X-Forwarded-For field with the last-hop IP address.
				  ○ **no_action**: retains the original value of the X-Forwarded-For field.
				• **header_config**: the HTTP header configurations. This field is required. Data type: list. If you do not need to configure the HTTP header, set the field to an empty array. This field is a string consisting of JSON arrays. Each element in a JSON array is a JSON struct that includes the following fields:
				  ○ **name**: the name of the HTTP header. This field is required. Data type: string.
				  ○ **context**: the type of the HTTP header. This field is required. Data type: string. Valid values: **request** and **response**.
				  ○ **action**: the action on the HTTP header. This field is required. Data type: string. Valid values: **set** and **hide**.
				  ○ **name**: the value of the HTTP header. This field is required. Data type: string.

PolicyGroupId	Integer	No	6	The ID of the protection policy. If type in BackendConfig is set to **proxy**, this field is required. You can call the DescribePolicyGroup operation to query the IDs of protection policies.

Parameter	Type	Required	Example	Description

SessionMethod	Json	Yes	{"param":"userId","type":"url_query"}	The method to identify users. This parameter is a string consisting of JSON structs. A JSON struct includes the following fields:
				• **param**: the ID of the user.
				• **type**: the method to identify users. This field is required. Data type: string. Valid values:
				  ○ **off**: does not identify users.
				  ○ **custom**: identifies users based on their IDs that are extracted from requests.
				  ○ **cookie**: identifies users based on the Cookie field.
				  ○ **url_query**: identifies users based on the GET parameters.
				  ○ **body_form**: identifies users based on the POST parameters.
				  ○ **header**: identifies users based on the HTTP header.
				  ○ **internal_session**: identifies users based on their systems.

Remark	String	No	Test site-1	The remarks.
Vpc	String	No	vpc-RSABVqbNiS****	The ID of the virtual private cloud (VPC). You can call the DescribeVpc operation to query the IDs of VPCs.
VpcName	String	No	csw	The name of the VPC. You can call the DescribeVpc operation to query the names of VPCs.
IsVpcWebsite	Boolean	No	true	Specifies whether the website is in a VPC. Default value: **false**. Valid values: • **true** • **false**
VipList	RepeatList	Yes	["192.168.XX.XX", "192.168.XX.XX"]	The virtual IP address (VIP). You can enter multiple VIPs. You can call the DescribeInternetVip operation to query the VIPs on the Internet and the DescribeVpcVip operation to query the VIPs in VPCs.

Parameter	Type	Required	Example	Description
IpSourceMethod	RepeatList	Yes	["Socket"]	The method to obtain the actual IP address. You can enter multiple methods. To obtain the actual IP address from **a field** in the HTTP request header, set the value to *XYZ/X-Forwarded-For:-n*. To obtain the socket information about the *last nth proxy* from **X-Forwarded-For**, append **Socket** to the end of the parameter value.

Parameter	Type	Required	Example	Description
AccessLogConfig	Json	Yes	{"is_enabled": true, "log_request_header": false, "log_response_header": false, "log_request_body": false, "log_payload": false, "log_dest_ip": true, "is_enable_full_access_log": false, "log_src_port": true, "log_event_id": true, "log_proxy_name": true}	The configurations for access logs. This parameter is a string consisting of JSON structs. A JSON struct includes the following fields: • **is_enabled**: specifies whether to record HTTP access logs. This parameter is required. Data type: Boolean. • **log_request_header**: specifies whether to record the HTTP request header. This parameter is required. Data type: Boolean. • **log_response_header**: specifies whether to record the HTTP response header. This parameter is required. Data type: Boolean. • **log_request_body**: specifies whether to record the HTTP request body. This parameter is required. Data type: Boolean. The maximum size of the HTTP request body that can be logged is 4 KB. • **log_payload**: specifies whether to record the payload. This parameter is required. Data type: Boolean. • **log_dest_ip**: specifies whether to record the destination IP address. This parameter is required. Data type: Boolean. • **is_enable_full_access_log**: specifies whether to record the full access logs. This parameter is required. Data type: Boolean. • **log_src_port**: specifies whether to record the source port. This parameter is required. Data type: Boolean. • **log_event_id**: specifies whether to record the ID of the event. This parameter is required. Data type: Boolean. • **log_proxy_name**: specifies whether to record the name of the proxy. This parameter is required. Data type: Boolean.
SSLProtocols	RepeatList	No	["TLSv1.1", "TLSv1.2"]	The version of the SSL protocol. Valid values: **SSLv2**, **SSLv3**, **TLSv1**, **TLSv1.1**, **TLSv1.2**, and **TLSv1.3**.

Parameter	Type	Required	Example	Description
SSLCiphers	String	No	TLS_RSA_WITH_AES_128_CBC_SHA	The SSL cipher suite. This parameter is empty by default. You can directly use the cipher strings provided by OpenSSL. You can also concatenate and combine the cipher strings to match the value of the **SSLProtocols** parameter. Example: TLSv1.2:!eNULL:!aNULL:!TLSv1.1:!TLSv1:!SSLv3

ProxyBindingConfig	Json	No	{"enable": true, "hash_select_ip_method": "remote_addr_and_port", "proxy_bind_ip_list": [{"id": "c43b02112.cloud.b03.amtest21", "ips": ["10.10.XX.XX"]}]}	The configurations of back-to-origin IP addresses. The value is a string that consists of a JSON struct. The JSON struct contains the following fields:
				• **enable**: specifies whether to enable session persistence. This field is required. Data type: Boolean.
				• **hash_select_ip_method**: the method for session persistence. This field is optional. Data type: string. Valid values:
				  ○ **remote_addr**: source address-based hashing
				  ○ **remote_addr_and_port**: source port-based hashing
				• **proxy_bind_ip_list**: the list of IP addresses. This field is optional. Data type: list.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
TaskStatus	Struct		
└TaskId	String	c68646a1-58f8-4b75-828a-a2d3b19b382a	The ID of the video moderation task. This ID is returned by the Content Moderation server.
└Time	String	1593593692	The UNIX timestamp of when the task ends. Unit: seconds.

Parameter	Type	Example	Description
└TaskList	String	["Website-related configuration generation", "Policy-related configuration generation"]	The descriptions of the task. This value is returned only for asynchronous tasks.
└StatusMessage	String	The configuration is in effect.	The status message of the task.
└SuccessCode	String	1	The status code of the task. Valid values: • **0**: The task fails. • **1**: The task is successful. • **2**: The task is not started.

Error codes

For a list of error codes, see Error codes.

19.1.4.3.4. ToggleWebsite

Enables or disables WAF protection for a specific website.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ToggleWebsite	The operation that you want to perform. Set the value to ToggleWebsite.
RegionId	String	Yes	cn-hangzhou	The ID of the region.
IdList	RepeatList	Yes	[1, 2]	The ID of the asynchronous task.

Parameter	Type	Required	Example	Description
ToggleAction	String	Yes	disable	Specifies the protection status of the website. Valid values: • **enable**: enables WAF protection. • **disable**: disables WAF protection.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
TaskStatus	Struct		The returned information.
└TaskId	String	c68646a1-58f8-4b75-828a-a2d3b19b382a	The ID of the task.
└Time	String	1593593692	The time when the task status message was generated. This value is a UNIX timestamp representing the number of seconds that have elapsed since the epoch time January 1, 1970, 00:00:00 UTC.
└TaskList	String	["Website-related configuration generation", "Policy-related configuration generation"]	The descriptions of the task. This value is returned only for asynchronous tasks.
└StatusMessage	String	The configuration is in effect.	The status message of the task.
└SuccessCode	String	1	The status code of the task. Valid values: • **0**: The task fails. • **1**: The task is successful. • **2**: The task is not started.

Examples

Sample requests

```
https://semawaf.[ RegionId].aliyuncs.com/?Action=ToggleWebsite
&RegionId=cn-hangzhou
&IdList.1=1
&ToggleAction=disable
```

Sample success responses

`XML` format

```
<ToggleWebsiteResponse>
    <RequestId>53e59af3-3209-452a-853c-ac10ad815929</RequestId>
    <TaskStatus>
        <TaskId>c68646a1-58f8-4b75-828a-a2d3b19b382a</TaskId>
        <Time>1593593692</Time>
        <TaskList>["Website-related configuration generation", "Policy-related configuratio
n generation"]</TaskList>
        <StatusMessage>The configuration is in effect.</StatusMessage>
        <SuccessCode>1</SuccessCode>
    </TaskStatus>
</ToggleWebsiteResponse>
```

`JSON` format

```
{
  "RequestId":"53e59af3-3209-452a-853c-ac10ad815929",
  "TaskStatus":{
    "TaskId":"c68646a1-58f8-4b75-828a-a2d3b19b382a",
    "TaskList":"[\"Website-related configuration generation\", \"Policy-related configurati
on generation\"]",
    "SuccessCode":"1",
    "Time":"1593593692",
    "StatusMessage":"The configuration is in effect."
  }
}
```

Error codes

For a list of error codes, see Error codes.

19.1.4.3.5. QueryAsyncTaskStatus

Queries the status of an asynchronous task.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	QueryAsyncTaskStatus	The operation that you want to perform. Set the value to QueryAsyncTaskStatus.
RegionId	String	Yes	cn-hangzhou	The ID of the region.
TaskId	String	Yes	11c745fc-1d66-40ea-90d7-7e9a12b987b2	The ID of the asynchronous task.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
TaskStatus	Struct		
└TaskId	String	c68646a1-58f8-4b75-828a-a2d3b19b382a	The ID of the task.
└Time	String	1593593692	The time when the task status message was generated. This value is a UNIX timestamp representing the number of seconds that have elapsed since the epoch time January 1, 1970, 00:00:00 UTC.
└TaskList	String	["Website-related configuration generation", "Policy-related configuration generation"]	The descriptions of the task. This value is returned only for asynchronous tasks.
└StatusMessage	String	The configuration is in effect.	The status message of the task.
└SuccessCode	String	1	The status code of the task. Valid values: • **0**: The task fails. • **1**: The task is successful. • **2**: The task is not started.

Examples

Sample requests

```
https://semawaf.[ RegionId].aliyuncs.com/?Action=QueryAsyncTaskStatus
&RegionId=cn-hangzhou
&TaskId=11c745fc-1d66-40ea-90d7-7e9a12b987b2
```

Sample success responses

`XML` format

```
<QueryAsyncTaskStatusResponse>
    <RequestId>53e59af3-3209-452a-853c-ac10ad815929</RequestId>
    <TaskStatus>
        <TaskId>c68646a1-58f8-4b75-828a-a2d3b19b382a</TaskId>
        <Time>1593593692</Time>
        <TaskList>["Website-related configuration generation", "Policy-related configuratio
n generation"]</TaskList>
        <StatusMessage>The configuration is in effect.</StatusMessage>
        <SuccessCode>1</SuccessCode>
    </TaskStatus>
</QueryAsyncTaskStatusResponse>
```

`JSON` format

```
{
  "RequestId":"53e59af3-3209-452a-853c-ac10ad815929",
  "TaskStatus":{
    "TaskId":"c68646a1-58f8-4b75-828a-a2d3b19b382a",
    "TaskList":"[\"Website-related configuration generation\", \"Policy-related configurati
on generation\"]",
    "SuccessCode":"1",
    "Time":"1593593692",
    "StatusMessage":"The configuration is in effect."
  }
}
```

Error codes

For a list of error codes, see Error codes.

19.1.4.3.6. QueryAsyncTaskStatus

Queries the status of an asynchronous task.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	QueryAsyncTaskStatus	The operation that you want to perform. Set the value to QueryAsyncTaskStatus.
RegionId	String	Yes	cn-hangzhou	The ID of the region.
TaskId	String	Yes	11c745fc-1d66-40ea-90d7-7e9a12b987b2	The ID of the asynchronous task.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
TaskStatus	Struct		
└TaskId	String	c68646a1-58f8-4b75-828a-a2d3b19b382a	The ID of the task.
└Time	String	1593593692	The time when the task status message was generated. This value is a UNIX timestamp representing the number of seconds that have elapsed since the epoch time January 1, 1970, 00:00:00 UTC.
└TaskList	String	["Website-related configuration generation", "Policy-related configuration generation"]	The descriptions of the task. This value is returned only for asynchronous tasks.
└StatusMessage	String	The configuration is in effect.	The status message of the task.
└SuccessCode	String	1	The status code of the task. Valid values: • **0**: The task fails. • **1**: The task is successful. • **2**: The task is not started.

Examples

Sample requests

```
https://semawaf.[ RegionId].aliyuncs.com/?Action=QueryAsyncTaskStatus
&RegionId=cn-hangzhou
&TaskId=11c745fc-1d66-40ea-90d7-7e9a12b987b2
```

Sample success responses

`XML` format

```
<QueryAsyncTaskStatusResponse>
    <RequestId>53e59af3-3209-452a-853c-ac10ad815929</RequestId>
    <TaskStatus>
        <TaskId>c68646a1-58f8-4b75-828a-a2d3b19b382a</TaskId>
        <Time>1593593692</Time>
        <TaskList>["Website-related configuration generation", "Policy-related configuratio
n generation"]</TaskList>
        <StatusMessage>The configuration is in effect.</StatusMessage>
        <SuccessCode>1</SuccessCode>
    </TaskStatus>
</QueryAsyncTaskStatusResponse>
```

`JSON` format

```
{
  "RequestId":"53e59af3-3209-452a-853c-ac10ad815929",
  "TaskStatus":{
    "TaskId":"c68646a1-58f8-4b75-828a-a2d3b19b382a",
    "TaskList":"[\"Website-related configuration generation\", \"Policy-related configurati
on generation\"]",
    "SuccessCode":"1",
    "Time":"1593593692",
    "StatusMessage":"The configuration is in effect."
  }
}
```

Error codes

For a list of error codes, see Error codes.

19.1.4.3.7. UploadResponsePage

Uploads a response page file.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	UploadResponsePage	The operation that you want to perform. Set the value to UploadResponsePage.
RegionId	String	Yes	cn-hangzhou	The ID of the region.
FileName	String	No	forbidden.html	The name of the file.
FileContent	String	Yes	VXVPVm5QZEVuWHJhc2ViUGhNZEZRWHBjSnNRZXJn	The Base64-encoded content of the file.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
Result	String	{"path":"572e83ed33331eb575f2dbd39f07e155"}	The returned information. **path**: the path of the uploaded file.

Examples

Sample requests

```
https://semawaf.[ RegionId].aliyuncs.com/?Action=UploadResponsePage
&RegionId=cn-hangzhou
&FileName=forbidden.html
&FileContent=VXVPVm5QZEVuWHJhc2ViUGhNZEZRWHBjSnNRZXJn
```

Sample success responses

`XML` format

```
<UploadResponsePageResponse>
    <RequestId>53e59af3-3209-452a-853c-ac10ad815929</RequestId>
    <Result>{&amp;quot;path&amp;quot;: &amp;quot;572e83ed33331eb575f2dbd39f07e155&amp;quot;}</Result>
</UploadResponsePageResponse>
```

`JSON` format

```
{
  "RequestId":"53e59af3-3209-452a-853c-ac10ad815929",
  "Result":"{\"path\": \"572e83ed33331eb575f2dbd39f07e155\"}"
}
```

Error codes

For a list of error codes, see Error codes.

19.1.4.3.8. DescribeInvalidWebsite

Queries the information about the invalid websites that are discovered by the upgrade detection feature.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeInvalidWebsite	The operation that you want to perform. Set the value to DescribeInvalidWebsite.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-hangzhou	The ID of the region.
Id	Integer	No	1	The ID of the invalid website.
PageSize	Integer	No	20	The number of entries to return on each page. Default value: 10.
PageNumber	Integer	No	1	The number of the page to return. Default value: 1.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.

Parameter	Type	Example	Description
Result	String	[{"id": 1, "name": "invalid_website_1", "server_names": ["www.taobao.com"], "backend_config": {"type": "proxy", "load_balance_policy": "Round Robin", "servers": [{"protocol": "http", "attr": "slb", "host": "192.168.XX.XX", "port": 80, "weight": 1}], "x_forwarded_for_action": "append", "header_config": [], "health_check_config": {"is_enabled": false, "check_http_expect_alive": ["http_2xx", "http_3xx"], "check_type": "http", "interval": 30000, "fall": 5, "rise": 2, "timeout": 1000, "port": null, "host": "", "method": "GET", "path": "/"}, "proxy_ssl_protocols": [], "proxy_ssl_ciphers": ""}, "aliyun_info": {"id": 1, "vpc": "vpc-tx9isq1jrry8k3h9q****", "vswitch": "vsw-tx9v9qpazlcdcc86f****", "vip": ["10.10.XX.XX"], "is_normal": true, "frontend_port": [80]}}]	The returned result of the request.

Examples

Sample requests

```
https://semawaf.[ RegionId].aliyuncs.com/?Action=DescribeInvalidWebsite
&RegionId=cn-hangzhou
&Id=1
&PageSize=20
&PageNumber=1
```

Sample success responses

`XML` format

```
<DescribeInvalidWebsiteResponse>
    <RequestId>53e59af3-3209-452a-853c-ac10ad815929</RequestId>
    <Result>[{"id": 1, "name": "invalid_website_1", "server_names": ["www.taobao.com"], "ba

}
```

Error codes

For a list of error codes, see Error codes.

19.1.4.3.9. DeleteInvalidWebsite

Deletes a specific invalid website. If you use Apsara Stack Enterprise V3.12.0 or upgrade Apsara Stack Enterprise to a later version, WAF performs validity checks and measures invalid websites.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteInvalidWebsite	The operation that you want to perform. Set the value to DeleteInvalidWebsite.
RegionId	String	Yes	cn-hangzhou	The ID of the region.
IdList	RepeatList	Yes	[1, 2]	The ID of the invalid website. You can enter multiple IDs. You can call the DescribeWebsite operation to query the IDs of websites.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
Result	String	None	The returned information. This value is empty.

Examples

Sample requests

```
https://semawaf.[ RegionId].aliyuncs.com/?Action=DeleteInvalidWebsite
&RegionId=cn-hangzhou
&IdList.1=1
```

Sample success responses

`XML` format

```
<DeleteInvalidWebsiteResponse>
    <RequestId>53e59af3-3209-452a-853c-ac10ad815929</RequestId>
    <Result></Result>
</DeleteInvalidWebsiteResponse>
```

`JSON` format

```
{
  "RequestId":"53e59af3-3209-452a-853c-ac10ad815929",
  "Result":""
}
```

Error codes

For a list of error codes, see Error codes.

19.1.4.3.10. DescribeInternetVip

Queries the information about the virtual IP addresses (VIPs) on the Internet.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeInternetVip	The operation that you want to perform. Set the value to DescribeInternetVip.
RegionId	String	Yes	cn-hangzhou	The ID of the region.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.

Result	String	[{"ip": "42.36.XX.XX", "type": "internet IP", "delete": false}, {"ip": "10.10.XX.XX", "type": "intranet IP", "delete": false}]	The information about the VIPs on the Internet. The information includes the following fields:
			• **ip**: the VIP on the Internet.
			• **type**: the type of the return value. The field value is fixed as **internet IP**, which indicates a VIP on the Internet.
			• **delete**: indicates whether the VIP can be deleted. Valid values:
			  ◦ **true**: The VIP can be deleted.
			  ◦ **false**: The VIP cannot be deleted.

Examples

Sample requests

```
https://semawaf.[ RegionId].aliyuncs.com/?Action=DescribeInternetVip
&RegionId=cn-hangzhou
```

Sample success responses

`XML` format

```
<DescribeInternetVipResponse>
    <RequestId>53e59af3-3209-452a-853c-ac10ad815929</RequestId>
    <Result>[{"ip": "42.36.XX.XX", "type": "internet IP", "delete": false}, {"ip": "10.10.X
X.XX", "type": "intranet IP", "delete": false}]</Result>
</DescribeInternetVipResponse>
```

`JSON` format

```
{
  "RequestId":"53e59af3-3209-452a-853c-ac10ad815929",
  "Result":"[{\"ip\": \"42.36.XX.XX\", \"type\": \"internet IP\", \"delete\": false}, {\"ip
\": \"10.10.XX.XX\", \"type\": \"intranet IP\", \"delete\": false}]"
}
```

Error codes

For a list of error codes, see Error codes.

19.1.4.3.11. CreateInternetVip

Creates a virtual IP address (VIP) on the Internet.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateInternetVip	The operation that you want to perform. Set the value to CreateInternetVip.
RegionId	String	Yes	cn-hangzhou	The ID of the region.
IpAddress	String	No	10.10.XX.XX	The VIP that you want to create on the Internet.
IpVersion	String	No	ipv6	The version of the IP protocol. Valid values: • **ipv4** • **ipv6**
NetworkType	String	Yes	internet	The type of the network. Valid values: • **intranet** • **internet** If you set the **IpVersion** parameter to **ipv6**, you can set the NetworkType parameter only to **intranet**.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.

Parameter	Type	Example	Description

Result	String	{"ip": "42.36.XX.XX", "type": "internet IP", "delete": true}	The information about the created VIP. The information includes the following fields:
			• **ip**: the VIP on the Internet.
			• **type**: the type of the return value. The field value is fixed as **internet IP**, which indicates a VIP on the Internet.
			• **delete**: indicates whether the VIP can be deleted. Valid values:
			  ◦ **true**: The VIP can be deleted.
			  ◦ **false**: The VIP cannot be deleted.

Examples

Sample requests

```
https://semawaf.[ RegionId].aliyuncs.com/?Action=CreateInternetVip
&RegionId=cn-hangzhou
&IpAddress=10.10.XX.XX
&IpVersion=ipv6
&NetworkType=internet
```

Sample success responses

`XML` format

```
<CreateInternetVipResponse>
    <RequestId>53e59af3-3209-452a-853c-ac10ad815929</RequestId>
    <Result>{"ip": "42.36.XX.XX", "type": "internet IP", "delete": true}</Result>
</CreateInternetVipResponse>
```

`JSON` format

```
{
  "RequestId":"53e59af3-3209-452a-853c-ac10ad815929",
  "Result":"{\"ip\": \"42.36.XX.XX\", \"type\": \"internet IP\", \"delete\": true}"
}
```

Error codes

For a list of error codes, see Error codes.

19.1.4.3.12. DeleteInternetVip

Deletes a virtual IP address (VIP) on the Internet.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteInternetVip	The operation that you want to perform. Set the value to DeleteInternetVip.
RegionId	String	Yes	cn-hangzhou	The ID of the region.
Vip	String	No	10.10.XX.XX	The VIP that you want to delete on the Internet.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
Result	String	Empty	The returned information. This value is empty.

Examples

Sample requests

```
https://semawaf.[ RegionId].aliyuncs.com/?Action=DeleteInternetVip
&RegionId=cn-hangzhou
&Vip=10.10.XX.XX
```

Sample success responses

`XML` format

```
<DeleteInternetVipResponse>
    <RequestId>53e59af3-3209-452a-853c-ac10ad815929</RequestId>
    <Result></Result>
</DeleteInternetVipResponse>
```

`JSON` format

```
{
  "RequestId":"53e59af3-3209-452a-853c-ac10ad815929",
  "Result":""
}
```

Error codes

For a list of error codes, see Error codes.

19.1.4.3.13. DescribeVpc

Queries the information about virtual private clouds (VPCs).

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeVpc	The operation that you want to perform. Set the value to DescribeVpc.
RegionId	String	Yes	cn-hangzhou	The ID of the region.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
Result	String	{"vpc_list": [{"vpc_id": "vpc-tx9fk7rftc9wbroix****", "name": "cfw_vpc****", "desc": "", "cidr": "172.16.XX.XX/16"}]	The information about the VPCs.

Examples

Sample requests

```
https://semawaf.[ RegionId].aliyuncs.com/?Action=DescribeVpc
&RegionId=cn-hangzhou
```

Sample success responses

`XML` format

```
<DescribeVpcResponse>
    <RequestId>53e59af3-3209-452a-853c-ac10ad815929</RequestId>
    <Result>{"vpc_list": [{"vpc_id": "vpc-tx9fk7rftc9wbroix****", "name": "cfw_vpc****", "d
esc": "", "cidr": "172.16.XX.XX/16"}]</Result>
</DescribeVpcResponse>
```

`JSON` format

```
{
  "RequestId":"53e59af3-3209-452a-853c-ac10ad815929",
  "Result":"{\"vpc_list\": [{\"vpc_id\": \"vpc-tx9fk7rftc9wbroix****\", \"name\": \"cfw_vpc
****\", \"desc\": \"\", \"cidr\": \"172.16.XX.XX/16\"}]"
}
```

Error codes

For a list of error codes, see Error codes.

19.1.4.3.14. DescribeVSwitch

Queries the information about the vSwitches in a specific virtual private cloud (VPC).

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeVSwitch	The operation that you want to perform. Set the value to DescribeVSwitch.
RegionId	String	Yes	cn-hangzhou	The ID of the region.
VpcId	String	Yes	vpc-RSABVqbNiSs****	The ID of the VPC. You can call the DescribeVpc operation to query the IDs of VPCs.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
Result	String	{"vswitch_list": [{"instanceId": "vsw-tx9v9qpazlcdcc86******", "instanceName": "zyp004", "vpcId": "vpc-tx9evaxvf65gt95gb******", "cidrBlock": "192.168.XX.XX/16", "description": ""}]}	The information about the vSwitches in the VPC.

Examples

Sample requests

```
https://semawaf.[ RegionId].aliyuncs.com/?Action=DescribeVSwitch
&RegionId=cn-hangzhou
&VpcId=vpc-RSABVqbNiSs****
```

Sample success responses

`XML` format

```
<DescribeVSwitchResponse>
    <RequestId>53e59af3-3209-452a-853c-ac10ad815929</RequestId>
    <Result>{"vswitch_list": [{"instanceId": "vsw-tx9v9qpazlcdcc86f****", "instanceName": "
zyp004", "vpcId": "vpc-tx9evaxvf65gt95gb****", "cidrBlock": "192.168.XX.XX/16", "descriptio
n": ""}]}</Result>
</DescribeVSwitchResponse>
```

`JSON` format

```
{
  "RequestId":"53e59af3-3209-452a-853c-ac10ad815929",
  "Result":"{\"vswitch_list\": [{\"instanceId\": \"vsw-tx9v9qpazlcdcc86f****\", \"instanceN
ame\": \"zyp004\", \"vpcId\": \"vpc-tx9evaxvf65gt95gb****\", \"cidrBlock\": \"192.168.XX.XX
/16\", \"description\": \"\"}]}"
}
```

Error codes

For a list of error codes, see Error codes.

19.1.4.3.15. DescribeVpcVip

Queries the information about the virtual IP addresses (VIPs) in a specific virtual private cloud (VPC).

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeVpcVip	The operation that you want to perform. Set the value to DescribeVpcVip.
RegionId	String	Yes	cn-hangzhou	The ID of the region.
VpcId	String	Yes	vpc-RSABVqbNiSs****	The ID of the VPC. You can call the DescribeVpc operation to query the IDs of VPCs.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.

Parameter	Type	Example	Description
Result	String	{"items": [{"ip": "192.168.XX.XX", "type": " IP"}], "total": 1}	The information about the VIPs in the VPC. The information includes the following fields: • **items**: the returned VIPs. Information about the VIPs: ◦ **ip**: the VIP in the VPC. ◦ **type**: the type of the return value. The field value is fixed as **IP**, which indicates a VIP. • **total**: the total number of VIPs returned.

Examples

Sample requests

```
https://semawaf.[ RegionId].aliyuncs.com/?Action=DescribeVpcVip
&RegionId=cn-hangzhou
&VpcId=vpc-RSABVqbNiSs****
```

Sample success responses

`XML` format

```
<DescribeVpcVipResponse>
    <RequestId>53e59af3-3209-452a-853c-ac10ad815929</RequestId>
    <Result>{"items": [{"ip": "192.168.XX.XX", "type": " IP"}], "total": 1}</Result>
</DescribeVpcVipResponse>
```

`JSON` format

```
{
  "RequestId":"53e59af3-3209-452a-853c-ac10ad815929",
  "Result":"{\"items\": [{\"ip\": \"192.168.XX.XX\", \"type\": \" IP\"}], \"total\": 1}"
}
```

Error codes

For a list of error codes, see Error codes.

19.1.4.3.16. CreateVpcVip

Creates a virtual IP address (VIP) in a specific virtual private cloud (VPC).

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateVpcVip	The operation that you want to perform. Set the value to CreateVpcVip.
RegionId	String	Yes	cn-hangzhou	The ID of the region.
VpcId	String	Yes	vpc-RSABVqbNiSs****	The ID of the VPC. You can call the DescribeVpc operation to query the IDs of VPCs.
VSwitchId	String	Yes	vsw-APUjoSJOoBw****	The ID of the vSwitch.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
Result	String	{"ip": "192.168.XX.XX", "type": "intranet IP"}	The information about the created VIP. The **type** field indicates the type of the VIP. The field value is fixed as **intranet IP**, which indicates an internal IP address.

Examples

Sample requests

```
https://semawaf.[ RegionId].aliyuncs.com/?Action=CreateVpcVip
&RegionId=cn-hangzhou
&VpcId=vpc-RSABVqbNiSs****
&VSwitchId=vsw-APUjoSJOoBw****
```

Sample success responses

`XML` format

```
<CreateVpcVipResponse>
    <RequestId>53e59af3-3209-452a-853c-ac10ad815929</RequestId>
    <Result>{"ip": "192.168.XX.XX", "type": "intranet IP"}</Result>
</CreateVpcVipResponse>
```

`JSON` format

```
{
  "RequestId":"53e59af3-3209-452a-853c-ac10ad815929",
  "Result":"{\"ip\": \"192.168.XX.XX\", \"type\": \"intranet IP\"}"
}
```

Error codes

For a list of error codes, see Error codes.

19.1.4.3.17. DeleteVpcVip

Deletes a virtual IP address (VIP) in a specific virtual private cloud (VPC).

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteVpcVip	The operation that you want to perform. Set the value to DeleteVpcVip.
RegionId	String	Yes	cn-hangzhou	The ID of the region.
VpcId	String	Yes	vpc-RSABVqbNiSs****	The ID of the VPC. You can call the DescribeVpc operation to query the IDs of VPCs.
Vip	String	Yes	10.10.XX.XX	The VIP in the VPC. You can call the DescribeVpcVip operation to query the VIPs in a specific VPC.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
Result	String	None	The returned information. If the call is successful, this value is empty.

Examples

Sample requests

```
https://semawaf.[ RegionId].aliyuncs.com/?Action=DeleteVpcVip
&RegionId=cn-hangzhou
&VpcId=vpc-RSABVqbNiSs****
&Vip=10.10.XX.XX
```

Sample success responses

`XML` format

```
<DeleteVpcVipResponse>
    <RequestId>53e59af3-3209-452a-853c-ac10ad815929</RequestId>
    <Result></Result>
</DeleteVpcVipResponse>
```

`JSON` format

```
{
  "RequestId":"53e59af3-3209-452a-853c-ac10ad815929",
  "Result":""
}
```

Error codes

For a list of error codes, see Error codes.

19.1.4.3.18. DescribeEcs

Queries the information about the Elastic Compute Service (ECS) instances in a specific virtual private cloud (VPC).

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeEcs	The operation that you want to perform. Set the value to DescribeEcs.
RegionId	String	Yes	cn-hangzhou	The ID of the region.
VpcId	String	Yes	vpc-RSABVqbNiSs****	The ID of the VPC. You can call the DescribeVpc operation to query the IDs of VPCs.

Response parameters

Parameter	Type	Example	Description

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
Result	String	{"ecs": [{"instanceId": "i-tx905fcsw7erxzox****", "instanceName": "ecs****", "internetIp": "", "intranetIp": "192.168.XX.XX", "eip": "", "natIp": "6.6.XX.XX", "status": "Running", "networkType": "vpc", "vpcId": "vpc-tx94ktgeqccd7l98c****", "vswitchId": "vsw-tx9vktwbt8w3vw6wh****", "securityGroupId": "sg-tx9aps47sy596qwj****", "hostName": "iZtx905fcsw7erxzoxa****", "osType": "CentOS 7.2", "createTime": 1588838676000}]}	The information about the ECS instances in the VPC.

Examples

Sample requests

```
https://semawaf.[ RegionId].aliyuncs.com/?Action=DescribeEcs
&RegionId=cn-hangzhou
&VpcId=vpc-RSABVqbNiSs****
```

Sample success responses

`XML` format

```
<DescribeEcsResponse>
    <RequestId>53e59af3-3209-452a-853c-ac10ad815929</RequestId>
    <Result>{"ecs": [{"instanceId": "i-tx905fcsw7erxzox****", "instanceName": "ecs****", "i
nternetIp": "", "intranetIp": "192.168.XX.XX", "eip": "", "natIp": "6.6.XX.XX", "status": "
Running", "networkType": "vpc", "vpcId": "vpc-tx94ktgeqccd7l98c****", "vswitchId": "vsw-tx9

, \"createTime\": 1588838676000}]}"
}
```

Error codes

For a list of error codes, see Error codes.

19.1.4.3.19. DescribeSlb

Queries the information about the Server Load Balancer (SLB) instances in a specific virtual private cloud (VPC).

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeSlb	The operation that you want to perform. Set the value to DescribeSlb.
RegionId	String	Yes	cn-hangzhou	The ID of the region.
VpcId	String	Yes	vpc-RSABVqbNiSs****	The ID of the VPC. You can call the DescribeVpc operation to query the IDs of VPCs.

Response parameters

Parameter	Type	Example	Description

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
Result	String	{"slb": [{"instanceId": "slb-tx9n49pigmazoow4h****", "instanceName": "waf****", "status": "active", "networkType": "intranet", "ip": "192.168.XX.XX", "ipVersion": "ipv4"}]}	The information about the SLB instances in the VPC.

Examples

Sample requests

```
https://semawaf.[ RegionId].aliyuncs.com/?Action=DescribeSlb
&RegionId=cn-hangzhou
&VpcId=vpc-RSABVqbNiSs****
```

Sample success responses

`XML` format

```
<DescribeSlbResponse>
    <RequestId>53e59af3-3209-452a-853c-ac10ad815929</RequestId>
    <Result>{"slb": [{"instanceId": "slb-tx9n49pigmazoow4h****", "instanceName": "waf****",
"status": "active", "networkType": "intranet", "ip": "192.168.XX.XX", "ipVersion": "ipv4"}]
}</Result>
</DescribeSlbResponse>
```

`JSON` format

```
{
  "RequestId":"53e59af3-3209-452a-853c-ac10ad815929",
  "Result":"{\"slb\": [{\"instanceId\": \"slb-tx9n49pigmazoow4h****\", \"instanceName\": \"
waf****\", \"status\": \"active\", \"networkType\": \"intranet\", \"ip\": \"192.168.XX.XX\"
, \"ipVersion\": \"ipv4\"}]}"
}
```

Error codes

For a list of error codes, see Error codes.

19.1.4.4. HTTP flood protection rules

19.1.4.4.1. DescribeCCRuleTemplate

Queries the information about HTTP flood protection rules.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeCCRuleTemplate	The operation that you want to perform. Set the value to DescribeCCRuleTemplate.
RegionId	String	Yes	cn-hangzhou	The ID of the region.
Id	Integer	No	1	The ID of the HTTP flood protection rule.
PageSize	Integer	No	10	The number of entries to return on each page. Default value: 10.
PageNumber	Integer	No	1	The number of the page to return. Default value: 1.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.

Parameter	Type	Example	Description
Result	String	{"items": [{"id": 1, "name": "cc-policy-test", "version": 40, "is_enabled": true, "match_method": {"target_type": "CIDR", "period": null, "limit": null, "scope": "URL Prefix", "policy": "www.taobao.com", "scheme": "http"}, "action": {"action": "forbid"}, "create_time": "1594627307", "expire_period": 10, "execution_number": 0, "template_type": "manual", "is_inaccurate": false, "dry_run": false}], "total": 1}	The returned result of the request. For more information about the **match_method** parameter in the returned result, see the description of **MatchMethod** in CreateCCRuleTemplate.

Examples

Sample requests

```
https://semawaf.[ RegionId].aliyuncs.com/?Action=DescribeCCRuleTemplate
&RegionId=cn-hangzhou
&Id=1
&PageSize=20
&PageNumber=1
```

Sample success responses

`XML` format

```
<DescribeCCRuleTemplateResponse>
    <RequestId>53e59af3-3209-452a-853c-ac10ad815929</RequestId>
    <Result>{"items": [{"id": 1, "name": "cc-policy-test", "version": 40, "is_enabled": tru
e, "match_method": {"target_type": "CIDR", "period": null, "limit": null, "scope": "URL Pre
fix", "policy": "www.taobao.com", "scheme": "http"}, "action": {"action": "forbid"}, "creat
e_time": "1594627307", "expire_period": 10, "execution_number": 0, "template_type": "manual
", "is_inaccurate": false, "dry_run": false}], "total": 1}</Result>
</DescribeCCRuleTemplateResponse>
```

`JSON` format

```
{
  "RequestId":"53e59af3-3209-452a-853c-ac10ad815929",
  "Result":"{\"items\": [{\"id\": 1, \"name\": \"cc-policy-test\", \"version\": 40, \"is_enabled\": true, \"match_method\": {\"target_type\": \"CIDR\", \"period\": null, \"limit\": null, \"scope\": \"URL Prefix\", \"policy\": \"www.taobao.com\", \"scheme\": \"http\"}, \"action\": {\"action\": \"forbid\"}, \"create_time\": \"1594627307\", \"expire_period\": 10, \"execution_number\": 0, \"template_type\": \"manual\", \"is_inaccurate\": false, \"dry_run\": false}], \"total\": 1}"
}
```

Error codes

For a list of error codes, see Error codes.

19.1.4.4.2. CreateCCRuleTemplate

Creates an HTTP flood protection rule.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateCCRuleTemplate	The operation that you want to perform. Set the value to CreateCCRuleTemplate.
RegionId	String	Yes	cn-hangzhou	The ID of the region.
Name	String	Yes	cc-rule-1	The name of the HTTP flood protection rule.
TemplateType	String	Yes	auto	The type of the rule. Valid values: • **manual**: limits requests based on specific IP addresses or sessions. • **auto**: limits requests that meet specific conditions.
Enable	Boolean	No	true	Specifies whether to enable the rule. Default value: **true**. Valid values: • **true**: enables the HTTP flood protection rule. • **false**: disables the HTTP flood protection rule.
RuleMode	Boolean	No	false	The mode of the rule. Default value: **false**. Valid values: • **true**: monitors specific requests. • **false**: blocks specific requests.

Parameter	Type	Required	Example	Description
RuleList	RepeatList	No	["192.168.XX.XX", "192.168.XX.XX/24"]	The IP addresses, classless inter-domain routing (CIDR) blocks, or sessions. If you set TemplateType to **manual** to limit requests from known sources, this parameter is required
RuleAction	Json	Yes	{"action":"forbid","limit_rate_limit":1,"limit_rate_period":5}	The action on requests. This parameter is a string consisting of JSON structs. A JSON struct includes the following fields: • **action**: the action on the requests. This field is required. Data type: string. Valid values: **forbid** and **Limit Rate**. The value forbid indicates that the system blocks requests. The value Limit Rate indicates that the system limits the number of requests to handle over a specific period. • **limit_rate_limit**: the number of requests to handle over a specific period. If you set **action** to **Limit Rate**, this field is required. Data type: integer. Valid values: any non-zero positive integer. • **limit_rate_period**: the period in which the system limits the number of requests to handle. If you set **action** to **Limit Rate**, this field is required. Data type: integer. Valid values: any non-zero positive integer.
FuzzyCount	Boolean	No	false	The statistical aggregation method to count requests. Default value: **false**. Valid values: • **true**: counts requests with the most occurrence. • **false**: counts all requests.

Parameter	Type	Required	Example	Description
MatchMethod	Json	Yes	{"scope":"URL Prefix","limit":"10","period":5,"target_type":"CIDR","policy":"www.aliyun.com","scheme":"http"}	The match conditions. This parameter is a string consisting of JSON structs. A JSON struct includes the following fields: • **scope** :the statistical aggregation method to count requests. This field is required. Data type: string. Valid values: **URL Prefix**, **URL**, and **All**. The value URL Prefix indicates that the requests containing the specific URL prefix are counted. The value URL indicates that the requests containing the specific URL are counted. The value All indicates that all requests are counted. • **limit**: the number of requests to handle over a specific period. If you set **RuleAction.action** to **Limit Rate**, this field is required. Data type: integer. Valid values: any non-zero positive integer. • **period**: the period in which the system limits the number of requests to handle. If you set **RuleAction.action** to **Limit Rate**, this field is required. Data type: integer. Valid values: any non-zero positive integer. • **target_type**: the object type based on which the system limits requests. This field is required. Data type: string. Valid values: **CIDR** and **Session**. • **policy**: the URL or URL prefix based on which requests are counted. If you set **scope** to **URL Prefix** or **URL**, this field is required. • **policy**: the scheme based on which requests are counted. If you set **scope** to **URL Prefix** or **URL**, this field is required. Valid values: **http** and **https**.
ExpirePeriod	Integer	No	86400	The validity period after the rule is triggered. Unit: seconds.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
TaskStatus	Struct		The returned information.
└TaskId	String	c68646a1-58f8-4b75-828a-a2d3b19b382a	The ID of the task. The ID of the task.
└Time	String	1593593692	The time when the task status message was generated. This value is a UNIX timestamp representing the number of seconds that have elapsed since the epoch time January 1, 1970, 00:00:00 UTC.
└TaskList	String	["Website-related configuration generation", "Policy-related configuration generation"]	The descriptions of the task. This value is returned only for asynchronous tasks.
└StatusMessage	String	The configuration is in effect.	The status message of the task. You can ignore this reserved parameter.
└SuccessCode	String	1	The status code of the task. Valid values: • **0**: The task fails. • **1**: The task is successful. • **2**: The task is not started.

Parameter	Type	Example	Description
└Result	String	{"id": 17, "name": "test-cc-rule-1", "version": 65, "is_enabled": true, "match_method": {"target_type": "CIDR", "period": 5, "limit": 5, "scope": "All"}, "action": {"action": "forbid"}, "create_time": "1598337034", "expire_period": null, "execution_number": 0, "template_type": "auto", "is_inaccurate": false, "dry_run": false}	The returned result of the request.

Examples

Sample requests

```
https://semawaf.[ RegionId].aliyuncs.com/?Action=CreateCCRuleTemplate
&RegionId=cn-hangzhou
&Name=cc-rule-1
&TemplateType=auto
&Enable=true
&RuleMode=true
&RuleList.1=192.168.XX.XX
&RuleAction={"action":"forbid","limit_rate_limit":1,"limit_rate_period":5}
&FuzzyCount=true
&MatchMethod={"scope":"URL Prefix","limit":"10","period":5,"target_type":"CIDR","policy":"w
ww.aliyun.com","scheme":"http"}
&ExpirePeriod=86400
```

Sample success responses

`XML` format

```
<CreateCCRuleTemplateResponse>
    <RequestId>53e59af3-3209-452a-853c-ac10ad815929</RequestId>

Error codes

For a list of error codes, see Error codes.

19.1.4.4.3. EditCCRuleTemplate

Modifies a specific HTTP flood protection rule.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	EditCCRuleTemplate	The operation that you want to perform. Set the value to EditCCRuleTemplate.
RegionId	String	Yes	cn-hangzhou	The ID of the region.

Parameter	Type	Required	Example	Description
Id	Integer	No	1	The ID of the HTTP flood protection rule. You can call the DescribeCCRuleTemplate operation to query the IDs of HTTP flood protection rules.
Name	String	Yes	cc-rule-1	The name of the HTTP flood protection rule.
Enable	Boolean	No	true	Specifies whether to enable the rule. Default value: **true**. Valid values: • **true**: enables the HTTP flood protection rule. • **false**: disables the HTTP flood protection rule.
RuleMode	Boolean	No	false	The mode of the rule. Default value: **false**. Valid values: • **true**: monitors specific requests. • **false**: blocks specific requests.

Parameter	Type	Required	Example	Description
RuleAction	Json	Yes	{"action":"forbid","limit_rate_limit":1,"limit_rate_period":5}	The action on requests. This parameter is a string consisting of JSON structs. A JSON struct includes the following fields: • **action**: the action on the requests. This field is required. Data type: string. Valid values: **forbid** and **Limit Rate**. The value forbid indicates that the system blocks requests. The value Limit Rate indicates that the system limits the number of requests to handle over a specific period. • **limit_rate_limit**: the number of requests to handle over a specific period. If you set **action** to **Limit Rate**, this field is required. Data type: integer. Valid values: any non-zero positive integer. • **limit_rate_period**: the period in which the system limits the number of requests to handle. If you set **action** to **Limit Rate**, this field is required. Data type: integer. Valid values: any non-zero positive integer.
FuzzyCount	Boolean	No	false	The statistical aggregation method to count requests. Default value: **false**. Valid values: • **true**: counts requests with the most occurrence. • **false**: counts all requests.

Parameter	Type	Required	Example	Description
MatchMethod	Json	Yes	{"scope":"URL Prefix","limit":"10","period":5,"target_type":"CIDR","policy":"www.aliyun.com","scheme":"http"}	The match conditions. This parameter is a string consisting of JSON structs. A JSON struct includes the following fields: • **scope** :the statistical aggregation method to count requests. This field is required. Data type: string. Valid values: **URL Prefix**, **URL**, and **All**. The value URL Prefix indicates that the requests containing the specific URL prefix are counted. The value URL indicates that the requests containing the specific URL are counted. The value All indicates that all requests are counted. • **limit**: the number of requests to handle over a specific period. If you set **RuleAction.action** to **Limit Rate**, this field is required. Data type: integer. Valid values: any non-zero positive integer. • **period**: the period in which the system limits the number of requests to handle. If you set **RuleAction.action** to **Limit Rate**, this field is required. Data type: integer. Valid values: any non-zero positive integer. • **target_type**: the object type based on which the system limits requests. This field is required. Data type: string. Valid values: **CIDR** and **Session**. • **policy**: the URL or URL prefix based on which requests are counted. If you set **scope** to **URL Prefix** or **URL**, this field is required. • **policy**: the scheme based on which requests are counted. If you set **scope** to **URL Prefix** or **URL**, this field is required. Valid values: **http** and **https**.
ExpirePeriod	Integer	No	86400	The validity period after the rule is triggered. Unit: seconds.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
TaskStatus	Struct		
└TaskId	String	c68646a1-58f8-4b75-828a-a2d3b19b382a	The ID of the task.
└Time	String	1593593692	The time when the task status message was generated. This value is a UNIX timestamp representing the number of seconds that have elapsed since the epoch time January 1, 1970, 00:00:00 UTC.
└TaskList	String	["Website-related configuration generation", "Policy-related configuration generation"]	The descriptions of the task. This value is returned only for asynchronous tasks.
└StatusMessage	String	The configuration is in effect.	The status message of the task. You can ignore this reserved parameter.
└SuccessCode	String	1	The status code of the task. Valid values: • **0**: The task fails. • **1**: The task is successful. • **2**: The task is not started.

Parameter	Type	Example	Description
└Result	String	{"id": 1, "name": "test-cc-rule-1", "version": 65, "is_enabled": true, "match_method": {"target_type": "CIDR", "period": 5, "limit": 5, "scope": "All"}, "action": {"action": "forbid"}, "create_time": "1598337034", "expire_period": null, "execution_number": 0, "template_type": "auto", "is_inaccurate": false, "dry_run": false}	The returned result of the request.

Examples

Sample requests

```
https://semawaf.[ RegionId].aliyuncs.com/?Action=EditCCRuleTemplate
&RegionId=cn-hangzhou
&Id=1
&Name=cc-rule-1
&Enable=true
&RuleMode=true
&RuleAction={"action":"forbid","limit_rate_limit":1,"limit_rate_period":5}
&FuzzyCount=true
&MatchMethod={"scope":"URL Prefix","limit":"10","period":5,"target_type":"CIDR","policy":"w
ww.aliyun.com","scheme":"http"}
&ExpirePeriod=86400
```

Sample success responses

`XML` format

```
<EditCCRuleTemplateResponse>
    <RequestId>53e59af3-3209-452a-853c-ac10ad815929</RequestId>
    <TaskStatus>
        <TaskId>c68646a1-58f8-4b75-828a-a2d3b19b382a</TaskId>
        <Time>1593593692</Time>
        <TaskList>["Website-related configuration generation", "Policy-related configuratio
n generation"]</TaskList>
        <StatusMessage>The configuration is in effect.</StatusMessage>
        <SuccessCode>1</SuccessCode>
        <Result>{"id": 1, "name": "test-cc-rule-1", "version": 65, "is_enabled": true, "mat
ch_method": {"target_type": "CIDR", "period": 5, "limit": 5, "scope": "All"}, "action": {"a
ction": "forbid"}, "create_time": "1598337034", "expire_period": null, "execution_number":
0, "template_type": "auto", "is_inaccurate": false, "dry_run": false}</Result>
    </TaskStatus>
</EditCCRuleTemplateResponse>
```

`JSON` format

```
{
  "RequestId":"53e59af3-3209-452a-853c-ac10ad815929",
  "TaskStatus":{
    "TaskId":"c68646a1-58f8-4b75-828a-a2d3b19b382a",
    "TaskList":"[\"Website-related configuration generation\", \"Policy-related configurati
on generation\"]",
    "SuccessCode":"1",
    "Time":"1593593692",
    "StatusMessage":"The configuration is in effect.",
    "Result":"{\"id\": 1, \"name\": \"test-cc-rule-1\", \"version\": 65, \"is_enabled\": tr
ue, \"match_method\": {\"target_type\": \"CIDR\", \"period\": 5, \"limit\": 5, \"scope\": \
"All\"}, \"action\": {\"action\": \"forbid\"}, \"create_time\": \"1598337034\", \"expire_pe
riod\": null, \"execution_number\": 0, \"template_type\": \"auto\", \"is_inaccurate\": fals
e, \"dry_run\": false}"
  }
}
```

Error codes

For a list of error codes, see Error codes.

19.1.4.4.4. ToggleCCRuleTemplate

Enables or disables a specific HTTP flood protection rule.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ToggleCCRuleTemplate	The operation that you want to perform. Set the value to ToggleCCRuleTemplate.
RegionId	String	Yes	cn-hangzhou	The ID of the region.

Parameter	Type	Required	Example	Description
IdList	RepeatList	Yes	[1, 2]	The ID of the HTTP flood protection rule. You can enter multiple IDs. You can call the DescribeCCRuleTemplate operation to query the IDs of HTTP flood protection rules.
ToggleAction	String	Yes	disable	Specifies the status of the HTTP flood protection rule. Valid values: • **enable** • **disable**

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
TaskStatus	Struct		
└TaskId	String	c68646a1-58f8-4b75-828a-a2d3b19b382a	The ID of the task.
└Time	String	1593593692	The time when the task status message was generated. This value is a UNIX timestamp representing the number of seconds that have elapsed since the epoch time January 1, 1970, 00:00:00 UTC.
└TaskList	String	["Website-related configuration generation", "Policy-related configuration generation"]	The descriptions of the task. This value is returned only for asynchronous tasks.
└StatusMessage	String	The configuration is in effect.	The status message of the task. You can ignore this reserved parameter.
└SuccessCode	String	1	The status code of the task. Valid values: • **0**: The task fails. • **1**: The task is successful. • **2**: The task is not started.

Examples

Sample requests

```
https://semawaf.[ RegionId].aliyuncs.com/?Action=ToggleCCRuleTemplate
&RegionId=cn-hangzhou
&IdList.1=1
&ToggleAction=disable
```

Sample success responses

`XML` format

```
<ToggleCCRuleTemplateResponse>
    <RequestId>53e59af3-3209-452a-853c-ac10ad815929</RequestId>
    <TaskStatus>
        <TaskId>c68646a1-58f8-4b75-828a-a2d3b19b382a</TaskId>
        <Time>1593593692</Time>
        <TaskList>["Website-related configuration generation", "Policy-related configuratio
n generation"]</TaskList>
        <StatusMessage>The configuration is in effect.</StatusMessage>
        <SuccessCode>1</SuccessCode>
    </TaskStatus>
</ToggleCCRuleTemplateResponse>
```

`JSON` format

```
{
  "RequestId":"53e59af3-3209-452a-853c-ac10ad815929",
  "TaskStatus":{
    "TaskId":"c68646a1-58f8-4b75-828a-a2d3b19b382a",
    "TaskList":"[\"Website-related configuration generation\", \"Policy-related configurati
on generation\"]",
    "SuccessCode":"1",
    "Time":"1593593692",
    "StatusMessage":"The configuration is in effect."
  }
}
```

Error codes

For a list of error codes, see Error codes.

19.1.4.4.5. DeleteCCRuleTemplate

Deletes a specific HTTP flood protection rule.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteCCRuleTemplate	The operation that you want to perform. Set the value to DeleteCCRuleTemplate.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-hangzhou	The ID of the region.
IdList	RepeatList	Yes	[1, 2]	The ID of the HTTP flood protection rule. You can enter multiple IDs. You can call the DescribeCCRuleTemplate operation to query the IDs of HTTP flood protection rules.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
TaskStatus	Struct		
└TaskId	String	c68646a1-58f8-4b75-828a-a2d3b19b382a	The ID of the task.
└Time	String	1593593692	The time when the task status message was generated. This value is a UNIX timestamp representing the number of seconds that have elapsed since the epoch time January 1, 1970, 00:00:00 UTC.
└TaskList	String	["Website-related configuration generation", "Policy-related configuration generation"]	The descriptions of the task. This value is returned only for asynchronous tasks.
└StatusMessage	String	The configuration is in effect.	The status message of the task. You can ignore this reserved parameter.
└SuccessCode	String	1	The status code of the task. Valid values: • **0**: The task fails. • **1**: The task is successful. • **2**: The task is not started.

Examples

Sample requests

```
https://semawaf.[ RegionId].aliyuncs.com/?Action=DeleteCCRuleTemplate
&RegionId=cn-hangzhou
&IdList.1=1
```

Sample success responses

`XML` format

```
<DeleteCCRuleTemplateResponse>
    <RequestId>53e59af3-3209-452a-853c-ac10ad815929</RequestId>
    <TaskStatus>
        <TaskId>c68646a1-58f8-4b75-828a-a2d3b19b382a</TaskId>
        <Time>1593593692</Time>
        <TaskList>["Website-related configuration generation", "Policy-related configuratio
n generation"]</TaskList>
        <StatusMessage>The configuration is in effect.</StatusMessage>
        <SuccessCode>1</SuccessCode>
    </TaskStatus>
</DeleteCCRuleTemplateResponse>
```

`JSON` format

```
{
  "RequestId":"53e59af3-3209-452a-853c-ac10ad815929",
  "TaskStatus":{
    "TaskId":"c68646a1-58f8-4b75-828a-a2d3b19b382a",
    "TaskList":"[\"Website-related configuration generation\", \"Policy-related configurati
on generation\"]",
    "SuccessCode":"1",
    "Time":"1593593692",
    "StatusMessage":"The configuration is in effect."
  }
}
```

Error codes

For a list of error codes, see Error codes.

19.1.4.4.6. ClearCCRestrictionList

Removes the restricted users in a specific HTTP flood protection rule.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ClearCCRestrictionList	The operation that you want to perform. Set the value to ClearCCRestrictionList.
RegionId	String	Yes	cn-hangzhou	The ID of the region.

Parameter	Type	Required	Example	Description
CCRuleTemplateId	Integer	Yes	35	The ID of the HTTP flood protection rule. You can call the DescribeCCRuleTemplate operation to query the IDs of HTTP flood protection rules.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
TaskStatus	Struct		
└TaskId	String	c68646a1-58f8-4b75-828a-a2d3b19b382a	The ID of the task.
└Time	String	1593593692	The time when the task status message was generated. This value is a UNIX timestamp representing the number of seconds that have elapsed since the epoch time January 1, 1970, 00:00:00 UTC.
└TaskList	String	["Website-related configuration generation", "Policy-related configuration generation"]	The descriptions of the task. This value is returned only for asynchronous tasks.
└StatusMessage	String	The configuration is in effect.	The status message of the task. You can ignore this reserved parameter.
└SuccessCode	String	1	The status code of the task. Valid values: • **0**: The task fails. • **1**: The task is successful. • **2**: The task is not started.

Examples

Sample requests

```
https://semawaf.[ RegionId].aliyuncs.com/?Action=ClearCCRestrictionList
&RegionId=cn-hangzhou
&CCRuleTemplateId=35
```

Sample success responses

`XML` format

```
<ClearCCRestrictionListResponse>
    <RequestId>53e59af3-3209-452a-853c-ac10ad815929</RequestId>
    <TaskStatus>
        <TaskId>c68646a1-58f8-4b75-828a-a2d3b19b382a</TaskId>
        <Time>1593593692</Time>
        <TaskList>["Website-related configuration generation", "Policy-related configuratio
n generation"]</TaskList>
        <StatusMessage>The configuration is in effect.</StatusMessage>
        <SuccessCode>1</SuccessCode>
    </TaskStatus>
</ClearCCRestrictionListResponse>
```

`JSON` format

```
{
  "RequestId":"53e59af3-3209-452a-853c-ac10ad815929",
  "TaskStatus":{
    "TaskId":"c68646a1-58f8-4b75-828a-a2d3b19b382a",
    "TaskList":"[\"Website-related configuration generation\", \"Policy-related configurati
on generation\"]",
    "SuccessCode":"1",
    "Time":"1593593692",
    "StatusMessage":"The configuration is in effect."
  }
}
```

Error codes

For a list of error codes, see Error codes.

19.1.4.4.7. DescribeCCWhitelist

Queries the information about HTTP flood protection whitelists.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeCCWhitelist	The operation that you want to perform. Set the value to DescribeCCWhitelist.
RegionId	String	Yes	cn-hangzhou	The ID of the region.
Id	Integer	No	1	The ID of the HTTP flood protection whitelist.
PageSize	Integer	No	10	The number of entries to return on each page. Default value: 10.

Parameter	Type	Required	Example	Description
PageNumber	Integer	No	1	The number of the page to return. Default value: 1.
TargetTypeFilter	RepeatList	No	["CIDR", "Session"]	The type to filter whitelists. You can enter multiple types. Valid values: • **CIDR** • **Session**
CommentFilter	RepeatList	No	["cc-whitelist-1", "cc-whitelist-2"]	The remarks to filter whitelists. You can enter multiple remarks.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
Result	String	{"items": [{"id": 5, "target": "10.12.XX.XX", "target_type": "CIDR", "target_ip_group": null, "comment": "", "create_time": "1594627457"}], "total": 1}	The returned result of the request.

Examples

Sample requests

```
https://semawaf.[ RegionId].aliyuncs.com/?Action=DescribeCCWhitelist
&RegionId=cn-hangzhou
&PageSize=10
&PageNumber=1
&TargetTypeFilter.1=CIDR
&CommentFilter.1=cc-whitelist-1
```

Sample success responses

`XML` format

```
<DescribeCCWhitelistResponse>
    <RequestId>53e59af3-3209-452a-853c-ac10ad815929</RequestId>
    <Result>{"items": [{"id": 5, "target": "10.12.XX.XX", "target_type": "CIDR", "target_ip
_group": null, "comment": "", "create_time": "1594627457"}], "total": 1}</Result>
</DescribeCCWhitelistResponse>
```

`JSON` format

```
{
  "RequestId":"53e59af3-3209-452a-853c-ac10ad815929",
  "Result":"{\"items\": [{\"id\": 5, \"target\": \"10.12.XX.XX\", \"target_type\": \"CIDR\"
, \"target_ip_group\": null, \"comment\": \"\", \"create_time\": \"1594627457\"}], \"total\
": 1}"
}
```

Error codes

For a list of error codes, see Error codes.

19.1.4.4.8. CreateCCWhitelist

Creates an HTTP flood protection whitelist.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateCCWhitelist	The operation that you want to perform. Set the value to CreateCCWhitelist.
RegionId	String	Yes	cn-hangzhou	The ID of the region.
TargetType	String	Yes	auto	The type of the HTTP flood protection whitelist. Valid values: • **CIDR** • **Session**
Comment	String	Yes	Whitelist-192168100200	The remarks of the whitelist.
TargetList	RepeatList	Yes	["10.10.XX.XX", "10.10.XX.XX/24"]	The IP address, CIDR block, or session in the whitelist. You can enter multiple IP addresses, CIDR blocks, or sessions.

Response parameters

Parameter	Type	Example	Description

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
TaskStatus	Struct		The returned information.
└TaskId	String	c68646a1-58f8-4b75-828a-a2d3b19b382a	The ID of the task. The ID of the task.
└Time	String	1593593692	The time when the task status message was generated. This value is a UNIX timestamp representing the number of seconds that have elapsed since the epoch time January 1, 1970, 00:00:00 UTC.
└TaskList	String	["Website-related configuration generation", "Policy-related configuration generation"]	The descriptions of the task. This value is returned only for asynchronous tasks.
└StatusMessage	String	The configuration is in effect.	The status message of the task. You can ignore this reserved parameter.
└SuccessCode	String	1	The status code of the task. Valid values: • **0**: The task fails. • **1**: The task is successful. • **2**: The task is not started.
└Result	String	[{"id": null, "target": "10.10.XX.XX", "target_type": "CIDR", "target_ip_group": null, "comment": "", "create_time": "1598337455"}]	The information about the created whitelist.

Examples

Sample requests

```
https://semawaf.[ RegionId].aliyuncs.com/?Action=CreateCCWhitelist
&RegionId=cn-hangzhou
&TargetType=CIDR
&Comment=Whitelist-192168100200
&TargetList.1=10.10.XX.XX
```

Sample success responses

`XML` format

```
<CreateCCWhitelistResponse>
    <RequestId>53e59af3-3209-452a-853c-ac10ad815929</RequestId>
    <TaskStatus>
        <TaskId>c68646a1-58f8-4b75-828a-a2d3b19b382a</TaskId>
        <Time>1593593692</Time>
        <TaskList>["Website-related configuration generation", "Policy-related configuratio
n generation"]</TaskList>
        <StatusMessage>The configuration is in effect.</StatusMessage>
        <SuccessCode>1</SuccessCode>
        <Result>[{"id": null, "target": "10.10.XX.XX", "target_type": "CIDR", "target_ip_gr
oup": null, "comment": "", "create_time": "1598337455"}]</Result>
    </TaskStatus>
</CreateCCWhitelistResponse>
```

`JSON` format

```
{
  "RequestId":"53e59af3-3209-452a-853c-ac10ad815929",
  "TaskStatus":{
    "TaskId":"c68646a1-58f8-4b75-828a-a2d3b19b382a",
    "TaskList":"[\"Website-related configuration generation\", \"Policy-related configurati
on generation\"]",
    "SuccessCode":"1",
    "Time":"1593593692",
    "StatusMessage":"The configuration is in effect.",
    "Result":"[{\"id\": null, \"target\": \"10.10.XX.XX\", \"target_type\": \"CIDR\", \"tar
get_ip_group\": null, \"comment\": \"\", \"create_time\": \"1598337455\"}]"
  }
}
```

Error codes

For a list of error codes, see Error codes.

19.1.4.4.9. DeleteCCWhitelist

Deletes a specific HTTP flood protection whitelist.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteCCWhitelist	The operation that you want to perform. Set the value to DeleteCCWhitelist.
RegionId	String	Yes	cn-hangzhou	The ID of the region.

Parameter	Type	Required	Example	Description
IdList	RepeatList	Yes	[1, 2]	The ID of the HTTP flood protection whitelist. You can enter multiple IDs. You can call the DescribeCCWhitelist operation to query the IDs of HTTP flood protection whitelists.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
TaskStatus	Struct		The returned information.
└TaskId	String	c68646a1-58f8-4b75-828a-a2d3b19b382a	The ID of the task. The ID of the task.
└Time	String	1593593692	The time when the task status message was generated. This value is a UNIX timestamp representing the number of seconds that have elapsed since the epoch time January 1, 1970, 00:00:00 UTC.
└TaskList	String	["Website-related configuration generation", "Policy-related configuration generation"]	The descriptions of the task. This value is returned only for asynchronous tasks.
└StatusMessage	String	The configuration is in effect.	The status message of the task. You can ignore this reserved parameter.
└SuccessCode	String	1	The status code of the task. Valid values: • **0**: The task fails. • **1**: The task is successful. • **2**: The task is not started.

Examples

Sample requests

19.1.4.5. Custom rules

19.1.4.5.1. DescribePolicyRule

Queries the information about custom rules.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribePolicyRule	The operation that you want to perform. Set the value to DescribePolicyRule.
RegionId	String	Yes	cn-hangzhou	The ID of the region.
Id	Integer	No	1	The ID of the custom rule.

Parameter	Type	Required	Example	Description
Enable	Boolean	No	true	Specifies whether to filter custom rules.
RiskLevelFilter	RepeatList	No	[1, 2]	The risk level to filter rules. You can enter multiple values. Valid values: • **0**: no risks • **1**: low • **2**: medium • **3**: high
AttackTypeFilter	RepeatList	No	[1, 2, 3]	The attack type to filter rules. You can enter multiple values. Valid values: **-1** (non-web attacks), **0** (SQL injection attacks), **1** (XSS attacks), **2** (CSRF attacks), **3** (SSRF attacks), **4** (denial of service attacks), **5** (backdoors), **6** (deserialization attacks), **7** (code executions), **8** (code injection attacks), **9** (command injection attacks), **10** (file uploads), **11** (file inclusions), **12** (redirection attacks), **13** (improper authorization), **14** (information leaks), **15** (unauthorized access), **16** (insecure configurations), **17** (XXE attacks), **18** (Xpath injection attacks), **19** (LDAP injection attacks), **20** (path traversal attacks), **21** (scanners), **22** (horizontal authorization bypass), **23** (vertical authorization bypass), **24** (file modifications), **25** (file reads), **26** (file deletions), **27** (logical errors), **28** (CRLF injection attacks), **29** (template injection attacks), **30** (click hijacking attacks), **31** (buffer overflows), **32** (integer overflows), **33** (format string attacks), **34** (race condition attacks), **61** (timeout errors), and **62** (unknown attacks).

Parameter	Type	Required	Example	Description
PolicyActionFilter	RepeatList	No	["deny", "allow"]	The action to filter rules. You can enter multiple values. Valid values: **deny**, **allow**, **dry_run**, and **modify_module**. The value dry_run indicates the rules that monitor requests. The value modify_module indicates the rules that are intended for detection modules.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
Result	String	[{"id": 19, "version": "19@time-1594205736", "websites": [1746], "target": "logic_expr", "pattern": {"$AND": [{"infix": {"decoded_path": "asda"}}]}, "action": "deny", "is_enabled": true, "is_expired": false, "comment": "1111", "attack_type": -1, "log_option": "Persistence", "create_time": "1594205736", "last_update_time": "1594205736", "expire_time": null, "is_global": false, "forbidden_page_config": null, "priority": 0, "module_management": null, "risk_level": 0, "extra": null}]	The returned result of the request. For more information about the **pattern** parameter in the returned result, see Fields in match conditions.

Error codes

For a list of error codes, see Error codes.

19.1.4.5.2. CreatePolicyRule

Creates a custom rule to deny, allow, or monitor requests.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreatePolicyRule	The operation that you want to perform. Set the value to CreatePolicyRule.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-hangzhou	The ID of the region.
ForbiddenPageConfig	Json	No	{"status_code":405,"action":"response","path":""}	The configurations to block requests. The value is a string that consists of a JSON struct. The JSON struct contains the following fields: • **status_code**: the status code. This field is required. Data type: integer. Valid values: 200, 301, 302, 307, 400, 403, 404, 501, and 502. • **action**: the method to respond to the requests. This field is required. Data type: string. Valid values: **redirect** and **response**. The value redirect indicates that the system redirects the requests. The value response indicates that the system returns specific content. If **status_code** is set to 301 or 302, set **action** to **redirect**. If status_code is set to a different value, set action to **response**. • **path**: the destination address for redirection. Data type: string. If **action** is set to **redirect**, this field is required. Otherwise, leave this field empty.
Comment	String	Yes	policy-rule-1	The description of the rule.
Enable	Boolean	No	true	Specifies whether to enable the custom rule. Default value: **true**.
PolicyAction	String	Yes	deny	The action on requests. Valid values: **deny**, **allow**, and **dry_run**. The value dry_run indicates that the system allows and monitors the requests.

Parameter	Type	Required	Example	Description
AttackType	Integer	Yes	-1	The attack type in the custom rule. Valid values: **-1** (non-web attacks), **0** (SQL injection attacks), **1** (XSS attacks), **2** (CSRF attacks), **3** (SSRF attacks), **4** (denial of service attacks), **5** (backdoors), **6** (deserialization attacks), **7** (code executions), **8** (code injection attacks), **9** (command injection attacks), **10** (file uploads), **11** (file inclusions), **12** (redirection attacks), **13** (improper authorization), **14** (information leaks), **15** (unauthorized access), **16** (insecure configurations), **17** (XXE attacks), **18** (Xpath injection attacks), **19** (LDAP injection attacks), **20** (path traversal attacks), **21** (scanners), **22** (horizontal authorization bypass), **23** (vertical authorization bypass), **24** (file modifications), **25** (file reads), **26** (file deletions), **27** (logical errors), **28** (CRLF injection attacks), **29** (template injection attacks), **30** (click hijacking attacks), **31** (buffer overflows), **32** (integer overflows), **33** (format string attacks), **34** (race condition attacks), **61** (timeout errors), and **62** (unknown attacks).
RiskLevel	Integer	Yes	3	The risk level in the custom rule. Valid values: • **0**: no risks • **1**: low • **2**: medium • **3**: high
LogOption	String	Yes	log	The logging operation. Valid values: **log** and **drop**. The value log indicates that matched requests are logged. The value drop indicates that matched requests are not logged.
Pattern	Json	Yes	{"$AND": [{"$NOT": [{"infix": {"urlpath":"admin"}}]}]}	The match conditions. The value is a string that consists of a JSON struct. For information about the JSON struct, see Fields in match conditions.

Parameter	Type	Required	Example	Description
ExpireTime	Long	No	1594982409	The UNIX timestamp of when the custom rule expires. Unit: seconds. If you leave this parameter empty or set it to 0, the rule does not expire.
WebsiteIdList	RepeatList	No	[1, 2]	The ID of the website to which the custom rule applies. You can enter multiple IDs. You can call the DescribePolicyRule operation to query the IDs of websites.

Fields in match conditions

The match conditions of a custom rule are specified in a string that consists of a JSON struct. The JSON struct contains the following fields:

```
{
  "$AND": [                    //The match conditions. This field is required. Data type: l
ist. You can specify the field value in the following default format:
    {
      "Operator":            //This field is required. Data type: string.
        "Match field": "Match content",  //This field is required. Data type: string. If th
e match content is a value, use this format.
        "Match field": {                     //This field is required. Data type: string.
If the match content is a key-value pair, use this format.
          "key": "Match field",                 //This field is required. Data type: strin
g.
          "value": "Match content"        //This field is required. Data type: string.
        }
      }
    },
    {
      "$NOT":                                      //If the operator is prefixed with not,
this field is required. Data type: string. You must specify the field value in the followin
g default format:
        {
          "Operator": {                            //This field is required. Data type: st
ring.
            "Match field": "Match content",  //This field is required. Data type: string. I
f the match content is a value, use this format. If the operator is prefixed with not, remo
ve not.
            "Match field": {                      //This field is required. Data type: stri
ng. If the match content is a key-value pair, use this format. If the operator is prefixed
with not, remove not.
              "key": "Match field",                 //This field is required. Data type: s
tring.
              "value": "Match content"                 //This field is required. Data type
: string.
            }
          }
        }
      ]
    }
  ]
}
```

Operators and match fields

The following lists describe the operators and match fields. The system does not support custom operators or match fields.

- Operators
  - **infix**: inclusion
  - **notinfix**: exclusion
  - **str**: exact match
  - **notstr**: fuzzy match
  - **re**: match based on regular expressions
  - **notre**: reverse match based on regular expressions

- **Match fields and match content types**
  - **urlpath**: the original URI in the request, which is not decoded. Match content type: value. Example: */query%20news?q=1%20or%201%3D1*.
  - **decoded_path**: the path after decoding. Match content type: value. The path is the content from the forward slash (/) to the question mark (?) in the URL.The path must be URL-decoded. Example: */query news*.
  - **decoded_query**: the query string in the URL. Match content type: value. The query string is the content from the question mark (?)to the end of the URL. The query string must be URL-decoded. Example: q=1 or 1=1.
  - **query**: the parameters in the query string. Match content type: key-value pair. The parameters are obtained by splitting the content from the question mark (?) to the end of the URL into key-value pairs. The parameters must be URL-decoded. Example: Parameter name q Parameter value 1 or 1=1.
  - **method**: the method of the HTTP request. Match content type: value. Example: GET or POST.
  - **host**: the Host field in the HTTP request header. Match content type: value.
  - **cookie_raw**: the Cookie field that is not split into key-value pairs. Match content type: value.
  - **cookie**: the cookies that are obtained by splitting the Cookie field into key-value pairs. Match content type: key-value pair.
  - **user_agent**: The User-Agent field in the HTTP request header. Match content type: value.
  - **referer**: the Referrer field in the HTTP request header. Match content type: value.
  - **content_type**: the Content-Type field in the HTTP request header. Match content type: value.
  - **remote_addr**: the actual IP address of the client. Match content type: value.
  - **x_forwarded_for**: the X-Forwarded-For field in the HTTP request header. Match content type: value.
  - **origin**: the Origin field in the HTTP request header. Match content type: value.
  - **session**: the Session content. You can configure this field only after you configure the session settings for your website. Match content type: value.
  - **request_header**: the complete header of the original HTTP request. Match content type: value.
  - **custom_header**: the HTTP request header that is split into key-value pairs. Match content type: key-value pair.
  - **request_header_length**: the length of the HTTP request header. Match content type: value.
  - **request_body_length**: the length of the HTTP request body. Match content type: value.
  - **form**: the form data in the HTTP request body. The data must be split into key-value pairs and URL-decoded. Match content type: key-value pair.
  - **file_name**: the name of the file that you want to upload in the HTTP request. Match content type: value.
  - **request_body**: the complete body of the HTTP request. Match content type: value.
  - **response_status**: the HTTP status code that the server returns. Match content type: value.
  - **response_header**: the HTTP response header that is split into key-value pairs. Match content type: key-value pair.
  - **response_body**: the complete response that the server returns. Match content type: value.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
TaskStatus	Struct		
└TaskId	String	c68646a1-58f8-4b75-828a-a2d3b19b382a	The ID of the task. The ID of the task.
└Time	String	1593593692	The time when the task status message was generated. This value is a UNIX timestamp representing the number of seconds that have elapsed since the epoch time January 1, 1970, 00:00:00 UTC.
└TaskList	String	["Website-related configuration generation", "Policy-related configuration generation"]	The descriptions of the task. This value is returned only for asynchronous tasks.
└StatusMessage	String	The configuration is in effect.	The status message of the task. You can ignore this reserved parameter.
└SuccessCode	String	1	The status code of the task. Valid values: • **0**: The task fails. • **1**: The task is successful. • **2**: The task is not started.

Parameter	Type	Example	Description
└Result	String	{"id": 57, "version": "57@time-1598336466", "websites": [781], "target": "logic_expr", "pattern": {"$AND": [{"infix": {"urlpath": "abcedfgh"}}]}, "action": "deny", "is_enabled": true, "is_expired": false, "comment": "test-policy-rule-1", "attack_type": -1, "log_option": "Persistence", "create_time": "1598336466", "last_update_time": "1598336466", "expire_time": null, "is_global": false, "forbidden_page_config": null, "priority": 0, "module_management": null, "risk_level": 0, "extra": null}	The information about the added website.

Error codes

For a list of error codes, see Error codes.

19.1.4.5.3. EditPolicyRule

Modifies a specific custom rule.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	EditPolicyRule	The operation that you want to perform. Set the value to EditPolicyRule.
RegionId	String	Yes	cn-hangzhou	The ID of the region.
ForbiddenPageConfig	Json	No	{"status_code":405,"action":"response","path":""}	The configurations to block requests. This parameter is a string consisting of JSON structs. A JSON struct includes the following fields: • **status_code**: the status code in the responses. This field is required. Data type: integer. Valid values: 200, 301, 302, 307, 400, 403, 404, 501, and 502. • **action**: the method to respond to the requests. This field is required. Data type: string. Valid values: **redirect** and **response**. The value redirect indicates that the system redirects the requests. The value response indicates that the system returns specific content. If **status_code** is set to 301 or 302, set **action** to **redirect**. If status_code is set to another value, set action to **response**. • **path**: the destination address for redirection. Data type: string. If **action** is set to **redirect**, this field is required. In other cases, leave this field unspecified.
Comment	String	Yes	policy-rule-1	The remarks.
Enable	Boolean	No	true	Specifies whether to enable the custom rule. Default value: **true**.
PolicyAction	String	Yes	deny	The action on requests. Valid values: **deny**, **allow**, and **dry_run**. The value dry_run indicates that the system allows and monitors the requests.

Parameter	Type	Required	Example	Description
AttackType	Integer	Yes	-1	The attack type in the custom rule. Valid values: **-1** (non-web attacks), **0** (SQL injection attacks), **1** (XSS attacks), **2** (CSRF attacks), **3** (SSRF attacks), **4** (denial of service attacks), **5** (backdoors), **6** (deserialization attacks), **7** (code executions), **8** (code injection attacks), **9** (command injection attacks), **10** (file uploads), **11** (file inclusions), **12** (redirection attacks), **13** (improper authorization), **14** (information leaks), **15** (unauthorized access), **16** (insecure configurations), **17** (XXE attacks), **18** (Xpath injection attacks), **19** (LDAP injection attacks), **20** (path traversal attacks), **21** (scanners), **22** (horizontal authorization bypass), **23** (vertical authorization bypass), **24** (file modifications), **25** (file reads), **26** (file deletions), **27** (logical errors), **28** (CRLF injection attacks), **29** (template injection attacks), **30** (click hijacking attacks), **31** (buffer overflows), **32** (integer overflows), **33** (format string attacks), **34** (race condition attacks), **61** (timeout errors), and **62** (unknown attacks).

Parameter	Type	Required	Example	Description
RiskLevel	Integer	Yes	3	The risk level in the custom rule. Valid values: • **0**: no risks • **1**: low • **2**: medium • **3**: high
LogOption	String	Yes	log	The logging operation. Valid values: **log** and **drop**. The value log indicates that matched requests are logged. The value drop indicates that matched requests are not logged.
Pattern	Json	Yes	{"$AND": [{"$NOT": [{"infix": {"urlpath":"admin"}}]}]}	The match conditions. This parameter is a string consisting of JSON structs. For information about the JSON structs, see Fields in match conditions.
ExpireTime	Long	No	1594982409	The expiration time of the custom rule. This value is a UNIX timestamp representing the number of seconds that have elapsed since the epoch time January 1, 1970, 00:00:00 UTC. If you leave this parameter unspecified or set it to 0, the rule does not expire.
WebsiteIdList	RepeatList	No	[1, 2]	The ID of the website to which the custom rule applies. You can enter multiple IDs. You can call the DescribePolicyRule operation to query the IDs of websites.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
TaskStatus	Struct		
└TaskId	String	c68646a1-58f8-4b75-828a-a2d3b19b382a	The ID of the task. The ID of the task.

Parameter	Type	Example	Description
└Time	String	1593593692	The time when the task status message was generated. This value is a UNIX timestamp representing the number of seconds that have elapsed since the epoch time January 1, 1970, 00:00:00 UTC.
└TaskList	String	["Website-related configuration generation", "Policy-related configuration generation"]	The descriptions of the task. This value is returned only for asynchronous tasks.
└StatusMessage	String	The configuration is in effect.	The status message of the task. You can ignore this reserved parameter.
└SuccessCode	String	1	The status code of the task. Valid values: • **0**: The task fails. • **1**: The task is successful. • **2**: The task is not started.
└Result	String	{"id": 57, "version": "57@time-1598336466", "websites": [781], "target": "logic_expr", "pattern": {"$AND": [{"infix": {"urlpath": "abcedfgh"}}]}, "action": "deny", "is_enabled": true, "is_expired": false, "comment": "test-policy-rule-1", "attack_type": -1, "log_option": "Persistence", "create_time": "1598336466", "last_update_time": "1598336466", "expire_time": null, "is_global": false, "forbidden_page_config": null, "priority": 0, "module_management": null, "risk_level": 0, "extra": null}	The information about the added website.

}
```

Error codes

For a list of error codes, see Error codes.

19.1.4.5.4. TogglePolicyRule

Enables or disables a specific custom rule.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	TogglePolicyRule	The operation that you want to perform. Set the value to TogglePolicyRule.
RegionId	String	Yes	cn-hangzhou	The ID of the region.
IdList	RepeatList	Yes	[1, 2]	The ID of the custom rule. You can enter multiple IDs. You can call the DescribePolicyRule operation to query the IDs of custom rules.
ToggleAction	String	Yes	disable	Specifies the status of the custom rule. Valid values: • **enable** • **disable**

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
TaskStatus	Struct		The returned information.
└TaskId	String	c68646a1-58f8-4b75-828a-a2d3b19b382a	The ID of the task.
└Time	String	1593593692	The time when the task status message was generated. This value is a UNIX timestamp representing the number of seconds that have elapsed since the epoch time January 1, 1970, 00:00:00 UTC.
└TaskList	String	["Website-related configuration generation", "Policy-related configuration generation"]	The descriptions of the task. This value is returned only for asynchronous tasks.
└StatusMessage	String	The configuration is in effect.	The status message of the task. You can ignore this reserved parameter.
└SuccessCode	String	1	The status code of the task. Valid values: • **0**: The task fails. • **1**: The task is successful. • **2**: The task is not started.

Examples

Sample requests

```
https://semawaf.[ RegionId].aliyuncs.com/?Action=TogglePolicyRule
&RegionId=cn-hangzhou
&IdList.1=1
&ToggleAction=disable
```

Sample success responses

`XML` format

```
<TogglePolicyRuleResponse>
    <RequestId>53e59af3-3209-452a-853c-ac10ad815929</RequestId>
    <TaskStatus>
        <TaskId>c68646a1-58f8-4b75-828a-a2d3b19b382a</TaskId>
        <Time>1593593692</Time>
        <TaskList>["Website-related configuration generation", "Policy-related configuratio
n generation"]</TaskList>
        <StatusMessage>The configuration is in effect.</StatusMessage>
        <SuccessCode>1</SuccessCode>
    </TaskStatus>
</TogglePolicyRuleResponse>
```

`JSON` format

```
{
  "RequestId":"53e59af3-3209-452a-853c-ac10ad815929",
  "TaskStatus":{
    "TaskId":"c68646a1-58f8-4b75-828a-a2d3b19b382a",
    "TaskList":"[\"Website-related configuration generation\", \"Policy-related configurati
on generation\"]",
    "SuccessCode":"1",
    "Time":"1593593692",
    "StatusMessage":"The configuration is in effect."
  }
}
```

Error codes

For a list of error codes, see Error codes.

19.1.4.5.5. DeletePolicyRule

Deletes a specific custom rule.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeletePolicyRule	The operation that you want to perform. Set the value to DeletePolicyRule.
RegionId	String	Yes	cn-hangzhou	The ID of the region.
IdList	RepeatList	Yes	[1, 2]	The ID of the custom rule. You can enter multiple IDs. You can call the DescribePolicyRule operation to query the IDs of custom rules.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
TaskStatus	Struct		
└TaskId	String	c68646a1-58f8-4b75-828a-a2d3b19b382a	The ID of the task.
└Time	String	1593593692	The time when the task status message was generated. This value is a UNIX timestamp representing the number of seconds that have elapsed since the epoch time January 1, 1970, 00:00:00 UTC.
└TaskList	String	["Website-related configuration generation", "Policy-related configuration generation"]	The descriptions of the task. This value is returned only for asynchronous tasks.
└StatusMessage	String	The configuration is in effect.	The status message of the task. You can ignore this reserved parameter.
└SuccessCode	String	1	The status code of the task. Valid values: • **0**: The task fails. • **1**: The task is successful. • **2**: The task is not started.

Examples

Sample requests

```
https://semawaf.[ RegionId].aliyuncs.com/?Action=DeletePolicyRule
&RegionId=cn-hangzhou
&IdList.1=1
```

Sample success responses

`XML` format

```
<DeletePolicyRuleResponse>
    <RequestId>53e59af3-3209-452a-853c-ac10ad815929</RequestId>
    <TaskStatus>
        <TaskId>c68646a1-58f8-4b75-828a-a2d3b19b382a</TaskId>
        <Time>1593593692</Time>
        <TaskList>["Website-related configuration generation", "Policy-related configuratio
n generation"]</TaskList>
        <StatusMessage>The configuration is in effect.</StatusMessage>
        <SuccessCode>1</SuccessCode>
    </TaskStatus>
</DeletePolicyRuleResponse>
```

`JSON` format

```
{
  "RequestId":"53e59af3-3209-452a-853c-ac10ad815929",
  "TaskStatus":{
    "TaskId":"c68646a1-58f8-4b75-828a-a2d3b19b382a",
    "TaskList":"[\"Website-related configuration generation\", \"Policy-related configurati
on generation\"]",
    "SuccessCode":"1",
    "Time":"1593593692",
    "StatusMessage":"The configuration is in effect."
  }
}
```

Error codes

For a list of error codes, see Error codes.

19.1.4.5.6. EditPolicyRulePriority

Modifies the priorities of custom rules for a specific website. The rules in PolicyRuleIdList are prioritized in descending order.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	EditPolicyRulePriority	The operation that you want to perform. Set the value to EditPolicyRulePriority.
RegionId	String	Yes	cn-hangzhou	The ID of the region.
WebsiteId	Integer	No	101	The ID of the website for which you want to modify custom rule priorities.

Parameter	Type	Required	Example	Description
PolicyRuleIdList	Integer	No	10	The ID of the custom rule. You can enter multiple IDs. You can call the DescribePolicyRule operation to query the IDs of custom rules.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
TaskStatus	Struct		
└TaskId	String	c68646a1-58f8-4b75-828a-a2d3b19b382a	The ID of the task.
└Time	String	1593593692	The time when the task status message was generated. This value is a UNIX timestamp representing the number of seconds that have elapsed since the epoch time January 1, 1970, 00:00:00 UTC.
└TaskList	String	["Website-related configuration generation", "Policy-related configuration generation"]	The descriptions of the task. This value is returned only for asynchronous tasks.
└StatusMessage	String	The configuration is in effect.	The status message of the task. You can ignore this reserved parameter.
└SuccessCode └Result	String		The status code of the task. Valid values: • **0**: The task fails. • **1**: The task is successful. • **2**: The task is not started.
└Result	String	{"website": 12, "policy_rule_ids": [12, 17]}	The returned result of the request.

Examples

Sample requests

```
https://semawaf.[ RegionId].aliyuncs.com/?Action=EditPolicyRulePriority
&RegionId=cn-hangzhou
&WebsiteId=101
&PolicyRuleIdList.1=3
```

Sample success responses

`XML` format

```
<EditPolicyRulePriorityResponse>
    <RequestId>53e59af3-3209-452a-853c-ac10ad815929</RequestId>
    <TaskStatus>
        <TaskId>c68646a1-58f8-4b75-828a-a2d3b19b382a</TaskId>
        <Time>1593593692</Time>
        <TaskList>["Website-related configuration generation", "Policy-related configuratio
n generation"]</TaskList>
        <StatusMessage>The configuration is in effect.</StatusMessage>
        <SuccessCode>1</SuccessCode>
        <Result>{"website": 12, "policy_rule_ids": [12, 17]}</Result>
    </TaskStatus>
</EditPolicyRulePriorityResponse>
```

`JSON` format

```
{
  "RequestId":"53e59af3-3209-452a-853c-ac10ad815929",
  "TaskStatus":{
    "TaskId":"c68646a1-58f8-4b75-828a-a2d3b19b382a",
    "TaskList":"[\"Website-related configuration generation\", \"Policy-related configurati
on generation\"]",
    "SuccessCode":"1",
    "Time":"1593593692",
    "StatusMessage":"The configuration is in effect.",
    "Result":"{\"website\": 12, \"policy_rule_ids\": [12, 17]}"
  }
}
```

Error codes

For a list of error codes, see Error codes.

19.1.4.5.7. GenerateFalsePositiveRuleCorrection

Generates correction rules based on false positives.

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	GenerateFalsePositiveRuleCorrection	The operation that you want to perform. Set the value to GenerateFalsePositiveRuleCorrection.
RegionId	String	Yes	cn-hangzhou	The ID of the region.
LogId	String	Yes	1e23f8d1-a9d2-4dd9-b7e2-424b9832183f	The ID of the log.
RuleId	String	Yes	m_sqli	The ID of the rule.
UrlPath	String	Yes	/	The path of the URL.
Host	String	Yes	www.taobao.com	The domain name.
SourceIpAddress	String	Yes	10.17.XX.XX	The source IP address.
DestinationIp	String	Yes	43.17.XX.XX	The destination IP address.
DestinationPort	Integer	Yes	80	The destination port.
RequestBody	String	No		The body of the request.
RawRequestHeader	String	Yes	GET /? id=1 or 1=1 HTTP/1.1\r\nUser-Agent: curl/7.29.0\r\nAccept: /\r\nhost: www.taobao.com\r\n\r\n	The original header of the request.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.

Parameter	Type	Example	Description
Result	String	{"pattern": {"decoded_path": "/", "host": "40.73.XX.XX", "remote_addr": "139.162.XX.XX"}, "action": "allow", "comment": "Clear false positives - 550877"}	The returned result of the request.

Examples

Sample requests

```
https://semawaf.[ RegionId].aliyuncs.com/?Action=GenerateFalsePositiveRuleCorrection
&RegionId=cn-hangzhou
&LogId=1e23f8d1-a9d2-4dd9-b7e2-424b9832183f
&RuleId=m_sqli
&UrlPath=/
&Host=www.taobao.com
&SourceIpAddress=10.17.XX.XX
&DestinationIp=43.17.XX.XX
&DestinationPort=80
&RequestBody=
&RawRequestHeader=GET /? id=1 or 1=1 HTTP/1.1\r\nUser-Agent: curl/7.29.0\r\nAccept: */*\r\n
host: www.taobao.com\r\n\r\n
```

Sample success responses

`XML` format

```
<GenerateFalsePositiveRuleCorrectionResponse>
    <RequestId>53e59af3-3209-452a-853c-ac10ad815929</RequestId>
    <Result>{"pattern": {"decoded_path": "/", "host": "40.73.XX.XX", "remote_addr": "139.16
2.XX.XX"}, "action": "allow", "comment": "Clear false positives - 550877"}</Result>
</GenerateFalsePositiveRuleCorrectionResponse>
```

`JSON` format

```
{
  "RequestId":"53e59af3-3209-452a-853c-ac10ad815929",
  "Result":"{\"pattern\": {\"decoded_path\": \"/\", \"host\": \"40.73.XX.XX\", \"remote_add
r\": \"139.162.XX.XX\"}, \"action\": \"allow\", \"comment\": \"Clear false positives - 5508
77\"}"
}
```

Error codes

For a list of error codes, see Error codes.

19.1.4.5.8. CreateDetectionModuleRule

Creates a rule for detection module control.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateDetectionModuleRule	The operation that you want to perform. Set the value to CreateDetectionModuleRule.
RegionId	String	Yes	cn-hangzhou	The ID of the region.
ForbiddenPageConfig	Json	No	{"status_code":405,"action":"response","path":""}	The configurations to block requests. This parameter is a string consisting of JSON structs. A JSON struct includes the following fields: • **status_code**: the status code in the responses. This field is required. Data type: integer. Valid values: 200, 301, 302, 307, 400, 403, 404, 501, and 502. • **action**: the method to respond to the requests. This field is required. Data type: string. Valid values: **redirect** and **response**. The value redirect indicates that the system redirects the requests. The value response indicates that the system returns specific content. If **status_code** is set to 301 or 302, set **action** to **redirect**. If status_code is set to another value, set action to **response**. • **path**: the destination address for redirection. Data type: string. If **action** is set to **redirect**, this field is required. In other cases, leave this field unspecified.
Comment	String	Yes	detection-module-rule-1	The remarks.
PolicyAction	String	Yes	modify_module	The action in the rule. Set the value to **modify_module**, which indicates detection module control.
Enable	Boolean	No	true	Specifies whether to enable the rule for detection module control. Default value: **true**.

Parameter	Type	Required	Example	Description
ModuleManagement	Json	Yes	{"disabled":["m_xss"],"enabled":[]}	Specifies whether to enable detection module control. This parameter is a string consisting of JSON structs. A JSON struct includes the following fields: • **disabled**: disables detection module control. This field is required. Data type: list. • **enabled**: enables detection module control. This filed is required. Data type: list. For more information about detection modules, see Module description.
LogOption	String	Yes	log	The logging operation. Valid values: **log** and **drop**. The value log indicates that matched requests are logged. The value drop indicates that matched requests are not logged.
Pattern	Json	Yes	{"$AND":[{"$NOT":[{"infix":{"urlpath":"admin"}}]}]}	The match conditions. This parameter is a string consisting of JSON structs. For more information about the JSON structs, see Fields in match conditions.
ExpireTime	Long	No	1594982409	The expiration time of the custom rule. This value is a UNIX timestamp representing the number of seconds that have elapsed since the epoch time January 1, 1970, 00:00:00 UTC. If you leave this parameter unspecified or set it to 0, the rule does not expire.
WebsiteIdList	RepeatList	No	[1, 2]	The ID of the website to which the custom rule applies. You can enter multiple IDs. You can call the DescribePolicyRule operation to query the IDs of websites.

Module description

Code	Description
m_sqli	SQL Injection Detection Module

Code	Description
m_xss	XSS Detection Module
m_rule	Intelligence Module
m_csrf	CSRF Detection Module
m_ssrf	SSRF Detection Module
m_php_unserialize	PHP Deserialization Detection Module
m_java_unserialize	Java Deserialization Detection Module
m_file_upload	File Upload Attack Detection Module
m_file_include	File Inclusion Attack Detection Module
m_php_code_injection	PHP Code Injection Detection Module
m_java	Java Code Injection Detection Module
m_cmd_injection	Command Injection Detection Module
m_response	Server Response Detection Module
m_scanner	Robot Detection Module
m_asp_code_injection	ASP Code Injection Detection Module
m_ssti	Template Injection Detection Module

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
TaskStatus	Struct		
└TaskId	String	c68646a1-58f8-4b75-828a-a2d3b19b382a	The ID of the task. The ID of the task.
└Time	String	1593593692	The time when the task status message was generated. This value is a UNIX timestamp representing the number of seconds that have elapsed since the epoch time January 1, 1970, 00:00:00 UTC.

Parameter	Type	Example	Description
└TaskList	String	["Website-related configuration generation", "Policy-related configuration generation"]	The descriptions of the task. This value is returned only for asynchronous tasks.
└StatusMessage	String	The configuration is in effect.	The status message of the task. You can ignore this reserved parameter.
└SuccessCode	String	1	The status code of the task. Valid values: • **0**: The task fails. • **1**: The task is successful. • **2**: The task is not started.
└Result	String	{"id": 58, "version": "58@time-1598338353", "websites": [], "target": "logic_expr", "pattern": {"$AND": [{"infix": {"urlpath": "1234567"}}]}, "action": "modify_module", "is_enabled": true, "is_expired": false, "comment": "test-module-rule-1", "attack_type": -1, "log_option": "Persistence", "create_time": "1598338348", "last_update_time": "1598338353", "expire_time": null, "is_global": false, "forbidden_page_config": null, "priority": 0, "module_management": {"disabled": ["m_sqli"], "enabled": []}, "risk_level": 0, "extra": null}	The returned result of the request.

Examples

Sample requests

```
https://semawaf.[RegionId].aliyuncs.com/?Action=CreateDetectionModuleRule
&RegionId=cn-hangzhou
&ForbiddenPageConfig={"status_code":405,"action":"response","path":""}
&Comment=detection-module-rule-1

Error codes

For a list of error codes, see Error codes.

19.1.4.5.9. EditDetectionModuleRule

Modifies a specific rule for detection module control.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	EditDetectionModuleRule	The operation that you want to perform. Set the value to EditDetectionModuleRule.
RegionId	String	Yes	cn-hangzhou	The ID of the region.
Id	Integer	Yes	1	The ID of the rule for detection module control.

Parameter	Type	Required	Example	Description
ForbiddenPageConfig	Json	No	{"status_code":405,"action":"response","path":""}	The configurations to block requests. This parameter is a string consisting of JSON structs. A JSON struct includes the following fields: • **status_code**: the status code in the responses. This field is required. Data type: integer. Valid values: 200, 301, 302, 307, 400, 403, 404, 501, and 502. • **action**: the method to respond to the requests. This field is required. Data type: string. Valid values: **redirect** and **response**. The value redirect indicates that the system redirects the requests. The value response indicates that the system returns specific content. If **status_code** is set to 301 or 302, set **action** to **redirect**. If status_code is set to another value, set action to **response**. • **path**: the destination address for redirection. Data type: string. If **action** is set to **redirect**, this field is required. In other cases, leave this field unspecified.
Comment	String	Yes	detection-module-rule-1	The remarks.
PolicyAction	String	Yes	modify_module	The action in the rule. Set the value to **modify_module**, which indicates detection module control.
Enable	Boolean	No	true	Specifies whether to enable the rule for detection module control. Default value: **true**.

Parameter	Type	Required	Example	Description
ModuleManagement	Json	Yes	{"disabled":["m_xss"],"enabled":[]}	Specifies whether to enable detection module control. This parameter is a string consisting of JSON structs. A JSON struct includes the following fields: • **disabled**: disables detection module control. This field is required. Data type: list. • **enabled**: enables detection module control. This field is required. Data type: list. For more information about detection modules, see Module description.
LogOption	String	Yes	log	The logging operation. Valid values: **log** and **drop**. The value log indicates that matched requests are logged. The value drop indicates that matched requests are not logged.
Pattern	Json	Yes	{"$AND":[{"$NOT":[{"infix":{"urlpath":"admin"}}]}]}	The match conditions. This parameter is a string consisting of JSON structs. For more information about the JSON structs, see Fields in match conditions.
ExpireTime	Long	No	1594982409	The expiration time of the custom rule. This value is a UNIX timestamp representing the number of seconds that have elapsed since the epoch time January 1, 1970, 00:00:00 UTC. If you leave this parameter unspecified or set it to 0, the rule does not expire.
WebsiteIdList	RepeatList	No	[1, 2]	The ID of the website to which the custom rule applies. You can enter multiple IDs. You can call the DescribePolicyRule operation to query the IDs of websites.

Response parameters

Parameter	Type	Example	Description

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
TaskStatus	Struct		
└TaskId	String	c68646a1-58f8-4b75-828a-a2d3b19b382a	The ID of the task. The ID of the task.
└Time	String	1593593692	The time when the task status message was generated. This value is a UNIX timestamp representing the number of seconds that have elapsed since the epoch time January 1, 1970, 00:00:00 UTC.
└TaskList	String	["Website-related configuration generation", "Policy-related configuration generation"]	The descriptions of the task. This value is returned only for asynchronous tasks.
└StatusMessage	String	The configuration is in effect.	The status message of the task. You can ignore this reserved parameter.
└SuccessCode	String	1	The status code of the task. Valid values: • **0**: The task fails. • **1**: The task is successful. • **2**: The task is not started.

Parameter	Type	Example	Description
└Result	String	{"id": 58, "version": "58@time-1598338353", "websites": [], "target": "logic_expr", "pattern": {"$AND": [{"infix": {"urlpath": "1234567"}}]}, "action": "modify_module", "is_enabled": true, "is_expired": false, "comment": "test-module-rule-1", "attack_type": -1, "log_option": "Persistence", "create_time": "1598338348", "last_update_time": "1598338353", "expire_time": null, "is_global": false, "forbidden_page_config": null, "priority": 0, "module_management": {"disabled": ["m_sqli"], "enabled": []}, "risk_level": 0, "extra": null}	The returned result of the request.

Examples

Error codes

For a list of error codes, see Error codes.

19.1.4.5.10. EditPolicyRuleWebsiteBinding

Modifies the binding relationship between a specific website and its custom rules.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	EditPolicyRuleWebsiteBinding	The operation that you want to perform. Set the value to EditPolicyRuleWebsiteBinding.
RegionId	String	Yes	cn-hangzhou	The ID of the region.
WebsiteId	Integer	No	101	The ID of the website for which you want to modify the binding relationship.
PolicyRuleIdList	Integer	No	10	The ID of the custom rule. You can enter multiple IDs. You can call the DescribePolicyRule operation to query the IDs of custom rules.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
TaskStatus	Struct		
└TaskId	String	c68646a1-58f8-4b75-828a-a2d3b19b382a	The ID of the task.
└Time	String	1593593692	The time when the task status message was generated. This value is a UNIX timestamp representing the number of seconds that have elapsed since the epoch time January 1, 1970, 00:00:00 UTC.
└TaskList	String	["Website-related configuration generation", "Policy-related configuration generation"]	The descriptions of the task. This value is returned only for asynchronous tasks.
└StatusMessage	String	The configuration is in effect.	The status message of the task. You can ignore this reserved parameter.

Parameter	Type	Example	Description
└SuccessCode	└Result	String	The status code of the task. Valid values: • **0**: The task fails. • **1**: The task is successful. • **2**: The task is not started.
└Result	String	{"website": 12, "policy_rule_ids": [12, 17]}	The returned result of the request.

Examples

Sample requests

```
https://semawaf.[ RegionId].aliyuncs.com/?Action=EditPolicyRuleWebsiteBinding
&RegionId=cn-hangzhou

Error codes

For a list of error codes, see Error codes.

19.1.4.5.11. DeletePolicyRuleWebsiteBinding

Deletes the binding relationship between a specific website and specific custom rules.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeletePolicyRuleWebsiteBinding	The operation that you want to perform. Set the value to DeletePolicyRuleWebsiteBinding.
RegionId	String	Yes	cn-hangzhou	The ID of the region.
WebsiteId	Integer	No	101	The ID of the website for which you want to modify the binding relationship.
PolicyRuleIdList	Integer	No	10	The ID of the custom rule. You can enter multiple IDs. You can call the DescribePolicyRule operation to query the IDs of custom rules.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
TaskStatus	Struct		
└TaskId	String	c68646a1-58f8-4b75-828a-a2d3b19b382a	The ID of the task.
└Time	String	1593593692	The time when the task status message was generated. This value is a UNIX timestamp representing the number of seconds that have elapsed since the epoch time January 1, 1970, 00:00:00 UTC.

Parameter	Type	Example	Description
└TaskList	String	["Website-related configuration generation", "Policy-related configuration generation"]	The descriptions of the task. This value is returned only for asynchronous tasks.
└StatusMessage	String	The configuration is in effect.	The status message of the task. You can ignore this reserved parameter.
└SuccessCode	└Result	String	The status code of the task. Valid values: • **0**: The task fails. • **1**: The task is successful. • **2**: The task is not started.

Examples

Sample requests

```
https://semawaf.[ RegionId].aliyuncs.com/?Action=DeletePolicyRuleWebsiteBinding
&RegionId=cn-hangzhou
&WebsiteId=101
&PolicyRuleId=12
```

Sample success responses

`XML` format

```

19.1.4.6. Protection policies

19.1.4.6.1. DescribePolicyGroup

Queries the information about protection policies.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribePolicyGroup	The operation that you want to perform. Set the value to DescribePolicyGroup.
RegionId	String	Yes	cn-hangzhou	The ID of the region.
Id	Integer	No	101	The ID of the protection policy.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
		DescribePolicyGroup": "[{"id": 6, "is_timeout_enabled": true, "name": "Default Policy Strategy", "create_time": "1589275411", "last_update_time": "1594607697", "is_default": true, "modules_state": true, "response_detection_state": true, "response_detection_max_body_size": 1024, "response_detection_generate_log": false, "request_detection_max_body_size": 1024, "detection_timeout_threshold": 1000, "log_detection_timeout_event": true, "forbidden_page_config": {"action": "response",

Error codes

For a list of error codes, see Error codes.

19.1.4.6.2. CreatePolicyGroup

Creates a protection policy.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreatePolicyGroup	The operation that you want to perform. Set the value to CreatePolicyGroup.
RegionId	String	Yes	cn-hangzhou	The ID of the region.
PolicyGroupName	String	Yes	Loose protection policy	The name of the protection policy.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
		{"id": 75, "is_timeout_enabled": true, "name": "policy-group-test", "create_time": "1594695152", "last_update_time": "1594695152", "is_default": false, "modules_state": true, "response_detection_state": true, "response_detection_max_body_size": 1024, "response_detection_generate_log": false, "request_detection_max_body_size": 1024,

Error codes

For a list of error codes, see Error codes.

19.1.4.6.3. EditPolicyGroup

Modifies a specific protection policy.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	EditPolicyGroup	The operation that you want to perform. Set the value to EditPolicyGroup.
RegionId	String	Yes	cn-hangzhou	The ID of the region.
Id	Integer	Yes	1	The ID of the protection policy. You can call the DescribePolicyGroup operation to query the IDs of protection policies.

Parameter	Type	Required	Example	Description
ForbiddenPageConfig	Json	Yes	{"status_code":405,"action":"response","path":""}	The configurations to block requests. This parameter is a string consisting of JSON structs. A JSON struct includes the following fields: • **status_code**: the status code in the responses. This field is required. Data type: integer. Valid values: 200, 301, 302, 307, 400, 403, 404, 501, and 502. • **action**: the method to respond to the requests. This field is required. Data type: string. Valid values: **redirect** and **response**. The value redirect indicates that the system redirects the requests. The value response indicates that the system returns specific content. If **status_code** is set to 301 or 302, set **action** to **redirect**. If status_code is set to another value, set action to **response**. • **path**: the destination address for redirection. Data type: string. If **action** is set to **redirect**, this field is required. In other cases, leave this field unspecified.

Parameter	Type	Required	Example	Description
ResponseDetection	Boolean	Yes	true	Specifies whether to enable response detection. Valid values: • **true** • **false**
ResponseDetectionLog	Boolean	No	false	Specifies whether to record response content in attack detection logs. Default value: **false**. Valid values: • **true** • **false**
ResponseDetectionMaxBody	Integer	Yes	1024	The maximum size of a response body for detection. Unit: KB.
RequestDetectionMaxBody	Integer	Yes	1024	The maximum size of a request body for detection. Unit: KB.
DetectionTimeout	Boolean	Yes	true	Specifies whether to enable detection timeout. Valid values: • **true** • **false**
DetectionTimeoutThreshold	Integer	Yes	1000	The detection timeout period. Unit: ms. If the DetectionTimeout parameter is set to **true**, this parameter is required.
DetectionTimeoutLog	Boolean	Yes	true	Specifies whether to record detection timeout in attack detection logs. If the DetectionTimeout parameter is set to **false**, this parameter is unavailable.
				The configurations of the attack detection module.

Parameter	Type	Required	Example	Description
			{"m_cmd_injection": {"low_risk_enable_log": 1, "high_risk_enable_log": 1, "low_risk_action": "continue", "medium_risk_action": "continue", "state": "disabled", "medium_risk_enable_log": 1, "high_risk_action": "deny"}, "m_scanner": {"low_risk_enable_log": 1, "high_risk_enable_log": 1, "detect_config": {"robot_types": ["scanner"]}, "low_risk_action": "continue", "medium_risk_action": "continue", "state": "disabled", "medium_risk_enable_log": 1, "high_risk_action": "deny"}, "m_file_include": {"low_risk_enable_log": 1, "high_risk_enable_log": 1, "low_risk_action": "continue", "medium_risk_action": "continue", "state": "enabled", "medium_risk_enable_log": 1, "high_risk_action": "deny"}, "m_php_code_injection": {"low_risk_enable_log": 1, "high_risk_enable_log": 1, "detect_config": {"detect_upload_file": true}, "low_risk_action": "continue", "medium_risk_action": "continue", "state": "enabled", "medium_risk_enable_log": 1, "high_risk_action": "deny"}, "m_response": {"low_risk_enable_log": 1, "high_risk_enable_log": 1, "detect_config": {"error_types": ["directory indexing", "SQL	You can call the DescribePolicyGroup operation to query the configurations. We recommend that you use the configurations in the query result. The value is a string that consists of a JSON struct. The JSON struct contains the following fields: • **detect_config**: the configurations of the attack detection module. This field is required. Data type: string. • **high_risk_action**: the action on requests when the upper threshold for blocking is triggered. This field is required. Data type: string. Valid values: **deny** and **continue**. The value deny indicates that requests are blocked. The value continue indicates that requests are not blocked. If the **high_risk_action**, **medium_risk_action**, and **low_risk_action** fields are all set to **deny**, all requests are blocked. If all the three fields are set to **continue**, no requests are blocked. • **medium_risk_action**: the action on requests when the medium threshold for blocking is triggered. This field is required. Data

Parameter	Type	Required	Example	Description
DetectionModuleConfig	Json	Yes	execution error", "server exception"]}, "low_risk_action": "continue", "medium_risk_action": "continue", "state": "disabled", "medium_risk_enable_log": 1, "high_risk_action": "deny"}, "m_java_unserialize": {"low_risk_enable_log": 1, "high_risk_enable_log": 1, "low_risk_action": "continue", "medium_risk_action": "continue", "state": "enabled", "medium_risk_enable_log": 1, "high_risk_action": "deny"}, "m_sqli": {"low_risk_enable_log": 1, "high_risk_enable_log": 1, "detect_config": {"detect_non_injection_sql": true}, "low_risk_action": "continue", "medium_risk_action": "continue", "state": "enabled", "medium_risk_enable_log": 1, "high_risk_action": "deny"}, "m_csrf": {"low_risk_enable_log": 1, "high_risk_enable_log": 1, "low_risk_action": "continue", "medium_risk_action": "continue", "state": "enabled", "medium_risk_enable_log": 1, "high_risk_action": "deny"}, "m_java": {"low_risk_enable_log": 1, "high_risk_enable_log": 1, "detect_config": {"detect_upload_file": true}, "low_risk_action": "continue", "medium_risk_action": "continue", "state": "enabled", "medium_risk_enable_log": 1, "high_risk_action": "deny"}, "m_file_upload": {"low_risk_enable_log": 1, "high_risk_enable_log": 1, "low_risk_action": "continue", "medium_risk_action": "continue", "state": "enabled", "medium_risk_enable_log": 1, "high_risk_action": "deny"}, "m_php_unserialize": {"low_risk_enable_log": 1, "high_risk_enable_log": 1, "low_risk_action": "continue", "medium_risk_action": "continue", "state": "enabled", "medium_risk_enable_log": 1, "high_risk_action": "deny"}, "m_rule": {"low_risk_enable_log": 1, "high_risk_enable_log": 1,	type: string. Valid values: **deny** and **continue**. The value deny indicates that requests are blocked. The value continue indicates that requests are not blocked. If the **high_risk_action** and **medium_risk_action** fields are set to **deny** and the **low_risk_action** field is set to **continue**, high-risk and medium-risk requests are blocked. If all the three fields are set to **continue**, no requests are blocked. • **low_risk_action**: the action on requests when the lower threshold for blocking is triggered. This field is required. Data type: string. Valid values: **deny** and **continue**. The value deny indicates that requests are blocked. The value continue indicates that requests are not blocked. If the **high_risk_action** field is set to **deny** and the **medium_risk_action** and **low_risk_action** fields are set to **continue**, high-risk requests are blocked. If all the three fields are set to **continue**, no requests are blocked.

Parameter	Type	Required	Example	Description
			"detect_config": {"info_leak_types": ["test file", "backup file", "code repository", "server sensitive file"], "check_info_leak_by_rsp": false, "detection_configure": ["detect_phpinfo", "detect_admin_page", "detect_backdoor", "detect_php_vuln", "detect_nginx", "detect_dedecms", "detect_apache", "detect_xml", "detect_struts2", "detect_java_vuln", "detect_php168", "detect_wordpress", "detect_directory_traversal", "detect_iis", "detect_gogs_gitea", "detect_thinkphp", "detect_jenkins", "detect_ecshop", "detect_nexus", "detect_drupal", "detect_ghostscript", "detect_atlassian", "detect_weblogic", "detect_coremail", "detect_phpcms", "detect_spring", "detect_southidc", "detect_fastjson", "detect_tbk_dvr", "detect_joomla", "detect_ecology_oa", "detect_jackson", "detect_xstream", "detect_activemq", "detect_solr"]}, "low_risk_action": "continue", "medium_risk_action": "continue", "state": "enabled", "medium_risk_enable_log": 1, "high_risk_action": "deny"}, "m_ssrf": {"low_risk_enable_log": 1, "high_risk_enable_log": 1, "low_risk_action": "continue", "medium_risk_action": "continue", "state": "enabled", "medium_risk_enable_log": 1, "high_risk_action": "deny"}, "m_xss": {"low_risk_enable_log": 1, "high_risk_enable_log": 1, "detect_config": {"detect_complete_html": true}, "low_risk_action": "continue", "medium_risk_action": "continue", "state": "enabled", "medium_risk_enable_log": 1, "high_risk_action": "deny"}, "m_asp_code_injection": {"state": "disabled", "high_risk_action": "deny", "high_risk_enable_log": 1,	• **high_risk_enable_log**: specifies whether to enable logging when the upper threshold is triggered. This field is required. Data type: integer. Valid values: **0** and **1**. The value 0 indicates that logs are not recorded. The value 1 indicates that logs are recorded. If the **high_risk_enable_log**, **medium_risk_enable_log**, and **low_risk_enable_log** fields are all set to**1**, all logs are recorded. If all the three fields are set to **0**, no logs are recorded. • **medium_risk_enable_log**: specifies whether to enable logging when the medium threshold is triggered. This field is required. Data type: integer. Valid values: **0** and **1**. The value 0 indicates that logs are not recorded. The value 1 indicates that logs are recorded. If the **high_risk_enable_log** and **medium_risk_enable_log** fields are set to **1** and the **low_risk_enable_log** field is set to **0**, high-risk and medium-risk logs are recorded. If all the three fields are set to **0**, no logs are recorded. • **low_risk_enable_log**: specifies

Parameter	Type	Required	Example	Description
			"medium_risk_action": "continue", "medium_risk_enable_log": 1, "low_risk_action": "continue", "low_risk_enable_log": 1, "detect_config": {}}, "m_ssti": {"state": "disabled", "high_risk_action": "deny", "high_risk_enable_log": 1, "medium_risk_action": "continue", "medium_risk_enable_log": 1, "low_risk_action": "continue", "low_risk_enable_log": 1, "detect_config": {}}}	whether to enable logging when the lower threshold is triggered. This field is required. Data type: integer. Valid values: **0** and **1**. The value 0 indicates that logs are not recorded. The value 1 indicates that logs are recorded. If the **high_risk_enable_log** field is set to **1** and the **medium_risk_enable_log** and **low_risk_enable_log** fields are set to **0**, high-risk logs are recorded. If all the three fields are set to **0**, no logs are recorded. • **state**: specifies whether to enable the attack detection module. This field is required. Data type: string. Valid values: **enabled** and **disabled**.

Parameter	Type	Required	Example	Description
MiscModuleConfig	Json	Yes	{"decode_config":{"decode_methods":["url decode","JSON","base64","hex","eval","XML","PHP deserialize","utf7"]}}	The configurations of other modules. The value is a string that consists of JSON arrays. The value is a string that consists of a JSON struct. The JSON struct contains the following fields: **decode_methods**: This field is required. Valid values: **url decode** (URL decoding), **JSON** (JSON parsing), **base64** (Base64 decoding), **hex** (hexadecimal conversion), **eval** (slash unescaping), **XML** (XML parsing), **PHP deserialize** (parsing of PHP serialized objects), and **utf7** (UTF-7 decoding).

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
TaskStatus	Struct		The returned information.
└TaskId	String	c68646a1-58f8-4b75-828a-a2d3b19b382a	The ID of the task. The ID of the task.
└Time	String	1593593692	The time when the task status message was generated. This value is a UNIX timestamp representing the number of seconds that have elapsed since the epoch time January 1, 1970, 00:00:00 UTC.

Parameter	Type	Example	Description
└TaskList	String	["Website-related configuration generation", "Policy-related configuration generation"]	The descriptions of the task. This value is returned only for asynchronous tasks.
└StatusMessage	String	The configuration is in effect.	The status message of the task. You can ignore this reserved parameter.
└SuccessCode	String	1	The status code of the task. Valid values: • **0**: The task fails. • **1**: The task is successful. • **2**: The task is not started.

Error codes

For a list of error codes, see Error codes.

19.1.4.7.2. QueryAttackDetectionLog

Queries attack detection logs.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	QueryAttackDetectionLog	The operation that you want to perform. Set the value to QueryAttackDetectionLog.
RegionId	String	Yes	cn-hangzhou	The ID of the region.
PageSize	Integer	No	10	The number of entries to return on each page. Default value: 10.
PageNumber	Integer	No	1	The number of the page to return. Default value: 1.
TimestampRangeFilter	RepeatList	No	["1594656000-1596729600"]	The time range to filter logs. You can enter multiple time ranges.

Parameter	Type	Required	Example	Description
RiskLevelFilter	RepeatList	No	[1, 2]	The risk level to filter rules. You can enter multiple values. Valid values: • **0**: no risks • **1**: low • **2**: medium • **3**: high
AttackTypeFilter	RepeatList	No	[1, 2, 3]	The attack type to filter rules. You can enter multiple values. Valid values: **-1** (non-web attacks), **0** (SQL injection attacks), **1** (XSS attacks), **2** (CSRF attacks), **3** (SSRF attacks), **4** (denial of service attacks), **5** (backdoors), **6** (deserialization attacks), **7** (code executions), **8** (code injection attacks), **9** (command injection attacks), **10** (file uploads), **11** (file inclusions), **12** (redirection attacks), **13** (improper authorization), **14** (information leaks), **15** (unauthorized access), **16** (insecure configurations), **17** (XXE attacks), **18** (Xpath injection attacks), **19** (LDAP injection attacks), **20** (path traversal attacks), **21** (scanners), **22** (horizontal authorization bypass), **23** (vertical authorization bypass), **24** (file modifications), **25** (file reads), **26** (file deletions), **27** (logical errors), **28** (CRLF injection attacks), **29** (template injection attacks), **30** (click hijacking attacks), **31** (buffer overflows), **32** (integer overflows), **33** (format string attacks), **34** (race condition attacks), **61** (timeout errors), and **62** (unknown attacks).
ActionFilter	RepeatList	No	[1, 2]	The action to filter logs. You can enter multiple actions. Valid values: **1**, **0**, and **2**. The value 1 indicates block, the value 0 indicates allow, and the value 2 indicates that all attack detection logs are returned.

Parameter	Type	Required	Example	Description
ProtocolFilter	RepeatList	No	[0, 1]	The protocol to filter logs. You can enter multiple protocols. Valid values: • **0**: HTTP • **1**: HTTPS
				The country or region to filter logs. You can enter multiple countries or regions. Valid values: CN (China), AD (Andorra), AE (United Arab Emirates), AF (Afghanistan), AG (Antigua and Barbuda), AI (Anguilla), AL (Albania), AM (Armenia), AO (Angola), AQ (Antarctica), AR (Argentina), AS (American Samoa), AT (Austria), AU (Australia), AW (Aruba), AX (Åland Islands), AZ (Azerbaijan), BA (Bosnia and Herzegovina), BB (Barbados), BD (Bangladesh), BE (Belgium), BF (Burkina Faso), BG (Bulgaria), BH (Bahrain), BI (Burundi), BJ (Benin), BL (Saint Barthelemy), BM (Bermuda), BN (Brunei), BO (Bolivia), BQ (Caribbean Netherlands), BR (Brazil), BS (The Bahamas), BT (Bhutan), BV (Bouvet Island), BW (Botswana), BY (Belarus), BZ (Belize), CA (Canada), CC (Cocos (Keeling) Islands), CD (Democratic Republic of the Congo), CF (Central African Republic), CG (Republic of the Congo), CH (Switzerland), CI (Côte d'Ivoire), CK (Cook Islands), CL (Chile), CM (Cameroon), CO (Colombia), CR (Costa Rica), CU (Cuba), CV (Cabo Verde), CW (Curacao), CX (Christmas Island), CY (Cyprus), CZ (Czech Republic), DE (Germany), DJ (Djibouti), DK (Denmark), DM (Dominica), DO (Dominican Republic), DZ (Algeria), EC (Ecuador), EE (Estonia), EG (Egypt), EH (Sahrawi Arab Democratic Republic), ER (Eritrea), ES (Spain), ET (Ethiopia), FI (Finland), FJ (Fiji), FK (Falkland Islands), FM (Federated States of Micronesia), FO (Faroe Islands), FR (France), GA (Gabon), GB (United Kingdom), GD (Grenada), GE (Georgia), GF (French Guiana), GG (Guernsey), GH (Ghana), GI (Gibraltar), GL (Greenland), GM (The Gambia), GN (Guinea), GP (Guadeloupe), GQ (Equatorial Guinea),

Parameter	Type	Required	Example	Description
CountryFilter	RepeatList	No	["GB, "US"]	GR (Greece), GS (South Georgia and the South Sandwich Islands), GT (Guatemala), GU (Guam), GW (Guinea-Bissau), GY (Guyana), HK (Hong Kong (China)), HM (Heard Island and McDonald Islands), HN (Honduras), HR (Croatia), HT (Haiti), HU (Hungary), ID (Indonesia), IE (Ireland), IL (Israel), IM (Isle of Man), IN (India), IO (British Indian Ocean Territory), IQ (Iraq), IR (Iran), IS (Iceland), IT (Italy), JE (Jersey), JM (Jamaica), JO (Jordan), JP (Japan), KE (Kenya), KG (Kyrgyzstan), KH (Kampuchea), KI (Kiribati), KM (Comoros), KN (Saint Kitts and Nevis), KP (North Korea), KR (South Korea), KW (Kuwait), KY (Cayman Islands), KZ (Kazakhstan), LA (Laos), LB (Lebanon), LC (Saint Lucia), LI (Liechtenstein), LK (Sri Lanka), LR (Liberia), LS (Lesotho), LT (Lithuania), LU (Luxembourg), LV (Latvia), LY (Libya), MA (Morocco), MC (Monaco), MD (Moldova), ME (Montenegro), MF (Saint Martin), MG (Madagascar), MH (Marshall Islands), MK (Macedonia), ML (Mali), MM (Myanmar), MN (Mongolia), MP (Northern Mariana Islands), MQ (Martinique), MR (Mauritania), MS (Montserrat), MT (Malta), MU (Mauritius), MV (Maldives), MW (Malawi), MX (Mexico), MY (Malaysia), MZ (Mozambique), NA (Namibia), NC (New Caledonia), NE (Niger), NF (Norfolk Island), NG (Nigeria), NI (Nicaragua), NL (Netherlands), NO (Norway), NP (Nepal), NR (Nauru), NU (Niue), NZ (New Zealand), OM (Oman), PA (Panama), PE (Peru), PF (French Polynesia), PG (Papua New Guinea), PH (Philippines), PK (Pakistan), PL (Poland), PM (Saint Pierre and Miquelon), PN (Pitcairn Islands), PR (Puerto Rico), PS (Palestine), PT (Portugal), PW (Palau), PY (Paraguay), QA (Qatar), RE (Reunion), RO (Romania), RS (Serbia), RU (Russia), RW (Rwanda), SA (Saudi Arabia), SB (Solomon Islands), SC (Seychelles), SD (Sudan), SE (Sweden), SG (Singapore), SH (Saint Helena), SI (Slovenia), SJ (Svalbard and Jan Mayen Islands), SK (Slovakia), SL (Sierra Leone), SM (San Marino), SN (Senegal), SO (Somalia), SR (Suriname), SS (South Sudan), ST (Sao

Parameter	Type	Required	Example	Description
				Tome and Principe), SV (El Salvador), SX (Sint Maarten), SY (Syria), SZ (Eswatini), TC (Turks and Caicos Islands), TD (Chad), TF (French Southern and Antarctic Lands), TG (Togo), TH (Thailand), TJ (Tajikistan), TK (Tokelau), TL (East Timor), TM (Turkmenistan), TN (Tunisia), TO (Tonga), TR (Turkey), TT (Trinidad and Tobago), TV (Tuvalu), TZ (Tanzania), UA (Ukraine), UG (Uganda), UM (United States Minor Outlying Islands), US (United States), UY (Uruguay), UZ (Uzbekistan), VA (Vatican City), VC (Saint Vincent and the Grenadines), VE (Venezuela), VG (British Virgin Islands), VI (United States Virgin Islands), VN (Vietnam), VU (Vanuatu), WF (Wallis and Futuna Islands), WS (Samoa), YE (Yemen), YT (Mayotte), ZA (South Africa), ZM (Zambia), and ZW (Zimbabwe).
EventIdFilter	RepeatList	No	["2a0ca6e9-a33d-4164-8a8d-3b0e91130069"]	The event ID to filter logs. You can enter multiple IDs.
SourceIpFilter	RepeatList	No	["192.168.XX.XX"]	The source IP address to filter logs. You can enter multiple source IP addresses.
HostFilter	RepeatList	No	["www.aliyun.com"]	The attacked domain name to filter logs. You can enter multiple domain names.
UrlPathFilter	RepeatList	No	["/"]	The URL path to filter logs. You can enter multiple URL paths.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
		{"items": [{"attack_type": "SQL injection", "risk_level": "High risk", "action": {"value": 1, "translation": "Block"}, "protocol":

19.1.4.7.3. QueryAttackDetectionDetailLog

Queries the details of a specific attack detection log.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	QueryAttackDetectionDetailLog	The operation that you want to perform. Set the value to QueryAttackDetectionDetailLog.
RegionId	String	Yes	cn-hangzhou	The ID of the region.
LogId	String	Yes	1e23f8d1-a9d2-4dd9-b7e2-424b9832183f	The ID of the attack detection log.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.

Parameter	Type	Example	Description
Result	String	{"items": [{"attack_type": "SQL injection", "risk_level": "High risk", "action": {"value": 1, "translation": "Block"}, "protocol": "http", "country": "United States", "province": "", "dest_port": 80, "src_ip": "1.2.XX.XX", "url_path": "/", "host": "www.baidu.com", "timestamp": 1594610215, "id": "976ada8c-7561-48be-8d63-2d668defcbad", "event_id": "7f7ae14bada0490bb257547f05901ec7", "rule_id": "m_sqli", "detector": "a36c01009.cloud.c01.amtest11", "proxy_name": "a36c01009.cloud.c01.amtest11", "src_port": 34109, "dest_ip": "43.17.XX.XX", "req_header_raw": ""HEAD /? id=1 or b=2 HTTP/1.1\r\nUser-Agent: curl/7.29.0\r\nAccept: /\r\nHost: www.baidu.com\r\nX-Forwarded-For: 1.2.XX.XX\r\n\r\n"", "req_body": """, "resp_header_raw": """, "resp_body": """, "payload": ""1 or b=2"", "session": "", "location": "urlpath", "decode_path": "", "ali_uid": "1376988933618853", "aliyun_extra": "{"resource_port_mapping":{}}", "real_dest_port": 80, "vpc_id": "", "vpc_name": "yd_vpc", "extra": "{}", "module": "SQL injection detection module", "reason": "SQL injection detected", "website": "http://www.baidu.com/"}]}	The returned result of the request.

19.1.4.7.4. QueryAuditLog

Queries system operations logs.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	QueryAuditLog	The operation that you want to perform. Set the value to QueryAuditLog.
RegionId	String	Yes	cn-hangzhou	The ID of the region.
PageNumber	Integer	No	1	The number of the page to return. Default value: 1.
PageSize	Integer	No	20	The number of entries to return on each page. Default value: 10.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.

Parameter	Type	Example	Description
Result	String	{"items": [{"content": "An access control whitelist is created. Data: {'comment': '', 'target_type': 'Session', 'target_list': ['1313'], 'target_group_list': []}", "username": "1376988933618853", "id": "756897bd-a178-445b-a193-5b46c14fa44c", "ip": "10.17.XX.XX", "user_agent": "Apache-HttpClient/4.5.2 (Java/1.8.0_152)", "log_type": "Access control and management", "create_time": "1594653501"}], "total": "36"}	The returned result of the request.

Examples

Sample requests

```
https://semawaf.[ RegionId].aliyuncs.com/?Action=QueryAuditLog
&RegionId=cn-hangzhou
&PageSize=20
&PageNumber=1
```

Sample success responses

`XML` format

```
<QueryAuditLogResponse>

}
```

Error codes

For a list of error codes, see Error codes.

19.1.4.7.5. QueryCCRuleExecutionLog

Queries the logs on the execution of HTTP flood protection rules.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	QueryCCRuleExecutionLog	The operation that you want to perform. Set the value to QueryCCRuleExecutionLog.
RegionId	String	Yes	cn-hangzhou	The ID of the region.
PageNumber	Integer	No	1	The number of the page to return. Default value: 1.
PageSize	Integer	No	20	The number of entries to return on each page. Default value: 10.
TimestampRangeFilter	RepeatList	No	["1594656000-1596729600"]	The time range to filter logs. You can enter multiple ranges. Unit: seconds.
CCRuleTemplateIdList	RepeatList	No	[1, 2]	The rule ID to filter logs. You can enter multiple IDs. You can call the DescribeCCRuleTemplate operation to query the IDs of HTTP flood protection rules.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
Result	String	{"items": [{"acl_rule_id": "29", "acl_rule_template_id": "38", "acl_rule_template_version": "39", "timestamp": "1594610400", "count": "100", "acl_rule_target": "1.2.XX.XX", "acl_rule_template": {"name": "123", "match_method": {"target_type": "CIDR", "period": 5, "limit": 1, "scope": "URL", "policy": "www.baidu.com", "scheme": "http"}, "action": {"action": "forbid"}, "template_type": "auto", "dry_run": false, "status": "ok"}}], "total": 11}	The returned result of the request.

Examples

Sample requests

```
https://semawaf.[ RegionId].aliyuncs.com/?Action=QueryCCRuleExecutionLog
&RegionId=cn-hangzhou
&PageSize=20
&PageNumber=1
&TimestampRangeFilter.1=1594656000-1596729600
&CCRuleTemplateIdList.1=1
```

Sample success responses

`XML` format

```
<QueryCCRuleExecutionLogResponse>
    <RequestId>53e59af3-3209-452a-853c-ac10ad815929</RequestId>
    <Result>{"items": [{"acl_rule_id": "29", "acl_rule_template_id": "38", "acl_rule_template_version": "39", "timestamp": "1594610400", "count": "100", "acl_rule_target": "1.2.XX.XX", "acl_rule_template": {"name": "123", "match_method": {"target_type": "CIDR", "period": 5, "limit": 1, "scope": "URL", "policy": "www.baidu.com", "scheme": "http"}, "action": {"action": "forbid"}, "template_type": "auto", "dry_run": false, "status": "ok"}}], "total": 11}
</Result>
</QueryCCRuleExecutionLogResponse>
```

`JSON` format

```
{
  "RequestId":"53e59af3-3209-452a-853c-ac10ad815929",
  "Result":"{\"items\": [{\"acl_rule_id\": \"29\", \"acl_rule_template_id\": \"38\", \"acl_rule_template_version\": \"39\", \"timestamp\": \"1594610400\", \"count\": \"100\", \"acl_rule_target\": \"1.2.XX.XX\", \"acl_rule_template\": {\"name\": \"123\", \"match_method\": {\"target_type\": \"CIDR\", \"period\": 5, \"limit\": 1, \"scope\": \"URL\", \"policy\": \"www.baidu.com\", \"scheme\": \"http\"}, \"action\": {\"action\": \"forbid\"}, \"template_type\": \"auto\", \"dry_run\": false, \"status\": \"ok\"}}], \"total\": 11}"
}
```

Error codes

For a list of error codes, see Error codes.

19.1.4.7.6. QueryFullAccessLog

Queries full access logs.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	QueryFullAccessLog	The operation that you want to perform. Set the value to QueryFullAccessLog.
RegionId	String	Yes	cn-hangzhou	The ID of the region.
PageSize	Integer	No	10	The number of entries to return on each page. Default value: 10.
PageNumber	Integer	No	1	The number of the page to return. Default value: 1.
TimestampRangeFilter	RepeatList	No	["1594656000-1596729600"]	The time range to filter logs. You can enter multiple time ranges.

Parameter	Type	Required	Example	Description
SourceIpFilter	RepeatList	No	["192.168.XX.XX"]	The source IP address to filter logs. You can enter multiple source IP addresses.
DestinationIp	RepeatList	No	["10.10.XX.XX"]	The destination IP address to filter logs. You can enter multiple destination IP addresses.
MethodFilter	RepeatList	No	["POST"]	The request method to filter logs. You can enter multiple methods.
SourcePortFilter	RepeatList	No	[11013, 55555]	The source port to filter logs. You can enter multiple source ports.
ResponseCode	RepeatList	No	[302, 404]	The response code to filter logs. You can enter multiple codes.
DestinationPortFilter	RepeatList	No	[80, 443]	The destination port to filter logs. You can enter multiple destination ports.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
		{"items": [{"id": "a03511f0-b325-4674-8f50-80feb5de2023", "ali_uid": "1376988933618853", "timestamp": 1594698077, "dest_ip": "43.17.XX.XX", "dest_port": 10003, "real_dest_port": 80, "src_ip": "10.17.XX.XX", "src_port": 37078, "req_header_raw": ""GET / HTTP/1.1\r\nUser-Agent: curl/7.29.0\r\nAccept: /\r\nhost: www.wafcloud.com\r\n\r\n"", "method": "GET",

Error codes

For a list of error codes, see Error codes.

19.1.4.7.7. QueryFullAccessDetailLog

Queries the details of a specific full access log.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	QueryFullAccessDetailLog	The operation that you want to perform. Set the value to QueryFullAccessDetailLog.
RegionId	String	Yes	cn-hangzhou	The ID of the region.
LogId	String	Yes	1e23f8d1-a9d2-4dd9-b7e2-424b9832183f	The ID of the log.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
Result	String	{"items": [{"id": "a03511f0-b325-4674-8f50-80feb5de2023", "ali_uid": "1376988933618853", "timestamp": 1594698077, "dest_ip": "43.17.XX.XX", "dest_port": 10003, "real_dest_port": 80, "src_ip": "10.17.XX.XX", "src_port": 37078, "req_header_raw": ""GET / HTTP/1.1\r\nUser-Agent: curl/7.29.0\r\nAccept: /\r\nhost: www.wafcloud.com\r\n\r\n"", "method": "GET", "req_body": """, "resp_header_raw": ""HTTP/1.1 200 OK\r\nServer: nginx/1.10.2\r\nDate: Tue, 14 Jul 2020 03:40:35 GMT\r\nContent-Type: text/html\r\nContent-Length: 3700\r\nLast-Modified: Tue, 28 Mar 2017 07:33:40 GMT\r\nConnection: keep-alive\r\nETag: "58da11d4-e74"\r\nAccept-Ranges: bytes\r\n\r\n"", "resp_code": 200, "payload": """, "url": "/", "content_type": "text/html", "event_id": "", "session": "null", "proxy_name": "a36c01009.cloud.c01.amtest11", "website": "www.wafcloud.com", "host": "www.wafcloud.com", "vpc": "vpc-9qb3r79gohas1khsr2x7e", "vpc_name": "-"}]}	The returned result of the request.

Examples

Error codes

For a list of error codes, see Error codes.

19.1.4.7.8. QueryPerformanceStatistics

Queries the historical performance data of a specific node.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	QueryPerformanceStatistics	The operation that you want to perform. Set the value to QueryPerformanceStatistics.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-hangzhou	The ID of the region.
NodeName	String	Yes	a36c01009.cloud.c01.amtest11	The name of the node.
TimestampRangeFilter	RepeatList		["1594656000-1596729600"]	The time range to filter historical performance data. You can enter multiple time ranges.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
Result	String	[{"id": 2005654, "name": "c43b02111.cloud.b03.amtest21", "timestamp": "1594697170", "cpu_usage": 1.5670533277966774, "memory_usage": 8.946810185810278, "disk_usage": 5.475940507296313, "network_read": 26010.129032258064, "network_write": 25739.064516129034, "qps": 0.0, "cps": 10.6, "extra": {}}, {"id": 2005652, "name": "c43b02111.cloud.b03.amtest21", "timestamp": "1594697165", "cpu_usage": 1.3590924225742251, "memory_usage": 8.943323969418117, "disk_usage": 5.475936863788965, "network_read": 23102.645161290322, "network_write": 22265.774193548386, "qps": 0.0, "cps": 9.2, "extra": {}}]	The returned result of the request.

Examples

Sample requests

```
https://semawaf.[ RegionId].aliyuncs.com/?Action=QueryPerformanceStatistics

Error codes

For a list of error codes, see Error codes.

19.1.4.8. SSL certificate management

19.1.4.8.1. DescribeSSLCert

Queries the information about SSL certificates.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeSSLCert	The operation that you want to perform. Set the value to DescribeSSLCert.
RegionId	String	Yes	cn-hangzhou	The ID of the region.
Id	Integer	No	1	The ID of the SSL certificate.
PageSize	Integer	No	10	The number of entries to return on each page. Default value: 10.

Parameter	Type	Required	Example	Description
PageNumber	Integer	No	1	The number of the page to return. Default value: 1.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
Result	String	[{"id": 1, "websites": [], "create_time": "1589445455", "name": "test_cert_1", "signature": "329b059f298419c002fc69f1ee9a3df1", "info": {"serial": "0xb79b1ba15f4fb061", "issuer": "Aliyun", "not_valid_before": 1567468800, "not_valid_after": 1882828800, "domains": []}}]	The returned result of the request.

Examples

Sample requests

```
https://semawaf.[ RegionId].aliyuncs.com/?Action=DescribeSSLCert
&RegionId=cn-hangzhou
&Id=1
&PageSize=10
&PageNumber=1
```

Sample success responses

`XML` format

```
<DescribeSSLCertResponse>
    <RequestId>53e59af3-3209-452a-853c-ac10ad815929</RequestId>

: []}}]</Result>
</DescribeSSLCertResponse>
```

`JSON` format

```
{
  "RequestId":"53e59af3-3209-452a-853c-ac10ad815929",
  "Result":"[{\"id\": 1, \"websites\": [], \"create_time\": \"1589445455\", \"name\": \"test_cert_1\", \"signature\": \"329b059f298419c002fc69f1ee9a3df1\", \"info\": {\"serial\": \"0xb79b1ba15f4fb061\", \"issuer\": \"Aliyun\", \"not_valid_before\": 1567468800, \"not_valid_after\": 1882828800, \"domains\": []}}]"
}
```

Error codes

For a list of error codes, see Error codes.

19.1.4.8.2. UploadSSLCert

Uploads an SSL certificate.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	UploadSSLCert	The operation that you want to perform. Set the value to UploadSSLCert.
RegionId	String	Yes	cn-hangzhou	The ID of the region.
CertName	String	No	taobao_cert	The name of the SSL certificate.
CertFile	Json	Yes	{"name":"","content":"bEtrYmdrVFVSb3plY1dMa01BVmZrekhGdGxw****"}	The Base64-encoded CA certificate file. This parameter is a string consisting of JSON structs. A JSON struct includes the following fields: • **name**: Leave this field unspecified. • **content**: the Base64-encoded CA certificate file.
KeyFile	Json	No	{"name":"","content":"eElzcEZEaElzaXlqVFBGU1B0ZG9qdm1iSEV1****"}	The Base64-encoded private key file. This parameter is a string consisting of JSON structs. A JSON struct includes the following fields: • **name**: Leave this field unspecified. • **content**: the Base64-encoded private key file.
CertPassword	String	No	jgXzOoigHGWCLxE	The password of the SSL certificate.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
Result	String	{"id": 7, "websites": [], "create_time": "1589771325", "name": "test-cert-1", "signature": "ec23ec040764d0cc078879582a375c2c", "info": {"serial": "0xdd45e828dca4b8c9", "issuer": null, "not_valid_before": 1560816000, "not_valid_after": 1592352000, "domains": []}}	The returned result of the request.

Examples

}
```

Error codes

For a list of error codes, see Error codes.

19.1.4.8.3. EditSSLCert

Modifies the name of a specific SSL certificate.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	EditSSLCert	The operation that you want to perform. Set the value to EditSSLCert.
RegionId	String	Yes	cn-hangzhou	The ID of the region.
Id	Integer	No	1	The ID of the SSL certificate. You can call the DescribeSSLCert operation to query the ID of the SSL certificate.
CertName	String	No	aliyun_cert	The name of the SSL certificate. You can call the DescribeSSLCert operation to query the name of the SSL certificate.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.

Parameter	Type	Example	Description
Result	String	{"id": 1, "websites": [], "create_time": "1589771325", "name": "test-cert-1", "signature": "ec23ec040764d0cc078879582a375c2c", "info": {"serial": "0xdd45e828dca4b8c9", "issuer": null, "not_valid_before": 1560816000, "not_valid_after": 1592352000, "domains": []}}	The returned result of the request.

Examples

Sample requests

```
https://semawaf.[ RegionId].aliyuncs.com/?Action=EditSSLCert
&RegionId=cn-hangzhou
&Id=1
&CertName=aliyun_cert
```

Sample success responses

`XML` format

```
<EditSSLCertResponse>
    <RequestId>53e59af3-3209-452a-853c-ac10ad815929</RequestId>
    <Result>{"id": 7, "websites": [], "create_time": "1589771325", "name": "test-cert-1", "

}
```

Error codes

For a list of error codes, see Error codes.

19.1.4.8.4. DeleteSSLCert

Deletes a specific SSL certificate.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteSSLCert	The operation that you want to perform. Set the value to DeleteSSLCert.
RegionId	String	Yes	cn-hangzhou	The ID of the region.
IdList	RepeatList	Yes	[1, 2]	The ID of the SSL certificate. You can enter multiple IDs. You can call the DescribeSSLCert operation to query the IDs of SSL certificates.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
Result	String		The returned result of the request.

Examples

Sample requests

```
https://semawaf.[ RegionId].aliyuncs.com/?Action=DeleteSSLCert
&RegionId=cn-hangzhou
&IdList.1=1
```

Sample success responses

`XML` format

```
<DeleteSSLCertResponse>
    <RequestId>53e59af3-3209-452a-853c-ac10ad815929</RequestId>
    <Result></Result>
</DeleteSSLCertResponse>
```

`JSON` format

```
{
  "RequestId":"53e59af3-3209-452a-853c-ac10ad815929",
  "Result":""
}
```

Error codes

For a list of error codes, see Error codes.

19.1.4.9. System information

19.1.4.9.1. DescribeMetrics

Queries the monitoring metrics of physical WAF nodes.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeMetrics	The operation that you want to perform. Set the value to DescribeMetrics.
RegionId	String	Yes	cn-hangzhou	The ID of the region.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
Result	String	{"nodes": [{"id": "a36c01009.cloud.c01.amtest11", "qps": 0, "disk_watermark": 0.05619211156645502, "throughput_read": 368475, "throughput_write": 368434, "connections": 1, "delta_connections": 0}], "website_count": 0, "domain_count": 0, "is_healthy": true}	The returned result of the request.

Examples

Sample requests

```
https://semawaf.[ RegionId].aliyuncs.com/?Action=DescribeMetrics
&RegionId=cn-hangzhou
```

Sample success responses

`XML` format

```
<DescribeMetricsResponse>
    <RequestId>53e59af3-3209-452a-853c-ac10ad815929</RequestId>
    <Result>{"nodes": [{"id": "a36c01009.cloud.c01.amtest11", "qps": 0, "disk_watermark": 0

is_healthy\": true}"
}
```

Error codes

For a list of error codes, see Error codes.

19.1.4.9.2. DescribeNodeStatus

Queries the status information about physical WAF nodes.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeNodeStatus	The operation that you want to perform. Set the value to DescribeNodeStatus.
RegionId	String	Yes	cn-hangzhou	The ID of the region.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.

Error codes

For a list of error codes, see Error codes.

19.1.4.9.3. DescribeRealTimeAccess

Queries the monitoring information about access status.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeRealTimeAccess	The operation that you want to perform. Set the value to DescribeRealTimeAccess.
RegionId	String	Yes	cn-hangzhou	The ID of the region.
Type	String	Yes	ip	The type to filter monitoring information. Valid values: • **ip** • **session** • **website** • **url** • If you leave this parameter unspecified, all monitoring information is returned. These types can be combined to filter monitoring information. Example: **ipwebsite**.

Parameter	Type	Required	Example	Description
OrderBy	String	Yes	count	The method to sort monitoring information. Valid values: • **count**: the number of requests • **time**: the average time of responses
Limit	Integer	No	100	The upper limit of returned entries. Default value: 100.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
Result	String	{"data": [{"ip": "10.10.XX.XX", "count": 2}], "type": "top_ip", "order_by": "count"}	The returned result of the request.

Examples

Sample requests

```
https://semawaf.[ RegionId].aliyuncs.com/?Action=DescribeRealTimeAccess
&RegionId=cn-hangzhou
&Type=ip
&OrderBy=count
&Limit=100
```

Sample success responses

`XML` format

```
<DescribeRealTimeAccessResponse>
    <RequestId>53e59af3-3209-452a-853c-ac10ad815929</RequestId>
    <Result>{"data": [{"ip": "10.10.XX.XX", "count": 2}], "type": "top_ip", "order_by": "co
unt"}</Result>
</DescribeRealTimeAccessResponse>
```

`JSON` format

```
{
  "RequestId":"53e59af3-3209-452a-853c-ac10ad815929",
  "Result":"{\"data\": [{\"ip\": \"10.10.XX.XX\", \"count\": 2}], \"type\": \"top_ip\", \"order_by\": \"count\"}"
}
```

Error codes

For a list of error codes, see Error codes.

19.1.4.9.4. DescribeAttackDetectionAggregation

Queries the statistics on attack detection aggregation.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeAttackDetectionAggregation	The operation that you want to perform. Set the value to DescribeAttackDetectionAggregation.
RegionId	String	Yes	cn-hangzhou	The ID of the region.
AggregationType	String	Yes	source	The type of attack detection aggregation. Valid values: • **source** • **destination**

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
Result	String	{"aggregate_type": "src_ip", "values": [{"item": "10.10.XX.XX", "value": 3, "timestamp": "1594695947"}]}	The returned result of the request.

Examples

Sample requests

```
https://semawaf.[ RegionId].aliyuncs.com/?Action=DescribeAttackDetectionAggregation
&RegionId=cn-hangzhou
&AggregationType=source
```

Sample success responses

`XML` format

```
<DescribeAttackDetectionAggregationResponse>
    <RequestId>53e59af3-3209-452a-853c-ac10ad815929</RequestId>
    <Result>{"aggregate_type": "src_ip", "values": [{"item": "10.10.XX.XX", "value": 3, "ti
mestamp": "1594695947"}]}</Result>
</DescribeAttackDetectionAggregationResponse>
```

`JSON` format

```
https://semawaf.[ RegionId].aliyuncs.com/?Action=DescribeAttackDetectionAggregation
&RegionId=cn-hangzhou
&AggregationType=source
```

Error codes

For a list of error codes, see Error codes.

19.1.4.9.5. DescribeAttackDetectionAggregationConfig

Queries the configurations of attack detection aggregation.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeAttackDetectionAggregationConfig	The operation that you want to perform. Set the value to DescribeAttackDetectionAggregationConfig.
RegionId	String	Yes	cn-hangzhou	The ID of the region.

Response parameters

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
Result	String	{"is_enabled": true}	The returned result of the request.

Examples

Sample requests

```
https://semawaf.[ RegionId].aliyuncs.com/?Action=DescribeAttackDetectionAggregationConfig
&RegionId=cn-hangzhou
```

Sample success responses

`XML` format

```
<DescribeAttackDetectionAggregationConfigResponse>
    <RequestId>53e59af3-3209-452a-853c-ac10ad815929</RequestId>
    <Result>{"is_enabled": true}</Result>
</DescribeAttackDetectionAggregationConfigResponse>
```

`JSON` format

```
{
  "RequestId":"53e59af3-3209-452a-853c-ac10ad815929",
  "Result":"{\"is_enabled\": true}"
}
```

Error codes

For a list of error codes, see Error codes.

19.1.4.9.6. ToggleAttackDetectionAggregation

Enables or disables the attack detection aggregation feature.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ToggleAttackDetectionAggregation	The operation that you want to perform. Set the value to ToggleAttackDetectionAggregation.
RegionId	String	Yes	cn-hangzhou	The ID of the region.
Enable	Boolean	No	true	Specifies whether to enable the attack detection aggregation feature. Valid values: • **true** • **false** Default value: **true**.

Response parameters

Parameter	Type	Example	Description

Parameter	Type	Example	Description
RequestId	String	53e59af3-3209-452a-853c-ac10ad815929	The ID of the request.
Result	String	{"is_enabled": true}	The returned result of the request.

Examples

Sample requests

```
https://semawaf.[ RegionId].aliyuncs.com/?Action=ToggleAttackDetectionAggregation
&RegionId=cn-hangzhou
&Enable=true
```

Sample success responses

`XML` format

```
<ToggleAttackDetectionAggregationResponse>
    <RequestId>53e59af3-3209-452a-853c-ac10ad815929</RequestId>
    <Result></Result>
</ToggleAttackDetectionAggregationResponse>
```

`JSON` format

```
{
  "RequestId":"53e59af3-3209-452a-853c-ac10ad815929",
  "Result":""
}
```

Error codes

For a list of error codes, see Error codes.

19.1.5. Error codes

This topic describes the error codes returned by operations for Apsara Stack Security.

Common errors of Apsara Stack Security

Error code	Error message	Description
yd.error.all.10001	Authorization required.	The error message returned because you are not authorized to perform the operation. Check the account permissions.
yd.error.all.10002	A system error has occurred. Try again later.	The error message returned because a system error has occurred. Try again later.

Error code	Error message	Description
yd.error.all.10003	The parameter is invalid.	The error message returned because the request parameter is invalid. Check the request parameter and try again.
yd.error.all.other	A system error has occurred.	The error message returned because a system error has occurred. Try again later.
yd.error.all.ConsoleSystemError_1001	An internal error has occurred.	The error message returned because a system error has occurred. Try again later.
yd.error.all.ConsoleSystemError_1007	The specified API is unavailable.	The error message returned because the operation has been brought offline. Contact Alibaba Cloud technical support.
yd.error.all.ConsoleSystemError_1008	An error occurred when you verify postOnly.	The error message returned because the verification has failed. Check the common request parameters and try again.
yd.error.all.ConsoleSystemError_1009	csrfToken must not be empty.	The error message returned because the csrfToken field is empty. Check the common request parameters and try again.
yd.error.all.ConsoleSystemError_1010	An error occurred when you verify csrfToken.	The error message returned because the verification has failed. Check the common request parameters and try again.
yd.error.all.ConsoleSystemError_1011	The Region ID must not be empty.	The error message returned because the RegionId request parameter is empty. Check the parameter.
yd.error.all.ConsoleSystemError_1012	The specified region ID format is invalid.	The error message returned because the specified region ID format is invalid. Check the RegionId parameter.
yd.error.all.ConsoleSystemError_1013	The parameter is null.	The error message returned because the specified request parameter is empty. Check the request parameter and try again.

Error code	Error message	Description
yd.error.all.ConsoleSystemError_1014	The specified parameter format is invalid.	The error message returned because the specified parameter format is invalid. Check the request parameter and try again.
yd.error.all.ConsoleNeedLogin	You are not logged on.	The error message returned because you are not authorized to perform the operation. Check the account permissions.
yd.error.all.InvalidApi	The API is invalid.	The error message returned because an operation exception has occurred. Try again later.
yd.error.all.InvalidParameter	The parameter is invalid.	The error message returned because the specified parameter is invalid. Check the request parameter and try again.
yd.error.all.InvalidResult	The return value is invalid.	The error message returned because the return value is invalid. Try again later.
yd.error.all.PropertyConvertFailed	An error occurred during conversion.	The error message returned because property conversion has failed. Try again later.
yd.error.all.NoPermission	Authorization required.	The error message returned because you are not authorized to perform the operation. Check the account permissions.
yd.error.all.ServerError	A server error has occurred.	The error message returned because a server error has occurred. Try again later or contact Alibaba Cloud technical support.
yd.error.all.UnkownError	An internal error has occurred.	The error message returned because an unknown error has occurred. Try again later or contact Alibaba Cloud technical support.

Errors of Threat Detection Service

Error code	Error message	Description
yd.error.sas.1	The specified field has not been found in the metadata.	The error message returned because the field you queried does not exist in the metadata. Check the request and try again.

Error code	Error message	Description
yd.error.sas.2	An error occurred when you invoke the task engine. Try again later.	The error message returned because the system has failed to call the task engine. Try again later.
yd.error.sas.3	An error occurred when you start the task. Try again later.	The error message returned because the system has failed to start the task. Try again later.
yd.error.sas.4	An error occurred when you stop the task. Try again later.	The error message returned because the system has failed to stop the task. Try again later.
yd.error.sas.5	An error occurred when you restart the task. Try again later.	The error message returned because the system has failed to restart the task. Try again later.
yd.error.sas.6	An error occurred when you obtain the task status. Try again later.	The error message returned because the system has failed to obtain the task status. Try again later.
yd.error.sas.7	An error occurred when you delete the task. Try again later.	The error message returned because the system has failed to delete the task. Try again later.
yd.error.sas.8	The specified table does not contain metadata.	The error message returned because the table you queried does not contain metadata. Check the request and try again.
yd.error.sas.100	Request failed. Refresh the page and try again.	The error message returned because the request has failed. Try again later.
yd.error.sas.101	The parameter is invalid.	The error message returned because the parameter is invalid. Check the request and try again.
yd.error.sas.103	Request failed.	The error message returned because the request has failed. Check the request and try again.
yd.error.sas.400	The asset is under protection. Uninstall the Server Guard client and try again.	The error message returned because the asset you want to delete is protected. Uninstall the Server Guard agent from the server and try again.
yd.error.sas.500	A system error has occurred.	The error message returned because a system error has occurred. Contact Alibaba Cloud technical support.

Error code	Error message	Description
yd.error.sas.501	The function is unavailable in the current version.	The error message returned because the version you used does not support this feature.
yd.error.sas.502	You are not authorized to access the instance.	The error message returned because you are not authorized to manage the server.

Errors of Anti-DDoS

Error code	Error message	Description
yd.error.ddos.400	An error occurred when you access the server. Try again later.	The error message returned because the system has failed to access the server. Check the request and try again.
yd.error.ddos.500	An error occurred on the server.	The error message returned because a server error has occurred. Contact Alibaba Cloud technical support.
yd.error.ddos.UNKNOWN_EXCEPTION	An internal error occurred.	The error message returned because an unknown error has occurred. Contact Alibaba Cloud technical support.
yd.error.ddos.REQUEST_TIMEOUT	The request has timed out.	The error message returned because the request has timed out. Try again later.
yd.error.ddos.SERVER_FAILED	An operation error occurred.	The error message returned because the operation has failed. Contact Alibaba Cloud technical support.
yd.error.ddos.NOT_AUTHORIZED	You are not authorized to perform this operation.	The error message returned because you are not authorized to perform the operation. Check the account permissions.
yd.error.ddos.PARAMETER_INVALID	The specified parameter is invalid or missing.	The error message returned because the specified request parameter is invalid. Check the request parameter and try again.
yd.error.ddos.IP_SEGMENT_INVALID	The specified CIDR block is invalid.	The error message returned because the specified CIDR block is invalid. Check the CIDR block specified in the request parameter.

Error code	Error message	Description
yd.error.ddos.IP_SEGMENT_REPEAT	One CIDR block cannot be used in different regions. Enter another CIDR block.	The error message returned because one CIDR block belongs to multiple regions. Check the CIDR block specified in the request parameter.
yd.error.ddos.IP_SEGMENT_ALREADY	The specified CIDR block already exists.	The error message returned because the specified CIDR block has been used. Check the CIDR block specified in the request parameter.
yd.error.ddos.IP_SEGMENT_MASK_LENGTH_ERR	The prefix length must be less than 24 bits.	The error message returned because the mask contains more than 24 bits. Check the CIDR block mask specified in the request parameter.
yd.error.ddos.QUERY_REGION_LIST_ERR	An error occurred when you obtain the region list.	The error message returned because the system has failed to obtain the region list. Try again later.
yd.error.ddos.IP_SEGMENT_OPERATION_ERR	An error occurred when you perform the operation on the CIDR block.	The error message returned because the system has failed to process the CIDR block. Try again later.
yd.error.ddos.QUERY_IP_SEGMENT_ERR	An error occurred when you obtain the CIDR block.	The error message returned because the system has failed to obtain the information about the CIDR block. Try again later.
yd.error.ddos.MODIFY_IP_SEGMENT_ERR	An error occurred when you modify the CIDR block.	The error message returned because the system has failed to modify the information about the CIDR block. Try again later.
yd.error.ddos.IP_SEGMENT_TYPE_ERR	Check whether the type of the CIDR block (internal or external) is specified.	The error message returned because the CIDR block type is not specified. Check the CIDR block type and try again.
yd.error.ddos.CANCEL_FLOW_CLEAN_ERR	An error occurred when you cancel traffic scrubbing. Check the network connection to Beaver.	The error message returned because the system has failed to cancel traffic scrubbing. Check the network connection to Network Traffic Monitoring System and try again.

Error code	Error message	Description
yd.error.ddos.QUERY_FLOW_ANALYSIS_ERR	An error occurred when you obtain the traffic analysis result. Check the network connection to Beaver.	The error message returned because the system has failed to obtain the traffic analysis result. Check the network connection to Network Traffic Monitoring System and try again.
yd.error.ddos.QUERY_BEAVER_URL_ERR	An error occurred when you obtain the Beaver URL.	The error message returned because the system has failed to obtain the URL of Network Traffic Monitoring System. Check the network connection to Network Traffic Monitoring System and try again.
yd.error.ddos.SET_VALVE_INVALID	The specified thresholds are invalid.	The error message returned because the threshold verification has failed. Check the thresholds and try again.
yd.error.ddos.VALVE_DEFAULT_ALREADY	You cannot add the default threshold again.	The error message returned because the system has failed to add the default threshold, which can only be modified.
yd.error.ddos.NOT_BELONG_BEAVER_IP_SEGMENT	Check whether the specified CIDR block belongs to the internal network of Beaver.	The error message returned because the CIDR block you entered is not in the internal CIDR block of Network Traffic Monitoring System. Check the CIDR block.
yd.error.ddos.VALVE_DELETE_ERR	Do not delete the threshold.	The error message returned because the system has failed to delete the default threshold or the threshold of 128.0.0.0/1.
yd.error.ddos.QUERY_CODE_ERR	An error occurred when you obtain the product configuration.	The error message returned because the system has failed to obtain the dictionary. Try again later.
yd.error.ddos.IS_OPENED	Enabled.	The error message returned because the specified switch has been turned on.
yd.error.ddos.IS_CLOSED	Disabled.	The error message returned because the specified switch has been turned off.

Errors of Server Guard

Error code	Error message	Description
yd.error.aqs.REQUEST_FAILED	Request failed. Try again later.	The error message returned because the request has failed. Try again later.

20.Log Service

20.1. Developer Guide

20.1.1. API Reference

20.1.1.1. Overview

Log Service allows you to collect and manage logs by using the Apsara Uni-manager Management Console. In addition, Log Service allows you to use the Log Service API to collect logs, query logs, and manage your projects and Logstores.

Object	Operation
Log	Basic terms such as log and log group
Project	ListProject, CreateProject, DeleteProject, GetProject, and UpdateProject
	GetProjectLogs (Queries all logs in a project)
Config	ListConfig, CreateConfig, DeleteConfig, GetConfig, and UpdateConfig
	GetAppliedMachineGroups (Queries the machine groups to which a Logtail configuration file is applied)
MachineGroup	ListMachineGroup, CreateMachineGroup, DeleteMachineGroup, GetMachineGroup, and UpdateMachineGroup
	ApplyConfigToMachineGroup and RemoveConfigFromMachineGroup (Deletes a Logtail configuration file)
	GetAppliedConfigs (Queries the applied Logtail configuration files)
Logstore	ListLogstore, CreateLogstore, DeleteLogstore, GetLogstore, and UpdateLogstore
	GetLogs (Queries logs) and GetHistograms (Queries the distribution of logs)
Index	GetIndex, CreateIndex, DeleteIndex, and UpdateIndex
	ListShards, SplitShard, and MergeShards
	PostLog (Writes logs)

Shard Object	Operation
	GetCursor (Locates logs)
	PullLogs (Consumes logs)
Consumer group	CreateConsumerGroup, DeleteConsumerGroup, ListConsumerGroup, and UpdateConsumerGroup
	HeartBeat (Sends heartbeat packets), GetCheckPoint, and UpdateCheckPoint

You can call the API to perform the following operations:

- Collect logs based on Logtail configurations and Logtail machine group.
- Create Logstores and write logs to or read logs from the Logstores.

> **Note**
> - The Log Service API is a RESTful API based on the HTTP protocol.
> - Security verification is required for all API requests. For information about the API request signature method and process, see Request signatures.

20.1.1.2. Common request headers

The Log Service API is a RESTful API based on the HTTP protocol. The Log Service API supports a set of common request headers that can be used in all API requests. Each Log Service API request must provide a common request header. The following table describes the fields of the common request headers.

Header field	Type	Description
Accept	String	The type of the response that the client expects Log Service to return. Two response types are supported: application/json and application/x-protobuf. This field is optional and valid for only GET requests. The specific value is subject to the definition of each API.
Accept-Encoding	String	The compression algorithm that the client expects Log Service to return. LZ4 and DEFLATE are supported. The value can also be an empty string, indicating that no compression is performed. This field is optional and valid only for GET requests. The specific value is subject to the definition of each API.
Authorization	String	The signature content. For more information, see Request signatures.
Content-Length	Numeric value	The length of the HTTP request body defined in RFC 2616. If the request does not have a body, this field is not required.

Header field	Type	Description
Content-MD5	String	The uppercase string that is generated after the request body is calculated based on the MD5 algorithm. If the request does not have a body, this field is not required.
Content-Type	String	The type of the HTTP request body defined in RFC 2616. Log Service API requests support only two types: application and x-protobuf. If the request does not have a body, this field is not required. The specific value is subject to the definition of each API.
Date	String	The time when the request is sent. Only the RFC 822 format is supported. The GMT standard time is used. The formatted string is %a, %d %b %Y %H:%M:%S GMT, for example, Mon, 3 Jan 2010 08:33:47 GMT.
Host	String	The complete hostname of the HTTP request. The value does not include protocol headers such as `http://`. Example: `big-game.regionid.example.com`.
x-log-apiversion	String	The API version. The current version is 0.6.0.
x-log-bodyrawsize	Numeric value	The initial size of the request body. If the request does not have a body, the value is 0. If the request body is compressed, the value is the size of the initial data before the compression. Valid values: 0 to 3 × 1024 × 1024. This field is optional and only required when the request body is compressed.
x-log-compresstype	String	The compression type of the API request body. LZ4 and DEFLATE that are defined in RFC 1951 are supported. If you want to use the ZLIB compression type, see RFC 1950. If the request body is not compressed, this field is not required.
x-log-date	String	The time when the request is sent. The time format is the same as that of the Date field. This field is optional. If a request contains this field, the value of this field replaces the value of the Date field for the request verification performed by Log Service. The Date field must be provided regardless of whether a request has an x-log-date field.
x-log-signaturemethod	String	The signature calculation method. Set the value to `hmac-sha1`.

Note

- The maximum difference between the time represented by the Date field of a request and the time when Log Service receives the request is 15 minutes. If the difference exceeds 15 minutes, Log Service rejects the request. If an x-log-date field is specified in the request, the time difference is calculated based on the value of the x-log-date field.
- If the compression algorithm is specified in x-log-compresstype of a request, the raw data must be compressed and then placed into the HTTP request body. The values of Content-Length and Content-MD5 fields are calculated based on the compressed HTTP body.
- The value of the Date field cannot be specified for the HTTP requests sent by some platforms. As a result, no correct value of the Date field is available to calculate the request signature. In this case, you must specify an x-log-date field and use the value of this field to calculate the request signature. After Log Service receives an API request, it checks whether the request contains an x-log-date field. If yes, Log Service uses the value of the x-log-date field for signature verification. If no, Log Service uses the value of the standard HTTP field Date for signature verification.

20.1.1.3. Common response headers

The Log Service API is a RESTful API based on the HTTP protocol. Each Log Service API response provides a common response header. The following table describes the fields in the common response headers.

Header field	Type	Description
Content-Length	Numeric value	The length of the HTTP response defined in RFC 2616.
Content-MD5	String	The MD5 value of the HTTP response defined in RFC 2616. This value is an uppercase string after the request body is calculated based on the MD5 algorithm.
Content-Type	String	The type of the HTTP response defined in RFC 2616. Log Service supports two response types: application/json and application/x-protobuf.
Date	String	The time when the request is returned. Only the RFC 822 format is supported. The GMT standard time is used. The formatted string is %a, %d %b %Y %H:%M:%S GMT, for example, Mon, 3 Jan 2010 08:33:47 GMT.
x-log-requestid	String	The unique ID that marks the request. The ID is generated by Log Service. This response header field is irrelevant to applications. It is used to troubleshoot problems. To troubleshoot failed API requests, you can provide this ID to the technical support team of Log Service.

20.1.1.4. Request signatures

Each HTTP request of a Log Service API operation must pass security verification to ensure log data security. The security verification is performed by using the symmetric encryption algorithm. You can use an AccessKey pair for security verification.

The security verification process of an API request is as follows:

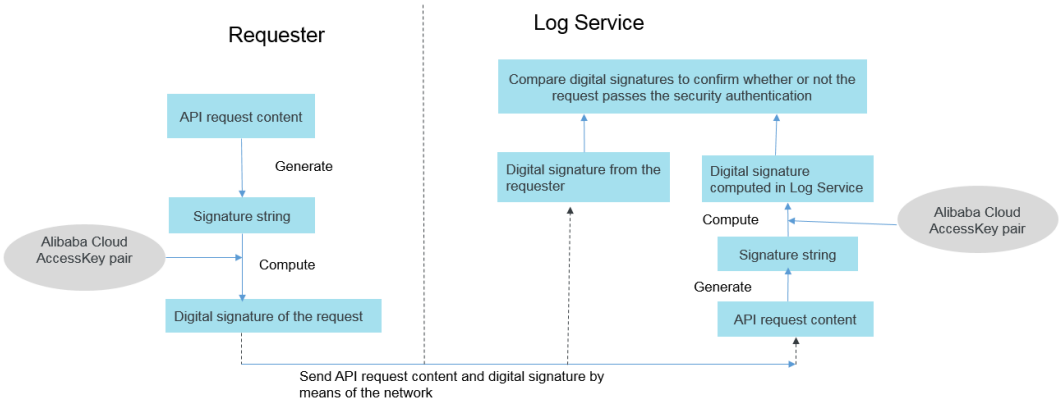
1. The requester generates a signature string based on the API request content, including the HTTP header and body.
2. The requester uses an AccessKey pair that consists of an AccessKey ID and AccessKey secret to sign the signature string. A digital signature is generated for this API request.
3. The requester sends both the API request content and digital signature to Log Service.
4. Log Service receives the request, and then repeats steps 1 and 2.

   > **Note** Log Service retrieves the AccessKey pair from the backend to calculate the signature string and generate the expected digital signature for this request.

5. The server compares the expected digital signature with the digital signature sent from the requester. If both signatures are the same, the request passes the security verification. Otherwise, the request is rejected.

The following figure shows the security verification process.

Security verification process



The security verification process can also be used for the following purposes:

- Identify the user that sends the API request. A user must specify the AccessKey pair that is used to generate the digital signature before the user sends the API request. Then, Log Service can use the AccessKey pair to identify the user and implement access control.
- Check whether the API request is intercepted and tampered with during transmission. Log Service recalculates the signature string based on the received API request. If the API request is intercepted and tampered with during transmission, the API request cannot pass the security verification.

Sign an API request

To pass the security verification for an API request, you must sign the API request on the requester to generate a digital signature. You must also use the Authorization field to transmit the digital signature of the API request over the network. The format of the Authorization field is as follows:

```
Authorization:LOG <AccessKeyId>:<Signature>
```

In the preceding format, the value of the Authorization field contains the AccessKey ID. The AccessKey secret is used to construct the signature. To construct the signature, follow these steps:

1. Prepare an AccessKey pair.

   To generate a digital signature for an API request, you must use an AccessKey pair. The AccessKey pair consists of an AccessKey ID and an AccessKey secret.

2. Generate a signature string for the API request.

   The signature string of a Log Service API operation is generated based on the method, header, and body of the HTTP request. The signature string is generated by using the following formula:

```
SignString = VERB + "\n"
             + CONTENT-MD5 + "\n"
             + CONTENT-TYPE + "\n"
             + DATE + "\n"
             + CanonicalizedLOGHeaders + "\n"
             + CanonicalizedResource
```

   In the preceding formula, `\n` indicates the newline escape character and the plus sign (`+`) indicates the string concatenation operator. The following table describes the other elements.

   Signature string elements

Element	Description	Example
VERB	The method name of the HTTP request.	PUT, GET, and POST
CONTENT-MD5	The MD5 value of the HTTP request body, which must be an uppercase string.	875264590688CA6171F6228AF5BBB3D2
CONTENT-TYPE	The type of the HTTP request body.	application/x-protobuf
DATE	The standard timestamp field of the HTTP request. This field complies with the RFC 1123 time format and uses the GMT standard time.	Mon, 3 Jan 2010 08:33:47 GMT
CanonicalizedLOGHeaders	The string constructed by the custom fields in the HTTP request. The custom fields are prefixed with `x-log` and `x-acs` .	x-log-apiversion:0.6.0\nx-log-bodyrawsize:50\nx-log-signaturemethod:hmac-sha1
CanonicalizedResource	The string constructed by using the HTTP request resources.	/logstores/app_log

   If an HTTP request does not have a body, the CONTENT-MD5 and CONTENT-TYPE fields are empty strings. In this case, the signature string is generated by using the following formula:

```
SignString = VERB + "\n"
             + "\n"
             + "\n"
             + DATE + "\n"
             + CanonicalizedLOGHeaders + "\n"
             + CanonicalizedResource
```

The `x-log-date` custom request field is used in Log Service API operations. For more information, see Common request headers. If you specify this field in a request, the field value replaces the value of the HTTP standard request field Date during signature generation.

The CanonicalizedLOGHeaders string is constructed as follows:

i. Convert the names of all HTTP request fields prefixed with `x-log` and `x-acs` into lowercase letters.
ii. Sort all Log Service custom request fields obtained in the previous step in lexicographical order.
iii. Delete all spaces on either side of a delimiter between the request header and content.
iv. Separate all headers and contents with the `\n` delimiter to obtain the CanonicalizedLOGHeader string.

The CanonicalizedResource string is constructed as follows:

i. Set the CanonicalizedResource string to an empty string ("").
ii. Enter the Log Service resources that you want to access, for example, */logstores/logstorename*. If `logstorename` does not exist, this string is left blank.
iii. If the request contains a query string (`QUERY_STRING`), add a question mark (`?`) and the query string at the end of the CanonicalizedResource string.

In the request, `QUERY_STRING` is the lexicographically sorted string of the request parameters included in the URL. Equal signs (`=`) are used between the names and values of parameters to form a string. The name-value pairs are then sorted in lexicographical order and connected with ampersands (`&`) to form a string. The formula is described as follows:

```
QUERY_STRING = "KEY1=VALUE1" + "&" + "KEY2=VALUE2"
```

3. Generate a digital signature for the request.

   Log Service API operations support only the `hmac-sha1` digital signature algorithm, which is also the default signature algorithm. The signature formula is as follows:

   ```
   Signature = base64(hmac-sha1(UTF8-Encoding-Of(SignString), AccessKeySecret))
   ```

   The HMAC-SHA1 method defined in RFC 2104 is used as the signature method. The AccessKey secret used in the preceding formula must match the AccessKey ID in the final Authorization field. Otherwise, the request cannot be verified by Log Service.

   After the digital signature is generated, use the signature to construct a complete security verification header for the API request. Then, enter the security verification header in the HTTP request and send the request.

Examples

The following two examples demonstrate how to sign an API request. In the examples, the AccessKey pair you use to sign the API request is as follows:

```
AccessKeyId = "<yourAccessKeyId>"
AccessKeySecret = "<yourAccessKeySecret>"
```

- Example 1: you want to send the following GET request to list all Logstores in the ali-test-project project:

  ```
  GET /logstores HTTP 1.1
  Mon, 09 Nov 2015 06:11:16 GMT
  Host: ali-test-project.regionid.example.com
  x-log-apiversion: 0.6.0
  x-log-signaturemethod: hmac-sha1
  ```

  The following signature string is generated for the API request:

  ```
  GET\n\n\nMon, 09 Nov 2015 06:11:16 GMT\nx-log-apiversion:0.6.0\nx-log-signaturemethod:hma
  c-sha1\n/logstores? logstoreName=&offset=0&size=1000
  ```

  The CONTENT-TYPE and CONTENT-MD5 fields are empty because the GET request does not have an HTTP body. If the AccessKey secret is used to generate a signature, the signature is as follows:

  ```
  jEYOTCJs2e88o+y5F4/S5IsnBJQ=
  ```

  The digitally signed HTTP request is as follows:

  ```
  GET /logstores HTTP 1.1
  Mon, 09 Nov 2015 06:11:16 GMT
  Host: ali-test-project.regionid.example.com
  x-log-apiversion: 0.6.0
  x-log-signaturemethod: hmac-sha1
  Authorization: LOG <yourAccessKeyId>:<yourSignature>
  ```

- Example 2: You want to write the following log to the Logstore named test-logstore in the ali-test-project project:

  ```
  topic=""
  time=1447048976
  source="10.10.10.1"
  "TestKey": "TestContent"
  ```

  The following HTTP request must be constructed based on the Log Service API definition:

```
POST /logstores/test-logstore HTTP/1.1
Date: Mon, 09 Nov 2015 06:03:03 GMT
Host: test-project.regionid.example.com
x-log-apiversion: 0.6.0
x-log-signaturemethod: hmac-sha1
Content-MD5: 1DD45FA4A70A9300CC9FE7305AF2C494
Content-Length: 52
x-log-apiversion:0.6.0
x-log-bodyrawsize:50
x-log-compresstype:lz4
x-log-signaturemethod:hmac-sha1
<The log is serialized to byte streams in the ProtoBuffer format.>
```

In this HTTP request, the log is first serialized to byte streams in the ProtoBuffer format and then used as the request body. For more information, see Data encoding. The value of the Content-Type header field value in this request is application/x-protobuf. The value of the Content-MD5 header field is the MD5 value that corresponds to the request body. The signature string of this request is as follows:

```
POST\n1DD45FA4A70A9300CC9FE7305AF2C494\napplication/x-protobuf\nMon, 09 Nov 2015 06:03:03
GMT\nx-log-apiversion:0.6.0\nx-log-bodyrawsize:50\nx-log-compresstype:lz4\nx-log-signatur
emethod:hmac-sha1\n/logstores/test-logstore
```

If the AccessKey secret is used to generate a signature, the signature is as follows:

```
XWLGYHGg2F2hcfxWxMLiNkGki6g=
```

The digitally signed HTTP request is as follows:

```
POST /logstores/test-logstore HTTP/1.1
Date: Mon, 09 Nov 2015 06:03:03 GMT
Host: test-project.regionid.example.com
x-log-apiversion: 0.6.0
x-log-signaturemethod: hmac-sha1
Content-MD5: 1DD45FA4A70A9300CC9FE7305AF2C494
Content-Length: 52
x-log-apiversion:0.6.0
x-log-bodyrawsize:50
x-log-compresstype:lz4
x-log-signaturemethod:hmac-sha1
Authorization: LOG <yourAccessKeyId>:<yourSignature>
<The log is serialized to byte streams in the ProtoBuffer format.>
```

20.1.1.5. Common error codes

When an API request error occurs, Log Service returns an error message, including the HTTP status code and the specific error details in the response body. The error details in the response body are formatted as follows:

```
{
"errorCode" : <ErrorCode>,
"errorMessage" : <ErrorMessage>
}
```

Some of the error messages that may be returned by Log Service apply to most APIs and are defined as common error codes. The other error messages apply only to some APIs and are defined as special error codes. The unique error codes of an API are described in the relevant API reference.

Common error codes

HTTP status code	Error code	Error message	Description
411	MissingContentLength	Content-Length does not exist in http header when it is necessary.	The error message returned because the required Content-Length field does not exist in the request header.
415	InvalidContentType	Content-Type {type} is unsupported.	The error message returned because the specified Content-Type is not supported.
400	MissingContentType	Content-Type does not exist in http header when body is not empty.	The error message returned because the Content-Type header field is not specified when the HTTP request body is not empty.
400	MissingBodyRawSize	x-log-bodyrawsize does not exist in header when it is necessary.	The error message returned because the required x-log-bodyrawsize field does not exist in the request header in the compression scenario.
400	InvalidBodyRawSize	x-log-bodyrawsize is invalid.	The error message returned because the x-log-bodyrawsize value is invalid.
400	InvalidCompressType	x-log-compresstype {type} is unsupported.	The error message returned because the compression type specified in the x-log-compresstype parameter is not supported.
400	MissingHost	Host does not exist in http header.	The error message returned because the Host field does not exist in the HTTP request header.
400	MissingDate	Date does not exist in http header.	The error message returned because the Data field does not exist in the HTTP request header.
400	InvalidDateFormat	Date {date} must follow RFC822.	The error message returned because the value of the Date field in the request header does not comply with the RFC 822 standard.

HTTP status code	Error code	Error message	Description
400	MissingAPIVersion	x-log-apiversion does not exist in http header.	The error message returned because the x-log-apiversion field does not exist in the HTTP request header.
400	InvalidAPIVersion	x-log-apiversion {version} is unsupported.	The error message returned because the value of the x-log-apiversion field in the HTTP request header is not supported.
400	MissAccessKeyId	x-log-accesskeyid does not exist in header.	The error message returned because no AccessKey ID exists in the Authorization header field.
401	Unauthorized	The AccessKeyId is unauthorized.	The error message returned because the specified AccessKey ID is unauthorized.
400	MissingSignatureMethod	x-log-signaturemethod does not exist in http header.	The error message returned because the x-log-signaturemethod field does not exist in the HTTP request header.
400	InvalidSignatureMethod	signature method {method} is unsupported.	The error message returned because the signature method specified in the x-log-signaturemethod header field is not supported.
400	RequestTimeTooSkewed	Request time exceeds server time more than 15 minutes.	The error message returned because the request sending time is more than 15 minutes before or after the current server time.
404	ProjectNotExist	Project {name} does not exist.	The error message returned because the specified project does not exist.
401	SignatureNotMatch	Signature {signature} is not matched.	The error message returned because the digital signature of the request does not match the signature computed in Log Service.
403	WriteQuotaExceed	Write quota is exceeded.	The error message returned because the log write quota is exceeded.
403	ReadQuotaExceed	Read quota is exceeded.	The error message returned because the log read quota is exceeded.

HTTP status code	Error code	Error message	Description
500	InternalServerError	Internal server error message.	The error message returned because an internal server error occurred.
503	ServerBusy	The server is busy, please try again later.	The error message returned because the server is busy. Try again later.

The {...} in the error message indicates the specific error information. For example, {name} in the ProjectNotExist error message is replaced by a specific project name.

20.1.1.6. Project API

20.1.1.6.1. CreateProject

Creates a project.

Request syntax

```
POST / HTTP/1.1
Authorization: <AuthorizationString>
x-log-bodyrawsize: 0
User-Agent: <UserAgent>
x-log-apiversion: 0.6.0
Host: <Project Endpoint>
x-log-signaturemethod: hmac-sha1
Date: <GMT Date>
Content-Type: application/json
Content-MD5: <Content-MD5>
Content-Length: <ContentLength>
Connection: Keep-Alive
{
  "projectName": <ProjectName>,
  "description": <Description>
}
```

Request elements

- Request headers

  The CreateProject API operation does not have special request headers. For information about common request headers of Log Service API operations, see Common request headers.

- Request parameters

Parameter	Type	Required	Description
projectName	String	Yes	The name of the project.

Parameter	Type	Required	Description
description	String	Yes	The description of the project.

Response elements

- Response headers

  The CreateProject API operation does not have special response headers. For information about common response headers of Log Service API operations, see Common response headers.

- Response parameters

  The HTTP status code 200 is returned.

Error codes

In addition to Common error codes, the API operation may also return the following special error codes.

HTTP status code	Error code	Error message
400	ProjectAlreadyExist	Project {project} already exist
400	ParameterInvalid	The body is not valid json string
500	InternalServerError	Specified Server Error Message

Examples

- Sample requests

```
POST / HTTP/1.1
Authorization: LOG <yourAccessKeyId>:<yourSignature>
x-log-bodyrawsize: 0
User-Agent: sls-java-sdk-v-0.6.1
x-log-apiversion: 0.6.0
Host: my-project-test.cn-shanghai.log.aliyuncs.com
x-log-signaturemethod: hmac-sha1
Date: Sun, 27 May 2018 07:43:26 GMT
Content-Type: application/json
Content-MD5: A7967D81EFF5E3CD447FB6D8DF294E20
Content-Length: 80
Connection: Keep-Alive
{
  "projectName": "my-project-test",
  "description": "Description of my-project-test"
}
```

- Sample responses

```
HTTP/1.1 200
Server: nginx
Content-Length: 0
Connection: close
Access-Control-Allow-Origin: *
Date: Sun, 27 May 2018 07:43:27 GMT
x-log-requestid: 5B0A619F205DC3F30EDA9322
```

20.1.1.6.2. DeleteProject

Deletes a project.

Request syntax

```
DELETE / HTTP/1.1
Authorization: <AuthorizationString>
x-log-bodyrawsize: 0
User-Agent: <UserAgent>
x-log-apiversion: 0.6.0
Host: <Project Endpoint>
x-log-signaturemethod: hmac-sha1
Date: <GMT Date>
Content-Type: application/x-protobuf
Connection: Keep-Alive
```

Request elements

- Request headers

  The DeleteProject API operation does not have special request headers. For information about common request headers of Log Service API operations, see Common request headers.

- Request parameters

Parameter	Type	Required	Description
projectName	String	Yes	The name of the project. The name is a part of the Host parameter in the header.

Response elements

- Response headers

  The DeleteProject API operation does not have special response headers. For information about common response headers of Log Service API operations, see Common response headers.

- Response parameters

  The HTTP status code 200 is returned.

Error codes

In addition to Common error codes, the API operation may also return the following special error codes.

HTTP status code	Error code	Error message
404	ProjectNotExist	The project does not exist: {project}
500	InternalServerError	Specified Server Error Message

Examples

- Sample requests

```
DELETE / HTTP/1.1
Authorization: LOG <yourAccessKeyId>:<yourSignature>
x-log-bodyrawsize: 0
User-Agent: sls-java-sdk-v-0.6.1
x-log-apiversion: 0.6.0
Host: my-project-test.cn-shanghai.log.aliyuncs.com
x-log-signaturemethod: hmac-sha1
Date: Sun, 27 May 2018 08:25:04 GMT
Content-Type: application/x-protobuf
Connection: Keep-Alive
```

- Sample responses

```
HTTP/1.1 200
Server: nginx
Content-Length: 0
Connection: close
Access-Control-Allow-Origin: *
Date: Sun, 27 May 2018 08:25:04 GMT
x-log-requestid: 5B0A6B60BB6EE39764D458B5
```

20.1.1.6.3. UpdateProject

Modifies a project.

Request syntax

```
PUT / HTTP/1.1
Authorization:  <AuthorizationString>
x-log-bodyrawsize: 0
User-Agent:  <UserAgent>
x-log-apiversion: 0.6.0
Host:  <Project Endpoint>
x-log-signaturemethod: hmac-sha1
Date:  <GMT Date>
Content-Type: application/json
Content-MD5:  <Content-MD5>
Content-Length:  <ContentLength>
Connection: Keep-Alive
```

Request elements

- Request headers

  The UpdateProject API operation does not have special request headers. For information about common request headers of Log Service API operations, see Common request headers.

- Request parameters

Parameter	Type	Required	Description
projectName	String	Yes	The name of the project. The name is a part of the Host parameter in the header.
description	String	Yes	The description of the project. The value is an empty string by default.

Response elements

- Response headers

  The UpdateProject API operation does not have special response headers. For information about common response headers of Log Service API operations, see Common response headers.

- Response parameters

  The HTTP status code 200 is returned.

Error codes

In addition to Common error codes, the API operation may also return the following special error codes.

HTTP status code	Error code	Error message
404	ProjectNotExist	The project does not exist: <Project>
400	ParameterInvalid	The body is not valid json string
500	InternalServerError	Specified Server Error Message

Examples

- Sample requests

```
PUT / HTTP/1.1
Authorization: LOG <yourAccessKeyId>:<yourSignature>
x-log-bodyrawsize: 0
User-Agent: sls-java-sdk-v-0.6.1
x-log-apiversion: 0.6.0
Host: my-project-test.cn-shanghai.log.aliyuncs.com
x-log-signaturemethod: hmac-sha1
Date: Sun, 27 May 2018 07:43:26 GMT
Content-Type: application/json
Content-MD5: A7967D81EFF5E3CD447FB6D8DF294E20
Content-Length: 40
Connection: Keep-Alive
{
  "description": "Description of my-project-test"
}
```

- Sample responses

```
HTTP/1.1 200
Server: nginx
Content-Length: 0
Connection: close
Access-Control-Allow-Origin: *
Date: Sun, 27 May 2018 07:43:27 GMT
x-log-requestid: 5B0A619F205DC3F30EDA9322
```

20.1.1.6.4. GetProject

Queries a project based on the project name.

Request syntax

```
GET / HTTP/1.1
Authorization: <AuthorizationString>
x-log-bodyrawsize: 0
User-Agent: <UserAgent>
x-log-apiversion: 0.6.0
Host: <Project Endpoint>
x-log-signaturemethod: hmac-sha1
Date: <GMT Date>
Content-Type: application/x-protobuf
Connection: Keep-Alive
```

Request elements

- Request headers

  The GetProject API operation does not have special request headers. For information about common request headers of Log Service API operations, see Common request headers.

- Request parameters

Parameter	Type	Required	Description
projectName	String	Yes	The name of the project. The name is a part of the Host parameter in the header.

Response elements

- Response headers

  The GetProject API operation does not have special response headers. For information about common response headers of Log Service API operations, see Common response headers.

- Response parameters

  After the request succeeds, the response body contains the details of the project. The following table describes the response parameters.

Parameter	Type	Description
createTime	String	The time when the project was created.
description	String	The description of the project.
lastModifyTime	String	The time when the project was last modified.
owner	String	The ID of the account that was used to create the project.
projectName	String	The name of the project.
status	String	The status of the project.
region	String	The region to which the project belongs.

Error codes

In addition to Common error codes, the API operation may also return the following special error codes.

HTTP status code	Error code	Error message
404	ProjectNotExist	The project does not exist: {project}
500	InternalServerError	Specified Server Error Message

Examples

- Sample requests

```
GET / HTTP/1.1
Authorization: LOG <yourAccessKeyId>:<yourSignature>
x-log-bodyrawsize: 0
User-Agent: sls-java-sdk-v-0.6.1
x-log-apiversion: 0.6.0
Host: my-project-test.cn-shanghai.log.aliyuncs.com
x-log-signaturemethod: hmac-sha1
Date: Sun, 27 May 2018 08:25:04 GMT
Content-Type: application/x-protobuf
Connection: Keep-Alive
```

- Sample responses

```
HTTP/1.1 200
Server: nginx
Content-Length: 0
Connection: close
Access-Control-Allow-Origin: *
Date: Sun, 27 May 2018 08:25:04 GMT
x-log-requestid: 5B0A6B60BB6EE39764D458B5
```

20.1.1.6.5. ListProject

Lists all projects.

Request syntax

```
GET /? offset={offset}&size={size} HTTP/1.1
Authorization: <AuthorizationString>
x-log-bodyrawsize: 0
User-Agent: <UserAgent>
x-log-apiversion: 0.6.0
Host: <Endpoint>
x-log-signaturemethod: hmac-sha1
Date: <GMT Date>
Content-Type: application/x-protobuf
Connection: Keep-Alive
```

Request elements

- Request headers

  The ListProject API operation does not have special request headers. For information about common request headers of Log Service API operations, see Common request headers.

- Request parameters

Parameter	Type	Required	Description
offset	Integer	No	The start position of the records to return. Default value: 0.

Parameter	Type	Required	Description
size	Integer	No	The maximum number of entries to return on each page. Default and maximum value: 500.

Response elements

- Response headers

  The ListProject API operation does not have special response headers. For information about common response headers of Log Service API operations, see Common response headers.

- Response parameters

  After the request succeeds, the response body contains the project list. The following table describes the response parameters.

Parameter	Type	Description
count	Integer	The number of returned projects on each page.
total	Integer	The total number of ruturned projects.
projects	Array	The list of projects.

The following table describes the elements of the projects parameter.

Element	Type	Description
createTime	String	The time when the project was created.
description	String	The description of the project.
lastModifyTime	String	The time when the project was last modified.
owner	String	The ID of the account that was used to create the project.
projectName	String	The name of the project.
status	String	The status of the project.
region	String	The region to which the project belongs.

Error codes

In addition to Common error codes, the API operation may also return the following special error codes.

HTTP status code	Error code	Error message
500	InternalServerError	Specified Server Error Message

Examples

- Sample requests

```
GET /? offset=0&size=2&projectName= HTTP/1.1
Authorization: LOG <yourAccessKeyId>:<yourSignature>
x-log-bodyrawsize: 0
User-Agent: sls-java-sdk-v-0.6.1
x-log-apiversion: 0.6.0
Host: cn-shanghai.log.aliyuncs.com
x-log-signaturemethod: hmac-sha1
Date: Sun, 27 May 2018 09:03:33 GMT
Content-Type: application/x-protobuf
Connection: Keep-Alive
```

- Sample responses

```
HTTP/1.1 200
Server: nginx
Content-Type: application/json
Content-Length: 345
Connection: close
Access-Control-Allow-Origin: *
Date: Sun, 27 May 2018 09:03:33 GMT
x-log-requestid: 5B0A7465AAEA20CA70DE3064
{
  "count": 2,
  "total": 11,
  "projects": [
    {
      "projectName": "project1",
      "status": "Normal",
      "owner": "",
      "description": "",
      "region": "cn-shanghai",
      "createTime": "1524222931",
      "lastModifyTime": "1524539357"
    },
    {
      "projectName": "project123456",
      "status": "Normal",
      "owner": "",
      "description": "",
      "region": "cn-shanghai",
      "createTime": "1471963876",
      "lastModifyTime": "1524539357"
    }
  ]
}
```

20.1.1.6.6. GetProjectLogs

Queries logs in a project by using an SQL statement.

Request syntax

The request syntax of the GetProjectLogs API operation is as follows:

```
GET /logs query=SELECT avg(latency) as avg_latency FROM  where __date__ >'2017-09-01 00:00:
00' and __date__ < '2017-09-02 00:00:00'
Authorization: <AuthorizationString>
Date: Wed, 3 Sept. 2014 08:33:46 GMT
Host: big-game.cn-hangzhou.log.aliyuncs.com
x-log-bodyrawsize: 0
x-log-apiversion: 0.6.0
x-log-signaturemethod: hmac-sha1
```

Request elements

- Request headers

  The GetProjectLogs API operation does not have special request headers. For information about common request headers of Log Service API operations, see Common request headers.

- Request parameters

Parameter	Type	Required	Description
query	String	Yes	The SQL statement that is used for the query.

Response elements

- Response headers

  For information about common response headers of Log Service API operations, see Common response headers. The following table describes the special response parameters of the GetProjectLogs API operation.

Parameter	Type	Description
x-log-progress	String	The status of the query results. Valid values: Incomplete and Complete.
x-log-count	Integer	The total number of logs in the current query results.
x-log-processed-rows	Integer	The number of rows processed in the query.
x-log-elapsed-millisecond	Integer	The number of milliseconds consumed by the query.

- Response parameters

The response body of the GetProjectLogs API operation is an array. Each element in the array is a log. The following table describes the response parameters.

Parameter	Type	Description
__time__	Integer	The log timestamp. This parameter indicates the number of seconds that have elapsed since the Unix epoch 00:00:00 UTC on January 1, 1970.
__source__	String	The log source, which is specified when logs are written.
[content]	Key-Value pair	The original content of logs.

Additional considerations

- The query statement that is used in this API operation is a standard SQL statement.
- You must specify a project in the domain name of the request.
- You must specify a Logstore in the FROM condition of the query statement. A Logstore can be regarded as a SQL table.
- You must specify a time range in the SQL statement by using the __date__ parameter (timestamp) or __time__ parameter (Unix timestamp).
- If the number of logs in the Logstore significantly changes, Log Service cannot predict how many times this API operation needs to be called to obtain the complete results. In this case, you must check the value of the x-log-progress parameter in the returned results of each request. Based on the value, you can determine whether to repeatedly call this API operation to obtain the complete results.

> **Note** The same number of query compute units (CUs) is consumed each time you call this API operation.

Error codes

In addition to Common error codes, the API operation may also return the following special error codes.

HTTP status code	Error code	Error message	Description
400	ParameterInvalid	parameter is invalid	The error message returned because the specified request parameter is invalid.

Example

In this example, the logs with the groupA topic are queried in a Logstore named app_log. The Logstore belongs to a project named big-game in the China (Hangzhou) region. The time range is from 2014-09-01 00:00:00 to 2014-09-01 22:00:00 and the keyword is "error". The query starts from the beginning of the time range. A maximum of 20 logs can be returned.

- Sample requests

```
GET /logs/? query=SELECT * FROM <logStoreName> where __line__ = 'abc' and __date__ >'2017
-09-01 00:00:00' and __date__ < '2017-09-02 00:00:00'&line=20&offset=0 HTTP/1.1
Authorization: <AuthorizationString>
Date: Wed, 3 Sept. 2014 08:33:46 GMT
Host: big-game.cn-hangzhou.log.aliyuncs.com
x-log-bodyrawsize: 0
x-log-apiversion: 0.4.0
x-log-signaturemethod: hmac-sha1
```

- Sample responses

```
HTTP/1.1 200 OK
Content-MD5: 36F9F7F0339BEAF571581AF1B0AAAFB5
Content-Type: application/json
Content-Length: 269
Date: Wed, 3 Sept. 2014 08:33:47 GMT
x-log-requestid: efag01234-12341-15432f
x-log-progress : Complete
x-log-count : 10000
x-log-processed-rows: 10000
x-log-elapsed-millisecond:5
{
    "progress": "Complete",
    "count": 2,
    "logs": [
        {
            "__time__": 1409529660,
            "__source__": "10.237.0.17",
            "Key1": "error",
            "Key2": "Value2"
        },
        {
            "__time__": 1409529680,
            "__source__": "10.237.0.18",
            "Key3": "error",
            "Key4": "Value4"
        }
    ]
}
```

In the sample response, the x-log-progress value is Complete. This indicates that the log query is completed and the returned results are complete. In this query, two logs that meet the query conditions are found. If the x-log-progress value is Incomplete, you must repeat the request to obtain the complete results.

20.1.1.7. Logstore operations

20.1.1.7.1. CreateLogstore

Creates a Logstore.

Request syntax

The request syntax of the CreateLogstore API operation is as follows:

```
POST /logstores HTTP/1.1
Authorization: <AuthorizationString>
Date: <GMT Date>
Host: <Project Endpoint>
x-log-apiversion: 0.6.0
x-log-signaturemethod: hmac-sha1
{
    "logstoreName" : <logStoreName>,
    "ttl": <ttl>,
    "shardCount": <shardCount>,
    "autoSplit": <autoSplit>,
    "maxSplitShard": <maxSplitShard>
}
```

Request elements

- Request headers

  The CreateLogstore API operation does not have special request headers. For information about common request headers of Log Service API operations, see Common request headers.

- Request parameters

Parameter	Type	Required	Description
logstoreName	String	Yes	The name of the Logstore. The name must be unique in a project.
ttl	Integer	Yes	The time to live (TTL) of log data. Unit: days. Valid values: 1 to 3600.
shardCount	Integer	Yes	The number of shards. Valid values: 1 to 100.
enable_tracking	Boolean	No	Specifies whether to enable the WebTracking feature. Default value: false.
autoSplit	Boolean	No	Specifies whether to enable automatic sharding. Default value: false.
maxSplitShard	Integer	No	The maximum number of shards for automatic sharding. Valid values: 1 to 64. Default value: 64. This parameter must be specified if the autoSplit parameter is set to true.

Response elements

- Response headers

  The CreateLogstore API operation does not have special response headers. For information about common response headers of Log Service API operations, see Common request headers.

- Response parameters

  The HTTP status code 200 is returned.

Error codes

In addition to Common error codes, the API operation may also return the following special error codes.

HTTP status code	Error code	Error message
400	LogstoreAlreadyExist	logstore {logstoreName} already exists
500	InternalServerError	Specified Server Error Message
400	LogstoreInfoInvalid	logstore info is invalid
400	ProjectQuotaExceed	Project Quota Exceed

Examples

- Sample requests

```
POST /logstores HTTP/1.1
Header :
{
x-log-apiversion=0.6.0,
Authorization=LOG <yourAccessKeyId>:<yourSignature>,
Host=ali-test-project.cn-hangzhou-devcommon-intranet.sls.aliyuncs.com,
Date=Wed, 11 Nov 2015 07:35:00 GMT,
Content-Length=55,
x-log-signaturemethod=hmac-sha1,
Content-MD5=7EF43D0B8F4A807B95E775048C911C72,
User-Agent=sls-java-sdk-v-0.6.0,
Content-Type=application/json
}
Body :
{
    "logstoreName": "test-logstore",
    "ttl": 1,
    "shardCount": 2,
    "autoSplit": true,
    "maxSplitShard": 64
}
```

- Sample responses

```
HTTP/1.1 200 OK
Header:
{
Date=Wed, 11 Nov 2015 07:35:00 GMT,
Content-Length=0,
x-log-requestid=5642EFA499248C827B012B39,
Connection=close,
Server=nginx/1.6.1
}
```

20.1.1.7.2. DeleteLogstore

Deletes a Logstore, including all shards and indexes of the Logstore.

Request syntax

```
DELETE /logstores/{logstoreName} HTTP/1.1
Authorization: <AuthorizationString>
Date: <GMT Date>
Host: <Project Endpoint>
x-log-apiversion: 0.6.0
x-log-signaturemethod: hmac-sha1
```

Request parameters

- Request headers

  The DeleteLogstore API operation does not have special request headers. For information about common request headers of Log Service API operations, see Common request headers.

- Request parameters

Parameter	Type	Required	Description
logstoreName	String	Yes	The name of the Logstore. The name must be unique in a project.

Response parameters

- Response headers

  The DeleteLogstore API operation does not have special response headers. For information about common response headers of Log Service API operations, see Common response headers.

- Response parameters

  The HTTP status code 200 is returned.

Error codes

In addition to Common error codes, the API operation may also return the following special error codes.

HTTP status code	Error code	Error message
404	LogStoreNotExist	logstore {logstoreName} does not exist
500	InternalServerError	Specified Server Error Message

Examples

- Sample requests

```
DELETE /logstores/test_logstore HTTP/1.1
Header :
{
x-log-apiversion=0.6.0,
Authorization=LOG <yourAccessKeyId>:<yourSignature>,
Host=ali-test-project.cn-hangzhou-devcommon-intranet.sls.aliyuncs.com,
Date=Wed, 11 Nov 2015 08:09:38 GMT,
Content-Length=0,
x-log-signaturemethod=hmac-sha1,
User-Agent=sls-java-sdk-v-0.6.0,
Content-Type=application/json
}
```

- Sample responses

```
HTTP/1.1 200 OK
Header:
{
Date=Wed, 11 Nov 2015 08:09:39 GMT,
Content-Length=0,
x-log-requestid=5642F7C399248C817B013A07,
Connection=close,
Server=nginx/1.6.1
}
```

20.1.1.7.3. UpdateLogstore

Updates the attributes of a Logstore. Only the time to live (TTL) and shard attributes can be updated.

Request syntax

```
PUT /logstores/{logstoreName} HTTP/1.1
Authorization: <AuthorizationString>
Date: <GMT Date>
Host: <Project Endpoint>
x-log-apiversion: 0.6.0
x-log-signaturemethod: hmac-sha1
{
    "logstoreName": <logstoreName>,
    "ttl": <ttl>,
    "shardCount": <shardCount>,
    "autoSplit": <autoSplit>,
    "maxSplitShard": <maxSplitShard>
}
```

Request elements

- Request headers

  The UpdateLogstore API operation does not have special request headers. For information about common request headers of Log Service API operations, see Common request headers.

- Request parameters

Parameter	Type	Required	Description
logstoreName	String	Yes	The name of the Logstore. The name must be unique in a project.
ttl	Integer	Yes	The time to live (TTL) of log data. Unit: days. Valid values: 1 to 3600.
shardCount	Integer	Yes	The number of shards. After the attributes of a Logstore are updated, the number of shards is unchanged. You can only call the SplitShard or MergeShards operation to change the number of shards.
enable_tracking	Boolean	No	Specifies whether to enable the WebTracking feature.
autoSplit	Boolean	No	Specifies whether to enable automatic sharding.

Parameter	Type	Required	Description
maxSplitShard	Integer	No	The maximum number of shards for automatic sharding. Valid values: 1 to 64. This parameter must be specified if the autoSplit parameter is set to true.

Response elements

- Response headers

  The UpdateLogstore API operation does not have special response headers. For information about common response headers of Log Service API operations, see Common response headers.

- Response parameters

  The HTTP status code 200 is returned.

Error codes

In addition to Common error codes, the API operation may also return the following special error codes.

HTTP status code	Error code	Error message
404	ProjectNotExist	Project {ProjectName} does not exist
404	LogStoreNotExist	logstore {logstoreName} does not exist
400	LogStoreAlreadyExist	logstore {logstoreName} already exists
500	InternalServerError	Specified Server Error Message
400	ParameterInvalid	invalid shard count,you can only modify shardCount by split& merge shard

Additional considerations

You can modify the number of shards be only calling the SplitShard or MergeShards API operation.

Examples

- Sample requests

```
PUT /logstores/test-logstore HTTP/1.1
Header:
{
x-log-apiversion=0.6.0,
Authorization=LOG <yourAccessKeyId>:<yourSignature>,
Host=ali-test-project.cn-hangzhou-devcommon-intranet.sls.aliyuncs.com,
Date=Wed, 11 Nov 2015 08:28:19 GMT,
Content-Length=55,
x-log-signaturemethod=hmac-sha1,
Content-MD5=757C60FC41CC7D3F60B88E0D916D051E,
User-Agent=sls-java-sdk-v-0.6.0,
Content-Type=application/json
}
Body :
{
    "logstoreName": "test-logstore",
    "ttl": 1,
    "shardCount": 2,
    "autoSplit": true,
    "maxSplitShard": 64
}
```

- Sample responses

```
HTTP/1.1 200 OK
Header:
{
Date=Wed, 11 Nov 2015 08:28:20 GMT,
Content-Length=0,
x-log-requestid=5642FC2399248C8F7B0145FD,
Connection=close,
Server=nginx/1.6.1
}
```

20.1.1.7.4. GetLogstore

Queries the attributes of a Logstore.

Request syntax

```
GET /logstores/{logstoreName} HTTP/1.1
Authorization: <AuthorizationString>
Date: <GMT Date>
Host: <Project Endpoint>
x-log-apiversion: 0.6.0
x-log-signaturemethod: hmac-sha1
```

Request elements

- Request headers

  The GetLogstore API operation does not have special request headers. For information about common request headers of Log Service API operations, see Common request headers.

- Request parameters

Parameter	Type	Required	Description
logstoreName	String	Yes	The name of the Logstore. The name must be unique in a project.

Response elements

- Response headers

  The GetLogstore API operation does not have special response headers. For information about common response headers of Log Service API operations, see Common response headers.

- Response parameters

  The HTTP status code 200 is returned.

```
{
    "logstoreName" : <logstoreName>,
    "ttl": <ttl>,
    "shardCount": <shardCount>,
    "createTime": <createTime>,
    "lastModifyTime": <lastModifyTime>
}
```

Error codes

In addition to Common error codes, the API operation may also return the following special error codes.

HTTP status code	Error code	Error message
404	ProjectNotExist	Project {ProjectName} does not exist
404	LogstoreNotExist	logstore {logstoreName} does not exist
500	InternalServerError	Specified Server Error Message

Examples

- Sample requests

```
GET /logstores/test-logstore HTTP/1.1
Header :
{
x-log-apiversion=0.6.0,
Authorization=LOG <yourAccessKeyId>:<yourSignature>,
Host=ali-test-project.cn-hangzhou-devcommon-intranet.sls.aliyuncs.com,
Date=Wed, 11 Nov 2015 07:53:29 GMT,
Content-Length=0,
x-log-signaturemethod=hmac-sha1,
User-Agent=sls-java-sdk-v-0.6.0,
Content-Type=application/json
}
```

- Sample responses

```
HTTP/1.1 200 OK
Header :
{
Date=Wed, 11 Nov 2015 07:53:30 GMT,
Content-Length=107,
x-log-requestid=5642F3FA99248C817B01352D,
Connection=close,
Content-Type=application/json,
Server=nginx/1.6.1
}
Body :
{
    "logstoreName": test-logstore,
    "ttl": 1,
    "shardCount": 2,
    "createTime": 1447833064,
    "lastModifyTime": 1447833064
}
```

20.1.1.7.5. ListLogstore

Lists all Logstores in a specified project.

Request syntax

```
GET /logstores HTTP/1.1
Authorization: <AuthorizationString>
Date: <GMT Date>
Host: <Project Endpoint>
x-log-apiversion: 0.6.0
x-log-signaturemethod: hmac-sha1
```

Request elements

- Request headers

  The ListLogstore API operation does not have special request headers. For information about common request headers of Log Service API operations, see Common request headers.

- Request parameters

Parameter	Type	Required	Description
offset	Integer	No	The start position of the records to return. Default value: 0.
size	Integer	No	The maximum number of entries to return on each page. Default and maximum value: 500.

Parameter	Type	Required	Description
logstoreName	String	Yes	The Logstore name that is used as a filtering condition. Fuzzy match is used.

Response elements

- Response headers

  The ListLogstore API operation does not have special response headers. For information about common response headers of Log Service API operations, see Common response headers.

- Response parameters

  After a ListLogstore request succeeds, the response body contains a list of all Logstores in the specified project. The following table describes the response parameters.

Parameter	Type	Description
count	Integer	The number of returned Logstores.
total	Integer	The total number of Logstores.
logstores	String array	The name list of returned Logstores.

Error codes

In addition to Common error codes, the API operation may also return the following special error codes.

HTTP status code	Error code	Error message
404	ProjectNotExist	Project {ProjectName} does not exist
500	InternalServerError	Specified Server Error Message
400	ParameterInvalid	Invalid parameter size, (0.6.0]
400	InvalidLogStoreQuery	logstore Query is invalid

Examples

- Sample requests

```
GET /logstores HTTP/1.1
Header:
{
x-log-apiversion=0.6.0,
Authorization=LOG <yourAccessKeyId>:<yourSignature>,
Host=ali-test-project.cn-hangzhou-devcommon-intranet.sls.aliyuncs.com,
Date=Wed, 11 Nov 2015 08:09:39 GMT,
Content-Length=0,
x-log-signaturemethod=hmac-sha1,
User-Agent=sls-java-sdk-v-0.6.0,
Content-Type=application/json
}
```

- Sample responses

```
HTTP/1.1 200 OK
Header:
{
Date=Wed, 11 Nov 2015 08:09:39 GMT,
Content-Length=52,
x-log-requestid=5642F7C399248C8D7B01342F,
Connection=close,
Content-Type=application/json,
Server=nginx/1.6.1
}
Body:
{
"count":1,
"logstores":["test-logstore"],
"total":1
}
```

20.1.1.7.6. ListShards

Lists all available shards in a Logstore.

Request syntax

```
GET /logstores/<logstorename>/shards HTTP/1.1
Authorization: <AuthorizationString>
Date: <GMT Date>
Host: <Project Endpoint>
x-log-apiversion: 0.6.0
x-log-signaturemethod: hmac-sha1
```

Request elements

- Request headers

  The ListShards API operation does not have special request headers. For information about common request headers of Log Service API operations, see Common request headers.

- Request parameters

Parameter	Type	Required	Description
logstoreName	String	Yes	The name of the Logstore.

Response elements

- Response headers

  The ListShards API operation does not have special response headers. For information about common response headers of Log Service API operations, see Common response headers.

- Response elements

  The response is an array that consists of shards.

```
[
    {
        "shardID": 0,
        "status": "readwrite",
        "inclusiveBeginKey": "00000000000000000000000000000000",
        "exclusiveEndKey": "80000000000000000000000000000000",
        "createTime": 1453949705
    },
    {
        ...
    },
    {
        ...
    }
]
```

Error codes

In addition to Common error codes, the API operation may also return the following special error codes.

HTTP status code	Error code	Error message
404	LogStoreNotExist	logstore {logstoreName} does not exist
500	InternalServerError	Specified Server Error Message
400	LogStoreWithoutShard	logstore has no shard

Note The {logstoreName} variable in the preceding error message is replaced with a specific Logstore name.

Examples

- Sample requests

```
GET /logstores/sls-test-logstore/shards
Header :
{
    "Content-Length": 0,
    "x-log-signaturemethod": "hmac-sha1",
    "x-log-bodyrawsize": 0,
    "User-Agent": "log-python-sdk-v-0.6.0",
    "Host": "ali-test-project.cn-hangzhou-devcommon-intranet.sls.aliyuncs.com",
    "Date": "Thu, 12 Nov 2015 03:40:31 GMT",
    "x-log-apiversion": "0.6.0",
    "Authorization": "LOG <yourAccessKeyId>:<yourSignature>"
}
```

- Sample responses

```
Header:
{
    "content-length": "57",
    "server": "nginx/1.6.1",
    "connection": "close",
    "date": "Thu, 12 Nov 2015 03:40:31 GMT",
    "content-type": "application/json",
    "x-log-requestid": "56440A2F99248C050600C74C"
}
Body :
[
    {
        "shardID": 1,
        "status": "readwrite",
        "inclusiveBeginKey": "00000000000000000000000000000000",
        "exclusiveEndKey": "80000000000000000000000000000000",
        "createTime": 1453949705
    },
    {
        "shardID": 2,
        "status": "readwrite",
        "inclusiveBeginKey": "80000000000000000000000000000000",
        "exclusiveEndKey": "ffffffffffffffffffffffffffffffff",
        "createTime": 1453949705
    },
    {
        "shardID": 0,
        "status": "readonly",
        "inclusiveBeginKey": "00000000000000000000000000000000",
        "exclusiveEndKey": "ffffffffffffffffffffffffffffffff",
        "createTime": 1453949705
    }
]
```

20.1.1.7.7. SplitShard

Splits a specified shard in the read/write state.

Request syntax

```
POST /logstores/<logstorename>/shards/<shardid>? action=split&key=<splitkey> HTTP/1.1
Authorization: <AuthorizationString>
Date: <GMT Date>
Host: <Project Endpoint>
x-log-apiversion: 0.6.0
x-log-signaturemethod: hmac-sha1
```

Request elements

- Request headers

  The SplitShard API operation does not have special request headers. For information about common request headers of Log Service API operations, see Common request headers.

- Request parameters

Parameter	Type	Required	Description
logstoreName	String	Yes	The name of the Logstore.
shardid	Integer	Yes	The ID of the shard.
splitkey	String	Yes	The location where the shard is split.

Response elements

- Response headers

  Content-Type: application/json

  The SplitShard API operation does not have special response headers. For information about common response headers of Log Service API operations, see Common response headers.

- Response parameters

  The response is an array that consists of three shards. The first shard is the original shard. The second and third shards are the new shards that are created by splitting the original shard.

```
[
    {
        "shardID": 33,
        "status": "readonly",
        "inclusiveBeginKey": "ee000000000000000000000000000000",
        "exclusiveEndKey": "ffffffffffffffffffffffffffffffff",
        "createTime": 1453949705
    },
    {
        "shardID": 163,
        "status": "readwrite",
        "inclusiveBeginKey": "ee000000000000000000000000000000",
        "exclusiveEndKey": "ef000000000000000000000000000000",
        "createTime": 1453949705
    },
    {
        "shardID": 164,
        "status": "readwrite",
        "inclusiveBeginKey": "ef000000000000000000000000000000",
        "exclusiveEndKey": "ffffffffffffffffffffffffffffffff",
        "createTime": 1453949705
    }
]
```

Error codes

In addition to Common error codes, the API operation may also return the following special error codes.

HTTP status code	Error code	Error message
404	LogStoreNotExist	logstore {logstoreName} does not exist
400	ParameterInvalid	invalid shard id
400	ParameterInvalid	invalid mid hash
500	InternalServerError	Specified Server Error Message
400	LogStoreWithoutShard	logstore has no shard

Note The {logstoreName} variable in the preceding error message is replaced with a specific Logstore name.

Examples

- Sample requests

```
POST /logstores/logstorename/shards/33? action=split&key=ef00000000000000000000000000000
Header :
{
    "Content-Length": 0,
    "x-log-signaturemethod": "hmac-sha1",
    "x-log-bodyrawsize": 0,
    "User-Agent": "log-python-sdk-v-0.6.0",
    "Host": "ali-test-project.cn-hangzhou.sls.aliyuncs.com",
    "Date": "Thu, 12 Nov 2015 03:40:31 GMT",
    "x-log-apiversion": "0.6.0",
    "Authorization": "LOG <yourAccessKeyId>:<yourSignature>"
}
```

- Sample responses

```
Header:
{
    "content-length": "57",
    "server": "nginx/1.6.1",
    "connection": "close",
    "date": "Thu, 12 Nov 2015 03:40:31 GMT",
    "content-type": "application/json",
    "x-log-requestid": "56440A2F99248C050600C74C"
}
Body :
[
    {
        "shardID": 33,
        "status": "readonly",
        "inclusiveBeginKey": "ee000000000000000000000000000000",
        "exclusiveEndKey": "ffffffffffffffffffffffffffffffff",
        "createTime": 1453949705
    },
    {
        "shardID": 163,
        "status": "readwrite",
        "inclusiveBeginKey": "ee000000000000000000000000000000",
        "exclusiveEndKey": "ef000000000000000000000000000000",
        "createTime": 1453949705
    },
    {
        "shardID": 164,
        "status": "readwrite",
        "inclusiveBeginKey": "ef000000000000000000000000000000",
        "exclusiveEndKey": "ffffffffffffffffffffffffffffffff",
        "createTime": 1453949705
    }
]
```

20.1.1.7.8. MergeShards

Merges two adjacent shards that are in the read/write state. If you specify the ID of a shard in the request, Log Service automatically finds the adjacent shard.

Request syntax

```
POST /logstores/<logstorename>/shards/<shardid>? action=merge HTTP/1.1
Authorization: <AuthorizationString>
Date: <GMT Date>
Host: <Project Endpoint>
x-log-apiversion: 0.6.0
x-log-signaturemethod: hmac-sha1
```

Request elements

- Request headers

  The MergeShards API operation does not have special request headers. For information about common request headers of Log Service API operations, see Common request headers.

- Request parameters

Parameter	Type	Required	Description
logstoreName	String	Yes	The name of the Logstore.
shardid	Integer	Yes	The ID of the shard.

Response elements

- Response headers

  Content-Type: application/json

  The MergeShards API operation does not have special response headers. For information about common response headers of Log Service API operations, see Common response headers.

- Response parameters

  An array that consists of three shards is returned. The first shard is the merged shard. The other two shards are the original shards.

```
[
    {
        'shardID': 167,
        'status': 'readwrite',
        'inclusiveBeginKey': 'e00000000000000000000000000000',
        'createTime': 1453953105,
        'exclusiveEndKey': 'ffffffffffffffffffffffffffffff'
    },
    {
        'shardID': 30,
        'status': 'readonly',
        'inclusiveBeginKey': 'e00000000000000000000000000000',
        'createTime': 0,
        'exclusiveEndKey':
        'e70000000000000000000000000000'
    },
    {
        'shardID': 166,
        'status': 'readonly',
        'inclusiveBeginKey': 'e70000000000000000000000000000',
        'createTime': 1453953073,
        'exclusiveEndKey': 'ffffffffffffffffffffffffffffff'
    }
]
```

Error codes

In addition to Common error codes, the API operation may also return the following special error codes.

HTTP status code	Error code	Error message
404	LogStoreNotExist	logstore {logstoreName} does not exist
400	ParameterInvalid	invalid shard id
400	ParameterInvalid	can not merge the last shard
500	InternalServerError	Specified Server Error Message
400	LogStoreWithoutShard	logstore has no shard

Note The {Name} variable in the preceding error message is replaced with a specific Logstore name.

Examples

- Sample requests

```
POST /logstores/logstorename/shards/30? action=merge
Header :
{
    "Content-Length": 0,
    "x-log-signaturemethod": "hmac-sha1",
    "x-log-bodyrawsize": 0,
    "User-Agent": "log-python-sdk-v-0.6.0",
    "Host": "ali-test-project.cn-hangzhou.sls.aliyuncs.com",
    "Date": "Thu, 12 Nov 2015 03:40:31 GMT",
    "x-log-apiversion": "0.6.0",
    "Authorization": "LOG <yourAccessKeyId>:<yourSignature>"
}
```

- Sample responses

```
Header:
{
    "content-length": "57",
    "server": "nginx/1.6.1",
    "connection": "close",
    "date": "Thu, 12 Nov 2015 03:40:31 GMT",
    "content-type": "application/json",

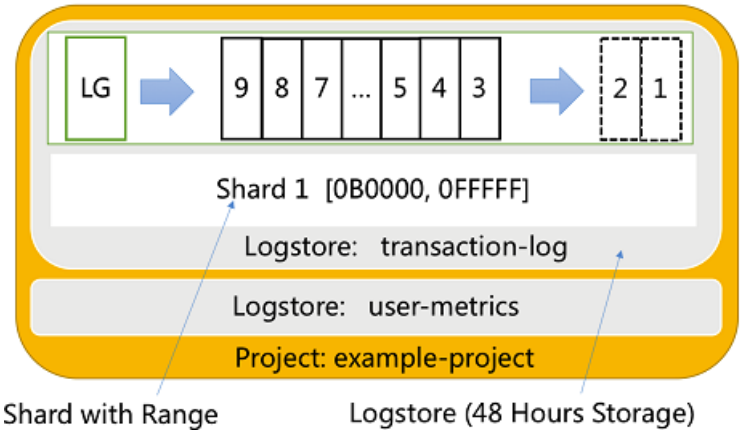
```

20.1.1.7.9. GetCursor

Queries a cursor based on a point in time.

You can use a cursor to obtain the location of a specific log. The following figure shows the relationships among a cursor, project, Logstore, and shard.



- Each project has multiple Logstores.
- Each Logstore has multiple shards.
- You can use a cursor to obtain the location of a specific log.

Request syntax

The request syntax of the GetCursor API operation is as follows:

```
GET /logstores/ay42/shards/2? type=cursor&from=1402341900 HTTP/1.1
Authorization: <AuthorizationString>
Date: <GMT Date>
Host: <Project Endpoint>
x-log-apiversion: 0.6.0
```

Request elements

- Request headers

  The GetCursor API operation does not have special request headers. For information about common request headers of Log Service API operations, see Common request headers.

- Request parameters

Parameter	Type	Required	Description
shard	String	Yes	The name of the shard.
type	String	Yes	This parameter must be set to cursor.
from	String	Yes	The time that is used to query a cursor. Set the value to a Unix timestamp or a string such as `begin` or `end`.

You can use the from parameter to locate the logs within the lifecycle of a shard in a Logstore. If the lifecycle of the Logstore is `[begin_time, end_time)` and the from parameter is set to from_time, the response is returned as follows:

- `from_time ≤ begin_time or from_time = "begin"` : A cursor is returned. The cursor corresponds to the log whose timestamp is begin_time.
- `from_time ≥ end_time or from_time = "end"` : A cursor is returned. The cursor corresponds to the next log to be written at the current time (No data exists in the current cursor location).
- `from_time > begin_time and from_time < end_time` : A cursor is returned. The cursor corresponds to the first packet that Log Service receives later than or at from_time.

> **Note** The lifecycle of a Logstore is specified by the ttl parameter of the Logstore. For example, the current time is 2018-11-11 09:00:00 and the ttl parameter is set to 5. The time interval of consumable data in each shard is `[2018-11-05 09:00:00, 2018-11-11 09:00:00)`. The server time is used.

Response elements

- Response headers

  The GetCursor API operation does not have special response headers. For information about common response headers of Log Service API operations, see Common response headers.

- Response parameters

```
{
    "cursor": "MTQ0NzI5OTYwNjg5NjYzMjM1Ng=="
}
```

Error codes

In addition to Common error codes, the API operation may also return the following special error codes.

HTTP status code	Error code	Error message
404	LogStoreNotExist	Logstore {Name} does not exist
400	ParameterInvalid	Parameter From is not valid
400	ShardNotExist	Shard {ShardID} does not exist
500	InternalServerError	Specified Server Error Message
400	LogStoreWithoutShard	the logstore has no shard

Examples

- Sample requests

```
GET /logstores/sls-test-logstore/shards/0? type=cursor&from=begin
Header:
{
    "Content-Length": 0,
    "x-log-signaturemethod": "hmac-sha1",
    "x-log-bodyrawsize": 0,
    "User-Agent": "log-python-sdk-v-0.6.0",
    "Host": "ali-test-project.cn-hangzhou-devcommon-intranet.sls.aliyuncs.com",
    "Date": "Thu, 12 Nov 2015 03:56:57 GMT",
    "x-log-apiversion": "0.6.0",
    "Content-Type": "application/json",
    "Authorization": "LOG <yourAccessKeyId>:<yourSignature>"
}
```

- Sample responses

```
Header:
{
    "content-length": "41",
    "server": "nginx/1.6.1",
    "connection": "close",
    "date": "Thu, 12 Nov 2015 03:56:57 GMT",
    "content-type": "application/json",
    "x-log-requestid": "56440E0999248C070600C6AA"
}
Body:
{
    "cursor": "MTQ0NzI5OTYwNjg5NjYzMjM1Ng=="
}
```

20.1.1.7.10. GetCursorTime

Queries the server time based on the cursor.

Request syntax

```
GET /logstores/{logstoreName}/shards/{shard}? cursor={cursor}&type=cursor_time HTTP/1.1
Authorization: <AuthorizationString>
Date: <GMT Date>
Host: <Project Endpoint>
x-log-apiversion: 0.6.0
x-log-signaturemethod: hmac-sha1
```

Request elements

- Request headers

  The GetCursorTime API operation does not have special request headers. For information about common request headers of Log Service API operations, see Common request headers.

- Request parameters

Parameter	Type	Required	Description
logstoreName	String	Yes	The name of the Logstore.
shard	Integer	Yes	The ID of the shard.
cursor	String	Yes	The cursor that is used to obtain the corresponding timestamp.
type	String	Yes	Set the value to cursor_time.

Response elements

- Response headers

  The GetCursorTime API does not have special response headers. For information about common response headers of Log Service API operations, see Common response headers.

- Response parameters

```
{
   "cursor_time": 1554260243
}
```

Error codes

In addition to Common error codes, the API operation may also return the following special error codes.

HTTP status code	Error code	Error message
404	LogStoreNotExist	Logstore {Name} does not exist
400	ParameterInvalid	Parameter From is not valid
400	ShardNotExist	Shard {ShardID} does not exist
500	InternalServerError	Specified Server Error Message
400	LogStoreWithoutShard	the logstore has no shard

Examples

- Sample requests

```
GET /logstores/internal-operation_log/shards/0? cursor=MTU0NzQ3MDY4MjM3NjUxMzQ0Ng%3D%3D&t
ype=cursor_time HTTP/1.1
Authorization: LOG <yourAccessKeyId>:<yourSignature>
x-log-bodyrawsize: 0
User-Agent: sls-java-sdk-v-0.6.1
x-log-apiversion: 0.6.0
Host: my-project.cn-hangzhou.sls.aliyuncs.com
x-log-signaturemethod: hmac-sha1
Date: Wed, 03 Apr 2019 02:57:23 GMT
Content-Type: application/x-protobuf
Connection: Keep-Alive
```

- Sample responses

```
HTTP/1.1 200
Server: nginx
Content-Type: application/json
Content-Length: 26
Connection: close
Access-Control-Allow-Origin: *
Date: Wed, 03 Apr 2019 02:57:23 GMT
x-log-requestid: 5CA42113D2F00378A74B9051
{
  "cursor_time": 1554260243
}
```

20.1.1.7.11. PullLogs

Pulls logs from a Logstore. You must specify a shard when you call this API operation.

Only Protocol Buffer log data can be pulled from a Logstore. For more information, see Protocol Buffer format.

In scenarios that involve the Storm architecture, election and collaborative consumption can be performed through LoghubClientLib.

Request syntax

```
GET /logstores/ay42/shards/0? type=logs&cursor=MTQ0NzMyOTQwMTEwMjEzMDkwNA==&count=100 HTTP/
1.1
Accept: application/x-protobuf
Accept-Encoding: lz4
Authorization: <AuthorizationString>
Date: <GMT Date>
Host: <Project Endpoint>
x-log-apiversion: 0.6.0
x-log-signaturemethod: hmac-sha1
```

Request parameters

- Request header fields
  - Accept: application/x-protobuf
  - Accept-Encoding: lz4, deflate, or “”

  - For information about common request headers of Log Service API operations, see Common request headers.

- Request parameters

Parameter	Type	Required	Description
type	String	Yes	Set the value to logs.
cursor	String	Yes	The cursor that identifies where data reading starts. This indicates the start point.
count	Integer	Yes	The number of returned log groups. Valid values: 1 to 1000.

Response parameters

- Response header fields
  - x-log-cursor: The next cursor of the currently read data.
  - x-log-count: The number of currently returned logs.
  - For information about common response headers of Log Service API operations, see Common response headers.
- Response elements

  Serialized data is returned in the Protocol Buffer format. The data may be compressed.

Error codes

In addition to Common error codes, the API operation may also return the following special error codes.

HTTP status code	Error code	Error message
404	LogStoreNotExist	Logstore {Name} does not exist
400	ParameterInvalid	Parameter Cursor is not valid
400	ParameterInvalid	ParameterCount should be in [0-1000]
400	ShardNotExist	Shard {ShardID} does not exist
400	InvalidCursor	this cursor is invalid
500	InternalServerError	Specified Server Error Message

Examples

- Sample requests

```
Read data from shard 0.
GET /logstores/sls-test-logstore/shards/0? cursor=MTQ0NzMyOTQwMTEwMjEzMDkwNA==&count=1000
&type=log
Header:
{
    "Authorization"="LOG <yourAccessKeyId>:<yourSignature>",
    "x-log-bodyrawsize"=0,
    "User-Agent" : "sls-java-sdk-v-0.6.0",
    "x-log-apiversion" : "0.6.0",
    "Host" : "ali-test-project.cn-hangzhou-failover-intranet.sls.aliyuncs.com",
    "x-log-signaturemethod" : "hmac-sha1",
    "Accept-Encoding" : "lz4",
    "Content-Length": 0,
    "Date" : "Thu, 12 Nov 2015 12:03:17 GMT",
    "Content-Type" : "application/x-protobuf",
    "accept" : "application/x-protobuf"
}
```

- Sample responses

```
Header:
{
    "x-log-count" : "1000",
    "x-log-requestid" : "56447FB20351626D7C000874",
    "Server" : "nginx/1.6.1",
    "x-log-bodyrawsize" : "34121",
    "Connection" : "close",
    "Content-Length" : "4231",
    "x-log-cursor" : "MTQ0NzMyOTQwMTEwMjEzMDkwNA==",
    "Date" : "Thu, 12 Nov 2015 12:01:54 GMT",
    "x-log-compresstype" : "lz4",
    "Content-Type" : "application/x-protobuf"
}
Body:
The <log group list in the Protocol Buffer format> after the compression.
```

- Page flip

  To flip the page (get the next token) without returning data, you can send HTTP HEAD requests.

20.1.1.7.12. PostLog

Writes log data to a Logstore.

Only Protocol Buffer log data can be written to a Logstore. For more information, see Protocol Buffer format.

> **Note** Log data is written in the form of log groups.

Log data can be written to a Logstore in either of the following modes:

- LoadBalance: In this mode, Log Service automatically writes logs to all writable shards in a Logstore. This mode provides high availability (SLA: 99.95%) in data writes. It applies to scenarios where data writes and reads are irrelevant to shards, for example, where ordering is not considered.

- KeyHash: The key field is added to the URL parameter. This determines which shard to store the log data. This field is optional. If you do not specify this field, Log Service automatically writes log data in the LoadBalance mode. For example, Log Service can hash an instance as a producer to a fixed shard based on the name of the instance. This ensures that data is written and consumed by using a strict order in the shard. The key is included only in the MD5 value range of a shard at a time even when the shard is merged or split. For more information, see Shards.

Protocol Buffer log data

The following table describes the fields of Protocol Buffer log data. For more information, see Data model and Data encoding.

- Log

Field	Type	Required	Description
Time	Integer	Yes	The time when the log was generated.
Contents	List	Yes, this field must contain at least one element.	The list of log fields. For information about the field elements, see the Content field table.

- Content

Field	Type	Required	Description
Key	String	Yes	The name of the custom key.
Value	String	Yes	The value of the custom key.

- LogTag

Field	Type	Required	Description
Key	String	Yes	The name of the custom key.
Value	String	Yes	The value of the custom key.

- LogGroup

Field	Type	Required	Description
Logs	List	Yes	A list of logs. For information about the field elements, see the Log field table.

Field	Type	Required	Description
Topic	String	Yes	A user-defined field in a log. This field identifies a group of logs.
Source	String	Yes	The source of the log, for example, the IP address of the machine where the log is generated.
LogTags	List	Yes	The list of log tags. For information about the field elements, see the LogTags field table.

Request syntax

- LoadBalance mode

```
POST /logstores/<logstorename>/shards/lb HTTP/1.1
Authorization: <AuthorizationString>
Content-Type: application/x-protobuf
Content-Length: <Content Length>
Content-MD5: <Content MD5>
Date: <GMT Date>
Host: <Project Endpoint>
x-log-apiversion: 0.6.0
x-log-bodyrawsize: <BodyRawSize>
x-log-compresstype: lz4
x-log-signaturemethod: hmac-sha1
<Compressed log data in the Protocol Buffer format>
```

- KeyHash mode

```
POST /logstores/<logstorename>/shards/route? key=14d2f850ad6ea48e46e4547edbbb27e0
Authorization: <AuthorizationString>
Content-Type: application/x-protobuf
Content-Length: <Content Length>
Content-MD5: <Content MD5>
Date: <GMT Date>
Host: <Project Endpoint>
x-log-apiversion: 0.6.0
x-log-bodyrawsize: <BodyRawSize>
x-log-compresstype: lz4
x-log-signaturemethod: hmac-sha1
<Compressed log data in the Protocol Buffer format>
```

Request elements

- Request headers

For information about common request headers of Log Service API operations, see Common request headers.

- Request parameters

Parameter	Type	Required	Description
logstorename	String	Yes	The name of the Logstore to which logs are written.

Response elements

- Response headers

  The PutLogs API operation does not have special response headers. For information about common response headers of Log Service API operations, see Common response headers.

- Response parameters

  No response element is returned after the request succeeds.

Additional considerations

- You can call the PutLogs API operation to write a maximum of 3 MB log group data or 4,096 logs each time. The size of values in each log cannot be greater than 1 MB. If these limits are exceeded, the request will fail and no log data will be written.
- Log Service checks the format of log data written by the PutLogs API operation. If a log does not meet the format requirements, the request will fail and no log data will be written.

Error codes

In addition to Common error codes, the API operation may also return the following special error codes.

HTTP status code	Error code	Error message	Description
400	PostBodyInvalid	Protobuffer content cannot be parsed.	The error message returned because the logs in the Protocol Buffer format cannot be parsed.
400	InvalidTimestamp	Invalid timestamps are in logs.	The error message returned because the logs contain invalid timestamps.
400	InvalidEncoding	Non-UTF8 characters are in logs.	The error message returned because the logs contain non-UTF-8 characters.
400	InvalidKey	Invalid keys are in logs.	The error message returned because the logs contain invalid keys.

HTTP status code	Error code	Error message	Description
400	PostBodyTooLarge	Logs must be less than or equal to 3 MB and 4096 entries.	The error message returned because the size of logs is greater than 3 MB or the number of logs exceeds 4,096.
400	PostBodyUncompressError	Failed to decompress logs.	The error message returned because the logs fail to be decompressed.
499	PostBodyInvalid	The post data time is out of range	The error message returned because the log timestamp is not within the valid range: [-7 × 24 hours, + 15 minutes].
404	LogStoreNotExist	logstore {Name} does not exist.	The error message returned because the specified Logstore does not exist.

Note The {Name} variable in the preceding error message is replaced with a specific Logstore name.

Examples

- Sample requests

```
POST /logstores/sls-test-logstore
{
    "Content-Length": 118,
    "Content-Type":"application/x-protobuf",
    "x-log-bodyrawsize":1356,
    "Host": "ali-test-project.cn-hangzhou-devcommon-intranet.sls.aliyuncs.com",
    "Content-MD5":"6554BD042149C844761C2C094A8FECCE",
    "Date":"Thu, 12 Nov 2015 06:54:26 GMT",
    "x-log-apiversion": "0.6.0",
    "x-log-compresstype":"lz4"
    "x-log-signaturemethod": "hmac-sha1",
    "Authorization":"LOG <yourAccessKeyId>:<yourSignature>"
}
<Binary data obtained after logs in the Protocol Buffer format are compressed with the LZ4 algorithm>
```

- Sample responses

```
Header
{
    "date": "Thu, 12 Nov 2015 06:53:03 GMT",
    "connection": "close",
    "x-log-requestid": "5644160399248C060600D216",
    "content-length": "0",
    "server": "nginx/1.6.1"
}
```

20.1.1.7.13. GetLogs

Queries logs in a Logstore of a specified project, or queries the logs that meet the specified conditions.

After a log is written to a Logstore, you can call the GetHistograms and GetLogs API operations to query the log. However, the query has a latency, which varies with the type of the log. Based on the log timestamp, Log Service classifies logs into the following two types:

- Real-time data: For this type, the difference between the time in a log and the current time on the server is (-180 seconds, 900 seconds]. For example, if the log time is UTC 2014-09-25 12:03:00 and the server receives the log at UTC 2014-09-25 12:05:00, the log is regarded as real-time data.
- Historical data: For this type, the difference between the time in a log and the current time on the server is [-7 × 86,400 seconds, -180 seconds). For example, if the log time is UTC 2014-09-25 12:00:00 and the server receives the log at UTC 2014-09-25 12:05:00, the log is regarded as historical data.

Real-time data can be queried with a maximum latency of three seconds after being written to a Logstore. In most cases, 99.9% of real-time data can be queried in one second.

Request syntax

The request syntax of the GetLogs API operation is as follows:

```
GET /logstores/<logstorename>? type=log&topic=<logtopic>&from=<starttime>&to=<endtime>&quer
y=<querystring>&line=<linenum>&offset=<startindex>&reverse=<ture|false> HTTP/1.1
Authorization: <AuthorizationString>
Date: <GMT Date>
Host: <Project Endpoint>
x-log-bodyrawsize: 0
x-log-apiversion: 0.6.0
x-log-signaturemethod: hmac-sha1
```

Request elements

- Request headers

  The GetLogs API operation does not have special request headers. For information about common request headers of Log Service API operations, see Common request headers.

- Request parameters

Parameter	Type	Required	Description
logstorename	String	Yes	The name of the Logstore whose logs you want to query.

Parameter	Type	Required	Description
type	String	Yes	The type of data in the Logstore. The value of this parameter must be log.
from	Integer	Yes	The start time of the time range during which the logs to be queried are generated. This parameter indicates the number of seconds that have elapsed since the Unix epoch 00:00:00 UTC on January 1, 1970.
to	Integer	Yes	The end time of the time range during which the logs to be queried are generated. This parameter indicates the number of seconds that have elapsed since the Unix epoch 00:00:00 UTC on January 1, 1970.
topic	String	No	The topic of the logs to be queried.
query	String	No	The query statement. see *User Guide.* The path is **Query and analysis > Query syntax and functions > Query syntax**.
line	Integer	No	The maximum number of logs to return for the request. Value range: 0 to 100. Default value: 100.
offset	Integer	No	The start point of the returned log for the request. Valid values: 0 and positive integers. Default value: 0.
reverse	Boolean	No	Specifies whether to return logs in reverse order based on the log timestamp, accurate to seconds. If the value is true, logs are returned in reverse order. If the value is false, logs are returned in regular order. Default value: false.

Response elements

- Response headers

  The GetLogs API operation does not have special response headers. For information about common response headers of Log Service API operations, see Common response headers.

  The response header contains a special element that indicates whether the returned results of the request are complete. The following table describes the response parameters.

Parameter	Type	Description

Parameter	Type	Description
x-log-progress	String	The status of the query results. Valid values: Incomplete and Complete.
x-log-count	Integer	The total number of logs in the current query results.

- Response parameters

  After a GetLogs request succeeds, the response body contains log data hits in the query. If a large number of logs (measured in TBs) are queried, the response of the GetLogs operation may be incomplete. The response body of the GetLogs operation is an array. Each element in the array is a log. The following table describes the elements in the array.

Element	Type	Description
__time__	Integer	The log timestamp. This parameter indicates the number of seconds that have elapsed since the Unix epoch 00:00:00 UTC on January 1, 1970.
__Source __	String	The log source, which is specified when logs are written.
[content]	Key-value pair	The original content of logs.

Additional considerations

- The time range defined by the from and to request parameters is left closed and right open. This means that the time range includes the start time, but does not include the end time. If the from and to parameters for a time range have the same value, the time range is invalid and the function will return an error.
- If the number of logs in the Logstore significantly changes, Log Service cannot predict how many times this API operation needs to be called to obtain the complete results. In this case, you must check the value of the x-log-progress parameter in the returned results of each request. Based on the value, you can decide whether to repeatedly call this API operation to obtain the complete results.

  > **Note** The same number of query compute units (CUs) is consumed each time you call this API operation.

Error codes

In addition to Common error codes, the API operation may also return the following special error codes.

HTTP status code	Error code	Error message	Description
404	LogStoreNotExist	logstore {Name} does not exist	The error message returned because the specified Logstore does not exist.

HTTP status code	Error code	Error message	Description
400	InvalidTimeRange	request time range is invalid	The error message returned because the specified time interval of the request is invalid.
400	InvalidQueryString	query string is invalid	The error message returned because the specified query string of the request is invalid.
400	InvalidOffset	offset is invalid	The error message returned because the specified offset parameter of the request is invalid.
400	InvalidLine	line is invalid	The error message returned because the specified line parameter of the request is invalid.
400	InvalidReverse	Reverse value is invalid	The error message returned because the specified reverse parameter is invalid.
400	IndexConfigNotExist	logstore without index config	The error message returned because the index feature has not been enabled for the Logstore.

Note The {name} variable in the preceding error message is replaced with a specific Logstore name.

Example

In this example, the logs with the groupA topic are queried in a Logstore named app_log. The Logstore belongs to a project named big-game in the China (Hangzhou) region. The time range is from 2014-09-01 00:00:00 to 2014-09-01 22:00:00 and the keyword is "error". The query starts from the beginning of the time range. A maximum of 20 logs can be returned.

- Sample requests

```
GET /logstores/app_log?  type=log&topic=groupA&from=1409529600&to=1409608800&query=error&
line=20&offset=0 HTTP/1.1
Authorization: <AuthorizationString>
Date: Wed, 3 Sept. 2014 08:33:46 GMT
Host: big-game.cn-hangzhou.log.aliyuncs.com
x-log-bodyrawsize: 0
x-log-apiversion: 0.4.0
x-log-signaturemethod: hmac-sha1
```

- Sample responses

```

        {
            "__time__": 1409529680,
            "__source__": "10.237.0.18",
            "Key3": "error",
            "Key4": "Value4"
        }
    ]
}
```

In the sample response, the x-log-progress value is Complete. This indicates that the log query is completed and the returned results are complete. Two logs meet the specified query conditions and are displayed as the value of the logs parameter. If the x-log-progress value is Incomplete, you must repeat the request to obtain the complete results.

20.1.1.7.14. GetHistograms

Queries the distribution of logs in a Logstore within a specified project, or queries the distribution of logs that meet the specified conditions.

After a log is written to a Logstore, you can call the GetHistograms and GetLogs API operations to query the log. However, the query has a latency, which varies with the type of the log. Based on the log timestamp, Log Service classifies logs into the following two types:

- Real-time data: For this type, the difference between the time in a log and the current time on the server is within the interval (-180 seconds, 900 seconds]. For example, if the log time is UTC 2014-09-25 12:03:00 and the server receives the log at UTC 2014-09-25 12:05:00, the log is regarded as real-time data. The latency for real-time data is three seconds, from the time when the data is written to the Logstore to the time when the data can be queried.
- Historical data: For this type, the difference between the time in a log and the current time on the server is [-7 × 86,400 seconds, -180 seconds). For example, if the log time is UTC 2014-09-25 12:00:00 and the server receives the log at UTC 2014-09-25 12:05:00, the log is regarded as historical data.

Request syntax

The request syntax of the GetHistograms API operation is as follows:

```
GET /logstores/<logstorename>? type=histogram&topic=<logtopic>&from=<starttime>&to=<endtime
>&query=<querystring> HTTP/1.1
Authorization: <AuthorizationString>
Date: <GMT Date>
Host: <Project Endpoint>
x-log-bodyrawsize: 0
x-log-apiversion: 0.6.0
x-log-signaturemethod: hmac-sha1
```

Request elements

- Request headers

  The GetHistograms API operation does not have special request headers. For information about common request headers of Log Service API operations, see Common request headers.

- Request parameters

Parameter	Type	Required	Description
logstorename	String	Yes	The name of the Logstore whose logs you want to query.
type	String	Yes	The type of data in the Logstore. The value of this parameter must be histogram.
from	Integer	Yes	The start time of the time range during which the logs to be queried are generated. This parameter indicates the number of seconds that have elapsed since the Unix epoch 00:00:00 UTC on January 1, 1970.
to	Integer	Yes	The end time of the time range during which the logs to be queried are generated. This parameter indicates the number of seconds that have elapsed since the Unix epoch 00:00:00 UTC on January 1, 1970.

Parameter	Type	Required	Description
topic	String	No	The topic of the logs to be queried.
query	String	No	The query statement. For more information about the query syntax, see *User Guide*. The path is **Query and analysis > Query syntax and functions > Query syntax**.

Response elements

- Response headers

  The GetHistograms API does not have special response headers. For information about common response headers of Log Service API operations, see Common response headers.

- Response parameters

  After a GetHistograms request succeeds, the response body contains the distribution of the log hits returned by the query along the timeline. The response results evenly divide the time range into several subintervals and returns the number of log hits for each subinterval. The following table describes the response parameters.

Parameter	Type	Description
progress	String	The status of the query results. Valid values: Incomplete and Complete.
count	Integer	The total number of logs in the current query results.
histograms	Array	The distribution of the current query results in the subintervals. For information about the parameters of each element in the histograms array, see the following table.

This table describes the elements in the histograms parameter.

Element	Type	Description
from	Integer	The start time of the subinterval. This parameter indicates the number of seconds that have elapsed since the Unix epoch 00:00:00 UTC on January 1, 1970.
to	Integer	The end time of the subinterval. This parameter indicates the number of seconds that have elapsed since the Unix epoch 00:00:00 UTC on January 1, 1970.
count	Integer	The number of logs that meet the query conditions for this subinterval in the current query results.

Element	Type	Description
progress	String	Indicates whether the current query results in the subinterval are complete. Valid values: Incomplete and Complete.

Additional considerations

- The preceding time ranges or subintervals are left closed and right open. This means that each time range or subinterval includes the start time, but does not include the end time. If the from and to parameters for a time range have the same value, the time range is invalid and the function will return an error.
- The time range is consistently divided into subintervals in the response. If the time range is unchanged, the subintervals divided in the response is also unchanged.
- If the number of logs in the Logstore significantly changes, Log Service cannot predict how many times this API operation needs to be called to obtain the complete results. In this case, you must check the value of the progress parameter in the returned results of each request. Based on the value, you can decide whether to repeatedly call this API operation to obtain the complete results.

> **Note** The same number of query compute units (CUs) is consumed each time you call this API operation.

Error codes

In addition to Common error codes, the API operation may also return the following special error codes.

HTTP status code	Error code	Error message	Description
404	LogStoreNotExist	logstore {Name} does not exist	The error message returned because the specified Logstore does not exist.
400	InvalidTimeRange	request time range is invalid	The error message returned because the specified time interval of the request is invalid.
400	InvalidQueryString	query string is invalid	The message returned when the query string of the request is invalid.

> **Note** The {name} variable in the preceding error message is replaced with a specific Logstore name.

Example

In this example, the distribution of logs with the groupA topic is queried in a Logstore named app_log. The Logstore belongs to a project named big-game in the China (Hangzhou) region. The time range is from 2014-09-01 00:00:00 to 2014-09-01 22:00:00 and the keyword is "error".

- Sample requests

```
GET /logstores/app_log? type=histogram&topic=groupA&from=1409529600&to=1409608800&query=e
rror HTTP/1.1
Authorization: LOG <yourAccessKeyId>:<yourSignature>
Date: Wed, 3 Sept. 2014 08:33:46 GMT
Host: big-game.cn-hangzhou.log.aliyuncs.com
x-log-bodyrawsize: 0
x-log-apiversion: 0.6.0
x-log-signaturemethod: hmac-sha1
```

- Sample responses

```
HTTP/1.1 200 OK
Content-Type: application/json
Content-MD5: E6AD9C21204868C2DE84EE3808AAA8C8
Content-Type: application/json
Date: Wed, 3 Sept. 2014 08:33:47 GMT
Content-Length: 232
x-log-requestid: efag01234-12341-15432f
[
        {
            "from": 1409529600,
            "to": 1409569200,
            "count": 2,
            "progress": "Complete"
        },
        {
            "from": 1409569200,
            "to": 1409608800,
            "count": 1,
            "progress": "Incomplete"
        }
]
```

In this sample response, the server divides the entire histogram into two equal time ranges: [2014-09-01 00:00:00, 2014-09-01 11:00:00) and [2014-09-01 11:00:00, 2014-09-01 22:00:00). The first query returns incomplete data because the amount of data exceeds the limit. The sample response indicates three hits. The results for the time range [2014-09-01 00:00:00 2014-09-01 11:00:00) are complete, including two hits. The results for the other time range are incomplete, including one hit. To obtain the complete results, you must repeatedly call the preceding sample request until the progress value in the response changes to Complete. The sample response is as follows:

```
HTTP/1.1 200 OK
Content-Type: application/json
Content-MD5: E6AD9C21204868C2DE84EE3808AAA8C8
Content-Type: application/json
Date: Wed, 3 Sept. 2014 08:33:48 GMT
Content-Length: 232
x-log-requestid: afag01322-1e241-25432e
[
        {
            "from": 1409529600,
            "to": 1409569200,
            "count": 2,
            "progress": "Complete"
        },
        {
            "from": 1409569200,
            "to": 1409608800,
            "count": 2,
            "progress": "complete"
        }
]
```

20.1.1.7.15. UpdateIndex

Updates the indexes of a Logstore.

Request syntax

```
PUT /logstores/<logstoreName>/index HTTP/1.1
Authorization: <AuthorizationString>
x-log-bodyrawsize: 0
User-Agent: <UserAgent>
x-log-apiversion: 0.6.0
Host: <Project Endpoint>
x-log-signaturemethod: hmac-sha1
Date: <GMT Date>
Content-Type: application/json
Content-MD5: <Content-MD5>
Content-Length: <ContentLength>
{
  "line": <full text index>,
  "keys": <key-value index>,
  "ttl": <ttl>
}
```

Request elements

- Request headers

  The UpdateIndex API operation does not have special request headers. For information about common request headers of Log Service API operations, see Common request headers.

- Request parameters

Parameter	Type	Required	Description
logstoreName	String	Yes	The name of the Logstore.
TTL	Integer	No	The time to live (TTL) of the indexes. Valid values: 7, 30, and 90. Default value: 0.
keys	Object	No	The key-value index, where the key refers to the field name and the value refers to the field value.
line	Object	No	The full-text index.

You must specify the keys parameter or the line parameter, or both. The following table describes the full-text index attributes.

Attribute	Type	Required	Description
token	Array	Yes	The list of delimiters.
caseSensitive	Boolean	No	Specifies whether the fields are case-sensitive.
chn	Boolean	No	Specifies whether the fields contain Chinese characters.
include_keys	Array	No	The list of included fields. This parameter and the exclude_keys parameter cannot be specified at the same time.
exclude_keys	Array	No	The list of the excluded fields. This parameter and the include_keys parameter cannot be specified at the same time.

The following table describes the key-value index attributes.

Attribute	Type	Required	Description
type	String	Yes	The type of the fields.

Attribute	Type	Required	Description
alias	String	No	The alias of the field.
chn	Boolean	No	Specifies whether the fields contain Chinese characters. This parameter takes effect only when the type parameter is set to text.
token	Array	Required only when the type parameter is set to text	The list of delimiters. This parameter takes effect only when the type parameter is set to text.
caseSensitive	Boolean	No	Specifies whether the fields are case-sensitive. This parameter takes effect only when the type parameter is set to text.
doc_value	Boolean	No	Specifies whether to enable analytics for the field.

Response elements

- Response headers

  The UpdateIndex API operation does not have special response headers. For information about common response headers of Log Service API operations, see Common response headers.

- Response parameters

  The HTTP status code 200 is returned.

Error codes

In addition to Common error codes, the API operation may also return the following special error codes.

HTTP status code	Error code	Error message
400	ParameterInvalid	log store index is not created
400	ParameterInvalid	key config must has type
400	IndexInfoInvalid	required field token is lacking or of error format
400	IndexInfoInvalid	required fields line/keys are lacking or of error format

HTTP status code	Error code	Error message
404	ProjectNotExist	The Project does not exist : {Project}
404	LogStoreNotExist	logstore {logstoreName} does not exist
500	InternalServerError	Specified Server Error Message

Examples

- Sample requests

```
PUT /logstores/logstore-4/index HTTP/1.1
Header:
Authorization: LOG <yourAccessKeyId>:<yourSignature>

```

20.1.1.7.16. CreateIndex

Creates indexes for a specified Logstore.

Request syntax

```
POST /logstores/<logstoreName>/index HTTP/1.1
Authorization: <AuthorizationString>
x-log-bodyrawsize: <x-log-bodyrawsize>
User-Agent: <User-Agent>
x-log-apiversion: <APIVersion>
Host: <Project Endpoint>
x-log-signaturemethod: hmac-sha1
Date: <GMT Date>
Content-Type: application/json
Content-MD5: <Content-MD5>
Content-Length: <Content-Length>
{
  "line": <full text index>,
  "keys": <key-value index>
}
```

Request elements

- Request headers

  The CreateIndex API operation does not have special request headers. For information about common request headers of Log Service API operations, see Common request headers.

-

Parameter	Type	Required	Description
logstoreName	String	Yes	The name of the Logstore.
keys	Object	No	The key-value index, where the key refers to the field name and the value refers to the field value.
line	Object	No	The full-text index.

You must specify the keys parameter or the line parameter, or both. The following table describes the full-text index attributes.

Attribute	Type	Required	Description
caseSensitive	Boolean	No	Specifies whether the fields are case-sensitive.
chn	Boolean	No	Specifies whether the fields contain Chinese characters.
token	Array	Yes	The list of delimiters.

Attribute	Type	Required	Description
include_keys	Array	No	The list of included fields. This parameter and the exclude_keys parameter cannot be specified at the same time.
exclude_keys	Array	No	The list of excluded fields. This parameter and the include_keys parameter cannot be specified at the same time.

The following table describes the key-value index attributes.

Attribute	Type	Required	Description
type	String	Yes	The type of the field.
alias	String	No	The alias of the field.
chn	Boolean	No	Specifies whether the fields contain Chinese characters. This parameter takes effect only when the type parameter is set to text.
token	Array	Required only when the type parameter is set to text	The list of delimiters. This parameter takes effect only when the type parameter is set to text.
caseSensitive	Boolean	No	Specifies whether the fields are case-sensitive. This parameter takes effect only when the type parameter is set to text.
doc_value	Boolean	No	Specifies whether to enable analytics for the field.

Response elements

- Response headers

The CreateIndex API operation does not have special response headers. For information about common response headers of Log Service API operations, see Common response headers.

- Response parameters

  The HTTP status code 200 is returned.

Error codes

In addition to Common error codes, the API operation may also return the following special error codes.

HTTP status code	Error code	Error message
400	IndexInfoInvalid	required field token is lacking or of error format
400	IndexAlreadyExist	log store index is already created
404	ProjectNotExist	The Project does not exist : {Project}
404	LogStoreNotExist	logstore {logstoreName} does not exist
500	InternalServerError	Specified Server Error Message

Note The {Project} and {logstoreName} variables in the preceding error messages are replaced with a specific project name and Logstore name.

Examples

Sample requests

```
POST /logstores/my-logstore/index HTTP/1.1
Authorization: LOG <yourAccessKeyId>:<yourSignature>
x-log-bodyrawsize: 0
User-Agent: sls-java-sdk-v-0.6.1
x-log-apiversion: 0.6.0
Host: my-project.cn-shanghai.log.aliyuncs.com

      "\"",
      ";",
      "=",
      "(
```

```
        "(",
        ")",
        "[",
        "]",
        "{",
        "}",
        "?",
        "@",
        "&",
        "<",
        ">",
        "/",
        ":",
        "\n",
        "\t",
        "\r"
      ]
    },
    "keys": {
      "agent": {
        "doc_value": true,
        "caseSensitive": true,
        "alias": "agent_alias",
        "type": "text",
        "token": [
          ",",
          " ",
          "'",
          "\"",
          ";",
          "=",
          "(",
          ")",
          "[",
          "]",
          "{",
          "}",
          "?",
          "@",
          "&",
          "<",
          ">",
          "/",
          ":",
          "\n",
          "\t",
          "\r"
        ]
      }
    }
  }
```

20.1.1.7.17. DeleteIndex

Deletes the indexes of a Logstore.

Request syntax

```
DELETE /logstores/<logstoreName>/index HTTP/1.1
Authorization: <AuthorizationString>
x-log-bodyrawsize: 0
User-Agent: <UserAgent>
x-log-apiversion: 0.6.0
Host: <Project Endpoint>
x-log-signaturemethod: hmac-sha1
Date: <GMT Date>
Content-Type: application/x-protobuf
Connection: Keep-Alive
```

Request parameters

- Request headers

  The DeleteIndex API operation does not have special request headers. For information about common request headers of Log Service API operations, see Common request headers.

- Request parameters

Parameter	Type	Required	Description
logstoreName	String	Yes	The name of the Logstore.

Response elements

- Response headers

  The DeleteIndex API operation does not have special response headers. For information about common response headers of Log Service API operations, see Common response headers.

- Response parameters

  The HTTP status code 200 is returned.

Error codes

In addition to Common error codes, the API operation may also return the following special error codes.

HTTP status code	Error code	Error message
400	ParameterInvalid	log store index not created
404	ProjectNotExist	The Project does not exist : {Project}
404	LogStoreNotExist	logstore {logstoreName} does not exist

HTTP status code	Error code	Error message
500	InternalServerError	Specified Server Error Message

Examples

- Sample requests

```
DELETE /logstores/my-logstore/index HTTP/1.1
Authorization: LOG <yourAccessKeyId>:<yourSignature>
x-log-bodyrawsize: 0
User-Agent: sls-java-sdk-v-0.6.1
x-log-apiversion: 0.6.0
Host: my-project.cn-shanghai.log.aliyuncs.com
x-log-signaturemethod: hmac-sha1
Date: Sun, 06 May 2018 13:22:57 GMT
Content-Type: application/x-protobuf
Connection: Keep-Alive
```

- Sample responses

```
HTTP/1.1 200
Server: nginx/1.12.1
Content-Length: 0
Connection: close
Access-Control-Allow-Origin: *
Date: Sun, 06 May 2018 13:22:57 GMT
x-log-requestid: 5AEF01B1A458E41C2F8326A8
```

20.1.1.7.18. GetIndex

Queries the indexes of a Logstore.

Request syntax

The request syntax of the GetIndex API operation is as follows:

```
GET /logstores/<logstoreName>/index HTTP/1.1
Authorization: <AuthorizationString>
x-log-bodyrawsize: 0
User-Agent: <UserAgent>
x-log-apiversion: 0.6.0
Host: <Project Endpoint>
x-log-signaturemethod: hmac-sha1
Date: <GMT Date>
Content-Type: application/x-protobuf
Connection: Keep-Alive
```

Request elements

- Request headers

The GetIndex API operation does not have special request headers. For information about common request headers of Log Service API operations, see Common response headers.

- Request parameters

Parameter	Type	Required	Description
logstoreName	String	Yes	The name of the Logstore.

Response elements

- Response headers

  The GetIndex API operation does not have special response headers. For information about common response headers of Log Service API operations, see Common response headers.

- Response parameters

  When the GetIndex API operation succeeds, the response body contains the indexes of the specified project and Logstore. The following table describes the response body parameters.

Parameter	Type	Description
index_mode	String	The type of the indexes.
keys	Dictionary	The key-value index, where the key refers to the field name and the value refers to the field value.
line	object	The full-text index.
storage	String	The storage type. The default value is pg, which refers to PostgreSQL.
ttl	Integer	The time to live (TTL) of the index file. Valid values: 7, 30, and 90. Unit: days.
lastModifyTime	Integer	The time when the indexes were last modified. The value is a Unix timestamp.

- Full-text index attributes

Parameter	Type	Description
caseSensitive	Boolean	Indicates whether the indexes are case sensitive.
chn	Boolean	Indicates whether the fields contain Chinese characters.
token	Array	The list of delimiters.
include_keys	Array	The list of included fields.
exclude_keys	Array	The list of excluded fields.

- Key-value index attributes

Parameter	Type	Description
type	String	Indicates the type of the field.
alias	String	The alias of the field.
chn	Boolean	Indicates whether the fields contain Chinese characters. This parameter takes effect only when the type parameter is set to text.
token	Array	The list of delimiters. This parameter takes effect only when the type parameter is set to text.
caseSensitive	Boolean	Indicates whether the fields are case-sensitive. This parameter takes effect only when the type parameter is set to text.
doc_value	Boolean	Indicates whether to enable analytics for the index.

Error codes

In addition to Common error codes, the API operation may also return the following special error codes.

HTTP status code	Error code	Error message	Description
400	IndexConfigNotExist	index config doesn't exist	The error message returned because the specified index does not exist.

HTTP status code	Error code	Error message	Description
404	ProjectNotExist	The Project does not exist : {Project}	The error message returned because the specified project does not exist.
404	LogStoreNotExist	logstore {logstoreName} does not exist	The error message returned because the specified Logstore does not exist.
500	InternalServerError	Specified Server Error Message	The error message returned because an error occurs on the specified server.

Examples

- Sample requests

```
GET /logstores/logstore-4/index HTTP/1.1
Authorization: LOG <yourAccessKeyId>:<yourSignature>
x-log-bodyrawsize: 0

20.1.1.7.19. PutWebtracking

Merges multiple logs into one log during a single collection request. In the WebTracking mode, only one log can be written to each request. This API operation applies to scenarios where you need to collect a large amount of logs. Before you can call the PutWebtracking API operation, you must turn on the WebTracking switch for the corresponding Logstore. We recommend that you call this API operation to collect logs from web pages or clients.

Request syntax

```
POST {project}.{endpoint}/logstores/{logstoreName}/track HTTP/1.1
x-log-apiversion: 0.6.0
x-log-bodyrawsize: 1234
x-log-compresstype: gzip
{
  "__topic__": "topic",
  "__source__": "source",
  "__logs__": [
    {
      "key1": "value1",
      "key2": "value2"
    },
    {
      "key1": "value1",
      "key2": "value2"
    }
  ],
  "__tags__": {
    "tag1": "value1",
    "tag2": "value2"
  }
}
```

Request elements

- Request headers

  Only the following three fields are required in the request header:

  - x-log-apiversion: 0.6.0
  - x-log-bodyrawsize: 1234
  - x-log-compresstype: gzip

  The first two fields are required, and the third one is optional. For more information, see Common request headers.

- Request parameters
  - URL parameters

Parameter	Type	Required	Description
logstoreName	String	Yes	The name of the Logstore.
endpoint	String	Yes	The endpoint of Log Service. For more information, see Obtain an endpoint.
project	String	Yes	The name of the project.

- Request body parameters

Parameter	Type	Required	Description
__topic__	String	No	The topic of the log.
__source__	String	No	The source of the log.
__logs__	list	Yes	The content of the log. Each element is a JSON object that indicates a log. **Note** The time in a log collected by using the WebTracking feature is the time when the log arrives at Log Service. You do not need to specify the __time__ field for each log. If this field is specified, it is overwritten by the time when the log arrives at Log Service.
__tags__	object	No	The tag of the log.

Response elements

- Response headers

  The PutWebtracking API operation does not have special response headers. For information about common response headers of Log Service API operations, see Common response headers.

- Response parameters

  No response parameter is returned after the request succeeds.

Examples

- Sample requests

```
POST my-project.cn-hangzhou.log.aliyuncs.com/logstores/logstore-test/track HTTP/1.1
x-log-apiversion: 0.6.0
x-log-bodyrawsize: 1234
x-log-compresstype: gzip
{
  "__topic__": "topic",
  "__source__": "source",
  "__logs__": [
    {
      "foo": "bar",
      "foo1": "bar1"
    },
    {
      "bar": "foo",
      "bar1": "foo1"
    }
  ],
  "__tags__": {
    "tag1": "value1",
    "tag2": "value2"
  }
}
```

- Sample responses

```
HTTP/1.1 200 OK
Header:
{
Date=Wed, 20 May 2019 07:35:00 GMT,
Content-Length=0,
x-log-requestid=5642EFA499248C827B012B39,
Connection=close,
Server=nginx/1.6.1
}
```

20.1.1.8. Logtail machine group operations

20.1.1.8.1. CreateMachineGroup

Creates a machine group to which the Logtail configuration is distributed and applied.

Request syntax

```
POST /machinegroups HTTP/1.1
Authorization: <AuthorizationString>
Content-Type:application/json
Content-Length:<Content Length>
Content-MD5<:<Content MD5>
Date: <GMT Date>
Host: <Project Endpoint>
x-log-apiversion: 0.6.0
x-log-signaturemethod: hmac-sha1
{
    "groupName" : "testgroup",
    "groupType" : "",
    "groupAttribute" : {
        "externalName" : "testgroup",
        "groupTopic": "testgrouptopic"
    },
    "machineIdentifyType" : "ip",
    "machineList" : [
        "test-ip1",
        "test-ip2"
    ]
}
```

Request elements

- Request headers

  The CreateMachineGroup API does not have special request headers. For information about common request headers of Log Service API operations, see Common request headers.

- Request parameters

  Request body parameters

Parameter	Type	Required	Description
groupName	String	Yes	The name of the machine group. The name must be unique in a project.
groupType	String	No	The type of the machine group. Default value: null.
machineIdentifyType	String	Yes	The type of the machine identifier. Valid values: ip and userdefined-id.
groupAttribute	object	Yes	The attribute of the machine group. Default value: null.

Parameter	Type	Required	Description
machineList	Array	Yes	The specific machine identifier, which can be an IP address or user-defined identifier.

The following table describes the attributes that are specified by the groupAttribute parameter.

Attribute	Type	Required	Description
groupTopic	String	No	The topic of the machine group. Default value: null.
externalName	String	No	The external identifier on which the machine group depends. Default value: null.

Response elements

- Response headers

  The CreateMachineGroup API operation does not have special response headers. For information about common response headers of Log Service API operations, see Common response headers.

- Response parameters

  The HTTP status code 200 is returned.

Error codes

In addition to Common error codes, the API operation may also return the following special error codes.

HTTP status code	Error code	Error message
400	MachineGroupAlreadyExist	group {GroupName} already exists
400	InvalidParameter	invalid group resource json
500	InternalServerError	Internal server error

Examples

- Sample requests

```
POST /machinegroups HTTP/1.1
Header :
{
    "x-log-apiversion": "0.6.0",
    "Authorization": "LOG <yourAccessKeyId>:<yourSignature>",
    "Host": "ali-test-project.cn-hangzhou-devcommon-intranet.sls.aliyuncs.com",
    "Date": "Tue, 10 Nov 2015 17:57:33 GMT",
    "Content-Length": "187",
    "x-log-signaturemethod": "hmac-sha1",
    "Content-MD5": "82033D507DEAAD72067BB58DFDCB590D",
    "User-Agent": "sls-java-sdk-v-0.6.0",
    "Content-Type": "application/json",
    "x-log-bodyrawsize": "0"
}
Body :
{
    "groupName": "test-machine-group",
    "groupType": "",
    "machineIdentifyType": "ip",
    "groupAttribute":     {
        "groupTopic": "testtopic",
        "externalName": "testgroup"
    },
    "machineList":     [
        "127.0.0.1",
        "127.0.0.2"
    ]
}
```

- Sample responses

```
HTTP/1.1 200 OK
Header :
{
    "Date": "Tue, 10 Nov 2015 17:57:33 GMT",
    "Content-Length": "0",
    "x-log-requestid": "5642300D99248CB76D005D36",
    "Connection": "close",
    "Server": "nginx/1.6.1"
}
```

20.1.1.8.2. DeleteMachineGroup

Deletes a machine group. After you delete a machine group, the Logtail configuration applied to the machine group is also deleted.

Request syntax

```
DELETE /machinegroups/{groupName} HTTP/1.1
Authorization: <AuthorizationString>
Date: <GMT Date>
Host: <Project Endpoint>
x-log-apiversion: 0.6.0
x-log-signaturemethod: hmac-sha1
```

Request elements

- Request headers

  The DeleteMachineGroup API operation does not have special request headers. For information about common request headers of Log Service API operations, see Common request headers.

- Request parameters

Parameter	Type	Required	Description
groupName	String	Yes	The name of the machine group.

Response elements

- Response headers

  The DeleteMachineGroup API operation does not have special response headers. For information about common response headers of Log Service API operations, see Common response headers.

- Response parameters

  The HTTP status code 200 is returned.

Error codes

In addition to Common error codes, the API operation may also return the following special error codes.

HTTP status code	Error code	Error message
404	GroupNotExist	group {GroupName} does not exist
500	InternalServerError	internal server error

Examples

- Sample requests

```
DELETE /machinegroups/test-machine-group-4 HTTP/1.1
Header :
{
    "x-log-apiversion": "0.6.0",
    "Authorization": "LOG <yourAccessKeyId>:<yourSignature>",
    "Host": "ali-test-project.cn-hangzhou-devcommon-intranet.sls.aliyuncs.com",
    "Date": "Tue, 10 Nov 2015 19:13:28 GMT",
    "Content-Length": "0",
    "x-log-signaturemethod": "hmac-sha1",
    "User-Agent": "sls-java-sdk-v-0.6.0",
    "Content-Type": "application/x-protobuf",
    "x-log-bodyrawsize": "0"
}
```

- Sample responses

```
HTTP/1.1 200 OK
Header :
{
    "Date": "Tue, 10 Nov 2015 19:13:28 GMT",
    "Content-Length": "0",
    "x-log-requestid": "564241D899248C827B000CFE",
    "Connection": "close",
    "Server": "nginx/1.6.1"
}
```

20.1.1.8.3. UpdateMachineGroup

Updates the information of a machine group. If the Logtail configurations are applied to a machine group, the configurations are automatically applied to or removed from a machine when the machine is added to or removed from the machine group.

Request syntax

```
PUT /machinegroups/{groupName} HTTP/1.1
Authorization: <AuthorizationString>
Content-Type:application/json
Content-Length:<Content Length>
Content-MD5<:<Content MD5>
Date: <GMT Date>
Host: <Project Endpoint>
x-log-apiversion: 0.6.0
x-log-signaturemethod: hmac-sha1
{
    "groupName": "test-machine-group",
    "groupType" : "",
    "groupAttribute" : {
        "externalName" : "testgroup",
        "groupTopic": "testgrouptopic"
    },
    "machineIdentifyType" : "ip",
    "machineList" : [
        "test-ip1",
        "test-ip2"
    ]
}
```

Request elements

- Request headers

  The UpdateMachineGroup API does not have special request headers. For information about common request headers of Log Service API operations, see Common request headers.

- Request parameters
  - URL parameters

Parameter	Type	Required	Description
groupName	String	Yes	The name of the machine group.

Parameter	Type	Required	Description
groupName	String	Yes	The name of the machine group. The name must be unique in a project.
groupType	String	No	The type of the machine group. Default value: null.
machineIdentifyType	String	Yes	The type of the machine identifier. Valid values: ip and userdefined-id.
groupAttribute	Object	Yes	The attribute of the machine group. Default value: null.
machineList	Array	Yes	The list of machine identifiers, which can be IP addresses or user-defined identifiers.

The groupAttribute parameter consists of the following parameters.

Parameter	Type	Required	Description
groupTopic	String	No	The topic of the machine group. Default value: null.
externalName	String	No	The identifier of the external management system on which the machine group depends. Default value: null.

Response elements

- Response headers

  The UpdateMachineGroup API operation does not have special response headers. For information about common response headers of Log Service API operations, see Common response headers.

- Response parameters

  The HTTP status code 200 is returned.

Error codes

In addition to Common error codes, the API operation may also return the following special error codes.

HTTP status code	Error code	Error message
404	GroupNotExist	group {GroupName} does not exist
400	InvalidParameter	invalid group resource json
500	InternalServerError	internal server error

Examples

- Sample requests

```
PUT /machinegroups/test-machine-group HTTP/1.1
Header :
{
    "x-log-apiversion": "0.6.0",
    "Authorization": "LOG <yourAccessKeyId>:<yourSignature>",
    "Host": "ali-test-project.cn-hangzhou-devcommon-intranet.sls.aliyuncs.com",
    "Date": "Tue, 10 Nov 2015 18:41:43 GMT",
    "Content-Length": "194",
    "x-log-signaturemethod": "hmac-sha1",
    "Content-MD5": "2CEBAEBE53C078891527CB70A855BAF4",
    "User-Agent": "sls-java-sdk-v-0.6.0",
    "Content-Type": "application/json",
    "x-log-bodyrawsize": "0"
}
Body :
{
    "groupName": "test-machine-group",
    "groupType": "",
    "machineIdentifyType": "userdefined",
    "groupAttribute":     {
        "groupTopic": "testtopic2",
        "externalName": "testgroup2"
    },
    "machineList":     [
        "uu_id_1",
        "uu_id_2"
    ]
}
```

- Sample responses

```
HTTP/1.1 200 OK
Header :
{
    "Date": "Tue, 10 Nov 2015 18:41:43 GMT",
    "Content-Length": "0",
    "x-log-requestid": "56423A6799248CA57B00035C",
    "Connection": "close",
    "Server": "nginx/1.6.1"
}
```

20.1.1.8.4. ListMachineGroup

Lists machine groups.

Request syntax

```
GET /machinegroups? offset=1&size=100 HTTP/1.1
Authorization: <AuthorizationString>
Date: <GMT Date>
Host: <Project Endpoint>
x-log-apiversion: 0.6.0
x-log-signaturemethod: hmac-sha1
```

Request elements

- Request headers

  The ListMachineGroup API operation does not have special request headers. For information about common request headers of Log Service API operations, see Common request headers.

- Request parameters

Parameter	Type	Required	Description
offset	Integer	No	The start position of the records to return. Default value: 0.
size	Integer	No	The maximum number of entries to return on each page. Default and maximum value: 500.
groupName	String	No	The group machine name that is used as a filtering condition. Fuzzy match is supported.

Response elements

- Response headers

The ListMachineGroup API operation does not have special response headers. For information about common response headers of Log Service API operations, see Common response headers.

- Response parameters

  After the request succeeds, the response body contains a list of all machine groups in the specified project. The following table describes the response parameters.

Parameter	Type	Description
count	Integer	The number of returned machine groups on each page.
total	Integer	The total number of returned machine groups.
machinegroups	JSON array	The list of returned machine groups.

```
{
    "machinegroups":     [
        "test-machine-group",
        "test-machine-group-2"
    ],
    "count": 2,
    "total": 2
}
```

Error codes

In addition to Common error codes, the API operation may also return the following special error codes.

HTTP status code	Error code	Error message
500	InternalServerError	internal server error

Examples

- Sample requests

```
GET /machinegroups? groupName=test-machine-group&offset=0&size=3 HTTP/1.1
Header :
{
    "x-log-apiversion": "0.6.0",
    "Authorization": "LOG <yourAccessKeyId>:<yourSignature>",
    "Host": "ali-test-project.cn-hangzhou-devcommon-intranet.sls.aliyuncs.com",
    "Date": "Tue, 10 Nov 2015 18:34:44 GMT",
    "Content-Length": "0",
    "x-log-signaturemethod": "hmac-sha1",
    "User-Agent": "sls-java-sdk-v-0.6.0",
    "Content-Type": "application/x-protobuf",
    "x-log-bodyrawsize": "0"
}
```

- Sample responses

```
HTTP/1.1 200 OK
Header :
{
    "Date": "Tue, 10 Nov 2015 18:34:44 GMT",
    "Content-Length": "83",
    "x-log-requestid": "564238C499248C8F7B0001DE",
    "Connection": "close",
    "Content-Type": "application/json",
    "Server": "nginx/1.6.1"
}
Body :
{
    "machinegroups":     [
        "test-machine-group",
        "test-machine-group-2"
    ],
    "count": 2,
    "total": 2
}
```

20.1.1.8.5. GetMachineGroup

Queries the details of a machine group.

Request syntax

```
GET /machinegroups/{groupName} HTTP/1.1
Authorization: <AuthorizationString>
Date: <GMT Date>
Host: <Project Endpoint>
x-log-apiversion: 0.6.0
x-log-signaturemethod: hmac-sha1
```

Request elements

- Request headers

  The GetMachineGroup API operation does not have special request headers. For information about common request headers of Log Service API operations, see Common request headers.

- Request parameters

Parameter	Type	Required	Description
groupName	String	Yes	The name of the machine group.

Response elements

- Response headers

  The GetMachineGroup API operation does not have special response headers. For information about common response headers of Log Service API operations, see Common response headers.

- Response parameters

Parameter	Type	Description
groupName	String	The name of the machine group. The name must be unique in a project.
groupType	String	The type of the machine group. Valid values: null and Armory. Default value: null.
machineIdentifyType	String	The type of the machine identifier. Valid values: ip and userdefined-id.
groupAttribute	JSON object	The attribute of the machine group. Default value: null.
machineList	JSON array	The list of machine identifiers, which can be IP addresses or user-defined identifiers.
createTime	Integer	The time when the machine group was created.
lastModifyTime	Integer	The time when the machine group was last updated.

The groupAttribute parameter consists of the following parameters.

Name	Type	Required	Description
groupTopic	String	No	The topic of the machine group.
externalName	String	No	The identifier of the external management system (Armory) on which the machine group depends.

```
{
    "groupName": "test-machine-group",
    "groupType": "",
    "groupAttribute":     {
        "externalName": "testgroup",
        "groupTopic": "testtopic"
    },
    "machineIdentifyType": "ip",
    "machineList":     [
        "127.0.0.1",
        "127.0.0.2"
    ],
    "createTime": 1447178253,
    "lastModifyTime": 1447178253
}
```

Error codes

In addition to Common error codes, the API operation may also return the following special error codes.

HTTP status code	Error code	Error message
404	MachineGroupNotExist	group {GroupName} does not exist
500	InternalServerError	internal server error

Examples

- Sample requests

```
GET /machinegroups/test-machine-group HTTP/1.1
Header :
{
    "x-log-apiversion": "0.6.0",
    "Authorization": "LOG <yourAccessKeyId>:<yourSignature>",
    "Host": "ali-test-project.cn-hangzhou-devcommon-intranet.sls.aliyuncs.com",
    "Date": "Tue, 10 Nov 2015 18:15:24 GMT",
    "Content-Length": "0",
    "x-log-signaturemethod": "hmac-sha1",
    "User-Agent": "sls-java-sdk-v-0.6.0",
    "Content-Type": "application/x-protobuf",
    "x-log-bodyrawsize": "0"
}
```

- Sample responses

```
HTTP/1.1 200 OK
Header :
{
    "Date": "Tue, 10 Nov 2015 18:15:23 GMT",
    "Content-Length": "239",
    "x-log-requestid": "5642343B99248CB36D0060B8",
    "Connection": "close",
    "Content-Type": "application/json",
    "Server": "nginx/1.6.1"
}
Body :
{
    "groupName": "test-machine-group",
    "groupType": "",
    "groupAttribute":     {
        "externalName": "testgroup",
        "groupTopic": "testtopic"
    },
    "machineIdentifyType": "ip",
    "machineList":     [
        "127.0.0.1",
        "127.0.0.2"
    ],
    "createTime": 1447178253,
    "lastModifyTime": 1447178253
}
```

20.1.1.8.6. ApplyConfigToMachineGroup

Applies a Logtail configuration to a machine group.

Request syntax

```
GET /machinegroups/{groupName} HTTP/1.1
Authorization: <AuthorizationString>
Date: <GMT Date>
Host: <Project Endpoint>
x-log-apiversion: 0.6.0
x-log-signaturemethod: hmac-sha1
```

Request elements

- Request headers

  The ApplyConfigToMachineGroup API operation does not have special request headers. For information about common request headers of Log Service API operations, see Common request headers.

- Request parameters

Parameter	Type	Required	Description

Parameter	Type	Required	Description
GroupName	String	Yes	The name of the machine group.
ConfigName	String	Yes	The name of the Logtail configuration.

Response elements

- Response headers

  The ApplyConfigToMachineGroup API operation does not have special response headers. For information about common response headers of Log Service API operations, see Common response headers.

- Response parameters

  The HTTP status code 200 is returned.

Error codes

In addition to Common error codes, the API operation may also return the following special error codes.

HTTP status code	Error code	Error message
404	GroupNotExist	group {GroupName} does not exist
404	ConfigNotExist	config {ConfigName} does not exist
500	InternalServerError	internal server error

Examples

- Sample requests

```
PUT /machinegroups/sample-group/configs/logtail-config-sample
Header :
{
    "Content-Length": 0,
    "x-log-signaturemethod": "hmac-sha1",
    "x-log-bodyrawsize": 0,
    "User-Agent": "log-python-sdk-v-0.6.0",
    "Host": "ali-test-project.cn-hangzhou-devcommon-intranet.sls.aliyuncs.com",
    "Date": "Mon, 09 Nov 2015 09:44:43 GMT",
    "x-log-apiversion": "0.6.0",
    "Authorization": "LOG <yourAccessKeyId>:<yourSignature>"
}
```

- Sample responses

```
{
    "date": "Mon, 09 Nov 2015 09:44:43 GMT",
    "connection": "close",
    "x-log-requestid": "56406B0B99248CAA230BA094",
    "content-length": "0",
    "server": "nginx/1.6.1"
}
```

20.1.1.8.7. RemoveConfigFromMachineGroup

Deletes a Logtail configuration from a machine group.

Request syntax

```
GET /machinegroups/{groupName} HTTP/1.1
Authorization: <AuthorizationString>
Date: <GMT Date>
Host: <Project Endpoint>
x-log-apiversion: 0.6.0
x-log-signaturemethod: hmac-sha1
```

Request elements

- Request headers

  The RemoveConfigFromMachineGroup API operation does not have special request headers. For information about common request headers of Log Service API operations, see Common request headers.

- Request parameters

Parameter	Type	Required	Description
GroupName	String	Yes	The name of the machine group.
ConfigName	String	Yes	The name of the Logtail configuration.

Response elements

- Response headers

  The RemoveConfigFromMachineGroup API operation does not have special response headers. For information about common response headers of Log Service API operations, see Common response headers.

- Response parameters

  The HTTP status code 200 is returned.

Error codes

In addition to Common error codes, the API operation may also return the following special error codes.

HTTP status code	Error code	Error message
404	GroupNotExist	group {GroupName} does not exist
404	ConfigNotExist	config {ConfigName} does not exist
500	InternalServerError	internal server error

Examples

- Sample requests

```
DELETE /machinegroups/sample-group/configs/logtail-config-sample
{
    "Content-Length": 0,
    "x-log-signaturemethod": "hmac-sha1",
    "x-log-bodyrawsize": 0,
    "User-Agent": "log-python-sdk-v-0.6.0",
    "Host": "ali-test-project.cn-hangzhou-devcommon-intranet.sls.aliyuncs.com",
    "Date": "Mon, 09 Nov 2015 09:48:48 GMT",
    "x-log-apiversion": "0.6.0",
    "Authorization": "LOG <yourAccessKeyId>:<yourSignature>"
}
```

- Sample responses

```
{
    "date": "Mon, 09 Nov 2015 09:48:48 GMT",
    "connection": "close",
    "x-log-requestid": "56406C0099248CAA230BE135",
    "content-length": "0",
    "server": "nginx/1.6.1"
}
```

20.1.1.8.8. ListMachines

Lists your machines in a machine group that is connected with Log Service.

Request syntax

```
GET /machinegroups/{groupName}/machines HTTP/1.1
Authorization: <AuthorizationString>
Date: <GMT Date>
Host: <Project Endpoint>
x-log-apiversion: 0.6.0
x-log-signaturemethod: hmac-sha1
```

Request elements

- Request headers

The ListMachines API operation does not have special request headers. For information about common request headers of Log Service API operations, see Common request headers.

- Request parameters

Parameter	Type	Required	Description
groupName	String	Yes	The name of the machine group.
offset	Integer	No	The start position of the returned records. Default value: 0.
size	Integer	No	The maximum number of entries to return on each page. Default and maximum value: 500.

Response elements

- Response headers

  The ListMachines API operation does not have special response headers. For information about common response headers of Log Service API operations, see Common response headers.

- Response parameters

Parameter	Type	Description
count	Integer	The number of returned machines on each page.
total	Integer	The total number of machines.
machines	JSON array	The list of returned machines.

The machines parameter consists of the following attributes.

Attribute	Type	Description
ip	String	The IP address of the machine.
machine-uniqueid	String	The universally unique identifier (UUID) of the machine.
userdefined-id	String	The user-defined identifier of the machine.

Error codes

In addition to Common error codes, the API operation may also return the following special error codes.

HTTP status code	Error code	Error message
404	GroupNotExist	group {GroupName} does not exist
500	InternalServerError	internal server error

Additional considerations

The API operation lists only the machines that are normally connected with Log Service.

Examples

- Sample requests

```
GET /machinegroups/test-machine-group-5/machines? offset=0&size=3 HTTP/1.1
Header :
{
    "x-log-apiversion": "0.6.0",
    "Authorization": "LOG <yourAccessKeyId>:<yourSignature>",
    "Host": "ali-test-project.cn-hangzhou-devcommon-intranet.sls.aliyuncs.com",
    "Date": "Tue, 10 Nov 2015 19:04:57 GMT",
    "Content-Length": "0",
    "x-log-signaturemethod": "hmac-sha1",
    "User-Agent": "sls-java-sdk-v-0.6.0",
    "Content-Type": "application/x-protobuf",
    "x-log-bodyrawsize": "0"
}
```

- Sample responses

```
HTTP/1.1 200 OK
Header :
{
    "Date": "Tue, 10 Nov 2015 19:04:58 GMT",
    "Content-Length": "324",
    "x-log-requestid": "56423FD999248C827B000A57",
    "Connection": "close",
    "Content-Type": "application/json",
    "Server": "nginx/1.6.1"
}
Body :
{
    "machines":     [
        {
            "ip": "10.101.166.116",
            "machine-uniqueid": "",
            "userdefined-id": "",
            "lastHeartbeatTime": 1447182247
        },
        {
            "ip": "10.101.165.193",
            "machine-uniqueid": "",
            "userdefined-id": "",
            "lastHeartbeatTime": 1447182246
        },
        {
            "ip": "10.101.166.91",
            "machine-uniqueid": "",
            "userdefined-id": "",
            "lastHeartbeatTime": 1447182248
        }
    ],
    "count": 3,
    "total": 8
}
```

20.1.1.8.9. GetAppliedConfigs

Queries the Logtail configurations that are applied to a machine group.

Request syntax

```
GET /machinegroups/{groupName}/configs HTTP/1.1
Authorization: <AuthorizationString>
Date: <GMT Date>
Host: <Project Endpoint>
x-log-apiversion: 0.6.0
x-log-signaturemethod: hmac-sha1
```

Request elements

- Request headers

The GetAppliedConfigs API operation does not have special request headers. For information about common request headers of Log Service API operations, see Common request headers.

- Request parameters

Parameter	Type	Required	Description
groupName	String	Yes	The name of the machine group.

Response elements

- Response headers

  The GetAppliedConfigs API operation does not have special response headers. For information about common response headers of Log Service API operations, see Common response headers.

- Response parameters

  After a GetAppliedConfigs request succeeds, the response body contains a list of all machines in the specified machine group. The following table describes the response parameters.

Parameter	Type	Description
count	Integer	The number of returned configurations on each page.
configs	String array	The list of returned configurations.

Error codes

In addition to the Common error codes of Log Service API operations, the API operation may also return the following special error codes.

HTTP status code	Error code	Error message
404	GroupNotExist	group {GroupName} does not exist
500	InternalServerError	internal server error

Examples

- Sample requests

```
GET /machinegroups/test-machine-group/configs HTTP/1.1
Header :
{
    "x-log-apiversion": "0.6.0",
    "Authorization": "LOG <yourAccessKeyId>:<yourSignature>",
    "Host": "ali-test-project.cn-hangzhou-devcommon-intranet.sls.aliyuncs.com",
    "Date": "Tue, 10 Nov 2015 19:45:48 GMT",
    "Content-Length": "0",
    "x-log-signaturemethod": "hmac-sha1",
    "User-Agent": "sls-java-sdk-v-0.6.0",
    "Content-Type": "application/x-protobuf",
    "x-log-bodyrawsize": "0"
}
```

- Sample responses

```
HTTP/1.1 200 OK
Header :
{
    "Date": "Tue, 10 Nov 2015 19:45:48 GMT",
    "Content-Length": "53",
    "x-log-requestid": "5642496C99248C8C7B00173F",
    "Connection": "close",
    "Content-Type": "application/json",
    "Server": "nginx/1.6.1"
}
Body :
{
    "configs":     [
        "two",
        "three",
        "test_logstore"
    ],
    "count": 3
}
```

20.1.1.9. Logtail configuration operations

20.1.1.9.1. CreateConfig

Creates a Logtail configuration.

Request syntax

```
POST /configs HTTP/1.1
Authorization: <AuthorizationString>
Content-Type:application/json
Content-Length:<Content Length>
Content-MD5<:<Content MD5>
Date: <GMT Date>
Host: <Project Endpoint>
x-log-apiversion: 0.6.0
x-log-signaturemethod: hmac-sha1
{
    "configName": "testcategory1",
    "inputType": "file",
    "inputDetail": {
        "logType": "common_reg_log",
        "logPath": "/var/log/httpd/",
        "filePattern": "access*.log",
        "localStorage": true,
        "timeFormat": "%Y/%m/%d %H:%M:%S",
        "logBeginRegex": ".*",
        "regex": "(\w+)(\s+)",
        "key" :["key1", "key2"],
        "filterKey":["key1"],
        "filterRegex":["regex1"],
        "fileEncoding":"utf8",
        "topicFormat": "none"
    },
    "outputType": "LogService",
    "outputDetail":
    {
        "logstoreName": "perfcounter"
    }
}
```

Request elements

- Request headers

  The CreateConfig API operation does not have special request headers. For information about common request headers of Log Service API operations, see Common request headers.

- Request parameters

  For information about the request parameters and Logtail configuration examples, see Logtail configurations.

Response elements

- Response headers

  The CreateConfig API operation does not have special response headers. For information about common response headers of Log Service API operations, see Common response headers.

- Response elements

  The HTTP status code 200 is returned.

Error codes

In addition to Common error codes, the API operation may also return the following special error codes.

HTTP status code	Error code	Error message
400	ConfigAlreadyExist	config {Configname} already exists
400	InvalidParameter	invalid config resource json
500	InternalServerError	internal server error

The configuration fails to be created if an error occurs, for example, the configuration already exists, the format is incorrect, the required parameters are missing, or the quota is exceeded.

Examples

- Sample requests

```
POST /configs HTTP/1.1
Header :
{
    'Content-Length': 737,
    'Host': 'ali-test-project.cn-hangzhou-devcommon-intranet.sls.aliyuncs.com',
    'x-log-bodyrawsize': 737,
    'Content-MD5': 'FBA01ECF7255BE143379BC70C56BBF68',
    'x-log-signaturemethod': 'hmac-sha1',
    'Date': 'Mon, 09 Nov 2015 07:45:30 GMT',
    'x-log-apiversion': '0.6.0',
    'User-Agent': 'log-python-sdk-v-0.6.0',
    'Content-Type': 'application/json',
    'Authorization': 'LOG <yourAccessKeyId>:<yourSignature>'
}
Body:
{
    "configName": "sample-logtail-config",
    "inputType": "file",
    "inputDetail": {
        "logType": "common_reg_log",
        "logPath": "/var/log/httpd/",
        "filePattern": "access*.log",
        "localStorage": true,
        "timeFormat": "%d/%b/%Y:%H:%M:%S",
        "logBeginRegex": "\\d+\\.\\d+\\.\\d+\\.\\d+ - .*",
        "regex": "([\\d\\.] +) \\S+ \\S+ \\[(\\S+) \\S+\\] \"(\\w+) ([^\"]*)\" ([\\d\\.]+
) (\\d+) (\\d+) (\\d+|-) \"([^\"]*)\" \"([^\"]*)\".*",
        "key": ["ip", "time", "method", "url", "request_time", "request_length", "status"
, "length", "ref_url", "browser"],
        "filterKey": [],
        "filterRegex": [],
        "topicFormat": "none",
        "fileEncoding": "utf8"
    },
    "outputType": "LogService",
    "outputDetail":
    {
        "logstoreName": "sls-test-logstore"
    }
}
```

- Sample responses

```
HTTP/1.1 200 OK
Header
{
    'date': 'Mon, 09 Nov 2015 07:45:30 GMT',
    'connection': 'close',
    'x-log-requestid': '56404F1A99248CA26C002180',
    'content-length': '0',
    'server': 'nginx/1.6.1'
}
```

20.1.1.9.2. ListConfig

Lists all configurations of a project. You can set the relevant parameters in the syntax to list the configurations on multiple pages.

Request syntax

```
GET /configs? offset=0&size=100 HTTP/1.1
Authorization: <AuthorizationString>
Date: <GMT Date>
Host: <Project Endpoint>
x-log-apiversion: 0.6.0
x-log-signaturemethod: hmac-sha1
```

Request elements

- Request headers

  The ListConfig API operation does not have special request headers. For information about common request headers of Log Service API operations, see Common request headers.

- Request parameters

Parameter	Type	Required	Description
offset	Integer	No	The start position of entries to return. Default value: 0.
size	Integer	No	The maximum number of entries to return on each page. Default value: 500.

Response elements

- Response headers

  The ListConfig API operation does not have special response headers. For information about common response headers of Log Service API operations, see Common response headers.

- Response parameters

  The response body of the ListConfig API operation contains a list of all configurations in the project. The following table describes the response parameters.

Parameter	Type	Description
count	Integer	The number of returned configurations on each page.
total	Integer	The total number of returned configurations.

Parameter	Type	Description
configs	String array	The list of returned configurations.

Error codes

In addition to Common error codes, the API operation may also return the following special error codes.

HTTP status code	Error code	Error message
404	ConfigNotExist	config {Configname} does not exist
500	InternalServerError	internal server error

Examples

- Sample requests

```
GET /configs? offset=0&size=10 HTTP/1.1
Header :
{
    "Content-Length": 0,
    "x-log-signaturemethod": "hmac-sha1",
    "x-log-bodyrawsize": 0,
    "User-Agent": "log-python-sdk-v-0.6.0",
    "Host": "ali-test-project.cn-hangzhou-devcommon-intranet.sls.aliyuncs.com",
    "Date": "Mon, 09 Nov 2015 09:19:13 GMT",
    "x-log-apiversion": "0.6.0",
    "Authorization": "LOG <yourAccessKeyId>:<yourSignature>"
}
```

- Sample responses

```
Header :
{
    "content-length": "103",
    "server": "nginx/1.6.1",
    "connection": "close",
    "date": "Mon, 09 Nov 2015 09:19:13 GMT",
    "content-type": "application/json",
    "x-log-requestid": "5640651199248CAA2300C2BA"
}
Body:
{
    "count": 3,
    "configs":
    [
        "logtail-config-sample",
        "logtail-config-sample-2",
        "logtail-config-sample-3"
    ],
    "total": 3
}
```

20.1.1.9.3. GetAppliedMachineGroups

Lists the machines that apply a Logtail configuration.

Request syntax

```
GET /configs/{configName}/machinegroups HTTP/1.1
Authorization: <AuthorizationString>
Date: <GMT Date>
Host: <Project Endpoint>
x-log-apiversion: 0.6.0
x-log-signaturemethod: hmac-sha1
```

Request elements

- Request headers

  The GetAppliedMachineGroups API operation does not have special request headers. For information about common request headers of Log Service API operations, see Logtail configurations.

- Request parameters

Parameter	Type	Required	Description
ConfigName	String	Yes	The name of the Logtail configuration.

Response elements

- Response headers

The GetAppliedMachineGroups API operation does not have special response headers. For information about common response headers of Log Service API operations, see Common response headers.

- Response parameters

  After the request succeeds, the response body contains a list of all machines in the specified machine group. The following table describes the response parameters.

Parameter	Type	Description
count	Integer	The number of returned machine groups.
machinegroups	String array	The list of returned machine groups.

Error codes

In addition to Common error codes, the API operation may also return the following special error codes.

HTTP status code	Error code	Error message
404	GroupNotExist	group {GroupName} does not exist
500	InternalServerError	internal server error

Examples

- Sample requests

```
GET /configs/logtail-config-sample/machinegroups
Header:
{
    "Content-Length": 0,
    "x-log-signaturemethod": "hmac-sha1",
    "x-log-bodyrawsize": 0,
    "User-Agent": "log-python-sdk-v-0.6.0",
    "Host": "ali-test-project.cn-hangzhou-devcommon-intranet.sls.aliyuncs.com",
    "Date": "Mon, 09 Nov 2015 09:51:38 GMT",
    "x-log-apiversion": "0.6.0",
    "Authorization": "LOG <yourAccessKeyId>:<yourSignature>"
}
```

- Sample responses

```
Header :
{
    "content-length": "44",
    "server": "nginx/1.6.1",
    "connection": "close",
    "date": "Mon, 09 Nov 2015 09:51:38 GMT",
    "content-type": "application/json",
    "x-log-requestid": "56406CAA99248CAA230BE828"
}
Body:
{
    "count": 1,
    "machinegroups":
    [
        "sample-group"
    ]
}
```

20.1.1.9.4. GetConfig

Queries the details of a Logtail configuration.

Request syntax

```
GET /configs/<configName> HTTP/1.1
Authorization: <AuthorizationString>
Date: <GMT Date>
Host: <Project Endpoint>
x-log-apiversion: 0.6.0
x-log-signaturemethod: hmac-sha1
```

Request elements

- Request headers

  The GetConfig API operation does not have special request headers. For information about common request headers of Log Service API operations, see Common request headers.

- Request parameters

Parameter	Type	Required	Description
ConfigName	String	Yes	The name of the Logtail configuration.

Response elements

- Response headers

  The GetConfig API operation does not have special response headers. For information about common response headers of Log Service API operations, see Common request headers.

- Response parameters

For information about the response parameters and Logtail configuration examples, see Logtail configurations.

Error codes

In addition to Common error codes, the API operation may also return the following special error codes.

HTTP status code	Error code	Error message
404	ConfigNotExist	Config {Configname} does not exist
500	InternalServerError	Specified Server Error Message

Examples

- Sample requests

```
GET /configs/logtail-config-sample
Header :
{
    "Content-Length": 0,
    "x-log-signaturemethod": "hmac-sha1",
    "x-log-bodyrawsize": 0,
    "User-Agent": "log-python-sdk-v-0.6.0",
    "Host": "ali-test-project.cn-hangzhou-devcommon-intranet.sls.aliyuncs.com",
    "Date": "Mon, 09 Nov 2015 08:29:15 GMT",
    "x-log-apiversion": "0.6.0",
    "Authorization": "LOG <yourAccessKeyId>:<yourSignature>"
}
```

- Sample responses

```
Header :
{
    "content-length": "730",
    "server": "nginx/1.6.1",
    "connection": "close",
    "date": "Mon, 09 Nov 2015 08:29:15 GMT",
    "content-type": "application/json",
    "x-log-requestid": "5640595B99248CAA23004A59"
}
Body :
{
    "configName": "logtail-config-sample",
    "outputDetail": {
        "endpoint": "http://cn-hangzhou-devcommon-intranet.sls.aliyuncs.com",
        "logstoreName": "sls-test-logstore"
    },
    "outputType": "LogService",
    "inputType": "file",
    "inputDetail": {
        "regex": "([\\d\\.] +) \\S+ \\S+ \\[(\\S+) \\S+\\] \"(\\w+) ([^\"]*)\" ([\\d\\.]+
) (\\d+) (\\d+) (\\d+|-) \"([^\"]*)\" \"([^\"]*)\".*",
        "filterKey": [],
        "logPath": "/var/log/httpd/",
        "logBeginRegex": "\\d+\\.\\d+\\.\\d+\\.\\d+ - .*",
        "logType": "common_reg_log",
        "topicFormat": "none",
        "localStorage": true,
        "key": [
            "ip",
            "time",
            "method",
            "url",
            "request_time",
            "request_length",
            "status",
            "length",
            "ref_url",
            "browser"
        ],
        "filePattern": "access*.log",
        "timeFormat": "%d/%b/%Y:%H:%M:%S",
        "filterRegex": []
    },
    "createTime": 1447040456,
    "lastModifyTime": 1447050456
}
```

20.1.1.9.5. DeleteConfig

Deletes a Logtail configuration. When you call this API operation, the Logtail configuration is deleted even if it is applied to the Machine Group.

Request syntax

```
DELETE /configs/<configName> HTTP/1.1
Authorization: <AuthorizationString>
Date: <GMT Date>
Host: <Project Endpoint>
x-log-apiversion: 0.6.0
x-log-signaturemethod: hmac-sha1
```

Request elements

- Request headers

  The DeleteConfig API operation does not have special request headers. For information about common request headers of Log Service API operations, see Common request headers.

- Request parameters

Parameter	Type	Required	Description
ConfigName	String	Yes	The name of the logtail configuration.

Response elements

- Response headers

  The DeleteConfig API operation does not have special response headers. For information about common response headers of Log Service API operations, see Common response headers.

- Response parameters

  The HTTP status code 200 is returned.

Error codes

In addition to Common error codes, the API operation may also return the following special error codes.

HTTP status code	Error code	Error message
404	ConfigNotExist	config {Configname} does not exist
400	InvalidParameter	invalid config resource json
500	InternalServerError	internal server error

Examples

- Sample requests

```
DELETE /configs/logtail-config-sample
Header :
{
    "Content-Length": 0,
    "x-log-signaturemethod": "hmac-sha1",
    "x-log-bodyrawsize": 0,
    "User-Agent": "log-python-sdk-v-0.6.0",
    "Host": "ali-test-project.cn-hangzhou-devcommon-intranet.sls.aliyuncs.com",
    "Date": "Mon, 09 Nov 2015 09:28:21 GMT",
    "x-log-apiversion": "0.6.0",
    "Authorization": "LOG <yourAccessKeyId>:<yourSignature>"
}
```

- Sample responses

```
Header :
{
    "date": "Mon, 09 Nov 2015 09:28:21 GMT",
    "connection": "close",
    "x-log-requestid": "5640673599248CAA230836C6",
    "content-length": "0",
    "server": "nginx/1.6.1"
}
```

20.1.1.9.6. UpdateConfig

Updates Logtail configurations. If the Logtail configurations are applied to a machine group, the configurations of the machine group are also updated.

Request syntax

```
PUT /configs/<configName> HTTP/1.1
Authorization: <AuthorizationString>
Content-Type:application/json
Content-Length:<Content Length>
Content-MD5<:<Content MD5>
Date: <GMT Date>
Host: <Project Endpoint>
x-log-apiversion: 0.6.0
x-log-signaturemethod: hmac-sha1
{
    "configName": "testcategory1",
    "inputType": "file",
    "inputDetail": {
        "logType": "common_reg_log",
        "logPath": "/var/log/httpd/",
        "filePattern": "access.log",
        "localStorage": true,
        "timeFormat": "%Y/%m/%d %H:%M:%S",
        "logBeginRegex": ".*",
        "regex": "(\w+)(\s+)",
        "key" :["key1", "key2"],
        "filterKey":["key1"],
        "filterRegex":["regex1"],
        "topicFormat": "none"
    },
    "outputType": "LogService",
    "outputDetail":
    {
        "logstoreName": "perfcounter"
    }
}
```

Request elements

- Request headers

  The UpdateConfig API operation does not have special request headers. For information about common request headers of Log Service API operations, see Common request headers.

- Request parameters

  For information about the request parameters and Logtail configuration examples, see Logtail configurations.

Response elements

- Response headers

  The UpdateConfig API operation does not have special response headers. For information about common response headers of Log Service API operations, see Common response headers.

- Response parameters

  After the request succeeds, the HTTP status code 200 is returned.

Error codes

In addition to Common error codes, the API operation may also return the following special error codes.

HTTP status code	Error code	Error message
404	ConfigNotExist	config {Configname} does not exist
400	InvalidParameter	invalid config resource json
400	BadRequest	config resource configname does not match with request
500	InternalServerError	internal server error

The configuration fails to be created if an error occurs, for example, the format is incorrect, the required parameters are missing, or the quota is exceeded.

Examples

- Sample requests

```
PUT /configs/logtail-config-sample
Header :
{
    "Content-Length": 737,
    "Host": "ali-test-project.cn-hangzhou-devcommon-intranet.sls.aliyuncs.com",
    "x-log-bodyrawsize": 737,

20.1.1.10. Consumer group operations

20.1.1.10.1. CreateConsumerGroup

Creates a consumer group in a Logstore.

Request syntax

```
POST /logstores/<logstoreName>/consumergroups HTTP/1.1
Authorization: <AuthorizationString>
x-log-bodyrawsize: 0
User-Agent: <UserAgent>
x-log-apiversion: 0.6.0
Host: <Project Endpoint>
x-log-signaturemethod: hmac-sha1
Date: <GMT Date>
Content-Type: application/json
Content-MD5: F58544E4D022CC28A93D0B7CC208A5AA
Content-Length: <ContentLength>
{
  "consumerGroup": <consumerGroup>,
  "timeout": <timeout>,
  "order": <order>
}
```

Request elements

- Request headers

  The CreateConsumerGroup API operation does not have special request headers. For information about common request headers of Log Service API operations, see Common request headers.

- Request parameters

Parameter	Type	Required	Description
logstoreName	String	Yes	The name of the Logstore.
consumerGroup	String	Yes	The name of the consumer group. The name must be unique in a project.
timeout	Integer	Yes	The timeout period. If Log Service does not receive a heartbeat message from a consumer within the timeout period, the consumer is deleted.

Parameter	Type	Required	Description
order	Boolean	Yes	Specifies whether to consume data in sequence from a single shard. Valid values: ◦ true: The data in a single shard is consumed in sequence. The data in the original shard is first consumed after the shard is split. Then, the data in the new shards is consumed at the same time. ◦ false: The data in a single shard is randomly consumed.

Response elements

- Response headers

  The CreateConsumerGroup API operation does not have special response headers. For information about common response headers of Log Service API operations, see Common response headers.

- Response parameters

  The HTTP status code 200 is returned.

Error codes

In addition to Common error codes, the API operation may also return the following special error codes.

HTTP status code	Error code	Error message
400	ConsumerGroupAlreadyExist	consumer group already exist
400	JsonInfoInvalid	consumerGroup or timeout is of error format
404	ProjectNotExist	The Project does not exist : {Project}
404	LogStoreNotExist	logstore {logstoreName} does not exist
500	InternalServerError	Specified Server Error Message

Examples

- Sample requests

```
POST /logstores/my-logstore/consumergroups HTTP/1.1
Header:
Authorization: LOG <yourAccessKeyId>:<yourSignature>
x-log-bodyrawsize: 0
User-Agent: sls-java-sdk-v-0.6.1
x-log-apiversion: 0.6.0
Host: my-project.cn-shanghai.log.aliyuncs.com
x-log-signaturemethod: hmac-sha1
Date: Fri, 04 May 2018 08:02:22 GMT
Content-Type: application/json
Content-MD5: F58544E4D022CC28A93D0B7CC208A5AA
Content-Length: 65
Connection: Keep-Alive
Body:
{
  "consumerGroup": "consumer-group-1",
  "timeout": 300,
  "order": true
}
```

- Sample responses

```
HTTP/1.1 200
Server: nginx/1.12.1
Content-Length: 0
Connection: close
Access-Control-Allow-Origin: *
Date: Fri, 04 May 2018 08:15:11 GMT
x-log-requestid: 5AEC168FA796F4195BF404CB
```

20.1.1.10.2. DeleteConsumerGroup

Deletes a consumer group.

Request syntax

```
DELETE /logstores/<logstoreName>/consumergroups/<consumerGroupName> HTTP/1.1
Authorization: <AuthorizationString>
x-log-bodyrawsize: 0
User-Agent: <UserAgent>
x-log-apiversion: 0.6.0
Host: <Project Endpoint>
x-log-signaturemethod: hmac-sha1
Date: <GMT Date>
Content-Type:  application/x-protobuf
Content-MD5: F58544E4D022CC28A93D0B7CC208A5AA
```

Request elements

- Request headers

  The DeleteConsumerGroup API operation does not have special request headers. For information about common request headers of Log Service API operations, see Common request headers.

- Request parameters

Parameter	Type	Required	Description
logstoreName	String	Yes	The name of the Logstore to which the consumer group belongs.
consumerGroup	String	Yes	The consumer group to be deleted.

Response elements

- Response headers

  The DeleteConsumerGroup API operation does not have special response headers. For information about common response headers of Log Service API operations, see Common response headers.

- Response parameters

  The HTTP status code 200 is returned.

Error codes

In addition to Common error codes, the API operation may also return the following special error codes.

HTTP status code	Error code	Error message
404	ProjectNotExist	The Project does not exist : {Project}
404	LogStoreNotExist	logstore {logstoreName} does not exist
500	InternalServerError	Specified Server Error Message

Additional considerations

If you attempt to delete a consumer group that does not exist, the system will return a success message.

Examples

- Sample requests

```
DELETE /logstores/logstore-test/consumergroups/consumer-group-1 HTTP/1.1
Header:
Authorization: LOG <yourAccessKeyId>:<yourSignature>
x-log-bodyrawsize: 0
User-Agent: sls-java-sdk-v-0.6.1
x-log-apiversion: 0.6.0
Host: my-project.cn-shanghai.log.aliyuncs.com
x-log-signaturemethod: hmac-sha1
Date: Fri, 04 May 2018 08:02:22 GMT
Content-Type: application/json
Content-MD5: F58544E4D022CC28A93D0B7CC208A5AA
Content-Length: 65
Connection: Keep-Alive
```

- Sample responses

```
HTTP/1.1 200
Server: nginx/1.12.1
Content-Length: 0
Connection: close
Access-Control-Allow-Origin: *
Date: Fri, 04 May 2018 08:15:11 GMT
x-log-requestid: 5AEC168FA796F4195BF404CB
```

20.1.1.10.3. GetCheckPoint

Queries the checkpoints of one or all shards from which data is consumed by a consumer group.

Request syntax

```
GET /logstores/<logstoreName>/consumergroups/<consumerGroup>? shard=<shardId> HTTP/1.1
Authorization: <AuthorizationString>
x-log-bodyrawsize: 0
User-Agent: <UserAgent>
x-log-apiversion: 0.6.0
Host: <Project Endpoint>
x-log-signaturemethod: hmac-sha1
Date: <GMT Date>
Content-Type: application/json
Connection: Keep-Alive
```

Request elements

- Request headers

  The GetCheckPoint API operation does not have special request headers. For information about common request headers of Log Service API operations, see Common request headers.

- Request parameters

Parameter	Type	Required	Description

Parameter	Type	Required	Description
logstoreName	String	Yes	The name of the Logstore to which the consumer group belongs.
consumerGroup	String	Yes	The name of the consumer group.
shardId	Integer	No	The ID of the shard. ◦ If the specified shard does not exist, an empty list is returned. ◦ If the shard ID is not specified, the checkpoints of all shards are returned.

Response elements

- Response headers

  The GetCheckPoint API operation does not have special response headers. For information about common response headers of Log Service API operations, see Common response headers.

- Response parameters

  After the request succeeds, the response body contains the checkpoint of the shard from which data is consumed by the specified consumer group. The following table describes the response parameters.

Parameter	Type	Description
shard	Integer	The ID of the shard.
checkpoint	String	The value of the checkpoint.
updateTime	Integer	The time when the checkpoint was last updated.
consumer	String	The consumer that consumes data from the shard.

Error codes

In addition to Common error codes, the API operation may also return the following special error codes.

HTTP status code	Error code	Error message
404	ProjectNotExist	The Project does not exist : {Project}
404	LogStoreNotExist	logstore {logstoreName} does not exist
404	ConsumerGroupNotExist	consumer group not exist
500	InternalServerError	Specified Server Error Message

Examples

- Sample requests

```
GET /logstores/my-logstore/consumergroups/consumer_group_test? shard=0
Authorization: LOG <yourAccessKeyId>:<yourSignature>
x-log-bodyrawsize: 0
User-Agent: sls-java-sdk-v-0.6.1
x-log-apiversion: 0.6.0
Host: my-project.cn-shanghai.log.aliyuncs.com
x-log-signaturemethod: hmac-sha1
Date: Fri, 04 May 2018 09:26:53 GMT
Content-Type: application/x-protobuf
Connection: Keep-Alive
```

- Sample responses

```
HTTP/1.1 200
Server: nginx/1.12.1
Content-Type: application/json
Content-Length: 111
Connection: close
Access-Control-Allow-Origin: *
Date: Fri, 04 May 2018 09:26:53 GMT
x-log-requestid: 5AEC275D1FFC036AB254B20C
[
  {
    "shard": 0,
    "checkpoint": "MTUyNDE1NTM3OTM3MzkwODQ5Ng==",
    "updateTime": 1524224984800922,
    "consumer": "consumer_1"
  }
]
```

20.1.1.10.4. HeartBeat

Sends a heartbeat packet to Log Service for a consumer.

Request syntax

```
POST /logstores/<logstoreName>/consumergroups/<consumerGroup>? type=heartbeat&consumer=<con
sumer> HTTP/1.1
Authorization: <AuthorizationString>
x-log-bodyrawsize: 0
User-Agent: <UserAgent>
x-log-apiversion: 0.6.0
Host: <Project Endpoint>
x-log-signaturemethod: hmac-sha1
Date: <GMT Date>
Content-Type: application/json
Content-MD5: F58544E4D022CC28A93D0B7CC208A5AA
Content-Length: <ContentLength>
<shard ID list>
```

Request elements

- Request headers

The HeartBeat API operation does not have special request headers. For information about common request headers of Log Service API operations, see Common request headers.

- Request parameters

Parameter	Type	Required	Description
logstoreName	String	Yes	The name of the Logstore. The name must be unique in a project.
consumerGroup	String	Yes	The name of the consumer group. The name must be unique in a project.
consumer	String	Yes	The consumer.
{Shard ID List}	Array	Yes	The ID list of shards from which data is consumed.

Response elements

- Response headers

  The HeartBeat API operation does not have special response headers. For information about common response headers of Log Service API operations, see Common response headers.

- Response parameters

  After the request succeeds, the HTTP status code 200 is returned. An ID list is also returned, containing all shards from which data are consumed by the consumer.

Error codes

In addition to Common error codes, the API operation may also return the following special error codes.

HTTP status code	Error code	Error message
400	NotExistConsumerWithBody	non-exist consumer with non-empty body of heartbeat message
404	ProjectNotExist	The Project does not exist : {Project}
404	LogStoreNotExist	logstore {logstoreName} does not exist
404	ConsumerGroupNotExist	consumer group not exist
500	InternalServerError	Specified Server Error Message

Additional considerations

The heartbeat packet can be sent only when the connection between the consumer and Log Service is established.

Examples

- Sample requests

```
POST /logstores/my-logstore/consumergroups/consumer_group_test? type=heartbeat&consumer=c
onsumer_1 HTTP/1.1
Authorization: LOG <yourAccessKeyId>:<yourSignature>
x-log-bodyrawsize: 0
User-Agent: sls-java-sdk-v-0.6.1
x-log-apiversion: 0.6.0
Host: my-project.cn-shanghai.log.aliyuncs.com
x-log-signaturemethod: hmac-sha1
Date: Sun, 06 May 2018 09:44:10 GMT
Content-Type: application/json
Content-MD5: 8D5162CA104FA7E79FE80FD92BB657FB
Content-Length: 3
Connection: Keep-Alive
[0]
```

- Sample responses

```
HTTP/1.1 200
Server: nginx/1.12.1
Content-Type: application/json
Content-Length: 5
Connection: close
Access-Control-Allow-Origin: *
Date: Sun, 06 May 2018 09:44:11 GMT
x-log-requestid: 5AEECE6B1FFC0366B2553FB5
[0,1]
```

20.1.1.10.5. ListConsumerGroup

Lists all consumer groups of a Logstore.

Request syntax

```
GET /logstores/<logstoreName>/consumergroups HTTP/1.1
Authorization: <AuthorizationString>
x-log-bodyrawsize: 0
User-Agent: <UserAgent>
x-log-apiversion: 0.6.0
Host: <Project Endpoint>
x-log-signaturemethod: hmac-sha1
Date: <GMT Date>
Content-Type: application/x-protobuf
Connection: Keep-Alive
```

Request elements

- Request headers

  The ListConsumerGroup API operation does not have special request headers. For information about common request headers of Log Service API operations, see Common request headers.

- Request parameters

Parameter	Type	Required	Description
logstoreName	String	Yes	The name of the Logstore.

Response elements

- Response headers

  The ListConsumerGroup API operation does not have special response headers. For information about common response headers of Log Service API operations, see Common response headers.

- Response parameters

  After the ListConsumerGroup request succeeds, the response body contains a list of all consumer groups that read log data from the specified Logstore. The following table describes the response parameters.

Parameter	Type	Description
consumerGroup	String	The name of the consumer group.
timeout	Integer	The timeout period. If the specified Logstore does not receive a heartbeat packet from the consumer group during the timeout period, the consumer group is deleted.
order	Boolean	Indicates whether log data was consumed in sequence.

Error codes

In addition to Common error codes, the API operation may also return the following special error codes.

HTTP status code	Error code	Error message
404	ProjectNotExist	The Project does not exist : {Project}
404	LogStoreNotExist	logstore {logstoreName} does not exist
500	InternalServerError	Specified Server Error Message

Examples

- Sample requests

```
GET /logstores/my-logstore/consumergroups HTTP/1.1
Authorization: LOG <yourAccessKeyId>:<yourSignature>
x-log-bodyrawsize: 0
User-Agent: sls-java-sdk-v-0.6.1
x-log-apiversion: 0.6.0
Host: my-project.cn-shanghai.log.aliyuncs.com
x-log-signaturemethod: hmac-sha1
Date: Fri, 04 May 2018 08:47:30 GMT
Content-Type: application/x-protobuf
Connection: Keep-Alive
```

- Sample responses

```
HTTP/1.1 200
Server: nginx/1.12.1
Content-Type: application/json
Connection: close
Access-Control-Allow-Origin: *
Date: Fri, 04 May 2018 08:47:31 GMT
x-log-requestid: 5AEC1E23048191954B42EAB9
[
  {
    "name": "test-consumer-group",
    "timeout": 30,
    "order": true
  }
]
```

20.1.1.10.6. UpdateCheckPoint

Updates the checkpoint of a shard in a Logstore of a project for a consumer group.

Request syntax

```
POST /logstores/<logstoreName>/consumergroups/<consumerGroupName>? forceSuccess=<forceSucce
ss>&type=checkpoint&consumer=<consumer> HTTP/1.1
Authorization: <AuthorizationString>
x-log-bodyrawsize: 0
User-Agent: <UserAgent>
x-log-apiversion: 0.6.0
Host: <Project Endpoint>
x-log-signaturemethod: hmac-sha1
Date: <GMT Date>
Content-Type: application/json
Content-Length: <ContentLength>
Connection: Keep-Alive
{
  "shard": <shardID>,
  "checkpoint": <checkpoint>
}
```

Request elements

- Request headers

  The UpdateCheckPoint API operation does not have special request headers. For information about common request headers of Log Service API operations, see Common request headers.

- Request parameters

Parameter	Type	Required	Description
logstoreName	String	Yes	The name of the Logstore to which the consumer group belongs.
consumerGroup	String	Yes	The name of the consumer group.
forceSuccess	Boolean	No	Specifies whether to forcibly update the consumer group.
consumer	String	No	The consumer.
shard	Integer	Yes	The ID of the shard.
checkpoint	String	Yes	The value of the checkpoint.

Response elements

- Response headers

  The UpdateCheckPoint API operation does not have special response headers. For information about common response headers of Log Service API operations, see Common response headers.

- Response parameters

  The HTTP status code 200 is returned.

Error codes

In addition to Common error codes, the API operation may also return the following special error codes.

HTTP status code	Error code	Error message
400	InvalidShardCheckPoint	shard checkpoint not encoded by base64
404	ProjectNotExist	The Project does not exist : {Project}
404	LogStoreNotExist	logstore {logstoreName} does not exist
404	ConsumerGroupNotExist	consumer group not exist

HTTP status code	Error code	Error message
404	ShardNotExist	shard not exist
500	InternalServerError	Specified Server Error Message

Additional considerations

If the consumer is not specified, the checkpoint can be updated only when the forceSuccess parameter is set to true.

Examples

- Sample requests

```
POST /logstores/logstore-4/consumergroups/consumer_group_test? forceSuccess=false&type=ch
eckpoint&consumer=consumer_1 HTTP/1.1
Authorization: LOG <yourAccessKeyId>:<yourSignature>
x-log-bodyrawsize: 0
User-Agent: sls-java-sdk-v-0.6.1
x-log-apiversion: 0.6.0
Host: my-project.cn-shanghai.log.aliyuncs.com
x-log-signaturemethod: hmac-sha1
Date: Sun, 06 May 2018 09:14:53 GMT
Content-Type: application/json
Content-MD5: 59457BAFB3F85A5117BDE243947583B0
Content-Length: 55
Connection: Keep-Alive
{
  "shard": 0,
  "checkpoint": "MTUyNDE1NTM3OTM3MzkwODQ5Ng=="
}
```

- Sample responses

```
HTTP/1.1 200
Server: nginx/1.12.1
Content-Length: 0
Connection: close
Access-Control-Allow-Origin: *
Date: Sun, 06 May 2018 09:14:54 GMT
x-log-requestid: 5AEEC78E1FFC0366B24F1C63
```

20.1.1.10.7. UpdateConsumerGroup

Updates the attributes of a consumer group.

Request syntax

```
PUT /logstores/<logstoreName>/consumergroups/<consumerGroupName> HTTP/1.1
Authorization: <AuthorizationString>
x-log-bodyrawsize: 0
User-Agent: <UserAgent>
x-log-apiversion: 0.6.0
Host: <Project Endpoint>
x-log-signaturemethod: hmac-sha1
Date: <GMT Date>
Content-Type: application/json
Content-MD5: F58544E4D022CC28A93D0B7CC208A5AA
Content-Length: <ContentLength>
{
  "timeout": <timeout>,
  "order": <order>
}
```

Request elements

- Request headers

  The UpdateConsumerGroup API operation does not have special request headers. For information about common request headers of Log Service API operations, see Common request headers.

- Request parameters

Parameter	Type	Required	Description
logstoreName	String	Yes	The name of the Logstore to which the consumer group belongs.
consumerGroup	String	Yes	The name of the consumer group.
timeout	Integer	No	The timeout period. If Log Service does not receive a heartbeat packet during the timeout period, the consumer group is deleted.
order	Boolean	No	Specifies whether to consume data in sequence from a single shard. Valid values: ◦ true: The data in a single shard is consumed in sequence. The data in the original shard is first consumed after the shard is split. Then, the data in the new shards is consumed at the same time. ◦ false: The data in a single shard is randomly consumed.

> **Note** You must specify the `timeout` or `order` parameter, or specify both parameters.

Response elements

- Response headers

  The UpdateConsumerGroup API operation does not have special response headers. For information about common response headers of Log Service API operations, see Common response headers.

- Response parameters

  The HTTP status code 200 is returned.

Error codes

In addition to Common response headers, the API operation may also return the following special error codes.

HTTP status code	Error code	Error message
400	JsonInfoInvalid	timeout is of error value type
404	ProjectNotExist	The Project does not exist : {Project}
404	ConsumerGroupNotExist	consumer group not exist
404	LogStoreNotExist	logstore {logstoreName} does not exist
500	InternalServerError	Specified Server Error Message

Examples

- Sample requests

```
PUT /logstores/logstore-test/consumergroups/consumer-group-1 HTTP/1.1
Header:
Authorization: LOG <yourAccessKeyId>:<yourSignature>
x-log-bodyrawsize: 0
User-Agent: sls-java-sdk-v-0.6.1
x-log-apiversion: 0.6.0
Host: my-project.cn-shanghai.log.aliyuncs.com
x-log-signaturemethod: hmac-sha1
Date: Fri, 04 May 2018 08:02:22 GMT
Content-Type: application/json
Content-MD5: F58544E4D022CC28A93D0B7CC208A5AA
Content-Length: 65
Connection: Keep-Alive
Body:
{
  "order": false,
  "timeout": 100
}
```

- Sample responses

```
HTTP/1.1 200
Server: nginx/1.12.1
Content-Length: 0
Connection: close
Access-Control-Allow-Origin: *
Date: Fri, 04 May 2018 08:15:11 GMT

```

20.1.1.11. RAM or STS

20.1.1.11.1. Overview

Use RAM to authorize a RAM user to access Log Service resources of an Alibaba Cloud account

You can create projects, Logstores, Logtail configurations, and machine group in Log Service. You have full permissions on these resources. You can call all relevant API operations to use the resources.

However, if you use your Alibaba Cloud account to create a RAM user, the RAM user is unauthorized to use your resources in Log Service. To allow the RAM user to use your resources, you must grant relevant permissions on the resources to the RAM user.

You can use RAM policies to grant a RAM user the following permissions on Log Service resources:

- Upload data to a specified Logstore

  If you grant this permission to a RAM user, the RAM user can upload data to the specified Logstore by using the relevant API or SDK. The policy is as follows:

```
  {
    "Version": "1",
    "Statement": [
      {
        "Action": [
          "log:Post*",
          "log:BatchPost*"
        ],
        "Resource": ["acs:log:*:*:project/<The name of the specified proejct>/logstore/<T
he name of the specified Logstore>"],
        "Effect": "Allow"
      }
    ]
  }
```

- Query data of a specified Logstore in the console

  If you grant this permission to a RAM user, the RAM user can query logs, pull logs, and view the Logstore list after logging on to the Log Service console. The policy is as follows:

```
{
  "Version": "1",
  "Statement": [
    {
      "Action": ["log:List*"],
      "Resource": ["acs:log:*:*:project/<The name of the specified proejct>/*"],
      "Effect": "Allow"
    },
    {
      "Action": ["log:Get*"],
      "Resource": ["acs:log:*:*:project/<The name of the proejct>/logstore/<The name of the Logstore>"],
      "Effect": "Allow"
    }
  ]
}
```

You can skip this topic if you do not need to grant access to your Log Service resources across accounts. Skipping this topic does not affect your understanding and use of the other topics in the document.

20.1.1.11.2. Resource list

This topic describes the resources whose permissions you can grant to a RAM user. You can use an Alibaba Cloud account to grant a RAM user specific permissions on Log Service resources.

The following table lists the resources and relevant expressions.

Resource	Expression in policies
Project and Logstore	acs:log:${regionName}:${projectOwnerAliUid}:project/${projectName}/logstore/${logstoreName}
Project, Logstore, and LogShipper	acs:log:${regionName}:${projectOwnerAliUid}:project/${projectName}/logstore/${logstoreName}/shipper/${shipperName}
	acs:log:${regionName}:${projectOwnerAliUid}:project/${projectName}/logstore/*
Project and Logtail	acs:log:${regionName}:${projectOwnerAliUid}:project/${projectName}/logtailconfig/${logtailconfig}
	acs:log:${regionName}:${projectOwnerAliUid}:project/${projectName}/logtailconfig/*
	acs:log:${regionName}:${projectOwnerAliUid}:project/${projectName}/machinegroup/${machineGroupName}

Project and machine group Resource	Expression in policies
	acs:log:${regionName}:${projectOwnerAliUid}:project/${projectName}/machinegroup/*
Project and consumer group	acs:log:${regionName}:${projectOwnerAliUid}:project/${projectName}/logstore/${logstoreName}/consumergroup/${consumerGroupName}
	acs:log:${regionName}:${projectOwnerAliUid}:project/${projectName}/logstore/${logstoreName}/consumergroup/*
Project and saved search	acs:log:${regionName}:${projectOwnerAliUid}:project/${projectName}/savedsearch/${savedSearchName}
	acs:log:${regionName}:${projectOwnerAliUid}:project/${projectName}/savedsearch/*
Project and dashboard	acs:log:${regionName}:${projectOwnerAliUid}:project/${projectName}/dashboard/${dashboardName}
	acs:log:${regionName}:${projectOwnerAliUid}:project/${projectName}/dashboard/*
Project and alert	acs:log:${regionName}:${projectOwnerAliUid}:project/${projectName}/alert/${alarmName}
	acs:log:${regionName}:${projectOwnerAliUid}:project/${projectName}/alert/*
All types of resources	acs:log:${regionName}:${projectOwnerAliUid}:*
	acs:log:*:${projectOwnerAliUid}:*

Note The resources in Log Service have hierarchical relationships. Projects are root resources. Logstores, Logtail, and machine groups are parallel sub-resources of projects. LogShipper and consumer groups are sub-resources of Logstores.

The following table describes the parameters that are used in policies.

Parameter	Description
`${regionName}`	The name of a region.
`${projectOwnerAliUid}`	The ID of an Alibaba Cloud account.
`${projectName}`	The name of a project.
`${logstoreName}`	The name of a Logstore.
`${logtailconfig}`	The name of a Logtail configuration.
`${machineGroupName}`	The name of a machine group.

Parameter	Description
`${shipperName}`	The name of a LogShipper rule.
`${consumerGroupName}`	The name of a consumer group.
`${savedSearchName}`	The name of a saved search.
`${dashboardName}`	The name of a dashboard.
`${alarmName}`	The name of an alert rule.

20.1.1.11.3. Action list

This topic describes the actions that a RAM user can perform on Log Service resources after you grant the relevant permissions to the RAM user in the RAM console.

Actions

In the RAM console, you can authorize a RAM user to perform the following actions on Log Service resources.

Action	Description
CreateProject	Creates a project.
GetLogs	Queries logs in a Logstore of a project.
GetHistograms	Queries the distribution of logs in a Logstore of a project.
GetLogstore	Queries the attributes of a Logstore.
ListLogstore	Lists all Logstores in a project.
CreateLogstore	Creates a Logstore in a project.
DeleteLogstore	Deletes a Logstore, including all shards and indexes in the Logstore.
UpdateLogstore	Updates the attributes of a Logstore.
GetCursorOrData (GetCursor and PullLogs)	Queries a cursor based on a point in time. It can also be used to query logs based on a cursor and quantity.
ListShards	Lists all available shards in a Logstore.
PostLog	Writes log data to a Logstore.
CreateConfig	Creates a Logtail configuration in a project.
UpdateConfig	Updates a Logtail configuration.

Action	Description
DeleteConfig	Deletes a Logtail configuration.
GetConfig	Queries the details of a Logtail configuration.
UpdateConfig	Lists all Logtail configurations in a project. You can set the relevant parameters to show the configurations on multiple pages.
CreateMachineGroup	Creates a machine group to specify the servers from which logs are collected.
UpdateMachineGroup	Updates the information of a machine group.
DeleteMachineGroup	Deletes a machine group.
GetMachineGroup	Queries the details of a machine group.
ListMachineGroup	Lists machine groups.
ListMachines	Lists your machines in a machine group that is connected with Log Service.
ApplyConfigToMachineGroup	Applies a Logtail configuration to a machine group.
RemoveConfigFromMachineGroup	Deletes a Logtail configuration from a machine group.
GetAppliedConfigs	Queries the name of Logtail configuration applied to a machine group.
CreateConsumerGroup	Creates a consumer group in a Logstore.
UpdateConsumerGroup	Modifies the attributes of a consumer group.
DeleteConsumerGroup	Deletes a consumer group.
ListConsumerGroup	Lists all consumer groups of a Logstore.
UpdateCheckPoint	Updates the checkpoint of a shard for a consumer group.
HeartBeat	Sends a heartbeat packet to Log Service for a consumer.
GetCheckPoint	Queries the checkpoints of one or all shards from which data is consumed by a consumer group.
CreateIndex	Creates one or more indexes for a Logstore.
DeleteIndex	Deletes one or more indexes from a Logstore.
GetIndex	Queries one or more indexes of a Logstore.

Action	Description
UpdateIndex	Updates one or more indexes of a Logstore.
log:CreateSavedSearch	Creates a saved search.
log:UpdateSavedSearch	Updates a saved search.
log:GetSavedSearch	Queries a saved search.
log:DeleteSavedSearch	Deletes a saved search.
log:ListSavedSearch	Queries the saved search list.
log:CreateDashboard	Creates a dashboard.
log:UpdateDashboard	Updates a dashboard.
log:GetDashboard	Queries a dashboard.
log:DeleteDashboard	Deletes a dashboard.
log:ListDashboard	Queries the dashboard list.
log:CreateJob	Creates a job, for example, an alert or subscription.
log:UpdateJob	Updates a job.
log:CreateApp	Grants a RAM user the permission to create an application, for example, Cost Manager or Log Audit Service.
log:UpdateApp	Grants a RAM user the permission to update an application, for example, Cost Manager or Log Audit Service.
log:GetApp	Grants a RAM user the permission to view an application, for example, Cost Manager or Log Audit Service.
log:DeleteApp	Grants a RAM user the permission to delete an application, for example, Cost Manager or Log Audit Service.

20.1.1.11.4. Authentication rules

When a RAM user calls Log Service API operations to access the resources of an Alibaba Cloud account, Log Service authenticate the RAM user. This ensures that the resource owner has granted the RAM user the relevant permissions on the resources. This topic describes the authentication rules that apply when a RAM user calls Log Service APIs to access the resources of an Alibaba Cloud account.

Logstore authentication rules

Each Log Service API operation determines which permissions to check based on the relevant resources and the API syntax. The following table describes the Logstore authentication rules for the relevant API operations.

Operation	Resource
log:GetLogStore	acs:log:${regionName}:${projectOwnerAliUid}:project/${projectName}/logstore/${logstoreName}
log:ListLogStores	acs:log:${regionName}:${projectOwnerAliUid}:project/${projectName}/logstore/*
log:CreateLogStore	acs:log:${regionName}:${projectOwnerAliUid}:project/${projectName}/logstore/*
log:DeleteLogStore	acs:log:${regionName}:${projectOwnerAliUid}:project/${projectName}/logstore/${logstoreName}
log:UpdateLogStore	acs:log:${regionName}:${projectOwnerAliUid}:project/${projectName}/logstore/${logstoreName}

LogHub authentication rules

The following table describes the LogHub authentication rules of the relevant data write and consumption API operations. The GetCursor and GetLogs API operations are included in the log:GetCursorOrData API operation.

Operation	Resource
log:GetCursorOrData	acs:log:${regionName}:${projectOwnerAliUid}:project/${projectName}/logstore/${logstoreName}
log:ListShards	acs:log:${regionName}:${projectOwnerAliUid}:project/${projectName}/logstore/${logstoreName}
log:PostLogStoreLogs	acs:log:${regionName}:${projectOwnerAliUid}:project/${projectName}/logstore/${logstoreName}

Configuration authentication rules

Operation	Resource
log:CreateConfig	acs:log:${regionName}:${projectOwnerAliUid}:project/${projectName}/logtailconfig/*
log:UpdateConfig	acs:log:${regionName}:${projectOwnerAliUid}:project/${projectName}/logtailconfig/${logtailConfigName}

Operation	Resource
log:DeleteConfig	acs:log:${regionName}:${projectOwnerAliUid}:project/${projectName}/logtailconfig/${logtailConfigName}
log:GetConfig	acs:log:${regionName}:${projectOwnerAliUid}:project/${projectName}/logtailconfig/${logtailConfigName}
log:ListConfig	acs:log:${regionName}:${projectOwnerAliUid}:project/${projectName}/logtailconfig/*

Machine group authentication rules

Operation	Resource
log:CreateMachineGroup	acs:log:${regionName}:${projectOwnerAliUid}:project/${projectName}/machinegroup/*
log:UpdateMachineGroup	acs:log:${regionName}:${projectOwnerAliUid}:project/${projectName}/machinegroup/${machineGroupName}
log:DeleteMachineGroup	acs:log:${regionName}:${projectOwnerAliUid}:project/${projectName}/machinegroup/${machineGroupName}
log:GetMachineGroup	acs:log:${regionName}:${projectOwnerAliUid}:project/${projectName}/machinegroup/${machineGroupName}
log:ListMachineGroup	acs:log:${regionName}:${projectOwnerAliUid}:project/${projectName}/machinegroup/*
log:ListMachines	acs:log:${regionName}:${projectOwnerAliUid}:project/${projectName}/machinegroup/${machineGroupName}

Interactive API operations for configurations and machine groups

Operation	Resource
log:ApplyConfigToGroup	acs:log:${regionName}:${projectOwnerAliUid}:project/${projectName}/logtailconfig/${logtailConfigName} acs:log:${regionName}:${projectOwnerAliUid}:project/${projectName}/machinegroup/${machineGroupName}

Operation	Resource
log:RemoveConfigFromGroup	acs:log:${regionName}:${projectOwnerAliUid}:project/${projectName}/logtailconfig/${logtailConfigName} acs:log:${regionName}:${projectOwnerAliUid}:project/${projectName}/machinegroup/${machineGroupName}
log:GetAppliedMachineGroups	acs:log:${regionName}:${projectOwnerAliUid}:project/${projectName}/logtailconfig/${logtailConfigName}
log:GetAppliedConfigs	acs:log:${regionName}:${projectOwnerAliUid}:project/${projectName}/machinegroup/${machineGroupName}

20.1.1.12. Description of common resources

20.1.1.12.1. Encrypt data

Log Service allows you to use Key Management Service (KMS) to encrypt data for secure storage. This topic describes the data encryption mechanism of Log Service and how to encrypt data by using KMS.

Data encryption mechanism

Log Service encrypts data by using KMS. The data encryption mechanism has the following characteristics:

- Log Service supports the Advanced Encryption Standard (AES) encryption algorithm.和国密算法SM4
- You can create and manage a customer master key (CMK) in the KMS console to ensure the security of the CMK.
- Log Service supports the following encryption types:
  - Service key-based encryption: Log service generates an independent service key for each Logstore. The service key never expires.
  - Bring Your Own Key (BYOK) encryption: You can create a CMK in the KMS console and grant the relevant permissions to Log Service. When Log Service calls a KMS API operation, this CMK is used to create a key for data encryption. If the CMK is deleted or disabled, the BYOK key becomes invalid.

Notice

- You can configure data encryption for a Logstore only when you call the CreateProject operation to create the Logstore. The algorithm or type of data encryption cannot be changed after the Logstore is created.
- If the CMK created in the KMS console becomes invalid, all read and write requests on the Logstore fail.
- The CMK generated by the service key of Log Service does not rotate.

Service key-based encryption

When you call the CreateProject operation to create a Logstore, add the encrypt_conf node to encrypt data by using the following sample code:

```
encrypt_conf = {
    "enable" : True, # If you set the value to True, data encryption is enabled.
    "encrypt_type": "aes_gcm", # The encryption algorithm. You can set the value tosm4_gcm
或aes_gcm.
}
```

Bring Your Own Key (BYOK) encryption

1. In the KMS console, create a BYOK.

   For more information, see the **Key Management Service (KMS) > Create a CMK** topic in *User Guide*.

2. Create a level -1 organization.

   i. Log on to the Apsara Uni-manager Management Console. For more information, see the **User Guide > Log on to the Apsara Uni-manager Management Console** topic.

   ii. Creates an organization. For more information, see the **User Guide > Enterprise > Organizations > Create an organization** topic in *User Guide*.

3. Create a RAM role for a level -1 organization.

   i. In the top navigation bar of the Apsara Uni-manager Management Console, click **Configurations**.

   ii. On the **RAM Service Linked Role** tab, click **Create RAM Role**.

   iii. In the **Organization Name** drop-down list, select the created organization. In the **Service Name** drop-down list, select **Log Service**, and click **OK**.

   iv. On the **RAM Service Linked Role** page, find the AliyunLogAccessingKMSRole service role, and click **Details** to obtain the ARN of the RAM role.

4. When you call the CreateProject operation to create a Logstore, add the encrypt_conf node to encrypt data by using the following sample code:

```
encrypt_conf = {
    "enable" : True, # If you set the value to True, data encryption is enabled.
    "encrypt_type": "aes_gcm", # The encryption algorithm. You can set the value tosm4_
gcm或aes_gcm.
    "user_cmk_info":
        {
            "cmk_key_id": "", # The ID of the CMK that you created in Step 1.
            "arn": "", # The ARN of the RAM role that is obtained in Step 3.
            "region_id" : ""# The ID of the region where the CMK resides.
        }
}
```

20.1.1.12.2. Data model

This topic describes the data model of Log Service.

Project

A project is a basic management unit in Log Service and is used to isolate and control resources. You can use a project to manage all logs and log sources of an application.

Logstore

A Logstore is a unit that collects, stores, and consumes logs in Log Service. Each Logstore belongs to a single project. Each project can have multiple Logstores. You can create multiple Logstores for a project based on your business requirements. We recommend that you create an independent Logstore for each type of logs in an application. For example, you have a game application named big-game. The server stores three types of logs: operation_log, application_log, and access_log. You can create a project named big-game and then create three Logstores in the project to collect, store, and query the three types of logs.

Log

A log is the minimum data unit that is processed in Log Service. Log Service uses a semi-structured data model to define a log. The data model is as follows:

- Topic: a user-defined field that marks multiple logs. For example, access logs can be marked based on the sites. This field is an empty string by default. An empty string is also a valid topic.
- Time: a reserved field in a log, used to indicate the time when the log is generated. This value is a Unix timestamp representing the number of seconds that have elapsed since the epoch time January 1, 1970, 00:00:00 UTC.
- Content: a field that records the content of a log. The content consists of one or more content items. Each content item is a key-value pair.
- Source: a field that indicates the source of a log, for example, the IP address of the machine where the log is generated. This field is empty by default.

The following table describes the requirements for the values of these fields.

Log fields

Field	Requirement
time	An integer in the Unix timestamp format. Unit: seconds.

Field	Requirement
topic	A UTF-8 encoded string of up to 128 characters.
source	A UTF-8 encoded string of up to 128 characters.
content	One or more key-value pairs. A key is a UTF-8 encoded string of up to 128 characters. It can contain only letters, underscores (_), and digits. It cannot start with a digit. A value is a UTF-8 encoded string of up to 1,048,576 (1024 × 1024) bytes.

Note The key in the content field cannot be any of the following keywords: `__time__`, `__source__`, `__topic__`, `__partition_time__`, and `_extract_others_`.

Topic

Logs in a Logstore can be grouped by topics. Topics can be specified when you write logs to a Logstore. For example, you can use your user ID as the topic of a log when you write the log to a Logstore. If you do not need to group logs in a Logstore, you can specify the same topic for all logs.

Note An empty string is a valid topic. The topic of a log is an empty string by default.

Logs are used in various formats in actual scenarios. The following example shows how to map a raw NGINX access log to the log data model of Log Service. In this example, the IP address of your NGINX server is 10.10.10.1. A raw log on this server is as follows:

```
10.1.1.1 - - [01/Mar/2012:16:12:07 +0800] "GET /Send? AccessKeyId=<yourAccessKeyId> HTTP/1.
1" 200 5 "-" "Mozilla/5.0 (X11; Linux i686 on x86_64; rv:10.0.2) Gecko/20100101 Firefox/10.
0.2"
```

The following table describes how to map the raw log to the log data model of Log Service.

Log data model of Log Service

Field	Field value	Description
topic	“”	The default value (empty string) is used.
time	1330589527	The time when the log was generated. The time is converted from the timestamp of the raw log. Unit: seconds.
source	“10.10.10.1”	The IP address of the server is used as the log source.
content	Key-value pair	The content of the log.

You can decide how to extract the raw log content and combine the extracted content into key-value pairs. The following table describes custom key-value pairs.

Custom key-value pairs

Key	Value
ip	“10.1.1.1”
method	“GET”
status	“200”
length	“5”
ref_url	“- “
browser	“Mozilla/5.0 (X11; Linux i686 on x86_64; rv:10.0.2) Gecko/20100101 Firef

LogGroup

A group of logs.

Logs

A collection of multiple logs.

LogGroupList

A collection of log groups that are used to return results.

Encoding method

The following table describes the content encoding method that is supported by Log Service. The RESTful API layer is indicated by Content-Type.

Supported encoding method

Encoding method	Content-Type	Description
ProtoBuf	The data model is encoded by Protocol Buffer.	application/x-protobuf

The following sample code shows how to use Protocol Buffer to define the objects in the data model:

```
message Log
{
    required uint32 Time = 1;// Unix time format
    message Content
    {
        required string Key = 1;
        required string Value = 2;
    }
    repeated Content Contents= 2;
}
message LogGroup
{
    repeated Log Logs= 1;
    optional string Reserved = 2; // Reserved fields
    optional string Topic = 3;
    optional string Source = 4;
}
message LogGroupList
{
    repeated LogGroup logGroupList = 1;
}
```

Note When you use the Protocol Buffer format, key-value pairs must be unique. Otherwise, an undefined behavior occurs.

20.1.1.12.3. Data encoding

Log Service uses Protocol Buffer as the standard log format. You can write logs to Log Service in the Protocol Buffer format.

Protocol Buffer is used as a format to interchange structured data. Before you write logs to Log Service by calling relevant API operations, you must serialize raw log data to Protocol Buffer data streams as follows:

```
message Log
{
    required uint32 time = 1; // UNIX Time Format
    message Content
    {
        required string key = 1;
        required string value = 2;
    }
    repeated Content contents= 2;
}
message LogGroup
{
    repeated Log logs= 1;
    optional string reserved =2; // An internal field. You do not need to specify this fiel
d.
    optional string topic = 3;
    optional string source = 4;
}
message LogGroupList
{
    repeated LogGroup logGroupList = 1;
}
```

Note

- When you use the Protocol Buffer format, key-value pairs must be unique. Otherwise, an undefined behavior occurs.
- For more information about the Protocol Buffer format, visit GitHub.
- For more information about the API operations that write logs to Log Service, see PostLog.

20.1.1.12.4. Logstores

A Logstore is a data storage unit. You can create up to 10 Logstores for each project by default. The name of a Logstore must be unique in the project to which the Logstore belongs. A Logstore is the portal for all log data. You can read data from or write data to the Logstore.

The naming rules for Logstores are as follows:

- The name can only contain lowercase letters, digits, hyphens (-), and underscores (_).
- The name must start and end with a lowercase letter or a digit.
- The name must be 2 to 63 characters in length.

Example

```
{
    "logstoreName" : "access_log",
    "ttl": 1,
    "shardCount": 2,
    "createTime":1439538649,
    "lastModifyTime":1439538649
}
```

The following table describes the Logstore parameters.

Logstore parameters

Parameter	Type	Required	Description
logstoreName	String	Yes	The name of the Logstore. The name must be unique in the project to which the Logstore belongs.
ttl	Integer	Yes	The time to live (TTL) of log data. Unit: days. Minimum value: 1.
shardCount	Integer	Yes	The number of shards in the Logstore.
createTime	Integer	No	The time when the Logstore was created in Log Service. This parameter is displayed only in the output result.
lastModifyTime	Integer	No	The time when the Logstore is updated in Log Service. This parameter is displayed only in the output result.

20.1.1.12.5. Shards

A shard is a basic read/write unit in each Logstore. You can specify the number of shards in each Logstore.

To read data from a shard, you must specify the shard. To write data to a shard, you do not need to specify the shard. Instead, you can use the load balancing mode. In this mode, data is written to multiple shards based on automatic balancing. This ensures high availability of the write operation.

The following table describes the parameters of a shard.

Shard parameters

Parameter	Type	Required	Description
shardID	Integer	Yes	The unique ID of a shard in the Logstore. The shard ID is automatically generated by the system.

20.1.1.12.6. Logtail configurations

You can create up to 100 Logtail configurations for a project. The name of a Logtail configuration must be unique in a project.

You can use a Logtail configuration to specify the location, method, and parameters for log collection.

The naming rules for Logtail configurations are as follows:

- The name can only contain lowercase letters, digits, hyphens (-), and underscores (_).

- The name must start and end with a lowercase letter or a digit.
- The name must be 2 to 128 characters in length.

Example

```
{
    "configName": "testcategory1",
    "inputType": "file",
    "inputDetail": {
        "logType": "common_reg_log",
        "logPath": "/var/log/httpd/",
        "filePattern": "access.log",
        "localStorage": true,
        "timeFormat": "%Y/%m/%d %H:%M:%S",
        "logBeginRegex": ".*",
        "regex": "(\w+)(\s+)",
        "key" :["key1", "key2"],
        "filterKey":["key1"],
        "filterRegex":["regex1"],
        "topicFormat": "none"
    },
    "outputType": "sls",
    "outputDetail":
    {
        "logstoreName": "perfcounter"
    },
    "createTime": 1400123456,
    "lastModifyTime": 1400123456
}
```

The following table describes the configuration parameters.

Configuration parameters

Parameter	Type	Required	Description
configName	String	Yes	The name of the Logtail configuration. The name must be unique in a project.
inputType	String	Yes	The input type. Default value: file.
inputDetail	json	Yes	See the following table.
outputType	String	Yes	The output type. Only LogService is supported.
outputDetail	String	Yes	See the following table.
createTime	Integer	No	The time when the Logtail configuration was created.

Parameter	Type	Required	Description
lastModifyTime	Integer	No	The time when the Logtail configuration was last updated on Log Service.

The following table describes the elements of the inputDetail parameter.

inputDetail elements

Element	Type	Required	Description
logType	String	Yes	The log type. Valid value: common_reg_log.
logPath	String	Yes	The parent directory where the log resides, for example, `/var/logs/`.
filePattern	String	Yes	The pattern of the log file, for example, `access*.log`.
localStorage	Boolean	Yes	Specifies whether to enable the local cache. Logs up to 1 GB can be locally cached when the link to Log Service is disconnected.
timeFormat	String	Yes	The format of the log time, for example, `%Y/%m/%d %H:%M:%S`.
logBeginRegex	String	Yes	The regular expression that specifies the pattern of the first line of a log. This parameter is applicable to multiline logs.
regex	String	Yes	The regular expression that is used to extract logs.
key	Array	Yes	The key that is generated after logs are extracted.
filterKey	Array	Yes	The key that is used to filter logs. A log meets the requirements only when the key value matches the regular expression specified in the corresponding filterRegex column.

Element	Type	Required	Description
filterRegex	Array	Yes	The regular expression that is specified for each filterKey. The length of filterRegex must be the same as that of filterKey.
topicFormat	String	No	Specifies part of the log file path as the topic, for example, `/var/log/(. *).log`. The default value is none, indicating that the topic is null.
preserve	Boolean	No	Valid values: true and false. The value true indicates that the directory monitoring never times out. The value false indicates that the timeout period for directory monitoring is 30 minutes. Default value: true.
preserveDepth	Integer	No	Specifies the depth of the monitored directories if the preserve parameter is set to false. Maximum value: 3.

The following table describes the elements of the outputDetail parameter.

outputDetail elements

Element	Type	Required	Description
logstoreName	String	Yes	The name of the Logstore.

20.1.1.12.7. Logtail machine group

After a machine with Logtail is started, the machine is automatically associated with the user specified in the Logtail configurations. The machine can be identified by using the following three methods:

- IP address: the IP address corresponding to the hostname. This is the simplest method, but the IP address may be duplicated in environments such as Virtual Private Cloud (VPC).
- Universally unique identifier (UUID): the UUID of the desktop management interface (DMI) device. For more information, visit RFC 4122.
- User-defined ID: the user-defined machine identifier in the Logtail directory.

The attributes of each machine are as follows:

```
{
    "ip" : "testip1",
    "machine-uniqueid" : "testuuid1",
    "userdefined-id" : "testuserdefinedid1",
    "lastHeartbeatTime”:1397781420
 }
```

The following table describes the machine attribute parameters.

Parameters

Parameter	Type	Description
ip	String	The IP address corresponding to the machine hostname.
machine-uniqueid	String	The unique primary key marked by the machine. The primary key is uploaded by Logtail.
userdefined-id	String	The user-defined machine identifier that is uploaded by Logtail.
lastHeartbeatTime(output-only)	Integer	The last heartbeat time of the machine. The value is a Unix timestamp representing the number of seconds that have elapsed since the epoch time.

machinegroup

The machinegroup parameter indicates the machine group that belongs to the current user in the project. The machine group can be identified by an IP address or user-defined ID. IP addresses are more easily identified than user-defined IDs. However, user-defined IDs can identify machine groups in VPC even when repeated IP addresses exist. You can select either of the two machine identification methods based on your business requirements.

The naming rules of machine groups are as follows:

- The name can contain only lowercase letters, digits, hyphens (-), and underscores (_).
- The name must start and end with a lowercase letter or digit.
- The name must be 2 to 128 characters in length.

Example

```
{
    "groupName" : "testgroup",
    "groupType" : "",
    "groupAttribute" : {
        "externalName" : "testgroup",
        "groupTopic": "testgrouptopic"
    },
    "machineIdentifyType": "ip",
    "machineList" : [
        "ip1",
        "ip2"
        ...
    ],
    "createTime": 1431705075,
    "lastModifyTime" : 1431705075
}
```

The following table lists the parameters of a machine group.

Machine group parameters

Parameter	Type	Required	Description
groupName	String	Yes	The name of the machine group. The name must be unique in a project.
groupType	String	No	The type of the machine group. Default value: null.
machineIdentifyType	String	Yes	The machine identification type. Valid values: ip or userdefined-id.
groupAttribute	object	Yes	The attribute of the machine group. Default value: null.
machineList	Array	Yes	The list of machine identifiers. Valid values: IP addresses or user-defined identifiers.
createTime(output-only)	Integer	No	The time when the machine group was created.
lastModifyTime(output-only)	Integer	No	The time when the machine group was last updated on Log Service.

The following table describes the parameters of groupAttribute.

groupAttribute parameters

Parameter	Type	Required	Description
groupTopic	String	No	The topic of the machine group. Default value: null.
externalName	String	No	The external management identifier on which the machine group depends. Default value: null.

20.1.2. SDK Reference

20.1.2.1. Introduction

20.1.2.1.1. Overview

Log Service provide software development kits (SDKs) for multiple languages, such as Java, .NET, Python, PHP, and C. You can select an SDK based on your business requirements.

Log Service SDKs are implemented based on Log Service APIs. Log Service SDKs provide the same capabilities as Log Service APIs. For more information about Log Service APIs, see API Reference.

Before you can use a Log Service SDK, you must have an active Alibaba Cloud AccessKey pair (AccessKey ID and AccessKey secret).

In addition, you must specify the endpoint of Log Service in the SDK. For more information, see Basic configurations.

Log Service SDKs can be regarded as Log Service APIs that are encapsulated in different languages to provide the following features:

- Uniform encapsulation. Log Service APIs are uniformly encapsulated. You do not need to create API requests and parse API responses. For more information, see API specifications. The APIs in different languages are similar. This simplifies the switchover between different languages.
- Automatic digital signatures. You do not need to specify the digital signature logic of Log Service APIs. This simplifies the use of Log Service APIs.
- Protocol Buffer-formatted encapsulation. The logs collected by Log Service are encapsulated in the Protocol Buffer format. You do not need to specify the format.
- Automatic compression. Logs are compressed by using the method defined in Log Service APIs. You do not need to manually compress logs. SDKs in some languages allow you to specify whether to write logs in the compression mode. The compression mode is used by default.
- Centralized error handling methods. You can use SDKs to handle errors based on the relevant language. For more information, see Error handling.
- Synchronous requests. SDKs in all languages support only synchronous requests.

The following table describes the download address and user guide of Log Service SDKs in different languages.

SDK language	Documentation	Source code
Java	SDK for Java and Log Service SDK for Java 0.6.0 API	GitHub

SDK language	Documentation	Source code
.NET	SDK for .NET and Aliyun.Api.SLS Namespace	GitHub
PHP	SDK for PHP and SLS_PHP_SDK	GitHub
Node.js	SDK for Node.js	GitHub
Python	SDK for Python and Python documentation	GitHub
C	SDK for C	GitHub
GO	SDK for Go	GitHub
iOS	SDK for iOS	GitHub
Android	SDK for Android	GitHub
C++	SDK for C ++	GitHub

20.1.2.1.2. Basic configurations

Before you can use SDKs to interact with Log Service, you must configure the basic settings. This topic describes the basic SDK configurations.

Basic configurations:

- Endpoint: You must specify the endpoint that is used by the client to access Log Service.
- AccessKey pair (AccessKey ID and AccessKey secret): You must specify the AccessKey pair that is used by the client to access Log Service.

The following sections describe how to use endpoints and AccessKey pairs.

Endpoint

Before you use an SDK, you must determine the access method and endpoint.

1. When you select an endpoint for a client instance, make sure that the region of your project is the same as the region of your endpoint. Otherwise, you cannot use the SDK to access your project.
2. All API endpoints support only the HTTP protocol.

AccessKey pairs

All interaction requests that are sent to Log Service must be authenticated. An AccessKey pair that consists of an AccessKey ID and AccessKey secret is the critical factor for the authentication. When you create a client instance, you must specify an AccessKey ID and AccessKey secret. You must obtain an AccessKey pair in the Apsara Uni-manager Management Console.

> **Note**
>
> - An Apsara Stack tenant account can have multiple AccessKey pairs. You must specify the AccessKey ID and AccessKey secret of the same AccessKey pair when you create a client instance. Otherwise, authentication fails.
> - The specified AccessKey must be in the Enabled state. Otherwise, the requests are denied by Log Service. To view the status of the AccessKey pair, you can log on to the Apsara Uni-manager Management Console.

Examples

Assume that you want to access a project and you have an AccessKey pair that is in the Enabled state. The following AccessKey pair is used:

```
AccessKeyId = "<yourAccessKeyId>"
AccessKeySecret = "<yourAccessKeySecret>"
```

You can use the following snippets to create a client instance based on the language:

- Java

```
String endpoint = "regionid.example.com"; // Specify the endpoint based on your region an
d access method.
String accessKeyId = "<youraccessKeyId>"; // Specify your AccessKey ID.
String accessKeySecret = "<youraccessKeySecret>"; // Specify your AccessKey secret.
Client client = new Client(endpoint, accessKeyId, acccessKeySecret);
//use client to operate log service project......
```

- .NET(C#)

```
String endpoint = "regionid.example.com"; // Specify the endpoint based on your region an
d access method.
String accessKeyId = "<youraccessKeyId>"; // Specify your AccessKey ID.
String accessKeySecret = "<youraccessKeySecret>"; // Specify your AccessKey secret.
SLSClient client = new SLSClient(endpoint, accessKeyId, accessKeySecret);
//use client to operate sls project......
```

- PHP

```
$endpoint = 'regionid.example.com'; // The endpoint of the China (Hangzhou) region is use
d as an example. Replace it with the actual endpoint based on your region and access meth
od.
$accessKeyId = '<youraccessKeyId>'; // Specify your AccessKey ID.
$accessKey = '<youraccessKey>'; // Specify your AccessKey secret.
$client = new Aliyun_Sls_Client($endpoint, $accessKeyId, $accessKey);
//use client to operate sls project......
```

- Python

```
# // Specify the endpoint based on your region and access method.
endpoint = 'regionid.example.com'
# Specify your AccessKey ID.
accessKeyId = '<youraccessKeyId>'
# Specify your AccessKey secret.
accessKey = '<youraccessKey>'
client = LogClient(endpoint, accessKeyId, accessKey)
#use client to operate log project......
```

20.1.2.1.3. Error handling

SDK errors are divided into the following types:

- Errors returned by Log Service. Errors of this type are handled by SDKs. For more information about this error type, see the common error codes of the Log Service API operations.
- Network errors that occur when you send requests to the server by using SDKs. This type of errors include network disconnection and server response timeout.
- Errors that are generated by SDKs and related to platforms or languages, for example, memory overflows.

All SDKs provided by Alibaba Cloud handle errors by throwing exceptions based on the following principles:

- The first and second types of errors are encapsulated as the LogException class and sent to users by SDKs.
- The third type of errors are not handled by SDKs, but are sent to users as the platform-specific and language-specific NativeException class.

LogException

The LogException class is defined by SDKs to handle the logical errors of Log Service. This class inherits the base class for all exceptions from each language, and provides the following exception information:

- Error code: indicates the error type. For an error returned by Log Service when you use an SDK, the error code is the same as that returned by the relevant API operation. The error code of SDK network request errors is RequestError. For more information, see API Reference.
- Error message: indicates the message that is returned together with an error. For an error returned by Log Service when you use an SDK, the error message is the same as that returned by the relevant API operation. The error message of network errors is "request is failed". For more information, see the relevant API reference.
- Request ID: indicates the ID of the request for which the current error is returned. The request ID is generated by Log Service. This ID is returned only when an error message is returned by Log Service. Otherwise, an empty string is returned. If you receives a request error, you can provide the relevant request ID to the Log Service team for troubleshooting.

Request failures and retries

When you use an SDK to access Log Service, the access request may fail due to temporary network disconnection, transmission delay, and slow server response. These errors are sent as exceptions. Log Service does not implement retry logic. When you use the SDK, you must customize the handling logic, for example, retry the request or report an error.

Examples

For example, you want to access a project named big-game and retry the access request for a specified number of times in the case of network exceptions. You can use the following snippets based on the language:

- Java

```
// Other code...
String accessId = "<youraccessId>";   // Specify your AccessKey ID.
String accessKey = "<youraccessKey>"; // Specify your AccessKey secret.
String project = "big-game";
String endpoint = "regionid.example.com";
int max_retries = 3;
/*
 * Create a client.
 */
Client client = new Client(accessId, accessKey, endpoint);
ListLogStoresRequest lsRequest = new ListLogStoresRequest(project);
for (int i = 0; i < max_retries; i++)
{
    try
    {
        ListLogStoresResponse res = client.ListLogStores(lsRequest)
        // Process the returned data...
        break;
    }
    catch(LogException ex)
    {
        if (e.GetErrorCode() == "RequestError")
        {
            if ( i == max_retries - 1)
            {
                System.out.println("request is still failed after all retries.");
                break;
            }
            else
                System.out.println("request error happens, retry it!") ;
        }
        else
        {
            System.out.println("error code :" + e.GetErrorCode());
            System.out.println("error message :" + e.GetErrorMessage());
            System.out.println("error requestId :" + e.GetRequestId());
            break;
        }
    }
    catch(...)
    {
        System.out.println("unrecoverable exception when listing logstores.");
        break;
    }
}
// Other code...
```

- .NET(C#):

```
// Other code...
String accessId = "<youraccessId>";     // Specify your AccessKey ID.
String accessKey = "<youraccessKey>";    // Specify your AccessKey secret.
String project = "big-game";
String endpoint = "regionid.example.com";
int max_retries = 3;
// Create a client.
SLSClient client = new SLSClient(endpoint, accessId, accessKey);
ListLogstoresRequest request = new ListLogstoresRequest();
request.Project = project;
for (int i = 0; i < max_retries; i++)
{
    try
    {
        ListLogstoresResponse response = client.ListLogstores(request);
        // Process the returned data...
        break;
    }
    catch(LogException ex)
    {
        if (e.errorCode == "SLSRequestError")
        {
            if ( i == max_retries - 1)
            {
                Console.Writeline("request is still failed after all retries.");
                break;
            }
            else
            {
                Console.Writeline("request error happens, retry it!") ;
            }
        }
        else
        {
            Console.Writeline("error code :" + e.errorCode;
            Console.Writeline("error message :" + e.Message;
            Console.Writeline("error requestId :" + e.RequestId;
            break;
        }
    }
    catch(...)
    {
        Console.Writeline("unrecoverable exception when listing logstores.");
        break;
    }
}
// Other code...
```

- PHP

```
<? php
// Other code...
$endpoint = 'regionid.example.com';
$accessId = '<youraccessId>'; // Specify your AccessKey ID.
$accessKey = '<youraccessKey>'; // Specify your AccessKey secret.
$maxRetries = 3;
// Create a Log Service client.
$client = new Aliyun_Sls_Client($endpoint, $accessId, $accessKey);
$project = 'big-game';
$request = new Aliyun_Sls_Models_ListLogstoresRequest($project);
for($i = 0; $i < $maxRetries; ++$i)
{
    try
    {
        $response = $client->ListLogstores($request);
        // Process the returned data...
        break;
    }
    catch (Aliyun_Sls_Exception $e)
    {
        if ($e->getErrorCode()=='RequestError')
        {
            if ($i+1 == $maxRetries)
            {
                echo "error code :" . $e->getErrorCode() . PHP_EOL;
                echo "error message :" . $e->getErrorMessage() . PHP_EOL;
                break;
            }
            echo 'request error happens, retry it!' . PHP_EOL;
        }
        else
        {
            echo "error code :" . $e->getErrorCode() . PHP_EOL;
            echo "error message :" . $e->getErrorMessage() . PHP_EOL;
            echo "error requestId :" . $e->getRequestId() . PHP_EOL;
            break;
        }
    }
    catch (Exception $ex)
    {
        echo 'unrecoverable exception when listing logstores.' . PHP_EOL;
        var_dump($ex);
        break;
    }
}
// Other code...
```

- Python

```
// Other code...
endpoint = 'regionid.example.com'
accessId = '<youraccessId>' # Specify your AccessKey ID.
accessKey = '<youraccessKey>' # Specify your AccessKey secret.
maxRetries = 3
# Create a client.
client = Client(endpoint, accessId, accessKey)
project = 'big-game'
lsRequest = ListLogstoresRequest(project)
for i in xrange(maxRetries):
    try:
        res = client.ListLogstores(lsRequest)
        # Process the returned data...
        break
    except LogException as e:
        if e.getErrorCode() == "RequestError":
            if i+1 == maxRetries:
                print "error code :" + e.getErrorCode()
                print "error message :" + e.getErrorMessage()
                break
            else:
                print "request error happens, retry it!"
        else:
            print "error code :" + e.getErrorCode()
            print "error message :" + e.getErrorMessage()
            print "error requestId :" + e.getRequestId()
            break
    except Exception as e:
        print 'unrecoverable exception when listing logstores.'
        break
// Other code...
```

20.1.2.1.4. API specifications

SDKs in different languages are implemented in different methods. However, all relevant API operations comply with the request-response principle. These API operations are called by using the following procedure:

1. Create a request instance by using request parameters.
2. Call the corresponding API operation in the SDK and pass the API information to the request instance.
3. Encapsulate the results returned by the SDK interface into a response instance and then return the response instance to the user.

The following snippets show how to obtain the names of all Logstores in a project based on the preceding steps.

Java

```
// Other code...
String accessId = "<youraccessId>";     // Specify your AccessKey ID.
String accessKey = "<youraccessKey>";   // Specify your AccessKey secret.
String project = "your_project";        // Specify your project name.
String endpoint = "region_endpoint";// The China (Hangzhou) region is used as an example. S
pecify the endpoint based on your region and access method.
// Create a client instance.
Client client = new Client(endpoint, accessId, accessKey);
// Specify the project request parameter to initialize the ListLogstores request class.
ListLogStoresRequest lsRequest = new ListLogStoresRequest(project);
// Use the request instance to call the ListLogstores API operation. The returned parameter
is the corresponding response instance.
ListLogStoresResponse res = client.ListLogStores(lsRequest);
// Access the response instance to retrieve the request results.
ArrayList<String> names = res.GetLogStores();
// Other code...
```

.NET(C#)

```
// Other code...
String accessId = "<youraccessId>";     // Specify your AccessKey ID.
String accessKey = "<youraccessKey>";   // Specify your AccessKey secret.
String project = "your_project";        // Specify your project name.
String endpoint = "region_endpoint";// The China (Hangzhou) region is used as an example. S
pecify the endpoint based on your region and access method.
// Create a client instance.
SLSClient client = new SLSClient(endpoint, accessId, accessKey);
// Specify the project request parameter to initialize the ListLogstores request class.
ListLogStoresRequest lsRequest = new ListLogStoresRequest();
lsRequest.Project = project;
// Use the request instance to call the ListLogstores API operation. The returned parameter
is the corresponding response instance.
ListLogStoresResponse res = client.ListLogStores(lsRequest);
// Access the response instance to retrieve the request results.
List<String> names = res.Logstores;
// Other code...
```

PHP

```
// Other code...
$accessId = "<youraccessId>";     // Specify your AccessKey ID.
$accessKey = "<youraccessKey>";   // Specify your AccessKey secret.
$project = "your_project";        // Specify your project name.
$endpoint = "region_endpoint";// The China (Hangzhou) region is used as an example. Specify
the endpoint based on your region and access method.
//Create a Log Service client instance.
$client = new Aliyun_Sls_Client($endpoint, $accessId, $accessKey);
// Specify the project request parameter to initialize the ListLogstores request class.
$request = new Aliyun_Sls_Models_ListLogstoresRequest($project);
// Use the request instance to call the ListLogstores API operation. The returned parameter
is the corresponding response instance.
$response = $client->listLogstores($request);
// Access the response instance to retrieve the request results.
$names = $response->getLogstores();
// Other code...
```

Python

```
// Other code...
accessId = '<youraccessId>';     // Specify your AccessKey ID.
accessKey = '<youraccessKey>';   // Specify your AccessKey secret.
project = 'your_project';        // Specify your project name.
endpoint = 'region_endpoint';// The China (Hangzhou) region is used as an example. Specify
the endpoint based on your region and access method.
# Create a client instance.
client = LogClient(endpoint, accessId, accessKey)
# Specify the project request parameter to initialize the ListLogstores request class.
lsRequest = ListLogstoresRequest(project)
# Use the request instance to call the ListLogstores API operation. The returned parameter
is the corresponding response instance.
res = client.list_logstores(lsRequest)
# Access the response instance to retrieve the request results.
names = res.get_logstores();
// Other code...
```

The Log Service SDKs implement multiple API operations such as ListLogStores, and define the corresponding request and response classes. The Log Service SDKs of different languages also provide secondary APIs encapsulated with these basic request-response APIs. You do not need to create request instances or parse the content of the response. For more information about the secondary interfaces, see the API reference of each SDK.

20.1.2.2. Java SDK

Log Service SDK for Java allows Java developers to perform operations in Log Service by using Java programs. You can use Maven dependencies to add the SDK. You can also download the SDK package to an on-premises server.

Download URL

Log Service SDK for Java supports J2SE V6.0 and later. Click here to download the latest SDK.

Step 1: Create an Apsara Stack tenant account

To access Log Service, you must create an account in the Apsara Uni-manager Management Console.

Step 2: Obtain an Apsara Stack AccessKey pair

To use Log Service SDK for Java, you must obtain an AccessKey pair.

Log on to the Apsara Uni-manager Management Console. Select an AccessKey pair for the SDK.

The AccessKey pair will be used in the following steps and must be kept confidential. For information about how to use an AccessKey pair in Log Service SDK for Java, see Basic configurations.

Step 3: Create a project and a Logstore in the Log Service console

Use Log Service SDK for Java to create a project and a Logstore.

> **Note**
>
> - The account that you use to create the project and the Logstore must be the same as the account that you used to obtain the AccessKey pair.
> - The project name must be unique in Log Service. The Logstore name must be unique in the project.
> - After you create the project, you cannot modify its region or migrate the project across regions.

Step 4: Install a Java development environment

Log Service SDK for Java supports Java development environment J2SE V6.0 and later. You can visit the Java official website to download and install the Java development environment.

Step 5: Install Log Service SDK for Java

After you install the Java development environment, you must install Log Service SDK for Java. To install Log Service SDK for Java, use one of the following methods:

Download the latest SDK for Java package from Apache Maven. Add the following configurations to your Maven project:

```
<dependency>
         <groupId>com.google.protobuf</groupId>
         <artifactId>protobuf-java</artifactId>
         <version>2.5.0</version>
</dependency>
<dependency>
<groupId>com.aliyun.openservices</groupId>
<artifactId>aliyun-log</artifactId>
<version>0.6.7</version>
<exclusions>
        <exclusion>
            <groupId>com.google.protobuf</groupId>
            <artifactId>protobuf-java</artifactId>
       </exclusion>
</exclusions>
</dependency>
```

Download Log Service SDK for Java package, and then reference the local package in your Java project.

1. Download Log Service SDK for Java package. Log Service SDK for Java is periodically updated. You can use Maven to obtain the latest version.
2. Decompress the downloaded package to a specified directory. Log Service SDK for Java does not require installation.
3. Add all JAR packages (including third-party dependent packages) in the SDK package to your Java project. For more information, see the relevant documents about integrated development environment (IDE).

Step 6: Start a new Java project

The following sample code shows how to use Log Service SDK for Java. To interact with Log Service and obtain the relevant output, run the following sample code in a text editor or Java IDE:

```
package sdksample;
import java.util.ArrayList;
import java.util.List;
import java.util.Vector;
import java.util.Date;
import com.aliyun.openservices.log.Client;
import com.aliyun.openservices.log.common.*;
import com.aliyun.openservices.log.exception.*;
import com.aliyun.openservices.log.request.*;
import com.aliyun.openservices.log.response.*;
import com.aliyun.openservices.log.common.LogGroupData;
import com.aliyun.openservices.log.common.LogItem;

            System.out.println("Read log count:" + String.valueOf(res4.GetCount()));
            log_offset += log_line;
        }
        // Enable the analytics feature. You can use SQL statements only after you enable t
he analytics feature. You can log on to the Log Service console or use the SDK to enable th
e analytics feature.
        IndexKeys indexKeys = new IndexKeys();
        ArrayList<String> tokens = new ArrayList<String>();
        tokens.add(",");
        tokens.add(".");
        tokens.add("#");
        IndexKey keyContent = new IndexKey(tokens,false,"text");
        indexKeys.AddKey("index0",keyContent);
        keyContent = new IndexKey(new ArrayList<String>(),false,"long");
        indexKeys.AddKey("index1",keyContent);
        keyContent = new IndexKey(new ArrayList<String>(),false,"double");
        indexKeys.AddKey("index2",keyContent);
        IndexLine indexLine = new IndexLine(new ArrayList<String>(),false);
        Index index = new Index(7,indexKeys,indexLine);
        CreateIndexRequest createIndexRequest = new CreateIndexRequest(project,logstore,ind
ex);
        client.CreateIndex(createIndexRequest);
        // Use the analytics feature.
        GetLogsRequest req4 = new GetLogsRequest(project, logstore, from, to, "", " index0:
value | select avg(index1) as v1,sum(index2) as v2, index0 group by index0");
        GetLogsResponse res4 = client.GetLogs(req4);
        if(res4 ! = null && res4.IsCompleted()){
            for (QueriedLog log : res4.GetLogs()){
                LogItem item = log.GetLogItem();
                for(LogContent content : item.GetLogContents()){
                    System.out.print(content.GetKey()+":"+content.GetValue());
                }
                System.out.println();
            }
        }
    }
}
```

Usage notes

- To improve the I/O efficiency of your system, we recommend that you do not use SDKs to write data to Log Service. For information about the recommended data writing methods, see the "Producer Library" section in *User Guide*. *Producer Library*
- To call API operations for data consumption in Log Service, we recommend that you do not use SDKs. Log Service provides an advanced consumer library. The consumer library consumes data in a manner that is transparent to the user, and provides advanced features such as load balancing and

sequential consumption. For more information, see Consumer Library in *User Guide*. *Consumer Library*

20.1.2.3. .NET SDK

Log Service provides developers with Log Service SDK for .NET to simplify the use of Log Service.

Download URL

Log Service SDK for .NET allows developers on Windows to use Log Service on the .NET platform. Log Service SDK for .NET supports .NET Framework 3.5, .NET Framework 4.0, and .NET Framework 4.5. Even though different SDK files are used for different .NET Framework versions, the APIs and features of these versions are the same.

The download URL of Log Service SDK for .NET is GitHub.

Step 1: Create an Apsara Stack tenant account

To access Log Service, you must create an account in the Apsara Uni-manager Management Console.

Step 2: Obtain an AccessKey pair

To use Log Service SDK for .NET, you must obtain an AccessKey pair.

Log on to the Apsara Uni-manager Management Console and select an AccessKey pair for the SDK.

The AccessKey pair will be used in the following steps and must be kept confidential. For information about how to use an AccessKey pair in Log Service SDK for .NET, see Basic configurations.

Step 3: Create a project and a Logstore in the Log Service console

Use Log Service SDK for .NET to create a project and a Logstore.

> **Note**
>
> - The account that you use to create the project and the Logstore must be the same as the account that you used to obtain the AccessKey pair.
> - The project name must be unique in Log Service. The Logstore name must be unique in the project.
> - After you create the project, you cannot modify its region or migrate the project across regions.

Step 4: Install a .NET development environment

Log Service SDK for .NET supports the .NET Framework 3.5, .NET Framework 4.0, and .NET Framework 4.5 development environments. We recommend that you install one of the following .NET development environments:

- Microsoft .NET Framework 3.5, Microsoft .NET Framework 4.0, or Microsoft .NET Framework 4.5 (based on your environment)
- Visual Studio 2010 or later

Step 5: Download and install Log Service SDK for .NET

After you build a .NET development environment, you must install Log Service SDK for .NET. To install Log Service SDK for .NET, perform the following steps:

1. Download Log Service SDK for .NET.
   - Download Log Service SDK for .NET from GitHub.
   - Click here to download the latest Log Service SDK for .NET package.
2. Decompress the downloaded package to a specified directory. Log Service SDK for .NET does not require installation. The following step describes how to use the SDK in your Visual Studio project.

Step 6: Create a Log Service .NET project

After you install the .NET development environment and Log Service SDK for .NET, you can create a Log Service .NET project. For more information, see the LOG SDK Sample project in the SLS SDK 40 solution at GitHub.

20.1.2.4. .NET Core SDK

Context

Log Service SDK for .NET Core allows developers to use Log Service by using the .NET Core framework.

The download URL of Log Service SDK for .NET Core is GitHub.

Procedure

1. Create an Apsara Stack tenant account.

   To access Log Service, you must create an account in the Apsara Uni-manager Management Console.

2. Obtain an Apsara Stack AccessKey pair.

   To use Log Service SDK for .NET Core, you must obtain an Apsara Stack AccessKey pair.

   Log on to the Apsara Uni-manager Management Console and select an AccessKey pair for the SDK.

   The AccessKey pair will be used in the following steps and must be kept confidential. For information about how to use the AccessKey pair in Log Service SDK for .NET Core, see Basic configurations.

3. Create a project and a Logstore.

   Before you can use the SDK, you must create a project and a Logstore in the Log Service console.

   i. Log on to the Log Service console.
   ii. In the Projects section, click **Create Project**.
   iii. Enter a **Project Name**, select a **Region**, and then click **OK**.
   iv. In the **Projects** section, click the name of the project. On the page that appears, click the plus sign (**+**) in the left-side navigation pane.

   You can also click **Create** to create a Logstore as prompted after you create a project.

   v. In the dialog box that appears, set the required parameters, and then click **OK**.

   You must specify the Logstore name, data retention period, and number of shards. Set the number of shards based on your business requirements. In this example, four shards are created.

> Note
> - The account that you use to create the project and the Logstore must be the same as the account that you used to obtain the AccessKey pair.
> - The project name must be unique in Log Service. The Logstore name must be unique in the project.
> - After you create the project, you cannot modify its region or migrate the project across regions.

4. Install the .NET Core development environment.

   Log Service SDK for .NET Core supports the following versions:

   - .NET Core 2.0
   - .NET Framework (with .NET Core 1.x SDK) 4.6.2
   - .NET Framework (with .NET Core 2.0 SDK) 4.6.1

   For more information about all supported versions, visit GitHub.

5. Download and install Log Service SDK for .NET Core.

   After you build the .NET Core development environment, you must install Log Service SDK for .NET Core.

   i. Download Log Service SDK for .NET Core.

      Click here to download Log Service SDK for .NET Core from GitHub.

   ii. Decompress the downloaded package to a specified directory.

      Log Service SDK for .NET Core does not require installation. You can use Log Service SDK for .NET Core for your Visual Studio project.

6. Create a Log Service .NET Core project.

   After you install the .NET Core development environment and Log Service SDK for .NET Core, you can create a .NET Core project. For more information, visit GitHub Wiki.

20.1.2.5. PHP SDK

Log Service provides developers with Log Service SDK for PHP to simplify the use of Log Service.

Download URL

You can download Log Service SDK for PHP from GitHub:

Step 1: Create an Apsara Stack tenant account

To access Log Service, you must create an account in the Apsara Uni-manager Management Console.

Step 2: Obtain an Apsara Stack AccessKey pair

To use Log Service SDK for PHP, you must obtain an AccessKey pair.

Log on to the Apsara Uni-manager Management Console. Select an AccessKey pair for the SDK. The AccessKey pair consists of an AccessKey ID and an AccessKey secret.

The AccessKey pair will be used in the following steps and must be kept confidential. For information about how to use an AccessKey pair in Log Service SDK for PHP, see Basic configurations.

Step 3: Create a project and a Logstore in the Log Service console

Use Log Service SDK for PHP to create a project and a Logstore.

> **Note**
>
> - The account that you use to create the project and the Logstore must be the same as the account that you used to obtain the AccessKey pair.
> - The project name must be unique in Log Service. The Logstore name must be unique in the project.
> - After you create the project, you cannot modify its region or migrate the project across regions.

Step 4: Install a PHP development environment

Log Service SDK for PHP supports PHP V5.2.1 and later. You can install a supported PHP on an on-premises server and build a PHP development environment.

Step 5: Download and install Log Service SDK for PHP

After you build a PHP development environment, you must install Log Service SDK for PHP. To install Log Service SDK for PHP, perform the following steps:

1. Download the latest SDK for PHP package from GitHub.
2. Decompress the downloaded package to a specified directory. Log Service SDK for PHP does not require installation. Log Service SDK for PHP includes the SDK code, third-party dependent packages, and an autoloader to simplify the use of the SDK. The following step describes how to use the SDK in your PHP project.

Step 6: Create a PHP project

To interact with Log Service and obtain the output, you can run the following sample code in a text editor or the PHP integrated development environment (IDE):

```
<? php
/* Use the autoloader to load all required PHP modules. Specify the path of the file that c
ontains the autoloader. */
require_once realpath(dirname(__FILE__) . '/.. /Log_Autoload.php');
$endpoint = 'regionid.example.com'; // The endpoint of the China (Hangzhou) region is used
as an example. Replace it with the actual endpoint based on your region and access method.
$accessKeyId = '<youraccessKeyId>'; // Specify your AccessKey ID.
$accessKey = '<youraccessKey>'; // Specify your AccessKey secret.
$project = 'your_project'; // The name of the project created in the preceding steps.
$logstore = 'your_logstore'; // The name of the Logstore created in the preceding steps.
$client = new Aliyun_Log_Client($endpoint, $accessKeyId, $accessKey);
# List all Logstores in the current project.
$req1 = new Aliyun_Log_Models_ListLogstoresRequest($project);
$res1 = $client->listLogstores($req1);
var_dump($res1);
# Create a Logstore.
$req2 = new Aliyun_Log_Models_CreateLogstoreRequest($project,$logstore,3,2);
```

```
$res2 = $client -> createLogstore($req2);
# Wait until the Logstore takes effect.
sleep(60);
# Write logs.
$topic = "";
$source = "";
$logitems = array();
for ($i = 0; $i < 5; $i++)
{
    $contents = array('index1'=> strval($i));
    $logItem = new Aliyun_Log_Models_LogItem();
    $logItem->setTime(time());
    $logItem->setContents($contents);
    array_push($logitems, $logItem);
}
$req2 = new Aliyun_Log_Models_PutLogsRequest($project, $logstore, $topic, $source, $logitem
s);
$res2 = $client->putLogs($req2);
var_dump($res2);
# Pull the data.
# List the shard IDs in the Logstore.
$listShardRequest = new Aliyun_Log_Models_ListShardsRequest($project,$logstore);
$listShardResponse = $client -> listShards($listShardRequest);
foreach($listShardResponse-> getShardIds()  as $shardId)
{
    # Obtain the cursor that corresponds to each shard ID.
    $getCursorRequest = new Aliyun_Log_Models_GetCursorRequest($project,$logstore,$shardId,
null, time() - 60);
    $response = $client -> getCursor($getCursorRequest);
    $cursor = $response-> getCursor();
    $count = 100;
    while(true)
    {
        # Start to read data from a cursor.
        $batchGetDataRequest = new Aliyun_Log_Models_BatchGetLogsRequest($project,$logstore
,$shardId,$count,$cursor);
        var_dump($batchGetDataRequest);
        $response = $client -> batchGetLogs($batchGetDataRequest);
        if($cursor == $response -> getNextCursor())
        {
            break;
        }
        $logGroupList = $response -> getLogGroupList();
        foreach($logGroupList as $logGroup)
        {
            print ($logGroup->getCategory());
            foreach($logGroup -> getLogsArray() as $log)
            {
                foreach($log -> getContentsArray() as $content)
                {
                    print($content-> getKey().":".$content->getValue()."\t");
                }
                print("\n");
            }
```

```
        }
        $cursor = $response -> getNextCursor();
    }
}
# Before you query logs, wait for 1 minute.
sleep(60);
# Query the distribution of logs. Before you query logs, you must ensure that indexes are c
reated. Log Service SDK for PHP does not provide the API operation that you can call to cre
ate indexes. You must create indexes in the Log Service console.
$topic = "";
$query='';
$from = time()-3600;
$to = time();
$res3 = NULL;
while (is_null($res3) || (! $res3->isCompleted()))
{
    $req3 = new Aliyun_Log_Models_GetHistogramsRequest($project, $logstore, $from, $to, $to
pic, $query);
    $res3 = $client->getHistograms($req3);
}
var_dump($res3);
# Query log data.
$res4 = NULL;
while (is_null($res4) || (! $res4->isCompleted()))
{
    $req4 = new Aliyun_Log_Models_GetLogsRequest($project, $logstore, $from, $to, $topic, $
query, 5, 0, False);
    $res4 = $client->getLogs($req4);
}
var_dump($res4);
```

20.1.2.6. Python SDK

Log Service provides developers with Log Service SDK for Python to simplify the use of Log Service.

Download URLs

You can click here to download Log Service SDK for Python.

You can also download Log Service SDK for Python from GitHub:

https://github.com/aliyun/aliyun-log-python-sdk

Step 1: Create an Apsara Stack tenant account

To access Log Service, you must create an account in the Apsara Uni-manager Management Console.

Step 2: Obtain an Apsara Stack AccessKey pair

To use Log Service SDK for Python, you must obtain an AccessKey pair.

Log on to the Apsara Uni-manager Management Console. Select an AccessKey pair for the SDK. The AccessKey pair consists of an AccessKey ID and an AccessKey secret.

The AccessKey pair will be used in the following steps and must be kept confidential. For information about how to use an AccessKey pair in Log Service SDK for Python, see Basic configurations.

Step 3: Create a project and a Logstore in the Log Service console

Before you can use the SDK, you must create a project and a Logstore in the Log Service console.

1. Log on to the Log Service console.
2. In the Projects section, click **Create Project**.
3. Set the **Project Name** and the **Region** parameters, and then click **OK**.
4. In the **Projects** section, click the name of the project. On the page that appears, click the plus sign (**+**) in the left-side navigation pane.

   You can also click **Create** to create a Logstore as prompted after you create a project.
5. In the dialog box that appears, set the required parameters, and then click **OK**.

   You must specify the Logstore name, data retention period, and number of shards. Set the number of shards based on your business requirements. In this example, four shards are created.

> **Note**
> - The account that you use to create the project and the Logstore must be the same as the account that you used to obtain the AccessKey pair.
> - The project name must be unique in Log Service. The Logstore name must be unique in the project.
> - After you create the project, you cannot modify its region or migrate the project across regions.

Step 4: Install the Python development environment

Log Service SDK for Python is a pure Python library that supports all operating systems on which Python runs, such as Linux, Mac OS X, and Windows. To install the Python development environment, perform the following steps:

1. Download and install the latest Python installation package.

   > **Note**
   > - Log Service SDK for Python supports Python 2.6, 2.7, 3.3, 3.4, 3.5, and 3.6. You can run the `python -V` command to check the current version of Python.
   > - Python no longer supports Python 2.6 or Python 3.3. We recommend that you use Python 2.7, Python 3.4, or a later version.

2. Download and install the Python package management tool pip.

   After you install pip, run the `pip -V` command to check whether the installation is successful and view the pip version.

Step 5: Install Log Service SDK for Python

Run the following command as an administrator in Shell to install Log Service SDK for Python.

```
pip install -U aliyun-log-python-sdk
```

Step 6: Start a Python program

The following sample code shows how to use Log Service SDK for Python. To interact with Log Service and obtain the relevant output, run the following sample code in a text editor or Python IDE:

For more information, visit GitHub.

```
# encoding: utf-8
import time
from aliyun.log.logitem import LogItem
from aliyun.log.logclient import LogClient
from aliyun.log.getlogsrequest import GetLogsRequest
from aliyun.log.putlogsrequest import PutLogsRequest
from aliyun.log.listlogstoresrequest import ListLogstoresRequest
from aliyun.log.gethistogramsrequest import GetHistogramsRequest
def main():
    endpoint = '' # Select the endpoint that matches the region of the project created in t
he preceding steps.
    accessKeyId = '' # Use your AccessKey ID.
    accessKey = '' # Use your AccessKey secret.
    project = '' # The name of the project created in the preceding steps.
    logstore = '' # The name of the Logstore created in the preceding steps.
    # Note: Configure four shards for the created Logstore.
    # Create a client instance.
    client = LogClient(endpoint, accessKeyId, accessKey)
    # List all Logstores.
    req1 = ListLogstoresRequest(project)
    res1 = client.list_logstores(req1)
    res1.log_print()
    topic = ""
    source = ""
    # Send 10 packets. Each packet contains 10 log entries.
    for i in range(10):
        logitemList = []  # LogItem list
        for j in range(10):
            contents = [('index', str(i * 10 + j))]
            logItem = LogItem()
            logItem.set_time(int(time.time()))
            logItem.set_contents(contents)
            logitemList.append(logItem)
        req2 = PutLogsRequest(project, logstore, topic, source, logitemList)
        res2 = client.put_logs(req2)
        res2.log_print()
    # List all shards and read the data written within the last minute.
    listShardRes = client.list_shards(project, logstore)
    for shard in listShardRes.get_shards_info():
        shard_id = shard["shardID"]
        start_time = int(time.time() - 60)
        end_time = start_time + 60
        res = client.get_cursor(project, logstore, shard_id, start_time)
        res.log_print()
        start_cursor = res.get_cursor()
```

```
        res = client.get_cursor(project, logstore, shard_id, end_time)
        end_cursor = res.get_cursor()
        while True:
            loggroup_count = 100  # Read 100 packets each time.
            res = client.pull_logs(project, logstore, shard_id, start_cursor, loggroup_coun
t, end_cursor)
            res.log_print()
            next_cursor = res.get_next_cursor()
            if next_cursor == start_cursor:
                break
            start_cursor = next_cursor

client.get_logs(req4) # Use Log Service SDK for Python to query data in ApsaraDB RDS for My
SQL through the JOIN syntax. req4 = GetLogsRequest(project, logstore, From, To, topic, "* |
select count(1) from "+logstore +" l join rds_store r on l.ikey =r.ekey", 10,0, False) res4
= client.get_logs(req4) # Use Log Service SDK for Python to write the query result to RDS.
req4 = GetLogsRequest(project, logstore, From, To, topic, "* | insert into rds_store select
count(1) ", 10,0, False) res4 = client.get_logs(req4)
if __name__ == '__main__':
    main()
```

20.1.2.7. SDK for Android

The Log Service SDK for Android is used to collect user data from Android platforms and write the data to Log Service.

Download URL at GitHub

https://github.com/aliyun/aliyun-log-android-sdk

20.1.2.8. SDK for C

The Log Service SDK for C is used to access logs in Log Service from multiple platforms, such as the MIPS and OpenWrt systems.

The SDK for C uses libcurl as a network library. The *apr/apr-util* library resolves issues about memory management and cross-platform operations. You can use the SDK for C after you compile a small part of the source code.

In addition, the C Producer Library and C Producer Lite Library provide you with a one-stop log collection solution across different platforms. This solution features simple deployment, high performance, and low resource consumption.

For more information, visit the following GitHub URLs:

- C Producer Library (recommended for servers)
- C Producer Lite Library (recommended for IoT and smart devices)

20.1.2.9. SDK for Go

Log Service provides developers with the SDK for Go to simplify the use of Log Service.

The Log Service SDK for Go allows developers to perform the following operations:

- Write and consume data in batches.
- Use keywords to query indexes.
- Manage Logtail configurations and machine groups.

You can download the SDK for Go from the following GitHub URL: https://github.com/aliyun/aliyun-log-go-sdk.

For information about the usage instructions and sample code, see README.

20.1.2.10. iOS SDK

Log Service SDK for iOS is implemented based on Log Service APIs. The SDK allows you to write logs to Log Service.

You can download Log Service SDK for iOS from GitHub based on your programming language.

- Swift: https://github.com/aliyun/aliyun-log-ios-sdk.
- Object-C: https://github.com/lujiajing1126/AliyunLogObjc. AliyunLogObjc is a third-party tested SDK. You can raise issues to the author and receive a quick response.

Swift-based sample code of Log Service SDK for iOS

```
/*
    Use an endpoint, AccessKey ID, and AccessKey secret to create a Log Service client.
    @endPoint: The endpoint. For more information, visit https://help.aliyun.com/document_d
etail/29008.html.
 */
let myClient = try! LOGClient(endPoint: "",
                              accessKeyID: "",
                              accessKeySecret: "",
                              projectName:"")
/* Create a log group. */
let logGroup = try! LogGroup(topic: "mTopic",source: "mSource")
   /* Write a log entry to the log group. */
    let log1 = Log()
          try! log1.PutContent("K11", value: "V11")
         try! log1.PutContent("K12", value: "V12")
         try! log1.PutContent("K13", value: "V13")
    logGroup.PutLog(log1)
   /* Write a log entry to the log group. */
    let log2 = Log()
          try! log2.PutContent("K21", value: "V21")
         try! log2.PutContent("K22", value: "V22")
         try! log2.PutContent("K23", value: "V23")
    logGroup.PutLog(log2)
 /* Send the log entry. */
 myClient.PostLog(logGroup,logStoreName: ""){ response, error in
        // handle response however you want
        if error?.domain == NSURLErrorDomain && error?.code == NSURLErrorTimedOut {
            print("timed out") // note, `response` is likely `nil` if it timed out
        }
    }
```

Objective-C

For information about how to use Log Service SDK for iOS based on Objective-C, visit Objective-C at GitHub.

20.1.2.11. SDK for C ++

The Log Service SDK for C ++ allows you call Log Service API operations in C++ programs. This SDK applies only to Linux platforms.

The Log Service SDK for C ++ supports all Log Service APIs and provides multiple features, such as resource creation and data read/write.

You can download the SDK for C ++ from the following GitHub URL: https://github.com/aliyun/aliyun-log-cpp-sdk.

20.1.2.12. Node.js SDK

Log Service SDK for Node.js allows developers to use Log Service by using Node.js programs. This topic describes how to use Log Service SDK for Node.js to write log data to Log Service.

Procedure

1. Create an Apsara Stack tenant account.
2. Obtain an Apsara Stack AccessKey pair.

   The AccessKey pair will be used in the following steps and must be kept confidential. For information about how to use the AccessKey pair in Log Service SDK for Node.js, see Basic configurations.
3. Create a project.
   i. Use the Node.js web framework Express to create a project.

      For more information, see installing.
   ii. Install morgan.
   iii. Create an app.js file in the project.

      The app.js file contains the following code:

```
var express = require('express')
var morgan = require('morgan')
var app = express()
const logger = morgan(function (tokens, req, res) {
  return [
    tokens.method(req, res),
    tokens.url(req, res),
    tokens.status(req, res),
    tokens.res(req, res, 'content-length'), '-',
    tokens['response-time'](req, res), 'ms'
  ].join(' ')
})
app.use(logger)
app.get('/', (req, res) => res.send('Hello World!'))
app.listen(3000, () => console.log('Example app listening on port 3000!'))
```

   iv. Run the **node app.js** command to start the project.

   Visit `http://localhost:3000`. Then, access logs are generated.

```
➜ myExpressApp node app.js
Example app listening on port 3000!
GET / 304  - 3.795 ms
```

4. Write logs to Log Service.
   i. Install aliyun-sdk.

      Click here to download aliyun-sdk. Run the **npm install aliyun-sdk** command to install aliyun-sdk.
   ii. Create a project and a Logstore in the Log Service console.
   iii. Call Log Service SDK for Node.js in the project.

      The following sample code is used:

```
var express = require('express')
var morgan = require('morgan')
var ALY = require('aliyun-sdk') // Call aliyun-sdk.
var app = express()
```

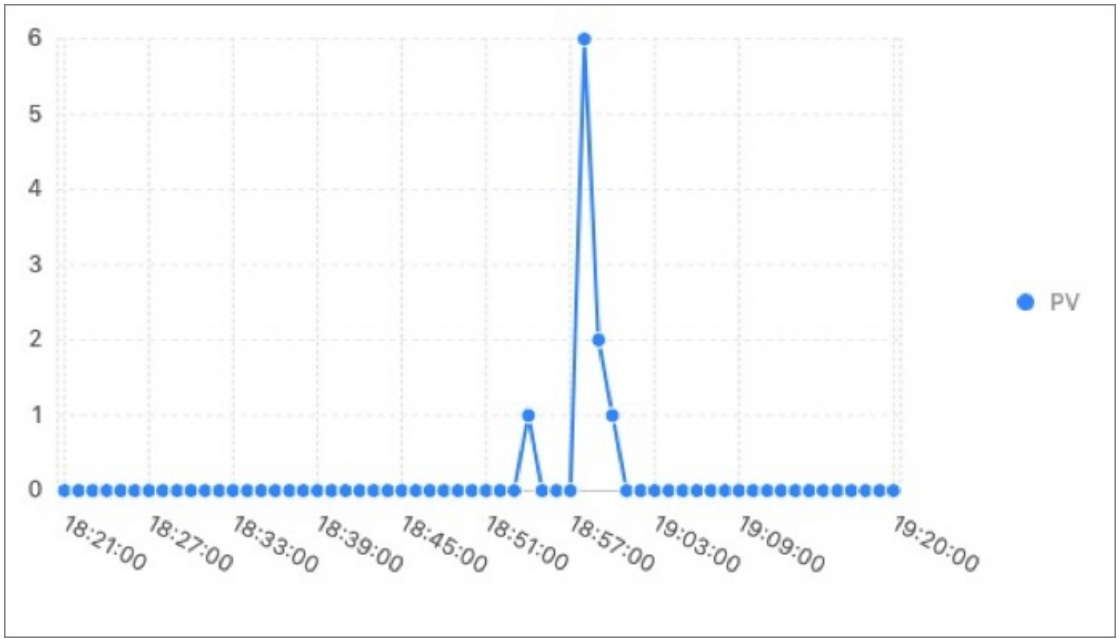
```
var app = express();
const logger = morgan(function (tokens, req, res) {
  // Obtain log data.
  const log = [
    tokens.method(req, res),
    tokens.url(req, res),
    tokens.status(req, res),
    tokens.res(req, res, 'content-length'), '-',
    tokens['response-time'](req, res), 'ms'
  ]
  var sls = new ALY.SLS({
    "accessKeyId": "LTA******G9", // The AccessKey ID that is obtained in Step 2
    "secretAccessKey": "MMfX******lo1", // The AccessKey secret that is obtained in
Step 2
    endpoint: 'http://cn-hangzhou.sls.aliyuncs.com',
    apiVersion: '2015-06-01'
  })
  var logGroup = {
    logs: [
      {
        time:  Math.floor(new Date().getTime()/1000), // Unit: seconds
        contents: [ // Key-value pairs
          {
            key: 'method',
            value: log[0]
          },
          {
            key: 'url',
            value: log[1]
          },
          {
            key: 'status',
            value: log[2]
          },
          {
            key: 'time',
            value: log[5]
          }
        ]
    }],
    topic: 'topicName', //optional
    source: '127.0.0.1' //optional
  };
  var opt = {
    projectName: 'wangdan-test',
    logStoreName: 'test',
    logGroup
  }
  sls.putLogs(opt,function(error, data) {
    console.log(error, data)
  })
  return [
    tokens.method(req, res),
    tokens.url(req, res),
    tokens.status(req, res),
```

```
    tokens.res(req, res, 'content-length'), '-',
    tokens['response-time'](req, res), 'ms'
  ].join(' ')
})
app.use(logger)
app.get('/', (req, res) => res.send('Hello World!'))
app.listen(3000, () => console.log('Example app listening on port 3000!'))
```

5. View collected log data.

   In the Log Service console, find the Logstore in the project. Click the Logstore name, enter a query statement in the search box on the **Search & Analysis** page, and then click Search & Analyze to view log data.

   The following figure indicates that most page views (PVs) occurred between 18:30 and 19:00 on September 12 during the specified time range. You can record and display the PV statistics as a chart on your dashboard.



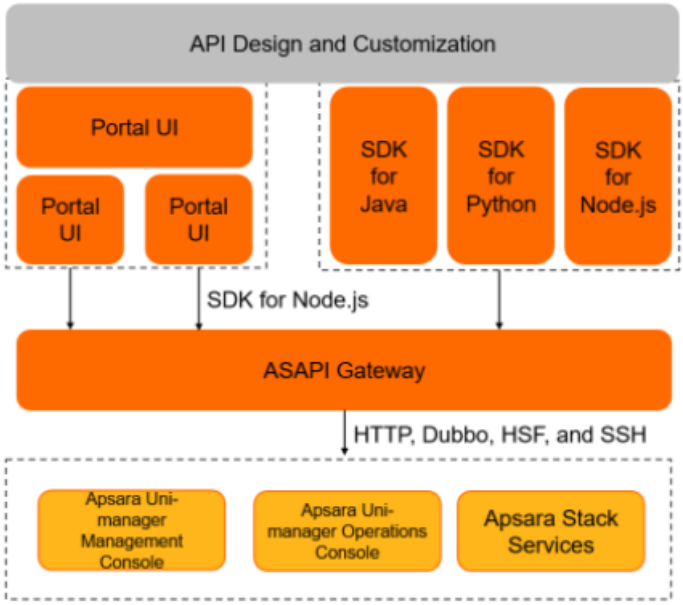
20.1.3. ASAPI Reference

20.1.3.1. Overview

This topic describes the architecture and features of Apsara Stack API (ASAPI).

ASAPI is a platform that integrates all features and is the only portal to connect to Apsara Stack. ASAPI can categorize, audit, and manage API operations. ASAPI can also assemble and customize existing API operations and adapt to your API operations. Each cloud service can call ASAPI for required data and features to avoid inconsistent operations that may be caused by different request methods and separate encapsulation. This ensures the integrity of API operations, increases the development efficiency of API operations, and improves the portability of code.

> **Note** Only the CreateProject, DeleteProject, UpdateProject, GetProject, and ListProject API operations in Log Service are available in ASAPI. You can use ASAPI to call these API operations.



ASAPI allows you to manage and call API operations in a centralized manner and customize development for API operations. ASAPI supports access to most cloud services deployed in Apsara Stack and supports pass-through or encapsulation of different backend APIs. This way, operations can be called by using the same method. ASAPI allows you to use SDKs and API portals to call API operations registered on ASAPI, customize SDKs, and manage versions of Apsara Stack, services, and APIs.

20.1.3.2. Preparations

20.1.3.2.1. Log on to the API Tool console

You can log on to the API Tool console from the Apsara Uni-manager Management Console.

Prerequisites

- The URL of the Apsara Uni-manager Management Console is obtained from the deployment personnel before you log on to the Apsara Uni-manager Management Console.
- We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL of the Apsara Uni-manager Management Console. Press the Enter key.
2. Enter your username and password.

   Obtain the username and password that you can use to log on to the console from the operations administrator.

> **Note** When you log on to the Apsara Uni-manager Management Console for the first time, you must change the password of your username. Your password must meet complexity requirements. The password must be 10 to 32 characters in length and must contain at least two of the following character types:
>
> - Uppercase or lowercase letters
> - Digits
> - Special characters, which include ! @ # $ %

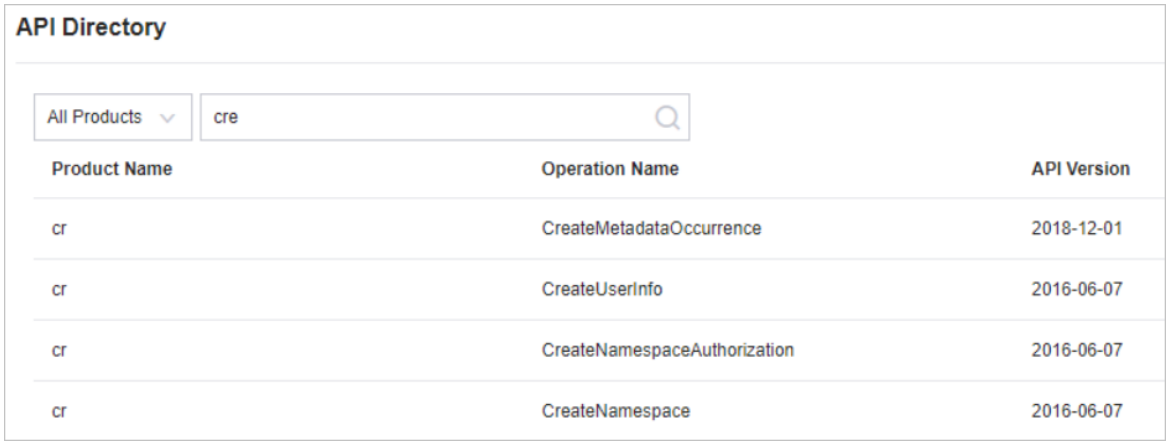
3. Click **Log On**.
4. In the top navigation bar, choose **Products > Others > API Tool**.

20.1.3.2.2. View the information of API operations

This topic describes how to view information of API operations. The following information is required when you use an SDK: service name, API operation name, and API operation version.

Procedure

1. Log on to the API Tool console.
2. In the left-side navigation pane, click **API Directory**.
3. On the **API Directory** page, select the required service from the drop-down list in the upper-left corner. Then, enter a keyword of an API operation name in the search box and click the Search icon.



4. Then, you can view the service name, API operation name, and API version number.

20.1.3.2.3. Generate an endpoint for the ASAPI

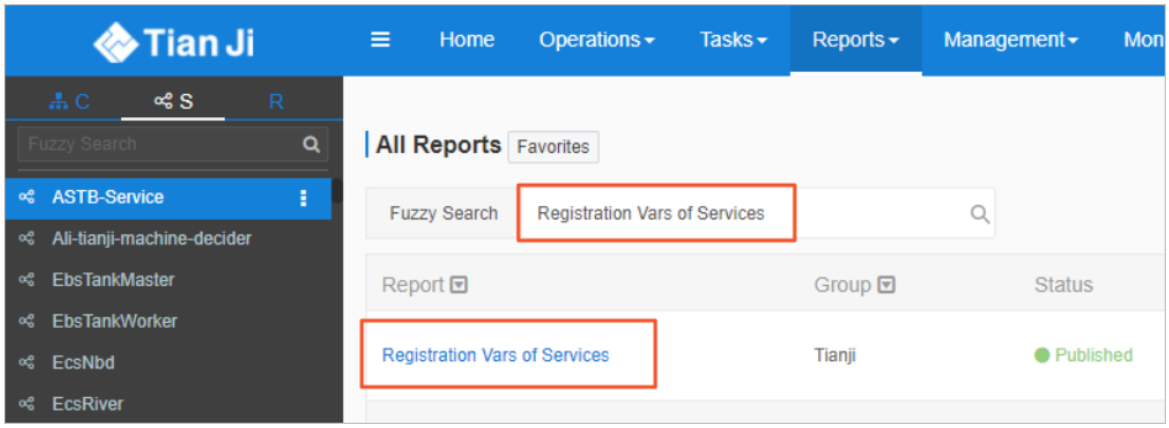
This topic describes three methods used to generate an endpoint for the Apsara Stack API (ASAPI).

Method 1: Use Registration Vars of Services to generate an endpoint

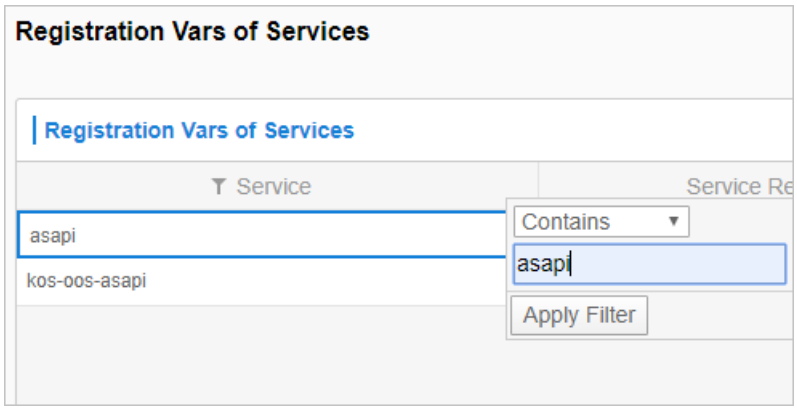
1. Log on to Apsara Infrastructure Management Framework.
   i. Log on to the Apsara Uni-manager Operations Console.
   ii. In the top navigation bar, click **O&M**.
   iii. In the left-side navigation pane, choose **Product Management > Products**.

iv. In the Apsara Stack O&M section, click **Apsara Infrastructure Management Framework**.

2. In the left-side navigation pane, click **Reports**.
3. On the **All Reports** page, search for `Registration Vars of Services` and click the report name.



4. On the **Registration Vars of Services** page, click the icon next to **Service** and search for `asapi`.



5. Find the asapi service, right-click in the **Service Registration** column, and then select **Show More** from the shortcut menu.

   In the **Details** dialog box, obtain the value of **asapi.public.endpoint**.

6. Generate an endpoint for the ASAPI based on the following format:

```
https://<asapi.public.endpoint>/asapi/v3
```

Method 2: Use cluster resources to generate an endpoint

1. Log on to Apsara Infrastructure Management Framework.
   i. Log on to the Apsara Uni-manager Operations Console.
   ii. In the top navigation bar, click **O&M**.
   iii. In the left-side navigation pane, choose **Product Management** > **Products**.
   iv. In the Apsara Stack O&M section, click **Apsara Infrastructure Management Framework**.
2. Go to the cluster operations page.

i. In the left-side navigation pane, choose Operations > Cluster Operations.

ii. In the **Cluster** search box, enter `ascm`.

iii. Find the cluster that you want to manage and click **Operations** in the **Actions** column.

3. Obtain the value of the domain parameter.

i. Click the Cluster Resources tab.

ii. In the **Name** field, search for `asapi_dns_public`.

iii. Click **Details** in the **Application Parameter** column.

In the **Application Parameter** message, obtain the value of the **domain** parameter.

4. Generate an endpoint for the ASAPI based on the following format:

```
https://<domain>/asapi/v3
```

Method 3: Concatenate strings to generate an endpoint

You can also concatenate strings to generate an endpoint based on the following format:

```
https://public.asapi.<region>.<internet-domain>/asapi/v3
```

> **Note**
>
> 1. Replace <region> with your actual region ID. For information about how to query a region ID, see Query a region ID.
> 2. Replace <internet-domain> with the root domain of your Apsara Stack service. To obtain the root domain, contact Apsara Stack O&M personnel. Take note of this point: Use the internet-domain parameter instead of the intranet-domain parameter.

If the **region** value is `cn-****-****-d01` and the **internet-domain** value is `inter.****.****.com`, the following endpoint can be generated:

```
https://public.asapi.cn-****-****-d01.inter.****.****.com/asapi/v3
```

20.1.3.2.4. Obtain Apsara Stack SDKs

The Apsara Stack API (ASAPI) is a unified portal provided by Apsara Stack. You can use the ASAPI to connect to all Apsara Stack services. Apsara Stack provides SDKs for API calls.

For more information about how to obtain Apsara Stack SDKs, see Apsara Stack documentation.

20.1.3.2.5. Obtain an AccessKey pair

An AccessKey pair consists of an AccessKey ID and an AccessKey secret. The AccessKey pair is used to implement symmetric encryption to verify the identity of the requester. The AccessKey ID is used to identify a user. The AccessKey secret is used to encrypt the signature string. This topic describes how to obtain an AccessKey pair.

Prerequisites

Only operations administrators and level-1 organization administrators can obtain the AccessKey pair of an organization.

Context

We recommend that you use the AccessKey pair of a personal account to call the API operations of the Apsara Uni-manager Management Console and cloud services. When you use the AccessKey pair of a personal account, you must configure header parameters as described in the following table for access control.

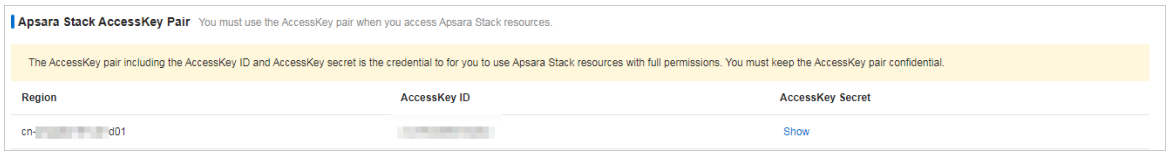
Parameter	Description
x-acs-regionid	The region ID, such as cn-hangzhou-*.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console.
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console.
x-acs-instanceid	The ID of the instance on which you want to perform operations.

Warning The AccessKey pairs of personal accounts are under control of the Apsara Uni-manager Management Console permission system. AccessKey pairs of organization accounts have higher permissions. For security purposes, organization operations must be approved by administrators.

Obtain the AccessKey pair of a personal account

To obtain the AccessKey pair of a personal account, perform the following operations:

1. Log on to the Apsara Uni-manager Management Console.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and click **User Information**.
3. In the **Apsara Stack AccessKey Pair** section, view your AccessKey pair.



> **Note** The AccessKey pair consists of an AccessKey ID and an AccessKey secret. AccessKey pairs allow you to access Apsara Stack resources with full permissions for your account. You must keep your AccessKey pair confidential.

Obtain the AccessKey pair of an organization

To obtain the AccessKey pair of an organization, perform the following operations:

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Organizations**.
4. In the organization navigation tree, click an organization name.
5. In the Current Organization section, click **Obtain an accesskey**.
6. In the AccessKey message, view the AccessKey pair of the organization.

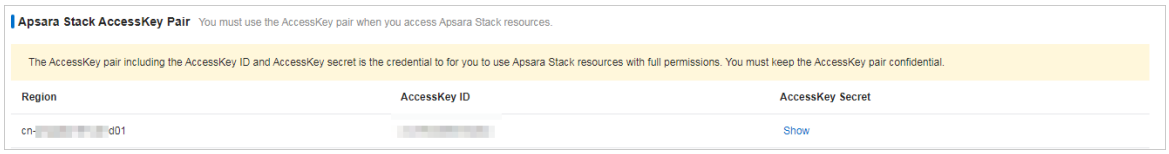
> **Note** An AccessKey pair is automatically allocated to each level-1 organization. Subordinate organizations use the same AccessKey pair of their level-1 organization.

20.1.3.2.6. Query a region ID

When you use Apsara Stack SDK for Node.js to make API calls, specify a region ID. You can obtain a region ID in the Apsara Uni-manager Management Console.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and click **User Information**.
3. In the **Apsara Stack AccessKey Pair** section, view the region ID.



20.1.3.3. Common request parameters

Common request parameters must be included in all API requests.

Common request parameters

The following common request parameters are used to call the ASAPI service.

Parameter	Type	Required	Description

Parameter	Type	Required	Description
Action	String	Yes	The operation that you want to perform. For more information, see View the information about API operations.
Product	String	Yes	The name of the service.
Version	String	Yes	The API version of the service. For more information, see View the information about API operations.
RegionId	String	Yes	The ID of the region. For more information, see Query the region ID.
AccessKeyId	String	Yes	The AccessKey ID used to connect to the service. For more information, see Obtain an AccessKey pair.
Signature	String	Yes	The signature string of the request. For more information, see Request signatures.
SignatureMethod	String	Yes	The encryption method of the signature string. Set the value to HMAC-SHA1 or HMAC-SHA256.
SignatureVersion	String	Yes	The version of the signature encryption algorithm. Set the value to 1.0 or 2.0.

Parameter	Type	Required	Description
SignatureNonce	String	Yes	A unique, random number used to prevent replay attacks. You must use different numbers for different requests.
Timestamp	String	Yes	The timestamp of the request. Specify the time in the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time must be in UTC. Example: 2018-01-01T12:00:00Z.
Format	String	Yes	The format in which to return the response. Set the value to JSON.

> **Note**
>
> The `Signature`, `SignatureMethod`, `SignatureVersion`, `SignatureNonce`, `Timestamp`, and `Format` parameters are encapsulated into the SDK.

20.1.3.4. SDK Reference

20.1.3.4.1. Apsara Stack SDK for Java

This topic describes how to obtain and use Apsara Stack SDK for Java.

Prerequisites

- An authorized account and an AccessKey pair are obtained. The AccessKey pair consists of an AccessKey ID and an AccessKey secret. For more information about how to obtain and view your AccessKey pair in the Apsara Uni-manager Management Console, see Obtain an AccessKey pair.
- The endpoint of ASAPI is obtained. For more information, see Obtain the endpoint of ASAPI.
- Apsara Stack SDK for Java supports JDK V1.8 and later.

Add dependencies

Add dependencies to the pom.xml file:

```
<dependency>
    <groupId>com.aliyun</groupId>
    <artifactId>asapi</artifactId>
    <version>0.0.8.1-RELEASE</version>
</dependency>
```

Use Apsara Stack SDK for Java

- ListProject

```
// Set the request parameters.
try {
  Map<String, String> requestParams = new HashMap<String, String>();
  // Set the parameters for Log Service.
  requestParams.put("Product", "SLS"); // The service name must be the same as that displ
ayed in the corresponding API directory.
  requestParams.put("Action", "ListProject"); // The name of the API operation. The name
is case-sensitive and must be the same as that in the API directory.
  requestParams.put("Version", "2020-03-31"); // The version number of the API.
  requestParams.put("offset", "0");
  requestParams.put("size", "10");
  // Set the authorization parameters.
  requestParams.put("AccessKeyId", ""); // The AccessKey ID of the authorized account.
  requestParams.put("AccessKeySecret", ""); // The AccessKey secret of the authorized acc
ount.
  requestParams.put("RegionId", ""); // The region ID.
  // Create a client to initiate requests.
  ASClient client = new ASClient();
  // Set the parameters in the request header.
  client.addHeader("x-acs-regionId", "");
  client.addHeader("x-acs-resourcegroupid", "");
  client.addHeader("x-acs-organizationid", "");
  // Initiate the request and obtain the response.
  String result = client.doRequest("your_endpoint", requestParams);
  JSONObject jsonObject = JSONObject.parseObject(result);
  Map<String, Object> mapData = new HashMap<String, Object>();
  if ("true".equals(jsonObject.getString("success"))) {
    String projects = jsonObject.getString("projects");
    List<String> array = JSONArray.parseArray(projects, String.class);
    List<Object> data = new ArrayList<Object>();
    for (String projectStr : array) {
      JSONObject object = JSONObject.parseObject(projectStr);
      Set<String> keySet = object.keySet();
      Map<String, String> map = new HashMap<String, String>(keySet.size());
      for (String key : keySet) {
        if ("description".equals(key)) {
          String description = object.getString(key);
          map.put("projectDesc", description == null ? "" : description);
      } else if ("region".equals(key)) {
        map.put("clusterRegion", object.getString(key));
      } else {
        map.put(key, object.getString(key));
      }
    }
```

```
    data.add(map);
  }
    mapData.put(SLSBaseConst.E_PROJECTS, data);
    mapData.put(SLSBaseConst.E_TOTAL, jsonObject.getInteger("total"));
    mapData.put(SLSBaseConst.E_COUNT, jsonObject.getInteger("count"));
    System.out.println(mapData);
   } else {
     throw new RuntimeException("list failed");
   }
  } catch (Exception e) {
    e.printStackTrace();
  }
```

- CreateProejct

```
try {
  Map<String, String> requestParams = new HashMap<String, String>();
  // Set the parameters for Log Service.
  requestParams.put("action", "CreateProject"); // The name of the API operation. The nam
e is case-sensitive and must be the same as that in the API directory.
  requestParams.put("product", "SLS"); // The service name must be the same as that displ
ayed in the corresponding API directory.
  requestParams.put("version", "2020-03-31"); // The version number of the API.
  requestParams.put("projectName", ""); // The name of the project.
  requestParams.put("description", ""); // The description of the project.
  requestParams.put("RegionId", ""); // The region ID.
  requestParams.put("AccessKeyId", ""); // The AccessKey ID of the authorized account.
  requestParams.put("AccessKeySecret", ""); // The AccessKey secret of the authorized acc
ount.
  requestParams.put("Department", "");
  requestParams.put("ResourceGroup", "");
  // Create a client to initiate requests.
  ASClient client = new ASClient();
  // Set the parameters in the request header.
  client.addHeader("x-acs-regionId", "");
  client.addHeader("x-acs-resourcegroupid", "");
  client.addHeader("x-acs-organizationid", "");
  String result = client.doRequest("your_endpoint", requestParams);
  System.out.println(result);
} catch (Exception e) {
  e.printStackTrace();
}
```

- GetProject

```
try {
  Map<String, String> requestParams = new HashMap<String, String>();
  // Set the parameters for Log Service.
  requestParams.put("action", "GetProject"); // The service name must be the same as that
displayed in the corresponding API directory.
  requestParams.put("product", "SLS"); // The name of the API operation. The name is case
-sensitive and must be the same as that in the API directory.
  requestParams.put("version", "2020-03-31"); // The version number of the API.
  requestParams.put("projectName", ""); // The name of the project.
  requestParams.put("RegionId", ""); // The AccessKey ID of the authorized account.
  requestParams.put("AccessKeyId", ""); // The AccessKey ID of the authorized account.
  requestParams.put("AccessKeySecret", ""); // The AccessKey secret of the authorized acc
ount.
  // Create a client to initiate requests.
  ASClient client = new ASClient();
  // Set the parameters in the request header.
  client.addHeader("x-acs-regionId", "");
  client.addHeader("x-acs-resourcegroupid", "");
  client.addHeader("x-acs-organizationid", "");
  client.addHeader("x-acs-instanceId", "");
    String result = client.doRequest("your_endpoint", requestParams);
    JSONObject object = JSONObject.parseObject(result);
    if (object.getString("projectName") == null) {
      throw new RuntimeException(result);
    } else {
      Set<String> keySet = object.keySet();
      Map<String, String> map = new HashMap<String, String>(keySet.size());
      for (String key : keySet) {
        if ("description".equals(key)) {
          String description = object.getString(key);
          map.put("projectDesc", description == null ? "" : description);
        } else if ("region".equals(key)) {
         map.put("clusterRegion", object.getString(key));
        } else {
        map.put(key, object.getString(key));
        }
      }
      System.out.println(map);
    }
  } catch (Exception e) {
    e.printStackTrace();
  }
```

- UpdateProject

```
try {
  Map<String, String> requestParams = new HashMap<String, String>();
  // Set the parameters for Log Service.
  requestParams.put("action", "UpdateProject"); // The name of the API operation. The nam
e is case-sensitive and must be the same as that in the API directory.
  requestParams.put("product", "SLS"); // The service name must be the same as that displ
ayed in the corresponding API directory.
  requestParams.put("version", "2020-03-31"); // The version number of the API.
  requestParams.put("projectName", "");// The name of the project to be updated.
  requestParams.put("description", ""); // The description of the project.
  requestParams.put("RegionId", ""); // The region ID.
  requestParams.put("AccessKeyId", ""); // The AccessKey ID of the authorized account.
  requestParams.put("AccessKeySecret", ""); // The AccessKey secret of the authorized acc
ount.
  requestParams.put("Department", "");
  requestParams.put("ResourceGroup", "");
  // Create a client to initiate requests.
  ASClient client = new ASClient();
  // Set the parameters in the request header.
  client.addHeader("x-acs-regionId", "");
  client.addHeader("x-acs-resourcegroupid", "");
  client.addHeader("x-acs-organizationid", "");
  String result = client.doRequest("your_endpoint", requestParams);
    System.out.println(result);
  } catch (Exception e) {
    e.printStackTrace();
  }
```

- DeleteProject

```
try {
  Map<String, String> requestParams = new HashMap<String, String>();
  // Set the parameters for Log Service.
  requestParams.put("action", "DeleteProject"); // The name of the API operation. The nam
e is case-sensitive and must be the same as that in the API directory.
  requestParams.put("product", "SLS"); // The service name must be the same as that displ
ayed in the corresponding API directory.
  requestParams.put("version", "2020-03-31"); // The version number of the API.
  requestParams.put("projectName", ""); // The name of the project to be deleted.
  requestParams.put("RegionId", ""); // The region ID.
  requestParams.put("AccessKeyId", ""); // The AccessKey ID of the authorized account.
  requestParams.put("AccessKeySecret", ""); // The AccessKey secret of the authorized acc
ount.
  // Create a client to initiate requests.
  ASClient client = new ASClient();
  // Set the parameters in the request header.
  client.addHeader("x-acs-regionId", "");
  client.addHeader("x-acs-resourcegroupid", "");
  client.addHeader("x-acs-organizationid", "");
  client.addHeader("x-acs-instanceId", "");
    String result =client.doRequest("<your_endpoint>", requestParams);
    System.out.println(result);
  } catch (Exception e) {
    e.printStackTrace();
  }
```

The following table describes the parameters in the request header.

Parameter	Description
x-acs-regionid	The region ID. For more information about how to obtain the region ID, see Query the region ID.
x-acs-resourcegroupid	The ID of the organization in the Apsara Uni-manager Management Console.
x-acs-organizationid	The ID of the resource set in the Apsara Uni-manager Management Console.
x-acs-instanceid	The ID of the instance that you want to manage.

20.1.3.5. HTTP Requests

20.1.3.5.1. Overview

This topic describes how to make API requests and is intended for users who use API URLs to initiate HTTP GET requests.

If you are using an SDK to initiate requests, you can skip this topic.

The request URL consists of different parameters and has a fixed syntax. The URL contains common request parameters, your signature, and operation-specific parameters. Sample request URLs are provided for each API operation. These URLs are not encoded to make them easy to read. Before you make a request, you must encode the request URL. After the authentication process is complete based on your signature, the results are returned to you. Response parameters are returned if the call is successful, whereas an error message is returned if the call fails. You can troubleshoot issues based on the error message.

20.1.3.5.2. Request syntax

The Apsara Stack API (ASAPI) allows you to call API operations by sending HTTP GET requests based on URLs. Each URL must include request parameters. This topic describes the syntax of HTTP GET requests and provides the endpoint of the ASAPI.

Sample request

GetOrganizationList is used in the following unencoded URL request:

```
https://public.asapi.aliyuns.com/asapi/v3?Action=GetOrganizationList&Product=ascm&Version=2019-05-10&Id=<Organization ID>&<Common parameters>
```

- `https` : the protocol used to transmit the request.
- `public.asapi.aliyuns.com/asapi/v3` : the endpoint of the ASAPI.
- `Action=GetOrganizationList Product=ascm Version=2019-05-10` : the API operation to call.
- `Id` : the ID of the organization.
- `<Common parameters>` : the common parameters specified in the system.

Protocol

The ASAPI supports only HTTPS.

Endpoint

For more information about how to obtain an endpoint, see Generate an endpoint for the ASAPI.

Parameter

To specify an API operation, use the `Action, Product, and Version` parameters. For example, set `Action` to GetOrganizationList, Product to ascm, and Version to 2019-05-10. You must also specify other operation-specific parameters and common parameters. For more information, see Common parameters.

20.1.3.5.3. Request signatures

This topic describes how to sign HTTP API requests. ASAPI uses the request signature to verify the identity of the request sender. ASAPI implements symmetric encryption by using an AccessKey pair to verify the identity of the request sender.

> **Note**
>
> - An AccessKey pair consists of an AccessKey ID and an AccessKey secret, which are issued to each user or organization in the Apsara Uni-manager Management Console.
> - The AccessKey ID is used to verify identities of users, and the AccessKey secret is used to encrypt and verify signature strings. You must keep your AccessKey secret confidential.
> - ASAPI provides SDKs for Node.js, Python, and Java to facilitate complex signature calculation. For more information, see Obtain the core package for ASAPI.

Step 1: Create a canonicalized query string

1. Arrange the request parameters in alphabetical order, including all common and operation-specific parameters except the `Signature` parameter.

   > **Note**
   >
   > If you use the GET method to send a request,these parameters are connected by ampersands (&) and included in the request URL. The first request parameter follows a question mark (?).

2. Encode the request parameters and their values in UTF-8 based on RFC 3986. The following rules apply in the encoding process:
   - Letters, digits, and special characters such as hyphens (`-`), underscores (`_`), and periods (`.`) do not need to be encoded.
   - Other characters must be percent encoded in the `%XY` format. `XY` represents the ASCII code of the characters in hexadecimal notation. For example, double quotation marks (`"`) are encoded as `%22` .
   - Extended UTF-8 characters are encoded in the `%XY%ZA…` format.
   - Spaces must be encoded as `%20` . Do not encode spaces as plus signs (`+`).

     This encoding method is similar to but different from the `application/x-www-form-urlencoded` MIME encoding algorithm.

     If you use `java.net.URLEncoder` from the Java standard library, use `percentEncode` to encode request parameters and their values. In the encoded query string, replace the plus signs (`+`) with `%20` , asterisks (`*`) with `%2A` , and `%7E` with tildes (`~`). This way, you can obtain an encoded string that matches the preceding encoding rules.

```
private static final String ENCODING = "UTF-8";
private static String percentEncode(String value) throws UnsupportedEncodingException
{
    return value != null ? URLEncoder.encode(value, ENCODING).replace("+", "%20").rep
lace("*", "%2A").replace("%7E", "~") : null;
}
```

3. Use equal signs (`=`) to connect the encoded request parameters and their values.
4. Use ampersands (`&`) to connect the encoded request parameters. These parameters must be arranged in the same order as those in Step 1.

Then, a canonicalized query string that follows the request structure is obtained. For more information, see Request structure.

Step 2: Create a string-to-sign

1. Create a `string-to-sign` . You can also use `percentEncode` to encode the canonicalized query string created in Step 1 based on the following rules:

```
StringToSign=
    HTTPMethod + "&" + //HTTPMethod: the HTTP method that is used to send a request, su
ch as GET.
    percentEncode("/") + "&" + //percentEncode("/"): Encode the forward slash (/) in UT
F-8 as %2F.
    percentEncode(CanonicalizedQueryString) // Encode the canonicalized query string cr
eated in Step 1.
```

2. Calculate the RFC 2104-compliant HMAC-SHA1 or HMAC-256 value of `StringToSign` . In the following example, Java Base64 is used:

```
String signature = Base64.getEncoder().encodeToString(signData);
```

> **Note**
>
> When you calculate the signature, the key value specified by RFC 2104 is your `AccessKey secret` plus an ampersand (&), which has an ASCII value of 38. For more information, see Obtain an AccessKey pair.

3. Encode the `Signature` parameter based on RFC 3986 and add it to the canonicalized query string.

Example 1: Concatenate parameters

`GetOrganizationList` is used in this example to query regions. For example, `AccessKeyID` is set to testid and `AccessKeySecret` is set to testsecret. Perform the following operations:

1. Construct a canonicalized query string.

```
https://public.asapi.aliyuns.com/asapi/v3/?AccessKeyId=testid&Action=GetOrganizationList&Format=JSON&Id=1&Product=ascm&RegionId=cn-region-test&SignatureMethod=HMAC-SHA1&SignatureNonce=43967c6e-e3ad-44fa-b06b-fcf3db5f39d2&SignatureVersion=1.0&Timestamp=2020-09-15T08%3A50%3A40Z&Version=2019-05-10
```

2. Create a `string-to-sign`.

```
GET&%2F&AccessKeyId%3Dtestid%26Action%3DGetOrganizationList%26Format%3DJSON%26Id%3D1%26Product%3Dascm%26RegionId%3Dcn-region-test%26SignatureMethod%3DHMAC-SHA1%26SignatureNonce%3D43967c6e-e3ad-44fa-b06b-fcf3db5f39d2%26SignatureVersion%3D1.0%26Timestamp%3D2020-09-15T08%253A50%253A40Z%26Version%3D2019-05-10
```

3. Calculate the signature.

   Calculate the signature. The key value used for calculation is `testsecret&` because `AccessKeySecret` is set to testsecret. The calculated signature is `OLeaidS1JvxuMvnyHOwuJ+uX5qY=`. Java Base64 is used in the following sample code:

   `String signature = Base64.getEncoder().encodeToString(signData);` Encode `Signature=hvqv9Ll5RE6kQ4YsQXFAf9VuRIY=` based on RFC 3986 and add it to the canonicalized query string.

```
https://public.asapi.aliyuns.com/asapi/v3/?AccessKeyId=testid&Action=GetOrganizationList&Format=JSON&Id=1&Product=ascm&RegionId=cn-region-test&SignatureMethod=HMAC-SHA1&SignatureNonce=43967c6e-e3ad-44fa-b06b-fcf3db5f39d2&SignatureVersion=1.0&Timestamp=2020-09-15T08%3A50%3A40Z&Version=2019-05-10
```

You can use browsers or tools such as cURL and Wget to initiate an HTTP request for calling the `DescribeRegions` operation to query the Alibaba Cloud region list.

Example 2: Use the standard library of the programming language

`GetOrganizationList` is used in this example to query regions. For example, `AccessKeyID` is set to testid, `AccessKeySecret` is set to testsecret, and all request parameters are stored in a Java `Map<String, String>` object.

1. Predefine an encoding method.

```
private static final String ENCODING = "UTF-8";
private static String percentEncode(String value) throws UnsupportedEncodingException {
        return value != null ? URLEncoder.encode(value, ENCODING).replace("+", "%20").replace("*", "%2A").replace("%7E", "~") : null;
}
```

2. Predefine the time format for the `Timestamp` parameter. Specify the `Timestamp` parameter in the ISO 8601 format. The time must be in UTC+0.

```
private static final String ISO8601_DATE_FORMAT = "yyyy-MM-dd'T'HH:mm:ss'Z'";
private static String formatIso8601Date(Date date) {
    SimpleDateFormat df = new SimpleDateFormat(ISO8601_DATE_FORMAT);
    df.setTimeZone(new SimpleTimeZone(0, "GMT"));
    return df.format(date);
}
```

3. Create a request string.

```
final String HTTP_METHOD = "GET";
Map parameters = new HashMap();
// Specify request parameters.
parameters.put("Product", "ascm");
parameters.put("Action", "GetOrganizationList");
parameters.put("Version", "2019-05-10");
parameters.put("AccessKeyId", "testid");
parameters.put("RegionId", "cn-region-test");
parameters.put("Timestamp", formatIso8601Date(new Date()));
parameters.put("SignatureMethod", "HMAC-SHA1");
parameters.put("SignatureVersion", "1.0");
parameters.put("SignatureNonce", UUID.randomUUID().toString());
parameters.put("Format", "JSON");
parameters.put("Id", "1");
// Arrange request parameters.
String[] sortedKeys = parameters.keySet().toArray(new String[]{});
Arrays.sort(sortedKeys);
final String SEPARATOR = "&";
// Create a string-to-sign.
StringBuilder stringToSign = new StringBuilder();
stringToSign.append(HTTP_METHOD).append(SEPARATOR);
stringToSign.append(percentEncode("/")).append(SEPARATOR);
StringBuilder canonicalizedQueryString = new StringBuilder();
for(String key : sortedKeys) {
    // Encode the key and the value.
    canonicalizedQueryString.append("&")
    .append(percentEncode(key)).append("=")
    .append(percentEncode(parameters.get(key)));
}
//Encode the canonicalized query string.
stringToSign.append(percentEncode(
canonicalizedQueryString.toString().substring(1)));
```

4. The signature. The key value used for calculation is `testsecret&` because `AccessKeySecret` is set to testsecret. The calculated signature is `OLeaidS1JvxuMvnyHOwuJ%2BuX5qY%3D`.

```
// The following sample code shows how to calculate the signature:
final String ALGORITHM = "HmacSHA1";
final String ENCODING = "UTF-8";
key = "testsecret&";
Mac mac = Mac.getInstance(ALGORITHM);
mac.init(new SecretKeySpec(key.getBytes(ENCODING), ALGORITHM));
byte[] signData = mac.doFinal(stringToSign.getBytes(ENCODING));
String signature = Base64.getEncoder().encodeToString(signData);
```

Encode the Signature parameter based on RFC 3986 and add it to the canonicalized query string. The following URL is obtained:

```
https://public.asapi.aliyuns.com/asapi/v3/?AccessKeyId=testid&Action=GetOrganizationLis
t&Format=JSON&Id=1&Product=ascm&RegionId=cn-region-test&SignatureMethod=HMAC-SHA1&Signa
tureNonce=43967c6e-e3ad-44fa-b06b-fcf3db5f39d2&SignatureVersion=1.0&Timestamp=2020-09-1
5T08%3A50%3A40Z&Version=2019-05-10
```

5. Use browsers or tools such as cURL and Wget to initiate an HTTP request.

20.1.3.5.4. Response

Responses are returned only in the JSON format. If a return code is greater than or equal to 200 and less than 300, a success response is returned. Otherwise, an error response is returned.

Sample success response

If a request is successful, the request ID and operation-specific parameter values are returned. For more information, see the developer guide of the corresponding Apsara Stack service.

```
{
    "eagleEyeTraceId": "xxx-xxx-xxx-xxx", // The trace ID provided by EagleEye.
    "asapiSuccess": true,
    "RequestId": "xxxxxxxxxx",
    "Regions": { // The regions returned after you call the DescribeRegions operation.
        "Region": [
            {
                "RegionId": "",
                "RegionEndpoint": "",
                "LocalName": ""
            }
        ]
    }
}
```

Sample error response

If a request fails, the following information is returned. For more information, see the developer guide of the corresponding Apsara Stack service.

```
{
    "code": "asapi.server.api.notfound",// The error code.
    "eagleEyeTraceId": "xxx-xxx-xxx-xxx", // The trace ID provided by EagleEye.
    "asapiSuccess": false, // Indicates whether the request is successful.
    "hostId": "xxxx", // The ID of the host.
    "message": "Failed to ....", // The message returned.
    "asapiErrorMessage": "Failed to ....", // The error message provided by the ASAPI.
    "asapiErrorCode": "asapi.server.api.notfound" // The error code provided by the ASAPI.
}
```

20.1.4. Obtain an AccessKey pair

An AccessKey pair consists of an AccessKey ID and an AccessKey secret. The AccessKey pair is used to implement symmetric encryption to verify the identity of the requester. The AccessKey ID is used to identify a user. The AccessKey secret is used to encrypt the signature string. This topic describes how to obtain the AccessKey pair of an organization.

Prerequisites

Only the operation administrators or level-1 organization administrators can obtain the AccessKey pair of an organization.

Context

We recommend that you use the AccessKey pair of a personal account to call Apsara Uni-manager and cloud service APIs. When you use the AccessKey pair of a personal account, you must configure header parameters in the following table for access control.

Parameter	Description
x-acs-regionid	The region ID, such as cn-hangzhou-*.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager console.
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager console.
x-acs-instanceid	The ID of the instance on which you want to perform operations.

Warning The AccessKey pairs of personal accounts are managed by the Apsara Uni-manager permission system. AccessKey pairs of organization accounts have higher permissions. For security purposes, organization operations must be approved by administrators.

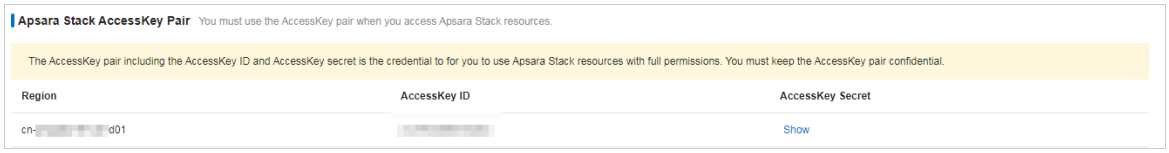
Obtain the AccessKey pair of a personal account

To obtain the AccessKey pair of a personal account, perform the following operations:

1. Log on to the Apsara Uni-manager Management Console.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and click **User**

Information.

3. In the **Apsara Stack AccessKey Pair** section, view your AccessKey pair.



> **Note** The AccessKey pair consists of an AccessKey ID and an AccessKey secret. AccessKey pairs allow you to access Apsara Stack resources with full permissions for your account. You must keep your AccessKey pair confidential.

Obtain the AccessKey pair of an organization

To obtain the AccessKey pair of an organization, perform the following operations:

1. In the address bar, enter the URL of the Apsara Uni-manager Management Console. Press the Enter key.
2. Enter your username and password.

   Obtain the username and password that you can use to log on to the console from the operations administrator.

   > **Note** When you log on to the Apsara Uni-manager Management Console for the first time, you must change the password of your username. Your password must meet complexity requirements. The password must be 8 to 20 characters in length and must contain at least two of the following character types:
   >
   > - Uppercase or lowercase letters
   > - Digits
   > - Special characters, which include ! @ # $ %

3. Click **Login**.
4. In the top navigation bar, click **Enterprise**.
5. In the left-side navigation pane of the **Enterprise** page, click **Organizations**.
6. In the organization navigation tree, click an organization name.
7. In the Current Organization section, click **Obtain an accesskey**.
8. In the AccessKey message, view the AccessKey pair of the organization.

   > **Note** An AccessKey pair is automatically allocated to each level-1 organization. Subordinate organizations use the same AccessKey pair of their level-1 organization.

20.1.5. Obtain an endpoint

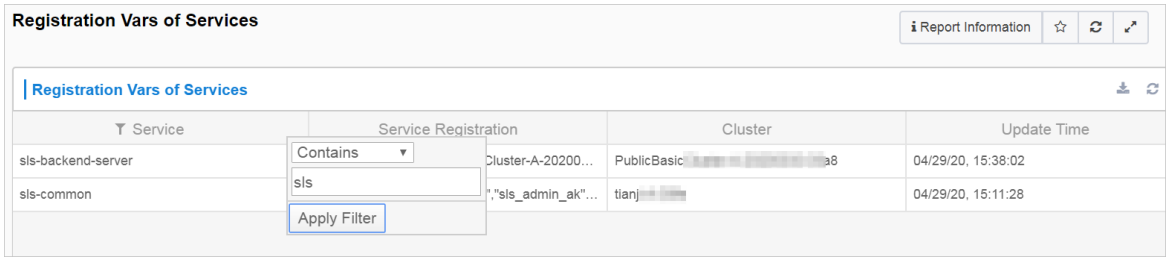
You can obtain an endpoint of a service in the Apsara Uni-manager Operations Console.

Procedure

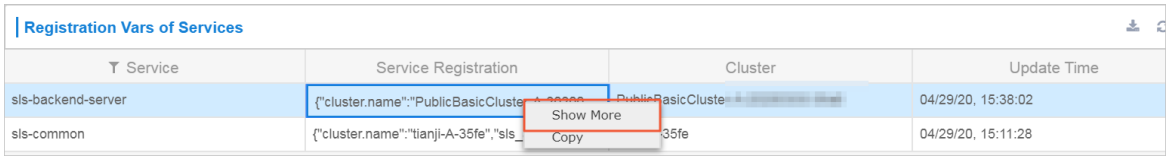
1. Log on to the Apsara Uni-manager Operations Console.

For more information, see Log on to the API Tool console.

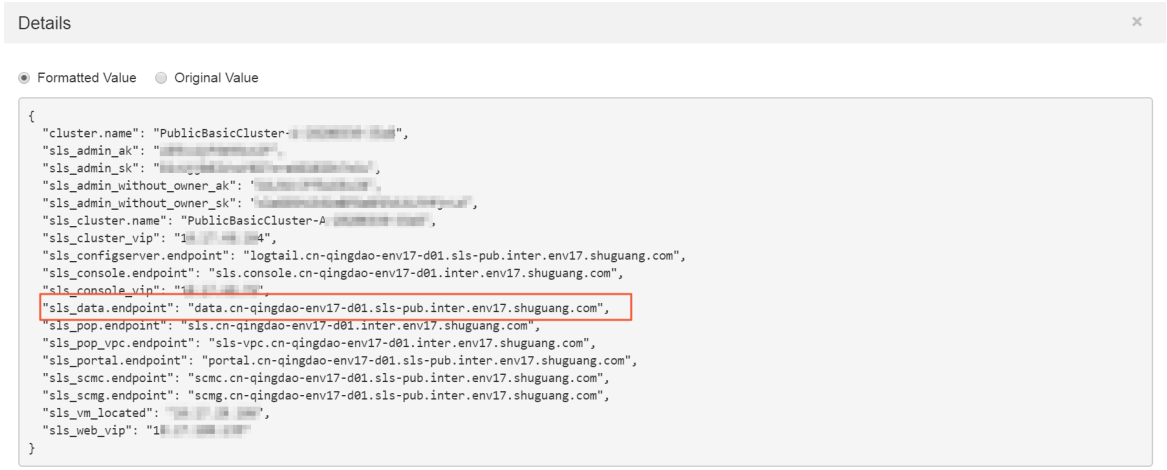
2. In the left-side navigation pane, choose **Products > Product List > Apsara Stack O&M**.
3. Click **Apsara Infrastructure Management Framework** to go to the Apsara Infrastructure Management Framework console.
4. In the left-side navigation pane, click **Reports** to open the **All Reports** page.
5. In the Report column, click **Registration Vars of Services**.
6. In the dialog box that appears, click the icon in the column, enter **sls** in the search box, and then click **Apply Filter**.



7. Right-click the service in the **Service Registration** column of **sls-backend-server**, and then click **Show More**.



8. In the **Details** dialog box, view the endpoint of Log Service.



21.Apsara Stack DNS

21.1. Developer Guide

21.1.1. Overview

21.1.1.1. Calling methods

You can use a pair of AccessKey ID and AccessKey Secret to call API operations. You can use SDKs of different languages, or create a client based on the signature description provided by the POP gateway.

21.1.1.2. Supported formats

- AccessKey ID and AccessKey Secret of an Apsara Stack tenant account
- Temporary AccessKey ID and AccessKey Secret of an Apsara Stack tenant account
- AccessKey ID and AccessKey Secret of a RAM user account
- Temporary AccessKey ID and AccessKey Secret of a RAM user account

21.1.1.3. Instructions

- The AccessKey ID is used to identify users.
- The AccessKey Secret is used to compute the request signature.

21.1.1.4. Time format

Unless otherwise specified, the time string is a UTC+0 time in the format of YYYY-MM-DDTHH:mm:ssZ. For example, 2018-01-16T09:00:01Z indicates 17:00:01 on January 16, 2018, in China Standard Time (UTC+8).

21.1.2. List of operations by function

DNS V2.0 provides the following API operations.

API	Description
ObtainGlobalAuthZoneList	Obtains global authoritative zones
ObtainGlobalAuthRecordList	Obtains global authoritative RRSets
AddGlobalRrSet	Adds global RRSets
DeleteGlobalRrSet	Deletes global RRSets
UpdateGlobalRrSet	Updates global RRSets
RemarkGlobalRrSet	Configures descriptions for global RRSets

21.1.3. Prerequisites

21.1.3.1. Obtain an AccessKey pair

An AccessKey pair consists of an AccessKey ID and an AccessKey secret. The AccessKey pair is used to implement symmetric encryption to verify the identity of the requester. The AccessKey ID is used to identify a user. The AccessKey secret is used to encrypt the signature string. This topic describes how to obtain an AccessKey pair.

Prerequisites

Only operations administrators and level-1 organization administrators can obtain the AccessKey pair of an organization.

Context

We recommend that you use the AccessKey pair of a personal account to call the API operations of the Apsara Uni-manager Management Console and cloud services. When you use the AccessKey pair of a personal account, you must configure header parameters as described in the following table for access control.

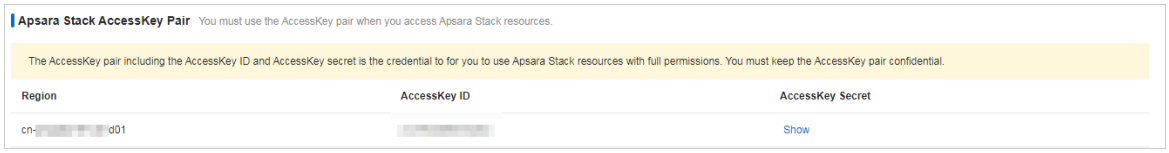
Parameter	Description
x-acs-regionid	The region ID, such as cn-hangzhou-*.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console.
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console.
x-acs-instanceid	The ID of the instance on which you want to perform operations.

Warning The AccessKey pairs of personal accounts are under control of the Apsara Uni-manager Management Console permission system. AccessKey pairs of organization accounts have higher permissions. For security purposes, organization operations must be approved by administrators.

Obtain the AccessKey pair of a personal account

To obtain the AccessKey pair of a personal account, perform the following operations:

1. Log on to the Apsara Uni-manager Management Console.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and click **User Information**.
3. In the **Apsara Stack AccessKey Pair** section, view your AccessKey pair.



> **Note** The AccessKey pair consists of an AccessKey ID and an AccessKey secret. AccessKey pairs allow you to access Apsara Stack resources with full permissions for your account. You must keep your AccessKey pair confidential.

Obtain the AccessKey pair of an organization

To obtain the AccessKey pair of an organization, perform the following operations:

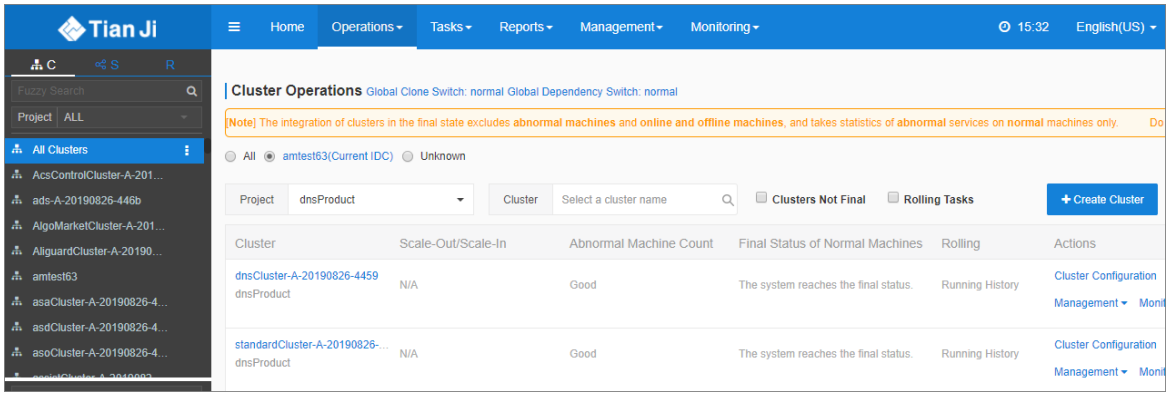
1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Organizations**.
4. In the organization navigation tree, click an organization name.
5. In the Current Organization section, click **Obtain an accesskey**.
6. In the AccessKey message, view the AccessKey pair of the organization.

> **Note** An AccessKey pair is automatically allocated to each level-1 organization. Subordinate organizations use the same AccessKey pair of their level-1 organization.

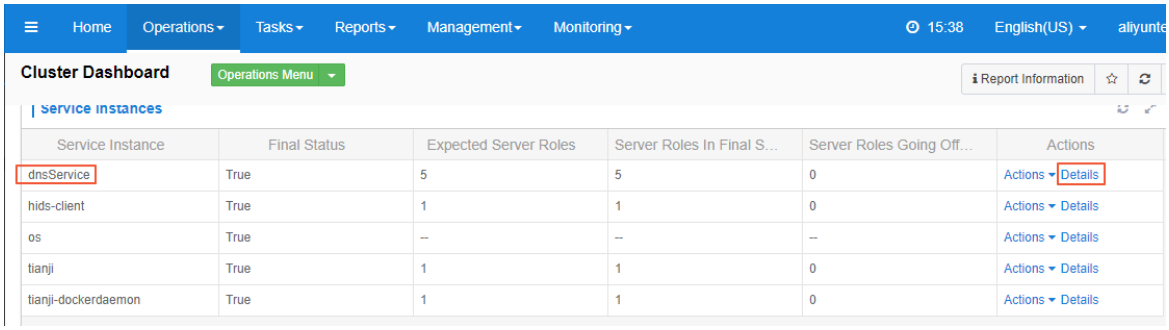
21.1.3.2. Obtain an endpoint

Procedure

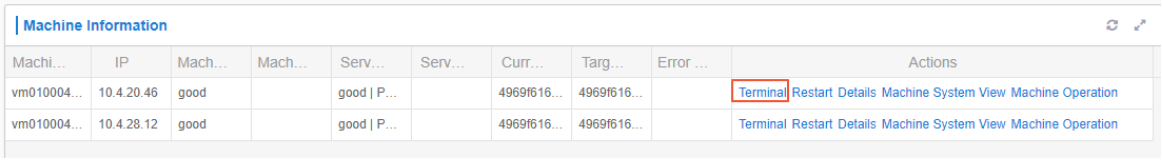
1. Log on to the Apsara Infrastructure Management Framework console as an administrator.
2. In the top navigation bar, choose **Operations > Cluster Operations**.
3. On the **Cluster Operations** page, select *dnsProduct* from the **Project** drop-down list.



4. In the Service Instances section, click **Details** in the Actions column corresponding to dnsService.



5. In the Machine Information section, click **Terminal** in the Actions column corresponding to a server to go to the console.



6. Run the `sudo docker ps -l` command to obtain the ID of the current container.
7. Run the `sudo docker inspect ${container id} |grep env` command to obtain the endpoint of the current environment.

   The endpoint is the value corresponding to pop_out_endpoint (the string starting with "api.").

21.1.4. SDK example

21.1.4.1. Create a client

You need to specify a region ID, AccessKey ID, and AccessKey Secret to create a client.

Go SDK

```
1.    if client, err := genesisdns.NewClientWithAccessKey(RegionId, AccessKey, AccessSecret
); err == nil  {
2.      //Normal business logic
3.    } else {
4.      //Business logic to handle exceptions
5.    }
```

Python SDK

```
1.    from aliyunsdkcore.client import AcsClient
2.    from aliyunsdkcore.acs_exception.exceptions import ClientException
3.    from aliyunsdkcore.acs_exception.exceptions import ServerException
4.
5.
6.    client = AcsClient("<access-key-id>",
7.       "<access-key-secret>",
8.       "<region-id>");
```

Java SDK

```
1.    public static void main(String[] args) {
2.         DefaultProfile profile = DefaultProfile.getProfile("{regionid}","{ak}", "{secret
}");
3.         IAcsClient client = new DefaultAcsClient(profile);
4.    }
```

21.1.4.2. Obtain global authoritative zones

Go SDK

```
1. if client, err := genesisdns.NewClientWithAccessKey("{regionid}","{ak}", "{secret}"); er
r == nil {
2.     request := genesisdns.CreateObtainGlobalAuthZoneListRequest()
3.     request.SetDomain("{endpoint}")
4.     if response, err := client.ObtainGlobalAuthZoneList(request); err == nil {
5.         fmt.Println(response.ZoneList)
6.     }
7. }
```

Python SDK

```
1. client = AcsClient("{ak}", "{secret}", "{regionid}");
2.
3. request = ObtainGlobalAuthZoneListRequest.ObtainGlobalAuthZoneListRequest()
4. request.set_PageSize(10)
5. region_provider.modify_point("GenesisDns", "{regionid}","{endpoint}")
6. try:
7.     response = client.do_action_with_exception(request)
8.     print(response)
9. except ServerException as e:
10.     print(e)
11. except ClientException as e:
12.     print(e)
```

Java SDK

```
public static void main(String[] args) {
    DefaultProfile profile = DefaultProfile.getProfile("{regionid}","{ak}", "{secret}");
    IAcsClient client = new DefaultAcsClient(profile);
    ObtainGlobalAuthZoneListRequest request = new ObtainGlobalAuthZoneListRequest();
    try {
        request.setEndpoint("{endpoint}");
        request.setConnectTimeout(1000);
        request.setReadTimeout(1000);
        request.setPageSize(10);
        ObtainGlobalAuthZoneListResponse response = client.getAcsResponse(request);
        System.out.println(JSON.toJSONString(response.getZoneList()));
    } catch (Exception ex) {
        System.out.println(ex.getMessage());
    }
}
```

21.1.4.3. Obtain global authoritative RRSets

Go SDK

```
if client, err := genesisdns.NewClientWithAccessKey("{regionid}","{ak}", "{secret}"); err == nil {
    request := genesisdns.CreateObtainGlobalAuthRecordListRequest()
    request.SetDomain("{endpoint}")
    request.Id = requests.Integer("{zone id}")
    if response, err := client.ObtainGlobalAuthRecordList(request); err == nil {
        fmt.Println(response.Records)
    }
}
```

Python SDK

```
from aliyunsdkcore.client import AcsClient
from aliyunsdkcore.profile import region_provider
from aliyunsdkcore.acs_exception.exceptions import ClientException
from aliyunsdkcore.acs_exception.exceptions import ServerException
from aliyunsdkgenesisdns.request.v20180925 import ObtainGlobalAuthRecordListRequest

client = AcsClient("{ak}", "{secret}", "{regionid}")

request = ObtainGlobalAuthRecordListRequest.ObtainGlobalAuthRecordListRequest()
request.set_PageSize(10)
request.set_Id({zone id})
region_provider.modify_point("GenesisDns", "{regionid}", "{endpoint}")
try:
    response = client.do_action_with_exception(request)
    print(response)
except ServerException as e:
    print(e)
except ClientException as e:
    print(e)
```

Java SDK

```
public static void main(String[] args) {
    DefaultProfile profile = DefaultProfile.getProfile("{regionid}","{ak}", "{secret}");
    IAcsClient client = new DefaultAcsClient(profile);
    ObtainGlobalAuthRecordListRequest request = new ObtainGlobalAuthRecordListRequest();
    try {
        request.setEndpoint("{endpoint}");
        request.setConnectTimeout(1000);
        request.setReadTimeout(1000);
        request.setPageSize(10);
         request.setId(Long.parseLong("{zone id}"));
         ObtainGlobalAuthRecordListResponse response = client.getAcsResponse(request);
         System.out.println(JSON.toJSONString(response.getRecords()));
    } catch (Exception ex) {
        System.out.println(ex.getMessage());
    }
}
```

21.1.4.4. Add global RRSets

The following examples describe how a Resource Record Set (RRSet) is defined.

```
1.          request.RrSet = "[\"2001:0:0:0:0:0:0:1\"]" //A RRSet with an AAAA record
2.          request.RrSet = "[\"2001:0:0:0:0:0:0:1\", \"2001::2\"]" //A RRSet with two AAAA
records
3.          request.RrSet = "[\"2001:0:0:0:0:0:0:1 10\", \"2001::2 10\"]" //A RRSet with two
weighted AAAA records
4.          request.Type = "AAAA"
5.
6.          request.RrSet = "[\"www.aliyun.com. \"]" //A RRSet with a CNAME record
7.          request.RrSet = "[\"www.aliyun.com. 10\",\"www.taobao.com 30\"]" //A RRSet with
two weighted CNAME records
8.          request.Type = "CNAME"
9.
10.          request.RrSet = "[\"10 mailserver1.example.com. \"]" //A RRSet with an MX recor
d
11.          request.Type = "MX"
12.
13.          request.RrSet = "[\"10 mailserver1.example.com.\",\"20 mailserver2.example.com.
\"]" //A RRSet with two MX records
14.          request.RrSet = "[\"v=spf1 ip4:192.168.0.1/16 ip6:2001::1/96 ~all\"]" //A RRSet
with a TXT record
15.          request.Type = "TXT"
16.
17.          request.RrSet = "[\"1 10 8080 www1.example.com.\", \"2 20 8081 www2.example.com
. \"]" //A RRSet with two SRV records
18.          request.Type = "SRV"
19.
20.          request.RrSet = "[\"100 50 \\\"S\\\" \\\"Z3950+I2L+I2C\\\" \\\"\\\" _z3950._tcp
.example.com. \"]" //A RRSet with a NAPTR record
21.          request.Type = "NAPTR"
22.
23.          request.RrSet = "[\"0 issue \\\"caa.example.com\\\"\",\"0 issuewild \\\";\\\"\"
]" //A RRSet with a CAA record
24.          request.Type = "CAA"
25.
26.          request.RrSet = "[\"inner-ns1.example01.com. hostmaster.example01.com. 1 7200 9
00 1209600 86400\"]" //A RRSet with an SOA record
27.          request.Type = "SOA"
28.
29.          request.RrSet = "[\"ns1.example.com.\",\"ns2.example.com. \"]" //A RRSet with t
wo NS records
30.          request.Type = "NS"
```

Go SDK

```
1. func main()  {
2.     if client, err := genesisdns.NewClientWithAccessKey("{regionid}","{ak}", "{secret}")
; err == nil {
3.         request := genesisdns.CreateAddGlobalRrSetRequest()
4.         request.SetDomain("{endpoint}")
5.         request.ZoneId = requests.Integer("{zone id}")
6.         request.Ttl = requests.Integer("300")
7.         request.Type = "A"
8.         request.RrSet = "[\"1.1.1.1\"]"
9.         request.Rr = "sdka"
10.
11.         if response, err := client.AddGlobalRrSet(request); err == nil {
12.             fmt.Println(response.RequestId, response.Id)
13.         }
14.     }
15. }
```

Python SDK

```
1. from aliyunsdkcore.client import AcsClient
2. from aliyunsdkcore.profile import region_provider
3. from aliyunsdkcore.acs_exception.exceptions import ClientException
4. from aliyunsdkcore.acs_exception.exceptions import ServerException
5. from aliyunsdkgenesisdns.request.v20180925 import AddGlobalRrSetRequest
6.
7. client = AcsClient("{ak}", "{secret}", "{regionid}")
8.
9. request = AddGlobalRrSetRequest.AddGlobalRrSetRequest()
10. request.set_ZoneId(93)
11. request.set_Rr("sdk_python_a")
12. request.set_RrSet("[\"3.3.3.3\"]")
13. request.set_Ttl(300)
14. request.set_Type("A")
15.
16. region_provider.modify_point("GenesisDns", "{regionid}", "{endpoint}")
17. try:
18.     response = client.do_action_with_exception(request)
19.     print(response)
20. except ServerException as e:
21.     print(e)
22. except ClientException as e:
23.     print(e)
```

Java SDK

```
public static void main(String[] args) {
    DefaultProfile profile = DefaultProfile.getProfile("{regionid}","{ak}", "{secret}");
    IAcsClient client = new DefaultAcsClient(profile);
    AddGlobalRrSetRequest request = new AddGlobalRrSetRequest();
    try {
        request.setEndpoint("{endpoint}");
        request.setConnectTimeout(1000);
        request.setReadTimeout(1000);
        request.setZoneId(Long.parseLong("93"));
         request.setRr("sdk_java_a");
         request.setTtl(300);
         request.setType("A");
         request.setRrSet("[\"1.1.1.1\", \"2.2.2.2\"]");
         AddGlobalRrSetResponse response = client.getAcsResponse(request);
         System.out.println(JSON.toJSONString(response));
    } catch (Exception ex) {
        System.out.println(ex.getMessage());
    }
}
```

21.1.4.5. Delete global RRSets

Go SDK

```
package main

import (
    "fmt"
    "github.com/aliyun/alibaba-cloud-sdk-go/sdk/requests"
    "github.com/aliyun/alibaba-cloud-sdk-go/services/genesisdns"
)

func main()  {
     if client, err := genesisdns.NewClientWithAccessKey("{regionid}","{ak}", "{secret}"); err == nil {
         request := genesisdns.CreateDeleteGlobalRrSetRequest()
         request.SetDomain("{endpoint}")
         request.Id = requests.Integer("{rrSet id")

         if response, err := client.DeleteGlobalRrSet(request); err == nil {
             fmt.Println(response.RequestId)
         }
     }
 }
```

Python SDK

```
from aliyunsdkcore.client import AcsClient
from aliyunsdkcore.profile import region_provider
from aliyunsdkcore.acs_exception.exceptions import ClientException
from aliyunsdkcore.acs_exception.exceptions import ServerException
from aliyunsdkgenesisdns.request.v20180925 import DeleteGlobalRrSetRequest

client = AcsClient("{ak}", "{secret}", "{regionid}")

request = DeleteGlobalRrSetRequest.DeleteGlobalRrSetRequest()
 request.set_Id(170)

 region_provider.modify_point("GenesisDns", "{regionid}", "{endpoint}")
 try:
     response = client.do_action_with_exception(request)
     print(response)
 except ServerException as e:
     print(e)
 except ClientException as e:
     print(e)
```

Java SDK

```
public static void main(String[] args) {
    DefaultProfile profile = DefaultProfile.getProfile("{regionid}","{ak}", "{secret}
");
    IAcsClient client = new DefaultAcsClient(profile);
    DeleteGlobalRrSetRequest request = new DeleteGlobalRrSetRequest();
    try {
        request.setEndpoint("{endpoint}");
        request.setConnectTimeout(1000);
        request.setReadTimeout(1000);
        request.setId(Long.parseLong("{RrSet id}"));
         DeleteGlobalRrSetResponse response = client.getAcsResponse(request);
         System.out.println(JSON.toJSONString(response));
     } catch (Exception ex) {
         System.out.println(ex.getMessage());
     }
```

21.1.4.6. Update global RRSets

Go SDK

```
package main

import (
    "fmt"
    "github.com/aliyun/alibaba-cloud-sdk-go/sdk/requests"
    "github.com/aliyun/alibaba-cloud-sdk-go/services/genesisdns"
)

func main()  {
     if client, err := genesisdns.NewClientWithAccessKey("{regionid}","{ak}", "{secret}"); err == nil {
          request := genesisdns.CreateUpdateGlobalRrSetRequest()
          request.SetDomain("{endpoint}")
          request.RrsetId = requests.Integer("{RrSet id}")
          request.Rr = "go_sdk_a"
          request.RrSet = "[\"8.8.8.8\"]"
          request.Ttl = requests.Integer("300")
          request.Type = "A"

          if response, err := client.UpdateGlobalRrSet(request); err == nil {
              fmt.Println(response.RequestId)
          }
      }
 }
```

Python SDK

```
from aliyunsdkcore.client import AcsClient
from aliyunsdkcore.profile import region_provider
from aliyunsdkcore.acs_exception.exceptions import ClientException
from aliyunsdkcore.acs_exception.exceptions import ServerException
from aliyunsdkgenesisdns.request.v20180925 import UpdateGlobalRrSetRequest

client = AcsClient("{ak}", "{secret}", "{regionid}")

request = UpdateGlobalRrSetRequest.UpdateGlobalRrSetRequest()
 request.set_RrsetId(165)
 request.set_Type("A")
 request.set_Rr("sdk_python_a")
 request.set_RrSet("[\"3.3.3.3\"]")
 request.set_Ttl(300)

 region_provider.modify_point("GenesisDns", "{regionid}", "{endpoint}")
 try:
     response = client.do_action_with_exception(request)
     print(response)
 except ServerException as e:
     print(e)
 except ClientException as e:
     print(e)
```

Java SDK

```
1.    public static void main(String[] args) {
2.        DefaultProfile profile = DefaultProfile.getProfile("{regionid}","{ak}", "{secret}
");
3.        IAcsClient client = new DefaultAcsClient(profile);
4.        UpdateGlobalRrSetRequest request = new UpdateGlobalRrSetRequest();
5.        try {
6.            request.setEndpoint("{endpoint}");
7.            request.setConnectTimeout(1000);
8.            request.setReadTimeout(1000);
9.            request.setRrsetId(Long.parseLong("165"));
10.            request.setRr("sdk_java_a");
11.            request.setRrSet("[\"4.4.4.4\"]");
12.            request.setTtl(300);
13.            request.setType("A");
14.
15.            UpdateGlobalRrSetResponse response = client.getAcsResponse(request);
16.            System.out.println(JSON.toJSONString(response));
17.        } catch (Exception ex) {
18.            System.out.println(ex.getMessage());
19.        }
20.    }
```

21.1.4.7. Configure descriptions for global RRSets

Go SDK

```
1. package main
2.
3. import (
4.     "fmt"
5.     "github.com/aliyun/alibaba-cloud-sdk-go/sdk/requests"
6.     "github.com/aliyun/alibaba-cloud-sdk-go/services/genesisdns"
7. )
8.
9. func main()  {
10.     if client, err := genesisdns.NewClientWithAccessKey(""{regionid}","{ak}", "{secret}
"); err == nil {
11.         request := genesisdns.CreateRemarkGlobalRrSetRequest()
12.         request.SetDomain("{endpoint}")
13.         request.Id = requests.Integer("165")
14.         request.Remark = "go remark"
15.
16.
17.         if response, err := client.RemarkGlobalRrSet(request); err == nil {
18.             fmt.Println(response.RequestId)
19.         }
20.     }
21. }
```

Python SDK

```
from aliyunsdkcore.client import AcsClient
from aliyunsdkcore.profile import region_provider
from aliyunsdkcore.acs_exception.exceptions import ClientException
from aliyunsdkcore.acs_exception.exceptions import ServerException
from aliyunsdkgenesisdns.request.v20180925 import RemarkGlobalRrSetRequest

client = AcsClient("{ak}", "{secret}", "{regionid}")
