Legal disclaimer

Alibaba Cloud reminds you to carefully read and fully understand the terms and conditions of this legal disclaimer before you read or use this document. If you have read or used this document, it shall be deemed as your total acceptance of this legal disclaimer.

1. You shall download and obtain this document from the Alibaba Cloud website or other Alibaba Cloud-authorized channels, and use this document for your own legal business activities only. The content of this document is considered confidential information of Alibaba Cloud. You shall strictly abide by the confidentiality obligations. No part of this document shall be disclosed or provided to any third party for use without the prior written consent of Alibaba Cloud.

2. No part of this document shall be excerpted, translated, reproduced, transmitted, or disseminated by any organization, company or individual in any form or by any means without the prior written consent of Alibaba Cloud.

3. The content of this document may be changed because of product version upgrade, adjustment, or other reasons. Alibaba Cloud reserves the right to modify the content of this document without notice and an updated version of this document will be released through Alibaba Cloud-authorized channels from time to time. You should pay attention to the version changes of this document as they occur and download and obtain the most up-to-date version of this document from Alibaba Cloud-authorized channels.

4. This document serves only as a reference guide for your use of Alibaba Cloud products and services. Alibaba Cloud provides this document based on the "status quo", "being defective", and "existing functions" of its products and services. Alibaba Cloud makes every effort to provide relevant operational guidance based on existing technologies. However, Alibaba Cloud hereby makes a clear statement that it in no way guarantees the accuracy, integrity, applicability, and reliability of the content of this document, either explicitly or implicitly. Alibaba Cloud shall not take legal responsibility for any errors or lost profits incurred by any organization, company, or individual arising from download, use, or trust in this document. Alibaba Cloud shall not, under any circumstances, take responsibility for any indirect, consequential, punitive, contingent, special, or punitive damages, including lost profits arising from the use or trust in this document (even if Alibaba Cloud has been notified of the possibility of such a loss).

5. By law, all the contents in Alibaba Cloud documents, including but not limited to pictures, architecture design, page layout, and text description, are intellectual property of Alibaba Cloud and/or its affiliates. This intellectual property includes, but is not limited to, trademark rights, patent rights, copyrights, and trade secrets. No part of this document shall be used, modified, reproduced, publicly transmitted, changed, disseminated, distributed, or published without the prior written consent of Alibaba Cloud and/or its affiliates. The names owned by Alibaba Cloud shall not be used, published, or reproduced for marketing, advertising, promotion, or other purposes without the prior written consent of Alibaba Cloud. The names owned by Alibaba Cloud include, but are not limited to, "Alibaba Cloud", "Aliyun", "HiChina", and other brands of Alibaba Cloud and/or its affiliates, which appear separately or in combination, as well as the auxiliary signs and patterns of the preceding brands, or anything similar to the company names, trade names, trademarks, product or service names, domain names, patterns, logos, marks, signs, or special descriptions that third parties identify as Alibaba Cloud and/or its affiliates.

Document conventions

Style	Description	Example
Danger	A danger notice indicates a situation that will cause major system changes, faults, physical injuries, and other adverse results.	**Danger:** Resetting will result in the loss of user configuration data.
Warning	A warning notice indicates a situation that may cause major system changes, faults, physical injuries, and other adverse results.	**Warning:** Restarting will cause business interruption. About 10 minutes are required to restart an instance.
Notice	A caution notice indicates warning information, supplementary instructions, and other content that the user must understand.	**Notice:** If the weight is set to 0, the server no longer receives new requests.
Note	A note indicates supplemental instructions, best practices, tips, and other content.	**Note:** You can use Ctrl + A to select all files.
>	Closing angle brackets are used to indicate a multi-level menu cascade.	Click **Settings**> **Network**> **Set network type**.
Bold	Bold formatting is used for buttons , menus, page names, and other UI elements.	Click **OK**.
`Courier font`	Courier font is used for commands	Run the `cd /d C:/window` command to enter the Windows system folder.
Italic	Italic formatting is used for parameters and variables.	`bae log list --instanceid` *Instance_ID*
[] or [a|b]	This format is used for an optional value, where only one item can be selected.	`ipconfig [-all|-t]`
{} or {a|b}	This format is used for a required value, where only one item can be selected.	`switch {active|stand}`

21.1.4.7. Configure descriptions for global RRSets ---- 5048

1.Apsara Uni-manager Management Console

1.1. Developer Guide

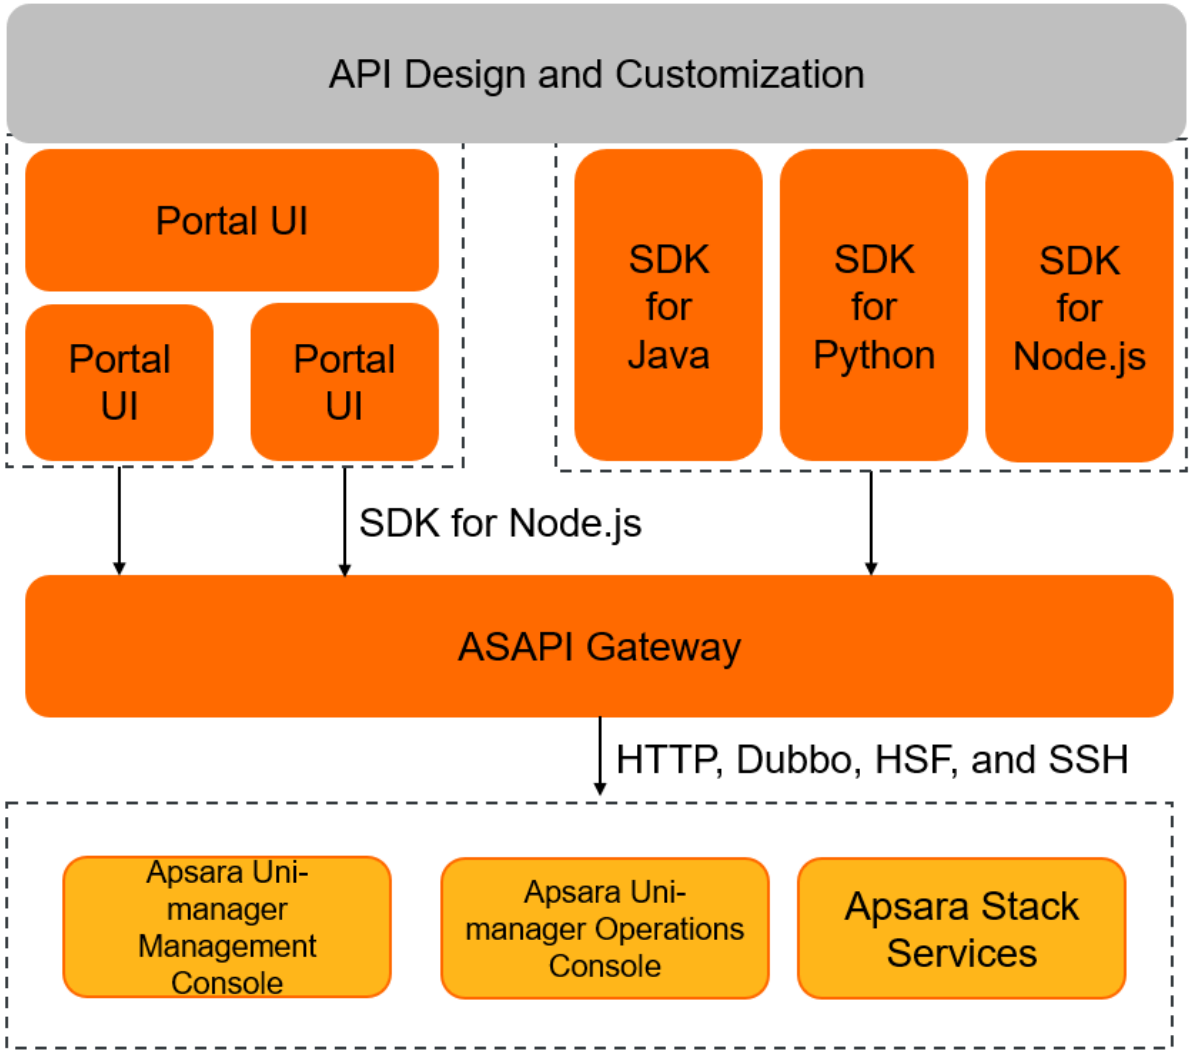
1.1.1. Call service SDKs by using ASAPI

1.1.1.1. 文档标题缺失，请补全后重新导出

1.1.1.1.1. ASAPI overview

This topic describes the architecture and features of the Apsara Stack API (ASAPI).

The ASAPI is a unified ingress gateway for Apsara Stack services and a main component of the Apsara Uni-manager Management Console. The ASAPI provides a unified method for you to manage and make API calls. You can use Apsara Stack SDK to centrally make API calls to Apsara Stack services, including Elastic Compute Service (ECS) and Virtual Private Cloud (VPC).



The ASAPI allows you to make API calls to manage and maintain Apsara Stack services.

- Make API calls to implement enterprise-grade management. For example, you can manage organizations, users, roles, resource sets, and logon policies. These operations are provided by the Apsara Uni-manager Management Console.
- Make API calls to manage operations. For example, you can manage quotas, usage statistics, specifications, and password policies. These operations are provided by the Apsara Uni-manager Management Console.
- Make API calls to manage resources. For example, you can create, delete, query, or modify cloud resources. These operations are provided by Apsara Stack services. If you call an API operation to create an ECS instance or a VPC, the API operation is provided by ECS or VPC.
- Make API calls to query monitoring metrics of Apsara Stack services. These operations are provided by the Apsara Uni-manager Management Console.
- Make API calls to perform O&M. For example, you can manage monitoring and alerting, inventories, tasks, and physical servers. These operations are provided by the Apsara Uni-manager Operations Console.

For more information, see the developer guide of the corresponding Apsara Stack service. For information about API operations used to manage organization users, see *Apsara Uni-manager Management Console Developer Guide*. For information about the API operation used to create an ECS instance, see *ECS Developer Guide*.

> **Note** If the "Use Apsara Stack SDK to make API calls" section is included in the developer guide of an Apsara Stack service, the ASAPI is supported by the Apsara Stack service. In this case, you can make API calls based on the developer guide.

1.1.1.1.2. Preparations

1.1.1.1.2.1. Log on to the API Tool console

You can log on to the API Tool console from the Apsara Uni-manager Management Console.

Prerequisites

- The URL of the Apsara Uni-manager Management Console is obtained from the deployment personnel before you log on to the Apsara Uni-manager Management Console.
- We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL of the Apsara Uni-manager Management Console. Press the Enter key.
2. Enter your username and password.

   Obtain the username and password that you can use to log on to the console from the operations administrator.

   > **Note** When you log on to the Apsara Uni-manager Management Console for the first time, you must change the password of your username. Your password must meet complexity requirements. The password must be 10 to 32 characters in length and must contain at least two of the following character types:
   >
   > - Uppercase or lowercase letters
   > - Digits
   > - Special characters, which include ! @ # $ %

3. Click **Log On**.
4. In the top navigation bar, choose **Products > Others > API Tool**.

1.1.1.1.2.2. View information about API operations

This topic describes how to view information about API operations. Before you use SDKs, obtain service names, API operation names, and API operation versions.

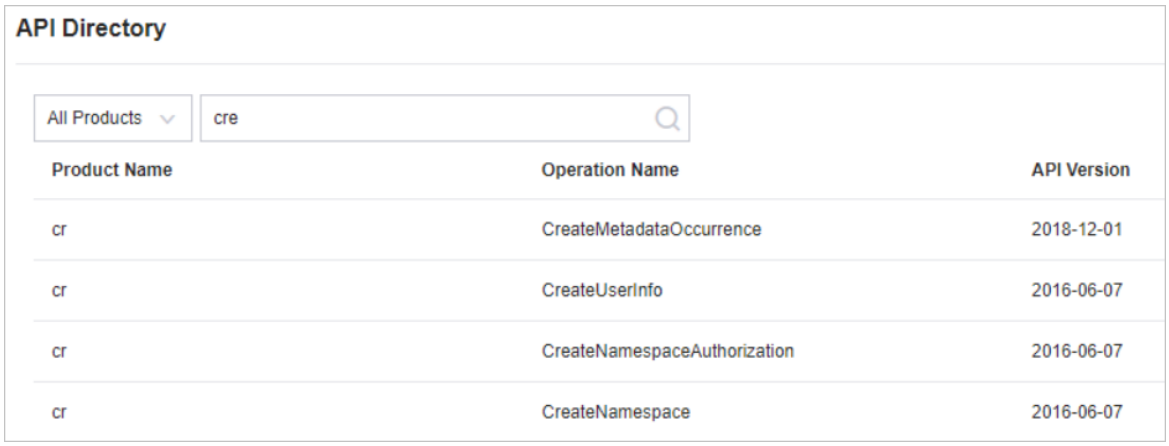
Context

The API operations on the API Directory page are only for reference. For information about how to call

API operations, see developer guides of the corresponding cloud services. If the information on the API Directory page is inconsistent with that in the developer guide of the corresponding cloud service, the information in the developer guide prevails.

Procedure

1. Go to the API Tool console. For more information, see Log on to the API Tool console.
2. In the left-side navigation pane, click **API Directory**.
3. On the **API Directory** page, select the desired service from the drop-down list, enter a keyword of an API operation name in the search box, and then click the search icon.



4. Then, you can view the service name, API operation name, and API operation version.

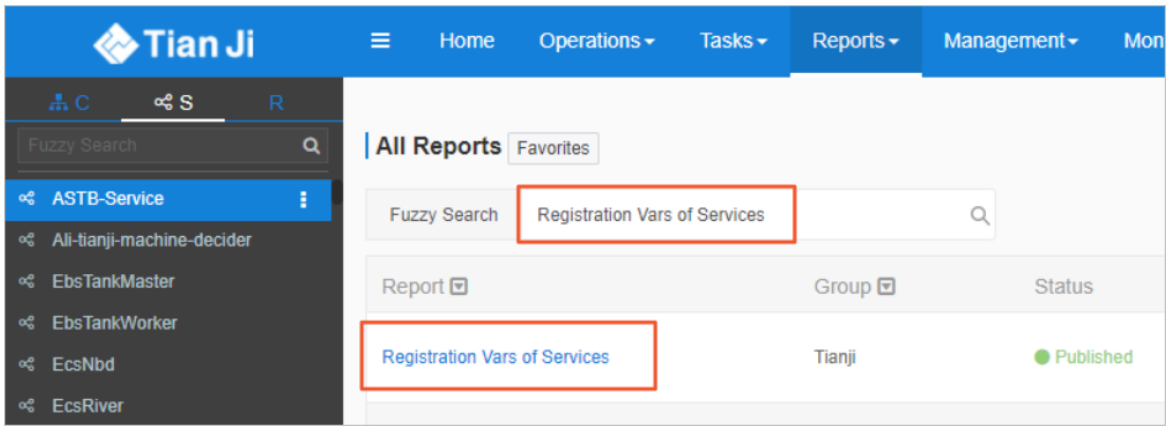
1.1.1.1.2.3. Generate an endpoint for the ASAPI

This topic describes three methods used to generate an endpoint for the Apsara Stack API (ASAPI).

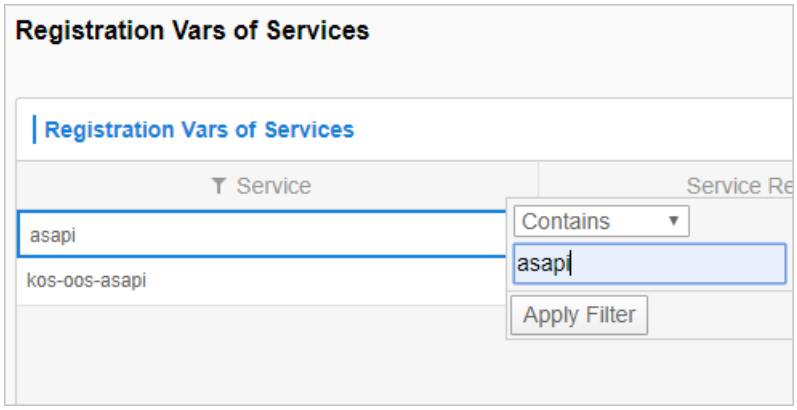
Method 1: Use Registration Vars of Services to generate an endpoint

1. Log on to Apsara Infrastructure Management Framework.
   i. Log on to the Apsara Uni-manager Operations Console.
   ii. In the top navigation bar, click **O&M**.
   iii. In the left-side navigation pane, choose **Product Management** > **Products**.
   iv. In the Apsara Stack O&M section, click **Apsara Infrastructure Management Framework**.
2. In the left-side navigation pane, click **Reports**.

3. On the **All Reports** page, search for `Registration Vars of Services` and click the report name.



4. On the **Registration Vars of Services** page, click the icon next to **Service** and search for `asapi`.



5. Find the asapi service, right-click in the **Service Registration** column, and then select **Show More** from the shortcut menu.

   In the **Details** dialog box, obtain the value of **asapi.public.endpoint**.

6. Generate an endpoint for the ASAPI based on the following format:

```
https://<asapi.public.endpoint>/asapi/v3
```

Method 2: Use cluster resources to generate an endpoint

1. Log on to Apsara Infrastructure Management Framework.
   i. Log on to the Apsara Uni-manager Operations Console.
   ii. In the top navigation bar, click **O&M**.
   iii. In the left-side navigation pane, choose **Product Management** > **Products**.
   iv. In the Apsara Stack O&M section, click **Apsara Infrastructure Management Framework**.
2. Go to the cluster operations page.
   i. In the left-side navigation pane, choose Operations > Cluster Operations.
   ii. In the **Cluster** search box, enter `ascm`.

iii. Find the cluster that you want to manage and click **Operations** in the **Actions** column.

3. Obtain the value of the domain parameter.
   i. Click the Cluster Resources tab.
   ii. In the **Name** field, search for `asapi_dns_public`.
   iii. Click **Details** in the **Application Parameter** column.

   In the **Application Parameter** message, obtain the value of the **domain** parameter.

4. Generate an endpoint for the ASAPI based on the following format:

```
https://<domain>/asapi/v3
```

Method 3: Concatenate strings to generate an endpoint

You can also concatenate strings to generate an endpoint based on the following format:

```
https://public.asapi.<region>.<internet-domain>/asapi/v3
```

> **Note**
>
> 1. Replace <region> with your actual region ID. For information about how to query a region ID, see Query a region ID.
> 2. Replace <internet-domain> with the root domain of your Apsara Stack service. To obtain the root domain, contact Apsara Stack O&M personnel. Take note of this point: Use the internet-domain parameter instead of the intranet-domain parameter.

If the **region** value is `cn-****-****-d01` and the **internet-domain** value is `inter.****.****.com`, the following endpoint can be generated:

```
https://public.asapi.cn-****-****-d01.inter.****.****.com/asapi/v3
```

1.1.1.1.2.4. Obtain Apsara Stack SDKs

The Apsara Stack API (ASAPI) is a unified portal provided by Apsara Stack. You can use the ASAPI to connect to all Apsara Stack services. Apsara Stack provides SDKs for API calls.

For more information about how to obtain Apsara Stack SDKs, see Apsara Stack documentation.

1.1.1.1.2.5. Obtain an AccessKey pair

An AccessKey pair that consists of an AccessKey ID and an AccessKey secret is used to implement symmetric encryption. This helps you verify the identity of a requester. The AccessKey ID is used to identify a user. The AccessKey secret is used to encrypt the signature string. This topic describes how to obtain an AccessKey pair.

Prerequisites

An account of the operations administrator or the level-1 organization administrator is obtained. Only an operations administrator or a level-1 organization administrator can obtain an AccessKey pair.

Context

If you need to make API calls to the Apsara Uni-manager Management Console or other Apsara Stack services, we recommend that you use the AccessKey pair of a personal account. If you use the AccessKey pair of a personal account, configure the request headers that are described in the following table for access control. Otherwise, an error that indicates insufficient permissions can occur.

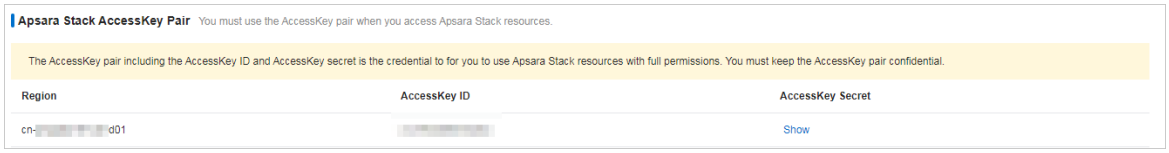
Parameter	Description
x-acs-regionid	The ID of the region, for example, cn-hangzhou-*.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console. For information about how to obtain an organization ID, see the "GetOrganizationList" section in Apsara Uni-manager Management Console Developer Guide.
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console. For information about how to obtain a resource set ID, see the "ListResourceGroup" section in Apsara Uni-manager Management Console Developer Guide.
x-acs-instanceid	The ID of the instance to which you make API calls. If you need to make API calls to an Elastic Compute Service (ECS) instance, obtain the ID of the ECS instance on the Instances page.

Warning The AccessKey pair of a personal account is managed and controlled by the permission system of the Apsara Uni-manage Management Console. If you need to obtain the AccessKey pair of an account that has permissions on an organization, make sure that your operation is allowed by an administrator. This ensures security. The account that has permissions on an organization is a privileged account.

Obtain the AccessKey pair of a personal account

To obtain the AccessKey pair of a personal account, perform the following operations:

1. Log on to the Apsara Uni-manager Management Console.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and click **User Information**.
3. In the **Apsara Stack AccessKey Pair** section, obtain the AccessKey pair.



> **Note** The AccessKey pair that consists of an AccessKey ID and an AccessKey secret is the credential for you to have full permissions on Apsara Stack resources. Keep your AccessKey pair confidential.

Obtain the AccessKey pair of an account that has permissions on an organization

To obtain the AccessKey pair of an account that has permissions on an organization, perform the following operations:

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Organizations**.
4. In the Organizations navigation tree, click the name of the organization that you want to manage.
5. On the right side of the page, click **Obtain AccessKey Pair**.
6. In the message that appears, obtain the AccessKey pair of the account that has permissions on the organization.

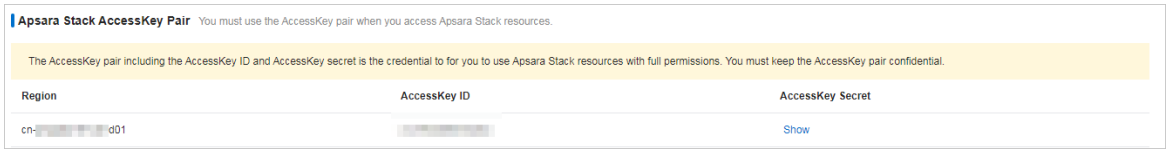
> **Note** The system automatically allocates an AccessKey pair to the account that has permissions on the level-1 organization. The same AccessKey pair is used by the accounts that have permissions on the subordinate organizations.

1.1.1.1.2.6. Query a region ID

When you use Apsara Stack SDK for Node.js to make API calls, specify a region ID. You can obtain a region ID in the Apsara Uni-manager Management Console.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and click **User Information**.
3. In the **Apsara Stack AccessKey Pair** section, view the region ID.



1.1.1.1.3. Common parameters

Common request parameters must be included in all API requests.

Sample common parameters

. .

The following table describes the common parameters that are used when you call API operations supported by the Apsara Stack API (ASAPI).

Parameter	Type	Required	Description
Action	String	Yes	The operation that you want to perform. For more information, see View information about API operations.
Product	String	Yes	The name of the service.
Version	String	Yes	The version of the API operation. For more information, see View information about API operations.
RegionId	String	Yes	The ID of the region. For more information, see Query a region ID.
AccessKeyId	String	Yes	The AccessKey ID used to connect to the service. For more information, see Obtain an AccessKey pair.
Signature	String	Yes	The signature string of the current request. For more information about how signatures are calculated, see Request signatures.
SignatureMethod	String	Yes	The encryption method of the signature string. Valid values: HMAC-SHA1 and HMAC-SHA256.

Parameter	Type	Required	Description
SignatureVersion	String	Yes	The version of the signature encryption algorithm. Valid values: 1.0 and 2.0.
SignatureNonce	String	Yes	A unique, random number used to prevent replay attacks. You must use different numbers for different requests.
Timestamp	String	Yes	The timestamp of the request. Specify the time in the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time must be in UTC. Sample value: 2018-01-01T12:00:00Z.
Format	String	Yes	The format in which to return the response. Set the value to JSON.

Note

The `Signature`, `SignatureMethod`, `SignatureVersion`, `SignatureNonce`, `Timestamp`, and `Format` parameters are encapsulated into Apsara Stack SDK. You do not need to configure these parameters.

1.1.1.1.4. SDK description

1.1.1.1.4.1. Use Apsara Stack SDK for Java to call API operations

This topic describes how to obtain and use Apsara Stack SDK for Java to call API operations.

Prerequisites

- An authorized account and an AccessKey pair are obtained. The AccessKey pair consists of an

AccessKey ID and an AccessKey secret. For more information about how to obtain an AccessKey pair in the Apsara Uni-manager Management Console, see Obtain an AccessKey pair.

- The endpoint of the Apsara Stack API (ASAPI) is obtained. For more information, see Generate an endpoint for the ASAPI.
- Apsara Stack SDK for Java 1.8 or later is installed.

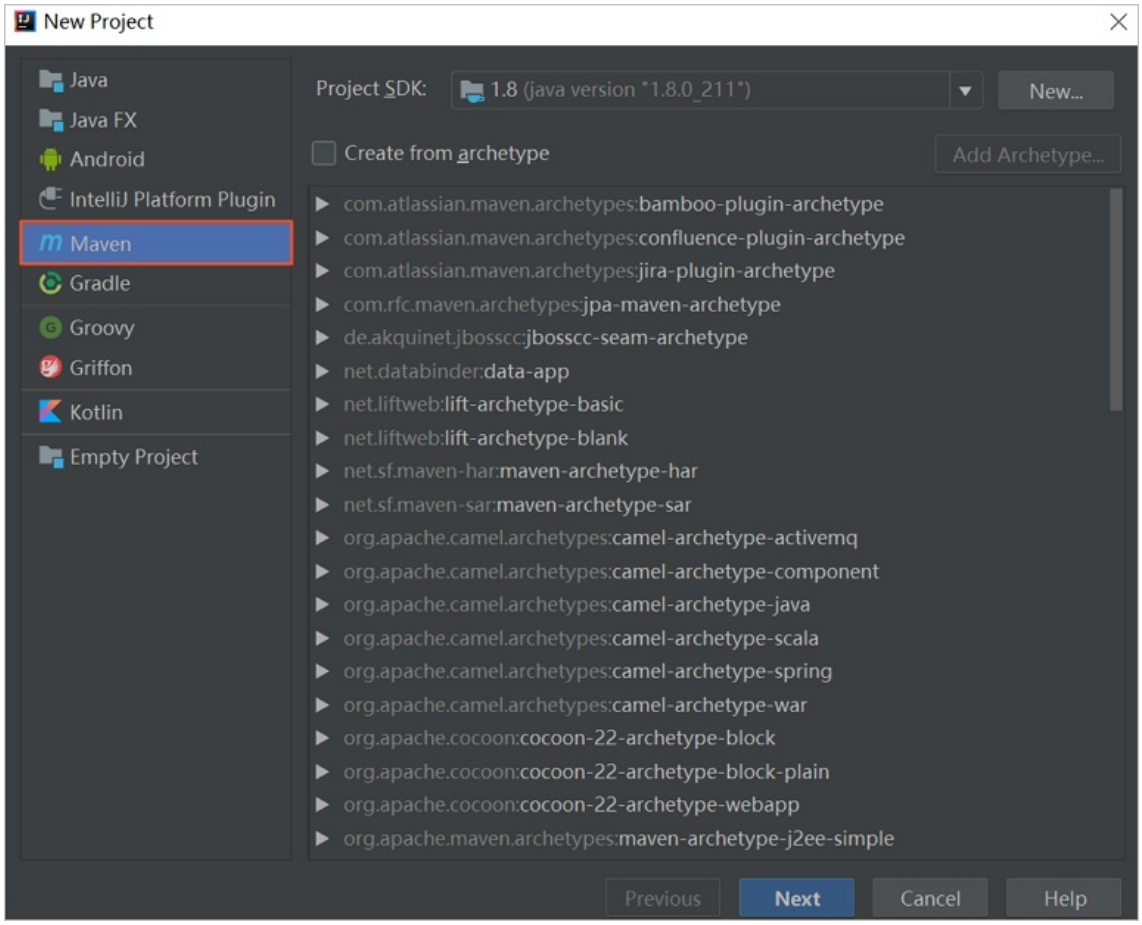
Background information

The help center of Apsara Stack provides Maven dependencies and JAR files for Apsara Stack SDK for Java. You can write code to use Apsara Stack SDK for Java to call API operations.

In this example, the Windows 10 64-bit OS and IntelliJ IDEA are used.

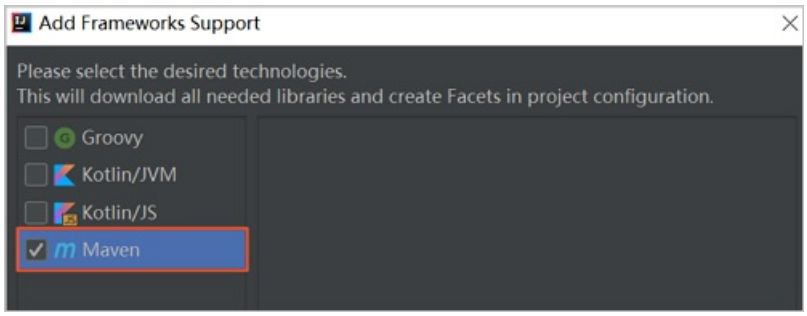
Procedure

1. Use one of the following methods to configure Maven in IntelliJ IDEA. Maven is a tool used for project management.
   - Use Maven that is integrated in IntelliJ IDEA.
   - Download Maven based on the OS that you are using from the official website and configure Maven. For more information, see Download Maven.
2. Obtain the Maven dependencies for Apsara Stack SDK for Java from the official website. For more information about how to obtain the dependencies, see Obtain the core package for ASAPI.
3. Use one of the following methods to create a Maven project:
   - Method 1: Create a Maven project in IntelliJ IDEA.

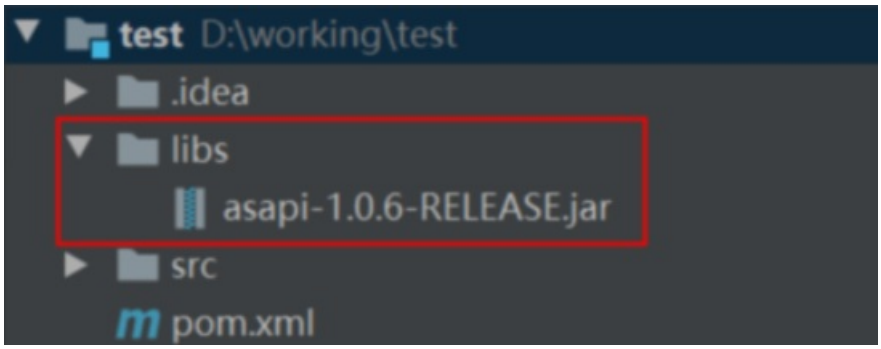


- Method 2: Convert an existing project to a Maven project.
  a. Right-click the project that you want to convert and select **Add Framework Support...**.

  b. Select **Maven** and click **OK**.



4. Create a folder named libs in the root directory of the project. Then, add the JAR file of Apsara Stack SDK for Java to the libs folder, as shown in the following figure.



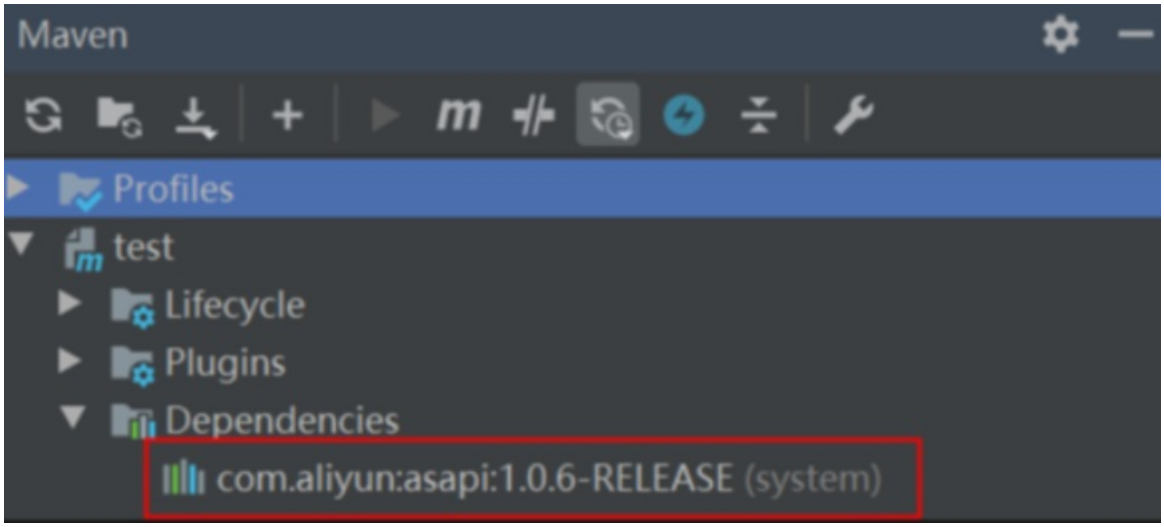
5. Add the dependencies of Apsara Stack SDK for Java to the pom.xml file in the project directory.

```
<dependencies>
    <dependency>
        <groupId>com.aliyun</groupId>
        <artifactId>asapi</artifactId>
        <version>1.0.6-RELEASE</version>
        <scope>system</scope>
        <systemPath>${project.basedir}/libs/asapi-1.0.6-RELEASE.jar</systemPath>
    </dependency>
  <dependency>
        <groupId>com.alibaba</groupId>
        <artifactId>alicrypto-java-aliyun</artifactId>
    <version>1.0.4</version>
    <systemPath>${project.basedir}/libs/alicrypto-java-aliyun-1.0.4.jar</systemPath>
  </dependency>
  <dependency>
    <groupId>com.aliyun</groupId>
    <artifactId>gmsse</artifactId>
    <version>1.1.0</version>
    <systemPath>${project.basedir}/libs/gmsse-1.1.0.jar</systemPath>
  </dependency>
</dependencies>
```

Note Replace `1.0.6-RELEASE` with the actual version of Apsara Stack SDK for Java.

6. On the right side of IntelliJ IDEA, view information in the Maven section.

   If the information in the following figure appears, the dependencies are added.



Use Apsara Stack SDK for Java

You can use the GET or POST method to call API operations provided by the ASAPI. The following sample code shows how to call API operations:

```
// 1. Create a connection to an ASClient object.
ASClient client = new ASClient();
// 2. Configure the identifier of the requester. This parameter is required and used only f
or identification. You can set this parameter to a random value.
client.setSdkSource("<The identifier of the requester>");
Map<String, Object> parameters = new HashMap<String, Object>();
// 3. Configure the parameters for authorization. The parameter values vary based on your e
nvironment.
// The AccessKey ID of your Apsara Stack tenant account.
parameters.put("AccessKeyId","<AccessKey ID>");
// The AccessKey secret of your Apsara Stack tenant account.
parameters.put("AccessKeySecret", "<AccessKey Secret>");
// The ID of the region.
parameters.put("RegionId", "<your RegionID>");
// 4. Configure parameters for an API call. In this example, the Product, Action, and Versi
on parameters are configured.
parameters.put("Product", "<The name of the service>");
parameters.put("Action", "<The name of the API operation>");
parameters.put("Version", "<The version of the API operation>");
// 5. Configure operation-specific parameters.
parameters.put("<The name of the operation-specific parameter>", "<The value of the operati
on-specific parameter>");
// 6. Configure request headers and the encryption method for the signature string. Valid v
alues of the SignatureMethod parameter: HMAC-SHA1 and HMAC-SHA256. By default, HMAC-SHA256
is used.
Map<String, String> headers = new HashMap<String, String>();
//headers.put("SignatureMethod", "HMAC-SHA1");
headers.put("x-acs-regionid", "<your-regionid>");
headers.put("x-acs-resourcegroupid", "<your-resourcegroupid>");
headers.put("x-acs-organizationid", "<your-organizationid>");
headers.put("x-acs-instanceid", "<your-instanceid>");
// 7. Make an API call. We recommend that you use the doPost() method.
// Configure the time-out period for a connection.
//client.setConnectTimeout(10000);
// Configure the time-out period for a request.
// client.setSocketTimeout(10000);
String result = client.doPost(endpoint, headers, parameters);
System.out.println(result);
```

Configure a proxy

If you need to use a proxy to make API calls, use the following sample code to configure the proxy:

```
Cloud cloud = new Cloud();
// Configure the IP address of the proxy.
cloud.setConfig("proxy_host", "<IP>");
// Configure the port used by the proxy.
cloud.setConfig("proxy_port", "<Port>");
// 1. Create a connection to an ASClient object.
ASClient client = new ASClient(cloud);
```

Request headers

Parameter	Description
x-acs-regionid	The ID of the region. For more information about how to obtain a region ID, see Query the region ID.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console.
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console.
x-acs-instanceid	The ID of the instance to which you make API calls.

1.1.1.1.4.2. Use Apsara Stack SDK for Python to call API operations

This topic describes how to use Apsara Stack SDK for Python to call API operations provided by the Apsara Stack API (ASAPI).

Preparations

- An authorized account and an AccessKey pair are obtained. The AccessKey pair consists of an AccessKey ID and an AccessKey secret. For more information about how to obtain an AccessKey pair in the Apsara Uni-manager Management Console, see Obtain an AccessKey pair.
- The endpoint of the ASAPI is obtained. For more information, see Generate an endpoint for the ASAPI.

Install Apsara Stack SDK for Python

1. Download the required version of Apsara Stack SDK for Python. For more information, see Obtain Apsara Stack SDKs.
2. Upload the compressed file of Apsara Stack SDK for Python to the host from which you want to send API requests and extract the file. Then, run the following code in the directory of the extracted files to install Apsara Stack SDK for Python:

```
# Install Apsara Stack SDK for Python 2.x.
pip install aliyun-python2-sdk-asapi-2.4.7.tar.gz
# Install Apsara Stack SDK for Python 3.x.
pip3 install aliyun-python3-sdk-asapi-2.4.7.tar.gz
```

> **Note**
>
> Replace `2.4.7` with the actual version of Apsara Stack SDK for Python.

Sample requests

You can use the GET or POST method to call API operations provided by the ASAPI.

```
    # 1. Import dependencies.
    from aliyunsdkasapi.ASClient import ASClient
    from aliyunsdkasapi.AsapiRequest import AsapiRequest

    if __name__ == '__main__':
     # 2. Create a request. The Product parameter specifies the name of the service. The Ver
sion parameter specifies the version of the API operation. The Action parameter specifies t
he operation that you want to perform. The asapi-endpoint parameter specifies the endpoint
of the ASAPI.
     req = AsapiRequest("<Product>", "<Version>", "<Action>", "<asapi-endpoint>")
     # 3. Configure operation-specific parameters.
     req.add_body_params("<key>", "<value>")
     # 4. Configure request headers.
     req.add_header("x-acs-resourcegroupid", "<your-resourcegroupid>");
     req.add_header("x-acs-organizationid", "<your-organizationid>");
     req.add_header("x-acs-regionid", "<your-regionid>");
     req.add_header("x-acs-instanceid", "<your-instanceid>");
     # 5. Configure a request method.
     req.set_method("POST")
     # 6. Configure initialization parameters for an ASClient object. The parameter values v
ary based on your environment. The timeout parameter specifies the time-out period for a re
quest. The cert_file parameter specifies the certificate. The verify parameter specifies wh
ether to verify the certificate.
     as_client = ASClient("<accesskeyid>", "<accesskeysecret>", "<regionid>",timeout=1000,
             cert_file=None,
             verify=False)
     # Configure the identifier of the requester. This parameter is required and used only f
or identification. You can set this parameter to a random value.
     as_client.setSdkSource("<The identifier of the requester>")
     response = as_client.do_request(req)
     print(response)
```

Request headers

Parameter	Description
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console.
x-acs-regionid	The ID of the region. For more information about how to obtain a region ID, see Query a region ID.
x-acs-instanceid	The ID of the instance to which you make API calls.

Configure a proxy

Perform the following steps to configure a proxy:

1. Import OS dependencies.

```
import os
```

2. Configure one or more proxies.

```
# Before you make an API call, configure one or more proxies.
os.environ['http_proxy'] = "http://x.x.x.x:xxxx"
os.environ['https_proxy'] = "https://x.x.x.x:xxxx"
```

1.1.1.1.4.3. Use Apsara Stack SDK for Node.js to call API operations

This topic describes how to obtain and use Apsara Stack SDK for Node.js to call API operations.

Preparations

- An authorized account and an AccessKey pair are obtained. The AccessKey pair consists of an AccessKey ID and an AccessKey secret. For more information about how to obtain an AccessKey pair in the Apsara Uni-manager Management Console, see Obtain an AccessKey pair.
- The endpoint of the Apsara Stack API (ASAPI) is obtained. For more information, see Generate an endpoint for the ASAPI.
- A region ID is obtained. For more information about how to obtain a region ID, see Query the region ID.

Add dependencies

Run the following command to install Apsara Stack SDK for Node.js:

```
tnpm install --save @ali/asapi-nodejs-sdk
```

Use Apsara Stack SDK for Node.js

The following sample code shows how to use Apsara Stack SDK for Node.js to make API calls:

```
// 1. Import the dependencies of Apsara Stack SDK for Node.js.
const Controller = require('egg').Controller;
const ASAPIClient = require('@ali/asapi-nodejs-sdk');
// 2. Configure the parameters.
const cnofig = {
    API_GATEWAY: '<The endpoint of the ASAPI>',
    regionId: '<The ID of the region in which the Apsara Stack service is deployed>',
    accessKeyId: '<The AccessKey ID of your Apsara Stack tenant account>',
    accessKeySecret: '<The AccessKey secret of your Apsara Stack tenant account>'
};
// 3. Initialize a client for API calls.
const AsapiClient = new ASAPIClient(cnofig, this.ctx);
// 4. Configure request parameters.
const params = {
    "Action": "<The name of the API operation>",
    "Product": "<The name of the service that provides the API operation>",
    "Version": "<The version of the API operation>",
    "regionId": '<The ID of the region in which the Apsara Stack service is deployed>',
      "<The name of the operation-specific parameter required by the API operation>": "<The
value of the operation-specific parameter>"
}
// 5. Configure request headers.
AsapiClient.addHeader('x-acs-caller-sdk-source', '<The identifier of the requester>')
AsapiClient.addHeader('x-acs-roleid', '<The ID of the role>')
AsapiClient.addHeader('x-acs-userid', '<The ID of the user>')
AsapiClient.addHeader('x-acs-organizationid', '<your-organizationid>')
AsapiClient.addHeadert("x-acs-regionid", "<your-regionid>");
AsapiClient.addHeader("x-acs-resourcegroupid", "<your-resourcegroupid>");
AsapiClient.addHeader("x-acs-instanceid", "<your-instanceid>");
// 6. Make an API call and obtain the response.
try {
  const res = await AsapiClient.doRequest(cnofig.API_GATEWAY, params, {
    method: 'POST', // The request method.
    formatParams: false, // Specifies whether to format parameters and capitalize the first
letter of each parameter.
    enableProxy: true, // Specifies whether to configure a proxy.
    proxy: 'http://x.x.x.x:xxxx',
    timeout: 10000, // The time-out period.
  // ca: , // The certificate issued by a certificate authority (CA). For more information,
visit https://nodejs.org/api/https.html#https_https_request_options_callback.
  })
  console.log(res)
} catch (e) {
  console.log(e)
}
```

Disable certificate validation

The following sample code shows how to disable certificate validation:

```
Configure the environment variable.
NODE_TLS_REJECT_UNAUTHORIZED=0
```

Request headers

Parameter	Description
x-acs-regionid	The ID of the region. For more information about how to obtain a region ID, see Query the region ID.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console.
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console.
x-acs-instanceid	The ID of the instance to which you make API calls.
x-acs-caller-sdk-source	The custom name of the requester or the system. This parameter is used to identify the source of the API request.
x-acs-roleid	The ID of the role.
x-acs-userid	The ID of the user.

1.1.1.1.4.4. SDK for POP

SDK for Java

Before you use Apsara Stack API (ASAPI) SDK for POP for Java to access ASAPI, you must know the remote procedure call (RPC) and resource-oriented architecture (ROA) styles that are supported for API calls. ASAPI is compatible with both styles. Their difference lies in the ASAPI endpoints that are used for API calls.

Prerequisites

- An Alibaba Cloud SDK package is downloaded for the service that you want to access. The required dependencies are installed.
- SSL certificate validation is ignored for requests over HTTPS.

Background information

ASAPI supports only the HTTPS request protocol.

Difference between two styles

When you use the RPC or ROA style to make API calls, take note that the two styles use different ASAPI endpoints.

```
# ASAPI endpoint for the RPC style:
public.asapi.<global:region>.<global:internet-domain>/asapi/v3
# ASAPI endpoint for the ROA style:
public.asapi.<global:region>.<global:internet-domain>/asapi/v3/roa
```

Call examples

The following sample code provides an example on how to use the RPC style to make an API call. In this example, the DescribeInstances operation of Elastic Compute Service (ECS) is called, and the API version is 2014-05-26.

Sample code:

```
package com.aliyuns.client.pop.ecs;

import com.aliyuncs.DefaultAcsClient;
import com.aliyuncs.ecs.model.v20140526.DescribeInstancesRequest;
import com.aliyuncs.ecs.model.v20140526.DescribeInstancesResponse;
import com.aliyuncs.http.HttpClientConfig;
import com.aliyuncs.http.ProtocolType;
import com.aliyuncs.profile.DefaultProfile;

import java.util.List;

public class DescribeInstancesTest {
    public static void main(String[] args) {
        // Specify the endpoint of ASAPI.
        String endpoint = "public.asapi.<global:region>.<global:internet-domain>/asapi/v3";
        // Specify the region where the ECS service resides.
        String region = "<global:region>";
        // Specify the name of the service that you want to access.
        String product = "ECS";
        // Specify your AccessKey pair.
        String ak = "<accessKeyId>";
        String sk = "<accessKeySecret>";
        try {
            DefaultProfile clientProfile = DefaultProfile.getProfile(region, ak, sk);
            // Ignore SSL certificate validation.
            HttpClientConfig clientConfig = HttpClientConfig.getDefault();
            clientConfig.setIgnoreSSLCerts(true);
            // Set the connection timeout period.
            clientConfig.setConnectionTimeoutMillis(3000L);
            // Set the read timeout period.
            clientConfig.setReadTimeoutMillis(10000L);
            clientProfile.setHttpClientConfig(clientConfig);
            // Create a connection.
            DefaultAcsClient acsClient = new DefaultAcsClient(clientProfile);
            // Create a request.
            DescribeInstancesRequest request = new DescribeInstancesRequest();
            // Specify the endpoint of ASAPI.
            request.setSysEndpoint(endpoint);
            // Specify the name of the service that you want to access and the region where
the service resides.
            request.setSysLocationProduct(product);
            request.setSysRegionId(region);
            // Set the request protocol to HTTPS.
            request.setSysProtocol(ProtocolType.HTTPS);
            DescribeInstancesResponse result =  acsClient.getAcsResponse(request);
            List<DescribeInstancesResponse.Instance> instances = result.getInstances();
            for (DescribeInstancesResponse.Instance instance: instances) {
                System.out.println(instance.getInstanceId());
                System.out.println(instance.getInstanceName());
```

```
            }

        } catch (Exception e) {
            e.printStackTrace();
        }
    }
}
```

The following sample code provides an example on how to use the ROA style to make an API call. In this example, the GetNamespaceList operation of Container Registry is called, and the API version is 2016-06-07.

Sample code:

```
package com.aliyuns.client.pop.cr;

import com.aliyuncs.CommonRequest;
import com.aliyuncs.CommonResponse;
import com.aliyuncs.DefaultAcsClient;
import com.aliyuncs.IAcsClient;
import com.aliyuncs.exceptions.ClientException;
import com.aliyuncs.exceptions.ServerException;
import com.aliyuncs.http.FormatType;
import com.aliyuncs.http.HttpClientConfig;
import com.aliyuncs.http.MethodType;
import com.aliyuncs.http.ProtocolType;
import com.aliyuncs.profile.DefaultProfile;

public class GetNamespaceListTest {
    public static void main(String[] args) {
        // Specify the endpoint of ASAPI.
        String endpoint = "public.asapi.<global:region>.<global:internet-domain>/asapi/v3/roa";
        // Specify the region where the Container Registry service resides.
        String region = "<global:region>";
        // Specify the name of the service that you want to access.
        String product = "cr";
        // Specify your AccessKey pair.
        String ak = "<accessKeyId>";
        String sk = "<accessKeySecret>";
        DefaultProfile profile = DefaultProfile.getProfile(region, ak, sk);
        // Ignore SSL certificate validation.
        HttpClientConfig clientConfig = HttpClientConfig.getDefault();
        clientConfig.setIgnoreSSLCerts(true);
        // Set the connection timeout period.
        clientConfig.setConnectionTimeoutMillis(3000L);
        // Set the read timeout period.
        clientConfig.setReadTimeoutMillis(10000L);
        profile.setHttpClientConfig(clientConfig);
        // Create a connection for the client.
        IAcsClient client = new DefaultAcsClient(profile);
        // Create a request.
        CommonRequest request = new CommonRequest();
        // Set the request protocol to HTTPS.
```

```
        request.setSysProtocol(ProtocolType.HTTPS);
        // Specify the request method.
        request.setSysMethod(MethodType.GET);
        // Specify the endpoint of ASAPI.
        request.setSysDomain(endpoint);
        // Specify the version of the API.
        request.setSysVersion("2016-06-07");
        // Specify the pattern of the uniform resource identifier (URI).
        request.setSysUriPattern("/namespace");
        // Specify the name of the service that you want to access and the region where the
service resides.
        request.setSysLocationProduct(product);

        request.putHeadParameter("Content-Type", "application/json");
        String requestBody = "" +
                "{}";
        request.setHttpContent(requestBody.getBytes(), "utf-8", FormatType.JSON);
        try {
            CommonResponse response = client.getCommonResponse(request);
            System.out.println(response.getData());
        } catch (ServerException e) {
            e.printStackTrace();
        } catch (ClientException e) {
            e.printStackTrace();
        }
    }
}
```

Notice

If you send a request over HTTPS, you must enable the request to ignore SSL certificate validation.

SDK for Go

This topic describes how to use Apsara Stack API (ASAPI) SDK for POP for Go.

Prerequisites

An Alibaba Cloud SDK package is downloaded for the service that you want to access. The required dependencies are installed.

Background information

Only the remote procedure call (RPC) style is supported for API calls.

Call examples

The following sample code provides an example on how to make an API call. In this example, the DescribeInstances operation of Elastic Compute Service (ECS) is called, and the API version is 2014-05-26.

Sample code:

```
package main
```

```
import (
 "fmt"
 "time"

 "github.com/aliyun/alibaba-cloud-sdk-go/sdk"
 "github.com/aliyun/alibaba-cloud-sdk-go/sdk/auth/credentials"
 "github.com/aliyun/alibaba-cloud-sdk-go/sdk/requests"
 "github.com/aliyun/alibaba-cloud-sdk-go/sdk/responses"
)

func getSdkConfig() *sdk.Config {
 return sdk.NewConfig().
  WithTimeout(time.Duration(30) * time.Second).
  WithEnableAsync(true).
  WithGoRoutinePoolSize(100).
  WithMaxTaskQueueSize(10000).
  WithDebug(false).
  WithScheme("HTTP")
}

func main(){
 ak := "<The AccessKey ID of your Apsara Stack tenant account.>"
 sk := "<The AccessKey secret of your Apsara Stack tenant account.>"
 regionId := "<The region where the ECS service resides.>"
 endpoint := "<The endpoint of ASAPI.>" // No network protocol.
 request := requests.NewCommonRequest()
  request.SetReadTimeout(10 * time.Second) // Set the read timeout period of the request to
10 seconds.
  request.SetConnectTimeout(5 * time.Second)  // Set the connection timeout period of the r
equest to 5 seconds.
 request.Method = requests.GET
 request.Domain = endpoint         // Location Service will not be enabled if the host is s
pecified. For example, the service with a certification type-bearer token must be specified
.
 request.Version = "2014-05-26"            // Specify the version of the API.
 request.Scheme = "https"                // Specify the request protocol. Default value: ht
tp.
 request.ApiName = "DescribeInstances"
 request.QueryParams["Product"] = "Ecs"  // Specify the name of the service that you want t
o access.
 request.TransToAcsRequest()
 client, err := sdk.NewClientWithOptions(regionId,getSdkConfig(),credentials.NewAccessKeyCr
edential(ak,sk))
 // If relevant parameters are not set for the request, the client settings are used.
  //client.SetReadTimeout(10 * time.Second)              // Set the read timeout period of
the client to 10 seconds.
 //client.SetConnectTimeout(5 * time.Second)            // Set the connection timeout perio
d of the client to 5 seconds.
  resp := responses.BaseResponse{}
  err = client.DoAction(request, &resp)
    if err != nil {
        panic(err)
    }
 fmt.Print(endpoint)
```

```
}
```

Configure proxies

You can configure proxies in one of the following ways:

- Configure proxies by using environment variables.

  Set the HTTP_PROXY and HTTPS_PROXY environment variables, or set the NO_PROXY environment variable.

  Sample code:

```
import (
    "os"
)
func main(){
 os.Setenv("HTTP_PROXY", "http://x.x.x.x:xxxx") // Set the HTTP_PROXY environment variable.
 os.Setenv("HTTPS_PROXY", "https://x.x.x.x:xxxx") // Set the HTTPS_PROXY environment variable.
}
```

- Configure proxies on the client.

  Sample code:

```
// The proxies that are configured on the client take precedence over those that are configured by using environment variables.
client.SetHttpProxy("http://x.x.x.x:xxxx")    // Configure the HTTP proxy.
client.GetHttpProxy()                           // Query the HTTP proxy.

client.SetHttpsProxy("https://x.x.x.x:xxxx")    // Configure the HTTPS proxy.
client.GetHttpsProxy()                            // Query the HTTPS proxy.

client.SetNoProxy("127.0.0.1,localhost")      // Configure the proxy whitelist.
client.GetNoProxy()                           // Query the proxy whitelist.
```

SDK for Python

This topic describes how to use Apsara Stack API (ASAPI) SDK for POP for Python.

Prerequisites

An Alibaba Cloud SDK package is downloaded for the service that you want to access. The required dependencies are installed.

Background information

Only the remote procedure call (RPC) style is supported for API calls.

Call examples

The following sample code provides an example on how to make an API call. In this example, the DescribeInstances operation of Elastic Compute Service (ECS) is called, and the API version is 2014-05-26.

Sample code:

```
from aliyunsdkcore.client import AcsClient
from aliyunsdkcore.acs_exception.exceptions import ClientException
from aliyunsdkcore.acs_exception.exceptions import ServerException
from aliyunsdkecs.request.v20140526 import DescribeInstancesRequest
import os

# Create an AcsClient instance.
client = AcsClient(
   "<your-access-key-id>",
   "<your-access-key-secret>",
   "<your-region-id>",

   timeout=1000,  # Set the timeout period.
    verify=False, # Ignore certificate validation. or verify='<The location where the certi
ficate is stored.>'
);
# Set the following parameters for the HTTPS request protocol:
# client.set_verify(False)
# os.environ["HTTPS_PROXY"] = "http://127.0.0.1:8080"

# os.environ["HTTP_PROXY"] = "http://127.0.0.1:8080"
def hello_ecs_instance():
    # Create a request and set the parameters.
    request = DescribeInstancesRequest.DescribeInstancesRequest()

    params = {"PageNumber":"1", "Product":"Ecs","Version": "2014-05-26","Action": "Describe
Instances"};
    request.set_body_params(params)
    # The endpoint that contains no network protocol is in the following format: ASAPI doma
in name/asapi/v3.
    request.set_endpoint('<The endpoint of ASAPI.>')
    # Set the following parameter if the endpoint contains no network protocol:
    request.set_protocol_type("https")

    request.set_PageSize(10)
    # Initiate the API request and obtain the response.
    response = client.do_action_with_exception(request)
    print(response)

if __name__ == '__main__':
    print("Hello Aliyun OpenApi!")
    hello_ecs_instance()
```

Configure proxies

Set the HTTP_PROXY and HTTPS_PROXY environment variables.

Sample code:

```
# Configure the HTTPS proxy.
os.environ["HTTPS_PROXY"] = "http://x.x.x.x:xxxx"

# Configure the HTTP proxy.
os.environ["HTTP_PROXY"] = "https://x.x.x.x:xxxx"
```

1.1.1.1.5. HTTP requests

1.1.1.1.5.1. Overview

This topic describes how to make API requests and is intended for users who use API URLs to initiate HTTP GET requests.

If you are using an SDK to initiate requests, you can skip this topic.

The request URL consists of different parameters and has a fixed syntax. The URL contains common request parameters, your signature, and operation-specific parameters. Sample request URLs are provided for each API operation. These URLs are not encoded to make them easy to read. Before you make a request, you must encode the request URL. After the authentication process is complete based on your signature, the results are returned to you. Response parameters are returned if the call is successful, whereas an error message is returned if the call fails. You can troubleshoot issues based on the error message.

1.1.1.1.5.2. Request syntax

The Apsara Stack API (ASAPI) allows you to call API operations by sending HTTP GET requests based on URLs. Each URL must include request parameters. This topic describes the syntax of HTTP GET requests and provides the endpoint of the ASAPI.

Sample request

GetOrganizationList is used in the following unencoded URL request:

```
https://public.asapi.aliyuns.com/asapi/v3?Action=GetOrganizationList&Product=ascm&Version=2019-05-10&Id=<Organization ID>&<Common parameters>
```

- `https`: the protocol used to transmit the request.
- `public.asapi.aliyuns.com/asapi/v3`: the endpoint of the ASAPI.
- `Action=GetOrganizationList Product=ascm Version=2019-05-10`: the API operation to call.
- `Id`: the ID of the organization.
- `<Common parameters>`: the common parameters specified in the system.

Protocol

The ASAPI supports only HTTPS.

Endpoint

For more information about how to obtain an endpoint, see Generate an endpoint for the ASAPI.

Parameter

To specify an API operation, use the `Action, Product, and Version` parameters. For example, set `Action` to GetOrganizationList, Product to ascm, and Version to 2019-05-10. You must also specify other operation-specific parameters and common parameters. For more information, see Common parameters.

1.1.1.1.5.3. Request signatures

This topic describes how to sign HTTP API requests. ASAPI uses the request signature to verify the identity of the request sender. ASAPI implements symmetric encryption by using an AccessKey pair to verify the identity of the request sender.

> **Note**
>
> - An AccessKey pair consists of an AccessKey ID and an AccessKey secret, which are issued to each user or organization in the Apsara Uni-manager Management Console.
> - The AccessKey ID is used to verify identities of users, and the AccessKey secret is used to encrypt and verify signature strings. You must keep your AccessKey secret confidential.
> - ASAPI provides SDKs for Node.js, Python, and Java to facilitate complex signature calculation. For more information, see Obtain the core package for ASAPI.

Step 1: Create a canonicalized query string

1. Arrange the request parameters in alphabetical order, including all common and operation-specific parameters except the `Signature` parameter.

   > **Note**
   >
   > If you use the GET method to send a request,these parameters are connected by ampersands (&) and included in the request URL. The first request parameter follows a question mark (?).

2. Encode the request parameters and their values in UTF-8 based on RFC 3986. The following rules apply in the encoding process:
   - Letters, digits, and special characters such as hyphens (`-`), underscores (`_`), and periods (`.`) do not need to be encoded.
   - Other characters must be percent encoded in the `%XY` format. `XY` represents the ASCII code of the characters in hexadecimal notation. For example, double quotation marks (`"`) are encoded as `%22` .

- Extended UTF-8 characters are encoded in the `%XY%ZA...` format.
- Spaces must be encoded as `%20`. Do not encode spaces as plus signs (`+`).

  This encoding method is similar to but different from the `application/x-www-form-urlencoded` MIME encoding algorithm.

  If you use `java.net.URLEncoder` from the Java standard library, use `percentEncode` to encode request parameters and their values. In the encoded query string, replace the plus signs (`+`) with `%20` , asterisks (`*`) with `%2A` , and `%7E` with tildes (`~`). This way, you can obtain an encoded string that matches the preceding encoding rules.

```
private static final String ENCODING = "UTF-8";
private static String percentEncode(String value) throws UnsupportedEncodingException
{
    return value != null ? URLEncoder.encode(value, ENCODING).replace("+", "%20").rep
lace("*", "%2A").replace("%7E", "~") : null;
}
```

3. Use equal signs (`=`) to connect the encoded request parameters and their values.
4. Use ampersands (`&`) to connect the encoded request parameters. These parameters must be arranged in the same order as those in Step 1.

Then, a canonicalized query string that follows the request structure is obtained. For more information, see Request structure.

Step 2: Create a string-to-sign

1. Create a `string-to-sign` . You can also use `percentEncode` to encode the canonicalized query string created in Step 1 based on the following rules:

```
StringToSign=
    HTTPMethod + "&" + //HTTPMethod: the HTTP method that is used to send a request, su
ch as GET.
    percentEncode("/") + "&" + //percentEncode("/"): Encode the forward slash (/) in UT
F-8 as %2F.
    percentEncode(CanonicalizedQueryString) // Encode the canonicalized query string cr
eated in Step 1.
```

2. Calculate the RFC 2104-compliant HMAC-SHA1 or HMAC-256 value of `StringToSign` . In the following example, Java Base64 is used:

```
String signature = Base64.getEncoder().encodeToString(signData);
```

> **Note**
> When you calculate the signature, the key value specified by RFC 2104 is your `AccessKey secret` plus an ampersand (&), which has an ASCII value of 38. For more information, see Obtain an AccessKey pair.

3. Encode the `Signature` parameter based on RFC 3986 and add it to the canonicalized query string.

Example 1: Concatenate parameters

`GetOrganizationList` is used in this example to query regions. For example, `AccessKeyID` is set to testid and `AccessKeySecret` is set to testsecret. Perform the following operations:

1. Construct a canonicalized query string.

```
https://public.asapi.aliyuns.com/asapi/v3/?AccessKeyId=testid&Action=GetOrganizationList&Format=JSON&Id=1&Product=ascm&RegionId=cn-region-test&SignatureMethod=HMAC-SHA1&SignatureNonce=43967c6e-e3ad-44fa-b06b-fcf3db5f39d2&SignatureVersion=1.0&Timestamp=2020-09-15T08%3A50%3A40Z&Version=2019-05-10
```

2. Create a `string-to-sign` .

```
GET&%2F&AccessKeyId%3Dtestid%26Action%3DGetOrganizationList%26Format%3DJSON%26Id%3D1%26Product%3Dascm%26RegionId%3Dcn-region-test%26SignatureMethod%3DHMAC-SHA1%26SignatureNonce%3D43967c6e-e3ad-44fa-b06b-fcf3db5f39d2%26SignatureVersion%3D1.0%26Timestamp%3D2020-09-15T08%253A50%253A40Z%26Version%3D2019-05-10
```

3. Calculate the signature.

   Calculate the signature. The key value used for calculation is `testsecret&` because `AccessKeySecret` is set to testsecret. The calculated signature is `OLeaidS1JvxuMvnyHOwuJ+uX5qY=` . Java Base64 is used in the following sample code:

   `String signature = Base64.getEncoder().encodeToString(signData);` Encode `Signature=hvqv9Ll5RE6kQ4YsQXFAf9VuRIY=` based on RFC 3986 and add it to the canonicalized query string.

```
https://public.asapi.aliyuns.com/asapi/v3/?AccessKeyId=testid&Action=GetOrganizationList&Format=JSON&Id=1&Product=ascm&RegionId=cn-region-test&SignatureMethod=HMAC-SHA1&SignatureNonce=43967c6e-e3ad-44fa-b06b-fcf3db5f39d2&SignatureVersion=1.0&Timestamp=2020-09-15T08%3A50%3A40Z&Version=2019-05-10
```

You can use browsers or tools such as cURL and Wget to initiate an HTTP request for calling the `DescribeRegions` operation to query the Alibaba Cloud region list.

Example 2: Use the standard library of the programming language

`GetOrganizationList` is used in this example to query regions. For example, `AccessKeyID` is set to testid, `AccessKeySecret` is set to testsecret, and all request parameters are stored in a Java `Map<String, String>` object.

1. Predefine an encoding method.

```
private static final String ENCODING = "UTF-8";
private static String percentEncode(String value) throws UnsupportedEncodingException {
        return value != null ? URLEncoder.encode(value, ENCODING).replace("+", "%20").r
eplace("*", "%2A").replace("%7E", "~") : null;
}
```

2. Predefine the time format for the `Timestamp` parameter. Specify the `Timestamp` parameter in the ISO 8601 format. The time must be in UTC+0.

```
private static final String ISO8601_DATE_FORMAT = "yyyy-MM-dd'T'HH:mm:ss'Z'";
private static String formatIso8601Date(Date date) {
    SimpleDateFormat df = new SimpleDateFormat(ISO8601_DATE_FORMAT);
    df.setTimeZone(new SimpleTimeZone(0, "GMT"));
    return df.format(date);
}
```

3. Create a request string.

```
final String HTTP_METHOD = "GET";
Map parameters = new HashMap();
// Specify request parameters.
parameters.put("Product", "ascm");
parameters.put("Action", "GetOrganizationList");
parameters.put("Version", "2019-05-10");
parameters.put("AccessKeyId", "testid");
parameters.put("RegionId", "cn-region-test");
parameters.put("Timestamp", formatIso8601Date(new Date()));
parameters.put("SignatureMethod", "HMAC-SHA1");
parameters.put("SignatureVersion", "1.0");
parameters.put("SignatureNonce", UUID.randomUUID().toString());
parameters.put("Format", "JSON");
parameters.put("Id", "1");
// Arrange request parameters.
String[] sortedKeys = parameters.keySet().toArray(new String[]{});
Arrays.sort(sortedKeys);
final String SEPARATOR = "&";
// Create a string-to-sign.
StringBuilder stringToSign = new StringBuilder();
stringToSign.append(HTTP_METHOD).append(SEPARATOR);
stringToSign.append(percentEncode("/")).append(SEPARATOR);
StringBuilder canonicalizedQueryString = new StringBuilder();
for(String key : sortedKeys) {
    // Encode the key and the value.
    canonicalizedQueryString.append("&")
    .append(percentEncode(key)).append("=")
    .append(percentEncode(parameters.get(key)));
}
//Encode the canonicalized query string.
stringToSign.append(percentEncode(
canonicalizedQueryString.toString().substring(1)));
```

4. The signature. The key value used for calculation is `testsecret&` because `AccessKeySecret` is set to testsecret. The calculated signature is `OLeaidS1JvxuMvnyHOwuJ%2BuX5qY%3D`.

```
// The following sample code shows how to calculate the signature:
final String ALGORITHM = "HmacSHA1";
final String ENCODING = "UTF-8";
key = "testsecret&";
Mac mac = Mac.getInstance(ALGORITHM);
mac.init(new SecretKeySpec(key.getBytes(ENCODING), ALGORITHM));
byte[] signData = mac.doFinal(stringToSign.getBytes(ENCODING));
String signature = Base64.getEncoder().encodeToString(signData);
```

Encode the Signature parameter based on RFC 3986 and add it to the canonicalized query string. The following URL is obtained:

```
https://public.asapi.aliyuns.com/asapi/v3/?AccessKeyId=testid&Action=GetOrganizationLis
t&Format=JSON&Id=1&Product=ascm&RegionId=cn-region-test&SignatureMethod=HMAC-SHA1&Signa
tureNonce=43967c6e-e3ad-44fa-b06b-fcf3db5f39d2&SignatureVersion=1.0&Timestamp=2020-09-1
5T08%3A50%3A40Z&Version=2019-05-10
```

5. Use browsers or tools such as cURL and Wget to initiate an HTTP request.

1.1.1.1.5.4. Response

Responses are returned only in the JSON format. If a return code is greater than or equal to 200 and less than 300, a success response is returned. Otherwise, an error response is returned.

Sample success response

If a request is successful, the request ID and operation-specific parameter values are returned. For more information, see the developer guide of the corresponding Apsara Stack service.

```
 {
    "eagleEyeTraceId": "xxx-xxx-xxx-xxx", // The trace ID provided by EagleEye.
    "asapiSuccess": true,
    "RequestId": "xxxxxxxxxx",
    "Regions": { // The regions returned after you call the DescribeRegions operation.
        "Region": [
            {
                "RegionId": "",
                "RegionEndpoint": "",
                "LocalName": ""
            }
        ]
    }
}
```

Sample error response

If a request fails, the following information is returned. For more information, see the developer guide of the corresponding Apsara Stack service.

```
{
    "code": "asapi.server.api.notfound",// The error code.
    "eagleEyeTraceId": "xxx-xxx-xxx-xxx", // The trace ID provided by EagleEye.
    "asapiSuccess": false, // Indicates whether the request is successful.
    "hostId": "xxxx", // The ID of the host.
    "message": "Failed to ....", // The message returned.
    "asapiErrorMessage": "Failed to ....", // The error message provided by the ASAPI.
    "asapiErrorCode": "asapi.server.api.notfound" // The error code provided by the ASAPI.
}
```

1.1.2. API reference

1.1.2.1. Common parameters

Common request parameters

Common request parameters must be included in the request of each API.

Common request parameters

Parameter	Type	Required	Description
Version	String	Yes	The version number of the API, in YYYY-MM-DD format. Set the value to 2019-05-10.
AccessKeyId	String	Yes	The AccessKey ID provided to you by Apsara Stack.
AccessKeySecret	String	Yes	The AccessKey secret provided to you by Apsara Stack.
RegionID	String	Yes	The region ID provided to you by Apsara Stack.
Product	String	Yes	The name of the service to which the API operation belongs.

You must obtain the values of the `Product` and `Version` parameters in the Apsara Uni-manager Management Console. Perform the following operations:

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, choose **Products > Others > API Tool**.
3. In the left-side navigation pane of the API Tool page, click **API Directory**.
4. In the **Operation Name** search box, enter the name of an operation to query its information.

Common response parameters

API responses use the HTTP response format:

- A 2xx status code indicates a successful call.
- A 4xx or 5xx status code indicates a failed call.

Responses are returned in the JSON format. Every response returns a unique RequestID regardless of whether the call is successful.

1.1.2.2. Apsara Uni-manager Management Console authentication

Before you can make ASAPI requests, you must obtain the AccessKey pair (AccessKey ID and AccessKey secret) of an organization account in the Apsara Uni-manager Management Console.

The organization account grants access permissions on available resources. Then, the resources can be accessed by using the AccessKey pair. For more information, see Obtain an AccessKey pair.

> **Notice** If you use the AccessKey pair of a personal account to call an API operation, you must configure header parameters for access control. Otherwise, a message is prompted to indicate that you have insufficient permissions.

Header parameters

Parameter	Description
x-acs-regionid	The region ID. Example: cn-hangzhou-*.

Parameter	Description
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console. For information about how to obtain the ID of an organization, see GetOrganizationList.
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console. For information about how to obtain the ID of a resource set, see ListResourceGroup.
x-acs-instanceid	The ID of the instance on which to perform operations. For example, you can query the ID of an Elastic Compute Service (ECS) instance from the ECS instance list.

1.1.2.3. Enterprise

1.1.2.3.1. Organizations

1.1.2.3.1.1. UpdateOrganization

You can call this operation to update an organization.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	UpdateOrganization	The operation that you want to perform. Set the value to UpdateOrganization.
Id	String	Yes	1	The ID of the organization.
Name	String	Yes	helloworld	The name of the organization.
RequestId	String	No	sdfsadfsdfsdfsdf	The ID of the request.
PersonNum	String	No	10	The maximum number of users.
ResourceGroupNum	String	No	10	The maximum number of resource groups.

Parameter	Type	Required	Example	Description
Alias	String	No	test	The alias.

Response parameters

Parameter	Type	Example	Description
code	String	200	The HTTP status code.
cost	Integer	10000	The time consumed by the operation.
data	Struct		The response.
alias	String	test	The alias of the organization.
ctime	Long	1607512443989	The creation time.
cuserId	String	admin	The creator.
id	Integer	1	The ID of the organization.
internal	Boolean	true	Indicates whether the organization is a preset organization.
level	String	0.1	The level of the organization.
mtime	Long	1606791494471	The modification time.
multiCloudStatus	String	master	Indicates whether the organization is a multi-cloud organization.
muserId	String	admin	The modifier.
name	String	test	The name of the organization.
parentId	Integer	0	The ID of the parent organization.

Parameter	Type	Example	Description
supportRegionList	List	cn-qingdao-env17-d01	The list of regions.
supportRegions	String	["cn-qingdao-env17-d01"]	The list of regions.
uuid	String	1231	The universally unique identifier (UUID) of the organization.
message	String	200	The message.
pureListData	Boolean	true	Indicates whether only data is returned.
redirect	Boolean	false	Indicates whether redirections are performed.
requestId	String	1	The ID of the request.
success	Boolean	true	Indicates whether the call was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=UpdateOrganization
&Id=1
&Name=helloworld
&<Common request parameters>
```

Sample success responses

`XML` format

```
<redirect>false</redirect>
<cost>10000</cost>
<code>200</code>
<data>
    <muserId>admin</muserId>
    <internal>true</internal>
    <level>0.1</level>
    <supportRegions>["cn-qingdao-env17-d01"]</supportRegions>
    <mtime>1606791494471</mtime>
    <uuid>1231</uuid>
    <parentId>0</parentId>
    <multiCloudStatus>master</multiCloudStatus>
    <supportRegionList>cn-qingdao-env17-d01</supportRegionList>
    <name>test</name>
    <ctime>1607512443989</ctime>
    <alias>test</alias>
    <id>1</id>
    <cuserId>admin</cuserId>
</data>
<success>true</success>
<requestId>1</requestId>
<pureListData>true</pureListData>
<message>200</message>
```

`JSON` format

```
{
    "redirect": "false",
    "cost": "10000",
    "code": "200",
    "data": {
        "muserId": "admin",
        "internal": "true",
        "level": "0.1",
        "supportRegions": "[\"cn-qingdao-env17-d01\"]",
        "mtime": "1606791494471",
        "uuid": "1231",
        "parentId": "0",
        "multiCloudStatus": "master",
        "supportRegionList": "cn-qingdao-env17-d01",
        "name": "test",
        "ctime": "1607512443989",
        "alias": "test",
        "id": "1",
        "cuserId": "admin"
    },
    "success": "true",
    "requestId": "1",
    "pureListData": "true",
    "message": "200"
}
```

1.1.2.3.1.2. UpdateSupportRegionsForOrg

You can call this operation to update supported regions for an organization.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	UpdateSupportRegionsForOrg	The operation that you want to perform. Set the value to UpdateSupportRegionsForOrg.
OrganizationId	Integer	Yes	5	The ID of the organization.
SupportRegions	String	Yes	RegionId1,RegionId2	The list of region IDs.

Response parameters

Parameter	Type	Example	Description
code	String	200	The HTTP status code.
cost	Integer	32	The time consumed by the operation.
message	String	success	The message.
pureListData	Boolean	false	Indicates whether only data is returned.
redirect	Boolean	false	Indicates whether redirections are performed.
success	Boolean	true	Indicates whether the call was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=UpdateSupportRegionsForOrg
&OrganizationId=5
&SupportRegions=RegionId1,RegionId2
&<Common request parameters>
```

Sample success responses

`XML` format

```
<redirect>false</redirect>
<cost>32</cost>
<code>200</code>
<success>true</success>
<pureListData>false</pureListData>
<message>success</message>
```

`JSON` format

```
{
    "redirect": "false",
    "cost": "32",
    "code": "200",
    "success": "true",
    "pureListData": "false",
    "message": "success"
}
```

1.1.2.3.1.3. GetOrganization

You can call this operation to query an organization.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	GetOrganization	The operation that you want to perform. Set the value to GetOrganization.
Id	String	Yes	1	The ID of the organization.
RequestId	String	No	dsfsdfsd	The ID of the request.

Response parameters

Parameter	Type	Example	Description
code	String	200	The HTTP status code.
cost	Integer	10000	The time consumed by the operation.
data	Struct		The response.

Parameter	Type	Example	Description
alias	String	test	The alias of the organization.
ctime	Long	1607512443989	The creation time.
cuserId	String	admin	The creator.
id	Integer	1	The ID of the organization.
internal	Boolean	true	Indicates whether the organization is a preset organization.
level	String	0.1	The level of the organization.
mtime	Long	1606791494471	The modification time.
multiCloudStatus	String	master	Indicates whether the organization is a multi-cloud organization.
muserId	String	admin	The modifier.
name	String	test	The name of the organization.
parentId	Integer	1	The ID of the parent organization.
supportRegionList	List	cn-qingdao-env17-d01	The list of regions.
supportRegions	String	["cn-qingdao-env17-d01"]	The list of regions.
uuid	String	1231	The universally unique identifier (UUID) of the organization.
message	String	200	The message.
pureListData	Boolean	true	Indicates whether only data is returned.

Parameter	Type	Example	Description
redirect	Boolean	true	Indicates whether redirections are performed.
requestId	String	1234	The ID of the request.
success	Boolean	true	Indicates whether the call was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=GetOrganization
&Id=1
&<Common request parameters>
```

Sample success responses

`XML` format

```
<redirect>true</redirect>
<cost>10000</cost>
<code>200</code>
<data>
    <muserId>admin</muserId>
    <internal>true</internal>
    <level>0.1</level>
    <supportRegions>["cn-qingdao-env17-d01"]</supportRegions>
    <mtime>1606791494471</mtime>
    <uuid>1231</uuid>
    <parentId>1</parentId>
    <multiCloudStatus>master</multiCloudStatus>
    <supportRegionList>cn-qingdao-env17-d01</supportRegionList>
    <name>test</name>
    <ctime>1607512443989</ctime>
    <alias>test</alias>
    <id>1</id>
    <cuserId>admin</cuserId>
</data>
<success>true</success>
<requestId>1234</requestId>
<pureListData>true</pureListData>
<message>200</message>
```

`JSON` format

```
{
    "redirect": "true",
    "cost": "10000",
    "code": "200",
    "data": {
        "muserId": "admin",
        "internal": "true",
        "level": "0.1",
        "supportRegions": "[\"cn-qingdao-env17-d01\"]",
        "mtime": "1606791494471",
        "uuid": "1231",
        "parentId": "1",
        "multiCloudStatus": "master",
        "supportRegionList": "cn-qingdao-env17-d01",
        "name": "test",
        "ctime": "1607512443989",
        "alias": "test",
        "id": "1",
        "cuserId": "admin"
    },
    "success": "true",
    "requestId": "1234",
    "pureListData": "true",
    "message": "200"
}
```

1.1.2.3.1.4. GetOrganizationList

Queries the list of organizations.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	GetOrganizationList	The operation that you want to perform. Set the value to GetOrganizationList.
RequestId	String	No	sdfasdfafsdf	The ID of the request.
Id	String	No	1	The ID of the organization.

Parameter	Type	Required	Example	Description
Name	String	No	test	The name of the organization. If both the organization ID and the organization name are specified, the organization ID prevails. If both the organization ID and the organization name are not specified, no data is returned.

Response parameters

Parameter	Type	Example	Description
code	String	200	The HTTP status code.
cost	Integer	10000	The amount of time taken to perform the operation.
data	Array of dataItem		The response.
alias	String	test	The alias of the organization.
ctime	Long	1607512443989	The time when the organization was created.
cuserId	String	admin	The creator of the organization.
id	Integer	1	The ID of the organization.
internal	Boolean	true	Indicates whether the organization is a preset organization.
level	String	0.1	The level of the organization.
mtime	Long	1606791494471	The time when the organization was modified.

Parameter	Type	Example	Description
multiCloudStatus	String	master	Indicates whether the organization is a multi-cloud organization. Valid values: master and slave. master indicates a primary-cloud organization. slave indicates a secondary-cloud organization.
muserId	String	admin	The user who modified the organization.
name	String	test	The name of the organization.
parentId	Integer	0	The ID of the parent organization.
supportRegionList	List	cn-qingdao-env17-d01	The list of regions.
supportRegions	String	["cn-qingdao-env17-d01"]	The list of regions.
uuid	String	1231	The UUID of the organization.
message	String	success	The error message.
pureListData	Boolean	true	Indicates whether only data is returned.
redirect	Boolean	true	Indicates whether redirections are performed.
requestId	String	1	The ID of the request.
success	Boolean	true	Indicates whether the call is successful.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=GetOrganizationList
&<Common request parameters>
```

Sample success responses

`XML` format

```
<redirect>true</redirect>
<cost>10000</cost>
<code>200</code>
<data>
    <muserId>admin</muserId>
    <internal>true</internal>
    <level>0.1</level>
    <supportRegions>["cn-qingdao-env17-d01"]</supportRegions>
    <mtime>1606791494471</mtime>
    <uuid>1231</uuid>
    <parentId>0</parentId>
    <multiCloudStatus>master</multiCloudStatus>
    <name>test</name>
    <ctime>1607512443989</ctime>
    <alias>test</alias>
    <id>1</id>
    <cuserId>admin</cuserId>
</data>
<data>
    <supportRegionList>cn-qingdao-env17-d01</supportRegionList>
</data>
<success>true</success>
<requestId>1</requestId>
<pureListData>true</pureListData>
<message>200</message>
```

`JSON` format

```
{
    "redirect": "true",
    "cost": "10000",
    "code": "200",
    "data": [
        {
            "muserId": "admin",
            "internal": "true",
            "level": "0.1",
            "supportRegions": "[\"cn-qingdao-env17-d01\"]",
            "mtime": "1606791494471",
            "uuid": "1231",
            "parentId": "0",
            "multiCloudStatus": "master",
            "name": "test",
            "ctime": "1607512443989",
            "alias": "test",
            "id": "1",
            "cuserId": "admin"
        },
        {
            "supportRegionList": "cn-qingdao-env17-d01"
        }
    ],
    "success": "true",
    "requestId": "1",
    "pureListData": "true",
    "message": "200"
}
```

1.1.2.3.1.5. RemoveOrganization

You can call this operation to delete an organization.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	RemoveOrganization	The operation that you want to perform. Set the value to RemoveOrganization.
Id	String	Yes	10	The ID of the organization.
RequestId	String	No	retertertet	The ID of the request.

Response parameters

Parameter	Type	Example	Description
code	String	200	The HTTP status code.
cost	Integer	10000	The time consumed by the operation.
message	String	200	The message.
pureListData	Boolean	true	Indicates whether only data is returned.
redirect	Boolean	false	Indicates whether redirections are performed.
requestId	String	1	The ID of the request.
success	Boolean	true	Indicates whether the call was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=RemoveOrganization
&Id=10
&<Common request parameters>
```

Sample success responses

`XML` format

```
<redirect>false</redirect>
<cost>10000</cost>
<code>200</code>
<success>true</success>
<requestId>1</requestId>
<pureListData>true</pureListData>
<message>200</message>
```

`JSON` format

```
{
    "redirect": "false",
    "cost": "10000",
    "code": "200",
    "success": "true",
    "requestId": "1",
    "pureListData": "true",
    "message": "200"
}
```

1.1.2.3.1.6. ListResourceGroupByOrgId

You can call this operation to query the list of resource sets in an organization.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ListResourceGroupByOrgId	The operation that you want to perform. Set the value to ListResourceGroupByOrgId.
Id	String	Yes	3	The ID of the organization.
resource_group_name	String	No	testrs	The name of the resource set.

Response parameters

Parameter	Type	Example	Description
code	String	200	The HTTP status code.
cost	Integer	10000	The time consumed by the operation.
data	Array of dataItem		The response.
creator	String	admin	The creator.
gmtCreated	Float	1607512443989	The creation time.
gmtModified	Float	1607512443989	The modification time.

Parameter	Type	Example	Description
id	Integer	1	The ID of the resource set.
organizationID	Integer	1	The ID of the organization.
organizationName	String	admin	The name of the organization.
resourceGroupName	String	test	The name of the resource set.
resourceGroupType	Integer	1	The type of the resource set.
message	String	200	The message.
pageInfo	Struct		The page information.
currentPage	Integer	1	The number of the page returned.
pageSize	Integer	10	The number of entries returned per page.
total	Integer	10	The total number of entries returned.
totalPage	Integer	10	The total number of pages returned.
pureListData	Boolean	true	Indicates whether only data is returned.
redirect	Boolean	true	Indicates whether redirections are performed.
success	Boolean	true	Indicates whether the call was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=ListResourceGroupByOrgId
&Id=3
&<Common request parameters>
```

Sample success responses

`XML` format

```
<redirect>true</redirect>
<cost>10000</cost>
<code>200</code>
<data>
    <organizationID>1</organizationID>
    <gmtModified>1607512443989</gmtModified>
    <creator>admin</creator>
    <resourceGroupName>test</resourceGroupName>
    <organizationName>admin</organizationName>
    <gmtCreated>1607512443989</gmtCreated>
    <resourceGroupType>1</resourceGroupType>
    <id>1</id>
</data>
<success>true</success>
<pageInfo>
    <total>10</total>
    <totalPage>10</totalPage>
    <pageSize>10</pageSize>
    <currentPage>1</currentPage>
</pageInfo>
<pureListData>true</pureListData>
<message> 200</message>
```

`JSON` format

```
{
    "redirect": "true",
    "cost": "10000",
    "code": "200",
    "data": [
        {
            "organizationID": "1",
            "gmtModified": "1607512443989",
            "creator": "admin",
            "resourceGroupName": "test",
            "organizationName": "admin",
            "gmtCreated": "1607512443989",
            "resourceGroupType": "1",
            "id": "1"
        }
    ],
    "success": "true",
    "pageInfo": {
        "total": "10",
        "totalPage": "10",
        "pageSize": "10",
        "currentPage": "1"
    },
    "pureListData": "true",
    "message": " 200"
}
```

1.1.2.3.1.7. CreateOrganization

You can call this operation to create an organization.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateOrganization	The operation that you want to perform. Set the value to CreateOrganization.
Name	String	Yes	hellowolrd	The name of the organization.
ParentId	String	Yes	1	The ID of the parent organization.
RequestId	String	No	100000000	The ID of the request.
PersonNum	String	No	1	A reserved parameter.
ResourceGroupNum	String	No	1	A reserved parameter.

Response parameters

Parameter	Type	Example	Description
code	String	200	The HTTP status code.
cost	Integer	10000	The time consumed by the operation.
data	Struct		The response.
alias	String	test	The alias of the organization.
ctime	Long	1607512443989	The creation time.
cuserId	String	admin	The creator.
id	Integer	1	The ID of the organization.

Parameter	Type	Example	Description
internal	Boolean	true	Indicates whether the organization is a preset organization.
level	String	0.1	The level of the organization.
mtime	Long	1606791494471	The modification time.
multiCloudStatus	String	master	Indicates whether the organization is a multi-cloud organization.
muserId	String	admin	The modifier.
name	String	test	The name of the organization.
parentId	Integer	1	The ID of the parent organization.
supportRegionList	List	cn-qingdao-env17-d01	The list of regions.
supportRegions	String	["cn-qingdao-env17-d01"]	The list of regions.
uuid	String	1231	The universally unique identifier (UUID) of the organization.
message	String	200	The message.
pureListData	Boolean	true	Indicates whether only data is returned.
redirect	Boolean	true	Indicates whether redirections are performed.
requestId	String	1234	The ID of the request.
success	Boolean	true	Indicates whether the call was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=CreateOrganization
&Name=hellowolrd
&ParentId=1
&<Common request parameters>
```

Sample success responses

`XML` format

```
<redirect>true</redirect>
<cost>10000</cost>
<code>200</code>
<data>
    <muserId>admin</muserId>
    <internal>true</internal>
    <level>0.1</level>
    <supportRegions>["cn-qingdao-env17-d01"]</supportRegions>
    <mtime>1606791494471</mtime>
    <uuid>1231</uuid>
    <parentId>1</parentId>
    <multiCloudStatus>master</multiCloudStatus>
    <supportRegionList>cn-qingdao-env17-d01</supportRegionList>
    <name>test</name>
    <ctime>1607512443989</ctime>
    <alias>test</alias>
    <id>1</id>
    <cuserId>admin</cuserId>
</data>
<success>true</success>
<requestId>1234</requestId>
<pureListData>true</pureListData>
<message>200</message>
```

`JSON` format

```
{
    "redirect": "true",
    "cost": "10000",
    "code": "200",

    "requestId": "1234",
    "pureListData": "true",
    "message": "200"
}
```

1.1.2.3.2. Resource sets

1.1.2.3.2.1. BindAscmUserAndResourceGroup

You can call this operation to bind a resource set to a user.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	BindAscmUserAndResourceGroup	The operation that you want to perform. Set the value to BindAscmUserAndResourceGroup.
ascm_user_ids	String	Yes	"[\"5017\",\"5023\"]"	The list of user IDs.
resource_group_id	Integer	Yes	7	The ID of the resource set.

Response parameters

Parameter	Type	Example	Description
code	String	200	The HTTP status code.
cost	Integer	10000	The time consumed by the operation.
message	String	200	The message.
redirect	Boolean	true	Indicates whether redirections are performed.
success	Boolean	true	Indicates whether the call was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=BindAscmUserAndResourceGroup
&ascm_user_ids="[\"5017\",\"5023 \"]"
&resource_group_id=7
&<Common request parameters>
```

Sample success responses

`XML` format

```
<redirect>false</redirect>
<code>200</code>
<cost>113</cost>
<success>true</success>
<pureListData>false</pureListData>
<message>success</message>
```

`JSON` format

```
{
    "redirect": false,
    "code": "200",
    "cost": 113,
    "success": true,
    "pureListData": false,
    "message": "success"
}
```

1.1.2.3.2.2. CreateResourceGroup

You can call this operation to create a resource set.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateResourceGroup	The operation that you want to perform. Set the value to CreateResourceGroup.
organization_id	Integer	Yes	3	The ID of the organization.
resource_group_name	String	Yes	testrs	The name of the resource set.

Response parameters

Parameter	Type	Example	Description
code	String	200	The HTTP status code.
cost	Integer	10000	The time consumed by the operation.
data	Struct		The response.
gmtCreated	Long	1607512443989	The creation time.
id	Integer	1	The ID of the resource set.
organizationID	String	1	The ID of the organization.
resourceGroupName	String	test	The name of the resource set.
rsId	String	rs-1010e71e5e520aab483b000f	The unique ID of the registry.
message	String	200	The message.
pureListData	Boolean	true	Indicates whether only data is returned.
redirect	Boolean	true	Indicates whether redirections are performed.

Parameter	Type	Example	Description
requestId	String	1234	The ID of the request.
success	Boolean	true	Indicates whether the call was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=CreateResourceGroup
&organization_id=3
&resource_group_name=testrs
&<Common request parameters>
```

Sample success responses

`XML` format

```
<redirect>true</redirect>
<cost>10000</cost>
<code>200</code>
<data>
    <organizationID>1</organizationID>
    <resourceGroupName>test</resourceGroupName>
    <gmtCreated>1607512443989</gmtCreated>
    <rsId>rs-1010e71e5e520aab483b000f</rsId>
    <id>1</id>
</data>
<success>true</success>
<requestId>1234</requestId>
<pureListData>true</pureListData>
<message>200</message>
```

`JSON` format

```
{
    "redirect": "true",
    "cost": "10000",
    "code": "200",
    "data": {
        "organizationID": "1",
        "resourceGroupName": "test",
        "gmtCreated": "1607512443989",
        "rsId": "rs-1010e71e5e520aab483b000f",
        "id": "1"
    },
    "success": "true",
    "requestId": "1234",
    "pureListData": "true",
    "message": "200"
}
```

1.1.2.3.2.3. UnbindAscmUserAndResourceGroup

You can call this operation to unbind a user from a resource set.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	UnbindAscmUserAndResourceGroup	The operation that you want to perform. Set the value to UnbindAscmUserAndResourceGroup.
AscmUserIds	String	Yes	1	The list of user IDs.
ResourceGroupId	Integer	Yes	1	The ID of the resource set.

Response parameters

Parameter	Type	Example	Description
code	String	200	The HTTP status code.
cost	Integer	10000	The time consumed by the operation.
message	String	200	The message.
pureListData	Boolean	true	Indicates whether only data is returned.

Parameter	Type	Example	Description
redirect	Boolean	true	Indicates whether redirections are performed.
success	Boolean	true	Indicates whether the call was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=UnbindAscmUserAndResourceGroup
&AscmUserIds=1
&ResourceGroupId=1
&<Common request parameters>
```

Sample success responses

`XML` format

```
<redirect>true</redirect>
<cost>10000</cost>
<code>200</code>
<success>true</success>
<pureListData>true</pureListData>
<message>200</message>
```

`JSON` format

```
{
    "redirect": "true",
    "cost": "10000",
    "code": "200",
    "success": "true",
    "pureListData": "true",
    "message": "200"
}
```

1.1.2.3.2.4. UpdateResourceGroup

Modifies the information of a resource set.

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	UpdateResourceGroup	The operation that you want to perform. Set the value to UpdateResourceGroup.
id	String	Yes	16	The ID of the resource set to be modified.
resource_group_name	String	Yes	old_res	The current name of the resource set to be modified.
resourceGroupName	String	Yes	new_res	The new name of the resource set to be modified.

Response parameters

Parameter	Type	Example	Description
code	String	200	The HTTP status code.
cost	Integer	10000	The amount of time taken to perform the operation.
message	String	200	The message.
pageInfo	Struct		The data information.
gmtModified	Float	1606791494471	The time when the resource set was modified.
id	Integer	1	The ID of the resource set.
resourceGroupName	String	test	The name of the resource set.
pureListData	Boolean	true	Indicates whether only data is returned.
redirect	Boolean	true	Indicates whether redirections are performed.

Parameter	Type	Example	Description
success	Boolean	true	Indicates whether the call is successful.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=UpdateResourceGroup
&id=16
&resource_group_name=DefaultRewwww
&<Common request parameters>
```

Sample success responses

`XML` format

```
<redirect>true</redirect>
<cost>10000</cost>
<code>200</code>
<success>true</success>
<pageInfo>
    <gmtModified>1606791494471</gmtModified>
    <resourceGroupName>test</resourceGroupName>
    <id>1</id>
</pageInfo>
<pureListData>true</pureListData>
<message>200</message>
```

`JSON` format

```
{
    "redirect": "true",
    "cost": "10000",
    "code": "200",
    "success": "true",
    "pageInfo": {
        "gmtModified": "1606791494471",
        "resourceGroupName": "test",
        "id": "1"
    },
    "pureListData": "true",
    "message": "200"
}
```

1.1.2.3.2.5. RemoveResourceGroup

You can call this operation to delete a resource set.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	RemoveResourceGroup	The operation that you want to perform. Set the value to RemoveResourceGroup.
resource_group_id	Integer	Yes	5	The ID of the resource set.

Response parameters

Parameter	Type	Example	Description
code	String	200	The HTTP status code.
cost	Integer	10000	The time consumed by the operation.
message	String	200	The message.
redirect	Boolean	true	Indicates whether redirections are performed.
requestId	String	1234	The ID of the request.
success	Boolean	true	Indicates whether the call was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=RemoveResourceGroup
&resource_group_id=5
&<Common request parameters>
```

Sample success responses

`XML` format

```
<redirect>false</redirect>
<code>200</code>
<cost>221</cost>
<success>true</success>
<pureListData>false</pureListData>
<message>success</message>
```

`JSON` format

```
{
    "redirect": false,
    "code": "200",
    "cost": 221,
    "success": true,
    "pureListData": false,
    "message": "success"
}
```

1.1.2.3.2.6. ListResourceGroup

Queries the list of available resource sets of a user.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ListResourceGroup	The operation that you want to perform. Set the value to ListResourceGroup.
resourceGroupName	String	No	test	The name of the resource set to be queried.
organizationId	Integer	No	1	The ID of the organization. After this parameter is specified, you can obtain the list of resource sets in the current organization, excluding its subordinate organizations. If this parameter is not specified or is set to 1, the list of all resource sets visible to the user is obtained.
pageNumber	Integer	No	1	The number of the page to return. Default value: 1.
pageSize	Integer	No	10	The number of entries to return on each page.

Response parameters

Parameter	Type	Example	Description
PageInfo	Struct		The page information.

Parameter	Type	Example	Description
CurrentPage	Integer	1	The page number of the returned page.
PageSize	Integer	10	The number of entries returned per page.
Total	Integer	10	The total number of entries returned.
TotalPage	Integer	1	The total number of pages.
code	String	200	The HTTP status code.
cost	Integer	10000	The amount of time taken to perform the operation.
data	Array of dataItem		The response.
creator	String	admin	The creator of the resource set.
gmtCreated	Float	1606719003858	The time when the resource set was created.
id	Integer	1	The ID of the resource set.
organizationID	Integer	1	The ID of the organization.
organizationName	String	test	The name of the organization.
resourceGroupName	String	test	The name of the resource set.
rsId	String	rs-1010e71e5e520aab483b000f	The ID of the resource set.
message	String	200	The message.
pureListData	Boolean	true	Indicates whether only data is returned.
redirect	Boolean	true	Indicates whether redirections are performed.

Parameter	Type	Example	Description
success	Boolean	true	Indicates whether the call is successful.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ListResourceGroup
&<Common request parameters>
```

Sample success response

`XML` format

```
<redirect>true</redirect>
<PageInfo>
    <TotalPage>1</TotalPage>
    <PageSize>10</PageSize>
    <CurrentPage>1</CurrentPage>
    <Total>10</Total>
</PageInfo>
<cost>10000</cost>
<code>200</code>
<data>
    <organizationID>1</organizationID>
    <creator>admin</creator>
    <resourceGroupName>test</resourceGroupName>
    <organizationName>test</organizationName>
    <gmtCreated>1606719003858</gmtCreated>
    <rsId>rs-1010e71e5e520aab483b000f</rsId>
    <id>1</id>
</data>
<success>true</success>
<pureListData>true</pureListData>
<message>200</message>
```

`JSON` format

```
{
    "redirect": "true",
    "PageInfo": {
        "TotalPage": "1",
        "PageSize": "10",
        "CurrentPage": "1",
        "Total": "10"
    },
    "cost": "10000",
    "code": "200",
    "data": [
        {
            "organizationID": "1",
            "creator": "admin",
            "resourceGroupName": "test",
            "organizationName": "test",
            "gmtCreated": "1606719003858",
            "rsId": "rs-1010e71e5e520aab483b000f",
            "id": "1"
        }
    ],
    "success": "true",
    "pureListData": "true",
    "message": "200"
}
```

1.1.2.3.2.7. ListAscmUsersInsideResourceGroup

You can call this operation to query the list of users within a resource set.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ListAscmUsersInsideResourceGroup	The operation that you want to perform. Set the value to ListAscmUsersInsideResourceGroup.
ResourceGroupId	Integer	Yes	7	The ID of the resource set.
CurrentPage	Integer	No	1	The number of the page to return.
PageSize	Integer	No	10	The number of entries to return on each page.

Response parameters

Parameter	Type	Example	Description
code	String	200	The HTTP status code.
cost	Integer	1000	The time consumed by the operation.
cost	Integer	1000	The time consumed by the operation.
data	Array of dataItem		The response.
accessKeys	Array of accessKey		The list of AccessKey pairs.
accesskeyId	String	JGdgSN2pVYahtrd7	The AccessKey ID.
ctime	Long	1606675230000	The creation time.
cuserId	String	1	The ID of the creator.
id	Integer	1	The ID of the AccessKey pair.
region	String	cn-qingdao-env17-d01	The region.
status	String	ACTIVE	The status.
cellphoneNum	String	00000000000	The phone number.
default	Boolean	false	Indicates whether the user is a preset user.
defaultRole	Struct		The list of roles.
active	Boolean	true	Indicates whether the operation is active.
arId	String	111	The unique code.
code	String	ROLE_RESOURCE_USER	The code of the role.

Parameter	Type	Example	Description
default	Boolean	true	Indicates whether the role is a preset role.
description	String	test	The description.
enable	Boolean	true	Indicates whether the operation is enabled.
id	Integer	1	The ID of the role.
muserId	String	admin	The creator.
organizationVisibility	String	organizationVisibility.global	The sharing scope of the organization.
ownerOrganizationId	Integer	1	The ID of the organization.
rAMRole	Boolean	false	Indicates whether the role is a RAM role.
roleLevel	Integer	11321	The level of the role.
roleName	String	role_test	The name of the role.
roleRange	String	roleRange.orgAndSubOrgs	The permissions of the role.
roleType	String	ROLETYPE_ASCM	The type of the role.
deleted	Boolean	false	Indicates whether the user is deleted.
displayName	String	test	The display name.
email	String	test@163.com	The email address.
enableDingTalk	Boolean	false	Indicates whether notifications are sent by DingTalk.
enableEmail	Boolean	false	Indicates whether notifications are sent by email.

Parameter	Type	Example	Description
enableShortMessage	Boolean	false	Indicates whether notifications are sent by SMS.
id	Integer	1	The ID of the user.
loginName	String	test	The username.
loginPolicy	Struct		The logon policy.
cuserId	String	admin	The creator.
default	Boolean	true	Indicates whether the logon policy is the default one.
enable	Boolean	true	Indicates whether the operation is enabled.
id	Integer	1	The ID of the logon policy.
ipRanges	Array of ipRange		The list of CIDR blocks.
ipRange	String	0.0.0.0/0	The CIDR block.
loginPolicyId	Integer	1	The ID of the logon policy.
protocol	String	IPV4	The protocol.
lpId	String	111	The unique code.
muserId	String	admin	The creator.
name	String	deafult.loginpolicy	The name of the logon policy.
organizationVisibility	String	organizationVisibility.global	The sharing scope of the organization.
ownerOrganizationId	Integer	1	The ID of the organization.

Parameter	Type	Example	Description
rule	String	ALLOW	The rule of the logon policy. Valid values: Allow and Deny.
timeRanges	Array of timeRange		The list of time ranges.
endTime	String	24:00	The end of the time range for the query.
loginPolicyId	Integer	1	The ID of the logon policy.
startTime	String	00:00	The start of the time range for the query.
mobileNationCode	String	86	The country code.
organization	Struct		The information of the organization.
alias	String	test	The alias of the organization.
ctime	Long	1606791494471	The creation time.
cuserId	String	admin	The creator.
id	Integer	1	The ID of the organization.
internal	Boolean	false	Indicates whether the organization is a preset organization.
level	String	0.1	The level of the organization.
mtime	Long	1606791494471	The modification time.
multiCloudStatus	String	master	Indicates whether the organization is a multi-cloud organization.
muserId	String	admin	The modifier.
name	String	test	The name of the organization.

Parameter	Type	Example	Description
parentId	Integer	0	The ID of the parent organization.
supportRegionList	List	["cn-qingdao-env17-d01"]	The list of regions.
supportRegions	String	cn-qingdao-env17-d01	The list of regions.
uuid	String	1231	The universally unique identifier (UUID) of the organization.
parentPk	String	1689406703302188	The primary key of the Apsara Stack tenant account.
primaryKey	String	212530506704030466	The primary key of the RAM user.
roles	Array of role		The list of roles.
active	Boolean	true	Indicates whether the operation is active.
arId	String	111	The unique code.
code	String	ROLE_RESOURCE_USER	The code of the role.
default	Boolean	true	Indicates whether the role is a preset role.
description	String	test	The description.
enable	Boolean	true	Indicates whether the operation is enabled.
id	Integer	1	The ID of the role.
muserId	String	admin	The creator.
organizationVisibility	String	organizationVisibility.global	The sharing scope of the organization.

Parameter	Type	Example	Description
ownerOrganizationId	Integer	1	The ID of the organization.
rAMRole	Boolean	false	Indicates whether the role is a RAM role.
roleLevel	Integer	11321	The level of the role.
roleName	String	role_test	The name of the role.
roleRange	String	roleRange.orgAndSubOrgs	The permissions of the role.
roleType	String	ROLETYPE_ASCM	The type of the role.
status	String	ACTIVE	The status.
userGroupRoles	List	admin	The list of roles of the user group.
userGroups	List	admin	The list of user groups.
userRoles	Array of userRole		The list of roles of the user.
active	Boolean	true	Indicates whether the operation is active.
arId	String	1121	The unique code.
code	String	ROLE_RESOURCE_USER	The code of the role.
cuserId	String	admin	The creator.
default	Boolean	true	Indicates whether the role is a preset role.
description	String	role_test	The description.
enable	Boolean	true	Indicates whether the operation is enabled.

Parameter	Type	Example	Description
id	Integer	1	The ID of the role.
muserId	String	admin	The modifier.
organizationVisibility	String	defaultRole.resourceUser.description	The sharing scope of the organization.
ownerOrganizationId	Integer	1	The ID of the organization.
rAMRole	Boolean	false	Indicates whether the role is a RAM role.
roleLevel	Integer	1123	The level of the role.
roleName	String	defaultRole.resourceUser.name	The name of the role.
roleRange	String	roleRange.orgAndSubOrgs	The permissions of the role.
roleType	String	ROLETYPE_ASCM	The type of the role.
message	String	200	The message.
pageInfo	Struct		The page information.
currentPage	Integer	1	The page number of the returned page.
pageSize	Integer	10	The number of entries returned per page.
total	Integer	10	The total number of entries returned.
totalPage	Integer	10	The total number of pages returned.
redirect	Boolean	false	Indicates whether redirections are performed.
requestId	String	111	The ID of the request.

Parameter	Type	Example	Description
success	Boolean	true	Indicates whether the call was successful.

Examples

1.1.2.3.3. Roles

1.1.2.3.3.1. SetDefaultRole

Sets a default role.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	SetDefaultRole	The operation that you want to perform. Set the value to SetDefaultRole.
RoleId	Integer	Yes	5	The ID of the role.
LoginName	String	No	testu	The logon name of the user.

Response parameters

Parameter	Type	Example	Description
code	String	200	The HTTP status code.
cost	Integer	1000	The amount of time taken to perform the operation.
message	String	success	The error message.
pureListData	Boolean	false	Indicates whether only data is returned and other parameters are not returned.
redirect	Boolean	false	Indicates whether redirections are performed.
success	Boolean	true	Indicates whether the call is successful.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=SetDefaultRole
&RoleId=5
&<Common request parameters>
```

Sample success responses

`XML` format

```
<redirect>false</redirect>
<cost>1000</cost>
<code>200</code>
<success>true</success>
<pureListData>false</pureListData>
<message>success</message>
```

`JSON` format

```
{
    "redirect":"false",
    "cost":"1000",
    "code":"200",
    "success":"true",
    "pureListData":"false",
    "message":"success"
}
```

1.1.2.3.3.2. ListRoles

Queries the list of available roles of a user.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ListRoles	The operation that you want to perform. Set the value to ListRoles.
CurrentPage	Integer	No	1	The number of the page to return.
PageSize	Integer	No	10	The number of entries to return on each page.
IsDefault	Boolean	No	true	Specifies whether the role is a built-in role.

Parameter	Type	Required	Example	Description
RoleType	String	No	ROLETYPE_ASCM	The type of the role. Valid values: • ROLETYPE_RAM: the Resource Access Management (RAM) role • ROLETYPE_ASCM: the custom role
RoleName	String	No	defaultRole.organizationAdmin.name	The name of the role.

Response parameters

Parameter	Type	Example	Description
code	String	200	The HTTP status code.
cost	Integer	1000	The amount of time taken to perform the operation.
data	Array of dataItem		The response.
active	Boolean	true	Indicates whether the role is valid.
arId	String	ar-9999999902	The ID of the role.
code	String	ROLE_RESOURCE_USER	The code of the role.
default	Boolean	true	Indicates whether the role is a preset role.
description	String	defaultRole.resourceUser.description	The description of the role.
enable	Boolean	true	Indicates whether the role is valid.
id	Integer	1	The ID of the role.
muserId	String	admin	The user who modified the role.

Parameter	Type	Example	Description
organizationVisibility	String	organizationVisibility.global	The sharing scope of the role. Valid values: • organizationVisibility.global: The role is globally shared. • organizationVisibility.organization: The role is shared within the same organization. • organizationVisibility.orgAndSubOrgs: The role is shared to subordinate organizations.
ownerOrganizationId	Integer	1	The organization to which the role belongs.
rAMRole	Boolean	false	Indicates whether the role is a RAM role.
roleLevel	Integer	2147483647	The level of the role.
roleName	String	defaultRole.resourceUser.name	The name of the role.
roleRange	String	roleRange.orgAndSubOrgs	The permissions of the role. Valid values: • roleRange.allOrganizations: The role has permissions on all organizations. • roleRange.orgAndSubOrgs: The role has permissions on the organization and its subordinate organizations. • roleRange.resourceSet: The role has permissions on the resource set. • roleRange.userGroup: The role has permissions on the user group to which the RAM role belongs.
roleType	String	ROLETYPE_ASCM	The type of the role. Valid values: • ROLETYPE_RAM: the RAM role • ROLETYPE_ASCM: the custom role
userCount	Integer	12	The number of users.
message	String	success	The error message.
pageInfo	Struct		The page information.

Parameter	Type	Example	Description
currentPage	Integer	1	The page number of the returned page.
pageSize	Integer	20	The number of entries returned per page.
total	Integer	2	The total number of entries returned.
totalPage	Integer	39	The total number of pages.
pureListData	Boolean	false	Indicates whether only data is returned and other parameters are not returned.
redirect	Boolean	false	Indicates whether redirections are performed.
success	Boolean	true	Indicates whether the call is successful.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ListRoles
&<Common request parameters>
```

Sample success responses

`XML` format

```
<redirect>false</redirect>
<cost>1000</cost>
<code>200</code>
<data>
    <roleRange>roleRange.orgAndSubOrgs</roleRange>
    <rAMRole>false</rAMRole>
    <muserId>admin</muserId>
    <arId>ar-9999999902</arId>
    <code>ROLE_RESOURCE_USER</code>
    <description>defaultRole.resourceUser.description</description>
    <active>true</active>
    <roleType>ROLETYPE_ASCM</roleType>
    <default>true</default>
    <userCount>12</userCount>
    <ownerOrganizationId>1</ownerOrganizationId>
    <enable>true</enable>
    <roleName>defaultRole.resourceUser.name</roleName>
    <roleLevel>2147483647</roleLevel>
    <id>1</id>
    <organizationVisibility>organizationVisibility.global</organizationVisibility>
</data>
<success>true</success>
<pageInfo>
    <total>2</total>
    <totalPage>39</totalPage>
    <pageSize>20</pageSize>
    <currentPage>1</currentPage>
</pageInfo>
<pureListData>false</pureListData>
<message>success</message>
```

`JSON` format

```
{
    "redirect": false,
    "cost": 1000,
    "code": 200,
    "data": {
        "roleRange": "roleRange.orgAndSubOrgs",
        "rAMRole": false,
        "muserId": "admin",

    },
    "pureListData": false,
    "message": "success"
}
```

1.1.2.3.3.3. ListActiveRoles

Queries the list of roles that can be bound.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ListActiveRoles	The operation that you want to perform. Set the value to ListActiveRoles.
IncludeRAMRoles	Boolean	No	false	Specifies whether to include Resource Access Management (RAM) roles.

Response parameters

Parameter	Type	Example	Description
code	String	200	The HTTP status code.
cost	Integer	1000	The amount of time taken to perform the operation.
data	Array of dataItem		The response.
active	Boolean	true	Indicates whether the role is valid.
arId	String	ar-9999999902	The ID of the role.
code	String	200 ROLE_RESOURCE_USER	The code of the role.
default	Boolean	true	Indicates whether the role is a preset role.
description	String	defaultRole.resourceUser.description	The description of the role.
enable	Boolean	true	Indicates whether the role is valid.
id	Integer	1	The ID of the role.
organizationVisibility	String	organizationVisibility.global	The sharing scope of the role. Valid values: • organizationVisibility.global: The role is globally shared. • organizationVisibility.organization: The role is shared within the same organization. • organizationVisibility.orgAndSubOrgs: The role is shared to subordinate organizations.
ownerOrganizationId	Integer	1	The organization to which the role belongs.
rAMRole	Boolean	false	Indicates whether the role is a RAM role.

Parameter	Type	Example	Description
roleLevel	Integer	2147483647	The level of the role.
roleName	String	defaultRole.resourceUser.name	The name of the role.
roleRange	String	roleRange.orgAndSubOrgs	The permissions of the role. Valid values: • roleRange.allOrganizations: The role has permissions on all organizations. • roleRange.orgAndSubOrgs: The role has permissions on the organization and its subordinate organizations. • roleRange.resourceSet: The role has permissions on the resource set. • roleRange.userGroup: The role has permissions on the user group to which the RAM role belongs.
roleType	String	ROLETYPE_ASCM	The type of the role. Valid values: ROLETYPE_RAM and ROLETYPE_ASCM. ROLETYPE_RAM indicates a RAM role. ROLETYPE_ASCM indicates a custom role.
userCount	Integer	12	The number of users.
message	String	success	The error message.
pageInfo	Struct		The page information.
currentPage	Integer	1	The page number of the returned page.
pageSize	Integer	20	The number of entries returned per page.
total	Integer	2	The total number of entries returned.
totalPage	Integer	39	The total number of pages.
pureListData	Boolean	false	Indicates whether only data is returned and other parameters are not returned.

Parameter	Type	Example	Description
redirect	Boolean	false	Indicates whether redirections are performed.
success	Boolean	true	Indicates whether the call is successful.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ListActiveRoles
&<Common request parameters>
```

Sample success responses

`XML` format

```
<redirect>false</redirect>
<cost>1000</cost>

}
```

1.1.2.3.4. Users

1.1.2.3.4.1. AddUser

Creates a user.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	AddUser	The operation that you want to perform. Set the value to AddUser.
CellphoneNum	String	Yes	10000000000	The mobile number of the user.

Parameter	Type	Required	Example	Description
DisplayName	String	Yes	testuser	The display name of the user.
Email	String	Yes	a@a.com	The email address of the user.
LoginName	String	Yes	testu	The logon name of the user.
LoginPolicyId	Integer	Yes	1	The ID of the logon policy.
MobileNationCode	String	Yes	86	The country code.
OrganizationId	Integer	Yes	5	The ID of the organization.
roleIdList	Json	No	{"RoleIdList": ["5", "6", "8"]}	The list of role IDs.
OrganizationUuid	String	No	1223	The UUID of the organization.
TelephoneNum	String	No	00000000	The telephone number.
DingTalkToken	String	No	12345abc	The DingTalk token.
EnableDingTalk	Boolean	No	false	Specifies whether to use DingTalk to send notifications.
EnableShortMessage	Boolean	No	false	Specifies whether to use SMS to send notifications.
EnableEmail	Boolean	No	false	Specifies whether to use emails to send notifications.
MultiCloudStatus	String	No	master	Specifies whether the user is a multi-cloud user. Valid values: master and slave. master indicates a primary-cloud user. slave indicates a secondary-cloud user.

Response parameters

Parameter	Type	Example	Description
code	String	200	The HTTP status code.
cost	Integer	1000	The amount of time taken to perform the operation.
data	Struct		The response.
accessKeys	Array of accessKey		The list of AccessKey pairs.
accesskeyId	String	JGdgSN2pVYahtrd7	The AccessKey ID of the user.
ctime	Long	1606675230000	The time when the AccessKey pair was created.
id	Integer	1	The ID of the AccessKey pair.
region	String	cn-qingdao-env17-d01	The region where the AccessKey pair is available.
status	String	ACTIVE	Indicates whether the AccessKey pair is valid. Valid values: active and inactive.
cellphoneNum	String	00000000000	The mobile number of the user.
default	Boolean	false	Indicates whether the role is a preset role.
deleted	Boolean	false	Indicates whether the user is deleted.
displayName	String	test	The display name of the user.
email	String	test@163.com	The email address of the user.
enableDingTalk	Boolean	false	Indicates whether to use DingTalk to send notifications.
enableEmail	Boolean	false	Indicates whether to use emails to send notifications.

Parameter	Type	Example	Description
enableShortMessage	Boolean	false	Indicates whether to use SMS to send notifications.
id	Integer	1	The ID of the user.
loginName	String	test	The logon name of the user.
loginPolicy	Struct		The logon policy.
cuserId	String	admin	The user who created the logon policy.
default	Boolean	true	Indicates whether the logon policy is the default one.
enable	Boolean	true	Indicates whether the logon policy is valid.
id	Integer	1	The ID of the logon policy.
ipRanges	Array of ipRange		The list of CIDR blocks.
ipRange	String	0.0.0.0/0	The CIDR block.
loginPolicyId	Integer	1	The ID of the logon policy.
protocol	String	IPV4	The protocol.
lpId	String	111	The ID of the logon policy.
muserId	String	admin	The user who created the logon policy.
name	String	deafult.loginpolicy	The name of the logon policy.

Parameter	Type	Example	Description
organizationVisibility	String	organizationVisibility.global	The sharing scope of the logon policy. Valid values: • organizationVisibility.global: The logon policy is globally shared. • organizationVisibility.organization: The logon policy is shared within the same organization. • organizationVisibility.orgAndSubOrgs: The logon policy is shared to subordinate organizations.
ownerOrganizationId	Integer	1	The ID of the organization.
rule	String	ALLOW	The rule of the logon policy. Valid values: Allow and Deny.
timeRanges	Array of timeRange		The list of time ranges.
endTime	String	24:00	The end of the time range for the query.
loginPolicyId	Integer	1	The ID of the logon policy.
startTime	String	00:00	The beginning of the time range for the query.
parentPk	String	1689406703302188	The primary key of the Apsara Stack tenant account.
primaryKey	String	212530506704030466	The primary key of the Resource Access Management (RAM) user.
roles	Array of role		The list of roles.
active	Boolean	true	Indicates whether the role is valid.
arId	String	111	The ID of the role.
code	String	ROLE_RESOURCE_USER	The code of the role.

Parameter	Type	Example	Description
cuserId	String	admin	The user who created the role.
default	Boolean	true	Indicates whether the role is a preset role.
description	String	test	The description of the role.
enable	Boolean	true	Indicates whether the role is valid.
id	Integer	1	The ID of the role.
muserId	String	admin	The user who modified the role.
organizationVisibility	String	organizationVisibility.global	The sharing scope of the role. Valid values: • organizationVisibility.global: The role is globally shared. • organizationVisibility.organization: The role is shared within the same organization. • organizationVisibility.orgAndSubOrgs: The role is shared to subordinate organizations.
ownerOrganizationId	Integer	1	The ID of the organization.
rAMRole	Boolean	false	Indicates whether the role is a RAM role.
roleLevel	Integer	11321	The level of the role.
roleName	String	role_test	The name of the role.

Parameter	Type	Example	Description
roleRange	String	roleRange.orgAndSubOrgs	The permissions of the role. Valid values: • roleRange.allOrganizations: The role has permissions on all organizations. • roleRange.orgAndSubOrgs: The role has permissions on the organization and its subordinate organizations. • roleRange.resourceSet: The role has permissions on the resource set. • roleRange.userGroup: The role has permissions on the user group to which the RAM role belongs.
roleType	String	ROLETYPE_ASCM	The type of the role. Valid values: ROLETYPE_RAM and ROLETYPE_ASCM. ROLETYPE_RAM indicates a RAM role. ROLETYPE_ASCM indicates a custom role.
status	String	ACTIVE	The status of the user. Valid values: active and inactive.
userGroupRoles	Array of userGroupRole		The list of roles of the user group.
active	Boolean	true	Indicates whether the role is valid.
arId	String	111	The ID of the role.
code	String	ROLE_RESOURCE_USER	The code of the role.
cuserId	String	admin	The user who created the role.
default	Boolean	true	Indicates whether the role is a preset role.
description	String	role_test	The description of the role.
enable	Boolean	true	Indicates whether the role is valid.
id	Integer	1	The ID of the role.
muserId	String	admin	The user who modified the role.

Parameter	Type	Example	Description
organizationVisibility	String	organizationVisibility.global	The sharing scope of the role. Valid values: • organizationVisibility.global: The role is globally shared. • organizationVisibility.organization: The role is shared within the same organization. • organizationVisibility.orgAndSubOrgs: The role is shared to subordinate organizations.
ownerOrganizationId	Integer	1	The ID of the organization.
rAMRole	Boolean	false	Indicates whether the role is a RAM role.
roleLevel	Integer	11321	The level of the role.
roleName	String	role_test	The name of the role.
roleRange	String	roleRange.orgAndSubOrgs	The permissions of the role. Valid values: • roleRange.allOrganizations: The role has permissions on all organizations. • roleRange.orgAndSubOrgs: The role has permissions on the organization and its subordinate organizations. • roleRange.resourceSet: The role has permissions on the resource set. • roleRange.userGroup: The role has permissions on the user group to which the RAM role belongs.
roleType	String	ROLETYPE_ASCM	The type of the role. Valid values: ROLETYPE_RAM and ROLETYPE_ASCM. ROLETYPE_RAM indicates a RAM role. ROLETYPE_ASCM indicates a custom role.
userGroups	Array of userGroup		The list of user groups.
augId	String	11213	The ID of the user group.

Parameter	Type	Example	Description
createTimeStamp	Long	1606791494471	The time when the user group was created.
groupName	String	ack-user-old	The name of the user group.
id	Integer	1	The ID of the user group.
organization	Struct		The information of the organization.
alias	String	test	The alias of the organization.
ctime	Long	1606791494471	The time when the organization was created.
cuserId	String	admin	The user who created the organization.
id	Integer	1	The ID of the organization.
internal	Boolean	false	Indicates whether the organization is a preset organization.
level	String	0.1	The level of the organization.
mtime	Long	1606791494471	The time when the organization was modified.
multiCloudStatus	String	master	Indicates whether the organization is a multi-cloud organization. Valid values: master and slave. master indicates a primary-cloud organization. slave indicates a secondary-cloud organization.
muserId	String	admin	The user who modified the organization.
name	String	test	The name of the organization.
parentId	Integer	0	The ID of the parent organization.

Parameter	Type	Example	Description
supportRegionList	List	["cn-qingdao-env17-d01"]	The list of regions.
supportRegions	String	cn-qingdao-env17-d01	The list of regions.
uuid	String	1231	The UUID of the organization.
organizationId	Integer	1	The ID of the organization.
resourceSets	Array of resourceSet		The list of resource sets.
creator	String	admin	The creator of the resource set.
gmtCreated	Long	1606791494471	The time when the resource set was created.
id	Integer	1	The ID of the resource set.
organizationID	Integer	1	The ID of the organization.
resourceGroupName	String	res_test	The name of the resource set.
rsId	String	12312a	The ID of the resource set.
roles	Array of role		The list of roles.
active	Boolean	true	Indicates whether the role is valid.
arId	String	1231	The ID of the role.
code	String	ROLE_RESOURCE_USER	The code of the role.
cuserId	String	admin	The user who created the role.
default	Boolean	true	Indicates whether the role is a preset role.

Parameter	Type	Example	Description
description	String	role_test	The description of the role.
enable	Boolean	true	Indicates whether the role is valid.
id	Integer	1	The ID of the role.
muserId	String	admin	The user who modified the role.
organizationVisibility	String	organizationVisibility.global	The sharing scope of the role. Valid values: • organizationVisibility.global: The role is globally shared. • organizationVisibility.organization: The role is shared within the same organization. • organizationVisibility.orgAndSubOrgs: The role is shared to subordinate organizations.
ownerOrganizationId	Integer	1	The ID of the organization.
rAMRole	Boolean	false	Indicates whether the role is a RAM role.
roleLevel	Integer	1231	The level of the role.
roleName	String	defaultRole.resourceUser.name	The name of the role.
roleRange	String	roleRange.orgAndSubOrgs	The permissions of the role. Valid values: • roleRange.allOrganizations: The role has permissions on all organizations. • roleRange.orgAndSubOrgs: The role has permissions on the organization and its subordinate organizations. • roleRange.resourceSet: The role has permissions on the resource set. • roleRange.userGroup: The role has permissions on the user group to which the RAM role belongs.

Parameter	Type	Example	Description
roleType	String	ROLETYPE_ASCM	The type of the role. Valid values: ROLETYPE_RAM and ROLETYPE_ASCM. ROLETYPE_RAM indicates a RAM role. ROLETYPE_ASCM indicates a custom role.
users	Array of user		The list of users.
accountType	Integer	1	The type of the account. This parameter is discarded and is not processed in the code. The default value is used.
active	Boolean	true	Indicates whether the user is valid.
aliyunUser	Boolean	false	Indicates whether the account is an Apsara Stack tenant account.
backendAccountType	String	RamUser	The type of the account. Valid values: • AscmUser: the user who is visible to customers in the Apsara Uni-manager Management Console • AliyunUser: the Apsara Stack tenant account • RamUser: the RAM user
cellphoneNum	String	00000000000	The mobile number of the user.
ctime	Long	1606791494471	The time when the user was created.
default	Boolean	false	Indicates whether the user is a preset user.
defaultRoleId	Integer	1	The ID of the default role.
deleted	Boolean	false	Indicates whether the user is deleted.
email	String	test@163.com	The email address of the user.
enableDingTalk	Boolean	false	Indicates whether to use DingTalk to send notifications.

Parameter	Type	Example	Description
enableEmail	Boolean	false	Indicates whether to use emails to send notifications.
enableShortMessage	Boolean	false	Indicates whether to use SMS to send notifications.
id	Integer	1	The ID of the user.
loginName	String	test	The logon name of the user.
loginTime	Long	1606791494471	The time when the user logged on.
mobileNationCode	String	86	The country code.
mtime	Long	1606791494471	The time when the user was modified.
muserId	String	admin	The one who calls the operation to modify the user.
organizationId	Integer	1	The ID of the organization.
password	String	H2xWNY8oitAhxMWLhtyjsO1fRkYoCRcErAgP9Hd0IXp2f5rRSmArS	The password of the user.
ramUser	Boolean	true	Indicates whether the account is a RAM user.
userLoginCtrlId	Integer	34	The ID of the logon control.
username	String	test	The display name of the user.
userRoles	Array of userRole		The list of roles of the user.
active	Boolean	true	Indicates whether the role is valid.
arId	String	1121	The ID of the role.

Parameter	Type	Example	Description
code	String	ROLE_RESOURCE_USER	The code of the role.
cuserId	String	admin	The user who created the role.
default	Boolean	true	Indicates whether the role is a preset role.
description	String	role_test	The description of the role.
enable	Boolean	true	Indicates whether the role is valid.
id	Integer	1	The ID of the role.
muserId	String	admin	The user who modified the role.
organizationVisibility	String	defaultRole.resourceUser.description	The sharing scope of the role. Valid values: • organizationVisibility.global: The role is globally shared. • organizationVisibility.organization: The role is shared within the same organization. • organizationVisibility.orgAndSubOrgs: The role is shared to subordinate organizations.
ownerOrganizationId	Integer	1	The ID of the organization.
rAMRole	Boolean	false	Indicates whether the role is a RAM role.
roleLevel	Integer	1123	The level of the role.
roleName	String	defaultRole.resourceUser.name	The name of the role.

Parameter	Type	Example	Description
roleRange	String	roleRange.orgAndSubOrgs	The permissions of the role. Valid values: • roleRange.allOrganizations: The role has permissions on all organizations. • roleRange.orgAndSubOrgs: The role has permissions on the organization and its subordinate organizations. • roleRange.resourceSet: The role has permissions on the resource set. • roleRange.userGroup: The role has permissions on the user group to which the RAM role belongs.
roleType	String	ROLETYPE_ASCM	The type of the role. Valid values: ROLETYPE_RAM and ROLETYPE_ASCM. ROLETYPE_RAM indicates a RAM role. ROLETYPE_ASCM indicates a custom role.
message	String	success	The error message.
pureListData	Boolean	false	Indicates whether only data is returned and other parameters are not returned.
redirect	Boolean	false	Indicates whether redirections are performed.
success	Boolean	true	Indicates whether the call is successful.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=AddUser
&CellphoneNum=10000000000
&DisplayName=testuser
&Email=a@a.com
&LoginName=testu
&LoginPolicyId=1
&MobileNationCode=86
&OrganizationId=5
&<Common request parameters>
```

Sample success responses

`XML` format

```
<redirect>false</redirect>
```

```

1.1.2.3.4.2. AddRoleToUser

Binds a role to a user.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	AddRoleToUser	The operation that you want to perform. Set the value to AddRoleToUser.
LoginName	String	Yes	test	The logon name of the user.
RoleId	Integer	Yes	3	The ID of the role.

Response parameters

Parameter	Type	Example	Description
code	String	200	The HTTP status code.
cost	Integer	1000	The amount of time taken to perform the operation.
message	String	success	The error message.
pureListData	Boolean	false	Indicates whether only data is returned and other parameters are not returned.
redirect	Boolean	false	Indicates whether redirections are performed.
success	Boolean	true	Indicates whether the call is successful.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=AddRoleToUser
&LoginName=test
&RoleId=3
&<Common request parameters>
```

Sample success responses

`XML` format

```
<redirect>false</redirect>
<cost>1000</cost>
<code>200</code>
<success>true</success>
<pureListData>false</pureListData>
<message>success</message>
```

`JSON` format

```
{
    "redirect": "false",
    "cost": "1000",
    "code": "200",
    "success": "true",
    "pureListData": "false",
    "message": "success"
}
```

1.1.2.3.4.3. ResetPasswordByLoginName

Resets the password of a user.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ResetPasswordByLoginName	The operation that you want to perform. Set the value to ResetPasswordByLoginName.
LoginName	String	Yes	testu	The logon name of the user.

Response parameters

Parameter	Type	Example	Description
code	String	200	The HTTP status code.

Parameter	Type	Example	Description
cost	Integer	1000	The amount of time taken to perform the operation.
message	String	sucess	The error message.
pureListData	Boolean	false	Indicates whether only data is returned and other parameters are not returned.
redirect	Boolean	false	Indicates whether redirections are performed.
success	Boolean	true	Indicates whether the call is successful.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ResetPasswordByLoginName
&LoginName=testu
&<Common request parameters>
```

Sample success responses

`XML` format

```
<redirect>false</redirect>
<cost>1000</cost>
<code>200</code>
<success>true</success>
<pureListData>false</pureListData>
<message>sucess</message>
```

`JSON` format

```
{
    "redirect": "false",
    "cost": "1000",
    "code": "200",
    "success": "true",
    "pureListData": "false",
    "message": "sucess"
}
```

1.1.2.3.4.4. GetLoginPolicyByLoginName

Queries the logon policy that is bound to a user.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	GetLoginPolicyByLoginName	The operation that you want to perform. Set the value to GetLoginPolicyByLoginName.
LoginName	String	Yes	testu	The logon name of the user.

Response parameters

Parameter	Type	Example	Description
code	String	200	The HTTP status code.
cost	Integer	1000	The amount of time taken to perform the operation.
data	Struct		The response.
cuserId	String	admin	The creator of the logon policy.
default	Boolean	true	Indicates whether the logon policy is the default one.
enable	Boolean	true	Indicates whether the logon policy is valid.
id	Integer	1	The ID of the logon policy.
ipRanges	Array of ipRange		The list of CIDR blocks.
ipRange	String	0.0.0.0/0	The CIDR block.
loginPolicyId	Integer	1	The ID of the logon policy.
protocol	String	IPV4	The protocol.

Parameter	Type	Example	Description
lpId	String	111	The ID of the logon policy.
muserId	String	admin	The user who modified the logon policy.
name	String	defaultLoginPolicy.name	The name of the logon policy.
organizationVisibility	String	organizationVisibility.global	The sharing scope of the logon policy. Valid values: • organizationVisibility.global: The logon policy is globally shared. • organizationVisibility.organization: The logon policy is shared within the same organization. • organizationVisibility.orgAndSubOrgs: The logon policy is shared to subordinate organizations.
ownerOrganizationId	Integer	1	The ID of the organization.
rule	String	ALLOW	The rule of the logon policy. Valid values: Allow and Deny.
timeRanges	Array of timeRange		The list of time ranges.
endTime	String	24:00	The end of the time range for the query.
loginPolicyId	Integer	1	The ID of the logon policy.
startTime	String	00:00	The beginning of the time range for query.
message	String	success	The error message.
pureListData	Boolean	false	Indicates whether only data is returned and other parameters are not returned.
redirect	Boolean	false	Indicates whether redirections are performed.

Parameter	Type	Example	Description
success	Boolean	true	Indicates whether the call is successful.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=GetLoginPolicyByLoginName
&LoginName=testu
&<Common request parameters>
```

Sample success responses

`XML` format

```
<redirect>false</redirect>
<cost>1000</cost>
<code>200</code>
<data>
    <ipRanges>
        <ipRange>0.0.0.0/0</ipRange>
        <protocol>IPV4</protocol>
        <loginPolicyId>1</loginPolicyId>
    </ipRanges>
    <muserId>admin</muserId>
    <default>true</default>
    <ownerOrganizationId>1</ownerOrganizationId>
    <timeRanges>
        <startTime>00:00</startTime>
        <loginPolicyId>1</loginPolicyId>
        <endTime>24:00</endTime>
    </timeRanges>
    <enable>true</enable>
    <name>defaultLoginPolicy.name</name>
    <rule>ALLOW</rule>
    <id>1</id>
    <organizationVisibility>organizationVisibility.global</organizationVisibility>
    <lpId>111</lpId>
    <cuserId>admin</cuserId>
</data>
<success>true</success>
<pureListData>false</pureListData>
<message>success</message>
```

`JSON` format

```
{
    "redirect": "false",
    "cost": "1000",
    "code": "200",
    "data": {
        "ipRanges": [
            {
                "ipRange": "0.0.0.0/0",
                "protocol": "IPV4",
                "loginPolicyId": "1"
            }
        ],
        "muserId": "admin",
        "default": "true",
        "ownerOrganizationId": "1",
        "timeRanges": [
            {
                "startTime": "00:00",
                "loginPolicyId": "1",
                "endTime": "24:00"
            }
        ],
        "enable": "true",
        "name": "defaultLoginPolicy.name",
        "rule": "ALLOW",
        "id": "1",
        "organizationVisibility": "organizationVisibility.global",
        "lpId": "111",
        "cuserId": "admin"
    },
    "success": "true",
    "pureListData": "false",
    "message": "success"
}
```

1.1.2.3.4.5. UpdatePassword

Modifies a password.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	UpdatePassword	The operation that you want to perform. Set the value to UpdatePassword.

Parameter	Type	Required	Example	Description
NewPassword	String	Yes	QAZ2wsx	The new password. The password must comply with the password policy specified by the administrator in the Apsara Uni-manager Operations Console.
OldPassword	String	Yes	#EDC4rfv	The current password.

Response parameters

Parameter	Type	Example	Description
code	String	200	The HTTP status code.
cost	Integer	1000	The amount of time taken to perform the operation.
message	String	success	The error message.
pureListData	Boolean	false	Indicates whether only data is returned and other parameters are not returned.
redirect	Boolean	false	Indicates whether redirections are performed.
success	Boolean	true	Indicates whether the call is successful.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=UpdatePassword
&NewPassword=QAZ2wsx
&OldPassword=#EDC4rfv
&<Common request parameters>
```

Sample success responses

`XML` format

```
<redirect>false</redirect>
<cost>1000</cost>
<code>200</code>
<success>true</success>
<pureListData>false</pureListData>
<message>success</message>
```

`JSON` format

```
{
    "redirect": "false",
    "cost": "1000",
    "code": "200",
    "success": "true",
    "pureListData": "false",
    "message": "success"
}
```

1.1.2.3.4.6. RemoveUserByLoginName

Deletes a user.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	RemoveUserByLoginName	The operation that you want to perform. Set the value to RemoveUserByLoginName.
LoginName	String	Yes	testu	The logon name of the user.
MultiCloudStatus	String	No	master	Specifies whether the user is a multi-cloud user. Valid values: master and slave. master indicates a primary-cloud user. slave indicates a secondary-cloud user.

Response parameters

Parameter	Type	Example	Description
code	String	200	The HTTP status code.
cost	Integer	1000	The amount of time taken to perform the operation.

Parameter	Type	Example	Description
message	String	success	The error message.
pureListData	Boolean	false	Indicates whether only data is returned and other parameters are not returned.
redirect	Boolean	false	Indicates whether redirections are performed.
success	Boolean	true	Indicates whether the call is successful.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=RemoveUserByLoginName
&LoginName=testu
&<Common request parameters>
```

Sample success responses

`XML` format

```
<redirect>false</redirect>
<cost>1000</cost>
<code>200</code>
<success>true</success>
<pureListData>false</pureListData>
<message>success</message>
```

`JSON` format

```
{
    "redirect": "false",
    "cost": "1000",
    "code": "200",
    "success": "true",
    "pureListData": "false",
    "message": "success"
}
```

1.1.2.3.4.7. GetUserInfo

Queries the information of a user.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	GetUserInfo	The operation that you want to perform. Set the value to GetUserInfo.
LoginName	String	No	testu	The logon name of the user.
UserAccessKeyId	String	No	test	The AccessKey ID of the user.
Pk	String	No	279319888999990000	The primary key of the user.

Response parameters

Parameter	Type	Example	Description
code	String	200	The HTTP status code.
cost	Integer	1000	The amount of time taken to perform the operation.
data	Struct		The response.
accessKeys	Array of accessKey		The list of AccessKey pairs.
accesskeyId	String	JGdgSN2pVYahtrd7	The AccessKey ID.
accesskeySecret	String	JGdgSN2pVYahtrd7$123	The AccessKey secret.
ctime	Long	1606675230000	The time when the AccessKey pair was created.
cuserId	String	1	The user who created the AccessKey pair.
id	Integer	1	The ID of the AccessKey pair.
region	String	cn-qingdao-env17-d01	The region where the AccessKey pair is available.

Parameter	Type	Example	Description
status	String	ACTIVE	Indicates whether the AccessKey pair is valid. Valid values: active and inactive.
cellphoneNum	String	00000000000	The mobile number of the user.
default	Boolean	false	Indicates whether the role is a preset role.
defaultRole	Struct		The default role.
active	Boolean	true	Indicates whether the role is valid.
arId	String	111	The ID of the role.
code	String	ROLE_RESOURCE_USER	The code of the role.
cuserId	String	admin	The user who created the role.
default	Boolean	true	Indicates whether the role is a preset role.
description	String	test	The description of the role.
enable	Boolean	true	Indicates whether the role is valid.
id	Integer	1	The ID of the role.
muserId	String	admin	The user who modified the role.
organizationVisibility	String	organizationVisibility.global	The sharing scope of the role. Valid values: • organizationVisibility.global: The role is globally shared. • organizationVisibility.organization: The role is shared within the same organization. • organizationVisibility.orgAndSubOrgs: The role is shared to subordinate organizations.

Parameter	Type	Example	Description
ownerOrganizationId	Integer	1	The ID of the organization.
rAMRole	Boolean	false	Indicates whether the role is a Resource Access Management (RAM) role.
roleLevel	Integer	11123	The level of the role.
roleName	String	role_test	The name of the role.
roleRange	String	roleRange.orgAndSubOrgs	The permissions of the role. Valid values: • roleRange.allOrganizations: The role has permissions on all organizations. • roleRange.orgAndSubOrgs: The role has permissions on the organization and its subordinate organizations. • roleRange.resourceSet: The role has permissions on the resource set. • roleRange.userGroup: The role has permissions on the user group to which the RAM role belongs.
roleType	String	ROLETYPE_ASCM	The type of the role. Valid values: ROLETYPE_RAM and ROLETYPE_ASCM. ROLETYPE_RAM indicates a RAM role. ROLETYPE_ASCM indicates a custom role.
deleted	Boolean	false	Indicates whether the user is deleted.
displayName	String	test	The display name of the user.
email	String	test@163.com	The email address of the user.
enableDingTalk	Boolean	false	Indicates whether notifications are sent by DingTalk.
enableEmail	Boolean	false	Indicates whether notifications are sent by email.

Parameter	Type	Example	Description
enableShortMessage	Boolean	false	Indicates whether notifications are sent by SMS.
id	Integer	1	The ID of the user.
lastLoginTime	Long	1132111	The most recent logon time.
loginName	String	test	The logon name of the user.
loginPolicy	Struct		The logon policy.
cuserId	String	admin	The user who created the logon policy.
default	Boolean	true	Indicates whether the logon policy is the default one.
enable	Boolean	true	Indicates whether the logon policy is valid.
id	Integer	1	The ID of the logon policy.
ipRanges	Array of ipRange		The list of CIDR blocks.
ipRange	String	0.0.0.0/0	The CIDR block.
loginPolicyId	Integer	1	The ID of the logon policy.
protocol	String	IPV4	The protocol.
lpId	String	111	The ID of the logon policy.
muserId	String	admin	The user who modified the logon policy.
name	String	default.loginpolicy	The name of the logon policy.

Parameter	Type	Example	Description
organizationVisibility	String	organizationVisibility.global	The sharing scope of the logon policy. Valid values: • organizationVisibility.global: The logon policy is globally shared. • organizationVisibility.organization: The logon policy is shared within the same organization. • organizationVisibility.orgAndSubOrgs: The logon policy is shared to subordinate organizations.
ownerOrganizationId	Integer	1	The ID of the organization.
rule	String	ALLOW	The rule of the logon policy. Valid values: Allow and Deny.
timeRanges	Array of timeRange		The list of time ranges.
endTime	String	24:00	The end of the time range for the query.
loginPolicyId	Integer	1	The ID of the logon policy.
startTime	String	00:00	The start of the time range for the query.
mobileNationCode	String	86	The country code.
organization	Struct		The information of the organization.
alias	String	test	The alias of the organization.
ctime	Long	1622311	The time when the organization was created.
cuserId	String	admin	The user who created the organization.
id	Integer	1	The ID of the organization.

Parameter	Type	Example	Description
internal	Boolean	false	Indicates whether the organization is a preset organization.
level	String	0.1	The level of the organization.
mtime	Long	15123222	The time when the organization was modified.
multiCloudStatus	String	master	Indicates whether the organization is a multi-cloud organization. Valid values: master and slave. master indicates a primary-cloud organization. slave indicates a secondary-cloud organization.
muserId	String	admin	The modifier.
name	String	test	The name of the organization.
parentId	Integer	0	The ID of the parent organization.
supportRegionList	List	["cn-qingdao-env17-d01"]	The list of regions.
supportRegions	String	cn-qingdao-env17-d01	The list of regions.
uuid	String	123331	The universally unique identifier (UUID) of the organization.
parentPk	String	1689406703302188	The primary key of the Apsara Stack tenant account.
primaryKey	String	212530506704030466	The primary key of the RAM user.
roles	Array of role		The list of roles.
active	Boolean	true	Indicates whether the role is valid.

Parameter	Type	Example	Description
arId	String	111	The ID of the role.
code	String	ROLE_RESOURCE_USER	The code of the role.
cuserId	String	admin	The user who created the role.
default	Boolean	true	Indicates whether the role is a preset role.
description	String	test	The description of the role.
enable	Boolean	true	Indicates whether the role is valid.
id	Integer	1	The ID of the role.
muserId	String	admin	The user who modified the role.
organizationVisibility	String	organizationVisibility.global	The sharing scope of the role. Valid values: • organizationVisibility.global: The role is globally shared. • organizationVisibility.organization: The role is shared within the same organization. • organizationVisibility.orgAndSubOrgs: The role is shared to subordinate organizations.
ownerOrganizationId	Integer	1	The ID of the organization.
rAMRole	Boolean	false	Indicates whether the role is a RAM role.
roleLevel	Integer	11321	The level of the role.
roleName	String	role_test	The name of the role.

Parameter	Type	Example	Description
roleRange	String	roleRange.orgAndSubOrgs	The permissions of the role. Valid values: • roleRange.allOrganizations: The role has permissions on all organizations. • roleRange.orgAndSubOrgs: The role has permissions on the organization and its subordinate organizations. • roleRange.resourceSet: The role has permissions on the resource set. • roleRange.userGroup: The role has permissions on the user group to which the RAM role belongs.
roleType	String	ROLETYPE_ASCM	The type of the role. Valid values: ROLETYPE_RAM and ROLETYPE_ASCM. ROLETYPE_RAM indicates a RAM role. ROLETYPE_ASCM indicates a custom role.
status	String	ACTIVE	The status of the user. Valid values: active and inactive.
userGroupRoles	Array of userGroupRole		The list of roles of the user group.
active	Boolean	true	Indicates whether the role is valid.
arId	String	111	The ID of the role.
code	String	ROLE_RESOURCE_USER	The code of the role.
cuserId	String	admin	The user who created the role.
default	Boolean	true	Indicates whether the role is a preset role.
description	String	role_test	The description of the role.
enable	Boolean	true	Indicates whether the role is valid.
id	Integer	1	The ID of the role.
muserId	String	admin	The user who modified the role.

Parameter	Type	Example	Description
organizationVisibility	String	organizationVisibility.global	The sharing scope of the role. Valid values: • organizationVisibility.global: The role is globally shared. • organizationVisibility.organization: The role is shared within the same organization. • organizationVisibility.orgAndSubOrgs: The role is shared to subordinate organizations.
ownerOrganizationId	Integer	1	The ID of the organization.
rAMRole	Boolean	false	Indicates whether the role is a RAM role.
roleLevel	Integer	11321	The level of the role.
roleName	String	role_test	The name of the role.
roleRange	String	roleRange.orgAndSubOrgs	The permissions of the role. Valid values: • roleRange.allOrganizations: The role has permissions on all organizations. • roleRange.orgAndSubOrgs: The role has permissions on the organization and its subordinate organizations. • roleRange.resourceSet: The role has permissions on the resource set. • roleRange.userGroup: The role has permissions on the user group to which the RAM role belongs.
roleType	String	ROLETYPE_ASCM	The type of the role. Valid values: ROLETYPE_RAM and ROLETYPE_ASCM. ROLETYPE_RAM indicates a RAM role. ROLETYPE_ASCM indicates a custom role.
userGroups	Array of userGroup		The list of user groups.
augId	String	11213	The ID of the user group.
createTimeStamp	Long	1606791494471	The time when the user group was created.

Parameter	Type	Example	Description
groupName	String	group-test	The name of the user group.
id	Integer	1	The ID of the user group.
organization	Struct		The information of the organization.
alias	String	test	The alias of the organization.
ctime	Long	1606791494471	The time when the organization was created.
cuserId	String	admin	The user who created the organization.
id	Integer	1	The ID of the organization.
internal	Boolean	false	Indicates whether the organization is a preset organization.
level	String	0.1	The level of the organization.
mtime	Long	1606791494471	The time when the organization was modified.
multiCloudStatus	String	master	Indicates whether the organization is a multi-cloud organization. Valid values: master and slave. master indicates a primary-cloud organization. slave indicates a secondary-cloud organization.
muserId	String	admin	The user who modified the organization.
name	String	test	The name of the organization.
parentId	Integer	0	The ID of the parent organization.
supportRegionList	List	["cn-qingdao-env17-d01"]	The list of regions.

Parameter	Type	Example	Description
supportRegions	String	cn-qingdao-env17-d01	The list of regions.
uuid	String	1231	The UUID of the organization.
organizationId	Integer	1	The ID of the organization.
resourceSets	Array of resourceSet		The list of resource sets.
creator	String	admin	The creator of the resource set.
gmtCreated	Long	1606791494471	The time when the storage set was created.
id	Integer	1	The ID of the resource set.
organizationID	Integer	1	The ID of the organization.
resourceGroupName	String	res_test	The name of the resource set.
rsId	String	123121a	The ID of the resource set.
roles	Array of role		The list of roles.
active	Boolean	true	Indicates whether the role is valid.
arId	String	1231	The ID of the role.
code	String	ROLE_RESOURCE_USER	The code of the role.
cuserId	String	admin	The user who created the role.
default	Boolean	true	Indicates whether the role is a preset role.
description	String	role_test	The description of the role.

Parameter	Type	Example	Description
enable	Boolean	true	Indicates whether the role is valid.
id	Integer	1	The ID of the role.
muserId	String	admin	The user who modified the role.
organizationVisibility	String	organizationVisibility.global	The sharing scope of the role. Valid values: • organizationVisibility.global: The role is globally shared. • organizationVisibility.organization: The role is shared within the same organization. • organizationVisibility.orgAndSubOrgs: The role is shared to subordinate organizations.
ownerOrganizationId	Integer	1	The ID of the organization.
rAMRole	Boolean	false	Indicates whether the role is a RAM role.
roleLevel	Integer	1231	The level of the role.
roleName	String	role_test	The name of the role.
roleRange	String	roleRange.orgAndSubOrgs	The permissions of the role. Valid values: • roleRange.allOrganizations: The role has permissions on all organizations. • roleRange.orgAndSubOrgs: The role has permissions on the organization and its subordinate organizations. • roleRange.resourceSet: The role has permissions on the resource set. • roleRange.userGroup: The role has permissions on the user group to which the RAM role belongs.

Parameter	Type	Example	Description
roleType	String	ROLETYPE_ASCM	The type of the role. Valid values: ROLETYPE_RAM and ROLETYPE_ASCM. ROLETYPE_RAM indicates a RAM role. ROLETYPE_ASCM indicates a custom role.
users	Array of user		The list of users.
accountType	Integer	1	The type of the account. This parameter is discarded and is not processed in the code. The default value is used.
active	Boolean	true	Indicates whether the user is valid.
aliyunUser	Boolean	false	Indicates whether the account is an Apsara Stack tenant account.
backendAccountType	String	RamUser	The type of the account. Valid values: • AscmUser: the user who is visible to customers in the Apsara Uni-manager Management Console • AliyunUser: the Apsara Stack tenant account • RamUser: the RAM user
cellphoneNum	String	00000000000	The mobile number of the user.
ctime	Long	1606791494471	The time when the user was created.
default	Boolean	false	Indicates whether the role is a preset role.
defaultRoleId	Integer	1	The ID of the default role.
deleted	Boolean	false	Indicates whether the user is deleted.
email	String	test@163.com	The email address of the user.

Parameter	Type	Example	Description
enableDingTalk	Boolean	false	Indicates whether notifications are sent by DingTalk.
enableEmail	Boolean	false	Indicates whether notifications are sent by email.
enableShortMessage	Boolean	false	Indicates whether notifications are sent by SMS.
id	Integer	1	The ID of the user.
loginName	String	test	The logon name of the user.
loginTime	Long	1606791494471	The time when the user logged on.
mobileNationCode	String	86	The country code.
mtime	Long	1606791494471	The time when the user was modified.
muserId	String	admin	The one who calls the operation to modify the user.
organizationId	Integer	1	The ID of the organization.
password	String	H2xWNY8oitAhxMWLhtyjsO1fRkYoCRcErAgP9Hd0IXp2f5rRSmArS	The password of the cluster user.
ramUser	Boolean	true	Indicates whether the account is a RAM user.
userLoginCtrlId	Integer	34	The ID of the logon control.
username	String	test	The display name of the user.
userRoles	Array of userRole		The list of roles of the user.
active	Boolean	true	Indicates whether the role is valid.

Parameter	Type	Example	Description
arId	String	1121	The ID of the role.
code	String	ROLE_RESOURCE_USER	The code of the role.
cuserId	String	admin	The user who created the role.
default	Boolean	true	Indicates whether the role is a preset role.
description	String	role_test	The description of the role.
enable	Boolean	true	Indicates whether the role is valid.
id	Integer	1	The ID of the role.
muserId	String	admin	The user who modified the role.
organizationVisibility	String	defaultRole.resourceUser.description	The sharing scope of the role. Valid values: • organizationVisibility.global: The role is globally shared. • organizationVisibility.organization: The role is shared within the same organization. • organizationVisibility.orgAndSubOrgs: The role is shared to subordinate organizations.
ownerOrganizationId	Integer	1	The ID of the organization.
rAMRole	Boolean	false	Indicates whether the role is a RAM role.
roleLevel	Integer	1123	The level of the role.
roleName	String	defaultRole.resourceUser.name	The name of the role.
roleRange	String	roleRange.orgAndSubOrgs	The permissions of the role.

Parameter	Type	Example	Description
roleType	String	ROLETYPE_ASCM	The type of the role. Valid values: ROLETYPE_RAM and ROLETYPE_ASCM. ROLETYPE_RAM indicates a RAM role. ROLETYPE_ASCM indicates a custom role.
message	String	success	The error message.
pureListData	Boolean	false	Indicates whether only data is returned and other fields are not returned.
redirect	Boolean	false	Indicates whether redirections are performed.
success	Boolean	true	Indicates whether the request is successful.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=GetUserInfo
&<Common request parameters>
```

Sample success responses

1.1.2.3.4.8. ListUsers

Queries the list of available users.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ListUsers	The operation that you want to perform. Set the value to ListUsers.
LoginName	String	No	test	The logon name of the user.
RoleId	Integer	No	2	The ID of the role.
LoginPolicyId	Integer	No	1	The ID of the logon policy.
OrganizationId	Integer	No	3	The ID of the organization.
CurrentPage	Integer	No	1	The number of the page to return.
PageSize	Integer	No	10	The number of entries to return on each page.

Response parameters

Parameter	Type	Example	Description

Parameter	Type	Example	Description
code	String	200	The HTTP status code.
cost	Integer	188	The amount of time taken to perform the operation. Unit: ms.
data	Array of dataItem		The response.
accessKeys	Array of accessKey		The list of AccessKey pairs.
accesskeyId	String	JGdgSN2pVYahtrd7	The AccessKey ID.
ctime	Long	1606675230000	The time when the AccessKey pair was created.
cuserId	String	5013	The user who created the AccessKey pair.
id	Integer	1	The AccessKey ID.
region	String	cn-**-d01	The region where the AccessKey pair is available.
status	String	ACTIVE	Indicates whether the AccessKey pair is valid. Valid values: active and inactive.
cellphoneNum	String	188*****188	The mobile number of the user.
default	Boolean	false	Indicates whether the role is a preset role.
defaultRole	Struct		The default role.
active	Boolean	true	Indicates whether the role is valid.
arId	String	111	The ID of the role.
code	String	ROLE_RESOURCE_USER	The code of the role.

Parameter	Type	Example	Description
default	Boolean	true	Indicates whether the role is a preset role.
description	String	test	The description of the role.
enable	Boolean	true	Indicates whether the role is valid.
id	Integer	1	The ID of the role.
muserId	String	admin	The user who modified the role.
organizationVisibility	String	organizationVisibility.global	The sharing scope of the role. Valid values: • organizationVisibility.global: The role is globally shared. • organizationVisibility.organization: The role is shared within the same organization. • organizationVisibility.orgAndSubOrgs: The role is shared to subordinate organizations.
ownerOrganizationId	Integer	1	The ID of the organization.
rAMRole	Boolean	false	Indicates whether the role is a Resource Access Management (RAM) role.
roleLevel	Integer	1	The level of the role.
roleName	String	role_test	The name of the role.

Parameter	Type	Example	Description
roleRange	String	roleRange.orgAndSubOrgs	The permissions of the role. Valid values: • roleRange.allOrganizations: The role has permissions on all organizations. • roleRange.orgAndSubOrgs: The role has permissions on the organization and its subordinate organizations. • roleRange.resourceSet: The role has permissions on the resource set. • roleRange.userGroup: The role has permissions on the user group to which the RAM role belongs.
roleType	String	ROLETYPE_ASCM	The type of the role. Valid values: ROLETYPE_RAM and ROLETYPE_ASCM. ROLETYPE_RAM indicates a RAM role. ROLETYPE_ASCM indicates a custom role.
deleted	Boolean	false	Indicates whether the user is deleted.
displayName	String	user_test	The display name of the user.
email	String	xxx@alibaba-inc.com	The email address of the user.
enableDingTalk	Boolean	false	Indicates whether to use DingTalk to send notifications.
enableEmail	Boolean	false	Indicates whether to use emails to send notifications.
enableShortMessage	Boolean	false	Indicates whether to use SMS to send notifications.
id	Integer	1	The ID of the user.
lastLoginTime	Long	1606675230000	The most recent logon time.
loginName	String	user_test	The logon name of the user.
loginPolicy	Struct		The logon policy.

Parameter	Type	Example	Description
cuserId	String	admin	The user who created the logon policy.
default	Boolean	false	Indicates whether the logon policy is the default one.
enable	Boolean	true	Indicates whether the logon policy is valid.
id	Integer	1	The ID of the logon policy.
ipRanges	Array of ipRange		The list of CIDR blocks.
ipRange	String	0.0.0.0	The CIDR block.
loginPolicyId	Integer	1	The ID of the logon policy.
protocol	String	IPV4	The protocol.
lpId	String	111	The ID of the logon policy.
muserId	String	admin	The user who modified the logon policy.
name	String	policy_test	The name of the logon policy.
organizationVisibility	String	organizationVisibility.global	The sharing scope of the logon policy. Valid values: • organizationVisibility.global: The logon policy is globally shared. • organizationVisibility.organization: The logon policy is shared within the same organization. • organizationVisibility.orgAndSubOrgs: The role is shared to subordinate organizations.
ownerOrganizationId	Integer	1	The ID of the organization.
rule	String	ALLOW	The rule of the logon policy. Valid values: Allow and Deny.

Parameter	Type	Example	Description
timeRanges	Array of timeRange		The list of time ranges.
endTime	String	24:00	The end of the time range for the query.
loginPolicyId	Integer	1	The ID of the logon policy.
startTime	String	00.00	The start of the time range for the query.
mobileNationCode	String	86	The country code.
organization	Struct		The information of the organization.
alias	String	test	The alias of the organization.
ctime	Long	1607512443989	The time when the organization was created.
cuserId	String	admin	The user who created the organization.
id	Integer	1	The ID of the organization.
internal	Boolean	true	Indicates whether the organization is a preset organization.
level	String	0.1	The level of the organization.
mtime	Long	1606791494471	The time when the organization was modified.
multiCloudStatus	String	master	Indicates whether the organization is a multi-cloud organization. Valid values: master and slave. master indicates a primary-cloud organization. slave indicates a secondary-cloud organization.
muserId	String	admin	The user who modified the organization.

Parameter	Type	Example	Description
name	String	test	The name of the organization.
parentId	Integer	1	The ID of the parent organization.
supportRegionList	List	cn-***-d01	The list of regions.
supportRegions	String	["cn-***-d01"]	The list of regions.
uuid	String	123456	The universally unique identifier (UUID) of the organization.
parentPk	String	1689406703302188	The primary key of the Apsara Stack tenant account.
primaryKey	String	212530506704030466	The primary key of the RAM user.
roles	Array of role		The list of roles.
active	Boolean	true	Indicates whether the role is valid.
arId	String	111	The ID of the role.
code	String	ROLE_RESOURCE_USER	The code of the role.
cuserId	String	admin	The user who created the role.
default	Boolean	true	Indicates whether the role is a preset role.
description	String	test	The description of the role.
enable	Boolean	true	Indicates whether the role is valid.
id	Integer	1	The ID of the role.
muserId	String	admin	The user who modified the role.

Parameter	Type	Example	Description
organizationVisibility	String	organizationVisibility.global	The sharing scope of the role. Valid values: • organizationVisibility.global: The role is globally shared. • organizationVisibility.organization: The role is shared within the same organization. • organizationVisibility.orgAndSubOrgs: The role is shared to subordinate organizations.
ownerOrganizationId	Integer	1	The ID of the organization.
rAMRole	Boolean	false	Indicates whether the role is a RAM role.
roleLevel	Integer	111	The level of the role.
roleName	String	role_test	The name of the role.
roleRange	String	roleRange.orgAndSubOrgs	The permissions of the role. Valid values: • roleRange.allOrganizations: The role has permissions on all organizations. • roleRange.orgAndSubOrgs: The role has permissions on the organization and its subordinate organizations. • roleRange.resourceSet: The role has permissions on the resource set. • roleRange.userGroup: The role has permissions on the user group to which the RAM role belongs.
roleType	String	ROLETYPE_ASCM	The type of the role. Valid values: ROLETYPE_RAM and ROLETYPE_ASCM. ROLETYPE_RAM indicates a RAM role. ROLETYPE_ASCM indicates a custom role.
status	String	ACTIVE	The status of the user. Valid values: active and inactive.
userGroupRoles	Array of userGroupRole		The list of roles of the user group.

Parameter	Type	Example	Description
active	Boolean	true	Indicates whether the role is valid.
arId	String	111	The ID of the role.
code	String	ROLE_RESOURCE_USER	The code of the role.
cuserId	String	admin	The user who created the role.
default	Boolean	true	Indicates whether the role is a preset role.
description	String	test	The description of the role.
enable	Boolean	true	Indicates whether the role is valid.
id	Integer	1	The ID of the role.
muserId	String	admin	The user who modified the role.
organizationVisibility	String	organizationVisibility.global	The sharing scope of the role. Valid values: • organizationVisibility.global: The role is globally shared. • organizationVisibility.organization: The role is shared within the same organization. • organizationVisibility.orgAndSubOrgs: The logon policy is shared to subordinate organizations.
ownerOrganizationId	Integer	1	The ID of the organization.
rAMRole	Boolean	false	Indicates whether the role is a RAM role.
roleLevel	Integer	111	The level of the role.
roleName	String	role_test	The name of the role.

Parameter	Type	Example	Description
roleRange	String	roleRange.orgAndSubOrgs	The permissions of the role. Valid values: • roleRange.allOrganizations: The role has permissions on all organizations. • roleRange.orgAndSubOrgs: The role has permissions on the organization and its subordinate organizations. • roleRange.resourceSet: The role has permissions on the resource set. • roleRange.userGroup: The role has permissions on the user group to which the RAM role belongs.
roleType	String	ROLETYPE_ASCM	The type of the role. Valid values: ROLETYPE_RAM and ROLETYPE_ASCM. ROLETYPE_RAM indicates a RAM role. ROLETYPE_ASCM indicates a custom role.
userGroups	Array of userGroup		The list of user groups.
augId	String	1111	The ID of the user group.
createTimeStamp	Long	1606791494471	The time when the user group was created.
groupName	String	ack-user-old	The name of the user group.
id	Integer	1	The ID of the user group.
organization	Struct		The information of the organization.
alias	String	test	The alias of the organization.
ctime	Long	1606791494471	The time when the organization was created.
cuserId	String	admin	The user who created the organization.
id	Integer	1	The ID of the organization.

Parameter	Type	Example	Description
internal	Boolean	true	Indicates whether the organization is a preset organization.
level	String	123	The level of the organization.
mtime	Long	1606791494471	The time when the organization was modified.
multiCloudStatus	String	master	Indicates whether the organization is a multi-cloud organization. Valid values: master and slave. master indicates a primary-cloud organization. slave indicates a secondary-cloud organization.
muserId	String	admin	The user who modified the organization.
name	String	test	The name of the organization.
parentId	Integer	1	The ID of the parent organization.
supportRegionList	List	cn-**-d01	The list of regions.
supportRegions	String	["cn-**-d01"]	The list of regions.
uuid	String	123456	The UUID of the organization.
organizationId	Integer	1	The ID of the organization.
resourceSets	Array of resourceSet		The list of resource sets.
creator	String	admin	The creator of the resource set.
gmtCreated	Long	1606791494471	The time when the resource set was created.
id	Integer	1	The ID of the resource set.
organizationID	Integer	1	The ID of the organization.

Parameter	Type	Example	Description
resourceGroupName	String	resource_test	The name of the resource set.
rsId	String	123456	The ID of the resource set.
roles	Array of role		The list of roles.
active	Boolean	true	Indicates whether the role is valid.
arId	String	123456	The ID of the role.
code	String	ROLE_RESOURCE_USER	The code of the role.
cuserId	String	admin	The user who created the role.
default	Boolean	true	Indicates whether the role is a preset role.
description	String	test	The description of the role.
enable	Boolean	true	Indicates whether the role is valid.
id	Integer	1	The ID of the role.
muserId	String	admin	The user who modified the role.
organizationVisibility	String	organizationVisibility.global	The sharing scope of the role. Valid values: • organizationVisibility.global: The role is globally shared. • organizationVisibility.organization: The role is shared within the same organization. • organizationVisibility.orgAndSubOrgs: The role is shared to subordinate organizations.
ownerOrganizationId	Integer	1	The ID of the organization.
rAMRole	Boolean	false	Indicates whether the role is a RAM role.

Parameter	Type	Example	Description
roleLevel	Integer	1231	The level of the role.
roleName	String	defaultRole.resourceUser.name	The name of the role.
roleRange	String	roleRange.orgAndSubOrgs	The permissions of the role. Valid values: • roleRange.allOrganizations: The role has permissions on all organizations. • roleRange.orgAndSubOrgs: The role has permissions on the organization and its subordinate organizations. • roleRange.resourceSet: The role has permissions on the resource set. • roleRange.userGroup: The role has permissions on the user group to which the RAM role belongs.
roleType	String	ROLETYPE_ASCM	The type of the role. Valid values: ROLETYPE_RAM and ROLETYPE_ASCM. ROLETYPE_RAM indicates a RAM role. ROLETYPE_ASCM indicates a custom role.
users	Array of user		The list of users.
accountType	Integer	1	The type of the account. This parameter is discarded and is not processed in the code. The default value is used.
active	Boolean	true	Indicates whether the user is valid.
aliyunUser	Boolean	false	Indicates whether the account is an Apsara Stack tenant account.
backendAccountType	String	RamUser	The type of the account. Valid values: • AscmUser: the user who is visible to customers in the Apsara Uni-manager Management Console • AliyunUser: the Apsara Stack tenant account • RamUser: the RAM user
cellphoneNum	String	00000000000	The mobile number of the user.

Parameter	Type	Example	Description
ctime	Long	1606791494471	The time when the user was created.
default	Boolean	true	Indicates whether the user is a preset user.
defaultRoleId	Integer	1	The ID of the default role.
deleted	Boolean	false	Indicates whether the user is deleted.
email	String	xxx@alibaba-inc.com	The email address of the user.
enableDingTalk	Boolean	false	Indicates whether to use DingTalk to send notifications.
enableEmail	Boolean	false	Indicates whether to use emails to send notifications.
enableShortMessage	Boolean	false	Indicates whether to use SMS to send notifications.
id	Integer	1	The ID of the user.
loginName	String	test	The logon name of the user.
loginTime	Long	1606791494471	The time when the user logged on.
mobileNationCode	String	86	The country code.
mtime	Long	1606791494471	The time when the user was modified.
muserId	String	admin	The one who calls the operation to modify the user.
organizationId	Integer	1	The ID of the organization.
password	String	H2xWNY8oitAhxMWLhtyjsO1fRkYoCRcErAgP9Hd0IXp2f5rRSmArS	The password of the user.

Parameter	Type	Example	Description
ramUser	Boolean	true	Indicates whether the account is a RAM user.
userLoginCtrlId	Integer	34	The ID of the logon control.
username	String	test	The display name of the user.
userRoles	Array of userRole		The list of roles of the user.
active	Boolean	true	Indicates whether the role is valid.
arId	String	1111	The ID of the role.
code	String	ROLE_RESOURCE_USER	The code of the role.
cuserId	String	admin	The user who created the role.
default	Boolean	true	Indicates whether the role is a preset role.
description	String	test	The description of the role.
enable	Boolean	true	Indicates whether the role is valid.
id	Integer	1	The ID of the role.
muserId	String	admin	The user who modified the role.
organizationVisibility	String	defaultRole.resourceUser.description	The sharing scope of the role. Valid values: • organizationVisibility.global: The role is globally shared. • organizationVisibility.organization: The role is shared within the same organization. • organizationVisibility.orgAndSubOrgs: The role is shared to subordinate organizations.
ownerOrganizationId	Integer	1	The ID of the organization.

Parameter	Type	Example	Description
rAMRole	Boolean	false	Indicates whether the role is a RAM role.
roleLevel	Integer	123	The level of the role.
roleName	String	defaultRole.resourceUser.name	The name of the role.
roleRange	String	roleRange.orgAndSubOrgs	The permissions of the role. Valid values: • roleRange.allOrganizations: The role has permissions on all organizations. • roleRange.orgAndSubOrgs: The role has permissions on the organization and its subordinate organizations. • roleRange.resourceSet: The role has permissions on the resource set. • roleRange.userGroup: The role has permissions on the user group to which the RAM role belongs.
roleType	String	ROLETYPE_ASCM	The type of the role. Valid values: ROLETYPE_RAM and ROLETYPE_ASCM. ROLETYPE_RAM indicates a RAM role. ROLETYPE_ASCM indicates a custom role.
message	String	success	The error message.
pageInfo	Struct		The page information.
currentPage	Integer	1	The page number of the returned page.
pageSize	Integer	20	The number of entries returned per page.
total	Integer	39	The total number of entries returned.
totalPage	Integer	2	The total number of pages returned.
pureListData	Boolean	false	Indicates whether only data is returned and other parameters are not returned.

Parameter	Type	Example	Description
redirect	Boolean	false	Indicates whether redirections are performed.
success	Boolean	true	Indicates whether the call is successful.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ListUsers
&<Common request parameters>
```

Sample success response

1.1.2.3.4.9. ListDeletedUsers

Queries the list of deleted users.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ListDeletedUsers	The operation that you want to perform. Set the value to ListDeletedUsers.
LoginName	String	No	testu	The logon name of the user.
CurrentPage	Integer	No	1	The number of the page to return.
PageSize	Integer	No	10	The number of entries to return on each page.

Response parameters

Parameter	Type	Example	Description
code	String	200	The HTTP status code.

Parameter	Type	Example	Description
cost	Integer	1000	The amount of time taken to perform the operation.
data	Array of dataItem		The response.
dataItem			
cellphoneNum	String	00000000000	The mobile number of the user.
default	Boolean	false	Indicates whether the user is a preset user.
deleted	Boolean	true	Indicates whether the user is deleted.
displayName	String	test	The display name of the user.
email	String	test@163.com	The email address of the user.
enableDingTalk	Boolean	false	Indicates whether to use DingTalk to send notifications.
enableEmail	Boolean	false	Indicates whether to use emails to send notifications.
enableShortMessage	Boolean	false	Indicates whether to use SMS to send notifications.
id	Integer	1	The ID of the user.
lastLoginTime	Long	1231212	The most recent logon time.
loginName	String	test	The logon name of the user.
mobileNationCode	String	86	The country code.
status	String	ACTIVE	The status of the user. Valid values: active and inactive.

Parameter	Type	Example	Description
message	String	success	The error message.
pageInfo	Struct		The page information.
currentPage	Integer	1	The page number of the returned page.
pageSize	Integer	20	The number of entries returned per page.
total	Integer	2	The total number of entries returned.
totalPage	Integer	39	The total number of pages.
pureListData	Boolean	false	Indicates whether only data is returned and other parameters are not returned.
redirect	Boolean	false	Indicates whether redirections are performed.
success	Boolean	true	Indicates whether the call is successful.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ListDeletedUsers
&<Common request parameters>
```

Sample success responses

`XML` format

```
<redirect>false</redirect>
<cost>1000</cost>
<code>200</code>
<data>
    <cellphoneNum>00000000000</cellphoneNum>
    <enableDingTalk>false</enableDingTalk>
    <displayName>test</displayName>
    <lastLoginTime>1231212</lastLoginTime>
    <default>false</default>
    <deleted>true</deleted>
    <loginName>test</loginName>
    <mobileNationCode>86</mobileNationCode>
    <id>1</id>
    <enableEmail>false</enableEmail>
    <enableShortMessage>false</enableShortMessage>
    <email>test@163.com</email>
    <status>ACTIVE</status>
</data>
<success>true</success>
<pageInfo>
    <total>2</total>
    <totalPage>39</totalPage>
    <pageSize>20</pageSize>
    <currentPage>1</currentPage>
</pageInfo>
<pureListData>false</pureListData>
<message>success</message>
```

`JSON` format

```
{
    "redirect": "false",
    "cost": "1000",
    "code": "200",
    "data": [
        {
            "cellphoneNum": "00000000000",
            "enableDingTalk": "false",
            "displayName": "test",
            "lastLoginTime": "1231212",
            "default": "false",
            "deleted": "true",
            "loginName": "test",
            "mobileNationCode": "86",
            "id": "1",
            "enableEmail": "false",
            "enableShortMessage": "false",
            "email": "test@163.com",
            "status": "ACTIVE"
        }
    ],
    "success": "true",
    "pageInfo": {
        "total": "2",
        "totalPage": "39",
        "pageSize": "20",
        "currentPage": "1"
    },
    "pureListData": "false",
    "message": "success"
}
```

1.1.2.3.4.10. ListResourceGroupByAscmUserId

Queries the list of resource sets of a user.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ListResourceGroupByAscmUserId	The operation that you want to perform. Set the value to ListResourceGroupByAscmUserId.
ascmuser_id	Integer	Yes	5	The ID of the user.

Response parameters

Parameter	Type	Example	Description
code	String	200	The HTTP status code.
cost	Integer	1000	The amount of time taken to perform the operation.
data	Array of dataItem		The response.
creator	String	admin	The creator of the resource set.
gmtCreated	Long	12314	The time when the resource set was created.
gmtModified	Long	12314	The time when the resource set was modified.
id	Integer	1	The ID of the resource set.
organizationID	Integer	1	The ID of the organization.
resourceGroupName	String	test	The name of the resource set.
resourceGroupType	Integer	1	The type of the resource set. 1 indicates the default resource set. If you leave this parameter empty, all the resource sets other than the default one are specified.
rsId	String	rs-123144	The ID of the resource set.
message	String	success	The error message.
pureListData	Boolean	false	Indicates whether only data is returned and other parameters are not returned.
redirect	Boolean	false	Indicates whether redirections are performed.
success	Boolean	true	Indicates whether the call is successful.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ListResourceGroupByAscmUserId
&ascmuser_id=5
&<Common request parameters>
```

Sample success responses

`XML` format

```
<redirect>false</redirect>
<cost>1000</cost>
<code>200</code>
<data>
    <organizationID>1</organizationID>
    <gmtModified>12314</gmtModified>
    <creator>admin</creator>
    <resourceGroupName>test</resourceGroupName>
    <gmtCreated>12314</gmtCreated>
    <rsId>rs-123144</rsId>
    <resourceGroupType>1</resourceGroupType>
    <id>1</id>
</data>
<success>true</success>
<pureListData>false</pureListData>
<message>success</message>
```

`JSON` format

```
{
    "redirect": "false",
    "cost": "1000",
    "code": "200",
    "data": [
        {
            "organizationID": "1",
            "gmtModified": "12314",
            "creator": "admin",
            "resourceGroupName": "test",
            "gmtCreated": "12314",
            "rsId": "rs-123144",
            "resourceGroupType": "1",
            "id": "1"
        }
    ],
    "success": "true",
    "pureListData": "false",
    "message": "success"
}
```

1.1.2.3.4.11. ModifyUserInformation

Modifies the information of a user.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyUserInformation	The operation that you want to perform. Set the value to ModifyUserInformation.
Id	Integer	No	100	The ID of the user.
LoginName	String	No	test	The logon name of the user.
DisplayName	String	No	test	The display name of the user.
LoginPolicyId	Integer	No	100	The ID of the logon policy.
MobileNationCode	String	No	test	The country code.
CellphoneNum	String	No	12345678	The mobile number of the user.
TelephoneNum	String	No	12345678	The landline number of the user.
Email	String	No	est@test.com	The email address of the user.
Description	String	No	test	The description of the user.
DingTalkToken	String	No	abc123	The DingTalk token.
EnableDingTalk	Boolean	No	false	Specifies whether to use DingTalk to send notifications.
EnableShortMessage	Boolean	No	false	Specifies whether to use SMS to send notifications.
EnableEmail	Boolean	No	false	Specifies whether to use emails to send notifications.

Parameter	Type	Required	Example	Description
MultiCloudStatus	String	No	master	Specifies whether the user is a multi-cloud user. Valid values: master and slave. master indicates a primary-cloud user. slave indicates a secondary-cloud user.

Response parameters

Parameter	Type	Example	Description
code	String	200	The HTTP status code.
cost	Integer	1000	The amount of time taken to perform the operation.
data	Struct		The response.
accessKeys	Array of accessKey		The list of AccessKey pairs.
accesskeyId	String	JGdgSN2pVYahtrd7	The AccessKey ID.
ctime	Long	1606675230000	The time when the AccessKey pair was created.
cuserId	String	admin	The user who created the AccessKey pair.
id	Integer	1	The ID of the AccessKey pair.
region	String	cn-qingdao-env17-d01	The region where the AccessKey pair is available.
status	String	ACTIVE	The status of the AccessKey pair. Valid values: active and inactive.
cellphoneNum	String	0000000000	The mobile number of the user.
default	Boolean	false	Indicates whether the role is a preset role.

Parameter	Type	Example	Description
defaultRole	Struct		The default role.
active	Boolean	true	Indicates whether the role is valid.
arId	String	111	The ID of the role.
code	String	ROLE_RESOURCE_USER	The code of the role.
default	Boolean	true	Indicates whether the role is a preset role.
description	String	test	The description of the role.
enable	Boolean	true	Indicates whether the role is valid.
id	Integer	1	The ID of the role.
muserId	String	admin	The user who modified the role.
organizationVisibility	String	organizationVisibility.global	The sharing scope of the role. Valid values: • organizationVisibility.global: The role is globally shared. • organizationVisibility.organization: The role is shared within the same organization. • organizationVisibility.orgAndSubOrgs: The role is shared to subordinate organizations.
ownerOrganizationId	Integer	1	The ID of the organization.
rAMRole	Boolean	false	Indicates whether the role is a Resource Access Management (RAM) role.
roleLevel	Integer	11231	The level of the role.
roleName	String	role_test	The name of the role.

Parameter	Type	Example	Description
roleRange	String	roleRange.orgAndSubOrgs	The permissions of the role. Valid values: • roleRange.allOrganizations: The role has permissions on all organizations. • roleRange.orgAndSubOrgs: The role has permissions on the organization and its subordinate organizations. • roleRange.resourceSet: The role has permissions on the resource set. • roleRange.userGroup: The role has permissions on the user group to which the RAM role belongs.
roleType	String	ROLETYPE_ASCM	The type of the role. Valid values: ROLETYPE_RAM and ROLETYPE_ASCM. ROLETYPE_RAM indicates RAM roles. ROLETYPE_ASCM indicates custom roles.
deleted	Boolean	false	Indicates whether the user is deleted.
displayName	String	test	The display name of the user.
email	String	test@163.com	The email address of the user.
enableDingTalk	Boolean	false	Indicates whether to use DingTalk to send notifications.
enableEmail	Boolean	false	Indicates whether to use emails to send notifications.
enableShortMessage	Boolean	false	Indicates whether to use SMS to send notifications.
id	Integer	1	The ID of the user.
lastLoginTime	Long	1606675230000	The most recent logon time.
loginName	String	test	The logon name of the user.
loginPolicy	Struct		The logon policy.

Parameter	Type	Example	Description
cuserId	String	admin	The user who created the logon policy.
default	Boolean	true	Indicates whether the logon policy is the default one.
enable	Boolean	true	Indicates whether the logon policy is valid.
id	Integer	1	The ID of the logon policy.
ipRanges	Array of ipRange		The list of CIDR blocks.
ipRange	String	0.0.0.0/0	The CIDR block.
loginPolicyId	Integer	1	The ID of the logon policy.
protocol	String	IPV4	The protocol.
lpId	String	11213	The ID of the logon policy.
muserId	String	admin	The user who modified the logon policy.
name	String	default.loginpolicy	The name of the logon policy.
organizationVisibility	String	organizationVisibility.global	The sharing scope of the organization.
ownerOrganizationId	Integer	1	The ID of the organization.
rule	String	ALLOW	The rule of the logon policy. Valid values: Allow and Deny.
timeRanges	Array of timeRange		The list of time ranges.
endTime	String	24:00	The end of the time range for the query.
loginPolicyId	Integer	1	The ID of the logon policy.

Parameter	Type	Example	Description
startTime	String	00:00	The start of the time range for the query.
mobileNationCode	String	86	The country code.
organization	Struct		The information of the organization.
alias	String	test	The alias of the organization.
ctime	Long	1606791494471	The time when the organization was created.
cuserId	String	admin	The user who created the organization.
id	Integer	1	The ID of the organization.
internal	Boolean	false	Indicates whether the organization is a preset organization.
level	String	0.1	The level of the organization.
mtime	Long	1606791494471	The time when the organization was modified.
multiCloudStatus	String	master	Indicates whether the organization is a multi-cloud organization. Valid values: master and slave. master indicates a primary-cloud organization. slave indicates a secondary-cloud organization.
muserId	String	admin	The user who modified the organization.
name	String	test	The name of the organization.
parentId	Integer	0	The ID of the parent organization.
supportRegionList	List	["cn-qingdao-env17-d01"]	The list of regions.

Parameter	Type	Example	Description
supportRegions	String	cn-qingdao-env17-d01	The list of regions.
uuid	String	11231	The universally unique identifier (UUID) of the organization.
parentPk	String	1689406703302188	The primary key of the Apsara Stack tenant account.
primaryKey	String	212530506704030466	The primary key of the RAM user.
roles	Array of role		The list of roles.
active	Boolean	true	Indicates whether the role is valid.
arId	String	11231	The ID of the role.
code	String	ROLE_RESOURCE_USER	The code of the role.
cuserId	String	admin	The user who created the role.
default	Boolean	true	Indicates whether the role is a preset role.
description	String	role_test	The description of the role.
enable	Boolean	true	Indicates whether the role is valid.
id	Integer	1	The ID of the role.
muserId	String	admmin	The user who modified the role.

Parameter	Type	Example	Description
organizationVisibility	String	organizationVisibility.global	The sharing scope of the role. Valid values: • organizationVisibility.global: The role is globally shared. • organizationVisibility.organization: The role is shared within the same organization. • organizationVisibility.orgAndSubOrgs: The role is shared to subordinate organizations.
ownerOrganizationId	Integer	1	The ID of the organization.
rAMRole	Boolean	false	Indicates whether the role is a RAM role.
roleLevel	Integer	11231	The level of the role.
roleName	String	role_test	The name of the role.
roleRange	String	roleRange.orgAndSubOrgs	The permissions of the role. Valid values: • roleRange.allOrganizations: The role has permissions on all organizations. • roleRange.orgAndSubOrgs: The role has permissions on the organization and its subordinate organizations. • roleRange.resourceSet: The role has permissions on the resource set. • roleRange.userGroup: The role has permissions on the user group to which the RAM role belongs.
roleType	String	ROLETYPE_ASCM	The type of the role. Valid values: ROLETYPE_RAM and ROLETYPE_ASCM. ROLETYPE_RAM indicates RAM roles. ROLETYPE_ASCM indicates custom roles.
status	String	ACTIVE	The status of the user. Valid values: active and inactive.
userGroupRoles	Array of userGroupRole		The list of roles of the user group.
active	Boolean	true	Indicates whether the role is valid.

Parameter	Type	Example	Description
arId	String	11231	The ID of the role.
code	String	ROLE_RESOURCE_USER	The code of the role.
cuserId	String	admin	The user who created the role.
default	Boolean	true	Indicates whether the role is a preset role.
description	String	role_test	The description of the role.
enable	Boolean	true	Indicates whether the role is valid.
id	Integer	1	The ID of the role.
muserId	String	admin	The user who modified the role.
organizationVisibility	String	organizationVisibility.global	The sharing scope of the role. Valid values: • organizationVisibility.global: The role is globally shared. • organizationVisibility.organization: The role is shared within the same organization. • organizationVisibility.orgAndSubOrgs: The role is shared to subordinate organizations.
ownerOrganizationId	Integer	1	The ID of the organization.
rAMRole	Boolean	false	Indicates whether the role is a RAM role.
roleLevel	Integer	11231	The level of the role.
roleName	String	role_test	The name of the role.

Parameter	Type	Example	Description
roleRange	String	roleRange.orgAndSubOrgs	The permissions of the role. Valid values: • roleRange.allOrganizations: The role has permissions on all organizations. • roleRange.orgAndSubOrgs: The role has permissions on the organization and its subordinate organizations. • roleRange.resourceSet: The role has permissions on the resource set. • roleRange.userGroup: The role has permissions on the user group to which the RAM role belongs
roleType	String	ROLETYPE_ASCM	The type of the role. Valid values: ROLETYPE_RAM and ROLETYPE_ASCM. ROLETYPE_RAM indicates RAM roles. ROLETYPE_ASCM indicates custom roles.
userGroups	Array of userGroup		The list of user groups.
augId	String	11231	The ID of the user group.
createTimeStamp	Long	1606675230000	The time when the user group was created.
groupName	String	group_test	The name of the user group.
id	Integer	1	The ID of the user group.
organization	Struct		The information of the organization.
alias	String	test	The alias of the organization.
ctime	Long	1606675230000	The time when the organization was created.
cuserId	String	admin	The user who created the organization.
id	Integer	1	The ID of the organization.

Parameter	Type	Example	Description
internal	Boolean	false	Indicates whether the organization is a preset organization.
level	String	0.1	The level of the organization.
mtime	Long	1606675230000	The time when the organization was modified.
multiCloudStatus	String	master	Indicates whether the organization is a multi-cloud organization. Valid values: master and slave. master indicates a primary-cloud organization. slave indicates a secondary-cloud organization.
muserId	String	admin	The user who modified the organization.
name	String	test	The name of the organization.
parentId	Integer	0	The ID of the parent organization.
supportRegionList	List	["cn-qingdao-env17-d01"]	The list of regions.
supportRegions	String	cn-qingdao-env17-d01	The list of regions.
uuid	String	11231	The UUID of the organization.
organizationId	Integer	1	The ID of the organization.
resourceSets	Array of resourceSet		The list of resource sets.
creator	String	admin	The creator of the resource set.
gmtCreated	Long	1606675230000	The time when the resource set was created.
id	Integer	1	The ID of the resource set.
organizationID	Integer	1	The ID of the organization.

Parameter	Type	Example	Description
resourceGroupName	String	res_test	The name of the resource set.
rsId	String	11231a	The unique code.
roles	Array of role		The list of roles.
active	Boolean	true	Indicates whether the role is valid.
arId	String	11231	The ID of the role.
code	String	ROLE_RESOURCE_USER	The code of the role.
cuserId	String	admin	The user who created the role.
default	Boolean	false	Indicates whether the role is a preset role.
description	String	role_test	The description of the role.
enable	Boolean	true	Indicates whether the role is valid.
id	Integer	1	The ID of the role.
muserId	String	admin	The user who modified the role.
organizationVisibility	String	organizationVisibility.global	The sharing scope of the role. Valid values: • organizationVisibility.global: The role is globally shared. • organizationVisibility.organization: The role is shared within the same organization. • organizationVisibility.orgAndSubOrgs: The role is shared to subordinate organizations.
ownerOrganizationId	Integer	1	The ID of the organization.
rAMRole	Boolean	false	Indicates whether the role is a RAM role.

Parameter	Type	Example	Description
roleLevel	Integer	11231	The level of the role.
roleName	String	role_test	The name of the role.
roleRange	String	roleRange.orgAndSubOrgs	The permissions of the role. Valid values: • roleRange.allOrganizations: The role has permissions on all organizations. • roleRange.orgAndSubOrgs: The role has permissions on the organization and its subordinate organizations. • roleRange.resourceSet: The role has permissions on the resource set. • roleRange.userGroup: The role has permissions on the user group to which the RAM role belongs.
roleType	String	ROLETYPE_ASCM	The type of the role. Valid values: ROLETYPE_RAM and ROLETYPE_ASCM. ROLETYPE_RAM indicates RAM roles. ROLETYPE_ASCM indicates custom roles.
users	Array of user		The list of users.
accountType	Integer	1	The type of the account. This parameter is discarded and is not processed in the code. The default value is used.
active	Boolean	true	Indicates whether the user is valid.
aliyunUser	Boolean	false	Indicates whether the account is an Apsara Stack tenant account.
backendAccountType	String	1	The type of the account. Valid values: • AscmUser: the user who is visible to customers in the Apsara Uni-manager Management Console • AliyunUser: the Apsara Stack tenant account • RamUser: the RAM user

Parameter	Type	Example	Description
cellphoneNum	String	00000000000	The mobile number of the user.
ctime	Long	1606675230000	The time when the user was created.
default	Boolean	false	Indicates whether the user is a preset user.
defaultRoleId	Integer	1	The ID of the default role.
deleted	Boolean	false	Indicates whether the user is deleted.
email	String	test@163.com	The email address of the user.
enableDingTalk	Boolean	false	Indicates whether to use DingTalk to send notifications.
enableEmail	Boolean	false	Indicates whether to use emails to send notifications.
enableShortMessage	Boolean	false	Indicates whether to use SMS to send notifications.
id	Integer	1	The ID of the user.
loginName	String	test	The logon name of the user.
loginTime	Long	1606675230000	The time when the user logged on.
mobileNationCode	String	86	The country code.
mtime	Long	1606675230000	The time when the user was modified.
muserId	String	admin	The one who calls the operation to modify the user.
organizationId	Integer	1	The ID of the organization.

Parameter	Type	Example	Description
password	String	H2xWNY8oitAhxMWLhtyjsO1fRkYoCRcErAgP9Hd0IXp2f5rRSmArS	The password of the user.
ramUser	Boolean	false	Indicates whether the account is a RAM user.
userLoginCtrlId	Integer	34	The ID of the logon control.
username	String	test	The display name of the user.
userRoles	Array of userRole		The list of roles of the user.
active	Boolean	true	Indicates whether the role is valid.
arId	String	11231	The ID of the role.
code	String	ROLE_RESOURCE_USER	The code of the role.
cuserId	String	admin	The user who created the role.
default	Boolean	true	Indicates whether the role is a preset role.
description	String	role_test	The description of the role.
enable	Boolean	true	Indicates whether the role is valid.
id	Integer	1	The ID of the role.
muserId	String	admin	The user who modified the role.

Parameter	Type	Example	Description
organizationVisibility	String	organizationVisibility.global	The sharing scope of the role. Valid values: • organizationVisibility.global: The role is globally shared. • organizationVisibility.organization: The role is shared within the same organization. • organizationVisibility.orgAndSubOrgs: The role is shared to subordinate organizations.
ownerOrganizationId	Integer	1	The ID of the organization.
rAMRole	Boolean	false	Indicates whether the role is a RAM role.
roleLevel	Integer	11231	The level of the role.
roleName	String	role_test	The name of the role.
roleRange	String	roleRange.orgAndSubOrgs	The permissions of the role. Valid values: • roleRange.allOrganizations: The role has permissions on all organizations. • roleRange.orgAndSubOrgs: The role has permissions on the organization and its subordinate organizations. • roleRange.resourceSet: The role has permissions on the resource set. • roleRange.userGroup: The role has permissions on the user group to which the RAM role belongs.
roleType	String	ROLETYPE_ASCM	The type of the role. Valid values: ROLETYPE_RAM and ROLETYPE_ASCM. ROLETYPE_RAM indicates RAM roles. ROLETYPE_ASCM indicates custom roles.
message	String	success	The error message.
pureListData	Boolean	false	Indicates whether only data is returned and other parameters are not returned.

Parameter	Type	Example	Description
redirect	Boolean	false	Indicates whether redirections are performed.
success	Boolean	true	Indicates whether the call is successful.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ModifyUserInformation
&<Common request parameters>
```

Sample success responses

1.1.2.3.4.12. RecoverUserByLoginName

Restores a deleted user.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	RecoverUserByLoginName	The operation that you want to perform. Set the value to RecoverUserByLoginName.
LoginName	String	Yes	testtest	The logon name of the user.
OrganizationId	Integer	Yes	5	The ID of the organization.
roleIdList	Json	No	{"RoleIdList": ["5", "6", "8"]}	The list of roles.

Response parameters

Parameter	Type	Example	Description
code	String	200	The HTTP status code.
cost	Integer	1000	The amount of time taken to perform the operation.
data	Struct		The response.
accessKeys	Array of accessKey		The list of AccessKey pairs.
accesskeyId	String	JGdgSN2pVYahtrd7	The AccessKey ID.
ctime	Long	1606675230000	The time when the AccessKey pair was created.
cuserId	String	admin	The user who created the AccessKey pair.
id	Integer	1	The AccessKey ID.

Parameter	Type	Example	Description
region	String	cn-qingdao-env17-d01	The region where the AccessKey pair is available.
status	String	ACTIVE	Indicates whether the AccessKey pair is valid. Valid values: active and inactive.
cellphoneNum	String	00000000000	The mobile number of the user.
default	Boolean	false	Indicates whether the role is a preset role.
defaultRole	Struct		The default role.
active	Boolean	true	Indicates whether the role is valid.
arId	String	111	The ID of the role.
code	String	ROLE_RESOURCE_USER	The code of the role.
default	Boolean	true	Indicates whether the role is a preset role.
description	String	test	The description of the role.
enable	Boolean	true	Indicates whether the role is valid.
id	Integer	1	The ID of the role.
muserId	String	admin	The user who modified the role.

Parameter	Type	Example	Description
organizationVisibility	String	organizationVisibility.global	The sharing scope of the role. Valid values: organizationVisibility.global, organizationVisibility.organization, and organizationVisibility.orgAndSubOrgs. organizationVisibility.global indicates that the role is globally shared. organizationVisibility.organization indicates that the role is shared within the same organization. organizationVisibility.orgAndSubOrgs indicates that the role is shared to subordinate organizations.
ownerOrganizationId	Integer	1	The ID of the organization.
rAMRole	Boolean	false	Indicates whether the role is a Resource Access Management (RAM) role.
roleLevel	Integer	11321	The level of the role.
roleName	String	role_test	The name of the role.

Parameter	Type	Example	Description
roleRange	String	roleRange.orgAndSubOrgs	The permissions of the role. Valid values: roleRange.allOrganizations, roleRange.orgAndSubOrgs, roleRange.resourceSet, and roleRange.userGroup. roleRange.allOrganizations indicates that the role has permissions on all organizations. roleRange.orgAndSubOrgs indicates that the role has permissions on the organization and its subordinate organizations. roleRange.resourceSet indicates that the role has permissions on the resource set. roleRange.userGroup indicates that the role has permissions on the user group to which the RAM role belongs.
roleType	String	ROLETYPE_ASCM	The type of the role. Valid values: ROLETYPE_RAM and ROLETYPE_ASCM. ROLETYPE_RAM indicates RAM roles. ROLETYPE_ASCM indicates custom roles.
deleted	Boolean	false	Indicates whether the user is deleted.
displayName	String	test	The display name of the user.
email	String	test@163.com	The email address of the user.
enableDingTalk	Boolean	false	Indicates whether to use DingTalk to send notifications.
enableEmail	Boolean	false	Indicates whether to use emails to send notifications.

Parameter	Type	Example	Description
enableShortMessage	Boolean	false	Indicates whether to use SMS to send notifications.
id	Integer	1	The ID of the user.
lastLoginTime	Long	1606675230000	The most recent logon time.
loginName	String	test	The logon name of the user.
loginPolicy	Struct		The logon policy.
cuserId	String	admin	The user who created the logon policy.
default	Boolean	true	Indicates whether the logon policy is the default one.
enable	Boolean	true	Indicates whether the logon policy is valid.
id	Integer	1	The ID of the logon policy.
ipRanges	Array of ipRang		The list of CIDR blocks.
ipRange	String	0.0.0.0/0	The CIDR block.
loginPolicyId	Integer	1	The ID of the logon policy.
protocol	String	IPV4	The protocol.
lpId	String	11231	The ID of the logon policy.
muserId	String	admin	The user who modified the logon policy.
name	String	default.loginpolicy	The name of the logon policy.

Parameter	Type	Example	Description
organizationVisibility	String	organizationVisibility.global	The sharing scope of the logon policy. Valid values: organizationVisibility.global, organizationVisibility.organization, and organizationVisibility.orgAndSubOrgs. organizationVisibility.global indicates that the logon policy is globally shared. organizationVisibility.organization indicates that the logon policy is shared within the same organization. organizationVisibility.orgAndSubOrgs indicates that the logon policy is shared to subordinate organizations.
ownerOrganizationId	Integer	1	The ID of the organization.
rule	String	ALLOW	The rule of the logon policy. Valid values: Allow and Deny.
timeRanges	Array of timeRang		The list of time ranges.
endTime	String	24:00	The end of the time range for the query.
loginPolicyId	Integer	1	The ID of the logon policy.
startTime	String	00:00	The start of the time range for the query.
mobileNationCode	String	86	The country code.
organization	Struct		The information of the organization.
alias	String	test	The alias of the organization.
ctime	Long	1606791494471	The time when the organization was created.
cuserId	String	admin	The user who created the organization.
id	Integer	1	The ID of the organization.

Parameter	Type	Example	Description
internal	Boolean	false	Indicates whether the organization is a preset organization.
level	String	0.1	The level of the organization.
mtime	Long	1606791494471	The time when the organization was modified.
multiCloudStatus	String	master	Indicates whether the organization is a multi-cloud organization. Valid values: master and slave. master indicates a primary-cloud organization. slave indicates a secondary-cloud organization.
muserId	String	admin	The user who modified the organization.
name	String	test	The name of the organization.
parentId	Integer	0	The ID of the parent organization.
supportRegionList	List	["cn-qingdao-env17-d01"]	The list of regions.
supportRegions	String	cn-qingdao-env17-d01	The list of regions.
uuid	String	11231	The universally unique identifier (UUID) of the organization.
parentPk	String	1689406703302188	The primary key of the Apsara Stack tenant account.
primaryKey	String	212530506704030466	The primary key of the RAM user.
roles	Array of role		The list of roles.
active	Boolean	true	Indicates whether the role is valid.
arId	String	112311	The ID of the role.

Parameter	Type	Example	Description
code	String	ROLE_RESOURCE_USER	The code of the role.
cuserId	String	admin	The user who created the role.
default	Boolean	true	Indicates whether the role is a preset role.
description	String	role_test	The description of the role.
enable	Boolean	true	Indicates whether the role is valid.
id	Integer	1	The ID of the role.
muserId	String	admin	The user who modified the role.
organizationVisibility	String	organizationVisibility.global	The sharing scope of the role. Valid values: organizationVisibility.global, organizationVisibility.organization, and organizationVisibility.orgAndSubOrgs. organizationVisibility.global indicates that the role is globally shared. organizationVisibility.organization indicates that the role is shared within the same organization. organizationVisibility.orgAndSubOrgs indicates that the role is shared to subordinate organizations.
ownerOrganizationId	Integer	1	The ID of the organization.
rAMRole	Boolean	false	Indicates whether the role is a RAM role.
roleLevel	Integer	11231	The level of the role.
roleName	String	role_test	The name of the role.

Parameter	Type	Example	Description
roleRange	String	roleRange.orgAndSubOrgs	The permissions of the role. Valid values: roleRange.allOrganizations, roleRange.orgAndSubOrgs, roleRange.resourceSet, and roleRange.userGroup. roleRange.allOrganizations indicates that the role has permissions on all organizations. roleRange.orgAndSubOrgs indicates that the role has permissions on the organization and its subordinate organizations. roleRange.resourceSet indicates that the role has permissions on the resource set. roleRange.userGroup indicates that the role has permissions on the user group to which the RAM role belongs.
roleType	String	ROLETYPE_ASCM	The type of the role. Valid values: ROLETYPE_RAM and ROLETYPE_ASCM. ROLETYPE_RAM indicates a RAM role. ROLETYPE_ASCM indicates a custom role.
status	String	ACTIVE	The status of the user. Valid values: active and inactive.
userGroupRoles	Array of userGroupRole		The list of roles of the user group.
active	Boolean	true	Indicates whether the role is valid.
arId	String	11231	The ID of the role.
code	String	ROLE_RESOURCE_USER	The code of the role.
cuserId	String	admin	The user who created the role.
default	Boolean	true	Indicates whether the role is a preset role.
description	String	test	The description of the role.
enable	Boolean	true	Indicates whether the role is valid.

Parameter	Type	Example	Description
id	Integer	1	The ID of the role.
muserId	String	admin	The user who modified the role.
organizationVisibility	String	organizationVisibility.global	The sharing scope of the role. Valid values: organizationVisibility.global, organizationVisibility.organization, and organizationVisibility.orgAndSubOrgs. organizationVisibility.global indicates that the role is globally shared. organizationVisibility.organization indicates that the role is shared within the same organization. organizationVisibility.orgAndSubOrgs indicates that the role is shared to subordinate organizations.
ownerOrganizationId	Integer	1	The ID of the organization.
rAMRole	Boolean	false	Indicates whether the role is a RAM role.
roleLevel	Integer	11231	The level of the role.
roleName	String	role_test	The name of the role.
roleRange	String	roleRange.orgAndSubOrgs	The permissions of the role. Valid values: roleRange.allOrganizations, roleRange.orgAndSubOrgs, roleRange.resourceSet, and roleRange.userGroup. roleRange.allOrganizations indicates that the role has permissions on all organizations. roleRange.orgAndSubOrgs indicates that the role has permissions on the organization and its subordinate organizations. roleRange.resourceSet indicates that the role has permissions on the resource set. roleRange.userGroup indicates that the role has permissions on the user group to which the RAM role belongs.

Parameter	Type	Example	Description
roleType	String	ROLETYPE_ASCM	The type of the role. Valid values: ROLETYPE_RAM and ROLETYPE_ASCM. ROLETYPE_RAM indicates a RAM role. ROLETYPE_ASCM indicates a custom role.
userGroups	Array of userGroups		The list of user groups.
augId	String	11231	The ID of the user group.
createTimeStamp	Long	1606675230000	The time when the user group was created.
groupName	String	group_test	The name of the user group.
id	Integer	1	The ID of the user group.
organization	Struct		The information of the organization.
alias	String	test	The alias of the organization.
ctime	Long	1606675230000	The time when the organization was created.
cuserId	String	admin	The user who created the organization.
id	Integer	1	The ID of the organization.
internal	Boolean	false	Indicates whether the organization is a preset organization.
level	String	0.1	The level of the organization.
mtime	Long	1606675230000	The time when the organization was modified.

Parameter	Type	Example	Description
multiCloudStatus	String	master	Indicates whether the organization is a multi-cloud organization. Valid values: master and slave. master indicates a primary-cloud organization. slave indicates a secondary-cloud organization.
muserId	String	admin	The user who modified the organization.
name	String	test	The name of the organization.
parentId	Integer	0	The ID of the parent organization.
supportRegionList	List	["cn-qingdao-env17-d01"]	The list of regions.
supportRegions	String	cn-qingdao-env17-d01	The list of regions.
uuid	String	11231	The UUID of the organization.
organizationId	Integer	1	The ID of the organization.
resourceSets	Array of resourceSet		The list of resource sets.
creator	String	admin	The creator of the resource set.
gmtCreated	Long	1606675230000	The time when the resource set was created.
id	Integer	1	The ID of the resource set.
organizationID	Integer	1	The ID of the organization.
resourceGroupName	String	res_test	The name of the resource set.
rsId	String	11231	The ID of the resource set.
roles	Array of role		The list of roles.

Parameter	Type	Example	Description
active	Boolean	true	Indicates whether the role is valid.
arId	String	11231	The ID of the role.
code	String	ROLE_RESOURCE_USER	The code of the role.
cuserId	String	admin	The user who created the role.
default	Boolean	true	Indicates whether the role is a preset role.
description	String	test	The description of the role.
enable	Boolean	true	Indicates whether the role is valid.
id	Integer	1	The ID of the role.
muserId	String	admin	The user who modified the role.
organizationVisibility	String	organizationVisibility.global	The sharing scope of the role. Valid values: organizationVisibility.global, organizationVisibility.organization, and organizationVisibility.orgAndSubOrgs. organizationVisibility.global indicates that the role is globally shared. organizationVisibility.organization indicates that the role is shared within the same organization. organizationVisibility.orgAndSubOrgs indicates that the role is shared to subordinate organizations.
ownerOrganizationId	Integer	1	The ID of the organization.
rAMRole	Boolean	false	Indicates whether the role is a RAM role.
roleLevel	Integer	11231	The level of the role.
roleName	String	role_test	The name of the role.

Parameter	Type	Example	Description
roleRange	String	roleRange.orgAndSubOrgs	The permissions of the role. Valid values: roleRange.allOrganizations, roleRange.orgAndSubOrgs, roleRange.resourceSet, and roleRange.userGroup. roleRange.allOrganizations indicates that the role has permissions on all organizations. roleRange.orgAndSubOrgs indicates that the role has permissions on the organization and its subordinate organizations. roleRange.resourceSet indicates that the role has permissions on the resource set. roleRange.userGroup indicates that the role has permissions on the user group to which the RAM role belongs.
roleType	String	ROLETYPE_ASCM	The type of the role. Valid values: ROLETYPE_RAM and ROLETYPE_ASCM. ROLETYPE_RAM indicates a RAM role. ROLETYPE_ASCM indicates a custom role.
users	Array of user		The list of users.
accountType	Integer	1	The type of the account. This parameter is discarded and is not processed in the code. The default value is used.
active	Boolean	true	Indicates whether the user is valid.
aliyunUser	Boolean	false	Indicates whether the account is an Apsara Stack tenant account.
backendAccountType	String	1	The type of the account. Valid values: AscmUser, AliyunUser, and RamUser. AscmUser indicates a user who is visible to customers in the Apsara Uni-manager Management Console. AliyunUser indicates an Apsara Stack tenant account. RamUser indicates a RAM user.
cellphoneNum	String	00000000000	The mobile number of the user.

Parameter	Type	Example	Description
ctime	Long	1606675230000	The time when the user was created.
default	Boolean	false	Indicates whether the user is a preset user.
defaultRoleId	Integer	1	The ID of the default role.
deleted	Boolean	false	Indicates whether the user is deleted.
email	String	test@163.com	The email address of the user.
enableDingTalk	Boolean	false	Indicates whether to use DingTalk to send notifications.
enableEmail	Boolean	false	Indicates whether to use emails to send notifications.
enableShortMessage	Boolean	false	Indicates whether to use SMS to send notifications.
id	Integer	1	The ID of the user.
loginName	String	test	The logon name of the user.
loginTime	Long	1606675230000	The time when the user logged on.
mobileNationCode	String	86	The country code.
mtime	Long	1606675230000	The time when the user was modified.
muserId	String	admin	The one who calls the operation to modify the user.
organizationId	Integer	1	The ID of the organization.

Parameter	Type	Example	Description
password	String	H2xWNY8oitAhxMWLhtyjsO1fRkYoCRcErAgP9Hd0IXp2f5rRSmArS	The password of the cluster user.
ramUser	Boolean	true	Indicates whether the account is a RAM user.
userLoginCtrlId	Integer	34	The ID of the logon control.
username	String	test	The display name of the user.
userRoles	Array of userRole		The list of roles of the user.
active	Boolean	true	Indicates whether the role is valid.
arId	String	11321	The ID of the role.
code	String	ROLE_RESOURCE_USER	The code of the role.
cuserId	String	admin	The user who created the role.
default	Boolean	true	Indicates whether the role is a preset role.
description	String	test	The description of the role.
enable	Boolean	true	Indicates whether the role is valid.
id	Integer	1	The ID of the role.
muserId	String	admin	The user who modified the role.

Parameter	Type	Example	Description
organizationVisibility	String	organizationVisibility.global	The sharing scope of the role. Valid values: • organizationVisibility.global: The role is globally shared. • organizationVisibility.organization: The role is shared within the same organization. • organizationVisibility.orgAndSubOrgs: The role is shared to subordinate organizations.
ownerOrganizationId	Integer	1	The ID of the organization.
rAMRole	Boolean	false	Indicates whether the role is a RAM role.
roleLevel	Integer	11231	The level of the role.
roleName	String	role_test	The name of the role.
roleRange	String	roleRange.orgAndSubOrgs	The permissions of the role. Valid values: roleRange.allOrganizations, roleRange.orgAndSubOrgs, roleRange.resourceSet, and roleRange.userGroup. roleRange.allOrganizations indicates that the role has permissions on all organizations. roleRange.orgAndSubOrgs indicates that the role has permissions on the organization and its subordinate organizations. roleRange.resourceSet indicates that the role has permissions on the resource set. roleRange.userGroup indicates that the role has permissions on the user group to which the RAM role belongs.
roleType	String	ROLETYPE_ASCM	The type of the role. Valid values: ROLETYPE_RAM and ROLETYPE_ASCM. ROLETYPE_RAM indicates a RAM role. ROLETYPE_ASCM indicates a custom role.
message	String	success	The error message.
pureListData	Boolean	false	Indicates whether only data is returned and other parameters are not returned.

Parameter	Type	Example	Description
redirect	Boolean	false	Indicates whether redirections are performed.
success	Boolean	true	Indicates whether the call is successful.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=RecoverUserByLoginName
&LoginName=testtest
&OrganizationId=5
&<Common request parameters>
```

Sample success response

1.1.2.3.4.13. RemoveRoleFromUser

Unbinds a role from a user.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	RemoveRoleFromUser	The operation that you want to perform. Set the value to RemoveRoleFromUser.

Parameter	Type	Required	Example	Description
LoginName	String	Yes	testu	The logon name of the user.
RoleId	Integer	Yes	5	The ID of the role.

Response parameters

Parameter	Type	Example	Description
code	String	200	The HTTP status code.
cost	Integer	1000	The amount of time taken to perform the operation.
message	String	success	The error message.
pureListData	Boolean	false	Indicates whether only data is returned and other parameters are not returned.
redirect	Boolean	false	Indicates whether redirections are performed.
success	Boolean	true	Indicates whether the call is successful.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=RemoveRoleFromUser
&LoginName=testu
&RoleId=5
&<Common request parameters>
```

Sample success responses

`XML` format

```
<redirect>false</redirect>
<cost>1000</cost>
<code>200</code>
<success>true</success>
<pureListData>false</pureListData>
<message>success</message>
```

`JSON` format

```
{
    "redirect": "false",
    "cost": "1000",
    "code": "200",
    "success": "true",
    "pureListData": "false",
    "message": "success"
}
```

1.1.2.3.5. Logon policies

1.1.2.3.5.1. AddLoginPolicy

Creates a logon policy.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	AddLoginPolicy	The operation that you want to perform. Set the value to AddLoginPolicy.
Name	String	Yes	testlp	The name of the logon policy.
Description	String	No	just for test	The description of the logon policy.
Rule	String	No	deny	The rule of the logon policy. Valid values: Allow and Deny.
ipRanges	Json	No	{"IpRanges": [{ " ipRange": "1.1.1.0/24" }, { " ipRange": "2.2.2.5/24" }]}	The list of CIDR blocks.
timeRanges	Json	No	{"TimeRanges ": [{ "startTime ": "11:00", " endTime": " 13:35" }, { " startTime": "12: 00", "endTime": "12:30" }]}	The list of time ranges.

Parameter	Type	Required	Example	Description
Enable	Boolean	No	true	Specifies whether the logon policy is valid.
OrganizationVisibility	String	No	organizationVisibility.global	The sharing scope of the logon policy. Valid values: • organizationVisibility.global: The logon policy is globally shared. • organizationVisibility.organization: The logon policy is shared within the same organization. • organizationVisibility.orgAndSubOrgs: The logon policy is shared to subordinate organizations.

Response parameters

Parameter	Type	Example	Description
code	String	200	The HTTP status code.
cost	Integer	1000	The amount of time taken to perform the operation.
data	Struct		The response.
cuserId	String	admin	The user who created the logon policy.
default	Boolean	true	Indicates whether the logon policy is the default one.
enable	Boolean	true	Indicates whether the logon policy is valid.
ipRanges	Array of ipRang		The list of CIDR blocks.
ipRange	String	0.0.0.0/0	The CIDR block.
loginPolicyId	Integer	1	The ID of the logon policy.

Parameter	Type	Example	Description
protocol	String	IPV4	The protocol.
lpId	Integer	111	The ID of the logon policy.
muserId	String	admin	The user who modified the logon policy.
name	String	defaultLoginPolicy.name	The name of the logon policy.
organizationVisibility	String	organizationVisibility.global	The sharing scope of the logon policy. Valid values: • organizationVisibility.global: The logon policy is globally shared. • organizationVisibility.organization: The logon policy is shared within the same organization. • organizationVisibility.orgAndSubOrgs: The logon policy is shared to subordinate organizations.
ownerOrganizationId	Integer	1	The ID of the organization.
rule	String	ALLOW	The rule of the logon policy. Valid values: Allow and Deny.
timeRanges	Array of timeRang		The list of time ranges.
endTime	String	24:00	The end of the time range for the query.
loginPolicyId	Integer	1	The ID of the logon policy.
startTime	String	00:00	The start of the time range for the query.
message	String	success	The error message.
pureListData	Boolean	true	Indicates whether only data is returned and other parameters are not returned.

Parameter	Type	Example	Description
redirect	Boolean	false	Indicates whether redirections are performed.
success	Boolean	true	Indicates whether the call is successful.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=AddLoginPolicy
&Name=testlp
&<Common request parameters>
```

Sample success responses

`XML` format

```
<redirect>false</redirect>
<cost>1000</cost>
<code>200</code>
<data>
    <ipRanges>
        <ipRange>0.0.0.0/0</ipRange>
        <protocol>IPV4</protocol>
        <loginPolicyId>1</loginPolicyId>
    </ipRanges>
    <muserId>admin</muserId>
    <default>true</default>
    <ownerOrganizationId>1</ownerOrganizationId>
    <timeRanges>
        <startTime>00:00</startTime>
        <loginPolicyId>1</loginPolicyId>
        <endTime>24:00</endTime>
    </timeRanges>
    <enable>true</enable>
    <name>defaultLoginPolicy.name</name>
    <rule>ALLOW</rule>
    <organizationVisibility>organizationVisibility.global</organizationVisibility>
    <lpId>111</lpId>
    <cuserId>admin</cuserId>
</data>
<success>true</success>
<pureListData>true</pureListData>
<message>success</message>
```

`JSON` format

```
{
    "redirect": "false",
    "cost": "1000",
    "code": "200",
    "data": {
        "ipRanges": [
            {
                "ipRange": "0.0.0.0/0",
                "protocol": "IPV4",
                "loginPolicyId": "1"
            }
        ],
        "muserId": "admin",
        "default": "true",
        "ownerOrganizationId": "1",
        "timeRanges": [
            {
                "startTime": "00:00",
                "loginPolicyId": "1",
                "endTime": "24:00"
            }
        ],
        "enable": "true",
        "name": "defaultLoginPolicy.name",
        "rule": "ALLOW",
        "organizationVisibility": "organizationVisibility.global",
        "lpId": "111",
        "cuserId": "admin"
    },
    "success": "true",
    "pureListData": "true",
    "message": "success"
}
```

1.1.2.3.5.2. CheckLoginPolicy

Checks a logon policy.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CheckLoginPolicy	The operation that you want to perform. Set the value to CheckLoginPolicy.

Parameter	Type	Required	Example	Description
Ip	String	Yes	1.1.1.1	The IP address to be checked. Logon policies include whitelist and blacklist policies. • A whitelist policy is used to check the IP addresses from which you can log on. • A blacklist policy is used to check the IP addresses from which you cannot log on.
LoginName	String	Yes	testu	The logon name to be checked.
Time	Long	No	1575889112	The timestamp to be checked. By default, the current system timestamp is used.

Response parameters

Parameter	Type	Example	Description
code	String	200	The HTTP status code.
cost	Integer	1000	The amount of time taken to perform the operation.
data	Boolean	true	The response.
message	String	success	The error message.
pureListData	Boolean	false	Indicates whether only data is returned and other parameters are not returned.
redirect	Boolean	false	Indicates whether redirections are performed.
success	Boolean	true	Indicates whether the call is successful.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=CheckLoginPolicy
&Ip=1.1.1.1
&LoginName=testu
&<Common request parameters>
```

Sample success responses

`XML` format

```
<redirect>false</redirect>
<cost>1000</cost>
<code>200</code>
<data>true</data>
<success>true</success>
<pureListData>false</pureListData>
<message>success</message>
```

`JSON` format

```
{
    "redirect": "false",
    "cost": "1000",
    "code": "200",
    "data": "true",
    "success": "true",
    "pureListData": "false",
    "message": "success"
}
```

1.1.2.3.5.3. ListLoginPolicies

Queries the list of logon policies.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ListLoginPolicies	The operation that you want to perform. Set the value to ListLoginPolicies.
Name	String	No	test	The name of the logon policy.
CurrentPage	Integer	No	1	The number of the page to return.
PageSize	Integer	No	10	The number of entries to return on each page.

Response parameters

Parameter	Type	Example	Description
code	String	200	The HTTP status code.
cost	Integer	1000	The amount of time taken to perform the operation.
data	Array of dataItem		The response.
cuserId	String	admin	The user who created the logon policy.
default	Boolean	true	Indicates whether the logon policy is the default one.
enable	Boolean	true	Indicates whether the logon policy is valid.
id	Integer	1	The ID of the logon policy.
ipRanges	Array of ipRang		The list of CIDR blocks.
ipRange	String	0.0.0.0/0	The CIDR block.
loginPolicyId	Integer	1	The ID of the logon policy.
protocol	String	IPV4	The protocol.
lpId	String	1111	The ID of the logon policy.
muserId	String	admin	The user who modified the logon policy.
name	String	deaultLogin	The name of the logon policy.

Parameter	Type	Example	Description
organizationVisibility	String	organizationVisibility.global	The sharing scope of the logon policy. Valid values: • organizationVisibility.global: The logon policy is globally shared. • organizationVisibility.organization: The logon policy is shared within the same organization. • organizationVisibility.orgAndSubOrgs: The logon policy is shared to subordinate organizations.
ownerOrganizationId	Integer	1	The ID of the organization.
rule	String	ALLOW	The rule of the logon policy. Valid values: Allow and Deny.
timeRanges	Array of timeRang		The list of time ranges.
endTime	String	24:00	The end of the time range for the query.
loginPolicyId	Integer	1	The ID of the logon policy.
startTime	String	00:00	The start of the time range for the query.
userCount	Integer	12	The number of users who use the logon policy.
message	String	success	The error message.
pageInfo	Struct		The page information.
currentPage	Integer	1	The page number of the returned page.
pageSize	Integer	20	The number of entries returned per page.
total	Integer	39	The total number of entries returned.
totalPage	Integer	2	The total number of pages returned.

Parameter	Type	Example	Description
pureListData	Boolean	false	Indicates whether only data is returned and other parameters are not returned.
redirect	Boolean	false	Indicates whether redirections are performed.
success	Boolean	true	Indicates whether the call is successful.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ListLoginPolicies
&<Common request parameters>
```

Sample success responses

`XML` format

```
<redirect>false</redirect>
<cost>1000</cost>
<code>200</code>
<data>
    <muserId>admin</muserId>
    <default>true</default>

}
```

1.1.2.3.5.4. ModifyLoginPolicy

Modifies a logon policy.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyLoginPolicy	The operation that you want to perform. Set the value to ModifyLoginPolicy.
Id	Integer	Yes	2	The ID of the logon policy.
Name	String	No	testtttt	The new name of the logon policy.
Description	String	No	tttt	The new description of the logon policy.
Rule	String	No	allow	The rule of the logon policy. Valid values: Allow and Deny.
ipRanges	Json	No	{ "ipRanges": [{ "ipRange": "0.0.0.0/0", "loginPolicyId": 1, "protocol": "IPV4" }]}	The list of new CIDR blocks.
timeRanges	Json	No	{"timeRanges": [{ "endTime": "24:00", "loginPolicyId": 1, "startTime": "00:00" }]}	The list of new time ranges.
Enable	Boolean	No	true	Specifies whether to enable the logon policy.

Response parameters

Parameter	Type	Example	Description
code	String	200	The HTTP status code.
cost	Integer	1000	The amount of time taken to perform the operation.
data	Struct		The response.

Parameter	Type	Example	Description
cuserId	String	admin	The creator of the logon policy.
default	Boolean	true	Indicates whether the logon policy is the default one.
enable	Boolean	true	Indicates whether the logon policy is valid.
id	Integer	1	The ID of the logon policy.
ipRanges	Array of ipRang		The list of CIDR blocks.
ipRange	String	0.0.0.0/0	The CIDR block.
loginPolicyId	Integer	1	The ID of the logon policy.
protocol	String	IPV4	The protocol.
lpId	String	lp-1010e681dc790aab5041000y	The ID of the logon policy.
mtime	Long	1608175299345	The time when the logon policy was modified.
muserId	String	admin	The user who modified the logon policy.
name	String	testNew	The name of the logon policy.
organizationVisibility	String	organizationVisibility.global	The sharing scope of the logon policy. Valid values: • organizationVisibility.global: The logon policy is globally shared. • organizationVisibility.organization: The logon policy is shared within the same organization. • organizationVisibility.orgAndSubOrgs: The logon policy is shared to subordinate organizations.

Parameter	Type	Example	Description
ownerOrganizationId	Integer	1	The ID of the organization.
rule	String	ALLOW	The rule of the logon policy. Valid values: Allow and Deny.
timeRanges	Array of timeRang		The list of time ranges.
endTime	String	24:00	The end of the time range for the query.
loginPolicyId	Integer	1	The ID of the logon policy.
startTime	String	00:00	The beginning of the time range for the query.
message	String	success	The error message.
pureListData	Boolean	false	Indicates whether only data is returned and other parameters are not returned.
redirect	Boolean	false	Indicates whether redirections are performed.
success	Boolean	true	Indicates whether the call is successful.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ModifyLoginPolicy
&Id=2
&<Common request parameters>
```

Sample success responses

`XML` format

```
<redirect>false</redirect>

1.1.2.3.5.5. GetLoginPolicyById

Queries the information of a logon policy.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	GetLoginPolicyById	The operation that you want to perform. Set the value to GetLoginPolicyById.
Id	Integer	Yes	1	The ID of the logon policy.

Response parameters

Parameter	Type	Example	Description
code	String	200	The HTTP status code.
cost	Integer	1000	The amount of time taken to perform the operation.
data	Struct		The response.
cuserId	String	admin	The user who created the logon policy.
default	Boolean	true	Indicates whether the logon policy is the default one.
enable	Boolean	true	Indicates whether the logon policy is valid.
id	Integer	1	The ID of the logon policy.
ipRanges	Array of ipRange		The list of CIDR blocks.
ipRange	String	0.0.0.0/0	The CIDR block.
loginPolicyId	Integer	1	The ID of the logon policy.
protocol	String	IPV4	The protocol.
lpId	String	111	The ID of the logon policy.
muserId	String	admin	The user who modified the logon policy.
name	String	defaultLoginPolicy.name	The name of the logon policy.

Parameter	Type	Example	Description
organizationVisibility	String	organizationVisibility.global	The sharing scope of the logon policy. Valid values: • organizationVisibility.global: The logon policy is globally shared. • organizationVisibility.organization: The logon policy is shared within the same organization. • organizationVisibility.orgAndSubOrgs: The logon policy is shared to subordinate organizations.
ownerOrganizationId	Integer	1	The ID of the organization.
rule	String	ALLOW	The rule of the logon policy. Valid values: Allow and Deny.
timeRanges	Array of timeRange		The list of time ranges.
endTime	String	24:00	The end of the time range for the query.
loginPolicyId	Integer	1	The ID of the logon policy.
startTime	String	00:00	The beginning of the time range for the query.
message	String	success	The error message.
pureListData	Boolean	false	Indicates whether only data is returned and other parameters are not returned.
redirect	Boolean	false	Indicates whether redirections are performed.
success	Boolean	true	Indicates whether the call is successful.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=GetLoginPolicyById
&Id=1
&<Common request parameters>
```

Sample success responses

`XML` format

```
<redirect>false</redirect>
<cost>1000</cost>
<code>200</code>
<data>
    <ipRanges>
        <ipRange>0.0.0.0/0</ipRange>
        <protocol>IPV4</protocol>
        <loginPolicyId>1</loginPolicyId>
    </ipRanges>
    <muserId>admin</muserId>
    <default>true</default>
    <ownerOrganizationId>1</ownerOrganizationId>
    <timeRanges>
        <startTime>00:00</startTime>
        <loginPolicyId>1</loginPolicyId>
        <endTime>24:00</endTime>
    </timeRanges>
    <enable>true</enable>
    <name>defaultLoginPolicy.name</name>
    <rule>ALLOW</rule>
    <id>1</id>
    <organizationVisibility>organizationVisibility.global</organizationVisibility>
    <lpId>111</lpId>
    <cuserId>admin</cuserId>
</data>

```

1.1.2.4. Operations

1.1.2.4.1. CreateQuota

You can call this operation to create a quota.

- ECS

```
    {"productName":"ECS",
    "quotaBody":{"totalCpu":100,"totalMem":100,"totalGpu":100,
    "totalDisk_cloud_ssd":100,"totalDisk_cloud_efficiency":100}}
```

- OSS

```
{"productName":"OSS",
    "quotaBody":{"totalAmount":100}}
```

- VPC

```
 {"productName":"VPC",
    "quotaBody":{"totalVPC":100}}
```

- ApsaraDB RDS

```
 {"productName":"RDS",
    "quotaBody":{"totalCpu":100,"totalMem":100,"totalDisk":100}}
```

- SLB

```
{"productName":"SLB",
    "quotaBody":{"totalVipInternal":100,"totalVipPublic":100}}
```

- MaxCompute (ODPS)

```
{"productName":"ODPS",
    "quotaBody":{"totalCu":100,"totalDisk":100}}
```

- EIP

```
{"productName":"EIP",
    "quotaBody":{"totalEIP":100}}
```

- AnalyticDB for MySQL (ADB)

```
  {"productName": "ADB",
       "quotaBody":{"totalCpu": 100, "totalMem": 100, "totalDisk":100}}
```

- AnalyticDB for PostgreSQL (GPDB)

```
{"productName": "GPDB",
  "quotaBody":{"totalCpu": 100, "totalMem": 100, "totalDisk":100}}
```

- KVStore for Redis (R-kvstore)

```
 {"productName": "R-kvstore",       "quotaBody":{"totalMem": 100}}
```

- PolarDB-X (DRDS)

```
 {"productName": "DRDS",
       "quotaBody":{"totalCpu": 100}}
```

- Tablestore (OTS)

```
{"productName": "OTS",
   "quotaBody":{"totalDisk": 100}}
```

- Apsara File Storage NAS

```
{"productName": "NAS",
     "quotaBody":{"totalDisk": 100}}
```

- ApsaraDB for MongoDB (DDS)

```
{"productName": "DDS",
      "quotaBody":{"totalCpu": 100, "totalMem": 100, "totalDisk":100}}
```

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateQuota	The operation that you want to perform. Set the value to CreateQuota.
ProductName	String	Yes	ECS	The name of the service. Valid values: ECS, OSS, VPC, RDS, SLB, ODPS, EIP, ADB, GPDB, R-kvstore, DRDS, OTS, NAS, and DDS.

Parameter	Type	Required	Example	Description
QuotaBody	Json	Yes	{"totalCpu":100,"totalMem":100,"totalGpu":100,"totalDisk_cloud_ssd":100,"totalDisk_cloud_efficiency":100}	The parameters of the quota to update. The parameters vary with the specific service. ECS: {"totalCpu":100,"totalMem":100,"totalGpu":100,"totalDisk_cloud_ssd":100,"totalDisk_cloud_efficiency":100} OSS: {"totalAmount":100} VPC: {"totalVPC":100} RDS: {"totalCpu":100,"totalMem":100,"totalDisk":100} SLB: {"totalVipInternal":100,"totalVipPublic":100} ODPS: {"totalCu":100,"totalDisk":100} EIP: {"totalEIP":100}
QuotaType	String	Yes	organization	Valid values: **organization** and **resourceGroup**.
QuotaTypeId	Integer	Yes	1	The ID of the quota type. Specify an organization ID when the QuotaType parameter is set to organization. Specify a resource set ID when the QuotaType parameter is set to resourceGroup.
RegionName	String	Yes	cn-******-****-d01	The region name.
RequestId	String	No	d0c6ed24-45af-4703-866f-5103302b9a72	The ID of the request.
ClusterName	String	No	""	The name of the cluster. This reserved parameter is optional and can be left empty.

Parameter	Type	Required	Example	Description
TargetType	String	No	MySQL	To create a quota for ApsaraDB RDS, specify the name of the engine. Valid values: MySQL and SQLServer. This parameter is optional and can be left empty for other services.

Response parameters

Parameter	Type	Example	Description
code	String	200	The HTTP status code.
cost	Integer	1000	The time consumed by the operation.
data	Struct		The response.
allocateVPC	Integer	1	The number of allocated virtual private clouds (VPCs).
cluster	String	cn-qingdao-env17-d01	The cluster.
ctime	Float	1608519825999	The creation time.
dtFlag	Boolean	false	The DTCenter flag.
id	Integer	1	The ID of the primary key.
quotaType	String	organization	The type of the quota.
quotaTypeId	Integer	1	The ID of the quota.
region	String	cn-qingdao-env17-d01	The region.
targetType	String	mysql	The type of the cluster.
totalVPC	Integer	10	The total number of VPCs.

Parameter	Type	Example	Description
usedVPC	Integer	1	The number of used VPCs.
message	String	200	The message.
pureListData	Boolean	false	Indicates whether only data is returned.
redirect	Boolean	false	Indicates whether redirections are performed.
requestId	String	111	The ID of the request.
success	Boolean	true	Indicates whether the call was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=CreateQuota
&ProductName=ECS
&QuotaBody={"totalCpu":100,"totalMem":100,"totalGpu":100, "totalDisk_cloud_ssd":100,"totalDisk_cloud_efficiency":100}
&QuotaType=organization
&QuotaTypeId=1
&<Common request parameters>
```

Sample success responses

`XML` format

```
<redirect>false</redirect>
<cost>1000</cost>
<code>200</code>
<data>
    <quotaType>organization</quotaType>
    <cluster>cn-qingdao-env17-d01</cluster>
    <totalVPC>10</totalVPC>
    <dtFlag>false</dtFlag>
    <quotaTypeId>1</quotaTypeId>
    <usedVPC>1</usedVPC>
    <ctime>1608519825999</ctime>
    <allocateVPC>1</allocateVPC>
    <targetType>mysql</targetType>
    <id>1</id>
    <region>cn-qingdao-env17-d01</region>
</data>
<success>true</success>
<requestId>111</requestId>
<pureListData>false</pureListData>
<message>200</message>
```

`JSON` format

```
{
    "redirect": "false",
    "cost": "1000",
    "code": "200",
    "data": {
        "quotaType": "organization",
        "cluster": "cn-qingdao-env17-d01",
        "totalVPC": "10",
        "dtFlag": "false",
        "quotaTypeId": "1",
        "usedVPC": "1",
        "ctime": "1608519825999",
        "allocateVPC": "1",
        "targetType": "mysql",
        "id": "1",
        "region": "cn-qingdao-env17-d01"
    },
    "success": "true",

    "pureListData": "false",
    "message": "200"
}
```

1.1.2.4.2. DescribeGpdbModifiableInstanceType

You can call this operation to query the AnalyticDB for PostgreSQL instance types that can be upgraded or downgraded.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeGpdbModifiableInstanceType	The operation that you want to perform. Set the value to DescribeGpdbModifiableInstanceType.
instanceId	String	Yes	sdfsdfsdfsfdsdf	The ID of the instance.

Response parameters

Parameter	Type	Example	Description
data	Struct		The collection of results.
result	Array of dataItem		The collection of results.
baseVersion	String	3.13	The version of the instance type.
cpu	String	1	The number of vCPUs.
engineVersion	String	5.6	The engine version of the instance.
gmtCreate	String	2020-12-23 19:08:15	The creation time.
gmtModified	String	2020-12-23 19:08:15	The modification time.
label	String	""	Indicates whether the field is internationalized. Valid values: true and false.
memory	String	4	The memory size.
node	String	""	The node.
regionId	String	cn-qingdao-env66-d01	The ID of the region.
resourceType	String	GDB	The resource type.

Parameter	Type	Example	Description
specFrom	String	system	The source of the instance type.
specification	String	gdb.r.13xlarge	The instance type.
status	String	Available	Indicates whether the instance type is available.
storage	String	20	The storage.
status	Integer	200	The returned status code.
success	String	true	The success code.
host	String	""	The host address.
status	Integer	200	The returned status code.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeGpdbModifiableInstanceType
&instanceId=sdfsdfsdfsfdsdf
&<Common request parameters>
```

Sample success responses

`XML` format

```
<data>
    <result>
        <engineVersion>5.6</engineVersion>
        <gmtModified>2020-12-23 19:08:15</gmtModified>
        <memory>4</memory>

                "regionId": "cn-qingdao-env66-d01",
                "status": "Available",
                "resourceType": "GDB"
            }
        ],
        "success": "true",
        "status": "200"
    },
    "host": """,
    "status": "200"
}
```

1.1.2.4.3. UpdateQuota

You can call this operation to update a quota.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	UpdateQuota	The operation that you want to perform. Set the value to UpdateQuota.
ProductName	String	Yes	ECS	The name of the service. Valid values: **ECS**, **OSS**, **VPC**, **RDS**, **SLB**, **ODPS**, and **EIP**.

QuotaBody	Json	Yes	{"totalCpu":100,"totalMem":100,"totalGpu":100,"totalDisk_cloud_ssd":100,"totalDisk_cloud_efficiency":100}	The parameters of the quota to update. The parameters vary with the specific service.
				`ECS: {"totalCpu":100,"totalMem":100,"totalGpu":100,"totalDisk_cloud_ssd":100,"totalDisk_cloud_efficiency":100}`
				`OSS: {"totalAmount":100}`
				`VPC: {"totalVPC":100}`
				`RDS: {"totalCpu":100,"totalMem":100,"totalDisk":100}`
				`SLB: {"totalVipInternal":100,"totalVipPublic":100}`
				`ODPS: {"totalCu":100,"totalDisk":100}`
				`EIP: {"totalEIP":100}`

QuotaType	String	Yes	organization	The type of the quota. Valid values: **organization** and **resourceGroup**.
QuotaTypeId	Integer	Yes	1	The ID of the quota type. Specify an organization ID when the QuotaType parameter is set to organization. Specify a resource set ID when the QuotaType parameter is set to resourceGroup.

Parameter	Type	Required	Example	Description
RegionName	String	Yes	cn-*******-****-d01	The region name.
RequestId	String	No	84319b92-835e-4aeb-9190-0c12c9******	The ID of the request.
ClusterName	String	No	TEST	The name of the cluster. This reserved parameter is optional and can be left empty.
TargetType	String	No	MySQL	如果为RDS产品则输入对应引擎的名称，本版本支持MySQL和SQLServer。对于其他产品则可不填或者传空字符串。

Response parameters

Parameter	Type	Example	Description
code	String	200	The HTTP status code.
cost	Integer	1000	The time consumed by the operation.
data	Struct		The response.
allocateVPC	Integer	1	The number of allocated virtual private clouds (VPCs).
cluster	String	cn-qingdao-env17-d01	The cluster.
ctime	Float	1608519825999	The creation time.
dtFlag	Boolean	false	The DTCenter flag.
id	Integer	1	The ID of the primary key.
quotaType	String	organization	The type of the quota.
quotaTypeId	Integer	1	The ID of the quota.

Parameter	Type	Example	Description
region	String	cn-qingdao-env17-d01	The region.
targetType	String	mysql	The type of the cluster.
totalVPC	Integer	10	The total number of VPCs.
usedVPC	Integer	1	The number of used VPCs.
message	String	200	The message.
pureListData	Boolean	false	Indicates whether only data is returned.
redirect	Boolean	false	Indicates whether redirections are performed.
requestId	String	111	The ID of the request.
success	Boolean	true	Indicates whether the call was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=UpdateQuota
&ProductName=ECS
&QuotaBody={"totalCpu":100,"totalMem":100,"totalGpu":100, "totalDisk_cloud_ssd":100,"totalDisk_cloud_efficiency":100}
&QuotaType=organization
&QuotaTypeId=1
&<Common request parameters>
```

Sample success responses

`XML` format

```
<redirect>false</redirect>
<cost>1000</cost>
<code>200</code>
<data>
    <quotaType>organization</quotaType>
    <cluster>cn-qingdao-env17-d01</cluster>
    <totalVPC>10</totalVPC>
    <dtFlag>false</dtFlag>
    <quotaTypeId>1</quotaTypeId>
    <usedVPC>1</usedVPC>
    <ctime>1608519825999</ctime>
    <allocateVPC>1</allocateVPC>
    <targetType>mysql</targetType>
    <id>1</id>
    <region>cn-qingdao-env17-d01</region>
</data>
<success>true</success>
<requestId>111</requestId>
<pureListData>false</pureListData>
<message>200</message>
```

`JSON` format

```
{
    "redirect": "false",
    "cost": "1000",
    "code": "200",
    "data": {
        "quotaType": "organization",
        "cluster": "cn-qingdao-env17-d01",
        "totalVPC": "10",

    "pureListData": "false",
    "message": "200"
}
```

1.1.2.4.4. DeleteQuota

You can call this operation to delete a quota.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteQuota	The operation that you want to perform. Set the value to DeleteQuota.

Response parameters

Parameter	Type	Example	Description
code	String	200	The HTTP status code.
cost	Integer	1000	The time consumed by the operation.
message	String	200	The message.
pureListData	Boolean	false	Indicates whether only data is returned.
redirect	Boolean	false	Indicates whether redirections are performed.
requestId	String	111	The ID of the request.
success	Boolean	true	Indicates whether the call was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DeleteQuota
&<Common request parameters>
```

Sample success responses

`XML` format

```
<redirect>false</redirect>
<cost>1000</cost>
<code>200</code>
<success>true</success>
<requestId>111</requestId>
<pureListData>false</pureListData>
<message>200</message>
```

`JSON` format

```
{
    "redirect": "false",
    "cost": "1000",
    "code": "200",
    "success": "true",
    "requestId": "111",
    "pureListData": "false",
    "message": "200"
}
```

1.1.2.4.5. GetQuota

You can call this operation to query a quota.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	GetQuota	The operation that you want to perform. Set the value to GetQuota.

Response parameters

Parameter	Type	Example	Description
code	String	200	The HTTP status code.
cost	Integer	1000	The time consumed by the operation.
data	Struct		The response.
allocateAmount	Integer	1	The number of allocated quotas.
cluster	String	cn-qingdao-env17-d01	The cluster.
ctime	Float	1608519825999	The creation time.
cuserId	String	admin	The creator.
dtFlag	Boolean	false	The DTCenter flag.
id	Integer	1	The ID of the primary key.

Parameter	Type	Example	Description
muserId	String	admin	The modifier.
quotaType	String	organization	The type of the quota.
quotaTypeId	Integer	1	The ID of the quota.
region	String	cn-qingdao-env17-d01	The region.
targetType	String	mysql	The type of the cluster.
totalAmount	Integer	10	The total number of quotas.
usedAmount	Integer	1	The number of used quotas.
message	String	200	The message.
pureListData	Boolean	false	Indicates whether only data is returned.
redirect	Boolean	false	Indicates whether redirections are performed.
requestId	String	111	The ID of the request.
success	Boolean	true	Indicates whether the call was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=GetQuota
&ProductName=ECS
&QuotaType=organization
&QuotaTypeId=1
&<Common request parameters>
```

Sample success responses

`XML` format

```
<redirect>false</redirect>
<cost>1000</cost>
<code>200</code>
<data>
    <muserId>admin</muserId>
    <cluster>cn-qingdao-env17-d01</cluster>
    <quotaTypeId>1</quotaTypeId>
    <usedAmount>1</usedAmount>
    <allocateAmount>1</allocateAmount>
    <targetType>mysql</targetType>
    <totalAmount>10</totalAmount>
    <quotaType>organization</quotaType>
    <dtFlag>false</dtFlag>
    <ctime>1608519825999</ctime>
    <id>1</id>
    <region>cn-qingdao-env17-d01</region>
    <cuserId>admin</cuserId>
</data>
<success>true</success>
<requestId>111</requestId>
<pureListData>false</pureListData>
<message>200</message>
```

`JSON` format

```
{
    "redirect": "false",
    "cost": "1000",
    "code": "200",
    "data": {
        "muserId": "admin",
        "cluster": "cn-qingdao-env17-d01",
        "quotaTypeId": "1",
        "usedAmount": "1",
        "allocateAmount": "1",
        "targetType": "mysql",
        "totalAmount": "10",
        "quotaType": "organization",
        "dtFlag": "false",
        "ctime": "1608519825999",
        "id": "1",
        "region": "cn-qingdao-env17-d01",
        "cuserId": "admin"
    },
    "success": "true",
    "requestId": "111",
    "pureListData": "false",
    "message": "200"
}
```

1.1.2.4.6. MeteringQuery

You can call this operation to query the metering data.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	MeteringQuery	The operation that you want to perform. Set the value to MeteringQuery.
startTime	String	Yes	2019-10-10T00:00:00Z	The start of the time range for the query. The time must be in UTC.
endTime	String	Yes	2019-10-10T01:00:00Z	The end of the time range for the query. The time must be in UTC.
orgId	String	Yes	1	The ID of the organization.
pageSize	Integer	No	500	The number of entries to return on each page. Maximum value: 1000.
productName	String	Yes	ECS	The name of the service. Valid values: ECS, OSS, RDS, SLB, EIP, and VPC.
isParentId	Integer	Yes	0	A value of 1 specifies that the metering data of subordinate organizations under this organization is returned. If you do not specify this parameter or set the parameter to a value other than 1, only the metering data of this organization is returned.
resourceGId	String	No	test	The metering data of the specified resource set. By fault, if this parameter is empty or not specified, the metering data of all the resource sets in the specified organization is queried. **Note** If refined query is not required, we recommend that you do not specify the resourceGId, region, and insId parameters. You can query all the metering data of the specified organization to improve efficiency.

Parameter	Type	Required	Example	Description
region	String	No	test	The metering data of the specified cluster. **Note** If refined query is not required, we recommend that you do not specify the resourceGId, region, and insId parameters. You can query all the metering data of the specified organization to improve efficiency.
insId	String	No	test	The metering data of the specified instance. **Note** If refined query is not required, we recommend that you do not specify the resourceGId, region, and insId parameters. You can query all the metering data of the specified organization to improve efficiency.
token	String	No	test	The token returned as an offset when the data volume to be queried is greater than the value of the pageSize parameter. You can query the data of the next page after you enter the token for the next request. You can ignore this parameter or enter an empty string for the first query.

Response parameters

Parameter	Type	Example	Description
code	String	200	The returned status code.
cost	Integer	1000	The time consumed by the operation.
message	String	success	The returned information.
requestId	String	sddsdsd	The ID of the request.

Parameter	Type	Example	Description
success	Normal	true	Indicates whether the call was successful.
token	String	{"InsId":"i-9fx013f0ueoh5fzc8yww","Pos":"ECS_0000000003_2000-01-01T01:00:00Z","ResourceGId":"2","RegionId":"cn-qingdao-env-d01"}	The token used to query data by page. You can query the data of the next page after you enter the token for the next request.
total	Integer	100	The amount of data returned for this query.
data	String		The response.
Pos	String	ECS_0000000003_2000-01-01T01:00:00Z	The primary key of the metering data. The primary key consists of the service name, organization ID, and start time.
OrgName	String	test	The name of the organization.
ResourceGId	Integer	test	The ID of the resource set.
ResourceGName	String	test	The name of the resource set.
InsId	String	i-h5i05vhigf256qxqmg4h	The ID of the instance.
RegionId	String	cn-qingdao-env3b-d02	The ID of the region.
StartTime	String	2019-12-16 06:00:00	The start time of the metering data.
EndTime	String	2019-12-16 07:00:00	The end time of the metering data.

Examples

- Sample requests

```
http(s)://[Endpoint]/? Action=MeteringQuery
&startTime=2019-10-10T00:00:00Z
&endTime=2019-10-10T01:00:00Z
&orgId=1
&pageSize=500
&productName=ECS
&isParentId=0
&<Common request parameters>
```

- Sample success responses in JSON format

```
{

```

1.1.2.4.7. SelectCommonSpec

You can call this operation to query the specifications of a service by condition.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	SelectCommonSpec	The operation that you want to perform. Set the value to SelectCommonSpec.

Response parameters

Parameter	Type	Example	Description
data	Struct		The dataset.
result	Array of dataItem		The collection of results.
baseVersion	String	3.13	The version of the specifications.
gmtCreate	String	2019-10-27 17:47:27	The creation time of the specifications.

Parameter	Type	Example	Description
gmtModified	String	2019-10-27 17:47:27	The modification time of the specifications.
pageOrder	String	1	The page order.
pageSize	Integer	5	The number of entries returned per page.
pageSort	String	null	The sorting of pages.
pageStart	Integer	1	The number of the page to query. Start from page 1.
regionId	String	cn-qingdao-env66-d01	The ID of the region.
resourceType	String	RDS	The resource type.
specFrom	String	system	The source of the specifications.
status	String	Available	Indicates whether the specifications are available.
status	Integer	200	The returned status code.
success	String	true	The success code.
host	String	""	The host address.
status	Integer	200	The returned status code.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=SelectCommonSpec
&<Common request parameters>
```

Sample success responses

`XML` format

```
<data>
    <result>
        <gmtModified>2019-10-27 17:47:27</gmtModified>
        <pageOrder>1</pageOrder>

                "resourceType": "RDS"
            }
        ],
        "success": "true",
        "status": "200"
    },
    "host": "\"\"",
    "status": "200"
}
```

1.1.2.4.8. AddCommonSpec

You can call this operation to add custom specifications of a service.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	AddCommonSpec	The operation that you want to perform. Set the value to AddCommonSpec.
specName	String	Yes	Enhanced Enterprise Edition	The Chinese name of the specifications.
status	String	Yes	Available	The status.

Response parameters

Parameter	Type	Example	Description
data	Struct		The returned dataset.
success	Boolean	true	The success code.
validationInfo	String	""	The verification code.
code	String	200	The HTTP status code.
httpOk	Boolean	true	The returned status code.
ip	String	""	The IP address.
message	String	success	The error message.
requestId	String	0a1ec3c216087759426241251d02bd	The ID of the request.
success	Boolean	true	The success code.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=AddCommonSpec
&resourceType=RDS
&specName=Enhanced Enterprise Edition
&status=Available
&<Common request parameters>
```

Sample success responses

`XML` format

```
<code>200</code>
<data>
    <success>true</success>
    <validationInfo>""</validationInfo>
</data>
<httpOk>true</httpOk>
<requestId>0a1ec3c216087759426241251d02bd</requestId>
<success>true</success>
<ip>""</ip>
<message>success</message>
```

`JSON` format

```
{
    "code": "200",
    "data": {
        "success": "true",
        "validationInfo": """
    },
    "httpOk": "true",
    "requestId": "0a1ec3c216087759426241251d02bd",
    "success": "true",
    "ip": """,
    "message": "success"
}
```

1.1.2.4.9. UpdateCommonSpecStatus

You can call this operation to enable or disable specifications.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	UpdateCommonSpecStatus	The operation that you want to perform. Set the value to UpdateCommonSpecStatus.
ids	String	Yes	1	The IDs of the specifications.

Parameter	Type	Required	Example	Description
status	String	Yes	Unavailable	The status. Valid values: **Available** and **Unavailable**.

Response parameters

Parameter	Type	Example	Description
code	String	200	The HTTP status code.
data	Integer	200	The collection of data.
message	String	success	The message.
success	Boolean	true	Indicates whether the call was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=UpdateCommonSpecStatus
&ids=1
&status=Unavailable
&<Common request parameters>
```

Sample success responses

`XML` format

```
<code>200</code>
<data>200</data>
<success>true</success>
<message>success</message>
```

`JSON` format

```
{
    "code": "200",
    "data": "200",
    "success": "true",
    "message": "success"
}
```

1.1.2.5. Cloud services

1.1.2.5.1. DescribeModifiableInstanceType

You can call this operation to query the Elastic Compute Service (ECS) instance types that can be upgraded or downgraded.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeModifiableInstanceType	The operation that you want to perform. Set the value to DescribeModifiableInstanceType.
destinationResource	String	Yes	sfdsf	Set the value to instanceType.
instanceId	String	Yes	sfdsfsfdsfsfdsf	The ID of the instance.

Response parameters

Parameter	Type	Example	Description
data	Struct		The collection of results.
result	Array of dataItem		The collection of data.
baselineCredit	Integer	1	The baseline vCPU computing performance (overall computing performance of all vCPUs) of the t5 or t6 burstable instance family.
cpuCoreCount	Integer	1	The number of vCPUs.
eniPrivateIpAddressQuantity	Integer	2	The maximum number of private IP addresses per elastic network interface (ENI).
eniQuantity	Integer	2	The maximum number of ENIs that can be bound to an instance.
gPUAmount	Integer	0	The number of GPUs.
gPUSpec	String	""	The GPU specifications.

Parameter	Type	Example	Description
initialCredit	Integer	1	The initial vCPU credits of the t5 or t6 burstable instance family.
instanceBandwidthRx	Integer	1	The maximum inbound internal bandwidth. Unit: Kbit/s.
instanceBandwidthTx	Integer	1	The maximum outbound internal bandwidth. Unit: Kbit/s.
instanceFamilyLevel	String	EnterpriseLevel	The level of the instance family.
instancePpsRx	Long	1	The inbound packet forwarding rate over the internal network. Unit: pps.
instancePpsTx	Long	1	The outbound packet forwarding rate over the internal network. Unit: pps.
instanceTypeFamily	String	ecs.sn2.large	The instance family.
instanceTypeId	String	ecs.sn2.large	The ID of the instance type.
localStorageAmount	Integer	1	The number of local disks attached per instance.
localStorageCapacity	Long	2000	The capacity of each local disk attached per instance. Unit: GiB.
localStorageCategory	String	2000	The capacity of each local disk attached per instance. Unit: GiB.
memorySize	Integer	4	The amount of memory. Unit: GiB.
status	Integer	200	The returned status code.
success	String	true	The success code.
host	String	""	The host address.

Parameter	Type	Example	Description
status	Integer	200	The returned status code.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeModifiableInstanceType
&destinationResource=sfdsf
&instanceId=sfdsfsfdsfsfdsf
&<Common request parameters>
```

Sample success responses

`XML` format

```
<data>
    <result>
        <instancePpsTx>1</instancePpsTx>
        <instanceTypeFamily>ecs.sn2.large</instanceTypeFamily>
        <localStorageCapacity>2000</localStorageCapacity>
        <instanceTypeId>ecs.sn2.large</instanceTypeId>
        <instancePpsRx>1</instancePpsRx>
        <cpuCoreCount>1</cpuCoreCount>
        <initialCredit>1</initialCredit>
        <localStorageAmount>1</localStorageAmount>
        <gPUAmount>0</gPUAmount>
        <memorySize>4</memorySize>
        <instanceFamilyLevel>EnterpriseLevel</instanceFamilyLevel>
        <eniQuantity>2</eniQuantity>
        <instanceBandwidthRx>1</instanceBandwidthRx>
        <eniPrivateIpAddressQuantity>2</eniPrivateIpAddressQuantity>
        <localStorageCategory>2000</localStorageCategory>
        <instanceBandwidthTx>1</instanceBandwidthTx>
        <baselineCredit>1</baselineCredit>
        <gPUSpec>""</gPUSpec>
    </result>
    <success>true</success>
    <status>200</status>
</data>
<host>""</host>
<status>200</status>
```

`JSON` format

```
{
    "data": {
        "result": [
            {
                "instancePpsTx": "1",
                "instanceTypeFamily": "ecs.sn2.large",
                "localStorageCapacity": "2000",

    },
    "host": "\"\"",
    "status": "200"
}
```

1.1.2.5.2. DescribeSeriesIdFamilies

You can call this operation to query instance families.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeSeriesIdFamilies	The operation that you want to perform. Set the value to DescribeSeriesIdFamilies.

Response parameters

Parameter	Type	Example	Description
data	Struct		The collection of results.

Parameter	Type	Example	Description
result	Array of dataItem		The collection of data.
baseVersion	String	3.13	The version of the instance type.
gmtCreate	String	2019-10-15 17:47:27	The creation time of the instance type.
gmtModified	String	2019-10-15 17:47:27	The modification time of the instance type.
pageOrder	String	null	The order of instance types.
pageSize	Integer	5	The number of entries returned per page.
pageSort	String	null	The sorting of pages.
pageStart	Integer	1	The number of the page to query. Start from page 1.
regionId	String	cn-qingdao-env66-d01	The region ID.
resourceType	String	RDS	The resource type.
seriesId	String	drds.sn2.8c32g	The ID of the edition.
seriesName	String	Standard Edition	The name of the edition.
seriesNameLabel	String	Standard Edition	The display name of the edition.
specFrom	String	systen	The source of the instance type.
status	String	Available	The status.
status	Integer	200	The returned status code.
success	String	true	The success code.

Parameter	Type	Example	Description
host	String	""	The host address.
status	Integer	200	The returned status code.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeSeriesIdFamilies
&<Common request parameters>
```

Sample success responses

`XML` format

```
<data>
    <result>
        <gmtModified>2019-10-15 17:47:27</gmtModified>
        <baseVersion>3.13</baseVersion>
        <seriesName>Standard Edition</seriesName>
        <pageSize>5</pageSize>
        <specFrom>systen</specFrom>
        <gmtCreate>2019-10-15 17:47:27</gmtCreate>
        <seriesId>drds.sn2.8c32g</seriesId>
        <pageOrder>null</pageOrder>
        <pageSort>null</pageSort>
        <regionId>cn-qingdao-env66-d01</regionId>
        <pageStart>1</pageStart>
        <seriesNameLabel>Standard Edition</seriesNameLabel>
        <status>Available</status>
        <resourceType>RDS</resourceType>
    </result>
    <success>true</success>
    <status>200</status>
</data>
<host>""</host>
<status>200</status>
```

`JSON` format

```
{
    "data": {
        "result": [
            {
                "gmtModified": "2019-10-15 17:47:27",
                "baseVersion": "3.13",
                "seriesName": "Standard Edition",
                "pageSize": "5",
                "specFrom": "systen",
                "gmtCreate": "2019-10-15 17:47:27",
                "seriesId": "drds.sn2.8c32g",

                "pageStart": "1",
                "seriesNameLabel": "Standard Edition",
                "status": "Available",
                "resourceType": "RDS"
            }
        ],
        "success": "true",
        "status": "200"
    },
    "host": """,
    "status": "200"
}
```

1.1.2.5.3. GroupCommonSpec

You can call this operation to query the valid values of the specifications-specific fields.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	GroupCommonSpec	The operation that you want to perform. Set the value to GroupCommonSpec.
groupFiled	String	Yes	storageType	The field for which to query valid values.
resourceType	String	Yes	RDS	The resource type.
label	String	No	""	The tag.

Response parameters

Parameter	Type	Example	Description
data	Struct		The dataset.
data	List	[{ "storageType":"AutoTest_Wn4MRxEkKK" }, { "storageType":"AutoTest_UZOBAEDvil" }, { "storageType":"AutoTest_8WqAc6rtpp" }, { "storageType":"AutoTest_aCPiv2nIh3" }, { "storageType":"Standard" }, { "storageType":"1" }]	The collection of results.
status	Integer	200	The returned status code.
success	String	true	The success code.
host	String	""	The host address.
status	Integer	200	The returned status code.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=GroupCommonSpec
&groupFiled=storageType
&resourceType=RDS
&<Common request parameters>
```

Sample success responses

`XML` format

```
<data>
    <data>[         {             "storageType":"AutoTest_Wn4MRxEkKK"         },         {
"storageType":"AutoTest_UZOBAEDvil"         },         {             "storageType":"AutoTes
t_8WqAc6rtpp"         },         {             "storageType":"AutoTest_aCPiv2nIh3"
},         {             "storageType":"Standard"         },         {             "storage
Type":"1"         }     ]</data>
    <success>true</success>
    <status>200</status>
</data>
<host>""</host>
<status>200</status>
```

`JSON` format

```
{
    "data": {
        "data": "[         {             \"storageType\":\"AutoTest_Wn4MRxEkKK\"         },
{             \"storageType\":\"AutoTest_UZOBAEDvil\"         },         {             \"st
orageType\":\"AutoTest_8WqAc6rtpp\"         },         {             \"storageType\":\"Auto
Test_aCPiv2nIh3\"         },         {             \"storageType\":\"Standard\"         },
{             \"storageType\":\"1\"         }     ]",
        "success": "true",
        "status": "200"
    },
    "host": "\"\"",
    "status": "200"
}
```

1.1.2.5.4. GetRegionsByProduct

You can call this operation to query the region list of a service.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	GetRegionsByProduct	The operation that you want to perform. Set the value to GetRegionsByProduct.
ProductName	String	Yes	ecs	The name of the service.
Organization	String	No	1	The ID of the organization.

Response parameters

Parameter	Type	Example	Description
body	Struct		The response body.
RegionList	Array of Region		The list of regions.
RegionId	String	cn-qingdao-env17-d01	The ID of the region.
RegionType	String	center	The type of the region. Valid values: center and cell.
code	Integer	200	The returned status code.
successResponse	Boolean	true	Indicates whether the response was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=GetRegionsByProduct
&ProductName=ecs
&<Common request parameters>
```

Sample success responses

`XML` format

```
<successResponse>true</successResponse>
<code>200</code>
<body>
    <RegionList>
        <RegionType>center</RegionType>
        <RegionId>cn-qingdao-env17-d01</RegionId>
    </RegionList>
</body>
```

`JSON` format

```
{
    "successResponse": "true",
    "code": "200",
    "body": {
        "RegionList": [
            {
                "RegionType": "center",
                "RegionId": "cn-qingdao-env17-d01"
            }
        ]
    }
}
```

1.1.2.5.5. DescribeInstanceTypeFamilies

You can call this operation to query Elastic Compute Service (ECS) instance families.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeInstanceTypeFamilies	The operation that you want to perform. Set the value to DescribeInstanceTypeFamilies.

Response parameters

Parameter	Type	Example	Description
data	Struct		The collection of results.
result	Struct		The collection of data.
instanceTypeFamilies	Array of instanceTypeFamilie		The ECS instance families.
generation	String	""	The code of the instance family.
instanceTypeFamilyId	String	ecs.se1ne	The ID of the instance family.
status	Integer	200	The returned status code.
success	String	true	The returned success code.

Parameter	Type	Example	Description
host	String	""	The host address.
status	Integer	200	The returned status code.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeInstanceTypeFamilies
&<Common request parameters>
```

Sample success responses

`XML` format

```
<data>
    <result>
        <instanceTypeFamilies>
            <generation>""</generation>
            <instanceTypeFamilyId>ecs.se1ne</instanceTypeFamilyId>
        </instanceTypeFamilies>
    </result>
    <success>true</success>
    <status>200</status>
</data>
<host>""</host>
<status>200</status>
```

`JSON` format

```
{
    "data": {
        "result": {
            "instanceTypeFamilies": [
                {
                    "generation": "\"\"",
                    "instanceTypeFamilyId": "ecs.se1ne"
                }
            ]
        },
        "success": "true",
        "status": "200"
    },
    "host": "\"\"",
    "status": "200"
}
```

1.1.2.5.6. GetRegionsByProduct

Queries the region list of a service.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	GetRegionsByProduct	The operation that you want to perform. Set the value to GetRegionsByProduct.
ProductName	String	Yes	ecs	The name of the service.
Organization	String	No	1	The ID of the organization.

Response parameters

Parameter	Type	Example	Description
body	Struct		The response body.
RegionList	Array of Region		The list of regions.
RegionId	String	cn-qingdao-env17-d01	The ID of the region.
RegionType	String	center	The type of the region. • center • cell
code	Integer	200	The HTTP status code.
successResponse	Boolean	true	Indicates whether the call is successful.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=GetRegionsByProduct
&ProductName=ecs
&<Common request parameters>
```

Sample success responses

`XML` format

```
<successResponse>true</successResponse>
<code>200</code>
<body>
    <RegionList>
        <RegionType>center</RegionType>
        <RegionId>cn-qingdao-env17-d01</RegionId>
    </RegionList>
</body>
```

`JSON` format

```
{
    "successResponse": "true",
    "code": "200",
    "body": {
        "RegionList": [
            {
                "RegionType": "center",
                "RegionId": "cn-qingdao-env17-d01"
            }
        ]
    }
}
```

1.1.2.6. Configurations

1.1.2.6.1. RemoveLoginPolicyById

Deletes a logon policy.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	RemoveLoginPolicyById	The operation that you want to perform. Set the value to RemoveLoginPolicyById.
Id	Integer	Yes	2	The ID of the logon policy.

Response parameters

Parameter	Type	Example	Description
code	String	200	The HTTP status code.

Parameter	Type	Example	Description
cost	Integer	1000	The amount of time taken to perform the operation.
message	String	success	The error message.
pureListData	Boolean	false	Indicates whether only data is returned and other parameters are not returned.
redirect	Boolean	false	Indicates whether redirections are performed.
success	Boolean	true	Indicates whether the call is successful.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=RemoveLoginPolicyById
&Id=2
&<Common request parameters>
```

Sample success responses

`XML` format

```
<redirect>false</redirect>
<cost>1000</cost>
<code>200</code>
<success>true</success>
<pureListData>false</pureListData>
<message>success</message>
```

`JSON` format

```
{
    "redirect": "false",
    "cost": "1000",
    "code": "200",
    "success": "true",
    "pureListData": "false",
    "message": "success"
}
```

1.1.2.6.2. GetPasswordPolicy

Queries a password policy.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	GetPasswordPolicy	The operation that you want to perform. Set the value to GetPasswordPolicy.

Response parameters

Parameter	Type	Example	Description
code	String	200	The HTTP status code.
cost	Integer	1000	The amount of time taken to perform the operation.
data	Struct		The response.
hardExpiry	Boolean	true	Indicates whether the password expires.
maxLoginAttemps	Integer	5	The maximum number of logon attempts within 1 hour when the password is incorrect.
maxPasswordAge	Integer	90	The validity period of the password. Unit: days. 0 indicates that the password expiration policy is disabled.
minimumPasswordLength	Integer	10	The minimum number of characters in the password.
passwordErrorLockPeriod	Integer	30	The locking period of the password.
passwordErrorTolerancePeriod	Integer	5	The tolerance period of the password when a password error occurs.
passwordReusePrevention	Integer	5	The number of previous passwords that the user is disallowed to reuse. Default value: 0. The default value indicates that the user can reuse previous passwords.

Parameter	Type	Example	Description
requireLowercaseCharacters	Boolean	true	Indicates whether lowercase letters are required.
requireNumbers	Boolean	true	Indicates whether digits are required.
requireSymbols	Boolean	true	Indicates whether special characters are required.
requireUppercaseCharacters	Boolean	true	Indicates whether uppercase letters are required.
message	String	success	The error message.
pureListData	Boolean	false	Indicates whether only data is returned and other parameters are not returned.
redirect	Boolean	false	Indicates whether redirections are performed.
success	Boolean	true	Indicates whether the call is successful.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=GetPasswordPolicy
&<Common request parameters>
```

Sample success responses

`XML` format

```
<redirect>false</redirect>
<cost>1000</cost>
<code>200</code>
<data>
    <passwordErrorTolerancePeriod>5</passwordErrorTolerancePeriod>
    <minimumPasswordLength>10</minimumPasswordLength>
    <requireSymbols>true</requireSymbols>
    <passwordErrorLockPeriod>30</passwordErrorLockPeriod>
    <passwordReusePrevention>5</passwordReusePrevention>
    <maxLoginAttemps>5</maxLoginAttemps>
    <requireLowercaseCharacters>true</requireLowercaseCharacters>
    <hardExpiry>true</hardExpiry>
    <requireNumbers>true</requireNumbers>
    <requireUppercaseCharacters>true</requireUppercaseCharacters>
    <maxPasswordAge>90</maxPasswordAge>
</data>
<success>true</success>
<pureListData>false</pureListData>
<message>success</message>
```

`JSON` format

```
{
    "redirect": "false",
    "cost": "1000",
    "code": "200",
    "data": {
        "passwordErrorTolerancePeriod": "5",
        "minimumPasswordLength": "10",
        "requireSymbols": "true",
        "passwordErrorLockPeriod": "30",
        "passwordReusePrevention": "5",
        "maxLoginAttemps": "5",
        "requireLowercaseCharacters": "true",
        "hardExpiry": "true",
        "requireNumbers": "true",
        "requireUppercaseCharacters": "true",
        "maxPasswordAge": "90"
    },
    "success": "true",
    "pureListData": "false",
    "message": "success"
}
```

1.1.2.6.3. ResetPasswordPolicy

Resets a password policy.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ResetPasswordPolicy	The operation that you want to perform. Set the value to ResetPasswordPolicy.

Response parameters

Parameter	Type	Example	Description
code	String	200	The HTTP status code.
cost	Integer	1000	The amount of time taken to perform the operation.
data	Struct		The response.
hardExpiry	Boolean	true	Indicates whether the password expires.
maxLoginAttemps	Integer	5	The maximum number of logon attempts within 1 hour when the password is incorrect.
maxPasswordAge	Integer	90	The validity period of the password. Unit: days. 0 indicates that the password expiration policy is disabled.
minimumPasswordLength	Integer	10	The minimum number of characters in the password.
passwordErrorLockPeriod	Integer	30	The locking period of the password.
passwordErrorTolerancePeriod	Integer	5	The tolerance period of the password when a password error occurs.
passwordReusePrevention	Integer	5	The number of previous passwords that the user is disallowed to reuse. The default value is 0, which indicates that the users can reuse previous passwords.
requireLowercaseCharacters	Boolean	true	Indicates whether lowercase letters are required.

Parameter	Type	Example	Description
requireNumbers	Boolean	true	Indicates whether digits are required.
requireSymbols	Boolean	true	Indicates whether special characters are required.
requireUppercaseCharacters	Boolean	true	Indicates whether uppercase letters are required.
message	String	success	The error message.
pureListData	Boolean	false	Indicates whether only data is returned and other parameters are not returned.
redirect	Boolean	false	Indicates whether redirections are performed.
success	Boolean	true	Indicates whether the call is successful.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=ResetPasswordPolicy
&<Common request parameters>
```

Sample success responses

`XML` format

```
<redirect>false</redirect>
<cost>1000</cost>
<code>200</code>
<data>
    <passwordErrorTolerancePeriod>5</passwordErrorTolerancePeriod>
    <minimumPasswordLength>10</minimumPasswordLength>
    <requireSymbols>true</requireSymbols>
    <passwordErrorLockPeriod>30</passwordErrorLockPeriod>
    <passwordReusePrevention>5</passwordReusePrevention>
    <maxLoginAttemps>5</maxLoginAttemps>
    <requireLowercaseCharacters>true</requireLowercaseCharacters>
    <hardExpiry>true</hardExpiry>
    <requireNumbers>true</requireNumbers>
    <requireUppercaseCharacters>true</requireUppercaseCharacters>
    <maxPasswordAge>90</maxPasswordAge>
</data>
<success>true</success>
<pureListData>false</pureListData>
<message>success</message>
```

`JSON` format

```
{
    "redirect": "false",
    "cost": "1000",
    "code": "200",
    "data": {
        "passwordErrorTolerancePeriod": "5",
        "minimumPasswordLength": "10",
        "requireSymbols": "true",
        "passwordErrorLockPeriod": "30",
        "passwordReusePrevention": "5",
        "maxLoginAttemps": "5",
        "requireLowercaseCharacters": "true",
        "hardExpiry": "true",
        "requireNumbers": "true",
        "requireUppercaseCharacters": "true",
        "maxPasswordAge": "90"
    },
    "success": "true",
    "pureListData": "false",
    "message": "success"
}
```

1.1.2.6.4. SetPasswordPolicy

Modifies a password policy.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	SetPasswordPolicy	The operation that you want to perform. Set the value to SetPasswordPolicy.
HardExpiry	Boolean	No	true	Specifies whether the password expires.
RequireNumbers	Boolean	No	true	Specifies whether digits are required.
RequireSymbols	Boolean	No	true	Specifies whether special characters are required.
RequireLowercaseCharacters	Boolean	No	true	Specifies whether lowercase letters are required.
RequireUppercaseCharacters	Boolean	No	true	Specifies whether uppercase letters are required.
MaxLoginAttemps	Integer	No	5	The maximum number of logon attempts within 1 hour when the password is incorrect.
MaxPasswordAge	Integer	No	90	The validity period of the password. Unit: days. 0 indicates that the password expiration policy is disabled.
MinimumPasswordLength	Integer	No	10	The minimum required number of characters in the password.
PasswordReusePrevention	Integer	No	5	The number of previous passwords that the user is disallowed to reuse. Default value: 0. The default value indicates that the user can reuse previous passwords.

Response parameters

Parameter	Type	Example	Description
code	String	200	The HTTP status code.

Parameter	Type	Example	Description
cost	Integer	1000	The amount of time taken to perform the operation.
data	Struct		The response.
hardExpiry	Boolean	true	Indicates whether the password expires.
maxLoginAttemps	Integer	5	The maximum number of logon attempts within 1 hour when the password is incorrect.
maxPasswordAge	Integer	90	The validity period of the password. Unit: days. 0 indicates that the password expiration policy is disabled.
minimumPasswordLength	Integer	10	The minimum number of characters in the password.
passwordErrorLockPeriod	Integer	30	The locking period of the password.
passwordErrorTolerancePeriod	Integer	5	The tolerance period of the password when a password error occurs.
passwordReusePrevention	Integer	5	The number of previous passwords that the user is disallowed to reuse. Default value: 0. The default value indicates that the user can reuse previous passwords.
requireLowercaseCharacters	Boolean	true	Indicates whether lowercase letters are required.
requireNumbers	Boolean	true	Indicates whether digits are required.
requireSymbols	Boolean	true	Indicates whether special characters are required.
requireUppercaseCharacters	Boolean	true	Indicates whether uppercase letters are required.

Parameter	Type	Example	Description
message	String	success	The error message.
pureListData	Boolean	false	Indicates whether only data is returned and other parameters are not returned.
redirect	Boolean	false	Indicates whether redirections are performed.
success	Boolean	true	Indicates whether the call is successful.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=SetPasswordPolicy
&<Common request parameters>
```

Sample success responses

`XML` format

```
<redirect>false</redirect>
<cost>1000</cost>
<code>200</code>
<data>
    <passwordErrorTolerancePeriod>5</passwordErrorTolerancePeriod>
    <minimumPasswordLength>10</minimumPasswordLength>
    <requireSymbols>true</requireSymbols>
    <passwordErrorLockPeriod>30</passwordErrorLockPeriod>
    <passwordReusePrevention>5</passwordReusePrevention>
    <maxLoginAttemps>5</maxLoginAttemps>
    <requireLowercaseCharacters>true</requireLowercaseCharacters>
    <hardExpiry>true</hardExpiry>
    <requireNumbers>true</requireNumbers>
    <requireUppercaseCharacters>true</requireUppercaseCharacters>
    <maxPasswordAge>90</maxPasswordAge>
</data>
<success>true</success>
<pureListData>false</pureListData>
<message>success</message>
```

```

1.1.2.7. Monitoring

1.1.2.7.1. Major metrics for Apsara Stack services

Precautions

- The Sum function is used to measure the total amount of an object during a specific time period. For example, you can measure the total amount of Internet traffic (KB/minute) that goes through an Elastic Compute Service (ECS) instance within a period of 5 minutes.
- You can use API operations to query monitoring data of the last 31 days.
- The Dimensions value is a JSON string. Example: `{"instanceId":"i-23gyb3kkd"}`.

Metrics for ECS whose namespace is acs_ecs_dashboard

Basic metrics

- The following metrics are used to monitor basic ECS properties. You can query monitoring data of these metrics without installing the CloudMonitor agent.
- Set Project to *acs_ecs_dashboard* and the statistical period to 60 seconds. Set Period to an integer multiple of 60.
- Assign the actual instance ID to instanceId in the Dimensions parameter.

Metric	Description	Unit	Dimensions	Statistics
InternetInRate	The inbound bandwidth to the Internet.	bit/s	instanceId	Average, Minimum, and Maximum

Metric	Description	Unit	Dimensions	Statistics
IntranetInRate	The inbound bandwidth to the internal network.	bit/s	instanceId	Average, Minimum, and Maximum
IntranetOutRate	The outbound bandwidth from the internal network.	bit/s	instanceId	Average, Minimum, and Maximum
DiskReadBPS	The number of bytes read from the system disk per second.	Bps	instanceId	Average, Minimum, and Maximum
DiskWriteBPS	The number of bytes written to the system disk per second.	Bps	instanceId	Average, Minimum, and Maximum
DiskReadIOPS	The number of read operations performed on the system disk per second.	Count/Second	instanceId	Average, Minimum, and Maximum
DiskWriteIOPS	The number of write operations performed on the system disk per second.	Count/Second	instanceId	Average, Minimum, and Maximum

Operating system metrics

The minimum period value is 15 seconds.

Metric	Description	Unit	Dimensions	Statistics
cpu_total	The total CPU utilization.	%	instanceId	Average, Minimum, and Maximum
memory_usedutilization	The memory usage.	%	instanceId	Average, Minimum, and Maximum
load_1m	The average system load in the last 1 minute. Windows operating systems do not support this metric.	N/A	instanceId	Average, Minimum, and Maximum

Metric	Description	Unit	Dimensions	Statistics
load_5m	The average system load in the last 5 minutes. Windows operating systems do not support this metric.	N/A	instanceId	Average, Minimum, and Maximum
load_15m	The average system load in the last 15 minutes. Windows operating systems do not support this metric.	N/A	instanceId	Average, Minimum, and Maximum
diskusage_utilization	The disk usage.	%	instanceId and device	Average, Minimum, and Maximum
disk_readbytes	The number of bytes that are read from the specified disk per second.	byte/s	instanceId and device	Average, Minimum, and Maximum
disk_writebytes	The number of bytes that are written to the specified disk per second.	byte/s	instanceId and device	Average, Minimum, and Maximum
disk_readiops	The number of read requests received by the specified disk per second.	count/s	instanceId and device	Average, Minimum, and Maximum
disk_writeiops	The number of write requests received by the specified disk per second.	count/s	instanceId and device	Average, Minimum, and Maximum
fs_inodeutilization	The inode usage.	%	instanceId and device	Average, Minimum, and Maximum

Metrics for ApsaraDB RDS whose namespace is acs_rds_dashboard

- Set Project to *acs_rds_dashboard* and the statistical period to 300 seconds. Set Period to an integer multiple of 300.
- If you have set the monitoring period to 1 minute in the ApsaraDB RDS console, you must set the

statistical period to 60 seconds or more.

- Assign the actual instance ID to instanceId in the Dimensions parameter.

Metrics for ApsaraDB RDS for PostgreSQL

Metric	Description	Unit	Dimensions	Statistics
CpuUsage	The CPU utilization.	Percent	instanceId	Average, Minimum, and Maximum
DiskUsage	The disk usage.	Percent	instanceId	Average, Minimum, and Maximum
IOPSUsage	The IOPS usage.	Percent	instanceId	Average, Minimum, and Maximum
ConnectionUsage	The connection usage.	Percent	instanceId	Average, Minimum, and Maximum
MemoryUsage	The memory usage.	Percent	instanceId	Average, Minimum, and Maximum

Metrics for ApsaraDB RDS for MySQL

Metric	Description	Unit	Dimensions	Statistics
MySQL_NetworkInNew	The amount of data sent to an ApsaraDB RDS for MySQL instance per second.	bit/s	instanceId	Average, Minimum, and Maximum
MySQL_NetworkOutNew	The amount of data sent from an ApsaraDB RDS for MySQL instance per second.	bit/s	instanceId	Average, Minimum, and Maximum
CpuUsage	The CPU utilization.	Percent	instanceId	Average, Minimum, and Maximum
DiskUsage	The disk usage.	Percent	instanceId	Average, Minimum, and Maximum
IOPSUsage	The IOPS usage.	Percent	instanceId	Average, Minimum, and Maximum

Metric	Description	Unit	Dimensions	Statistics
ConnectionUsage	The connection usage.	Percent	instanceId	Average, Minimum, and Maximum
MemoryUsage	The memory usage.	Percent	instanceId	Average, Minimum, and Maximum

Metrics for ApsaraDB RDS for SQL Server

Metric	Description	Unit	Dimensions	Statistics
SQLServer_NetworkInNew	The amount of data sent to an ApsaraDB RDS for SQL Server instance per second.	bit/s	instanceId	Average, Minimum, and Maximum
SQLServer_NetworkOutNew	The amount of data sent from an ApsaraDB RDS for SQL Server instance per second.	bit/s	instanceId	Average, Minimum, and Maximum
CpuUsage	The CPU utilization.	Percent	instanceId	Average, Minimum, and Maximum
DiskUsage	The disk usage.	Percent	instanceId	Average, Minimum, and Maximum
IOPSUsage	The IOPS usage.	Percent	instanceId	Average, Minimum, and Maximum
ConnectionUsage	The connection usage.	Percent	instanceId	Average, Minimum, and Maximum
MemoryUsage	The memory usage.	Percent	instanceId	Average, Minimum, and Maximum

Metrics for Server Load Balancer (SLB) whose namespace is acs_slb_dashboard

- Set Project to *acs_slb_dashboard* and the statistical period to 60 seconds. Set Period to an integer multiple of 60.
- Assign the actual instance ID to instanceId in the Dimensions parameter.

- Assign the actual port used by the SLB instance to port in the Dimensions parameter.
- Assign the actual endpoint of the SLB instance to vip in the Dimensions parameter.

Metric	Description	Unit	Dimensions	Statistics
HeathyServerCount	The number of healthy backend ECS instances.	Count	instanceId	Average, Minimum, and Maximum
UnhealthyServerCount	The number of faulty backend ECS instances.	Count	instanceId	Average, Minimum, and Maximum
PacketTX	The number of packets sent over the specified port per second.	Count/Second	instanceId, port, and vip	Average, Minimum, and Maximum
PacketRX	The number of packets received over the specified port per second.	Count/Second	instanceId, port, and vip	Average, Minimum, and Maximum
TrafficRXNew	The amount of data received over the specified port per second.	bit/s	instanceId, port, and vip	Average, Minimum, and Maximum
TrafficTXNew	The amount of data sent over the specified port per second.	bit/s	instanceId, port, and vip	Average, Minimum, and Maximum
ActiveConnection	The number of active connections to SLB on the specified port.	Count	instanceId, port, and vip	Average, Minimum, and Maximum
InactiveConnection	The number of idle connections to SLB on the specified port.	Count	instanceId, port, and vip	Average, Minimum, and Maximum
NewConnection	The number of new connections on the specified port.	Count	instanceId, port, and vip	Average, Minimum, and Maximum
MaxConnection	The number of concurrent connections on the specified port.	Count	instanceId, port, and vip	Average, Minimum, and Maximum

Metric	Description	Unit	Dimensions	Statistics
DropConnection	The number of connections that are dropped per second.	Count/Second	instanceId, port, and vip	Average, Minimum, and Maximum
DropPacketRX	The number of inbound packets that are lost per second.	Count/Second	instanceId, port, and vip	Average, Minimum, and Maximum
DropPacketTX	The number of outbound packets that are lost per second.	Count/Second	instanceId, port, and vip	Average, Minimum, and Maximum
DropTrafficRX	The amount of inbound data that is lost per second.	bit/s	instanceId, port, and vip	Average, Minimum, and Maximum
DropTrafficTX	The amount of outbound data that is lost per second.	bit/s	instanceId, port, and vip	Average, Minimum, and Maximum

Metrics for KVStore for Redis whose namespace is acs_kvstore

- Set Project to *acs_kvstore* and the statistical period to 60 seconds. Set Period to an integer multiple of 60.
- Assign the actual instance ID to instanceId in the Dimensions parameter.

Metric	Description	Unit	Dimensions	Statistics
ConnectionUsage	The connection usage on the specified node.	%	instanceId and nodeId	Average and Maximum
FailedCount	The number of failed commands.	Count/second	instanceId	instanceId and nodeId
IntranetIn	The inbound bandwidth of the specified node.	bit/s	instanceId and nodeId	Average and Maximum
IntranetInRatio	The inbound bandwidth usage of the specified node.	%	instanceId and nodeId	Average and Maximum
IntranetOut	The outbound bandwidth of the specified node.	bit/s	instanceId and nodeId	Average and Maximum

Metric	Description	Unit	Dimensions	Statistics
IntranetOutRatio	The outbound bandwidth usage of the specified node.	%	instanceId and nodeId	Average and Maximum
MemoryUsage	The memory usage of the specified node.	%	instanceId and nodeId	Average and Maximum
UsedQPS	The average queries on the specified node per second.	Count	instanceId and nodeId	Average and Maximum

Metrics for Object Storage Service (OSS) whose namespace is acs_oss_dashboard

Metric	Metric name	Unit	Level
Availability	Availability	%	Bucket level
RequestValidRate	Valid request rate	%	Bucket level
TotalRequestCount	Total requests	N/A	Bucket level
ValidRequestCount	Valid requests	N/A	Bucket level
InternetSend	Outbound traffic from the Internet	byte	Bucket level
InternetRecv	Inbound traffic to the Internet	byte	Bucket level
IntranetSend	Outbound traffic from the internal network	byte	Bucket level
IntranetRecv	Inbound traffic to the internal network	byte	Bucket level
CdnSend	CDN outbound traffic	byte	Bucket level
CdnRecv	CDN inbound traffic	byte	Bucket level
SyncSend	Outbound traffic of cross-region replication	byte	Bucket level
SyncRecv	Inbound traffic of cross-region replication	byte	Bucket level
ServerErrorCount	Server-side error requests	N/A	Bucket level

Metric	Metric name	Unit	Level
ServerErrorRate	Server-side error request rate	%	Bucket level
NetworkErrorCount	Network-side error requests	N/A	Bucket level
NetworkErrorRate	Network-side error request rate	%	Bucket level
AuthorizationErrorCount	Client-side authorization error requests	N/A	Bucket level
AuthorizationErrorRate	Client-side authorization error request rate	%	Bucket level
ResourceNotFoundErrorCount	Client-side error requests indicating resources not found	N/A	Bucket level
ResourceNotFoundErrorRate	Rate of client-side error requests indicating resources not found	%	Bucket level
ClientTimeoutErrorCount	Client-side timeout error requests	N/A	Bucket level
ClientTimeoutErrorRate	Client-side timeout error request rate	%	Bucket level
ClientOtherErrorCount	Other client-side error requests	N/A	Bucket level
ClientOtherErrorRate	Rate of other client-side error requests	%	Bucket level
SuccessCount	Successful requests	N/A	Bucket level
SuccessRate	Successful request rate	%	Bucket level
RedirectCount	Redirect requests	N/A	Bucket level
RedirectRate	Redirect request rate	%	Bucket level
MaxGetObjectE2eLatency	Maximum end-to-end latency of GetObject requests	ms	Bucket level
MaxGetObjectServerLatency	Maximum server latency of GetObject requests	ms	Bucket level

Metric	Metric name	Unit	Level
MaxHeadObjectE2eLatency	Maximum end-to-end latency of HeadObject requests	ms	Bucket level
MaxHeadObjectServerLatency	Maximum server latency of HeadObject requests	ms	Bucket level
MaxPutObjectE2eLatency	Maximum end-to-end latency of PutObject requests	ms	Bucket level
MaxPutObjectServerLatency	Maximum server latency of PutObject requests	ms	Bucket level
MaxPostObjectE2eLatency	Maximum end-to-end latency of PostObject requests	ms	Bucket level
MaxPostObjectServerLatency	Maximum server latency of PostObject requests	ms	Bucket level
MaxAppendObjectE2eLatency	Maximum end-to-end latency of AppendObject requests	ms	Bucket level
MaxAppendObjectServerLatency	Maximum server latency of AppendObject requests	ms	Bucket level
MaxUploadPartE2eLatency	Maximum end-to-end latency of UploadPart requests	ms	Bucket level
MaxUploadPartServerLatency	Maximum server latency of UploadPart requests	ms	Bucket level
MaxUploadPartCopyE2eLatency	Maximum end-to-end latency of UploadPartCopy requests	ms	Bucket level
MaxUploadPartCopyServerLatency	Maximum server latency of UploadPartCopy requests	ms	Bucket level
GetObjectCount	Successful GetObject requests	N/A	Bucket level
HeadObjectCount	Successful HeadObject requests	N/A	Bucket level
PostObjectCount	Successful PostObject requests	N/A	Bucket level

Metric	Metric name	Unit	Level
AppendObjectCount	Successful AppendObject requests	N/A	Bucket level
UploadPartCount	Successful UploadPart requests	N/A	Bucket level
DeleteObjectCount	Successful DeleteObject requests	N/A	Bucket level
DeleteObjectsCount	Successful DeleteObjects requests	N/A	Bucket level

Metrics for VPN Gateway

Set Project to *acs_vpn* and the statistical period to 60 seconds. Set Period to an integer multiple of 60.

Metric	Description	Unit	Dimensions
ssl_client.count	The number of SSL connections.	count	instanceId
ipsec.rxPkgs	The number of inbound packets of a connection per second.	package/s	VpnConnectionId
ipsec.txPkgs	The number of outbound packets of a connection per second.	package/s	VpnConnectionId
ipsec_rx.rate	The inbound bandwidth of a connection.	bit/s	VpnConnectionId
ipsec_tx.rate	The outbound bandwidth of a connection.	bit/s	VpnConnectionId

Metrics for API Gateway

Metric	Description	Unit	Dimensions	Statistics
Latency	The response time.	ms	userId, region, and apiUid	Average
SumQPS	The overall queries per second (QPS).	Count	userId, region, and apiUid	Count
TrafficRX	The inbound bandwidth.	KBytes	userId, region, and apiUid	Sum

Metric	Description	Unit	Dimensions	Statistics
TrafficTX	The outbound bandwidth.	KBytes	userId, region, and apiUid	Sum
code2XX	code2XX	count	userId, region, and apiUid	Value
code4XX	code4XX	count	userId, region, and apiUid	Value
code5XX	code5XX	count	userId, region, and apiUid	Value

Metrics for Elastic IP Address (EIP)

- Set Project to *acs_vpc_eip* and the statistical period to 60 seconds. Set Period to an integer multiple of 60.
- Assign the actual instance ID to instanceId in the Dimensions parameter.
- Assign the actual elastic IP address (EIP) to ip in the Dimensions parameter.

Metric	Description	Unit	Dimensions	Statistics
net_rx.rate	The inbound bandwidth.	bits/s	userId and instanceId	Value
net_rxPkgs.rate	The number of inbound packets per second.	Packets/Second	userId and instanceId	Value
net_rx.rate	The outbound bandwidth.	bits/s	userId and instanceId	Value
net_txPkgs.rate	The number of outbound packets per second.	Packets/Second	userId and instanceId	Value
out_ratelimit_drop_speed	The packet loss rate when the data transfer rate is limited.	Packets/Second	userId and instanceId	Average

Metrics for AnalyticDB for PostgreSQL

Metric	Description	Unit	Dimensions	Statistics
ConnectionUsage	The connection usage.	%	userId, instanceId, and role	Average
CpuUsage	The CPU utilization.	%	userId, instanceId, and role	Average

Metric	Description	Unit	Dimensions	Statistics
DiskUsage	The disk usage.	%	userId, instanceId, and role	Average
IOPSUsage	The IOPS usage.	%	userId, instanceId, and role	Average
MemoryUsage	The memory usage.	%	userId, instanceId, and role	Average

1.1.2.7.2. Monitoring data on time series metrics of cloud services

1.1.2.7.2.1. DescribeProjectMeta

You can call this operation to query information of monitored services in Cloud Monitor.

The information obtained by this operation includes the service description, namespace, and tags.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeProjectMeta	The operation that you want to perform. Set the value to DescribeProjectMeta.
callerType	String	No	""	The type of the caller.

Parameter	Type	Required	Example	Description
Labels	String	No	[{"name":"product","value":"ECS"}]	The tags of metrics. You can specify tags of metrics to filter services. A tag of a metric is used as a special mark of alerts triggered by the metric. For example, a tag can specify the service specification to which an alert belongs and whether an alert rule can be configured for a metric. The format is `[{"name":"Tag name","value":"Tag value"},{"name":"Tag name","value":"Tag value"}]`. The following section describes the common tags: • alertUnit: the unit of the metric in the alert. **Note** The original metric value may be too large due to a small unit. In this case, you can use the `alertUnit` tag to specify an appropriate unit. This tag is used in Cloud Monitor. • minAlertPeriod: the minimum time interval to raise a new alert. Typically, the interval is 1 minute. • metricCategory: the service specification. Example: kvstore_sharding. **Note** Some services of Apsara Stack have different specifications with the same namespace. The metricCategory tag can be used to distinguish between the specifications. • is_alarm: specifies whether an alert rule can be configured for a metric. **Note** Apsara Stack has some other tags that are dedicated for Cloud Monitor. We recommend that you do not use such tags.

Parameter	Type	Required	Example	Description
PageNumber	Integer	No	1	The number of the page to return. Default value: 1.
PageSize	Integer	No	30	The number of entries to return on each page. Default value: 30. **Note** Apsara Stack does not limit the value of this parameter. If you want to view all desired entries on a small number of pages, set this parameter to a greater value.
RequestId	string	No	sdsdsdd	The ID of the request.

Response parameters

Parameter	Type	Example	Description
Code	String	200	The HTTP status code. **Note** The status code 200 indicates that the call was successful.
Message	String	success	The error message.
PageNumber	String	1	The page number of the returned page.
PageSize	String	10	The number of entries returned per page.
RequestId	String	4C2061B2-3B1B-43BF-A4A4-C53426F479C0	The ID of the request.
Resources	Array	N/A	The information of services found.
Resource	N/A	N/A	The information of a service found.
Description	String	CDN	The description of the service.

Parameter	Type	Example	Description
Labels	String	[{"groupFlag":true}]	The tags of metrics. Services were filtered based on the specified tags. A tag of a metric is used as a special mark of alerts triggered by the metric. For example, a tag can specify the service specification to which an alert belongs and whether an alert rule can be configured for a metric. The format is `[{"name":"Tag name","value":"Tag value"},{"name":"Tag name","value":"Tag value"}]`. The following section describes the common tags: • alertUnit: the unit of the metric in the alert. **Note** The original metric value may be too large due to a small unit. In this case, you can use the `alertUnit` tag to specify an appropriate unit. This tag is used in Cloud Monitor. • minAlertPeriod: the minimum time interval to raise a new alert. Typically, the interval is 1 minute. • metricCategory: the service specification. Example: kvstore_sharding. **Note** Some services of Apsara Stack have different specifications with the same namespace. The metricCategory tag can be used to distinguish between the specifications. • is_alarm: specifies whether an alert rule can be configured for a metric. **Note** Apsara Stack has some other tags that are dedicated for Cloud Monitor. We recommend that you do not use such tags.

Parameter	Type	Example	Description
Namespace	String	acs_cdn	The namespace of the service, which is used to distinguish between services. Typically, the value of the format is `acs_Abbreviation of the service name`.
Success	Boolean	true	Indicates whether the call was successful.
Total	String	12	The total number of entries returned.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeProjectMeta
&<Common request parameters>
```

Sample success responses

> **Note** The response content varies with the services that are actually monitored.

`JSON` format

```
{
 "PageNumber":1,
 "PageSize":5,
 "RequestId":"4C2061B2-3B1B-43BF-A4A4-C53426F479C0",
 "Success":true,
 "Code":200,
 "Total":62,
 "Resources":{
  "Resource":[{
     "Description": "ECS",
     "Labels": "[{\"name\":\"product\",\"value\":\"ECS\"},{\"name\":\"productCategory\",\"value\":\"ecs,ecs_net_interface,hpc_node,hpc_cluster\"},{\"name\":\"groupFlag\",\"value\":\"true\"},{\"name\":\"cnName\",\"value\":\"ECS\"},{\"name\":\"enName\",\"value\":\"ECS\"}]",
     "Namespace": "acs_ecs_dashboard"
    },
  ]
 }
}
```

1.1.2.7.2.2. DescribeMetricLast

You can call this operation to query the latest monitoring data of a monitored object.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeMetricLast	The operation that you want to perform. Set the value to DescribeMetricLast.
MetricName	String	Yes	CPUUtilization	The name of the metric.
Namespace	String	Yes	acs_ecs_dashboard	The namespace of the service. Specify the value in the format of acs_Service name.
Dimensions	String	No	[{"instanceId":"XXXXXX"}]	The dimension map of the monitored resources. The value is a collection of `key-value` pairs. A typical `key-value` pair is `instanceId:XXXXXX`. The `key` and `value` must each be 1 to 64 bytes in length. Excessive bytes are truncated from the string. The `key` and `value` can contain letters, digits, periods (.), hyphens (-), underscores (_), forward slashes (/), and backslashes (\). **Note** If you hope to see a key-value map expressed by JSON strings, set `Dimensions` to ordered strings.
EndTime	String	No	2019-01-31 10:10:00	The end of the time range for the query. The value is a UNIX timestamp representing the number of seconds that have elapsed since the epoch time January 1, 1970, 00:00:00 UTC. **Note** Only a time range within the last 270 days can be specified to query.

Parameter	Type	Required	Example	Description
Express	String	No	{"groupby":["userId","instanceId"]}	The expression for real-time computation on the query results.
Length	String	No	1000	The number of entries to return on each page. Default value: 1000.
NextToken	String	No	15761432850009dd70bb64cff1f0fff6c0b08ffff073be5fb1e785e2b020f7fed9b5e137bd810a6d6cff5ae****	The pagination cursor. • If the number of entries that match the search criteria exceeds the maximum number allowed on a single page, a pagination cursor is returned. • This pagination cursor can be used as an input parameter to obtain entries on the next page. If a response does not contain pagination cursors, all query results are returned.
Period	String	No	60	The time interval at which to query monitoring data. Typically, the time interval is the same as the interval for reporting metric data. Unit: seconds. • If you do not specify this parameter, raw data is queried at the reporting interval specified when the corresponding metric was created. • If a statistical period was specified for the corresponding alert rule, raw data is queried based on the statistical period.
StartTime	String	No	2019-01-31 10:00:00	The start of the time range for the query. The value is a UNIX timestamp representing the number of seconds that have elapsed since the epoch time January 1, 1970, 00:00:00 UTC. **Note** Only a time range that covers a maximum of 31 days within the last 270 days can be specified to query.

Response parameters

Parameter	Type	Example	Description
RequestId	String	021472A6-25E3-4094-8D00-BA4B6A5486C3	The ID of the request.
Code	String	200	The HTTP status code. **Note** The status code 200 indicates that the call was successful.
Success	Boolean	true	Indicates whether the call was successful.
Period	String	60	The time interval at which monitoring data was queried. Unit: seconds.
NextToken	String	xxxxxx	The pagination cursor.
Datapoints	String	[{"timestamp":1548777660000,"userId":"123","instanceId":"i-abc","Minimum":9.92,"Average":9.92,"Maximum":9.92}]	The list of monitoring data.
Message	String	Success	The error message.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeMetricLast
&MetricName=CPUUtilization
&Namespace=acs_ecs_dashboard
&<Common request parameters>
```

Sample success responses

`XML` format

```
<QueryMetricListResponse>
    <Period>60</Period>
    <Datapoints>
        <Datapoints>
            <timestamp>1490152860000</timestamp>
            <Maximum>100</Maximum>
```

```

1.1.2.7.2.3. DescribeMetricList

You can call this operation to query the monitoring data of time series metrics of Apsara Stack services in a specified period.

For more information about how to assign values to the Namespace, Project, Metric, Period, and Dimensions parameters for Apsara Stack services, see Major metrics of Apsara Stack services.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeMetricList	The operation that you want to perform. Set the value to DescribeMetricList.
MetricName	String	Yes	cpu_idle	The name of the metric that you want to query.
Namespace	String	Yes	acs_ecs_dashboard	The namespace of the service. Specify the value in the format of acs_Service name.

Parameter	Type	Required	Example	Description
Dimensions	String	No	[{"instanceId": "i-abcdefgh12****"}]	The dimension map of the monitored resources. The value is a collection of `key-value` pairs. A typical `key-value` pair is `instanceId:XXXXXX`. The `key` and `value` must each be 1 to 64 bytes in length. Excessive bytes are truncated from the string. The `key` and `value` can contain letters, digits, periods (.), hyphens (-), underscores (_), forward slashes (/), and backslashes (\). **Note** If you want to see a key-value map expressed by JSON strings, set `Dimensions` to ordered strings.
EndTime	String	No	2019-01-30 00:10:00	The end of the time range for the query. Supported formats: • UNIX timestamp: The value can be a UNIX timestamp representing the number of seconds that have elapsed since the epoch time January 1, 1970, 00:00:00 UTC. • Time format: The value can be in the YYYY-MM-DDThh:mm:ssZ format.
Express	String	No	{"groupby": ["userId","instanceId"]}	The expression for real-time computation on the query results. Only the `groupby` expression is supported, which is similar to the `groupby` statement used in databases.
Length	String	No	1000	The number of entries to return on each page. Default value: 1000.

Parameter	Type	Required	Example	Description
NextToken	String	No	15761485350009dd70bb64cff1f0fff750b08ffff073be5fb1e785e2b020f1a949d5ea14aea7fed82f01dd87311	The pagination cursor. **Note** You do not need to specify this parameter if you only want to obtain entries on the first page. The pagination cursor returned in a response can be used as an input parameter for obtaining entries on the next page. If a response contains no pagination cursors, all the query result has been returned.
Period	String	No	60	The time interval at which monitoring data is queried. Unit: seconds. Valid values: 60, 300, and 900, which represent 1 minute, 5 minutes, and 15 minutes. **Note** Set this parameter to suit your needs. For example, if you set this parameter to 60, only 1,000 records are returned, though a total of 1,440 records are generated. This is because the maximum number of records that can be returned for each query is 1,000. If you set this parameter to 300, 288 records are returned.

Parameter	Type	Required	Example	Description
StartTime	String	No	2019-01-30 00:00:00	The start of the time range for the query. Supported formats: • UNIX timestamp: The value can be a UNIX timestamp representing the number of seconds that have elapsed since the epoch time January 1, 1970, 00:00:00 UTC. • Time format: The value can be in the YYYY-MM-DDThh:mm:ssZ format. **Note** The period specified by StartTime and EndTime includes the time point specified by EndTime but does not include the time point specified by StartTime. StartTime must be earlier than EndTime.

Response parameters

Parameter	Type	Example	Description
RequestId	String	3121AE7D-4AFF-4C25-8F1D-C8226EBB1F42	The ID of the request.
Code	String	200	The HTTP status code. **Note** The status code 200 indicates that the call was successful.
Success	Boolean	true	Indicates whether the call was successful.
NextToken	String	15761441850009dd70bb64cff1f0fff6d0b08ffff073be5fb1e785e2b020f7fed9b5e137bd810a6d6cff5aee816	The pagination cursor. **Note** If this parameter was not specified, only entries on the first page were returned. If a response contains a pagination cursor, more entries are to be returned. If a response contains no pagination cursors, all the query result has been returned.

Parameter	Type	Example	Description
Period	String	60	The time interval at which monitoring data was queried. Unit: seconds. Valid values: 60, 300, and 900.
Datapoints	String	[{"timestamp":1548777660000,"userId":"123","instanceId":"i-abc","Minimum":9.92,"Average":9.92,"Maximum":9.92}]	The list of monitoring data.
Message	String	Success	The error message.

1.1.2.7.2.4. DescribeMetricMetaList

You can call this operation to query the descriptions of time series metrics that are supported in Cloud Monitor.

This operation is used with DescribeMetricList and DescribeMetricLast.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeMetricMetaList	The operation that you want to perform. Set the value to DescribeMetricMetaList.
Namespace	String	Yes	acs_kvstore	The namespace of the service. You can call the DescribeProjectMeta operation to query the namespace of each service.
Labels	String	No	[{"name":"productCategory","value":"kvstore_old"}]	The tags of the metric. You must specify the tags in the following format: `[{"name":"Tag key","value":"Tag value"},{"name":"Tag key","value":"Tag value"}]`. The following tags are available: • metricCategory: the category of the metric. • alertEnable: specifies whether to enable alerts. • alertUnit: the unit of the metric in the alert. • unitFactor: the factor for metric unit conversion. • minAlertPeriod: the minimum time interval to raise a new alert. • productCategory: the category of the service.
MetricName	String	No	CPUUtilization	The name of the metric. The metric with the specified name is matched.
PageNumber	Integer	No	1	The number of the page to return. Default value: 1.
PageSize	Integer	No	30	The number of entries to return on each page. Default value: 30.

Response parameters

Parameter	Type	Example	Description
Success	Boolean	true	Indicates whether the call was successful.
Code	String	200	The HTTP status code. The status code 200 indicates that the call was successful.
RequestId	String	0CCE0AF0-053C-4B13-A583-DC9A85785D49	The ID of the request, which can be used for troubleshooting.
Message	String	success	The error message.
Resources			The information of metrics found.
Resource			The information of a metric found.
Description	String	CPUUtilization	The description of the metric.
Dimensions	String	instanceId	The dimensions of the metric. Multiple dimensions are separated by commas (,). Example: userId,instanceId.
Labels	String	[{\"name\":\"alertUnit\",\"value\":\"Bytes\"},{\"name\":\"minAlertPeriod\",\"value\":\"60\"},{\"name\":\"metricCategory\",\"value\":\"instanceId\"},{\"name\":\"instanceType\",\"value\":\"disaster\"},{\"name\":\"is_alarm\",\"value\":\"true\"},{\"name\":\"productCategory\",\"value\":\"kvstore_old\"}]	The tags of the metric. The value is a JSON array string. The array can include repeated tag names `[{"name":"Tag name","value":"Tag value"}]`. The following tags are available: • metricCategory: the category of the metric. • alertEnable: indicates whether the alert is enabled. • alertUnit: the unit of the metric in the alert. • unitFactor: the factor for metric unit conversion. • minAlertPeriod: the minimum time interval to raise a new alert. • productCategory: the category of the service.
MetricName	String	CPUUtilization	The name of the metric that you want to query.

Parameter	Type	Example	Description
Namespace	String	acs_kvstore	The namespace of the service. The namespace is in the format of acs_Service name.
Periods	String	60,300	The statistical period of the metric. Multiple periods are separated by commas (,). Example: 15,60,900.
Statistics	String	Average,Minimum,Maximum	The statistical method of the metric. Multiple statistical methods are separated by commas (,). Example: Average,Minimum,Maximum.
Unit	String	%	The unit of the metric.
TotalCount	String	12	The total number of records.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeMetricMetaList
&Namespace=acs_ecs_dashboard
&<Common request parameters>
```

Sample success responses

Note The response content varies with the services that are actually monitored.

`XML` format

```

1.1.2.7.3. Alert rules for time series metrics

1.1.2.7.3.1. DescribeMetricRuleList

You can call this operation to query alert rules.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeMetricRuleList	The operation that you want to perform. Set the value to DescribeMetricRuleList.
Namespace	String	No	acs_ecs_dashboard	The namespace of the service. **Note** For more information, see Major metrics of Apsara Stack services.
MetricName	String	No	cpu_total	The name of the metric. **Note** For more information, see Major metrics of Apsara Stack services.
EnableState	Boolean	No	true	Specifies whether to query enabled or disabled alert rules. Valid values: • true: indicates that enabled alert rules are queried. • false: indicates that disabled alert rules are queried. This parameter is empty by default, which indicates that both enabled and disabled rules are queried.
Page	String	No	1	The number of the page to return. Default value: 1.

Parameter	Type	Required	Example	Description
PageSize	String	No	10	The number of entries to return on each page. Default value: 10.
AlertState	String	No	ALARM	The status of the alert rule. Valid values: • OK: No active alerts are triggered based on the alert rule. • ALARM: At least one alert is triggered based on the alert rule. • INSUFFICIENT_DATA: No data is available.
Dimensions	String	No	{"instanceId":"i-xy123****"}	The dimension map of the monitored resources. The value is a collection of `key-value` pairs. A typical `key-value` pair is `instanceId:XXXXXX`. The `key` and `value` must each be 1 to 64 bytes in length. Excessive bytes are truncated from the string. The `key` and `value` can contain letters, digits, periods (.), hyphens (-), underscores (_), forward slashes (/), and backslashes (\). **Note** If you hope to see a key-value map expressed by JSON strings, set `Dimensions` to ordered strings.
RuleName	String	No	ECS CPU alert rule	The name of the alert rule. **Note** This parameter supports fuzzy match.
GroupId	String	No	123456	The ID of the application group.

Parameter	Type	Required	Example	Description
RuleIds	String	No	a151cd6023eacee2f0978e03863cc1697c8950812****	The ID of the alert rule. **Note** You can specify a maximum of 20 alert rule IDs. Separate multiple IDs with commas (,).

Response parameters

Parameter	Type	Example	Description
RequestId	String	0E657631-CD6C-4C24-9637-98D000B9272C	The ID of the request.
Code	Integer	200	The HTTP status code. **Note** The status code 200 indicates that the call was successful.
Total	String	21	The total number of entries returned.
Success	Boolean	true	Indicates whether the call was successful.
Alarms	Array	None	The list of alert rules.
Alarm	None	None	The information of an alert rule.
AlertState	String	OK	The status of the alert rule. Valid values: • OK: No active alerts are triggered based on the alert rule. • ALARM: At least one alert is triggered based on the alert rule. • INSUFFICIENT_DATA: No data is available.
ContactGroups	String	Default alert contacts	The information of the alert contacts.

Parameter	Type	Example	Description
Dimensions	String	{"userId":"4342","instanceId":"212312"}	The dimension map of the monitored resources. The value is a collection of `key-value` pairs. A typical `key-value` pair is `instanceId:XXXXXX`. The `key` and `value` must each be 1 to 64 bytes in length. Excessive bytes are truncated from the string. The `key` and `value` can contain letters, digits, periods (.), hyphens (-), underscores (_), forward slashes (/), and backslashes (\). **Note** If you set `Dimensions` to ordered strings in the request, the value of this parameter is a key-value map expressed by JSON strings.
EffectiveInterval	String	00:00-23:59	The time period during which the alert rule is effective.
EnableState	Boolean	true	Indicates whether enabled or disabled alert rules are queried. Valid values: • true: indicates that enabled alert rules are queried. • false: indicates that disabled alert rules are queried. This parameter is empty by default, which indicates that both enabled and disabled rules are queried.
Escalations	None	None	The conditions that trigger different levels of alerts.
Critical	None	None	The conditions for triggering critical-level alerts.

Parameter	Type	Example	Description
ComparisonOperator	String	GreaterThanOrEqualToThreshold	The comparison operator of the threshold for critical-level alerts. Valid values: • GreaterThanOrEqualToThreshold: greater than or equal to • GreaterThanThreshold: greater than • LessThanOrEqualToThreshold: less than or equal to • LessThanThreshold: less than • NotEqualToThreshold: not equal to • GreaterThanYesterday: greater than the metric value at the same time yesterday • LessThanYesterday: less than the metric value at the same time yesterday • GreaterThanLastWeek: greater than the metric value at the same time last week • LessThanLastWeek: less than the metric value at the same time last week • GreaterThanLastPeriod: greater than the metric value in the last monitoring cycle • LessThanLastPeriod: less than the metric value in the last monitoring cycle
Statistics	String	Average	The statistical method for critical-level alerts.
Threshold	String	90	The threshold for critical-level alerts.
Times	String	3	The consecutive number of times for which the metric value exceeds the threshold for critical-level alerts before a critical-level alert is triggered.
Info	None	None	The conditions for triggering info-level alerts.

Parameter	Type	Example	Description
ComparisonOperator	String	GreaterThanOrEqualToThreshold	The comparison operator of the threshold for info-level alerts. Valid values: • GreaterThanOrEqualToThreshold: greater than or equal to • GreaterThanThreshold: greater than • LessThanOrEqualToThreshold: less than or equal to • LessThanThreshold: less than • NotEqualToThreshold: not equal to • GreaterThanYesterday: greater than the metric value at the same time yesterday • LessThanYesterday: less than the metric value at the same time yesterday • GreaterThanLastWeek: greater than the metric value at the same time last week • LessThanLastWeek: less than the metric value at the same time last week • GreaterThanLastPeriod: greater than the metric value in the last monitoring cycle • LessThanLastPeriod: less than the metric value in the last monitoring cycle
Statistics	String	Average	The statistical method for info-level alerts.
Threshold	String	90	The threshold for info-level alerts.
Times	String	1	The consecutive number of times for which the metric value exceeds the threshold for info-level alerts before an alert is triggered.
Warn	None	None	The conditions for triggering warn-level alerts.

Parameter	Type	Example	Description
ComparisonOperator	String	GreaterThanOrEqualToThreshold	The comparison operator of the threshold for warn-level alerts. Valid values: • GreaterThanOrEqualToThreshold: greater than or equal to • GreaterThanThreshold: greater than • LessThanOrEqualToThreshold: less than or equal to • LessThanThreshold: less than • NotEqualToThreshold: not equal to • GreaterThanYesterday: greater than the metric value at the same time yesterday • LessThanYesterday: less than the metric value at the same time yesterday • GreaterThanLastWeek: greater than the metric value at the same time last week • LessThanLastWeek: less than the metric value at the same time last week • GreaterThanLastPeriod: greater than the metric value in the last monitoring cycle • LessThanLastPeriod: less than the metric value in the last monitoring cycle
Statistics	String	Average	The statistical method for warn-level alerts.
Threshold	String	90	The threshold for warn-level alerts.
Times	String	3	The consecutive number of times for which the metric value exceeds the threshold for warn-level alerts before a warn-level alert is triggered.
GroupId	String	123456	The ID of the application group.
GroupName	String	My application group	The name of the application group. **Note** If the alert rule is associated with an application group, the name of the application group is returned in this parameter.

Parameter	Type	Example	Description
MailSubject	String	An alert occurs	The subject of the alert notification email.
MetricName	String	cpu_total	The name of the metric.
Namespace	String	acs_ecs_dashboard	The namespace of the service.
NoEffectiveInterval	String	00:00-23:59	The time period during which the alert rule is ineffective.
Period	String	60	The statistical period.
Resources	String	[{\"instanceId\":\"i-a2d5q7pm3f9yr29e****\"},{\"instanceId\":\"i-a2d5q7pm3f9yr29e****\"}	The resources that are associated with the alert rule.
RuleId	String	a151cd6023eacee2f0978e03863cc1697c895012****	The ID of the alert rule.
RuleName	String	My alert rule	The name of the alert rule.
SilenceTime	String	86400	The mute period during which new alerts are not reported even if the alert trigger conditions are met. Unit: seconds. Default value: 86400. Minimum value: 3600. Only one alert is reported during each mute period even if the metric value consecutively exceeds the alert rule threshold several times.
SourceType	String	METRIC	The type of the alert rule. Valid values: METRIC: the alert rule for time series metrics. EVENT: the alert rule for event-type metrics. This type was used in earlier versions and has been discarded.
Webhook	String	http://www.aliyun.com	The callback URL.
Message	String	success	The error message.

Examples

1.1.2.7.3.2. PutResourceMetricRule

You can call this operation to configure an alert rule for a performance metric of a resource.

For more information about example values of the cloud service parameters, such as `Namespace`, `MetricName`, and `Dimensions`, that you must set when you configure an alert rule, see Major metrics of Apsara Stack services.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	PutResourceMetricRule	The operation that you want to perform. Set the value to PutResourceMetricRule.
ContactGroups	String	Yes	Default contact group	The alert contact group. **Note** Separate multiple groups with commas (,).
MetricName	String	Yes	cpu_total	The name of the metric. **Note** For more information, see Major metrics of Apsara Stack services.
Namespace	String	Yes	acs_ecs_dashboard	The namespace of the service. **Note** For more information, see Major metrics of Apsara Stack services.
Resources	String	Yes	[{"instanceId":"xxxxxx"}]	The resource for which the alert rule is to be configured. **Note** For more information, see `Dimensions` in Major metrics of Apsara Stack services.

Parameter	Type	Required	Example	Description
RuleId	String	Yes	a151cd6023eacee2f0978e03863cc1697c89508****	The ID of the alert rule. **Note** The ID is generated by the caller. You can specify an existing ID to modify the corresponding alert rule or specify a new ID to create an alert rule.
RuleName	String	Yes	My alert rule	The name of the alert rule.
Webhook	String	No	http://ww.aliyun.com	The callback URL to which a POST request is sent when an alert is triggered based on the alert rule.
EffectiveInterval	String	No	00:00-23:59	The time period during which the alert rule is effective.
NoEffectiveInterval	String	No	00:00-06:00	The time period during which the alert rule is ineffective.
SilenceTime	Integer	No	86400	The mute period during which new alerts are not reported even if the alert trigger conditions are met. Unit: seconds. Default value: 86400. **Note** Only one alert is reported during each mute period even if the metric value consecutively exceeds the alert rule threshold several times.
Interval	String	No	60	The interval at which Cloud Monitor checks whether the alert rule is triggered. The default value is the lowest frequency at which the metric is polled. Unit: seconds. **Note** For more information about the frequency at which monitoring data is collected, see DescribeMetricMetaList.

Parameter	Type	Required	Example	Description
EmailSubject	String	No	An alert occurs	The subject of the alert notification email.
Period	String	No	60	The aggregation cycle of monitoring data. The value is an integer multiple of 60. Unit: seconds. The default value is the frequency at which monitoring data is collected.
Escalations.Critical.Statistics	String	No	Average	The statistical method for critical-level alerts.
Escalations.Critical.ComparisonOperator	String	No	GreaterThanOrEqualToThreshold	The comparison operator of the threshold for critical-level alerts. Valid values: • `GreaterThanOrEqualToThreshold`: greater than or equal to • `GreaterThanThreshold`: greater than • `LessThanOrEqualToThreshold`: less than or equal to • `LessThanThreshold`: less than • `NotEqualToThreshold`: not equal to • `GreaterThanYesterday`: greater than the metric value at the same time yesterday • `LessThanYesterday`: less than the metric value at the same time yesterday • `GreaterThanLastWeek`: greater than the metric value at the same time last week • `LessThanLastWeek`: less than the metric value at the same time last week • `GreaterThanLastPeriod`: greater than the metric value in the last monitoring cycle • `LessThanLastPeriod`: less than the metric value in the last monitoring cycle

Parameter	Type	Required	Example	Description
Escalations.Critical.Threshold	String	No	90	The threshold for triggering critical-level alerts.
Escalations.Critical.Times	Integer	No	3	The consecutive number of times for which the metric value exceeds the threshold for critical-level alerts before a critical-level alert is triggered.
Escalations.Warn.Statistics	String	No	Average	The statistical method for warn-level alerts.
Escalations.Warn.ComparisonOperator	String	No	GreaterThanOrEqualToThreshold	The comparison operator of the threshold for warn-level alerts. Valid values: • `GreaterThanOrEqualToThreshold`: greater than or equal to • `GreaterThanThreshold`: greater than • `LessThanOrEqualToThreshold`: less than or equal to • `LessThanThreshold`: less than • `NotEqualToThreshold`: not equal to • `GreaterThanYesterday`: greater than the metric value at the same time yesterday • `LessThanYesterday`: less than the metric value at the same time yesterday • `GreaterThanLastWeek`: greater than the metric value at the same time last week • `LessThanLastWeek`: less than the metric value at the same time last week • `GreaterThanLastPeriod`: greater than the metric value in the last monitoring cycle • `LessThanLastPeriod`: less than the metric value in the last monitoring cycle

Parameter	Type	Required	Example	Description
Escalations.Warn.Threshold	String	No	90	The threshold for triggering warn-level alerts.
Escalations.Warn.Times	Integer	No	3	The consecutive number of times for which the metric value exceeds the threshold for warn-level alerts before a warn-level alert is triggered.
Escalations.Info.Statistics	String	No	Average	The statistical method for info-level alerts.
Escalations.Info.ComparisonOperator	String	No	GreaterThanOrEqualToThreshold	The comparison operator of the threshold for Info alerts. Valid values: • `GreaterThanOrEqualToThreshold`: greater than or equal to • `GreaterThanThreshold`: greater than • `LessThanOrEqualToThreshold`: less than or equal to • `LessThanThreshold`: less than • `NotEqualToThreshold`: not equal to • `GreaterThanYesterday`: greater than the metric value at the same time yesterday • `LessThanYesterday`: less than the metric value at the same time yesterday • `GreaterThanLastWeek`: greater than the metric value at the same time last week • `LessThanLastWeek`: less than the metric value at the same time last week • `GreaterThanLastPeriod`: greater than the metric value in the last monitoring cycle • `LessThanLastPeriod`: less than the metric value in the last monitoring cycle
Escalations.Info.Threshold	String	No	90	The threshold for info-level alerts.

Parameter	Type	Required	Example	Description
Escalations.Info.Times	Integer	No	3	The consecutive number of times for which the metric value exceeds the threshold for info-level alerts before an info-level alert is triggered.

Response parameters

Parameter	Type	Example	Description
Code	String	200	The HTTP status code. **Note** The status code 200 indicates that the call was successful.
Message	String	success	The error message.
RequestId	String	65D50468-ECEF-48F1-A6E1-D952E89D9436	The ID of the request.
Success	Boolean	true	Indicates whether the call was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=PutResourceMetricRule
&ContactGroups=Default alert group
&MetricName=cpu_total
&Namespace=acs_ecs_dashboard
&Resources=[{"instanceId":"xxxxxxx"}]
&RuleId=a151cd6023eacee2f0978e03863cc1697c89508****
&RuleName=My alert rule
&<Common request parameters>
```

Sample success responses

`XML` format

```
<Code>200</Code>
<Message>success</Message>
<RequestId>65D50468-ECEF-48F1-A6E1-D952E89D9436</RequestId>
<Success>true</Success>
```

`JSON` format

```
{
 "Message":"success",
 "RequestId":"65D50468-ECEF-48F1-A6E1-D952E89D9436",
 "Success":true,
 "Code":"200"
}
```

1.1.2.7.3.3. DescribeMetricRuleCount

Request parameters

Parameter	Type	Required	Example	Description
Action	String	No	DescribeMetricRuleCount	The operation that you want to perform. Set the value to DescribeMetricRuleCount.
MetricName	String	No	cpu_total	The name of the metric. You can call the DescribeMetricMetaList operation to query metric names.
Namespace	String	No	acs_ecs_dashboard	The namespace of the service. You can call the DescribeMetricMetaList operation to query namespaces.

Response parameters

Parameter	Type	Example	Description
Code	String	200	The HTTP status code. The status code 200 indicates that the call was successful.
Message	String	success	The error message.
MetricRuleCount	None	None	The number of alert rules in each state.
Alarm	Integer	5	The number of alert rules based on which alerts were triggered and not cleared.
Disable	Integer	0	The number of disabled alert rules.

Parameter	Type	Example	Description
Nodata	Integer	0	The number of alert rules for which status data is unavailable.
Ok	Integer	40	The number of alert rules that do not have active alerts triggered.
Total	Integer	45	The total number of alert rules.
RequestId	String	FF38D33A-67C1-40EB-AB65-FAEE51EDB644	The ID of the request, which can be used for troubleshooting.
Success	Boolean	true	Indicates whether the call was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeMetricRuleCount
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeMetricRuleCountResponse>
      <Success>true</Success>
      <Code>200</Code>
      <RequestId>FF38D33A-67C1-40EB-AB65-FAEE51EDB644</RequestId>
      <MetricRuleCount>
            <Ok>40</Ok>
            <Disable>0</Disable>
            <Total>45</Total>
            <Nodata>0</Nodata>
            <Alarm>5</Alarm>
      </MetricRuleCount>
</DescribeMetricRuleCountResponse>
```

`JSON` format

```
{
 "RequestId":"FF38D33A-67C1-40EB-AB65-FAEE51EDB644",
 "Success":true,
 "Code":"200",
 "MetricRuleCount":{
  "Ok":40,
  "Disable":0,
  "Nodata":0,
  "Total":45,
  "Alarm":5
 }
}
```

1.1.2.7.3.4. DeleteMetricRules

You can call this operation to delete one or more alert rules.

Request parameters

Parameter	Type	Required	Example	Description
Id.N	RepeatList	Yes	ab05733c97b7ce239fb1b53393dc1697c7e12****	The ID of the alert rule.
Action	String	No	DeleteMetricRules	The operation that you want to perform. Set the value to DeleteMetricRules.

Response parameters

Parameter	Type	Example	Description
Code	String	200	The HTTP status code. The status code 200 indicates that the call was successful.
Message	String	success	The error message.
RequestId	String	E5599964-8D0D-40DC-8E90-27A619384B81	The ID of the request, which can be used for troubleshooting.
Success	Boolean	true	Indicates whether the call was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DeleteMetricRules
&Id.1=ab05733c97b7ce239fb1b53393dc1697c7e12****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteMetricRulesResponse>
      <Code>200</Code>
      <Message>success</Message>
      <RequestId>FF38D33A-67C1-40EB-AB65-FAEE51EDB644</RequestId>
      <Success>true</Success>
</DeleteMetricRulesResponse>
```

`JSON` format

```
{
 "Message":"success",
 "RequestId":"E5599964-8D0D-40DC-8E90-27A619384B81",
 "Success":true,
 "Code":"200"
}
```

1.1.2.7.3.5. EnableMetricRules

Enables one or more alert rules.

Debugging

OpenAPI Explorer automatically calculates the signature value. For your convenience, we recommend that you call this operation in OpenAPI Explorer. OpenAPI Explorer dynamically generates the sample code of the operation for different SDKs.

Request parameters

Parameter	Type	Required	Example	Description
RuleId.N	RepeatList	Yes	ab05733c97b7ce239fb1b53393dc1697c123****	The ID of the alert rule.
Action	String	No	EnableMetricRules	The operation that you want to perform. Set the value to EnableMetricRules.

Response parameters

Parameter	Type	Example	Description
Code	String	200	The HTTP status code. The status code 200 indicates that the call was successful.
Message	String	success	The returned message.
RequestId	String	FF38D33A-67C1-40EB-AB65-FAEE51EDB644	The ID of the request.
Success	Boolean	true	Indicates whether the call was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/?Action=EnableMetricRules
&RuleId.1=ab05733c97b7ce239fb1b53393dc1697c123****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<EnableMetricRulesResponse>
      <Code>200</Code>
      <Message>success</Message>
      <RequestId>FF38D33A-67C1-40EB-AB65-FAEE51EDB644</RequestId>
      <Success>true</Success>
</EnableMetricRulesResponse>
```

`JSON` format

```
{
 "Message":"success",
 "RequestId":"FF38D33A-67C1-40EB-AB65-FAEE51EDB644",
 "Success":true,
 "Code":200
}
```

Error codes

For a list of error codes, visit the API Error Center.

For a list of error codes, visit the API Error Center.

1.1.2.7.3.6. DisableMetricRules

You can call this operation to disable one or more alert rules.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DisableMetricRules	The operation that you want to perform. Set the value to DisableMetricRules.
RuleId.N	RepeatList	Yes	ab05733c97b7ce239fb1b53393dc1697c7e012****	The ID of the alert rule. Valid values of N: 1 to 20.

Response parameters

Parameter	Type	Example	Description
Code	String	200	The HTTP status code. The status code 200 indicates that the call was successful.
Message	String	success	The error message.
RequestId	String	FF38D33A-67C1-40EB-AB65-FAEE51EDB644	The ID of the request, which can be used for troubleshooting.
Success	Boolean	true	Indicates whether the call was successful.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DisableMetricRules
&RuleId.1=ab05733c97b7ce239fb1b53393dc1697c7e012****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DisableMetricRulesResponse>
      <Code>200</Code>
      <Message>success</Message>
      <RequestId>FF38D33A-67C1-40EB-AB65-FAEE51EDB644</RequestId>
      <Success>true</Success>
</DisableMetricRulesResponse>
```

`JSON` format

```
{
 "Message":"success",
 "RequestId":"FF38D33A-67C1-40EB-AB65-FAEE51EDB644",
 "Success":true,
 "Code":"200"
}
```

1.1.2.7.3.7. DescribeAlertingMetricRuleResources

You can call this operation to query the resources that have active alerts triggered based on an alert rule.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeAlertingMetricRuleResources	The operation that you want to perform. Set the value to DescribeAlertingMetricRuleResources.
GroupId	String	No	123456	The ID of the application group.
Page	Integer	No	1	The number of the page to return. Default value: 1.
PageSize	Integer	No	10	The number of entries to return on each page. Default value: 10.
RuleId	String	No	alerRuleId****	The ID of the alert rule. **Note** You must specify at least one of the `GroupId` and `RuleId` parameters. If you specify both parameters, only entries that meet both conditions are returned.

Response parameters

Parameter	Type	Example	Description
RequestId	String	9B868619-77B4-4623-AD64-6181EA7CF8FA	The ID of the request.

Parameter	Type	Example	Description
Success	Boolean	true	Indicates whether the call was successful.
Code	Integer	200	The HTTP status code. **Note** The status code 200 indicates that the call was successful.
Total	Integer	1	The total number of entries returned.
Resources	Array	None	The list of resources to which the alert rule applies.
Resource	None	None	The information of a resource to which the alert rule applies.
Enable	String	true	Indicates whether the alert rule is enabled for the resource.
GroupId	String	123456	The ID of the application group. **Note** If the alert rule is associated with an application group, the ID of the application group is returned in this parameter.
LastAlertTime	String	1554718182000	The last time when an alert was triggered for the resource based on the alert rule. The value is a UNIX timestamp representing the number of seconds that have elapsed since the epoch time January 1, 1970, 00:00:00 UTC.
LastModifyTime	String	1554723762000	The time when the resource was last modified. The value is a UNIX timestamp representing the number of seconds that have elapsed since the epoch time January 1, 1970, 00:00:00 UTC.

Parameter	Type	Example	Description
MetricValues	String	{"timestamp":1554723720000,"Value":631}	The metric value that triggered the alert based on the alert rule. The value is a JSON string.
Resource	String	userId=1775413231932****,taskId=3****,instanceId=i-bp1a0v6yzqrms01k****	The resource for which an alert was triggered based on the alert rule.
RetryTimes	String	3	The consecutive number of times for which the metric value was measured before an alert was triggered.
RuleId	String	alerRuleId****	The ID of the alert rule.
RuleName	String	cpuAlert	The name of the alert rule.
StartTime	String	1545901080000	The time when the resource was associated with the alert rule. The value is a UNIX timestamp representing the number of seconds that have elapsed since the epoch time January 1, 1970, 00:00:00 UTC.
Threshold	String	400	The alert threshold.
Message	String	success	The error message.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DescribeAlertingMetricRuleResources
&<Common request parameters>
```

Sample success responses

`XML` format

```
<Total>1</Total>
<Resources>
    <Resource>
        <Enable>true</Enable>
        <Resource>userId=12****,instanceId=i-bp1a012****</Resource>
        <RuleId>alerRuleId****</RuleId>
        <RetryTimes>3</RetryTimes>
        <LastAlertTime>1554718182000</LastAlertTime>
        <MetricValues>{"timestamp":1554723720000,"Value":631}</MetricValues>
        <LastModifyTime>1554723762000</LastModifyTime>
        <StartTime>1545901080000</StartTime>
        <RuleName>cpuAlert</RuleName>
        <Threshold>400</Threshold>
        <GroupId>123456</GroupId>
    </Resource>
</Resources>
<Success>true</Success>
```

`JSON` format

```
{
 "Success":true,
 "Total":1,
 "Resources":{
  "Resource":[
   {
    "LastAlertTime":1554718182000,
    "Resource":"userId=12****,instanceId=i-bp1a012****",
    "Threshold":"400",
    "Enable":true,
    "LastModifyTime":1554723762000,
    "RuleId":"alerRuleId****",
    "MetricValues":"{\"timestamp\":1554723720000,\"Value\":631}",
    "RetryTimes":3,
    "StartTime":1545901080000,
    "RuleName":"cpuAlert",
    "GroupId":"123456"
   }
  ]
 }
}
```

1.1.2.7.3.8. DeleteMetricRuleResources

You can call this operation to delete resources associated with an alert rule.

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteMetricRuleResources	The operation that you want to perform. Set the value to DeleteMetricRuleResources.
Resources	String	Yes	[{"instanceId":"*****ixxxId1"}]	The resources to be disassociated from the alert rule. The value is a JSON array.
RuleId	String	Yes	rr-bp18017n6iolv****	The ID of the alert rule.

Response parameters

Parameter	Type	Example	Description
RequestId	String	D8A35882-90C6-4F03-BBEB-153C180398EA	The ID of the request.
Success	Boolean	true	Indicates whether the call was successful.
Code	String	200	The HTTP status code. **Note** The status code 200 indicates that the call was successful.
Message	String	success	The error message.

Examples

Sample requests

```
http(s)://[Endpoint]/? Action=DeleteMetricRuleResources
&Resources=[{"instanceId":"*****ixxxId1"}]
&RuleId=rr-bp18017n6iolv****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<RequestId>0671A721-0D7A-4F11-BB77-2416325D65AB</RequestId>
<Success>true</Success>
<Message>success</Message>
<Code>200</Code>
```

`JSON` format

```
{
    "Message":"success",
    "RequestId":"0671A721-0D7A-4F11-BB77-2416325D65AB",
    "Success":true,
    "Code":"200"
}
```

1.1.2.8. Parameters related to the MeteringQuery operation

1.1.2.8.1. ECS

After you call the MeteringQuery operation to obtain statistical data, common response parameters and service-specific response parameters are returned. This topic describes the response parameters specific to Elastic Compute Service (ECS).

Parameter	Name	Description
Pos	Primary key	The primary key consists of the service ID, organization ID, and start time.
OrgName	Organization name	The name of the organization to which the instance belongs.
ResourceGId	Resource set ID	The ID of the resource set to which the instance belongs.
ResourceGName	Resource set name	The name of the resource set to which the instance belongs.
InsId	Instance ID	The ID of the instance.
RegionId	Region	The ID of the region where the instance resides.

Parameter	Name	Description
StartTime	Start time	The beginning of the time range to query. The time is displayed in UTC.
EndTime	End time	The end of the time range to query. The time is displayed in UTC.
CreateTime	Instance creation time	The time when the instance was created.
ZoneId	Zone	The ID of the zone where the instance resides.
InstanceType	Instance type	The ECS instance type defines the basic properties of the ECS instance, such as CPU (including CPU model and clock speed) and memory.
InstanceTypeFamily	Instance family	ECS instances are categorized into different instance families based on the business scenarios to which they can be applied. Each instance family is divided into different instance types based on their CPU and memory specifications.
SerialNumber	Serial number	The serial number of the ECS instance.
InstanceNetworkType	Network type	The network type of the instance. Valid values: • Classic • VPC
ExpiredTime	Expiration time	The time when the instance expires.
HostName	Hostname	The hostname of the ECS instance.
Status	Instance status	The status of the instance. Valid values: • Pending: The instance is being created. • Running: The instance is running. • Starting: The instance is being started. • Stopping: The instance is being stopped. • Stopped: The instance is stopped.

Parameter	Name	Description
InstanceName	Instance name	The name of the ECS instance.
PrivateIpAddress	Internal IP address	The private IP address of the instance in a virtual private cloud (VPC). When InstanceNetworkType is set to vpc, this parameter value can consist of multiple IP addresses.
OSName	Operating system name	The name of the operating system installed on the instance.
EipAddress	Elastic IP address (EIP)	The EIPs of the instance.
NatIpAddress	Network translation address	The public or private IP address of the ECS instance.
VpcId	VPC ID	The ID of the VPC.
EipBandwidth	EIP bandwidth	The bandwidth of the EIP associated with the ECS instance.
IoOptimized	Whether I/O optimization is enabled	Indicates whether the instance is I/O optimized.
InternetMaxBandwidthIn	Maximum inbound public bandwidth	Valid values: 1 to 200. Unit: Mbit/s.
GPUAmount	Number of GPUs	The number of GPUs that the GPU-accelerated instance has.
GPUSpec	GPU model	The model of GPUs used by the GPU-accelerated instance.
InstanceBandwidthTx	Maximum outbound internal bandwidth	Unit: KB/s.

Parameter	Name	Description
Memory	Memory	The amount of memory. Unit: MB.
Cpu	Processor	The number of processors.
SysDiskSize	System disk	The size of the system disk. Unit: GB.
DataDiskSize	Data disk size	The size of the data disk. Unit: GB.

1.1.2.8.2. SLB

After you call the MeteringQuery operation to obtain statistical data, common response parameters and service-specific response parameters are returned. This topic describes the response parameters specific to Server Load Balancer (SLB).

Parameter	Name	Description
Pos	Primary key	The primary key consists of the service ID, organization ID, and start time.
OrgName	Organization name	The name of the organization to which the instance belongs.
ResourceGId	Resource set ID	The ID of the resource set to which the instance belongs.
ResourceGName	Resource set name	The name of the resource set to which the instance belongs.
InsId	Instance ID	The ID of the instance.
RegionId	Region	The ID of the region where the instance resides.

Parameter	Name	Description
StartTime	Start time	The beginning of the time range to query. The time is displayed in UTC.
EndTime	End time	The end of the time range to query. The time is displayed in UTC.
CreateTime	Instance creation time	The time when the instance was created.
ChargeType	Billing method	Valid values: • PayByBandwidth • PayByTraffic
StoreSpace	Capacity threshold	The capacity threshold set for the bucket. After the threshold value is exceeded, write operations cannot be performed on the bucket. Unit: GB.
CdnOut	CDN back-to-origin traffic	The traffic sent from OSS to Alibaba Cloud CDN (CDN). Unit: byte.
IntranetIn	Inbound traffic to the internal network	Unit: byte.
ChargedDatasize	Actually billed storage space	The actually billed Infrequent Access (IA) locally redundant storage (LRS) or OSS Archive LRS space. Unit: byte.
GetRequest	Number of GET requests	The number of GET requests that occurred between the specified start time and the specified end time.
RetrievalData	Volume of retrieved data	The volume of retrieved IA or Archive data. Unit: byte.
PutRequest	Number of PUT requests	The number of PUT requests that occurred between the specified start time and the specified end time.

Parameter	Name	Description
IntranetOut	Outbound traffic from the internal network	Unit: byte.
ProcessI	Number of video snapshots	The number of video snapshots.
ProcessImgSize	Volume of processed images	The volume of processed images. Unit: byte.
SelectScanSize	Volume of scanned data	The volume of scanned data that is queried by using the SELECT statement.
NetworkOut	Outbound traffic	The traffic sent from OSS to external networks, which occurred between the specified start time and the specified end time. Unit: byte.
Storage	Volume of stored data	The amount of used Standard LRS storage space. Unit: byte.
NetworkIn	Inbound traffic	The traffic sent from external networks to OSS, which occurred between the specified start time and the specified end time. Unit: byte.
Availability_Average	Average availability value	The average availability obtained from CloudMonitor at the specified end time.
Availability_Maximum	Maximum availability value	The maximum availability value obtained from CloudMonitor at the specified end time.
Availability_Minimum	Minimum availability value	The minimum availability value obtained from CloudMonitor at the specified end time.
MeteringStorageUtilization_Average	Average capacity value	The average capacity value obtained from CloudMonitor at the specified end time. Unit: byte.

Parameter	Name	Description
MeteringStorageUtilization_Maximum	Maximum capacity value	The maximum capacity value obtained from CloudMonitor at the specified end time. Unit: byte.
MeteringStorageUtilization_Minimum	Minimum capacity value	The minimum capacity value obtained from CloudMonitor at the specified end time. Unit: byte.

1.1.2.8.3. OSS

After you call the MeteringQuery operation to obtain statistical data, common response parameters and service-specific response parameters are returned. This topic describes the response parameters specific to Object Storage Service (OSS).

Parameter	Name	Description
Pos	Primary key	The primary key consists of the service ID, organization ID, and start time.
OrgName	Organization name	The name of the organization to which the bucket belongs.
ResourceGId	Resource set ID	The ID of the resource set to which the bucket belongs.
ResourceGName	Resource set name	The name of the resource set to which the bucket belongs.
InsId	Bucket ID	The ID of the bucket.
RegionId	Region	The ID of the region where the bucket resides.
StartTime	Start time	The beginning of the time range to query. The time is displayed in UTC.
EndTime	End time	The end of the time range to query. The time is displayed in UTC.

Parameter	Name	Description
CreateTime	Bucket creation time	The time when the bucket was created.
ChargeType	Billing method	Valid values: • PayByBandwidth • PayByTraffic
StoreSpace	Capacity threshold	The capacity threshold set for the bucket. After the threshold value is exceeded, write operations cannot be performed on the bucket. Unit: GB.
CdnOut	CDN back-to-origin traffic	The traffic sent from OSS to Alibaba Cloud CDN (CDN). Unit: byte.
IntranetIn	Inbound traffic to the internal network	Unit: byte.
ChargedDatasize	Actually billed storage space	The actually billed Infrequent Access (IA) locally redundant storage (LRS) or OSS Archive LRS space. Unit: byte.
GetRequest	The number of GET requests.	The number of GET requests that occurred between the specified start time and the specified end time.
RetrievalData	Volume of retrieved data	The volume of retrieved IA or Archive data. Unit: byte.
PutRequest	The number of PUT requests.	The number of PUT requests that occurred between the specified start time and the specified end time.
IntranetOut	Outbound traffic from the internal network	Unit: byte.
ProcessI	Number of video snapshots	The number of video snapshots.

Parameter	Name	Description
ProcessImgSize	Volume of processed images	The volume of processed images. Unit: byte.
SelectScanSize	Volume of scanned data	The volume of scanned data that is queried by using the SELECT statement.
NetworkOut	Outbound traffic	The traffic sent from OSS to external networks, which occurred between the specified start time and the specified end time. Unit: byte.
Storage	Volume of stored data	The amount of used Standard LRS storage space. Unit: byte.
NetworkIn	Inbound traffic	The traffic sent from external networks to OSS, which occurred between the specified start time and the specified end time. Unit: byte.
Availability_Average	Average availability value	The average availability obtained from CloudMonitor at the specified end time.
Availability_Maximum	Maximum availability value	The maximum availability value obtained from CloudMonitor at the specified end time.
Availability_Minimum	Minimum availability value	The minimum availability value obtained from CloudMonitor at the specified end time.
MeteringStorageUtilization_Average	Average capacity value	The average capacity value obtained from CloudMonitor at the specified end time. Unit: byte.
MeteringStorageUtilization_Maximum	Maximum capacity value	The maximum capacity value obtained from CloudMonitor at the end time. Unit: byte.

Parameter	Name	Description
MeteringStorageUtilization_Minimum	Minimum capacity value	The minimum capacity value obtained from CloudMonitor at the end time. Unit: byte.

1.1.2.8.4. EIP

After you call the MeteringQuery operation to obtain statistical data, common response parameters and service-specific response parameters are returned. This topic describes the response parameters specific to Elastic IP Address (EIP).

Parameter	Name	Description
Pos	Primary key	The primary key consists of the service ID, organization ID, and start time.
OrgName	Organization name	The name of the organization to which the elastic IP address (EIP) belongs.
ResourceGId	Resource set ID	The ID of the resource set to which the EIP belongs.
ResourceGName	Resource set name	The name of the resource set to which the EIP belongs.
InsId	EIP ID	The ID of the EIP.
RegionId	Region	The ID of the region where the EIP resides.
StartTime	Start time	The beginning of the time range to query. The time is displayed in UTC.
EndTime	End time	The end of the time range to query. The time is displayed in UTC.
CreateTime	EIP creation time	The time when the EIP was created.
PrivateIpAddress	Internal IP address	The IP address that belongs to the CIDR block of the vSwitch.

Parameter	Name	Description
Name	EIP name	The name of the EIP.
ExpiredTime	Expiration time	The time when the EIP expires. The time follows the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time is displayed in UTC.
BandwidthPackageId	ID of the EIP bandwidth plan	The ID of the EIP bandwidth plan.
Status	EIP status	The status of the EIP. Valid values: • Associating: The EIP is being associated with an instance. • Unassociating: The EIP is being disassociated from an instance. • InUse: The EIP is associated with an instance. • Available: The EIP is available.
ISP	Line type	The line type. Valid values: • BGP: BGP (Multi-ISP) lines • BGP_PRO: BGP (Multi-ISP) Pro lines
Mode	Association mode	The mode in which you associate the EIP. Valid values: • NAT: the standard NAT mode • MULTI_BINDED: the Multi-EIP to ENI mode • BINDED: the cut-through mode This parameter is required only when InstanceType is set to NetworkInterface.
BandwidthPackageType	Bandwidth type	The type of the bandwidth. Only CommonBandwidthPackage (an EIP bandwidth plan) is returned.
ChargeType	Billing method	The billing method of the EIP. Valid values: • PrePaid: subscription • PostPaid: pay-as-you-go

Parameter	Name	Description
IpAddress	IP address	The IP address of the EIP.
BindInstanceId	ID of the associated instance	The ID of the instance with which the EIP is associated.
BindInstanceType	The type of the associated instance.	The type of the instance with which the EIP is associated. Valid values: • EcsInstance: an Elastic Compute Service (ECS) instance in a virtual private cloud (VPC) • SlbInstance: a Server Load Balancer (SLB) instance in a VPC • Nat: a NAT gateway. • HaVip: a high-availability virtual IP address (HAVIP) • NetworkInterface: a secondary elastic network interface (ENI).
BindInstanceName	Name of the associated instance	The name of the associated instance.
Bandwidth	Maximum bandwidth value	The maximum bandwidth value of the EIP. Unit: Mbit/s.

1.1.2.8.5. VPC

After you call the MeteringQuery operation to obtain statistical data, common response parameters and service-specific response parameters are returned. This topic describes the response parameters specific to Virtual Private Cloud (VPC).

Parameter	Name	Description
Pos	Primary key	The primary key consists of the service ID, organization ID, and start time.
OrgName	Organization name	The name of the organization to which the virtual private cloud (VPC) belongs.
ResourceGId	Resource set ID	The ID of the resource set to which the VPC belongs.

Parameter	Name	Description
ResourceGName	Resource set name	The name of the resource set to which the VPC belongs.
InsId	VPC ID	The ID of the VPC.
RegionId	Region	The ID of the region where the VPC resides.
StartTime	Start time	The beginning of the time range to query. The time is displayed in UTC.
EndTime	End time	The end of the time range to query. The time is displayed in UTC.
CreateTime	VPC creation time	The time when the VPC was created.
Status	VPC status	The status of the VPC. Valid values: • Pending: The VPC is being configured. • Available: The VPC is available.
CidrBlock	IPv4 CIDR block	The IPv4 CIDR block of the VPC.
VRouterId	Router ID	The ID of the vRouter.
VpcName	VPC name	The name of the VPC.
Ipv6CidrBlock	IPv6 CIDR block	The IPv6 CIDR block of the VPC.
Description	Description	The description of the VPC.
IsDefault	Default VPC	Indicates whether the VPC is the default VPC in the region. Valid values: • true: The VPC is the default VPC in the region. • false: The VPC is not the default VPC in the region.

1.1.2.8.6. ApsaraDB RDS for MySQL

After you call the MeteringQuery operation to obtain statistical data, common response parameters and service-specific response parameters are returned. This topic describes the response parameters specific to ApsaraDB RDS for MySQL.

Parameter	Name	Description
Pos	Primary key	The primary key consists of the service ID, organization ID, and start time.
OrgName	Organization name	The name of the organization to which the instance belongs.
ResourceGId	Resource set ID	The ID of the resource set to which the instance belongs.
ResourceGName	Resource set name	The name of the resource set to which the instance belongs.
InsId	Instance ID	The ID of the instance.
RegionId	Region	The ID of the region where the instance resides.
StartTime	Start time	The beginning of the time range to query. The time is displayed in UTC.
EndTime	End time	The end of the time range to query. The time is displayed in UTC.
CreateTime	Instance creation time	The time when the instance was created.
DBInstanceDescription	Instance description	The description of the instance.
Category	Instance edition	The edition of the instance. Valid values: • Basic: Basic Edition • HighAvailability: High-availability Edition • AlwaysOn: Cluster Edition • Finance: Enterprise Edition

Parameter	Name	Description
ClassCode	Instance type	The instance type of the instance. Example: rds.mysql.t1.small.
DBType	Engine type	The type of the database. Example: MySQL.
DBVersion	Engine version	The database version. Example: 8.0.
Zone	Zone ID	The zone ID of the instance.
DBInstanceStatus	Instance status	The status of the RDS instance.
DBInstanceType	Instance architecture	The architecture of the instance. Valid values: • Primary: primary instance • Readonly: read-only instance • Guard: disaster recovery instance • Temp: temporary instance
LockMode	Lock mode	The lock mode of the instance. Valid values: • Unlock: The instance is unlocked. • ManualLock: The instance is manually locked. • LockByExpiration: The instance is automatically locked because it has expired. • LockByRestoration: The instance is automatically locked for a rollback. • LockByDiskQuota: The instance is automatically locked because its disk space is used up. • LockReadInstanceByDiskQuota: The instance is a read-only instance and is automatically locked when the disk space is full.
Port	Port number	The internal port of the instance.

Parameter	Name	Description
DBInstanceClassType	Instance family	The instance family of the instance. Valid values: • s: shared instance family • x: general purpose instance family • d: dedicated instance family • h: dedicated host instance family
DBInstanceStorageType	Storage type	The type of storage media that is used by the instance. Valid values: • local_ssd or ephemeral_ssd: local SSD • cloud_ssd: standard SSD • cloud_essd: enhanced SSD
AvailabilityValue	Availability	The availability status of the instance. Unit: %.
IpAddress	IP address	The IP address.
VPCId	VPC ID	The ID of the virtual private cloud (VPC).
BackupStorage	Backup storage	The backup storage. Unit: byte.
NetworkIn	Inbound traffic	The traffic sent from external networks to RDS, which occurred between the specified start time and the specified end time.
NetworkOut	Outbound traffic	The traffic sent from RDS to external networks, which occurred between the specified start time and the specified end time.
Storage	Volume of stored data	The total storage capacity. Unit: byte.
UsedStorage	Used storage	The amount of used storage. Unit: byte.
AccountMaxQuantity	Maximum number of accounts that can be created	The maximum number of accounts that can be created.

Parameter	Name	Description
DBInstanceCPU	Number of CPUs	The number of CPUs that are configured for the instance.
MaxConnections	Maximum number of connections	The maximum number of concurrent connections that are allowed by the instance.
DBInstanceMemory	Memory	The memory capacity of the instance. Unit: MB.
MaxIOPS	Maximum IOPS	The maximum number of I/O requests that the instance can process per second.
DBMaxQuantity	Maximum number of databases that can be created	The maximum number of databases that can be created.
CpuUsage_Maximum	Maximum CPU utilization	The maximum CPU utilization obtained from CloudMonitor at the specified end time.
CpuUsage_Minimum	Minimum CPU utilization	The minimum CPU utilization obtained from CloudMonitor at the specified end time.
DiskUsage_Average	Average disk usage	The average disk usage obtained from CloudMonitor at the specified end time.
DiskUsage_Maximum	Maximum disk usage	The maximum disk usage obtained from CloudMonitor at the specified end time.
DiskUsage_Minimum	Minimum disk usage	The minimum disk usage obtained from CloudMonitor at the specified end time.
IOPSUsage_Average	Average IOPS usage	The average IOPS usage obtained from CloudMonitor at the specified end time.
IOPSUsage_Maximum	Maximum IOPS usage	The maximum IOPS usage obtained from CloudMonitor at the specified end time.

Parameter	Name	Description
IOPSUsage_Minimum	Minimum IOPS usage	The minimum IOPS usage obtained from CloudMonitor at the specified end time.
MemoryUsage_Average	Average memory usage	The average memory usage obtained from CloudMonitor at the specified end time.
MemoryUsage_Maximum	Maximum memory usage	The maximum memory usage obtained from CloudMonitor at the specified end time.
MemoryUsage_Minimum	Minimum memory usage	The minimum memory usage obtained from CloudMonitor at the specified end time.

1.1.2.8.7. Tablestore

After you call the MeteringQuery operation to obtain statistical data, common response parameters and service-specific response parameters are returned. This topic describes the response parameters specific to Tablestore.

Parameter	Name	Description
Pos	Primary key	The primary key consists of the service ID, organization ID, and start time.
OrgName	Organization name	The name of the organization to which the instance belongs.
ResourceGId	Resource set ID	The ID of the resource set to which the instance belongs.
ResourceGName	Resource set name	The name of the resource set to which the instance belongs.
InsId	Instance ID	The ID of the instance.
RegionId	Region	The ID of the region where the instance resides.
StartTime	Start time	The beginning of the time range to query. The time is displayed in UTC.

Parameter	Name	Description
EndTime	End time	The end of the time range to query. The time is displayed in UTC.
CreateTime	Instance creation time	The time when the instance was created.
InstanceType	Instance type	The instance type of the instance. Example: ssd.
TableName	Table name	The name of the table.
InstanceName	Instance name	The name of the instance.
Description	Instance description	The description of the instance.
Status	Instance status	The status of the instance.
Version	Engine version	The database engine version.

1.1.2.8.8. PolarDB-X

After you call the MeteringQuery operation to obtain statistical data, common response parameters and service-specific response parameters are returned. This topic describes the response parameters specific to PolarDB-X.

Parameter	Name	Description
Pos	Primary key	The primary key consists of the service ID, organization ID, and start time.
OrgName	Organization name	The name of the organization to which the cluster belongs.
ResourceGId	Resource set ID	The ID of the resource set to which the cluster belongs.
ResourceGName	Resource set name	The name of the resource set to which the cluster belongs.

Parameter	Name	Description
InsId	Cluster ID	The ID of the cluster.
RegionId	Region	The ID of the region where the cluster resides.
StartTime	Start time	The beginning of the time range to query. The time is displayed in UTC.
EndTime	End time	The end of the time range to query. The time is displayed in UTC.
CreateTime	Cluster creation time	The time when the cluster was created.
Status	Cluster status	The status of the cluster.
Description	Description	The description of the database.
InstanceSpec	Instance type	The instance type of the cluster. Example: drds.sn2.4c16g.8C32G.
ZoneId	Zone ID	The zone ID of the cluster.
MachineType	Cluster machine type	The type of the machine where the cluster is deployed. The value is set to ECS.
Label	Instance label	The label of the cluster. Valid values: • NORMAL: the normal cluster • HAVPC: the high-availability cluster • VPC: the cluster of the VPC type
InstanceSeries	Instance family	The instance family of the cluster. Example: drds.sn2.4c16g/.
VersionAction	Available action for the cluster version	The available actions for the cluster version.

Parameter	Name	Description
Type	Instance architecture	The architecture of the cluster. Valid values: • PRIVATE: the dedicated cluster • PUBLIC: the shared cluster
VpcId	VPC ID	The ID of the virtual private cloud (VPC).
OrderInstanceId	ID of the purchased cluster	The ID of the purchased cluster.
InstRole	Cluster role	The role of the cluster. • MASTER: the primary cluster • SLAVE: the analytic read-only cluster • SLAVE_FLOW: the concurrent read-only cluster
NetworkType	Network type	The network type of the cluster. Valid values: • CLASSIC • VPC
CommodityCode	Commodity code	The commodity code.
IpAddress	IP address	The IP address.

1.1.2.8.9. What is KVStore for Redis?

After you call the MeteringQuery operation to obtain statistical data, common response parameters and service-specific response parameters are returned. This topic describes the response parameters specific to KVStore for Redis.

Parameter	Name	Description
Pos	Primary key	The primary key consists of the service ID, organization ID, and start time.
OrgName	Organization name	The name of the organization to which the instance belongs.

Parameter	Name	Description
ResourceGId	Resource set ID	The ID of the resource set to which the instance belongs.
ResourceGName	Resource set name	The name of the resource set to which the instance belongs.
InsId	Instance ID	The ID of the instance.
RegionId	Region	The ID of the region where the instance resides.
StartTime	Start time	The beginning of the time range to query. The time is displayed in UTC.
EndTime	End time	The end of the time range to query. The time is displayed in UTC.
CreateTime	Instance creation time	The time when the instance was created.
ConnectionDomain	Private IP address	The private IP address of the instance.
NetworkType	Network type	The network type. Valid values: • CLASSIC • VPC
InstanceStatus	Instance status	The status of the instance.
PackageType	Service plan	The plan type. Valid values: • standard: the standard plan • customized: the custom plan
InstanceType	Instance type	The instance type of the instance.

Parameter	Name	Description
ArchitectureType	Instance architecture	The architecture of the instance. Valid values: • cluster: the cluster architecture • standard: the standard architecture • rwsplit: the read/write splitting architecture
EngineVersion	The engine version.	The database engine version.
ZoneId	Zone ID	The zone ID of the instance.
InstanceClass	Instance type	The instance type of the instance.
InstanceName	Instance name	The name of the instance.
ChargeType	Billing method	The billing method of the instance. Valid values: • PrePaid: subscription • PostPaid: pay-as-you-go
NodeType	Node type	The type of the node. Valid values: • double: master and replica nodes • single: the single replica node
HasRenewChangeOrder	Whether an order for renewal and configuration change that has not taken effect exists	Indicates whether an order for renewal and configuration change that has not taken effect exists. Valid values: • true: yes • false: no
IsRds	Whether the instance is managed by ApsaraDB RDS	Indicates whether the instance is managed by RDS. Valid values: • true: yes • false: no

Parameter	Name	Description
Connections	Connections	The maximum number of connections supported by the instance.
Port	Port number	The service port of the KVStore for Redis instance.
QPS	QPS	The estimated maximum queries per second (QPS).
Capacity	Capacity	The storage capacity of the instance. Unit: MB.
Bandwidth	Bandwidth	The bandwidth of the instance. Unit: MB/s.
ConnectionUsage_Average	Average connection usage	The average connection usage obtained from CloudMonitor at the specified end time.
ConnectionUsage_Maximum	Maximum connection usage	The maximum connection usage obtained from CloudMonitor at the specified end time.
ConnectionUsage_Minimum	Minimum connection usage	The minimum connection usage obtained from CloudMonitor at the specified end time.
FailedCount_Average	Average number of failures	The average number of failures obtained from CloudMonitor at the specified end time.
FailedCount_Maximum	Maximum number of failures	The maximum number of failures obtained from CloudMonitor at the specified end time.
FailedCount_Minimum	Minimum number of failures	The minimum number of failures obtained from CloudMonitor at the specified end time.
IntranetIn_Average	Average write bandwidth	The average write bandwidth obtained from CloudMonitor at the specified end time.
IntranetIn_Maximum	Maximum write bandwidth	The maximum write bandwidth obtained from CloudMonitor at the specified end time.

Parameter	Name	Description
IntranetIn_Minimum	Minimum write bandwidth	The minimum write bandwidth obtained from CloudMonitor at the specified end time.
IntranetInRatio_Average	Average write bandwidth usage	The average write bandwidth usage obtained from CloudMonitor at the specified end time.
IntranetInRatio_Maximum	Maximum write bandwidth usage	The maximum write bandwidth obtained from CloudMonitor at the specified end time.
IntranetInRatio_Minimum	Minimum write bandwidth usage	The minimum write bandwidth obtained from CloudMonitor at the specified end time.
IntranetOut_Average	Average read bandwidth	The average read bandwidth obtained from CloudMonitor at the specified end time.
IntranetOut_Maximum	Maximum read bandwidth	The maximum read bandwidth obtained from CloudMonitor at the specified end time.
IntranetOut_Minimum	Minimum read bandwidth	The minimum read bandwidth obtained from CloudMonitor at the specified end time.
IntranetOutRatio_Average	Average read bandwidth usage	The average read bandwidth usage obtained from CloudMonitor at the specified end time.
IntranetOutRatio_Maximum	Maximum read bandwidth usage	The maximum read bandwidth usage obtained from CloudMonitor at the specified end time.
IntranetOutRatio_Minimum	Minimum read bandwidth usage	The minimum read bandwidth usage obtained from CloudMonitor at the specified end time.
MemoryUsage_Average	Average memory usage	The average memory usage obtained from CloudMonitor at the specified end time.
MemoryUsage_Maximum	Maximum memory usage	The maximum memory usage obtained from CloudMonitor at the specified end time.
MemoryUsage_Minimum	Minimum memory usage	The minimum memory usage obtained from CloudMonitor at the specified end time.

1.1.2.8.10. AnalyticDB for PostgreSQL

After you call the MeteringQuery operation to obtain statistical data, common response parameters and service-specific response parameters are returned. This topic describes the response parametersGPDBspecific to AnalyticDB for PostgreSQL.

Parameter	Name	Description
Pos	Primary key	The primary key consists of the service ID, organization ID, and start time.
OrgName	Organization name	The name of the organization to which the instance belongs.
ResourceGId	Resource set ID	The ID of the resource set to which the instance belongs.
ResourceGName	Resource set name	The name of the resource set to which the instance belongs.
InsId	Instance ID	The ID of the instance.
RegionId	Region	The ID of the region where the instance resides.
StartTime	Start time	The beginning of the time range to query. The time is displayed in UTC.
EndTime	End time	The end of the time range to query. The time is displayed in UTC.
CreateTime	Instance creation time	The time when the instance was created.
EngineVersion	Engine version	The database engine version that is run on the instance.
ZoneId	Zone ID	The zone ID of the instance.
DBInstanceNetType	NIC type	The type of the network interface card (NIC) that is used by the instance.

Parameter	Name	Description
PayType	Billing method	The billing method. Valid values: • PostPaid: pay-as-you-go • PrePaid: subscription
InstanceNetworkType	Network type	The network type of the instance. Valid values: • Classic • VPC
DBInstanceDescription	Instance description	The description of the instance.
Engine	Database engine	The engine of the database.
DBInstanceStatus	Instance status	The status of the instance.
LockMode	Lock mode	The lock mode. • Unlock: The instance is unlocked. • ManualLock: The instance is manually locked. • LockByExpiration: The instance is automatically locked because it has expired. • LockByRestoration: The instance is automatically locked for a rollback. • LockByDiskQuota: The instance is automatically locked because its disk space is used up.
LockReason	Lock reason	The reason why the cluster is locked.
ConnectionMode	Access mode	The access mode of the instance. • Performance: the standard mode • Safety: the safe mode
HostType	Disk type of compute nodes	The disk type of compute nodes. Valid values: • 0: SSD • 1: HDD
DBInstanceClass	Instance type	The instance type of the instance.

Parameter	Name	Description
DBInstanceClassType	Instance family	The instance family. Valid values: • s: shared instance family • x: general purpose instance family • d: dedicated instance family • h: dedicated host instance family
AvailabilityValue	Availability status	The availability status of the instance. Unit: %.
VpcId	VPC ID	The ID of the virtual private cloud (VPC).
Port	Port number	The port number.
DBInstanceDiskMBPS	Disk throughput	The maximum disk throughput of a compute node. Unit: Mbit/s.
MaxConnections	Maximum number of connections	The maximum number of concurrent connections to an instance.
DBInstanceGroupCount	Number of compute nodes	The number of compute nodes.
DBInstanceMemory	Memory	The memory capacity of the instance. Unit: MB.
DBInstanceStorage	Storage	The storage capacity of the instance. Unit: GB.
DBInstanceCpuCores	CPU	The number of CPU cores.

1.1.2.8.11. ApsaraDB for MongoDB

After you call the MeteringQuery operation to obtain statistical data, common response parameters and service-specific response parameters are returned. This topic describes the response parameters specific to ApsaraDB for MongoDB.

Parameter	Name	Description

Parameter	Name	Description
Pos	Primary key	The primary key consists of the service ID, organization ID, and start time.
OrgName	Organization name	The name of the organization to which the instance belongs.
ResourceGId	Resource set ID	The ID of the resource set to which the instance belongs.
ResourceGName	Resource set name	The name of the resource set to which the instance belongs.
InsId	Instance ID	The ID of the instance.
RegionId	Region	The ID of the region where the instance resides.
StartTime	Start time	The beginning of the time range to query. The time is displayed in UTC.
EndTime	End time	The end of the time range to query. The time is displayed in UTC.
CreateTime	Instance creation time	The time when the instance was created.
EngineVersion	Engine version	The database engine version.
ZoneId	Zone ID	The zone ID of the instance.
DBInstanceStatus	Instance status	The status of the instance.
DBInstanceClass	Instance type	The instance type. Example: dds.mongo.mid.
DBInstanceType	Instance architecture	The architecture of the instance. Valid values: • replicate: the replica set instance • sharding: the sharded cluster instance

Parameter	Name	Description
LockMode	Lock status	The lock status of the instance. • Unlock: The instance is not locked. • ManualLock: The instance is manually locked. • LockByExpiration: The instance is automatically locked because it has expired. • LockByRestoration: The instance is automatically locked for a rollback. • LockByDiskQuota: The instance is automatically locked because its disk space is used up. • Released: The instance is released. When the instance is in the Released state, it cannot be unlocked. You must use backup data to create a new instance. It may take an extended period of time to create another instance.
ChargeType	Billing method	The billing method of the instance. Valid values: • PrePaid: subscription • Postpaid: pay-as-you-go
NetworkType	Network type	The network type of the instance. Valid values: • Classic • VPC
DBInstanceDescription	Instance name	The name of the instance.
Engine	Database engine	The engine of the database.
VpcId	VPC ID	The ID of the virtual private cloud (VPC).
VSwitchId	vSwitch ID	The ID of the vSwitch to which the instance is connected.
DBInstanceStorage	Storage	The storage capacity of the instance. Unit: GB.

Parameter	Name	Description
Storage	Volume of stored data	The volume of stored data. Unit: byte.
CpuNum	Number of CPUs	The number of CPUs.
MemoryNum	Memory size	The memory size. Unit: GiB.
CPUUtilization_Average	Average CPU utilization	The average CPU utilization obtained from CloudMonitor at the specified end time.
CPUUtilization_Maximum	Maximum CPU utilization	The maximum CPU utilization obtained from CloudMonitor at the specified end time.
CPUUtilization_Minimum	Minimum CPU utilization	The minimum CPU utilization obtained from CloudMonitor at the specified end time.
ConnectionAmount_Average	Average number of connections	The average number of connections obtained from CloudMonitor at the specified end time.
ConnectionAmount_Maximum	Maximum number of connections	The maximum number of connections obtained from CloudMonitor at the specified end time.
ConnectionAmount_Minimum	Minimum number of connections	The minimum number of connections obtained from CloudMonitor at the specified end time.
ConnectionUtilization_Average	Average connection usage	The average connection usage obtained from CloudMonitor at the specified end time.
ConnectionUtilization_Maximum	Maximum connection usage	The maximum connection usage obtained from CloudMonitor at the specified end time.
ConnectionUtilization_Minimum	Minimum connection usage	The minimum connection usage obtained from CloudMonitor at the specified end time.
DiskUtilization_Average	Average disk usage	The average disk usage obtained from CloudMonitor at the specified end time.

Parameter	Name	Description
DiskUtilization_Maximum	Maximum disk usage	The maximum disk usage obtained from CloudMonitor at the specified end time.
DiskUtilization_Minimum	Minimum disk usage	The minimum disk usage obtained from CloudMonitor at the specified end time.
IOPSUtilization_Average	Average IOPS usage	The average IOPS usage obtained from CloudMonitor at the specified end time.
IOPSUtilization_Maximum	Maximum IOPS usage	The maximum IOPS usage obtained from CloudMonitor at the specified end time.
IOPSUtilization_Minimum	Minimum IOPS usage	The minimum IOPS usage obtained from CloudMonitor at the specified end time.
MemoryUtilization_Average	Average memory usage	The average memory usage obtained from CloudMonitor at the specified end time.
MemoryUtilization_Maximum	Minimum memory usage	The minimum memory usage obtained from CloudMonitor at the specified end time.
MemoryUtilization_Minimum	Maximum memory usage	The maximum memory usage obtained from CloudMonitor at the specified end time.
QPS_Average	Average QPS	The average queries per second (QPS) obtained from CloudMonitor at the specified end time.
QPS_Maximum	Maximum QPS	The maximum QPS obtained from CloudMonitor at the specified end time.
QPS_Minimum	Minimum QPS	The minimum QPS obtained from CloudMonitor at the specified end time.

1.1.2.8.12. Message Queue for Apache RocketMQ

After you call the MeteringQuery operation to obtain statistical data, common response parameters and service-specific response parameters are returned. This topic describes the response parameters specific to Message Queue for Apache RocketMQ.

Parameter	Name	Description
Pos	Primary key	It consists of the product ID, organization ID, and start time.
OrgName	Organization name	The name of the organization to which the instance belongs.
ResourceGId	Resource set ID	The ID of the resource set to which the instance belongs.
ResourceGName	Resource set name	The name of the resource set to which the instance belongs.
InsId	Instance ID	The ID of the instance.
RegionId	Region	The ID of the region where the instance resides.
StartTime	Start time	The beginning of the time range to query. The time is displayed in UTC.
EndTime	End time	The end of the time range to query. The time is displayed in UTC.
CreateTime	Instance creation time	The time when the instance was created.
cluster	Cluster ID	The ID of the cluster.
instanceName	Instance name	The name of the instance.
spInstanceId	Instance ID	The ID of the instance.
independentNaming	Whether a separate namespace is configured	Indicates whether a separate namespace is configured.
instanceType	Instance type	The instance type of the instance.

Parameter	Name	Description
instanceStatus	Instance status	The status of the instance.
topicCapacity	Topic capacity	The number of topics.

1.1.2.8.13. ApsaraDB RDS for PostgreSQL

After you call the MeteringQuery operation to obtain statistical data, common response parameters and service-specific response parameters are returned. This topic describes the response parameters specific to ApsaraDB RDS for PostgreSQL.

Parameter	Name	Description
Pos	Primary key	The primary key consists of the service ID, organization ID, and start time.
OrgName	Organization name	The name of the organization to which the instance belongs.
ResourceGId	Resource set ID	The ID of the resource set to which the instance belongs.
ResourceGName	Resource set name	The name of the resource set to which the instance belongs.
InsId	Instance ID	The ID of the instance.
RegionId	Region	The ID of the region where the instance resides.
StartTime	Start time	The beginning of the time range to query. The time is displayed in UTC.
EndTime	End time	The end of the time range to query. The time is displayed in UTC.
CreateTime	Instance creation time	The time when the instance was created.

Parameter	Name	Description
Port	Port number	The internal port number of the instance.
DBInstanceClassType	Instance family	The instance family of the instance. Valid values: • s: shared instance family • x: general purpose instance family • d: dedicated instance family • h: dedicated host instance family
DBInstanceClass	Instance type	The instance type of the instance. Example: rds.mys2.small.
DBInstanceNetType	Internet and internal networks	Indicates whether the instance is connected over the Internet or an internal network. Valid values: • Internet: the Internet • Intranet: internal networks
DBInstanceType	Instance role	The role of the instance. Valid values: • Primary: primary instance • Readonly: read-only instance • Guard: disaster recovery instance • Temp: temporary instance
InstanceNetworkType	Network type	The network type of the instance. Valid values: • Classic • VPC
DBInstanceDescription	Instance description	The description of the instance.
DBType	Database type	The type of the database.
DBVersion	Engine version	The database engine version that is available.
ZoneId	Zone ID	The zone ID of the instance.

Parameter	Name	Description
LockMode	Lock mode	The lock mode of the instance. Valid values: • Unlock: The instance is unlocked. • ManualLock: The instance is manually locked. • LockByExpiration: The instance is automatically locked because it has expired. • LockByRestoration: The instance is automatically locked for a rollback. • LockByDiskQuota: The instance is automatically locked because its disk space is used up. • LockReadInstanceByDiskQuota: The instance is a read-only instance and is automatically locked when the disk space is full.
PayType	Billing method	The billing method of the instance. Valid values: • PostPaid: pay-as-you-go • PrePaid: subscription
ConnectionMode	Access mode	The access mode of the instance. Valid values: • Standard: the standard mode • Safe: the proxy mode
DBInstanceStorageType	Storage type	The type of storage media that is used by the instance. Valid values: • local_ssd or ephemeral_ssd: local SSD • cloud_ssd: standard SSD. • cloud_essd: enhanced SSD
DBInstanceStatus	Instance status	The status of the instance.
AvailabilityValue	Availability status	The availability status of the instance. Unit: %.
IpAddress	IP address	The IP address.
VPCId	VPC ID	The ID of the virtual private cloud (VPC).

Parameter	Name	Description
AccountMaxQuantity	Maximum number of accounts that can be created	The maximum number of accounts that can be created.
DBInstanceCPU	Number of CPUs that are configured for the instance	The number of CPUs that are configured for the instance.
MaxConnections	Maximum number of concurrent connections	The maximum number of concurrent connections that are allowed by the instance.
DBInstanceMemory	Memory	The memory capacity of the instance. Unit: MB.
DBInstanceDiskUsed	Used storage	The used storage. Unit: byte.
MaxIOPS	Maximum IOPS	The maximum number of I/O requests that the instance can process per second.
DBMaxQuantity	Maximum number of databases that can be created	The maximum number of databases that can be created on the instance.
DBInstanceStorage	Storage	The storage capacity of the instance. Unit: GB.

1.1.2.8.14. ApsaraDB RDS for SQL Server

After you call the MeteringQuery operation to obtain statistical data, common response parameters and service-specific response parameters are returned. This topic describes the response parameters specific to ApsaraDB RDS for SQL Server.

Parameter	Name	Description
Pos	Primary key	The primary key consists of the service ID, organization ID, and start time.
OrgName	Organization name	The name of the organization to which the instance belongs.

Parameter	Name	Description
ResourceGId	Resource set ID	The ID of the resource set to which the instance belongs.
ResourceGName	Resource set name	The name of the resource set to which the instance belongs.
InsId	Instance ID	The ID of the instance.
RegionId	Region	The ID of the region where the instance resides.
StartTime	Start time	The beginning of the time range to query. The time is displayed in UTC.
EndTime	End time	The end of the time range to query. The time is displayed in UTC.
CreateTime	Instance creation time	The time when the instance was created.
DBInstanceDescription	Instance description	The description of the instance.
Category	Instance edition	The edition of the instance. Valid values: • Basic: Basic Edition • HighAvailability: High-availability Edition • AlwaysOn: Cluster Edition • Finance: Enterprise Edition
ClassCode	Instance type	The instance type. Example: mssql.x4.medium.s2.
DBType	Database type	The type of the database.
DBVersion	Engine version	The database engine version.
Zone	Zone	The ID of the zone.

Parameter	Name	Description
LockMode	Lock mode	The lock mode of the instance. Valid values: • Unlock: The instance is unlocked. • ManualLock: The instance is manually locked. • LockByExpiration: The instance is automatically locked because it has expired. • LockByRestoration: The instance is automatically locked for a rollback. • LockByDiskQuota: The instance is automatically locked because its disk space is used up. • LockReadInstanceByDiskQuota: The instance is a read-only instance and is automatically locked when the disk space is full.
DBInstanceStatus	Instance status	The status of the instance.
DBInstanceType	Instance role	The role of the instance. Valid values: • Primary: primary instance • Readonly: read-only instance • Guard: disaster recovery instance • Temp: temporary instance
Port	Port number	The internal port number of the instance.
DBInstanceClassType	Instance family	The instance family. Valid values: • s: shared instance family • x: general purpose instance family • d: dedicated instance family • h: dedicated host instance family
DBInstanceStorageType	Storage type	The type of storage media that is used by the instance. Valid values: • local_ssd or ephemeral_ssd: local SSD • cloud_ssd: standard SSD. • cloud_essd: enhanced SSD

Parameter	Name	Description
AvailabilityValue	Availability status	The availability status of the instance. Unit: %.
IpAddress	IP address	The IP address.
VPCId	VPC ID	The ID of the virtual private cloud (VPC).
BackupStorage	Backup storage	The amount of backup storage. Unit: byte.
IORequest	Number of I/O requests	The number of I/O requests.
NetworkIn	Inbound traffic	The traffic sent from external networks, which occurred between the specified start time and the specified end time.
NetworkOut	Outbound traffic	The traffic sent to external networks, which occurred between the specified start time and the specified end time.
Storage	Volume of stored data	The amount of stored data. Unit: byte.
UsedStorage	Used storage	The amount of used storage space. Unit: byte.
AccountMaxQuantity	Maximum number of accounts that can be created	The maximum number of accounts that can be created.
DBInstanceCPU	Number of CPUs	The number of CPUs that are configured for the instance.
MaxConnections	Maximum number of concurrent connections	The maximum number of concurrent connections.
DBInstanceMemory	Memory	The memory capacity of the instance. Unit: MB.
DBInstanceDiskUsed	Used storage	The used storage. Unit: byte.

Parameter	Name	Description
MaxIOPS	Maximum IOPS	The maximum number of I/O requests that the instance can process per second.
DBMaxQuantity	Maximum number of databases that can be created	The maximum number of databases that can be created on the instance.
DBInstanceStorage	Storage	The storage capacity of the instance. Unit: GB.

1.1.2.8.15. Log Service

After you call the MeteringQuery operation to obtain statistical data, common response parameters and service-specific response parameters are returned. This topic describes the response parameters specific to Log Service.

Parameter	Name	Description
Pos	Primary key	It consists of the product ID, organization ID, and start time.
OrgName	Organization name	The name of the organization to which the logstore belongs.
ResourceGId	Resource set ID	The ID of the resource set to which the logstore belongs.
ResourceGName	Resource set name	The name of the resource set to which the logstore belongs.
InsId	Logstore ID	The ID of the logstore.
RegionId	Region	The ID of the region where the logstore resides.
StartTime	Start time	The beginning of the time range to query. The time is displayed in UTC.
EndTime	End time	The end of the time range to query. The time is displayed in UTC.

Parameter	Name	Description
CreateTime	Logstore creation time	The time when the logstore was created.
description	Description	The description of the logstore.
status	Status	The status of the logstore.
ShardSize	Number of active shards	The number of active shards. The number can include decimal places.
OutflowSize	Read traffic	The volume of compressed read traffic of Log Service between the specified start time and the specified end time, and also at the specified start time. Unit byte.
InflowSize	Write traffic	The volume of compressed write traffic of Log Service between the specified start time and the specified end time, and also at the specified start time. Unit byte.
WriteCount	Number of writes	The number of writes to Log Service between the specified start time and the specified end time, and also at the specified start time. Unit byte.
ReadCount	Number of reads	The number of reads from Log Service between the specified start time and the specified end time, and also at the specified start time. Unit byte.
IndexSum	Total index volume	The total volume of indexes occupied by Log Service. Unit: byte.
RawSum	Total data size	The total size of data occupied by Log Service. Unit: byte.
IndexSize	Volume of index data	The volume of index data between the specified start time and the specified end time, and also at the specified start time. Unit byte.

1.1.2.8.16. EBS

After you call the MeteringQuery operation to obtain statistical data, common response parameters and service-specific response parameters are returned. This topic describes the response parameters specific to Elastic Block Storage (EBS).

Parameter	Name	Description
Pos	Primary key	The primary key consists of the service ID, organization ID, and start time.
OrgName	Organization name	The name of the organization to which the EBS device belongs.
ResourceGId	Resource set ID	The ID of the resource set to which the EBS device belongs.
ResourceGName	Resource set name	The name of the resource set to which the EBS device belongs.
InsId	Instance ID	The ID of the EBS device.
RegionId	Region	The ID of the region where the EBS device resides.
StartTime	Start time	The beginning of the time range to query. The time is displayed in UTC.
EndTime	End time	The end of the time range to query. The time is displayed in UTC.
CreateTime	Instance creation time	The time when the EBS device was created.
Description	Description	The description of the cloud disk or local disk.

Parameter	Name	Description
DiskCategory	Disk category	The category of the cloud disk or local disk. Valid values: • all: all disk categories • cloud: basic disk • cloud_efficiency: ultra disk • cloud_ssd: standard SSD • cloud_essd: enhanced SSD (ESSD) • local_ssd_pro: I/O-intensive local disk • local_hdd_pro: throughput-intensive local disk • ephemeral: retired local disk • ephemeral_ssd: retired local SSD Default value: all.
DiskChargeType	Billing method	The billing method of the cloud disk or local disk. Valid values: • PrePaid: subscription • PostPaid: pay-as-you-go
ExpiredTime	Expiration time	The time when the cloud desktop expires.
ImageId	Image ID	The ID of the image used to create the Elastic Compute Service (ECS) instance. This parameter is empty unless the disk was created from an image. This parameter value remains unchanged throughout the lifecycle of the disk.
Status	Disk status	The status of the disk. Valid values: • In_use • Available • Attaching • Detaching • Creating • ReIniting • All Default value: All.

Parameter	Name	Description
AttachedTime	Attach time	The time when the disk was attached. The time follows the ISO 8601 standard and is displayed in UTC. This parameter is valid only when Status is set to Available.
BindInstanceId	ID of the instance to which the disk was attached	The ID of the instance to which the cloud disk or local disk was attached. This parameter has a value only when Status is set to In_use. Otherwise, the parameter is empty.
Device	Mount point	The mount point of the cloud disk or local disk.
DiskName	Name of the cloud disk or local disk.	The name of the cloud disk or local disk.
Type	Disk type	The type of the cloud disk or local disk. Valid values: • system: system disk • data: data disk
KMSKeyId	ID of the KMS key	The ID of the Key Management Service (KMS) key used by the disk.
DiskSize	Disk size	The size of the cloud disk or local disk. Unit: GiB.

1.1.2.8.17. Snapshots

After you call the MeteringQuery operation to obtain statistical data, common response parameters and service-specific response parameters are returned. This topic describes the response parameters specific to the snapshot feature.

Parameter	Name	Description
Pos	Primary key	The primary key consists of the service ID, organization ID, and start time.
OrgName	Organization name	The name of the organization to which the snapshot belongs.

Parameter	Name	Description
ResourceGId	Resource set ID	The ID of the resource set to which the snapshot belongs.
ResourceGName	Resource set name	The name of the resource set to which the snapshot belongs.
InsId	Snapshot ID	The ID of the snapshot.
RegionId	Region	The region ID of the snapshot.
StartTime	Start time	The beginning of the time range to query. The time is displayed in UTC.
EndTime	End time	The end of the time range to query. The time is displayed in UTC.
CreateTime	Snapshot creation time	The time when the snapshot was created.
Status	Snapshot status	The status of the snapshot. Default value: all. Valid values: • progressing: The snapshot is being created. • accomplished: The snapshot is created. • failed: The snapshot fails to be created. • all: This parameter indicates all snapshot states.
Progress	Creation progress	The progress of snapshot creation. Example: 100%.

Parameter	Name	Description
Usage	Whether the snapshot has been used	Indicates whether the snapshot has been used to create images or disks. Valid values: • image: The snapshot has been used to create custom images. • disk: The snapshot has been used to create disks. • image_disk: The snapshot has been used to create custom images and data disks. • none: The snapshot has not been used to create custom images or disks.
Description	Snapshot description	The description of the snapshot.
SnapshotCategory	Snapshot type	The type of the snapshot. Valid values: • standard: normal snapshot • flash: local snapshot
SnapshotName	Snapshot name	The name of the snapshot.
SourceDiskId	Source disk ID	The ID of the source disk.
SourceStorageType	Source disk type	The type of the source disk.
SnapshotSN	Snapshot serial number	The serial number of the snapshot.
LastModifiedTime	Time when the snapshot was last changed	The time when the snapshot was last changed. The time follows the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time is displayed in UTC.
SnapshotType	Type of snapshot creation	The type of snapshot creation. Valid values: • auto or timer: automatically created snapshot • user: manually created snapshot • all: all snapshot types

Parameter	Name	Description
SourceDiskType	Source disk attribute	The attribute of the source disk. The value is set to systemdata.
SourceDiskSize	Source disk size	The size of the system disk. Unit: GB.
RetentionDays	Retention period of the automatic snapshot	The retention period of the automatic snapshot.

1.1.2.8.18. Auto Scaling

After you call the MeteringQuery operation to obtain statistical data, common response parameters and service-specific response parameters are returned. This topic describes the response parameters specific to Auto Scaling.

Parameter	Name	Description
Pos	Primary key	The primary key consists of the service ID, organization ID, and start time.
OrgName	Organization name	The name of the organization to which the scaling group belongs.
ResourceGId	Resource set ID	The ID of the resource set to which the scaling group belongs.
ResourceGName	Resource set name	The name of the resource set to which the scaling group belongs.
InsId	Scaling group ID	The ID of the scaling group.
RegionId	Region	The ID of the region where the scaling group resides.
StartTime	Start time	The beginning of the time range to query. The time is displayed in UTC.
EndTime	End time	The end of the time range to query. The time is displayed in UTC.

Parameter	Name	Description
CreateTime	Scaling group creation time	The time when the scaling group was created.
LifecycleState	Status	The status of the scaling group. Valid values: • Active: The scaling group is active. Active scaling groups can receive requests to execute scaling rules and trigger scaling activities. • Inactive: The scaling group is inactive. Inactive scaling groups cannot receive requests to execute scaling rules. • Deleting: The scaling group is being deleted. Scaling groups that are being deleted cannot receive requests to execute scaling rules and their parameters cannot be modified.
ScalingPolicy	Reclaim mode	Indicates the reclaim mode of the scaling group. Valid values: • recycle: The reclaim mode of the scaling group is set to Shutdown and Reclaim Mode. • release: The reclaim mode of the scaling group is set to Release Mode.
VSwitchId	vSwitch ID	The ID of the vSwitch that is associated with the scaling group.
ScalingGroupName	ScalinggGroup name	The name of the scaling group.
VpcId	VPC ID	The ID of the virtual private cloud (VPC) to which the scaling group belongs.

Parameter	Name	Description
MultiAZPolicy	Multi-zone scaling policy	The Elastic Compute Service (ECS) instance scaling policy for the multi-zone scaling group. Valid values: • PRIORITY: ECS instances are scaled based on the specified vSwitch. When an ECS instance cannot be created in the zone where the vSwitch that has the highest priority resides, the system uses the vSwitch that has the next highest priority to create the instance. • COST_OPTIMIZED: ECS instances are created based on the unit price of vCPU in ascending order. Preemptible instances are preferentially created when preemptible instance types are specified in the active scaling configuration. • BALANCE: ECS instances are evenly distributed in multiple zones specified for the scaling group.
PendingWaitCapacity	Number of instances in the Pending state	The number of ECS instances that are in the Pending state in the scaling group.
TotalCapacity	Total capacity	Indicates the total weighted capacity of all ECS instances in the scaling group if the instance type weight is specified for the scaling group. If the instance type weight is not specified, this parameter indicates the total number of ECS instances in the scaling group.
RemovingWaitCapacity	Number of instances in the Suspending state	The number of ECS instances that are in the Suspending state in the scaling group.
ProtectedCapacity	Number of instances in the Protected state	The number of ECS instances that are in the Protected state in the scaling group.
StandbyCapacity	Number of instances in the Standby state	The number of instances that are in the Standby state in the scaling group.
RemovingCapacity	Number of instances in the Removing state	The number of ECS instances that are in the Removing state in the scaling group.

Parameter	Name	Description
PendingCapacity	Number of instances in the Adding state	The number of ECS instances that are being added to the scaling group and are still being configured.
ActiveCapacity	Number of instances in the In Service state	The number of ECS instances that have been added to the scaling group and are running normally.
StoppedCapacity	Number of stopped instances	The number of instances that are in the Stopped state in the scaling group.
MaxSize	Maximum number of instances	The maximum number of ECS instances in the scaling group.
MinSize	Minimum number of instances	The minimum number of ECS instances in the scaling group.
DefaultCooldown	Default cooldown time	The default cooldown time of the scaling group. Unit: seconds. During the cooldown time, Auto Scaling executes only scaling activities that are triggered by CloudMonitor event-triggered tasks.

1.1.2.8.19. API Gateway

After you call the MeteringQuery operation to obtain statistical data, common response parameters and service-specific response parameters are returned. This topic describes the response parameters specific to API Gateway.

Parameter	Name	Description
Pos	Primary key	It consists of the product ID, organization ID, and start time.
OrgName	Organization name	The name of the organization to which the instance belongs.
ResourceGId	Resource set ID	The ID of the resource set to which the instance belongs.

Parameter	Name	Description
ResourceGName	Resource set name	The name of the resource set to which the instance belongs.
InsId	Instance ID	The ID of the instance.
RegionId	Region	The ID of the region where the instance resides.
StartTime	Start time	The beginning of the time range to query. The time is displayed in UTC.
EndTime	End time	The end of the time range to query. The time is displayed in UTC.
CreateTime	Instance creation time	The time when the instance was created.
ApiName	API name	The name of the API.
GroupId	API group ID	The ID of the specified API group.
GroupName	API group name	The name of the specified API group.
Visibility	Type	The type of the API.

2.Elastic Compute Service (ECS)

2.1. Developer Guide

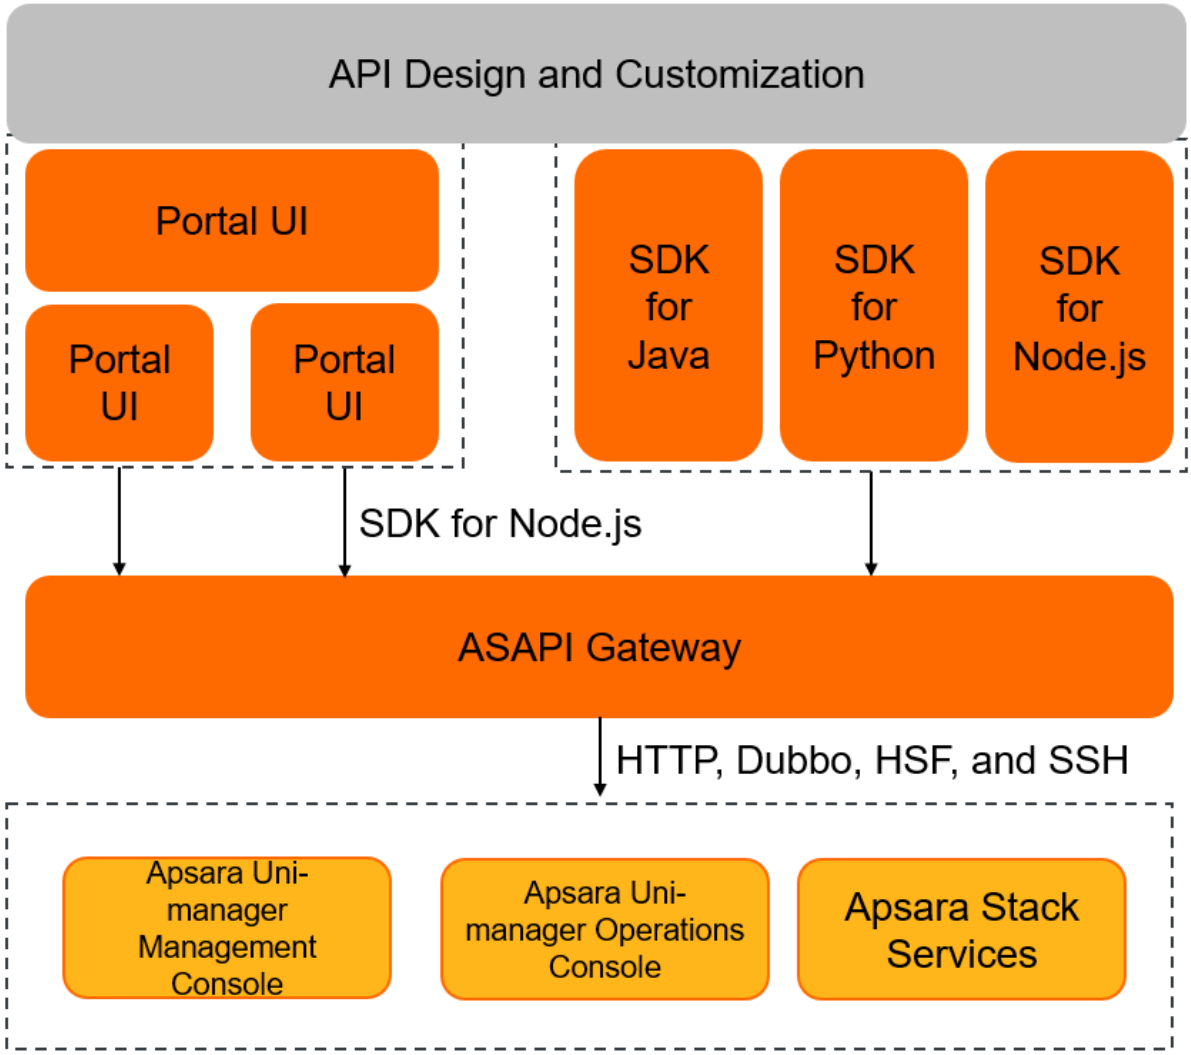
2.1.1. Call ECS SDK by using ASAPI

2.1.1.1. 文档标题缺失，请补全后重新导出

2.1.1.1.1. ASAPI overview

This topic describes the architecture and features of the Apsara Stack API (ASAPI).

The ASAPI is a unified ingress gateway for Apsara Stack services and a main component of the Apsara Uni-manager Management Console. The ASAPI provides a unified method for you to manage and make API calls. You can use Apsara Stack SDK to centrally make API calls to Apsara Stack services, including Elastic Compute Service (ECS) and Virtual Private Cloud (VPC).



The ASAPI allows you to make API calls to manage and maintain Apsara Stack services.

- Make API calls to implement enterprise-grade management. For example, you can manage organizations, users, roles, resource sets, and logon policies. These operations are provided by the Apsara Uni-manager Management Console.
- Make API calls to manage operations. For example, you can manage quotas, usage statistics, specifications, and password policies. These operations are provided by the Apsara Uni-manager Management Console.
- Make API calls to manage resources. For example, you can create, delete, query, or modify cloud resources. These operations are provided by Apsara Stack services. If you call an API operation to create an ECS instance or a VPC, the API operation is provided by ECS or VPC.
- Make API calls to query monitoring metrics of Apsara Stack services. These operations are provided by the Apsara Uni-manager Management Console.
- Make API calls to perform O&M. For example, you can manage monitoring and alerting, inventories, tasks, and physical servers. These operations are provided by the Apsara Uni-manager Operations Console.

For more information, see the developer guide of the corresponding Apsara Stack service. For information about API operations used to manage organization users, see *Apsara Uni-manager Management Console Developer Guide*. For information about the API operation used to create an ECS instance, see *ECS Developer Guide*.

> **Note** If the "Use Apsara Stack SDK to make API calls" section is included in the developer guide of an Apsara Stack service, the ASAPI is supported by the Apsara Stack service. In this case, you can make API calls based on the developer guide.

2.1.1.1.2. Preparations

2.1.1.1.2.1. Log on to the API Tool console

You can log on to the API Tool console from the Apsara Uni-manager Management Console.

Prerequisites

- The URL of the Apsara Uni-manager Management Console is obtained from the deployment personnel before you log on to the Apsara Uni-manager Management Console.
- We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL of the Apsara Uni-manager Management Console. Press the Enter key.
2. Enter your username and password.

   Obtain the username and password that you can use to log on to the console from the operations administrator.

> **Note** When you log on to the Apsara Uni-manager Management Console for the first time, you must change the password of your username. Your password must meet complexity requirements. The password must be 10 to 32 characters in length and must contain at least two of the following character types:
>
> - Uppercase or lowercase letters
> - Digits
> - Special characters, which include ! @ # $ %

3. Click **Log On**.
4. In the top navigation bar, choose **Products > Others > API Tool**.

2.1.1.1.2.2. View information about API operations

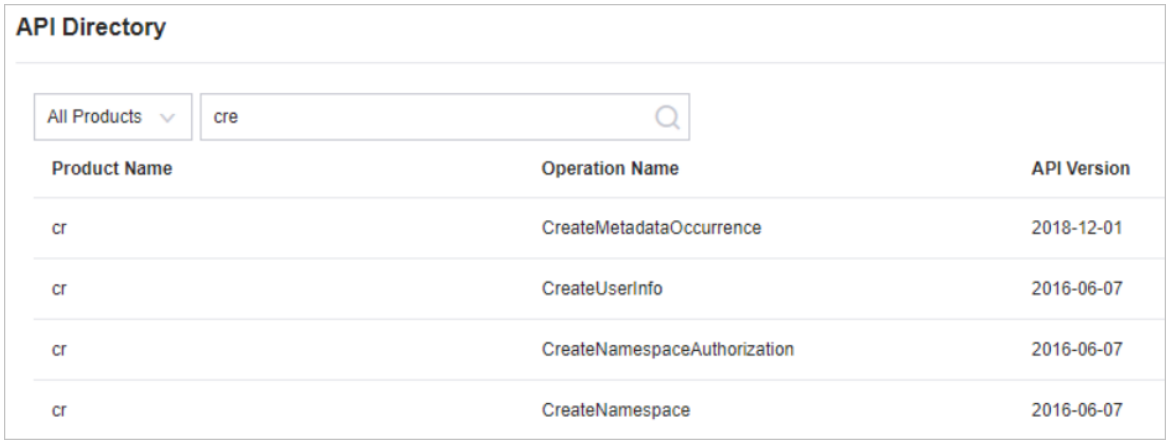
This topic describes how to view information about API operations. Before you use SDKs, obtain service names, API operation names, and API operation versions.

Context

The API operations on the API Directory page are only for reference. For information about how to call API operations, see developer guides of the corresponding cloud services. If the information on the API Directory page is inconsistent with that in the developer guide of the corresponding cloud service, the information in the developer guide prevails.

Procedure

1. Go to the API Tool console. For more information, see Log on to the API Tool console.
2. In the left-side navigation pane, click **API Directory**.
3. On the **API Directory** page, select the desired service from the drop-down list, enter a keyword of an API operation name in the search box, and then click the search icon.



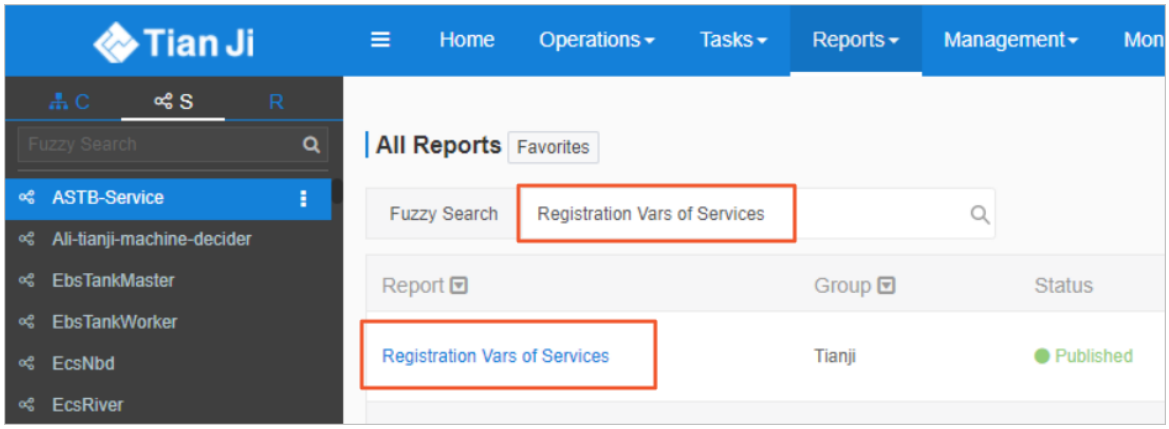
4. Then, you can view the service name, API operation name, and API operation version.

2.1.1.1.2.3. Generate an endpoint for the ASAPI

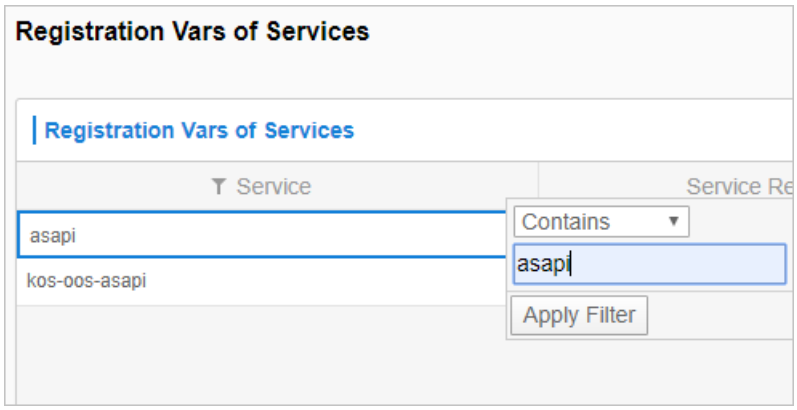
This topic describes three methods used to generate an endpoint for the Apsara Stack API (ASAPI).

Method 1: Use Registration Vars of Services to generate an endpoint

1. Log on to Apsara Infrastructure Management Framework.
   i. Log on to the Apsara Uni-manager Operations Console.
   ii. In the top navigation bar, click **O&M**.
   iii. In the left-side navigation pane, choose **Product Management** > **Products**.
   iv. In the Apsara Stack O&M section, click **Apsara Infrastructure Management Framework**.
2. In the left-side navigation pane, click **Reports**.
3. On the **All Reports** page, search for `Registration Vars of Services` and click the report name.



4. On the **Registration Vars of Services** page, click the icon next to **Service** and search for `asapi`.



5. Find the asapi service, right-click in the **Service Registration** column, and then select **Show More** from the shortcut menu.

   In the **Details** dialog box, obtain the value of **asapi.public.endpoint**.
6. Generate an endpoint for the ASAPI based on the following format:

```
https://<asapi.public.endpoint>/asapi/v3
```

Method 2: Use cluster resources to generate an endpoint

1. Log on to Apsara Infrastructure Management Framework.
   i. Log on to the Apsara Uni-manager Operations Console.

ii. In the top navigation bar, click **O&M**.

iii. In the left-side navigation pane, choose **Product Management** > **Products**.

iv. In the Apsara Stack O&M section, click **Apsara Infrastructure Management Framework**.

2. Go to the cluster operations page.

i. In the left-side navigation pane, choose Operations > Cluster Operations.

ii. In the **Cluster** search box, enter `ascm`.

iii. Find the cluster that you want to manage and click **Operations** in the **Actions** column.

3. Obtain the value of the domain parameter.

i. Click the Cluster Resources tab.

ii. In the **Name** field, search for `asapi_dns_public`.

iii. Click **Details** in the **Application Parameter** column.

In the **Application Parameter** message, obtain the value of the **domain** parameter.

4. Generate an endpoint for the ASAPI based on the following format:

```
https://<domain>/asapi/v3
```

Method 3: Concatenate strings to generate an endpoint

You can also concatenate strings to generate an endpoint based on the following format:

```
https://public.asapi.<region>.<internet-domain>/asapi/v3
```

> **Note**
>
> 1. Replace <region> with your actual region ID. For information about how to query a region ID, see Query a region ID.
> 2. Replace <internet-domain> with the root domain of your Apsara Stack service. To obtain the root domain, contact Apsara Stack O&M personnel. Take note of this point: Use the internet-domain parameter instead of the intranet-domain parameter.

If the **region** value is `cn-****-****-d01` and the **internet-domain** value is `inter.****.****.com`, the following endpoint can be generated:

```
https://public.asapi.cn-****-****-d01.inter.****.****.com/asapi/v3
```

2.1.1.1.2.4. Obtain Apsara Stack SDKs

The Apsara Stack API (ASAPI) is a unified portal provided by Apsara Stack. You can use the ASAPI to connect to all Apsara Stack services. Apsara Stack provides SDKs for API calls.

For more information about how to obtain Apsara Stack SDKs, see Apsara Stack documentation.

2.1.1.1.2.5. Obtain an AccessKey pair

An AccessKey pair that consists of an AccessKey ID and an AccessKey secret is used to implement symmetric encryption. This helps you verify the identity of a requester. The AccessKey ID is used to identify a user. The AccessKey secret is used to encrypt the signature string. This topic describes how to obtain an AccessKey pair.

Prerequisites

An account of the operations administrator or the level-1 organization administrator is obtained. Only an operations administrator or a level-1 organization administrator can obtain an AccessKey pair.

Context

If you need to make API calls to the Apsara Uni-manager Management Console or other Apsara Stack services, we recommend that you use the AccessKey pair of a personal account. If you use the AccessKey pair of a personal account, configure the request headers that are described in the following table for access control. Otherwise, an error that indicates insufficient permissions can occur.

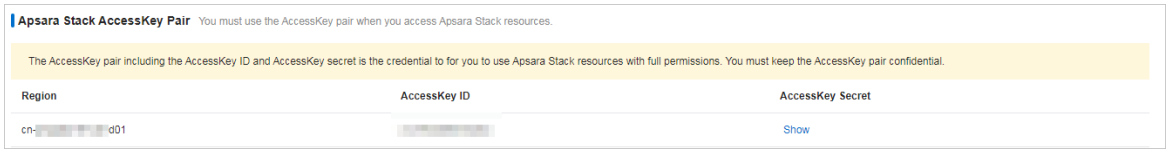
Parameter	Description
x-acs-regionid	The ID of the region, for example, cn-hangzhou-*.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console. For information about how to obtain an organization ID, see the "GetOrganizationList" section in Apsara Uni-manager Management Console Developer Guide.
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console. For information about how to obtain a resource set ID, see the "ListResourceGroup" section in Apsara Uni-manager Management Console Developer Guide.
x-acs-instanceid	The ID of the instance to which you make API calls. If you need to make API calls to an Elastic Compute Service (ECS) instance, obtain the ID of the ECS instance on the Instances page.

Warning The AccessKey pair of a personal account is managed and controlled by the permission system of the Apsara Uni-manage Management Console. If you need to obtain the AccessKey pair of an account that has permissions on an organization, make sure that your operation is allowed by an administrator. This ensures security. The account that has permissions on an organization is a privileged account.

Obtain the AccessKey pair of a personal account

To obtain the AccessKey pair of a personal account, perform the following operations:

1. Log on to the Apsara Uni-manager Management Console.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and click **User Information**.
3. In the **Apsara Stack AccessKey Pair** section, obtain the AccessKey pair.



> **Note** The AccessKey pair that consists of an AccessKey ID and an AccessKey secret is the credential for you to have full permissions on Apsara Stack resources. Keep your AccessKey pair confidential.

Obtain the AccessKey pair of an account that has permissions on an organization

To obtain the AccessKey pair of an account that has permissions on an organization, perform the following operations:

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Organizations**.
4. In the Organizations navigation tree, click the name of the organization that you want to manage.
5. On the right side of the page, click **Obtain AccessKey Pair**.
6. In the message that appears, obtain the AccessKey pair of the account that has permissions on the organization.

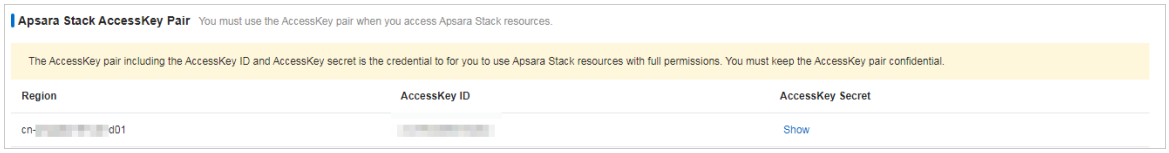
> **Note** The system automatically allocates an AccessKey pair to the account that has permissions on the level-1 organization. The same AccessKey pair is used by the accounts that have permissions on the subordinate organizations.

2.1.1.1.2.6. Query a region ID

When you use Apsara Stack SDK for Node.js to make API calls, specify a region ID. You can obtain a region ID in the Apsara Uni-manager Management Console.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and click **User Information**.
3. In the **Apsara Stack AccessKey Pair** section, view the region ID.



2.1.1.1.3. Common parameters

Common request parameters must be included in all API requests.

Sample common parameters

The following table describes the common parameters that are used when you call API operations supported by the Apsara Stack API (ASAPI).

Parameter	Type	Required	Description
Action	String	Yes	The operation that you want to perform. For more information, see View information about API operations.
Product	String	Yes	The name of the service.
Version	String	Yes	The version of the API operation. For more information, see View information about API operations.
RegionId	String	Yes	The ID of the region. For more information, see Query a region ID.
AccessKeyId	String	Yes	The AccessKey ID used to connect to the service. For more information, see Obtain an AccessKey pair.
Signature	String	Yes	The signature string of the current request. For more information about how signatures are calculated, see Request signatures.

Parameter	Type	Required	Description
SignatureMethod	String	Yes	The encryption method of the signature string. Valid values: HMAC-SHA1 and HMAC-SHA256.
SignatureVersion	String	Yes	The version of the signature encryption algorithm. Valid values: 1.0 and 2.0.
SignatureNonce	String	Yes	A unique, random number used to prevent replay attacks. You must use different numbers for different requests.
Timestamp	String	Yes	The timestamp of the request. Specify the time in the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time must be in UTC. Sample value: 2018-01-01T12:00:00Z.
Format	String	Yes	The format in which to return the response. Set the value to JSON.

Note

The `Signature`, `SignatureMethod`, `SignatureVersion`, `SignatureNonce`, `Timestamp`, and `Format` parameters are encapsulated into Apsara Stack SDK. You do not need to configure these parameters.

2.1.1.1.4. SDK description

2.1.1.1.4.1. Use Apsara Stack SDK for Java to call API operations

This topic describes how to obtain and use Apsara Stack SDK for Java to call API operations.

Prerequisites

- An authorized account and an AccessKey pair are obtained. The AccessKey pair consists of an AccessKey ID and an AccessKey secret. For more information about how to obtain an AccessKey pair in the Apsara Uni-manager Management Console, see Obtain an AccessKey pair.
- The endpoint of the Apsara Stack API (ASAPI) is obtained. For more information, see Generate an endpoint for the ASAPI.
- Apsara Stack SDK for Java 1.8 or later is installed.

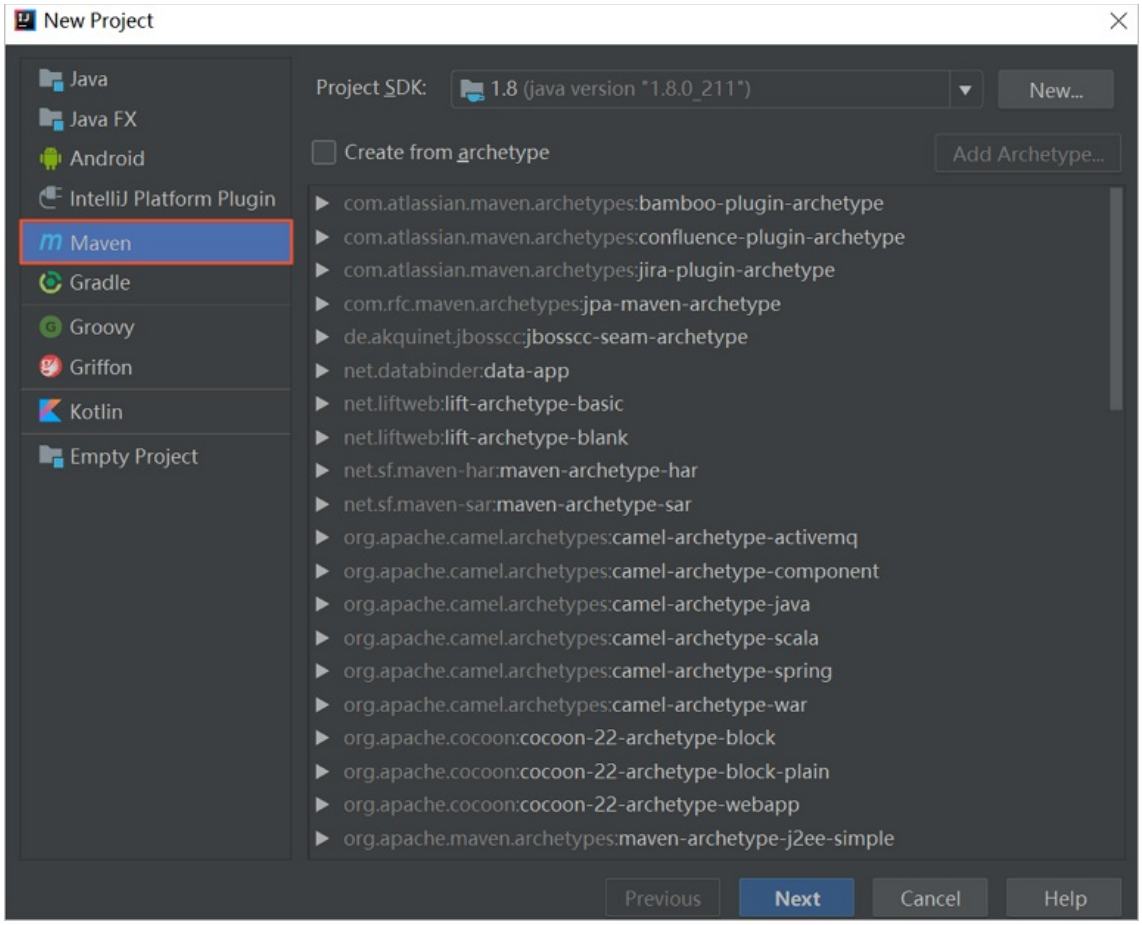
Background information

The help center of Apsara Stack provides Maven dependencies and JAR files for Apsara Stack SDK for Java. You can write code to use Apsara Stack SDK for Java to call API operations.

In this example, the Windows 10 64-bit OS and IntelliJ IDEA are used.

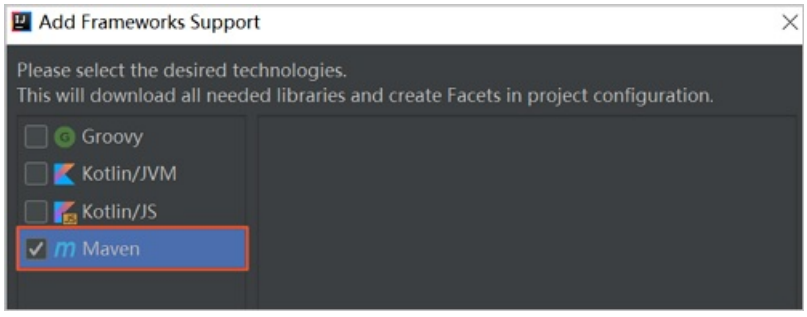
Procedure

1. Use one of the following methods to configure Maven in IntelliJ IDEA. Maven is a tool used for project management.
   - Use Maven that is integrated in IntelliJ IDEA.
   - Download Maven based on the OS that you are using from the official website and configure Maven. For more information, see Download Maven.
2. Obtain the Maven dependencies for Apsara Stack SDK for Java from the official website. For more information about how to obtain the dependencies, see Obtain the core package for ASAPI.
3. Use one of the following methods to create a Maven project:
   - Method 1: Create a Maven project in IntelliJ IDEA.

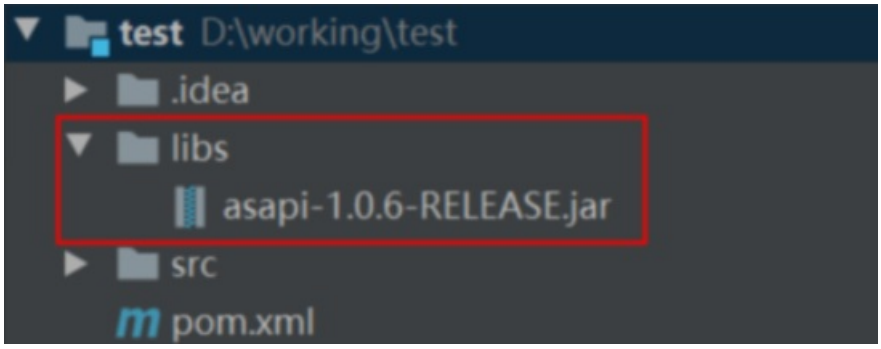


- Method 2: Convert an existing project to a Maven project.
  a. Right-click the project that you want to convert and select **Add Framework Support...**.

  b. Select **Maven** and click **OK**.



4. Create a folder named libs in the root directory of the project. Then, add the JAR file of Apsara Stack SDK for Java to the libs folder, as shown in the following figure.



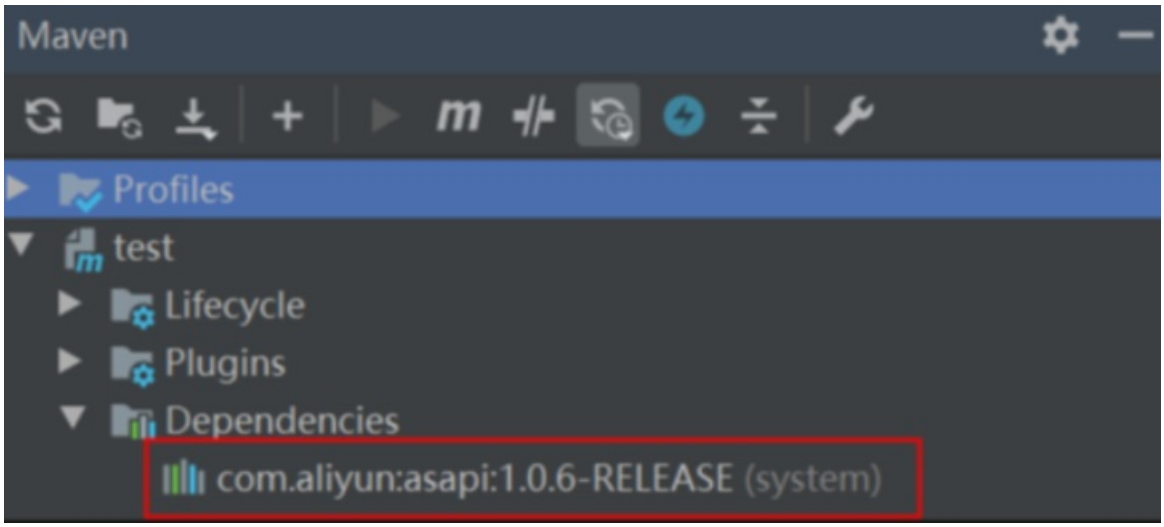
5. Add the dependencies of Apsara Stack SDK for Java to the pom.xml file in the project directory.

```
<dependencies>
    <dependency>
        <groupId>com.aliyun</groupId>
        <artifactId>asapi</artifactId>
        <version>1.0.6-RELEASE</version>
        <scope>system</scope>
        <systemPath>${project.basedir}/libs/asapi-1.0.6-RELEASE.jar</systemPath>
    </dependency>
  <dependency>
        <groupId>com.alibaba</groupId>
        <artifactId>alicrypto-java-aliyun</artifactId>
    <version>1.0.4</version>
    <systemPath>${project.basedir}/libs/alicrypto-java-aliyun-1.0.4.jar</systemPath>
  </dependency>
  <dependency>
    <groupId>com.aliyun</groupId>
    <artifactId>gmsse</artifactId>
    <version>1.1.0</version>
    <systemPath>${project.basedir}/libs/gmsse-1.1.0.jar</systemPath>
  </dependency>
</dependencies>
```

> **Note** Replace `1.0.6-RELEASE` with the actual version of Apsara Stack SDK for Java.

6. On the right side of IntelliJ IDEA, view information in the Maven section.

If the information in the following figure appears, the dependencies are added.



Use Apsara Stack SDK for Java

You can use the GET or POST method to call API operations provided by the ASAPI. The following sample code shows how to call API operations:

```
// 1. Create a connection to an ASClient object.
ASClient client = new ASClient();
// 2. Configure the identifier of the requester. This parameter is required and used only f
or identification. You can set this parameter to a random value.
client.setSdkSource("<The identifier of the requester>");
Map<String, Object> parameters = new HashMap<String, Object>();
// 3. Configure the parameters for authorization. The parameter values vary based on your e
nvironment.
// The AccessKey ID of your Apsara Stack tenant account.
parameters.put("AccessKeyId","<AccessKey ID>");
// The AccessKey secret of your Apsara Stack tenant account.
parameters.put("AccessKeySecret", "<AccessKey Secret>");
// The ID of the region.
parameters.put("RegionId", "<your RegionID>");
// 4. Configure parameters for an API call. In this example, the Product, Action, and Versi
on parameters are configured.
parameters.put("Product", "<The name of the service>");
parameters.put("Action", "<The name of the API operation>");
parameters.put("Version", "<The version of the API operation>");
// 5. Configure operation-specific parameters.
parameters.put("<The name of the operation-specific parameter>", "<The value of the operati
on-specific parameter>");
// 6. Configure request headers and the encryption method for the signature string. Valid v
alues of the SignatureMethod parameter: HMAC-SHA1 and HMAC-SHA256. By default, HMAC-SHA256
is used.
Map<String, String> headers = new HashMap<String, String>();
//headers.put("SignatureMethod", "HMAC-SHA1");
headers.put("x-acs-regionid", "<your-regionid>");
headers.put("x-acs-resourcegroupid", "<your-resourcegroupid>");
headers.put("x-acs-organizationid", "<your-organizationid>");
headers.put("x-acs-instanceid", "<your-instanceid>");
// 7. Make an API call. We recommend that you use the doPost() method.
// Configure the time-out period for a connection.
//client.setConnectTimeout(10000);
// Configure the time-out period for a request.
// client.setSocketTimeout(10000);
String result = client.doPost(endpoint, headers, parameters);
System.out.println(result);
```

Configure a proxy

If you need to use a proxy to make API calls, use the following sample code to configure the proxy:

```
Cloud cloud = new Cloud();
// Configure the IP address of the proxy.
cloud.setConfig("proxy_host", "<IP>");
// Configure the port used by the proxy.
cloud.setConfig("proxy_port", "<Port>");
// 1. Create a connection to an ASClient object.
ASClient client = new ASClient(cloud);
```

Request headers

Parameter	Description
x-acs-regionid	The ID of the region. For more information about how to obtain a region ID, see Query the region ID.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console.
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console.
x-acs-instanceid	The ID of the instance to which you make API calls.

2.1.1.1.4.2. Use Apsara Stack SDK for Python to call API operations

This topic describes how to use Apsara Stack SDK for Python to call API operations provided by the Apsara Stack API (ASAPI).

Preparations

- An authorized account and an AccessKey pair are obtained. The AccessKey pair consists of an AccessKey ID and an AccessKey secret. For more information about how to obtain an AccessKey pair in the Apsara Uni-manager Management Console, see Obtain an AccessKey pair.
- The endpoint of the ASAPI is obtained. For more information, see Generate an endpoint for the ASAPI.

Install Apsara Stack SDK for Python

1. Download the required version of Apsara Stack SDK for Python. For more information, see Obtain Apsara Stack SDKs.
2. Upload the compressed file of Apsara Stack SDK for Python to the host from which you want to send API requests and extract the file. Then, run the following code in the directory of the extracted files to install Apsara Stack SDK for Python:

```
# Install Apsara Stack SDK for Python 2.x.
pip install aliyun-python2-sdk-asapi-2.4.7.tar.gz
# Install Apsara Stack SDK for Python 3.x.
pip3 install aliyun-python3-sdk-asapi-2.4.7.tar.gz
```

> **Note**
>
> Replace `2.4.7` with the actual version of Apsara Stack SDK for Python.

Sample requests

You can use the GET or POST method to call API operations provided by the ASAPI.

```
    # 1. Import dependencies.
    from aliyunsdkasapi.ASClient import ASClient
    from aliyunsdkasapi.AsapiRequest import AsapiRequest

    if __name__ == '__main__':
     # 2. Create a request. The Product parameter specifies the name of the service. The Ver
sion parameter specifies the version of the API operation. The Action parameter specifies t
he operation that you want to perform. The asapi-endpoint parameter specifies the endpoint
of the ASAPI.
     req = AsapiRequest("<Product>", "<Version>", "<Action>", "<asapi-endpoint>")
     # 3. Configure operation-specific parameters.
     req.add_body_params("<key>", "<value>")
     # 4. Configure request headers.
     req.add_header("x-acs-resourcegroupid", "<your-resourcegroupid>");
     req.add_header("x-acs-organizationid", "<your-organizationid>");
     req.add_header("x-acs-regionid", "<your-regionid>");
     req.add_header("x-acs-instanceid", "<your-instanceid>");
     # 5. Configure a request method.
     req.set_method("POST")
     # 6. Configure initialization parameters for an ASClient object. The parameter values v
ary based on your environment. The timeout parameter specifies the time-out period for a re
quest. The cert_file parameter specifies the certificate. The verify parameter specifies wh
ether to verify the certificate.
     as_client = ASClient("<accesskeyid>", "<accesskeysecret>", "<regionid>",timeout=1000,
             cert_file=None,
             verify=False)
     # Configure the identifier of the requester. This parameter is required and used only f
or identification. You can set this parameter to a random value.
     as_client.setSdkSource("<The identifier of the requester>")
     response = as_client.do_request(req)
     print(response)
```

Request headers

Parameter	Description
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console.
x-acs-regionid	The ID of the region. For more information about how to obtain a region ID, see Query a region ID.
x-acs-instanceid	The ID of the instance to which you make API calls.

Configure a proxy

Perform the following steps to configure a proxy:

1. Import OS dependencies.

```
import os
```

2. Configure one or more proxies.

```
# Before you make an API call, configure one or more proxies.
os.environ['http_proxy'] = "http://x.x.x.x:xxxx"
os.environ['https_proxy'] = "https://x.x.x.x:xxxx"
```

2.1.1.1.4.3. Use Apsara Stack SDK for Node.js to call API operations

This topic describes how to obtain and use Apsara Stack SDK for Node.js to call API operations.

Preparations

- An authorized account and an AccessKey pair are obtained. The AccessKey pair consists of an AccessKey ID and an AccessKey secret. For more information about how to obtain an AccessKey pair in the Apsara Uni-manager Management Console, see Obtain an AccessKey pair.
- The endpoint of the Apsara Stack API (ASAPI) is obtained. For more information, see Generate an endpoint for the ASAPI.
- A region ID is obtained. For more information about how to obtain a region ID, see Query the region ID.

Add dependencies

Run the following command to install Apsara Stack SDK for Node.js:

```
tnpm install --save @ali/asapi-nodejs-sdk
```

Use Apsara Stack SDK for Node.js

The following sample code shows how to use Apsara Stack SDK for Node.js to make API calls:

```
// 1. Import the dependencies of Apsara Stack SDK for Node.js.
const Controller = require('egg').Controller;
const ASAPIClient = require('@ali/asapi-nodejs-sdk');
// 2. Configure the parameters.
const cnofig = {
    API_GATEWAY: '<The endpoint of the ASAPI>',
    regionId: '<The ID of the region in which the Apsara Stack service is deployed>',
    accessKeyId: '<The AccessKey ID of your Apsara Stack tenant account>',
    accessKeySecret: '<The AccessKey secret of your Apsara Stack tenant account>'
};
// 3. Initialize a client for API calls.
const AsapiClient = new ASAPIClient(cnofig, this.ctx);
// 4. Configure request parameters.
const params = {
    "Action": "<The name of the API operation>",
    "Product": "<The name of the service that provides the API operation>",
    "Version": "<The version of the API operation>",
    "regionId": '<The ID of the region in which the Apsara Stack service is deployed>',
      "<The name of the operation-specific parameter required by the API operation>": "<The
value of the operation-specific parameter>"
}
// 5. Configure request headers.
AsapiClient.addHeader('x-acs-caller-sdk-source', '<The identifier of the requester>')
AsapiClient.addHeader('x-acs-roleid', '<The ID of the role>')
AsapiClient.addHeader('x-acs-userid', '<The ID of the user>')
AsapiClient.addHeader('x-acs-organizationid', '<your-organizationid>')
AsapiClient.addHeadert("x-acs-regionid", "<your-regionid>");
AsapiClient.addHeader("x-acs-resourcegroupid", "<your-resourcegroupid>");
AsapiClient.addHeader("x-acs-instanceid", "<your-instanceid>");
// 6. Make an API call and obtain the response.
try {
  const res = await AsapiClient.doRequest(cnofig.API_GATEWAY, params, {
    method: 'POST', // The request method.
    formatParams: false, // Specifies whether to format parameters and capitalize the first
letter of each parameter.
    enableProxy: true, // Specifies whether to configure a proxy.
    proxy: 'http://x.x.x.x:xxxx',
    timeout: 10000, // The time-out period.
  // ca: , // The certificate issued by a certificate authority (CA). For more information,
visit https://nodejs.org/api/https.html#https_https_request_options_callback.
  })
  console.log(res)
} catch (e) {
  console.log(e)
}
```

Disable certificate validation

The following sample code shows how to disable certificate validation:

```
Configure the environment variable.
NODE_TLS_REJECT_UNAUTHORIZED=0
```

Request headers

Parameter	Description
x-acs-regionid	The ID of the region. For more information about how to obtain a region ID, see Query the region ID.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console.
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console.
x-acs-instanceid	The ID of the instance to which you make API calls.
x-acs-caller-sdk-source	The custom name of the requester or the system. This parameter is used to identify the source of the API request.
x-acs-roleid	The ID of the role.
x-acs-userid	The ID of the user.

2.1.1.1.4.4. SDK for POP

SDK for Java

Before you use Apsara Stack API (ASAPI) SDK for POP for Java to access ASAPI, you must know the remote procedure call (RPC) and resource-oriented architecture (ROA) styles that are supported for API calls. ASAPI is compatible with both styles. Their difference lies in the ASAPI endpoints that are used for API calls.

Prerequisites

- An Alibaba Cloud SDK package is downloaded for the service that you want to access. The required dependencies are installed.
- SSL certificate validation is ignored for requests over HTTPS.

Background information

ASAPI supports only the HTTPS request protocol.

Difference between two styles

When you use the RPC or ROA style to make API calls, take note that the two styles use different ASAPI endpoints.

```
# ASAPI endpoint for the RPC style:
public.asapi.<global:region>.<global:internet-domain>/asapi/v3
# ASAPI endpoint for the ROA style:
public.asapi.<global:region>.<global:internet-domain>/asapi/v3/roa
```

Call examples

The following sample code provides an example on how to use the RPC style to make an API call. In this example, the DescribeInstances operation of Elastic Compute Service (ECS) is called, and the API version is 2014-05-26.

Sample code:

```
package com.aliyuns.client.pop.ecs;

import com.aliyuncs.DefaultAcsClient;
import com.aliyuncs.ecs.model.v20140526.DescribeInstancesRequest;
import com.aliyuncs.ecs.model.v20140526.DescribeInstancesResponse;
import com.aliyuncs.http.HttpClientConfig;
import com.aliyuncs.http.ProtocolType;
import com.aliyuncs.profile.DefaultProfile;

import java.util.List;

public class DescribeInstancesTest {
    public static void main(String[] args) {
        // Specify the endpoint of ASAPI.
        String endpoint = "public.asapi.<global:region>.<global:internet-domain>/asapi/v3";
        // Specify the region where the ECS service resides.
        String region = "<global:region>";
        // Specify the name of the service that you want to access.
        String product = "ECS";
        // Specify your AccessKey pair.
        String ak = "<accessKeyId>";
        String sk = "<accessKeySecret>";
        try {
            DefaultProfile clientProfile = DefaultProfile.getProfile(region, ak, sk);
            // Ignore SSL certificate validation.
            HttpClientConfig clientConfig = HttpClientConfig.getDefault();
            clientConfig.setIgnoreSSLCerts(true);
            // Set the connection timeout period.
            clientConfig.setConnectionTimeoutMillis(3000L);
            // Set the read timeout period.
            clientConfig.setReadTimeoutMillis(10000L);
            clientProfile.setHttpClientConfig(clientConfig);
            // Create a connection.
            DefaultAcsClient acsClient = new DefaultAcsClient(clientProfile);
            // Create a request.
            DescribeInstancesRequest request = new DescribeInstancesRequest();
            // Specify the endpoint of ASAPI.
            request.setSysEndpoint(endpoint);
            // Specify the name of the service that you want to access and the region where
the service resides.
            request.setSysLocationProduct(product);
            request.setSysRegionId(region);
            // Set the request protocol to HTTPS.
            request.setSysProtocol(ProtocolType.HTTPS);
            DescribeInstancesResponse result =  acsClient.getAcsResponse(request);
            List<DescribeInstancesResponse.Instance> instances = result.getInstances();
            for (DescribeInstancesResponse.Instance instance: instances) {
                System.out.println(instance.getInstanceId());
                System.out.println(instance.getInstanceName());
```

```
            }

        } catch (Exception e) {
            e.printStackTrace();
        }
    }
}
```

The following sample code provides an example on how to use the ROA style to make an API call. In this example, the GetNamespaceList operation of Container Registry is called, and the API version is 2016-06-07.

Sample code:

```
package com.aliyuns.client.pop.cr;

import com.aliyuncs.CommonRequest;
import com.aliyuncs.CommonResponse;
import com.aliyuncs.DefaultAcsClient;
import com.aliyuncs.IAcsClient;
import com.aliyuncs.exceptions.ClientException;
import com.aliyuncs.exceptions.ServerException;
import com.aliyuncs.http.FormatType;
import com.aliyuncs.http.HttpClientConfig;
import com.aliyuncs.http.MethodType;
import com.aliyuncs.http.ProtocolType;
import com.aliyuncs.profile.DefaultProfile;

public class GetNamespaceListTest {
    public static void main(String[] args) {
        // Specify the endpoint of ASAPI.
        String endpoint = "public.asapi.<global:region>.<global:internet-domain>/asapi/v3/roa";
        // Specify the region where the Container Registry service resides.
        String region = "<global:region>";
        // Specify the name of the service that you want to access.
        String product = "cr";
        // Specify your AccessKey pair.
        String ak = "<accessKeyId>";
        String sk = "<accessKeySecret>";
        DefaultProfile profile = DefaultProfile.getProfile(region, ak, sk);
        // Ignore SSL certificate validation.
        HttpClientConfig clientConfig = HttpClientConfig.getDefault();
        clientConfig.setIgnoreSSLCerts(true);
        // Set the connection timeout period.
        clientConfig.setConnectionTimeoutMillis(3000L);
        // Set the read timeout period.
        clientConfig.setReadTimeoutMillis(10000L);
        profile.setHttpClientConfig(clientConfig);
        // Create a connection for the client.
        IAcsClient client = new DefaultAcsClient(profile);
        // Create a request.
        CommonRequest request = new CommonRequest();
        // Set the request protocol to HTTPS.
```

```
        request.setSysProtocol(ProtocolType.HTTPS);
        // Specify the request method.
        request.setSysMethod(MethodType.GET);
        // Specify the endpoint of ASAPI.
        request.setSysDomain(endpoint);
        // Specify the version of the API.
        request.setSysVersion("2016-06-07");
        // Specify the pattern of the uniform resource identifier (URI).
        request.setSysUriPattern("/namespace");
        // Specify the name of the service that you want to access and the region where the
service resides.
        request.setSysLocationProduct(product);

        request.putHeadParameter("Content-Type", "application/json");
        String requestBody = "" +
                "{}";
        request.setHttpContent(requestBody.getBytes(), "utf-8", FormatType.JSON);
        try {
            CommonResponse response = client.getCommonResponse(request);
            System.out.println(response.getData());
        } catch (ServerException e) {
            e.printStackTrace();
        } catch (ClientException e) {
            e.printStackTrace();
        }
    }
}
```

> **Notice**
>
> If you send a request over HTTPS, you must enable the request to ignore SSL certificate validation.

SDK for Go

This topic describes how to use Apsara Stack API (ASAPI) SDK for POP for Go.

Prerequisites

An Alibaba Cloud SDK package is downloaded for the service that you want to access. The required dependencies are installed.

Background information

Only the remote procedure call (RPC) style is supported for API calls.

Call examples

The following sample code provides an example on how to make an API call. In this example, the DescribeInstances operation of Elastic Compute Service (ECS) is called, and the API version is 2014-05-26.

Sample code:

```
package main
```

```
import (
 "fmt"
 "time"

 "github.com/aliyun/alibaba-cloud-sdk-go/sdk"
 "github.com/aliyun/alibaba-cloud-sdk-go/sdk/auth/credentials"
 "github.com/aliyun/alibaba-cloud-sdk-go/sdk/requests"
 "github.com/aliyun/alibaba-cloud-sdk-go/sdk/responses"
)

func getSdkConfig() *sdk.Config {
 return sdk.NewConfig().
  WithTimeout(time.Duration(30) * time.Second).
  WithEnableAsync(true).
  WithGoRoutinePoolSize(100).
  WithMaxTaskQueueSize(10000).
  WithDebug(false).
  WithScheme("HTTP")
}

func main(){
 ak := "<The AccessKey ID of your Apsara Stack tenant account.>"
 sk := "<The AccessKey secret of your Apsara Stack tenant account.>"
 regionId := "<The region where the ECS service resides.>"
 endpoint := "<The endpoint of ASAPI.>" // No network protocol.
 request := requests.NewCommonRequest()
  request.SetReadTimeout(10 * time.Second) // Set the read timeout period of the request to
10 seconds.
  request.SetConnectTimeout(5 * time.Second)  // Set the connection timeout period of the r
equest to 5 seconds.
 request.Method = requests.GET
 request.Domain = endpoint         // Location Service will not be enabled if the host is s
pecified. For example, the service with a certification type-bearer token must be specified
.
 request.Version = "2014-05-26"            // Specify the version of the API.
 request.Scheme = "https"                // Specify the request protocol. Default value: ht
tp.
 request.ApiName = "DescribeInstances"
 request.QueryParams["Product"] = "Ecs"  // Specify the name of the service that you want t
o access.
 request.TransToAcsRequest()
 client, err := sdk.NewClientWithOptions(regionId,getSdkConfig(),credentials.NewAccessKeyCr
edential(ak,sk))
 // If relevant parameters are not set for the request, the client settings are used.
  //client.SetReadTimeout(10 * time.Second)              // Set the read timeout period of
the client to 10 seconds.
 //client.SetConnectTimeout(5 * time.Second)            // Set the connection timeout perio
d of the client to 5 seconds.
  resp := responses.BaseResponse{}
  err = client.DoAction(request, &resp)
    if err != nil {
        panic(err)
    }
 fmt.Print(endpoint)
```

```
}
```

Configure proxies

You can configure proxies in one of the following ways:

- Configure proxies by using environment variables.

  Set the HTTP_PROXY and HTTPS_PROXY environment variables, or set the NO_PROXY environment variable.

  Sample code:

```
import (
    "os"
)
func main(){
 os.Setenv("HTTP_PROXY", "http://x.x.x.x:xxxx") // Set the HTTP_PROXY environment variable.
 os.Setenv("HTTPS_PROXY", "https://x.x.x.x:xxxx") // Set the HTTPS_PROXY environment variable.
}
```

- Configure proxies on the client.

  Sample code:

```
// The proxies that are configured on the client take precedence over those that are configured by using environment variables.
client.SetHttpProxy("http://x.x.x.x:xxxx")    // Configure the HTTP proxy.
client.GetHttpProxy()                           // Query the HTTP proxy.

client.SetHttpsProxy("https://x.x.x.x:xxxx")    // Configure the HTTPS proxy.
client.GetHttpsProxy()                            // Query the HTTPS proxy.

client.SetNoProxy("127.0.0.1,localhost")      // Configure the proxy whitelist.
client.GetNoProxy()                           // Query the proxy whitelist.
```

SDK for Python

This topic describes how to use Apsara Stack API (ASAPI) SDK for POP for Python.

Prerequisites

An Alibaba Cloud SDK package is downloaded for the service that you want to access. The required dependencies are installed.

Background information

Only the remote procedure call (RPC) style is supported for API calls.

Call examples

The following sample code provides an example on how to make an API call. In this example, the DescribeInstances operation of Elastic Compute Service (ECS) is called, and the API version is 2014-05-26.

Sample code:

```
from aliyunsdkcore.client import AcsClient
from aliyunsdkcore.acs_exception.exceptions import ClientException
from aliyunsdkcore.acs_exception.exceptions import ServerException
from aliyunsdkecs.request.v20140526 import DescribeInstancesRequest
import os

# Create an AcsClient instance.
client = AcsClient(
   "<your-access-key-id>",
   "<your-access-key-secret>",
   "<your-region-id>",

   timeout=1000,  # Set the timeout period.
    verify=False, # Ignore certificate validation. or verify='<The location where the certi
ficate is stored.>'
);
# Set the following parameters for the HTTPS request protocol:
# client.set_verify(False)
# os.environ["HTTPS_PROXY"] = "http://127.0.0.1:8080"

# os.environ["HTTP_PROXY"] = "http://127.0.0.1:8080"
def hello_ecs_instance():
    # Create a request and set the parameters.
    request = DescribeInstancesRequest.DescribeInstancesRequest()

    params = {"PageNumber":"1", "Product":"Ecs","Version": "2014-05-26","Action": "Describe
Instances"};
    request.set_body_params(params)
    # The endpoint that contains no network protocol is in the following format: ASAPI doma
in name/asapi/v3.
    request.set_endpoint('<The endpoint of ASAPI.>')
    # Set the following parameter if the endpoint contains no network protocol:
    request.set_protocol_type("https")

    request.set_PageSize(10)
    # Initiate the API request and obtain the response.
    response = client.do_action_with_exception(request)
    print(response)

if __name__ == '__main__':
    print("Hello Aliyun OpenApi!")
    hello_ecs_instance()
```

Configure proxies

Set the HTTP_PROXY and HTTPS_PROXY environment variables.

Sample code:

```
# Configure the HTTPS proxy.
os.environ["HTTPS_PROXY"] = "http://x.x.x.x:xxxx"

# Configure the HTTP proxy.
os.environ["HTTP_PROXY"] = "https://x.x.x.x:xxxx"
```

2.1.1.1.5. HTTP requests

2.1.1.1.5.1. Overview

This topic describes how to make API requests and is intended for users who use API URLs to initiate HTTP GET requests.

If you are using an SDK to initiate requests, you can skip this topic.

The request URL consists of different parameters and has a fixed syntax. The URL contains common request parameters, your signature, and operation-specific parameters. Sample request URLs are provided for each API operation. These URLs are not encoded to make them easy to read. Before you make a request, you must encode the request URL. After the authentication process is complete based on your signature, the results are returned to you. Response parameters are returned if the call is successful, whereas an error message is returned if the call fails. You can troubleshoot issues based on the error message.

2.1.1.1.5.2. Request syntax

The Apsara Stack API (ASAPI) allows you to call API operations by sending HTTP GET requests based on URLs. Each URL must include request parameters. This topic describes the syntax of HTTP GET requests and provides the endpoint of the ASAPI.

Sample request

GetOrganizationList is used in the following unencoded URL request:

```
https://public.asapi.aliyuns.com/asapi/v3?Action=GetOrganizationList&Product=ascm&Version=2019-05-10&Id=<Organization ID>&<Common parameters>
```

- `https`: the protocol used to transmit the request.
- `public.asapi.aliyuns.com/asapi/v3`: the endpoint of the ASAPI.
- `Action=GetOrganizationList Product=ascm Version=2019-05-10`: the API operation to call.
- `Id`: the ID of the organization.
- `<Common parameters>`: the common parameters specified in the system.

Protocol

The ASAPI supports only HTTPS.

Endpoint

For more information about how to obtain an endpoint, see Generate an endpoint for the ASAPI.

Parameter

To specify an API operation, use the `Action, Product, and Version` parameters. For example, set `Action` to GetOrganizationList, Product to ascm, and Version to 2019-05-10. You must also specify other operation-specific parameters and common parameters. For more information, see Common parameters.

2.1.1.1.5.3. Request signatures

This topic describes how to sign HTTP API requests. ASAPI uses the request signature to verify the identity of the request sender. ASAPI implements symmetric encryption by using an AccessKey pair to verify the identity of the request sender.

> **Note**
>
> - An AccessKey pair consists of an AccessKey ID and an AccessKey secret, which are issued to each user or organization in the Apsara Uni-manager Management Console.
> - The AccessKey ID is used to verify identities of users, and the AccessKey secret is used to encrypt and verify signature strings. You must keep your AccessKey secret confidential.
> - ASAPI provides SDKs for Node.js, Python, and Java to facilitate complex signature calculation. For more information, see Obtain the core package for ASAPI.

Step 1: Create a canonicalized query string

1. Arrange the request parameters in alphabetical order, including all common and operation-specific parameters except the `Signature` parameter.

   > **Note**
   >
   > If you use the GET method to send a request,these parameters are connected by ampersands (&) and included in the request URL. The first request parameter follows a question mark (?).

2. Encode the request parameters and their values in UTF-8 based on RFC 3986. The following rules apply in the encoding process:
   - Letters, digits, and special characters such as hyphens (`-`), underscores (`_`), and periods (`.`) do not need to be encoded.
   - Other characters must be percent encoded in the `%XY` format. `XY` represents the ASCII code of the characters in hexadecimal notation. For example, double quotation marks (`"`) are encoded as `%22` .

- Extended UTF-8 characters are encoded in the `%XY%ZA...` format.
- Spaces must be encoded as `%20`. Do not encode spaces as plus signs (`+`).

  This encoding method is similar to but different from the `application/x-www-form-urlencoded` MIME encoding algorithm.

  If you use `java.net.URLEncoder` from the Java standard library, use `percentEncode` to encode request parameters and their values. In the encoded query string, replace the plus signs (`+`) with `%20` , asterisks (`*`) with `%2A` , and `%7E` with tildes (`~`). This way, you can obtain an encoded string that matches the preceding encoding rules.

  ```
  private static final String ENCODING = "UTF-8";
  private static String percentEncode(String value) throws UnsupportedEncodingException
  {
      return value != null ? URLEncoder.encode(value, ENCODING).replace("+", "%20").rep
  lace("*", "%2A").replace("%7E", "~") : null;
  }
  ```

3. Use equal signs (`=`) to connect the encoded request parameters and their values.
4. Use ampersands (`&`) to connect the encoded request parameters. These parameters must be arranged in the same order as those in Step 1.

Then, a canonicalized query string that follows the request structure is obtained. For more information, see Request structure.

Step 2: Create a string-to-sign

1. Create a `string-to-sign` . You can also use `percentEncode` to encode the canonicalized query string created in Step 1 based on the following rules:

   ```
   StringToSign=
       HTTPMethod + "&" + //HTTPMethod: the HTTP method that is used to send a request, su
   ch as GET.
       percentEncode("/") + "&" + //percentEncode("/"): Encode the forward slash (/) in UT
   F-8 as %2F.
       percentEncode(CanonicalizedQueryString) // Encode the canonicalized query string cr
   eated in Step 1.
   ```

2. Calculate the RFC 2104-compliant HMAC-SHA1 or HMAC-256 value of `StringToSign` . In the following example, Java Base64 is used:

   ```
   String signature = Base64.getEncoder().encodeToString(signData);
   ```

> **Note**
>
> When you calculate the signature, the key value specified by RFC 2104 is your `AccessKey secret` plus an ampersand (&), which has an ASCII value of 38. For more information, see Obtain an AccessKey pair.

3. Encode the `Signature` parameter based on RFC 3986 and add it to the canonicalized query string.

Example 1: Concatenate parameters

`GetOrganizationList` is used in this example to query regions. For example, `AccessKeyID` is set to testid and `AccessKeySecret` is set to testsecret. Perform the following operations:

1. Construct a canonicalized query string.

```
https://public.asapi.aliyuns.com/asapi/v3/?AccessKeyId=testid&Action=GetOrganizationList&Format=JSON&Id=1&Product=ascm&RegionId=cn-region-test&SignatureMethod=HMAC-SHA1&SignatureNonce=43967c6e-e3ad-44fa-b06b-fcf3db5f39d2&SignatureVersion=1.0&Timestamp=2020-09-15T08%3A50%3A40Z&Version=2019-05-10
```

2. Create a `string-to-sign` .

```
GET&%2F&AccessKeyId%3Dtestid%26Action%3DGetOrganizationList%26Format%3DJSON%26Id%3D1%26Product%3Dascm%26RegionId%3Dcn-region-test%26SignatureMethod%3DHMAC-SHA1%26SignatureNonce%3D43967c6e-e3ad-44fa-b06b-fcf3db5f39d2%26SignatureVersion%3D1.0%26Timestamp%3D2020-09-15T08%253A50%253A40Z%26Version%3D2019-05-10
```

3. Calculate the signature.

   Calculate the signature. The key value used for calculation is `testsecret&` because `AccessKeySecret` is set to testsecret. The calculated signature is `OLeaidS1JvxuMvnyHOwuJ+uX5qY=` . Java Base64 is used in the following sample code:

   `String signature = Base64.getEncoder().encodeToString(signData);` Encode `Signature=hvqv9Ll5RE6kQ4YsQXFAf9VuRIY=` based on RFC 3986 and add it to the canonicalized query string.

```
https://public.asapi.aliyuns.com/asapi/v3/?AccessKeyId=testid&Action=GetOrganizationList&Format=JSON&Id=1&Product=ascm&RegionId=cn-region-test&SignatureMethod=HMAC-SHA1&SignatureNonce=43967c6e-e3ad-44fa-b06b-fcf3db5f39d2&SignatureVersion=1.0&Timestamp=2020-09-15T08%3A50%3A40Z&Version=2019-05-10
```

You can use browsers or tools such as cURL and Wget to initiate an HTTP request for calling the `DescribeRegions` operation to query the Alibaba Cloud region list.

Example 2: Use the standard library of the programming language

`GetOrganizationList` is used in this example to query regions. For example, `AccessKeyID` is set to testid, `AccessKeySecret` is set to testsecret, and all request parameters are stored in a Java `Map<String, String>` object.

1. Predefine an encoding method.

```
private static final String ENCODING = "UTF-8";
private static String percentEncode(String value) throws UnsupportedEncodingException {
        return value != null ? URLEncoder.encode(value, ENCODING).replace("+", "%20").r
eplace("*", "%2A").replace("%7E", "~") : null;
}
```

2. Predefine the time format for the `Timestamp` parameter. Specify the `Timestamp` parameter in the ISO 8601 format. The time must be in UTC+0.

```
private static final String ISO8601_DATE_FORMAT = "yyyy-MM-dd'T'HH:mm:ss'Z'";
private static String formatIso8601Date(Date date) {
    SimpleDateFormat df = new SimpleDateFormat(ISO8601_DATE_FORMAT);
    df.setTimeZone(new SimpleTimeZone(0, "GMT"));
    return df.format(date);
}
```

3. Create a request string.

```
final String HTTP_METHOD = "GET";
Map parameters = new HashMap();
// Specify request parameters.
parameters.put("Product", "ascm");
parameters.put("Action", "GetOrganizationList");
parameters.put("Version", "2019-05-10");
parameters.put("AccessKeyId", "testid");
parameters.put("RegionId", "cn-region-test");
parameters.put("Timestamp", formatIso8601Date(new Date()));
parameters.put("SignatureMethod", "HMAC-SHA1");
parameters.put("SignatureVersion", "1.0");
parameters.put("SignatureNonce", UUID.randomUUID().toString());
parameters.put("Format", "JSON");
parameters.put("Id", "1");
// Arrange request parameters.
String[] sortedKeys = parameters.keySet().toArray(new String[]{});
Arrays.sort(sortedKeys);
final String SEPARATOR = "&";
// Create a string-to-sign.
StringBuilder stringToSign = new StringBuilder();
stringToSign.append(HTTP_METHOD).append(SEPARATOR);
stringToSign.append(percentEncode("/")).append(SEPARATOR);
StringBuilder canonicalizedQueryString = new StringBuilder();
for(String key : sortedKeys) {
    // Encode the key and the value.
    canonicalizedQueryString.append("&")
    .append(percentEncode(key)).append("=")
    .append(percentEncode(parameters.get(key)));
}
//Encode the canonicalized query string.
stringToSign.append(percentEncode(
canonicalizedQueryString.toString().substring(1)));
```

4. The signature. The key value used for calculation is `testsecret&` because `AccessKeySecret` is set to testsecret. The calculated signature is `OLeaidS1JvxuMvnyHOwuJ%2BuX5qY%3D`.

```
// The following sample code shows how to calculate the signature:
final String ALGORITHM = "HmacSHA1";
final String ENCODING = "UTF-8";
key = "testsecret&";
Mac mac = Mac.getInstance(ALGORITHM);
mac.init(new SecretKeySpec(key.getBytes(ENCODING), ALGORITHM));
byte[] signData = mac.doFinal(stringToSign.getBytes(ENCODING));
String signature = Base64.getEncoder().encodeToString(signData);
```

Encode the Signature parameter based on RFC 3986 and add it to the canonicalized query string. The following URL is obtained:

```
https://public.asapi.aliyuns.com/asapi/v3/?AccessKeyId=testid&Action=GetOrganizationLis
t&Format=JSON&Id=1&Product=ascm&RegionId=cn-region-test&SignatureMethod=HMAC-SHA1&Signa
tureNonce=43967c6e-e3ad-44fa-b06b-fcf3db5f39d2&SignatureVersion=1.0&Timestamp=2020-09-1
5T08%3A50%3A40Z&Version=2019-05-10
```

5. Use browsers or tools such as cURL and Wget to initiate an HTTP request.

2.1.1.1.5.4. Response

Responses are returned only in the JSON format. If a return code is greater than or equal to 200 and less than 300, a success response is returned. Otherwise, an error response is returned.

Sample success response

If a request is successful, the request ID and operation-specific parameter values are returned. For more information, see the developer guide of the corresponding Apsara Stack service.

```
 {
    "eagleEyeTraceId": "xxx-xxx-xxx-xxx", // The trace ID provided by EagleEye.
    "asapiSuccess": true,
    "RequestId": "xxxxxxxxxx",
    "Regions": { // The regions returned after you call the DescribeRegions operation.
        "Region": [
            {
                "RegionId": "",
                "RegionEndpoint": "",
                "LocalName": ""
            }
        ]
    }
}
```

Sample error response

If a request fails, the following information is returned. For more information, see the developer guide of the corresponding Apsara Stack service.

```
{
    "code": "asapi.server.api.notfound",// The error code.
    "eagleEyeTraceId": "xxx-xxx-xxx-xxx", // The trace ID provided by EagleEye.
    "asapiSuccess": false, // Indicates whether the request is successful.
    "hostId": "xxxx", // The ID of the host.
    "message": "Failed to ....", // The message returned.
    "asapiErrorMessage": "Failed to ....", // The error message provided by the ASAPI.
    "asapiErrorCode": "asapi.server.api.notfound" // The error code provided by the ASAPI.
}
```

2.1.2. API reference

2.1.2.1. ECS API

2.1.2.1.1. Make API requests

2.1.2.1.1.1. Overview

You can call an operation by sending an HTTP GET request to the ECS endpoint. You must specify the relevant request parameters in the request based on the operation descriptions. The system returns the processing result of the request. Requests and responses are encoded using UTF-8.

2.1.2.1.1.2. Request structure

Endpoints

For information about how to obtain the service endpoint, see Obtain the endpoint of ASAPI.

Methods

You can use the HTTP GET method to send the request for calling an API operation. If you use this method, the request parameters must be included in the URL of the request.

Protocols

You can send requests over HTTP or HTTPS. For security considerations, we recommend that you send requests over HTTPS.

Request parameters

For each request, you must specify the Action parameter (example: StartInstance), common request parameters, and operation-specific request parameters.

Encoding

All requests and responses are encoded in UTF-8.

2.1.2.1.1.3. Authorization

To ensure the security of your account, we recommend that you call ECS API operations as a RAM user. Before you can call ECS API operations as a RAM user, you must create and authorize the RAM user.

In RAM, you can authorize the RAM user to perform the following API operations on an ECS resource:

- AttachDisk
- AuthorizeSecurityGroup
- CreateDisk
- CreateImage
- CreateInstance
- CreateSecurityGroup
- CreateSnapshot
- DeleteDisk
- DeleteImage
- DeleteInstance
- DeleteSecurityGroup
- DeleteSnapshot
- DescribeAutoSnapshotPolicy
- DescribeDisks

- DescribeImages
- DescribeInstanceMonitorData
- DescribeInstances
- DescribeInstanceStatus
- DescribeInstanceTypes
- DescribeRegions
- DescribeSecurityGroupAttribute
- DescribeSecurityGroups
- DescribeSnapshots
- DescribeZones
- DetachDisk
- JoinSecurityGroup
- LeaveSecurityGroup
- ModifyAutoSnapshotPolicy
- ModifyDiskAttribute
- ModifyInstanceAttribute
- ModifyInstanceNetworkSpec
- RebootInstance
- ReplaceSystemDisk
- ReInitDisk
- ResetDisk
- RevokeSecurityGroup
- StartInstance
- StopInstance

2.1.2.1.1.4. Request signatures

You must sign all API requests to ensure security. ECS uses the request signature to verify the identity of the API caller

ECS implements symmetric encryption with an AccessKey pair to verify the identity of the request sender. An AccessKey pair is an identity credential issued to Apsara Stack tenant accounts and RAM users that is similar to a logon username and password. An AccessKey pair consists of an AccessKey ID and an AccessKey secret. The AccessKey ID is used to verify the identity of the user, while the AccessKey secret is used to encrypt and verify the signature string. You must keep your AccessKey secret strictly confidential. For more information about how to obtain an AccessKey pair, see Obtain an AccessKey pair.

Perform the following steps to sign an access request:

1. Create a canonicalized query string by using request parameters.

i. Arrange all the request parameters (including all common and operation-specific request parameters except Signature) in alphabetical order.

> **Note** If you use the GET method to make the request, these parameters are connected by ampersands (&) and included in the request URI. The first request parameter follows the question mark (?).

ii. Encode all the request parameters. URL encode all the request parameter names and values in UTF-8 based on the following rules:

- Uppercase letters, lowercase letters, digits, and some special characters such as ampersands (&), hyphens (-), underscores (_), periods (.), and tildes (~) do not need to be encoded.
- Other characters must be percent encoded in the %XY format. XY represents the ASCII code of the characters in hexadecimal notation. For example, double quotation marks (") are encoded as %22.
- Extended UTF-8 characters are encoded in the %XY%ZA... format.
- Spaces must be encoded as %20. Do not encode spaces as plus signs (+).

This encoding method is similar to but different from the `application/x-www-form-urlencoded` MIME encoding algorithms, such as java.net.URLEncoder in the Java standard library. You can encode the parameter names and values by using the encoding method in the Java standard library. Then in the encoded string, replace the plus signs (+) with %20, asterisks (*) with %2A, and %7E with tildes (~) to obtain an encoded string that complies with the preceding encoding rules. You can use the following percentEncode method to implement the encoding:

```
  private static final String ENCODING = "UTF-8";
  private static String percentEncode(String value) throws UnsupportedEncodingExcep
tion {
    return value ! = null ? URLEncoder.encode(value, ENCODING).replace("+", "%20")
.replace("*", "%2A").replace("%7E", "~") : null;
 }
```

iii. Use equal signs (`=`) to connect the encoded parameter names and values.

iv. Sort the connected parameter name-value pairs in the order specified in Step 1.i and connect these pairs with ampersands (&) to obtain a canonicalized query string.

2. Create a string-to-sign from the encoded canonicalized query string based on the following rules:

```
StringToSign=
    HTTPMethod + "&" +
    percentEncode("/") + "&" +
     percentEncode(CanonicalizedQueryString)
```

- HTTPMethod: the HTTP method used to make the request, such as GET.
- percentEncode(“/”): Encode backslashes (/) as %2F.
  percentEncode(CanonicalizedQueryString): Encode the canonicalized query string created in Step 1.ii.

3. Calculate the RFC 2104-compliant HMAC value of the string-to-sign.

> **Note** Use the SHA1 algorithm to calculate the HMAC value of the string-to-sign. The AccessKey secret to which an ampersand (&) (ASCII:38) is appended is used as the key for HMAC calculation.

4. Encode the HMAC value in Base64 to obtain the signature string.
5. Add the signature string to the request as the Signature parameter. The result is the signed API request.

> **Note** When the signature string is submitted to ECS as the final request parameter value, the value must be URL-encoded like other parameters based on rules defined in RFC 3986.

DescribeRegions is used in this example. Assume that the AccessKey ID is *testid* and the AccessKey secret is *testsecret*. The following URL is the request URL to be signed:

```
http://ecs.example.com/?TimeStamp=2016-02-23T12:46:24Z&Format=XML&AccessKeyId=testid&Action=DescribeRegions&SignatureMethod=HMAC-SHA1&SignatureNonce=3ee8c1b8-83d3-44af-a94f-4e0ad82f****&Version=2014-05-26&SignatureVersion=1.0
```

The following code is the calculated string-to-sign (StringToSign):

```
GET&%2F&AccessKeyId%3Dtestid%26Action%3DDescribeRegions%26Format%3DXML%26SignatureMethod%3DHMAC-SHA1%26SignatureNonce%3D3ee8c1b8-83d3-44af-a94f-4e0ad82f****%26SignatureVersion%3D1.0%26TimeStamp%3D2016-02-23T12%253A46%253A24Z%26Version%3D2014-05-26
```

The AccessKey secret is *testsecret*, so the key used for the HMAC calculation is *testsecret&* and the calculated signature string is *CT9X0VtwR86fNWSnsc6v8YG****.

In the original API request, set the value of Signature to the calculated signature string. The following signed request URL is obtained:

```
http://ecs.example.com/?SignatureVersion=1.0&Action=DescribeRegions&Format=XML&SignatureNonce=3ee8c1b8-83d3-44af-a94f-4e0ad82f****&Version=2014-05-26&AccessKeyId=testid&Signature=CT9X0VtwR86fNWSnsc6v8YGO****&SignatureMethod=HMAC-SHA1&TimeStamp=2016-02-23T12%3A46%3A24Z
```

2.1.2.1.1.5. Responses

API responses use a unified format. 2xx HTTP status codes indicate successful calls. 4xx or 5xx HTTP status codes indicate failed calls. Responses can be returned in XML or JSON format. By default, responses are returned in XML format. You can specify the response format in the request of an API call.

> **Note** To improve readability, the sample responses in this topic are formatted. The actual responses are not formatted with line breaks or indentation.

Successful response examples

- XML format

```
<? xml version="1.0" encoding="UTF-8"? >
<! --Result root node-->
<API name+Response>
    <! --Returned request tag-->
    <RequestId>4C467B38-3910-447D-87BC-AC049166F216</RequestId>
    <! --Returned results-->
</API name+Response>
```

- JSON format

```
{
    "RequestId": "4C467B38-3910-447D-87BC-AC049166F216",
    /*Returned results*/
}
```

Error response examples

If an error occurs when you call an operation, the requested data will not be returned. You can troubleshoot the error based on the error code specific to the operation and the common errors. If the operation fails to be called, a 4xx or 5xx HTTP status code will be returned. The response body contains the error code, the error message, a unique request ID, and the ID of the site accessed by the request.

- XML format

```
<? xml version="1.0" encoding="UTF-8"? >
<Error>
   <RequestId>8906582E-6722-409A-A6C4-0E7863B733A5</RequestId>
   <HostId>ecs.example.com</HostId>
   <Code>InvalidOwnerId</Code>
   <Message>The specified OwnerId is not valid. </Message>
</Error>
```

- JSON format

```
{
    "RequestId": "8906582E-6722-409A-A6C4-0E7863B733A5",
    "HostId": "ecs.example.com",
    "Code": "InvalidOwnerId",
    "Message": "The specified OwnerId is not valid."
}
```

2.1.2.1.2. RAM authorization

When you call an ECS API operation to access the ECS resources in your Apsara Stack tenant account as a RAM user, ECS checks with RAM whether the RAM user has the permissions on these resources.

ECS determines which permissions to check based on the involved resources and the semantics of the API operation. Resources involved in ECS API operations describes the resources involved in each ECS API operation.

Resources involved in ECS API operations

Action	Resource
AttachDisk	acs:ecs:$regionid:$accountid:disk/$diskid acs:ecs:$regionid:$accountid:instance/$instanceid
AuthorizeSecurityGroup	acs:ecs:$regionid:$accountid:securitygroup/$securitygroupid[and acs:ecs:$regionid:$accountid:securitygroup/$sourcegroupid] **Note** If you specify the SourceGroupId parameter in the API request, you must specify the sourcegroupid variable.
CreateDisk	acs:ecs:$regionid:$accountid:disk/*[and acs:ecs:$regionid:$accountid:snapshot/$snapshotid] **Note** If you specify the SnapshotId parameter in the API request, you must specify the snapshotid variable.
CreateImage	acs:ecs:$regionid:$accountid:image/*acs:ecs:$regionid:$accountid:snapshot/$snapshotid
CreateInstance	acs:ecs:$regionid:$accountid:instance/*acs:ecs:$regionid:$accountid:securitygroup/$securitygroupidacs:ecs:$regionid:$accountid:image/$imageid[and acs:ecs:$regionid:$accountid:snapshot/$snapshotid] **Note** If you specify the DataDisk.N.SnapshotId parameter in the API request, you must specify the snapshotid variable.
CreateSecurityGroup	acs:ecs:$regionid:$accountid:securitygroup/*
CreateSnapshot	acs:ecs:$regionid:$accountid:disk/$diskid acs:ecs:$regionid:$accountid:snapshot/*

2.1.2.1.3. Common parameters

Common parameters include common request parameters and common response parameters.

Common request parameters

Common request parameters must be included in all ECS API requests.

Request parameter description

Parameter	Type	Required	Description
Format	String	No	The format to return the response values in. Valid values: JSON and XML. Default value: XML.
Version	String	Yes	The version number of the API in the format of YYYY-MM-DD. **Note** Access *http://gitlab.alibaba-inc.com/apsara_stack/APIVersionController/blob/v3.5*, find a specific service, open the API under the OpenAPI folder of the service, and view the corresponding API version. The current version is 2014-05-26.
AccessKeyId	String	Yes	The AccessKey ID provided to you by Alibaba Cloud.
Signature	String	Yes	The signature string of the current request. For more information about how signatures are calculated, see Request signatures.
SignatureMethod	String	Yes	The encryption method of the signature string. Set the value to HMAC-SHA1.

Parameter	Type	Required	Description
Timestamp	String	Yes	The timestamp of the request. Specify the time in the ISO 8601 standard in the YYYY-MM-DDThh:mm:ssZ format. The time must be in UTC.
SignatureVersion	String	Yes	The version of the signature encryption algorithm.
SignatureNonce	String	Yes	A unique, random number used to prevent replay attacks. You must use different numbers for different requests.
ResourceOwnerAccount	String	No	The owner account (the logon username) of the resource to be accessed through this API request. You must use this parameter in operations where ECS resources can be authorized in the RAM console. Otherwise, the request is rejected.

Examples

```
https://ecs.example.com/
? Format=xml
&Version=2014-05-26
&Signature=Pc5WB8gokVn0xfeu%2FZV%2BiNM1****
&SignatureMethod=HMAC-SHA1
&SignatureNonce=1521552885****
&SignatureVersion=1.0
&AccessKeyId=key-test
&Timestamp=2012-06-01T12:00:00Z
...
```

Common response parameters

Each time you send a request to call an API, the system returns a unique identifier RequestId, regardless of whether the call is successful.

Examples

- XML format

```
<?xml version="1.0" encoding="UTF-8"? >
<!--Result Root Node-->
<Interface Name+Response>
    <!--Return Request Tag-->
    <RequestId>4C467B38-3910-447D-87BC-AC049166F216</RequestId>
    <!--Return Result Data-->
</Interface Name+Response>
```

- JSON format

```
{
    "RequestId": "4C467B38-3910-447D-87BC-AC049166F216",
    /* Return Result Data */
}
```

2.1.2.1.4. Instances

2.1.2.1.4.1. RunInstances

You can call this operation to create one or more ECS instances.

Description

- **Prerequisites**:
  - Instance type: You can call the DescribeInstanceTypes operation to query the performance data of instance types.
  - Available resource: You can call the DescribeAvailableResource operation to query available resources in a specific region or zone.
  - Network planning: Security groups are created. For more information, see CreateSecurityGroup in ECS Developer Guide. Before you create a VPC-type instance in a region, you must first create a VPC in that region.
- **Precautions**:
  - You can create a maximum of 100 instances at a time.
  - You can use the `AutoReleaseTime` parameter to set the automatic release time of the created instances.
  - After an instance is created, you can call the DescribeInstances operation to check the status of the instance.
  - Instances automatically start after they are created. Instances are ready for use when they are in the Running (`Running`) state.
  - After you call this operation, an error is returned if parameters are invalid or available resources are insufficient. For more information, see the "Error codes" section of this topic.
- **Best practices**:
  - You can call the `RunInstances` operation to create multiple instances at a time. To make it easy to manage and search for the created instances, we recommend that you specify tag key-value pairs (`Tag.N.Key` and `Tag.N.Value`) for the instances, and append sequential suffixes (`UniqueSuffix`) to the hostnames (`HostName`) and instance names (`InstanceName`).
  - A launch template contains parameters required to create an instance so that you do not have to specify these parameters every time you create an instance. You can call the CreateLaunchTemplate operation to create a launch template. Then, in your request to call the `RunInstances` operation, you can specify the `LaunchTemplateId` and `LaunchTemplateVersion` parameters to use the launch template.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	RunInstances	The operation that you want to perform. Set the value to RunInstances.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region in which to create the instance. You can call the DescribeRegions operation to query the most recent region list.
ImageId	String	No	aliyun_2_1903_x64_20G_alibase_20200324.vhd	The ID of the image used to create the instance. You can call the DescribeImages operation to query available images. If you do not set `LaunchTemplateId` or `LaunchTemplateName` to specify a launch template, you must specify the `ImageId` parameter.
InstanceType	String	No	ecs.g6.large	The instance type. If you do not set `LaunchTemplateId` or `LaunchTemplateName` to specify a launch template, you must specify the `InstanceType` parameter. • Select an appropriate instance type. For the performance data about instance types, see Instance families in ECS Product Introduction or call the DescribeInstanceTypes operation. • Query available ECS resources. You can call the DescribeAvailableResource operation to query available resources in the specified region or zone.

Parameter	Type	Required	Example	Description
SecurityGroupId	String	No	sg-bp15ed6xe1yxeycg7****	The ID of the security group to which to assign the instance. Instances in the same security group can communicate with each other. The maximum number of instances that a security group can contain depends on the security group type. **Note** The SecurityGroupId parameter determines the network type of instances in the security group. For example, a security group of the VPC type can contain only VPC-type instances, and you must also specify the VSwitchId parameter for the instances. If you do not use the `LaunchTemplateId` or `LaunchTemplateName` parameter to specify a launch template, you must set the `SecurityGroupId` parameter.
SecurityGroupIds.N	RepeatList	No	sg-bp15ed6xe1yxeycg7****	The IDs of security groups to which to assign the instance. The valid values of N depend on the maximum number of security groups to which an instance can belong. **Note** You cannot specify both SecurityGroupId and SecurityGroupIds.N.
VSwitchId	String	No	vsw-bp1s5fnvk4gn2tws0****	The ID of the vSwitch to which to connect the instance. You must specify this parameter when you create a VPC-type instance. The vSwitch and security group must belong to the same VPC.

Parameter	Type	Required	Example	Description
InstanceName	String	No	k8s-node-[1,4]-alibabacloud	The name of the instance. The name must be 2 to 128 characters in length and can contain letters, digits, colons (:), underscores (_), periods (.), and hyphens (-). It must start with a letter and cannot start with http:// or https://. The default value of this parameter is the `InstanceId` value. **Note** When you create multiple ECS instances, you can use `UniqueSuffix` to configure different instance names for the instances. You can also use the `name_prefix[begin_number,bits]name_suffix` naming format to configure sequential instance names. For example, if you set `InstanceName` to `k8s-node-[1,4]-alibabacloud`, the name of the first created ECS instance is `k8s-node-0001-alibabacloud`. If you do not append suffixes (`name_suffix`) to instance names or hostnames but configure instance names or hostnames in the `name_prefix[begin_number,bits]` format, the `UniqueSuffix` parameter is ignored. For example, when you set `InstanceName` to `instance-[99,3]` and `UniqueSuffix` to `true`, the instance name is `instance099` instead of `instance099001`.
Description	String	No	Instance_Description	The description of the instance. The description must be 2 to 256 characters in length and cannot start with http:// or https://.

Parameter	Type	Required	Example	Description
InternetMaxBandwidthIn	Integer	No	10	The maximum inbound bandwidth. Unit: Mbit/s. Valid values: • When the maximum outbound bandwidth is less than or equal to 10 Mbit/s, the valid values of InternetMaxBandwidthIn are 1 to 10 and the default value of InternetMaxBandwidthIn is 10. • When the maximum outbound bandwidth is greater than 10 Mbit/s, the valid values of InternetMaxBandwidthIn are 1 to the `InternetMaxBandwidthOut` value, and the default value of InternetMaxBandwidthIn is the `InternetMaxBandwidthOut` value.
InternetMaxBandwidthOut	Integer	No	10	The maximum outbound bandwidth. Unit: Mbit/s. Valid values: 0 to 100. Default value: 0.

Parameter	Type	Required	Example	Description
HostName	String	No	k8s-node-[1,4]-ecshost	The hostname of the instance. • The hostname cannot start or end with a period (,) or a hyphen (-). It cannot contain consecutive periods (.) or hyphens (-). • For Windows instances, the hostname must be 2 to 15 characters in length and can contain letters, digits, and hyphens (-). It cannot contain periods (.) or only digits. • For instances that run other operating systems such as Linux, the hostname must be 2 to 64 characters in length. You can use periods (.) to separate the hostname into multiple segments. Each segment can contain letters, digits, and hyphens (-). **Note** When you create multiple ECS instances, you can use the `UniqueSuffix` parameter to configure different hostnames for the instances. You can also use the `name_prefix[begin_number,bits]name_suffix` naming format to configure sequential hostnames. For example, if you set `HostName` to `k8s-node-[1,4]-ecshost`, the hostname of the first created instance is `k8s-node-0001-ecshost`. If you do not append suffixes (`name_suffix`) to instance names or hostnames but configure instance names or hostnames in the `name_prefix[begin_number,bits]` format, the `UniqueSuffix` parameter is ignored. For example, when you set `InstanceName` to `instance-[99,3]` and `UniqueSuffix` to `true`, the instance name is `instance099` instead of `instance099001`.

Parameter	Type	Required	Example	Description
UniqueSuffix	Boolean	No	true	Specifies whether to append sequential suffixes to the hostname specified by the `HostName` parameter and to the instance name specified by the `InstanceName` parameter. The sequential suffixes range from 001 to 999. For example, the names can be `LocalHost001`, `LocalHost002`, `MyInstance001`, and `MyInstance002`. Default value: false.
Password	String	No	EcsV587!	The password of the instance. The password must be 8 to 30 characters in length. It must include at least three of the following characters types: uppercase letters, lowercase letters, digits, and special characters. Special characters include: `()`~! @#$%^&*-_+=|{}[]:;'<>,.? /` For Windows instances, the password cannot start with a forward slash (/). **Note** For security reasons, we recommend that you use HTTPS to send requests if the `Password` parameter is specified.
PasswordInherit	Boolean	No	false	Specifies whether to use the password preset in the image. **Note** When you use this parameter, leave Password empty and make sure that the selected image has a password preset.

Parameter	Type	Required	Example	Description
ZoneId	String	No	cn-qingdao-env17-amtest11001-a	The ID of the zone in which to create the instance. You can call the DescribeZones operation to query the zone list. If you do not specify a zone ID, the system randomly selects a zone.
SystemDisk.Size	String	No	40	The size of the system disk. Unit: GiB. Valid values: 20 to 500. The value of this parameter must be at least 20 and greater than or equal to the size of the image. Default value: 40 or the size of the image, whichever is greater.
SystemDisk.Category	String	No	cloud_ssd	The category of the system disk. Valid values: • cloud_efficiency: ultra disk • cloud_ssd: standard SSD • cloud: basic disk For non-I/O optimized instances of retired instance types, the default value is cloud. For other instances, the default value is cloud_efficiency.
SystemDisk.DiskName	String	No	cloud_ssdSystem	The name of the system disk. The name must be 2 to 128 characters in length. It must start with a letter and cannot start with http:// or https://. The name can contain letters, digits, periods (.), colons (:), underscores (_), and hyphens (-). This parameter is empty by default.
SystemDisk.Description	String	No	SystemDisk_Description	The description of the system disk. The description must be 2 to 256 characters in length and cannot start with http:// or https://.
SystemDisk.AutoSnapshotPolicyId	String	No	sp-bp67acfmxazb4p****	The ID of the automatic snapshot policy to be applied to the system disk.

Parameter	Type	Required	Example	Description
DataDisk.N.Size	Integer	No	2000	The size of data disk N. Valid values of N: 1 to 16. Unit: GiB. Valid values: • Valid values when DataDisk.N.Category is set to cloud_efficiency: 20 to 32768 • Valid values when DataDisk.N.Category is set to cloud_ssd: 20 to 32768 • Valid values when DataDisk.N.Category is set to cloud: 5 to 2000 The value of this parameter must be greater than or equal to the size of the snapshot specified by the `SnapshotId` parameter.
DataDisk.N.SnapshotId	String	No	s-bp17441ohwka0yuh****	The ID of the snapshot used to create data disk N. Valid values of N: 1 to 16. When the `DataDisk.N.SnapshotId` parameter is specified, the `DataDisk.N.Size` parameter is ignored. The data disk is created based on the size of the specified snapshot. Use snapshots created after July 15, 2013. Otherwise, an error message is returned and your request is rejected.
DataDisk.N.Category	String	No	cloud_ssd	The category of data disk N. Valid values: • cloud_efficiency: ultra disk • cloud_ssd: standard SSD • cloud: basic disk For I/O optimized instances, the default value is cloud_efficiency. For non-I/O optimized instances, the default value is cloud.
DataDisk.N.Encrypted	String	No	false	Specifies whether to encrypt data disk N. Default value: false.

Parameter	Type	Required	Example	Description
DataDisk.N.KMSKeyId	String	No	0e478b7a-4262-4802-b8cb-00d3fb40****	The ID of the KMS key to be used by data disk N.
DataDisk.N.DiskName	String	No	cloud_ssdData	The name of data disk N. The name must be 2 to 128 characters in length and can contain letters, digits, periods (.), colons (:), underscores (_), and hyphens (-). It must start with a letter and cannot start with http:// or https://. This parameter is empty by default.
DataDisk.N.Description	String	No	DataDisk_Description	The description of data disk N. The description must be 2 to 256 characters in length and cannot start with http:// or https://.
DataDisk.N.Device	String	No	null	The mount point of data disk N. **Note** This parameter will be removed in the future. We recommend that you use other parameters to ensure future compatibility.
DataDisk.N.DeleteWithInstance	Boolean	No	true	Specifies whether to release data disk N when the instance is released. Default value: true.
DataDisk.N.AutoSnapshotPolicyId	String	No	sp-bp67acfmxazb4p****	The ID of the automatic snapshot policy to be applied to data disk N.
IoOptimized	String	No	optimized	Specifies whether the instance is I/O optimized. For instances of phased-out instance types, the default value is none. For other instances, the default value is optimized. Valid values: • none: The instance is not I/O optimized. • optimized: The instance is I/O optimized.

Parameter	Type	Required	Example	Description
NetworkInterface.N.PrimaryIpAddress	String	No	172.16.236.***	The primary IP address of secondary elastic network interface (ENI) N. Set the value of N to 1. **Note** You can bind only one secondary ENI when you create an ECS instance. After the instance is created, you can call the CreateNetworkInterface and AttachNetworkInterface operations to bind more secondary ENIs. The default value is an IP address that is randomly selected from within the CIDR block of the vSwitch to which to connect the secondary ENI.
NetworkInterface.N.VSwitchId	String	No	vsw-bp67acfmxazb4p****	The ID of the vSwitch to which to connect secondary ENI N. Set the value of N to 1. The default value is the ID of the vSwitch to which to connect the instance.
NetworkInterface.N.SecurityGroupId	String	No	sg-bp67acfmxazb4p****	The ID of the security group to which to assign secondary ENI N. Set the value of N to 1. The default value is the ID of the security group to which to assign the instance.

Parameter	Type	Required	Example	Description
NetworkInterface.N.SecurityGroupIds.N	RepeatList	No	sg-bp15ed6xe1yxeycg7****	The ID of security group N to which to assign secondary ENI N. The valid values of N in `SecurityGroupIds.N` depend on the maximum number of security groups to which an ENI or instance can belong. **Note** You cannot specify both the `NetworkInterface.N.SecurityGroupId` and `NetworkInterface.N.SecurityGroupIds.N` parameters.
NetworkInterface.N.NetworkInterfaceName	String	No	Network_Name	The name of secondary ENI N. Set the value of N to 1.
NetworkInterface.N.Description	String	No	Network_Description	The description of secondary ENI N. Set the value of N to 1. The description must be 2 to 256 characters in length and cannot start with http:// or https://.
UserData	String	No	ZWNobyBoZWxsbyBlY3Mh	The user data of the instance. User data must be encoded in Base64. The maximum size of raw data is 16 KB.
KeyPairName	String	No	KeyPair_Name	The name of the key pair to be bound to the instance. • For Windows instances, this parameter is ignored and is empty by default. The `Password` parameter takes effect even if the KeyPairName parameter is specified. • For Linux instances, the username and password logon method is disabled by default.

Parameter	Type	Required	Example	Description
RamRoleName	String	No	RAM_Name	The name of the instance RAM role to be attached to the instance. You can call the ListRoles operation provided by RAM to query the instance RAM roles that you created.
Amount	Integer	No	3	The number of instances that you want to create. Valid values: 1 to 100. Default value: 1.
MinAmount	Integer	No	2	The minimum number of instances that can be created. Valid values: 1 to 100. • If the number of ECS instances that available resources are sufficient to create is less than the MinAmount value, instances fail to be created. • If the number of ECS instances that available resources are sufficient to create is greater than or equal to the MinAmount value, instances are created based on the number of available resources.
AutoReleaseTime	String	No	2018-01-01T12:05:00Z	The automatic release time of the instance. Specify the time in the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time must be in UTC. • If the value of the seconds (`ss`) is not `00` , the time is automatically rounded down to the nearest minute based on the value of `mm` . • The release time must be at least 30 minutes later than the current time. • The release time must be no later than three years from the current time.

Parameter	Type	Required	Example	Description
SpotPriceLimit	Float	No	0.97	The maximum hourly price of the instance. A maximum of three decimal places are allowed in the value of this parameter. This parameter takes effect only when the `SpotStrategy` parameter is set to `SpotWithPriceLimit`.
SecurityEnhancementStrategy	String	No	Active	Specifies whether to enable security hardening. Valid values: • Active: enables security hardening. This value is applicable only to public images. • Deactive: disables security hardening. This value is applicable to all image types.
ClientToken	String	No	123e4567-e89b-12d3-a456-426655440000	The client token that is used to ensure the idempotence of the request You can use the client to generate the value, but you must make sure that it is unique among different requests. The **ClientToken** value can only contain ASCII characters and cannot exceed 64 characters in length. For more information, see How to ensure idempotence in ECS Developer Guide.
Tag.N.Key	String	No	TestKey	The key of tag N to be bound to the instance, disks, and primary ENI. Valid values of N: 1 to 20. The tag key cannot be an empty string. It can be up to 128 characters in length and cannot start with acs: or aliyun. It cannot contain http:// or https://.
Tag.N.Value	String	No	TestValue	The value of tag N to be bound to the instance, disks, and primary ENI. Valid values of N: 1 to 20. The tag value can be an empty string. It can be up to 128 characters in length. It cannot start with acs: or contain http:// or https://.
HpcClusterId	String	No	hpc-bp67acfmxazb4p****	The ID of the E-HPC cluster to which to assign the instance.

Parameter	Type	Required	Example	Description
DryRun	Boolean	No	false	Specifies whether to check the validity of the request without actually making the request. Default value: false. Valid values: • true: The validity of the request is checked but the request is not made. Check items include the request format, service limits, available ECS resources, and whether the required parameters are specified. If the check fails, the corresponding error is returned. If the check succeeds, the `DryRunOperation` error code is returned. • false: The validity of the request is checked. If the check succeeds, the request is made.
DedicatedHostId	String	No	dh-bp67acfmxazb4p****	The ID of the dedicated host on which to create the instance. You can call the DescribeDedicatedHosts operation to query the dedicated host list.
LaunchTemplateId	String	No	lt-bp1apo0bbbkuy0rj****	The ID of the launch template. For more information, see DescribeLaunchTemplates. To use a launch template to create an instance, you must specify the launch template by using the `LaunchTemplateId` or `LaunchTemplateName` parameter.
LaunchTemplateName	String	No	LaunchTemplate_Name	The name of the launch template. To use a launch template to create an instance, you must specify the launch template by using the `LaunchTemplateId` or `LaunchTemplateName` parameter.

Parameter	Type	Required	Example	Description
LaunchTemplateVersion	Long	No	3	The version of the launch template. If you specify `LaunchTemplateId` or `LaunchTemplateName` but do not specify the version number of the launch template, the default template version is used.
ResourceGroupId	String	No	rg-bp67acfmxazb4p****	The ID of the resource group to which to assign the instance.
DeploymentSetId	String	No	ds-bp1brhwhoqinyjd6****	The ID of the deployment set to which to deploy the instance.
PrivateIpAddress	String	No	10.1.2.1	The private IP address to be assigned to the instance. To assign a private IP address to a VPC-type ECS instance, make sure that the IP address is an idle IP address within the CIDR block of the vSwitch specified by the `VSwitchId` parameter. **Note** If the `PrivateIpAddress` parameter is specified, the `Amount` parameter must be set to 1.
CreditSpecification	String	No	Standard	The performance mode of the burstable instance. Valid values: • Standard: standard mode • Unlimited: unlimited mode This parameter is empty by default.

Parameter	Type	Required	Example	Description
Ipv6Address.N	RepeatList	No	Ipv6Address.1=2001:db8:1234:1a00::***	IPv6 address N to be assigned to the primary ENI. Set the value of N to 1. Example: `Ipv6Address.1=2001:db8:1234:1a00::***`. **Note** If the `Ipv6Address.N` parameter is specified, the `Amount` parameter must be set to 1 and the `Ipv6AddressCount` parameter must be empty.
Ipv6AddressCount	Integer	No	1	The number of IPv6 addresses to be randomly generated for the primary ENI. **Note** You cannot specify both the `Ipv6Addresses.N` and `Ipv6AddressCount` parameters.
DeletionProtection	Boolean	No	false	Specifies whether to enable release protection for the instance. The release protection attribute of the instance determines whether you can release the instance by using the ECS console or by calling the DeleteInstance operation. Default value: false. Valid values: • true: enables release protection. • false: disables release protection. **Note** This attribute can protect instances only against manual releases, not against automatic releases.

Parameter	Type	Required	Example	Description
Affinity	String	No	default	Specifies whether to associate the instance deployed on a dedicated host with the dedicated host. Valid values: • default: does not associate the instance with the dedicated host. If you start the instance from the No Fees for Stopped Instances (VPC-Connected) state and the resources of the dedicated host are insufficient, the instance is automatically deployed to another dedicated host in the automatic deployment resource pool. • host: associates the instance with the dedicated host. If you start the instance from the No Fees for Stopped Instances (VPC-Connected) state, the instance still resides on the associated dedicated host. If the resources of the associated dedicated host are insufficient, the instance fails to be started. Default value: default.
Tenancy	String	No	default	Specifies whether to create the instance on a dedicated host. Valid values: • default: creates the instance on a non-dedicated host. • host: creates the instance on a dedicated host. If you do not specify the `DedicatedHostId` parameter, Apsara Stack automatically selects a dedicated host for the instance. Default value: default.
StorageSetId	String	No	ss-bp67acfmxazb4p****	The ID of the storage set.
StorageSetPartitionNumber	Integer	No	2	The maximum number of partitions in the storage set. Valid values: greater than or equal to 2.

Parameter	Type	Required	Example	Description
CpuOptions.Core	Integer	No	2	The number of CPU cores. This parameter cannot be specified but only uses its default value.
CpuOptions.ThreadsPerCore	Integer	No	2	The number of threads per core. The following formula is used to calculate the number of vCPUs of the instance: `CpuOptions.Core` value × `CpuOptions.ThreadPerCore` value. • If the `CpuOptions.ThreadPerCore` parameter is set to 1, CPU hyper-threading is disabled. • This parameter is applicable only to some instance types.
CpuOptions.Numa	String	No	1	The number of CPU Numa nodes.

Response parameters

Parameter	Type	Example	Description
InstanceIdSets	List	["i-bp67acfmxazb4pd2****", "i-bp1i43l28m7u48p1****", "i-bp12yqg7jdyxl11f****"]	The IDs of the instances (`InstanceIdSet`).
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.
TradePrice	Float	0.165	**Note** This parameter is not supported.

Examples

Sample requests

```
https://ecs.example.com/?Action=RunInstances
&RegionId=cn-qingdao-env17-d01
&ImageId=aliyun_2_1903_x64_20G_alibase_20200324.vhd
&InstanceType=ecs.g6.large
&SecurityGroupId=sg-bp67acfmxazb4p****
&VSwitchId=vsw-bp1s5fnvk4gn2tws0****
&SystemDisk.AutoSnapshotPolicyId=sp-bp67acfmxazb4p****
&Amount=3
&<Common request parameters>
```

Sample success responses

`XML` format

```
<RunInstancesResponse>
      <InstanceIdSets>
            <InstanceIdSet>i-bp67acfmxazb4pd2****</InstanceIdSet>
            <InstanceIdSet>i-bp1i43l28m7u48p1****</InstanceIdSet>
            <InstanceIdSet>i-bp12yqg7jdyxl11f****</InstanceIdSet>
      </InstanceIdSets>
      <RequestId>04F0F334-1335-436C-A1D7-6C044FE73368</RequestId>
</RunInstancesResponse>
```

`JSON` format

```
{
    "InstanceIdSets": {
        "InstanceIdSet": [
            "i-bp67acfmxazb4pd2****",
            "i-bp1i43l28m7u48p1****",
            "i-bp12yqg7jdyxl11f****"
        ]
    },
    "RequestId": "04F0F334-1335-436C-A1D7-6C044FE73368"
}
```

Error codes

HttpCode	Error code	Error message	Description
400	InvalidInstanceType.ValueUnauthorized	The specified InstanceType is not authorized.	The error message returned because you are not authorized to use the specified instance type.
404	InvalidSecurityGroupId	The specified SecurityGroupId is invalid or does not exist.	The error message returned because the specified SecurityGroupId parameter is invalid or does not exist.

HttpCode	Error code	Error message	Description
400	InvalidInstanceType.ValueNotSupported	The specified InstanceType beyond the permitted range.	The error message returned because the specified InstanceType parameter is invalid.
404	InvalidSecurityGroupId.NotFound	The SecurityGroupId provided does not exist in our records.	The error message returned because the specified security group does not exist in this account. Check whether the security group ID is correct.
400	InvalidDescription.Malformed	The specified parameter "Description" is not valid.	The error message returned because the specified Description parameter is invalid. The description must be 2 to 256 characters in length and cannot start with http:// or https://.
400	InvalidInternetChargeType.ValueNotSupported	The specified InternetChargeType is not valid.	The error message returned because the specified billing method for network usage is not supported.
400	InvalidParameter	The specified parameter "InternetMaxBandwidthOut" is not valid.	The error message returned because the specified InternetMaxBandwidthOut parameter is invalid.
400	InvalidHostName.Malformed	The specified parameter "HostName" is not valid.	The error message returned because the specified HostName parameter is invalid.
403	InvalidParams.InstanceNameExceed	The uniqueSuffix takes three naming places, please shorten your InstanceName.	The error message returned because the instance name must be shortened to make space for the sequential suffix specified by UniqueSuffix. The sequential suffix is three characters in length.
403	InvalidParams.HostnameExceed	The uniqueSuffix takes three naming places, please shorten your Hostname.	The error message returned because the instance hostname must be shortened to make space for the sequential suffix specified by UniqueSuffix. The sequential suffix is three characters in length.
400	InvalidPassword.Malformed	The specified parameter "Password" is not valid.	The error message returned because the specified Password parameter is invalid.

HttpCode	Error code	Error message	Description
400	InvalidPasswordParam.Mismatch	The input password should be null when passwdInherit is true.	The error message returned because the Password parameter is specified when PasswdInherit is set to true.
400	InvalidSystemDiskCategory.ValueNotSupported	The specified parameter "SystemDisk.Category" is not valid.	The error message returned because the specified SystemDisk.Category parameter is invalid.
400	InvalidDiskName.Malformed	The specified parameter "SyatemDisk.DiskName or DataDisk.n.DiskName" is not valid.	The error message returned because the specified SystemDisk.DiskName or DataDisk.N.DiskName parameter is invalid. The name must be 2 to 128 characters in length and can contain letters, digits, periods (.), underscores (_), and hyphens (-). It must start with a letter and cannot start with http:// or https://.
400	InvalidDiskDescription.Malformed	The specified parameter "SyatemDisk.DiskDescription" or "DataDisk.n.Description" is not valid.	The error message returned because the specified SystemDisk.Description or DataDisk.N.Description parameter is invalid.
400	InvalidDataDiskSize.ValueNotSupported	The specified DataDisk.n.Size beyond the permitted range, or the capacity of snapshot exceeds the size limit of the specified disk category.	The error message returned because the specified DataDisk.N.Size parameter is invalid or the snapshot size exceeds the maximum capacity allowed for the specified disk category.
400	InvalidDataDiskCategory.ValueNotSupported	The specified parameter "DataDisk.n.Category" is not valid.	The error message returned because the specified DataDisk.N.Category parameter is invalid.
404	InvalidDataDiskSnapshotId.NotFound	The specified parameter "DataDisk.n.SnapshotId" is not valid.	The error message returned because the specified DataDisk.N.SnapshotId parameter is invalid.
400	InvalidDataDevice.Malformed	The specified parameter "DataDisk.n.Device" is not valid.	The error message returned because the specified DataDisk.N.Device parameter is invalid.

HttpCode	Error code	Error message	Description
400	InvalidNodeControllerId.Malformed	The specified parameter "NodeControllerId" is not valid.	The error message returned because the specified NodeControllerId parameter is invalid.
400	InvalidInnerIpAddress.Malformed	The specified parameter "InnerIpAddress" is not valid.	The error message returned because the specified InnerIpAddress parameter is invalid.
400	InvalidInnerIpAddress.Unusable	The specified InnerIpAddress is already used or not found in usable ip range.	The error message returned because the specified internal IP address is unavailable.
400	InvalidParameter.Conflict	The specified image does not support the specified instance type.	The error message returned because the specified image does not support the specified instance type.
400	ImageNotSupportCloudInit	The specified image does not support cloud-init.	The error message returned because the specified image does not support cloud-init.
400	InvalidSnapshotId.BasedSnapshotTooOld	The specified snapshot is created before 2013-07-15.	The error message returned because the specified snapshot was created before July 15, 2013.
400	QuotaExceed.AfterpayInstance	Living afterpay instances quota exceeded.	The error message returned because the maximum number of active pay-as-you-go instances has been reached.
403	ImageNotSubscribed	The specified image has not be subscribed.	The error message returned because you have not subscribed to the specified Alibaba Cloud Marketplace image.
403	InvalidSystemDiskCategory.ValueUnauthorized	The disk category is not authorized.	The error message returned because you are not authorized to use the specified disk category.
403	InvalidSnapshotId.NotReady	The specified snapshot has not completed yet.	The error message returned because the specified snapshot is being created.
403	InstanceDiskCategoryLimitExceed	The total size of specified disk category in an instance exceeds.	The error message returned because the total size of disks of the specified category exceeds the maximum capacity allowed for an instance.

HttpCode	Error code	Error message	Description
403	InvalidDevice.InUse	The specified device has been occupied.	The error message returned because the specified device is already in use.
403	ImageRemovedInMarket	The specified market image is not available, Or the specified user defined image includes product code because it is based on an image subscribed from marketplace, and that image in marketplace includeing exact the same product code has been removed.	The error message returned because the specified Alibaba Cloud Marketplace image is unavailable, or because the specified custom image contains the product code of the Alibaba Cloud Marketplace image from which the custom image is derived and the Alibaba Cloud Marketplace image has been removed from Alibaba Cloud Marketplace.
404	InvalidClusterId.NotFound	The ClusterId provided does not exist in our records.	The error message returned because the specified cluster ID does not exist.
403	CategoryNotSupported	The specified zone does not offer the specified disk category.	The error message returned because the specified disk category is unavailable in the specified zone.
400	InvalidInstanceName.Malformed	The specified parameter "InstanceName" is not valid.	The error message returned because the specified InstanceName parameter is invalid. The name must be 2 to 128 characters in length and can contain letters, digits, periods (.), underscores (_), and hyphens (-). It must start with a letter and cannot start with http:// or https://.
400	InvalidDiskDescription.Malformed	The specified parameter "SyatemDisk.DiskDescription or DataDisk.n.Description" is not valid.	The error message returned because the specified SystemDisk.Description or DataDisk.N.Description parameter is invalid.
403	QuotaExceed.PortableCloudDisk	The quota of portable cloud disk exceeds.	The error message returned because the maximum number of removable disks has been reached.
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.

HttpCode	Error code	Error message	Description
400	InvalidParameter.Conflict	The speicified region and cluster do not match.	The error message returned because the specified region and cluster do not correspond to each other.
403	SecurityGroupInstanceLimitExceed	Exceeding the allowed amount of instances of a security group.	The error message returned because the maximum number of instances in the security group has been reached.
403	NodeControllerUnavailable	The Node Controller is temporarily unavailable.	The error message returned because the node controller is unavailable.
403	RegionUnauthorized	There is no authority to create instance in the specified region.	The error message returned because you are not authorized to create instances in the specified region.
403	CategoryNotSupported	The specified Zone or cluster does not offer the specified disk category.	The error message returned because the specified disk category is unavailable in the specified zone or cluster.
403	InvalidSnapshotId.NotDataDiskSnapshot	The specified snapshot is system disk snapshot.	The error message returned because the specified snapshot is a system disk snapshot.
403	CategoryNotSupported	The specified cluster does not offer the specified disk category.	The error message returned because the specified disk category is unavailable in the specified cluster.
404	InvalidVSwitchId.NotFound	Specified virtual switch does not exist.	The error message returned because the specified VSwitchId parameter does not exist.
404	InvalidVSwitchId.NotFound	%s	The error message returned because the specified VSwitchId parameter does not exist.
400	InvalidParameter.Mismatch	Specified security group and virtual switch are not in the same VPC.	The error message returned because the specified security group and vSwitch do not belong to the same VPC.
400	InvalidNetworkType.Mismatch	Specified parameter "InternetMaxBandwidthIn" or "InternetMaxBandwidthOut" conflict with instance network type.	The error message returned because the specified InternetMaxBandwidthIn or InternetMaxBandwidthOut parameter conflicts with the instance network type.

HttpCode	Error code	Error message	Description
400	InvalidNetworkType.Mismatch	Specified parameter "InternetChargeType" conflict with instance network type.	The error message returned because the network type of the instance does not support the specified billing method for network usage.
400	InvalidPrivateIpAddress	Specified private IP address is not in the CIDR block of virtual switch.	The error message returned because the specified private IP address is not within the CIDR block of the specified vSwitch.
400	InvalidPrivateIpAddress.Malformed	Specified private IP address is malformed.	The error message returned because the specified PrivateIpAddress parameter is invalid.
400	InvalidPrivateIpAddress.Duplicated	Specified private IP address is duplicated.	The error message returned because the specified private IP address is already in use. Try another IP address.
400	QuotaExceeded.PrivateIpAddress	Don't have enough private IPs in this switch	The error message returned because all the private IP addresses within the CIDR block of the specified vSwitch are already in use. Try another vSwitch.
400	QuotaExceeded	Living instances quota exceeded in this VPC.	The error message returned because the maximum number of active instances has been reached.
400	IncorrectVSwitchStatus	The current status of virtual switch does not support this operation.	The error message returned because the specified vSwitch is in the Pending state and cannot be deleted.
400	InvalidParameter.Mismatch	Specified virtual switch is not in the specified zone.	The error message returned because the specified vSwitch does not exist in the specified zone.
400	ResourceNotAvailable	Resource you requested is not available in this region or zone.	The error message returned because VPC is not supported by the specified region or zone.
400	MissingParameter	The input parameter "VSwitchId" that is mandatory for processing this request is not supplied.	The error message returned because the VSwitchId parameter is not specified.

HttpCode	Error code	Error message	Description
400	InvalidDiskCategory.Mismatch	The specified disk categories' combination is not supported.	The error message returned because the combination of specified disk categories is not supported.
403	Forbbiden	User not authorized to operate on the specified resource.	The error message returned because you are not authorized to perform operations on the specified resource.
403	DeleteWithInstance.Conflict	The specified disk is not a portable disk and cannot be set to DeleteWithInstance attribute.	The error message returned because the specified disk is not removable and cannot be released along with the instance.
404	InvalidImageId.NotFound	The specified ImageId does not exist.	The error message returned because the specified image does not exist in this account. Check whether the image ID is correct.
403	InstanceDiskNumLimitExceed	The number of specified disk in an instance exceeds.	The error message returned because the number of specified disks exceeds the upper limit for an instance.
403	IoOptimized.NotSupported	The specified image is not support IoOptimized Instance.	The error message returned because the specified image does not support I/O optimized instances.
404	IoOptimized.NotSupported	The specified instancetype is not support IoOptimized instance	The error message returned because the specified instance type does not support I/O optimization.
403	InvalidDiskSize.TooSmall	Specified disk size is less than the size of snapshot	The error message returned because the specified disk size is smaller than the snapshot size.
404	InvalidInstanceChargeType.NotFound	The InstanceChargeType does not exist in our records	The error message returned because the specified instance billing method does not exist.
400	MissingParamter	The specified parameter "Period" is not null.	The error message returned because the Period parameter is not specified.
400	InvalidPeriod	The specified period is not valid.	The error message returned because the specified Period parameter is invalid.

HttpCode	Error code	Error message	Description
403	InvalidDiskCategory.Mismatch	The specified disk categories combination is not supported.	The error message returned because the combination of specified disk categories is not supported.
403	IoOptimized.NotSupported	Vpc is not support IoOptimized instance.	The error message returned because the VPC does not support I/O optimized instances.
400	InvalidDataDiskCategory.ValueNotSupported	The specified parameter " DataDisk.n.Category " is not valid.	The error message returned because the specified DataDisk.N.Category parameter is invalid.
400	InvalidSystemDiskCategory.ValueNotSupported	The specified parameter " SystemDisk.Category " is not valid.	The error message returned because the specified SystemDisk.Category parameter is invalid.
403	InvalidDiskCategory.NotSupported	The specified disk category is not support the specified instance type.	The error message returned because the specified disk category does not support the instance type.
400	InstanceDiskCategoryLimitExceed	The specified DataDisk.n.Size beyond the permitted range, or the capacity of snapshot exceeds the size limit of the specified disk category.	The error message returned because the specified DataDisk.N.Size parameter is invalid or the snapshot size exceeds the maximum capacity allowed for the specified disk category.
403	QuotaExceed.BuyImage	The specified image is from the image market? You have not bought it or your quota has been exceeded.	The error message returned because the specified Alibaba Cloud Marketplace image has not been purchased or the maximum number of images has been reached.
404	DependencyViolation.IoOptimized	The specified instancetype must be IoOptimized instance.	The error message returned because the specified instance type is not I/O optimized.
404	PaymentMethodNotFound	No payment method has been registered on the account.	The error message returned because you have not configured a payment method for your account.
400	InvalidInstanceType.ValueNotSupported	InternetMaxBandwidthOut should be set.	The error message returned because the InternetMaxBandwidthOut parameter is not specified.

HttpCode	Error code	Error message	Description
400	InvalidInstanceType.ValueNotSupported	instancetype is not valid.	The error message returned because the specified InstanceType parameter is invalid.
400	InvalidClientToken.ValueNotSupported	clienttoken is not valid.	The error message returned because the specified ClientToken parameter is invalid.
400	InvalidIoOptimize.ValueNotSupported	The specified IoOptimize is not valid.	The error message returned because the specified IoOptimized parameter is invalid.
400	InvalidHostName.Malformed	The specified parameter HostName is not valid.	The error message returned because the specified HostName parameter is invalid.
404	HOSTNAME_ILLEGAL	hostname is not valid.	The error message returned because the specified HostName parameter is invalid.
400	InvalidInternetMaxBandwidthOut.Malformed	The specified parameter internetMaxBandwidthOut is not valid.	The error message returned because the specified InternetMaxBandwidthOut parameter is invalid.
400	InvalidInternetMaxBandwidthIn.Malformed	The specified parameter internetMaxBandwidthIn is not valid.	The error message returned because the specified InternetMaxBandwidthIn parameter is invalid.
400	InvalidSnapshotId.NotFound	The specified parameter SnapshotId is not exist.	The error message returned because the specified snapshot does not exist.
400	InvalidTagKey.Malformed	The specified Tag.n.Key is not valid.	The error message returned because the specified Tag.N.Key parameter is invalid.
400	InvalidTagValue.Malformed	The specified Tag.n.Value is not valid.	The error message returned because the specified Tag.N.Value parameter is invalid.
403	InvalidResourceId.NotSupported	The specified ResourceId does not support tagging.	The error message returned because the specified resource does not support tagging.
400	InvalidTag.Mismatch	The specified Tag.n.Key and Tag.n.Value are not match.	The error message returned because the specified Tag.N.Key and Tag.N.Value parameters do not match.

HttpCode	Error code	Error message	Description
400	InvalidTagCount	The specified tags are beyond the permitted range.	The error message returned because the number of specified tags exceeds the upper limit.
400	InvalidMinAmount.Malformed	The specified parameter MinAmount is not valid.	The error message returned because the specified MinAmount parameter is invalid.
400	InvalidMaxAmount.Malformed	The specified parameter MaxAmount is not valid.	The error message returned because the specified MaxAmount parameter is invalid.
400	InvalidAutoReleaseTime.Malformed	The specified parameter AutoReleaseTime is not valid.	The error message returned because the specified AutoReleaseTime parameter is invalid. Specify the time in the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time must be in UTC.
400	InvalidPrivateIpAddress.Malformed	The specified parameter PrivateIpAddress is not valid.	The error message returned because the specified PrivateIpAddress parameter is invalid.
400	InvalidInnerIpAddress.Malformed	The specified parameter InnerIpAddress is not valid.	The error message returned because the specified InnerIpAddress parameter is invalid.
404	InvalidSystemDiskSize.LessThanImageSize	The specified parameter SystemDisk.Size is less than the image size.	The error message returned because the specified system disk size is smaller than the size of the image.
404	InvalidSystemDiskSize.LessThanMinSize	The specified parameter SystemDisk.Size is less than the min size.	The error message returned because the specified system disk size is smaller than the minimum size.
403	OperationDenied	The specified RegionId does not support the creation of the network type ECS instance.	The error message returned because instances of the specified network type cannot be created in the specified region. Check whether instance resources of this network type are available in the region.
400	OperationDenied.NoVlan	The specified parameter "VlanId" is not valid or vlan has not enough IP address.	The error message returned because the specified VLAN ID is invalid or because available IP addresses in the specified VLAN are insufficient.

HttpCode	Error code	Error message	Description
403	OperationDenied.ImageNotValid	The specified Image is disabled or is deleted.	The error message returned because the specified ImageId parameter does not exist.
403	OperationDenied.SnapshotNotValid	The specified snapshot is not allowed to create disk.	The error message returned because the specified snapshot cannot be used to create disks.
403	OperationDenied.SnapshotNotAllowed	The specified snapshot is not allowed to create disk.	The error message returned because the specified snapshot cannot be used to create disks.
403	OperationDenied.ZoneNotAllowed	The creation of Instance to the specified Zone is not allowed.	The error message returned because instances cannot be created in the specified zone.
403	OperationDenied.ZoneSystemCategoryNotMatch	The specified Zone or cluster does not offer the specified disk category or the speicified zone and cluster do not match.	The error message returned because the specified disk category is unavailable in the specified zone or cluster, or because the specified zone and cluster do not correspond to each other.
403	OperationDenied.ResourceControl	The specified region is in resource control, please try later.	The error message returned because the specified region is under resource control. Try again later.
403	OperationDenied.NoStock	The resource is out of usage.	The error message returned because the instance is not in the Running state. Start the instance or check whether the operation is valid.
403	OperationDenied.SnapshotParamsNotValid	The capacity of snapshot exceeds the size limit of the specified disk category or the specified category is not authorizied.	The error message returned because the maximum snapshot size has been reached or because you are not authorized to use the specified disk category.
404	OperationDenied.CreatingConflict	Another Instance has been creating	The error message returned because no other instances can be created while an instance is being created.
403	OperationDenied.DiskTypeNotSupport	The type of the disk does not support the operation	The error message returned because the specified operation is invalid.

HttpCode	Error code	Error message	Description
400	OperationDenied.QuotaExceed	The quota of tags on resource is beyond permitted range.	The error message returned because the maximum number of tags that can be bound to the resource has been reached.
400	Account.Arrearage	Your account has been in arrears.	The error message returned because you have insufficient balance in your account. Add funds to your account and try again.
403	InvalidUserData.Forbidden	User not authorized to input the parameter "UserData", please apply for permission "UserData"	The error message returned because you are not authorized to manage user data. Apply for the permission first.
400	InvalidUserData.SizeExceeded	The specified parameter "UserData" exceeds the size.	The error message returned because the size of user data specified in the UserData value exceeds the upper limit.
400	InvalidUserData.NotSupported	The specified parameter "UserData" only support the vpc and IoOptimized Instance.	The error message returned because the specified UserData parameter is not supported. UserData is supported only on VPC-type instances and I/O optimized instances.
404	InvalidZoneId.NotFound	The specified zoneId does not exist.	The error message returned because the specified ZoneId parameter does not exist.
403	Zone.NotOpen	The specified zone is not granted to you to buy resources yet.	The error message returned because you are not authorized to purchase resources in the specified zone.
403	Zone.NotOnSale	The resource in the specified zone is no longer available for sale. Please try other regions and zones.	The error message returned because the specified resource is unavailable in the specified zone. Try other resource types, or select other regions or zones.
403	InvalidClusterId.NotFound	The specified clusterId does not exist.	The error message returned because the specified cluster ID does not exist.
403	OperationDenied.NoStock	The resource is out of stock in the specified zone. Please try other types, or choose other regions and zones.	The error message returned because the specified resource is unavailable in the specified zone. Try other resource types, or select other regions or zones.

HttpCode	Error code	Error message	Description
403	InvalidInstanceType.ZoneNotSupported	The specified zone does not support this instancetype.	The error message returned because the specified instance type is not supported in the specified zone.
400	InstanceDiskNumber.LimitExceed	The total number of specified disk in an instance exceeds.	The error message returned because the number of specified disks exceeds the upper limit for an instance.
400	InvalidDiskCategory.ValueNotSupported	The specified parameter "DiskCategory" is not valid.	The error message returned because the specified SystemDisk.Category parameter is invalid.
400	InvalidSpotStrategy	The specified SpotStrategy is not valid.	The error message returned because the specified SpotStrategy parameter is invalid.
400	InvalidSpotPriceLimit	The specified SpotPriceLimitis not valid.	The error message returned because the specified SpotPriceLimit parameter is invalid.
400	InvalidSpotDuration	The specified SpotDuration is not valid.	The error message returned because the specified SpotDuration parameter is invalid.
400	InvalidSpotAuthorized	The specified Spot param is unauthorized.	The error message returned because you are not authorized to set the SpotDuration parameter.
400	InvalidSpotPrepaid	The specified Spot type is not support PrePay Instance.	The error message returned because preemptible instances do not support the subscription billing method.
400	InvalidSpotAliUid	The specified UID is not authorized to use SPOT instance.	The error message returned because you are not authorized to create preemptible instances.
400	InvalidParameter.Bandwidth	%s	The error message returned because the specified bandwidth is invalid.
400	InvalidDataDiskCategory.ValueNotSupported	%s	The error message returned because the specified data disk category is invalid.

HttpCode	Error code	Error message	Description
400	InvalidSystemDiskCategory.ValueNotSupported	%s	The error message returned because the operation is not supported by the specified system disk category.
400	InvalidParameter.Conflict	%s	The error message returned because a specified parameter is invalid. Check whether parameter conflicts exist.
400	InvalidInternetChargeType.ValueNotSupported	%s	The error message returned because the specified billing method for network usage is not supported.
400	InvalidInstanceType.ValueNotSupported	%s	The error message returned because the operation is not supported by the specified instance type.
403	InstanceType.Offline	%s	The error message returned because the operation is not supported while the instance type is retired or resources of the instance type are insufficient.
400	RegionUnauthorized	%s	The error message returned because you are not authorized to perform the operation in the specified region.
400	Zone.NotOnSale	%s	The error message returned because the requested resources are unavailable in the specified zone.
400	InvalidSystemDiskSize.ValueNotSupported	%s	The error message returned because the specified system disk size is invalid.
400	InvalidDataDiskSize.ValueNotSupported	%s	The error message returned because the specified data disk size is invalid.
403	DependencyViolation.WindowsInstance	The instance creating is window, cannot use ssh key pair to login.	The error message returned because the specified instance is a Windows instance and does not support logons based on SSH key pairs.

HttpCode	Error code	Error message	Description
400	InvalidInstanceType.ValueNotSupported	The specified parameter "KeyPairName" only support IoOptimized Instance.	The error message returned because non-I/O optimized instances do not support SSH key pairs.
404	InvalidResourceGroup.NotFound	The ResourceGroup provided does not exist in our records.	The error message returned because the specified ResourceGroupId parameter does not exist.
403	InvalidUser.PassRoleForbidden	The RAM user does not have the privilege to pass a RAM role.	The error message returned because the RAM user is not authorized to pass the RAM role.
404	InvalidRamRole.NotFound	The specified parameter "RAMRoleName" does not exist.	The error message returned because the specified RAMRoleName parameter does not exist.
404	InvalidLaunchTemplate.NotFound	%s	The error message returned because the specified launch template does not exist. Check whether the parameter is correct.
404	InvalidLaunchTemplateVersion.NotFound	%s	The error message returned because the specified launch template of the specified version does not exist. Check whether the parameter is correct.
400	InvalidInstanceType.ElasticNetworkInterfaceNotSupported	The specified instance type does not support Elastic Network Interface, you can not attach Elastic Network Interface to generation I instances.	The error message returned because ENIs are not supported by the specified instance type.
400	InvalidParameter.EncryptedIllegal	%s	The error message returned because the specified parameter is invalid. Check whether your encryption operation is valid.
400	InvalidParameter.EncryptedNotSupported	%s	The error message returned because the specified parameter is invalid and your encryption operation is not supported.
500	InternalError	The request processing has failed due to some unknown error, exception or failure.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.

HttpCode	Error code	Error message	Description
403	Forbidden.RiskControl	This operation is forbidden by Aliyun RiskControl system.	The error message returned because the operation is forbidden by the risk control system.
403	InvalidInstance.UnPaidOrder	The specified Instance has unpaid order.	The error message returned because you have unpaid orders for the specified instance. Pay for the orders and try again.
403	RealNameAuthenticationError	Your account has not passed the real-name authentication yet.	The error message returned because you have not completed real-name verification. Complete real-name verification and try again.
403	InvalidInstanceType.NotSupported	The specified InstanceType is not Supported.	The error message returned because the specified InstanceType parameter is not supported.
403	InvalidPayMethod	The specified pay method is not valid.	The error message returned because the specified payment method is invalid.
403	InvalidAccountStatus.NotEnoughBalance	Your account does not have enough balance.	The error message returned because you have insufficient balance in your account. Add funds to your account and try again.
400	InvalidSpotPriceLimit.LowerThanPublicPrice	The specified parameter "spotPriceLimit" can't be lower than current public price.	The error message returned because the specified value of SpotPriceLimit is less than the current market price.
400	InvalidRelationResource.NotFound	The relation resource has been deleted.	The error message returned because the associated resource has been deleted.
400	IncorrectRecycleBinStatus	The operation is not permitted due to resource status.	The error message returned because the operation is not supported while the resource is in the current state.
400	InvalidHpcClusterId.Unnecessary	The specified HpcClusterId is unnecessary	The error message returned because the HpcClusterId parameter is specified.
400	InvalidVSwitchId.Necessary	The VSwitchId is necessary	The error message returned because the VSwitchId parameter is not specified.

HttpCode	Error code	Error message	Description
400	InvalidHpcClusterId.Necessary	The HpcClusterId is necessary	The error message returned because the HpcClusterId parameter is not specified.
400	InvalidHpcClusterId.NotFound	The specified HpcClusterId is not found	The error message returned because the specified HpcClusterId parameter does not exist.
404	InvalidVSwitchId.NotExist	%s	The error message returned because the specified VSwitchId parameter does not exist.
403	ImageNotSupportInstanceType	The specified image does not support the specified InstanceType.	The error message returned because the specified image does not support the specified instance type.
400	InvalidSecurityGroup.NotInDefaultVpc	%s	The error message returned because the specified security group is not in the default VPC. Check whether the specified SecurityGroupId parameter is correct.
400	VpcNotFound	Vpc is not found according to the specified VSwitch or the vpc does not belong to you.	The error message returned because the specified vSwitch does not belong to any VPC, or the corresponding VPC does not belong to you.
400	InvalidSystemDiskSize.ImageNotSupportResize	The specified image does not support resize.	The error message returned because the specified image does not support resizing.
403	OperationDenied.InvalidNetworkType	%s	The error message returned because the operation is not supported by the specified network type.
400	InvalidSpotInterruptionBehavior	%s	The error message returned because the specified SpotInterruptionBehavior parameter is invalid.
403	InvalidSpotInterruptionBehavior.ClassicNetworkNotSupport	The specified SpotInterruptionBehavior does not support Classic network Instance.	The error message returned because the operation is not applicable to instances in the classic network.

HttpCode	Error code	Error message	Description
403	InvalidSpotInterruptionBehavior.LocalDiskNotSupport	The specified SpotInterruptionBehavior does not support local disk instance.	The error message returned because the operation is not supported by instances that have local disks attached.
400	InvalidDeploymentOnHost	%s	The error message returned because the instance cannot be deployed in the specified deployment set.
400	InvalidInstanceChargeType.NotSupport	The Dedicated host not support the specified Instance charge type.	The error message returned because the dedicated host does not support instances that use the specified billing method.
400	InvalidNetworkType.NotSupported	The classic networkType not support create ECS on dedicatedHost	The error message returned because the dedicated host does not support instances in the classic network.
400	InvalidDedicatedHostId.NotFound	The specified DedicatedHostId does not exist.	The error message returned because the specified DedicatedHostId parameter does not exist.
400	InvalidDedicatedHostStatus.NotSupport	Operation denied due to dedicated host status.	The error message returned because the operation is not supported while the dedicated host is in the current state.
400	IncorrectDedicatedHostStatus	The current status of the resource does not support this operation.	The error message returned because the operation is not supported while the resource is in the current state.
400	ChargeTypeViolation.PostPaidDedicatedHost	Prepaid instance onto postpaid dedicated host is not allowed	The error message returned because subscription instances cannot be deployed on pay-as-you-go dedicated hosts.
400	InvalidPeriod.ExceedEdDedicatedHost	Instance expired date can't exceed dedicated host expired date.	The error message returned because the expiration date of the instance is later than that of the dedicated host.
400	InvalidInstanceType.ValueUnauthorized	The specified InstanceType is not authorize.	The error message returned because you are not authorized to use the specified instance type.

HttpCode	Error code	Error message	Description
400	DedicatedHostType.Unmatched	The specified DedicatedHostType doesn? t match the instance type.	The error message returned because the specified dedicated host type does not correspond to the specified instance type.
400	MissingParameter	The input parameter ImageId that is mandatory for processing this request is not supplied.	The error message returned because the ImageId parameter is not specified.
400	MissingParameter	The input parameter InstanceType that is mandatory for processing this request is not supplied.	The error message returned because the InstanceType parameter is not specified.
400	ChargeTypeViolation.PostPaidDedicatedHost	Prepaid instance onto postpaid dedicated host is not allowed.	The error message returned because subscription instances cannot be deployed on pay-as-you-go dedicated hosts.
400	InvalidParam.NetworkInterface	%s	The error message returned because a specified parameter is invalid. Check whether the parameter corresponds to the interface.
403	OperationDenied.ImageNotValid	%s	The error message returned because the image does not support the operation.
403	QuotaExceed.PostPaidDisk	Living postPaid disks quota exceeded.	The error message returned because the maximum number of pay-as-you-go disks has been reached.
401	InvalidRamRole.NotEcsRole	The specified ram role is not authorized for ecs, please check your role policy.	The error message returned because the specified RAM role is not authorized to use ECS. Check your role policy.
403	InvalidParameter.NotMatch	%s	The error message returned because a specified parameter is invalid. Check whether parameter conflicts exist.
400	InvalidParameter.CreditSpecification	The specified CreditSpecification is not supported in this region.	The error message returned because the specified credit policy is not supported in the region.

HttpCode	Error code	Error message	Description
404	InvalidMarketImage.NotFound	The specified marketplace image does not exist, please change the imageId and try again.	The error message returned because the specified Alibaba Cloud Marketplace image does not exist. Modify the parameter and try again later.
400	IncorrectVpcStatus	Current VPC status does not support this operation.	The error message returned because the operation is not supported while the VPC is in the current state.
400	InvalidInstanceType.NotSupported	The specified instanceType is not supported by the deployment set.	The error message returned because the specified instance type is not supported by the current deployment set. Try another instance type.
400	InvalidVpcZone.NotSupported	The specified operation is not allowed in the zone to which your VPC belongs, please try in other zones.	The error message returned because the specified region does not support the specified operation. Try another region.
400	IncorrectDefaultVpcStatus	The status of the default VPC is invalid.	The error message returned because the status of the default VPC is invalid.
404	DeploymentSet.NotFound	The specified deployment set does not exist.	The error message returned because the specified DeploymentSetId parameter does not exist.
400	InvalidAutoRenewPeriod.ValueNotSupported	The specified autoRenewPeriod is invalid.	The error message returned because the specified auto-renewal duration is invalid.
403	OperationDenied.LocalDiskUnsupported	The configuration change is not allowed when the specified instance has local disks mounted.	The error message returned because the instance types of instances that have local disks attached cannot be changed.
403	OperationDenied.InconsistentNetwork	The specified security group and vswitch are not in the same vpc.	The error message returned because the specified security group and vSwitch do not belong to the same VPC.
403	OperationDenied	If the network segment of the vswitch is the same as that of its VPC. Therefore, the VPC cannot create other vswitchs across the region.	The error message returned because the VPC and vSwitch have the same CIDR block and no additional vSwitches can be created for other zones of the VPC.

HttpCode	Error code	Error message	Description
403	DefaultVswitch.Existed	The default vswitch for VPC already exists.	The error message returned because a default vSwitch already exists in the current VPC.
400	InvalidMarketImageChargeType.NotSupport	The specified chargeType of marketImage is unsupported.	The error message returned because the billing method of the Alibaba Cloud Marketplace image is not supported.
403	OperationDenied.NoStock	The requested resource is sold out in the specified zone; try other types of resources or other regions and zones.	The error message returned because resources are insufficient in the specified zone. Try other types of resources, or select other regions and zones.
403	IncorrectInstanceStatus	The current status of the resource does not support this operation.	The error message returned because the operation is not supported while the resource is in the current state.
403	CategoryViolation	The specified instance does not support this operation because of its disk category.	The error message returned because the configurations of instances that have local disks attached cannot be upgraded or downgraded.
400	InvalidPeriodType.ValueNotSupported	The specified parameter PeriodType is invalid.	The error message returned because the specified PeriodType parameter is invalid.
403	ResourcesNotInSameZone	The specified instance and dedicated host are not in the same zone.	The error message returned because the specified instance and the dedicated host are not in the same region.
403	InvalidDisk.SystemDiskSize	The specified SystemDiskSize beyond the permitted range.	The error message returned because the specified system disk size exceeds the upper limit.
400	InvalidClientToken.ValueNotSupported	The ClientToken provided is invalid.	The error message returned because the specified ClientToken parameter is invalid.
400	OperationDenied	The current user does not support this operation.	The error message returned because your account does not support the operation.
403	InsufficientBalance	Your account does not have enough balance.	The error message returned because you have insufficient balance in your account. Add funds to your account and try again.

HttpCode	Error code	Error message	Description
400	InvalidInstanceType.ValueNotSupported	The specified InstanceType does not exist or beyond the permitted range.	The error message returned because the specified InstanceType parameter does not exist or because you are not authorized to manage instances of the specified instance type.
400	InvalidParam.Tenancy	The specified Tenancy is invalid.	The error message returned because the specified Tenancy parameter is invalid.
403	MaxEniIpv6IpsCountExceeded	%s	The error message returned because the maximum number of IPv6 addresses that can be assigned to the ENI has been reached.
403	InvalidIp.IpRepeated	%s	The error message returned because the specified IP address already exists.
403	InvalidIp.IpAssigned	%s	The error message returned because the specified IP address is already assigned.
403	InvalidIp.Address	%s	The error message returned because the specified IPv6 address is invalid.
403	InvalidOperation.Ipv4CountExceeded	%s	The error message returned because the maximum number of IPv4 addresses has been reached.
403	InvalidOperation.Ipv6CountExceeded	%s	The error message returned because the maximum number of IPv6 addresses has been reached.
403	InvalidOperation.Ipv6NotSupport	%s	The error message returned because IPv6 does not support the operation.
403	InvalidVSwitch.Ipv6NotTurnOn	%s	The error message returned because IPv6 is not enabled on your current vSwitch. Enable the feature and try again.
403	InvalidParam.Amount	%s	The error message returned because the specified Amount parameter is invalid.

HttpCode	Error code	Error message	Description
403	InvalidVSwitchId.IpInvalid	%s	The error message returned because the specified private IP address is invalid.
403	Forbidden.RegionId	%s	The error message returned because the service is unavailable in the current region.
400	IncorrectVpcStatus	The current status of vpc does not support this operation.	The error message returned because the operation is not supported while the VPC is in the current state.
403	QuotaExceed.DeploymentSetInstanceQuotaFull	instance quota in one deployment set exceeded.	The error message returned because the maximum number of instances in the deployment set has been reached.
403	InvalidRegion.NotSupport	The specified region does not support byok.	The error message returned because the bring your own key (BYOK) feature is not supported in this region.
403	UserNotInTheWhiteList	The user is not in byok white list.	The error message returned because you are not in the BYOK whitelist. Try again when you are in the whitelist.
400	InvalidParameter.EncryptedIllegal	The specified parameter Encrypted must be true when kmsKeyId is not empty.	The error message returned because the encryption feature is not enabled after a KMS key ID is specified.
400	IoOptimized.NotSupported	The specified instance must be IoOptimized instance when kmsKeyId is not empty.	The error message returned because I/O optimized instances are not used after a KMS key ID is specified.
404	InvalidParameter.KMSKeyId.NotFound	The specified KMSKeyId does not exist.	The error message returned because the specified DataDisk.N.KMSKeyId parameter does not exist.
403	InvalidParameter.KMSKeyId.KMSUnauthorized	ECS service have no right to access your KMS.	The error message returned because ECS is not authorized to access your KMS resources.
403	SecurityRisk.3DVerification	We have detected a security risk with your default credit or debit card. Please proceed with verification via the link in your email.	The error message returned because risks are detected in your default credit card or debit card. Click the link in the email for verification.

HttpCode	Error code	Error message	Description
400	Duplicate.TagKey	The Tag.N.Key contain duplicate key.	The error message returned because the specified tag key already exists. Tag keys must be unique.
404	InvalidSecurityGroupId.NotFound	%s	The error message returned because the specified security group ID does not exist.
404	InvalidDiskIds.NotPortable	The specified DiskId is not portable.	The error message returned because the specified disk is not removable.
403	QuotaExceed.Tags	%s	The error message returned because the maximum number of tags has been reached.
400	InvalidHttpEndpoint.NotSupported	The specified HttpEndpoint not supported, you can use enabled(default) or disabled.	The error message returned because the specified HttpEndpoint parameter is invalid. Valid values of this parameter: enabled and disabled. Default value: enabled.
400	InvalidHttpTokens.NotSupported	The specified HttpTokens not supported, you can use optional(default) or required.	The error message returned because the specified HttpTokens parameter is invalid. Valid values of this parameter: optional or required. Default value: optional.
400	InvalidHttpPutResponseHopLimit.NotSupported	The specified HttpPutResponseHopLimit not supported, more than 1 and less than 64 is reasonable.	The error message returned because the specified HttpPutResponseHopLimit parameter is invalid. The value must be in the range of 1 to 64.

2.1.2.1.4.2. CreateInstance

You can call this operation to create an ECS instance.

Description

Note You can call the DescribeAvailableResource operation to query available resources in a specific region or zone. If you want to create multiple instances at a time that automatically enter the Running state, we recommend that you call the RunInstances operation.

When you create an ECS instance, take note of the following items:

- **Instance type**:

- You can use the `IoOptimized` parameter to specify whether to create an I/O optimized instance.
- Select an appropriate instance type. For the performance data about instance types, see Instance families in ECS Product Introduction or call the DescribeInstanceTypes operation.
- You can call the DescribeAvailableResource operation to query available resources in the specified region or zone.

- **Image**:
  - The image determines the system disk configurations of the new instance. The system disk of the new instance is a clone of the specified image.
  - If the instance memory size is 512 MiB, you cannot use Windows Server images except for Windows Server Semi-Annual Channel images.
  - If the instance memory size is 4 GiB or larger, you cannot use 32-bit OS images.
- **Network type**:
  - Each VPC-type instance must be connected to only one vSwitch.
  - If `VSwitchId` is specified, the security group specified by `SecurityGroupId` and the vSwitch specified by `VSwitchId` must belong to the same VPC.
  - The value of `PrivateIpAddress` depends on the value of `VSwitchId` and cannot be specified separately. If you specify both `VSwitchId` and `PrivateIpAddress`, the IP address specified by `PrivateIpAddress` must be available in the CIDR block of the specified vSwitch.
- **Security group**:
  - You must call the CreateSecurityGroup operation to create a security group before you can create an instance.
  - The maximum number of instances that a security group can contain depends on the security group type.
  - Instances in the same security group can communicate with each other over the internal network. By default, instances in different security groups cannot communicate with each other. However, you can allow communication between instances by authorizing mutual access between their security groups. For more information, see AuthorizeSecurityGroup and AuthorizeSecurityGroupEgress in ECS Developer Guide.
- **Storage**:
  - The instance is assigned a system disk whose capacity is based on the specified image. The capacity of the system disk must be at least `20 GiB and greater than or equal to the size of the image`. For more information about system disk categories, see the description of the `SystemDisk.Category` parameter.
  - When the system disk of an instance is a basic disk (`cloud`), an ultra disk (`cloud_efficiency`), or a standard SSD (`cloud_ssd`), the data disks of the instance cannot be local SSDs (`ephemeral_ssd`).
  - The system disks of I/O optimized instances can only be ultra disks (`cloud_efficiency`) or standard SSDs (`cloud_ssd`).
  - The maximum capacity of data disks varies based on their categories. For more information, see the description of the `DataDisk.N.Size` parameter.
  - A maximum of 16 data disks can be attached to each instance. The mount points of data disks are allocated by the system in alphabetical order from /dev/xvdb to /dev/xvdz.

- **User data**: If the instance type supports user data, you can use the UserData parameter to pass in user data. User data must be encoded in Base64. We recommend that you do not pass in confidential information such as passwords and private keys in the plaintext format. This is because the system does not encrypt the user data specified in the `UserData` value when API requests are transmitted. If you must pass in confidential information, we recommend that you encrypt and Base64-encode the information before you pass it in. Then you can decode and decrypt the information in the same way within the instance.
- **Others**: When you call API operations by using Apsara Stack Command Line Interface (CLI) and SDKs, you must delete the periods (.) from input parameters before you use them. For example, use `SystemDiskCategory` instead of `SystemDisk.Category` as a request parameter.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateInstance	The operation that you want to perform. Set the value to CreateInstance.
InstanceType	String	Yes	ecs.g6.large	The instance type. • Select an appropriate instance type. For the performance data about instance types, see Instance families in ECS Product Introduction or call the DescribeInstanceTypes operation. • You can call the DescribeAvailableResource operation to query available resources in the specified region or zone.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region in which to create the instance. You can call the DescribeRegions operation to query the most recent region list.
ImageId	String	No	ubuntu_18_04_64_20G_alibase_20190624.vhd	The ID of the image used to create the instance.
SecurityGroupId	String	No	sg-bp15ed6xe1yxeycg****	The ID of the security group to which to assign the instance. Instances in the same security group can communicate with each other.

Parameter	Type	Required	Example	Description
InstanceName	String	No	2018-12-06T103200Z	The name of the instance. The name must be 2 to 128 characters in length. It must start with a letter and cannot start with http:// or https://. The name can contain letters, digits, colons (:), underscores (_), and hyphens (-). If you do not specify this parameter, the instance ID is used as the instance name.
InternetMaxBandwidthIn	Integer	No	50	The maximum inbound bandwidth. Unit: Mbit/s. Valid values: • When the maximum outbound bandwidth is less than or equal to 10 Mbit/s, the valid values of InternetMaxBandwidthIn are 1 to 10 and the default value is 10. • When the maximum outbound bandwidth is greater than 10 Mbit/s, the valid values of InternetMaxBandwidthIn are 1 to the value of `InternetMaxBandwidthOut`, and the default value of InternetMaxBandwidthIn is the value of `InternetMaxBandwidthOut`.
InternetMaxBandwidthOut	Integer	No	5	The maximum outbound bandwidth. Unit: Mbit/s. Valid values: 0 to 100. Default value: 0.

Parameter	Type	Required	Example	Description
HostName	String	No	LocalHostName	The hostname of the instance. • The hostname cannot start or end with a period (,) or a hyphen (-). It cannot contain consecutive periods (.) or hyphens (-). • For a Windows instance, the hostname must be 2 to 15 characters in length and can contain letters, digits, and hyphens (-). The hostname cannot contain periods (.) or contain only digits. • For instances that run other operating systems such as Linux, the hostname must be 2 to 64 characters in length. You can use periods (.) to separate the hostname into multiple segments. Each segment can contain letters, digits, and hyphens (-).
Password	String	No	TestEcs123!	The password of the instance. The password must be 8 to 30 characters in length and include at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. Special characters include: `( ) ` ~ ! @ # $ % ^ & * - _ + = | { } [ ] : ; ' < > , . ? /` For a Windows instance, the password cannot start with a forward slash (/). **Note** For security reasons, we recommend that you use HTTPS to send requests if the `Password` parameter is specified.

Parameter	Type	Required	Example	Description
PasswordInherit	Boolean	No	false	Specifies whether to use the password predefined in the image. When you use PasswordInherit, leave Password empty and make sure that the selected image has a password preset.
DeploymentSetId	String	No	ds-bp1brhwhoqinyjd6****	The ID of the deployment set to which to deploy the instance.
ZoneId	String	No	cn-qingdao-env17-amtest11001-a	The ID of the zone in which to create the instance. You can call the DescribeZones operation to query the most recent zone list. This parameter is empty by default. If you do not specify a zone, the system randomly selects one.
ClusterId	String	No	c-bp67acfmxazb4p****	The ID of the cluster in which to create the instance. **Note** This parameter will be removed in the future. We recommend that you use other parameters to ensure future compatibility.
ClientToken	String	No	123e4567-e89b-12d3-a456-426655440000	The client token that is used to ensure the idempotence of the request You can use the client to generate the value, but you must make sure that it is unique among different requests. The **ClientToken** value can only contain ASCII characters and cannot exceed 64 characters in length. For more information, see How to ensure idempotence in ECS Developer Guide.
VlanId	String	No	10	The ID of the virtual local area network (VLAN).
InnerIpAddress	String	No	192.168.*. *	The internal IP address to be assigned to the instance.

Parameter	Type	Required	Example	Description
SystemDisk.Size	Integer	No	40	The size of the system disk. Unit: GiB. Valid values: 20 to 500. The value of this parameter must be at least 20 and greater than or equal to the size of the image. Default value: 40 or the size of the image, whichever is greater.
SystemDisk.Category	String	No	cloud_ssd	The category of the system disk. Valid values: • cloud_efficiency: ultra disk • cloud_ssd: standard SSD • cloud: basic disk For non-I/O optimized instances of retired instance types, the default value is cloud. For other instances, the default value is cloud_efficiency.
SystemDisk.DiskName	String	No	SystemDiskName	The name of the system disk. The name must be 2 to 128 characters in length. It must start with a letter and cannot start with http:// or https://. The name can contain letters, digits, colons (:), underscores (_), and hyphens (-). This parameter is empty by default.
SystemDisk.Description	String	No	TestDescription	The description of the system disk. The description must be 2 to 256 characters in length and cannot start with http:// or https://. This parameter is empty by default.

Parameter	Type	Required	Example	Description
DataDisk.N.Size	Integer	No	2000	The size of data disk N. Valid values of N: 1 to 16. Unit: GiB. Valid values: • Valid values when DataDisk.N.Category is set to cloud_efficiency: 20 to 32768 • Valid values when DataDisk.N.Category is set to cloud_ssd: 20 to 32768 • Valid values when DataDisk.N.Category is set to cloud: 5 to 2000 The value of this parameter must be greater than or equal to the size of the snapshot specified by the `SnapshotId` parameter.
DataDisk.N.SnapshotId	String	No	s-bp17441ohwka0yuh****	The ID of the snapshot used to create data disk N. Valid values of N: 1 to 16. • When the `DataDisk.N.SnapshotId` parameter is specified, the `DataDisk.N.Size` parameter is ignored. The data disk is created based on the size of the specified snapshot. • Use snapshots created after July 15, 2013. Otherwise, an error is returned and your request is rejected.
DataDisk.N.Category	String	No	cloud_ssd	The category of data disk N. Valid values: • cloud_efficiency: ultra disk • cloud_ssd: standard SSD • cloud: basic disk For I/O optimized instances, the default value is cloud_efficiency. For non-I/O optimized instances, the default value is cloud.

Parameter	Type	Required	Example	Description
DataDisk.N.DiskName	String	No	DataDiskName	The name of data disk N. The name must be 2 to 128 characters in length. It must start with a letter and cannot start with http:// or https://. The name can contain letters, digits, colons (:), underscores (_), and hyphens (-). This parameter is empty by default.
DataDisk.N.Description	String	No	TestDescription	The description of data disk N. The description must be 2 to 256 characters in length and cannot start with http:// or https://. This parameter is empty by default.
DataDisk.N.Device	String	No	null	The mount point of data disk N. **Note** This parameter will be removed in the future. We recommend that you use other parameters to ensure future compatibility.
DataDisk.N.DeleteWithInstance	Boolean	No	true	Specifies whether to release data disk N when the instance is released. Default value: true.
DataDisk.N.Encrypted	Boolean	No	false	Specifies whether to encrypt data disk N. Default value: false.
DataDisk.N.KMSKeyId	String	No	0e478b7a-4262-4802-b8cb-00d****	The ID of the KMS key to be used by data disk N.
NodeControllerId	String	No	null	The ID of the node controller.
Description	String	No	InstanceTest	The description of the instance. The description must be 2 to 256 characters in length and cannot start with http:// or https://. This parameter is empty by default.

Parameter	Type	Required	Example	Description
VSwitchId	String	No	vsw-bp1s5fnvk4gn2tws0****	The ID of the vSwitch to which to connect the instance. This parameter is required when you create a VPC-type instance.
PrivateIpAddress	String	No	172.16.236.**	The private IP address to be assigned to the instance. The private IP address must be an available IP address in the CIDR block of the vSwitch.
IoOptimized	String	No	optimized	Specifies whether the instance is I/O optimized. Valid values: • none: The instance is not I/O optimized. • optimized: The instance is I/O optimized.
UseAdditionalService	Boolean	No	true	Specifies whether to use the virtual machine system configuration provided by Apsara Stack (Windows: NTP and KMS. Linux: NTP and YUM).
Tag.N.value	String	No	null	The value of tag N. **Note** This parameter will be removed in the future. We recommend that you use the Tag.N.Value parameter to ensure future compatibility.
Tag.N.key	String	No	null	The key of tag N. **Note** This parameter will be removed in the future. We recommend that you use the Tag.N.Key parameter to ensure future compatibility.

Parameter	Type	Required	Example	Description
Tag.N.Key	String	No	TestKey	The key of tag N to be bound to the instance, disks, and primary ENI. Valid values of N: 1 to 20. The tag key cannot be an empty string. It can be up to 128 characters in length and cannot start with acs: or aliyun. It cannot contain http:// or https://.
Tag.N.Value	String	No	TestValue	The value of tag N to be bound to the instance, disks, and primary ENI. Valid values of N: 1 to 20. The tag value can be an empty string. It can be up to 128 characters in length. It cannot start with acs: or contain http:// or https://.
UserData	String	No	ZWNobyBoZWxsbyBlY3Mh	The user data of the instance. User data must be encoded in Base64. The maximum size of raw data is 16 KB.
KeyPairName	String	No	KeyPairTestName	The name of the key pair to be bound to the instance. • For Windows instances, this parameter is ignored and is empty by default. The `Password` parameter takes effect even if the KeyPairName parameter is specified. • For Linux instances, the username and password authentication method is disabled by default. To make the instances more secure, we recommend that you use key pairs for logons.
RamRoleName	String	No	RAMTestName	The name of the instance RAM role to be attached to the instance. You can call the ListRoles operation provided by RAM to query the instance RAM roles that you created.

Parameter	Type	Required	Example	Description
SecurityEnhancementStrategy	String	No	Active	Specifies whether to enable security hardening. Valid values: • Active: enables security hardening. This value is applicable only to public images. • Deactive: disables security hardening. This value is applicable to all images.
ResourceGroupId	String	No	rg-bp67acfmxazb4p****	The ID of the resource group to which to assign the instance.
HpcClusterId	String	No	hpc-bp67acfmxazb4p****	The ID of the HPC cluster to which to assign the instance.
DryRun	Boolean	No	false	Specifies whether to check the validity of the request without actually making the request. Default value: false. Valid values: • true: The validity of the request is checked but the request is not made. Check items include whether required parameters are specified, the request format, service limits, and available ECS resources. If the check fails, the corresponding error is returned. If the check succeeds, the `DryRunOperation` error code is returned. • false: The request is checked, and the instance is created if the check succeeds.
DedicatedHostId	String	No	dh-bp67acfmxazb4p****	The ID of the dedicated host on which to create the instance. You can call the DescribeDedicatedHosts operation to query the list of dedicated host IDs.
CreditSpecification	String	No	Standard	The performance mode of the burstable instance. Valid values: • Standard: standard mode • Unlimited: unlimited mode This parameter is empty by default.

Parameter	Type	Required	Example	Description
DeletionProtection	Boolean	No	false	The release protection attribute of the instance. This parameter specifies whether you can use the ECS console or call the DeleteInstance operation to release the instance. Default value: false. Valid values: • true: enables release protection. • false: disables release protection. **Note** This attribute can protect instances only against manual releases, not against automatic releases.
Affinity	String	No	default	Specifies whether to associate the instance on a dedicated host with the dedicated host. Valid values: • default: does not associate the instance with the dedicated host. When you restart an instance in the No Fees for Stopped Instances (VPC-Connected) state, the instance is automatically deployed to another dedicated host in the automatic deployment resource pool if the available resources of the original dedicated host are insufficient. • host: associates the instance with the dedicated host. When you restart an instance in the No Fees for Stopped Instances (VPC-Connected) state, the instance still resides on the original dedicated host. if the available resources of the original dedicated host are insufficient, the instance fails to be restarted. Default value: default.

Parameter	Type	Required	Example	Description
Tenancy	String	No	default	Specifies whether to create the instance on a dedicated host. Valid values: • default: creates the instance on a non-dedicated host. • host: creates the instance on a dedicated host. If you do not specify `DedicatedHostId`, Apsara Stack automatically selects a dedicated host to deploy the instance. Default value: default.
StorageSetId	String	No	ss-bp1j4i2jdf3owlhe****	The ID of the storage set.
StorageSetPartitionNumber	Integer	No	2	The maximum number of partitions in the storage set. Valid values: greater than or equal to 2.

Response parameters

Parameter	Type	Example	Description
InstanceId	String	i-bp67acfmxazb4p****	The ID of the instance.
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.
TradePrice	Float	0.165	**Note** This parameter is not supported.

Examples

Sample requests

```
https://ecs.example.com/?Action=CreateInstance
&RegionId=cn-qingdao-env17-d01
&ImageId=ubuntu_18_04_64_20G_alibase_20190624.vhd
&SecurityGroupId=sg-bp15ed6xe1yxeycg****
&HostName=LocalHostName
&InstanceType=ecs.g6.large
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreateInstanceResponse>
      <RequestId>04F0F334-1335-436C-A1D7-6C044FE73368</RequestId>
      <InstanceId>i-bp67acfmxazb4p****</InstanceId>
</CreateInstanceResponse>
```

`JSON` format

```
{
    "RequestId": "04F0F334-1335-436C-A1D7-6C044FE73368",
    "InstanceId": "i-bp67acfmxazb4p****"
}
```

Error codes

HTTP status code	Error code	Error message	Description
400	InvalidInstanceType.ValueUnauthorized	The specified InstanceType is not authorized.	The error message returned because you are not authorized to use the specified instance type.
400	InvalidInternetChargeType.ValueNotSupported	The specified InternetChargeType is not valid.	The error message returned because the specified billing method for network usage is invalid.
400	InvalidParameter	The specified parameter "InternetMaxBandwidthOut" is not valid.	The error message returned because the specified InternetMaxBandwidthOut parameter is invalid.
400	InvalidSystemDiskCategory.ValueNotSupported	The specified parameter " SystemDisk.Category " is not valid.	The error message returned because the specified SystemDisk.Category parameter is invalid.
404	IoOptimized.NotSupported	The specified instancetype is not support IoOptimized instance	The error message returned because the specified instance type is not I/O optimized.
400	InvalidDataDiskSize.ValueNotSupported	The specified DataDisk.n.Size beyond the permitted range, or the capacity of snapshot exceeds the size limit of the specified disk category.	The error message returned because the specified DataDisk.N.Size parameter is invalid or the snapshot size exceeds the maximum capacity allowed for of the specified category.

HTTP status code	Error code	Error message	Description
403	InvalidDiskCategory.NotSupported	The specified disk category is not support the specified instance type.	The error message returned because the specified disk category does not support the instance type.
400	InvalidInstanceType.ValueNotSupported	The specified InstanceType does not exist or beyond the permitted range.	The error message returned because the specified InstanceType parameter does not exist or you are not authorized to manage instances of the specified instance type.
404	InvalidSecurityGroupId.NotFound	The specified SecurityGroupId does not exist.	The error message returned because the specified security group does not exist in this account. Check whether the security group ID is correct.
400	InvalidDescription.Malformed	The specified parameter "Description" is not valid.	The error message returned because the specified Description parameter is invalid. The description must be 2 to 256 characters in length and cannot start with http:// or https://.
400	InvalidHostName.Malformed	The specified parameter "HostName" is not valid.	The error message returned because the specified HostName parameter is invalid.
400	InvalidPassword.Malformed	The specified parameter "Password" is not valid.	The error message returned because the specified Password parameter is invalid.
400	InvalidPasswordParam.Mismatch	The input password should be null when passwdInherit is true.	The error message returned because the Password parameter is specified when PasswdInherit is set to true.
400	InvalidSystemDiskCategory.ValueNotSupported	The specified parameter "SystemDisk.Category" is not valid.	The error message returned because the specified SystemDisk.Category parameter is invalid.
400	InvalidDiskName.Malformed	The specified parameter "SystemDisk.DiskName or DataDisk.n.DiskName" is not valid.	The error message returned because the specified SystemDisk.DiskName or DataDisk.N.DiskName parameter is invalid.

HTTP status code	Error code	Error message	Description
400	InvalidDiskDescription.Malformed	The specified parameter "SystemDisk.DiskDescription" or "DataDisk.n.Description" is not valid.	The error message returned because the specified SystemDisk.Description or DataDisk.N.Description parameter is invalid.
400	InvalidDataDiskCategory.ValueNotSupported	The specified parameter "DataDisk.n.Category" is not valid.	The error message returned because the specified DataDisk.N.Category parameter is invalid.
404	InvalidDataDiskSnapshotId.NotFound	The specified parameter "DataDisk.n.SnapshotId" is not valid.	The error message returned because the specified DataDisk.N.SnapshotId parameter is invalid.
400	InvalidDataDevice.Malformed	The specified parameter "DataDisk.n.Device" is not valid.	The error message returned because the specified DataDisk.N.Device parameter is invalid.
400	InvalidNodeControllerId.Malformed	The specified parameter "NodeControllerId" is not valid.	The error message returned because the specified NodeControllerId parameter is invalid.
400	InvalidInnerIpAddress.Malformed	The specified parameter "InnerIpAddress" is not valid.	The error message returned because the specified InnerIpAddress parameter is invalid.
400	InvalidInnerIpAddress.Unusable	The specified InnerIpAddress is already used or not found in usable ip range.	The error message returned because the specified internal IP address is unavailable.
400	OperationDenied	The specified parameter "VlanId" is not valid or vlan has not enough IP address.	The error message returned because the specified VlanId parameter is invalid or available IP addresses in the specified VLAN are insufficient.
400	InvalidParameter.Conflict	The specified image does not support the specified instance type.	The error message returned because the specified image does not support the specified instance type.
400	ImageNotSupportCloudInit	The specified image does not support cloud-init.	The error message returned because the specified image does not support cloud-init.

HTTP status code	Error code	Error message	Description
400	InvalidSnapshotId.BasedSnapshotTooOld	The specified snapshot is created before 2013-07-15.	The error message returned because the specified snapshot was created before July 15, 2013.
400	QuotaExceed.AfterpayInstance	The maximum number of Pay-As-You-Go instances is exceeded: %s	The error message returned because the pay-as-you-go resources of the specified instance type are insufficient. Reduce the number of instances to be created.
403	ImageNotSubscribed	The specified image has not be subscribed.	The error message returned because you have not subscribed to the specified Alibaba Cloud Marketplace image.
400	InvalidMarketImageChargeType.NotSupport	The specified chargeType of marketImage is unsupported.	The error message returned because the billing method of the Alibaba Cloud Marketplace image is not supported.
403	OperationDenied	The specified Image is disabled or is deleted.	The error message returned because the specified image has been disabled or deleted.
403	InvalidSystemDiskCategory.ValueUnauthorized	The disk category is not authorized.	The error message returned because you are not authorized to use the specified disk category.
403	InvalidSnapshotId.NotReady	The specified snapshot has not completed yet.	The error message returned because the specified snapshot is being created.
403	OperationDenied	The specified snapshot is not allowed to create disk.	The error message returned because the specified snapshot cannot be used to create disks.
403	InstanceDiskCategoryLimitExceed	The total size of specified disk category in an instance exceeds.	The error message returned because the total capacity of disks of the specified category exceeds the maximum capacity allowed for an instance.
403	InvalidDevice.InUse	The specified device has been occupied.	The error message returned because the specified device already has a disk attached.

HTTP status code	Error code	Error message	Description
403	ImageRemovedInMarket	The specified market image is not available, Or the specified user defined image includes product code because it is based on an image subscribed from marketplace, and that image in marketplace includeing exact the same product code has been removed.	The error message returned because the specified Alibaba Cloud Marketplace image is unavailable, or because the specified custom image contains the product code of the Alibaba Cloud Marketplace image from which the custom image is derived and the Alibaba Cloud Marketplace image has been removed from Alibaba Cloud Marketplace.
404	InvalidClusterId.NotFound	The ClusterId provided does not exist in our records.	The error message returned because the specified ClusterId parameter does not exist.
403	OperationDenied	The creation of Instance to the specified Zone is not allowed.	The error message returned because instances cannot be created in the specified zone.
403	CategoryNotSupported	The specified zone does not offer the specified disk category.	The error message returned because the specified disk category is unavailable in the specified zone.
403	OperationDenied	The specified Zone or cluster does not offer the specified disk category or the speicified zone and cluster do not match.	The error message returned because the specified disk category is unavailable in the specified zone or cluster, or because the specified zone and cluster do not correspond to each other.
403	OperationDenied.NoStock	The requested resource is sold out in the specified zone; try other types of resources or other regions and zones.	The error message returned because the requested resources are insufficient in the specified zone.
400	InvalidInstanceName.Malformed	The specified parameter "InstanceName" is not valid.	The error message returned because the specified InstanceName parameter is invalid. The name must be 2 to 128 characters in length and can contain letters, digits, periods (.), underscores (_), and hyphens (-). It must start with a letter and cannot start with http:// or https://.

HTTP status code	Error code	Error message	Description
400	InvalidDiskDescription.Malformed	The specified parameter "SystemDisk.DiskDescription or DataDisk.n.Description" is not valid.	The error message returned because the specified SystemDisk.Description or DataDisk.N.Description parameter is invalid.
403	QuotaExceed.PortableCloudDisk	The quota of portable cloud disk exceeds.	The error message returned because the maximum number of removable disks has been reached.
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.
403	OperationDenied	Sales of this resource are temporarily suspended in the specified region; please try again later.	The error message returned because the requested resource is unavailable in the specified region. Try again later.
400	InvalidParameter.Conflict	The specified region and cluster do not match.	The error message returned because the specified region and cluster do not correspond to each other.
403	SecurityGroupInstanceLimitExceed	The maximum number of instances in a security group is exceeded.	The error message returned because the maximum number of instances in the specified security group has been reached.
403	NodeControllerUnavailable	The Node Controller is temporarily unavailable.	The error message returned because the node controller is unavailable.
403	RegionUnauthorized	There is no authority to create instance in the specified region.	The error message returned because you are not authorized to create instances in the specified region.
403	CategoryNotSupported	The specified Zone or cluster does not offer the specified disk category.	The error message returned because the specified disk category is unavailable in the specified zone or cluster.
403	InvalidSnapshotId.NotDataDiskSnapshot	The specified snapshot is system disk snapshot.	The error message returned because the specified snapshot is a system disk snapshot.

HTTP status code	Error code	Error message	Description
403	CategoryNotSupported	The specified cluster does not offer the specified disk category.	The error message returned because the specified disk category is unavailable in the specified cluster.
404	InvalidVSwitchId.NotFound	Specified virtual switch does not exist.	The error message returned because the specified VSwitchId parameter does not exist.
400	InvalidParameter.Mismatch	Specified security group and virtual switch are not in the same VPC.	The error message returned because the specified security group and vSwitch do not belong to the same VPC.
400	InvalidNetworkType.Mismatch	Specified parameter "InternetChargeType" conflict with instance network type.	The error message returned because the network type of the instance does not support the specified billing method for network usage.
400	InvalidPrivateIpAddress	Specified private IP address is not in the CIDR block of virtual switch.	The error message returned because the specified private IP address is not within the CIDR block of the vSwitch.
400	InvalidPrivateIpAddress.Duplicated	Specified private IP address is duplicated.	The error message returned because the specified private IP address is already in use. Try another IP address.
400	QuotaExceeded.PrivateIpAddress	Don't have enough private IPs in this switch	The error message returned because all the private IP addresses on the vSwitch are already in use. Try another vSwitch.
400	QuotaExceeded	Living instances quota exceeded in this VPC.	The error message returned because the maximum number of active instances has been reached.
400	IncorrectVSwitchStatus	The current status of virtual switch does not support this operation.	The error message returned because the specified vSwitch is in the Pending state and cannot be deleted.
400	InvalidParameter.Mismatch	Specified virtual switch is not in the specified zone.	The error message returned because the specified vSwitch does not exist in the specified zone.

HTTP status code	Error code	Error message	Description
400	ResourceNotAvailable	Resource you requested is not available in this region or zone.	The error message returned because VPC is not supported by the specified region or zone.
400	MissingParameter	The input parameter "VSwitchId" that is mandatory for processing this request is not supplied.	The error message returned because the VSwitchId parameter is not specified.
400	InvalidDiskCategory.Mismatch	The specified disk categories' combination is not supported.	The error message returned because the combination of the specified disk categories is not supported.
403	DeleteWithInstance.Conflict	The specified disk is not a portable disk and cannot be set to DeleteWithInstance attribute.	The error message returned because the specified disk is not removable and cannot be released along with the instance.
404	InvalidImageId.NotFound	The specified ImageId does not exist.	The error message returned because the specified image does not exist in this account. Check whether the image ID is correct.
403	InstanceDiskNumLimitExceed	The number of specified disk in an instance exceeds.	The error message returned because the number of specified disks exceeds the upper limit.
403	IoOptimized.NotSupported	The specified image is not support IoOptimized Instance.	The error message returned because the specified image does not support I/O optimized instances.
403	ImageNotSupportInstanceType	The specified image don't support the InstanceType instance.	The error message returned because the specified image does not support this instance type.
400	InvalidIoOptimizedValue.ValueNotSupported	IoOptimized value not supported.	The error message returned because the specified IoOptimized parameter is invalid.
404	OperationDenied	Another Instance has been creating	The error message returned because no other instances can be created while an instance is being created.
403	InvalidDiskSize.TooSmall	Specified disk size is less than the size of snapshot	The error message returned because the specified disk size is smaller than the snapshot size.

HTTP status code	Error code	Error message	Description
403	OperationDenied	The type of the disk does not support the operation	The error message returned because the operation is not supported by the specified disk category.
404	InvalidInstanceChargeType.NotFound	The InstanceChargeType does not exist in our records	The error message returned because the specified InstanceChargeType parameter does not exist.
400	MissingParamter	The specified parameter "Period" is not null.	The error message returned because the Period parameter is not specified.
400	InvalidPeriod	The specified period is not valid.	The error message returned because the specified Period parameter is invalid.
403	InvalidDiskCategory.Mismatch	The specified disk categories combination is not supported.	The error message returned because the combination of the specified disk categories is not supported.
403	IoOptimized.NotSupported	Vpc is not support IoOptimized instance.	The error message returned because I/O optimized instances are not supported in the VPC.
400	InvalidDataDiskCategory.ValueNotSupported	The specified parameter " DataDisk.n.Category " is not valid.	The error message returned because the specified DataDisk.N.Category parameter is invalid.
400	InstanceDiskCategoryLimitExceed	The specified DataDisk.n.Size beyond the permitted range, or the capacity of snapshot exceeds the size limit of the specified disk category.	The error message returned because the specified DataDisk.N.Size parameter is invalid or the snapshot size exceeds the maximum capacity allowed for the specified disk category.
403	OperationDenied	The resource is out of usage.	The error message returned because the instance is not in the Running state. Start the instance or check whether the operation is valid.
403	QuotaExceed.BuyImage	The specified image is from the image market, You have not bought it or your quota has been exceeded.	The error message returned because you have not purchased the specified Alibaba Cloud Marketplace image or your image quota has been used up.

HTTP status code	Error code	Error message	Description
404	DependencyViolation.IoOptimized	The specified instancetype must be IoOptimized instance.	The error message returned because the specified instance type is not I/O optimized.
404	PaymentMethodNotFound	No payment method has been registered on the account.	The error message returned because you have not configured the payment method for your account.
404	HOSTNAME_ILLEGAL	hostname is not valid.	The error message returned because the specified HostName parameter is invalid.
404	InvalidSystemDiskSize.LessThanImageSize	The specified parameter SystemDisk.Size is less than the image size.	The error message returned because the specified system disk size is smaller than the size of the image.
404	InvalidSystemDiskSize.LessThanMinSize	The specified parameter SystemDisk.Size is less than the min size.	The error message returned because the specified system disk size is smaller than the minimum size.
404	InvalidSystemDiskSize.MoreThanMaxSize	The specified SystemDisk.Size parameter exceeds the maximum size.	The error message returned because the specified system disk size exceeds the maximum size.
404	InvalidDataDiskSnapshotId.NotFound	The specified parameter DataDisk.n.SnapshotId is not valid.	The error message returned because the specified DataDisk.N.SnapshotId parameter is invalid.
403	InvalidVSwitchId.NotFound	The VSwitchId provided does not exist in our records.	The error message returned because the specified VSwitchId parameter does not exist.
400	InvalidParameter	The specified vm bandwidth is not valid.	The error message returned because the specified virtual machine bandwidth is invalid.
400	InvalidSystemDiskCategory.ValueNotSupported	The specified parameter SystemDisk.Category is not valid.	The error message returned because the specified SystemDisk.Category parameter is invalid.
403	InvalidParameter.ResourceOwnerAccount	ResourceOwnerAccount is Invalid.	The error message returned because the specified ResourceOwnerAccount parameter is invalid.

HTTP status code	Error code	Error message	Description
404	InvalidSystemDiskSize	The specified parameter SystemDisk.Size is invalid.	The error message returned because the specified SystemDisk.Size parameter is invalid.
400	InvalidParameter.Bandwidth	The specified parameter Bandwidth is not valid.	The error message returned because the specified bandwidth is invalid.
400	InvalidIPAddress.AlreadyUsed	The specified IPAddress is already used by other resource.	The error message returned because the specified IP address is already in use. Try another one.
403	InvalidUserData.Forbidden	User not authorized to input the parameter "UserData", please apply for permission "UserData"	The error message returned because you are not authorized to manage user data. Apply for the permission first.
400	InvalidUserData.SizeExceeded	The specified parameter "UserData" exceeds the size.	The error message returned because the size of user data specified in the UserData value exceeds the upper limit.
400	InvalidUserData.NotSupported	The specified parameter "UserData" only support the vpc and IoOptimized Instance.	The error message returned because the specified UserData parameter is not supported. UserData is supported only on VPC-type instances and I/O optimized instances.
403	Zone.NotOpen	The specified zone is not granted to you to buy resources yet.	The error message returned because you are not authorized to purchase resources in the specified zone.
403	Zone.NotOnSale	The specified zone is not available for purchase.	The error message returned because the requested resources are unavailable in the specified zone. Change the resource type or select a different zone.
403	InvalidClusterId.NotFound	The specified clusterId does not exist.	The error message returned because the specified ClusterId parameter does not exist.
403	InvalidInstanceType.ZoneNotSupported	The specified zone does not support this instancetype.	The error message returned because the specified instance type is not supported in the specified zone.

HTTP status code	Error code	Error message	Description
400	InstanceDiskNumber.LimitExceed	The total number of specified disk in an instance exceeds.	The error message returned because the number of specified disks exceeds the upper limit.
400	Account.Arrearage	Your account has an outstanding payment.	The error message returned because you have overdue payments in your account.
400	InvalidDiskCategory.ValueNotSupported	The specified parameter "DiskCategory" is not valid.	The error message returned because the specified SystemDisk.Category parameter is invalid.
400	InvalidAutoRenewPeriod.ValueNotSupported	The specified autoRenewPeriod is not valid.	The error message returned because the specified AutoRenewPeriod parameter is invalid.
400	QuotaExceed.AfterpayInstance	The maximum number of Pay-As-You-Go instances is exceeded.	The error message returned because the pay-as-you-go resources of the specified instance type are insufficient. Reduce the number of instances to be created.
400	InvalidSpotStrategy	The specified SpotStrategy is not valid.	The error message returned because the specified SpotStrategy parameter is invalid.
400	InvalidSpotParam.EmptyZoneID	The specified ZoneId is empty when SpotStrategy is set.	The error message returned because the ZoneId parameter is not specified while the SpotStrategy parameter is specified.
400	InvalidSpotPriceLimit	The specified SpotPriceLimitis not valid.	The error message returned because the specified SpotPriceLimit parameter is invalid.
400	InvalidSpotDuration	The specified SpotDuration is not valid.	The error message returned because the specified SpotDuration parameter is invalid.
400	InvalidSpotAuthorized	The specified Spot param is unauthorized.	The error message returned because you are not authorized to set the SpotDuration parameter.

HTTP status code	Error code	Error message	Description
400	InvalidSpotPrepaid	The specified Spot type is not support PrePay Instance.	The error message returned because preemptible instances do not support the subscription billing method.
400	InvalidSpotAliUid	The specified UID is not authorized to use SPOT instance.	The error message returned because you are not authorized to create preemptible instances.
403	InvalidPayMethod	The specified pay method is not valid.	The error message returned because the specified payment method is invalid.
403	OperationDenied.ImageNotValid	The specified Image is disabled or is deleted.	The error message returned because the specified image does not exist.
400	InvalidTagKey.Malformed	The specified Tag.n.Key is not valid.	The error message returned because the specified Tag.N.Key parameter is invalid.
400	InvalidParameter.Bandwidth	%s	The error message returned because the specified bandwidth is invalid.
400	InvalidDataDiskCategory.ValueNotSupported	%s	The error message returned because the specified DataDisk.N.Category parameter is invalid.
400	InvalidSystemDiskCategory.ValueNotSupported	%s	The error message returned because the operation is not supported by the specified system disk category.
400	InvalidParameter.Conflict	%s	The error message returned because a specified parameter is invalid. Check whether parameter conflicts exist.
400	InvalidInternetChargeType.ValueNotSupported	%s	The error message returned because the specified billing method for network usage is not supported. Check whether the parameter is correct.
400	InvalidInstanceType.ValueNotSupported	%s	The error message returned because the operation is not supported by the specified instance type.

HTTP status code	Error code	Error message	Description
403	InstanceType.Offline	%s	The error message returned because the operation is not supported when the instance type is retired or resources of the instance type are insufficient.
400	RegionUnauthorized	%s	The error message returned because you are not authorized to perform the operation in the specified region.
500	InternalError	%s	The error message returned because an internal error has occurred.
400	Zone.NotOnSale	%s	The error message returned because the requested resources are unavailable in the specified zone.
400	InvalidSystemDiskSize.ValueNotSupported	%s	The error message returned because the specified system disk size is invalid.
400	InvalidDataDiskSize.ValueNotSupported	%s	The error message returned because the specified data disk size is invalid.
403	DependencyViolation.WindowsInstance	The instance creating is window, cannot use ssh key pair to login.	The error message returned because the specified instance is a Windows instance and does not support logons based on SSH key pairs.
400	InvalidInstanceType.ValueNotSupported	The specified parameter "KeyPairName" only support IoOptimized Instance.	The error message returned because non-I/O optimized instances do not support SSH key pairs.
403	RealNameAuthenticationError	Your account has not passed the real-name authentication yet.	The error message returned because you have not completed real-name verification. Complete real-name verification and try again.
403	InvalidNetworkType.MismatchRamRole	Ram role cannot be applied to instances of Classic network type.	The error message returned because an instance RAM role can be used only for instances in VPCs, not for instances in the classic network.

HTTP status code	Error code	Error message	Description
403	InvalidUser.PassRoleForbidden	The RAM user does not have the privilege to pass a RAM role.	The error message returned because the RAM user is not authorized to pass the RAM role.
404	InvalidRamRole.NotFound	The specified RAMRoleName does not exist.	The error message returned because the specified RamRoleName parameter does not exist.
400	OperationDenied	The specified InstanceType or Zone is not available or not authorized.	The error message returned because the specified instance type or zone is unavailable or unauthorized.
403	InvalidAccountStatus.NotEnoughBalance	Your account does not have enough balance.	The error message returned because you have insufficient balance in your account. Add funds to your account and try again.
500	InternalError	The request processing has failed due to some unknown error, exception or failure.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.
404	InvalidResourceGroup.NotFound	The ResourceGroup provided does not exist in our records.	The error message returned because the specified ResourceGroupId parameter does not exist.
403	IncorrectVpcStatus	Current VPC status does not support this operation.	The error message returned because the operation is not supported while the VPC is in the current state.
400	InvalidParameter.EncryptedIllegal	%s	The error message returned because the specified parameter is invalid. Check whether your encryption operation is valid.
400	InvalidParameter.EncryptedNotSupported	%s	The error message returned because the specified parameter is invalid and your encryption operation is not supported.
400	EncryptedOption.Conflict	%s	The error message returned because the parameter used to encrypt disks is not supported.

HTTP status code	Error code	Error message	Description
400	InvalidSpotPriceLimit.LowerThanPublicPrice	The specified parameter "soptPriceLimit" can't be lower than current public price.	The error message returned because the specified value of SpotPriceLimit is lower than the current market price.
400	InvalidHpcClusterId.Unnecessary	The specified HpcClusterId is unnecessary.	The error message returned because the HpcClusterId parameter is specified.
400	InvalidVSwitchId.Necessary	The VSwitchId is necessary.	The error message returned because the VSwitchId parameter is not specified.
400	InvalidHpcClusterId.Necessary	The HpcClusterId is necessary.	The error message returned because the HpcClusterId parameter is not specified.
400	InvalidHpcClusterId.NotFound	The specified HpcClusterId is not found.	The error message returned because the specified HpcClusterId parameter does not exist.
400	InvalidHpcClusterId.Creating	The specified HpcClusterId is creating.	The error message returned because the specified HPC cluster is being created.
400	QuotaExceeded.PrivateIpAddress	Don't have enough private IPs in this switch.	The error message returned because no private IP address is available in the CIDR block of the vSwitch. Try another vSwitch.
400	InvalidPeriodUnit.ValueNotSupported	The specified parameter PeriodUnit is not valid.	The error message returned because the specified PeriodUnit parameter is invalid.
400	IncorrectImageStatus	Encrypted snapshots do not support this operation.	The error message returned because the operation is not supported by encrypted snapshots.
400	InvalidTagValue.Malformed	The specified Tag.n.Value is not valid.	The error message returned because the specified Tag.N.Value parameter is invalid.
400	InvalidSecurityGroup.NotInDefaultVpc	%s	The error message returned because the specified security group is not in the default VPC.

HTTP status code	Error code	Error message	Description
400	VpcNotFound	Vpc is not found according to the specified VSwitch or the vpc does not belong to you.	The error message returned because the specified vSwitch does not belong to any VPC, or the corresponding VPC does not belong to you.
403	InvalidParameter.NotMatch	%s	The error message returned because a specified parameter is invalid. Check whether parameter conflicts exist.
403	OperationDenied.InvalidNetworkType	%s	The error message returned because the operation is not supported by the specified network type.
400	InvalidSpotInterruptionBehavior	%s	The error message returned because the specified SpotInterruptionBehavior parameter is invalid.
403	InvalidSpotInterruptionBehavior.ClassicNetworkNotSupport	The specified SpotInterruptionBehavior does not support Classic network Instance.	The error message returned because the operation is not supported by instances in the classic network.
403	InvalidSpotInterruptionBehavior.LocalDiskNotSupport	The specified SpotInterruptionBehavior does not support local disk instance.	The error message returned because the operation is not supported by instances that have local disks attached.
400	OperationDenied.IllegalPaymentPolicy	The current payment policy is illegal, please connect your service provider to authenticate relative agreement.	The error message returned because the current payment policy is invalid. Contact your service provider for authentication.
400	InvalidDeploymentOnHost	%s	The error message returned because the instance cannot be deployed in the specified deployment set.
400	InvalidInstanceChargeType.NotSupport	The Dedicated host not support the specified Instance charge type.	The error message returned because the dedicated host does not support instances that use the specified billing method.
400	InvalidNetworkType.NotSupported	The classic networkType not support create ECS on dedicatedHost	The error message returned because the dedicated host does not support instances in the classic network.

HTTP status code	Error code	Error message	Description
400	InvalidDedicatedHostId.NotFound	The specified DedicatedHostId does not exist.	The error message returned because the specified DedicatedHostId parameter does not exist.
400	InvalidDedicatedHostStatus.NotSupport	Operation denied due to dedicated host status.	The error message returned because the operation is not supported while the dedicated host is in the current state.
400	IncorrectDedicatedHostStatus	The current status of the resource does not support this operation.	The error message returned because the operation is not supported while the resource is in the current state.
400	ChargeTypeViolation.PostPaidDedicatedHost	Prepaid instance onto postpaid dedicated host is not allowed	The error message returned because subscription instances cannot be deployed on pay-as-you-go dedicated hosts.
400	InvalidPeriod.ExceededDedicatedHost	Instance expired date can't exceed dedicated host expired date.	The error message returned because the expiration date of the instance is later than that of the dedicated host.
400	InvalidInstanceType.ValueUnauthorized	The specified InstanceType is not authorize.	The error message returned because you are not authorized to use the specified instance type.
400	DedicatedHostType.Unmatched	The specified DedicatedHostType doesn? t match the instance type.	The error message returned because the specified dedicated host type does not correspond to the specified instance type.
400	ChargeTypeViolation.PostPaidDedicatedHost	Prepaid instance onto postpaid dedicated host is not allowed.	The error message returned because subscription instances cannot be deployed on pay-as-you-go dedicated hosts.
400	InvalidParam.Tenancy	The specified Tenancy is invalid.	The error message returned because the specified Tenancy parameter is invalid.
403	OperationDenied.ImageNotValid	%s	The error message returned because the image does not support the operation.

HTTP status code	Error code	Error message	Description
403	QuotaExceed.PostPaidDisk	Living postPaid disks quota exceeded.	The error message returned because the maximum number of pay-as-you-go disks has been exceeded.
403	QuotaExceed.DeploymentSetInstanceQuotaFull	instance quota in one deployment set exceeded.	The error message returned because the maximum number of instances in the deployment set has been reached.
403	InvalidDiskCategory.NotSupported	The specified disk category is not supported.	The error message returned because the specified disk category does not support the operation.
400	InvalidParameter.CreditSpecification	The specified CreditSpecification is not supported in this region.	The error message returned because the specified credit policy is not supported in the region.
403	OperationDenied.ImageNotValid	the specified image is not published in the region.	The error message returned because the specified image is not available in the region.
403	OperationDenied.ImageNotValid	the specified image is not found in marketplace.	The error message returned because the specified image does not exist in Alibaba Cloud Marketplace.
404	InvalidMarketImage.NotFound	The specified marketplace image does not exist, please change the imageId and try again.	The error message returned because the specified Alibaba Cloud Marketplace image does not exist. Modify the parameter and try again later.
400	InvalidInstanceType.NotSupported	The specified instanceType is not supported by the deployment set.	The error message returned because the specified instance type is not supported by the deployment set. Try another instance type.
400	InvalidVpcZone.NotSupported	Zone of the specified VSwitch is not available for creating, please try in other zones.	The error message returned because the default vSwitch cannot be created in the specified zone. Try another zone.
400	IncorrectDefaultVpcStatus	The status of the default VPC is invalid.	The error message returned because the status of the default VPC is invalid.

HTTP status code	Error code	Error message	Description
404	DeploymentSet.NotFound	The specified deployment set does not exist.	The error message returned because the specified DeploymentSetId parameter does not exist.
403	OperationDenied.LocalDiskUnsupported	The configuration change is not allowed when the specified instance has local disks mounted.	The error message returned because the instance types of instances that have local disks attached cannot be changed.
403	OperationDenied.InconsistentNetwork	The specified security group and vswitch are not in the same vpc.	The error message returned because the specified security group and vSwitch do not belong to the same VPC.
403	OperationDenied	If the network segment of the vswitch is the same as that of its VPC. Therefore, the VPC cannot create other vswitchs across the region.	The error message returned because the VPC and vSwitch have the same CIDR block and no additional vSwitches can be created for other zones of this VPC.
403	DefaultVswitch.Existed	The default vswitch for VPC already exists.	The error message returned because a default vSwitch already exists in the VPC.
403	IncorrectInstanceStatus	The current status of the resource does not support this operation.	The error message returned because the operation is not supported while the resource is in the current state.
403	CategoryViolation	The specified instance does not support this operation because of its disk category.	The error message returned because the configurations of instances that have local disks attached cannot be upgraded or downgraded.
403	ResourcesNotInSameZone	The specified instance and dedicated host are not in the same zone.	The error message returned because the specified instance and dedicated host are not located in the same region.
403	InvalidRegion.NotSupport	The specified region does not support byok.	The error message returned because the bring your own key (BYOK) feature is not supported in the region.
403	UserNotInTheWhiteList	The user is not in byok white list.	The error message returned because you are not in the BYOK whitelist. Try again when you are in the whitelist.

HTTP status code	Error code	Error message	Description
400	InvalidParameter.EncryptedIllegal	The specified parameter Encrypted must be true when kmsKeyId is not empty.	The error message returned because the encryption feature is not enabled after a KMS key ID is specified.
400	IoOptimized.NotSupported	The specified instance must be IoOptimized instance when kmsKeyId is not empty.	The error message returned because I/O optimized instances are not used after a KMS key ID is specified.
404	InvalidParameter.KMSKeyId.NotFound	The specified KMSKeyId does not exist.	The error message returned because the specified DataDisk.N.KMSKeyId parameter does not exist.
403	InvalidParameter.KMSKeyId.KMSUnauthorized	ECS service have no right to access your KMS.	The error message returned because ECS is not authorized to access your KMS resources.
403	SecurityRisk.3DVerification	We have detected a security risk with your default credit or debit card. Please proceed with verification via the link in your email.	The error message returned because risks are detected in your default credit card or debit card. Click the link in the email for verification.
403	InvalidDisk.SystemDiskSize	The specified SystemDiskSize beyond the permitted range.	The error message returned because the specified system disk size exceeds the upper limit.
400	InvalidClientToken.ValueNotSupported	The ClientToken provided is invalid.	The error message returned because the specified client token is invalid.
400	OperationDenied	The current user does not support this operation.	The error message returned because your account does not support the operation.
403	InsufficientBalance	Your account does not have enough balance.	The error message returned because you have insufficient balance in your account. Add funds to your account and try again.
400	Duplicate.TagKey	The Tag.N.Key contain duplicate key.	The error message returned because the specified tag key already exists. Tag keys must be unique.

HTTP status code	Error code	Error message	Description
404	InvalidSecurityGroupId.NotFound	%s	The error message returned because the specified security group ID does not exist.
403	InvalidVSwitchId.IpInvalid	%s	The error message returned because the specified PrivateIpAddress parameter is invalid.
404	InvalidDiskIds.NotPortable	The specified DiskId is not portable.	The error message returned because the specified disk is not removable.
403	QuotaExceed.Tags	%s	The error message returned because the number of specified tags exceeds the upper limit.
401	InvalidRamRole.NotEcsRole	The specified ram role is not authorized for ecs, please check your role policy.	The error message returned because the specified RAM role is not authorized to use ECS. Check your role policy.
400	InvalidHttpEndpoint.NotSupported	The specified HttpEndpoint not supported, you can use enabled(default) or disabled.	The error message returned because the specified HttpEndpoint parameter is invalid. The valid values of this parameter are enabled and disabled. The default value is enabled.
400	InvalidHttpTokens.NotSupported	The specified HttpTokens not supported, you can use optional(default) or required.	The error message returned because the specified HttpTokens parameter is invalid. The valid values of this parameter are optional and required. The default value is optional.
400	InvalidHttpPutResponseHopLimit.NotSupported	The specified HttpPutResponseHopLimit not supported, more than 1 and less than 64 is reasonable.	The error message returned because the specified HttpPutResponseHopLimit parameter is invalid. The value must be in the range of 1 to 64.
400	InvalidPrivateIpAddress.Malformed	Specified private IP address is malformed.	The error message returned because the specified PrivateIpAddress parameter is invalid.

2.1.2.1.4.3. StartInstance

You can call this operation to start an ECS instance. After the operation is called, the instance enters the Starting state.

Description

When you call this operation, take note of the following items:

- The ECS instance to be started must be in the **Stopped** (`Stopped`) state.
- If `OperationLocks` in the DescribeInstances response contains `"LockReason" : "security"` for an instance, the instance is locked for security reasons and cannot be started through calls to this operation.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	StartInstance	The operation that you want to perform. Set the value to StartInstance.
InstanceId	String	Yes	i-bp67acfmxazb4p****	The ID of the instance that you want to start.
InitLocalDisk	Boolean	No	true	Specifies whether to restore the instance to its initial health status. This parameter is applicable to instances of the instance families such as d1 and i2 that are equipped with local disks. If a local disk of a d1 or i2 instance fails, you can use this parameter to specify whether to restore the instance to its initial health status on startup. Default value: false. Valid values: • true: restores the instance to its initial health status on startup. After the instance is restored to its initial health status, data stored on the local disks of the instance is lost. • false: does not perform any operations and keeps the instance in the current state.

Parameter	Type	Required	Example	Description
DryRun	Boolean	No	true	Specifies whether to check the validity of the request without actually making the request. Default value: false. Valid values: • true: The validity of the request is checked but the request is not made. Check items include whether your AccessKey pair is valid, whether RAM users are authorized, and whether the required parameters are specified. If the check fails, the corresponding error is returned. If the check succeeds, the DryRunOperation error code is returned. • false: The validity of the request is checked. If the check succeeds, a 2XX HTTP status code is returned and the request is made.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=StartInstance
&InstanceId=i-bp67acfmxazb4p****
&InitLocalDisk=true
&<Common request parameters>
```

Sample success responses

`XML` format

```
<StartInstanceResponse>
      <RequestId>473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E</RequestId>
</StartInstanceResponse>
```

`JSON` format

```
{
    "RequestId": "473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E"
}
```

Error codes

HTTP status code	Error code	Error message	Description
404	InvalidInstanceId.NotFound	The specified InstanceId does not exist.	The error message returned because the specified InstanceId parameter does not exist.
403	IncorrectInstanceStatus	The current status of the resource does not support this operation.	The error message returned because the operation is not supported while the resource is in the current state.
403	InstanceLockedForSecurity	The specified operation is denied as your instance is locked for security reasons.	The error message returned because the operation is not supported while the instance is locked for security reasons.
403	InsufficientBalance	Your account does not have enough balance.	The error message returned because you have insufficient balance in your account. Add funds to your account and try again.
500	InstanceNotReady	The specified instance is not ready for use	The error message returned because the specified instance cannot be connected for the moment. Try again later.
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.
403	DiskError	IncorrectDiskStatus.	The error message returned because the status of the specified disk is invalid.
403	InstanceExpired	The postPaid instance has been expired.Please ensure your account have enough balance.	The error message returned because the pay-as-you-go instance has expired. Make sure that your account balance is sufficient.
403	InstanceExpired	The prePaid instance has been expired.	The error message returned because the subscription instance has expired.

HTTP status code	Error code	Error message	Description
403	InstanceNotReady	The specified instance is not ready for use.	The error message returned because the operation is not supported while the resource is in the current state. Try again later.
403	DiskInArrears	The specified operation is denied as your disk has expired.	The error message returned because the disk has expired due to overdue payments.
403	OperationDenied.NoStock	The requested resource is sold out in the specified zone; try other types of resources or other regions and zones.	The error message returned because the requested resources are insufficient in the specified zone. Try other resource types, regions, or zones.
403	OperationDenied.SpotPriceLowerThanPublicPrice	The spot instance price is lower than public price.	The error message returned because the user-defined maximum hourly price of a preemptible instance is lower than the current market price.
403	IncorrectInstanceStatus	%s	The error message returned because the operation is not supported while the instance is in the current state.
403	InvalidParameter.KMSKeyId.KMSUnauthorized	ECS service have no right to access your KMS.	The error message returned because ECS is not authorized to access your KMS resources.
500	InternalError	The request processing has failed due to some unknown error, exception or failure.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.

2.1.2.1.4.4. StopInstance

You can call this operation to stop an ECS instance in the Running state. After the operation is called, the status of the instance changes to Stopping and then to Stopped.

Description

- If OperationLocks in the DescribeInstances response contains "LockReason" : "security" for an instance, the instance is locked for security reasons and cannot be stopped through calls to this operation.
- To stop an instance of an instance family equipped with local SSDs, take note of the following items:

- After the instance is stopped, data in its local disks is cleared. To ensure data availability, we recommend that you implement data redundancy at the application layer.
- ECS automatically ignores the `ConfirmStop` parameter in the requests to stop instances of other instance families.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	StopInstance	The operation that you want to perform. Set the value to StopInstance.
InstanceId	String	Yes	i-bp67acfmxazb4ph***	The ID of the instance.
ForceStop	Boolean	No	false	Specifies whether to forcibly stop the instance. Default value: false. Valid values: • true: forcibly stops the instance. • false: normally stops the instance.
DryRun	Boolean	No	true	Specifies whether to check the validity of the request without actually making the request. Default value: false. Valid values: • true: The validity of the request is checked but the request is not made. Check items include the request format, service limits, available ECS resources, and whether the required parameters are specified. If the check fails, the corresponding error is returned. If the check succeeds, the `DryRunOperation` error code is returned. • false: The validity of the request is checked, and the request is made if the check succeeds.

Response parameters

Parameter	Type	Example	Description
RequestId	String	1C488B66-B819-4D14-8711-C4EAAA13AC01	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=StopInstance
&InstanceId=i-bp67acfmxazb4ph***
&ConfirmStop=true
&ForceStop=false
&<Common request parameters>
```

Sample success responses

`XML` format

```
<StopInstanceResponse>
      <RequestId>1C488B66-B819-4D14-8711-C4EAAA13AC01</RequestId>
</StopInstanceResponse>
```

`JSON` format

```
{
    "RequestId": "1C488B66-B819-4D14-8711-C4EAAA13AC01"
}
```

Error codes

HTTP status code	Error code	Error message	Description
404	InvalidInstanceId.NotFound	The specified InstanceId does not exist.	The error message returned because the specified InstanceId parameter does not exist.
403	IncorrectInstanceStatus	The current status of the resource does not support this operation.	The error message returned because the operation is not supported while the resource is in the current state.
403	InstanceLockedForSecurity	The specified operation is denied as your instance is locked for security reasons.	The error message returned because the operation is not supported while the instance is locked for security reasons.
403	DiskError	IncorrectDiskStatus	The error message returned because the status of the specified disk is invalid.
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.

HTTP status code	Error code	Error message	Description
403	InstanceType.ParameterMismatch	The input parameter ConfirmStop must be true when an instance have localstorage.	The error message returned because the ConfirmStop parameter is set to false for an instance that uses local storage.
403	InstanceExpiredOrInArrears	The specified operation is denied as your prepay instance is expired (prepay mode) or in arrears (afterpay mode).	The error message returned because the subscription instance has expired. Renew the instance first.
403	InvalidInstanceId.NotSupport	Classic network Instance does not support this operation.	The error message returned because the operation is not supported by instances in the classic network.
403	InvalidInstanceId.NotSupport	Pre pay instance does not support this operation.	The error message returned because the operation is not supported by subscription instances.
403	InvalidInstanceId.NotSupport	Local disk instance does not support this operation.	The error message returned because the operation is not supported by instances that use local disks.
403	InvalidInstanceId.NotSupport	Spot instance does not support this operation.	The error message returned because the operation is not supported by preemptible instances.
403	IncorrectInstanceStatus	%s	The error message returned because the operation is not supported while the instance is in the current state.
403	InvalidParameter.KMSKeyId.KMSUnauthorized	ECS service have no right to access your KMS.	The error message returned because ECS is not authorized to access your KMS resources.
500	InternalError	The request processing has failed due to some unknown error, exception or failure.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.

2.1.2.1.4.5. RebootInstance

You can call this operation to restart an instance in the Running state.

Description

- Only instances in the **Running** (`Running`) state can be restarted.
- After the operation is called, the status of the corresponding instance changes to **Starting** (`Starting`).
- Instances can be forcibly restarted. A forced restart (`ForceStop`) is equivalent to powering off traditional servers to restart them. This operation can cause data loss if data in the instance is not written to disks.
- If OperationLocks in the DescribeInstances response contains "LockReason" : "security" for an instance, the instance is locked for security reasons and cannot be restarted through calls to this operation.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	RebootInstance	The operation that you want to perform. Set the value to RebootInstance.
InstanceId	String	Yes	i-bp67acfmxazb4ph***	The ID of the instance.
ForceStop	Boolean	No	false	Specifies whether to forcibly stop the instance to restart it. Default value: false. Valid values: • true: forcibly stops the instance. This operation is equivalent to the typical power-off operation. Cache data that is not written to storage in the instance will be lost. • false: normally stops the instance.
DryRun	Boolean	No	false	Specifies whether to check the validity of the request without actually making the request. Default value: false. Valid values: • true: The validity of the request is checked but the request is not made. Check items include the request format, service limits, available ECS resources, and whether the required parameters are specified. If the check fails, the corresponding error is returned. If the check succeeds, the `DryRunOperation` error code is returned. • false: The validity of the request is checked, and the request is made if the check succeeds.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=RebootInstance
&InstanceId=i-bp67acfmxazb4ph***
&ForceStop=false
&<Common request parameters>
```

Sample success responses

`XML` format

```
<RebootInstanceResponse>
      <RequestId>F2E2C40D-AB09-45A1-B5C5-EB9F5C4E4E4A</RequestId>
</RebootInstanceResponse>
```

`JSON` format

```
{
    "RequestId": "F2E2C40D-AB09-45A1-B5C5-EB9F5C4E4E4A"
}
```

Error codes

HTTP status code	Error code	Error message	Description
404	InvalidInstanceId.NotFound	The specified InstanceId does not exist.	The error message returned because the specified InstanceId parameter does not exist.
403	IncorrectInstanceStatus	The current status of the resource does not support this operation.	The error message returned because the operation is not supported while the resource is in the current state.
403	InstanceLockedForSecurity	The specified operation is denied as your instance is locked for security reasons.	The error message returned because the operation is not supported while the instance is locked for security reasons.

HTTP status code	Error code	Error message	Description
403	DiskError	IncorrectDiskStatus.	The error message returned because the status of the specified disk is invalid.
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.
403	InstanceExpiredOrInArrears	The specified operation is denied as your prepay instance is expired (prepay mode) or in arrears (afterpay mode).	The error message returned because the subscription instance has expired. Renew the instance first.
403	IncorrectInstanceStatus	%s	The error message returned because the operation is not supported while the instance is in the current state.
403	InvalidParameter.KMSKeyId.KMSUnauthorized	ECS service have no right to access your KMS.	The error message returned because ECS is not authorized to access your KMS resources.
500	InternalError	The request processing has failed due to some unknown error, exception or failure.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.

2.1.2.1.4.6. DeleteInstance

You can call this operation to release an ECS instance.

Description

- After an instance is released, all the physical resources used by the instance are recycled. Relevant data is erased and cannot be recovered.
- Disks attached to the instance:
  - The disks for which `DeleteWithInstance` is set to true are released along with the instance.
  - For disks for which `DeleteAutoSnapshot` is set to false, the automatic snapshots are retained.
  - For disks for which `DeleteAutoSnapshot` is set to true, the automatic snapshots are released.
  - Manual snapshots of the disks are retained.
  - If OperationLocks in the DescribeInstances response contains `"LockReason" : "security` for an instance, the instance is locked for security reasons. Even if `DeleteWithInstance` is set to false for the disks attached to the instance, this parameter is ignored and the disks are released along with the instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteInstance	The operation that you want to perform. Set the value to DeleteInstance.
InstanceId	String	Yes	i-bp1g6zv0ce8oghu7k***	The ID of the instance.
Force	Boolean	No	false	Specifies whether to forcibly release the instance in the **Running** (`Running`) state. Default value: false. Valid values: • true: forcibly releases the instance in the **Running** (`Running`) state. This operation is equivalent to the power-off operation. Temporary data in the memory and storage of the instance is erased and cannot be recovered. • false: normally releases the instance. This value is valid only for an instance in the **Stopped** (`Stopped`) state.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=DeleteInstance
&InstanceId=i-bp1g6zv0ce8oghu7k****
&Force=false
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteInstanceResponse>
      <RequestId>928E2273-5715-46B9-A730-238DC996A533</RequestId>
</DeleteInstanceResponse>
```

`JSON` format

```
{
    "RequestId": "928E2273-5715-46B9-A730-238DC996A533"
}
```

Error codes

HTTP status code	Error code	Error message	Description
403	IncorrectInstanceStatus	The current status of the resource does not support this operation.	The error message returned because the operation is not supported while the resource is in the current state.
403	InstanceLockedForSecurity	The specified operation is denied as your instance is locked for security reasons.	The error message returned because the operation is not supported while the instance is locked for security reasons.
403	ChargeTypeViolation	The operation is not permitted due to charge type of the instance.	The error message returned because the operation is not supported while the instance uses the current billing method.
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.
400	DependencyViolation.SLBConfiguring	Specified operation is denied as your instance is using by another product.	The error message returned because the instance is referenced by an SLB instance that is being configured.
400	DependencyViolation.RouteEntry	Specified instance is used by route entry.	The error message returned because custom routing rules still exist in the VPC.
400	InvalidParameter	The input parameter InstanceId is invalid.	The error message returned because the specified InstanceId parameter is invalid.
404	InvalidInstanceId.NotFound	The specified InstanceId does not exist.	The error message returned because the specified InstanceId parameter does not exist.

HTTP status code	Error code	Error message	Description
403	IncorrectInstanceStatus.Initializing	The specified instance status does not support this operation.	The error message returned because the instance is being initialized and cannot be released. Try again later.
403	IncorrectInstanceStatus	The specified instance is still attached by volumes.	The error message returned because the specified instance still has data volumes.
403	InvalidOperation.DeletionProtection	%s	The error message returned because the operation is invalid. Disable release protection for the instance first.
403	InvalidOperation.EniLinked	%s	The error message returned because the operation is not supported while the instance is bound with elastic network interfaces (ENIs). You must unbind the ENIs before you can release the instance.

2.1.2.1.4.7. AttachInstanceRamRole

You can call this operation to attach an instance RAM role to one or more instances. An instance can have only one instance RAM role. If an instance already has an instance RAM role, an error is returned when you attach another instance RAM role to the instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	AttachInstanceRamRole	The operation that you want to perform. Set the value to AttachInstanceRamRole.
InstanceIds	String	Yes	[“i-bp14ss25xca5ex1u****” , “i-bp154z5o1qjalfse****” , “i-bp10ws62o04ubhvi****” ...]	The IDs of instances. The value can be a JSON array that consists of up to 100 instance IDs. Separate multiple instance IDs with commas (,).

Parameter	Type	Required	Example	Description
RamRoleName	String	Yes	RamRoleTest	The name of the instance RAM role. You can call the ListRoles operation provided by RAM to query the instance RAM roles that you created.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region. You can call the DescribeRegions operation to query the most recent region list.

Response parameters

Parameter	Type	Example	Description
AttachInstanceRamRoleResults	Array of AttachInstanceRamRoleResult		Details about the results of attaching the instance RAM role.
AttachInstanceRamRoleResult			
Code	String	200	Indicates whether the instance RAM role was attached. If 200 is returned, the instance RAM role was attached. If any other value is returned, the instance RAM role failed to be attached. For more information, see the "Error codes" section.
InstanceId	String	i-bp10ws62o04ubhvi****	The ID of the instance.
Message	String	success	Indicates whether the instance RAM role was attached. If success is returned, the instance RAM role was attached. If any other value is returned, the instance RAM role failed to be attached. For more information, see the "Error codes" section.

Parameter	Type	Example	Description
Success	Boolean	true	Indicates whether the instance RAM role was attached. • true: The instance RAM role was attached. • false: The instance RAM role failed to be attached.
FailCount	Integer	0	The number of the instances to which the instance RAM role failed to be attached.
RamRoleName	String	RamRoleTest	The name of the instance RAM role.
RequestId	String	D9553E4C-6C3A-4D66-AE79-9835AF705639	The ID of the request.
TotalCount	Integer	1	The total number of instances to which you attempted to attach the instance RAM role.

Examples

Sample requests

```
https://ecs.example.com/?Action=AttachInstanceRamRole
&InstanceIds=["i-bp10ws62o04ubhvi****"]
&RamRoleName=RamRoleTest
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<AttachInstanceRamRoleResponse>
      <RequestId>E6352369-5C2B-41CD-AB50-471550C8F674</RequestId>
      <AttachInstanceRamRoleResults>
            <AttachInstanceRamRoleResult>
                  <InstanceId>i-bp10ws62o04ubhvi****</InstanceId>
                  <Code>200</Code>
                  <Message>success</Message>
            </AttachInstanceRamRoleResult>
      </AttachInstanceRamRoleResults>
      <TotalCount>1</TotalCount>
      <FailCount>0</FailCount>
      <RamRoleName>RamRoleTest</RamRoleName>
</AttachInstanceRamRoleResponse>
```

`JSON` format

```
{
    "RequestId": "D9553E4C-6C3A-4D66-AE79-9835AF705639",
    "AttachInstanceRamRoleResults": {
        "AttachInstanceRamRoleResult": [
            {
                "Message": "success",
                "InstanceId": "i-bp10ws62o04ubhvi****",
                "Code": "200"
            }
        ]
    },
    "TotalCount": 1,
    "FailCount": 0,
    "RamRoleName": "RamRoleTest"
}
```

Error codes

HTTP status code	Error code	Error message	Description
400	InvalidInstanceIds.Malformed	The specified instanceIds are not valid.	The error message returned because the specified InstanceIds parameter is invalid.
404	InvalidInstanceId.NotFound	The specified instanceId does not exist	The error message returned because a specified instance does not exist.
403	InvalidNetworkType.MismatchRamRole	Ram role cannot be applied to instances of Classic network type.	The error message returned because instance RAM roles can be used only for instances in VPCs, not for instances in the classic network.
403	InvalidUser.PassRoleForbidden	The RAM user does not have the privilege to pass a RAM role.	The error message returned because the RAM user is not authorized to pass the RAM role.
404	InvalidRamRole.NotFound	The specified RAMRoleName does not exist.	The error message returned because the specified RamRoleName parameter does not exist.
404	InvalidRamRole.NotEcsRole	The specified ram role is not authorized for ecs, please check your role policy.	The error message returned because the specified RAM role is not authorized to use ECS. Check your role policy.

2.1.2.1.4.8. DetachInstanceRamRole

You can call this operation to detach instance RAM roles from one or more ECS instances.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DetachInstanceRamRole	The operation that you want to perform. Set the value to DetachInstanceRamRole.
InstanceIds	String	Yes	["i-bp67acfmxazb4p****", "i-bp67acfmxazb4p****", "i-bp67acfmxazb4p****"...]	The IDs of instances. The value can be a JSON array that consists of up to 100 instance IDs. Separate multiple instance IDs with commas (,).
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region. You can call the DescribeRegions operation to query the most recent region list.
RamRoleName	String	No	RamRoleTest	The name of the instance RAM role. You can call the ListRoles operation provided by RAM to query the instance RAM roles that you created.

Response parameters

Parameter	Type	Example	Description
DetachInstanceRamRoleResults	Array of DetachInstanceRamRoleResult		Details about the results of detaching instance RAM roles from the instances.
DetachInstanceRamRoleResult			
Code	String	200	Indicates whether the instance RAM role was detached. If 200 is returned, the instance RAM role was detached. If any other value is returned, the instance RAM role failed to be detached. For more information, see the "Error codes" section.
InstanceId	String	i-bp67acfmxazb4p****	The ID of the instance from which you attempted to detach the instance RAM role.

Parameter	Type	Example	Description
InstanceRamRoleSets	Array of InstanceRamRoleSet		Details about the instance RAM role of the instance.
InstanceRamRoleSet			
InstanceId	String	i-bp67acfmxazb4p****	The ID of the instance.
RamRoleName	String	RamRoleTest	The name of the instance RAM role.
Message	String	Success	The message that indicates whether the instance RAM role was detached. If success is returned, the instance RAM role was detached. If any other value is returned, the instance RAM role failed to be detached. For more information, see the "Error codes" section.
Success	Boolean	true	Indicates whether the instance RAM role was detached.
FailCount	Integer	0	The number of instances from which instance RAM roles failed to be detached.
RamRoleName	String	RamRoleTest	The name of the instance RAM role.
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.
TotalCount	Integer	1	The total number of instances from which you attempted to detach instance RAM roles.

Examples

Sample requests

```
https://ecs.example.com/?Action=DetachInstanceRamRole
&InstanceIds=["i-bp67acfmxazb4p****"]
&RegionId=cn-qingdao-env17-d01
&RamRoleName=RamRoleTest
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DetachInstanceRamRoleResponse>
      <TotalCount>1</TotalCount>
      <DetachInstanceRamRoleResults>
            <DetachInstanceRamRoleResult>
                  <Message>success</Message>
                  <InstanceId>i-bp16qng6jnvt6g7t****</InstanceId>
                  <Code>200</Code>
                  <InstanceRamRoleSets>
                        <InstanceId>i-bp16qng6jnvt6g7t****</InstanceId>
                        <RamRoleName>RamRoleTest</RamRoleName>
                  </InstanceRamRoleSets>
            </DetachInstanceRamRoleResult>
      </DetachInstanceRamRoleResults>
      <RequestId>14D5B163-CE6C-4489-B979-DBE5D0495A63</RequestId>
      <RamRoleName></RamRoleName>
      <FailCount>0</FailCount>
</DetachInstanceRamRoleResponse>
```

`JSON` format

```
{
    "TotalCount": 1,
    "DetachInstanceRamRoleResults": {
        "DetachInstanceRamRoleResult": [
            {
                "Message": "success",
                "InstanceId": "i-bp16qng6jnvt6g7t****",
                "Code": "200",
                "InstanceRamRoleSets": {
                    "InstanceId": "i-bp16qng6jnvt6g7t****",
                    "RamRoleName": "RamRoleTest"
                }
            }
        ]
    },
    "RequestId": "14D5B163-CE6C-4489-B979-DBE5D0495A63",
    "RamRoleName": "",
    "FailCount": 0
}
```

Error codes

HTTP status code	Error code	Error message	Description

HTTP status code	Error code	Error message	Description
400	InvalidInstanceIds.Malformed	The specified instanceIds are not valid.	The error message returned because the specified InstanceIds parameter is invalid.
403	InvalidNetworkType.MismatchRamRole	Ram role cannot be applied to instances of Classic network type.	The error message returned because instance RAM roles can be used only for instances in VPCs, not for instances in the classic network.
403	InvalidUser.PassRoleForbidden	The RAM user does not have the privilege to pass a RAM role.	The error message returned because the RAM user is not authorized to pass the RAM role.

2.1.2.1.4.9. DescribeInstanceStatus

You can call this operation to query the status information of multiple instances.

Description

You can also call this operation to query the list of instances.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeInstanceStatus	The operation that you want to perform. Set the value to DescribeInstanceStatus.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the instance. You can call the DescribeRegions operation to query the most recent region list.
InstanceId.N	RepeatList	No	i-bp1j4i2jdf3owlhe****	The ID of instance N. Valid values of N: 1 to 100. Specify multiple values in the repeated list format.
ZoneId	String	No	cn-qingdao-env17-amtest11001-a	The zone ID of the instance.
ClusterId	String	No	cls-bp67acfmxazb4p****	The cluster ID of the instance.

Parameter	Type	Required	Example	Description
PageNumber	Integer	No	1	The number of the page to return. Pages start from page 1. Default value: 1.
PageSize	Integer	No	10	The number of entries to return on each page. Valid values: 1 to 50. Default value: 10.

Response parameters

Parameter	Type	Example	Description
InstanceStatuses	Array of InstanceStatus		The status information of the instances.
InstanceStatus			
InstanceId	String	i-bp1j4i2jdf3owlhe****	The ID of the instance.
Status	String	Running	The status of the instance.
PageNumber	Integer	1	The page number of the returned page.
PageSize	Integer	1	The number of entries returned per page.
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.
TotalCount	Integer	58	The total number of instances.

Examples

Sample requests

```
https://ecs.example.com/?Action=DescribeInstanceStatus
&RegionId=cn-qingdao-env17-d01
&PageSize=1
&PageNumber=1
&InstanceId.1=i-bp1j4i2jdf3owlhe****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeInstanceStatusResponse>
      <PageNumber>1</PageNumber>
      <InstanceStatuses>
            <InstanceStatus>
                  <Status>Running</Status>
                  <InstanceId>i-bp1j4i2jdf3owlhe****</InstanceId>
            </InstanceStatus>
      </InstanceStatuses>
      <TotalCount>58</TotalCount>
      <PageSize>1</PageSize>
      <RequestId>746C3444-9A24-4D7D-B8A8-DCBF7AC8BD66</RequestId>
</DescribeInstanceStatusResponse>
```

`JSON` format

```
{
    "PageNumber": 1,
    "InstanceStatuses": {
        "InstanceStatus": [
            {
                "Status": "Running",
                "InstanceId": "i-bp1j4i2jdf3owlhe****"
            }
        ]
    },
    "TotalCount": 58,
    "PageSize": 1,
    "RequestId": "746C3444-9A24-4D7D-B8A8-DCBF7AC8BD66"
}
```

2.1.2.1.4.10. DescribeInstances

You can call this operation to query the details of one or more instances.

Description

- You can specify multiple request parameters to be queried. Specified parameters have logical AND relations. Only the specified parameters are included in the filter conditions. However, if InstanceIds is set to an empty JSON array, it is regarded as a valid filter condition and an empty result is returned.
- If you are using a RAM user or RAM role, an empty list is returned when the user or the role does not have the permission to call this operation. You can include the `DryRun` parameter in your request to check whether the empty list is caused by the lack of permissions.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeInstances	The operation that you want to perform. Set the value to DescribeInstances.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the instance. You can call the DescribeRegions operation to query the most recent region list.
VpcId	String	No	v-bp67acfmxazb4p****	The ID of the VPC to which the instance belongs.
VSwitchId	String	No	vsw-bp67acfmxazb4p****	The ID of the vSwitch to which the instance is connected.
ZoneId	String	No	cn-qingdao-env17-amtest11001-a	The zone ID of the instance.
InstanceNetworkType	String	No	vpc	The network type of the instance. Valid values: • classic: classic network • vpc: VPC
SecurityGroupId	String	No	sg-bp67acfmxazb4p****	The ID of the security group to which the instance belongs.
InstanceIds	String	No	["i-bp67acfmxazb4p****", "i-bp67acfmxazb4p****", ... "i-bp67acfmxazb4p****"]	The IDs of instances. The value can be a JSON array that consists of up to 100 instance IDs. Separate multiple instance IDs with commas (,).
PageNumber	Integer	No	1	The number of the page to return. Pages start from page 1. Default value: 1.
PageSize	Integer	No	10	The number of entries to return on each page. Valid values: 1 to 100. Default value: 10.

Parameter	Type	Required	Example	Description
InnerIpAddresses	String	No	["10.1.1.1", "10.1.2.1", ... "10.1.10.1"]	The internal IP addresses of classic network-type instances. This parameter takes effect when InstanceNetworkType is set to classic. The value can be a JSON array that consists of up to 100 IP addresses. Separate multiple IP addresses with commas (,).
PrivateIpAddresses	String	No	["172.16.1.1", "172.16.2.1", ... "172.16.10.1"]	The private IP addresses of VPC-type instances. This parameter takes effect when InstanceNetworkType is set to vpc. The value can be a JSON array that consists of up to 100 IP addresses. Separate multiple IP addresses with commas (,).
PublicIpAddresses	String	No	["42.1.1. **", "42.1.2. **", ... "42.1.10. **"]	Note This parameter is not supported.
EipAddresses	String	No	["42.1.1. **", "42.1.2. **", ... "42.1.10. **"]	The elastic IP addresses (EIPs) of instances. This parameter takes effect when InstanceNetworkType is set to vpc. The value can be a JSON array that consists of up to 100 IP addresses. Separate multiple IP addresses with commas (,).
InstanceName	String	No	test-InstanceName	The name of the instance. Fuzzy search with the asterisk (*) wildcard is supported.
ImageId	String	No	m-bp67acfmxazb4p****	The ID of the image.

Parameter	Type	Required	Example	Description
Status	String	No	Running	The status of the instance. Valid values: • Running • Starting • Stopping • Stopped
LockReason	String	No	security	The reason why the instance is locked.
IoOptimized	Boolean	No	true	Specifies whether the instance is I/O optimized.
Tag.N.Key	String	No	TestKey	The key of tag N of the instance. Valid values of N: 1 to 20.
Tag.N.Value	String	No	TestValue	The value of tag N of the instance. Valid values of N: 1 to 20.
InstanceType	String	No	ecs.g5.large	The instance type of the instance.
InstanceTypeFamily	String	No	ecs.g5	The instance family of the instance.
KeyPairName	String	No	test-KeyPairName	The name of the SSH key pair bound to the instance.
ResourceGroupId	String	No	rg-bp67acfmxazb4p****	The ID of the resource group to which the instance belongs.
HpcClusterId	String	No	hpc-bp67acfmxazb4p****	The ID of the HPC cluster to which the instance belongs.
RdmaIpAddresses	String	No	10.10.10.102	The RDMA IP addresses of HPC instances.

Parameter	Type	Required	Example	Description
DryRun	Boolean	No	false	Specifies whether to check the validity of the request without actually making the request. Default value: false. Valid values: • true: The validity of the request is checked but the request is not made. Check items include whether your AccessKey pair is valid, whether RAM users are authorized, and whether the required parameters are specified. If the check fails, the corresponding error is returned. If the check succeeds, the DryRunOperation error code is returned. • false: The validity of the request is checked. If the check succeeds, a 2XX HTTP status code is returned and the request is made.
AdditionalAttributes.N	RepeatList	No	META_OPTIONS	The value of attribute N. Valid values of N: 1 to 20.
HttpEndpoint	String	No	enabled	Specifies whether the access channel for instance metadata is enabled. Valid values: • enabled • disabled Default value: enabled.
HttpTokens	String	No	optional	Specifies whether to forcibly use the security-enhanced mode (IMDSv2) to access instance metadata. Valid values: • optional: does not forcibly use the security-enhanced mode (IMDSv2) to access instance metadata. • required: forcibly uses the security-enhanced mode (IMDSv2) to access instance metadata. After you set this parameter to required, you cannot access instance metadata in normal mode. Default value: optional.

Response parameters

Parameter	Type	Example	Description
Instances	Array of Instance		Details about the instances.
Instance			
AutoReleaseTime	String	test	**Note** This parameter is not supported.
ClusterId	String	c-bp67acfmxazb4p****	The ID of the cluster to which the instance belongs. **Note** This parameter will be removed in the future. We recommend that you use other parameters to ensure future compatibility.
Cpu	Integer	8	The number of vCPUs.
CpuOptions	Struct		The CPU options.
CoreCount	Integer	2	The number of CPU cores.
Numa	String	2	The number of threads allocated. Valid value: 2.
ThreadsPerCore	Integer	4	The number of threads per core.
CreationTime	String	2017-12-10T04:04Z	The time when the instance was created.
CreditSpecification	String	Standard	The performance mode of the burstable instance. Valid values: • Standard: standard mode • Unlimited: unlimited mode
DedicatedHostAttribute	Struct		The attributes of the dedicated hosts.
DedicatedHostClusterId	String	dc-bp67acfmxazb4h****	The ID of the dedicated host cluster.

Parameter	Type	Example	Description
DedicatedHostId	String	dh-bp67acfmxazb4p****	The ID of the dedicated host.
DedicatedHostName	String	test-DedicatedHostName	The name of the dedicated host.
DedicatedInstanceAttribute	Struct		The attributes of the instance on a dedicated host.
Affinity	String	default	**Note** This parameter is not supported.
Tenancy	String	default	Indicates whether the instance is hosted on a dedicated host. Valid values: • default: The instance is not hosted on a dedicated host. • host: The instance is hosted on a dedicated host.
DeletionProtection	Boolean	false	**Note** This parameter is not supported.
DeploymentSetGroupNo	Integer	1	The group number of the instance in a deployment set when the deployment set is used to distribute instances across multiple physical machines.
DeploymentSetId	String	ds-bp67acfmxazb4p****	The ID of the deployment set.
Description	String	This is a description example.	The description of the instance.
DeviceAvailable	Boolean	true	Indicates whether data disks can be attached to the instance.
EcsCapacityReservationAttr	Struct		The capacity reservation attributes of the ECS instance.

Parameter	Type	Example	Description
CapacityReservationId	String	cr-bp67acfmxazb4p****	The ID of the capacity reservation.
CapacityReservationPreference	String	cr-bp67acfmxazb4p****	The preference of the capacity reservation.
EipAddress	Struct		Details about the EIP associated with the instance.
AllocationId	String	i-bp67acfmxazb4p****	The ID of the instance with which the EIP is associated.
Bandwidth	Integer	5	The maximum public bandwidth of the EIP. Unit: Mbit/s.
InternetChargeType	String	test	**Note** This parameter is not supported.
IpAddress	String	42.112.17.**	The EIP.
IsSupportUnassociate	Boolean	true	Indicates whether the EIP can be disassociated.
ExpiredTime	String	2017-12-10T04:04Z	**Note** This parameter is not supported.
GPUAmount	Integer	4	The number of GPUs for the instance type.
GPUSpec	String	NVIDIA V100	The category of GPUs for the instance type.
HostName	String	test-HostName	The hostname of the instance.
HpcClusterId	String	hpc-bp67acfmxazb4p****	The ID of the HPC cluster to which the instance belongs.

Parameter	Type	Example	Description
ImageId	String	m-bp67acfmxazb4p****	The ID of the image that the instance is running.
InnerIpAddress	List	10.170.**. ***	The internal IP address of the instance.
InstanceChargeType	String	test	**Note** This parameter is not supported.
InstanceId	String	i-bp67acfmxazb4p****	The ID of the instance.
InstanceName	String	test-InstanceName	The name of the instance.
InstanceNetworkType	String	vpc	The network type of the instance. Valid values: • classic: classic network • vpc: VPC
InstanceType	String	ecs.g5.large	The instance type of the instance.
InstanceTypeFamily	String	ecs.g5	The instance family of the instance.
InternetChargeType	String	test	**Note** This parameter is not supported.
InternetMaxBandwidthIn	Integer	50	The maximum inbound public bandwidth. Unit: Mbit/s.
InternetMaxBandwidthOut	Integer	5	The maximum outbound public bandwidth. Unit: Mbit/s.
IoOptimized	Boolean	true	Indicates whether the instance is I/O optimized.
KeyPairName	String	test-KeyPairName	The name of the key pair.

Parameter	Type	Example	Description
LocalStorageAmount	Integer	2	The number of local disks attached to the instance.
LocalStorageCapacity	Long	1000	The capacity of local disks attached to the instance.
Memory	Integer	1024	The memory size of the instance. Unit: MiB.
MetadataOptions	Struct		The metadata options.
HttpEndpoint	String	enabled	Indicates whether the access channel for instance metadata was enabled. Valid values: • enabled • disabled
HttpPutResponseHopLimit	Integer	0	**Note** This parameter is not supported.
HttpTokens	String	optional	Indicates whether to forcibly use the security-enhanced mode (IMDSv2) to access instance metadata. Valid values: • optional: does not forcibly use the security-enhanced mode (IMDSv2) to access instance metadata. • required: forcibly uses the security-enhanced mode (IMDSv2) to access instance metadata.
NetworkInterfaces	Array of NetworkInterface		Details about the ENIs bound to the instance.
NetworkInterface			
MacAddress	String	00:16:3e:32:b4:**	The MAC address of the ENI.

Parameter	Type	Example	Description
NetworkInterfaceId	String	eni-2zeh9atclduxvf1z****	The ID of the ENI.
PrimaryIpAddress	String	172.17.**. ***	The private IP address of the primary ENI.
OSName	String	CentOS 7.4 64-bit	The name of the operating system for the instance.
OSNameEn	String	CentOS 7.4 64 bit	The English name of the operating system for the instance.
OSType	String	linux	The operating system type of the instance. Valid values: • windows • linux
OperationLocks	Array of LockReason		Details about the reasons why the instance was locked.
LockReason			
LockMsg	String	The specified instance is locked due to financial reason.	The message returned when the instanced was locked.
LockReason	String	test	Note This parameter is not supported.
PublicIpAddress	List	121.40.61.***	Note This parameter is not supported.
RdmaIpAddress	List	10.10.10.102	The RDMA IP address of the HPC instance.
Recyclable	Boolean	false	Indicates whether the instance can be recycled.
RegionId	String	cn-qingdao-env17-d01	The region ID of the instance.

Parameter	Type	Example	Description
ResourceGroupId	String	rg-bp67acfmxazb4p****	The ID of the resource group to which the instance belongs.
SaleCycle	String	month	Note This parameter is not supported.
SecurityGroupIds	List	sg-bp67acfmxazb4p****	The IDs of security groups to which the instance belongs.
SerialNumber	String	51d1353b-22bf-4567-a176-8b3e12e4****	The serial number of the instance.
SpotPriceLimit	Float	0.00	Note This parameter is not supported.
SpotStrategy	String	test	Note This parameter is not supported.
StartTime	String	test	Note This parameter is not supported.
Status	String	Running	The status of the instance.
StoppedMode	String	test	Note This parameter is not supported.
Tags	Array of Tag		The tags of the instance.
Tag			
TagKey	String	TestKey	The tag key of the instance.

Parameter	Type	Example	Description
TagValue	String	TestValue	The tag value of the instance.
VlanId	String	10	The VLAN ID of the instance. **Note** This parameter will be removed in the future. We recommend that you use other parameters to ensure future compatibility.
VpcAttributes	Struct		The VPC attributes of the instance.
NatIpAddress	String	172.17.**. ***	The NAT IP address of the instance. It is used by ECS instances in different VPCs for communication.
PrivateIpAddress	List	172.17.**. ***	The private IP address of the instance.
VSwitchId	String	vsw-2zeh0r1pabwtg6wcs****	The ID of the vSwitch to which the instance is connected.
VpcId	String	vpc-2zeuphj08tt7q3brd*****	The ID of the VPC to which the instance belongs.
ZoneId	String	cn-qingdao-env17-amtest11001-a	The zone ID of the instance.
PageNumber	Integer	1	The page number of the returned page.
PageSize	Integer	1	The number of entries returned per page.
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.
TotalCount	Integer	58	The total number of instances returned.

Error codes

HTTP status code	Error code	Error message	Description
404	InvalidInstanceChargeType.NotFound	The InstanceChargeType does not exist in our records	The error message returned because the specified InstanceChargeType parameter does not exist.
404	InvalidInternetChargeType.ValueNotSupported	The specified InternetChargeType is not valid	The error message returned because the specified InternetChargeType parameter is invalid.
404	InvalidLockReason.NotFound	The specified LockReason is not found	The error message returned because the specified LockReason parameter does not exist.
404	InvalidFilterKey.NotFound		The error message returned because the specified start time or end time is invalid.
404	InvalidNetworkType.NotFound	The specified InstanceNetworkType is not found	The error message returned because the specified InstanceNetworkType parameter does not exist.
404	InvalidStatus.NotFound	The specified Status is not found	The error message returned because the specified resource status does not exist.

HTTP status code	Error code	Error message	Description
400	InvalidTag.Mismatch	The specified Tag.n.Key and Tag.n.Value are not match.	The error message returned because the specified Tag.N.Key and Tag.N.Value parameters do not match.
400	InvalidTagCount	The specified tags are beyond the permitted range.	The error message returned because the number of specified tags has exceeded the upper limit.
400	InvalidHpcClusterId.NotFound	The specified HpcClusterId is not found.	The error message returned because the specified HpcClusterId parameter does not exist.
400	InvalidHpcClusterId.Creating	The specified HpcClusterId is creating.	The error message returned because the specified HPC cluster is being created.

2.1.2.1.4.11. DescribeUserData

You can call this operation to query the user data of an ECS instance.

Description

- The returned user data is encoded in Base64.
- If the instance does not have user data configured, an empty result is returned.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeUserData	The operation that you want to perform. Set the value to DescribeUserdata.
InstanceId	String	Yes	i-bp1a0cmfrfi71qlh****	The ID of the instance.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the instance. You can call the DescribeRegions operation to query the most recent region list.

Response parameters

Parameter	Type	Example	Description
InstanceId	String	i-bp1a0cmfrfi71qlh****	The ID of the instance.
RegionId	String	cn-qingdao-env17-d01	The region ID of the instance.
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.
UserData	String	ZWNobyBoZWxsbyBlY3Mh	The user data of the instance.

Examples

Sample requests

```
https://ecs.example.com/?Action= DescribeUserdata
&RegionId=cn-qingdao-env17-d01
&InstanceId=i-bp1a0cmfrfi71qlh****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeUserdataResponse>
      <RequestId>473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E</RequestId>
      <UserData>ZWNobyBoZWxsbyBlY3Mh</UserData>
      <InstanceId>i-bp1a0cmfrfi71qlh****</InstanceId>
      <RegionId>cn-qingdao-env17-d01</RegionId>
</DescribeUserdataResponse>
```

`JSON` format

```
{
    "RequestId": "473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E",
    " UserData ": "ZWNobyBoZWxsbyBlY3Mh",
    " InstanceId ": "i-bp1a0cmfrfi71qlh****",
    " RegionId": "cn-qingdao-env17-d01"
}
```

Error codes

HTTP status code	Error code	Error message	Description

HTTP status code	Error code	Error message	Description
404	InvalidInstanceId.NotFound	The specified InstanceId does not exist.	The error message returned because the specified InstanceId parameter does not exist.

2.1.2.1.4.12. DescribeInstanceRamRole

You can call this operation to query the instance RAM roles attached to one or more ECS instances.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeInstanceRamRole	The operation that you want to perform. Set the value to DescribeInstanceRamRole.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the instance RAM role. You can call the DescribeRegions operation to query the most recent region list.
PageNumber	Integer	No	1	The number of the page to return. Pages start from page 1. Default value: 1.
PageSize	Integer	No	10	The number of entries to return on each page. Valid values: 1 to 50. Default value: 10.
InstanceIds	String	No	["i-bp67acfmxazb4p****", "i-bp67acfmxazb4p****", "bp67acfmxazb4p****"...]	The IDs of instances. A maximum of 100 instance IDs can be entered at a time. You must specify at least one of the `InstanceIds` and `RamRoleName` parameters.

Parameter	Type	Required	Example	Description
RamRoleName	String	No	EcsServiceRole-EcsDocGuideTest	The name of the instance RAM role. This parameter can be used to query all the ECS instances to which the instance RAM role is attached. You can call the ListRoles operation provided by RAM to query the instance RAM roles that you created. You must specify at least one of the `InstanceIds` and `RamRoleName` parameters.

Response parameters

Parameter	Type	Example	Description
InstanceRamRoleSets	Array of InstanceRamRoleSet		Details about the instance RAM roles.
InstanceRamRoleSet			
InstanceId	String	i-bp67acfmxazb4p****	The ID of the instance.
RamRoleName	String	EcsServiceRole-EcsDocGuideTest	The name of the instance RAM role.
RegionId	String	cn-qingdao-env17-d01	The region ID of the instance RAM role.
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.
TotalCount	Integer	1	The total number of instance RAM roles returned.

Examples

Sample requests

```
https://ecs.example.com/?Action=DescribeInstanceRamRole
&RegionId=cn-qingdao-env17-d01
&InstanceIds=["i-bp67acfmxazb4p****"]
&PageNumber=1
&PageSize=1
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeInstanceRamRoleResponse>
      <RequestId>8F4CAE3F-7892-4662-83A5-2C2FFD639553</RequestId>
      <InstanceRamRoleSets>
            <InstanceRamRoleSet>
                  <InstanceId>i-bp67acfmxazb4p****</InstanceId>
                  <RamRoleName>EcsServiceRole-EcsDocGuideTest</RamRoleName>
            </InstanceRamRoleSet>
      </InstanceRamRoleSets>
      <TotalCount>1</TotalCount>
      <PageNumber>1</PageNumber>
      <PageSize>1</PageSize>
</DescribeInstanceRamRoleResponse>
```

`JSON` format

```
{
    "RequestId": "8F4CAE3F-7892-4662-83A5-2C2FFD639553",
    "InstanceRamRoleSets": {
        "InstanceRamRoleSet": [
            {
                "InstanceId": "i-bp67acfmxazb4p****",
                "RamRoleName": "EcsServiceRole-EcsDocGuideTest"
            }
        ]
    },
    "TotalCount": 1,
    "PageNumber": 1,
    "PageSize": 1
}
```

Error codes

HTTP status code	Error code	Error message	Description
400	InvalidInstanceIds.Malformed	The specified instanceIds are not valid.	The error message returned because the specified InstanceIds parameter is invalid.
404	InvalidInstanceId.NotFound	The specified instanceId does not exist	The error message returned because a specified instance does not exist.
403	InvalidNetworkType.MismatchRamRole	Ram role cannot be applied to instances of Classic network type.	The error message returned because instance RAM roles can be used only for instances in VPCs, not for instances in the classic network.

HTTP status code	Error code	Error message	Description
403	InvalidParameter.AllEmpty	%s	The error message returned because no parameters are specified. Specify required parameters.
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.

2.1.2.1.4.13. DescribeInstanceTypeFamilies

You can call this operation to query the instance families provided by ECS.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeInstanceTypeFamilies	The operation that you want to perform. Set the value to DescribeInstanceTypeFamilies.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region. You can call the DescribeRegions operation to query the most recent region list.

Parameter	Type	Required	Example	Description
Generation	String	No	ecs-3	The generation of the instance family. Valid values: • ecs-1: Generation I, which consists of the earliest and cost-effective instance families • ecs-2: Generation II, which provides upgraded software and hardware and higher performance than Generation I • ecs-3: Generation III, which consists of high-performance instance families and is suitable for different business scenarios • ecs-4: Generation IV, which consists of the low-latency instance families that can meet a wide variety of business requirements • ecs-5: Generation V, which includes Bare Metal Instance families and enterprise-level instance families such as g6, c6, and r6, and delivers quicker response and higher performance

Response parameters

Parameter	Type	Example	Description
InstanceTypeFamilies	Array of InstanceTypeFamily		Details about the instance families.
InstanceTypeFamily			
Generation	String	ecs-5	The generation of the instance family.
InstanceTypeFamilyId	String	ecs.g6	The ID of the instance family.
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=DescribeInstanceTypeFamilies
&RegionId=cn-qingdao-env17-d01
&Generation=ecs-5
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeInstanceTypeFamiliesResponse>
      <InstanceTypeFamilies>
            <InstanceTypeFamily>
                  <InstanceTypeFamilyId>ecs.g6</InstanceTypeFamilyId>
                  <Generation>ecs-5</Generation>
            </InstanceTypeFamily>
            <InstanceTypeFamily>
                  <InstanceTypeFamilyId>ecs.ebmg6</InstanceTypeFamilyId>
                  <Generation>ecs-5</Generation>
            </InstanceTypeFamily>
            <InstanceTypeFamily>
                  <InstanceTypeFamilyId>ecs.ebmg6e</InstanceTypeFamilyId>

2.1.2.1.4.14. DescribeInstanceTypes

You can call this operation to query the instance types provided by ECS.

Description

The DescribeInstanceTypes operation is used to query only the specifications and performance data of instance types. To query instance types that are available in a region, call the DescribeAvailableResource operation.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeInstanceTypes	The operation that you want to perform. Set the value to DescribeInstanceTypes.
InstanceTypeFamily	String	No	ecs.g6	The instance family to which the instance type belongs. For valid values, see DescribeInstanceTypeFamilies. For more information, see Instance types in ECS Product Introduction.

Response parameters

Parameter	Type	Example	Description
InstanceTypes	Array of InstanceType		Details about the instance types.
InstanceType			
BaselineCredit	Integer	4	The baseline vCPU computing performance (overall computing performance of all vCPUs) of the t5 burstable instance family.
CpuCoreCount	Integer	8	The number of vCPUs.
EniIpv6AddressQuantity	Integer	1	The maximum number of IPv6 addresses that can be assigned to a single elastic network interface (ENI).

Parameter	Type	Example	Description
EniPrivateIpAddressQuantity	Integer	6	The maximum number of private IP addresses that can be assigned to a single ENI.
EniQuantity	Integer	2	The maximum number of ENIs that can be bound to an instance.
EniTotalQuantity	Integer	0	**Note** This parameter is not supported.
EniTrunkSupported	Boolean	false	**Note** This parameter is not supported.
GPUAmount	Integer	2	The number of GPUs.
GPUSpec	String	NVIDIA V100	The GPU type.
InitialCredit	Integer	120	The initial vCPU credits of the t5 burstable instance family.
InstanceBandwidthRx	Integer	1024000	The maximum inbound internal bandwidth. Unit: Kbit/s.
InstanceBandwidthTx	Integer	1024000	The maximum outbound internal bandwidth. Unit: Kbit/s.
InstanceFamilyLevel	String	EnterpriseLevel	The level of the instance family. Valid values: • EntryLevel • EnterpriseLevel • CreditEntryLevel
InstancePpsRx	Long	300000	The inbound packet forwarding rate over the internal network. Unit: PPS.

Parameter	Type	Example	Description
InstancePpsTx	Long	300000	The outbound packet forwarding rate over the internal network. Unit: PPS.
InstanceTypeFamily	String	ecs.g5	The instance family.
InstanceTypeId	String	ecs.g5.large	The ID of the instance type.
LocalStorageAmount	Integer	1	The number of local disks attached per instance.
LocalStorageCapacity	Long	5000	The capacity of each local disk attached per instance. Unit: GiB.
LocalStorageCategory	String	local_ssd_pro	The category of local disks. Valid values: • local_hdd_pro: local SATA HDDs attached to instances of the d1 instance family • local_ssd_pro: local NVMe SSDs attached to instances of the i2, ga1, and gn5 instance families
MemorySize	Float	8.0	The memory size. Unit: GiB.
TotalEniQueueQuantity	Integer	128	The maximum number of NIC queues that the instance type can support. **Note** The queues of the primary NIC are excluded.
RequestId	String	00827261-20B7-4562-83F2-4DF39876A45A	The ID of the request.

Examples

2.1.2.1.4.15. ModifyInstanceAttribute

You can call this operation to modify some attributes of an ECS instance, such as the password, name, description, hostname, security group, and user data. If the instance is a burstable instance, you can also change its performance mode.

Description

If the API response contains `{"OperationLocks": {"LockReason" : "security"}}` when you query information about an instance, the instance is locked for security reasons and all operations are prohibited on the instance.

When you call ModifyInstanceAttribute to perform the following operations on an instance, take note of the following items:

- Modify the hostname (`HostName`): After the hostname is modified, you must restart the instance by using the ECS console or by calling the RebootInstance operation for the new hostname to take effect. The new hostname does not take effect if you restart the instance from within the operating system.
- Reset the password (`Password`):
  - The instance must not be in the **Starting** (`Starting`) state.

  - After the password is reset, you must restart the instance by using the ECS console or by calling the RebootInstance operation for the new password to take effect. The new password does not take effect if you restart the instance from within the operating system.
- Modify user data (`UserData`):
  - The instance must be in the **Stopped** (`Stopped`) state.
  - The instance must meet the limits of user data.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyInstanceAttribute	The operation that you want to perform. Set the value to ModifyInstanceAttribute.
InstanceId	String	Yes	i-bp67acfmxazb4ph***	The ID of the instance.
Password	String	No	EcsV****	The password of the instance. The password must be 8 to 30 characters in length and contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. Special characters include: `( ) ` ~ ! @ # $ % ^ & * - _ + = | { } [ ] : ; ' < > , . ? /` For Windows instances, the password cannot start with a forward slash (/). **Note** For security reasons, we recommend that you use HTTPS to send requests if the `Password` parameter is specified.

Parameter	Type	Required	Example	Description
HostName	String	No	LocalHost	The hostname of the instance. After the hostname is modified, call the RebootInstance operation for the new hostname to take effect. • For Windows Server, the hostname must be 2 to 15 characters in length and can contain letters, digits, and hyphens (-). It cannot start or end with a hyphen (-), contain consecutive hyphens (-), or contain only digits. • For other operating systems such as Linux, the hostname must be 2 to 64 characters in length. You can use periods (.) to separate a hostname into multiple segments. Each segment can contain letters, digits, and hyphens (-). The hostname cannot contain consecutive periods (.) or hyphens (-). It cannot start or end with a period (.) or a hyphen (-).
InstanceName	String	No	EcsInstance	The name of the instance. The name must be 2 to 128 characters in length. It must start with a letter and cannot start with http:// or https://. The name can contain letters, digits, colons (:), underscores (_), and hyphens (-).
Description	String	No	InstanceAttribute	The description of the instance. The description must be 2 to 256 characters in length and cannot start with http:// or https://. This parameter is empty by default.

Parameter	Type	Required	Example	Description
UserData	String	No	ZWNobyBoZWxsbyBlY3Mh	The user data of the instance. User data must be encoded in Base64. The size of the user data must be no greater than 16 KB before it is encoded in Base64. We recommend that you do not pass in confidential information such as passwords and private keys in the plaintext format. If you must pass in confidential information, we recommend that you encrypt and Base64-encode the information before you pass it in. Then you can decode and decrypt the information in the same way within the instance.
Recyclable	Boolean	No	false	Specifies whether the instance can be recycled.
CreditSpecification	String	No	Standard	The performance mode of the burstable instance. Valid values: • Standard: standard mode • Unlimited: unlimited mode This parameter is empty by default.
DeletionProtection	Boolean	No	false	The release protection attribute of the instance. This parameter specifies whether you can use the ECS console or call the DeleteInstance operation to release the instance. This parameter is empty by default. **Note** This attribute can protect instances only against manual releases, not against automatic releases.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=ModifyInstanceAttribute
&InstanceId=i-bp67acfmxazb4ph***
&CreditSpecification=Standard
&DeletionProtection=false
&Description=InstanceAttribute
&HostName=LocalHost
&InstanceName=EcsInstance
&Password=EcsV*
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyInstanceAttributeResponse>
      <RequestId>473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E</RequestId>
</ModifyInstanceAttributeResponse>
```

`JSON` format

```
{
    "RequestId": "473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E"
}
```

Error codes

HTTP status code	Error code	Error message	Description
400	InvalidInstanceName.Malformed	The specified parameter "InstanceName" is not valid.	The error message returned because the specified InstanceName parameter is invalid. The name must be 2 to 128 characters in length and can contain letters, digits, periods (.), underscores (_), and hyphens (-). It must start with a letter and cannot start with http:// or https://.
400	InvalidDescription.Malformed	The specified parameter "Description" is not valid.	The error message returned because the specified Description parameter is invalid. The description must be 2 to 256 characters in length and cannot start with http:// or https://.

HTTP status code	Error code	Error message	Description
400	InvalidHostPassword.Malformed	The specified parameter "Password" is not valid.	The error message returned because the specified Password parameter is invalid.
400	InvalidHostName.Malformed	The specified parameter "HostName" is not valid.	The error message returned because the specified HostName parameter is invalid.
403	IncorrectInstanceStatus	The current status of the resource does not support this operation.	The error message returned because the operation is not supported while the resource is in the current state.
403	InstanceLockedForSecurity	The specified operation is denied as your instance is locked for security reasons.	The error message returned because the operation is not supported while the instance is locked for security reasons.
404	InvalidInstanceId.NotFound	The specified InstanceId does not exist.	The error message returned because the specified InstanceId parameter does not exist.
404	InvalidSecurityGroupId.NotFound	The specified SecurityGroupId does not exist.	The error message returned because the specified security group does not exist in this account. Check whether the security group ID is correct.
403	OperationDenied	The instance amount in the specified SecurityGroup reach its limit.	The error message returned because the maximum number of instances in the specified security group has been reached.
403	OperationDenied	The current status of the resource does not support this operation.	The error message returned because the operation is not supported while the resource is in the current state.
400	InvalidPassword.Malformed	The specified parameter "Password" is not valid.	The error message returned because the specified Password parameter is invalid.
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.

HTTP status code	Error code	Error message	Description
403	InvalidUserData.Forbidden	User not authorized to input the parameter "UserData"please apply for permission "UserData"	The error message returned because you are not authorized to configure the UserData parameter. Apply for the permissions first.
400	InvalidUserData.SizeExceeded	The specified parameter "UserData" exceeds the size.	The error message returned because the size of user data specified in the UserData value exceeds the upper limit.
400	InvalidUserData.NotSupported	The specified parameter "UserData" only support the vpc and IoOptimized Instance.	The error message returned because the specified UserData parameter is not supported. UserData is supported only on VPC-type instances and I/O optimized instances.
400	ImageNotSupportCloudInit	The specified image does not support cloud-init.	The error message returned because the specified image does not support cloud-init.
400	ChargeTypeViolation	Pay-As-You-Go instances do not support this operation.	The error message returned because the pay-as-you-go billing method does not support this operation.
400	InvalidParameter.RecycleBin	You do not have permission to set recyclable properties.	The error message returned because you are not authorized to perform this operation.
400	InvalidParameter.CreditSpecification	The specified CreditSpecification is not supported in this region.	The error message returned because the specified credit policy is not supported in the region.
400	InvalidInstanceStatus.CreditSpecRestricted	The current status of the resource does not support this operation.	The error message returned because the operation is not supported while the resource is in the current state.
400	InvalidInstanceStatus.NotRunning	The current status of the resource is invalid, you can only do this operation when instance is running.	The error message returned because the operation is not supported while the instance is in the current state. Try again when the instance is in the Running state.
404	Credit.NotFound	The specified credit information does not exist.	The error message returned because the specified credit information does not exist.

HTTP status code	Error code	Error message	Description
500	InternalError	The request processing has failed due to some unknown error, exception or failure.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.
403	InvalidUser.Unauthorized	The user is not authorized	The error message returned because you are not authorized to perform this operation.
403	SecurityGroupInstanceLimitExceed	%s	The error message returned because the maximum number of instances in the specified security group has been reached.
403	InstanceNotInSecurityGroup	The instance not in the group.	The error message returned because the specified instance does not belong to the security group.
403	InvalidOperation.InvalidRegion	%s	The error message returned because the specified RegionId parameter is invalid.
400	InvalidParameter	The specified parameter is not valid.	The error message returned because a specified parameter is invalid.
403	OperationDenied	The specified Image is disabled or is deleted.	The error message returned because the specified image has been disabled or deleted.

2.1.2.1.4.16. ModifyInstanceVncPasswd

You can call this operation to change the VNC password of an instance.

Description

- The VNC password must be six characters in length and can contain uppercase letters, lowercase letters, and digits.
- After you change the VNC password of an instance:
  - If the instance is I/O optimized, the new password takes effect immediately.
  - If the instance is not I/O optimized, you must restart the instance by using the ECS console or by calling the RebootInstance operation for the new password to take effect.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyInstanceVncPasswd	The operation that you want to perform. Set the value to ModifyInstanceVncPasswd.
InstanceId	String	Yes	i-bp67acfmxazb4ph***	The ID of the instance.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the instance. You can call the DescribeRegions operation to query the most recent region list.
VncPassword	String	Yes	123456	The new VNC password of the instance.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=ModifyInstanceVncPasswd
&RegionId=cn-qingdao-env17-d01
&InstanceId=i-bp67acfmxazb4ph***
&VncPassword=123456
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyInstanceVncPasswdResponse>
      <RequestId>FDB6C963-9CE8-4B7F-BCA3-845F6BD29AFC</RequestId>
</ModifyInstanceVncPasswdResponse>
```

`JSON` format

```
{
      "RequestId": "FDB6C963-9CE8-4B7F-BCA3-845F6BD29AFC"
}
```

Error codes

HTTP status code	Error code	Error message	Description
404	InvalidInstanceId.NotFound	The specified InstanceId does not exist.	The error message returned because the specified InstanceId parameter does not exist.
404	InvalidRegionId.NotFound	The specified RegionId does not exist.	The error message returned because the specified RegionId parameter does not exist.
403	IncorrectInstanceStatus	The current status of the resource does not support this operation.	The error message returned because the operation is not supported while the resource is in the current state.
400	IncorrectVncPassword.Malformed	The specified parameter VncPassword is not valid.	The error message returned because the specified VncPassword parameter is invalid.
404	NoSuchResource	The specified resource is not found.	The error message returned because the specified resource does not exist.

2.1.2.1.5. Dedicated hosts

2.1.2.1.5.1. AllocateDedicatedHosts

You can call this operation to create one or more dedicated hosts. A dedicated host is a physical server dedicated to a single tenant. You can create ECS instances on a dedicated host and view the attributes of the dedicated host.

Description

Before you create a dedicated host, you can call the DescribeAvailableResource operation to view the available resources in the target region or zone.

- You can create a maximum of 100 dedicated hosts at a time.
- After you create a dedicated host, you can use its ID that is returned by the system as the request parameter to call the DescribeDedicatedHosts operation to query the status of the dedicated host.
- After you submit a request to create a dedicated host, an error is returned if a specified parameter is invalid or the requested resources are insufficient. For more information about error causes, see Error codes.
- After a dedicated host is created, you can call the ModifyInstanceDeployment operation to migrate ECS instances from a shared host to the dedicated host. You can also migrate ECS instances from another dedicated host to the created dedicated host.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	AllocateDedicatedHosts	The operation that you want to perform. Set the value to AllocateDedicatedHosts.
DedicatedHostType	String	Yes	ddh.c5	The dedicated host type. You can call the DescribeDedicatedHostTypes operation to obtain the most recent list of dedicated host types.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region in which to create the dedicated host. You can call the DescribeRegions operation to query the most recent region list.
Tag.N.Key	String	No	Environment	The key of tag N to be bound to the dedicated host. Valid values of N: 1 to 20. The tag key cannot be an empty string. It can be up to 128 characters in length and cannot start with acs: or aliyun. It cannot contain http:// or https://.
Tag.N.Value	String	No	Production	The value of tag N to be bound to the dedicated host. Valid values of N: 1 to 20. The tag value can be an empty string. It can be up to 128 characters in length. It cannot start with acs: or contain http:// or https://.
ResourceGroupId	String	No	rg-bp67acfmxazb4ph***	The ID of the resource group to which to assign the dedicated host.
ZoneId	String	No	cn-qingdao-env17-amtest11001-a	The ID of the zone in which to create the dedicated host. This parameter is empty by default, which indicates that the system automatically assigns a zone.

Parameter	Type	Required	Example	Description
DedicatedHostName	String	No	myDDH	The name of the dedicated host. The name must be 2 to 128 characters in length and can contain letters, digits, colons (:), underscores (_), and hyphens (-). The name must start with a letter and cannot start with http:// or https://.
ActionOnMaintenance	String	No	Migrate	The policy used to migrate the instances deployed on the dedicated host when the dedicated host fails or needs to be repaired online. Valid values: • Migrate: The instances are migrated to another physical server and restarted. If the dedicated host is attached with cloud disks, the default value is Migrate. • Stop: The instances on the dedicated host are stopped. If the dedicated host cannot be repaired, the instances are migrated to another physical server and restarted. If the dedicated host is attached with local disks, the default value is Stop.
NetworkAttributes.SlbUdpTimeout	Integer	No	60	The timeout period of the UDP session that is established to SLB. Unit: seconds. Valid values: 15 to 310.
NetworkAttributes.UdpTimeout	Integer	No	60	The timeout period for the UDP session between a user and an Apsara Stack service on the dedicated host. Unit: seconds. Valid values: 15 to 310.
Description	String	No	This-is-my-DDH	The description of the dedicated host. The description must be 2 to 256 characters in length and cannot start with http:// or https://.

Parameter	Type	Required	Example	Description
AutoPlacement	String	No	off	Specifies whether to add the dedicated host to the resource pool for automatic deployment. If you do not specify the **DedicatedHostId** parameter when you create an ECS instance on a dedicated host, Apsara Stack automatically selects a dedicated host from the resource pool to host the instance. Valid values: • on: adds the dedicated host to the resource pool for automatic deployment. • off: does not add the dedicated host to the resource pool for automatic deployment. Default value: on. **Note** If you do not want to add the dedicated host to the resource pool for automatic deployment, set the value to off.
Quantity	Integer	No	1	The number of dedicated hosts that you want to create. Valid values: 1 to 100 Default value: 1
AutoReleaseTime	String	No	2019-08-21T12:30:24Z	The automatic release time of the dedicated host. Specify the time in the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time must be in UTC. **Note** • It must be at least half an hour later than the current time. • It must be at most three years later than the current time. • If the value of the seconds (ss) is not 00, it is automatically set to 00.

Parameter	Type	Required	Example	Description
ClientToken	String	No	123e4567-e89b-12d3-a456-426655440000	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must ensure that it is unique among different requests. The **ClientToken** value can only contain ASCII characters and cannot exceed 64 characters in length. For more information, see How to ensure idempotence in ECS Developer Guide.

Response parameters

Parameter	Type	Example	Description
DedicatedHostIdSets	List	"DedicatedHostIdSets": {"DedicatedHostId": ["dh-bp67acfmxazb4ph***", "dh-bp67acfmxazb4pi***"]}	The IDs of the dedicated hosts.
RequestId	String	E2A664A6-2933-4C64-88AE-5033D003EADF	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=AllocateDedicatedHosts
&RegionId=cn-qingdao-env17-d01
&DedicatedHostType=ddh.sn1ne
&Quantity=2
&ClientToken=123e4567-e89b-12d3-a456-426655440000
&<Common request parameters>
```

Sample success responses

`XML` format

```
<AllocateDedicatedHostsResponse>
    <RequestId>E2A664A6-2933-4C64-88AE-5033D003EADF</RequestId>
    <DedicatedHostIdSets>
        <DedicatedHostId>dh-bp67acfmxazb4ph***</DedicatedHostId>
        <DedicatedHostId>dh-bp67acfmxazb4pi***</DedicatedHostId>
    </DedicatedHostIdSets>
</AllocateDedicatedHostsResponse>
```

`JSON` format

```
{
    "RequestId":"E2A664A6-2933-4C64-88AE-5033D003EADF",
    "DedicatedHostIdSets":{
        "DedicatedHostId":[
            "dh-bp67acfmxazb4ph***",
            "dh-bp67acfmxazb4pi***"
        ]
    }
}
```

Error codes

HTTP status code	Error code	Error message	Description
400	InvalidInstanceType.ValueUnauthorized	The specified InstanceType is not authorized.	The error message returned because you are not authorized to use the specified instance type.
400	InvalidDescription.Malformed	The specified parameter "Description" is not valid.	The error message returned because the specified Description parameter is invalid. The description must be 2 to 256 characters in length and cannot start with http:// or https://.
403	OperationDenied	The creation of Host to the specified Zone is not allowed.	The error message returned because you are not authorized to create a dedicated host in the specified zone.
403	OperationDenied.NoStock	The requested resource is sold out in the specified zone; try other types of resources or other regions and zones.	The error message returned because the requested resources are insufficient.
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.
403	OperationDenied	Sales of this resource are temporarily suspended in the specified region; please try again later.	The error message returned because this resource is unavailable in the specified region. Try again later.

HTTP status code	Error code	Error message	Description
400	InvalidParameter.Conflict	The specified region and cluster do not match.	The error message returned because the specified region and the specified cluster do not correspond to each other.
403	NodeControllerUnavailable	The Node Controller is temporarily unavailable.	The error message returned because the node controller is unavailable.
404	OperationDenied	Another Host has been creating	The error message returned because another host is being created.
403	OperationDenied	The resource is out of usage.	The error message returned because the instance is not in the Running state. Start the instance or check whether the operation is valid.
404	PaymentMethodNotFound	No payment method has been registered on the account.	The error message returned because you have not registered a payment method for your account.
404	InvalidDedicatedHostName.Malformed	The specified parameter DedicatedHostName is not valid.	The error message returned because the specified DedicatedHostName parameter is invalid.
403	InvalidParameter.ResourceOwnerAccount	ResourceOwnerAccount is Invalid.	The error message returned because the specified ResourceOwnerAccount parameter is invalid.
403	InvalidUserData.Forbidden	User not authorized to input the parameter "UserData", please apply for permission "UserData"	The error message returned because you are not authorized to manage user data.
403	Zone.NotOpen	The specified zone is not granted to you to buy resources yet.	The error message returned because you are not authorized to purchase resources in the specified zone.
403	Zone.NotOnSale	The specified zone is not available for purchase.	The error message returned because the requested resources are unavailable in the specified zone. Change the resource type or select a different zone.

HTTP status code	Error code	Error message	Description
403	InvalidDedicatedHostType.ValueNotSupported	The specified DedicatedHostType does not exist or beyond the permitted range.	The error message returned because the specified DedicatedHostType parameter does not exist.
403	InvalidDedicatedHostType.ZoneNotSupported	The specified zone does not support this dedicatedHostType.	The error message returned because the specified DedicatedHostType parameter is not supported in the specified zone.
400	InvalidAutoRenewPeriod.ValueNotSupported	The specified autoRenewPeriod is not valid.	The error message returned because the specified AutoReleaseTime parameter is invalid.
400	InvalidTagKey.Malformed	The specified Tag.n.Key is not valid.	The error message returned because the specified Tag.N.Key parameter is invalid.
400	InvalidDedicatedHostType.ValueNotSupported	%s	The error message returned because the specified DedicatedHostType parameter is invalid.
400	RegionUnauthorized	%s	The error message returned because you are not authorized to perform the operation in the specified region.
500	InternalError	%s	The error message returned because an internal error has occurred. Try again later.
400	Zone.NotOnSale	%s	The error message returned because the requested resources are unavailable in the specified zone.
400	OperationDenied	The specified DedicatedHostType or Zone is not available or not authorized.	The error message returned because the specified dedicated host type or zone is unavailable or you are not authorized to manage the resources.
400	InvalidPeriodUnit.ValueNotSupported	The specified parameter PeriodUnit is not valid.	The error message returned because the specified PeriodUnit parameter is invalid.

HTTP status code	Error code	Error message	Description
400	InvalidTagValue.Malformed	The specified Tag.n.Value is not valid.	The error message returned because the specified Tag.N.Value parameter is invalid.
403	InvalidParameter.NotMatch	%s	The error message returned because a specified parameter is invalid. Check whether parameter conflicts exist.
403	Account.Arrearage	Your account has been in arrears.	The error message returned because your account balance is insufficient. Add funds to your account and try again.
400	QuotaExceed.AfterpayDedicatedHost	The maximum number of Pay-As-You-Go DedicatedHosts is exceeded: %s	The error message returned because the pay-as-you-go resources of the specified dedicated host type are insufficient. Reduce the number of dedicated hosts to be created.
400	InvalidChargeType.ValueNotSupported	ChargeType is not valid	The error message returned because the specified billing method is invalid.
400	InvalidParameter.SlbUdpTimeout	The specified value is invalid.	The error message returned because the specified NetworkAttributes.SlbUdpTimeout parameter is invalid.
400	InvalidParameter.UdpTimeout	The specified value is invalid.	The error message returned because the specified NetworkAttributes.UdpTimeout parameter is invalid.
400	Duplicate.TagKey	The Tag.N.Key contain duplicate key.	The error message returned because the specified tag key already exists. Tag keys must be unique.

2.1.2.1.5.2. ModifyDedicatedHostAttribute

You can call this operation to modify some attributes of a dedicated host, such as the name, description, and instance migration policy applied when the dedicated host fails.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyDedicatedHostAttribute	The operation that you want to perform. Set this parameter to ModifyDedicatedHostAttribute.
DedicatedHostId	String	Yes	ddh-xxxxxxxxxxxxxxxxxxx	The ID of the dedicated host.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the dedicated host. You can call the DescribeRegions operation to query the most recent region list.
DedicatedHostName	String	No	myDDH	The name of the dedicated host. The name must be 2 to 128 characters in length and can contain letters, digits, colons (:), underscores (_), and hyphens (-). It must start with a letter and cannot start with http:// or https://.
Description	String	No	this-is-my-ddh	The description of the dedicated host. The description must be 2 to 256 characters in length and cannot start with http:// or https://.
ActionOnMaintenance	String	No	Migrate	The policy used to migrate the instances deployed on the dedicated host when the dedicated host fails or needs to be repaired online. Valid values: • Migrate: The instances are migrated to another physical server and restarted. • Stop: The instances on the dedicated host are stopped. If the dedicated host cannot be repaired, the instances are migrated to another physical server and restarted. If the dedicated host is attached with cloud disks, the default value is Migrate. If the dedicated host is attached with local disks, the default value is Stop.

Parameter	Type	Required	Example	Description
NetworkAttributes.SlbUdpTimeout	Integer	No	60	The timeout period of the UDP session that is established to SLB. Unit: seconds. Valid values: 15 to 310.
NetworkAttributes.UdpTimeout	Integer	No	60	The timeout period for the UDP session between a user and an Apsara Stack service on the dedicated host. Unit: seconds. Valid values: 15 to 310.
AutoPlacement	String	No	on	Specifies whether to add the dedicated host to the resource pool for automatic deployment. If you do not specify the **DedicatedHostId** parameter when you create an instance on a dedicated host, Apsara Stack automatically selects a dedicated host from the resource pool to host the instance. Valid values: • on: adds the dedicated host to the resource pool for automatic deployment. • off: does not add the dedicated host to the resource pool for automatic deployment.

Response parameters

Parameter	Type	Example	Description
RequestId	String	2A4EA075-CB5B-41B7-B0EB-70D339F64DE7	The ID of the request.

Examples

Sample requests

```
http(s)://ecs.example.com/? Action=ModifyDedicatedHostAttribute
&DedicatedHostId=ddh-xxxxxxxxxxxxxxxxxx
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyDedicatedHostAttributeResponse>
    <RequestId>2A4EA075-CB5B-41B7-B0EB-70D339F64DE7</RequestId>
</ModifyDedicatedHostAttributeResponse>
```

`JSON` format

```
{
    "RequestId":"2A4EA075-CB5B-41B7-B0EB-70D339F64DE7"
}
```

Error codes

HTTP status code	Error code	Error message	Description
404	InvalidDedicatedHostId.NotFound	The specified DedicatedHostId does not exist.	The error message returned because the specified DedicatedHostId parameter does not exist.
400	InvalidDedicatedHostName.Malformed	The specified parameter DedicatedHostName is not valid.	The error message returned because the specified DedicatedHostName parameter is invalid.
400	InvalidDescription.Malformed	The specified parameter Description is not valid.	The error message returned because the specified Description parameter is invalid. The description must be 2 to 256 characters in length and cannot start with http:// or https://.
403	InvalidUser.Unauthorized	The user is not authorized	The error message returned because you are not authorized to perform this operation.
400	InvalidParameter.SlbUdpTimeout	The specified value is invalid.	The error message returned because the specified NetworkAttributes.SlbUdpTimeout parameter is invalid.
400	InvalidParameter.UdpTimeout	The specified value is invalid.	The error message returned because the specified NetworkAttributes.UdpTimeout parameter is invalid.

2.1.2.1.5.3. ModifyInstanceDeployment

You can call this operation to change the deployment set of an instance or migrate an instance to a dedicated host. When you migrate an instance, you can change its instance type.

Description

When you migrate an instance to a dedicated host or change the instance type during the migration, make sure that the following requirements are met:

- The instance is in the **Stopped** (Stopped) state. The instance is automatically restarted after the migration.
- The instance is located in a VPC.
- The instance and the dedicated host belong to the same region, zone, and account.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyInstanceDeployment	The operation that you want to perform. Set the value to ModifyInstanceDeployment.
InstanceId	String	Yes	i-bp67acfmxazb4ph***	The ID of the instance. The instance must be in the **Stopped** (Stopped) state.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the instance. You can call the DescribeRegions operation to query the most recent region list.
DeploymentSetId	String	No	ds-bp67acfmxazb4ph***	The ID of the deployment set. If you want to add an instance to a deployment set or change the deployment set of an instance, you must specify this parameter. **Note** You cannot change the deployment set of an instance when you modify dedicated host-related parameters of the instance, such as `Tenancy`, `Affinity`, and `DedicatedHostId`.

Parameter	Type	Required	Example	Description
Force	Boolean	No	false	Specifies whether to forcibly change the host of the instance. Default value: false. Valid values: • true: forcibly changes the host of the instance. The instance must be in the **Running** (Running) or **Stopped** (Stopped) state so that it can be restarted for the host change to take effect. • false: does not forcibly change the host of the instance. You can add the instance to a deployment set only when the instance resides on the current host. If you change the host of the instance, deployment set replacement may fail.
DedicatedHostId	String	No	dh-bp67acfmxazb4ph***	The ID of the destination dedicated host. You can call the DescribeDedicatedHosts operation to query the available dedicated hosts. When you migrate an instance from a shared host to a dedicated host or from one dedicated host to another: • To migrate the instance to a specific dedicated host, you must specify this parameter. • To migrate the instance to an automatically selected dedicated host, you must leave this parameter empty and set `Tenancy` to host.
Tenancy	String	No	host	Specifies whether to deploy the instance on a dedicated host. Valid value: host. This value indicates that the instance is deployed on a dedicated host.

Parameter	Type	Required	Example	Description
MigrationType	String	No	live	Specifies whether to stop the instance to migrate it to the destination dedicated host. Default value: reboot. Valid values: • reboot: stops the instance to migrate it. • live: does not stop the instance to migrate it. In this case, you must specify **DedicatedHostId**. If you set MigrationType to live, you cannot change the instance type during the migration.
InstanceType	String	No	ecs.c6.large	The target instance type. You can call the DescribeInstanceTypes operation to query the most recent instance type list. When you migrate an instance to a dedicated host, you can change the instance type. The target instance type must match the specified dedicated host type. • To change the instance type, you must specify `DedicatedHostId`. • You cannot change the instance type when you use the automatic deployment feature to migrate the instance.

Response parameters

Parameter	Type	Example	Description
RequestId	String	04F0F334-1335-436C-A1D7-6C044FE73368	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=ModifyInstanceDeployment
&InstanceId=i-bp67acfmxazb4ph****
&RegionId=cn-qingdao-env17-d01
&DedicatedHostId=dh-bp67acfmxazb4ph****
&Tenancy=host
&MigrationType=live
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyInstanceDeploymentResponse>
      <RequestId>04F0F334-1335-436C-A1D7-6C044FE73368</RequestId>
</ModifyInstanceDeploymentResponse>
```

`JSON` format

```
{
    "RequestId": "04F0F334-1335-436C-A1D7-6C044FE73368"
}
```

Error codes

HTTP status code	Error code	Error message	Description
404	InvalidDedicatedHostId.NotFound	The specified DedicatedHostId does not exist.	The error message returned because the specified DedicatedHostId parameter does not exist.
404	InvalidInstanceId.NotFound	The specified InstanceId does not exist.	The error message returned because the specified InstanceId parameter does not exist.
400	OperationDenied.UnstoppedInstance	Operation denied due to unstopped instance.	The error message returned because the operation is not supported while the instance is in the current state. Check whether the instance is stopped.
400	InvalidDedicatedHostStatus.NotSupport	Operation denied due to dedicated host status.	The error message returned because the operation is not supported while the dedicated host is in the current state.
400	InvalidPeriod.ExceededDedicatedHost	Instance expired date can't exceed dedicated host expired date.	The error message returned because the expiration date of the instance is later than that of the dedicated host.
404	InvalidInstanceNetworkType.NotSupport	The specified Instance network type not support.	The error message returned because the operation is not supported while the instance is of the current network type.
404	InvalidInstanceType.NotSupport	The Dedicated host not support the specified instance type.	The error message returned because the dedicated host does not support the specified instance type.

HTTP status code	Error code	Error message	Description
400	OperationDenied.LocalDiskInstance	Operation denied due to instance has local disk	The error message returned because the operation is denied while the instance is equipped with local disks.
403	IncorrectInstanceStatus	%s	The error message returned because the operation is not supported while the instance is in the current state.
400	InvalidParam.Tenancy	The specified Tenancy is invalid.	The error message returned because the specified Tenancy parameter is invalid.
403	OperationDenied.NoStock	The resource is out of usage.	The error message returned because the instance is not in the Running state. Start the instance or check whether the operation is valid.
400	ChargeTypeViolation.PostPaidDedicatedHost	Prepaid instance onto postpaid dedicated host is not allowed	The error message returned because subscription instances cannot be deployed to pay-as-you-go dedicated hosts.
400	InvalidInstanceType.ValueNotSupported	The specified InstanceType does not exist or beyond the permitted range.	The error message returned because the specified InstanceType parameter does not exist or you are not authorized to manage instances of the specified instance type.

2.1.2.1.5.4. DescribeDedicatedHostTypes

You can call this operation to query the details about dedicated host types supported in a region, or the ECS instance families supported by a specific dedicated host type.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeDedicatedHostTypes	The operation that you want to perform. Set the value to DescribeDedicatedHostTypes.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region. You can call the DescribeRegions operation to query the most recent region list.
DedicatedHostType	String	No	ddh.sn1ne	The dedicated host type.
SupportedInstanceTypeFamily	String	No	ecs.sn1ne	The ECS instance family supported by the dedicated host type.

Response parameters

Parameter	Type	Example	Description
DedicatedHostTypes	Array		The collection of details about dedicated host types.
DedicatedHostType			
Cores	Integer	2	The number of cores in a single physical CPU.
DedicatedHostType	String	ddh.sn1ne	The dedicated host type. You can submit a ticket to request more dedicated host types.
GPUSpec	String	gpu	The GPU model.
LocalStorageAmount	Integer	0	The number of local disks on a dedicated host.
LocalStorageCapacity	Long	0	The capacity of a local disk. Unit: GiB.
LocalStorageCategory	String	local	The category of the local disk.
MemorySize	Float	112.0	The size of the memory. Unit: GiB.
PhysicalGpus	Integer	2	The number of physical GPUs.
Sockets	Integer	2	The number of physical CPUs.

Parameter	Type	Example	Description
SupportedInstanceTypeFamilies	List	ecs.sn1ne	The ECS instance families supported by the dedicated host type.
SupportedInstanceTypesList	List	ecs.sn1ne.large	The ECS instance types supported by the dedicated host type.
TotalVcpus	Integer	56	The total number of vCPUs.
TotalVgpus	Integer	10	The total number of vGPUs.
RequestId	String	5FE5FF06-3A33-4658-8495-6445FC54E327	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=DescribeDedicatedHostTypes
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeDedicatedHostTypesResponse>
    <DedicatedHostTypes>
        <DedicatedHostType>
            <LocalStorageAmount>0</LocalStorageAmount>
            <Sockets>2</Sockets>
            <DedicatedHostType>ddh.sn1ne</DedicatedHostType>
            <LocalStorageCapacity>0</LocalStorageCapacity>
            <SupportedInstanceTypeFamilies>

2.1.2.1.5.5. DescribeDedicatedHosts

You can call this operation to query the details about one or more dedicated hosts, including the physical performance specifications, machine code, service status, and a list of ECS instances that are deployed on the dedicated hosts.

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeDedicatedHosts	The operation that you want to perform. Set the value to DescribeDedicatedHosts.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the dedicated host. You can call the DescribeRegions operation to query the most recent region list.
ZoneId	String	No	cn-qingdao-env17-amtest11001-a	The zone ID of the dedicated host.
DedicatedHostIds	String	No	["dh-bp165p6xk2tlw61e****", "dh-bp165p6xk2tlw61e****", ... "dh-bp165p6xk2tlw61e****"]	The IDs of dedicated hosts. You can specify up to 100 dedicated host IDs in a single request. Separate multiple IDs with commas (,).
DedicatedHostName	String	No	test-DedicatedHostName	The name of the dedicated host.
Status	String	No	Available	The service status of the dedicated host. Default value: Available. Valid values: • Available: The dedicated host is available for use. • Under-Assessment: The dedicated host has potential failures and may fail when it is used. • Permanent-Failure: The dedicated host has permanent failures and cannot be used.
DedicatedHostType	String	No	ddh.g5	The dedicated host type.
PageNumber	Integer	No	1	The number of the page to return. Default value: 1.
PageSize	Integer	No	10	The number of entries to return on each page. Valid values: 1 to 100 Default value: 10.

Parameter	Type	Required	Example	Description
Tag.N.Key	String	No	TestKey	The key of tag N of the dedicated host. Valid values of N: 1 to 20. The tag key cannot be an empty string. It can be up to 128 characters in length and cannot contain http:// or https://. It cannot start with acs: or aliyun.
Tag.N.Value	String	No	TestValue	The value of tag N of the dedicated host. Valid values of N: 1 to 20. The tag value can be an empty string. It can be up to 128 characters in length and cannot contain http:// or https://. It cannot start with acs: or aliyun.

Response parameters

Parameter	Type	Example	Description
DedicatedHosts	Array		The collection of details about dedicated hosts.
DedicatedHost			
ActionOnMaintenance	String	Migrate	The policy used to migrate the instances deployed on the dedicated host when the dedicated host fails or needs to be repaired online. Valid values: • Migrate: The instances are migrated to another physical server and restarted. If the dedicated host is attached with cloud disks, the default value is Migrate. • Stop: The instances on the dedicated host are stopped. If the dedicated host cannot be repaired, the instances are migrated to another physical server and restarted. If the dedicated host is attached with local disks, the default value is Stop.

Parameter	Type	Example	Description
AutoPlacement	String	on	Indicates whether the dedicated host was added to the resource pool for automatic deployment. Valid values: • on: The dedicated host was added to the resource pool for automatic deployment. • off: The dedicated host was not added to the resource pool for automatic deployment.
AutoReleaseTime	String	2017-01-01T12:00:00Z	The automatic release time of the dedicated host. The time follows the ISO 8601 standard in the `yyyy-MM-ddTHH:mmZ` format. The time is displayed in UTC.
Capacity	Struct		The performance specifications of the dedicated host.
AvailableLocalStorage	Integer	65	The available space of the local disk. Unit: GiB.
AvailableMemory	Float	25	The available space of the memory. Unit: GiB.
AvailableVcpus	Integer	5	The number of available vCPUs.
AvailableVgpus	Integer	2	The number of available vGPUs.
LocalStorageCategory	String	i2	The category of the local disk.
TotalLocalStorage	Integer	512	The total capacity of the local disk. Unit: GiB.
TotalMemory	Float	1024	The total capacity of the memory. Unit: GiB.
TotalVcpus	Integer	56	The total number of vCPUs.
TotalVgpus	Integer	10	The total number of vGPUs.

Parameter	Type	Example	Description
ChargeType	String	test	**Note** This parameter is not supported.
Cores	Integer	3	The number of physical cores in a single CPU.
CreationTime	String	2018-01-01T12:00:00Z	The time when the dedicated host was created. The time follows the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time is displayed in UTC.
DedicatedHostId	String	dh-bp165p6xk2tlw61e****	The ID of the dedicated host.
DedicatedHostName	String	myDDH	The name of the dedicated host.
DedicatedHostType	String	ddh.g5	The dedicated host type.
Description	String	This is a description example.	The description of the dedicated host.
ExpiredTime	String	test	**Note** This parameter is not supported.
GPUSpec	String	gpu	The GPU model.
Instances	Array		The ECS instances that are deployed on the dedicated host.
Instance			
InstanceId	String	i-bp1a0cmfrfi71qlh3fk3	The ID of the ECS instance.
InstanceType	String	ecs.g5	The instance family of the ECS instance.
MachineId	String	2099-09-08T16:00Z	The machine code of the dedicated host.

Parameter	Type	Example	Description
NetworkAttributes	Struct		The network attributes of the dedicated host.
SlbUdpTimeout	Integer	60	The timeout period of the UDP session that was established to SLB.
UdpTimeout	Integer	60	The timeout period of the UDP session.
OperationLocks	Array		The reasons why the resources of the dedicated host were locked.
OperationLock			
LockReason	String	financial	The reason why the resource of the dedicated host was locked.
PhysicalGpus	Integer	10	The number of physical GPUs.
RegionId	String	cn-qingdao-env17-d01	The region ID of the dedicated host.
ResourceGroupId	String	rg-****	The ID of the resource group to which the dedicated host belongs.
SaleCycle	String	test	**Note** This parameter is not supported.
Sockets	Integer	5	The number of physical CPUs.
Status	String	Available	The service status of the dedicated host. Valid values: Available, Under-Assessment, and Permanent-Failure.
SupportedCustomInstanceTypeFamilies	List	ecs.ddh6s.custom	The custom instance families supported by the dedicated host.
SupportedInstanceTypeFamilies	List	ecs.g5	The ECS instance types supported by the dedicated host.

Parameter	Type	Example	Description
SupportedInstanceTypesList	List	ecs.g5	The ECS instance type supported by the dedicated host.
Tags	Array		The tags of the dedicated host.
Tag			
TagKey	String	TestKey	The tag key of the dedicated host.
TagValue	String	TestValue	The tag value of the dedicated host.
ZoneId	String	cn-qingdao-env17-amtest11001-a	The zone ID of the dedicated host.
PageNumber	Integer	5	The page number of the returned page.
PageSize	Integer	1	The number of entries returned per page.
RequestId	String	C9E9EA51-6B74-409E-BA40-107126A200D4	The ID of the request.
TotalCount	Integer	3	The total number of dedicated hosts.

```

Error codes

HTTP status code	Error code	Error message	Description
400	InvalidStatus.ValueNotSupported	The pecified dedicated host status is not supported.	The error message returned because the operation is not supported while the dedicated host is in the current state.
400	MissingParamter.RegionId	The regionId should not be null.	The error message returned because the required RegionId parameter is not specified.
403	InvalidDedicatedHostIds.Malformed	The amount of specified dedicatedHostIds exceeds the limit.	The error message returned because more than 100 dedicated host IDs are specified in the DedicatedHostIds value.
400	InvalidParameter.DedicatedHostIds	The specified parameter dedicatedHostIds is not valid.	The error message returned because the specified DedicatedHostIds parameter is invalid.
400	InvalidRegion.NotFound	The specified parameter RegionId is not valid.	The error message returned because the specified RegionId parameter is invalid.
400	InvalidZone.NotFound	The specified parameter ZoneId is not valid.	The error message returned because the specified ZoneId parameter is invalid.
404	InvalidLockReason.NotFound	The specified LockReason is not found	The error message returned because the specified reason why the resources of the dedicated host were locked does not exist.

2.1.2.1.5.6. ReleaseDedicatedHost

You can call this operation to release a dedicated host.

Description

Before you release a dedicated host, make sure that no ECS instances are deployed on the dedicated host.

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	ReleaseDedicatedHost	The operation that you want to perform. Set the value to ReleaseDedicatedHost.
DedicatedHostId	String	Yes	dh-xxxxxxxxxxxxxxxx	The ID of the dedicated host to be released.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the dedicated host. You can call the DescribeRegions operation to query the most recent region list.

Response parameters

Parameter	Type	Example	Description
RequestId	String	A1B15AC8-E6F6-49A4-8985-8C07104B9199	The ID of the request.

Examples

Sample requests

```
http(s)://ecs.example.com/? Action=ReleaseDedicatedHost
&DedicatedHostId=dh-xxxxxxxxxxxxxxxx
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ReleaseDedicatedHostResponse>
    <RequestId>A1B15AC8-E6F6-49A4-8985-8C07104B9199</RequestId>
</ReleaseDedicatedHostResponse>
```

`JSON` format

```
{
    "RequestId":"A1B15AC8-E6F6-49A4-8985-8C07104B9199"
}
```

Error codes

HTTP status code	Error code	Error message	Description
403	InstanceExist	Instance exists on the dedicated host.	The error message returned because ECS instances exist on the dedicated host.
400	ChargeTypeViolation	The operation is not permitted due to charge type of the dedicated host.	The error message returned because the billing method of the dedicated host does not support this operation.
400	IncorrectHostStatus.Initializing	The specified dedicatedHost status is not support this operation	The error message returned because the operation is not supported while the dedicated host is in the current state.
404	InvalidDedicatedHostId.NotFound	The specified DedicatedHostId does not exist.	The error message returned because the specified DedicatedHostId parameter does not exist.
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.

2.1.2.1.5.7. CreateDedicatedHostCluster

You can call this operation to create a dedicated host cluster.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateDedicatedHostCluster	The operation that you want to perform. Set the value to CreateDedicatedHostCluster.
RegionId	String	Yes	cn-qingdao-env8e-d01	The ID of the region in which to create the dedicated host cluster. You can call the DescribeRegions operation to query the most recent region list.

Parameter	Type	Required	Example	Description
DryRun	Boolean	No	false	Specifies whether to check the validity of the request without actually making the request. Valid values: • true: The validity of the request is checked but the request is not made. Check items include whether your AccessKey pair is valid, whether RAM users are authorized, and whether the required parameters are specified. If the check fails, the corresponding error is returned. If the check succeeds, the `DryRunOperation` error code is returned. • false: The validity of the request is checked. If the check succeeds, a 2XX HTTP status code is returned and the request is made. Default value: false.
Tag.N.Key	String	No	TestKey	The key of tag N to be bound to the dedicated host cluster. Valid values of N: 1 to 20. The tag key cannot be an empty string. It can be up to 64 characters in length and cannot start with `acs:` or `aliyun`. It cannot contain `http://` or `https://`.
Tag.N.Value	String	No	TestValue	The value of tag N to be bound to the dedicated host cluster. Valid values of N: 1 to 20. The tag value cannot be an empty string. It can be up to 64 characters in length and cannot start with `acs:` or `aliyun`. It cannot contain `http://` or `https://`.
ResourceGroupId	String	No	rg-bp67acfmxazb4p****	The ID of the resource group to which to assign the dedicated host cluster.
ZoneId	String	No	cn-qingdao-env8e-nu20001-a	The ID of the zone in which to create the dedicated host cluster. You can call the DescribeZones operation to query the most recent zone list.

Parameter	Type	Required	Example	Description
DedicatedHostClusterName	String	No	myDDHCluster	The name of the dedicated host cluster. The name must be 2 to 128 characters in length and can contain letters, digits, periods (.), underscores (_), and hyphens (-). It must start with a letter. It cannot contain `http://` or `https://`. This parameter is empty by default.
Description	String	No	This-is-my-DDHCluster	The description of the dedicated host cluster. The description must be 2 to 256 characters in length. It cannot start with `http://` or `https://`. This parameter is empty by default.

Response parameters

Parameter	Type	Example	Description
DedicatedHostClusterId	String	dc-bp12wlf6bw0vz9v2****	The ID of the dedicated host cluster.
RequestId	String	E2A664A6-2933-4C64-88AE-5033D003EADF	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=CreateDedicatedHostCluster
&RegionId=cn-qingdao-env8e-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreateDedicatedHostClusterResponse>
        <RequestId>214A2187-B06F-4E49-A081-4D053466A8C7</RequestId>
        <DedicatedHostClusterId>dc-bp12wlf6bw0vz9v2****</DedicatedHostClusterId>
</CreateDedicatedHostClusterResponse>
```

`JSON` format

```
{
    "RequestId": "214A2187-B06F-4E49-A081-4D053466A8C7",
    "DedicatedHostClusterId": "dc-bp12wlf6bw0vz9v2****"
}
```

Error codes

HTTP status code	Error code	Error message	Description
404	InvalidResourceGroup.NotFound	The ResourceGroup provided does not exist in our records.	The error message returned because the specified ResourceGroupId parameter does not exist.
400	InvalidTagKey.Malformed	The specified Tag.n.Key is not valid.	The error message returned because the specified Tag.N.Key parameter is invalid.
400	InvalidTagValue.Malformed	The specified Tag.n.Value is not valid.	The error message returned because the specified Tag.N.Value parameter is invalid.
400	Duplicate.TagKey	The Tag.N.Key contain duplicate key.	The error message returned because the specified tag key already exists. Tag keys must be unique.

2.1.2.1.5.8. DescribeDedicatedHostClusters

You can call this operation to query details of one or more dedicated host clusters.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeDedicatedHostClusters	The operation that you want to perform. Set the value to DescribeDedicatedHostClusters.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-qingdao-env8e-d01	The region ID of the dedicated host cluster. You can call the DescribeRegions operation to query the most recent region list.
Tag.N.Key	String	No	TestKey	The key of tag N of the dedicated host cluster. Valid values of N: 1 to 20. The tag key cannot be an empty string. It can be up to 64 characters in length and cannot start with `acs:` or `aliyun`. It cannot contain `http://` or `https://`. If a single tag is specified to query resources, up to 1,000 resources that are bound with this tag can be displayed in the response. If multiple tags are specified to query resources, up to 1,000 resources that are bound with all these tags can be displayed in the response. To query more than 1,000 resources that are bound with specified tags, call the ListTagResources operation.
Tag.N.Value	String	No	TestValue	The value of tag N of the dedicated host cluster. Valid values of N: 1 to 20. The tag value cannot be an empty string. It can be up to 64 characters in length and cannot start with `acs:` or `aliyun`. It cannot contain `http://` or `https://`.
ResourceGroupId	String	No	rg-bp67acfmxazb4p****	The ID of the resource group to which the dedicated host cluster belongs. If this parameter is specified to query resources, up to 1,000 resources that belong to the specified resource group can be displayed in the response.
ZoneId	String	No	cn-qingdao-env8e-nu20001-a	The zone ID of the dedicated host cluster. You can call the DescribeZones operation to query the most recent zone list.

Parameter	Type	Required	Example	Description
DedicatedHostClusterIds	String	No	["dc-bp12wlf6am0vz9v2****", "dc-bp12wlf6am0vz9v3****"]	The IDs of dedicated host clusters. The value can be a JSON array that consists of up to 100 dedicated host cluster IDs in the format of `["dc-xxxxxxxxx", "dc-yyyyyyyyy", ... "dc-zzzzzzzzz"]`. Separate multiple IDs with commas (,).
DedicatedHostClusterName	String	No	myDDHCluster	The name of the dedicated host cluster.
PageNumber	Integer	No	1	The number of the page to return. Pages start from page 1. Default value: 1.
PageSize	Integer	No	5	The number of entries to return per page. Valid values: 1 to 100. Default value: 10.

Response parameters

Parameter	Type	Example	Description
DedicatedHostClusters	Array of DedicatedHostCluster		Details about the dedicated host clusters.
DedicatedHostCluster			
DedicatedHostClusterCapacity	Struct		The capacity of the dedicated host cluster.
AvailableMemory	Integer	4	The available memory size. Unit: GiB.
AvailableVcpus	Integer	2	The number of available vCPUs.
LocalStorageCapacities	Array of LocalStorageCapacity		The local storage capacity.

Parameter	Type	Example	Description
LocalStorageCapacity			
AvailableDisk	Integer	20	The available capacity of the local disk. Unit: GiB.
DataDiskCategory	String	cloud	The category of the data disk. Valid values: • cloud: basic disk. • cloud_efficiency: ultra disk • cloud_ssd: standard SSD
TotalDisk	Integer	40	The total capacity of the local disk. Unit: GiB.
TotalMemory	Integer	8	The total memory size. Unit: GiB.
TotalVcpus	Integer	4	The total number of vCPUs.
DedicatedHostClusterId	String	dc-bp12wlf6am0vz9v2****	The ID of the dedicated host cluster.
DedicatedHostClusterName	String	myDDHCluster	The name of the dedicated host cluster.
DedicatedHostIds	List	["dh-bp181e5064b5sotr*****","dh-bp18064b5sotrr9c*****"]	The IDs of dedicated hosts in the dedicated host cluster.
Description	String	This-is-my-DDHCluster	The description of the dedicated host cluster.
RegionId	String	cn-qingdao-env8e-d01	The region ID of the dedicated host cluster.
ResourceGroupId	String	rg-bp67acfmxazb4p****	The ID of the resource group to which the dedicated host cluster belongs.
Tags	Array of Tag		The tags of the dedicated host cluster.
Tag			

Parameter	Type	Example	Description
TagKey	String	TestKey	The tag key of the dedicated host cluster.
TagValue	String	TestValue	The tag value of the dedicated host cluster.
ZoneId	String	cn-qingdao-env8e-nu20001-a	The zone ID of the dedicated host cluster.
PageNumber	Integer	1	The page number of the returned page.
PageSize	Integer	5	The number of entries returned per page.
RequestId	String	214A2187-B06F-4E49-A081-4D053466A8C7	The ID of the request.
TotalCount	Integer	2	The total number of dedicated host clusters.

Examples

Error codes

HTTP status code	Error code	Error message	Description
400	MissingParamter.RegionId	The regionId should not be null.	The error message returned because the RegionId parameter is not specified.
400	InvalidRegion.NotFound	The specified parameter RegionId is not valid.	The error message returned because the specified RegionId parameter is invalid.
400	InvalidZone.NotFound	The specified parameter ZoneId is not valid.	The error message returned because the specified ZoneId parameter is invalid.

2.1.2.1.5.9. ModifyDedicatedHostClusterAttribute

You can call this operation to modify some attributes of a dedicated host cluster, such as the name and description.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyDedicatedHostClusterAttribute	The operation that you want to perform. Set the value to ModifyDedicatedHostClusterAttribute.
DedicatedHostClusterId	String	Yes	dc-bp12wlf6am0vz9v2****	The ID of the dedicated host cluster.
RegionId	String	Yes	cn-qingdao-env8e-d01	The region ID of the dedicated host cluster. You can call the DescribeRegions operation to query the most recent region list.
DedicatedHostClusterName	String	No	newClusterName	The new name of the dedicated host cluster. The name must be 2 to 128 characters in length and can contain letters, digits, periods (.), underscores (_), and hyphens (-). It must start with a letter. The name cannot contain `http://` or `https://`.
Description	String	No	newClusterDescription	The new description of the dedicated host cluster. The description must be 2 to 256 characters in length. It cannot start with `http://` or `https://`.

Response parameters

Parameter	Type	Example	Description
RequestId	String	11B55F58-D3A4-4A9B-9596-342420D02FF8	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=ModifyDedicatedHostClusterAttribute
&RegionId=cn-qingdao-env8e-d01
&DedicatedHostClusterId=dc-bp12wlf6am0vz9v2****
&DedicatedHostClusterName=newClusterName
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyDedicatedHostClusterAttributeResponse>
        <RequestId>11B55F58-D3A4-4A9B-9596-342420D02FF8</RequestId>
</ModifyDedicatedHostClusterAttributeResponse>
```

`JSON` format

```
{
    "RequestId": "11B55F58-D3A4-4A9B-9596-342420D02FF8"
}
```

Error codes

HTTP status code	Error code	Error message	Description
400	InvalidDescription.Malformed	The specified parameter Description is not valid.	The error message returned because the specified Description parameter is invalid. The description must be 2 to 256 characters in length and cannot start with http:// or https://.
403	InvalidUser.Unauthorized	The user is not authorized	The error message returned because you are not authorized to perform this operation.

2.1.2.1.5.10. DeleteDedicatedHostCluster

You can call this operation to delete a dedicated host cluster.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteDedicatedHostCluster	The operation that you want to perform. Set the value to DeleteDedicatedHostCluster.

Parameter	Type	Required	Example	Description
DedicatedHostClusterId	String	Yes	dc-bp12wlf6am0vz9v2****	The ID of the dedicated host cluster.
RegionId	String	Yes	cn-qingdao-env8e-d01	The region ID of the dedicated host cluster.

Response parameters

Parameter	Type	Example	Description
RequestId	String	11B55F58-D3A4-4A9B-9596-342420D02FF8	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=DeleteDedicatedHostCluster
&DedicatedHostClusterId=dc-bp12wlf6am0vz9v2****
&RegionId=cn-qingdao-env8e-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteDedicatedHostClusterResponse>
        <RequestId>11B55F58-D3A4-4A9B-9596-342420D02FF8</RequestId>
</DeleteDedicatedHostClusterResponse>
```

`JSON` format

```
{
    "RequestId": "11B55F58-D3A4-4A9B-9596-342420D02FF8"
}
```

2.1.2.1.6. Deployment set

2.1.2.1.6.1. CreateDeploymentSet

You can call this operation to create a deployment set in a specified region.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateDeploymentSet	The operation that you want to perform. Set the value to CreateDeploymentSet.
RegionId	String	Yes	cn-qingdao-****	The ID of the region in which to create the deployment set. You can call the DescribeRegions operation to query the most recent region list.
OnUnableToRedeployFailedInstance	String	No	CancelMembershipAndStart	The emergency solution to be used in the following situation: Instances in the deployment set cannot be evenly distributed to different zones due to resource insufficiency after the instances are failed over from faulty physical machines to normal physical machines. Default value: CancelMembershipAndStart. Valid values: • CancelMembershipAndStart: removes the instances from the deployment set and restarts the instances immediately after the failover is complete. • KeepStopped: keeps the instances in the abnormal state and restarts them after ECS resources are replenished.
Description	String	No	This is a description example.	The description of the deployment set. The description must be 2 to 256 characters in length and cannot start with http:// or https://.
ClientToken	String	No	123e4567-e89b-12d3-a456-426655440000	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must ensure that it is unique among different requests. The **ClientToken** value can only contain ASCII characters and cannot exceed 64 characters in length. For more information, see How to ensure idempotence in ECS Developer Guide.

Parameter	Type	Required	Example	Description
DeploymentSetName	String	No	FinanceDeployment	The name of the deployment set. The name must be 2 to 128 characters in length and can contain letters, digits, colons (:), underscores (_), and hyphens (-). It must start with a letter and cannot start with http:// or https://.
Domain	String	No	null	The deployment domain. Valid values: • Default • Switch Default value: Default
Granularity	String	No	null	The deployment granularity. Valid values: • Host: The minimum scheduling granularity is a physical server. • Rack: The minimum scheduling granularity is a rack. • Switch: The minimum scheduling granularity is a VSwitch. Default value: Host. If Domain is set to Switch, you cannot set Granularity to Switch.
Strategy	String	No	null	The deployment strategy. Valid values: • LooseDispersion: dispersed as much as possible • LooseAggregation: aggregated as much as possible • StrictAggregation: strictly aggregated • StrictDispersion: strictly dispersed Default value: LooseDispersion. If Granularity is set to Switch, you can set Strategy to one of the preceding values. If Granularity is set to Rack or Host, you can set Strategy only to LooseDispersion or StrictDispersion.

Response parameters

Parameter	Type	Example	Description
DeploymentSetId	String	ds-bp1frxuzdg87zh4pzq***	The ID of the deployment set.
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=CreateDeploymentSet
&RegionId=cn-qingdao-****
&DeploymentSetName=FinanceDeployment
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreateDeploymentSetResponse>
      <RequestId>04F0F334-1335-436C-A1D7-6C044FE73368</RequestId>
      <DeploymentSetId>ds-bp1frxuzdg87zh4pzq***</DeploymentSetId>
</CreateDeploymentSetResponse>
```

`JSON` format

```
{
    "RequestId": "04F0F334-1335-436C-A1D7-6C044FE73368",
    "DeploymentSetId": "ds-bp1frxuzdg87zh4pzq***"
}
```

Error codes

HTTP status code	Error code	Error message	Description
400	MissingParameter	The input parameter RegionId that is mandatory for processing this request is not supplied.	The error message returned because the required RegionId parameter is not specified.
400	InvalidDeploymentSetName.Malformed	Specified deployment set name is not valid.	The error message returned because the specified DeploymentSetName parameter is invalid.

HTTP status code	Error code	Error message	Description
400	InvalidDescription.Malformed	The specified parameter Description is not valid.	The error message returned because the specified Description parameter is invalid. The description must be 2 to 256 characters in length and cannot start with http:// or https://.
400	InvalidDeploymentSetId.NotFound	The specified DeploymentSetId does not exist.	The error message returned because the specified deployment set ID does not exist.
400	MissingParameter	The input parameter DeploymentSetId that is mandatory for processing this request is not supplied.	The error message returned because the required DeploymentSetId parameter is not specified.
400	InvalidParameter.Domain	The specified parameter Domain is not valid.	The error message returned because the specified Domain parameter is invalid.
400	InvalidParameter.Strategy	The specified parameter Strategy is not valid	The error message returned because the specified Strategy parameter is invalid.
400	InvalidParameter.granularity	The specified parameter Granularity is not valid.	The error message returned because the specified Granularity parameter is invalid.
400	DependencyViolation.domain.granularity	The DeploymentSet domain and granularity is violation.	The error message returned because the specified Domain and Granularity parameters do not correspond to each other.
400	DependencyViolation.strategy.granularity	The DeploymentSet strategy and granularity is violation.	The error message returned because the specified Strategy and Granularity parameters do not correspond to each other.
400	DEPLOYMENTSET.QUOTA_FULL	The deploymentSet quota is full	The error message returned because the maximum number of deployment sets has been reached.

2.1.2.1.6.2. ModifyDeploymentSetAttribute

You can call this operation to modify the name and description of a deployment set.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyDeploymentSetAttribute	The operation that you want to perform. If you use a custom HTTP URL or HTTPS URL to make an API request, you must specify the `Action` parameter. Set the value to ModifyDeploymentSetAttribute.
DeploymentSetId	String	Yes	ds-bp1frxuzdg87zh4p****	The ID of the deployment set to be modified.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the deployment set. You can call the DescribeRegions operation to query the most recent region list.
Description	String	No	TestDescription	The new description of the deployment set. The description must be 2 to 256 characters in length and cannot start with http:// or https://.
DeploymentSetName	String	No	DeploymentSetTestName	The new name of the deployment set. The name must be 2 to 128 characters in length and can contain letters, digits, colons (:), underscores (_), and hyphens (-). It must start with a letter and cannot start with http:// or https://.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=ModifyDeploymentSetAttribute
&RegionId=cn-qingdao-env17-d01
&DeploymentSetId=ds-bp1frxuzdg87zh4p****
&DeploymentSetName=DeploymentSetTestName
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyDeploymentSetAttributeResponse>
      <RequestId>04F0F334-1335-436C-A1D7-6C044FE73368</RequestId>
</ModifyDeploymentSetAttributeResponse>
```

`JSON` format

```
{
    "RequestId": "04F0F334-1335-436C-A1D7-6C044FE73368"
}
```

Error codes

HTTP status code	Error code	Error message	Description
400	MissingParameter	The input parameter RegionId that is mandatory for processing this request is not supplied.	The error message returned because the required RegionId parameter is not specified.
400	InvalidDeploymentSetName.Malformed	Specified deployment set name is not valid.	The error message returned because the specified DeploymentSetName parameter is invalid.
400	InvalidDescription.Malformed	The specified parameter Description is not valid.	The error message returned because the specified Description parameter is invalid. The description must be 2 to 256 characters in length and cannot start with http:// or https://.
400	InvalidDeploymentSetId.NotFound	The specified DeploymentSetId does not exist.	The error message returned because the specified DeploymentSetId parameter does not exist.
403	QuotaExceed.DeploymentSetInstanceQuotaFull	instance quota in one deployment set exceeded.	The error message returned because the maximum number of instances in the current deployment set has been reached.

2.1.2.1.6.3. DescribeDeploymentSets

You can call this operation to query the attributes of one or more deployment sets.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeDeploymentSets	The operation that you want to perform. Set the value to DescribeDeploymentSets.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the deployment set. You can call the DescribeRegions operation to query the most recent region list.
PageNumber	Integer	No	1	The number of the page to return. Pages start from page 1. Default value: 1
PageSize	Integer	No	10	The number of the page to return . Valid values: 1 to 50 Default value: 10
DeploymentSetIds	String	No	["ds-bp67acfmxazb4ph***", "ds-bp67acfmxazb4pi***", ... "ds-bp67acfmxazb4pj***"]	The IDs of deployment sets. The value can be a JSON array that consists of up to 100 deployment set IDs. Separate multiple deployment set IDs with commas (,).
DeploymentSetName	String	No	FinanceDeployemn****	The name of the deployment set.
Strategy	String	No	Availability	The deployment strategy. Valid values: • LooseDispersion: dispersed as much as possible • LooseAggregation: aggregated as much as possible • StrictAggregation: strictly aggregated • StrictDispersion: strictly dispersed Default value: LooseDispersion. If Granularity is set to Switch, you can set Strategy to one of the preceding values. If Granularity is set to Rack or Host, you can set Strategy only to LooseDispersion or StrictDispersion.

Parameter	Type	Required	Example	Description
NetworkType	String	No	null	The network type of instances in the deployment set. **Note** This parameter will be removed in the future. We recommend that you use other parameters to ensure future compatibility.
Granularity	String	No	null	The deployment granularity. Valid values: • Host: The minimum scheduling granularity is a physical server. • Rack: The minimum scheduling granularity is a rack. • Switch: The minimum scheduling granularity is a VSwitch. Default value: Host
Domain	String	No	null	The deployment domain. Valid values: • Default • Switch Default value: Default

Response parameters

Parameter	Type	Example	Description
DeploymentSets	Array		The collection of details about deployment sets.
DeploymentSet			
CreationTime	String	2017-12-05T22:40:00Z	The time when the deployment set was created.
DeploymentSetDescription	String	FinanceDeptLooseDispersion	The description of the deployment set.
DeploymentSetId	String	ds-deploymentse****	The ID of the deployment set.

Parameter	Type	Example	Description
DeploymentSetName	String	FinanceDept	The name of the deployment set.
DeploymentStrategy	String	Availability	The deployment strategy.
Domain	String	Default	The deployment domain.
Granularity	String	Host	The deployment granularity.
InstanceAmount	Integer	1	The number of instances in the deployment set.
InstanceIds	List	["i-instanc****"]	The IDs of the instances in the deployment set.
Strategy	String	StrictDispersion	The deployment strategy.
PageNumber	Integer	1	The page number of the returned page.
PageSize	Integer	10	The number of entries returned per page.
RegionId	String	cn-qingdao-env17-d01	The region ID of the deployment set.
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.
TotalCount	Integer	1	The total number of queried deployment sets.

Examples

Sample requests

```
https://ecs.example.com/?Action=DescribeDeploymentSets
&RegionId=cn-qingdao-env17-d01
&PageSize=1
&<Common request parameters>
```

Sample success responses

```

Error codes

HTTP status code	Error code	Error message	Description
403	InvalidDeploymentSetIds.TooManyInput	The parameter DeploymentSets size should less than 100.	The error message returned because more than 100 deployment sets are specified.

2.1.2.1.6.4. DeleteDeploymentSet

You can call this operation to delete a deployment set.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteDeploymentSet	The operation that you want to perform. Set the value to DeleteDeploymentSet.

Parameter	Type	Required	Example	Description
DeploymentSetId	String	Yes	ds-deploymentsetid1	The ID of the deployment set. You cannot delete a deployment set that contains instances.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the deployment set. You can call the DescribeRegions operation to query the most recent region list.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=DeleteDeploymentSet
&RegionId=cn-qingdao-env17-d01
&DeploymentSetId=ds-bp1frxuzdg87zh4pz***
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteDeploymentSetResponse>
      <RequestId>04F0F334-1335-436C-A1D7-6C044FE73368</RequestId>
</DeleteDeploymentSetResponse>
```

`JSON` format

```
{
    "RequestId": "04F0F334-1335-436C-A1D7-6C044FE73368"
}
```

Error codes

HTTP status code	Error code	Error message	Description

HTTP status code	Error code	Error message	Description
400	MissingParameter	The input parameter "DeploymentSetId" that is mandatory for processing this request is not supplied.	The error message returned because the required DeploymentSetId parameter is not specified.
403	DependencyViolation.NotEmpty	There are still instance(s) in the specified DeploymentSetId.	The error message returned because the specified deployment set contains instances and cannot be deleted.
403	DependencyViolation.ReferByHPC	The specified deployment set is still referred by an HPC cluster.	The error message returned because the specified deployment set is associated with other HPC clusters.

2.1.2.1.7. Disks

2.1.2.1.7.1. CreateDisk

You can call this operation to create a data disk such as a basic disk, ultra disk, standard SSD, or enhanced SSD (ESSD).

Description

- By default, the DeleteAutoSnapshot parameter is set to true when a disk is created. This indicates that when the disk is released, the automatic snapshots of the disk are deleted. You can call the ModifyDiskAttribute operation to modify the DeleteAutoSnapshot value.
- You must specify either the Size or SnapshotId parameter. The Size parameter specifies the size of the disk and the SnapshotId parameter specifies the snapshot that is used to create the disk.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateDisk	If you use a custom HTTP URL or HTTPS URL to make an API request, you must specify the `Action` parameter. Set the value to CreateDisk.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region in which to create the disk. You can call the DescribeRegions operation to query the most recent region list.

Parameter	Type	Required	Example	Description
ZoneId	String	No	cn-qingdao-env17-amtest11001-a	The ID of the zone in which to create the disk.
SnapshotId	String	No	s-bp67acfmxazb4p****	The ID of the snapshot used to create the disk. If this parameter is specified, the Size parameter is ignored, and the disk is created with the size of the specified snapshot. The snapshots created on or before July 15, 2013 cannot be used to create disks.
DiskName	String	No	test-DiskName	The name of the disk. The name must be 2 to 128 characters in length and can contain letters, digits, colons (:), underscores (_), and hyphens (-). It must start with a letter and cannot start with http:// or https://. This parameter is empty by default.
Size	Integer	No	2000	The size of the disk. Unit: GiB. The value of this parameter must be greater than or equal to the size of the specified snapshot. Valid values: • Valid values for a basic disk: 5 to 2000 • Valid values for an ultra disk: 20 to 32768 • Valid values for a standard SSD: 20 to 32768 • Valid values for an ESSD: 20 to 32768
DiskCategory	String	No	cloud_ssd	The category of the data disk. Valid values: • cloud: basic disk • cloud_efficiency: ultra disk • cloud_ssd: standard SSD • cloud_essd: ESSD Default value: cloud

Parameter	Type	Required	Example	Description
Description	String	No	This is a description example.	The description of the disk. The description must be 2 to 256 characters in length and cannot start with http:// or https://. This parameter is empty by default.
Encrypted	Boolean	No	false	Specifies whether to encrypt the disk. Default value: false.
ClientToken	String	No	123e4567-e89b-12d3-a456-426655440000	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must ensure that it is unique among different requests. The **ClientToken** value can only contain ASCII characters and cannot exceed 64 characters in length. For more information, see How to ensure idempotence in ECS Developer Guide.
InstanceId	String	No	i-bp1g6zv0ce8ogp12****	The ID of the instance to which to automatically attach the disk after the disk is created. • If this parameter is specified, the specified ResourceGroupId, Tag.N.Key, Tag.N.Value, ClientToken, and KMSKeyId parameters are ignored. • You cannot specify both ZoneId and InstanceId.
Tag.N.value	String	No	TestValue	The value of tag N to be bound to the disk.
Tag.N.key	String	No	TestKey	The key of tag N to be bound to the disk.
Tag.N.Key	String	No	TestKey	The key of tag N to be bound to the disk. Valid values of N: 1 to 20. The tag key cannot be an empty string. It can be up to 128 characters in length and cannot contain http:// or https://. It cannot start with acs: or aliyun.

Parameter	Type	Required	Example	Description
Tag.N.Value	String	No	TestValue	The value of tag N to be bound to the disk. Valid values of N: 1 to 20. The tag value can be an empty string. It can be up to 128 characters in length. It cannot start with acs: or contain http:// or https://.
ResourceGroupId	String	No	rg-bp67acfmxazb4p****	The ID of the resource group to which to assign the disk.
KMSKeyId	String	No	0e478b7a-4262-4802-b8cb-00d3fb40826X	The ID of the KMS key used by the disk.
PerformanceLevel	String	No	PL1	The performance level of the ESSD. Default value: PL1. Valid values: • PL1: A single ESSD can deliver up to 50,000 random read/write IOPS. • PL2: A single ESSD can deliver up to 100,000 random read/write IOPS. • PL3: A single ESSD can deliver up to 1,000,000 random read/write IOPS.
StorageSetId	String	No	ss-bp67acfmxazb4p****	The ID of the storage set.
EncryptAlgorithm	String	No	aes-256	The encryption algorithm. Valid values: • aes-256: AES-256 algorithm • sm4-128: SM4 encryption algorithm
StorageSetPartitionNumber	Integer	No	3	The number of partitions in the storage set.

Response parameters

Parameter	Type	Example	Description
DiskId	String	d-bp131n0q38u3a4zi1****	The ID of the disk.
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=CreateDisk
&RegionId=cn-qingdao-env17-d01
&ZoneId=cn-qingdao-env17-amtest11001-a
&SnapshotId=s-bp67acfmxazb4p****
&DiskName=test-DiskName
&Size=2000
&DiskCategory=cloud_ssd
&Description=This is a description example.
&Encrypted=false
&ClientToken=123e4567-e89b-12d3-a456-426655440000
&Tag.1.Key=TestKey
&Tag.1.Value=TestValue
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreateDiskResponse>
      <RequestId>473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E</RequestId>
      <DiskId>d-bp131n0q38u3a4zi1****</DiskId>
</CreateDiskResponse>
```

`JSON` format

```
{
    "RequestId": "473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E",
    "DiskId": "d-bp131n0q38u3a4zi1****"
}
```

Error codes

HTTP status code	Error code	Error message	Description
400	InvalidSize.ValueNotSupported	The specified parameter Size is not valid.	The error message returned because the specified Size parameter is invalid.
403	InvalidDataDiskCategory.NotSupported	Specified disk category is not supported.	The error message returned because the specified DiskCategory parameter is invalid.
404	InvalidRegionId.NotFound	The specified RegionId does not exist.	The error message returned because the specified RegionId parameter does not exist.

HTTP status code	Error code	Error message	Description
404	InvalidZoneId.NotFound	The specified zone does not exist.	The error message returned because the specified ZoneId parameter does not exist.
404	InvalidSnapshotId.NotFound	The specified SnapshotId does not exist.	The error message returned because the specified SnapshotId parameter does not exist.
400	InvalidDiskName.Malformed	The specified disk name is wrongly formed.	The error message returned because the specified DiskName parameter is invalid. The name must be 2 to 128 characters in length and can contain letters, digits, periods (.), underscores (_), and hyphens (-). It must start with a letter and cannot start with http:// or https://.
400	InvalidDescription.Malformed	The specified description is wrongly formed.	The error message returned because the specified Description parameter is invalid. The description must be 2 to 256 characters in length and cannot start with http:// or https://.
403	InstanceDiskCategoryLimitExceed	The total size of specified disk category in an instance exceeds.	The error message returned because the total size of disks of the specified category exceeds the maximum capacity that is allowed for an instance.
403	InvalidSnapshot.NotReady	The specified snapshot creation is not completed yet.	The error message returned because the specified snapshot is not created.
403	InvalidSnapshot.TooOld	This operation is forbidden because the specified snapshot is created before 2013-07-15.	The error message returned because the specified snapshot was created on or before July 15, 2013 and cannot be re-initialized.
403	InvalidSnapshot.TooLarge	The capacity of snapshot exceeds 2000GB.	The error message returned because the size of the specified snapshot exceeds 2,000 GB.
403	OperationDenied	The specified snapshot is not allowed to create disk.	The error message returned because the specified snapshot cannot be used to create disks.

HTTP status code	Error code	Error message	Description
403	QuotaExceed.PortableCloudDisk	The quota of portable cloud disk exceeds.	The error message returned because the maximum number of removable disks has been reached.
400	MissingParameter	The input parameter either "SnapshotId" or "Size" should be specified.	The error message returned because neither SnapshotId nor Size is specified.
403	InvalidDiskCategory.ValueUnauthorized	The disk category is not authorized.	The error message returned because you are not authorized to use the specified disk category.
403	InvalidSnapshotId.NotReady	The specified snapshot has not completed yet.	The error message returned because the specified snapshot is being created.
403	InvalidSnapshotId.NotDataDiskSnapshot	The specified snapshot is system disk snapshot.	The error message returned because the specified snapshot is a system disk snapshot.
403	InvalidDiskSize.TooSmall	Specified disk size is less than the size of snapshot.	The error message returned because the specified disk size is smaller than the snapshot size.
403	OperationDenied	The type of the disk does not support the operation.	The error message returned because the specified disk type does not support this operation.
403	InvalidDataDiskCategory.NotSupported	%s	The error message returned because the specified DiskCategory parameter is invalid.
403	InvalidDiskSize.NotSupported	disk size is not supported.	The error message returned because the specified Size parameter is invalid.
400	InvalidDiskCategory.NotSupported	The specified disk category is not support.	The error message returned because the specified DiskCategory parameter is invalid.
400	Account.Arrearage	Your account has an outstanding payment.	The error message returned because you have overdue payments in your account.

HTTP status code	Error code	Error message	Description
400	InvalidDiskCategory.ValueNotSupported	The specified parameter "DiskCategory" is not valid.	The error message returned because the specified DiskCategory parameter is invalid.
403	InvalidAccountStatus.NotEnoughBalance	Your account does not have enough balance.	The error message returned because your account balance is insufficient. Add funds to your account and try again.
403	InvalidAccountStatus.SnapshotServiceUnavailable	Snapshot service has not been opened yet.	The error message returned because the operation is not supported while the snapshot service is not activated.
400	InvalidDataDiskCategory.ValueNotSupported	%s	The error message returned because the specified DiskCategory parameter is invalid.
400	InvalidParameter.Conflict	%s	The error message returned because a specified parameter is invalid. Check whether parameter conflicts exist.
400	RegionUnauthorized	%s	The error message returned because you are not authorized to create disks in the specified region.
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.
400	Zone.NotOnSale	%s	The error message returned because the requested resources are unavailable in the specified zone.
400	InvalidDataDiskSize.ValueNotSupported	%s	The error message returned because the specified Size parameter is invalid.
403	InvalidPayMethod	The specified pay method is not valid.	The error message returned because the specified payment method is invalid.

HTTP status code	Error code	Error message	Description
400	OperationDenied	The specified Zone is not available or not authorized.	The error message returned because the specified zone is unavailable or you are not authorized to access it.
404	InvalidResourceGroup.NotFound	The ResourceGroup provided does not exist in our records.	The error message returned because the specified ResourceGroupId parameter does not exist.
403	InvalidDiskCategory.NotSupported	The specified disk category is not supported.	The error message returned because the specified DiskCategory parameter is invalid.
403	InvalidDiskSize.NotSupported	The specified disk size is not supported.	The error message returned because the specified Size parameter is invalid.
400	InvalidDiskSize.NotSupported	The specified parameter size is not valid.	The error message returned because the specified Size parameter is invalid.
403	UserNotInTheWhiteList	The user is not in disk white list.	The error message returned because you are not authorized to manage disks.
400	InvalidDiskSizeOrCategory	The specified disk category or size is invalid.	The error message returned because the specified DiskCategory or Size parameter is invalid.
400	InvalidParameter.EncryptedIllegal	%s	The error message returned because the specified parameter is invalid. Check whether your encryption operation is valid.
400	InvalidParameter.EncryptedNotSupported	%s	The error message returned because the specified parameter is invalid and your encryption operation is not supported.
400	EncryptedOption.Conflict	%s	The error message returned because encrypted disks do not support the parameter.
400	InvalidParameter.Encrypted.KmsNotEnabled	The encrypted disk need enable KMS	The error message returned because KMS has not been activated.

HTTP status code	Error code	Error message	Description
500	InternalError	The request processing has failed due to some unknown error, exception or failure.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.
403	QuotaExceed.PostPaidDisk	Living postPaid disks quota exceeded.	The error message returned because the maximum number of pay-as-you-go disks has been reached.
403	InvalidRegion.NotSupport	The specified region does not support byok.	The error message returned because the bring your own key (BYOK) feature is not supported in this region.
403	UserNotInTheWhiteList	The user is not in byok white list.	The error message returned because you are not in the BYOK whitelist. Try again when you are in the whitelist.
400	InvalidParameter.EncryptedIllegal	The specified parameter Encrypted must be true when kmsKeyId is not empty.	The error message returned because the encryption feature is not enabled after the KMSKeyId parameter is specified.
404	InvalidParameter.KMSKeyId.NotFound	The specified KMSKeyId does not exist.	The error message returned because the specified KMSKeyId parameter does not exist.
403	InvalidParameter.KMSKeyId.KMSUnauthorized	ECS service have no right to access your KMS.	The error message returned because ECS is not authorized to access your KMS resources.
403	SecurityRisk.3DVerification	We have detected a security risk with your default credit or debit card. Please proceed with verification via the link in your email.	The error message returned because risks are detected in your default credit card or debit card. Use the link in the email for verification.
400	Duplicate.TagKey	The Tag.N.Key contain duplicate key.	The error message returned because the specified tag key already exists. Tag keys must be unique.
400	InvalidTagKey.Malformed	The specified Tag.n.Key is not valid.	The error message returned because the specified Tag.N.Key parameter is invalid.

HTTP status code	Error code	Error message	Description
400	InvalidTagValue.Malformed	The specified Tag.n.Value is not valid.	The error message returned because the specified Tag.N.Value parameter is invalid.
404	InvalidInstanceId.NotFound	The InstanceId provided does not exist in our records.	The error message returned because the specified InstanceId parameter does not exist.
403	InvalidStatus.Upgrading	The instance is upgrading; please try again later.	The error message returned because the specified instance is being upgraded. Try again later.
400	InvalidPerformanceLevel.Malformed	The specified parameter PerformanceLevel is not valid.	The error message returned because the specified PerformanceLevel parameter is invalid.
403	QuotaExceed.Tags	%s	The error message returned because the number of specified tags exceeds the upper limit.
404	InvalidInstanceId.NotFound	The specified InstanceId does not exist.	The error message returned because the specified InstanceId parameter does not exist.

2.1.2.1.7.2. DescribeDisks

You can call this operation to query one or more Elastic Block Storage (EBS) devices that you have created, including cloud disks and local disks.

Description

- You can specify multiple request parameters such as `RegionId`, `ZoneId`, `DiskIds`, and `InstanceId` to be queried. Specified parameters have logical AND relations. Only the specified parameters are included in the filter conditions.
- The `DiskIds` value is a JSON array. If DiskIds is not specified, it is not used as a filter condition. If `DiskIds` is set to an empty JSON array, it is regarded as a valid filter condition and an empty result is returned.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeDisks	The operation that you want to perform. Set the value to DescribeDisks.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the disk. You can call the DescribeRegions operation to query the most recent region list.
ZoneId	String	No	cn-qingdao-env17-amtest11001-a	The zone ID of the disk.
DiskIds	String	No	["d-bp67acfmxazb4p****", "d-bp67acfmxazb4p****", ... "d-bp67acfmxazb4p****"]	The IDs of disks. The value is a JSON array that consists of up to 100 disk IDs. Separate multiple disk IDs with commas (,).
InstanceId	String	No	i-bp67acfmxazb4p****	The ID of the instance to which the disk is attached.
DiskType	String	No	all	The type of the disk. Valid values: • all: system disk and data disk • system: system disk • data: data disk Default value: all.
Category	String	No	all	The category of the disk. Valid values: • all: all disk categories • cloud: basic disk • cloud_efficiency: ultra disk • cloud_ssd: standard SSD • cloud_essd: enhanced SSD (ESSD) • local_ssd_pro: I/O-intensive local disk • local_hdd_pro: throughput-intensive local disk • ephemeral: retired local disk • ephemeral_ssd: retired local SSD Default value: all.

Parameter	Type	Required	Example	Description
Status	String	No	All	The status of the disk. Valid values: • In_use • Available • Attaching • Detaching • Creating • ReIniting • All Default value: All.
SnapshotId	String	No	s-bp67acfmxazb4p****	The ID of the snapshot used to create the disk.
Portable	Boolean	No	false	Specifies whether the disk is removable. Valid values: • true: The disk is removable. A removable disk can exist independently and can be attached to or detached from an instance within the same zone. • false: The disk is not removable. A disk that is not removable cannot exist independently or be detached from one instance and then attached to another instance within the same zone. To attach or detach a disk, make sure that the disk is removable. When basic disks, ultra disks, and standard SSDs are used as system disks, they are not removable. This attribute cannot be modified.
DeleteWithInstance	Boolean	No	false	Specifies whether the disk is released when its associated instance is released. Valid values: • true: The disk is released when its associated instance is released. • false: The disk is not released but is retained when its attached instance is released. Default value: false.

Parameter	Type	Required	Example	Description
DeleteAutoSnapshot	Boolean	No	false	Specifies whether the automatic snapshots of the disk are deleted when the disk is released. Default value: false.
PageNumber	Integer	No	1	The number of the page to return. Pages start from page 1. Default value: 1.
PageSize	Integer	No	10	The number of entries to return on each page. Valid values: 1 to 100. Default value: 10.
NextToken	String	No	AAAAAdDWBF2****	The query token. Set the value to the `NextToken` value returned in the last call to the DescribeDisks operation.
MaxResults	Integer	No	50	The maximum number of entries to return on each page. Valid values: 1 to 500. Default value: 10.
DiskName	String	No	test-DiskName	The name of the disk.
AutoSnapshotPolicyId	String	No	sp-m5e2w2jutw8bv31a****	The ID of the automatic snapshot policy applied to the disk.
EnableAutomatedSnapshotPolicy	Boolean	No	false	Specifies whether to query disks that have automatic snapshot policies applied. Default value: false.
Filter.1.Key	String	No	CreationStartTime	The key of filter 1 used to query resources. Set the value to CreationStartTime.

Parameter	Type	Required	Example	Description
Filter.2.Key	String	No	CreationEndTime	The key of filter 2 used to query resources. Set the value to CreationEndTime.
Filter.1.Value	String	No	2017-12-05T22:40:00Z	The value of filter 1 used to query resources. Set the value to the beginning of the time range to query.
Filter.2.Value	String	No	2017-12-06T22:40:00Z	The value of filter 2 used to query resources. Set the value to the end of the time range to query.
Tag.N.Key	String	No	TestKey	The key of tag N of the disk. Valid values of N: 1 to 20.
Tag.N.Value	String	No	TestValue	The value of tag N of the disk. Valid values of N: 1 to 20.
ResourceGroupId	String	No	rg-bp67acfmxazb4p****	The ID of the resource group to which the disk belongs.
EnableShared	Boolean	No	false	Specifies whether the disk is a Shared Block Storage device.
Encrypted	Boolean	No	false	Specifies whether to query only encrypted disks. Default value: false.
AdditionalAttributes.N	RepeatList	No	null	Attribute N of the disk. **Note** This parameter will be removed in the future. We recommend that you use other parameters to ensure future compatibility.

Parameter	Type	Required	Example	Description
DryRun	Boolean	No	false	Specifies whether to check the validity of the request without actually making the request. Valid values: • true: The validity of the request is checked but the request is not made. The system checks whether your AccessKey pair is valid, whether RAM users are authorized, and whether the required parameters are specified. If the check fails, the corresponding error is returned. If the check succeeds, the `DryRunOperation` error code is returned. • false: The validity of the request is checked. If the check succeeds, a 2XX HTTP status code is returned and the request is made. Default value: false.
KMSKeyId	String	No	0e478b7a-4262-4802-b8cb-00d3fb408***	The ID of the KMS key used by the disk.

Response parameters

Parameter	Type	Example	Description
Disks	Array of Disk		Details about the disks.
Disk			
AttachedTime	String	2018-01-01T01:04:22Z	The time when the disk was attached. The time follows the ISO 8601 standard in the yyyy-MM-ddThh:mmZ format. The time is displayed in UTC. This parameter is valid only when the value of `Status` is `Available`.
AutoSnapshotPolicyId	String	sp-bp67acfmxazb4p****	The ID of the automatic snapshot policy applied to the disk.
BdfId	String	test	**Note** This parameter is not supported.

Parameter	Type	Example	Description
Category	String	cloud_ssd	The category of the disk. Valid values: • cloud: basic disk • cloud_efficiency: ultra disk • cloud_ssd: standard SSD • cloud_essd: ESSD • local_ssd_pro: I/O-intensive local disk • local_hdd_pro: throughput-intensive local disk • ephemeral: retired local disk • ephemeral_ssd: retired local SSD
CreationTime	String	2018-01-01T01:01:22Z	The time when the disk was created.
DeleteAutoSnapshot	Boolean	false	Indicates whether the automatic snapshots of the disk are deleted when the disk is released. Valid values: • true: The automatic snapshots of the disk are deleted when the disk is released. • false: The automatic snapshots of the disk are retained when it is released. The snapshots created by calling the CreateSnapshot operation or by using the ECS console are not affected by this parameter.
DeleteWithInstance	Boolean	true	Indicates whether the disk is released when its associated instance is released. Valid values: • true: The disk is released when its associated instance is released. • false: The disk is retained when its associated instance is released.
Description	String	This is a description example.	The description of the disk.
DetachedTime	String	2018-01-08T01:01:22Z	The time when the disk was detached. This parameter is valid only when the value of `Status` is `Available`.

Parameter	Type	Example	Description
Device	String	/dev/xvdb	The device name of the disk on its associated instance. Example: /dev/xvdb. This parameter has a value only when the value of `Status` is `In_use`. **Note** This parameter will be removed in the future. We recommend that you use other parameters to ensure future compatibility.
DiskChargeType	String	PostPaid	**Note** This parameter is not supported.
DiskId	String	d-bp18um4r4f2fve24****	The ID of the disk.
DiskName	String	test-DiskName	The name of the disk.
EnableAutoSnapshot	Boolean	false	**Note** This parameter is not supported.
EnableAutomatedSnapshotPolicy	Boolean	false	Indicates whether the disk has an automatic snapshot policy applied.
Encrypted	Boolean	false	Indicates whether the disk was encrypted.
ExpiredTime	String	2018-01-10T01:01:22Z	**Note** This parameter is not supported.
IOPS	Integer	4000	The number of input/output operations per second (IOPS).
IOPSRead	Integer	2000	The number of I/O reads per second.
IOPSWrite	Integer	2000	The number of I/O writes per second.

Parameter	Type	Example	Description
ImageId	String	m-bp13aqm171qynt3*****	The ID of the image used to create the instance. This parameter is empty unless the disk was created from an image. The value of this parameter remains unchanged throughout the lifecycle of the disk.
InstanceId	String	i-bp1j4i2jdf3owlhe*****	The ID of the instance to which the disk is attached. This parameter has a value only when the value of `Status` is `In_use`.
KMSKeyId	String	0e478b7a-4262-4802-b8cb-00d3fb40****	The ID of the KMS key used by the disk.
MountInstanceNum	Integer	1	The number of instances to which the Shared Block Storage device is attached.
MountInstances	Array of MountInstance		The attaching information of the disk.
MountInstance			
AttachedTime	String	2017-12-05T2340:00Z	The time when the disk was attached. The time follows the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time is displayed in UTC.
Device	String	/dev/xvda	The mount point of the disk.
InstanceId	String	i-bp1j4i2jdf3owlhe*****	The ID of the instance to which the disk is attached.
OperationLocks	Array of OperationLock		The reasons why the disk was locked.
OperationLock			
LockReason	String	security	The security reason why the disk was locked.

Parameter	Type	Example	Description
PerformanceLevel	String	PL2	The performance level of the ESSD. Valid values: • PL1: A single enhanced SSD can deliver up to 50,000 random read/write IOPS. • PL2: A single enhanced SSD can deliver up to 100,000 random read/write IOPS. • PL3: A single ESSD can deliver up to 1,000,000 random read/write IOPS.
Portable	Boolean	false	Indicates whether the disk is removable.
ProductCode	String	test	Note This parameter is not supported.
RegionId	String	cn-qingdao-env17-d01	The region ID of the disk.
ResourceGroupId	String	rg-bp67acfmxazb4p****	The ID of the resource group to which the disk belongs.
SerialNumber	String	bp18um4r4f2fve2****	The serial number of the disk.
Size	Integer	2000	The size of the disk. Unit: GiB.
SourceSnapshotId	String	s-bp67acfmxazb4p****	The ID of the snapshot used to create the disk. This parameter is empty unless the disk was created from a snapshot. The value of this parameter remains unchanged throughout the lifecycle of the disk.
Status	String	Available	The status of the disk. Valid values: • In_use • Available • Attaching • Detaching • Creating • ReIniting

Parameter	Type	Example	Description
StorageSetId	String	ss-i-bp1j4i2jdf3owlhe****	Note This parameter is not supported.
StorageSetPartitionNumber	Integer	11	Note This parameter is not supported.
Tags	Array of Tag		The tags of the disk.
Tag			
TagKey	String	TestKey	The tag key of the disk.
TagValue	String	TestValue	The tag value of the disk.
Type	String	data	The type of the disk. Valid values: • system: system disk • data: data disk
ZoneId	String	cn-qingdao-env17-amtest11001-a	The zone ID of the disk.
NextToken	String	AAAAAdDWBF2****	The query token returned in this call.
PageNumber	Integer	1	The page number of the returned page.
PageSize	Integer	1	The number of entries returned per page.
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.
TotalCount	Integer	76	The total number of entries returned.

Error codes

HTTP status code	Error code	Error message	Description
400	InvalidDiskType.ValueNotSupported	The specified disk type is not supported.	The error message returned because the specified DiskType parameter is invalid.
400	InvalidCategory.ValueNotSupported	The specified disk category is not supported.	The error message returned because the specified Category parameter is invalid.
400	InvalidStatus.ValueNotSupported	The specified disk status is not supported.	The error message returned because the operation is not supported while the disk is in the current state.
403	InvalidDiskIds.Malformed	The amount of specified disk Ids exceeds the limit.	The error message returned because the specified DiskIds parameter is invalid.
404	InvalidDiskChargeType.NotFound	The DiskChargeType does not exist in our records	The error message returned because the specified DiskChargeType parameter does not exist.
404	InvalidLockReason.NotFound	The specified LockReason is not found	The error message returned because the specified LockReason parameter does not exist.
404	InvalidFilterKey.NotFound		The error message returned because the specified start time or end time is invalid.
400	InvalidTag.Mismatch	The specified Tag.n.Key and Tag.n.Value are not match.	The error message returned because the specified Tag.N.Key and Tag.N.Value parameters do not match.
400	InvalidTagCount	The specified tags are beyond the permitted range.	The error message returned because the number of specified tags exceeds the upper limit.
400	InvalidRegion.NotFound	The specified parameter RegionId is not valid.	The error message returned because the specified RegionId parameter is invalid.
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.

HTTP status code	Error code	Error message	Description
400	InvalidZoneId.NotFound	The zoneId provided does not exist in our records.	The error message returned because the specified ZoneId parameter does not exist.
400	MissingParamter.RegionId	The regionId should not be null.	The error message returned because the RegionId parameter is not specified.
400	InvalidParameter.DiskIds	The specified parameter diskIds is not valid.	The error message returned because the specified DiskIds parameter is invalid.
400	IncompleteParamter	Some fields can not be null in this request.	The error message returned because a required parameter is not specified.
400	InvalidParamter	Some parameters are invalid in this request.	The error message returned because the request contains invalid parameters.
400	InvalidSnapshot.NotFound	The specified parameter SnapshotId is not valid.	The error message returned because the specified SnapshotId parameter is invalid.
403	UserNotInTheWhiteList	The user is not in volume white list.	The error message returned because you are not authorized to manage Shared Block Storage devices. Submit a ticket to apply for the authorization.
404	InvalidDiskIds.ValueNotSupported	The specified parameter "DiskIds" is not supported.	The error message returned because the specified DiskIds parameter is invalid.

2.1.2.1.7.3. AttachDisk

You can call this operation to attach a system disk or data disk to an instance. The instance and the disk must be in the same zone.

Description

When you call this operation, take note of the following items:

- The disk to be attached must be in the **Unattached** (`Available`) state.
- When you attach a data disk to an instance:

  The instance must be in the **Running** (`Running`) or **Stopped** (`Stopped`) state.
- When you attach a system disk to an instance:
  - The instance must be the same instance from which the system disk was detached.

- The instance must be in the **Stopped** (`Stopped`) state.
- Logon credentials must be configured.

- If the API response contains `{"OperationLocks": {"LockReason" : "security"}}` when you query information of an instance, the instance is locked for security reasons and all operations are prohibited on it.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	AttachDisk	The operation that you want to perform. Set the value to AttachDisk.
DiskId	String	Yes	d-bp198f7xn673w2rw****	The ID of the disk to be attached. The disk (`DiskId`) and the instance (`InstanceId`) must belong to the same zone. **Note** For more information about restrictions on attaching a data disk and system disk, see the "Description" section of this topic.
InstanceId	String	Yes	i-bp1ahcvgu9z55pk7****	The ID of the instance to which to attach the disk.
Device	String	No	testName	The device name of the disk. **Note** This parameter will be removed in the future. We recommend that you use other parameters to ensure future compatibility.

Parameter	Type	Required	Example	Description
DeleteWithInstance	Boolean	No	false	Specifies whether to release the disk along with its attached instance. • true: releases the disk when the instance is released. • false: does not release the disk when the instance is released. Default value: false **Note** If `OperationLocks` in the DescribeInstances response contains `"LockReason" : "security"` for the instance to which the disk is attached, the instance is locked for security reasons. In this case, the disk is released along with the instance even if `DeleteWithInstance` is set to `false`.
Bootable	Boolean	No	false	Specifies whether to attach the disk as a system disk. Default value: false **Note** You can set `Bootable` to true only when the target instance is in the No System Disk state.

Parameter	Type	Required	Example	Description
Password	String	No	EcsV587!	The password set when you attach the system disk. The password is applicable only to the administrator and root users. The password must be 8 to 30 characters in length. It must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. Special characters include: `( ) ` ~ ! @ # $ % ^ & * - _ + = | { } [ ] : ; ' < > , . ? /` For Windows instances, the password cannot start with a forward slash (/). **Note** For security reasons, we recommend that you use HTTPS to send requests if the `Password` parameter is specified.
KeyPairName	String	No	test-KeyPairName	The name of the SSH key pair that you bind to the Linux instance when you attach the system disk. • Windows instances do not support logons using SSH key pairs. The `Password` parameter takes effect even if the KeyPairName parameter is specified. • For Linux instances, the username and password logon method is disabled by default.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=AttachDisk
&DiskId=d-bp198f7xn673w2rw****
&InstanceId=i-bp1ahcvgu9z55pk7****
&DeleteWithInstance=false
&<Common request parameters>
```

Sample success responses

`XML` format

```
<AttachDiskResponse>
      <RequestId>473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E</RequestId>
</AttachDiskResponse>
```

`JSON` format

```
{
    "RequestId": "473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E"
}
```

Error codes

HTTP status code	Error code	Error message	Description
404	InvalidInstanceId.NotFound	The specified InstanceId does not exist.	The error message returned because the specified InstanceId parameter does not exist.
404	InvalidDiskId.NotFound	The specified disk does not exist.	The error message returned because the specified DiskId parameter does not exist. Check whether the DiskId parameter is correct.
400	InvalidDevice.Malformed	The specified device is not valid.	The error message returned because the specified Device parameter does not exist.
403	InstanceDiskLimitExceeded	The amount of the disk on instance in question reach its limits.	The error message returned because the maximum number of disks that can be attached to the specified instance has been reached.
403	InvalidDevice.InUse	The specified device has been occupied.	The error message returned because the specified device already has a disk attached.

HTTP status code	Error code	Error message	Description
403	IncorrectDiskStatus	The operation is not supported in this status.	The error message returned because the operation is not supported while the disk is in the current state. Ensure that the disk is available and you have no overdue payments for it.
403	DiskNotPortable	The specified disk is not a portable disk.	The error message returned because the specified disk is not removable.
403	InstanceLockedForSecurity	The instance is locked due to security.	The error message returned because the operation is not supported while the resource is locked for security reasons.
403	ResourcesNotInSameZone	The specified instance and disk are not in the same zone.	The error message returned because the specified instance and disk are not in the same zone.
403	InstanceExpiredOrInArrears	The specified operation is denied as your prepay instance is expired (prepay mode) or in arrears (afterpay mode).	The error message returned because the subscription instance has expired. Renew the instance first.
403	DiskInArrears	The specified operation is denied as your disk owing fee.	The error message returned because you have an overdue payment for the specified disk.
400	IncorrectInstanceStatus	The current status of the resource does not support this operation.	The error message returned because the operation is not supported while the resource is in the current state.
403	DiskError	IncorrectDiskStatus.	The error message returned because the status of the specified disk is invalid.
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.
400	InvalidParameter	The input parameter is mandatory for processing this request is empty.	The error message returned because a required parameter is not specified.

HTTP status code	Error code	Error message	Description
403	DiskId.ValueNotSupported	The specified parameter diskid is not supported.	The error message returned because the category of the specified Block Storage device does not support this operation.
403	DiskId.StatusNotSupported	The specified disk status is not supported.	The error message returned because the operation is not supported while the disk is in the current state.
404	InvalidDisk.InUse	The specified disk has been occupied.	The error message returned because the specified disk is in use.
404	DiskAttachedNumberExceeded	The attaching times of the specified disk exceeded.	The error message returned because the maximum number of times that the disk can be attached has been reached.
403	UserNotInTheWhiteList	The user is not in disk white list.	The error message returned because you are not authorized to manage the disk.
400	InvalidRegionId.MalFormed	The specified RegionId is not valid	The error message returned because the specified RegionId parameter is invalid.
400	InvalidOperation.InstanceTypeNotSupport	The instance type of the specified instance does not support hot attach disk.	The error message returned because the instance to which the disk is attached does not support the hot swapping of disks.
400	DiskCategory.OperationNotSupported	The operation is not supported to the specified disk due to its disk category	The error message returned because the disk category does not support the operation.
400	InvalidOperation.InstanceTypeNotSupport	The specified disk which has kms key should only attach to ioOptimized instance.	The error message returned because the specified instance is not supported. You can set KMS keys only for I/O optimized instances.
403	InvalidParameter.KMSKeyId.KMSUnauthorized	ECS service have no right to access your KMS.	The error message returned because ECS is not authorized to access your KMS resources.

HTTP status code	Error code	Error message	Description
500	InternalError	The request processing has failed due to some unknown error, exception or failure.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.
400	InvalidParameter.AllEmpty	%s	The error message returned because no parameters are specified. Specify required parameters.

2.1.2.1.7.4. DetachDisk

You can call this operation to detach a data disk or system disk from an instance.

Description

When you call this operation, take note of the following items:

- The disk to be detached must be in the Running (`In_Use`) state.
- The instance from which you want to detach a data disk must be in the **Running** (`Running`) or **Stopped** (`Stopped`) state.
- The instance from which you want to detach the system disk must be in the **Stopped** (`Stopped`) state.
- If the API response contains `{"OperationLocks":` `{"LockReason" : "security"}}` when you query information of an instance, the instance is locked for security reasons and all operations are prohibited on it.
- DetachDisk is an asynchronous operation. It takes about one minute for the disk to be detached after this operation is called.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DetachDisk	The operation that you want to perform. Set the value to DetachDisk.
DiskId	String	Yes	d-bp67acfmxazb4p****	The ID of the disk to be detached.
InstanceId	String	Yes	i-bp67acfmxazb4p****	The ID of the instance from which the disk is to be detached.

Parameter	Type	Required	Example	Description
DeleteWithInstance	Boolean	No	false	The automatic release attribute of the system disk. That is, this parameter specifies whether the system disk is released when its attached instance is released. Valid values: • true: The system disk is released when its attached instance is released. • false: The system disk is not released but is retained when its attached instance is released. Default value: true. **Note** If a data disk is to be detached, the default value is `false`.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=DetachDisk
&DiskId=d-bp67acfmxazb4p****
&InstanceId=i-bp67acfmxazb4p****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DetachDiskResponse>
      <RequestId>473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E</RequestId>
</DetachDiskResponse>
```

`JSON` format

```
{
    "RequestId": "473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E"
}
```

Error codes

HTTP status code	Error code	Error message	Description
404	InvalidInstanceId.NotFound	The specified InstanceId does not exist.	The error message returned because the specified InstanceId parameter does not exist.
404	InvalidDiskId.NotFound	The specified disk does not exist.	The error message returned because the specified DiskId parameter does not exist. Check whether the disk ID is correct.
403	IncorrectDiskStatus	The current disk status does not support this operation.	The error message returned because the operation is not supported while the disk is in the current state. Ensure that the disk is available and you have no overdue payment for it.
403	DiskNotPortable	The specified disk is not a portable disk.	The error message returned because the specified disk is not removable.
403	InstanceLockedForSecurity	The instance is locked due to security.	The error message returned because the operation is not supported while the resource is locked for security reasons.
403	DependencyViolation	The specified disk has not been attached on the specified instance.	The error message returned because the operation is not supported while the resource has other dependencies. For example, the specified disk is not attached to the specified instance, or the specified security group cannot be deleted while it contains instances.
403	DiskTypeViolation	The specified disk is a system disk and cannot support the operation.	The error message returned because the specified disk is a system disk and cannot be detached from the associated instance.
403	IncorrectInstanceStatus	The current status of the resource does not support this operation.	The error message returned because the operation is not supported while the resource is in the current state.

HTTP status code	Error code	Error message	Description
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.
400	InvalidParameter	The input parameter is mandatory for processing this request is empty.	The error message returned because a required parameter is not specified.
403	UserNotInTheWhiteList	The user is not in disk white list.	The error message returned because you are not authorized to manage the disk.
400	InvalidRegionId.Malformed	The specified RegionId is not valid	The error message returned because the specified region ID is invalid.
404	InvalidDisk.AlreadyDetached	The specified disk has been detached.	The error message returned because the specified disk has been detached.
400	InvalidOperation.InstanceTypeNotSupport	The instance type of the specified instance does not support hot detach disk.	The error message returned because the instance to which the disk is attached does not support the hot swapping of disks.
500	InternalError	The request processing has failed due to some unknown error, exception or failure.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.

2.1.2.1.7.5. ModifyDiskAttribute

You can call this operation to modify the attributes of one or more Block Storage devices, including their names, descriptions, and whether they are released along with their attached instances.

Description

If you set DeleteWithInstance to false for a disk and the instance to which the disk is attached is locked for security reasons, the DeleteWithInstance parameter will be ignored and the disk will be released along with the instance. (If the value of `LockReason` is security in OperationLocks of the API response when you query information of an instance, the instance is locked for security reasons.)

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyDiskAttribute	The operation that you want to perform. Set the value to ModifyDiskAttribute.
DiskId	String	No	d-bp198f7xn673w2rw****	The ID of the disk to be modified. **Note** You can specify either `DiskId` or `DiskIds.N` but you cannot specify both of them.
DiskIds.N	RepeatList	No	d-bp198f7xn673w2rw****	The ID of disk N to be modified. Valid values of N: 0 to 100. **Note** You can specify either `DiskId` or `DiskIds.N` but you cannot specify both of them.
DiskName	String	No	test-DiskName	The name of the disk. The name must be 2 to 128 characters in length. and can contain letters, digits, colons (:), underscores (_), and hyphens (-). It must start with a letter and cannot start with http:// or https://.
Description	String	No	This is a description example.	The description of the disk. The description must be 2 to 256 characters in length and cannot start with http:// or https://.
DeleteWithInstance	Boolean	No	false	Specifies whether the disk is released with the instance. This parameter is empty by default, which indicates that the current value remains unchanged. An error will be returned if you set this parameter to false in the following cases: • The specified disk is a local disk. • The specified disk is a basic disk and is not removable.

Parameter	Type	Required	Example	Description
DeleteAutoSnapshot	Boolean	No	false	Specifies whether the automatic snapshots of the disk are deleted when it is released. This parameter is empty by default, which indicates that the current value remains unchanged.
EnableAutoSnapshot	Boolean	No	true	Specifies whether to apply a created automatic snapshot policy to the disk. This parameter is empty by default, which indicates that the current value remains unchanged.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=ModifyDiskAttribute
&DiskId=d-bp198f7xn673w2rw****
&DiskName=test-DiskName
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyDiskAttributeResponse>
      <RequestId>473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E</RequestId>
</ModifyDiskAttributeResponse>
```

`JSON` format

```
{
    "RequestId": "473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E"
}
```

Error codes

HTTP status code	Error code	Error message	Description
404	InvalidDiskId.NotFound	The specified disk does not exist.	The error message returned because the specified disk does not exist. Check whether the disk ID is correct.
400	InvalidDiskName.Malformed	The specified disk name is wrongly formed.	The error message returned because the specified DiskName parameter is invalid. The name must be 2 to 128 characters in length and can contain letters, digits, periods (.), underscores (_), and hyphens (-). It must start with a letter and cannot start with http:// or https://.
404	InvalidDescription.Malformed	The specified description is wrongly formed.	The error message returned because the specified Description parameter is invalid. The description must be 2 to 256 characters in length and cannot start with http:// or https://.
400	NoAttributeToModify	No attribute to be modified in this request.	The error message returned because no attributes of the specified disk are modified.
403	QuotaExceed.Snapshot	The snapshot quota exceeds.	The error message returned because the maximum number of snapshots has been reached. To store new snapshots, delete snapshots that are no longer needed.
403	DiskNotPortable	The specified disk is not a portable disk.	The error message returned because the specified disk is not removable.
403	IncorrectDiskStatus	The operation is not supported in this status.	The error message returned because the operation is not supported while the disk is in the current state. Ensure that the disk is available and you have no overdue payment for it.
400	IncompleteParamter	Some fields can not be null in this request.	The error message returned because some required parameters are not specified.

HTTP status code	Error code	Error message	Description
403	UserNotInTheWhiteList	The user is not in disk white list.	The error message returned because you are not authorized to manage the disk.
400	InvalidRegionId.Malformed	The specified RegionId is not valid	The error message returned because the specified region ID is invalid.
404	InvalidInstanceId.NotFound	Specified attached instance does not exist.	The error message returned because the specified instance ID does not exist.

2.1.2.1.7.6. ReInitDisk

You can call this operation to re-initialize a disk.

Description

When you call this operation, take note of the following items:

- The disk to be re-initialized must be in the **Running** (In Use) state, and the instance to which the disk is attached must be in the **Stopped** (Stopped) state.
- If the instance has never been started since it was created, the disks attached to it cannot be re-initialized.
- When a system disk is re-initialized, it is restored to the state of the image from which it was created. If the image has been deleted, the disk cannot be re-initialized.
- When a separately created data disk is re-initialized, it is restored to an empty data disk.
- When a data disk that was created from a snapshot is re-initialized, the disk is restored to the state of the snapshot. If the snapshot has been deleted, the disk cannot be re-initialized and an error will be returned.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ReInitDisk	The operation that you want to perform. Set the value to ReInitDisk.
DiskId	String	Yes	d-bp67acfmxazb4p****	The ID of the disk.

Parameter	Type	Required	Example	Description
Password	String	No	EcsV587!	Specifies whether to reset the password of the instance when you re-initialize its system disk. The password must be 8 to 30 characters in length. It must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. Special characters include: `( ) ` ~ ! @ # $ % ^ & * - _ + = | { } [ ] : ; ' < > , . ? /` For Windows instances, the password cannot start with a forward slash (/). **Note** For security reasons, we recommend that you use HTTPS to send requests if the `Password` parameter is specified.
KeyPairName	String	No	test-KeyPairName	The name of the key pair. **Note** The parameter is applicable only to Linux instances. You can bind an SSH key pair to an instance as the logon credential when you re-initialize its system disk. After the SSH key pair is bound, the username and password logon method is disabled for the instance.
AutoStartInstance	Boolean	No	true	Specifies whether to automatically start the instance after the disk is re-initialized. Default value: false.

Parameter	Type	Required	Example	Description
SecurityEnhancementStrategy	String	No	Active	Specifies whether to use Security Center after the system disk is re-initialized. Valid values: • Active: Security Center is used after the system disk is re-initialized. This value is applicable only to public images. • Deactive: Security Center is not used after the system disk is re-initialized. This value is applicable to all images. Default value: Deactive.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=ReInitDisk
&DiskId=d-bp67acfmxazb4p****
&KeyPairName=test-KeyPairName
&AutoStartInstance=true
&SecurityEnhancementStrategy=Active
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ReInitDiskResponse>
      <RequestId>F3CD6886-D8D0-4FEE-B93E-1B73239673DE</RequestId>
</ReInitDiskResponse>
```

`JSON` format

```
{
    "RequestId":"F3CD6886-D8D0-4FEE-B93E-1B73239673DE"
}
```

Error codes

HTTP status code	Error code	Error message	Description
404	InvalidDiskId.NotFound	The specified disk does not exist.	The error message returned because the specified DiskId parameter does not exist. Check whether the disk ID is correct.
403	IncorrectDiskStatus	The current disk status does not support this operation.	The error message returned because the operation is not supported while the disk is in the current state. Ensure that the disk is available and you have no overdue payment for it.
403	IncorrectInstanceStatus	The current status of the resource does not support this operation.	The error message returned because the operation is not supported while the resource is in the current state.
403	InstanceLockedForSecurity	The instance is locked due to security.	The error message returned because the operation is not supported while the resource is locked for security reasons.
403	InvalidSnapshot.TooOld	The disk is created from a snapshotId made before 2013-07-15, it cannot be re-initiated the specified disk any more since the detached first time.	The error message returned because snapshots created before July 15, 2013 do not support this operation.
403	OperationDenied	The snapshot which is used to create the specified disk has been deleted.	The error message returned because the snapshot used to create the specified disk does not exist.
403	InstanceExpiredOrInArrears	The specified operation is denied as your prepay instance is expired (prepay mode) or in arrears (afterpay mode).	The error message returned because the subscription instance has expired. Renew the instance first.
403	DiskCreatingSnapshot	The operation is denied due to a snapshot of the specified disk is not completed yet.	The error message returned because a snapshot is being created for the specified disk.
403	InvalidSourceSnapshot	The snapshot which is used to create the specified disk has been deleted.	The error message returned because the snapshot used to create the specified disk has been deleted.

HTTP status code	Error code	Error message	Description
404	InvalidImageId.NotFound	The specified ImageId does not exist.	The error message returned because the specified image does not exist in this account. Check whether the image ID is correct.
403	SharedImageDeleted	The specified image by others shared is deleted.	The error message returned because the specified shared image has been deleted.
400	InvalidPassword.Malformed	The specified parameter "Password" is not valid.	The error message returned because the specified Password parameter is invalid.
400	DiskCategory.OperationNotSupported	The operation is not supported to the specified disk due to its disk category	The error message returned because the disk category does not support the operation.
400	InvalidKeyPairName.NotFound	The specified KeyPairName does not exist.	The error message returned because the specified KeyPairName parameter does not exist.
400	DependencyViolation.IoOptimize	The specified parameter InstanceId is not valid.	The error message returned because the specified instance ID is invalid.
403	UserNotInTheWhiteList	The user is not in volume white list.	The error message returned because you are not authorized to manage the Shared Block Storage device.
400	InvalidRegionId.Malformed	The specified RegionId is not valid	The error message returned because the specified region ID is invalid.
404	InvalidDiskId.OperationNotSupported	The operation is not supported due to image not exist.	The error message returned because the specified image does not exist.
403	InvalidParameter.KMSKeyId.KMSUnauthorized	ECS service have no right to access your KMS.	The error message returned because ECS is not authorized to access your KMS resources.
500	InternalError	The request processing has failed due to some unknown error, exception or failure.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.

2.1.2.1.7.7. ResetDisk

You can call this operation to restore a disk to a specific point in time from a snapshot of the disk.

Description

When you call this operation, take note of the following items:

- The disk to be restored must be in the Running (In_Use) state.
- The instance to which the disk is attached must be in the Stopped (Stopped) state.
- The snapshot specified by the SnapshotId parameter must be created from the disk specified by the DiskId parameter.
- If the DescribeInstances response includes `{"OperationLocks": {"LockReason" : "security"}}` for an instance, the instance is locked for security reasons and all operations are prohibited on it.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ResetDisk	The operation that you want to perform. Set the value to ResetDisk.
DiskId	String	Yes	d-bp198f7xn673w2rw****	The ID of the disk to be restored.
SnapshotId	String	Yes	s-bp1btgnlb4licd41****	The ID of the snapshot that is used to restore the disk.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=ResetDisk
&DiskId=d-bp198f7xn673w2rw****
&SnapshotId=s-bp1btgnlb4licd41****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ResetDiskResponse>
      <RequestId>F3CD6886-D8D0-4FEE-B93E-1B73239673DE</RequestId>
</ResetDiskResponse>
```

`JSON` format

```
{
    "RequestId":"F3CD6886-D8D0-4FEE-B93E-1B73239673DE"
}
```

Error codes

HTTP status code	Error code	Error message	Description
404	InvalidDiskId.NotFound	The specified disk does not exist.	The error message returned because the specified DiskId parameter does not exist. Check whether the disk ID is correct.
404	Disk.NotFound	The specified disk does not exist.	The error message returned because the specified DiskId parameter does not exist.
404	InvalidSnapshotId.NotFound	The specified SnapshotId does not exist.	The error message returned because the specified SnapshotId parameter does not exist.
403	IncorrectDiskStatus	The current disk status does not support this operation.	The error message returned because the operation is not supported while the disk is in the current state. Ensure that the disk is available and you have no overdue payment for it.
403	IncorrectInstanceStatus	The current status of the resource does not support this operation.	The error message returned because the operation is not supported while the resource is in the current state.
403	InstanceLockedForSecurity	The instance is locked due to security.	The error message returned because the operation is not supported while the resource is locked for security reasons.
403	InvalidParameter.Mismatch	The specified snapshot is not created from the specified disk.	The error message returned because the specified snapshot was not created from the specified disk.

HTTP status code	Error code	Error message	Description
403	InvalidSnapshot.TooOld	The snapshotId is created before 2013-07-15, it cannot be restored since the first time the disk detached.	The error message returned because snapshots created before July 15, 2013 do not support this operation.
403	InstanceExpiredOrInArrears	The specified operation is denied as your prepay instance is expired (prepay mode) or in arrears (afterpay mode).	The error message returned because the subscription instance has expired. Renew the instance first.
403	OperationDenied	The specified snapshot dees not support ResetDisk.	The error message returned because the specified snapshot does not support the ResetDisk operation.
403	InvalidSnapshotId.NotReady	The specified snapshot has not completed yet.	The error message returned because the specified snapshot is being created.
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.
400	DiskCategory.OperationNotSupported	The operation is not supported to the specified disk due to its disk category	The error message returned because the disk category does not support the operation.
403	InvalidAccountStatus.NotEnoughBalance	Your account does not have enough balance.	The error message returned because your account balance is insufficient. Add funds to your account and try again.
403	InvalidAccountStatus.SnapshotServiceUnavailable	Snapshot service has not been opened yet.	The error message returned because the operation is not supported while the snapshot service is not activated.
404	InvalidInstanceId.NotFound	The specified InstanceId does not exist.	The error message returned because the specified instance ID does not exist. Check whether the instance ID is correct.
403	Operation.Conflict	The operation may conflicts with others.	The error message returned because the operation conflicts with other operations.
403	UserNotInTheWhiteList	The user is not in disk white list.	The error message returned because you are not authorized to manage the disk.

HTTP status code	Error code	Error message	Description
400	InvalidRegionId.MalFormed	The specified RegionId is not valid	The error message returned because the specified RegionId parameter is invalid.
500	InternalError	The request processing has failed due to some unknown error, exception or failure.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.
403	InvalidParameter.KMSKeyId.KMSUnauthorized	ECS service have no right to access your KMS.	The error message returned because ECS is not authorized to access your KMS resources.

2.1.2.1.7.8. ReplaceSystemDisk

You can call this operation to replace the system disk or operating system of an ECS instance. After the system disk is replaced, the ID of the system disk changes and the original disk is released.

Description

When you call this operation, take note of the following items:

- You cannot change the category of the system disk.
- The instance to which the system disk to be replaced is attached must be in the Stopped (Stopped) state.
- If OperationLocks in the DescribeInstances response contains "LockReason" : "security" for an instance, the instance is locked for security reasons and cannot be restarted.
- You can use the SystemDisk.Size parameter to specify the capacity of the new system disk.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ReplaceSystemDisk	The operation that you want to perform. Set the value to ReplaceSystemDisk.
InstanceId	String	Yes	i-bp67acfmxazb4p****	The ID of the instance.
ImageId	String	No	m-bp67acfmxazb4p****	The ID of the image to be used to replace the system disk.

Parameter	Type	Required	Example	Description
SystemDisk.Size	Integer	No	80	The capacity of the new system disk. Unit: GiB. Valid values: Max{20, the size of the image specified by ImageId} to 500. Default value: 40 or the size of the specified image, whichever is greater.
ClientToken	String	No	123e4567-e89b-12d3-a456-426655440000	The client token that is used to ensure the idempotence of the request You can use the client to generate the value, but you must make sure that it is unique among different requests. The **ClientToken** value can only contain ASCII characters and cannot exceed 64 characters in length. For more information, see How to ensure idempotence in ECS Developer Guide.
UseAdditionalService	Boolean	No	true	Specifies whether to use the virtual machine system configuration provided by Apsara Stack (Windows: NTP and KMS. Linux: NTP and YUM). **Note** This parameter takes effect only when you attach a system disk, whose device name is /dev/xvda.

Parameter	Type	Required	Example	Description
Password	String	No	EcsV587!	The new password of the instance. The password must be 8 to 30 characters in length. It must include at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. Special characters include: `( ) ` ~ ! @ # $ % ^ & * - _ + = | { } [ ] : ; ' < > , . ? /` The password of a Windows instance cannot start with a forward slash (/). This parameter is empty by default, which indicates that the current password remains unchanged. **Note** If the `Password` parameter is specified, we recommend that you send requests over HTTPS to avoid password leaks.
PasswordInherit	Boolean	No	false	Specifies whether to use the password preset in the image. Default value: false. **Note** If the PasswordInherit parameter is set to true, you must not specify the Password parameter and make sure that the selected image has a password preset.
KeyPairName	String	No	test-KeyPairName	The name of the key pair. **Note** This parameter is applicable only to Linux instances. You can bind an SSH key pair to the instance as a logon credential. However, the password logon method is disabled after you bind the SSH key pair.

Parameter	Type	Required	Example	Description
Platform	String	No	CentOS	The distribution of the operating system. Valid values: • CentOS • Ubuntu
Architecture	String	No	i386	The system architecture. Valid values: • i386 • x86_64
SecurityEnhancementStrategy	String	No	Active	Specifies whether to use Security Center after you replace the system disk. Valid values: • Active: Security Center is used for free after the system disk is replaced. This value is applicable only to public images. • Deactive: Security Center is not used for free after the system disk is replaced. This value is applicable to all images. Default value: Deactive.

Response parameters

Parameter	Type	Example	Description
DiskId	String	d-bp67acfmxazb4p****	The ID of the new system disk.
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=ReplaceSystemDisk
&InstanceId=i-bp67acfmxazb4p****
&ImageId=m-bp67acfmxazb4p****
&SystemDisk.Size=80
&ClientToken=123e4567-e89b-12d3-a456-426655440000
&PasswordInherit=false
&KeyPairName=test-KeyPairName
&SecurityEnhancementStrategy=Active
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ReplaceSystemDiskResponse>
      <DiskId>d-bp67acfmxazb4p****</DiskId>
      <RequestId>F3CD6886-D8D0-4FEE-B93E-1B73239673DE</RequestId>
</ReplaceSystemDiskResponse>
```

`JSON` format

```
{
    "RequestId": "337568C5-64F3-4B76-8CDD-D3D8C57B5B8C",
    "DiskId": "d-bp67acfmxazb4p****"
}
```

Error codes

HTTP status code	Error code	Error message	Description
404	InvalidInstanceId.NotFound	The specified InstanceId does not exist.	The error message returned because the specified InstanceId parameter does not exist.
400	InvalidSystemDiskSize.ValueNotSupported	The specified parameter SystemDisk.Size is invalid.	The error message returned because the specified SystemDisk.Size parameter is invalid.
404	InvalidInstanceId.NotFound	The specified instance does not exist.	The error message returned because the specified InstanceId parameter does not exist.
403	InvalidSystemDiskStatus.IsTransfering	The current status of the resource does not support this operation, system disk is transfering.	The error message returned because the operation is not supported while the resource is in the current state. Try again after the system disk stops transmitting data.

HTTP status code	Error code	Error message	Description
403	IncorrectDiskStatus	The current disk status does not support this operation.	The error message returned because the operation is not supported while the disk is in the current state. Make sure that the disk is available and you have no overdue payments for it.
404	InvalidImageId.NotFound	The specified ImageId does not exist.	The error message returned because the specified image does not exist in this account. Check whether the image ID is correct.
403	IncorrectInstanceStatus	The current status of the resource does not support this operation.	The error message returned because the operation is not supported while the resource is in the current state.
403	InstanceLockedForSecurity	The instance is locked due to security.	The error message returned because the operation is not supported while the resource is locked for security reasons.
403	ImageNotSubscribed	The specified image has not be subscribed.	The error message returned because you have not subscribed to the specified Alibaba Cloud Marketplace image.
403	ImageRemovedInMarket	The specified market image is not available, Or the specified user defined image includes product code because it is based on an image subscribed from marketplace, and that image in marketplace includeing exact the same product code has been removed.	The error message returned because the specified Alibaba Cloud Marketplace image is unavailable, or because the specified custom image contains the product code of the Alibaba Cloud Marketplace image from which the custom image is derived and the Alibaba Cloud Marketplace image has been removed from Alibaba Cloud Marketplace.
500	OperationDenied	Internal Error.	The error message returned because an internal error has occurred.
400	InvalidParameter.Conflict	The specified image does not support the specified instance type.	The error message returned because the specified image does not support the specified instance type.

HTTP status code	Error code	Error message	Description
404	InvalidSystemDiskSize.MoreThanMaxSize	The specified SystemDisk.Size parameter exceeds the maximum size.	The error message returned because the specified system disk size exceeds the allowed maximum size.
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.
403	InstanceExpiredOrInArrears	The specified operation is denied as your prepay instance is expired (prepay mode) or in arrears (afterpay mode).	The error message returned because the subscription instance has expired. Renew the instance first.
403	ChargeTypeViolation	The operation is not permitted due to charge type of the instance.	The error message returned because the billing method of the instance does not support this operation.
403	DiskCreatingSnapshot	The operation is denied due to a snapshot of the specified disk is not completed yet.	The error message returned because a snapshot is being created for the specified disk.
403	IoOptimized.NotSupported	The specified image is not support IoOptimized Instance.	The error message returned because the specified image does not support I/O optimized instances.
403	ImageNotSupportInstanceType	The specified image don not support the InstanceType instance.	The error message returned because the specified image does not support the specified instance type.
403	QuotaExceed.BuyImage	The specified image is from the image market,You have not bought it or your quota has been exceeded.	The error message returned because you have not purchased the specified Alibaba Cloud Marketplace image or your image quota has been used up.
404	InvalidSystemDiskSize.LessThanImageSize	The specified parameter SystemDisk.Size is less than the image size.	The error message returned because the specified system disk size is smaller than the image size.
404	InvalidSystemDiskSize.LessThanMinSize	The specified parameter SystemDisk.Size is less than the min size.	The error message returned because the specified system disk size is smaller than the allowed minimum size.

HTTP status code	Error code	Error message	Description
404	NoSuchResource	The specified resource is not found.	The error message returned because the specified resource does not exist.
400	InvalidSystemDiskSize.ImageNotSupportResize	The specified image does not support resize.	The error message returned because the specified image does not support resizing.
400	InvalidSystemDiskSize	The specified parameter SystemDisk.Size is invalid.	The error message returned because the specified SystemDisk.Size parameter is invalid.
403	INST_HAS_UNPAID_ORDER	The instance has unpaid order.	The error message returned because you have unpaid orders for the instance.
400	InvalidSystemDiskSize.ValueNotSupported	The specified parameter SystemDisk.Size is invalid	The error message returned because the specified SystemDisk.Size parameter is invalid.
400	InvalidPassword.Malformed	The specified parameter "Password" is not valid.	The error message returned because the specified Password parameter is invalid.
400	InvalidPasswordParam.Mismatch	The input password should be null when passwdInherit is true.	The error message returned because the Password parameter is specified when PasswdInherit is set to true.
400	OperationDenied	The specified image contains the snapshot of the data disk,does not support this operation.	The error message returned because the operation is not supported while the image contains data disk snapshots.
400	InvalidDiskCategory.ValueNotSupported	The specified parameter "DiskCategory" is not valid.	The error message returned because the specified disk category is invalid.
403	OperationDenied.InstanceCreating	The specified instance is creating.	The error message returned because the specified instance is being created.
400	InvalidParameter.Conflict	%s	The error message returned because a specified parameter is invalid. Check whether parameter conflicts exist.

HTTP status code	Error code	Error message	Description
400	InvalidSystemDiskSize.ValueNotSupported	%s	The error message returned because the specified SystemDisk.Size parameter is invalid.
400	OperationDenied	%s	The error message returned because the operation is denied.
400	InvalidKeyPairName.NotFound	The specified KeyPairName does not exist.	The error message returned because the specified KeyPairName parameter does not exist.
400	DependencyViolation.IoOptimize	The specified parameter InstanceId is not valid.	The error message returned because the specified InstanceId parameter is invalid.
403	InvalidParameter.NotMatch	%s	The error message returned because a specified parameter is invalid. Check whether parameter conflicts exist.
400	MissingParameter.Architecture	Architecture should not be null.	The error message returned because the Architecture parameter is not specified.
400	InvalidArchitecture.Malformed	Architecture is not valid.	The error message returned because the specified Architecture parameter is invalid.
400	MissingParameter.Platform	Platform should not be null.	The error message returned because the Platform parameter is not specified.
400	InvalidPlatform.Malformed	Platform is not valid.	The error message returned because the specified Platform parameter is invalid.
400	InvalidParameter.AllEmpty	%s	The error message returned because the required parameters are not specified.
400	InvalidDiskId.NotFound	The specified disk do not exist.	The error message returned because the specified disk does not exist.
400	InvalidDatadisk.DiskStatusViolation	The operation is not permitted due to status of the Datadisk.	The error message returned because the operation is not supported while the data disk is in the current state.

HTTP status code	Error code	Error message	Description
400	InvalidDatadisk.DiskCategoryViolation	The operation is not permitted due to category of the Datadisk.	The error message returned because the category of the data disk does not support the operation.
403	ResourcesNotInSameZone	The specified instance and disk are not in the same zone.	The error message returned because the specified instance and disk are not in the same zone.
400	InvalidSystemDiskSize.ValueNotSupported	The specified SystemDiskSize is not valid.	The error message returned because the specified SystemDisk.Size parameter is invalid.
400	MissingParameter	The input parameter "ImageId" that is mandatory for processing this request is not supplied.	The error message returned because the ImageId parameter is not specified.
403	ImageNotSupportInstanceType	The specified instanceType is not supported by instance with marketplace image.	The error message returned because the specified Alibaba Cloud Marketplace image does not support the instance type.
500	InternalError	The request processing has failed due to some unknown error, exception or failure.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.
403	OperationDenied.ImageNotValid	%s	The error message returned because the image does not support the operation.

2.1.2.1.7.9. ResizeDisk

You can call this operation to resize a system disk or data disk.

Description

Note Before you call this operation to resize a disk, you must check the partition format of the disk. You cannot resize an MBR disk to larger than 2 TiB in size without data loss. To resize an MBR disk to larger than 2 TiB in size, we recommend that you create and attach a new data disk with the desired size. Then, we recommend that you use the GPT partition format to partition and format the new data disk and copy data from the MBR-formatted data disk to the new GPT-formatted data disk. For more information, see Expand a disk in ECS User Guide.

- You can resize the disks of different categories, including basic disks (`cloud`), ultra disks (`cloud_e`

fficiency), and standard SSDs (cloud_ssd).

- You cannot resize a disk when a snapshot is being created for the disk.
- The instance to which the disk to be resized is attached must be in the **Running** (Running) or **Stopped** (Stopped) state.
- After you resize a disk, its partitions and file systems are not changed. You must manually allocate the storage space on the disk after it is resized.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ResizeDisk	The operation that you want to perform. If you use a custom HTTP URL or HTTPS URL to make an API request, you must specify the Action parameter. Set the value to ResizeDisk.
DiskId	String	Yes	d-bp67acfmxazb4p****	The ID of the disk.
NewSize	Integer	Yes	1900	The new disk capacity. Unit: GiB. Valid values: • For ultra disks (cloud_efficiency): 20 to 32768 • For standard SSDs (cloud_efficiency): 20 to 32768 • For basic disks (cloud): 5 to 2000 The new disk capacity must be greater than the original disk capacity.
Type	String	No	offline	The method used to resize the disk. Default value: offline. Valid values: • offline: resizes the disk offline. After you resize a disk offline, you must restart its associated instance by using the ECS console or by calling the RebootInstance operation to make the resizing operation take effect. • online: resizes the disk online. After you resize a disk online, the operation takes effect immediately without the need to restart the instance. You can resize ultra disks and standard SSDs online.

Parameter	Type	Required	Example	Description
ClientToken	String	No	123e4567-e89b-12d3-a456-426655440000	The client token that is used to ensure the idempotence of the request You can use the client to generate the value, but you must make sure that it is unique among different requests. The **ClientToken** value can only contain ASCII characters and cannot exceed 64 characters in length. For more information, see How to ensure idempotence in ECS Developer Guide.

Response parameters

Parameter	Type	Example	Description
RequestId	String	F3CD6886-D8D0-4FEE-B93E-1B73239673DE	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=ResizeDisk
&DiskId=d-bp67acfmxazb4p****
&NewSize=1900
&ClientToken=123e4567-e89b-12d3-a456-426655440000
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ResizeDiskResponse>
      <RequestId>F3CD6886-D8D0-4FEE-B93E-1B73239673DE</RequestId>
</ResizeDiskResponse>
```

`JSON` format

```
{
    "RequestId": "F3CD6886-D8D0-4FEE-B93E-1B73239673DE"
}
```

Error codes

HTTP status code	Error code	Error message	Description
403	InvalidDataDiskSize.ValueNotSupported	The specified DataDisk.n.Size beyond the permitted range, or the capacity of snapshot exceeds the size limit of the specified disk category.	The error message returned because the specified DataDisk.N.Size parameter is invalid or the snapshot size exceeds the maximum capacity that is allowed for the specified category.
404	InvalidDiskId.NotFound	The specified disk does not exist.	The error message returned because the specified DiskId parameter does not exist. Check whether the disk ID is correct.
404	InvalidInstanceId.NotFound	The specified InstanceId does not exist.	The error message returned because the specified instance does not exist.
403	OperationDenied	The type of the disk does not support the operation.	The error message returned because the specified disk category does not support the operation.
403	OperationDenied	The status of the disk or the instance that the disk is attaching with does not support the operation.	The error message returned because the operation is not supported while the disk or instance is in the current state.
403	InvalidDiskSize.TooSmall	Specified new disk size is less than the original disk size.	The error message returned because the specified new disk capacity is smaller than the original disk capacity.
403	InvalidDiskSize.TooLarge	Specified new disk size is beyond the permitted range.	The error message returned because the specified new disk capacity exceeds the capacity limit.
403	InstanceExpiredOrInArrears	The specified operation is denied as your prepay instance is expired (prepay mode) or in arrears (afterpay mode).	The error message returned because the subscription instance has expired. Renew the instance first.
403	DiskError	IncorrectDiskStatus	The error message returned because the status of the specified disk is invalid.
403	DiskInArrears	The specified operation is denied as your disk owing fee.	The error message returned because you have an overdue payment for the disk.

HTTP status code	Error code	Error message	Description
403	IncorrectInstanceStatus	The current status of the resource does not support this operation.	The error message returned because the operation is not supported while the resource is in the current state.
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.
403	DiskCreatingSnapshot	The operation is denied due to a snapshot of the specified disk is not completed yet.	The error message returned because a snapshot is being created for the specified disk.
400	InvalidDataDiskCategory.ValueNotSupported	%s	The error message returned because the specified data disk category is invalid.
400	InvalidParameter.Conflict	%s	The error message returned because a specified parameter is invalid. Check whether parameter conflicts exist.
400	InvalidDataDiskSize.ValueNotSupported	%s	The error message returned because the specified data disk capacity is invalid.
400	InvalidSystemDiskSize.ValueNotSupported	%s	The error message returned because the specified system disk size is invalid.
403	InvalidDiskSize	Specified new disk size is less than or equal the original disk size.	The error message returned because the specified new disk capacity is smaller than or equal to the original disk capacity.
400	IncompleteParamter	Some fields can not be null in this request.	The error message returned because some required parameters are not specified.
403	Operation.Conflict	The operation may conflicts with others.	The error message returned because the operation conflicts with other operations.
403	InstanceLockedForSecurity	The instance is locked due to security.	The error message returned because the operation is not supported while the resource is locked for security reasons.

HTTP status code	Error code	Error message	Description
403	IncorrectDiskStatus	The current disk status does not support this operation.	The error message returned because the operation is not supported while the disk is in the current state. Make sure that the disk is available and you have no overdue payment for it.
403	UserNotInTheWhiteList	The user is not in disk white list.	The error message returned because you are authorized to manage the disk. Try again when you are authorized.
400	InvalidRegionId.MalFormed	The specified RegionId is not valid	The error message returned because the specified RegionId parameter is invalid.
403	InvalidDiskCategory.NotSupported	The specified disk category is not supported.	The error message returned because the specified disk category does not support the operation.
400	InvalidParam.Type	The specified type is not supported.	The error message returned because the specified Type parameter is invalid.
403	InvalidRegion.NotSupport	The specified region does not support resize online.	The error message returned because online resizing is not supported in the specified region.
403	InvalidDiskCategory.NotSupported	The specified disk category does not support resize online.	The error message returned because the specified disk category does not support online resizing.
403	IncorrectInstanceStatus	The current status of the resource does not support resize online.	The error message returned because this operation is not supported while the resource is in the current state.
403	InvalidInstanceStatus.NotRunning	The status of instance to which the disk attachs must be running when resizing online.	The error message returned because the instance to which the disk is attached is not in the Running state when you resize the disk online.
403	IncorrectDiskStatus	The current status of the resource does not support resize online	The error message returned because online resizing is not supported while the resource is in the current state.

HTTP status code	Error code	Error message	Description
400	LastOrderProcessing	The previous order is still processing, please try again later.	The error message returned because the order is being processed. Try again later.
403	InvalidParameter.KMSKeyId.KMSUnauthorized	ECS service have no right to access your KMS.	The error message returned because ECS is not authorized to access your KMS resources.
500	InternalError	The request processing has failed due to some unknown error, exception or failure.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.
403	SecurityRisk.3DVerification	We have detected a security risk with your default credit or debit card. Please proceed with verification via the link in your email.	The error message returned because risks are detected in your default credit card or debit card. Click the link in the email for verification.
400	InvalidSystemDiskSize.ImageNotSupportResize	The specified image does not support resize.	The error message returned because the specified image does not support resizing.

2.1.2.1.7.10. DeleteDisk

You can call this operation to release a data disk. The data disk can be a basic disk, an ultra disk, a standard SSD, or an enhanced SSD (ESSD).

Description

When you call this operation, take note of the following items:

- Manual snapshots of the disk to be released will be retained.
- You can call the ModifyDiskAttribute operation to configure whether automatic snapshots are retained or released along with the disk. We recommend that you delete the snapshots that are no longer needed to maintain a sufficient quota for new automatic snapshots.
- The disk must be in the Available (Available) state.
- If the specified disk does not exist, the request will be ignored.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteDisk	The operation that you want to perform. Set the value to DeleteDisk.

Parameter	Type	Required	Example	Description
DiskId	String	Yes	d-bp198f7xn673w2rw****	The ID of the disk to be released.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=DeleteDisk
&DiskId=d-bp198f7xn673w2rw****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteDiskResponse>
      <RequestId>CEF72CEB-54B6-4AE8-B225-F876FF7BA984</RequestId>
</DeleteDiskResponse>
```

`JSON` format

```
{
    "RequestId": "CEF72CEB-54B6-4AE8-B225-F876FF7BA984"
}
```

Error codes

HTTP status code	Error code	Error message	Description
403	IncorrectDiskStatus	The current disk status does not support this operation.	The error message returned because the operation is not supported while the disk is in the current state. Ensure that the disk is available and you have no overdue payments for it.

HTTP status code	Error code	Error message	Description
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.
403	DiskNotPortable	The specified disk is not a portable disk.	The error message returned because the specified disk is not removable.
403	DiskTypeViolation	The specified disk is a system disk and cannot support the operation.	The error message returned because the specified disk is a system disk and cannot be detached from its attached instance.
403	DiskCreatingSnapshot	The operation is denied due to a snapshot of the specified disk is not completed yet.	The error message returned because a snapshot is being created for the specified disk.
403	IncorrectDiskStatus.Initializing	The current disk status does not support this operation.	The error message returned because the operation is not supported while the disk is in the current state. Ensure that the disk is available and you have no overdue payments for it.
404	InvalidDiskId.NotFound	The specified disk does not exist.	The error message returned because the specified DiskId parameter does not exist. Check whether the disk ID is correct.
403	DiskStillAttached	The disk is still attached to the disk.	The error message returned because the specified disk is still attached to an instance.
403	UserNotInTheWhiteList	The user is not in disk white list.	The error message returned because you are not authorized to manage the disk.
400	InvalidRegionId.MalFormed	The specified parameter RegionId is not valid.	The error message returned because the specified region ID is invalid.

2.1.2.1.8. Snapshots

2.1.2.1.8.1. CreateSnapshot

You can call this operation to create a snapshot for a disk.

Description

In the following scenarios, you cannot create snapshots for a disk:

- The number of manual snapshots created for the disk has reached 256.
- A snapshot is being created for the disk.
- The instance to which the disk is attached has never been started.
- The instance to which the disk is attached is not in the **Stopped** (`Stopped`) or **Running** (`Running`) state.
- If the response contains `{"OperationLocks": {"LockReason" : "security"}}` when you query the information of an instance, the instance is locked for security reasons and all operations are prohibited on it.

When you create a snapshot, take note of the following items:

- You can create a snapshot for a disk one hour after its attached instance is created or the system disk of the instance is replaced. After a data disk is added, you must wait a period of time before you can create snapshots for the disk. The amount of time to wait depends on the size of the disk data.
- If a snapshot is being created, you cannot use this snapshot to create a custom image by calling the CreateImage operation.
- If the disk is attached to an instance, do not change the instance state during snapshot creation.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateSnapshot	The operation that you want to perform. If you use a custom HTTP URL or HTTPS URL to make an API request, you must specify the `Action` parameter. Set the value to CreateSnapshot.
DiskId	String	Yes	d-bp1s5fnvk4gn2tws0****	The ID of the disk.
SnapshotName	String	No	test-Snapshot****	The name of the snapshot to be created. The name must be 2 to 128 characters in length and can contain letters, digits, colons (:), underscores (_), and hyphens (-). The name must start with a letter and cannot start with http:// or https://. It also cannot start with auto because snapshot names that start with auto are recognized as automatic snapshots.

Parameter	Type	Required	Example	Description
Description	String	No	This is a description example.	The description of the snapshot. The description must be 2 to 256 characters in length and cannot start with http:// or https://. This parameter is empty by default.
RetentionDays	Integer	No	30	The retention period of the snapshot. Valid values: 1 to 65536. Unit: days. The snapshot will be automatically released when the retention period expires. This parameter is empty by default, which indicates that the snapshot will not be automatically released.
Category	String	No	Standard	The type of the snapshot. Valid values: • Standard: normal snapshot • Flash: local snapshot
ClientToken	String	No	123e4567-e89b-12d3-a456-42665544****	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must ensure that it is unique among different requests. The **ClientToken** value can only contain ASCII characters and cannot exceed 64 characters in length. For more information, see How to ensure idempotence in ECS Developer Guide.
Tag.N.Key	String	No	TestKey	The key of tag N of the snapshot. Valid values of N: 1 to 20. The tag key cannot be an empty string. It can be up to 128 characters in length and cannot start with acs: or aliyun. It cannot contain http:// or https://.
Tag.N.Value	String	No	TestValue	The value of tag N of the snapshot. Valid values of N: 1 to 20. The tag value can be an empty string. It can be up to 128 characters in length. It cannot start with acs: or contain http:// or https://.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.
SnapshotId	String	s-bp17441ohwka0yuh****	The ID of the snapshot.

Examples

Sample requests

```
https://ecs.example.com/?Action=CreateSnapshot
&DiskId=d-bp1s5fnvk4gn2tws0****
&SnapshotName=test-SnapshotName
&Description=This is a description example.
&ClientToken=123e4567-e89b-12d3-a456-42665544****
&Tag.1.Key=TestKey
&Tag.1.Value=TestValue
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreateSnapshotResponse>
          <RequestId>C8B26B44-0189-443E-9816-D951F59623A9</RequestId>
          <SnapshotId>s-bp17441ohwka0yuh****</SnapshotId>
</CreateSnapshotResponse>
```

`JSON` format

```
{
    "RequestId": "C8B26B44-0189-443E-9816-D951F59623A9",
    "SnapshotId": "s-bp17441ohwka0yuh****"
}
```

Error codes

HTTP status code	Error code	Error message	Description
404	InvalidDiskId.NotFound	The specified DiskId does not exist.	The error message returned because the specified DiskId parameter does not exist. Check whether the disk ID is correct.

HTTP status code	Error code	Error message	Description
400	InvalidSnapshotName.Malformed	The specified SnapshotName is wrongly formed.	The error message returned because the specified SnapshotName parameter is invalid.
404	InvalidDescription.Malformed	The specified description is wrongly formed.	The error message returned because the specified Description parameter is invalid. The description must be 2 to 256 characters in length and cannot start with http:// or https://.
400	IncorrectInstanceStatus	The current status of the resource does not support this operation.	The error message returned because the operation is not supported while the resource is in the current state.
403	IncorrectDiskStatus.CreatingSnapshot	A previous snapshot creation is in process.	The error message returned because another snapshot is being created. Wait until the snapshot is created and try again.
403	InstanceLockedForSecurity	The disk attached instance is locked due to security.	The error message returned because the instance to which the disk is attached is locked for security reasons.
403	IncorrectDiskStatus.NeverAttached	The specified disk has never been attached to any instance.	The error message returned because the specified disk has never been attached to instances and its content remains unchanged.
403	QuotaExceed.Snapshot	The snapshot quota exceeds.	The error message returned because the maximum number of snapshots has been reached. To store new snapshots, delete snapshots that are no longer needed.
403	IncorrectDiskStatus.NeverUsed	The specified disk has never been used after creating.	The error message returned because the specified disk has never been used and its content remains unchanged.
403	CreateSnapshot.Failed	The process of creating snapshot is failed.	The error message returned because the snapshot has failed to be created.

HTTP status code	Error code	Error message	Description
403	DiskInArrears	The specified operation is denied as your disk has expired.	The error message returned because the disk has expired due to an overdue payment.
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.
403	DiskId.ValueNotSupported	The specified parameter diskid is not supported.	The error message returned because the specified Block Storage device does not support the operation.
400	DiskCategory.OperationNotSupported	The operation is not supported to the specified disk due to its disk category	The error message returned because the disk category does not support the operation.
403	IncorrectDiskStatus	The current disk status does not support this operation.	The error message returned because the operation is not supported while the disk is in the current state. Ensure that the disk is available and you have no overdue payments for it.
403	InvalidAccountStatus.NotEnoughBalance	Your account does not have enough balance.	The error message returned because your account balance is insufficient. Add funds to your account and try again.
403	InvalidAccountStatus.SnapshotServiceUnavailable	Snapshot service has not been opened yet.	The error message returned because the operation is not supported while the snapshot service is not activated.
404	InvalidInstanceId.NotFound	The specified InstanceId does not exist.	The error message returned because the specified instance does not exist.
403	IncorrectVolumeStatus	The current volume status does not support this operation.	The error message returned because the operation is not supported while the Shared Block Storage device is in the current state.

HTTP status code	Error code	Error message	Description
404	InvalidVolumeId.NotFound	The specified volume does not exist.	The error message returned because the specified Shared Block Storage device does not exist. Check whether the Shared Block Storage device ID is correct.
403	IdempotentParameterMismatch	The specified clientToken is used.	The error message returned because the specified client token is already in use.
403	IncorrectDiskStatus.Invalid	The specified device status invalid, restart instance and try again.	The error message returned because the status of the specified disk is invalid. Restart the instance and try again.
403	IncorrectDiskType.NotSupport	The specified device type is not supported.	The error message returned because the disk category does not support the operation.
403	IncorrectDiskStatus.Transferring	The specified device is transferring, you can retry after the process is finished.	The error message returned because the specified disk is being migrated. Wait until the disk is migrated and try again.
403	InvalidParameter.KMSKeyId.KMSUnauthorized	ECS service have no right to access your KMS.	The error message returned because ECS is not authorized to access your KMS resources.
500	InternalError	The request processing has failed due to some unknown error, exception or failure.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.
400	Duplicate.TagKey	The Tag.N.Key contain duplicate key.	The error message returned because the specified tag key already exists. Tag keys must be unique.
400	InvalidTagKey.Malformed	The specified Tag.n.Key is not valid.	The error message returned because the specified Tag.N.Key parameter is invalid.
400	InvalidTagValue.Malformed	The specified Tag.n.Value is not valid.	The error message returned because the specified Tag.N.Value parameter is invalid.

HTTP status code	Error code	Error message	Description
403	IdempotentProcessing	The previous idempotent request(s) is still processing.	The error message returned because a previous idempotent request is being processed. Try again later.
403	QuotaExceed.Tags	%s	The error message returned because the number of specified tags exceeds the upper limit.

2.1.2.1.8.2. DeleteSnapshot

You can call this operation to delete a snapshot. If you call this operation to delete a snapshot that is being created, the snapshot creation task is canceled.

Description

When you call this operation, take note of the following items:

- If the specified snapshot ID does not exist, the request will be ignored.
- A snapshot that has already been used to create custom images cannot be deleted. The snapshot can be deleted only after the created custom images are deleted (DeleteImage).

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteSnapshot	The operation that you want to perform. Set the value to DeleteSnapshot.
SnapshotId	String	Yes	s-bp1btgnlb4licd41****	The ID of the snapshot to be deleted.
Force	Boolean	No	false	Specifies whether to forcibly delete the snapshot that has been used to create disks. **Note** After an snapshot is deleted, the disks created from this snapshot cannot be re-initialized.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request. Every response returns a unique request ID regardless of whether the call is successful.

Examples

Sample requests

```
https://ecs.example.com/?Action=DeleteSnapshot
&SnapshotId=s-bp1btgnlb4licd41****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteSnapshotResponse>
       <RequestId>CEF72CEB-54B6-4AE8-B225-F876FF7BA984</RequestId>
</DeleteSnapshotResponse>
```

`JSON` format

```
{
    "RequestId": "CEF72CEB-54B6-4AE8-B225-F876FF7BA984"
}
```

Error codes

HTTP status code	Error code	Error message	Description
403	SnapshotCreatedImage	The snapshot has been used to create user defined image(s).	The error message returned because the specified snapshot has been used to create custom images. You must delete the associated images before you can delete the snapshot. If you forcibly delete the snapshot, the images associated with the snapshot will become unavailable.
403	SnapshotCreatedDisk	The snapshot has been used to create disk(s).	The error message returned because the specified snapshot has been used to create disks.

HTTP status code	Error code	Error message	Description
400	MissingParameter	The input parameter SnapshotId that is mandatory for processing this request is not supplied.	The error message returned because the required SnapshotId parameter is not specified.
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.
404	InvalidSnapshotId.NotFound	The specified snapshot is not found	The error message returned because the specified SnapshotId parameter does not exist.
403	Operation.Conflict	The operation may conflicts with others, please retry later.	The error message returned because the operation conflicts with other operations. Try again later.

2.1.2.1.8.3. DescribeSnapshots

You can call this operation to query all snapshots of an ECS instance or a disk.

Description

You can specify multiple request parameters such as InstanceId, DiskId, and SnapshotIds to be queried. Specified parameters have logical AND relations. Only specified parameters are included in the filter conditions.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeSnapshots	The operation that you want to perform. Set the value to DescribeSnapshots.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the instance or disk. You can call the DescribeRegions operation to query the most recent region list.
InstanceId	String	No	i-bp67acfmxazb4p****	The ID of the instance.

Parameter	Type	Required	Example	Description
DiskId	String	No	d-bp67acfmxazb4p****	The ID of the disk.
SnapshotLinkId	String	No	sp-bp67acfmxazb4p****	The ID of the snapshot chain.
SnapshotIds	String	No	["s-bp67acfmxazb4ph****", "s-bp67acfmxazb4pk****", ... "s-bp67acfmxazb4pj****"]	The IDs of snapshots. The value can be a JSON array that consists of up to 100 snapshot IDs. Separate multiple snapshot IDs with commas (,).
PageNumber	Integer	No	1	The number of the page to return. Pages start from page 1. Default value: 1.
PageSize	Integer	No	10	The number of entries to return on each page. Valid values: 1 to 100. Default value: 10.
SnapshotName	String	No	test-SnapshotName	The name of the snapshot.
Status	String	No	all	The status of the snapshot. Default value: all. Valid values: • progressing: The snapshot is being created. • accomplished: The snapshot is created. • failed: The snapshot failed to be created. • all: all snapshot states.
SnapshotType	String	No	all	The type of the snapshot. Default value: all. Valid values: • auto: automatic snapshot • user: manual snapshot • all: all snapshot types

Parameter	Type	Required	Example	Description
Filter.1.Key	String	No	CreationStartTime	The key of filter condition 1 used to query resources. Set the value to CreationStartTime.
Filter.2.Key	String	No	CreationEndTime	The key of filter condition 2 used to query resources. Set the value to CreationEndTime.
Filter.1.Value	String	No	2019-12-13T17:00Z	The value of filter condition 1 used to query resources. The value must be the beginning of the time range in which to query created resources.
Filter.2.Value	String	No	2019-12-13T22:00Z	The value of filter condition 2 used to query resources. The value must be the end of the time range in which to query created resources.
Usage	String	No	none	Specifies whether the snapshot has been used to create images or disks. Valid values: • image: The snapshot has been used to create custom images. • disk: The snapshot has been used to create disks. • image_disk: The snapshot has been used to create custom images and data disks. • none: The snapshot has not been used to create custom images or disks.
SourceDiskType	String	No	Data	The category of the disk for which the snapshot was created. Valid values: • System: system disk • Data: data disk
Tag.N.Key	String	No	TestKey	The key of tag N of the snapshot. Valid values of N: 1 to 20.
Tag.N.Value	String	No	TestValue	The value of tag N of the snapshot. Valid values of N: 1 to 20.

Parameter	Type	Required	Example	Description
Encrypted	Boolean	No	false	Specifies whether the snapshot is encrypted. Default value: false.
ResourceGroupId	String	No	rg-bp67acfmxazb4p****	The ID of the resource group to which the snapshot belongs.
DryRun	Boolean	No	false	Specifies whether to check the validity of the request without actually making the request. Default value: false. Valid value: • true: The validity of the request is checked but the request is not made. Check items include whether your AccessKey pair is valid, whether RAM users are authorized, and whether the required parameters are specified. If the check fails, the corresponding error is returned. If the check succeeds, the DryRunOperation error code is returned. • false: The validity of the request is checked. If the check succeeds, a 2XX HTTP status code is returned and the request is made.
KMSKeyId	String	No	0e478b7a-4262-4802-b8cb-00d3fb40****	The ID of the KMS key used by the data disk.

Response parameters

Parameter	Type	Example	Description
PageNumber	Integer	1	The page number of the returned page.
PageSize	Integer	10	The number of entries returned per page.
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.
Snapshots	Array		The collections of details about snapshots.
Snapshot			

Parameter	Type	Example	Description
Category	String	standard	The type of the snapshot. Valid values: • standard: normal snapshot • flash: local snapshot
CreationTime	String	2019-12-24T13:00:52Z	The time when the snapshot was created. The time follows the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time is displayed in UTC.
Description	String	FinanceDept	The description of the snapshot.
Encrypted	Boolean	false	Indicates whether the snapshot was encrypted.
KMSKeyId	String	0e478b7a-4262-4802-b8cb-00d3fb40826X	The ID of the KMS key used by the data disk.
LastModifiedTime	String	test	**Note** This parameter is not supported.
ProductCode	String	jxsc000***	**Note** This parameter is not supported.
Progress	String	100	The progress of the snapshot creation task. Unit: percent (%).
RemainTime	Integer	38	The time remaining for the snapshot creation task. Unit: seconds.
ResourceGroupId	String	rg-bp67acfmxazb4p****	The ID of the resource group to which the snapshot belongs.
RetentionDays	Integer	30	The retention period of the automatic snapshot. Unit: days.
SnapshotId	String	s-bp67acfmxazb4p****	The ID of the snapshot.

Parameter	Type	Example	Description
SnapshotName	String	test-SnapshotName	The name of the snapshot. This parameter is returned only if a name was specified during creation of the snapshot.
SnapshotSN	String	64472-116742336-61976****	The serial number of the snapshot.
SnapshotType	String	all	The type of the snapshot. Default value: all. Valid values: • auto: automatic snapshot • user: manual snapshot • all: all snapshot types
SourceDiskId	String	d-bp67acfmxazb4p****	The ID of the disk for which the snapshot was created. This parameter is retained even after the disk is released.
SourceDiskSize	String	2000	The size of the disk for which the snapshot was created. Unit: GiB.
SourceDiskType	String	Data	The type of the disk for which the snapshot was created. Valid values: • System • Data
SourceStorageType	String	disk	The category of the disk for which the snapshot was created. **Note** This parameter will be removed in the future. We recommend that you use other parameters to ensure compatibility.
Status	String	accomplished	The status of the snapshot. Valid values: • progressing • accomplished • failed

Parameter	Type	Example	Description
Tags	Array		The tags of the snapshot.
Tag			
TagKey	String	TestKey	The tag key of the snapshot.
TagValue	String	TestValue	The tag value of the snapshot.
Usage	String	none	Indicates whether the snapshot had been used to create images or disks. Valid values: • image • disk • image_disk • none
TotalCount	Integer	36	The total number of snapshots.

Examples

Error codes

HTTP status code	Error code	Error message	Description
403	InvalidSnapshotIds.Malformed	The amount of specified specified snapshot Ids exceeds the limit.	The error message returned because the specified SnapshotIds parameter is invalid.
404	InvalidFilterKey.NotFound		The error message returned because the specified start time or end time is invalid.
404	InvalidUsage	The specifed Usage is not valid	The error message returned because the specified Usage parameter is invalid.

HTTP status code	Error code	Error message	Description
404	InvalidSourceDiskType	The specifed SourceDiskType is not valid	The error message returned because the specified SourceDiskType parameter is invalid.
404	InvalidStatus.NotFound	The specified Status is not found	The error message returned because the specified Status parameter does not exist.
404	InvalidSnapshotType.NotFound	The specfied SnapshotType is not found	The error message returned because the specified SnapshotType parameter does not exist.
400	InvalidTag.Mismatch	The specified Tag.n.Key and Tag.n.Value are not match.	The error message returned because the specified Tag.N.Key and Tag.N.Value parameters do not match.
400	InvalidTagCount	The specified tags are beyond the permitted range.	The error message returned because the number of specified tags exceeds the upper limit.
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.
404	InvalidSnapshotLinkId.NotFound	The specified snapshot link is not found.	The error message returned because the specified snapshot chain does not exist.

2.1.2.1.8.4. CopySnapshot

You can call this operation to copy a normal snapshot from one region to another.

Description

When you call this operation, take note of the following items:

- New snapshots, which are the copies of source snapshots, cannot be used to roll back the disks for which the source snapshots were created.
- Encrypted snapshots cannot be copied.
- Local snapshots cannot be copied.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CopySnapshot	The operation that you want to perform. Set the value to CopySnapshot.
SnapshotId	String	Yes	s-bp67acfmxazb4p****	The ID of the source snapshot.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the source snapshot. You can call the DescribeRegions operation to query the most recent region list.
DestinationRegionId	String	Yes	cn-beijing-env17-d01	The region ID of the new snapshot.
DestinationSnapshotName	String	Yes	test-DestinationSnapshotName	The name of the new snapshot. The name must be 2 to 128 characters in length and can contain letters, digits, colons (:), underscores (_), periods (.), and hyphens (-). It must start with a letter and cannot start with http:// or https://. This parameter is empty by default.
DestinationSnapshotDescription	String	Yes	This is a description example.	The description of the new snapshot. The description must be 2 to 256 characters in length and cannot start with http:// or https://. This parameter is empty by default.
RetentionDays	Integer	No	60	The retention period of the new snapshot. Unit: days. The new snapshot will be automatically released when it expires. Valid values: 1 to 65536. This parameter is empty by default, which indicates that the snapshot will not be automatically released.

Parameter	Type	Required	Example	Description
Tag.N.Key	String	No	TestKey	The key of tag N to be bound to the new snapshot. The tag key cannot be an empty string. It can be up to 128 characters in length and cannot contain http:// or https://. It cannot start with acs: or aliyun.
Tag.N.Value	String	No	TestValue	The value of tag N to be bound to the new snapshot. The tag value can be an empty string. It can be up to 128 characters in length and cannot contain http:// or https://. It cannot start with acs: or aliyun.

Response parameters

Parameter	Type	Example	Description
RequestId	String	C8B26B44-0189-443E-9816-D951F59623A9	The ID of the request.
SnapshotId	String	s-bp17441ohwka0yui****	The ID of the new snapshot.

Examples

Sample requests

```
https://ecs.example.com/?Action=CopySnapshot
&DestinationRegionId=cn-beijing-env17-d01
&RegionId=cn-qingdao-env17-d01
&SnapshotId=s-bp67acfmxazb4p****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CopySnapshotResponse>
            <RequestId>C8B26B44-0189-443E-9816-D951F59623A9</RequestId>
            <SnapshotId>s-bp17441ohwka0yuhi****</SnapshotId>
</CopySnapshotResponse>
```

`JSON` format

```
{
        "RequestId": "C8B26B44-0189-443E-9816-D951F59623A9",
        "SnapshotId": "s-bp17441ohwka0yuhi****"
}
```

Error codes

HTTP status code	Error code	Error message	Description
403	InvalidSnapshotId.NotFound	The specified snapshot is not exists.	The error message returned because the specified SnapshotId parameter does not exist.
403	InvalidUser.NotInWhiteList	The user is not in the white list of copying snapshot.	The error message returned because you are not authorized to perform this operation.
403	InvalidAccountStatus.NotEnoughBalance	Your account does not have enough balance.	The error message returned because your account balance is insufficient. Add funds to your account and try again.
403	InvalidAccountStatus.SnapshotServiceUnavailable	Snapshot service has not been opened yet.	The error message returned because the operation is not supported while the snapshot service is not activated.
400	Duplicate.TagKey	The Tag.N.Key contain duplicate key.	The error message returned because the specified tag key already exists. Tag keys must be unique.
400	InvalidTagKey.Malformed	The specified Tag.n.Key is not valid.	The error message returned because the specified Tag.N.Key parameter is invalid.
400	InvalidTagValue.Malformed	The specified Tag.n.Value is not valid.	The error message returned because the specified Tag.N.Value parameter is invalid.
400	InvalidRegionId.MalFormed	The specified RegionId is not valid	The error message returned because the specified RegionId parameter is invalid.

2.1.2.1.8.5. DescribeSnapshotLinks

You can call this operation to query the snapshot chains of one or more disks. A snapshot chain is a chain of all the snapshots created for a disk. A disk corresponds to a chain of snapshots.

Description

When you call this operation, take note of the following items:

- You can specify multiple request parameters such as `RegionId`, `DiskIds`, and `InstanceId` to be queried. Specified parameters have logical AND relations.
- Only the specified parameters are used as filter conditions. If the `DiskIds` and `SnapshotLinkIds` parameters are set to empty JSON arrays, they are regarded as valid filter conditions and an empty result is returned.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeSnapshotLinks	The operation that you want to perform. Set the value to DescribeSnapshotLinks.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the disk. You can call the DescribeRegions operation to query the most recent region list.
InstanceId	String	No	i-bp1ahcvgu9z55pk7****	The ID of the instance.
DiskIds	String	No	["d-bp198f7xn673w2rw****", "d-bp12te2l9m0170wc****", ... "d-bp1btgnlb4lgdzoi****"]	The IDs of disks. The value is a JSON array that consists of up to 100 disk IDs. Separate multiple disk IDs with commas (,).
SnapshotLinkIds	String	No	["sl-bp14r3b4xczuenhr****", "sl-bp1eftye2796vi2a****", ... "sl-bp1aixnfbjo290a8****"]	The IDs of snapshot chains. The value is a JSON array that consists of up to 100 snapshot chain IDs. Separate multiple snapshot chain IDs with commas (,).
PageNumber	Integer	No	1	The number of the page to return. Pages start from page 1. Default value: 1.
PageSize	Integer	No	50	The number of entries to return on each page. Valid values: 1 to 100. Default value: 10.

Response parameters

Parameter	Type	Example	Description
PageNumber	Integer	1	The page number of the returned page.
PageSize	Integer	50	The number of entries returned per page.
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.
SnapshotLinks	Array of SnapshotLink		Details about the snapshot chains.
SnapshotLink			
Category	String	test	**Note** This parameter is not supported.
InstanceId	String	i-bp1ahcvgu9z55pk7****	The ID of the instance.
InstanceName	String	test-InstanceName	The name of the instance.
RegionId	String	cn-qingdao-env17-d01	The ID of the region where the source disk of the snapshot chain is located.
SnapshotLinkId	String	sl-bp14r3b4xczuenhr****	The ID of the snapshot chain.
SourceDiskId	String	d-bp198f7xn673w2rw****	The ID of the source disk. This parameter is retained even if the source disk is deleted.
SourceDiskName	String	test-SourceDiskName	The name of the source disk.
SourceDiskSize	Integer	40	The size of the source disk. Unit: GiB.

Parameter	Type	Example	Description
SourceDiskType	String	cloud_ssd	The category of the source disk. Valid values: • cloud_efficiency: ultra disk • cloud_ssd: standard SSD • cloud_essd: enhanced SSD (ESSD) • ephemeral_ssd: local SSD • cloud: basic disk
TotalCount	Integer	1	The total number of snapshots.
TotalSize	Long	2097152	The total size of all snapshots in the snapshot chain. Unit: byte.
TotalCount	Integer	9	The total number of snapshot chains.

Examples

Sample requests

```
https://ecs.example.com/?Action=DescribeSnapshotLinks
&RegionId=cn-qingdao-env17-d01
&InstanceId=i-bp1ahcvgu9z55pk7****
&DiskIds=["d-bp198f7xn673w2rw****", "d-bp12te2l9m0170wc****", ... "d-bp1btgnlb4lgdzoi****"]
&SnapshotLinkIds=["sl-bp14r3b4xczuenhr****", "sl-bp1eftye2796vi2a****", ... "sl-bp1aixnfbjo290a8****"]
&PageNumber=1
&PageSize=10
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeSnapshotLinksResponse>
      <SnapshotLinks>
            <SnapshotLink>

Error codes

HTTP status code	Error code	Error message	Description
400	InvalidRegionId	The specified regionId is invalid.	The error message returned because the specified RegionId parameter is invalid.
400	InvalidSnapshotLinkIds	The specified snapshotLinkIds is invalid.	The error message returned because the specified SnapshotLinkIds parameter is invalid.
400	InvalidDiskIds	The specified diskIds is invalid.	The error message returned because the specified DiskIds parameter is invalid.
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.

2.1.2.1.8.6. DescribeSnapshotsUsage

You can call this operation to query the number of snapshots stored in a region and the total size of the snapshots.

If you want to view the snapshot usage information on each disk in the current region, we recommend that you call the DescribeSnapshotLinks operation to query snapshot chain information.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeSnapshotsUsage	The operation that you want to perform. Set the value to DescribeSnapshotsUsage.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the snapshot. You can call the DescribeRegions operation to query the most recent region list.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.
SnapshotCount	Integer	5	The number of snapshots stored in the current region.
SnapshotSize	Long	122	The total size of snapshots stored in the current region. Unit: byte.

Examples

Sample requests

```
https://ecs.example.com/?Action=DescribeSnapshotsUsage
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeSnapshotsUsageResponse>
      <SnapshotCount>5</SnapshotCount>
      <SnapshotSize>122</SnapshotSize>
      <RequestId>ED5CF6DD-71CA-462C-9C94-A61A78A01479</RequestId>
</DescribeSnapshotsUsageResponse>
```

`JSON` format

```
{
    "SnapshotCount": "5",
    "SnapshotSize": "122",
    "RequestId": "ACD9BBB0-A9D1-46D7-9630-B7A69889E110"
}
```

Error codes

HTTP status code	Error code	Error message	Description
403	InvalidParam.RegionId	The specified region is not exist.	The error message returned because the specified RegionId parameter does not exist.

2.1.2.1.8.7. CreateAutoSnapshotPolicy

You can call this operation to create an automatic snapshot policy.

Description

After an automatic snapshot policy is created, you can call the ApplyAutoSnapshotPolicy operation to apply the policy to disks. You can also call the ModifyAutoSnapshotPolicyEx operation to modify the automatic snapshot policy.

When you call this operation, take note of the following items:

- A maximum of 100 automatic snapshot policies can be created in each region per Apsara Stack tenant account.
- If an automatic snapshot is being created when the time scheduled for a new automatic snapshot is due, the new snapshot task is skipped. This may occur when a disk contains a large volume of data. For example, an automatic snapshot policy is applied to a disk that contains a large volume of data, and the policy specifies that snapshots are created at 09:00, 10:00, 11:00, and 12:00. The system starts to create a snapshot for the disk at 09:00. The snapshot creation process takes 80 minutes and ends at 10:20. The system skips the automatic snapshot task scheduled for 10:00 and creates the next automatic snapshot for the disk at 11:00.

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateAutoSnapshotPolicy	The operation that you want to perform. Set the value to CreateAutoSnapshotPolicy.
regionId	String	Yes	cn-qingdao-env17-d01	The ID of the region in which to create an automatic snapshot policy. You can call the DescribeRegions operation to query the most recent region list.
repeatWeekdays	String	Yes	["1","2"]	The days of the week on which to create automatic snapshots. Valid values: 1 to 7, which correspond to Monday to Sunday. 1 indicates Monday. To schedule multiple automatic snapshots to be created for a disk in a week, you can set this parameter to a JSON array. • You can specify up to seven values in the array. • Separate the values in the array with commas (,). Example: `["1","2"..." "7"]`.
retentionDays	Integer	Yes	30	The number of days for which to retain automatic snapshots. Valid values: • -1: Automatic snapshots are permanently retained. • 1 to 65535: Automatic snapshots are retained for a specified number of days. Default value: -1.
timePoints	String	Yes	["0", "1", ... "23"]	The point in time at which to create automatic snapshots. Unit: hours. Valid values: 0 to 23. These values correspond to the hours of the day from 00:00 to 23:00. 1 indicates 01:00. To schedule multiple automatic snapshots to be created for a disk in a day, you can set this parameter to a JSON array that consists of multiple values. You can specify up to 24 values in the array.

Parameter	Type	Required	Example	Description
autoSnapshotPolicyName	String	No	test-autoSnapshotPolicyName	The name of the automatic snapshot policy. The name must be 2 to 128 characters in length and can contain letters, digits, colons (:), underscores (_), and hyphens (-). The name must start with a letter and cannot start with http:// or https://. This parameter is empty by default.

Response parameters

Parameter	Type	Example	Description
AutoSnapshotPolicyId	String	sp-bp12m37ccmxvbmi5****	The ID of the automatic snapshot policy.
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=CreateAutoSnapshotPolicy
&regionId=cn-qingdao-env17-d01
&repeatWeekdays=["1"]
&retentionDays=30
&timePoints=["0", "19"]
&autoSnapshotPolicyName=test-autoSnapshotPolicyName
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreateAutoSnapshotPolicyResponse>
      <RequestId>F3CD6886-D8D0-4FEE-B93E-1B73239673DE</RequestId>
      <AutoSnapshotPolicyId>sp-bp12m37ccmxvbmi5****</AutoSnapshotPolicyId>
</CreateAutoSnapshotPolicyResponse>
```

`JSON` format

```
{
    "RequestId": "F3CD6886-D8D0-4FEE-B93E-1B73239673DE",
    "AutoSnapshotPolicyId": "sp-bp12m37ccmxvbmi5****"
}
```

Error codes

HTTP status code	Error code	Error message	Description
403	ParameterInvalid	The specified RegionId parameter is invalid.	The error message returned because the specified regionId parameter is invalid.
403	ParameterInvalid	The specified RepeatWeekDays parameter is invalid.	The error message returned because the specified repeatWeekDays parameter is invalid.
403	ParameterInvalid	The specified TimePoints parameter is invalid.	The error message returned because the specified timePoints parameter is invalid.
403	ParameterInvalid	The specified RetentionDays parameter is invalid.	The error message returned because the specified retentionDays parameter is invalid.
403	AutoSnapshotPolicy.QuotaExceed	The maximum number of automatic snapshot policy has been reached.	The error message returned because the maximum number of automatic snapshot policies has been reached.
400	DiskCategory.OperationNotSupported	The type of the specified disk does not support creating a snapshot.	The error message returned because the operation is not supported by the current disk category.
403	InvalidAccountStatus.NotEnoughBalance	Your account does not have enough balance.	The error message returned because your account balance is insufficient. Add funds to your account and try again.
403	InvalidAccountStatus.SnapshotServiceUnavailable	Snapshot service has not been opened yet.	The error message returned because the operation is not supported while the snapshot service is not activated.

2.1.2.1.8.8. DeleteAutoSnapshotPolicy

You can call this operation to delete an automatic snapshot policy. After an automatic snapshot policy is deleted, the policy will no longer be applied to the disks that it previously took effect on.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteAutoSnapshotPolicy	The operation that you want to perform. Set the value to DeleteAutoSnapshotPolicy.
autoSnapshotPolicyId	String	Yes	sp-bp12m37ccmxvbmi5****	The ID of the automatic snapshot policy. You can call the DescribeAutoSnapshotPolicies operation to query available automatic snapshot policies.
regionId	String	Yes	cn-qingdao-env17-d01	The region ID of the automatic snapshot policy. You can call the DescribeRegions operation to query the most recent region list.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request. Every response returns a unique request ID regardless of whether the call is successful.

Examples

Sample requests

```
https://ecs.example.com/?Action=DeleteAutoSnapshotPolicy
&autoSnapshotPolicyId=sp-bp12m37ccmxvbmi5****
&regionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteAutoSnapshotPolicyResponse>
      <RequestId>F3CD6886-D8D0-4FEE-B93E-1B73239673DE</RequestId>
</DeleteAutoSnapshotPolicyResponse>
```

`JSON` format

```
{
    "RequestId":"F3CD6886-D8D0-4FEE-B93E-1B73239673DE"
}
```

Error codes

HTTP status code	Error code	Error message	Description
404	ParameterInvalid	The specified automatic snapshot policy does not exist.	The error message returned because the specified autoSnapshotPolicyID parameter does not exist.
404	ParameterInvalid	The specified automatic snapshot policy does not exist in the region.	The error message returned because the specified automatic snapshot policy does not exist in the current region.

2.1.2.1.8.9. ModifyAutoSnapshotPolicyEx

You can call this operation to modify an automatic snapshot policy. After an automatic snapshot policy is modified, the modifications take effect immediately on the disks to which the policy is applied.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyAutoSnapshotPolicyEx	The operation that you want to perform. Set the value to ModifyAutoSnapshotPolicyEx.
autoSnapshotPolicyId	String	Yes	sp-bp12m37ccmxvbmi5****	The ID of the automatic snapshot policy. You can call the DescribeAutoSnapshotPolicies operation to query available automatic snapshot policies.
regionId	String	Yes	cn-qingdao-env17-d01	The region ID of the automatic snapshot policy. You can call the DescribeRegions operation to query the most recent region list.
autoSnapshotPolicyName	String	No	test-autoSnapshotPolicyName	The name of the automatic snapshot policy. If this parameter is not specified, the original name is retained.

Parameter	Type	Required	Example	Description
timePoints	String	No	["0", "1"]	The point in time at which to create automatic snapshots. Unit: hours. Valid values: 0 to 23. These values correspond to the hours of the day from 00:00 to 23:00. 1 indicates 01:00. To schedule multiple automatic snapshots to be created for a disk in a day, you can set timePoints to a JSON array that consists of multiple values. • You can specify up to 24 values in the array. • Separate the values in array with commas (,). Example: ["0", "1", ... "23"].
repeatWeekdays	String	No	["1", "7"]	The days of the week on which to create automatic snapshots. Valid values: 1 to 7, which correspond to Monday to Sunday. 1 indicates Monday. To schedule multiple automatic snapshots to be created for a disk in a week, you can set repeatWeekdays to a JSON array that consists of multiple values. • You can specify up to seven values in the array. • Separate the values in the array with commas (,). Example: ["1", "2", ... "7"].
retentionDays	Integer	No	30	The number of days for which to retain automatic snapshots. Valid values: • -1: Automatic snapshots are permanently retained. • 1 to 65536: Automatic snapshots are retained for a specified number of days.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=ModifyAutoSnapshotPolicyEx
&autoSnapshotPolicyId=sp-bp12m37ccmxvbmi5****
&regionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyAutoSnapshotPolicyResponse>
      <RequestId>F3CD6886-D8D0-4FEE-B93E-1B73239673DE</RequestId>
</ModifyAutoSnapshotPolicyResponse>
```

`JSON` format

```
{
    "RequestId":"F3CD6886-D8D0-4FEE-B93E-1B73239673DE"
}
```

Error codes

HTTP status code	Error code	Error message	Description
404	ParameterInvalid	The specified automatic snapshot policy does not exist.	The error message returned because the specified automatic snapshot policy does not exist.
404	ParameterInvalid	The specified automatic snapshot policy does not exist in the region.	The error message returned because the specified automatic snapshot policy does not exist in the current region.
403	ParameterInvalid	The specified RegionId parameter is invalid.	The error message returned because the specified regionId parameter is invalid.
403	ParameterInvalid	The specified RepeatWeekDays parameter is invalid.	The error message returned because the specified repeatWeekDays parameter is invalid.
403	ParameterInvalid	The specified TimePoints parameter is invalid.	The error message returned because the specified timePoints parameter is invalid.

HTTP status code	Error code	Error message	Description
403	ParameterInvalid	The specified AutoSnapshotPolicyId is invalid.	The error message returned because the specified autoSnapshotPolicyId parameter is invalid.
403	ParameterInvalid	The specified RetentionDays parameter is invalid.	The error message returned because the specified retentionDays parameter is invalid.

2.1.2.1.8.10. ModifySnapshotAttribute

You can call this operation to modify the name or description of a snapshot.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifySnapshotAttribute	The operation that you want to perform. If you use a custom HTTP URL or HTTPS URL to make an API request, you must specify the `Action` parameter. Set this parameter to ModifySnapshotAttribute.
SnapshotId	String	Yes	s-923FE2B***	The ID of the snapshot.
SnapshotName	String	No	NewSnapshotName-EcsGuideTest	The new name of the snapshot. The name must be 2 to 128 characters in length and can contain letters, digits, colons (:), underscores (_), and hyphens (-). The name must start with a letter and cannot start with http:// or https://. It also cannot start with auto because snapshot names that start with auto are recognized as automatic snapshots.

Parameter	Type	Required	Example	Description
Description	String	No	NewSnapshotDescription-EcsGuideTest	The new description of the snapshot. The description must be 2 to 256 characters in length and cannot start with http:// or https://.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=ModifySnapshotAttribute
&SnapshotName=NewSnapshotName-EcsGuideTest
&Description=NewSnapshotDescription-EcsGuideTest
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifySnapshotAttributeResponse>
            <RequestId>C8B26B44-0189-443E-9816-D951F59623A9</RequestId>
</ModifySnapshotAttributeResponse>
```

`JSON` format

```
{
    "RequestId":"C8B26B44-0189-443E-9816-D951F59623A9"
}
```

Error codes

HTTP status code	Error code	Error message	Description

HTTP status code	Error code	Error message	Description
404	InvalidDescription.Malformed	The specified description is wrongly formed.	The error message returned because the specified Description parameter is invalid. The description must be 2 to 256 characters in length and cannot start with http:// or https://.
400	InvalidSnapshotName.Malformed	The specified SnapshotName is wrongly formed.	The error message returned because the specified SnapshotName parameter is invalid.
400	NoAttributeToModify	No attribute to be modified in this request.	The error message returned because no attributes of the specified snapshot are modified.
404	InvalidSnapshotId.NotFound	The specified SnapshotId does not exist.	The error message returned because the specified SnapshotId parameter does not exist.

2.1.2.1.8.11. DescribeAutoSnapshotPolicyEX

You can call this operation to query the automatic snapshot policies that you have created.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeAutoSnapshotPolicyEx	The operation that you want to perform. Set the value to DescribeAutoSnapshotPolicyEx.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the automatic snapshot policy. You can call the DescribeRegions operation to query the most recent region list.
AutoSnapshotPolicyId	String	No	sp-bp67acfmxazb4p****	The ID of the automatic snapshot policy.

Parameter	Type	Required	Example	Description
PageNumber	Integer	No	1	The number of the page to return. Pages start from page 1. Default value: 1
PageSize	Integer	No	1	The number of entries to return on each page. Valid values: 1 to 100 Default value: 10
Tag.N.Key	String	No	TestKey	The key of tag N of the automatic snapshot policy. Valid values of N: 1 to 20. The tag key cannot be an empty string. It can be up to 128 characters in length and cannot contain http:// or https://. It cannot start with acs: or aliyun.
Tag.N.Value	String	No	TestValue	The value of tag N of the automatic snapshot policy. Valid values of N: 1 to 20. The tag value can be an empty string. It can be up to 128 characters in length. It cannot start with acs: or contain http:// or https://.

Response parameters

Parameter	Type	Example	Description
AutoSnapshotPolicies	Array		The collection of details about automatic snapshot policies.
AutoSnapshotPolicy			
AutoSnapshotPolicyId	String	sp-bp67acfmxazb4p****	The ID of the automatic snapshot policy.
AutoSnapshotPolicyName	String	test-AutoSnapshotPolicyName	The name of the automatic snapshot policy.

Parameter	Type	Example	Description
CopiedSnapshotsRetentionDays	Integer	0	Note This parameter is not supported.
CreationTime	String	2014-04-21T12:08:52Z	The time when the automatic snapshot policy was created. The time follows the ISO 8601 standard in the yyyy-MM-ddThh:mm:ssZ format. The time is displayed in UTC.
DiskNums	Integer	1	The number of disks to which the automatic snapshot policy was applied.
EnableCrossRegionCopy	Boolean	false	Note This parameter is not supported.
RegionId	String	cn-qingdao-env17-d01	The region ID of the automatic snapshot policy.
RepeatWeekdays	String	["6"]	The days of the week on which to create automatic snapshots. Valid values: 1 to 7, which correspond to the days of the week. 1 indicates Monday. One or more days can be specified.
RetentionDays	Integer	30	The number of days for which to retain an automatic snapshot. Valid values: • -1: The automatic snapshot is retained permanently. • 1 to 65536: The automatic snapshot is retained for the specified number of days.
Status	String	Normal	The status of the automatic snapshot policy. Valid values: • Normal • Expire
Tags	Array		The tags of the automatic snapshot policy.
Tag			

Parameter	Type	Example	Description
TagKey	String	TestKey	The tag key of the automatic snapshot policy.
TagValue	String	TestValue	The tag value of the automatic snapshot policy.
TargetCopyRegions	String	test	**Note** This parameter is not supported.
TimePoints	String	["4", "19"]	The points in time at which to create automatic snapshots. The least interval at which snapshots can be created is one hour. Valid values: 0 to 23, which correspond to the hours of the day from 00:00 to 23:00. 1 indicates 01:00. The value is a JSON array that consists of multiple points in time. Example: `["0", "1", ... "23"]`. You can specify a maximum of 24 points in time. Separate the points in time with commas (,).
VolumeNums	Integer	2	The number of extended volumes to which this policy is applied.
PageNumber	Integer	1	The page number of the returned page.
PageSize	Integer	1	The number of entries returned per page.
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.
TotalCount	Integer	2	The total number of automatic snapshot policies.

Examples

Sample requests

```

Error codes

HTTP status code	Error code	Error message	Description
400	InvalidRegionId.NotFound	The specified RegionId does not exist.	The error message returned because the specified RegionId parameter does not exist.
400	InvalidTag.Mismatch	The specified Tag.n.Key and Tag.n.Value are not match.	The error message returned because the specified Tag.N.Key and Tag.N.Value parameters do not match.
400	InvalidTagCount	The specified tags are beyond the permitted range.	The error message returned because the number of specified tags exceeds the upper limit.

2.1.2.1.8.12. ApplyAutoSnapshotPolicy

You can call this operation to apply an automatic snapshot policy to one or more disks. If you apply an automatic snapshot policy to a disk that already has an automatic snapshot policy, the new policy replaces the original policy to take effect on the disk.

Description

- Each disk can have only one automatic snapshot policy applied.
- A single automatic snapshot policy can be applied to multiple disks.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ApplyAutoSnapshotPolicy	The operation that you want to perform. Set the value to ApplyAutoSnapshotPolicy.
regionId	String	Yes	cn-qingdao-env17-d01	The ID of the region to which the automatic snapshot policy and the disks belong. You can call the DescribeRegions operation to query the most recent region list.
autoSnapshotPolicyId	String	Yes	sp-bp12m37ccmxvbmi5****	The ID of the automatic snapshot policy to apply.
diskIds	String	Yes	["d-bp198f7xn673w2rw****", "d-bp12te2l9m0170wc****", "d-bp1btgnlb4lgdzoi****"]	The IDs of disks to which you want to apply the automatic snapshot policy. The value is a JSON array that consists of disk IDs. Separate multiple disk IDs with commas (,).

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=ApplyAutoSnapshotPolicy
&autoSnapshotPolicyId=sp-bp12m37ccmxvbmi5****
&diskIds=["d-bp198f7xn673w2rw****", "d-bp12te2l9m0170wc****", "d-bp1btgnlb4lgdzoi****"]
&regionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ApplyAutoSnapshotPolicyResponse>
      <RequestId>F3CD6886-D8D0-4FEE-B93E-1B73239673DE</RequestId>
</ApplyAutoSnapshotPolicyResponse>
```

`JSON` format

```
{
    "RequestId":"F3CD6886-D8D0-4FEE-B93E-1B73239673DE"
}
```

Error codes

HTTP status code	Error code	Error message	Description
404	ParameterInvalid	The specified automatic snapshot policy does not exist.	The error message returned because the specified autoSnapshotPolicyId parameter does not exist.
404	ParameterInvalid	The specified automatic snapshot policy does not exist in the region.	The error message returned because the specified autoSnapshotPolicyId parameter does not exist in the current region.
404	InvalidDiskId.NotFound	The specified disk does not exist in the region.	The error message returned because the specified disk does not exist in the current region.
403	ParameterInvalid	The specified RegionId parameter is invalid.	The error message returned because the specified RegionId parameter is invalid.
403	ParameterInvalid	The specified AutoSnapshotPolicyId parameter is invalid.	The error message returned because the specified autoSnapshotPolicyId parameter is invalid.
403	ParameterInvalid	The specified DiskIds are invalid.	The error message returned because the specified diskIds parameter is invalid.
400	DiskCategory.OperationNotSupported	The type of the specified disk does not support creating a snapshot.	The error message returned because the operation is not supported by the current disk category.

HTTP status code	Error code	Error message	Description
400	PartofDiskCategory.OperationNotSupported	The types of some disks in the disk list do not support creating snapshots.	The error message returned because some of the specified disks does not support this operation.
403	InvalidAccountStatus.NotEnoughBalance	Your account does not have enough balance.	The error message returned because your account balance is insufficient. Add funds to your account and try again.
403	InvalidAccountStatus.SnapshotServiceUnavailable	Snapshot service has not been opened yet.	The error message returned because the operation is not supported while the snapshot service is not activated.

2.1.2.1.8.13. CancelAutoSnapshotPolicy

You can call this operation to disable the automatic snapshot policy for one or more disks.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CancelAutoSnapshotPolicy	The operation that you want to perform. Set the value to CancelAutoSnapshotPolicy.
diskIds	String	Yes	["d-bp198f7xn673w2rw****", "d-bp12te2l9m0170wc****", "d-bp1btgnlb4lgdzoi****"]	The IDs of disks. To disable an automatic snapshot policy for multiple disks, you can set this parameter to a JSON array that consists of multiple disk IDs in the format of ["dxxxxxxxxx", "dyyyyyyyyy", ... "dzzzzzzzzz"]. Separate multiple disk IDs with commas (,).
regionId	String	Yes	cn-qingdao-env17-d01	The ID of the region to which the automatic snapshot policy and the disks belong. You can call the DescribeRegions operation to query the most recent region list.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request. Every response returns a unique request ID regardless of whether the call is successful.

Examples

Sample requests

```
https://ecs.example.com/?Action=CancelAutoSnapshotPolicy
&diskIds=["d-bp198f7xn673w2rw****", "d-bp12te2l9m0170wc****", "d-bp1btgnlb4lgdzoi****"]
&regionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CancelAutoSnapshotPolicyResponse>
      <RequestId>F3CD6886-D8D0-4FEE-B93E-1B73239673DE</RequestId>
</CancelAutoSnapshotPolicyResponse>
```

`JSON` format

```
{
    "RequestId":"F3CD6886-D8D0-4FEE-B93E-1B73239673DE"
}
```

Error codes

HTTP status code	Error code	Error message	Description
403	ParameterInvalid	The specified RegionId parameter is invalid.	The error message returned because the specified regionId parameter is invalid.
403	ParameterInvalid	The specified DiskIds are invalid.	The error message returned because the specified diskIds parameter is invalid.
404	InvalidDiskId.NotFound	The specified DiskIds are not found.	The error message returned because the specified diskIds parameter does not exist.

2.1.2.1.9. Images

2.1.2.1.9.1. CreateImage

You can call this operation to create a custom image. The created custom image can be used to create ECS instances (RunInstances) and replace system disks (ReplaceSystemDisk).

Description

When you call this operation, take note of the following items:

- The created custom image can be used only when it is in the Available (Available) state.
- If the API response contains `{"OperationLocks": {"LockReason" : "security"}}` when you query information of an instance, the instance is locked for security reasons and all operations are prohibited on it.

You can call the CreateImage operation to create a custom image by using one of the following methods. The request parameters have the following priorities: `InstanceId` > `DiskDeviceMapping` > `SnapshotId`. If your request contains two or more parameters, the custom image is created based on the parameter with a higher priority by default.

- **Method 1**: Create a custom image from an instance. You only need to specify the instance ID (`InstanceId`). The instance must be in the Running (`Running`) or Stopped (`Stopped`) state. After the CreateImage operation is called, a new snapshot is created for each disk of the instance.
- **Method 2**: Create a custom image from the system disk snapshot of an ECS instance. You only need to specify the ID of the system disk snapshot (`SnapshotId`). The specified snapshot cannot be created on or before July 15, 2013.
- **Method 3**: Create a custom image from multiple disk snapshots. You must specify the data mapping between the disks corresponding to the snapshots (`DiskDeviceMapping` parameters).

When you use method 3 to create a custom image, take note of the following items:

- You can specify only one system disk snapshot. The device name of the system disk must be /dev/xvda.
- You can specify multiple data disk snapshots. The device names of the data disks are automatically allocated by the system. The device names are unique and ascend from /dev/xvdb to /dev/xvdz.
- `SnapshotId` may not be specified. In this case, an empty data disk with a specific size is created.
- The specified snapshot cannot be created on or before July 15, 2013.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateImage	The operation that you want to perform. Set the value to CreateImage.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region in which to create the custom image. You can call the DescribeRegions operation to query the most recent region list.

Parameter	Type	Required	Example	Description
DiskDeviceMapping.N.SnapshotId	String	No	s-bp17441ohwkdca0****	The ID of snapshot N that is used to create disk N specified by DiskDeviceMapping.N.Size in the custom image.

DiskDeviceMapping.N.Size	Integer	No	2000	The size of disk N in the custom image. Unit: GiB. The valid values and default value of DiskDeviceMapping.N.Size depend on DiskDeviceMapping.N.SnapshotId.
				• If no corresponding snapshot IDs are specified in the DiskDeviceMapping.N.SnapshotId value, the following valid values and default value are available for DiskDeviceMapping.N.Size:
				  ◦ For basic disks, the valid values are 5 to 2000, and the default value is 5.
				  ◦ For other disk categories, the valid values are 20 to 32768, and the default value is 20.
				• If a corresponding snapshot ID is specified in the DiskDeviceMapping.N.SnapshotId value, the value of DiskDeviceMapping.N.Size must be greater than or equal to the size of the specified snapshot. The default value of DiskDeviceMapping.N.Size is the size of the specified snapshot.

DiskDeviceMapping.N.Device	String	No	/dev/vdb	The device name of disk N in the custom image. Valid values: • For disk categories other than basic disks, such as standard SSDs, ultra disks, and enhanced SSDs: /dev/vda to /dev/vdz • For basic disks: /dev/xvda to /dev/xvdz

Parameter	Type	Required	Example	Description
DiskDeviceMapping.N.DiskType	String	No	system	The type of disk N in the custom image. You can set this parameter to create the system disk of the custom image from a data disk snapshot. If you do not set this parameter, the disk type is determined by the corresponding snapshot. Valid values: • system: system disk • data: data disk
SnapshotId	String	No	s-bp17441ohwkdca0****	The ID of the snapshot that is used to create the custom image.
InstanceId	String	No	i-bp1g6zv0ce8oghu7****	The ID of the instance.
ImageName	String	No	TestCentOS	The name of the image. The name must be 2 to 128 characters in length and can contain letters, digits, colons (:), underscores (_), and hyphens (-). It must start with a letter and cannot start with http:// or https://. This parameter is empty by default.
Description	String	No	ImageTestDescription	The description of the image. The description must be 2 to 256 characters in length and cannot start with http:// or https://. This parameter is empty by default.

Parameter	Type	Required	Example	Description
Platform	String	No	CentOS	The distribution of the operating system for the system disk in the custom image. If you specify a data disk snapshot to create the system disk of the custom image, you must use the Platform parameter to determine the distribution of the operating system for the system disk. Default value: Others Linux. Valid values: • CentOS • Ubuntu • SUSE • OpenSUSE • RedHat • Debian • CoreOS • Aliyun Linux • Windows Server 2012 • Windows 7 • Customized Linux • Others Linux
Architecture	String	No	x86_64	The system architecture of the system disk. If you specify a data disk snapshot to create the system disk of the custom image, you must use the Architecture parameter to determine the system architecture of the system disk. Default value: x86_64. Valid values: • i386 • x86_64
ClientToken	String	No	123e4567-e89b-12d3-a456-426655440000	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must ensure that it is unique among different requests. The **ClientToken** value can only contain ASCII characters and cannot exceed 64 characters in length. For more information, see How to ensure idempotence in ECS Developer Guide.

Parameter	Type	Required	Example	Description
Tag.N.value	String	No	null	The value of tag N of the custom image. **Note** This parameter will be removed in the future. We recommend that you use the Tag.N.Value parameter to ensure future compatibility.
Tag.N.key	String	No	null	The key of tag N of the custom image. **Note** This parameter will be removed in the future. We recommend that you use the Tag.N.Key parameter to ensure future compatibility.
Tag.N.Key	String	No	KeyTest	The key of tag N of the custom image. Valid values of N: 1 to 20. The tag key cannot be an empty string. It can be up to 128 characters in length and cannot contain http:// or https://. It cannot start with acs: or aliyun.
Tag.N.Value	String	No	ValueTest	The value of tag N of the custom image. Valid values of N: 1 to 20. The tag value can be an empty string. It can be up to 128 characters in length. It cannot start with acs: or contain http:// or https://.
ResourceGroupId	String	No	rg-bp67acfmxazb4p****	The ID of the resource group to which to assign the custom image.

Response parameters

Parameter	Type	Example	Description
ImageId	String	m-bp146shijn7hujku****	The ID of the image.
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=CreateImage
&RegionId=cn-qingdao-env17-d01
&SnapshotId=s-bp17441ohwkdca0****
&ImageName=TestCentOS
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreateImageResponse>
      <RequestId>C8B26B44-0189-443E-9816-D951F59623A9</RequestId>
      <ImageId>m-bp146shijn7hujku****</ImageId>
</CreateImageResponse>
```

`JSON` format

```
{
    "RequestId": "C8B26B44-0189-443E-9816-D951F59623A9",
    "ImageId": "m-bp146shijn7hujku****"
}
```

Error codes

HTTP status code	Error code	Error message	Description
404	InvalidSnapshotId.NotFound	The specified SnapshotId does not exist.	The error message returned because the specified snapshot ID does not exist. Check whether the snapshot ID is correct.
400	InvalidImageName.Malformed	The specified Image name is wrongly formed.	The error message returned because the specified ImageName parameter is invalid. The name must be 2 to 128 characters in length and can contain letters, digits, periods (.), underscores (_), and hyphens (-). It must start with a letter and cannot start with http:// or https://.
400	InvalidImageName.Duplicated	The specified Image name has already bean used.	The error message returned because the specified image name already exists.

HTTP status code	Error code	Error message	Description
400	InvalidDescription.Malformed	The specified description is wrongly formed.	The error message returned because the specified Description parameter is invalid. The description must be 2 to 256 characters in length and cannot start with http:// or https://.
400	InvalidImageVersion.Malformed	The specified ImageVersion is wrongly formed.	The error message returned because the specified image version is invalid or you are not authorized to use the snapshot.
403	InvalidSnapshotId.NotReady	The current status of the DiskDeviceMapping.n.SnapshotId or SnapshotId does not support this operation.	The error message returned because the operation is not supported while the specified snapshot is in the current state.
403	InvalidSnapshot.TooOld	This operation is denied because the specified snapshot by DiskDeviceMapping.n.SnapshotId or SnapshotId is created before 2013-07-15.	The error message returned because the operation is not supported while the snapshot specified by the DiskDeviceMapping.N.SnapshotId or SnapshotId parameter was created before July 15, 2013.
403	OperationDenied	The specified snapshot is not allowed to create image.	The error message returned because the specified snapshot cannot be used to create images.
403	QuotaExceed.Image	The Image Quota exceeds.	The error message returned because the maximum number of custom images has been reached.
403	OperationDenied	The specified snapshot is not from system disk.	The error message returned because the specified snapshot was not created from a system disk.
403	InvalidParamter.Conflict	The specified same token is trying to make requests with different parameters.	The error message returned because the same token is used to make requests with different parameters.
404	InvalidInstanceId.NotFound	The specified InstanceId does not exist.	The error message returned because the specified InstanceId parameter does not exist.

HTTP status code	Error code	Error message	Description
400	IncorrectInstanceStatus	The current status of the instance does not support this operation.	The error message returned because the operation is not supported while the instance is in the current state.
400	InstanceLockedForSecurity	The specified operation is denied as your instance is locked for security reasons.	The error message returned because the operation is not supported while the instance is locked for security reasons.
400	InvalidDevice.Malformed	The specified parameter DiskDeviceMapping.n.Device is not valid.	The error message returned because the specified DiskDeviceMapping.N.Device parameter is invalid.
400	MissingParameter	The input parameter SnapshotId or InstanceId or DiskDeviceMapping that is mandatory for processing this request is not supplied.	The error message returned because SnapshotId, InstanceId or parameters that contain DiskDeviceMapping are not specified.
400	InvalidSize.ValueNotSupported	The specified parameter DiskDeviceMapping.n.Size beyond the permitted range.	The error message returned because the specified DiskDeviceMapping.N.Size parameter is not within the permitted range.
400	InvalidDevice.InUse	The specified parameter DiskDeviceMapping.n.Device has been occupied.	The error message returned because device names specified in the DiskDeviceMapping.N.Device value already exists.
400	OperationDenied	The specified parameter DiskDeviceMapping.n.SnapshotId does not contain system disk snapshot.	The error message returned because the specified DiskDeviceMapping.N.SnapshotID parameter does not contain a system disk snapshot ID.
400	OperationDenied	The specified parameter DiskDeviceMapping.n.SnapshotId contains two or more system disk snapshots.	The error message returned because the specified DiskDeviceMapping.N.SnapshotID parameter already contains system disk snapshot IDs.
400	InvalidDiskCategory.CreateImage	The specified diskCategory is not allowed to create image.	The error message returned because the operation is not supported by the specified disk category.

HTTP status code	Error code	Error message	Description
403	InvalidAccountStatus.NotEnoughBalance	Your account does not have enough balance.	The error message returned because your account balance is insufficient. Add funds to your account and try again.
403	InvalidAccountStatus.SnapshotServiceUnavailable	Snapshot service has not been opened yet.	The error message returned because the operation is not supported while the snapshot service is not activated.
403	UserNotInTheWhiteList	The user is not in the white list of create image by data disk snapshot.	The error message returned because you are not authorized to create an image from data disk snapshots. Try again when you are authorized to do so.
400	InvalidArchitecture.Malformed	The specified Architecture is wrongly formed.	The error message returned because the specified Architecture parameter is invalid.
400	InvalidPlatform.Malformed	The specified Platform is wrongly formed.	The error message returned because the specified Platform parameter is invalid.
400	OperationDenied	Not support creating system image from an encrypted snapshot/disk.	The error message returned because an encrypted disk or snapshot cannot be used to create custom images.
400	InvalidParameter.AllEmpty	%s	The error message returned because no parameters are specified. Specify required parameters.
403	IncorrectDiskStatus.Invalid	Device status is invalid, please restart instance and try again.	The error message returned because the device status is invalid. Restart the instance and try again.
403	OperationDenied.InvalidSnapshotCategory	%s	The error message returned because the operation is not supported by the snapshot type.
403	QuotaExceed.Snapshot	The snapshot quota exceeds.	The error message returned because the maximum number of snapshots has been reached. To store new snapshots, delete snapshots that are no longer needed.

HTTP status code	Error code	Error message	Description
403	IncorrectDiskStatus.Transferring	The specified device is transferring, you can retry after the process is finished.	The error message returned because the specified disk is being migrated. Wait until the disk is migrated and try again.
403	IncorrectDiskStatus	The current disk status does not support this operation.	The error message returned because the operation is not supported while the disk is in the current state. Ensure that the disk is available and you have no overdue payment for it.
403	IncorrectDiskStatus.CreatingSnapshot	A previous snapshot creation is in process.	The error message returned because another snapshot is being created. Wait until the snapshot is created and try again.
404	InvalidResourceGroup.NotFound	The ResourceGroup provided does not exist in our records.	The error message returned because the specified ResourceGroupId parameter does not exist.
500	InternalError	The process of creating snapshot has failed due to some unknown error.	The error message returned because the snapshot has failed to be created.
403	InvalidParameter.KMSKeyId.KMSUnauthorized	ECS service have no right to access your KMS.	The error message returned because ECS is not authorized to access your KMS resources.
500	InternalError	The request processing has failed due to some unknown error, exception or failure.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.
400	Duplicate.TagKey	The Tag.N.Key contain duplicate key.	The error message returned because the specified tag key already exists. Tag keys must be unique.
400	InvalidTagKey.Malformed	The specified Tag.n.Key is not valid.	The error message returned because the specified Tag.N.Key parameter is invalid.
400	InvalidTagValue.Malformed	The specified Tag.n.Value is not valid.	The error message returned because the specified Tag.N.Value parameter is invalid.

HTTP status code	Error code	Error message	Description
403	QuotaExceed.Tags	%s	The error message returned because the number of specified tags exceeds the upper limit.

2.1.2.1.9.2. DescribeImages

You can call this operation to query available images.

Description

- You can query your custom images and public images provided by Apsara Stack.
- This operation supports paged query. The response contains the total number of available images and the images on the returned page. Ten entries are displayed on each page by default.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeImages	The operation that you want to perform. Set the value to DescribeImages.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the image. You can call the DescribeRegions operation to query the most recent region list.
Status	String	No	Available	The status of the image. Default value: Available. Valid values: • Creating: The image is being created. • Waiting: The image is waiting to be processed. • Available: The image is available. • UnAvailable: The image is unavailable. • CreateFailed: The image failed to be created. Separate multiple values with commas (,).
ImageId	String	No	m-bp1g7004ksh0oeuc3***	The ID of the image.

Parameter	Type	Required	Example	Description
ShowExpired	Boolean	No	false	Specifies whether the subscription image has expired. **Note** This parameter will be removed in the future. We recommend that you use other parameters to ensure future compatibility.
SnapshotId	String	No	s-bp17ot2q7x72ggtwr***	The ID of the snapshot from which the custom image was created.
ImageName	String	No	Test	The name of the image.
ImageOwnerAlias	String	No	self	The source of the image. Valid values: • system: public images provided by Apsara Stack. • self: your custom images. This parameter is empty by default, which indicates that the results matching system and self are returned.
InstanceType	String	No	ecs.g5.large	The instance type for which the image can be used.
IsSupportIoOptimized	Boolean	No	true	Specifies whether the image can be used on I/O optimized instances.
IsSupportCloudinit	Boolean	No	true	Specifies whether the image supports cloud-init.
OSType	String	No	linux	The operating system type of the image. Valid values: • windows • linux
Architecture	String	No	i386	The image architecture. Valid values: • i386 • x86_64

Parameter	Type	Required	Example	Description
PageNumber	Integer	No	1	The number of the page to return. Pages start from page 1. Default value: 1.
PageSize	Integer	No	1	The number of entries to return on each page. Valid values: 1 to 100. Default value: 10.
Usage	String	No	instance	Specifies whether the image is running on an ECS instance. Valid values: • instance: The image is already in use and running on an ECS instance. • none: The image is not in use.
Tag.N.value	String	No	null	The value of tag N of the image. **Note** This parameter will be removed in the future. We recommend that you use the Tag.N.Value parameter to ensure future compatibility.
Tag.N.key	String	No	null	The key of tag N of the image. **Note** This parameter will be removed in the future. We recommend that you use the Tag.N.Key parameter to ensure future compatibility.
Tag.N.Key	String	No	Test	The key of tag N of the image. Valid values of N: 1 to 20.
Tag.N.Value	String	No	Test	The value of tag N of the image. Valid values of N: 1 to 20.

Parameter	Type	Required	Example	Description
DryRun	Boolean	No	false	Specifies whether to check the validity of the request without actually making the request. • true: The validity of the request is checked but the request is not made. Check items include whether your AccessKey pair is valid, whether RAM users are authorized, and whether the required parameters are set. If the check fails, the corresponding error is returned. If the check succeeds, the DryRunOperation error code is returned. • false: The validity of the request is checked. If the check succeeds, a 2XX HTTP status code is returned and the request is made. Default value: false.
ActionType	String	No	CreateEcs	The scenario in which the image will be used. Default value: CreateEcs. Valid values: • CreateEcs: instance creation • ChangeOS: replacement of the system disk or operating system
Filter.N.Key	String	No	CreationStartTime	The key of filter condition N.
Filter.N.Value	String	No	2017-12-05T22:40:00Z	The value of filter condition N.
ResourceGroupId	String	No	rg-bp67acfmxazb4ph***	The ID of the resource group to which the custom image belongs.

Response parameters

Parameter	Type	Example	Description
Images	Array		The collection of details about images.
Image			

Parameter	Type	Example	Description
Architecture	String	x86_64	The image architecture. Valid values: • i386 • x86_64
CreationTime	String	2018-01-10T01:01:10Z	The time when the image was created.
Description	String	Archive log for Oracle	The description of the image.
DiskDeviceMappings	Array		The mappings between disks and snapshots under the image.
DiskDeviceMapping			
Device	String	/dev/xvdb	The device information of the disk, such as /dev/xvdb. **Note** This parameter will be removed in the future. We recommend that you use other parameters to ensure future compatibility.
Format	String	qcow2	The format of the image.
ImportOSSBucket	String	testEcsImport	The OSS bucket where an imported image is stored.
ImportOSSObject	String	imageImport	The OSS object that corresponds to an imported image.
Progress	String	32%	The progress of an image copying task.
RemainTime	Integer	213	The remaining time for an image copying task. Unit: seconds.

Parameter	Type	Example	Description
Size	String	80	The size of the disk.
SnapshotId	String	s-bp17ot2q7x72ggtwr***	The ID of the snapshot.
Type	String	custom	The type of the image.
ImageFamily	String	as-hangzhou-game-01	**Note** This parameter is not supported.
ImageId	String	m-bp1g7004ksh0oeuc3***	The ID of the image.
ImageName	String	Test	The name of the image.
ImageOwnerAlias	String	self	The source of the image. Valid values: • system: public images. • self: your custom images. • marketplace: Alibaba Cloud Marketplace images.
ImageVersion	String	2	The version of the image.
IsCopied	Boolean	false	Indicates whether the image is a copy of another image.
IsSelfShared	String	true	Indicates whether the custom image was shared to other Apsara Stack tenant accounts.
IsSubscribed	Boolean	false	Indicates whether you have subscribed to the image corresponding to the specified product code.
IsSupportCloudinit	Boolean	true	Indicates whether the image supports cloud-init.

Parameter	Type	Example	Description
IsSupportIoOptimized	Boolean	true	Indicates whether the image can be used on I/O optimized instances.
OSName	String	Aliyun Linux 2.1903	The Chinese name of the operating system.
OSNameEn	String	Aliyun Linux 2.1903	The English name of the operating system.
OSType	String	Linux	The type of the operating system. Valid values: • windows • linux
Platform	String	Aliyun Linux	The platform of the operating system.
ProductCode	String	jxsc000204	Note This parameter is not supported.
Progress	String	100	The image creation progress. Unit: percent (%).
ResourceGroupId	String	rg-bp67acfmxazb4ph***	The ID of the resource group to which the image belongs.
Size	Integer	80	The size of the image. Unit: GiB.
Status	String	Available	The status of the image. Valid values: • UnAvailable: The image is unavailable. • Available: The image is available. • Creating: The image is being created. • CreateFailed: The image failed to be created.
Tags	Array		Tags of the image.
Tag			
TagKey	String	Test	The tag key of the image.

Parameter	Type	Example	Description
TagValue	String	Test	The tag value of the image.
Usage	String	none	The referenced resource type. Valid values: • instance: One or more ECS instances were created from the image. • none: No ECS instance was created from the image.
PageNumber	Integer	1	The page number of the returned page.
PageSize	Integer	1	The number of entries returned per page.
RegionId	String	cn-qingdao-env17-d01	The region ID of the image.
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.
TotalCount	Integer	24	The total number of images.

Error codes

HTTP status code	Error code	Error message	Description
400	InvalidImageOwnerAlias.ValueNotSupported	The specified ImageOwnerAlias value is not supported.	The error message returned because the specified ImageOwnerAlias parameter is invalid.
400	InvalidParamter	Invalid Parameter	The error message returned because a specified parameter is invalid.
404	InvalidFilterKey.NotFound		The error message returned because the specified start time or end time is invalid.
404	InvalidUsage	The specifed Usage is not valid	The error message returned because the specified Usage parameter is invalid.
400	InvalidTag.Mismatch	The specified Tag.n.Key and Tag.n.Value are not match.	The error message returned because the specified Tag.N.Key and Tag.N.Value parameters do not match.
400	InvalidTagCount	The specified tags are beyond the permitted range.	The error message returned because the number of specified tags exceeds the upper limit.
400	InvalidInstanceType.ValueNotSupported	The specified InstanceType does not exist or beyond the permitted range.	The error message returned because the specified InstanceType parameter does not exist or you are not authorized to manage instances of the specified instance type.
404	InvalidOSType	The specifed OSType is not valid	The error message returned because the specified OSType parameter is invalid.
404	InvalidArchitecture	The specifed Architecture is not valid	The error message returned because the specified Architecture parameter does not exist.

HTTP status code	Error code	Error message	Description
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.

2.1.2.1.9.3. ModifyImageAttribute

You can call this operation to modify the name or description of a custom image.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyImageAttribute	The operation that you want to perform. If you use a custom HTTP URL or HTTPS URL to make an API request, you must specify the `Action` parameter. Set the value to ModifyImageAttribute.
ImageId	String	Yes	m-imageid1	The ID of the custom image.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the custom image. You can call the DescribeRegions operation to query the most recent region list.
ImageName	String	No	Test	The name of the custom image. The name must be 2 to 128 characters in length and can contain letters, digits, colons (:), underscores (_), and hyphens (-). It must start with a letter and cannot start with http:// or https://. This parameter is empty by default, which indicates that the original name is retained.

Parameter	Type	Required	Example	Description
Description	String	No	FinanceDept	The description of the custom image. The description must be 2 to 256 characters in length and cannot start with http:// or https://. This parameter is empty by default, which indicates that the original description is retained.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=ModifyImageAttribute
&ImageId=m-imageid1
&RegionId=cn-qingdao-env17-d01
&ImageName=Test
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyImageAttributeResponse>
      <RequestId>C8B26B44-0189-443E-9816-D951F59623A9</RequestId>
</ModifyImageAttributeResponse>
```

`JSON` format

```
{
    "RequestId": "C8B26B44-0189-443E-9816-D951F59623A9"
}
```

Error codes

HTTP status code	Error code	Error message	Description

HTTP status code	Error code	Error message	Description
400	InvalidImageName.Malformed	The specified Image name is wrongly formed.	The error message returned because the specified ImageName parameter is invalid. The name must be 2 to 128 characters in length and can contain letters, digits, periods (.), underscores (_), and hyphens (-). It must start with a letter and cannot start with http:// or https://.
400	MissingParameter	The input parameter "RegionId" that is mandatory for processing this request is not supplied.	The error message returned because the required RegionId parameter is not specified.
400	InvalidImageName.Duplicated	The specified Image name has already bean used.	The error message returned because the specified image name already exists.
400	InvalidDescription.Malformed	The specified description is wrongly formed.	The error message returned because the specified Description parameter is invalid. The description must be 2 to 256 characters in length and cannot start with http:// or https://.
404	InvalidImageId.NotFound	The specified ImageId does not exist.	The error message returned because the specified image does not exist in this account. Check whether the image ID is correct.

2.1.2.1.9.4. DeleteImage

You can call this operation to delete a custom image.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteImage	The operation that you want to perform. Set the value to DeleteImage.
ImageId	String	Yes	m-bp67acfmxazb4ph***	The ID of the image. If the specified custom image does not exist, the request will be ignored.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the custom image. You can call the DescribeRegions operation to query the most recent region list.
Force	Boolean	No	false	Specifies whether to forcibly delete the custom image. Valid values: • true: forcibly deletes the custom image, regardless of whether the image is in use by other instances. • false: verifies that the image is not in use by other instances before the image is deleted. Default value: false.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=DeleteImage
&ImageId=m-bp67acfmxazb4ph***
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteImageResponse>
       <RequestId>CEF72CEB-54B6-4AE8-B225-F876FF7BA984</RequestId>
</DeleteImageResponse>
```

`JSON` format

```
{
    "RequestId": "CEF72CEB-54B6-4AE8-B225-F876FF7BA984"
}
```

Error codes

HTTP status code	Error code	Error message	Description
403	ImageUsingByInstance	The specified image has been used to create instances.	The error message returned because the specified image has been used to create instances and cannot be deleted.
403	ImageUseShared	The specified image has been shared to others.	The error message returned because the specified image is shared to other accounts.
403	OperationDenied.ImageCopying	The Image is coping.	The error message returned because the specified image is being copied. Try again later.
403	ImageIsCreating	The specified image is being created.	The error message returned because the specified image is being created.
403	ImageIsImporting	The specified Image is importing.	The error message returned because the specified image is being imported and cannot be deleted.
403	ImageIsExporting	The specified Image is exporting. Please cancel task first.	The error message returned because the specified image is being exported. Cancel the export task first.
404	InvalidImageId.NotFound	The specified ImageId does not exist.	The error message returned because the specified image does not exist in this account. Check whether the image ID is correct.

2.1.2.1.9.5. CopyImage

You can call this operation to copy a custom image from one region to another. You can deploy or copy instances across regions by copying images.

Description

You can use the image copy to create ECS instances (RunInstances) or replace system disks of instances (ReplaceSystemDisk) in the destination region.

When you call this operation, take note of the following items:

- Only custom images that are in the Available (`Available`) state can be copied.
- You can copy only the images in your Apsara Stack tenant account. Images cannot be copied across accounts.
- When an image is being copied, you cannot delete the image copy by calling the DeleteImage operation, but you can cancel the copy task by calling the CancelCopyImage operation.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CopyImage	The operation that you want to perform. Set the value to CopyImage.
ImageId	String	Yes	m-bp1h46wfpjsjastc****	The ID of the source custom image (custom image to be copied).
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the source custom image. You can call the DescribeRegions operation to query the most recent region list.
DestinationRegionId	String	No	cn-shanghai-env17-d02	The ID of the destination region to which to copy the source custom image.
DestinationImageName	String	No	YourImageName	The name of the image copy. The name must be 2 to 128 characters in length. It must start with a letter and cannot start with http:// or https://. The name can contain letters, digits, colons (:), underscores (_), and hyphens (-). This parameter is empty by default.
DestinationDescription	String	No	This is a description example.	The description of the image copy. It must be 2 to 256 characters in length and cannot start with http:// or https://. This parameter is empty by default.
Encrypted	Boolean	No	false	Specifies whether to encrypt the image copy. Default value: false.
KMSKeyId	String	No	e522b26d-abf6-4e0d-b5da-04b7******3c	The ID of the key used to encrypt the image copy.

Response parameters

Parameter	Type	Example	Description
ImageId	String	m-bp1h46wfpjsjastd****	The ID of the image copy.
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=CopyImage
&ImageId=m-bp1h46wfpjsjastc****
&RegionId=cn-qingdao-env17-d01
&DestinationRegionId=cn-shanghai-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CopyImageResponse>
      <RequestId>C8B26B44-0189-443E-9816-D951F59623A9</RequestId>
      <ImageId>m-bp1h46wfpjsjastd****</ImageId>
</CopyImageResponse>
```

`JSON` format

```
{
    "RequestId": "C8B26B44-0189-443E-9816-D951F59623A9",
    "ImageId": "m-bp1h46wfpjsjastd****"
}
```

Error codes

HTTP status code	Error code	Error message	Description
401	InvalidAliUid.IsNull	The aliUid must not be null	The error message returned because the required aliUid parameter is not specified.

HTTP status code	Error code	Error message	Description
400	InvalidImageName.Malformed	The specified Image name is wrongly formed.	The error message returned because the specified DestinationImageName parameter is invalid. The name must be 2 to 128 characters in length and can contain letters, digits, periods (.), underscores (_), and hyphens (-). The name must start with a letter and cannot start with http:// or https://.
403	Forbbiden	User not authorized to operate on the specified resource.	The error message returned because you are not authorized to access the specified resource.
400	InvalidImageName.Malformed	The specified destination Image name is wrongly formed.	The error message returned because the specified DestinationImageName parameter is invalid. For more information, see the description of the DestinationImageName parameter.
400	InvalidDescription.Malformed	The specified destination description is wrongly formed.	The error message returned because the specified DestinationDescription parameter is invalid. The description must be 2 to 256 characters in length and cannot start with http:// or https://.
400	InvalidDescription.Malformed	The specified description is wrongly formed.	The error message returned because the specified DestinationDescription parameter is invalid. The description must be 2 to 256 characters in length and cannot start with http:// or https://.
400	SourceRegion.NotFound	The source region not found	The error message returned because the specified RegionId parameter does not exist.
400	DestinationRegion.NotFound	The destination region not found	The error message returned because the specified DestinationRegionId parameter does not exist.

HTTP status code	Error code	Error message	Description
404	InvalidImageId.NotFound	The specified ImageId does not exist.	The error message returned because the specified image does not exist in this account. Check whether the image ID is correct.
400	IncorrectImageStatus	The image not available.	The error message returned because the specified image is unavailable.
400	InvalidSnapshotId.NotFound	The specified SnapshotId does not exist.	The error message returned because the specified snapshot does not exist. Check whether the snapshot ID is correct.
400	InvalidImageName.Duplicated	The destination image is exist.	The error message returned because the specified image name already exists.
403	QuotaExceed.Image	The Image Quota exceeds.	The error message returned because the custom image quota has been used up.
403	QuotaExceed.Snapshot	The snapshot quota exceeds.	The error message returned because the maximum number of snapshots has been reached. To store new snapshots, delete snapshots that are no longer needed.
403	OperationDenied.ImageCopying	The Image are coping.	The error message returned because the source image is being copied. Try again later.
403	RegionNotSupportCopy	The region not support copy.	The error message returned because the specified source or destination region does not support image copying.
403	InvalidSnapshot.TooOld	This operation is denied because the specified snapshot is created before 2013-07-15.	The error message returned because the operation is rejected while the specified snapshot was created before July 15, 2013.
403	OperationDenied	The specified snapshot is not allowed to create image.	The error message returned because the specified snapshot cannot be used to create images.

HTTP status code	Error code	Error message	Description
403	IncorrectDestinationRegion	The destination region is not equal the target region.	The error message returned because the source region is the same as the destination region.
403	SizeExceed.Image	The image exceeds the maximum size. Please open a ticket to add the account to the white list.	The error message returned because the size of the image exceeds the upper limit. Contact customer service to request a quota increase.
403	OperationDeined.EncryptedSnapshot	The image contains encrypted snapshots, which do not support copying.	The error message returned because the specified image contains encrypted snapshots and cannot be copied.
403	InternalError	The request processing has failed due to some unknown error.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.
403	OperationDenied.SameRegionOnly	The image shared from others can not be copied to another region directly.	The error message returned because you cannot copy images shared by other Apsara Stack tenant accounts to another region.
403	OperationDenied.NotPublished	The operation is denied because corresponding marketplace image is not published in destination region.	The error message returned because the image type is not supported in the destination region and the operation is rejected.
404	InvalidParameter.KMSKeyId.NotFound	The specified KMSKeyId does not exist.	The error message returned because the specified KMS key ID does not exist.
403	InvalidParameter.KMSKeyId.KMSUnauthorized	ECS service have no right to access your KMS.	The error message returned because ECS is not authorized to access your KMS resources.
500	InternalError	The request processing has failed due to some unknown error, exception or failure.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.
403	InvalidRegion.NotSupport	The specified region does not support byok.	The error message returned because the bring your own key (BYOK) feature is not supported in this region.

HTTP status code	Error code	Error message	Description
403	UserNotInTheWhiteList	The user is not in byok white list.	The error message returned because you are not in the BYOK whitelist. Try again when you are in the whitelist.
400	InvalidParameter.EncryptedIllegal	The specified parameter Encrypted must be true when kmsKeyId is not empty.	The error message returned because the encryption feature is not enabled after a KMS key ID is specified.

2.1.2.1.9.6. CancelCopyImage

You can call this operation to cancel an ongoing image copy (CopyImage) task.

Description

When you call this operation, take note of the following items:

- After you cancel the image copy task, the image copy created in the destination region is deleted, and the source image remains unchanged.
- If the image copy task is complete, the CancelCopyImage operation fails and an error is returned.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CancelCopyImage	The operation that you want to perform. Set the value to CancelCopyImage.
ImageId	String	Yes	m-imageid1	The ID of the image being copied.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the image copy. You can call the DescribeRegions operation to query the most recent region list.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=CancelCopyImage
&ImageId=m-imageid1
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CancelCopyImageResponse>
      <RequestId>C8B26B44-0189-443E-9816-D951F59623A9</RequestId>
</CancelCopyImageResponse>
```

`JSON` format

```
{
    "RequestId": "C8B26B44-0189-443E-9816-D951F59623A9"
}
```

Error codes

HTTP status code	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist.	The error message returned because the specified RegionId parameter does not exist.
404	InvalidImageId.NotFound	The specified ImageId does not exist.	The error message returned because the specified image does not exist in this account.
400	ImageCreatedNotFromCopy	The specified image is not the target image of a copy action.	The error message returned because the specified image ID is not the ID of an image that is being copied.
400	IncorrectImageStatus	The image is copied finished.	The error message returned because the image copy task is complete.
400	InvalidDescription.Malformed	The specified description is wrongly formed.	The error message returned because the specified description is invalid. The description must be 2 to 256 characters in length and cannot start with http:// or https://.

HTTP status code	Error code	Error message	Description
400	IncorrectImageStatus	The specified snapshot is not coping.	The error message returned because the specified snapshot is not being copied.
400	IncorrectImageStatus	The specified image is not coping.	The error message returned because the specified image is not being copied.
400	IncorrectImageStatus	The image has completed copy.	The error message returned because the image copy task is complete.
400	IncorrectImageStatus	The Image copy has been failed.	The error message returned because the specified image failed to be copied.
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.
400	CancelNotSupported	The specified image coping can not be cancelled.	The error message returned because the specified image copy task cannot be canceled.

2.1.2.1.9.7. ModifyImageSharePermission

You can call this operation to manage the share permission on a custom image. After you share a custom image to another Apsara Stack tenant account, the account can use the shared image to create ECS instances (RunInstances) or replace the system disks of ECS instances (ReplaceSystemDisk).

Description

When you call this operation, take note of the following items:

- You can share only your own custom images to other Apsara Stack tenant accounts.
- A custom image can be shared to a maximum of 10 Apsara Stack tenant accounts at a time. You can specify up to 10 Apsara Stack tenant account IDs in the AddAccount.N or RemoveAccount.N parameter. If you specify more than 10 account IDs, the parameter will be ignored.
- A single custom image can be shared to a maximum of 50 Apsara Stack tenant accounts.
- If an instance was created (RunInstances) from a shared image, this instance cannot be re-initialized (ReInitDisk) after the image owner unshares or deletes the image (DeleteImage).

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyImageSharePermission	The operation that you want to perform. Set the value to ModifyImageSharePermission.
ImageId	String	Yes	m-imageid1	The ID of the custom image.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the custom image. You can call the DescribeRegions operation to query the most recent region list.
AddAccount.N	RepeatList	No	155780923***	The ID of Apsara Stack tenant account N to which to share the custom image. Valid values of N: 1 to 10. If the value of N is greater than 10, this parameter will be ignored.
RemoveAccount.N	RepeatList	No	155780923***	The ID of Apsara Stack tenant account N to which to unshare the custom image. Valid values of N: 1 to 10. If the value of N is greater than 10, this parameter will be ignored.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The request ID.

Examples

Sample requests

```
https://ecs.example.com/?Action=ModifyImageSharePermission
&ImageId=m-imageid1
&RegionId=cn-qingdao-env17-d01
&AddAccount.1=155780923***
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyImageSharePermissionResponse>
      <RequestId>C8B26B44-0189-443E-9816-D951F59623A9</RequestId>
</ModifyImageSharePermissionResponse>
```

`JSON` format

```
{
    "RequestId": "C8B26B44-0189-443E-9816-D951F59623A9"
}
```

Error codes

HTTP status code	Error code	Error message	Description
400	MissingParameter	The input parameter "RegionId" that is mandatory for processing this request is not supplied.	The error message returned because the required RegionId parameter is not specified.
404	InvalidImageId.NotFound	The specified ImageId does not exist.	The error message returned because the specified image does not exist in this account.
404	InvalidAccount.NotFound	The specified parameter "AddAccount.n" or "RemoveAccount.n" does not exist.	The error message returned because the specified AddAccount.N or RemoveAccount.N parameter does not exist.
404	InvalidAccount.Forbiden	The specified Account does not yourself.	The error message returned because you are trying to share the image to your own account.
403	QuotaExceed.ShareImage	The shared Image Quota exceeds.	The error message returned because the maximum number of custom images that can be shared has been reached.
403	QuotaExceed.ShareImageUser	The shared Image user Quota exceeds.	The error message returned because the maximum number of Apsara Stack tenant accounts to which a single image can be shared has been reached.
400	InvalidGroup.Malformed	The specified Group is wrongly formed.	The error message returned because the specified group does not exist.
403	InvalidImageId.BidMismatch	Cannot share image with other bid user.	The error message returned because images cannot be shared among users of different carriers.

HTTP status code	Error code	Error message	Description
403	OperationDeined.EncryptedSnapshot	The image contains encrypted snapshots, which do not support share.	The error message returned because the specified image contains encrypted snapshots and cannot be shared.

2.1.2.1.9.8. DescribeImageSharePermission

You can call this operation to query the accounts to which a custom image is shared. The response can be displayed by page. By default, ten entries are displayed on each page.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeImageSharePermission	The operation that you want to perform. Set the value to DescribeImageSharePermission.
ImageId	String	Yes	m-282dz****	The ID of the custom image.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the custom image. You can call the DescribeRegions operation to query the most recent region list.
PageNumber	Integer	No	1	The number of the page to return. Pages start from page 1. Default value: 1
PageSize	Integer	No	10	The number of entries to return on each page. Valid values: 1 to 100. Default value: 10

Response parameters

Parameter	Type	Example	Description
Accounts	Array		The Apsara Stack tenant accounts.
Account			

Parameter	Type	Example	Description
AliyunId	String	123456****	The ID of the Apsara Stack tenant account.
ImageId	String	m-282dz****	The ID of the custom image.
PageNumber	Integer	1	The page number of the returned page.
PageSize	Integer	10	The number of entries returned per page.
RegionId	String	cn-qingdao-env17-d01	The region ID of the image.
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.
ShareGroups	Array		The shared groups.
ShareGroup			
Group	String	all	The name of the shared group.
TotalCount	Integer	1	The total number of entries returned.

Examples

Sample requests

```
https://ecs.example.com/?Action=DescribeImageSharePermission
&ImageId=m-282dz****
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeImageSharePermissionResponse>
      <ImageId>m-282dz****</ImageId>
      <PageNumber>1</PageNumber>
      <PageSize>10</PageSize>
      <RegionId>cn-qingdao-env17-d01</RegionId>
      <TotalCount>1</TotalCount>
      <RequestId>441CF898-42FF-47CF-9348-3C3BFF557278</RequestId>
      <ShareGroups>
            <ShareGroup>
                  <Group>all</Group>
            </ShareGroup>
      </ShareGroups>
      <Accounts>
            <Account>
                  <AliyunId>123456****</AliyunId>
            </Account>
      </Accounts>
</DescribeImageSharePermissionResponse>
```

`JSON` format

```
{
    "ShareGroups": {
        "ShareGroup": [
            {
                "Group": "all"
            }
        ]
    },
    "Accounts": {
        "Account": [
            {
                "AliyunId": "123456****"
            }
        ]
    },
    "ImageId": "m-282dz****",
    "PageNumber": 1,
    "PageSize": 10,
    "RegionId": "cn-qingdao-env17-d01",
    "TotalCount": 1,
    "RequestId": "9AD96F49-0BE5-4868-A66A-224352549CEC"
}
```

Error codes

HTTP status code	Error code	Error message	Description

HTTP status code	Error code	Error message	Description
400	MissingParameter	The input parameter "RegionId "that is mandatory for processing this request is not supplied.	The error message returned because the RegionId parameter is not specified.
400	MissingParameter	The input parameter "ImageId "that is mandatory for processing this request is not supplied.	The error message returned because the ImageId parameter is not specified.
404	InvalidImageId.NotFound	The specified ImageId does not exist.	The error message returned because the specified image does not exist in this account.

2.1.2.1.9.9. ImportImage

You can call this operation to import a local image to ECS. The imported local image appears as a custom image in the corresponding region. You can use the imported image to create ECS instances (RunInstances) or replace system disks of instances (ReplaceSystemDisk).

Description

When you call this operation, take note of the following items:

- You must upload an image to an Object Storage Service (OSS) bucket before you can import the image.
- You must use Resource Access Management (RAM) to authorize ECS to access your OSS buckets before you upload an image for the first time. If ECS is not authorized to access your OSS buckets, the `NoSetRoletoECSServiceAcount` error code is returned when you call the ImportImage operation. The following example shows some steps in the authorization procedure:

  1. Create a role named `AliyunECSImageImportDefaultRole`. You must use this exact name. Otherwise, the image will fail to be imported. Configure the following trust policy for the role:

```
{
    "Statement": [
    {
        "Action": "sts:AssumeRole",
        "Effect": "Allow",
        "Principal": {
        "Service": [
            "ecs.example.com"
        ]
        }
    }
],
    "Version": "1"
}
```

2. Attach the `AliyunECSImageImportRolePolicy` system policy to the role. Alternatively, you can create a custom policy that contains the following content and attach the policy to the role:

```
{
    "Version": "1",
    "Statement": [
    {
        "Action": [
                "oss:GetObject",
                "oss:GetBucketLocation",
                "oss:GetBucketInfo"
    ],
            "Resource": "*",
            "Effect": "Allow"
            }
    ]
}
```

- You cannot delete an image that is being imported. However, you can call the CancelTask operation to cancel the image import task.
- You can import an image only to the same region as the OSS bucket to which the image is uploaded.
- Valid values of N in the `DiskDeviceMapping.N` parameter: 1 to 17. When N is 1, the disk is a system disk. When N ranges from 2 to 17, the disk is a data disk.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ImportImage	The operation that you want to perform. Set the value to ImportImage.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the image to be imported. You can call the DescribeRegions operation to query the most recent region list.
DiskDeviceMapping.N.Format	String	No	qcow2	The format of the image. Valid values: • RAW • VHD • qcow2 This parameter is empty by default, which indicates that the system automatically checks the format of the image and uses the check result as the value of this parameter.

Parameter	Type	Required	Example	Description
DiskDeviceMapping.N.OSSBucket	String	No	ecsimageos	The OSS bucket where the image is stored. **Note** Before you upload an image to an OSS bucket for the first time, see the "Description" section in this topic to authorize ECS to access your OSS buckets. If ECS is not authorized to access your OSS buckets, the `NoSetRoletoECSServiceAcount` error code is returned when you call the ImportImage operation.
DiskDeviceMapping.N.OSSObject	String	No	CentOS_5.4_32.raw	The OSS object that corresponds to the image.
DiskDeviceMapping.N.DiskImSize	Integer	No	80	The size of the image. **Note** This parameter will be removed in the future. We recommend that you use the DiskDeviceMapping.N.DiskImageSize parameter to ensure future compatibility.

Parameter	Type	Required	Example	Description
DiskDeviceMapping.N.DiskImageSize	Integer	No	80	The size of disk N in the image. The capacity of the system disk must be greater than or equal to the actual space used by file systems. Valid values: • When N is set to 1, the disk is a system disk and its size ranges from 5 GiB to 500 GiB. • When N is set to a value from 2 to 17, the disk is a data disk and its size ranges from 5 GiB to 1,000 GiB. When you import an image, the system automatically checks the sizes of disks contained in the image and uses the check results as the values of this parameter.
DiskDeviceMapping.N.Device	String	No	null	The device name of disk N in the custom image. Note This parameter will be removed in the future. We recommend that you use other parameters to ensure future compatibility.
ImageName	String	No	ImageTestName	The name of the image. The name must be 2 to 128 characters in length and can contain letters, digits, colons (:), underscores (_), and hyphens (-). It must start with a letter and cannot start with http:// or https://. This parameter is empty by default.
Description	String	No	TestDescription	The description of the image. The description must be 2 to 256 characters in length and cannot start with http:// or https://. This parameter is empty by default.

Parameter	Type	Required	Example	Description
Architecture	String	No	x86_64	The system architecture. Default value: x86_64. Valid values: • i386 • x86_64
OSType	String	No	linux	The type of the operating system. Default value: linux. Valid values: • windows • linux
Platform	String	No	Aliyun	The distribution of the operating system. Default value: Others Linux. Valid values: • CentOS • Ubuntu • SUSE • OpenSUSE • Debian • CoreOS • Aliyun • Windows Server 2003 • Windows Server 2008 • Windows Server 2012 • Others Linux • Customized Linux
RoleName	String	No	AliyunECSImageImportDefaultRole	The name of the RAM role used to import the image.

Parameter	Type	Required	Example	Description
LicenseType	String	No	Auto	The type of the license used to activate the operating system after the image is imported. Default value: Auto. Valid values: • Auto: ECS checks the operating system of the imported image and allocates a license to the operating system. Specifically, ECS first checks whether the operating system distribution specified by `Platform` has a license allocated through an official Alibaba Cloud channel. If yes, ECS allocates that license to the imported image. If no, the license that comes with the source operating system is used. • Aliyun: The license allocated through an official Alibaba Cloud channel is used for the operating system distribution specified by `Platform`. • BYOL: The license that comes with the source operating system is used. In this case, ensure that your license key can be used in Apsara Stack.

Response parameters

Parameter	Type	Example	Description
ImageId	String	m-bp67acfmxazb4p****	The ID of the image.
RegionId	String	cn-qingdao-env17-d01	The ID of the region.
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.
TaskId	String	t-bp67acfmxazb4p****	The ID of the image import task.

Examples

Sample requests

```
https://ecs.example.com/?Action=ImportImage
&RegionId=cn-qingdao-env17-d01
&DiskDeviceMapping.1.Format=qcow2
&DiskDeviceMapping.1.OSSBucket=ecsimageos
&DiskDeviceMapping.1.OSSObject=CentOS_5.4_32.raw
&DiskDeviceMapping.1.DiskImageSize=80
&ImageName=Test
&Description=Test
&Architecture=x86_64
&OSType=linux
&Platform=Aliyun
&LicenseType=Aliyun
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ImportImageResponse>
      <RequestId>C8B26B44-0189-443E-9816-D951F59623A9</RequestId>
      <ImageId>m-bp67acfmxazb4p****</ImageId>
      <RegionId>cn-qingdao-env17-d01</RegionId>
      <TaskId>t-bp67acfmxazb4p****</TaskId>
</ImportImageResponse>
```

`JSON` format

```
{
    "RequestId": "C8B26B44-0189-443E-9816-D951F59623A9",
    "ImageId": "m-bp67acfmxazb4p****",
    "RegionId": "cn-qingdao-env17-d01",
    "TaskId": "t-bp67acfmxazb4p****"
}
```

Error codes

HTTP status code	Error code	Error message	Description
400	MissingParameter	An input parameter "RegionId" that is mandatory for processing the request is not supplied.	The error message returned because the required RegionId parameter is not specified.
400	MissingParameter	An input parameter "DiskDeviceMapping.1.OSSBucket" that is mandatory for processing the request is not supplied.	The error message returned because the DiskDeviceMapping.N.OSSBucket parameter is not specified.

HTTP status code	Error code	Error message	Description
400	MissingParameter	An input parameter "DiskDeviceMapping.1.OSSObject " that is mandatory for processing the request is not supplied.	The error message returned because the DiskDeviceMapping.N.OSSObject parameter is not specified.
400	InvalidImageName.Malformed	The specified Image name is wrongly formed.	The error message returned because the specified ImageName parameter is invalid. The name must be 2 to 128 characters in length and can contain letters, digits, periods (.), underscores (_), and hyphens (-). It must start with a letter and cannot start with http:// or https://.
400	InvalidOSSObject.Malformed	The specified OSS object is wrongly formed.	The error message returned because the specified DiskDeviceMapping.N.OSSObject parameter is invalid.
400	InvalidDescription.Malformed	The specified Image description is wrongly formed.	The error message returned because the specified Description parameter is invalid.
400	InvalidArchitecture.Malformed	The specified Architecture is wrongly formed.	The error message returned because the specified Architecture parameter is invalid.
400	InvalidPlatform.Malformed	The specified Platform is wrongly formed.	The error message returned because the specified Platform parameter is invalid.
400	InvalidOSType.Malformed	The specified OSType is wrongly formed.	The error message returned because the specified OSType parameter is invalid.
400	InvalidImageName.Duplicated	The destination image is exist.	The error message returned because the specified image name already exists.
400	InvalidImageSize	%s	The error message returned because the specified image size is invalid.
400	InvalidDataDiskSize	The specified DiskDeviceMapping.N.DiskImSize should be in the specified range.	The error message returned because the specified DiskDeviceMapping.N.DiskImSize parameter is invalid.

HTTP status code	Error code	Error message	Description
400	InvalidImageFormat.Malformed	The specified Image Format is wrongly formed.	The error message returned because the specified image format is invalid.
400	InvalidRegionId.NotFound	The specified RegionId does not exist.	The error message returned because the specified RegionId parameter does not exist.
400	InvalidRegion.NotSupport	The specified region does not support image import or export.	The error message returned because the specified region does not support this operation.
403	ImageIsImporting	The specified Image is importing.	The error message returned because the specified image is being imported and cannot be operated.
403	QuotaExceed.Image	The Image Quota exceeds.	The error message returned because the maximum number of custom images has been reached.
403	ImportImageFailed	Importing image is failed, Please contact the administrator.	The error message returned because the image failed to be imported. Contact a system administrator.
403	UserNotInTheWhiteList	The user is not in the white list of importing image.	The error message returned because you are not authorized to import images.
403	NoSetRoletoECSServiceAcount	ECS service account Have no right to access your OSS.please attach a role of access your oss to ECS service account.	The error message returned because ECS is not authorized to access the specified OSS bucket and object.
400	InvalidOSSBucket.NotFound	The specified OSS bucket does not exist in this region.	The error message returned because the specified OSS bucket does not exist.
403	InvalidParameter.Malformed	The specified parameter "DiskDeviceMapping.n.Device " is not valid.	The error message returned because the specified DiskDeviceMapping.N.Device parameter is invalid.
403	MissingParameter.DiskDeviceMapping	The specified parameter DiskDeviceMapping is not supplied.	The error message returned because a parameter that starts with DiskDeviceMapping is not specified.

HTTP status code	Error code	Error message	Description
400	InvalidOSSObject.NotFound	The specified OSS object does not exist in this region.	The error message returned because the specified OSS object does not exist.
400	InvalidOSSObject.NotFound	The specified OSS object cannot be retrieved.	The error message returned because the specified OSS object does not exist.
400	InvalidLicenseType.NotSupported	The specified LicenseType is not supported	The error message returned because the specified LicenseType parameter is invalid.
400	InvalidLicenseType.BYOLOnly	Only BYOL LicenseType is supported for the current platform provided	The error message returned because the current platform supports only BYOL licenses.

2.1.2.1.9.10. ExportImage

You can call this operation to export a custom image to an OSS bucket in the same region.

Description

- A custom image cannot be exported if it contains more than four data disk snapshots or if one of the data disk snapshots exceeds 500 GiB in size.
- Before you export a custom image, you must use Resource Access Management (RAM) to create a RAM role for ECS and authorize ECS to write data to OSS.

  1. Create a role named `AliyunECSImageExportDefaultRole`. Any other role names are invalid. Configure the following trust policy for the role:

```
{
  "Statement": [
    {
      "Action": "sts:AssumeRole",
      "Effect": "Allow",
      "Principal": {
        "Service": [
          "ecs.aliyuncs.com"
        ]
      }
    }
  ],
  "Version": "1"
}
```

  2. Attach the `AliyunECSImageExportRolePolicy` system policy to the `AliyunECSImageExportDefaultRole` role. This policy is the default policy used for ECS to export images. Alternatively, you can create a custom policy that contains the following content and attach the policy to the role:

```
{
  "Version": "1",
  "Statement": [
    {
      "Action": [
        "oss:GetObject",
        "oss:PutObject",
        "oss:DeleteObject",
        "oss:GetBucketLocation",
        "oss:GetBucketInfo",
        "oss:AbortMultipartUpload",
        "oss:ListMultipartUploads",
        "oss:ListParts"
      ],
      "Resource": "*",
      "Effect": "Allow"
    }
  ]
}
```

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ExportImage	The operation that you want to perform. Set the value to ExportImage.
ImageId	String	Yes	m-bp67acfmxazb4p****	The ID of the custom image.
OSSBucket	String	Yes	testexportImage	The OSS bucket to which to export the custom image.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the custom image. You can call the DescribeRegions operation to query the most recent region list.
OSSPrefix	String	No	EcsExport	The prefix of the object as which to store the custom image in the OSS bucket. It must be 1 to 30 characters in length and can contain digits and letters.

Parameter	Type	Required	Example	Description
ImageFormat	String	No	raw	The format in which to export the custom image. Valid values: • raw • vhd • qcow2 • vmdk • vdi Default value: raw.
RoleName	String	No	EcsServiceRole-EcsDocGuideTest	The name of the RAM role used to export the custom image.

Response parameters

Parameter	Type	Example	Description
RegionId	String	cn-qingdao-env17-d01	The ID of the region.
RequestId	String	C8B26B44-0189-443E-9816-D951F59623A9	The ID of the request.
TaskId	String	tsk-bp67acfmxazb4p****	The ID of the image export task.

Examples

Sample requests

```
https://ecs.example.com/?Action=ExportImage
&ImageId=m-bp67acfmxazb4p****
&OSSBucket=testexportImage
&RegionId=cn-qingdao-env17-d01
&OSSPrefix=EcsExport
&ImageFormat=raw
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ExportImageResponse>
      <RequestId>C8B26B44-0189-443E-9816-D951F59623A9</RequestId>
      <TaskId>tsk-bp67acfmxazb4p****</TaskId>
      <RegionId>cn-qingdao-env17-d01</RegionId>
</ExportImageResponse>
```

`JSON` format

```
{
    "RequestId": "C8B26B44-0189-443E-9816-D951F59623A9",
    "TaskId": "tsk-bp67acfmxazb4p****",
    "RegionId": "cn-qingdao-env17-d01"
}
```

Error codes

HTTP status code	Error code	Error message	Description
400	MissingParameter	An input parameter "RegionId" that is mandatory for processing the request is not supplied.	The error message returned because the RegionId parameter is not specified.
400	MissingParameter	An input parameter "ImageId" that is mandatory for processing the request is not supplied.	The error message returned because the ImageId parameter is not specified.
400	MissingParameter	An input parameter "OSSBucket" that is mandatory for processing the request is not supplied.	The error message returned because the OSSBucket parameter is not specified.
400	InvalidImageName.Malformed	The specified Image name is wrongly formed.	The error message returned because the specified image name is invalid. The name must be 2 to 128 characters in length and can contain letters, digits, periods (.), underscores (_), and hyphens (-). It must start with a letter and cannot start with http:// or https://.
400	InvalidOSSPrefix.Malformed	The specified OSSPrefix format is wrongly formed.	The error message returned because the specified OSSPrefix parameter is invalid.
400	InvalidRegionId.NotFound	The specified RegionId does not exist.	The error message returned because the specified RegionId parameter does not exist.
400	InvalidRegion.NotSupport	The specified region does not support image import or export.	The error message returned because the specified region does not support the operation.

HTTP status code	Error code	Error message	Description
404	InvalidImageId.NotFound	The specified ImageId does not exist.	The error message returned because the specified image does not exist in this account. Check whether the image ID is correct.
400	IncorrectImageStatus	The specified Image is not available.	The error message returned because the status of the specified image is invalid.
403	ImageNotSupported	The specified image from the image market, do not support export image.	The error message returned because the specified image is an Alibaba Cloud Marketplace image and cannot be exported.
400	InvalidImageFormat.Malformed	The specified Image Format is wrongly formed.	The error message returned because the specified ImageFormat parameter is invalid.
403	ImageIsExporting	The specified Image is exporting.	The error message returned because the specified image is being exported.
403	ExportImageFailed	Exporting image is failed, Please contact the administrator.	The error message returned because the image failed to be exported. Contact a system administrator.
403	UserNotInTheWhiteList	The user is not in the white list of exporting image.	The error message returned because you are not authorized to export images.
403	NoSetRoletoECSServiceAcount	ECS service account Have no right to access your OSS.please attach a role of access your oss to ECS service account.	The error message returned because ECS is not authorized to access the specified OSS bucket and object.
400	InvalidOSSBucket.NotFound	The specified OSS bucket does not exist in this region.	The error message returned because the specified OSSBucket parameter does not exist.
400	OperationDenied	The specified image contains the snapshot of the data disk,does not support this operation.	The error message returned because the operation is not supported while the image contains data disk snapshots.

HTTP status code	Error code	Error message	Description
400	InvalidImage.DiskAmountOrSize	%s	The error message returned because the image contains more than four data disk snapshots or one of the data disk snapshot exceeds 500 GiB in size.
400	ImageNotSupported	The specified Image contains encrypted snapshots, do not support export.	The error message returned because the specified image contains encrypted snapshots and cannot be exported.
400	ImageNotSupported	Image from image market does not support exporting.	The error message returned because the specified image is an Alibaba Cloud Marketplace image and cannot be exported.
403	ConcurrentQuotaExceed.ExportImage	%s	The error message returned because the maximum number of concurrent ongoing tasks has been reached. Try again later.
403	WeeklyQuotaExceed.ExportImage	%s	The error message returned because the weekly quota for exported images of this week has been used up. Retry when the quota becomes available again.

2.1.2.1.9.11. DescribeImageSupportInstanceTypes

You can call this operation to query the instance types supported by an image.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeImageSupportInstanceTypes	The operation that you want to perform. Set the value to DescribeImageSupportInstanceTypes.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the image. You can call the DescribeRegions operation to query the most recent region list.

Parameter	Type	Required	Example	Description
ImageId	String	No	m-o6w3gy99qf89rkga****	The ID of the image.
ActionType	String	No	CreateEcs	The scenario in which the instance type is used. Default value: CreateEcs. Valid values: • CreateEcs: instance creation • Upgrade: instance type upgrade • Downgrade: instance type downgrade
Filter.N.Key	String	No	imageId	The key of filter N. Valid values: • imageId: image ID • filter: image ID
Filter.N.Value	String	No	m-o6w3gy99qf89rkga****	The value of filter N.

Response parameters

Parameter	Type	Example	Description
ImageId	String	m-o6w3gy99qf89rkga****	The ID of the image.
InstanceTypes	Array		The collection of details about instance types that are supported by the image.
InstanceType			
CpuCoreCount	Integer	1	The number of vCPUs of the instance type.
InstanceTypeFamily	String	ecs.t1	The instance family.
InstanceTypeId	String	ecs.t1.xsmall	The ID of the instance type.
MemorySize	Float	1024	The memory size of the instance type. Unit: GiB.
RegionId	String	cn-qingdao-env17-d01	The region ID of the image.

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=DescribeImageSupportInstanceTypes

Error codes

HTTP status code	Error code	Error message	Description
400	InvalidParamter	Invalid Parameter	The error message returned because a specified parameter is invalid.
404	InvalidUsage	The specifed Usage is not valid	The error message returned because the specified referenced resource type (image, disk, image_disk, or none) is invalid.
400	InvalidInstanceType.ValueNotSupported	The specified InstanceType does not exist or beyond the permitted range.	The error message returned because the specified instance type does not exist or you are not authorized to manage instances of this instance type.

2.1.2.1.10. Networks

2.1.2.1.10.1. ModifyInstanceNetworkSpec

You can call this operation to modify the bandwidth configurations of an instance. You can modify the bandwidth configurations of an instance to improve network performance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyInstanceNetworkSpec	The operation that you want to perform. Set the value to ModifyInstanceNetworkSpec.
InstanceId	String	Yes	i-bp67acfmxazb4ph***	The ID of the instance for which you want to modify bandwidth configurations.
InternetMaxBandwidthOut	Integer	No	10	The maximum outbound network bandwidth. Unit: Mbit/s. Valid values: 0 to 100.
InternetMaxBandwidthIn	Integer	No	10	The maximum inbound bandwidth. Unit: Mbit/s. Valid values: • When the maximum outbound bandwidth is less than or equal to 10 Mbit/s, the valid values of InternetMaxBandwidthIn are 1 to 10 and the default value is 10. • When the maximum outbound bandwidth is greater than 10 Mbit/s, the valid values of InternetMaxBandwidthIn are 1 to the `InternetMaxBandwidthOut` value and the default value is the `InternetMaxBandwidthOut` value.
AllocatePublicIp	Boolean	No	false	**Note** This parameter is not supported.
StartTime	String	No	2017-12-05T22:40Z	The start time of the temporary bandwidth upgrade. Specify the time in the ISO 8601 standard in the yyyy-MM-ddThh:mmZ format. The time must be in UTC and accurate to **minutes** (mm).
EndTime	String	No	2017-12-06T22Z	The end time of the temporary bandwidth upgrade. Specify the time in the ISO 8601 standard in the yyyy-MM-ddThhZ format. The time must be in UTC and accurate to **hours** (hh).

Parameter	Type	Required	Example	Description
ClientToken	String	No	123e4567-e89b-12d3-a456-426655440000	The client token that is used to ensure the idempotence of the request You can use the client to generate the value, but you must make sure that it is unique among different requests. The **ClientToken** value can only contain ASCII characters and cannot exceed 64 characters in length. For more information, see How to ensure idempotence in ECS Developer Guide.

Response parameters

Parameter	Type	Example	Description
OrderId	String	0	**Note** This parameter is not supported.
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=ModifyInstanceNetworkSpec
&InstanceId=i-bp67acfmxazb4ph****
&InternetMaxBandwidthOut=10
&ClientToken=123e4567-e89b-12d3-a456-426655440000
```

Sample success responses

Error codes

HTTP status code	Error code	Error message	Description
404	InvalidInstanceId.NotFound	The specified InstanceId does not exist.	The error message returned because the specified InstanceId parameter does not exist.
400	InvalidInternetMaxBandwidthIn.ValueNotSupported	The specified InternetMaxBandwidthIn is beyond the permitted range.	The error message returned because the specified InternetMaxBandwidthIn parameter is not within the permitted range.
400	InvalidInternetMaxBandwidthOut.ValueNotSupported	The specified InternetMaxBandwidthOut is beyond the permitted range.	The error message returned because the specified InternetMaxBandwidthOut parameter is not within the permitted range.
403	IncorrectInstanceStatus	The current status of the instance does not support this operation.	The error message returned because the operation is not supported while the instance is in the current state.
403	InstanceLockedForSecurity	The specified operation is denied as your instance is locked for security reasons.	The error message returned because the operation is not supported while the instance is locked for security reasons.
403	InstanceExpiredOrInArrears	The specified operation is denied as your prepay instance is expired (prepay mode) or in arrears (afterpay mode).	The error message returned because the subscription instance has expired. Renew the instance and try again.
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.
403	ChargeTypeViolation	The operation is not permitted due to billing method of the instance.	The error message returned because the billing method of the instance does not support the operation.
403	OperationDenied	The operation is denied due to the instance is PrePaid.	The error message returned because the instance is a subscription instance and does not support the operation.
400	OperationDenied	Specified instance is in VPC.	The error message returned because the instance resides in a VPC.

HTTP status code	Error code	Error message	Description
400	InvalidParameter.Bandwidth	%s	The error message returned because the specified bandwidth is invalid.
400	InvalidParameter.Conflict	%s	The error message returned because a specified parameter is invalid. Check whether parameter conflicts exist.
400	InvalidStartTime.ValueNotSupported	%s	The error message returned because the end time is earlier than the start time.
400	Account.Arrearage	Your account has an outstanding payment.	The error message returned because you have overdue payments in your account.
400	InvalidInternetChargeType.ValueNotSupported	The specified InternetChargeType is invalid.	The error message returned because the specified InternetChargeType parameter is invalid.
400	DecreasedBandwidthNotAllowed	%s	The error message returned because the bandwidth cannot be downgraded.
400	BandwidthUpgradeDenied.EipBoundInstance	The specified VPC instance has bound EIP, temporary bandwidth upgrade is denied.	The error message returned because the instance is associated with an elastic IP address and cannot have its bandwidth temporarily upgraded.
400	InvalidClientToken.ValueNotSupported	The ClientToken provided is invalid.	The error message returned because the specified client token is invalid.
403	InvalidAccountStatus.NotEnoughBalance	Your account does not have enough balance.	The error message returned because your account balance is insufficient. Add funds to your account and try again.
403	InvalidInstance.UnPaidOrder	The specified Instance has unpaid order.	The error message returned because you have unpaid orders for the specified instance. Pay for the orders and try again.
400	Throttling	Request was denied due to request throttling, please try again after 5 minutes.	The error message returned because your request is denied due to throttling. Try again 5 minutes later.

HTTP status code	Error code	Error message	Description
400	InvalidAction	Specified action is not valid.	The error message returned because this operation is invalid.
400	IpAllocationError	Allocate public ip failed.	The error message returned because a public IP address failed to be assigned.
400	InvalidParam.AllocatePublicIp	The specified param AllocatePublicIp is invalid.	The error message returned because the specified AllocatePublicIp parameter is invalid.
400	InstanceDowngrade.QuotaExceed	Quota of instance downgrade is exceed.	The error message returned because the maximum number of configuration downgrades allowed for the instance has been reached.
400	InvalidBandwidth.ValueNotSupported	Instance upgrade bandwidth of temporary not allow less then existed.	The error message returned because the new bandwidth specified for the temporary bandwidth upgrade is lower than the current bandwidth.
403	InvalidInstance.InstanceNotSupported	The special vpc instance with eip not need bandwidth.	The error message returned because the instance is located in a VPC and associated with an elastic IP address and you cannot specify a public bandwidth for the instance.
400	InvalidInstanceStatus	The specified instance status does not support this action.	The error message returned because the operation is not supported while the instance is in the current state.
403	InvalidInstanceStatus	The current status of the instance does not support this operation.	The error message returned because this operation is not supported while the instance is in the current state.
400	InvalidInstance.UnPaidOrder	Unpaid order exists in your account, please complete or cancel the payment in the expense center.	The error message returned because you have unpaid orders in your account. Pay for the orders and try again.

HTTP status code	Error code	Error message	Description
400	OperationDenied	After downgrade, you cannot upgrade or downgrade your instances again in the remaining time of the current billing cycle.	The error message returned because you have downgraded the configurations of the instance and cannot upgrade or downgrade the configurations again until a new billing cycle starts.
400	InvalidInternetChargeType.ValueNotSupported	%s	The error message returned because the specified InternetChargeType parameter is invalid.
400	LastOrderProcessing	The previous order is still processing, please try again later.	The error message returned because the order is being processed. Try again later.
400	OperationDenied	The current user does not support this operation.	The error message returned because your account does not support the operation.
403	NAT_PUBLIC_IP_BINDING_FAILED	Binding nat public ip failed	The error message returned because the public IP address failed to be associated with the gateway.
403	InvalidInstance.EipNotSupport	The specified instance with eip is not supported, please unassociate eip first.	The error message returned because the operation is not supported while an elastic IP address is associated with the instance. Disassociate the elastic IP address first.
403	InvalidNetworkType.ValueNotSupported	The specified parameter NetworkType is not valid.	The error message returned because the specified network type is invalid.
500	InternalError	The request processing has failed due to some unknown error, exception or failure.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.
403	IncorrectInstanceStatus	The current status of the resource does not support this operation.	The error message returned because the operation is not supported while the resource is in the current state.

2.1.2.1.10.2. AttachClassicLinkVpc

You can call this operation to link a classic network-type instance to a VPC by establishing a ClassicLink connection. This way, the instance can communicate with cloud resources in the VPC through the internal network.

Description

When you call this operation, make sure that the following requirements are met:

- The classic network-type instance to be linked is in the **Running** (Running) or **Stopped** (Stopped) state.
- ClassicLink is enabled for the target VPC. For more information, see Enable ClassicLink.
- The instance and the VPC are in the same region.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	AttachClassicLinkVpc	The operation that you want to perform. Set the value to AttachClassicLinkVpc.
InstanceId	String	Yes	i-test	The ID of the classic network-type instance. You can call the DescribeInstances operation to query the most recent instance list.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the instance. You can call the DescribeRegions operation to query the most recent region list.
VpcId	String	Yes	vpc-test	The ID of the VPC where ClassicLink is enabled. You can call the DescribeVpcs operation to query available VPCs.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=AttachClassicLinkVpc
&RegionId=cn-qingdao-env17-d01
&InstanceId=i-test
&VpcId=vpc-test
&<Common request parameters>
```

Sample success responses

`XML` format

```
<AttachClassicLinkVpcResponse>
      <RequestId>C0003E8B-B930-4F59-ADC0-0E209A9012A8</RequestId>
</AttachClassicLinkVpcResponse>
```

`JSON` format

```
{
    "RequestId": "C0003E8B-B930-4F59-ADC0-0E209A9012A8"
}
```

Error codes

HTTP status code	Error code	Error message	Description
403	InvalidInstanceId.NotFound	The InstanceId provided does not exist in our records.	The error message returned because the specified InstanceId parameter does not exist.
403	InvalidInstanceId.MalFormed	The specified instance is not a classic network instance.	The error returned because the specified instance is not in the classic network.
403	OperationDenied	The instance does not allow link to vpc.	The error returned because the instance is linked to another VPC.
403	InvalidParameter.InvalidInstanceIdAndVpcId	The parameter InstanceId and VpcId are not allowed to be empty at the same time.	The error message returned because neither InstanceId nor VpcId is specified.
403	OperationDenied	The specified vpc is disabled attach classic link.	The error message returned because ClassicLink cannot be enabled for the specified VPC.
403	InvalidInstanceId.NotFound	The specified instance does not exist.	The error message returned because the specified InstanceId parameter does not exist.

HTTP status code	Error code	Error message	Description
403	InvalidStatus.InstanceStatus	The specified instance status is not support this operation ,expect status is running or shutted.	The error message returned because the operation is not supported while the instance is in the current state. The instance must be in the Running or Stopped state.
403	InvalidStatus.InstanceStatus	The specified instance status is not support this operation, expect status is running or shutted.	The error message returned because the operation is not supported while the instance is in the current state. The instance must be in the Running or Stopped state.
403	InvalidInstanceId.NotBelong	The specified instance is not belong to you.	The error message returned because the specified instance does not exist in your account.
403	QuotaExceeded	The link quota exceeded in this vpc.	The error message returned because the maximum number of ClassicLink connections that can be established to the specified VPC has been reached.
403	InvalidStatus.InstanceLocked	The specified instance is locked,please wait more.	The error message returned because the specified instance is locked. Try again when the instance is unlocked.
403	InvalidInstanceId.LimitedRegion	The specified instance does not support this operation due to the limitation of its region.	The error message returned because a ClassicLink connection cannot be established for the instance due to the region limit.
403	Forbidden.SubUser	User not authorized to operate on the specified resource.	The error message returned because the RAM user is not authorized to manage this resource.

2.1.2.1.10.3. ModifyInstanceSpec

You can call this operation to change the instance type and network bandwidth of an ECS instance.

Description

When you call this operation, take note of the following items:

- You can adjust the network bandwidth of an instance only when the instance is in the **Running** (`Running`) or **Stopped** (`Stopped`) state.
- Before you change the instance type of an instance, you can call the DescribeResourcesModification

operation to query the instance types to which you can change.

- You can change the instance type of an instance only when the instance is in the **Stopped** (`Stopped`) state.
- You can only change either the instance type or the network bandwidth each time.
- After a change is complete for an instance, you cannot initiate another change for this instance within five minutes.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyInstanceSpec	The operation that you want to perform. If you use a custom HTTP URL or HTTPS URL to make an API request, you must specify the `Action` parameter. Set the value to ModifyInstanceSpec.
InstanceId	String	Yes	i-bp67acfmxazb4ph***	The ID of the instance.
InstanceType	String	No	ecs.g5.large	The target instance type. You can call the DescribeInstanceTypes operation to query the most recent instance type list.
InternetMaxBandwidthOut	Integer	No	10	The maximum outbound network bandwidth. Unit: Mbit/s. Valid values: 0 to 100.
InternetMaxBandwidthIn	Integer	No	10	The maximum inbound network bandwidth. Unit: Mbit/s. Valid values: • When the maximum outbound network bandwidth is less than or equal to 10 Mbit/s, the valid values of InternetMaxBandwidthIn are 1 to 10 and the default value is 10. • When the maximum outbound network bandwidth is greater than 10 Mbit/s, the valid values of InternetMaxBandwidthIn are 1 to the `InternetMaxBandwidthOut` value and the default value is the `InternetMaxBandwidthOut` value.

Parameter	Type	Required	Example	Description
Temporary.StartTime	String	No	2017-12-05T22:40:00Z	The start time of the temporary bandwidth upgrade. Specify the time in the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time must be in UTC.
Temporary.EndTime	String	No	2017-12-05T22:40:00Z	The end time of the temporary bandwidth upgrade. Specify the time in the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time must be in UTC.
Temporary.InternetMaxBandwidthOut	Integer	No	50	The maximum outbound network bandwidth after the temporary bandwidth upgrade. Valid values: 1 to 100. **Note** This parameter will be removed in the future. We recommend that you use other parameters to ensure future compatibility.
Async	Boolean	No	false	Specifies whether to submit an asynchronous request. Default value: false.

Parameter	Type	Required	Example	Description
AllowMigrateAcrossZone	Boolean	No	false	Specifies whether to allow cross-cluster instance type upgrade. Default value: false. When `AllowMigrateAcrossZone` is set to true and you upgrade the instance configurations based on the returned information, take note of the following items: Instances in the classic network: • For phased-out instance types, when a non-I/O optimized instance is upgraded to an I/O optimized instance, the private IP address, disk device names, and software license codes of the instance are changed. For Linux instances, basic disks (`cloud`) are identified as **xvda** through **xvdz**, and ultra disks (`cloud_efficiency`) and standard SSDs (`cloud_ssd`) are identified as **vda** through **vdz**. • For instance families available for purchase, when the instance type of an instance is changed, the private IP address of the instance is also changed. Instances in a VPC: For phased-out instance types, when a non-I/O optimized instance is upgraded to an I/O optimized instance, the disk device names and software license codes of the instance are changed. For Linux instances, basic disks (`cloud`) are identified as **xvda** through **xvdz** and ultra disks (`cloud_efficiency`) and standard SSDs (`cloud_ssd`) are identified as **vda** through **vdz**.

Parameter	Type	Required	Example	Description
SystemDisk.Category	String	No	cloud_ssd	The category of the system disk. This parameter takes effect only when you upgrade a non-I/O optimized instance of a phased-out instance type to an I/O optimized instance of an instance type available for purchase. Valid values: • cloud_efficiency: ultra disk • cloud_ssd: standard SSD
ClientToken	String	No	0c593ea1-3bea-11e9-b96b-88e9fe637760	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must ensure that it is unique among different requests. The **ClientToken** value can only contain ASCII characters and cannot exceed 64 characters in length. For more information, see How to ensure idempotence in ECS Developer Guide.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=ModifyInstanceSpec
&InstanceId=i-bp67acfmxazb4ph****
&InstanceType=ecs.s1.large
&InternetMaxBandwidthOut=10
&ClientToken=0c593ea1-3bea-11e9-b96b-88e9fe637760
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifyInstanceSpecResponse>
     <RequestId>04F0F334-1335-436C-A1D7-6C044FE73368</RequestId>
</ModifyInstanceSpecResponse>
```

`JSON` format

```
{
   "RequestId": "04F0F334-1335-436C-A1D7-6C044FE73368"
}
```

Error codes

HTTP status code	Error code	Error message	Description
400	InvalidInternetChargeType.ValueNotSupported	The specified InternetChargeType is not valid.	The error message returned because the specified billing method of network usage is not supported.
400	InvalidInstanceType.ValueUnauthorized	The specified InstanceType does not exist or beyond the permitted range.	The error message returned because the specified InstanceType parameter does not exist or you are not authorized to manage instances of this instance type.
400	InvalidInstanceType.ValueUnauthorized	The specified InstanceType is not authorized.	The error message returned because you are not authorized to use the specified instance type.
404	InvalidInstanceId.NotFound	The specified InstanceId does not exist.	The error message returned because the specified InstanceId parameter does not exist.
400	InvalidInstanceType.ValueNotSupported	The specified InstanceType does not exist or beyond the permitted range.	The error message returned because the specified InstanceType parameter does not exist or you are not authorized to manage instances of this instance type.
400	InvalidParameter	The specified parameter "InternetMaxBandwidthOut" is not valid.	The error message returned because the specified InternetMaxBandwidthOut parameter is invalid.
400	InvalidParameter.Mismatch	Too many parameters in one request.	The error message returned because the request contains invalid parameters.

HTTP status code	Error code	Error message	Description
403	CategoryViolation	The specified instance does not support this operation because of its disk category.	The error message returned because the instance types of instances that are attached with local disks cannot be changed.
403	InvalidStatus.ValueNotSupported	The current status of the resource does not support this operation.	The error message returned because the operation is not supported while the resource is in the current state.
403	InstanceLockedForSecurity	The specified operation is denied as your instance is locked for security reasons.	The error message returned because the operation is not supported while the instance is locked for security reasons.
500	InternalError	The request processing has failed due to some unknown error, exception or failure.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.
403	InvalidAccountStatus.NotEnoughBalance	Your account does not have enough balance.	The error message returned because your account balance is insufficient. Add funds to your account and try again.
403	ChargeTypeViolation	The operation is not permitted due to charge type of the instance.	The error message returned because the billing method of the instance does not support this operation.
403	OperationDenied	The specified instance is out of usage.	The error message returned because the resource inventory of the specified instance type is insufficient.
400	BandwidthUpgradeDenied.EipBoundInstance	The specified VPC instance has bound EIP, temporary bandwidth upgrade is denied.	The error message returned because the instance is associated with an elastic IP address and the instance network bandwidth cannot be temporarily upgraded.
404	MissingTemporary.StartTime	Temporary.StartTime is not specified.	The error message returned because the Temporary.StartTime parameter is not specified.
404	MissingTemporary.EndTime	Temporary.EndTime is not specified.	The error message returned because the Temporary.EndTime parameter is not specified.

HTTP status code	Error code	Error message	Description
400	InvalidTemporary.StartTime	The specifed Temporary.StartTime is not valid.	The error message because the specified Temporary.StartTime parameter is invalid.
400	InvalidTemporary.EndTime	The specifed Temporary.EndTime is not valid.	The error message returned because the specified Temporary.EndTime parameter is invalid.
403	LastTokenProcessing	The last token request is processing.	The error message returned because the previous token request is being processed. Try again later.
400	Downgrade.NotSupported	Downgrade operation is not supported.	The error message returned because the downgrade operation is not supported.
403	InstanceSpecModification.NotEffective	The specified instance has been reserved for making a spec modification and not taken effective in the current contract period.	The error message returned because the instance is reserved due to specification changes. Changes made to it cannot take effect during the current contract period.
400	DependencyViolation.InstanceType	The current InstanceType cannot be changed to the specified InstanceType.	The error message returned because the current instance type cannot be changed to the specified instance type.
403	InvalidInstanceType.ValueNotSupported	The specified zone does not offer the specified instancetype.	The error message returned because the specified instance type is unavailable in the specified region.
403	ImageNotSupportInstanceType	The specified image do not support the InstanceType instance.	The error message returned because the specified image does not support the specified instance type.
400	Account.Arrearage	Your account has an outstanding payment.	The error message returned because you have overdue payments in your account.
400	InvalidParameter.Bandwidth	The specified parameter Bandwidth is not valid.	The error message returned because the specified bandwidth is invalid.

HTTP status code	Error code	Error message	Description
400	InvalidParameter.Conflict	The specified image does not support the specified instance type.	The error message returned because the specified image does not support the specified instance type.
400	InvalidParameter.AllowMigrateAcrossZone	The specified parameter CanMigrateAcrossZone is not valid.	The error message returned because the specified AllowMigrateAcrossZone parameter is invalid.
400	InvalidParam.SystemDiskCategory	The specified param SystemDisk.Category is not valid.	The error message returned because the specified SystemDisk.Category parameter is invalid.
400	Throttling	Request was denied due to request throttling, please try again after 5 minutes.	The error message returned because your current request is denied due to throttling. Try again five minutes later.
400	InvalidInstanceStatus.NotStopped	The specified Instance status is not stopped.	The error message returned because the specified instance is not in the Stopped state.
403	InstanceType.Offline	The specified InstanceType has been offline	The error message returned because the specified instance type is phased out. Select another instance type and try again.
400	InvalidAction	Specified action is not valid.	The error message returned because the operation is invalid.
400	IdempotenceParamNotMatch	There is a idempotence signature mismatch between this and last request.	The error message returned because the idempotence signature of this request does not correspond to that of the last request.
400	InvalidClientToken.ValueNotSupported	The ClientToken provided is invalid.	The error message returned because the specified ClientToken parameter is invalid.
400	Price.PricePlanResultNotFound	The internetMaxBandwidthIn or internetMaxBandwidthOut provided is invalid.	The error message returned because the specified InternetMaxBandwidthOut or InternetMaxBandwidthIn parameter is invalid.

HTTP status code	Error code	Error message	Description
403	InvalidParameter.NotMatch	%s	The error message returned because a specified parameter is invalid. Check whether parameter conflicts exist.
403	InvalidInstance.EipNotSupport	The specified instance with eip is not supported, please unassociate eip first.	The error message returned because the operation is not supported while an elastic IP address is associated with this instance. Disassociate the elastic IP address first.
400	InvalidAction.NotSupport	The ecs on dedicatedHost not support modify instanceType.	The error message returned because you cannot change the instance types of instances hosted on dedicated hosts.
400	InvalidMarketImageStatus.NotSupported	The status of specified market image does not support this operation.	The error message returned because the operation is not supported while the specified Alibaba Cloud Marketplace image is in the current state.
403	OperationDenied.NoStock	The resource is out of usage.	The error message returned because the instance is not in the Running state. Start the instance or check whether the operation is valid.
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.
403	OperationDenied	%s	The error message is returned because the operation is denied.
403	InvalidOperation.Ipv4CountExceeded	%s	The error message returned because the maximum number of IPv4 addresses has been reached.
403	InvalidOperation.Ipv6CountExceeded	%s	The error message returned because the maximum number of IPv6 addresses has been reached.
403	InvalidOperation.Ipv6NotSupport	%s	The error message returned because IPv6 does not support this operation.

HTTP status code	Error code	Error message	Description
403	InvalidOperation.InstanceWithEipNotSupport	The special instance with eip not support operate, please unassociate eip first.	The error message returned because the operation is not supported while an elastic IP address is associated with this instance. Disassociate the elastic IP address first.
403	SecurityRisk.3DVerification	We have detected a security risk with your default credit or debit card. Please proceed with verification via the link in your email.	The error message returned because risks are detected in your default credit card or debit card. Click the link in the email for verification.
404	InvalidInstanceChargeType.NotFound	The InstanceChargeType does not exist in our records	The error message returned because the specified InstanceChargeType parameter does not exist.

2.1.2.1.10.4. DescribeClassicLinkInstances

You can call this operation to query one or more classic network-type instances that are linked to VPCs.

Description

When you call this operation, take note of the following items:

- This operation applies only to instances in the classic network.
- You can query a maximum of 100 classic network-type instances each time.
- At least one of VpcId and InstanceId must be specified.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeClassicLinkInstances	The operation that you want to perform. Set the value to DescribeClassicLinkInstances.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the instance. You can call the DescribeRegions operation to query the most recent region list.
VpcId	String	No	vpc-tes****	The ID of the VPC. ClassicLink must be enabled for the VPC.

Parameter	Type	Required	Example	Description
InstanceId	String	No	i-tes****	The ID of the instance. You can specify a maximum of 100 instance IDs in a single request. Separate multiple IDs with commas (,).
PageNumber	String	No	1	The number of the page to return. Pages start from page 1. Default value: 1.
PageSize	String	No	10	The number of entries to return on each page. Valid values: 1 to 100. Default value: 10

Response parameters

Parameter	Type	Example	Description
Links	Array		The details about the ClassicLink connections between the classic network-type instances and the VPC.
Link			
InstanceId	String	i-tes****	The ID of the instance.
VpcId	String	vpc-tes****	The ID of the VPC.
PageNumber	Integer	1	The page number of the returned page.
PageSize	Integer	10	The number of entries returned per page.
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.
TotalCount	Integer	2	The total number of connections.

Examples

Sample requests

```
https://ecs.example.com/?Action=DescribeClassicLinkInstances
&RegionId=cn-qingdao-env17-d01
&VpcId=vpc-tes****
&InstanceId=i-tes****, i-tes****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeClassicLinkInstancesResponse>
      <RequestId>B154D309-F3E1-4AB7-BA94-FEFCA8B89001</RequestId>
      <TotalCount>2</TotalCount>
      <PageNumber>1</PageNumber>
      <PageSize>10</PageSize>
      <Links>
            <Link>
                  <InstanceId>i-tes****</InstanceId>
                  <VpcId>vpc-test</VpcId>
            </Link>
            <Link>
                  <InstanceId>i-tes****</InstanceId>
                  <VpcId>vpc-tes****</VpcId>
            </Link>
      </Links>
</DescribeClassicLinkInstancesResponse>
```

`JSON` format

```
{
    "PageNumber":1,
    "Links":{
        "Link":[{
            "InstanceId":"i-tes****",
            "VpcId":"vpc-tes****"
            },
           {
           "InstanceId": "i-tes****",
           "VpcId": "vpc-tes****"
           }]
    },
    "TotalCount":2,
    "PageSize":10,
    "RequestId":"B154D309-F3E1-4AB7-BA94-FEFCA8B89001"
}
```

Error codes

HTTP status code	Error code	Error message	Description
403	InvalidInstanceId.NotFound	The InstanceId provided does not exist in our records.	The error message returned because the specified InstanceId parameter does not exist.
403	InvalidParameter.ToManyInstanceIds	No more than 100 InstanceIds can be specified.	The error message returned because more than 100 instance IDs are specified.
403	InvalidParameter.InvalidInstanceIdAndVpcId	The parameter InstanceId and VpcId are not allowed to be empty at the same time.	The error message returned because neither InstanceId nor VpcId is specified.
403	InvalidInstanceId.NotBelong	The specified instance is not belong to you.	The error message returned because the specified instance does not exist in your account.
403	InvalidVpc.NotBelong	The specified vpc is not belong to you.	The error message returned because the specified VPC does not exist in your account.

2.1.2.1.10.5. DetachClassicLinkVpc

You can call this operation to unlink a classic network-type instance from a virtual private cloud (VPC) by removing the ClassicLink connection between them. After the instance is unlinked from the VPC, they can no longer communicate with each other.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DetachClassicLinkVpc	The operation that you want to perform. Set the value to DetachClassicLinkVpc.
InstanceId	String	Yes	i-bp67acfmxazb4p****	The ID of the classic network-type instance.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the classic network-type instance. You can call the DescribeRegions operation to query the most recent region list.
VpcId	String	Yes	vpc-bp67acfmxazb4p****	The ID of the VPC to which the instance is linked.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=DetachClassicLinkVpc
&RegionId=cn-qingdao-env17-d01
&VpcId=vpc-bp67acfmxazb4p****
&InstanceId=i-bp67acfmxazb4p****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DetachClassicLinkVpcResponse>
      <RequestId>C0003E8B-B930-4F59-ADC0-0E209A9012A8</RequestId>
</DetachClassicLinkVpcResponse>
```

`JSON` format

```
{
    "RequestId": "C0003E8B-B930-4F59-ADC0-0E209A9012A8"
}
```

Error codes

HTTP status code	Error code	Error message	Description
403	InvalidInstanceId.NotFound	The InstanceId provided does not exist in our records.	The error message returned because the specified InstanceId parameter does not exist.
403	InvalidInstanceId.MalFormed	The specified instance is not a classic network instance.	The error returned because the specified instance is not in the classic network.
403	OperationDenied	The instances are not allowed to detach from the linked vpc.	The error message returned because the instance cannot be unlinked from the VPC.

HTTP status code	Error code	Error message	Description
403	InvalidParameter.InvalidInstanceIdAndVpcId	The parameter InstanceId and VpcId are not allowed to be empty at the same time.	The error message returned because neither InstanceId nor VpcId is specified.
403	InvalidInstanceId.NotFound	The specified instance does not exist.	The error message returned because the specified InstanceId parameter does not exist.
403	InvalidStatus.InstanceStatus	The specified instance status is not support this operation ,expect status is running or shutted.	The error message returned because the operation is not supported while the instance is in the current state. The instance must be in the Running or Stopped state.
403	InvalidInstanceId.NotBelong	The specified instance is not belong to you.	The error message returned because the specified instance does not exist in your account.
403	Forbidden.SubUser	User not authorized to operate on the specified resource.	The error message returned because the RAM user is not authorized to manage this resource.
403	InvalidStatus.InstanceStatus	The specified instance status does not support this operation, expected status is Running or Stopped.	The error message returned because the operation is not supported while the instance is in the current state. The instance must be in the Running or Stopped state.

2.1.2.1.11. Security groups

2.1.2.1.11.1. CreateSecurityGroup

You can call this operation to create a security group. For a new security group, only instances in the security group can access each other by default. Access requests to the security group from outside are denied. If you want to accept requests from resources on the Internet or requests from instances in other security groups, you can call the AuthorizeSecurityGroup operation to grant access permissions to those resources or instances.

Description

When you call this operation, take note of the following items:

- You can create a maximum of 100 security groups within a single region.
- To create a security group of the VPC type, you must specify the VpcId parameter.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateSecurityGroup	The operation that you want to perform. Set the value to CreateSecurityGroup.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region in which to create the security group. You can call the DescribeRegions operation to query the most recent region list.
VpcId	String	No	vpc-bp1opxu1zkhn00gzv****	The ID of the VPC in which to create the security group.
Description	String	No	SecurityGroupTestDescription	The description of the security group. The description must be 2 to 256 characters in length and cannot start with `http://` or `https://`. This parameter is empty by default.
ClientToken	String	No	123e4567-e89b-12d3-a456-426655440000	The client token that is used to ensure the idempotence of the request You can use the client to generate the value, but you must make sure that it is unique among different requests. The **ClientToken** value can only contain ASCII characters and cannot exceed 64 characters in length. For more information, see How to ensure idempotence in ECS Developer Guide.
SecurityGroupName	String	No	SecurityGroupTestName	The name of the security group. The name must be 2 to 128 characters in length. It must start with a letter and cannot start with `http://` or `https://`. The name can contain letters, digits, colons (:), underscores (_), and hyphens (-). This parameter is empty by default.
SecurityGroupType	String	No	enterprise	The type of the security group. Valid values: • normal: basic security group • enterprise: advanced security group

Parameter	Type	Required	Example	Description
Tag.N.value	String	No	null	The value of tag N to be bound to the security group. **Note** We recommend that you use the Tag.N.Value parameter to ensure future compatibility.
Tag.N.key	String	No	null	The key of tag N to be bound to the security group. **Note** We recommend that you use the Tag.N.Key parameter to ensure future compatibility.
Tag.N.Key	String	No	Test	The key of tag N to be bound to the security group. Valid values of N: 1 to 20. The tag key cannot be an empty string. It can be up to 128 characters in length and cannot start with acs: or aliyun. It cannot contain `http://` or `https://`.
Tag.N.Value	String	No	Test	The value of tag N to be bound to the security group. Valid values of N: 1 to 20. The tag value can be an empty string. It can be up to 128 characters in length. It cannot start with acs: or contain `http://` or `https://`.
ResourceGroupId	String	No	rg-bp67acfmxazb4p****	The ID of the resource group to which to assign the security group.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.
SecurityGroupId	String	sg-bp1fg655nh68xyz9****	The ID of the security group.

Examples

Sample requests

```
https://ecs.example.com/?Action=CreateSecurityGroup
&RegionId=cn-qingdao-env17-d01
&Description=SecurityGroupTestDescription
&VpcId=vpc-bp1opxu1zkhn00gzv****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreateSecurityGroupResponse>
      <RequestId>CEF72CEB-54B6-4AE8-B225-F876FF7BA984</RequestId>
      <SecurityGroupId>sg-bp1fg655nh68xyz9****</SecurityGroupId>
</CreateSecurityGroupResponse>
```

`JSON` format

```
{
    "RequestId": "CEF72CEB-54B6-4AE8-B225-F876FF7BA984",
    "SecurityGroupId": "sg-bp1fg655nh68xyz9****"
}
```

Error codes

HTTP status code	Error code	Error message	Description
400	InvalidDescription.Malformed	The specified parameter "Description" is not valid.	The error message returned because the specified Description parameter is invalid. The description must be 2 to 256 characters in length and cannot start with http:// or https://.
403	QuotaExceed.SecurityGroup	The maximum number of security groups is reached.	The error message returned because the maximum number of security groups has been reached. Submit a ticket to request a quota increase.
404	InvalidVpcId.NotFound	Specified VPC does not exist.	The error message returned because the specified VpcId parameter does not exist.

HTTP status code	Error code	Error message	Description
400	InvalidSecurityGroupName.Malformed	Specified security group name is not valid.	The error message returned because the specified SecurityGroupName parameter is invalid. By default, the SecurityGroupName parameter is empty. If this parameter is specified, the specified name is displayed in the ECS console. The name must be 2 to 128 characters in length. It must start with a letter and can contain letters, digits, periods (.), underscores (_), and hyphens (-). The name cannot start with http:// or https://.
400	InvalidSecurityGroupDiscription.Malformed	Specified security group description is not valid.	The error message returned because the specified Description parameter is invalid.
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.
403	InvalidVpcId.NotFound	vpc id must not empty when only support vpc vm.	The error message returned because the VpcId parameter is not specified.
400	IncorrectVpcStatus	Current VPC status does not support this operation.	The error message returned because the operation is not supported while the VPC is in the current state.
400	InvalidTagKey.Malformed	Specified tag key is not valid.	The error message returned because the specified tag key is invalid.
400	InvalidTagValue.Malformed	Specified tag value is not valid.	The error message returned because the specified tag value is invalid.
404	InvalidResourceGroup.NotFound	The ResourceGroup provided does not exist in our records.	The error message returned because the specified ResourceGroupId parameter does not exist.

HTTP status code	Error code	Error message	Description
400	Duplicate.TagKey	The Tag.N.Key contain duplicate key.	The error message returned because the specified tag key already exists. Tag keys must be unique.
400	InvalidTagKey.Malformed	The specified Tag.n.Key is not valid.	The error message returned because the specified Tag.N.Key parameter is invalid.
400	InvalidTagValue.Malformed	The specified Tag.n.Value is not valid.	The error message returned because the specified Tag.N.Value parameter is invalid.
403	IdempotentProcessing	The previous idempotent request(s) is still processing.	The error message returned because the previous idempotent request is being processed. Try again later.
403	QuotaExceed.Tags	%s	The error message returned because the number of specified tags exceeds the upper limit.
500	InternalError	The request processing has failed due to some unknown error, exception or failure.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.

2.1.2.1.11.2. AuthorizeSecurityGroup

You can call this operation to create an inbound security group rule. The created rule allows or denies the inbound traffic from other devices to the ECS instances in the security group to which the rule belongs.

Description

In the security group-related API documents, inbound traffic refers to the traffic sent by the source device and received at the destination device.

When you call this operation, take note of the following items:

- The total number of outbound and inbound security group rules in each security group cannot exceed 200.
- The priority (`Priority`) of a security group rule ranges from 1 to 100. A smaller value indicates a higher priority.
- When multiple security group rules have the same priority, drop (`drop`) rules take precedence.
- The source devices can belong to a specified range of IP addresses (SourceCidrIp) or can be ECS instances in another security group (SourceGroupId).
- If the rule to be created matches an existing rule, the AuthorizeSecurityGroup operation succeeds

but no rule is created.

- You can determine a security group rule by specifying one of the following groups of parameters. You cannot determine a security group rule by specifying a single parameter.
  - Parameters used to determine an inbound security group rule that controls access from a specified range of IP addresses: IpProtocol, PortRange, SourcePortRange (optional), NicType, Policy, and SourceCidrIp. For a security group of the classic network type, you can set the NicType parameter to internet or intranet. For a security group of the VPC type, you can set the NicType parameter only to intranet. Sample request:

```
https://ecs.example.com/?Action=AuthorizeSecurityGroup
&SecurityGroupId=sg-F876FF7**
&SourceCidrIp=10.0.0.0/8
&IpProtocol=tcp
&PortRange=22/22
&NicType=intranet
&Policy=accept
&<Common request parameters>
```

  - Parameters used to determine an inbound security group rule that controls access from another security group: IpProtocol, PortRange, SourcePortRange (optional), NicType, Policy, SourceGroupOwnerAccount, and SourceGroupId. To create an inbound security group rule to control access from another security group, you can set the NicType parameter only to intranet. For mutual access between security groups of the classic network type, you can allow or deny another security group in the same region access to your security group. The security group that is allowed access to your security group can belong to your own Apsara Stack tenant account or another Apsara Stack tenant specified by the SourceGroupOwnerAccount parameter. For mutual access between security groups of the VPC type, you can allow or deny another security group in the same VPC access to your security group. Sample request:

```
https://ecs.example.com/?Action=AuthorizeSecurityGroup
&SecurityGroupId=sg-F876FF7**
&SourceGroupId=sg-1651FBB**
&SourceGroupOwnerAccount=test@aliyun.com
&IpProtocol=tcp
&PortRange=22/22
&NicType=intranet
&Policy=drop
&<Common request parameters>
```

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	AuthorizeSecurityGroup	The operation that you want to perform. Set the value to AuthorizeSecurityGroup.

Parameter	Type	Required	Example	Description
IpProtocol	String	Yes	all	The transport layer protocol. The values of this parameter are case-sensitive. Valid values: • tcp • udp • icmp • gre • all: All protocols are supported. **Note** IpProtocol can be set to icmp only for IPv4 addresses.
PortRange	String	Yes	22/22	The range of destination ports relevant to the transport layer protocol. Valid values: • When the IpProtocol parameter is set to tcp or udp, the valid port numbers are 1 to 65535. Specify a port range in the format of <start port number>/<end port number>. Correct example: 1/200. Incorrect example: 200/1. • When the IpProtocol parameter is set to icmp, the port range is -1/-1, which indicates all ports. • When the IpProtocol parameter is set to gre, the port range is -1/-1, which indicates all ports. • When the IpProtocol parameter is set to all, the port range is -1/-1, which indicates all ports.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region. You can call the DescribeRegions operation to query the most recent region list.
SecurityGroupId	String	Yes	sg-bp67acfmxazb4ph***	The ID of the destination security group.

Parameter	Type	Required	Example	Description
SourceGroupId	String	No	sg-bp67acfmxazb4pj***	The ID of the source security group. At least one of SourceGroupId and SourceCidrIp must be specified. • If SourceGroupId is specified but SourceCidrIp is not, the NicType parameter can be set only to intranet. • If both SourceGroupId and SourceCidrIp are specified, SourceCidrIp takes precedence.
SourceGroupOwnerId	Long	No	155780923770	The ID of the Apsara Stack tenant account that manages the source security group when you create a security group rule across accounts. • If both SourceGroupOwnerId and SourceGroupOwnerAccount are empty, access permissions are configured for another security group managed by your account. • If SourceCidrIp is specified, the SourceGroupOwnerId parameter is ignored.
SourceGroupOwnerAccount	String	No	test@aliyun.com	The Apsara Stack tenant account that manages the source security group when you create a security group rule across accounts. • If both SourceGroupOwnerId and SourceGroupOwnerAccount are empty, access permissions are configured for another security group managed by your account. • If SourceCidrIp is specified, the SourceGroupOwnerAccount parameter is ignored.
SourceCidrIp	String	No	10.0.0.0/8	The range of source IPv4 addresses. IPv4 addresses and CIDR blocks are supported. This parameter is empty by default.

Parameter	Type	Required	Example	Description
Ipv6SourceCidrIp	String	No	2001:250:6000::***	The range of source IPv6 addresses. IPv6 addresses and CIDR blocks are supported. **Note** Only IPv6 addresses of VPC-type instances are supported. This parameter is empty by default.
SourcePortRange	String	No	22/22	The range of source ports relevant to the transport layer protocol. Valid values: • When the IpProtocol parameter is set to tcp or udp, the valid port numbers are 1 to 65535. Specify a port range in the format of <start port number>/<end port number>. Correct example: 1/200. Incorrect example: 200/1. • When the IpProtocol parameter is set to icmp, the port range is -1/-1, which indicates all ports. • When the IpProtocol parameter is set to gre, the port range is -1/-1, which indicates all ports. • When the IpProtocol parameter is set to all, the port range is -1/-1, which indicates all ports.
DestCidrIp	String	No	10.0.0.0/8	The range of destination IPv4 addresses. IPv4 addresses and CIDR blocks are supported. This parameter is empty by default.

Parameter	Type	Required	Example	Description
Ipv6DestCidrIp	String	No	2001:250:6000::***	The range of destination IPv6 addresses. IPv6 addresses and CIDR blocks are supported. **Note** Only IPv6 addresses of VPC-type instances are supported. This parameter is empty by default.
Policy	String	No	accept	The access control policy. Default value: accept. Valid values: • accept: allows access. • drop: denies access without returning a rejection response. In this case, the request times out or the connection fails to be established.
Priority	String	No	1	The priority of the security group rule. A smaller value indicates a higher priority. Valid values: 1 to 100. Default value: 1.

NicType	String	No	intranet	The NIC type of the security group rule when the security group is in the classic network. Valid values:
				• internet: public NIC
				• intranet: internal NIC
				  ◦ If the security group is in a VPC, the parameter is set to intranet by default and cannot be modified.
				  ◦ If DestGroupId is specified but DestCidrIp is not, this parameter can be set only to intranet.
				Default value: internet.

Parameter	Type	Required	Example	Description
ClientToken	String	No	123e4567-e89b-12d3-a456-426655440000	The client token that is used to ensure the idempotence of the request You can use the client to generate the value, but you must make sure that it is unique among different requests. The **ClientToken** value can only contain ASCII characters and cannot exceed 64 characters in length. For more information, see How to ensure idempotence in ECS Developer Guide.
Description	String	No	Manually authorize SSH port 22 - RuleDemo	The description of the security group rule. The description must be 1 to 512 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=AuthorizeSecurityGroup
&SecurityGroupId=sg-bp67acfmxazb4ph***
&SourceCidrIp=10.0.0.0/8
&IpProtocol=tcp
&PortRange=22/22
&NicType=intranet
&Policy=accept
&<Common request parameters>
```

Sample success responses

`XML` format

```
<AuthorizeSecurityGroupResponse>
      <RequestId>CEF72CEB-54B6-4AE8-B225-F876FF7BA984</RequestId>
</AuthorizeSecurityGroupResponse>
```

`JSON` format

```
{
    "RequestId":"CEF72CEB-54B6-4AE8-B225-F876FF7BA984"
}
```

Error codes

HTTP status code	Error code	Error message	Description
404	InvalidSecurityGroupId.NotFound	The specified SecurityGroupId does not exist.	The error message returned because the specified security group does not exist in this account. Check whether the security group ID is correct.
404	InvalidSourceGroupId.NotFound	The SourceGroupId provided does not exist in our records.	The error message returned because the specified SourceGroupId parameter does not exist.
400	OperationDenied	The specified IpProtocol does not exist or IpProtocol and PortRange do not match.	The error message returned because the specified IpProtocol parameter does not exist or does not match the specified port range.
400	InvalidIpProtocol.Malformed	The specified parameter "PortRange" is not valid.	The error message returned because the specified IpProtocol or PortRange parameter is invalid.
403	InvalidSourceGroupId.Mismatch	NicType is required or NicType expects intranet.	The error message returned because the NicType parameter is not specified or is not set to intranet.
400	InvalidSourceCidrIp.Malformed	The specified parameter "SourceCidrIp" is not valid.	The error message returned because the specified SourceCidrIp parameter is invalid.
403	MissingParameter	The input parameter "SourceGroupId" or "SourceCidrIp" cannot be both blank.	The error message returned because both the SourceGroupId and SourceCidrIp parameters are empty.
400	InvalidPolicy.Malformed	The specified parameter "Policy" is not valid.	The error message returned because the specified Policy parameter is invalid.
400	InvalidNicType.ValueNotSupported	The specified NicType does not exist.	The error message returned because the specified NicType parameter does not exist.

HTTP status code	Error code	Error message	Description
400	InvalidNicType.Mismatch	Specified nic type conflicts with the authorization record.	The error message returned because the specified NIC type conflicts with the authorization record.
403	AuthorizationLimitExceed	The limit of authorization records in the security group reaches.	The error message returned because the maximum number of rules in the security group has been reached.
403	InvalidParamter.Conflict	The specified SecurityGroupId should be different from the SourceGroupId.	The error message returned because the destination security group is the same as the source security group.
400	InvalidSourceGroupId.Mismatch	Specified security group and source group are not in the same VPC.	The error message returned because the destination security group and the source security group do not belong to the same VPC.
400	InvalidSourceGroup.NotFound	Specified source security group does not exist.	The error message returned because the specified inbound security group rule does not exist or relevant parameters are not specified.
400	VPCDisabled	Can't use the SecurityGroup in VPC.	The error message returned because the VPC does not support security groups.
400	InvalidPriority.Malformed	The parameter Priority is invalid.	The error message returned because the specified Priority parameter is invalid.
400	InvalidPriority.ValueNotSupported	The parameter Priority is invalid.	The error message returned because the specified Priority parameter is invalid.
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.
403	InvalidNetworkType.Mismatch	The specified SecurityGroup network type should be same with SourceGroup network type (vpc or classic).	The error message returned because the network type of the destination security group is different from that of the source security group.

HTTP status code	Error code	Error message	Description
403	InvalidNetworkType.Conflict	The specified SecurityGroup network type should be same with SourceGroup network type (vpc or classic).	The error message returned because the network type of the destination security group is different from that of the source security group.
400	InvalidNicType.ValueNotSupported	The specified NicType is not valid.	The error message returned because the specified NicType parameter does not exist.
400	InvalidSecurityGroupDiscription.Malformed	The specified security group rule description is not valid.	The error message returned because the specified Description parameter is invalid.
400	InvalidSecurityGroup.InvalidNetworkType	The specified security group network type is not support this operation, please check the security group network types. For VPC security groups, ClassicLink must be enabled.	The error message returned because the operation is not supported while the security group is of the current network type. If the network type is VPC, ClassicLink must be enabled.
400	MissingParameter.Source	Either SourceCidrIp or SourceGroupId must be specified.	The error message returned because both the SourceCidrIp and SourceGroupId parameters are empty.
400	InvalidIpProtocol.ValueNotSupported	The parameter IpProtocol must be specified with case insensitive TCP, UDP, ICMP, GRE or All.	The error message returned because the specified IpProtocol parameter is invalid. The valid values of this parameter are tcp, udp, icmp, gre, and all.
400	InvalidSecurityGroupId.Malformed	The specified parameter "SecurityGroupId" is not valid.	The error message returned because the specified SecurityGroupId parameter is invalid.
400	InvalidParamter.Conflict	The specified SourceCidrIp should be different from the DestCidrIp.	The error message returned because the value of SourceCidrIp is the same as that of DestCidrIp.
500	InvalidGressFlow.Malformed	The specified parameter GressFlow is not valid,it cause by internal,try calling again.	The error message returned because the specified GressFlow parameter is invalid.
400	InvalidSourcePortRange.Malformed	The specified parameter "SourcePortRange" is not valid.	The error message returned because the specified SourcePortRange parameter is invalid.

HTTP status code	Error code	Error message	Description
400	InvalidParam.SourceIp	%s	The error message returned because the specified SourceCidrIp parameter is invalid.
400	InvalidParam.DestIp	%s	The error message returned because the specified DestCidrIp parameter is invalid.
400	InvalidParam.Ipv6DestCidrIp	%s	The error message returned because the specified Ipv6SourceCidrIp parameter is invalid.
400	InvalidParam.Ipv6SourceCidrIp	%s	The error message returned because the specified Ipv6SourceCidrIp parameter is invalid.
400	InvalidParam.Ipv4ProtocolConflictWithIpv6Address	%s	The error message returned because the specified parameter is invalid. Check whether you have entered an IPv6 address under an IPv4 protocol by mistake.
400	InvalidParam.Ipv6ProtocolConflictWithIpv4Address	%s	The error message returned because the specified parameter is invalid. Check whether you have entered an IPv4 address under an IPv6 protocol by mistake.
400	ILLEGAL_IPV6_CIDR	%s	The error message returned because the specified IPv6 address is invalid.
400	InvalidDestCidrIp.Malformed	The specified parameter DestCidrIp is not valid.	The error message returned because the specified DestCidrIp parameter is invalid.

2.1.2.1.11.3. AuthorizeSecurityGroupEgress

You can call this operation to create an outbound security group rule in a specific security group. The created rule allows or denies outbound traffic from the instances in the security group to other devices.

Description

In the security group-related API documents, inbound traffic refers to the traffic sent by the source device and received at the destination device.

When you call this operation, take note of the following items:

- The total number of outbound and inbound security group rules in each security group cannot exceed 200.
- You can set Policy to accept or drop for each security group rule to grant or deny access.
- The value of Priority ranges from 1 to 100. A smaller value indicates a higher priority.
- When several security group rules have the same priority, drop rules take precedence.
- The destination devices can be a specified range of IP addresses (DestCidrIp) or ECS instances in another security group (DestGroupId).
- If the rule to be created matches an existing rule, the AuthorizeSecurityGroupEgress operation succeeds but no rule is created.
- You can determine a security group rule by specifying one of the following groups of parameters. You cannot determine a security group rule by specifying a single parameter.
  - Parameters used to determine an outbound bound security group rule that controls access to a specified range of IP addresses: IpProtocol, PortRange, SourcePortRange (optional), NicType, Policy, and DestCidrIp. Sample request:

```
https://ecs.example.com/?Action=AuthorizeSecurityGroupEgress
&SecurityGroupId=sg-bp67acfmxazb4ph***
&IpProtocol=icmp
&DestCidrIp=10.0.0.0/8
&PortRange=-1/-1
&NicType=intranet
&Policy=Allow
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

  - Parameters used to determine an outbound security group rule that controls access to another security group: IpProtocol, PortRange, SourcePortRange (optional), NicType, Policy, DestGroupOwnerAccount, and DestGroupId. Sample request:

```
https://ecs.example.com/?Action=AuthorizeSecurityGroupEgress
&SecurityGroupId=sg-bp67acfmxazb4ph***
&DestGroupId=sg-bp67acfmxazb4pi***
&DestGroupOwnerAccount=Test@aliyun.com
&IpProtocol=tcp
&PortRange=22/22
&NicType=intranet
&Policy=Drop
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	AuthorizeSecurityGroupEgress	The operation that you want to perform. Set the value to AuthorizeSecurityGroupEgress.
IpProtocol	String	Yes	all	The transport layer protocol. The values are case-sensitive. Valid values: • icmp • gre • tcp • udp • all: All protocols are supported.
PortRange	String	Yes	80/80	The range of destination ports that correspond to the transport layer protocol. Valid values: • When the IpProtocol parameter is set to tcp or udp, the valid port numbers are 1 to 65535. Specify a port range in the format of <start port number>/<end port number>. Correct example: 1/200. Incorrect example: 200/1. • When the IpProtocol parameter is set to icmp, the port range is -1/-1, which indicates all ports. • When the IpProtocol parameter is set to gre, the port range is -1/-1, which indicates all ports. • When IpProtocol is set to all, the port range is -1/-1, which indicates all ports.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the source security group. You can call the DescribeRegions operation to query the most recent region list.
SecurityGroupId	String	Yes	sg-bp67acfmxazb4ph***	The ID of the source security group.

Parameter	Type	Required	Example	Description
DestGroupId	String	No	sg-bp67acfmxazb4pi***	The ID of the destination security group. • You must specify at least one of the DestGroupId and DestCidrIp parameters. • If DestGroupId is specified but DestCidrIp is not, the NicType parameter can be set only to intranet. • If both DestGroupId and DestCidrIp are specified, DestCidrIp takes precedence.
DestGroupOwnerId	Long	No	12345678910	The ID of the Apsara Stack tenant account that manages the destination security group when you create a security group rule across accounts. • If both DestGroupOwnerId and DestGroupOwnerAccount are empty, the rule is created to control access to another security group in your Apsara Stack tenant account. • If DestCidrIp is specified, DestGroupOwnerId is ignored.
DestGroupOwnerAccount	String	No	Test@aliyun.com	The Apsara Stack tenant account that manages the destination security group when you create a security group rule across accounts. • If both DestGroupOwnerAccount and DestGroupOwnerId are empty, the rule is created to control access to another security group in your Apsara Stack tenant account. • If DestCidrIp is specified, DestGroupOwnerAccount is ignored.
DestCidrIp	String	No	10.0.0.0/8	The range of destination IPv4 addresses. IPv4 addresses and CIDR blocks are supported. This parameter is empty by default.

Parameter	Type	Required	Example	Description
Ipv6DestCidrIp	String	No	2001:db8:1233:1a00::***	The range of destination IPv6 addresses. IPv6 addresses and CIDR blocks are supported. This parameter is empty by default. **Note** Only IP addresses in VPCs can be specified.
SourceCidrIp	String	No	10.0.0.0/8	The range of source IPv4 addresses. IPv4 addresses and CIDR blocks are supported. This parameter is empty by default.
Ipv6SourceCidrIp	String	No	2001:db8:1234:1a00::***	The range of source IPv6 addresses. IPv6 addresses and CIDR blocks are supported. This parameter is empty by default. **Note** Only IP addresses in VPCs can be specified.
SourcePortRange	String	No	80/80	The range of source ports relevant to the transport layer protocol. Valid values: • When the IpProtocol parameter is set to tcp or udp, the valid port numbers are 1 to 65535. Specify a port range in the format of <start port number>/<end port number>. Correct example: 1/200. Incorrect example: 200/1. • When the IpProtocol parameter is set to icmp, the port range is -1/-1, which indicates all ports. • When the IpProtocol parameter is set to gre, the port range is -1/-1, which indicates all ports. • When IpProtocol is set to all, the port range is -1/-1, which indicates all ports.

Parameter	Type	Required	Example	Description
Policy	String	No	accept	The access control policy. Valid values: • accept: grants access. • drop: denies access without returning a rejection response. Default value: accept.
Priority	String	No	1	The priority of the security group rule. Valid values: 1 to 100. Default value: 1.

NicType	String	No	intranet	The NIC type of the security group rule when the security group is in the classic network. Valid values:
				• internet
				• intranet
				  ○ If the security group is in a VPC, the parameter is set to intranet by default and cannot be modified.
				  ○ If DestGroupId is specified but DestCidrIp is not, this parameter can be set only to intranet.
				Default value: internet.

ClientToken	String	No	123e4567-e89b-12d3-a456-426655440000	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must ensure that it is unique among different requests. The **ClientToken** value can only contain ASCII characters and cannot exceed 64 characters in length. For more information, see How to ensure idempotence in ECS Developer Guide.
Description	String	No	Manually authorize SSH port 22 - RuleDemo	The description of the security group rule. The description must be 1 to 512 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=AuthorizeSecurityGroupEgress
&IpProtocol=tcp
&PortRange=80/80
&RegionId=cn-qingdao-env17-d01
&SecurityGroupId=sg-bp67acfmxazb4ph***
&<Common request parameters>
```

Sample success responses

`XML` format

```
<AuthorizeSecurityGroupEgressResponse>
      <RequestId>CEF72CEB-54B6-4AE8-B225-F876FF7BA984</RequestId>
</AuthorizeSecurityGroupEgressResponse>
```

`JSON` format

```
{
    "RequestId":"CEF72CEB-54B6-4AE8-B225-F876FF7BA984"
}
```

Error codes

HTTP status code	Error code	Error message	Description
404	InvalidSecurityGroupId.NotFound	The specified SecurityGroupId does not exist.	The error message returned because the specified security group does not exist in this account. Check whether the security group ID is correct.
404	InvalidDestGroupId.NotFound	The DestGroupId provided does not exist in our records.	The error message returned because the specified DestGroupId parameter does not exist.

HTTP status code	Error code	Error message	Description
400	OperationDenied	The specified IpProtocol does not exist or IpProtocol and PortRange do not match.	The error message returned because the specified IpProtocol parameter does not exist or does not match the specified port range.
400	InvalidIpProtocol.Malformed	The specified parameter "PortRange" is not valid.	The error message returned because the specified IpProtocol or PortRange parameter is invalid.
403	InvalidDestGroupId.Mismatch	NicType is required or NicType expects intranet.	The error message returned because the NicType parameter is not specified or is not set to intranet.
400	InvalidDestCidrIp.Malformed	The specified parameter "DestCidrIp" is not valid.	The error message returned because the specified DestCidrIp parameter is invalid.
403	MissingParameter	The input parameter "DestGroupId" or "DestCidrIp" cannot be both blank.	The error message returned because both the DestGroupId and DestCidrIp parameters are empty.
400	InvalidPolicy.Malformed	The specified parameter "Policy" is not valid.	The error message returned because the specified Policy parameter is invalid.
400	InvalidNicType.ValueNotSupported	The specified NicType does not exist.	The error message returned because the specified NicType parameter does not exist.
400	InvalidNicType.Mismatch	Specified nic type conflicts with the authorization record.	The error message returned because the specified NIC type conflicts with the authorization record.
403	AuthorizationLimitExceed	The limit of authorization records in the security group reaches.	The error message returned because the maximum number of rules in the security group has been reached.
403	InvalidParamter.Conflict	The specified SecurityGroupId should be different from the SourceGroupId.	The error message returned because the source security group is the same as the destination security group.

HTTP status code	Error code	Error message	Description
400	InvalidDestGroupId.Mismatch	Specified security group and destination group are not in the same VPC.	The error message returned because the specified source and destination security groups do not belong to the same VPC.
400	InvalidDestGroup.NotFound	Specified destination security group does not exist.	The error message returned because the specified DestGroupId parameter does not exist.
400	VPCDisabled	Can't use the SecurityGroup in VPC.	The error message returned because the VPC does not support security groups.
400	InvalidPriority.Malformed	The parameter Priority is invalid.	The error message returned because the specified Priority parameter is invalid.
400	InvalidPriority.ValueNotSupported	The parameter Priority is invalid.	The error message returned because the specified Priority parameter is invalid.
400	InvalidDestCidrIp.Malformed	The specified parameter DestCidrIp is not valid.	The error message returned because the specified DestCidrIp parameter is invalid.
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.
403	InvalidNetworkType.Conflict	The specified SecurityGroup network type should be same with SourceGroup network type (vpc or classic).	The error message returned because the network type of the destination security group is different from that of the source security group.
403	InvalidSecurityGroup.IsSame	The authorized SecurityGroupId should be different from the DestGroupId.	The error message returned because the ID of the source security group is the same as that of the destination security group.
400	InvalidDestCidrIp.Malformed	The parameter DestCidrIp is not valid.	The error message returned because the specified DestCidrIp parameter is invalid.

HTTP status code	Error code	Error message	Description
403	InvalidNetworkType.Conflict	The parameter SecurityGroup network type should be same with SourceGroup network type (vpc or classic).	The error message returned because the network type of the specified security group is different from that of the source group.
400	InvalidNicType.ValueNotSupported	The parameter NicType is not valid.	The error message returned because the specified NicType parameter is invalid.
400	InvalidSecurityGroupDiscription.Malformed	The specified security group rule description is not valid.	The error message returned because the specified Description parameter is invalid.
400	InvalidSecurityGroup.InvalidNetworkType	The specified security group network type is not support this operation, please check the security group network types. For VPC security groups, ClassicLink must be enabled.	The error message returned because the operation is not supported while the security group is of the current network type. You must enable ClassicLink for security groups in VPCs.
400	MissingParameter.Dest	Either DestCidrIp or DestGroupId must be specified.	The error message returned because both the DestCidrIp and DestGroupId parameters are empty.
400	InvalidIpProtocol.ValueNotSupported	The parameter IpProtocol must be specified with case insensitive TCP, UDP, ICMP, GRE or All.	The error message returned because the specified IpProtocol parameter is invalid. The valid values of this parameter are tcp, udp, icmp, gre, and all.
400	InvalidSecurityGroupId.Malformed	The specified parameter "SecurityGroupId" is not valid.	The error message returned because the specified SecurityGroupId parameter is invalid.
400	InvalidParamter.Conflict	The specified SourceCidrIp should be different from the DestCidrIp.	The error message returned because the value of SourceCidrIp is the same as that of DestCidrIp.
500	InvalidGressFlow.Malformed	The specified parameter GressFlow is not valid,it cause by internal,try calling again.	The error message returned because the specified GressFlow parameter is invalid.
400	InvalidSourcePortRange.Malformed	The specified parameter "SourcePortRange" is not valid.	The error message returned because the specified SourcePortRange parameter is invalid.

HTTP status code	Error code	Error message	Description
400	InvalidParam.SourceIp	%s	The error message returned because the specified SourceCidrIp parameter is invalid.
400	InvalidParam.DestIp	%s	The error message returned because the specified DestCidrIp parameter is invalid.
400	InvalidParam.Ipv6DestCidrIp	%s	The error message returned because the specified Ipv6DestCidrIp parameter is invalid.
400	InvalidParam.Ipv6SourceCidrIp	%s	The error message returned because the specified Ipv6SourceCidrIp parameter is invalid.
400	InvalidParam.Ipv4ProtocolConflictWithIpv6Address	%s	The error message returned because the specified parameter is invalid. Check whether you have entered an IPv6 address under an IPv4 protocol by mistake.
400	InvalidParam.Ipv6ProtocolConflictWithIpv4Address	%s	The error message returned because the specified parameter is invalid. Check whether you have entered an IPv4 address under an IPv6 protocol by mistake.
400	ILLEGAL_IPV6_CIDR	%s	The error message returned because the specified IPv6 address is invalid.

2.1.2.1.11.4. RevokeSecurityGroup

You can call this operation to delete an inbound security group rule. After the rule is deleted, the access control implemented by it is removed.

Description

In the security group-related API documents, traffic is sent by the source device and received at the destination device.

- You can determine an inbound rule by specifying one of the following groups of parameters. You cannot determine a security group rule by specifying only one parameter.

- Parameters used to specify an inbound security group rule that controls access from specified ranges of IP addresses: IpProtocol, PortRange, SourcePortRange (optional), NicType, Policy, DestCidrIp, and SourceCidrIp (optional).
- Parameters used to specify an inbound security group rule that controls access from a specified security group: IpProtocol, PortRange, SourcePortRange (optional), NicType, Policy, DestCidrIp (optional), DestGroupOwnerAccount, and DestGroupId.

- If the security group rule to be deleted does not exist, the RevokeSecurityGroup operation succeeds but no rule is deleted.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	RevokeSecurityGroup	The operation that you want to perform. Set the value to RevokeSecurityGroup.
IpProtocol	String	Yes	all	The transport layer protocol. The values are case-sensitive. Valid values: • icmp • icmpv6 • gre • tcp • udp • all: All protocols are supported.
PortRange	String	Yes	1/200	The range of destination ports relevant to the transport layer protocol. Valid values: • When the IpProtocol parameter is set to tcp or udp, the valid port numbers are 1 to 65535. Specify a port range in the format of <start port number>/<end port number>. Correct example: 1/200. Incorrect example: 200/1. • When the IpProtocol parameter is set to icmp, the port range is -1/-1, which indicates all ports. • When the IpProtocol parameter is set to gre, the port range is -1/-1, which indicates all ports. • When IpProtocol is set to all, the port range is -1/-1, which indicates all ports.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the destination security group. You can call the DescribeRegions operation to query the most recent region list.
SecurityGroupId	String	Yes	sg-bp67acfmxazb4p****	The ID of the destination security group.
DestCidrIp	String	No	10.0.0.0/8	The range of destination IPv4 addresses. IPv4 addresses and CIDR blocks are supported. Default value: 0.0.0.0/0.
Ipv6DestCidrIp	String	No	2001:db8:1233:1a00::***	The range of destination IPv6 addresses. IPv6 addresses and CIDR blocks are supported. **Note** Only IPv6 addresses in VPCs are supported. This parameter is empty by default.
SourceGroupId	String	No	sg-bp67acfmxazb4p****	The ID of the source security group. • You must specify at least one of the SourceGroupId and SourceCidrIp parameters. • If SourceGroupId is specified and SourceCidrIp is not, the value of NicType can be set only to intranet. • If both SourceGroupId and SourceCidrIp are specified, SourceCidrIp takes precedence.
SourceGroupOwnerId	Long	No	12345678910	The ID of the Apsara Stack tenant account that manages the source security group when you delete a security group rule across accounts. • If both SourceGroupOwnerId and SourceGroupOwnerAccount are empty, access control on another security group under your account is revoked. • If SourceCidrIp is specified, the SourceGroupOwnerId parameter is ignored.

Parameter	Type	Required	Example	Description
SourceGroupOwnerAccount	String	No	Test@aliyun.com	The Apsara Stack tenant account that manages the source security group when you delete a security group rule across accounts. • If both SourceGroupOwnerId and SourceGroupOwnerAccount are empty, access control on another security group under your account is revoked. • If SourceCidrIp is specified, the SourceGroupOwnerAccount parameter is ignored.
SourceCidrIp	String	No	10.0.0.0/8	The range of source IPv4 addresses. IPv4 addresses and CIDR blocks are supported. Default value: 0.0.0.0/0.
Ipv6SourceCidrIp	String	No	2001:db8:1234:1a00::***	The range of source IPv6 addresses. IPv6 addresses and CIDR blocks are supported. Note Only IPv6 addresses in VPCs are supported. This parameter is empty by default.
SourcePortRange	String	No	80/80	The range of source ports relevant to the transport layer protocol. Valid values: • When the IpProtocol parameter is set to tcp or udp, the valid port numbers are 1 to 65535. Specify a port range in the format of <start port number>/<end port number>. Correct example: 1/200. Incorrect example: 200/1. • When the IpProtocol parameter is set to icmp, the port range is -1/-1, which indicates all ports. • When the IpProtocol parameter is set to gre, the port range is -1/-1, which indicates all ports. • When IpProtocol is set to all, the port range is -1/-1, which indicates all ports.

Parameter	Type	Required	Example	Description
Policy	String	No	accept	The access control policy. Valid values: • accept: grants access. • drop: denies access without returning a rejection response. Default value: accept.
Priority	String	No	1	The priority of the security group rule. Valid values: 1 to 100. Default value: 1.

NicType	String	No	intranet	The NIC type of the security group rule when the security group is in the classic network. Valid values:
				• internet
				• intranet
				  ○ If the security group is in a VPC, the parameter is set to intranet by default and cannot be modified.
				  ○ If DestGroupId is specified but DestCidrIp is not, the NicType parameter can be set only to intranet.
				Default value: internet.

ClientToken	String	No	123e4567-e89b-12d3-a456-426655440000	The client token that is used to ensure the idempotence of the request You can use the client to generate the value, but you must make sure that it is unique among different requests. The **ClientToken** value can only contain ASCII characters and cannot exceed 64 characters in length. For more information, see How to ensure idempotence in ECS Developer Guide.
Description	String	No	TestDescription	The description of the security group rule.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=RevokeSecurityGroup
&SecurityGroupId=sg-bp67acfmxazb4p****
&SourceGroupId=sg-bp67acfmxazb4p****
&SourceGroupOwnerAccount=Test@aliyun.com
&IpProtocol=tcp
&PortRange=80/80
&Priority=1
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<RevokeSecurityGroupResponse>
      <RequestId>CEF72CEB-54B6-4AE8-B225-F876FF7BA984</RequestId>
</RevokeSecurityGroupResponse>
```

{
    "RequestId":"CEF72CEB-54B6-4AE8-B225-F876FF7BA984"
}
```

Error codes

HTTP status code	Error code	Error message	Description
404	InvalidSecurityGroupId.NotFound	The specified SecurityGroupId does not exist.	The error message returned because the specified security group does not exist in this account. Check whether the security group ID is correct.
400	InvalidSecurityGroupId.Malformed	The specified SecurityGroupId is not valid.	The error message returned because the specified SecurityGroupId parameter is invalid.

HTTP status code	Error code	Error message	Description
400	InvalidIpProtocol.ValueNotSupported	The specified IpProtocol does not exist.	The error message returned because the specified IpProtocol parameter is invalid.
400	InvalidIpPortRange.Malformed	The specified parameter "PortRange" is not valid.	The error message returned because the specified PortRange parameter is invalid.
404	InvalidSourceGroupId.NotFound	The SourceGroupId provided does not exist in our records.	The error message returned because the specified SourceGroupId parameter does not exist.
403	InvalidNicType.Mismatch	Specified nic type conflicts with the authorization record.	The error message returned because the specified NIC type conflicts with the authorization record.
403	InvalidGroupAuthItem.NotFound	Specified group authorized item does not exist in our records.	The error message returned because the specified authorized security group does not exist.
400	InvalidSourceCidrIp.Malformed	The specified parameter "SourceCidrIp" is not valid.	The error message returned because the specified SourceCidrIp parameter is invalid.
400	MissingParameter	The input parameter "SourceGroupId" or "SourceCidrIp" cannot be both blank.	The error message returned because both the SourceGroupId and SourceCidrIp parameters are empty.
400	InvalidPolicy.Malformed	The specified parameter "Policy" is not valid.	The error message returned because the specified Policy parameter is invalid.
400	InvalidNicType.ValueNotSupported	The specified NicType does not exist.	The error message returned because the specified NicType parameter does not exist.
400	InvalidSourceGroupId.Mismatch	Specified security group and source group are not in the same VPC.	The error message returned because the destination security group and the source security group do not belong to the same VPC.
400	VPCDisabled	Can't use the SecurityGroup in VPC.	The error message returned because the VPC does not support security groups.

HTTP status code	Error code	Error message	Description
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.
400	MissingParameter.Source	Either SourceCidrIp or SourceGroupId must be specified.	The error message returned because both the SourceCidrIp and SourceGroupId parameters are empty.
400	InvalidIpProtocol.ValueNotSupported	The parameter IpProtocol must be specified with case insensitive TCP, UDP, ICMP, GRE or All.	The error message returned because the specified IpProtocol parameter is invalid. The valid values of this parameter are tcp, udp, icmp, gre, and all.
400	InvalidPriority.Malformed	The parameter Priority is invalid.	The error message returned because the specified Priority parameter is invalid.
400	InvalidPriority.ValueNotSupported	The parameter Priority is invalid.	The error message returned because the specified Priority parameter is invalid.
400	InvalidParamter.Conflict	The specified SecurityGroupId should be different from the SourceGroupId.	The error message returned because the destination security group is the same as the source security group.
400	InvalidDestCidrIp.Malformed	The specified parameter DestCidrIp is not valid.	The error message returned because the specified DestCidrIp parameter is invalid.
400	InvalidParam.SourceIp	%s	The error message returned because the specified SourceCidrIp parameter is invalid.
400	InvalidParam.DestIp	%s	The error message returned because the specified DestCidrIp parameter is invalid.
400	InvalidParam.Ipv6DestCidrIp	%s	The error message returned because the specified Ipv6DestCidrIp parameter is invalid.

HTTP status code	Error code	Error message	Description
400	InvalidParam.Ipv6SourceCidrIp	%s	The error message returned because the specified Ipv6SourceCidrIp parameter is invalid.
400	InvalidParam.Ipv4ProtocolConflictWithIpv6Address	%s	The error message returned because the specified parameter is invalid. Check whether you have entered an IPv6 address under an IPv4 protocol by mistake.
400	InvalidParam.Ipv6ProtocolConflictWithIpv4Address	%s	The error message returned because the specified parameter is invalid. Check whether you have entered an IPv4 address under an IPv6 protocol by mistake.
400	ILLEGAL_IPV6_CIDR	%s	The error message returned because the specified IPv6 address is invalid.
400	InvalidSourcePortRange.Malformed	The specified parameter "SourcePortRange" is not valid.	The error message returned because the specified SourcePortRange parameter is invalid.
400	InvalidSecurityGroupDiscription.Malformed	The specified security group rule description is not valid.	The error message returned because the specified Description parameter is invalid.

2.1.2.1.11.5. JoinSecurityGroup

You can call this operation to add an ECS instance to a security group.

Description

When you call this operation, take note of the following items:

- Before you add an ECS instance to a security group, make sure that the instance is in the **Stopped** (Stopped) or **Running** (Running) state.
- An instance can long to a maximum of five security groups.
- You can request to increase the maximum number of security groups to which an instance can belong to up to 16.
- Each security group can contain a maximum of 1,000 instances.
- The specified security group and the instance must belong to the same region.
- The security group and the instance must be of the same network type. If the network type is VPC,

the security group and the instance must belong to the same VPC.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	JoinSecurityGroup	The operation that you want to perform. Set the value to JoinSecurityGroup.
InstanceId	String	Yes	i-bp67acfmxazb4ph***	The ID of the instance.
SecurityGroupId	String	Yes	sg-bp67acfmxazb4ph***	The ID of the security group. You can call the DescribeSecurityGroups operation to query the most recent security group list.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=JoinSecurityGroup
&InstanceId=i-bp67acfmxazb4ph***
&SecurityGroupId=sg-bp67acfmxazb4ph***
&<Common request parameters>
```

Sample success responses

`XML` format

```
<JoinSecurityGroupResponse>
      <RequestId>473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E</RequestId>
</JoinSecurityGroupResponse>
```

`JSON` format

```
{
    "RequestId": "473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E"
}
```

Error codes

HTTP status code	Error code	Error message	Description
404	InvalidSecurityGroupId.NotFound	The specified SecurityGroupId does not exist.	The error message returned because the specified security group does not exist in this account. Check whether the security group ID is correct.
400	InstanceSecurityGroupLimitExceeded	Exceeding the allowed amount of security groups that an instance can be in.	The error message returned because the maximum number of security groups to which the instance can belong has been reached.
403	IncorrectInstanceStatus	The current status of the resource does not support this operation.	The error message returned because the operation is not supported while the resource is in the current state.
403	InstanceLockedForSecurity	The specified operation is denied as your instance is locked for security reasons.	The error message returned because the operation is not supported while the instance is locked for security reasons.
403	SecurityGroupInstanceLimitExceeded	The maximum number of instances in a security group is exceeded.	The error message returned because the maximum number of instances in the specified security group has been reached.
404	InvalidInstanceId.NotFound	The specified InstanceId does not exist.	The error message returned because the specified InstanceId parameter does not exist.
400	InvalidInstanceId.Mismatch	Specified instance and security group are not in the same VPC.	The error message returned because the specified instance and security group do not belong to the same VPC or one of the following cases occurs: 1. The security group is of the VPC network type but the instance is not. 2. The instance is of the VPC network type but the security group is not.
403	InvalidInstanceId.AlreadyExists	The specified instance already exists in the specified security group.	The error message returned because the specified instance already exists in the specified security group.

HTTP status code	Error code	Error message	Description
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.
403	SecurityGroupInstanceLimitExceeded	%s	The error message returned because the maximum number of instances in the specified security group has been reached.
403	AclLimitExceed	%s	The error message returned because the value of AccessPoint exceeds the upper limit.
403	InstanceSecurityGroupLimitExceeded	%s	The error message returned because the maximum number of security groups to which the instance can belong has been reached.
400	InvalidInstanceId.Malformed	The specified parameter "InstanceId" is not valid.	The error message returned because the specified InstanceId parameter is invalid.

2.1.2.1.11.6. LeaveSecurityGroup

You can call this operation to remove an ECS instance from a security group.

Description

When you call this operation, take note of the following items:

- Before you remove an ECS instance from a security group, make sure that the instance is in the **Stopped** (Stopped) or **Running** (Running) state.
- An instance must belong to at least one security group. Therefore, if the instance to be removed belongs to only a single security group, the LeaveSecurityGroup request fails.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	LeaveSecurityGroup	The operation that you want to perform. Set the value to LeaveSecurityGroup.

Parameter	Type	Required	Example	Description
InstanceId	String	Yes	i-bp67acfmxazb4ph***	The ID of the instance.
SecurityGroupId	String	Yes	sg-bp67acfmxazb4ph***	The ID of the security group.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=LeaveSecurityGroup
&InstanceId=i-bp67acfmxazb4ph***
&SecurityGroupId=sg-bp67acfmxazb4ph***
&<Common request parameters>
```

Sample success responses

`XML` format

```
<LeaveSecurityGroupResponse>
      <RequestId>473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E</RequestId>
</LeaveSecurityGroupResponse>
```

`JSON` format

```
{
    "RequestId": "473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E"
}
```

Error codes

HTTP status code	Error code	Error message	Description
404	InvalidInstanceId.NotFound	The specified InstanceId does not exist.	The error message returned because the specified InstanceId parameter does not exist.

HTTP status code	Error code	Error message	Description
404	InvalidSecurityGroupId.NotFound	The specified SecurityGroupId does not exist.	The error message returned because the specified security group does not exist in this account. Check whether the security group ID is correct.
403	InstanceLastSecurityGroup	The specified security group is the last security group for the instance.	The error message returned because the specified security group is the only security group to which the instance belongs.
403	IncorrectInstanceStatus	The current status of the resource does not support this operation.	The error message returned because the operation is not supported while the resource is in the current state.
403	InstanceLockedForSecurity	The specified operation is denied as your instance is locked for security reasons.	The error message returned because the operation is not supported while the instance is locked for security reasons.
403	InstanceNotInSecurityGroup	The instance not in the group.	The error message returned because the specified instance does not belong to the specified security group.
504	RequestTimeout	The request encounters an upstream server timeout.	The error message returned because the request is denied due to a timeout error of the upstream server.
400	InvalidInstanceId.Malformed	The specified parameter "InstanceId" is not valid.	The error message returned because the specified InstanceId parameter is invalid.

2.1.2.1.11.7. DeleteSecurityGroup

You can call this operation to delete a security group.

Description

Before you delete a security group, make sure that no instances exist in the security group and that the security group is not referenced by rules of other security groups. Otherwise, the DeleteSecurityGroup request fails. You can call the DescribeSecurityGroupReferences operation to check whether the security group is referenced by rules of other security groups.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteSecurityGroup	The operation that you want to perform. Set the value to DeleteSecurityGroup.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the security group. You can call the DescribeRegions operation to query the most recent region list.
SecurityGroupId	String	Yes	sg-bp1fg655nh68xyz9i***	The ID of the security group.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=DeleteSecurityGroup
&RegionId=cn-qingdao-env17-d01
&SecurityGroupId=sg-bp1fg655nh68xyz9i***
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteSecurityGroupResponse>
       <RequestId>CEF72CEB-54B6-4AE8-B225-F876FF7BA984</RequestId>
</DeleteSecurityGroupResponse>
```

`JSON` format

```
{
    "RequestId":"CEF72CEB-54B6-4AE8-B225-F876FF7BA984"
}
```

Error codes

HTTP status code	Error code	Error message	Description
403	DependencyViolation	There is still instance(s) in the specified security group.	The error message returned because instances exist in the security group. Remove the instances and then try again.
403	DependencyViolation	The specified security group has been authorized in another one.	The error message returned because the specified security group is referenced by rules of another security group.
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.

2.1.2.1.11.8. DescribeSecurityGroupAttribute

You can call this operation to query the rules of a security group.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeSecurityGroupAttribute	The operation that you want to perform. Set the value to DescribeSecurityGroupAttribute.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the security group. You can call the DescribeRegions operation to query the most recent region list.
SecurityGroupId	String	Yes	sg-bp1gxw6bznjjvhu3g***	The ID of the security group.

Parameter	Type	Required	Example	Description

NicType	String	No	intranet	The NIC type of the security group rule.
				• Default value for rules of security groups in the classic network: internet. Valid values for rules of security groups in the classic network:
				  ○ internet
				  ○ intranet
				  Note You can query security group rules of only one NIC type in a single call. To query security group rules of both NIC types, call the operation twice.
				• Default value for rules of security groups in VPCs: intranet. Valid value for rules of security groups in VPCs:
				  ○ intranet
				  Note If you set this parameter to internet or leave this parameter empty, the value of intranet is automatically used.

Direction	String	No	all	The direction in which the security group rule is applied. Valid values: • egress: outbound • ingress: inbound • all: inbound and outbound Default value: all.

Response parameters

Parameter	Type	Example	Description
Description	String	FinanceDept	The description of the security group.

Parameter	Type	Example	Description
InnerAccessPolicy	String	Accept	The access control policy of the security group. Valid values: • Accept: All instances in the security group can communicate with each other. • drop: All instances in the security group are isolated from each other.
Permissions	Array of Permission		Details about the security group rules.
Permission			
CreateTime	String	2018-12-12T07:28:38Z	The time when the security group rule was created. The time is displayed in UTC.
Description	String	FinanceDept	The description of the security group.
DestCidrIp	String	0.0.0.0/0	The range of destination IP addresses for outbound access control
DestGroupId	String	sg-securitygroupid1	The ID of the destination security group for outbound access control.
DestGroupName	String	SecurityGuard	The name of the destination security group.
DestGroupOwnerAccount	String	SecurityGuard	The Apsara Stack tenant account that manages the destination security group.
Direction	String	ingress	The direction in which the security group rule is applied.
IpProtocol	String	TCP	The transport layer protocol.
Ipv6DestCidrIp	String	2001:db8:1233:1a00::***	The range of destination IPv6 addresses.
Ipv6SourceCidrIp	String	2001:db8:1234:1a00::***	The range of source IPv6 addresses.
NicType	String	intranet	The NIC type of the security group rule.

Parameter	Type	Example	Description
Policy	String	Accept	The access control policy.
PortRange	String	80/80	The port range.
Priority	String	1	The priority of the rule.
SourceCidrIp	String	0.0.0.0/0	The range of source IP addresses for inbound access control.
SourceGroupId	String	sg-securitygroupid2	The ID of the source security group for inbound access control.
SourceGroupName	String	FinanceDeptSourceG****	The name of the source security group.
SourceGroupOwnerAccount	String	FinanceGroupO****	The Apsara Stack tenant account that manages the source security group.
SourcePortRange	String	80/80	The source port range.
RegionId	String	cn-qingdao-env17-d01	The ID of the region.
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.
SecurityGroupId	String	sg-bp1gxw6bznjjvhu3g***	The ID of the destination security group.
SecurityGroupName	String	FinanceSecurityG****	The name of the security group.
VpcId	String	vpc-bp1opxu1zkhn00gzv2***	The ID of the VPC. If a VPC ID is returned, the network type of the security group is VPC. If no VPC ID is returned, the network type of the security group is classic network.

Examples

Sample requests

```
https://ecs.example.com/?Action=DescribeSecurityGroupAttribute
&SecurityGroupId=sg-bp1gxw6bznjjvhu3g***
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeSecurityGroupAttributeResponse>
      <SecurityGroupId>sg-bp1gxw6bznjjvhu3g***</SecurityGroupId>
      <InnerAccessPolicy>Accept</InnerAccessPolicy>

Error codes

HTTP status code	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist.	The error message returned because the specified RegionId parameter does not exist.

HTTP status code	Error code	Error message	Description
404	InvalidSecurityGroupId.NotFound	The specified SecurityGroupId does not exist.	The error message returned because the specified security group does not exist in this account. Check whether the security group ID is correct.
400	InvalidNicType.ValueNotSupported	The specified NicType does not exist.	The error message returned because the specified NicType parameter does not exist.
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.
400	InvalidParamter	Invalid Parameter	The error message returned because a specified parameter is invalid.
400	InvalidSecurityGroupId.Malformed	The specified parameter "SecurityGroupId" is not valid.	The error message returned because the specified SecurityGroupId parameter is invalid.

2.1.2.1.11.9. DescribeSecurityGroups

You can call this operation to query basic information of security groups.

Description

Basic information of security groups includes their IDs and descriptions. Security groups are displayed in descending order of their IDs.

When you use Apsara Stack CLI to call an API operation, make sure that request parameter values of different data types are in required formats.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeSecurityGroups	The operation that you want to perform. Set the value to DescribeSecurityGroups.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the security group. You can call the DescribeRegions operation to query the most recent region list.
VpcId	String	No	vpc-bp67acfmxazb4p****	The ID of the VPC to which the security group belongs.
PageNumber	Integer	No	1	The number of the page to return. Pages start from page 1. Default value: 1.
PageSize	Integer	No	10	The number of entries to return on each page. Valid values: 1 to 50. Default value: 10.
SecurityGroupIds	String	No	["sg-bp67acfmxazb4p****", "sg-bp67acfmxazb4p****", "sg-bp67acfmxazb4p****",....]	The IDs of security groups. The value is a JSON array that consists of up to 100 security group IDs. Separate multiple security group IDs with commas (,).
Tag.N.value	String	No	null	The value of tag N of the security group. **Note** We recommend that you use the Tag.N.Value parameter to ensure future compatibility.
Tag.N.key	String	No	null	The key of tag N of the security group. **Note** We recommend that you use the Tag.N.Key parameter to ensure future compatibility.

Parameter	Type	Required	Example	Description
Tag.N.Key	String	No	TestKey	The key of tag N of the security group. Valid values of N: 1 to 20.
Tag.N.Value	String	No	TestValue	The value of tag N of the security group. Valid values of N: 1 to 20.
ResourceGroupId	String	No	rg-bp67acfmxazb4p****	The ID of the resource group to which the security group belongs.
NetworkType	String	No	vpc	The network type of the security group. Valid values: • vpc • classic
SecurityGroupId	String	No	sg-bp67acfmxazb4p****	The ID of the security group.
SecurityGroupName	String	No	SGTestName	The name of the security group.
DryRun	Boolean	No	false	Specifies whether to check the validity of the request without actually making the request. Valid values: • true: The validity of the request is checked but the request is not made. Check items include whether your AccessKey pair is valid, whether RAM users are authorized, and whether the required parameters are specified. If the check fails, the corresponding error is returned. If the check succeeds, the DryRunOperation error code is returned. • false: The validity of the request is checked. If the check succeeds, a 2XX HTTP status code is returned and the request is made. Default value: false.

Response parameters

Parameter	Type	Example	Description
PageNumber	Integer	1	The page number of the returned page.
PageSize	Integer	1	The number of entries returned per page.
RegionId	String	cn-qingdao-env17-d01	The region ID of the security group.
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.
SecurityGroups	Array of SecurityGroup		Details about the security groups.
SecurityGroup			
AvailableInstanceAmount	Integer	880	This parameter is in invitational preview and not available.
CreationTime	String	2017-12-05T22:40:00Z	The time when the security group was created. The time follows the ISO 8601 standard in the yyyy-MM-ddThh:mmZ format. The time is displayed in UTC.
Description	String	TestDescription	The description of the security group.
EcsCount	Integer	120	This parameter is in invitational preview and not available.
ResourceGroupId	String	rg-bp67acfmxazb4p****	The ID of the resource group to which the security group belongs.
SecurityGroupId	String	sg-bp67acfmxazb4p****	The ID of the security group.
SecurityGroupName	String	SGTestName	The name of the security group.
SecurityGroupType	String	normal	The type of the security group. Valid values: • normal: basic security group • enterprise: advanced security group

Parameter	Type	Example	Description
ServiceID	Long	111111111	This parameter is in invitational preview and not available.
ServiceManaged	Boolean	false	This parameter is in invitational preview and not available.
Tags	Array of Tag		The tags of the security groups.
Tag			
TagKey	String	TestKey	The tag key of the security group.
TagValue	String	TestValue	The tag value of the security group.
VpcId	String	vpc-bp67acfmxazb4p****	The ID of the VPC to which the security group belongs.
TotalCount	Integer	49	The total number of security groups.

Examples

Error codes

HTTP status code	Error code	Error message	Description

HTTP status code	Error code	Error message	Description
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.

2.1.2.1.11.10. DescribeSecurityGroupReferences

You can call this operation to query whether one or more security groups are referenced by rules of other security groups.

Description

When you call this operation, take note of the following items:

- Security group-level authorization includes authorization for inbound and outbound traffic.
- A maximum of 100 entries can be returned each time.
- If you fail to delete a security group by calling the DeleteSecurityGroup operation, you can call the DescribeSecurityGroupReferences operation to check whether the security group is referenced by rules of other security groups. If the security group is referenced by a rule of another security group, you must remove the reference before you can delete the security group.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeSecurityGroupReferences	The operation that you want to perform. Set the value to DescribeSecurityGroupReferences.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the security group.
SecurityGroupId.N	RepeatList	Yes	sg-bp1euoep32o6kvrw****	The ID of security group N. Valid values of N: 1 to 10.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Parameter	Type	Example	Description
SecurityGroupReferences	Array of SecurityGroupReference		Details about the references to the specified security groups.
SecurityGroupReference			
ReferencingSecurityGroups	Array of ReferencingSecurityGroup		Details about the security groups whose rules are referencing the specified security groups.
ReferencingSecurityGroup			
AliUid	String	1557809237**	The ID of the Apsara Stack tenant account to which the security group belongs.
SecurityGroupId	String	sg-bp1euoep32o6kvrw****	The ID of the security group whose rules reference the specified security group
SecurityGroupId	String	sg-bp67acfmxazb4pj****	The ID of the specified security group.

Examples

Sample requests

```
https://ecs.example.com/?Action=DescribeSecurityGroupReferences
&RegionId=cn-qingdao-env17-d01
&SecurityGroupId.1=sg-bp1euoep32o6kvrw****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeSecurityGroupReferencesResponse>
      <RequestId>CEF72CEB-54B6-4AE8-B225-F876FF7BA984</RequestId>
      <SecurityGroupReferences>
          <SecurityGroupReference>
              <SecurityGroupId>sg-bp1euoep32o6kvrw****</SecurityGroupId>
              <ReferencingSecurityGroups>
                  <ReferencingSecurityGroup>
                      <SecurityGroupId>sg-bp67acfmxazb4pi****</SecurityGroupId>
                      <AliUid>155780923770</AliUid>
                  </ReferencingSecurityGroup>
                  <ReferencingSecurityGroup>
                      <SecurityGroupId>sg-bp67acfmxazb4pj****</SecurityGroupId>
                      <AliUid>155780923770</AliUid>
                  </ReferencingSecurityGroup>
              </ReferencingSecurityGroups>
          </SecurityGroupReference>
      </SecurityGroupReferences>
</DescribeSecurityGroupReferencesResponse>
```

`JSON` format

```
{
    "RequestId": "CEF72CEB-54B6-4AE8-B225-F876FF7BA984",
    "SecurityGroupReferences": [
        {
            "SecurityGroupId": "sg-bp1euoep32o6kvrw****",
            "SecurityReferencingGroups": [
                {
                    "AliUid": "1557809237**",
                    "SecurityGroupId": "sg-bp67acfmxazb4pi****"
                },
                {
                    "AliUid": "1557809237**",
                    "SecurityGroupId": "sg-bp67acfmxazb4pj****"
                }
            ]
        }
    ]
}
```

Error codes

HTTP status code	Error code	Error message	Description
400	InvalidSecurityGroupId.Malformed	The specified parameter SecurityGroupId is essential and size should less than 10	The error message returned because the SecurityGroupId.N parameter must be specified and the value of N cannot exceed 10.

HTTP status code	Error code	Error message	Description
404	InvalidSecurityGroupId.NotFound	The SecurityGroupId provided does not exist in our records.	The error message returned because the specified security group does not exist in this account. Check whether the security group ID is correct.

2.1.2.1.11.11. ModifySecurityGroupAttribute

You can call this operation to modify the name or description of a security group.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifySecurityGroupAttribute	The operation that you want to perform. Set the value to ModifySecurityGroupAttribute.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the security group. You can call the DescribeRegions operation to query the most recent region list.
SecurityGroupId	String	Yes	sg-bp67acfmxazb4p****	The ID of the security group.
SecurityGroupName	String	No	SecurityGroupTestName	The new name of the security group. The name must be 2 to 128 characters in length. It must start with a letter and cannot start with http:// or https://. The name can contain letters, digits, colons (:), underscores (_), and hyphens (-). This parameter is empty by default.
Description	String	No	TestDescription	The new description of the security group. The description must be 2 to 256 characters in length and cannot start with http:// or https://. This parameter is empty by default.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=ModifySecurityGroupAttribute
&SecurityGroupId=sg-bp67acfmxazb4p****
&RegionId=cn-qingdao-env17-d01
&SecurityGroupName=SecurityGroupTestName
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifySecurityGroupAttributeResponse>
       <RequestId>CEF72CEB-54B6-4AE8-B225-F876FF7BA984</RequestId>
</ModifySecurityGroupAttributeResponse>
```

`JSON` format

```
{
    "RequestId":"CEF72CEB-54B6-4AE8-B225-F876FF7BA984"
}
```

Error codes

HTTP status code	Error code	Error message	Description
404	InvalidSecurityGroupId.NotFound	The specified SecurityGroupId does not exist.	The error message returned because the specified security group does not exist in this account. Check whether the security group ID is correct.

HTTP status code	Error code	Error message	Description
400	InvalidSecurityGroupName.Malformed	Specified security group name is not valid.	The error message returned because the specified SecurityGroupName parameter is invalid. By default, the SecurityGroupName parameter is empty. If this parameter is specified, the specified name is displayed on the console. The name must be 2 to 128 characters in length. It must start with a letter and can contain letters, digits, periods (.), underscores (_), and hyphens (-). The name cannot start with http:// or https://.
400	InvalidSecurityGroupDiscription.Malformed	Specified security group description is not valid.	The error message returned because the specified Description parameter is invalid.

2.1.2.1.11.12. ModifySecurityGroupPolicy

You can call this operation to modify the internal access policy of a basic security group. The internal access policies of advanced security groups cannot be modified.

Description

When you call this operation, take note of the following items:

- When InnerAccessPolicy is set to Accept for a security group, the instances in the security group can communicate with each other. The Accept internal access policy takes precedence over user-created security group rules to keep instances in the security group accessible to each other.
- When InnerAccessPolicy is set to Drop for a security group, the instances in the security group are isolated from each other. User-created security group rules take precedence over the Drop internal access policy and can be used to allow access between the instances. For example, you can call the AuthorizeSecurityGroup operation to create an inbound security group rule that allows the instances in the security group to communicate with each other.
- You can call the DescribeSecurityGroupAttribute operation to query the internal access policy of a security group.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifySecurityGroupPolicy	The operation that you want to perform. Set the value to ModifySecurityGroupPolicy.

Parameter	Type	Required	Example	Description
InnerAccessPolicy	String	Yes	Drop	The internal access policy of the security group. Valid values: • Accept: All instances in the security group can communicate with each other. • Drop: All instances in the security group are isolated from each other. The values are case-insensitive.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the security group. You can call the DescribeRegions operation to query the most recent region list.
SecurityGroupId	String	Yes	sg-bp67acfmxazb4ph***	The ID of the security group.
ClientToken	String	No	123e4567-e89b-12d3-a456-426655440000	The client token that is used to ensure the idempotence of the request You can use the client to generate the value, but you must make sure that it is unique among different requests. The **ClientToken** value can only contain ASCII characters and cannot exceed 64 characters in length. For more information, see How to ensure idempotence in ECS Developer Guide.

Response parameters

Parameter	Type	Example	Description
RequestId	String	CEF72CEB-54B6-4AE8-B225-F876FF7BA984	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=ModifySecurityGroupPolicy
&RegionId=cn-qingdao-env17-d01
&SecurityGroupId=sg-bp67acfmxazb4ph***
&InnerAccessPolicy=Drop
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifySecurityGroupPolicyResponse>
      <RequestId>CEF72CEB-54B6-4AE8-B225-F876xxxxxxxx</RequestId>
</ModifySecurityGroupPolicyResponse>
```

`JSON` format

```
{
    "RequestId": "CEF72CEB-54B6-4AE8-B225-F876FF7BA984"
}
```

Error codes

HTTP status code	Error code	Error message	Description
400	InvalidSecurityGroupId.Malformed	The SecurityGroupId is invalid. Only letters, numbers and underscores are supported. Maximum length is 100 characters.	The error message returned because the specified SecurityGroupId parameter is invalid. The security group ID can be up to 100 characters in length and can contain only letters, digits, and underscores (_).
400	InvalidPolicy.Malformed	The Policy is invalid. Only 'Accept' and 'Drop' are supported. Ignore case.	The error message returned because the specified InnerAccessPolicy parameter is invalid. The valid values of this parameter are Accept and Drop, and these values are case-insensitive.
404	InvalidSecurityGroupId.NotFound	The specified SecurityGroupId does not exist.	The error message returned because the specified security group does not exist in this account. Check whether the security group ID is correct.

2.1.2.1.11.13. ModifySecurityGroupRule

You can call this operation to modify the description of an inbound rule of a security group. You can call this operation to modify only the description of an inbound security group rule. If you want to modify other attributes such as the policy, port range, and authorization objects of the rule, log on to the ECS console.

Description

In the security group-related API documents, inbound traffic refers to the traffic that is sent from the source device and received at the destination device.

You can determine an inbound rule by specifying one of the following groups of parameters. You cannot determine a security group rule by specifying only one parameter.

- Parameters used to specify an inbound security group rule that controls access from specified ranges of IP addresses: IpProtocol, PortRange, SourcePortRange (optional), NicType, Policy, DestCidrIp, and SourceCidrIp (optional).
- Parameters used to control access from other security groups: IpProtocol, PortRange, SourcePortRange (optional), NicType, Policy, DestCidrIp (optional), DestGroupOwnerAccount, and DestGroupId.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifySecurityGroupRule	The operation that you want to perform. Set the value to ModifySecurityGroupRule.
IpProtocol	String	Yes	all	The transport layer protocol. The values are case-insensitive. Valid values: • icmp • icmpv6 • gre • tcp • udp • all: All protocols are supported.

Parameter	Type	Required	Example	Description
PortRange	String	Yes	80/80	The range of destination ports relevant to the transport layer protocol. Valid values: • When the IpProtocol parameter is set to tcp or udp, the valid port numbers are 1 to 65535. Specify a port range in the format of <start port number>/<end port number>. Correct example: 1/200. Incorrect example: 200/1. • When the IpProtocol parameter is set to icmp, the port range is -1/-1, which indicates all ports. • When the IpProtocol parameter is set to gre, the port range is -1/-1, which indicates all ports. • When IpProtocol is set to all, the port range is -1/-1, which indicates all ports.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the destination security group. You can call the DescribeRegions operation to query the most recent region list.
SecurityGroupId	String	Yes	sg-bp67acfmxazb4p****	The ID of the destination security group.
SourceGroupId	String	No	sg-bp67acfmxazb4p****	The ID of the source security group. You must specify at least one of the SourceGroupId and SourceCidrIp parameters. If SourceGroupId is specified but SourceCidrIp is not, the NicType parameter can be set only to intranet. If both SourceGroupId and SourceCidrIp are specified, SourceCidrIp takes precedence.

Parameter	Type	Required	Example	Description
SourceGroupOwnerId	Long	No	12345678910	The ID of the Apsara Stack tenant account that manages the source security group when you configure a security group rule across accounts. • If both SourceGroupOwnerId and SourceGroupOwnerAccount are empty, access permissions are configured for another security group managed by your account. • If SourceCidrIp is specified, the SourceGroupOwnerId parameter is ignored.
SourceGroupOwnerAccount	String	No	Test@aliyun.com	The Apsara Stack tenant account that manages the source security group when you configure a security group rule across accounts. • If both SourceGroupOwnerId and SourceGroupOwnerAccount are empty, access permissions are configured for another security group managed by your account. • If SourceCidrIp is specified, the SourceGroupOwnerAccount parameter is ignored.
SourceCidrIp	String	No	10.0.0.0/8	The range of source IPv4 addresses. IPv4 addresses and CIDR blocks are supported. This parameter is empty by default.
Ipv6SourceCidrIp	String	No	2001:db8:1233:1a00::***	The range of source IPv6 addresses. IPv6 addresses and CIDR blocks are supported. **Note** Only IPv6 addresses in VPCs are supported. This parameter is empty by default.

Parameter	Type	Required	Example	Description
SourcePortRange	String	No	80/80	The range of source ports relevant to the transport layer protocol. Valid values: • When the IpProtocol parameter is set to tcp or udp, the valid port numbers are 1 to 65535. Specify a port range in the format of <start port number>/<end port number>. Correct example: 1/200. Incorrect example: 200/1. • When the IpProtocol parameter is set to icmp, the port range is -1/-1, which indicates all ports. • When the IpProtocol parameter is set to gre, the port range is -1/-1, which indicates all ports. • When IpProtocol is set to all, the port range is -1/-1, which indicates all ports.
DestCidrIp	String	No	10.0.0.0/8	The range of destination IPv4 addresses. IPv4 addresses and CIDR blocks are supported. This parameter is empty by default.
Ipv6DestCidrIp	String	No	2001:db8:1234:1a00::***	The range of destination IPv6 addresses. IPv6 addresses and CIDR blocks are supported. Note Only IPv6 addresses in VPCs are supported. This parameter is empty by default.
Policy	String	No	accept	The access control policy. Valid values: • accept: grants access. • drop: denies access without returning a rejection response. Default value: accept.
Priority	String	No	1	The priority of the security group rule. Valid values: 1 to 100. Default value: 1.

Parameter	Type	Required	Example	Description
NicType	String	No	intranet	The NIC type of the security group rule when the security group is in the classic network. Valid values: • internet • intranet Default value: internet. This parameter can be set only to intranet in the following cases: • For rules of a security group in a VPC, this parameter is set to intranet by default and cannot be modified. • If DestGroupId is specified but DestCidrIp is not, this parameter must be set to intranet.
ClientToken	String	No	123e4567-e89b-12d3-a456-426655440000	The client token that is used to ensure the idempotence of the request You can use the client to generate the value, but you must make sure that it is unique among different requests. The **ClientToken** value can only contain ASCII characters and cannot exceed 64 characters in length. For more information, see How to ensure idempotence in ECS Developer Guide.
Description	String	No	This is a new security group rule.	The description of the security group rule. The description must be 1 to 512 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=ModifySecurityGroupRule
&SecurityGroupId=sg-bp67acfmxazb4p****
&SourceGroupId=sg-bp67acfmxazb4p****
&SourceGroupOwnerAccount=Test@aliyun.com
&IpProtocol=all
&PortRange=80/80
&Policy=accept
&Description=This is a new security group rule.
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ModifySecurityGroupRuleResponse>
      <RequestId>CEF72CEB-54B6-4AE8-B225-F876FF7BA984</RequestId>
</ModifySecurityGroupRuleResponse>
```

`JSON` format

```
{
    "RequestId":"CEF72CEB-54B6-4AE8-B225-F876FF7BA984"
}
```

Error codes

HTTP status code	Error code	Error message	Description
404	InvalidSecurityGroupId.NotFound	The specified SecurityGroupId does not exist.	The error message returned because the specified security group does not exist in this account. Check whether the security group ID is correct.
404	InvalidSourceGroupId.NotFound	The SourceGroupId provided does not exist in our records.	The error message returned because the specified SourceGroupId parameter does not exist.
400	OperationDenied	The specified IpProtocol does not exist or IpProtocol and PortRange do not match.	The error message returned because the specified IpProtocol parameter does not exist or does not match the specified port range.
400	InvalidIpProtocol.Malformed	The specified parameter "PortRange" is not valid.	The error message returned because the specified IpProtocol or PortRange parameter is invalid.

HTTP status code	Error code	Error message	Description
403	InvalidSourceGroupId.Mismatch	NicType is required or NicType expects intrnet.	The error message returned because the NicType parameter is not specified or is not set to intranet.
400	InvalidSourceCidrIp.Malformed	The specified parameter "SourceCidrIp" is not valid.	The error message returned because the specified SourceCidrIp parameter is invalid.
403	MissingParameter	The input parameter "SourceGroupId" or "SourceCidrIp" cannot be both blank.	The error message returned because both the SourceGroupId and SourceCidrIp parameters are empty.
400	InvalidPolicy.Malformed	The specified parameter "Policy" is not valid.	The error message returned because the specified Policy parameter is invalid.
400	InvalidNicType.ValueNotSupported	The specified NicType does not exist.	The error message returned because the specified NicType parameter does not exist.
400	InvalidNicType.Mismatch	Specified nic type conflicts with the authorization record.	The error message returned because the specified NIC type conflicts with the authorization record.
403	AuthorizationLimitExceed	The limit of authorization records in the security group reaches.	The error message returned because the maximum number of rules in the security group has been reached.
403	InvalidParamter.Conflict	The specified SecurityGroupId should be different from the SourceGroupId.	The error message returned because the destination security group is the same as the source security group.
400	InvalidSourceGroupId.Mismatch	Specified security group and source group are not in the same VPC.	The error message returned because the destination security group and the source security group do not belong to the same VPC.
400	InvalidSourceGroup.NotFound	Specified source security group does not exist.	The error message returned because the specified inbound security group rule does not exist or relevant parameters are not specified.

HTTP status code	Error code	Error message	Description
400	VPCDisabled	Can't use the SecurityGroup in VPC.	The error message returned because the VPC does not support security groups.
400	InvalidPriority.Malformed	The parameter Priority is invalid.	The error message returned because the specified Priority parameter is invalid.
400	InvalidPriority.ValueNotSupported	The parameter Priority is invalid.	The error message returned because the specified Priority parameter is invalid.
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.
403	InvalidNetworkType.Mismatch	The specified SecurityGroup network type should be same with SourceGroup network type (vpc or classic).	The error message returned because the network type of the destination security group is different from that of the source security group.
400	InvalidSecurityGroupDiscription.Malformed	The specified security group rule description is not valid.	The error message returned because the specified Description parameter is invalid.
404	SecurityGroupRule.NotFound	The target security group rule not exist.	The error message returned because the specified security group rule does not exist.
400	MissingParameter.Source	Either SourceCidrIp or SourceGroupId must be specified.	The error message returned because both the SourceCidrIp and SourceGroupId parameters are empty.
400	InvalidIpProtocol.ValueNotSupported	The parameter IpProtocol must be specified with case insensitive TCP, UDP, ICMP, GRE or All.	The error message returned because the specified IpProtocol parameter is invalid. The valid values of this parameter are tcp, udp, icmp, gre, and all.
400	InvalidParam.SourceIp	%s	The error message returned because the specified SourceCidrIp parameter is invalid.
400	InvalidParam.DestIp	%s	The error message returned because the specified DestCidrIp parameter is invalid.

HTTP status code	Error code	Error message	Description
400	InvalidParam.Ipv6DestCidrIp	%s	The error message returned because the specified Ipv6DestCidrIp parameter is invalid.
400	InvalidParam.Ipv6SourceCidrIp	%s	The error message returned because the specified Ipv6SourceCidrIp parameter is invalid.
400	InvalidParam.Ipv4ProtocolConflictWithIpv6Address	%s	The error message returned because the specified parameter is invalid. Check whether you have entered an IPv6 address under an IPv4 protocol by mistake.
400	InvalidParam.Ipv6ProtocolConflictWithIpv4Address	%s	The error message returned because the specified parameter is invalid. Check whether you have entered an IPv4 address under an IPv6 protocol by mistake.
400	ILLEGAL_IPV6_CIDR	%s	The error message returned because the specified IPv6 address is invalid.
400	InvalidSourcePortRange.Malformed	The specified parameter "SourcePortRange" is not valid.	The error message returned because the specified SourcePortRange parameter is invalid.
400	InvalidSecurityGroupId.Malformed	The specified parameter "SecurityGroupId" is not valid.	The error message returned because the specified SecurityGroupId parameter is invalid.

2.1.2.1.11.14. ModifySecurityGroupEgressRule

You can call this operation to modify the description of outbound rules of a security group. You can modify only the description by calling this operation. If you want to modify the policies, port ranges, and authorization objects of security group rules, log on to the ECS console.

Description

You can determine an outbound rule by specifying one of the following groups of parameters. You cannot determine a security group rule by specifying only one parameter.

- Parameters used to specify an outbound security group rule that controls access to a specified range

of IP addresses: IpProtocol, PortRange, SourcePortRange (optional), NicType, Policy, DestCidrIp, and SourceCidrIp (optional).

- Parameters used to specify an outbound security group rule that controls access to another security group: IpProtocol, PortRange, SourcePortRange (optional), NicType, Policy, DestCidrIp (optional), DestGroupOwnerAccount, and DestGroupId.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifySecurityGroupEgressRule	The operation that you want to perform. Set the value to ModifySecurityGroupEgressRule.
IpProtocol	String	Yes	tcp	The transport layer protocol. The values of this parameter are case-insensitive. Valid values: • icmp • icmpv6 • gre • tcp • udp • all: All protocols are supported.
PortRange	String	Yes	80/80	The range of destination ports relevant to the transport layer protocol. Valid values: • When the IpProtocol parameter is set to tcp or udp, the valid port numbers are 1 to 65535. Specify a port range in the format of <start port number>/<end port number>. Correct example: 1/200. Incorrect example: 200/1. • When the IpProtocol parameter is set to icmp, the port range is -1/-1, which indicates all ports. • When the IpProtocol parameter is set to gre, the port range is -1/-1, which indicates all ports. • When the IpProtocol parameter is set to all, the port range is -1/-1, which indicates all ports.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the source security group. You can call the DescribeRegions operation to query the most recent region list.

Parameter	Type	Required	Example	Description
SecurityGroupId	String	Yes	sg-bp67acfmxazb4ph***	The ID of the source security group.
DestGroupId	String	No	sg-bp67acfmxazb4pi***	The ID of the destination security group.
DestGroupOwnerId	Long	No	155780923770	The name of the Apsara Stack tenant account that manages the destination security group.
DestGroupOwnerAccount	String	No	EcsforCloud@Alibaba.com	The ID of the Apsara Stack tenant account that manages the destination security group.
DestCidrIp	String	No	10.0.0.0/8	The range of destination IPv4 addresses. IPv4 addresses and CIDR blocks are supported. This parameter is empty by default.
Ipv6DestCidrIp	String	No	2001:db8:1233:1a00::***	The range of destination IPv6 addresses. IPv6 addresses and CIDR blocks are supported. This parameter is empty by default.
SourceCidrIp	String	No	10.0.0.0/8	The range of source IPv4 addresses. IPv4 addresses and CIDR blocks are supported. This parameter is empty by default.
Ipv6SourceCidrIp	String	No	2001:db8:1234:1a00::***	The range of source IPv6 addresses. IPv6 addresses and CIDR blocks are supported. This parameter is empty by default.

Parameter	Type	Required	Example	Description
SourcePortRange	String	No	80/80	The range of source ports relevant to the transport layer protocol. Valid values: • When the IpProtocol parameter is set to tcp or udp, the valid port numbers are 1 to 65535. Specify a port range in the format of <start port number>/<end port number>. Correct example: 1/200. Incorrect example: 200/1. • When the IpProtocol parameter is set to icmp, the port range is -1/-1, which indicates all ports. • When the IpProtocol parameter is set to gre, the port range is -1/-1, which indicates all ports. • When the IpProtocol parameter is set to all, the port range is -1/-1, which indicates all ports.
Policy	String	No	accept	The access control policy. Valid values: • accept: grants access. • drop: denies access without returning a rejection response. Default value: accept.
Priority	String	No	1	The priority of the security group rule. Valid values: 1 to 100. Default value: 1.

NicType	String	No	internet	The NIC type of the security group rule when the security group is in the classic network. Valid values:
				• internet: public NIC
				• intranet: internal NIC
				  ◦ If the security group is in a VPC, the parameter is set to intranet by default and cannot be modified.
				  ◦ If `DestGroupId` is specified but `DestCidrIp` is not, the NicType parameter can be set only to intranet.
				Default value: internet.

Parameter	Type	Required	Example	Description
ClientToken	String	No	123e4567-e89b-12d3-a456-426655440000	The client token that is used to ensure the idempotence of the request You can use the client to generate the value, but you must make sure that it is unique among different requests. The **ClientToken** value can only contain ASCII characters and cannot exceed 64 characters in length. For more information, see How to ensure idempotence in ECS Developer Guide.
Description	String	No	Thisisanewsecuritygrouprule	The new description of the security group rule. The description must be 1 to 512 characters in length.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Error codes

HTTP status code	Error code	Error message	Description
404	InvalidSecurityGroupId.NotFound	The specified SecurityGroupId does not exist.	The error message returned because the specified security group does not exist in this account. Check whether the security group ID is correct.
404	InvalidDestGroupId.NotFound	The DestGroupId provided does not exist in our records.	The error message returned because the specified DestGroupId parameter does not exist.
400	OperationDenied	The specified IpProtocol does not exist or IpProtocol and PortRange do not match.	The error message returned because the specified IpProtocol parameter does not exist or does not match the specified port range.
400	InvalidIpProtocol.Malformed	The specified parameter "PortRange" is not valid.	The error message returned because the specified IpProtocol or PortRange parameter is invalid.
403	InvalidDestGroupId.Mismatch	NicType is required or NicType expects intranet.	The error message returned because the NicType parameter is not specified or is not set to intranet.
400	InvalidDestCidrIp.Malformed	The specified parameter "DestCidrIp" is not valid.	The error message returned because the specified DestCidrIp parameter is invalid.
403	MissingParameter	The input parameter "DestGroupId" or "DestCidrIp" cannot be both blank.	The error message returned because both the DestGroupId and DestCidrIp parameters are empty.
400	InvalidPolicy.Malformed	The specified parameter "Policy" is not valid.	The error message returned because the specified Policy parameter is invalid.
400	InvalidNicType.ValueNotSupported	The specified NicType does not exist.	The error message returned because the specified NicType parameter does not exist.

HTTP status code	Error code	Error message	Description
400	InvalidNicType.Mismatch	Specified nic type conflicts with the authorization record.	The error message returned because the specified NIC type conflicts with the authorization record.
403	AuthorizationLimitExceed	The limit of authorization records in the security group reaches.	The error message returned because the maximum number of rules in the security group has been reached.
403	InvalidParamter.Conflict	The specified SecurityGroupId should be different from the SourceGroupId.	The error message returned because the destination security group is the same as the source security group.
400	InvalidDestGroupId.Mismatch	Specified security group and destination group are not in the same VPC.	The error message returned because the specified source and destination security groups do not belong to the same VPC.
400	InvalidDestGroup.NotFound	Specified destination security group does not exist.	The error message returned because the specified DestGroupId parameter does not exist.
400	VPCDisabled	Can't use the SecurityGroup in VPC.	The error message returned because the VPC does not support security groups.
400	InvalidPriority.Malformed	The specified parameter "Priority" is not valid.	The error message returned because the specified Priority parameter is invalid.
400	InvalidPriority.ValueNotSupported	The specified Priority is invalid.	The error message returned because the specified Priority parameter is invalid.
400	InvalidDestCidrIp.Malformed	The specified parameter DestCidrIp is not valid.	The error message returned because the specified DestCidrIp parameter is invalid.
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.

HTTP status code	Error code	Error message	Description
403	InvalidNetworkType.Conflict	The specified SecurityGroup network type should be same with SourceGroup network type (vpc or classic).	The error message returned because the network type of the destination security group is different from that of the source security group.
403	InvalidSecurityGroup.IsSame	The authorized SecurityGroupId should be different from the DestGroupId.	The error message returned because the ID of the destination security group is the same as that of the source security group.
400	InvalidNicType.ValueNotSupported	The specified NicType is not valid.	The error message returned because the specified NicType parameter does not exist.
400	InvalidSecurityGroupDiscription.Malformed	The specified security group rule description is not valid.	The error message returned because the specified Description parameter is invalid.
404	SecurityGroupRule.NotFound	The target security group rule do not exist.	The error message returned because the specified security group rule does not exist.
400	InvalidSecurityGroup.InvalidNetworkType	The specified security group network type is not support this operation, please check the security group network types. For VPC security groups, ClassicLink must be enabled.	The error message returned because the operation is not supported while the security group is of the current network type. If the network type is VPC, ClassicLink must be enabled.
400	MissingParameter.Dest	The parameter DestCidrIp or DestGroupId is essential.	The error message returned because both the DestCidrIp and DestGroupId parameters are empty.
400	InvalidParam.PortRange	The specified param PortRange or SourcePortRange is not valid. should be integer and less than 65535, range separator is '/'.	The error message returned because the specified PortRange or SourcePortRange parameter is invalid. The values of PortRange and SourcePortRange must be in the format of <start port number>/<end port number>. The port numbers must be integers ranging from 1 to 65535.

HTTP status code	Error code	Error message	Description
400	InvalidIpProtocol.ValueNotSupported	The specified parameter IpProtocol should not be null and only tcp, udp, icmp, gre or all is supported. Ignore case.	The error message returned because the specified IpProtocol parameter is invalid. The valid values of this parameter are tcp, udp, icmp, gre, and all.
400	InvalidPriority.ValueNotSupported	The parameter Priority is invalid.	The error message returned because the specified Priority parameter is invalid.
400	InvalidParam.SourceIp	%s	The error message returned because the specified SourceCidrIp parameter is invalid.
400	InvalidParam.DestIp	%s	The error message returned because the specified DestCidrIp parameter is invalid.
400	InvalidParam.Ipv6DestCidrIp	%s	The error message returned because the specified Ipv6SourceCidrIp parameter is invalid.
400	InvalidParam.Ipv6SourceCidrIp	%s	The error message returned because the specified Ipv6SourceCidrIp parameter is invalid.
400	InvalidParam.Ipv4ProtocolConflictWithIpv6Address	%s	The error message returned because the specified parameter is invalid. Check whether you have entered an IPv6 address under an IPv4 protocol by mistake.
400	InvalidParam.Ipv6ProtocolConflictWithIpv4Address	%s	The error message returned because the specified parameter is invalid. Check whether you have entered an IPv4 address under an IPv6 protocol by mistake.
400	ILLEGAL_IPV6_CIDR	%s	The error message returned because the specified IPv6 address is invalid.
400	InvalidSourcePortRange.Malformed	The specified parameter "SourcePortRange" is not valid.	The error message returned because the specified SourcePortRange parameter is invalid.

2.1.2.1.12. SSH key pairs

2.1.2.1.12.1. CreateKeyPair

You can call this operation to create an SSH key pair. Apsara Stack stores the public key and returns the unencrypted private key. The private key is PEM-encoded in the PKCS#8 format. You must securely lock away the private key on your own.

Description

In addition to calling CreateKeyPair, you can create a key pair by using other key pair generation tools and call ImportKeyPair to upload the key pair to a region.

You have a maximum of 500 key pairs in each region.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateKeyPair	The operation that you want to perform. Set the value to CreateKeyPair.
KeyPairName	String	Yes	TestKeyPairV23	The name of the key pair. The name must be 2 to 128 characters in length. It must start with a letter and cannot start with http:// or https. The name can contain letters, digits, colons (:), underscores (_), and hyphens (-).
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region in which to create the key pair. You can call the DescribeRegions operation to query the most recent region list.
Tag.N.Key	String	No	TestKey	The key of tag N to be bound to the key pair. Valid values of N: 1 to 20. The tag key cannot be an empty string. It can be up to 128 characters in length and cannot start with acs: or aliyun. It cannot contain http:// or https://.
Tag.N.Value	String	No	TestValue	The value of tag N to be bound to the key pair. Valid values of N: 1 to 20. It can be up to 128 characters in length and cannot start with acs: or contain http:// or https://.

Parameter	Type	Required	Example	Description
ResourceGroupId	String	No	rg-bp67acfmxazb4ph***	The ID of the resource group to which to assign the key pair.

Response parameters

Parameter	Type	Example	Description
KeyPairFingerPrint	String	89:f0:ba:62:ac:b8:aa:e1:61:5e:fd:81:69:86:6d:6b:f0:c0:5a:**	The fingerprint of the key pair. The fingerprint uses the message-digest algorithm 5 (MD5) based on the public key fingerprint format defined in RFC 4716. For more information, see RFC 4716.
KeyPairId	String	ssh-bp67acfmxazb4ph***	The ID of the key pair.
KeyPairName	String	TestKeyPairV23	The name of the key pair.
PrivateKeyBody	String	MIIEpAIBAAKCAQEAtReyMzLIcBH78EV2zj****	The private key of the key pair. The private key is PEM-encoded in the PKCS#8 format.
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=CreateKeyPair
&RegionId=cn-qingdao-env17-d01
&KeyPairName=TestKeyPairV23
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CreateKeyPairResponse>
      <RequestId>473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E</RequestId>
      <KeyPairName>test</KeyPairName>
      <KeyPairId>ssh-bp67acfmxazb4ph***</KeyPairId>
      <KeyPairFingerPrint>89:f0:ba:62:ac:b8:aa:e1:61:5e:fd:81:69:86:6d:6b:f0:c0:5a:**</KeyPairFingerPrint>
      <PrivateKeyBody>MIIEpAIBAAKCAQEAtReyMzLIcBH78EV2zj****</PrivateKeyBody>
</CreateKeyPairResponse>
```

`JSON` format

```
{
    "RequestId": "473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E",
    "KeyPairName": "TestKeyPairV23",
    "KeyPairId": "ssh-bp67acfmxazb4ph***",
    "KeyPairFingerPrint": "89:f0:ba:62:ac:b8:aa:e1:61:5e:fd:81:69:86:6d:6b:f0:c0:5a:**",
    "PrivateKeyBody": "MIIEpAIBAAKCAQEAtReyMzLIcBH78EV2zj****"
}
```

Error codes

HTTP status code	Error code	Error message	Description
400	InvalidKeyPairName.Malformed	Specified Key Pair name is not valid.	The error message returned because the specified KeyPairName parameter is invalid.
403	QuotaExceed.KeyPair	The key pair quota exceeds.	The error message returned because the maximum number of key pairs has been reached.
400	KeyPair.AlreadyExist	The key pair already exist.	The error message returned because a key pair with the same name already exists. Key pair names must be unique.
404	InvalidResourceGroup.NotFound	The ResourceGroup provided does not exist in our records.	The error message returned because the specified ResourceGroupId parameter does not exist.
400	Duplicate.TagKey	The Tag.N.Key contain duplicate key.	The error message returned because the specified tag key already exists. Tag keys must be unique.
400	InvalidTagKey.Malformed	The specified Tag.n.Key is not valid.	The error message returned because the specified Tag.N.Key parameter is invalid.
400	InvalidTagValue.Malformed	The specified Tag.n.Value is not valid.	The error message returned because the specified Tag.N.Value parameter is invalid.
403	QuotaExceed.Tags	%s	The error message returned because the number of specified tags exceeds the upper limit.

2.1.2.1.12.2. ImportKeyPair

You can call this operation to import the public key of an RSA-encrypted key pair generated by a third-party tool. After the public key is imported, it is stored on Apsara Stack. You must securely lock away the private key on your own.

Description

When you call this operation, take note of the following items:

- You have a maximum of 500 key pairs per region.
- The key pair to be imported must support one of the following encryption methods:
  - rsa
  - dsa
  - ssh-rsa
  - ssh-dss
  - ecdsa
  - ssh-rsa-cert-v00@openssh.com
  - ssh-dss-cert-v00@openssh.com
  - ssh-rsa-cert-v01@openssh.com
  - ssh-dss-cert-v01@openssh.com
  - ecdsa-sha2-nistp256-cert-v01@openssh.com
  - ecdsa-sha2-nistp384-cert-v01@openssh.com
  - ecdsa-sha2-nistp521-cert-v01@openssh.com

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ImportKeyPair	The operation that you want to perform. Set the value to ImportKeyPair.
KeyPairName	String	Yes	KeyPairV24	The name of the key pair. The name must be globally unique. It must be 2 to 128 characters in length. It must start with a letter but cannot start with http:// or https://. The name can contain letters, digits, colons (:), underscores (_), and hyphens (-).
PublicKeyBody	String	Yes	xxxxxxxxxxxxxx	The public key of the key pair.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the key pair. You can call the DescribeRegions operation to query the most recent region list.

Parameter	Type	Required	Example	Description
Tag.N.Key	String	No	TestKey	The key of tag N to be bound to the key pair. Valid values of N: 1 to 20. The tag key cannot be an empty string. It can be up to 128 characters in length and cannot start with acs: or aliyun. It cannot contain http:// or https://.
Tag.N.Value	String	No	TestValue	The value of tag N to be bound to the key pair. Valid values of N: 1 to 20. The tag value can be an empty string. It can be up to 128 characters in length. It cannot start with acs: or contain http:// or https://.
ResourceGroupId	String	No	rg-bp67acfmxazb4ph***	The ID of the resource group to which to assign the key pair.

Response parameters

Parameter	Type	Example	Description
KeyPairFingerPrint	String	89:f0:ba:62:ac:b8:aa:e1:61:5e:fd:81:69:86:6d:6b:f0:c0:5a:**	The fingerprint of the key pair. The message-digest algorithm 5 (MD5) is used based on the public key fingerprint format defined in RFC 4716.
KeyPairName	String	KeyPairV24	The name of the key pair.
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=ImportKeyPair
&RegionId=cn-qingdao-env17-d01
&PublicKeyBody=xxxxxxxxxxxxxx
&KeyPairName=test
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ImportKeyPairResponse>
      <RequestId>473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E</RequestId>
      <KeyPairName>test</KeyPairName>
      <KeyPairFingerPrint>89:f0:ba:62:ac:b8:aa:e1:61:5e:fd:81:69:86:6d:6b:f0:c0:5a:**</KeyP
airFingerPrint>
</ImportKeyPairResponse>
```

`JSON` format

```
{
    "RequestId": "473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E",
    "KeyPairName": "test",
    "KeyPairFingerPrint": "89:f0:ba:62:ac:b8:aa:e1:61:5e:fd:81:69:86:6d:6b:f0:c0:5a:**"
}
```

Error codes

HTTP status code	Error code	Error message	Description
400	InvalidKeyPairName.Malformed	Specified Key Pair name is not valid.	The error message returned because the specified KeyPairName parameter is invalid.
403	QuotaExceed.KeyPair	The key pair quota exceeds.	The error message returned because the maximum number of key pairs has been reached.
400	InvalidPublicKeyBody.Malformed	The PublicKeyBody format is not supported.	The error message returned because the public key format is not supported.
400	MissingParameter	The input parameter "PublicKeyBody" that is mandatory for processing this request is not supplied.	The error message returned because the required PublicKeyBody parameter is not specified.
400	KeyPair.AlreadyExist	The key pair already exist.	The error message returned because a key pair with the same name already exists. Key pair names must be unique.
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.

HTTP status code	Error code	Error message	Description
404	InvalidResourceGroup.NotFound	The ResourceGroup provided does not exist in our records.	The error message returned because the specified ResourceGroupId parameter does not exist.

2.1.2.1.12.3. AttachKeyPair

You can call this operation to attach an SSH key pair to one or more Linux instances.

Description

When you call this operation, take note of the following items:

- SSH key pairs are not supported on Windows instances.
- If an SSH key pair is attached to an instance, the username and password authentication method is disabled for the instance.
- After you attach an SSH key pair to an instance in the **Running** (Running) state, you must call the RebootInstance operation to restart the instance for the key pair to take effect.
- After you attach an SSH key pair to an instance in the **Stopped** (Stopped) state, you must call the StartInstance operation to start the instance for the key pair to take effect.
- If an instance already has an SSH key pair attached, the new SSH key pair automatically replaces the original one.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	AttachKeyPair	The operation that you want to perform. Set the value to AttachKeyPair.
InstanceIds	String	Yes	["i-xxxxxxxxx", "i-yyyyyyyyy", ... "i-zzzzzzzzz"]	The IDs of instances to which you want to attach the SSH key pair. The value can be a JSON array that consists of up to 50 instance IDs. Separate multiple instance IDs with commas (,).
KeyPairName	String	Yes	KeyPairV25	The name of the SSH key pair.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the SSH key pair. You can call the DescribeRegions operation to query the most recent region list.

Response parameters

Parameter	Type	Example	Description
FailCount	String	0	The number of instances to which the SSH key pair failed to be attached.
KeyPairName	String	KeyPairV25	The name of the SSH key pair.
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.
Results	Array		The result set of the attach operation.
Result			
Code	String	200	The operation status code returned. 200 indicates that the operation is successful.
InstanceId	String	i-instanc****	The ID of the instance.
Message	String	successful	The operation information returned. When the value of Code is 200, the value of Message is successful.
Success	String	true	Indicates whether the operation was successful.
TotalCount	String	2	The total number of instances to which the SSH key pair was attached.

Examples

Sample requests

```
https://ecs.example.com/?Action=AttachKeyPair
&InstanceIds=["i-xxxxx****", "i-yyyyy****", … "i-zzzzz****"]
&KeyPairName=KeyPairV25
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<AttachKeyPairResponse>
      <TotalCount>2</TotalCount>
      <RequestId>4ADF7A06-66BD-4FBF-A2ED-2364E41D8C06</RequestId>
      <Results>
            <Result>
                  <Message>successful</Message>
                  <InstanceId>i-m5eg7be9ndloji64j***</InstanceId>
                  <Success>true</Success>
                  <Code>200</Code>
            </Result>
            <Result>
                  <Message>successful</Message>
                  <InstanceId>i-m5e25x2mwr0hk33dw***</InstanceId>
                  <Success>true</Success>
                  <Code>200</Code>
            </Result>
      </Results>
      <FailCount>0</FailCount>
</AttachKeyPairResponse>
```

`JSON` format

```
{
    "TotalCount": 2,
    "RequestId": "4ADF7A06-66BD-4FBF-A2ED-2364E41D8C06",
    "Results": {
        "Result": [
            {
                "Message": "successful",
                "InstanceId": "i-m5eg7be9ndloji64j***",
                "Success": true,
                "Code": "200"
            },
            {
                "Message": "successful",
                "InstanceId": "i-m5e25x2mwr0hk33dw***",
                "Success": true,
                "Code": "200"
            }
        ]
    },
    "FailCount": 0
}
```

Error codes

HTTP status code	Error code	Error message	Description

HTTP status code	Error code	Error message	Description
400	InvalidKeyPairName.NotFound	The specified KeyPairName does not exist in our records.	The error message returned because the specified KeyPairName parameter does not exist.
403	DependencyViolation.WindowsInstance	The instance creating is windows, cannot use ssh key pair to login	The error message returned because the specified instance is a Windows instance and does not support logons with SSH key pairs.
403	InstanceKeyPairLimitExceeded	Exceeding the allowed amount of instance that an key pair can attach.	The error message returned because the number of instances exceeds the maximum number allowed in a single request.
400	InvalidInstanceIds.ValueNotSupported	The specified parameter InstanceIds is not valid.	The error message returned because the specified InstanceIds parameter is invalid.
400	DependencyViolation.IoOptimize	The specified parameter InstanceIds is not valid.	The error message returned because the specified InstanceIds parameter is invalid.

2.1.2.1.12.4. DetachKeyPair

You can call this operation to detach an SSH key pair from one or more Linux instances.

Description

When you call this operation, take note of the following items:

- After you detach an SSH key pair from an instance, you must call the RebootInstance operation to restart the instance for the detach operation to take effect.
- By default, the username and password authentication method is used for an instance after you detach an SSH key pair from the instance.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DetachKeyPair	The operation that you want to perform. Set the value to DetachKeyPair.

Parameter	Type	Required	Example	Description
InstanceIds	String	Yes	["i-xxxxx****", "i-yyyyy****", ... "i-zzzzz****"]	The IDs of instances from which you want to detach the SSH key pair. The value can be a JSON array that consists of up to 50 instance IDs. Separate multiple instance IDs with commas (,).
KeyPairName	String	Yes	KeyPairV26	The name of the SSH key pair.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the SSH key pair. You can call the DescribeRegions operation to query the most recent region list.

Response parameters

Parameter	Type	Example	Description
FailCount	String	0	The number of instances from which the SSH key pair failed to be detached.
KeyPairName	String	KeyPairV26	The name of the SSH key pair.
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.
Results	Array		The result set of the detach operation.
Result			
Code	String	200	The operation status code returned. 200 indicates that the operation is successful.
InstanceId	String	i-instanc****	The ID of the instance.
Message	String	successful	The operation information returned. When the value of Code is 200, the value of Message is successful.
Success	String	true	Indicates whether the operation was successful.

Parameter	Type	Example	Description
TotalCount	String	2	The total number of instances from which the SSH key pair was detached.

Examples

Sample requests

```
https://ecs.example.com/?Action=DetachKeyPair
&RegionId=cn-qingdao-env17-d01
&InstanceIds=["i-xxx****", "i-yyy****"]
&KeyPairName=test
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DetachKeyPairResponse>
      <TotalCount>2</TotalCount>
      <RequestId>834B3E6B-2D1D-482F-81A4-810C327D4735</RequestId>
      <Results>
            <Result>
                  <Message>successful</Message>
                  <InstanceId>i-m5eg7be9ndloji64j***</InstanceId>
                  <Success>true</Success>
                  <Code>200</Code>
            </Result>
            <Result>
                  <Message>successful</Message>
                  <InstanceId>i-m5e25x2mwr0hk33dw***</InstanceId>
                  <Success>true</Success>
                  <Code>200</Code>
            </Result>
      </Results>
      <FailCount>0</FailCount>
</DetachKeyPairResponse>
```

`JSON` format

```
{
    "TotalCount": 2,
    "RequestId": "834B3E6B-2D1D-482F-81A4-810C327D4735",
    "Results": {
        "Result": [
            {
                "Message": "successful",
                "InstanceId": "i-m5eg7be9ndloji64j***",
                "Success": true,
                "Code": "200"
            },
            {
                "Message": "successful",
                "InstanceId": "i-m5e25x2mwr0hk33dw***",
                "Success": true,
                "Code": "200"
            }
        ]
    },
    "FailCount": 0
}
```

Error codes

HTTP status code	Error code	Error message	Description
400	InvalidKeyPairName.NotFound	The specified KeyPairName does not exist in our records.	The error message returned because the specified KeyPairName parameter does not exist.
403	DependencyViolation.WindowsInstance	The instance creating is windows, cannot use ssh key pair to login	The error message returned because the specified instance is a Windows instance and does not support logons with SSH key pairs.
403	InstanceKeyPairLimitExceeded	Exceeding the allowed amount of instance that an key pair can attach.	The error message returned because the number of instances exceeds the maximum number allowed in a single request.
400	InvalidInstanceIds.ValueNotSupported	The specified parameter InstanceIds is not valid.	The error message returned because the specified InstanceIds parameter is invalid.

2.1.2.1.12.5. DeleteKeyPairs

You can call this operation to delete one or more SSH key pairs.

Description

After an SSH key pair is deleted:

- You cannot query the key pair by calling the DescribeKeyPairs operation.
- If the key pair was bound to one or more ECS instances:
  - The key pair is no longer stored on Apsara Stack but the instances can still use the key pair.
  - When you call the DescribeInstance operation to query instance information, the name of the key pair name (KeyPairNames) is still returned, but no other information about the key pair.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteKeyPairs	The operation that you want to perform. Set the value to DeleteKeyPairs.
KeyPairNames	String	Yes	["skp-bp67acfmxazb4ph***", "skp-bp67acfmxazb4pi***", ... "skp-bp67acfmxazb4pk***"]	The names of SSH key pairs. The value can be a JSON array that consists of up to 100 key pair names. Separate multiple key pair names with commas (,).
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the key pair. You can call the DescribeRegions operation to query the most recent region list.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=DeleteKeyPairs
&RegionId=cn-qingdao-env17-d01
&KeyPairNames=["skp-bp67acfmxazb4ph***", "skp-bp67acfmxazb4pi***", ... "skp-bp67acfmxazb4pk***"]
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DeleteKeyPairsResponse>
      <RequestId>473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E</RequestId>
</DeleteKeyPairsResponse>
```

`JSON` format

```
{
    "RequestId": "473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E"
}
```

Error codes

HTTP status code	Error code	Error message	Description
400	MissingParameter	The input parameter "KeyPairNames" that is mandatory for processing this request is not supplied.	The error message returned because the required KeyPairNames parameter is not specified.
400	InvalidKeyPairNames.ValueNotSupported	The specified parameter "KeyPairNames" is not valid.	The error message returned because the specified KeyPairNames parameter is invalid.
403	InstanceKeyPairLimitExceeded	Exceeding the allowed amount of instance which will be deleted.	The error message returned because the number of specified key pairs exceeds the upper limit.

2.1.2.1.12.6. DescribeKeyPairs

You can call this operation to query one or more key pairs.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeKeyPairs	The operation that you want to perform. Set the value to DescribeKeyPairs.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the key pair. You can call the DescribeRegions operation to query the most recent region list.

Parameter	Type	Required	Example	Description
KeyPairName	String	No	*Finance*	The name of the key pair. You can use the asterisk (*) symbol as a wild card in regular expressions to query key pairs by performing a fuzzy search. Sample patterns: • `*SshKey` : queries key pairs whose names end with SshKey, including the key pair named SshKey. • `SshKey*` : queries key pairs whose names start with SshKey, including the key pair named SshKey. • `*SshKey*` : queries key pairs whose names include SshKey, including the key pair named SshKey. • `SshKey` : queries the key pair named SshKey.
KeyPairFingerPrint	String	No	XXXXXXXXXX	The fingerprint of the key pair. The message-digest algorithm 5 (MD5) is used based on the public key fingerprint format defined in RFC 4716. For more information, see RFC 4716.
PageNumber	Integer	No	1	The number of the page to return. Pages start from page 1. Default value: 1.
PageSize	Integer	No	10	The number of entries to return on each page. Valid values: 1 to 50 Default value: 10.
Tag.N.Key	String	No	FinanceDeptKey	The key of tag N of the key pair. Valid values of N: 1 to 20.
Tag.N.Value	String	No	FinanceDeptValue	The value of tag N of the key pair. Valid values of N: 1 to 20.
ResourceGroupId	String	No	rg-resourcegrou****	The ID of the resource group to which the key pair belongs.

Response parameters

Parameter	Type	Example	Description
KeyPairs	Array		The collection of details about key pairs.
KeyPair			
CreationTime	String	2019-12-04T13:35:00Z	The time when the key pair was created.
KeyPairFingerPrint	String	xxxxxxxxxx	The fingerprint of the key pair.
KeyPairName	String	KeyPairV27	The name of the key pair.
ResourceGroupId	String	rg-resourcegrou****	The ID of the resource group to which the key pair belongs.
Tags	Array		The tags of the key pair.
Tag			
TagKey	String	FinanceDeptKey	The tag key of the key pair.
TagValue	String	FinanceDeptValue	The tag value of the key pair.
PageNumber	Integer	1	The page number of the returned page.
PageSize	Integer	10	The number of entries returned per page.
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.
TotalCount	Integer	1	The total number of key pairs.

Examples

Sample requests

```
https://ecs.example.com/?Action=DescribeKeyPairs
&RegionId=cn-qingdao-env17-d01
&KeyPairFingerPrint=xxxxxxxxxx
&KeyPairName=test
&PageNumber=1
&PageSize=20
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeKeyPairsResponse>
      <PageNumber>1</PageNumber>
      <PageSize>2</PageSize>
      <TotalCount>1</TotalCount>
      <KeyPairs>
            <KeyPair>
                  <CreationTime>2018-10-10T01:00Z</CreationTime>
                  <ResourceGroupId></ResourceGroupId>
                  <KeyPairName>test</KeyPairName>
                  <KeyPairFingerPrint>xxxxxxxxxx</KeyPairFingerPrint>
            </KeyPair>
      </KeyPairs>
      <RequestId>473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E</RequestId>
</DescribeKeyPairsResponse>
```

`JSON` format

```
{
 "PageNumber": 1,
 "PageSize": 2,
 "TotalCount": 1,
 "KeyPairs": {
  "KeyPair": [{
   "CreationTime": "2018-10-10T01:00Z",
   "ResourceGroupId": "",
   "KeyPairName": "test",
   "KeyPairFingerPrint": "xxxxxxxxxx"
  }]
 },
 "RequestId": "473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E"
}
```

2.1.2.1.13. Elastic network interfaces

2.1.2.1.13.1. CreateNetworkInterface

You can call this operation to create an elastic network interface (ENI).

Description

- The newly created ENI is in the Available state.
- An ENI can be bound to a single VPC-type instance in the same zone.
- An ENI can be bound to a single instance. You must unbound an ENI from the instance to which the ENI is bound before you can bind the ENI to another instance.
- After an ENI is bound to another instance, the attributes of the ENI remain unchanged and its data traffic is redirected to the new instance.
- By default, an Apsara Stack tenant account can create a maximum of 100 ENIs in a region.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CreateNetworkInterface	The operation that you want to perform. Set the value to CreateNetworkInterface.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region in which to create the ENI. You can call the DescribeRegions operation to query the most recent region list.
VSwitchId	String	Yes	vsw-bp1s5fnvk4gn2tws03***	The ID of the VSwitch which to connect to the ENI in the specified VPC. The private IP addresses assigned to the ENI must be available IP addresses in the CIDR block of the VSwitch.
Tag.N.Key	String	No	test	The key of tag N to be bound to the ENI. Valid values of N: 1 to 20. The tag key cannot be an empty string. It can be up to 128 characters in length and cannot contain http:// or https://. It cannot start with acs: or aliyun.
Tag.N.Value	String	No	api	The value of tag N to be bound to the ENI. Valid values of N: 1 to 20. The tag value can be an empty string. It can be up to 128 characters in length and cannot start with acs: or contain http:// or https://.
ResourceGroupId	String	No	rg-bp67acfmxazb4ph***	The ID of the resource group to which to assign the ENI.

Parameter	Type	Required	Example	Description
PrimaryIpAddress	String	No	172.17.**. ***	The primary private IP address of the ENI. The specified IP address must be available within the CIDR block of the VSwitch. If this parameter is not specified, an available IP address is assigned from the VSwitch CIDR block at random.
SecurityGroupId	String	No	sg-bp1fg655nh68xyz9i***	The ID of the security group to which to assign the ENI. The security group and the ENI must belong to the same VPC.
SecurityGroupIds.N	RepeatList	No	sg-bp1fg655nh68xyz9i***	The ID of security group N to which to assign the ENI. The security group and the ENI must belong to the same VPC. The valid values of N depend on the maximum number of security groups to which an ENI can be added. **Note** You cannot specify `SecurityGroupId` and `SecurityGroupIds.N` at the same time.
NetworkInterfaceName	String	No	eni-eniname	The name of the ENI. The name must be 2 to 128 characters in length and can contain letters, digits, colons (:), underscores (_), and hyphens (-). The name must start with a letter and cannot start with http:// or https://. This parameter is empty by default.
Description	String	No	test	The description of the ENI. The description must be 2 to 256 characters in length and cannot start with http:// or https://. This parameter is empty by default.

Parameter	Type	Required	Example	Description
PrivateIpAddress.N	RepeatList	No	172.***. ***.177	The secondary private IP address N of the ENI. This IP address must be an available IP address in the CIDR block of the VSwitch to be connected to the ENI. Valid values of N: `0 to 10`. **Note** To assign secondary private IP addresses to the ENI, you must specify one of the `PrivateIpAddress` and `SecondaryPrivateIpAddressCount` parameters but you cannot both of them.
SecondaryPrivateIpAddressCount	Integer	No	1	The number of private IP addresses to be created automatically by ECS.
ClientToken	String	No	123e4567-e89b-12d3-a456-426655440000	The client token that is used to ensure the idempotence of the request. You can use the client to generate the value, but you must ensure that it is unique among different requests. The **ClientToken** value can only contain ASCII characters and cannot exceed 64 characters in length. For more information, see How to ensure idempotence in ECS Developer Guide.

Response parameters

Parameter	Type	Example	Description
NetworkInterfaceId	String	eni-bp14v2sdd3v8htlnm***	The ID of the ENI.
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=CreateNetworkInterface
&RegionId=cn-qingdao-env17-d01
&SecurityGroupIds.1=sg-bp1fg655nh68xyz9i***
&SecurityGroupIds.2=sg-bp67acfmxazb4ph***

}
```

Error codes

HTTP status code	Error code	Error message	Description
403	InvalidUserType.NotSupported	%s	The error message returned because your account does not support this operation.
403	Abs.InvalidAccount.NotFound	%s	The error message returned because your Apsara Stack tenant account does not exist or your AccessKey pair has expired.
400	MissingParameter	%s	The error message returned because a required parameter is not specified.

HTTP status code	Error code	Error message	Description
403	Forbidden.NotSupportRAM	%s	The error message returned because RAM users are not authorized to perform this operation.
400	UnsupportedParameter	%s	The error message returned because a specified parameter is not supported.
403	Forbidden.SubUser	%s	The error message returned because your account is not authorized to manage this resource. Contact the owner of the Apsara Stack tenant account for authorization.
400	InvalidParameter	%s	The error message returned because a specified parameter is invalid.
400	InvalidInstanceID.Malformed	%s	The error message returned because the specified InstanceId parameter is invalid.
400	InvalidOperation.InvalidEcsState	%s	The error message returned because the operation is not supported while the instance is in the current state.
400	InvalidOperation.InvalidEniState	%s	The error message returned because the operation is not supported while the ENI is in the current state.
400	InvalidOperation.DetachPrimaryEniNotAllowed	%s	The error message returned because the primary ENI cannot be unbound from the instance.
404	InvalidEcsId.NotFound	%s	The error message returned because the specified instance ID does not exist.
404	InvalidEniId.NotFound	%s	The error message returned because the specified ENI ID does not exist.
404	InvalidVSwitchId.NotFound	%s	The error message returned because the specified VSwitch ID does not exist.

HTTP status code	Error code	Error message	Description
404	InvalidSecurityGroupId.NotFound	%s	The error message returned because the specified security group ID does not exist.
403	MaxEniCountExceeded	%s	The error message returned because the maximum number of ENIs that can be managed has been reached.
403	EniPerInstanceLimitExceeded	%s	The error message returned because the maximum number of ENIs that can be bound to the specified instance has been reached.
403	InvalidOperation.AvailabilityZoneMismatch	%s	The error message returned because the operation is invalid.
403	InvalidOperation.VpcMismatch	%s	The error message returned because the operation is invalid. Check whether the VPC in the operation corresponds to other parameters.
403	SecurityGroupInstanceLimitExceed	%s	The error message returned because the maximum number of instances in the specified security group has been reached.
403	InvalidSecurityGroupId.NotVpc	%s	The error message returned because the specified SecurityGroupId parameter is invalid and the specified security group is not of the VPC type.
403	InvalidOperation.InvalidEniType	%s	The error message returned because the current ENI type does not support this operation.
403	InvalidVSwitchId.IpNotEnough	%s	The error message returned because available IP addresses in the CIDR block of the specified VSwitch are insufficient.
403	InvalidVSwitchId.IpInvalid	%s	The error message returned because the specified private IP address is invalid.

HTTP status code	Error code	Error message	Description
400	Forbidden.RegionId	%s	The error message returned because the service is not available in the current region.
404	InvalidResourceGroup.NotFound	The ResourceGroup provided does not exist in our records.	The error message returned because the specified ResourceGroupId parameter does not exist.
400	Duplicate.TagKey	The Tag.N.Key contain duplicate key.	The error message returned because the specified tag key already exists. Tag keys must be unique.
400	InvalidTagKey.Malformed	The specified Tag.n.Key is not valid.	The error message returned because the specified Tag.N.Key parameter is invalid.
400	InvalidTagValue.Malformed	The specified Tag.n.Value is not valid.	The error message returned because the specified Tag.N.Value parameter is invalid.
403	QuotaExceed.Tags	%s	The error message returned because the number of specified tags exceeds the upper limit.
403	InvalidIp.Address	%s	The error message returned because the specified IPv6 address is invalid.
403	InvalidIp.IpRepeated	%s	The error message returned because the specified IP address already exists.
400	InvalidPrivateIpAddress.Duplicated	Specified private IP address is duplicated.	The error message returned because the specified private IP address is already in use. Try another IP address.
400	InvalidParameter.Conflict	%s	The error message returned because a specified parameter is invalid. Check whether parameter conflicts exist.

2.1.2.1.13.2. AttachNetworkInterface

You can call this operation to bind an elastic network interface (ENI) to an ECS instance in a VPC.

Description

When you call this operation, take note of the following items:

- The ENI must be in the **Available** (`Available`) state. Each ENI can be bound to a single instance.
- The instance must be in the **Running** (`Running`) or **Stopped** (`Stopped`). When you bind ENIs to instances of some instance types, the instances must be in the **Stopped** (`Stopped`) state.

  > **Note** If the last start time of the instance (including the last start time of the instance if it is newly purchased, the last restart time of the instance, the last reactivation time of the instance) is before April 1, 2018 and the instance stays in the Running state, you must call the RebootInstance operation to restart the instance. Otherwise, the ENI cannot be attached to the instance.

- You can bind multiple ENIs to a single instance.
- The instance must be in the same zone and the same VPC as the VSwitch to which the ENI is connected.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	AttachNetworkInterface	The operation that you want to perform. Set the value to AttachNetworkInterface.
InstanceId	String	Yes	i-bp16qstyvxj9gpqw****	The ID of the instance.
NetworkInterfaceId	String	Yes	eni-bp17pdijfczax1huji****	The ID of the ENI.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the instance. You can call the DescribeRegions operation to query the most recent region list.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=AttachNetworkInterface
&RegionId=cn-qingdao-env17-d01
&InstanceId=i-bp16qstyvxj9gpqw****
&NetworkInterfaceId=eni-bp17pdijfczax1huji****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<AttachNetworkInterfaceResponse>
      <RequestId>473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E</RequestId>
</AttachNetworkInterfaceResponse>
```

`JSON` format

```
{
    "RequestId": "473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E"
}
```

Error codes

HTTP status code	Error code	Error message	Description
403	InvalidUserType.NotSupported	%s	The error message returned because your account does not support this operation.
403	Abs.InvalidAccount.NotFound	%s	The error message returned because your Apsara Stack tenant account does not exist or your AccessKey pair has expired.
400	MissingParameter	%s	The error message returned because a required parameter is not specified.
403	Forbidden.NotSupportRAM	%s	The error message returned because RAM users are not authorized to perform this operation.
400	UnsupportedParameter	%s	The error message returned because a specified parameter is not supported.

HTTP status code	Error code	Error message	Description
403	Forbidden.SubUser	%s	The error message returned because your account is not authorized to manage this resource. Contact the owner of the Apsara Stack tenant account for authorization.
400	InvalidParameter	%s	The error message returned because a specified parameter is invalid.
400	InvalidInstanceID.Malformed	%s	The error message returned because the specified InstanceId parameter is invalid.
400	InvalidOperation.InvalidRegion	%s	The error message returned because the specified RegionId parameter is invalid.
400	InvalidOperation.InvalidEcsState	%s	The error message returned because the operation is not supported while the instance is in the current state.
400	InvalidOperation.InvalidEniState	%s	The error message returned because the operation is not supported while the ENI is in the current state.
400	InvalidOperation.DetachPrimaryEniNotAllowed	%s	The error message returned because the primary ENI cannot be unbound from the instance.
404	InvalidEcsId.NotFound	%s	The error message returned because the specified instance ID does not exist.
404	InvalidEniId.NotFound	%s	The error message returned because the specified ENI ID does not exist.
404	InvalidVSwitchId.NotFound	%s	The error message returned because the specified VSwitch does not exist.
404	InvalidSecurityGroupId.NotFound	%s	The error message returned because the specified security group ID does not exist.

HTTP status code	Error code	Error message	Description
403	MaxEniCountExceeded	%s	The error message returned because the maximum number of ENIs that can be managed has been reached.
403	EniPerInstanceLimitExceeded	%s	The error message returned because the maximum number of ENIs that can be bound to the specified instance has been reached.
403	InvalidOperation.AvailabilityZoneMismatch	%s	The error message returned because the operation is invalid.
403	InvalidOperation.VpcMismatch	%s	The error message returned because the operation is invalid. Check whether the VPC in the operation corresponds to other parameters.
403	SecurityGroupInstanceLimitExceed	%s	The error message returned because the maximum number of instances in the specified security group has been reached.
403	InvalidSecurityGroupId.NotVpc	%s	The error message returned because the specified SecurityGroupId parameter is invalid and the specified security group is not of the VPC type.
403	InvalidOperation.InvalidEniType	%s	The error message returned because the current ENI type does not support this operation.
400	Forbidden.RegionId	%s	The error message returned because the service is not available in the current region.
403	InvalidInstanceId.NotFound	%s	The error message returned because the specified InstanceId parameter does not exist.
400	InvalidOperation.InvalidGeneration	%s	The error message returned because the operation is invalid.
400	InvalidParams.EniId	%s	The error message returned because the specified ENI ID is invalid.

HTTP status code	Error code	Error message	Description
403	InvalidOperation.Ipv4CountExceeded	%s	The error message returned because the maximum number of IPv4 addresses has been reached.
403	InvalidOperation.EniServiceManaged	%s	The error message returned because the operation is invalid.
403	InvalidOperation.Ipv6NotSupport	%s	The error message returned because IPv6 does not support this operation.

2.1.2.1.13.3. AssignPrivateIpAddresses

You can call this operation to assign one or more secondary private IP addresses to an elastic network interface (ENI). You can specify available private IP addresses within the CIDR block of the VSwitch to which the ENI is connected. Alternatively, you can specify a number of private IP addresses for ECS to assign them automatically.

Description

- The ENI to which you want to assign private IP addresses must be in the Available (Available) or Bound (InUse) state.
- When you perform operations on the primary ENI, the instance to which the ENI is bound must be in the Running or Stopped state.
- When an ENI is in the Available state, you can assign up to 10 secondary private IP addresses to it. When an ENI is bound to an instance, the number of private IP addresses that can be assigned to the ENI is subject to the instance type.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	AssignPrivateIpAddresses	The operation that you want to perform. Set the value to AssignPrivateIpAddresses.
NetworkInterfaceId	String	Yes	eni-bp67acfmxazb4p****	The ID of the ENI.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the ENI. You can call the DescribeRegions operation to query the most recent region list.

Parameter	Type	Required	Example	Description
PrivateIpAddress.N	RepeatList	No	10.1.2.1	Private IP address N to be assigned. Select one or more IP addresses from within the CIDR block of the VSwitch to which the ENI is connected. Valid values of N: • When the ENI is in the `Available` (Available) state, the valid values of N are 1 to 10. • When the ENI is in the `Bound` (InUse) state, the valid values of N are subject to the instance type. To assign secondary private IP addresses, you must specify one of the `PrivateIpAddress` and `SecondaryPrivateIpAddressCount` parameters but you cannot specify both of them.
SecondaryPrivateIpAddressCount	Integer	No	1	The number of private IP addresses to be automatically assigned from within the CIDR block of the VSwitch.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=AssignPrivateIpAddresses
&NetworkInterfaceId=eni-bp67acfmxazb4p****
&RegionId=cn-qingdao-env17-d01
&PrivateIpAddress.1=10.1.2.1
&PrivateIpAddress.2=10.1.2.2
&<Common request parameters>
```

Sample success responses

`XML` format

```
<AssignPrivateIpAddressesResponse>
      <RequestId>04F0F334-1335-436C-A1D7-6C044FE70008</RequestId>
</AssignPrivateIpAddressesResponse>
```

`JSON` format

```
{
    "RequestId": "04F0F334-1335-436C-A1D7-6C044FE70008"
}
```

Error codes

HTTP status code	Error code	Error message	Description
403	InvalidUserType.NotSupported	%s	The error message returned because your account does not support this operation.
403	Abs.InvalidAccount.NotFound	%s	The error message returned because your Apsara Stack tenant account does not exist or your AccessKey pair has expired.
403	MissingParameter	%s	The error message returned because a required parameter is not specified.
403	Forbidden.NotSupportRAM	%s	The error message returned because RAM users are not authorized to perform this operation.
400	UnsupportedParameter	%s	The error message returned because a specified parameter is not supported.
403	Forbidden.SubUser	%s	The error message returned because your account is not authorized to manage this resource. Contact the owner of the Apsara Stack tenant account for authorization.
400	InvalidParameter	%s	The error message returned because a specified parameter is invalid.
400	InvalidInstanceID.Malformed	%s	The error message returned because the specified InstanceId parameter is invalid.

HTTP status code	Error code	Error message	Description
400	InvalidOperation.InvalidEcsState	%s	The error message returned because the operation is not supported while the instance is in the current state.
400	InvalidOperation.InvalidEniState	%s	The error message returned because the operation is not supported while the ENI is in the current state.
400	InvalidOperation.DetachPrimaryEniNotAllowed	%s	The error message returned because primary ENIs cannot be unbound from the instance.
404	InvalidEcsId.NotFound	%s	The error message returned because the specified instance ID does not exist.
404	InvalidEniId.NotFound	%s	The error message returned because the specified NetworkInterfaceId parameter does not exist.
404	InvalidVSwitchId.NotFound	%s	The error message returned because the specified VSwitch ID does not exist.
404	InvalidSecurityGroupId.NotFound	%s	The error message returned because the specified security group ID does not exist.
403	MaxEniCountExceeded	%s	The error message returned because the maximum number of ENIs that can be managed has been reached.
403	EniPerInstanceLimitExceeded	%s	The error message returned because the maximum number of ENIs that can be bound to the specified instance has been reached.
403	InvalidOperation.AvailabilityZoneMismatch	%s	The error message returned because the operation is invalid.
403	InvalidOperation.VpcMismatch	%s	The error message returned because the operation is invalid. Check whether the VPC in the operation corresponds to other parameters.

HTTP status code	Error code	Error message	Description
403	SecurityGroupInstanceLimitExceed	%s	The error message returned because the maximum number of instances that can be added to the specified security group has been reached.
403	InvalidSecurityGroupId.NotVpc	%s	The error message returned because the specified SecurityGroupId parameter is invalid and the specified security group is not of the VPC type.
403	InvalidOperation.InvalidEniType	%s	The error message returned because the current ENI type does not support this operation.
404	InvalidInstanceId.NotFound	%s	The error message returned because the specified instance does not exist.
403	InvalidVSwitchId.IpNotEnough	%s	The error message returned because available IP addresses within the CIDR block of the specified VSwitch are insufficient.
403	InvalidVSwitchId.IpInvalid	%s	The error message returned because the specified private IP address is invalid.
403	InvalidIp.IpAssigned	%s	The error message returned because the specified IP address is already in use.
403	Operation.Conflict	%s	The error message returned because this operation conflicts with another operation in progress. Try again later.
400	Forbidden.RegionId	%s	The error message returned because the service is not available in the current region.
400	InvalidAction	%s	The error message returned because the operation is invalid.
403	InvalidOperation.Ipv4CountExceeded	%s	The error message returned because the maximum number of IPv4 addresses has been reached.

HTTP status code	Error code	Error message	Description
403	InvalidOperation.EniServiceManaged	%s	The error message returned because the operation is invalid.
400	InvalidPrivateIpAddress.Duplicated	Specified private IP address is duplicated.	The error message returned because the specified private IP address is already in use. Try another IP address.

2.1.2.1.13.4. UnassignPrivateIpAddresses

You can call this operation to unassign one or more secondary private IP addresses from an elastic network interface (ENI).

Description

- The ENI from which you want to unassign private IP addresses must be in the **Available** (Available) or **Bound** (InUse) state.
- When you perform operations on the primary ENI, the instance to which the ENI is bound must be in the **Running** (Running) or **Stopped** (Stopped) state.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	UnassignPrivateIpAddresses	The operation that you want to perform. Set the value to UnassignPrivateIpAddresses.
NetworkInterfaceId	String	Yes	eni-bp67acfmxazb4ph***	The ID of the ENI from which you want to unassign one or more secondary private IP addresses.
PrivateIpAddress.N	RepeatList	Yes	192.168.**.1	The secondary private IP addresses to be unassigned.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the ENI. You can call the DescribeRegions operation to query the most recent region list.

Response parameters

Parameter	Type	Example	Description

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=UnassignPrivateIpAddresses
&NetworkInterfaceId=eni-bp67acfmxazb4ph***
&PrivateIpAddress.1=192.168. **.1
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<UnassignPrivateIpAddressesResponse>
      <RequestId>04F0F334-1335-436C-A1D7-6C044FE70008</RequestId>
</UnassignPrivateIpAddressesResponse>
```

`JSON` format

```
{
    "RequestId": "04F0F334-1335-436C-A1D7-6C044FE70008"
}
```

Error codes

HTTP status code	Error code	Error message	Description
403	InvalidUserType.NotSupported	%s	The error message returned because your account does not support this operation.
403	Abs.InvalidAccount.NotFound	%s	The error message returned because your Apsara Stack tenant account does not exist or your AccessKey pair has expired.
403	MissingParameter	%s	The error message returned because a required parameter is not specified.

HTTP status code	Error code	Error message	Description
403	Forbidden.NotSupportRAM	%s	The error message returned because RAM users are not authorized to perform this operation.
400	UnsupportedParameter	%s	The error message returned because a specified parameter is not supported.
403	Forbidden.SubUser	%s	The error message returned because your account is not authorized to manage this resource. Contact the owner of the Apsara Stack tenant account for authorization.
400	InvalidParameter	%s	The error message returned because a specified parameter is invalid.
400	InvalidInstanceID.Malformed	%s	The error message returned because the specified InstanceId parameter is invalid.
400	InvalidOperation.InvalidEcsState	%s	The error message returned because the operation is not supported while the instance is in the current state.
400	InvalidOperation.InvalidEniState	%s	The error message returned because the operation is not supported while the ENI is in the current state.
400	InvalidOperation.DetachPrimaryEniNotAllowed	%s	The error message returned because primary ENIs cannot be unbound from the instance.
404	InvalidEcsId.NotFound	%s	The error message returned because the specified instance ID does not exist.
404	InvalidEniId.NotFound	%s	The error message returned because the specified NetworkInterfaceId parameter does not exist.
404	InvalidVSwitchId.NotFound	%s	The error message returned because the specified VSwitch ID does not exist.

HTTP status code	Error code	Error message	Description
404	InvalidSecurityGroupId.NotFound	%s	The error message returned because the specified security group ID does not exist.
403	MaxEniCountExceeded	%s	The error message returned because the maximum number of ENIs that can be managed has been reached.
403	EniPerInstanceLimitExceeded	%s	The error message returned because the maximum number of ENIs that can be bound to the specified instance has been reached.
403	InvalidOperation.AvailabilityZoneMismatch	%s	The error message returned because the operation is invalid.
403	InvalidOperation.VpcMismatch	%s	The error message returned because the operation is invalid. Check whether the VPC in the operation corresponds to other parameters.
403	SecurityGroupInstanceLimitExceed	%s	The error message returned because the maximum number of instances that can be added to the specified security group has been reached.
403	InvalidSecurityGroupId.NotVpc	%s	The error message returned because the specified SecurityGroupId parameter is invalid and the specified security group is not of the VPC type.
403	InvalidOperation.InvalidEniType	%s	The error message returned because the current ENI type does not support this operation.
404	InvalidInstanceId.NotFound	%s	The error message returned because the specified instance does not exist.
403	InvalidVSwitchId.IpInvalid	%s	The error message returned because the specified private IP address is invalid.

HTTP status code	Error code	Error message	Description
403	InvalidIp.IpUnassigned	%s	The error message returned because the specified IP address is not assigned.
403	Operation.Conflict	%s	The error message returned because this operation conflicts with another operation in progress. Try again later.
400	Forbidden.RegionId	%s	The error message returned because the service is not available in the current region.
400	InvalidAction	%s	The error message returned because the operation is invalid.
403	InvalidOperation.EniServiceManaged	%s	The error message returned because the operation is invalid.

2.1.2.1.13.5. DescribeNetworkInterfaces

You can call this operation to query the list of elastic network interfaces (ENIs).

Description

`You can use one of the following methods to check` the responses returned by the DescribeNetworkInterfaces operation:

- Method 1: Use `NextToken` to configure the query token. Set the value of this parameter to the `NextToken` value returned in the last call to `DescribeNetworkInterfaces`. Then use `MaxResults` to set the maximum number of entries to return on each page.
- Method 2: Use `PageSize` to set the number of entries to return on each page and then use `PageNumber` to set the number of the page to return.

  You can use only one of the preceding methods. If a large number of entries are returned, we recommend that you use method 1. If `NextToken` is set, `PageSize` and `PageNumber` will not take effect and `TotalCount` in the response will be invalid.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeNetworkInterfaces	The operation that you want to perform. Set the value to DescribeNetworkInterfaces.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the ENI. You can call the DescribeRegions operation to query the most recent region list.
Tag.N.Key	String	No	TestKey	The key of tag N that is bound to the ENI. Valid values of N: 1 to 20.
Tag.N.Value	String	No	TestValue	The value of tag N that is bound to the ENI. Valid values of N: 1 to 20.
ResourceGroupId	String	No	rg-bp67acfmxazb4p****	The ID of the resource group to which the ENI belongs.
VSwitchId	String	No	vsw-bp16usj2p27htro3****	The ID of the VSwitch to which the ENI is connected.
VpcId	String	No	vpc-wz9wh0fywtu5szszb****	The ID of the VPC to which the ENI belongs.
PrimaryIpAddress	String	No	192.168.*. *	The primary private IP address of the ENI.
PrivateIpAddress.N	RepeatList	No	192.168.*. *	Secondary private IP address N of the ENI. Valid values of N: 1 to 100.
SecurityGroupId	String	No	sg-bp144yr32sx6ndw****	The ID of the security group to which the ENI belongs.
NetworkInterfaceName	String	No	my-eni-name	The name of the ENI.
Type	String	No	Secondary	The type of the ENI. Valid values: • Primary • Secondary This parameter is empty by default, which indicates that both primary and secondary ENIs are queried.
InstanceId	String	No	i-bp1e2l6djkndyuli*****	The ID of the instance to which an ENI is bound.

Parameter	Type	Required	Example	Description
NetworkInterfaceId.N	RepeatList	No	eni-bp125p95hhdhn3ot****	The ID of ENI N. Valid values of N: 1 to 100.
ServiceManaged	Boolean	No	true	Specifies whether the user is an Apsara Stack service or a distributor.
Status	String	No	InUse	The state of the ENI. Valid values: • Creating: The ENI is being created. • Available: The ENI is not bound to any instance. • Attaching: The ENI is being bound to an instance. • InUse: The ENI is bound to an instance. • Detaching: The ENI is being unbound from an instance. • Deleting: The ENI is being deleted. • CreateFailed: The ENI failed to be created. This parameter is empty by default, which indicates that ENIs in all states are queried.
PageNumber	Integer	No	1	The number of the page to return. Pages start from page 1. Default value: 1.
PageSize	Integer	No	100	The number of entries to return on each page. Valid values: 1 to 100. Default value: 10. For more information about how to check responses returned by this operation, see the preceding "Description" section.

Parameter	Type	Required	Example	Description
NextToken	String	No	AAAAAdDWBF2****	The query token. Set the value to the `NextToken` value returned in the last call to DescribeNetworkInterfaces. For more information about how to check responses returned by this operation, see the preceding "Description" section.
MaxResults	Integer	No	50	The maximum number of entries to return on each page. Valid values: 1 to 500 Default value: 10

Response parameters

Parameter	Type	Example	Description
NetworkInterfaceSets	Array		The collection of details about ENIs.
NetworkInterfaceSet			
AssociatedPublicIp	Struct		The public IP address associated with the secondary private IP address of the ENI.
AllocationId	String	eip-2ze88m67qx5z****	The ID of the elastic IP address (EIP).
PublicIpAddress	String	116.62.*. *	**Note** This parameter is not supported.
Attachment	Struct		The binding state of the ENI.
DeviceIndex	Integer	1	
InstanceId	String	null	
TrunkNetworkInterfaceId	String	null	
CreationTime	String	2017-11-24T06:14:22Z	The time when the ENI was created.

Parameter	Type	Example	Description
Description	String	DescriptionTest	The description of the ENI.
InstanceId	String	i-bp1e2l6djkndyuli****	The ID of the instance to which the ENI was bound. **Note** For the ENIs that are managed and controlled by other Apsara Stack services, no instance IDs are returned.
Ipv6Sets	Array		The IPv6 addresses assigned to the ENI.
Ipv6Set			
Ipv6Address	String	2408:4321:180:1701:94c7:bc38:3bfa:****	The IPv6 address assigned to the ENI.
MacAddress	String	00:16:3e:12:e7:**	The MAC address of the ENI.
NetworkInterfaceId	String	eni-bp125p95hhdhn3ot*****	The ID of the ENI.
NetworkInterfaceName	String	my-eni-name	The name of the ENI.
OwnerId	String	123456****	The ID of the account that owns the ENI.
PrivateIpAddress	String	172.17.*. *	The private IP address of the ENI.
PrivateIpSets	Array		The private IP addresses of the ENI.
PrivateIpSet			
AssociatedPublicIp	Struct		The public IP address associated with the ENI.
AllocationId	String	eip-2ze88m67qx5z****	The ID of the EIP.

Parameter	Type	Example	Description
PublicIpAddress	String	116.62.*. *	Note This parameter is not supported.
Primary	Boolean	true	Indicates whether the IP address is the primary private IP address.
PrivateIpAddress	String	172.17.*. *	The private IP address of the instance.
QueueNumber	Integer	2	The queue number of the ENI.
ResourceGroupId	String	rg-2ze88m67qx5z****	The ID of the resource group.
SecurityGroupIds	List	sg-bp18kz60mefsicfg****	The IDs of security groups.
ServiceID	Long	12345678910	The ID of the distributor to which the ENI belongs.
ServiceManaged	Boolean	true	Indicates whether the user is an Apsara Stack service or a distributor.
Status	String	Available	The state of the ENI.
Tags	Array		The tags of the ENI.
Tag			
TagKey	String	TestKey	The key of the tag.
TagValue	String	TestValue	The value of the tag.
Type	String	Secondary	The type of the ENI.
VSwitchId	String	vsw-bp16usj2p27htro3****	The ID of the VSwitch.

Parameter	Type	Example	Description
VpcId	String	vpc-bp1j7w3gc1cexjqd****	The ID of the VPC.
ZoneId	String	cn-qingdao-env17-amtest11001-a	The ID of the zone.
NextToken	String	AAAAAdDWBF2****	The query token returned in this call.
PageNumber	Integer	1	The page number of the returned page.
PageSize	Integer	1	The number of entries returned per page.
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.
TotalCount	Integer	70	The total number of ENIs.

Error codes

HTTP status code	Error code	Error message	Description
403	InvalidUserType.NotSupported	%s	The error message returned because your account does not support this operation.
403	Abs.InvalidAccount.NotFound	%s	The error message returned because your Apsara Stack tenant account does not exist or your AccessKey pair has expired.
400	MissingParameter	%s	The error message returned because a required parameter is not specified.
403	Forbidden.NotSupportRAM	%s	The error message returned because RAM users are not authorized to perform this operation.
400	UnsupportedParameter	%s	The error message returned because a specified parameter is not supported.
403	Forbidden.SubUser	%s	The error message returned because your account is not authorized to manage this resource. Contact the owner of the Apsara Stack tenant account for authorization.
400	InvalidParameter	%s	The error message returned because a specified parameter is invalid.
400	InvalidInstanceID.Malformed	%s	The error message returned because the specified InstanceId parameter is invalid.
400	InvalidOperation.InvalidEcsState	%s	The error message returned because the operation is not supported while the instance is in the current state.
400	InvalidOperation.InvalidEniState	%s	The error message returned because the operation is not supported while the ENI is in the current state.
400	InvalidOperation.DetachPrimaryEniNotAllowed	%s	The error message returned because primary ENIs cannot be unbound from the instance.

HTTP status code	Error code	Error message	Description
404	InvalidEcsId.NotFound	%s	The error message returned because the specified InstanceId parameter does not exist.
404	InvalidEniId.NotFound	%s	The error message returned because the specified NetworkInterfaceId.N parameter does not exist.
404	InvalidVSwitchId.NotFound	%s	The error message returned because the specified VSwitchId parameter does not exist.
404	InvalidSecurityGroupId.NotFound	%s	The error message returned because the specified SecurityGroupId parameter does not exist.
403	MaxEniCountExceeded	%s	The error message returned because the maximum number of ENIs that can be managed has been reached.
403	EniPerInstanceLimitExceeded	%s	The error message returned because the maximum number of ENIs that can be bound to the specified instance has been reached.
403	InvalidOperation.AvailabilityZoneMismatch	%s	The error message returned because the operation is invalid.
403	InvalidOperation.VpcMismatch	%s	The error message returned because the operation is invalid. Check whether the VPC in the operation corresponds to other parameters.
403	SecurityGroupInstanceLimitExceed	%s	The error message returned because the maximum number of instances that can be added to the specified security group has been reached.
403	InvalidSecurityGroupId.NotVpc	%s	The error message returned because the specified SecurityGroupId parameter is invalid and the specified security group is not of the VPC type.

HTTP status code	Error code	Error message	Description
403	InvalidOperation.InvalidEniType	%s	The error message returned because the current ENI type does not support this operation.
400	Forbidden.RegionId	%s	The error message returned because the service is not available in the current region.

2.1.2.1.13.6. DetachNetworkInterface

You can call this operation to unbind an elastic network interface (ENI) from an ECS instance.

Description

When you call this operation, take note of the following items:

- The primary ENIs of ECS instances cannot be unbound.
- The ENI must be in the Detaching (Detaching) or Bound (InUse) state.
- The instance must be in the Running (Running) or Stopped (Stopped) state.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DetachNetworkInterface	The operation that you want to perform. Set the value to DetachNetworkInterface.
InstanceId	String	Yes	i-bp67acfmxazb4p****	The ID of the instance from which you want to unbind an ENI.
NetworkInterfaceId	String	Yes	eni-bp67acfmxazb4p****	The ID of the ENI to be unbound.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the ENI. You can call the DescribeRegions operation to query the most recent region list.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=DetachNetworkInterface
&InstanceId=i-bp67acfmxazb4p****
&NetworkInterfaceId=eni-bp67acfmxazb4p****
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DetachNetworkInterfaceResponse>
      <RequestId>473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E</RequestId>
</DetachNetworkInterfaceResponse>
```

`JSON` format

```
{
    "RequestId": "473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E"
}
```

Error codes

HTTP status code	Error code	Error message	Description
403	InvalidUserType.NotSupported	%s	The error message returned because your account does not support this operation.
403	Abs.InvalidAccount.NotFound	%s	The error message returned because your Apsara Stack tenant account does not exist or your AccessKey pair has expired.
400	MissingParameter	%s	The error message returned because a required parameter is not specified.

HTTP status code	Error code	Error message	Description
403	Forbidden.NotSupportRAM	%s	The error message returned because RAM users are not authorized to perform this operation.
400	UnsupportedParameter	%s	The error message returned because a specified parameter is not supported.
403	Forbidden.SubUser	%s	The error message returned because you are not authorized to manage this resource. Contact the owner of the Apsara Stack tenant account for authorization.
400	InvalidParameter	%s	The error message returned because a specified parameter is invalid.
400	InvalidInstanceID.Malformed	%s	The error message returned because the specified InstanceId parameter is invalid.
400	InvalidOperation.InvalidRegion	%s	The error message returned because the specified RegionId parameter is invalid.
400	InvalidOperation.InvalidEcsState	%s	The error message returned because the operation is not supported while the instance is in the current state.
400	InvalidOperation.InvalidEniState	%s	The error message returned because the operation is not supported while the ENI is in the current state.
400	InvalidOperation.DetachPrimaryEniNotAllowed	%s	The error message returned because primary ENIs cannot be unbound from their instances.
404	InvalidEcsId.NotFound	%s	The error message returned because the specified instance ID does not exist.
404	InvalidEniId.NotFound	%s	The error message returned because the specified ENI ID does not exist.

HTTP status code	Error code	Error message	Description
404	InvalidVSwitchId.NotFound	%s	The error message returned because the specified VSwitch ID does not exist.
404	InvalidSecurityGroupId.NotFound	%s	The error message returned because the specified security group ID does not exist.
403	MaxEniCountExceeded	%s	The error message returned because the maximum number of ENIs that can be managed has been reached.
403	EniPerInstanceLimitExceeded	%s	The error message returned because the maximum number of ENIs that can be bound to the specified instance has been reached.
403	InvalidOperation.AvailabilityZoneMismatch	%s	The error message returned because the operation is invalid.
403	InvalidOperation.VpcMismatch	%s	The error message returned because the operation is invalid. Check whether the VPC in the operation corresponds to other parameters.
403	SecurityGroupInstanceLimitExceed	%s	The error message returned because the maximum number of instances in the specified security group has been reached.
403	InvalidSecurityGroupId.NotVpc	%s	The error message returned because the specified security group ID is invalid and the network type of the security group is not VPC.
403	InvalidOperation.InvalidEniType	%s	The error message returned because the current ENI type does not support the operation.
400	Forbidden.RegionId	%s	The error message returned because the service is not available in the current region.

HTTP status code	Error code	Error message	Description
400	InvalidParams.EniId	%s	The error message returned because the specified ENI ID is invalid.
403	InvalidOperation.EniServiceManaged	%s	The error message returned because the operation is invalid.
403	InvalidOperation.EniLinked	%s	The error message returned because the operation is not supported while ENIs are bound to the instance.
403	InvalidInstanceId.NotFound	%s	The error message returned because the specified InstanceId parameter does not exist.

2.1.2.1.13.7. DeleteNetworkInterface

You can call this operation to delete an elastic network interface (ENI).

Description

- The ENI must be in the Available (Available) state.
- If the ENI is bound to an ECS instance, you must unbind the ENI from the ECS instance (DetachNetworkInterface) before you can delete the ENI.
- After an ENI is deleted:
  - The primary private IP address of the ENI is automatically released.
  - The ENI is automatically removed from its security groups.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DeleteNetworkInterface	The operation that you want to perform. Set the value to DeleteNetworkInterface.
NetworkInterfaceId	String	Yes	eni-bp14v2sdd3v8htlnm***	The ID of the ENI to be deleted.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the ENI. You can call the DescribeRegions operation to query the most recent region list.

Response parameters

Parameter	Type	Example	Description
RequestId	String	F3CD6886-D8D0-4FEE-B93E-1B73239673DE	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=DeleteNetworkInterface
&NetworkInterfaceId=eni-bp14v2sdd3v8htlnm***
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DetachNetworkInterface>
      <RequestId>04F0F334-1335-436C-A1D7-6C044FExxxxx</RequestId>
</DetachNetworkInterface>
```

`JSON` format

```
{
    "RequestId": "04F0F334-1335-436C-A1D7-6C044FExxxxx"
}
```

Error codes

HTTP status code	Error code	Error message	Description
403	InvalidUserType.NotSupported	%s	The error message returned because your account does not support this operation.
403	Abs.InvalidAccount.NotFound	%s	The error message returned because your Apsara Stack tenant account does not exist or your AccessKey pair has expired.
400	MissingParameter	%s	The error message returned because a required parameter is not specified.
403	Forbidden.NotSupportRAM	%s	The error message returned because RAM users are not authorized to perform this operation.

HTTP status code	Error code	Error message	Description
400	UnsupportedParameter	%s	The error message returned because a specified parameter is not supported.
403	Forbidden.SubUser	%s	The error message returned because you are not authorized to manage this resource. Contact the owner of the Apsara Stack tenant account for authorization.
400	InvalidParameter	%s	The error message returned because a specified parameter is invalid.
400	InvalidInstanceID.Malformed	%s	The error message returned because the specified instance ID is invalid.
400	InvalidOperation.InvalidEcsState	%s	The error message returned because the operation is not supported while the instance is in the current state.
400	InvalidOperation.InvalidEniState	%s	The error message returned because the operation is not supported while the ENI is in the current state.
400	InvalidOperation.DetachPrimaryEniNotAllowed	%s	The error message returned because primary ENIs cannot be unbound from their instances.
404	InvalidEcsId.NotFound	%s	The error message returned because the specified instance ID does not exist.
404	InvalidEniId.NotFound	%s	The error message returned because the specified ENI ID does not exist.
404	InvalidVSwitchId.NotFound	%s	The error message returned because the specified VSwitch ID does not exist.
404	InvalidSecurityGroupId.NotFound	%s	The error message returned because the specified security group ID does not exist.

HTTP status code	Error code	Error message	Description
403	MaxEniCountExceeded	%s	The error message returned because the maximum number of ENIs that can be managed has been reached.
403	EniPerInstanceLimitExceeded	%s	The error message returned because the maximum number of ENIs that can be bound to the specified instance has been reached.
403	InvalidOperation.AvailabilityZoneMismatch	%s	The error message returned because the operation is invalid.
403	InvalidOperation.VpcMismatch	%s	The error message returned because the operation is invalid. Check whether the VPC in the operation corresponds to other parameters.
403	SecurityGroupInstanceLimitExceed	%s	The error message returned because the maximum number of instances in the specified security group has been reached.
403	InvalidSecurityGroupId.NotVpc	%s	The error message returned because the specified security group ID is invalid and the network type of the security group is not VPC.
403	InvalidOperation.InvalidEniType	%s	The error message returned because the current ENI type does not support the operation.
400	Forbidden.RegionId	%s	The error message returned because the service is not available in the current region.
400	InvalidParams.EniId	%s	The error message returned because the specified ENI ID is invalid.
403	InvalidOperation.EniServiceManaged	%s	The error message returned because the operation is invalid.

2.1.2.1.13.8. ModifyNetworkInterfaceAttribute

You can call this operation to modify the attributes of an elastic network interface (ENI), such as name, description, and security group.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ModifyNetworkInterfaceAttribute	The operation that you want to perform. Set the value to ModifyNetworkInterfaceAttribute.
NetworkInterfaceId	String	Yes	eni-bp67acfmxazb4ph***	The ID of the ENI to be modified.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the ENI. You can call the DescribeRegions operation to query the most recent region list.
SecurityGroupId.N	RepeatList	No	sg-bp67acfmxazb4ph***	The IDs of security groups to which to add the ENI. The ENI is removed from its current security groups and added to the specified security groups. Valid values of N: 1, 2, 3, 4, and 5.
NetworkInterfaceName	String	No	my-eni-name	The name of the ENI. The name must be 2 to 128 characters in length and can contain letters, digits, colons (:), underscores (_), and hyphens (-). It must start with a letter and cannot start with http:// or https://. This parameter is empty by default.
Description	String	No	test	The description of the ENI. The description must be 2 to 256 characters in length and cannot start with http:// or https://. This parameter is empty by default.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=ModifyNetworkInterfaceAttribute
&NetworkInterfaceId=eni-bp67acfmxazb4ph***
&RegionId=cn-qingdao-env17-d01
&SecurityGroupId.1=sg-bp67acfmxazb4ph***
&NetworkInterfaceName=my-eni-name
&Description=test
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DetachNetworkInterfaceResponse>
        <RequestId>04F0F334-1335-436C-A1D7-6C044FExxxxx</RequestId>
</DetachNetworkInterfaceResponse>
```

`JSON` format

```
{
    "RequestId":"04F0F334-1335-436C-A1D7-6C044FExxxxx"
}
```

Error codes

HTTP status code	Error code	Error message	Description
403	InvalidUserType.NotSupported	%s	The error message returned because your account does not support this operation.
403	Abs.InvalidAccount.NotFound	%s	The error message returned because your Apsara Stack tenant account does not exist or your AccessKey pair has expired.
400	MissingParameter	%s	The error message returned because a required parameter is not specified.
403	Forbidden.NotSupportRAM	%s	The error message returned because RAM users are not authorized to perform this operation.
400	UnsupportedParameter	%s	The error message returned because a specified parameter is not supported.

HTTP status code	Error code	Error message	Description
403	Forbidden.SubUser	%s	The error message returned because you are not authorized to manage this resource. Contact the owner of the Apsara Stack tenant account for authorization.
400	InvalidParameter	%s	The error message returned because a specified parameter is invalid.
400	InvalidInstanceID.Malformed	%s	The error message returned because the specified instance ID is invalid.
400	InvalidOperation.InvalidEcsState	%s	The error message returned because the operation is not supported while the instance is in the current state.
400	InvalidOperation.InvalidEniState	%s	The error message returned because the operation is not supported while the ENI is in the current state.
400	InvalidOperation.DetachPrimaryEniNotAllowed	%s	The error message returned because primary ENIs cannot be unbound from their instances.
400	InvalidParams.EniId	%s	The error message returned because the specified ENI ID is invalid.
404	InvalidEcsId.NotFound	%s	The error message returned because the specified instance ID does not exist.
404	InvalidEniId.NotFound	%s	The error message returned because the specified ENI ID does not exist.
404	InvalidVSwitchId.NotFound	%s	The error message returned because the specified VSwitch ID does not exist.
404	InvalidSecurityGroupId.NotFound	%s	The error message returned because the specified security group ID does not exist.

HTTP status code	Error code	Error message	Description
403	MaxEniCountExceeded	%s	The error message returned because the maximum number of ENIs that can be managed has been reached.
403	EniPerInstanceLimitExceeded	%s	The error message returned because the maximum number of ENIs that can be bound to the specified instance has been reached.
403	InvalidOperation.AvailabilityZoneMismatch	%s	The error message returned because the operation is invalid.
403	InvalidOperation.VpcMismatch	%s	The error message returned because the operation is invalid. Check whether the VPC in the operation corresponds to other parameters.
403	SecurityGroupInstanceLimitExceed	%s	The error message returned because the maximum number of instances in the specified security group has been reached.
403	InvalidSecurityGroupId.NotVpc	%s	The error message returned because the specified security group ID is invalid and the network type of the security group is not VPC.
403	InvalidOperation.InvalidEniType	%s	The error message returned because the current ENI type does not support the operation.
400	Forbidden.RegionId	%s	The error message returned because the service is not available in the current region.
403	InvalidOperation.EniServiceManaged	%s	The error message returned because the operation is invalid.

2.1.2.1.13.9. AssignIpv6Addresses

You can call this operation to assign one or multiple IPv6 addresses to an elastic network interface (ENI).

Description

You can assign available IPv6 addresses from within the CIDR block of the VSwitch with which the ENI is associated. Alternatively, you can specify the number of IPv6 addresses for ECS to automatically assign.

- The ENI must be in the **Available** (`Available`) or **Bound** (`InUse`) state.
- The ECS instance to which the primary ENI is bound must be in the **Running** (`Running`) or **Stopped** (`Stopped`) status.
- The maximum number of IPv6 addresses that can be assigned to an ENI depends on the instance type of the instance to which the ENI is bound.
  - If the ENI is in the **Available** (`Available`) state, it can be assigned a maximum of 10 IPv6 addresses.
  - If the ENI is already bound to an ECS instance, the maximum number of IPv6 addresses that can be assigned to the ENI depends on the instance type.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	AssignIpv6Addresses	The operation that you want to perform. Set the value to AssignIpv6Addresses.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the ENI to which you want to assign IPv6 addresses. You can call the DescribeRegions operation to query the most recent region list.
NetworkInterfaceId	String	Yes	eni-bp14v2sdd3v8ht******	The ID of the ENI.
Ipv6Address.N	RepeatList	No	2001:db8:1234:1a00::***	The list of IPv6 addresses to be assigned to the ENI. Valid value of N: 1. Example: Ipv6Address.1=2001:db8:1234:1a00::XXX **Note** You cannot specify both Ipv6Addresses.N and Ipv6AddressCount.
Ipv6AddressCount	Integer	No	1	The number of IPv6 addresses to be randomly generated for the ENI. **Note** You cannot specify both Ipv6Addresses.N and Ipv6AddressCount.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=AssignIpv6Addresses
&NetworkInterfaceId=eni-bp14v2sdd3v8ht******
&RegionId=cn-qingdao-env17-d01
&Ipv6Address.1=2001:db8:1234:1a00::***
&<Common request parameters>
```

Sample success responses

`XML` format

```
<AssignIpv6AddressesResponse>
      <RequestId>A94E0C9F-B39E-4A87-BFFC-6DC7840xxxxx</RequestId>
</AssignIpv6AddressesResponse>
```

`JSON` format

```
{
    "RequestId": "A94E0C9F-B39E-4A87-BFFC-6DC7840xxxxx"
}
```

Error codes

HTTP status code	Error code	Error message	Description
403	InvalidUserType.NotSupported	%s	The error message returned because your account does not support this operation.
403	Abs.InvalidAccount.NotFound	%s	The error message returned because your Apsara Stack tenant account does not exist or your AccessKey pair has expired.
403	MissingParameter	%s	The error message returned because a required parameter is not specified.

HTTP status code	Error code	Error message	Description
403	Forbedden.NotSupportRAM	%s	The error message returned because RAM users are not authorized to perform this operation.
400	UnsupportedParameter	%s	The error message returned because a specified parameter is not supported.
403	Forbbiden.SubUser	%s	The error message returned because you are not authorized to manage this resource. Contact the owner of the Apsara Stack tenant account for authorization.
400	InvalidParameter	%s	The error message returned because a specified parameter is invalid.
400	InvalidInstanceID.Malformed	%s	The error message returned because the specified instance ID is invalid.
400	InvalidParams.EniId	%s	The error message returned because the specified ENI ID is invalid.
400	InvalidOperation.InvalidEcsState	%s	The error message returned because the operation is not supported while the instance is in the current state.
400	InvalidOperation.InvalidEniState	%s	The error message returned because the operation is not supported while the ENI is in the current state.
404	InvalidEniId.NotFound	%s	The error message returned because the specified ENI ID does not exist.
403	InvalidOperation.InvalidEniType	%s	The error message returned because the current ENI type does not support the operation.
403	MaxEniIpv6IpsCountExceeded	%s	The error message returned because the maximum number of IPv6 addresses that can be assigned to the ENI has been reached.

HTTP status code	Error code	Error message	Description
403	InvalidIp.IpUnassigned	%s	The error message returned because the specified IP address is not assigned.
403	InvalidIp.IpRepeated	%s	The error message returned because the specified IP addresses are not unique.
403	InvalidIp.IpAssigned	%s	The error message returned because the specified IP address is already assigned.
403	InvalidIp.Address	%s	The error message returned because the specified range of IPv6 addresses is invalid.
403	InvalidOperation.Ipv4CountExceeded	%s	The error message returned because the maximum number of IPv4 addresses has been reached.
403	InvalidOperation.Ipv6CountExceeded	%s	The error message returned because the maximum number of IPv6 addresses has been reached.
403	InvalidOperation.Ipv6NotSupport	%s	The error message returned because IPv6 does not support this operation.
403	InvalidVSwitch.Ipv6NotTurnOn	%s	The error message returned because IPv6 is not enabled on your VSwitch. Enable this feature and try again.
403	InvalidVSwitchId.IpInvalid	%s	The error message returned because the specified private IP address is invalid.
403	Forbidden.RegionId	%s	The error message returned because the service is not available in the current region.
403	InvalidOperation.EniServiceManaged	%s	The error message returned because the operation is invalid.
400	InvalidPrivateIpAddress.Duplicated	Specified private IP address is duplicated.	The error message returned because the specified private IP address is already in use. Try another IP address.

2.1.2.1.13.10. UnassignIpv6Addresses

You can call this operation to reclaim one or multiple IPv6 addresses assigned to an elastic network interface (ENI).

Description

When you call this operation, take note of the following items:

- The ENI must be in the **Available** (Available) or **Bound** (InUse) state.
- If the ENI is a primary ENI, the ECS instance to which the primary ENI is attached must be in the **Running** (Running) or **Stopped** (Stopped) state.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	UnassignIpv6Addresses	The operation that you want to perform. Set the value to UnassignIpv6Addresses.
Ipv6Address.N	RepeatList	Yes	2001:db8:1234:1a00::***	The IPv6 addresses assigned to the ENI. Set the value of N to 1. Example: Ipv6Address.1=2001:db8:1234:1a00::*.
NetworkInterfaceId	String	Yes	eni-bp14v2sdd3v8ht*****	The ID of the ENI.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the ENI. You can call the DescribeRegions operation to query the most recent region list.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=UnassignIpv6Addresses
&Ipv6Address.1=2001:db8:1234:1a00::***
&NetworkInterfaceId=eni-bp14v2sdd3v8ht******
&RegionId=cn-qingdao-env17-d01
&<Common request parameters>
```

Sample success responses

`XML` format

```
<UnassignIpv6AddressesResponse>
      <RequestId>48285314-3192-47FE-B4C8-9D51E7Fxxxxx</RequestId>
</UnassignIpv6AddressesResponse>
```

`JSON` format

```
{
    "RequestId": "48285314-3192-47FE-B4C8-9D51E7Fxxxxx"
}
```

Error codes

HTTP status code	Error code	Error message	Description
403	InvalidUserType.NotSupported	%s	The error message returned because your account does not support this operation.
403	Abs.InvalidAccount.NotFound	%s	The error message returned because your Apsara Stack tenant account does not exist or your AccessKey pair has expired.
403	MissingParameter	%s	The error message returned because a required parameter is not specified.
403	Forbedden.NotSupportRAM	%s	The error message returned because RAM users are not authorized to perform this operation.
400	UnsupportedParameter	%s	The error message returned because a specified parameter is not supported.

HTTP status code	Error code	Error message	Description
403	Forbbiden.SubUser	%s	The error message returned because you are not authorized to manage this resource. Contact the owner of the Apsara Stack tenant account for authorization.
400	InvalidParameter	%s	The error message returned because a specified parameter is invalid.
400	InvalidInstanceID.Malformed	%s	The error message returned because the specified InstanceId parameter is invalid.
400	InvalidOperation.InvalidEcsState	%s	The error message returned because the operation is not supported while the instance is in the current state.
400	InvalidOperation.InvalidEniState	%s	The error message returned because the operation is not supported while the ENI is in the current state.
404	InvalidEniId.NotFound	%s	The error message returned because the specified NetworkInterfaceId parameter does not exist.
403	InvalidOperation.InvalidEniType	%s	The error message returned because the current ENI type does not support this operation.
403	InvalidIp.IpUnassigned	%s	The error message returned because the specified IP address is not assigned.
403	InvalidIp.IpRepeated	%s	The error message returned because the specified IP addresses are not unique.
403	InvalidIp.Address	%s	The error message returned because a specified IPv6 address is invalid.
403	Forbidden.RegionId	%s	The error message returned because the service is not available in the current region.

HTTP status code	Error code	Error message	Description
403	InvalidOperation.EniServiceManaged	%s	The error message returned because the operation is invalid.

2.1.2.1.14. System events

2.1.2.1.14.1. DescribeInstanceHistoryEvents

You can call this operation to query the system events of an instance. By default, inactive historical system events are queried.

Description

- You can query system events of instances within the past seven days.
- You can specify the InstanceEventCycleStatus parameter to query the system events that are in the Scheduled or Executing status.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeInstanceHistoryEvents	The operation that you want to perform. If you use a custom HTTP URL or HTTPS URL to make an API request, you must specify this parameter. Set the value to DescribeInstanceHistoryEvents.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the instance. You can call the DescribeRegions operation to query the most recent region list.
InstanceId	String	No	i-uf678mass4zvr9n1****	The ID of the instance. If this parameter is not specified, system events of all instances in the specified region are queried.
EventId.N	RepeatList	No	e-uf64yvznlao4jl2c****	The IDs of one or more system events. Valid values of N: 1 to 100. Specify multiple values in the repeated list form.

Parameter	Type	Required	Example	Description
InstanceEventCycleStatus.N	RepeatList	No	Executed	The lifecycle status of one or multiple system events. Valid values of N: 1 to 6. Specify multiple values in the repeated list form. Valid values: • Scheduled • Avoided • Executing • Executed • Canceled • Failed • Inquiring
EventCycleStatus	String	No	Executed	The lifecycle status of the system event. This parameter takes effect only when the InstanceEventCycleStatus.N parameter is not specified. Valid values: • Scheduled • Avoided • Executing • Executed • Canceled • Failed • Inquiring

Parameter	Type	Required	Example	Description
InstanceEventType.N	RepeatList	No	SystemMaintenance.Reboot	The types of one or multiple system events. Valid values of N: 1 to 30. Specify multiple values in the repeated list form. Valid values: • SystemMaintenance.Reboot: The instance is restarted due to system maintenance. • SystemMaintenance.Redeploy: The instance is redeployed due to system maintenance. • SystemFailure.Reboot: The instance is restarted due to a system failure. • SystemFailure.Redeploy: The instance is redeployed due to a system failure. • SystemFailure.Delete: The instance is released due to an instance creation failure. • InstanceFailure.Reboot: The instance is restarted due to an instance failure.
EventType	String	No	SystemMaintenance.Reboot	The type of the system event. This parameter takes effect only when the InstanceEventType.N parameter is not specified. Valid values: • SystemMaintenance.Reboot: The instance is restarted due to system maintenance. • SystemMaintenance.Redeploy: The instance is redeployed due to system maintenance. • SystemFailure.Reboot: The instance is restarted due to a system failure. • SystemFailure.Redeploy: The instance is redeployed due to a system failure. • SystemFailure.Delete: The instance is released due to an instance creation failure. • InstanceFailure.Reboot: The instance is restarted due to an instance failure.

Parameter	Type	Required	Example	Description
NotBefore.Start	String	No	2017-11-30T06:32:31Z	The beginning of the time range in which to query system events that are scheduled to executed. Specify the time in the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time must be in UTC.
NotBefore.End	String	No	2017-12-01T06:32:31Z	The end of the time range in which to query system events that are scheduled to executed. Specify the time in the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time must be in UTC.
EventPublishTime.Start	String	No	2017-11-30T06:32:31Z	The beginning of the time range in which to query published system events. Specify the time in the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time must be in UTC.
EventPublishTime.End	String	No	2017-12-01T06:32:31Z	The end of the time range in which to query published system events. Specify the time in the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time must be in UTC.
PageNumber	Integer	No	1	The number of the page to return. Pages start from page 1. Default value: 1.
PageSize	Integer	No	10	The number of entries to return on each page. Valid values: 1 to 100. Default value: 10.

Response parameters

Parameter	Type	Example	Description
InstanceSystemEventSet	Array		The collection of details about system events for the instance.
InstanceSystemEventType			

Parameter	Type	Example	Description
EventCycleStatus	Struct		The lifecycle status of the system event.
Code	Integer	0	The status code of the system event.
Name	String	Executed	The status name of the system event.
EventFinishTime	String	2017-12-01T06:35:31Z	The time when the system event ended. The time follows the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time is displayed in UTC.
EventId	String	e-uf64yvznlao4jl2c****	The ID of the system event.
EventPublishTime	String	2017-11-30T06:32:31Z	The time when the system event was published. The time follows the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time is displayed in UTC.
EventType	Struct		The type of the system event.
Code	Integer	34	The code of the system event type.
Name	String	InstanceExpiration.Stop	The name of the system event type.
ExtendedAttribute	Struct		The extended attribute of the system event.
Device	String	/dev/vda	The device name of the local disk.
DiskId	String	d-bp198jigq7l1xliw****	The ID of the local disk.
InactiveDisks	Array		The information of inactive cloud or local disks that have been released but need to be removed.
InactiveDisk			

Parameter	Type	Example	Description
CreationTime	String	2018-11-30T06:32:31Z	The time when the cloud or local disk was created. The time follows the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time is displayed in UTC.
DeviceCategory	String	cloud_efficiency	The category of the cloud or local disk. Valid values: • cloud: basic disk • cloud_efficiency: ultra disk • cloud_ssd: standard SSD • cloud_essd: enhanced SSD • local_ssd_pro: I/O-intensive local disk • local_hdd_pro: throughput-intensive local disk
DeviceSize	String	80	The size of the cloud or local disk. Unit: GiB.
DeviceType	String	data	The type of the cloud or local disk. Valid values: • system: system disk • data: data disk
ReleaseTime	String	2019-11-30T06:32:31Z	The time when the cloud disk or local disk was released. The time follows the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time is displayed in UTC.
InstanceId	String	i-uf678mass4zvr9n1****	The ID of the instance.
NotBefore	String	2017-12-06T00:00:00Z	The scheduled execution time of the system event. The time follows the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time is displayed in UTC.
Reason	String	System maintenance is scheduled due to ***.	The reason why the system event was scheduled.
PageNumber	Integer	1	The page number of the returned page.

Parameter	Type	Example	Description
PageSize	Integer	10	The number of entries returned per page.
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.
TotalCount	Integer	2	The total number of instances.

Error codes

HTTP status code	Error code	Error message	Description
404	MissingParameter	%s	The error message returned because a required parameter is not specified.

HTTP status code	Error code	Error message	Description
403	InvalidParameter	%s	The error message returned because a specified parameter is invalid.
403	EventIdLimitExceeded	%s	The error message returned because more than 100 system event IDs are specified.
403	InvalidParameter.TimeEndBeforeStart	%s	The error message returned because the specified parameter is invalid. Check whether the end time is earlier than the start time.
403	OperationDenied.NotInWhiteList	%s	The error message returned because you are not authorized to perform this operation.

2.1.2.1.15. Regions and zones

2.1.2.1.15.1. DescribeRegions

You can call this operation to query available regions.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeRegions	The operation that you want to perform. Set the value to DescribeRegions.
ResourceType	String	No	instance	The resource type. Valid values: • instance • disk Default value: instance

Parameter	Type	Required	Example	Description
AcceptLanguage	String	No	zh-CN	The natural language that is used to filter the response. For more information, see RFC 7231. Valid values: • zh-CN: Chinese • en-US: English • ja: Japanese Default value: zh-CN

Response parameters

Parameter	Type	Example	Description
Regions	Array		The collection of regions.
Region			
LocalName	String	China (Qingdao)	The name of the region.
RegionEndpoint	String	ecs.example.com	The endpoint of the region.
RegionId	String	cn-qingdao-env17-d01	The ID of the region.
Status	String	available	This parameter is not supported.
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

Error codes

HTTP status code	Error code	Error message	Description
403	Unauthorized.EmptyRegion	The specified account has no access authority to any region.	The error message returned because you have no access to regions. Apply for permissions and try again.
404	InvalidAcceptLanguage.NotFound	Only Chinese (zh-CN), English (en-US), and Japanese (ja) are allowed.	The error message returned because the specified AcceptLanguage parameter is invalid. Only Chinese, English, and Japanese are supported.

HTTP status code	Error code	Error message	Description
404	InvalidResourceType.NotFound	The ResourceType provided does not exist in our records.	The error message returned because the specified ResourceType parameter does not exist.

2.1.2.1.15.2. DescribeZones

You can call this operation to query zones in a region.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeZones	The operation that you want to perform. Set the value to DescribeZones.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region. You can call the DescribeRegions operation to query the most recent region list.
AcceptLanguage	String	No	zh-CN	The natural language that is used to filter responses. For more information, visit RFC 7231. Valid values: • zh-CN • en-US • ja Default value: zh-CN.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.
Zones	Array of Zone		Details about the zones.
Zone			
AvailableDedicatedHostTypes	List	Compute optimized	The supported dedicated host types.

Parameter	Type	Example	Description
AvailableDiskCategories	List	cloud	The supported disk categories.
AvailableInstanceTypes	List	c5	The available instance types.
AvailableResourceCreation	List	DedicatedHost	The types of resources that can be created.
AvailableResources	Array of ResourcesInfo		Details about the resources that can be created.
ResourcesInfo			
DataDiskCategories	List	cloud_ssd	The categories of data disks. Valid values: • cloud: basic disk • cloud_efficiency: ultra disk • cloud_ssd: standard SSD • ephemeral_ssd: local SSD
InstanceGenerations	List	IV	The generation numbers of instance families.
InstanceTypeFamilies	List	["d1", "d1ne"]	The instance families.
InstanceTypes	List	["ecs.g5.large"]	The instance types.
IoOptimized	Boolean	true	Indicates whether the instance type is I/O optimized.
NetworkTypes	List	VPC	The network types. Valid values: • VPC: VPC • Classic: classic network
SystemDiskCategories	List	cloud_ssd	The categories of system disks. Valid values: • cloud: basic disk • cloud_efficiency: ultra disk • cloud_ssd: standard SSD
AvailableVolumeCategories	List	san_ssd	The categories of available Shared Block Storage devices.

Parameter	Type	Example	Description
DedicatedHostGenerations	List	I	The generation numbers of dedicated hosts.
LocalName	String	Hangzhou Zone G	The name of the zone in the local language.
ZoneId	String	cn-qingdao-env17-amtest11001-a	The ID of the zone.

Error codes

HTTP status code	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist.	The error message returned because the specified RegionId parameter does not exist.
404	InvalidInstanceChargeType.NotFound	The InstanceChargeType does not exist in our records	The error message returned because the specified instance billing method does not exist.

HTTP status code	Error code	Error message	Description
400	InvalidSpotStrategy	The specified SpotStrategy is not valid.	The error message returned because the specified SpotStrategy parameter is invalid.
404	InvalidAcceptLanguage.NotFound	Only Chinese (zh-CN), English (en-US), and Japanese (ja) are allowed.	The error message returned because the specified AcceptLanguage parameter is invalid. The valid values of this parameter are Chinese, English, and Japanese.

2.1.2.1.15.3. DescribeAvailableResource

You can call this operation to query resources in a zone. For example, you can query available resources in a zone before you create ECS instances (RunInstances) or before you modify instance specifications (ModifyInstanceSpec).

Description

Values for the `DestinationResource` parameter have dependencies. When you select a value in the following chain for the DestinationResource parameter, the more to the right the selected value is ordered, the more parameters you must specify.

- Sequence: `Zone > IoOptimized > InstanceType = Network = ddh > SystemDisk > DataDisk`
- For example:
  - If you set `DestinationResource` to `DataDisk`, you must specify the `IoOptimized`, `InstanceType`, `SystemDiskCategory`, and `DataDiskCategory` parameters.
  - If you set `DestinationResource` to `InstanceType`, you must specify the `IoOptimized` and `InstanceType` parameters.
  - Use the following parameter settings to query the ecs.g5.large resources in all zones of the China (Hangzhou) region: `RegionId=cn-qingdao-env17-d01 &DestinationResource=InstanceType &IoOptimized=optimized &InstanceType=ecs.g5.large`
  - Use the following parameter settings to query the zones where ecs.g5.large resources are available within the China (Hangzhou) region: `RegionId=cn-qingdao-env17-d01 &DestinationResource=Zone &IoOptimized=optimized &InstanceType=ecs.g5.large`

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeAvailableResource	The operation that you want to perform. If you use a custom HTTP URL or HTTPS URL to make an API request, you must specify the `Action` parameter. Set the value to DescribeAvailableResource.
DestinationResource	String	Yes	InstanceType	The resource type. Valid values: • Zone: zone • IoOptimized: I/O optimized • InstanceType: instance type • SystemDisk: system disk • DataDisk: data disk • Network: network type • ddh: dedicated host For more information about how to set the DestinationResource parameter, see the preceding Description section.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the destination region. You can call the DescribeRegions operation to query the most recent region list.
ZoneId	String	No	cn-qingdao-env17-amtest11001-a	The ID of the zone. This parameter is empty by default. When this parameter is empty, the system returns resources that match the other criteria of all zones within the region specified by `RegionId`.
IoOptimized	String	No	optimized	Specifies whether the instance is I/O optimized. Valid values: • none: non-I/O optimized • optimized: I/O optimized Default value: optimized
DedicatedHostId	String	No	dh-bp165p6xk2tlw61e****	The ID of the dedicated host.

Parameter	Type	Required	Example	Description
InstanceType	String	No	ecs.g5.large	The instance type. For more information, see Instance types in ECS User Guide or call the DescribeInstanceTypes operation to query the most recent instance type list. When DestinationResource is set to SystemDisk or DataDisk, the InstanceType parameter is required.
SystemDiskCategory	String	No	cloud_ssd	The category of the system disk. Valid values: • cloud: basic disk • cloud_efficiency: ultra disk • cloud_ssd: standard SSD • ephemeral_ssd: local SSD • cloud_essd: enhanced SSD When DestinationResource is set to SystemDisk, InstanceType, or DataDisk, the SystemDiskCategory parameter is optional. Default value: cloud_efficiency
DataDiskCategory	String	No	cloud_ssd	The category of the data disk. Valid values: • cloud: basic disk • cloud_efficiency: ultra disk • cloud_ssd: standard SSD • ephemeral_ssd: local SSD • cloud_essd: enhanced SSD
NetworkCategory	String	No	vpc	The network type. Valid values: • vpc: VPC • classic: classic network

Parameter	Type	Required	Example	Description
Cores	Integer	No	2	The number of vCPUs of the instance type. For more information, see Instance types in ECS Production Introduction. The Cores parameter takes effect only when DestinationResource is set to InstanceType.
Memory	Float	No	8.0	The memory size of the instance type. Unit: GiB. For more information, see Instance types in ECS Production Introduction. The Memory parameter takes effect only when DestinationResource is set to InstanceType.
ResourceType	String	No	instance	The resource type. Valid values: • instance: ECS instance • disk: cloud disk • ddh: dedicated host

Response parameters

Parameter	Type	Example	Description
AvailableZones	Array		The collection of details about zones.
AvailableZone			
AvailableResources	Array		The available resources.
AvailableResource			
SupportedResources	Array		The supported resource types.
SupportedResource			
Max	Integer	2	The maximum number of resources of the type that can be created. No value is returned when this parameter is empty.

Parameter	Type	Example	Description
Min	Integer	1	The minimum value of resources of the type that can be created. No value is returned when the parameter is empty.
Status	String	Available	The status of the resource. Valid values: • Available • SoldOut
StatusCategory	String	WithStock	The stock status of the resource. Valid values: • WithStock: The resource is in sufficient stock. • ClosedWithStock: The resource is in low stock. We recommend that you use resources in sufficient stock. • WithoutStock: The resource is out of stock and will be replenished. We recommend that you use resources in sufficient stock. • ClosedWithoutStock: The resource is out of stock and will not be replenished. We recommend that you use resources in sufficient stock.
Unit	String	null	The unit of the resource. No value is returned when this parameter is empty.
Value	String	ecs.d1ne.xlarge	The value of the resource.
Type	String	InstanceType	The resource type. Valid values: • Zone: zone • IoOptimized: I/O optimzied • InstanceType: instance type • SystemDisk: system disk • DataDisk: data disk • Network: network type • ddh: dedicated host
RegionId	String	cn-qingdao-env17-d01	The ID of the region.

Parameter	Type	Example	Description
Status	String	Available	The status of the resource. Valid values: • Available • SoldOut
StatusCategory	String	WithStock	The stock status of the resource. Valid values: • WithStock: The resource is in sufficient stock. • ClosedWithStock: The resource is in low stock. We recommend that you use resources in sufficient stock. • WithoutStock: The resource is out of stock and will be replenished. We recommend that you use resources in sufficient stock. • ClosedWithoutStock: The resource is out of stock and will not be replenished. We recommend that you use resources in sufficient stock.
ZoneId	String	cn-qingdao-env17-amtest11001-a	The ID of the zone.
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Error codes

HTTP status code	Error code	Error message	Description
404	Invalid.RegionId	The specified RegionId does not exist.	The error message returned because the specified RegionId parameter does not exist.
404	Unavailable.Regions	The available regions does not exists	The error message returned because the specified RegionId parameter does not exist.
400	Invalid.InstanceChargeType	The specified InstanceChargeType is not valid.	The error message returned because the specified InstanceChargeType parameter is invalid.
400	Invalid.Param	The input parameter DestinationResource that is mandatory for processing this request is not supplied.	The error message returned because the required DestinationResource parameter is not specified.

HTTP status code	Error code	Error message	Description
404	Invalid.ResourceType	The ResourceType provided does not exist in our records.	The error message returned because the specified ResourceType parameter is invalid.
404	Invalid.DestinationResource	The specified DestinationResource is not valid.	The error message returned because the specified DestinationResource parameter is invalid.
404	Invalid.IoOptimized	The specified IoOptimized is not valid.	The error message returned because the specified IoOptimized parameter is invalid.
404	Invalid.NetworkCategory	The specified NetworkCategory is not valid.	The error message returned because the specified NetworkCategory parameter is invalid.
404	Invalid.SpotStrategy	The specified SpotStrategy is not valid.	The error message returned because the specified SpotStrategy parameter is invalid.
403	InvalidDedicatedHostId.NotFound	The specified DedicatedHostId does not exist.	The error message returned because the specified DedicatedHostId parameter does not exist.
404	Invalid.NetworkType	The specified NetworkType is not valid.	The error message returned because the specified NetworkCategory parameter is invalid.
404	InvalidResourceId.NotFound	The specified ResourceId is not found in our records	The error message returned because the specified resource does not exist.
403	InvalidParam.TypeAndCpuMem.Conflict	The specified 'InstanceType' and 'Cores','Memory' are not blank at the same time.	The error message returned because none of the InstanceType, Cores, and Memory parameters is specified.
403	InvalidParam.Cores	The specified parameter 'Cores' should be empty	The error message returned because the Cores parameter is specified.
403	InvalidParam.Memory	The specified parameter 'Memory' should be empty	The error message returned because the Memory parameter is specified.

HTTP status code	Error code	Error message	Description
400	InvalidRegionId.Malformed	The specified parameter RegionId is not valid.	The error message returned because the specified RegionId parameter is invalid.

2.1.2.1.15.4. DescribeResourcesModification

You can call this operation to query available resources in a zone when you upgrade or downgrade instance types or replace system disks.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeResourcesModification	The operation that you want to perform. If you use a custom HTTP URL or HTTPS URL to make an API request, you must specify the `Action` parameter. Set the value to DescribeResourcesModification.
DestinationResource	String	Yes	InstanceType	The type of the resource. Valid values: • InstanceType • SystemDisk
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region. You can call the DescribeRegions operation to query the most recent region list.
ResourceId	String	Yes	i-bp67acfmxazb4p****	The ID of the resource. For example, when DestinationResource is set to InstanceType, this parameter can be interpreted as InstanceId.
MigrateAcrossZone	Boolean	No	true	Specifies whether to allow cross-cluster instance type upgrades. Valid values: • true • false Default value: false

Parameter	Type	Required	Example	Description
InstanceType	String	No	ecs.g5.large	The instance type. For more information, see Instance types in ECS User Guide or call the DescribeInstanceTypes operation to query the most recent instance type list. When DestinationResource is set to SystemDisk, you must specify this parameter.
Cores	Integer	No	2	The number of vCPUs of the instance type. For more information, see Instance types in ECS User Guide. This parameter is valid only when DestinationResource is set to InstanceType.
Memory	Float	No	8.0	The memory size of the instance type. Unit: GiB. For more information, see Instance types in ECS User Guide. This parameter is valid only when DestinationResource is set to InstanceType.

Response parameters

Parameter	Type	Example	Description
AvailableZones	Array		The collection of zones.
AvailableZone			
AvailableResources	Array		The collection of available resources.
AvailableResource			
SupportedResources	Array		The collection of supported resources.
SupportedResource			
Max	Integer	2	The maximum number of resources of a specific type that can be created. No value is returned when this parameter is empty.

Parameter	Type	Example	Description
Min	Integer	1	The minimum number of resources of a specific type that can be created. No value is returned when this parameter is empty.
Status	String	Available	The status of the resource. Valid values: • Available • SoldOut
StatusCategory	String	WithStock	The stock status of the resource. Valid values: • WithStock: sufficient stock • ClosedWithStock: insufficient stock • WithoutStock: out of stock
Unit	String	null	The unit of the resource type. No value is returned when this parameter is empty.
Value	String	ecs.g5.large	The value of the resource.
Type	String	InstanceType	The type of the resource. Valid values: • Zone • IoOptimized • InstanceType • SystemDisk • DataDisk • Network
RegionId	String	cn-qingdao-env17-d01	The ID of the region.
Status	String	Available	The status of the resource. Valid values: • Available • SoldOut
StatusCategory	String	WithStock	The stock status of the resource. Valid values: • WithStock: sufficient stock • ClosedWithStock: insufficient stock • WithoutStock: out of stock

Parameter	Type	Example	Description
ZoneId	String	cn-qingdao-env17-amtest11001-a	The ID of the zone.
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Error codes

HTTP status code	Error code	Error message	Description
404	Invalid.RegionId	The specified RegionId does not exist.	The error message returned because the specified RegionId parameter is invalid.

HTTP status code	Error code	Error message	Description
404	Unavailable.Regions	The available regions does not exists	The error message returned because the specified RegionId parameter is invalid.
400	Invalid.OperationType	The specified operationType is not valid.	The error message returned because the specified OperationType parameter is invalid.
400	Invalid.Param	The input parameter DestinationResource that is mandatory for processing this request is not supplied.	The error message returned because the required DestinationResource parameter is not specified.
404	Invalid.ResourceType	The ResourceType provided does not exist in our records.	The error message returned because the specified DestinationResource parameter is invalid.
404	Invalid.DestinationResource	The specified DestinationResource is not valid.	The error message returned because the specified DestinationResource parameter is invalid.
404	Invalid.IoOptimized	The specified IoOptimized is not valid.	The error message returned because the specified IoOptimized parameter is invalid.
404	Invalid.NetworkCategory	The specified NetworkCategory is not valid.	The error message returned because the specified NetworkCategory parameter is invalid.
404	Invalid.SpotStrategy	The specified SpotStrategy is not valid.	The error message returned because the specified SpotStrategy parameter is invalid.
400	Invalid.InstanceChargeType	The specified InstanceChargeType is not valid.	The error message returned because the specified InstanceChargeType parameter is invalid.
404	Invalid.ResourceId	The specified ResourceId is not valid.	The error message returned because the specified ResourceId parameter is invalid.
404	Invalid.InstancePayType	The specified InstancePayType is not valid.	The error message returned because the specified InstanceChargeType parameter is invalid.

HTTP status code	Error code	Error message	Description
404	OperationDenied	The specified operation is denied as this instanceType is not support.	The error message returned because the instance type does not support this operation.
403	InvalidDedicatedHostId.NotFound	The specified DedicatedHostId does not exist in our records.	The error message returned because the specified dedicated host does not exist in the current region.
404	InvalidInstanceId.NotFound	The specified InstanceId provided does not exist in our records.	The error message returned because the specified instance does not exist.
404	InvalidResourceId.NotFound	The specified ResourceId is not found in our records	The error message returned because the specified ResourceId parameter does not exist.
403	InvalidParam.TypeAndCpuMem.Conflict	The specified 'InstanceType' and 'Cores','Memory' are not blank at the same time.	The error message returned because none of the InstanceType, Cores, or Memory parameters is specified.
403	InvalidParam.Cores	The specified parameter 'Cores' should be empty	The error message returned because the Cores parameter is specified.
403	InvalidParam.Memory	The specified parameter 'Memory' should be empty	The error message returned because the Memory parameter is specified.

2.1.2.1.16. Operations and monitoring

2.1.2.1.16.1. GetInstanceConsoleOutput

You can call this operation to obtain the command output of an instance. The returned command output is encoded in Base64.

Description

- ECS is a virtualized cloud-based service and cannot be connected to display devices. However, the command output for the last start, restart, or shutdown of each instance is cached. You can call GetInstanceConsoleOutput to obtain this information.
- You cannot obtain the command output of Windows instances.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	GetInstanceConsoleOutput	The operation that you want to perform. Set the value to GetInstanceConsoleOutput.
InstanceId	String	Yes	i-bp1c1xhsrac2coiw****	The ID of the instance.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the instance. You can call the DescribeRegions operation to query the most recent region list.

Response parameters

Parameter	Type	Example	Description

Parameter	Type	Example	Description
ConsoleOutput	String	V2VsY29tZSB0byBDZW50T1MgCgpDaGVja2luZyBmaWxlc3lzdGVtcwpDaGVja2luZyBhbGwgZmlsZSBzeXN0ZW1zLgpbL3NiaW4vZnNjay5leHQ0ICgxKSAtLSAvXSBmc2NrLmV4dDQgLWEgL2Rldi92ZGExIAovZGV2L3ZkYTE6IGNsZWFuLCAzMjAxNi8yNjIxNDQwIGZpbGVzLCA0NDc5NzQvMTA0ODU1MDQgYmxvY2tzCgpFbnRlcmluZyBub24taW50ZXJhY3RpdmUgc3RhcnR1cCApDYWxsaW5nIHRoZSBzeXN0ZW0gYWN0aXZpdHkgZGF0YSBjb2xsZWN0b3IgKHNhZGMpLi4uIAoKQnJpbmdpbmcgcmcgdXAgaW50ZXJmYWNlIGV0aDA6ICAKRGV0ZXJtaW5pbmcgSVAgaW5mb3JtYXRpb24gZm9yIGV0aDAuLi4gZG9uZS4KCmFsaXl1bi1zZXJ2aWNlIHN0YXJ0L3J1bm5pbmcsIHByb2Nlc3MgMTczMwpmaW5pc2hlZAoKQ2VudE9TIHJlbGVhc2UgNi44ICChGaW5hbCkKS2VybmVsIDIuNi4zMi02OTYuMy4yLmVsNi5pNjg2IG9uIGFuIGk2ODYKCmlaMnplZDk2ZTQ2MmF5cjBxeioqKioqIGxvZ2luOg==	The command output of the instance, which is encoded in Base64.
InstanceId	String	i-bp1c1xhsrac2coiw****	The ID of the instance.
LastUpdateTime	String	2018-03-22 10:04:57	The time when the instance was last started, restarted, or shut down. The time follows the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time is displayed in UTC.

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

}
```

Error codes

HTTP status code	Error code	Error message	Description
400	MissingParameter	%s	The error message returned because a required parameter is not specified.
404	InvalidParameter	%s	The error message returned because a specified parameter is invalid.
405	IncorrectInstanceStatus	%s	The error message returned because the operation is not supported while the instance is in the current state.
405	NotSupported	%s	The error message returned because the operation is invalid.
429	Throttling	%s	The error message returned because the request is denied due to throttling.

2.1.2.1.16.2. GetInstanceScreenshot

You can call this operation to obtain screenshots of an instance.

Description

ECS returns an instance screenshot that is in the JPG format and encoded in Base64. You must decode the screenshot. We recommend that you call this operation for troubleshooting and diagnosis. When you call this operation, take note of the following items:

- The instance must be in the Running state.
- If you call this operation on the same instance for multiple times, the call interval must be at least 10 seconds. Otherwise, the `Throttling` error code is returned.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	GetInstanceScreenshot	The operation that you want to perform. Set the value to GetInstanceScreenshot.
InstanceId	String	Yes	i-bp1gbz20g229bvu5****	The ID of the instance.

Parameter	Type	Required	Example	Description
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the instance. You can call the DescribeRegions operation to query the most recent region list.
WakeUp	Boolean	No	false	Specifies whether to wake up the instance that is in sleep mode. Default value: false

Response parameters

Parameter	Type	Example	Description
InstanceId	String	i-bp1gbz20g229bvu5****	The ID of the instance.
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.
Screenshot	String	iVBORw0KGgoA...AAABJRU5ErkJggg==	The JPG-formatted instance screenshot, which is encoded in Base64.

Examples

Sample requests

```
http://ecs.example.com/?Action=GetInstanceScreenshot
&InstanceId=i-bp1gbz20g229bvu5****
&RegionId=cn-qingdao-env17-d01
&WakeUp=false
&<Common request parameters>
```

Sample success responses

`XML` format

```
<GetInstanceScreenshotResponse>
      <RequestId>22A1933F-AD02-4560-A6A7-53CF2231D942</RequestId>
      <InstanceId>i-bp1gbz20g229bvu5****</InstanceId>
      <Screenshot>iVBORw0KGgoA...AAABJRU5ErkJggg==</Screenshot>
</GetInstanceScreenshotResponse>
```

`JSON` format

```
{
    "RequestId": "22A1933F-AD02-4560-A6A7-53CF2231D942",
    "InstanceId": "i-bp1gbz20g229bvu5****",
    "Screenshot": "iVBORw0KGgoA...AAABJRU5ErkJggg=="
}
```

Error codes

HTTP status code	Error code	Error message	Description
400	MissingParameter	%s	The error message returned because a required parameter is not specified.
404	InvalidParameter	%s	The error message returned because a specified parameter is invalid.
405	IncorrectInstanceStatus	%s	The error message returned because the operation is not supported while the instance is in the current state.
405	NotSupported	%s	The error message returned because the operation is invalid.
429	Throttling	%s	The error message returned because the request is denied due to throttling.

2.1.2.1.16.3. DescribeDiskMonitorData

You can call this operation to query the monitoring data of a disk over a specific period of time.

Description

The monitoring data includes read IOPS, write IOPS, read bandwidth (byte/s), write bandwidth (byte/s), read latency (μs), and write latency (μs) of the disk.

When you call this operation, take note of the following items:

- Only monitoring data about disks that are in the Running (`In_use`) state can be queried.

  > **Note** A portion may be missing from the returned monitoring data. This is because the system cannot obtain the relevant information, such as when a disk is not in the Running (`In_Use`) state.

- Up to 400 monitoring data entries can be returned at a time. An error is returned if the value calculated based on the following formula is greater than 400: `(EndTime - StartTime)/Period` .
- You can query the monitoring data in the past 30 days. If the value of `StartTime` is more than 30

days earlier than the current time, an error is returned.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeDiskMonitorData	The operation that you want to perform. Set the value to DescribeDiskMonitorData.
DiskId	String	Yes	d-bp1bq5g3dxxo1x4o****	The ID of the disk.
EndTime	String	Yes	2014-07-23T12:09:00Z	The end of the time range to query. Specify the time in the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time must be in UTC. If the value of seconds (ss) is not 00, the time is rounded up to the next minute.
StartTime	String	Yes	2014-07-23T12:07:00Z	The start of the time range to query. Specify the time in the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time must be in UTC. If the value of seconds (ss) is not 00, the time is rounded up to the next minute.
Period	Integer	No	60	The interval at which to retrieve monitoring data. Unit: seconds. Valid values: • 60 • 600 • 3600 Default value: 60

Response parameters

Parameter	Type	Example	Description
MonitorData	Array		The collection of monitoring data about the disk.

Parameter	Type	Example	Description
DiskMonitorData			
BPSRead	Integer	0	The read bandwidth of the system disk. Unit: Byte/s.
BPSTotal	Integer	204	The total read and write bandwidth of the system disk. Unit: Byte/s.
BPSWrite	Integer	204	The write bandwidth of the system disk. Unit: Byte/s.
DiskId	String	d-bp1bq5g3dxxo1x4o****	The ID of the disk.
IOPSRead	Integer	0	The number of read I/O operations per second on the system disk.
IOPSTotal	Integer	0	The total number of read and write I/O operations per second on the system disk.
IOPSWrite	Integer	0	The number of write I/O operations per second on the system disk.
LatencyRead	Integer	0	The read latency of the disk. Unit: μs.
LatencyWrite	Integer	0	The write latency of the disk. Unit: μs.
TimeStamp	String	2014-07-23T12:07:00Z	The timestamp of the data query. The time follows the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time is displayed in UTC.
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.
TotalCount	Integer	3	The total number of returned monitoring data entries.

Examples

Error codes

HTTP status code	Error code	Error message	Description
404	InvalidDiskId.NotFound	The DiskId provided does not exist in our records.	The error message returned because the specified DiskId parameter does not exist. Check whether the DiskId parameter is correct.

HTTP status code	Error code	Error message	Description
400	InvalidStartTime.Malformed	The specified parameter "StartTime" is not valid.	The error message returned because the specified StartTime parameter is invalid.
400	InvalidEndTime.Malformed	The specified parameter "EndTime" is not valid.	The error message returned because the specified EndTime parameter is invalid.
400	InvalidPeriod.ValueNotSupported	The specified parameter "Period" is not valid.	The error message returned because the specified Period parameter is invalid.
400	InvalidStartTime.TooEarly	The specified parameter "StartTime" is too early.	The error message returned because the specified StartTime parameter is more than 30 days earlier than the current time.
400	InvalidParameter.TooManyDataQueried	Too many data queried.	The error message returned because the amount of queried monitoring data has reached the upper limit.
400	Throttling	Request was denied due to request throttling.	The error message returned because the request is denied due to throttling. Try again later.
400	InvalidInstanceType.NotSupportCredit	The InstanceType of the specified instance does not support credit.	The error message returned because the instance type does not support burstable instances.
400	InvalidParameter.EndTime	The specified parameter EndTime is earlier than StartTime.	The error message returned because the end time is earlier than the start time.
500	InternalError	The request processing has failed due to some unknown error, exception or failure.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.

2.1.2.1.16.4. DescribeInstanceMonitorData

You can call this operation to query all monitoring data about an ECS instance. The monitoring data includes the vCPU utilization, CPU credits of the burstable instance, received data traffic, sent data traffic, and average bandwidth.

Description

When you call this operation, take note of the following items:

- Up to 400 monitoring data entries can be returned at a time. An error is returned if the value calculated based on the following formula is greater than 400: `(EndTime - StartTime)/Period`.
- You can query the monitoring data from up to the past 30 days. If the value of StartTime is more than 30 days earlier than the current time, an error is returned.
- A portion may be missing from the returned monitoring data. This is because the system cannot obtain the relevant information, such as when the instance is in the Stopped state.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeInstanceMonitorData	The operation that you want to perform. If you use a custom HTTP URL or HTTPS URL to make an API request, you must specify the `Action` parameter. Set the value to DescribeInstanceMonitorData.
InstanceId	String	Yes	i-bp1a36962lrhj4ab****	The ID of the instance.
StartTime	String	Yes	2014-10-29T23:00:00Z	The beginning of the time range to query. Specify the time in the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time must be in UTC. If the value of seconds (`ss`) is not `00`, the time is rounded up to the next minute.
EndTime	String	Yes	2014-10-30T08:00:00Z	The end of the time range to query. Specify the time in the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time must be in UTC. If the value of seconds (`ss`) is not `00`, the time is rounded up to the next minute.
Period	Integer	No	60	The interval at which to retrieve monitoring data. Unit: seconds. Valid values: • 60 • 600 • 3600 Default value: 60

Response parameters

Parameter	Type	Example	Description
MonitorData	Array		The collection of monitoring data about the instance.
InstanceMonitorData			
BPSRead	Integer	1000	The read bandwidth of the system disk. Unit: Byte/s.
BPSWrite	Integer	13585	The write bandwidth of the system disk. Unit: Byte/s.
CPU	Integer	2	The vCPU utilization of the instance. Unit: percent (%).
CPUAdvanceCreditBalance	Float	0.4	The overdrawn CPU credits of the burstable instance.
CPUCreditBalance	Float	120	The total CPU credits of the burstable instance.
CPUCreditUsage	Float	30	The number of CPU credits consumed by the burstable instance.
CPUNotpaidSurplusCreditUsage	Float	0.5	This parameter is not supported.
IOPSRead	Integer	1000	The number of read I/O operations per second on the system disk.
IOPSWrite	Integer	200	The number of write I/O operations per second on the system disk.
InstanceId	String	i-bp1a36962lrhj4*****	The ID of the instance.
InternetBandwidth	Integer	10	The public bandwidth of the instance. Unit: Kbit/s.

Parameter	Type	Example	Description
InternetRX	Integer	122	The public data traffic received by the instance at the time of monitoring data query. Unit: Kbit/s.
InternetTX	Integer	343	The public data traffic sent by the instance at the time of monitoring data query. Unit: Kbit/s.
IntranetBandwidth	Integer	10	The internal bandwidth of the instance. Unit: Kbit/s.
IntranetRX	Integer	122	The internal data traffic received by the instance at the time of monitoring data query. Unit: Kbit/s.
IntranetTX	Integer	343	The internal data traffic sent by the instance at the time of monitoring data query. Unit: Kbit/s.
TimeStamp	String	2014-10-30T05:00:00Z	The timestamp of the data query.
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

400	InvalidStartTime.TooEarly	The specified parameter "StartTime" is too early.	The error message returned because the specified StartTime parameter is more than 30 days earlier than the current time.
400	InvalidParameter.TooManyDataQueried	Too many data queried.	The error message returned because the amount of queried monitoring data has reached the upper limit.
400	Throttling	Request was denied due to request throttling.	The error message returned because the request is denied due to throttling. Try again later.
400	InvalidStartTime.ValueNotSupported	The specified parameter StartTime is later than EndTime.	The error message returned because the end time is earlier than the start time.
500	InternalError	The request processing has failed due to some unknown error.	The error message returned because an internal error has occurred. Try again later. If the problem persists, submit a ticket.

2.1.2.1.16.5. DescribeSnapshotMonitorData

You can call this operation to query all monitoring data about snapshot size changes in a region over the past 30 days.

Description

When you call this operation, take note of the following items:

- Up to 400 monitoring data entries can be returned at a time. An error is returned if the value calculated based on the following formula is greater than 400: `(EndTime - StartTime)/Period`.
- You can query the monitoring data from up to the past 30 days. If the value of `StartTime` is more than 30 days earlier than the current time, an error is returned.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeSnapshotMonitorData	The operation that you want to perform. Set the value to DescribeSnapshotMonitorData.
EndTime	String	Yes	2019-05-10T03:00:00Z	The end of the time range to query. Specify the time in the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time must be in UTC. If the value of seconds (ss) is not 00, the time is rounded up to the next minute.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region. You can call the DescribeRegions operation to query the most recent region list.
StartTime	String	Yes	2019-05-10T00:00:00Z	The beginning of the time range to query. Specify the time in the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time must be in UTC. If the value of seconds (ss) is not 00, the time is rounded up to the next minute.
Period	Integer	No	60	The interval at which to retrieve snapshot size changes. Unit: seconds. Valid values: • 60 • 600 • 3600 Default value: 60
Category	String	No	Standard	The type of the snapshot. Valid values: • Standard: normal snapshot • Flash: local snapshot Default value: Standard

Response parameters

Parameter	Type	Example	Description
MonitorData	Array		The collection of monitoring data about snapshot size changes.
DataPoint			
Size	Long	243036848128	The total size of the snapshots. Unit: bytes.
TimeStamp	String	2019-05-10T04:00:00Z	The timestamp that corresponds to a snapshot size.
RequestId	String	9F8163A8-F5DE-47A2-A572-4E062D223E09	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?&Action=DescribeSnapshotMonitorData
&RegionId=cn-qingdao-env17-d01
&StartTime=2019-05-10T00:00:00Z

Error codes

HTTP status code	Error code	Error message	Description
400	InvalidStartTime.Malformed	The specified parameter "StartTime" is not valid.	The error message returned because the specified StartTime parameter is invalid.

HTTP status code	Error code	Error message	Description
400	InvalidEndTime.Malformed	The specified parameter "EndTime" is not valid.	The error message returned because the specified EndTime parameter is invalid.
400	InvalidPeriod.ValueNotSupported	The specified parameter "Period" is not valid.	The error message returned because the specified Period parameter is invalid.
400	InvalidStartTime.TooEarly	The specified parameter "StartTime" is too early.	The error message returned because the specified StartTime parameter is more than 30 days earlier than the current time.
400	InvalidParameter.TooManyDataQueried	Too many data queried.	The error message returned because the amount of queried monitoring data has reached the upper limit.
400	Throttling	Request was denied due to request throttling.	The error message returned because the request is denied due to throttling. Try again later.

2.1.2.1.16.6. DescribeEniMonitorData

You can call this operation to query all monitoring data about traffic on a secondary elastic network interface (ENI) over a specific period of time.

Description

The monitoring data includes traffic sent and received over the internal network, the number of packets sent and received by the secondary ENI, and the number of dropped packets sent and received by the secondary ENI. A portion may be missing from the returned monitoring data. This is because the system cannot obtain the relevant information. For example, if the instance to which the secondary ENI is bound is in the Stopped state, or if the secondary ENI is not bound to an instance and in the Available state, monitoring data about traffic on the ENI cannot be obtained. When you call this operation, take note of the following items:

- Up to 400 monitoring data entries can be returned at a time. An error is returned if the value calculated based on the following formula is greater than 400: (EndTime – StartTime)/Period.
- You can query monitoring data from up to the past 30 days. If the value of StartTime is more than 30 days earlier than the current time, an error is returned.

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeEniMonitorData	The operation that you want to perform. Set the value to DescribeEniMonitorData.
EndTime	String	Yes	2018-05-21T12:22:00Z	The end of the time range to query. Specify the time in the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time must be in UTC. If the value of seconds (ss) is not 00, the time is rounded up to the next minute.
InstanceId	String	Yes	i-m5e88p52tbip9r2x****	The ID of the instance to which the secondary ENI is bound.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the secondary ENI. You can call the DescribeRegions operation to query the most recent region list.
StartTime	String	Yes	2018-05-21T12:19:00Z	The beginning of the time range to query. Specify the time in the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time must be in UTC. If the value of seconds (ss) is not 00, the time is rounded up to the next minute.
EniId	String	No	eni-m5e0ajic0vbwx7l3****	The ID of the secondary ENI. By default, all secondary ENIs that are bound to the specified instance are queried.
Period	Integer	No	60	The interval at which to retrieve monitoring data. Unit: seconds. Valid values: • 60 • 600 • 3600 Default value: 60

Response parameters

Parameter	Type	Example	Description

Parameter	Type	Example	Description
MonitorData	Array		The collection of monitoring data about traffic on the secondary ENI.
EniMonitorData			
DropPacketRx	String	0	The number of inbound internal data packets discarded by the secondary ENI.
DropPacketTx	String	0	The number of outbound internal data packets discarded by the secondary ENI.
EniId	String	eni-m5e0ajic0vbwx7l3****	The ID of the secondary ENI.
IntranetRx	String	0	The internal data traffic received by the secondary ENI. Unit: Kbit/s.
IntranetTx	String	0	The internal data traffic sent by the secondary ENI. Unit: Kbit/s.
PacketRx	String	0	The number of internal data packets received by the secondary ENI. Unit: packets.
PacketTx	String	0	The number of internal data packets sent by the secondary ENI. Unit: packets.
TimeStamp	String	2018-05-21T03:22:00Z	The timestamp of the data query. The time follows the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time is displayed in UTC.
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.
TotalCount	Integer	4	The total number of returned entries.

Error codes

HTTP status code	Error code	Error message	Description
404	InvalidDiskId.NotFound	The DiskId provided does not exist in our records.	The error message returned because the specified disk does not exist. Check whether the disk ID is correct.
403	InvalidStartTime.Malformed	The specified parameter "StartTime" is not valid.	The error message returned because the specified StartTime parameter is invalid.
403	InvalidEndTime.Malformed	The specified parameter "EndTime" is not valid.	The error message returned because the specified EndTime parameter is invalid.
403	InvalidPeriod.ValueNotSupported	The specified parameter "Period" is not valid.	The error message returned because the specified Period parameter is invalid.
403	InvalidStartTime.TooEarly	The specified parameter "StartTime" is too early.	The error message returned because the specified StartTime parameter is more than 30 days earlier than the current time.
403	InvalidParameter.TooManyDataQueried	Too many data queried.	The error message returned because the amount of queried monitoring data has reached the upper limit.
403	Throttling	Request was denied due to request throttling.	The error message returned because the request is denied due to throttling. Try again later.
403	InvalidInstanceType.NotSupportCredit	The InstanceType of the specified instance does not support credit.	The error message returned because the instance type does not support burstable instances.
403	InvalidParameter.EndTime	The specified parameter EndTime is earlier than StartTime.	The error message returned because the end time is earlier than the start time.
4003	InvalidParam.Malformed	The specified parameter "EniId" and "InstanceId" are not valid	The error message returned because a specified parameter is invalid.

2.1.2.1.17. Tags

2.1.2.1.17.1. AddTags

You can call this operation to add or overwrite one or more tags on your ECS resources. You can add or overwrite tags on instances, disks, snapshots, images, and security groups to facilitate resource management.

Description

When you call this operation, take note of the following items:

- Up to 20 tags can be added to each ECS resource.
- `Tag.N.Key` must match `Tag.N.Value` based on the value of N.
- If you add a tag that has the same key (`Tag.N.Key`) as an existing tag on the specified resource, the new tag value (`Tag.N.Value`) overwrites the original tag value.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	AddTags	The operation that you want to perform. Set the value to AddTags.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the resource on which you want to add or overwrite tags. You can call the DescribeRegions operation to query the most recent region list.
ResourceType	String	Yes	instance	The type of the resource. Valid values: • disk • instance • image • securitygroup • snapshot All values must be in lowercase.
ResourceId	String	Yes	i-bp1ecr********5go2go	The ID of the resource. When the value of the ResourceType parameter is instance, this parameter can be interpreted as InstanceId.

Parameter	Type	Required	Example	Description
Tag.N.value	String	No	FinanceTagValue	The value of tag N to be bound to the resource. **Note** This parameter will be removed in the future. We recommend that you use the Tag.N.Value parameter to ensure future compatibility.
Tag.N.key	String	No	Finance	The key of tag N to be bound to the resource. **Note** This parameter will be removed in the future. We recommend that you use the Tag.N.Key parameter to ensure future compatibility.
Tag.N.Key	String	No	Finance	The key of tag N to be bound to the resource. Valid values of N: 1 to 20. The tag key cannot be an empty string. It can be up to 128 characters in length and cannot contain http:// or https://. It cannot start with acs: or aliyun.
Tag.N.Value	String	No	FinanceTagValue	The value of tag N to be bound to the resource. Valid values of N: 1 to 20. The tag value can be an empty string. It can be up to 128 characters in length and cannot contain http:// or https://. It cannot start with acs: or aliyun.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=AddTags
&RegionId=cn-qingdao-env17-d01
&ResourceType=instance
&ResourceId=i-bp1ecr5g****
&Tag.1.Key=Finance
&Tag.1.Value=FinanceTagValue
&<Common request parameters>
```

Sample success responses

`XML` format

```
<AddTagsResponse>
      <RequestId>C46FF5A8-C5F0-4024-8262-B16B639225A0</RequestId>
</AddTagsResponse>
```

`JSON` format

```
{
  "RequestId": "C46FF5A8-C5F0-4024-8262-B16B639225A0"
}
```

Error codes

HTTP status code	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist.	The error message returned because the specified RegionId parameter does not exist.
404	InvalidResourceId.NotFound	The specified ResourceId is not found in our records.	The error message returned because the specified ResourceId parameter does not exist.
404	InvalidResourceType.NotFound	The ResourceType provided does not exist in our records.	The error message returned because the specified ResourceType parameter does not exist.
400	InvalidTagKey.Malformed	The specified Tag.n.Key is not valid.	The error message returned because the specified Tag.N.Key parameter is invalid.
400	InvalidTagValue.Malformed	The specified Tag.n.Value is not valid.	The error message returned because the specified Tag.N.Value parameter is invalid.

HTTP status code	Error code	Error message	Description
400	OperationDenied.QuotaExceed	The quota of tags on resource is beyond permitted range.	The error message returned because the maximum number of tags that can be bound to the resource has been reached.
403	InvalidResourceId.NotSupported	The specified ResourceId does not support tagging.	The error message returned because the specified resource does not support tagging.
400	InvalidTag.Mismatch	The specified Tag.n.Key and Tag.n.Value are not match.	The error message returned because the specified Tag.N.Key and Tag.N.Value parameters do not match.
400	InvalidTagCount	The specified tags are beyond the permitted range.	The error message returned because the number of specified tags exceeds the upper limit.
400	Duplicate.TagKey	The Tag.N.Key contain duplicate key.	The error message returned because the specified tag key already exists. Tag keys must be unique.
403	QuotaExceed.Tags	%s	The error message returned because the number of tags has reached the quota.

2.1.2.1.17.2. RemoveTags

You can call this operation to unbind one or more tags from a resource such as an instance, disk, snapshot, image, or security group.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	RemoveTags	The operation that you want to perform. Set the value to RemoveTags.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the resource from which you want to unbind tags. You can call the DescribeRegions operation to query the most recent region list.

Parameter	Type	Required	Example	Description
ResourceId	String	Yes	s-946ntx4**	The ID of the resource from which you want to unbind tags. When the value of the ResourceType parameter is instance, this parameter can be interpreted as InstanceId.
ResourceType	String	Yes	snapshot	The type of the resource. Valid values: • disk • instance • image • securitygroup • snapshot All values must be in lowercase.
Tag.N.value	String	No	FinanceTagValue	The value of tag N of the resource. **Note** This parameter will be removed in the future. We recommend that you use the Tag.N.Value parameter to ensure future compatibility.
Tag.N.key	String	No	Finance	The key of tag N of the resource. **Note** This parameter will be removed in the future. We recommend that you use the Tag.N.Key parameter to ensure future compatibility.
Tag.N.Key	String	No	Finance	The key of tag N of the resource. Valid values of N: 1 to 20. The tag key cannot be an empty string. It can be up to 64 characters in length and cannot contain http:// or https://. It cannot start with acs: or aliyun.
Tag.N.Value	String	No	FinanceTagValue	The value of tag N of the resource. Valid values of N: 1 to 20. The tag value can be an empty string. It can be up to 128 characters in length and cannot contain http:// or https://. It cannot start with acs: or aliyun.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=RemoveTags
&RegionId=cn-qingdao-env17-d01
&ResourceId=s-946ntx4****
&ResourceType=snapshot
&Tag.1.Key=Finance
&Tag.1.Value=FinanceTagValue
&<Common request parameters>
```

Sample success responses

`XML` format

```
<RemoveTagsResponse>
      <RequestId>6A2C8AB5-E15D-478C-B56A-CF3DAF060028</RequestId>
</RemoveTagsResponse>
```

`JSON` format

```
{
  "RequestId": "6A2C8AB5-E15D-478C-B56A-CF3DAF060028"
}
```

Error codes

HTTP status code	Error code	Error message	Description
404	InvalidResourceId.NotFound	The specified ResourceId is not found in our records.	The error message returned because the specified ResourceId parameter does not exist.
404	InvalidRegionId.NotFound	The specified RegionId does not exist.	The error message returned because the specified RegionId parameter does not exist.

HTTP status code	Error code	Error message	Description
404	InvalidResourceType.NotFound	The ResourceType provided does not exist in our records.	The error message returned because the specified ResourceType parameter does not exist.
403	InvalidResourceId.NotSupported	The specified ResourceId does not support tagging.	The error message returned because the specified resource does not support tagging.
400	InvalidTagCount	The specified tags are beyond the permitted range.	The error message returned because the number of specified tags exceeds the upper limit.
400	InvalidTagKey.Malformed	The specified Tag.n.Key is not valid.	The error message returned because the specified Tag.N.Key parameter is invalid.
400	InvalidResourceType.NotFound	The specified ResourceType does not exist.	The error message returned because the specified ResourceType parameter is invalid.

2.1.2.1.17.3. DescribeTags

You can call this operation to query available tags. You can query tags by specifying filter conditions such as resource type, resource ID, tag key, and tag value. The specified filter conditions have logical AND relations. Only the tags that meet all the specified filter conditions are returned.

Description

If a tag key is specified and no tag values are specified, all tags that contain the tag key are returned. If a tag key-value pair is specified, only tags that exactly match the key-value pair are returned.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeTags	The operation that you want to perform. Set the value to DescribeTags.
RegionId	String	Yes	cn-qingdao-env17-d01	The ID of the region. You can call the DescribeRegions operation to query the most recent region list.

Parameter	Type	Required	Example	Description
PageSize	Integer	No	50	The number of entries to return on each page. Valid values: 1 to 100 Default value: 50
PageNumber	Integer	No	1	The number of the page to return. Pages start from page 1. Default value: 1
ResourceType	String	No	snapshot	The type of the resource. Valid values: • disk • instance • image • securitygroup • snapshot All values must be in lowercase.
ResourceId	String	No	s-946ntx4wr	The ID of the resource. When the value of the ResourceType parameter is instance, this parameter can be interpreted as InstanceId.
Tag.N.value	String	No	Finance	The value of tag N bound to the resource. Note This parameter will be removed in the future. We recommend that you use the Tag.N.Value parameter to ensure future compatibility.
Tag.N.key	String	No	Finance	The key of tag N bound to the resource. Note This parameter will be removed in the future. We recommend that you use the Tag.N.Key parameter to ensure future compatibility.

Parameter	Type	Required	Example	Description
Tag.N.Key	String	No	Finance	The key of tag N bound to the resource. Valid values of N: 1 to 20. The tag key cannot be an empty string. It can be up to 64 characters in length and cannot contain http:// or https://. It cannot start with acs: or aliyun.
Tag.N.Value	String	No	Finance	The value of tag N bound to the resource. Valid values of N: 1 to 20. The tag value can be an empty string. It can be up to 128 characters in length and cannot contain http:// or https://. It cannot start with acs: or aliyun.

Response parameters

Parameter	Type	Example	Description
PageNumber	Integer	1	The page number of the returned page.
PageSize	Integer	50	The number of entries returned per page.
RequestId	String	B04B8CF3-4489-432D-83BA-6F128E4F2295	The ID of the request.
Tags	Array		The collection of details about tags that match all the filter conditions.
Tag			
ResourceTypeCount	Struct		The number of resource types.
Ddh	Integer	1	The number of dedicated hosts to which the tag is bound.
Disk	Integer	15	The number of disks to which the tag is bound.
Eni	Integer	5	The number of ENIs to which the tag is bound.

Parameter	Type	Example	Description
Image	Integer	6	The number of images to which the tag is bound.
Instance	Integer	45	The number of instances to which the tag is bound.
KeyPair	Integer	17	The number of key pairs to which the tag is bound.
LaunchTemplate	Integer	6	The number of launch templates to which the tag is bound.
Securitygroup	Integer	4	The number of security groups to which the tag is bound.
Snapshot	Integer	15	The number of snapshots to which the tag is bound.
Volume	Integer	6	The number of extended volumes to which the tag is bound.
TagKey	String	test	The tag key.
TagValue	String	api	The tag value.
TotalCount	Integer	1	The total number of tags.

Examples

Sample requests

```
https://ecs.example.com/?Action=DescribeTags
&RegionId=cn-qingdao-env17-d01
&PageSize=50
&PageNumber=1
&ResourceType=snapshot
&ResourceId=s-946ntx4**
&Tag.1.Key=Finance
&Tag.1.Value=Finance
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeTagsResponse>
      <RequestId>B04B8CF3-4489-432D-83BA-6F128E4F2295</RequestId>
      <PageNumber>1</PageNumber>
      <PageSize>50</PageSize>
      <Tags>
            <Tag>
                  <TagKey>test</TagKey>
                  <TagValue>api</TagValue>
            </Tag>
      </Tags>
      <TotalCount>1</TotalCount>
</DescribeTagsResponse>
```

`JSON` format

```
{
  "PageNumber": 1,
  "PageSize": 50,
  "RequestId": "B04B8CF3-4489-432D-83BA-6F128E4F2295",
  "Tags": {
    "Tag": [
      {
        "TagKey": "test",
        "TagValue": "api"
      }
    ]
  },
  "TotalCount": 1
}
```

Error codes

HTTP status code	Error code	Error message	Description
404	InvalidRegionId.NotFound	The specified RegionId does not exist.	The error message returned because the specified RegionId parameter does not exist.
404	InvalidResourceType.NotFound	The ResourceType provided does not exist in our records.	The error message returned because the specified ResourceType parameter does not exist.
400	InvalidTagCount	The specified tags are beyond the permitted range.	The error message returned because the number of specified tags exceeds the upper limit.

HTTP status code	Error code	Error message	Description
400	InvalidTagKey.Malformed	The parameter Tag.n.Key is illegal.	The error message returned because the specified Tag.N.Key parameter is invalid.
400	InvalidTagValue.Malformed	The parameter Tag.n.Value is illegal.	The error message returned because the specified Tag.N.Value parameter is invalid.

2.1.2.1.17.4. TagResources

You can call this operation to create and bind tags to specified ECS resources.

Description

Before you bind tags to a resource, the system checks the number of existing tags on the resource. An error message is returned if the maximum number of tags is reached.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	TagResources	The operation that you want to perform. Set the value to TagResources.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the resource. You can call the DescribeRegions operation to query the most recent region list.
ResourceId.N	RepeatList	Yes	i-bp67acfmxazb4ph***	The IDs of resources. Valid values of N: 1 to 50.
ResourceType	String	Yes	instance	The type of the resource. Valid values: • instance: ECS instance • disk: disk • snapshot: snapshot • image: image • securitygroup: security group • volume: storage volume • eni: elastic network interface (ENI) • ddh: dedicated host • keypair: SSH key pair

Parameter	Type	Required	Example	Description
Tag.N.Key	String	No	Test	The key of tag N to be bound to the resource. Valid values of N: 1 to 20. The tag key cannot be an empty string. It can be up to 128 characters in length and cannot start with acs: or aliyun. It cannot contain http:// or https://.
Tag.N.Value	String	No	Test	The value of tag N to be bound to the resource. Valid values of N: 1 to 20. The tag value can be an empty string. It can be up to 128 characters in length. It cannot start with acs: or contain http:// or https://.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=TagResources
&RegionId=cn-qingdao-env17-d01
&ResourceId.1=i-bp1j6qtvdm8w0z1o0****
&ResourceId.2=i-bp1j6qtvdm8w0z1oP****
&ResourceType=instance
&Tag.1.Key=Test
&<Common request parameters>
```

Sample success responses

`XML` format

```
<TagResourcesResponse>
    <RequestId>C46FF5A8-C5F0-4024-8262-B16B639225A0</RequestId>
</TagResourcesResponse>
```

`JSON` format

```
{
    "RequestId":"C46FF5A8-C5F0-4024-8262-B16B639225A0"
}
```

Error codes

HTTP status code	Error code	Error message	Description
404	InvalidRegionId.NotFound	%s	The error message returned because the specified RegionId parameter does not exist.
404	MissingParameter.TagOwnerUid	The parameter - TagOwnerUid should not be null	The error message returned because the TagOwnerUid parameter is not specified.
404	MissingParameter.TagOwnerBid	The parameter - TagOwnerBid should not be null	The error message returned because the TagOwnerBid parameter is not specified.
404	MissingParameter.ResourceType	The parameter - ResourceType should not be null	The error message returned because the ResourceType parameter is not specified.
404	MissingParameter.Tags	The parameter - Tags should not be null	The error message returned because the tag-related parameters are not specified.
404	MissingParameter.RegionId	The parameter - RegionId should not be null	The error message returned because the RegionId parameter is not specified.
403	PermissionDenied.TagOwnerUid	The specified operator not have permission to set TagOwnerUid value.	The error message returned because you are not authorized to set the owner of the tag.
403	PermissionDenied.Scope	The specified operator not have permission to set Scope value.	The error message returned because the specified operator is not authorized to specify the Scope parameter.
400	NumberExceed.ResourceIds	The ResourceIds parameter's number is exceed , Valid : 50	The error message returned because more than 50 resource IDs are specified in the ResourceId.N parameter.
400	NumberExceed.Tags	The Tags parameter's number is exceed , Valid : 20	The error message returned because more than 20 tags are specified.

HTTP status code	Error code	Error message	Description
400	Duplicate.TagKey	The Tag.N.Key contain duplicate key.	The error message returned because the specified tag key already exists. Tag keys must be unique.
404	InvalidResourceId.NotFound	The specified ResourceIds are not found in our records.	The error message returned because the specified ResourceId parameter does not exist.
404	InvalidResourceType.NotFound	The ResourceType provided does not exist in our records.	The error message returned because the specified ResourceType parameter does not exist.
400	InvalidTagKey.Malformed	The specified Tag.n.Key is not valid.	The error message returned because the specified Tag.N.Key parameter is invalid.
400	InvalidTagValue.Malformed	The specified Tag.n.Value is not valid.	The error message returned because the specified Tag.N.Value parameter is invalid.
400	OperationDenied.QuotaExceed	The quota of tags on resource is beyond permitted range.	The error message returned because the maximum number of tags that can be bound to the resource has been reached.
403	InvalidResourceId.NotSupported	The specified ResourceId does not support tagging.	The error message returned because the specified resource does not support tagging.
400	InvalidTag.Mismatch	The specified Tag.n.Key and Tag.n.Value are not match.	The error message returned because the specified Tag.N.Key and Tag.N.Value parameters do not match.
400	InvalidTagCount	The specified tags are beyond the permitted range.	The error message returned because the number of specified tags exceeds the upper limit.
404	InvalidRegionId.NotFound	The specified RegionId does not exist.	The error message returned because the specified RegionId parameter does not exist.
400	Invalid.Scope	The specified scope is invalid.	The error message returned because the specified scope is invalid.

HTTP status code	Error code	Error message	Description
403	NoPermission.Tag	The operator is not permission for the tag.	The error message returned because you are not authorized to manage the resource tag.
403	QuotaExceed.Tags	%s	The error message returned because the number of tags has reached the quota.

2.1.2.1.17.5. ListTagResources

You can call this operation to query the tags that are bound to one or more ECS instances.

Description

- Specify in the request at least one of the following parameters or parameter pairs to determine a query object: the `ResourceId.N` parameter, the `Tag.N` parameter pair (`Tag.N.Key` and `Tag.N.Value`), and the `TagFilter.N` parameter pair (TagFilter.N.TagValues.N and TagFilter.N.TagKey).
- If one of the following sets of request parameters is specified as filter conditions, the response contains only ECS resources that meet all these filter conditions:
  - `Set 1: Tag.N.Key, Tag.N.Value` , and `ResourceId.N`
  - `Set 2: TagFilter.N.TagValues.N, TagFilter.N.TagKey` , and `ResourceId.N`

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	ListTagResources	The operation that you want to perform. Set the value to ListTagResources.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the resource. You can call the DescribeRegions operation to query the most recent region list.

Parameter	Type	Required	Example	Description
ResourceType	String	Yes	instance	The type of the resource. Valid values: • instance: ECS instance • disk: Block Storage device • snapshot: snapshot • image: image • securitygroup: security group • volume: storage volume • eni: elastic network interface (ENI) • ddh: dedicated host • keypair: SSH key pair
TagFilter.N.TagKey	String	Yes	env	The key of tag N used for fuzzy search of ECS resources. It must be 1 to 128 characters in length. Valid values of N: 1 to 5. The `TagFilter.N` parameter pair (TagFilter.N.TagKey and TagFilter.N.TagValues.N) specifies tags used for fuzzy search of ECS resources that are bound with the tags. In these tags, a tag key may correspond to one or more tag values. Fuzzy search may have a latency of two seconds. A fuzzy search can return a result set of up to 5,000 resources. • When a tag key (`TagFilter.N.TagKey`) is used for fuzzy search of ECS resources, tag values (`TagFilter.N.TagValues.N`) that correspond to this tag key must not be specified. For example, when you use the `environment` tag key for fuzzy search of ECS resources, you can set `TagFilter.1.TagKey` to `env` and leave `TagFilter.1.TagValues.N` empty. • When a tag value (`TagFilter.N.TagValues.N`) is used for fuzzy search of ECS resources, the corresponding tag key (`TagFilter.N.TagKey`) must be specified. For example, when you use the `env` tag key and the `product` tag value for fuzzy search of ECS resources, you can set `TagFilter.1.TagKey` to `env` and `TagFil`

Parameter	Type	Required	Example	Description
				ter.1.TagValues.1 to proc . • If you specify multiple tag keys, only the ECS resources whose tags contain all the specified tag keys are returned. • If you specify a tag key and multiple corresponding tag values, all the ECS resources that are bound with any of these tag key-value pairs are returned. **Note** The TagFilter.N parameter pair (TagFilter.N.TagKey and TagFilter.N.TagValues.N) cannot be used together with the Tag.N parameter pairs (Tag.N.Key and Tag.N.Value). Otherwise, an error message is returned.
ResourceId.N	RepeatList	No	i-bp1j6qtvdm8w0z1o0***	The IDs of ECS resources. Valid values of N: 1 to 50.
Tag.N.Key	String	No	FinanceDeptKey	The key of tag N used for exact search of ECS resources. It must be 1 to 128 characters in length. Valid values of N: 1 to 20. The Tag.N parameter pair (Tag.N.Key and Tag.N.Value) specifies tags used for exact search of ECS resources that are bound with the tags. In these tags, a tag key corresponds to only one tag value. • If you specify only Tag.N.Key, the ECS resources whose tags contain all the specified tag keys are returned. • If you specify only Tag.N.Value, the InvalidParameter.TagValue error is returned. • If you specify multiple tag key-value pairs, only the ECS resources that are bound with all these tag key-value pairs are returned.

Parameter	Type	Required	Example	Description
Tag.N.Value	String	No	FinanceDeptValue	The value of tag N used for exact search of ECS resources. It must be 1 to 128 characters in length. Valid values of N: 1 to 20.
TagFilter.N.TagValues.N	RepeatList	No	product	The value of tag N used for fuzzy search of ECS resources. It must be 1 to 128 characters in length. Valid values of N: 1 to 5.
NextToken	String	No	caeba0bbb2be03f84eb48b699f0a4883	The token for starting the next query.

Response parameters

Parameter	Type	Example	Description
NextToken	String	caeba0bbb2be03f84eb48b699f0a4883	The token for starting the next query.
RequestId	String	484256DA-D816-44D2-9D86-B6EE4D5BA78C	The ID of the request.
TagResources	Array		The collection of details about resources and tags, such as resource IDs, resource types, and tag key-value pairs.
TagResource			
ResourceId	String	i-bp1j6qtvdm8w0z1o0***	The ID of the resource.
ResourceType	String	instance	The type of the resource.
TagKey	String	FinanceDeptKey	The tag key of the resource.
TagValue	String	FinanceDeptValue	The tag value of the resource.

Examples

Sample requests

```
https://ecs.example.com/?Action=ListTagResources
&RegionId=cn-qingdao-env17-d01
&ResourceType=instance
&ResourceId.1=i-bp1j6qtvdm8w0z1o0***
&<Common request parameters>
```

Sample success responses

`XML` format

```
<ListTagResourcesResponse>
      <TagResources>
            <TagResource>
                  <ResourceType>instance</ResourceType>
                  <TagValue>FinanceTagValue</TagValue>
                  <ResourceId>i-bp1j6qtvdm8w0z1o0***</ResourceId>
                  <TagKey>FinanceTagKey</TagKey>
            </TagResource>
      </TagResources>
      <RequestId>DE65F6B7-7566-4802-9007-96F2494AC5XX</RequestId>
</ListTagResourcesResponse>
```

`JSON` format

```

                "TagValue": "FinanceTagValue",
                "ResourceId": "i-bp1j6qtvdm8w0z1o0***",
                "TagKey": "FinanceTagKey"
            }
        ]
    },
    "RequestId": "DE65F6B7-7566-4802-9007-96F2494AC512"
}
```

Error codes

HTTP status code	Error code	Error message	Description
404	InvalidRegionId.NotFound	%s	The error message returned because the specified RegionId parameter does not exist.
404	MissingParameter.TagOwnerUid	The parameter - TagOwnerUid should not be null	The error message returned because the TagOwnerUid parameter is not specified.

HTTP status code	Error code	Error message	Description
404	MissingParameter.TagOwnerBid	The parameter - TagOwnerBid should not be null	The error message returned because the TagOwnerBid parameter is not specified.
404	MissingParameter.ResourceType	The parameter - ResourceType should not be null	The error message returned because the ResourceType parameter is not specified.
404	MissingParameter.Tags	The parameter - Tags should not be null	The error message returned because the tag-related parameters are not specified.
404	MissingParameter.RegionId	The parameter - RegionId should not be null	The error message returned because the RegionId parameter is not specified.
403	PermissionDenied.TagOwnerUid	The specified operator not have permission to set TagOwnerUid value.	The error message returned because you are not authorized to set the owner of the tag.
403	PermissionDenied.Scope	The specified operator not have permission to set Scope value.	The error message returned because the specified operator is not authorized to specify the Scope parameter.
400	NumberExceed.ResourceIds	The ResourceIds parameter's number is exceed , Valid : 50	The error message returned because more than 50 resource IDs are specified in the ResourceId.N parameter.
400	NumberExceed.Tags	The Tags parameter's number is exceed , Valid : 20	The error message returned because more than 20 tags are specified.
400	Duplicate.TagKey	The Tag.N.Key contain duplicate key.	The error message returned because the specified tag key already exists. Tag keys must be unique.
404	InvalidResourceId.NotFound	The specified ResourceIds are not found in our records.	The error message returned because the specified ResourceId.N parameter does not exist.
404	InvalidResourceType.NotFound	The ResourceType provided does not exist in our records.	The error message returned because the specified ResourceType parameter does not exist.

HTTP status code	Error code	Error message	Description
400	InvalidTagKey.Malformed	The specified Tag.n.Key is not valid.	The error message returned because the specified Tag.N.Key parameter is invalid.
400	InvalidTagValue.Malformed	The specified Tag.n.Value is not valid.	The error message returned because the specified Tag.N.Value parameter is invalid.
400	OperationDenied.QuotaExceed	The quota of tags on resource is beyond permitted range.	The error message returned because the maximum number of tags that can be bound to the resource has been reached.
403	InvalidResourceId.NotSupported	The specified ResourceId does not support tagging.	The error message returned because the specified resource does not support tagging.
400	InvalidTag.Mismatch	The specified Tag.n.Key and Tag.n.Value are not match.	The error message returned because the specified Tag.N.Key and Tag.N.Value parameters do not match.
400	InvalidTagCount	The specified tags are beyond the permitted range.	The error message returned because the number of specified tags exceeds the upper limit.
404	InvalidRegionId.NotFound	The specified RegionId does not exist.	The error message returned because the specified RegionId parameter does not exist.
400	Invalid.Scope	The specified scope is invalid.	The error message returned because the specified scope is invalid.
403	NoPermission.Tag	The operator is not permission for the tag.	The error message returned because you are not authorized to manage the resource tag.

2.1.2.1.17.6. UntagResources

You can call this operation to unbind tags from specified ECS resources. After a tag is unbound from a resource, it is automatically deleted if it is not bound to any other resources.

Request parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
Action	String	Yes	UntagResources	The operation that you want to perform. Set the value to UntagResources.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the resource. You can call the DescribeRegions operation to query the most recent region list.
ResourceId.N	RepeatList	Yes	i-bp67acfmxazb4ph***	The IDs of resources. Valid values of N: 1 to 50.
ResourceType	String	Yes	instance	The type of the resource. Valid values: • instance: ECS instance • disk: disk • snapshot: snapshot • image: image • securitygroup: security group • volume: storage volume • eni: elastic network interface (ENI) • ddh: dedicated host • keypair: SSH key pair • launchtemplate: launch template
TagKey.N	RepeatList	No	FinanceDept	The key of tag N bound to the resource. Valid values of N: 1 to 20.
All	Boolean	No	false	Specifies whether to unbind all tags from the resource. This parameter takes effect only when the TagKey.N parameter is not specified. Valid values: • true • false Default value: false

Response parameters

Parameter	Type	Example	Description
RequestId	String	C46FF5A8-C5F0-4024-8262-B16B639225A0	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=UntagResources
&RegionId=cn-qingdao-env17-d01
&ResourceType=instance
&ResourceId.1=i-bp1j6qtvdm8w0z1o0***
&TagKey.1=FinanceDept
&<Common request parameters>
```

Sample success responses

`XML` format

```
<UntagResourcesResponse>
    <RequestId>C46FF5A8-C5F0-4024-8262-B16B639225A0</RequestId>
</UntagResourcesResponse>
```

`JSON` format

```
{
    "RequestId":"C46FF5A8-C5F0-4024-8262-B16B639225A0"
}
```

Error codes

HTTP status code	Error code	Error message	Description
404	InvalidRegionId.NotFound	%s	The error message returned because the specified RegionId parameter does not exist.
404	MissingParameter.TagOwnerUid	The parameter - TagOwnerUid should not be null	The error message returned because the TagOwnerUid parameter is not specified.
404	MissingParameter.TagOwnerBid	The parameter - TagOwnerBid should not be null	The error message returned because the TagOwnerBid parameter is not specified.
404	MissingParameter.ResourceType	The parameter - ResourceType should not be null	The error message returned because the ResourceType parameter is not specified.

HTTP status code	Error code	Error message	Description
404	MissingParameter.Tags	The parameter - Tags should not be null	The error message returned because the tag-related parameters are not specified.
404	MissingParameter.RegionId	The parameter - RegionId should not be null	The error message returned because the RegionId parameter is not specified.
403	PermissionDenied.TagOwnerUid	The specified operator not have permission to set TagOwnerUid value.	The error message returned because you are not authorized to set the owner of the tag.
403	PermissionDenied.Scope	The specified operator not have permission to set Scope value.	The error message returned because the specified operator is not authorized to specify the Scope parameter.
400	NumberExceed.ResourceIds	The ResourceIds parameter's number is exceed , Valid : 50	The error message returned because more than 50 resource IDs are specified in the ResourceId.N parameter.
400	NumberExceed.Tags	The Tags parameter's number is exceed , Valid : 20	The error message returned because more than 20 tags are specified.
400	Duplicate.TagKey	The Tag.N.Key contain duplicate key.	The error message returned because the specified tag key already exists. Tag keys must be unique.
404	InvalidResourceId.NotFound	The specified ResourceIds are not found in our records.	The error message returned because the specified ResourceId.N parameter does not exist.
404	InvalidResourceType.NotFound	The ResourceType provided does not exist in our records.	The error message returned because the specified ResourceType parameter does not exist.
400	InvalidTagKey.Malformed	The specified Tag.n.Key is not valid.	The error message returned because the specified Tag.N.Key parameter is invalid.
400	InvalidTagValue.Malformed	The specified Tag.n.Value is not valid.	The error message returned because the specified Tag.N.Value parameter is invalid.

HTTP status code	Error code	Error message	Description
400	OperationDenied.QuotaExceed	The quota of tags on resource is beyond permitted range.	The error message returned because the maximum number of tags that can be bound to the resource has been reached.
403	InvalidResourceId.NotSupported	The specified ResourceId does not support tagging.	The error message returned because the specified resource does not support tagging.
400	InvalidTag.Mismatch	The specified Tag.n.Key and Tag.n.Value are not match.	The error message returned because the specified Tag.N.Key and Tag.N.Value parameters do not match.
400	InvalidTagCount	The specified tags are beyond the permitted range.	The error message returned because the number of specified tags exceeds the upper limit.
404	InvalidRegionId.NotFound	The specified RegionId does not exist.	The error message returned because the specified RegionId parameter does not exist.
400	Invalid.Scope	The specified scope is invalid.	The error message returned because the specified scope is invalid.
403	NoPermission.Tag	The operator is not permission for the tag.	The error message returned because you are not authorized to manage the resource tag.

2.1.2.1.18. Other operations

2.1.2.1.18.1. DescribeTasks

You can call this operation to query the progress of one or more asynchronous tasks.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeTasks	The operation that you want to perform. Set the value to DescribeTasks.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the task. You can call the DescribeRegions operation to query the most recent region list.

Parameter	Type	Required	Example	Description
PageNumber	Integer	No	1	The number of the page to return. Pages start from page 1. Default value: 1.
PageSize	Integer	No	2	The number of entries to return on each page. Valid values: 1 to 100. Default value: 10.
TaskIds	String	No	t-bp1hvgwromzv32iq****,t-bp179lofu2pv768w****	The IDs of tasks. You can specify up to 100 task IDs at a time. Separate multiple tasks IDs with commas (,).
TaskAction	String	No	ImportImage	The name of the operation to which the task corresponds. Valid values: • ImportImage • ExportImage
TaskStatus	String	No	Finished	The status of the task. Valid values: • Finished • Processing • Pending • Deleted • Paused This parameter is empty by default.
StartTime	String	No	2015-11-23T15:10:00Z	The beginning of the time range to query. Specify the time in the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time must be in UTC.
EndTime	String	No	2015-11-23T15:16:00Z	The end of the time range to query. Specify the time in the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time must be in UTC.

Response parameters

Parameter	Type	Example	Description
PageNumber	Integer	1	The page number of the returned page.
PageSize	Integer	2	The number of entries returned per page.
RegionId	String	cn-qingdao-env17-d01	The region ID of the task.
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.
TaskSet	Array of Task		Details about the tasks.
Task			
CreationTime	String	2015-11-24T12:50Z	The time when the task was created.
FinishedTime	String	2015-11-24T12:50Z	The time when the task was completed.
SupportCancel	String	true	Indicates whether the task can be canceled.
TaskAction	String	IMPORT_IMAGE	The name of the task.
TaskId	String	t-bp1hvgwromzv32iq****	The ID of the task.
TaskStatus	String	Finished	The status of the task.
TotalCount	Integer	2	The total number of entries returned.

Examples

Sample requests

```
https://ecs.example.com/?Action=DescribeTasks
&RegionId=cn-qingdao-env17-d01
&PageNumber=1
&PageSize=2
&TaskIds=t-bp1hvgwromzv32iq****
&TaskAction=ImportImage
&TaskStatus=Finished
&StartTime=2015-11-23T15:10:00Z
&EndTime=2015-11-23T15:16:00Z
&<Common request parameters>
```

Sample success responses

`XML` format

```
<DescribeTasksResponse>
    <PageNumber>1</PageNumber>
    <TotalCount>2</TotalCount>
    <PageSize>2</PageSize>
    <RegionId>cn-qingdao-env17-d01</RegionId>

Error codes

HTTP status code	Error code	Error message	Description
400	MissingParameter	An input parameter "RegionId" that is mandatory for processing the request is not supplied.	The error message returned because the RegionId parameter is not specified.
400	InvalidRegionId.NotFound	The specified RegionId does not exist.	The error message returned because the specified RegionId parameter does not exist.

2.1.2.1.18.2. DescribeTaskAttribute

You can call this operation to query the details about an asynchronous task.

This operation support the following asynchronous task types:

- Image import (ImportImage)
- Image export (ExportImage)

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	DescribeTaskAttribute	The operation that you want to perform. Set the value to DescribeTaskAttribute.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the task. You can call the DescribeRegions operation to query the most recent region list.
TaskId	String	Yes	t-taskid	The ID of the task. You can call the DescribeTasks operation to query the list of task IDs.

Response parameters

Parameter	Type	Example	Description
CreationTime	String	2015-11-23T02:13Z	The time when the task was created.
FailedCount	Integer	0	The number of failed tasks.
FinishedTime	String	2015-11-23T02:19Z	The time when the task was completed.
OperationProgressSet	Array		The collection of task-related data such as the status and information of each subtask.
OperationProgress			
ErrorCode	String	ParameterInvalid	The error code.
ErrorMsg	String	The specified RegionId parameter is invalid.	The error message.
OperationStatus	String	Success	The status of the operation.
RelatedItemSet	Array		The collection of related items.
RelatedItem			

Parameter	Type	Example	Description
Name	String	OSSObject	The name of the related item.
Value	String	MYOSSPRE_m-23f8tcp***_t-23ym6mv***.vhd	The value of the related item.
RegionId	String	cn-qingdao-env17-d01	The ID of the region.
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.
SuccessCount	Integer	1	The number of completed tasks.
SupportCancel	String	true	Indicates whether the task can be canceled. Valid values: • true: The task can be canceled. • false: The task cannot be canceled.
TaskAction	String	ExportImage	The operation name of the task.
TaskId	String	t-taskid	The ID of the task.
TaskProcess	String	100%	The progress of the task.
TaskStatus	String	Finished	The status of the task.
TotalCount	Integer	1	The total number of tasks.

Examples

Sample requests

```
https://ecs.example.com/?Action=DescribeTaskAttribute
&RegionId=cn-qingdao-env17-d01
&TaskId=t-taskid
&<Common request parameters>
```

Sample success responses

Error codes

HTTP status code	Error code	Error message	Description
400	InvalidRegionId.NotFound	The specified RegionId does not exist.	The error message returned because the specified RegionId parameter does not exist.

HTTP status code	Error code	Error message	Description
400	MissingParameter	An input parameter "RegionId" that is mandatory for processing the request is not supplied.	The error message returned because the RegionId parameter is not specified.
400	MissingParameter	An input parameter "TaskId" that is mandatory for processing the request is not supplied.	The error message returned because the TaskId parameter is not specified.
400	InvalidTaskId.NotFound	The specified "TaskId" is not found.	The error message returned because the specified TaskId parameter does not exist.

2.1.2.1.18.3. CancelTask

You can call this operation to cancel a running task.

Description

You can call this operation to cancel the following tasks:

- Image import (ImportImage)
- Image export (ExportImage)

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	CancelTask	The operation that you want to perform. Set the value to CancelTask.
RegionId	String	Yes	cn-qingdao-env17-d01	The region ID of the task. You can call the DescribeRegions operation to query the most recent region list.
TaskId	String	Yes	t-23ym6****	The ID of the task. You can call the DescribeTasks operation to query the list of task IDs.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=CancelTask
&RegionId=cn-qingdao-env17-d01
&TaskId=t-23ym6mv****
&<Common request parameters>
```

Sample success responses

`XML` format

```
<CancelTaskResponse>
      <RequestId>4BE2C7FE-C7A4-4675-A153-174E032AABFB</RequestId>
</CancelTaskResponse>
```

`JSON` format

```
{
    "RequestId": "4BE2C7FE-C7A4-4675-A153-174E032AABFB"
}
```

Error codes

HTTP status code	Error code	Error message	Description
400	MissingParameter	An input parameter "RegionId" that is mandatory for processing the request is not supplied.	The error message returned because the RegionId parameter is not specified.
400	MissingParameter	An input parameter "TaskId" that is mandatory for processing the request is not supplied.	The error message returned because the TaskId parameter is not specified.
400	InvalidRegionId.NotFound	The specified RegionId does not exist.	The error message returned because the specified RegionId parameter does not exist.
400	InvalidTaskId.NotFound	The specified "TaskId" is not found.	The error message returned because the specified TaskId parameter does not exist.
403	InvalidTaskId.TaskActionNotSupport	The specified task action not support.	The error message returned because the specified task operation is not supported.
403	InvalidTaskId.IncorrectTaskStatus	The specified task status is not invalid.	The error message returned because the status of the specified task is invalid.

HTTP status code	Error code	Error message	Description
403	CancelTaskFailed	The task is failed to cancel, Please contact the administrator.	The error message returned because the task cannot be canceled. Contact the administrator.

2.1.2.1.18.4. JoinResourceGroup

You can call this operation to add an ECS resource or service to a resource group.

Description

A resource is a cloud service entity created in Apsara Stack, such as an ECS instance, elastic network interface (ENI), or ECS image. A resource group is a collection of infrastructure for projects, environments, or stacks. In a resource group, you can manage resources and monitor and run tasks in a centralized manner without switching between Apsara Stack services.

Request parameters

Parameter	Type	Required	Example	Description
Action	String	Yes	JoinResourceGroup	The operation that you want to perform. Set the value to JoinResourceGroup.
ResourceType	String	No	securitygroup	The type of the ECS resource. Valid values: • instance: instance • disk: Block Storage device • snapshot: snapshot • image: image • securitygroup: security group • ddh: dedicated host • eni: elastic network interface (ENI) • keypair: SSH key pair • launchtemplate: launch template These values are case-sensitive.
ResourceId	String	No	sg-bp67acfmxazb4ph***	The ID of the resource. This parameter depends on ResourceType. For example, when ResourceType is set to instance, ResourceId can be interpreted as InstanceId.

Parameter	Type	Required	Example	Description
RegionId	String	No	cn-qingdao-env17-d01	The region ID of the ECS resource. You can call the DescribeRegions operation to query the most recent region list.
ResourceGroupId	String	No	rg-bp67acfmxazb4ph***	The ID of the resource group to which to add the resource.

Response parameters

Parameter	Type	Example	Description
RequestId	String	473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E	The ID of the request.

Examples

Sample requests

```
https://ecs.example.com/?Action=JoinResourceGroup
&RegionId=cn-qingdao-env17-d01
&RsourceType=securitygroup
&ResourceId=sg-bp67acfmxazb4ph***
&ResourceGroupId=rg-bp67acfmxazb4ph***
&<Common request parameters>
```

Sample success responses

`XML` format

```
<JoinResourceGroupResponse>
      <RequestId>473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E</RequestId>
</JoinResourceGroupResponse>
```

`JSON` format

```
{
    "RequestId": "473469C7-AA6F-4DC5-B3DB-A3DC0DE3C83E"
}
```

Error codes

HTTP status code	Error code	Error message	Description
403	MissingParameter	The input parameter "ResourceId" that is mandatory for processing this request is not supplied.	The error message returned because the ResourceId parameter is not specified.
403	MissingParameter	The input parameter "ResourceGroupId" that is mandatory for processing this request is not supplied.	The error message returned because the ResourceGroupId parameter is not specified.
403	MissingParameter	The input parameter "RegionId" that is mandatory for processing this request is not supplied.	The error message returned because the RegionId parameter is not specified.
404	InvalidResourceType.NotFound	The ResourceType provided does not exist in our records.	The error message returned because the specified ResourceType parameter does not exist.
404	InvalidResourceGroup.NotFound	The ResourceGroup provided does not exist in our records.	The error message returned because the specified ResourceGroupId parameter does not exist.
404	InvalidResourceId.NotFound	The ResourceId provided does not exist in our records.	The error message returned because the specified ResourceId parameter does not exist.
403	InvalidResourceGroup.Duplicate	The ResourceId provided has a ResourceGroup in our records.	The error message returned because the specified resource has already been added to another resource group.

2.1.2.1.19. Appendix

2.1.2.1.19.1. Glossary

This topic describes the terms that you may encounter in ECS API operations.

Terms

Description

Term	Definition	Description
Instance	ECS instance, instance for short	An ECS instance is a virtual computer that is emulated on a physical server.

Term	Definition	Description
Region	Region	A region is the geographic location where resources are located. Each region contains a group of zones.
Zone	Zone	A zone is a physical area that operates an independent network and has its own power supply. The network latency is shorter for communication between ECS instances in the same zone. Zones within the same region can access each other, but faults which occur in one zone are isolated from other zones.
Image	Image file, image for short	An image file contains data for an operating system and applications. You can select an image to initialize an ECS instance. Before you create an instance, ensure that available images exist. All of the system disk contents of a newly created instance, including its OS and software configurations, are copied from the image. To create instances of different operating systems, you must select different image files.
Disk	Disk	A disk is the storage device used by an instance.
Snapshot	Snapshot	A snapshot is a backup copy of data on a disk for a certain point in time. A snapshot can be used to restore disk data and create custom images.
IP	IP address	A public IP address on the Internet.
SecurityGroup	Security group	A security group is a group of instances to which a set of security policies will be applied to. An instance must belong to at least one security group. The security policies of a security group apply to all instances in the group.
CIDR	Classless Inter-Domain Routing (CIDR)	CIDR is an Internet address allocation scheme. Compared with the Class A, B, and C addressing schemes, CIDR is much more efficient. For example, to convert the IP address segment 125.203.96.0 - 125.203.127.255 into CIDR format, find the same first 19 bits: 125.203.0110 0000.0000 0000 to 125.203.0111 1111.1111 1111, which can be represented in 125.203.96.0/19.

Limits

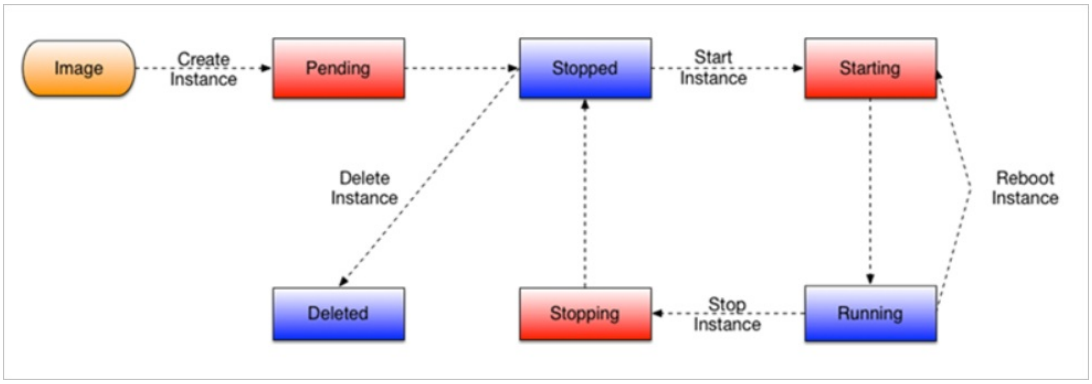
- In ECS, the number of instances, security groups, and other resources that can be used by each user is limited.
- Specifications such as the instance type, number of disks that can be mounted on each instance, disk capacity, and number of disk snapshots are also limited.

2.1.2.1.19.2. Instance statuses

Statuses

Status	Description
Pending	The instance is being created.
Stopped	The instance is stopped.
Starting	The instance is starting.
Running	The instance is running.
Stopping	The instance is being stopped.

Instance state diagram



2.1.2.1.19.3. Common errors

Error codes

Error code	HTTP status code	Error message
IdempotentParameterMismatch	400	The request is retried with updated parameters.
IllegalTimestamp	400	The input parameter "Timestamp" that is mandatory for processing this request is not supplied.
IncompleteSignature	400	The request signature does not conform to Aliyun standards.
InvalidAccessKeyId.NotFound	400	The Access Key ID provided does not exist in our records.
InvalidOwner	400	OwnerId and OwnerAccount can't be used at one API access.
InvalidOwnerId	400	The specified OwnerId is not valid.
InvalidOwnerAccount	400	The specified OwnerAccount is not valid.

Error code	HTTP status code	Error message
InvalidParamater	400	The specified parameter "SignatureMethod" is not valid.
InvalidParamater	400	The specified parameter "SignatureVersion" is not valid.
InvalidParameter	400	The specified parameter "Action or Version" is not valid.
InvalidParameter	400	The specified parameter is not valid.
InvalidParameter.IsNull	400	The required parameter must be not null.
MissingParameter	400	The input parameter "Action" that is mandatory for processing this request is not supplied.
MissingParameter	400	The input parameter "AccessKeyId" that is mandatory for processing this request is not supplied.
MissingParameter	400	An input parameter "Signature" that is mandatory for processing the request is not supplied.
MissingParameter	400	The input parameter "Timestamp" that is mandatory for processing this request is not supplied. supplied.
MissingParameter	400	The input parameter "Version" that is mandatory for processing this request is not supplied.
SignatureNonceUsed	400	The request signature nonce has been used.
Throttling	400	You have made too many requests within a short time; your request is denied due to request throttling.
UnsupportedParameter	400	The parameter is unsupported.
UnknownError	400	The request processing has failed due to some unknown error.
Forbidden.AccessKeyDisabled	403	The Access Key is disabled.
Forbidden.NotSupportRAM	403	This action does not support accessed by RAM mode.
Forbidden.RAM	403	User not authorized to operate the specified resource, or this API doesn't support RAM.

Error code	HTTP status code	Error message
Forbidden.RiskControl	403	This operation is forbidden by Aliyun Risk Control system.
Forbidden.SubUser	403	The specified action is not available for you.
Forbidden.Unauthorized	403	User not authorized to operate on the specified resource.
InvalidAccount.NotFound	403	The specified Account does not exist.
InvalidAction	403	The specified action is not valid.
InvalidIdempotenceParameter.Mismatch	403	The specified parameters are different from before.
InvalidParameter.OwnerAccount	403	OwnerAccount is Invalid.
InvalidParameter.ResourceOwnerAccount	403	ResourceOwnerAccount is Invalid.
LastTokenProcessing	403	The last token request is processing.
MissingParameter	403	The input parameter OwnerId, OwnerAccount that is mandatory for processing this request is not supplied.
RealNameAuthenticationError	403	Your account has not passed the real-name authentication yet.
UnsupportedHTTPMethod	403	This http method is not supported.
InvalidDiskId.NotFound	404	The specified DiskId does not exist.
InvalidImageId.NotFound	404	The specified ImageId does not exist.
InvalidInstanceId.NotFound	404	The specified InstanceId does not exist.
InvalidRegionId.NotFound	404	The specified RegionId does not exist.
InvalidSecurityGroupId.NotFound	404	The specified SecurityGroupId does not exist.
InvalidSnapshotId.NotFound	404	The specified SnapshotId does not exist.
OperationConflict	409	Request was denied due to conflict with a previous request.
InternalError	500	The request processing has failed due to some unknown error, exception or failure.
ServiceUnavailable	500	The request has failed due to a temporary failure of the server.

Error code	HTTP status code	Error message
ServiceUnavailable.RegionMaintaining	503	System maintenance is in progress on the selected region, please wait a few minutes before trying again.

2.1.2.1.19.4. Disk categories

Disk types

Disk type	Category	Maximum capacity of a disk
Basic disk	cloud	2,000 GiB
Ultra disk	cloud_efficiency	32,768 GiB
SSD disk	cloud_ssd	32,768 GiB

2.1.2.1.19.5. How to ensure idempotency

If a request timeout or internal server error occurs when you call CreateInstance to create an ECS instance, the client may attempt to resend the request. You can specify the ClientToken parameter to prevent the server from creating redundant instances in these cases. The ClientToken parameter ensures idempotency of the request.

A ClientToken is a unique and case-sensitive string generated by the client. It cannot exceed 64 ASCII characters in length.

If you use the same ClientToken for multiple CreateInstance operations, the server will return identical responses that contain the same InstanceId parameter. Therefore, if an error occurs during an instance creation request, you can retry the creation request using the same ClientToken as the failed request. This ensures that only one ECS instance is created and that it assigned to a specific InstanceId.

If you specify a ClientToken that is in use with different request parameters than previously used, ECS will return the IdempotentParameterMismatch error code. You must change the SignatureNonce, Timestamp, and Signature values when calling the operation again. This is because ECS uses SignatureNonce to prevent replay attacks and Timestamp to mark the time of each request. Each new request must have different SignatureNonce and Timestamp values, which changes the Signature value.

Typically, if a 500 (InternalError) or 503 (ServiceUnavailable) error code is returned or no responses are returned, you must retry operations. If an operation is retried after a response code of 200 is returned, an identical response will be returned but the server status will not be affected. If a 4xx error code is returned and *try it later* does not appear in the error message, attempts to retry the operation will fail.

2.1.2.1.19.6. API behavior when an instance is locked for security reasons

When OperationLocks in the DescribeInstances response contains LockReason: security for an instance, the instance is locked for security reasons.

If a disk on the instance is in the In_use state, the behavior of API operations related to the disk is subject to the OperationLocks settings of the instance. If the disk is in other states, the OperationLocks settings can be ignored.

Operations and behavior

Operation	Behavior
AttachDisk	Returns an error.
AuthorizeSecurityGroup	Is called and returns a response based on its normal logic.
CreateDisk	Is called and returns a response based on its normal logic.
CreateImage	Is called and returns a response based on its normal logic.
CreateInstance	-
CreateSecurityGroup	Is called and returns a response based on its normal logic.
CreateSnapshot	Returns an error when the disk is attached to the current instance and is in the **In_use** state.
DeleteDisk	Is called and returns a response based on its normal logic.
DeleteImage	Is called and returns a response based on its normal logic.
DeleteInstance	Is called and returns a response based on its normal logic.
DeleteSecurityGroup	Is called and returns a response based on its normal logic.
DeleteSnapshot	Is called and returns a response based on its normal logic.
DescribeAutoSnapshotPolicy	Is called and returns a response based on its normal logic.
DescribeDisks	Is called and returns a response based on its normal logic.
DescribeImages	Is called and returns a response based on its normal logic.
DescribeInstanceAttribute	Is called and returns a response based on its normal logic.
DescribeInstanceStatus	Is called and returns a response based on its normal logic.
DescribeInstanceTypes	Is called and returns a response based on its normal logic.
DescribeInstanceMonitorData	Is called and returns a response based on its normal logic.
DescribeRegions	Is called and returns a response based on its normal logic.
DescribeSecurityGroupAttribute	Is called and returns a response based on its normal logic.
DescribeSecurityGroups	Is called and returns a response based on its normal logic.
DescribeSnapshotAttribute	Is called and returns a response based on its normal logic.

Operation	Behavior
DescribeSnapshots	Is called and returns a response based on its normal logic.
DescribeZones	Is called and returns a response based on its normal logic.
DetachDisk	Returns an error.
JoinSecurityGroup	Returns an error.
LeaveSecurityGroup	Returns an error.
ModifyAutoSnapshotPolicy	Is called and returns a response based on its normal logic.
ModifyDiskAttribute	Is called and returns a response based on its normal logic.
ModifyInstanceAttribute	Returns an error.
RebootInstance	Returns an error.
ReInitDisk	Returns an error when the disk is attached to the current instance and is in the In_use state When the disk is attached to the current instance and is in other states, the operation is called and returns a response based on its normal logic.
ReplaceSystemDisk	Is called and returns a response based on its normal logic.
ResetDisk	Returns an error.
RevokeSecurityGroup	Is called and returns a response based on its normal logic.
StartInstance	Returns an error.
StopInstance	Returns an error.

2.1.2.1.19.7. ISO 8601 date and time formats

ISO 8601 Data elements and interchange formats – Information interchange – Representation of dates and times is an international standard covering the exchange of date- and time-related data. It was issued by the International Organization for Standardization (ISO). ECS open APIs adopt the ISO 8601 standard date and time formats.

3.Container Service for Kubernetes

3.1. Developer Guide

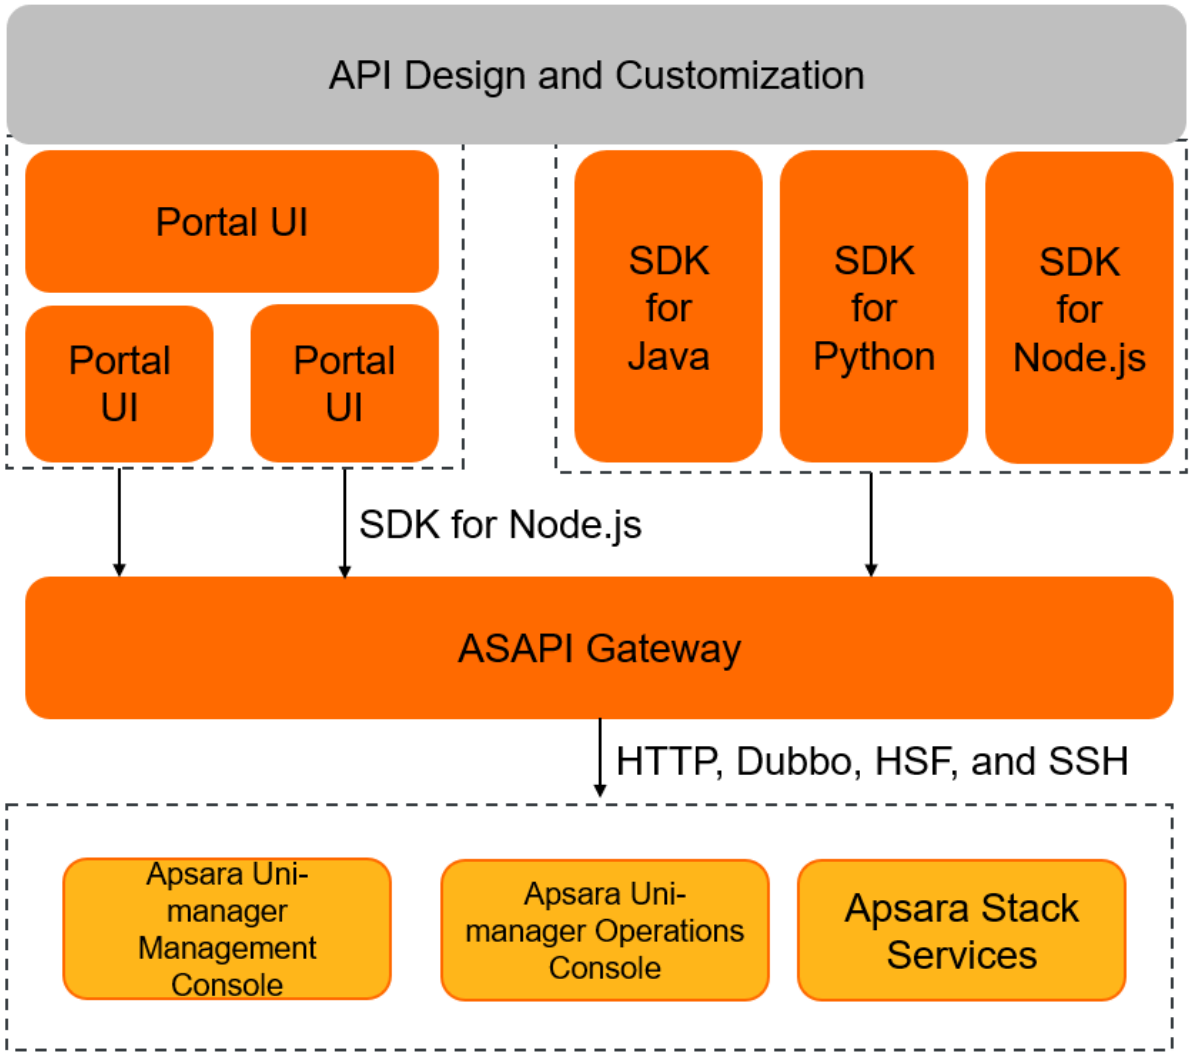
3.1.1. Use ASAPI to call the Apsara Stack SDK

3.1.1.1. 文档标题缺失，请补全后重新导出

3.1.1.1.1. ASAPI overview

This topic describes the architecture and features of the Apsara Stack API (ASAPI).

The ASAPI is a unified ingress gateway for Apsara Stack services and a main component of the Apsara Uni-manager Management Console. The ASAPI provides a unified method for you to manage and make API calls. You can use Apsara Stack SDK to centrally make API calls to Apsara Stack services, including Elastic Compute Service (ECS) and Virtual Private Cloud (VPC).



The ASAPI allows you to make API calls to manage and maintain Apsara Stack services.

- Make API calls to implement enterprise-grade management. For example, you can manage organizations, users, roles, resource sets, and logon policies. These operations are provided by the Apsara Uni-manager Management Console.
- Make API calls to manage operations. For example, you can manage quotas, usage statistics, specifications, and password policies. These operations are provided by the Apsara Uni-manager Management Console.
- Make API calls to manage resources. For example, you can create, delete, query, or modify cloud resources. These operations are provided by Apsara Stack services. If you call an API operation to create an ECS instance or a VPC, the API operation is provided by ECS or VPC.
- Make API calls to query monitoring metrics of Apsara Stack services. These operations are provided by the Apsara Uni-manager Management Console.
- Make API calls to perform O&M. For example, you can manage monitoring and alerting, inventories, tasks, and physical servers. These operations are provided by the Apsara Uni-manager Operations Console.

For more information, see the developer guide of the corresponding Apsara Stack service. For information about API operations used to manage organization users, see *Apsara Uni-manager Management Console Developer Guide*. For information about the API operation used to create an ECS instance, see *ECS Developer Guide*.

> **Note** If the "Use Apsara Stack SDK to make API calls" section is included in the developer guide of an Apsara Stack service, the ASAPI is supported by the Apsara Stack service. In this case, you can make API calls based on the developer guide.

3.1.1.1.2. Preparations

3.1.1.1.2.1. Log on to the API Tool console

You can log on to the API Tool console from the Apsara Uni-manager Management Console.

Prerequisites

- The URL of the Apsara Uni-manager Management Console is obtained from the deployment personnel before you log on to the Apsara Uni-manager Management Console.
- We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL of the Apsara Uni-manager Management Console. Press the Enter key.
2. Enter your username and password.

   Obtain the username and password that you can use to log on to the console from the operations administrator.

   > **Note** When you log on to the Apsara Uni-manager Management Console for the first time, you must change the password of your username. Your password must meet complexity requirements. The password must be 10 to 32 characters in length and must contain at least two of the following character types:
   >
   > - Uppercase or lowercase letters
   > - Digits
   > - Special characters, which include ! @ # $ %

3. Click **Log On**.
4. In the top navigation bar, choose **Products > Others > API Tool**.

3.1.1.1.2.2. View information about API operations

This topic describes how to view information about API operations. Before you use SDKs, obtain service names, API operation names, and API operation versions.

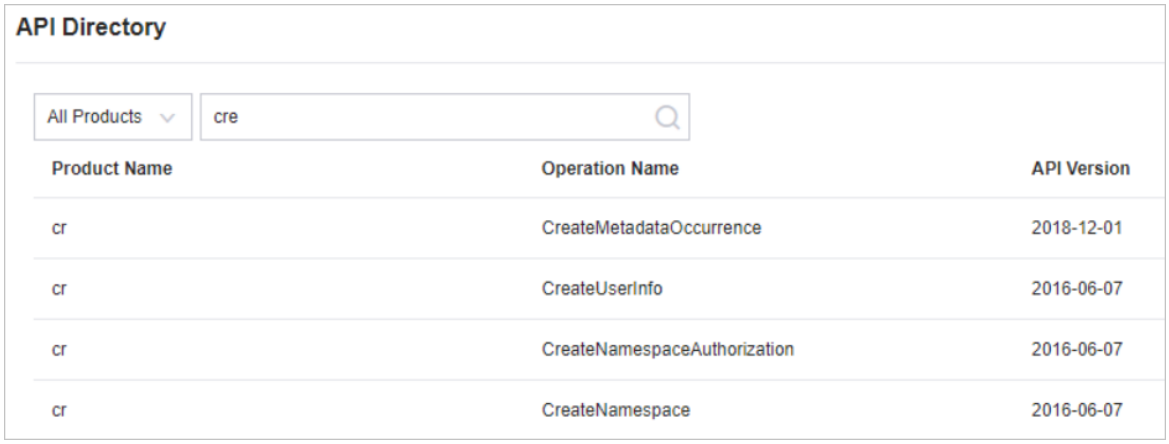
Context

The API operations on the API Directory page are only for reference. For information about how to call

API operations, see developer guides of the corresponding cloud services. If the information on the API Directory page is inconsistent with that in the developer guide of the corresponding cloud service, the information in the developer guide prevails.

Procedure

1. Go to the API Tool console. For more information, see Log on to the API Tool console.
2. In the left-side navigation pane, click **API Directory**.
3. On the **API Directory** page, select the desired service from the drop-down list, enter a keyword of an API operation name in the search box, and then click the search icon.



4. Then, you can view the service name, API operation name, and API operation version.

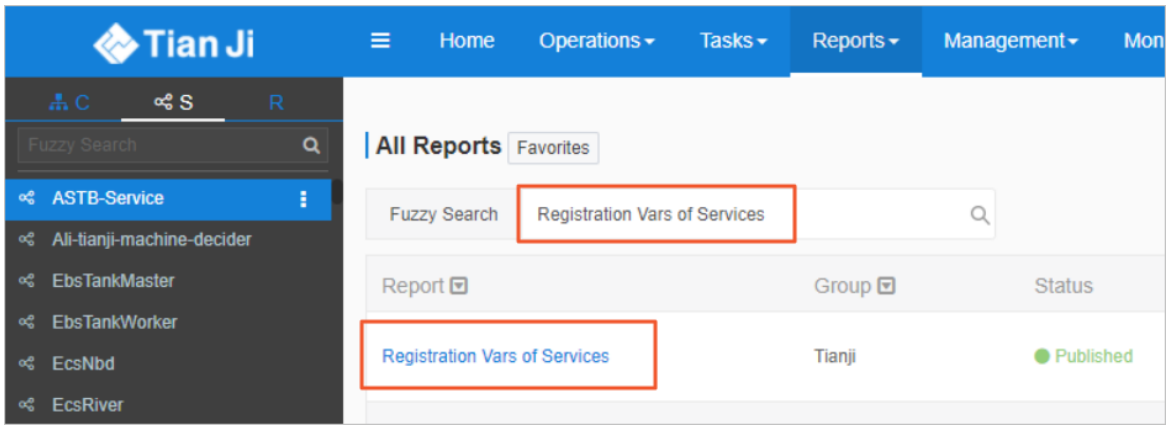
3.1.1.1.2.3. Generate an endpoint for the ASAPI

This topic describes three methods used to generate an endpoint for the Apsara Stack API (ASAPI).

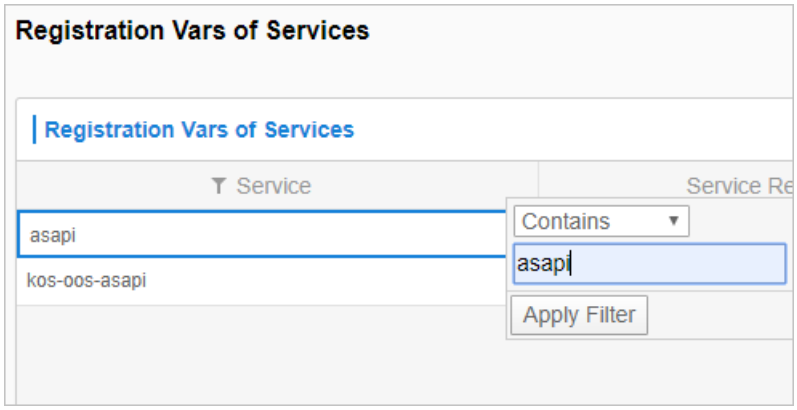
Method 1: Use Registration Vars of Services to generate an endpoint

1. Log on to Apsara Infrastructure Management Framework.
   i. Log on to the Apsara Uni-manager Operations Console.
   ii. In the top navigation bar, click **O&M**.
   iii. In the left-side navigation pane, choose **Product Management** > **Products**.
   iv. In the Apsara Stack O&M section, click **Apsara Infrastructure Management Framework**.
2. In the left-side navigation pane, click **Reports**.

3. On the **All Reports** page, search for `Registration Vars of Services` and click the report name.



4. On the **Registration Vars of Services** page, click the icon next to **Service** and search for `asapi`.



5. Find the asapi service, right-click in the **Service Registration** column, and then select **Show More** from the shortcut menu.

   In the **Details** dialog box, obtain the value of **asapi.public.endpoint**.

6. Generate an endpoint for the ASAPI based on the following format:

```
https://<asapi.public.endpoint>/asapi/v3
```

Method 2: Use cluster resources to generate an endpoint

1. Log on to Apsara Infrastructure Management Framework.
   i. Log on to the Apsara Uni-manager Operations Console.
   ii. In the top navigation bar, click **O&M**.
   iii. In the left-side navigation pane, choose **Product Management** > **Products**.
   iv. In the Apsara Stack O&M section, click **Apsara Infrastructure Management Framework**.
2. Go to the cluster operations page.
   i. In the left-side navigation pane, choose Operations > Cluster Operations.
   ii. In the **Cluster** search box, enter `ascm`.

iii. Find the cluster that you want to manage and click **Operations** in the **Actions** column.

3. Obtain the value of the domain parameter.
   i. Click the Cluster Resources tab.
   ii. In the **Name** field, search for `asapi_dns_public`.
   iii. Click **Details** in the **Application Parameter** column.

   In the **Application Parameter** message, obtain the value of the **domain** parameter.

4. Generate an endpoint for the ASAPI based on the following format:

```
https://<domain>/asapi/v3
```

Method 3: Concatenate strings to generate an endpoint

You can also concatenate strings to generate an endpoint based on the following format:

```
https://public.asapi.<region>.<internet-domain>/asapi/v3
```

> **Note**
>
> 1. Replace <region> with your actual region ID. For information about how to query a region ID, see Query a region ID.
> 2. Replace <internet-domain> with the root domain of your Apsara Stack service. To obtain the root domain, contact Apsara Stack O&M personnel. Take note of this point: Use the internet-domain parameter instead of the intranet-domain parameter.

If the **region** value is `cn-****-****-d01` and the **internet-domain** value is `inter.****.****.com`, the following endpoint can be generated:

```
https://public.asapi.cn-****-****-d01.inter.****.****.com/asapi/v3
```

3.1.1.1.2.4. Obtain Apsara Stack SDKs

The Apsara Stack API (ASAPI) is a unified portal provided by Apsara Stack. You can use the ASAPI to connect to all Apsara Stack services. Apsara Stack provides SDKs for API calls.

For more information about how to obtain Apsara Stack SDKs, see Apsara Stack documentation.

3.1.1.1.2.5. Obtain an AccessKey pair

An AccessKey pair that consists of an AccessKey ID and an AccessKey secret is used to implement symmetric encryption. This helps you verify the identity of a requester. The AccessKey ID is used to identify a user. The AccessKey secret is used to encrypt the signature string. This topic describes how to obtain an AccessKey pair.

Prerequisites

An account of the operations administrator or the level-1 organization administrator is obtained. Only an operations administrator or a level-1 organization administrator can obtain an AccessKey pair.

Context

If you need to make API calls to the Apsara Uni-manager Management Console or other Apsara Stack services, we recommend that you use the AccessKey pair of a personal account. If you use the AccessKey pair of a personal account, configure the request headers that are described in the following table for access control. Otherwise, an error that indicates insufficient permissions can occur.

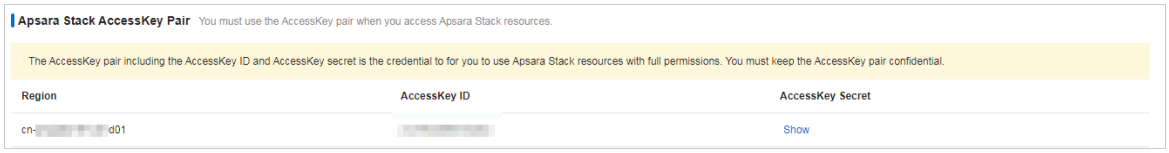
Parameter	Description
x-acs-regionid	The ID of the region, for example, cn-hangzhou-*.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console. For information about how to obtain an organization ID, see the "GetOrganizationList" section in Apsara Uni-manager Management Console Developer Guide.
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console. For information about how to obtain a resource set ID, see the "ListResourceGroup" section in Apsara Uni-manager Management Console Developer Guide.
x-acs-instanceid	The ID of the instance to which you make API calls. If you need to make API calls to an Elastic Compute Service (ECS) instance, obtain the ID of the ECS instance on the Instances page.

Warning The AccessKey pair of a personal account is managed and controlled by the permission system of the Apsara Uni-manage Management Console. If you need to obtain the AccessKey pair of an account that has permissions on an organization, make sure that your operation is allowed by an administrator. This ensures security. The account that has permissions on an organization is a privileged account.

Obtain the AccessKey pair of a personal account

To obtain the AccessKey pair of a personal account, perform the following operations:

1. Log on to the Apsara Uni-manager Management Console.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and click **User Information**.
3. In the **Apsara Stack AccessKey Pair** section, obtain the AccessKey pair.



> **Note** The AccessKey pair that consists of an AccessKey ID and an AccessKey secret is the credential for you to have full permissions on Apsara Stack resources. Keep your AccessKey pair confidential.

Obtain the AccessKey pair of an account that has permissions on an organization

To obtain the AccessKey pair of an account that has permissions on an organization, perform the following operations:

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Organizations**.
4. In the Organizations navigation tree, click the name of the organization that you want to manage.
5. On the right side of the page, click **Obtain AccessKey Pair**.
6. In the message that appears, obtain the AccessKey pair of the account that has permissions on the organization.

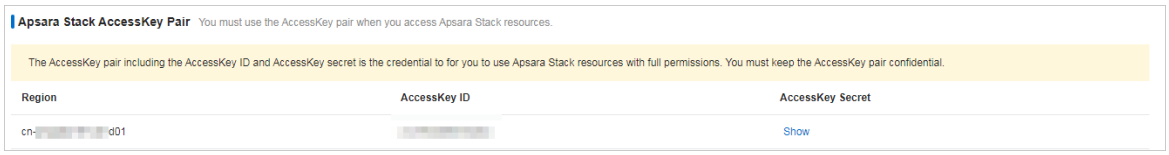
> **Note** The system automatically allocates an AccessKey pair to the account that has permissions on the level-1 organization. The same AccessKey pair is used by the accounts that have permissions on the subordinate organizations.

3.1.1.1.2.6. Query a region ID

When you use Apsara Stack SDK for Node.js to make API calls, specify a region ID. You can obtain a region ID in the Apsara Uni-manager Management Console.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and click **User Information**.
3. In the **Apsara Stack AccessKey Pair** section, view the region ID.



3.1.1.1.3. Common parameters

Common request parameters must be included in all API requests.

Sample common parameters

. .

The following table describes the common parameters that are used when you call API operations supported by the Apsara Stack API (ASAPI).

Parameter	Type	Required	Description
Action	String	Yes	The operation that you want to perform. For more information, see View information about API operations.
Product	String	Yes	The name of the service.
Version	String	Yes	The version of the API operation. For more information, see View information about API operations.
RegionId	String	Yes	The ID of the region. For more information, see Query a region ID.
AccessKeyId	String	Yes	The AccessKey ID used to connect to the service. For more information, see Obtain an AccessKey pair.
Signature	String	Yes	The signature string of the current request. For more information about how signatures are calculated, see Request signatures.
SignatureMethod	String	Yes	The encryption method of the signature string. Valid values: HMAC-SHA1 and HMAC-SHA256.

Parameter	Type	Required	Description
SignatureVersion	String	Yes	The version of the signature encryption algorithm. Valid values: 1.0 and 2.0.
SignatureNonce	String	Yes	A unique, random number used to prevent replay attacks. You must use different numbers for different requests.
Timestamp	String	Yes	The timestamp of the request. Specify the time in the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time must be in UTC. Sample value: 2018-01-01T12:00:00Z.
Format	String	Yes	The format in which to return the response. Set the value to JSON.

> **Note**
>
> The `Signature`, `SignatureMethod`, `SignatureVersion`, `SignatureNonce`, `Timestamp`, and `Format` parameters are encapsulated into Apsara Stack SDK. You do not need to configure these parameters.

3.1.1.1.4. SDK description

3.1.1.1.4.1. Use Apsara Stack SDK for Java to call API operations

This topic describes how to obtain and use Apsara Stack SDK for Java to call API operations.

Prerequisites

- An authorized account and an AccessKey pair are obtained. The AccessKey pair consists of an

AccessKey ID and an AccessKey secret. For more information about how to obtain an AccessKey pair in the Apsara Uni-manager Management Console, see Obtain an AccessKey pair.

- The endpoint of the Apsara Stack API (ASAPI) is obtained. For more information, see Generate an endpoint for the ASAPI.
- Apsara Stack SDK for Java 1.8 or later is installed.

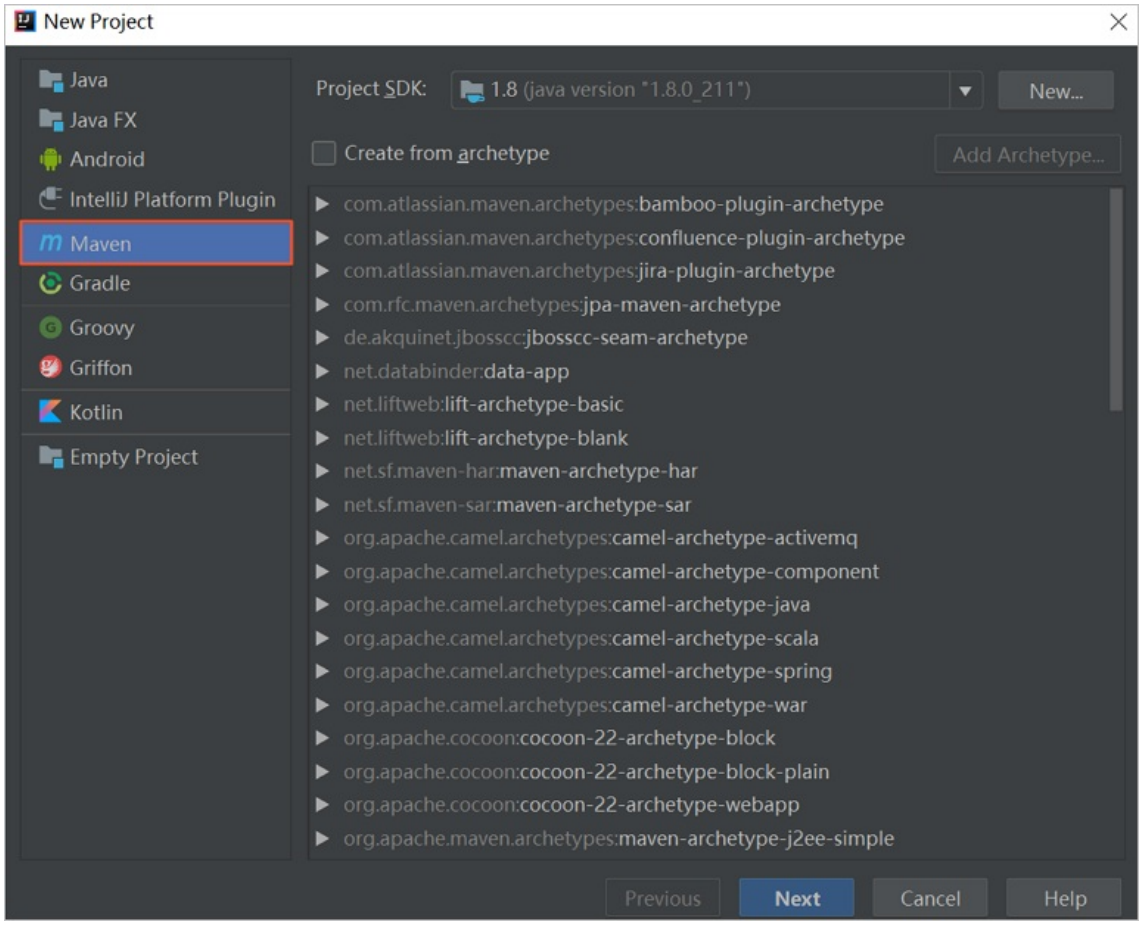
Background information

The help center of Apsara Stack provides Maven dependencies and JAR files for Apsara Stack SDK for Java. You can write code to use Apsara Stack SDK for Java to call API operations.

In this example, the Windows 10 64-bit OS and IntelliJ IDEA are used.

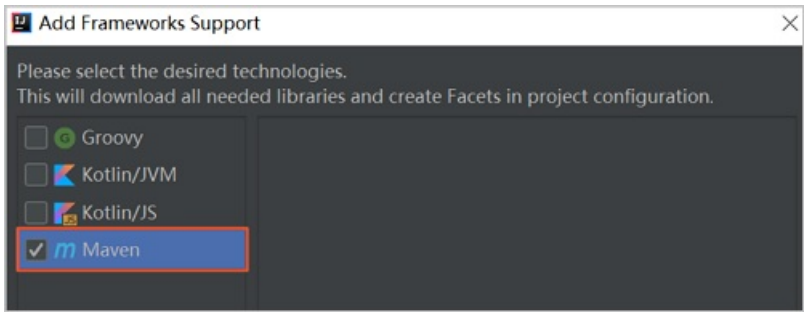
Procedure

1. Use one of the following methods to configure Maven in IntelliJ IDEA. Maven is a tool used for project management.
   - Use Maven that is integrated in IntelliJ IDEA.
   - Download Maven based on the OS that you are using from the official website and configure Maven. For more information, see Download Maven.
2. Obtain the Maven dependencies for Apsara Stack SDK for Java from the official website. For more information about how to obtain the dependencies, see Obtain the core package for ASAPI.
3. Use one of the following methods to create a Maven project:
   - Method 1: Create a Maven project in IntelliJ IDEA.

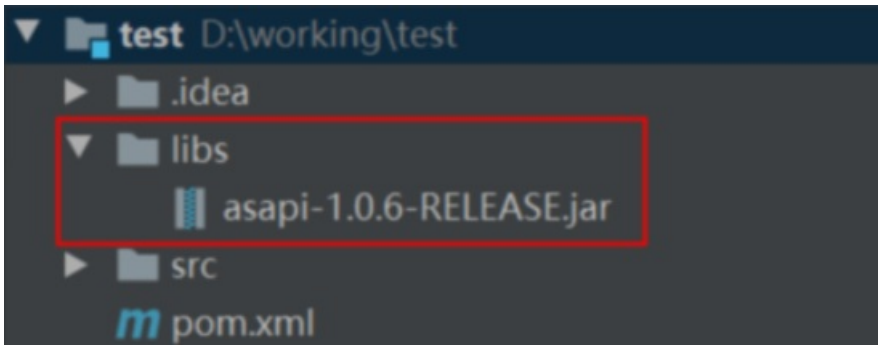


- Method 2: Convert an existing project to a Maven project.
  a. Right-click the project that you want to convert and select **Add Framework Support...**.

  b. Select **Maven** and click **OK**.



4. Create a folder named libs in the root directory of the project. Then, add the JAR file of Apsara Stack SDK for Java to the libs folder, as shown in the following figure.



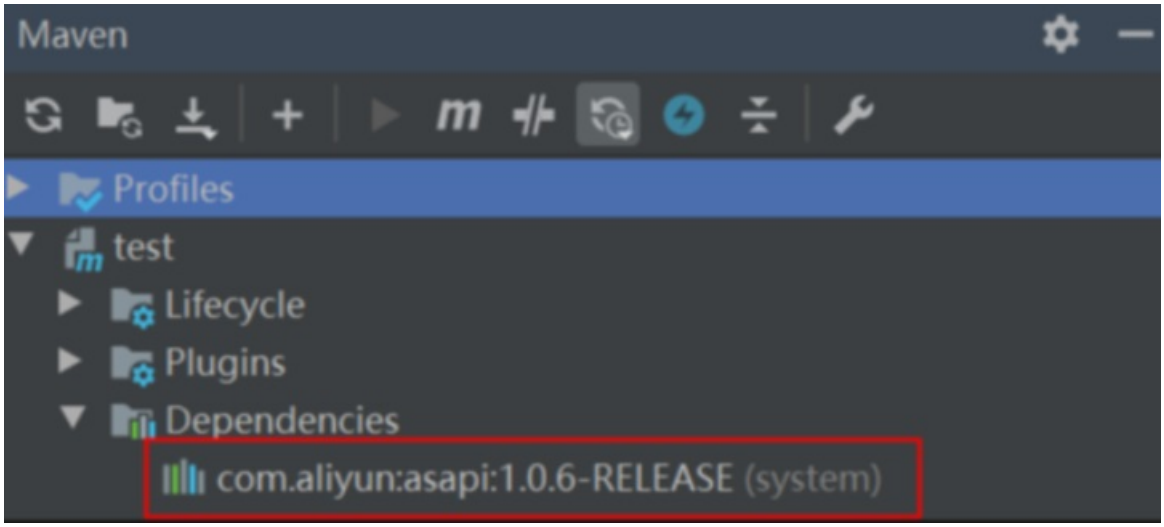
5. Add the dependencies of Apsara Stack SDK for Java to the pom.xml file in the project directory.

```
<dependencies>
    <dependency>
        <groupId>com.aliyun</groupId>
        <artifactId>asapi</artifactId>
        <version>1.0.6-RELEASE</version>
        <scope>system</scope>
        <systemPath>${project.basedir}/libs/asapi-1.0.6-RELEASE.jar</systemPath>
    </dependency>
  <dependency>
        <groupId>com.alibaba</groupId>
        <artifactId>alicrypto-java-aliyun</artifactId>
    <version>1.0.4</version>
    <systemPath>${project.basedir}/libs/alicrypto-java-aliyun-1.0.4.jar</systemPath>
  </dependency>
  <dependency>
    <groupId>com.aliyun</groupId>
    <artifactId>gmsse</artifactId>
    <version>1.1.0</version>
    <systemPath>${project.basedir}/libs/gmsse-1.1.0.jar</systemPath>
  </dependency>
</dependencies>
```

Note Replace `1.0.6-RELEASE` with the actual version of Apsara Stack SDK for Java.

6. On the right side of IntelliJ IDEA, view information in the Maven section.

   If the information in the following figure appears, the dependencies are added.



Use Apsara Stack SDK for Java

You can use the GET or POST method to call API operations provided by the ASAPI. The following sample code shows how to call API operations:

```
// 1. Create a connection to an ASClient object.
ASClient client = new ASClient();
// 2. Configure the identifier of the requester. This parameter is required and used only f
or identification. You can set this parameter to a random value.
client.setSdkSource("<The identifier of the requester>");
Map<String, Object> parameters = new HashMap<String, Object>();
// 3. Configure the parameters for authorization. The parameter values vary based on your e
nvironment.
// The AccessKey ID of your Apsara Stack tenant account.
parameters.put("AccessKeyId","<AccessKey ID>");
// The AccessKey secret of your Apsara Stack tenant account.
parameters.put("AccessKeySecret", "<AccessKey Secret>");
// The ID of the region.
parameters.put("RegionId", "<your RegionID>");
// 4. Configure parameters for an API call. In this example, the Product, Action, and Versi
on parameters are configured.
parameters.put("Product", "<The name of the service>");
parameters.put("Action", "<The name of the API operation>");
parameters.put("Version", "<The version of the API operation>");
// 5. Configure operation-specific parameters.
parameters.put("<The name of the operation-specific parameter>", "<The value of the operati
on-specific parameter>");
// 6. Configure request headers and the encryption method for the signature string. Valid v
alues of the SignatureMethod parameter: HMAC-SHA1 and HMAC-SHA256. By default, HMAC-SHA256
is used.
Map<String, String> headers = new HashMap<String, String>();
//headers.put("SignatureMethod", "HMAC-SHA1");
headers.put("x-acs-regionid", "<your-regionid>");
headers.put("x-acs-resourcegroupid", "<your-resourcegroupid>");
headers.put("x-acs-organizationid", "<your-organizationid>");
headers.put("x-acs-instanceid", "<your-instanceid>");
// 7. Make an API call. We recommend that you use the doPost() method.
// Configure the time-out period for a connection.
//client.setConnectTimeout(10000);
// Configure the time-out period for a request.
// client.setSocketTimeout(10000);
String result = client.doPost(endpoint, headers, parameters);
System.out.println(result);
```

Configure a proxy

If you need to use a proxy to make API calls, use the following sample code to configure the proxy:

```
Cloud cloud = new Cloud();
// Configure the IP address of the proxy.
cloud.setConfig("proxy_host", "<IP>");
// Configure the port used by the proxy.
cloud.setConfig("proxy_port", "<Port>");
// 1. Create a connection to an ASClient object.
ASClient client = new ASClient(cloud);
```

Request headers

Parameter	Description
x-acs-regionid	The ID of the region. For more information about how to obtain a region ID, see Query the region ID.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console.
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console.
x-acs-instanceid	The ID of the instance to which you make API calls.

3.1.1.1.4.2. Use Apsara Stack SDK for Python to call API operations

This topic describes how to use Apsara Stack SDK for Python to call API operations provided by the Apsara Stack API (ASAPI).

Preparations

- An authorized account and an AccessKey pair are obtained. The AccessKey pair consists of an AccessKey ID and an AccessKey secret. For more information about how to obtain an AccessKey pair in the Apsara Uni-manager Management Console, see Obtain an AccessKey pair.
- The endpoint of the ASAPI is obtained. For more information, see Generate an endpoint for the ASAPI.

Install Apsara Stack SDK for Python

1. Download the required version of Apsara Stack SDK for Python. For more information, see Obtain Apsara Stack SDKs.
2. Upload the compressed file of Apsara Stack SDK for Python to the host from which you want to send API requests and extract the file. Then, run the following code in the directory of the extracted files to install Apsara Stack SDK for Python:

```
# Install Apsara Stack SDK for Python 2.x.
pip install aliyun-python2-sdk-asapi-2.4.7.tar.gz
# Install Apsara Stack SDK for Python 3.x.
pip3 install aliyun-python3-sdk-asapi-2.4.7.tar.gz
```

> **Note**
>
> Replace `2.4.7` with the actual version of Apsara Stack SDK for Python.

Sample requests

You can use the GET or POST method to call API operations provided by the ASAPI.

```
    # 1. Import dependencies.
    from aliyunsdkasapi.ASClient import ASClient
    from aliyunsdkasapi.AsapiRequest import AsapiRequest

    if __name__ == '__main__':
     # 2. Create a request. The Product parameter specifies the name of the service. The Ver
sion parameter specifies the version of the API operation. The Action parameter specifies t
he operation that you want to perform. The asapi-endpoint parameter specifies the endpoint
of the ASAPI.
     req = AsapiRequest("<Product>", "<Version>", "<Action>", "<asapi-endpoint>")
     # 3. Configure operation-specific parameters.
     req.add_body_params("<key>", "<value>")
     # 4. Configure request headers.
     req.add_header("x-acs-resourcegroupid", "<your-resourcegroupid>");
     req.add_header("x-acs-organizationid", "<your-organizationid>");
     req.add_header("x-acs-regionid", "<your-regionid>");
     req.add_header("x-acs-instanceid", "<your-instanceid>");
     # 5. Configure a request method.
     req.set_method("POST")
     # 6. Configure initialization parameters for an ASClient object. The parameter values v
ary based on your environment. The timeout parameter specifies the time-out period for a re
quest. The cert_file parameter specifies the certificate. The verify parameter specifies wh
ether to verify the certificate.
     as_client = ASClient("<accesskeyid>", "<accesskeysecret>", "<regionid>",timeout=1000,
             cert_file=None,
             verify=False)
     # Configure the identifier of the requester. This parameter is required and used only f
or identification. You can set this parameter to a random value.
     as_client.setSdkSource("<The identifier of the requester>")
     response = as_client.do_request(req)
     print(response)
```

Request headers

Parameter	Description
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console.
x-acs-regionid	The ID of the region. For more information about how to obtain a region ID, see Query a region ID.
x-acs-instanceid	The ID of the instance to which you make API calls.

Configure a proxy

Perform the following steps to configure a proxy:

1. Import OS dependencies.

```
import os
```

2. Configure one or more proxies.

```
# Before you make an API call, configure one or more proxies.
os.environ['http_proxy'] = "http://x.x.x.x:xxxx"
os.environ['https_proxy'] = "https://x.x.x.x:xxxx"
```

3.1.1.1.4.3. Use Apsara Stack SDK for Node.js to call API operations

This topic describes how to obtain and use Apsara Stack SDK for Node.js to call API operations.

Preparations

- An authorized account and an AccessKey pair are obtained. The AccessKey pair consists of an AccessKey ID and an AccessKey secret. For more information about how to obtain an AccessKey pair in the Apsara Uni-manager Management Console, see Obtain an AccessKey pair.
- The endpoint of the Apsara Stack API (ASAPI) is obtained. For more information, see Generate an endpoint for the ASAPI.
- A region ID is obtained. For more information about how to obtain a region ID, see Query the region ID.

Add dependencies

Run the following command to install Apsara Stack SDK for Node.js:

```
tnpm install --save @ali/asapi-nodejs-sdk
```

Use Apsara Stack SDK for Node.js

The following sample code shows how to use Apsara Stack SDK for Node.js to make API calls:

```
// 1. Import the dependencies of Apsara Stack SDK for Node.js.
const Controller = require('egg').Controller;
const ASAPIClient = require('@ali/asapi-nodejs-sdk');
// 2. Configure the parameters.
const cnofig = {
    API_GATEWAY: '<The endpoint of the ASAPI>',
    regionId: '<The ID of the region in which the Apsara Stack service is deployed>',
    accessKeyId: '<The AccessKey ID of your Apsara Stack tenant account>',
    accessKeySecret: '<The AccessKey secret of your Apsara Stack tenant account>'
};
// 3. Initialize a client for API calls.
const AsapiClient = new ASAPIClient(cnofig, this.ctx);
// 4. Configure request parameters.
const params = {
    "Action": "<The name of the API operation>",
    "Product": "<The name of the service that provides the API operation>",
    "Version": "<The version of the API operation>",
    "regionId": '<The ID of the region in which the Apsara Stack service is deployed>',
      "<The name of the operation-specific parameter required by the API operation>": "<The
value of the operation-specific parameter>"
}
// 5. Configure request headers.
AsapiClient.addHeader('x-acs-caller-sdk-source', '<The identifier of the requester>')
AsapiClient.addHeader('x-acs-roleid', '<The ID of the role>')
AsapiClient.addHeader('x-acs-userid', '<The ID of the user>')
AsapiClient.addHeader('x-acs-organizationid', '<your-organizationid>')
AsapiClient.addHeadert("x-acs-regionid", "<your-regionid>");
AsapiClient.addHeader("x-acs-resourcegroupid", "<your-resourcegroupid>");
AsapiClient.addHeader("x-acs-instanceid", "<your-instanceid>");
// 6. Make an API call and obtain the response.
try {
  const res = await AsapiClient.doRequest(cnofig.API_GATEWAY, params, {
    method: 'POST', // The request method.
    formatParams: false, // Specifies whether to format parameters and capitalize the first
letter of each parameter.
    enableProxy: true, // Specifies whether to configure a proxy.
    proxy: 'http://x.x.x.x:xxxx',
    timeout: 10000, // The time-out period.
  // ca: , // The certificate issued by a certificate authority (CA). For more information,
visit https://nodejs.org/api/https.html#https_https_request_options_callback.
  })
  console.log(res)
} catch (e) {
  console.log(e)
}
```

Disable certificate validation

The following sample code shows how to disable certificate validation:

```
Configure the environment variable.
NODE_TLS_REJECT_UNAUTHORIZED=0
```

Request headers

Parameter	Description
x-acs-regionid	The ID of the region. For more information about how to obtain a region ID, see Query the region ID.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console.
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console.
x-acs-instanceid	The ID of the instance to which you make API calls.
x-acs-caller-sdk-source	The custom name of the requester or the system. This parameter is used to identify the source of the API request.
x-acs-roleid	The ID of the role.
x-acs-userid	The ID of the user.

3.1.1.1.4.4. SDK for POP

SDK for Java

Before you use Apsara Stack API (ASAPI) SDK for POP for Java to access ASAPI, you must know the remote procedure call (RPC) and resource-oriented architecture (ROA) styles that are supported for API calls. ASAPI is compatible with both styles. Their difference lies in the ASAPI endpoints that are used for API calls.

Prerequisites

- An Alibaba Cloud SDK package is downloaded for the service that you want to access. The required dependencies are installed.
- SSL certificate validation is ignored for requests over HTTPS.

Background information

ASAPI supports only the HTTPS request protocol.

Difference between two styles

When you use the RPC or ROA style to make API calls, take note that the two styles use different ASAPI endpoints.

```
# ASAPI endpoint for the RPC style:
public.asapi.<global:region>.<global:internet-domain>/asapi/v3
# ASAPI endpoint for the ROA style:
public.asapi.<global:region>.<global:internet-domain>/asapi/v3/roa
```

Call examples

The following sample code provides an example on how to use the RPC style to make an API call. In this example, the DescribeInstances operation of Elastic Compute Service (ECS) is called, and the API version is 2014-05-26.

Sample code:

```
package com.aliyuns.client.pop.ecs;

import com.aliyuncs.DefaultAcsClient;
import com.aliyuncs.ecs.model.v20140526.DescribeInstancesRequest;
import com.aliyuncs.ecs.model.v20140526.DescribeInstancesResponse;
import com.aliyuncs.http.HttpClientConfig;
import com.aliyuncs.http.ProtocolType;
import com.aliyuncs.profile.DefaultProfile;

import java.util.List;

public class DescribeInstancesTest {
    public static void main(String[] args) {
        // Specify the endpoint of ASAPI.
        String endpoint = "public.asapi.<global:region>.<global:internet-domain>/asapi/v3";
        // Specify the region where the ECS service resides.
        String region = "<global:region>";
        // Specify the name of the service that you want to access.
        String product = "ECS";
        // Specify your AccessKey pair.
        String ak = "<accessKeyId>";
        String sk = "<accessKeySecret>";
        try {
            DefaultProfile clientProfile = DefaultProfile.getProfile(region, ak, sk);
            // Ignore SSL certificate validation.
            HttpClientConfig clientConfig = HttpClientConfig.getDefault();
            clientConfig.setIgnoreSSLCerts(true);
            // Set the connection timeout period.
            clientConfig.setConnectionTimeoutMillis(3000L);
            // Set the read timeout period.
            clientConfig.setReadTimeoutMillis(10000L);
            clientProfile.setHttpClientConfig(clientConfig);
            // Create a connection.
            DefaultAcsClient acsClient = new DefaultAcsClient(clientProfile);
            // Create a request.
            DescribeInstancesRequest request = new DescribeInstancesRequest();
            // Specify the endpoint of ASAPI.
            request.setSysEndpoint(endpoint);
            // Specify the name of the service that you want to access and the region where
the service resides.
            request.setSysLocationProduct(product);
            request.setSysRegionId(region);
            // Set the request protocol to HTTPS.
            request.setSysProtocol(ProtocolType.HTTPS);
            DescribeInstancesResponse result =  acsClient.getAcsResponse(request);
            List<DescribeInstancesResponse.Instance> instances = result.getInstances();
            for (DescribeInstancesResponse.Instance instance: instances) {
                System.out.println(instance.getInstanceId());
                System.out.println(instance.getInstanceName());
```

```
            }

        } catch (Exception e) {
            e.printStackTrace();
        }
    }
}
```

The following sample code provides an example on how to use the ROA style to make an API call. In this example, the GetNamespaceList operation of Container Registry is called, and the API version is 2016-06-07.

Sample code:

```
package com.aliyuns.client.pop.cr;

import com.aliyuncs.CommonRequest;
import com.aliyuncs.CommonResponse;
import com.aliyuncs.DefaultAcsClient;
import com.aliyuncs.IAcsClient;
import com.aliyuncs.exceptions.ClientException;
import com.aliyuncs.exceptions.ServerException;
import com.aliyuncs.http.FormatType;
import com.aliyuncs.http.HttpClientConfig;
import com.aliyuncs.http.MethodType;
import com.aliyuncs.http.ProtocolType;
import com.aliyuncs.profile.DefaultProfile;

public class GetNamespaceListTest {
    public static void main(String[] args) {
        // Specify the endpoint of ASAPI.
        String endpoint = "public.asapi.<global:region>.<global:internet-domain>/asapi/v3/roa";
        // Specify the region where the Container Registry service resides.
        String region = "<global:region>";
        // Specify the name of the service that you want to access.
        String product = "cr";
        // Specify your AccessKey pair.
        String ak = "<accessKeyId>";
        String sk = "<accessKeySecret>";
        DefaultProfile profile = DefaultProfile.getProfile(region, ak, sk);
        // Ignore SSL certificate validation.
        HttpClientConfig clientConfig = HttpClientConfig.getDefault();
        clientConfig.setIgnoreSSLCerts(true);
        // Set the connection timeout period.
        clientConfig.setConnectionTimeoutMillis(3000L);
        // Set the read timeout period.
        clientConfig.setReadTimeoutMillis(10000L);
        profile.setHttpClientConfig(clientConfig);
        // Create a connection for the client.
        IAcsClient client = new DefaultAcsClient(profile);
        // Create a request.
        CommonRequest request = new CommonRequest();
        // Set the request protocol to HTTPS.
```

```
        request.setSysProtocol(ProtocolType.HTTPS);
        // Specify the request method.
        request.setSysMethod(MethodType.GET);
        // Specify the endpoint of ASAPI.
        request.setSysDomain(endpoint);
        // Specify the version of the API.
        request.setSysVersion("2016-06-07");
        // Specify the pattern of the uniform resource identifier (URI).
        request.setSysUriPattern("/namespace");
        // Specify the name of the service that you want to access and the region where the
service resides.
        request.setSysLocationProduct(product);

        request.putHeadParameter("Content-Type", "application/json");
        String requestBody = "" +
                "{}";
        request.setHttpContent(requestBody.getBytes(), "utf-8", FormatType.JSON);
        try {
            CommonResponse response = client.getCommonResponse(request);
            System.out.println(response.getData());
        } catch (ServerException e) {
            e.printStackTrace();
        } catch (ClientException e) {
            e.printStackTrace();
        }
    }
}
```

> **Notice**
>
> If you send a request over HTTPS, you must enable the request to ignore SSL certificate validation.

SDK for Go

This topic describes how to use Apsara Stack API (ASAPI) SDK for POP for Go.

Prerequisites

An Alibaba Cloud SDK package is downloaded for the service that you want to access. The required dependencies are installed.

Background information

Only the remote procedure call (RPC) style is supported for API calls.

Call examples

The following sample code provides an example on how to make an API call. In this example, the DescribeInstances operation of Elastic Compute Service (ECS) is called, and the API version is 2014-05-26.

Sample code:

```
package main
```

```
import (
 "fmt"
 "time"

 "github.com/aliyun/alibaba-cloud-sdk-go/sdk"
 "github.com/aliyun/alibaba-cloud-sdk-go/sdk/auth/credentials"
 "github.com/aliyun/alibaba-cloud-sdk-go/sdk/requests"
 "github.com/aliyun/alibaba-cloud-sdk-go/sdk/responses"
)

func getSdkConfig() *sdk.Config {
 return sdk.NewConfig().
  WithTimeout(time.Duration(30) * time.Second).
  WithEnableAsync(true).
  WithGoRoutinePoolSize(100).
  WithMaxTaskQueueSize(10000).
  WithDebug(false).
  WithScheme("HTTP")
}

func main(){
 ak := "<The AccessKey ID of your Apsara Stack tenant account.>"
 sk := "<The AccessKey secret of your Apsara Stack tenant account.>"
 regionId := "<The region where the ECS service resides.>"
 endpoint := "<The endpoint of ASAPI.>" // No network protocol.
 request := requests.NewCommonRequest()
  request.SetReadTimeout(10 * time.Second) // Set the read timeout period of the request to
10 seconds.
  request.SetConnectTimeout(5 * time.Second)  // Set the connection timeout period of the r
equest to 5 seconds.
 request.Method = requests.GET
 request.Domain = endpoint         // Location Service will not be enabled if the host is s
pecified. For example, the service with a certification type-bearer token must be specified
.
 request.Version = "2014-05-26"            // Specify the version of the API.
 request.Scheme = "https"                // Specify the request protocol. Default value: ht
tp.
 request.ApiName = "DescribeInstances"
 request.QueryParams["Product"] = "Ecs"  // Specify the name of the service that you want t
o access.
 request.TransToAcsRequest()
 client, err := sdk.NewClientWithOptions(regionId,getSdkConfig(),credentials.NewAccessKeyCr
edential(ak,sk))
 // If relevant parameters are not set for the request, the client settings are used.
  //client.SetReadTimeout(10 * time.Second)              // Set the read timeout period of
the client to 10 seconds.
 //client.SetConnectTimeout(5 * time.Second)            // Set the connection timeout perio
d of the client to 5 seconds.
  resp := responses.BaseResponse{}
  err = client.DoAction(request, &resp)
    if err != nil {
        panic(err)
    }
 fmt.Print(endpoint)
```

```
}
```

Configure proxies

You can configure proxies in one of the following ways:

- Configure proxies by using environment variables.

  Set the HTTP_PROXY and HTTPS_PROXY environment variables, or set the NO_PROXY environment variable.

  Sample code:

```
import (
    "os"
)
func main(){
 os.Setenv("HTTP_PROXY", "http://x.x.x.x:xxxx") // Set the HTTP_PROXY environment variable.
 os.Setenv("HTTPS_PROXY", "https://x.x.x.x:xxxx") // Set the HTTPS_PROXY environment variable.
}
```

- Configure proxies on the client.

  Sample code:

```
// The proxies that are configured on the client take precedence over those that are configured by using environment variables.
client.SetHttpProxy("http://x.x.x.x:xxxx")    // Configure the HTTP proxy.
client.GetHttpProxy()                           // Query the HTTP proxy.

client.SetHttpsProxy("https://x.x.x.x:xxxx")    // Configure the HTTPS proxy.
client.GetHttpsProxy()                            // Query the HTTPS proxy.

client.SetNoProxy("127.0.0.1,localhost")      // Configure the proxy whitelist.
client.GetNoProxy()                           // Query the proxy whitelist.
```

SDK for Python

This topic describes how to use Apsara Stack API (ASAPI) SDK for POP for Python.

Prerequisites

An Alibaba Cloud SDK package is downloaded for the service that you want to access. The required dependencies are installed.

Background information

Only the remote procedure call (RPC) style is supported for API calls.

Call examples

The following sample code provides an example on how to make an API call. In this example, the DescribeInstances operation of Elastic Compute Service (ECS) is called, and the API version is 2014-05-26.

Sample code:

```
from aliyunsdkcore.client import AcsClient
from aliyunsdkcore.acs_exception.exceptions import ClientException
from aliyunsdkcore.acs_exception.exceptions import ServerException
from aliyunsdkecs.request.v20140526 import DescribeInstancesRequest
import os

# Create an AcsClient instance.
client = AcsClient(
   "<your-access-key-id>",
   "<your-access-key-secret>",
   "<your-region-id>",

   timeout=1000,  # Set the timeout period.
    verify=False, # Ignore certificate validation. or verify='<The location where the certi
ficate is stored.>'
);
# Set the following parameters for the HTTPS request protocol:
# client.set_verify(False)
# os.environ["HTTPS_PROXY"] = "http://127.0.0.1:8080"

# os.environ["HTTP_PROXY"] = "http://127.0.0.1:8080"
def hello_ecs_instance():
    # Create a request and set the parameters.
    request = DescribeInstancesRequest.DescribeInstancesRequest()

    params = {"PageNumber":"1", "Product":"Ecs","Version": "2014-05-26","Action": "Describe
Instances"};
    request.set_body_params(params)
    # The endpoint that contains no network protocol is in the following format: ASAPI doma
in name/asapi/v3.
    request.set_endpoint('<The endpoint of ASAPI.>')
    # Set the following parameter if the endpoint contains no network protocol:
    request.set_protocol_type("https")

    request.set_PageSize(10)
    # Initiate the API request and obtain the response.
    response = client.do_action_with_exception(request)
    print(response)

if __name__ == '__main__':
    print("Hello Aliyun OpenApi!")
    hello_ecs_instance()
```

Configure proxies

Set the HTTP_PROXY and HTTPS_PROXY environment variables.

Sample code:

```
# Configure the HTTPS proxy.
os.environ["HTTPS_PROXY"] = "http://x.x.x.x:xxxx"

# Configure the HTTP proxy.
os.environ["HTTP_PROXY"] = "https://x.x.x.x:xxxx"
```

3.1.1.1.5. HTTP requests

3.1.1.1.5.1. Overview

This topic describes how to make API requests and is intended for users who use API URLs to initiate HTTP GET requests.

If you are using an SDK to initiate requests, you can skip this topic.

The request URL consists of different parameters and has a fixed syntax. The URL contains common request parameters, your signature, and operation-specific parameters. Sample request URLs are provided for each API operation. These URLs are not encoded to make them easy to read. Before you make a request, you must encode the request URL. After the authentication process is complete based on your signature, the results are returned to you. Response parameters are returned if the call is successful, whereas an error message is returned if the call fails. You can troubleshoot issues based on the error message.

3.1.1.1.5.2. Request syntax

The Apsara Stack API (ASAPI) allows you to call API operations by sending HTTP GET requests based on URLs. Each URL must include request parameters. This topic describes the syntax of HTTP GET requests and provides the endpoint of the ASAPI.

Sample request

GetOrganizationList is used in the following unencoded URL request:

```
https://public.asapi.aliyuns.com/asapi/v3?Action=GetOrganizationList&Product=ascm&Version=2019-05-10&Id=<Organization ID>&<Common parameters>
```

- `https`: the protocol used to transmit the request.
- `public.asapi.aliyuns.com/asapi/v3`: the endpoint of the ASAPI.
- `Action=GetOrganizationList Product=ascm Version=2019-05-10`: the API operation to call.
- `Id`: the ID of the organization.
- `<Common parameters>`: the common parameters specified in the system.

Protocol

The ASAPI supports only HTTPS.

Endpoint

For more information about how to obtain an endpoint, see Generate an endpoint for the ASAPI.

Parameter

To specify an API operation, use the `Action, Product, and Version` parameters. For example, set `Action` to GetOrganizationList, Product to ascm, and Version to 2019-05-10. You must also specify other operation-specific parameters and common parameters. For more information, see Common parameters.

3.1.1.1.5.3. Request signatures

This topic describes how to sign HTTP API requests. ASAPI uses the request signature to verify the identity of the request sender. ASAPI implements symmetric encryption by using an AccessKey pair to verify the identity of the request sender.

> **Note**
>
> - An AccessKey pair consists of an AccessKey ID and an AccessKey secret, which are issued to each user or organization in the Apsara Uni-manager Management Console.
> - The AccessKey ID is used to verify identities of users, and the AccessKey secret is used to encrypt and verify signature strings. You must keep your AccessKey secret confidential.
> - ASAPI provides SDKs for Node.js, Python, and Java to facilitate complex signature calculation. For more information, see Obtain the core package for ASAPI.

Step 1: Create a canonicalized query string

1. Arrange the request parameters in alphabetical order, including all common and operation-specific parameters except the `Signature` parameter.

   > **Note**
   >
   > If you use the GET method to send a request,these parameters are connected by ampersands (&) and included in the request URL. The first request parameter follows a question mark (?).

2. Encode the request parameters and their values in UTF-8 based on RFC 3986. The following rules apply in the encoding process:
   - Letters, digits, and special characters such as hyphens (`-`), underscores (`_`), and periods (`.`) do not need to be encoded.
   - Other characters must be percent encoded in the `%XY` format. `XY` represents the ASCII code of the characters in hexadecimal notation. For example, double quotation marks (`"`) are encoded as `%22` .

- Extended UTF-8 characters are encoded in the `%XY%ZA...` format.
- Spaces must be encoded as `%20`. Do not encode spaces as plus signs (`+`).

  This encoding method is similar to but different from the `application/x-www-form-urlencoded` MIME encoding algorithm.

  If you use `java.net.URLEncoder` from the Java standard library, use `percentEncode` to encode request parameters and their values. In the encoded query string, replace the plus signs (`+`) with `%20`, asterisks (`*`) with `%2A`, and `%7E` with tildes (`~`). This way, you can obtain an encoded string that matches the preceding encoding rules.

```
private static final String ENCODING = "UTF-8";
private static String percentEncode(String value) throws UnsupportedEncodingException
{
    return value != null ? URLEncoder.encode(value, ENCODING).replace("+", "%20").rep
lace("*", "%2A").replace("%7E", "~") : null;
}
```

3. Use equal signs (`=`) to connect the encoded request parameters and their values.
4. Use ampersands (`&`) to connect the encoded request parameters. These parameters must be arranged in the same order as those in Step 1.

Then, a canonicalized query string that follows the request structure is obtained. For more information, see Request structure.

Step 2: Create a string-to-sign

1. Create a `string-to-sign`. You can also use `percentEncode` to encode the canonicalized query string created in Step 1 based on the following rules:

```
StringToSign=
    HTTPMethod + "&" + //HTTPMethod: the HTTP method that is used to send a request, su
ch as GET.
    percentEncode("/") + "&" + //percentEncode("/"): Encode the forward slash (/) in UT
F-8 as %2F.
    percentEncode(CanonicalizedQueryString) // Encode the canonicalized query string cr
eated in Step 1.
```

2. Calculate the RFC 2104-compliant HMAC-SHA1 or HMAC-256 value of `StringToSign`. In the following example, Java Base64 is used:

```
String signature = Base64.getEncoder().encodeToString(signData);
```

> **Note**
>
> When you calculate the signature, the key value specified by RFC 2104 is your `AccessKey secret` plus an ampersand (&), which has an ASCII value of 38. For more information, see Obtain an AccessKey pair.

3. Encode the `Signature` parameter based on RFC 3986 and add it to the canonicalized query string.

Example 1: Concatenate parameters

`GetOrganizationList` is used in this example to query regions. For example, `AccessKeyID` is set to testid and `AccessKeySecret` is set to testsecret. Perform the following operations:

1. Construct a canonicalized query string.

```
https://public.asapi.aliyuns.com/asapi/v3/?AccessKeyId=testid&Action=GetOrganizationList&Format=JSON&Id=1&Product=ascm&RegionId=cn-region-test&SignatureMethod=HMAC-SHA1&SignatureNonce=43967c6e-e3ad-44fa-b06b-fcf3db5f39d2&SignatureVersion=1.0&Timestamp=2020-09-15T08%3A50%3A40Z&Version=2019-05-10
```

2. Create a `string-to-sign` .

```
GET&%2F&AccessKeyId%3Dtestid%26Action%3DGetOrganizationList%26Format%3DJSON%26Id%3D1%26Product%3Dascm%26RegionId%3Dcn-region-test%26SignatureMethod%3DHMAC-SHA1%26SignatureNonce%3D43967c6e-e3ad-44fa-b06b-fcf3db5f39d2%26SignatureVersion%3D1.0%26Timestamp%3D2020-09-15T08%253A50%253A40Z%26Version%3D2019-05-10
```

3. Calculate the signature.

   Calculate the signature. The key value used for calculation is `testsecret&` because `AccessKeySecret` is set to testsecret. The calculated signature is `OLeaidS1JvxuMvnyHOwuJ+uX5qY=` . Java Base64 is used in the following sample code:

   `String signature = Base64.getEncoder().encodeToString(signData);` Encode `Signature=hvqv9Ll5RE6kQ4YsQXFAf9VuRIY=` based on RFC 3986 and add it to the canonicalized query string.

```
https://public.asapi.aliyuns.com/asapi/v3/?AccessKeyId=testid&Action=GetOrganizationList&Format=JSON&Id=1&Product=ascm&RegionId=cn-region-test&SignatureMethod=HMAC-SHA1&SignatureNonce=43967c6e-e3ad-44fa-b06b-fcf3db5f39d2&SignatureVersion=1.0&Timestamp=2020-09-15T08%3A50%3A40Z&Version=2019-05-10
```

You can use browsers or tools such as cURL and Wget to initiate an HTTP request for calling the `DescribeRegions` operation to query the Alibaba Cloud region list.

Example 2: Use the standard library of the programming language

`GetOrganizationList` is used in this example to query regions. For example, `AccessKeyID` is set to testid, `AccessKeySecret` is set to testsecret, and all request parameters are stored in a Java `Map<String, String>` object.

1. Predefine an encoding method.

```
private static final String ENCODING = "UTF-8";
private static String percentEncode(String value) throws UnsupportedEncodingException {
        return value != null ? URLEncoder.encode(value, ENCODING).replace("+", "%20").r
eplace("*", "%2A").replace("%7E", "~") : null;
}
```

2. Predefine the time format for the `Timestamp` parameter. Specify the `Timestamp` parameter in the ISO 8601 format. The time must be in UTC+0.

```
private static final String ISO8601_DATE_FORMAT = "yyyy-MM-dd'T'HH:mm:ss'Z'";
private static String formatIso8601Date(Date date) {
    SimpleDateFormat df = new SimpleDateFormat(ISO8601_DATE_FORMAT);
    df.setTimeZone(new SimpleTimeZone(0, "GMT"));
    return df.format(date);
}
```

3. Create a request string.

```
final String HTTP_METHOD = "GET";
Map parameters = new HashMap();
// Specify request parameters.
parameters.put("Product", "ascm");
parameters.put("Action", "GetOrganizationList");
parameters.put("Version", "2019-05-10");
parameters.put("AccessKeyId", "testid");
parameters.put("RegionId", "cn-region-test");
parameters.put("Timestamp", formatIso8601Date(new Date()));
parameters.put("SignatureMethod", "HMAC-SHA1");
parameters.put("SignatureVersion", "1.0");
parameters.put("SignatureNonce", UUID.randomUUID().toString());
parameters.put("Format", "JSON");
parameters.put("Id", "1");
// Arrange request parameters.
String[] sortedKeys = parameters.keySet().toArray(new String[]{});
Arrays.sort(sortedKeys);
final String SEPARATOR = "&";
// Create a string-to-sign.
StringBuilder stringToSign = new StringBuilder();
stringToSign.append(HTTP_METHOD).append(SEPARATOR);
stringToSign.append(percentEncode("/")).append(SEPARATOR);
StringBuilder canonicalizedQueryString = new StringBuilder();
for(String key : sortedKeys) {
    // Encode the key and the value.
    canonicalizedQueryString.append("&")
    .append(percentEncode(key)).append("=")
    .append(percentEncode(parameters.get(key)));
}
//Encode the canonicalized query string.
stringToSign.append(percentEncode(
canonicalizedQueryString.toString().substring(1)));
```

4. The signature. The key value used for calculation is `testsecret&` because `AccessKeySecret` is set to testsecret. The calculated signature is `OLeaidS1JvxuMvnyHOwuJ%2BuX5qY%3D`.

```
// The following sample code shows how to calculate the signature:
final String ALGORITHM = "HmacSHA1";
final String ENCODING = "UTF-8";
key = "testsecret&";
Mac mac = Mac.getInstance(ALGORITHM);
mac.init(new SecretKeySpec(key.getBytes(ENCODING), ALGORITHM));
byte[] signData = mac.doFinal(stringToSign.getBytes(ENCODING));
String signature = Base64.getEncoder().encodeToString(signData);
```

Encode the Signature parameter based on RFC 3986 and add it to the canonicalized query string. The following URL is obtained:

```
https://public.asapi.aliyuns.com/asapi/v3/?AccessKeyId=testid&Action=GetOrganizationLis
t&Format=JSON&Id=1&Product=ascm&RegionId=cn-region-test&SignatureMethod=HMAC-SHA1&Signa
tureNonce=43967c6e-e3ad-44fa-b06b-fcf3db5f39d2&SignatureVersion=1.0&Timestamp=2020-09-1
5T08%3A50%3A40Z&Version=2019-05-10
```

5. Use browsers or tools such as cURL and Wget to initiate an HTTP request.

3.1.1.1.5.4. Response

Responses are returned only in the JSON format. If a return code is greater than or equal to 200 and less than 300, a success response is returned. Otherwise, an error response is returned.

Sample success response

If a request is successful, the request ID and operation-specific parameter values are returned. For more information, see the developer guide of the corresponding Apsara Stack service.

```
 {
    "eagleEyeTraceId": "xxx-xxx-xxx-xxx", // The trace ID provided by EagleEye.
    "asapiSuccess": true,
    "RequestId": "xxxxxxxxxx",
    "Regions": { // The regions returned after you call the DescribeRegions operation.
        "Region": [
            {
                "RegionId": "",
                "RegionEndpoint": "",
                "LocalName": ""
            }
        ]
    }
}
```

Sample error response

If a request fails, the following information is returned. For more information, see the developer guide of the corresponding Apsara Stack service.

```
{
    "code": "asapi.server.api.notfound",// The error code.
    "eagleEyeTraceId": "xxx-xxx-xxx-xxx", // The trace ID provided by EagleEye.
    "asapiSuccess": false, // Indicates whether the request is successful.
    "hostId": "xxxx", // The ID of the host.
    "message": "Failed to ....", // The message returned.
    "asapiErrorMessage": "Failed to ....", // The error message provided by the ASAPI.
    "asapiErrorCode": "asapi.server.api.notfound" // The error code provided by the ASAPI.
}
```

3.1.2. Container Service API invocation

3.1.2.1. Overview

To use the APIs provided by Container Service, you can send HTTP requests to the endpoint of Container Service APIs and include specific parameters in the requests. The system returns a response after processing the request.

1. Common parameters

2. Request structure
3. Response parameters
4. Sign API requests

3.1.2.2. Common parameters

This topic lists the common request headers, common response headers, and common parameters that are required in Apsara Stack API (ASAPI) requests when you make Container Service API requests.

Common request headers

Common request parameters must be included in all Container Service API requests.

Parameter	Description	Required
Authorization	The authentication information that is used to check the authenticity of a request. The string must follow the `AccessKeyId:Signature` format.	Yes
Content-Length	The length of the HTTP request content. This length is specified in RFC 2616.	Yes
Content-Type	The type of HTTP request content. This type must follow the format that is specified in RFC 2616.	Yes
Content-MD5	The 128-bit MD5 hash value of the HTTP message body. The hash value is encoded in the Base64 format. We recommend that you set this parameter for all requests to prevent parameter tampering.	Yes
Date	The time when a request is created. The time must be in GMT. If the time between when the request is sent and when the request is received exceeds 15 minutes, the request is deemed invalid.	Yes
Host	The host to which the request is sent, for example, *diku.aliyuncs.com*.	Yes

Parameter	Description	Required
Accept	The type of response that is required by the client. Valid values: *application/json* and *application/xml*.	Yes
x-acs-version	The version number of the API. Set the value to *2015-12-15*.	Yes
x-acs-region-id	The region where the Elastic Compute Service (ECS) instance is deployed.	Yes
x-acs-signature-nonce	A unique, random number used to prevent replay attacks. You must use different numbers for different requests.	Yes
x-acs-signature-method	The encryption method of the signature string. Set the value to *HMAC-SHA1*.	Yes

Examples

```
GET /clusters HTTP/1.1
Host: cs.aliyuncs.com
Accept: application/json
User-Agent: cs-sdk-python/0.0.1 (Darwin/15.2.0/x86_64;2.7.10)
x-acs-signature-nonce: f63659d4-10ac-483b-99da-ea8fde61eae3
Authorization: acs <yourAccessKeyId>:<yourSignature>
x-acs-signature-version: 1.0
Date: Wed, 16 Dec 2015 11:18:47 GMT
x-acs-signature-method: HMAC-SHA1
Content-Type: application/json;charset=utf-8
X-Acs-Region-Id: cn-beijing
Content-Length: 0
```

Common parameters required in ASAPI requests

Additional common parameters are required when you make ASAPI requests. The following table lists these common parameters.

Parameter	Description	Required
x-ascm-product-ak	The AccessKey pair. You can check your AccessKey pair in the Alibaba Cloud Management Console.	Yes
x-ascm-product-name	The name of the service that supports the API. Set the value to cs for Container Service.	Yes

Parameter	Description	Required
x-ascm-product-version	The version number of the API. Set the value to 2015-12-15.	Yes
x-acs-regionid	The ID of the region where the Container Service cluster is deployed.	Yes
x-acs-organizationid	The ID of the organization to which the Container Service cluster belongs.	Yes
x-acs-resourceGroupId	The ID of the resource set of the Container Service cluster.	Yes
x-acs-roleid	The ID of the role.	Yes

Common response parameters

Every response returns a unique request ID regardless of whether the call is successful.

Examples

XML format:

```
<? xml version="1.0" encoding="UTF-8"? >
<!—Result Root Node-->
<Interface Name + Response>
 | <! -Returned Request Tag -->
 | <RequestId>4C467B38-3910-447D-87BC-AC049166F216</RequestId>
 | <! -Return Result Data -->
<Interface Name+Response>
```

JSON format

```
{
    "RequestId": "4C467B38-3910-447D-87BC-AC049166F216"
    /* Return Result Data */
}
```

3.1.2.3. Request syntax

This topic describes the syntax that you must follow when you make Container Service API requests.

Endpoint

- The endpoints of the API operations are classified into the following types:
  - Primary region: `cs.${global:internet-domain}`
  - Secondary region: `cs.${global:region}.${global:internet-domain}`

- You must add the */roa* prefix to the endpoint that you use to make an Apsara Stack API (ASAPI) request. For example, if the */clusters* endpoint is used to create a cluster, you must include */roa/clusters* in your ASAPI request.

Protocols

HTTP and HTTPS are supported. We recommend that you send requests over HTTPS to enhance security.

Request methods

The following HTTP methods are supported: PUT, POST, GET, and DELETE.

Request parameters

Each request must contain common request parameters and parameters unique to specific operations.

Request encoding

All requests and responses are encoded in the UTF-8 format.

3.1.2.4. Response parameters

The response data is returned in a unified format. If status code `2xx` is returned, it indicates that the API call is successful. If status code `4xx` or `5xx` is returned, it indicates that the API call has failed. For successful API calls, response data is returned in XML or JSON format. You can pass a parameter to specify the format when you call the API. The default format is XML.

The following example is formatted for readability. The actual result is not formatted with line feeds or indentation.

3.1.2.5. Sign API requests

This topic describes how to sign API requests to protect Container Service from unauthorized access.

Introduction

Apsara Stack issues an AccessKey pair to each Apsara Stack tenant account. Each AccessKey pair consists of an AccessKey ID and an AccessKey secret. The AccessKey ID is used to verify the identity of the user. The AccessKey secret is used to encrypt and verify the signature string. You must keep your AccessKey secret confidential. You can obtain and manage the AccessKey pair in the Apsara Uni-manager Management Console.

Container Service verifies every request it receives. All requests to Container Service must contain signature information. Container Service implements symmetric encryption with an AccessKey pair to verify the identity of the request sender. Container Service accepts only requests that are validated by verification codes. Invalid requests are rejected and the HTTP status code 403 is returned.

You can add the Authorization header to every HTTP request and include the signature in the header.

You must add the signature to the Authorization header in the following format: `Authorization: acs [Access Key Id]:[Signature]` .

The `Signature` is calculated based on the following rules:

```
Signature = base64(hmac-sha1(VERB + "\n"
            + ACCEPT + "\n"
            + Content-MD5 + "\n"
            + Content-Type + "\n"
            + Date + "\n"
            + CanonicalizedHeaders + "\n"
            + CanonicalizedResource))
```

- `VERB` indicates the HTTP method. Example: `PUT`.
- `ACCEPT` specifies the type of response that is required by the client. Valid values: application/json and application/xml.
- `Content-MD5` indicates the MD5 hash value of the request content.
- `Content-Type` indicates the type of request content.
- `Date` indicates the time when the request was sent. This parameter is required. The time must be in GMT. If the time between when the request was sent and when the request was received exceeds 15 minutes, the request is deemed invalid and the HTTP status code 400 is returned. For example, `Thu, 17 Mar 2012 18:49:58 GMT` can be used.
- `CanonicalizedHeaders` indicates the header fields that are prefixed with `x-acs-` in the request.
- `CanonicalizedResource` indicates the URI of the requested resource. For example, `/clusters? name=my-clusters&resource=new` can be used.

`CanonicalizedHeaders` (headers that start with `x-acs-`) must comply with the following specifications before the signature is verified:

1. Convert the names of all HTTP request headers prefixed with `x-acs-` to lowercase letters. For example, you must convert `X-ACS-Meta-Name: TaoBao` into `x-acs-meta-name: TaoBao`. Header field names are case-insensitive. We recommend that you use lowercase letters.
2. If a header field value is too long, replace specific delimiters with spaces. The delimiters include `\t`, `\n`, `\r`, and `\f`.
3. Sort all HTTP request headers that are obtained from the preceding step in alphabetical order.
4. Delete spaces from each side of a delimiter between the request header and its content. For example, convert `x-acs-meta-name: TaoBao,Alipay` into `x-acs-meta-name:TaoBao,Alipay`.
5. Separate all headers and content with delimiters (`\n`) to form the final canonicalized headers.

> **Note** `CanonicalizedResource` must follow this format: `CanonicalizedResource` specifies the URIs of the requested resources. You must sort sub-resources in alphabetical order and combine them with the `&` delimiter to form a string. In the following example, the string that follows the question mark (`?`) indicates CanonicalizedResource.

```
http://cs.aliyuncs.com/clusters?name=my-clusters&resource=new
```

The value of `CanonicalizedResource` must be in the following format:

```
/clusters? name=my-clusters&resource=new
```

Example

Overview

The following example shows how to sign an API request.

The `access_key_id` and `access_key_secret` fields separately specify the AccessKey ID and AccessKey secret that are used in the example. We recommend that you use your own program to construct an API request. You can then calculate the signature that is used in the following example.

Sample request:

```
POST http://cs.aliyuncs.com/clusters?param1=value1&param2=value2 HTTP/1.1
Accept-Encoding: identity
Content-Length: 210
Content-MD5: 6U4ALMkKSj0PYbeQSHqgmA==
x-acs-version: 2015-12-15
Accept: application/json
User-Agent: cs-sdk-python/0.0.1 (Darwin/15.2.0/x86_64;2.7.10)
x-acs-signature-nonce: fbf6909a-93a5-45d3-8b1c-3e03a7916799
x-acs-signature-version: 1.0
Date: Wed, 16 Dec 2015 12:20:18 GMT
x-acs-signature-method: HMAC-SHA1
Content-Type: application/json;charset=utf-8
X-Acs-Region-Id: cn-beijing
Authorization: acs <yourAccessKeyId>:<yourSignature>
{"password": "Just$****","instance_type": "ecs.m2.medium","name": "my-test-cluster-9708****
","size": 1,"network_mode": "vpc","data_disk_category": "cloud","data_disk_size": 10,"ecs_i
mage_id": "m-253l****l"}
```

Construct the request

Calculate the values of `Content-Length` and `Content-MD5`.

`Content-Length` specifies the length of the content body.

> **Note** The body cannot start with a space or line feed.

```
body: {"password": "Just$****","instance_type": "ecs.m2.medium","name": "my-test-cluster-97
08****","size": 1,"network_mode": "vpc","data_disk_category": "cloud","data_disk_size": 10,
"ecs_image_id": "m-253ll****"}
Content-Length: 210
```

`Content-MD5`: The MD5 value is calculated based on the following rules:

```
body: {"password": "Just$****","instance_type": "ecs.m2.medium","name": "my-test-cluster-97
08****","size": 1,"network_mode": "vpc","data_disk_category": "cloud","data_disk_size": 10,
"ecs_image_id": "m-253ll****"}
# Calculate the MD5 value of the body
md5(body): e94e002cc90a4a3d0f61b790487aa098
# Convert the MD5 hash value into a byte array. Convert every two hexadecimal digits into o
ne byte.
# Example: e9 -> 11111111111111111111111111101001 -> -23
bytes(md5(body)): {[-23], [78], [0], [44], [-55], [10], [74], [61], [15], [97], [-73], [-11
2], [72], [122], [-96], [-104]}
# Convert the byte array into a string that is encoded in the Base64 format.
base64(bytes(md5(body))): 6U4ALMkKSj0PYbeQSHqgmA==
Content-MD5: 6U4ALMkKSj0PYbeQSHqgmA==
```

Process `CanonicalizedHeaders`

```
# List all header fields prefixed with 'x-acs-'
x-acs-version: 2015-12-15
x-acs-signature-nonce: ca480402-7689-43ba-acc4-4d2013d9d8d4
x-acs-signature-version: 1.0
x-acs-signature-method: HMAC-SHA1
X-Acs-Region-Id: cn-beijing
# Convert the header field name to lowercase, delete the spaces at the start and end of eac
h line, and sort the header fields in lexicographical order. Delete spaces from each side o
f a delimiter between the request header and its content.
# Note: No line feed in the last line.
x-acs-region-id:cn-beijing
x-acs-signature-method:HMAC-SHA1
x-acs-signature-nonce:fbf6909a-93a5-45d3-8b1c-3e03a7916799
x-acs-signature-version:1.0
x-acs-version:2015-12-15
```

Calculate `CanonicalizedResource`

In this example, the length of the `CanonicalizedResource` field value is 27 bytes.

Note A line feed `\n` exists at the end of the first line.

```
/clusters? param1=value1&param2=value2
```

Calculate `Signature`

Construct the value of `SignatureString`. In this example, the length of the signature string is 307 bytes. Apart from the last line, each line has a line feed `\n` at the end.

```
POST
application/json
6U4ALMkKSj0PYbeQSHqgmA==
application/json;charset=utf-8
Wed, 16 Dec 2015 12:20:18 GMT
x-acs-region-id:cn-beijing
x-acs-signature-method:HMAC-SHA1
x-acs-signature-nonce:fbf6909a-93a5-45d3-8b1c-3e03a7916799
x-acs-signature-version:1.0
x-acs-version:2015-12-15
/clusters? param1=value1&param2=value2
```

Calculate `Signature` base on the following rules:

```
# Use the AccessKey secret to encrypt the value of SignatureString. In this example, access
_key_secret specifies the AccessKey secret.
hmac-sha1(SignatureString): fee03d405e421ebaf514adec881038c4b313584d
#  Convert the encrypted string into a byte array, which is similar to calculating Content-
MD5.
# Convert the byte array into a string that is encoded in the Base64 format. The output is
the signature string.
base64(bytes(hmac-sha1(SignatureString))): ZmVlMDNkNDA1ZTQyMWViYWY1MTRhZGVjODgxMDM4YzRiMzEz
NTg0ZA==
Signature: ZmVlMDNkNDA1ZTQyMWViYWY1MTRhZGVjODgxMDM4YzRiMzEzNTg0ZA==
```

The signature string is calculated.

Add other header fields to your request and set the value of Signature to the calculated signature string. The following sample code shows the signed API request.

```
POST http://cs.aliyuncs.com/clusters?param1=value1&param2=value2 HTTP/1.1
Accept-Encoding: identity
Content-Length: 210
Content-MD5: 6U4ALMkKSj0PYbeQSHqgmA==
x-acs-version: 2015-12-15
Accept: application/json
User-Agent: cs-sdk-python/0.0.1 (Darwin/15.2.0/x86_64;2.7.10)
x-acs-signature-nonce: fbf6909a-93a5-45d3-8b1c-3e03a7916799
x-acs-signature-version: 1.0
Date: Wed, 16 Dec 2015 12:20:18 GMT
x-acs-signature-method: HMAC-SHA1
Content-Type: application/json;charset=utf-8
X-Acs-Region-Id: cn-beijing
Authorization: acs <yourAccessKeyId>:<yourSignature>
{"password": "Just$****","instance_type": "ecs.m2.medium","name": "my-test-cluster-9708****
","size": 1,"network_mode": "vpc","data_disk_category": "cloud","data_disk_size": 10,"ecs_i
mage_id": "m-253ll****"}
```

3.1.3. Cluster API list

3.1.3.1. Clusters

3.1.3.1.1. CreateCluster

Creates a standard dedicated Kubernetes cluster.

Request syntax

```
POST /clusters HTTP/1.1
Content-Type:application/json
{
  "name" : "String",
  "region_id" : "String",
  "cluster_type" : "String",

Request parameters

Request body parameters

Parameter	Type	Required	Example	Description
name	String	Yes	cluster-demo	The name of the cluster. The name must be 1 to 63 characters in length, and can contain digits, letters, and hyphens (-). It cannot start with a hyphen.
region_id	String	Yes	cn-beijing	The ID of the region where you want to deploy the cluster.
cluster_type	String	Yes	Kubernetes	The type of cluster. Valid values: • `Kubernetes`: dedicated Kubernetes cluster. • `ManagedKubernetes`: managed edge Kubernetes cluster.

Parameter	Type	Required	Example	Description
kubernetes_version	String	No	1.16.9-aliyun.1	The version of the cluster. The cluster versions provided by Container Service are consistent with the open source versions. We recommend that you select the latest version. If you do not specify this parameter, the latest version is used. You can create clusters of the latest two versions in the Container Service console. You can create clusters of earlier versions by calling API operations.
runtime	runtime	No	{"name": "docker", "version": "19.03.5"}	The container runtime of the cluster. The following runtimes are supported: `containerd`, `Docker`, and `Sandboxed-Container`. The default runtime is `Docker`. You must specify the name and version of the container runtime. • `name`: the name of the container runtime. • `version`: the version of the container runtime.
vpcid	String	Yes	vpc-2zeik9h3ahvv2zz95****	The virtual private cloud (VPC) where the cluster is deployed. You must specify a VPC when you create the cluster.
container_cidr	String	Yes	172.20.0.0/16	The CIDR block of pods. This CIDR block cannot overlap with the CIDR block of the VPC where the cluster is deployed. If the VPC is automatically created by the system, the CIDR block of pods is set to 172.16.0.0/16 by default. **Notice** • This parameter is required if the cluster uses the Flannel plug-in. • This parameter is not required if the cluster uses the Terway plug-in.

Parameter	Type	Required	Example	Description
service_cidr	String	Yes	172.21.0.0/20	The CIDR block of Services. Valid values: 10.0.0.0/16-24, 172.16-31.0.0/16-24, and 192.168.0.0/16-24. The CIDR block of Services cannot overlap with the CIDR block of the VPC (10.1.0.0/21) or the CIDR blocks of existing clusters in the VPC. You cannot modify the CIDR block of Services after the cluster is created. By default, the CIDR block of Services is set to 172.19.0.0/20.
is_enterprise_security_group	Boolean	No	true	Specifies whether to create an advanced security group. This parameter takes effect only if `security_group_id` is left empty. **Note** To use a basic security group, make sure that the sum of the number of nodes in the cluster plus the number of pods that use Terway does not exceed 2,000. Therefore, we recommend that you specify an advanced security group for a cluster that has Terway installed. • `true`: creates an advanced security group. • `false`: does not create an advanced security group. Default value: `true`.

Parameter	Type	Required	Example	Description
snat_entry	Boolean	No	true	Specifies whether to configure Source Network Address Translation (SNAT) rules for the VPC where your cluster is deployed. Valid values: • true: automatically creates a Network Address Translation (NAT) gateway and configures SNAT rules. Set this parameter to `true` if nodes and applications in the cluster need to access the Internet. • false: does not create a NAT gateway or configure SNAT rules. In this case, nodes and applications in the cluster cannot access the Internet. Default value: true.
endpoint_public_access	Boolean	No	true	Specifies whether to enable Internet access for the cluster. You can use an elastic IP address (EIP) to expose the API server. This way, you can access the cluster over the Internet. • `true`: enables Internet access. • `false`: disables Internet access. If you set this parameter to false, the API server cannot be accessed over the Internet. Default value: `false`.
ssh_flags	Boolean	No	true	Specifies whether to enable Secure Shell (SSH) logon over the Internet. • `true`: enables SSH logon over the Internet. • `false`: disables SSH logon over the Internet. Default value: `false`.
node_cidr_mask	String	No	25	The maximum number of IP addresses that can be assigned to nodes. This number is determined by the specified pod CIDR block. This parameter takes effect only if the cluster uses the Flannel plug-in. Default value: `26`.

Parameter	Type	Required	Example	Description
user_ca	String	No	-----BEGIN CERTIFICATE----- ****	The custom Certificate Authority (CA) certificate for the cluster.
user_data	String	No	IyEvdXNyL2Jpbi9iYXNoCmVjaG8gIkhlbGxvIEFD****	The user-defined data of the node. For more information, see the *User-defined data* chapter in the *Elastic Compute Service (ECS)* documentation.
cluster_domain	String	No	cluster.local	The domain name of the cluster. The domain name consists of one or more parts that are separated with periods (.).Each part cannot exceed 63 characters in length, and can contain lowercase letters, digits, and hyphens (-). Each part must start and end with a lowercase letter or digit.
image_id	String	No	m-bp16z7xko3vvv8gt****	Specifies a custom image for nodes. By default, the system image is used. You can select a custom image to replace the default image.
tags	Array of tag	No		The labels to be added to nodes. Labeling rules: • Each label consists of a case-sensitive key-value pair. You can add up to 20 labels. • When you add a label, you must specify a unique key but you can leave the value empty. A key cannot exceed 64 characters in length and a value cannot exceed 128 characters in length. Keys and values cannot start with aliyun, acs:, https://, or http://.
				The list of add-ons to be installed. When you create a cluster, you can set the `addons` parameter to install specific add-ons. **Network plug-in**: required. Supported network plug-ins are Flannel and Terway. Select one of the plug-ins for the cluster. • Specify the Flannel plug-in in the

Parameter	Type	Required	Example	Description
addons	Array of addon	No		following format: [{"name":"flannel","config":""}]. • Specify the Terway plug-in in the following format: [{"name": "terway-eniip","config": ""}]. **Volume plug-in**: required. Supported volume plug-ins are `CSI` and `FlexVolume`. • Specify the `CSI` plug-in in the following format: [{"name":"csi-plugin","config": ""},{"name": "csi-provisioner","config": ""}]. • Specify the `FlexVolume` plug-in in the following format: [{"name": "flexvolume","config": ""}]. **Log Service component**: optional. We recommend that you enable Log Service. If Log Service is disabled, you cannot use the cluster auditing feature. • To use an existing `Log Service project`, specify the component in the following format: [{"name": "logtail-ds","config": "{\"IngressDashboardEnabled\":\"true\",\"sls_project_name\":\"your_sls_project_name\"}"}]. • To create a `Log Service project`, specify the component in the following format: [{"name": "logtail-ds","config": "{\"IngressDashboardEnabled\":\"true\"}"}]. **Ingress controller**: optional. By default, the `nginx-ingress-controller` component is installed for dedicated Kubernetes clusters. • To install nginx-ingress-controller and enable Internet access, specify the component in the following format: [{"name":"nginx-ingress-controller","config":"{\"IngressSlbNetworkType\":\"internet\"}"}]. • To disable the automatic installation of nginx-ingress-controller, specify the component in the following format: [{"name": "nginx-ingress-controller","config": "","disabled": true}]. **Event center**: optional. By default, the event center feature is enabled.

Parameter	Type	Required	Example	Description
				The event center feature allows you to log Kubernetes events, query events, and configure alerts for the events. Logstores that are associated with the Kubernetes event center are free of charge for the first 90 days. Enable the ack-node-problem-detector component in the following format: [{"name":"ack-node-problem-detector","config":"{\"sls_project_name\":\"your_sls_project_name\"}"}].
taints	Array of taint	No		The taints to be added to nodes. Taints are added to nodes to prevent pods from being scheduled to inappropriate nodes. However, toleration rules allow pods to be scheduled to nodes with matching taints.
cloud_monitor_flags	Boolean	No	true	Specifies whether to install the CloudMonitor agent. Valid values: • `true`: installs the CloudMonitor agent. • `false`: does not install the CloudMonitor agent. Default value: `false`.
platform	String	No	CentOS	The release version of the operating system. Valid values: • CentOS • AliyunLinux • QbootAliyunLinux • Qboot • Windows • WindowsCore Default value: `AliyunLinux`.
os_type	String	No	Linux	The type of operating system. Valid values: • Windows • Linux Default value: `Linux`.

Parameter	Type	Required	Example	Description
cpu_policy	String	No	none	The CPU policy. The following policies are supported if the cluster version is 1.12.6 or later. • `static`: This policy allows pods with specific resource characteristics on the node to be granted with enhanced CPU affinity and exclusivity. • `none`: This policy indicates that the default CPU affinity is used. Default value: `none`.
proxy_mode	String	No	ipvs	The kube-proxy mode. • `iptables`: iptables is a kube-proxy mode. It uses iptables rules to conduct Service discovery and load balancing. The performance of this mode is limited by the size of the cluster. This mode is suitable for clusters that run a small number of Services. • `IPVS` is a high-performance kube-proxy mode. It uses Linux IP Virtual Server (IPVS) to conduct Service discovery and load balancing. This mode is suitable for clusters that run a large number of Services. We recommend that you use this mode in scenarios where high-performance load balancing is required. Default value: `ipvs`.
node_port_range	String	No	30000~32767	The node port range. Valid values: 30000 to 65535. Default value: `30000-32767`.
login_password	String	Yes	Hello@1234	The password for SSH logon. You must set this parameter or the `key_pair` parameter. The password must be 8 to 30 characters in length, and must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters.

Parameter	Type	Required	Example	Description
master_count	Long	No	3	The number of master nodes to be created. Valid values: `3` and `5`. Default value: `3`.
master_vswitch_ids	Array of String	Yes	vsw-2ze3ds0mdip0hdz8i****	The IDs of vSwitches.
master_instance_types	Array of String	Yes	ecs.n4.xlarge	The instance types of master nodes. For more information, see the *Instance types* chapter of *ECS User Guide*.
master_system_disk_category	String	Yes	cloud_ssd	The type of system disk that is specified for master nodes. Valid values: • `cloud_efficiency`: ultra disk. • `cloud_ssd`: standard SSD. • `cloud_essd`: enhanced SSD. Default value: `cloud_ssd`. The default value may vary in different zones.
master_system_disk_size	Long	Yes	120	The size of the system disk that is specified for master nodes. Valid values: 40 to 500. Unit: GiB. Default value: `120`.
num_of_nodes	Long	Yes	3	The number of worker nodes to be created. Valid values: 0 to 100.
worker_vswitch_ids	Array of String	Yes	vsw-2ze3ds0mdip0hdz8i****	The list of vSwitch IDs. You can specify 1 to 20 vSwitches. We recommend that you select vSwitches in different zones to ensure high availability.

Parameter	Type	Required	Example	Description
worker_instance_types	Array of String	Yes	ecs.n4.large	The instance types of worker nodes. You must specify at least one instance type. For more information, see the *Instance types* chapter of *ECS User Guide*. **Note** The instance types are listed in descending order of priority. If worker nodes fail to be created based on the instance type of the highest priority, the system attempts to create worker nodes by using the instance type of the next highest priority.
worker_system_disk_category	String	Yes	cloud_efficiency	The type of system disk that is specified for worker nodes. Valid values: • `cloud_efficiency`: ultra disk. • `cloud_ssd`: standard SSD. Default value: `cloud_ssd`.
worker_system_disk_size	Long	Yes	120	The size of the system disk that is specified for worker nodes. Unit: GiB. Valid values: 40 to 500. The value of this parameter must be at least 40 and greater than or equal to the size of the image. Default value: 120.
worker_data_disks	Array	No		The configurations of data disks that are mounted to worker nodes. Each configuration includes disk type and disk size.
instances	Array of String	No	i-2ze4zxnm36vq00xn****	The names of instances.

Parameter	Type	Required	Example	Description
format_disk	Boolean	No	false	Specifies whether to mount a data disk to nodes that are created on existing ECS instances. Valid values: • `true`: stores the data of containers and images on a data disk. The original data on the disk will be overwritten. Back up data before you mount the disk. • `false`: does not store the data of containers and images on a data disk. Default value: `false`. How to mount a data disk: • If the ECS instances have data disks mounted and the file system of the last data disk is not initialized, the system automatically formats the data disk to ext4. Then, the system mounts the data disk to /var/lib/docker and /var/lib/kubelet. • The system does not create and mount a new data disk if no data disk has been mounted to the ECS instances.
keep_instance_name	Boolean	No	true	Specifies whether to retain the names of existing ECS instances that are used in the cluster. • `true`: retains the names. • `false`: does not retain the names. The new names are assigned by the system. Default value: `true`.

Parameter	Type	Required	Example	Description
deletion_protection	Boolean	No	true	Specifies whether to enable deletion protection for the cluster. After deletion protection is enabled, the cluster cannot be deleted in the console or by calling API operations. Valid values: • `true`: enables deletion protection for the cluster. This way, the cluster cannot be deleted in the console or by calling API operations. • `false`: disables deletion protection for the cluster. This way, the cluster can be deleted in the console or by calling API operations. Default value: `false`.
disable_rollback	Boolean	No	true	Specifies whether to perform a rollback when the cluster fails to be created. Valid values: • `true`: performs a rollback when the cluster fails to be created. • `false`: does not perform a rollback when the cluster fails to be created. Default value: `true`.
timeout_mins	Long	No	60	Specifies the timeout period of cluster creation. Unit: minutes. Default value: `60`.

Response syntax

```
HTTP/1.1 200
Content-Type:application/json
{
  "cluster_id" : "String",
  "request_id" : "String",
  "task_id" : "String"
}
```

Response parameters

Response body parameters

Parameter	Type	Example	Description
cluster_id	String	cb95aa626a47740afbf6aa099b650****	The ID of the cluster.
request_id	String	687C5BAA-D103-4993-884B-C35E4314A1E1	The ID of the request.
task_id	String	T-5a54309c80282e39ea00002f	The ID of the task.

Examples

Sample requests

```
POST /clusters
{
    "cluster_type":"Kubernetes",
    "name":"dedicated Kubernetes cluster",
    "region_id":"cn-zhangjiakou",
    "disable_rollback":true,
    "timeout_mins":60,
    "kubernetes_version":"1.18.8-aliyun.1",
    "snat_entry":true,
    "endpoint_public_access":true,
    "ssh_flags":true,               // Specifies whether master nodes in the cluster can be
accessed by using SSH.
    "cloud_monitor_flags":true,
    "deletion_protection":true,
    "node_cidr_mask":"26",
    "user_ca":"-----BEGIN CERTIFICATE-----\n***", // The custom CA certificate.
    "proxy_mode":"ipvs",
    "timezone":"Asia/Shanghai",
    "tags":[
        {
            "key":"tag-k",

}
```

Error codes

You can check further details of error codes. For more information, see Error codes.

3.1.3.1.2. ScaleOutCluster

Adds worker nodes to a Container Service cluster. The worker nodes can be deployed in multiple zones.

Request syntax

```
POST /api/v2/clusters/ClusterId HTTP/1.1
Content-Type:application/json
{
  "count" : Long,
  "login_password" : "String",
  "vswitch_ids" : [ "String" ],
  "worker_instance_types" : [ "String" ],
  "worker_system_disk_category" : "String",
  "worker_system_disk_size" : Long,
  "worker_data_disks" : [ {
    "category" : "String",
    "size" : Long,
    "encrypted" : "String",
    "auto_snapshot_policy_id" : "String"
  } ],
  "cloud_monitor_flags" : Boolean,
  "cpu_policy" : "String",
  "image_id" : "String",
  "user_data" : "String",
  "rds_instances" : [ "String" ],
  "tags" : [ {
    "key" : "String",
    "value" : "String"
  } ],
  "taints" : [ {
    "key" : "String",
    "value" : "String",
    "effect" : "String"
  } ],
  "runtime" : {
    "name" : "String",
    "version" : "String"
  }
}
```

Request parameters

Request path parameters

Parameter	Type	Required	Example	Description
ClusterId	String	Yes	c82e6987e2961451182edacd74faf****	The ID of the cluster.

Request body parameters

Parameter	Type	Required	Example	Description
count	Long	Yes	3	The number of worker nodes that you want to add.

Parameter	Type	Required	Example	Description
login_password	String	Yes	Hello@1234	The Secure Shell (SSH) logon password. The password must be 8 to 30 characters in length, and must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters.
vswitch_ids	Array of String	Yes	vsw-2ze4jvvvade1yk899****	The IDs of the vSwitches that are specified for the nodes that you want to add. Before you scale out a cluster, the cluster uses the vSwitches that are specified when the cluster is created.
worker_instance_types	Array of String	Yes	ecs.c5.xlarge	The instance types of worker nodes. You must specify at least one instance type. For more information, see the *Instance type* chapter in *Elastic Compute Service (ECS) User Guide*. **Note** The instance types are listed in descending order of priority. If worker nodes fail to be created based on the instance type of the highest priority, the system attempts to create worker nodes by using the instance type of the next highest priority.
worker_system_disk_category	String	Yes	cloud_efficiency	The type of system disk that is specified for worker nodes. Valid values: • `cloud_efficiency`: ultra disk. • `cloud_ssd`: standard SSD. • `cloud_essd`: enhanced SSD. Default value: `cloud_ssd`.

Parameter	Type	Required	Example	Description
worker_system_disk_size	Long	Yes	120	The size of the system disk that is specified for worker nodes. Unit: GiB. Valid values: 40 to 500. Default value: `120`.
worker_data_disks	Array of data_disk	No		The configurations of the data disks that are mounted to worker nodes. Each configuration includes disk type and disk size.
cloud_monitor_flags	Boolean	No	true	Specifies whether to install the CloudMonitor agent. Valid values: • `true`: installs the CloudMonitor agent. • `false`: does not install the CloudMonitor agent. Default value: `false`.
cpu_policy	String	No	none	The CPU policy. The following policies are supported if the cluster version is 1.12.6 or later. • `static`: This policy allows pods with specific resource characteristics on the node to be granted with enhanced CPU affinity and exclusivity. • `none`: This policy indicates that the default CPU affinity is used. Default value: `none`.
image_id	String	No	m-bp16z7xko3vvv8gt****	Specifies a custom image for nodes. By default, the system image is used. You can select a custom image to replace the default image.
user_data	String	No	IyEvdXNyL2Jpbi9iYXNoCmVjaG8gIkhlbGxvIEFD****	The user-defined data. For more information, see the *User-defined data* chapter in the *ECS* documentation.

Parameter	Type	Required	Example	Description
rds_instances	Array of String	No	rm-2zev748xi27xc****	The names of the Relational Database Service (RDS) instances.
tags	Array of	No		The labels to be added to nodes. Labeling rules: • Each label consists of a case-sensitive key-value pair. You can add up to 20 labels. • When you add a label, you must specify a unique key but you can leave the value empty. A key cannot exceed 64 characters in length and a value cannot exceed 128 characters in length. Keys and values cannot start with aliyun, acs:, https://, or http://.
taints	Array of taint	No		The taints to be added to nodes. Taints are added to nodes to prevent pods from being scheduled to inappropriate nodes. However, toleration rules allow pods to be scheduled to nodes with matching taints.
runtime	runtime	No		The container runtime.

Response syntax

```
HTTP/1.1 200
Content-Type:application/json
{
  "cluster_id" : "String",
  "request_id" : "String",
  "task_id" : "String"
}
```

Response parameters

Response body parameters

Parameter	Type	Example	Description
cluster_id	String	c82e6987e2961451182edacd74faf****	The ID of the cluster.

Parameter	Type	Example	Description
request_id	String	687C5BAA-D103-4993-884B-C35E4314A1E1	The ID of the request.
task_id	String	T-5a54309c80282e39ea00002f	The ID of the task.

Examples

Sample requests

}
```

Error codes

You can check further details of error codes. For more information, see Error codes.

3.1.3.1.3. DeleteCluster

Deletes a Container Service cluster by ID and releases all nodes in the cluster.

Request syntax

```
DELETE /clusters/ClusterId?retain_all_resources=Boolean&keep_slb=Boolean&retain_resources=[
"String"] HTTP/1.1
Content-Type:application/json
```

Request parameters

Request path parameters

Parameter	Type	Required	Example	Description
ClusterId	String	Yes	c905d1364c2dd4b6284a3f41790c4****	The ID of the cluster.

Request query parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
retain_all_resources	Boolean	No	false	Specifies whether to retain all resources. If you set the parameter to `true`, the `retain_resources` parameter is ignored. • `true`: retains all resources. • `false`: does not retain all resources. Default value: `false`.
keep_slb	Boolean	No	false	Specifies whether to retain the Server Load Balancer (SLB) instances that are created for the cluster. • `true`: retains the SLB instances that are created for the cluster. • `false`: does not retain the SLB instances that are created for the cluster. Default value: `false`.
retain_resources	Array of String	No	sg-2ze6ess9kho6fdn9****	The names of the resources that you want to retain.

Response syntax

```
HTTP/1.1 200 OK
```

Response parameters

No response parameters.

Examples

Sample requests

```
DELETE /clusters/c905d1364c2dd4b6284a3f41790c4****?retain_all_resources=false&keep_slb=false&retain_resources=["sg-2ze6ess9kho6fdn9****"] HTTP/1.1
Host:cs.aliyuncs.com
Content-Type:application/json
```

Sample success responses

`JSON` format

```
HTTP/1.1 200 OK
```

Error codes

You can check further details of error codes. For more information, see Error codes.

3.1.3.1.4. DescribeClusterUserKubeconfig

Obtains the kubeconfig file of a specified Container Service cluster. The kubeconfig file contains detailed information about the current user and is used to configure access to the cluster.

Request syntax

```
GET /k8s/ClusterId/user_config?PrivateIpAddress=Boolean&TemporaryDurationMinutes=Long HTTP/1.1
Content-Type:application/json
```

Request parameters

Request path parameters

Parameter	Type	Required	Example	Description
ClusterId	String	Yes	c5b5e80b0b64a4bf6939d2d8fbbc5****	The ID of the cluster.

Request query parameters

Parameter	Type	Required	Example	Description
PrivateIpAddress	Boolean	No	true	Specifies whether to obtain the credential that is used to connect to the cluster over the internal network. Valid values: • `true`: obtains the credential that is used to connect to the cluster over the internal network. • `false`: obtains the credential that is used to connect to the cluster over the Internet. Default value: `false`.

Parameter	Type	Required	Example	Description
TemporaryDurationMinutes	Long	No	15	The validity period of a temporary kubeconfig file. Unit: minutes. Valid values: 15 to 4320. **Note** • If you specify this parameter, the returned kubeconfig file will expire at the time specified by `expiration`. • If you do not specify this parameter, the returned kubeconfig file is permanently valid.

Response syntax

```
HTTP/1.1 200 OK
Content-Type:application/json
{
  "config" : "String",
  "expiration" : "String"
}
```

Response parameters

Response body parameters

Parameter	Type	Example	Description
config	String	apiVersion: v1****	The content of the kubeconfig file.
expiration	String	2024-03-10T09:56:17Z	The expiration time of the kubeconfig file. The value is in the RFC3339 format and is displayed in UTC.

Examples

Sample requests

```
GET /k8s/c5b5e80b0b64a4bf6939d2d8fbbc5****/user_config?PrivateIpAddress=true&TemporaryDurationMinutes=15 HTTP/1.1
Host:cs.aliyuncs.com
Content-Type:application/json
```

Sample success responses

`XML` format

```
HTTP/1.1 200 OK
Content-Type:application/xml
<config>
apiVersion: v1
clusters:
- cluster:
...
</config>
<expiration>2021-03-25T10:01:20Z</expiration>
```

`JSON` format

```
HTTP/1.1 200 OK
Content-Type:application/json
{
  "config" : "\napiVersion: v1\nclusters:\n- cluster:\n...\n",
  "expiration" : "2021-03-25T10:01:20Z"
}
```

Error codes

You can check further details of error codes. For more information, see Error codes.

3.1.3.1.5. Query

3.1.3.1.5.1. DescribeClustersV1

Queries the details of a specified Container Service cluster.

Request syntax

```
GET /api/v1/clusters?name=String&cluster_type=String&page_size=Long&page_number=Long HTTP/1.1
Content-Type:application/json
```

Request parameters

Request query parameters

Parameter	Type	Required	Example	Description
name	String	No	cluster-demo	The name of the cluster. The name must be 1 to 63 characters in length, and can contain digits, letters, and hyphens (-). It cannot start with a hyphen.
cluster_type	String	No	Kubernetes	The type of cluster. Valid values: • `Kubernetes`: dedicated Kubernetes cluster. • `ManagedKubernetes`: managed edge Kubernetes cluster.
page_size	Long	No	10	The number of entries to return on each page.
page_number	Long	No	3	The number of pages to return.

Response syntax

```
HTTP/1.1 200
Content-Type:application/json
{
  "clusters" : [ {
    "cluster_id" : "String",
    "cluster_type" : "String",
    "created" : "String",
    "init_version" : "String",
    "current_version" : "String",
    "next_version" : "String",
    "deletion_protection" : Boolean,
    "docker_version" : "String",
    "external_loadbalancer_id" : "String",
    "master_url" : "String",
    "meta_data" : "String",
    "name" : "String",
    "network_mode" : "String",
    "private_zone" : Boolean,
    "profile" : "String",
    "region_id" : "String",
    "resource_group_id" : "String",
    "security_group_id" : "String",
    "size" : Long,
    "state" : "String",
    "subnet_cidr" : "String",
    "tags" : [ {
      "key" : "String",
      "value" : "String"
    } ],
    "updated" : "String",
    "vpc_id" : "String",
    "vswitch_id" : "String",
    "worker_ram_role_name" : "String",
    "zone_id" : "String",
  } ],
  "page_info" : {
    "page_number" : Integer,
    "page_size" : Integer,
    "total_count" : Integer
  }
}
```

Response parameters

Response body parameters

Parameter	Type	Example	Description
clusters	Array		The list of the details of the queried cluster.

Parameter	Type	Example	Description
cluster_id	String	c3fb96524f9274b4495df0f12a6b5****	The ID of the queried cluster.
cluster_type	String	Kubernetes	The type of cluster. Valid values: • `Kubernetes`: dedicated Kubernetes cluster. • `ManagedKubernetes`: managed edge Kubernetes cluster.
created	String	2020-08-20T10:51:29+08:00	The time when the cluster was created.
init_version	String	1.16.9-aliyun.1	The version of the cluster. The cluster versions provided by Container Service are consistent with the open source versions. We recommend that you select the latest version. If you do not specify this parameter, the latest version is used. You can create clusters of the latest two Kubernetes versions in the Container Service console. You can create clusters of earlier versions by calling API operations.
current_version	String	1.16.9-aliyun.1	The Kubernetes version of the cluster.
next_version	String	1.18.8-aliyun.1	The Kubernetes version to which the cluster can be upgraded.
deletion_protection	Boolean	true	Indicates whether deletion protection is enabled for the cluster. After deletion protection is enabled, the cluster cannot be deleted in the console or by calling API operations. Valid values: • `true`: Deletion protection is enabled for the cluster. This way, the cluster cannot be deleted in the console or by calling API operations. • `false`: Deletion protection is disabled for the cluster. You can delete the cluster in the console or by calling the API.
docker_version	String	19.03.5	The Docker version that is used by the cluster.

Parameter	Type	Example	Description
external_loadbalancer_id	String	lb-2vcrbmlevo6kjpgch****	The ID of the Server Load Balancer (SLB) instance that is used for the Ingress of the cluster. The default SLB specification is slb.s1.small, which belongs to the high-performance instance type.
master_url	String	{\"api_server_endpoint\":\"\",\"intranet_api_server_endpoint\":\"https://192.168.0.251:6443\"}	The address of the cluster API server. It includes an internal endpoint and a public endpoint.
meta_data	String	{\"Addons\":[{\"config\":***}	The metadata of the cluster.
name	String	cluster-demo	The name of the cluster. The name must be 1 to 63 characters in length, and can contain digits, letters, and hyphens (-). It cannot start with a hyphen (-).
network_mode	String	vpc	The network mode of the cluster. Valid values: • `classic`: classic network. • `vpc`: virtual private cloud (VPC). • `overlay`: overlay network. • `calico`: network powered by Calico.
private_zone	Boolean	false	Indicates whether Alibaba Cloud DNS PrivateZone is enabled. Valid values: • `true`: indicates that Alibaba Cloud DNS PrivateZone is enabled. • `false`: indicates that Alibaba Cloud DNS PrivateZone is disabled.
profile	String	Default	The identifier of the cluster. Valid values: • `Edge`: indicates that the cluster is a managed edge Kubernetes cluster. • `Default`: indicates that the cluster is not a managed edge Kubernetes cluster.
region_id	String	cn-beijing	The ID of the region where the cluster is deployed.

Parameter	Type	Example	Description
resource_group_id	String	rg-acfmyvw3wjm****	The ID of the resource group to which the cluster belongs.
security_group_id	String	sg-2vcgwsrwgt5mp0yi****	The ID of the security group to which the instances of the cluster belong.
size	Long	5	The number of nodes in the cluster. Master nodes and worker nodes are included.
state	String	running	The state of the cluster. Valid values: • `initial`: The cluster is being created. • `failed`: The cluster failed to be created. • `running`: The cluster is running. • `updating`: The cluster is being upgraded. • `updating_failed`: The cluster failed to be upgraded. • `scaling`: The cluster is being scaled. • `stopped`: The cluster is stopped. • `deleting`: The cluster is being deleted. • `deleted`: The cluster is deleted. • `delete_failed`: The cluster failed to be deleted.
subnet_cidr	String	172.21.0.0/16	The pod CIDR block. It must be a valid and private CIDR block, and must be one of the following CIDR blocks or their subnets: • 10.0.0.0/8 • 172.16-31.0.0/12-16 • 192.168.0.0/16 The CIDR block of pods cannot overlap with the CIDR block of the VPC in which the cluster is deployed and the CIDR blocks of existing clusters in the VPC. You cannot modify the pod CIDR block after the cluster is created.
tags	Array of tag		The labels of the cluster.

Parameter	Type	Example	Description
updated	String	2020-09-16T11:09:55+08:00	The time when the cluster was updated.
vpc_id	String	vpc-2vcg932hsxsxuqbgl****	The ID of the VPC where the cluster is deployed. This parameter is required when you create a cluster.
vswitch_id	String	vsw-2vc41xuumx5z2rdma****,vsw-2vc41xuumx5z2rdma****	The IDs of the vSwitches. You can select one to three vSwitches when you create a cluster. We recommend that you select vSwitches in different zones to ensure high availability.
worker_ram_role_name	String	KubernetesWorkerRole-ec87d15b-edca-4302-933f-c8a16bf0****	The name of the Resource Access Management (RAM) role. The RAM role is assigned to the worker nodes that are created on Elastic Compute Service (ECS) instances.
zone_id	String	cn-beijing-b	The ID of the zone where the cluster is deployed.
page_info	object		The pagination details.
page_number	Integer	3	The page number of the returned page.
page_size	Integer	20	The number of entries returned per page.
total_count	Integer	50	The total number of entries returned.

Examples

Sample requests

```
GET /api/v1/clusters?name=cluster-demo&cluster_type=Kubernetes&page_size=10&page_number=3 HTTP/1.1
Content-Type:application/json
```

Sample success responses

`XML` format

```
HTTP/1.1 200 OK

Error codes

You can check further details of error codes. For more information, see Error codes.

3.1.3.1.5.2. DescribeClusterDetail

Queries the details of a specific Container Service cluster by the cluster ID.

Request syntax

```
GET /clusters/ClusterId HTTP/1.1
Content-Type:application/json
```

Request parameters

Request path parameters

Parameter	Type	Required	Example	Description
ClusterId	String	Yes	cdde1f21ae22e483ebcb068a6eb7f****	The ID of the cluster.

Response syntax

```
HTTP/1.1 200
Content-Type:application/json
{
  "cluster_id" : "String",
  "cluster_type" : "String",
  "created" : "String",
  "init_version" : "String",
  "current_version" : "String",
  "next_version" : "String",
  "deletion_protection" : Boolean,
  "docker_version" : "String",
  "external_loadbalancer_id" : "String",
  "meta_data" : "String",
  "name" : "String",
  "network_mode" : "String",
  "region_id" : "String",
  "resource_group_id" : "String",
  "security_group_id" : "String",
  "size" : Long,
  "state" : "String",
  "tags" : [ {
    "key" : "String",
    "value" : "String"
  } ],
  "updated" : "String",
  "vpc_id" : "String",
  "vswitch_id" : "String",
  "subnet_cidr" : "String",
  "zone_id" : "String",
  "master_url" : "String",
  "private_zone" : Boolean,
  "profile" : "String",
  "worker_ram_role_name" : "String",
}
```

Response parameters

Response body parameters

Parameter	Type	Example	Description
cluster_id	String	c82e6987e2961451182edacd74faf****	The ID of the cluster.
cluster_type	String	Kubernetes	The type of cluster. Valid values: • `Kubernetes`: dedicated Kubernetes cluster. • `ManagedKubernetes`: managed edge Kubernetes cluster.
created	String	2019-11-25T15:50:20+08:00	The time when the cluster was created.
init_version	String	1.16.6-aliyun.1	The Kubernetes version that is initially used by the cluster.
current_version	String	1.16.6-aliyun.1	The Kubernetes version of the cluster.
next_version	String	1.18.8-aliyun.1	The Kubernetes version to which the cluster can be upgraded.
deletion_protection	Boolean	true	Indicates whether deletion protection is enabled for the cluster. If deletion protection is enabled, the cluster cannot be deleted in the console or by calling API operations. Valid values: • `true`: Deletion protection is enabled for the cluster. This way, the cluster cannot be deleted in the console or by calling API operations. • `false`: Deletion protection is disabled for the cluster. You can delete the cluster in the console or by calling API operations.
docker_version	String	19.03.5	The Docker version that is used by the cluster.
external_loadbalancer_id	String	lb-2ze3buguz3gx9920z****	The ID of the Server Load Balancer (SLB) instance that is used for the Ingress of the cluster.
meta_data	String	\"Addons\":***	The metadata of the cluster.

Parameter	Type	Example	Description
name	String	cluster-demo	The name of the cluster. The name must be 1 to 63 characters in length, and can contain digits, letters, and hyphens (-). It cannot start with a hyphen.
network_mode	String	vpc	The network mode of the cluster. Valid values: • `classic`: classic network. • `vpc`: virtual private cloud (VPC). • `overlay`: overlay network. • `calico`: network powered by Calico. Default value: `vpc`.
region_id	String	cn-beijing	The ID of the region where the cluster is deployed.
resource_group_id	String	rg-acfmyvw3wjm****	The ID of the resource group to which the cluster belongs.
security_group_id	String	sg-25yq****	The ID of the security group to which the instances of the cluster belong.
size	Long	5	The number of nodes in the cluster. Master nodes and worker nodes are included.

Parameter	Type	Example	Description
state	String	running	The state of the cluster. Valid values: • `initial`: The cluster is being created. • `failed`: The cluster failed to be created. • `running`: The cluster is running. • `updating`: The cluster is being upgraded. • `updating_failed`: The cluster failed to be upgraded. • `scaling`: The cluster is being scaled. • `stopped`: The cluster is stopped. • `deleting`: The cluster is being deleted. • `deleted`: The cluster is deleted. • `delete_failed`: The cluster failed to be deleted.
tags	Array of tag		The labels of the cluster.
updated	String	2020-01-13T23:01:03+08:00	The time when the cluster was updated.
vpc_id	String	vpc-2zecuu62b9zw7a7qn****	The ID of the VPC where the cluster is deployed. This parameter is required when you create a cluster.
vswitch_id	String	vsw-2zete8s4qocqg0mf6****,vsw-2zete8s4qocqg0mf6****	The IDs of vSwitches. You can select one to three vSwitches when you create a cluster. We recommend that you select vSwitches in different zones to ensure high availability.
subnet_cidr	String	172.20.0.0/16	The pod CIDR block. It must be a valid and private CIDR block, and must be one of the following CIDR blocks or their subnets: • 10.0.0.0/8 • 172.16-31.0.0/12-16 • 192.168.0.0/16 The pod CIDR block cannot overlap with the CIDR block of the VPC or the CIDR blocks of the clusters in the VPC.

Parameter	Type	Example	Description
zone_id	String	cn-beijing-a	The ID of the zone where the cluster is deployed.
master_url	String	{\"intranet_api_server_endpoint\":\"https://192.168.0.251:6443\"***}	The address of the cluster. It includes an internal endpoint and a public endpoint.
private_zone	Boolean	false	Indicates whether Alibaba Cloud DNS PrivateZone is enabled. • `true`: indicates that Alibaba Cloud DNS PrivateZone is enabled. • `false`: indicates that Alibaba Cloud DNS PrivateZone is disabled.
profile	String	Default	Indicates the scenario in which the cluster is used. Valid values: • `Default`: indicates that the cluster is used in non-edge computing scenarios. • `Edge`: indicates that the cluster is used in edge computing scenarios.
worker_ram_role_name	String	KubernetesWorkerRole-ec87d15b-edca-4302-933f-c8a16bf0****	The name of the Resource Access Management (RAM) role. The RAM role is assigned to the worker nodes that are created on Elastic Compute Service (ECS) instances.

Examples

Sample requests

Error codes

You can check further details of error codes. For more information, see Error codes.

3.1.3.1.5.3. DescribeClusterResources

Queries all resources in a specified Container Service cluster.

Request syntax

```
GET /clusters/ClusterId/resources HTTP/1.1
Content-Type:application/json
```

Request parameters

Request path parameters

Parameter	Type	Required	Example	Description
ClusterId	String	Yes	cb95aa626a47740afbf6aa099b65****	The ID of the cluster.

Response syntax

```
HTTP/1.1 200
Content-Type:application/json
[ {
  "cluster_id" : "String",
  "created" : "String",
  "instance_id" : "String",
  "resource_info" : "String",
  "resource_type" : "String",
  "state" : "String"
} ]
```

Response parameters

Response body parameters

Parameter	Type	Example	Description
	Array		The list of resources in the cluster.
cluster_id	String	cb95aa626a47740afbf6aa099b65****	The ID of the cluster.
created	String	2020-09-11T10:11:54+08:00	The time when the resource was created.
instance_id	String	lb-wz9poz4r0ymh8u0uf****	The ID of the resource.
resource_info	String	{\"Id\":\"k8s_master_slb\",\"Name\":\"k8s_master_slb\",\"Type\":\"ALIYUN::SLB::LoadBalancer\",\"Status\":\"CREATE_COMPLETE\",\"StatusReason\":\"state changed\",\"Updated\":\"2020-05-21T13:25:02\",\"PhysicalId\":\"lb-wz9poz4r0ymh8u0uf****\"}	The information about the resource.

Parameter	Type	Example	Description
resource_type	String	ALIYUN::SLB::LoadBalancer	The type of resource.
state	String	CREATE_COMPLETE	The state of the resource. Valid values: • `CREATE_COMPLETE`: The resource is created. • `CREATE_FAILED`: The resource failed to be created. • `CREATE_IN_PROGRESS`: The resource is being created. • `DELETE_FAILED`: The resource failed to be deleted. • `DELETE_IN_PROGRESS`: The resource is being deleted. • `ROLLBACK_COMPLETE`: The resource is rolled back. • `ROLLBACK_FAILED`: The resource failed to be rolled back. • `ROLLBACK_IN_PROGRESS`: The resource is being rolled back.

Examples

Sample requests

```
GET /clusters/cb95aa626a47740afbf6aa099b65****/resources HTTP/1.1
Content-Type:application/json
```

Sample success responses

`XML` format

```
HTTP/1.1 200 OK
Content-Type:application/xml
<0>
    <cluster_id>cb95aa626a47740afbf6aa099b65****</cluster_id>

  "resource_type" : "ALIYUN::SLB::LoadBalancer",
  "state" : "CREATE_COMPLETE"
} ]
```

Error codes

You can check further details of error codes. For more information, see Error codes.

3.1.3.1.5.4. DescribeClusterNamespaces

Queries the namespaces of a specified cluster.

Request syntax

```
GET /k8s/ClusterId/namespaces HTTP/1.1
Content-Type:application/json
```

Request parameters

Request path parameters

Parameter	Type	Required	Example	Description
ClusterId	String	Yes	c68069cade53b4558924a924b415f****	The ID of the cluster.

Response syntax

```
HTTP/1.1 200 OK
Content-Type:application/json
[ "String" ]
```

Response parameters

Response body parameters

Parameter	Type	Example	Description

Parameter	Type	Example	Description
	Array of String	kube-system	The names of the namespaces.

Examples

```
GET /k8s/c68069cade53b4558924a924b415f****/namespaces HTTP/1.1
Host:cs.aliyuncs.com
Content-Type:application/json
```

Sample success responses

`XML` format

```
HTTP/1.1 200 OK
Content-Type:application/xml
<0>kube-system</0>
```

`JSON` format

```
HTTP/1.1 200 OK
Content-Type:application/json
[ "kube-system" ]
```

Error codes

You can check further details of error codes. For more information, see Error codes.

3.1.3.1.5.5. DescribeExternalAgent

Obtains the agent configurations of an external cluster that is registered in the Container Service console. You can deploy the agent configurations in an external cluster. This allows you to access the API server of the cluster.

Request syntax

```
GET /k8s/ClusterId/external/agent/deployment?PrivateIpAddress=String HTTP/1.1
Content-Type:application/json
```

Request parameters

Request path parameters

Parameter	Type	Required	Example	Description
ClusterId	String	Yes	c106f377e16f34eb1808d6b9362c9****	The ID of the cluster.

Request query parameters

Parameter	Type	Required	Example	Description
PrivateIpAddress	String	No	true	Specifies whether to obtain the credential that is used to access the internal network. • `true`: obtains the credential that is used to access the internal network. • `false`: obtains the credential that is used to access the Internet. Default value: `false`.

Response syntax

```
HTTP/1.1 200
Content-Type:application/json
{
  "config" : "String"
}
```

Response parameters

Response body parameters

Parameter	Type	Example	Description
config	String	apiVersion: v1****	The agent configurations in the YAML format.

Examples

Sample requests

```
GET /k8s/c106f377e16f34eb1808d6b9362c9****/external/agent/deployment?PrivateIpAddress=true
HTTP/1.1
Content-Type:application/json
```

Sample success responses

`XML` format

```
HTTP/1.1 200 OK
Content-Type:application/xml
<config>apiVersion: v1****</config>
```

`JSON` format

```
HTTP/1.1 200 OK
Content-Type:application/json
{
  "config" : "apiVersion: v1****"
}
```

3.1.3.1.5.6. DescribeUserQuota

Queries resource quotas.

Request parameter types

This operation uses only common request parameters. For more information, see the Common request parameters topic.

Request structure

```
http://provision.cs.aliyun-inc.com http
```

Request parameters

Response parameters

Parameter	Type	Example	Description
cluster_quota	Long	"20"	The quota of dedicated Kubernetes clusters. Default value: 20. To increase the quota, submit a ticket.
ask_cluster_quota	Long	3	The quota of serverless Kubernetes (ASK) clusters.
cluster_nodepool_quota	Long	"10"	The quota of node pools in an ACK cluster.
cluster_quota	Long	"50"	The quota of ACK clusters for all types.
node_quota	Long	"100"	The quota of nodes in an ACK cluster.

Examples

Sample requests

```
GET /quota HTTP/1.1
Common request parameters
```

Sample success responses

`XML` format

```
<amk_cluster_quota>20</amk_cluster_quota>
<cluster_nodepool_quota>10</cluster_nodepool_quota>
<cluster_quota>50</cluster_quota>
<node_quota>100</node_quota>
<ask_cluster_quota>3</ask_cluster_quota>
```

`JSON` format

```
{
    "amk_cluster_quota": "20",
    "cluster_nodepool_quota": "10",
    "cluster_quota": "50",
    "node_quota": "100",
    "ask_cluster_quota": "3"
}
```

Error codes

You can check further details of error codes. For a list of error codes, visit the Error codes.

3.1.3.1.5.7. DescribeClusterLogs

Queries the logs of a specified Container Service cluster.

Request syntax

```
GET /clusters/ClusterId/logs HTTP/1.1
Content-Type:application/json
```

Request parameters

Request path parameters

Parameter	Type	Required	Example	Description
ClusterId	String	Yes	c106f377e16f34eb1808d6b9362c9****	The ID of the cluster.

Response syntax

```
HTTP/1.1 200
Content-Type:application/json
[ {
  "ID" : Long,
  "cluster_id" : "String",
  "cluster_log" : "String",
  "log_level" : "String",
  "created" : "String",
  "updated" : "String"
} ]
```

Response parameters

Response body parameters

Parameter	Type	Example	Description
	Array		The list of the returned logs.
ID	Long	590749245	The ID of the log.
cluster_id	String	c23421cfa74454bc8b37163fd19af***	The ID of the cluster.
cluster_log	String	start to update cluster status to CREATE_COMPLETE	The content of the log.
log_level	String	0004	The level of the log.
created	String	2020-09-11T10:11:51+08:00	The time when the log was generated.
updated	String	2020-09-11T10:11:51+08:00	The time when the log was updated.

Examples

Sample requests

```
GET /clusters/c106f377e16f34eb1808d6b9362c9****/logs HTTP/1.1
Content-Type:application/json
```

Sample success responses

`XML` format

```
HTTP/1.1 200 OK
Content-Type:application/xml
<0>
    <ID>590749245</ID>
    <cluster_id>c23421cfa74454bc8b37163fd19af***</cluster_id>

```

Error codes

You can check further details of error codes. For more information, see Error codes.

3.1.3.1.5.8. DescribeKubernetesVersionMetadata

Queries the details of a Container Service for Kubernetes (ACK) cluster version.

Request parameter types

This operation uses only common request parameters. For more information, see the Common request parameters topic.

Request structure

```
get /api/v1/metadata/versions http|https
```

Request parameters

Parameter	Type	Required	Example	Description
Region	String	Yes	cn-beijing	The ID of the region where the ACK cluster is deployed.

Parameter	Type	Required	Example	Description
MultiAZ	Boolean	No	false	Specifies whether to query a multi-zone ACK cluster.
ClusterType	String	Yes	Kubernetest	The type of ACK cluster. Valid values:
KubernetesVersion	String	No	1.16.9-aliyun.1	The version of the ACK cluster, such as 1.16.9-aliyun.1.
Profile	String	No	Default	The identifier of an edge cluster. • Default: The ACK cluster is not an edge cluster. • Edge: The ACK cluster is an edge cluster.

Response parameters

Parameter	Type	Example	Description
	Array of data		The returned data.
capabilities	Object	N/A	The features of the ACK cluster version.
images	Array		The system images of the Elastic Compute Service (ECS) instances.
image_id	String	"centos_7_7_x64_20G_alibase_20200426.vhd"	The ID of the snapshot.
image_name	String	"CentOS 7.7"	The name of the image.
image_type	String	"centos_7_7_2"	The type of image.
os_type	String	"Linux"	The type of operating system. Valid values: Windows and Linux. Default value: Linux.
os_version	String	"7.7"	The version number of the operating system.

Parameter	Type	Example	Description
platform	String	"CentOS"	The release version of the operating system. Valid values: CentOS, AliyunLinux, Windows, and WindowsCore.
meta_data	Object	N/A	The metadata of the ACK cluster version.
multi_az	String	"false"	Indicates whether the ACK cluster is a multi-zone cluster.
runtimes	Array		The configuration of the container runtime.
name	String	"docker"	The name of the container runtime.
version	String	"19.05.3"	The version of the container runtime.
version	String	"1.16.9-aliyun.1"	The version of the ACK cluster.

Examples

Sample requests

```
GET /api/v1/metadata/versions HTTP/1.1
{
    "Region":"cn-beijing",
    "ClusterType":"Kubernetes",
    "MultiAZ":false,
    "KubernetestVersion":"1.16.9-aliyun.1"
}
```

Sample success responses

`XML` format

```
<0>
    <version>1.14.8-aliyun.1</version>
    <multi_az>false</multi_az>
    <capabilities>
        <VpcCidr>192.168.0.0/16</VpcCidr>
        <ZoneId/>
    </capabilities>
    <meta_data>
        <KubernetesVersion>1.14.8-aliyun.1</KubernetesVersion>
    </meta_data>
    <runtimes>
        <name>docker</name>
        <version>19.03.5</version>
    </runtimes>
    <images>

                "os_type":"Linux",
                "os_version":"7.7"
            }
        ]
    }
]
```

Error codes

You can check further details of error codes. For a list of error codes, visit the Error codes.

3.1.3.1.6. Modify

3.1.3.1.6.1. ModifyCluster

Modifies the configurations of a specified Container Service cluster.

Request syntax

```
PUT /api/v2/clusters/ClusterId HTTP/1.1
Content-Type:application/json
{
  "api_server_eip" : Boolean,
  "api_server_eip_id" : "String",
  "deletion_protection" : Boolean,
  "instance_deletion_protection" : Boolean,
  "ingress_domain_rebinding" : "String",
  "ingress_loadbalancer_id" : "String",
  "resource_group_id" : "String",
}
```

Request parameters

Request path parameters

Parameter	Type	Required	Example	Description
ClusterId	String	Yes	cb95aa626a47740afbf6aa099b65****	The ID of the cluster.

Request body parameters

Parameter	Type	Required	Example	Description
api_server_eip	Boolean	No	true	Specifies whether to associate an elastic IP address (EIP) with the cluster API server. This enables Internet access for the cluster. Valid values: • `true`: associates an EIP with the cluster API server. • `false`: does not associate an EIP with the cluster API server.
api_server_eip_id	String	No	eip-wz9fnasl6dsfhmvci****	The ID of the EIP that you want to associate with the cluster API server. The parameter takes effect only if `api_server_eip` is set to `true`.

Parameter	Type	Required	Example	Description
deletion_protection	Boolean	No	true	Specifies whether to enable deletion protection for the cluster. After deletion protection is enabled, the cluster cannot be deleted in the console or by calling API operations. Valid values: • `true`: enables deletion protection for the cluster. This way, the cluster cannot be deleted in the console or by calling API operations. • `false`: disables deletion protection for the cluster. This way, the cluster can be deleted in the console or by calling API operations. Default value: `false`.
instance_deletion_protection	Boolean	No	true	Specifies whether to enable deletion protection for the nodes in the cluster. If deletion protection is enabled, the nodes in the cluster cannot be deleted in the console or by calling API operations. Valid values: • `true`: The nodes in the cluster cannot be deleted in the console or by calling API operations. • `false`: The nodes in the cluster can be deleted in the console or by calling API operations. Default value: `false`.
ingress_domain_rebinding	String	No	true	Specifies whether to remap the test domain name of the cluster. Valid values: • `true`: remaps the test domain name of the cluster. • `false`: does not remap the test domain name of the cluster. Default value: `false`.

Parameter	Type	Required	Example	Description
ingress_loadbalancer_id	String	No	lb-wz97kes8tnndkpodw****	The ID of the Server Load Balancer (SLB) instance that is associated with the cluster.
resource_group_id	String	No	rg-acfmyvw3wjm****	The ID of the resource group to which the cluster belongs.

Response syntax

```
HTTP/1.1 200
Content-Type:application/json
{
  "cluster_id" : "String",
  "request_id" : "String",
  "task_id" : "String"
}
```

Response parameters

Response body parameters

Parameter	Type	Example	Description
cluster_id	String	cb95aa626a47740afbf6aa09****	The ID of the cluster.
request_id	String	687C5BAA-D103-4993-884B-C35E4314****	The ID of the request.
task_id	String	T-5a54309c80282e39ea00****	The ID of the task.

Examples

Sample requests

```
PUT /api/v2/clusters/cb95aa626a47740afbf6aa099b65**** HTTP/1.1
Content-Type:application/json
{
  "api_server_eip" : true,
  "api_server_eip_id" : "eip-wz9fnasl6dsfhmvci****",
  "deletion_protection" : true,
  "instance_deletion_protection" : true,
  "ingress_domain_rebinding" : "true",
  "ingress_loadbalancer_id" : "lb-wz97kes8tnndkpodw****",
  "resource_group_id" : "rg-acfmyvw3wjm****",
}
```

Sample success responses

`XML` format

```
HTTP/1.1 200 OK
Content-Type:application/xml
<cluster_id>cb95aa626a47740afbf6aa09****</cluster_id>
<request_id>687C5BAA-D103-4993-884B-C35E4314****</request_id>
<task_id>T-5a54309c80282e39ea00****</task_id>
```

`JSON` format

```
HTTP/1.1 200 OK
Content-Type:application/json
{
  "cluster_id" : "cb95aa626a47740afbf6aa09****",
  "request_id" : "687C5BAA-D103-4993-884B-C35E4314****",
  "task_id" : "T-5a54309c80282e39ea00****"
}
```

Error codes

You can check further details of error codes. For more information, see Error codes.

3.1.3.1.6.2. ModifyClusterTags

Modifies the labels of a specified Container Service cluster.

Request syntax

```
POST /clusters/ClusterId/tags HTTP/1.1
Content-Type:application/json
[ {
  "key" : "String",
  "value" : "String"
} ]
```

Request parameters

Request path parameters

Parameter	Type	Required	Example	Description
ClusterId	String	Yes	c106f377e16f34eb1808d6b9362c9****	The ID of the cluster.

Request body parameters

Parameter	Type	Required	Example	Description
	Array of tag	No		The data of the labels that you want to modify.

Response syntax

```
HTTP/1.1 200 OK
```

Response parameters

No response parameters.

Examples

Sample requests

```
POST /clusters/c106f377e16f34eb1808d6b9362c9****/tags HTTP/1.1
Content-Type:application/json
[ {
  "key" : "env",
  "value" : "prod"
} ]
```

Sample success responses

`JSON` format

```
HTTP/1.1 200 OK
```

Error codes

You can check further details of error codes. For more information, see Error codes.

3.1.3.1.7. Upgrade

3.1.3.1.7.1. UpgradeCluster

Upgrades a specified Container Service cluster.

Request syntax

```
POST /api/v2/clusters/ClusterId/upgrade HTTP/1.1
Content-Type:application/json
{
  "component_name" : "String",
  "next_version" : "String",
  "version" : "String"
}
```

Request parameters

Request path parameters

Parameter	Type	Required	Example	Description
ClusterId	String	Yes	c82e6987e2961451182edacd74faf****	The ID of the cluster.

Request body parameters

Parameter	Type	Required	Example	Description
component_name	String	No	k8s	The name of the component. Set the value to `k8s`.
next_version	String	No	1.16.9-aliyun.1	The Kubernetes version to which the cluster can be upgraded.
version	String	No	1.14.8-aliyun.1	The Kubernetes version of the cluster.

Response syntax

```
HTTP/1.1 200 OK
```

Response parameters

No response parameters.

Examples

Sample requests

```
POST /api/v2/clusters/c82e6987e2961451182edacd74faf****/upgrade HTTP/1.1
Content-Type:application/json
{
  "component_name" : "k8s",
  "next_version" : "1.16.9-aliyun.1",
  "version" : "1.14.8-aliyun.1"
}
```

Sample success responses

`JSON` format

```
HTTP/1.1 200 OK
```

Error codes

You can check further details of error codes. For more information, see Error codes.

3.1.3.1.7.2. GetUpgradeStatus

Queries the upgrade status of a specified Container Service cluster.

Request syntax

```
GET /api/v2/clusters/ClusterId/upgrade/status HTTP/1.1
Content-Type:application/json
```

Request parameters

Request path parameters

Parameter	Type	Required	Example	Description
ClusterId	String	Yes	c106f377e16f34eb1808d6b9362c9****	The ID of the cluster.

Response syntax

```
HTTP/1.1 200
Content-Type:application/json
{
  "error_message" : "String",
  "precheck_report_id" : "String",
  "status" : "String",
  "upgrade_step" : "String",
  "upgrade_task" : {
    "status" : "String",
    "message" : "String"
  }
}
```

Response parameters

Response body parameters

Parameter	Type	Example	Description
error_message	String	subject to actual return	The error message returned during the upgrade.
precheck_report_id	String	be4c8eb72de94d459ea7ace7c811d119	The ID of the precheck report.
status	String	running	The state of the upgrade.
upgrade_step	String	prechecking	The current phase of the upgrade.
upgrade_task	object		The details of the upgrade task.
status	String	running	The state of the upgrade task.
message	String	subject to actual return	The description of the upgrade task.

Examples

Sample requests

```
GET /api/v2/clusters/c106f377e16f34eb1808d6b9362c9****/upgrade/status HTTP/1.1
Content-Type:application/json
```

Sample success responses

`XML` format

```
HTTP/1.1 200 OK
Content-Type:application/xml
<error_message>subject to actual return</error_message>
<precheck_report_id>be4c8eb72de94d459ea7ace7c811d119</precheck_report_id>
<status>running</status>
<upgrade_step>prechecking</upgrade_step>
<upgrade_task>
    <status>running</status>
    <message>subject to actual return</message>
</upgrade_task>
```

`JSON` format

```
HTTP/1.1 200 OK
Content-Type:application/json
{
  "error_message" : "subject to actual return",
  "precheck_report_id" : "be4c8eb72de94d459ea7ace7c811d119",
  "status" : "running",
  "upgrade_step" : "prechecking",
  "upgrade_task" : {
    "status" : "running",
    "message" : "subject to actual return"
  }
}
```

Error codes

You can check further details of error codes. For more information, see Error codes.

3.1.3.1.7.3. PauseClusterUpgrade

Suspends the upgrade of a specified Container Service cluster.

Request syntax

```
POST /api/v2/clusters/ClusterId/upgrade/pause HTTP/1.1
Content-Type:application/json
```

Request parameters

Request path parameters

Parameter	Type	Required	Example	Description
ClusterId	String	Yes	c82e6987e2961451182edacd74faf****	The ID of the cluster.

Response syntax

```
HTTP/1.1 200 OK
```

Response parameters

No response parameters.

Examples

Sample requests

```
POST /api/v2/clusters/c82e6987e2961451182edacd74faf****/upgrade/pause HTTP/1.1
Content-Type:application/json
```

Sample success responses

`JSON` format

```
HTTP/1.1 200 OK
```

Error codes

You can check further details of error codes. For more information, see Error codes.

3.1.3.1.7.4. CancelClusterUpgrade

Cancels the upgrade of a specified Container Service cluster.

Request syntax

```
POST /api/v2/clusters/ClusterId/upgrade/cancel HTTP/1.1
Content-Type:application/json
```

Request parameters

Request path parameters

Parameter	Type	Required	Example	Description
ClusterId	String	Yes	c106f377e16f34eb1808d6b9362c9****	The ID of the cluster.

Response syntax

```
HTTP/1.1 200 OK
```

Response parameters

No response parameters.

Examples

Sample requests

```
POST /api/v2/clusters/c106f377e16f34eb1808d6b9362c9****/upgrade/cancel HTTP/1.1
Content-Type:application/json
```

Sample success responses

`JSON` format

```
HTTP/1.1 200 OK
```

Error codes

You can check further details of error codes. For more information, see Error codes.

3.1.3.1.7.5. ResumeUpgradeCluster

Resumes the upgrade of a specified Container Service cluster.

Request syntax

```
POST /api/v2/clusters/ClusterId/upgrade/resume HTTP/1.1
Content-Type:application/json
```

Request parameters

Request path parameters

Parameter	Type	Required	Example	Description
ClusterId	String	Yes	c82e6987e2961451182edacd74faf****	The ID of the cluster.

Response syntax

```
HTTP/1.1 200 OK
```

Response parameters

No response parameters.

Examples

Sample requests

```
POST /api/v2/clusters/c82e6987e2961451182edacd74faf****/upgrade/resume HTTP/1.1
Content-Type:application/json
```

Sample success responses

`JSON` format

```
HTTP/1.1 200 OK
```

Error codes

You can check further details of error codes. For more information, see Error codes.

3.1.3.2. Nodes

3.1.3.2.1. DescribeClusterNodes

Queries information about the nodes in a specified Container Service cluster.

Request headers

This operation uses only common request headers. For more information, see the Common request parameters topic.

Request syntax

```
get /clusters/{ClusterId}/nodes http|https
```

Request parameters

Parameter	Type	Required	Example	Description
ClusterId	String	Yes	c82e6987e2961451182edacd74faf****	The ID of the cluster.
pageSize	String	No	3	The number of entries to return on each page.
pageNumber	String	No	50	The number of the page to return.
nodepool_id	String	No	np***	The ID of the node pool.
state	String	No	all	The state of the nodes in the cluster. You can filter the nodes by state. Valid values: • all: Query all nodes in the cluster. • running: Query nodes that are running in the cluster. • removing: Query nodes that are being removed from the cluster. • initial: Query nodes that are initializing in the cluster. • failed: Query nodes that failed to be created in the cluster.

Response

Parameter	Type	Example	Description
nodes	Array of node		The details of the nodes in the cluster.

Parameter	Type	Example	Description
creation_time	String	"2020-08-25T11:25:35+08:00"	The time when the node was created.
error_message	String	"***"	The error message generated when the node was created.
expired_time	String	"2099-12-31T23:59:00+08:00"	The expiration time of the node.
host_name	String	"iZ2vcckdmxp7u0urj2k****"	The name of the host.
image_id	String	"aliyun_2_1903_x64_20G_alibase_20200529.vhd"	The ID of the system image that is used by the node.
instance_charge_type	String	"PostPaid"	The billing method of the node.
instance_id	String	"i-2vcckdmxp7u0urj2k2rw"	The ID of the Elastic Compute Service (ECS) instance on which the node is created.
instance_name	String	"worker-k8s-for-cs-c5cdf7e3938bc4f8eb0e44b21a80f****"	The name of the node.
instance_role	String	"Worker"	The type of node. Valid values: • Master: master node. • Worker: worker node.
instance_status	String	"Running"	The state of the node.
instance_type	String	"ecs.c5.xlarge"	The instance type of the node.
instance_type_family	String	"ecs.c5"	The ECS instance family of the node.
ip_address	Array of String		The IP address of the node.
is_aliyun_node	Boolean	"true"	Indicates whether the instance is provided by Alibaba Cloud.

Parameter	Type	Example	Description
node_name	String	"cn-chengdu.192.168.0.36"	The name of the node. This name is the identifier of the node in the cluster.
node_status	String	"Ready"	Indicates whether the node is ready.
nodepool_id	String	"np0794239424a84eb7a95327369d56****"	The ID of the node pool to which the node belongs.
source	String	"ess_attach"	The source of the node. You can add a node to a cluster in the Container Service console or Resource Orchestration Service (ROS) console.
state	String	"running"	The state of the node.
page	Object		The pagination details.
page_number	Integer	"1"	The page number of the returned page.
page_size	Integer	"10"	The number of entries returned per page.
total_count	Integer	"5"	The total number of entries returned.

Example

Sample requests

```
GET /clusters/[ClusterId]/nodes HTTP/1.1
Common request headers
{
    "ClusterId":" c82e6987e2961451182edacd74faf****"
}
```

Sample success responses

`XML` format

```
<nodes>
    <creation_time>2020-08-25T11:25:35+08:00</creation_time>
    <error_message/>
    <instance_name>worker-k8s-for-cs-c5cdf7e3938bc4f8eb0e44b21a80f****</instance_name>
    <node_status>Ready</node_status>
    <is_aliyun_node>true</is_aliyun_node>
    <node_name>cn-chengdu.192.168.0.36</node_name>
    <expired_time>2099-12-31T23:59:00+08:00</expired_time>
    <ip_address>192.168.0.36</ip_address>
    <source>ess_attach</source>
    <instance_type_family>ecs.c5</instance_type_family>
    <instance_id>i-2vcckdmxp7u0urj2k2rw</instance_id>
    <instance_charge_type>PostPaid</instance_charge_type>
    <instance_role>Worker</instance_role>
    <instance_status>Running</instance_status>
    <state>running</state>

Error codes

You can check further details of error codes. For more information, see Error codes.

3.1.3.2.2. RemoveClusterNodes

Removes nodes from a specified Container Service cluster.

> **Note**
>
> - When you remove a node, the pods that run on the node are migrated to other nodes. This may cause service interruptions. We recommend that you remove nodes during off-peak hours.
> - Unknown errors may occur when you remove nodes. Before you remove nodes, we recommend that you back up the data of these nodes.
> - Nodes remain in the Unschedulable state when they are being removed.
> - You can remove only worker nodes by calling this operation.

Request headers

This operation uses only common request headers. For more information, see Common parameters.

Request syntax

```
POST /api/v2/clusters/{ClusterId}/nodes/remove
```

Request parameters

Parameter	Type	Location	Required	Example	Description
ClusterId	String	Path	Yes	c82e6987e2961451182edacd74faf****	The ID of the cluster.
	Object	Body	No		Specifies whether to release the Elastic Compute Service (ECS) instances when they are removed from the cluster.
drain_node	Boolean	Body	No	true	Specifies whether to remove all pods from the nodes that you want to remove.
nodes	Array of String	Body	Yes	cn-shenzhen.10.1.0.1	The names of the nodes that you want to remove.
release_node	Boolean	Body	No	false	Specifies whether to release the ECS instances when they are removed from the cluster.

Examples

Sample requests

```
POST /api/v2/clusters/c82e6987e2961451182edacd74faf****/nodes/remove
Common request headers
{
    "release_node":false,
    "nodes":[
        "cn-shenzhen.192.168.x.x"
    ],
    "drain_node":false
}
```

Error codes

You can check further details of error codes. For more information, see Error codes.

3.1.3.2.3. AttachInstances

Adds existing Elastic Compute Service (ECS) instances to a specified Container Service cluster.

Request syntax

```
POST /clusters/ClusterId/attach HTTP/1.1
Content-Type:application/json
{
  "instances" : [ "String" ],
  "key_pair" : "String",
  "password" : "String",
  "format_disk" : Boolean,
  "keep_instance_name" : Boolean,
  "is_edge_worker" : Boolean,
  "nodepool_id" : "String",
  "image_id" : "String",
  "cpu_policy" : "String",
  "user_data" : "String",
  "rds_instances" : [ "String" ],
  "runtime" : {
    "name" : "String",
    "version" : "String"
  },
  "tags" : [ {
    "key" : "String",
    "value" : "String"
  } ]
}
```

Request parameters

Request path parameters

Parameter	Type	Required	Example	Description
ClusterId	String	Yes	c106f377e16f34eb1808d6b9362c9****	The ID of the cluster.

Request body parameters

Parameter	Type	Required	Example	Description
instances	Array of String	Yes	i-2zed0sswuau6o89b****	The IDs of the ECS instances that you want to add.

Parameter	Type	Required	Example	Description
key_pair	String	Yes	secrity-key	The name of the key pair that is used to log to the ECS instances. You must set this parameter or the `login_password` parameter.
password	String	Yes	Hello1234	The Secure Shell (SSH) logon password that is used to log on to the ECS instances. You must set this parameter or the `key_pair` parameter. The password must be 8 to 30 characters in length, and must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. It cannot contain backward slashes (\) or double quotation marks ("). For security considerations, the password is encrypted during data transfer.

Parameter	Type	Required	Example	Description
format_disk	Boolean	No	false	Specifies whether to store the data of containers and images on a data disk. Valid values: • `true`: stores the data of containers and images on a data disk. • `false`: does not store the data of containers and images on a data disk. Default value: `false`. How to mount a data disk: • If the ECS instances have data disks mounted and the file system of the last data disk is not initialized, the system automatically formats the data disk to ext4. Then, the system mounts the data disk to /var/lib/docker and /var/lib/kubelet. • The system does not create and mount a new data disk if no data disk has been mounted to the ECS instances. **Note** If you mount a data disk to the ECS instances and write data to the data disk, the original data on the disk is erased. Back up data before you mount a data disk.
keep_instance_name	Boolean	No	true	Specifies whether to retain the names of the ECS instances. Valid values: • `true`: retains the instances names. • `false`: does not retain the instance names. Default value: `true`.

Parameter	Type	Required	Example	Description
is_edge_worker	Boolean	No	false	Specifies whether the instances that you want to add are Edge Node Service (ENS) nodes. Valid values: • `true`: The instances that you want to add are ENS nodes. • `false`: The instances that you want to add are not ENS nodes. Default value: `false`. **Note**: If the instances that you want to add are ENS nodes, you must set this parameter to `true`. This allows you to identify these ENS nodes.
nodepool_id	String	No	np615c0e0966124216a0412e10afe0****	The ID of the node pool to which the instances are added. If you do not set this parameter, the instances are added to a default node pool.
image_id	String	No	aliyun_2_1903_x64_20G_alibase_20200529.vhd	The ID of the custom image. If you do not set this parameter, the default system image is used. **Note**: If you specify a custom image, the custom image is used to deploy the operating systems on the system disks of the instances.

Parameter	Type	Required	Example	Description
cpu_policy	String	No	none	The CPU policy. The following policies are supported if the cluster version is 1.12.6 or later. • `static`: This policy allows pods with specific resource characteristics on the node to be granted with enhanced CPU affinity and exclusivity. • `none`: This policy indicates that the default CPU affinity is used. Default value: `none`.
user_data	String	No	IyEvdXNyL2Jpbi9iYXNoCmVjaG8gIkhlbGxvIEFDSyEi	The user-defined data. For more information, see the *User-defined data* chapter in the *ECS* documentation.
rds_instances	Array of String	No	rm-67yawhau****	The IDs of the Relational Database Service (RDS) instances.
runtime	runtime	No		The container runtime.
tags	Array of tag	No		The labels to be added to nodes. Labeling rules: • Each label consists of a case-sensitive key-value pair. You can add up to 20 labels. • When you add a label, you must specify a unique key but you can leave the value empty. A key cannot exceed 64 characters in length and a value cannot exceed 128 characters in length. Keys and values cannot start with `aliyun`, `acs:`, `https://`, or `http://`.

Response syntax

```
HTTP/1.1 200
Content-Type:application/json
{
  "list" : [ {
    "code" : "String",
    "instanceId" : "String",
    "message" : "String"
  } ],
  "task_id" : "String"
}
```

Response parameters

Response body parameters

Parameter	Type	Example	Description
list	Array of list		The details of the added instances.
code	String	200	The code that indicates the task result.
instanceId	String	i-2ze0lgm3y6iylcbt****	The IDs of the added ECS instances.
message	String	successful	Indicates whether the ECS instances are added to the specified cluster.
task_id	String	T-5a544aff80282e39ea000039	The ID of the task.

Examples

Sample requests

```
POST /clusters/c106f377e16f34eb1808d6b9362c9****/attach HTTP/1.1
Content-Type:application/json
{
  "instances" : [ "i-2zed0sswuau6o89b****" ],
  "key_pair" : "secrity-key",
  "password" : "Hello1234",
  "format_disk" : false,
  "keep_instance_name" : true,
  "is_edge_worker" : false,
  "nodepool_id" : "np615c0e0966124216a0412e10afe0****",
  "image_id" : "aliyun_2_1903_x64_20G_alibase_20200529.vhd",
  "cpu_policy" : "none",
  "user_data" : "IyEvdXNyL2Jpbi9iYXNoCmVjaG8gIkhlbGxvIEFDSyEi",
  "rds_instances" : [ "rm-67yawhau****" ],
  "runtime" : {
    "name" : "docker",
    "version" : "19.03.5"
  },
  "tags" : [ {
    "key" : "env",
    "value" : "prod"
  } ]
}
```

Sample success responses

`XML` format

```
HTTP/1.1 200 OK
Content-Type:application/xml
<list>
    <code>200</code>
    <instanceId>i-2ze0lgm3y6iylcbt****</instanceId>
    <message>successful</message>
</list>
<task_id>T-5a544aff80282e39ea000039</task_id>
```

`JSON` format

```
HTTP/1.1 200 OK
Content-Type:application/json
{
  "list" : [ {
    "code" : "200",
    "instanceId" : "i-2ze0lgm3y6iylcbt****",
    "message" : "successful"
  } ],
  "task_id" : "T-5a544aff80282e39ea000039"
}
```

Error codes

You can check further details of error codes. For more information, see Error codes.

3.1.3.2.4. DescribeClusterAttachScripts

Adds an existing instance to a specified Container Service cluster. This operation returns a unique executable script. You can run this script on an existing instance to add the instance to the specified cluster.

Request syntax

```
POST /clusters/ClusterId/attachscript HTTP/1.1
Content-Type:application/json
{
  "nodepool_id" : "String",
  "format_disk" : Boolean,
  "keep_instance_name" : Boolean,
  "rds_instances" : [ "String" ],
  "arch" : "String",
  "options" : "String"
}
```

Request parameters

Request path parameters

Parameter	Type	Required	Example	Description
ClusterId	String	Yes	ca375a93a3047 4552ad2a0ebe1 83e****	The ID of the cluster.

Request body parameters

Parameter	Type	Required	Example	Description
nodepool_id	String	No	np1c9229d9be2 d432c93f77a88f ca0****	The ID of the node pool to which the existing instance is added. You can specify this parameter to add the existing instance to a specific node pool.

Parameter	Type	Required	Example	Description
format_disk	Boolean	No	false	Specifies whether to mount data disks to the existing instance when the instance is added to the cluster. You can add data disks to store the data of containers and images. Valid values: • `true`: mounts data disks to the existing instance. If you mount a data disk to the instance and write data to the data disk, the original data on the disk is erased. Back up data before you mount a data disk. • `false`: does not mount data disks to the existing instance. Default value: `false`. How to mount a data disk: • If the existing Elastic Compute Service (ECS) instance has data disks mounted and the file system of the last data disk is not initialized, the system automatically formats the data disk to ext4. Then, the system mounts the data disk to /var/lib/docker and /var/lib/kubelet. • The system does not create and mount a new data disk if no data disk has been mounted to the ECS instance.
keep_instance_name	Boolean	No	true	Specifies whether to retain the name of the existing instance when the instance is added to the cluster. If you do not retain the instance name, the instance is named in the `worker-k8s-for-cs-<clusterid>` format. Valid values: • `true`: retains the instance name. • `false`: does not retain the instance name. Default value: `true`.

Parameter	Type	Required	Example	Description
rds_instances	Array of String	No	rm-xxx	The names of the Relational Database Service (RDS) instances.
arch	String	No	amd64	The CPU architecture of the node. Valid values: `amd64`, `arm`, and `arm64`. Default value: `amd64`. **Note** This parameter is required if the existing instance is added to a managed edge Kubernetes cluster.
options	String	No	{\"enableIptables\": true,\"manageRuntime\": true,\"quiet\": true,\"allowedClusterAddons\": [\"kube-proxy\",\"flannel\",\"coredns\"]}	The connection configurations of the existing instance that you want to add. **Note** This parameter is required if the existing instance is added to a managed edge Kubernetes cluster.

Response syntax

```
HTTP/1.1 200
Content-Type:application/json
{
  "result" : "String"
}
```

Response parameters

Response body parameters

Parameter	Type	Example	Description

Parameter	Type	Example	Description
	String	"wget http://aliacs-k8s-cn-hangzhou.oss-cn-hangzhou.aliyuncs.com/public/pkg/run/attach/1.12.6-aliyunedge.1/edgeadm -O edgeadm; chmod u+x edgeadm; ./edgeadm join --openapi-token=XXX --node-spec="{\"flannelIface\":\"eth0\",\"enableIptables\":true,\"assumeYes\":true,\"manageRuntime\":true,\"nodeNameStrategy\":\"hostname\",\"enabledAddons\":[\"kube-proxy\",\"flannel\",\"coredns\"]}""	The returned script that is used to add an existing instance to the specified cluster.

Examples

Sample requests

```
POST /clusters/ca375a93a30474552ad2a0ebe183e****/attachscript HTTP/1.1
Content-Type:application/json
{
  "nodepool_id" : "np1c9229d9be2d432c93f77a88fca0****",
  "format_disk" : false,
  "keep_instance_name" : true,
  "rds_instances" : [ "rm-xxx" ],
  "arch" : "amd64",
  "options" : "{\\\"enableIptables\\\": true,\\\"manageRuntime\\\": true,\\\"quiet\\\": true,\\\"allowedClusterAddons\\\": [\\\"kube-proxy\\\",\\\"flannel\\\",\\\"coredns\\\"]}"
}
```

Description of the sample request

```
When you add an existing instance to a managed edge Kubernetes cluster, you must set option
s and arch. The following content describes the parameters of options:
```
{
    "options":"{
        "allowedClusterAddons": The name of the component.
        "enableIptables": Specifies whether to enable iptables. Default value: true.
        "flannelIface": the network interface controller (NIC) that is used by the Flannel
plug-in. By default, this parameter is set to the name of the NIC that is specified in the
default route entry of the node.
        "gpuVersion": Specifies whether the node to be added is a GPU-accelerated node. By
default, this parameter is empty. Valid values: Nvidia_Tesla_T4, Nvidia_Tesla_P4, and Nvidi
a_Tesla_P100.
        "manageRuntime": Specifies whether to use edgeadm to install and check the runtime.
Default value: false.
        "nodeNameOverride": Specifies how the node is named. A pair of quotation marks ("")
indicates the host name is used as the node name. This is the default value. An asterisk (*
) indicates that a random string that contains six characters is used as the node name.The
string "*.XXX" indicates that a random string that is followed by a suffix is used as the n
ode name. The random string contains six characters.
        "quiet": Specifies whether to enable the silent installation mode.
    }
}
```
```

Sample success responses

`XML` format

```
HTTP/1.1 200 OK
Content-Type:application/xml
<result>"wget http://aliacs-k8s-cn-hangzhou.oss-cn-hangzhou.aliyuncs.com/public/pkg/run/att
ach/1.12.6-aliyunedge.1/edgeadm -O edgeadm; chmod u+x edgeadm; ./edgeadm join --openapi-tok
en=XXX --node-spec="{\"flannelIface\":\"eth0\",\"enableIptables\":true,\"assumeYes\":true,\
"manageRuntime\":true,\"nodeNameStrategy\":\"hostname\",\"enabledAddons\":[\"kube-proxy\",\
"flannel\",\"coredns\"]}""</result>
```

`JSON` format

```
HTTP/1.1 200 OK
Content-Type:application/json
{
  "result" : "\"wget http://aliacs-k8s-cn-hangzhou.oss-cn-hangzhou.aliyuncs.com/public/pkg/
run/attach/1.12.6-aliyunedge.1/edgeadm -O edgeadm; chmod u+x edgeadm; ./edgeadm join --open
api-token=XXX --node-spec=\"{\\\"flannelIface\\\":\\\"eth0\\\",\\\"enableIptables\\\":true,
\\\"assumeYes\\\":true,\\\"manageRuntime\\\":true,\\\"nodeNameStrategy\\\":\\\"hostname\\\"
,\\\"enabledAddons\\\":[\\\"kube-proxy\\\",\\\"flannel\\\",\\\"coredns\\\"]}\"\""
}
```

Description of the sample response

```
If the cluster is not a managed edge Kubernetes cluster, the following script is returned:
"curl http://aliacs-k8s-cn-chengdu.oss-cn-chengdu-internal.aliyuncs.com/public/pkg/run/attach/1.16.9-aliyun.1/attach_node.sh | bash -s -- --node-name-mode nodeip --cms-enabled --cms-version 1.3.7 --openapi-token **** --addon-names flannel,csi-plugin,csi-provisioner,logtail-ds,ack-node-problem-detector,nginx-ingress-controller,kube-flannel-ds --cpu-policy none --node-cidr-mask 26 --node-port-range 30000-32767 --runtime docker --runtime-version 19.03.5"
If the cluster is a managed edge Kubernetes cluster, the following script is returned:
"wget http://aliacs-k8s-cn-hangzhou.oss-cn-hangzhou.aliyuncs.com/public/pkg/run/attach/1.12.6-aliyunedge.1/edgeadm -O edgeadm; chmod u+x edgeadm; ./edgeadm join --openapi-token=*** --node-spec="{\"flannelIface\":\"eth0\",\"enableIptables\":true,\"assumeYes\":true,\"manageRuntime\":true,\"nodeNameStrategy\":\"hostname\",\"enabledAddons\":[\"kube-proxy\",\"flannel\",\"coredns\"]}""
```

Error codes

You can check further details of error codes. For more information, see Error codes.

3.1.3.2.5. Node pools

3.1.3.2.5.1. CreateClusterNodePool

Creates a node pool for a Container Service cluster.

Request syntax

```
POST /clusters/ClusterId/nodepools HTTP/1.1
Content-Type:application/json
{
  "auto_scaling" : {
    "enable" : Boolean,
    "max_instances" : Long,
    "min_instances" : Long,
    "type" : "String",
  },
  "kubernetes_config" : {
    "cms_enabled" : Boolean,
    "cpu_policy" : "String",
    "labels" : [ {
      "key" : "String",
      "value" : "String"
    } ],
    "runtime" : "String",
    "runtime_version" : "String",
    "taints" : [ {
      "key" : "String",
      "value" : "String",
      "effect" : "String"
    } ],
    "user_data" : "String"
  },
  "nodepool_info" : {
```

```
    "name" : "String",
  },
  "scaling_group" : {
    "data_disks" : [ {
      "category" : "String",
      "size" : Long,
      "encrypted" : "String",
      "auto_snapshot_policy_id" : "String"
    } ],
    "image_id" : "String",
    "instance_charge_type" : "String",
    "instance_types" : [ "String" ],
    "login_password" : "String",
    "platform" : "String",
    "rds_instances" : [ "String" ],
    "scaling_policy" : "String",
    "system_disk_category" : "String",
    "system_disk_size" : Long,
    "tags" : [ {
      "key" : "String",
      "value" : "String"
    } ],
    "vswitch_ids" : [ "String" ],
  },
  "tee_config" : {
    "tee_enable" : Boolean
  },
  "count" : Long
}
```

Request parameters

Request path parameters

Parameter	Type	Required	Example	Description
ClusterId	String	Yes	c61da77e8bfbc4c4c999af2b51b65****	The ID of the cluster.

Request body parameters

Parameter	Type	Required	Example	Description
auto_scaling	Object	No		The configuration of auto scaling.

Parameter	Type	Required	Example	Description
enable	Boolean	Yes	true	Specifies whether to enable auto scaling. Valid values: • `true`: enables auto scaling for the node pool. • `false`: disables auto scaling for the node pool. If you set the parameter to false, the `auto_scaling` parameter does not take effect. Default value: `false`.
max_instances	Long	Yes	10	The maximum number of Elastic Compute Service (ECS) instances in the scaling group.
min_instances	Long	Yes	1	The minimum number of ECS instances in the scaling group.
type	String	No	cpu	The type of instances that are specified for auto scaling. Valid values: • `cpu`: regular instance. • `gpu`: GPU-accelerated instance. • `gpushare`: instance that uses shared GPUs. • `spot`: preemptible instance. Default value: `cpu`.
kubernetes_config	Object	No		The configuration of the cluster.

Parameter	Type	Required	Example	Description
cms_enabled	Boolean	No	true	Specifies whether to install the CloudMonitor agent on ECS instances. After the CloudMonitor agent is installed on ECS instances, you can view monitoring information about the instances in the CloudMonitor console. We recommend that you install the CloudMonitor agent. Valid values: • `true`: installs the CloudMonitor agent on ECS instances. • `false`: does not install the CloudMonitor agent on ECS instances. Default value: `false`.
cpu_policy	String	No	none	The CPU policy. The following policies are supported if the cluster version is 1.12.6 or later. • `static`: This policy allows pods with specific resource characteristics on the node to be granted with enhanced CPU affinity and exclusivity. • `none`: This policy indicates that the default CPU affinity is used. Default value: `none`.
labels	Array of tag	No		The labels of the cluster. You can add labels to the nodes in the cluster.
runtime	String	Yes	docker	The container runtime.
runtime_version	String	Yes	19.03.5	The version of the container runtime.
taints	Array of taint	No		The taints of the nodes in the cluster.

Parameter	Type	Required	Example	Description
user_data	String	No	dGhpcyBpcyBhIGV4YW1wbGU=	The user-defined data.
nodepool_info	Object	No		The configuration of the node pool.
name	String	Yes	cluster-demo	The name of the node pool.
scaling_group	Object	No		The configuration of the scaling group.
data_disks	Array of data_disk	No		The configurations of data disks that are mounted to the nodes in the node pool.
image_id	String	No	aliyun_2_1903_x64_20G_alibase_20200529.vhd	The ID of a custom image. By default, the system image is used.
instance_charge_type	String	Yes	PrePaid	The billing method of the nodes in the node pool. Valid values: • `PrePaid`: subscription. • `PostPaid`: pay-as-you-go. Default value: `PostPaid`.
instance_types	Array of String	Yes	ecs.d1ne.2xlarge	The instance types of the nodes in the node pool.
login_password	String	No	Hello1234	The Secure Shell (SSH) logon password. The password must be 8 to 30 characters in length, and must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters.

Parameter	Type	Required	Example	Description
platform	String	Yes	Linux	The release version of the operating system. Valid values: • `CentOS` • `AliyunLinux` • `Windows` • `WindowsCore` Default value: `AliyunLinux.`
rds_instances	Array of String	No	rds-****	The IDs of the Relational Database Service (RDS) instances.
scaling_policy	String	No	release	The scaling mode of the scaling group. Valid values: • `release` : the standard mode. Auto scaling is implemented by creating or releasing ECS instances based on the requested resources. • `recycle` : the swift mode. Auto scaling is implemented by creating, stopping, and starting ECS instances. This mode accelerates scaling activities. When an ECS instance is stopped, you are charged only the storage fees. This does not apply to ECS instances that use local disks. Default value: `release` .
system_disk_category	String	Yes	cloud_efficiency	The type of system disk that is specified for the nodes in the node pool. Valid values: • `cloud_efficiency` : ultra disk. • `cloud_ssd` : standard SSD. • `cloud_essd` : enhanced SSD. Default value: `cloud_efficiency.`

Parameter	Type	Required	Example	Description
system_disk_size	Long	Yes	120	The size of the system disk that is specified for the nodes in the node pool. Unit: GiB. Valid values: 40 to 500.
tags	Array	No		The labels of ECS instances. You can add labels to only ECS instances. The key of each label must be unique and cannot exceed 128 characters in length. Keys and values cannot start with aliyun or acs:. Keys and values cannot contain https:// or http://.
key	String	No	node-k-1	The key of the label.
value	String	No	node-v-1	The value of the label.
vswitch_ids	Array of String	Yes	vsw-wz9mfnhmssud6eicu****	The IDs of vSwitches.
tee_config	Object	No		The configuration of confidential computing.
tee_enable	Boolean	Yes	true	Specifies whether to enable confidential computing for the cluster.
count	Long	No	1	The number of nodes in the node pool.

Response syntax

```
HTTP/1.1 200
Content-Type:application/json
{
  "nodepool_id" : "String"
}
```

Response parameters

Response body parameters

Parameter	Type	Example	Description
nodepool_id	String	np31da1b38983f4511b490fc62108a****	The ID of the node pool.

}
```

Sample success responses

`XML` format

```
HTTP/1.1 200 OK
Content-Type:application/xml
<nodepool_id>np31da1b38983f4511b490fc62108a****</nodepool_id>
```

`JSON` format

```
HTTP/1.1 200 OK
Content-Type:application/json
{
  "nodepool_id" : "np31da1b38983f4511b490fc62108a****"
}
```

Error codes

You can check further details of error codes. For more information, see Error codes.

3.1.3.2.5.2. ScaleClusterNodePool

Scales out a node pool.

Request syntax

```
POST /clusters/ClusterId/nodepools/NodepoolId HTTP/1.1
Content-Type:application/json
{
  "count" : Long
}
```

Request parameters

Request path parameters

Parameter	Type	Required	Example	Description
ClusterId	String	Yes	c23421cfa74454bc8b37163fd19af****	The ID of the cluster to which the node pool belongs.
NodepoolId	String	Yes	np31da1b38983f4511b490fc62108a****	The ID of the node pool.

Request body parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
count	Long	No	1	The number of nodes that you want to add to the node pool. You can add at most 500 nodes in one API call. The maximum number of nodes that can be added is limited by the quota of nodes in the cluster.

Response syntax

```
HTTP/1.1 200
Content-Type:application/json
{
  "task_id" : "String"
}
```

Response parameters

Response body parameters

Parameter	Type	Example	Description
task_id	String	T-5faa48fb31b6b8078d00****	The ID of the task.

Examples

Response example

```
POST /clusters/c23421cfa74454bc8b37163fd19af****/nodepools/np31da1b38983f4511b490fc62108a****
HTTP/1.1
Content-Type:application/json
{
  "count" : 1
}
```

Sample success responses

`XML` format

```
HTTP/1.1 200 OK
Content-Type:application/xml
<task_id>T-5faa48fb31b6b8078d00****</task_id>
```

`JSON` format

```
HTTP/1.1 200 OK
Content-Type:application/json
{
  "task_id" : "T-5faa48fb31b6b8078d00****"
}
```

Error codes

You can check further details of error codes. For more information, see Error codes.

3.1.3.2.5.3. ModifyClusterNodePool

Updates the configuration of a node pool.

Request syntax

```
PUT /clusters/ClusterId/nodepools/NodepoolId HTTP/1.1
Content-Type:application/json
{
  "auto_scaling" : {
    "enable" : Boolean,
    "max_instances" : Long,
    "min_instances" : Long,
    "type" : "String"
  },
  "kubernetes_config" : {
    "cms_enabled" : Boolean,
    "cpu_policy" : "String",
    "labels" : [ {
      "key" : "String",
      "value" : "String"
    } ],
    "runtime" : "String",
    "runtime_version" : "String",
    "taints" : [ {
      "key" : "String",
      "value" : "String",
      "effect" : "String"
    } ],
    "user_data" : "String"
  },
  "nodepool_info" : {
    "name" : "String",
    "resource_group_id" : "String"
  },
  "scaling_group" : {
    "data_disks" : [ {
      "category" : "String",
      "size" : Long,
      "encrypted" : "String",
      "auto_snapshot_policy_id" : "String"
    } ],
    "instance_charge_type" : "String",
```

```
    "platform" : "String",
    "image_id" : "String",
    "instance_types" : [ "String" ],
    "login_password" : "String",
    "rds_instances" : [ "String" ],
    "scaling_policy" : "String",
    "system_disk_category" : "String",
    "system_disk_size" : Long,
    "tags" : [ {
      "key" : "String",
      "value" : "String"
    } ],
    "vswitch_ids" : [ "String" ],
  },
  "tee_config" : {
    "tee_enable" : Boolean
  },
  "update_nodes" : Boolean
}
```

Request parameters

Request path parameters

Parameter	Type	Required	Example	Description
ClusterId	String	Yes	c23421cfa74454bc8b37163fd19af****	The ID of the cluster to which the node pool belongs.
NodepoolId	String	Yes	p31da1b38983f4511b490fc62108a****	The ID of the node pool.

Request body parameters

Parameter	Type	Required	Example	Description
auto_scaling	Object	No		The configuration of auto scaling.

Parameter	Type	Required	Example	Description
enable	Boolean	No	true	Specifies whether to enable auto scaling. Valid values: • `true`: enables auto scaling for the node pool. • `false`: disables auto scaling for the node pool. If you set this parameter to false, the `auto_scaling` parameter does not take effect. Default value: `false`.
max_instances	Long	No	10	The maximum number of Elastic Compute Service (ECS) instances.
min_instances	Long	No	2	The minimum number of ECS instances.
type	String	No	cpu	The type of instances that are specified for auto scaling. Valid values: • `cpu`: regular instance. • `gpu`: GPU-accelerated instance. • `gpushare`: instance that uses shared GPUs. • `spot`: preemptible instance. Default value: `cpu`.
kubernetes_config	Object	No		The configuration of the cluster.

Parameter	Type	Required	Example	Description
cms_enabled	Boolean	No	true	Specifies whether to install the CloudMonitor agent on ECS instances. After the CloudMonitor agent is installed on ECS instances, you can view monitoring information about the instances in the CloudMonitor console. We recommend that you install the CloudMonitor agent. Valid values: • `true`: installs the CloudMonitor agent on ECS instances. • `false`: does not install the CloudMonitor agent on ECS instances. Default value: `false`.
cpu_policy	String	No	none	The CPU policy. The following policies are supported if the cluster version is 1.12.6 or later. • `static`: This policy allows pods with specific resource characteristics on the node to be granted with enhanced CPU affinity and exclusivity. • `none`: This policy indicates that the default CPU affinity is used. Default value: `none`.

Parameter	Type	Required	Example	Description
labels	Array of tag	No		The labels of nodes. You can add labels to the nodes in the cluster. Labeling rules: • Each label consists of a case-sensitive key-value pair. You can add up to 20 labels. • When you add a label, you must specify a unique key but you can leave the value empty. A key cannot exceed 64 characters in length and a value cannot exceed 128 characters in length. Keys and values cannot start with `aliyun`, `acs:`, `https://`, or `http://`.
runtime	String	No	docker	The name of the container runtime.
runtime_version	String	No	19.03.5	The version of the container runtime.
taints	Array of taint	No		The taints to be added to the nodes in the node pool.
user_data	String	No	lyEvdXNyL2Jpbi9iYXNoCmVjaG8gIkhlbGxvIEFDSyEi	The user-defined data of the node pool. For more information, see the *User-defined data* chapter in the *ECS* documentation.
nodepool_info	Object	No		The configuration of the node pool.
name	String	No	default-nodepool	The name of the node pool. The name must be 1 to 63 characters in length, and can contain digits, letters, and hyphens (-). It cannot start with a hyphen.
resource_group_id	String	No	rg-acfmyvw3wjm****	The ID of the resource group to which the node pool belongs.

Parameter	Type	Required	Example	Description
scaling_group	Object	No		The configuration of the scaling group.
data_disks	Array of data_disk	No		The configurations of the data disks that are mounted to the nodes in the node pool. You can mount 0 to 10 data disks. You can mount at most 10 data disks to the nodes in the node pool.
platform	String	No	AliyunLinux	The operating system. Valid values: • `AliyunLinux` • `CentOS` • `Windows` • `WindowsCore`
image_id	String	No	aliyun_2_1903_x64_20G_alibase_20200904.vhd	The ID of the custom image. You can call the `DescribeKubernetesVersionMetadata` operation to query the supported images. By default, the latest image is used.
instance_types	Array of String	No	ecs.c6.large	The instance types of the nodes in the node pool. For more information, see the *Instance types* chapter in *ECS User Guide*.
login_password	String	No	Hello1234	The Secure Shell (SSH) logon password. The password must be 8 to 30 characters in length, and must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters.
rds_instances	Array of String	No	rds-xxx	The IDs of the Relational Database Service (RDS) instances. After you specify the list of RDS instances, the ECS instances in the cluster are automatically added to the whitelist of the RDS instances.

Parameter	Type	Required	Example	Description
scaling_policy	String	No	release	The scaling mode of the scaling group. Valid values: • `release`: the standard mode. Auto scaling is implemented by creating or releasing ECS instances based on the requested resources. • `recycle`: the swift mode. Auto scaling is implemented by creating, stopping, and starting ECS instances. This mode accelerates scaling activities. When an ECS instance is stopped, you are charged only the storage fees. This does not apply to ECS instances that use local disks.
system_disk_category	String	No	cloud_efficiency	The type of system disk that is specified for the nodes in the node pool. Valid values: • `cloud_efficiency`: ultra disk. • `cloud_ssd`: standard SSD. Default value: `cloud_ssd`.
system_disk_size	Long	No	120	The size of the system disk that is specified for the nodes in the node pool. Unit: GiB. Valid values: 20 to 500. The value of this parameter must be no less than the greater value between 20 and the image size. Default value: the greater value between 40 and the image size.

Parameter	Type	Required	Example	Description
tags	Array of tag	No		The labels of ECS instances. You can add labels to only ECS instances. The key of each label must be unique and cannot exceed 128 characters in length. Keys and values cannot start with aliyun, acs:, https://, or http://.
vswitch_ids	Array of String	No	vsw-wz9uwxhawmtzg7u9h****	The IDs of vSwitches.
tee_config	Object	No		The configuration of confidential computing.
tee_enable	Boolean	No	false	Specifies whether to enable confidential computing for the cluster. • `true`: enables confidential computing. • `false`: disables confidential computing. Default value: `false`.
update_nodes	Boolean	No	true	Specifies whether to update node information, such as labels and taints.

Response syntax

```
HTTP/1.1 200
Content-Type:application/json
{
  "task_id" : "String",
  "nodepool_id" : "String"
}
```

Response parameters

Response body parameters

Parameter	Type	Example	Description

Parameter	Type	Example	Description
task_id	String	T-5fd211e924e1d00787000293	The ID of the task.
nodepool_id	String	np737c3ac1ac684703b9e10673aa2c****	The ID of the node pool.

```

Response parameters

Response body parameters

Parameter	Type	Example	Description
nodepools	Array		The list of node pools in the cluster.
auto_scaling	Object		The configuration of auto scaling.
enable	Boolean	true	Indicates whether auto scaling is enabled. Valid values: • `true`: Auto scaling is enabled for the node pool. • `false`: Auto scaling is disabled for the node pool. If you set this parameter to `false`, the `auto_scaling` parameter does not take effect.

Parameter	Type	Example	Description
max_instances	Long	10	The maximum number of Elastic Compute Service (ECS) instances.
min_instances	Long	2	The minimum number of ECS instances.
type	String	cpu	The type of instances that are specified for auto scaling. Valid values: • `cpu`: regular instance. • `gpu`: GPU-accelerated instance. • `gpushare`: instance that uses shared GPUs. • `spot`: preemptible instance.
kubernetes_config	Object		The configuration of the cluster.
cms_enabled	Boolean	true	Indicates whether the CloudMonitor agent is installed on ECS instances. After the CloudMonitor agent is installed on ECS instances, you can view monitoring information about the instances in the CloudMonitor console. We recommend that you install the CloudMonitor agent. Valid values: • `true`: The CloudMonitor agent is installed on ECS instances. • `false`: The CloudMonitor agent is not installed on ECS instances.
cpu_policy	String	none	The CPU policy. The following policies are supported if the cluster version is 1.12.6 or later. • `static`: This policy allows pods with specific resource characteristics on the node to be granted with enhanced CPU affinity and exclusivity. • `none`: This policy indicates that the default CPU affinity is used.

Parameter	Type	Example	Description
labels	Array of tag		The labels of nodes. You can add labels to the nodes in the cluster. Labeling rules: • Each label consists of a case-sensitive key-value pair. You can add up to 20 labels. • When you add a label, you must specify a unique key but you can leave the value empty. A key cannot exceed 64 characters in length and a value cannot exceed 128 characters in length. Keys and values cannot start with `aliyun`, `acs:`, `https://`, or `http://`.
runtime	String	docker	The name of the container runtime.
runtime_version	String	19.03.5	The version of the container runtime.
taints	Array of taint		The taints that are added to nodes. Taints are added to nodes to prevent pods from being scheduled to inappropriate nodes. However, toleration rules allow pods to be scheduled to nodes with matching taints.
user_data	String	IyEvYmluL3NoCmVja G8gIkhlbGxvIEFD****	The user-defined data of the node pool. For more information, see the *User-defined data* chapter in the *ECS* documentation.
nodepool_info	Object		The information about the node pool.
created	String	2020-09-27T19:14:09.156823496+08:00	The time when the node pool was created.
is_default	Boolean	true	Indicates whether the node pool is a default node pool. By default, a cluster has only one default node pool. Valid values: • `true`: The node pool is a default node pool. • `false`: The node pool is not a default node pool.

Parameter	Type	Example	Description
name	String	default-nodepool	The name of the node pool. The name must be 1 to 63 characters in length, and can contain digits, letters, and hyphens (-). It cannot start with a hyphen.
nodepool_id	String	np615c0e0966124216a0412e10afe0****	The ID of the node pool.
region_id	String	cn-beijing	The ID of the region where the node pool is deployed.
resource_group_id	String	rg-acfmyvw3wjm****	The ID of the resource group to which the node pool belongs.
type	String	ess	The type of node pool.
updated	String	2020-09-27T20:37:46+08:00	The time when the node pool was updated.
scaling_group	Object		The configuration of the scaling group.
data_disks	Array of data_disk		The configurations of the data disks that are mounted to the nodes in the node pool. Each configuration includes disk type and disk size.
image_id	String	aliyun_2_1903_x64_20G_alibase_20200529.vhd	The ID of the custom image. You can call the `DescribeKubernetesVersionMetadata` operation to query the supported images.
instance_charge_type	String	PostPaid	The billing method of the nodes in the node pool. Valid values: • `PrePaid`: subscription. • `PostPaid`: pay-as-you-go.
instance_types	Array of String	ecs.n4.large	The instance types of nodes.

Parameter	Type	Example	Description
platform	String	AliyunLinux	The release version of the operating system. Valid values: • `CentOS` • `AliyunLinux` • `Windows` • `WindowsCore`
ram_policy	String	KubernetesWorkerRole-021dc54f-929b-437a-8ae0-34c24d3e****	The name of the Resource Access Management (RAM) role. The RAM role is assigned to the worker nodes that are created on ECS instances.
rds_instances	Array of String	rm-xxx	The Relational Database Service (RDS) instances.
scaling_group_id	String	asg-2ze8n5qw4atggut8****	The ID of the scaling group.
scaling_policy	String	release	The scaling mode of the scaling group. Valid values: • `release`: the standard mode. Auto scaling is implemented by creating or releasing ECS instances based on the requested resources. • `recycle`: the swift mode. Auto scaling is implemented by creating, stopping, and starting ECS instances. This mode accelerates scaling activities. When an ECS instance is stopped, you are charged only the storage fees. This does not apply to ECS instances that use local disks.
security_group_id	String	sg-2ze1iuk12m2sb4c4****	The ID of the security group to which the instances of the cluster belong.
system_disk_category	String	cloud_efficiency	The type of system disk that is specified for the nodes in the node pool. Valid values: • `cloud_efficiency`: ultra disk. • `cloud_ssd`: standard SSD.

Parameter	Type	Example	Description
system_disk_size	Long	120	The size of the system disk that is specified for the nodes in the node pool. Unit: GiB. Valid values: 20 to 500.
tags	Array of tag		The labels of ECS instances. You can add labels to only ECS instances. The key of each label must be unique and cannot exceed 128 characters in length. Keys and values cannot start with aliyun, acs:, https://, or http://.
vswitch_ids	Array of String	vsw-2ze3ds0mdip0hdz8i****	The IDs of vSwitches.
login_password	String	******	The Secure Shell (SSH) logon password. The password must be 8 to 30 characters in length, and must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. For security considerations, the password is encrypted during data transfer.
status	Object		The status of the node pool.
failed_nodes	Long	0	The number of failed nodes.
healthy_nodes	Long	3	The number of healthy nodes.
initial_nodes	Long	0	The number of nodes that are being created.
offline_nodes	Long	0	The number of offline nodes.
removing_nodes	Long	0	The number of nodes that are being removed.
serving_nodes	Long	3	The number of running nodes.

Parameter	Type	Example	Description
state	String	active	The state of the node pool. Valid values: • `active`: The node pool is activated. • `scaling`: The node pool is being scaled. • `removing`: The node pool is removing nodes. • `deleting`: The node pool is being deleted. • `updating`: The node pool is being updated.
total_nodes	Long	3	The number of nodes in the node pool.
tee_config	Object		The configuration of confidential computing.
tee_enable	Boolean	false	Indicates whether confidential computing is enabled for the cluster. Valid values: • `true`: Confidential computing is enabled for the cluster. • `false`: Confidential computing is disabled for the cluster.

Examples

Sample requests

```
GET /clusters/cc0f87de0b8fb403f86e10e204f83****/nodepools HTTP/1.1

Error codes

You can check further details of error codes. For more information, see Error codes.

3.1.3.2.5.5. DescribeClusterNodePoolDetail

Queries the details of a specified node pool.

Request syntax

```
GET /clusters/ClusterId/nodepools/NodepoolId HTTP/1.1
Content-Type:application/json
```

Request parameters

Request path parameters

Parameter	Type	Required	Example	Description
ClusterId	String	Yes	c23421cfa74454bc8b37163fd19af****	The ID of the cluster to which the node pool belongs.
NodepoolId	String	Yes	np31da1b38983f4511b490fc62108a****	The ID of the node pool.

Response syntax

```
HTTP/1.1 200
Content-Type:application/json

Response parameters

Response body parameters

Parameter	Type	Example	Description
auto_scaling	Object		The configuration of auto scaling.
enable	Boolean	true	Indicates whether auto scaling is enabled for the node pool. • `true`: Auto scaling is enabled for the node pool. • `false`: Auto scaling is disabled for the node pool. If you set this parameter to false, the `auto_scaling` parameter does not take effect.

Parameter	Type	Example	Description
max_instances	Long	10	The maximum number of Elastic Compute Service (ECS) instances.
min_instances	Long	1	The minimum number of ECS instances.
type	String	cpu	The type of instances that are specified for auto scaling. Valid values: • `cpu`: regular instance. • `gpu`: GPU-accelerated instance. • `gpushare`: instance that uses shared GPUs. • `spot`: preemptible instance.
kubernetes_config	Object		The configuration of the cluster.
cms_enabled	Boolean	true	Indicates whether the CloudMonitor agent is installed on ECS instances. After the CloudMonitor agent is installed on ECS instances, you can view monitoring information about the instances in the CloudMonitor console. We recommend that you install the CloudMonitor agent. Valid values: • `true`: The CloudMonitor agent is installed on ECS instances. • `false`: The CloudMonitor agent is not installed on ECS instances.
cpu_policy	String	none	The CPU policy. The following policies are supported if the cluster version is 1.12.6 or later. • `static`: This policy allows pods with specific resource characteristics on the node to be granted with enhanced CPU affinity and exclusivity. • `none`: This policy indicates that the default CPU affinity is used.

Parameter	Type	Example	Description
labels	Array of tag		The labels of nodes. You can add labels to the nodes in the cluster. Labeling rules: • Each label consists of a case-sensitive key-value pair. You can add up to 20 labels. • When you add a label, you must specify a unique key but you can leave the value empty. A key cannot exceed 64 characters in length and a value cannot exceed 128 characters in length. Keys and values cannot start with `aliyun`, `acs:`, `https://`, or `http://`.
runtime	String	docker	The name of the container runtime.
runtime_version	String	19.03.5	The version of the container runtime.
taints	Array of taint		The taints that are added to nodes. Taints are added to nodes to prevent pods from being scheduled to inappropriate nodes. However, toleration rules allow pods to be scheduled to nodes with matching taints. For more information, see taint-and-toleration.
user_data	String	lyEvYmluL3NoCmVjaG8gIkhlbGxvIEFDSyEi	The user-defined data of the node pool. For more information, see the *User-defined data* chapter in the *ECS* documentation.
nodepool_info	Object		The configuration of the node pool.
created	String	2020-09-27T19:14:09.156823496+08:00	The time when the node pool was created.
is_default	Boolean	true	Indicates whether the node pool is a default node pool. By default, a cluster has only one default node pool. Valid values: `true`: The node pool is a default node pool. `false`: The node pool is not a default node pool.

Parameter	Type	Example	Description
name	String	default-nodepool	The name of the node pool. The name must be 1 to 63 characters in length, and can contain digits, letters, and hyphens (-). It cannot start with a hyphen.
nodepool_id	String	np615c0e0966124216a0412e10afe0****	The ID of the node pool.
region_id	String	cn-beijing	The ID of the region where the node pool is deployed.
resource_group_id	String	rg-acfmyvw3wjmb****	The ID of the resource group to which the node pool belongs.
type	String	ess	The type of node pool.
updated	String	2020-09-27T20:37:46+08:00	The time when the node pool was updated.
scaling_group	Object		The configuration of the scaling group.
data_disks	Array of data_disk		The configurations of the data disks that are mounted to the nodes in the node pool. Each configuration includes disk type and disk size.
image_id	String	aliyun_2_1903_x64_20G_alibase_20200529.vhd	The ID of the custom image. You can call the `DescribeKubernetesVersionMetadata` operation to query the supported images.
instance_types	Array of String	ecs.n4.large	The instance types of nodes.
platform	String	AliyunLinux	The release version of the operating system. Valid values: • `CentOS` • `AliyunLinux` • `Windows` • `WindowsCore`

Parameter	Type	Example	Description
ram_policy	String	KubernetesWorkerRole-021dc54f-929b-437a-8ae0-34c24d3e****	The name of the Resource Access Management (RAM) role. The RAM role is assigned to the worker nodes that are created on ECS instances.
rds_instances	Array of String	rm-xxx	The Relational Database Service (RDS) instances.
scaling_group_id	String	asg-2zeieod8giqmov7z****	The ID of the scaling group.
scaling_policy	String	release	The scaling mode of the scaling group. Valid values: • `release`: the standard mode. Auto scaling is implemented by creating or releasing ECS instances based on the requested resources. • `release`: the swift mode. Auto scaling is implemented by creating, stopping, and starting ECS instances. This mode accelerates scaling activities. When an ECS instance is stopped, you are charged only the storage fees. This does not apply to ECS instances that use local disks.
security_group_id	String	sg-2ze60ockeekspl3d****	The ID of the security group to which the instances of the cluster belong.
system_disk_category	String	cloud_efficiency	The type of system disk that is specified for the nodes in the node pool. Valid values: • `cloud_efficiency`: ultra disk. • `cloud_ssd`: standard SSD.
system_disk_size	Long	120	The size of the system disk that is specified for the nodes in the node pool. Unit: GiB. Valid values: 20 to 500.

Parameter	Type	Example	Description
tags	Array of tag		The labels of ECS instances. You can add labels to only ECS instances. The key of each label must be unique and cannot exceed 128 characters in length. Keys and values cannot start with `aliyun`, `acs:`, `https://`, or `http://`.
vswitch_ids	Array of String	vsw-2ze3ds0mdip0hdz8i****	The IDs of vSwitches.
login_password	String	********	The Secure Shell (SSH) logon password. The password must be 8 to 30 characters in length, and must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. For security considerations, the password is encrypted during data transfer.
status	Object		The status of the node pool.
failed_nodes	Long	0	The number of failed nodes.
healthy_nodes	Long	3	The number of healthy nodes.
initial_nodes	Long	0	The number of nodes that are being created.
offline_nodes	Long	0	The number of offline nodes.
removing_nodes	Long	0	The number of nodes that are being removed.
serving_nodes	Long	3	The number of running nodes.

Parameter	Type	Example	Description
state	String	active	The state of the node pool. Valid values: • `active`: The node pool is activated. • `scaling`: The node pool is being scaled. • `removing`: The node pool is removing nodes. • `deleting`: The node pool is being deleted. • `updating`: The node pool is being updated.
total_nodes	Long	3	The total number of nodes in the node pool.
tee_config	Object		The configuration of confidential computing.
tee_enable	Boolean	false	Indicates whether confidential computing is enabled for the cluster. • `true`: Confidential computing is enabled for the cluster. • `false`: Confidential computing is disabled for the cluster.

Error codes

You can check further details of error codes. For more information, see Error codes.

3.1.3.2.5.6. DeleteClusterNodepool

Deletes a node pool.

Request syntax

```
DELETE /clusters/ClusterId/nodepools/NodepoolId HTTP/1.1
Content-Type:application/json
```

Request parameters

Request path parameters

Parameter	Type	Required	Example	Description
ClusterId	String	Yes	c61da77e8bfbc4c4c999af2b51b65****	The ID of the cluster.

Parameter	Type	Required	Example	Description
NodepoolId	String	Yes	np30db56bcac7843dca90b999c8928****	The ID of the node pool.

Response syntax

```
HTTP/1.1 200 OK
```

Response parameters

No response parameters.

Examples

Sample requests

```
DELETE /clusters/c61da77e8bfbc4c4c999af2b51b65****/nodepools/np30db56bcac7843dca90b999c8928
**** HTTP/1.1
Content-Type:application/json
```

Sample success responses

`JSON` format

```
HTTP/1.1 200 OK
```

Error codes

You can check further details of error codes. For more information, see Error codes.

3.1.3.3. Templates

3.1.3.3.1. CreateTemplate

Creates an orchestration template.

Request syntax

```
POST /templates HTTP/1.1
Content-Type:application/json
{
  "name" : "String",
  "template" : "String",
  "tags" : "String",
  "description" : "String",
  "template_type" : "String"
}
```

Request parameters

Request body parameters

Parameter	Type	Required	Example	Description
name	String	Yes	service-account-template	The name of the template. The name must be 1 to 63 characters in length, and can contain digits, letters, and hyphens (-). It cannot start with a hyphen.
template	String	Yes	apiVersion: v1\nkind: ServiceAccount\nmetadata:\n name: test-sa	The template content in the YAML format.
tags	String	No	test	The label of the template.
description	String	No	this is test	The description of the template.
template_type	String	No	kubernetes	The type of template. You can set the parameter to a custom value. • If you set the parameter to `kubernetes`, the template is displayed on the Templates page in the Container Service console. • If you set the parameter to `compose`, the template is not displayed in the console. We recommend that you set the parameter to `kubernetes`. Default value: `compose`.

Response syntax

```
HTTP/1.1 200
Content-Type:application/json
{
  "template_id" : "String"
}
```

Response parameters

Response body parameters

Parameter	Type	Example	Description
template_id	String	ba1fe77b-b01e-4640-b77e-8f1b80e3e3cf	The ID of the template.

Examples

Sample requests

```
POST /templates HTTP/1.1
Content-Type:application/json
{
  "name" : "service-account-template",
  "template" : "apiVersion: v1\\nkind: ServiceAccount\\nmetadata:\\n  name: test-sa",
  "tags" : "test",
  "description" : "this is test",
  "template_type" : "kubernetes"
}
```

Sample success responses

`XML` format

```
HTTP/1.1 200 OK
Content-Type:application/xml
<template_id>ba1fe77b-b01e-4640-b77e-8f1b80e3e3cf</template_id>
```

`JSON` format

```
HTTP/1.1 200 OK
Content-Type:application/json
{
  "template_id" : "ba1fe77b-b01e-4640-b77e-8f1b80e3e3cf"
}
```

Error codes

You can check further details of error codes. For more information, see Error codes.

3.1.3.3.2. DeleteTemplate

Deletes an orchestration template.

Request syntax

```
DELETE /templates/TemplateId HTTP/1.1
Content-Type:application/json
```

Request parameters

Request path parameters

Parameter	Type	Required	Example	Description
TemplateId	String	Yes	20663627-81ee-4cfe-9b69-c96fcb84a674	The ID of the template.

Response syntax

```
HTTP/1.1 200 OK
```

Response parameters

No response parameters.

Examples

Sample requests

```
DELETE /templates/20663627-81ee-4cfe-9b69-c96fcb84a674
```

Sample success responses

`JSON` format

```
HTTP/1.1 200 OK
```

Error codes

You can check further details of error codes. For more information, see Error codes.

3.1.3.3.3. DescribeTemplates

Queries all orchestration templates.

Request syntax

```
GET /templates?template_type=String&page_num=Long&page_size=Long HTTP/1.1
Content-Type:application/json
```

Request parameters

Request query parameters

Parameter	Type	Required	Example	Description

Parameter	Type	Required	Example	Description
template_type	String	Yes	kubernetes	The type of template. You can set this parameter to a custom value. • If you set the parameter to `kubernetes`, the template is displayed on the Templates page in the Container Service console. • If you set the parameter to `compose`, the template is not displayed on the Templates page in the console. Default value: `kubernetes`.
page_num	Long	No	1	The number of the page to return. Default value: 1.
page_size	Long	No	10	The number of entries to return on each page. Default value: 10.

Response syntax

```
HTTP/1.1 200
Content-Type:application/json
{
  "templates" : [ {
    "acl" : "String",
    "id" : "String",
    "name" : "String",
    "description" : "String",
    "tags" : "String",
    "template" : "String",
    "template_type" : "String",
    "created" : "String",
    "updated" : "String",
    "template_with_hist_id" : "String"
  } ],
  "page_info" : {
    "page_number" : Long,
    "page_size" : Long,
    "total_count" : Long
  }
}
```

Response parameters

Response body parameters

Parameter	Type	Example	Description
templates	Array of template		The list of returned templates.
acl	String	private	The access control policy of the template. Valid values: • `private`: The template is private. • `public`: The template is public. • `shared`: The template can be shared. Default value: `private`.
id	String	874ec485-e7e6-4373-8a3b-47bde8ae789f	The ID of the template.
name	String	webserver	The name of the template.
description	String	a web server	The description of the template.
tags	String	kubernetes	The label of the template. By default, the value is the name of the template.
template	String	apiVersion: apps/v1\nkind: Deployment\nmetadata:\n name: nginx-deployment-basic\n labels:\n app: nginx\nspec:\n replicas: 2\n selector:\n matchLabels:\n app: nginx\n template:\n metadata:\n labels:\n app: nginx\n spec:\n containers:\n - name: nginx\n image: busybox:latest\n ports:\n - containerPort: 80	The template content in the YAML format.

Parameter	Type	Example	Description
template_type	String	kubernetes	The type of template. You can set this parameter to a custom value. • If you set the parameter to `kubernetes`, the template is displayed on the Templates page in the Container Service console. • If you set the parameter to `compose`, the template is displayed on the Container Service - Swarm page in the console. However, Container Service for Swarm is deprecated.
created	String	2020-06-10T16:30:16+08:00	The time when the template was created.
updated	String	2020-06-10T16:30:16+08:00	The time when the template was updated.
template_with_hist_id	String	ad81d115-7c8b-47e7-a222-9c28d7f6e588	The ID of the parent template. The value of `template_with_hist_id` is the same for each template version. This allows you to manage different template versions.
page_info	Object		The pagination details.
page_number	Long	20	The page number of the returned page.
page_size	Long	3	The maximum number of entries returned per page.
total_count	Long	50	The total number of entries returned.

Examples

Sample requests

```
GET /templates?template_type=kubernetes&page_num=1&page_size=10 HTTP/1.1
Content-Type:application/json
```

Sample success responses

`XML` format

```
HTTP/1.1 200 OK
Content-Type:application/xml
<templates>
    <acl>private</acl>
    <id>874ec485-e7e6-4373-8a3b-47bde8ae789f</id>
    <name>webserver</name>
    <description>a web server</description>
    <tags>kubernetes</tags>
    <template>apiVersion: apps/v1\nkind: Deployment\nmetadata:\n  name: nginx-deployment-basic\n  labels:\n    app: nginx\nspec:\n  replicas: 2\n  selector:\n    matchLabels:\n      app: nginx\n  template:\n    metadata:\n      labels:\n        app: nginx\n    spec:\n      containers:\n      - name: nginx\n        image: busybox:latest\n        ports:\n        - containerPort: 80</template>
    <template_type>kubernetes</template_type>
    <created>2020-06-10T16:30:16+08:00</created>
    <updated>2020-06-10T16:30:16+08:00</updated>
    <template_with_hist_id>ad81d115-7c8b-47e7-a222-9c28d7f6e588</template_with_hist_id>
</templates>
<page_info>
    <page_number>20</page_number>
    <page_size>3</page_size>
    <total_count>50</total_count>
</page_info>
```

`JSON` format

```
HTTP/1.1 200 OK
Content-Type:application/json
{
  "templates" : [ {
    "acl" : "private",
    "id" : "874ec485-e7e6-4373-8a3b-47bde8ae789f",

  } ],
  "page_info" : {
    "page_number" : 20,
    "page_size" : 3,
    "total_count" : 50
  }
}
```

Error codes

You can check further details of error codes. For more information, see Error codes.

3.1.3.3.4. DescribeTemplateAttribute

Queries the details of a specified orchestration template.

Request syntax

```
GET /templates/TemplateId?template_type=String HTTP/1.1
Content-Type:application/json
```

Request parameters

Request path parameters

Parameter	Type	Required	Example	Description
TemplateId	String	Yes	874ec485-e7e6-4373-8a3b-47bde8a****	The ID of the template.

Request query parameters

Parameter	Type	Required	Example	Description
template_type	String	No	kubernetes	The type of template. The value can be a custom value. • If the value is `kubernetes`, the template is displayed on the Templates page in the Container Service console. • If the value is `compose`, the template is displayed on the Container Service - Swarm page in the console. However, Container Service for Swarm is deprecated. • If the value of the parameter is not `kubernetes`, the template is not displayed on the Templates page in the console. We recommend that you set the parameter to `kubernetes`. Default value: `kubernetes`.

Response syntax

```
HTTP/1.1 200
Content-Type:application/json
[ {
  "id" : "String",
  "acl" : "String",
  "name" : "String",
  "template" : "String",
  "template_type" : "String",
  "description" : "String",
  "tags" : "String",
  "template_with_hist_id" : "String",
  "created" : "String",
  "updated" : "String"
} ]
```

Response parameters

Response body parameters

Parameter	Type	Example	Description
	Array of template_info		The details of the queried template.
id	String	72d20cf8-a533-4ea9-a10d-e7630d3d****	The ID of the template. When you update a template, a new template ID is generated.
acl	String	private	The access control policy of the template.
name	String	web	The name of the template.
template	String	apiVersion: V1\n***	The template content in the YAML format.

Parameter	Type	Example	Description
template_type	String	kubernetes	The type of template. The value can be a custom value. • If the value is `kubernetes`, the template is displayed on the Templates page in the Container Service console. • If the value is `compose`, the template is displayed on the Container Service - Swarm page in the console. However, Container Service for Swarm is deprecated. • If the value of the parameter is not `kubernetes`, the template is not displayed on the Templates page in the console. We recommend that you set the parameter to `kubernetes`. Default value: `kubernetes`.
description	String	test template	The description of the template.
tags	String	sa	The label of the template.
template_with_hist_id	String	874ec485-e7e6-4373-8a3b-47bde8ae****	The unique ID of the template. The value remains unchanged after the template is updated.
created	String	2020-09-16T19:21:29+08:00	The time when the template was created.
updated	String	2020-09-16T19:21:29+08:00	The time when the template was updated.

Examples

Sample requests

```
GET /templates/874ec485-e7e6-4373-8a3b-47bde8a****?template_type=kubernetes HTTP/1.1
Content-Type:application/json
```

Sample success responses

`XML` format

```
HTTP/1.1 200 OK
Content-Type:application/xml
<0>
    <id>72d20cf8-a533-4ea9-a10d-e7630d3d****</id>
    <acl>private</acl>
    <name>web</name>
    <template>apiVersion: V1\n***</template>
    <template_type>kubernetes</template_type>
    <description>test template</description>
    <tags>sa</tags>
    <template_with_hist_id>874ec485-e7e6-4373-8a3b-47bde8ae****</template_with_hist_id>
    <created>2020-09-16T19:21:29+08:00</created>
    <updated>2020-09-16T19:21:29+08:00</updated>
</0>
```

`JSON` format

```
HTTP/1.1 200 OK
Content-Type:application/json
[ {
  "id" : "72d20cf8-a533-4ea9-a10d-e7630d3d****",
  "acl" : "private",
  "name" : "web",
  "template" : "apiVersion: V1\\n***",
  "template_type" : "kubernetes",
  "description" : "test template",
  "tags" : "sa",
  "template_with_hist_id" : "874ec485-e7e6-4373-8a3b-47bde8ae****",

  "updated" : "2020-09-16T19:21:29+08:00"
} ]
```

Error codes

You can check further details of error codes. For more information, see Error codes.

3.1.3.3.5. UpdateTemplate

Updates an orchestration template.

Request syntax

```
PUT /templates/TemplateId HTTP/1.1
Content-Type:application/json
{
  "description" : "String",
  "name" : "String",
  "tags" : "String",
  "template" : "String",
  "template_type" : "String"
}
```

Request parameters

Request path parameters

Parameter	Type	Required	Example	Description
TemplateId	String	Yes	72d20cf8-a533-4ea9-a10d-e7630d3d2708	The ID of the template.

Request body parameters

Parameter	Type	Required	Example	Description
description	String	No	web server cluster	The description of the template.
name	String	No	webserver01	The name of the template.
tags	String	No	web	The label of the template.
template	String	No	apiVersion: apps/v1\\nkind: Deployment\\nmetadata:\\n name: nginx-deployment-basic\\n labels:\\n app: nginx\\nspec:\\n replicas: 2\\n selector:\\n matchLabels:\\n app: nginx\\n template:\\n metadata:\\n labels:\\n app: nginx\\n spec:\\n containers:\\n - name: nginx\\n image: busybox:latest\\n ports:\\n - containerPort: 8080	The template content in the YAML format.

Parameter	Type	Required	Example	Description
template_type	String	No	kubernetes	The type of template. You can set this parameter to a custom value. • If you set the parameter to `kubernetes`, the template is displayed on the Templates page in the Container Service console. • If you set the parameter to `compose`, the template is displayed on the Container Service - Swarm page in the console. However, Container Service for Swarm is deprecated.

Response syntax

```
HTTP/1.1 200 OK
```

Response parameters

No response parameters.

Examples

Sample requests

```
PUT /templates/72d20cf8-a533-4ea9-a10d-e7630d3d2708 HTTP/1.1
Content-Type:application/json
{
  "description" : "web server cluster",
  "name" : "webserver01",
  "tags" : "web",
  "template" : "apiVersion: apps/v1\\\\nkind: Deployment\\\\nmetadata:\\\\n  name: nginx-deployment-basic\\\\n  labels:\\\\n    app: nginx\\\\nspec:\\\\n  replicas: 2\\\\n  selector:\\\\n    matchLabels:\\\\n      app: nginx\\\\n  template:\\\\n    metadata:\\\\n      labels:\\\\n        app: nginx\\\\n    spec:\\\\n      containers:\\\\n      - name: nginx\\\\n image: busybox:latest\\\\n        ports:\\\\n        - containerPort: 8080",
  "template_type" : "kubernetes"
}
```

Sample success responses

`JSON` format

```
HTTP/1.1 200 OK
```

Error codes

You can check further details of error codes. For more information, see Error codes.

3.1.3.4. Add-ons

3.1.3.4.1. InstallClusterAddons

Installs a component in a specified Container Service cluster.

Request syntax

```
POST /clusters/ClusterId/components/install HTTP/1.1
Content-Type:application/json
[ {
  "name" : "String",
  "version" : "String",
  "config" : "String"
} ]
```

Request parameters

Request path parameters

Parameter	Type	Required	Example	Description
ClusterId	String	Yes	c82e6987e2961451182edacd74faf****	The ID of the cluster.

Request body parameters

Parameter	Type	Required	Example	Description
	Array	No		The request body parameters.
name	String	Yes	ags-metrics-collector	The name of the component that you want to install.
version	String	Yes	v1.0.0.2-cc3b2d6-aliyun	The version of the component. **Note** You can call the DescribeClusterAddonsVersion operation to query the version of the component. For more information, see DescribeClusterAddonsVersion.

Parameter	Type	Required	Example	Description
config	String	No	{\"IngressDashboardEnabled\":\"true\",\"sls_project_name\":\"your_sls_project_name\"}"}	The configuration of the component.

Response syntax

```
HTTP/1.1 200 OK
```

Response parameters

No response parameters.

Examples

Sample requests

```
POST /clusters/c82e6987e2961451182edacd74faf****/components/install HTTP/1.1
Content-Type:application/json
[ {
  "name" : "ags-metrics-collector",
  "version" : "v1.0.0.2-cc3b2d6-aliyun",
  "config" : "{\\\"IngressDashboardEnabled\\\":\\\"true\\\",\\\"sls_project_name\\\":\\\"yo
ur_sls_project_name\\\"}\"}"
} ]
```

Description of the sample request

```
POST /clusters/c3fb96524f9274b4495df0f12a6b5****/components/install?RegionId=cn-hangzhou --
header "Content-Type=application/json;" --body '[{"name":"ack-node-problem-detector"}]'
```

Sample success responses

`JSON` format

```
HTTP/1.1 200 OK
```

Error codes

You can check further details of error codes. For more information, see Error codes.

3.1.3.4.2. DescribeAddons

Queries the details of the components that are installed in a specified Container Service cluster.

Request syntax

```
GET /clusters/components/metadata?region=String&cluster_type=String HTTP/1.1
Content-Type:application/json
```

Request parameters

Request query parameters

Parameter	Type	Required	Example	Description
region	String	Yes	cn-beijing	The ID of the region where the cluster is deployed.
cluster_type	String	No	Kubernetes	The type of cluster. Valid values: • `Kubernetes`: dedicated Kubernetes cluster. • `ManagedKubernetes`: managed edge Kubernetes cluster.

Response syntax

```
HTTP/1.1 200
Content-Type:application/json
{
  "ComponentGroups" : [ {
    "group_name" : "String",
    "items" : [ {
      "name" : "String"
    } ]
  } ],
  "StandardComponents" : {
    "key" : {
      "name" : "String",
      "version" : "String",
      "description" : "String",
      "required" : "String",
      "disabled" : Boolean
    }
  }
}
```

Response parameters

Response body parameters

Parameter	Type	Example	Description

Parameter	Type	Example	Description
ComponentGroups	Array of ComponentGroup		The list of the returned components.
group_name	String	storage	The name of the component group.
items	Array of item		The names of the components in the component group.
name	String	flexvolume	The name of the component.
StandardComponents	Map		Standard components.
	object		The details of the standard components.
name	String	ack-arena	The name of the component.
version	String	0.5.0	The version of the component.
description	String	test	The description of the component.
required	String	false	Indicates whether the component is required in a Container Service cluster. Valid values: • `true`: The component is required and must be installed when a cluster is created. • `false`: The component is optional. After a cluster is created, you can go to the Add-ons page to install the component.

Parameter	Type	Example	Description
disabled	Boolean	false	Indicates whether the automatic installation of the component is disabled. By default, some optional components, such as components for logging and Ingresses, are installed when a cluster is created. You can set this parameter to disable the automatic installation of a component. Valid values: • `true`: disables the automatic installation of the component. • `false`: allows the automatic installation of the component.

Examples

Sample requests

```
GET /clusters/components/metadata?region=cn-beijing    &cluster_type=kubernetes HTTP/1.1
Content-Type:application/json
```

Sample success responses

`XML` format

```
HTTP/1.1 200 OK
Content-Type:application/xml
<StandardComponents>
    <cloud-controller-manager>
        <name>cloud-controller-manager</name>

}
```

Error codes

You can check further details of error codes. For more information, see Error codes.

3.1.3.4.3. DescribeClusterAddonsVersion

Queries the details of all components that are installed in a specified Container Service cluster.

Request syntax

```
GET /clusters/ClusterId/components/version HTTP/1.1
Content-Type:application/json
```

Request parameters

Request path parameters

Parameter	Type	Required	Example	Description
ClusterId	String	Yes	c82e6987e2961451182edacd74faf****	The ID of the cluster.

Response syntax

```
HTTP/1.1 200
Content-Type:application/json
{
  "key" : {
    "component_name" : "String",
    "version" : "String",
    "next_version" : "String",
    "changed" : "String",
    "can_upgrade" : Boolean,
    "policy" : "String",
    "ready_to_upgrade" : "String",
    "exist" : Boolean,
    "required" : Boolean,
    "message" : "String",
    "value" : "String"
  }
}
```

Response parameters

Response body parameters

Parameter	Type	Example	Description
	Map		The response body parameters.

Parameter	Type	Example	Description
	Object		The details of the component.
component_name	String	ack-node-problem-detector	The name of the component.
version	String	1.2.1	The current version of the component.
next_version	String	1.2.1	The version to which the component can be upgraded.
changed	String	false	Indicates whether the component was upgraded. Valid values: • `true`: The component was upgraded. • `false`: The component was not upgraded.
can_upgrade	Boolean	false	Indicates whether the component is upgradable. Valid values: • `true`: The component is upgradable. • `false`: The component is not upgradable.
policy	String	overwrite	The upgrade policy of the component. • `overwrite`: The component configurations of the later version overwrite those of the earlier version. Default value: `overwrite`.
ready_to_upgrade	String	false	Indicates whether the component meets the upgrade conditions. Valid values: • `true`: The component meets the upgrade conditions. • `false`: The component does not meet the upgrade conditions.

Parameter	Type	Example	Description
exist	Boolean	true	Indicates whether the component was installed. Valid values: • `true`: The component was installed. • `false`: The component was not installed.
required	Boolean	false	Indicates whether the component is required in a Container Service cluster. Valid values: • `true`: The component is required in a Container Service cluster. • `false`: The component is not required in a Container Service cluster.
message	String	A plug-in that detects exceptions and reports them to the Kubernetes event center.	Additional information about whether the component is upgradable.
value	String	npd:\n # Custom monitor definitions to add to Node Problem Detector ****	The custom parameter setting. When you install a component, you can customize parameter settings for the component.

Examples

Sample requests

```
GET /clusters/c82e6987e2961451182edacd74faf****/components/version HTTP/1.1
Content-Type:application/json
```

Sample success responses

`XML` format

```
HTTP/1.1 200 OK
Content-Type:application/xml
<ack-node-problem-detector>
    <exist>true</exist>
    <component_name>ack-node-problem-detector</component_name>
    <can_upgrade>false</can_upgrade>
    <ready_to_upgrade>false</ready_to_upgrade>
    <message>A plug-in that detects node exceptions and reports them to the Kubernetes even
t center.</message>
    <version>1.2.1</version>
    <value>npd:
  # Custom monitor definitions to add to Node Problem Detector ****</value>
    <required>false</required>
    <next_version>1.2.1</next_version>
    <changed>false</changed>
    <policy>overwrite</policy>
</ack-node-problem-detector>
```

`JSON` format

```
HTTP/1.1 200 OK
Content-Type:application/json
{
  "ack-node-problem-detector" : {
    "exist" : "true",
    "component_name" : "ack-node-problem-detector",
    "can_upgrade" : "false",
    "ready_to_upgrade" : "false",
    "message": "A plug-in that detects node exceptions and reports them to the Kubernetes e
vent center.",
    "version" : "1.2.1",
    "value" : "npd:\n  # Custom monitor definitions to add to Node Problem Detector ****",
    "required" : "false",
    "next_version" : "1.2.1",
    "changed" : "false",
    "policy" : "overwrite"
  }
}
```

Error codes

You can check further details of error codes. For more information, see Error codes.

3.1.3.4.4. DescribeClusterAddonsUpgradeStatus

Queries the upgrade status of the specified components in a Container Service cluster.

Request syntax

```
GET /clusters/[ClusterId]/components/upgradestatus?componentIds=["String"] HTTP/1.1
Content-Type:application/json
```

Request parameters

Request path parameters

Parameter	Type	Required	Example	Description
ClusterId	String	Yes	c23421cfa74454bc8b37163fd19af****	The ID of the cluster.

Request query parameters

Parameter	Type	Required	Example	Description
componentIds	Array of String	No	metric-server	The names of the components that you want to query.

Response syntax

```
HTTP/1.1 200
Content-Type:application/json
{
  "key" : {
    "addon_info" : {
      "component_name" : "String",
      "version" : "String",
      "ready_to_upgrade" : "String"
    },
    "tasks" : {
      "created_at" : "String",
      "finished_at" : "String",
      "status" : "String",
      "is_canceled" : Boolean
    }
  }
}
```

Response parameters

Response body parameters

Parameter	Type	Example	Description
	Map		The returned data.
	Object		The details of the upgrade status of the queried components.

Parameter	Type	Example	Description
addon_info	Object		The information about the component.
component_name	String	cloud-controller-manager	The name of the component.
version	String	v1.9.3.340-g9830b58-aliyun	The current version of the component.
ready_to_upgrade	String	true	Indicates whether the component is upgradable. Valid values: • `true`: The component is upgradable. • `false`: The component is not upgradable.
tasks	Object		The details of the upgrade task.
created_at	String	2020-12-28T17:00:50Z	The beginning time of the task.
finished_at	String	2020-12-28T17:05:36Z	The end time of the task.
status	String	Success	The state of the upgrade task.
is_canceled	Boolean	false	Indicates whether the upgrade task was canceled. Valid values: • `true`: The upgrade task was canceled. • `false`: The upgrade task was not canceled.

Examples

Sample requests

```
GET /clusters/[ClusterId]/components/upgradestatus?componentIds=["metric-server"] HTTP/1.1
Content-Type:application/json
```

Sample success responses

`XML` format

```
HTTP/1.1 200 OK
Content-Type:application/xml
<cloud-controller-manager>
    <tasks>
        <created_at>2020-12-28T17:01:55Z</created_at>
        <finished_at>2020-12-28T17:05:11Z</finished_at>
        <is_canceled>false</is_canceled>
        <status>Success</status>
    </tasks>
    <addon_info>
        <component_name>cloud-controller-manager</component_name>
        <version>v1.9.3.340-g9830b58-aliyun</version>
        <ready_to_upgrade>true</ready_to_upgrade>
    </addon_info>
</cloud-controller-manager>
<metric-server>
    <tasks>
        <created_at>2020-12-28T17:00:32Z</created_at>
        <finished_at>2020-12-28T17:05:54Z</finished_at>
        <is_canceled>false</is_canceled>
        <status>Success</status>
    </tasks>
    <addon_info>
        <component_name>metric-server</component_name>
        <version/>
        <ready_to_upgrade>true</ready_to_upgrade>
    </addon_info>
</metric-server>
```

`JSON` format

```
HTTP/1.1 200 OK
Content-Type:application/json
{
  "cloud-controller-manager" : {
    "tasks" : {
      "created_at" : "2020-12-28T17:01:55Z",
      "finished_at" : "2020-12-28T17:05:11Z",
      "is_canceled" : false,
      "status" : "Success"
    },
    "addon_info" : {
      "component_name" : "cloud-controller-manager",
      "version" : "v1.9.3.340-g9830b58-aliyun",
      "ready_to_upgrade" : "true"
    }
  },
  "metric-server" : {
    "tasks" : {
      "created_at" : "2020-12-28T17:00:32Z",
      "finished_at" : "2020-12-28T17:05:54Z",
      "is_canceled" : false,
      "status" : "Success"
    },
    "addon_info" : {
      "component_name" : "metric-server",
      "version" : "",
      "ready_to_upgrade" : "true"
    }
  }
}
```

Error codes

You can check further details of error codes. For more information, see Error codes.

3.1.3.4.5. UpgradeClusterAddons

Upgrades a specified component of a Container Service cluster to the required version.

Request syntax

```
POST /clusters/ClusterId/components/upgrade HTTP/1.1
Content-Type:application/json
[ {
  "component_name" : "String",
  "next_version" : "String",
  "version" : "String"
} ]
```

Request parameters

Request path parameters

Parameter	Type	Required	Example	Description
ClusterId	String	Yes	cf4299b79b3e34226abfdc80a4bda****	The ID of the cluster.

Request body parameters

Parameter	Type	Required	Example	Description
	Array	No		The request parameters.
component_name	String	Yes	coredns	The name of the component that you want to upgrade.
next_version	String	Yes	1.6.7	The version to which the component can be upgraded. You can call `DescribeClusterAddonsVersion` to query the version to which the component can be upgraded.
version	String	Yes	v1.6.2	The current version of the component.

Response syntax

```
HTTP/1.1 200 OK
```

Response parameters

No response parameters.

Examples

Sample requests

```
POST /clusters/cf4299b79b3e34226abfdc80a4bda****/components/upgrade HTTP/1.1
Content-Type:application/json
[ {
  "component_name" : "coredns",
  "next_version" : "1.6.7",
  "version" : "v1.6.2"
} ]
```

Sample success responses

`JSON` format

```
HTTP/1.1 200 OK
```

Error codes

You can check further details of error codes. For more information, see Error codes.

3.1.3.4.6. UnInstallClusterAddons

Uninstalls components from a specified Container Service cluster.

Request syntax

```
POST /clusters/ClusterId/components/uninstall HTTP/1.1
Content-Type:application/json
[ {
  "name" : "String"
} ]
```

Request parameters

Request path parameters

Parameter	Type	Required	Example	Description
ClusterId	String	Yes	c5b5e80b0b64a4bf6939d2d8fbbc5****	The ID of the cluster.

Request body parameters

Parameter	Type	Required	Example	Description
	Array	No		The list of components that you want to uninstall. The list is an array.
name	String	No	ack-node-problem-detector	The name of the component.

Response syntax

```
HTTP/1.1 200 OK
```

Response parameters

No response parameters.

Examples

Sample requests

```
POST /clusters/c5b5e80b0b64a4bf6939d2d8fbbc5****/components/uninstall HTTP/1.1
Host:cs.aliyuncs.com
Content-Type:application/json
[ {
  "name" : "ack-node-problem-detector"
} ]
```

Sample success responses

`JSON` format

```
HTTP/1.1 200 OK
```

Error codes

You can check further details of error codes. For more information, see Error codes.

3.1.3.5. Commonly used parameters

addon

Configurations of cluster components.

Parameter	Type	Example	Description
name	String	nginx-ingress-controller	The name of a component.
config	String	{\"IngressSlbNetworkType\":\"internet\"}	The configuration of a component.

Parameter	Type	Example	Description
disabled	Boolean	false	Specifies whether a component is automatically installed in a newly created cluster. In addition to the required components, some optional components, such as Log Service components, are also installed when you create a cluster. You can set this parameter to disable the automatic installation of an optional component. You can install the component in the console or by calling the API after the cluster is created. Valid values: • `true`: disables the automatic installation of a component. • `false`: allows the automatic installation of a component.

data_disk

Configurations of data disks that are mounted to nodes.

Parameter	Type	Example	Description

Parameter	Type	Example	Description
category	String	cloud_ssd	The type of data disk. Valid values: • `cloud`: basic disk. • `cloud_efficiency`: ultra disk. • `cloud_ssd`: standard SSD. • `cloud_essd`: enhanced SSD. Default value: `cloud_efficiency`.
size	Long	40	The size of a data disk. Unit: GiB. Valid values: 40 to 32768. Default value: `120`.
encrypted	String	true	Specifies whether to encrypt a data disk. Valid values: • `true`: encrypts the data disk. • `false`: does not encrypt the data disk. Default value: `false`.
auto_snapshot_policy_id	String	sp-2zej1nogjvovnz4z****	The ID of an automatic snapshot policy. Automatic backup is performed for disks based on the specified automatic snapshot policy. By default, this parameter is empty. This indicates that automatic backup is disabled.

runtime

Configurations of container runtimes.

Parameter	Type	Example	Description
name	String	docker	The name of a container runtime. The following types of runtimes are supported by Container Service. • `Sandboxed-Container.runv` : runs sandboxed containers and provides improved isolation for application containers. • `docker` . • `containerd` . Default value: `docker` .
version	String	19.03.5	The version of a container runtime. By default, the latest version is used.

tag

Configurations of labels.

Parameter	Type	Example	Description
key	String	env	The `key` of a label.
value	String	prod	The `value` of a label.

taint

Configurations of node taints.

Parameter	Type	Example	Description
key	String	key	The `key` of a taint.
value	String	value	The `value` of a taint.
effect	String	NoSchedule	The scheduling policy. Valid values: • `NoSchedule`: Pods that do not tolerate this taint are not scheduled to nodes with this taint. This policy affects only the scheduling process and takes effect for only pods to be scheduled. Scheduled pods are not affected. • `NoExecute`: Pods that do not tolerate this taint are evicted after this taint is added to the node. • `PreferNoSchedule`: a preferable policy on pods. Scheduled pods are not affected. If this taint is added to a node, the system tries not to schedule pods that do not tolerate this taint to the node. Default value: `NoSchedule`.

3.1.3.6. Error codes

This topic describes the error codes that are returned when you fail to call API operations of Container Service for Kubernetes (ACK).

Error code	Error message	Description
ErrorRegionConfigNotFound?	region (%s) dockerVersion (%s) config not found in our records	The error message returned because the specified container version is unavailable in the current region.
ErrorValidateParameters	nvalid CIDR, 192.168.X.0/24 or 172.18.X.0/24 ~ 172.31.X.0/24 are accepted	The error message returned because the specified request parameters that are used to manage to the ACK cluster are invalid.
ErrorInvalidInstanceType	instanceType (%s) invalid	The error message returned because the specified instance type is invalid.
ErrorInitClusterTask	init cluster task failed	The error message returned because the ACK cluster is failed to be initialized.
ErrorClusterNotFound	cluster (%s) not found in our records	The error message returned because the specified cluster does not exist.
ErrorGenerateShorTermAccessKeys	N/A	The error message returned because an error has occurred when the system attempted to retrieve the AccessKey information.
ErrorMissingClusterName	N/A	The error message returned because the cluster name is missing from the request parameters.
502	N/A	The error message returned because the current request failed. Refresh the page or try again later.
LB_SLB_HTTPS_PORT_MUST_CREATE_FIRST	N/A	The error message returned because an SSL certificate must be created and specified before you configure the HTTPS listening port for the Server Load Balancer (SLB) instance.
HOST_NOT_FOUND	N/A	The error message returned because the specified host is not found.

Error code	Error message	Description
ROUTING_INVALID_DOMAIN	N/A	The error message returned because the specified URL that is used by the service contains an invalid domain name.
ErrorClusterNameAlreadyExist	N/A	The error message returned because the specified cluster name already exists. Modify the cluster name and try again.
ErrorMissingClusterID	N/A	The error message returned because the cluster ID is missing from the request parameters.
CLUSTER_IMAGE_NEEDED	N/A	The error message returned because an image must be specified for the ACK cluster.
LB_HOST_PORT_NOT_SPECIFIED	N/A	The error message returned because a host port that is mapped to the container port must be specified when you configure the SLB instance.
403	N/A	The error message returned because you are not authorized to perform the specified operation. If you use a Resource Access Management (RAM) user, contact the owner of the Alibaba Cloud account to authorize the RAM user.
504	N/A	The error message returned because the internal gateway timed out.
PROJECT_NAME_EXIST	N/A	The error message returned because the specified application name already exists.
ROUTING_DUPLICATE_COMBO	N/A	The error message returned because the specified URL exists. Check whether the URL is used by another service of the ACK cluster.
CONTAINER_NOT_FOUND	N/A	The error message returned because the specified container does not exist.

Error code	Error message	Description
InternalError	N/A	The error message returned because an internal service error has occurred. Try again later.
ErrorCheckAcl	N/A	The error message returned because the specified operation is not supported when the ACK cluster is in the current state.
ErrorNotSupport	N/A	The error message returned because the cluster scale-in operation is not supported.
PROJECT_VERSION_NEEDED	N/A	The error message returned because the application version must be specified.
ROUTING_CONVERT_TO_PORT_FAILED	N/A	The error message returned because the port that is used by the service is failed to be parsed.
SERVER_ERROR_CODE	N/A	The error message returned because the service is busy. Refresh the service and try again.
ROUTING_CONTEXT_ROOT_TOO_LONG	N/A	The error message returned because the length of the specified path in the URL that is used by the service exceeds the upper limit.
CLUSTER_RAMAK_INVLIAD	N/A	The error message returned because the specified AccessKey pair of the ACK cluster is invalid. Activate the RAM service and request another AccessKey pair.
ServiceUnavailable	N/A	The error message returned because the service is temporarily unavailable due to a brief exception.
ErrorQuerySecurityGroup	N/A	The error message returned because the system failed to query the security group.
LB_INVLIAD_PROTOCOL	N/A	The error message returned because the specified protocol of the listening port is invalid when you configure the SLB instance.

Error code	Error message	Description
ROUTING_INVALID_CONTEXT_ROOT	N/A	The error message returned because the specified path in the URL that is used by the service is invalid.
ROUTING_DOMAIN_NAME_TOO_LONG	N/A	The error message returned because the length of the domain name in the URL that is used by the service exceeds the upper limit.
505	N/A	The error message returned because the specified HTTP version is not supported.
ErrorMissingIP	N/A	The error message returned because the IP address is missing from the request parameters.
ErrorAttachInstance	N/A	The error message returned because the specified instance failed to be manually added.
LB_SLB_NAME_OR_ID_NOT_FOUND	N/A	The error message returned because the specified name and ID of the SLB instance cannot be found.
ErrorInvalidNodeId	N/A	The error message returned because the specified node ID in the request parameters is invalid.
503	N/A	The error message returned because the current request failed. Refresh the page or try again later.
LB_INVLIAD_CONTAINER_PORT	N/A	The error message returned because the specified container port is invalid when you configure the SLB instance.
ErrorInvalidClusterName	N/A	The error message returned because the format of the specified cluster name is invalid.
ErrorNoAttachEcsInstance	N/A	The error message returned because the manually added instance is invalid.
ErrorCheckClusterStatus	N/A	The error message returned because the specified ACK cluster exists.

Error code	Error message	Description
LB_SLB_SHARED_BETWEEN_SERVICES	N/A	The error message returned because different services cannot share the same SLB instance when you configure the SLB instance.
InvalidParameter	N/A	The error message returned because the specified parameter is invalid.
ErrorUpdateClusterName	N/A	The error message returned because the ACK cluster name failed to be updated.
ROUTING_FULLY_QUALIFIED_DOMAIN_NAME_NEEDED	N/A	The error message returned because the URL that is used by the HTTPS service must be a fully qualified domain name.
ErrorQueryRegionConfig	N/A	The error message returned because the configurations that are specified in the request to create an ACK cluster are invalid.
ErrorMissingInstanceID	N/A	The error message returned because the instance ID is missing from the request parameters.
ROUTING_COMBO_ALREADY_EXIST	N/A	The error message returned because the specified URL has been used by another service of the ACK cluster.

4.Auto Scaling (ESS)

4.1. Developer Guide

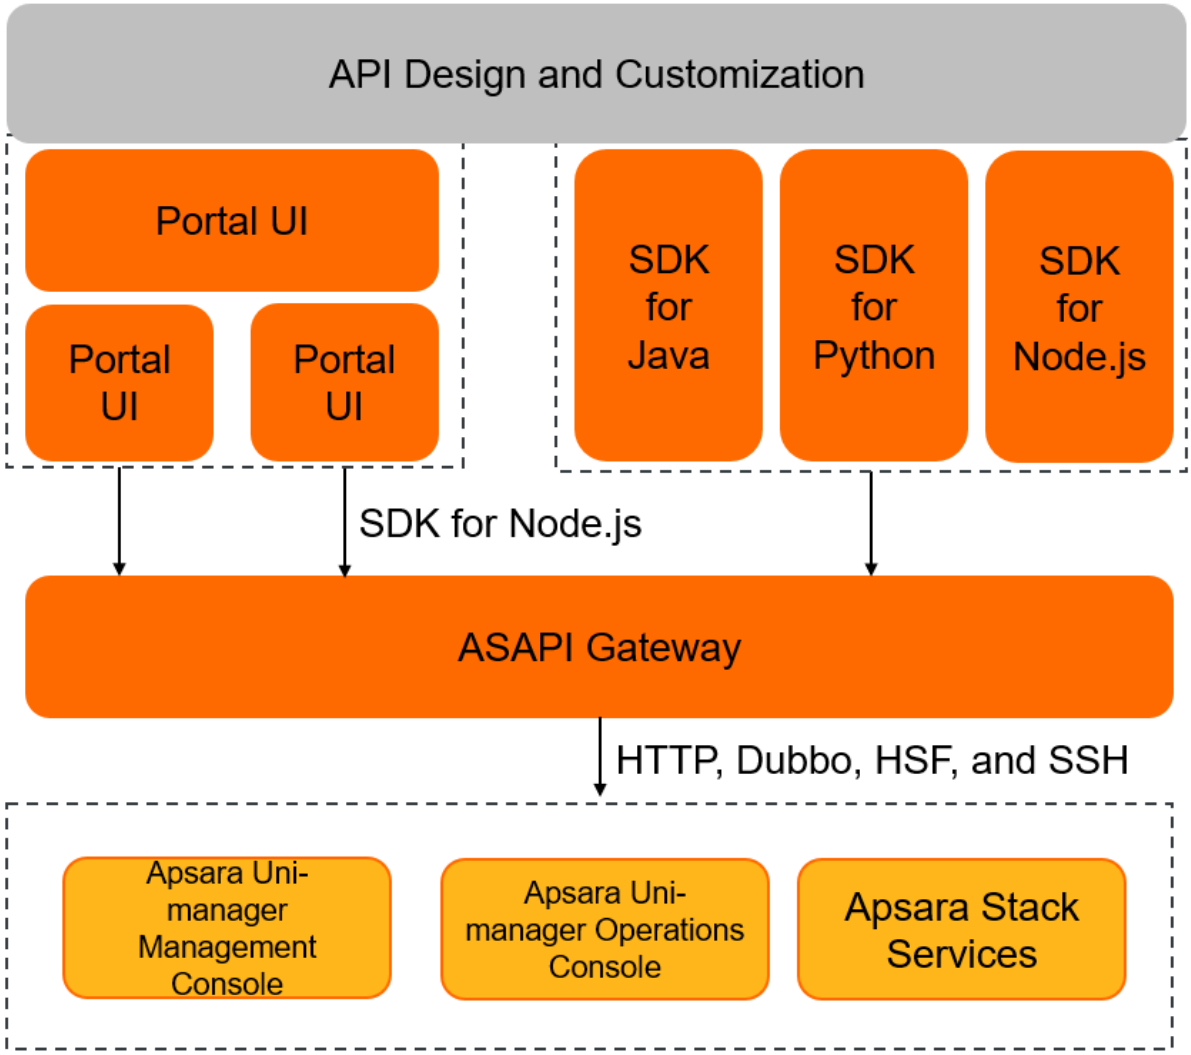
4.1.1. Call SDKs for cloud services by using ASAPI

4.1.1.1. 文档标题缺失，请补全后重新导出

4.1.1.1.1. ASAPI overview

This topic describes the architecture and features of the Apsara Stack API (ASAPI).

The ASAPI is a unified ingress gateway for Apsara Stack services and a main component of the Apsara Uni-manager Management Console. The ASAPI provides a unified method for you to manage and make API calls. You can use Apsara Stack SDK to centrally make API calls to Apsara Stack services, including Elastic Compute Service (ECS) and Virtual Private Cloud (VPC).



The ASAPI allows you to make API calls to manage and maintain Apsara Stack services.

- Make API calls to implement enterprise-grade management. For example, you can manage organizations, users, roles, resource sets, and logon policies. These operations are provided by the Apsara Uni-manager Management Console.
- Make API calls to manage operations. For example, you can manage quotas, usage statistics, specifications, and password policies. These operations are provided by the Apsara Uni-manager Management Console.
- Make API calls to manage resources. For example, you can create, delete, query, or modify cloud resources. These operations are provided by Apsara Stack services. If you call an API operation to create an ECS instance or a VPC, the API operation is provided by ECS or VPC.
- Make API calls to query monitoring metrics of Apsara Stack services. These operations are provided by the Apsara Uni-manager Management Console.
- Make API calls to perform O&M. For example, you can manage monitoring and alerting, inventories, tasks, and physical servers. These operations are provided by the Apsara Uni-manager Operations Console.

For more information, see the developer guide of the corresponding Apsara Stack service. For information about API operations used to manage organization users, see *Apsara Uni-manager Management Console Developer Guide*. For information about the API operation used to create an ECS instance, see *ECS Developer Guide*.

> **Note** If the "Use Apsara Stack SDK to make API calls" section is included in the developer guide of an Apsara Stack service, the ASAPI is supported by the Apsara Stack service. In this case, you can make API calls based on the developer guide.

4.1.1.1.2. Preparations

4.1.1.1.2.1. Log on to the API Tool console

You can log on to the API Tool console from the Apsara Uni-manager Management Console.

Prerequisites

- The URL of the Apsara Uni-manager Management Console is obtained from the deployment personnel before you log on to the Apsara Uni-manager Management Console.
- We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL of the Apsara Uni-manager Management Console. Press the Enter key.
2. Enter your username and password.

   Obtain the username and password that you can use to log on to the console from the operations administrator.

> **Note** When you log on to the Apsara Uni-manager Management Console for the first time, you must change the password of your username. Your password must meet complexity requirements. The password must be 10 to 32 characters in length and must contain at least two of the following character types:
>
> - Uppercase or lowercase letters
> - Digits
> - Special characters, which include ! @ # $ %

3. Click **Log On**.
4. In the top navigation bar, choose **Products > Others > API Tool**.

4.1.1.1.2.2. View information about API operations

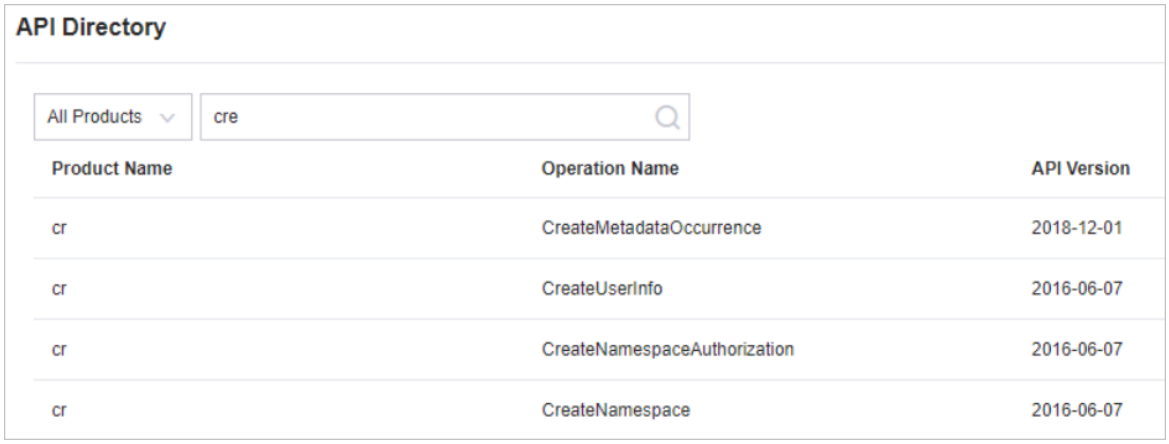
This topic describes how to view information about API operations. Before you use SDKs, obtain service names, API operation names, and API operation versions.

Context

The API operations on the API Directory page are only for reference. For information about how to call API operations, see developer guides of the corresponding cloud services. If the information on the API Directory page is inconsistent with that in the developer guide of the corresponding cloud service, the information in the developer guide prevails.

Procedure

1. Go to the API Tool console. For more information, see Log on to the API Tool console.
2. In the left-side navigation pane, click **API Directory**.
3. On the **API Directory** page, select the desired service from the drop-down list, enter a keyword of an API operation name in the search box, and then click the search icon.



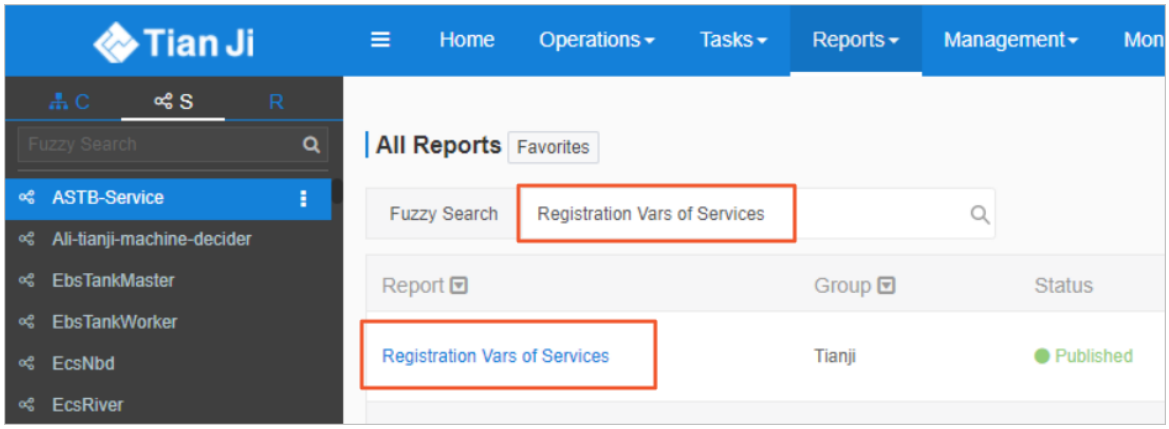
4. Then, you can view the service name, API operation name, and API operation version.

4.1.1.1.2.3. Generate an endpoint for the ASAPI

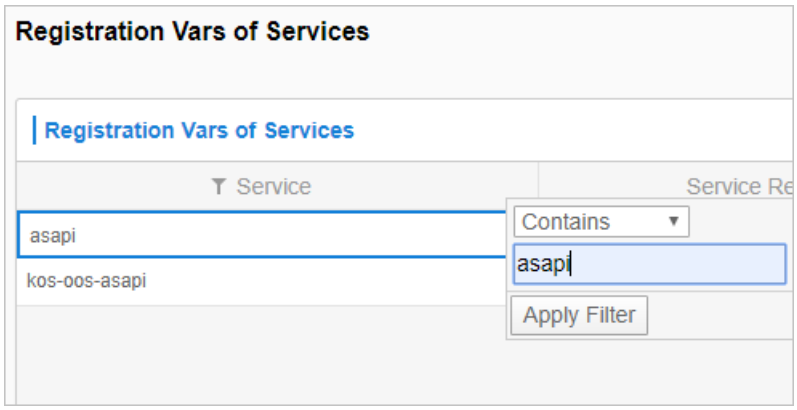
This topic describes three methods used to generate an endpoint for the Apsara Stack API (ASAPI).

Method 1: Use Registration Vars of Services to generate an endpoint

1. Log on to Apsara Infrastructure Management Framework.
   i. Log on to the Apsara Uni-manager Operations Console.
   ii. In the top navigation bar, click **O&M**.
   iii. In the left-side navigation pane, choose **Product Management** > **Products**.
   iv. In the Apsara Stack O&M section, click **Apsara Infrastructure Management Framework**.
2. In the left-side navigation pane, click **Reports**.
3. On the **All Reports** page, search for `Registration Vars of Services` and click the report name.



4. On the **Registration Vars of Services** page, click the icon next to **Service** and search for `asapi`.



5. Find the asapi service, right-click in the **Service Registration** column, and then select **Show More** from the shortcut menu.

   In the **Details** dialog box, obtain the value of **asapi.public.endpoint**.
6. Generate an endpoint for the ASAPI based on the following format:

```
https://<asapi.public.endpoint>/asapi/v3
```

Method 2: Use cluster resources to generate an endpoint

1. Log on to Apsara Infrastructure Management Framework.
   i. Log on to the Apsara Uni-manager Operations Console.

ii. In the top navigation bar, click **O&M**.

iii. In the left-side navigation pane, choose **Product Management** > **Products**.

iv. In the Apsara Stack O&M section, click **Apsara Infrastructure Management Framework**.

2. Go to the cluster operations page.

i. In the left-side navigation pane, choose Operations > Cluster Operations.

ii. In the **Cluster** search box, enter `ascm`.

iii. Find the cluster that you want to manage and click **Operations** in the **Actions** column.

3. Obtain the value of the domain parameter.

i. Click the Cluster Resources tab.

ii. In the **Name** field, search for `asapi_dns_public`.

iii. Click **Details** in the **Application Parameter** column.

In the **Application Parameter** message, obtain the value of the **domain** parameter.

4. Generate an endpoint for the ASAPI based on the following format:

```
https://<domain>/asapi/v3
```

Method 3: Concatenate strings to generate an endpoint

You can also concatenate strings to generate an endpoint based on the following format:

```
https://public.asapi.<region>.<internet-domain>/asapi/v3
```

> **Note**
>
> 1. Replace <region> with your actual region ID. For information about how to query a region ID, see Query a region ID.
> 2. Replace <internet-domain> with the root domain of your Apsara Stack service. To obtain the root domain, contact Apsara Stack O&M personnel. Take note of this point: Use the internet-domain parameter instead of the intranet-domain parameter.

If the **region** value is `cn-****-****-d01` and the **internet-domain** value is `inter.****.****.com`, the following endpoint can be generated:

```
https://public.asapi.cn-****-****-d01.inter.****.****.com/asapi/v3
```

4.1.1.1.2.4. Obtain Apsara Stack SDKs

The Apsara Stack API (ASAPI) is a unified portal provided by Apsara Stack. You can use the ASAPI to connect to all Apsara Stack services. Apsara Stack provides SDKs for API calls.

For more information about how to obtain Apsara Stack SDKs, see Apsara Stack documentation.

4.1.1.1.2.5. Obtain an AccessKey pair

An AccessKey pair that consists of an AccessKey ID and an AccessKey secret is used to implement symmetric encryption. This helps you verify the identity of a requester. The AccessKey ID is used to identify a user. The AccessKey secret is used to encrypt the signature string. This topic describes how to obtain an AccessKey pair.

Prerequisites

An account of the operations administrator or the level-1 organization administrator is obtained. Only an operations administrator or a level-1 organization administrator can obtain an AccessKey pair.

Context

If you need to make API calls to the Apsara Uni-manager Management Console or other Apsara Stack services, we recommend that you use the AccessKey pair of a personal account. If you use the AccessKey pair of a personal account, configure the request headers that are described in the following table for access control. Otherwise, an error that indicates insufficient permissions can occur.

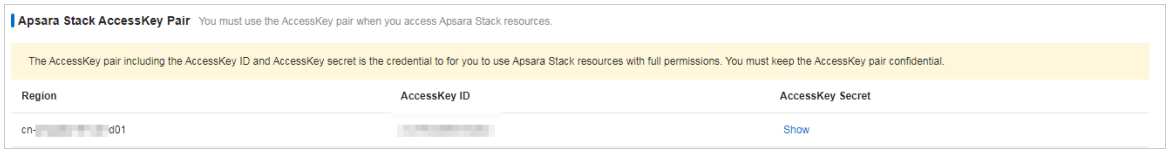
Parameter	Description
x-acs-regionid	The ID of the region, for example, cn-hangzhou-*.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console. For information about how to obtain an organization ID, see the "GetOrganizationList" section in Apsara Uni-manager Management Console Developer Guide.
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console. For information about how to obtain a resource set ID, see the "ListResourceGroup" section in Apsara Uni-manager Management Console Developer Guide.
x-acs-instanceid	The ID of the instance to which you make API calls. If you need to make API calls to an Elastic Compute Service (ECS) instance, obtain the ID of the ECS instance on the Instances page.

Warning The AccessKey pair of a personal account is managed and controlled by the permission system of the Apsara Uni-manage Management Console. If you need to obtain the AccessKey pair of an account that has permissions on an organization, make sure that your operation is allowed by an administrator. This ensures security. The account that has permissions on an organization is a privileged account.

Obtain the AccessKey pair of a personal account

To obtain the AccessKey pair of a personal account, perform the following operations:

1. Log on to the Apsara Uni-manager Management Console.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and click **User Information**.
3. In the **Apsara Stack AccessKey Pair** section, obtain the AccessKey pair.



> **Note** The AccessKey pair that consists of an AccessKey ID and an AccessKey secret is the credential for you to have full permissions on Apsara Stack resources. Keep your AccessKey pair confidential.

Obtain the AccessKey pair of an account that has permissions on an organization

To obtain the AccessKey pair of an account that has permissions on an organization, perform the following operations:

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Organizations**.
4. In the Organizations navigation tree, click the name of the organization that you want to manage.
5. On the right side of the page, click **Obtain AccessKey Pair**.
6. In the message that appears, obtain the AccessKey pair of the account that has permissions on the organization.

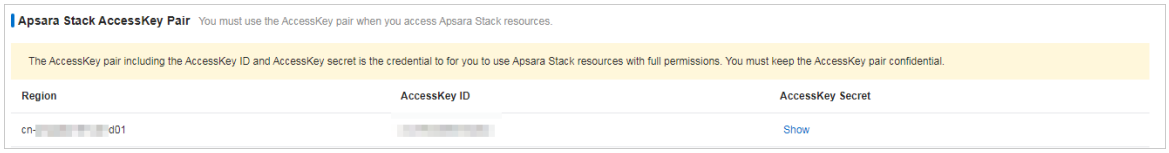
> **Note** The system automatically allocates an AccessKey pair to the account that has permissions on the level-1 organization. The same AccessKey pair is used by the accounts that have permissions on the subordinate organizations.

4.1.1.1.2.6. Query a region ID

When you use Apsara Stack SDK for Node.js to make API calls, specify a region ID. You can obtain a region ID in the Apsara Uni-manager Management Console.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and click **User Information**.
3. In the **Apsara Stack AccessKey Pair** section, view the region ID.



4.1.1.1.3. Common parameters

Common request parameters must be included in all API requests.

Sample common parameters

The following table describes the common parameters that are used when you call API operations supported by the Apsara Stack API (ASAPI).

Parameter	Type	Required	Description
Action	String	Yes	The operation that you want to perform. For more information, see View information about API operations.
Product	String	Yes	The name of the service.
Version	String	Yes	The version of the API operation. For more information, see View information about API operations.
RegionId	String	Yes	The ID of the region. For more information, see Query a region ID.
AccessKeyId	String	Yes	The AccessKey ID used to connect to the service. For more information, see Obtain an AccessKey pair.
Signature	String	Yes	The signature string of the current request. For more information about how signatures are calculated, see Request signatures.

Parameter	Type	Required	Description
SignatureMethod	String	Yes	The encryption method of the signature string. Valid values: HMAC-SHA1 and HMAC-SHA256.
SignatureVersion	String	Yes	The version of the signature encryption algorithm. Valid values: 1.0 and 2.0.
SignatureNonce	String	Yes	A unique, random number used to prevent replay attacks. You must use different numbers for different requests.
Timestamp	String	Yes	The timestamp of the request. Specify the time in the ISO 8601 standard in the yyyy-MM-ddTHH:mm:ssZ format. The time must be in UTC. Sample value: 2018-01-01T12:00:00Z.
Format	String	Yes	The format in which to return the response. Set the value to JSON.

Note

The `Signature`, `SignatureMethod`, `SignatureVersion`, `SignatureNonce`, `Timestamp`, and `Format` parameters are encapsulated into Apsara Stack SDK. You do not need to configure these parameters.

4.1.1.1.4. SDK description

4.1.1.1.4.1. Use Apsara Stack SDK for Java to call API operations

This topic describes how to obtain and use Apsara Stack SDK for Java to call API operations.

Prerequisites

- An authorized account and an AccessKey pair are obtained. The AccessKey pair consists of an AccessKey ID and an AccessKey secret. For more information about how to obtain an AccessKey pair in the Apsara Uni-manager Management Console, see Obtain an AccessKey pair.
- The endpoint of the Apsara Stack API (ASAPI) is obtained. For more information, see Generate an endpoint for the ASAPI.
- Apsara Stack SDK for Java 1.8 or later is installed.

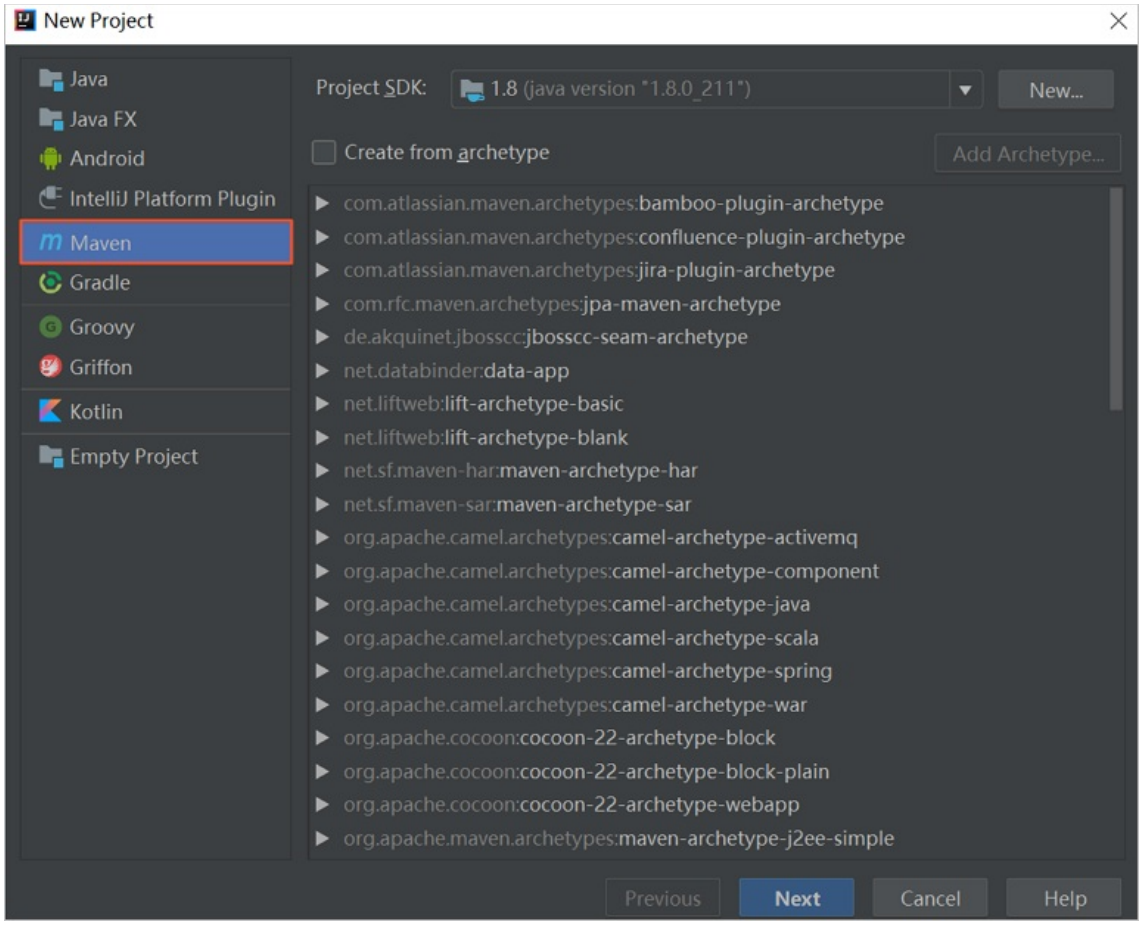
Background information

The help center of Apsara Stack provides Maven dependencies and JAR files for Apsara Stack SDK for Java. You can write code to use Apsara Stack SDK for Java to call API operations.

In this example, the Windows 10 64-bit OS and IntelliJ IDEA are used.

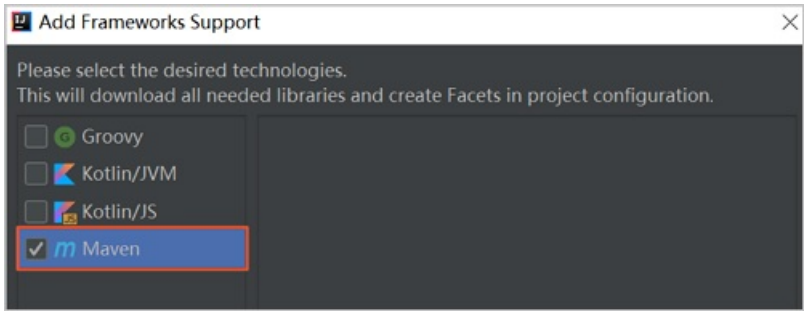
Procedure

1. Use one of the following methods to configure Maven in IntelliJ IDEA. Maven is a tool used for project management.
   - Use Maven that is integrated in IntelliJ IDEA.
   - Download Maven based on the OS that you are using from the official website and configure Maven. For more information, see Download Maven.
2. Obtain the Maven dependencies for Apsara Stack SDK for Java from the official website. For more information about how to obtain the dependencies, see Obtain the core package for ASAPI.
3. Use one of the following methods to create a Maven project:
   - Method 1: Create a Maven project in IntelliJ IDEA.

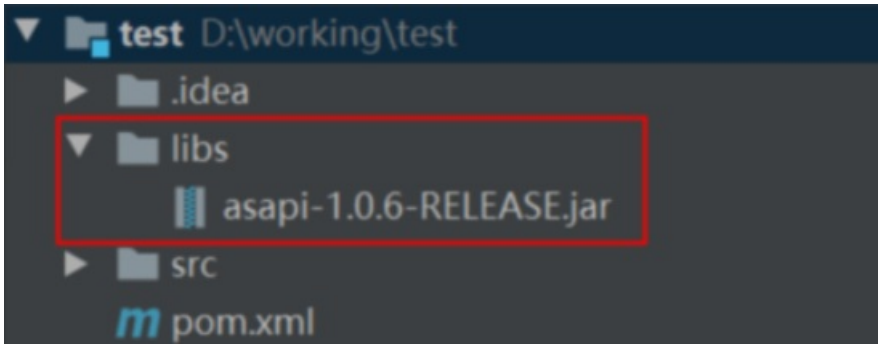


- Method 2: Convert an existing project to a Maven project.
  a. Right-click the project that you want to convert and select **Add Framework Support...**.

  b. Select **Maven** and click **OK**.



4. Create a folder named libs in the root directory of the project. Then, add the JAR file of Apsara Stack SDK for Java to the libs folder, as shown in the following figure.



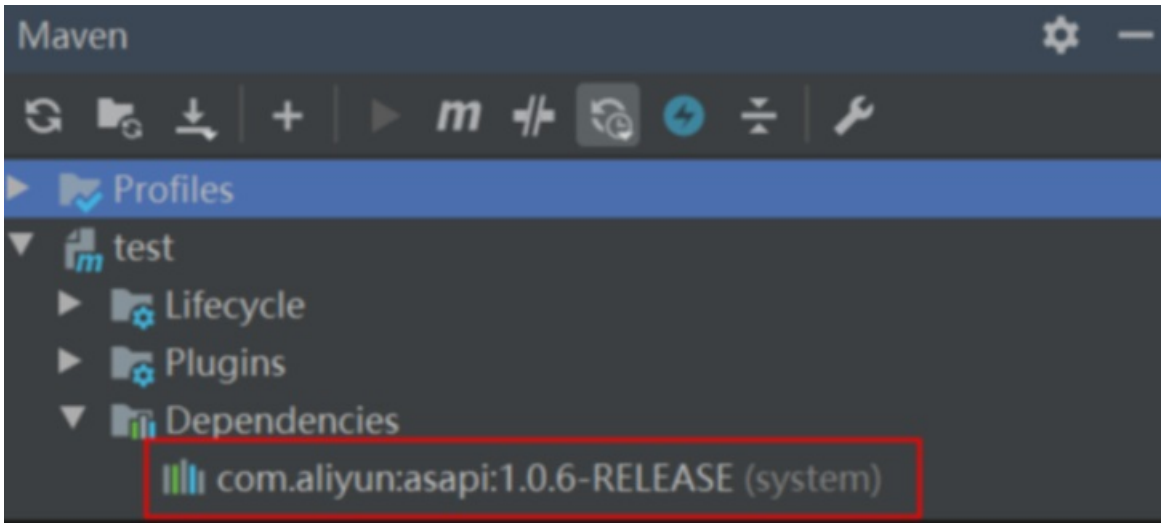
5. Add the dependencies of Apsara Stack SDK for Java to the pom.xml file in the project directory.

```
<dependencies>
    <dependency>
        <groupId>com.aliyun</groupId>
        <artifactId>asapi</artifactId>
        <version>1.0.6-RELEASE</version>
        <scope>system</scope>
        <systemPath>${project.basedir}/libs/asapi-1.0.6-RELEASE.jar</systemPath>
    </dependency>
  <dependency>
        <groupId>com.alibaba</groupId>
        <artifactId>alicrypto-java-aliyun</artifactId>
    <version>1.0.4</version>
    <systemPath>${project.basedir}/libs/alicrypto-java-aliyun-1.0.4.jar</systemPath>
  </dependency>
  <dependency>
    <groupId>com.aliyun</groupId>
    <artifactId>gmsse</artifactId>
    <version>1.1.0</version>
    <systemPath>${project.basedir}/libs/gmsse-1.1.0.jar</systemPath>
  </dependency>
</dependencies>
```

> **Note** Replace `1.0.6-RELEASE` with the actual version of Apsara Stack SDK for Java.

6. On the right side of IntelliJ IDEA, view information in the Maven section.

If the information in the following figure appears, the dependencies are added.



Use Apsara Stack SDK for Java

You can use the GET or POST method to call API operations provided by the ASAPI. The following sample code shows how to call API operations:

```
// 1. Create a connection to an ASClient object.
ASClient client = new ASClient();
// 2. Configure the identifier of the requester. This parameter is required and used only f
or identification. You can set this parameter to a random value.
client.setSdkSource("<The identifier of the requester>");
Map<String, Object> parameters = new HashMap<String, Object>();
// 3. Configure the parameters for authorization. The parameter values vary based on your e
nvironment.
// The AccessKey ID of your Apsara Stack tenant account.
parameters.put("AccessKeyId","<AccessKey ID>");
// The AccessKey secret of your Apsara Stack tenant account.
parameters.put("AccessKeySecret", "<AccessKey Secret>");
// The ID of the region.
parameters.put("RegionId", "<your RegionID>");
// 4. Configure parameters for an API call. In this example, the Product, Action, and Versi
on parameters are configured.
parameters.put("Product", "<The name of the service>");
parameters.put("Action", "<The name of the API operation>");
parameters.put("Version", "<The version of the API operation>");
// 5. Configure operation-specific parameters.
parameters.put("<The name of the operation-specific parameter>", "<The value of the operati
on-specific parameter>");
// 6. Configure request headers and the encryption method for the signature string. Valid v
alues of the SignatureMethod parameter: HMAC-SHA1 and HMAC-SHA256. By default, HMAC-SHA256
is used.
Map<String, String> headers = new HashMap<String, String>();
//headers.put("SignatureMethod", "HMAC-SHA1");
headers.put("x-acs-regionid", "<your-regionid>");
headers.put("x-acs-resourcegroupid", "<your-resourcegroupid>");
headers.put("x-acs-organizationid", "<your-organizationid>");
headers.put("x-acs-instanceid", "<your-instanceid>");
// 7. Make an API call. We recommend that you use the doPost() method.
// Configure the time-out period for a connection.
//client.setConnectTimeout(10000);
// Configure the time-out period for a request.
// client.setSocketTimeout(10000);
String result = client.doPost(endpoint, headers, parameters);
System.out.println(result);
```

Configure a proxy

If you need to use a proxy to make API calls, use the following sample code to configure the proxy:

```
Cloud cloud = new Cloud();
// Configure the IP address of the proxy.
cloud.setConfig("proxy_host", "<IP>");
// Configure the port used by the proxy.
cloud.setConfig("proxy_port", "<Port>");
// 1. Create a connection to an ASClient object.
ASClient client = new ASClient(cloud);
```

Request headers

Parameter	Description
x-acs-regionid	The ID of the region. For more information about how to obtain a region ID, see Query the region ID.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console.
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console.
x-acs-instanceid	The ID of the instance to which you make API calls.

4.1.1.1.4.2. Use Apsara Stack SDK for Python to call API operations

This topic describes how to use Apsara Stack SDK for Python to call API operations provided by the Apsara Stack API (ASAPI).

Preparations

- An authorized account and an AccessKey pair are obtained. The AccessKey pair consists of an AccessKey ID and an AccessKey secret. For more information about how to obtain an AccessKey pair in the Apsara Uni-manager Management Console, see Obtain an AccessKey pair.
- The endpoint of the ASAPI is obtained. For more information, see Generate an endpoint for the ASAPI.

Install Apsara Stack SDK for Python

1. Download the required version of Apsara Stack SDK for Python. For more information, see Obtain Apsara Stack SDKs.
2. Upload the compressed file of Apsara Stack SDK for Python to the host from which you want to send API requests and extract the file. Then, run the following code in the directory of the extracted files to install Apsara Stack SDK for Python:

```
# Install Apsara Stack SDK for Python 2.x.
pip install aliyun-python2-sdk-asapi-2.4.7.tar.gz
# Install Apsara Stack SDK for Python 3.x.
pip3 install aliyun-python3-sdk-asapi-2.4.7.tar.gz
```

> **Note**
>
> Replace `2.4.7` with the actual version of Apsara Stack SDK for Python.

Sample requests

You can use the GET or POST method to call API operations provided by the ASAPI.

```
    # 1. Import dependencies.
    from aliyunsdkasapi.ASClient import ASClient
    from aliyunsdkasapi.AsapiRequest import AsapiRequest

    if __name__ == '__main__':
     # 2. Create a request. The Product parameter specifies the name of the service. The Ver
sion parameter specifies the version of the API operation. The Action parameter specifies t
he operation that you want to perform. The asapi-endpoint parameter specifies the endpoint
of the ASAPI.
     req = AsapiRequest("<Product>", "<Version>", "<Action>", "<asapi-endpoint>")
     # 3. Configure operation-specific parameters.
     req.add_body_params("<key>", "<value>")
     # 4. Configure request headers.
     req.add_header("x-acs-resourcegroupid", "<your-resourcegroupid>");
     req.add_header("x-acs-organizationid", "<your-organizationid>");
     req.add_header("x-acs-regionid", "<your-regionid>");
     req.add_header("x-acs-instanceid", "<your-instanceid>");
     # 5. Configure a request method.
     req.set_method("POST")
     # 6. Configure initialization parameters for an ASClient object. The parameter values v
ary based on your environment. The timeout parameter specifies the time-out period for a re
quest. The cert_file parameter specifies the certificate. The verify parameter specifies wh
ether to verify the certificate.
     as_client = ASClient("<accesskeyid>", "<accesskeysecret>", "<regionid>",timeout=1000,
             cert_file=None,
             verify=False)
     # Configure the identifier of the requester. This parameter is required and used only f
or identification. You can set this parameter to a random value.
     as_client.setSdkSource("<The identifier of the requester>")
     response = as_client.do_request(req)
     print(response)
```

Request headers

Parameter	Description
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console.
x-acs-regionid	The ID of the region. For more information about how to obtain a region ID, see Query a region ID.
x-acs-instanceid	The ID of the instance to which you make API calls.

Configure a proxy

Perform the following steps to configure a proxy:

1. Import OS dependencies.

```
import os
```

2. Configure one or more proxies.

```
# Before you make an API call, configure one or more proxies.
os.environ['http_proxy'] = "http://x.x.x.x:xxxx"
os.environ['https_proxy'] = "https://x.x.x.x:xxxx"
```

4.1.1.1.4.3. Use Apsara Stack SDK for Node.js to call API operations

This topic describes how to obtain and use Apsara Stack SDK for Node.js to call API operations.

Preparations

- An authorized account and an AccessKey pair are obtained. The AccessKey pair consists of an AccessKey ID and an AccessKey secret. For more information about how to obtain an AccessKey pair in the Apsara Uni-manager Management Console, see Obtain an AccessKey pair.
- The endpoint of the Apsara Stack API (ASAPI) is obtained. For more information, see Generate an endpoint for the ASAPI.
- A region ID is obtained. For more information about how to obtain a region ID, see Query the region ID.

Add dependencies

Run the following command to install Apsara Stack SDK for Node.js:

```
tnpm install --save @ali/asapi-nodejs-sdk
```

Use Apsara Stack SDK for Node.js

The following sample code shows how to use Apsara Stack SDK for Node.js to make API calls:

```
// 1. Import the dependencies of Apsara Stack SDK for Node.js.
const Controller = require('egg').Controller;
const ASAPIClient = require('@ali/asapi-nodejs-sdk');
// 2. Configure the parameters.
const cnofig = {
    API_GATEWAY: '<The endpoint of the ASAPI>',
    regionId: '<The ID of the region in which the Apsara Stack service is deployed>',
    accessKeyId: '<The AccessKey ID of your Apsara Stack tenant account>',
    accessKeySecret: '<The AccessKey secret of your Apsara Stack tenant account>'
};
// 3. Initialize a client for API calls.
const AsapiClient = new ASAPIClient(cnofig, this.ctx);
// 4. Configure request parameters.
const params = {
    "Action": "<The name of the API operation>",
    "Product": "<The name of the service that provides the API operation>",
    "Version": "<The version of the API operation>",
    "regionId": '<The ID of the region in which the Apsara Stack service is deployed>',
      "<The name of the operation-specific parameter required by the API operation>": "<The
value of the operation-specific parameter>"
}
// 5. Configure request headers.
AsapiClient.addHeader('x-acs-caller-sdk-source', '<The identifier of the requester>')
AsapiClient.addHeader('x-acs-roleid', '<The ID of the role>')
AsapiClient.addHeader('x-acs-userid', '<The ID of the user>')
AsapiClient.addHeader('x-acs-organizationid', '<your-organizationid>')
AsapiClient.addHeadert("x-acs-regionid", "<your-regionid>");
AsapiClient.addHeader("x-acs-resourcegroupid", "<your-resourcegroupid>");
AsapiClient.addHeader("x-acs-instanceid", "<your-instanceid>");
// 6. Make an API call and obtain the response.
try {
  const res = await AsapiClient.doRequest(cnofig.API_GATEWAY, params, {
    method: 'POST', // The request method.
    formatParams: false, // Specifies whether to format parameters and capitalize the first
letter of each parameter.
    enableProxy: true, // Specifies whether to configure a proxy.
    proxy: 'http://x.x.x.x:xxxx',
    timeout: 10000, // The time-out period.
  // ca: , // The certificate issued by a certificate authority (CA). For more information,
visit https://nodejs.org/api/https.html#https_https_request_options_callback.
  })
  console.log(res)
} catch (e) {
  console.log(e)
}
```

Disable certificate validation

The following sample code shows how to disable certificate validation:

```
Configure the environment variable.
NODE_TLS_REJECT_UNAUTHORIZED=0
```

Request headers

Parameter	Description
x-acs-regionid	The ID of the region. For more information about how to obtain a region ID, see Query the region ID.
x-acs-organizationid	The ID of the organization in the Apsara Uni-manager Management Console.
x-acs-resourcegroupid	The ID of the resource set in the Apsara Uni-manager Management Console.
x-acs-instanceid	The ID of the instance to which you make API calls.
x-acs-caller-sdk-source	The custom name of the requester or the system. This parameter is used to identify the source of the API request.
x-acs-roleid	The ID of the role.
x-acs-userid	The ID of the user.

4.1.1.1.4.4. SDK for POP

SDK for Java

Before you use Apsara Stack API (ASAPI) SDK for POP for Java to access ASAPI, you must know the remote procedure call (RPC) and resource-oriented architecture (ROA) styles that are supported for API calls. ASAPI is compatible with both styles. Their difference lies in the ASAPI endpoints that are used for API calls.

Prerequisites

- An Alibaba Cloud SDK package is downloaded for the service that you want to access. The required dependencies are installed.
- SSL certificate validation is ignored for requests over HTTPS.

Background information

ASAPI supports only the HTTPS request protocol.

Difference between two styles

When you use the RPC or ROA style to make API calls, take note that the two styles use different ASAPI endpoints.

```
# ASAPI endpoint for the RPC style:
public.asapi.<global:region>.<global:internet-domain>/asapi/v3
# ASAPI endpoint for the ROA style:
public.asapi.<global:region>.<global:internet-domain>/asapi/v3/roa
```

Call examples

The following sample code provides an example on how to use the RPC style to make an API call. In this example, the DescribeInstances operation of Elastic Compute Service (ECS) is called, and the API version is 2014-05-26.

Sample code:

```
package com.aliyuns.client.pop.ecs;

import com.aliyuncs.DefaultAcsClient;
import com.aliyuncs.ecs.model.v20140526.DescribeInstancesRequest;
import com.aliyuncs.ecs.model.v20140526.DescribeInstancesResponse;
import com.aliyuncs.http.HttpClientConfig;
import com.aliyuncs.http.ProtocolType;
import com.aliyuncs.profile.DefaultProfile;

import java.util.List;

public class DescribeInstancesTest {
    public static void main(String[] args) {
        // Specify the endpoint of ASAPI.
        String endpoint = "public.asapi.<global:region>.<global:internet-domain>/asapi/v3";
        // Specify the region where the ECS service resides.
        String region = "<global:region>";
        // Specify the name of the service that you want to access.
        String product = "ECS";
        // Specify your AccessKey pair.
        String ak = "<accessKeyId>";
        String sk = "<accessKeySecret>";
        try {
            DefaultProfile clientProfile = DefaultProfile.getProfile(region, ak, sk);
            // Ignore SSL certificate validation.
            HttpClientConfig clientConfig = HttpClientConfig.getDefault();
            clientConfig.setIgnoreSSLCerts(true);
            // Set the connection timeout period.
            clientConfig.setConnectionTimeoutMillis(3000L);
            // Set the read timeout period.
            clientConfig.setReadTimeoutMillis(10000L);
            clientProfile.setHttpClientConfig(clientConfig);
            // Create a connection.
            DefaultAcsClient acsClient = new DefaultAcsClient(clientProfile);
            // Create a request.
            DescribeInstancesRequest request = new DescribeInstancesRequest();
            // Specify the endpoint of ASAPI.
            request.setSysEndpoint(endpoint);
            // Specify the name of the service that you want to access and the region where
the service resides.
            request.setSysLocationProduct(product);
            request.setSysRegionId(region);
            // Set the request protocol to HTTPS.
            request.setSysProtocol(ProtocolType.HTTPS);
            DescribeInstancesResponse result =  acsClient.getAcsResponse(request);
            List<DescribeInstancesResponse.Instance> instances = result.getInstances();
            for (DescribeInstancesResponse.Instance instance: instances) {
                System.out.println(instance.getInstanceId());
                System.out.println(instance.getInstanceName());
```

```
            }

        } catch (Exception e) {
            e.printStackTrace();
        }
    }
}
```

The following sample code provides an example on how to use the ROA style to make an API call. In this example, the GetNamespaceList operation of Container Registry is called, and the API version is 2016-06-07.

Sample code:

```
package com.aliyuns.client.pop.cr;

import com.aliyuncs.CommonRequest;
import com.aliyuncs.CommonResponse;
import com.aliyuncs.DefaultAcsClient;
import com.aliyuncs.IAcsClient;
import com.aliyuncs.exceptions.ClientException;
import com.aliyuncs.exceptions.ServerException;
import com.aliyuncs.http.FormatType;
import com.aliyuncs.http.HttpClientConfig;
import com.aliyuncs.http.MethodType;
import com.aliyuncs.http.ProtocolType;
import com.aliyuncs.profile.DefaultProfile;

public class GetNamespaceListTest {
    public static void main(String[] args) {
        // Specify the endpoint of ASAPI.
        String endpoint = "public.asapi.<global:region>.<global:internet-domain>/asapi/v3/r
oa";
        // Specify the region where the Container Registry service resides.
        String region = "<global:region>";
        // Specify the name of the service that you want to access.
        String product = "cr";
        // Specify your AccessKey pair.
        String ak = "<accessKeyId>";
        String sk = "<accessKeySecret>";
        DefaultProfile profile = DefaultProfile.getProfile(region, ak, sk);
        // Ignore SSL certificate validation.
        HttpClientConfig clientConfig = HttpClientConfig.getDefault();
        clientConfig.setIgnoreSSLCerts(true);
        // Set the connection timeout period.
        clientConfig.setConnectionTimeoutMillis(3000L);
        // Set the read timeout period.
        clientConfig.setReadTimeoutMillis(10000L);
        profile.setHttpClientConfig(clientConfig);
        // Create a connection for the client.
        IAcsClient client = new DefaultAcsClient(profile);
        // Create a request.
        CommonRequest request = new CommonRequest();
        // Set the request protocol to HTTPS.
```

```
        request.setSysProtocol(ProtocolType.HTTPS);
        // Specify the request method.
        request.setSysMethod(MethodType.GET);
        // Specify the endpoint of ASAPI.
        request.setSysDomain(endpoint);
        // Specify the version of the API.
        request.setSysVersion("2016-06-07");
        // Specify the pattern of the uniform resource identifier (URI).
        request.setSysUriPattern("/namespace");
        // Specify the name of the service that you want to access and the region where the
service resides.
        request.setSysLocationProduct(product);

        request.putHeadParameter("Content-Type", "application/json");
        String requestBody = "" +
                "{}";
        request.setHttpContent(requestBody.getBytes(), "utf-8", FormatType.JSON);
        try {
            CommonResponse response = client.getCommonResponse(request);
            System.out.println(response.getData());
        } catch (ServerException e) {
            e.printStackTrace();
        } catch (ClientException e) {
            e.printStackTrace();
        }
    }
}
```

> **Notice**
>
> If you send a request over HTTPS, you must enable the request to ignore SSL certificate validation.

SDK for Go

This topic describes how to use Apsara Stack API (ASAPI) SDK for POP for Go.

Prerequisites

An Alibaba Cloud SDK package is downloaded for the service that you want to access. The required dependencies are installed.

Background information

Only the remote procedure call (RPC) style is supported for API calls.

Call examples

The following sample code provides an example on how to make an API call. In this example, the DescribeInstances operation of Elastic Compute Service (ECS) is called, and the API version is 2014-05-26.

Sample code:

```
package main
```

```
import (
 "fmt"
 "time"

 "github.com/aliyun/alibaba-cloud-sdk-go/sdk"
 "github.com/aliyun/alibaba-cloud-sdk-go/sdk/auth/credentials"
 "github.com/aliyun/alibaba-cloud-sdk-go/sdk/requests"
 "github.com/aliyun/alibaba-cloud-sdk-go/sdk/responses"
)

func getSdkConfig() *sdk.Config {
 return sdk.NewConfig().
  WithTimeout(time.Duration(30) * time.Second).
  WithEnableAsync(true).
  WithGoRoutinePoolSize(100).
  WithMaxTaskQueueSize(10000).
  WithDebug(false).
  WithScheme("HTTP")
}

func main(){
 ak := "<The AccessKey ID of your Apsara Stack tenant account.>"
 sk := "<The AccessKey secret of your Apsara Stack tenant account.>"
 regionId := "<The region where the ECS service resides.>"
 endpoint := "<The endpoint of ASAPI.>" // No network protocol.
 request := requests.NewCommonRequest()
  request.SetReadTimeout(10 * time.Second) // Set the read timeout period of the request to
10 seconds.
  request.SetConnectTimeout(5 * time.Second)  // Set the connection timeout period of the r
equest to 5 seconds.
 request.Method = requests.GET
 request.Domain = endpoint         // Location Service will not be enabled if the host is s
pecified. For example, the service with a certification type-bearer token must be specified
.
 request.Version = "2014-05-26"            // Specify the version of the API.
 request.Scheme = "https"                // Specify the request protocol. Default value: ht
tp.
 request.ApiName = "DescribeInstances"
 request.QueryParams["Product"] = "Ecs"  // Specify the name of the service that you want t
o access.
 request.TransToAcsRequest()
 client, err := sdk.NewClientWithOptions(regionId,getSdkConfig(),credentials.NewAccessKeyCr
edential(ak,sk))
 // If relevant parameters are not set for the request, the client settings are used.
  //client.SetReadTimeout(10 * time.Second)              // Set the read timeout period of
the client to 10 seconds.
 //client.SetConnectTimeout(5 * time.Second)            // Set the connection timeout perio
d of the client to 5 seconds.
  resp := responses.BaseResponse{}
  err = client.DoAction(request, &resp)
    if err != nil {
        panic(err)
    }
 fmt.Print(endpoint)
```

```
}
```

Configure proxies

You can configure proxies in one of the following ways:

- Configure proxies by using environment variables.

  Set the HTTP_PROXY and HTTPS_PROXY environment variables, or set the NO_PROXY environment variable.

  Sample code:

```
import (
    "os"
)
func main(){
 os.Setenv("HTTP_PROXY", "http://x.x.x.x:xxxx") // Set the HTTP_PROXY environment variabl
e.
 os.Setenv("HTTPS_PROXY", "https://x.x.x.x:xxxx") // Set the HTTPS_PROXY environment vari
able.
}
```

- Configure proxies on the client.

  Sample code:

```
// The proxies that are configured on the client take precedence over those that are conf
igured by using environment variables.
client.SetHttpProxy("http://x.x.x.x:xxxx")   // Configure the HTTP proxy.
client.GetHttpProxy()                          // Query the HTTP proxy.

client.SetHttpsProxy("https://x.x.x.x:xxxx")   // Configure the HTTPS proxy.
client.GetHttpsProxy()                           // Query the HTTPS proxy.

client.SetNoProxy("127.0.0.1,localhost")     // Configure the proxy whitelist.
client.GetNoProxy()                          // Query the proxy whitelist.
```

SDK for Python

This topic describes how to use Apsara Stack API (ASAPI) SDK for POP for Python.

Prerequisites

An Alibaba Cloud SDK package is downloaded for the service that you want to access. The required dependencies are installed.

Background information

Only the remote procedure call (RPC) style is supported for API calls.

Call examples

The following sample code provides an example on how to make an API call. In this example, the DescribeInstances operation of Elastic Compute Service (ECS) is called, and the API version is 2014-05-26.

Sample code:

```
from aliyunsdkcore.client import AcsClient
from aliyunsdkcore.acs_exception.exceptions import ClientException
from aliyunsdkcore.acs_exception.exceptions import ServerException
from aliyunsdkecs.request.v20140526 import DescribeInstancesRequest
import os

# Create an AcsClient instance.
client = AcsClient(
   "<your-access-key-id>",
   "<your-access-key-secret>",
   "<your-region-id>",

   timeout=1000,  # Set the timeout period.
    verify=False, # Ignore certificate validation. or verify='<The location where the certi
ficate is stored.>'
);
# Set the following parameters for the HTTPS request protocol:
# client.set_verify(False)
# os.environ["HTTPS_PROXY"] = "http://127.0.0.1:8080"

# os.environ["HTTP_PROXY"] = "http://127.0.0.1:8080"
def hello_ecs_instance():
    # Create a request and set the parameters.
    request = DescribeInstancesRequest.DescribeInstancesRequest()

    params = {"PageNumber":"1", "Product":"Ecs","Version": "2014-05-26","Action": "Describe
Instances"};
    request.set_body_params(params)
    # The endpoint that contains no network protocol is in the following format: ASAPI doma
in name/asapi/v3.
    request.set_endpoint('<The endpoint of ASAPI.>')
    # Set the following parameter if the endpoint contains no network protocol:
    request.set_protocol_type("https")

    request.set_PageSize(10)
    # Initiate the API request and obtain the response.
    response = client.do_action_with_exception(request)
    print(response)

if __name__ == '__main__':
    print("Hello Aliyun OpenApi!")
    hello_ecs_instance()
```

Configure proxies

Set the HTTP_PROXY and HTTPS_PROXY environment variables.

Sample code:

```
# Configure the HTTPS proxy.
os.environ["HTTPS_PROXY"] = "http://x.x.x.x:xxxx"

# Configure the HTTP proxy.
os.environ["HTTP_PROXY"] = "https://x.x.x.x:xxxx"
```

4.1.1.1.5. HTTP requests

4.1.1.1.5.1. Overview

This topic describes how to make API requests and is intended for users who use API URLs to initiate HTTP GET requests.

If you are using an SDK to initiate requests, you can skip this topic.

The request URL consists of different parameters and has a fixed syntax. The URL contains common request parameters, your signature, and operation-specific parameters. Sample request URLs are provided for each API operation. These URLs are not encoded to make them easy to read. Before you make a request, you must encode the request URL. After the authentication process is complete based on your signature, the results are returned to you. Response parameters are returned if the call is successful, whereas an error message is returned if the call fails. You can troubleshoot issues based on the error message.

4.1.1.1.5.2. Request syntax

The Apsara Stack API (ASAPI) allows you to call API operations by sending HTTP GET requests based on URLs. Each URL must include request parameters. This topic describes the syntax of HTTP GET requests and provides the endpoint of the ASAPI.

Sample request

GetOrganizationList is used in the following unencoded URL request:

```
https://public.asapi.aliyuns.com/asapi/v3?Action=GetOrganizationList&Product=ascm&Version=2019-05-10&Id=<Organization ID>&<Common parameters>
```

- `https`: the protocol used to transmit the request.
- `public.asapi.aliyuns.com/asapi/v3`: the endpoint of the ASAPI.
- `Action=GetOrganizationList Product=ascm Version=2019-05-10`: the API operation to call.
- `Id`: the ID of the organization.
- `<Common parameters>`: the common parameters specified in the system.

Protocol

The ASAPI supports only HTTPS.

Endpoint

For more information about how to obtain an endpoint, see Generate an endpoint for the ASAPI.

Parameter

To specify an API operation, use the `Action, Product, and Version` parameters. For example, set `Action` to GetOrganizationList, Product to ascm, and Version to 2019-05-10. You must also specify other operation-specific parameters and common parameters. For more information, see Common parameters.

4.1.1.1.5.3. Request signatures

This topic describes how to sign HTTP API requests. ASAPI uses the request signature to verify the identity of the request sender. ASAPI implements symmetric encryption by using an AccessKey pair to verify the identity of the request sender.

> **Note**
>
> - An AccessKey pair consists of an AccessKey ID and an AccessKey secret, which are issued to each user or organization in the Apsara Uni-manager Management Console.
> - The AccessKey ID is used to verify identities of users, and the AccessKey secret is used to encrypt and verify signature strings. You must keep your AccessKey secret confidential.
> - ASAPI provides SDKs for Node.js, Python, and Java to facilitate complex signature calculation. For more information, see Obtain the core package for ASAPI.

Step 1: Create a canonicalized query string

1. Arrange the request parameters in alphabetical order, including all common and operation-specific parameters except the `Signature` parameter.

   > **Note**
   >
   > If you use the GET method to send a request,these parameters are connected by ampersands (&) and included in the request URL. The first request parameter follows a question mark (?).

2. Encode the request parameters and their values in UTF-8 based on RFC 3986. The following rules apply in the encoding process:
   - Letters, digits, and special characters such as hyphens (`-`), underscores (`_`), and periods (`.`) do not need to be encoded.
   - Other characters must be percent encoded in the `%XY` format. `XY` represents the ASCII code of the characters in hexadecimal notation. For example, double quotation marks (`"`) are encoded as `%22` .

- Extended UTF-8 characters are encoded in the `%XY%ZA...` format.
- Spaces must be encoded as `%20`. Do not encode spaces as plus signs (`+`).

  This encoding method is similar to but different from the `application/x-www-form-urlencoded` MIME encoding algorithm.

  If you use `java.net.URLEncoder` from the Java standard library, use `percentEncode` to encode request parameters and their values. In the encoded query string, replace the plus signs (`+`) with `%20` , asterisks (`*`) with `%2A` , and `%7E` with tildes (`~`). This way, you can obtain an encoded string that matches the preceding encoding rules.

```
private static final String ENCODING = "UTF-8";
private static String percentEncode(String value) throws UnsupportedEncodingException
{
    return value != null ? URLEncoder.encode(value, ENCODING).replace("+", "%20").rep
lace("*", "%2A").replace("%7E", "~") : null;
}
```

3. Use equal signs (`=`) to connect the encoded request parameters and their values.
4. Use ampersands (`&`) to connect the encoded request parameters. These parameters must be arranged in the same order as those in Step 1.

Then, a canonicalized query string that follows the request structure is obtained. For more information, see Request structure.

Step 2: Create a string-to-sign

1. Create a `string-to-sign` . You can also use `percentEncode` to encode the canonicalized query string created in Step 1 based on the following rules:

```
StringToSign=
    HTTPMethod + "&" + //HTTPMethod: the HTTP method that is used to send a request, su
ch as GET.
    percentEncode("/") + "&" + //percentEncode("/"): Encode the forward slash (/) in UT
F-8 as %2F.
    percentEncode(CanonicalizedQueryString) // Encode the canonicalized query string cr
eated in Step 1.
```

2. Calculate the RFC 2104-compliant HMAC-SHA1 or HMAC-256 value of `StringToSign` . In the following example, Java Base64 is used:

```
String signature = Base64.getEncoder().encodeToString(signData);
```

> **Note**
>
> When you calculate the signature, the key value specified by RFC 2104 is your `AccessKey secret` plus an ampersand (&), which has an ASCII value of 38. For more information, see Obtain an AccessKey pair.

3. Encode the `Signature` parameter based on RFC 3986 and add it to the canonicalized query string.

Example 1: Concatenate parameters

`GetOrganizationList` is used in this example to query regions. For example, `AccessKeyID` is set to testid and `AccessKeySecret` is set to testsecret. Perform the following operations:

1. Construct a canonicalized query string.

```
https://public.asapi.aliyuns.com/asapi/v3/?AccessKeyId=testid&Action=GetOrganizationList&Format=JSON&Id=1&Product=ascm&RegionId=cn-region-test&SignatureMethod=HMAC-SHA1&SignatureNonce=43967c6e-e3ad-44fa-b06b-fcf3db5f39d2&SignatureVersion=1.0&Timestamp=2020-09-15T08%3A50%3A40Z&Version=2019-05-10
```

2. Create a `string-to-sign` .

```
GET&%2F&AccessKeyId%3Dtestid%26Action%3DGetOrganizationList%26Format%3DJSON%26Id%3D1%26Product%3Dascm%26RegionId%3Dcn-region-test%26SignatureMethod%3DHMAC-SHA1%26SignatureNonce%3D43967c6e-e3ad-44fa-b06b-fcf3db5f39d2%26SignatureVersion%3D1.0%26Timestamp%3D2020-09-15T08%253A50%253A40Z%26Version%3D2019-05-10
```

3. Calculate the signature.

   Calculate the signature. The key value used for calculation is `testsecret&` because `AccessKeySecret` is set to testsecret. The calculated signature is `OLeaidS1JvxuMvnyHOwuJ+uX5qY=` . Java Base64 is used in the following sample code:

   `String signature = Base64.getEncoder().encodeToString(signData);` Encode `Signature=hvqv9Ll5RE6kQ4YsQXFAf9VuRIY=` based on RFC 3986 and add it to the canonicalized query string.

```
https://public.asapi.aliyuns.com/asapi/v3/?AccessKeyId=testid&Action=GetOrganizationList&Format=JSON&Id=1&Product=ascm&RegionId=cn-region-test&SignatureMethod=HMAC-SHA1&SignatureNonce=43967c6e-e3ad-44fa-b06b-fcf3db5f39d2&SignatureVersion=1.0&Timestamp=2020-09-15T08%3A50%3A40Z&Version=2019-05-10
```

You can use browsers or tools such as cURL and Wget to initiate an HTTP request for calling the `DescribeRegions` operation to query the Alibaba Cloud region list.

Example 2: Use the standard library of the programming language

`GetOrganizationList` is used in this example to query regions. For example, `AccessKeyID` is set to testid, `AccessKeySecret` is set to testsecret, and all request parameters are stored in a Java `Map<String, String>` object.

1. Predefine an encoding method.

```
private static final String ENCODING = "UTF-8";
private static String percentEncode(String value) throws UnsupportedEncodingException {
        return value != null ? URLEncoder.encode(value, ENCODING).replace("+", "%20").r
eplace("*", "%2A").replace("%7E", "~") : null;
}
```

2. Predefine the time format for the `Timestamp` parameter. Specify the `Timestamp` parameter in the ISO 8601 format. The time must be in UTC+0.

```
private static final String ISO8601_DATE_FORMAT = "yyyy-MM-dd'T'HH:mm:ss'Z'";
private static String formatIso8601Date(Date date) {
