Document conventions

Style	Description	Example
Danger	A danger notice indicates a situation that will cause major system changes, faults, physical injuries, and other adverse results.	**Danger:** Resetting will result in the loss of user configuration data.
Warning	A warning notice indicates a situation that may cause major system changes, faults, physical injuries, and other adverse results.	**Warning:** Restarting will cause business interruption. About 10 minutes are required to restart an instance.
Notice	A caution notice indicates warning information, supplementary instructions, and other content that the user must understand.	**Notice:** If the weight is set to 0, the server no longer receives new requests.
Note	A note indicates supplemental instructions, best practices, tips, and other content.	**Note:** You can use Ctrl + A to select all files.
>	Closing angle brackets are used to indicate a multi-level menu cascade.	Click **Settings**> **Network**> **Set network type**.
Bold	Bold formatting is used for buttons , menus, page names, and other UI elements.	Click **OK**.
`Courier font`	Courier font is used for commands	Run the `cd /d C:/window` command to enter the Windows system folder.
Italic	Italic formatting is used for parameters and variables.	`bae log list --instanceid` *Instance_ID*
[] or [a|b]	This format is used for an optional value, where only one item can be selected.	`ipconfig [-all|-t]`
{} or {a|b}	This format is used for a required value, where only one item can be selected.	`switch {active|stand}`

Table of Contents

1.Apsara Uni-manager Management Console

1.1. What is the Apsara Uni-manager Management Console?

The Apsara Uni-manager Management Console is a service capability platform based on the Alibaba Cloud Apsara Stack platform and designed for government and enterprise customers. This platform improves IT management and troubleshooting and is dedicated to providing a leading service capability platform of the cloud computing industry. It provides large-scale and cost-efficient end-to-end cloud computing and big data services for customers in industries such as government, education, healthcare, finance, and enterprise.

Overview

The Apsara Uni-manager Management Console simplifies the management and deployment of physical and virtual resources by building an Apsara Stack platform that supports various business types of government and enterprise customers. The console helps you build your business systems in a simple and quick manner, fully improve resource utilization, and reduce O&M costs. This allows you to shift your focus from O&M to business. The console brings the Internet economy model to government and enterprise customers, and builds a new ecosystem chain based on cloud computing.

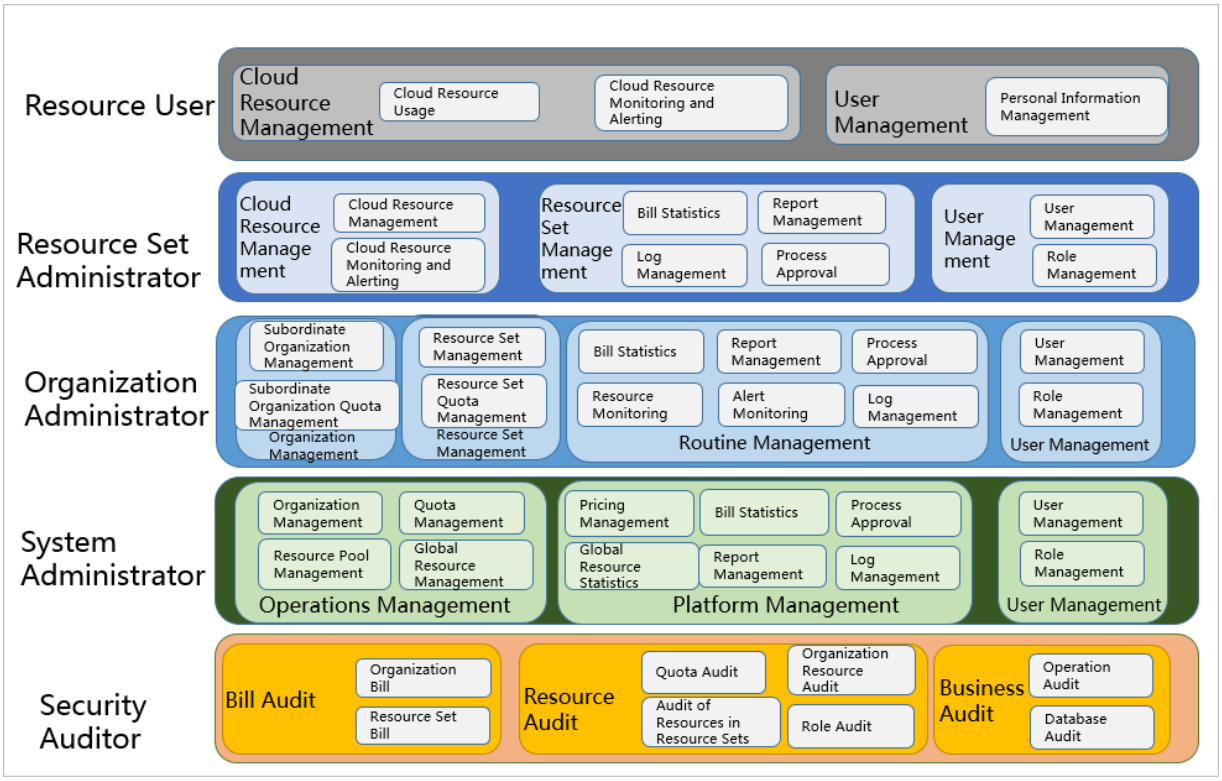
Workflow

Operations in the Apsara Uni-manager Management Console are divided into the following parts:

- System initialization: This part is designed to complete basic system configurations, such as creating organizations, resource sets, and users, creating basic resources such as VPCs, and creating contacts and contact groups in Cloud Monitor.
- Cloud resource creation: This part is designed to create resources.
- Cloud resource management: This part is designed to complete resource management operations, such as starting, using, and releasing resources, and changing resource configurations and resource quotas.

1.2. User roles and permissions

This topic describes roles and their permissions.



Roles and permissions

Role	Role permission
Resource user	This role has the permissions to view and modify resources in a resource set and create alert rules.
Resource set administrator	This role has the permissions to create, modify, and delete resources in a resource set and manage the users of the resource set.
Organization administrator	This role has the permissions to manage an organization and its subordinate organizations, create, modify, and delete the resources of organizations, create and view alert rules for resources, and export reports.
Operations administrator	This role has read and write permissions on all resources.
Security auditor	This role performs security audit on the Apsara Uni-manager Management Console and has the read-only permissions on operation logs of the Apsara Uni-manager Management Console.
Platform administrator	This role has the permissions to initialize the system and create operations administrators.
Resource auditor	This role has the read-only permissions on all resources in the Apsara Uni-manager Management Console.
Organization security administrator	This role manages the security of an organization, including the security of hosts, applications, and networks. This role has the read-only permissions on operation logs of the Apsara Uni-manager Management Console and read and write permissions on ApsaraDB RDS, ECS, and Apsara Stack Security.

Role	Role permission
Security system configuration administrator	This role configures system security features such as the upgrade center and global configurations. This role has read and write permissions on the upgrade, protection, and configuration features of Apsara Stack Security.
Global organization security administrator	This role manages the security of global tenants by using Cloud Security Operation Center (SOC). This role has read and write permissions on all features of Apsara Stack Security.
Platform security administrator	This role manages the security of the Apsara Uni-manager Management Console by using SOC.
Global organization security auditor	This role checks the security conditions of all organizations by using SOC. This role has the read-only permissions on operation logs of the Apsara Uni-manager Management Console and all features of Apsara Stack Security.
Platform security auditor	This role checks the security conditions of the Apsara Uni-manager Management Console by using SOC. This role has the read-only permissions on operation logs of the Apsara Uni-manager Management Console, Server Guard, Cloud Firewall, Sensitive Data Discovery and Protection, SOC, system configurations, and Web Application Firewall (WAF) configurations as well as read and write permissions on Anti-DDoS, Threat Detection, and Update Center of Apsara Stack Security.
Platform security configuration administrator	This role configures and has read and write permissions on security services in the Apsara Uni-manager Management Console, such as Server Guard and WAF.
Organization resource auditor	This role has the read-only permissions on all resources in an organization to which it belongs.

1.3. Log on to the Apsara Uni-manager Management Console

This topic describes how to log on to the Apsara Uni-manager Management Console.

Prerequisites

- The URL of the Apsara Uni-manager Management Console is obtained from the deployment personnel before you log on to the Apsara Uni-manager Management Console.
- A browser is available. We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL of the Apsara Uni-manager Management Console. Press the Enter key.
2. Enter your username and password.

   Obtain the username and password that you can use to log on to the console from the operations administrator.

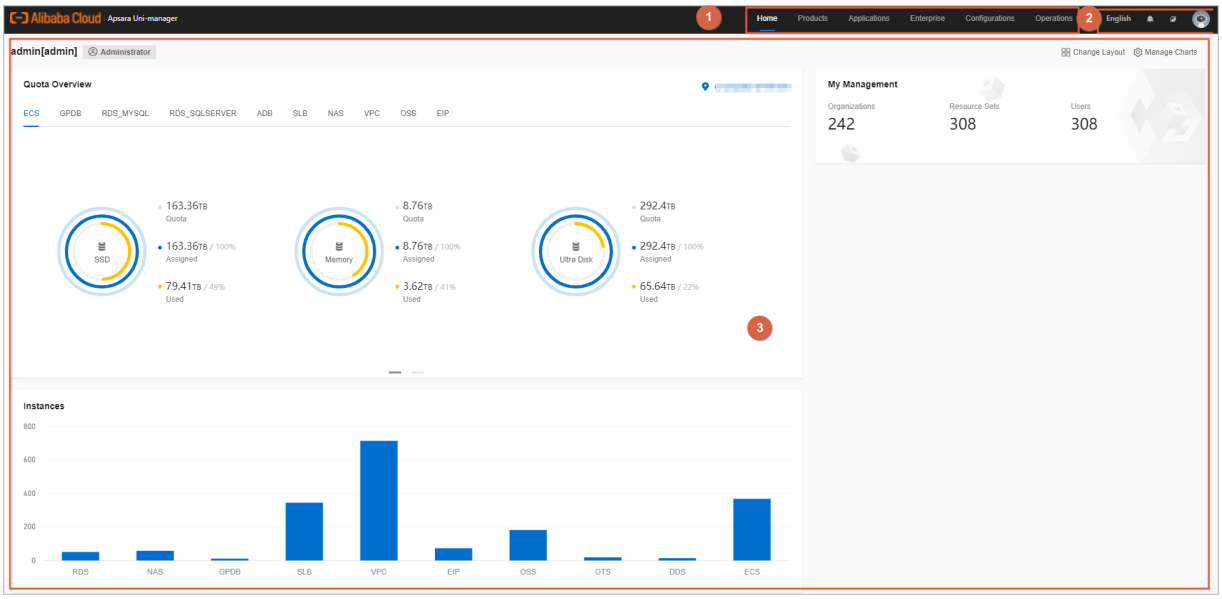
> **Note** When you log on to the Apsara Uni-manager Management Console for the first time, you must change the password of your username. Your password must meet complexity requirements. The password must be 8 to 20 characters in length and must contain at least two of the following character types:
>
> - Uppercase or lowercase letters
> - Digits
> - Special characters, which include ! @ # $ %

3. Click **Login**.

1.4. Web page introduction

The web page of the Apsara Uni-manager Management Console consists of the search box, top navigation bar, information section of the current logon user, and operation section.

Apsara Uni-manager Management Console page



Functional sections of the web page

Section		Description
1	Top navigation bar	This section includes the following modules: • **Home**: uses charts to show the usage and monitoring data of existing system resources in each region. • **Products**: manages all types of basic cloud services and resources. • **Applications**: manages cloud apps of enterprises. • **Enterprise**: manages organizations, resource sets, roles, users, logon policies, user groups, ownership, and resource pools. • **Configurations**: manages resource pools, password policies, specifications, menus, and Resource Access Management (RAM) roles. • **Operations**: manages the daily operations of cloud resources, including usage statistics and quotas. • **Security**: provides operation and system logs.

Section		Description
2	Information section of the current logon user	• English: allows you to switch between English, simplified Chinese, and traditional Chinese. • : provides message notifications. • : allows you to switch between day and night modes. • User Information: When you click the icon of the current logon user, the **User Information**, View Version, and **Exit** menu items are displayed. If you click **User Information**, you can perform the following operations on the User Information page: ◦ View basic information. ◦ Modify personal information. ◦ Change the logon password. ◦ View the AccessKey pair of your Apsara Stack tenant account. ◦ Switch the current role. ◦ Enable or disable alert notification.
3	Operation section	**Operation section**: shows the information and operations.

1.5. Initial configuration

1.5.1. Configuration description

Before you use the Apsara Uni-manager Management Console, you must complete a series of basic configuration operations as an administrator, such as creating organizations, resource sets, users, and roles and initializing resources. This is the initial system configuration.

The Apsara Uni-manager Management Console manages the organizations, resource sets, users, and roles of cloud data centers in a centralized and service-oriented manner to grant different resource access permissions to different users.

- Organization

  After the Apsara Uni-manager Management Console is deployed, a root organization is automatically generated. You can create other organizations under the root organization.

  Organizations are displayed in a hierarchical structure. You can create subordinate organizations under each organization level.

- Resource Set

  A resource set is a container used to store resources. Each resource must belong to a resource set.

- User

  A user is a resource manager and user.

- Role

  A role is a set of access permissions. You can assign different roles to different users to implement system access control to meet a variety of different requirements.

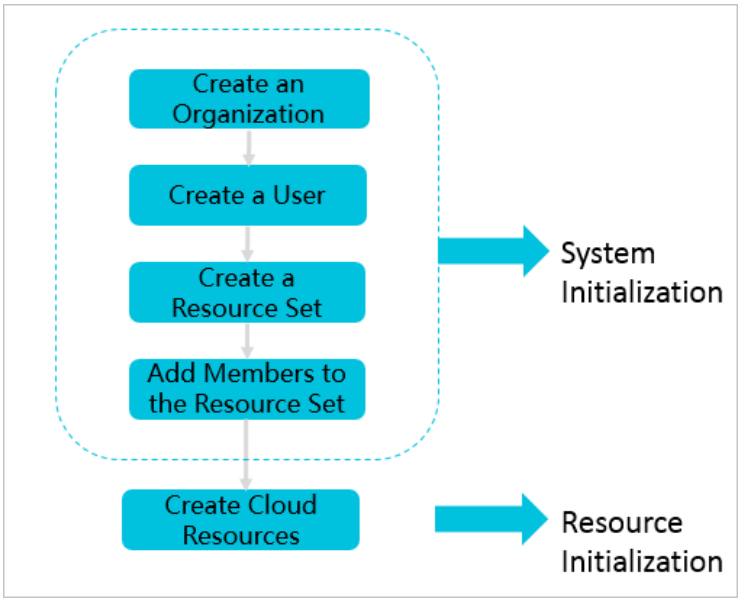
The following table describes the relationships among organizations, resource sets, users, roles, and cloud resources.

Relationship between two items	Relationship type	Description
Organization and resource set	One-to-many	An organization can have multiple resource sets, but each resource set can belong to only a single organization.
Organization and user	One-to-many	An organization can have multiple users, but each user can belong to only a single organization.
Resource set and user	Many-to-many	A user can have multiple resource sets, and a resource set can be assigned to multiple users under the same level-1 organization.
User and role	Many-to-many	A user can have multiple roles, and a role can be assigned to multiple users.
Resource set and resource	One-to-many	A resource set can have multiple resources, but each cloud resource can belong to only a single resource set.

1.5.2. Configuration process

This topic describes the initial configuration process.

Before you use the Apsara Uni-manager Management Console, you must complete the initial system configurations as an administrator based on the process shown in the following figure.



1. Create an organization

   Create an organization to store resource sets and their resources.

2. Create a user

   Create a user and assign the user different roles to meet different requirements for system access control.

3. Create a resource set

   Create a resource set before you apply for resources.

4. Add a member to a resource set

   Add users to the resource set.

5. Create cloud resources

   Create instances in each service console based on project requirements. For more information about how to create cloud service instances, see the user guide of each cloud service.

1.6. Monitoring

1.6.1. View the workbench

The Apsara Uni-manager Management Console uses charts to keep you up to date on the current usage and monitoring information of resources.

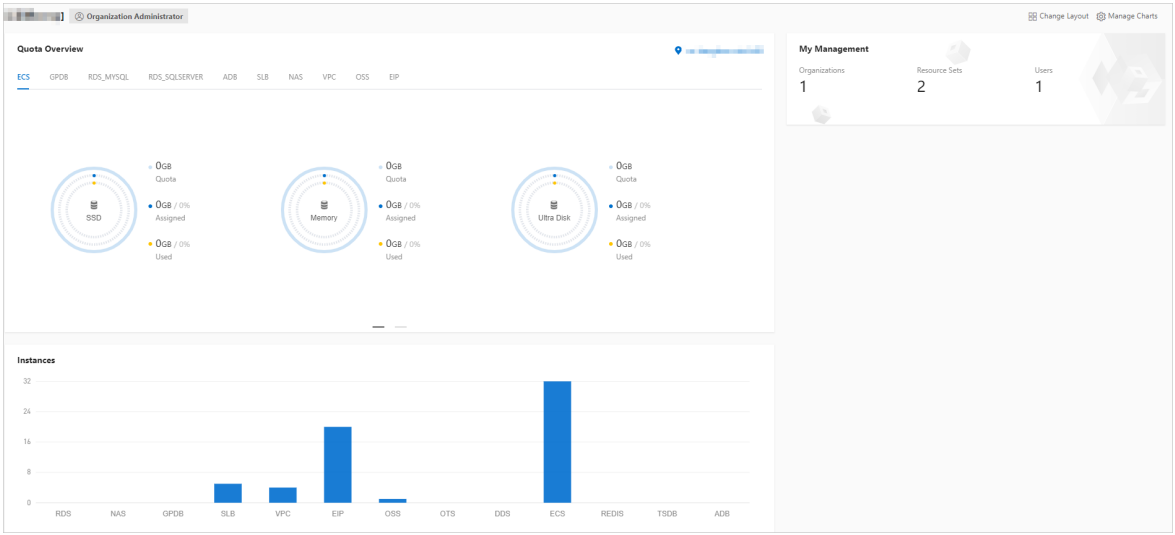
Context

The resource types displayed may vary with region types. See your dashboard for available resource types.

Procedure

1. Log on to the Apsara Uni-manager Management Console.

   By default, the **workbench** page appears when you log on to the Apsara Uni-manager Management Console. To return to the workbench page from other pages, click **Home** in the top navigation bar.



2. On the **workbench** page, you can view the instance summary information for all regions of the Apsara Stack environment.

   You can click **Manage Charts** in the upper-right corner of the page to select all or individual modules to view relevant information. You can also click **Change Layout** in the upper-right corner of the page and drag a specific module to the desired location.

   - **Quota Overview**

     Shows the usage and quotas of Elastic Compute Service (ECS), ApsaraDB RDS, Object Storage Service (OSS), and Server Load Balancer (SLB) resources.

   - **Instances**

     Shows the numbers of ECS instances, ApsaraDB RDS instances, OSS buckets, and SLB instances in each region.

   - **Instance Trends**

     Shows the numbers of recent ECS instances, ApsaraDB RDS instances, OSS buckets, and SLB instances.

   - **Resource Load**

Shows the top five ECS and ApsaraDB RDS instances in terms of disk usage, CPU utilization, and memory usage.

- **Alert Rules**

  Shows the number of alerts and details of the alerts.

- **My Management**

  Shows the numbers of organizations, resource sets, and users.

- **Multi-cloud Regions**

  Shows the information of all primary and secondary nodes in Apsara Stack. The network connection status and related alerts are displayed for each secondary node.

- **Multi-cloud Resources**

  Shows the cloud services and the number of instances in each secondary node.

1.6.2. CloudMonitor

1.6.2.1. Cloud Monitor overview

Cloud Monitor provides real-time monitoring, alerting, and notification services for resources to protect your services and businesses.

Cloud Monitor can monitor metrics for a variety of services such as ECS, ApsaraDB for RDS, SLB, OSS, KVStore for Redis, VPN Gateway, AnalyticDB for PostgreSQL, ApsaraDB for MongoDB, EIP, and API Gateway.

You can use the metrics of cloud services to configure alert rules and notification policies. This way, you can stay up to date on the running status and performance of your service instances and scale resources in a timely manner when resources are insufficient.

1.6.2.2. Metrics

This topic describes the metrics available for each service.

CloudMonitor checks the availability of services based on their metrics. You can configure alert rules and notification policies for these metrics to stay up to date on the running status and performance of monitored service instances.

CloudMonitor can monitor resources of other services, including Elastic Compute Service (ECS), ApsaraDB RDS, Server Load Balancer (SLB), Object Storage Service (OSS), KVStore for Redis, VPN Gateway, AnalyticDB for PostgreSQL, ApsaraDB for MongoDB, Elastic IP Address (EIP), and API Gateway. The following tables list the metrics for each service.

Operating system metrics for ECS

Metric	Description	Unit
Host.cpu.total	The total CPU utilization of an ECS instance.	%
Host.mem.usedutilization	The memory usage of an ECS instance.	%
Host.load1	The system loads over the last 1 minute. This metric is unavailable for Windows operating systems.	N/A
Host.load5	The system loads over the last 5 minutes. This metric is unavailable for Windows operating systems.	N/A

Metric	Description	Unit
Host.load15	The system loads over the last 15 minutes. This metric is unavailable for Windows operating systems.	N/A
Host.disk.utilization	The disk usage of an ECS instance.	%
Host.disk.readbytes	The number of bytes read from the disk per second.	byte/s
Host.disk.writebytes	The number of bytes written to the disk per second.	byte/s
Host.disk.readIops	The number of read requests received by the disk per second.	count/s
Host.disk.writeIops	The number of write requests received by the disk per second.	count/s
Host.fs.inode	The inode usage.	%

Basic metrics for ECS

Metric	Description	Unit
CPU utilization	The CPU utilization of an ECS instance.	%
Inbound bandwidth to the Internet	The average rate of inbound traffic to the Internet.	bit/s
Inbound bandwidth to the internal network	The average rate of inbound traffic to the internal network.	bit/s
Outbound bandwidth from the Internet	The average rate of outbound traffic from the Internet.	bit/s
Outbound bandwidth from the internal network	The average rate of outbound bandwidth from the internal network.	bit/s
System disk BPS	The number of bytes read from and written to the system disk per second.	byte/s
System disk IOPS	The number of reads from and writes to the system disk per second.	count/s
Advance CPU credits	The changes in advance CPU credits. Advance CPU credits can be used only when the unlimited mode is enabled.	N/A
CPU credit consumption	The changes in CPU credit consumption. Consumption trends are consistent with CPU utilization.	N/A

Metric	Description	Unit
Overdrawn CPU credits	The changes in overdrawn CPU credits. Overdrawn CPU credits can be used only when the unlimited mode is enabled.	N/A
CPU credit balance	The changes in CPU credit balance. The CPU credit balance is used to maintain CPU credit usage.	N/A

> **Note**
>
> For ECS instances, you must install a monitoring plug-in to collect metric data at the operating system level.
>
> Installation method: On the **Cloud Monitor** page, select the instance that you want to monitor from the ECS instance list and click **Batch Install** in the lower part of the page.
>
> Metric data is displayed in the monitoring chart within 5 to 10 minutes after the monitoring plug-in is installed.

Metrics for ApsaraDB RDS for PostgreSQL

Metric	Description	Apsara Stack service	Formula
CPU utilization	The CPU utilization of an ApsaraDB RDS for PostgreSQL instance. Unit: %.	ApsaraDB RDS for PostgreSQL	Used CPU cores of an ApsaraDB RDS for PostgreSQL instance/Total CPU cores of the ApsaraDB RDS for PostgreSQL instance
Memory usage	The memory usage of an ApsaraDB RDS for PostgreSQL instance. Unit: %.	ApsaraDB RDS for PostgreSQL	Used memory of an ApsaraDB RDS for PostgreSQL instance/Total memory of the ApsaraDB RDS for PostgreSQL instance
Disk usage	The disk usage of an ApsaraDB RDS for PostgreSQL instance. Unit: %.	ApsaraDB RDS for PostgreSQL	None
IOPS usage	The number of I/O requests for an ApsaraDB RDS for PostgreSQL instance per second. Unit: %.	ApsaraDB RDS for PostgreSQL	Number of I/O requests for an ApsaraDB RDS for PostgreSQL instance/Statistical period
Connection usage	The number of connections between an application and an ApsaraDB RDS for PostgreSQL instance per second. Unit: %.	ApsaraDB RDS for PostgreSQL	Number of connections between an application and an ApsaraDB RDS for PostgreSQL instance/Statistical period

Metrics for ApsaraDB RDS for MySQL

Metric	Description	Apsara Stack service	Formula
CPU utilization	The CPU utilization of an ApsaraDB RDS for MySQL instance. Unit: %.	ApsaraDB RDS for MySQL	Used CPU cores of an ApsaraDB RDS for MySQL instance/Total CPU cores of the ApsaraDB RDS for MySQL instance
Memory usage	The memory usage of an ApsaraDB RDS for MySQL instance. Unit: %.	ApsaraDB RDS for MySQL	Used memory of an ApsaraDB RDS for MySQL instance/Total memory of the ApsaraDB RDS for MySQL instance

Metric	Description	Apsara Stack service	Formula
Disk usage	The disk usage of an ApsaraDB RDS for MySQL instance. Unit: %.	ApsaraDB RDS for MySQL	None
IOPS usage	The number of I/O requests for an ApsaraDB RDS for MySQL instance per second. Unit: %.	ApsaraDB RDS for MySQL	Number of I/O requests for an ApsaraDB RDS for MySQL instance/Statistical period
Connection usage	The number of connections between an application and an ApsaraDB RDS for MySQL instance per second. Unit: %.	ApsaraDB RDS for MySQL	Number of connections between an application and an ApsaraDB RDS for MySQL instance/Statistical period
Inbound bandwidth to ApsaraDB RDS for MySQL	The inbound traffic to an ApsaraDB RDS for MySQL instance per second.	ApsaraDB RDS for MySQL	None
Outbound bandwidth from ApsaraDB RDS for MySQL	The outbound traffic from an ApsaraDB RDS for MySQL instance per second.	ApsaraDB RDS for MySQL	None

Metrics for ApsaraDB RDS for SQL Server

Metric	Description	Apsara Stack service	Formula
CPU utilization	The CPU utilization of an ApsaraDB RDS for SQL Server instance. Unit: %.	ApsaraDB RDS for SQL Server	Used CPU cores of an ApsaraDB RDS for SQL Server instance/Total CPU cores of the ApsaraDB RDS for SQL Server instance
Memory usage	The memory usage of an ApsaraDB RDS for SQL Server instance. Unit: %.	ApsaraDB RDS for SQL Server	Used memory of an ApsaraDB RDS for SQL Server instance/Total memory of the ApsaraDB RDS for SQL Server instance
Disk usage	The disk usage of an ApsaraDB RDS for SQL Server instance. Unit: %.	ApsaraDB RDS for SQL Server	None
IOPS usage	The number of I/O requests for an ApsaraDB RDS for SQL Server instance per second. Unit: %.	ApsaraDB RDS for SQL Server	Number of I/O requests for an ApsaraDB RDS for SQL Server instance/Statistical period
Connection usage	The number of connections between an application and an ApsaraDB RDS for SQL Server instance per second. Unit: %.	ApsaraDB RDS for SQL Server	Number of connections between an application and an ApsaraDB RDS for SQL Server instance/Statistical period
Inbound bandwidth to ApsaraDB RDS for SQL Server	The inbound traffic to an ApsaraDB RDS for SQL Server instance per second.	ApsaraDB RDS for SQL Server	None

Metric	Description	Apsara Stack service	Formula
Outbound bandwidth from ApsaraDB RDS for SQL Server	The outbound traffic from an ApsaraDB RDS for SQL Server instance per second.	ApsaraDB RDS for SQL Server	None

Metrics for PolarDB

Metric	Description	Apsara Stack service	Formula
CPU utilization	The CPU utilization of a PolarDB instance. Unit: %.	PolarDB	Used CPU cores of a PolarDB instance/Total CPU cores of the PolarDB instance
Memory usage	The memory usage of a PolarDB instance. Unit: %.	PolarDB	Used memory of a PolarDB instance/Total memory of the PolarDB instance
Disk usage	The disk usage of a PolarDB instance. Unit: %.	PolarDB	None
IOPS usage	The number of I/O requests for a PolarDB instance per second. Unit: %.	PolarDB	Number of I/O requests for a PolarDB instance/Statistical period
Connection usage	The number of connections between an application and a PolarDB instance per second. Unit: %.	PolarDB	Number of connections between an application and a PolarDB instance/Statistical period

Metrics for SLB

Metric	Description	Unit
Inbound bandwidth on a port	The average rate of inbound traffic on a port.	bit/s
Outbound bandwidth on a port	The average rate of outbound traffic on a port.	bit/s
Number of new connections on a port	The average number of new TCP connections established between clients and SLB instances in a statistical period.	N/A
Number of inbound packets received on a port	The number of packets received by an SLB instance per second.	count/s
Number of outbound packets sent on a port	The number of packets sent by an SLB instance per second.	count/s
Number of active connections on a port	The number of TCP connections in the ESTABLISHED state. If persistent connections are used, a connection can transfer multiple file requests at one time.	N/A

Metric	Description	Unit
Number of inactive connections on a port	The number of TCP connections that are not in the ESTABLISHED state. You can run the **netstat -an** command to view the connections for both Windows and Linux instances.	N/A
Number of concurrent connections on a port	The number of established TCP connections.	count/s
Number of dropped connections on a port	The number of connections dropped per second.	count/s
Number of dropped inbound packets on a port	The number of inbound packets dropped per second.	count/s
Number of dropped outbound packets on a port	The number of outbound packets dropped per second.	count/s
Dropped inbound bandwidth on a port	The amount of inbound traffic dropped per second.	bit/s
Dropped outbound bandwidth on a port	The amount of outbound traffic dropped per second.	bit/s

Metrics for monitoring service overview of OSS

Metric	Description	Unit
Availability	The metric that describes the system availability of OSS. You can obtain the metric value based on the following formula: Metric value = **1 - Server error requests with the returned HTTP status code 5xx/All requests**.	%
Valid request percentage	The percentage of valid requests out of all requests.	%
Total number of requests	The total number of requests that are received and processed by the OSS server.	N/A
Number of valid requests	The total number of requests with HTTP status codes 2xx and 3xx returned.	N/A
Outbound traffic from the Internet	The amount of outbound traffic from the Internet.	byte
Inbound traffic to the Internet	The amount of inbound traffic to the Internet.	byte
Outbound traffic from the internal network	The amount of outbound traffic from the internal network.	byte
Inbound traffic to the internal network	The amount of inbound traffic to the internal network.	byte

Metric	Description	Unit
CDN outbound traffic	The amount of outbound traffic sent over CDN after CDN is activated. Such outbound traffic over CDN is back-to-origin traffic.	byte
CDN inbound traffic	The amount of inbound traffic received over CDN after CDN is activated.	byte
Outbound traffic of cross-region replication	The amount of outbound traffic generated during data replication after cross-region replication is enabled.	byte
Inbound traffic of cross-region replication	The amount of inbound traffic generated during data replication after cross-region replication is enabled.	byte
Storage size	The amount of total storage occupied by the buckets of a specified user before the statistics collection deadline.	byte
Number of PUT requests	The total number of PUT requests made by the user between 00:00:00 on the first day of the current month and the statistics collection deadline.	N/A
Number of GET requests	The total number of GET requests made by the user between 00:00:00 on the first day of the current month and the statistics collection deadline.	N/A

Metrics for request status details of OSS

Metric	Description	Unit
Number of requests with server-side errors	The total number of system-level error requests with the returned HTTP status code 5xx.	N/A
Percentage of requests with server-side errors	The percentage of requests with server-side errors out of all requests.	%
Number of requests with network errors	The total number of requests with the returned HTTP status code 499.	N/A
Percentage of requests with network errors	The percentage of requests with network errors out of all requests.	%
Number of requests with client-side authorization errors	The total number of requests with the returned HTTP status code 403.	N/A
Percentage of requests with client-side authorization errors	The percentage of requests with authorization errors out of all requests.	%

Metric	Description	Unit
Number of requests with client-side errors indicating resources not found	The total number of requests with the returned HTTP status code 404.	N/A
Percentage of requests with client-side errors indicating resources not found	The percentage of requests with errors indicating resources not found out of all requests.	%
Number of requests with client-side timeout errors	The total number of requests with the returned HTTP status code 408 or OSS error code RequestTimeout.	N/A
Percentage of requests with client-side timeout errors	The percentage of requests with client-side timeout errors out of all requests.	%
Number of requests with other client-side errors	The total number of requests other than the foregoing client-side error requests with the returned HTTP status code 4xx.	N/A
Percentage of requests with other client-side errors	The percentage of requests with other client-side errors out of all requests.	%
Number of successful requests	The total number of requests with the returned HTTP status code 2xx.	N/A
Percentage of successful requests	The percentage of successful requests out of all requests.	%
Number of redirected requests	The total number of requests with the returned HTTP status code 3xx.	N/A
Percentage of redirected requests	The percentage of redirected requests out of all requests.	%

Metrics for maximum latency of OSS

Metric	Description	Unit
Maximum end-to-end latency of GetObject requests	The maximum end-to-end latency of successful GetObject requests.	ms
Maximum server latency of GetObject requests	The maximum server latency of successful GetObject requests.	ms
Maximum end-to-end latency of HeadObject requests	The maximum end-to-end latency of successful HeadObject requests.	ms
Maximum server latency of HeadObject requests	The maximum server latency of successful HeadObject requests.	ms
Maximum end-to-end latency of PutObject requests	The maximum end-to-end latency of successful PutObject requests.	ms
Maximum server latency of PutObject requests	The maximum server latency of successful PutObject requests.	ms

Metric	Description	Unit
Maximum end-to-end latency of PostObject requests	The maximum end-to-end latency of successful PostObject requests.	ms
Maximum server latency of PostObject requests	The maximum server latency of successful PostObject requests.	ms
Maximum end-to-end latency of AppendObject requests	The maximum end-to-end latency of successful AppendObject requests.	ms
Maximum server latency of AppendObject requests	The maximum server latency of successful AppendObject requests.	ms
Maximum end-to-end latency of UploadPart requests	The maximum end-to-end latency of successful UploadPart requests.	ms
Maximum server latency of UploadPart requests	The maximum server latency of successful UploadPart requests.	ms
Maximum end-to-end latency of UploadPartCopy requests	The maximum end-to-end latency of successful UploadPartCopy requests.	ms
Maximum server latency of UploadPartCopy requests	The maximum server latency of successful UploadPartCopy requests.	ms

Metrics for successful request category of OSS

Metric	Description	Unit
Number of successful GetObject requests	The number of successful GetObject requests.	N/A
Number of successful HeadObject requests	The number of successful HeadObject requests.	N/A
Number of successful PostObject requests	The number of successful PostObject requests.	N/A
Number of successful AppendObject requests	The number of successful AppendObject requests.	N/A
Number of successful UploadPart requests	The number of successful UploadPart requests.	N/A
Number of successful UploadPartCopy requests	The number of successful UploadPartCopy requests.	N/A
Number of successful DeleteObject requests	The number of successful DeleteObject requests.	N/A
Number of successful DeleteObjects requests	The number of successful DeleteObjects requests.	N/A

Metrics for KVStore for Redis

Metric	Description	Apsara Stack service	Unit
CPU utilization	The CPU utilization of a KVStore for Redis instance.	KVStore for Redis	%

Metric	Description	Apsara Stack service	Unit
Memory usage	The percentage of memory that is in use.	KVStore for Redis	%
Used memory	The amount of memory that is in use.	KVStore for Redis	byte
Number of used connections	The total number of client connections that are in use.	KVStore for Redis	N/A
Percentage of used connections	The percentage of connections that are in use.	KVStore for Redis	%
Write bandwidth	The write traffic per second.	KVStore for Redis	byte/s
Read bandwidth	The read traffic per second.	KVStore for Redis	byte/s
Number of failed operations per second	The number of failed operations on a KVStore for Redis instance per second.	KVStore for Redis	count/s
Write bandwidth usage	The percentage of total bandwidth used by write operations.	KVStore for Redis	%
Read bandwidth usage	The percentage of total bandwidth used by read operations.	KVStore for Redis	%
Used QPS	The number of queries per second (QPS).	KVStore for Redis	count/s
QPS usage	The QPS usage.	KVStore for Redis	%
Average response time	The average response time.	KVStore for Redis	ms
Maximum response time	The maximum response time.	KVStore for Redis	ms
Number of failed commands	The number of failed commands.	KVStore for Redis	N/A
Hit rate	The current hit rate.	KVStore for Redis	%
Inbound traffic	The inbound traffic to a KVStore for Redis instance.	KVStore for Redis	byte
Inbound bandwidth usage	The inbound bandwidth usage of a KVStore for Redis instance.	KVStore for Redis	%
Outbound traffic	The outbound traffic from a KVStore for Redis instance.	KVStore for Redis	byte
Outbound bandwidth usage	The outbound bandwidth usage of a KVStore for Redis instance.	KVStore for Redis	%

Metrics for VPN Gateway

Metric	Dimension	Monitoring period	Unit
Number of inbound packets in a connection per second	User and instance	1 minute	pps

Metric	Dimension	Monitoring period	Unit
Number of outbound packets in a connection per second	User and instance	1 minute	pps
Inbound bandwidth of a connection	User and instance	1 minute	bit/s
Outbound bandwidth of a connection	User and instance	1 minute	bit/s
Number of connections	User and instance	1 minute	N/A

Metrics for AnalyticDB for PostgreSQL

Metric	Description	Unit
Connection usage	The number of connections between an application and an AnalyticDB for PostgreSQL instance per second.	%
CPU utilization	The CPU utilization of an AnalyticDB for PostgreSQL instance.	%
Disk usage	The disk usage of an AnalyticDB for PostgreSQL instance.	%
IOPS usage	The number of I/O requests for an AnalyticDB for PostgreSQL instance per second.	%
Memory usage	The memory usage of an AnalyticDB for PostgreSQL instance.	%

Metrics for ApsaraDB for MongoDB

Tab	Metric	Description	Unit
Basic metric	CPU utilization	The CPU utilization of an ApsaraDB for MongoDB instance.	%
	Memory usage	The memory usage of an ApsaraDB for MongoDB instance.	%
	Disk usage	The disk usage of an ApsaraDB for MongoDB instance.	%
	IOPS usage	The percentage of the IOPS used by an ApsaraDB for MongoDB instance out of the maximum available IOPS.	%

Tab	Metric	Description	Unit
	Connection usage	The number of connections between an application and an ApsaraDB for MongoDB instance per second.	%
	QPS	The number of queries per second.	N/A
	Number of used connections	The number of current connections to an ApsaraDB for MongoDB instance.	N/A
Disk capacity	Disk space occupied by an instance	The total used space.	byte
	Disk space occupied by data	The disk space occupied by data.	byte
	Disk space occupied by logs	The disk space occupied by logs.	byte
Network request	Inbound traffic to the internal network	The inbound traffic.	byte
	Outbound traffic from the internal network	The outbound traffic.	byte
	Number of requests	The number of processed requests.	N/A
Number of operations	Number of Insert operations	None	N/A
	Number of Query operations	None	N/A
	Number of Update operations	None	N/A
	Number of Delete operations	None	N/A
	Number of Getmore operations	None	N/A
	Number of Command operations	None	N/A

Metrics for EIP

Metric	Description	Dimension	Monitoring period	Unit
Inbound bandwidth	The traffic that passes through EIP to ECS per second.	Instance	1 minute	bit/s

Metric	Description	Dimension	Monitoring period	Unit
Outbound bandwidth	The traffic that passes through EIP from ECS per second.	Instance	1 minute	bit/s
Number of inbound packets per second	The number of packets that pass through EIP to ECS per second.	Instance	1 minute	pps
Number of outbound packets per second	The number of packets that pass through EIP from ECS per second.	Instance	1 minute	pps
Packet loss rate due to throttling	The packet loss rate when the actually used bandwidth exceeds the configured upper limit.	Instance	1 minute	pps

Metrics for API Gateway

Metric	Description	Dimension	Unit	Monitoring period
Error distribution	The number of 2xx, 4xx, and 5xx status codes returned for an API in the monitoring period.	User and API	N/A	1 minute
Inbound traffic	The total traffic of requests received by an API in the monitoring period.	User and API	byte	1 minute
Outbound traffic	The total traffic of responses sent by an API in the monitoring period.	User and API	byte	1 minute
Response time	The latency between the time when API Gateway calls the backend service of an API and the time when the result is received from the backend service in the monitoring period.	User and API	s	1 minute
Number of total requests	The total number of requests received by an API in the monitoring period.	User and API	N/A	1 minute

1.6.2.3. View monitoring charts

You can view monitoring charts to obtain up-to-date information about each instance.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, choose **Products > Monitoring and O&M > CloudMonitor**.
3. In the left-side navigation pane of the CloudMonitor page, click **Cloud Service Monitoring**.
4. Click a cloud service.
5. Click **Monitoring Charts** in the **Actions** column corresponding to an instance.

   On the Monitoring Charts page that appears, you can select a date and time to view the monitoring data of each metric.

1.6.3. Alerts

1.6.3.1. View alert overview

On the **Overview** page in Cloud Monitor, you can view the alert status statistics and alert logs.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, choose **Products > Monitoring and O&M > CloudMonitor**.
3. In the left-side navigation pane of the Cloud Monitor page, click **Overview**.
4. On the **Overview** page, view the alert status statistics and alert logs that are generated in the last 24 hours.

1.6.3.2. Enable or disable alert notification

You can choose whether to enable alert notification by SMS, email, or DingTalk.

Prerequisites

Valid contact information is specified when you create a user. If your contact information is changed, you must modify personal information. For more information, see Modify personal information.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and click **User Information**.
3. In the **Messages** section, select **Email** or **DingTalk** to enable alert notification.

   To disable alert notification, clear the corresponding check box.

1.6.3.3. View alert logs

You can view alert information to stay up to date on the running status of Elastic Compute Service (ECS), ApsaraDB RDS, Server Load Balancer (SLB), KVStore for Redis, VPN Gateway, AnalyticDB for PostgreSQL, ApsaraDB for MongoDB, Elastic IP Address (EIP), API Gateway, and Object Storage Service (OSS).

Context

Alert information contains information for all items that do not comply with your configured alert rules.

> Note
> - The system can retain up to one million alert items generated within the last three months.
> - This topic describes how to view alert information for ECS. You can view the alert information for other cloud resources in a similar manner.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, choose **Products > Monitoring and O&M > Cloud Monitor**.
3. In the left-side navigation pane of the Cloud Monitor page, choose **Alerts > Alert History**.
4. On the **Alert Rule History List** page, filter alert information by rule ID, rule name, service, and date.

   The following table describes the fields in the query result. Alert information fields

Parameter	Description
Product	The service for which the alert was triggered.
Fault Instance	The instance for which the alert was triggered.
Occurred At	The time when the alert was triggered.
Rule Name	The name of the alert rule.
Status	The status of the alert rule.
Notification Contact	The recipient of the alert notification.

1.6.3.4. Alarm rules

1.6.3.4.1. View alert rules

After you create alert rules, you can view your alert rules on the Alert Rules page.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, choose **Products > Monitoring and O&M > CloudMonitor**.
3. In the left-side navigation pane of the Cloud Monitor page, click **Cloud Service Monitoring**.
4. Click a cloud service.
5. Click **Alert Rules** in the **Actions** column corresponding to an instance to go to its **Alert Rules** page.

   On the **Alert Rules** page, view the detailed information of alert rules.

1.6.3.4.2. Create an alert rule

You can create an alert rule to monitor an instance.

Prerequisites

For Elastic Compute Service (ECS) instances, you must install a monitoring plug-in to collect metric data at the operating system level.

You can use the following method to install a monitoring plug-in:

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, choose **Products > Monitoring and O&M > Cloud Monitor**.
3. In the left-side navigation pane, choose **Cloud Service Monitoring > ECS**.
4. In the ECS instance list, select the instances that you want to monitor and click **Batch Install**.

> **Note**
> The monitoring chart displays monitoring data 5 to 10 minutes after the monitoring plug-in is installed.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, choose **Products > Monitoring and O&M > Cloud Monitor**.
3. In the left-side navigation pane of the Cloud Monitor page, click **Cloud Service Monitoring**.
4. Click a cloud service.
5. Click **Alert Rules** in the **Actions** column corresponding to an instance.

   > **Note** You can also use the search feature to query specific instances for which you want to create alert rules.

6. On the **Alert Rules** page, click **Create Alert Rule**.

   Parameters for creating an alert rule

Parameter	Description
Product	The monitored cloud service.
Resource Range	The range of resources that is associated with the alert rule.
Rule Description	The description of the alert rule.
Add Rule Description	Click **Add Rule Description** to go to the rule configuration panel. For more information, see Parameters for adding rule description.
Effective Time	Only a single alert is sent during each mute duration, even if the metric value exceeds the alert rule threshold several times in a row.
Effective Period	An alert is sent only when the threshold is crossed during the effective period.
HTTP CallBack	The callback URL when the alert conditions are met.
Alert Contact Group	The group to which alerts are sent.

   Parameters for adding rule description

Parameter	Description
Rule Name	The name of the alert rule. The name must be 1 to 64 characters in length and can contain letters and digits.
Metric Name	Different products have different monitoring metrics. For more information, see Metrics.
Comparison	The comparison between thresholds and observed values. The comparison operators include >, >=, <, and <=. When the comparison rule is satisfied, an alert rule is triggered.

Parameter	Description
Threshold and Alert Level	Different metrics have different reference thresholds.

7. Click **OK**.

1.6.3.4.3. Disable an alert rule

You can disable one or more alert rules.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, choose **Products > Monitoring and O&M > CloudMonitor**.
3. In the left-side navigation pane of the Cloud Monitor page, click **Cloud Service Monitoring**.
4. Click a cloud service.
5. Click **Alert Rules** in the **Actions** column corresponding to an instance.
6. On the **Alert Rules** page, choose **More > Disable** in the **Actions** column corresponding to the alert rule to be disabled.
7. In the Disable Alert Rule message, click **Confirm**.

1.6.3.4.4. Enable an alert rule

After an alert rule is disabled, you can re-enable it

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, choose **Products > Monitoring and O&M > CloudMonitor**.
3. In the left-side navigation pane of the Cloud Monitor page, click **Cloud Service Monitoring**.
4. Click a cloud service.
5. Click **Alert Rules** in the **Actions** column corresponding to an instance.
6. On the **Alert Rules** page, choose **More > Enable** in the **Actions** column corresponding to the alert rule to be enabled.
7. In the Enable Alert Rule message, click **Confirm**.

1.6.3.4.5. Delete an alert rule

You can delete alert rules that are no longer needed.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, choose **Products > Monitoring and O&M > CloudMonitor**.
3. In the left-side navigation pane of the Cloud Monitor page, click **Cloud Service Monitoring**.
4. Click a cloud service.
5. Click **Alert Rules** in the **Actions** column corresponding to an instance.
6. On the **Alert Rules** page, click **Delete** in the **Actions** column corresponding to the alert rule to be deleted.
7. In the Delete Alert message, click **Confirm**.

1.7. VMware Cloud on Alibaba Cloud

1.7.1. Log on to the VMware Cloud on Alibaba Cloud console

This topic describes how to log on to the VMware Cloud on Alibaba Cloud console.

Prerequisites

- Before you log on to the Apsara Uni-manager Management Console, you must obtain the endpoint of the console from the deployment personnel.
- A browser is available. We recommend that you use Google Chrome.

Procedure

1. In the address bar, enter the URL of the Apsara Uni-manager Management Console. Press the Enter key.
2. Enter your username and password.

   Obtain the username and password that you can use to log on to the console from the operations administrator.

   > **Note** When you log on to the Apsara Uni-manager Management Console for the first time, you must change the password of your username. Your password must meet complexity requirements. The password must be 8 to 20 characters in length and must contain at least two of the following character types:
   >
   > - Uppercase or lowercase letters
   > - Digits
   > - Special characters, which include ! @ # $ %

3. Click **Login**.
4. In the top navigation bar, choose **Products > Elastic Computing > VMware Cloud on Alibaba Cloud**.

1.7.2. Bind a VMware Cloud on Alibaba Cloud region

Before you use VMware Cloud on Alibaba Cloud, you must bind a VMware Cloud on Alibaba Cloud region to an organization.

Prerequisites

A VMware Cloud on Alibaba Cloud region is managed. For more information, see Add a VMware node.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, click **Resource Pools**.
4. In the organization navigation tree, click an organization. In the **Regions** section, select the region that you want to bind.
5. Click **Update Association**.

1.7.3. Instructions

1.7.3.1. Limits

Before you use VMware Cloud on Alibaba Cloud virtual machine (VM) templates, you must familiarize yourself with the limits of instances.

General limits

- You must select appropriate operating systems for VMware Cloud on Alibaba Cloud VM templates.

  The following operating systems are verified to be available in the Apsara Uni-manager Management Console:

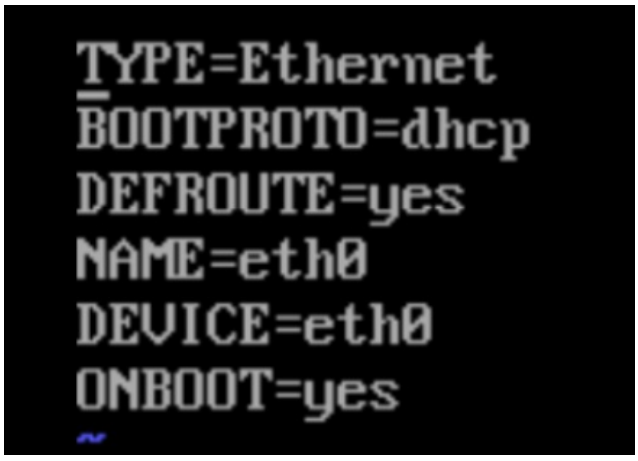
  - CentOS8.2.2004
  - CentOS7.2003
  - CentOS6.10
  - Ubuntu-20.04.1
  - Ubuntu-18.04.5
  - Ubuntu-16.04.7
  - Windows Server 2016
  - Windows Server 2019

- The Apsara Uni-manager Management Console supports VMware vSphere 6.x. Other versions of VMware vSphere, such as 5.x or 7.x, can in theory be supported. However, the specific support depends on the compatibility of the VMware Cloud on Alibaba Cloud API and must be evaluated by the R&D team of the Apsara Uni-manager Management Console.
- You must install VMware Tools.

  For more information, see the VMware documentation. Select Full Installation in the installation process.
- You must modify network interface controller configurations in the operating system of the VM.

  When you create a VM in the Apsara Uni-manager Management Console, you can specify the IP address of the operating system. This feature is supported by valid network interface controller configurations.

  Operating systems of VM templates must be in DHCP mode. Information such as the MAC address and universally unique identifier (UUID) in the network interface controller configurations must be removed. The following information can be retained.

> **Note**
>
> Some configurations are required for the following operating systems:
>
> - CentOS 6: You must clear the content in the network interface controller configuration file named 70-persistent-net.rules. The file is stored in the /etc/udev/rules.d/ directory.
> - CentOS 7: The system generates the name for a network interface controller, such as ifcfg-ens160. You must modify the name to ifcfg-eth0 to make the name take effect.
> - Ubuntu18.04, 20.04, and later: You must run the `sudo rm /etc/netplan/*.yaml` command to remove the network interface controller configurations.

1.7.3.2. Suggestions

Consider the following operation suggestions to make more efficient use of VMware Cloud on Alibaba Cloud virtual machine (VM) templates.

- Select the latest version of VM hardware.
- Select thin provision for VM disks.

  Disk replication is required when you create VMs based on templates. Files of disks of the thin provision type are small in size. This can help accelerate the creation of VMs.

> **Note**
>
> Large sizes of disk files in VM templates or slow storage write speeds may cause VM creation to time out and fail. The maximum timeout period supported by the Apsara Uni-manager Management Console is 10 minutes.

1.7.4. Instances

1.7.4.1. Create a VMware Cloud on Alibaba Cloud instance

A VMware Cloud on Alibaba Cloud instance is a virtual machine (VM) that contains the basic computing components of a server, such as CPU, memory, operating system, network, and disks.

Prerequisites

- The region where VMware Cloud on Alibaba Cloud is deployed is managed. For more information, see Add a VMware node.
- The region where VMware Cloud on Alibaba Cloud is deployed is bound to an organization. For more information, see Bind a VMware Cloud on Alibaba Cloud region.

Procedure

1. Log on to the VMware Cloud on Alibaba Cloud console.
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, move the pointer over **Region** and select the region where VMware Cloud on Alibaba Cloud is deployed.
4. Click **Create Instance** in the upper-right corner.
5. Configure parameters listed in the following table to create an instance.

Section	Parameter	Required	Description
Basic Settings	**Organization**	Yes	The organization in which to create the instance.
	Resource Set	Yes	The resource set in which to create the instance.
Region	**Region**	Yes	The region in which to create the instance.
	Zone	Yes	The zone in which to create the instance.
	VPC	Yes	The VPC in which to create the instance.
	vSwitch	Yes	Select the vSwitch to which the instance belongs. The vSwitch corresponds to the port group of a VMware ESXi host or a distributed switch, and maps to the VLAN of a physical switch.
	Private IP Address	Yes	The private IPv4 address of the instance. The private IPv4 address must be within the CIDR block of the vSwitch.
	Private Subnet Mask	Yes	The private subnet mask. Example: 255.255.255.0. The specified subnet mask must be within the CIDR block of the selected vSwitch.
	Private IP Address of Gateway	Yes	The private IP address of the gateway. Example: 192.168.100.1. The IP address must be within the CIDR block of the selected vSwitch.
	Private IP Address of DNS Server	No	The private IP address of the DNS server. Example: 114.114.114.114. The IP address must be within the CIDR block of the selected vSwitch.

Section	Parameter	Required	Description
Instance	**Instance Family**	No	The instance family of the instance. Valid values: ○ Memory Optimized ○ Compute Optimized ○ General Purpose
	Instance Type	Yes	The instance type of the instance. You can specify the vCPUs and memory.
Image	**Image Type**	No	The type of the image. Default value: **Public Image**.
	Public image	Yes	The public image of the instance.
	System Disk (GB)	No	The system disk to which the operating system is installed. You can configure different storage types for the disk. Valid values: ○ **Shared Storage: All**: The system selects an available shared storage. We recommend that you select this type. ○ **Shared Storage: storageA**: The storage named storageA of the VMware Cloud on Alibaba Cloud instance is used. Administrators must make sure the storage is appropriate. If the storage capacity is insufficient, the instance fails to be created.

Section	Parameter	Required	Description
Storage	**Data Disk (GB)**	No	You can also add data disks after the instance is created. You can configure different storage types for the disk. Valid values: ◦ **Shared Storage: All**: The system selects an available shared storage. We recommend that you select this type. ◦ **Shared Storage: storageA**: The storage named storageA of the VMware Cloud on Alibaba Cloud instance is used. Administrators must make sure the storage is appropriate. If the storage capacity is insufficient, the instance fails to be created. You must also specify the provision type when you create the instance. Valid values: ◦ Thin Provision: Storage space increases with the use of the disk. ◦ Thick Provision Lazy Zeroed: Storage space is equal to the size of the disk and does not increase. The disk is formatted when data is written. ◦ Thick Provision Eager Zeroed: Storage space is equal to the size of the disk and does not increase. The storage of the disk is immediately formatted when the disk is created.
Password	**Password Setting**	No	Select **Set after Purchase**.
Instance Name	**Instance Name**	Yes	The name of the instance. The name must be 2 to 128 characters in length and can contain letters, periods (.), underscores (_), hyphens (-), and colons (:). It must start with a letter and cannot start with http:// or https://.

6. Click **Submit**.

1.7.4.2. View instance information

You can view the list of created instances as well as details of individual instances, such as their basic configurations, disks, and elastic network interfaces (ENIs).

Procedure

1. Log on to the VMware Cloud on Alibaba Cloud console.
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, move the pointer over **Region** and select the region where VMware Cloud on Alibaba Cloud is deployed.

   You can view the list of VMware Cloud on Alibaba Cloud instances that are deployed in the current region.
4. Use one of the following methods to go to the details page of an instance:
   - In the **Instance ID/Name** column, click the instance ID.
   - Click **Manage** in the **Actions** column corresponding to the instance.
   - Choose **More** > **Show Details** in the **Actions** column corresponding to the instance.

1.7.4.3. Modify an instance

You can modify the name and description of a created VMware Cloud on Alibaba Cloud instance.

Procedure

1. Log on to the VMware Cloud on Alibaba Cloud console.
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, move the pointer over **Region** and select the region where VMware Cloud on Alibaba Cloud is deployed.
4. Find the instance that you want to modify and choose **More** > **Modify** in the **Actions** column.
5. Modify the name and description of the instance.
6. Click **OK**.

1.7.4.4. Remotely connect to an instance

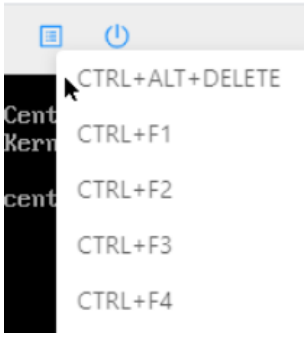
You can remotely connect to and manage added VMware Cloud on Alibaba Cloud instances.

Procedure

1. Log on to the VMware Cloud on Alibaba Cloud console.
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, move the pointer over **Region** and select the region where VMware Cloud on Alibaba Cloud is deployed.
4. Find the instance that you want to manage and click **Remote Connection** in the **Actions** column.
5. Enter the username and password.
   - For a Linux instance, enter the username *root* and the logon password.

     > **Note**
     >
     > When you log on to the Linux instance, the password is not displayed as you enter it. Press the Enter key after you enter the password.

- For a Windows instance, to use a key combination such as Ctrl+Alt+Delete, click the List icon in the upper-right corner of the page and select the corresponding composite key from the drop-down list.



Enter the username and password, and click the Log On icon.

1.7.4.5. Stop an instance

You can stop VMware Cloud on Alibaba Cloud instances that are not in use. The stop operation interrupts services that are running on the instances. Exercise caution when you perform this operation.

Prerequisites

The instance is in the **Running** state.

Procedure

1. Log on to the VMware Cloud on Alibaba Cloud console.
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, move the pointer over **Region** and select the region where VMware Cloud on Alibaba Cloud is deployed.
4. Use one of the following methods to stop instances:
   - To stop a single instance, find the instance and choose **More** > **Instance Status** > **Stop** in the **Actions** column.
   - To stop one or more instances at a time, select the instances and click **Stop** in the lower part of the Instances page.
5. Click **OK**.

Execution results

When the instance is being stopped, its state in the **Status** column changes from **Running** to **Stopping**. After the instance is stopped, its state changes to **Stopped**.

1.7.4.6. Start an instance

You can start a stopped instance.

Prerequisites

The instance is in the **Stopped** state.

Procedure

1. Log on to the VMware Cloud on Alibaba Cloud console.
2. In the left-side navigation pane, click **Instances**.

3. In the top navigation bar, move the pointer over **Region** and select the region where VMware Cloud on Alibaba Cloud is deployed.
4. Use one of the following methods to start instances:
   - To start a single instance, find the instance and choose **More** > **Instance Status** > **Start** in the **Actions** column.
   - To start one or more instances at a time, select the instances and click **Start** in the lower part of the Instances page.
5. Click **OK**.

Execution results

When the instance is being started, its state in the **Status** column changes from **Stopped** to **Starting**. After the instance is started, its state changes to **Running**.

1.7.4.7. Restart an instance

After you change the logon password of an instance or install system updates, you must restart the instance. The restart operation stops the instances for a short period of time and interrupts services that are running on the instance. Exercise caution when you perform this operation.

Prerequisites

The instance is in the **Running** state.

Procedure

1. Log on to the VMware Cloud on Alibaba Cloud console.
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, move the pointer over **Region** and select the region where VMware Cloud on Alibaba Cloud is deployed.
4. Use one of the following methods to restart the instance:
   - To restart a single instance, find the instance and choose **More** > **Instance Status** > **Restart** in the **Actions** column.
   - To restart one or more instances at a time, select the instances and click **Restart** in the lower part of the Instances page.
5. In the Restart Instance dialog box, select a restart mode.
   - **Restart**: restarts the instance normally.
   - **Force Restart**: forces the instance to restart. This may result in the loss of unsaved data.
6. Click **OK**.

1.7.4.8. Delete an instance

You can delete instances that are no longer needed to release their resources. Deleted instances cannot be recovered. We recommend that you back up data before you delete an instance. If data disks are released with the instances, the disk data cannot be recovered.

Prerequisites

The instance is in the **Stopped** state.

Procedure

1. Log on to the VMware Cloud on Alibaba Cloud console.

2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, move the pointer over **Region** and select the region where VMware Cloud on Alibaba Cloud is deployed.
4. Select the instance and click **Delete** in the lower part of the Instances page.
5. Click **OK**.

1.7.4.9. Change the instance type of an instance

You can change the instance types of instances to suit your business needs. This eliminates the need to create VMware Cloud on Alibaba Cloud instances.

Prerequisites

The instance is in the **Stopped** state.

Procedure

1. Log on to the VMware Cloud on Alibaba Cloud console.
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the instance whose instance type you want to change and click **Upgrade/Downgrade** in the **Actions** column.
5. On the page that appears, select a new instance type and click **Submit**.

   The page that appears shows the instance types available for selection.
6. Start the instance to make the new instance type take effect.

   For more information, see Start an instance.

1.7.5. Images

1.7.5.1. Create a custom image

You can create a custom image and use it to create identical instances or replace the system disks of existing instances. This way, you can configure many instances that have identical operating systems and data environments.

Create a custom image from an instance

You can create a custom image from an instance to replicate the data of all system and data disks on the instance.

> **Note**
>
> To avoid data security risks, we recommend that you delete sensitive data from an instance before you use the instance to create a custom image.

1. Log on to the VMware Cloud on Alibaba Cloud console.
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, move the pointer over **Region** and select the region where VMware Cloud on Alibaba Cloud is deployed.
4. Find the instance from which you want to create a custom image and choose **More** > **Create Custom Image** in the **Actions** column.
5. Set the name, sharing scope, and description for the custom image, and click **OK**.

The name must be 2 to 128 characters in length and can contain letters, digits, periods (.), underscores (_), hyphens (-), and colons (:). It cannot start with a special character or digit.

You can set the sharing scope to the permission scope of the image.

The description must be 2 to 256 characters in length and cannot start with http:// or https://.

1.7.5.2. View images

You can view the list of created images.

Procedure

1. Log on to the VMware Cloud on Alibaba Cloud console.
2. In the left-side navigation pane, choose **Images** > **Images**.
3. In the top navigation bar, move the pointer over **Region** and select the region where the image is created.
4. Select a filter option, enter the corresponding information in the search box, and then click **Search**.

   You can select multiple filter options to narrow down search results.

Parameter	Description
Image Name	The image name used to search for the image.
Image ID	The image ID used to search for the image.

1.7.6. Snapshots

1.7.6.1. Create a snapshot

You can manually create a snapshot for a disk to back up disk data.

Prerequisites

- The instance to which the disk is attached is in the **Running** or **Stopped** state.
- The disk is in the **Running** state.

Background information

A snapshot of a disk can be used to roll back data of the disk.

When you create a snapshot, take note of the following items:

- For each disk, the first snapshot taken is a full snapshot and subsequent snapshots are incremental snapshots. It takes longer to create the first full snapshot than it does subsequent incremental snapshots. The amount of taken time depends on the amount of data that has been changed since the previous snapshot. The more data that has been changed, the longer it takes to create an incremental snapshot.
- Avoid creating snapshots during peak hours.

Procedure

1. Log on to the VMware Cloud on Alibaba Cloud console.
2. In the left-side navigation pane, click **Instances**.

3. In the top navigation bar, move the pointer over **Region** and select the region where VMware Cloud on Alibaba Cloud is deployed.
4. Click the instance from which you want to create a snapshot. On the page that appears, click the **Snapshots** tab.
5. Click **Create and Bind Snapshot**.
6. Set the name, type, and description for the snapshot, and click **Submit**.

Parameter	Description
Snapshot Name	The name of the snapshot.
Snapshot Type	The snapshot type. Valid values: ○ Disk Snapshot: stores information in disks. ○ Memory Snapshot: stores information in memory.
Snapshot Description	The description of the snapshot.

1.7.6.2. Delete a snapshot

You can delete a snapshot that is no longer needed. After the snapshot is deleted, it cannot be recovered.

Procedure

1. Log on to the VMware Cloud on Alibaba Cloud console.
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, move the pointer over **Region** and select the region where VMware Cloud on Alibaba Cloud is deployed.
4. Find the instance whose snapshot is to be deleted and click the **Snapshots** tab.
5. Use one of the following methods to delete the snapshot:
   - To delete a single snapshot, find the snapshot and click **Delete** in the **Actions** column.
   - To delete one or more snapshots at a time, select the snapshots and click **Delete** in the lower part of the Snapshots tab.
6. Click **OK**.

1.7.6.3. View snapshots

You can view the list of created snapshots.

Procedure

1. Log on to the VMware Cloud on Alibaba Cloud console.
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, move the pointer over **Region** and select the region where VMware Cloud on Alibaba Cloud is deployed.
4. Find the instance in which you want to view snapshots and click the **Snapshots** tab.
5. Select a filter option, enter the corresponding information in the search box, and then click **Search**.

You can select multiple filter options to narrow down search results.

Parameter	Description
Snapshot Name	The snapshot name used to search for the snapshot.
Snapshot ID	The snapshot ID used to search for the snapshot.

1.7.7. Disks

1.7.7.1. Create a disk

To increase the storage space of VMware Cloud on Alibaba Cloud instances, you can create standalone data disks and then attach them to the instances. This topic describes how to create an empty data disk. You cannot create standalone system disks.

Procedure

1. Log on to the VMware Cloud on Alibaba Cloud console.
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, move the pointer over **Region** and select the region where VMware Cloud on Alibaba Cloud is deployed.
4. Find the instance for which you want to create a disk and click the **Disks** tab.
5. Click **Create and Attach Disk**.
6. Configure parameters listed in the following table to create a disk.

Section	Parameter	Required	Description
Region	**Zone**	Yes	The zone in which to create the disk.
	Specifications	Yes	The disk category and the disk size.

Section Basic Settings	Parameter	Required	Description
	Provision Type	Yes	The provision type. Valid values: ○ Thin Provision: Storage space increases with the use of the disk. ○ Thick Provision Lazy Zeroed: Storage space is equal to the size of the disk and does not increase. The disk is formatted when data is written. ○ Thick Provision Eager Zeroed: Storage space is equal to the size of the disk and does not increase. The storage of the disk is immediately formatted when the disk is created.

7. Click **Submit**.

Execution results

The created disk is displayed in the disk list and in the **Running** state.

1.7.7.2. View disks

You can view the list of created disks and the details of individual disks.

Procedure

1. Log on to the VMware Cloud on Alibaba Cloud console.
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, move the pointer over **Region** and select the region where VMware Cloud on Alibaba Cloud is deployed.
4. Click the instance for which you want to view disks. On the page that appears, click the **Disks** tab.
5. Select a filter option from the drop-down list, enter the relevant information in the search box, and then click **Search**.

   You can select multiple filter options to narrow down search results.

Parameter	Description
Disk Name	The disk name used to search for the disk.
Disk ID	The disk ID used to search for the disk.

Parameter	Description
Disk Properties	The disk type used to search for disks of that type. Valid values: ○ All ○ System Disk ○ Data Disk

1.7.7.3. Detach a data disk

You can detach data disks. System disks cannot be detached.

Procedure

> **Warning**
> Resources are released after disks are detached. Make sure that the data of a disk is backed up before you detach it.

1. Log on to the VMware Cloud on Alibaba Cloud console.
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, move the pointer over **Region** and select the region where VMware Cloud on Alibaba Cloud is deployed.
4. Click the instance from which you want to detach a data disk. On the page that appears, click the **Disks** tab.
5. Find the data disk that you want to detach and choose **More** > **Detach** in the **Actions** column.
6. Click **OK**.

1.7.8. ENIs

1.7.8.1. Create an ENI

You can create and bind elastic network interfaces (ENIs) to VMware Cloud on Alibaba Cloud instances.

Prerequisites

A virtual private cloud (VPC) and a vSwitch are created. For more information, see Create a VPC and Create a vSwitch in *Apsara Stack VPC User Guide*.

Background information

ENIs are classified into primary and secondary ENIs.

A primary ENI is created by default when an instance is created in a VPC. This primary ENI has the same lifecycle as the instance and cannot be unbound from the instance.

ENIs that are separately created are secondary ENIs. This topic describes how to create a secondary ENI.

Procedure

1. Log on to the VMware Cloud on Alibaba Cloud console.
2. In the left-side navigation pane, click **Instances**.

3. In the top navigation bar, move the pointer over **Region** and select the region where VMware Cloud on Alibaba Cloud is deployed.
4. Click the instance for which you want to create an ENI. On the page that appears, click the **ENIs** tab.
5. Click **Create and Bind ENI**.
6. Configure parameters listed in the following table to create an ENI.

Section	Parameter	Required	Description
Region	**Organization**	Yes	The organization in which to create the ENI.
	Resource Set	Yes	The resource set in which to create the ENI.
	Region	Yes	The region in which to create the ENI.
	Zone	Yes	The zone in which to create the ENI.
Basic Settings	**VPC**	Yes	The VPC in which to create the ENI. The secondary ENI can be bound only to an instance in the same VPC. **Note** After an ENI is created, you cannot change its VPC.
	vSwitch	Yes	The vSwitch in which to create the ENI. The secondary ENI can be bound only to an instance in the same VPC. Select a vSwitch that is deployed within the same zone as the instance to which the ENI is bound. The vSwitch of the ENI can be different from that of the instance. **Note** After an ENI is created, you cannot change its vSwitch.

7. Click **Submit**.

Execution results

The created ENI is displayed on the ENIs page and is in the **Bound** state.

1.7.8.2. View ENIs

You can view the list of created elastic network interfaces (ENIs).

Procedure

1. Log on to the VMware Cloud on Alibaba Cloud console.
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, move the pointer over **Region** and select the region where VMware Cloud on Alibaba Cloud is deployed.
4. Click the instance for which you want to view ENIs. On the page that appears, click the **ENIs** tab.
5. Select a filter option, enter the corresponding information in the search box, and then click **Search**.

   You can select multiple filter options to narrow down search results.

Parameter	Description
ENI Name	The ENI name used to search for the ENI.
ENI ID	The ENI ID used to search for the ENI.
VSwitch ID	The vSwitch ID used to search for the ENIs that are associated with the vSwitch.

1.7.8.3. Delete an ENI

You can delete secondary elastic network interfaces (ENIs) that are no longer needed.

Background information

Only secondary ENIs can be deleted. Primary ENIs share the same lifecycle as instances and cannot be deleted.

Procedure

1. Log on to the VMware Cloud on Alibaba Cloud console.
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, move the pointer over **Region** and select the region where VMware Cloud on Alibaba Cloud is deployed.
4. Find the instance whose secondary ENI is to be deleted and click the **ENIs** tab.
5. Find the secondary ENI and click **Delete** in the **Actions** column.
6. Click **OK**.

1.8. Enterprise

1.8.1. Organizations

1.8.1.1. Create an organization

You can create organizations to store resource sets and their resources.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.

3. In the left-side navigation pane of the Enterprise page, click **Organizations**.
4. In the organization navigation tree, click a parent organization. In the Current Organization section, click **Add Organization**.
5. In the Add Organization dialog box, enter an organization name and click **OK**.
6. (Optional)If the primary node has enabled the multi-cloud management feature, the **Synchronously Create Multi-cloud Organization** check box is displayed after you click **OK**.

   Select **Synchronously Create Multi-cloud Organization**, select clouds where the organization is synchronously created, and then click **OK**.

1.8.1.2. Query an organization

You can query an organization by name to view its resource sets, users, and user groups.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Organizations**.
4. In the search box below **Organizations**, enter an organization name.

   You can view the information about the corresponding organization.

1.8.1.3. View organization information

You can view information about an organization on the Organizations page.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Organizations**.
4. On the **Organizations** page, click an organization in the organization list.
5. In the right-side area, view the organization information.
   - In the **Resource Sets** section, you can view information such as the name, creation time, and creator of each resource set in the organization. Click the name of a resource set to view its details.
   - In the **Users** section, you can view information such as the name, status, and role of each user in the organization. Click a username to view the user details.
   - In the **User Groups** section, you can view the name, organization, role, members, and creation time of each user group in the organization.

1.8.1.4. Modify the name of an organization

Users that have operation permissions on an organization can modify the name of the organization.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Organizations**.
4. In the organization navigation tree, click an organization name.
5. In the Current Organization section, click **Edit Organization**.
6. In the Edit Organization dialog box, modify the organization name.

If you want to synchronously modify the name of a multi-cloud organization in other clouds, select **Synchronously Modify Multi-cloud Organization**.

7. Click **OK**.

1.8.1.5. Change organization ownership

Users that have operation permissions on organizations can change the ownership of organizations.

Prerequisites

- Make sure that each organization under the organization that you want to change the ownership has a unique name.
- The ownership of an organization cannot be changed cross level-1 organizations.

Context

Users can change the ownership of an organization cross parent organizations. This way, the ownership of subordinate organizations, users, and resources are also changed in a cascading manner.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Resource Sets**.
4. On the **Change Ownership** page, select an organization and click **Change Organization** in the upper-right corner.
5. In the **Change Organization** dialog box, select the destination organization and click **OK** to change the ownership of the organization along with that of its resources sets and users.

1.8.1.6. Obtain the AccessKey pair of an organization

An AccessKey pair consists of an AccessKey ID and an AccessKey secret. The AccessKey pair is used to implement symmetric encryption to verify the identity of the requester. The AccessKey ID is used to identify a user. The AccessKey secret is used to encrypt the signature string. This topic describes how to obtain the AccessKey pair of an organization.

Prerequisites

Only operations administrators and level-1 organization administrators can obtain the AccessKey pair of an organization.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, click **Organizations**.
4. In the organization navigation tree, click an organization name.
5. In the Current Organization section, click **Obtain AccessKey Pair**.
6. In the AccessKey message, view the AccessKey pair of the organization.

1.8.1.7. Delete an organization

Administrators can delete organizations that are no longer needed.

Prerequisites

Before you delete an organization, make sure that the organization does not contain users, resource sets, or subordinate organizations. Otherwise, the organization cannot be deleted.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the Enterprise page, click **Organizations**.
4. In the organization navigation tree, click an organization name. In the **Current Organization** section, click **Delete Organization**.
5. In the Confirm message, click **OK**.

1.8.2. Resource sets

1.8.2.1. Create a resource set

You must create a resource set before you apply for resources.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Resource Sets**.
4. In the upper-left corner of the **Resource Sets** page, click **Create Resource Set**.
5. In the **Create Resource Set** dialog box, set **Name** and **Organization**.
6. Click **OK**.

1.8.2.2. View the details of a resource set

When you want to use a cloud resource in your organization, you can view the details of the resource set that contains the resource, including all resource instances and users of the resource set.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Resource Sets**.
4. Select an **organization** from the drop-down list, or enter a **resource set** name in the search bar, and then click **Search**.
5. Click the name of the target **resource set**.
6. On the **Resource Set Details** page, click the **Resources** and **Members** tabs to view information about all resource instances and users of the resource set.
7. On the **Resources** tab, click the number of a service to go to the instance list page of the service. The list is automatically filtered and displayed based on the organization and resource set.

1.8.2.3. Modify the name of a resource set

An administrator can modify the name of a resource set to keep it up-to-date.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.

2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Resource Sets**.
4. Click **More** in the **Actions** column corresponding to a resource set, and choose **Edit Name** from the shortcut menu.
5. In the dialog box that appears, enter the new name.
6. Click **OK**.

1.8.2.4. Add a member to a resource set

You can add a member to a resource set so that the member can use the resources in the resource set.

Prerequisites

Before adding a member, make sure that the following prerequisites are met:

- A resource set is created. For more information, see Create a resource set.
- A user is created. For more information, see Create a user.

Context

Members of a resource set have the permissions to use resources in the resource set.

Deleting resources from a resource set does not affect the members of the resource set. Similarly, deleting members from a resource set does not affect the resources in the resource set.

You can delete a member that is no longer in use in a resource set. After the member is deleted, it will no longer be able to access the resource set.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Resource Sets**.
4. Click **More** in the **Actions** column corresponding to a resource set, and choose **Add Member** from the shortcut menu.
5. In the dialog box that appears, select a username.
6. Click **OK**.

1.8.2.5. Add or remove a user group of a resource set

You can add or remove a user group of a resource set to manage user group access to resources in the resource set.

Prerequisites

- A resource set is created. For more information, see Create a resource set.
- A user group is created. For more information, see Create a user group.

Context

User groups in a resource set have the permissions to use resources in the resource set.

Deleting resources from a resource set does not affect user groups of the resource set. Similarly, deleting user groups from a resource set does not affect the resources in the resource set.

You can delete a user group that is no longer in use in a resource set. After the user group is deleted, it will no longer be able to access the resource set.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Resource Sets**.
4. Click **More** in the **Actions** column corresponding to the target resource set.
5. Add or remove a user group.
   - Select **Add User Group**. In the dialog box that appears, select a user group. Click **OK** to add the user group.
   - Select **Delete User Group**. In the dialog box that appears, select a user group. Click **OK** to remove the user group.

1.8.2.6. Delete a resource set

You can delete resource sets that are not needed as an administrator.

Prerequisites

Ensure that the resource set to be deleted does not contain resources, users, or user groups.

> **Notice** A resource set cannot be deleted if it contains resources, users, or user groups.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Resource Sets**.
4. Click **More** in the **Actions** column corresponding to the target resource set, and select **Delete**.
5. In the message that appears, click **OK**.

1.8.3. Roles

1.8.3.1. Create a custom role

You can create custom roles in the Apsara Uni-manager Management Console to more efficiently grant permissions to users so that different personnel can work with different features.

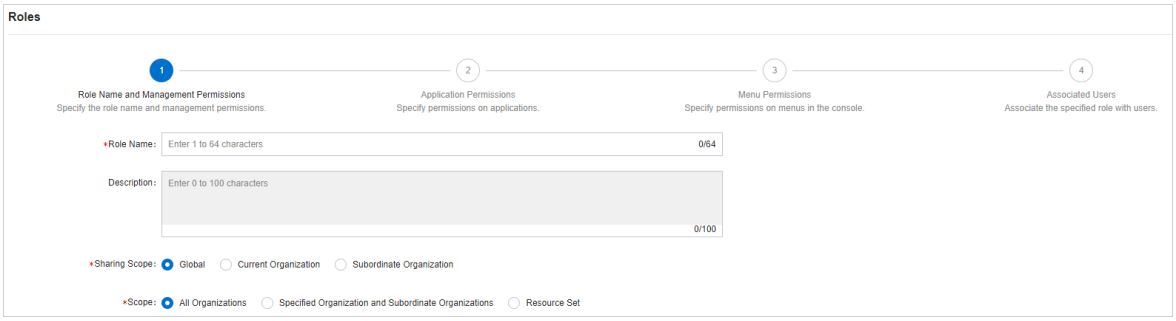
Context

A role is a set of access permissions. Each role has a range of permissions. A user can have multiple roles, which means that the user is granted all of the permissions defined for each role. A role can be used to grant the same set of permissions to a group of users.

The total number of custom and default roles cannot exceed 20.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Roles**.
4. In the upper-right corner of the page, click **Create Custom Role**.
5. On the **Roles** page, set the role name and management permissions.



The following table describes the role parameters.

Role parameters

Parameter	Description
Role Name	The name of the RAM role. The name can be up to 15 characters in length and can contain only letters and digits.
Description	Optional. The description of the role. The description can be up to 100 characters in length and can contain letters, digits, commas (,), semicolons (;), and underscores (_).
Sharing Scope	○ **Global** The role is visible and valid to all organizations involved. The default value is Global. ○ **Current Organization** The role is visible and valid to the organization to which the user belongs. ○ **Subordinate Organization** The role is visible and valid to the organization to which the user belongs and its subordinate organizations.
Scope	○ **All Organizations** The permissions apply to all organizations involved. ○ **Specified Organization and Subordinate Organizations** The permissions apply to the organization to which the user belongs and its subordinate organizations. ○ **Resource Sets** The permissions apply to the resource sets that are assigned to the user.

6. Select the operation permissions that this role has and click **Next**.
7. In the **Application Permissions** step, select the operation permissions that this role has on the cloud services, and click **Next**.
8. In the **Menu Permissions** step, select the operation permissions that this role has on the menus and the homepage template corresponding to the role, and click **Create Role**.
9. In the **Associated Users** step, select the users associated with the role from the drop-down list.
   The associated users are granted the permissions of the role.

1.8.3.2. View the details of a role

If you are uncertain about the specific permissions of a role, you can go to the **Roles** page to view the role permissions.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Roles**.
4. Click the name of the role that you want to view. On the **Roles** page, view the information of the role.

1.8.3.3. Modify custom role information

You can modify the name and permissions of a custom role as an administrator.

Context

Information about preset roles cannot be modified.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Roles**.
4. In the role name list, click **More** in the **Actions** column corresponding to the target custom role, and select **Modify**.
5. On the **Roles** page, modify the custom role name, permissions, and associated users or user groups.
   - Modify role name: Enter a new role name in the **Role Name** field.
   - Modify permissions: Click the **Management Permissions**, **Application Permissions**, or **Menu Permissions** tab, select or clear related permissions from the corresponding tab, and then click **Update**.
   - Bind a user to a role: Click the **Associated Users** tab and select a user from the **Select one or more users** drop-down list to add the user. To unbind the user from the role, click **Remove** in the **Actions** column.
   - Manage user groups: Click the **User Groups** tab, click **Add User Group**, select a user group from the drop-down list, and then click **OK** to bind the user group. To unbind the user group from the role, click **Remove** in the **Actions** column.

1.8.3.4. Copy a role

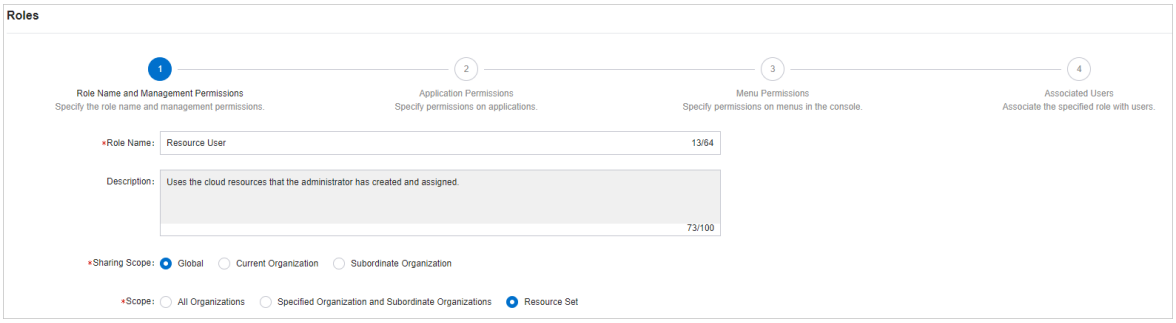
You can copy a preset role or a custom role to create a role that has the same permissions.

Context

Operations on the **Roles** page are the same as those for creating a custom role. You can add, modify, and remove the role permissions in the copied role. By default, if you do not modify the role permissions, the sharing scope, management permissions, application permissions, menu permissions, and associated users of the copied role are all the same as those of the source role.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Roles**.
4. In the role list, choose **More** > **Copy** in the **Actions** column corresponding to a role.
5. On the **Roles** page, set the new role name, sharing scope, and management permissions.



Note The role name must be unique.

6. Select the operation permissions that this role has and click **Next**.
7. In the **Application Permissions** step, select the operation permissions that this role has on the cloud services and click **Next**.
8. In the **Menu Permissions** step, select the operation permissions that this role has on the menus and click **Create Role**.
9. In the **Associated Users** step, select the users that are associated with the role from the drop-down list. The associated users are granted the permissions of the role.

1.8.3.5. Disable a role

When you disable a role, the permissions of the role are disabled.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Roles**.
4. In the role list, click **More** in the **Actions** column corresponding to a role and choose **Disable** from the shortcut menu.

1.8.3.6. Enable a role

When you enable a disabled role, the permissions of the role are restored.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Roles**.
4. In the role list, click **More** in the **Actions** column corresponding to a disabled role and choose **Enable** from the shortcut menu.

1.8.3.7. Delete a custom role

You can delete a custom role that is no longer needed.

Prerequisites

- Default or preset roles cannot be deleted.
- To delete a role, you must unbind all user groups from the role.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Roles**.
4. Choose **More** > **Delete** in the **Actions** column corresponding to a role.
5. In the Confirm message, click **OK**.

1.8.4. Users

1.8.4.1. System users

1.8.4.1.1. Create a user

You can create a user and assign the user different roles as an administrator to meet different requirements for system access control.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. Use one of the following methods to open the Create User window:
   - In the left-side navigation pane of the **Enterprise** page, click **Organizations**. In the **Users** section of the **Organizations** page, click **Create User**.
   - In the left-side navigation pane of the **Enterprise** page, click **Users**. On the **System Users** tab of the **Users** page, click **Create**.
4. In the Create User dialog box, configure the parameters.

Parameter	Description
Username	The Apsara Stack account name of the user. The name must be 1 to 64 characters in length and can contain letters, digits, hyphens (-), underscores (_), periods (.), and at signs (@). It must start with a letter or digit.
Display Name	The display name of the user. The name must be 1 to 128 characters in length and can contain letters, digits, hyphens (-), underscores (_), periods (.), and at signs (@).
Roles	The role to be assigned to the user. **Note** You can enter role names in the field. Fuzzy match is supported.
Organization	The organization to which the user belongs.
Logon Policy	The logon policy that restricts the logon time and IP addresses of the user. The default policy is automatically bound to new users. **Note** The default policy does not restrict the time period and IP addresses for users to log on. To restrict the allowed logon time and IP addresses of a user, you can modify the logon policy of the user or create a logon policy for the user. For more information, see Create a logon policy.

Parameter	Description
Mobile Number	The mobile phone number of the user. This mobile number is used by the system to notify users of resource application and usage. Make sure that this mobile number is valid. **Note** If the user mobile number changes, update it on the system in a timely manner.
Landline Number	Optional. The landline number of the user. The landline number must be 4 to 20 characters in length and can contain only digits and hyphens (-).
Email	The email address of the user. Emails about the usage and requests for resources are sent to this email address. Make sure that this email address is valid. **Note** If the user email address changes, update it on the system in a timely manner.
DingTalk Key	The key of the chatbot for the DingTalk group where the user is a member. For more information about how to configure the key, see DingTalk development documentation.
Notify User by Email	After this option is selected, the Apsara Uni-manager Management Console informs the user configured as the alert contact by email whenever an alert is generated. **Note** You must configure an email server to receive an email each time an alert is triggered. For more information, contact on-site O&M engineers.
Notify User by DingTalk	After this option is selected, the Apsara Uni-manager Management Console informs the user configured as the alert contact by DingTalk whenever an alert is generated.

5. Click **OK**.

1.8.4.1.2. Query a user

You can view user information such as name, organization, mobile number, email address, role, logon time, and initial password.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Users**.
4. Click the **System Users** tab.
5. Set **Username**, **Organization**, or **Role**, and then click **Search**.
6. Click **More** in the **Actions** column corresponding to a user, and choose **User Information** from the shortcut menu to view basic information about the user.

1.8.4.1.3. Modify user information

You can modify user information such as display name, mobile number, and email address to keep it up to date.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Users**.
4. Click the **System Users** tab.
5. Find the user that you want to modify and choose **More** > **Edit** in the **Actions** column.
6. In the **Modify User Information** dialog box, enter the relevant information and click **OK**.

1.8.4.1.4. Change user roles

You can add, change, and delete roles for a user.

Change user roles by using user management

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Users**.
4. Click the **System Users** tab.
5. Find the user that you want to modify and choose **More** > **Authorize** in the **Actions** column.
6. In the **Role** field, add, delete, or change user roles.

   You can enter role names in the field. Fuzzy match is supported.
7. Click **OK**.

Change user roles by changing ownership

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Change Ownership**.
4. Click the ▸ icon to the left of an organization and click **Users**.
5. In the **Users** section on the right, set **Logon Policy** and **Role** or **Username**, and click **Search** to query the user that you want to modify
6. Find the user and click **Change** in the **Actions** column.
7. In the **Organization to Change** dialog box, select the destination or original organization and select the role to be added or removed from the **Assigned Roles** drop-down list.

   > **Note**
   > - If you change only roles without changing the organization, select the original organization.
   > - Blue role names are the roles that are selected, and black role names are the roles that are not selected.
8. Click **OK**.

1.8.4.1.5. Modify the information of a user group

On the Users page, you can view the user group information and modify the ownership of users in user groups.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.

2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, click **Users**.
4. Click the **System Users** tab, select the user that you want to modify, and then click **More** in the **Actions** column.
   - Select **Add to User Group**. In the dialog box that appears, select a user group and click **OK** to add the user to the user group.
   - Select **Remove from User Group**. In the dialog box that appears, select a user group and click **OK** to remove the user from the user group.

1.8.4.1.6. Modify a user logon policy

An administrator can modify a user logon policy to restrict the permitted logon time and IP addresses of the user.

Prerequisites

A new logon policy is created. For more information about how to create a logon policy, see Create a logon policy.

Modify the logon policy of a single user

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Users**.
4. Click the **System Users** tab.
5. Find the user that you want to modify and choose **More > Logon Policy** in the Actions column.
6. In the **Assign Logon Policy** dialog box, select a logon policy and click **OK**.

Modify multiple user logon policies at a time

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Users**.
4. Click the **System Users** tab.
5. Select users that you want to modify.
6. In the upper-right corner of the page, click **Change Logon Policy**.
7. In the **Batch Assign Logon Policy** dialog box, select a logon policy and click **OK**.

1.8.4.1.7. View the initial password of a user

After a user is created, the system generates an initial password for the user.

Context

Organization administrators can view the initial passwords of all users in the organizations they manage.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. Use one of the following methods to view the initial password of a user on the **Enterprise** page:
   - In the left-side navigation pane, click **Users**. On the **System Users** tab of the **Users** page, select a username.
     - Click **View Initial Password** in the upper-right corner of the **Users** page to view the initial password.

- Choose **More** > **User Information** in the **Actions** column corresponding to the user. On the user information page, click **View Password** to view the initial password.

- In the left-side navigation pane, click **Organizations**. In the organization navigation tree on the **Organizations** page, click an organization name. In the **Users** section, click a username. On the user information page, click **View Password** to view the initial password.

1.8.4.1.8. Reset the password of a user

If users forget their logon passwords, the system administrator can reset the logon passwords for them.

Prerequisites

Only organization administrators can reset the password of a user.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. Use one of the following methods to go to the **User Information** page:
   - In the left-side navigation pane of the **Enterprise** page, click **Users**. On the **System Users** tab of the **Users** page, click a username.
   - In the left-side navigation pane of the **Enterprise** page, click **Organizations**. On the **Organizations** page, click a username in the **Users** section.
4. Click **Reset Password**.

   After the password is reset, a message is displayed, which indicates that the password has been reset. If you want to view the initial password after password reset, click **View Password**.

1.8.4.1.9. Disable or enable a user account

You can disable a user account to prevent the user account from logging on to the Apsara Uni-manager Management Console. User accounts that are disabled must be re-enabled before they can be used to log on to the Apsara Uni-manager Management Console again.

Context

By default, user accounts are enabled when they are created.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Users**.
4. Click the **System Users** tab.
5. Perform the following operations on the current tab:
   - Select a user account whose **Status** is **Enabled**, choose **More** > **Disable** in the **Actions** column to disable the user account.
   - Select a user whose **Status** is **Disabled**, choose **More** > **Enable** in the **Actions** column to enable the user account.

1.8.4.1.10. Delete a user

You can delete a specific user as an administrator.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. On the Enterprise page, use one of the following methods to delete a user:
   - In the left-side navigation pane of the **Enterprise** page, click **Users**. On the page that appears, click the **System Users** tab. Click **More** in the **Actions** column corresponding to the target user, and select **Delete**.
   - In the left-side navigation pane of the **Enterprise** page, click **Organizations**. On the page that appears, find the **Users** section. Find the target user, click **More** in the **Actions** column, and then select **Delete**.
4. Click **OK**.

1.8.4.2. Historical users

1.8.4.2.1. Query historical users

You can check whether a user has been deleted and restore a user that has been deleted.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Users**.
4. Click the **Historical Users** tab.
5. Enter the username that you want to query in the **Username** search box.

   > **Note** You can search for usernames by fuzzy match.

6. Click **Search**.

1.8.4.2.2. Restore historical users

An administrator can restore a deleted user account from the **Historical Users** tab.

Context

The basic information such as logon password of a restored user is the same as it was before the user was deleted, except for the organization and role.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Users**.
4. Click the **Historical Users** tab.
5. Find the user that you want to restore and click **Restore** in the **Actions** column.
6. In the **Restore User** dialog box, select an organization and a role.
7. Click **OK**.

1.8.5. Logon policies

1.8.5.1. Create a logon policy

To improve the security of the Apsara Uni-manager Management Console, you can create a logon policy as an administrator to control logon access based on the logon time and user IP address.

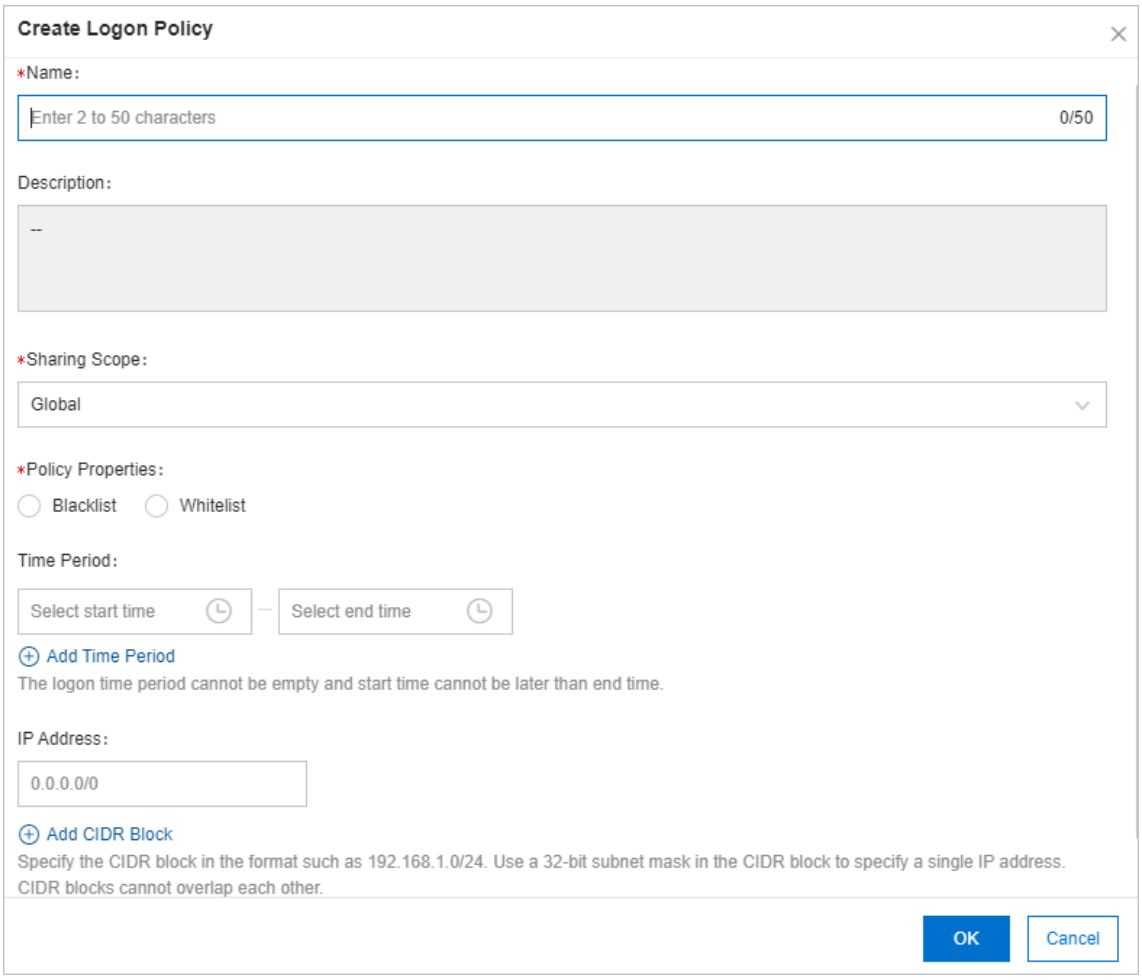
Context

Logon policies are used to control the time period and IP addresses for users to log on. After a user is bound to a logon policy, user logons are restricted based on the logon time and IP addresses specified in the policy.

A default policy without limits on logon time and IP addresses is automatically generated in the Apsara Uni-manager Management Console. The default policy cannot be deleted.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Logon Policies**.
4. In the upper-right corner of the page, click **Create**.
5. In the **Create Logon Policy** dialog box, set Name, Sharing Scope, Policy Properties, Time Period, and IP Address.



Parameters for creating a logon policy

Parameter	Description
Name	The name of the logon policy. The name must be 2 to 50 characters in length and can contain only letters and digits. The name must be unique in the system.
Description	The description of the logon policy.
Sharing Scope	The scope in which the role is visible. ○ **Global**: The role is globally visible. The default value is Global. ○ **Current Organization**: The role is visible only in the current organization and is invisible in subordinate organizations. ○ **Subordinate Organization**: The role is visible in the current organization and all its subordinate organizations.
Policy Properties	The authentication method of the logon policy. ○ **Whitelist**: Logon is allowed if the parameter settings are met. ○ **Blacklist**: Logon is denied if the parameter settings are met.
Time Period	The permitted logon time period. When this policy is configured, users can log on to the Apsara Uni-manager Management Console only during the configured period. Specify the time in minutes in a 24-hour clock. Example: `16:32`. **Note** When the Policy Properties parameter is set to Whitelist, you can select No Time Limit.
IP Address	The permitted CIDR block. ○ If the **Policy Properties** parameter is set to **Whitelist**, IP addresses within this CIDR block are allowed to log on to the Apsara Uni-manager Management Console. ○ If the **Policy Properties** parameter is set to **Blacklist**, IP addresses within this CIDR block are not allowed to log on to the Apsara Uni-manager Management Console. **Note** When the Policy Properties parameter is set to Whitelist, you can select No CIDR Block Limit.

1.8.5.2. Query a logon policy

You can query the detailed information of a logon policy in the Apsara Uni-manager Management Console.

Context

When the Apsara Uni-manager Management Console provides services, it automatically generates a default policy without limits on the logon time and IP addresses.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Logon Policies**.
4. Enter the name of the policy that you want to view and click **Search**.
5. View the logon policy, including the permitted logon time and IP addresses.

1.8.5.3. Modify a logon policy

You can modify the policy name, policy properties, permitted logon time period, and IP addresses of a logon policy.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Logon Policies**.
4. Find the logon policy that you want to modify and choose **More** > **Modify** in the **Actions** column.
5. In the **Modify Logon Policy** dialog box, modify the logon policy information.
6. Click **OK**.

1.8.5.4. Disable a logon policy

You can disable logon policies that are no longer needed.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Logon Policies**.
4. Find the logon policy that you want to disable and choose **More** > **Disable** in the **Actions** column.

1.8.5.5. Enable a logon policy

You can re-enable disabled logon policies.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Logon Policies**.
4. Click **More** in the **Actions** column corresponding to a policy, and choose **Enable** from the shortcut menu.

1.8.5.6. Delete a logon policy

You can delete logon policies that are no longer needed.

Prerequisites

The logon policy to be deleted is not bound to any users. If a logon policy is bound to a user, the logon policy cannot be deleted.

Context

> **Note** The default policy cannot be deleted.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Logon Policies**.

4. Click **More** in the **Actions** column corresponding to a policy, and choose **Delete** from the shortcut menu.
5. In the message that appears, click **OK**.

1.8.6. User groups

1.8.6.1. Create a user group

You can create a user group in a selected organization and grant batch authorizations to users in the group.

Prerequisites

Before creating a user group, you must create an organization. For more information, see Create an organization.

Context

Relationship between user groups and users:

- A user group can contain zero or more users.
- You can add users to user groups as needed.
- You can add a user to multiple user groups.

Relationship between user groups and organizations:

- A user group can only belong to a single organization.
- You can create multiple user groups in an organization.

Relationship between user groups and roles:

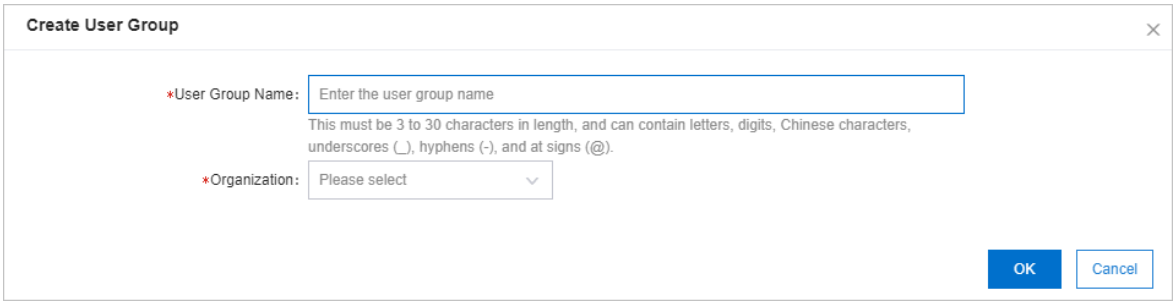
- A user group can only be bound to a single role.
- A role can be associated with multiple user groups.
- When a role is associated with a user group, the role permissions are automatically granted to users in the user group.

Relationship between user groups and resource sets:

- You can add zero or more user groups to a resource set.
- A user group can be added to multiple resource sets.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **User Groups**.
4. In the upper-right corner of the page, click **Create User Group**.
5. In the dialog box that appears, set **User Group Name** and **Organization**.



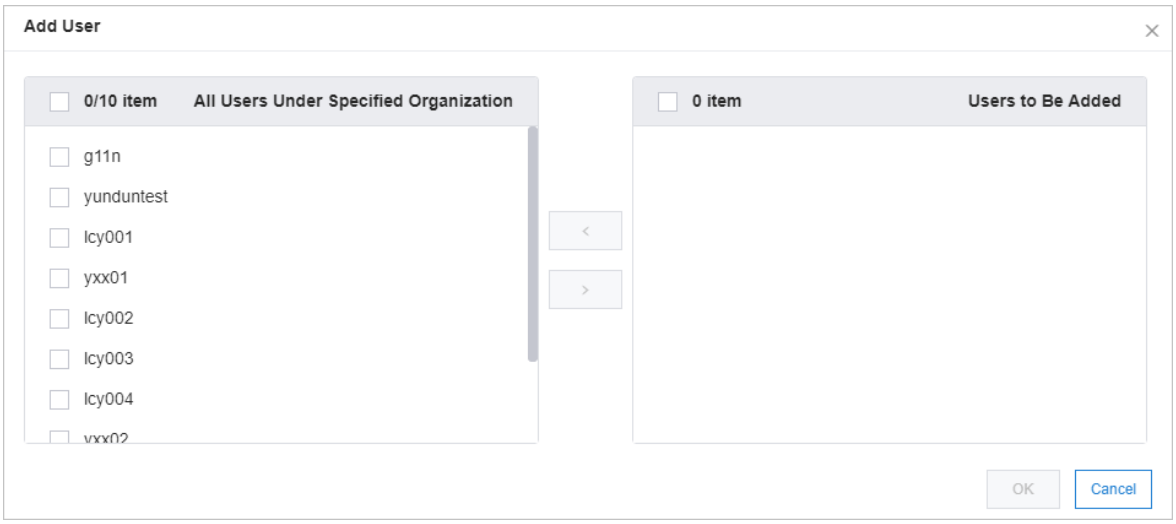
6. Click **OK**.

1.8.6.2. Add users to a user group

You can add users to a user group.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **User Groups**.
4. Click **Add User** in the **Actions** column corresponding to a user group.
5. Select the names of users to be added from the left list, and click the right arrow to move them to the right list.



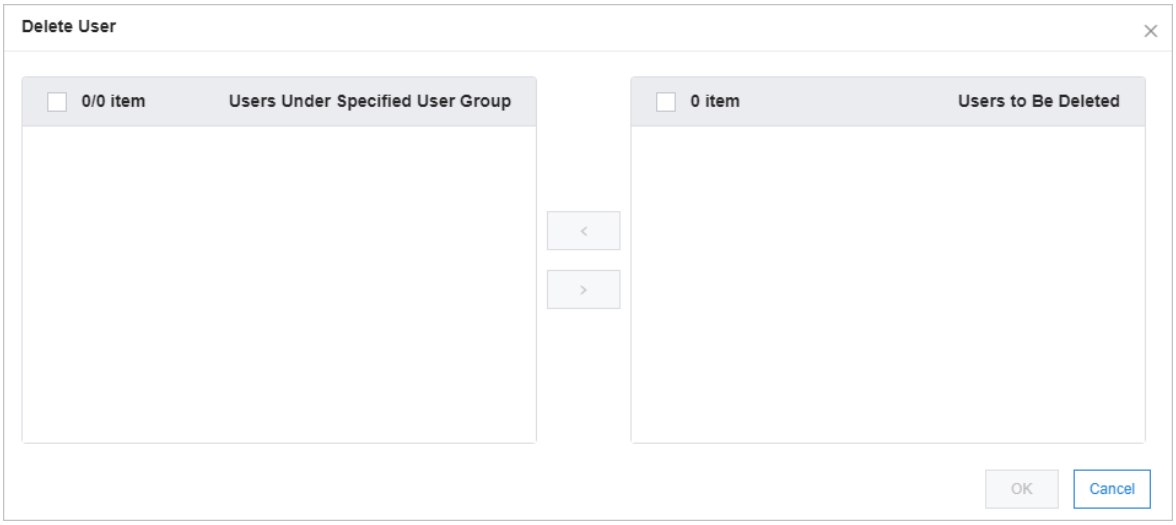
6. Click **OK**.

1.8.6.3. Delete users from a user group

You can delete users from a user group.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **User Groups**.
4. Click **Delete User** in the **Actions** column corresponding to a user group.
5. Select the names of users to be deleted from the **Users Under Specified User Group** list, and click the right arrow to move them to the **Users to Be Deleted** list.



6. Click **OK**.

1.8.6.4. Add a role

You can add a role to a user group and assign the role to all users in the group.

Context

> **Note** You can add only one role to a user group.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **User Groups**.
4. Click **Add Role** in the **Actions** column corresponding to a user group.
5. In the dialog box that appears, select a role.
6. Click **OK**.

1.8.6.5. Delete a role

You can delete existing roles.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **User Groups**.
4. Find the user group from which you want to delete a role and click **Delete Role** in the **Actions** column.
5. In the **Confirm** message, click **OK**.

1.8.6.6. Modify the name of a user group

You can modify the names of user groups.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **User Groups**.
4. Click **Edit User Group** in the **Actions** column corresponding to a user group.
5. In the dialog box that appears, enter the new name.
6. Click **OK**.

1.8.6.7. Delete a user group

You can delete user groups that are no longer needed.

Prerequisites

The user group to be deleted is unbound from all roles. If a user group is bound to a role, the user group cannot be deleted.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **User Groups**.
4. Find the user group that you want to delete and click **Delete User Group** in the **Actions** column.
5. In the **Confirm** message, click **OK**.

1.8.7. Resource pools

1.8.7.1. Update associations

You can deploy the Apsara Uni-manager Management Console in multiple regions. You can update the associations between organizations and regions.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Resource Pools**.
4. In the left-side organization navigation tree, click the name of the organization that you want to update.
5. In the corresponding region list, select the names of regions to be associated.
6. Click **Update Association**.

1.8.8. Change the ownership of an instance

You can change the ownership of an instance from one resource set to another.

Change the ownership of an instance

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Change Ownership**.
4. Click the ▸ icon to the left of an organization and click a resource set.
5. In the resource list on the right side of the page, set a service type and a resource type, enter an instance ID,

and then click **Search** to query the instance.

6. Click **Change Ownership** in the **Actions** column corresponding to the instance to change the ownership of the instance to another resource set.
7. Click **Change Sharing Scope** in the **Actions** column corresponding to the instance to change the sharing scope of the instance.
   - Current Organization and Subordinate Organizations: The instance can be shared by the organization that contains the resource set to which the instance belongs and by subordinate organizations.
   - Current Resource Set: The instance can be shared by the resource set to which the instance belongs.
   - Current Organization: The instance can be shared by the organization that contains the resource set to which the instance belongs.
8. In the **Change Resource Set** dialog box, select a resource set and click **OK**.

1.8.9. Cloud instances

1.8.9.1. Manage Apsara Stack cloud instances

1.8.9.1.1. Export data of the current cloud

You can export the data of secondary Apsara Stack nodes to a configuration file. This can be used by the primary node to manage nodes in a centralized manner.

Procedure:

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the Enterprise page, click **Cloud Instances**.
4. Click the **Apsara Stack Management** tab.
5. Click **Collect Data of Current Cloud** to collect the deployment information of the current cloud.
6. Click **Export** to export the information in the JSON format.

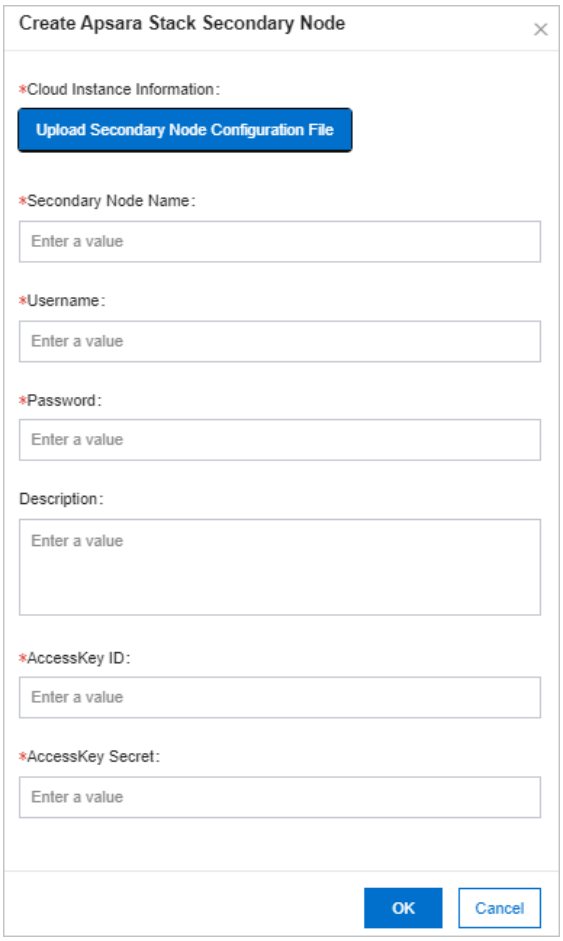
1.8.9.1.2. Add a secondary Apsara Stack node

You can add the configuration information of secondary Apsara Stack nodes to the multi-cloud configuration of the primary Apsara Stack node for centralized management.

Procedure:

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the Enterprise page, click **Cloud Instances**.
4. Click the **Apsara Stack Management** tab.
5. Click **Import**.

6. In the **Create Apsara Stack Secondary Node** dialog box, enter the configuration information of a secondary node and click **OK**.



Parameter	Description
Cloud Instance Information	The configuration file of the secondary node. For more information, see Export data of the current cloud.
Secondary Node Name	The name of the secondary node.
Username	The username of the operations administrator that manages the secondary node.
Password	The password of the operations administrator that manages the secondary node.
Description	The description of the secondary node.

Parameter	Description
AccessKey ID	The AccessKey ID of the operations administrator that manages the secondary node. For more information, see View the AccessKey pair of your Apsara Stack tenant account.
AccessKey Secret	The AccessKey secret of the operations administrator that manages the secondary node. For more information, see View the AccessKey pair of your Apsara Stack tenant account.

> **Notice**
>
> You must create an operations administrator account in the secondary node. This account is for dedicated use by the primary node and cannot be the default operations administrator account.

1.8.9.1.3. View managed cloud instances

You can use the multi-cloud management feature to view the details of all managed cloud instances.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the Enterprise page, click **Cloud Instances**.
4. Click the **Apsara Stack Management** tab.

   You can view the name, description, cloud type, cloud role, and address of all managed cloud instances.
5. Enter a cloud instance name in the search box and click **Search** to search for the cloud instance.
6. Click **View Details** in the **Actions** column corresponding to the cloud instance.

   In the Manage Cloud Instance message, you can view the version, Apsara Stack API (ASAPI) address, and region of the cloud.

1.8.9.1.4. Modify a cloud instance

If you want to change the information of a cloud instance for more efficient management, you can modify it in the Apsara Uni-manager Management Console.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, click **Enterprise**. In the left-side navigation pane of the Enterprise page, click **Cloud Instances**.
3. Click the **Apsara Stack Management** tab.
4. Enter the name of a cloud instance that you want to modify in the search box and click **Search** to search for the cloud instance.
5. Click **Edit** in the **Actions** column corresponding to the cloud instance.

6. In the **Edit Cloud Instance** dialog box, set **Cloud Name**, **Username**, **Password**, **Description**, **AccessKey ID**, **AccessKey Secret**, **Longitude**, and **Latitude**, and click **OK**.

1.8.9.1.5. Manage cloud instances

You can manage Apsara Stack cloud instances to check whether they can be connected.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the Enterprise page, click **Cloud Instances**.
4. Click the **Apsara Stack Management** tab.
5. Enter a cloud instance name in the search box and click **Search** to search for the cloud instance.
6. Click **Manage** in the **Actions** column corresponding to the cloud instance.
7. In the **Manage Cloud Instance** dialog box, click **Test Connectivity**.

1.8.9.2. Manage VMware nodes

1.8.9.2.1. Add a VMware node

You can add the configuration information of VMware nodes to the Apsara Stack VMware management configuration for centralized management.

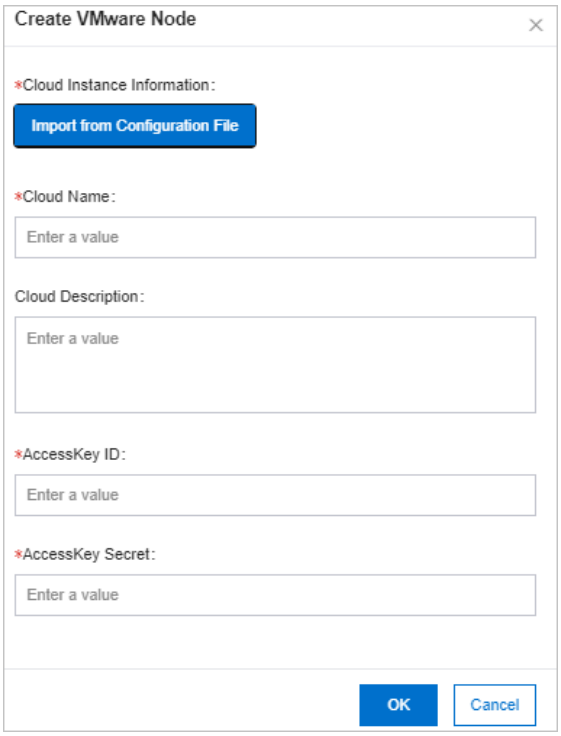
Prerequisites

- The configuration file of a VMware node is obtained from the deployment personnel.
- The VMware node is configured.

Procedure:

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the Enterprise page, click **Cloud Instances**.
4. Click the **VMware Management** tab.
5. Click **Create VMware Node**.

6. In the **Create VMware Node** dialog box, enter the configuration information of a VMware node and click **OK**.



Parameter	Description
Cloud Instance Information	The configuration file of the VMware node.
Cloud Name	The name of the VMware node.
Cloud Description	The description of the VMware node.
AccessKey ID	The AccessKey ID in the configuration file of the VMware node.
AccessKey Secret	The AccessKey secret in the configuration file of the VMware node.

1.8.9.2.2. Modify a VMware node

If you want to change the information of a VMware node for more efficient management, you can modify it in the Apsara Uni-manager Management Console.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the Enterprise page, click **Cloud Instances**.
4. Click the **VMware Management** tab.

5. Enter the name of the VMware node that you want to modify in the search box and click **Search** to search for the VMware node.
6. Click **Edit** in the **Actions** column corresponding to the VMware node.
7. In the **Edit Cloud Instance** dialog box, set **Cloud Name**, **Cloud Description**, **AccessKey ID**, and **AccessKey Secret**, and click **OK**.

1.8.9.2.3. Test VMware node connectivity

You can manage VMware nodes to check whether they can be connected.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the Enterprise page, click **Cloud Instances**.
4. Click the **VMware Management** tab.
5. Enter a VMware node name in the search box and click **Search** to search for the VMware node.
6. Click **Manage** in the **Actions** column corresponding to the VMware node.
7. In the **Manage Cloud Instance** dialog box, click **Test Connectivity**.

1.8.10. Data permissions

1.8.10.1. Overview

Data permission management allows you to specify which users can access instances of a specific service, grant data access permissions to the users, and view and modify the data permissions in all the RAM policies attached to specified users.

Apsara Stack controls users and permissions by managing their visibility and operability in the Apsara Uni-manager Management Console. Many Apsara Stack cloud services are directly used by calling their API operations or SDKs instead of in the console. In this case, data access permissions must be controlled by RAM permission verification provided by the cloud services.

RAM policies are configured for such cloud service instances for access control. Automatic judgment is used when personnel are added to or removed from resource sets. However, this judgement method can affect performance and has a high error rate in complex scenarios. To solve this problem, the authorization of cloud services that require data access permissions is separately managed. Organization administrators can configure the data permissions granted to related personnel on the data authorization page.

1.8.10.2. Set the data permissions of resource instances

Organization administrators can set the data permissions of resource instances to allow or prohibit access to and operations on cloud services in the Apsara Uni-manager Management Console.

Prerequisites

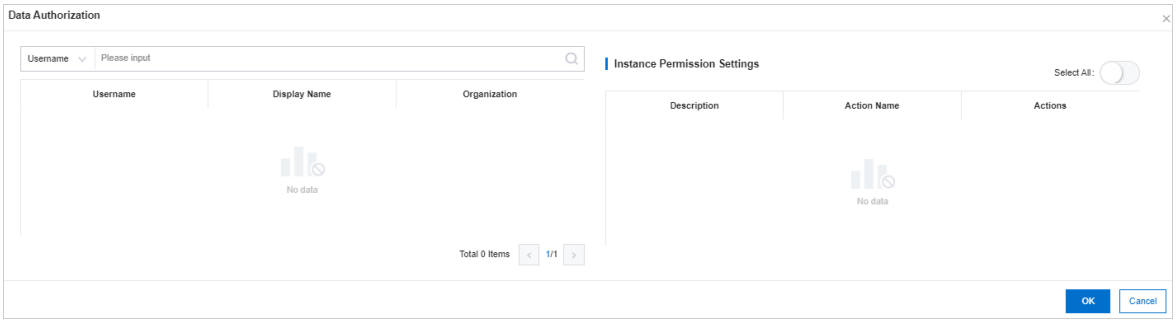
The cloud services that support data authorization include Message Queue (MQ), Object Storage Service (OSS), Log Service, DataHub, and Container Service.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, click **Enterprise**.

3. In the left-side navigation pane of the Enterprise page, click **Data Permissions**.
4. Click a resource set and click a product type on the right side of the page.
5. Click **Authorize** in the **Actions** column corresponding to the instance that you want to manage.
6. In the Data Authorization dialog box, select a user on the left side.
7. Turn on or off the data permission switches in the Actions column on the right side.

   You can also turn on or off the Select All switch to manage permissions in batches.



8. Click **OK**.

1.8.10.3. Edit user permissions

You can use JSON statements to edit user permissions.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the Enterprise page, click **Data Permissions**.
4. In the organization navigation tree, click the ▸ icon to the left of the organization that contains the user you want to manage.
5. Click **Users**.
6. Enter the username in the search box and click **Search**.
7. Click **Edit Permissions** in the **Actions** column corresponding to the user.
8. In the Edit Permissions dialog box, select a data permission on the left side and click OK.

   If no permissions are available, specify a policy in the text editor. For more information about the syntax and structure of a policy, see Permission policy structure and syntax.

1.8.10.4. View the permissions of a user

You can view the existing policies of a user.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the Enterprise page, click **Data Permissions**.
4. In the organization navigation tree, find the organization that contains the user you want to manage and click the ▸ icon.
5. Click **Users**.

6. Enter the username in the search box and click **Search**.
7. Click **View Permissions** in the **Actions** column corresponding to the user.

1.9. Configurations

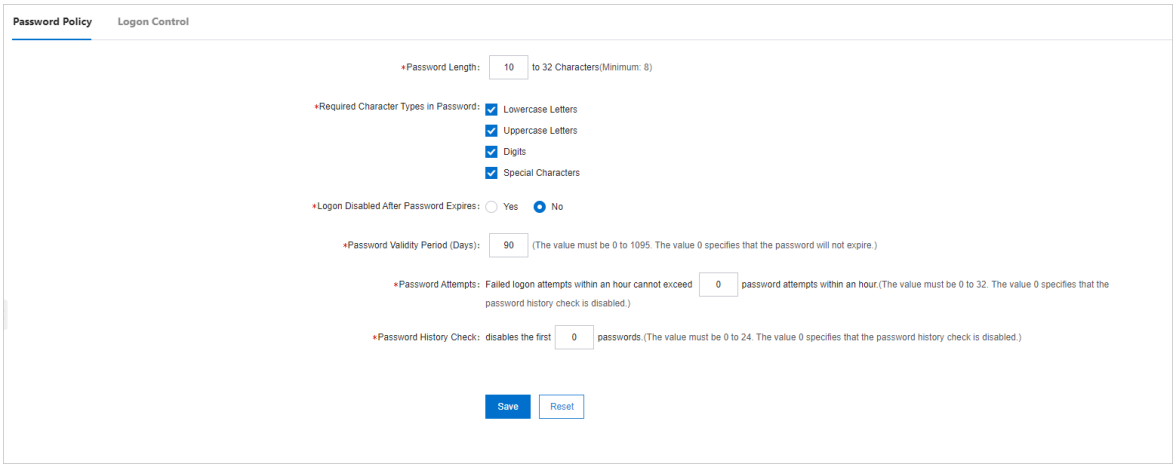
1.9.1. Security policies

1.9.1.1. Configure password policies

You can configure password policies for user logons.

Procedure

1. Log on to the Apsara Uni-manager Management Console as a platform administrator.
2. In the top navigation bar, click **Configurations**.
3. In the left-side navigation pane of the **Configurations** page, click **Security Policies**.
4. Click the **Password Policy** tab.
5. On the **Password Policy** tab, set the password policy parameters.



To restore to the default password policy, click **Reset**.

1.9.1.2. Configure logon control

You can limit the access from multiple clients of users.

1. Log on to the Apsara Uni-manager Management Console as a platform administrator.
2. In the top navigation bar, click **Configurations**.
3. In the left-side navigation pane, click **Security Policies**.
4. Click the **Logon Control** tab.
5. Perform the following operations:
   - Select **Single Session**. A single session means that a user is allowed to log on only by using a single client at the same time.
   - Select **Multi-session**. A multi-session means that a user is allowed to log on by using multiple clients at the same time.

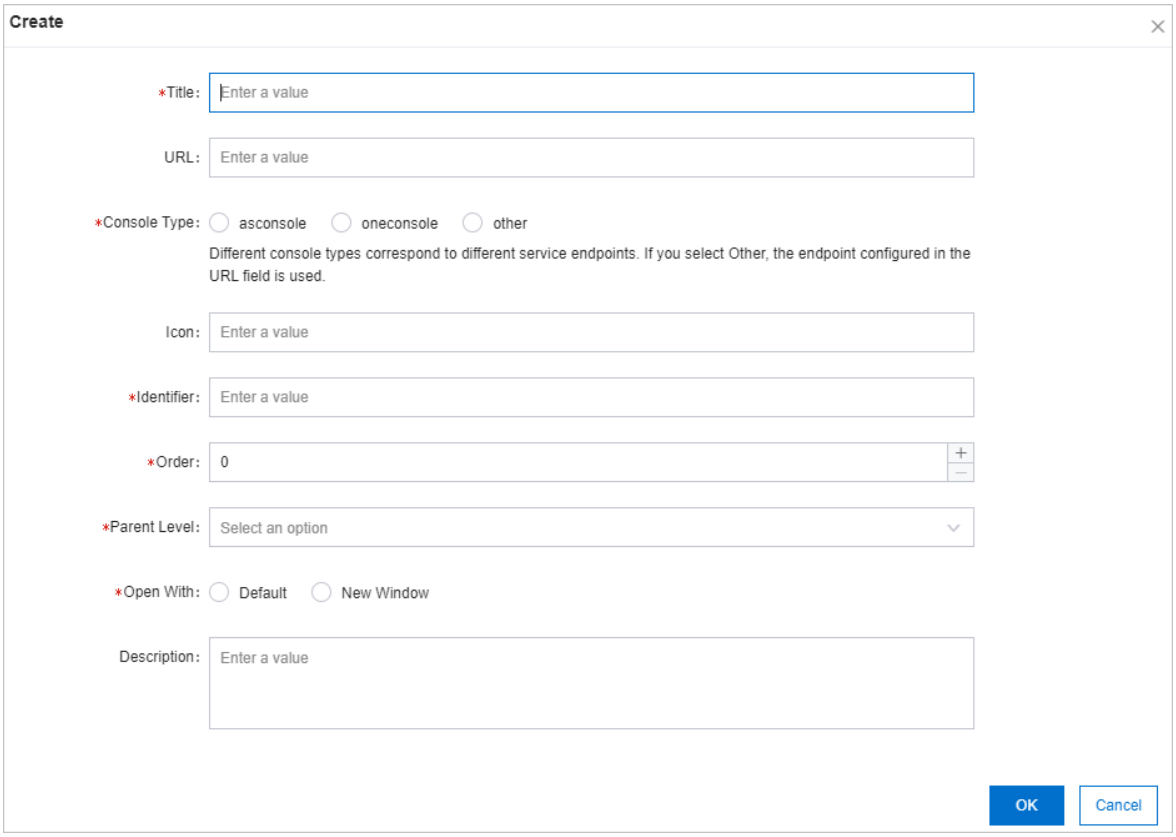
1.9.2. Menus

1.9.2.1. Create a menu

You can create a menu and add its URL to the Apsara Uni-manager Management Console for quick access.

Procedure

1. Log on to the Apsara Uni-manager Management Console as a platform administrator.
2. In the top navigation bar, click **Configurations**.
3. In the left-side navigation pane of the **Configurations** page, click **Menu Settings**.
4. On the **Main Menu** page, click **Create** in the upper-right corner.
5. In the **Create** dialog box, configure the menu parameters.



Menu parameters

Parameter	Description
Title	The display name of the menu.
URL	The URL of the menu.
Console Type	Different console types correspond to different domain names. ○ **oneconsole**: You need only to enter the path in the URL field. The domain name is automatically matched. ○ **asconsole**: You need only to enter the path in the URL field. The domain name is automatically matched. ○ **other**: You must enter the domain name in the URL field.
Icon	The icon displayed in the left-side navigation pane. The icon cannot be changed.

Parameter	Description
Identifier	The unique identifier of the menu in the system. This identifier can be used to indicate whether the menu is selected in the navigation bar. The identifier cannot be changed.
Order	The display order among the same-level menus. The larger the value, the lower the display order. Leave the Order field empty.
Parent Level	The displayed tree structure.
Open With	Specifies whether to open the menu in the current window or in a new window.
Description	The description of the menu.

1.9.2.2. Modify a menu

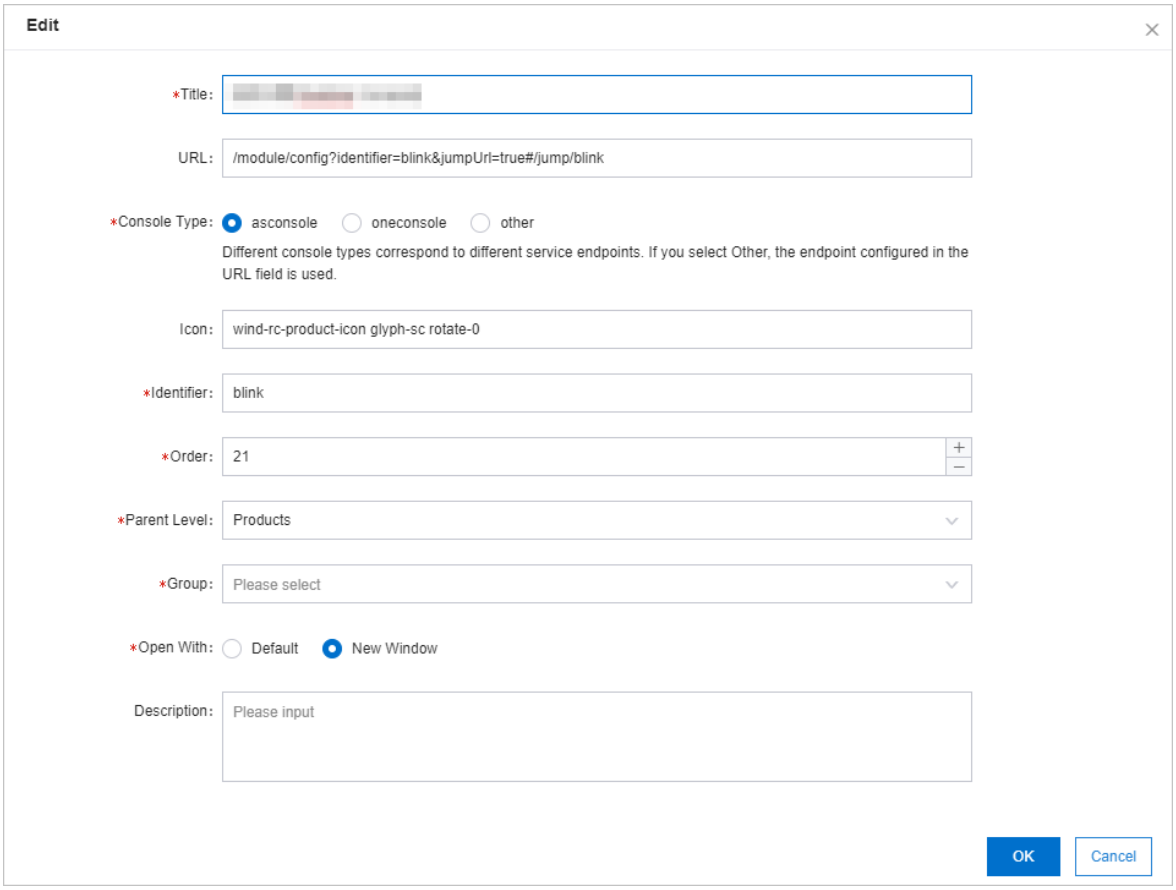
You can modify an existing menu, including the menu name, URL, icon, and menu order.

Prerequisites

Default menus cannot be modified.

Procedure

1. Log on to the Apsara Uni-manager Management Console as a platform administrator.
2. In the top navigation bar, click **Configurations**.
3. In the left-side navigation pane of the **Configurations** page, click **Menu Settings**.
4. Click **Edit** in the **Actions** column corresponding to a menu.
5. In the **Edit** dialog box, modify the relevant information of the menu.



6. Click **OK**.

1.9.2.3. Delete a menu

You can delete menus that are no longer needed.

Prerequisites

Default menus cannot be deleted.

Procedure

1. Log on to the Apsara Uni-manager Management Console as a platform administrator.
2. In the top navigation bar, click **Configurations**.
3. In the left-side navigation pane of the **Configurations** page, click **Menu Settings**.
4. Find the menu that you want to delete and click **Delete** in the **Actions** column.
5. In the message that appears, click **OK**.

1.9.2.4. Show or hide menus

You can perform the following operations to show or hide menus:

Procedure

1. Log on to the Apsara Uni-manager Management Console as a platform administrator.
2. In the top navigation bar, click **Configurations**.
3. In the left-side navigation pane of the **Configurations** page, click **Menu Settings**.

4. Select or clear the check box in the **Displayed** column corresponding to a menu.

1.9.3. Specifications

1.9.3.1. Specification parameters

This topic describes the specification parameters of each resource type.

NAT Gateway

Parameter	Description
Specifications	The specifications that can be configured for NAT Gateway.
Specifications Description	The description of the specifications that can be configured for NAT Gateway.

AnalyticDB for PostgreSQL

Parameter	Description
Specifications	The specifications that can be configured for AnalyticDB for PostgreSQL.
Specifications Name	The name of the instance type that can be configured for AnalyticDB for PostgreSQL.
CPU	The total number of CPU cores that can be configured for AnalyticDB for PostgreSQL.
Memory	The memory size that can be configured for AnalyticDB for PostgreSQL.
Storage Space	The total storage size that can be configured for AnalyticDB for PostgreSQL.
Version	The version number of AnalyticDB for PostgreSQL.
Node	The number of nodes that can be configured for AnalyticDB for PostgreSQL.

SLB

Parameter	Description
Specifications	The instance type that can be configured for Server Load Balancer (SLB).
Specifications Name	The name of the instance type that can be configured for SLB.
Maximum Connections	The maximum number of connections that can be configured for SLB.
New Connections	The number of new connections that can be configured for SLB.

Parameter	Description
QPS	The queries per second (QPS) that can be configured for SLB.
Description	The description of the specifications that can be configured for SLB.

ApsaraDB RDS

Parameter	Description
Engine Type	The engine type that can be configured for ApsaraDB RDS.
Minimum Storage (GB)	The minimum amount of storage space that can be configured for ApsaraDB RDS.
Maximum Storage (GB)	The maximum amount of storage space that can be configured for ApsaraDB RDS.
Specifications Name	The name of the instance type that can be configured for ApsaraDB RDS.
Version	The version number of ApsaraDB RDS.
CPUs	The number of CPU cores that can be configured for ApsaraDB RDS.
Maximum Connections	The maximum number of connections that can be configured for ApsaraDB RDS.
Memory (GB)	The memory size that can be configured for ApsaraDB RDS.
Share Type	The share type that can be configured for ApsaraDB RDS.

PolarDB-X

Parameter	Description
Instance Type	The instance type that can be configured for PolarDB-X.
Instance Type Name	The name of the instance type that can be configured for PolarDB-X.
Specifications	The specifications that can be configured for PolarDB-X.
Specifications Name	The name of the specifications that can be configured for PolarDB-X.

ECS

Parameter	Description
Instance Family	The instance family that is divided into different instance types based on the scenarios for which they are suitable.

Parameter	Description
Specifications Level	The level of the instance type that can be configured for Elastic Compute Service (ECS).
vCPUs	The maximum number of vCPUs that can be configured for ECS.
Memory (GB)	The memory size that can be configured for ECS.
Instance Specifications	The instance type that can be configured for ECS.
GPU Type	The GPU type that can be configured for ECS.
GPUs	The number of GPUs that can be configured for ECS.
Supported ENIs	The number of elastic network interface (ENIs) that can be configured for ECS.
Number Of Private IP Addresses	The number of private IP addresses that can be configured for ECS.

KVStore for Redis

Parameter	Description
Specifications Name	The name of the specifications that can be configured for KVStore for Redis.
Instance Specifications	The instance type that can be configured for KVStore for Redis.
Maximum Connections	The maximum number of connections that can be configured for KVStore for Redis.
Maximum Bandwidth	The maximum bandwidth that can be configured for KVStore for Redis.
CPUs	The number of CPU cores that can be configured for KVStore for Redis.
Version	The version number of KVStore for Redis.
Architecture	The architecture of KVStore for Redis.
Node Type	The node type of KVStore for Redis.
Service Plan	The service plan that can be configured for KVStore for Redis.

ApsaraDB for MongoDB

Parameter	Description
Specifications	The instance type that can be configured for ApsaraDB for MongoDB.
Instance Specifications	The name of the specifications that can be configured for ApsaraDB for MongoDB.

Parameter	Description
Engine Type	The engine type that can be configured for ApsaraDB for MongoDB.
Version	The version number of ApsaraDB for MongoDB.
Serial Number	The serial number of ApsaraDB for MongoDB.
Sequence Description	The description of the serial number of ApsaraDB for MongoDB.
Maximum Connections	The maximum number of connections that can be configured for ApsaraDB for MongoDB.
IOPS	The IOPS of ApsaraDB for MongoDB.
Storage Space	The amount of storage space that can be configured for ApsaraDB for MongoDB.
Minimum Storage	The minimum amount of storage space that can be configured for ApsaraDB for MongoDB.
Maximum Storage	The maximum amount of storage space that can be configured for ApsaraDB for MongoDB.

1.9.3.2. Create specifications

You can customize specifications for each resource type.

Procedure

1. Log on to the Apsara Uni-manager Management Console as a platform administrator.
2. In the top navigation bar, click **Configurations**.
3. In the left-side navigation pane of the **Configurations** page, click **Specifications**.
4. Select the resource type for which you want to create specifications and click the **Resource Specifications** tab.
5. On the **Resource Specifications** tab, click **Create Specifications** in the upper-right corner.
6. In the dialog box that appears, configure the specifications parameters.

   For more information about specification parameters, see Specification parameters.
7. Click **OK**.

1.9.3.3. View specifications

You can view the specifications of each resource type.

Procedure

1. Log on to the Apsara Uni-manager Management Console as a platform administrator.
2. In the top navigation bar, click **Configurations**.
3. In the left-side navigation pane of the **Configurations** page, click **Specifications**.
4. Click the resource type for which you want to view specifications.
5. On the **Resource Specifications** tab, set a **region**, **column**, and **value**. The corresponding information is displayed in the specifications list.

6. Click the **Existing Specifications** tab and view the existing specifications and their quantity.

1.9.3.4. Disable specifications

By default, newly created specifications are in the Enabled state.

Procedure

1. Log on to the Apsara Uni-manager Management Console as a platform administrator.
2. In the top navigation bar, click **Configurations**.
3. In the left-side navigation pane of the **Configurations** page, click **Specifications**.
4. Select the resource type for which you want to disable specifications.
5. Click **Disable** in the **Actions** column corresponding to the specifications that you want to disable.
6. In the message that appears, click **OK**.

1.9.3.5. Export specifications

You can export specifications that you want to view and share.

Procedure

1. Log on to the Apsara Uni-manager Management Console as a platform administrator.
2. In the top navigation bar, click **Configurations**.
3. In the left-side navigation pane of the **Configurations** page, click **Specifications**.
4. Click the resource type for which you want to export specifications.
5. Click the **Resource Specifications** tab and click **Export** in the upper-right corner to export the file to your PC.

1.9.3.6. View specifications of each resource type in previous versions

You can view specifications of each resource type in previous versions.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Configurations**.
3. In the left-side navigation pane of the **Configurations** page, click **Specifications**.
4. On the **Specifications** page, click the resource type for which you want to view specifications.
5. Click the **Specifications History** tab. View the detailed information in the specifications list.

1.9.4. Message center

1.9.4.1. View internal messages

You can view all internal messages, including read and unread messages.

Context

When changes are made to or alerts are generated for an instance in a resource, all users that have read and operation permissions on this resource receive corresponding messages.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, move the pointer over the icon and click **More**.
3. In the left-side navigation pane of the **Message Center** page, click the target message scope.
   - Choose **Internal Messages > All Messages** to view all messages, including unread and read messages.
   - Choose **Internal Messages > Unread Messages** to view unread messages.
   - Choose **Internal Messages > Read Messages** to view read messages.

1.9.4.2. Mark messages as read

You can mark unread messages as read messages to facilitate message management.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, move the pointer over the icon and click **More**.
3. In the left-side navigation pane of the **Message Center** page, choose **Internal Messages > Unread Messages**.

   In the upper part of the **Unread Messages** page, click different message types to filter messages.
4. On the Unread Messages page, find the message that you want to mark as read and click **Mark as Read** in the **Actions** column.

   You can also select the check boxes to the left of messages and click **Batch Read** in the upper-left corner of the page.
5. In the **Mark as Read** message, click **OK**.

1.9.4.3. Delete a message

You can delete messages that are no longer needed.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, move the pointer over the icon and click **More**.
3. In the left-side navigation pane of the **Message Center** page, choose **Internal Messages > All Messages**.
4. Find the message that you want to delete on the All Messages tab or other tabs and click **Delete**.

   You can also select the check boxes to the left of messages and click **Batch Delete** in the upper-left corner of the page.

1.9.5. Resource pool management

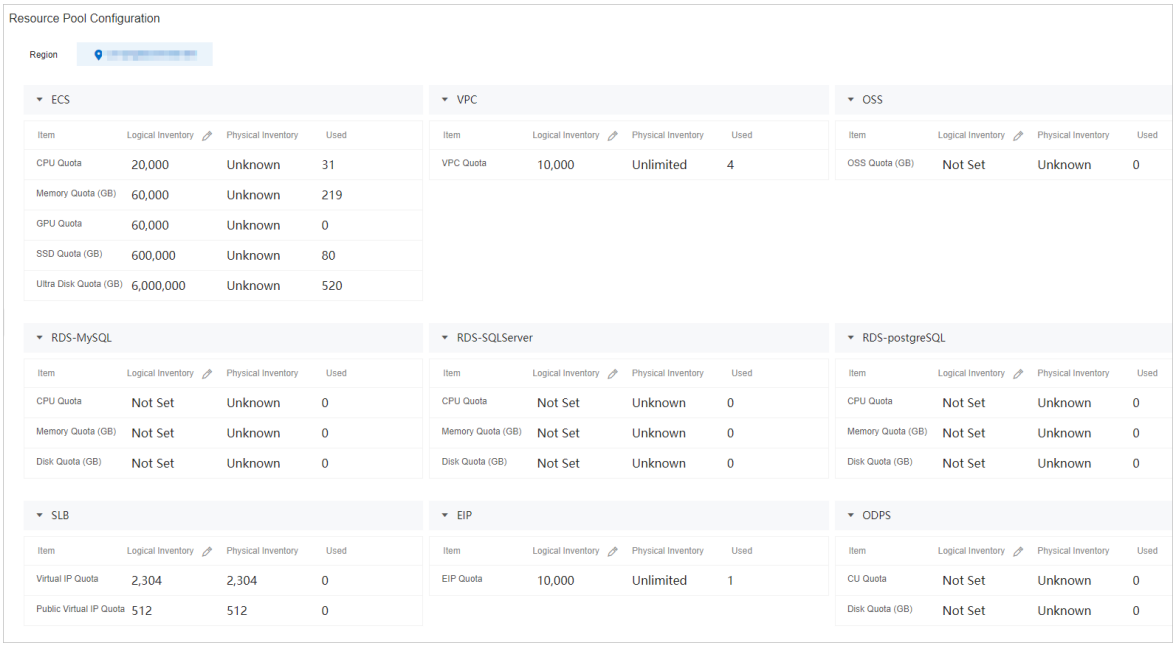
You can modify the maximum usage of each resource.

Prerequisites

- If the physical inventory is unlimited, the logical inventory cannot be less than the used inventory.
- If the physical inventory is limited, the logical inventory cannot be less than the used inventory or greater than the physical inventory.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Configurations**.
3. In the left-side navigation pane of the **Configurations** page, click **Resource Pool Management**.
4. On the **Resource Pools** page, click the icon in the module that you want to modify and modify the number of resources.



5. Click the icon to complete modification.

1.9.6. Custom configurations

1.9.6.1. Configure brands

You can customize the icon, platform name, and logon page of the Apsara Uni-manager Management Console logon interface.

Procedure

1. Log on to the Apsara Uni-manager Management Console as a platform administrator.
2. In the top navigation bar, click **Configurations**.
3. In the left-side navigation pane, click **Custom Configurations**.
4. In the **Brand Settings** section, click a language tab of the page that you want to modify.
5. Configure the following parameters and click OK.

Parameter	Description

Parameter	Description
Icon	You can click Upload Image, select an image file, and then click Open. The recommended resolution of an image is 160 × 36 pixels, and the recommended formats are PNG and JPG. After the image is uploaded, you can click the icon to preview it. Before you replace the image, you must click the icon to delete the current image.
Platform Name	You can customize a platform name. The name can be up to 8 characters in length.
Logon Page	You can click + Add Screen or the icon after screens to increase or decrease the number of scrolling screens. The number of scrolling screens on the logon page must be in the range of one to three. After you click the tab of a screen, you can perform the following operations: ◦ **Background Image**: Click Upload Image, select a background image file, and then click Open. The recommended resolution of an image is 1,880 × 1,600 pixels, and the recommended formats are PNG and JPG. After the image is uploaded, you can click the icon to preview it. Before you replace the image, you must click the icon to delete the current image. ◦ **Image Copywriting**: Customize the image copywriting. The image copywriting can be up to 40 characters in length.
Copyright Notice	You can customize the information of the copyright notice.

1.10. Operations

1.10.1. Quotas

1.10.1.1. Quota parameters

This topic describes the quota parameters of each service.

An organization administrator can set resource quotas and create resources within the allowed quotas for the organization. When the quotas for the organization are used up, the system does not allow the organization administrator to create more resources for the organization. To create more resources, you must first increase the quotas for the organization.

If no quotas are set, you can create an unlimited amount of resources.

ECS

Parameter	Description
CPU Quota (Cores)	The total number of CPU cores that you can configure for Elastic Compute Service (ECS) and the number of used cores.
Memory Quota (GB)	The total memory size that you can configure for ECS.
GPU Quota (Cores)	The total number of GPU cores that you can configure for ECS.
SSD Quota (GB)	The total SSD capacity that you can configure for ECS.
Ultra Disk Quota (GB)	The total number of disks that you can configure for an ECS instance.

VPC

Parameter	Description
VPC Quota	The maximum number of virtual private clouds (VPCs) that you can configure.

OSS

Parameter	Description
OSS Quota (GB)	The maximum capacity that you can allocate for Object Storage Service (OSS).

ApsaraDB RDS for MySQL

Parameter	Description
CPU Quota (Cores)	The total number of CPU cores that you can configure for ApsaraDB RDS for MySQL and the number of used cores.
Memory Quota (GB)	The total memory size that you can configure for ApsaraDB RDS for MySQL.
Disk Quota (GB)	The total storage size that you can configure for ApsaraDB RDS for MySQL.

PolarDB

Parameter	Description
CPU Quota (Cores)	The total number of CPU cores that you can configure for PolarDB and the number of used cores.
Memory Quota (GB)	The total memory size that you can configure for PolarDB.
Disk Quota (GB)	The total storage size that you can configure for PolarDB.

ApsaraDB RDS for SQL Server

Parameter	Description
CPU Quota (Cores)	The total number of CPU cores that you can configure for ApsaraDB RDS for SQL Server and the number of used cores.
Memory Quota (GB)	The total memory size that you can configure for ApsaraDB RDS for SQL Server.
Disk Quota (GB)	The total storage size that you can configure for ApsaraDB RDS for SQL Server.

ApsaraDB RDS for PostgreSQL

Parameter	Description
CPU Quota (Cores)	The total number of CPU cores that you can configure for ApsaraDB RDS for PostgreSQL and the number of used cores.
Memory Quota (GB)	The total memory size that you can configure for ApsaraDB RDS for PostgreSQL.
Disk Quota (GB)	The total storage size that you can configure for ApsaraDB RDS for PostgreSQL.

SLB

Parameter	Description
Virtual IP Quota (a)	The maximum number of internal IP addresses that you can configure for Server Load Balancer (SLB).
Public Virtual IP Quota	The maximum number of public IP addresses that you can configure for SLB.

EIP

Parameter	Description
EIP Quota	The maximum number of elastic IP addresses (EIPs) that you can configure.

MaxCompute

Parameter	Description
CU Quota (a)	The total number of capacity units (CUs) that you can configure for MaxCompute.
Disk Quota (GB)	The total storage size that you can configure for MaxCompute.

KVStore for Redis

Parameter	Description
Memory Quota (GB)	The total memory size that you can configure for KVStore for Redis.

PolarDB-X

Parameter	Description
CPU Quota (Cores)	The total number of CPUs that you can configure for PolarDB-X.

AnalyticDB for PostgreSQL

Parameter	Description
CPU Quota (Cores)	The total number of CPU cores that you can configure for AnalyticDB for PostgreSQL and the number of used cores.
Memory Quota (GB)	The total memory size that you can configure for AnalyticDB for PostgreSQL.
Disk Quota (GB)	The total storage size that you can configure for AnalyticDB for PostgreSQL.

ApsaraDB for MongoDB

Parameter	Description
CPU Quota (Cores)	The total number of CPU cores that you can configure for ApsaraDB for MongoDB and the number of used cores.
Memory Quota (GB)	The total memory size that you can configure for ApsaraDB for MongoDB.
Disk Quota (GB)	The total storage size that you can configure for ApsaraDB for MongoDB.

1.10.1.2. Set quotas for a cloud service

The Apsara Uni-manager Management Console allows you to set quotas to properly allocate resources among organizations.

Prerequisites

You must set quotas for a parent organization before you can set quotas for its subordinate organizations.

Context

If the parent organization has quotas (except when the parent organization is a level-1 organization), the available quotas for a subordinate organization are equal to the quotas for the parent organization minus the quotas for other subordinate organizations.

This topic describes how to modify quotas for Elastic Compute Service (ECS). You can modify quotas for other cloud resources in a similar manner.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an organization administrator.
2. In the top navigation bar, click **Operations**.
3. In the left-side navigation pane of the **Operations** page, click **Quotas**.
4. In the left-side navigation tree, click the name of the organization for which you want to create cloud resources.

5. Select the cloud service for which you want to set quotas. In this example, **ECS** is selected.
6. In the upper-right corner of the quota section, click **Set Quota**.
7. Set the total quotas and click **Save**.

   For more information about quota parameters, see Quota parameters.

1.10.1.3. Modify quotas

Administrators can adjust quotas for cloud resources based on organizational requirements.

Context

This topic describes how to modify quotas for ECS. You can modify quotas for other cloud resources in a similar manner.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Operations**.
3. In the left-side navigation pane of the **Operations** page, click **Quotas**.
4. In the left-side navigation tree, click the name of the organization for which you want to create cloud resources.
5. Select the Apsara Stack service for which you want to modify quotas. For this example, **ECS** is selected.
6. In the upper-right corner of the quota area, click **Modify**.
7. Set the total quotas and click **Save**.

   For more information about quota parameters, see Quota parameters.

1.10.1.4. Reset quotas

Administrators can reset quotas as needed.

Prerequisites

Before deleting a quota for an organization, make sure that no subordinate organizations have any quotas.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Operations**.
3. In the left-side navigation pane of the **Operations** page, click **Quotas**.
4. In the left-side organization navigation tree, click the name of the target organization.
5. Select the cloud service for which you want to reset quotas. For this example, **ECS** is selected.
6. In the upper-right corner of the quota section, click **Reset**.
7. In the message that appears, click **OK**.

1.10.2. Usage statistics

1.10.2.1. View the usage statistics of cloud resources

The Apsara Uni-manager Management Console shows the number of resource instances that run in the Apsara Stack environment by time, organization, resource set, and region. You can also export statistical reports from the Apsara Uni-manager Management Console.

Context

The cloud resources that can be metered include Elastic Compute Service (ECS), Virtual Private Cloud (VPC), Server Load Balancer (SLB), Object Storage Service (OSS), ApsaraDB RDS for MySQL, Elastic IP Address (EIP), Tablestore, PolarDB-X, KVStore for Redis, AnalyticDB for PostgreSQL, ApsaraDB for MongoDB, ApsaraDB RDS for PostgreSQL, ApsaraDB RDS for SQL Server, Log Service, ECS disks, ECS snapshots, scaling group rules, API gateways, and Key Management Service (KMS).

This topic describes how to create quotas for ECS. You can set quotas for other cloud resources in a similar manner.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, click **Operations**.
3. In the left-side navigation pane of the **Operations** page, click **Usage Statistics**.
4. In the **Resource Type** section, click **Elastic Compute Service ECS**.
5. In the **Search Conditions** section, set **Time Period**, **Organization**, **Resource Set**, **Region**, and **Instance ID** to filter resources.

   You can view the statistics in the console or click **Export** in the upper-right corner to export the statistics to your PC as an XLS file.

   > **Note** In the console, you can view or export up to 1,000 statistical records to an Excel file. Use the statistics query API to obtain more statistical data.

   The exported file is named *<Resource type name>.xls*. Find the downloaded file from the download path of the browser.

1.10.3. Statistical analysis

1.10.3.1. View reports of current data

You can use reports to view the most recent data of each service.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, click **Operations**.
3. In the left-side navigation pane of the Operations page, choose **Statistical Analysis** > **Reports**.
4. Click the tab that you want to view.

   You can click the **Resource Reports**, **Quota Reports**, or **CloudMonitor Reports** tab.
5. (Optional) Set **Organizations and Resource Sets** and **Region** and click **Search**.
6. Click the tab of the service that you want to view.

   View the most recent data of the service.

1.10.3.2. Export reports of current data

You can batch export data that you want to view by cloud service.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, click **Operations**.

3. In the left-side navigation pane of the Operations page, choose **Statistical Analysis** > **Reports**.
4. Click the tab that you want to view.

   You can click the **Resource Reports**, **Quota Reports**, or **CloudMonitor Reports** tab.
5. (Optional) Set **Organizations and Resource Sets** and **Region** for which you want to view data and click **Search**.

   Click **Reset** to clear all filter properties.
6. Use one of the following methods to export data:
   - Export data by service.
     a. Click **Export Reports** on the right side of the page.
     b. In the **Select Products to Export** dialog box, select the service that you want to view and click **OK**.

        You can also select **Select All** in the lower-left corner and click **OK**.
   - Export data by instance.
     a. Click the tab of the service that you want to view.
     b. Select the instance that you want to view and click **Export Selected Reports** in the lower-left corner of the page.

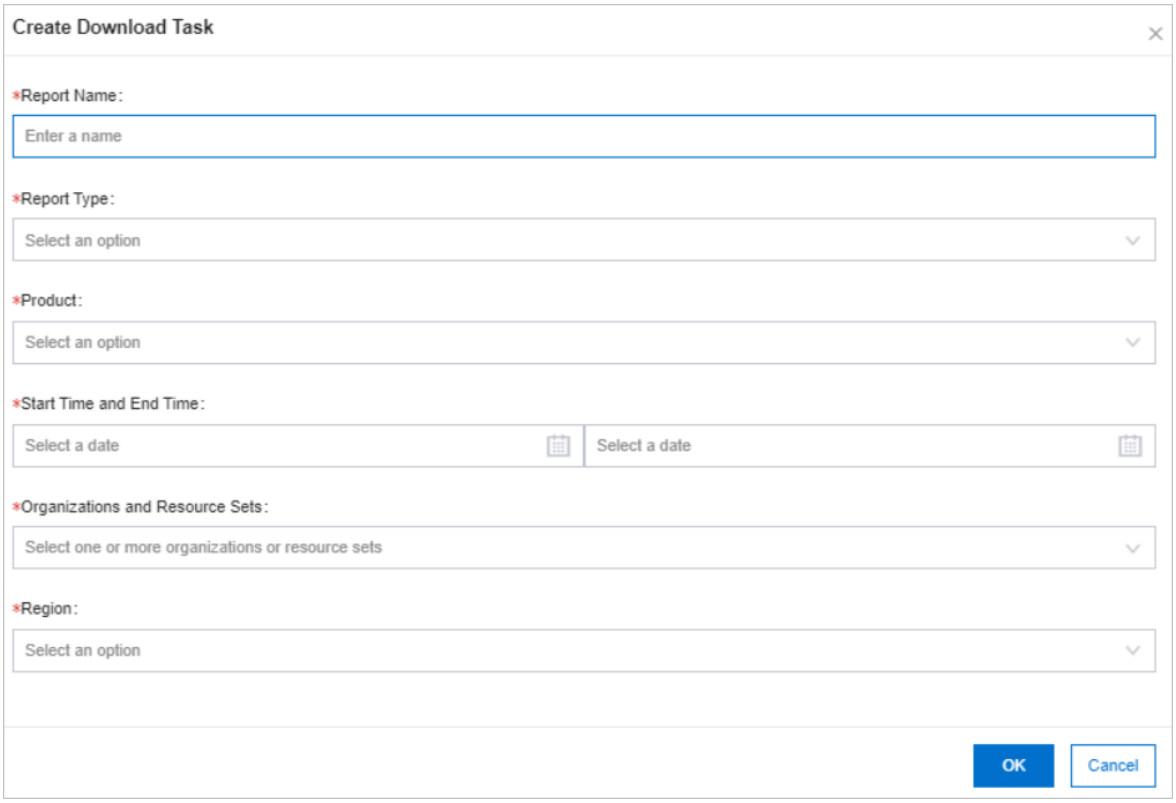
1.10.3.3. Download reports of historical data

You can download data reports of cloud services within the specified period of time, resource set, and region by creating download tasks.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, click **Operations**.
3. In the left-side navigation pane of the Operations page, choose **Statistical Analysis** > **Download Center**.
4. In the upper-right corner of the page, click **Create Download Task**.

5. Enter the information of the download task.



Parameter	Description
Report Name	The name of the report.
Report Type	The type of the report. Valid values: ○ Resource Reports ○ CloudMonitor Reports
Product	The cloud service for which you want to download reports. You can select multiple cloud services.
Start Time and End Time	The start and end time of the data.
Organizations and Resource Sets	The organization to which the data belongs. You can select multiple organizations.
Region	The region of the data. You can select multiple regions.

6. Click **OK**.
7. After the **Created** message appears, the Download Center page appears. Enter the information of the created report in the search box and click **Search** to search for the created download task.

8. After **In Progress** changes to **Completed** in the **Status** column, click **Download Report** in the Actions column.

1.11. Security

1.11.1. View operation logs

You can view operation logs to obtain up-to-date information for various resources and functional modules in the Apsara Uni-manager Management Console. You can also export operation logs to your PC.

Procedure

1. Log on to the Apsara Uni-manager Management Console as a security administrator.
2. In the top navigation bar, click **Security**.
3. You can filter logs by username, resource type, resource ID, product, organization, keyword, source IP address, start time, and end time.

   The following table describes the fields in the query result.

   Fields in the query result

Log field	Description
Organization	The organization of the object on which operations are performed.
Resource Set	The resource set of the object on which operations are performed.
Resource Type	The resource type of the object on which operations are performed.
Resource ID	The ID of the object on which operations are performed.
Status	The current status of the operation.
User	The name of the operator.
Event Type	The operation performed on an Apsara Stack service. The operations include creating, modifying, deleting, querying, updating, binding, unbinding, enabling and disabling service instances, applying for and releasing service instances, and changing the ownership of service instances.
Source IP	The IP address of the operator.
Details	A brief introduction of the operation.
Start Time	The time when the operation started.
End Time	The time when the operation ended.
Region	The region of the object on which operations are performed.
Level	The level of logs.

> **Note** Click the  icon. In the **Show/Hide Columns** dialog box, select fields that you want to show in the query result.

4. (Optional)Click **Download** to download the logs displayed on the current page to your PC as an XLS file.

   The exported log file is named *log.xls* and stored in the *C:\Users\Username\Downloads* directory.

1.12. RAM

1.12.1. RAM introduction

Resource Access Management (RAM) is a resource access control service provided by Apsara Stack.

You can use RAM to manage users and control which resources are accessible to employees, systems, and applications.

RAM provides the following features:

- RAM role

  To authorize a cloud service in a level-1 organization to use other resources in the organization, you must create a RAM role. This role specifies the operations that the cloud service can perform on resources.

  Only system administrators and level-1 organization administrators can create RAM roles.

- User group

  You can create multiple users within an organization and grant them different operation permissions on cloud resources.

  You can create RAM user groups to classify and authorize RAM users within your Apsara Stack tenant account. This simplifies the management of RAM users and their permissions.

  You can create RAM permission policies to grant different operation permissions to different user groups.

1.12.2. Permission policy structure and syntax

This topic describes the structure and syntax used to create or update permission policies in Resource Access Management (RAM).

Policy characters and usage rules

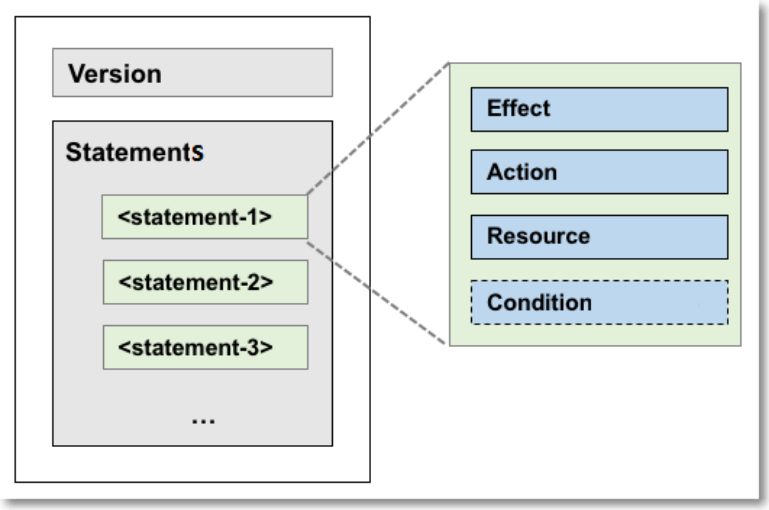
- Characters in a policy
  - The following characters are JSON tokens and are included in policies: `{}[]",:`.
  - The following characters are special characters in the syntax and are not included in policies: `=<>()|`.
- Use of characters
  - If an element can have more than one value, you can perform the following operations:
    - Separate multiple values by using commas (,) as delimiters between each value and use an ellipsis (...) to describe the remaining values. Example: `[<action_string>,<action_string>,...]`.
    - Include only one value. Examples: `"Action":[<action_string>]` and `"Action":<action_string>`.
  - A question mark (?) following an element indicates that the element is optional. Example: `<condition_block?>`.
  - A vertical bar (|) between elements indicates multiple options. Example: `("Allow"|"Deny")`.
  - Elements that must be text strings are enclosed in double quotation marks (""). Example: `<version_block>="Version":("1")`.

Policy structure

The policy structure includes the following components:

- The version number.
- A list of statements. Each statement contains the following elements: Effect, Action, Resource, and Condition.

The Condition element is optional.



Policy syntax

```
policy ={
   <version_block>,
   <statement_block>
}
<version_block>= "Version" : ("1")
<statement_block>= "Statement" : [ <statement>, <statement>, ... ]
<statement>={
  <effect_block>,
  <action_block>,
  <resource_block>,
  <condition_block? >
}
<effect_block>= "Effect" : ("Allow" | "Deny")
<action_block>= ("Action" | "NotAction") :
  ("*" | [<action_string>, <action_string>, ...])
<resource_block>= ("Resource" | "NotResource") :
  ("*" | [<resource_string>, <resource_string>, ...])
<condition_block>= "Condition" : <condition_map>
<condition_map>={
 <condition_type_string> : {
    <condition_key_string> : <condition_value_list>,
    <condition_key_string> : <condition_value_list>,
    ...
 },
 <condition_type_string> : {
    <condition_key_string> : <condition_value_list>,
    <condition_key_string> : <condition_value_list>,
    ...
 }, ...
}
<condition_value_list>= [<condition_value>, <condition_value>, ...]
<condition_value>= ("String" | "Number" | "Boolean")
```

Description:

- The current policy version is 1.
- The policy can have multiple statements.

- The effect of each statement can be either `Allow` or `Deny`.

  > **Note** In a statement, both the Action and Resource elements can have multiple values.

- Each statement can have its own conditions.

  > **Note** A condition block can contain multiple conditions with different operators and logical combinations of these conditions.

- You can attach multiple policies to a RAM user. If policies that apply to a request include an `Allow` statement and a `Deny` statement, the Deny statement overrides the Allow statement.
- Element value:
  - If an element value is a number or Boolean value, it must be enclosed in double quotation marks ("") in the same way as strings.
  - If an element value is a string, characters such as the asterisk (`*`) and question mark (`?`) can be used for fuzzy matching.
    - The asterisk (`*`) indicates any number (including zero) of allowed characters. For example, `ecs:Describe*` indicates all ECS API operations that start with `Describe`.
    - `The question mark (?)` indicates an allowed character.

Policy format check

Policies are stored in RAM as JSON documents. When you create or update a policy, RAM first checks whether the JSON format is valid.

- For more information about JSON syntax standards, see RFC 7159.
- We recommend that you use tools such as JSON validators and editors to check whether the policies meet JSON syntax standards.

1.12.3. RAM roles

1.12.3.1. View basic information about a RAM role

You can view basic information about a RAM role, including its user groups and existing permission policies.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Roles**.
4. On the Roles page, click the name of the target RAM role.
5. In the basic information section, click the **User Groups** and **Permissions** tabs to view relevant information.

1.12.3.2. Create a RAM role

To authorize a cloud service in a level-1 organization to use other resources in the organization, you must create a RAM role. This role contains the operations that the cloud service can perform on resources.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Roles**.

4. In the upper-right corner of the page, click **Create RAM Role**.
5. On the **Roles - Create RAM Role** page, set **Role Name**, **Description**, and **Sharing Scope**.

   Valid values of the **Sharing Scope** parameter:

   - **Global**

     The role is visible and valid to all organizations involved. The default value is Global.
   - **Current Organization**

     The role is visible and valid to the organization to which the user belongs.
   - **Subordinate Organization**

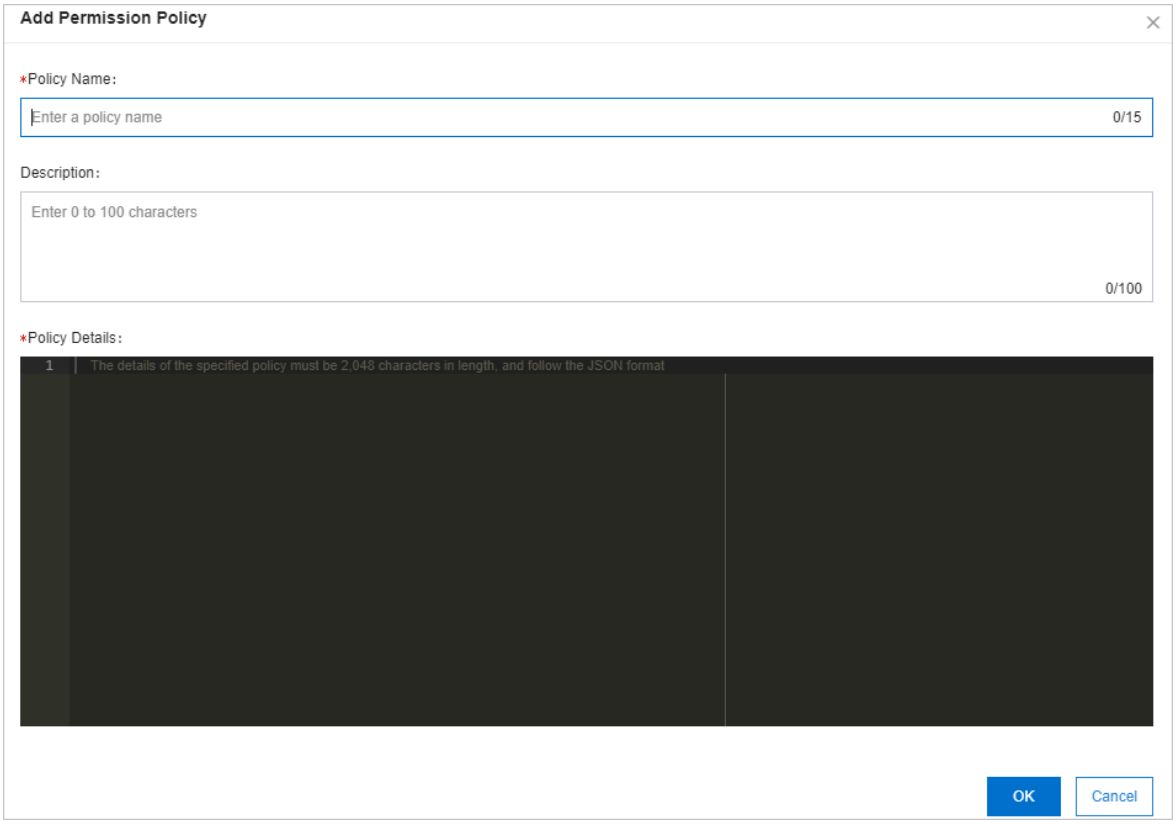
     The role is visible and valid to the organization to which the user belongs and its subordinate organizations.
6. Click **Create**.

1.12.3.3. Create a policy

To use a cloud service to access other cloud resources, you must create a policy and attach it to a user group.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Roles**.
4. In the role name list, find the RAM role that you want to modify and choose **More** > **Modify** in the **Actions** column to go to the **Roles** page.
5. Click the **Permissions** tab.
6. Click **Add Permission Policy**.
7. In the Add Permission Policy dialog box, enter information of the policy.



For more information about how to enter the policy content, see Permission policy structure and syntax.

1.12.3.4. Modify the content of a RAM policy

You can modify the content of a RAM policy.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Roles**.
4. In the role list, find the RAM role that you want to modify and choose **More** > **Modify** in the **Actions** column to go to the **Roles** page.
5. Click the **Permissions** tab.
6. Click the name of a policy in the **Permission Policy Name** column.
7. In the **Modify Permission Policy** dialog box, modify the relevant information and click **OK**.

   For more information about how to modify the policy content, see Permission policy structure and syntax.

1.12.3.5. Modify the name of a RAM policy

You can modify the name of a RAM policy.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Roles**.
4. In the role name list, find the RAM role that you want to modify and choose **More** > **Modify** in the **Actions** column to go to the **Roles** page.
5. Click the Permissions tab. Click the name of that policy that you want to modify in the **Permission Policy Name** column.
6. In the **Modify Permission Policy** dialog box, modify the policy name.

1.12.3.6. Add a RAM role to a user group

You can bind RAM roles to user groups.

Prerequisites

You must create a user group before RAM roles can be added. For more information, see Add a role.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Roles**.
4. In the role name list, find the RAM role that you want to modify and choose **More** > **Modify** in the **Actions** column to go to the **Roles** page.
5. Click the **User Groups** tab.
6. Click **Add User Group**. In the Add User Group dialog box, select a user group.
7. Click **OK**.

1.12.3.7. Grant permissions to a RAM role

When you grant permissions to a RAM role, all users in the user groups that are assigned this role share the granted permissions.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Roles**.
4. In the role list, find the RAM role that you want to modify and choose **More** > **Modify** in the **Actions** column to go to the **Roles** page.
5. Click the **Permissions** tab.
6. Click **Select Existing Permission Policy**.
7. In the dialog box that appears, select a RAM policy and click **OK**.

   If no RAM policies are available, see Add a permission policy.

1.12.3.8. Remove permissions from a RAM role

You can remove permissions that are no longer needed from RAM roles.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Roles**.
4. In the role list, find the RAM role that you want to modify and choose **More** > **Modify** in the **Actions** column to go to the **Roles** page.
5. Click the **Permissions** tab.
6. Find the policy that you want to remove and click **Remove** in the **Actions** column.

1.12.3.9. Modify a RAM role name

Administrators can modify the names of RAM roles.

Context

The name of a preset role cannot be modified.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Roles**.
4. In the role name list, find the RAM role that you want to modify and choose **More** > **Modify** in the **Actions** column to go to the **Roles** page.
5. Move the pointer over the role name and click the icon to enter a new role name.

1.12.3.10. Delete a RAM role

This topic describes how to delete a RAM user.

Prerequisites

Before you delete a RAM role, make sure that no policies are attached to the RAM role.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, click **Roles**.
4. In the role name list, click **More** in the **Actions** column corresponding to a RAM role, and choose **Delete** from the shortcut menu.
5. In the message that appears, click **OK**.

1.12.4. RAM authorization policies

1.12.4.1. Create a service-linked role

You can create authorization policies and grant them to organizations.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Configurations**.
3. In the left-side navigation pane of the **Configurations** page, click **Service-linked Roles**.
4. In the upper-right corner of the page, click **Create RAM Role**.
5. On the **Create RAM Role** page, set **Organization Name** and **Service Name**.
6. Click **OK**.

1.12.4.2. View the details of a service-linked role

You can view the details of a Resource Access Management (RAM) role, including its role name, creation time, description, and Alibaba Cloud Resource Name (ARN).

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Configurations**.
3. In the left-side navigation pane of the **Configurations** page, click **Service-linked Roles**.
4. On the **Service-linked Roles** page, set **Role Name**, **Service Name**, or **Organization Name**, and click **Search** in the upper-right corner.

   To perform another search, click **Clear**.
5. Find the service-linked role that you want to view and click **Details** in the Actions column.

1.12.4.3. View RAM authorization policies

You can view the details of a Resource Access Management (RAM) authorization policy, including its policy name, policy type, default version, description, association time, and policy content.

Prerequisites

A RAM authorization policy is created. For more information, see Create a RAM role.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Configurations**.
3. In the left-side navigation pane of the **Configurations** page, click **Service-linked Roles**.
4. On the **RAM Roles** page, set **Role Name** or **Service Name** and click **Search** in the upper-right corner.

   To perform another search, click **Clear**.
5. Find the service-linked role that you want to view and click **Details** in the **Actions** column.
6. Click the **Role Policy** tab to view the information of the role authorization policy. Click **Details** in the Actions column to view the policy details.

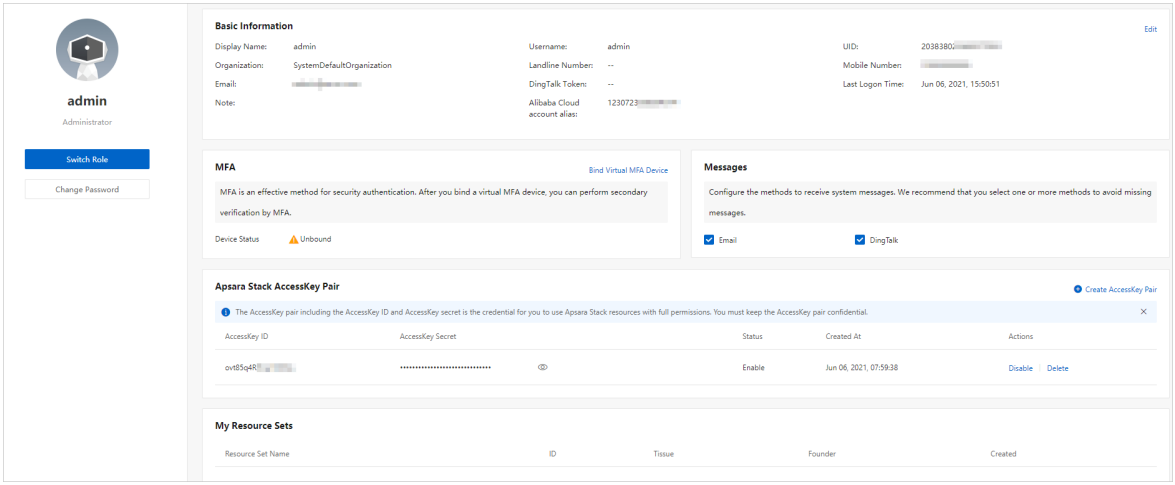
1.13. Personal information management

1.13.1. Modify personal information

You can modify your personal information to keep it up to date.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and choose **User Information** from the shortcut menu.



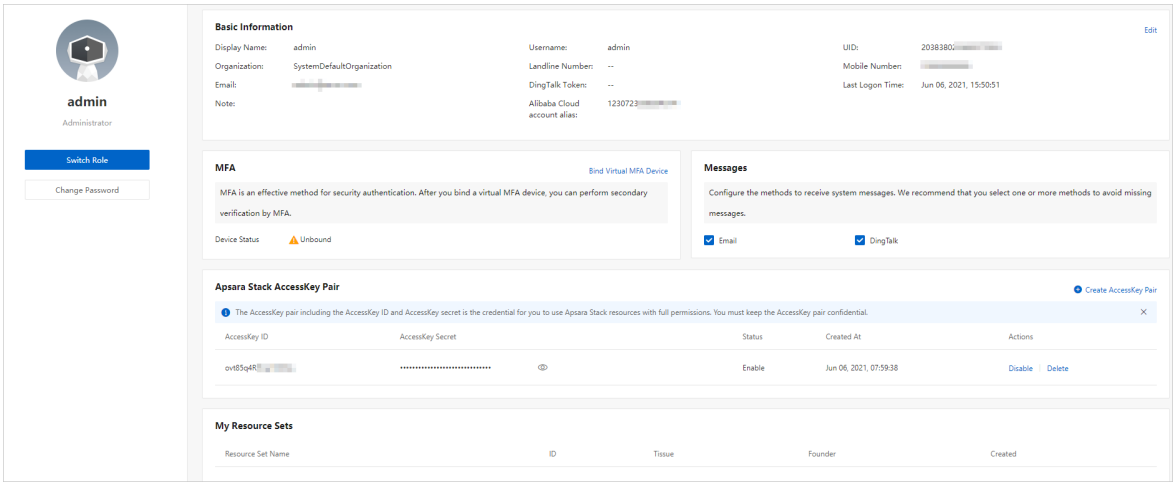
3. In the upper-right corner of the **Basic Information** section, click **Edit**.
4. In the **Modify User Information** dialog box, modify the personal information.
5. Click **OK**.

1.13.2. Change the logon password

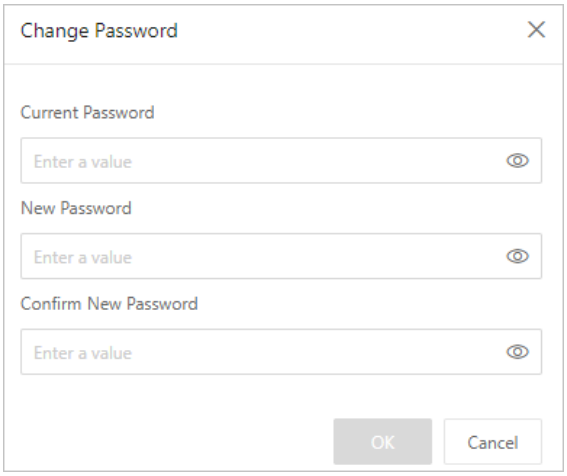
To improve security, you must change your logon password in a timely manner. This topic describes how to change your logon password.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and choose **User Information** from the shortcut menu.



3. Click **Change Password**.
4. In the **Change Password** dialog box, set **Current Password**, **New Password**, and **Confirm New Password**.



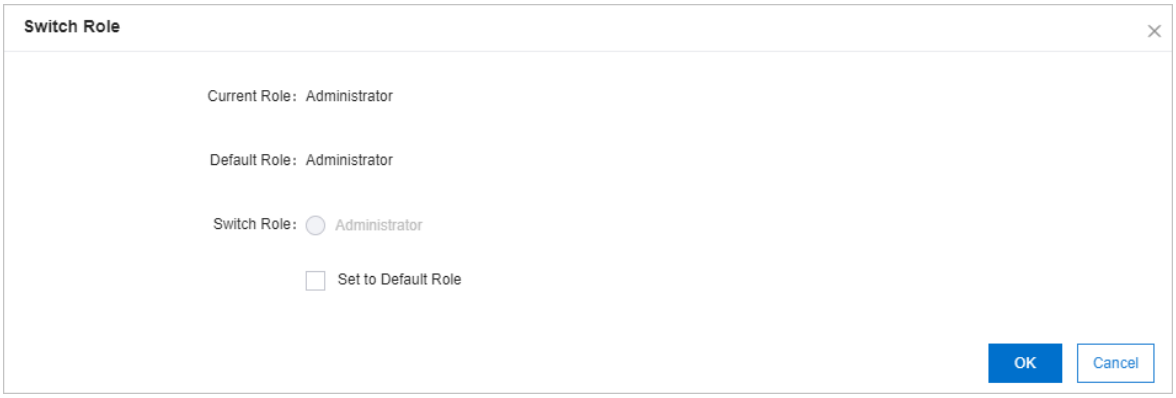
5. Click **OK**.

1.13.3. Switch the current role

You can switch the scope of your current role.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the upper-right corner of the homepage, move the pointer over the user profile picture and choose **User Information** from the shortcut menu.
3. Click **Switch Role**.
4. In the **Switch Role** dialog box that appears, select the role that you want to switch to.



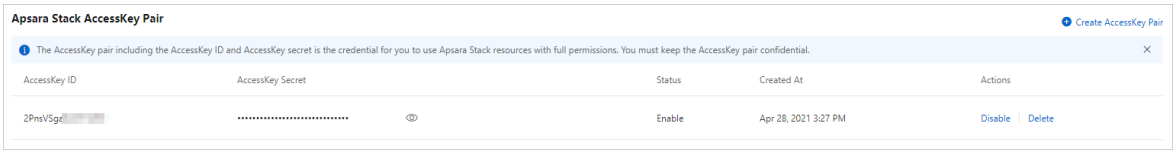
You can also switch back to the default role.

1.13.4. View the AccessKey pair of your Apsara Stack tenant account

To ensure the security of cloud resources, the system must verify the identity of visitors and ensure that they have the relevant permissions. You must obtain the AccessKey ID and AccessKey secret of your Apsara Stack tenant to access cloud resources.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and choose **User Information** from the shortcut menu.
3. In the **Apsara Stack AccessKey Pair** section, view your AccessKey pair.



> **Note** The AccessKey pair consists of an AccessKey ID and an AccessKey secret. These credentials provide you with full permissions on Apsara Stack resources. You must keep the AccessKey pair confidential.

1.13.5. Create an AccessKey pair

You can delete your old AccessKey pairs and create new ones to implement the rotation of your AccessKey pairs.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and choose **User Information** from the shortcut menu.
3. In the upper-right corner of the **Apsara Stack AccessKey Pair** section, click **Create AccessKey Pair**.

> **Note**
>
> Each user can have up to two AccessKey pairs.

1.13.6. Delete an AccessKey pair

You can delete AccessKey pairs that are no longer needed.

Prerequisites

- Each user can delete only its own AccessKey pairs. The administrator cannot delete the AccessKey pairs of users.
- Each user retains at least one AccessKey pair.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and choose **User Information** from the shortcut menu.
3. In the **Apsara Stack AccessKey Pair** section, find the AccessKey pair that you want to delete and click **Delete** in the **Actions** column.
4. In the message that appears, click **OK**.

1.13.7. Disable an AccessKey pair

You can disable AccessKey pairs that are no longer needed. Newly created AccessKey pairs are in the Enable state by default.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and choose **User Information** from the shortcut menu.
3. In the **Apsara Stack AccessKey Pair** section, find the AccessKey pair that you want to disable and click **Disable** in the **Actions** column.

   Each user can disable only its own AccessKey pairs. The administrator cannot disable the AccessKey pairs of users.
4. In the message that appears, click **OK**.

> **Note**
>
> Make sure that at least one AccessKey pair is in the Enable state.

1.13.8. Enable an AccessKey pair

Disabled AccessKey pairs must be re-enabled before you can continue to use them. Newly created AccessKey pairs are in the Enable state by default.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and choose **User Information** from the shortcut menu.
3. In the **Apsara Stack AccessKey Pair** section, find the AccessKey pair that you want to enable and click **Enable** in the **Actions** column.
4. In the message that appears, click **OK**.

> **Note**
>
> Make sure that at least one AccessKey pair is in the Enable state.

1.13.9. MFA

1.13.9.1. Overview

Multi-factor authentication (MFA) is an identity authentication method in computer systems. It requires users to provide two or more verification factors to gain access to a resource. This topic introduces the principles and use scenarios of MFA.

Introduction to MFA

When MFA is enabled, you must enter your username and password (first security factor) and then a variable verification code (second security factor) from an MFA device when you log on to the Apsara Uni-manager Management Console. Two-factor authentication enhances security for your account.

MFA devices use the Time-based One-time Password (TOTP) algorithm to generate time-dependent 6-digit dynamic verification codes. The Apsara Uni-manager Management Console supports software-based virtual MFA devices. You can install software such as the Alibaba Cloud app that supports MFA on your mobile device such as your mobile phone to act as a virtual MFA device.

Limits

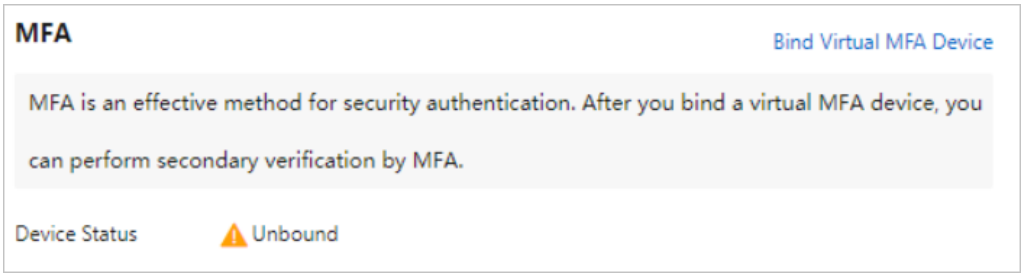
The TOTP algorithm requires that the time of the system clock of the Apsara Uni-manager Management Console remain consistent with the standard time on the Internet. Otherwise, discrepancies in time can lead to inconsistent MFA verification codes and leave you unable to log on to the Apsara Uni-manager Management Console.

1.13.9.2. Bind a virtual MFA device to enable MFA

Multi-factor authentication (MFA) is automatically enabled after you bind an MFA device. This topic describes how to bind a virtual MFA device.

1. Log on to the Apsara Uni-manager Management Console.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and choose **User Information** from the shortcut menu.
3. In the upper-right corner of the **MFA** section, click **Bind Virtual MFA Device**.
4. On the **Bind Virtual MFA Device** page, follow the instructions to bind an MFA device.

   The following figure shows the MFA section after the MFA device is bound.



Results

After a virtual MFA device is bound, you must enter a 6-digit MFA verification code in addition to your username and password before you can log on to the Apsara Uni-manager Management Console.

1.13.9.3. Unbind a virtual MFA device to disable MFA

To disable multi-factor authentication (MFA), you must disable the MFA device that is bound. This topic describes how to unbind a virtual MFA device to disable MFA.

1. Log on to the Apsara Uni-manager Management Console.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and choose **User Information** from the shortcut menu.
3. In the upper-right corner of the **MFA** section, click **Disable Virtual MFA Device**.
4. In the dialog box that appears, click **Disable Virtual MFA Device**.

   After you disable MFA, you need only to enter your username and password the next time you log on to the Apsara Uni-manager Management Console.

1.13.9.4. Forcibly enable MFA

Administrators including the platform administrator, operations administrator, and organization administrator can check whether their users have multi-factor authentication (MFA) enabled. If MFA is disabled for the users, the administrators can forcibly enable MFA for the users.

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Users** > **Users**.
4. Click the **System Users** tab.
5. Find the user for whom you want to forcibly enable MFA and choose **More** > **View MFA Status** in the **Actions** column.

   You can search for the user by username, organization, or role.
6. In the MFA Status Prompt message, click **OK**.

> **Note**
>
> - After MFA is forcibly enabled for a user, the user must go to the Bind Virtual MFA Device page to bind a virtual MFA device before the user can log on to the Apsara Uni-manager Management Console.
> - MFA can be forcibly enabled for users, but cannot be forcibly disabled. Before MFA is enabled, the MFA status of the user is **Not Enabled**.
> - After MFA is enabled, the MFA status of the user is **Enabled but Not Bound**.

1.13.9.5. Reset MFA

If you lose your multi-factor authentication (MFA) key, you must have the administrator reset the key. The MFA key is automatically reset while the password is reset.

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Users** > **Users**.
4. Click the **System Users** tab.
5. Find the user for whom you want to reset MFA and click the username.

   You can search for the user by username, organization, or role.
6. In the user details panel, click **Reset password**.

2.Elastic Compute Service (ECS)

2.1. What is ECS?

2.1.1. Overview

Elastic Compute Service (ECS) is a type of computing service that features elastic processingcapabilities. Compared with physical servers, ECS can be more efficientlymanaged and is more user-friendly. You can create instances, resize disks, and add or release any number of ECS instances at any time based on your business needs.

An ECS instance is a virtual computing environment that contains the most basic components of computers such as the CPU, memory, and storage. Users perform operations on ECS instances. Instances are core components of ECS, and operations can be performed on instances by using the ECS console. Other resources such as block storage, images, and snapshots can only be used after they are integrated into ECS instances. For more information, see ECS components.

ECS components

2.1.2. Instance lifecycle

The lifecycle of an ECS instance begins when the instance is created and ends when the instance is released. This topic describes the instance states in the ECS console, state attributes, and corresponding instance states in API responses.

The following table describes the states that an ECS instances may go through during its lifecycle.

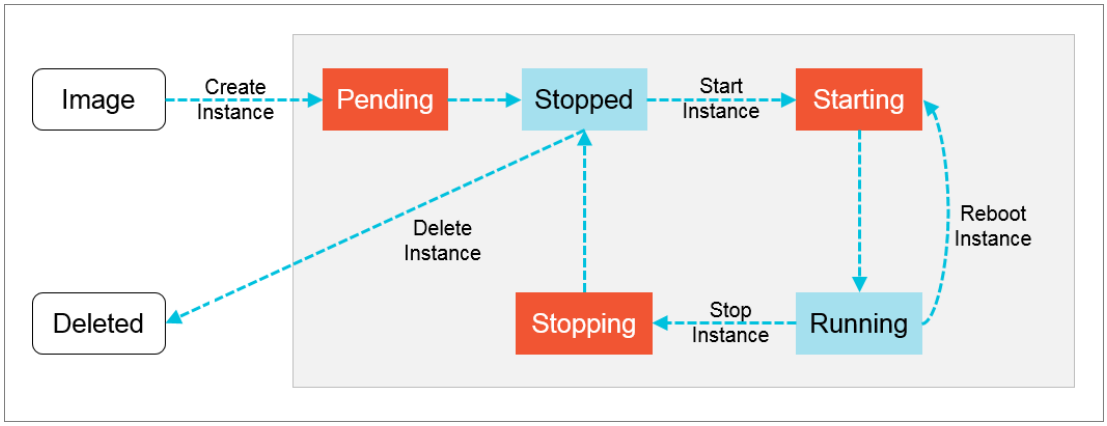
Instance states

State	State attribute	Description	State in an API response
Instance being created	Intermediate	The instance is being created and waiting to be started. If an instance remains in the Instance being created state for an extended period of time, an exception has occurred.	Pending

State	State attribute	Description	State in an API response
Starting	Intermediate	When you start or restart an instance by using the ECS console or calling an API operation, the instance enters this state before it enters the Running state. If an instance remains in the Starting state for an extended period of time, an exception has occurred.	Starting
Running	Stable	While an instance is in the Running state, the instance can function normally and can accommodate your business needs.	Running
Stopping	Intermediate	When you stop an instance by using the ECS console or calling an API operation, the instance enters this state before it enters the Stopped state. If an instance remains in the Stopping state for an extended period of time, an exception has occurred.	Stopping
Stopped	Stable	An instance enters this state when it is stopped. An instance in the Stopped state cannot provide external services.	Stopped
Reinitializing	Intermediate	When you re-initialize the system disk or a data disk of an instance by using the ECS console or calling an API operation, the instance enters this state before it enters the Running state. If an instance remains in the Reinitializing state for an extended period of time, an exception has occurred.	Stopped
Changing system disk	Intermediate	When you replace the system disk of an instance by using the ECS console or calling an API operation, the instance enters the Changing system disk state before it enters the Running state. If an instance remains in the Changing system disk state for an extended period of time, an exception has occurred.	Stopped

Instance states describes the relationships between instance states in the ECS console and instance states in API responses. The following figure shows the transitions between instance states in API responses.

Transitions between instance states in API responses



2.2. Instructions

2.2.1. Restrictions

Learn about restrictions before performing operations on ECS instances.

- Do not upgrade the kernel or operating system version of an ECS instance.
- Do not start SELinux for Linux systems except CentOS and RedHat.
- Do not detach PVDriver.
- Do not arbitrarily modify the MAC address of the network interface.

2.2.2. Suggestions

Consider the following suggestions to make more efficient use of ECS:

- ECS instances with 4 GiB or higher memory must use a 64-bit operating system. 32-bit operating systems have a maximum of 4 GiB of memory addressing.
- A 32-bit Windows operating system supports a maximum of 4 CPU cores.
- To ensure service continuity and avoid failover-induced service unavailability, we recommend that you configure service applications to boot automatically at system startup.

2.2.3. Limits

Before using ECS instances, you must be familiar with the limits of instance families.

General limits

- Windows operating systems support a maximum of 64 vCPUs in instance specifications.
- ECS instances do not support the installation of virtualization software and secondary virtualization.
- Sound card applications are not supported. Only GPU instances support virtual sound cards. External hardware devices, such as hardware dongles, USB flash drives, external hard disks, and bank U keys, cannot be directly connected to ECS instances.
- ECS does not support multicast protocols. If multicasting services are required, we recommend that you use unicast instead.

Instance family ga1

To create a ga1 instance, you must use one of the following images pre-installed with drivers:

- Ubuntu 16.04 with an AMD GPU driver pre-installed
- Windows Server 2016 English version with an AMD GPU driver pre-installed
- Windows Server 2008 R2 English version with an AMD GPU driver pre-installed

Note:

- A ga1 instance uses an optimized driver provided by Alibaba Cloud and AMD. The driver is installed in images provided by Alibaba Cloud and is currently unavailable for download.
- If the GPU driver malfunctions due to improper removal of related components, you need to replace the system disk to restore GPU related functions.

  > **Note** This operation causes data loss.

- If the driver malfunctions because an improper image is selected, you need to replace the system disk to reselect an image with an AMD GPU driver pre-installed.
- For Windows Server 2008 or earlier, you cannot connect to the VNC after the GPU driver takes effect. The VNC is irresponsive with a black screen or stuck at the splash screen. You can use other methods such as Remote

Desktop Protocol (RDP) to access the system.

- RDP does not support DirectX, OpenGL, or other related applications. You need to install the VNC and a client, or use other supported protocols such as PCOIP and XenDesktop HDX 3D.

Instance families gn4, gn5i, and gn5

- Bandwidth: If you use an image of Windows Server 2008 R2 for a gn4 instance, you cannot use the Connect to VNC function in the ECS console to connect to the instance after the installed GPU driver takes effect. You need to set the bandwidth to a non-zero value or attach an Elastic IP address to the created instance.
- Image: If an NVIDIA GPU driver is not required, you can select any image, and then Install the CUDA and GPU drivers for a Linux instance or Install the CUDA and GPU drivers for a Windows instance.

2.2.4. Notice for Windows users

Before using Windows-based ECS instances, you must consider the following points:

- Data loss may occur if a local disk is used as the data disk of an instance. We recommend that you use a cloud disk to create your instance if you are not sure about the reliability of the data architecture.
- Do not close the built-in shutdownmon.exe process. Otherwise, the server may require a longer time to restart.
- Do not rename, delete, or disable Administrator accounts or it may affect the use of the server.
- We do not recommend that you use virtual memory.
- When you modify your computer name, you must synchronize the following key values in the registry. Otherwise, the computer name cannot be modified, causing failure when installing certain third-party programs. The following key values must be modified in the registry:

  ```
  HKEY_LOCAL_MACHINE\SYSTEM\ControlSet001\Control\ComputerName\ActiveComputerName
  ```

  ```
  HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\ComputerName\ComputerName
  ```

2.2.5. Notice for Linux users

Before using Linux-based ECS instances, you must consider the following points:

- Do not modify content of the default /etc/issue files under a Linux instance. Otherwise, the custom image created from the instance cannot be recognized, and instances created based on the image cannot start as expected.
- Do not arbitrarily modify the permissions of each directory in the partition where the root directory is located, especially permissions of /etc, /sbin, /bin, /boot, /dev, /usr, and /lib directories. Improper modification of permissions can cause errors.
- Do not rename, delete, or disable Linux root accounts.
- Do not compile or perform any other operations on the Linux kernel.
- We do not recommend the use of Swap for partitioning.
- Do not enable the NetWorkManager service. This service conflicts with the internal network service of the system, causing network errors.

2.2.6. Notice on defense against DDoS attacks

You need to purchase Anti-DDoS Pro to defend against DDoS attacks. For more information, see *Apsara Stack Security Product Introduction*.

2.3. Quick start

2.3.1. Overview

This topic describes how to quickly create and connect to an ECS instance.

Perform the following procedure:

1. Create a security group

   A security group is a virtual firewall used to control traffic to and from ECS instances. Each ECS instance must be added to at least one security group. Before creating an instance, you must select a security group to control traffic to and from the instance.

2. Create an instance

   An ECS instance is a virtual machine that contains basic computing components such as CPU, memory, operating system, network, and disks. After a security group is created, you can select an instance type based on your business requirements. For more information, see Instance types.

3. Connect to an instance

   Select a remote connection method based on the network configuration and operating system of the ECS instance and your local operating system. After you log on to the instance, you can perform other operations on it, such as installing applications.

2.3.2. Log on to the ECS console

This topic describes how to log on to the ECS console.

Prerequisites

- Before logging on to the ASCM console, make sure that you have obtained the IP address or domain name of the ASCM console from the deployment personnel. The URL used to access the ASCM console is in the following format: https://[IP address or domain name of the ASCM console].
- We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL used to access the ASCM console. Press the Enter key.
2. Enter your username and password.

   Obtain the username and password for logging on to the console from the operations administrator.

   > **Note** When you log on to the ASCM console for the first time, you must change the password of your username as prompted. Due to security concerns, your password must meet the minimum complexity requirements: The password must be 8 to 20 characters in length and must contain at least two of the following character types: uppercase letters, lowercase letters, digits, and special characters such as exclamation points (!), at signs (@), number signs (#), dollar signs ($), and percent signs (%).

3. Click **Login** to go to the ASCM console homepage.
4. In the top navigation bar, choose **Products > Elastic Computing > Elastic Compute Service**.

2.3.3. Create a security group

Security groups are an important means for network security isolation. They are used to set network access control for one or more ECS instances.

Prerequisites

A Virtual Private Cloud (VPC) has been created. For more information, see *VPC User Guide* .

Context

Instances that belong to the same account and are in the same region and in the same security group can communicate with each other over the internal network. If instances that belong to the same account in the same

region are in different security groups, you can implement internal network communication by authorizing mutual access between two security groups.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Networks and Security > Security Groups**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Click **New Security Group**.
5. Configure the parameters of the security group.

Type	Parameter	Required	Description
Region	Organization	Yes	The organization to which the security group belongs. Make sure that the security group and the VPC belong to the same organization.
	Resource Set	Yes	The resource set to which the security group belongs. Make sure that the security group and the VPC belong to the same resource set.
	Region	Yes	The region to which the security group belongs. Make sure that the security group and the VPC belong to the same region.
	Zone	Yes	The ID of the zone where the security group resides.
Basic Settings	VPC	Yes	The VPC to which the security group belongs.
	Security Group Name	No	The name must be 2 to 128 characters in length and start with a letter. It can contain letters, digits, periods (.), underscores (_), hyphens (-), colons (:), and commas (,). It cannot start with http:// or https://.

Type	Parameter	Required	Description
	Description	No	The description of the security group. We recommend that you provide an informational description to simplify future management operations. The name must be 2 to 256 characters in length and start with a letter. It can contain letters, digits, periods (.), underscores (_), hyphens (-), and commas (,). It cannot start with http:// or https://.

6. Click **Submit**.

2.3.4. Create an instance

An ECS instance is a virtual machine that contains the basic computing components of a server, such as CPU, memory, operating system, network, and disks.

Prerequisites

- A VPC and a VSwitch are created. For more information, see *Create a VPC and Create a VSwitch* in Apsara Stack VPC User Guide.
- If you want to assign an IPv6 address to the instance that you want to create, make sure that the VPC and VSwitch are associated with IPv6 CIDR blocks. For more information, see *Enable an IPv6 CIDR block for a VPC and Enable an IPv6 CIDR block for a VSwitch* in Apsara Stack VPC User Guide.
- A security group is available. If no security group is available, create a security group. For more information, see Create a security group.

Context

Some limits apply when you create GPU-accelerated instances. For more information, see Limits.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, click **Instances**.
3. Click **Create Instance**.
4. Configure parameters listed in the following tables to create an instance.
   i. Configure the basic settings of the instance.

Parameter	Required	Description
Organization	Yes	Select an organization in which to create the instance.
Resource Set	Yes	Select a resource set in which to create the instance.

ii. Select a region and zone for the instance.

Parameter	Required	Description
Region	Yes	Select a region in which to create the instance.
Zone	Yes	Select a zone in which to create the instance. Zones are the physical zones with separate power supplies and networks in the same region. The internal networks of zones are interconnected, and faults in one zone are isolated from the other zones. To increase the availability of your applications, we recommend that you create instances in different zones.

iii. Configure the network of the instance.

Parameter	Required	Description
Network Type	Yes	Select the type of the network in which to create the instance. **VPC** is available.
VPC	Yes	Select a VPC in which to create the instance.
VSwitch	Yes	Select a VSwitch to be connected to the instance.
Private IP	No	Specify a private IP address for the instance. The private IP address must be within the CIDR block of the VSwitch. If you do not specify a private IP address, the system will automatically allocate a private IP address to the instance.

iv. (Optional)Specify whether to assign an IPv6 address to the instance.

v. Select a security group in which to create the instance.

vi. Select an instance family and instance type for the instance.

Parameter	Required	Description
Instance Family	Yes	Select an instance family for the instance. After you select an instance family, you must select an instance type.
Instance Type	Yes	Select an instance type. Windows Server images require specific CPU and memory combinations. For more information, see Limits in *ECS Product Introduction*.

vii. Configure the image to be used by the instance.

Parameter	Required	Description
Image Type	Yes	Select an image type. Valid values: **Public Image** and **Custom Image**.
Public Image	Subject to the image type	Select a public image for the instance. Public images provided by Alibaba Cloud are licensed, secure, and stable. Public images include Windows Server images and major Linux images. This parameter must be specified when you set Image Type to **Public Image**. When you use an image that supports DHCPv6 to create an instance, an IPv6 address is automatically assigned to the instance. The created instance can use this IPv6 address to communicate over the internal network. When you use an image that does not support DHCPv6 to create an instance, you must manually assign an IPv6 address to the instance. The following images support DHCPv6: ■ Linux images: ■ CentOS 7.6 IPv6 64-bit ■ CentOS 6.10 64-bit ■ SUSE Linux Enterprise Server 12 SP4 64-bit ■ Windows Server images **Note** To use an IPv6 address to communicate over the Internet, you must also enable public bandwidth for the IPv6 address. For more information, see Enable Internet bandwidth for an IPv6 address in *Apsara Stack VPC User Guide*.
Custom Image	Subject to the image type	Select a custom image for the instance. Custom images are created from instances or snapshots, or imported from your local device. This parameter must be specified when you set Image Type to **Custom Image**.

viii. Configure the storage settings for the instance.

Parameter	Required	Description
System Disk	Yes	Specify the disk category and capacity of the system disk. Valid disk categories: **Ultra Disk** and **SSD Disk**. The system disk size must range from 20 GiB to 500 GiB.
Data Disk	No	You can click Data Disk to add data disks. Specify the disk category and capacity of each data disk. Valid disk categories: **Ultra Disk** and **SSD Disk**. A maximum of 16 data disks can be added to an instance. The maximum capacity of each data disk is 32 TiB. You can select or clear **Release with Instance** and **Encrypt** for each data disk. To encrypt a data disk, set **Encryption Algorithm** to **AES256** or **SM4** and set **Encryption Key** to a key created in **Key Management Service (KMS)**. You can also add data disks after the instance is created. For more information, see Create a disk.

ix. Configure the logon password settings for the instance.

Parameter	Required	Description
Set Password	Yes	Specify when to set the password. Valid values: **Now** and **Later**. If Later is selected, you can use the password reset feature to set a password at a later time. For more information, see Change the logon password of an instance. **Note** The password is used to log on to the instance, not to the VNC.
Logon Password	No	Set the password to be used to log on to the instance. The password must be 8 to 30 characters in length and must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. The supported special characters include `()`~!@#$%^&*-_+=|{}[]:;'<>,.?/`
Confirm Password	No	Re-enter the password.

x. (Optional)Select a deployment set in which to create the instance.

xi. (Optional)Enter a name for the instance.

The name must be 2 to 128 characters in length and start with a letter. It can contain periods (.), underscores (_), colons (:), and hyphens (-).

If you do not specify a name, the system will assign an instance name at random.

xii. (Optional)In the User Data field, enter the user data to be automatically run upon instance startup.

Windows supports Batch and PowerShell scripts. Before you perform Base64 encoding, make sure that the content to be encoded includes `[bat]` or `[powershell]` as the first line. Linux supports shell scripts.

xiii. Enter the number of instances that you want to create.

The number must be an integer ranging from 1 to 100.

5. Click **Submit**.

Result

The instance appears in the instance list. When the instance is being created, it is in the **Preparing** state. After the instance is created, it enters the **Running** state.

2.3.5. Connect to an instance

2.3.5.1. Instance connecting overview

After an instance is created, you can connect to the instance to perform operations such as installing applications.

You can use one of the following methods to connect to an instance:

- Use remote connection tools to connect to instances that have public IP addresses. For more information about the procedure, see the following topics:
  - Connect to a Linux-based instance by using SSH commands in Linux or Mac OS X
  - Connect to a Linux-based instance by using remote connection tools in Windows
  - Connect to a Windows-based instance by using RDP
- Use the VNC feature in the ECS console. For more information, see Connect to an instance by using a VNC management terminal.

The username of a Windows instance is Administrator, and that of a Linux instance is root.

2.3.5.2. Connect to a Linux instance by using SSH commands in Linux or Mac OS X

This topic describes how to use SSH commands to connect to a Linux instance.

Prerequisites

- The instance and the security group are created.
- The instance is in the **Running** state.
- A logon password is set for the instance.
- An Elastic IP address (EIP) is bound with the instance.
- An inbound security group rule is added to the security group to allow the SSH port.

Rule direction	Authorization policy	Protocol type	Port range	Priority	Authorization type	Authorization object
Inbound	Accept	TCP	22/22	1	IPv4 CIDR block	0.0.0.0/0

Procedure

1. Enter the following command and press the Enter key.

```
ssh root@instance IP
```

2. Enter the instance password of the root user and press the Enter key.

2.3.5.3. Connect to a Linux-based instance by using remote connection tools in Windows

This topic describes how to connect to an instance by using the PuTTY tool.

Prerequisites

Remote connection tools are designed with similar logics. In this example, PuTTY is used to connect to an instance. Download PuTTY at the following URL: .

Procedure

1. Download and install PuTTY for Windows.
2. Start the PuTTY client and complete the following settings:
   - Host Name (or IP Address): Enter the EIP of the instance to be connected.
   - Port: Select the default port 22.
   - Connection Type: Select SSH.
   - Saved Session: Enter the name of the session. Click **Save**. After the settings are saved, PuTTY remembers the name and IP address of the instance. This eliminates the need to enter them every time you connect to the instance.
3. Click **Open** to connect to the instance.

   When you connect to the instance for the first time, PuTTY displays security alerts. Click **Yes** to proceed.
4. Enter the username root and press Enter.
5. Enter the password for the instance and press Enter.

   If a message similar to the following one appears, a connection to the instance is established.

   ```
   Welcome to aliyun Elastic Compute Server!
   ```

2.3.5.4. Connect to a Windows instance by using RDP

This topic describes how to connect to a Windows instance by using Remote Desktop Protocol (RDP).

Prerequisites

- The instance and the security group are created.
- The instance is in the **Running** state.
- A logon password is set for the instance.
- An Elastic IP address (EIP) is bound with the instance.
- An inbound security group rule is added to the security group to allow the RDP port.

Rule direction	Authorization policy	Protocol type	Port range	Priority	Authorization type	Authorization object
Inbound	Accept	TCP	3389/3389	1	IPv4 CIDR block	0.0.0.0/0

- CredSSP-related security updates are installed on the operating system of the instance.

Procedure

1. Activate the Remote Desktop Connection feature by using any of the following methods:

- Click **Start**, enter *mstsc* in the search box, and click **mstsc** in the search result.
- Press Windows Key + R. In the **Run** dialog box that appears, enter *mstsc* and click **OK**.

2. In the **Remote Desktop Connection** dialog box, enter the EIP of the instance and click **Show Options**.
3. Enter the username.

   The default username is administrator.
4. (Optional)If you do not want to enter the password upon subsequent logons, select **Allow me to save credentials**.
5. Click **Connect**.
6. In the **Windows Security** dialog box that appears, enter the password for the account and click **OK**.

Result

After you log on to the instance, the Windows desktop appears.

If authentication errors occur or the required function is not supported, install security updates.

1. Connect to an ECS instance by using the VNC before proceeding.
2. Choose **Start > Control Panel**.
3. Click **System and Security**.
4. Click **Check for updates** in the **Windows Updates** pane.
5. If updates are available, click **Install updates**.
6. Restart the instance.

2.3.5.5. Connect to an ECS instance by using the VNC

You can access your instance by using the VNC in the ECS console when other SSH clients such as PuTTy, Xshell, and SecureCRT do not work properly.

Prerequisites

- The instance is in the **Running** state.
- The root certificate is imported to your web browser. For more information, see Install a certificate.
- If you log on to an instance for the first time after the instance is created, make sure that you set a new VNC password. For more information, see Change the VNC password.

Context

The VNC password is used to log on to the VNC of the ECS console, and the instance password is used to log on to an instance.

You can use the VNC to connect to an instance to solve issues shown in the following table.

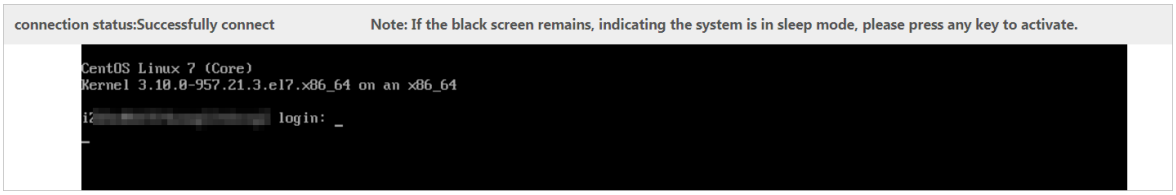
Scenario	Resolution
The instance startup is slowly due to self-check upon startup.	Check the progress of the self check.
The firewall of the operating system is enabled by mistake.	Disable the firewall.
Abnormal processes appear, which consume large amounts of CPU or bandwidth resources.	Troubleshoot and terminate the abnormal processes.

Procedure

1. Log on to the ECS console.

2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the ECS instance, and click **Remote Connection** in the **Actions** column.
5. Enter the VNC password, and then click **OK**.

   After the connection is successful, the logon page is displayed, as shown in the following figure.



6. Enter the username and password.
   - For Linux instances: Enter the username *root* and the logon password.

     > **Note** Passwords in Linux are not displayed as you type. Press the Enter key after you enter the password.

   - For Windows instances: To use key combinations such as Ctrl + Alt + Delete, click the corresponding key combination in the upper-right corner of the VNC page.

   Enter the username and password as prompted, and click the Log In icon  .

2.4. Instances

2.4.1. Create an instance

An Elastic Compute Service (ECS) instance is a virtual machine that contains the basic computing components of a server, such as CPU, memory, operating system, network settings, and disks.

Prerequisites

- A virtual private cloud (VPC) and a vSwitch are created. For more information, see the "Create a VPC" and "Create a vSwitch" topics in *Apsara Stack VPC User Guide*.
- If you want to assign an IPv6 address to the instance that you want to create, make sure that the VPC and vSwitch are associated with IPv6 CIDR blocks. For more information, see the "Enable an IPv6 CIDR block for a VPC" and "Enable an IPv6 CIDR block for a vSwitch" topics in *Apsara Stack VPC User Guide*.
- One or more security groups are available. If no security groups are available, create one. For more information, see Create a security group.

Context

Some limits apply when you create GPU-accelerated instances. For more information, see Limits.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Click **Create Instance**.
5. Configure the parameters listed in the following tables.
   i. Configure the basic settings of the instance.

Parameter	Required	Description
Organization	Yes	Select an organization.
Resource Set	Yes	Select a resource set.

   ii. Select a region and zone for the instance.

Parameter	Required	Description
Region	Yes	Select a region.
Zone	Yes	Select a zone. Zones are the physical zones with separate power supplies and networks within the same region. The internal networks of zones are connected, and faults in one zone are isolated from the other zones. To increase the availability of your applications, we recommend that you create instances in different zones.

   iii. Configure network settings for the instance.

Parameter	Required	Description
Network Type	Yes	Select a network type. Only **VPC** is supported.
VPC	Yes	Select a VPC.
vSwitch	Yes	Select a vSwitch.
Private IP Address	No	Specify a private IPv4 address for the instance. The private IPv4 address must be within the CIDR block of the selected vSwitch. If you do not specify a private IP address, the system allocates one to the instance.
IPv6	No	Specify whether to assign an IPv6 address to the instance.

iv. Configure instance settings such as security group, instance family, and instance type and specify the number of instances that you want to create.

Parameter	Required	Description
Security Group	Yes	Select a security group.
Deployment Set	No	Select a deployment set. You can use deployment sets to disperse or aggregate the instances involved in your business.
User Data	No	In the User Data field, enter the user data to be automatically run on instance startup. ■ Windows supports batch and PowerShell scripts. Before you perform Base64 encoding of user data, make sure that the data to be encoded includes `[bat]` or `[powershell]` as the first line. ■ Linux supports shell scripts.
Quantity	Yes	Specify the number of instances that you want to create. The number must be an integer within the range of 1 to 100.
Instance Family	Yes	Select an instance family. After you select an instance family, you must select an instance type.
Instance Type	Yes	Select an instance type. Instance types that have specific CPU and memory combinations do not support Windows Server images. For more information, see *ECS Product Introduction*.

v. Configure the image to be used by the instance.

Parameter	Required	Description
Image Type	Yes	Select an image type. Valid values: **Public Image**, **Custom Image**, and **Shared Custom Image**.

Parameter	Required	Description
Public Image	Subject to the image type	Select a public image. Public images provided by Alibaba Cloud are licensed, secure, and stable. Public images include Windows Server images and major Linux images. This parameter is required when you set Image Type to **Public Image**. When you use an image that supports Dynamic Host Configuration Protocol version 6 (DHCPv6) to create an instance, an IPv6 address is automatically assigned to the instance. The instance can use this IPv6 address to communicate over the internal network. When you use an image that does not support DHCPv6 to create an instance, you must manually assign an IPv6 address to the instance. The following images support DHCPv6: ■ Linux images: ■ CentOS 7.6 IPv6 64-bit ■ CentOS 6.10 64-bit ■ SUSE Linux Enterprise Server 12 SP4 64-bit ■ Windows Server images **Note** To use an IPv6 address to communicate over the Internet, you must enable public bandwidth for the IPv6 address. For more information, see the "Enable Internet bandwidth for an IPv6 address" topic in *Apsara Stack VPC User Guide*.
Custom Image	Subject to the image type	Select a custom image. Custom images are created from instances or snapshots or are imported from your device. This parameter is required when you set Image Type to **Custom Image**.
Shared Custom Image	Subject to the image type	Select a custom image that is shared by another Apsara Stack tenant. This parameter is required when you set Image Type to **Shared Custom Image**.

vi. Configure the storage settings for the instance.

Parameter	Required	Description
System Disk	Yes	Select a disk category from the drop-down list and specify the system disk capacity. Valid values for the disk category: **Ultra Disk** and **Standard SSD**. The system disk capacity must range from 20 GiB to 500 GiB.
Data Disk	No	You can click Data Disk to create and attach data disks. For each data disk, select a disk category from the drop-down list and specify the disk capacity. Valid values for the disk category: **Ultra Disk** and **Standard SSD**. A maximum of 16 data disks can be attached to an instance. The maximum capacity of each data disk is 32 TiB. You can optionally select **Release with Instance** and **Encryption** for each data disk. To encrypt a data disk, you can select **AES256** or **SM4** from the **Encryption Method** drop-down list and then select a key created in **Key Management Service (KMS)** from the **Encryption Key** drop-down list. You can also attach data disks after the instance is created. For more information, see Create a disk.

vii. Configure the logon password settings for the instance.

Parameter	Required	Description
Password Setting	Yes	Specify when to set a password. Valid values: **Set Now** and **Set After Purchase**. If you select Set After Purchase, you can use the password reset feature to set a password after the instance is created. For more information, see Change the logon password of an instance. **Note** The password is used to log on to the instance, not to a VNC management terminal.
Logon Password	No	Set the password to be used to log on to the instance. The password must be 8 to 30 characters in length and must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. The supported special characters include `()` ~ ! @ # $ % ^ & * - _ + = | { } [ ] : ; ' < > , . ? /` **Note** This parameter is required when you set **Password** to **Set Now**.
Confirm Password	No	Enter the password again. **Note** This parameter is required when you set **Password** to **Set Now**.

viii. (Optional)Enter a name for the instance.

The name must be 2 to 128 characters in length and can contain **hyphens (-), underscores (_), and colons (:)**. It must start with a letter and cannot start with **http://** or **https://**.

If you do not specify a name, the system assigns one at random.

6. Click **Submit**.

Result

The new instance appears in the instance list. When the instance is being created, it is in the **Preparing** state. When the instance is created, it enters the **Running** state.

2.4.2. Connect to an instance

2.4.2.1. Instance connecting overview

After an instance is created, you can connect to the instance to perform operations such as installing applications.

You can use one of the following methods to connect to an instance:

- Use remote connection tools to connect to instances that have public IP addresses. For more information about the procedure, see the following topics:
  - Connect to a Linux-based instance by using SSH commands in Linux or Mac OS X
  - Connect to a Linux-based instance by using remote connection tools in Windows

- Connect to a Windows-based instance by using RDP

- Use the VNC feature in the ECS console. For more information, see Connect to an instance by using a VNC management terminal.

The username of a Windows instance is Administrator, and that of a Linux instance is root.

2.4.2.2. Connect to a Linux-based instance by using SSH commands in Linux or Mac OS X

This topic describes how to use SSH commands to connect to a Linux-based instance.

Prerequisites

Create a security group and an instance.

Procedure

1. Enter the following command: `ssh root@instance IP` .
2. Enter the password for the *root* user to log on to the instance.

2.4.2.3. Connect to a Linux-based instance by using remote connection tools in Windows

This topic describes how to connect to an instance by using the PuTTY tool.

Prerequisites

Remote connection tools are designed with similar logics. In this example, PuTTY is used to connect to an instance. Download PuTTY at the following URL: .

Procedure

1. Download and install PuTTY for Windows.
2. Start the PuTTY client and complete the following settings:
   - Host Name (or IP Address): Enter the EIP of the instance to be connected.
   - Port: Select the default port 22.
   - Connection Type: Select SSH.
   - Saved Session: Enter the name of the session. Click **Save**. After the settings are saved, PuTTY remembers the name and IP address of the instance. This eliminates the need to enter them every time you connect to the instance.
3. Click **Open** to connect to the instance.

   When you connect to the instance for the first time, PuTTY displays security alerts. Click **Yes** to proceed.
4. Enter the username root and press Enter.
5. Enter the password for the instance and press Enter.

   If a message similar to the following one appears, a connection to the instance is established.

   ```
   Welcome to aliyun Elastic Compute Server!
   ```

2.4.2.4. Connect to a Windows instance by using RDC

This topic describes how to connect to a Windows instance by using Remote Desktop Connection (RDC).

Prerequisites

- A security group and a Windows instance are created.
- The instance is in the **Running** state.
- A logon password is set for the instance.
- An Elastic IP address is associated with the instance.
- An inbound security group rule is added to the security group to allow traffic on the RDP port.

Rule direction	Action	Protocol	Port range	Priority	Authorization type	Authorization object
Inbound	Allow	tcp	3389/3389	1	IPv4 addresses	0.0.0.0/0

Procedure

1. Use one of the following methods to enable RDC:
   - Click **Start**, enter *mstsc* in the search box, and click **mstsc** in the search result.
   - Press the Windows logo key+R. In the **Run** dialog box that appears, enter *mstsc* and click **OK**.
2. In the **Remote Desktop Connection** dialog box, enter the Elastic IP address of the instance and click **Show Options**.
3. Enter the username.

   The default username is administrator.
4. (Optional)If you do not want to enter the password upon subsequent logons, select **Allow me to save credentials**.
5. Click **Connect**.
6. In the **Windows Security** dialog box that appears, enter the password corresponding to the username you entered and click **OK**.

Result

If the Windows desktop appears, a connection to the Windows instance is established.

If an error message is returned indicating that an authentication error has occurred and the function requested is not supported, install CredSSP updates and try again. Follow these steps to install the updates:

1. Connect to an ECS instance by using the VNC.
2. Choose **Start > Control Panel**.
3. Click **System and Security**.
4. Click **Check for updates** in the **Windows Updates** section.
5. If updates are available, click **Install updates**.
6. Restart the instance.

2.4.2.5. Install the certificate for VNC in Windows

Before you log on to VNC, you must export the relative certificate from the site such as the Apsara Stack Cloud Management (ASCM) console and install the certificate in your local browser.

Context

The VNC feature is provided by the VNC proxy service. The VNC proxy service uses the relative certificate different from that of Apsara Infrastructure Management Framework. The certificate of the VNC proxy service must be manually imported.

Procedure

1. Export the certificate from the ASCM console.
   i. Log on to the ASCM console. Press the **F12** key or **Fn+F12** to view and select the certificate.

      For example, in the Chrome browser, press the **F12** key to open Chrome DevTools.

   ii. In the **Certificate** dialog box, click the **Certificate Path** tab, select the root certificate, and then click **View Certificate**.
   iii. In the **Certificate** dialog box, click the **Details** tab, and click **Copy to File**.
   iv. In the **Certificate Export Wizard** dialog box, click **Next**.
   v. Select **DER encoded binary X.509 (.CER)** as the format and then click **Next**.
   vi. Click **Browse**, select where to store the certificate, enter a file name, and then click **Save**.
   vii. Click **Next**.
   viii. Click **Finish**.
   ix. Click **OK**.
2. Install the certificate in your local browser.
   i. Double-click the certificate.
   ii. In the **Certificate** dialog box, click **Install Certificate**.
   iii. In the **Certificate Import Wizard** dialog box, click **Next**.
   iv. Select **Place all certificates in the following store** and click **Browse**.
   v. In the **Select Certificate Store** dialog box, select **Trusted Root Certificate Authority** and then click **OK**.
   vi. In the **Certificate Import Wizard** dialog box, click **Next**.
   vii. Click **Finish**.
   viii. If a security warning message is displayed, click **Yes**.
3. Restart your browser and log on to the ASCM console.

   If no security warning message is displayed in the left part of the address bar, the certificate is installed.

2.4.2.6. Connect to an ECS instance by using the VNC

You can access your instance by using the VNC in the ECS console when other SSH clients such as PuTTy, Xshell, and SecureCRT do not work properly.

Prerequisites

- The instance is in the **Running** state.
- The root certificate is imported to your web browser. For more information, see Install a certificate.
- If you log on to an instance for the first time after the instance is created, make sure that you set a new VNC password. For more information, see Change the VNC password.

Context

The VNC password is used to log on to the VNC of the ECS console, and the instance password is used to log on to an instance.

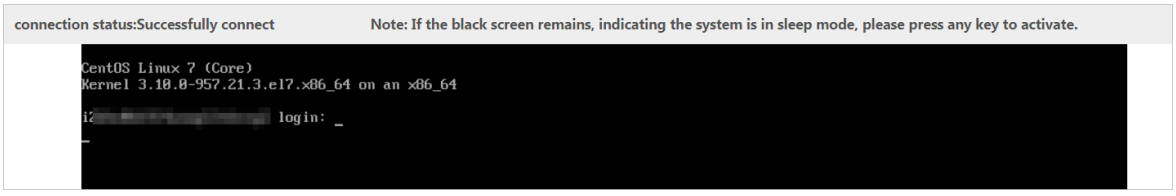
You can use the VNC to connect to an instance to solve issues shown in the following table.

Scenario	Resolution
The instance startup is slowly due to self-check upon startup.	Check the progress of the self check.
The firewall of the operating system is enabled by mistake.	Disable the firewall.
Abnormal processes appear, which consume large amounts of CPU or bandwidth resources.	Troubleshoot and terminate the abnormal processes.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the ECS instance, and click **Remote Connection** in the **Actions** column.
5. Enter the VNC password, and then click **OK**.

   After the connection is successful, the logon page is displayed, as shown in the following figure.

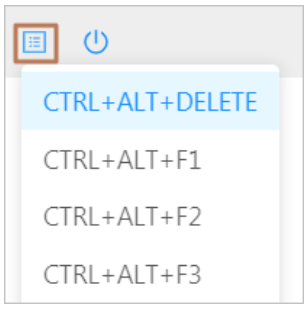


6. Enter the username and password.
   - For Linux instances: Enter the username *root* and the logon password.

     > **Note** Passwords in Linux are not displayed as you type. Press the Enter key after you enter the password.

   - For Windows instances: To use key combinations such as Ctrl + Alt + Delete, click the corresponding key

combination in the upper-right corner of the VNC page.



Enter the username and password as prompted, and click the Log In icon .

2.4.3. View instances

You can view the list of created instances and the details of individual instances. The details of an instance include basic configurations, disks, snapshots, security groups, and elastic network interfaces (ENIs).

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, select an organization, a resource set, and a region.
   The created instances that match the specified criteria are displayed.
4. Select a filter option from the drop-down list, enter the relevant information in the search bar, and click **Search**.

   You can select multiple filter options to narrow down search results.

Filter option	Description
Instance Name	Enter an instance name to search for the instance.
Instance ID	Enter an instance ID to search for the instance.
IP Address	Enter the IP address of an instance to search for the instance.
VPC ID	Enter a VPC ID to search for the instances that belong to the VPC.
Image ID	Enter an image ID to search for the instances that use the image.
Status	Select an instance status to search for the instances in that status. Valid values: ○ **Running** ○ **Stopped** ○ **Starting** ○ **Stopping**
Security Group ID	Enter a security group ID to search for the instances that belong to the security group.

Filter option	Description
Operating System	Enter the name of operating system to search for the instances that use the operating system.

5. Use one of the following methods to go to the Instance Details page of an instance:
   - In the **Instance ID/Name** column, click the instance ID.
   - Click **Manage** in the **Actions** column corresponding to the instance.
   - In the **Actions** column corresponding to the instance, choose **More > Show Details**.

2.4.4. Modify an instance

You can modify the name, description, and custom data of an existing instance.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the instance and choose **More > Modify** from the **Actions** column.
5. Modify the name, description, and custom data for the instance.

   The name must be 2 to 128 characters in length. The description must be 2 to 256 characters in length. The custom data must be 2 to 999 characters in length.
6. Click **OK**.

2.4.5. Stop an instance

You can stop an instance that is not in use. Stopping an instance will interrupt the services that are running on it. Exercise caution when you stop an instance.

Prerequisites

The instance is in the **Running** state.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Use one of the following methods to stop the instance:
   - To stop a single instance, find the instance and choose **More > Instance Status > Stop** in the **Actions** column.
   - To stop one or more instances at a time, select the instances and click **Stop** in the lower-left corner of the Instances page.
5. In the message that appears, click **OK**.

Result

In the **Status** column, the instance state changes from **Running** to **Stopping**. After the instance is stopped, its state changes to **Stopped**.

2.4.6. Start an instance

You can start a stopped instance.

Prerequisites

The instance is in the **Stopped** state.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Use one of the following methods to start the instance:
   - To start a single instance, find the instance and choose **More > Instance Status > Start** in the **Actions** column.
   - To start one or more instances at a time, select the instances and click **Start** in the lower-left corner of the Instances page.
5. In the message that appears, click **OK**.

Result

In the **Status** column, the instance state changes from **Stopped** to **Starting**. After the instance is started, its state changes to **Running**.

2.4.7. Restart an instance

You must restart an instance after you change its logon password or install system updates. Restarting an instance will stop the instance and interrupt the services that are running on it for a period of time. Exercise caution when you restart an instance.

Prerequisites

The instance is in the **Running** state.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Use one of the following methods to restart the instance:
   - To restart a single instance, find the instance and choose **More > Instance Status > Restart** in the **Actions** column.
   - To restart one or more instances at a time, select the instances and click **Restart** in the lower-left corner of the Instances page.
5. In the Restart Instance dialog box, select a restart mode.
   - **Restart**: restarts the instance normally.
   - **Force Restart**: forces the instance to restart. This may result in loss of unsaved data.
6. Click **OK**.

2.4.8. Delete an instance

You can delete an instance that is no longer needed to release its resources. Deleted instances cannot be recovered. We recommend that you back up data before you delete an instance. If a data disk is released along with the instance, the data on the disk cannot be recovered.

Prerequisites

The instance is in the **Stopped** state.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Select the instance and click **Delete** in the lower-left corner of the Instances page.
5. In the message that appears, click **OK**.

2.4.9. View the monitoring information of an instance

You can view monitoring charts in the CloudMonitor console to learn about the running conditions of Elastic Compute Service (ECS) instances. This topic describes how to go to the CloudMonitor console to view the monitoring information of an ECS instance.

Context

CloudMonitor provides real-time monitoring, alerting, and notification services for resources to protect your services and business. For more information, see **CloudMonitor overview** in *Apsara Uni-manager Management Console User Guide*.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the ECS instance whose monitoring information you want to view and click **Monitor** in the Monitoring column.
5. On the **Monitoring Charts** page, view the monitoring information of the ECS instance.

2.4.10. Change the instance type of an instance

You can change the instance type of an instance to suit your business needs. This eliminates the need to create a new instance.

Prerequisites

The instance is in the **Stopped** state.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the instance and click **Upgrade/Downgrade** in the **Actions** column.
5. On the Change Specifications page that appears, select a new instance type and click **Submit**.

   The instance types available for selection are displayed on the Change Specifications page.
6. Restart the instance by using the console or calling an API operation for the new instance type to take effect.

   For more information, see Start an instance or StartInstance in *ECS Developer Guide*.

2.4.11. Change an instance logon password

If you did not set a logon password when creating an instance or forgot the password, you can reset the password.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the instance and select one of the following methods to access the instance details page.
   - In the **Instance ID/Name** column, click the instance ID.
   - Click **Manage** in the **Actions** column.
   - In the **Actions** column, choose **More > Show Details**.
5. Click **Change Password**.
6. Enter and confirm the new password, and then click **OK**.

   The password must be 8 to 30 characters in length and must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. The supported special characters include `()'~!@#$%^&*-_+=|{}[]:;'<>,.?/`
7. Restart the instance in the console or by calling an API operation to make the new password take effect.

   For more information, see Restart an instance or *the RebootInstance section* in ECS Developer Guide.

2.4.12. Change the VNC password

If you log on to the VNC for the first time or forget the VNC password, you can reset the password.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the instance and select one of the following methods to access the instance details page.
   - In the **Instance ID/Name** column, click the instance ID.
   - Click **Manage** in the **Actions** column.
   - In the **Actions** column, choose **More > Show Details**.
5. Click **Change VNC Password**.
6. Enter and confirm the new password, and click **OK**.

   The password must be 6 characters in length and can contain digits and uppercase and lowercase letters. It does not support special characters.
7. Restart the instance in the console or by calling an API operation to make the new password take effect.

   For more information, see Restart an instance or *the RebootInstance section* in ECS Developer Guide.

2.4.13. Add an ECS instance to a security group

You can add a created instance to a security group and use security group rules to control network access to the instance.

Context

A security group acts as a virtual firewall and is used to provide security isolation. A security group controls access to ECS instances.

Instances that belong to the same account and are in the same region and in the same security group can communicate with each other over the internal network. If instances that belong to the same account in the same region are in different security groups, you can implement internal network communication by authorizing mutual access between two security groups.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Networks and Security > Security Groups**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the security group and click **Manage Instances** in the **Actions** column.
5. Click **Add Instance**.
6. Select the instance and click **OK**.

   An instance can be added to five security groups. After an instance is added, the security group rules automatically apply to the instance.

2.4.14. Customize instance data

ECS allows you to run the instance customization script upon startup and import data into instances.

Context

The instance data customization feature is applicable to both Windows and Linux instances. It allows you to:

- Run the instance customization script upon startup.
- Import data into instances.

Usage instructions

- **Limits**

  The instance data customization feature can only be used when an instance meets all the following requirements:

  - Network type: VPC
  - Image: a system image or a custom image that is inherited from the system image
  - Operating system: one type included in Supported operating systems Supported operating systems

Windows	Linux
■ Windows Server 2016 64-bit ■ Windows Server 2012 64-bit ■ Windows Server 2008 64-bit	■ CentOS ■ Ubuntu ■ SUSE Linux Enterprise ■ OpenSUSE ■ Debian ■ Aliyun Linux

- When you configure instance data customization scripts, you must enter custom data based on the type of operating system and script.

  > **Note** Only English characters are allowed.

  - If your data is Base64 encoded, select **Enter Base64 Encoded Information**.

    > **Note** The size of the customization script cannot exceed 16 KB before the data is Base64 encoded.

  - For Linux instances, the script format must meet the requirements described in Types of Linux instance customization scripts.
  - For Windows instances, the script can only start with `[bat]` or `[powershell]`.

- After starting an instance, run a command to view the following information:
  - Execution result of the instance customization script
  - Data imported to instances
- **Console**: You can modify the custom instance data in the console. Whether the modified instance customization script needs to be re-executed depends on the script type. For example, if the `bootcmd` script in Cloud Config is modified for Linux instances, the script is automatically executed each time instances are restarted.
- **OpenAPI**: You can also use OpenAPI to customize instance data. For more information, see **CreateInstance** and **ModifyInstanceAttribute** in *ECS Developer Guide*.

Linux instance data customization scripts

Linux instance data customization scripts provided by Alibaba Cloud are designed based on the cloud-init architecture. They are used to automatically configure parameters of Linux instances. Customization script types are compatible with the cloud-init.

Description of Linux instance data customization scripts

- Linux instance customization scripts are executed after instances are started and before `/etc/init` is executed.
- Linux instance customization scripts can only be executed with root permissions by default.

Types of Linux instance customization scripts

- **User-Data Script**
  - Description: A script, such as shell script, is used to customize data.
  - Format: The first line must include `#!`, such as `#! /bin/sh`.
  - Limit: The script size (including the first line) cannot exceed 16 KB before the data is Base64 encoded.
  - Frequency: The script is executed only when instances are started for the first time.
  - Example:

```
#! /bin/sh
echo "Hello World. The time is now $(date -R)!" | tee /root/output10.txt
```

- **Cloud Config Data**
  - Description: Predefined data is used to configure services, such as specifying yum sources or importing SSH keys.
  - Format: The first line must be `#cloud-config`.
  - Limit: The script size (including the first line) cannot exceed 16 KB before the data is Base64 encoded.
  - Frequency: The script execution frequency varies with the specific service.

- Example:

```
#cloud-config
apt:
primary:
- arches: [default]
uri: http://us.archive.ubuntu.com/ubuntu/
```

- **Include**
  - Description: The configuration content can be saved in a text file and imported into cloud-init as a URL.
  - Format: The first line must be `#include`.
  - Limit: The script size (including the first line) cannot exceed 16 KB before the data is Base64 encoded.
  - Frequency: The script execution frequency depends on the script type in the text file.
  - Example:

```
#include
http://ecs-image-test.oss-cn-hangzhou.aliyuncs.com/userdata/cloudconfig
```

- **GZIP format**
  - Description: Cloud-ini limits the size of customization scripts to 16 KB. You can compress and import the script file into the customization script if the file size exceeds 16 KB.
  - Format: The .gz file is imported into the customization script as a URL in `#include`.
  - Frequency: The script execution frequency depends on the script content contained in the GZIP file.
  - Example:

```
#include
http://ecs-image-test.oss-cn-hangzhou.aliyuncs.com/userdata/config.gz
```

View the custom data of a Linux instance

Run the following command in the instance:

```
curl http://100.100.100.200/latest/user-data
```

Windows instance customization scripts

Windows instance customization scripts independently developed by Alibaba Cloud can be used to initialize Windows instances.

There are two types of Windows instance customization scripts:

- Batch processing program: starts with `[bat]` and serves as the first line. The script size must be smaller than 16 KB before the data is Base64 encoded.
- PowerShell script: starts with `[powershell]` and serves as the first line. The script size must be smaller than 16 KB before the data is Base64 encoded.

View the custom data of a Windows instance

Run the following PowerShell command in the instance:

```
Invoke-RestMethod http://100.100.100.200/latest/user-data/
```

2.4.15. Modify a private IP address

Each instance is assigned a private NIC and bound with a private IP address. You can modify the private IP address of the instance. The private IP address you use must be within the CIDR block of the VSwitch to which the instance belongs and cannot be used by another instance.

Prerequisites

The instance is in the **Stopped** state.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the instance and choose **More > Change Private IP Address** from the **Actions** column.
5. Enter a new private IP address and click **OK**.

   The private IP address you can use must be within the CIDR block of the VSwitch to which the instance belongs and cannot be used by another instance or for a specific purpose.

   For example, if the CIDR block of the VSwitch is 192.168.1.0/24, you can use an IP address in the range of 192.168.1.1 to 192.168.1.254. The first address 192.168.1.0 identifies the subnet itself, and the last address 192.168.1.255 identifies the broadcast address. Both addresses are reserved and cannot be used.

2.4.16. Install the CUDA and GPU drivers for a Linux instance

You must install a GPU driver on GPU instances to use the GPU. If the image you use does not contain a pre-installed GPU driver, you must manually install the CUDA and GPU drivers for the instance.

Prerequisites

If your instance cannot connect to the Internet, the installation file cannot be downloaded. You can install an FTP client on the instance to transfer the installation file to the instance.

Context

When installing NVIDIA drivers, you must install the kernel package that contains the kernel header file before you install the CUDA and GPU drivers on the instance.

Procedure

1. Install the kernel package.
   i. Run the **uname -r** command to view the current kernel version.

      A similar output is displayed:

      - CentOS: `3.10.0-862.14.4.el7.x86_64`
      - Ubuntu: `4.4.0-117-generic`

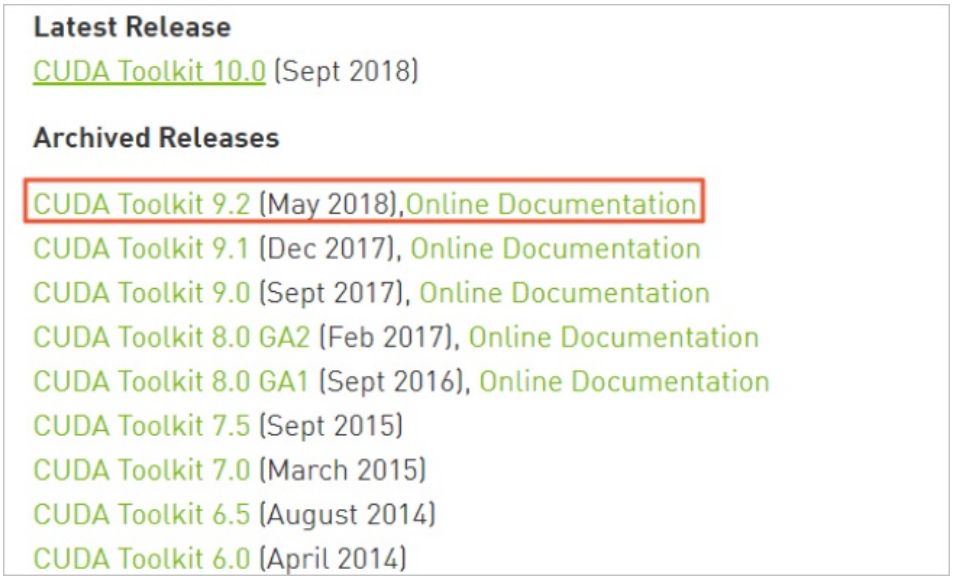
   ii. Copy the kernel package of the corresponding version to the instance and install the package.

      - CentOS: Copy the RPM package of the `kernel-devel` component and run the **rpm -ivh 3.10.0-862.14.4.el7.x86_64.rpm** command to install the package. *3.10.0-862.14.4.el7.x86_64.rpm* is used as an example. Replace it with the actual package name.
      - Ubuntu: Copy the DEB package of the `linux-headers` component and run the **dpkg -i 4.4.0-117-generic.deb** command to install the package. *4.4.0-117-generic.deb* is used as an example. Replace it with the actual package name.
2. Download the CUDA Toolkit.

i. Access the official CUDA download page. Choose the version based on the GPU application requirements for CUDA.

This example uses CUDA Toolkit 9.2.

Download the CUDA Toolkit



ii. Choose a platform based on your operating system. Select **Installer Type** to **runfile (local)** and click **Download**.

NVIDIA drivers are already included in the CUDA Toolkit.

Download the drivers

3. Copy the downloaded *cuda_9.2.148_396.37_linux.run* file to the instance. *cuda_9.2.148_396.37_linux.run* is used as an example. Replace it with the actual file name.
4. Run the **sudo sh ./cuda_9.2.148_396.37_linux.run --silent --verbose --driver --toolkit --samples** command to install the CUDA driver. *cuda_9.2.148_396.37_linux.run* is used as an example. Replace it with the actual file name.
   The installation takes about 10 to 20 minutes. When `Driver: Installed` is displayed, the installation is successful.

   View the CUDA installation result

```
===========
= Summary =
===========

Driver:   Installed
Toolkit:  Installed in /usr/local/cuda-9.2
Samples:  Installed in /home/lb164654, but missing recommended libraries

Please make sure that
 -   PATH includes /usr/local/cuda-9.2/bin
 -   LD_LIBRARY_PATH includes /usr/local/cuda-9.2/lib64, or, add /usr/local/cuda-9.2/lib64 to /etc/ld.so.conf and run ldconfig as root

To uninstall the CUDA Toolkit, run the uninstall script in /usr/local/cuda-9.2/bin
To uninstall the NVIDIA Driver, run nvidia-uninstall

Please see CUDA_Installation_Guide_Linux.pdf in /usr/local/cuda-9.2/doc/pdf for detailed information on setting up CUDA.

Logfile is /tmp/cuda_install_19765.log
```

5. Run the **nvidia-smi** command to view the GPU driver status.
   If the output displays the details of the GPU driver, the driver is running properly.

   View the GPU driver status

```
$ nvidia-smi

```

What's next

If you want to run the OpenGL program, you must first purchase the licenses and install the GRID drivers. For information about the installation procedure, see the official NVIDIA documentation.

2.4.17. Install the CUDA and GPU drivers for a Windows instance

You must install a GPU driver on GPU instances to use the GPU. If the image you use does not contain a pre-installed GPU driver, you must manually install the CUDA and GPU drivers for the instance.

Prerequisites

- If your instance cannot connect to the Internet, the installation file cannot be downloaded. You can install an FTP client on the instance to transfer the installation file to the instance.
- To compile CUDA programs, first install a Windows compiling environment, such as Visual Studio 2015. If you do not need to compile CUDA programs, ignore it.

Procedure

1. Download the CUDA Toolkit.

i. Access the official CUDA download page. Choose the version based on the GPU application requirements for CUDA.

   This example uses CUDA Toolkit 9.2.

ii. Choose a platform based on your operating system. Set **Installer Type** to **exe (local)** and click **Download**.

   NVIDIA drivers are already included in the CUDA Toolkit.

2. Copy the downloaded *cuda_9.2.148_windows.exe* file to the instance. *cuda_9.2.148_windows.exe* is used as an example. Replace it with the actual file name.
3. Double-click *cuda_9.2.148_windows.exe* and follow the installation wizard to install the CUDA driver. *cuda_9.2.148_windows.exe* is used as an example. Replace it with the actual file name.
   The installation takes about 10 to 20 minutes. When `Installed: - Nsight Monitor and HUD Launcher` is displayed, the driver is installed.
4. Press *Win + R* and enter **devmgmt.msc**.
   The NVIDIA device is displayed in **Display Adapter**.
5. Press *Win + R*, enter **cmd**, and run the **"C:\Program Files\NVIDIA Corporation\NVSMI\nvidia-smi"** command.
   If the output displays the details of the GPU driver, the driver is running properly.

What's next

If you want to run the OpenGL and DirectX programs, you must first purchase the licenses and install the GRID drivers. For information about the installation procedure, see the official NVIDIA documentation.

2.5. Disks

2.5.1. Create a disk

You can create an independent data disk and attach it to an ECS instance to increase the storage space of the instance. This topic describes how to create an empty data disk. You cannot create independent system disks.

Context

We recommend that you plan the number and size of data disks before you create them. The following limits apply to data disks:

- A maximum of 16 data disks can be attached to an instance. Disks and Shared Block Storage devices share this quota.
- Each Shared Block Storage device can be attached to up to four ECS instances at the same time.
- Each ultra disk, shared ultra disk, standard SSD, or shared SSD can have a maximum capacity of 32 TiB.
- Disks cannot be combined in ECS. They are independent of each other. You cannot combine multiple disks into one by formatting them.

We recommend that you do not use Logical Volume Manager (LVM) to create logical volumes across multiple disks, because a snapshot can only back up data of a single disk. If you create a logical volume across several disks, data discrepancies will occur when you restore these disks.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Storage > Disks**.
3. Click **Create Disk**.
4. Configure parameters listed in the following table to create a disk.

Section	Parameter	Required	Description
Region	Organization	Yes	Select an organization in which to create the disk.
	Resource Set	Yes	Select a resource set in which to create the disk.
	Region	Yes	Select a region in which to create the disk.
	Zone	Yes	Select a zone in which to create the disk.
Basic Settings	Name	Yes	Enter a name for the disk. The name must be 2 to 128 characters in length. It must start with a letter and cannot start with http:// or https://. It can contain letters, digits, periods (.), underscores (_), hyphens (-), colons (:), and commas (,).
	Specifications	Yes	Select a disk category and specify the disk size. Valid disk categories: ○ **SSD Disk** ○ **Ultra Disk** ○ **Shared SSD**: shared SSD ○ **Shared Ultra Disk**: shared ultra disk The disk size must range from 20 GiB to 32768 GiB.
	Encrypt	No	Specify whether to encrypt the disk.
	Encryption Algorithm	No	Select an encryption algorithm. This parameter is required when you set **Encrypt** to **Yes**. Valid values: ○ **AES256**: AES256 encryption algorithm. ○ **SM4**: Chinese encryption algorithm SM4.

Section	Parameter	Required	Description
	Encryption Key	No	Select an encryption key. This parameter is required when you set **Encrypt** to **Yes**. **Note** If no key is available, create a key in **KMS**.
	Use Snapshot	No	Specify whether to create the disk from a snapshot. If you select **Yes**, you must specify a snapshot. The size of the created disk depends on the size of the specified snapshot. ○ If the disk size that you specify is greater than the snapshot size, the disk will be created with the size you specified. ○ If the disk size that you specify is smaller than the snapshot size, the disk will be created with the snapshot size.

5. Click **Submit**.

Result

The created disk is displayed in the disk list and in the **Pending** state.

What's next

After the disk is created, you must attach the disk to an instance and partition and format the disk. For more information, see the following topics:

- Attach a disk
- Format a data disk for a Linux instance
- Format a data disk of a Windows instance

2.5.2. Attach a disk

You can attach a disk that is created separately to an ECS instance as a data disk. The disk and the instance must be in the same region and the same zone.

Prerequisites

The disk is in the **Pending** state.

Context

- You do not need to attach data disks that are created at the same time as an instance.

- A disk can only be attached to an instance that is in the same zone and region as the disk.
- You can attach a disk to a single ECS instance at a time.
- A Shared Block Storage device can be attached to a maximum of four ECS instances at the same time.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Storage > Disks**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the disk and choose **More > Attach** from the **Actions** column.
5. Specify the destination instance and configure the release mode as needed.
   - If you select **Release Disk with Instance**, the disk is released together when the instance it is attached to is deleted.
   - If you do not select **Release Disk with Instance**, the disk changes to the **Pending** state when the instance it is attached to is deleted.
6. Click **OK**.

2.5.3. Partition and format disks

2.5.3.1. Format a data disk for a Linux instance

Data disks created separately are not partitioned or formatted. This topic describes how to partition and format a data disk of a Linux instance.

Prerequisites

The disk has been attached to the instance.

Procedure

1. Connect to the instance.
2. Run the **fdisk -l** command to view all data disks attached to the ECS instance.

   If */dev/vdb* is not displayed in the command output, the ECS instance does not have a data disk. Check whether the data disk is attached to the instance.

```
[root@iZ********eZ ~]# fdisk -l
Disk /dev/vda: 42.9 GB, 42949672960 bytes
255 heads, 63 sectors/track, 5221 cylinders
Units = cylinders of 16065 * 512 = 8225280 bytes
Sector size (logical/physical): 512 bytes / 512 bytes
I/O size (minimum/optimal): 512 bytes / 512 bytes
Disk identifier: 0x00078f9c
Device Boot      Start         End      Blocks   Id  System
/dev/vda1   *           1        5222    41940992   83  Linux
Disk /dev/vdb: 21.5 GB, 21474836480 bytes
16 heads, 63 sectors/track, 41610 cylinders
Units = cylinders of 1008 * 512 = 516096 bytes
Sector size (logical/physical): 512 bytes / 512 bytes
I/O size (minimum/optimal): 512 bytes / 512 bytes
Disk identifier: 0x00000000
```

3. Create partitions for the data disk.
   i. Run the **fdisk /dev/sdb** command.
   ii. Enter *n* to create a new partition.

iii. Enter *p* to set the partition as the primary partition.

iv. Enter a partition number and press the Enter key. In this example, *1* is entered to create Partition 1.

v. Enter the number of the first available sector. This example uses the default value. This is done by pressing the Enter key. You can also enter a value from 1 to 41610 and press the Enter key.

vi. Enter the number of the last sector. This example uses the default value. This is done by pressing the Enter key. You can also enter a value from 1 to 11748 and press the Enter key.

vii. (Optional)Optional. To create multiple partitions, repeat steps b through f until all four primary partitions are created.

viii. Run the **wq** command to start partitioning.

```
[root@iZ********eZ ~]# fdisk /dev/vdb
Device contains neither a valid DOS partition table, nor Sun, SGI or OSF disklabel
Building a new DOS disklabel with disk identifier 0x01ac58fe.
Changes will remain in memory only, until you decide to write them.
After that, of course, the previous content won't be recoverable.
Warning: invalid flag 0x0000 of partition table 4 will be corrected by w(rite)
WARNING: DOS-compatible mode is deprecated. It's strongly recommended to
      switch off the mode (command 'c') and change display units to
      sectors (command 'u').
Command (m for help): n
Command action
  e  extended
  p  primary partition (1-4)
p
Partition number (1-4): 1
First cylinder (1-41610, default 1):
Using default value 1
Last cylinder, +cylinders or +size{K,M,G} (1-41610, default 41610):
Using default value 41610
Command (m for help): wq
The partition table has been altered!
```

4. Run the **fdisk -l** command to view the partitions.

   If */dev/vdb1* is displayed in the command output, new partition *vdb1* is created.

```
[root@iZ********eZ ~]# fdisk -l
Disk /dev/vda: 42.9 GB, 42949672960 bytes
255 heads, 63 sectors/track, 5221 cylinders
Units = cylinders of 16065 * 512 = 8225280 bytes
Sector size (logical/physical): 512 bytes / 512 bytes
I/O size (minimum/optimal): 512 bytes / 512 bytes
Disk identifier: 0x00078f9c
Device Boot      Start         End      Blocks   Id  System
/dev/vda1   *           1        5222    41940992   83  Linux
Disk /dev/vdb: 21.5 GB, 21474836480 bytes
16 heads, 63 sectors/track, 41610 cylinders
Units = cylinders of 1008 * 512 = 516096 bytes
Sector size (logical/physical): 512 bytes / 512 bytes
I/O size (minimum/optimal): 512 bytes / 512 bytes
Disk identifier: 0x01ac58fe
Device Boot      Start         End      Blocks   Id  System
/dev/vdb1               1       41610    20971408+  83  Linux
```

5. Format the new partition. In this example, the new partition is formatted as ext3 after you run the **mkfs.ext3 /dev/vdb1** command.

   The time required for formatting depends on the disk size. You can also format the new partition to another file system. For example, you can run the **mkfs.ext4 /dev/vdb1** command to format the partition as ext4.

Compared with ext2, ext3 only adds the log function. Compared with ext3, ext4 improves on some important data structures. ext4 provides better performance and reliability, and more functions.

```
[root@iZ********leZ ~]# mkfs.ext3 /dev/vdb1
mke2fs 1.41.12 (17-May-2010)
Filesystem label=
OS type: Linux
Block size=4096 (log=2)
Fragment size=4096 (log=2)
Stride=0 blocks, Stripe width=0 blocks
1310720 inodes, 5242852 blocks
262142 blocks (5.00%) reserved for the super user
First data block=0
Maximum filesystem blocks=4294967296
160 block groups
32768 blocks per group, 32768 fragments per group
8192 inodes per group
Superblock backups stored on blocks:
  32768, 98304, 163840, 229376, 294912, 819200, 884736, 1605632, 2654208,
  4096000
Writing inode tables: done
Creating journal (32768 blocks): done
Writing superblocks and filesystem accounting information: done
This filesystem will be automatically checked every 25 mounts or
180 days, whichever comes first.  Use tune2fs -c or -i to override.
```

6. Run the `echo '/dev/vdb1 /mnt ext3 defaults 0 0' >> /etc/fstab` command to write the information of the new partition to the /etc/fstab file. You can run the `cat /etc/fstab` command to view the new partition information.

   Ubuntu 12.04 does not support barriers. To write the information of the new partition into the /etc/fstab file, you must run the `echo '/dev/vdb1 /mnt ext3 barrier=0 0 0' >> /etc/fstab` command.

   In this example, the partition information is added to the ext3 file system. You can also modify the ext3 parameter to add the partition information to another type of file system.

   To attach the data disk to a specific folder, for example, to store web pages, modify the /mnt part of the preceding command.

```
[root@iZ********eZ ~]# echo '/dev/vdb1 /mnt ext3 defaults 0 0' >> /etc/fstab
[root@iZbp19cdhgdj0aw5r2izleZ ~]# cat /etc/fstab
#
# /etc/fstab
# Created by anaconda on Thu Aug 14 21:16:42 2014
#
# Accessible filesystems, by reference, are maintained under '/dev/disk'
# See man pages fstab(5), findfs(8), mount(8) and/or blkid(8) for more info
#
UUID=94e4e384-0ace-437f-bc96-057dd64f**** / ext4 defaults,barrier=0 1 1
tmpfs                   /dev/shm                tmpfs   defaults        0 0
devpts                  /dev/pts                devpts  gid=5,mode=620  0 0
sysfs                   /sys                    sysfs   defaults        0 0
proc                    /proc                   proc    defaults        0 0
/dev/vdb1 /mnt ext3 defaults 0 0
```

7. Mount the new partitions. Run the **mount -a** command to mount all the partitions listed in */etc/fstab* and run the **df -h** command to view the result.

   If the following information is displayed, the new partitions are mounted and available for use.

```
[root@iZ********eZ ~]# mount -a
[root@iZ********eZ ~]# df -h
Filesystem      Size  Used Avail Use% Mounted on
/dev/vda1        40G  5.6G   32G  15% /
tmpfs           499M     0  499M   0% /dev/shm
/dev/vdb1        20G  173M   19G   1% /mnt
```

2.5.3.2. Format a data disk of a Windows instance

Data disks created separately are not partitioned or formatted. This topic describes how to partition and format a data disk of a Windows instance. This example uses Windows Server 2008.

Prerequisites

The disk has been attached to an instance.

Procedure

1. In the lower-left corner of the screen, click the **Server Manager** icon.
2. In the left-side navigation pane of the Server Manager window, choose **Storage > Disk Management**.
3. Right-click an empty partition and select **New Simple Volume** from the shortcut menu.

   If the disk status is **Offline**, change it to **Online**.
4. Click **Next**.
5. Set the size of the simple volume, which is the partition size. Then click **Next**.

   The default value is the maximum value of the disk space. You can specify the partition size as needed.
6. Specify the drive letter and then click **Next**.
7. Specify the formatting options and then click **Next**.

   We recommend that you format the partition with the default settings provided by the wizard.
8. When the wizard prompts that the partition has been completed, click **Finish** to close the wizard.

2.5.4. View disks

You can view the list of created disks and the details of individual disks.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Storage > Disks**.
3. In the top navigation bar, select an organization, a resource set, and a region.
   The created disks that match the specified criteria are displayed.
4. Select a filter option from the drop-down list, enter the relevant information in the search box, and click **search**.

   You can select multiple filter options to narrow down search results.

Filter option	Description
Disk Name	Enter a disk name to search for the disk.
Disk ID	Enter a disk ID to search for the disk.
Instance ID	Enter an instance ID to search for the disks that are attached to the instance.

Filter option	Description
Disk Status	Select a disk status to search for disks in that status. Valid values: ○ **Running** ○ **Pending** ○ **Attaching** ○ **Detaching** ○ **Creating** ○ **Deleting** ○ **Deleted** **Note** Deleted disks are no longer displayed in the disk list. ○ **Initializing** ○ **All Statuses**
Disk Properties	Select a disk type to search for disks of that type. Valid values: ○ **All** ○ **System Disk** ○ **Data Disk**
Policy ID	Enter the ID of an automatic snapshot policy to search for the disks that use the policy.
Encryption Key ID	Enter the ID of an encryption key to search for the disks that are encrypted with the key.

5. In the **Disk ID/Name** column, click a disk ID to go to the Disk Details page of the disk.

   The properties and mount information of the disk are displayed on the Disk Details page.

2.5.5. Roll back a disk

If you have created snapshots for a disk, you can use a snapshot to roll back the disk to the state it was when the snapshot was taken. Rolling back a disk is irreversible. Once the disk is rolled back, the disk data before the rollback time cannot be restored. Exercise caution when you perform this operation.

Prerequisites

- Snapshots have been created for the disk.
- The disk is not released.
- The instance where the target disk resides must be in the **Stopped** state.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Snapshots and Images > Snapshots**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Select a filtering option from the drop-down list, enter the relevant information in the search bar, and click **Search**.

You can select multiple filtering options to narrow down the search results.

Filtering option	Description
Snapshot Name	Enter a snapshot name to search for the snapshot.
Snapshot ID	Enter a snapshot ID to search for the snapshot.
Instance ID	Enter an instance ID to search for the snapshots related to the instance.
Disk ID	Enter a disk ID to search for the snapshots related to the disk.
Snapshot Type	Select a snapshot type to search for the snapshots of that type. Options include: ○ **All** ○ **User Snapshots**: manual snapshots. ○ **Automatic snapshots**: automatic snapshots.
Creation Time	Enter a creation time to search for the snapshots that were created at that time.

5. Find the snapshot and click **Restore** in the **Actions** column.
6. Click **OK**.

2.5.6. Modify the disk properties

You can modify the properties of a created disk, such as changing the settings of the Release Disk with Instance and Release Automatic Snapshots with Disk options.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Storage > Disks**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the disk and choose **More > Modify Disk Properties** from the **Actions** column.
5. Modify the release mode.
   - **Release Disk with Instance**: When this option is selected, the disk is released together when the instance it is attached to is deleted. When this option is not selected, the disk changes to the **Pending** state when the instance it is attached to is deleted.
   - **Release Automatic Snapshots with Disk**: When this option is selected, the automatic snapshots created for the disk is released together when the disk is deleted. When this option is not selected, the automatic snapshots are retained.
6. Click **OK**.

2.5.7. Modify the disk description

You can modify the name and description of a created disk.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Storage > Disks**.

3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the disk and choose **More > Modify Disk Description** from the **Actions** column.
5. Modifies the name and description of the disk.

   The name must be 2 to 128 characters in length and start with a letter. It can contain periods (.), underscores (_), colons (:), and hyphens (-).

   The description must be 2 to 256 characters in length and cannot start with http:// and https://.
6. Click **OK**.

2.5.8. Expand a disk

You can expand system or data disks online. After a disk is expanded, you do not need to restart the instance to which the disk is attached for the new disk capacity to take effect.

Prerequisites

- To avoid data loss, we recommend that you create a snapshot to back up disk data before you expand a disk. For more information, see Create a snapshot.
- No snapshot is being created for the disk to be expanded.
- The disk or the instance to which the disk is attached meets the following requirements:
  - If the disk is a system disk, the instance is in the **Running** state.
  - If the disk is a data disk, one of the following requirements is met:
    - The disk is in the **Pending** state.
    - If the disk is attached to an instance, the instance is in the **Running** state.
  - If the disk is a Shared Block Storage device, it is in the **Pending** state.

Context

The following limits apply when you expand a disk.

Limit	Description
Disk category	• Ultra disks and standard SSDs can be expanded. • Shared SSDs and shared ultra disks can be expanded.
Operating system	The system disks of Windows Server 2003 instances cannot be expanded.
Partitioning mode	You cannot expand a data disk that uses the MBR partitioning scheme to more than 2 TiB. To expand this kind of disk to more than 2 TiB, we recommend that you create and attach a new data disk with the desired size. Use the GPT partitioning scheme to partition the new data disk and then copy data from the original data disk to the new data disk.
File system	For Windows instances, you can expand only disks that use NTFS file systems.
Maximum capacity	• Ultra disk and standard SSD: 32,768 GiB • Shared SSD and shared ultra disk: 32,768 GiB
Operations	• When you expand disks, only the capacity of the disks is expanded. The sizes of partitions and file systems do not change. You must manually re-allocate storage space on a disk after the disk is expanded. • You cannot shrink an expanded disk by any means, such as by rolling it back.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Storage > Disks**.
3. Find the target disk and choose **More > Expand Disk** in the **Actions** column.
4. In the Expand Disk dialog box that appears, specify a new capacity for the disk.

   The new capacity must be greater than the current capacity.
5. Click **OK**.

Result

When you expand disks, only the capacity of the disks is expanded. The sizes of partitions and file systems do not change. You must manually re-allocate storage space on a disk after the disk is expanded.

2.5.9. Encrypt a disk

2.5.9.1. Encrypt a system disk

In the scenarios that require data security and regulatory compliance, you can encrypt disks to secure your data stored on the disks. To encrypt system disks, you can encrypt custom images and then use the encrypted custom images to create instances. The system disks of the created instances are automatically encrypted.

Context

You can encrypt system disks only by encrypting custom images.

Step 1: Create a custom image from an instance

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Snapshots and Images > Snapshots**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the snapshot from which you want to create a custom image and click **Create Custom Image** in the **Actions** column.
5. Configure the parameters listed in the following table to create a custom image.

Parameter	Description
Custom Image Name	Enter a name for the custom image. The name must be 2 to 128 characters in length and can contain letters, digits, periods (.), underscores (_), hyphens (-), and colons (:). It must start with a letter.
Sharing Scope	Select the scope in which to share the custom image. ◦ **Current Organization and Subordinate Organizations** ◦ **Current Resource Set** ◦ **Current Organization**
Description	Enter a description for the custom image. The description must be 2 to 256 characters in length and cannot start with http:// or https://.

6. Click **OK**.

Step 2: Encrypt the custom image

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Snapshots and Images > Images**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Click the **Custom Images** tab.
5. Find the custom image that you want to encrypt and click **Encrypt Image** in the **Actions** column.
6. In the **Encrypt Image** dialog box, configure the parameters listed in the following table.

Parameter	Description
Image ID	The system automatically obtains the ID of the image to be encrypted. You do not need to configure this parameter.
Custom Image Name	Enter a name for the new encrypted custom image. The name must be 2 to 128 characters in length and can contain letters, digits, underscores (_), periods (.), and hyphens (-). It must start with a letter.
Description	Enter a description for the new encrypted custom image. The description must be 2 to 256 characters in length and cannot start with http:// or https://.

7. Click **OK**.

Step 3: Use the encrypted custom image to create an instance

1. Log on to the ECS console.
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Click **Create Instance**.
5. Configure the parameters for the instance.

   For more information about how to configure these parameters, see Create an instance

   In the **Image** section, set Image Type to **Custom Image**. Then, select the image that you encrypted from the **Custom Image** drop-down list.
6. Click **Submit**.

Result

After the instance is created, you can click its ID to go to the **Instance Details** page. Then, you can click the **Disks** tab and check the value in the **Disk Encryption** column corresponding to the system disk. If the value is **Yes**, the system disk is encrypted.

2.5.9.2. Encrypt a data disk

In the scenarios that require data security and regulatory compliance, you can encrypt disks to secure your data stored on the disks. After a data disk is created, you cannot change its encryption state. If you want to encrypt a data disk, enable encryption for the disk when you create it.

Context

We recommend that you determine the number and sizes of data disks before you create them. The following limits apply to data disks:

- A maximum of 16 data disks can be attached to an instance. Disks and Shared Block Storage devices share this quota.

- Each Shared Block Storage device can be attached to up to four ECS instances at the same time.
- Each ultra disk, standard SSD, Ultra Shared Block Storage device, or SSD Shared Block Storage device can have a maximum capacity of 32 TiB.
- Disks cannot be combined in ECS. They are independent of each other. You cannot combine multiple disks into one by formatting them.

We recommend that you do not use Logical Volume Manager (LVM) to create logical volumes across multiple disks, because a snapshot can back up data only of a single disk. If you create a logical volume across several disks, data discrepancies may occur when you restore these disks.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Storage > Disks**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Click **Create Disk**.
5. On the **Create Disk** page, configure the parameters for the disk.

   When you encrypt the disk, take note of the following parameters:

   - **Encrypted**: Select **Yes**.
   - **Encryption Method**: Select an encryption algorithm.
     - **AES256**: indicates the AES256 encryption algorithm.
   - **Encryption Key**: Select an encryption key.

   For information about how to configure the other parameters to create a disk, see Create a disk.
6. Click **Submit**.

2.5.10. Reinitialize a disk

You can reinitialize a disk to restore it to its initial state.

Prerequisites

- The disk is in the **Running** state.
- The instance is in the **Stopped** state.
- After a disk is reinitialized, its data is lost and cannot be recovered. Exercise caution when you perform this operation. We recommend that you back up the data of the disk or create snapshots before you reinitialize the disk. For more information, see Create a snapshot.

Context

The result of disk reinitialization depends on the disk type and how the disk is created.

- System disk:
  - The disk is restored to the initial state of the image used by the disk.
  - If the original image is deleted, the disk cannot be reinitialized.
- Data disk:
  - If the disk is empty when created, the disk is restored to an empty disk.
  - If the disk is created from a snapshot, the disk is restored to a disk with only the data of the source snapshot.
  - If the disk is created from a snapshot and the snapshot is deleted, the disk cannot be reinitialized.

Procedure

1. Log on to the ECS console.

2. In the left-side navigation pane, choose **Storage > Disks**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the data disk and click **Reinitialize** in the **Actions** column.
5. Perform the following operations based on the disk type.
   - For a system disk, enter and confirm a new logon password, select the Start Instance After Reinitializing Disk option as needed, and then click **OK**.

     The password must be 8 to 30 characters in length and must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. The supported special characters include `()'~!@#$%^&*-_+=|{}[]:;'<>,.?/`
   - For a data disk, click **OK**.

Result

When the disk is being reinitialized, the disk enters the **Initializing** state. After the reinitialization, it changes to the **Running** state.

2.5.11. Detach a data disk

You can detach a data disk, not a system disk.

Prerequisites

- For a Windows instance, you must bring the data disk offline in Disk Management.

  > **Note** To guarantee data integrity, we recommend that you stop read/write operations on the data disk when you detach the disk. Otherwise, data may be lost.

- For a Linux instance, you must connect to the instance and unmount the partitions on the disk.

  > **Note** If you have configured the */etc/fstab* file to automatically mount the disk partitions upon instance startup, you must delete the mounting information from the */etc/fstab* file before you detach the disk. Otherwise, you cannot connect to the instance after the instance is restarted.

- The data disk to be detached is in the **Running** state.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Storage > Disks**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the data disk and choose **More > Detach** from the **Actions** column.
5. Click **OK**.

2.5.12. Release a data disk

You can release a data disk that is no longer needed. The released data disk cannot be recovered. Exercise caution when you release a data disk.

Prerequisites

The data disk is in the **Pending** state. If the data disk is attached to an instance, detach the disk from the instance first.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Storage > Disks**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the data disk and choose **More > Release** from the **Actions** column.
5. Click **OK**.

2.6. Images

2.6.1. Create a custom image

You can create a custom image and use it to create identical instances or replace the system disks of existing instances. This allows you to have multiple instances with the same operating system and data environment.

Create a custom image from a snapshot

You can create a custom image from a system disk snapshot to fully load the operating system and data environment of the snapshot to the image. Before you perform this operation, make sure that a snapshot of system disks is used. You cannot create a custom image from snapshots of data disks.

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Snapshots and Images > Snapshots**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the snapshot and click **Create Custom Image** in the **Actions** column.
5. Enter the name and description of the image, and then click **OK**.

   The name must be 2 to 128 characters in length and can contain periods (.), underscores (_), hyphens (-), and colons (:). It cannot start with a special character or digit.

   The description must be 2 to 256 characters in length and cannot start with http:// and https://.

Create a custom image from an instance

You can create a custom image from an instance to completely replicate the data of all disks of the instance, including the system disk and data disks.

> **Note** To avoid data security risks, delete sensitive data before you create a custom image.

When you create a custom image from an instance, a snapshot is generated for each disk in the instance, and all the snapshots constitute a complete custom image.

1. Log on to the ECS console.
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the instance and choose **More > Create Custom Image** from the **Actions** column.
5. Enter the name and description of the custom image, and then click **OK**.

   The name must be 2 to 128 characters in length and can contain periods (.), underscores (_), hyphens (-), and colons (:). It cannot start with a special character or digit.

   The description must be 2 to 256 characters in length and cannot start with http:// and https://.

2.6.2. View images

You can view the list of created images.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Snapshots and Images > Images**.
3. In the top navigation bar, select an organization, a resource set, and a region.
   The created images that match the specified criteria are displayed.
4. Select the tab based on the type of images you want to view.

   You can select the **Custom Images** or **Public Images** tab.
5. Select a filtering option from the drop-down list, enter the relevant information in the search bar, and click **Search**.

   You can select multiple filtering options to narrow down the search results.

Filtering option	Description
Image Name	Enter an image name to search for the image.
Image ID	Enter an image ID to search for the image.
Snapshot ID	Enter a snapshot ID to search for the images associated with the snapshot. This option is not available for public images.

2.6.3. View instances related to an image

You can view the instances that use the specified image.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Snapshots and Images > Images**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Select a tab based on the type of the image.

   You can select the **Custom Images** or **Public Images** tab.
5. Find the target image and click **Related Instances** in the **Actions** column.

Result

The Instances page appears, showing the instances that use the image. You can perform operations on these instances, such as updating the image.

2.6.4. Modify the description of a custom image

You can modify the description of a created custom image.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Snapshots and Images > Images**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the target custom image and click **Modify Description** in the **Actions** column.
5. In the dialog box that appears, modify the image description in the Basic Settings field.

   The description must be 2 to 256 characters in length and cannot start with http:// or https://.
6. Click **OK**.

2.6.5. Share custom images

You can share a custom image that you create to organizations that you manage to create multiple identical ECS instances in a short time.

Context

Only custom images can be shared. Shared images are not counted towards the image quota assigned to the organization.

The organization can use the shared image to create instances or replace system disks of existing instances.

You can delete shared images. After a shared image is deleted, the image is no longer visible to the organization to which the image was shared. The system disk of instances created from the shared image can no longer be reinitialized.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Snapshots and Images > Images**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the image and click **Share Image** in the **Actions** column.
5. Select the organization to which you want to share the image and click **OK**.

   An image can be shared only to the organizations that the image owner manages.

2.6.6. Encrypt a custom image

This topic describes how to encrypt a custom image to generate a new identical encrypted custom image.

Prerequisites

The custom image that you want to encrypt is in the Available (Available) state.

Context

To meet the requirements for data security compliance, you can use encrypted custom images to create instances. The system disks of the created instances are automatically encrypted.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Snapshots and Images > Images**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Click the **Custom Images** tab.
5. Find the custom image that you want to encrypt and click **Encrypt Image** in the **Actions** column.
6. In the **Encrypt Image** dialog box, configure the parameters listed in the following table.

Parameter	Description
Image ID	The system automatically obtains the ID of the image to be encrypted. You do not need to configure this parameter.

Parameter	Description
Custom Image Name	Enter a name for the new encrypted custom image. The name must be 2 to 128 characters in length and can contain letters, digits, underscores (_), periods (.), and hyphens (-). It must start with a letter.
Description	Enter a description for the new encrypted custom image. The description must be 2 to 256 characters in length and cannot start with http:// or https://.

7. Click **OK**.

Result

After you encrypt the custom image, a new identical encrypted custom image is generated and displayed on the Custom Images tab.

2.6.7. Import custom images

2.6.7.1. Limits on importing custom images

This topic describes the limits on importing images. You must understand the limits to ensure image availability and improve import efficiency.

The following limits apply when you import custom images:

- Limits on importing custom images in Linux
- Limits on importing custom images in Windows

Limits on importing custom images in Linux

When you import custom images in Linux, note the following limits:

- Multiple network interfaces are not supported.
- IPv6 addresses are not supported.
- The password must be 8 to 30 characters in length. It must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters.
- The firewall is disabled, and port 22 is opened.
- The Linux system disk size ranges from 40 GiB to 500 GiB.
- DHCP must be enabled in the image.
- SELinux is disabled.
- The Kernel-based Virtual Machine (KVM) driver must be installed.
- We recommend that you install cloud-init to configure the hostname and NTP and yum sources.

Limits

Item	Standard operating system image	Non-standard operating system image

Item	Standard operating system image	Non-standard operating system image
Description	The supported standard 32-bit and 64-bit operating systems include: • CentOS • Ubuntu • SUSE • openSUSE • Red Hat • Debian • CoreOS • Aliyun Linux **Note** Support for standard operating systems may be subject to version changes. You can access the ECS console to check the latest supported operating systems.	Non-standard operating systems include: • Operating systems that are not supported by Alibaba Cloud. • Standard operating systems that do not meet the requirements of critical system configuration files, basic system environments, and applications. If you want to use non-standard operating system images, you must select Others Linux when importing images. If you import non-standard operating system images, Alibaba Cloud does perform any processing on the instances created from these images. After you create an instance, you must connect to the instance by clicking Connect to VPN in the ECS console. You can then configure the IP address, route, and password for the instance.
Critical system configuration files	• Do not modify `/etc/issue*`. Otherwise, the version of the operating system cannot be identified, which leads to system creation failure. • Do not modify `/boot/grub/menu.lst`. Otherwise, the system may fail to start. • Do not modify `/etc/fstab`. Otherwise, partitions cannot be loaded, which leads to system startup failure. • Do not modify `/etc/shadow` to read-only. Otherwise, the password file cannot be modified, which leads to system creation failure. • Do not modify `/etc/selinux/config` to enable SELinux. Otherwise, the system may fail to start.	

Requirements for standard operating

Item	Standard operating system image	Requirements for standard operating system images and non-standard operating system image
Requirements for the basic system environment	• Do not adjust the system disk partitions. Only disks with a single root partition are supported. • Make sure that the system disk has sufficient storage space. • Do not modify critical system files, such as `/sbin`, `/bin`, and `/lib*`. • Before importing an image, confirm the integrity of the file system. • Only ext3 and ext4 file systems are supported.	
Applications	Do not install `qemu-ga` on a custom image. Otherwise, some of the services that Alibaba Cloud needs may be unavailable.	
Image file formats	Only images in the RAW, VHD, or qcow2 format can be imported. If you want to import images in other formats, use a tool to convert the format before importing the image. We recommend that you import images in the VHD format, which has a smaller transmission footprint.	
Image file size	We recommend that you configure the disk size for importing images based on the virtual disk size (not the image file size). The disk size for importing images must be at least 40 GiB.	

Limits on importing custom images in Windows

When you import custom images in Windows, note the following limits:

- The password must be 8 to 30 characters in length. It must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters.
- Imported Windows images do not provide the Windows activation service.
- The firewall must be disabled. Otherwise, remote logon is unavailable. Port 3389 must be opened.
- The Windows system disk size ranges from 40 GiB to 500 GiB.

Limits

Item	Description

Item	Description

Operating system versions	Alibaba Cloud supports importing the following versions of 32-bit and 64-bit operating system images:
	• Microsoft Windows Server 2016
	• Microsoft Windows Server 2012, including:
	  ◦ Microsoft Windows Server 2012 R2 (Standard Edition)
	  ◦ Microsoft Windows Server 2012 (Standard Edition and Datacenter Edition)
	• Microsoft Windows Server 2008, including:
	  ◦ Microsoft Windows Server 2008 R2 (Standard Edition, Datacenter Edition, and Enterprise Edition)
	  ◦ Microsoft Windows Server 2008 (Standard Edition, Datacenter Edition, and Enterprise Edition)
	• Microsoft Windows Server 2003, including:
	  ◦ Microsoft Windows Server 2003 R2 (Standard Edition, Datacenter Edition, and Enterprise Edition)
	  ◦ Microsoft Windows Server 2003 (Standard Edition, Datacenter Edition, and Enterprise Edition) or later, including Service Pack 1 (SP1)
	• Microsoft Windows 7, including:
	  ◦ Microsoft Windows 7 (Professional Edition)
	  ◦ Microsoft Windows 7 (Enterprise Edition)
	Note Support for standard operating systems may be subject to version changes. You can access the ECS console to check the latest supported operating systems.

Requirements for the basic system environment	• Multi-partition system disks are supported. • Make sure that the system disk has sufficient storage space. • Do not modify critical system files. • Before importing an image, confirm the integrity of the file system. • The NTFS file system with the MBR partition type is supported.
Applications	Do not install qemu-ga on an imported image. If it is installed, some of the services that Alibaba Cloud needs may be unavailable.
Image file formats	• RAW • VHD • qcow2 We recommend that you configure the system disk size for importing images based on the virtual disk size (not the image file size). The system disk size for importing images must range from 40 GiB to 500 GiB. **Note** We recommend that you import images in the VHD format, which has a smaller transmission footprint.

2.6.7.2. Convert the image file format

You can only import image files in the RAW, VHD, and qcow2 formats to ECS. If you want to import images in other formats, you must convert the image into a supported format. This topic describes how to convert the image format in Windows and Linux.

Context

You can use the qemu-img tool to convert an image from VMDK, VDI, VHDX, qcow1, or QED to RAW, VHD, or qcow2, or implement conversion between RAW, VHD, and qcow2.

> **Note** We recommend that you use the qcow2 format if your application environment supports this format.

Windows

1. Download qemu.

   Visit QEMU Binaries for Windows (64 bit) to download the qemu tool. Select a qemu version based on your operating system.

2. Install qemu.

   The installation path in this example is *C:\Program Files\qemu*.

3. Configure the environment variables for qemu.

   i. Choose **Start > Computer**, right-click Computer, and choose **Properties** from the shortcut menu.

   ii. In the left-side navigation pane, click **Advanced System Settings**.

   iii. In the **System Properties** dialog box that appears, click the **Advanced** tab and then click **Environment Variables**.

   iv. In the **Environment Variables** dialog box that appears, find the **Path** variable from the **System variables** section.

   - If the **Path** variable exists, click **Edit**.
   - If the **Path** variable does not exist, click **New**.

   v. Add a system variable value.

   - In the Edit System Variable dialog box that appears, add *C:\Program Files\qemu* to the **Variable value** field, separate different variable values with semicolons (;), and then click **OK**.
   - In the New System Variable dialog box that appears, enter *Path* in the **Variable name** field, enter *C:\Program Files\qemu* in the **Variable value** field, and then click **OK**.

4. Open Command Prompt in Windows and run the `qemu-img --help` command. If a successful response is displayed, the tool is installed.

5. In the Command Prompt window, run the `cd [Directory of the source image file]` command to switch to a new file directory,

   for example, `cd D:\ConvertImage` .

6. In the Command Prompt window, run the `qemu-img convert -f raw -O qcow2 centos.raw centos.qcow2` command to convert the image file format.

   The parameters are described as follows:

   - The `-f` parameter is followed by the source image format.
   - The `-O` parameter (case-sensitive) is followed by the destination image format, source file name, and destination file name.

   After the conversion is complete, the destination file appears in the directory of the source image file.

Linux

1. Install the qemu-img tool.
   - For Ubuntu, run the `apt install qemu-img` command.
   - For CentOS, run the `yum install qemu-img` command.
2. Run the `qemu-img convert -f raw -O qcow2 centos.raw centos.qcow2` command to convert the image file format.

   The parameters are described as follows:
   - The `-f` parameter is followed by the source image format.
   - The `-O` parameter (case-sensitive) is followed by the destination image format, source file name, and destination file name.

2.6.7.3. Import a custom image

After you upload a local image to an OSS bucket, you can import the image to the ECS environment as a custom image.

Prerequisites

- An image that meets the limits and requirements for image import has been made. The image must be in the RAW, VHD, or qcow2 format. For more information, see Limits on importing custom images and Convert the image file format.
- You have been authorized to import images. For more information, see *the RAM authorization section* in ASCM Console User Guide.
- A local image has been uploaded to a bucket by using the OSS console or calling an OSS API operation. For more information, see *the Upload objects section in OSS User Guide* or *the PutObject section* in OSS Developer Guide.

> **Note** Make sure that the bucket is in the same region as the custom image you want to create.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Snapshots and Images > Images**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Click **Import Image**.
5. Configure the parameters of the image.

Parameter	Required	Description
Region	Yes	The region of the custom image to be imported.
Organization	Yes	The organization to which the custom image belongs.
Resource Set	Yes	The resource set of the custom image.
OSS Bucket Name	Yes	The name of the OSS bucket where the image to be imported resides.
OSS Object Name	Yes	The endpoint of the OSS object where the image is stored. For information about how to obtain the endpoint of an OSS object, see *the Obtain object URLs section* in OSS User Guide.

Parameter	Required	Description
Image Name	Yes	The name of the custom image. The name must be 2 to 128 characters in length. It must start with a letter and can contain letters, periods (.), underscores (_), and hyphens (-).
Operating System	Yes	**Linux** and **Windows** are available.
System Disk	Yes	The size of the system disk of the ECS instance. Unit: GiB.
System Architecture	Yes	**x86_64** and **i386** are available.
Platform	Yes	Linux: ○ **CentOS** ○ **Ubuntu** ○ **SUSE** ○ **OpenSUSE** ○ **Debian** ○ **CoreOS** ○ **Aliyun** ○ **Others Linux** ○ **Customized Linux** Windows: ○ **Windows Server 2003** ○ **Windows Server 2008** ○ **Windows Server 2012**
Image Format	Yes	The format of the custom image. **RAW**, **VHD**, and **qcow2** are available.
Description	No	The description of the custom image.

6. Click **OK**.

Result

You can go to the Images page to view the progress of custom image creation. For more information, see View images. When 100% is displayed in the Progress column of the Images page, the image is created.

2.6.8. Export a custom image

You can export a custom image to an OSS bucket and then download it to your local device.

Prerequisites

- OSS is activated and an OSS bucket is created. For more information, see the *"Create buckets" section* in OSS User Guide.
- You are authorized to export images. For more information, see *the "RAM" chapter* in ASCM Console User Guide.

Context

You can export custom images to the RAW, VHD, or qcow2 format. After a custom image is exported to an OSS bucket, you can download the image to your local device. For more information, see *the "Obtain object URLs"*

section in OSS User Guide.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Snapshots and Images > Images**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the target custom image and click **Export Image** in the **Actions** column.
5. Select a bucket for **OssBucket**. Enter a prefix in the **OSS Prefix** field. Then click **OK**.

   The **OSS Prefix** field is optional. The prefix must be 1 to 30 characters in length and can contain digits and letters.

2.6.9. Delete a custom image

You can delete a custom image that is no longer needed. However, public images cannot be deleted.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Snapshots and Images > Images**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Select one of the following methods to delete custom images.
   - To delete one image, find the image and click **Delete Image** in the **Actions** column.
   - To delete multiple images, select images and click **Delete** at the bottom of the image list.
5. Click **OK**.

2.7. Snapshots

2.7.1. Create a snapshot

You can manually create a snapshot for a disk to back up disk data.

Prerequisites

- The instance to which the disk is attached is in the **Running** or **Stopped** state.
- The disk is in the **Running** state.

Context

You can create up to 64 snapshots for each disk.

Snapshots can be used in the following scenarios:

- Restore a disk from one of its snapshots.
- Create a custom image from a system disk snapshot.

  For more information, see Create a custom image from a snapshot. Data disk snapshots cannot be used to create custom images.
- Create a new data disk from a data disk snapshot.

  To create a data disk from a snapshot, set Use Snapshot to Yes and specify a snapshot on the Create Disk page. For more information, see Create a disk. When you re-initialize a data disk created from a snapshot, the disk is restored to the status of the snapshot.

Note the following considerations when you create a snapshot:

- For each disk, the first snapshot is a full snapshot and subsequent snapshots are incremental snapshots. It takes

an extended period of time to create the first snapshot. It takes a short period of time to create an incremental snapshot. The amount of taken time depends on the volume of data that has been changed since the last snapshot. The more data that has been changed, the more time it takes.

- Avoid creating snapshots during peak hours.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Storage > Disks**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the target disk and click **Create Snapshot** in the **Actions** column.
5. Enter a snapshot name and description and then click **OK**.

   > **Note** The names of manual snapshots cannot start with auto because auto is a prefix reserved for automatic snapshots.

   You can go to the Snapshots page to check the progress of snapshot creation. For more information, see View snapshots. When 100% is displayed in the Progress column, the snapshot is created.

2.7.2. View snapshots

You can view the list of created snapshots.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Snapshots and Images > Snapshots**.
3. In the top navigation bar, select an organization, a resource set, and a region.
   The created snapshots that match the specified criteria are displayed.
4. Select a filter option from the drop-down list, enter the relevant information in the search bar, and click **Search**.

   You can select multiple filter options to narrow down search results.

Filter option	Description
Snapshot Name	Enter a snapshot name to search for the snapshot.
Snapshot ID	Enter a snapshot ID to search for the snapshot.
Instance ID	Enter an instance ID to search for the snapshots related to the instance.
Disk ID	Enter a disk ID to search for the snapshots related to the disk.
Snapshot Type	Select a snapshot type to search for the snapshots of that type. Valid values: ○ **All** ○ **User Snapshots**: manual snapshots ○ **Automatic Snapshots**: automatic snapshots
Creation Time	Enter a time to search for the snapshots that were created at that time.

2.7.3. Delete a snapshot

You can delete a snapshot that is no longer needed. After the snapshot is deleted, it cannot be recovered. You cannot delete system disk snapshots that have been used to create custom images.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Snapshots and Images > Snapshots**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Use one of the following methods to delete the snapshot:
   - To delete a single snapshot, find the snapshot and click **Delete** in the **Actions** column.
   - To delete one or more snapshots at a time, select the snapshots and click **Delete** in the lower-left corner of the Snapshots page.
5. In the message that appears, click **OK**.

2.8. Automatic snapshot policies

2.8.1. Create an automatic snapshot policy

Automatic snapshot policies can apply to both system disks and data disks and can be used to create periodical snapshots for the disks. Using automatic snapshot policies can improve data availability and operation error tolerance.

Context

Automatic snapshot policies can effectively eliminate the following risks associated with manual snapshot creation:

- When applications such as personal websites or databases deployed on an ECS instance encounter attacks or system vulnerabilities, you may not be able to manually create snapshots. In this case, you can use the latest automatic snapshot to roll back the affected disks to restore your data and reduce losses.
- You can also specify an automatic snapshot policy to create snapshots before regular system maintenance tasks. This eliminates the need to manually create snapshots and ensures that snapshots are always created before maintenance.

You can create up to 64 snapshots for each disk. If the maximum number of snapshots for a disk is reached when a new snapshot is being created, the system deletes the oldest automatic snapshot.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Snapshots and Images > Automatic Snapshot Policies**.
3. Click **Create Policy**.
4. Configure the properties of the automatic snapshot policy.

Parameter	Required	Description
Region	Yes	The ID of the region to which the automatic snapshot policy applies.
Organization	Yes	The organization to which the automatic snapshot policy applies.

Parameter	Required	Description
Policy Name	Yes	The name of the automatic snapshot policy. The name must be 2 to 128 characters in length and cannot start with a special character or digit. It can contain periods (.), underscores (_), hyphens (-), and colons (:).
Creation Time	Yes	The time when a snapshot is automatically created. You can select any hour from 00:00 to 23:00. **Note** The default time zone for the snapshot policy is UTC+8. You can change the time zone based on your business requirements. The creation of an automatic snapshot is canceled if the scheduled time for creating the snapshot is reached but the previous automatic snapshot is still being created. This may occur if the disk stores a large volume of data. For example, you can specify a policy for the system to create automatic snapshots at the following points in time: 00:00, 01:00, and 02:00. When the system starts creating a snapshot at 00:00, it takes 70 minutes for the system to complete the snapshot task. Therefore, the system does not create another snapshot at 01:00. Instead, after the system completes the snapshot task at 01:10, the system creates the next snapshot at 02:00.
Frequency	Yes	The day when a snapshot is created. You can select multiple values. The day ranges from Monday to Sunday.
Retention Policy	No	The retention policy of the automatic snapshot. The default value of the retention time is 30 days. You can configure the following parameters: ◦ **Keep for**: Specify the number of days during which the snapshots can be retained. Valid values: 1 to 65536. ◦ **Always keep the snapshots until the number of snapshots reaches the upper limit**: Select this option to retain the snapshots until the maximum number of snapshots is reached.

5. Click **OK**.

What's next

After the automatic snapshot policy is created, you need to apply it to a disk to automatically create snapshots for the disk. For more information, see Configure an automatic snapshot policy for multiple disks.

2.8.2. View automatic snapshot policies

You can view the list of automatic snapshot policies.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Snapshots and Images > Automatic Snapshot Policies**.
3. In the top navigation bar, select an organization, a resource set, and a region.
   The created automatic snapshot policies that match the specified criteria are displayed.
4. View the list of automatic snapshot policies.

2.8.3. Modify an automatic snapshot policy

You can modify the properties of an automatic snapshot policy, such as the name, creation time, frequency, and retention policy.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Snapshots and Images > Automatic Snapshot Policies**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the automatic snapshot policy and click **Modify Policy** in the **Actions** column.
5. Modify the properties of the policy.

   Changes made to the retention duration do not take effect on existing snapshots, but take effect only on newly created snapshots.
6. Click **OK**.

2.8.4. Configure an automatic snapshot policy

After you apply an automatic snapshot policy to a disk, snapshots will be created automatically for the disk based on the policy settings. You can cancel an applied automatic snapshot policy at any time.

Context

We recommend that you configure the automatic snapshot policy to create automatic snapshots during off-peak hours. You can also manually create a snapshot for the disk that already has an automatic snapshot policy applied. When an automatic snapshot is being created, you must wait until the snapshot is complete before you can create a manual snapshot. The automatic snapshot is named in the following format: auto_yyyyMMdd_1, such as auto_20140418_1.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Storage > Disks**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the disk and click **Configure Automatic Snapshot Policy** in the **Actions** column.
5. Select a procedure based on the operation you want to perform on the policy.
   - To apply an automatic snapshot policy, turn on **Automatic Snapshot Policy**, select a policy, and then click **OK**.
   - To cancel an automatic snapshot policy, turn off **Automatic Snapshot Policy** and click **OK**.

2.8.5. Configure an automatic snapshot policy for multiple disks

After you apply an automatic snapshot policy to a disk, snapshots will be created automatically for the disk based on the policy settings. You can cancel an applied automatic snapshot policy at any time.

Context

We recommend that you configure the automatic snapshot policy to create automatic snapshots during off-peak hours. You can also manually create a snapshot for the disk that already has an automatic snapshot policy applied. When an automatic snapshot is being created, you must wait until the snapshot is complete before you can create a manual snapshot. The automatic snapshot is named in the following format: auto_yyyyMMdd_1, such as auto_20140418_1.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Snapshots and Images > Automatic Snapshot Policies**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the automatic snapshot policy and click **Apply Policy** in the **Actions** column.
5. Select a tab based on the operation you want to perform on the disks.
   - To apply the automatic snapshot policy, click the **Disks Without Policy Applied** tab, select one or more disks, and click **Apply Policy** at the bottom of the disk list.
   - To cancel the automatic snapshot policy, click the **Disks With Policy Applied** tab, select one or more disks, and click **Disable Automatic Snapshot Policy** at the bottom of the disk list.

2.8.6. Delete an automatic snapshot policy

You can delete an automatic snapshot policy that is no longer needed. After you delete the automatic snapshot policy, the policy is automatically canceled for disks that have it applied.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Snapshots and Images > Automatic Snapshot Policies**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the automatic snapshot policy and click **Delete Policy** in the **Actions** column.
5. In the message that appears, click **OK**.

2.9. Security groups

2.9.1. Create a security group

Security groups are an important means for network security isolation. They are used to set network access control for one or more ECS instances.

Prerequisites

A Virtual Private Cloud (VPC) has been created. For more information, see *VPC User Guide* .

Context

Instances that belong to the same account and are in the same region and in the same security group can

communicate with each other over the internal network. If instances that belong to the same account in the same region are in different security groups, you can implement internal network communication by authorizing mutual access between two security groups.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Networks and Security > Security Groups**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Click **New Security Group**.
5. Configure the parameters of the security group.

Type	Parameter	Required	Description
Region	Organization	Yes	The organization to which the security group belongs. Make sure that the security group and the VPC belong to the same organization.
	Resource Set	Yes	The resource set to which the security group belongs. Make sure that the security group and the VPC belong to the same resource set.
	Region	Yes	The region to which the security group belongs. Make sure that the security group and the VPC belong to the same region.
	Zone	Yes	The ID of the zone where the security group resides.
Basic Settings	VPC	Yes	The VPC to which the security group belongs.
	Security Group Name	No	The name must be 2 to 128 characters in length and start with a letter. It can contain letters, digits, periods (.), underscores (_), hyphens (-), colons (:), and commas (,). It cannot start with http:// or https://.

Type	Parameter	Required	Description
	Description	No	The description of the security group. We recommend that you provide an informational description to simplify future management operations. The name must be 2 to 256 characters in length and start with a letter. It can contain letters, digits, periods (.), underscores (_), hyphens (-), and commas (,). It cannot start with http:// or https://.

6. Click **Submit**.

2.9.2. View security groups

You can view the list of security groups that you create.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Networks and Security > Security Groups**.
3. In the top navigation bar, select an organization, a resource set, and a region.
   The created security groups that match the specified criteria are displayed.
4. Select a filtering option from the drop-down list, enter the relevant information in the search bar, and click **Search**.

   You can select multiple filtering options to narrow down the search results.

Filtering option	Description
Security Group ID	Enter a security group ID to search for the security group.
Security Group Name	Enter a security group name to search for the security group.
VPC ID	Enter a VPC ID to search for the security groups that belong to the VPC.

2.9.3. Modify a security group

You can modify the name and description of a created security group.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Networks and Security > Security Groups**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the security group and click **Modify** in the **Actions** column.

5. Modify the name and description of the security group.
6. Click **OK**.

2.9.4. Add a security group rule

You can use security group rules to control access to and from the ECS instances in a security group over the Internet and the internal network.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Networks and Security > Security Groups**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the target security group and click **Rules** in the **Actions** column.
5. Click **Create Rule**.
6. Configure parameters listed in the following table to create a security group rule.

Parameter	Required	Description
ENI Type	Yes	Valid value: **Internal Network ENI**. In VPCs, you cannot find public NICs in ECS instances and can add only internal security group rules. However, the added security group rules apply to both the Internet and internal network.
Direction	Yes	◦ **Outbound**: access from the ECS instances in the current security group to other ECS instances on the internal network or resources on the Internet. ◦ **Inbound**: access from other ECS instances on the internal network or resources on the Internet to the ECS instances in the current security group.
Action	Yes	◦ **Allow**: allows access requests on the specified port or ports. ◦ **Deny**: discards data packets and returns no messages. If two security group rules are different only in the Action parameter, the **Deny** rule takes effect while the **Allow** rule is ignored.
Protocol	Yes	◦ **All**: all protocols. This value can be used in total trust scenarios. ◦ **TCP**: can be used to allow or deny traffic on one or several successive ports. ◦ **UDP**: can be used to allow or deny traffic on one or several successive ports. ◦ **ICMP**: can be used when the `ping` command is used to test the status of the network connection between instances. ◦ **ICMPv6**: can be used when the `ping6` command is used to test the status of the network connection between instances. ◦ **GRE**: can be used for VPN.

Parameter	Required	Description
Port Range	Yes	The port range depends on the protocol type. ◦ When you set Protocol to **All**, **-1/-1** is displayed, indicating all ports. You cannot specify a port range in this case. ◦ When you set Protocol to **TCP**, you can use the <start port number>/<end port number> format to specify a port range. Valid port numbers: 1 to 65535. Set the start port number and end port number to the same value to specify a single port. For example, use 22/22 to specify port 22. ◦ When you set Protocol to **UDP**, you can use the <start port number>/<end port number> format to specify a port range. Valid port numbers: 1 to 65535. Set the start port number and end port number to the same value to specify a single port. For example, use 3389/3389 to specify port 3389. ◦ When you set Protocol to **ICMP**, **-1/-1** is displayed, indicating all ports. You cannot specify a port range in this case. ◦ When you set Protocol to **ICMPv6**, **-1/-1** is displayed, indicating all ports. You cannot specify a port range in this case. ◦ When you set Protocol to **GRE**, **-1/-1** is displayed, indicating all ports. You cannot specify a port range in this case.
Priority	Yes	The priority of the rule. Valid values: 1 to 100. The default value is 1, indicating the highest priority.
Authorization Type	Yes	◦ **IPv4 Addresses**: IPv4 addresses or IPv4 CIDR blocks. ◦ **IPv6 Addresses**: IPv6 addresses or IPv6 CIDR blocks. ◦ **Security Groups**: another security group. This authorization type takes effect only on the internal network.
Authorization Object	Yes	Authorization objects depend on the authorization type. When you set Authorization Type to **IPv4 Addresses**: ◦ Enter an IPv4 address or IPv4 CIDR block. Example: *12.1.1.1* or *13.1.1.1/25*. ◦ You can enter up to 10 authorization objects at a time. Separate multiple objects with commas (,). ◦ If you specify *0.0.0.0/0*, all IPv4 addresses will be allowed or denied based on the Action parameter. Exercise caution when you specify 0.0.0.0/0. When you set Authorization Type to **IPv6 Addresses**: ◦ Enter an IPv6 address or IPv6 CIDR block. Example: *2001:0db8::1428:***** or *2001:0db8::1428:****/128*. ◦ You can enter up to 10 authorization objects at a time. Separate multiple objects with commas (,). ◦ If you specify *::/0*, all IPv6 addresses will be allowed or denied based on the Action parameter. Exercise caution when you specify ::/0. When you set Authorization Type to **Security Groups**, select a security group ID. If the current security group is of the VPC type, the selected security group must be in the same VPC as the current security group.

Parameter	Required	Description
Description	No	The description of the security group rule. We recommend that you provide an informational description to simplify future management operations. The description must be 2 to 256 characters in length and cannot start with http:// or https://.

7. Click **OK**.

2.9.5. Clone a security group rule

You can clone a security group rule to quickly create a similar rule.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Networks and Security > Security Groups**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the target security group and click **Rules** in the **Actions** column.
5. On the Rules page that appears, click the **Inbound** or **Outbound** tab.
6. Find the target security group rule and click **Clone** in the **Actions** column.
7. In the **Clone Security Group Rule** dialog box, modify the attributes of the security group rule.

   For more information about the attributes of security group rules, see Add a security group rule.
8. Click **OK**.

2.9.6. Modify a security group rule

You can modify improper rules in a security group to ensure the security of ECS instances in the security group.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Networks and Security > Security Groups**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the target security group and click **Rules** in the **Actions** column.
5. On the Rules page that appears, click the **Inbound** or **Outbound** tab.
6. Find the target security group rule and click **Modify** in the **Actions** column.
7. In the **Modify Security Group Rule** dialog box, modify the attributes of the security group rule.

   For more information about the attributes of security group rules, see Add a security group rule.
8. Click **OK**.

2.9.7. Export security group rules

You can export security group rules of a security group to a local device for backup.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Networks and Security > Security Groups**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the target security group and click **Rules** in the **Actions** column.

5. On the Rules page that appears, click the **Inbound** or **Outbound** tab.
6. Click **Export** in the upper-right corner to download and save the rules to a local device.

2.9.8. Import security group rules

You can import a local backup file of security group rules into a security group to quickly create or restore security group rules.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Networks and Security > Security Groups**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the target security group and click **Rules** in the **Actions** column.
5. On the Rules page that appears, click the **Inbound** or **Outbound** tab.
6. Click **Import** in the upper-right corner.
7. In the **Import Rule** dialog box, click **Choose File**.
8. Select the target local backup file of security group rules and click Open. Then, click **OK**.

   The local backup file must be in the CSV format. You can download a template file from the **Import Rule** dialog box.

2.9.9. Add an instance

You can add an existing instance to a security group in the same region. After the instance is added, the security group rules of the security group automatically apply to the instance.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Networks and Security > Security Groups**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the security group and click **Manage Instances** in the **Actions** column.
5. Click **Add Instance**.
6. Select an instance and click **OK**.

2.9.10. Remove instances from a security group

You can remove instances from a security group, but each of the instances must always belong to at least one security group.

Prerequisites

The instances to be removed are added to two or more security groups.

Context

After an ECS instance is removed from a security group, the instance will be isolated from the other ECS instances in the security group. We recommend that you perform a full test in advance to ensure that services can run properly after you remove the instance.

Procedure

1. Log on to the ECS console.

2. In the left-side navigation pane, choose **Networks and Security > Security Groups**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the target security group and click **Manage Instances** in the **Actions** column.
5. On the Instances page that appears, select one or more instances and click **Remove** in the lower-left corner.
6. Click **OK**.

2.9.11. Delete a security group

You can delete a security group that is no longer needed.

Prerequisites

No instances exist in the security group.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Networks and Security > Security Groups**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Use one of the following methods to delete the security group:
   - To delete a single security group, find the security group and click **Delete** in the **Actions** column.
   - To delete one or more security groups at a time, select the security groups and click **Delete** in the lower-left corner of the Security Groups page.
5. In the message that appears, click **OK**.

2.10. Elastic Network Interfaces

2.10.1. Create an ENI

You can bind elastic network interfaces (ENIs) to instances to create high-availability clusters and implement fine-grained network management. You can also unbind an ENI from an instance and then bind the ENI to another instance to implement a low-cost failover solution.

Prerequisites

- A virtual private cloud (VPC) and a VSwitch are created. For more information, see Create a VPC and Create a VSwitch in *Apsara Stack VPC User Guide* .
- A security group is available in the VPC. If no security group is available in the VPC, create a security group. For more information, see Create a security group.

Context

ENIs are classified into primary and secondary ENIs.

A primary ENI is created by default when an instance is created in a VPC. This primary ENI has the same lifecycle as the instance and cannot be unbound from the instance.

ENIs created separately are secondary ENIs. You can bind secondary ENIs to or unbind them from instances. This topic describes how to create a secondary ENI.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Networks and Security > ENIs**.
3. In the top navigation bar, select an organization, a resource set, and a region.

4. Click **Create ENI**.
5. Configure parameters listed in the following table to create an ENI.

Section	Parameter	Required	Description
Region	Organization	Yes	The organization in which to create the ENI.
	Resource Set	Yes	The resource set in which to create the ENI.
	Region	Yes	The region in which to create the ENI.
	Zone	Yes	The zone in which to create the ENI.
Basic Settings	VPC	Yes	The VPC in which to create the ENI. The secondary ENI can be bound only to an instance in the same VPC. **Note** After the ENI is created, you cannot change its VPC.
	VSwitch	Yes	The VSwitch to be associated with the ENI. The secondary ENI can be bound only to an instance in the same VPC. Select a VSwitch that is in the same zone as the instance to which the ENI will be bound. The VSwitch of the ENI can be different from that of the instance. **Note** After an ENI is created, you cannot change its VSwitch.
	Security Group	Yes	The security group in which to create the ENI within the specified VPC. The rules of the security group automatically apply to the ENI.

Section	Parameter	Required	Description
	ENI Name	Yes	The name of the ENI. The name must be 2 to 128 characters in length. It must start with a letter and cannot start with http:// or https://. It can contain letters, digits, periods (.), underscores (_), hyphens (-), colons (:), and commas (,).
	Description	No	The description of the ENI. We recommend that you provide an informational description to simplify future management operations. The description must be 2 to 256 characters in length. It must start with a letter and cannot start with http:// or https://. It can contain letters, digits, periods (.), underscores (_), hyphens (-), colons (:), and commas (,).
	Primary Private IP	No	The primary private IPv4 address of the ENI. The IPv4 address must be within the CIDR block of the specified VSwitch. If you do not specify a primary private IP address, the system automatically assigns a private IP address to the ENI.

6. Click **Submit**.

Result

The created ENI is displayed on the ENIs page and is in the **Available** state.

2.10.2. View ENIs

You can view the list of created ENIs.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Networks and Security > ENIs**.
3. In the top navigation bar, select an organization, a resource set, and a region.
   The created ENIs that match the specified criteria are displayed.
4. Select a filter option from the drop-down list, enter the relevant information in the search bar, and click **Search**.

You can select multiple filter options to narrow down search results.

Filter option	Description
ENI Name	Enter an ENI name to search for the ENI.
ENI ID	Enter an ENI ID to search for the ENI.
VSwitch ID	Enter a VSwitch ID to search for the ENIs that are associated with the VSwitch.
Security Group ID	Enter a security group ID to search for the ENIs that belong to the security group.
Instance ID	Enter an instance ID to search for the ENIs that are bound to the instance.

2.10.3. Modify a secondary ENI

You can modify the attributes of a secondary elastic network interface (ENI), including the name, security group, and description.

Prerequisites

The secondary ENI is in the **Available** state.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Networks and Security > ENIs**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the secondary ENI and click **Modify** in the **Actions** column.
5. In the Modify ENI dialog box that appears, modify the name, security group, and description of the ENI.
6. Click **OK**.

2.10.4. Bind a secondary ENI to an instance

You can bind a secondary elastic network interface (ENI) to an instance. After the ENI is bound to the instance, the instance can process the traffic on the ENI.

Prerequisites

- The secondary ENI is in the **Available** state.
- The instance to which you want to bind the secondary ENI is in the **Running** or **Stopped** state.
- The instance and the secondary ENI belong to the same VPC.
- The VSwitch with which the secondary ENI is associated is in the same zone as the VSwitch to which the instance is connected. An ENI can be bound only to an instance in the same zone. The VSwitches of the ENI and of the instance can be different but must be in the same zone.

Context

The following limits apply when you bind an ENI to an instance:

- You can manually bind only secondary ENIs. Primary ENIs share the same lifecycle as instances and cannot be manually bound.
- An ENI can only be bound to a single ECS instance. However, an ECS instance can be bound with multiple ENIs. The maximum number of ENIs that can be bound to an instance depends on the instance type. For more

information about the number of ENIs that can be bound to an instance of each instance type, see Instance families in *ECS Product Introduction*.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Networks and Security > ENIs**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the target secondary ENI and click **Bind** in the **Actions** column.
5. In the Bind dialog box that appears, select an instance and click **OK**.

Result

In the **Status/Creation Time** column, the status of the secondary ENI changes to **Bound**.

2.10.5. Unbind a secondary ENI from an instance

You can unbind a secondary elastic network interface (ENI) from an instance. After the secondary ENI is unbound from the instance, the instance no longer processes the traffic on the ENI.

Prerequisites

- The secondary ENI is in the **Bound** state.
- The instance is in the **Running** or **Stopped** state.

Context

Only secondary ENIs can be unbound. Primary ENIs share the same lifecycle as instances and cannot be unbound.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Networks and Security > ENIs**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the secondary ENI and click **Unbind** in the **Actions** column.
5. Click **OK**.

Result

In the **Status/Creation Time** column, the status of the secondary ENI changes to **Available**.

2.10.6. Delete a secondary ENI

You can delete a secondary elastic network interface (ENI) that is no longer needed.

Prerequisites

The secondary ENI is in the **Available** state.

Context

You can delete only secondary ENIs. Primary ENIs share the same lifecycle as instances and cannot be deleted.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, choose **Networks and Security > ENIs**.
3. In the top navigation bar, select an organization, a resource set, and a region.

4. Find the secondary ENI and click **Delete** in the **Actions** column.
5. Click **OK**.

2.11. Deployment sets

2.11.1. Create a deployment set

You can use a deployment set to distribute or aggregate instances involved in your business. You can select hosts, racks, or network switches to improve service availability or network performance based on your needs.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, click **Deployment Sets**.
3. Click **Create Deployment Set**.
4. Configure the parameters of the deployment set.

Category	Parameter	Required	Description
Region	Organization	Yes	The organization to which the deployment set belongs.
	Resource Set	Yes	The resource set to which the deployment set belongs.
	Region	Yes	The region where the deployment set is located.
	Zone	Yes	The zone where the deployment set is located.
Basic Settings	Deployment Domain	Yes	This parameter setting determines the Deployment Target options. Valid values: ○ **Default**: When Default is selected, the deployment target options are Host, Rack, and Network Switch. ○ **Switch**: When Switch is selected, the deployment target options are Host and Rack.
	Deployment Target	Yes	The basic unit that can be scheduled when you deploy instances. ○ **Host**: Instances are distributed or aggregated at the host level. ○ **Rack**: Instances are distributed or aggregated at the rack level. ○ **VSwitch**: Instances are distributed or aggregated at the VSwitch level.

Category	Parameter	Required	Description
	Deployment Policy	Yes	The dispersion policies are used to improve service availability to avoid business impact when a host, rack, or switch fails. The aggregation policies are used to improve network performance to minimize the access latency between instances. Options are: ○ **Loose Dispersion** ○ **Strict Dispersion** ○ **Loose Aggregation** ○ **Strict Aggregation**
	Deployment Set Name	No	The name of the deployment set. The name must be 2 to 128 characters in length. It must start with a letter but cannot start with http:// or https://. It can contain digits, periods (.), underscores (_), hyphens (-), colons (:), and commas (,).
	Description	No	The description of the deployment set. We recommend that you provide an informational description to simplify future management operations. The description must be 2 to 256 characters in length. It must start with a letter but cannot start with http:// or https://. It can contain digits, periods (.), underscores (_), hyphens (-), colons (:), and commas (,).

5. Click **Submit**.

2.11.2. View deployment sets

You can view the list of created deployment sets.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, click **Deployment Sets**.
3. In the top navigation bar, select an organization, a resource set, and a region.
   The created deployment sets that match the specified criteria are displayed.
4. Select a filter option from the drop-down list, enter the relevant information in the search bar, and then click **Search**.

   You can select multiple filter options to narrow down search results.

Filter option	Description
Deployment Set Name	Enter a deployment set name to search for the deployment set.
Deployment Set ID	Enter a deployment set ID to search for the deployment set.
Resource Set	Enter a resource set name to search for the deployment sets that belong to the resource set.

2.11.3. Modify a deployment set

You can modify the name and description of a deployment set.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, click **Deployment Sets**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the deployment set and click **Modify** in the **Actions** column.
5. In the Change Deployment Set dialog box, change the name of the deployment set.
6. Click **OK**.

2.11.4. Delete a deployment set

You can delete a deployment set that is no longer needed.

Prerequisites

No instances exist in the deployment set.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, click **Deployment Sets**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the deployment set and click **Delete** in the **Actions** column.
5. Click **OK**.

2.12. Install FTP software

2.12.1. Overview

File Transfer Protocol (FTP) transfers files between a client and a server by establishing two TCP connections. One is the command link for transferring commands between a client and a server. The other is the data link used to upload or download data. Before uploading files to an instance, you must build an FTP site for the instance.

2.12.2. Install and configure vsftp in CentOS

This topic describes how to install and configure vsftp in CentOS to transfer files.

Procedure

1. Install vsftp.

   ```
   yum install vsftpd -y
   ```

2. Add an FTP account and a directory.
   i. Check the location of the *nologin* file,
   which is usually under the */usr/sbin* or */sbin* directory.

ii. Create an FTP account.

Run the following commands to create the */alidata/www/wwwroot* directory and specify this directory as the home directory of the account pwftp. You can also customize the account name and directory.

```
mkdir -p /alidata/www/wwwroot
useradd -d /alidata/www/wwwroot -s /sbin/nologin pwftp
```

iii. Modify the account password.

```
passwd pwftp
```

iv. Modify the permissions on the specified directory.

```
chown -R pwftp.pwftp /alidata/www/wwwroot
```

3. Configure vsftp.

i. Open the vsftp configuration file.

```
vi /etc/vsftpd/vsftpd.conf
```

ii. Change the value of anonymous_enable from `YES` to `NO`.

iii. Delete the comment delimiter (`#`) from the following configuration lines:

```
local_enable=YES
    write_enable=YES
    chroot_local_user=YES
```

iv. Press the Esc key to exit the edit mode, and enter `:wq` to save the modifications and exit.

4. Modify the shell configuration.

i. Open the shell configuration file.

```
vi /etc/shells
```

ii. If the file does not contain */usr/sbin/nologin* or */sbin/nologin*, add it to the file.

5. Start vsftp and perform a logon test.

i. Start vsftp.

```
service vsftpd start
```

ii. Use the account pwftp to perform an FTP logon test.

This example uses the directory */alidata/www/wwwroot*.

2.12.3. Install vsftp in Ubuntu or Debian

This topic describes how to install and configure vsftp in an instance running Ubuntu or Debian to transfer files.

Procedure

1. Update the software source.

```
apt-get update
```

2. Install vsftp.

```
apt-get install vsftpd -y
```

3. Add an FTP account and a directory.

i. Check the location of the *nologin* file,

which is typically under the */usr/sbin* or */sbin* directory.

ii. Create an FTP account.

Run the following commands to create the */alidata/www/wwwroot* directory and specify this directory as the home directory of the account pwftp. You can also customize the account name and directory.

```
mkdir -p /alidata/www/wwwroot
useradd -d /alidata/www/wwwroot -s /sbin/nologin pwftp
```

iii. Modify the account password.

```
passwd pwftp
```

iv. Modify the permissions on the specified directory.

```
chown -R pwftp.pwftp /alidata/www/wwwroot
```

4. Configure vsftp.

i. Open the vsftp configuration file.

```
vi /etc/vsftpd.conf
```

ii. Change the value of anonymous_enable from `YES` to `NO`.

iii. Delete the comment delimiter (`#`) from the following configuration lines:

```
local_enable=YES
    write_enable=YES
    chroot_local_user=YES
    chroot_list_enable=YES
    chroot_list_file=/etc/vsftpd.chroot_list
```

iv. Press the Esc key to exit the edit mode, and enter `:wq` to save the modifications and exit.

v. Open the */etc/vsftpd.chroot_list* file and add the FTP account name to the file. Save the modifications and exit.

You can follow steps a to d to open and save the file.

5. Modify shell configurations.

i. Open the shell configuration file.

```
vi /etc/shells
```

ii. If the file does not contain */usr/sbin/nologin* or */sbin/nologin*, add it to the file.

6. Start vsftp and perform a logon test.

i. Start vsftp.

```
service vsftpd restart
```

ii. Use the account pwftp to perform an FTP logon test.

This example uses the directory */alidata/www/wwwroot*.

2.12.4. Build an FTP site in Windows Server 2008

This topic describes how to build an FTP site on an instance running Windows Server 2008.

Prerequisites

You have added the Web Server (IIS) role and installed FTP on an instance.

Procedure

1. Connect to an instance.

2. Choose **Start > Adminstrative Tools > Internet Information Services (IIS) Manager**.
3. Right-click the server name and select **Add FTP Site** from the shortcut menu.
4. Enter an FTP site name and a physical path, and then click **Next**.
5. Set **IP Address** to **All Unassigned** and **SSL** to **No SSL**, and then click **Next**.
6. Set **Authentication** to **Basic**, **Authorization** to **All Users**, and **Permissions** to **Read** and **Write**, and click **Finish**.

Result

Then you can use the administrator account and password to upload and download files through FTP. Make sure that the following conditions are met:

- The port for the FTP site is not in use by other applications, and Windows firewall is not blocking the port.
- The security group of the instance contains a security group rule that allows inbound access to the FTP port.

2.12.5. Build an FTP site in Windows Server 2012

This topic describes how to build an FTP site on an instance running Windows Server 2012.

Prerequisites

You have added the Web Server (IIS) role and installed FTP on an instance.

Procedure

1. Connect to an instance.
2. Click the **Server Manager** icon.
3. In the left-side navigation pane, click **IIS**.
4. In the **Server** area, right-click the server name and select **Internet Information Services (IIS) Manager** from the shortcut menu.
5. Right-click the server name and select **Add FTP Site** from the shortcut menu.
6. Enter an FTP site name and a physical path, and then click **Next**.
7. Set **IP Address** to **All Unassigned** and **SSL** to **No SSL**, and then click **Next**.
8. Set **Authentication** to **Basic**, **Authorization** to **All Users**, and **Permissions** to **Read** and **Write**, and click **Finish**.

Result

Then you can use the administrator account and password to upload and download files through FTP. Make sure that the following conditions are met:

- The port for the FTP site is not in use by other applications, and Windows firewall is not blocking the port.
- The security group of the instance contains a security group rule that allows inbound access to the FTP port.

3.Container Service

3.1. Container Service support for Kubernetes 1.18

Container Service strictly conforms to the terms of the Certified Kubernetes Conformance Program. This topic describes the changes that Container Service has made to support Kubernetes 1.18.

Version upgrades

Container Servcie has upgraded and optimized all of its components to support Kubernetes 1.18.8.

Key component	Version	Description
Kubernetes	1.18.8	Some frequently used API versions are deprecated in Kubernetes 1.18. Before you upgrade a Kubernetes cluster, we recommend that you upgrade the deprecated API versions that are listed in this topic.
Docker	19.03.5 (containerd 1.2.10)	No.
etcd	3.4.3	No.
CoreDNS	1.6.7	No.

Version details

- **Resource changes and deprecation**

  The following APIs are deprecated in Kubernetes 1.18:

  - The APIs apps/v1beta1 and apps/v1beta2 of all the resources are replaced by **apps/v1**.
  - The API extensions/v1beta1 of DaemonSets, Deployments, and ReplicaSets is replaced by **apps/v1**.
  - The API extensions/v1beta1 of Networkpolicies resources is replaced by **networking.k8s.io/v1**.
  - The API extensions/v1beta1 of pod security policies is replaced by **policy/v1beta1**.

  The label that specifies the regions of a node is changed to topology.kubernetes.io/region. The label that specifies the zone of a node is changed to topology.kubernetes.io/zone. We recommend that you update the related configurations for your workloads.

- **Feature upgrades**
  - Server-side Apply Beta 2 is introduced. You can view the relationships between the configuration items of a resource in the metadata.managedFields field of the resource.
  - The Node Local DNS Cache feature is released to improve the DNS availability and performance of your cluster.
  - The Volume Snapshot feature is in public preview and supports operations such as data volume backup, recovery, and scheduled backup.

Container Service upgrades for Kubernetes 1.18.8

In Kubernetes 1.18.8, Container Service enables the following feature in the kubelet configuration file: Users who use raw data volumes can upgrade clusters without the need to drain the nodes.

3.2. What is Container Service?

Container Service provides high-performance, scalable, and enterprise-class management service for Kubernetes containerized applications throughout the application lifecycle.

Container Service simplifies the deployment and scaling operations on Kubernetes clusters. Integrated with services such as virtualization, storage, network, and security, Container Service aims to provide the optimal cloud environment for Kubernetes containerized applications. Alibaba Cloud is a Kubernetes Certified Service Provider (KCSP). As one of the first services to participate in the Certified Kubernetes Conformance Program, Container Service provides you with professional support and services.

3.3. ACK@Edge overview

ACK@Edge is released for commercial use. ACK@Edge is a cloud-managed solution that is provided by Container Service to coordinate cloud and edge computing. This topic describes the background and features of edge Kubernetes clusters.

Overview

With the rapid growth of smart devices connected to the Internet and the advent of 5G and IoT, computing and storage services provided by traditional cloud computing platforms can no longer satisfy the needs of edge devices for time-efficient computing, larger storage capacity, and enhanced computing capacity. Edge Kubernetes clusters are intended for bringing cloud computing to edges (clients). Edge Kubernetes clusters can be created, managed, and maintained in the Container Service console. This is the trend of cloud computing.

An edge Kubernetes cluster is a standard, secure, and highly-available Kubernetes cluster deployed in the cloud. This type of cluster is integrated with features of Alibaba Cloud, such as virtualization, storage, networking, and security. This simplifies the management and maintenance of clusters and allows you to focus on your business development. ACK@Edge provides the following features:

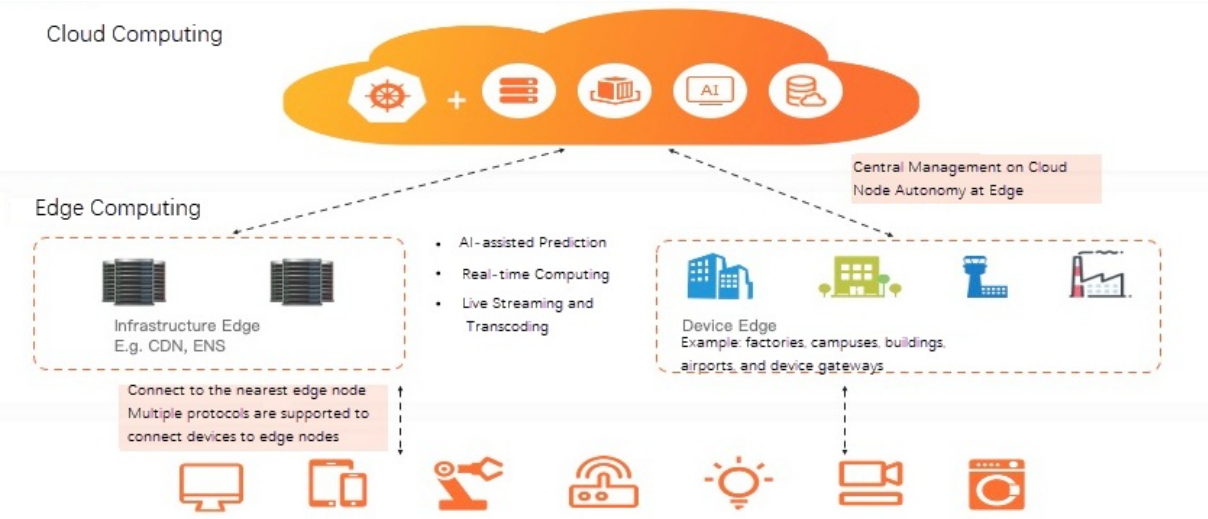
- Allows you to build a cloud-native infrastructure for edge computing with a few clicks.
- Allows you to quickly connect edge computing resources to the cloud. These resources include IoT gateway devices, terminals, Content Delivery Network (CDN) resources, and data centers.
- Applies to diverse scenarios, such as edge intelligence, intelligent buildings, intelligent factories, audio and video live streaming, online education, and CDN.

Edge Kubernetes clusters support features such as node autonomy, cell-based management, and native APIs for the management and maintenance of resources at the edge side. To use these features, you do not need to rewrite the logic of your services. This provides a native and centralized method for application lifecycle management and resource scheduling in edge computing scenarios.

Features

Edge Kubernetes clusters provide the following features to support lifecycle management for containerized applications and resources in edge computing scenarios:

- Allows you to create highly available edge Kubernetes clusters with a few clicks and provides lifecycle management on edge Kubernetes clusters, such as scaling cloud nodes, adding edge nodes to clusters, upgrading, logging, and monitoring. You can perform the preceding operations in the Container Service console.
- Supports access to various heterogeneous resources, such as data centers and IoT devices. Hybrid scheduling of heterogeneous resources is also supported.
- Supports node autonomy and network autonomy to ensure the reliability of edge nodes and services in edge computing scenarios where the network connection is weak.
- Supports reverse tunneling for management and maintenance of edge nodes.



3.4. Planning and preparation

Before you start using Container Service, you need to create cloud resources such as VPC networks, VSwitches, disks, and OSS buckets based on your application requirements.

Before you create a Kubernetes cluster, make the following preparations:

- **Create a VPC network** (optional)

  To create a cluster in an existing VPC network, you must create the VPC network and VSwitches in advance.
- **Create a volume** (optional)

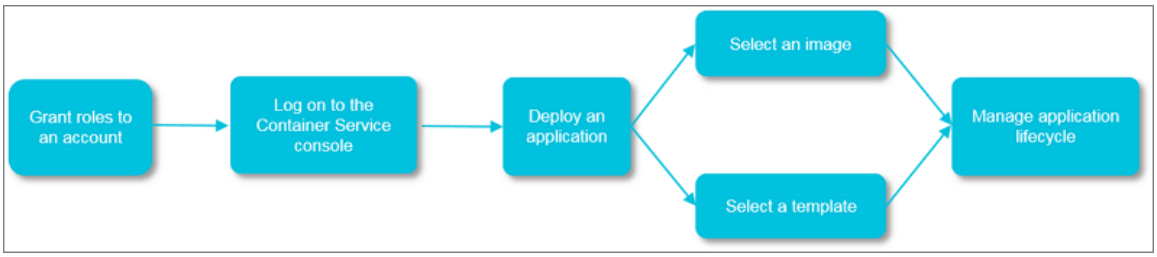
  To create a stateful application with network storage, you must create disks or OSS buckets in advance.

3.5. Quick start

3.5.1. Procedure

You can perform the following steps to use the Container Service service.

The following diagram shows the procedure to use the Container Service service.



Step 1: Authorize the default role

Authorize the default role of Container Service to perform operations on the resources that belong to the specified organization.

Step 2: Log on to the Container Service console

Log on to the Container Service console. For more information, see Log on to the Container Service console.

Step 3: Create an Container Service cluster

Set the network environment and the number of nodes, and configure node details.

Step 4: Deploy an application by using an image or orchestration template

You can use an existing image or orchestration template, or create a new image or orchestration template.

To create an application that consists of services based on different images, use an orchestration template.

Step 5: Manage the application lifecycle

3.5.2. Log on to the Container Service console

You can perform the following steps to log on to the Container Service console.

Prerequisites

- The URL of the Apsara Uni-manager Management Console is obtained from the deployment personnel before you log on to the Apsara Uni-manager Management Console.
- A browser is available. We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL of the Apsara Uni-manager Management Console. Press the Enter key.
2. Enter your username and password.

   Obtain the username and password that you can use to log on to the console from the operations administrator.

   > **Note** When you log on to the Apsara Uni-manager Management Console for the first time, you must change the password of your username. Your password must meet complexity requirements. The password must be 8 to 20 characters in length and must contain at least two of the following character types:
   >
   > - Uppercase or lowercase letters
   > - Digits
   > - Special characters, which include ! @ # $ %

3. Click **Login**.
4. In the top navigation bar, choose **Products > Elastic Computing > Container Service for Kubernetes**.
5. Select the required organization and region.
6. Click **ACK** to go to the Container Service console.

3.5.3. Create a Kubernetes cluster

This topic describes how to create a Kubernetes cluster in the Container Service console.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**. On the Clusters page that appears, click **Create Kubernetes Cluster** in the upper-right corner.
3. On the **Create Kubernetes Cluster** page, set the parameters.

Parameter	Description

Parameter	Description
Cluster Name	Enter a name for the cluster. The name must be 1 to 63 characters in length, and can contain digits, letters, and hyphens (-). **Note** The cluster name must be unique among clusters that belong to the same Alibaba Cloud account.
Region	Select the region where you want to deploy the cluster.
VPC	You can select a virtual private cloud (VPC) from the drop-down list. ○ If the specified VPC is already associated with a NAT gateway, the cluster uses this NAT gateway. ○ Otherwise, the system automatically creates a NAT gateway. If you do not want the system to create a NAT gateway, clear **Configure SNAT for VPC**. **Note** If you disable the system to automatically create a NAT gateway and want the VPC to access the Internet, you must manually associate the VPC with a NAT gateway or create Source Network Address Translation (SNAT) rules for the VPC.
VSwitch	Select one or more vSwitches for the cluster. You can select up to three vSwitches that are deployed in different **zones**.
Kubernetes Version	Select a Kubernetes version.
Container Runtime	You can select Docker or Sandboxed-Container.
Billing Method	Only pay-as-you-go nodes are supported.

Parameter	Description
Master Configurations	Set the Instance Type and System Disk parameters: ○ Master Node Quantity: You can add up to three master nodes. ○ Instance Type: You can select one or more instance types. For more information, see the *Instance types* chapter of *ECS User Guide*. ○ System Disk: **SSD Disk** and **Ultra Disk** are supported. **Note** You can select **Enable Backup** to back up disk data.
Worker Instance	You can select **Create Instance** or **Add Existing Instance**.
Worker Configurations	If **Worker Instance** is set to **Create Instance**, set the following parameters: ○ Instance Type: You can select one or more instance types. For more information, see the *Instance types* chapter of *ECS User Guide*. ○ Selected Types: The selected instance types are displayed. ○ Quantity: Set the number of worker nodes. ○ System Disk: **SSD Disk** and **Ultra Disk** are supported. **Note** You can select **Enable Backup** to back up disk data. ○ Mount Data Disk: **SSD Disk** and **Ultra Disk** are supported. **Note** ■ You can select **Encrypt Disk** to encrypt disks. ■ You can select **Enable Backup** to back up disk data.
Operating System	The CentOS and Aliyun Linux operating systems are supported.

Parameter	Description
Password	Set a password that is used to log on to the nodes. **Note** The password must be 8 to 30 characters in length, and must contain at least three of the following types of characters: uppercase letters, lowercase letters, digits, and special characters.
Confirm Password	Enter the password again.
Network Plug-in	Flannel and Terway are supported. By default, Flannel is selected.
Pod CIDR Block and Service CIDR	These parameters are optional. For more information, see *Network planning* in *VPC User Guide*. **Note** These parameters are available only when you select an existing VPC.
Configure SNAT	This parameter is optional. If you clear Configure SNAT for VPC, you must create a NAT gateway or configure SNAT rules for the VPC.
Access to the Internet	Specify whether to expose the API server with an elastic IP address (EIP). The Kubernetes API server provides multiple HTTP-based RESTful APIs that can be used to create, delete, modify, query, and watch resource objects such as pods and Services. ◦ If you select this check box, an EIP is created and associated with an internal-facing Server Load Balancer (SLB) instance. Port 6443 used by the API server is exposed on the master nodes. You can connect to and manage the cluster by using kubeconfig over the Internet. ◦ If you clear this check box, no EIP is created. You can connect to and manage the cluster only by using kubeconfig within the VPC.
Ingress	Specify whether to **Install Ingress Controllers**. By default, **Install Ingress Controllers** is selected.
Log Service	If you enable Log Service, you can select an existing project or create a project. If you select **Enable Log Service**, the Log Service plug-in is automatically installed in the cluster. If you select **Create Ingress Dashboard**, Ingress access logs are collected and displayed on dashboards.
Volume Plug-in	By default, **CSI** is selected.
Deletion Protection	This check box prevents you from accidentally deleting the cluster in the console or by calling API operations.

Parameter	Description
RDS Whitelist	Add the IP addresses of the nodes to the whitelist of the ApsaraDB RDS instance that is allowed to access the Kubernetes cluster. **Note** To enable an ApsaraDB RDS instance to access the Kubernetes cluster, you must deploy the ApsaraDB RDS instance in the same VPC as the Kubernetes cluster.
Node Protection	This check box is selected by default to prevent you from accidentally deleting the nodes in the console or by calling API operations.
Label	Add labels to the cluster.

4. Complete the advanced settings of the cluster.

Parameter	Description
IP Addresses per Node	The number of IP addresses that are assigned to a node.
Custom Image	You can select a custom image. After you select a custom image, all nodes in the cluster are deployed by using this image.
Kube-proxy Mode	**iptables** and **IPVS** are supported. ○ iptables is a tested and stable kube-proxy mode. It uses iptables rules to conduct service discovery and load balancing. The performance of this mode is limited by the size of the Kubernetes cluster. This mode is suitable for Kubernetes clusters that manage a small number of Services. ○ IPVS is a high-performance kube-proxy mode. It uses Linux Virtual Server (LVS) to conduct service discovery and load balancing. This mode is suitable for Kubernetes clusters that manage a large number of Services. We recommend that you use this mode in scenarios where high-performance load balancing is required.
Custom Node Name	Specify whether to use a custom node name.
Node Port Range	Specify the value of **Node Port Range**.
Taints	Add taints to all worker nodes in the Kubernetes cluster.
CPU Policy	Specify the CPU policy. Valid values: ○ None: indicates that the default CPU affinity is used. This is the default policy. ○ Static: allows pods with specific resource characteristics on the node to be granted with enhanced CPU affinity and exclusivity.

Parameter	Description
Cluster Domain	The default domain name of the cluster is cluster.local. You can specify a custom domain name.
Cluster CA	Specify whether to enable the cluster CA certificate.
User Data	Customize the startup behaviors of ECS instances and import data to the ECS instances. The user data can be used to perform the following operations: ○ Run scripts during instance startup. ○ Import user data as normal data to an ECS instance for future reference.

5. Click **Create Cluster** in the upper-right corner of the page.
6. On the **Confirm** page, after all check items are verified, select the terms of service and disclaimer and click **OK** to start the deployment.

Result

After the cluster is created, you can find the cluster on the **Clusters** page in the Container Service console.

3.5.4. Create an application from an orchestration template

Container Service provides orchestration templates that you can use to create applications. You can also modify the templates based on YAML syntax to customize applications.

Prerequisites

A Kubernetes cluster is created. For more information, see Create a Kubernetes cluster.

Context

This topic describes how to use an orchestration template to create an NGINX application that consists of a Deployment and a Service. The Deployment provisions pods for the application and the Service manages access to the pods at the backend.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Workloads > Deployments**.
5. On the **Deployments** page, select the namespace and click **Create from YAML** in the upper-right corner.
6. Configure the template and click **Create**.
   - **Sample Template**: Container Service provides YAML templates of various resource types to help you quickly deploy resource objects. You can also create a custom template based on YAML syntax to describe the resource that you want to define.
   - **Add Deployment**: This feature allows you to quickly define a YAML template.
   - **Use Existing Template**: You can import an existing template to the configuration page.

   Based on an orchestration template provided by Container Service, the following sample template is used to create a Deployment of an NGINX application.

> **Note** Container Service supports YAML syntax. You can use the `---` symbol to separate multiple resource objects. This allows you to create multiple resource objects in a single template.

```
apiVersion: apps/v1beta2 # for versions before 1.8.0 use apps/v1beta1
kind: Deployment
metadata:
  name: nginx-deployment
  labels:
    app: nginx
spec:
  replicas: 2
  selector:
    matchLabels:
      app: nginx
  template:
    metadata:
      labels:
        app: nginx
    spec:
      containers:
      - name: nginx
        image: nginx:1.7.9 # replace it with your exactly <image_name:tags>
        ports:
        - containerPort: 80
---
apiVersion: v1    # for versions before 1.8.0 use apps/v1beta1
kind: Service
metadata:
  name: my-service1      #TODO: to specify your service name
  labels:
    app: nginx
spec:
  selector:
    app: nginx         #TODO: change label selector to match your backend pod
  ports:
  - protocol: TCP
    name: http
    port: 30080        #TODO: choose an unique port on each node to avoid port conflict
    targetPort: 80
  type: LoadBalancer      ##In this example, the type is changed from Nodeport to LoadBalancer.
```

7. Click **Create**. A message that indicates the deployment status appears.

   After the application is created, choose **Services and Ingresses > Services** in the left-side navigation pane. On the Services page, you can find that a Service named my-service1 is created for the application. The external endpoint of the Service is also displayed on the page. Click the endpoint in the **External Endpoint** column.

8. You can visit the NGINX welcome page in the browser.

3.6. Kubernetes clusters

3.6.1. Authorizations

3.6.1.1. Assign RBAC roles to a RAM user

This topic describes how to assign role-based access control (RBAC) roles to Resource Access Management (RAM) users. By default, RBAC is enabled for Kubernetes 1.6 and later. RBAC is important for you to manage clusters. You can use RBAC to specify the types of operations that are allowed for specific users based on their roles in an organization.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Authorizations**.
3. On the **RAM Users** tab, select the RAM user to which you want to grant permissions and click **Modify Permissions**.

   > **Note** If you log on to the Container Service console as a RAM user, make sure that the RAM user is assigned the predefined RBAC administrator role or the cluster-admin role.

4. On the **Configure Role-Based Access Control (RBAC)** wizard page, click **Add Permissions** to add cluster-scoped or namespace-scoped permissions and select a predefined or custom RBAC role in the Permission column. You can also click the minus sign (-) to delete permissions. After you add the permissions, click **Next Step**.

   > **Note** For each RAM user, you can assign only one predefined RBAC role but one or more custom RBAC roles to manage the same cluster or namespace.

   The following table describes the permissions that the predefined and custom RBAC roles have on clusters and namespaces.

   Roles and permissions

Role	RBAC permissions on cluster resources
Administrator	Read and write permissions on resources in all namespaces.
O&M Engineer	Read and write permissions on resources in all namespaces and read-only permissions on nodes, persistent volumes (PVs), namespaces, and service quotas within a cluster.
Developer	Read and write permissions on resources in a specified namespace or all namespaces.
Restricted User	Read-only permissions on resources in a specified namespace or all namespaces.
Custom	The cluster role that you select for a custom role determines what permissions the custom role has. Before you select a cluster role, make sure that you are aware of the permissions that the cluster role has in case the RAM user is granted excessive permissions.

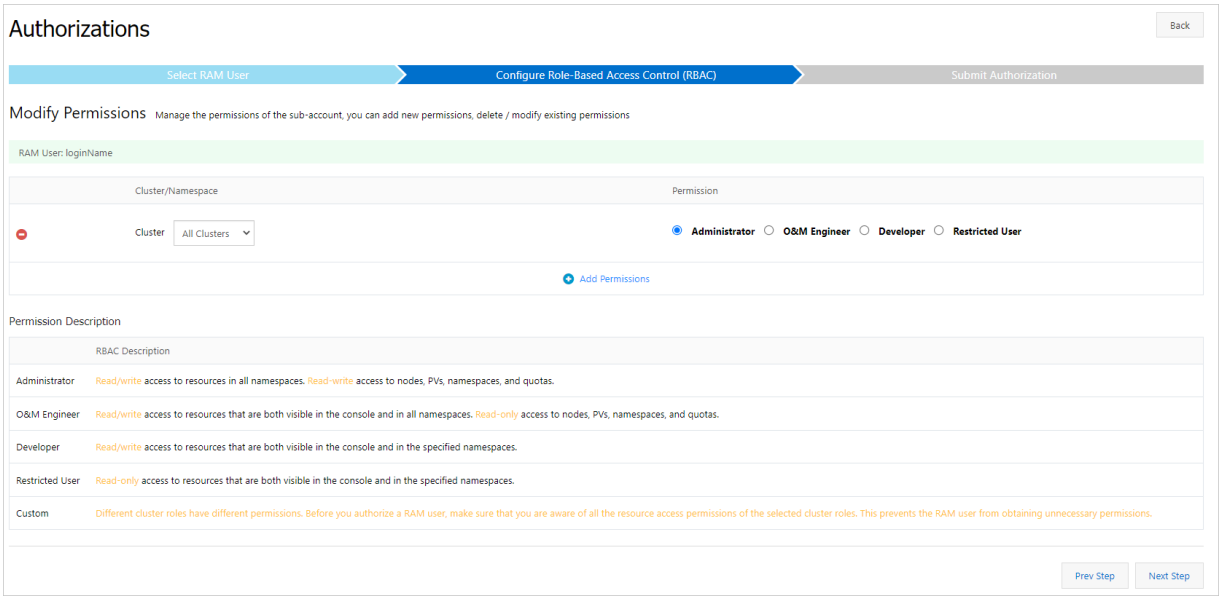
   After the authorization is complete, you can use the account of the specified RAM user to log on to the Container Service console. For more information, see Log on to the Container Service console.

Predefined and custom RBAC roles

Container Service provides the following predefined RBAC roles: administrator, O&M engineer, developer, and restricted user. You can use these roles to regulate Container Service access control in most scenarios. In addition, you can use custom roles to customize permissions on clusters.

Container Service provides a set of custom RBAC roles.

> **Note** The cluster-admin role is similar to a super administrator. By default, the cluster-admin role has the permissions to manage all resources within a cluster.



You can log on to a master node of a cluster and run the following command to view the custom RBAC roles that are assigned to the current account:

```
# kubectl get clusterrole
```

```
# kubectl get clusterrole
NAME                                   AGE
admin                                  13d
alibaba-log-controller                 13d
alicloud-disk-controller-runner        13d
cluster-admin                          13d
cs:admin                               13d
edit                                   13d
flannel                                13d
kube-state-metrics                     22h
node-exporter                          22h
prometheus-k8s                         22h
prometheus-operator                    22h
system:aggregate-to-admin              13d
....
system:volume-scheduler                13d
view                                   13d
```

Run the following command to view the details of a role, for example, the cluster-admin role:

```
# kubectl get clusterrole cluster-admin -o yaml
```

Notice After a RAM user is assigned the cluster-admin role, the RAM user has the same permissions as the Alibaba Cloud account to which the RAM user belongs. The RAM user has full control over all resources within the cluster. Proceed with caution.

```
# kubectl get clusterrole cluster-admin  -o yaml
apiVersion: rbac.authorization.k8s.io/v1
kind: ClusterRole
metadata:
 annotations:
  rbac.authorization.kubernetes.io/autoupdate: "true"

3.6.2. Clusters

3.6.2.1. Create a Kubernetes cluster

This topic describes how to create a Kubernetes cluster in the Container Service console.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**. On the Clusters page, click **Create Kubernetes Cluster** in the upper-right corner.
3. On the **Create Kubernetes Cluster** page, set the parameters.

Parameter	Description
Cluster Name	Enter a name for the cluster. The name must be 1 to 63 characters in length, and can contain digits, letters, and hyphens (-). **Note** The names of the clusters that belong to the same Alibaba Cloud account must be unique.
Region	Select the region where you want to deploy the cluster.

Parameter	Description
VPC	You can select a virtual private cloud (VPC) from the drop-down list. ◦ If the specified VPC is already associated with a NAT gateway, the cluster uses the associated NAT gateway. ◦ Otherwise, the system automatically creates a NAT gateway. If you do not want the system to create a NAT gateway, clear **Configure SNAT for VPC**. **Note** If you disable the system to automatically create a NAT gateway and want the VPC to access the Internet, you must manually associate the VPC with a NAT gateway or create Source Network Address Translation (SNAT) rules for the VPC.
VSwitch	Select one or more vSwitches for the cluster. You can select at most three vSwitches that are deployed in different **zones**.
Kubernetes Version	Select a Kubernetes version.
Container Runtime	You can select Docker or Sandboxed-Container.
Billing Method	Only pay-as-you-go nodes are supported.
Master Configurations	Set the Instance Type and System Disk parameters: ◦ Master Node Quantity: You can add at most three master nodes. ◦ Instance Type: You can select one or more instance types. For more information, see the *Instance types* chapter of *ECS User Guide*. ◦ System Disk: **SSD Disk** and **Ultra Disk** are supported. **Note** You can select **Enable Backup** to back up disk data.
Worker Instance	You can select **Create Instance** or **Add Existing Instance**.

Parameter	Description
Worker Configurations	If **Worker Instance** is set to **Create Instance**, set the following parameters: ○ Instance Type: You can select one or more instance types. For more information, see the *Instance types* chapter of *ECS User Guide*. ○ Selected Types: The selected instance types are displayed. ○ Quantity: Set the number of worker nodes. ○ System Disk: **SSD Disk** and **Ultra Disk** are supported. **Note** You can select **Enable Backup** to back up disk data. ○ Mount Data Disk: **SSD Disk** and **Ultra Disk** are supported. **Note** ■ You can select **Encrypt Disk** to encrypt disks. ■ You can select **Enable Backup** to back up disk data.
Operating System	The CentOS and Aliyun Linux operating systems are supported.
Password	Set a password that is used to log on to the nodes. **Note** The password must be 8 to 30 characters in length, and must contain at least three of the following types of character: uppercase letters, lowercase letters, digits, and special characters.
Confirm Password	Enter the password again.
Network Plug-in	Flannel and Terway are supported. By default, Flannel is selected.
Pod CIDR Block and Service CIDR	These parameters are optional. For more information, see *Network planning* in *VPC User Guide*. **Note** These parameters are available only when you select an existing VPC.
Configure SNAT	This parameter is optional. If you clear Configure SNAT for VPC, you must create a NAT gateway or configure SNAT rules for the VPC.

Parameter	Description
Access to the Internet	Specify whether to expose the API server with an elastic IP address (EIP). The Kubernetes API server provides multiple HTTP-based RESTful APIs that can be used to create, delete, modify, query, and watch resource objects such as pods and Services. ◦ If you select this check box, an EIP is created and attached to an internal-facing Server Load Balancer (SLB) instance. Port 6443 used by the API server is exposed on the master nodes. You can connect to and manage the cluster by using kubeconfig over the Internet. ◦ If you clear this check box, no EIP is created. You can connect to and manage the cluster only by using kubeconfig from within the VPC.
Ingress	Specify whether to **Install Ingress Controllers**. By default, **Install Ingress Controllers** is selected.
Log Service	If you enable Log Service, you can select an existing project or create a project. If you select **Enable Log Service**, the Log Service plug-in is automatically installed in the cluster. If you select **Create Ingress Dashboard**, the Ingress access log is collected and displayed on dashboards.
Volume Plug-in	By default, **CSI** is selected.
Deletion Protection	This check box prevents you from accidentally deleting the cluster in the console or by calling API operations.
RDS Whitelist	Add the IP addresses of the nodes to the whitelist of the ApsaraDB RDS instance that is allowed to access the Kubernetes cluster. **Note** To enable an ApsaraDB RDS instance to access the Kubernetes cluster, you must deploy the ApsaraDB RDS instance in the same VPC as the Kubernetes cluster.
Node Protection	This check box is selected by default to prevent you from accidentally deleting the nodes in the console or by calling API operations.
Label	Add labels to the cluster.

4. Complete the advanced settings of the cluster.

Parameter	Description
IP Addresses per Node	The number of IP addresses that are assigned to a node.
Custom Image	You can select a custom image. After you select a custom image, all nodes in the cluster are deployed by using this image.

Parameter	Description
Kube-proxy Mode	**iptables** and **IPVS** are supported. ◦ iptables is a tested and stable kube-proxy mode. It uses iptables rules to conduct service discovery and load balancing. The performance of this mode is limited by the size of the Kubernetes cluster. This mode is suitable for Kubernetes clusters that manage a small number of Services. ◦ IPVS is a high-performance kube-proxy mode. It uses Linux Virtual Server (LVS) to conduct service discovery and load balancing. This mode is suitable for Kubernetes clusters that manage a large number of Services. We recommend that you use this mode in scenarios where high-performance load balancing is required.
Custom Node Name	Specify whether to use a custom node name.
Node Port Range	Specify the value of **Node Port Range**.
Taints	Add taints to all worker nodes in the Kubernetes cluster.
CPU Policy	Specify the CPU policy. Valid values: ◦ None: indicates that the default CPU affinity is used. This is the default policy. ◦ Static: allows pods with specific resource characteristics on the node to be granted with enhanced CPU affinity and exclusivity.
Cluster Domain	The default domain name of the cluster is cluster.local. You can specify a custom domain name.
Cluster CA	Specify whether to enable the cluster CA certificate.
User Data	You can customize the startup behaviors of ECS instances and import data to the ECS instances. The user data can be used to perform the following operations: ◦ Run scripts during instance startup. ◦ Import user data as normal data to an ECS instance for future reference.

5. Click **Create Cluster** in the upper-right corner of the page.
6. On the **Confirm** page, after all check items are verified, select the terms of service and disclaimer and click **OK** to start the deployment.

Result

After the cluster is created, you can view the created cluster on the **Clusters** page in the Container Service console.

3.6.2.2. Create an edge Kubernetes cluster

Edge Kubernetes clusters are intended for bringing cloud computing to edges (clients). Edge Kubernetes clusters can be created, managed, and maintained in the Container Service console. Container Service is a platform built on top of the edge computing infrastructure. It is also integrated with cloud computing and edge computing. This topic describes how to create an edge Kubernetes cluster.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**. On the Clusters page that appears, click **Create Kubernetes Cluster** in the upper-right corner.
3. On the Create Cluster page, click the **Managed Edge Kubernetes** tab and set the cluster parameters.

Parameter	Description
Cluster Name	Enter a name for the cluster. The name must be 1 to 63 characters in length, and can contain digits, letters, and hyphens (-). **Note** The cluster name must be unique among clusters that belong to the same Alibaba Cloud account.
Region	Select the region where you want to deploy the cluster.
VPC	You can select a virtual private cloud (VPC) from the drop-down list. ◦ If the specified VPC is already associated with a NAT gateway, the cluster uses this NAT gateway. ◦ Otherwise, the system automatically creates a NAT gateway. If you do not want the system to create a NAT gateway, clear **Configure SNAT for VPC**. **Note** If you disable the system to automatically create a NAT gateway and want the VPC to access the Internet, you must manually associate the VPC with a NAT gateway or create Source Network Address Translation (SNAT) rules for the VPC.
VSwitch	Select one or more vSwitches for the cluster. You can select up to three vSwitches that are deployed in different **zones**.
Kubernetes Version	Select a Kubernetes version.

Parameter	Description
Master Configurations	Set the Instance Type and System Disk parameters: ◦ Master Node Quantity: You can add up to three master nodes. ◦ Instance Type: You can select one or more instance types. For more information, see the *Instance types* chapter of *ECS User Guide*. ◦ System Disk: **SSD Disk** and **Ultra Disk** are supported. **Note** You can select **Enable Backup** to back up disk data.
Worker Instance	You can select **Create Instance** or **Add Existing Instance**.
Worker Configurations	If **Worker Instance** is set to **Create Instance**, set the following parameters: ◦ Instance Type: You can select one or more instance types. For more information, see the *Instance types* chapter of *ECS User Guide*. ◦ Selected Types: The selected instance types are displayed. ◦ Quantity: Set the number of worker nodes. By default, worker nodes are not required in edge Kubernetes clusters. Therefore, the value of this parameter is set to 0. ◦ System Disk: **SSD Disk** and **Ultra Disk** are supported. **Note** You can select **Enable Backup** to back up disk data. ◦ Mount Data Disk: **SSD Disk** and **Ultra Disk** are supported. **Note** ■ You can select **Encrypt Disk** to encrypt disks. ■ You can select **Enable Backup** to back up disk data.
Operating System	The CentOS and Aliyun Linux operating systems are supported.
Network Plug-in	Edge Kubernetes clusters support only Flannel. You do not need to set this parameter.

Parameter	Description
Password	Set a password that is used to log on to the nodes. **Note** The password must be 8 to 30 characters in length, and must contain at least three of the following types of character: uppercase letters, lowercase letters, digits, and special characters.
Confirm Password	Enter the password again.
Pod CIDR Block and Service CIDR	These parameters are optional. For more information, see *Network planning* in *VPC User Guide*. **Note** These parameters are available only when you select an existing VPC.
Configure SNAT	This parameter is optional. If you clear Configure SNAT for VPC, you must create a NAT gateway or configure SNAT rules for the VPC. **Note** For edge Kubernetes clusters, we recommend that you select Configure SNAT for VPC.
Access to the Internet	Specify whether to expose the API server with an elastic IP address (EIP). The Kubernetes API server provides multiple HTTP-based RESTful APIs that can be used to create, delete, modify, query, and watch resource objects such as pods and Services. **Note** We recommend that you expose the API server with an EIP. ◦ If you select this check box, an EIP is created and associated with an internal-facing Server Load Balancer (SLB) instance. Port 6443 used by the API server is exposed on the master nodes. You can connect to and manage the cluster by using kubeconfig over the Internet. ◦ If you clear this check box, no EIP is created. You can connect to and manage the cluster only by using kubeconfig within the VPC.

Parameter	Description
SSH Logon	To enable Secure Shell (SSH) logon, you must first select Expose API Server with EIP. ◦ If you select Use SSH to Access the Cluster from the Internet, you can access the cluster through SSH. ◦ If you clear Use SSH to Access the Cluster from the Internet, you cannot access the cluster through SSH or kubectl. If you want to access an Elastic Compute Service (ECS) instance in the cluster through SSH, you must manually bind an elastic IP address (EIP) to the ECS instance and configure security group rules to open SSH port 22.
Log Service	If you enable Log Service, you can select an existing project or create a project. If you select **Enable Log Service**, the Log Service plug-in is automatically installed in the cluster. If you select **Create Ingress Dashboard**, Ingress access logs are collected and displayed on dashboards.
Deletion Protection	If you select this check box, the cluster cannot be deleted in the console or by calling API operations.
Node Protection	This check box is selected by default to prevent nodes from being accidentally deleted in the console or by calling API operations.

4. Complete advanced settings of the cluster.

Parameter	Description
IP Addresses per Node	The number of IP addresses that is assigned to a node. We recommend that you use the default value.
Custom Image	You can select a custom image. After you select a custom image, all nodes in the cluster are deployed by using this image.
Kube-proxy Mode	**iptables** and **IPVS** are supported. ◦ iptables is a tested and stable kube-proxy mode. It uses iptables rules to conduct service discovery and load balancing. The performance of this mode is limited by the size of the Kubernetes cluster. This mode is suitable for Kubernetes clusters that manage a small number of Services. ◦ IPVS is a high-performance kube-proxy mode. It uses Linux Virtual Server (LVS) to conduct service discovery and load balancing. This mode is suitable for Kubernetes clusters that manage a large number of Services. We recommend that you use this mode in scenarios where high-performance load balancing is required.
Node Port Range	Specify the value of **Node Port Range**.

Parameter	Description
Taints	Add taints to all of the worker nodes in the cluster. We recommend that you do not add additional taints in case the system components cannot be deployed in the edge Kubernetes cluster.
CPU Policy	Specify the CPU policy. Valid values: ○ None: indicates that the default CPU affinity is used. This is the default policy. ○ Static: allows pods with specific resource characteristics on the node to be granted with enhanced CPU affinity and exclusivity.
Cluster Domain	The default domain name of the cluster is cluster.local. You can specify a custom domain name.
Cluster CA	Specify whether to enable the cluster CA certificate.
User Data	Customize the startup behaviors of ECS instances and import data to the ECS instances. The user data can be used to perform the following operations: ○ Run scripts during instance startup. ○ Import user data as normal data to an ECS instance for future reference.

5. Click **Create Cluster** in the upper-right corner of the page.
6. On the **Confirm** page, after all check items are verified, select the terms of service and disclaimer and click **OK** to start the deployment.

Result

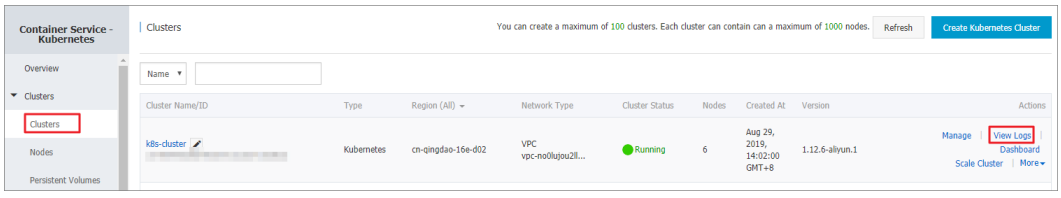
After the cluster is created, you can find the cluster on the **Clusters** page in the Container Service console.

3.6.2.3. View log files of a cluster

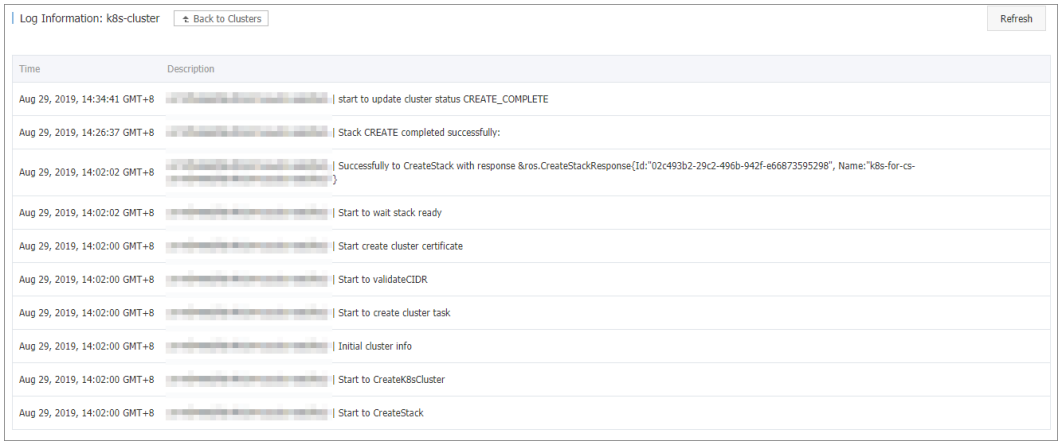
You can view the operation log of a cluster in the Container Service console.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. Find the cluster that you want to manage and click **View Logs** in the Actions column.



You can view operations performed on the cluster.



3.6.2.4. Connect to a cluster through kubectl

You can use the Kubernetes command line tool, kubectl, to connect to a Kubernetes cluster from a local computer.

Procedure

1. Download the latest kubectl client from the Kubernetes change log page.
2. Install and set up the kubectl client.

   For more information, see Install and set up kubectl.
3. Configure the cluster credentials.

   You can use the `scp` command to securely copy the master node configuration file from the `/etc/kubernetes/kube.conf` directory of the master VM and paste it to the `$HOME/.kube/config` directory of the local computer, where the `kubectl` credentials are expected to be stored.

   ```
   mkdir $HOME/.kube
   scp root@<master-public-ip>:/etc/kubernetes/kube.conf $HOME/.kube/config
   ```

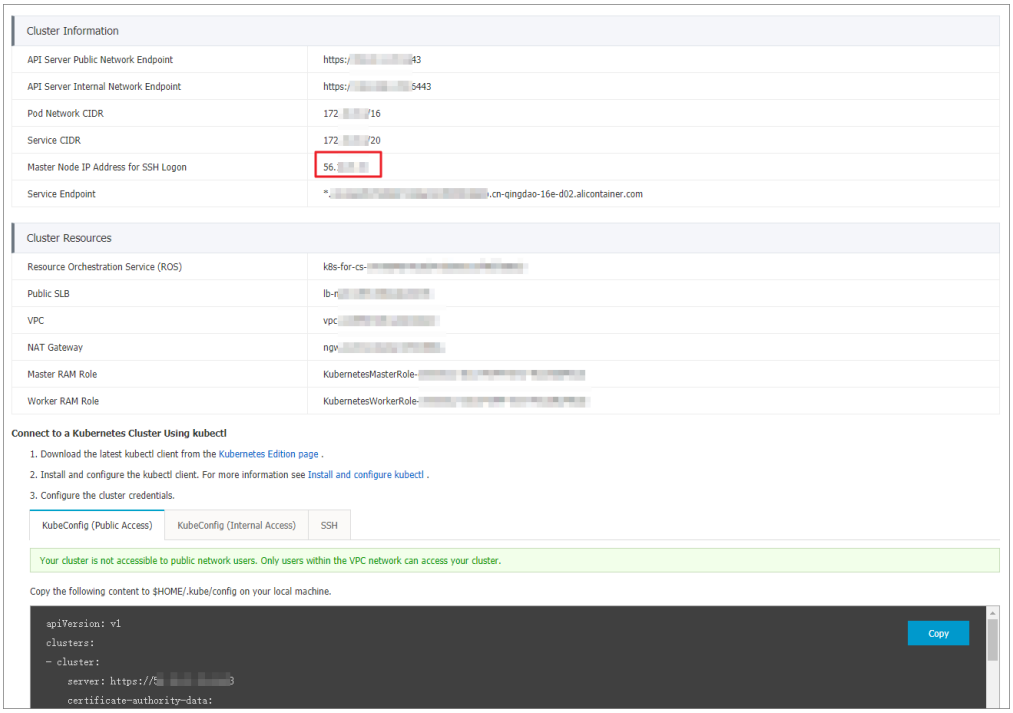
   You can find `master-public-ip` on the cluster details page.

   i. Log on to the Container Service console.

   ii. In the left-side navigation pane, click **Clusters**. The Clusters page appears.

iii. Find the target cluster and click **Manage** in the Actions column.

In the **Cluster Information** section, you can find the master node IP address.



3.6.2.5. Connect to a master node by using SSH

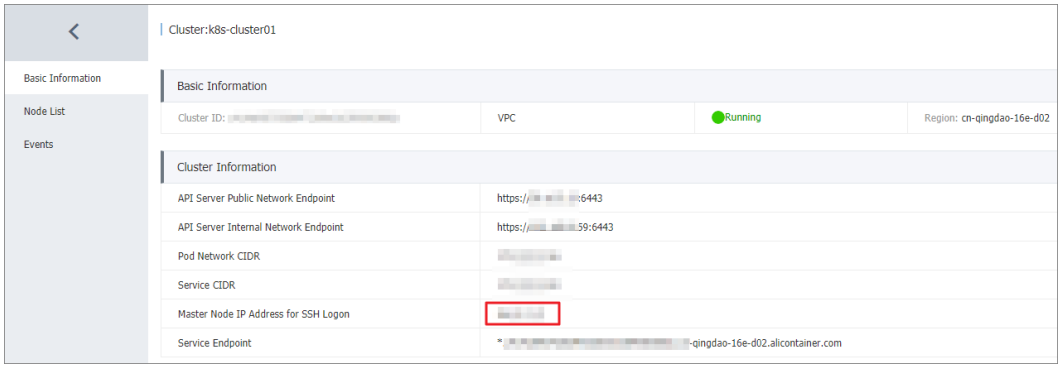
You can access a master node in a cluster by using a Secure Shell (SSH) client.

Prerequisites

- A Kubernetes cluster is created and **Use SSH to Access the Cluster from the Internet** is selected for the cluster. For more information, see Create a Kubernetes cluster.
- The SSH client can connect to the network where the cluster is deployed.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, choose **Clusters** > **Clusters** to go to the Clusters page. Find the cluster that you want to manage, and click Manage in the Actions column for the cluster.
3. The Basic Information page appears. In the Cluster Information section, you can find the IP address that is displayed in the **Master Node IP Address for SSH Logon** field.



4. Use SSH to connect to the cluster from an SSH client that has access to the cluster network.
   - If you have a leased line that connects to the cluster network over the Internet, you can use tools such as PuTTY to create an SSH connection.
   - If you have an Elastic Compute Service (ECS) instance that is connected to the Virtual Private Cloud (VPC) network of the cluster, run the following command to create an SSH connection:

     ```
     ssh   root@ssh_ip          #ssh_ip specifies the IP address of the master node for SSH connection.
     ```

3.6.2.6. Expand a cluster

This topic describes how to scale out the worker nodes of a Kubernetes cluster in the Container Service console.

Context

You cannot scale out the master nodes of a Kubernetes cluster.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to expand and choose **More > Expand** in the **Actions** column.
4. On the **Node Pools** page, select the node pool that you want to scale out and click **Scale Out** in the **Actions** column.
5. Go to the Expand page and set the required parameters.

   In this example, the number of worker nodes in the cluster is increased from three to five. The following table describes the required parameters.

Parameter	Description
Nodes to Add	Specify the number of nodes to be added to the cluster.
Region	By default, the region where the cluster is deployed is displayed.
Container Runtime	By default, the container runtime of the cluster is displayed.
VPC	By default, the virtual private cloud (VPC) of the cluster is displayed.
VSwitch	Select one or more vSwitches for the cluster. You can select at most three vSwitches that are deployed in different **zones**.
Instance Type	You can select one or more instance types. For more information, see the *Instance types* topic of *ECS User Guide*.
Selected Types	The selected instance types.
System Disk	Standard SSDs, enhanced SSDs (ESSDs), and ultra disks are supported.
Mount Data Disk	Standard SSDs, ESSDs, and ultra disks are supported.
Operating System	The operating system of the cluster.
Password	◦ **Password**: Enter the password that is used to log on to the nodes. ◦ **Confirm Password**: Enter the password again.

Parameter	Description
ECS Label	You can add labels to the ECS instances.
Node Label	Add labels to nodes.
Taints	Add taints to the worker nodes in the cluster.
Custom Image	You can select a custom image. After you select a custom image, all nodes in the cluster are deployed by using this image.
RDS Whitelist	Set the Relational Database Service (RDS) whitelist. Add the IP addresses of the nodes in the cluster to the RDS whitelist.
User Data	Customize the startup behaviors of ECS instances and import data to the ECS instances. The user data can be used in the following ways: ○ Run scripts during instance startup. ○ Import user data as normal data to an ECS instance for future reference.

6. Click **Submit**.

What's next

After the cluster is expanded, choose **Nodes > Nodes** in the left-side navigation pane. On the Nodes page, you can find that the number of worker nodes is increased from 3 to 5.

3.6.2.7. Renew a certificate

This topic describes how to renew a Kubernetes cluster certificate in the console.

Prerequisites

A Kubernetes cluster is created and the cluster certificate is about to expire.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. Select the cluster for which you want to renew the certificate and click **Update Certificate**. The **Update Certificate** message appears.

   > **Note** The **Update Certificate** button will be displayed two months before your cluster certificate expires.

4. Click **Update** and the **Confirm** page appears.
5. Click **OK**.

Result

- On the **Update Certificate** page, the following message appears: **The certificate has been updated**.
- On the **Clusters** page, the **Update Certificate** button disappears.

3.6.2.8. Delete a Kubernetes cluster

This topic describes how to delete a Kubernetes cluster in the Container Service console.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to delete and choose **More > Delete** in the **Actions** column.
4. In the **Delete Cluster** dialog box that appears, select the resources that you want to retain, select **I understand the above information and want to delete the specified cluster**, and then click **OK**.

What's next

Resource Orchestration Service (ROS) does not have permissions to delete resources that are manually added to resource created by ROS. For example, if you manually add a vSwitch to a virtual private cloud (VPC) created by ROS, ROS cannot delete the VPC and therefore the cluster cannot be deleted.

Container Service allows you to forcibly delete clusters. If your first attempt to delete a cluster fails, you can forcibly delete the cluster and ROS resource stack. However, you still need to manually release the resources that are manually added.

An error message appears when an attempt to delete a cluster fails.

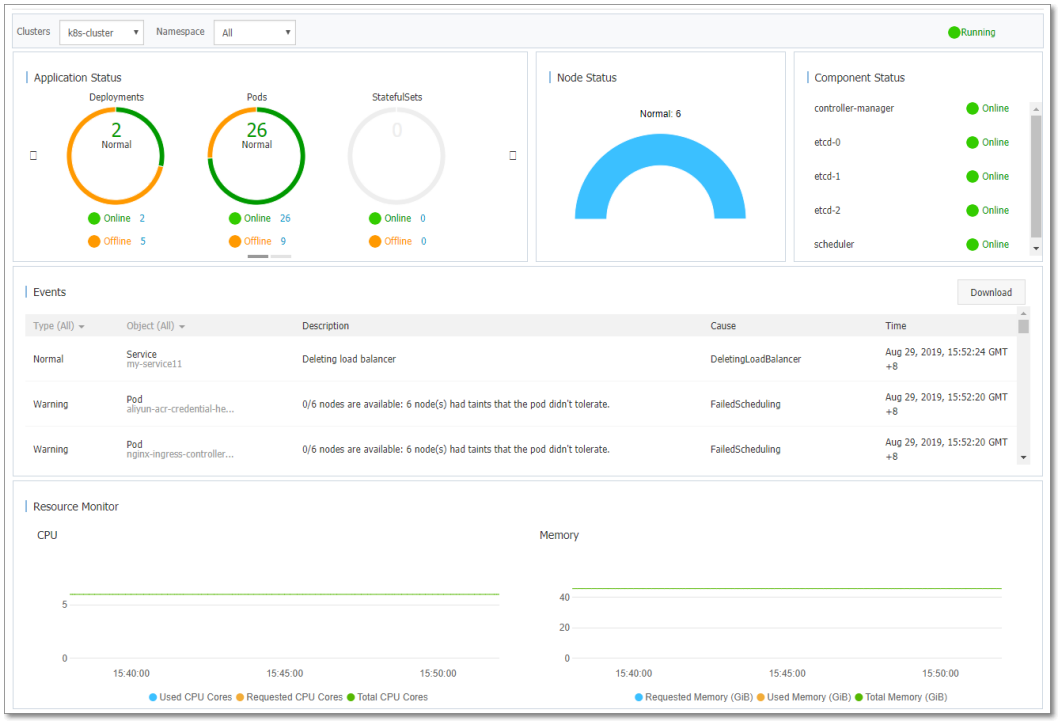
Select the cluster that you failed to delete and choose **More > Delete** in the Actions column. In the dialog box that appears, you can view the resources that are manually added. Select the **Force Delete** check box and click **OK** to delete the cluster and ROS resource stack.

3.6.2.9. View cluster overview

The Container Service console provides a cluster overview page. This page displays the information such as application status, component status, and resource monitoring status. This allows you to check the health status of your cluster at your convenience.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Overview**. The Overview page appears.
3. Select the target cluster and namespace. You can view the application status, component status, and resource monitoring charts.
   - **Application Status**: displays the statuses of the deployments, pods, and replica sets that are running in the cluster. Green sections indicate a normal state and yellow sections indicate an exception state.
   - **Node Status**: displays the statuses of the nodes in the cluster.
   - **Component Status**: Components are deployed in the kube-system namespace. Core components are used, such as the scheduler, controller-manager, and etcd.
   - **Events**: displays events such as warnings and errors. If no events are displayed, the cluster is running in the normal state.
   - **Monitoring**: displays CPU and memory monitoring charts. CPU usage is measured in cores or millicores and accurate to three decimal places. A millicore is one thousandth of a core. Memory usage is measured in GiB and accurate to three decimal places. For more information, see Meaning of CPU and Meaning of memory.



3.6.3. Nodes

3.6.3.1. Add existing nodes to a Kubernetes cluster

Container Service allows you to add an existing Elastic Compute Service (ECS) instance to a Kubernetes cluster. You can add only worker nodes to clusters.

Prerequisites

- A Kubernetes cluster is created. For more information, see Log on to the Container Service console.
- An ECS instance is created. Make sure that the region, zone, organization, project, security group, virtual private cloud (VPC), and operating system settings of the ECS instance are the same as those of the cluster.

Context

- By default, a cluster can contain at most 50 nodes. To increase the quota, submit a ticket.
- The ECS instance that you add must be in the same region and VPC as the cluster.
- The ECS instance must belong to the same Apsara Stack tenant account as the cluster.
- The ECS instance must be running the CentOS operating system.

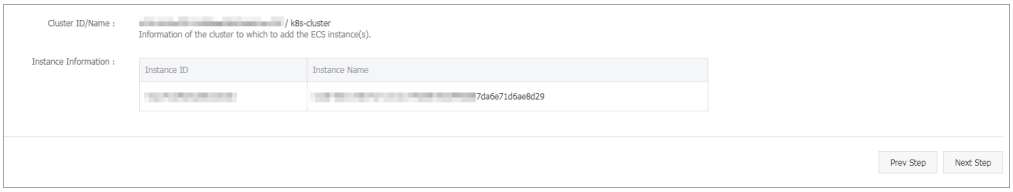
Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Nodes > Nodes**.
5. In the upper-right corner of the page, click **Add Existing Node**.
6. On the page that appears, you can manually add existing ECS instances to the cluster.

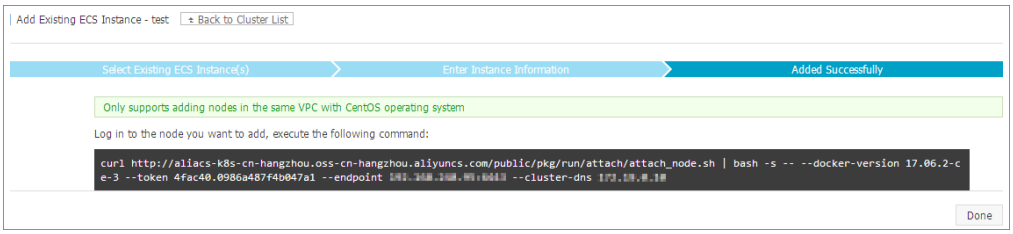
   To manually add an ECS instance, you must obtain the installation command and log on to the ECS instance to run the command. You can add only one ECS instance at a time.

i. Select **Manual**, find and select the ECS instance that you want to add, and then click **Next Step**. You can add only one ECS instance at a time.

ii. Confirm the instance information and click **Next Step**.



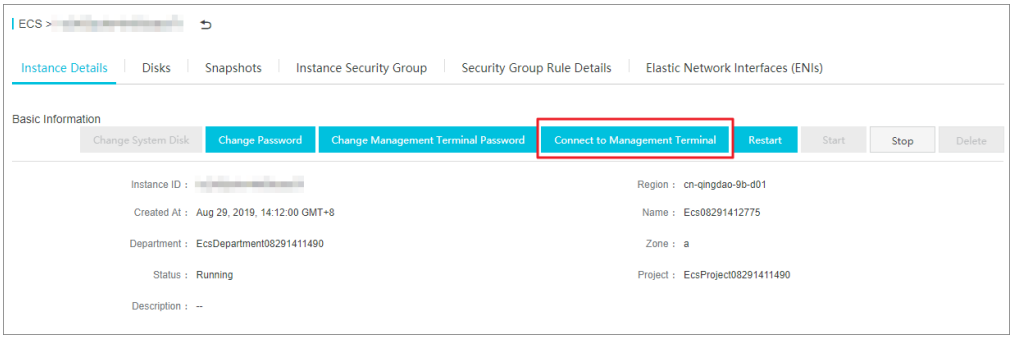
iii. On the Complete wizard page, copy the command.

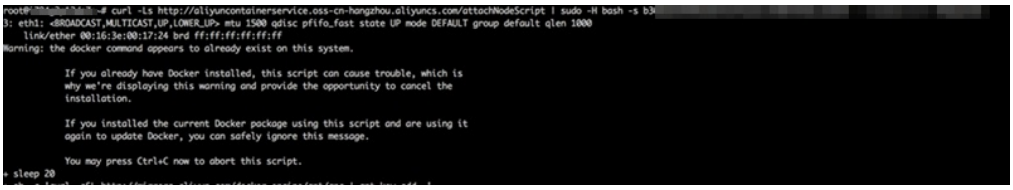


iv. Click **Done**.

v. Go to the Apsara Uni-manager Management Console. In the top navigation bar, choose **Products > Elastic Compute Service**. On the **Instances** page, select the organization and region of the cluster, and then find the ECS instance that you want to add to the cluster.

vi. Click the instance name to go to the Instance Details tab. Click **Connect to VNC**. In the dialog box that appears, enter the VNC password and then click **OK**. After you log on to the instance, paste the copied command and click **OK** to run the script.





vii. After the script is executed, the ECS instance is added to the cluster. You can go to the Clusters page and click the cluster ID to view nodes in the cluster. Check whether the ECS instance has been added to the cluster.

3.6.3.2. Add nodes to an edge Kubernetes cluster

You can add worker nodes to an edge Kubernetes cluster in the Container Service console. However, you must make sure that the added nodes can communicate with the Kubernetes API server of the cluster. This topic describes how to add nodes to an edge Kubernetes cluster.

Prerequisites

Create an edge Kubernetes cluster

Context

By default, a cluster can contain at most 50 nodes.

Procedure

1. Log on to the Container Service console
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, click the name of the cluster that you want to manage.
4. In the left-side navigation pane of the cluster details page, choose **Nodes > Nodes**. On the page that appears, click **Add Existing Node** in the upper-right corner.
5. On the **Select Existing ECS Instance** wizard page, click **Next Step**.

   You can only manually add nodes to edge Kubernetes clusters.
6. On the **Specify Instance Information** wizard page, set the parameters and click **Next Step**.

Parameter	Description	Default
flannelIface	The name of the network interface controller (NIC) that is used by the Flannel plug-in.	The name of the NIC that is specified in the default route entry of the node.
enableIptables	Specifies whether to enable iptables.	false
quiet	Specifies whether to answer all questions with yes when you add nodes.	false
manageRuntime	Specifies whether to use edgeadm to install and manage the runtime.	false
nodeNameOverride	The name of the node.	○ "". This is the default value. This value specifies that the hostname is used as the node name. ○ "*". This value specifies that a random string that contains six characters is used as the node name. ○ "*."*.XXX". This value specifies that a random string that is followed by a suffix is used as the node name. The random string contains six characters.
allowedClusterAddons	The list of add-ons to be installed. By default, this parameter is empty. This indicates that no add-on is installed. For a standard edge node, set this parameter to ["kube-proxy","flannel","coredns"].	[]

Parameter	Description	Default
gpuVersion	Specifies whether the node to be added is a GPU-accelerated node. By default, this parameter is empty. Supported GPU models are Nvidia_Tesla_T4, Nvidia_Tesla_P4, and Nvidia_Tesla_P100.	"". This is the default value. This value specifies that the node to be added is not a GPU-accelerated node.
inDedicatedNetwork	Specifies whether an Express Connect circuit is used to connect to the managed edge Kubernetes cluster.	false
labels	Specifies the labels to be added to the node.	{}
annotations	Specifies the annotations to be added to the node.	{}
nodeIface	This parameter specifies the following information: ○ Specifies the node IP address that kubelet retrieves from the specified network interface. If you do not specify this parameter, kubelet attempts to retrieve the node IP address in the following order: ■ Searches */etc/hosts* for the node whose name is the same as the specified hostname. ■ Finds the IP address of the network interface that is specified in the default route entry of the node. ○ Specifies the name of the NIC that is used by the Flannel plug-in. In this case, this parameter is equivalent to the flannelIface parameter. This parameter will soon replace the flannelIface parameter.	""

7. On the **Complete** wizard page, copy the script to the node that you want to add to the edge Kubernetes cluster and click **Done**.

8. Log on to the edge node and execute the script. This way, the node is added to the edge Kubernetes cluster.

3.6.3.3. View nodes

You can view nodes of a Kubernetes cluster by using the Container Service console, kubectl, or Kubernetes Dashboard.

View nodes by using kubectl

> **Note** To view the nodes in a cluster by using kubectl, you must Connect to a Kubernetes cluster through kubectl.

Connect to a cluster by using kubectl and run the following command to view the nodes in the cluster:

```
kubectl get nodes
```

Sample output:

```
$ kubectl get nodes
  NAME           STATUS   AGE    VERSION
  iz2ze2n6ep53tch701yh9zz  Ready   19m    v1.6.1-2+ed9e3d33a07093
  iz2zeafr762wibijx39e5az  Ready   7m     v1.6.1-2+ed9e3d33a07093
  iz2zeafr762wibijx39e5bz  Ready   7m     v1.6.1-2+ed9e3d33a07093
  iz2zef4dnn9nos8elyr32kz  Ready   14m    v1.6.1-2+ed9e3d33a07093
  iz2zeitvvo8enoreufstkmz  Ready   11m    v1.6.1-2+ed9e3d33a07093
```

View nodes by using the Container Service console

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Nodes > Nodes** to view the nodes in the cluster.

3.6.3.4. Manage node labels

You can manage node labels in the Container Service console. You can add a label to multiple nodes at a time, filter nodes by label, and delete labels.

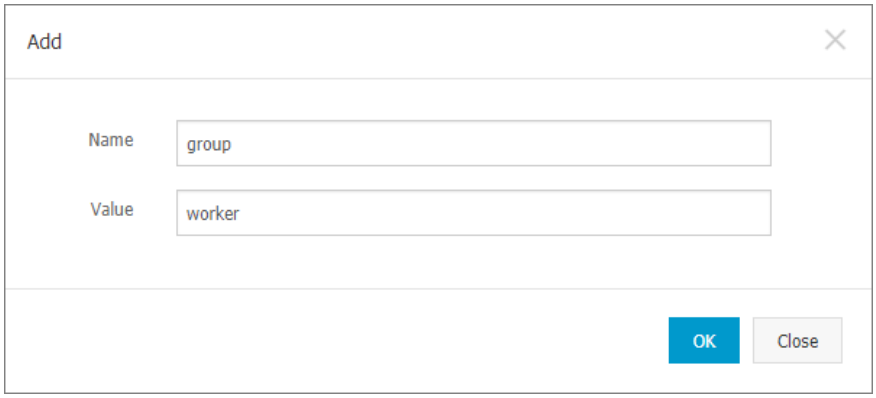
You can use labels to schedule nodes. For more information, see Set node scheduling.

Prerequisites

A Kubernetes cluster is created. For more information, see Create a Kubernetes cluster.

Add a label to multiple nodes at a time

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Nodes > Nodes**.
5. On the **Nodes** page, click **Manage Labels and Taints** in the upper-right corner.
6. Select multiple nodes and click **Add Label**.
7. In the dialog box that appears, enter the name and value of the label and click **OK**.



On the Labels tab, you can find that the selected nodes have the same label.

Delete a label

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Nodes > Nodes**.
5. On the **Nodes** page, click **Manage Labels and Taints** in the upper-right corner.
6. Select a node, find the label that you want to delete, and then click the icon. In the message that appears, click **Confirm**.

   After the label is deleted, it is removed from the Labels column.

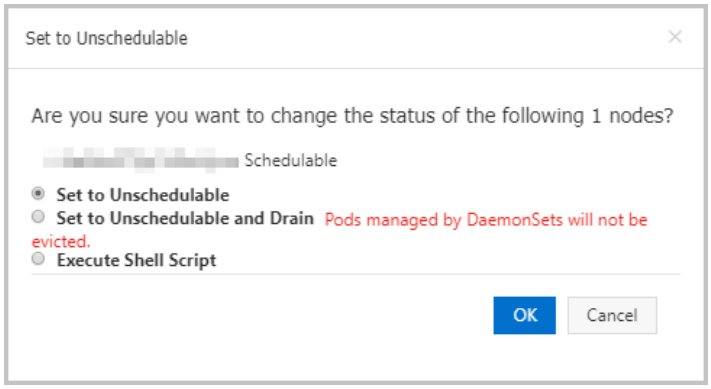
3.6.3.5. Set node schedulability

You can mark a node as schedulable or unschedulable in the Container Service console. This allows you to optimize the distribution of the loads on each node. This topic describes how to set node schedulability.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Nodes > Nodes**.
5. On the Nodes page, select the node that you want to manage and click **Drain/Set to Unschedulable** in the Actions column.
6. In the dialog box that appears, you can change the status of the node.
   - If you select **Set to Unschedulable**, pods will not be scheduled to this node when you deploy new applications.
   - If you select **Set to Unschedulable and Drain**, pods will not be scheduled to this node when you deploy new applications. Pods on this node will be evicted, except for the pods that are managed by DaemonSets.

     In this example, **Set to Unschedulable** is selected.



7. Click **OK**.

   The status of the node is changed to Unschedulable.

What's next

Pods will not be scheduled to the node when you deploy new applications.

3.6.3.6. Remove a node

To restart or release an Elastic Compute Service (ECS) node in a cluster, you must first remove the node from the cluster. This topic describes how to remove a node.

Prerequisites

- A Kubernetes cluster is created. For more information, see Create a Kubernetes cluster.
- You can connect to the Kubernetes cluster by using kubectl. For more information, see Connect to a Kubernetes cluster through kubectl.

Context

- When you remove a node, pods that run on the node are migrated to other nodes. This may cause service interruption. We recommend that you remove nodes during off-peak hours.
- Unknown errors may occur when you remove nodes. Before you remove nodes, we recommend that you back up data on these nodes.
- Nodes remain in the unschedulable state when they are being removed.
- You can remove only worker nodes. You cannot remove master nodes.

Procedure

1. Run the following command to migrate the pods on the node that you want to remove to other nodes.

   > **Note** Make sure that the other nodes have sufficient resources for these pods.

   ```
   kubectl drain node-name
   ```

   > **Note** *node-name* must be in the format of *your-region-name.node-id*.
   >
   > - *your-region-name* specifies the region where the cluster that you want to manage is deployed.
   > - *node-id* specifies the ID of the ECS instance where the node to be removed is deployed. Example: *cn-hanghzou.i-xxx*.

2. Log on to the Container Service console.
3. In the left-side navigation pane, click **Clusters**.

4. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
5. In the left-side navigation pane of the details page, choose **Nodes > Node**.
6. Find the node that you want to remove and choose **More > Remove** in the **Actions** column.

   > **Note** To remove multiple nodes at a time, select the nodes that you want to remove on the **Nodes** page and click **Batch Remove**.

7. (Optional)Set parameters in the Remove Node dialog box.
   - Select **Drain the Node** to migrate the pods on the node to other nodes. If you select this option, make sure that the other nodes have sufficient resources for these pods.
   - Select **Release ECS Instance** to release the ECS instance where the node is deployed.

   > **Note**
   > - Select this option to release only pay-as-you-go ECS instances.
   > - Subscription ECS instances are automatically released after the subscription expires.
   > - If you do not select **Release ECS Instance**, you are still billed for the ECS instance where the node is deployed.

8. In the **Remove Node** message, click **OK**.

3.6.3.7. View node resource usage

You can view the resource usage of the nodes in a cluster in the Container Service console.

Prerequisites

A Kubernetes cluster is created. For more information, see Create a Kubernetes cluster.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Nodes > Nodes**.
5. On the Nodes page, find the node that you want to manage and choose **More > Details** in the **Actions** column.

   You can view the request rate and usage rate of CPU and memory resources on each node.
   - CPU request rate = sum (The amount of CPU resources requested by all pods on the node) / Total CPU resources of the node
   - CPU usage rate = sum (The amount of CPU resources used by all pods on the node) / Total CPU resources of the node
   - Memory request rate = (The amount of memory resources requested by all pods on the node) / Total memory resources of the node
   - Memory usage rate = sum (The amount of memory resources used by all pods on the node) / Total memory resources of the node

> **Note**
> - You can adjust the workload of a node based on the resource usage. For more information, see Set node scheduling.
> - When the request or usage rate of a node reaches 100%, pods are not scheduled to the node.

3.6.3.8. Upgrade the NVIDIA driver on a GPU node

This topic describes how to upgrade the NVIDIA driver on a GPU node when workloads are deployed on the node and when no workload is deployed on the node.

Upgrade the NVIDIA driver on a GPU node where workloads are deployed

1. Connect to a Kubernetes cluster through kubectl
2. Run the following command to set the target node to unschedulable.

   ```
   kubectl cordon node-name
   ```

   > **Note**
   > - Currently, you can only upgrade the NVIDIA driver on worker nodes.
   > - *node-name* must be in the format of *your-region-name.node-id*.
   >   - *your-region-name* represents the region where your cluster is deployed.
   >   - *node-id* represents the ID of the ECS instance where the target node is deployed.
   >
   > You can run the following command to query *node-name*.
   >
   > ```
   > kubectl get node
   > ```

   ```
   [root@gpu-test ~]# kubectl cordon cn-hangzhou.i-
   node/cn-hangzhou.i-                    already cordoned
   ```

3. Run the following command to migrate pods from the target node to other nodes:

   ```
   kubectl drain node-name --grace-period=120 --ignore-daemonsets=true
   ```

   ```
   [root@gpu-test ~]# kubectl drain cn-hangzhou.i-                    --grace-period=120 --ignore-daemonsets=true
   node/cn-hangzhou.i-                    cordoned
   WARNING: Ignoring DaemonSet-managed pods: flexvolume-      , kube-flannel-ds-      , kube-proxy-worker-      , logtail-ds-
   pod/domain-nginx-                    evicted
   pod/old-nginx-                    evicted
   pod/new-nginx-                    evicted
   pod/old-nginx-                    evicted
   ```

4. Run the following command to log on to the target node:

   ```
   ssh root@xxx.xxx.x.xx
   ```

5. Run the following command to check the current NVIDIA driver version:

   ```
   nvidia-smi
   ```

```
[root@                    ~]# nvidia-smi
Fri Jan 18 16:44:52 2019
+-----------------------------------------------------------------------------+
| NVIDIA-SMI 384.111                Driver Version: 384.111                   |
|-------------------------------+----------------------+----------------------+
| GPU  Name        Persistence-M| Bus-Id        Disp.A | Volatile Uncorr. ECC |

|===============================+======================+======================|
|   0  Tesla P4            On   | 00000000:00:08.0 Off |                    0 |
| N/A   24C    P8     6W /  75W |      0MiB /  7606MiB |      0%      Default |
+-------------------------------+----------------------+----------------------+

+-----------------------------------------------------------------------------+
| Processes:                                                       GPU Memory |
|  GPU       PID   Type   Process name                             Usage      |
|=============================================================================|
|  No running processes found                                                 |
+-----------------------------------------------------------------------------+
```

6. Run the following commands to uninstall the existing driver:

   > **Note**
   > - If your driver version is *384.111*, perform the following steps.
   > - If your driver version is not *384.111*, download the corresponding driver from the official NVIDIA website first.

   ```
   cd /tmp
   ```

   ```
   curl -O https://cn.download.nvidia.cn/tesla/384.111/NVIDIA-Linux-x86_64-384.111.run
   ```

   ```
   chmod u+x NVIDIA-Linux-x86_64-384.111.run
   ```

   ```
   ./NVIDIA-Linux-x86_64-384.111.run --uninstall -a -s -q
   ```

7. Run the following command to restart the target node:

   ```
   reboot
   ```

8. Download the driver that you want to use from the official NVIDIA website. In this example, version *410.79* is used.
9. Run the following command to install the downloaded driver under the directory where it was saved:

   ```
   sh ./NVIDIA-Linux-x86_64-410.79.run -a -s -q
   ```

10. Run the following commands to configure the driver:

    ```
    nvidia-smi -pm 1 || true
    ```

    ```
    nvidia-smi -acp 0 || true
    ```

11. Run the following commands to update device-plugin:

    ```
    mv /etc/kubernetes/manifests/nvidia-device-plugin.yml /
    ```

    ```
    mv /nvidia-device-plugin.yml /etc/kubernetes/manifests/
    ```

12. Log on to a master node and run the following command to set the target node to schedulable:

    ```
    kubectl uncordon node-name
    ```

Result

Run the following command on a master node to check the NVIDIA driver version on the target node. The driver version is now *410.79*.

> **Note** Replace *node-name* with the target node name.

```
kubectl exec -n kube-system -t nvidia-device-plugin-node-name nvidia-smi
```

```
[root@gpu-test ~]#  kubectl exec -n kube-system -t nvidia-device-plugin-cn-[redacted] nvid
ia-smi

3.6.3.9. GPU scheduling for Kubernetes clusters with GPU-accelerated nodes

This topic describes GPU scheduling for Kubernetes clusters with GPU-accelerated nodes.

Prerequisites

Container Service, Resource Orchestration Service (ROS), and Resource Access Management (RAM) are activated.

> **Note** Container Service uses ROS to deploy applications in Kubernetes clusters. To create a Kubernetes cluster, you must first activate ROS.

Context

Starting from version 1.8, Kubernetes adds support for the following hardware acceleration devices by using device plug-ins: NVIDIA GPUs, InfiniBand devices, and field-programmable gate arrays (FPGAs). GPU solutions developed by the community will be phased out in version 1.10, and removed from the master code in version 1.11. Container Service enables you to use a Kubernetes cluster with GPU-accelerated nodes to run compute-intensive tasks such as machine learning and image processing. You can deploy applications and achieve auto scaling without the need to install NVIDIA drivers or Compute Unified Device Architecture (CUDA) in advance.

The system performs the following operations when a Kubernetes cluster is created:

- Creates Elastic Compute Service (ECS) instances, configures a public key to enable Secure Shell (SSH) logon from master nodes to other nodes, and then configures the Kubernetes cluster through CloudInit.
- Creates a security group that allows access to the virtual private cloud (VPC) over Internet Control Message Protocol (ICMP).
- If you do not specify an existing VPC, the system creates a VPC and a vSwitch and creates SNAT entries for the vSwitch.
- Adds route entries to the VPC.
- Creates a NAT gateway and an elastic IP address (EIP).
- Creates a RAM user and grants it permissions to query, create, and delete ECS instances, and permissions to add and delete disks. The RAM user is also granted full permissions on Server Load Balancer (SLB) instances, CloudMonitor, VPC, Log Service, and Apsara File Storage NAS (NAS). The system also creates an AccessKey pair for the RAM user. The system automatically creates SLB instances, disks, and VPC route entries based on your configuration.
- Creates an internal-facing SLB instance and opens port 6443.
- Creates an Internet-facing SLB instance and open ports 6443, 8443, and 22. If you enable SSH logon when you create the cluster, port 22 is open. Otherwise, port 22 is not open.

Limits

- Kubernetes clusters support only VPCs.
- By default, you can create only a limited amount of cloud resources with each account. You cannot create clusters if the quota on clusters is reached. Make sure that you have sufficient quota before you create a cluster. To request a quota increase, submit a ticket.
  - By default, you can create at most five clusters across all regions with each account. Each cluster can contain at most 40 nodes. To increase the quota of clusters or nodes, submit a ticket.

    > **Note** In a Kubernetes cluster, you can create at most 48 route entries for each VPC. This means that a cluster can contain at most 48 nodes. To increase the quota of nodes, submit a ticket to increase the quota of route entries first.

  - By default, you can create at most 100 security groups with each account.
  - By default, you can create at most 60 pay-as-you-go SLB instances with each account.
  - By default, you can create at most 20 EIPs with each account.
- Limits on ECS instances:

  Only CentOS is supported.

Create a GN5 Kubernetes cluster

GN5 Kubernetes clusters support only Kubernetes 1.12.6-aliyun.1. Kubernetes 1.11.5 is not supported.

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. In the upper-right corner of the **Clusters** page, click **Create Kubernetes Cluster**.

   On the cluster configuration page, set the parameters.

   > **Note** To create a cluster with GPU-accelerated nodes, select GPU-accelerated ECS instance types as worker nodes. For more information about other parameters, see Cluster parameters.

4. Configure worker nodes. In this example, worker nodes are used to run GPU computing tasks and the gn5i-c4gi1 instance type is selected.
   i. If you choose to create worker instances, you must set Instance Type and Quantity. In this example, three GPU-accelerated worker nodes are created.

   
   > **Note** We recommend that you use standard SSDs.

   ii. If you choose to add existing instances, you must create GPU-accelerated ECS instances in the region where you want to create the cluster in advance.
5. Specify the other parameters and click **Create Cluster** to start the deployment.

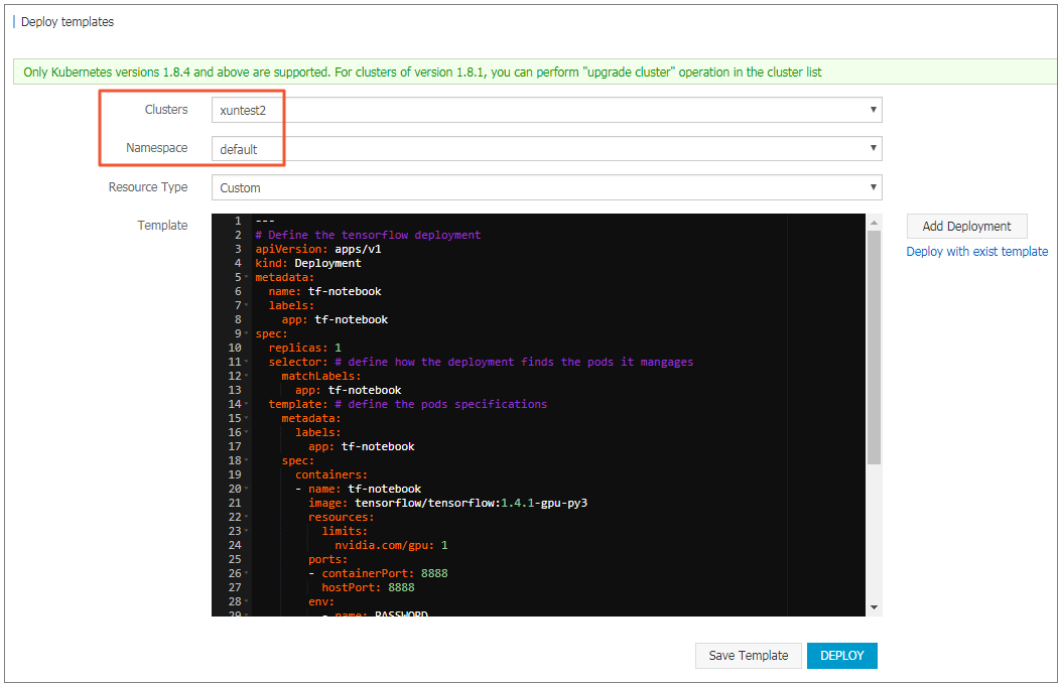
   After the cluster is created, choose **Clusters > Nodes** to go to the Nodes page.

   Select a worker nodes that was configured for the cluster and choose **More > Details** in the Actions column to view the GPU devices that are attached to the node.

Create a GPU experimental environment to run TensorFlow

Jupyter is a standard tool that is used by data scientists to create an experimental environment to run TensorFlow. The following example shows how to deploy a Jupyter application.

1. Log on to the Container Service console. In the left-side navigation pane, choose **Applications > Deployments** to go to the **Deployments** page.
2. In the upper-right corner of the page, click **Create from Template**.
3. Select the required cluster and namespace. Select a sample template, or set Sample Template to Custom and customize the template in the Template field. Then, click **Create** to create the application.

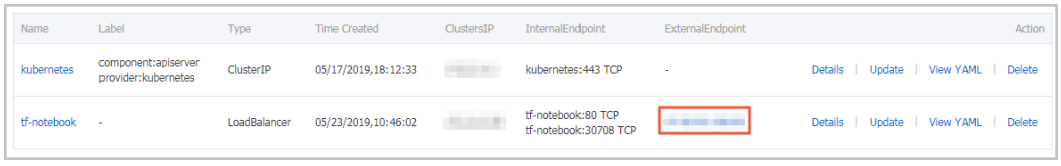


```
---
# Define the tensorflow deployment
apiVersion: apps/v1
kind: Deployment
metadata:
  name: tf-notebook
  labels:
    app: tf-notebook
spec:
  replicas: 1
  selector: # define how the deployment finds the pods it mangages
    matchLabels:
      app: tf-notebook
  template: # define the pods specifications
    metadata:
      labels:
        app: tf-notebook
    spec:
      containers:
      - name: tf-notebook
        image: tensorflow/tensorflow:1.4.1-gpu-py3
        resources:
          limits:
            nvidia.com/gpu: 1
        ports:
        - containerPort: 8888
          hostPort: 8888
        env:
```

In this example, the template uses a Deployment and a Service to create a Jupyter application.

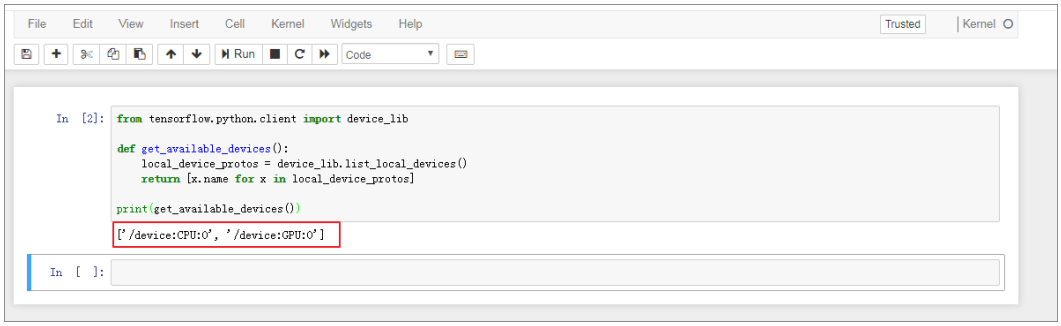
```
---
# Define the tensorflow deployment
apiVersion: apps/v1
kind: Deployment
metadata:
 name: tf-notebook
 labels:
  app: tf-notebook
spec:
 replicas: 1
 selector: # define how the deployment finds the pods it manages
  matchLabels:
   app: tf-notebook
 template: # define the pods specifications
  metadata:
   labels:
    app: tf-notebook
  spec:
   containers:
   - name: tf-notebook
    image: tensorflow/tensorflow:1.4.1-gpu-py3
    resources:
     limits:
      nvidia.com/gpu: 1              #The number of NVIDIA GPUs that are requested by the application.
    ports:
    - containerPort: 8888
     hostPort: 8888
    env:
     - name: PASSWORD                #The password that is used to access the Jupyter application. You can modify th
e password as required.
       value: mypassw0rd
# Define the tensorflow service
---
apiVersion: v1
kind: Service
metadata:
 name: tf-notebook
spec:
 ports:
 - port: 80
  targetPort: 8888
  name: jupyter
 selector:
  app: tf-notebook
 type: LoadBalancer               #An SLB instance is used to route internal traffic and perform load balancing.
```

4. In the left-side navigation pane, choose **Ingresses and Load Balancing > Services**. Select the required cluster and namespace, find the tf-notebook Service, and then check its external endpoint.



5. To connect to the Jupyter application, enter `http://EXTERNAL-IP` into the address bar of your browser and enter the password specified in the template.
6. You can run the following program to verify that the Jupyter application is allowed to use GPU resources. The program lists all devices that can be used by TensorFlow:

```
from tensorflow.python.client import device_lib
def get_available_devices():
  local_device_protos = device_lib.list_local_devices()
  return [x.name for x in local_device_protos]
print(get_available_devices())
```



3.6.3.10. Use labels to schedule pods to GPU-accelerated nodes

To use Kubernetes clusters for GPU computing, you must schedule pods to GPU-accelerated nodes. Container Service allows you to schedule pods to specific GPU-accelerated nodes by adding labels to the GPU-accelerated nodes.

Context

When Kubernetes deploys nodes with NVIDIA GPUs, the attributes of these GPUs are discovered and exposed as node labels. These labels have the following benefits:

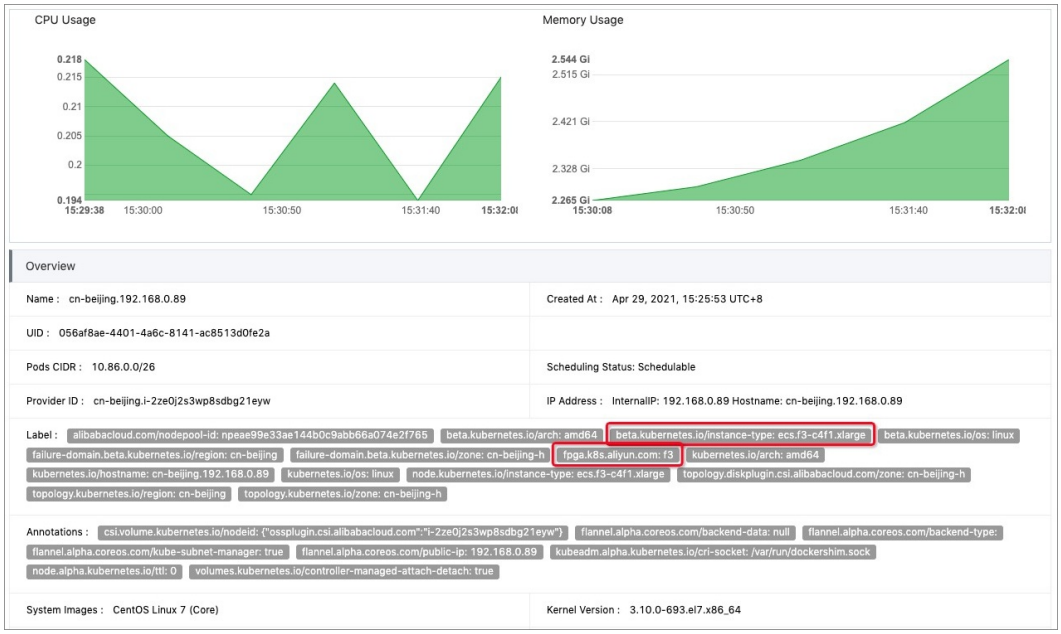
- You can use the labels to filter GPU-accelerated nodes.
- The labels can be used as conditions to schedule pods.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Nodes > Nodes**.

   > **Note** In this example, the Kubernetes cluster contains three master nodes, among which two are equipped with GPUs. Record the node IP addresses.

5. On the **Nodes** page, select the node that is equipped with GPUs and choose **More > Details** in the Actions column to view the labels that are added to the node.



You can also log on to a master node and run the following command to view the labels of GPU-accelerated nodes:

```
# kubectl get nodes
NAME                    STATUS   ROLES    AGE    VERSION
cn-beijing.i-2ze2dy2h9w97v65u****  Ready    master   2d     v1.12.6-aliyun.1
cn-beijing.i-2ze8o1a45qdv5q8a****  Ready    <none>   2d     v1.12.6-aliyun.1       # Compare these nodes with the nodes displayed in the console to identify GPU-accelerated nodes.
cn-beijing.i-2ze8o1a45qdv5q8a****  Ready    <none>   2d     v1.12.6-aliyun.1
cn-beijing.i-2ze9xylyn11vop7g****  Ready    master   2d     v1.12.6-aliyun.1
cn-beijing.i-2zed5sw8snjniq6m****  Ready    master   2d     v1.12.6-aliyun.1
cn-beijing.i-2zej9s0zijykp9pw****  Ready    <none>   2d     v1.12.6-aliyun.1
```

Select a GPU-accelerated node and run the following command to query the labels of the node:

```
# kubectl describe node cn-beijing.i-2ze8o1a45qdv5q8a****
Name:         cn-beijing.i-2ze8o1a45qdv5q8a7luz
Roles:        <none>
Labels:       aliyun.accelerator/nvidia_count=1                #Note
              aliyun.accelerator/nvidia_mem=12209MiB
              aliyun.accelerator/nvidia_name=Tesla-M40
              beta.kubernetes.io/arch=amd64
              beta.kubernetes.io/instance-type=ecs.gn4-c4g1.xlarge
              beta.kubernetes.io/os=linux
              failure-domain.beta.kubernetes.io/region=cn-beijing
              failure-domain.beta.kubernetes.io/zone=cn-beijing-a
              kubernetes.io/hostname=cn-beijing.i-2ze8o1a45qdv5q8a****
......
```

In this example, the following labels are added to the GPU-accelerated node.

key	value
aliyun.accelerator/nvidia_count	The number of GPU cores.
aliyun.accelerator/nvidia_mem	The size of the GPU memory. Unit: MiB.

key	value
aliyun.accelerator/nvidia_name	The name of the NVIDIA GPU.

GPU-accelerated nodes of the same type have the same GPU name. You can use this label to locate GPU-accelerated nodes.

```
# kubectl get no -l aliyun.accelerator/nvidia_name=Tesla-M40
NAME                 STATUS   ROLES    AGE    VERSION
cn-beijing.i-2ze8o1a45qdv5q8a****  Ready    <none>   2d     v1.12.6-aliyun.1
cn-beijing.i-2ze8o1a45qdv5q8a****  Ready    <none>   2d     v1.12.6-aliyun.1
```

6. In the left-side navigation pane of the details page, choose **Workloads > Deployments**.
7. On the **Deployments** page, select the namespace and click **Create from Template** in the upper-right corner.
8. Create a Deployment for a TensorFlow job. The Deployment is used to schedule pods to a GPU-accelerated node.
9. You can also exclude an application from GPU-accelerated nodes. The following example shows how to schedule a pod based on node affinity for an NGINX application. For more information, see the section that describes node affinity in Create an application from an image.

   The following YAML template is used as an example:

```
apiVersion: v1
kind: Pod
metadata:
 name: not-in-gpu-node
spec:
 affinity:
  nodeAffinity:
   requiredDuringSchedulingIgnoredDuringExecution:
    nodeSelectorTerms:
    - matchExpressions:
      - key: aliyun.accelerator/nvidia_name
        operator: DoesNotExist
 containers:
 - name: not-in-gpu-node
  image: nginx
```

Result

In the left-side navigation pane of the details page, choose **Workloads > Pods**. On the Pods page, select the namespace to view pods created in the namespace. On the Pods page, you can find that the pods in the preceding examples are scheduled to the desired nodes. This means that labels can be used to schedule pods to GPU-accelerated nodes.

3.6.3.11. Manually upgrade the kernel of a GPU node in a cluster

This topic describes how to manually upgrade the kernel of a GPU node in a cluster.

Context

The current kernel version is earlier than `3.10.0-957.21.3`.

Procedure

1. Connect to a Kubernetes cluster through kubectl.
2. Run the following command to set the target GPU node to unschedulable. This example uses node cn-beijing.i-2ze19qyi8votgjz12345 as the target node.

```
kubectl cordon cn-beijing.i-2ze19qyi8votgjz12345
node/cn-beijing.i-2ze19qyi8votgjz12345 already cordoned
```

3. Run the following command to drain the target GPU node:

```
# kubectl drain cn-beijing.i-2ze19qyi8votgjz12345 --grace-period=120 --ignore-daemonsets=true
node/cn-beijing.i-2ze19qyi8votgjz12345 cordoned
WARNING: Ignoring DaemonSet-managed pods: flexvolume-9scb4, kube-flannel-ds-r2qmh, kube-proxy-worker-l62sf
, logtail-ds-f9vbg
pod/nginx-ingress-controller-78d847fb96-5fkkw evicted
```

4. Uninstall the existing nvidia-driver.

   Note This step uninstalls the version 384.111 driver. If your driver version is not 384.111, you need to download a driver from the official NVIDIA website and replace `384.111` with your actual version number.

   i. Log on to the target GPU node and run the `nvidia-smi` command to query the driver version.

```
# nvidia-smi -a | grep 'Driver Version'
Driver Version                  : 384.111
```

   ii. Run the following commands to download the driver installation package:

```
cd /tmp/
curl -O https://cn.download.nvidia.cn/tesla/384.111/NVIDIA-Linux-x86_64-384.111.run
```

   Note The installation package is required to uninstall the driver.

   iii. Run the following commands to uninstall the existing nvidia-driver:

```
chmod u+x NVIDIA-Linux-x86_64-384.111.run
./NVIDIA-Linux-x86_64-384.111.run --uninstall -a -s -q
```

5. Run the following commands to upgrade kernel:

```
yum clean all && yum makecache
yum update kernel  -y
```

6. Run the following command to restart the GPU node:

```
reboot
```

7. Log on to the GPU node and run the following command to install the kernel-devel package.

```
yum install -y kernel-devel-$(uname -r)
```

8. Run the following commands to download the required driver and install it on the target node. In this example, version 410.79 is used.

```
cd /tmp/
curl -O https://cn.download.nvidia.cn/tesla/410.79/NVIDIA-Linux-x86_64-410.79.run
chmod u+x NVIDIA-Linux-x86_64-410.79.run
sh . /NVIDIA-Linux-x86_64-410.79.run -a -s -q
# warm up GPU
nvidia-smi -pm 1 || true
nvidia-smi -acp 0 || true
nvidia-smi --auto-boost-default=0 || true
nvidia-smi --auto-boost-permission=0 || true
nvidia-modprobe -u -c=0 -m || true
```

9. Check the */etc/rc.d/rc.local* file and check whether the following configurations are included. If not, add the following content.

```
nvidia-smi -pm 1 || true
nvidia-smi -acp 0 || true
nvidia-smi --auto-boost-default=0 || true
nvidia-smi --auto-boost-permission=0 || true
nvidia-modprobe -u -c=0 -m || true
```

10. Run the following commands to restart kubelet and Docker.

```
service kubelet stop
service docker restart
service kubelet start
```

11. Run the following command to set the GPU node to schedulable:

```
# kubectl uncordon cn-beijing.i-2ze19qyi8votgjz12345
node/cn-beijing.i-2ze19qyi8votgjz12345 already uncordoned
```

12. Run the following command on the nvidia-device-plugin container to check the driver version:

```
kubectl exec -n kube-system -t nvidia-device-plugin-cn-beijing.i-2ze19qyi8votgjz12345 nvidia-smi
Thu Jan 17 00:33:27 2019

```

3.6.3.12. Node pools

3.6.3.12.1. Create a node pool

You can use a node pool to manage multiple nodes in a Kubernetes cluster as a group. For example, you can centrally manage the labels and taints of the nodes in a node pool. This topic describes how to create a node pool in the Container Service console.

Prerequisites

- A Kubernetes cluster is created. For more information, see Create a Kubernetes cluster.
- The Kubernetes cluster must run Kubernetes 1.9 or later.

> Notice
> - By default, a cluster can contain at most 100 nodes.
> - Before you add an existing Elastic Compute Service (ECS) instance that is deployed in a virtual private cloud (VPC), make sure that an elastic IP address (EIP) is associated with the ECS instance, or a NAT gateway is created for the VPC. In addition, make sure that the ECS instance can access the Internet. Otherwise, you cannot add the ECS instance.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Nodes > Node Pools**.
5. On the **Node Pools** page, click **Create Node Pool**.
6. In the **Create Node Pool** dialog box, set the parameters.

   For more information about the parameters, see Create a Kubernetes cluster. The following list describes some of the parameters:

   - Name: the name of the node pool.
   - Quantity: the initial number of nodes in the node pool. If you do not want to add nodes to the node pool, set this parameter to 0.
   - ECS Label: the labels of the ECS instances.
   - Node Label: the labels of nodes in the node pool.
   - Custom Resource Group: the resource group to which the nodes of the node pool belong.
   - Custom Security Group: the custom security group of the ECS instance.
7. Click **Confirm Order**.
   On the **Node Pools** page, check the **Status** column of the managed node pool. If the node pool is in the **Initializing** state, it indicates that the node pool is being created. After the node pool is created, the **state** of the node pool changes to **Active**.

What's next

After the node pool is created, find the node pool on the **Node Pools** page and click **Details** in the **Actions** column to view details of the node pool.

3.6.3.12.2. Scale out a node pool

You can use a node pool to manage multiple nodes in a Kubernetes cluster as a group. For example, you can centrally manage the labels and taints of the nodes in a node pool. This topic describes how to scale out a node pool in the Container Service console.

Prerequisites

- A node pool is created. For more information, see Create a node pool.
- The Kubernetes cluster must run Kubernetes 1.9 or later.

> **Notice**
> - By default, a cluster can contain at most 100 nodes.
> - Before you add an existing Elastic Compute Service (ECS) instance that is deployed in a virtual private cloud (VPC), make sure that an elastic IP address (EIP) is associated with the ECS instance, or a NAT gateway is created for the VPC. In addition, make sure that the ECS instance can access the Internet. Otherwise, you cannot add the ECS instance.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Nodes > Node Pools**.
5. On the **Node Pools** page, select the node pool that you want to manage and click **Scale Out** in the **Actions** column.
6. In the dialog box that appears, set the number of nodes that you want to add to the node pool.
7. (Optional)In the dialog box that appears, click **Modify Node Pool Settings** to modify the node pool.

   For more information, see Expand a Container Service cluster. The following list describes some of the parameters:

   - ECS Label: You can add labels to the ECS instances in the node pool.
   - Node Label: You can add labels to the nodes in the node pool.
   - Taints: You can add one or more taints to the specified nodes.

     > **Note** If you select **Synchronize Node Labels and Taints**, the specified labels and taints are synchronized to the existing and newly added nodes.

   - CloudMonitor Agent: You can install the CloudMonitor agent on the nodes and view monitoring information about the nodes in the CloudMonitor console.
8. Click **Submit**.
   On the **Node Pools** page, the **status** of the node pool is **Scaling**. This indicates that the scale-out event is in progress. After the scale-out event is completed, the **status** of the node pool changes to **Active**.

What's next

Click **Details** in the Actions column for the node pool. On the **Nodes** tab, you can check the nodes that are added to the node pool.

3.6.3.12.3. Schedule an application pod to a specific node pool

Label is an important concept of Kubernetes. Services, Deployments, and pods are associated with each other by labels. You can configure pod scheduling policies based on node labels. This allows you to schedule pods to nodes that have specific labels. This topic describes how to schedule an application pod to a specific node pool.

Procedure

1. Add a label to the nodes in a node pool.

   Container Service allows you to manage a group of cluster nodes by using a node pool. For example, you can centrally manage the labels and taints of the nodes in a node pool. For more information about how to create a node pool, see Create a node pool.

   i. Log on to the Container Service console
   ii. In the left-side navigation pane, click **Clusters**.

iii. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.

iv. In the left-side navigation pane of the details page, choose **Nodes > Node Pools**.

v. In the upper-right corner of the **Node Pools** page, click **Create Node Pool**.

vi. In the Create Node Pool dialog box, click **Show Advanced Options** and click  on the right of **Node Label** to add labels to nodes.

In this example, the pod: nginx label is added.

You can also click **Scale Out** on the right side of a node pool to update or add labels for the nodes. If automatic scaling is enabled for a node pool, click **Modify** on the right side of the node pool to update or add labels for the nodes.

2. Configure a scheduling policy for an application pod.

After the preceding step is completed, the pod: nginx label is added to the nodes in the node pool. You can set the nodeSelector or nodeAffinity field in pod configurations to ensure that an application pod is scheduled to nodes with matching labels in a node pool. Perform the following steps:

- Set nodeSelector.

nodeSelector is a field in the spec section of pod configurations. Add the pod: nginx label to nodeSelector. Sample template:

```
apiVersion: apps/v1
kind: Deployment
metadata:
 name: nginx-deployment-basic
 labels:
  app: nginx
spec:
 replicas: 2
 selector:
  matchLabels:
   app: nginx
 template:
  metadata:
   labels:
    app: nginx
  spec:
   nodeSelector:
    pod: nginx    # After you add the label in this field, the application pod can run only on nodes with this label in the node pool.
   containers:
   - name: nginx
    image: nginx:1.7.9
    ports:
    - containerPort: 80
```

- Set nodeAffinity.

You can also use nodeAffinity to schedule an application pod based on your requirements. nodeAffinity supports the following scheduling policies:

```
- requiredDuringSchedulingIgnoredDuringExecution
```

If this policy is used, a pod can be scheduled only to a node that meets the match rules. If no node meets the match rules, the system retries until a node that meets the rules is found. IgnoreDuringExecution indicates that if the label of the node where the pod is deployed changes and no longer meets the match rules, the pod continues to run on the node.

```
- requiredDuringSchedulingRequiredDuringExecution
```

If this policy is used, the pod can be scheduled only to a node that meets the match rules. If no node meets the rules, the system retries until a node that meets the rules is found. RequiredDuringExecution indicates that if the label of the node where the pod is deployed changes and no longer meets the match rules, the system redeploys the pod to another node that meets the rules.

```
- preferredDuringSchedulingIgnoredDuringExecution
```

If this policy is used, the pod is preferably scheduled to a node that meets the match rules. If no node meets the rules, the system ignores the rules.

```
- preferredDuringSchedulingRequiredDuringExecution
```

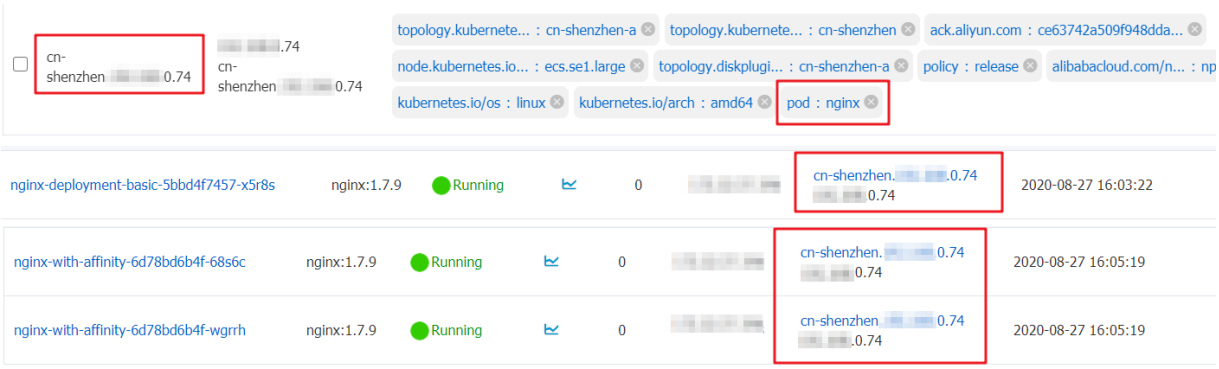
If this policy is used, the pod is preferably scheduled to a node that meets the match rules. If no node meets the rules, the system ignores the rules. RequiredDuringExecution indicates that if the label of a node where the pod is deployed changes and still meets the match rules, the system reschedules the pod to a node that meets the match rules.

In the following example, the requiredDuringSchedulingIgnoredDuringExecution policy is used to ensure that the application pod always runs on a node in a specific node pool.

```
apiVersion: apps/v1
kind: Deployment
metadata:
 name: nginx-with-affinity
 labels:
  app: nginx-with-affinity
spec:
 replicas: 2
 selector:
  matchLabels:
   app: nginx-with-affinity
 template:
  metadata:
   labels:
    app: nginx-with-affinity
  spec:
   affinity:
    nodeAffinity:
     requiredDuringSchedulingIgnoredDuringExecution:
      nodeSelectorTerms:
      - matchExpressions:
        - key: pod
          operator: In     # This policy ensures that the application pod can run only on a node that has the pod: ngin
x label.
          values:
          - nginx
   containers:
   - name: nginx-with-affinity
    image: nginx:1.7.9
    ports:
    - containerPort: 80
```

Result

In the preceding example, all application pods are scheduled to the xxx.xxx.0.74 node. This node has the pod: nignx label.



3.6.4. Storage

3.6.4.1. Overview

In the Container Service console, you can create volumes of other Apsara Stack services, enabling you to create stateful applications and use Apsara Stack disks and OSS to implement persistent storage.

Both static and dynamic volumes are supported. The following table shows how static and dynamic volumes are supported.

Apsara Stack storage	Static volume	Dynamic volume
Apsara Stack disk	You can use a static disk volume through either of the following methods: • Use a volume directly • Use a volume through a PV and PVC	Supported

Apsara Stack NAS	You can use a static NAS volume through either of the following methods:
	• Use a volume through the FlexVolume plug-in
	  ◦ Use a volume directly
	  ◦ Use a volume through a PV or PVC
	• Use a volume through the Kubernetes NFS driver
		Supported

Apsara Stack OSS	You can use a static OSS volume through either of the following methods: • Use a volume directly • Use a volume through a PV or PVC	Not supported

3.6.4.2. Mount disk volumes

You can mount disks as volumes.

Container Service allows you to mount disks as persistent volumes (PVs) in Kubernetes clusters.

Disks can be mounted to Kubernetes clusters as the following volume types:

- Statically provisioned disk volumes

  You can use statically provisioned disk volumes in the following ways:

  - Mount disks as volumes
  - Mount disk volumes by creating a PV and a persistent volume claim (PVC)

- Dynamically provisioned disk volumes

Usage notes

- You can mount a disk only to one pod.
- Before you mount a disk to a pod, you must create the disk and obtain its disk ID.

  The disk must meet the following capacity requirements:

  - If the disk is a basic disk, it must be at least 5 GiB in size.
  - If the disk is an ultra disk, it must be at least 20 GiB in size.
  - If the disk is a standard SSD, it must be at least 20 GiB in size.

- volumeId: the ID of the disk that you want to mount. The value must be the same as those of volumeName and PV Name.
- A disk can be mounted only to a node that is deployed in the same zone as the disk.
- Only pay-as-you-go disks can be mounted. If you change the billing method of an Elastic Compute Service (ECS) instance in the cluster from pay-as-you-go to subscription, you cannot change the billing method of its disks to subscription. Otherwise, the disks cannot be mounted to the cluster.

Statically provisioned disk volumes

You can mount disks as volumes or by creating PVs and PVCs.

Prerequisites

A disk is created in the ECS console.

- **Mount a disk as a volume**

  Use the following *disk-deploy.yaml* file to create a pod:

```
apiVersion: extensions/v1beta1
kind: Deployment
metadata:
 name: nginx-disk-deploy
spec:
 replicas: 1
 template:
  metadata:
   labels:
    app: nginx
  spec:
   containers:
   - name: nginx-flexvolume-disk
    image: nginx
    volumeMounts:
     - name: "d-bp1j17ifxfasvts3tf40"
      mountPath: "/data"
   volumes:
    - name: "d-bp1j17ifxfasvts3tf40"
     flexVolume:
      driver: "alicloud/disk"
      fsType: "ext4"
      options:
       volumeId: "d-bp1j17ifxfasvts3tf40"
```

- **Mount disk volumes by creating a PV and a PVC**
  i. **Create a PV of the disk type**

  You can create a PV of the disk type in the Container Service console or by using a YAML file.

  - **Create a PV by using a YAML file**

    Use the following `disk-pv.yaml` file to create a PV:

    > **Note** The PV name must be the same as the disk ID.

```
apiVersion: v1
kind: PersistentVolume
metadata:
 name: d-bp1j17ifxfasvts3tf40
 labels:
  failure-domain.beta.kubernetes.io/zone: cn-hangzhou-b
  failure-domain.beta.kubernetes.io/region: cn-hangzhou
spec:
 capacity:
  storage: 20Gi
 storageClassName: disk
 accessModes:
  - ReadWriteOnce
 flexVolume:
  driver: "alicloud/disk"
  fsType: "ext4"
  options:
   volumeId: "d-bp1j17ifxfasvts3tf40"
```

  - **Create a PV in the console**

    a. Log on to the Container Service console.
    b. In the left-side navigation pane, click **Clusters**.
    c. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
    d. In the left-side navigation pane of the details page, choose **Volumes > Persistent Volumes**.
    e. On the **Persistent Volumes** page, click **Create** in the upper-right corner.
    f. In the Create PV dialog box, set the parameters. PV parameters

Parameter	Description
PV Type	In this example, **Cloud Disk** is selected.
Volume Plug-in	Displays the supported storage drivers.
Access Mode	By default, ReadWriteOnce is selected.
Disk ID	Select a disk that is in the same region and zone as your cluster.
File System Type	Select the file system of the disk. Supported file systems are ext4, ext3, xfs, and vfat. Default value: ext4.
Label	Add labels to the PV.

    g. Click **Create**.

ii. **Create a PVC**

Use the following `disk-pvc.yaml` file to create a PVC:

```
kind: PersistentVolumeClaim
apiVersion: v1
metadata:
 name: pvc-disk
spec:
 accessModes:
  - ReadWriteOnce
 storageClassName: disk
 resources:
  requests:
   storage: 20Gi
```

iii. **Create a pod**

Use the following *disk-pod.yaml* file to create a pod:

```
apiVersion: v1
kind: Pod
metadata:
 name: "flexvolume-alicloud-example"
spec:
 containers:
  - name: "nginx"
    image: "nginx"
    volumeMounts:
     - name: pvc-disk
       mountPath: "/data"
 volumes:
 - name: pvc-disk
   persistentVolumeClaim:
    claimName: pvc-disk
```

Dynamically provisioned disk volumes

To mount a disk as a dynamically provisioned volume, you must create a StorageClass of the disk type and specify the StorageClass in the storageClassName field of the PVC.

1. **Create a StorageClass**

```
kind: StorageClass
apiVersion: storage.k8s.io/v1beta1
metadata:
 name: alicloud-disk-common-hangzhou-b
provisioner: alicloud/disk
parameters:
 type: cloud_ssd
 regionid: cn-hangzhou
 zoneid: cn-hangzhou-b
```

Required parameters:

- provisioner: Set this parameter to alicloud/disk. This indicates that the Provisioner plug-in is used to create the StorageClass.
- type: Specify the disk type. Valid values: cloud, cloud_efficiency, cloud_ssd, and available. If you set this parameter to available, the system attempts to create a disk in the following order: ultra disk, standard SSD, and basic disk. The system stops trying until a disk is created.
- regionid: Specify the region of the disk.

- zoneid: Specify the zone of the disk.

2. **Create a PVC**

```
kind: PersistentVolumeClaim
apiVersion: v1
metadata:
 name: disk-common
spec:
 accessModes:
  - ReadWriteOnce
 storageClassName: alicloud-disk-common-hangzhou-b
 resources:
  requests:
   storage: 20Gi
---
kind: Pod
apiVersion: v1
metadata:
 name: disk-pod-common
spec:
 containers:
 - name: disk-pod
  image: nginx
  volumeMounts:
   - name: disk-pvc
     mountPath: "/mnt"
 restartPolicy: "Never"
 volumes:
  - name: disk-pvc
    persistentVolumeClaim:
     claimName: disk-common
```

Default options

By default, Kubernetes clusters support the following types of StorageClass:

- alicloud-disk-common: basic disk.
- alicloud-disk-efficiency: ultra disk.
- alicloud-disk-ssd: standard SSD.
- alicloud-disk-available: This option ensures high availability. The system attempts to create an ultra disk first. If no ultra disk is available in the specified zone, the system attempts to create a standard SSD. If no standard SSD is available, the system attempts to create a basic disk.

3. **Create a multi-instance StatefulSet by using a disk**

We recommend that you use the volumeClaimTemplates parameter. This parameter allows the system to dynamically create PVCs and PVs. PVCs are associated with corresponding PVs.

```
apiVersion: v1
kind: Service
metadata:
 name: nginx
 labels:
  app: nginx
spec:
 ports:
 - port: 80
  name: web
 clusterIP: None
 selector:
  app: nginx
---
apiVersion: apps/v1beta2
kind: StatefulSet
metadata:
 name: web
spec:
 selector:
  matchLabels:
   app: nginx
 serviceName: "nginx"
 replicas: 2
 template:
  metadata:
   labels:
    app: nginx
  spec:
   containers:
   - name: nginx
    image: nginx
    ports:
    - containerPort: 80
     name: web
    volumeMounts:
    - name: disk-common
     mountPath: /data
 volumeClaimTemplates:
 - metadata:
   name: disk-common
  spec:
   accessModes: [ "ReadWriteOnce" ]
   storageClassName: "alicloud-disk-common"
   resources:
    requests:
     storage: 10Gi
```

3.6.4.3. Mount NAS volumes

Container Service allows you to mount Apsara File Storage NAS (NAS) file systems as persistent volumes (PVs) in Container Service clusters.

NAS file systems can be mounted to Kubernetes clusters as the following volume types:

- Statically provisioned NAS volumes

  You can statically provision NAS volumes in the following ways:

- Use the FlexVolume plug-in
  - Directly mount NAS file systems as volumes
  - Mount NAS file systems by creating a PV and a persistent volume claim (PVC)
- Use the Network File System (NFS) driver

- Dynamically provisioned NAS volumes

Prerequisites

A NAS file system is created in the NAS console and a mount target is added. The mount target is used to mount the NAS file system to the Kubernetes cluster. The NAS file system and your cluster are deployed in the same virtual private cloud (VPC).

Statically provisioned NAS volumes

You can use the FlexVolume plug-in provided by Alibaba Cloud or the NFS driver provided by Kubernetes to mount NAS file systems.

Use the FlexVolume plug-in

You can use the FlexVolume plug-in to directly mount a NAS file system as a volume. You can also mount a NAS file system by creating a PV and a PVC.

> **Note**
> - NAS is a shared storage service. You can mount a NAS file system to multiple pods.
> - server: the mount target of the NAS volume.
> - path: the directory to which the NAS volume is mount. You can specify a subdirectory. If the specified subdirectory does not exist, the system automatically creates the subdirectory.
> - vers: the version of the NFS protocol. Version 4.0 is supported.
> - mode: the access permissions on the directory of the NAS file system. If the root directory of the NAS file system is specified, you cannot modify the access permissions. If the NAS file system stores a large amount of data, the mounting operation may be time-consuming or even fail. Therefore, we recommend that you do not set the mode parameter.

Mount a NAS file system as a volume

Use the following `nas-deploy.yaml` file to create a pod:

```
apiVersion: v1
kind: Pod
metadata:
 name: "flexvolume-nas-example"
spec:
 containers:
  - name: "nginx"
    image: "nginx"
    volumeMounts:
     - name: "nas1"
       mountPath: "/data"
 volumes:
  - name: "nas1"
    flexVolume:
     driver: "alicloud/nas"
     options:
      server: "0cd8b4a576-grs79.cn-hangzhou.nas.aliyuncs.com"
      path: "/k8s"
      vers: "4.0"
```

Mount a NAS file system by creating a PV and a PVC

Step 1: Create a PV

You can create a PV in the Container Service console or by using a YAML file.

- Create a PV by using a YAML file.

  Use the following `nas-pv.yaml` file to create a PV:

```
apiVersion: v1
kind: PersistentVolume
metadata:
 name: pv-nas
spec:
 capacity:
  storage: 5Gi
 storageClassName: nas
 accessModes:
  - ReadWriteMany
 flexVolume:
  driver: "alicloud/nas"
  options:
   server: "0cd8b4a576-uih75.cn-hangzhou.nas.aliyuncs.com"
   path: "/k8s"
   vers: "4.0"
```

- Create a PV in the console
  i. Log on to the Container Service console.
  ii. In the left-side navigation pane, click **Clusters**.
  iii. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
  iv. In the left-side navigation pane of the details page, choose **Volumes > Persistent Volumes**.
  v. On the **Persistent Volumes** page, click **Create** in the upper-right corner.
  vi. In the Create PV dialog box, set the parameters.

Parameter	Description
PV Type	Select **NAS**.
Volume Name	Enter a name for the PV. The name must be unique in the cluster.
Volume Plug-in	By default, CSI is selected.
Capacity	Specify the capacity of the PV. The capacity of the PV cannot exceed the capacity of the disk.
Access Mode	By default, ReadWriteMany is selected.
Mount Target Domain Name	The domain name of the mount target that is used to mount the NAS file system to the cluster.

Parameter	Description
Subdirectory	Enter a subdirectory in the NAS file system. The subdirectory must start with a forward slash (/). If you set this parameter, the PV is mounted to the specified subdirectory. ■ If the specified subdirectory does not exist, the system automatically creates the subdirectory in the NAS file system. ■ If you do not set this parameter, the PV is mounted to the root directory of the NAS file system.
Version	The version of the NFS protocol. Version 3 and 4.0 are supported. By default, version 3 is used. We recommend that you use version 3.
Label	Add labels to the PV.

vii. Click **Create**.

Step 2: Create a PVC

Use the following *nas-pvc.yaml* file to create a PVC:

```
kind: PersistentVolumeClaim
apiVersion: v1
metadata:
 name: pvc-nas
spec:
 accessModes:
  - ReadWriteMany
 storageClassName: nas
 resources:
  requests:
   storage: 5Gi
```

Step 3: Create a pod

Use the following *nas-pod.yaml* file to create a pod:

```
apiVersion: v1
kind: Pod
metadata:
 name: "flexvolume-nas-example"
spec:
 containers:
  - name: "nginx"
    image: "nginx"
    volumeMounts:
      - name: pvc-nas
        mountPath: "/data"
 volumes:
 - name: pvc-nas
   persistentVolumeClaim:
     claimName: pvc-nas
```

Use the NFS driver

Step 1: Create a NAS file system

Log on to the NAS console. For more information about how to log on to the NAS console, see the *Create a NAS file system* chapter of the *NAS User Guide*.

> **Note** The NAS file system that you want to create and the Kubernetes cluster must be deployed in the same region.

In this example, the following mount target is used: `055f84ad83-ixxxx.cn-hangzhou.nas.aliyuncs.com`.

Step 2: Create a PV

You can create a PV in the console or by using a YAML file.

- **Create a PV by using a YAML template**

  Use the following *nas-pv.yaml* file to create a PV.

  Run the following command to create a PV that uses the NAS file system:

```
root@master # cat << EOF |kubectl apply -f -
apiVersion: v1
kind: PersistentVolume
metadata:
  name: nas
spec:
  capacity:
    storage: 8Gi
  accessModes:
    - ReadWriteMany
  persistentVolumeReclaimPolicy: Retain
  nfs:
    path: /
    server: 055f84ad83-ixxxx.cn-hangzhou.nas.aliyuncs.com
EOF
```

- **Create a PV by using the console**

  For more information, see Mount a NAS file system by creating a PV and a PVC.

Step 3: Create a PVC

Create a PVC and associate the PVC with the PV that is created in Step 2.

```
root@master # cat << EOF | kubectl apply -f -
apiVersion: v1
kind: PersistentVolumeClaim
metadata:
   name: nasclaim
spec:
   accessModes:
    - ReadWriteMany
   resources:
     requests:
       storage: 8Gi
EOF
```

Step 4: Create a pod

Create an application to use the PV.

```
root@master # cat << EOF |kubectl apply -f -
apiVersion: v1
kind: Pod
metadata:
  name: mypod
spec:
  containers:
   - name: myfrontend
     image: registry.aliyuncs.com/spacexnice/netdia:latest
     volumeMounts:
     - mountPath: "/var/www/html"
       name: mypd
  volumes:
   - name: mypd
     persistentVolumeClaim:
       claimName: nasclaim
EOF
```

The NAS file system is mounted to the application that runs in the pod.

Dynamically provisioned NAS volumes

If you want to dynamically provision NAS volumes, you must install a driver plug-in and configure a NAS mount target.

Install the plug-in

```
apiVersion: storage.k8s.io/v1
kind: StorageClass
metadata:
 name: alicloud-nas
provisioner: alicloud/nas
---
apiVersion: v1
kind: ServiceAccount
metadata:
 name: alicloud-nas-controller
 namespace: kube-system
---
kind: ClusterRoleBinding
apiVersion: rbac.authorization.k8s.io/v1beta1
metadata:
 name: run-alicloud-nas-controller
subjects:
 - kind: ServiceAccount
   name: alicloud-nas-controller
   namespace: kube-system
roleRef:
 kind: ClusterRole
 name: alicloud-disk-controller-runner
 apiGroup: rbac.authorization.k8s.io
---
kind: Deployment
apiVersion: extensions/v1beta1
metadata:
 name: alicloud-nas-controller
 namespace: kube-system
spec:
 replicas: 1
 strategy:
```

```
  type: Recreate
 template:
  metadata:
   labels:
    app: alicloud-nas-controller
  spec:
   tolerations:
   - effect: NoSchedule
    operator: Exists
    key: node-role.kubernetes.io/master
   - effect: NoSchedule
    operator: Exists
    key: node.cloudprovider.kubernetes.io/uninitialized
   nodeSelector:
    node-role.kubernetes.io/master: ""
   serviceAccount: alicloud-nas-controller
   containers:
    - name: alicloud-nas-controller
     image: registry.cn-hangzhou.aliyuncs.com/acs/alicloud-nas-controller:v1.8.4
     volumeMounts:
     - mountPath: /persistentvolumes
      name: nfs-client-root
     env:
      - name: PROVISIONER_NAME
       value: alicloud/nas
      - name: NFS_SERVER
       value: 0cd8b4a576-mmi32.cn-hangzhou.nas.aliyuncs.com
      - name: NFS_PATH
       value: /
   volumes:
    - name: nfs-client-root
     nfs:
      server: 0cd8b4a576-mmi32.cn-hangzhou.nas.aliyuncs.com
      path: /
```

Dynamically provision a NAS volume

```
apiVersion: apps/v1beta1
kind: StatefulSet
metadata:
 name: web
spec:
 serviceName: "nginx"
 replicas: 2
 volumeClaimTemplates:
 - metadata:
    name: html
  spec:
   accessModes:
    - ReadWriteOnce
   storageClassName: alicloud-nas
   resources:
    requests:
     storage: 2Gi
 template:
  metadata:
   labels:
    app: nginx
  spec:
   containers:
   - name: nginx
    image: nginx:alpine
    volumeMounts:
    - mountPath: "/usr/share/nginx/html/"
     name: html
```

3.6.4.4. Mount OSS volumes

You can mount Object Storage Service (OSS) buckets as volumes in Kubernetes clusters.

You can mount OSS buckets in the following ways:

- Mount an OSS bucket as a volume.
- Mount an OSS bucket by creating a PV and a PVC.

Prerequisites

To mount an OSS bucket as a statically provisioned volume, you must create an OSS bucket in the OSS console.

Background

- OSS buckets can be mounted only as statically provisioned volumes.
- An OSS bucket can be shared by multiple pods.
- bucket: Only buckets can be mounted to a Kubernetes cluster. The subdirectories or files in a bucket cannot be mounted to a Kubernetes cluster.
- url: specifies the endpoint of the OSS bucket. The endpoint is the domain name that is used to mount the OSS bucket to the Kubernetes cluster.
- akId: specifies your AccessKey ID.
- akSecret: specifies your AccessKey secret.
- otherOpts: the custom parameters that are used to mount the OSS bucket. The parameters must be in the following format: `-o *** -o ***`.

> **Note** To mount an OSS bucket as a volume, you must create a Secret with your AccessKey pair when you deploy the flexvolume Service.

Mount an OSS bucket as a statically provisioned volume

- **Mount an OSS bucket as a volume**

  Use the following *oss-deploy.yaml* file to create a pod:

```
apiVersion: extensions/v1beta1
kind: Deployment
metadata:
 name: nginx-oss-deploy
spec:
 replicas: 1
 template:
  metadata:
   labels:
    app: nginx
  spec:
   containers:
   - name: nginx-flexvolume-oss
    image: nginx
    volumeMounts:
     - name: "oss1"
      mountPath: "/data"
   volumes:
    - name: "oss1"
     flexVolume:
      driver: "alicloud/oss"
      options:
       bucket: "docker"
       url: "oss-cn-hangzhou.aliyuncs.com"
       akId: ***
       akSecret: ***
       otherOpts: "-o max_stat_cache_size=0 -o allow_other"
```

- **Create a static PV and a PVC**

  i. **Create a PV**

  You can create a persistent volume (PV) in the Container Service console or by using a YAML file.

- **Create a PV by using a YAML file**

  Use the following *oss-pv.yaml* file to create a PV:

```
apiVersion: v1
kind: PersistentVolume
metadata:
 name: pv-oss
spec:
 capacity:
  storage: 5Gi
 accessModes:
  - ReadWriteMany
 storageClassName: oss
 flexVolume:
  driver: "alicloud/oss"
  options:
   bucket: "docker"
   url: "oss-cn-hangzhou.aliyuncs.com"
   akId: ***
   akSecret: ***
   otherOpts: "-o max_stat_cache_size=0 -o allow_other"
```

- **Create a PV in the Container Service console**

  a. Log on to the Container Service console.

  b. In the left-side navigation pane, click **Clusters**.

  c. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.

  d. In the left-side navigation pane of the details page, choose **Volumes > Persistent Volumes**.

  e. On the **Persistent Volumes** page, click **Create** in the upper-right corner.

f. In the Create PV dialog box, set the parameters.

Parameter	Description
PV Type	In this example, OSS is selected.
Name	Enter a name for the PV. The name must be unique in the cluster. In this example, pv-oss is used.
Volume Plug-in	By default, CSI is selected.
Capacity	Specify the capacity of the PV.
Access Mode	By default, ReadWriteMany is selected.
AccessKey ID and **AccessKey Secret**	The AccessKey pair that is required to access OSS buckets. To obtain your AccessKey pair, go to the Apsara Uni-manager Management Console, choose **Enterprise > Organizations**, click  on the right side of the organization. Then, click **AccessKey** and copy the AccessKey pair.
Optional Parameters	Enter custom parameters in the format of `-o *** -o ***`.
Bucket ID	Enter the name of the OSS bucket that you want to mount. Click **Select Bucket**. In the dialog box that appears, select the OSS bucket that you want to mount and click **Select**.
Endpoint	**Internal Endpoint** is recommended.
Label	Add labels to the PV.

g. Click **Create**.

ii. **Create a PVC**

Use the following *oss-pvc.yaml* file to create a persistent volume claim (PVC):

```
kind: PersistentVolumeClaim
apiVersion: v1
metadata:
 name: pvc-oss
spec:
 storageClassName: oss
 accessModes:
  - ReadWriteMany
 resources:
  requests:
   storage: 5Gi
```

iii. **Create a pod**

Use the following *oss-pod.yaml* file to create a pod:

```
apiVersion: v1
kind: Pod
metadata:
 name: "flexvolume-oss-example"
spec:
 containers:
  - name: "nginx"
    image: "nginx"
    volumeMounts:
      - name: pvc-oss
        mountPath: "/data"
 volumes:
 - name: pvc-oss
  persistentVolumeClaim:
    claimName: pvc-oss
```

Can I mount an OSS bucket as a dynamically provisioned volume?

No. Dynamically provisioned OSS volumes are not supported.

3.6.4.5. Create a PVC

This topic describes how to create a persistent volume claim (PVC).

Prerequisites

- A Kubernetes cluster is created. For more information, see Create a Kubernetes cluster.
- A persistent volume (PV) is created. In this example, a PV created from a disk is used. For more information, see Use Apsara Stack disks.

  By default, PVCs are associated with PVs that have the alicloud-pvname label. This label is added to all PVs that are created in the Container Service console. If a PV does not have this label, manually add the label to the PV before you can associate the PV with a PVC.

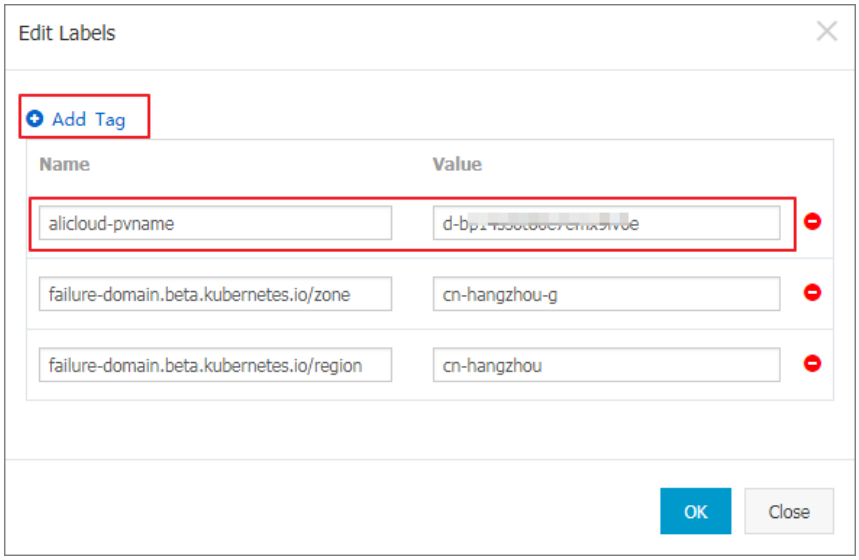
Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Volumes > Persistent Volume Claims**.
5. In the upper-right corner of the **Persistent Volume Claims** page, click **Create**.
6. In the **Create PVC** dialog box, set the parameters and click **Create**.
   - **PVC Type**: The PVC and PV must be of the same type. You can select Cloud Disk, NAS, and OSS.
   - **Name**: Enter the name of the PVC.
   - **Allocation Mode**: **Use StorageClass**, **Existing Volumes**, and **Create Volume** are supported. In this example, **Use StorageClass** or **Existing Volumes** is selected.
   - **Existing Storage Class**: Click **Select**. In the Select Storage Class dialog box, find the Storage Class that you want to use and click **Select** in the Actions column. This parameter is required only when you set Allocation Mode to **Use StorageClass**.
   - **Existing Volumes**: Click **Select PV**. In the Select PV dialog box, find the PV that you want to use and click **Select** in the Actions column. This parameter is required only when you set Allocation Mode to **Existing Volumes**.
   - **Capacity**: Specifies the capacity used by the PVC. The value cannot be larger than the total capacity of the associated PV.

- **Access Mode**: The default value is ReadWriteOnce. This parameter is required only when you set Allocation Mode to **Use StorageClass**.

> **Note** If your cluster has a PV that is not used, but you cannot find it in the **Select PV** dialog box, the reason may be that the PV does not have the alicloud-pvname label.

If you cannot find available PVs, click **Persistent Volumes** in the left-side navigation pane. On the Persistent Volumes page, find the PV that you want to use, click **Manage Labels** in the Actions column, and then add a label to the PV. On the Manage Labels dialog box, set the key of the label to alicloud-pvname and the value to the name of the PV. If the PV is created from a disk, the disk ID is used as the name of the PV.



7. Go to the Persistent Volume Claims page. You can find the newly created PVC in the list.

3.6.4.6. Use PVCs

You can use persistent volume claims (PVCs) to mount volumes for applications.

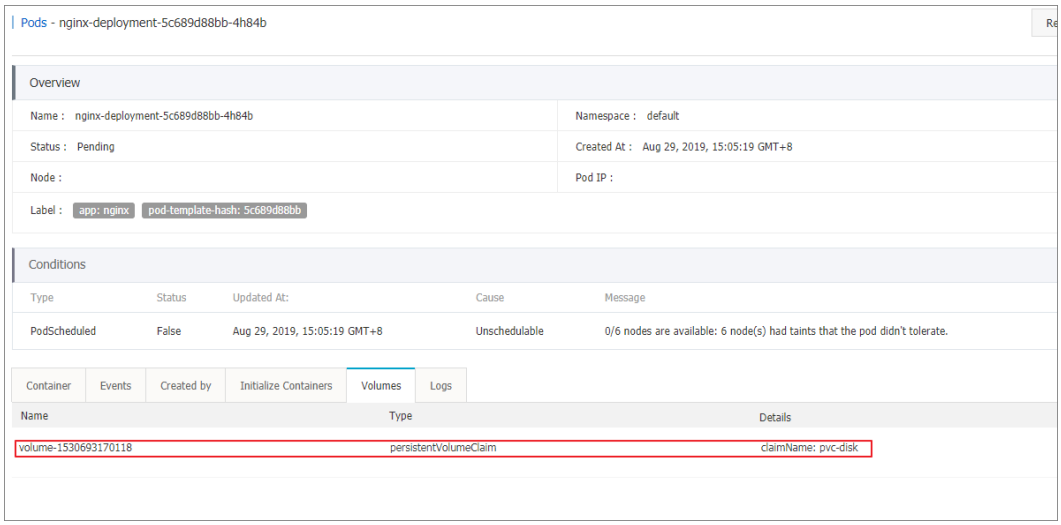
Prerequisites

- A Kubernetes cluster is created. For more information, see Create a Kubernetes cluster.
- A PVC is created. In this example, a PVC named pvc-disk is created to mount a disk volume. For more information, see Create PVCs.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Workloads > Deployments**.
5. On the **Deployments** page, click **Create from Image** in the upper-right corner.
6. On the **Basic Information** wizard page, specify the application name, number of replicas, type, and labels, select whether to synchronize the time zone from nodes to containers, and then click **Next**.
7. On the **Container** wizard page, select an image and configure volumes of the cloud storage type. You can select Cloud Disk, Apsara File Storage NAS (NAS), and Object Service Storage (OSS). In this example, select the PVC named pvc-disk and click **Next**. For more information, see Container configurations.
8. On the **Advanced** wizard page, create a Service for the test-nginx application and click **Create**.

9. On the **Complete** wizard page, click View Details to view detailed information about the application. You are redirected to the details page of the test-nginx application.
10. On the **Pods** tab, you can find the pods to which the application belongs. Select a pod and click **View Details** to view detailed information about the pod.
11. On the details page of the pod, click the **Volumes** tab. You can find that the pod is associated with the pvc-disk PVC.



3.6.5. Network management

3.6.5.1. Set access control for pods

This topic describes how to use network policies to control access between pods.

Prerequisites

You have created a Kubernetes cluster and selected the **Terwaynetwork plug-in**. For more information, see Create a Kubernetes cluster.

Context

You can declare network policies to control access between pods and thus prevent applications from interfering each other.

Procedure

For more information about standard Kubernetes network policies, see Network policies.

1. Create a pod that runs as a server and attach `label run=nginx` to the pod. For more information, see Create an application from an orchestration template.

   The sample YAML file is as follows:

```
apiVersion: v1
kind: Pod
metadata:
 name: server
 labels:
  run: nginx
spec:
 containers:
  - name: nginx
    image: registry.acs.intranet.env22.com/nginx:1.8
```

2. Create a network policy. For more information, see Create an application from an orchestration template.

   The sample YAML file is as follows:

```
kind: NetworkPolicy
apiVersion: networking.k8s.io/v1
metadata:
 name: access-nginx
spec:
 podSelector:
  matchLabels:
   run: nginx # Apply the network policy to pods with the run=nginx label
 ingress:
 - from:
  - podSelector:
     matchLabels:
      access: "true" # Only pods with the access=true label are accessible
```

3. Use the *client.yaml* and *client-label* files to create two pods that run as clients.

   One pod has the required label and the other does not.

   i. Create the *client.yaml* and *client-label* files with the following contents respectively.

```
# This pod has no label
apiVersion: v1
kind: Pod
metadata:
 name: client
spec:
 containers:
  - name: busybox
    image: registry.acs.intranet.env22.com/acs/busybox
    command: ["sh", "-c", "sleep 200000"]
```

```
# This pod has the label
apiVersion: v1
kind: Pod
metadata:
 name: client-label
 labels:
  access: "true"
spec:
 containers:
  - name: busybox
    image: registry.acs.intranet.env22.com/acs/busybox
    command: ["sh", "-c", "sleep 200000"]
```

ii. Run the following commands to create these pods:

```
kubectl apply -f client.yaml
kubectl apply -f client-label.yaml
```

You can see that only the pod with the required label can access the server.

3.6.5.2. Set bandwidth limits for pods

This topic describes how to limit the bandwidth of inbound and outbound traffic that flows through a pod.

Prerequisites

You have created a Kubernetes cluster and selected the **Terwaynetwork plug-in**. For more information, see Create a Kubernetes cluster.

Context

Throttling pods helps prevent performance degradation of the host or other workloads when certain pods occupy excessive resources.

Method

You can use the `k8s.aliyun.com/ingress-bandwidth` and `k8s.aliyun.com/egress-bandwidth` annotations for pod throttling.

- `k8s.aliyun.com/ingress-bandwidth`: limits the pod inbound bandwidth.
- `k8s.aliyun.com/egress-bandwidth`: limits the pod outbound bandwidth.
- The bandwidth limit is measured in m and k, which represent Mbit/s and Kbit/s respectively.

Procedure

1. Create a pod that runs as a server in the console. For more information, see Create an application from an orchestration template.

   The sample YAML file is as follows:

   ```
   apiVersion: v1
   kind: Pod
   metadata:
    name: server
    annotations:
     k8s.aliyun.com/ingress-bandwidth: 10m # Set the inbound bandwidth limit to 10 Mbit/s
     k8s.aliyun.com/egress-bandwidth: 10m
   spec:
    containers:
     - name: nginx
       image: registry.acs.intranet.env22.com/nginx:1.8
   ```

2. Run the kubectl exec command to connect to the pod. To verify that pod throttling is effective, run the following commands to create a file on the pod. Assume that the IP address of the pod created in step 1 is 172.16.XX.XX.

   ```
   cd /usr/share/nginx/html
   dd if=/dev/zero of=bigfile bs=1M count=1000
   ```

3. Use the *client-deploy.yaml* file to create a pod that runs as a client.

i. Create the *client-deploy.yaml* file with the following content:

```
apiVersion: v1
kind: Pod
metadata:
 name: client
 annotations:
   k8s.aliyun.com/ingress-bandwidth: 10m # Set the inbound bandwidth limit to 10 Mbit/s
   k8s.aliyun.com/egress-bandwidth: 10m
spec:
 containers:
  - name: busybox
    image: registry.acs.intranet.env22.com/acs/netdia
    command: ["sh", "-c", "sleep 200000"]
```

ii. Run the following command to create the pod:

```
kubectl apply -f client-deploy.yaml
```

4. Run the following command to check whether bandwidth is limited:

```
kubectl exec -it client sh
```

3.6.5.3. Work with Terway

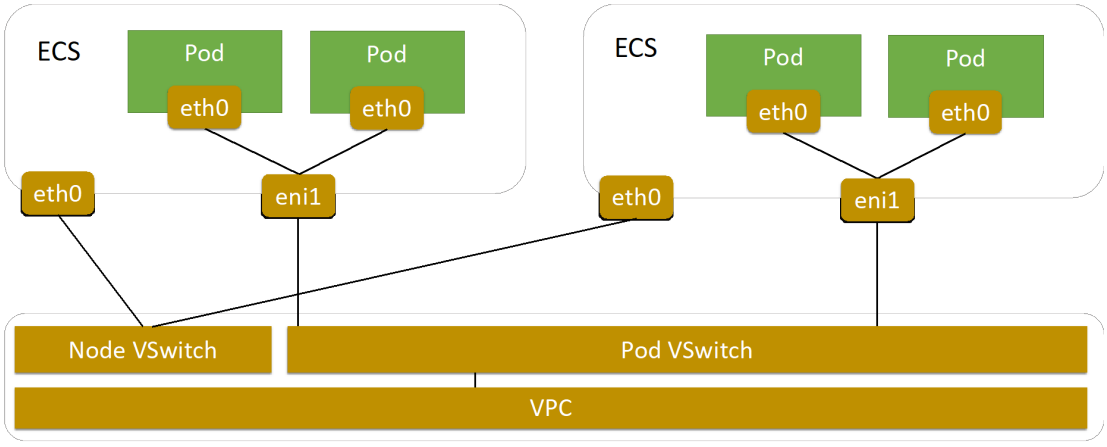
Terway is an open source Container Network Interface (CNI) plug-in developed by Alibaba Cloud. Terway works with Virtual Private Cloud (VPC) and allows you to use standard Kubernetes network policies to regulate how containers communicate with each other. You can use Terway to enable internal communication within a Kubernetes cluster. This topic describes how to use Terway.

Context

Terway is a network plug-in developed by Alibaba Cloud for Container Service. Terway allows you to set up networks for pods by associating Alibaba Cloud elastic network interfaces (ENIs) with the pods. Terway also allows you to use standard Kubernetes network policies to regulate how containers communicate with each other. In addition, Terway is compatible with Calico network polices.

In a cluster that has Terway installed, each pod has a separate network stack and is assigned a separate IP address. Pods on the same Elastic Compute Service (ECS) instance communicate with each other by forwarding packets inside the ECS instance. Pods on different ECS instances communicate with each other through ENIs in the VPC where the ECS instances are deployed. This improves communication efficiency because no tunneling technologies such as Virtual Extensible Local Area Network (VXLAN) are required to encapsulate packets.

How Terway works



Comparison between Flannel and Terway

When you create a Kubernetes cluster, you can choose one of the following network plug-ins:

- Terway: a network plug-in developed by Alibaba Cloud for Container Service. Terway allows you to assign ENIs to containers and use standard Kubernetes network policies to regulate how containers communicate with each other. Terway also supports bandwidth throttling on individual containers. Terway uses flexible IP Address Management (IPAM) policies to allocate IP addresses to containers. This avoids IP address waste. If you do not want to use network policies, you can select Flannel as the network plug-in. Otherwise, we recommend that you select Terway.
- Flannel: an open source CNI plug-in, which is simple and stable. You can use Flannel with VPC of Alibaba Cloud. This allows your clusters and containers to run in high-performance and stable networks. However, Flannel provides only basic features. It does not support standard Kubernetes network policies. For more information, see Flannel.

Item	Terway	Flannel
Performance	The IP address of each pod in a Kubernetes cluster is assigned from the CIDR block of the VPC where the cluster is deployed. Therefore, you do not need to use the Network Address Translation (NAT) service to translate IP addresses. This avoids IP address waste. In addition, each pod in the cluster can use an exclusive ENI.	Flannel works with VPC of Alibaba Cloud. The CIDR block of pods that you specify must be different from that of the VPC where the cluster is deployed. Therefore, the NAT service is required and some IP addresses may be wasted.
Security	Terway supports network policies.	Flannel does not support network policies.
IP address management	Terway allows you to assign IP addresses on demand. You do not have to assign CIDR blocks by node. This avoids IP address waste.	You can only assign CIDR blocks by node. In large-scale clusters, a great number of IP addresses may be wasted.
SLB	Server Load Balancer (SLB) directly forwards network traffic to pods. You can upgrade the pods without service interruption.	SLB forwards network traffic to the NodePort Service. Then, the NodePort Service routes the network traffic to pods.

Considerations

- To use the Terway plug-in, we recommend that you use ECS instances of higher specifications and newer types, such as ECS instances that belong to the g5 or g6 instance family with at least eight CPU cores. For more information, see the *Instance families* chapter of *ECS User Guide*.
- The maximum number of pods that each node supports is based on the number of ENIs assigned to the node.
  - Maximum number of pods supported by each shared ENI = (Number of ENIs supported by each ECS instance - 1) × Number of private IP addresses supported by each ENI
  - Maximum number of pods supported by each exclusive ENI = Number of ENIs supported by each ECS instance - 1

Step 1: Plan CIDR blocks

When you create a Kubernetes cluster, you must specify a VPC, vSwitches, the CIDR block of pods, and the CIDR block of Services. If you want to install the Terway plug-in, you must first create a VPC and two vSwitches in the VPC. The two vSwitches must be created in the same zone.

You can assign the following CIDR blocks for a cluster that uses Terway.

- VPC CIDR block: 192.168.0.0/16
- vSwitch CIDR block: 192.168.0.0/19

- CIDR block of pod vSwitch: 192.168.32.0/19
- Service CIDR block:172.21.0.0/20

> **Note**
> - IP addresses within the CIDR block of the vSwitch are assigned to nodes.
> - IP addresses within the CIDR block of the pod vSwitch are assigned to pods.

The following example describes how to create a VPC and two vSwitches. The CIDR blocks in the preceding section are assigned in this example.

1. Log on to the VPC console.

   > **Note** For more information, see the *Log on to the VPC console* chapter of *VPC*.

2. Create a VPC.
   i. In the top navigation bar, select the region where you want to create the VPC.
   ii. On the **VPCs** page, click **Create VPC**.

iii. On the **Create VPC** page, set the following parameters and click **Submit**.

Parameter	Description
Organization	Select the organization to which the VPC belongs.
Resource Set	Select the resource set to which the VPC belongs.
Region	Select the region where you want to deploy the VPC.
Sharing Scope	Select the sharing scope of the VPC. ■ **Current Resource Set**: Only the administrator of the current resource set can use the VPC to create resources. ■ **Current Organization and Subordinate Organization**: Only the administrators of the current organization and its subordinate organization can create resources for the shared VPC. ■ **Current Organization**: Only the administrator of the current organization can use create resources for the shared VPC.
VPC Name	Enter a name for the VPC. In this example, vpc_192_168_0_0_16 is used. The name must be 2 to 128 characters in length, and can contain letters, digits, underscores (_), and hyphens (-). The name must start with a letter and cannot start with `http://` or `https://`.
IPv4 CIDR Block	Select an IPv4 CIDR block for the VPC. In this example, 192.168.0.0/16 is specified. **Note** After a VPC is created, the IPv4 CIDR block of the VPC cannot be modified.
IPv6 CIDR Block	Specify whether to assign an IPv6 CIDR block. ■ **Do Not Assign**: The system does not assign an IPv6 CIDR block to the VPC. ■ **Assign**: An IPv6 CIDR block is automatically assigned to the VPC. If you set this parameter to Assign, the system automatically creates a free IPv6 gateway for this VPC, and assigns an IPv6 CIDR block with the subnet mask /56, such as 2xx1: db8: : /56. By default, IPv6 addresses can be used to communicate within only private networks. If you want to allow an instance assigned with an IPv6 address to access the Internet or be accessed by IPv6 clients over the Internet, you must purchase an Internet bandwidth plan for the IPv6 address. For more information, see Enable Internet connectivity for an IPv6 addressthe **Activate IPv6 Internet bandwidth** section of the **Manage IPv6 Internet bandwidth** topic of the *IPv6 gateway user guide*.
Description	Enter a description for the VPC. The description must be 2 to 256 characters in length, and can contain digits, underscores (_), hyphens (-), periods (.), colons (:), and commas (,). It must start with a letter and cannot start with `http://` or `https://`.

3. Create vSwitches.
   i. In the left-side navigation pane, click **VSwitches**.
   ii. Select the region of the VPC in which you want to create a vSwitch.
   iii. On the **VSwitches** page, click **Create VSwitch**.
   iv. On the **Create vSwitch** page, set the following parameters and click **Submit**.

> **Note** Make sure that the two vSwitches are in the same zone.

Parameter	Description
Organization	Select the organization to which the vSwitch belongs.
Resource Set	Select the resource set to which the vSwitch belongs.
Region	Select the region where you want to deploy the vSwitch.
Zone	Select the zone to which the vSwitch belongs. In a VPC, each vSwitch can be deployed in only one zone. You cannot deploy a vSwitch across zones. However, you can deploy cloud resources in vSwitches that belong to different zones to achieve cross-zone disaster recovery. **Note** A cloud instance can be deployed in only one vSwitch.
Sharing Scope	Select the sharing scope of the vSwitch. ■ **Current Resource Set**: Only the administrator of the current resource set can create resources in the shared vSwitch. ■ **Current Organization and Subordinate Organization**: Only the administrators of the current organization and its subordinate organizations can create resources in the shared vSwitch. ■ **Current Organization**: Only the administrator of the current organization can create resources in the shared vSwitch.
VPC	Select the VPC for which you want to create the vSwitch.
Dedicated for Out-of-cloud Physical Machines	Specify whether the vSwitch to be created is dedicated for bare-metal instances. For more information about bare-metal instances, see the **VPC bare-metal instance features** topic in *BMS User Guide*.
vSwitch Name	Enter a name for the vSwitch. In this example, node_switch_192_168_0_0_19 is used. The name must be 2 to 128 characters in length and can contain digits, underscores (_), hyphens (-), periods (.), colons (:), and commas (,). It must start with a letter and cannot start with `http://` or `https://`.
IPv4 CIDR Block	Specify an IPv4 CIDR block for the vSwitch. In this example, 192.168.0.0/19 is used.
IPv6 CIDR Block	Specify an IPv6 CIDR block for the vSwitch. ■ You must check whether IPv6 is enabled for the specified VPC. If IPv6 is disabled, you cannot assign an IPv6 CIDR block to the vSwitch. ■ If IPv6 is enabled, you can enter a decimal number ranging from 0 to 255 to define the last 8 bits of the IPv6 CIDR block of the vSwitch. For example, if the IPv6 CIDR block of the VPC is 2xx1:db8::/64, specify 255 to define the last 8 bits of the IPv6 CIDR block. In this case, the IPv6 CIDR block of the vSwitch is 2xx1:db8:ff::/64. ff is the hexadecimal value of 255.

Parameter	Description
Description	Enter a description for the vSwitch. The description must be 2 to 256 characters in length and can contain letters, digits, underscores (_), hyphens (-), periods (.), colons (:), and commas (,). The name must start with a letter and cannot start with `http://` or `https://`.

4. Repeat Step to create a pod vSwitch. Set the name of the pod vSwitch to **pod_switch_192_168_32_0_19** and IPv4 CIDR Block to **192.168.32.0/19**.

Step 2: Set up networks for a cluster that uses Terway

To install Terway in a cluster and set up networks for the cluster, set the following parameters.

> **Note** A Kubernetes cluster is used as an example to show how to set up networks for a cluster that uses Terway as the network plug-in. For more information about how to create a Kubernetes cluster, see Create a Kubernetes cluster.

- **VPC**: Select the VPC created in Step 1: Plan CIDR blocks.
- **VSwitch**: Select the vSwitch created in Step 1: Plan CIDR blocks.
- **Network Plug-in**: Select **Terway**.
- **Pod VSwitch**: Select the pod vSwitch created in Step 1: Plan CIDR blocks.
- **Service CIDR**: Use the default settings.

3.6.6. Namespaces

3.6.6.1. Create a namespace

You can create a namespace in the Container Service console.

Prerequisites

A Kubernetes cluster is created.

Context

In a Kubernetes cluster, you can use namespaces to create multiple virtual spaces. When a large number of users share a cluster, you can use namespaces to divide different workspaces and allocate cluster resources to different tasks. You can also use resource quotas to allocate resources to each namespace.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, click **Namespaces and Quotas**.
5. On the **Namespace** page, click **Create** in the upper-right corner.
6. In the **Create Namespace** dialog box, configure the namespace.

   Create a namespace

Parameter	Description

Parameter	Description
Name	Enter a name for the namespace. In this example, test is entered. The name must be 1 to 63 characters in length and can contain digits, letters, and hyphens (-). It must start and end with a letter or digit.
Label	**Label**: Add one or more labels to the namespace. Labels are used to identify namespaces. For example, you can label a namespace as one used in the test environment. To add a label, enter a key and a value and click **Add** in the Actions column.

7. Click **OK**.
   You can find the namespace that you created on the Namespace page.

3.6.6.2. Set resource quotas and limits

You can set resource quotas and limits for a namespace in the Container Service console.

Prerequisites

- A Kubernetes cluster is created. For more information, see Create a Kubernetes cluster.
- A sample namespace named **test** is created. For more information, see Create a namespace.
- You are connected to a master node of the cluster. For more information, see Connect to a Kubernetes cluster through kubectl.

Context

By default, a running pod uses the CPU and memory resources of a node without limit. This means that pods can compete for computing resources of a cluster. As a result, the pods in a namespace may exhaust all of the computing resources.

Namespaces can be used as virtual clusters to serve multiple purposes. We recommend that you set resource quotas for namespaces.

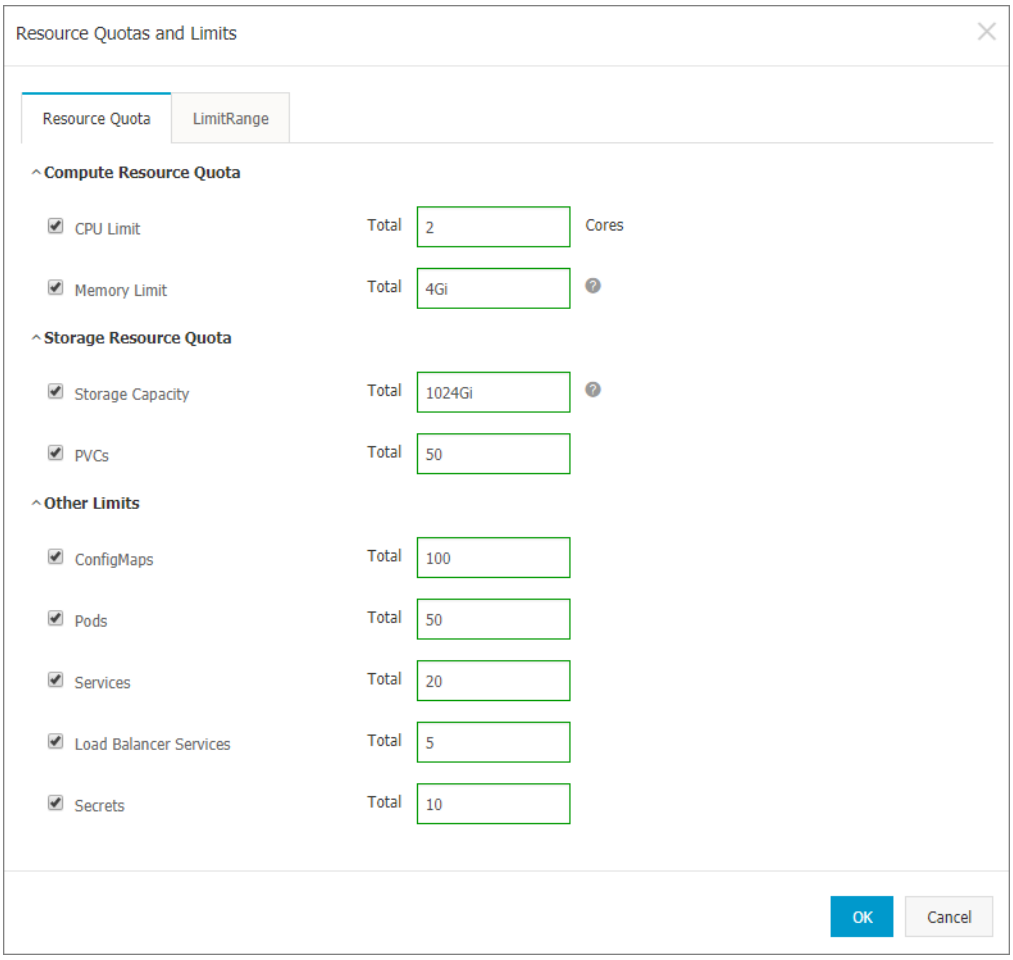
For a namespace, you can set quotas on resources such as CPU, memory, and pod quantity. For more information, see Resource Quotas.

Procedure

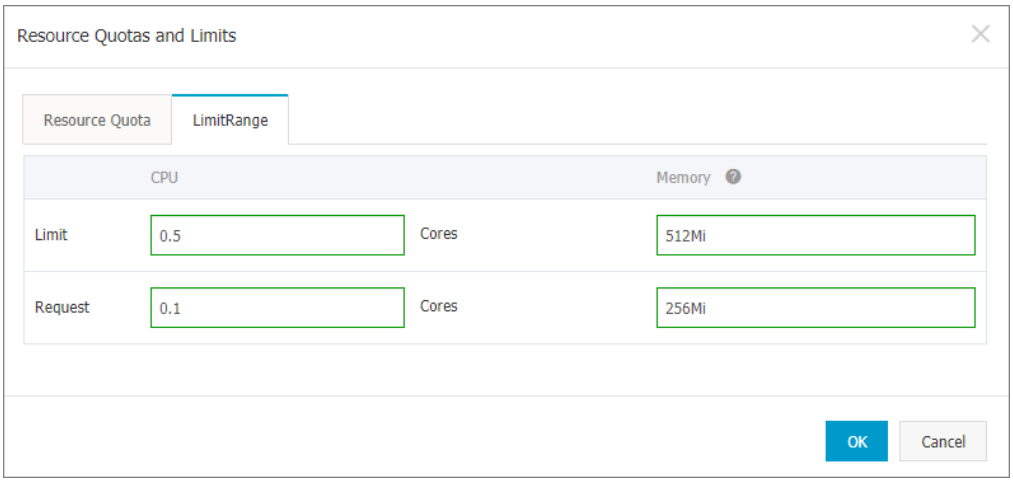
1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, click **Namespaces and Quotas**.
5. Find the namespace that you want to manage and click **Resource Quotas and Limits** in the **Actions** column.
6. In the dialog box that appears, set resource quotas and default resource limits.

> **Note** After you set CPU and memory quotas for a namespace, you must specify CPU and memory limits when you create a pod. You can also set the default resource limits for the namespace. For more information, see Resource Quotas.

i. Set resource quotas for the namespace.



ii. You can set resource limits and resource requests for containers in the namespace. This enables you to control the amount of resources consumed by the containers. For more information, see https://kubernetes.io//memory-default-namespace/.



7. After you set resource quotas and limits, connect to a master node of the cluster and run the following commands to query the resource configurations of the namespace.

```
# kubectl get limitrange,ResourceQuota -n test
NAME AGE
limitrange/limits 8m
NAME AGE
resourcequota/quota 8m
# kubectl describe limitrange/limits resourcequota/quota -n test
Name: limits
Namespace: test
Type Resource Min Max Default Request Default Limit Max Limit/Request Ratio
---- -------- --- --- --------------- ------------- -----------------------
Container cpu - - 100m 500m -
Container memory - - 256Mi 512Mi -
Name: quota
Namespace: test
Resource Used Hard
-------- ---- ----
configmaps 0 100
limits.cpu 0 2
limits.memory 0 4Gi
persistentvolumeclaims 0 50
pods 0 50
requests.storage 0 1Ti
secrets 1 10
services 0 20
services.loadbalancers 0 5
```

3.6.6.3. Modify a namespace

You can modify an existing namespace.

Prerequisites

- A Kubernetes cluster is created. For more information, see Create a Kubernetes cluster.
- A sample namespace named **test** is created. For more information, see Create a namespace.

Context

When you modify a namespace, you can add, delete, or modify the labels that are added to the namespace based on your requirements.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, click **Namespaces and Quotas**.
5. Find the namespace that you want to modify and click **Edit** in the **Actions** column.
6. In the **Edit Namespace** dialog box, find the label that you want to modify and click **Edit** to modify the label. For example, you can change the key-value pair of the label to `env:test-V2`. Then, click **Save**.
7. Click **OK**.

   You can find that the labels of the namespace on the Namespace page are updated.

3.6.6.4. Delete a namespace

You can delete namespaces that are no longer in use.

Prerequisites

- A Kubernetes cluster is created. For more information, see Create a Kubernetes cluster.
- A sample namespace named **test** is created. For more information, see Create a namespace.

Context

> **Note** When you delete a namespace, all resource objects under the namespace are deleted. Proceed with caution.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, click **Namespaces and Quotas**.
5. Find the namespace that you want to delete and click **Delete** in the **Actions** column.
6. In the message that appears, click **Confirm**.

   Return to the Namespace page. You can find that the namespace is deleted. Resource objects in the namespace are also deleted.

3.6.7. Applications

3.6.7.1. Create an application from an image

You can use an image to create an NGINX application that is accessible over the Internet.

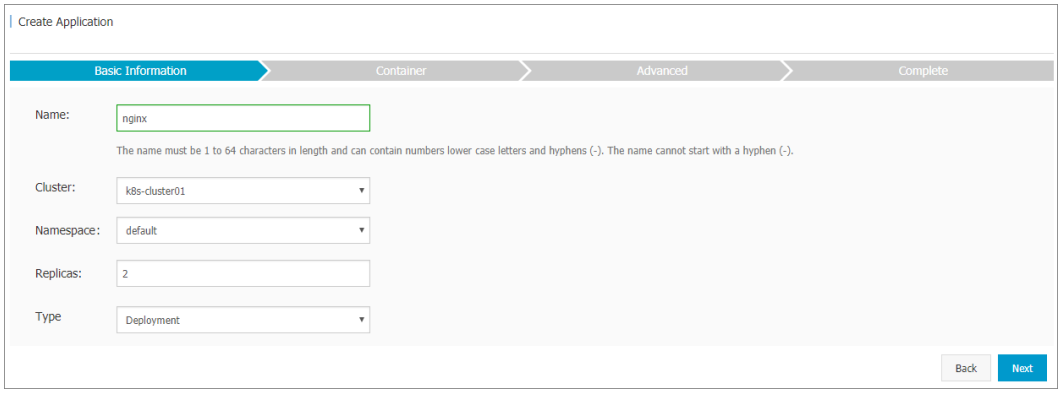
Prerequisites

- A Kubernetes cluster is created. For more information, see Create a Kubernetes cluster.
- Your Kubernetes cluster is accessible over the Internet.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Workloads > Deployments**.
5. On the **Deployments** page, select the namespace and click **Create from Image** in the upper-right corner.
6. On the page that appears, set the following parameters: **Name**, **Cluster**, **Namespace**, **Replicas**, and **Type**. Then, select **Synchronize Timezone**. Click **Next**.

   If you do not set the **Namespace** parameter, the default namespace is used.



7. Configure containers.

> **Note** You can configure a pod that contains one or more containers for the application.

i. Configure basic settings.

Basic settings of the container

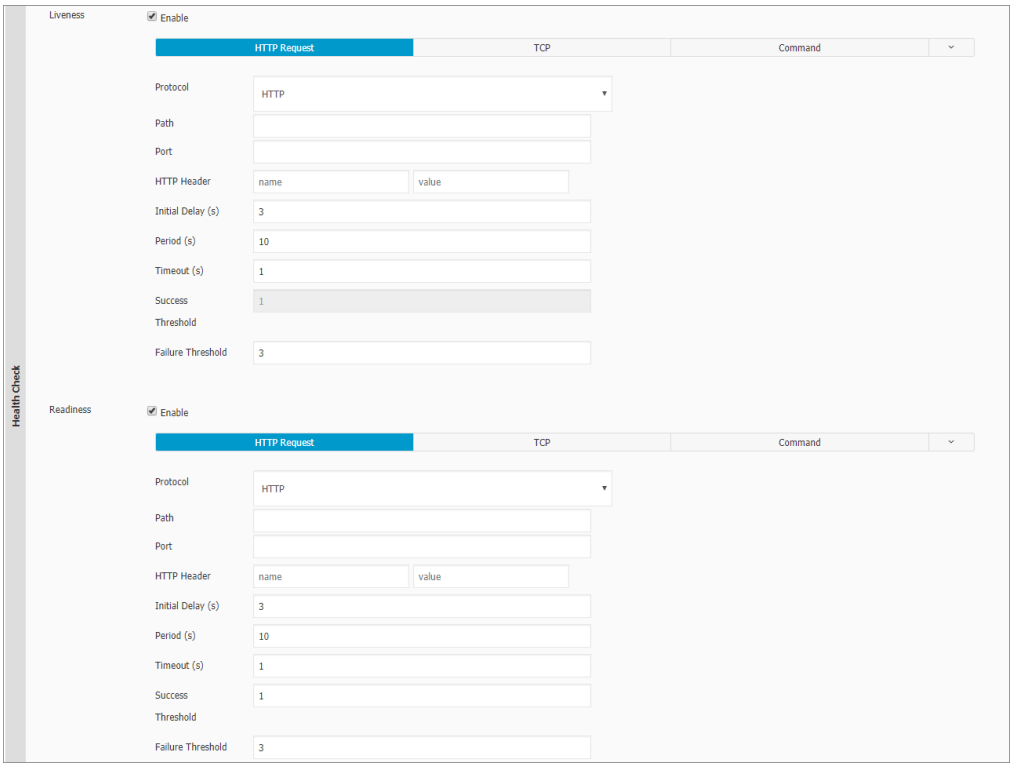
Parameter	Description
Image Name	You can click **Select Image** to select an image in the dialog box that appears and click **OK**. In this example, NGINX is selected. You can also specify an image in a private registry. Use the following format to specify an image in a private registry: `domainname/namespace/imagename` .
Image Version	You can click **Select Image Version** to select a version. If you do not specify the image version, the latest version is used.
Always	Container Service caches images to improve the efficiency of application deployment. When Container Service deploys the application, if the specified image version is the same as the cached image version, the cached image is used. Therefore, when you update the application code, if you do not change the image version for reasons such as to support the upper-layer workloads, the cached image is used to deploy the application. After you select the Always option, Container Service always pulls the latest image from the repository. This ensures that the latest image and code are used to deploy the application.
Set Image Pull Secret	Click Set Image Pull Secret to set the image Secret. The Secret is required if you need to access a private repository.
Resource Limit	The upper limits of CPU and memory resources that can be used by this application. This prevents the application from occupying excessive resources. The unit of CPU resources is Core. The unit of memory is MiB.
Required Resources	The amount of CPU and memory resources that are reserved for this application. These resources are exclusive to the container. This prevents other services or processes from occupying the resources of the application.
Container Start Parameter	**stdin**: Pass stdin to the container. **tty**: Stdin is a TTY. Typically, these two check boxes are both selected. This allows you to associate the terminal (tty) with the standard inputs (stdin) of the container. For example, an interactive program can obtain standard inputs from users and then display the inputs on the terminal.
Init Container	When this check box is selected, the system creates an Init Container that contains useful tools. For more information, see .

ii. (Optional)Set environment variables.

You can set environment variables in key-value pairs for pods. Environment variables are used to apply pod configurations to containers. For more information, see Pod variable.

iii. (Optional)Configure the **Health Check** settings.

Health check settings include liveness and readiness probes. Liveness probes determine when to restart the container. Readiness probes indicate whether the container is ready to accept network traffic. For more information about health checks, see .



Request type	Description

Request type	Description
HTTP	Sends an HTTP GET request to the container. Supported parameters: ■ Protocol: HTTP or HTTPS. ■ Path: the requested path on the server. ■ Port: the container port that you want to open. Enter a port number from 1 to 65535. ■ HTTP Header: the custom headers in the HTTP request. Duplicate headers are allowed. Key-value pairs are supported. ■ Initial Delay (s): The **initialDelaySeconds** field. The time (in seconds) to wait before performing the first probe after the container is started. Default value: 3. ■ Period (s): the **periodSeconds** field. The intervals (in seconds) between two adjacent probes. Default value: 10. Minimum value: 1. ■ Timeout (s): the **timeoutSeconds** field. The time (in seconds) after which a probe times out. Default value: 1. Minimum value: 1. ■ Healthy Threshold: the minimum number of times that an unhealthy container must consecutively pass health checks before it is considered healthy. Default value: 1. Minimum value: 1. For liveness probes, this parameter must be set to 1. ■ Unhealthy Threshold: the minimum number of times that a healthy container must consecutively fail health checks before it is considered unhealthy. Default value: 3. Minimum value: 1.
TCP	Sends a TCP socket to the container. Kubelet attempts to open the socket on the specified port. If the connection can be established, the container is considered healthy. Otherwise, the container is considered unhealthy. You can set the following parameters: ■ Port: the container port that you want to open. Enter a port number from 1 to 65535. ■ Initial Delay (s): the **initialDelaySeconds** field. The time (in seconds) to wait before performing the first probe after the container is started. Default value: 15. ■ Period (s): the **periodSeconds** field. The intervals (in seconds) between two adjacent probes. Default value: 10. Minimum value: 1. ■ Timeout (s): the **timeoutSeconds** field. The time (in seconds) after which a probe times out. Default value: 1. Minimum value: 1. ■ Healthy Threshold: the minimum number of times that an unhealthy container must consecutively pass health checks before it is considered healthy. Default value: 1. Minimum value: 1. For liveness probes, this parameter must be set to 1. ■ Unhealthy Threshold: the minimum number of times that a healthy container must consecutively fail health checks before it is considered unhealthy. Default value: 3. Minimum value: 1.

Request type	Description
Command	Runs a probe command in the container to check the health status of the container. You can set the following parameters: ■ Command: the probe command that is run to check the health status of the container. ■ Initial Delay (s): the **initialDelaySeconds** field. The time (in seconds) to wait before performing the first probe after the container is started. Default value: 5. ■ Period (s): the **periodSeconds** field. The intervals (in seconds) between two adjacent probes. Default value: 10. Minimum value: 1. ■ Timeout (s): the **timeoutSeconds** field. The time (in seconds) after which a probe times out. Default value: 1. Minimum value: 1. ■ Healthy Threshold: the minimum number of times that an unhealthy container must consecutively pass health checks before it is considered healthy. Default value: 1. Minimum value: 1. For liveness probes, this parameter must be set to 1. ■ Unhealthy Threshold: the minimum number of times that a healthy container must consecutively fail health checks before it is considered unhealthy. Default value: 3. Minimum value: 1.

iv. Configure the lifecycle of the container.

You can set the following parameters to configure the lifecycle of the container in the Start, Post Start, and Pre Stop fields. For more information, see https://kubernetes.io/docs/tasks/configure-pod-container/attach-handler-lifecycle-event/.

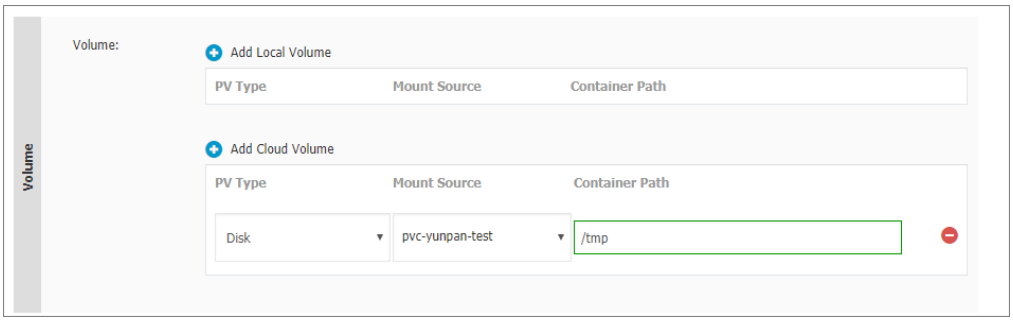
- **Start**: the pre-start command and parameter.
- **Post Start**: the post-start command.
- **Pre Stop**: the pre-stop command.

v. (Optional)Configure volumes.

Local storage and cloud storage are supported.

- **Local Storage**: supports hostPath, ConfigMap, Secret, and emptyDir. The specified volume is mounted to a path in the container. For more information, see Volumes.
- **Cloud Storage**: supports disks, Apsara File Storage NAS (NAS) volumes, and Object Storage Service (OSS) volumes.

In this example, a persistent volume (PV) is created from a disk and mounted to the */tmp* path in the container. Data generated in this path is stored in the disk.



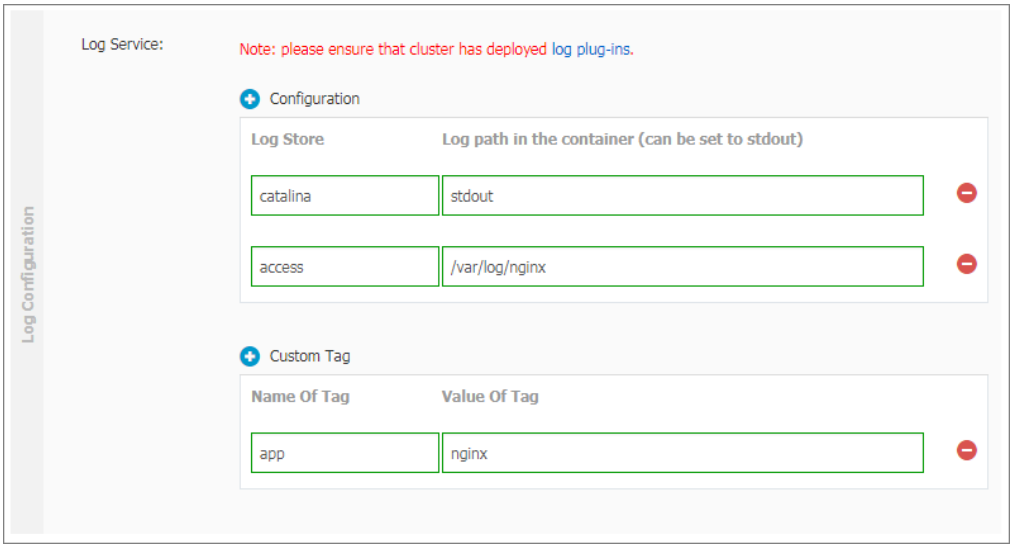
vi. (Optional)Configure **Log Service**. You can specify log collection configurations and custom tags.

> **Note** Make sure that the Log Service agent is installed in the cluster.

You can configure the following log collection settings:

- **Logstore**: Create a Logstore in Log Service to store the collected log data.
- **Log Path in Container**: Specify stdout or a path to collect log data.
  - **stdout**: specifies that the stdout files are collected.
  - **Text Logs**: specifies that the log data in the specified path of the container is collected. In this example, the log data in the */var/log/nginx* path is collected. Wildcard characters can be used in the path.

You can also add custom tags. Tags are added to the log data of the container when the log data is collected. Log data with tags is easier to aggregate and filter.

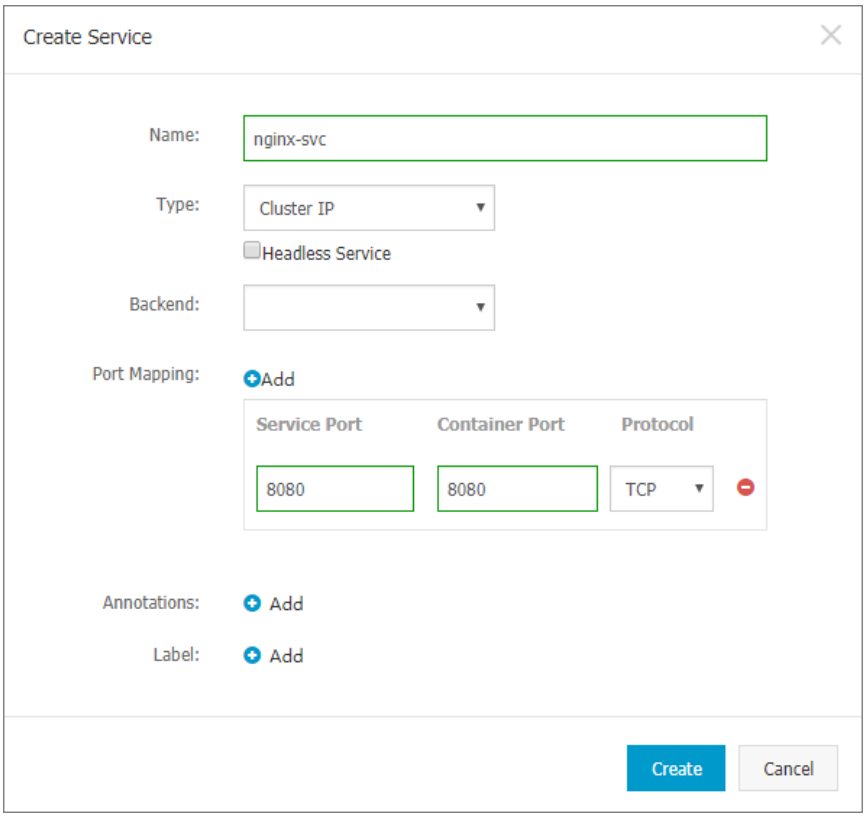


8. After you complete the configurations of the container, click **Next**.
9. Configure advanced settings. Configure the **Access Control** settings.

You can configure the method to expose pods and click **Create**. In this example, a ClusterIP Service and an Ingress are created to enable Internet access to the NGINX application.

> **Note**
>
> You can configure the following access control settings based on your business requirements:
>
> - Internal applications: For applications that run inside the cluster, you can create a ClusterIP Service or a NodePort Service to enable internal communication.
> - External applications: For applications that need to be accessed over the Internet, you can configure access control settings by using one of the following methods:
>   - Create a LoadBalancer Service: When you create a LoadBalancer Service, a Server Load Balancer (SLB) instance is associated with the Service and is created to expose applications to the Internet.
>   - Create a ClusterIP Service or a NordPort Service, and then create an Ingress: When you use this method, an Ingress is created to expose applications to the Internet. For more information, see .

i. To create **Services**, click **Create** in the Access Control section. In the dialog box that appears, set the parameters, and then click **Create**.



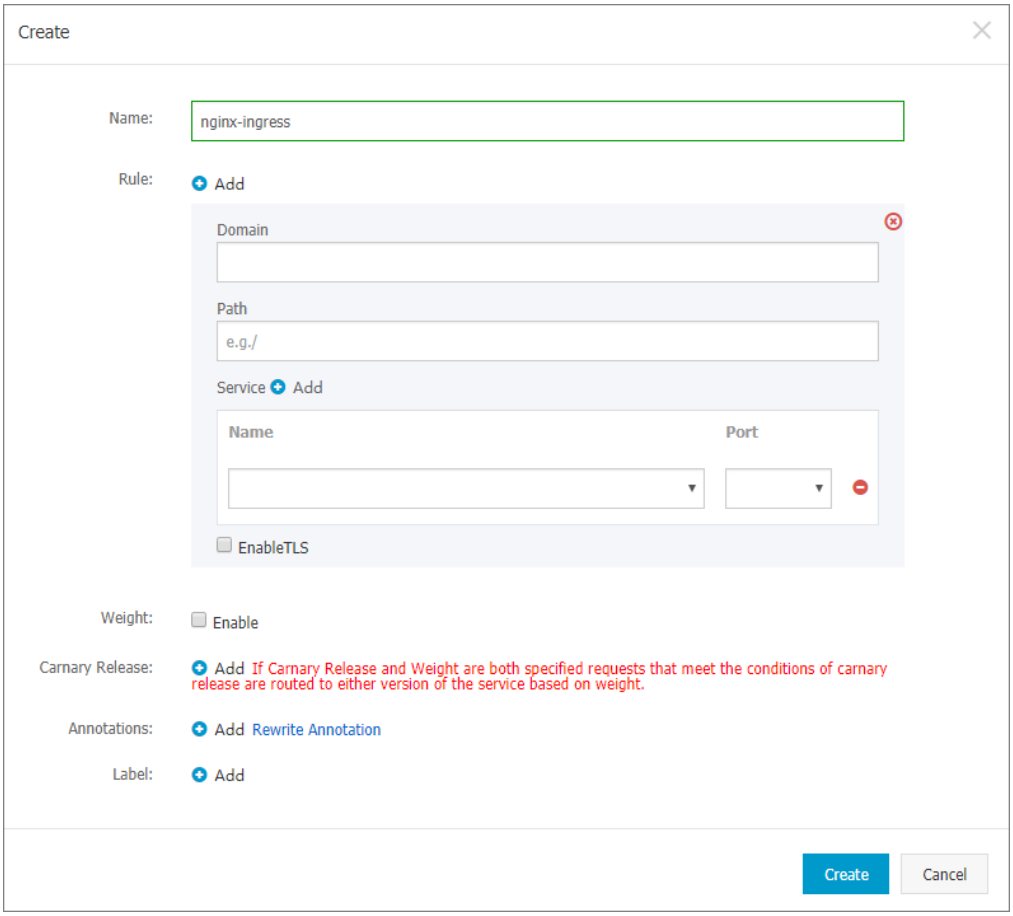
Parameter	Description
Name	Enter a name for the Service. Default value: `applicationname-svc`.

Parameter	Description
Type	Select one from the following three Service types: ■ Cluster IP: creates a ClusterIP Service. This type of Service exposes applications through an internal IP address of the cluster. If you select this type, applications can be accessed only within the cluster. ■ Node Port: creates a NordPort Service. This type of Service exposes applications through the IP address and static port on each node. A NodePort Service can be used to route requests to a ClusterIP Service. The system automatically creates the ClusterIP Service. You can access a NodePort Service from outside the cluster by requesting `<NodeIP>:<NodePort>`. ■ Server Load Balancer: creates a LoadBalancer Service. This type of Service exposes applications through an SLB instance, which supports Internet access or internal access. The SLB instance can route requests to NodePort and ClusterIP Services.
Port Mapping	Specify a Service port and a container port. If the **Type** parameter is set to Node Port, you must specify a node port to avoid port conflicts. TCP and UDP protocols are supported.
Annotations	Add annotations to the Service. SLB parameters are supported. For more information, see Access services by using SLB.
Label	Add one or more labels to the Service. The labels are used to identify the Service.

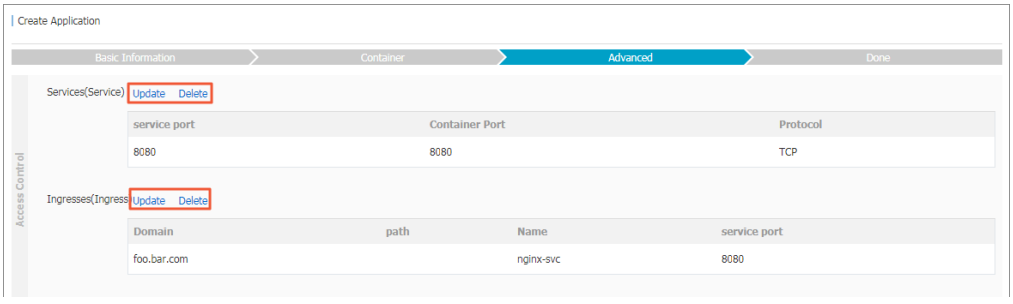
ii. To create **Ingresses**, click **Create** in the Access Control section. Configure Ingress rules in the dialog box that appears, and then click **Create**. For more information about Ingress configuration, see Ingress configurations.

When you create an application from an image, you can create an Ingress for only one Service. In this example, a virtual hostname is specified as the test domain name. You must add a mapping rule to the hosts file for this domain name, as shown in the following code block. In actual scenarios, use a domain name that has obtained an Internet Content Provider (ICP) number.

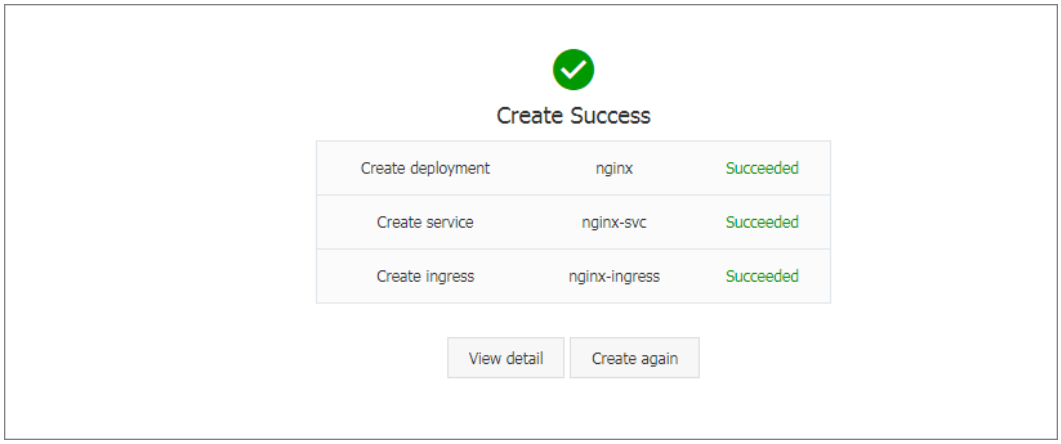
```
101.37.224.146  foo.bar.com  #The IP address of the Ingress.
```



iii. You can find the newly created Service and Ingress in the Access Control section. You can click **Update** or **Delete** to make changes.

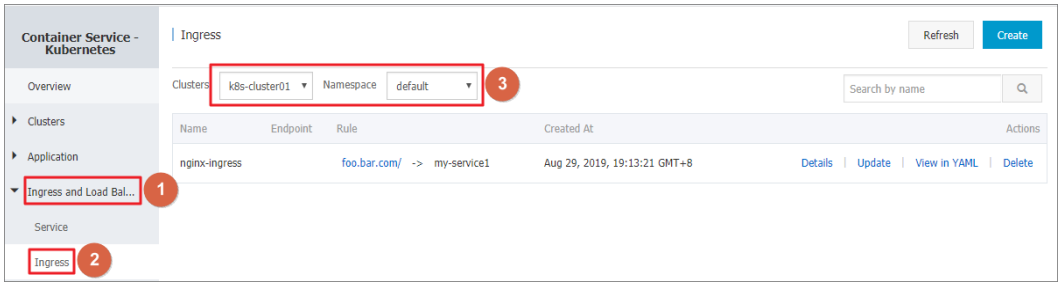


10. Click **Create**.
11. After the application is created, you are redirected to the Complete page, which displays the resource objects under the application. You can click **View Details** to view application details.



The nginx-deployment details page appears.

12. In the left-side navigation pane, choose **Services and Ingresses > Ingresses**. On the Ingresses page, you can find the created Ingress.



13. Enter the test domain in the address bar of your browser and press Enter. The NGINX welcome page appears.

3.6.7.2. Create an application from an orchestration template

Container Service provides orchestration templates that you can use to create applications. You can also modify the templates based on YAML syntax to customize applications.

Prerequisites

A Kubernetes cluster is created. For more information, see Create a Kubernetes cluster.

Context

This topic describes how to use an orchestration template to create an NGINX application that consists of a Deployment and a Service. The Deployment provisions pods for the application and the Service manages access to the pods at the backend.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.

3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Workloads > Deployments**.
5. On the **Deployments** page, select the namespace and click **Create from YAML** in the upper-right corner.
6. Configure the template and click **Create**.
   - **Sample Template**: Container Service provides YAML templates of various resource types to help you quickly deploy resource objects. You can also create a custom template based on YAML syntax to describe the resource that you want to define.
   - **Add Deployment**: This feature allows you to quickly define a YAML template.
   - **Use Existing Template**: You can import an existing template to the configuration page.

   Based on an orchestration template provided by Container Service, the following sample template is used to create a Deployment of an NGINX application.

   > **Note** Container Service supports YAML syntax. You can use the `---` symbol to separate multiple resource objects. This allows you to create multiple resource objects in a single template.

```
apiVersion: apps/v1beta2 # for versions before 1.8.0 use apps/v1beta1
kind: Deployment
metadata:
  name: nginx-deployment
  labels:
    app: nginx
spec:
  replicas: 2
  selector:
    matchLabels:
      app: nginx
  template:
    metadata:
      labels:
        app: nginx
    spec:
      containers:
      - name: nginx
        image: nginx:1.7.9 # replace it with your exactly <image_name:tags>
        ports:
        - containerPort: 80
---
apiVersion: v1    # for versions before 1.8.0 use apps/v1beta1
kind: Service
metadata:
  name: my-service1      #TODO: to specify your service name
  labels:
    app: nginx
spec:
  selector:
    app: nginx         #TODO: change label selector to match your backend pod
  ports:
  - protocol: TCP
    name: http
    port: 30080        #TODO: choose an unique port on each node to avoid port conflict
    targetPort: 80
  type: LoadBalancer      ##In this example, the type is changed from Nodeport to LoadBalancer.
```

7. Click **Create**. A message that indicates the deployment status appears.

After the application is created, choose **Services and Ingresses > Services** in the left-side navigation pane. On the Services page, you can find that a Service named my-service1 is created for the application. The external endpoint of the Service is also displayed on the page. Click the endpoint in the **External Endpoint** column.

8. You can visit the NGINX welcome page in the browser.

3.6.7.3. Use commands to manage applications

You can use commands to create applications or view application containers.

Prerequisites

Before you use commands on your local host, you have connected to a Kubernetes cluster through kubectl. For more information, see Connect to a Kubernetes cluster through kubectl.

Run a command to create an application

You can use the following command to run a simple container (an NGINX Web server in this example):

```
# kubectl run -it nginx --image=registry.aliyuncs.com/spacexnice/netdia:latest
```

This command creates a service portal for this container. After you specify `--type=LoadBalancer`, an SLB route to the NGINX container is created.

```
# kubectl expose deployment nginx --port=80 --target-port=80 --type=LoadBalancer
```

Run a command to view container information

Run the following command to list all running containers in the default namespace:

```
root@master # kubectl get pods
  NAME                READY   STATUS  RESTARTS  AGE
  nginx-2721357637-dvwq3        1/1    Running  1     9h
```

3.6.7.4. Create a Service

You can create a Service for your application in the Container Service console. The Service provides access to the application.

In Kubernetes, a Service is an abstraction which defines a logical set of pods and a policy by which to access the pods. This pattern is also known as a microservice. A label selector determines whether the set of pods can be accessed by the Service.

Each pod in Kubernetes clusters has its own IP address. However, pods are frequently created and deleted. Therefore, if you directly expose pods to external access, high availability is not ensured. Services decouple the frontend from the backend. The frontend clients do not need to be aware of which backend pods are used. This provides a loosely-decoupled microservice architecture.

For more information, see Kubernetes Services.

Prerequisites

A Kubernetes cluster is created. For more information, see Create a Kubernetes cluster.

Step 1: Create a Deployment

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Workloads > Deployments**.
5. On the **Deployments** page, select the namespace and click **Create from Template** in the upper-right corner.
6. Select a sample template or customize a template, and click **Create**.

   In this example, the template of an NGINX Deployment is used.

   ```
   apiVersion: apps/v1 # for versions before 1.8.0 use apps/v1beta1 kind: Deployment metadata: name: nginx-deployment-basic labels: app: nginx spec: replicas: 2 selector: matchLabels: app: nginx template: metadata: labels: app: nginx spec: # nodeSelector: # env: test-team containers: - name: nginx image: nginx:1.7.9 # replace it with your exactly <image_name:tags> ports: - containerPort: 80
   ```

   Query the state of the Deployment.

Step 2: Create a Service

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Services and Ingresses > Services**.
5. On the Services page, select the **Namespace** and click **Create** in the upper-right corner.
6. On the Create Service dialog box, set the parameters.
   - **Name**: Enter a name for the Service. In this example, nginx-svc is used.
   - **Type**: Select the type of the Service. This parameter specifies how to access the Service. Valid values:
     - Cluster IP: a ClusterIP Service. This type of Service exposes pods through an internal IP address of the cluster. If you select this option, pods can be accessed only within the cluster. This is the default value.
     - Node Port: a NodePort Service. This type of Service exposes pods by using the IP address and a static port of each node. A NodePort Service can be used to route requests to a ClusterIP Service, which is automatically created by the system. You can access a NodePort Service from outside the cluster by sending requests to `<NodeIP>:<NodePort>`.
     - Server Load Balancer: a LoadBalancer Service. This type of Service exposes pods by using Server Load Balancer (SLB) instances, which support Internet access or internal access. SLB instances can be used to route requests to NodePort and ClusterIP Services.
   - **Backend**: the backend object that you want to associate with the Service. In this example, select nginx-deployment-basic that was created in the preceding step. If you do not associate the Service with a backend object, no Endpoint object is created. You can also manually associate the Service with an Endpoint object. For more information, see Create a Service without selectors.
   - **Port Mapping**: Set the Service port and container port. The container port must be the same as the one that is exposed in the backend pod.
   - **Annotations**: Add one or more annotations to the Service to configure SLB parameters. For example, set the name to `service.beta.kubernetes.io` and the value to `20`. This means that the maximum bandwidth of

the Service is 20 Mbit/s. For more information, see Access services by using SLB.

- **Label**: Add one or more labels to the Service. The labels are used to identify the Service.

7. Click **Create**. After the nginx-svc Service is created, it appears on the Services page.
8. On the **Services** page, you can view basic information about the Service. You can also access its external endpoint by using a browser.

3.6.7.5. View a Service

You can view details about a Service in the Container Service console.

Context

Each pod in Kubernetes clusters has its own IP address. However, pods are frequently created and deleted. Therefore, it is not practical to directly expose pods to external access. Services decouple the frontend from the backend, which provides a loosely-coupled microservice architecture.

Procedure

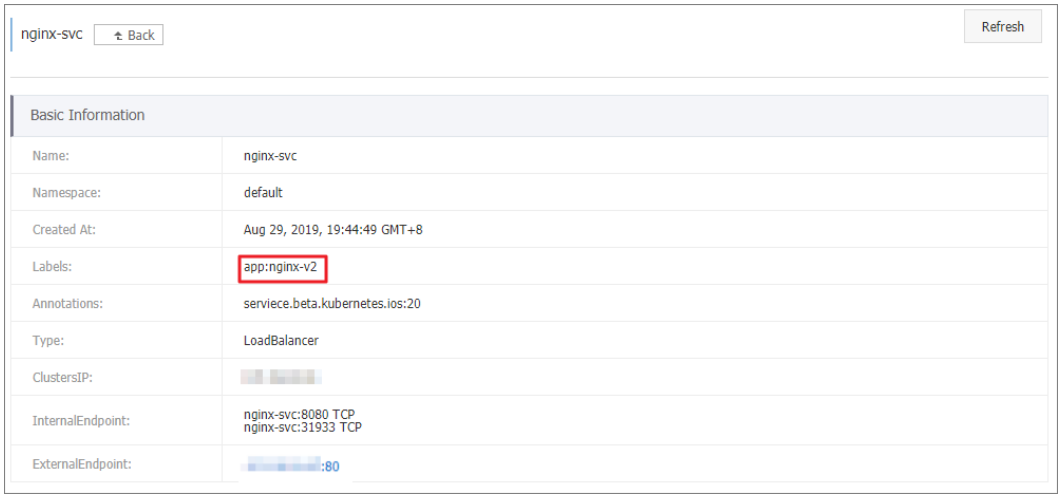
1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane, choose **Services and Ingresses > Services**.
5. On the **Services** page, select the namespace, find the Service that you want to view, and then click **Details** in the Actions column.
   On the details page, you can view detailed information about the Service.

3.6.7.6. Update a Service

You can update a Service through the Container Service console. This topic describes how to update a Service.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Services and Ingresses > Services**.
5. On the **Services** page, select the namespace, find the Service that you want to update, and then click **Update** in the Actions column.
6. In the **Update Service** dialog box, modify the configurations and click **Update**.
7. In the Service list, find the Service that you updated and click **Details** in the Actions column to view configuration changes. In this example, the labels of the Service are modified.



3.6.7.7. Delete a Service

This topic describes how to delete a Service.

Prerequisites

- A Kubernetes cluster is created. For more information, see Create a Kubernetes cluster.
- A Service is created. For more information, see Create Servcies.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Services and Ingresses > Services**.
5. On the Services page, select the namespace, find the Service that you want to delete, and then click **Delete** in the Actions column.
6. In the message that appears, click **Confirm**.

3.6.7.8. Use a trigger to redeploy an application

You can create a trigger and use it to redeploy an application. This topic describes how to use a trigger.

Prerequisites

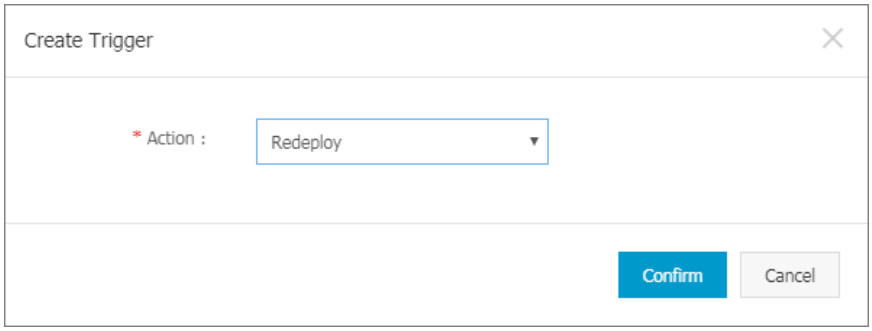
- A Kubernetes cluster is created. For more information, see Create a Kubernetes cluster.
- An application is created. Then, a trigger is created for the application and the application is used to test the trigger. In this example, an NGINX application is created.

Procedure

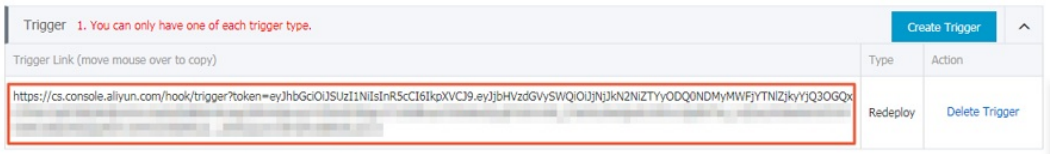
1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Manage** in the **Actions** column of the cluster.
4. In the left-side navigation pane, click Deployments. On the **Deployments** page, find the NGINX application and click **Details** in the Actions column.
5. On the details page of the application, click the **Triggers** tab. Then, click **Create Trigger**.

6. In the dialog box that appears, set Action to **Redeploy** and click **Confirm**.

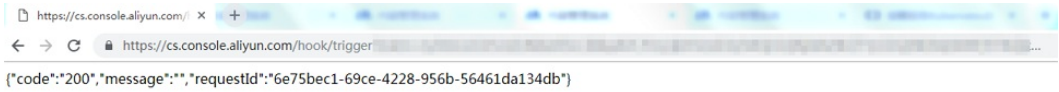
> **Note** You can create triggers only to redeploy applications.



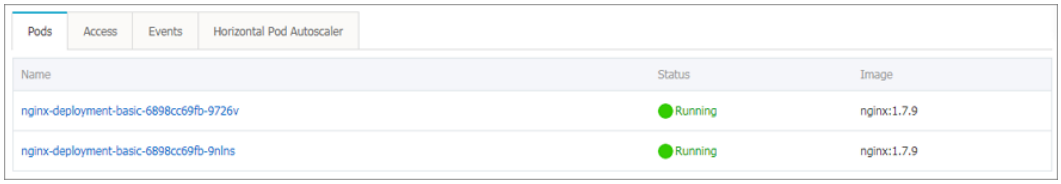
After the trigger is created, the webhook URL of the trigger appears in the Trigger Link Address column on the **nginx - deployment** page.



7. Copy the webhook URL, enter it into the address bar of your browser, and press Enter. A message that indicates specific information such as the request ID appears.



8. Go to the **nginx - deployment** page. A new pod appears on the **Pods** tab.



After the new pod is deployed, the original pod is automatically deleted.

What's next

You can run triggers by sending GET or POST requests from an external system. For example, you can use the **curl** command-line tool to run triggers.

To run the redeploy trigger, run the following command:

```
curl https://cs.console.aliyun.com/hook/trigger?token=xxxxxxx
```

3.6.7.9. View pods

You can view pods in the Container Service console.

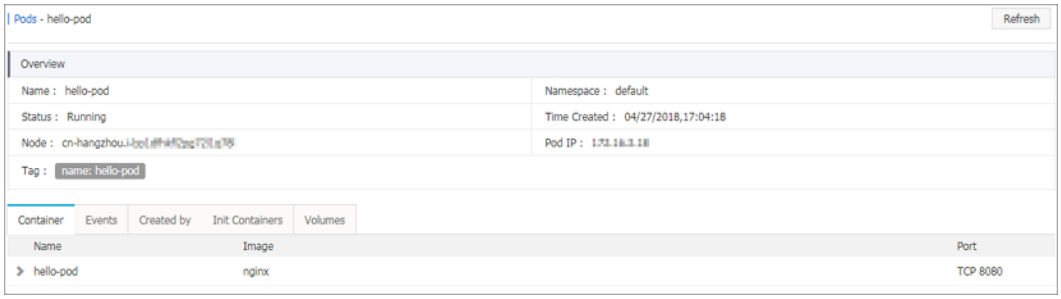
Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.

4. In the left-side navigation pane of the details page, choose **Workloads > Pods**.
5. In the left-side navigation pane, choose **Applications > Pods**. The Pods page appears.
6. On the **Pods** page, select the namespace, find the pod that you want to view, and then click **View Details** in the Actions column.

> **Note** You can update or delete pods on the Pods page. We recommend that you use Deployments to manage pods if the pods are created by Deployments.

On the details page of the pod, you can view detailed information about the pod.



3.6.7.10. Manage pods

Pods are the smallest deployable units in Kubernetes. A pod runs an instance of an independent application in Kubernetes. Each pod contains one or more containers that are tightly coupled. You can modify pods, view pods, and manually scale the number of pods for an application in the Container Service console.

View pods

View pod details

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click the name or click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Workloads > Pods**.
5. Find the pod that you want to view and click **View Details** in the Actions column.

   You can view details of pods by using one of the following methods:

   - Method 1: In the left-side navigation pane of the details page, choose **Workloads > Deployments**. Find the application that you want to manage and click the name of the application. On the **Pods** tab, click the name of the pod to view details.
   - Method 2: In the left-side navigation pane of the details page, choose **Services and Ingresses > Services**. Click the name of the Service that you want to manage. On the page that appears, find and click the name of the application that you want to manage. On the **Pods** tab, click the name of the pod to view details.

> **Note** On the Pods page, you can modify and delete pods. For pods that are created by using a Deployment, we recommend that you use the Deployment to manage the pods.

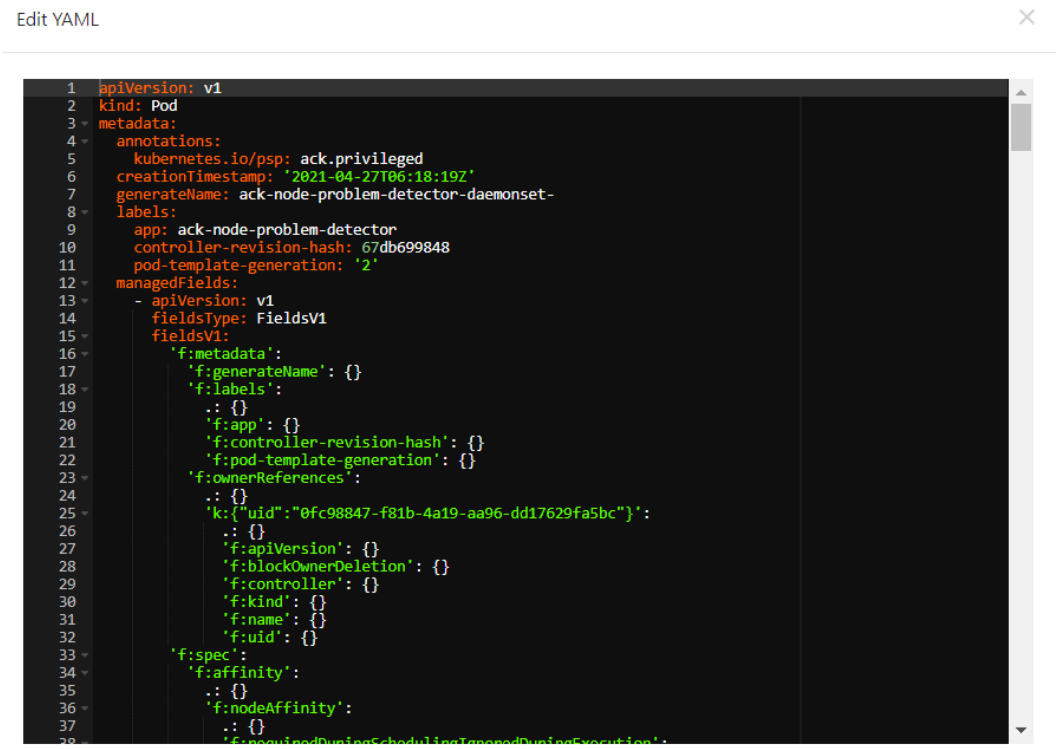
View pod log

You can view a pod log by using the following methods:

Navigate to the Pods tab, find the pod that you want to manage, and then click **Logs** on the right side to view the log data.

Modify pod configurations

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click the name or click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Workloads > Pods**.
5. On the **Pods** page, find the pod that you want to manage and click **Edit** in the Actions column.
6. In the dialog box that appears, modify the configuration of the pod and click **Update**.



Manually scale the number of pods for an application

After an application is created, you can scale in or out the pods that are provisioned for the application.

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click the name or click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Workloads > Deployments**.
5. Select the namespace where the Deployment is deployed, find the Deployment, and then click **Scale** in the **Actions** column.
6. In the dialog box that appears, set Desired Number of Pods to 4 and click **OK**.

> **Note** By default, the resources created by a Deployment are updated based on the rollingUpdate strategy. This ensures that a minimum number of pods are running during the update. You can specify the minimum number of pods that must run in Pod Template of the YAML file.

3.6.7.11. Schedule pods to specific nodes

You can add labels to nodes and schedule pods to the nodes with specified labels. This topic describes how to schedule a pod to a node with specified labels.

You can add labels to nodes and then configure `nodeSelector` to schedule pods to nodes with specified labels. For more information about how nodeSelector works, see nodeselector.

To meet business requirements, you may want to deploy a controller service on a master node, or deploy services on nodes that use standard SSDs. You can use the following method to schedule pods to nodes with specified labels.

Prerequisites

A Kubernetes cluster is created. For more information, see Create a Kubernetes cluster.

Step 1: Add a label to a node

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Nodes > Nodes**.
5. On the **Nodes** page, click **Manage Labels and Taints** in the upper-right corner.
6. Select one or more nodes and then click **Add Label**. In this example, a worker node is selected.
7. In the dialog box that appears, enter the name and value of the label and click **OK**.

   On the Labels tab, you can find the `group:worker` label next to the selected node.

You can also run the following command to add a label to a node: `kubectl label nodes <node-name> <label-key>=<label-value>`.

Step 2: Schedule a pod to the node

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.

3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Workloads > Deployments**.
5. On the **Deployments** page, select the namespace and click **Create from Template** in the upper-right corner.
6. On the **Create** page, select a template from the Sample Template drop-down list. In this example, a custom template is selected. Copy the following content to the custom template and click **Create**.

   The following template is used as an example:

```
apiVersion: v1
kind: Pod
metadata:
 labels:
  name: hello-pod
 name: hello-pod
spec:
 containers:
  - image: nginx
    imagePullPolicy: IfNotPresent
    name: hello-pod
    ports:
     - containerPort: 8080
       protocol: TCP
    resources: {}
    securityContext:
     capabilities: {}
     privileged: false
    terminationMessagePath: /dev/termination-log
 dnsPolicy: ClusterFirst
 restartPolicy: Always
 nodeSelector:
  group: worker                ## This value must be the same as the node label that is added in Step 1.
status: {}
```

3.6.7.12. Simplify application deployment by using Helm

This topic introduces the basic terms and components of Helm and describes how to use Helm to deploy the sample applications WordPress and Spark in a Kubernetes cluster.

Prerequisites

- A Kubernetes cluster is created in the Container Service console. For more information, see Create a Kubernetes cluster.

  Tiller is automatically deployed to the cluster when the Kubernetes cluster is created. The Helm CLI is automatically installed on each master node. An Alibaba Cloud chart repository is added to Helm.

- A Kubernetes version that supports Helm is used.

  Only Kubernetes 1.8.4 and later support Helm. If the Kubernetes version of your cluster is 1.8.1, you can **upgrade** the cluster on the Clusters page of the Container Service console.

Context

Application management is the most challenging task in Kubernetes. The Helm project provides a unified method to package software and manage software versions. You can use Helm to simplify application distribution and deployment. App Catalog is integrated with Helm in the Container Service console and provides extended features based on Helm. App Catalog also supports Alibaba Cloud chart repositories to help you accelerate application deployments. You can deploy applications in the Container Service console or by using the Helm CLI.

This topic introduces the basic terms and components of Helm and describes how to use Helm to deploy the sample applications WordPress and Spark in a Kubernetes cluster.

Basic terms

Helm is an open source project initiated by Deis. Helm can be used to simplify the deployment and management of Kubernetes applications.

Helm serves as a package manager for Kubernetes and allows you to find, share, and use applications built by Kubernetes. Before you use Helm, you must familiarize yourself with the following basic terms:

- Chart: a packaging format used by Helm. Each chart contains the images, dependencies, and resource definitions that are required to run an application. A chart may contain service definitions in a Kubernetes cluster. A Helm chart is similar to a Homebrew formula, an Advanced Package Tool (APT) dpkg, or a Yum rpm.
- Release: an instance of a chart that runs in a Kubernetes cluster. A chart can be installed multiple times into a Kubernetes cluster. After a chart is installed, a new release is created. For example, you can install a MySQL chart. If you want to run two databases in your cluster, you can install the MySQL chart twice. Each time a chart is installed, a release is created with a different name.
- Repository: the storage of charts. Charts are published and stored in repositories.

Helm components

Helm uses a client-server architecture and consists of the following components:

- The Helm CLI is the Helm client that runs on your on-premises machine or on the master nodes of a Kubernetes cluster.
- Tiller is the server-side component and runs in a Kubernetes cluster. Tiller manages the lifecycles of Kubernetes applications.
- A repository is used to store charts. The Helm client can access the index file and packaged charts in a chart repository over HTTP.

Deploy an application in the Container Service console

1. Log on to the Container Service console
2. In the left-side navigation pane, choose **Marketplace > App Catalog**.
3. On the App Catalog page, find and click the WordPress chart to go to the details page of the chart.
4. Click the **Parameters** tab and modify the configurations.

   In this example, a dynamically provisioned disk volume is associated with a persistent volume claim (PVC). For more information, see Use Apsara Stack disks.

   > **Note** You must first provision a disk as a persistent volume (PV). The capacity of the PV cannot be less than the capacity specified in the PVC.

5. In the **Deploy** section, select the cluster in which you want to deploy the application and click **Create**. After the application is deployed, you are redirected to the release page of the application.
6. In the left-side navigation pane, click **Clusters**.
7. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
8. In the left-side navigation pane of the details page, choose **Services and Ingresses > Services**. On the Services page, select the namespace, find the Service that is created for the application, and then check its HTTP and HTTPS external endpoints.
9. Click one of the endpoints to go to the WordPress website where you can publish blog posts.

Deploy an application by using the Helm CLI

After the Helm CLI is automatically installed on the master nodes of the Kubernetes cluster and the required chart repository is added to Helm, you can log on to the master nodes by using SSH. Then, you can deploy applications by using the Helm CLI. For more information, see Connect to a master node through SSH. You can also install and configure the Helm CLI and kubectl on your on-premises machine.

In this example, the Helm CLI and kubectl are installed and configured on your on-premises machine, and then an Apache Spark-based WordPress application is deployed.

1. Install and configure the Helm CLI and kubectl.
   i. Install and configure kubectl on your on-premises machine.

      For more information, see Connect to a Kubernetes cluster through kubectl.

      To view the details of a Kubernetes cluster, run the `kubectl cluster-info` command.

   ii. Install Helm on your on-premises machine.

      For more information, see Install Helm.
2. Deploy the WordPress application.

   In the following example, a WordPress blog website is deployed by using Helm.

   i. Run the following command:

   ```
   helm install --name wordpress-test stable/wordpress
   ```

   > **Note** Container Service allows you to mount disks as dynamically provisioned volumes. Before you deploy the application, you must create a disk volume.

   The following output is returned:

   ```
   NAME: wordpress-testLAST DEPLOYED: Mon Nov 20 19:01:55 2017NAMESPACE: defaultSTATUS: DEPLOYED...
   ```

   ii. Run the following command to query the release and Service created for the WordPress application:

   ```
   helm listkubectl get svc
   ```

   iii. Run the following command to view the pods provisioned for the WordPress application. You may need to wait until the pods change to the Running state.

   ```
   kubectl get pod
   ```

   iv. Run the following command to obtain the endpoint of the WordPress application:

   ```
   echo http://$(kubectl get svc wordpress-test-wordpress -o jsonpath='{.status.loadBalancer.ingress[0].ip}')
   ```

   You can enter the preceding URL into the address bar of your browser to access the WordPress application.

   You can also run the following command based on the chart description to obtain the username and password of the administrator account for the WordPress application:

   ```
   echo Username: userecho Password: $(kubectl get secret --namespace default wordpress-test-wordpress -o jsonpath="{.data.wordpress-password}" | base64 --decode)
   ```

   v. To delete the WordPress application, run the following command:

   ```
   helm delete --purge wordpress-test
   ```

Use a third-party chart repository

You can use the default Alibaba Cloud chart repository. If a third-party chart repository is accessible from your cluster, you can also use the third-party chart repository. Run the following command to add a third-party chart repository to Helm:

```
helm repo add Repository name Repository URLhelm repo update
```

For more information about Helm commands, see Helm documentation.

References

Helm contributes to the development of Kubernetes. A growing number of software suppliers, such as Bitnami, have provided high-quality charts. For more information about available charts, visit `https://kubeapps.com/` .

3.6.8. SLB and Ingress

3.6.8.1. Overview

Container Service allows you to flexibly manage load balancing and customize load balancing policies for Kubernetes clusters. Kubernetes clusters provide you with a variety of methods to access containerized applications. They also allow you to use SLB or Ingress to access internal services and implement load balancing.

3.6.8.2. Use SLB to access Services

You can access a Service through Server Load Balancer (SLB).

Use the CLI

1. Create an NGINX application by using the command-line interface (CLI).

```
root@master # kubectl run nginx --image=registry.aliyuncs.com/acs/netdia:latest
    root@master # kubectl get po
    NAME                READY   STATUS   RESTARTS  AGE
    nginx-2721357637-dvwq3        1/1    Running  1     6s
```

2. Create a Service for the NGINX application and set `type=LoadBalancer` to expose the NGINX Service to the Internet through an SLB instance.

```
root@master # kubectl expose deployment nginx --port=80 --target-port=80 --type=LoadBalancer
    root@master # kubectl get svc
    NAME         CLUSTER-IP    EXTERNAL-IP    PORT(S)             AGE
    nginx        172.19.XX.XX  101.37.XX.XX   80:31891/TCP         4s
```

3. Copy `http://101.37.XX.XX` into the address bar of your browser and press Enter to access the NGINX Service.

SLB parameters

SLB provides a variety of parameters that you can use to configure features and services such as health check, billing method, and SLB instance type. For more information, see SLB parameters.

Annotations

You can add annotations to use the load balancing features provided by SLB.

Use an existing internal-facing SLB instance

You need to add two annotations. You must replace "yourloadbalancer-id" with your SLB instance ID.

```
apiVersion: v1
kind: Service
metadata:
 annotations:
  service.beta.kubernetes.io/alicloud-loadbalancer-address-type: intranet
  service.beta.kubernetes.io/alicloud-loadbalancer-id: your-loadbalancer-id
 labels:
  run: nginx
 name: nginx
 namespace: default
spec:
 ports:
 - name: web
  port: 80
  protocol: TCP
  targetPort: 80
 selector:
  run: nginx
 sessionAffinity: None
 type: LoadBalancer
```

Save the preceding code as an slb.svc file and run the following command: `kubectl apply -f slb.svc` .

Create an HTTPS-based Service of the Loadbalancer type

You must first create a certificate in the SLB console. Then, you can use the certificate ID (cert-id) and the following template to create a LoadBalancer Service and an HTTPS-based SLB instance.

```
apiVersion: v1
kind: Service
metadata:
 annotations:
  service.beta.kubernetes.io/alicloud-loadbalancer-cert-id: your-cert-id
  service.beta.kubernetes.io/alicloud-loadbalancer-protocol-port: "https:443"
 labels:
  run: nginx
 name: nginx
 namespace: default
spec:
 ports:
 - name: web
  port: 443
  protocol: TCP
  targetPort: 443
 selector:
  run: nginx
 sessionAffinity: None
 type: LoadBalancer
```

> **Note** Annotations are case sensitive.

SLB parameters

Annotation	Description	Default value
service.beta.kubernetes.io/alicloud-loadbalancer-protocol-port	The listening port. Separate multiple ports with commas (,). Example: https:443,http:80.	N/A

Annotation	Description	Default value
service.beta.kubernetes.io/alicloud-loadbalancer-address-type	The type of the SLB instance. Valid values: internet and intranet.	internet
service.beta.kubernetes.io/alicloud-loadbalancer-slb-network-type	The network type of the SLB instance. Valid values: classic and vpc.	classic
service.beta.kubernetes.io/alicloud-loadbalancer-charge-type	The billing method of the SLB instance. Valid values: paybytraffic and paybybandwidth.	paybybandwidth
service.beta.kubernetes.io/alicloud-loadbalancer-id	The ID of the SLB instance. You can set the loadbalancer-id parameter to specify an existing SLB instance and its existing listeners will be overwritten. The SLB instance will not be deleted if the Service is deleted.	N/A
service.beta.kubernetes.io/alicloud-loadbalancer-backend-label	The labels that specify the nodes to be added as backend servers of the SLB instance.	N/A
service.beta.kubernetes.io/alicloud-loadbalancer-region	The region where the SLB instance is deployed.	N/A
service.beta.kubernetes.io/alicloud-loadbalancer-bandwidth	The bandwidth of the SLB instance.	50
service.beta.kubernetes.io/alicloud-loadbalancer-cert-id	The certificate ID. You must upload the certificate first.	""
service.beta.kubernetes.io/alicloud-loadbalancer-health-check-flag	Valid values: on and off.	Default value: off. If TCP is used, do not modify this parameter. The health check feature is enabled for TCP listeners by default and cannot be disabled.
service.beta.kubernetes.io/alicloud-loadbalancer-health-check-type	For more information, see *CreateLoadBalancerTCPListener* in the *SLB Developers Guide*.	N/A
service.beta.kubernetes.io/alicloud-loadbalancer-health-check-uri	For more information, see *CreateLoadBalancerTCPListener* in the *SLB Developers Guide*.	N/A
service.beta.kubernetes.io/alicloud-loadbalancer-health-check-connect-port	For more information, see *CreateLoadBalancerTCPListener* in the *SLB Developers Guide*.	N/A
service.beta.kubernetes.io/alicloud-loadbalancer-healthy-threshold	For more information, see *CreateLoadBalancerTCPListener* in the *SLB Developers Guide*.	N/A
service.beta.kubernetes.io/alicloud-loadbalancer-unhealthy-threshold	For more information, see *CreateLoadBalancerTCPListener* in the *SLB Developers Guide*.	N/A

Annotation	Description	Default value
service.beta.kubernetes.io/alicloud-loadbalancer-health-check-interval	For more information, see *CreateLoadBalancerTCPListener* in the *SLB Developers Guide*.	N/A
service.beta.kubernetes.io/alicloud-loadbalancer-health-check-connect-timeout	For more information, see *CreateLoadBalancerTCPListener* in the *SLB Developers Guide*.	N/A
service.beta.kubernetes.io/alicloud-loadbalancer-health-check-timeout	For more information, see *CreateLoadBalancerTCPListener* in the *SLB Developers Guide*.	N/A

3.6.8.3. Configure Ingress monitoring

You can enable the virtual host traffic status (VTS) dashboard to view Ingress monitoring data.

Enable the VTS dashboard by using the CLI

1. Add the following configuration item to the Ingress ConfigMap: `enable-vts-status: "true"` .

   ```
   root@master # kubectl edit configmap nginx-configuration -n kube-system
     configmap "nginx-configuration" edited
   ```

   The following template shows the modified Ingress ConfigMap:

   ```
   apiVersion: v1
   data:
    enable-vts-status: "true"# Enables the VTS dashboard.
    proxy-body-size: 20m
   kind: ConfigMap
   metadata:
    annotations:
     kubectl.kubernetes.io/last-applied-configuration: |
      {"apiVersion":"v1","data":{"proxy-body-size":"20m"},"kind":"ConfigMap","metadata":{"annotations":{},"labels":
   {"app":"ingress-nginx"},"name":"nginx-configuration","namespace":"kube-system"}}
    creationTimestamp: 2018-03-20T07:10:18Z
    labels:
     app: ingress-nginx
    name: nginx-configuration
    namespace: kube-system
    selfLink: /api/v1/namespaces/kube-system/configmaps/nginx-configuration
   ```

2. Verify that the VTS dashboard is enabled for the NGINX Ingress controller.

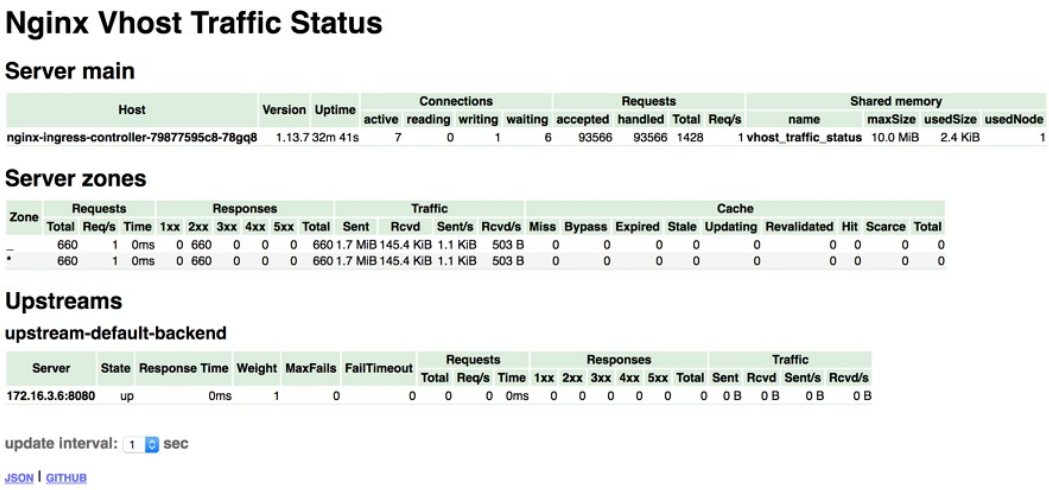
   ```
   root@master # kubectl get pods --selector=app=ingress-nginx -n kube-system
   NAME                             READY   STATUS   RESTARTS  AGE
   nginx-ingress-controller-79877595c8-78gq8  1/1     Running  0      1h
   root@master # kubectl exec -it nginx-ingress-controller-79877595c8-78gq8 -n kube-system -- cat /etc/nginx/nginx.co
   nf | grep vhost_traffic_status_display
       vhost_traffic_status_display;
       vhost_traffic_status_display_format html;
   ```

3. Access the VTS dashboard from an on-premises machine.

   > **Note** By default, the VTS port is not exposed due to security concerns. In the following example, port forwarding is used to access the VTS dashboard.

```
root@master # kubectl port-forward nginx-ingress-controller-79877595c8-78gq8 -n kube-system 18080
Forwarding from 127.0.0.1:18080 -> 18080
Handling connection for 18080
```

4. Visit `http://localhost:18080/nginx_status` to access the VTS dashboard.



Nginx Vhost Traffic Status

3.6.8.4. Ingress support

Kubernetes clusters support Ingress rules. You can define Ingress rules based on your needs to implement load balancing.

In Kubernetes clusters, an Ingress is a collection of routing rules that authorize external access to cluster Services. You can use an Ingress to enable Layer-7 load balancing. You can configure an Ingress to provide Kubernetes Services with externally reachable URLs, SLB instances, SSL connections, and name-based virtual hosting.

Prerequisites

To test a complex routing scenario, an NGINX application that consists of multiple Services is created in this example. You need to create a Deployment and multiple Services for the NGINX application in advance. In practice, replace Service names with the actual values.

```
kubectl run nginx --image=registry.cn-hangzhou.aliyuncs.com/acs/netdia:latest
kubectl expose deploy nginx --name=http-svc --port=80 --target-port=80
kubectl expose deploy nginx --name=http-svc1 --port=80 --target-port=80
kubectl expose deploy nginx --name=http-svc2 --port=80 --target-port80
kubectl expose deploy nginx --name=http-svc3 --port=80 --target-port=80
```

Create a simple Ingress

Run the following commands to create a simple Ingress that redirects traffic to the */svc* path to a http-svc Service. `nginx.ingress.kubernetes.io/rewrite-target: /` redirects traffic destined for the */svc* path to the */* path that can be recognized by the backend application.

```
cat <<EOF | kubectl create -f -
apiVersion: extensions/v1beta1
kind: Ingress
metadata:
 name: simple
 annotations:
  nginx.ingress.kubernetes.io/rewrite-target: /
spec:
 rules:
 - http:
    paths:
    - path: /svc
      backend:
       serviceName: http-svc
       servicePort: 80
EOF
```

```
kubectl get ing
NAME      HOSTS     ADDRESS      PORTS   AGE
simple    *       101.37.19*.***  80     11s
```

You can visit `http://101.37.19*.***/svc` to access the NGINX application.

Create a simple fanout Ingress that uses multiple domain names

You can create a simple fanout Ingress to route traffic from an external IP address to multiple Services with different domain names. The following example shows the configuration of a simple fanout Ingress:

```
cat <<EOF | kubectl create -f -
apiVersion: extensions/v1beta1
kind: Ingress
metadata:
 name: simple-fanout
spec:
 rules:
 - host: foo.bar.com
   http:
    paths:
    - path: /foo
      backend:
       serviceName: http-svc1
       servicePort: 80
    - path: /bar
      backend:
       serviceName: http-svc2
       servicePort: 80
 - host: foo.example.com
   http:
    paths:
    - path: /film
      backend:
       serviceName: http-svc3
       servicePort: 80
EOF
```

```
kubectl get ing
NAME       HOSTS     ADDRESS      PORTS   AGE
simple-fanout  *       101.37.19*.*** 80     11s
```

You can visit `http://foo.bar.com/foo` to access Service `http-svc1`, visit `http://foo.bar.com/bar` to access Service `http-svc2`, and visit `http://foo.example.com/film` to access Service `http-svc3`.

> **Note**
>
> - In a production environment, you need to point the domain name to the returned address `101.37.19*.***`.
> - In a test environment, you need to add the following mapping rules to the `hosts` file.
>
>   ```
>   101.37.19*.*** foo.bar.com
>   101.37.19*.*** foo.example.com
>   ```

Create a simple Ingress that uses the default domain name

If you do not have a domain name, you can use the default domain name associated with the Ingress to access the Service. The default domain name is in the following format: `*.[cluster-id].[region-id].alicontainer.com`. You can find the default domain name in the basic information of the Kubernetes cluster in the Container Service console.

The following example shows the configuration of a simple Ingress that allows external access to the Service through the default domain name:

```
cat <<EOF | kubectl create -f -
apiVersion: extensions/v1beta1
kind: Ingress
metadata:
 name: shared-dns
spec:
 rules:
 - host: foo.[cluster-id].[region-id].alicontainer.com  ## Replace with the default domain name of your cluster.
  http:
   paths:
   - path: /
    backend:
     serviceName: http-svc1
     servicePort: 80
 - host: bar.[cluster-id].[region-id].alicontainer.com  ## Replace with the default domain name of your cluster.
  http:
   paths:
   - path: /
    backend:
     serviceName: http-svc2
     servicePort: 80
EOF
```

```
kubectl get ing
NAME       HOSTS     ADDRESS      PORTS   AGE
shared-dns  foo.[cluster-id].[region-id].alicontainer.com,bar.[cluster-id].[region-id].alicontainer.com       47.95.16*.***
80     40m
```

You can visit `http://foo.[cluster-id].[region-id].alicontainer.com/` to access Service `http-svc1` and visit `http://bar.[cluster-id].[region-id].alicontainer.com` to access Service `http-svc2`.

Create an Ingress to secure data transmission

Container Service allows you to use multiple types of certificates to reinforce the security of your applications.

1. Prepare your certificate.

   If you do not have a certificate, perform the following steps to generate a test certificate:

   > **Note** The domain name must be the same as the one specified in your Ingress configuration.

   ```
   openssl req -x509 -nodes -days 365 -newkey rsa:2048 -keyout tls.key -out tls.crt -subj "/CN=foo.bar.com/O=foo.bar.com"
   ```

   After you run the preceding command, a certificate file *tls.crt* and a private key file *tls.key* are generated.

   Use the certificate and private key to create a Kubernetes Secret named *foo.bar*. You need to reference the Secret when you create the Ingress.

   ```
   kubectl create secret tls foo.bar --key tls.key --cert tls.crt
   ```

2. Create an Ingress to secure data transmission.

   ```
   cat <<EOF | kubectl create -f -
   apiVersion: extensions/v1beta1
   kind: Ingress
   metadata:
    name: tls-fanout
   spec:
    tls:
    - hosts:
      - foo.bar.com
      secretName: foo.bar
    rules:
    - host: foo.bar.com
      http:
       paths:
       - path: /foo
         backend:
           serviceName: http-svc1
           servicePort: 80
       - path: /bar
         backend:
           serviceName: http-svc2
           servicePort: 80
   EOF
   ```

   ```
   kubectl get ing
   NAME       HOSTS     ADDRESS      PORTS   AGE
   tls-fanout    *       101.37.19*.***  80     11s
   ```

3. You need to configure the `hosts` file or set a domain to access the tls Ingress, as described in **Simple fanout based on domains**.

   You can visit `http://foo.bar.com/foo` to access Service `http-svc1` and visit `http://foo.bar.com/bar` to access Service `http-svc2`.

   You can also access the HTTPS Service by using HTTP. By default, the Ingress redirects HTTP traffic to the HTTPS address. Traffic to `http://foo.bar.com/foo` is automatically redirected to `https://foo.bar.com/foo`.

Create an Ingress

1. Log on to the Container Service console.

2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Services and Ingresses > Ingresses**.
5. On the **Ingresses** page, select a namespace and click Create Resources in YAML to create an Ingress.
6. On the **Create** page, select **Custom** from the **Sample Template** drop-down list, copy the following content to the template, and then click **Create**.

```
apiVersion: extensions/v1beta1
kind: Ingress
metadata:
 name: simple
spec:
 rules:
 - http:
    paths:
    - path: /svc
      backend:
        serviceName: http-svc
        servicePort: 80
```

This way, an Ingress that routes Layer-7 traffic for Service `http-svc` is created.

3.6.8.5. Ingress configurations

Container Service provides Ingress controller components. Integrated with Apsara Server Load Balancer, these components provide Kubernetes clusters with flexible and reliable Ingress service.

An Ingress orchestration template is provided below. When you configure an Ingress through the console, you need to configure annotations and may need to create dependencies. For more information, see Create an ingress through the console, Ingress support, and Kubernetes Ingress. You can also create ConfigMaps to configure Ingresses. For more information, see https://kubernetes.github.io/ingress-nginx/user-guide/nginx-configuration/configmap/.

```
apiVersion: extensions/v1beta1
kind: Ingress
metadata:
 annotations:
  nginx.ingress.kubernetes.io/service-match: 'new-nginx: header("foo", /^bar$/)' #Canary release rule. In this example, t
he request header is used.
  Nginx. ingress. kubernetes. IO/service-weight: 'New-nginx: 50, old-nginx: 50' #The route weight.
 creationTimestamp: null
 generation: 1
 name: nginx-ingress
 selfLink: /apis/extensions/v1beta1/namespaces/default/ingresses/nginx-ingress
spec:
 rules: ##The Ingress rule.
 - host: foo.bar.com
  http:
   paths:
   - backend:
     serviceName: new-nginx
     servicePort: 80
    path: /
   - backend:
     serviceName: old-nginx
     servicePort: 80
    path: /
tls:        ## Enable TLS for secure routing.
 - hosts:
  - *.xxxxxx.cn-hangzhou.alicontainer.com
  - foo.bar.com
  secretName: nginx-ingress-secret    ##The Secret name.
status:
 loadBalancer: {}
```

Annotations

For each Ingress, you can configure its annotations, Ingress controller, and rules, such as the route weight, canary release rule, and rewrite rules. For more information about annotations, see https://kubernetes.github.io/ingress-nginx/user-guide/nginx-configuration/annotations/.

For example, the following rewrite annotation, `nginx.ingress.kubernetes.io/rewrite-target: /` , indicates that */path* is redirected to the root path */*, which can be recognized by the backend service.

Rules

Ingress rules are used to manage external access to the services in the cluster and can be HTTP or HTTPS rules. You can configure the following items in rules: domain name (virtual hostname), URL path, service name, and port.

For each rule, you need to set the following parameters:

- Domain: The test domain or virtual hostname of your service, such as `foo.bar.com` .
- Path: The URL path of your service. Each path is associated with a backend service. Server Load Balancer only forwards traffic to the backend if the incoming request matches the domain and path.
- Service: Specify the service in the form of `service:port` . You also need to specify a route weight for each service. The Ingress routes traffic to the matching service based on the route weight.
  - Name: The name of the backend service.
  - Port: The port of the service.

- Weight: The route weight of the service in the service group.

  > **Note**
  >
  > a. The weight is a percentage value. For example, you can set two services to the same weight of 50%.
  >
  > b. A service group includes services that have the same domain and path defined in the Ingress configuration. If no weight is set for a service, the default value, 100, is used.

Canary release

Container Service supports multiple traffic splitting approaches to suit scenarios such as canary release and A/B testing.

> **Note** Currently, only Ingress controllers of 0.12.0-5 and later versions support traffic splitting.

1. Traffic splitting based on request header
2. Traffic splitting based on cookie
3. Traffic splitting based on query parameter

After canary release is configured, only requests that match certain rules are routed to the corresponding service. If the weight of the corresponding service is lower than 100%, requests that match certain rules are routed to one of the services in the service group based on the weight.

TLS

You can use a Secret that contains a TLS private key and certificate to encrypt the Ingress. This ensures secure routing. The TLS Secret must contain a certificate named tls.crt and a private key named tls.key. For more information about how TLS works, see TLS. For how to create a Secret, see Configure a secure Ingress.

Labels

You can add labels to the Ingress.

3.6.8.6. Create an Ingress in the console

The Container Service console is integrated with the Ingress service. You can create an Ingress in the console and manage inbound traffic that is forwarded to different Services to meet your business requirements.

Prerequisites

- A Kubernetes cluster is created and an Ingress controller runs as normal in the cluster. For more information, see Create a Kubernetes cluster.
- You are connected to a master node by using kubectl. For more information, see Connect to a Kubernetes cluster through kubectl.
- The image address used in this example requires Internet access. You can use the image address of your own cluster to replace it. You can also build and push the image used in this example to a repository and then pull it from the repository when you use it.

Step 1: Create a Deployment and a Service

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Workloads > Deployments**.
5. On the **Deployments** page, select a namespace and click **Create from Template** in the upper-right corner.

6. On the **Create** page, select a sample template or customize a template and click **Create**.

   In this example, two NGINX applications are created: old-nginx and new-nginx.

   The following template is used to create the old-nginx application:

```
apiVersion: extensions/v1beta1
kind: Deployment
metadata:
 name: old-nginx
spec:
 replicas: 2
 selector:
  matchLabels:
   run: old-nginx
 template:
  metadata:
   labels:
    run: old-nginx
  spec:
   containers:
   - image: registry.cn-hangzhou.aliyuncs.com/xianlu/old-nginx
    imagePullPolicy: Always
    name: old-nginx
    ports:
    - containerPort: 80
      protocol: TCP
   restartPolicy: Always
---
apiVersion: v1
kind: Service
metadata:
 name: old-nginx
spec:
 ports:
 - port: 80
  protocol: TCP
  targetPort: 80
 selector:
  run: old-nginx
 sessionAffinity: None
 type: NodePort
```

   The following template is used to create the new-nginx application:

```
apiVersion: extensions/v1beta1
kind: Deployment
metadata:
 name: new-nginx
spec:
 replicas: 1
 selector:
  matchLabels:
   run: new-nginx
 template:
  metadata:
   labels:
    run: new-nginx
  spec:
   containers:
   - image: registry.cn-hangzhou.aliyuncs.com/xianlu/new-nginx
    imagePullPolicy: Always
    name: new-nginx
    ports:
    - containerPort: 80
     protocol: TCP
   restartPolicy: Always
---
apiVersion: v1
kind: Service
metadata:
 name: new-nginx
spec:
 ports:
 - port: 80
  protocol: TCP
  targetPort: 80
 selector:
  run: new-nginx
 sessionAffinity: None
 type: NodePort
```

7. In the left-side navigation pane of the details page, choose **Services and Ingresses > Services**.

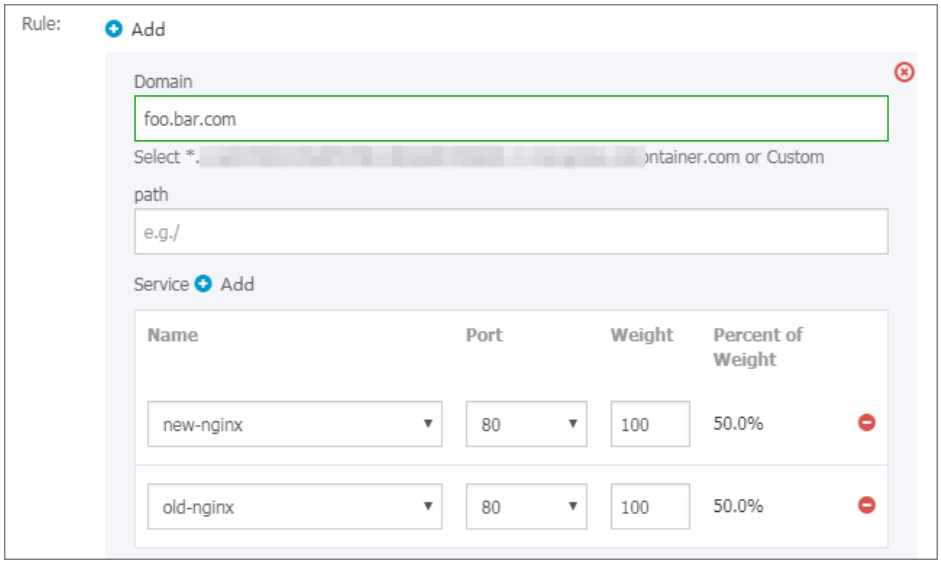
   After the Services are created, you can find these Services on the Services page.

Step 2: Create an Ingress

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Services and Ingresses > Ingresses**.
5. On the **Ingresses** page, select a namespace and click **Create** in the upper-right corner.
6. In the dialog box that appears, enter a name for the Ingress. In this example, the Ingress is named nginx-ingress.
7. Configure Ingress rules.

   Ingress rules are used to manage external access to Services in the cluster. Ingress rules can be HTTP or HTTPS rules. You can configure the following items in rules: domain name (virtual hostname), URL path, Service name, port, and weight. For more information, see Ingress configurations.

   In this example, a complex rule is added to configure Services for the default domain name and virtual hostname of the cluster. Traffic is routed based on domain names.



Create a simple fanout Ingress that uses multiple domain names

In this example, a virtual hostname is used as the test domain name for external access. Route weights are specified for two backend Services and canary release settings are configured for one of the Services. In your production environment, you can use a domain name that has obtained an Internet Content Provider (ICP) number for external access.

- **Domain**: Enter the test domain name. In this example, the test domain name is `foo.bar.com`.

  You must add the following domain name mapping to the hosts file:

  ```
  118.178.XX.XX foo.bar.com    #The IP address of the Ingress.
  ```

- **Services**: Set the names, paths, port numbers, and weights of the backend Services that you want to access.
  - Path: Enter the URL of the backend Service. In this example, the root path `/` is used.
  - Name: In this example, both the old-nginx and new-nginx Services are specified.
  - Port: In this example, port 80 is open.
  - Weight: Set a weight for each backend Service. The weight is a percentage value. The default value is 100. In this example, the weight of each backend Service is 50. This means that the two backend Services have the same weight.

8. Configure Transport Layer Security (TLS). Select **EnableTLS** to enable TLS and configure a secure Ingress. For more information, see Configure a secure Ingress.
   - You can use an existing Secret.

     
     a. Log on to a master node. Create a file named *tls.key* and another file named *tls.crt*.

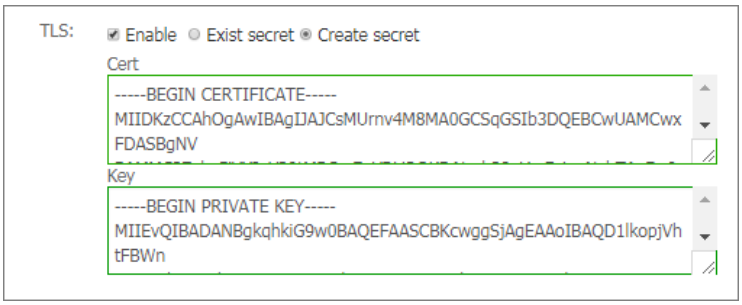
     ```
     openssl req -x509 -nodes -days 365 -newkey rsa:2048 -keyout tls.key -out tls.crt -subj "/CN=foo.bar.com/O=foo.bar.com"
     ```

     b. Create a Secret.

     ```
     kubectl create secret tls foo.bar --key tls.key --cert tls.crt
     ```

     c. Run the `kubectl get secret` command and verify that the Secret is created. Then, you can select the newly created Secret *foo.bar*.

- You can also use the TLS private key and certificate to create a Secret.



a. Log on to a master node, and then create a file named *tls.key* and another file named *tls.crt*.

```
openssl req -x509 -nodes -days 365 -newkey rsa:2048 -keyout tls.key -out tls.crt -subj "/CN=foo.bar.com/O=foo.bar.com"
```

b. Run the `vim tls.key` and `vim tls.crt` commands to obtain the private key and certificate that are generated.

c. Paste the certificate to the Cert field and the private key to the Key field.

9. Configure canary release settings.

> **Note** Only Ingress controllers of 0.12.0-5 and later versions support traffic splitting.

Container Service supports multiple traffic splitting methods. This allows you to select suitable solutions for specific scenarios, such as canary releases and A/B testing:

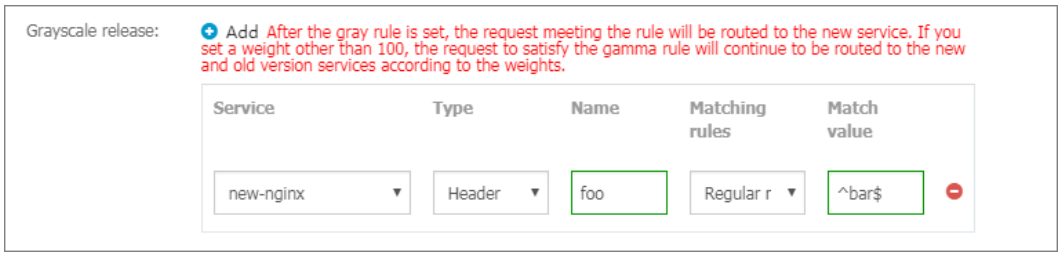
i. Traffic splitting based on request headers.

ii. Traffic splitting based on cookies

iii. Traffic splitting based on query parameters.

After canary release settings are configured, only requests that match the specified rules are routed to the new-nginx Service. If the weight of new-nginx is lower than 100%, requests that match certain rules are routed to this Service based on the weight.

In this example, the rule is added to specify a request header that matches the regular expression `foo=^bar$`. Only requests with headers that match the regular expression are forwarded to new-nginx.



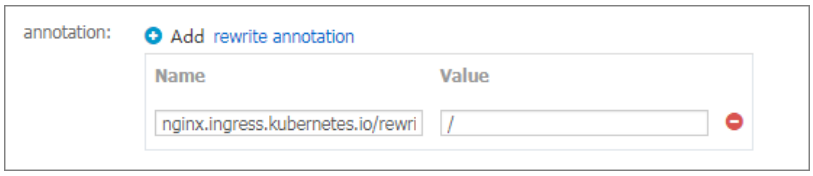
- **Services**: Specify the Services to be accessed.
- **Type**: Select the type of matching rule. Valid values: Header, Cookie, and Query.
- **Name and Match Value**: Specify custom request fields. Each field is a key-value pair.
- **Matching Rule**: Regular expressions and exact matches are supported.

10. Configure annotations.

Click **Rewrite Annotation** and add an annotation to redirect inbound traffic for the Ingress. For example, `nginx.ingress.kubernetes.io/rewrite-target: /` specifies that */path* is redirected to the root path */*. The root path can be recognized by the backend Services.

> **Note** In this example, no path is configured for the backend Services. Therefore, you do not need to configure rewrite annotations. Rewrite annotations allow the Ingress to forward traffic through root paths to the backend Services. This avoids the 404 error that is caused by invalid paths.

You can also click **Add** to enter annotation names and values in key-value pairs. For more information about Ingress annotations, visit https://kubernetes.github.io/ingress-nginx/user-guide/nginx-configuration/annotations/.

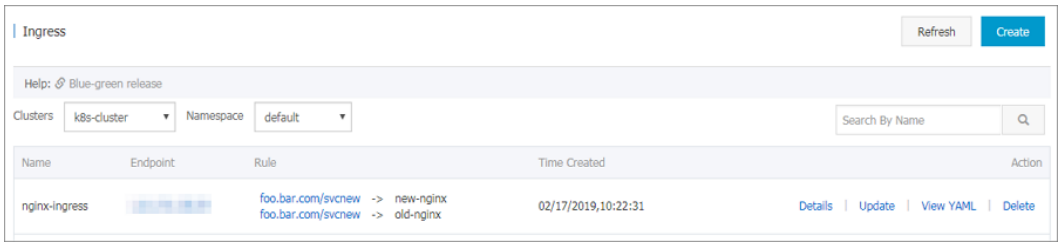


11. Add labels.

    Add labels to describe the Ingress.

12. Click **Create**. You are redirected to the Ingresses page.

    After the Ingress is created, you can find the nginx-ingress Ingress on the Ingresses page.



13. Click foo.bar.com to view the NGINX welcome page.

    Click the domain name that points to new-nginx, the old-nginx Service page appears.

> **Note** By default, when you enter the domain name in the browser, request headers do not match the `foo=^bar$` regular expression. Therefore, requests are directed to old-nginx.

14. Log on to a master node by using SSH. Run the following commands to simulate requests with specific headers and check the results:

```
curl -H "Host: foo.bar.com" http://47.107.XX.XX
old
 curl -H "Host: foo.bar.com" http://47.107.XX.XX
old
 curl -H "Host: foo.bar.com" http://47.107.XX.XX              #Similar to a browser request.
old
 curl -H "Host: foo.bar.com" -H "foo: bar" http://47.107.XX.XX       #Simulate a request with a specific header. The results are returned based on the weight.
new
 curl -H "Host: foo.bar.com" -H "foo: bar" http://47.107.XX.XX
old
 curl -H "Host: foo.bar.com" -H "foo: bar" http://47.107.XX.XX
old
 curl -H "Host: foo.bar.com" -H "foo: bar" http://47.107.XX.XX
new
```

3.6.8.7. Update an Ingress

You can update Ingresses in the Container Service console.

Prerequisites

- A Kubernetes cluster is created and an Ingress controller is running as normal in the cluster. For more information, see Create a Kubernetes cluster.
- An Ingress is created. For more information, see Create an ingress through the console.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Services and Ingresses > Ingresses**.
5. On the **Ingresses** page, select the namespace, find the Ingress that you want to update, and then click **Update** in the Actions column.
6. In the dialog box that appears, modify the parameters and click **Update**. In this example, change `foo.bar.com` to `test.bar.com`.
   On the Ingresses page, you can find the changed Ingress rule.

3.6.8.8. Delete an Ingress

This topic describes how to delete an Ingress.

Prerequisites

- A Kubernetes cluster is created and an Ingress controller is running as normal in the cluster. For more information about how to create a cluster, see Create a Kubernetes cluster.
- An Ingress is created. For more information, see Create an ingress through the console.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Services and Ingresses > Ingresses**.
5. On the **Ingresses** page, select the namespace, find the Ingress that you want to delete, and then click **Delete**

in the Actions column.

6. In the message that appears, click **Confirm**.

3.6.9. Config maps and secrets

3.6.9.1. Create a ConfigMap

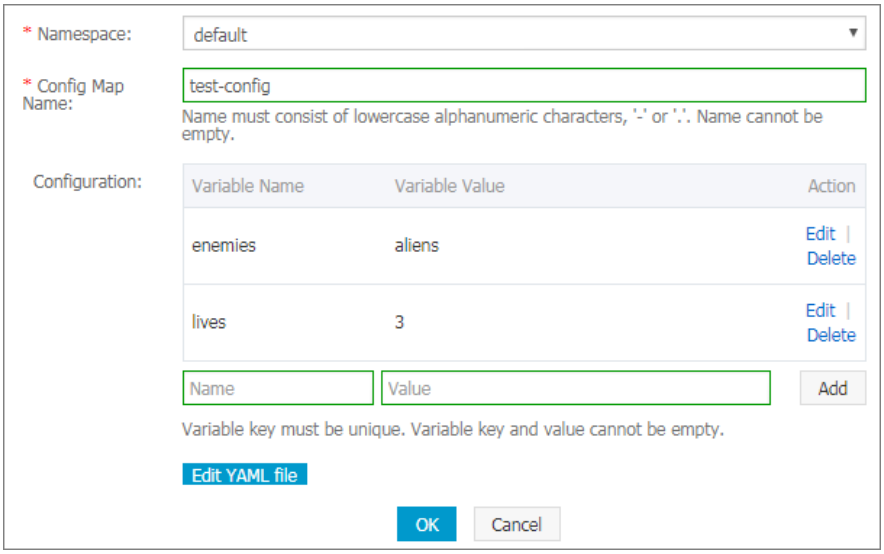
In the Container Service console, you can create a ConfigMap on the ConfigMap page or by using a template. This topic describes how to create a ConfigMap.

Create a ConfigMap on the ConfigMap page

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Configurations > ConfigMaps**.
5. On the **ConfigMap** page, select a namespace and click **Create**.
6. Set the parameters and click **OK**. Create a ConfigMap on the ConfigMap page

Parameter	Description
Clusters	The ID of the cluster that you have selected.
Namespaces	The namespace that you have selected. A ConfigMap is a Kubernetes resource object and must be scoped to a namespace.
ConfigMap Name	The name of the ConfigMap. The name can contain lowercase letters, digits, hyphens (-), and periods (.). This parameter is required. Other resource objects must reference the ConfigMap name to obtain the configuration information.
ConfigMap	Specify **Name** and **Value**, and then click **Add** to add the key-value pair. You can also click **Edit YAML file**, modify the parameters in the dialog box that appears, and then click **OK**.

In this example, two variables named enemies and lives are created. Their values are set to aliens and 3 separately.



7. Click **OK**. You can find the test-config ConfigMap on the ConfigMap page.

You can also click **Browse** and upload a configuration file to create a ConfigMap.

Create a ConfigMap from a template

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Workloads > Deployments**.
5. On the **Deployments** page, select the namespace and click **Create from Template** in the upper-right corner.
6. On the page that appears, set the parameters and click **Create**. Create a ConfigMap from a template

Parameter	Description
Sample Template	Container Service provides YAML templates of various resource types to help you quickly deploy resource objects. You can select *Custom* from the drop-down list and configure your ConfigMap based on YAML syntax. You can also select the *Resource-ConfigMap* template to create a ConfigMap. In the sample template, the ConfigMap is named aliyun-config and contains two variable files: *game.properties* and *ui.properties*. You can modify the ConfigMap based on your needs.
Template	Enter the template content based on YAML syntax. The template can contain multiple resource objects that are separated by `---`.
Add Deployment	This feature allows you to quickly define a YAML template. You can click **Use Existing Template** to import an existing template.

After the deployment is completed, you can find the ConfigMap named *aliyun-config* on the ConfigMap page.

3.6.9.2. Use a ConfigMap in a pod

This topic describes how to use a ConfigMap in a pod.

You can use a ConfigMap in a pod in the following scenarios:

- Use a ConfigMap to define environment variables for a pod.
- Use a ConfigMap to set command line parameters.
- Use a ConfigMap in a volume.

For more information, see Configure a pod to use a ConfigMap.

Limits

To use a ConfigMap in a pod, make sure that the ConfigMap and the pod are in the same cluster and namespace.

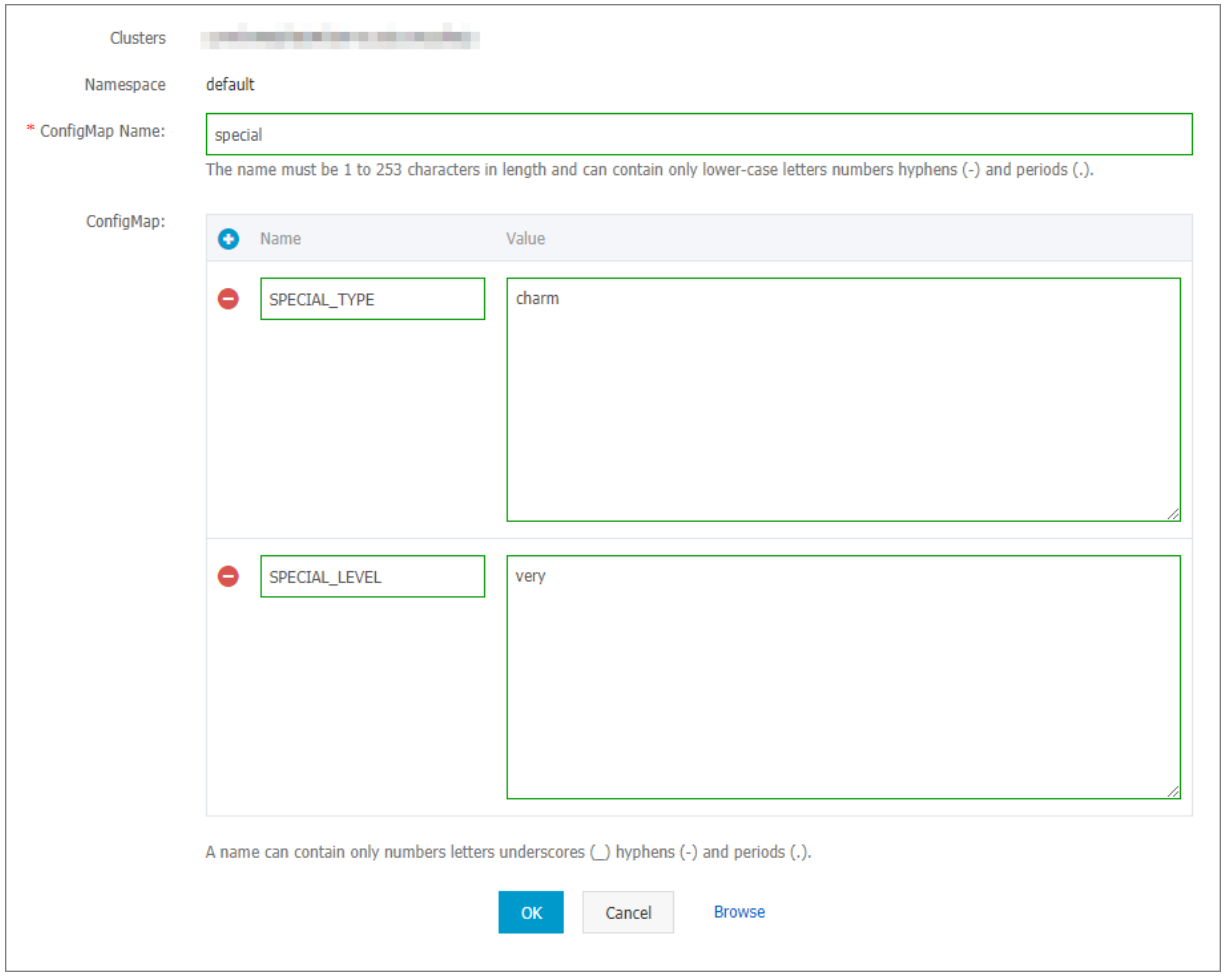
Create a ConfigMap

In this example, a ConfigMap named special config is created. This ConfigMap consists of two key-value pairs: `SPECIAL_LEVEL: very` and `SPECIAL_TYPE: charm`.

You can use the following YAML template to create the ConfigMap:

```
apiVersion: v1
kind: ConfigMap
metadata:
 name: special-config
 namespace: default
data:
 SPECIAL_LEVEL: very
 SPECIAL_TYPE: charm
```

You can also log on to the Container Service console and choose **Configuration > ConfigMaps** in the left-side navigation pane. You can then click **Create** to create the ConfigMap.



Use a ConfigMap to define one or multiple environment variables for a pod

Use a key-value pair of a ConfigMap to define one environment variable

You can log on to the Container Service console. In the left-side navigation pane, click **Clusters**. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column. In the left-side navigation pane of the details page, choose **Workloads > Deployments**. Click **Create from Template**, select a pod template from the Sample Template drop-down list, and then start the deployment.

You can use the following sample template to create a pod and defines environment variables in the pod. valueFrom is used to reference the value of SPECIAL_LEVEL to define an environment variable.

```
apiVersion: v1
kind: Pod
metadata:
 name: config-pod-1
spec:
 containers:
  - name: test-container
    image: busybox
    command: [ "/bin/sh", "-c", "env" ]
    env:
     - name: SPECIAL_LEVEL_KEY
       valueFrom:                  ##valueFrom is used to reference the value of the ConfigMap to define an environment variable.
        configMapKeyRef:
          name: special-config          ##The name of the referenced ConfigMap.
          key: SPECIAL_LEVEL            ##The key of the referenced key-value pair.
 restartPolicy: Never
```

To use the values of multiple ConfigMaps to define multiple environment variables, add multiple env parameters to the pod configuration file.

Use all the key-value pairs of a ConfigMap to define multiple environment variables

To define the key-value pairs of a ConfigMap as pod environment variables, you can use the envFrom parameter. The keys in a ConfigMap are used as the names of the environment variables.

The following sample template is used to create a pod:

```
apiVersion: v1
kind: Pod
metadata:
 name: config-pod-2
spec:
 containers:
  - name: test-container
    image: busybox
    command: [ "/bin/sh", "-c", "env" ]
    envFrom:          ##Reference all the key-value pairs of the sepcial-config ConfigMap.
    - configMapRef:
      name: special-config
 restartPolicy: Never
```

Use a ConfigMap to set command line parameters

You can use ConfigMaps to define the commands or parameter values for a container by using the environment variable replacement syntax *$(VAR_NAME)*. The following template is used as an example:

```
apiVersion: v1
kind: Pod
metadata:
 name: config-pod-3
spec:
 containers:
  - name: test-container
    image: busybox
    command: [ "/bin/sh", "-c", "echo $(SPECIAL_LEVEL_KEY) $(SPECIAL_TYPE_KEY)" ]
    env:
     - name: SPECIAL_LEVEL_KEY
       valueFrom:
        configMapKeyRef:
          name: special-config
          key: SPECIAL_LEVEL
     - name: SPECIAL_TYPE_KEY
       valueFrom:
        configMapKeyRef:
          name: special-config
          key: SPECIAL_TYPE
 restartPolicy: Never
```

After you run the pod, the following output is returned:

```
very charm
```

Use a ConfigMap in a volume

You can use a ConfigMap to define volumes. The following sample template specifies a ConfigMap name under volumes. This stores the key-value pairs of the ConfigMap to the path that you specified in the mountPath field. In this example, the path is /etc/config. This generates configuration files that are named after the keys of the ConfigMap. The corresponding values of the ConfigMap are stored in these files.

```
apiVersion: v1
kind: Pod
metadata:
 name: config-pod-4
spec:
 containers:
  - name: test-container
    image: busybox
    command: [ "/bin/sh", "-c", "ls /etc/config/" ]  ##List the files under the directory.
    volumeMounts:
     - name: config-volume
       mountPath: /etc/config
 volumes:
  - name: config-volume
    configMap:
      name: special-config
 restartPolicy: Never
```

After you run the pod, the following output is returned:

```
SPECIAL_TYPE
SPECIAL_LEVEL
```

3.6.9.3. Update a ConfigMap

You can use multiple methods to update a ConfigMap.

Considerations

If you update a ConfigMap, the applications that use the ConfigMap are affected.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Configurations > ConfigMaps**.
5. On the **ConfigMap** page, select the namespace, find the ConfigMap that you want to update, and then click **Edit** in the Actions column.
6. In the dialog box that appears, modify the configurations and click **OK**.

3.6.9.4. Delete a ConfigMap

You can use multiple methods to delete a ConfigMap.

Considerations

If you delete a ConfigMap, the applications that use this ConfigMap are affected.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Configurations > ConfigMaps**.
5. On the **ConfigMap** page, select the namespace, find the ConfigMap that you want to delete, and then click **Delete** in the **Actions** column.
6. In the message that appears, click **OK**.

3.6.9.5. Create a Secret

You can create Secrets for applications in the Container Service console.

Prerequisites

A Kubernetes cluster is created.

Context

We recommend that you use Secrets to store sensitive information in Kubernetes clusters, such as passwords and certificates.

Secrets are classified into the following types:

- Service account: A service account is automatically created by Kubernetes and automatically mounted to the */run/secrets/kubernetes.io/serviceaccount* directory of a pod. The service account provides an identity for the pod to interact with the API server.
- Opaque: This type of secret is encoded in Base64 and used to store sensitive information, such as passwords and certificates.

By default, you can create only Opaque Secrets in the Container Service console. Opaque Secrets store map type data. Therefore, values must be encoded in Base64. You can create Secrets in the Container Service console with a few clicks. Plaintext is automatically encoded in Base64.

You can also create Secrets by using the CLI. For more information, see Kubernetes Secrets.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Configurations > Secrets**.
5. On the **Secrets** page, select the namespace and click **Create** in the upper-right corner.
6. Configure the Secret and click **OK**.

> **Note** To enter Secret data in plaintext, select **Encode Data Values Using Base64**.

Parameter	Description
Name	Enter a name for the Secret. The name must be 1 to 253 characters in length, and can contain only lowercase letters, digits, hyphens (-), and periods (.).
Namespace	Select the namespace of the Secret.
Type	You can select Opaque, Private Repository Logon Secret, or TLS Certificate.
Opaque	If you set Type to Opaque, configure the following parameters: ○ (Optional)To enter Secret data in plaintext, select **Encode Data Values Using Base64**. ○ Configure the Secret in key-value pairs. Click **+ Add**. Enter the keys and values for the Secret in the **Name** and **Value** fields.
Private Repository Logon Secret	If you set Type to Private Repository Logon Secret, configure the following parameters: ○ Docker Registry URL: Enter the address of the Docker registry where your Secret is stored. ○ Username: Enter the username that is used to log on to the Docker registry. ○ Password: Enter the password that is used to log on to the Docker registry.
TLS Certificate	If you set Type to TLS Certificate, configure the following parameters: ○ Cert: Enter a TLS certificate. ○ Key: Enter the key for the TLS certificate.

You can view the newly created Secret on the Secrets page.

3.6.9.6. Modify a Secret

This topic describes how to modify a Secret in the Container Service console.

Prerequisites

- A Kubernetes cluster is created.
- A Secret is created. For more information, see Create a secret.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Configurations > Secrets**.
5. On the Secrets page, select the namespace, find the Secret that you want to modify, and then click **Edit** in the Actions column.
6. In the dialog box that appears, modify the Secret and click **OK**.

3.6.9.7. Delete a Secret

This topic describes how to delete a Secret in the Container Service console.

Prerequisites

- A Kubernetes cluster is created.
- A Secret is created. For more information, see Create a secret.

Context

> **Note** Do not delete Secrets that are generated when the cluster is created.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Configurations > Secrets**.
5. On the **Secrets** page, select the namespace, find the Secret that you want to delete, and then click **Delete** in the **Actions** column.
6. In the message that appears, click **OK**.

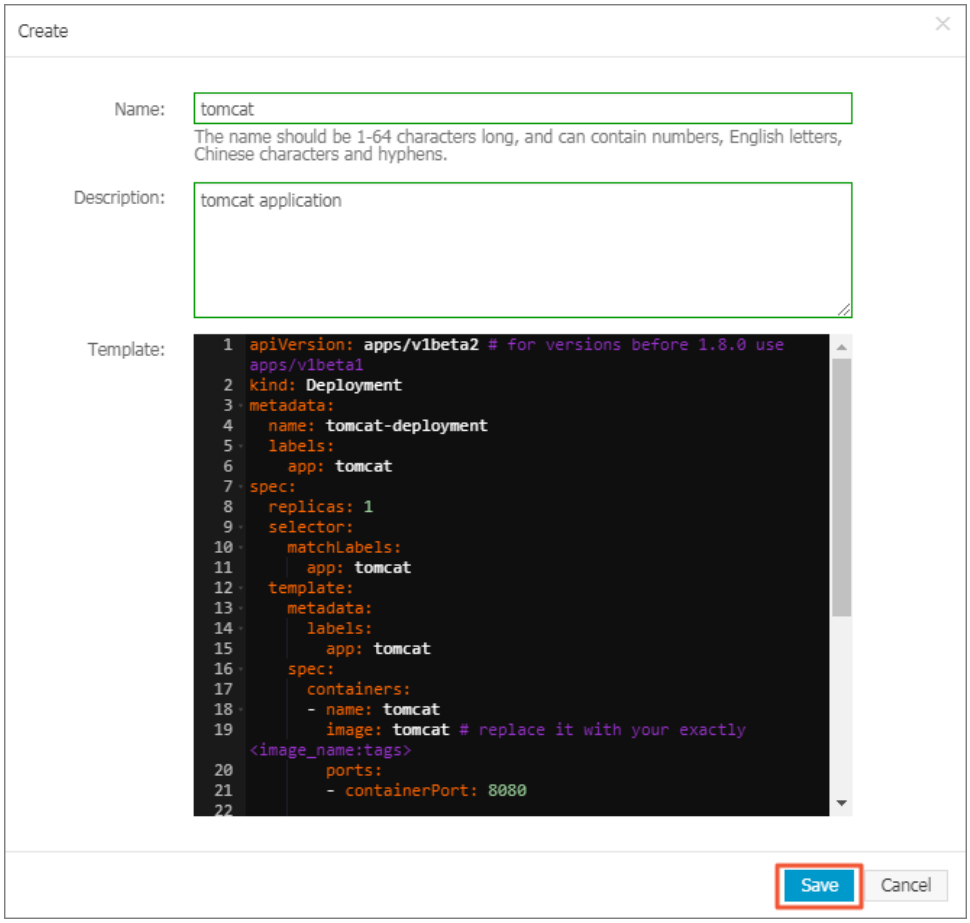
3.6.10. Templates

3.6.10.1. Create an orchestration template

This topic describes how to use multiple methods to create orchestration templates through the Container Service console.

Procedure

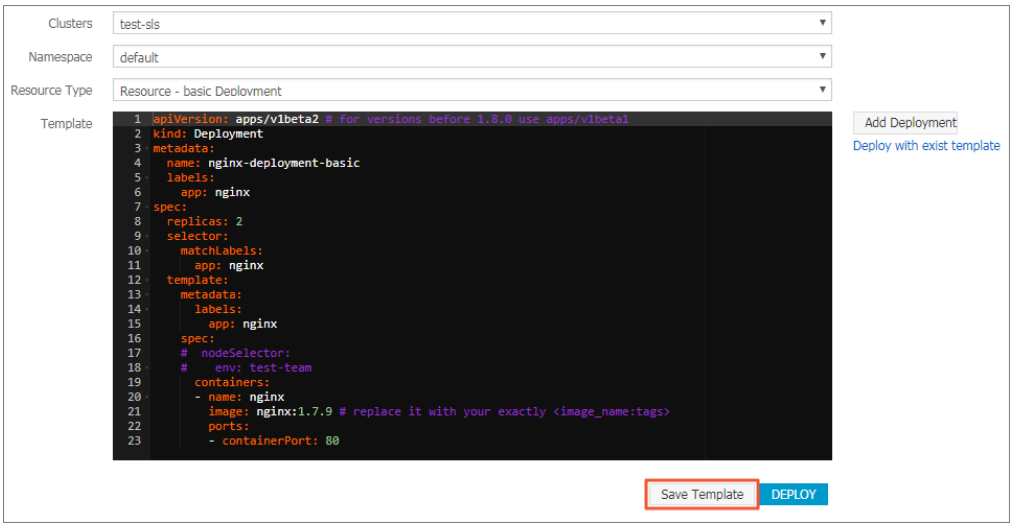
1. Log on to the Container Service console.
2. In the left-side navigation pane, choose **Marketplace > Orchestration Templates** and click **Create** in the upper-right corner.
3. In the dialog box that appears, configure the template, and then click **Save**. This example demonstrates how to create a Tomcat application template that contains a deployment and a service.
   - **Name**: The name of the template.
   - **Description**: Optional. The description of the template.
   - **Template**: Enter the template content based on YAML syntax. The template can contain multiple resource objects that are separated by `---`.



4. After the template is created, you are redirected to the **Templates** page by default. You can find the template on the **My Templates** tab.

5. (Optional)You can also choose **Applications > Deployments** in the left-side navigation pane, and click **Create from Template** to go to the **Create from Template** page. You can modify a built-in template provided by Container Service and save it as a custom template.

i. Select a built-in template and click **Save Template**.



ii. In the dialog box that appears, specify the name, description, and content. Click **Save** to save the template.

> **Note** You can modify the built-in template based on your needs.

iii. In the left-side navigation pane, choose **Marketplace > Orchestration Templates**. You can find the newly created template on the **My Templates** tab.

What's next

You can use the orchestration templates on the **My Templates** tab to quickly create applications.

3.6.10.2. Update an orchestration template

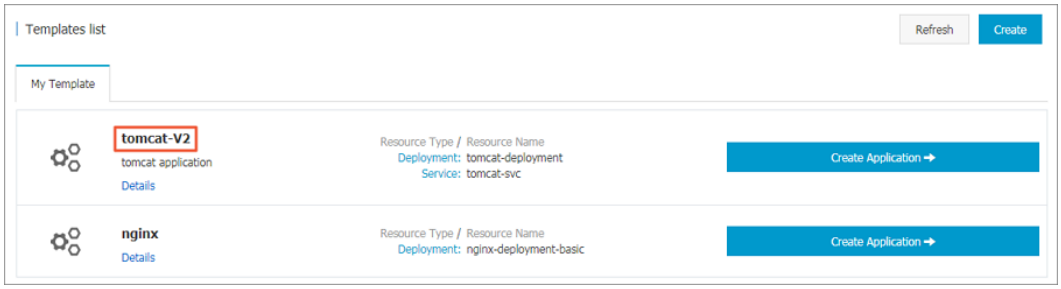
This topic describes how to edit and update an orchestration template.

Prerequisites

You have created an orchestration template. For more information, see Create orchestration templates.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, choose **Marketplace > Orchestration Templates**. The **Templates** page appears. You can view existing templates on the **My Templates** tab.
3. Select the target template and click **Details**.
4. On the template details page, click **Edit** in the upper-right corner.
5. In the dialog box that appears, edit the name, description, and template content, and click **Save**.
6. Go to the **Templates** page. You can view the template that you have updated on the **My Templates** tab.



3.6.10.3. Save an orchestration template as a new one

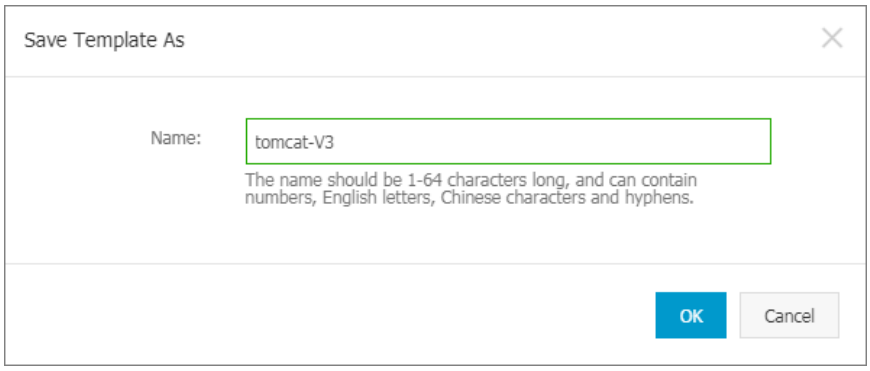
This topic describes how to save an orchestration template as a new one.

Prerequisites

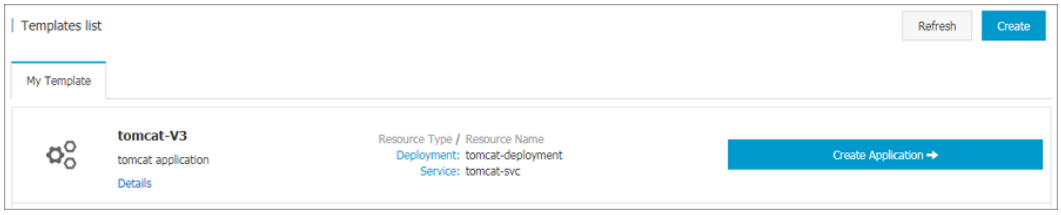
You have created an orchestration template. For more information, see Create orchestration templates.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, choose **Marketplace > Orchestration Templates**. The **Templates** page appears. You can view existing templates on the **My Templates** tab.
3. Select the target template and click **Details**.
4. On the template details page, modify the template and click **Save As** in the upper-right corner.
5. In the dialog box that appears, enter the template name and click **OK**.



6. Go to the **Templates** page. The newly saved template is displayed on the **My Templates** tab.



3.6.10.4. Download an orchestration template

This topic describes how to download an orchestration template.

Prerequisites

You have created an orchestration template. For more information, see Create orchestration templates.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, choose **Marketplace > Orchestration Templates**. The **Templates** page appears. You can view existing templates on the **My Templates** tab.
3. Select the target template and click **Details**.
4. On the template details page, click **Download** in the upper-right corner to download the template as a YAML file.

3.6.10.5. Delete an orchestration template

Prerequisites

You have created an orchestration template. For more information, see Create orchestration templates.

Procedure

1. Log on to the Container Service console
2. In the left-side navigation pane, choose **Marketplace > Orchestration Templates**. The **Templates** page appears. You can view existing templates on the **My Templates** tab.
3. Select the target template and click **Details**.
4. On the template details page, click **Delete** in the upper-right corner.
5. In the dialog box that appears, click **OK**.

3.6.11. Auto scaling

3.6.11.1. Auto scaling of nodes

Container Service provides the auto scaling component to automatically scale the number of nodes. Regular instances and GPU-accelerated instances can be automatically added to or removed from a Container Service cluster to meet your business requirements. This component supports multiple scaling modes, various instance types, and instances that are deployed across zones. This component is applicable to diverse scenarios.

How it works

The auto scaling model of Kubernetes is different from the traditional scaling model that is based on the resource usage threshold. Developers must understand the differences between the two scaling models before they migrate workloads from traditional data centers or other orchestration systems such as Swarm to Kubernetes.

The traditional scaling model is based on resource usage. For example, if a cluster contains three nodes and the CPU utilization or memory usage of the nodes exceeds the scaling threshold, new nodes are added to the cluster. However, you must consider the following issues when you use the traditional scaling model:

- How do you set a proper scaling threshold and how does the system check whether the threshold is exceeded?

  In a Kubernetes cluster, the resource usage of hot nodes is higher than that of other nodes. If you specify the average resource usage as the scaling threshold, scaling activities may not be promptly triggered. If you specify the lowest node resource usage as the scaling threshold, the newly added nodes may not be used. This causes a waste of resources.

- How are the loads balanced after new nodes are added?

  In Kubernetes, pods are the smallest deployable units for applications. Pods are deployed on different nodes in a Kubernetes cluster. When auto scaling is triggered for a cluster or a node in the cluster, pods with high resource usage are not replicated and the resource limits of these pods are not changed. As a result, the loads cannot be balanced to newly added nodes.

- How do you determine whether scaling activities must be triggered and how are scaling activities performed?

If scale-in activities are triggered based on resource usage, pods that request large amounts of resources but have low resource usage may be evicted. If the number of these pods is large within a Kubernetes cluster, resources may be exhausted and some pods may fail to be scheduled.

How does the auto scaling model of Kubernetes fix these issues? Kubernetes provides a two-layer scaling model that decouples pod scheduling from resource scaling.

In simple terms, pods are scaled based on resource usage. When pods enter the Pending state due to insufficient resources, a scale-out activity is triggered. After new nodes are added to the cluster, the pending pods are automatically scheduled to the newly added nodes. This way, the loads of the application are balanced. The following section describes the auto scaling model of Kubernetes in detail:

- How is a scale-out activity triggered?

  The cluster-autoscaler component scans for pending pods and then triggers scaling activities. When pods enter the Pending state due to insufficient resources, cluster-autoscaler simulates pod scheduling to decide the scaling group that can provide new nodes to accept the pending pods. If a scaling group meets the requirement, nodes from this scaling group are added to the cluster. In simple terms, a scaling group is treated as a node during the simulation. The instance type of the scaling group specifies the CPU, memory, and GPU resources of the node. The labels and taints of the scaling group are also applied to the node. The node is used to simulate the scheduling of the pending pods. If the pending pods can be scheduled to the node, cluster-autoscaler calculates the number of nodes that need to be added from the scaling group.

- How is a scale-in activity triggered?

  Only nodes that are added by scaling activities can be removed by cluster-autoscaler. This component cannot manage static nodes. Each node is separately evaluated to determine whether the node needs to be removed. If the resource usage of a node drops below the scale-in threshold, a scale-in activity is triggered for the node. In this case, cluster-autoscaler simulates the eviction of all workloads on the node to determine whether the node can be completely drained. cluster-autoscaler does not drain the nodes that contain specific pods, such as non-DaemonSet pods in the kube-system namespace and pods that are controlled by PodDisruptionBudgets (PDBs). A node is drained before it is removed. After pods on the node are evicted to other nodes, the node can be removed.

- How is a scaling group selected from multiple scaling groups that meet the requirements?

  Different scaling groups are treated as nodes in different specifications. cluster-autoscaler selects a scaling group based on a scoring policy that is similar to a scheduling policy. Nodes are first filtered by the scheduling policy. Among the filtered nodes, the nodes that conform to policies, such as affinity settings, are selected. If no scheduling policy or affinity settings are configured, cluster-autoscaler selects a scaling group based on the least-waste policy. The least-waste policy selects the scaling group that has the fewest idle resources after simulation. If a scaling group of CPU-accelerated nodes and a scaling group of GPU-accelerated nodes both meet the requirements, the scaling group of CPU-accelerated nodes is selected by default.

- How can the success rate of auto scaling be increased? The success rate of auto scaling depends on the following factors:
  - Whether the scheduling policy is met

    After you configure a scaling group, you must be aware of the pod scheduling policies that the scaling group supports. If you are unaware of the pod scheduling policies, you can simulate a scaling activity by using the node selectors of pending pods and the labels of the scaling group.

  - Whether resources are sufficient

    After the scaling simulation is complete, a scaling group is selected. However, the scaling activity fails if the specified types of Elastic Compute Service (ECS) instances in the scaling group are out of stock. To increase the success rate of auto scaling, you can select different types of instances in more than one zone.

- How can auto scaling be accelerated?
  - Method 1: Perform auto scaling in swift mode. After a scaling group experiences a scale-in activity and a scale-out activity, the swift mode is enabled for the scaling group.
  - Method 2: Use custom images that are created from the base image of Alibaba Cloud Linux 2 (formerly known as Aliyun Linux 2). This ensures that the resources of Infrastructure as a Service (IaaS) are delivered 50% faster.

Considerations

- For each account, the default CPU quota for pay-as-you-go instances in each region is 50 vCPUs. You can add at most 48 custom route entries to each route table of a virtual private cloud (VPC). To request a quota increase, submit a ticket.
- The stock of ECS instances may be insufficient for auto scaling if you specify only one ECS instance type for a scaling group. We recommend that you specify multiple ECS instance types with the same specification for a scaling group. This increases the success rate of auto scaling.
- In swift mode, when a node is shut down and reclaimed, the node stops running and enters the *NotReady* state. When a scale-out activity is triggered, the state of the node changes to *Ready*.
- If a node is shut down and reclaimed in swift mode, you are charged only for the disks. This rule does not apply to nodes that use local disks, such as the instance type of ecs.d1ne.2xlarge, for which you are also charged a computing fee. If the stock of nodes is sufficient, nodes can be launched within a short period of time.
- If elastic IP addresses (EIPs) are associated with pods, we recommend that you do not delete the scaling group or remove ECS instances from the scaling group in the ECS console. Otherwise, these EIPs cannot be automatically released.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the Clusters page, find the cluster that you want to manage and choose **More > Auto Scaling** in the **Actions** column.
4. On the **Configure Auto Scaling** page, set the following parameters and click **Submit**.

Parameter	Description
Cluster	The name of the cluster for which you want to enable auto scaling.
Scale-in Threshold	For a scaling group that is managed by cluster-autoscaler, set the value to the ratio of the requested resources per node to the total resources per node. If the actual value is lower than the threshold, the node is removed from the cluster. **Note** In auto scaling, a scale-out activity is automatically triggered based on node scheduling. Therefore, you need to set only scale-in parameters.
GPU Scale-in Threshold	The scale-in threshold for GPU-accelerated instances. If the actual value is lower than the threshold, the node is removed from the cluster.
Defer Scale-in For	The amount of time that the cluster must wait before the cluster scales in. The default value is 10 minutes.
Cooldown	The cooldown period after a scale-in activity is triggered. No scale-in activity is triggered during the cooldown period. The default value is 10 minutes.

5. Click **Create Scaling Group** and specify the type of resource for auto scaling based on your business requirements. Regular instances and GPU-accelerated instances are supported.
6. In the **Auto Scaling Group Configuration** dialog box, set the following parameters.

Parameter	Description
Region	The region where you want to deploy the scaling group. The scaling group and the Kubernetes cluster must be deployed in the same region. You cannot change the region after the scaling group is created.
VPC	The scaling group and the Kubernetes cluster must be deployed in the same VPC.
VSwitch	The vSwitches of the scaling group. You can specify vSwitches of different zones. The vSwitches allocate pod CIDR blocks to the scaling group.

7. Configure worker nodes.

Parameter	Description
Instance Type	The instance types in the scaling group.
Selected Types	The instance types that you select. You can select at most 10 instance types.
System Disk	The system disk of the scaling group.
Mount Data Disk	Specify whether to mount data disks to the scaling group. By default, no data disk is mounted.
Instances	The number of instances contained in the scaling group. **Note** ◦ Existing instances in the cluster are excluded. ◦ By default, the minimum number of instances is 0. If you specify one or more instances, the system adds the instances to the scaling group. When a scale-out activity is triggered, the instances in the scaling group are added to the cluster to which the scaling group is bound.
Password	Use a password. ◦ Password: Enter the password that is used to log on to the nodes. ◦ Confirm Password: Enter the password again.
Scaling Mode	You can select **Standard** or **Swift**.
RDS Whitelist	The ApsaraDB RDS instances that can be accessed by the nodes in the scaling group after a scaling activity is triggered.
Label	Labels are automatically added to nodes that are added to the cluster by scale-out activities.
ECS Label	You can add labels to the selected ECS instances.
Taints	After you add taints to a node, Container Service no longer schedules pods to the node.

Parameter	Description
CPU Policy	Specify the CPU policy. Valid values: ○ None: indicates that the default CPU affinity is used. This is the default policy. ○ Static: allows pods with specific resource characteristics on the node to be granted with enhanced CPU affinity and exclusivity.

8. Set advanced options.

Parameter	Description
Custom Security Group	Set a custom security group.
Custom Image	You can select a custom image. Then, all nodes in the Kubernetes cluster are deployed based on the image.
User Data	Customize the startup behaviors of ECS instances and import data to the ECS instances. The user data can be used to perform the following operations: ○ Run scripts during instance startup. ○ Import user data as normal data to an ECS instance for future reference.

9. Click **OK**.

Check the results

In the left-side navigation pane, choose **Applications > Deployments**, select the kube-system namespace. You can find the cluster-autoscaler component. This indicates that the scaling group is created.

FAQ

- Why does the auto scaling component fail to add nodes after a scale-out activity is triggered?

  Check whether the following situations exist:

  - The instance types in the scaling group cannot fulfill the resource request from pods. By default, system components are installed for each node. Therefore, the requested pod resources must be less than the resource capacity of the instance type.
  - The Resource Access Management (RAM) role does not have the permissions to manage the Kubernetes cluster. You must complete the authorization for each Kubernetes cluster that is involved in the scale-out activity.
  - The Kubernetes cluster cannot connect to the Internet. The auto scaling component must call Alibaba Cloud API operations. Therefore, the nodes must have access to the Internet.

- Why does the auto scaling component fail to remove nodes after a scale-in activity is triggered?

  Check whether the following situations exist:

  - The requested resource threshold of each pod is higher than the configured scale-in threshold.
  - Pods that belong to the *kube-system* namespace are running on the node.
  - A scheduling policy forces the pods to run on the current node. Therefore, the pods cannot be scheduled to other nodes.
  - PodDisruptionBudget is set for the pods on the node and the minimum value of PodDisruptionBudget is reached.

  For more information about FAQ, see open source component.

- How does the system choose a scaling group for a scaling activity?

  When pods cannot be scheduled to nodes, the auto scaling component simulates the scheduling of the pods based on the configuration of scaling groups. The configuration includes labels, taints, and instance specifications. If a scaling group can simulate the scheduling of the pods, this scaling group is selected for the scale-out activity. If more than one scaling groups meet the requirements, the system selects the scaling group that has the fewest idle resources after simulation.

3.6.11.2. Horizontal pod autoscaling

You can create an application that has Horizontal Pod Autoscaling (HPA) enabled in the Container Service console. HPA can automatically scale container resources for your application. You can also use a YAML file to describe HPA settings.

Create an application that has HPA enabled in the Container Service console

Container Service provided by Alibaba Cloud is integrated with HPA. You can create an application that has HPA enabled in the Container Service console. You can enable HPA when you create an application or after the application is created.

Enable HPA when you create an application

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click the name or click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Workloads > Deployments**.
5. On the **Deployments** tab, click **Create from Image**.
6. On the **Basic Information** wizard page, enter a name for your application, set other required parameters, and then click **Next**.

Parameter	Description
Name	Enter a name for the application.
Replicas	The number of pods that are provisioned for the application. Default value: 2.
Type	The type of the application. You can select **Deployments**, **StatefulSets**, **Jobs**, **Cron Jobs**, or **DaemonSets**.
Label	Add a label to the application. The label is used to identify the application.
Annotations	Add an annotation to the application.
Synchronize Timezone	Specify whether to synchronize the time zone between nodes and containers.

7. On the **Container** wizard page, set the container parameters, select an image, and then configure the required computing resources. Click **Next**. For more information, see Configure the containers.

   > **Note** You must configure the required computing resources for the Deployment. Otherwise, you cannot enable HPA.

8. On the **Advanced** wizard page, find the **Access Control** section, click **Create** on the right side of Services, and then set the parameters. For more information, see Create an application from an image.

9. On the **Advanced** wizard page, select **Enable** for **HPA** and configure the scaling threshold and related settings.
   - **Metric**: Select CPU Usage or Memory Usage. The selected resource type must be the same as the one that you have specified in the Required Resources field.
   - **Condition**: Specify the resource usage threshold. HPA triggers scaling activities when the threshold is exceeded.
   - **Max. Replicas**: Specify the maximum number of pods to which the Deployment can be scaled.
   - **Min. Replicas**: Specify the minimum number of pods that must run for the Deployment.
10. In the lower-right corner of the Advanced wizard page, click **Create**. The application is created with HPA enabled.
    Verify the result
    i. Click **View Details** or choose **Workloads > Deployments**. On the page that appears, click the **name of the created application** or click **Details** in the **Actions** column. Then, click the **Horizontal Pod Autoscaler** tab to view information about the scaling group of the application.
    ii. After the application starts to run, container resources are automatically scaled based on the CPU utilization. You can also check whether HPA is enabled in the staging environment by performing a CPU stress test on the pods of the application. Verify that the pods are automatically scaled within 30 seconds.

Enable HPA after an application is created

This example describes how to enable HPA for a stateless application.

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage, and click the name of the cluster or click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Workloads > Deployments**.
5. On the **Deployments** page, click the name of the application that you want to manage.
6. Click the **Pod Scaling** tab and click **Create**.
7. In the **Create** dialog box, configure the HPA settings. For more information about how to set the parameters, see HPA settings in Step 9.
8. Click **OK**.

Create an application that has HPA enabled by using kubectl

You can also create a Horizontal Pod Autoscaler by using an orchestration template and associate the Horizontal Pod Autoscaler with the Deployment for which you want to enable HPA. Then, you can run **kubectl** commands to enable HPA.

In the following example, HPA is enabled for an NGINX application.

1. Create a file named *nginx.yml* and copy the following content into the file.

   The following code block is a YAML template that is used to create a Deployment:

```
apiVersion: apps/v1
kind: Deployment
metadata:
 name: nginx
 labels:
  app: nginx
spec:
 replicas: 2
 selector:
  matchLabels:
   app: nginx
 template:
  metadata:
   labels:
    app: nginx
  spec:
   containers:
   - name: nginx
    image: nginx:1.7.9 # replace it with your exactly <image_name:tags>
    ports:
    - containerPort: 80
    resources:
     requests:                ##To enable HPA, you must set this parameter.
      cpu: 500m
```

2. Run the following command to create an NGINX application:

```
kubectl create -f nginx.yml
```

3. Create a Horizontal Pod Autoscaler.

   Use scaleTargetRef to associate the Horizontal Pod Autoscaler with the Deployment named **nginx**.

```
apiVersion: autoscaling/v2beta1
kind: HorizontalPodAutoscaler
metadata:
 name: nginx-hpa
 namespace: default
spec:
 scaleTargetRef:                ##Associate the Horizontal Pod Autoscaler with the nginx Deployment.
  apiVersion: apps/v1
  kind: Deployment
  name: nginx
 minReplicas: 1
 maxReplicas: 10
 metrics:
 - type: Resource
  resource:
   name: cpu
   targetAverageUtilization: 50
```

   Note You must configure the requested resources for the pods of the application. Otherwise, the Horizontal Pod Autoscaler cannot be started.

4. Run the `kubectl describe hpa name` command. The following output is an example of a warning that is returned:

```
Warning  FailedGetResourceMetric    2m (x6 over 4m)  horizontal-pod-autoscaler  missing request for cpu on container nginx in pod default/nginx-deployment-basic-75675f5897-mqzs7
Warning  FailedComputeMetricsReplicas  2m (x6 over 4m)  horizontal-pod-autoscaler  failed to get cpu utilization: missing request for cpu on container nginx in pod default/nginx-deployment-basic-75675f5
```

5. After the Horizontal Pod Autoscaler is created, run the `kubectl describe hpa name` command.

   If the following output is returned, it indicates that the Horizontal Pod Autoscaler is running as expected:

   ```
   Normal SuccessfulRescale 39s horizontal-pod-autoscaler New size: 1; reason: All metrics below target
   ```

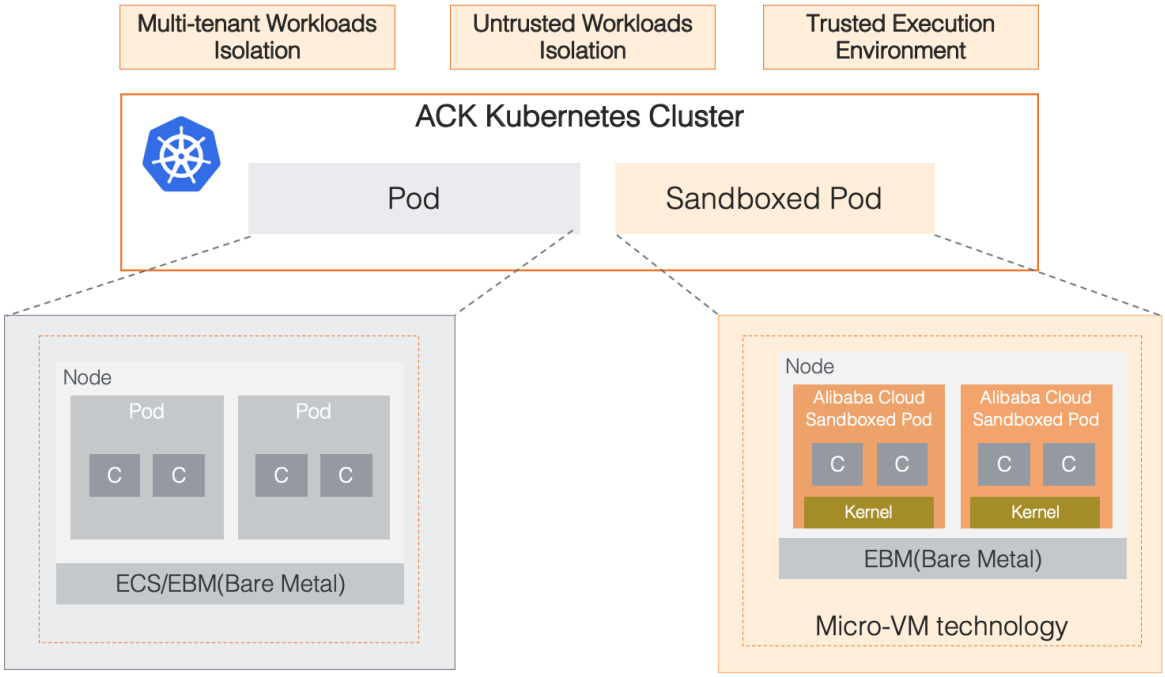
   If the CPU utilization of the NGINX application pod exceeds 50% as specified in the HPA settings, the Horizontal Pod Autoscaler automatically adds pods. If the CPU utilization of the NGINX application pod drops below 50%, the Horizontal Pod Autoscaler automatically removes pods.

3.6.12. Sandboxed-containers

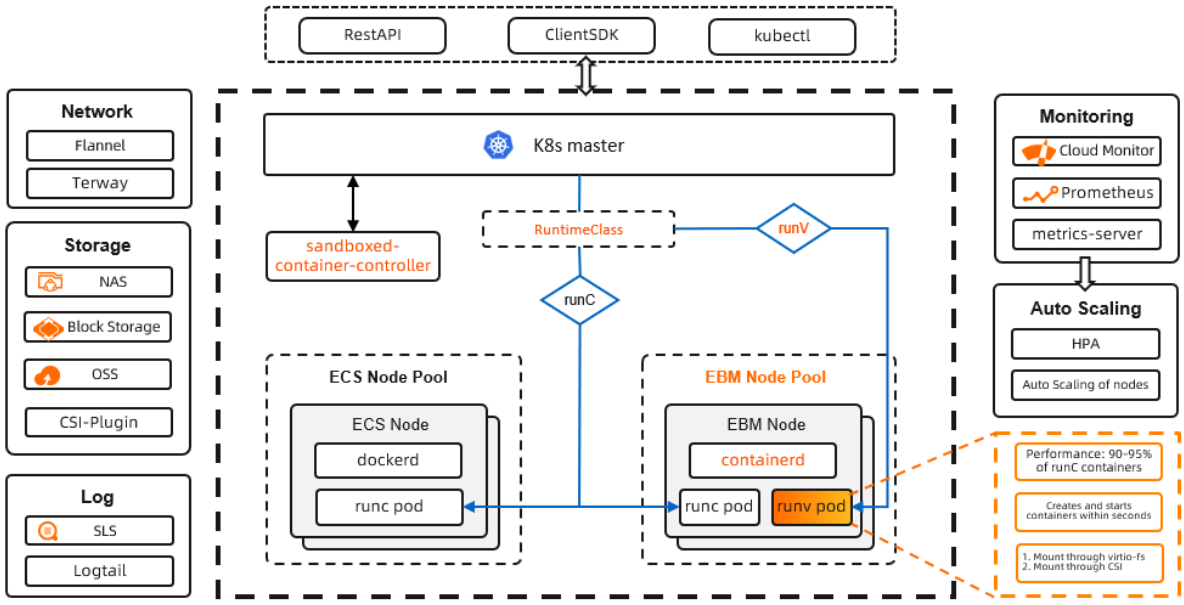
3.6.12.1. Overview

Sandboxed-Container is an alternative to the Docker runtime. Sandboxed-Container allows you to run applications in a sandboxed and lightweight virtual machine that has a dedicated kernel. This enhances resource isolation and improves security.

Sandboxed-Container is applicable to scenarios such as untrusted application isolation, fault isolation, performance isolation, and workload isolation among multiple users. Sandboxed-Container provides higher security. Sandboxed-Container has minor impacts on application performance and offers the same user experience as Docker in terms of logging, monitoring, and elastic scaling.



Architecture



Features

Sandboxed-Container is a container-securing runtime that is developed by Alibaba Cloud based on sandboxed and lightweight virtual machines. Compared with Sandboxed-Container V1, Sandboxed-Container V2 maintains the same isolation performance and reduces the pod overhead by 90%. It also allows you to start sandboxed containers 3 times faster and increases the maximum number of pods that can be deployed on a host by 10 times. Sandboxed-Container V2 provides the following key features:

- Strong isolation based on sandboxed and lightweight virtual machines.
- Good compatibility with runC in terms of application management.
- Network Attached Storage (NAS) file systems, disks, and Object Storage Service (OSS) buckets can be mounted both directly and through virtio-fs.
- The same user experience as runC in terms of logging, monitoring, and storage.
- Supports RuntimeClass (runC and runV). For more information, see RuntimeClass.
- Easy to use with minimum requirements on technical skills.
- Higher stability than Kata Containers. For more information about Kata Containers, see Kata Containers.

3.6.12.2. Create a Kubernetes cluster that runs sandboxed containers

This topic describes how to create a Kubernetes cluster that runs sandboxed containers in the Container Service console.

1. Log on to the Container Service console.
2. In the left-side navigation pane of the Container Service console, click **Clusters**. On the Clusters page that appears, click **Create Kubernetes Cluster** in the upper-right corner.
3. On the **Create Cluster** page, set basic configurations for the cluster.

Parameter	Description

Parameter	Description
Cluster Name	Enter a name for the cluster. The name must be 1 to 63 characters in length, and can contain digits, letters, and hyphens (-). **Note** The cluster name must be unique among clusters that belong to the same Alibaba Cloud account.
Region	Select the region where you want to deploy the Kubernetes cluster.
VPC	You can select a virtual private cloud (VPC) from the drop-down list. ◦ If the specified VPC is already associated with a NAT gateway, the cluster uses this NAT gateway. ◦ Otherwise, the system automatically creates a NAT gateway. If you do not want the system to create a NAT gateway, clear **Configure SNAT for VPC**. **Note** If you disallow the system to automatically create a NAT gateway and want the VPC to access the Internet, you must manually associate the VPC with a NAT gateway or create Source Network Address Translation (SNAT) rules for the VPC.
VSwitch	Select one or more vSwitches for the cluster. You can select up to three vSwitches that are deployed in different zones.
Kubernetes Version	Select a Kubernetes version.
Container Runtime	Select a runtime for the Kubernetes cluster.
Billing Method	Only pay-as-you-go nodes are supported.
Master Configurations	Set the Instance Type and System Disk parameters: ◦ Master Node Quantity: You can add up to three master nodes. ◦ Instance Type: You can select one or more instance types. For more information, see the *Instance types* chapter of *ECS User Guide*. ◦ System Disk: Standard SSDs and ultra disks are supported. **Note** You can select **Enable Backup** to back up disk data.
Worker Instance	By default, **Create Instance** is selected.

Parameter	Description
Worker Configurations	If **Worker Instance** is set to **Create Instance**, set the following parameters: ◦ Instance Type: Select Elastic Compute Service (ECS) bare metal instance types. ◦ Selected Types: The selected instance types are displayed. ◦ Quantity: Set the number of worker nodes. ◦ System Disk: Standard SSDs and ultra disks are supported. **Note** You can select **Enable Backup** to back up disk data. ◦ Mount Data Disk: Standard SSDs and ultra disks are supported. **Note** You can enable disk encryption and data backup when you mount disks. The disks are used to store the root file systems of containers on the nodes. Therefore, you must mount a disk of at least 200 GiB. We recommend that you mount a disk of at least 1 TiB.
Password	Set a password that is used to log on to the nodes. **Note** The password must be 8 to 30 characters in length, and must contain at least three of the following types of character: uppercase letters, lowercase letters, digits, and special characters.
Confirm Password	Enter the password again.
Network Plug-in	Flannel and Terway are supported. By default, Flannel is selected.
Pod CIDR Block and Service CIDR	These parameters are optional. For more information, see *Network planning* in *VPC User Guide*. **Note** These parameters are available only when you select an existing VPC.
Configure SNAT	This parameter is optional. If you clear Configure SNAT for VPC, you must create a NAT gateway or configure SNAT rules for the VPC.
Access to the Internet	Specify whether to expose the API server with an elastic IP address (EIP). The Kubernetes API server provides multiple HTTP-based RESTful APIs that can be used to create, delete, modify, query, and watch resource objects such as pods and Services. ◦ If you select this check box, an EIP is created and attached to an internal-facing Server Load Balancer (SLB) instance. Port 6443 used by the API server is exposed on the master nodes. You can connect to and manage the cluster by using kubeconfig over the Internet. ◦ If you clear this check box, no EIP is created. You can connect to and manage the cluster only by using kubeconfig from within the VPC.
Ingress	Specify whether to install Ingress controllers. By default, **Install Ingress Controller** is selected.

Parameter	Description
Log Service	If you enable Log Service, you can select an existing project or create a project. If you select **Enable Log Service**, the Log Service plug-in is automatically installed in the cluster. If you select **Create Ingress Dashboard**, Ingress access logs are collected and displayed on dashboards.
Volume Plug-in	By default, CSI is selected.
Deletion Protection	If you select this check box, the cluster cannot be deleted in the console or by calling API operations.
RDS Whitelist	Add the IP addresses of the nodes to the whitelist of the ApsaraDB RDS instance that is allowed to access the Kubernetes cluster. **Note** To enable an ApsaraDB RDS instance to access the Kubernetes cluster, you must deploy the ApsaraDB RDS instance in the same VPC as the Kubernetes cluster.
Node Protection	This check box is selected by default to prevent nodes from being deleted in the console or by calling API operations.
Label	Add labels to the cluster.

4. Complete the advanced settings of the cluster.

Parameter	Description
IP Addresses per Node	The number of IP addresses that is assigned to a node.
Kube-proxy Mode	iptables and IPVS are supported. ○ iptables is a mature and stable kube-proxy mode. It uses iptables rules to conduct service discovery and load balancing. The performance of this mode is restricted by the size of the Kubernetes cluster. This mode is suitable for Kubernetes clusters that manage a small number of Services. ○ IPVS is a high-performance kube-proxy mode. It uses Linux Virtual Server (LVS) to conduct service discovery and load balancing. This mode is suitable for Kubernetes clusters that manage a large number of Services. We recommend that you use this mode in scenarios where high-performance load balancing is required.
Custom Node Name	Specify whether to use a custom node name.
Node Port Range	Specify the node port range.
Taints	Add taints to all worker nodes in the Kubernetes cluster.
CPU Policy	Specify the CPU policy. Valid values: ○ None: indicates that the default CPU affinity is used. This is the default policy. ○ Static: allows pods with specific resource characteristics on the node to be granted with enhanced CPU affinity and exclusivity.
Cluster Domain	The default domain name of the cluster is cluster.local. You can specify a custom domain name.

Parameter	Description
Cluster CA	Specify whether to enable the cluster CA certificate.
User Data	You can customize the startup behaviors of ECS instances and import data to the ECS instances. The user data can be used to perform the following operations: ◦ Run user data scripts during instance startup. ◦ Import user data as common data to an ECS instance for future reference.

5. Click **Create Cluster** in the upper-right corner of the page.
6. On the **Confirm** page, click **OK** to start the deployment.

Result

After the cluster is created, you can find the cluster on the **Clusters** page in the Container Service console.

3.6.12.3. Expand a Container Service cluster that runs sandboxed containers

This topic describes how to scale out the worker nodes in a Container Service cluster that runs sandboxed containers in the Container Service console.

Prerequisites

You cannot scale out the master nodes in a Container Service cluster that runs sandboxed containers.

To expand a Container Service cluster that runs sandboxed containers, you must set the parameters as required in the following table. Otherwise, the added nodes cannot run sandboxed containers.

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Expand** in the **Actions** column.
4. Go to the Expand page and set the required parameters.

   In this example, the number of worker nodes in the Container Service cluster is increased from three to five. The following table describes the required parameters.

Parameter	Description
Cluster Name	By default, the name of the Container Service cluster appears.
Region	The region where the Container Service cluster is deployed.
Container Runtime	By default, Sandboxed-Container appears.

Parameter	Description
VPC	You can select a virtual private cloud (VPC) from the drop-down list. ◦ If the specified VPC is already associated with a NAT gateway, the cluster uses this NAT gateway. ◦ Otherwise, the system automatically creates a NAT gateway. If you do not want the system to create a NAT gateway, clear **Configure SNAT for VPC**. **Note** If you disallow the system to automatically create a NAT gateway and want the VPC to access the Internet, you must manually associate the VPC with a NAT gateway or create Source Network Address Translation (SNAT) rules for the VPC.
VSwitch	Select one or more vSwitches for the cluster. You can select up to three vSwitches that are deployed in different zones.
Billing Method	Only pay-as-you-go nodes are supported.
Existing Worker Nodes	The number of existing workers in the Container Service cluster.
Nodes to Add	Set the number of worker nodes to add.
Worker Nodes After Scaling	The number of worker nodes after the scaling.
Instance Type	Select ECS Bare Metal Instance.
Selected Types	The selected instance types are displayed.
System Disk	Standard SSDs and ultra disks are supported. **Note** You can select **Enable Backup** to back up disk data.
Mount Data Disk	Standard SSDs and ultra disks are supported. **Note** You can enable disk encryption and data backup when you mount disks. The disks are used to store the root file systems of containers on the nodes. Therefore, you must mount a disk of at least 200 GiB. We recommend that you mount a disk of at least 1 TiB.
Password	◦ **Password**: Enter the password that is used to log on to the nodes. ◦ **Confirm Password**: Enter the password again.
RDS Whitelist	Set the Apsara RDS whitelist. Add the IP addresses of the nodes in the cluster to the RDS whitelist.
Label	Add labels to the cluster.
Taints	Add taints to all worker nodes in the Kubernetes cluster.

Parameter	Description
CPU Policy	Specify the CPU policy. Valid values: ○ None: indicates that the default CPU affinity is used. This is the default policy. ○ Static: allows pods with specific resource characteristics on the node to be granted with enhanced CPU affinity and exclusivity.
User Data	You can customize the startup behaviors of ECS instances and import data to the ECS instances. The user data can be used to perform the following operations: ○ Run user data scripts during instance startup. ○ Import user data as common data to an ECS instance for future reference.

5. Click **Submit**.

What's next

After the Container Service cluster is expanded, go to the details page of the Container Service cluster. In the left-side navigation pane, choose **Clusters > Node Pools**. You can find that the number of worker nodes is increased from 3 to 5.

3.6.12.4. Create an application that runs in sandboxed containers

This topic describes how to use an image to create an NGINX application that runs in sandboxed containers. The NGINX application is accessible over the Internet.

Prerequisites

A cluster that contains sandboxed containers is created. For more information, see Create a Kubernetes cluster that supports sandboxed containers.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Workloads > Deployments**.
5. On the **Deployments** page, select the namespace and click **Create from Image** in the upper-right corner.
6. On the **Basic Information** wizard page, specify the basic information of the application and click **Next**.

   Set **Container Runtime** to **runv**. Set the following parameters: **Name**, **Replicas**, **Type**, **Label**, and **Annotations**. Select whether you want to enable **Synchronize Timezone**. The number of replicas specifies the number of pods that are provisioned for in the application.

   > **Note**
   >
   > **Deployments** is selected in this example.

7. Configure containers.

> **Note** In the upper part of the **Container** wizard page, click **Add Container** to add more containers for the application.

The following table describes the parameters that are required to configure the containers.

- General settings

Parameter	Description
Image Name	Click **Select Image**. In the dialog box that appears, select an image and click **OK**. In this example, an NGINX image is selected. You can also enter the address of an image stored in a private registry. The image address must be in the following format: `domainname/namespace/imagename:tag`.
Image Version	■ Click **Select Image Version** and select an image version. If you do not specify an image version, the latest image version is used. ■ You can select the following image pulling policies: ■ **ifNotPresent**: If the image that you want to pull is found in the region where the cluster is deployed, Container Service uses the local image. Otherwise, Container Service pulls the image from the corresponding repository. ■ **Always**: Container Service pulls the image from the repository each time the application is deployed or expanded. ■ **Never**: Container Service uses only images on your on-premise machine. **Note** If you select **Image Pull Policy**, no image pulling policy is applied. ■ To pull the image without a Secret, click **Set Image Pull Secret** to set a Secret for pulling images.
Resource Limit	You can specify an upper limit for the CPU, memory, and ephemeral storage space that the container can consume. This prevents the container from occupying an excessive amount of resources. The CPU resource is measured in milicores (one thousandth of one core). The memory resource is measured in MiB. The ephemeral storage resource is measured in GiB.
Required Resources	The amount of CPU and memory resources that are reserved for this application. These resources are exclusive to the container. This prevents the application from becoming unavailable if other services or processes compete for computing resources.
Container Start Parameter	■ stdin: Pass stdin to the container. ■ tty: Stdin is a TeleTYpewriter (TTY).
Privileged Container	■ If you select Privileged Container, privileged=true is set for the container and the privilege mode is enabled. ■ If you do not select Privileged Container, privileged=false is set for the container and the privilege mode is disabled.
Init Container	If you select Init Container, an init container is created. An init container provides tools to manage pods. For more information, see Init Containers.

- (Optional)Ports

  Configure container ports.

  - Name: Enter a name for the port.
  - Container Port: Enter the container port that you want to open. Enter a port number from 1 to 65535.
  - Protocol: Select TCP or UDP.

- (Optional)Environments

  You can configure environment variables for pods in key-value pairs. Environment variables are used to apply pod configurations to containers. For more information, see Pod variables.

  - Type: Select the type of the environment variable. You can select **Custom**, **ConfigMaps**, **Secrets**, **Value/ValueFrom**, or **ResourceFieldRef**. If you select ConfigMaps or Secret as the type of the environment variable, all values in the selected ConfigMap or Secret are passed to the container environment variables. In this example, Secret is selected.

    Select **Secrets** from the Type drop-down list and select a Secret from the **Value/ValueFrom** drop-down list. All values in the selected Secret are passed to the environment variable.

    
    In this case, the YAML file that is used to deploy the application contains the settings that reference all data in the selected Secret.

    ```
    envFrom:
      - secretRef:
          name: test
    ```

  - Variable Key: Specify the name of the environment variable.
  - Value/ValueFrom: Specify the value that is referenced by the environment variable.

- (Optional)Health Check

  Health check settings include liveness and readiness probes. Liveness probes determine when to restart the container. Readiness probes determine whether the container is ready to accept network traffic. For more information about health checks, see Configure Liveness, Readiness, and Startup Probes.

Request type	Description

Request type	Description
HTTP	Sends an HTTP GET request to the container. You can configure the following parameters: ■ Protocol: HTTP or HTTPS. ■ Path: the requested path on the server. ■ Port: Enter the container port that you want to open. Enter a port number from 1 to 65535. ■ HTTP Header: Enter the custom headers in the HTTP request. Duplicate headers are allowed. Key-value pairs are supported. ■ Initial Delay (s): the initialDelaySeconds field in the YAML file. This field specifies the time (in seconds) that the system must wait before it can send a probe to the container after the container is started. Default value: 3. ■ Period (s): the periodSeconds field in the YAML file. This field specifies the interval (in seconds) at which probes are performed. Default value: 10. Minimum value: 1. ■ Timeout (s): the timeoutSeconds field in the YAML file. This field specifies the time (in seconds) after which a probe times out. Default value: 1. Minimum value: 1. ■ Healthy Threshold: the minimum number of times that an unhealthy container must consecutively pass health checks before it is considered healthy. Default value: 1. Minimum value: 1. For liveness probes, this parameter must be set to 1. ■ Unhealthy Threshold: the minimum number of times that a healthy container must consecutively fail health checks before it is considered unhealthy. Default value: 3. Minimum value: 1.
TCP	Sends a TCP socket to the container. kubelet attempts to open the socket on the specified port. If the connection can be established, the container is considered healthy. Otherwise, the container is considered unhealthy. You can set the following parameters: ■ Port: Enter the container port that you want to open. Enter a port number from 1 to 65535. ■ Initial Delay (s): the initialDelaySeconds field in the YAML file. This field specifies the time (in seconds) that the system must wait before it can send a probe to the container after the container is started. Default value: 15. ■ Period (s): the periodSeconds field in the YAML file. This field specifies the time interval (in seconds) at which probes are performed. Default value: 10. Minimum value: 1. ■ Timeout (s): the timeoutSeconds field in the YAML file. This field specifies the time (in seconds) after which a probe times out. Default value: 1. Minimum value: 1. ■ Healthy Threshold: the minimum number of times that an unhealthy container must consecutively pass health checks before it is considered healthy. Default value: 1. Minimum value: 1. For liveness probes, this parameter must be set to 1. ■ Unhealthy Threshold: the minimum number of times that a healthy container must consecutively fail health checks before it is considered unhealthy. Default value: 3. Minimum value: 1.

Request type	Description
Command	Runs a probe command in the container to check the health status of the container. You can set the following parameters: ■ Command: the probe command that is run to check the health status of the container. ■ Initial Delay (s): the initialDelaySeconds field in the YAML file. This field specifies the time (in seconds) that the system must wait before it can send a probe to the container after the container is started. Default value: 5. ■ Period (s): the periodSeconds field in the YAML file. This field specifies the interval (in seconds) at which probes are performed. Default value: 10. Minimum value: 1. ■ Timeout (s): the timeoutSeconds field in the YAML file. This field specifies the time (in seconds) after which a probe times out. Default value: 1. Minimum value: 1. ■ Healthy Threshold: the minimum number of times that an unhealthy container must consecutively pass health checks before it is considered healthy. Default value: 1. Minimum value: 1. For liveness probes, this parameter must be set to 1. ■ Unhealthy Threshold: the minimum number of times that a healthy container must consecutively fail health checks before it is considered unhealthy. Default value: 3. Minimum value: 1.

- Lifecycle

  You can set the following parameters to configure the lifecycle of the container: Start, Post Start, and Pre Stop. For more information, see Configure the lifecycle of a container.

  - **Start**: Set the command and parameter that take effect before the container starts.
  - **Post Start**: Set the command that takes effect after the container starts.
  - **Pre Stop**: Set the command that takes effect before the container stops.

- (Optional)Volume

  You can mount local volumes and persistent volume claims (PVCs) to the container.

  - **Add Local Storage**: You can select HostPath, ConfigMap, Secret, and EmptyDir. The source directory or file is mounted to a path in the container. For more information, see Volumes.
  - **Add PVC**: Cloud Storage is supported.

  In this example, a PVC named disk-ssd is mounted to the */tmp* path of the container.

- (Optional)Log

  Configure **Log Service**. You can specify log collection configurations and add custom tags.

  > **Notice** Make sure that the Log Service agent is installed in the cluster.

Parameter	Description
	Logstore: creates a Logstore in Log Service to store collected log data.

Parameter Collection Configuration	Description
	Log Path in Container: specifies stdout or a path to collect log data ■ stdout: specifies that the stdout files are collected. ■ Text Logs: specifies that log data in the specified path of the container is collected. In this example, */var/log/nginx* is specified as the path. Wildcard characters can be used to specify the path.
Custom Tag	You can also add custom tags. Custom tags are added to the log data of the container when the log data is collected. Log data with tags is easier to aggregate and filter.

8. Configure the parameters based on your business requirements and click **Next**.
9. (Optional)Configure advanced settings.
   - Access Control

> **Note**
>
> You can configure the following access control settings based on your business requirements:
>
> - Internal applications: For applications that run inside the cluster, you can create a ClusterIP or NodePort Service to enable internal communication.
> - External applications: For applications that are open to the Internet, you can configure access control by using one of the following methods:
>   - Create a LoadBalancer Service and enable access to your application over the Internet by using a Server Load Balancer (SLB) instance.
>   - Create an Ingress and use the Ingress to expose your application to the Internet. For more information, see Ingress.

You can also specify how the backend pods are exposed to the Internet. In this example, a ClusterIP Service and an Ingress are created to expose the NGINX application to the Internet.

Parameter	Description
Services	Click **Create** on the right side of **Services**. In the Create Service dialog box, set the parameters. Select **Cluster IP**.
Ingresses	Click **Create** on the right side of **Ingresses**. In the Create dialog box, set the parameters. **Note** When you create an application from an image, you can create an Ingress only for one Service. In this example, a virtual hostname is used as the test domain name. You must add the following entry to the hosts file to map the domain name to the IP address of the Ingress. In actual scenarios, use a domain name that has obtained an Internet Content Provider (ICP) number. `101.37.224.146 foo.bar.com #The IP address of the Ingress.`

You can find the created Service and Ingress in the **Access Control** section. You can click **Update** or **Delete** to change the configurations.

- Scaling

  Specify whether to enable **HPA** to automatically scale the number of pods based on the CPU and memory usage. This enables the application to run smoothly at different load levels.

  > **Note** To enable HPA, you must configure required resources for the container. Otherwise, HPA does not take effect.

  - **Metric**: Select CPU Usage or Memory Usage. The selected resource type must be the same as the one you have specified in the Required Resources field.
  - **Condition**: Specify the resource usage threshold. HPA triggers scaling events when the threshold is exceeded.
  - **Max. Replicas**: Specify the maximum number of replicated pods to which the application can be scaled.
  - **Min. Replicas**: Specify the minimum number of replicated pods that must run.

- Scheduling

  You can set the following parameters: Update Method, Node Affinity, Pod Affinity, Pod Anti Affinity, and Toleration. For more information, see Affinity and anti-affinity.

  > **Note** Node affinity and pod affinity affect pod scheduling based on node labels and pod labels. You can add node labels and pod labels that are provided by Kubernetes to configure node affinity and pod affinity. You can also add custom labels to nodes and pods, and then configure node affinity and pod affinity based on these custom labels.

Parameter	Description
Update Method	Select Rolling Update or OnDelete. For more information, see Deployments.
Node Affinity	Set **Node Affinity** by adding labels to worker nodes. Node Affinity supports required and preferred rules, and various operators, such as In, NotIn, Exists, DoesNotExist, Gt, and Lt. ■ **Required**: Specify the rules that must be matched for pod scheduling. In the YAML file, these rules are defined by the requiredDuringSchedulingIgnoredDuringExecution field of the nodeAffinity parameter. These rules have the same effect as the **Node Selector** parameter. In this example, pods can be scheduled only to nodes with the specified labels. You can create multiple required rules. However, only one of them must be met. ■ **Preferred**: Specify the rules that are not required to be matched for pod scheduling. Pods are scheduled to a node that matches the preferred rules when multiple nodes match the required rules. In the YAML file, these rules are defined by the preferredDuringSchedulingIgnoredDuringExecution field of the nodeAffinity parameter. In this example, the scheduler attempts to schedule a pod to a node that matches the preferred rules. You can also set weights for preferred rules. If multiple nodes match the rule, the node with the highest weight is preferred. You can create multiple preferred rules. However, all of them must be met before the pod can be scheduled.

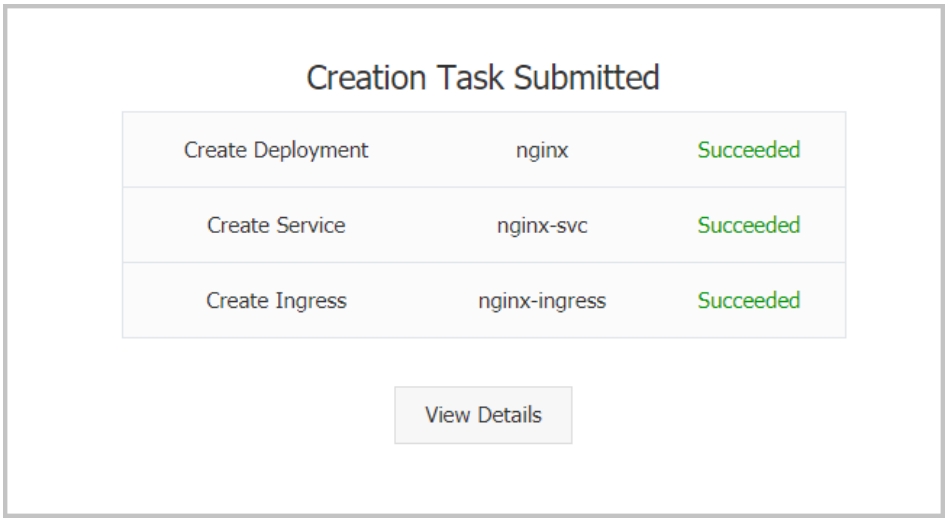
Parameter	Description
Pod Affinity	Pod affinity rules specify how pods are deployed relative to other pods in the same topology domain. For example, you can use pod affinity to deploy services that communicate with each other to the same topological domain, such as a host. This reduces the network latency between these services. Pod affinity enables you to select nodes to which pods can be scheduled based on the labels of other running pods. Pod affinity supports required and preferred rules, and the following operators: **In, NotIn, Exists, and DoesNotExist**. ■ **Required**: Specify rules that must be matched for pod scheduling. In the YAML file, these rules are defined by the requiredDuringSchedulingIgnoredDuringExecution field of the podAffinity parameter. A node must match the required rules before pods can be scheduled to the node. ■ **Namespace**: Specify the namespace to apply the required rule. Pod affinity rules are defined based on the labels that are added to pods and therefore must be scoped to a namespace. ■ **Topological Domain**: Set the topologyKey. This specifies the key for the node label that the system uses to denote the topological domain. For example, if you set the parameter to **kubernetes.io/hostname**, topologies are determined by nodes. If you set the parameter to **beta.kubernetes.io/os**, topologies are determined by the operating systems of nodes. ■ **Selector**: Click Add to add pod labels. ■ **View Applications**: Click **View Applications** and set the namespace and application in the dialog box that appears. You can view the pod labels on the selected application and add the labels as selectors. ■ Required Rules: Specify labels on existing applications, the operator, and the label value. In this example, the required rule specifies that the application to be created is scheduled to a host that runs applications with the **app:nginx** label. ■ **Preferred**: Specify rules that are not required to be matched for pod scheduling. In the YAML file, preferred rules are defined by the preferredDuringSchedulingIgnoredDuringExecution field of the podAffinity parameter. The scheduler attempts to schedule the pod to a node that matches the preferred rules. You can set weights for preferred rules. The other parameters are the same as those of required rules. **Note** **Weight**: Set the weight of a preferred rule to a value from 1 to 100. The scheduler calculates the weight of each node that meets the preferred rule based on an algorithm, and then schedules the pod to the node with the highest weight.

Parameter	Description
Pod Anti Affinity	Pod anti-affinity rules specify that pods are not scheduled to topological domains where pods with matching labels are deployed. Pod anti-affinity rules apply to the following scenarios: ■ Schedule the pods of an application to different topological domains, such as multiple hosts. This allows you to enhance the stability of the service. ■ Grant a pod exclusive access to a node. This enables resource isolation and ensures that no other pod can share the resources of the specified node. ■ Schedule pods of an application to different hosts if the pods may interfere with each other. **Note** The parameters of pod anti-affinity rules are the same as those of pod affinity rules. You can create the rules for different scenarios.
Toleration	Configure toleration rules to allow pods to be scheduled to nodes with matching taints.
Schedule to Virtual Nodes	Specify whether to schedule pods to virtual nodes. This option is unavailable if the cluster does not contain a virtual node.

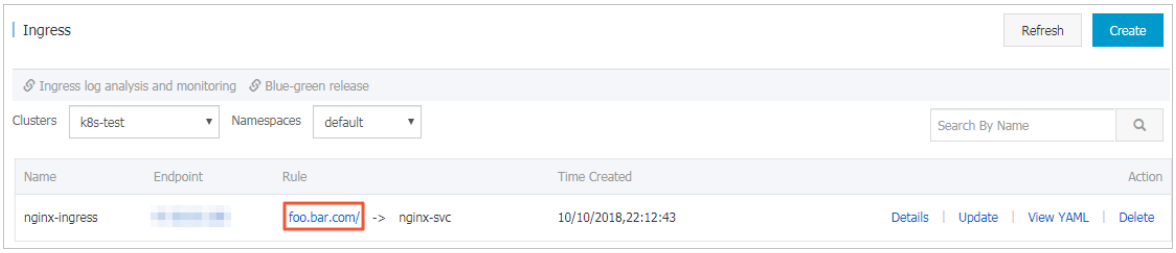
- Labels and Annotations
  - Pod Labels: Add a label to the pod. The label is used to identify the application.
  - Pod Annotations: Add an annotation to the pod.

10. Click **Create**.

    After the application is deployed, you are redirected to the Complete wizard page. The resource objects of the application are displayed. You can find the resource objects under the application and click **View Details** to view application details.



11. In the left-side navigation pane, choose **Ingresses and Load Balancing > Ingresses**.
    The created Ingress rule is displayed on the page.



Result

Enter the test domain in the address bar of your browser and press Enter. The NGINX welcome page appears.

3.6.12.5. Configure a Kubernetes cluster that runs both sandboxed and Docker containers

Node pools support multiple types of container runtime. However, nodes in the same node pool must use the same type of container runtime. Container Service allows you to create node pools of different container runtime types for a cluster. This topic describes how to create a node pool that runs sandboxed containers and a node pool that runs Docker containers for a Kubernetes cluster.

Prerequisites

A Kubernetes cluster is created. For more information, see Create a Kubernetes cluster.

> **Notice** The Kubernetes cluster must meet the following requirements:
>
> - The cluster version must be 1.14.6-aliyun.1 or later.
> - The network plug-in must be Flannel or Terway. Terway must run in One ENI for Multi-Pod mode.
> - The volume plug-in must be CSI-Plugin 1.14.8.39-0d749258-aliyun or later. Flexvolume is not supported.
> - The logtail-ds version must be 0.16.34.2-f6647154-aliyun or later.

Considerations

- By default, a cluster can contain at most 100 nodes.
- Before you add an existing Elastic Compute Service (ECS) instance that is deployed in a virtual private cloud (VPC), make sure that an elastic IP address (EIP) is associated with the ECS instance, or a NAT gateway is created in the VPC. In addition, the nodes that you want to add to the node pool must have access to the Internet. Otherwise, the ECS instance cannot be added.

Create a node pool that runs Docker containers

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.

4. In the left-side navigation pane of the details page, choose **Nodes > Node Pools**.
5. On the **Node Pools** page, click **Create Node Pool** and set the parameters.

   For more information, see Create a Kubernetes cluster. The following table describes the parameters.

Parameter	Description
Name	Enter a name for the node pool.
Container Runtime	Select Docker. This specifies that all containers in the node pool are Docker containers.
Quantity	Specify the initial number of nodes in the node pool. If you do not need to create nodes, set this parameter to 0.
Operating System	The CentOS and Aliyun Linux operating systems are supported.
ECS Label	You can add labels to the ECS instances.
Node Label	You can add labels to the nodes in the cluster.
Custom Resource Group	Specify the resource group of the nodes to be added to the node pool.
Custom Security Group	Select a custom security group.

6. Click **OK**.

Create a node pool that runs sandboxed containers

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Nodes > Node Pools**.
5. On the **Node Pools** page, click **Create Node Pool** and set the parameters.

   For more information, see Create a Kubernetes cluster. The following table describes the parameters.

Parameter	Description
Name	Enter a name for the node pool.
Container Runtime	Select Sandboxed-Container. This specifies that all containers in the node pool are sandboxed containers.
Quantity	Specify the initial number of nodes in the node pool. If you do not need to create nodes, set this parameter to 0.
Operating System	Select an operating system. Sandboxed containers support only the Aliyun Linux operating system.
Mount Data Disk	You must mount a disk of at least 200 GiB.
ECS Label	You can add labels to the ECS instances.
Node Label	You can add labels to the nodes in the cluster.

Parameter	Description
Custom Resource Group	Specify the resource group of the nodes to be added to the node pool.
Custom Security Group	Select a custom security group.

6. Click **OK**.

Result

- After you perform the preceding steps, check the states of the node pools on the **Node Pools** page. If the node pools are in the **Activate** state, the node pools are created.
- You can connect to the Kubernetes cluster and view detailed information about the nodes in the node pools.
  i. On the **Node Pools** page, select a node pool that you have created and click its name. In the **Node Pool Information** section, find and record the **Node Pool ID**.

  ii. Connect to the Kubernetes cluster by using kubectl. For more information, see Connect to a cluster through kubectl.
  iii. Run the following command to query the names of the nodes in a specified node pool:

```
kubectl get node --show-labels | grep -E "${node pool ID}|${node pool ID}"
```

  iv. Run the following command to query detailed information about a specified node:

```
kubectl get node -o wide | grep -E "${node name} {node name}"
```

3.6.12.6. How do I select between Docker and Sandboxed-Container?

Containers and images have become the industry standards for software packaging and delivery. Kubernetes has become a standard platform for building, developing, and managing containerized cloud-native applications. An increasing number of enterprises and customers choose to deploy their applications in Container Service. Container Service supports two types of runtime: Docker and Sandboxed-Container. This topic describes the differences between these runtimes in the following aspects: implementations and limits, commonly used commands provided by Docker Engine and Containerd, and deployment architectures. This provides references for you to select between Docker and Sandboxed-Container based on your requirements.

Differences between Docker and Sandboxed-Container in terms of implementations and limits

Item	Docker	Sandboxed-Container V2	Description
Cluster type	All types	All types	N/A

Item	Docker	Sandboxed-Container V2	Description
Node type	• ECS • EBM	EBM	N/A
Node operating system	• CentOS • Alibaba Cloud Linux2	Alibaba Cloud Linux2	• You cannot deploy both Docker and Sandboxed-Container on the same node. • To deploy both Docker and Sandboxed-Container in a cluster, you can create node pools of different runtime types.
Container engine	Docker	Containerd	N/A
Monitoring	Supported	Supported	N/A
Container log collection	Supported	Sidecar: supported. Manual configuration is required.	N/A
Container stdout collection	Supported	Supported	N/A
RuntimeClass	Not supported	Supported (runV)	N/A
Pod scheduling	No configuration is required.	• For Kubernetes V1.14.x, you must add the following configuration to the nodeSelector field: **alibabacloud.com/sandboxed-container: Sandboxed-Container.runv** • For Kubernetes V1.16.x and later, no configuration is required.	N/A
HostNetwork	Supported	Not supported	N/A
exec/logs	Supported	Supported	N/A
Node data disk	N/A	Required. The data disk must be at least 200 GiB.	N/A
Network plug-in	• Flannel • Terway	• Flannel • Terway: supports only the One ENI for Multi-Pod mode.	N/A
Kube-proxy mode	• Iptables • IPVS	• Iptables • IPVS	N/A

Item	Docker	Sandboxed-Container V2	Description
Volume plug-in	CSI Plugin	CSI Plugin	N/A
Container root file system	OverlayFS	VirtioFS	N/A

Differences in the commonly used commands provided by Docker Engine and Containerd

Docker uses Docker Engine for container lifecycle management. Sandboxed-Container uses Containerd for container lifecycle management. These tools support different commands that can be used to manage images and containers. The following table lists the commonly used commands.

Command	Docker	Containerd	
	docker	crictl (recommended)	ctr
Queries containers	docker ps	crictl ps	ctr -n k8s.io c ls
Queries container details	docker inspect	crictl inspect	ctr -n k8s.io c info
Queries container logs	docker logs	crictl logs	N/A
Runs a command in a container	docker exec	crictl exec	N/A
Mounts local standard input, output, and error streams to a running container	docker attach	crictl attach	N/A
Queries resource usage statistics	docker stats	crictl stats	N/A
Creates a container	docker create	crictl create	ctr -n k8s.io c create
Starts one or more containers	docker start	crictl start	ctr -n k8s.io run
Stops one or more containers	docker stop	crictl stop	N/A
Removes one or more containers	docker rm	crictl rm	ctr -n k8s.io c del
Queries images	docker images	crictl images	ctr -n k8s.io i ls
Queries image details	docker inspect	crictl inspecti	N/A
Pulls an image	docker pull	crictl pull	ctr -n k8s.io i pull
Pushes an image	docker push	N/A	ctr -n k8s.io i push
Removes one or more images	docker rmi	crictl rmi	ctr -n k8s.io i rm
Queries pods	N/A	crictl pods	N/A
Queries pod details	N/A	crictl inspectp	N/A

Command	Docker	Containerd	
	docker	crictl (recommended)	ctr
Starts one or more pods	N/A	crictl runp	N/A
Stops one or more pods	N/A	crictl stopp	N/A

Differences between Docker and Sandboxed-Container in terms of deployment architectures

Runtime	Deployment architecture
Docker	kubelet -> dockerd -> containerd -> containerd-shim -> runC containers
Sandboxed-Container V1	kubelet -> (CRI)containerd \-> containerd-shim -> runC containers \-> containerd-shim-kata-v2 -> runV sandboxed containers
Sandboxed-Container V2	kubelet -> (CRI)containerd \-> containerd-shim -> runC containers \-> containerd-shim-rund-v2 -> runV sandboxed containers

3.6.12.7. Benefits of Sandboxed-Container

This topic describes the advantages and application scenarios of Sandboxed-Container and provides a comparison between Sandboxed-Container and open source Kata Containers. This allows you to learn more about the benefits of Sandboxed-Container.

Context

Sandboxed-Container provides an alternative to the Docker runtime environment. It supports the following features:

- Sandboxed-Container allows your applications to run in a sandboxed and lightweight virtual machine. This virtual machine is equipped with a dedicated kernel and provides better isolation and enhanced security.
- Compared with open source Kata Containers, Sandboxed-Container is optimized for storage, networking, and stability.
- You can use Sandboxed-Container to isolate untrusted applications and applications of different tenants for higher security. You can also use Sandboxed-Container to isolate applications with faults and applications with degraded performance. This minimizes the negative impact on your service. In addition, Sandboxed-Container offers the same user experience as Docker in terms of logging, monitoring, and elastic scaling.

Benefits

Compared with Docker, Sandboxed-Container has the following benefits:

- Strong isolation based on sandboxed and lightweight virtual machines.
- Compatibility with runC in terms of application management.
- High performance that corresponds to 90% performance of applications based on runC.

- The same user experience as runC in terms of logging, monitoring, and storage.
- Support for RuntimeClass.
- Easy to use with limited expertise that is required to use virtual machines.
- Higher stability than that provided by Kata Containers.

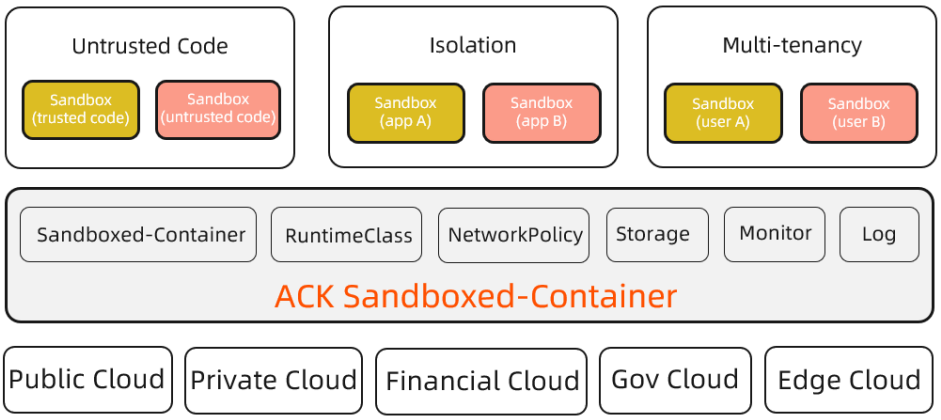
Comparison between Sandboxed-Container and Kata Containers

Sandboxed-Container outperforms Kata Containers in the following aspects.

Item	Category	Sandboxed-Container	Kata Containers
Sandbox startup time consumption		About 150 ms	About 500 ms
Root file system		OverlayFS over virtio-fs. Performance: ☆☆☆☆	OverlayFS over 9pfs. Performance: ☆☆
Volume	HostPath	Disks are mounted to Sandboxed-Container over 9pfs. Performance: ☆☆	Disks are mounted to Kata Containers over 9pfs. Performance: ☆☆
	EmptyDir	over VirtioFS	By default, the volume is mounted to Kata Containers over 9pfs.
	Disk	By default, cloud disks are mounted to Sandboxed-Container over virtio-fs. Performance: ☆☆☆☆	Cloud disks are mounted to Kata Containers over 9pfs. Performance: ☆☆
	NAS	By default, Apsara File Storage NAS (NAS) file systems are mounted to Sandboxed-Container over virtio-fs. Performance: ☆☆☆☆	NAS file systems are mounted to Kata Containers over 9pfs. Performance: ☆
Network plug-in		• The Terway network plug-in is used. Its network performance is 20% to 30% higher than Flannel. Terway supports features such as NetworkPolicy. This allows you to define the networking policies for pods. • Flannel	Flannel
Monitoring and alerting		• Enhanced monitoring of disks and network conditions for pods that host Sandboxed-Container. • Integrated with Cloud Monitor. This facilitates cluster monitoring and alerting.	Monitoring of disks and network conditions is unavailable for pods that host Sandboxed-Container.
Stability		☆☆☆☆☆	☆☆

Applicable scenarios of Sandboxed-Container

This section describes the applicable scenarios of Sandboxed-Container.



- Scenario 1: Sandboxed-Container can run untrusted code and applications in isolated containers. This is not supported by containers in runC.
  - Security risks of runC

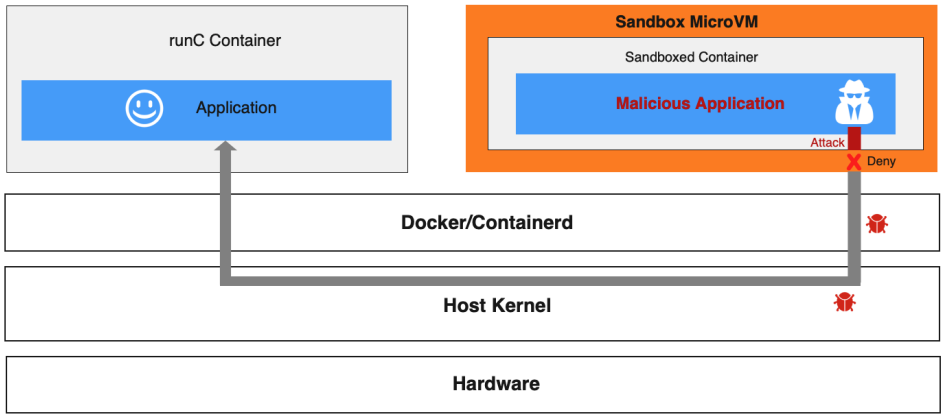
    - runC isolates containers by using namespaces and control groups (cgroups). This exposes containers to security threats.
    - All containers on a node share the host kernel. If a kernel vulnerability is exposed, malicious code may escape to the host and then infiltrate the backend network. Malicious code execution may cause privilege escalation, compromise sensitive data, and destroy system services and other applications.
    - Attackers may also exploit application vulnerabilities to infiltrate the internal network.

    You can implement the following measures to reduce security risks of containers in runC.

    - Seccomp: filters system calls.
    - SElinux: restricts the permissions of container processes, files, and users.
    - Capability: limits the capability of container processes.
    - dockerd rootless mode: forbids users to use root permissions to run the Docker daemon and containers.

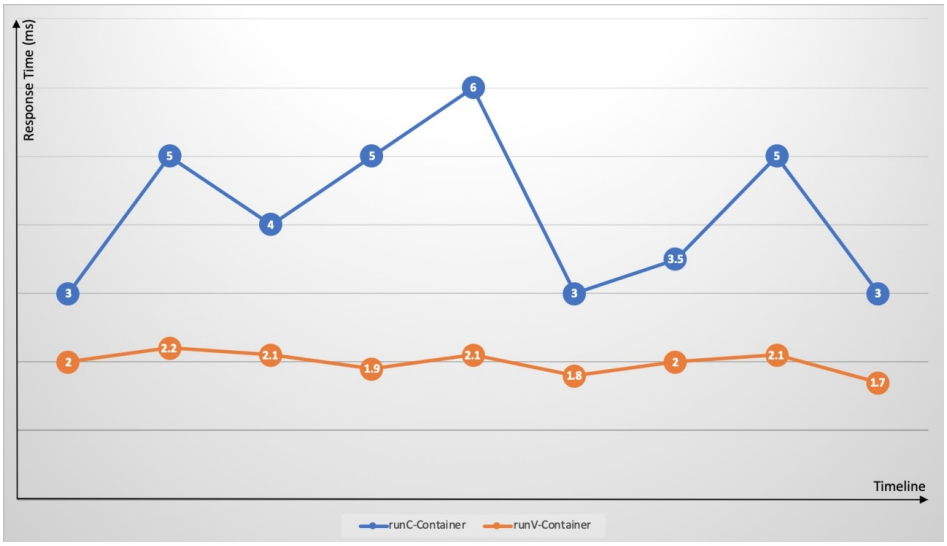
    The preceding measures can enhance the security of containers in runC and reduce attacks on the host kernel by malicious containers. However, container escapes and host kernel vulnerabilities remain unresolved.

- Sandboxed-Container prevents potential risks based on container isolation



In a Sandboxed-Container runtime environment, applications that have potential security risks are deployed on sandboxed and lightweight virtual machines. Each of the virtual machines has a dedicated guest OS kernel. If a security vulnerability is detected on a guest OS kernel, the attack is limited to one sandbox and does not affect the host kernel or other containers. The Terway network plug-in allows you to define networking policies for pods. This enables system isolation, data isolation, and network isolation for Sandboxed-Containers.

- Scenario 2: Sandboxed-Container resolves common issues of runC containers, such as fault spreading, resource contention, and performance interference.

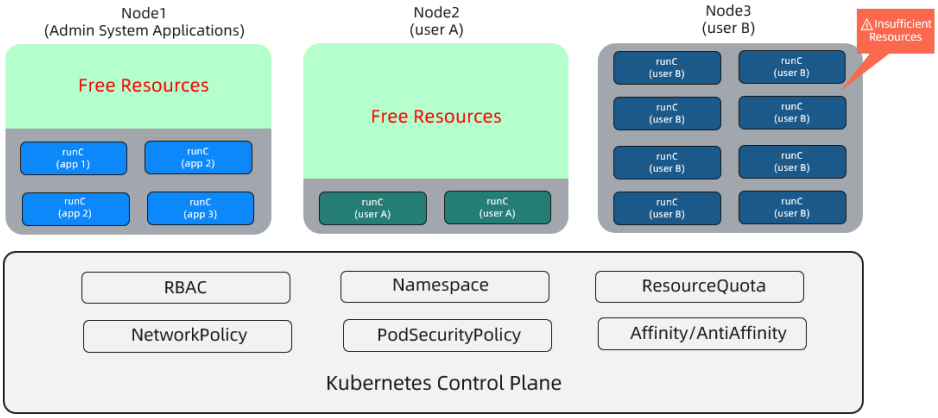


Kubernetes provides easy deployment of different containers on a single node. However, cgroups are not optimized to address resource contention. Resource-intensive applications (such as CPU-intensive, I/O-intensive applications) may compete for the same resources. This causes significant fluctuations in response time and increases the overall response time. Exceptions or faults on an application may spread to the hosting node and disrupt the running of the total cluster. For example, memory leaks and frequent core dumps of an application may overload the node, and exceptions on a container may trigger a host kernel bug that results in complete system failure. Sandboxed-Container addresses the issues that are common with runC containers by using dedicated guest OS kernels and hypervisors. The issues include failure spreading, resource contention, and performance interference.

- Scenario 3: Sandboxed-Container supports multi-tenant services.

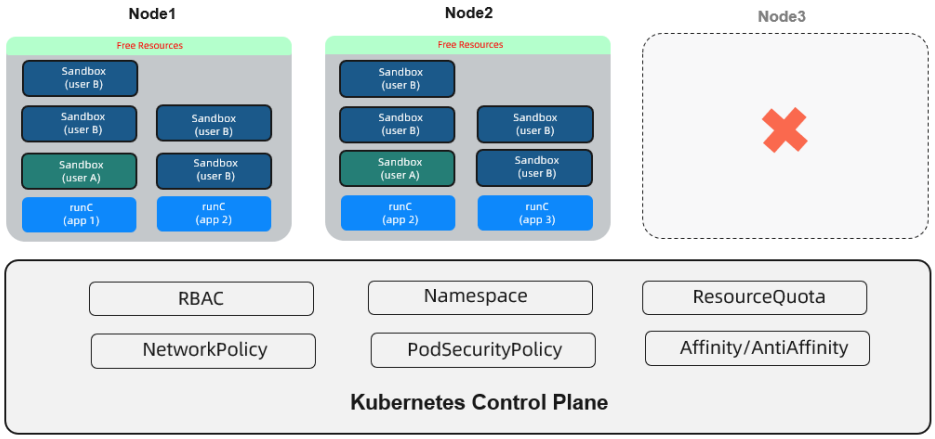
You may need to isolate the applications of an enterprise that consists of multiple business lines or departments. For example, a financial department requires high security applications. However, other non-security-sensitive applications do not have high security requirements. Containers in runC fail to eliminate the potential risks that arise in untrusted applications. In this scenario, you can implement the following counter measures:

- Deploy multiple independent single-tenant clusters. For example, deploy financial business and other non-security-sensitive business in different clusters.
- Deploy a multi-tenant cluster and separate applications of different business lines by namespaces. The resource of a node is exclusive to a single business line. This solution provides data isolation for coordination with the resource quotas and network policies to implement multi-tenant isolation. Compared with multiple single-tenant clusters, this solution focuses on fewer management planes and thus reduces management costs. However, this solution cannot avoid resource waste on nodes. This issue is caused by low resource utilization of some tenants.



Sandboxed-Container allows you to isolate untrusted applications by using sandboxed virtual machines. This prevents the risks of container escapes. This also allows you to deploy different containerized applications on each node. This way, the following benefits are provided:

- Resource scheduling is simplified.
- A node is no longer exclusive to a service. This improves node resource usage and reduces resource fragments and cluster resource costs.
- Sandboxed containers use lightweight virtual machines to provide almost the same performance as containers in runC.



3.6.12.8. Differences between runC and runV

This topic describes the differences between runC and Sandboxed-Container (runV) in terms of their performance and pod creation methods. This allows you to better understand and utilize the benefits of sandboxed containers.

Differences between runC and runV

Item	runC	runV
Container engine	Docker and Containerd	Containerd
Node type	Elastic Compute Service (ECS) instances and ECS Bare Metal instances	EBM
Container kernel	Share the host kernel	Dedicated kernel
Container isolation	Cgroups and namespaces	Lightweight virtual machines (VMs)
Rootfs Graph Driver	OverlayFS	DeviceMapper
RootFS I/O throttling	Cgroups	DeviceMapper Block IO Limit **Note** Supported by only Sandboxed-Container V1.
NAS mounting	Not supported	Supported
Disk mounting	Not supported	Supported
Collection of container logs	Logtail directly collects container logs from the host.	logtail sidecar
Pod Overhead	None	• Sandboxed-Container V1: For example, if you set memory: 512 Mi for a pod overhead, it indicates that 512 MiB of memory is allocated to the pod sandbox. Pod overhead refers to the amount of resources consumed by the pod sandbox. In this case, if you set a memory limit of 512 MiB for containers in the pod, the pod will request a total memory of 1,024 MiB. • Sandboxed-Container V2: The memory limit for a pod overhead is calculated based on the following formula: Memory for a pod overhead = 64 MiB + Requested memory of containers in a pod × 2%. If the result is greater than 512 MiB, the value is set to 512 Mi. If the result is smaller than 64 MiB, the value is set to 64 Mi.

Differences in pod creation between runC and runV

You can connect to clusters of Container Service by using kubectl. For more information, see Connect to a cluster through kubectl.

- Create a pod that uses runC
  i. (Optional)Use `runtimeClassName: runc` to set the container runtime to runC.

  Note The preceding command is optional. runC is the default container runtime.

ii. Run the following commands to create a pod that uses runC:

```
cat <<EOF | kubectl create -f -
apiVersion: v1
kind: Pod
metadata:
 name: busybox-runc
 labels:
  app: busybox-runc
spec:
 containers:
 - name: busybox
  image: registry.cn-hangzhou.aliyuncs.com/acs/busybox:v1.29.2
  command:
  - tail
  - -f
  - /dev/null
  resources:
   limits:
    cpu: 1000m
    memory: 512Mi
   requests:
    cpu: 1000m
    memory: 512Mi
EOF
```

- Create a pod that uses runV
  i. Use `runtimeClassName: runv` to set the container runtime to runV.
  ii. (Optional)Run the following command to verify that a RuntimeClass object named `runv` exists in the cluster.

```
kubectl get runtimeclass runv -o yaml
```

> **Note** A RuntimeClass object named `runv` is automatically created in a Kubernetes cluster that uses Sandboxed-Container.

  iii. Run the following command to create a pod that uses runV:

```
cat <<EOF | kubectl create -f -
apiVersion: v1
kind: Pod
metadata:
 name: busybox-runv
 labels:
  app: busybox-runv
spec:
 runtimeClassName: runv
 nodeSelector:
  alibabacloud.com/container-runtime: Sandboxed-Container.runv
 containers:
 - name: busybox
  image: registry.cn-hangzhou.aliyuncs.com/acs/busybox:v1.29.2
  command:
  - tail
  - -f
  - /dev/null
  resources:
   limits:
    cpu: 1000m
    memory: 512Mi
   requests:
    cpu: 1000m
    memory: 512Mi
EOF
```

Notice If the Kubernetes version is earlier than 1.16, add the following nodeSelector configuration:

```
nodeSelector:
  alibabacloud.com/container-runtime: Sandboxed-Container.runv
```

iv. Run the following command to query the pod that you have created: If the output is `runv`, it indicates that the pod is running in a sandbox.

```
kubectl get pod busybox-runv -o jsonpath={.spec.runtimeClassName}
```

v. Run the following command to log on to the pod and query its CPU and memory specifications:

```
kubectl exec -ti pod busybox-runv /bin/sh
/ # cat /proc/meminfo | head -n1
MemTotal:     1130692 kB
/ # cat /proc/cpuinfo | grep processor
processor   : 0
```

The output shows that the number of CPUs is not the same as that of the host. The total memory is the sum of pod memory and pod overhead. Be aware that the total memory is slightly smaller because the system also consumes some memory.

3.6.12.9. Compatibility notes

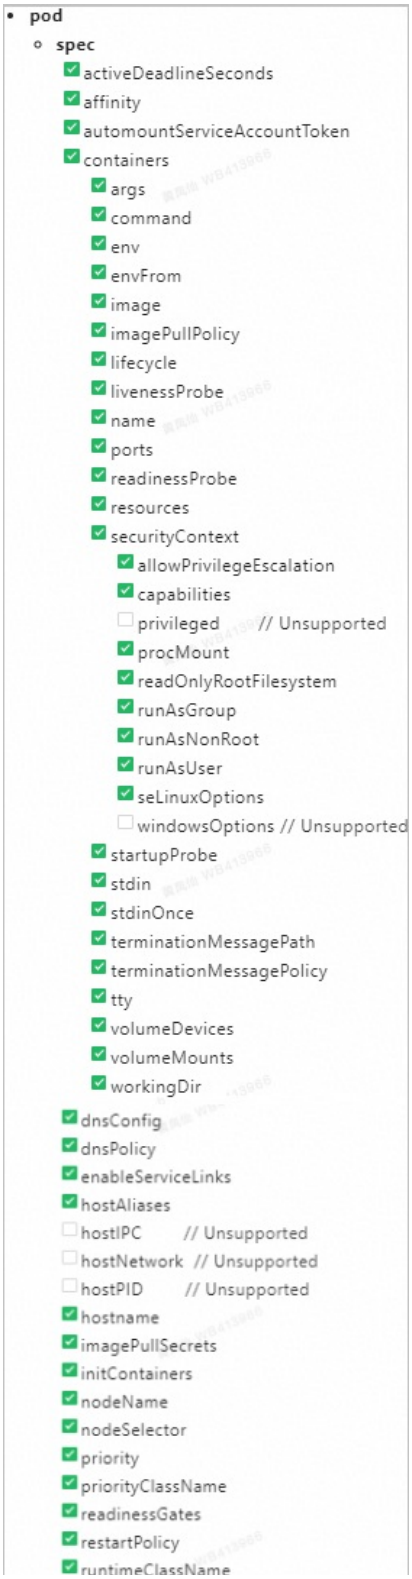
This topic describes the pod fields that are supported by Sandboxed-Container. This allows you to fully use the Sandboxed-Container runtime.

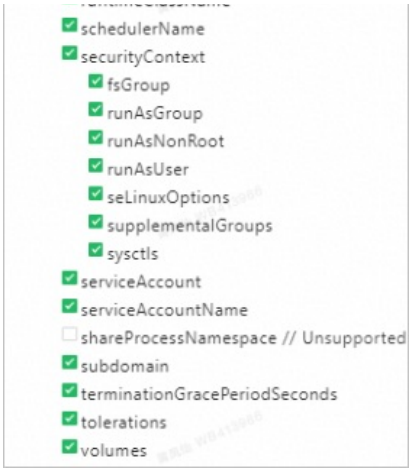
Context

Sandboxed-Container is a new runV container runtime that provides compatibility with runC in terms of pod networking, service networking (ClusterIP and NodePort), and image management. However, Sandboxed-Container does not support all pod fields. To use Sandboxed-Container, you do not need to change your development mode or image packaging method.

Supported pod fields

Sandboxed-Container supports the following pod fields that are marked by ticks:





3.6.13. Use the Kubernetes event center

The event center feature allows you to log Kubernetes events, query events, and configure alerting. This topic describes how to enable and view the Kubernetes event center.

Enable the Kubernetes event center

Enable the Kubernetes event center when a Kubernetes cluster is created

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**. On the page that appears, click **Create Kubernetes Cluster** in the upper-right corner.
3. On the **Create Cluster** page, select **Install node-problem-detector and Create Event Center** in the **Log Service** field. For more information about other parameters, see Create a Kubernetes cluster. Then, click **Create Cluster**.
4. On the **Confirm** dialog box, after all check items are verified, select the terms of service and disclaimer and click **OK** to create the cluster.

Enable the Kubernetes event center in App Catalog

1. Log on to the Container Service console.
2. In the left-side navigation pane, choose **Marketplace > App Catalog**.
3. On the **App Catalog** page, find and click ack-node-problem-detector.
4. On the **App Catalog - ack-node-problem-detector** page, click the **Parameters** tab and set `eventer.sinks.sls.enabled` to `true`.

```
sinks:
  sls:
    enabled: true
    # If you want the monitoring results to be notified by sls, set enabled to true.
    topic: ""
    project:  "k8s-log-cc7640381ac7f4a99971f55a2744a2748"
    # You can view the project information by logging in to the
    # SLS console. Please fill in the name of the project here.
    # eg: your project name is k8s-log-cc18a5f3443dhdss22654da,
    # then you can fill k8s-log-cc18a5f3443dhdss22654da to project label.
    logstore: "k8s-event"
    # You can view the project information by logging in to the
    # SLS console. Please fill the logstore address in here.
```

5. On the **App Catalog - ack-node-problem-detector** page, click the **Description** tab.
6. In the **Deploy** pane, select the cluster and click **Create**.

Access the Kubernetes event center

Access the Kubernetes event center in the Container Service console

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Operations > Event Center**.
5. Access the Kubernetes event center on the Event Center page

   > **Note** If the Event Center page does not appear, check whether the Kubernetes event center is enabled.

   - On the **Event Center** page, click the **Events Overview** tab to go to the overview page of the Kubernetes event center.
   - On the **Event Center** page, click the **Cluster Events Query** tab to customize query conditions.
   - On the **Event Center** page, click the **Pod Events** tab to query events of pods.

Access the Kubernetes event center by using Log Service

1. View the cluster ID.
   i. Log on to the Container Service console.
   ii. In the left-side navigation pane, click **Clusters**.
   iii. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
   iv. Click the **Basic Information** tab to view the cluster ID.
2. Log on to the Log Service console.
3. In the search box of the Projects section, enter and click k8s-log-<CLUSTER_ID>.

   > **Note** Replace the CLUSTER_ID with the cluster ID that you obtained in Step .

4. In the Logstores section, choose **K8s-event > Visual Dashboards > Kubernetes Event Center V1.2**.
5. On the **Kubernetes Event Center V1.2** page, you can view the trends of WARNING events and ERROR events.

3.6.14. Use Log Service to collect log data from containers

Container Service is integrated with Log Service. When you create a cluster, you can enable Log Service to collect log data from containers, including standard outputs (stdout) and text files.

Activate Log Service

To activate Log Service, perform the following steps:

1. Log on to the Apsara Uni-manager Management Console. In the top navigation bar, choose **Products > Log Service** to go to the **Log Service** page.
2. Select the required organization and region.
3. Click **SLS** to go to the Log Service console.

Create a Kubernetes cluster and enable Log Service

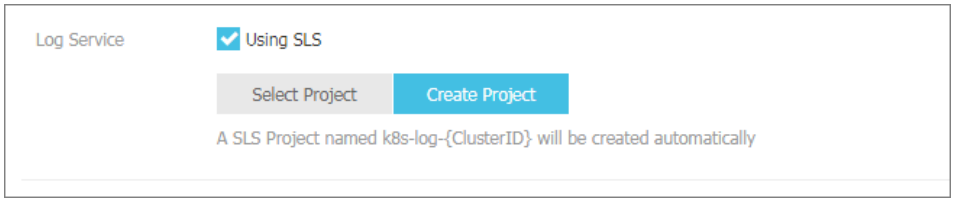
To create a Kubernetes cluster, perform the following steps:

1. Log on to the Container Service console.

> **Note** The specified organization must be the same as the one that you selected when you activated Log Service. For more information, see Activate Log Service.

2. In the left-side navigation pane, click **Clusters**.
3. On the Clusters page, click **Create Kubernetes Cluster**. For more information, see Create a Kubernetes cluster.
4. In the Component Configuration step, select **Enable Log Service** to install the Log Service component.
5. When the Enable Log Service check box is selected, the system prompts you to create a Log Service project. You can only select **Create Project**.

   After you select Create Proiect, the system creates a project. By default, the system names the project in the format of `k8s-log-{ClusterID}`. ClusterID indicates the unique ID of the cluster to be created.



6. Click **Create Cluster** in the upper-right corner of the page.
7. On the **Confirm Order** page, after all check items are verified, select the terms of service and disclaimer and click **OK** to start the deployment.
   On the Clusters page, you can find the created cluster.

Install Log Service components in an existing Kubernetes cluster

If you created a Kubernetes cluster and activated Log Service, you can perform the following steps to use Log Service:

1. Connect to the Kubernetes cluster by using CloudShell.

   For more information, see Connect to a Kubernetes cluster through kubectl.

2. Run the *logtail-dedicated.sh* script to install Log Service components in the Kubernetes cluster.

```
#!/env/bin/bash
yaml=$(cat <<-END

    hostPath:
      path: /var/run/docker.sock
      type: Socket
  - name: root
    hostPath:
      path: /
      type: Directory
  - name: alibaba-log-config-file-volume
    configMap:
      name: alibaba-log-config-file
END
)
echo "$yaml" > logtail.yml
kubectl create -f logtail.yml
```

3. Replace `<your server architecture>`, `<your k8s cluster region_id>`, `<your_k8s_cluster_id>`, `<k8s_cluster_domain_suffix>`, `<your_ali_uid>`, and `<your_image_repo_url>` with actual values, and run the following commands. This allows you to set the environment variables and deploy the components.

```
export ARCH=<your_server_architecture>
export REGION=<your_k8s_cluster_region_id>
export CLUSTER_ID=<your_k8s_cluster_id>
export INTERNET_DOMAIN=<k8s_cluster_domain_suffix>
export IMAGE_REPO_URL=<your_image_repo_url>
export ALI_UID=<your_ali_uid>
bash logtail-dedicated.sh // Run the script to install the components.
```

> **Note**
> - `<your_server_architecture>`: the server architecture, for example, amd64.
> - `<your_k8s_cluster_region_id>`: the region where the Kubernetes cluster is deployed, for example, cn-qingdao-apsara-d01.
> - `<your_k8s_cluster_id>`: the ID of the Kubernetes cluster.
> - `<k8s_cluster_domain_suffix>`: the domain suffix of the Kubernetes cluster, for example, env28.internet.com.
> - `<your_ali_uid>`: the ID of the Apsara Stack tenant account, for example, 1234074238634394.
> - `<your_image_repo_url>`: the URL of the image repository, for example, registry.cn-hangzhou.aliyuncs.com.

Create an application and configure Log Service

When you create an application in Container Service, you can configure Log Service to collect log data from containers. You can only use YAML templates to configure Log Service.

1. Log on to the Container Service console. In the left-side navigation pane, choose **Applications > Deployments**. In the upper-right corner of the Deployments page, click **Create from Template**.
2. YAML templates follow the Kubernetes syntax. You can use environment variables to add **collection configurations** and **custom tags**. You must also configure volumeMounts and volumes. The following is an example of a pod for collecting log data:

```
apiVersion: extensions/v1beta1
kind: Deployment
metadata:
 labels:
  app: logtail-test
 name: logtail-test
spec:
 replicas: 1
 template:
  metadata:
   labels:
    app: logtail-test
   name: logtail-test
  spec:
   containers:
   - name: logtail
    image: registry.acs.env28.intranet.com/acs/busybox:latest
    args:
    - ping
    - 127.0.0.1
    env:
    - name: aliyun_logs_log-stdout
     value: stdout
    - name: aliyun_logs_log-varlog
     value: /log/*.log
    - name: aliyun_logs_log_tags
     value: tag1=v1
    volumeMounts:
    - name: volumn-sls
     mountPath: /log
   volumes:
   - name: volumn-sls
    emptyDir: {}
```

- Specify the following configurations in order based on your business requirements:
- Use environment variables to add **collection configurations** and **custom tags**. All environment variables for collection configurations must use the `aliyun_logs_` prefix.
- Add log collection configurations in the following format:

  ```
  - name: aliyun_logs_{Logstore name}
   value: {Log file path}
  ```

  In the preceding YAML template, two environment variables are added to the log collection configuration. Environment variable `aliyun_logs_log-stdout` indicates that a Logstore named log-stdout is created to store the standard outputs collected from containers.

  > **Note** The name of the Logstore cannot contain underscores (_). You can use hyphens (-) instead.

- **Custom tags** must be specified in the following format:

  ```
  - name: aliyun_logs_{Tag name without underscores (_)}_tags
   value: {Tag name }={Tag value}
  ```

  After a tag is added, the tag is automatically appended to the log files that are collected from the container.
- If you specify a log path to collect log files that are not standard outputs, you must configure volumeMounts.

In the preceding YAML template, the mountPath field in volumeMounts is set to */var/log*. This allows the Log Service component to collect */var/log/*.log* files.

3. After you modify the YAML template, click **Create** to submit the configurations.

Configure advanced parameters in the env field

You can specify multiple parameters in the env field to configure log collection. The following table describes the parameters.

Parameter	Description	Example	Precaution
aliyun_logs_{key}	• Required.{key} can contain only lowercase letters, digits, and hyphens (-), and cannot contain underscores (_). • If the specified aliyun_logs_{key}_logstore does not exist, a Logstore named {key} is created. • To collect standard outputs of container log files, set the value to stdout. You can also set the value to a path inside a container.	- name: aliyun_logs_catalina stdout - name: aliyun_logs_access-log /var/log/nginx/access.log	• By default, the Log Service component collects log files in simple mode. In this case, the collected log files are not parsed. If you want to parse the log files, we recommend that you change the collection mode in the Log Service console. • The value of {key} must be unique in the cluster.
aliyun_logs_{key}_tags	Optional. This parameter is used to add tags to log data. The value must be in the following format: {tag-key}={tag-value}.	- name: aliyun_logs_catalina_tags app=catalina	-
aliyun_logs_{key}_project	Optional. This parameter specifies a project in Log Service. By default, the project that you specified when you create the cluster is used.	- name: aliyun_logs_catalina_project my-k8s-project	The region of the project must be the same as where your logtail-ds is deployed.
aliyun_logs_{key}_logstore	Optional. This variable specifies a Logstore in Log Service. By default, the Logstore is named after {key}.	- name: aliyun_logs_catalina_tags my-logstore	-
aliyun_logs_{key}_shard	Optional. This variable specifies the number of shards in the Logstore. Valid values: 1 to 10. Default value: 2.	- name: aliyun_logs_catalina_shard 4	-

Parameter	Description	Example	Precaution
aliyun_logs_{key}_ttl	Optional. This parameter specifies the number of days for which log data is retained. Valid values: 1 to 3650. • To permanently retain log data, set the value to 3650. • Default value: 90.	- name: aliyun_logs_catalina_ttl 3650	-
aliyun_logs_{key}_machinegroup	Optional. This parameter specifies the machine group of the application. By default, the machine group is the one where your logtail-ds is deployed.	- name: aliyun_logs_catalina_machinegroup my-machine-group	-

- Scenario 1: Collect log files from multiple applications and store them in the same Logstore

  In this scenario, set the aliyun_logs_{key}_logstore parameter. The following example shows how to collect standard outputs from two applications and store the outputs in stdout-logstore.

  Configure the following environment variables for Application 1:

  ```
  ######### Configure environment variables ###########
    - name: aliyun_logs_app1-stdout
      value: stdout
    - name: aliyun_logs_app1-stdout_logstore
      value: stdout-logstore
  ```

  Configure the following environment variables for Application 2:

  ```
  ######### Configure environment variables ###########
    - name: aliyun_logs_app2-stdout
      value: stdout
    - name: aliyun_logs_app2-stdout_logstore
      value: stdout-logstore
  ```

- Scenario 2: Collect log files from different applications and store them in different projects

  In this scenario, perform the following steps:

  i. Create a machine group in each project and set the machine group ID in the following format: k8s-group-{cluster-id}, where {cluster-id} is the ID of the cluster. You can customize the machine group name.

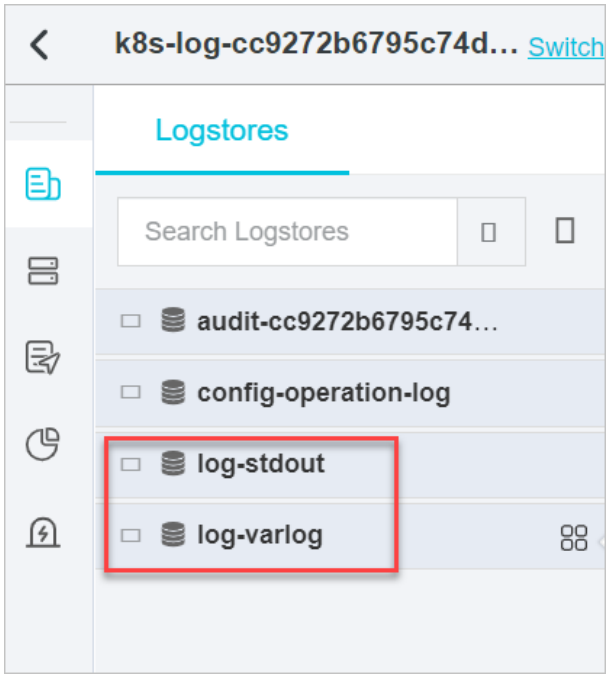
  ii. Specify the project, Logstore, and machine group in the environment variables for each application.

  ```
  ######### Configure environment variables ###########
    - name: aliyun_logs_app1-stdout
      value: stdout
    - name: aliyun_logs_app1-stdout_project
      value: app1-project
    - name: aliyun_logs_app1-stdout_logstore
      value: app1-logstore
    - name: aliyun_logs_app1-stdout_machinegroup
      value: app1-machine-group
  ```

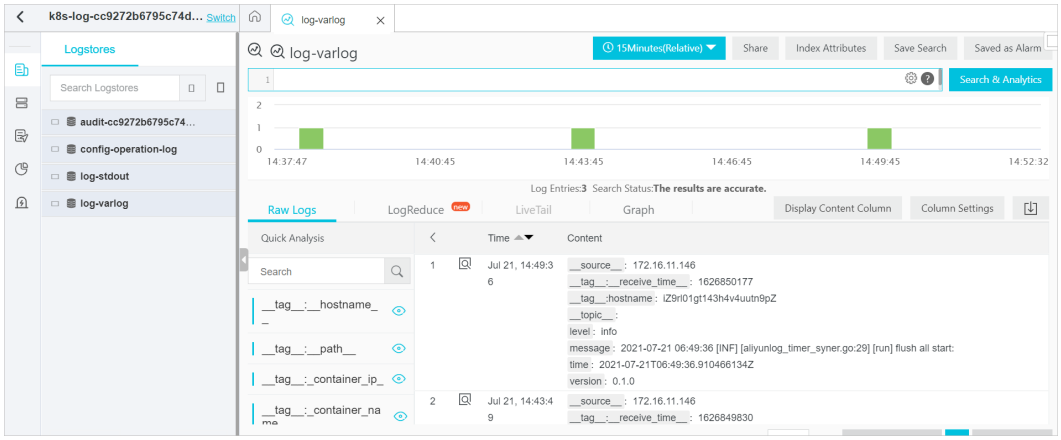
View log data

Perform the following steps to view log data:

1. Log on to the Log Service console. For more information, see Activate Log Service.
2. Select the project that is associated with the Kubernetes cluster to go to the Logstores tab. By default, the project name is in the format of k8s-log-{Kubernetes cluster ID}.
3. In the list of Logstores, find the Logstores and click **Search** in the Log Search column for each Logstore. In this example, the Logstores are log-stdout and log-varlog.



4. On the Raw Logs tab, you can view raw log data in log-stdout and log-varlog.



4.Auto Scaling (ESS)

4.1. What is Auto Scaling?

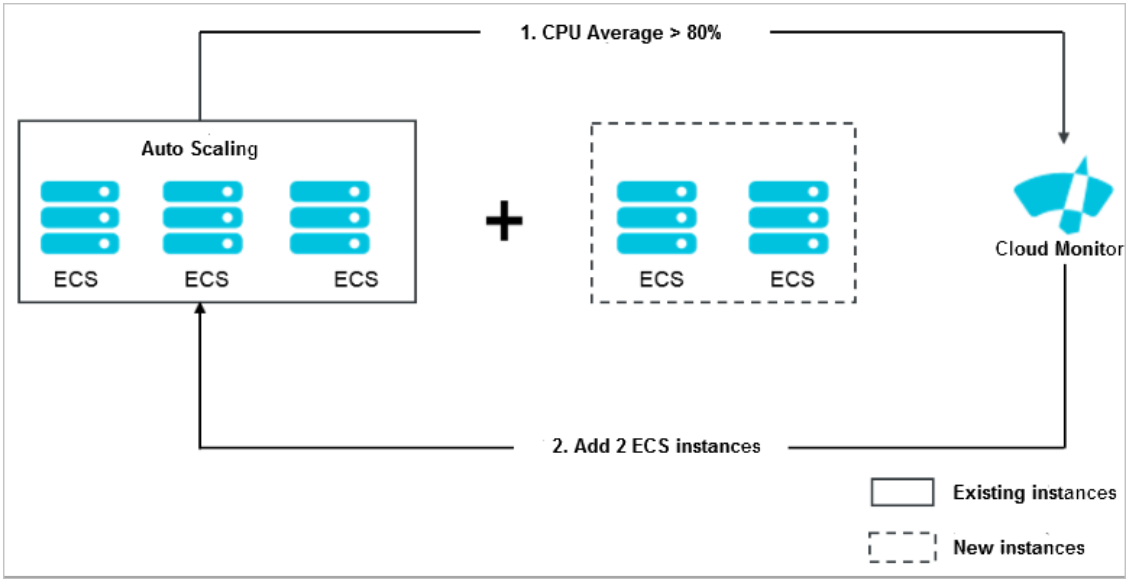
Auto Scaling is a management service that automatically adjusts your elastic computing resources based on your business needs and policies.

When business loads increase, Auto Scaling automatically adds ECS instances based on user-defined scaling rules to ensure sufficient computing capabilities. When business loads decrease, Auto Scaling automatically removes ECS instances to save costs.

Auto Scaling provides the following features:

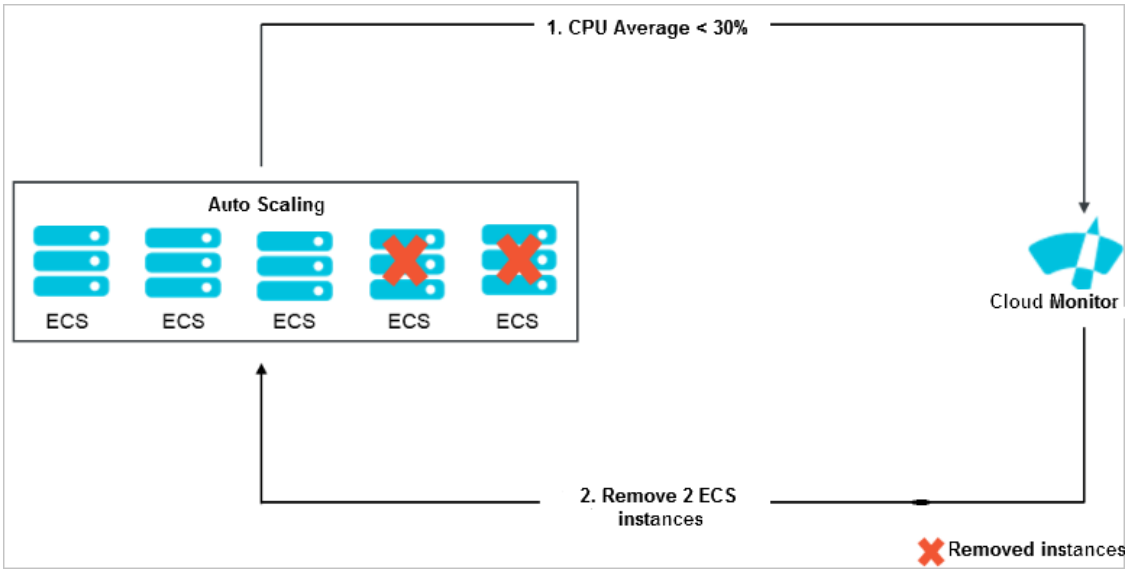
- Scale-out

  When business loads surge above normal loads, Auto Scaling automatically increases underlying resources. This helps maintain access speed and ensures that resources are not overloaded. For example, if the CPU utilization of ECS instances exceeds 80%, Auto Scaling scales out ECS resources based on your configured rules. During the scale-out event, Auto Scaling automatically creates and adds ECS instances to a scaling group, and adds the new instances to the backend server groups of the associated SLB instances and the whitelists of the associated ApsaraDB RDS instances. The following figure shows the implementation of a scale-out event.



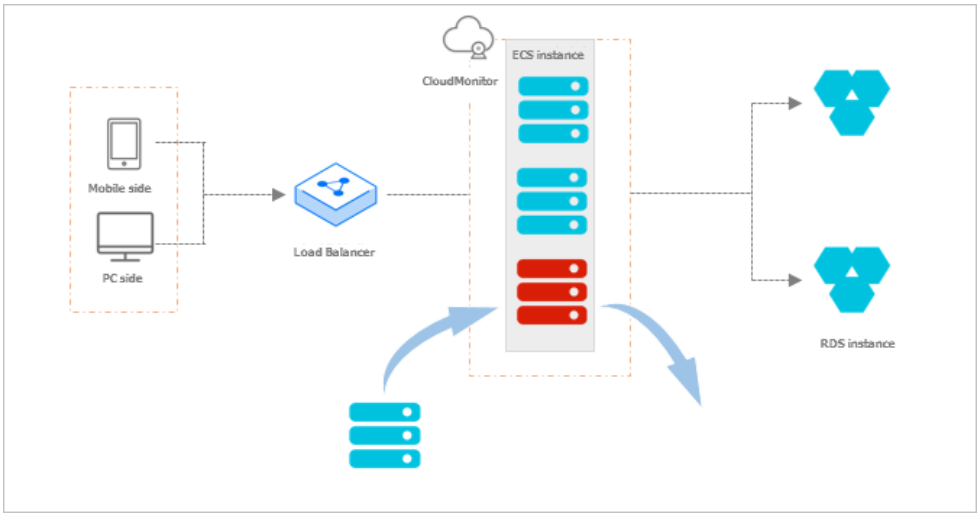
- Scale-in

  When your business loads decrease, Auto Scaling automatically releases underlying resources to prevent resource wastage and reduce costs. For example, if the CPU utilization of ECS instances in a scaling group is less than 30%, Auto Scaling automatically scales in ECS instances based on your configured rules. During the scale-in event, Auto Scaling removes ECS instances from the scaling group and also from the backend server groups of the associated SLB instances as well as the whitelists of the associated ApsaraDB RDS instances. The following figure shows the implementation of a scale-in event.



- Elastic recovery

  If ECS instances in a scaling group are not in the Running state, Auto Scaling considers the instances to be unhealthy. If an ECS instance is considered unhealthy, Auto Scaling automatically releases the instance and creates a new one. This process is called elastic recovery. It ensures that the number of healthy ECS instances in a scaling group does not fall below the minimum number of ECS instances that you specified for the scaling group. The following figure shows the implementation of elastic recovery.



4.2. Notes

4.2.1. Precautions

This topic describes the precautions when you use Auto Scaling (ESS).

Scaling rules

ESS uses scaling rules to scale ECS instances in a scaling group based on the minimum and maximum numbers of ECS instances specified for the scaling group. Assume that a scaling group can contain up to 45 ECS instances. If you configure a scaling rule to increase the number of ECS instances in the scaling group to 50, ESS only increases the number of ECS instances to 45 at most.

Scaling activities

- Only one scaling activity can be executed at a time in a scaling group.
- An ongoing scaling activity cannot be terminated. For example, if a scaling activity is being executed to create 20 ECS instances but only five have been created, you cannot forcibly terminate the scaling activity.
- If some ECS instances fail to be added to a scaling group during a scaling activity, ESS considers that the scaling activity is complete without trying to add the failed instances to the scaling group. ESS rolls back the ECS instances that fails to be added but not the scaling activity. For example, if ESS has created 20 ECS instances for a scaling group, and 19 of the instances are added to SLB instances, only the one ECS instance that failed to be added is automatically released.

Cooldown period

- During the cooldown period, if you manually execute a scaling task, such as a scaling rule or scheduled task, the task is immediately executed without waiting for the cooldown period to expire.
- The cooldown period starts after the last ECS instance is added to or removed from a scaling group during a scaling activity.

4.2.2. Manual intervention

If you manually intervene with Auto Scaling operations, Auto Scaling processes the intervention accordingly.

Auto Scaling does not prevent you from performing manual intervention, such as deleting automatically created ECS instances in the ECS console. The following table describes how Auto Scaling processes manual intervention.

Resource	Manual intervention type	Processing method
ECS	A user deletes an ECS instance from a scaling group by using the ECS console or calling API operations.	Auto Scaling performs health checks to determine whether the ECS instance is unhealthy. If the instance is unhealthy, Auto Scaling removes it from the scaling group. The internal IP address of the ECS instance is not automatically deleted from the whitelist of the associated ApsaraDB RDS (RDS) instance. If the total number of ECS instances in the scaling group falls below the lower limit after the ECS instance is removed, the scaling group automatically creates an ECS instance to ensure that the number of instances reaches the lower limit.
ECS	A user revokes the ECS API permissions granted to Auto Scaling.	Auto Scaling rejects all scaling activity requests.
SLB	A user manually removes an ECS instance from an SLB instance by using the SLB console or calling API operations.	Auto Scaling does not automatically detect this action or handle such exceptions. The ECS instance remains in the scaling group. When a scale-in event is triggered, Auto Scaling releases the ECS instance if the instance meets the removal policy.
SLB	A user manually deletes an SLB instance or disables the health check feature for an SLB instance by using the SLB console or calling API operations.	Auto Scaling does not add ECS instances to scaling groups that are associated with this SLB instance. Auto Scaling removes ECS instances from the scaling groups if a scaling task triggers a scale-in rule or the ECS instances are recognized as unhealthy after a health check is performed.
SLB	An SLB instance is unavailable because of system-related reasons.	All scaling activities fail except for instance removal tasks that are manually executed.
SLB	A user revokes the SLB API permissions granted to Auto Scaling.	Auto Scaling rejects all scaling activity requests for scaling groups with which SLB instances are associated.

Resource	Manual intervention type	Processing method
RDS	A user manually removes the IP address of an ECS instance from the whitelist of the associated RDS instance by using the RDS console or calling API operations.	Auto Scaling does not automatically detect this action or handle such exceptions. The ECS instance remains in the scaling group. When a scale-in event is triggered, Auto Scaling releases the ECS instance if the instance meets the removal policy.
RDS	A user manually deletes an RDS instance by using the RDS console or calling API operations.	Auto Scaling does not add ECS instances that are associated with this RDS instance to scaling groups. Auto Scaling removes ECS instances from the scaling groups if a scaling task triggers a scale-in rule or the ECS instances are recognized as unhealthy after a health check is performed.
RDS	An RDS instance is unavailable because of system-related reasons.	All scaling activities fail except for instance removal tasks that are manually executed.
RDS	A user revokes the RDS API permissions granted to Auto Scaling.	Auto Scaling rejects all scaling activity requests for the scaling groups associated with RDS instances.

4.2.3. Limits

This topic describes the limits of ESS.

- ESS does not support vertical scaling. It can only scale the number of ECS instances. The CPU, memory, and bandwidth configurations of ECS instances cannot be automatically adjusted.
- The following table describes the quantity limits that are applied to a scaling group.

Item	Quota
Scaling configuration	You can create a maximum of 10 scaling configurations for a scaling group.
Scaling rule	You can create a maximum of 50 scaling rules for a scaling group.
ECS instance	A scaling group can contain a maximum of 1,000 ECS instances.

4.2.4. Scaling group status

This topic describes the states of a scaling group in the console and in an API operation.

State in the console	State in an API operation
Creating	Inactive
Created	Inactive
Enabling	Inactive
Enabled	Active
Disabling	Inactive
Disabled	Inactive
Deleting	Deleting

4.2.5. Scaling processes

Before you use Auto Scaling, you must understand the processes related to scaling activities.

Automatic scaling of a scaling group

- Automatic scale-out
  i. Check the health status and boundary conditions of the scaling group.
  ii. Assign the activity ID and execute the scaling activity.
  iii. Create ECS instances.
  iv. Modify Total Capacity.
  v. Assign IP addresses to the created ECS instances.
  vi. Add the ECS instances to the whitelist of the associated ApsaraDB RDS instance.
  vii. Start the ECS instances.
  viii. Associate the ECS instances with an SLB instance and set the weight to the SLB weight value that is specified when the scaling configuration is created.
  ix. The cooldown period starts after the scaling activity is complete.
- Automatic scale-in
  i. Check the health status and boundary conditions of the scaling group.
  ii. Assign the activity ID and execute the scaling activity.
  iii. Remove ECS instances from the associated SLB instance.
  iv. Stop the ECS instances.
  v. Remove the ECS instances from the whitelist of the associated ApsaraDB RDS instance.
  vi. Release the ECS instances.
  vii. Modify Total Capacity.
  viii. The cooldown period starts after the scaling activity is complete.

Manually add or remove existing ECS instances

- Manually add instances
  i. Check the health status and boundary conditions of the scaling group, and check the status and type of ECS instances.
  ii. Assign the activity ID and execute the scaling activity.
  iii. Add the ECS instances.
  iv. Modify Total Capacity.
  v. Add the ECS instances to the whitelist of the associated ApsaraDB RDS instance.
  vi. Associate the ECS instances with an SLB instance and set the weight to the SLB weight value that is specified in the active scaling configuration.

    > **Note** If you want to manually add an instance to a scaling group, the instance type of the instance must be the same as that specified in the active scaling configuration of the scaling group. Therefore, you must set the weight to the SLB weight value that is specified in the active scaling configuration.

  vii. The cooldown period starts after the scaling activity is complete.
- Manually remove instances
  i. Check the health status and boundary conditions of the scaling group.

ii. Assign the activity ID and execute the scaling activity.
iii. SLB stops forwarding traffic to ECS instances.
iv. Remove the ECS instances from SLB after 60 seconds.
v. Remove the ECS instances from the whitelist of the associated ApsaraDB RDS instance.
vi. Modify Total Capacity.
vii. Remove the ECS instances from the scaling group.
viii. After the scaling activity is complete, the cooldown period starts.

4.2.6. Remove unhealthy ECS instances

Before you use ESS, you must understand information about the removal of unhealthy ECS instances.

After an ECS instance is added to a scaling group, ESS checks the status of the instance on a regular basis. If the ECS instance is not in the Running state, ESS removes the ECS instance from the scaling group. The removal method depends on how the ECS instance is added:

- If an ECS instance is automatically created, ESS immediately removes and releases it.
- If an ECS instance is manually added, ESS immediately removes it, but does not stop or release it.

The removal of unhealthy ECS instances is not limited by the MinSize value. After the unhealthy ECS instances are removed, the number of ECS instances (Total Capacity) may fall below the MinSize value. In this case, ESS automatically creates ECS instances based on the difference between the actual instance number and MinSize value to ensure that the total number of ECS instances is equal to the MinSize value.

4.2.7. Instance rollback after a failed scaling activity

Before you use ESS, you must understand the mechanism of instance rollback after a failed scaling activity.

If some ECS instances fail to be added to a scaling group during a scaling activity, ESS considers that the scaling activity is complete without trying to add the failed instances to the scaling group. ESS rolls back ECS instances, not the scaling activity.

For example, if a scaling group has created 20 ECS instances, and 19 of the instances are added to SLB instances, only the one ECS instance that failed to be added is automatically released.

4.2.8. Instance lifecycle management

Before you use Auto Scaling (ESS), you must understand concepts related to the instance lifecycle.

Automatically created ECS instances

ECS instances are automatically created by ESS based on user-defined scaling configurations and rules.

ESS manages the entire lifecycle of automatically created ECS instances. ESS creates ECS instances during scale-out events, and stops and releases them during scale-in events.

Manually added ECS instances

ECS instances are manually added to a scaling group.

ESS does not manage the entire lifecycle of manually added ECS instances. These instances are not automatically created by ESS, but are manually added by a user to a scaling group. If the ECS instances are manually or automatically removed from the scaling group, ESS removes the instances but does not stop or release them.

Instance status

An ECS instance in a scaling group goes through the following states during its lifecycle:

- Pending: The ECS instance is being added to the scaling group. The instance is being created, added to an SLB instance, or added to the whitelist of the associated ApsaraDB RDS instance.

- InService: The ECS instance is added to the scaling group and is providing services normally.
- Removing: The ECS instance is being removed from the scaling group.

Instance health status

An ECS instance in a scaling group has the following health states:

- Healthy
- Unhealthy

If an ECS instance is not in the Running state, ESS considers the instance to be unhealthy and automatically removes it from the scaling group.

- ESS stops and releases automatically created ECS instances.
- ESS does not stop or release manually added ECS instances.

4.3. Quick start

4.3.1. Overview

This topic describes how to create a scaling group and how to add or remove ECS instances.

You can perform the following steps to create a scaling group, and add or remove ECS instances.

1. Create a scaling group

   Set the parameters for the scaling group, such as the Maximum Capacity and Minimum Capacity of ECS instances.

2. Create a scaling configuration

   Set the parameters for the scaling configuration, such as Instance Type and Image.

3. Enable a scaling group

   Enable the scaling group after creating the scaling configuration.

4. Create a scaling rule

   Specify how to add or remove ECS instances. For example, add an ECS instance to a scaling group.

5. Create a scheduled task

   Create scheduled tasks to add or remove instances at a specified time point. Auto Scaling executes the scheduled tasks and scaling rules at the specified time. For example, Auto Scaling can trigger a task to execute a specific scaling rule at 08:00 everyday.

4.3.2. Log on to the Auto Scaling console

This topic describes how to log on to the Auto Scaling console.

Prerequisites

- The URL of the Apsara Uni-manager Management Console is obtained from the deployment personnel before you log on to the Apsara Uni-manager Management Console.
- A browser is available. We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL of the Apsara Uni-manager Management Console. Press the Enter key.
2. Enter your username and password.

   Obtain the username and password that you can use to log on to the console from the operations administrator.

> **Note** When you log on to the Apsara Uni-manager Management Console for the first time, you must change the password of your username. Your password must meet complexity requirements. The password must be 8 to 20 characters in length and must contain at least two of the following character types:
>
> - Uppercase or lowercase letters
> - Digits
> - Special characters, which include ! @ # $ %

3. Click **Login**.
4. In the top navigation bar, choose **Products > Elastic Computing > Auto Scaling**.

4.3.3. Create a scaling group

This topic describes how to create a scaling group. A scaling group is a group of Elastic Compute Service (ECS) instances that is dynamically scaled based on the configured scenario. You can specify the minimum and maximum numbers of ECS instances in a scaling group.

Prerequisites

- A virtual private cloud (VPC) and a vSwitch are created. For more information, see Create a VPC and Create a vSwitch in *VPC User Guide*.
- To associate a scaling group with Server Load Balancer (SLB) instances, make sure that the following requirements are met:
  - You have one or more SLB instances in the **Running** state.
  - The SLB instances and the scaling group are in the same organization, resource set, and region.
- To associate a scaling group with ApsaraDB RDS instances, make sure that the following requirements are met:
  - You have one or more RDS instances in the **Running** state.
  - The RDS instances and the scaling group are in the same organization, resource set, and region.

Procedure

1. Log on to the Auto Scaling console.
2. In the left-side navigation pane, click **Scaling groups**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. In the upper-right corner of the Scaling Groups page, click **Create Scaling Group**.
5. Configure parameters for the scaling group.

Parameter	Required	Description
Scaling Group	Yes	The name of the scaling group. It must be 2 to 64 characters in length, and can contain letters, digits, underscores (_), hyphens (-), and periods (.). It must start with a letter or a digit.
Organization/Resource Group	Yes	The organization and resource set in which to create the scaling group.
Maximum Capacity	Yes	The maximum number of instances that the scaling group can contain. Set the value based on your business requirements to control costs. Valid values: 0 to 1000.

Parameter	Required	Description
Minimum Capacity	Yes	The minimum number of instances that a scaling group must contain. Set the value based on your business requirements to ensure service availability. When the scaling group is enabled, Auto Scaling automatically creates this number of ECS instances. Valid values: 0 to 1000.
Cooldown (Seconds)	Yes	The period of time after each scaling activity is complete. During the cooldown time, Auto Scaling rejects all scaling activity requests triggered by event-triggered tasks from CloudMonitor. However, scaling activities triggered by other types of tasks such as manually triggered tasks and scheduled tasks are not limited by the cooldown time and are immediately executed. The value must be an integer that is greater than or equal to zero. Unit: seconds.
Scale-In Policy	No	The policy for automatically removing ECS instances from the scaling group. This parameter contains the **Select** and **From the list, select** fields. You cannot specify the same values for the two fields. Valid values: ○ **Earliest Instance Created Using Scaling Configuration**: filters instances that were created based on the earliest scaling configuration. ○ **Earliest Created Instance**: filters instances that were added to the scaling group at the earliest point in time. ○ **Newest Instances**: filters instances that were most recently added to the scaling group. ○ **None**: is available only for **From the list, select**. This value indicates that Auto Scaling does not filter instances based on the From the list, select field. For example, if Auto Scaling filters instances based on the **Earliest Created Instance** value of Select, you can select one of the following values for From the list, select: ○ **None**: indicates that Auto Scaling does not filter instances based on the From the list, select field. ○ **Newest Instances**: filters instances obtained based on the Select field and then filters instances that were most recently added to the scaling group.
Region/VPC	Yes	The region and VPC in which to create the scaling group.
Vswitch	Yes	The ID of the vSwitch with which to associate the scaling group.

Parameter	Required	Description
Associate SLB Instance	No	After you associate SLB instances with the scaling group, ECS instances that are added to the scaling group are automatically added as SLB backend servers. You can specify a server group to which to add the ECS instances. ECS instances can be added to the following types of server groups: ◦ Default server group: the group of ECS instances that are used to receive requests. If the listener is not configured with a vServer group or a primary/secondary server group, requests are forwarded to the ECS instances in the default server group. ◦ vServer group: If you want to distribute different requests to different backend servers or configure domain name- or URL-based routing methods, you can use vServer groups.
Associate RDS Instance	No	After you associate RDS instances with the scaling group, the internal IP addresses of ECS instances that are added to the scaling group are automatically added to the whitelists of the RDS instances to allow communication over the internal network.

6. Click **OK**.

Result

The created scaling group is displayed in the scaling group list but is in the **Disabled** state. To enable the scaling group, you must create a scaling configuration. For more information, see Create a scaling configuration.

4.3.4. Create a scaling configuration

This topic describes how to create a scaling configuration for a scaling group.

Prerequisites

At least one security group is available. If you do not have any security groups, create a security group. For more information, see Create a security group *in ECS User Guide.*

Context

You can create only a limited number of scaling configurations for a scaling group. For more information, see the Limits topic in *Auto Scaling Product Introduction.*

Procedure

1. Log on to the Auto Scaling console.
2. In the top navigation bar, select an organization, a resource set, and a region.
3. Find the target scaling group and click the name of the scaling group in the **Scaling Group Name/ID** column.
4. In the left-side navigation pane, click **Scaling Configuration**.
5. Choose **Create > Create Scaling Configuration**.
6. Configure parameters for the scaling configuration.

Section	Parameter	Required	Description

Section	Parameter	Required	Description
Region	Region	Yes	The region where the ECS instance is located.
	Zone	Yes	The zone where the ECS instance is located.
Security Group	Security Group	Yes	The security group to which the ECS instance belongs.
Instance	Instance Family	Yes	The instance family to which the ECS instance belongs.
	Instance Type	Yes	The instance type of the ECS instance.
Image	Image Type	Yes	◦ **Public Image**: Public images provided by Alibaba Cloud are fully licensed to offer a secure and stable operating environment for applications on ECS instances. ◦ **Custom Image**: You can create custom images to install software or deploy projects that have special requirements.
Storage	System Disk	Yes	Specify the category and size of the system disk. The operating system is installed on the system disk. You can select **Ultra Disk** or **Standard SSD**.
	Data Disk	No	Specify the category and size of the data disk. You can select **Ultra Disk** or **Standard SSD**. You can add a maximum of 16 data disks. The maximum capacity of each data disk is 32 TiB. You can set **Release with Instance** and **Encrypt** for each data disk.
	Set Password	Yes	Select when to set password. You can select **Now** or **Later**. If you select Later, you can use the Change Password feature in the console to set the password. For more information, see the Change Password topic in *ECS User Guide.*

Section	Parameter	Required	Description
Password	Logon Password	No	The password used to log on to the ECS instance. The password must be 8 to 30 characters in length and must contain at least three of the following character types: digits, uppercase letters, lowercase letters, and special characters. **Note** The password is used to log on to the operating system and is not the VNC password.
	Confirm Password	No	Enter the password again.
Deployment Set	Deployment Set	No	The deployment set to which the instance belongs.
Instance Name	Configuration Name	No	The name of the scaling configuration.
	Instance Name	No	The name of the ECS instance.
User Data	User Data	No	Windows supports two formats: Bat and Powershell. Before you perform Base64 encoding, make sure to include `[bat]` or `[powershell]` as the first line. You can run shell scripts for Linux ECS instances.
Quantity	Quantity	No	The number of instances to purchase.

7. Click **Submit**.

Result

After the scaling configuration is created, it is in the **Disabled** state and is displayed in your scaling configuration list. To automatically create ECS instances, you must apply a scaling configuration. For more information, see Apply a scaling configuration.

4.3.5. Enable a scaling group

This topic describes how to enable a scaling group. You can enable a scaling group to trigger scaling activities.

Prerequisites

- The scaling group is in the **Disabled** state.
- The scaling group has a scaling configuration that is in the **Enable** state.

Procedure

1. Log on to the Auto Scaling console.
2. In the top navigation bar, select an organization, a resource set, and a region.

3. Find the scaling group that you want to enable and click **Enable** in the **Actions** column.
4. In the message that appears, click **OK**.

Result

The status of the scaling group is changed from **Disabled** to **Enable** in the **Status** column.

4.3.6. Create a scaling rule

This topic describes how to create a scaling rule. You can create scaling rules to add or remove ECS instances. For example, you can add an ECS instance to a scaling group.

Context

- You can create only a limited number of scaling rules for a scaling group. For more information, see the Limits topic in *Auto Scaling Product Introduction*.
- After a scaling rule is executed, the resulting number of ECS instances in the scaling group may fall outside of the specified range. In this case, Auto Scaling automatically adjusts the number of ECS instances to ensure that the number of ECS instances in the scaling group is within the specified range.

Procedure

1. Log on to the Auto Scaling console.
2. In the top navigation bar, select an organization, a resource set, and a region.
3. Find the target scaling group and click the name of the scaling group in the **Scaling Group Name/ID** column.
4. In the left-side navigation pane, click **Scaling Rules**.
5. Click **Create Scaling Rule**.
6. Configure parameters for the scaling rule.

Parameter	Required	Description
Rule Name	Yes	The name of the scaling rule. It must be 2 to 64 characters in length and can contain letters, digits, underscores (_), hyphens (-), and periods (.). It must start with a letter or digit.
Scaling Activity	Yes	The operation that is performed when the scaling rule is triggered. The operations include: ○ **Change to N instances**: After the scaling rule is executed, the number of instances in the scaling group is changed to N. ○ **Add N instances**: After the scaling rule is executed, N instances are added to the scaling group. ○ **Remove N instances**: After the scaling rule is executed, N instances are removed from the scaling group.
Default Cooldown (Seconds)	No	The cooldown period. If this parameter is not specified, the default value is used.

7. Click **OK**.

4.3.7. Create a scheduled task

This topic describes how to create a scheduled task to scale computing resources in response to predictable business changes in the future. Scheduled tasks enable the system to automatically obtain sufficient computing resources before business peaks and release idle computing resources after the business peaks.

Context

A scheduled task is preconfigured to execute the specified scaling rule at the specified time. When the specified time arrives, the scheduled task automatically scales computing resources. This allows you to reduce costs and meet business requirements. You can also specify recurring schedules for scheduled tasks if business changes are regular.

If multiple scheduled tasks need to be executed in 1 minute, Auto Scaling executes the most recently created scheduled task.

Procedure

1. Log on to the Auto Scaling console.
2. In the left-side navigation pane, choose **Event-driven Tasks > Timed tasks**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. In the upper-right corner of the Scheduled Tasks page, click **Create Scheduled Task**.
5. In the dialog box that appears, configure parameters for the scheduled task.

Parameter	Required	Description
Task Name	Yes	The name of the scheduled task. The name must be 2 to 64 characters in length and can contain letters, digits, underscores (_), hyphens (-), and periods (.). It must start with a letter or a digit.
Description	Yes	The description of the scheduled task.
Organization/Resource Group	Yes	The organization and resource set in which to create the scheduled task.
Start Time	Yes	The time to execute the scheduled task.
Scaling Rules	Yes	The scaling group to be monitored and the scaling rule to be executed.
Retry Interval (Seconds)	No	The period of time during which the system retires to execute the scheduled task. Unit: seconds. If a scaling activity fails to be executed at the specified time, Auto Scaling executes the scheduled task again within the period of time that is specified by the Retry Interval (Seconds) parameter.
Recurrence Settings (Advanced)	No	Specifies whether to execute the scheduled task on a recurring schedule. Select **Recurrence Settings (Advanced)** and set the Recurrence and Expire parameters. The valid values for Recurrence include **Daily**, **Weekly**, and **Monthly**.

6. Click **OK**.

Result

The scheduled task that you created is displayed in the scheduled task list.

4.3.8. Create an event-triggered task

This topic describes how to create an event-triggered task associated with monitoring metrics in response to emergent or unpredictable business changes. After you create and enable an event-triggered task, Auto Scaling collects data for the specified metric in real time and triggers an alert when the specified condition is met. Then, Auto Scaling executes the corresponding scaling rule to scale Elastic Compute Service (ECS) instances in the scaling group.

Procedure

1. Log on to the Auto Scaling console.
2. In the left-side navigation pane, choose **Event-driven Tasks > Alert Tasks**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. In the upper-right corner of the Event-Triggered Tasks page, click **Create Alert**.
5. In the dialog box that appears, configure parameters for the event-triggered task.

Parameter	Required	Description
Task Name	Yes	The name of the event-triggered task. It must be 2 to 64 characters in length and can contain letters, digits, underscores (_), hyphens (-), and periods (.). It must start with a letter or a digit.
Description	No	The description of the event-triggered task.
Organization/Resource Group	Yes	The organization and resource set in which to create the event-triggered task.
Monitoring Metrics/Scaling Rule	Yes	The scaling group to be monitored and the scaling rule to be executed.
Monitoring Type	Yes	**System-Level Monitoring** is selected by default.
Monitoring Metrics	Yes	The metrics that you want to monitor. Valid values: ○ **Average CPU Utilization** ○ **Memory Usage** ○ **Outbound Traffic** ○ **Inbound Traffic** ○ **Average System Load**
Monitoring Period	Yes	The period during which data is aggregated and analyzed. The shorter the period, the higher the frequency that the alert is triggered. Unit: minutes. Valid values: ○ 1 ○ 2 ○ 5 ○ 15

Parameter	Required	Description
Statistic	Yes	The rule that determines whether to trigger an alert. Select **Average**, **Max Capacity**, or **Min Capacity**, and specify a threshold value. For example, to trigger an alert when the CPU utilization exceeds 80%, you can use one of the following methods to specify the trigger condition: ○ Average: An alert is triggered when the average CPU utilization of all ECS instances in the scaling group exceeds 80%. ○ Max Capacity: An alert is triggered when the highest CPU utilization among the ECS instances in the scaling group exceeds 80%. ○ Min Capacity: An alert is triggered when the lowest CPU utilization among the ECS instances in the scaling group exceeds 80%.
Trigger After	Yes	The number of consecutive times that the threshold must be exceeded before the alert is triggered. Valid values: ○ 1 ○ 2 ○ 3 ○ 5

6. Click **OK**.

4.4. Scaling groups

4.4.1. Create a scaling group

This topic describes how to create a scaling group. A scaling group is a group of Elastic Compute Service (ECS) instances that is dynamically scaled based on the configured scenario. You can specify the minimum and maximum numbers of ECS instances in a scaling group.

Prerequisites

- A virtual private cloud (VPC) and a vSwitch are created. For more information, see Create a VPC and Create a vSwitch in *VPC User Guide*.
- To associate a scaling group with Server Load Balancer (SLB) instances, make sure that the following requirements are met:
  - You have one or more SLB instances in the **Running** state.
  - The SLB instances and the scaling group are in the same organization, resource set, and region.
- To associate a scaling group with ApsaraDB RDS instances, make sure that the following requirements are met:
  - You have one or more RDS instances in the **Running** state.
  - The RDS instances and the scaling group are in the same organization, resource set, and region.

Procedure

1. Log on to the Auto Scaling console.
2. In the left-side navigation pane, click **Scaling groups**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. In the upper-right corner of the Scaling Groups page, click **Create Scaling Group**.
5. Configure parameters for the scaling group.

Parameter	Required	Description
Scaling Group	Yes	The name of the scaling group. It must be 2 to 64 characters in length, and can contain letters, digits, underscores (_), hyphens (-), and periods (.). It must start with a letter or a digit.
Organization/Resource Group	Yes	The organization and resource set in which to create the scaling group.
Maximum Capacity	Yes	The maximum number of instances that the scaling group can contain. Set the value based on your business requirements to control costs. Valid values: 0 to 1000.
Minimum Capacity	Yes	The minimum number of instances that a scaling group must contain. Set the value based on your business requirements to ensure service availability. When the scaling group is enabled, Auto Scaling automatically creates this number of ECS instances. Valid values: 0 to 1000.
Cooldown (Seconds)	Yes	The period of time after each scaling activity is complete. During the cooldown time, Auto Scaling rejects all scaling activity requests triggered by event-triggered tasks from CloudMonitor. However, scaling activities triggered by other types of tasks such as manually triggered tasks and scheduled tasks are not limited by the cooldown time and are immediately executed. The value must be an integer that is greater than or equal to zero. Unit: seconds.
Scale-In Policy	No	The policy for automatically removing ECS instances from the scaling group. This parameter contains the **Select** and **From the list, select** fields. You cannot specify the same values for the two fields. Valid values: ◦ **Earliest Instance Created Using Scaling Configuration**: filters instances that were created based on the earliest scaling configuration. ◦ **Earliest Created Instance**: filters instances that were added to the scaling group at the earliest point in time. ◦ **Newest Instances**: filters instances that were most recently added to the scaling group. ◦ **None**: is available only for **From the list, select**. This value indicates that Auto Scaling does not filter instances based on the From the list, select field. For example, if Auto Scaling filters instances based on the **Earliest Created Instance** value of Select, you can select one of the following values for From the list, select: ◦ **None**: indicates that Auto Scaling does not filter instances based on the From the list, select field. ◦ **Newest Instances**: filters instances obtained based on the Select field and then filters instances that were most recently added to the scaling group.

Parameter	Required	Description
Region/VPC	Yes	The region and VPC in which to create the scaling group.
Vswitch	Yes	The ID of the vSwitch with which to associate the scaling group.
Associate SLB Instance	No	After you associate SLB instances with the scaling group, ECS instances that are added to the scaling group are automatically added as SLB backend servers. You can specify a server group to which to add the ECS instances. ECS instances can be added to the following types of server groups: ◦ Default server group: the group of ECS instances that are used to receive requests. If the listener is not configured with a vServer group or a primary/secondary server group, requests are forwarded to the ECS instances in the default server group. ◦ vServer group: If you want to distribute different requests to different backend servers or configure domain name- or URL-based routing methods, you can use vServer groups.
Associate RDS Instance	No	After you associate RDS instances with the scaling group, the internal IP addresses of ECS instances that are added to the scaling group are automatically added to the whitelists of the RDS instances to allow communication over the internal network.

6. Click **OK**.

Result

The created scaling group is displayed in the scaling group list but is in the **Disabled** state. To enable the scaling group, you must create a scaling configuration. For more information, see Create a scaling configuration.

4.4.2. Enable a scaling group

This topic describes how to enable a scaling group. You can enable a scaling group to trigger scaling activities.

Prerequisites

- The scaling group is in the **Disabled** state.
- The scaling group has a scaling configuration that is in the **Enable** state.

Procedure

1. Log on to the Auto Scaling console.
2. In the top navigation bar, select an organization, a resource set, and a region.
3. Find the scaling group that you want to enable and click **Enable** in the **Actions** column.
4. In the message that appears, click **OK**.

Result

The status of the scaling group is changed from **Disabled** to **Enable** in the **Status** column.

4.4.3. View scaling groups

This topic describes how to view the scaling group list and the details of a specific scaling group.

Procedure

1. Log on to the Auto Scaling console.
2. In the top navigation bar, select an organization, a resource set, and a region.
   The scaling groups that correspond to the specified organization, resource set, and region are displayed.
3. Select a filter option, enter the corresponding information, and then click **Search**.

   You can select multiple filter options to narrow down the search results.

Option	Description
Scaling Group	Enter a scaling group name to search for the scaling group.
Scaling Group ID	Enter a scaling group ID to search for the scaling group.

4. Click the name of the scaling group in the **Scaling Group Name/ID** column.
5. View the details of the specified scaling group.

Parameter	Description
Basic Information	The configurations of the scaling group, such as the scaling group ID, scaling group name, total instances, minimum number of instances, maximum number of instances, and scale-in policy.
ECS Instances	The details of ECS instances, such as the list of automatically created ECS instances, the list of manually added ECS instances, and the number of ECS instances that are in service.
Scaling Activities	All the scaling activities that have been executed in the scaling group.
Scaling Configuration	The information of scaling configurations in the scaling group.
Scaling Rules	The information of scaling rules.

4.4.4. Modify a scaling group

This topic describes how to modify a scaling group. You can modify the parameters of a specific scaling group, such as the minimum and maximum numbers of ECS instances.

Context

After you modify the minimum or maximum number of ECS instances that a scaling group can have, if the number of instances in the scaling group is outside this range, Auto Scaling automatically creates or removes ECS instances until the number of instances are within the range.

Procedure

1. Log on to the Auto Scaling console.
2. In the top navigation bar, select an organization, a resource set, and a region.
3. Find the target scaling group and click **Edit** in the **Actions** column.
4. Modify the parameters of the scaling group.

   You can modify the scaling configuration and other parameters, but not the organization and resource set. For

more information about other parameters, see Create a scaling group.

5. Click **OK**.

4.4.5. Disable a scaling group

This topic describes how to disable a scaling group.

Prerequisites

- The scaling group does not have scaling activities in progress.
- The scaling group is in the **Enable** state.

Procedure

1. Log on to the Auto Scaling console.
2. In the top navigation bar, select an organization, a resource set, and a region.
3. Find the target scaling group and click **Disable** in the **Actions** column.
4. Click **OK**.

Result

The status of the scaling group is changed from **Enable** to **Disabled** in the **Status** column.

4.4.6. Delete a scaling group

This topic describes how to delete a scaling group. When you delete a scaling group, Auto Scaling removes and releases ECS instances that are automatically created, removes ECS instances that are manually added, and deletes the scaling configurations and rules in the scaling group. However, the scheduled tasks and event-triggered tasks that are associated with the scaling group are not deleted.

Procedure

1. Log on to the Auto Scaling console.
2. In the top navigation bar, select an organization, a resource set, and a region.
3. Find the target scaling group and click **Delete** in the **Actions** column.
4. Click **OK**.

4.4.7. Query ECS instances

You can query all ECS instances in a scaling group and their states.

Procedure

1. Log on to the Auto Scaling console.
2. In the left-side navigation pane, click **Scaling groups**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the target scaling group and click the name of the scaling group in the **Scaling Group Name/ID** column.
5. In the left-side navigation pane, click **ECS instances**.
6. View the details of ECS instances.

Category	Description
Automatically created ECS instances	The ECS instances that are automatically created based on the active scaling configuration when a scaling rule is triggered.

Category	Description
Manually added ECS instances	The ECS instances that are manually added to the specified scaling group.
The number of ECS instances in each state.	The following section describes the states: ○ Total: all ECS instances in the scaling group ○ In Service: the ECS instances that are in normal use ○ On Standby: the ECS instances that are on standby ○ Protected: the ECS instances that are protected ○ Adding: the ECS instances that are being added to the scaling group ○ Removing: the ECS instances that are being removed from the scaling group **Note** The Disabled, Adding:wait, and Suspending states are unavailable.

4.4.8. Put an ECS instance into the Standby state

This topic describes how to put an ECS instance into the Standby state. Auto Scaling does not perform health checks on or release ECS instances in the Standby state.

Context

After an ECS instance is put into the Standby state:

- The ECS instance stays in the Standby state until you change its status.
- Auto Scaling stops managing the lifecycle of the ECS instance. You must manually manage the lifecycle of the ECS instance.
- If a scale-in event is triggered, Auto Scaling will not remove the ECS instance.
- When the ECS instance is stopped or restarted, its health check status is not affected.
- To release the ECS instance, you must first remove it from the scaling group.
- If you delete the scaling group, the ECS instance is automatically put out of the Standby state and is released.
- You can also perform other operations on the ECS instance, such as stopping, restarting, changing the instance type of, or changing the operating system of the ECS instance.

Procedure

1. Log on to the Auto Scaling console.
2. In the top navigation bar, select an organization, a resource set, and a region.
3. Find the target scaling group and click the name of the scaling group in the **Scaling Group Name/ID** column.
4. In the left-side navigation pane, click **ECS Instances**.
5. Select the source of the ECS instance.
   - To select an automatically created ECS instance, click the **Auto Created** tab.
   - To select a manually added ECS instance, click the **Manually Added** tab.
6. Find the target ECS instance and choose **Actions > Switch to Standby** in the **Actions** column.
7. Click **OK**.

4.4.9. Remove an ECS instance from the Standby state

This topic describes how to remove an ECS instance from the Standby state. You can remove an instance from the Standby state to reuse it.

Context

After an ECS instance is removed from the Standby state:

- The ECS instance enters the In Service state.
- When the ECS instance is stopped or restarted, its health status is updated.
- Auto Scaling continues to manage the lifecycle of the ECS instance, and can remove the ECS instance from the scaling group during a scale-in event.

Procedure

1. Log on to the Auto Scaling console.
2. In the top navigation bar, select an organization, a resource set, and a region.
3. Find the target scaling group and click the name of the scaling group in the **Scaling Group Name/ID** column.
4. In the left-side navigation pane, click **ECS Instances**.
5. Select the source of the ECS instance.
   - To select an automatically created ECS instance, click the **Auto Created** tab.
   - To select a manually added ECS instance, click the **Manually Added** tab.
6. Find the target ECS instance and choose **Actions > Move Out Of Standby** in the **Actions** column.
7. Click **OK**.

4.4.10. Put an ECS instance into the Protected state

This topic describes how to put an ECS instance into the Protected state. Auto Scaling does not perform health checks on or release ECS instances that are in the Protected state.

Context

After an ECS instance is put into the Protected state:

- The ECS instance stays in the Protected state until you change its status.
- If a scale-in event is triggered, Auto Scaling will not remove the ECS instance. To release the ECS instance, you must remove the ECS instance from the Protected state and then remove it from the scaling group.
- When the ECS instance is stopped or restarted, its health check status is not affected.

Procedure

1. Log on to the Auto Scaling console.
2. In the top navigation bar, select an organization, a resource set, and a region.
3. Find the target scaling group and click the name of the scaling group in the **Scaling Group Name/ID** column.
4. In the left-side navigation pane, click **ECS Instances**.
5. Select the source of the ECS instance.
   - To select an automatically created ECS instance, click the **Auto Created** tab.
   - To select a manually added ECS instance, click the **Manually Added** tab.
6. Find the target ECS instance and choose **Actions > Switch to Protection** in the **Actions** column.

7. Click **OK**.

4.4.11. Remove an ECS instance from the Protected state

This topic describes how to remove an ECS instance from the Protected state. After an ECS instance is removed from the Protected state, Auto Scaling continues to manage the lifecycle of the ECS instance.

Procedure

1. Log on to the Auto Scaling console.
2. In the top navigation bar, select an organization, a resource set, and a region.
3. Find the target scaling group and click the name of the scaling group in the **Scaling Group Name/ID** column.
4. In the left-side navigation pane, click **ECS Instances**.
5. Select the source of the ECS instance.
   - To select an automatically created ECS instance, click the **Auto Created** tab.
   - To select a manually added ECS instance, click the **Manually Added** tab.
6. Find the target ECS instance and choose **Actions > Move Out Of Protection** in the **Actions** column.
7. Click **OK**.

4.5. Scaling configurations

4.5.1. Create a scaling configuration

This topic describes how to create a scaling configuration for a scaling group.

Prerequisites

At least one security group is available. If you do not have any security groups, create a security group. For more information, see Create a security group *in ECS User Guide.*

Context

You can create only a limited number of scaling configurations for a scaling group. For more information, see the Limits topic in *Auto Scaling Product Introduction.*

Procedure

1. Log on to the Auto Scaling console.
2. In the top navigation bar, select an organization, a resource set, and a region.
3. Find the target scaling group and click the name of the scaling group in the **Scaling Group Name/ID** column.
4. In the left-side navigation pane, click **Scaling Configuration**.
5. Choose **Create > Create Scaling Configuration**.
6. Configure parameters for the scaling configuration.

Section	Parameter	Required	Description
Region	Region	Yes	The region where the ECS instance is located.
	Zone	Yes	The zone where the ECS instance is located.

Section	Parameter	Required	Description
Security Group	Security Group	Yes	The security group to which the ECS instance belongs.
Instance	Instance Family	Yes	The instance family to which the ECS instance belongs.
	Instance Type	Yes	The instance type of the ECS instance.
Image	Image Type	Yes	◦ **Public Image**: Public images provided by Alibaba Cloud are fully licensed to offer a secure and stable operating environment for applications on ECS instances. ◦ **Custom Image**: You can create custom images to install software or deploy projects that have special requirements.
Storage	System Disk	Yes	Specify the category and size of the system disk. The operating system is installed on the system disk. You can select **Ultra Disk** or **Standard SSD**.
	Data Disk	No	Specify the category and size of the data disk. You can select **Ultra Disk** or **Standard SSD**. You can add a maximum of 16 data disks. The maximum capacity of each data disk is 32 TiB. You can set **Release with Instance** and **Encrypt** for each data disk.
Password	Set Password	Yes	Select when to set password. You can select **Now** or **Later**. If you select Later, you can use the Change Password feature in the console to set the password. For more information, see the Change Password topic in *ECS User Guide*.

Section	Parameter	Required	Description
	Logon Password	No	The password used to log on to the ECS instance. The password must be 8 to 30 characters in length and must contain at least three of the following character types: digits, uppercase letters, lowercase letters, and special characters. **Note** The password is used to log on to the operating system and is not the VNC password.
	Confirm Password	No	Enter the password again.
Deployment Set	Deployment Set	No	The deployment set to which the instance belongs.
Instance Name	Configuration Name	No	The name of the scaling configuration.
	Instance Name	No	The name of the ECS instance.
User Data	User Data	No	Windows supports two formats: Bat and Powershell. Before you perform Base64 encoding, make sure to include `[bat]` or `[powershell]` as the first line. You can run shell scripts for Linux ECS instances.
Quantity	Quantity	No	The number of instances to purchase.

7. Click **Submit**.

Result

After the scaling configuration is created, it is in the **Disabled** state and is displayed in your scaling configuration list. To automatically create ECS instances, you must apply a scaling configuration. For more information, see Apply a scaling configuration.

4.5.2. View scaling configurations

This topic describes how to view scaling configurations.

Procedure

1. Log on to the Auto Scaling console.
2. In the top navigation bar, select an organization, a resource set, and a region.
   The scaling groups that correspond to the specified organization, resource set, and region are displayed.
3. Find the target scaling group and click the name of the scaling group in the **Scaling Group Name/ID** column.
4. In the left-side navigation pane, click **Scaling Configuration**.
5. View the list of scaling configurations.

4.5.3. Modify a scaling configuration

This topic describes how to modify a scaling configuration. You can modify the parameters of a scaling configuration based on your actual needs.

Procedure

1. Log on to the Auto Scaling console.
2. In the top navigation bar, select an organization, a resource set, and a region.
3. Find the target scaling group and click the name of the scaling group in the **Scaling Group Name/ID** column.
4. In the left-side navigation pane, click **Scaling Configuration**.
5. Find the target scaling configuration and click its name in the **Scaling Configuration Name/ID** column.
6. Modify the parameters of the scaling configuration.

   For more information about parameters of the scaling configuration, see Create a scaling configuration.
7. Click **OK**.

4.5.4. Apply a scaling configuration

This topic describes how to apply a scaling configuration. You can create multiple scaling configurations for a scaling group and apply one.

Procedure

1. Log on to the Auto Scaling console.
2. In the top navigation bar, select an organization, a resource set, and a region.
3. Find the target scaling group and click the name of the scaling group in the **Scaling Group Name/ID** column.
4. In the left-side navigation pane, click **Scaling Configuration**.
5. Find the target scaling configuration and click **Select** in the **Actions** column.

   Only one scaling configuration can be in the **Enabled** state in a scaling group. After a scaling configuration is applied, other scaling configurations are put into the **Disabled** state.
6. Click **OK**.

Result

The status of the scaling configuration changes from **Disabled** to **Enable** in the **Status** column.

4.5.5. Delete a scaling configuration

This topic describes how to delete a scaling configuration that is no longer needed. After you delete a scaling configuration, existing ECS instances that are created from the scaling configuration are not removed.

Prerequisites

The scaling configuration is in the **Disabled** state.

Procedure

1. Log on to the Auto Scaling console.
2. In the top navigation bar, select an organization, a resource set, and a region.
3. Find the target scaling group and click the name of the scaling group in the **Scaling Group Name/ID** column.
4. In the left-side navigation pane, click **Scaling Configuration**.
5. Find the target scaling configuration and click **Delete** in the **Actions** column.

6. Click **OK**.

4.6. Scaling rules

4.6.1. Create a scaling rule

This topic describes how to create a scaling rule. You can create scaling rules to add or remove ECS instances. For example, you can add an ECS instance to a scaling group.

Context

- You can create only a limited number of scaling rules for a scaling group. For more information, see the Limits topic in *Auto Scaling Product Introduction.*
- After a scaling rule is executed, the resulting number of ECS instances in the scaling group may fall outside of the specified range. In this case, Auto Scaling automatically adjusts the number of ECS instances to ensure that the number of ECS instances in the scaling group is within the specified range.

Procedure

1. Log on to the Auto Scaling console.
2. In the top navigation bar, select an organization, a resource set, and a region.
3. Find the target scaling group and click the name of the scaling group in the **Scaling Group Name/ID** column.
4. In the left-side navigation pane, click **Scaling Rules**.
5. Click **Create Scaling Rule**.
6. Configure parameters for the scaling rule.

Parameter	Required	Description
Rule Name	Yes	The name of the scaling rule. It must be 2 to 64 characters in length and can contain letters, digits, underscores (_), hyphens (-), and periods (.). It must start with a letter or digit.
Scaling Activity	Yes	The operation that is performed when the scaling rule is triggered. The operations include: ○ **Change to N instances**: After the scaling rule is executed, the number of instances in the scaling group is changed to N. ○ **Add N instances**: After the scaling rule is executed, N instances are added to the scaling group. ○ **Remove N instances**: After the scaling rule is executed, N instances are removed from the scaling group.
Default Cooldown (Seconds)	No	The cooldown period. If this parameter is not specified, the default value is used.

7. Click **OK**.

4.6.2. View scaling rules

This topic describes how to view scaling rules.

Procedure

1. Log on to the Auto Scaling console.
2. In the top navigation bar, select an organization, a resource set, and a region.
   The scaling groups that correspond to the specified organization, resource set, and region are displayed.
3. Find the target scaling group and click the name of the scaling group in the **Scaling Group Name/ID** column.
4. In the left-side navigation pane, click **Scaling Rules**.
5. View the list of scaling rules.

4.6.3. Modify a scaling rule

This topic describes how to modify a scaling rule. You can modify the following parameters of a scaling rule: Rule Name, Scaling Activity, and Default Cooldown.

Procedure

1. Log on to the Auto Scaling console.
2. In the top navigation bar, select an organization, a resource set, and a region.
3. Find the target scaling group and click the name of the scaling group in the **Scaling Group Name/ID** column.
4. In the left-side navigation pane, click **Scaling Rules**.
5. Find the target scaling rule and click **Edit** in the **Actions** column.
6. Modify the Rule Name, Scaling Activity, and Default Cooldown parameters.
7. Click **OK**.

4.6.4. Delete a scaling rule

This topic describes how to delete a scaling rule that is no longer needed.

Procedure

1. Log on to the Auto Scaling console.
2. In the top navigation bar, select an organization, a resource set, and a region.
3. Find the target scaling group and click the name of the scaling group in the **Scaling Group Name/ID** column.
4. In the left-side navigation pane, click **Scaling Rules**.
5. Find the target scaling rule and click **Delete** in the **Actions** column.
6. In the message that appears, click **OK**.

4.7. Scaling tasks

4.7.1. Manually execute a scaling rule

This topic describes how to manually execute a scaling rule to add or remove ECS instances.

Prerequisites

- The scaling group to which the scaling rule belongs is in the **Enable** state.
- No scaling activity is in progress in the scaling group to which the scaling rule belongs.

Context

After the scaling rule is executed, if the number of ECS instances is greater than the maximum number or less than the minimum number, Auto Scaling automatically adjusts the number of ECS instances to be within the valid range.

Auto Scaling enables you to manually execute scaling rules. You can also associate an event-triggered task or scheduled task with the scaling rule to automatically adjust the number of ECS instances. For more information, see Create a scheduled task and Create an event-triggered task.

Procedure

1. Log on to the Auto Scaling console.
2. In the top navigation bar, select an organization, a resource set, and a region.
3. Find the target scaling group and click the name of the scaling group in the **Scaling Group Name/ID** column.
4. In the left-side navigation pane, click **Scaling Rules**.
5. Find the scaling rule that you want to execute and click **Run** in the **Actions** column.
6. In the message that appears, click **OK**.

Result

The **Scaling Activities** page appears. You can view the details of your scaling activity.

4.7.2. Manually add an ECS instance

This topic describes how to manually add an ECS instance to a scaling group. You can add existing ECS instances to a scaling group to take full advantage of the computing resources.

Prerequisites

The ECS instance to be added must meet the following conditions:

- The ECS instance and the scaling group to which to add the instance share the same region, organization, and resource set.
- The ECS instance is in the **Running** state.
- The ECS instance does not belong to any scaling groups.
- The ECS instance and the scaling group are in the same VPC.

The scaling group to which to add the ECS instance must meet the following conditions:

- The scaling group is in the **Enable** state.
- No scaling activity is in progress in the scaling group.

Context

- When no scaling activity is being executed in the scaling group, you can add an ECS instance to the scaling group without the need to wait for the cooldown time to expire.
- If the number of instances in the scaling group is greater than the maximum number of instances after an ECS instance is added to the scaling group, the ECS instance cannot be added.
- The ECS instances that are manually added to a scaling group are not limited by scaling configurations. The instance types of the manually added instances can be different from that of the scaling configuration in the **Enable** state.

Procedure

1. Log on to the Auto Scaling console.
2. In the top navigation bar, select an organization, a resource set, and a region.
3. Find the target scaling group and click the name of the scaling group in the **Scaling Group Name/ID** column.
4. In the left-side navigation pane, click **ECS Instances**.
5. Click **Add Instance**.
6. Select the ECS instance to be added and click **OK**.

Result

The manually added instance is displayed on the **Manually Added** tab.

4.7.3. Manually remove an ECS instance

This topic describes how to manually remove an ECS instance that is no longer needed from a scaling group.

Prerequisites

The scaling group must meet the following conditions:

- The scaling group is in the **Enable** state.
- No scaling activity is in progress in the scaling group.

Context

- When no scaling activity is being executed in the scaling group, you can immediately remove an ECS instance from the scaling group without the need to wait for the cooldown time to expire.
- After an ECS instances is removed from a scaling group, the number of instances in the scaling group must be greater than or equal to the minimum number of instances. Otherwise, the ECS instance cannot be removed.

Procedure

1. Log on to the Auto Scaling console.
2. In the top navigation bar, select an organization, a resource set, and a region.
3. Find the target scaling group and click the name of the scaling group in the **Scaling Group Name/ID** column.
4. In the left-side navigation pane, click **ECS Instances**.
5. Select the source of the ECS instance.
   - To select an automatically created ECS instance, click the **Auto Created** tab.
   - To select a manually added ECS instance, click the **Manually Added** tab.
6. Use one of the following methods to remove one or more ECS instances from a scaling group:

   Manually added ECS instances can only be removed, but cannot be released.

   - Find the ECS instance that you want to remove and choose **Actions > Remove from Scaling Group** in the **Actions** column.
   - Find the ECS instance that you want to remove and release, and choose **Actions > Remove from Scaling Group and Release** in the **Actions** column.
7. In the message that appears, click **OK**.

4.8. Scheduled tasks

4.8.1. Create a scheduled task

This topic describes how to create a scheduled task to scale computing resources in response to predictable business changes in the future. Scheduled tasks enable the system to automatically obtain sufficient computing resources before business peaks and release idle computing resources after the business peaks.

Context

A scheduled task is preconfigured to execute the specified scaling rule at the specified time. When the specified time arrives, the scheduled task automatically scales computing resources. This allows you to reduce costs and meet business requirements. You can also specify recurring schedules for scheduled tasks if business changes are regular.

If multiple scheduled tasks need to be executed in 1 minute, Auto Scaling executes the most recently created scheduled task.

Procedure

1. Log on to the Auto Scaling console.
2. In the left-side navigation pane, choose **Event-driven Tasks > Timed tasks**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. In the upper-right corner of the Scheduled Tasks page, click **Create Scheduled Task**.
5. In the dialog box that appears, configure parameters for the scheduled task.

Parameter	Required	Description
Task Name	Yes	The name of the scheduled task. The name must be 2 to 64 characters in length and can contain letters, digits, underscores (_), hyphens (-), and periods (.). It must start with a letter or a digit.
Description	Yes	The description of the scheduled task.
Organization/Resource Group	Yes	The organization and resource set in which to create the scheduled task.
Start Time	Yes	The time to execute the scheduled task.
Scaling Rules	Yes	The scaling group to be monitored and the scaling rule to be executed.
Retry Interval (Seconds)	No	The period of time during which the system retires to execute the scheduled task. Unit: seconds. If a scaling activity fails to be executed at the specified time, Auto Scaling executes the scheduled task again within the period of time that is specified by the Retry Interval (Seconds) parameter.
Recurrence Settings (Advanced)	No	Specifies whether to execute the scheduled task on a recurring schedule. Select **Recurrence Settings (Advanced)** and set the Recurrence and Expire parameters. The valid values for Recurrence include **Daily**, **Weekly**, and **Monthly**.

6. Click **OK**.

Result

The scheduled task that you created is displayed in the scheduled task list.

4.8.2. View scheduled tasks

This topic describes how to view scheduled tasks.

Procedure

1. Log on to the Auto Scaling console.
2. In the left-side navigation pane, choose **Event-driven Tasks > Timed tasks**.
3. In the top navigation bar, select an organization, a resource set, and a region.
   The scheduled tasks that correspond to the specified organization, resource set, and region are displayed.
4. Select a filter option, enter the corresponding information, and then click **Search**.

   You can select multiple filter options to narrow down the search results.

Option	Description
Task Name	Enter a task name to search for the scheduled task.
Task ID	Enter a task ID to search for the scheduled task.

5. View the scheduled task list.

4.8.3. Modify a scheduled task

This topic describes how to modify a scheduled task. You can modify parameters such as Start Time, Scaling Rules, and Retry Expiry Time for a scheduled task.

Procedure

1. Log on to the Auto Scaling console.
2. In the left-side navigation pane, choose **Event-driven Tasks > Timed tasks**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the scheduled task that you want to modify and click **Edit** in the **Actions** column.
5. Modify the parameters of the scheduled task.

   You can modify the Recurrence and Expire parameters if you have enabled the Recurrence Settings (Advanced) feature when you create the scheduled task, but the Recurrence Settings (Advanced) feature cannot be disabled. For more information about other parameters of the scheduled task, see Create a scheduled task.
6. Click **OK**.

4.8.4. Disable a scheduled task

This topic describes how to disable a scheduled task. You can disable a scheduled task that is no longer needed.

Prerequisites

The scheduled task is in the **Running** state.

Procedure

1. Log on to the Auto Scaling console.
2. In the left-side navigation pane, choose **Event-driven Tasks > Timed tasks**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the scheduled task that you want to disable and click **Disabled** in the **Actions** column.
5. In the message that appears, click **OK**.

Result

The status of the scheduled task is changed from **Running** to **Stop** in the **Status** column.

4.8.5. Enable a scheduled task

This topic describes how to enable a scheduled task. You can enable a scheduled task that has been disabled and use it to trigger scaling activities at the specified time point.

Prerequisites

The scheduled task is in the **Stop** state.

Procedure

1. Log on to the Auto Scaling console.
2. In the left-side navigation pane, choose **Event-driven Tasks > Timed tasks**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the scheduled task that you want to enable and click **Enable** in the **Actions** column.
5. In the message that appears, click **OK**.

Result

The status of the scheduled task is changed from **Stop** to **Running** in the **Status** column.

4.8.6. Delete a scheduled task

This topic describes how to delete a scheduled task that is no longer needed.

Procedure

1. Log on to the Auto Scaling console.
2. In the left-side navigation pane, choose **Event-driven Tasks > Timed tasks**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the scheduled task that you want to delete and click **Delete** in the **Actions** column.
5. In the message that appears, click **OK**.

4.9. Event-triggered tasks

4.9.1. Create an event-triggered task

This topic describes how to create an event-triggered task associated with monitoring metrics in response to emergent or unpredictable business changes. After you create and enable an event-triggered task, Auto Scaling collects data for the specified metric in real time and triggers an alert when the specified condition is met. Then, Auto Scaling executes the corresponding scaling rule to scale Elastic Compute Service (ECS) instances in the scaling group.

Procedure

1. Log on to the Auto Scaling console.
2. In the left-side navigation pane, choose **Event-driven Tasks > Alert Tasks**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. In the upper-right corner of the Event-Triggered Tasks page, click **Create Alert**.
5. In the dialog box that appears, configure parameters for the event-triggered task.

Parameter	Required	Description
Task Name	Yes	The name of the event-triggered task. It must be 2 to 64 characters in length and can contain letters, digits, underscores (_), hyphens (-), and periods (.). It must start with a letter or a digit.
Description	No	The description of the event-triggered task.
Organization/Resource Group	Yes	The organization and resource set in which to create the event-triggered task.
Monitoring Metrics/Scaling Rule	Yes	The scaling group to be monitored and the scaling rule to be executed.
Monitoring Type	Yes	**System-Level Monitoring** is selected by default.

Parameter	Required	Description
Monitoring Metrics	Yes	The metrics that you want to monitor. Valid values: ○ **Average CPU Utilization** ○ **Memory Usage** ○ **Outbound Traffic** ○ **Inbound Traffic** ○ **Average System Load**
Monitoring Period	Yes	The period during which data is aggregated and analyzed. The shorter the period, the higher the frequency that the alert is triggered. Unit: minutes. Valid values: ○ 1 ○ 2 ○ 5 ○ 15
Statistic	Yes	The rule that determines whether to trigger an alert. Select **Average**, **Max Capacity**, or **Min Capacity**, and specify a threshold value. For example, to trigger an alert when the CPU utilization exceeds 80%, you can use one of the following methods to specify the trigger condition: ○ Average: An alert is triggered when the average CPU utilization of all ECS instances in the scaling group exceeds 80%. ○ Max Capacity: An alert is triggered when the highest CPU utilization among the ECS instances in the scaling group exceeds 80%. ○ Min Capacity: An alert is triggered when the lowest CPU utilization among the ECS instances in the scaling group exceeds 80%.
Trigger After	Yes	The number of consecutive times that the threshold must be exceeded before the alert is triggered. Valid values: ○ 1 ○ 2 ○ 3 ○ 5

6. Click **OK**.

4.9.2. View event-triggered tasks

This topic describes how to view event-triggered tasks.

Procedure

1. Log on to the Auto Scaling console.
2. In the left-side navigation pane, choose **Event-driven Tasks > Alert Tasks**.
3. In the top navigation bar, select an organization, a resource set, and a region.
   The event-triggered tasks that correspond to the specific organization, resource set, and region are displayed.
4. Select a filter option, enter the corresponding information, and then click **Search**.

   You can select multiple filter options to narrow down the search results.

Option	Description
Alert Name	Enter an event-triggered task name to search for the event-triggered task.
Scaling Group ID	Enter a scaling group ID to search for the event-triggered task associated with the scaling group.

4.9.3. Modify an event-triggered task

This topic describes how to modify an event-triggered task. You can modify parameters such as Scaling Rules, Monitoring Type, and Statistic for an event-triggered task.

Procedure

1. Log on to the Auto Scaling console.
2. In the left-side navigation pane, choose **Event-driven Tasks > Alert Tasks**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the event-triggered task that you want to modify and click **Edit** in the **Actions** column.
5. Modify the parameters of the event-triggered task.

   For more information about other parameters of the scheduled task, see Create an event-triggered task. The following parameters cannot be modified:

   - Organization
   - Resource Group
   - Monitoring Metrics
   - Monitoring Period
6. Click **OK**.

4.9.4. Disable an event-triggered task

This topic describes how to disable an event-triggered task. You can disable an event-triggered task if you no longer want to use it to trigger scaling activities.

Prerequisites

The event-triggered task is in the **Normal**, **Alerts**, or **Insufficient Data** state.

Procedure

1. Log on to the Auto Scaling console.
2. In the left-side navigation pane, choose **Event-driven Tasks > Alert tasks**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the event-triggered task that you want to disable and click **Disable** in the **Actions** column.
5. In the message that appears, click **OK**.

Result

The status of the event-triggered task is changed to **Stopped** in the **Status** column.

4.9.5. Enable an event-triggered task

This topic describes how to enable an event-triggered task. You can enable an event-triggered task that has been disabled to continue to monitor metrics and trigger scaling activities for a scaling group.

Prerequisites

The event-triggered task is in the **Stopped** state.

Procedure

1. Log on to the Auto Scaling console.
2. In the left-side navigation pane, choose **Event-driven Tasks > Alert tasks**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the event-triggered task that you want to enable and click **Enable** in the **Actions** column.
5. In the message that appears, click **OK**.

Result

The status of the event-triggered task changes from **Stopped** to **Normal** in the **Status** column.

4.9.6. Delete an event-triggered task

This topic describes how to delete an event-triggered task. You can delete an event-triggered task that is no longer needed.

Procedure

1. Log on to the Auto Scaling console.
2. In the left-side navigation pane, choose **Event-driven Tasks > Alert Tasks**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the event-triggered task that you want to delete and click **Delete** in the **Actions** column.
5. In the message that appears, click **OK**.

5.Resource Orchestration Service (ROS)

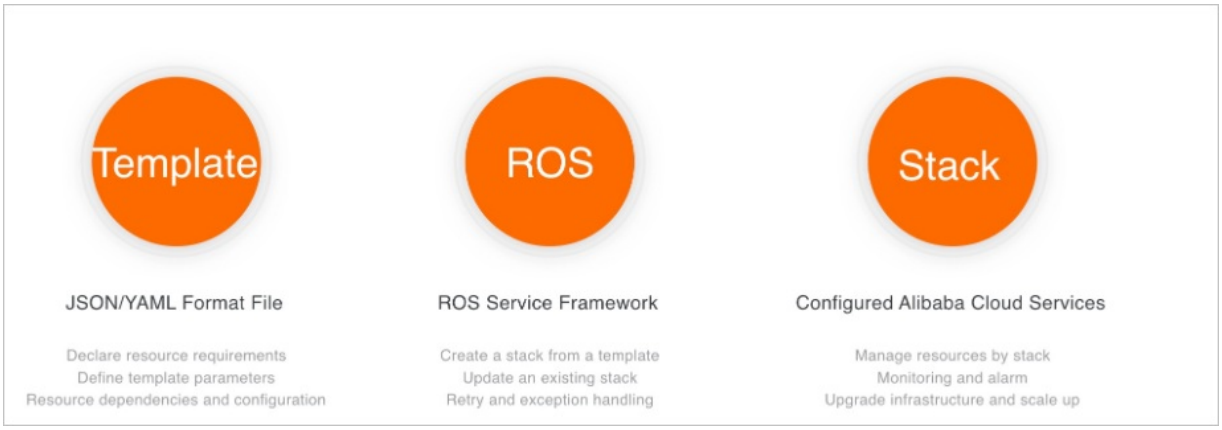
5.1. What is ROS?

Resource Orchestration Service (ROS) is an Apsara Stack service that can simplify the management of cloud computing resources. You can author stack templates based on the template specifications defined in ROS. Within a template, you can define required cloud computing resources such as Elastic Compute Service (ECS) and ApsaraDB RDS instances, and the dependencies between resources. The ROS engine automatically creates and configures all resources in a stack based on a template, which makes automatic deployment and O&M possible.

An ROS template is a readable, easy-to-author text file. You can directly edit a JSON-formatted template or use version control tools such as SVN and Git to control the template and infrastructure versions. You can use APIs and SDKs to integrate the orchestration capabilities of ROS with your own applications to implement Infrastructure as Code (IaC).

ROS templates are also a standardized way to deliver resources and applications. If you are an independent software vendor (ISV), you can use ROS templates to deliver a holistic system or solution that encompasses cloud resources and applications. ISVs can use this method to integrate Apsara Stack resources with their own software systems for centralized delivery.

ROS manages a group of cloud resources as a single unit called a stack. A stack is a group of Apsara Stack resources. You can create, delete, and clone cloud resources by stack.



5.2. Log on to the ROS console

This topic describes how to log on to the Resource Orchestration Service (ROS) console.

Prerequisites

- The URL, username, and password of the Apsara Uni-manager Management Console is obtained from the operations administrator before you log on.
- A browser is available. We recommend that you use Google Chrome.

Procedure

1. In the address bar, enter the URL used to log on to the Apsara Uni-manager Management Console. Press the Enter key.
2. Enter the correct username and password.

   The first time you log on to the Apsara Uni-manager Management Console, you must change the password of your username. For higher security, the password must meet the minimum complexity requirements. The password must be 8 to 20 characters in length and must contain at least two of the following character types:

   - Uppercase and lowercase letters

- Digits
- Special characters including exclamation points (!), at signs (@), number signs (#), dollar signs ($), and percent signs (%)

3. Click **Login**.
4. In the top navigation bar, choose **Products > Elastic Computing > Resource Orchestration Service**.

5.3. Create a stack

This topic describes how to create a stack in the Resource Orchestration Service (ROS) console.

Procedure

1. Log on to the ROS console.
2. In the upper-right corner of the page, click **Create Stack**.
3. In the **Select Template** step, set **Organization**, **Resource Set**, and **regionId**.
4. In the **Prepare Template** section, enter template content in the JSON format. Click **Next**.
5. In the **Configure Template Parameters** step, specify the stack name and parameters, and click **Next**.

   > **Note** The parameters that you need to specify vary based on the templates. Specify the parameters as instructed in the ROS console.

6. In the **Configure Stack** step, set Rollback on Failure and Timeout Period, and click **Next**.
7. In the **Confirm** step, check the template and stack configurations, and click **Create Stack**.

What to do next

On the **Stacks** page in the ROS console, you can perform the following operations:

- To delete a stack, click **Delete** in the Actions column corresponding to the stack.
- To update a stack, click **Update** in the Actions column corresponding to the stack.
- To recreate a stack, click **Recreate** in the Actions column corresponding to the stack.

> **Note**
> - If you need only to modify the current template and configurations of a specified stack but do not need to change the region where the stack resides, update the stack.
> - If you need to modify the current template and configurations of a specified stack and change the region where the stack resides, recreate the stack.

5.4. Template syntax

5.4.1. Template structure

A template is a UTF-8 encoded JSON file that is used to create stacks. Templates serve as the blueprint for underlying infrastructure and architecture. Templates define the configurations of Apsara Stack resources and dependencies between the resources.

ROS template structure

```
{
 "ROSTemplateFormatVersion" : "2015-09-01",
 "Description" : "The description of the template, which is used to provide information such as use scenarios and architecture of the template",
 "Metadata" : {
  // The template metadata that provides information such as the layout for visualizations.
 },
 "Parameters" : {
  // The parameters that you can specify when you create a stack.
 },
 "Mappings" : {
  // The mapping tables. Mapping tables are nested tables.
 },
 "Conditions": {
  // The conditions defined by using internal condition functions. These conditions determine when to create associated resources.
 },
 "Resources" : {
  // The detailed information of resources such as configurations and dependencies.
 },
 "Outputs" : {
  // The outputs that are used to provide information such as resource properties. You can use the Resource Orchestration Service (ROS) console or API to obtain the information.
 }
}
```

ROSTemplateFormatVersion

Required. The template versions supported by ROS. Current version: 2015-09-01.

Description

Optional. The description of the template, which is used to provide information such as use scenarios and architecture of the template.

A detailed description can help users better understand the content of the template.

Metadata

Optional. The metadata of the template, in the JSON format.

Parameters

Optional. The parameters that you can specify when you create a stack. An Elastic Compute Service (ECS) instance type is often defined as a parameter. Parameters have default values. Parameters can improve the flexibility and reusability of the template. When you create a stack, select appropriate specifications.

Mappings

Optional. Mappings are defined as nested mapping tables. You can use Fn::FindInMap to retrieve values corresponding to keys. You can also use parameter values as keys. For example, you can search the region-image mapping table for desired images by region.

Conditions

Optional. The conditions defined by using Fn::And, Fn::Or, Fn::Not, and Fn::Equals. Multiple conditions are separated by commas (,). The system evaluates all conditions in the template before it creates or updates a stack. All resources associated with `true` conditions are created, and all resources associated with `false` conditions are ignored.

Resources

Optional. The detailed information of resources in the stack created based on the template. The information includes resource dependencies and configurations.

Outputs

Optional. The outputs that are used to provide information such as resource properties. You can use the ROS console or API to obtain the information.

5.4.2. Parameters

When you create a template, you can use the Parameters section to improve the flexibility and reusability of the template. When you create a stack, you can replace parameter values in the template.

For example, you have a web application requiring a stack that contains one Server Load Balancer (SLB) instance, two Elastic Compute Service (ECS) instances, and one ApsaraDB RDS instance. If the web application has a heavy workload, you can select ECS instances with advanced specifications when you create the stack. Otherwise, you can select ECS instances with basic specifications. The following example shows how to define the InstanceType parameter for an ECS instance:

```
"Parameters" : {
 "InstanceType" : {
  "Type" : "String",
  "AllowedValues":["ecs.t1.small","ecs.s1.medium", "ecs.m1.medium", "ecs.c1.large"],
  "Default": "ecs.t1.small",
  "Label": "ECS instance type",
  "Description" : "The type of the ECS instance that you want to create. Default value: ecs.t1.small. Valid values: ecs.t1.small, ecs.s1.medium, ecs.m1.medium, and ecs.c1.large."
 }
}
```

You can assign a value to the InstanceType parameter when you create stacks based on templates. If this parameter is not specified, the default value `ecs.t1.small` is used.

The following example shows how to reference the InstanceType parameter when you define a resource:

```
"Webserver" : {
 "Type" : "ALIYUN::ECS::Instance",
 "InstanceType": {
  "Ref": "InstanceType"
 }
}
```

Syntax

Each parameter consists of a name and properties. The parameter name can contain only letters and digits, and must be unique within the template. You can use the `Label` field to define the alias of a parameter.

The following table describes the parameter properties.

Parameter property	Required	Description

Parameter property	Required	Description
Type	Yes	The data type of the parameter. • String: a string value. Example: `"ecs.s1.medium"`. • Number: an integer or a floating-point number. Example: 3.14. • CommaDelimitedList: a set of strings separated by commas (,), which can be indexed by using the Fn::Select function. Example: `"80, foo, bar"`. • Json: a JSON string. Example: `{"foo": "bar"}`. • Boolean: a Boolean value. Example: `true` or `false`.
Default	No	The default value of the parameter. If you do not specify a value when you create a stack, Resource Orchestration Service (ROS) checks whether a default value is defined in the template. If a default value is found, ROS uses the default value. Otherwise, an error is returned.
AllowedValues	No	The list of one or more valid parameter values.
AllowedPattern	No	The regular expression that is used to check whether the specified parameter value is a string. If the input is not a string, an error is returned.
MaxLength	No	The integer value that determines the longest string allowed for a String-type parameter.
MinLength	No	The integer value that determines the shortest string allowed for a String-type parameter.
MaxValue	No	The numeric value that determines the maximum value allowed for a Number-type parameter.
MinValue	No	The numeric value that determines the minimum value allowed for a Number-type parameter.
NoEcho	No	Specifies whether to mask the parameter value when the GetStack operation is called. If you set this property to `true`, only asterisks (*) are returned.
Description	No	The string that describes the parameter.
ConstraintDescription	No	The description of the parameter constraints.
Label	No	The alias of the parameter, encoded in UTF-8. When you create a web form based on a template, the `Label` value can be mapped to the parameter name.

Parameter property	Required	Description
AssociationProperty	No	The associated resource property. If you specify this parameter property, ROS verifies whether the specified parameter value is valid and provides a list of valid values based on the associated resource property. Valid values: • `ALIYUN::ECS::Instance::ImageId` • `ALIYUN::ECS::Instance::ZoneId` • `ALIYUN::ECS::VPC::VPCId` • `ALIYUN::ECS::VSwitch::VSwitchId` For example, if you set `AssociationProperty` to `ALIYUN::ECS::Instance::ImageId`, ROS verifies whether the specified image ID is valid and lists other valid values in a drop-down list.
Confirm	No	Specifies whether to enter the parameter value for a second time if the NoEcho property is set to `true`. Default value: `false`. **Notice** The Confirm property can be set to `true` only when it is used with a String-type parameter and when the NoEcho parameter is set to `true`.

Examples

In the following example, two parameters are defined in the Parameters section:

- `username`
  - Type: String
  - Valid values:
    - `anonymous`
    - `user-one`
    - `user-two`
  - Length: 6 to 12 characters

  Notice The default value `anonymous` must also meet the length and valid value requirements.
- `password`
  - Type: String
  - Length: 1 to 41 characters
  - The password can contain letters and digits.
  - If you set the NoEcho property to `true`, the GetStack operation does not return parameter values.

```
"Parameters": {
  "username": {
    "Label": "Username"
    "Description": "Enter the username"
    "Default": "anonymous",
    "Type": "String",
    "MinLength": "6",
    "MaxLength": "12",
    "AllowedValues": ["anonymous", "user-one", "user-two"]
  },
  "password": {
    "Label": "Password"
    "NoEcho": "True",
    "Description": "Enter the password"
    "Type": "String",
    "MinLength": "1",
    "MaxLength": "41",
    "AllowedPattern": "[a-zA-Z0-9]*"
  }
}
```

Pseudo parameters

Pseudo parameters are internal parameters provided by the ROS engine. They can be referenced in the same manner as user-defined parameters, and their values are determined when ROS is running. The following pseudo parameters are supported:

- `ALIYUN::StackName` : the name of the stack.
- `ALIYUN::StackId` : the ID of the stack.
- `ALIYUN::Region` : the region where the stack resides.
- A `LIYUN::AccountId` : the account ID of the stack.
- `ALIYUN::NoValue` : specifies whether the specific resource property is deleted when the resource is created or updated.

5.4.3. Resources

This topic describes the properties of each resource and dependencies between resources in a stack. A resource can be referenced by other resources and output items.

Syntax

Each resource consists of an ID and a description. All resource descriptions are enclosed in braces {}. Multiple resources are separated by commas (,). The following sample code shows the Resources syntax:

```
"Resources" : {
  "Resource1 ID" : {
    "Type" : "The resource type",
    "Condition": "The condition that specifies whether to create the resource",
    "Properties" : {
      The description of the resource properties
    }
  },
  "Resource2 ID" : {
    "Type" : "The resource type",
    "Condition": "The condition that specifies whether to create the resource",
    "Properties" : {
      The description of the resource properties
    }
  }
}
```

Parameter description:

- The resource ID must be unique within the template. You can use the resource ID to reference the resource in other parts of the template.
- The Type parameter specifies the type of the resource that is being declared. For example, ALIYUN::ECS::Instance indicates that the resource is an Elastic Cloud Service (ECS) instance.
- The Properties section provides additional options that you can specify for a resource. For example, you must specify an image ID for each ECS instance. The image ID is one of the resource properties.

Examples

```
"Resources" : {
 "ECSInstance" : {
  "Type" : "ALIYUN::ECS::Instance",
  "Properties" : {
   "ImageId" : "m-25l0r****"
  }
 }
}
```

If a resource does not need properties to be declared, omit the Properties section of that resource.

Property values can be text strings, string lists, Boolean values, referenced parameters, or return values of functions.

The following example shows how to declare different types of property values:

```
"Properties" : {
  "String" : "string",
  "LiteralList" : [ "value1", "value2" ],
  "Boolean" : "true"
  "ReferenceForOneValue" : { "Ref" : "ResourceID" },
  "FunctionResultWithFunctionParams" : {
    "Fn::Join" : [ "%", [ "Key=", { "Ref" : "SomeParameter" } ] ] }
}
```

DeletionPolicy

The DeletionPolicy parameter specifies whether to retain a resource when its stack is deleted. The following sample code shows how to use the DeletionPolicy parameter to retain an ECS instance when its stack is deleted:

```
"Resources" : {
 "ECSInstance" : {
  "Type" : "ALIYUN::ECS::Instance",
  "Properties" : {
   "ImageId" : "m-25l0r****"
  },
  "DeletionPolicy" : "Retain"
 }
}
```

DependsOn

The DependsOn parameter allows you to create a specific resource after you create its dependent resource. If you specify the DependsOn parameter for a resource, the resource is created only after its dependent resource specified by the DependsOn parameter is created.

In the following example, WebServer is created only after DatabaseServer is created:

```
{
 "ROSTemplateFormatVersion" : "2015-09-01",
 "Resources" : {
  "WebServer": {
   "Type": "ALIYUN::ECS::Instance",
   "DependsOn": "DatabseServer"
  },
  "DatabseServer": {
   "Type": "ALIYUN::ECS::Instance",
   "Properties": {
    "ImageId" : "m-25l0r****",
    "InstanceType": "ecs.t1.small"
   }
  }
 }
}
```

Condition

The Condition parameter specifies whether to create the resource. The resource can be created only when the Condition parameter is set to true.

In the following example, WebServer is created only if the condition determined by the MaxAmount parameter is true:

```
{
 "ROSTemplateFormatVersion" : "2015-09-01",
 "Parameters": {
  "MaxAmount": {
   "Type": "Number",
   "Default": 1
  }
 },
 "Conditions": {
  "CreateWebServer": {"Fn::Not": {"Fn::Equals": [0, {"Ref": "MaxAmount"}]}}
 }
 "Resources" : {
  "WebServer": {
   "Type": "ALIYUN::ECS::InstanceGroup",
   "Condition": "CreateWebServer",
   "Properties": {
    "ImageId" : "m-25l0r****",
    "InstanceType": "ecs.t1.small"
    "MaxAmount": {"Ref": "MaxAmount"}
   }
  },
  "DatabseServer": {
   "Type": "ALIYUN::ECS::Instance",
   "Properties": {
    "ImageId" : "m-25l0r****",
    "InstanceType": "ecs.t1.small"
   }
  }
 }
}
```

Resource declaration example

The following example shows how to declare a resource:

```
"Resources" : {
  "WebServer": {
   "Type": "ALIYUN::ECS::Instance",
   "Properties": {
    "ImageId" : "m-25l0r****",
    "InstanceType": "ecs.t1.small",
    "SecurityGroupId": "sg-25zwc****",
    "ZoneId": "cn-beijing-b",
    "Tags": [{
      "Key": "Department1",
      "Value": "HumanResource"
    },{
      "Key": "Department2",
      "Value": "Finance"
    }
    ]
   }
  },
  "ScalingConfiguration": {
   "Type": "ALIYUN::ESS::ScalingConfiguration",
   "Properties": {
    "ImageId": "ubuntu1404_64_20G_aliaegis_2015****.vhd",
    "InstanceType": "ecs.t1.small",
    "InstanceId": "i-25xhh****",
    "InternetChargeType": "PayByTraffic",
    "InternetMaxBandwidthIn": 1,
    "InternetMaxBandwidthOut": 20,
    "SystemDisk_Category": "cloud",
    "ScalingGroupId": "bwhtvpcBcKYac9fe3vd0****",
    "SecurityGroupId": "sg-25zwc****",
    "DiskMappings": [
      {
        "Size": 10
      },
      {
        "Category": "cloud",
        "Size": 10
      }
    ]
   }
  }
}
```

5.4.4. Outputs

The Outputs section is used to define the values returned when the GetStack operation is called. For example, if you define an Elastic Compute Service (ECS) instance ID as an output item, the ECS instance ID is returned when the GetStack operation is called.

Syntax

Each output item consists of an ID and a description. All output descriptions are enclosed in braces {}. Multiple output items are separated by commas (,). Each output item can have multiple values in an array format. The following example shows the Outputs syntax:

```
"Outputs" : {
 "Output1 ID" : {
  "Description": "The description of the output item",
  "Condition": "The condition that specifies whether to provide resource properties",
  "Value": "The output value expression"
 },
 "Output2 ID" : {
  "Description": "The description of the output item",
  "Condition": "The condition that specifies whether to provide resource properties",
  "Value" : [
   "Output value expression 1",
   "Output value expression 2",
   ...
  ]
 }
}
```

- Output ID: the ID of the output item. Duplicate IDs are not allowed within a template.
- Description: optional. The description of the output item.
- Value: required. The value returned when the GetStack operation is called.
- Condition: optional. The condition that specifies whether to create a resource and provide its information. The resource is created and its information is provided only when the specified condition is `true`.

  In the following example, WebServer is created only if the condition determined by the MaxAmount parameter is true:

```
{
 "ROSTemplateFormatVersion" : "2015-09-01",
 "Parameters": {
  "MaxAmount": {
   "Type": "Number",
   "Default": 1
  }
 },
 "Conditions": {
  "CreateWebServer": {"Fn::Not": {"Fn::Equals": [0, {"Ref": "MaxAmount"}]}}
 }
 "Resources" : {
  "WebServer": {
   "Type": "ALIYUN::ECS::InstanceGroup",
   "Condition": "CreateWebServer",
   "Properties": {
    "ImageId" : "m-25l0r****",
    "InstanceType": "ecs.t1.small"
    "MaxAmount": {"Ref": "MaxAmount"}
   }
  }
 }
 "Outputs": {
  "WebServerIP": {
   "Condition": "CreateWebServer",
   "Value": {
    "Fn::GetAtt": ["WebServer", "PublicIps"]
   }
  }
 }
}
```

Examples

The following example contains two output items:

- The InstanceId value of WebServer
- The PublicIp and PrivateIp values of WebServer

```
"Outputs": {
 "InstanceId": {
  "Value" : {"Fn::GetAtt": ["WebServer", "InstanceId"]}
 },
 "PublicIp & PrivateIp": {
  "Value" : [
   {"Fn::GetAtt": ["WebServer", "PublicIp"]},
   {"Fn::GetAtt": ["WebServer", "PrivateIp"]}
  ]
 }
}
```

5.4.5. Functions

Resource Orchestration Service (ROS) provides several built-in functions to help you manage stacks. You can use built-in functions to define Resources and Outputs.

Fn::Base64Encode

The Fn::Base64Encode function is used to return the Base64 representation of the input string.

- Declaration

  ```
  "Fn::Base64Encode": "stringToEncode"
  ```

- Parameters

  `stringToEncode` : the string to be encoded in Base64.

- Return value

  The Base64 representation of the input string.

- Examples

  ```
  {"Fn::Base64Encode": "string to encode"}
  ```

  `c3RyaW5nIHRvIGVuY29kZQ==` is returned in this example.

Fn::Base64Decode

The Fn::Base64Decode function is used to return a string decoded from a Base64-encoded string.

- Declaration

  ```
  {"Fn::Base64Decode": "stringToEncode"}
  ```

- Parameters

  `stringToDecode` : the string decoded from the Base64-encoded string.

- Return value

  The string decoded from the Base64-encoded string.

- Examples

  ```
  {"Fn::Base64Decode": "c3RyaW5nIHRvIGVuY29kZQ=="}
  ```

`string to encode` is returned in this example.

Fn::Base64

The Fn::Base64 function returns the Base64 representation of the input string.

- Declaration

  `"Fn::Base64": stringToEncode`

- Parameters

  valueToEncode: the string to be encoded in Base64.

- Return value

  The Base64 representation of the input string.

- Examples

  `"Fn::Base64":"string to encode"`

Fn::FindInMap

The Fn::FindInMap function is used to return the values based on keys in a two-level mapping that is declared in the Mappings section.

- Declaration

  ```
  "Fn::FindInMap": ["MapName", "TopLevelKey", "SecondLevelKey"]
  ```

- Parameters
  - `MapName` : the ID of a mapping declared in the Mappings section that contains keys and values.
  - `TopLevelKey` : the top-level key name. The value is a list of key-value pairs.
  - `SecondLevelKey` : the second-level key name. The value is a string or a number.

- Return value

  The value that is assigned to the SecondLevelKey parameter.

- Examples

  The ImageId property must be specified when you create a WebServer instance. The Mappings section describes the ImageId mappings by region. The Parameters section describes the regions that must be specified by template users. Fn::FindInMap finds the corresponding ImageId mapping in RegionMap based on the region specified by a user, and then finds the corresponding ImageId values in the mapping.
  - MapName can be set to a custom value, which is `RegionMap` in this example.
  - TopLevelKey is set to the region where the stack is created, which is `{"Ref":"regionParam"}` in this example.
  - SecondLevelKey is set to the required architecture, which is `32` in this example.

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Parameters": {
  "regionParam": {
   "Description": "The region where the ECS instance is created",
   "Type": "String",
   "AllowedValues": [
    "hangzhou",
    "beijing"
   ]
  }
 },
 "Mappings": {
  "RegionMap": {
   "hangzhou": {
    "32": "m-25l0rcfjo",
    "64": "m-25l0rcfj1"
   },
   "beijing": {
    "32": "m-25l0rcfj2",
    "64": "m-25l0rcfj3"
   }
  }
 },
 "Resources": {
  "WebServer": {
   "Type": "ALIYUN::ECS::Instance",
   "Properties": {
    "ImageId": {
     "Fn::FindInMap": [
      "RegionMap",
      {"Ref": "regionParam"},
      "32"
     ]
    },
    "InstanceType": "ecs.t1.small",
    "SecurityGroupId": "sg-25zwc****",
    "ZoneId": "cn-beijing-b",
    "Tags": [
     {
      "Key": "key1",
      "Value": "value1"
     },
     {
      "Key": "key2",
      "Value": "value2"
     }
    ]
   }
  }
 }
}
```

- Supported functions
  - Fn::FindInMap
  - Ref

Fn::GetAtt

The Fn::GetAtt function is used to return the value of a property from a resource in a template.

- Declaration

```
"Fn::GetAtt": ["resourceID", "attributeName"]
```

- Parameters
  - `resourceID`: the ID of the resource.
  - `attributeName`: the name of the resource property.
- Return value

  The value of the resource property.
- Examples

  The ImageId property of MyEcsInstance is returned in this example.

```
{"Fn::GetAtt" : ["MyEcsInstance" , "ImageID"]}
```

Fn::Join

The Fn::Join function is used to combine a set of values into a single value that is separated by a specified delimiter.

- Declaration

```
{"Fn::Join": ["delimiter", ["string1", "string2", ... ]]}
```

- Parameters
  - `delimiter`: the value used to divide the string. The delimiter value can be left blank so that all the values are directly combined.
  - `[ "string1", "string2", ... ]`: the list of values that are combined into a string.
- Return value

  The combined string.
- Examples

```
{"Fn::Join": [ ",", ["a", "b", "c"]]}
```

  `"a,b,c"` is returned in this example.
- Supported functions
  - Fn::Base64Encode
  - Fn::GetAtt
  - Fn::Join
  - Fn::Select
  - Ref

Fn::Select

The Fn::Select function is used to return a single data element from a list of data elements by using an index.

- Declaration
  - The following example assumes that the list of data elements is an array:

```
"Fn::Select": ["index", ["value1", "value2", ... ]]
```

  - The following example assumes that the list of data elements is a mapping table:

```
"Fn::Select": ["index", {"key1": "value1", ... }]
```

- Parameters

  `index` : the index of the object data element. If the list of data elements is an array, the index must be an integer ranging from 0 to N-1, where N indicates the number of elements in the array. If the list of data elements is a mapping table, the index must be a key in the mapping table.

  If the corresponding value of the index cannot be found, the system returns an empty string.

- Return value

  The object data element.

- Examples
  - The following example assumes that the list of data elements is an array:

    ```
    {"Fn::Select": ["1", ["apples", "grapes", "oranges", "mangoes"]]}
    ```

    `"grapes"` is returned in this example.
  - The following example assumes that the list of data elements is a mapping table:

    ```
    {"Fn::Select": ["key1", {"key1": "grapes", "key2": "mangoes"}]}
    ```

    `"grapes"` is returned in this example.
  - The following example assumes that the list of data elements is a comma-delimited list:

    ```
    "Parameters": {
     "userParam": {
      "Type": "CommaDelimitedList",
       "Default": "10.0.100.0/24, 10.0.101.0/24, 10.0.102.0/24"
     }
    }
    "Resources": {
     "resourceID": {
       "Properties": {
         "CidrBlock": {"Fn::Select": ["0", {"Ref": "userParam"}]}
      }
     }
    }
    ```

- Supported functions
  - For the Fn::Select index value, you can use the Ref function.
  - For the Fn::Select list of data elements, you can use the following functions:
    - Fn::Base64Encode
    - Fn::FindInMap
    - Fn::GetAtt
    - Fn::Join
    - Fn::Select
    - Ref

Ref

The Ref function is used to return the value of a specified parameter or resource.

If the specified parameter is a resource ID, the value of the resource is returned. Otherwise, the system returns the value of the specified parameter.

- Declaration

  ```
  "Ref": "logicalName"
  ```

- Parameters

  `logicalName`: the logical name of the resource or parameter that you want to reference.

- Return value

  The value of the resource or parameter.

- Examples

  The following example demonstrates how to use the Ref function to specify regionParam as the region parameter for RegionMap of WebServer:

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Parameters": {
  "regionParam": {
   "Description": "The region where the ECS instance is created",
   "Type": "String",
   "AllowedValues": [
    "hangzhou",
    "beijing"
   ]
  }
 },
 "Mappings": {
  "RegionMap": {
   "hangzhou": {
    "32": "m-25l0rcfjo",
    "64": "m-25l0rcfj1"
   },
   "beijing": {
    "32": "m-25l0rcfj2",
    "64": "m-25l0rcfj3"
   }
  }
 },
 "Resources": {
  "WebServer": {
   "Type": "ALIYUN::ECS::Instance",
   "Properties": {
    "ImageId": {
     "Fn::FindInMap": [
      "RegionMap",
      {"Ref": "regionParam"},
      "32"
     ]
    },
    "InstanceType": "ecs.t1.small",
    "SecurityGroupId": "sg-25zwc****",
    "ZoneId": "cn-beijing-b",
    "Tags": [
     {
      "Key": "tiantt",
      "Value": "ros"
     },
     {
      "Key": "tiantt1",
      "Value": "ros1"
     }
    ]
   }
  }
 }
}
```

- Supported function

  When you use the Ref function, you cannot use other functions in it at the same time. You must specify a string value for the logical ID of a resource.

Fn::GetAZs

The Fn::GetAZs function is used to return a list of zones for a specified region.

- Declaration

```
"Fn::GetAZs": "region"
```

- Parameters

  `region` : the ID of the region.

- Return value

  The list of zones within the specified region.

- Examples

  The following example demonstrates how to create an Elastic Compute Service (ECS) instance in the first zone of a specified region:

```
{
 "ROSTemplateFormatVersion" : "2015-09-01",
 "Resources" : {
  "WebServer": {
   "Type": "ALIYUN::ECS::Instance",
   "Properties": {
    "ImageId": "centos7u2_64_40G_cloudinit_2016****.raw",
    "InstanceType": "ecs.n1.tiny",
    "SecurityGroupId": "sg-2zedcm7ep5quses0****",
    "Password": "Ros1****",
    "AllocatePublicIP": true,
    "InternetChargeType": "PayByTraffic",
    "InternetMaxBandwidthIn": 100,
    "InternetMaxBandwidthOut": 100,
    "SystemDiskCategory": "cloud_efficiency",
    "IoOptimized": "optimized",
    "ZoneId": {"Fn::Select": ["0", {"Fn::GetAZs": {"Ref": "ALIYUN::Region"}}]}
   }
  }
 },
 "Outputs": {
  "InstanceId": {
     "Value": {"Fn::GetAtt": ["WebServer","InstanceId"]}
  },
  "PublicIp": {
     "Value": {"Fn::GetAtt": ["WebServer","PublicIp"]}
  }
 }
}
```

- Supported functions
  - Fn::Base64Encode
  - Fn::FindInMap
  - Fn::GetAtt
  - Fn::Join
  - Fn::Select
  - Ref

Fn::Replace

The Fn::Replace function is used to replace a specified substring contained in a string with a new substring.

- Declaration

```
{"Fn::Replace": [{"object_key": "object_value"}, "object_string"]}
```

- Parameters
  - `object_key` : the substring to be replaced.
  - `object_value` : the new substring to replace the previous substring.
  - `object_string` : the string whose `object_key` is replaced.
- Return value

  The string after replacement.
- Examples

  The following example demonstrates how to replace "print" with "echo" in the specified script:

```
{
 "ROSTemplateFormatVersion" : "2015-09-01",
 "Resources" : {
  "WebServer": {
   "Type": "ALIYUN::ECS::Instance",
   "Properties": {
    "ImageId" : "centos_7_2_64_40G_base_2017****.vhd",
    "InstanceType": "ecs.n1.medium",
    "SecurityGroupId": "sg-94q49****",
    "Password": "MytestPassword****",
    "IoOptimized": "optimized",
    "VSwitchId": "vsw-94vdv8****",
    "VpcId": "vpc-949uz****",
    "SystemDiskCategory": "cloud_ssd",
    "UserData": {"Fn::Replace": [{"print": "echo"},
    {"Fn::Join": ["", [
       "#!/bin/sh\n",
       "mkdir ~/test_ros\n",
       "print hello > ~/1.txt\n"
     ]]}]}
   }
  }
 },
 "Outputs": {
  "InstanceId": {
     "Value" : {"Fn::GetAtt": ["WebServer","InstanceId"]}
  },
  "PublicIp": {
     "Value" : {"Fn::GetAtt": ["WebServer","PublicIp"]}
  }
 }
}
```

- Supported functions
  - Fn::Base64Encode
  - Fn::GetAtt
  - Fn::Join
  - Fn::Select
  - Ref

Fn::Split

The Fn::Split function is used to split a string into a list of values separated by a specified delimiter and return the list.

- Declaration

  ```
  "Fn::Split": ["delim", "original_string"]
  ```

- Parameters
  - `delim` : the specified delimiter, which can be a comma (,), semicolon (;), line break (\n), or indent (\t).
  - `original_string` : the string to be split.
- Return value

  A list of string values.
- Examples
  - The following example assumes that the list of data elements is an array:

    ```
    {"Fn::Split": [";", "foo; bar; achoo"]}
    ```

    `["foo", " bar", "achoo "]` is returned in this example.
  - The following example demonstrates how to use Fn::Split to split InstanceIds:

    ```
    {
     "Parameters": {
      "InstanceIds": {
       "Type": "String",
       "Default": "instane1_id,instance2_id,instance2_id"
      }
     },
     "Resources": {
      "resourceID": {
       "Type": "ALIYUN::SLB::BackendServerAttachment",
       "Properties": {
        "BackendServerList": {
         "Fn::Split": [
          ",",
          {
           "Ref": "InstanceIds"
          }
         ]
        }
       }
      }
     }
    }
    ```

- Supported functions
  - Fn::Base64Encode
  - Fn::FindInMap
  - Fn::GetAtt
  - Fn::Join
  - Fn::Select
  - Fn::Replace
  - Fn::GetAZs
  - Fn::If
  - Ref

Fn::Equals

The Fn::Equals function is used to compare whether two values are equal. If the two values are equal, true is returned. If the two values are not equal, false is returned.

- Declaration

```
{"Fn::Equals": ["value_1", "value_2"]}
```

- Parameters

  `value` : the values to be compared.

- Return value

  true or false.

- Examples

  The following example demonstrates how to use Fn::Equals to define a condition in the Conditions section:

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Parameters": {
  "EnvType": {
   "Default": "pre",
   "Type": "String"
  }
 },
 "Conditions": {
  "TestEqualsCond": {
   "Fn::Equals": [
    "prod",
    {"Ref": "EnvType"}
   ]
  }
 }
}
```

- Supported functions
  - Fn::Or
  - Fn::Not
  - Fn::Equals
  - Fn::FindInMap
  - Fn::And
  - Ref

Fn::And

The Fn::And function is used to represent the AND operator, and must contain at least two conditions. If all the specified conditions are evaluated as true, true is returned. If any condition is evaluated as false, false is returned.

- Declaration

```
{"Fn::And": ["condition", {...}]}
```

- Parameters

  `condition` : the condition to be evaluated.

- Return value

  true or false.

- Examples

  The following example demonstrates how to use Fn::And to define a condition in the Conditions section:

```
{
 "ROSTemplateFormatVersion" : "2015-09-01",
 "Parameters":{
  "EnvType":{
   "Default":"pre",
   "Type":"String"
  }
 },
 "Conditions": {
  "TestEqualsCond": {"Fn::Equals": ["prod", {"Ref": "EnvType"}]},
  "TestAndCond": {"Fn::And": ["TestEqualsCond", {"Fn::Equals": ["pre", {"Ref": "EnvType"}]}]}
 }
}
```

- Supported functions
  - Fn::Or
  - Fn::Not
  - Fn::Equals
  - Fn::FindInMap
  - Fn::And
  - Ref

Fn::Or

The Fn::Or function is used to represent the OR operator, and must contain at least two conditions. If any specified condition is evaluated as true, true is returned. If all the conditions are evaluated as false, false is returned.

- Declaration

```
{"Fn::Or": ["condition", {...}]}
```

- Parameters

  `condition` : the condition to be evaluated.

- Return value

  true or false.

- Examples

  The following example demonstrates how to use Fn::Or to define a condition in the Conditions section:

```
{
 "ROSTemplateFormatVersion" : "2015-09-01",
 "Parameters":{
  "EnvType":{
   "Default":"pre",
   "Type":"String"
  }
 },
 "Conditions": {
  "TestEqualsCond": {"Fn::Equals": ["prod", {"Ref": "EnvType"}]},
  "TestOrCond": {"Fn::And": ["TestEqualsCond", {"Fn::Equals": ["pre", {"Ref": "EnvType"}]}]}
 }
}
```

- Supported functions
  - Fn::Or
  - Fn::Not

- Fn::Equals
- Fn::FindInMap
- Fn::And
- Ref

Fn::Not

The Fn::Not function is used to represent the NOT operator. If a condition is evaluated as false, true is returned. If a condition is evaluated as true, false is returned.

- Declaration

```
{"Fn::Not": "condition"}
```

- Parameters

  `condition`: the condition to be evaluated.

- Return value

  true or false.

- Examples

  The following example demonstrates how to use Fn::Not to define a condition in the Conditions section:

```
{
 "ROSTemplateFormatVersion" : "2015-09-01",
 "Parameters":{
  "EnvType":{
   "Default":"pre",
   "Type":"String"
  }
 },
 "Conditions": {
  "TestNotCond": {"Fn::Not": {"Fn::Equals": ["pre", {"Ref": "EnvType"}]}}
 }
}
```

- Supported functions
  - Fn::Or
  - Fn::Not
  - Fn::Equals
  - Fn::FindInMap
  - Fn::And
  - Ref

Fn::If

This function returns one of two possible values. If a specified condition is evaluated as true, one value is returned. If the specified condition is evaluated as false, the other value is returned. The property values of Resources and Outputs in templates support the Fn::If function. You can use the `ALIYUN::NoValue` pseudo parameter as the return value to delete the corresponding property.

- Declaration

```
{"Fn::If": ["condition_name", "value_if_true", "value_if_false"]}
```

- Parameters
  - `condition_name`: the name of the condition in the Conditions section. A condition is referenced by using the condition name.

- `value_if_true`: If the specified condition is evaluated as true, this value is returned.
- `value_if_false`: If the specified condition is evaluated as false, this value is returned.

- Examples

  The following example demonstrates how to determine whether to create a data disk based on input parameters:

```
{
  "ROSTemplateFormatVersion":"2015-09-01",
  "Parameters":{
    "EnvType":{
      "Default":"pre",
      "Type":"String"
    }
  },
  "Conditions":{
    "CreateDisk":{
      "Fn::Equals":[
        "prod",
        {
          "Ref":"EnvType"
        }
      ]
    }
  },
  "Resources":{
    "WebServer":{
      "Type":"ALIYUN::ECS::Instance",
      "Properties":{
        "DiskMappings":{
          "Fn::If":[
            "CreateDisk",
            [
              {
                "Category":"cloud_efficiency",
                "DiskName":"FirstDataDiskName",
                "Size":40
              },
              {
                "Category":"cloud_ssd",
                "DiskName":"SecondDataDiskName",
                "Size":40
              }
            ],
            {
              "Ref":"ALIYUN::NoValue"
            }
          ]
        },
        "VpcId":"vpc-2zew9pxh2yirtzqxd****",
        "SystemDiskCategory":"cloud_efficiency",
        "SecurityGroupId":"sg-2zece6wcqriejf1v****",
        "SystemDiskSize":40,
        "ImageId":"centos_6_8_64_40G_base_2017****.vhd",
        "IoOptimized":"optimized",
        "VSwitchId":"vsw-2zed9txvy7h2srqo6****",
        "InstanceType":"ecs.n1.medium"
      }
    }
```

```
  },
  "Outputs":{
    "InstanceId":{
      "Value":{
        "Fn::GetAtt":[
          "WebServer",
          "InstanceId"
        ]
      }
    },
    "ZoneId":{
      "Value":{
        "Fn::GetAtt":[
          "WebServer",
          "ZoneId"
        ]
      }
    }
  }
}
```

- Supported functions
  - Fn::Or
  - Fn::Not
  - Fn::Equals
  - Fn::FindInMap
  - Fn::And
  - Ref

Fn::ListMerge

The Fn::ListMerge function is used to merge multiple lists into one list.

- Declaration

```
{"Fn::ListMerge": [["list_1_item_1", "list_1_imte_2", ...], ["list_2_item_1", "list_2_imte_2", ...]]}
```

- Parameters
  - `["list_1_item_1", "list_1_imte_2", ...]` : the first list to merge.
  - `["list_2_item_1", "list_2_imte_2", ...]` : the second list to merge into the first list.
- Examples

  The following example demonstrates how to attach two ECS instance groups to a Server Load Balancer (SLB) instance:

```
{
 "ROSTemplateFormatVersion" : "2015-09-01",
 "Resources" : {
  "LoadBalancer": {
   "Type": "ALIYUN::SLB::LoadBalancer",
   "Properties": {
    "LoadBalancerName": "ros",
    "AddressType": "internet",
    "InternetChargeType": "paybybandwidth",
   }
  },
  "BackendServer1": {
   "Type": "ALIYUN::ECS::InstanceGroup",
   "Properties": {
    "ImageId" : "m-2ze9uqi7wo61hwep****",
    "InstanceType": "ecs.t1.small",
    "SecurityGroupId": "sg-2ze8yxgempcdsq3****",
    "MaxAmount": 1,
    "MinAmount": 1
   }
  },
  "BackendServer2": {
   "Type": "ALIYUN::ECS::InstanceGroup",
   "Properties": {
    "ImageId" : "m-2ze9uqi7wo61hwep****",
    "InstanceType": "ecs.t1.small",
    "SecurityGroupId": "sg-2ze8yxgempcdsq3iu****",
    "MaxAmount": 1,
    "MinAmount": 1
   }
  },
  "Attachment": {
   "Type": "ALIYUN::SLB::BackendServerAttachment",
   "Properties": {
    "LoadBalancerId": {"Ref": "LoadBalancer"},
    "BackendServerList": { "Fn::ListMerge": [
      {"Fn::GetAtt": ["BackendServer1", "InstanceIds"]},
      {"Fn::GetAtt": ["BackendServer2", "InstanceIds"]}
     ]
    }
   }
  }
 }
}
```

- Supported functions
  - Fn::Base64Encode
  - Fn::GetAtt
  - Fn::Join
  - Fn::Select
  - Ref
  - Fn::If

Fn::GetJsonValue

The Fn::GetJsonValue function is used to resolve a JSON string and obtain its key value from the first layer.

- Declaration

```
{"Fn::GetJsonValue": ["key", "json_string"]}
```

- Parameters
  - `key` : the key value.
  - `json_string` : the specified JSON string to be resolved.
- Examples

  In the following example, the WebServer instance executes UserData and returns a JSON string, and the WebServer2 instance then obtains the corresponding key value from the string.

```
{
 "ROSTemplateFormatVersion" : "2015-09-01",
 "Resources" : {
  "WebServer": {
   "Type": "ALIYUN::ECS::Instance",
   "Properties": {
    "ImageId" : "m-2ze45uwova5fedlu****",
    "InstanceType": "ecs.n1.medium",
    "SecurityGroupId": "sg-2ze7pxymaix640qr****",
    "Password": "Wenqiao****",
    "IoOptimized": "optimized",
    "VSwitchId": "vsw-2zei67xd9nhcqxze****",
    "VpcId": "vpc-2zevx9ios1rszqv0a****",
    "SystemDiskCategory": "cloud_ssd",
    "UserData": {"Fn::Join": ["", [
       "#!/bin/sh\n",
       "mkdir ~/test_ros\n",
       "print hello > ~/1.txt\n",
       "Fn::GetAtt": ["WaitConHandle", "CurlCli"],
       "\n",
       "Fn::GetAtt": ["WaitConHandle", "CurlCli"],
       " -d '{\\"id\\" : \\"1\\", \\"data\\": [\\"1111\\", \\"2222\\"]}'\n"
     ]]},
    "PrivateIpAddress": "192.168.XX.XX",
    "HostName": "userdata-1
   }
  },
  "WaitConHandle": {
    "Type": "ALIYUN::ROS::WaitConditionHandle"
  },
  "WaitCondition": {
    "Type": "ALIYUN::ROS::WaitCondition",
    "Properties": {
     "Handle": {"Ref": "WaitConHandle"},
     "Timeout": 900
    }
  },
  "WebServer2": {
   "Type": "ALIYUN::ECS::Instance",
   "Properties": {
    "ImageId" : "m-2ze45uwova5fedlu****",
    "InstanceType": "ecs.n1.medium",
    "SecurityGroupId": "sg-2ze7pxymaix640qr****",
    "Password": "Wenqiao****",
    "IoOptimized": "optimized",
    "VSwitchId": "vsw-2zei67xd9nhcqxzec****",
    "VpcId": "vpc-2zevx9ios1rszqv0a****",
    "SystemDiskCategory": "cloud_ssd",
    "UserData":
```

```
      {"Fn::Join": ["", [
        "#!/bin/sh\n",
        "mkdir ~/test_ros\n",
        "echo hello > ~/1.txt\n",
        "server_1_token=",
        {"Fn::GetJsonValue": ["1", { "Fn::GetAtt": ["WaitCondition", "Data"]}]},
        "\n"
      ]]},
      "PrivateIpAddress": "192.168.XX.XX",
      "HostName": "userdata-2"
    }
   },
  },
 "Outputs": {
  "InstanceId": {
     "Value" : {"Fn::GetAtt": ["WebServer","InstanceId"]}
  },
  "PublicIp": {
     "Value" : {"Fn::GetAtt": ["WebServer","PublicIp"]}
  }
 }
}
```

- Supported functions
  - Fn::Base64Encode
  - Fn::GetAtt
  - Fn::Join
  - Fn::Select
  - Ref
  - Fn::If

Fn::MergeMapToList

The Fn::MergeMapToList function is used to merge multiple mappings into a list of mapping elements.

- Declaration

```
{"Fn::MergeMapToList": [{"key_1": ["key_1_item_1", "key_1_item_2", ...]}, {"key_2":["key_2_item_1", "key_2_item_2", ...]}, ... ]}
```

- Parameters
  - `{"kev 1": ["key_1_item_1", "key_1_item_2", ...]}` : the first mapping to merge. The `"key_1"` value must be a list. `"key_1"` is the key for each mapping in the list of merged mappings. The "key_1" value is `"key_1_item_1"` for the first merged mapping and `"key_1_item_2"` for the second merged mapping. All values follow the same format. The length of the final list of merged mappings is the length of the longest list `"key_x"` from all mappings being merged. If a `"key_y"` list is shorter, the last element of the list is repeated until the list is the longest.
  - `{"key_2": ["key_2_item_1", "kev 2 item_2", ...]}` : the second mapping to merge into the first mapping. The `"kev 2"` value must be a list. `"key_2"` is the kev for each mapping in the merged list. The "key_2" value is `"key_2_item_1"` for the first merged mapping and `"key_2_item_2"` for the second merged mapping. All values follow the same format.

- Examples

- The following example demonstrates how to merge three mappings. The length of the list based on the key values for each mapping is the same.

```
{
  "Fn::MergeMapToList": [
    {"key_1": ["kye_1_item_1", "kye_1_item_2"]},
    {"key_2": ["kye_2_item_1", "kye_2_item_2"]},
    {"key_3": ["kye_3_item_1", "kye_3_item_2"]}
  ]
}
```

  The following code shows the merged result:

```
[
  {
    "key_1": "kye_1_item_1",
    "key_2": "kye_2_item_1",
    "key_3": "kye_3_item_1"
  },
  {
    "key_1": "kye_1_item_2",
    "key_2": "kye_2_item_2",
    "key_3": "kye_3_item_2"
  }
]
```

- The length of the list based on the key values for each mapping varies in the following example:

```
{
  "Fn::MergeMapToList": [
    {"key_1": ["kye_1_item_1", "kye_1_item_2"]},
    {"key_2": ["kye_2_item_1", "kye_2_item_2", "key_2_item_3"]},
    {"key_3": ["kye_3_item_1", "kye_3_item_2"]}
  ]
}
```

  The following code shows the merged result:

```
[
  {
    "key_1": "kye_1_item_1",
    "key_2": "kye_2_item_1",
    "key_3": "kye_3_item_1"
  },
  {
    "key_1": "kye_1_item_2",
    "key_2": "kye_2_item_2",
    "key_3": "kye_3_item_2"
  },
  {
    "key_1": "kye_1_item_2",
    "key_2": "kye_2_item_3",
    "key_3": "kye_3_item_2"
  }
]
```

- In the following template example, all instances created in WebServer are added to the vServer group of an SLB instance:

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "WebServer": {
     "Type": "ALIYUN::ECS::InstanceGroupClone",
     "Properties": {
       "SourceInstanceId": "i-xxxxx",
       "Password": "Hello****",
       "MinAmount": 1,
       "MaxAmount": 1
     }
    },
    "CreateVServerGroup": {
      "Type": "ALIYUN::SLB::VServerGroup",
      "Properties": {
        "LoadBalancerId": "lb-****",
        "VServerGroupName": "VServerGroup-****",
        "BackendServers": {
          "Fn::MergeMapToList": [
            {"Port": [6666, 9090, 8080]},
            {"ServerId": {"Fn::GetAtt": ["WebServer", "InstanceIds"]}},
            {"Weight": [20, 100]}
          ]
        }
      }
    }
  }
}
```

- Supported functions
  - Fn::Base64Encode
  - Fn::GetAtt
  - Fn::Join
  - Fn::Select
  - Ref
  - Fn::If
  - Fn::ListMerge
  - Fn::GetJsonValue

Fn::Avg

The Fn::Avg function is used to return the average value of a set of numbers.

- Declaration

```
{"Fn::Avg": [ndigits, [number1, number2, ... ]]}
```

- Parameters
  - `ndigits`: the number of decimal places to display. This parameter value must be an integer.
  - `[number1, number2, ... ]`: the set of numbers for which the average value will be calculated. Each element in the group must be a number or a string that can be converted into a number.
- Return value

  The average value of the set of numbers.

- Examples

```
{ "Fn::Avg": [ 1, [1, 2, 6.0] ] }
{ "Fn::Avg": [ 1, ['1', '2', '6.0'] ] }
```

3.0 is returned in this example.

- Supported functions
  - Fn::GetAtt
  - Ref

Fn::SelectMapList

The Fn::SelectMapList function is used to return a list of map elements.

- Declaration

```
{"Fn::SelectMapList": ["key2", [{"key1": "value1-1", "key3": "value1-3"}, {"key1": "value2-1", "key2": "value2-2"}, {"key1": "value3-1", "key2": "value3-2"}, ...] ] }
```

- Parameters
  - `key2` : the key to be queried in the map.
  - `[{ "key1": "value1-1", "key3": "value1-3" }, ... ]` : the list of maps.
- Return value

  A list of key values for all maps in the map list.
- Examples

```
{
 "Fn::SelectMapList": [
  "key2",
  [
    {"key1": "value1-1", "key3": "value1-3"},
    {"key1": "value2-1", "key2": "value2-2"},
    {"key1": "value3-1", "key2": "value3-2"}
  ]
 ]
}
```

`["value2-2","value3-2"]` is returned in this example.

Fn::Add

The Fn::Add function is used to sum the values of parameters.

- Declaration

```
{"Fn::Add": [{"Product": "ROS"}, {"Fn": "Add"}]}
```

- Parameters
  - The parameters must be arranged as a list.
  - The parameters in the list can be of the Number, List, or Dictionary type. All the parameters must be of the same type. The list must contain at least two parameters.
- Return value

  If the parameter values are numbers, sum the parameter values. If the parameter values are lists, concatenate the values. If the parameter values are dictionaries, merge the values. If the two parameters have the same key, overwrite the former parameter value with the latter.
- Examples

```
{
 "Fn::Add": [
  {"Product": "ROS"},
  {"Fn": "Add"}
 ]
}
```

`{"Fn":"Add","Product":"ROS"}` is returned in this example.

5.4.6. Mappings

The Mappings section is a key-value mapping table. When mappings are used in resource and output definitions, use Fn::FindInMap to find their values by specifying corresponding keys.

Syntax

A mapping consists of key-value pairs, where both the keys and values can be strings or numbers. Multiple mappings are separated by commas (,). Each mapping name must be unique. Mappings must be pure data and cannot parse functions.

Examples

The following example shows a correct mapping definition:

```
"Mappings": {
  "ValidMapping": {
    "TestKey1": {"TestValu1": "value1"},
    "TestKey2": {"TestValu2": "value2"},
    1234567890: {"TestValu3": "value3"},
    "TestKey4": {"TestValu4": 1234}
  }
}
```

The following example shows an incorrect mapping definition:

```
"Mappings": {
  "InvalidMapping1": {
    "ValueList": ["foo", "bar"],
     "ValueString": "baz"
  },
  "InvalidMapping2": ["foo", {"bar" : "baz"}],
  "InvalidMapping3": "foobar"
}
```

The following example shows how to use Fn::FindInMap to find the return value:

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Parameters": {
  "regionParam": {
   "Description": "The region where the ECS instance is created",
   "Type": "String",
   "AllowedValues": [
    "hangzhou",
    "beijing"
   ]
  }
 },
 "Mappings": {
  "RegionMap": {
   "hangzhou": {
    "32": "m-25l0rcfjo",
    "64": "m-25l0rcfj1"
   },
   "beijing": {
    "32": "m-25l0rcfj2",
    "64": "m-25l0rcfj3"
   }
  }
 },
 "Resources": {
  "WebServer": {
   "Type": "ALIYUN::ECS::Instance",
   "Properties": {
    "ImageId": {
     "Fn::FindInMap": [
      "RegionMap",
      {
       "Ref": "regionParam"
      },
      "32"
     ]
    },
    "InstanceType": "ecs.t1.small",
    "SecurityGroupId": "sg-25zwc****",
    "ZoneId": "cn-beijing-b",
    "Tags": [
     {
      "Key": "Department1",
      "Value": "HumanResource"
     },
     {
      "Key": "Department2",
      "Value": "Finance"
     }
    ]
   }
  }
 }
}
```

5.4.7. Conditions

Condition bodies are defined by Fn::And, Fn::Or, Fn::Not, and Fn::Equals operators. These operators, along with the parameters that you specify when you create or update a stack, are used to evaluate each condition. You can reference other conditions, parameters, and mappings in your condition. Conditions are used in resource and output definitions to establish dependencies. Use Fn::If or Condition in resource and output definitions to implement conditions.

Syntax

Each condition consists of a condition name and a condition body. The condition name is a string. The condition body starts with Fn::And, Fn::Or, Fn::Not, or Fn::Equals. You can reference other conditions in your condition. Separate multiple conditions with comma (,). Each condition name must be unique.

The following functions can be used, but not as the outermost functions:

"Fn::Select", "Fn::Join", "Fn::Split", "Fn::Replace","Fn::Base64Encode", "Fn::Base64Decode", "Fn::MemberListToMap","Fn::If", "Fn::ListMerge", "Fn::GetJsonValue", "Fn::MergeMapToList","Fn::SelectMapList", "Fn::Add", "Fn::Avg", "Fn::Str", "Fn::Calculate","Ref"(parameter references only), and "Fn:: FindInMap".

Examples

- The following example shows how to define conditions:

```
"Conditions" : {
    "DevEnv": {"Fn::Equals": ["Dev", {"Ref": "EnvType"}]},
    "UTEnv": {"Fn::Equals": ["UT", {"Ref": "EnvType"}]},
    "PREEnv": {"Fn::Not": {"Fn::Or": ["DevEnv", "UTEnv"]}},
    "ProdEnv": {"Fn::And": [{"Fn::Equals": ["Prod", {"Ref": "EnvType"}]}, "PREEnv"]}
}
```

- The following example shows how to use conditions in a resource definition.

  In this example, a condition is used to determine whether to create a data disk and an Object Storage Service (OSS) bucket for an Elastic Compute Service (ECS) instance based on the EnvType value.

```
{
  "ROSTemplateFormatVersion":"2015-09-01",
  "Parameters":{
    "EnvType":{
      "Default":"pre",
      "Type":"String"
    }
  },
  "Conditions":{
    "CreateProdRes":{
      "Fn::Equals":[
        "prod",
        {
          "Ref":"EnvType"
        }
      ]
    }
  },
  "Resources":{
    "WebServer":{
      "Type":"ALIYUN::ECS::Instance",
      "Properties":{
        "DiskMappings":{
          "Fn::If":[
            "CreateProdRes",
            [
              {
                "Category":"cloud_efficiency",
```

```
            "DiskName":"FirstDataDiskName",
            "Size":40
          },
          {
            "Category":"cloud_ssd",
            "DiskName":"SecondDataDiskName",
            "Size":40
          }
        ],
        {
          "Ref":"ALIYUN::NoValue"
        }
      ]
    },
    "VpcId":"vpc-2zew9pxh2yirtzqxd****",
    "SystemDiskCategory":"cloud_efficiency",
    "SecurityGroupId":"sg-2zece6wcqriejf1v****",
    "SystemDiskSize":40,
    "ImageId":"centos_6_8_64_40G_base_2017****.vhd",
    "IoOptimized":"optimized",
    "VSwitchId":"vsw-2zed9txvy7h2srqo6****",
    "InstanceType":"ecs.n1.medium"
  }
 },
 "OssBucket": {
  "Type": "ALIYUN::OSS::Bucket",
  "Condition": "CreateProdRes",
  "Properties": {
   "AccessControl": "private",
   "BucketName": "myprodbucket"
  }
 }
},
"Outputs":{
 "InstanceId":{
  "Value":{
   "Fn::GetAtt":[
    "WebServer",
    "InstanceId"
   ]
  }
 },
 "OssDomain":{
  "Condition": "CreateProdRes",
  "Value":{
   "Fn::GetAtt":[
    "OssBucket",
    "DomainName"
   ]
  }
 }
}
}
```

5.5. Resource types

5.5.1. ECS

5.5.1.1. ALIYUN::ECS::AutoSnapshotPolicy

ALIYUN::ECS::AutoSnapshotPolicy is used to create an automatic snapshot policy.

Statement

```
{
 "Type" : "ALIYUN::ECS::AutoSnapshotPolicy",
 "Properties" : {
  "TimePoints" : String,
  "RepeatWeekdays" : String,
  "RetentionDays" : Integer,
  "DiskIds" : String,
  "AutoSnapshotPolicyName" : String
 }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
TimePoints	List	Retained	Yes	The points in time at which automatic snapshots are created. Unit: hours.	Value range:[0, 23], represents 24 time points from 00:00 to 23:00. For example: `1` indicating 01:00. To schedule multiple automatic snapshot creation tasks in a day, you can set the TimePoints parameter as an array. • The maximum number of time points allowed is 24. • Use one format for multiple time points like [0, 1,... 23]. Separate time points with commas (,).

Parameter	Type	Required	Editable	Description	Constraint
RepeatWeekdays	List	Retained	Yes	The days of a week on which automatic snapshots are created.	Value range:[1, 7], `1` indicates Monday. To schedule multiple automatic snapshot creation tasks in a week, you can set the RepeatWeekdays parameter as an array. • You can specify up to 7 days over a one week period. • Use one format for multiple time points like [1, 2,... 7]. Separate the time points with commas (,).
RetentionDays	Integer	Retained	Yes	The number of days for which you want to retain automatic snapshots.	Default value: -1. Valid values: • -1: The automatic snapshots are retained indefinitely. • [1, 65536]: The automatic snapshots are retained for the specified number of days. Default value: -1.

Parameter	Type	Required	Editable	Description	Constraint
DiskIds	List	Retained	Yes	The ID of the destination disk. When you want to apply the automatic snapshot policy to multiple disks, you can set the diskids "d-zzzzzzzzz"]. Separate multiple disk IDs with commas (,).	None
AutoSnapshotPolicyName	String	Yes	True	The name of the automatic snapshot policy.	• The name must be 2 to 128 characters in length • It can contain letters, digits, colons (:), underscores (_), and hyphens (-). • It cannot start with http:// or https://. This parameter is empty by default.

Response parameters

Fn::GetAtt

AutoSnapshotPolicyId: the ID of the automatic snapshot policy.

Sample request

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Resources": {
  "AutoSnapshotPolicy": {
   "Type": "ALIYUN::ECS::AutoSnapshotPolicy",
   "Properties": {
    "TimePoints": ["0"],
    "RepeatWeekdays": ["1"],
    "RetentionDays": 10,
    "DiskIds": ["<DiskId>"],
    "AutoSnapshotPolicyName": "MyAutoSnapshotPolicy"
   }
  }
 }
}
```

5.5.1.2. ALIYUN::ECS::BandwidthPackage

ALIYUN::ECS::BandwidthPackage is used to create a service plan for a NAT gateway.

Syntax

```
{
 "Type": "ALIYUN::ECS::BandwidthPackage",
 "Properties": {
  "Description": String,
  "NatGatewayId": String,
  "ZoneId": String,
  "BandwidthPackageName": String,
  "Bandwidth": Integer,
  "IpCount": Integer
 }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
NatGatewayId	String	Yes	No	The ID of the NAT gateway to which you want to bind the service plan.	None
Bandwidth	Integer	Yes	No	The bandwidth.	Valid values: 5 to 5000. Unit: Mbit/s. Default value: 5.
IpCount	Integer	Yes	No	The number of public IP addresses assigned to the NAT gateway.	Valid values: 1 to 5.
Description	String	No	No	The description of the service plan.	The description must be 2 to 256 characters in length.
ZoneId	String	No	No	The ID of the zone where the NAT gateway resides.	None

Property	Type	Required	Editable	Description	Constraint
BandwidthPackageName	String	No	No	The name of the service plan.	The name must be 2 to 128 characters in length and can contain letters, digits, underscores (_), hyphens (-), and periods (.). It must start with a letter.

Response parameters

Fn::GetAtt

- BandwidthPackageId: the ID of the service plan.
- BandwidthPackageIps: all IP addresses included in the service plan.

Examples

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Resources": {
  "BandwidthPackage": {
   "Type": "ALIYUN::ECS::BandwidthPackage",
   "Properties": {
    "BandwidthPackageName": "pkg_2",
    "Description": "my_bandwidth",
    "NatGatewayId": "ngw-h1xox****",
    "IpCount": 2,
    "Bandwidth": 5,
    "ZoneId": "cn-beijing-c"
   }
  }
 },
 "Outputs": {
  "BandwidthPackageId": {
     "Value": {"Fn::GetAttr": ["BandwidthPackage","BandwidthPackageId"]}
  },
  "BandwidthPackageIps": {
     "Value": {"Fn::GetAttr": ["BandwidthPackage","BandwidthPackageIps"]}
  }
 }
}
```

5.5.1.3. ALIYUN::ECS::Command

ALIYUN::ECS::Command is used to create a Cloud Assistant command.

Statement

```
{
 "Type": "ALIYUN::ECS::Command",
 "Properties": {
  "Name": String,
  "WorkingDir": String,
  "CommandContent": String,
  "Timeout": Integer,
  "Type": String,
  "Description": String
 }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
Name	String	Yes	True	The name of the command, which supports all character sets. The name can be up to 30 characters in length.	None
WorkingDir	String	Yes	True	The working directory on the ECS instance where the command will be run.	None
CommandContent	String	Yes	Released	The Base64-encoded content of the command. When you specify request parameters `Type` you must also specify this parameter. The parameter value must be Base64-encoded and cannot exceed 16 KB in size after encoding.	None
Timeout	String	No.	True	The timeout period that is specified for the command to run on ECS instances. Unit: seconds. If the command fails to run within the specified period, the command execution will time out and the process will be forcibly terminated. Default value: 3600.	None

Parameter	Type	Required	Editable	Description	Constraint
Type	String	No	No	The command type. Valid values: • RunBatScript: Creates a Bat script for a Windows instance. • RunPowerShellScript: Create a PowerShell script to run on a Windows instance. • RunShellScript: Creates a Shell script for Linux-based instances.	None
Description	String	Yes	True	The description of the command, which supports all character sets. The description can be up to 100 characters in length.	None

Response parameters

Fn::GetAtt

CommandId: the ID of the command.

Sample request

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Parameters": {
  "WorkingDir": {
   "Type": "String",
   "Description": "The path where command will be executed in the instance."
  },
  "CommandContent": {
   "Type": "String",
   "Description": "The content of command. Content requires base64 encoding. Maximum size support 16KB."
  },
  "Type": {
   "Type": "String",
   "Description": "The type of command."
  },
  "Description": {
   "Type": "String",
   "Description": "The description of command."
  },
  "Timeout": {
   "Type": "Number",
   "Description": "Total timeout when the command is executed in the instance. Input the time unit as second. Default is 3600s."
  },
  "Name": {
   "Type": "String",
   "Description": "The name of command."
  }
 },
 "Resources": {
```

```
  "Resources":{
   "Command":{
    "Type":"ALIYUN::ECS::Command",
    "Properties":{
     "WorkingDir":{
      "Ref":"WorkingDir"
     },
     "CommandContent":{
      "Ref":"CommandContent"
     },
     "Type":{
      "Ref":"Type"
     },
     "Description":{
      "Ref":"Description"
     },
     "Timeout":{
      "Ref":"Timeout"
     },
     "Name":{
      "Ref":"Name"
     }
    }
   }
  },
  "Outputs":{
   "CommandId":{
    "Description":"The id of command created.",
    "Value":{
     "Fn::GetAtt":[
      "Command",
      "CommandId"
     ]
    }
   }
  }
}
```

5.5.1.4. ALIYUN::ECS::CustomImage

ALIYUN::ECS::CustomImage is used to create a custom image.

Statement

```
{
 "Type": "ALIYUN::ECS::CustomImage",
 "Properties": {
  "Description": String,
  "InstanceId": String,
  "ImageName": String,
  "ImageVersion": String,
  "SnapshotId": String,
  "Tag": List,
  "ResourceGroupId": String,
  "Platform": String,
  "DiskDeviceMapping": List,
  "Architecture": String
 }
}
```

Properties

Parameter	Type	Required or Not	Editable	Description	Constraint
Description	String	Yes	Released	The description of the image.	The description can be up to 256 characters in length. This parameter is empty by default. It cannot start with http:// or https://.
InstanceId	String	Yes	Released	The ID of the ECS instance.	If this parameter is specified, an ECS instance will be used to create the custom image.
ImageName	String	Yes	Released	The name of the image.	The name must be 2 to 128 characters in length and can contain letters, digits, underscores (_), and hyphens(-). It must start with a letter but cannot start with http:// or https://.
ImageVersion	String	Yes	Released	The image version.	The image version must be 1 to 40 characters in length.
SnapshotId	String	Yes	Released	The ID of the snapshot.	• If this parameter is specified, a snapshot will be used to create the custom image. • If both this parameter and the InstanceId parameter are specified, this parameter will be ignored and an instance will be used to create the custom image.

Parameter	Type	Required or Not	Editable	Description	Constraint
Tags	List	Erased	Released	The tags of the image.	None
ResourceGroupId	String	Yes	Released	The ID of the resource group to which the custom image belongs.	None
Platform	String	Yes	Released	If you specify a data disk snapshot to be used to create the system disk of the custom image, you must use the Platform parameter to determine the release version of the operating system for the system disk.	None
DiskDeviceMapping	List	Erased	Released	The mappings between images and snapshots.	None
Architecture	String	Yes	Released	If you specify a data disk snapshot to be used to create the system disk of the custom image, you must use the Architecture parameter to determine the architecture of the system disk. Default value: x86_64.	Valid values: • i386 • x86_64

Tag syntax

```
"Tag": [
 {
  "Key": String,
  "Value": String
 }
]
```

Tag properties

Parameter	Type	Required or Not	Editable	Description	Constraint

Parameter	Type	Required or Not	Editable	Description	Constraint
Key	String	Yes	Released	The tag key of the image.	The tag key cannot be a null string. The key can be up to 64 characters in length. It cannot start with aliyun or acs: and cannot contain http:// or https://.
Value	String	Yes	Released	The tag value of the image.	The tag value can be an empty string. The value can be up to 128 characters in length. It cannot start with aliyun or acs: and cannot contain http:// or https://.

DiskDeviceMapping

```
"DiskDeviceMapping": [
 {
  "Device": String,
  "SnapshotId": String,
  "Size": Integer,
  "DiskType": String
 }
]
```

DiskDeviceMapping properties

Parameter	Type	Required or Not	Editable	Description	Constraint
Device	String	Yes	Released	The device name of disk N in the custom image.	The system allocates a device name in alphabetical order from /dev/xvda to /dev/xvdz.
SnapshotId	String	Yes	Released	The ID of the snapshot that is used to create the custom image.	None

Parameter	Type	Required or Not	Editable	Description	Constraint
Size	String	Optional	Released	The size of disk N. Unit: GiB.	Valid values: 5 to 2000. • The default value is the size of the snapshot specified by the DiskDeviceMapping.N.SnapshotId parameter. • If the DiskDeviceMapping.N.SnapshotId parameter is not specified, the default disk size is 5 GiB. • The disk size must be greater than or equal to the size of the snapshot specified by the DiskDeviceMapping.N.SnapshotId parameter.
DiskType	String	Yes	Released	The type of disk N in the custom image. You can specify this parameter to create the system disk of the custom image from a data disk snapshot. If you do not specify this parameter, the disk type is determined by the corresponding snapshot.	Valid values: • system: indicates a system disk. • data: indicates a data disk.

Response parameters

Fn::GetAtt

ImageId: the ID of the custom image.

Sample request

```
{
 "ROSTemplateFormatVersion": "2015-09-01",

5.5.1.5. ALIYUN::ECS::DedicatedHost

ALIYUN::ECS::DedicatedHost is used to create a dedicated host.

Statement

```
{
 "Type": "ALIYUN::ECS::DedicatedHost",
 "Properties": {
  "DedicatedHostType": String,
  "DedicatedHostName": String,
  "AutoReleaseTime": String,
  "Description": String,
  "AutoPlacement": String,
  "Tags": List,
  "ActionOnMaintenance": String,
  "NetworkAttributesSlbUdpTimeout": Integer,
  "ChargeType": String,
  "ResourceGroupId": String,
  "ZoneId": String,
  "NetworkAttributesUdpTimeout": Integer,
  "Quantity": Integer
 }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
DedicatedHostType	String	No	No	The dedicated host type.	None
DedicatedHostName	String	Yes	Released	The name of the dedicated host.	• The name must be 2 to 128 characters in length and can contain letters, digits, colons (:), underscores (_), and hyphens (-). • Must start with an uppercase or lowercase letter, and cannot start with `http://` or `https://` the beginning. • It can contain digits, colons (:), underscores (_), and hyphens (-).

Parameter	Type	Required	Editable	Description	Constraint
AutoReleaseTime	String	Yes	Released	The time scheduled for the dedicated host to be automatically released. If you do not specify the AutoReleaseTime parameter, the dedicated host will not be automatically released. • The minimum release time must be at least 30 minutes after the current time. • The maximum release time must be at most three years from the current time. • If the value of `ss` is not `00`, the start time is automatically rounded down to the nearest minute based on the value of `mm`.	None
Description	String	Yes	Released	The description of the dedicated host.	None
ZoneId	String	Yes	Released	The ID of the zone where the dedicated host resides. This parameter is empty by default. If this parameter is not specified, the system will automatically select a zone.	None
ChargeType	String	Yes	Released	The billing method of the dedicated host.	Valid values: PostPaid and pay-as-you-go.

Parameter	Type	Required	Editable	Description	Constraint
AutoPlacement	String	Yes	Released	Specifies whether to add the dedicated host to the resource pool for automatic deployment. If you do not specify a DedicatedHostId when you create an instance on a DDH, Alibaba Cloud automatically selects a DDH from the resource pool to host the instance.	Valid values: • on • off **Note** If you do not specify this parameter, the dedicated host is added to the automatic deployment resource pool. If you do not want to add the dedicated host to the resource pool for automatic deployment, set the value to off.
Tags	List	Erased	Released	The custom tags of the instance.	A maximum of 20 tags are supported. The format is as follows: `[{"Key": "tagKey", "Value": "tagValue"}, {"Key": "tagKey2", "Value": "tagValue2"}]`.

Parameter	Type	Required	Editable	Description	Constraint
ActionOnMaintenance	String	Yes	Released	The method used to migrate the instances on the DDH when the DDH fails or needs to be repaired online.	Valid valus: • Migrate: specifies that the instances are migrated to another physical server and restarted. • Stop: specifies that all the instances on the DDH are stopped. If the DDH cannot be repaired, the instances are migrated to another physical server and restarted. The default value is "Migrate" for a dedicated host and "Stop" for a local disk.
NetworkAttributesSlbUdpTimeout	String	Optional	Released	The timeout period for a UDP session.	Valid values: 15 to 310. Unit: seconds.
ResourceGroupId	String	Yes	Released	The ID of the resource group to which the dedicated host belongs.	None
NetworkAttributesUdpTimeout	String	Optional	Released	The timeout period for UDP sessions that users can access for cloud services running on the dedicated host.	Valid values: 15 to 310. Unit: seconds.
Quantity	String	Optional	Released	The number of DDHs that you want to create this time.	Valid values: 1 to 100. Default value: 1

Response parameters

Fn::GetAtt

- OrderId: the ID of the order.
- DedicatedHostIds: the list of host IDs.

Sample request

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Parameters": {
  "AutoRenewPeriod": {
   "Type": "Number",
   "Description": "The time period of auto renew. When the parameter InstanceChargeType is PrePaid, it will take effect. It could be 1, 2, 3, 6, 12\. Default value is 1.",
```

```
    "AllowedValues": [
     1,
     2,
     3,
     6,
     12

 }
}
```

5.5.1.6. ALIYUN::ECS::Disk

ALIYUN::ECS::Disk is used to create an ECS Disk.

Statement

```
{
 "Type": "ALIYUN::ECS::Disk",
 "Properties": {
  "DiskName": String,
  "Description": String,
  "Tags": List,
  "AutoSnapshotPolicyId": String,
  "Encrypted": Boolean,
  "ZoneId": String,
  "ResourceGroupId": String,
  "SnapshotId": String,
  "DiskCategory": String,
  "PerformanceLevel": String,
  "DeleteAutoSnapshot": Boolean,
  "Size": Integer
 }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	Yes	Released	The ID of the resource group to which the instance belongs.	None
ZoneId	String	No	No	The ID of the zone where the instance resides.	None

Parameter	Type	Required	Editable	Description	Constraint
DiskName	String	Yes	Released	The name of the disk.	• The name must be 2 to 128 characters in length • And can contain letters, digits, periods, underscores (_), and hyphens (-). • It cannot start with http:// or https://. • The disk name will be displayed in the ECS console.
Description	String	Yes	Released	The description of the disk.	• The description must be 2 to 256 characters in length. • Cannot `http://` or `https://` the beginning. • The disk description will be displayed in the ECS console.
Tags	List	Erased	Released	The custom tags of the instance.	Up to four tags are supported. Example values: `[{"Key": "tagKey", "Value": "tagValue"},{"Key": "tagKey2", "Value": "tagValue2"}]`.
DiskCategory	String	Yes	Released	The type of the data disk.	Value range • cloud: indicates a basic disk. • cloud_efficiency: indicates an ultra disk. • cloud_ssd: indicates a standard SSD. • cloud_essd: enhanced SSD (ESSD) Default value: cloud.

Parameter	Type	Required	Editable	Description	Constraint
SnapshotId	String	Yes	Released	The ID of the snapshot used to create the data disk.	• If both this parameter and 'Size' are specified, the value of this parameter prevails. • The actual size of the created disk is the size of the specified snapshot. • Snapshots created on or before July 15, 2013 cannot be used to create disks.
PerformanceLevel	String	Yes	Released	Specifies the performance level of an ESSD when you create the ESSD.	Default value: PL1. Valid values: • PL1: A single enhanced SSD delivers up to 50,000 random read/write IOPS. • PL2: A single ESSD delivers up to 100,000 random read/write IOPS. • PL3: maximum random read /write IOPS of 100,000 per disk.
Size	String	Optional	Released	The size of the disk. Unit: GiB. The value of this parameter must be equal to or greater than the capacity of the specified snapshot.	Valid values: • cloud: 5 to 2000 • cloud_efficiency: 20 to 32768 • cloud_ssd: 20 to 32768 • cloud_essd: 20 to 32768
AutoSnapshotPolicyId	String	Yes	Released	The ID of each automatic snapshot policy.	None
Encrypted	Boolean	Erased	Released	Specifies whether to encrypt the disk.	Valid values: • true • false Default value: false.

Parameter	Type	Required	Editable	Description	Constraint
DeleteAutoSnapshot	Boolean	Erased	Released	Specifies whether to delete the automatic snapshots of the disk when the disk is released.	Valid values: • true • false Default value: true.

Tags syntax

```
"Tags" : [
 {
  "Value" : String,
  "Key" : String
 }
]
```

Tags properties

Parameter	Type	Required	Editable
Key	String	No	No
Value	String	Yes	Released

Response parameters

Fn::GetAtt

- DiskId: the ID of the disk.
- Status: The Status of the disk.

Sample request

```
{
 "ROSTemplateFormatVersion" : "2015-09-01",
 "Resources" : {
  "DataDisk": {
   "Type": "ALIYUN::ECS::Disk",
   "Properties": {
    "Size": 10,
    "ZoneId": "cn-beijing-a",
    "DiskName": "DataDisk",
    "Description": "ECSDataDisk"
   }
  }
 },
 "Outputs": {
  "DiskId": {
     "Value" : {"Fn::GetAtt": ["DataDisk","DiskId"]}
  },
  "Status": {
     "Value" : {"Fn::GetAtt": ["DataDisk","Status"]}
  }
 }
}
```

5.5.1.7. ALIYUN::ECS::DiskAttachment

ALIYUN::ECS::DiskAttachment is used to attach an ECS disk.

Statement

```
{
  "Type" : "ALIYUN::ECS::DiskAttachment",
  "Properties" : {
    "DiskId" : String,
    "InstanceId" : String,
    "Device" : String,
    "DeleteWithInstance" : String
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
InstanceId	String	No	No	The ID of the instance.	None
DiskId	String	No	No	The ID of the disk.	The disk and the ECS instance must belong to the same zone.

Parameter	Type	Required	Editable	Description	Constraint
Device	String	Yes	Released	The name of the disk.	If you do not set this parameter, the system will automatically allocate a device name in alphabetical order from /dev/xvdb to /dev/xvdz.
DeleteWithInstance	Boolean	Erased	Released	Specifies whether the disk is to be released together with the instance.	Valid values: • true: The disk will be released when the instance is released. • false: The disk will be retained when the instance is released.

Response parameters

Fn::GetAtt

- DiskId: the ID of the disk.
- Status: The Status of the disk.
- The name of the Device: disk.

Sample request

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Resources": {
  "DiskAttachment": {
   "Type": "ALIYUN::ECS::DiskAttachment",
   "Properties": {
    "InstanceId": {
     "Ref": "InstanceId"
    },
    "Device": {
     "Ref": "Device"
    },
    "DeleteWithInstance": {
     "Ref": "DeleteWithInstance"
    },
    "DiskId": {
     "Ref": "DiskId"
    }
   }
  }
 },
 "Parameters": {
  "InstanceId": {
```

```
    "Type": "String",
    "Description": "The ID of the instance to attach the disk."
   },
   "Device": {
    "Type": "String",
    "Description": "The device where the volume is exposed on the instance. The device name could be /dev/xvd[a-z]. If th
is parameter is not specified, the default value will be used."
   },
   "DeleteWithInstance": {
    "Type": "Boolean",
    "Description": "If this parameter is set to true, the disk will be deleted while the instance is deleted. If this parameter i
s set to false, the disk will be retained after the instance is deleted.",
    "AllowedValues": [
     "True",
     "true",
     "False",
     "false"
    ]
   },
   "DiskId": {
    "Type": "String",
    "Description": "The ID of the disk to be attached."
   }
  },
  "Outputs": {
   "Status": {
    "Description": "The disk status now.",
    "Value": {
     "Fn::GetAtt": [
      "DiskAttachment",
      "Status"
     ]
    }
   },
   "Device": {
    "Description": "The device where the volume is exposed on the ECS instance.",
    "Value": {
     "Fn::GetAtt": [
      "DiskAttachment",
      "Device"
     ]
    }
   },
   "DiskId": {
    "Description": "The ID of the created disk.",
    "Value": {
     "Fn::GetAtt": [
      "DiskAttachment",
      "DiskId"
     ]
    }
   }
  }
}
```

5.5.1.8. ALIYUN::ECS::ForwardEntry

ALIYUN::ECS::ForwardEntry is used to configure the DNAT table of a NAT Gateway.

Statement

```
{
 "Type": "ALIYUN::ECS::ForwardEntry",
 "Properties": {
  "ExternalIp": String,
  "ExternalPort": String,
  "ForwardTableId": String,
  "InternalIp": String,
  "IpProtocol": String,
  "InternalPort": String
 }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
ExternalIp	String	No	No	The public IP address of the NAT gateway.	It must be an IP address that is included in the shared NAT Gateway of the bandwidth plan to which the DNAT table belongs.
ExternalPort	String	No	No	The public port number.	Valid values: 1 to 65535.
ForwardTableId	String	No	No	The ID of the DNAT table.	None
InternalIp	String	No	No	The destination IP address to which the request is forwarded.	This IP address is a private IP address.
IpProtocol	String	No	No	The type of the protocol.	Valid values: TCP, UDP, and Any.
InternalPort	String	No	No	The destination private port.	Valid values: 1 to 65535.

Response parameters

Fn::GetAtt

ForwardEntryId: the ID of each entry in the DNAT table.

Sample request

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Resources": {
  "ForwardEntry": {
   "Type": "ALIYUN::ECS::ForwardEntry",
   "Properties": {
    "ForwardTableId": "my_forwardtable",
    "ExternalIp": "101.201.XX.XX",
    "ExternalPort": "8080",
    "IpProtocol": "TCP",
    "InternalIp": "10.2.XX.XX",
    "InternalPort": "80"
   }
  }
 },
 "Outputs": {
  "ForwardEntryId": {
   "Value" : {"Fn::GetAttr": ["ForwardEntry","ForwardEntryId"]}
  }
 }
}
```

5.5.1.9. ALIYUN::ECS::Instance

ALIYUN::ECS::Instance is used to create an ECS instance.

Statement

```
{
 "Type": "ALIYUN::ECS::Instance",
 "Properties": {
  "RamRoleName": String,
  "IoOptimized": String,
  "PrivateIpAddress": String,
  "KeyPairName": String,
  "SystemDiskDiskName": String,
  "Description": String,
  "Tags": List,
  "HostName": String,
  "ImageId": String,
  "ResourceGroupId": String,
  "VSwitchId": String,
  "Password": String,
  "InstanceType": String,
  "SystemDiskCategory": String,
  "UserData": String,
  "SystemDiskSize": Number,
  "ZoneId": String,
  "VpcId": String,
  "InstanceName": String,
  "InternetMaxBandwidthIn": Integer,
  "DeletionProtection": Boolean,
  "DeploymentSetId": String,
  "SecurityGroupId": String,
  "HpcClusterId": String,
  "SystemDiskDescription": String,
  "DiskMappings": List
 }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	Yes	Released	The ID of the resource group to which the instance belongs.	None

Parameter	Type	Required	Editable	Description	Constraint
ImageId	String	No	Yes	The ID of the image used to start the ECS instance. You can use a public image, a custom image, or an Alibaba Cloud Marketplace image.	When editing a template, you can specify the image type and version or only the image type. ROS automatically selects an appropriate public image ID. You can use the wildcard character (*) to represent part of an image ID. Take all Ubuntu public images provided by Alibaba Cloud as an example. You can use one of the following methods to specify the public image ID for the ECS instance: • If you enter ubuntu, the system matches it with the following ID: ubuntu16_0402_64_20G_alibase_20170818.vhd • If you enter ubuntu_14, the system matches it with the following ID: ubuntu_14_0405_64_20G_alibase_20170824.vhd • If you enter ubuntu*14*32, the system matches it with the following ID: ubuntu_14_0405_32_40G_alibase_20170711.vhd • If you enter ubuntu_16_0402_32, the system matches it with the following ID: ubuntu_16_0402_32_40G_alibase_20170711.vhd
InstanceType	String	No	No	The type of the ECS instance.	None
SecurityGroupId	String	No	No	The ID of the security group to which the created instance will belong.	None
Description	String	Yes	Released	The description of created instances.	The description can be up to 256 characters in length.

Parameter	Type	Required	Editable	Description	Constraint
InstanceName	String	Yes	Released	The name of a created instance.	The name can be up to 128 characters in length and can contain letters, digits, underscores (_), periods (.), and hyphens (-).
Password	String	Yes	Released	The password used to log on to the ECS instance.	The characters in length is 8 to 30. And must contain at least one of the following character types: uppercase letters, lowercase letters, digits, and special character. Special characters include ( ) ` ~ ! @ # $ % ^ & * - + = | { } [ ] : ; ' < > , . ? / - / - If you specify the Password parameter in the API request, use HTTPS to secure the API and protect your password.
HostName	String	Yes	Released	The hostname of the instance.	The password must be at least 2 characters in length. It cannot And hyphens (-) cannot start or end the hostname and cannot be used consecutively. On Windows, the hostname can be up to 15 characters in length and can contain letters, digits, and hyphens (-). It cannot contain periods (.) and cannot be composed of only digits. On other OSs such as Linux, the hostname can contain a maximum of 30 characters, including periods (.), each segment can contain uppercase or lowercase letters, digits, and hyphens (-).
PrivateIpAddress	String	Yes	Released	The private IP address of an ECS instance in a VPC. The specified IP address must not be used by other instances in the VPC.	None

Parameter	Type	Required	Editable	Description	Constraint
InternetMaxBandwidthIn	String	Optional	Released	The maximum inbound bandwidth from the Internet.	Valid values: 1 to 100. Default value: 100. Unit: Mbit/s.
IoOptimized	String	Yes	Released	Specifies whether an I/O optimized instance is created.	Valid values: • none (non-I/O optimized) • optimized Default value: none.
DiskMappings	List	Erased	Released	The data disks to be attached to the instance.	A maximum of 16 disks can be attached to each instance.
SystemDiskCategory	String	Yes	Released	The type of the system disk.	Valid values: • cloud • cloud_efficiency • cloud_ssd • ephemeral_ssd
SystemDiskDescription	String	Yes	Released	The description of the ECS instance system disk.	None
SystemDiskDiskName	String	Yes	Released	The name of the ECS instance system disk.	None
SystemDiskSize	Number	No.	True	The size of the system disk. Unit: GB.	Valid values: 40 to 500. If a custom image is used to create a system disk, make sure that the size of the system disk is greater than that of the custom image.
Tags	List	Erased	Released	The custom tags of the instance.	A maximum of 20 tags are supported. The format is as follows: `[{&ldquo;Key&rdquo; :&rdquo; tagKey&rdquo; ,&rdquo; Value&rdquo; :&rdquo; tagValue&rdquo; }, {&ldquo;Key&rdquo; :&rdquo; tagKey2&rdquo; ,&rdquo; Value&rdquo; :&rdquo; tagValue2&rdquo; }]` .
UserData	String	Yes	Released	The user data that you provide when you create ECS instances.	The user data can be up to 16KB in size. You do not need to use Base64. you must use special characters. `\` Escape.
ZoneId	String	Yes	Released	The ID of the zone where the instance resides.	None

Parameter	Type	Required	Editable	Description	Constraint
HpcClusterId	String	Yes	Released	The ID of the HPC cluster to which the ECS instance belongs.	None
VpcId	String	Yes	Released	The ID of the VPC to which the ECS instance belongs.	None
VSwitchId	String	Yes	Released	The ID of the VSwitch for the ECS instance.	None
KeyPairName	String	Yes	Released	The name of the key pair that is used to connect to created ECS instances.	• For Windows-based instances, this parameter is empty by default. • In the Linux, if this parameter is specified, the Password content is still set to the instance, but the Password logon method is disabled by default. The key pair is used to verify the logon.
RamRoleName	String	Yes	Released	The RAM role name of the instance. You can call the ListRoles operation to query the role name.	None
DeletionProtection	Boolean	Erased	Released	The release protection property of created instances. It specifies whether the instances can be released from the ECS console or through the DeleteInstance operation.	Valid values: • True • False
DeploymentSetId	String	Yes	True	Deployment Set ID.	None

DiskMappings syntax

```
"DiskMappings": [
 {
  "Category": String,
  "DiskName": String,
  "Description": String,
  "Device": String,
  "SnapshotId": String,
  "Size": String
 }
]
```

DiskMappings properties

Parameter	Type	Required	Editable	Description	Constraint
Size	String	No	No	The size of data disk N. Unit: GB.	None
Category	String	Yes	Released	The type of the data disk.	Valid values: • cloud • cloud_efficiency • cloud_ssd • ephemeral_ssd Default value: cloud.
DiskName	String	Yes	Released	The name of data disk N.	The name can be up to 128 characters in length and can contain letters, digits, underscores (_), periods (.), and hyphens (-).
Description	String	Yes	Released	The description of data disk N.	Valid values: 2 to 256. Default value: Null.
Device	String	Yes	Released	The device name of the data disk.	If you do not specify this parameter, the system automatically allocates a device name in alphabetical order from /dev/xvdb to /dev/xvdz.
SnapshotId	String	Yes	Released	The ID of the snapshot used to create the data disk.	None

Tags syntax

```
"Tags": [
 {
  "Value": String,
  "Key": String
 }
]
```

Tags properties

Parameter	Type	Required	Editable	Description	Constraint
Key	String	No	No	None	None
Value	String	Yes	Released	None	Valid values: 1025 to 10000. You cannot use the following commonly used port numbers: 2222, 4500, 4510, 4560, 7505, 9000, 9001, and 9002.

Response parameters

Fn::GetAtt

- InstanceId: the ID of the instance. An ID is a globally unique identifier (GUID) generated by the system for an instance.
- PrivateIp: The private IP address of the instance in a VPC. This parameter takes effect only when the NetworkType parameter is set to VPC.
- InnerIp: The private IP address of the instance in a Classic network. This parameter takes effect only when the NetworkType parameter is set to Classic.
- PublicIp: the public IP address of the instance in a Classic network. This parameter takes effect only when the NetworkType parameter is set to Classic.
- ZoneId: the zone ID.
- HostName: the hostname of the instance.

Sample request

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Resources": {
  "WebServer": {
   "Type": "ALIYUN::ECS::Instance",
   "Properties": {
    "ImageId": "m-25l0rc****",

}
```

5.5.1.10. ALIYUN::ECS::InstanceClone

ALIYUN::ECS::InstanceClone is used to clone an ECS instance.

Statement

```
{
 "Type": "ALIYUN::ECS::InstanceClone",
 "Properties": {
  "DeletionProtection": Boolean,
  "DiskMappings": List,
  "LoadBalancerIdToAttach": String,
  "Description": String,
  "BackendServerWeight": Integer,
  "Tags": List,
  "SecurityGroupId": String,
  "RamRoleName": String,
  "ImageId": String,
  "ResourceGroupId": String,
  "SpotPriceLimit": String,
  "InstanceChargeType": String,
  "SourceInstanceId": String,
  "Period": Number,
  "SpotStrategy": String,
  "Password": String,
  "InstanceName": String,
  "InternetMaxBandwidthIn": Integer,
  "ZoneId": String,
  "KeyPairName": String
 }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	Yes	Released	The ID of the resource group to which the instance belongs.	None
SourceInstanceId	String	No	No	The ID of the ECS instance to be cloned.	The clone operation clones the specified instance, including its instance type, image, bandwidth billing method, bandwidth limit, and network type. If the source ECS instance belongs to multiple security groups, the cloned instance is added only to the first of these security groups.
BackendServerWeight	String	Optional	Released	The weight of the ECS instance in the Server Load Balancer instance.	Value range:[0, 100]. Default value: 100.
LoadBalancerIdToAttach	String	Yes	Released	The ID of the SLB instance to which the ECS instance is to be attached.	None
Description	String	Yes	Released	The description of created instances.	The description can be up to 256 characters in length.

Parameter	Type	Required	Editable	Description	Constraint
ImageId	String	Yes	True	The ID of the image used to start created instances. You can use a public image, a custom image, or an Alibaba Cloud Marketplace image.	When editing a template, you can specify the image type and version or only the image type. ROS automatically selects an appropriate public image ID. You can use the wildcard character (*) to represent part of an image ID. Take all Ubuntu public images provided by Alibaba Cloud as an example. You can use one of the following methods to specify the public image ID for the ECS instance: If you enter ubuntu, the system matches it with the following ID: ubuntu16_0402_64_20G_alibase_20170818.vhd If you enter ubuntu_14, the system matches it with the following ID: ubuntu_14_0405_64_20G_alibase_20170824.vhd If you enter ubuntu*14*32, the system matches it with the following ID: ubuntu_14_0405_32_40G_alibase_20170711.vhd If you enter ubuntu_16_0402_32, the system matches it with the following ID: ubuntu_16_0402_32_40G_alibase_20170711.vhd
SecurityGroupId	String	Yes	Released	The ID of the security group to which the created instance will belong.	None
InstanceName	String	Yes	Released	The name of a created instance.	The name can be up to 128 characters in length and can contain letters, digits, underscores (_), periods (.), and hyphens (-).

Parameter	Type	Required	Editable	Description	Constraint
Password	String	Yes	Released	The password used to log on to the ECS instance.	The password must be 8 to 30 characters in length. The password must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. Special characters include ( ) ` ~ ! @ # $ % ^ & * - + = | { } [ ] : ; < > , . ? / If you specify the password parameter in the API request, use HTTPS to secure the API and protect your password.
DiskMappings	List	Erased	Released	The disks to be attached to created instances.	A maximum of 16 disks can be attached to each instance.
Tags	List	Erased	Released	The custom tags of the instance.	A maximum of 20 tags can be specified in the [{"Key":"tagKey","Value":"tagValue" },{ "Key":"tagKey2","Value":"tagValue 2"}].
ZoneId	String	Yes	Released	The ID of the zone where the instance resides.	None
InstanceChargeType	String	Yes	Released	The billing method of the new ECS instance.	Valid values: PrePaid and PostPaid. Default value: Postpaid. If you set this parameter to Prepaid, make sure that you have sufficient balance in your account. Otherwise, the instance fails to be created.
Period	Number	Erased	Released	The subscription period of the new ECS instance. This parameter is required when the InstanceChargeType parameter is set to PrePaid. This parameter is ignored when the InstanceChargeType parameter is set to PostPaid.	Valid values: 1, 2, 3, 4, 5, 6, 7, 8, 9, 12, 24, and 36. Unit: month.

Parameter	Type	Required	Editable	Description	Constraint
KeyPairName	String	Yes	Released	The name of the key pair that is used to connect to created ECS instances.	For Windows-based instances, this parameter is empty by default. In the Linux, if this parameter is specified, the Password content is still set to the instance, but the Password logon method is disabled by default. The key pair is used to verify the logon.
RamRoleName	String	Yes	Released	The RAM role name of the instance. You can call the ListRoles operation to query the role name.	None
SpotPriceLimit	String	Yes	Released	The maximum hourly price of the instance.	Parameter SpotStrategy this parameter takes effect only when the value is SpotWithPriceLimit.
SpotStrategy	String	Yes	Released	The bidding policy for the pay-as-you-go instance.	This parameter is valid only when the InstanceChargeType parameter is set to PostPaid. Valid values: NoSpot: applies to regular pay-as-you-go instances. SpotWithPriceLimit: applies to preemptible instances with a maximum hourly price. SpotAsPriceGo: applies to pay-as-you-go instances priced at the market price at the time of purchase. Default value: NoSpot.
InternetMaxBandwidthIn	String	Optional	Released	The maximum inbound bandwidth from the Internet. Unit: Mbit/s.	Valid values: 1 to 200.
DeletionProtection	Boolean	Erased	Released	Specifies whether to enable instance release protection in the console or by calling an API operation. (DeleteInstance) Release instances.	Valid values: true and false.

DiskMappings syntax

```
"DiskMappings": [
 {
  "Category": String,
  "DiskName": String,
  "Description": String,
  "Device": String,
  "SnapshotId": String,
  "Size": String
 }
]
```

DiskMappings properties

Parameter	Type	Required	Editable	Description	Constraint
Size	String	No	No	The size of data disk N. Unit: GB.	None
Category	String	Yes	Released	The type of the data disk.	Valid values: cloud, cloud_efficiency, cloud_ssd, and ephemeral_ssd Default value: cloud.
DiskName	String	Yes	Released	Disk name.	The name can be up to 128 characters in length and can contain letters, digits, underscores (_), periods (.), and hyphens (-).
Description	String	Yes	Released	The description of data disk N.	The description must be 2 to 256 characters in length. This parameter is empty by default.
Device	String	Yes	Released	The device name of the data disk.	If you do not specify this parameter, the system automatically allocates a device name in alphabetical order from /dev/xvdb to /dev/xvdz.
SnapshotId	String	Yes	Released	The ID of the snapshot used to create the data disk.	None

Tags syntax

```
"Tags": [
 {
  "Value": String,
  "Key": String
 }
]
```

Tags properties

Parameter	Type	Required	Editable	Description	Constraint
Key	String	No	No	The tag key, which cannot be an empty string. It can be up to 64 characters in length, cannot start with acs: or aliyun, and cannot contain http:// or https://.	None
Value	String	Yes	Released	The tag value, which can be an empty string. It can be up to 128 characters in length and cannot start with acs: or aliyun. It cannot contain http:// or https://.	Valid values: 1025 to 10000. You cannot use the following commonly used port numbers: 2222, 4500, 4510, 4560, 7505, 9000, 9001, and 9002.

Response parameters

Fn::GetAtt

- InstanceId: the ID of the instance. An ID is a globally unique identifier (GUID) generated by the system for an instance.
- PrivateIp: The private IP address of the instance in a VPC. This parameter takes effect only when the NetworkType parameter is set to VPC.
- InnerIp: The private IP address of the instance in a Classic network. This parameter takes effect only when the NetworkType parameter is set to Classic.
- PublicIp: the public IP address of the instance in a Classic network. This parameter takes effect only when the NetworkType parameter is set to Classic.
- ZoneId: the zone ID.
- HostName: the hostname of the instance.

Sample request

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Resources": {
  "WebServer": {
   "Type": "ALIYUN::ECS::InstanceClone",
   "Properties": {
    "SourceInstanceId": "i-25zsk****",
    "SecurityGroupId": "sg-25zwc****",
    "ZoneId": "cn-beijing-b",
    "DiskMappings": [
      {"Size": 10, "Category": "cloud"},
      {"Size": 10, "Category": "cloud", "SnapshotId": "s-25wsw****"}
    ]
   }
  }
 },
 "Outputs": {

  },
  "PublicIp": {
     "Value": {"get_attr": ["WebServer","PublicIp"]}
  }
 }
}
```

5.5.1.11. ALIYUN::ECS::InstanceGroup

ALIYUN::ECS::InstanceGroup is used to create an ECS instance group.

Syntax

```
{
 "Type": "ALIYUN::ECS::InstanceGroup",
 "Properties": {
  "SystemDiskAutoSnapshotPolicyId": String,
  "DedicatedHostId": String,
  "LaunchTemplateName": String,
  "RamRoleName": String,
  "IoOptimized": String,
  "PrivateIpAddress": String,
  "KeyPairName": String,
  "SystemDiskDiskName": String,
  "Description": String,
  "Tags": List,
  "HostName": String,
  "ImageId": String,
  "ResourceGroupId": String,
  "VSwitchId": String,
  "EniMappings": List,
  "Password": String,
  "InstanceType": String,
  "MaxAmount": Integer,
  "AutoReleaseTime": String,
  "SystemDiskCategory": String,
  "UserData": String,
  "LaunchTemplateId": String,
  "LaunchTemplateVersion": String,
  "SystemDiskSize": Number,
  "ZoneId": String,
  "VpcId": String,
  "InternetMaxBandwidthIn": Integer,
  "DeletionProtection": Boolean,
  "DeploymentSetId": String,
  "Ipv6AddressCount": Integer,
  "SecurityGroupId": String,
  "HpcClusterId": String,
  "SystemDiskDescription": String,
  "Ipv6Addresses": List,
  "NetworkType": String,
  "DiskMappings": List,
  "SystemDiskPerformanceLevel": String
 }
}
```

Properties

Attribute	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	No	Yes	The ID of the resource group to which a created instance belongs.	None.

Attribute	Type	Required	Editable	Description	Constraint
HpcClusterId	String	No	Yes	The ID of the HPC cluster to which a created instance belongs.	None.
MaxAmount	Integer	Supported	Yes	The maximum number of ECS instances that can be created at a time.	Valid values: 1 to 100. The MaxAmount parameter must be set to a value greater than or equal to the value of MinAmount.
MinAmount	String	Yes	Yes	The minimum number of ECS instances that can be created at a time.	Valid values: 1 to 100. The MinAmount parameter must be set to a value less than or equal to the value of MaxAmount.
Description	String	No	Yes	The description of created instances.	The description can be up to 256 characters in length.
InstanceType	String	Yes	Yes	The type of the ECS instance.	None.
ImageId	String	Yes	Yes	The ID of the image used to start an ECS instance. You can use a public image, a custom image, or an Alibaba Cloud Marketplace image.	You can specify a partial public image ID instead of providing the complete ID. The following example shows how to use a CNAME record: • Ubuntu is specified and ubuntu_16_0402_64_20G_alibase_20170818.vhd are matched. • If ubuntu1432 is specified, ubuntu_14_0405_32_40G_alibase_20170711.vhd is matched.
SecurityGroupId	String	No	No	The ID of the security group to which created instances belong.	None.

Attribute	Type	Required	Editable	Description	Constraint
InstanceName	String	No	No	The name of an instance.	The names can be up to 128 characters in length It can contain English letters, Chinese characters, digits, underscores (_), periods (.), and hyphens (-). By `name_prefix[begin_number,bits]name_suffix` format to specify different instance name for each ECS instance.
Password	String	No	Yes	The password used to log on to created ECS instances.	• The password must be 8 to 30 characters in length • and must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. • The following special characters are supported `:( ) '~! @ # $ % ^ & * - + = | { } [ ] : ; ' < > , . ? /` If you specify the Password parameter in the API request, use HTTPS to secure the API and protect your password.
HostName	String	No	No	The hostname of created ECS instances.	The hostname must contain at least two characters in length. The periods and hyphens (-) cannot start or end the hostname and cannot be used together.
AutoReleaseTime	String	No	No	The time scheduled for created ECS instances to be automatically released.	The time format must comply with ISO8601 specifications, for example, `"yyyy-MM-ddTHH:mm:ssZ"`. The maximum release time must be within three years from the current time.
PrivateIpAddress	String	No	No	The private IP address of an ECS instance in a VPC.	The specified IP address must not be used by other instances in the VPC.

Attribute	Type	Required	Editable	Description	Constraint
DiskMappings	List	No	Yes	The data disks to be attached to created instances.	None.
InternetMaxBandwidthIn	Integer	No	No	The maximum inbound bandwidth from the Internet.	Unit: Mbit/s. Valid values: 1 to 100 Default value: 100.
IoOptimized	String	No	No	Specifies whether the created instances are I/O optimized.	Valid values: • none (non-I/O optimized) • optimized Default value: none.
SystemDiskCategory	String	No	Yes	The category of the system disk.	Valid values: cloud: basic disk cloud_efficiency: the ultra disk cloud_ssd: standard SSDs cloud_essd: enhanced SSD ephemeral_ssd: local SSDs
SystemDiskDescription	String	No	Yes	The description of the ECS instance system disk.	None.
SystemDiskDiskName	String	No	Yes	The name of the ECS instance system disk.	None.
SystemDiskSize	Number	No	Yes	The size of the system disk.	Valid values: 40 to 500. If a custom image is used to create a system disk, make sure that the size of the system disk is greater than that of the custom image.
Tags	List	No	Yes	The custom tags of a created instance.	A maximum of 20 tags are supported. The format is as follows: `[{"Key":"tagKey","Value":"tagValue"},{"Key":"tagKey2","Value":"tagValue2"}]`.

Attribute	Type	Required	Editable	Description	Constraint
UserData	String	No	Yes	The user data that you provide when you create ECS instances.	The user data can be up to 16 KB in size. You do not need to use Base64 for transcoding. Special characters need to be escaped.
ZoneId	String	No	No	The zone ID of the disk.	None.
VpcId	String	No	No	The ID of the VPC.	None.
VSwitchId	String	No	No	The ID of the VSwitch for the ECS instance.	None.
KeyPairName	String	No	Yes	The name of the key pair that is used to connect to created ECS instances.	For Windows-based ECS instances, this parameter is ignored. and it is empty by default. For Linux-based ECS instances, the Password parameter still takes effect if this parameter is specified. However, logon by password is disabled, and the KeyPairName value is used.
RamRoleName	String	No	Yes	The name of the instance RAM role.	You can call the ListRoles operation to query the role name.
DedicatedHostId	String	No	No	The ID of the dedicated host.	None.
LaunchTemplateName	String	No	Yes	The name of the launch template for the instance.	None.
EniMappings	List	No	Yes	The elastic network interfaces (ENIs) to be attached to created instances.	Only one ENI can be attached to each instance.
LaunchTemplateId	String	No	Yes	The ID of the launch template.	None.

Attribute	Type	Required	Editable	Description	Constraint
LaunchTemplateVersion	String	No	Yes	The version of the launch template.	If you do not specify a version, the default version is used.
NetworkType	String	No	No	The network type of created ECS instances.	Valid values: • vpc • classic Default value: classic.
DeletionProtection	Boolean	No	No	The release protection attribute of the instance. It specifies whether you can use the ECS console or call the DeleteInstance operation to release the instance.	Valid values: • true • false
DeploymentSetId	String	No	Yes	Deployment Set ID.	None.

DiskMappings syntax

```
"DiskMappings": [
 {
  "Category": String,
  "DiskName": String,
  "Description": String,
  "Device": String,
  "SnapshotId": String,
  "Size": String,
  "Encrypted": String,
  "KMSKeyId": String,
  "PerformanceLevel": String,
  "AutoSnapshotPolicyId": String
 }
]
```

DiskMappings properties

Attribute	Type	Required	Editable	Description	Constraint
Size	String	Yes	No	The size of a data disk.	Unit: GB.

Attribute	Type	Required	Editable	Description	Constraint
Category	String	No	No	The type of the data disk.	Valid values: • cloud • cloud_efficiency • cloud_ssd • cloud_essd • ephemeral_ssd For I/O optimized instances, the default value is cloud_efficiency. For non-I/O optimized instances, the default value is cloud.
DiskName	String	No	No	The name of data disk N.	The name can be up to 128 characters in length. It can contain English letters, Chinese characters, digits, underscores (_), periods (.), and hyphens (-).
Description	String	No	No	The description of data disk N.	The description must be 2 to 256 characters in length. The description cannot start with `http://` or `https://`.
Device	String	No	No	The device name of the data disk.	The system allocates a device name in alphabetical order from /dev/xvda to /dev/xvdz.
SnapshotId	String	No	No	The ID of the snapshot.	None.
Encrypted	Boolean	No	No	Specifies whether to encrypt the data disk.	Valid values: • true • false Default value: false
KMSKeyId	String	No	No	The ID of the KMS key corresponding to the data disk.	None.
AutoSnapshotPolicyId	String	No	Yes	The ID of the automatic snapshot policy.	None.

Attribute	Type	Required	Editable	Description	Constraint
PerformanceLevel	String	No	No	The performance level of the enhanced SSD used as the data disk.	• (Default): Maximum random read /write IOPS of 50,000 per disk • PL2: A single enhanced SSD delivers up to 100,000 random read/write IOPS. • PL3: A single enhanced SSD delivers up to 1,000,000 random read/write IOPS.

Tags syntax

```
"Tags": [
 {
  "Value": String,
  "Key": String
 }
]
```

Tags properties

Attribute	Type	Required	Editable	Description	Constraint
Key	String	Yes	No	The key of tag N.	It must be 1 to 128 characters in length, and cannot start with `aliyun` and `acs:` beginning, cannot contain `http://` or `https://` .
Value	String	No	No	The value of tag N.	It must be 0 to 128 characters in length and cannot start with `aliyun` and `acs:` beginning, cannot contain `http://` or `https://` .

EniMappings syntax

```
"EniMappings": [
 {
  "SecurityGroupId": String,
  "VSwitchId": String,
  "Description": String,
  "NetworkInterfaceName": String,
  "PrimaryIpAddress": String
 }
]
```

EniMappings properties

Attribute	Type	Required	Editable	Description	Constraint
SecurityGroupId	String	Yes	Yes	The ID of the security group to which an instance belongs.	The security group and the instance must be in the same VPC.
VSwitchId	String	Yes	No	The ID of the VSwitch to which the instance is connected.	None.
Description	String	No	Yes	The description of the ENI.	It can contain 2 to 256 English letters or Chinese character. It cannot start with `http://` or `https://` the beginning.
NetworkInterfaceName	String	No	Yes	The ENI name.	• The name must be 2 to 128 characters in length • Must start with an uppercase or lowercase letter, and cannot start with `http://` or `https://` the beginning. • It must start with a letter and cannot start with http:// or https://.
PrimaryIpAddress	String	No	No	The primary private IP address of ENI N.	The specified IP address must be available within the CIDR block of the VSwitch. If this parameter is not specified, an available IP address in the VSwitch CIDR block will be selected at random.

Return value

Fn::GetAtt

- InstanceIds: the IDs of created instances in the ECS instance group. An ID is a system-generated globally unique identifier (GUID) for an instance.
- PrivateIps: the list of private IP addresses of instances in a VPC. This parameter takes effect only when the NetworkType parameter is set to VPC. For example, a Json-formatted Array: `["172.16.XX.XX", "172.16.XX.XX",&help; "172.16.XX.XX"]` the maximum number of IP addresses that can be specified. Separate multiple IP addresses with commas (,).
- InnerIps: the list of private IP addresses of instances in a classic network. This parameter takes effect only when the NetworkType parameter is set to Classic. For example, a Json-formatted Array: `["10.1.XX.XX", "10.1.XX.XX",&hel`

lip;"10.1.XX.XX"] the maximum number of IP addresses that can be specified. Separate multiple IP addresses with commas (,).

- PublicIps: the list of public IP addresses of instances in a classic network. This parameter takes effect only when the NetworkType parameter is set to Classic. For example, a Json-formatted Array: ["42.1.XX.XX","42.1.XX.XX",…"42.1.XX.XX"] the maximum number of IP addresses that can be specified. Separate multiple IP addresses with commas (,).
- HostNames: the list of hostnames of all instances.
- OrderId: the list of order IDs of all instances.
- ZoneIds: the IDs of the zones where created instances reside.
- RelatedOrderIds: the list of related order IDs of created ECS instances.

Examples

```
{
 "ROSTemplateFormatVersion":"2015-09-01",
 "Resources":{
  "WebServer": {
   "Type": "ALIYUN::ECS::InstanceGroup",
   "Properties": {
    "ImageId":"m-25l0r****",
    "InstanceType": "ecs.t1.small",
    "SecurityGroupId": "sg-25zwc****",
    "ZoneId": "cn-beijing-b",

    "MinAmount":1,
    "Tags": [{
      "Key": "tiantt",
      "Value": "ros"
    },{
      "Key": "tiantt1",
      "Value": "ros1"
    }
    ]
   }
  }
 },
 "Outputs": {
  "InstanceIds": {
     "Value":{"get_attr": ["WebServer","InstanceIds"]}
  },
  "PublicIps": {
     "Value":{"get_attr": ["WebServer","PublicIps"]}
  }
 }
}
```

5.5.1.12. ALIYUN::ECS::InstanceGroupClone

ALIYUN::ECS::InstanceGroupClone is used to clone an ECS instance group.

Statement

```
{
 "Type": "ALIYUN::ECS::InstanceGroupClone",
 "Properties": {
  "BackendServerWeight": Integer,
  "DiskMappings": List,
  "LaunchTemplateName": String,
  "SpotPriceLimit": String,
  "ResourceGroupId": String,
  "KeyPairName": String,
  "SystemDiskDiskName": String,
  "PeriodUnit": String,
  "Description": String,
  "Tags": List,
  "ImageId": String,
  "SpotStrategy": String,
  "SourceInstanceId": String,
  "EniMappings": List,
  "Password": String,
  "MaxAmount": Integer,
  "AutoReleaseTime": String,
  "SystemDiskCategory": String,
  "LoadBalancerIdToAttach": String,
  "LaunchTemplateId": String,
  "LaunchTemplateVersion": String,
  "ZoneId": String,
  "InstanceName": String,
  "InternetMaxBandwidthIn": Integer,
  "DeletionProtection": Boolean,
  "DeploymentSetId": String,
  "SecurityGroupId": String,
  "RamRoleName": String,
  "HpcClusterId": String,
  "SystemDiskDescription": String
 }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	Yes	Released	The ID of the enterprise resource group to which a created instance belongs.	None
HpcClusterId	String	Yes	True	The ID of the E-HPC cluster to which a created instance belongs.	None
SourceInstanceId	String	No	No	The ID of the ECS instance to be cloned.	The clone operation clones the specified instance, including its instance type, image, bandwidth limit, and network type. If the source ECS instance belongs to multiple security groups, the cloned instance is added only to the first of these security groups.

Parameter	Type	Required	Editable	Description	Constraint
MaxAmount	Integer	Retained	Yes	The maximum number of ECS instances to be created.	Valid values: 1 to 100. The MaxAmount parameter must be set to a value greater than or equal to the value of the MinAmount parameter.
MinAmount	String	No	Yes	The minimum number of ECS instances to be created.	Valid values: 1 to 100. The MinAmount parameter must be set to a value less than or equal to the value of the MaxAmount parameter.
BackendServerWeight	String	Optional	Released	The weight assigned to the ECS instance in the Server Load Balancer instance.	Valid values: 0 to 100. Default value: 100.
LoadBalancerIdToAttach	String	Yes	Released	The ID of the SLB instance to which the ECS instance is to be attached.	None
Description	String	Yes	Released	The description of created instances.	The description can be up to 256 characters in length.

Parameter	Type	Required	Editable	Description	Constraint
ImageId	String	Yes	True	The ID of the image used to start created instances. You can use a public image, a custom image, or an Alibaba Cloud Marketplace image.	You can specify a partial public image ID instead of providing the complete ID. When editing a template used to deploy an ECS instance, you can specify the image type and version or only the image type. ROS automatically selects an appropriate public image ID. You can use the wildcard character (*) to represent part of an image ID. You can use one of the following methods to specify the public image ID for the ECS instance: • If you set the parameter to ubuntu, ubuntu_16_0402_64_20G_alibase_20170818.vhd. • If this parameter is set to ubuntu_14, ubuntu_14_0405_64_20G_alibase_20170824.vhd is returned. • Specify: ubuntu1432, which will eventually match: ubuntu_14_0405_32_40G_alibase_20170711.vhd • Specify: ubuntu_16_0402_32, which will eventually match: ubuntu_16_0402_32_40G_alibase_20170711.vhd
SecurityGroupId	String	Yes	Released	The ID of the security group to which created instances belong.	None
InstanceName	String	Yes	Released	The name of a created instance.	The name can be up to 128 characters in length and can contain letters, digits, underscores (_), periods (.), and hyphens (-).
Password	String	Yes	Released	The password used to log on to the ECS instance.	The password The password must be 8 to 30 characters in length and must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special character. Special characters include ( ) ` ~ ! @ # $ % ^ & * - + = | { } [ ] : ; ' < > , . ? / If the Password parameter is specified, you must use HTTPS to call the operation to ensure that the Password remains confidential.
DiskMappings	List	Erased	Released	The data disks to be attached to the instance.	A maximum of 16 disks can be attached to each instance.

Parameter	Type	Required	Editable	Description	Constraint
Tags	List	Erased	Released	The custom tags of the instance.	You can specify a maximum of 20 tags. The format is as follows: [{"Key":"tagKey","Value":"tagValue"}, {"Key":"tagKey2","Value":"tagValue2"}] .
ZoneId	String	Yes	Released	The ID of the zone where the instance resides.	None
KeyPairName	String	Yes	Released	The name of the key pair that is used to connect to the ECS instance. For Windows-based ECS instances, this parameter is ignored. Default value: empty. For Linux-based instances, the Password parameter still takes effect if this parameter is specified. However, logon by Password is disabled, and the KeyPairName value is used.	None
RamRoleName	String	Yes	Released	The RAM role name of the instance.	You can use RAM API ListRoles you can call this operation to query the RAM role name of an instance.
SpotPriceLimit	String	Yes	Released	The maximum hourly price of the instance.	This parameter supports up to three decimal places. Parameter SpotStrategy this parameter takes effect only when the value is SpotWithPriceLimit.
SystemDiskDiskName	String	Yes	True	The name of the system disk of created instances.	The name must be 2 to 128 characters in length Must start with an uppercase or lowercase letter, and cannot start with http:// or https:// and can contain digits, colons (:), underscores (_), and hyphens (-).
PeriodUnit	String	Yes	True	The billing cycle for created ECS instances.	Valid values: • Week. 1, 2, 3, and 4} when the value of the PeriodUnit parameter is Week. AutoRenewPeriod values are 1, 2, "3"}. • Month 1, 2, 3, 4, 5, 6, and 7 when the PeriodUnit parameter is set to Month "8", "9", "12", "24", "36", "48", "60"},AutoRenewPeriod can be {"1", "2", "3", "6", "12"}. Default value: Month.

Parameter	Type	Required	Editable	Description	Constraint
EniMappings	List	No.	True	The elastic network interfaces (ENIs) to be attached to a created instance.	Only a single ENI can be attached to each instance.
AutoReleaseTime	String	Yes	Released	The time scheduled for a created ECS instance to be automatically released. Specify the time in the ISO 8601 standard in the YYYY-MM-DDThh:mmZ format. in the yyyy-MM-ddTHH:mm:ssZ format. The time must be in UTC. • If the value of seconds (ss) is a value other than 00, the start time is automatically rounded down to the nearest minute based on the value of mm. • The minimum release time must be at least 30 minutes later than the current time. • The maximum release time must be at most three years from the current time. If you do not specify the AutoReleaseTime it indicates that the auto release feature is disabled and the ECS instance will not be automatically released.	None

Parameter	Type	Required	Editable	Description	Constraint
SystemDiskCategory	String	Yes	True	The type of the system disk.	Valid values: • cloud: basic disk • cloud_efficiency: indicates an ultra disk. • cloud_ssd: indicates a standard SSD. • ephemeral_ssd: local SSD. • cloud_essd: indicates an enhanced SSD (ESSD). ESSDs are still in public preview and only available in some regions. For phased-out instance types that are not I/O optimized, the default value is cloud. For other instances, the default value is cloud_efficiency.
LaunchTemplateName	String	Yes	True	The name of the launch template.	None
LaunchTemplateVersion	String	Yes	True	The version of the launch template. If you do not specify this parameter, the default version is used.	None
InternetMaxBandwidthIn	String	Optional	Released	The maximum inbound bandwidth from the Internet. Unit: Mbit/s.	Valid values: 1 to 200. Default value: 200.
LaunchTemplateId	String	Yes	True	The ID of the launch template.	None
SystemDiskDescription	String	Yes	True	The description of the system disk.	The description must be 2 to 256 characters in length and cannot start with http:// or https://. This parameter is empty by default.
DeletionProtection	Boolean	Erased	Released	The release protection attribute of the instance. Specifies whether the ECS console or API DeleteInstance) to release the instance.	Valid values: • true • false
DeploymentSetId	String	Yes	True	Deployment Set ID.	None

DiskMappings syntax

```
"DiskMappings": [
 {
  "Category": String,
  "DiskName": String,
  "Description": String,
  "Encrypted": String,
  "KMSKeyId": String,
  "Device": String,
  "SnapshotId": String,
  "Size": String
 }
]
```

DiskMappings properties

Parameter	Type	Required	Editable	Description	Constraint
Encrypted	String	Yes	Released	Specifies whether to encrypt the data disk.	Valid values: • true • false Default value :false
KMSKeyId	String	Yes	Released	The KMS key ID for data disk N.	None
Size	String	No	No	The size of data disk N. Unit: GB.	None
Category	String	Yes	Released	The type of the data disk.	Valid values: • cloud • cloud_efficiency • cloud_ssd • ephemeral_ssdDefault
DiskName	String	Yes	Released	The name of data disk N.	The name can be up to 128 characters in length and can contain letters, digits, underscores (_), periods (.), and hyphens (-).
Description	String	Yes	Released	The description of data disk N.	Valid values: 2 to 256. Default value: Null.
Device	String	Yes	Released	The device name of the data disk attached to an ECS instance.	The system allocates a device name in alphabetical order from /dev/xvda to /dev/xvdz.
SnapshotId	String	Yes	Released	Create a data disk by using a snapshot.	None

EniMappings syntax

```
"EniMappings": [
 {
  "SecurityGroupId": String,
  "VSwitchId": String,
  "Description": String,
  "NetworkInterfaceName": String,
  "PrimaryIpAddress": String
 }
]
```

EniMappings properties

Parameter	Type	Required	Editable	Description	Constraint
SecurityGroupId	String	No	Yes	The ID of the security group to which the ENI belongs.	None
VSwitchId	String	No	No	The ID of the VSwitch to which the ENI belongs.	None
Description	String	Yes	True	The description of the ENI.	It can contain 2 to 256 English letters or Chinese character. It cannot start with `http://` and `https://` the beginning.
NetworkInterface Name	String	Yes	True	The name of the ENI.	None
PrimaryIpAddress	String	Yes	Released	The primary IP address of the ENI.	None

Tags syntax

```
"Tags": [
 {
  "Value": String,
  "Key": String
 }
]
```

Tags properties

Parameter	Type	Required	Editable	Description	Constraint
Key	String	No	No	None	None

Parameter	Type	Required	Editable	Description	Constraint
Value	String	Yes	Released	None	Valid values: 1025 to 10000. You cannot use the following commonly used port numbers: 2222, 4500, 4510, 4560, 7505, 9000, 9001, and 9002.

Response parameters

Fn::GetAtt

- InstanceIds: the IDs of instances in the ECS instance group. An ID is a globally unique identifier (GUID) generated by the system for an instance.
- PrivateIps: the private IP addresses of VPC-type instances. This parameter is valid only when the NetworkType parameter is set to VPC. The parameter value is a JSON-formatted array, containing up to 100 IP addresses separated by commas (,). Example: ["172.16.XX.XX", "172.16.XX.XX", ... "172.16.XX.XX"].
- InnerIps: the private IP addresses of instances in the classic network. This parameter is valid only when the NetworkType parameter is set to Classic. The parameter value is a JSON-formatted array, containing up to 100 IP addresses separated by commas (,). Example: ["10.1.XX.XX", "10.1.XX.XX", ... "10.1.XX.XX"].
- PublicIps: the public IP addresses of instances in the classic network. This parameter is applicable only when the NetworkType parameter is set is Classic. The parameter value is a JSON-formatted array, containing up to 100 IP addresses separated by commas (,). Example: ["42.1.XX.XX", "42.1.XX.XX", ... "42.1.XX.XX"].
- HostNames: the hostnames of all instances. The parameter value is a JSON-formatted array. Example: ["host1", "host2", ... "host3"].
- OrderId: the order IDs of all instances.
- ZoneIds: the IDs of the zones where created instances reside.

Sample request

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Resources": {
  "WebServer": {
   "Type": "ALIYUN::ECS::InstanceGroupClone",
   "Properties": {
    "SourceInstanceId": "i-25zsk****",
    "ImageId": "m-25l0r****",
    "SecurityGroupId": "sg-25zwc****",
    "ZoneId": "cn-beijing-b",
    "MaxAmount": 1,
    "MinAmount": 1
   }
  }
 },
 "Outputs": {

  },
  "PublicIps": {
   "Value": {"get_attr": ["WebServer","PublicIps"]}
  }
 }
}
```

5.5.1.13. ALIYUN::ECS::Invocation

ALIYUN::ECS::Invocation is used to invoke a Cloud Assistant command for one or more ECS instances.

Statement

```
{
 "Type": "ALIYUN::ECS::Invocation",
 "Properties": {
  "Timed": Boolean,
  "Frequency": String,
  "CommandId": String,
  "InstanceIds": List
 }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
Timed	Boolean	Erased	Released	Specifies whether to invoke the command on a periodic basis. Default value: false.	None
Frequency	String	Yes	Released	The frequency at which the command is invoked.	None

Parameter	Type	Required	Editable	Description	Constraint
CommandId	String	No	No	The ID of the script.	None
InstanceIds	List	Yes	No	The IDs of the instances for which you want to invoke the command. A maximum of 20 instance IDs can be specified.	Valid values: 1025 to 10000. You cannot use the following commonly used port numbers: 2222, 4500, 4510, 4560, 7505, 9000, 9001, and 9002.

Response parameters

Fn::GetAtt

The execution ID of the InvokeId: command.

Sample request

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Parameters": {
  "Timed": {
   "Type": "Boolean",
   "Description": "Whether it is timed execution. Default is False.",
   "AllowedValues": [
    "True",
    "true",
    "False",
    "false"
   ]
  },
  "Frequency": {
   "Type": "String",
   "Description": "The frequency of timing execution (the shortest frequency is performed every 1 minute). It is mandatory when Timing is True.The value rule follows the rules of the cron expression. "
  },
  "CommandId": {
   "Type": "String",
   "Description": "The id of command."
  },
  "InstanceIds": {
   "Type": "CommaDelimitedList",
   "Description": "The instance id list. Select up to 20 instances at a time.Instances selected network type must be VPC network, status must be running"
  }
 },
 "Resources": {
  "Invocation": {
   "Type": "ALIYUN::ECS::Invocation",
   "Properties": {
    "Timed": {
     "Ref": "Timed"
    },
    "Frequency": {
```

```
      "Ref": "Frequency"
     },
     "CommandId": {
      "Ref": "CommandId"
     },
     "InstanceIds": {

        "Ref": "InstanceIds"
       },
       {
        "Ref": "InstanceIds"
       }
      ]
     }
    }
   }
  }
 },
 "Outputs": {
  "InvokeId": {
   "Description": "The id of command execution.",
   "Value": {
    "Fn::GetAtt": [
     "Invocation",
     "InvokeId"
    ]
   }
  }
 }
}
```

5.5.1.14. ALIYUN::ECS::JoinSecurityGroup

ALIYUN::ECS::JoinSecurityGroup is used to add one or more ECS instances to a specified security group.

Syntax

```
{
 "Type": "ALIYUN::ECS::JoinSecurityGroup",
 "Properties": {
  "InstanceId": String,
  "InstanceIdList": List,
  "SecurityGroupId": String,
  "NetworkInterfaceList": List
 }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
SecurityGroupId	String	Yes	No	The ID of the security group.	None

Property	Type	Required	Editable	Description	Constraint
InstanceId	String	No	No	The ID of the ECS instance to be added to the security group.	None
InstanceIdList	List	No	Yes	The IDs of the ECS instances to be added to the security group.	None
NetworkInterfaceList	List	No	Yes	The IDs of the elastic network interfaces (ENIs).	None

Response parameters

Fn::GetAtt

None

Examples

`JSON` format

```
{

   - i-m5e505hio0wyjc6r****
```

5.5.1.15. ALIYUN::ECS::LaunchTemplate

ALIYUN::ECS::LaunchTemplate is used to create an ECS instance launch template.

Syntax

```
{
 "Type": "ALIYUN::ECS::LaunchTemplate",
 "Properties": {
  "LaunchTemplateName": String,
  "VersionDescription": String,
  "ImageId": String,
  "InstanceType": String,
  "SecurityGroupId": String,
  "NetworkType": String,
  "VSwitchId": String,
  "InstanceName": String,
  "Description": String,
  "InternetMaxBandwidthIn": Integer,
  "InternetMaxBandwidthOut": Integer,
  "HostName": String,
  "ZoneId": String,
  "SystemDiskCategory": String,
  "SystemDiskSize": Number,
  "SystemDiskDiskName": String,
  "SystemDiskDescription": String,
  "IoOptimized": String,
  "InternetChargeType": String,
  "UserData": String,
  "KeyPairName": String,
  "RamRoleName": String,
  "AutoReleaseTime": String,
  "SpotStrategy": String,
  "SpotPriceLimit": String,
  "SecurityEnhancementStrategy": String,
  "DiskMappings": List,
  "NetworkInterfaces": List,
  "Tags": List,
  "TemplateTags": List
 }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
LaunchTemplateName	String	Yes	No	The name of the instance launch template.	• The name must be 2 to 128 characters in length. • It must start with a letter but cannot start with `http://` or `https://`. • It can contain letters, digits, colons (:), underscores (_), and hyphens (-).

Property	Type	Required	Editable	Description	Constraint
VersionDescription	String	No	No	The description of the version of the instance launch template.	• The description must be 2 to 128 characters in length. • It must start with a letter but cannot start with `http://` or `https://`.
ImageId	String	No	No	The ID of the image.	None
InstanceType	String	No	No	The type of the instance.	None
SecurityGroupId	String	No	No	The ID of the security group.	None
NetworkType	String	No	No	The network type of the instance.	Valid values: • classic • vpc
VSwitchId	String	No	No	The ID of the VSwitch. You must specify this parameter when you create an instance in a VPC.	None
InstanceName	String	No	No	The name of the instance.	• The name must be 2 to 128 characters in length. • It must start with a letter but cannot start with `http://` or `https://`.
Description	String	No	No	The description of the instance.	• The description must be 2 to 128 characters in length. • It must start with a letter but cannot start with `http://` or `https://`.
InternetMaxBandwidthIn	Integer	No	No	Maximum inbound bandwidth from the Internet.	Valid values: 1 to 200. Unit: Mbit/s.
InternetMaxBandwidthOut	Integer	No	No	Maximum outbound bandwidth to the Internet.	Valid values: 0 to 100. Unit: Mbit/s.

Property	Type	Required	Editable	Description	Constraint
HostName	String	No	No	The hostname of the instance.	The name cannot start or end with a period (.) or a hyphen (-). It cannot contain consecutive periods (.) or hyphens (-). • For Windows instances: ◦ The name must be 2 to 15 characters in length and can contain letters, digits, and hyphens (-). ◦ It cannot only contain digits. • For other instances such as Linux instances: ◦ The name must be 2 to 64 characters in length and can contain letters, digits, and hyphens (-).
ZoneId	String	No	No	The ID of the zone where the instance resides.	None
SystemDiskCategory	String	No	No	The category of the system disk.	Valid values: • cloud: the basic disk • cloud_efficiency: the ultra disk • cloud_ssd: the standard SSD • ephemeral_ssd: the local SSD
SystemDiskSize	Number	No	No	The size of the system disk.	Valid values: 20 to 500. Unit: GiB.
SystemDiskDiskName	String	No	No	The name of the system disk.	• The name must be 2 to 128 characters in length and can contain letters, digits, colons (:), underscores (_), and hyphens (-). • It must start with a letter but cannot start with `http://` or `https://`.

Property	Type	Required	Editable	Description	Constraint
SystemDiskDescription	String	No	No	The description of the system disk.	The description must be 2 to 256 characters in length and cannot start with `http://` or `https://`.
IoOptimized	String	No	No	Specifies whether the instance is I/O optimized.	Valid values: • none • optimized
InternetChargeType	String	No	No	The billing method for network usage.	Valid values: • PayByBandwidth • PayByTraffic
UserData	String	No	No	The user data of the instance.	The data must be encoded in Base64. The maximum size of the raw data is 16 KB.
KeyPairName	String	No	No	The AccessKey pair name.	• For Windows instances, this parameter is ignored and is empty by default. The Password parameter takes effect even if the KeyPairName parameter is specified. • For Linux instances, the username and password authentication method is disabled by default.
RamRoleName	String	No	No	The RAM role name of the instance.	None
AutoReleaseTime	String	No	No	The time scheduled for the instance to be automatically released.	Specify the time in the ISO 8601 standard in the `yyyy-MM-ddTHH:mm:ssZ` format. The time must be in UTC.

Property	Type	Required	Editable	Description	Constraint
SpotStrategy	String	No	No	The preemption policy for pay-as-you-go instances.	This parameter takes effect only when the InstanceChargeType parameter is set to PostPaid. Valid values: • NoSpot: The instance is created as a regular pay-as-you-go instance. • SpotWithPriceLimit: The instance to be created is a preemptible instance with a user-defined maximum hourly price. • SpotAsPriceGo: The instance to be created is a preemptible instance whose price is based on the market price at the time of purchase.
SpotPriceLimit	String	No	No	The maximum hourly price of the instance.	A maximum of three decimal places can be specified.
SecurityEnhancementStrategy	String	No	No	Specifies whether to enable security hardening.	Valid values: • Active: enables security hardening. • Deactive: disables security hardening.
DiskMappings	List	No	No	The list of data disks.	A maximum of 16 data disks can be specified.
NetworkInterfaces	List	No	No	The list of elastic network interfaces (ENIs).	A maximum of eight ENIs can be specified.
Tags	List	No	No	The tags of the instance, security group, disks, and ENIs.	A maximum of 20 tags can be specified.
TemplateTags	List	No	No	The tags of the launch template.	A maximum of 20 tags can be specified.

DiskMappings syntax

```
"DiskMappings": [
 {
  "Category": String,
  "DiskName": String,
  "Description": String,
  "SnapshotId": String,
  "Size": String,
  "Encrypted": String,
  "DeleteWithInstance": String
 }
]
```

DiskMappings properties

Property	Type	Required	Editable	Description	Constraint
Category	String	No	No	The category of the data disk.	Valid values: • cloud: the basic disk • cloud_efficiency: the ultra disk • cloud_ssd: the standard SSD • ephemeral_ssd: the local SSD
DiskName	String	No	No	The name of the data disk.	• The name must be 2 to 128 characters in length. • It must start with a letter but cannot start with `http://` or `https://`. • It can contain letters, digits, colons (:), underscores (_), and hyphens (-).
Description	String	No	No	The description of the data disk.	The description must be 2 to 256 characters in length and cannot start with `http://` or `https://`.
SnapshotId	String	No	No	The ID of the snapshot used to create the data disk.	None

Property	Type	Required	Editable	Description	Constraint
Size	String	No	No	The size of the system disk.	• Valid values when the Category parameter is set to cloud: 5 to 2000. • Valid values when the Category parameter is set to cloud_efficiency: 20 to 32768. • Valid values when the Category parameter is set to cloud_ssd: 20 to 32768. • Valid values when the Category parameter is set to ephemeral_ssd: 5 to 800. Unit: GiB.
Encrypted	Boolean	No	No	Specifies whether to encrypt the data disk.	None
DeleteWithInstance	Boolean	No	No	Specifies whether to release the data disk when the instance is released.	None

NetworkInterfaces syntax

```
"NetworkInterfaces": [
 {
  "PrimaryIpAddress": String,
  "VSwitchId": String,
  "SecurityGroupId": String,
  "NetworkInterfaceName": String,
  "Description": String
 }
]
```

NetworkInterfaces properties

Property	Type	Required	Editable	Description	Constraint
PrimaryIpAddress	String	No	No	The primary private IP address of the ENI.	None
VSwitchId	String	No	No	The ID of the VSwitch to which the ENI belongs.	None
SecurityGroupId	String	No	No	The ID of the security group to which the ENI belongs.	None

Property	Type	Required	Editable	Description	Constraint
NetworkInterfaceName	String	No	No	The name of the ENI.	None
Description	String	No	No	The description of the ENI.	The description must be 2 to 256 characters in length and cannot start with `http://` or `https://`.

Tags syntax

```
"Tags": [
 {
  "Value": String,
  "Key": String
 }
]
```

Tags properties

Property	Type	Required	Editable	Description	Constraint
key	String	Yes	No	None	None
value	String	No	No	None	None

TemplateTags syntax

```
"TemplateTags": [
 {
  "Value": String,
  "Key": String
 }
]
```

TemplateTags properties

Property	Type	Required	Editable	Description	Constraint
key	String	Yes	No	None	None
value	String	No	No	None	None

Response parameters

Fn::GetAtt

- LaunchTemplateId: the ID of the instance launch template.
- LaunchTemplateName: the name of the instance launch template.
- DefaultVersionNumber: the default version number of the instance launch template.
- LatestVersionNumber: the latest version number of the instance launch template.

Examples

5.5.1.16. ALIYUN::ECS::NatGateway

ALIYUN::ECS::NatGateway is used to create a NAT Gateway for a VPC.

Statement

```
{
 "Type": "ALIYUN::ECS::NatGateway",
 "Properties": {
  "DeletionProtection": Boolean,
  "VpcId": String,
  "Description": String,
  "NatGatewayName": String,
  "VSwitchId": String,
  "DeletionForce": Boolean,
  "Spec": String
 }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
VpcId	String	Yse	No	The ID of the VPC that you want to create NAT Gateway.	None
VSwitchId	String	Yse	No	The ID of the vSwitch in the specified VPC.	None
Description	String	Erased	Released	The description of the NAT Gateway.	The description must be 2 to 256 characters in length.
NatGatewayName	String	Erased	Released	The name of the NAT Gateway.	The name must be 2 to 128 characters in length and can contain letters, digits, underscores (_), periods (.), and hyphens (-). It must start with a letter.
Spec	String	Erased	Released	The type of the NAT Gateway.	Valid values: Small,Middle, and Large.
DeletionProtection	Boolean	Erased	Released	Indicates whether deletion protection is enabled. Default value: false.	None
DeletionForce	Boolean	Erased	Released	Specifies whether to forcibly delete SNAT and DNAT entries in the Gateway and unbind EIP from the NAT gateway. Default value: false.	Valid values: 1025 to 10000. You cannot use the following commonly used port numbers: 2222, 4500, 4510, 4560, 7505, 9000, 9001, and 9002.

Response parameters

Fn::GetAtt

- ForwardTableId: the ID of the port forwarding table.
- The ID of the SNatTableId:SNat source network address translation table.
- NatGatewayId: the unique ID of the Nat gateway.

Sample request

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Resources": {
  "NatGateway": {
   "Type": "ALIYUN::ECS::NatGateway",
   "Properties": {
    "NatGatewayName": "nat_gateway_1",
    "Description": "my nat gateway",
    "VpcId": "vpc-25o8s****",
    "VSwitchId": "vsw-25rc1****",
    "Spec": "Small"
   }
  }
 },
 "Outputs": {
  "NatGatewayId": {
     "Value": {"Fn::GetAttr": ["NatGateway","NatGatewayId"]}
  },
  "ForwardTableId": {
     "Value": {"Fn::GetAttr": ["NatGateway","ForwardTableId"]}
  },
  "SNatTableId": {
     "Value": {"Fn::GetAttr": ["NatGateway", "SNatTableId"]}
  }
 }
}
```

5.5.1.17. ALIYUN::ECS::NetworkInterface

ALIYUN::ECS::NetworkInterface is used to create an elastic network interface (ENI).

Statement

```
{
 "Type": "ALIYUN::ECS::NetworkInterface",
 "Properties": {
  "Description": String,
  "SecurityGroupId": String,
  "PrimaryIpAddress": String,
  "ResourceGroupId": String,
  "VSwitchId": String,
  "NetworkInterfaceName": String
 }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	Yes	Released	The ID of the resource group to which the instance belongs.	None

Parameter	Type	Required	Editable	Description	Constraint
SecurityGroupId	String	No	Yes	The ID of the security group to which the instance belongs. The security group and the instance must be in the same VPC.	None
VSwitchId	String	No	No	The ID of the VSwitch in the VPC.	None
Description	String	Yes	True	The description of the ENI. It can contain 2 to 256 English letters or Chinese character. It cannot start with `http://` and `https://` the beginning. This parameter is empty by default.	None

Parameter	Type	Required	Editable	Description	Constraint
NetworkInterfaceName	String	Yes	True	The name of the ENI. The name must be 2 to 128 characters in length Must start with an uppercase or lowercase letter, and cannot start with `http://` and `https://` the beginning. It can contain letters, digits, colons (:), underscores (_), and hyphens (-). Default value: null.	None
PrimaryIpAddress	String	Yes	Released	The primary private IP address of the ENI. The specified IP address must be available within the CIDR block of the VSwitch. If this parameter is not specified, an available IP address in the VSwitch CIDR block is assigned at random.	Valid values: 1025 to 10000. You cannot use the following commonly used port numbers: 2222, 4500, 4510, 4560, 7505, 9000, 9001, and 9002.

Response parameters

Fn::GetAtt

- NetworkInterfaceId: the ID of the ENI.
- The MAC address of the MacAddress: Elastic Network Interface.
- The private IP address of the PrivateIpAddress: Elastic Network Interface.

Sample request

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Parameters": {
  "Description": {
   "Type": "String",
   "Description": "Description of your ENI. It is a string of [2, 256] English or Chinese characters."
  },
  "SecurityGroupId": {
   "Type": "String",
   "Description": "The ID of the security group that the ENI joins. The security group and the ENI must be in a same VPC."
  },
  "VSwitchId": {
   "Type": "String",
   "Description": "VSwitch ID of the specified VPC. Specifies the switch ID for the VPC."
  },
  "NetworkInterfaceName": {
   "Type": "String",
   "Description": "Name of your ENI. It is a string of [2, 128]  Chinese or English characters. It must begin with a letter and can contain numbers, underscores (_), colons (:), or hyphens (-)."
  },
  "PrimaryIpAddress": {
   "Type": "String",
   "Description": "The primary private IP address of the ENI.  The specified IP address must have the same Host ID as the VSwitch. If no IP addresses are specified, a random network ID is assigned for the ENI."
  }
 },
 "Resources": {
  "EniInstance": {
   "Type": "ALIYUN::ECS::NetworkInterface",
   "Properties": {
    "Description": {
     "Ref": "Description"
    },
    "SecurityGroupId": {
     "Ref": "SecurityGroupId"
    },
    "VSwitchId": {
     "Ref": "VSwitchId"
    },
    "NetworkInterfaceName": {
     "Ref": "NetworkInterfaceName"
    },
    "PrimaryIpAddress": {
     "Ref": "PrimaryIpAddress"
    }
   }
  }
 },
 "Outputs": {
  "NetworkInterfaceId": {
   "Description": "ID of your Network Interface.",
   "Value": {
    "Fn::GetAtt": [
     "EniInstance",
     "NetworkInterfaceId"
    ]
   }
  }
```

```
 }
}
```

5.5.1.18. ALIYUN::ECS::NetworkInterfaceAttachment

ALIYUN::ECS::NetworkInterfaceAttachment is used to attach an elastic network interface (ENI) to an instance in a VPC.

Statement

```
{
 "Type": "ALIYUN::ECS::NetworkInterfaceAttachment",
 "Properties": {
  "InstanceId": String,
  "NetworkInterfaceId": String
 }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
InstanceId	String	No	No	The ID of the RDS instance.	None
NetworkInterfaceId	String	No	No	The IDs of the elastic network interfaces (ENIs).	Valid values: 1025 to 10000. You cannot use the following commonly used port numbers: 2222, 4500, 4510, 4560, 7505, 9000, 9001, and 9002.

Response parameters

Fn::GetAtt

NetworkInterfaceId: the ID of the ENI.

Sample request

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Parameters": {
  "InstanceId": {
   "Type": "String",
   "Description": "ECS instance id"
  },
  "NetworkInterfaceId": {
   "Type": "String",
   "Description": "Network interface id"
  }
 },
 "Resources": {
  "EniAttachment": {
   "Type": "ALIYUN::ECS::NetworkInterfaceAttachment",
   "Properties": {
    "InstanceId": {
     "Ref": "InstanceId"
    },
    "NetworkInterfaceId": {
     "Ref": "NetworkInterfaceId"
    }
   }
  }
 },
 "Outputs": {
  "NetworkInterfaceId": {
   "Description": "ID of your Network Interface.",
   "Value": {
    "Fn::GetAtt": [
     "EniAttachment",
     "NetworkInterfaceId"
    ]
   }
  }
 }
}
```

5.5.1.19. ALIYUN::ECS::NetworkInterfacePermission

ALIYUN::ECS::NetworkInterfacePermission is used to grant an account the permission to attach an elastic network interface (ENI) to an instance.

Syntax

```
{
 "Type": "ALIYUN::ECS::NetworkInterfacePermission",
 "Properties": {
  "NetworkInterfaceId": String,
  "AccountId": String,
  "Permission": String
 }
}
```

Properties

Name	Type	Required	Editable	Description	Validity
NetworkInterfaceId	String	Yes	No	The ID of the ENI.	None
AccountId	String	Yes	No	The ID of the account.	None
Permission	String	Yes	No	The permission granted to the account.	None

Response parameters

Fn::GetAtt

- NetworkInterfacePermissionId: the ID of the ENI permission.

Examples

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Parameters": {
  "AccountId": {
   "Type": "String",
   "Description": "the account id"
  },
  "Permission": {
   "Type": "String",
   "Description": "the permission",
   "Default": "InstanceAttach"
  },
  "NetworkInterfaceId": {
   "Type": "String",
   "Description": "Network interface id"
  }
 },
 "Resources": {
  "EniPermission": {
   "Type": "ALIYUN::ECS::NetworkInterfacePermission",
   "Properties": {
    "AccountId": {
     "Ref": "AccountId"
    },
    "Permission": {
     "Ref": "Permission"
    },
    "NetworkInterfaceId": {
     "Ref": "NetworkInterfaceId"
    }
   }
  }
 },
 "Outputs": {
  "NetworkInterfacePermissionId": {
   "Description": "the network interface permission id",
   "Value": {
    "Fn::GetAtt": [
     "EniPermission",
     "NetworkInterfacePermissionId"
    ]
   }
  }
 }
}
```

5.5.1.20. ALIYUN::ECS::Route

ALIYUN::ECS::Route is used to create a custom route.

Syntax

```
{
 "Type": "ALIYUN::ECS::Route",
 "Properties": {
  "DestinationCidrBlock": String,
  "RouteTableId": String,
  "NextHopId": String,
  "NextHopType": String,
  "RouteId": String,
  "NextHopList": List
 }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
DestinationCidrBlock	String	Yes	No	The destination Classless Inter-Domain Routing (CIDR) block of the route entry.	None
RouteTableId	String	Yes	No	The ID of the route table.	None
NextHopId	String	No	No	The ID of the next-hop instance of the route entry.	The route is a non-ECMP route.
RouteId	String	Yes	No	The ID of the route.	None
NextHopType	String	No	No	The type of the next hop.	Default value: Instance. Valid values: • Instance • Tunnel • HaVip • RouterInterface

Property	Type	Required	Editable	Description	Constraint
NextHopList	List	No	No	The list of next hops of the route entry.	You must specify the NextHopType and NextHopId parameters to specify the next hops. • If you specify the NextHopList parameter, the route is an ECMP route. The list contains two to four next hops of the ECMP route entry. **Note** The NextHopList parameter can be specified only when the route entry belongs to a VRouter. In addition, the next hops must be the router interfaces pointing to the connected VBRs. • If you do not specify the NextHopList parameter, the route is a non-ECMP route.

NextHopList syntax

```
"NextHopList": [
 {
  "NextHopId": String,
  "NextHopType": String
 }
]
```

NextHopList properties

Property	Type	Required	Editable	Description	Constraint
NextHopId	String	Yes	No	The ID of the next-hop instance of the route entry.	None
NextHopType	String	No	No	The type of the next hop.	Default value: RouterInterface. Valid values: • Instance • Tunnel • HaVip • RouterInterface

Response parameters

Fn::GetAtt

None

Examples

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Resources": {
  "ECSRoute": {
   "Type": "ALIYUN::ECS::Route",
   "Properties": {
"RouteId": "vrt-25mz0****",
    "RouteTableId": "vtb-25oud****",
    "DestinationCidrBlock": "172.16.XX.XX/24",
    "NextHopId": "i-25xzy****"
   }
  }
 }
}
```

5.5.1.21. ALIYUN::ECS::SNatEntry

ALIYUN::ECS::SNatEntry is used to configure a NAT Gateway table in a source network address translation.

Statement

```
{
 "Type": "ALIYUN::ECS::SNatEntry",
 "Properties": {
  "SNatTableId": String,
  "SNatIp": String,
  "SourceVSwitchId": String
 }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
SNatTableId	String	Retained	Yes	The ID source network address translation table.	None
SNatIp	String	Retained	Yes	The public IP address used to source network address translation.	The public IP address must be NAT Gateway in the bandwidth plan. It cannot exist in both the forwarding table and the SNAT table.

Parameter	Type	Required	Editable	Description	Constraint
SourceVSwitchId	String	Retained	Yes	The ID of the VSwitch that accesses the Internet through the SNAT function of NAT Gateway.	Valid values: 1025 to 10000. You cannot use the following commonly used port numbers: 2222, 4500, 4510, 4560, 7505, 9000, 9001, and 9002.

Response parameters

Fn::GetAtt

SNatEntryId: the table entry ID in the source network address translation table.

Sample request

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Resources": {
  "SNatEntry": {
   "Type": "ALIYUN::ECS::SNatEntry",
   "Properties": {
    "SNatTableId": "stb-3er41****",
    "SourceVSwitchId": "vsw-25rc1****",
    "SNatIp": "101.201.XX.XX"
   }
  }
 },
 "Outputs": {
  "SNatEntryId": {
     "Value": {"Fn::GetAttr": ["SNatEntry","SNatEntryId"]}
  }
}
```

5.5.1.22. ALIYUN::ECS::SecurityGroup

ALIYUN::ECS::SecurityGroup is used to create a security group.

Statement

```
{
 "Type": "ALIYUN::ECS::SecurityGroup",
 "Properties": {
  "VpcId": String,
  "Description": String,
  "SecurityGroupName": String,
  "Tags": List,
  "SecurityGroupEgress": List,
  "SecurityGroupIngress": List,
  "ResourceGroupId": String,
  "SecurityGroupType": String
 }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	Yes	Released	The ID of the resource group to which the instance belongs.	None
VpcId	String	Yes	Released	The ID of the VPC.	None
Description	String	Yes	Released	The description of the new security group.	The description must be 2 to 256 characters in length.
Tags	List	Erased	Released	The tags of the security group.	A maximum of 20 tags can be specified.
SecurityGroupName	String	Yes	Released	The name of the new security group.	Default value: empty. • The name must be 2 to 128 characters in length • Must start with an uppercase or lowercase letter, and cannot start with `http://` and `https://` the beginning. • It must start with a letter and cannot start with http:// or https://.
SecurityGroupEgress	List	Erased	Released	The outbound access rules of the security group.	None
SecurityGroupIngress	List	Erased	Released	The inbound access rules of the security group.	None

Parameter	Type	Required	Editable	Description	Constraint
SecurityGroupType	String	Yes	Released	The type of the new security group.	Valid values: • normal (basic security group) • enterprise (Advanced Security Group)

Tags syntax

```
"Tags": [
 {
  "Value" : String,
  "Key" : String
 }
]
```

Tags properties

Parameter	Type	Required	Editable	Description	Constraint
Key	String	No	No	None	None
Value	String	Yes	Released	None	None

SecurityGroupEgress syntax

```
"SecurityGroupEgress": [
 {
  "Description": String,
  "PortRange": String,
  "SecurityGroupId": String,
  "NicType": String,
  "Priority": Integer,
  "DestGroupId": String,
  "DestCidrIp": String,
  "Policy": String,
  "IpProtocol": String,
  "DestGroupOwnerAccount": String,
  "DestGroupOwnerId": String,
  "Ipv6DestCidrIp": String
 }
]
```

SecurityGroupEgress properties

Parameter	Type	Required	Editable	Description	Constraint
Description	String	Yes	Released	The description of the security group rule.	The description must be 1 to 512 characters in length.

Parameter	Type	Required	Editable	Description	Constraint
DestGroupOwnerId	String	Yes	Released	The ID of the Alibaba Cloud account that owns the destination security group. This parameter is used to grant the current security group access to security groups in another Alibaba Cloud account.	If neither the DestGroupOwnerId parameter nor the DestGroupOwnerAccount parameter is specified, the current security group is granted access to other security groups in the same Alibaba Cloud account. If the DestCidrIp parameter is specified, the DestGroupOwnerId parameter is ignored.
IpProtocol	String	No	No	The Internet protocol over which the listener will forward requests.	Valid values: • TCP • udp • icmp • GRE • All A value of all specifies that all the four protocols are supported.

Parameter	Type	Required	Editable	Description	Constraint
PortRange	String	Yes	Released	The range of port numbers corresponding to the Internet protocol.	The range of destination ports corresponding to the transport layer protocol. Valid values: • When the IpProtocol parameter is set to tcp or udp, the port number range is 1 to 65535. Separate the starting port and the ending port with a forward slash (/). Correct example: 1/200. Incorrect example: 200/1. • When the IpProtocol parameter is set to icmp, the port number range is -1/-1, indicating that all ports are available. • When the IpProtocol parameter is set to gre, the port number range is -1/-1, indicating that all ports are available. • When the IpProtocol parameter is set to all, the port number range is -1/-1.

Parameter	Type	Required	Editable	Description	Constraint
SecurityGroupId	String	Yes	Released	The ID of the security group for which to create the outbound access rules.	None
NicType	String	Yes	Released	The network type of the instance. Valid values:	Valid values: • internet • intranet Default value: internet.
Priority	String	Optional	Released	The priority of the authorization policy.	Valid values: 1 to 100. Default value: 1
DestGroupId	String	Yes	Released	The ID of the destination security group within the same region.	You must specify either the DestGroupId parameter or the DestCidrIp parameter. If both parameters are specified, the system authorizes the destination CIDR block specified by the DestCidrIp parameter. If the DestGroupId parameter is specified, but the DestCidrIp parameter is not, you must set the NicType parameter to intranet.

Parameter	Type	Required	Editable	Description	Constraint
DestCidrIp	String	Yes	Released	The source IPv4 CIDR block.	The value must be in CIDR format. The default value is 0.0.0.0/0, indicating that access from any IP addresses is allowed. Examples of other supported formats include 10.159.XX.XX/12. Only IPv4 addresses are supported.
Policy	String	Yes	Released	The authorization policy.	Valid values: • accept: grants access • drop: denies access Default value: accept.
DestGroupOwnerAccount	String	Yes	Released	The Alibaba Cloud account of the destination security group when you grant security group permissions across accounts.	None
Ipv6DestCidrIp	String	Yes	Released	The destination IPv6 CIDR block.	IPv6 addresses in CIDR format are supported. You can only specify the IP addresses for ECS instances in VPCs.

SecurityGroupIngress syntax

```
"SecurityGroupIngress": [
 {
  "SourceGroupOwnerId": String,
  "SourceGroupOwnerAccount": String,
  "Description": String,
  "PortRange": String,
  "SecurityGroupId": String,
  "NicType": String,
  "Ipv6SourceCidrIp": String,
  "Priority": Integer,
  "SourceGroupId": String,
  "Policy": String,
  "IpProtocol": String,
  "SourcePortRange": String,
  "SourceCidrIp": String
 }
]
```

SecurityGroupIngress properties

Parameter	Type	Required	Editable	Description	Constraint
SourceGroupOwnerId	String	Yes	Released	The ID of the Alibaba Cloud account that owns the source security group.	None
Description	String	Yes	Released	The description of the security group rule.	The description must be 1 to 512 characters in length.
IpProtocol	String	No	No	The Internet protocol over which the listener will forward requests.	Valid values: tcp, udp, icmp, gre, and all. A value of all specifies that all the four protocols are supported.

Parameter	Type	Required	Editable	Description	Constraint
PortRange	String	Yes	Released	The range of port numbers corresponding to the Internet protocol.	The range of destination ports corresponding to the transport layer protocol. Valid values: • When the IpProtocol parameter is set to tcp or udp, the port number range is 1 to 65535. Separate the starting port and the ending port with a forward slash (/). Correct example: 1/200. Incorrect example: 200/1. • When the IpProtocol parameter is set to icmp, the port number range is -1/-1, indicating that all ports are available. • When the IpProtocol parameter is set to gre, the port number range is -1/-1, indicating that all ports are available. • When the IpProtocol parameter is set to all, the port number range is -1/-1, indicating that all ports are available.

Parameter	Type	Required	Editable	Description	Constraint
SourceGroupId	String	Yes	Released	The ID of the source security group within the same region.	You must specify either the SourceGroupId parameter or the SourceCidrIp parameter. If both parameters are specified, the system authorizes the source CIDR block specified by the SourceCidrIp parameter. If the SourceGroupId parameter is specified, but the SourceCidrIp parameter is not, you must set the NicType parameter to intranet.
SecurityGroupId	String	Yes	Released	The ID of the security group for which you want to create the inbound access rule.	None
NicType	String	Yes	Released	The network type of the instance. Valid values:	Valid values: • internet • intranet Default value: internet.
SourceGroupOwnerAccount	String	Yes	Released	The Alibaba Cloud account of the destination security group when you grant security group permissions across accounts.	None
Priority	String	Optional	Released	The priority of the authorization policy.	Valid values: 1 to 100. Default value: 1

Parameter	Type	Required	Editable	Description	Constraint
SourceCidrIp	String	Yes	Released	The source IPv4 CIDR block.	The value must be in CIDR format. The default value is 0.0.0.0/0, indicating that access from any IP addresses is allowed. Examples of other supported formats include 10.159.XX.XX/12. Only IPv4 CIDR blocks are supported.
Policy	String	Yes	Released	The authorization policy.	Valid values: • accept: accepts the request. • drop: access is denied. Default value: accept.

Parameter	Type	Required	Editable	Description	Constraint
SourcePortRange	String	Yes	Released	The range of source ports relevant to transport layer protocols.	Valid values: • When the IpProtocol parameter is set to tcp or udp, the port number range is 1 to 65535. Separate the starting port and the ending port with a forward slash (/). Correct example: 1/200. Incorrect example: 200/1. • When the IpProtocol parameter is set to icmp, the port number range is -1/-1, indicating that all values are valid. • When the IpProtocol parameter is set to gre, the port number range is -1/-1, indicating that all ports are available. • The IpProtocol value is all:-1/-1.
Ipv6SourceCidrIp	String	Yes	Released	The source IPv6 CIDR block. IPv6 addresses in CIDR format are supported.	You can only specify the IP addresses of ECS instances in VPCs.

Response parameters

Fn::GetAtt

SecurityGroupId: the ID of the new security group.

Sample request

```
{
 "ROSTemplateFormatVersion" : "2015-09-01",
 "Resources" : {
  "SG": {
   "Type": "ALIYUN::ECS::SecurityGroup",
   "Properties": {
    "SecurityGroupName": {
     "Ref": "SecurityGroupName"
    },
    "SecurityGroupIngress": [
     {
      "SourceCidrIp": "0.0.0.0/0",
      "IpProtocol": "all",
      "NicType": "internet",
      "PortRange": "-1/-1",
      "Priority": 1
     },
     {
      "SourceCidrIp": "0.0.0.0/0",
      "IpProtocol": "all",

  "SecurityGroupId": {
   "Value" : {"Fn::GetAtt": ["SG","SecurityGroupId"]}
  }
 }
}
```

5.5.1.23. ALIYUN::ECS::SecurityGroupClone

ALIYUN::ECS::SecurityGroupClone is used to clone a security group.

Syntax

```
{
 "Type": "ALIYUN::ECS::SecurityGroupClone",
 "Properties": {
  "DestinationRegionId": String,
  "VpcId": String,
  "Description": String,
  "SecurityGroupName": String,
  "SourceSecurityGroupId": String,
  "ResourceGroupId": String,
  "NetworkType": String,
  "SecurityGroupType": String
 }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	No	No	The ID of the resource group to which the instance belongs.	None
SourceSecurityGroupId	String	Yes	No	The ID of the source security group.	Only applicable security group rules are copied to the new security group. The security group rules are selected based on the network type of the new security group.
NetworkType	String	No	No	The network type of the new security group.	Set the value to Classic.
VpcId	String	No	No	The ID of the VPC to which the new security group belongs.	The NetworkType parameter is ignored if both the VpcId and NetworkType parameters are specified.
Description	String	No	No	The description of the new security group.	The description must be 2 to 256 characters in length. It cannot start with http:// or https://.

Property	Type	Required	Editable	Description	Constraint
SecurityGroupName	String	No	No	The name of the new security group.	This parameter is empty by default. The name must be 2 to 128 characters in length and can contain letters, digits, periods (.), underscores (_), and hyphens (-). It must start with a letter and cannot start with http:// or https://.
DestinationRegionId	String	No	No	The ID of the destination region where the new security group resides.	Default value: CURRENT.
SecurityGroupType	String	No	No	The type of the new security group.	Valid values: normal and enterprise. A value of normal specifies a basic security group. A value of enterprise specifies an advanced security group.

Response parameters

Fn::GetAtt

SecurityGroupId: the ID of the new security group.

Examples

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Resources": {
  "SecurityGroupClone": {
   "Type": "ALIYUN::ECS::SecurityGroupClone",
   "Properties": {
    "SourceSecurityGroupId": {
     "Ref": "SourceSecurityGroupId"
    },
    "VpcId": {
     "Ref": "VpcId"
    },
    "Description": {
     "Ref": "Description"
    },
    "SecurityGroupName": {
```

```
        "Ref": "SecurityGroupName"
       },
       "DestinationRegionId": {
        "Ref": "DestinationRegionId"
       },
       "NetworkType": {
        "Ref": "NetworkType"
       }
      }
     }
    },
    "Parameters": {
     "SourceSecurityGroupId": {
      "Type": "String",
      "Description": "Source security group ID is used to copy properties to clone new security group. If the NetworkType and VpcId is not specified, the same security group will be cloned. If NetworkType or VpcId is specified, only proper security group rules will be cloned."
     },
     "VpcId": {
      "Type": "String",
      "Description": "Physical ID of the VPC."
     },
     "Description": {
      "Type": "String",
      "Description": "Description of the security group, [2, 256] characters. Do not fill or empty, the default is empty."
     },
     "SecurityGroupName": {
      "Type": "String",
      "Description": "Display name of the security group, [2, 128] English or Chinese characters, must start with a letter or Chinese in size, can contain numbers, '_' or '.', '-'"
     },
     "DestinationRegionId": {
      "Default": "CURRENT",
      "Type": "String",
      "Description": "Clone security group to the specified region. Default to current region."
     },
     "NetworkType": {
      "Type": "String",
      "Description": "Clone new security group as classic network type. If the VpcId is specified, the value will be ignored.",
      "AllowedValues": [
       "Classic"
      ]
     }
    },
    "Outputs": {
     "SecurityGroupId": {
      "Description": "Generated security group id of new security group.",
      "Value": {
       "Fn::GetAtt": [
        "SecurityGroupClone",
        "SecurityGroupId"
       ]
      }
     }
    }
}
```

5.5.1.24. ALIYUN::ECS::SecurityGroupEgress

ALIYUN::ECS::SecurityGroupEgress is used to create an outbound access rule for a security group.

Syntax

```
{
 "Type": "ALIYUN::ECS::SecurityGroupEgress",
 "Properties": {
  "SecurityGroupId": String,
  "IpProtocol": String,
  "PortRange": String,
  "DestGroupId": String,
  "DestGroupOwnerAccount": String,
  "DestCidrIp": String,
  "Policy": String,
  "Priority": String,
  "NicType": String,
  "Ipv6DestCidrIp": String
 }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
IpProtocol	String	Yes	No	The transport layer protocol.	Valid values: • tcp • udp • icmp • gre • all **Note** The value all indicates that all the four protocols are supported.

Property	Type	Required	Editable	Description	Constraint
PortRange	String	Yes	No	The range of destination port numbers corresponding to the transport layer protocol.	• Valid values when IpProtocol is set to tcp or udp: 1 to 65535. Separate the starting and ending port numbers with a forward slash (/). Correct example: 1/200. Incorrect example: 200/1. • Set the value to -1/-1 when IpProtocol is set to icmp. • Set the value to -1/-1 when IpProtocol is set to gre. • Set the value to -1/-1 when IpProtocol is set to all.
SecurityGroupId	String	No	No	The ID of the source security group.	None
NicType	String	No	No	The type of the network interface controller (NIC).	Default value: internet. Valid values: • internet • intranet If the DestGroupId parameter is specified, but the DestCidrIp parameter is not, set the value to intranet.
Priority	Integer	No	No	The priority of the security group rule.	Valid values: 1 to 100 Default value: 1.

Property	Type	Required	Editable	Description	Constraint
DestGroupId	String	No	No	The ID of the destination security group for which you want to set access permissions.	You must specify at least one of the DestGroupId and DestCidrIp parameters. If the DestGroupId parameter is specified, but the DestCidrIp parameter is not, set the NicType value to intranet. If both the DestGroupId and DestCidrIp parameters are specified, the DestCidrIp parameter takes precedence.
DestCidrIp	String	No	No	The destination CIDR block.	Only IPv4 CIDR blocks are supported.
Policy	String	No	No	The authorization policy.	Default value: accept. Valid values: • accept: allows access. • drop: denies access.
DestGroupOwnerAccount	String	No	No	The Alibaba Cloud account that manages the destination security group when you set a security group rule across accounts.	If you specify neither of the DestGroupOwnerAccount parameter nor the DestGroupOwnerId parameter, the access permission is configured on another security group managed by your account. If you specify the DestCidrIp parameter, the DestGroupOwnerAccount parameter is ignored.

Property	Type	Required	Editable	Description	Constraint
Description	String	No	Yes	The description of the security group rule.	The description must be 1 to 512 characters in length.
DestGroupOwnerId	String	No	No	The ID of the Alibaba Cloud account that manages the destination security group when you set a security group rule across accounts.	If you specify neither of the DestGroupOwnerAccount parameter nor the DestGroupOwnerId parameter, the access permission is configured on another security group managed by your account. If you specify the DestCidrIp parameter, the DestGroupOwnerId parameter is ignored.
Ipv6DestCidrIp	String	No	No	The destination IPv6 CIDR block.	IPv6 addresses in the CIDR format are supported. You can specify only the IP addresses of ECS instances in VPCs.

Response parameters

Fn::GetAtt

None

Examples

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Resources": {
  "SG": {
   "Type": "ALIYUN::ECS::SecurityGroupEgress",
   "Properties": {
    "SecurityGroupId": "sg-25bow****",
    "IpProtocol": "tcp",
    "PortRange": "65535/65535",
    "DestCidrIp": "0.0.0.0/0"
   }
  }
 }
}
```

5.5.1.25. ALIYUN::ECS::SecurityGroupIngress

ALIYUN::ECS::SecurityGroupIngress is used to create an inbound access rule for a security group.

Syntax

```
{
 "Type": "ALIYUN::ECS::SecurityGroupIngress",
 "Properties": {
  "SourceGroupOwnerId": String,
  "Description": String,
  "PortRange": String,
  "SecurityGroupId": String,
  "NicType": String,
  "Ipv6SourceCidrIp": String,
  "Priority": Integer,
  "SourceGroupId": String,
  "Policy": String,
  "IpProtocol": String,
  "SourcePortRange": String,
  "SourceCidrIp": String
 }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
IpProtocol	String	Yes	No	The Internet protocol.	Valid values: tcp, udp, icmp, gre, and all. A value of all specifies that all the four protocols are supported.

Property	Type	Required	Editable	Description	Constraint
PortRange	String	Yes	No	The range of destination ports relevant to transport layer protocols.	• When the IpProtocol parameter is set to tcp or udp, the port number range is 1 to 65535. Separate the starting port and the ending port with a forward slash (/). Correct example: 1/200. Incorrect example: 200/1. • When the IpProtocol parameter is set to icmp, the port number range is -1/-1. • When the IpProtocol parameter is set to gre, the port number range is -1/-1. • When the IpProtocol parameter is set to all, the port number range is -1/-1.

Property	Type	Required	Editable	Description	Constraint
SourceGroupId	String	No	No	The ID of the source security group for which you want to set access permissions.	You must specify at least one of the SourceGroupId and SourceCidrIp parameters. If the SourceGroupId parameter is specified, but the SourceCidrIp parameter is not, the NicType parameter must be set to intranet. If both the SourceGroupId and SourceCidrIp parameters are specified, the SourceCidrIp value is used by default.
SecurityGroupId	String	No	No	The ID of the security group for which you want to create the inbound access rule.	None
NicType	String	No	No	The network type of the instance.	Valid values: • internet • intranet Default value: internet.
SourceGroupOwnerAccount	String	No	No	The Alibaba Cloud account that manages the source security group when you set a security group rule across accounts.	If neither the SourceGroupOwnerAccount parameter nor the SourceGroupOwnerId parameter is specified, the access permission is configured for another security group managed by your account. If the SourceCidrIp parameter is specified, this parameter is ignored.

Property	Type	Required	Editable	Description	Constraint
Priority	Integer	No	No	The priority of the security group rule.	Valid values: 1 to 100. Default value: 1.
SourceCidrIp	String	No	No	The source IPv4 CIDR block.	Only IPv4 CIDR blocks are supported.
Policy	String	No	No	The access control policy.	Valid values: • accept: grants access. • drop: denies access. Default value: accept.
SourceGroupOwnerId	String	No	No	The ID of the Alibaba Cloud account that manages the source security group when you set a security group rule across accounts.	If neither the SourceGroupOwnerId parameter nor the SourceGroupOwnerAccount parameter is specified, the access permission is configured for another security group managed by your account. If the SourceCidrIp parameter is specified, this parameter is ignored.
Description	String	No	Yes	The description of the security group rule.	The description must be 1 to 512 characters in length.

Property	Type	Required	Editable	Description	Constraint
SourcePortRange	String	No	No	The range of source ports relevant to transport layer protocols.	• When the IpProtocol parameter is set to tcp or udp, the port number range is 1 to 65535. Separate the starting port and the ending port with a forward slash (/). Correct example: 1/200. Incorrect example: 200/1. • When the IpProtocol parameter is set to icmp, the port number range is -1/-1. • When the IpProtocol parameter is set to gre, the port number range is -1/-1. • When the IpProtocol parameter is set to all, the port number range is -1/-1.
Ipv6SourceCidrIp	String	No	No	The range of source IPv6 addresses.	CIDR blocks and IPv6 addresses are supported. You can only specify the IP addresses of ECS instances in VPCs.

Response parameters

Fn::GetAtt

None

Examples

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Resources": {
  "SG": {
   "Type": "ALIYUN::ECS::SecurityGroupIngress",
   "Properties": {
    "SecurityGroupId": "sg-25bow****",
    "IpProtocol": "tcp",
    "PortRange": "65535/65535",
    "SourceCidrIp": "0.0.0.0/0"
   }
  }
 }
}
```

5.5.1.26. ALIYUN::ECS::Snapshot

ALIYUN::ECS::Snapshot is used to create a disk Snapshot.

Statement

```
{
 "Type": "ALIYUN::ECS::Snapshot",
 "Properties": {
  "SnapshotName": String,
  "Timeout": Integer,
  "Description": String,
  "DiskId": String
 }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
DiskId	String	No	No	The ID of the disk for which you want to create the snapshot.	None

Parameter	Type	Required	Editable	Description	Constraint
SnapshotName	String	Yes	Released	The name of the snapshot.	It must be 2 to 128 characters in length. And can contain letters, digits, underscores (_), and hyphens (-). It cannot start with auto. Snapshot names starting with auto are reserved for automatic snapshots. It cannot start with `http://` or `https://`.
Timeout	String	Optional	Released	The timeout period that is specified for the snapshot creation request.	If this parameter is set, the timeout period to create a resource stack is prolonged. If the snapshot is not created within the specified time period, the entire resource stack fails to be created. You must set the timeout period according to the disk size and data amount. Valid values: 200 to 1440. Unit: minute. The default value is 200 minutes.
Description	String	Yes	Released	The description of the snapshot.	The length must be 2 to 256 characters in length. This parameter is empty by default. It cannot start with `http://` or `https://`.

Response parameters

Fn::GetAtt

SnapshotId: the ID of the snapshot.

Sample request

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Resources": {
  "Snapshot": {
   "Type": "ALIYUN::ECS::Snapshot",
   "Properties": {
    "DiskId": "d-2zedgvuvu8cylvrd****"
   }
  }
 },
 "Outputs": {
  "SnapshotId": {
   "Value": {
    "Fn::GetAtt": [
     "Snapshot",
     "SnapshotId"
    ]
   }
  }
 }
}
```

5.5.1.27. ALIYUN::ECS::SSHKeyPair

ALIYUN::ECS::SSHKeyPair is used to create or import an SSH key pair to an ECS instance.

Statement

```
{
 "Type": "ALIYUN::ECS::SSHKeyPair",
 "Properties": {
  "ResourceGroupId": String,
  "KeyPairName": String,
  "PublicKeyBody": String
 }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	Yes	Released	The ID of the resource group to which the instance belongs.	None

Parameter	Type	Required	Editable	Description	Constraint
KeyPairName	String	No	No	The globally unique name of the SSH key pair.	The name must be 2 to 128 characters in length and can contain letters, digits, periods (.), underscores (_), and hyphens (-). It cannot start with `http://` or `https://`.
PublicKeyBody	String	Yes	Released	Specifies the SSH public key to import.	Valid values: 1025 to 10000. You cannot use the following commonly used port numbers: 2222, 4500, 4510, 4560, 7505, 9000, 9001, and 9002.

Response parameters

Fn::GetAtt

- KeyPairFingerPrint: the fingerprint of the key pair. The message-digest algorithm 5 (MD5) is used based on the public key fingerprint format defined in RFC 4716.
- PrivateKeyBody: the private key of the key pair. An unencrypted RSA private key must be encoded using PEM and must be in the PKCS#8 format. The private key of a key pair can only be obtained at the time of its creation. If you import an existing public key, no private key information will be available.
- KeyPairName: the globally unique name of the SSH key pair.

Sample request

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Resources": {
  "SSHKeyPair": {
   "Type": "ALIYUN::ECS::SSHKeyPair",
   "Properties": {
    "KeyPairName": "ssh_key_pair_v1"
   }
  }
 },
 "Outputs": {
  "KeyPairName": {
   "Value": {
    "Fn::GetAtt": [
     "SSHKeyPair",
     "KeyPairName"
    ]
   }
  },
  "PrivateKeyBody": {
   "Value": {
    "Fn::GetAtt": [
     "SSHKeyPair",
     "PrivateKeyBody"
    ]
   }
  },
  "KeyPairFingerPrint": {
   "Value": {
    "Fn::GetAtt": [
     "SSHKeyPair",
     "KeyPairFingerPrint"
    ]
   }
  }
 }
}
```

5.5.1.28. ALIYUN::ECS::SSHKeyPairAttachment

ALIYUN::ECS::SSHKeyPairAttachment is used to bind an SSH key pair to an ECS instance.

Statement

```
{
 "Type": "ALIYUN::ECS::SSHKeyPairAttachment",
 "Properties": {
  "InstanceIds": List,
  "KeyPairName": String
 }
}
```

Properties

Parameter	Type	Required or Not	Editable	Description	Constraint
InstanceIds	List	Retained	Yes	The IDs of the ECS instances with which you want to associate the EIP.	Separate the IDs with a comma (,). Only Linux instances are supported.
KeyPairName	String	No	No	The name of the SSH key pair.	Valid values: 1025 to 10000. You cannot use the following commonly used port numbers: 2222, 4500, 4510, 4560, 7505, 9000, 9001, and 9002.

Response parameters

Fn::GetAtt

None

Sample request

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Resources": {
  "SSHKeyPairAttachment": {
   "Type": "ALIYUN::ECS::SSHKeyPairAttachment",
   "Properties": {
    "KeyPairName": "ssh_key_pair_v1",
    "InstanceIds": [
     'I-2zeiofnh20hj**** has been added * ',
     'I-2zebt3kfvxm2**** has two records *'
    ]
   }
  }
 }
}
```

5.5.1.29. ALIYUN::ECS::VPC

ALIYUN::ECS::VPC is used to create a VPC.

Statement

```
{
 "Type": "ALIYUN::ECS::VPC",
 "Properties": {
  "Description": String,
  "Ipv6CidrBlock": String,
  "EnableIpv6": Boolean,
  "ResourceGroupId": String,
  "VpcName": String,
  "CidrBlock": String
 }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	Yes	Released	The ID of the resource group to which the instance belongs.	None
VpcName	String	Yes	True	The name of the VPC.	• The name must be 2 to 128 characters in length • Must start with english letters or starts with a Chinese character. • It cannot start with `http://` or `https://` . • It must start with a letter and cannot start with http:// or https://.
CidrBlock	String	Yes	True	The CIDR block of the VPC.	Valid values: 10.0.0.0/8, 172.16.0.0/12, and 192.168.0.0/16.
Description	String	Yes	True	The description of the VPC.	The description must be 2 to 256 characters in length. It cannot start with `http://` or `https://` .

Parameter	Type	Required	Editable	Description	Constraint
Ipv6CidrBlock	String	Yes	Released	The IPv6 CIDR block of the VPC.	None
EnableIpv6	Boolean	No.	True	Specifies whether to enable an IPv6 CIDR block.	Valid values: • true • false Default value: false.

Response parameters

Fn::GetAtt

- VpcId: The VPC ID allocated by the system.
- VRouterId: the ID of the vRouter.
- RouteTableId: the ID of the routing table.

Sample request

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Resources": {
  "EcsVpc": {
   "Type": "ALIYUN::ECS::VPC",
   "Properties": {
    "CidrBlock": "172.16.0.0/12",
    "VpcName": "vpc-test-del"
   }
  }
 },
 "Outputs": {
  "VpcId": {
   "Value": {
    "Fn::GetAtt": [
     "EcsVpc",
     "VpcId"
    ]
   }
  },
  "VRouterId": {
   "Value": {
    "Fn::GetAtt": [
     "EcsVpc",
     "VRouterId"
    ]
   }
  },
  "RouteTableId": {
   "Value": {
    "Fn::GetAtt": [
     "EcsVpc",
     "RouteTableId"
    ]
   }
  }
 }
}
```

5.5.1.30. ALIYUN::ECS::VSwitch

ALIYUN::ECS::VSwitch is used to create a VSwitch.

Statement

```
{
 "Type": "ALIYUN::ECS::VSwitch",
 "Properties": {
  "VSwitchName": String,
  "VpcId": String,
  "Description": String,
  "Ipv6CidrBlock": Integer,
  "ZoneId": String,
  "CidrBlock": String
 }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
VpcId	String	No	No	The ID of the VPC where a vSwitch is to be created	None
ZoneId	String	No	No	The ID of the zone where the instance resides.	None
VSwitchName	String	Yes	True	The name of the VSwitch.	• The name must be 2 to 128 characters in length • It must start with a letter. • Cannot `http://` or `https://` the beginning. • It must start with a letter and cannot start with http:// or https://.
CidrBlock	String	No	No	The CIDR block of the VSwitch.	The VSwitch CIDR block must be a subset of the CIDR block assigned to the VPC where the VSwitch resides and not be used by other VSwitches.
Description	String	Yes	True	The description of the vSwitch.	The description must be 2 to 256 characters in length. It cannot start with `http://` or `https://` .
Ipv6CidrBlock	String	Optional	Released	The IPv6 CIDR block of the VSwitch. You can customize the last eight bits of the IPv6 CIDR block.	Valid values: 0 to 255. The value is a decimal integer. By default, the prefix of the IPv6 CIDR block of the VSwitch is set to /64.

Response parameters

Fn::GetAtt

- VSwitchId: indicates the vSwitch ID allocated by the system.
- CidrBlock: the IPv4 CIDR block of the vSwitch.
- Ipv6CidrBlock: the IPv6 CIDR block of the vSwitch.

Sample request

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Parameters": {
  "VpcName": {
   "Type": "String"
  },
  "VSwitch1CidrBlock": {
   "Type": "String",
   "Default": "172.16.100.0/24"
  },
  "VSwitch2CidrBlock": {
    "Type": "String",
    "Default": "172.16.80.0/24"
  }
 },
 "Resources": {
  "EcsVpc": {
   "Type": "ALIYUN::ECS::VPC",
   "Properties": {
    "CidrBlock": "172.16.0.0/12",
    "VpcName": {"Ref": "VpcName"},
   },
  },
  "VSwitch1": {
   "Type": "ALIYUN::ECS::VSwitch",
   "Properties": {
    "ZoneId": "cn-beijing-a",
    "CidrBlock": {"Ref": "VSwitch1CidrBlock"},

5.5.2. ESS

5.5.2.1. ALIYUN::ESS::AlarmTask

ALIYUN::ESS::AlarmTask is used to create a metric-based alarm task.

Syntax

```
{
 "Type": "ALIYUN::ESS::AlarmTask",
 "Properties": {
  "Statistics": String,
  "Name": String,
  "EvaluationCount": Integer,
  "Period": Integer,
  "MetricType": String,
  "ComparisonOperator": String,
  "Dimensions": List,
  "ScalingGroupId": String,
  "AlarmAction": List,
  "Threshold": Number,
  "MetricName": String,
  "GroupId": Integer,
  "Description": String
 }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
Statistics	String	No	No	The method used to calculate monitoring data. The statistics must be appropriate for the metric chosen.	Valid values: Average, Minimum, and Maximum. Default value: Average.
Name	String	No	Yes	The name of the alarm rule.	None
EvaluationCount	Integer	No	No	The number of consecutive times that the threshold must be exceeded before an alarm is triggered.	Default value: 3. Minimum value: 1.
Period	Integer	No	No	The metric query period, which must be appropriate for the metric chosen. Unit: seconds.	Valid values: 60, 120, 300, and 900. Default value: 300.
MetricType	String	No	No	The metric type.	Valid values: system and custom.
ComparisonOperator	String	No	No	The alarm comparison operator used to define a condition in the alarm rule.	Valid values: <=, <, >, and > =.
Dimensions	List	No	No	The list of instances associated with the alarm rule.	You must include at least one instance in the list.

Property	Type	Required	Editable	Description	Constraint
ScalingGroupId	String	Yes	No	The ID of the scaling group.	None
AlarmAction	List	Yes	Yes	The list of alarm actions.	You must include one to five alarm actions in the list.
Threshold	Number	Yes	No	The alarm threshold, which must be a numeric value.	None
MetricName	String	Yes	No	The metric name of a service. For more information, see the metrics defined for each service.	None
GroupId	Integer	No	No	The group ID.	None
Description	String	No	Yes	The description of the alarm task.	None

Dimensions syntax

```
"Dimensions": [
 {
  "DimensionKey": String,
  "DimensionValue": String
 }
]
```

Dimensions properties

Property	Type	Required	Editable	Description	Constraint
DimensionValue	String	Yes	No	None	None
DimensionKey	String	Yes	No	None	None

Response parameters

Fn::GetAtt

AlarmTaskId: the ID of the alarm task.

Examples

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Parameters": {
  "ComparisonOperator": {
   "Type": "String",
   "Description": "Comparison Operator",
   "AllowedValues": [
    ">=",
    "<=",
    ">",
```

```
    "<"
   ]
  },
  "Description": {

   "AlarmTaskId": {
    "Description": "The alarm task ID",
    "Value": {
     "Fn::GetAtt": [
      "AlarmTask",
      "AlarmTaskId"
     ]
    }
   }
  }
}
```

5.5.2.2. ALIYUN::ESS::AlarmTaskEnable

ALIYUN::ESS::AlarmTaskEnable is used to start an alarm task. You can call this operation to enable alarm tasks when the task is stopped.

Statement

```
{
 "Type": "ALIYUN::ESS::AlarmTaskEnable",
 "Properties": {
  "AlarmTaskId": String,
  "Enable": Boolean
 }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
AlarmTaskId	String	No	No	The ID of the monitoring task.	None

Parameter	Type	Required	Editable	Description	Constraint
Enable	String	Retained	Yes	Specifies whether to enable the alarm task.	Valid values: 1025 to 10000. You cannot use the following commonly used port numbers: 2222, 4500, 4510, 4560, 7505, 9000, 9001, and 9002.

Response parameters

Fn::GetAtt

None

Sample request

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Parameters": {
  "Enable": {
   "Type": "Boolean",
   "Description": "Enable alarm task or not",
   "AllowedValues": [
    "True",
    "true",
    "False",
    "false"
   ]
  },
  "AlarmTaskId": {
   "Type": "String",
   "Description": "The id of alarm task."
  }
 },
 "Resources": {
  "AlarmTaskEnable": {
   "Type": "ALIYUN::ESS::AlarmTaskEnable",
   "Properties": {
    "Enable": {
     "Ref": "Enable"
    },
    "AlarmTaskId": {
     "Ref": "AlarmTaskId"
    }
   }
  }
 },
 "Outputs": {}
}
```

5.5.2.3. ALIYUN::ESS::LifecycleHook

ALIYUN::ESS::LifecycleHook is used to create a lifecycle hook for a scaling group.

Syntax

```
{
 "Type": "ALIYUN::ESS::LifecycleHook",
 "Properties": {
  "LifecycleHookName": String,
  "NotificationArn": String,
  "HeartbeatTimeout": Integer,
  "NotificationMetadata": String,
  "ScalingGroupId": String,
  "DefaultResult": String,
  "LifecycleTransition": String
 }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
LifecycleHookName	String	No	Yes	The name of the lifecycle hook. Each lifecycle hook name must be unique within a scaling group.	The name must be 2 to 40 characters in length and can contain letters, digits, underscores (_), hyphens (-), and periods (.). It must start with a letter or digit. The default name is the ID of the lifecycle hook.
NotificationArn	String	No	Yes	The Alibaba Cloud Resource Name (ARN) of the notification target that Auto Scaling uses to notify you when an instance is in the transition state for the lifecycle hook.	This target can be either an MNS queue or an MNS topic. The format of the parameter value is acs:ess:{region}:{account-id}:{resource-relative-id}. • `region` : the region where the scaling group resides. • `account-id` : the ID of the Apsara Stack tenant account. Examples: • MNS queue: acs:ess:{region}:{account-id}:queue/{queuename} • MNS topic: acs:ess:{region}:{account-id}:topic/{topicname}

Property	Type	Required	Editable	Description	Constraint
HeartbeatTimeout	Integer	No	Yes	The waiting period before the lifecycle hook times out. When the lifecycle hook times out, the scaling group performs the action specified by the DefaultResult parameter. Unit: seconds.	Valid values: 30 to 21600. Default value: 600.
NotificationMetadata	String	No	Yes	The fixed string to include when Auto Scaling sends a notification about the wait state of a scaling activity. Auto Scaling sends the specified `NotificationMetadata` parameter value along with the notification message so that you can easily categorize notifications. The `NotificationMetadata` parameter is valid only after you set the `NotificationArn` parameter.	The parameter value cannot exceed 128 characters in length.
ScalingGroupId	String	Yes	No	The ID of the scaling group.	None
DefaultResult	String	No	Yes	The action that the scaling group takes when the lifecycle hook times out. If the scaling group has multiple lifecycle hooks and one of them is terminated when the `DefaultResult` parameter is set to ABANDON during a `scale-in` event, the remaining lifecycle hooks in the same scaling group will also be terminated. Otherwise, the scaling activity will proceed normally after the waiting period expires and continue with the action specified by the DefaultResult parameter.	Valid values: • CONTINUE: The scaling group continues the scale-in or scale-out event. • ABANDON: The scaling group releases the created ECS instances if the scaling activity type is scale-out or removes the ECS instances to be scaled in if the scaling activity type is scale-in. Default value: CONTINUE.

Property	Type	Required	Editable	Description	Constraint
LifecycleTransition	String	Yes	Yes	The type of scaling activity to which the lifecycle hook applies.	Valid values: • SCALE_OUT: scale-out events of the scaling group. • SCALE_IN: scale-in events of the scaling group.

Response parameters

Fn::GetAtt

LifecycleHookId: the ID of the lifecycle hook.

Examples

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Parameters": {
  "LifecycleHookName": {
   "Type": "String",
   "Description": "The name of the lifecycle hook. Each name must be unique within a scaling group. The name must be 2 to 40 characters in length and can contain letters, numbers, Chinese characters, and special characters including underscores (_), hyphens (-) and periods (.).\nDefault value: Lifecycle Hook ID",
   "AllowedPattern": "^[a-zA-Z0-9\\u4e00-\\u9fa5][-_.a-zA-Z0-9\\u4e00-\\u9fa5]{1,63}$"
  },
  "NotificationArn": {
   "Type": "String",
   "Description": "The Alibaba Cloud Resource Name (ARN) of the notification target that Auto Scaling will use to notify you when an instance is in the transition state for the lifecycle hook. This target can be either an MNS queue or an MNS topic. The format of the parameter value is acs:ess:{region}:{account-id}:{resource-relative-id}.\nregion: the region to which the scaling group locates\naccount-id: Alibaba Cloud ID\nFor example:\nMNS queue: acs:ess:{region}:{account-id}:queue/{queuename}\nMNS topic: acs:ess:{region}:{account-id}:topic/{topicname}",
   "AllowedPattern": "^acs:ess:([a-zA-Z0-9-]+):(\\d+):(queue|topic)/([a-zA-Z0-9][a-zA-Z0-9-]{0,255})$",
   "MaxLength": 300
  },
  "ScalingGroupId": {
   "Type": "String",
   "Description": "The ID of the scaling group."
  },
  "LifecycleTransition": {
   "Type": "String",
   "Description": "The scaling activities to which lifecycle hooks apply Value range:\n SCALE_OUT: scale-out event\n SCALE_IN: scale-in event",
   "AllowedValues": [
    "SCALE_OUT",
    "SCALE_IN"
   ]
  },
  "HeartbeatTimeout": {
   "Type": "Number",
   "Description": "The time, in seconds, that can elapse before the lifecycle hook times out. If the lifecycle hook times out, the scaling group performs the default action (DefaultResult). The range is from 30 to 21,600 seconds. The default value is 600 seconds.\nYou can prevent the lifecycle hook from timing out by calling the RecordLifecycleActionHeartbeat operation. You can also terminate the lifecycle action by calling the CompleteLifecycleAction operation.",
   "MinValue": 30,
   "MaxValue": 21600
```

```
    },
    "NotificationMetadata": {
      "Type": "String",
      "Description": "The fixed string that you want to include when Auto Scaling sends a message about the wait state of the scaling activity to the notification target. The length of the parameter can be up to 128 characters. Auto Scaling will send the specified NotificationMetadata parameter along with the notification message so that you can easily categorize your notifications. The NotificationMetadata parameter will only take effect after you specify the NotificationArn parameter.",
      "MaxLength": 128
    },
    "DefaultResult": {
      "Type": "String",
      "Description": "The action that the scaling group takes when the lifecycle hook times out. Value range:\n CONTINUE: the scaling group continues with the scale-in or scale-out process.\n ABANDON: the scaling group stops any remaining action of the scale-in or scale-out event.\nDefault value: CONTINUE\nIf the scaling group has multiple lifecycle hooks and one of them is terminated by the DefaultResult=ABANDON parameter during a scale-in event (SCALE_IN), the remaining lifecycle hooks under the same scaling group will also be terminated. Otherwise, the action following the wait state is the next action, as specified in the parameter DefaultResult, after the last lifecycle event under the same scaling group.",
      "AllowedValues": [
        "CONTINUE",
        "ABANDON"
      ]
    }
  },
  "Resources": {
    "LifecycleHook": {
      "Type": "ALIYUN::ESS::LifecycleHook",
      "Properties": {
        "LifecycleHookName": {
          "Ref": "LifecycleHookName"
        },

```

```
    }
   }
  }
 }
```

5.5.2.4. ALIYUN::ESS::ScalingConfiguration

ALIYUN::ESS::ScalingConfiguration is used to create a scaling configuration for a scaling group.

Statement

```
{
 "Type": "ALIYUN::ESS::ScalingConfiguration",
 "Properties": {
  "PasswordInherit": Boolean,
  "DiskMappings": List,
  "RamRoleName": String,
  "IoOptimized": String,
  "InternetChargeType": String,
  "KeyPairName": String,
  "InstanceId": String,
  "InstanceTypes": List,
  "ImageId": String,
  "ResourceGroupId": String,
  "SpotStrategy": String,
  "InstanceType": String,
  "SystemDiskCategory": String,
  "SystemDiskSize": Integer,
  "SystemDiskAutoSnapshotPolicyId": String,
  "InternetMaxBandwidthOut": Integer,
  "InstanceName": String,
  "InternetMaxBandwidthIn": Integer,
  "ScalingConfigurationName": String,
  "UserData": String,
  "DeploymentSetId": String,
  "SecurityGroupId": String,
  "SpotPriceLimit": Number,
  "HpcClusterId": String,
  "ScalingGroupId": String,
  "SpotPriceLimitForInstanceType": Map,
  "TagList": List
 }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	Yes	True	The ID of the resource group to which the instance belongs.	None
DeploymentSetId	String	Yes	Released	The ID of the deployment set.	None

Parameter	Type	Required	Editable	Description	Constraint
HpcClusterId	String	Yes	Released	The ID of the E-HPC cluster to which the instance belongs.	None
ScalingGroupId	String	No	No	The ID of the scaling group to which the scaling configuration belongs.	None
DiskMappings	List	No.	True	The disks to be attached to created instances.	A maximum of 16 disks can be attached to each instance.
InternetChargeType	String	Yes	True	The billing method for Internet usage.	Valid values: • PayByBandwidth • PayByTraffic: pay-by-traffic Default value: PayByTraffic
InternetMaxBandwidthIn	String	Optional	Released	The maximum inbound bandwidth from the Internet.	Unit: Mbit/s. Valid values: 1 to 100. Default value: 100
InternetMaxBandwidthOut	String	No.	True	The maximum outbound bandwidth to the Internet.	Valid values: • Pay-by-bandwidth: 0 to 100. Default value: 0. • Pay-by-data-transfer: 1 to 200. This parameter is required. Unit: Mbit/s.
InstanceId	String	Yes	Released	The instance ID of the scaling configuration.	None

Parameter	Type	Required	Editable	Description	Constraint
SystemDiskCategory	String	Yes	True	The category of the system disk.	Valid values: • cloud: indicates a basic disk. • cloud_efficiency: indicates an ultra disk. • cloud_ssd: indicates a standard SSD. • ephemeral_ssd: indicates a local SSD. • cloud_essd: enhanced SSD (ESSD) Default value: cloud for Generation I instance types that are not I/O optimized, default value: cloud_efficiency.
ImageId	String	Yes	True	The ID of the image used to start the instance. You can use a public image, a custom image, or an Alibaba Cloud Marketplace image.	None
InstanceType	String	Yes	True	The specification of the instance.	None
SecurityGroupId	String	Yes	True	The ID of the security group to which the instance belongs.	None
IoOptimized	String	Yes	True	Specifies whether the created instances are I/O optimized.	Valid values: • none (non-I/O optimized) • optimized Default value: none.

Parameter	Type	Required	Editable	Description	Constraint
ScalingConfigurationName	String	Yes	True	The name of the scaling configuration.	• The name must be 2 to 64 characters in length. It can contain letters, digits, underscores (_), hyphens (-), and periods (.). It must start with a letter or digit. • The name of the scaling configuration must be unique within a scaling group. • If this parameter is not specified, the value of scalingconfigurationid is used.
KeyPairName	String	Yes	True	The name of the key pair that is bound to the instance.	• This parameter is ignored if the instance type is Windows and the default value is null. • If the instance type is Linux, password logon is disabled by default.
RamRoleName	String	Yes	True	The RAM role name of the instance.	You can use RAM API ListRoles you can call this operation to query the RAM role name of an instance.
SystemDiskSize	String	No.	True	The size of the system disk. Unit: GB.	Valid values: 40 to 500. Unit: GB. If a custom image is used to create a system disk, the system disk size must be larger than the size of the custom image.
UserData	String	Yes	True	The user data that you pass when you create the instance.	The user can encode up to 16KB in size. You do not need to perform Base64 encoding. Special characters must be escaped with a backslash (\).

Parameter	Type	Required	Editable	Description	Constraint
InstanceTypes	List	No.	True	The instance types from which ECS instances can be created. If you specify InstanceTypes, InstanceType is invalid.	Up to 10 instance types can be configured in a scaling configuration. The priority of each instance type is decreased in the order of its list elements. Auto Scaling creates instances in order of priority. If an instance of the highest priority type cannot be created, Auto Scaling will create an instance of the next highest priority type.
PasswordInherit	Boolean	No.	True	Specifies whether to use the preconfigured password of the specified image.	To use this parameter, ensure that a password is configured for the specified image.
TagList	List	No.	True	The tags of the instance.	Tags must be specified as key-value pairs. You can specify a maximum of five Tag groups in the format of `{"key1": "value1", "key2": "value2", ..., "key5": "value5"}`. The key can contain a maximum of 64 characters. `alivun`, `http://` or `https://` the beginning. If you use tags, the key cannot be an empty string. The value must be 0 to 128 characters in length.
SpotStrategy	String	Yes	True	The preemption policy for pay-as-you-go instances.	Valid values: • NoSpot (pay-as-you-go instance) • SpotWithPriceLimit (a preemptible instance with a maximum price) • SpotAsPriceGo (the SpotAsPriceGo parameter that is set automatically based on the actual market price.) Default value: NoSpot.
InstanceName	String	Yes	True	The name of the instance created based on the current scaling configuration.	None

Parameter	Type	Required	Editable	Description	Constraint
SpotPriceLimit	Number	No.	True	The maximum hourly price of the instance.	A maximum of three decimal places can be specified. This parameter takes effect only when the SpotStrategy parameter is set to SpotWithPriceLimit. The value of this parameter can be overwritten by the value of the SpotPriceLimitForInstanceType parameter.
SpotPriceLimitForInstanceType	Map	No.	True	Preemptible instance type and bid of the instance.	The format is {"<instance_type_1>":<price_limit_1>,...,{"<instance_type_10>":<price_limit_10>}. This parameter takes effect only when the SpotStrategy parameter is set to SpotWithPriceLimit. You can set up to 10 instance groups and prices.
SystemDiskAutoSnapshotPolicyId	String	Yes	True	The ID of the automatic snapshot policy applied to the data disk.	None

DiskMappings syntax

```
"DiskMappings": [
 {
  "Category": String,
  "Device": String,
  "SnapshotId": String,
  "Size": String,
  "Encrypted": String,
  "KMSKeyId": String,
  "Description": String,
  "DiskName": String
 }
]
```

DiskMappings properties

Parameter	Type	Required	Editable	Description	Constraint

Parameter	Type	Required	Editable	Description	Constraint
Size	String	No	No	The size of the data disk.	Valid values: • cloud: 5 to 2000 • cloud_efficiency: 20 to 32768 • cloud_ssd: 20 to 32768 • cloud_essd: 20 to 32768. • ephemeral_ssd: 5 to 800 The value of this parameter must be greater than or equal to that of the snapshot specified by SnapshotId. Unit: GiB.
Category	String	Yes	Released	The type of the data disk.	Valid values: cloud, cloud_efficiency, cloud_ssd, ephemeral_ssd, and cloud_essd. For I/O optimized instances, the default value is cloud_efficiency. For non-I/O optimized instances, the default value is cloud.
DiskName	String	Yes	Released	The name of the data disk.	The name must be 2 to 128 characters in length It can contain letters, digits, colons (:), underscores (_), and hyphens (-). It must start with a letter and cannot start with `http://` or `https://` the beginning.
Description	String	Yes	Released	The description of the data disk.	The description must be 2 to 256 characters in length. Cannot `http://` or `https://` the beginning.
Device	String	Yes	Released	The device name of the data disk.	By default, the system automatically assigns a value for this parameter when the ECS instance is created. The value starts from /dev/xvdb and ends at /dev/xvdz.

Parameter	Type	Required	Editable	Description	Constraint
SnapshotId	String	Yes	Released	The ID of the snapshot used to create the data disk.	If this parameter is specified, the Size parameter will be ignored, and the Size of the created disk will be the Size of the specified snapshot. If the snapshot was created on or before July 15, 2013, calling the snapshot is denied and InvalidSnapshot.TooOld is displayed in the response parameter.
Encrypted	String	Yes	Released	Specifies whether to encrypt the data disk.	Default value: false.
KMSKeyId	String	Yes	Released	The KMS key ID for data disk N.	Valid values: 1025 to 10000. You cannot use the following commonly used port numbers: 2222, 4500, 4510, 4560, 7505, 9000, 9001, and 9002.

Response parameters

Fn::GetAtt

ScalingConfigurationId: the ID of the scaling configuration. This ID is a globally unique identifier (GUID) generated by the system.

Sample request

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Resources": {
  "ScalingConfiguration": {
   "Type": "ALIYUN::ESS::ScalingConfiguration",
   "Properties": {
    "ImageId": "ubuntu1404_64_20G_aliaegis_2015****.vhd",
    "InstanceType": "ecs.t1.small",
    "InstanceId": "i-25xhh****",
    "InternetChargeType": "PayByTraffic",
    "InternetMaxBandwidthIn": 1,
    "InternetMaxBandwidthOut": 20,
    "SystemDisk_Category": "cloud",

   "Value": {"get_attr": ["ScalingConfigurationId"]}
  }
 }
}
```

5.5.2.5. ALIYUN::ESS::ScalingGroup

ALIYUN::ESS::ScalingGroup is used to create a scaling group. A scaling group is a group of ECS instances that are dynamically scaled based on the configured scenario. A scaling group does not take effect immediately after it is created. You must use ALIYUN::ESS::ScalingGroupEnable to enable the scaling group to trigger scaling rules and execute scaling activities.

Syntax

```
{
 "Type": "ALIYUN::ESS::ScalingGroup",
 "Properties": {
  "MultiAZPolicy": String,
  "DesiredCapacity": Integer,
  "NotificationConfigurations": List,
  "ProtectedInstances": List,
  "LaunchTemplateId": String,
  "LaunchTemplateVersion": String,
  "ScalingGroupName": String,
  "VSwitchIds": List,
  "DefaultCooldown": Integer,
  "MinSize": Integer,
  "GroupDeletionProtection": Boolean,
  "MaxSize": Integer,
  "InstanceId": String,
  "VSwitchId": String,
  "LoadBalancerIds": List,
  "StandbyInstances": List,
  "RemovalPolicys": List,
  "HealthCheckType": String,
  "DBInstanceIds": List
 }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
MinSize	Integer	Yes	Yes	The minimum number of ECS instances in the scaling group.	Valid values: 0 to 1000. When the number of ECS instances in the scaling group is less than the MinSize value, Auto Scaling automatically creates ECS instances until the number of instances is equal to the MinSize value.

Property	Type	Required	Editable	Description	Constraint
MaxSize	Integer	Yes	Yes	The maximum number of ECS instances in the scaling group.	Valid values: 0 to 1000. When the number of ECS instances in the scaling group is greater than the MaxSize value, Auto Scaling removes ECS instances from the scaling group until the number of instances is equal to the MaxSize value.
ScalingGroupName	String	No	Yes	The display name of the scaling group.	• The name must be 2 to 40 characters in length and can contain letters, digits, underscores (_), hyphens (-), and periods (.). • It must start with an uppercase letter, lowercase letter, or digit. • The name must be unique to an Alibaba Cloud account in a region. The default value is the ID of the scaling group.
LaunchTemplateId	String	No	Yes	The ID of the instance launch template from which the scaling group obtains launch configurations.	None

Property	Type	Required	Editable	Description	Constraint
LaunchTemplateVersion	String	No	Yes	The version of the instance launch template.	Valid values: • The fixed template version number. • Default: The default template version is always used. • Latest: The latest template version is always used.
RemovalPolicys	List	No	Yes	The list of one or more policies that are used to remove ECS instances from the scaling group.	Default value: OldestScalingConfiguration or OldestInstance. Valid values: • OldestInstance: removes the ECS instance that is added to the scaling group at the earliest point in time. • NewestInstance: removes the ECS instance that is added to the scaling group at the latest point in time. • OldestScalingConfiguration: removes the ECS instance that is created based on the earliest scaling configuration.
VSwitchId	String	No	No	The ID of the vSwitch.	None

Property	Type	Required	Editable	Description	Constraint
LoadBalancerIds	List	No	Yes	The ID of the Server Load Balancer (SLB) instance.	This value can be a JSON array that contains up to five SLB instance IDs. Separate multiple IDs with commas (,).
DefaultCooldown	Integer	No	Yes	The cooldown time after a scaling activity (adding or removing ECS instances) is executed.	• Valid values: 0 to 86400. • Unit: seconds. • Default value: 300. During the cooldown time, the scaling group executes only scaling activities that are triggered by Cloud Monitor event-triggered tasks.
DBInstanceIds	List	No	Yes	The list of one or more ApsaraDB RDS instance IDs.	This value can be a JSON array that contains up to eight ApsaraDB RDS instance IDs. Separate multiple IDs with commas (,).

Property	Type	Required	Editable	Description	Constraint
VSwitchIds	List	No	No	The list of one or more vSwitch IDs.	You can specify a maximum of five vSwitch IDs. If you specify this parameter, the VSwitchId parameter is ignored. vSwitches are sorted in descending order of priority. When an ECS instance cannot be created in the zone where the vSwitch with the highest priority resides, the system uses the vSwitch with the next highest priority to create the ECS instance.
MultiAZPolicy	String	No	No	The ECS instance scaling policy for the multi-zone scaling group.	Valid values: • PRIORITY: ECS instances are scaled based on the specified vSwitch. When an ECS instance cannot be created in the zone where the vSwitch with the highest priority resides, the system uses the vSwitch with the next highest priority to create the ECS instance. • BALANCE: ECS instances are distributed evenly in multiple zones specified in the scaling group. • COST_OPTIMIZ

Property	Type	Required	Editable	Description	Constraint
					ED: ECS instances are created based on the unit price of vCPUs, from low to high. Preemptible instances are created first when preemptible instance types are specified for the scaling configuration. Pay-as-you-go instances are automatically created when no preemptible instances are available due to issues such as insufficient ECS resources.
NotificationConfigurations	List	No	Yes	The notification configurations for event and resource changes.	None
ProtectedInstances	List	No	Yes	The number of protected ECS instances in the scaling group.	Maximum value: 1000.
StandbyInstances	List	No	Yes	The number of ECS instances that are in the standby state in the scaling group.	Maximum value: 1000.
HealthCheckType	String	No	Yes	The health check type.	Valid values: • ECS • NONE

Property	Type	Required	Editable	Description	Constraint
GroupDeletionProtection	Boolean	No	Yes	Specifies whether to enable deletion protection for the scaling group.	Default value: false. Valid values: • true: enables deletion protection for the scaling group. In this case, you cannot delete the scaling group. • false: disables deletion protection for the scaling group.
DesiredCapacity	Integer	No	Yes	The expected number of ECS instances in the scaling group. The scaling group automatically keeps the number of ECS instances at the expected value.	The number of ECS instances must be greater than the MinSize value and less than the MaxSize value.
InstanceId	String	No	No	The ID of the ECS instance from which the scaling group obtains configuration information to create scaling configurations.	None

Response parameters

Fn::GetAtt

ScalingGroupId: the ID of the scaling group. This ID is a globally unique identifier (GUID) that is generated by the system.

Examples

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Resources": {
  "ScalingGroup": {
   "Type": "ALIYUN::ESS::ScalingGroup",
   "Properties": {
    "MaxSize": 1,
    "MinSize": 1,
    # "ScalingGroupName": "HeatCreatedR****",
    # "DefaultCooldown": 500,
    # "RemovalPolicy_1": "",
    # "RemovalPolicy_2": "",
   }
  }
 },
 "Outputs": {
  "ScalingGroup": {
     "Value": {"Fn::GetAtt": ["ScalingGroup", "ScalingGroupId"]}
  }
 }
}
```

5.5.2.6. ALIYUN::ESS::ScalingGroupEnable

ALIYUN::ESS::ScalingGroupEnable is used to enable a scaling group.

Syntax

```
{
 "Type": "ALIYUN::ESS::ScalingGroupEnable",
 "Properties": {
  "ScalingConfigurationId": String,
  "ScalingRuleArisExecuteVersion": Integer,
  "ScalingRuleAris": List,
  "ScalingGroupId": String,
  "RemoveInstanceIds": List,
  "InstanceIds": List
 }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
ScalingGroupId	String	Yes	No	The ID of the scaling group.	None
ScalingConfigurationId	String	No	No	The ID of the scaling configuration to be activated in the scaling group.	None

Property	Type	Required	Editable	Description	Constraint
InstanceIds	List	No	Yes	The IDs of ECS instances to be added to the enabled scaling group.	A maximum of 20 instance IDs can be specified.
ScalingRuleArisExecuteVersion	Integer	No	Yes	The version of the identifier for the scaling rule to be executed. If you change this property, all scaling rules specified by ScalingRuleAris will be executed once.	Minimum value: 0.
ScalingRuleAris	List	No	Yes	The unique identifiers of scaling rules in the scaling group. Invalid unique identifiers are not displayed in the query results and no errors are reported.	A maximum of 10 scaling rule identifiers can be specified.
RemoveInstanceIds	List	No	Yes	The IDs of ECS instances to be deleted.	A maximum of 1,000 instance IDs can be specified.

Response parameters

Fn::GetAtt

- LifecycleState: the status of the scaling group.
- ScalingInstances: the instances that are automatically created in the scaling group.
- ScalingGroupId: the ID of the scaling group.
- ScalingRuleArisExecuteResultInstancesRemoved: the instances that are removed from the scaling group by executing the scaling rules specified by ScalingRuleAris.
- ScalingRuleArisExecuteResultNumberOfAddedInstances: the number of instances that are added to the scaling group by executing the scaling rules specified by ScalingRuleAris.
- ScalingInstanceDetails: the instance scaling details.
- ScalingRuleArisExecuteErrorInfo: the error information about the execution of the scaling rules specified by ScalingRuleAris.
- ScalingRuleArisExecuteResultInstancesAdded: the instances that are added to the scaling group by executing the scaling rules specified by ScalingRuleAris.

Examples

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Resources": {
  "ScalingGroupEnable": {
   "Type": "ALIYUN::ESS::ScalingGroupEnable",
   "Properties": {
    "ScalingGroupId": "r0HUqbJ411cc2eQw8bU****",
    "ScalingConfigurationId": "bJlLfdexm77Ldsyptmel****",
    "InstanceIds": "",
   }
  }
 },
 "Outputs": {
  "ScalingGroupEnable": {
   "Value": {"Fn::GetAtt": ["ScalingGroupEnable", "LifecycleState"]}
  }
 }
}
```

5.5.2.7. ALIYUN::ESS::ScalingRule

ALIYUN::ESS::ScalingRule is used to create a scaling rule.

Syntax

```
{
 "Type": "ALIYUN::ESS::ScalingRule",
 "Properties": {
  "AdjustmentValue": Integer,
  "Cooldown": Integer,
  "ScalingGroupId": String,
  "AdjustmentType": String,
  "ScalingRuleName": String
 }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
AdjustmentValue	Integer	No	Yes	The number of ECS instances to add or release when scaling occurs. The number of ECS instances to be adjusted in a single scaling activity cannot exceed 500.	Valid values in different adjustment modes: • QuantityChangeInCapacity: -500 to 500. • PercentChangeInCapacity: -100 to 10000. • TotalCapacity: 0 to 1000.
Cooldown	Integer	No	Yes	The cooldown period of the scaling rule. Unit: seconds.	Valid values: 0 to 86400. This parameter is empty by default.

Property	Type	Required	Editable	Description	Constraint
ScalingGroupId	String	Yes	No	The ID of the scaling group to which the scaling rule belongs.	None
AdjustmentType	String	Yes	Yes	The adjustment mode of the scaling rule.	Valid values: • QuantityChangeInCapacity: adds or removes a specified number of ECS instances. • PercentChangeInCapacity: adds or removes a specified proportion of ECS instances. • TotalCapacity: adds or removes ECS instances to ensure that the current scaling group has a specified number of ECS instances.
ScalingRuleName	String	No	Yes	The display name of the scaling rule.	The name must be 2 to 40 characters in length and can contain letters, digits, underscores (_), hyphens (-), and periods (.). It must start with a letter or digit. The name of a scaling rule must be unique within the scaling group that it belongs to. The default value is the ID of the scaling rule.

Response parameters

Fn::GetAtt

- ScalingRuleAri: the unique identifier of the scaling rule.
- ScalingRuleId: the ID of the scaling rule. It is a globally unique identifier (GUID) generated by the system.

Examples

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Resources": {
  "ScalingRule": {
   "Type": "ALIYUN::ESS::ScalingRule",
   "Properties": {
    "ScalingRuleName": {
     "Ref": "ScalingRuleName"
    },

    ]
   }
  }
 }
}
```

5.5.2.8. ALIYUN::ESS::ScheduledTask

ALIYUN::ESS::ScheduledTask is used to create a scheduled task based on input parameters.

Syntax

```
{
 "Type": "ALIYUN::ESS::ScheduledTask",
 "Properties": {
  "TaskEnabled": Boolean,
  "Description": String,
  "ScheduledTaskName": String,
  "LaunchExpirationTime": Integer,
  "LaunchTime": String,
  "RecurrenceEndTime": String,
  "RecurrenceType": String,
  "RecurrenceValue": String,
  "ScheduledAction": String
 }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
TaskEnabled	Boolean	No	Yes	Specifies whether to start the scheduled task. • true: starts the scheduled task. • false: stops the scheduled task. Default value: true.	None
Description	String	No	Yes	The description of the scheduled task.	The description must be 2 to 200 characters in length.

Property	Type	Required	Editable	Description	Constraint
ScheduledTaskName	String	No	Yes	The display name of the scheduled task.	The name must be 2 to 40 characters in length and can contain letters, digits, underscores (_), hyphens (-), and periods (.). It must start with a letter or digit. This parameter must be unique in a region and under an Apsara Stack tenant account. The default value is the ID of the scheduled scaling task.
LaunchExpirationTime	Integer	No	Yes	The time period during which a failed scheduled task is retried. Unit: seconds. Default value: 600.	Valid values: 0 to 21600.
LaunchTime	String	Yes	Yes	The time at which the scheduled task is triggered. Specify the time in the ISO 8601 standard in the YYYY-MM-DDThh:mmZ format. The time must be in UTC. If the RecurrenceType parameter is specified, the task is executed each day at the time specified by LaunchTime. If the RecurrenceType parameter is not specified, the task is only executed once at the date and time specified by LaunchTime. You cannot enter a point in time later than 90 days from the date of scheduled task creation or modification.	None

Property	Type	Required	Editable	Description	Constraint
RecurrenceEndTime	String	No	Yes	The end time after which the scheduled task will not be repeated. Specify the time in the ISO 8601 standard in the YYYY-MM-DDThh:mmZ format. The time must be in UTC. You cannot enter a point in time later than 90 days from the date of scheduled task creation or modification. If you set RecurrenceEndTime, you must also set both RecurrenceType and RecurrenceValue.	None
RecurrenceType	String	No	Yes	The interval that the scheduled task is repeated at.	Valid values: • Daily: The scheduled task is executed once every specified number of days. • Weekly: The scheduled task is executed on each specified day of a week. • Monthly: The scheduled task is executed on each specified day of a month. • Cron: The scheduled task is executed based on the specified Cron expression. If you set RecurrenceType, you must also set both RecurrenceEndTime and RecurrenceValue.

Property	Type	Required	Editable	Description	Constraint
RecurrenceValue	String	No	Yes	Specifies how often the scheduled task recurs.	• Daily: indicates the interval of days that the scheduled task is repeated on. You can enter a single value ranging from 1 to 31. • Weekly: indicates which days of the week that the scheduled task is repeated on. You can enter multiple values separated by commas (,). The values 0 to 6 correspond to the days of the week in sequence from Sunday to Saturday. • Monthly: indicates which days of the month that the scheduled task is repeated on. You can enter two values ranging from 1 to 31. The format is A-B. B must be greater than or equal to A. • Cron: indicates a user-defined Cron expression that the scheduled task is repeated on. A Cron expression is written in UTC time and consists of five fields: minute, hour, day of month (date), month, and day of week. The expression can contain wildcard characters including commas (,), question marks (?), hyphens (-), asterisks (*), number signs (#), forward slashes (/), and the L and W characters. If you set RecurrenceValue, you must also set both RecurrenceEndTime and RecurrenceType.
ScheduledAction	String	Yes	Yes	The operations to be performed when the scheduled task is triggered. When you set this parameter, you must also enter the unique identifier of the scaling rule.	The parameter value can be up to 200 characters in length.

Response parameters

Fn::GetAtt

ScheduledTaskId: the ID of the scheduled task. This ID is a globally unique identifier (GUID) generated by the system.

Examples

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Resources": {
  "ScheduledTask": {
   "Type": "ALIYUN::ESS::ScheduledTask",
   "Properties": {
    "TaskEnabled": "true",
    "Description": "scheduledtask",
    "ScheduledTaskName": "task1",
    "LaunchTime": "2014-08-17T16:52Z",
    "RecurrenceEndTime": "2014-08-17T16:55Z",
    "RecurrenceType": "Daily",
    "RecurrenceValue": "1",
    "ScheduledAction": "ari:acs:ess:cn-qingdao:1344371:scalingRule/cCBpdYdQuBe2cUxOdu6piOk"
   }
  }
 },
 "Outputs": {
  "ScheduledTaskId": {
   "Value": {
    "FN::GetAtt": [
     "ScheduledTask",
     "ScheduledTaskId"
    ]
   }
  }
 }
}
```

5.5.3. OSS

5.5.3.1. ALIYUN::OSS::Bucket

ALIYUN::OSS::Bucket is used to create an OSS bucket.

Syntax

```
{
 "Type": "ALIYUN::OSS::Bucket",
 "Properties": {
  "AccessControl": String,
  "RefererConfiguration": Map,
  "ServerSideEncryptionConfiguration": Map,
  "CORSConfiguration": Map,
  "Tags": Map,
  "LoggingConfiguration": Map,
  "LifecycleConfiguration": Map,
  "StorageClass": String,
  "DeletionForce": Boolean,
  "WebsiteConfiguration": Map,
  "Policy": Map,
  "BucketName": String
 }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
BucketName	String	Yes	No	The name of the bucket.	• The name must be 3 to 63 characters in length and can contain lowercase letters, digits, and hyphens (-). • It must start and end with a lowercase letter or digit.
AccessControl	String	No	No	The access control policy.	Valid values: private, public-read, and public-read-write.
CORSConfiguration	Map	No	No	The configuration of cross-origin resource sharing for objects in the bucket.	None
LifecycleConfiguration	Map	No	No	The lifecycle configuration for objects in the bucket.	None
LoggingConfiguration	Map	No	No	The logging configuration.	None
RefererConfiguration	Map	No	No	The hotlinking protection configuration.	None
DeletionForce	Boolean	No	No	Specifies whether to forcibly delete objects from an OSS bucket	Valid values: • true • false Default value: false.

Property	Type	Required	Editable	Description	Constraint
WebsiteConfiguration	Map	No	No	The information used to configure the bucket as a static website.	None
ServerSideEncryptionConfiguration	Map	No	No	The server-side encryption rules.	None
Tags	Map	No	No	The tags of the bucket. Tags exist as key-value pairs.	• A maximum of 20 tags can be specified. • A tag key must be 1 to 64 bytes in length and cannot start with `http://`, `https://`, or `Aliyun`. • A tag value can be up to 128 bytes in length and must be encoded in UTF-8.
StorageClass	String	No	No	The type of the bucket.	Valid values: Standard, IA, and Archive.
Policy	Map	No	No	The bucket policy configuration.	None

CORSConfiguration syntax

```
"CORSConfiguration": {
 "CORSRule": [
  {
   "AllowedHeader": String,
   "AllowedMethod": List,
   "AllowedOrigin": List,
   "ExposeHeader": List,
   "MaxAgeSeconds": Integer
  }
 ]
}
```

CORSConfiguration properties

Property	Type	Required	Editable	Description	Constraint
CORSRule	List	No	No	The rules that define cross-origin resource sharing of objects in the bucket.	None

Property	Type	Required	Editable	Description	Constraint
AllowedHeader	String	No	No	The allowed cross-origin request headers.	Valid values: *, Cache-Control, Content-Language, Content-Type, Expires, Last-Modified, and Pragma.
AllowedMethod	List	No	No	The allowed cross-origin request methods.	Valid values: *, GET, PUT, POST, DELETE, and HEAD.
AllowedOrigin	List	No	No	The origins from which cross-origin requests are allowed.	None
ExposeHeader	List	No	No	The response headers for allowed access requests from applications.	Asterisks (*) cannot be used as wildcard characters.
MaxAgeSeconds	Integer	No	No	The period of time that the browser can cache the response of a preflight (OPTIONS) request to a specific resource.	None

LifecycleConfiguration syntax

```
"LifecycleConfiguration": {
 "Rule": [
  {
   "ID": String,
   "Prefix": String,
   "Status": String,
   "Expiration": Map,
   "AbortMultipartUpload": Map
  }
 ]
}
```

LifecycleConfiguration properties

Property	Type	Required	Editable	Description	Constraint
Rule	List	No	No	The lifecycle rule.	None
ID	String	No	No	The unique ID of the rule.	The ID can be up to 255 characters in length. When this parameter is empty or not specified, OSS generates a unique rule ID.
Prefix	String	No	No	The prefix to which the rule applies.	The rule takes effect only on objects that have a matching prefix.
Status	String	No	No	Specifies whether to enable or disable the rule.	Valid values: Enable and Disable.
Expiration	Map	No	No	The expiration attributes of the rule for the specified object.	None
AbortMultipartUpload	Map	No	No	The expiration attributes of the multipart upload tasks that are not complete.	None

Expiration syntax

```
"Expiration":{
 "Days": Number,
 "CreatedBeforeDate": String
}
```

Expiration properties

Property	Type	Required	Editable	Description	Constraint
Days	Number	No	No	The number of days since the object was last modified after which the rule will take effect.	When the number of days since the object was last modified exceeds the specified number of days, the object is deleted. If you set the Days parameter to 30, objects that were last modified on January 1, 2016 are deleted by the backend application on January 31, 2016.
CreatedBeforeDate	String	No	No	The date before which the rule takes effect.	Specify the time in the ISO 8601 standard. The time must be UTC 00:00. Example: 2002-10-11T00:00:00.000Z.

AbortMultipartUpload syntax

```
"AbortMultipartUpload": {
 "CreatedBeforeDate": String,
 "Days": Number
}
```

AbortMultipartUpload properties

Property	Type	Required	Editable	Description	Constraint
Days	Number	No	No	The number of days since the object was last modified after which the rule will take effect.	When the number of days since the object was last modified exceeds the specified number of days, the object is deleted. If you set the Days parameter to 30, objects that were last modified on January 1, 2016 are deleted by the backend application on January 31, 2016.
CreatedBeforeDate	String	No	No	The date before which the rule takes effect.	Specify the time in the ISO 8601 standard. The time must be UTC 00:00. Example: 2002-10-11T00:00:00.000Z.

LoggingConfiguration syntax

```
"LoggingConfiguration": {
 "TargetBucket": String,
 "TargetPrefix": String
}
```

LoggingConfiguration properties

Property	Type	Required	Editable	Description	Constraint
TargetBucket	String	No	No	The storage space for storing access logs.	None
TargetPrefix	String	No	No	The prefix of the names of saved access log files.	None

WebsiteConfiguration syntax

```
"WebsiteConfiguration":{
 "IndexDocument": String,
 "ErrorDocument": String
}
```

WebsiteConfiguration properties

Property	Type	Required	Editable	Description	Constraint
IndexDocument	String	No	No	The default homepage for a static website.	None
ErrorDocument	String	No	No	The default error page for a static website.	None

RefererConfiguration syntax

```
"RefererConfiguration":{
 "AllowEmptyReferer": String,
 "RefererList": List
}
```

RefererConfiguration properties

Property	Type	Required	Editable	Description	Constraint
AllowEmptyReferer	String	No	No	Specifies whether the Referer field can be left empty in an access request.	None
RefererList	List	No	No	The referer whitelist. OSS allows requests whose Referer field values are in the referer whitelist.	None

ServerSideEncryptionConfiguration syntax

```
"ServerSideEncryptionConfiguration":{
 "KMSMasterKeyID": String,
 "SSEAlgorithm": String
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
KMSMasterKeyID	String	No	No	The ID of the customer master key.	The key ID is required only when the SSEAlgorithm value is KMS and the specified key is used for encryption.
SSEAlgorithm	String	Yes	No	The default server-side encryption method.	Valid values: KMS and AES256.

Response parameters

Fn::GetAtt

- Name: the bucket name, which must be globally unique.
- DomainName: the public domain name of the specified bucket.
- InternalDomainName: the internal domain name of the specified bucket.

Examples

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Resources": {
  "Bucket": {
   "Type": "ALIYUN::OSS::Bucket",
   "Properties": {
    "AccessControl": "private",
    "BucketName": "rostest",
    "WebsiteConfiguration":{
      "IndexDocument": "index1.html",
      "ErrorDocument": "error404.html"
    },
    "LoggingConfiguration": {
      "TargetBucket": "cos-mirror",
      "TargetPrefix": "test404"
    },
    "CORSConfiguration": {
      "CORSRule": [{
        "AllowedHeader": ["*"],
        "AllowedMethod": ["GET", "PUT"],
        "AllowedOrigin": ["*"],
        "ExposeHeader": ["Date"],
        "MaxAgeSeconds": 3600
      }]
    },
    "LifecycleConfiguration": {
      "Rule": [{
        "ID": "deleteRule",
        "Prefix": "test/",
        "Status": "Enabled",
        "Expiration":{
          "Days": 2
        },
        "AbortMultipartUpload":{
          "CreatedBeforeDate": "2014-10-11T00:00:00.000Z"
        }
      }]
    },
    "RefererConfiguration": {
      "AllowEmptyReferer": true,
      "RefererList": ["http://www.aliyun.com", "https://www.?.aliyuncs.com"]
    }
   }
  }
 },
 "Outputs": {
  "Name": {
     "Value": {"Fn::GetAtt": ["Bucket","Name"]}
  },
  "DomainName": {
     "Value": {"Fn::GetAtt": ["Bucket","DomainName"]}
  }
 }
}
```

5.5.4. RDS

5.5.4.1. ALIYUN::RDS::Account

ALIYUN::RDS::Account is used to create a database management Account.

Statement

```
{
 "Type": "ALIYUN::RDS::Account",
 "Properties": {
  "AccountDescription": String,
  "DBInstanceId": String,
  "AccountPassword": String,
  "AccountType": String,
  "AccountName": String
 }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
AccountDescription	String	Yes	True	The description of the account.	The name must be 2 to 256 characters in length. It can contain digits, letters, underscores (_), and hyphens (-); but must start with a letter.
DBInstanceId	String	No	No	The ID of the RDS instance.	None
AccountPassword	String	No	No	The password of the database account.	The password must be 8 to 32 characters in length.
AccountType	String	Yes	Released	The type of the database account.	Valid values: • Normal: indicates a standard account. • Super: indicates a privileged account. Default value: Normal.

Parameter	Type	Required	Editable	Description	Constraint
AccountName	String	No	No	The name of the database account.	Valid values: 1025 to 10000. You cannot use the following commonly used port numbers: 2222, 4500, 4510, 4560, 7505, 9000, 9001, and 9002.

Response parameters

Fn::GetAtt

AccountName: the name of the database account.

Sample request

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Resources": {
  "Account": {
   "Type": "ALIYUN::RDS::Account",
   "Properties": {
    "AccountDescription": {
     "Ref": "AccountDescription"
    },
    "DBInstanceId": [
     "Ref": "DBInstanceId"
    },
    "AccountPassword": {
     "Ref": "AccountPassword"
    },
    "AccountType": {
     "Ref": "AccountType"
    },
    "AccountName": {
     "Ref": "AccountName"
    }
   }
  }
 },
 "Parameters": {
  "AccountDescription": {
   "Type": "String",
   "Description": "Account remarks.\nIt cannot begin with http:// or https://.\nIt must start with a Chinese character or English letter.\nIt can include Chinese and English characters/letters, underscores (_), hyphens (-), and digits.\nThe length may be 2-256 characters."
  },
  "DBInstanceId": [
   "Type": "String",
   "Description": "RDS instance ID."
  },
  "AccountPassword": {
   "MinLength": 8,
   "Type": "String",
   "Description": "The account password for the database instance. It may consist of letters, digits, or underlines, with a
```

```
length of 8 to 32 characters.",
    "MaxLength": 32
   },
   "AccountType": {
    "Default": "Normal",
    "Type": "String",
    "Description": "Privilege type of account.\nNormal: Common privilege.\nSuper: High privilege. And the default value is Normal.\nThis parameter is valid for MySQL 5.5/5.6 only.\nMySQL 5.7, SQL Server 2012/2016, PostgreSQL, and PPAS each can have only one initial account. Other accounts are created by the initial account that has logged on to the database.",
    "AllowedValues": ["Normal", "Super"]
   },
   "AccountName": {
    "Type": "String",
    "Description": "Account name, which must be unique and meet the following requirements:\nStart with a letter;\nConsist of lower-case letters, digits, and underscores (_);\nContain no more than 16 characters.\nFor other invalid characters, see Forbidden keywords table."
   }
  },
  "Outputs": {
   "AccountName": {
    "Description": "Account name",
    "Value": {
     "Fn::GetAtt": ["Account", "AccountName"]
    }
   }
  }
}
```

5.5.4.2. ALIYUN::RDS::AccountPrivilege

ALIYUN::RDS::AccountPrivilege is used to grant database access permissions to accounts.

Statement

```
{
 "Type": "ALIYUN::RDS::AccountPrivilege",
 "Properties": {
  "AccountPrivilege": String,
  "DBInstanceId": String,
  "DBName": String,
  "AccountName": String
 }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint

Parameter	Type	Required	Editable	Description	Constraint
AccountPrivilege	String	No	Yes	The permissions of the database account.	Valid values: • ReadWrite: has read and write permissions on the database. • ReadOnly: The account has read-only permission on the database. • DDLOnly: The account can run only data definition language (DDL) commands in the database. This is applicable to MySQL and MariaDB. • DMLOnly: The account can run only data manipulation language (DML) commands in the database. This is applicable to MySQL and MariaDB. • DBOwner: The account has full permissions on the database. This is applicable to SQL Server.
DBInstanceId	String	No	No	The ID of the RDS instance.	None
DBName	String	No	No	The name of the database.	None

Parameter	Type	Required	Editable	Description	Constraint
AccountName	String	No	No	The name of the account.	Valid values: 1025 to 10000. You cannot use the following commonly used port numbers: 2222, 4500, 4510, 4560, 7505, 9000, 9001, and 9002.

Response parameters

Fn::GetAtt

None

Sample request

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Resources": {
  "AccountPrivilege": {
   "Type": "ALIYUN::RDS::AccountPrivilege",
   "Properties": {
    "AccountPrivilege": {
     "Ref": "AccountPrivilege"
    },
    "DBInstanceId": [
     "Ref": "DBInstanceId"
    },
    "DBName": {
     "Ref": "DBName"
    },
    "AccountName": {
     "Ref": "AccountName"
    }
   }
  }
 },
 "Parameters": {
  "AccountPrivilege": {
   "Type": "String",
   "Description": "RDS account privilege",
   "AllowedValues": ["ReadOnly", "ReadWrite", "DDLOnly", "DMLOnly", "DBOwner"]
  },
  "DBInstanceId": [
   "Type": "String",
   "Description": "RDS instance ID."
  },
  "DBName": {
   "Type": "String",
   "Description": "RDS database name"
  },
  "AccountName": {
   "Type": "String",
   "Description": "RDS account name."
  }
 },
 "Outputs": {}
}
```

5.5.4.3. ALIYUN::RDS::DBInstance

ALIYUN::RDS::DBInstance is used to create an ApsaraDB RDS instance.

Syntax

```
{
 "Type": "ALIYUN::RDS::DBInstance",
 "Properties": {
  "Engine": String,
  "MultiAZ": Boolean,
  "VpcId": String,
  "DBMappings": List,
  "DBInstanceDescription": String,
  "ConnectionMode": String,
  "MasterUsername": String,
  "MasterUserPassword": String,
  "ZoneId": String,
  "DBInstanceNetType": String,
  "DBInstanceStorage": Integer,
  "VSwitchId": String,
  "AllocatePublicConnection": Boolean,
  "EngineVersion": String,
  "PreferredBackupTime": String,
  "DBInstanceClass": String,
  "SecurityIPList": String,
  "BackupRetentionPeriod": Integer,
  "PrivateIpAddress": String,
  "PreferredBackupPeriod": List,
  "PeriodType": String,
  "PayType": String,
  "Period": Integer,
  "ResourceGroupId": String
 }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	No	No	The ID of the resource group.	None
Engine	String	Yes	No	The database engine that the instance runs.	Valid values: • MySQL • SQLServer • PostgreSQL • PPAS

Property	Type	Required	Editable	Description	Constraint
DBInstanceStorage	Integer	Yes	Yes	The storage capacity of the instance.	• Valid values when Engine is set to MySQL: 5 to 1000. • Valid values when Engine is set to SQLServer: 10 to 1000. • Valid values when Engine is set to PostgreSQL: 5 to 2000. • Valid values when Engine is set to PPAS: 5 to 2000. Unit: GB. **Note** This value must be in 5 GB increments.
EngineVersion	String	Yes	No	The version of the database engine.	• Valid values when Engine is set to MySQL: 5.5, 5.6, 5.7, and 8.0. • Set the value to 2008r2 when Engine is set to SQLServer. • Set the value to 9.4 when Engine is set to PostgreSQL. • Set the value to 9.3 when Engine is set to PPAS.
DBInstanceClass	String	Yes	Yes	The instance type.	Valid values: • rds.mys2.large • rds.mss1.large • rds.pg.s1.small
SecurityIPList	String	Yes	Yes	The whitelist of IP addresses that are allowed to access all databases in the instance.	• Separate multiple IP addresses with commas (,). Each IP address in the whitelist must be unique. A maximum of 1,000 IP addresses can be specified. • The 0.0.0.0/0 format is supported. You can specify IP addresses in the 10.23.XX.XX format and CIDR blocks in the 10.23.XX.XX/24 format. In 10.23.XX.XX/24, /24 indicates the length of the prefix in the CIDR block, and the prefix length can range from 1 to 32. 0.0.0.0/0 indicates that no access restriction is applied.
MultiAZ	Boolean	No	No	Specifies whether the instance can be deployed across multiple zones.	None
VpcId	String	No	No	The ID of the VPC.	None

Property	Type	Required	Editable	Description	Constraint
DBMappings	List	No	No	The list of one or more databases to be created in the instance.	None
DBInstanceDescription	String	No	No	The description of the instance.	• The description must be 2 to 256 characters in length and can contain letters, digits, underscores (_), and hyphens (-). • It must start with a letter and cannot start with `http://` or `https://`.
ConnectionMode	String	No	No	The connection mode of the instance.	Valid values: • Performance: standard connection mode • Safty: safe connection mode If you do not specify this parameter, the system assigns a connection mode.
MasterUsername	String	No	No	The name of the database account.	The name must be unique. The name can be up to 16 characters in length and can contain letters, digits, and underscores (_).
MasterUserPassword	String	No	No	The password of the database account.	The password must be 6 to 32 characters in length and can contain letters, digits, and underscores (_).
ZoneId	String	No	No	The zone ID of the instance.	None
DBInstanceNetType	String	No	No	The network type of the instance.	Default value: Intranet. Valid values: • Internet • Intranet
VSwitchId	String	No	No	The ID of the vSwitch in the specified VPC.	None
AllocatePublicConnection	Boolean	No	No	Specifies whether to apply for a public endpoint for the instance.	None

Property	Type	Required	Editable	Description	Constraint
PreferredBackupTime	String	No	No	The backup window.	• Specify the window in the `HH:mmZ-HH:mmZ` format. • Valid values: 00:00Z-01:00Z, 01:00Z-02:00Z, 02:00Z-03:00Z, 03:00Z-04:00Z, 04:00Z-05:00Z, 05:00Z-06:00Z, 06:00Z-07:00Z, 07:00Z-08:00Z, 08:00Z-09:00Z, 09:00Z-10:00Z, 10:00Z-11:00Z, 11:00Z-12:00Z, 12:00Z-13:00Z, 13:00Z-14:00Z, 14:00Z-15:00Z, 15:00Z-16:00Z, 16:00Z-17:00Z, 17:00Z-18:00Z, 18:00Z-19:00Z, 19:00Z-20:00Z, 20:00Z-21:00Z, 21:00Z-22:00Z, 22:00Z-23:00Z, and 23:00Z-24:00Z.
BackupRetentionPeriod	Number	No	No	The number of days for which backup files can be retained.	Valid values: 7 to 30. Unit: days. Default value: 7.
PrivateIpAddress	String	No	No	The private IP address within the CIDR block of the vSwitch.	If you do not specify this parameter, the system allocates a private IP address.
PreferredBackupPeriod	List	No	No	The backup cycle.	Valid values: • Monday • Tuesday • Wednesday • Thursday • Friday • Saturday • Sunday
MasterUserType	String	No	No	The type of the database account.	Default value: Normal. Valid values: • Normal • Super
Tags	Map	No	Yes	The list of one or more tags. Each tag consists of a tag key and a tag value.	• The tag key is required and the tag value is optional. • Format example: `{"key1":"value1","key2":""}`.
PeriodType	String	No	No	The unit of the subscription period.	Default value: Month. Valid values: • Month • Year

Property	Type	Required	Editable	Description	Constraint
PayType	String	No	No	The billing method of the instance.	Valid values: • PostPaid: pay-as-you-go • PrePaid: subscription
Period	Integer	No	No	The subscription period of the instance.	• Valid values when PeriodType is set to Year: 1, 2, and 3. • Valid values when PeriodType is set to Month: 1, 2, 3, 4, 5, 6, 7, 8, and 9.

DBMappings syntax

```
"DBMappings": [
 {
  "DBDescription": String,
  "CharacterSetName": String,
  "DBName": String
 }
]
```

DBMappings properties

Property	Type	Required	Editable	Description	Constraint

CharacterSetName	String	Yes	No	The character set.	• Valid values when Engine is set to MySQL:
					  ◦ utf8
					  ◦ gbk
					  ◦ latin1
					  ◦ utf8mb4 (applicable to versions 5.5 and 5.6)
					• Valid values when Engine is set to SQLServer:
					  ◦ Chinese_PRC_CI_AS
					  ◦ Chinese_PRC_CS_AS
					  ◦ SQL_Latin1_General_CP1_CI_AS
					  ◦ SQL_Latin1_General_CP1_CS_AS
					  ◦ Chinese_PRC_BIN

DBName	String	Yes	No	The name of the database.	The name must be unique. The name can be up to 64 characters in length and can contain letters, digits, and underscores (_). It must start with a letter.

Property	Type	Required	Editable	Description	Constraint
DBDescription	String	No	No	The description of the database.	• The description must be 2 to 256 characters in length and can contain letters, digits, underscores (_), and hyphens (-). • It must start with a letter and cannot start with `http://` or `https://`.

Response parameters

Fn::GetAtt

- DBInstanceId: the ID of the instance.
- InnerPort: the internal port of the instance.
- InnerIPAddress: the internal IP address of the instance.
- InnerConnectionString: the internal endpoint of the instance.
- PublicPort: the public port of the instance.
- PublicConnectionString: the public endpoint of the instance.
- PublicIPAddress: the public IP address of the instance.

Examples

The following example demonstrates how to create an ApsaraDB RDS instance in the classic network:

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Resources": {
  "Database": {
   "Type": "ALIYUN::RDS::DBInstance",
   "Properties": {
    "Engine": "MySQL",
    "EngineVersion": "5.6",
    "DBInstanceClass":"rds.mysql.t1.small",
    "DBInstanceStorage": 10,
    "DBInstanceNetType": "Internet",
    "SecurityIPList": "0.0.0.0/0",
    "MasterUsername": "A****",
    "DBMappings":[{
      "DBName": "hope",
      "CharacterSetName": "utf8"
    }]
   }
  }
 },
 "Outputs": {
  "DBInstanceId": {
   "Value": {"get_attr": ["DBInstanceId"]}
  },
  "PublicConnectionString": {
   "Value": {"get_attr": ["ConnectionString"]}
  },
  "PublicPort": {
   "Value": {"get_attr": ["Port"]}
  }
 }
}
```

The following example demonstrates how to create an ApsaraDB RDS instance in a VPC:

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Resources": {
  "Database": {
   "Type": "ALIYUN::RDS::DBInstance",
   "Properties": {
    "Engine":"MySQL",
    "EngineVersion":"5.6",
    "DBInstanceClass":"rds.mys2.small",
    "DBInstanceStorage":"10",
    "DBInstanceNetType":"Intranet",
    "SecurityIPList": "0.0.0.0/0",
    "VSwitchId": "ttt",
    "VpcId": "myvp****"
   }
  }
 },
 "Outputs": {
  "DBInstanceId": {
   "Value": {"get_attr": ["DBInstanceId"]}
  },
  "InnerConnectionString": {
   "Value": {"get_attr": ["ConnectionString"]}
  },
  "InnerPort": {
   "Value": {"get_attr": ["Port"]}
  }
 }
}
```

5.5.4.4. ALIYUN::RDS::DBInstanceParameterGroup

ALIYUN::RDS::DBInstanceParameterGroup is used to modify parameters of an ApsaraDB RDS instance.

Syntax

```
{
 "Type": "ALIYUN::RDS::DBInstanceParameterGroup",
 "Properties": {
  "Forcerestart": String,
  "DBInstanceId": String,
  "Parameters": List
 }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
DBInstanceId	String	Yes	No	The ID of the ApsaraDB RDS instance.	None

Property	Type	Required	Editable	Description	Constraint
Parameters	List	Yes	No	The list of one or more parameters of the instance.	The parameters and their values must be arranged in the JSON format. The parameter values must be of the string type. Example: {"auto_increment_increment":"1","character_set_client":"utf8"}.
Forcerestart	String	No	No	Specifies whether to forcibly restart the instance.	Default value: false. Valid values: • true: The system forcibly restarts the instance. • false: The system does not forcibly restart the instance.

Response parameters

Fn::GetAtt

None

Examples

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Resources": {
  "Database": {
   "Type": "ALIYUN::RDS::DBInstance",
   "Properties": {
    "Engine": "MySQL",
    "EngineVersion": "5.6",
    "DBInstanceClass": "rds.mys2.small",
    "DBInstanceStorage": "10",
    "DBInstanceNetType": "Intranet",
    "SecurityIPList": "0.0.0.0/0"
   }
  },
  "DatabaseConfig": {
   "Type": "ALIYUN::RDS::DBInstanceParameterGroup",
   "Properties": {
    "DBInstanceId": {
     "Ref": "Database"
    },
    "Parameters": [
     {
      "Key": "auto_increment_increment",
      "Value": "xxx"
     }
    ]
   }
  }
 },
 "Outputs": {
  "DBInstanceId": {
   "Value": {
    "Fn::GetAtt": [
     "Database",
     "DBInstanceId"
    ]
   }
  }
 }
}
```

5.5.4.5. ALIYUN::RDS::DBInstanceSecurityIps

ALIYUN::RDS::DBInstanceSecurityIps is used to modify the instance whitelist.

Statement

```
{
 "Type": "ALIYUN::RDS::DBInstanceSecurityIps",
 "Properties": {
  "DBInstanceId": String,
  "DBInstanceIPArrayName": String,
  "DBInstanceIPArrayAttribute": String
 }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
DBInstanceId	String	No	No	The ID of the RDS instance.	None
DBInstanceIPArrayAttribute	String	No	Yes	The attribute of the IP address whitelist.	The console does not display groups labeled with hidden.
DBInstanceIPArrayName	String	Yes	Released	The name of the IP address whitelist.	The name can contain only lowercase letters and underscores (_). Default value: Default.

Response parameters

Fn::GetAtt

SecurityIps: the IP address whitelist after the modification.

Sample request

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Resources": {
  "DBInstanceSecurityIps": {
   "Type": "ALIYUN::RDS::DBInstanceSecurityIps",
   "Properties": {
    "DBInstanceIPArrayName": {
     "Ref": "DBInstanceIPArrayName"
    },
    "DBInstanceId": [
     "Ref": "DBInstanceId"
    },
    "DBInstanceIPArrayAttribute": {
     "Ref": "DBInstanceIPArrayAttribute"
    }
   }
  }
 },
 "Parameters": {
  "DBInstanceIPArrayName": {
   "Type": "String",
   "Description": "Group name of the security ips, only support lower characters and '_'. Advice use a new group name a
void effect your database system. If the properties is not specified, it will set to default group, please be careful."
  },
  "DBInstanceId": [
   "Type": "String",
   "Description": "Database instance id to update security ips."
  },
  "DBInstanceIPArrayAttribute": {
   "Type": "String",
   "Description": "Security ips to add or remove."
  }
 },
 "Outputs": {
  "SecurityIps": {
   "Description": "The security ips of selected database instance.",
   "Value": {
    "Fn::GetAtt": [
     "DBInstanceSecurityIps",
     "SecurityIps"
    ]
   }
  }
 }
}
```

5.5.4.6. ALIYUN::RDS::PrepayDBInstance

ALIYUN::RDS::PrepayDBInstance is used to create a subscription ApsaraDB RDS instance.

Syntax

```
{
 "Type": "ALIYUN::RDS::PrepayDBInstance",
 "Properties": {
  "DBMappings": List,
  "CouponCode": String,

```

Properties

Property	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	No	No	The ID of the resource group.	None
DBMappings	List	No	No	The list of one or more databases to be created in the instance.	None
CouponCode	String	No	No	None	None
MasterUsername	String	No	No	The name of the database account.	The name must be unique. The name can be up to 16 characters in length and can contain lowercase letters, digits, and underscores (_). It must start with a lowercase letter.

Property	Type	Required	Editable	Description	Constraint
PeriodType	String	Yes	No	The unit of the subscription period.	Default value: Month. Valid values: • Year • Month
DBInstanceNetType	String	No	No	The network type of the instance.	Default value: Intranet. Valid values: • Internet • Intranet
MasterUserType	String	No	No	The type of the database account.	Valid values: • Normal • Master
PreferredBackupTime	String	No	No	The backup window.	Specify the window in the HH:mmZ-HH:mmZ format. Value values: 00:00Z-01:00Z, 01:00Z-02:00Z, 02:00Z-03:00Z, 03:00Z-04:00Z, 04:00Z-05:00Z, 05:00Z-06:00Z, 06:00Z-07:00Z, 07:00Z-08:00Z, 08:00Z-09:00Z, 09:00Z-10:00Z, 10:00Z-11:00Z, 11:00Z-12:00Z, 12:00Z-13:00Z, 13:00Z-14:00Z, 14:00Z-15:00Z, 15:00Z-16:00Z, 16:00Z-17:00Z, 17:00Z-18:00Z, 18:00Z-19:00Z, 19:00Z-20:00Z, 20:00Z-21:00Z, 21:00Z-22:00Z, 22:00Z-23:00Z, and 23:00Z-24:00Z.
PrivateIpAddress	String	No	No	The private IP address with the CIDR block of the specified vSwitch.	If you do not specify this parameter, the system allocates a private IP address.
Engine	String	Yes	No	The database engine that the instance runs.	Valid values: • MySQL • SQLServer • PostgreSQL • PPAS

Property	Type	Required	Editable	Description	Constraint
MultiAZ	Boolean	No	No	Specifies whether the instance can be deployed across multiple zones.	None
VpcId	String	No	No	The ID of the VPC.	None
ConnectionMode	String	No	No	The connection mode of the instance.	Default value: Safty. Valid values: • Performance: the standard mode. • Safty: the database proxy mode. If you do not specify this parameter, the system assigns a connection mode.
AutoRenew	Boolean	No	No	Specifies whether to enable automatic renewal for the instance.	Valid values: • True • False
VSwitchId	String	No	No	The ID of the vSwitch in the specified VPC.	None
BackupRetentionPeriod	Number	No	No	The number of days for which backup files can be retained.	None
Quantity	Number	No	No	The number of instances to be created.	Valid values: 1 to 99. Default value: 1.
CommodityCode	String	Yes	No	The commodity code.	Valid values: • rds • bards • rords
ZoneId	String	No	No	The zone ID of the instance.	None
EngineVersion	String	Yes	No	The version of the database engine.	• Valid values when Engine is set to MySQL: 5.5 and 5.6. • Set the value to 2008r2 when Engine is set to SQLServer. • Set the value to 9.4 when Engine is set to PostgreSQL. • Set the value to 9.3 when Engine is set to PPAS.

Property	Type	Required	Editable	Description	Constraint
DBInstanceClass	String	Yes	Yes	The instance type.	Examples: rds.mys2.large, rds.mss1.large, and rds.pg.s1.small.
PreferredBackupPeriod	List	No	No	The backup cycle.	Valid values: • Monday • Tuesday • Wednesday • Thursday • Friday • Saturday • Sunday
DBInstanceStorage	Integer	Yes	Yes	The storage capacity of the instance.	• Valid values when Engine is set to MySQL: 5 to 1000. • Valid values when Engine is set to SQLServer: 10 to 1000. • Valid values when Engine is set to PostgreSQL or PPAS: 5 to 2000. Unit: GB. This value must be in 5 GB increments.
DBInstanceDescription	String	No	No	The description of the instance.	The description must be 2 to 256 characters in length and can contain letters, digits, underscores (_), and hyphens (-). It must start with a letter and cannot start with `http://` or `https://`.
Tags	map	No	Yes	The tags of the instance.	None
Period	Number	Yes	No	The subscription period of the instance.	• Valid values when PeriodType is set to Month: 1, 2, 3, 4, 5, 6, 7, 8, and 9. • Valid values when PeriodType is set to Year: 1, 2, and 3.
MasterUserPassword	String	No	No	The password of the database account.	The password must be 6 to 32 characters in length and can contain letters, digits, and underscores (_).

Property	Type	Required	Editable	Description	Constraint
AllocatePublicConnection	Boolean	No	No	Specifies whether to apply for a public endpoint for the instance.	None
PayType	String	No	No	The billing method of the instance.	Valid values: • Postpaid: pay-as-you-go • Prepaid: subscription
AutoPay	Boolean	No	No	Specifies whether to enable automatic payment for the instance.	Default value: False. Valid values: • True • False

DBMappings syntax

```
"DBMappings": [
 {
  "DBDescription": String,
  "CharacterSetName": String,
  "DBName": String
 }
]
```

DBMappings properties

Property	Type	Required	Editable	Description	Constraint
DBDescription	String	No	No	The description of the database.	The description must be 2 to 256 characters in length and can contain letters, digits, underscores (_), and hyphens (-). It must start with a letter and cannot start with `http://` or `https://`.
CharacterSetName	String	Yes	No	The character set.	• Valid values when Engine is set to MySQL: utf8, gbk, latin1, and utf8mb4 (applicable to versions 5.5 and 5.6). • Valid values when Engine is set to SQLServer: Chinese_PRC_CI_AS, Chinese_PRC_CS_AS, SQL_Latin1_General_CP1_CI_AS, SQL_Latin1_General_CP1_CS_AS, and Chinese_PRC_BIN.

Property	Type	Required	Editable	Description	Constraint
DBName	String	Yes	No	The name of the database.	The name must be unique. It can be up to 64 characters in length and can contain lowercase letters, digits, and underscores (_). It must start with a lowercase letter.

Response parameters

Fn::GetAtt

- InnerPort: the internal port of the instance.
- OrderId: the order ID of the instance.
- PublicConnectionString: the public endpoint of the instance.
- InnerIPAddress: the internal IP address of the instance.
- DBInstanceId: the ID of the instance.
- PublicIPAddress: the public IP address of the instance.
- PublicPort: the public port of the instance.
- InnerConnectionString: the internal endpoint of the instance.

5.5.5. ROS

5.5.5.1. ALIYUN::ROS::WaitCondition

ALIYUN::ROS::WaitCondition is used to create an instance to process UserData messages.

Statement

```
{
 "Type": "ALIYUN::ROS::WaitCondition",
 "Properties": {
  "Count": Number,
  "Handle": String,
  "Timeout": Number
 }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
Handle	String	No	No	Reference ALIYUN::ROS::WaitConditionHandle.	None
Timeout	Number	Yes	No	The length of time to wait for UserData messages.	Valid values: 1 to 43200. Unit: seconds.

Parameter	Type	Required	Editable	Description	Constraint
Count	Number	No.	True	The total number of messages to be received.	None

Response parameters

Fn::GetAtt

- Data: A JSON-serialized dictionary that contains the signal Data after the most recent stack creation or update.
- LastData: a JSON-serialized dictionary that contains the signal data before the most recent stack update.
- JoinedErrorData: a string consisting of the ErrorData signal data.
- JoinedLastErrorData: a string consisting of the LastErrorData signal data.
- ErrorData: a JSON-serialized dictionary that contains the error signal data after the most recent stack creation or update.
- Lasterprotodata: a JSON-serialized dictionary that contains the error signal data before the most recent stack update.

Sample request

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Resources": {
  "WaitCondition": {
   "Type": "ALIYUN::ROS::WaitCondition",
   "Properties": {
    "Handle": {
     "Ref": "WaitConHandle"
    },
    "Timeout": 5,
    "Count": 2
   }
  },
  "WaitConHandle": {
   "Type": "ALIYUN::ROS::WaitConditionHandle"
  }
 },
 "Outputs": {
  "CurlCli": {
   "Value": {
    "Fn::GetAtt": [
     "WaitConHandle",
     "CurlCli"
    ]
   }
  },
  "Data": {

    "Fn::GetAtt": [
     "WaitCondition",
     "Data"
    ]
   }
  }
 }
}
```

5.5.5.2. ALIYUN::ROS::WaitConditionHandle

ALIYUN::ROS::WaitConditionHandle is used to create an instance that sends and receives messages during UserData execution.

Statement

```
{
 "Type": "ALIYUN::ROS::WaitConditionHandle",
 "Properties": {
  "Count": Integer,
  "Mode": String
 }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
Count	Integer	No.	True	The total number of messages to be received.	Default value: -1.
Mode	String	Yes	True	If you set this parameter to Increment, all previous signals will be updated before they are deleted. If you set this parameter to Full, no previous signals will be deleted unless the Count parameter is specified.	Valid values: • Increment • Full Default value: Full.

Response parameters

Fn::GetAtt

- CurlCli: A curl Command is generated by the resource. You can use the command to send the UserData execution result or status to Resource Orchestration Service.
- WindowsCurlCli: provides Windows with cURL CLI command prefixes and sends a message indicating that the execution is completed or failed. Windows does not support the curl command. Therefore, you must install curl.exe and add it to PATH. You can add `--data-binary "{\"status\": \" success \"}` to indicate success, or by adding `--data-binary "{\"status\": \" failure \"}` to indicate failure.
- PowerShellCurlCli: provides PowerShell with cURL CLI command prefixes and sends a message indicating that the execution is completed or failed. Because this cmdlet was introduced in PowerShell 3.0, make sure that the PowerShell version meets this constraint. By `$PSVersionTable.PSVersion` displays the version. You can add `-Body '{"status": "success "}` to indicate success, or by adding `-Body '{"status": "failure "}` to indicate failure.

Sample request

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Parameters": {
  "Mode": {
   "Type": "String",
   "Description": "If set to Increment, all old signals will be deleted before update. In this mode, WaitCondition.Count should reference an incremental value instead of a full value, such as ScalingGroupEnable.ScalingRuleArisExecuteResultNumberOfAddedInstances.\n\nIf set to Full, no old signal will be deleted unless Count is set. In this mode, WaitCondition.Count should reference a full value, such as the same value with InstanceGroup.MaxAmount. It is recommended to use this mode with Count.\n\nDefault to Full.",
   "AllowedValues": [
    "Increment",
    "Full"
   ],
   "Default": "Full"
  },

   "Description": "Convenience attribute, provides curl CLI command prefix for PowerShell, which can be used for signalling handle completion or failure. As this cmdlet was introduced in PowerShell 3.0, ensure the version of PowerShell satisfies the constraint. (Show the version via $PSVersionTable.PSVersion.) You can signal success by adding -Body '{\"status\": \"SUCCESS\"}' , or signal failure by adding -Body '{\"status\": \"FAILURE\"}' ",
   "Value": {
    "Fn::GetAtt": [
     "WaitConditionHandle",
     "PowerShellCurlCli"
    ]
   }
  }
 }
}
```

5.5.5.3. ALIYUN::ROS::Stack

ALIYUN::ROS::Stack is used to create a nested stack. You can have a maximum of five nested levels.

ALIYUN::ROS::Stack is used in a top-level template to nest stacks as resources.

You can add output values from a nested stack contained within the template. You can use Fn::GetAtt together with the logical name of the nested stack and the output name in the Outputs.NestedStackOutputName format.

> **Note** We recommend that you run an update to the Nested stack from the parent stack.

When you apply a template change to update a top-level stack, ROS updates the top-level stack and initiates an update to its nested stacks. Resource orchestration service (ROS) updates resources that have been modified in the nested stack, but does not update resources that have not been modified in the nested stack.

Statement

```
{
 "Type": "ALIYUN::ROS::Stack",
 "Properties": {
  "TemplateURL": String,
  "TimeoutMins": Number,
  "Parameters": Map
 }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint

Parameter	Type	Required	Editable	Description	Constraint
TemplateURL	String	No	Yes	The URL of the file containing the template body. The template file can be up to 524,288 bytes in size. The URL must point to a template located on the http or https Web server or Alibaba Cloud OSS bucket. For example: `oss://ros/template/demo`. `oss://ros/template/demo?RegionId=cn-hangzhou`. If the region of the OSS bucket is not specified, the RegionId of the stack is used.	The URL can be up to 1,024 bytes in length.
TimeoutMins	Number	No.	True	The length of time that ROS will wait for the nested stack to be created or updated.	Unit: minutes. Default value: 60.

Parameter	Type	Required	Editable	Description	Constraint
Parameters	Map	No.	True	A set of value pairs that represent the parameters passed to ROS when this Nested stack is created. Each parameter has a name corresponding to a parameter defined in the embedded template and the value to which you want to set the parameter. This parameter is required if the nested stack needs input parameters.	None

Response parameters

Fn::GetAtt

You can use the following code to obtain the output of the nested stack:

```
{
 "Fn::GetAtt": [
  "<nested_stack>",
  "Outputs.<nested_stack_output_name>"
 ]
}
```

When you use `Ref` to reference resources in a nested stack, the Alibaba Cloud Resource Name (ARN) of the nested stack is returned. Example: `arn:acs:ros::cn-hangzhou:12345****:stacks/test-nested-stack-Demo-jzkyq7mn2ykj/e71c1e04-1a57-46fc-b9a4-cf7ce0d3****`

Examples

- The following code provides an example of how to create a VPC, a VSwitch, and a security group in a nested stack and save the output results to the *oss://ros/template/vpc.txt* directory:

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Description": "One VPC, VSwitch, security group.",
 "Parameters": {
  "ZoneId": {
   "Type": "String",
   "Description": "The available zone"
  },
  "SecurityGroupName": {
   "Type": "String",
   "Description": "The security group name",
   "Default": "my-sg-name"
```

```
  },
  "VpcName": {
   "Type": "String",
   "Description": "The VPC name",
   "MinLength": 2,
   "MaxLength": 128,
   "ConstraintDescription": "[2, 128] English or Chinese letters",
   "Default": "my-vpc-name"
  },
  "VpcCidrBlock": {
   "Type": "String",
   "AllowedValues": [
    "192.168.0.0/16",
    "172.16.0.0/12",
    "10.0.0.0/8"
   ],
   "Default": "10.0.0.0/8"
  },
  "VSwitchCidrBlock": {
   "Type": "String",
   "Description": "The VSwitch subnet which must be within VPC",
   "Default": "10.0.10.0/24"
  },
  "UpdateVersion": {
   "Type": "Number",
   "Default": 0
  }
 },
 "Resources": {
  "Vpc": {
   "Type": "ALIYUN::ECS::VPC",
   "Properties": {
    "CidrBlock": {
     "Ref": "VpcCidrBlock"
    },
    "VpcName": {
     "Ref": "VpcName"
    }
   }
  },
  "VSwitch": {
   "Type": "ALIYUN::ECS::VSwitch",
   "Properties": {
    "CidrBlock": {
     "Ref": "VSwitchCidrBlock"
    },
    "ZoneId": {
     "Ref": "ZoneId"
    },
    "VpcId": {
     "Fn::GetAtt": [
      "Vpc",
      "VpcId"
     ]
    }
   }
  },
  "SecurityGroup": {
   "Type": "ALIYUN::ECS::SecurityGroup",
   "Properties": {
```

```
      "SecurityGroupName": {
       "Ref": "SecurityGroupName"
      },
      "VpcId": {
       "Ref": "Vpc"
      }
     }
    },
    "WaitConditionHandle": {
     "Type": "ALIYUN::ROS::WaitConditionHandle",
     "Properties": {
      "UpdateVersion": {
       "Ref": "UpdateVersion"
      }
     }
    }
   },
   "Outputs": {
    "SecurityGroupId": {
     "Value": {
      "Fn::GetAtt": [
       "SecurityGroup",
       "SecurityGroupId"
      ]
     }
    },
    "VpcId": {
     "Value": {
      "Fn::GetAtt": [
       "Vpc",
       "VpcId"
      ]
     }
    },
    "VSwitchId": {
     "Value": {
      "Fn::GetAtt": [
       "VSwitch",
       "VSwitchId"
      ]
     }
    }
   }
}
```

- The following code provides an example of a top-level stack:

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Description": "One ECS instance.",
 "Parameters": {
  "ImageId": {
   "Default": "centos_7",
   "Type": "String",
   "Description": "Image Id, represents the image resource to startup the ECS instance"
  },
  "InstanceType": {
   "Type": "String",
   "Description": "The ECS instance type,",
   "Default": "ecs.xn4.small"
```

```
  },
  "ZoneId": {
   "Type": "String",
   "Description": "The available zone "
  },
  "InstanceChargeType": {
   "Type": "String",
   "AllowedValues": [
    "PrePaid",
    "PostPaid"
   ],
   "Default": "PostPaid",
   "Description": "The instance charge type"
  },
  "SecurityGroupName": {
   "Type": "String",
   "Description": "The security group name",
   "Default": "my-sg-name"
  },
  "NetworkInterfaceName": {
   "Type": "String",
   "Description": "The Network interface name",
   "Default": "my-eni-name"
  },
  "VpcName": {
   "Type": "String",
   "Description": "The VPC name",
   "MinLength": 2,
   "MaxLength": 128,
   "ConstraintDescription": "[2, 128] English or Chinese letters",
   "Default": "my-vpc-name"
  },
  "IoOptimized": {
   "AllowedValues": [
    "none",
    "optimized"
   ],
   "Description": "IO optimized, optimized is for the IO optimized instance type",
   "Type": "String",
   "Default": "optimized"
  },
  "SystemDiskCategory": {
   "AllowedValues": [

    }
   }
}
```

5.5.6. SLB

5.5.6.1. ALIYUN::SLB::AccessControl

ALIYUN::SLB::AccessControl is used to create an access control list (ACL).

Syntax

```
{
 "Type": "ALIYUN::SLB::AccessControl",
 "Properties": {
  "AddressIPVersion": String,
  "AclName": String,
  "AclEntrys": List
 }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
AddressIPVersion	String	No	No	The Internet protocol version.	Valid values: ipv4 and ipv6.
AclName	String	Yes	Yes	The name of the ACL.	None
AclEntrys	List	No	No	The list of ACL entries.	A list can contain up to 50 ACL entries.

AclEntrys syntax

```
"AclEntrys": [
 {
  "comment": String,
  "entry": String
 }
]
```

AclEntrys properties

Property	Type	Required	Editable	Description	Constraint
comment	String	No	No	The comments on ACL entries.	None
entry	String	Yes	No	The authorized IP addresses or CIDR blocks.	None

Response parameters

Fn::GetAtt

AclId: the ID of the ACL.

Examples

Resource usage example

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Resources": {
  "AccessControl": {
   "Type": "ALIYUN::SLB::AccessControl",
   "Properties": {
    "AddressIPVersion": {
     "Ref": "AddressIPVersion"
    },
    "AclName": {
     "Ref": "AclName"
    },
    "AclEntrys": {
     "Fn::Split": [",", {
      "Ref": "AclEntrys"
     }, {
      "Ref": "AclEntrys"
     }]
    }
   }
  }
 },
 "Parameters": {
  "AddressIPVersion": {
   "Type": "String",
   "Description": "IP version. Could be \"ipv4\" or \"ipv6\".",
   "AllowedValues": ["ipv4", "ipv6"]
  },
  "AclName": {
   "Type": "String",
   "Description": "The name of the access control list."
  },
  "AclEntrys": {
   "Type": "CommaDelimitedList",
   "Description": "A list of acl entrys. Each entry can be IP addresses or CIDR blocks. Max length: 50.",
   "MaxLength": 50
  }
 },
 "Outputs": {
  "AclId": {
   "Description": "The ID of the access control list.",
   "Value": {
    "Fn::GetAtt": ["AccessControl", "AclId"]
   }
  }
 }
}
```

Example of combined use of SLB-related resources

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Resources": {
  "LoadBalancer": {
   "Type": "ALIYUN::SLB::LoadBalancer",
   "Properties": {
    "LoadBalancerName": "slb-with-listener-and-acl",
    "AddressType": "internet",
    "InternetChargeType": "paybybandwidth",
```

```
      "Bandwidth": 10,
      "VpcId": "vpc-xxxxxxxxxxxxxxxxxxxx",
      "VSwitchId": "vsw-xxxxxxxxxxxxxxxxxxx"
     }
    },
    "ACL": {
     "Type": "ALIYUN::SLB::AccessControl",
     "Properties": {
      "AclName": "acl-for-listener",
      "AddressIPVersion": "ipv4",
      "AclEntrys": [
       {
        "entry": "192.168.x.x"
       },
       {
        "entry": "10.0.x.x/24",
        "comment": "just comment"
       }
      ]
     }
    },
    "CreateListener": {
     "Type": "ALIYUN::SLB::Listener",
     "Properties": {
      "LoadBalancerId": {
       "Ref": "LoadBalancer"
      },
      "ListenerPort": "80",
      "BackendServerPort": 8080,
      "Bandwidth": 1,
      "Protocol": "http",
      "HealthCheck": {
       "HealthyThreshold": 3,
       "UnhealthyThreshold": 3,
       "Interval": 2,
       "Timeout": 5
      },
      "Scheduler": "wrr",
      "RequestTimeout": 179,
      "IdleTimeout": 59,
      "AclId": {
       "Ref": "ACL"
      },
      "AclStatus": "on",
      "AclType": "white"
     }
    }
   },
   "Outputs": {
    "LoadBalanceDetails": {
     "Value": {
      "Fn::GetAtt": [
       "LoadBalancerId",
       "Listeners"
      ]
     }
    }
   }
}
```

5.5.6.2. ALIYUN::SLB::BackendServerAttachment

ALIYUN::SLB::BackendServerAttachment is used to add backend servers.

Statement

```
{
 "Type": "ALIYUN::SLB::BackendServerAttachment",
 "Properties": {
  "LoadBalancerId": String,
  "BackendServers": List,
  "BackendServerList": List,
  "BackendServerWeightList": List
 }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
LoadBalancerId	String	No	No	The unique ID of the SLB instance.	None
BackendServerList	List	No.	True	The list of backend servers to add.	You can call this operation with LoadBalancerId and BackendServerWeightList. Separate ECS instance IDs with commas (,). This parameter is ignored when the BackendServers parameter is specified.

Parameter	Type	Required	Editable	Description	Constraint
BackendServerWeightList	List	No.	True	The weights of the ECS instances in the BackendServerList, which are specified in order.	If this parameter is not specified, the weight of all ECS instances included in the BackendServerList is 100. When the BackendServerWeightList length is less than BackendServerList, the last value in the BackendServerWeightList is used to weight the remaining ECS instances in the BackendServerList.
BackendServers	List	No.	True	The list of backend servers to add.	Only backend servers in the running state can be attached to the SLB instance.

BackendServers syntax

```
"BackendServers": [
 {
  "ServerId" : String,
  "Weight" : Integer
 }
]
```

BackendServers properties

Parameter	Type	Required	Editable	Description	Constraint
ServerId	String	No	Yes	The ID of the ECS instance that acts as a backend server.	The ECS instance must be in the Running state.
Weight	Integer	Retained	Yes	The weight of the ECS instance in the SLB instance.	Valid values: 0 to 100. Default value: 100.

Response parameters

Fn::GetAtt

- BackendServers: the backend servers added to the SLB instance.

- LoadBalancerId: the ID of the SLB instance.

Sample request

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Resources": {
  "Attachment2": {
   "Type": "ALIYUN::SLB::BackendServerAttachment",
   "Properties": {
    "LoadBalancerId": "15187200816-cn-beijing-btc-****",
    "BackendServerList": [
     "i-25o0m****",
     "i-25zsk****"
    ],
    "BackendServerWeightList": [
     "20",
     "100"
    ]
   }
  }
 }
}
```

5.5.6.3. ALIYUN::SLB::BackendServerToVServerGroupAddition

ALIYUN::SLB::BackendServerToVServerGroupAddition is used to add backend servers to an existing VServer group.

Statement

```
{
 "Type": "ALIYUN::SLB::BackendServerToVServerGroupAddition",
 "Properties": {
  "BackendServers": List,
  "VServerGroupId": String
 }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
VServerGroupId	String	No	No	The ID of the VServer group.	None
BackendServers	List	Retained	Yes	The list of ECS instances to be added.	None

BackendServers syntax

```
"BackendServers": [
 {
  "ServerId": String,
  "Port": Integer,
  "Weight": Integer
 }
]
```

BackendServers properties

Parameter	Type	Required	Editable	Description	Constraint
ServerId	String	No	Yes	The ID of the ECS instance that acts as a backend server.	None
Port	Integer	Retained	Yes	The ECS port number that is listened to in the server load balancer instance.	Valid values: 1 to 65535.
Weight	Integer	Retained	Yes	The weight of the ECS instance to be attached to the SLB instance.	Valid values: 0 to 100.

Response parameters

Fn::GetAtt

VServerGroupId: the ID of the VServer group.

Sample request

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Resources": {
  "AttachVServerGroup": {
   "Type": "ALIYUN::SLB::BackendServerToVServerGroupAddition",
   "Properties": {
    "VServerGroupId": "sg-2zenh4ndwrqg14yt0****",
    "BackendServers": [
     {
      "ServerId": "i-25zsk****",
      "Weight": 20,
      "Port": 8080
     },
     {
      "ServerId": "i-25zsk****",
      "Weight": 100,
      "Port": 8081
     }
    ]
   }
  }
 }
}
```

5.5.6.4. ALIYUN::SLB::Certificate

ALIYUN::SLB::Certificate is used to upload a certificate to an SLB instance. Server certificates and CA certificates are supported.

> **Notice**
> - You can upload only one CA certificate at a time ("CertificateType": "CA ").
> - You can upload only one server certificate and the corresponding private key at a time ("CertificateType": "Server ").

Syntax

```
{
 "Type": "ALIYUN::SLB::Certificate",
 "Properties": {
  "CertificateName": String,
  "Certificate": String,
  "AliCloudCertificateName": String,
  "PrivateKey": String,
  "ResourceGroupId": String,
  "CertificateType": String,
  "AliCloudCertificateId": String
 }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint

Property	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	No	No	The ID of the resource group.	None
CertificateName	String	No	Yes	The name of the certificate.	None
Certificate	String	Yes	No	The public key of the certificate.	None
AliCloudCertificateName	String	No	No	The name of the Alibaba Cloud certificate.	None
PrivateKey	String	No	No	The server private key that you want to upload.	None
AliCloudCertificateId	String	No	No	The ID of the Alibaba Cloud certificate.	This parameter is required if you use a certificate from Alibaba Cloud SSL Certificates Service.
CertificateType	String	No	No	The type of the certificate.	Valid values: Server and CA.

Response parameters

Fn::GetAtt

- CertificateId: the ID of the certificate.
- Fingerprint: the fingerprint of the certificate.

Examples

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Parameters": {
  "CertificateType": {
   "Type": "String",
   "Description": "The type of the certificate.",
   "AllowedValues": [
    "Server",
    "CA"
   ],
   "Default": "Server"
  },
  "AliCloudCertificateName": {
   "Type": "String",
   "Description": "The name of the Alibaba Cloud certificate."
  },
  "PrivateKey": {
   "Type": "String",
   "Description": "The private key."
```

```
    },
    "CertificateName": {
      "Type": "String",
      "Description": "The name of the certificate."
    },
    "Certificate": {
      "Type": "String",
      "Description": "The content of the certificate public key."
    },
    "AliCloudCertificateId": {
      "Type": "String",
      "Description": "The ID of the Alibaba Cloud certificate."
    }
  },
  "Resources": {
    "Certificate": {
      "Type": "ALIYUN::SLB::Certificate",
      "Properties": {
        "CertificateType": {
          "Ref": "CertificateType"
        },
        "AliCloudCertificateName": {
          "Ref": "AliCloudCertificateName"
        },
        "PrivateKey": {
          "Ref": "PrivateKey"
        },
        "CertificateName": {
          "Ref": "CertificateName"
        },
        "Certificate": {
          "Ref": "Certificate"
        },
        "AliCloudCertificateId": {
          "Ref": "AliCloudCertificateId"
        }
      }
    }
  },
  "Outputs": {
    "Fingerprint": {
      "Description": "The fingerprint of the certificate.",
      "Value": {
        "Fn::GetAtt": [
          "Certificate",
          "Fingerprint"
        ]
      }
    },
    "CertificateId": {
      "Description": "The ID of the certificate.",
      "Value": {
        "Fn::GetAtt": [
          "Certificate",
          "CertificateId"
        ]
      }
    }
  }
}
```

5.5.6.5. ALIYUN::SLB::DomainExtension

ALIYUN::SLB::DomainExtension is used to create a domain extension for an SLB instance.

Statement

```
{
 "Type": "ALIYUN::SLB::DomainExtension",
 "Properties": {
  "Domain": String,
  "ListenerPort": Integer,
  "ServerCertificateId": String,
  "LoadBalancerId": String
 }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
Domain	String	No	No	The custom domain name.	None
ListenerPort	Integer	Yes	No	The frontend port used by the HTTPS listener of the SLB instance.	Valid values: 1 to 65535.
ServerCertificateId	String	No	Yes	The ID of the certificate corresponding to the domain name.	None
LoadBalancerId	String	No	No	The ID of the SLB instance.	None

Response parameters

Fn::GetAtt

- DomainExtensionId: the ID of the created domain extension.
- ListenerPort: The frontend port used by the SLB instance.

Sample request

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Resources": {
  "DomainExtension": {
   "Type": "ALIYUN::SLB::DomainExtension",
   "Properties": {
    "Domain": "*.example1.com",
    "ListenerPort": "443",
    "ServerCertificateId": "123157908552****_166f8204689_1714763408_70998****",
    "LoadBalancerId": "lb-bp1o94dp5i6earr9g****"
   }
  }
 },
 "Outputs": {
  "DomainExtensionId": {
   "Value": {
    "Fn::GetAtt": [
     "DomainExtension",
     "DomainExtensionId"
    ]
   }
  },
  "ListenerPort": {
   "Value": {
    "Fn::GetAtt": [
     "DomainExtension",
     "ListenerPort"
    ]
   }
  }
 }
}
```

5.5.6.6. ALIYUN::SLB::Listener

ALIYUN::SLB::Listener is used to create a listener for an SLB instance.

Statement

```
{
 "Type": "ALIYUN::SLB::Listener",
 "Properties": {
  "MasterSlaveServerGroupId": String,
  "AclStatus": String,
  "Protocol": String,
  "AclId": String,
  "ServerCertificateId": String,
  "HealthCheck": Map,
  "RequestTimeout": Integer,
  "IdleTimeout": Integer,
  "ListenerPort": Integer,
  "HttpConfig": Map,
  "Bandwidth": Integer,
  "AclType": String,
  "BackendServerPort": Integer,
  "Scheduler": String,
  "LoadBalancerId": String,
  "CACertificateId": String,
  "Persistence": Map,
  "VServerGroupId": String
 }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
MasterSlaveServerGroupId	String	Yes	Released	The ID of the active/standby server group.	None
AclStatus	String	Yes	Released	Specifies whether to enable access control on the listener.	Valid values: • on • off Default value: off.
AclId	String	Yes	Released	The ID of the access control list (ACL) to which the listener is bound. This parameter is required when the AclStatus parameter is set to on.	None
				The type of the ACL. Valid values: white and black. • white: specifies the ACL as a whitelist. Only	

Parameter	Type	Required	Editable	Description	Constraint
AclType	String	Yes	Released	requests from the IP addresses or CIDR blocks specified in the ACL are forwarded. Whitelists are applicable to scenarios where you want an application to only be accessed from specific IP addresses. Configuring a whitelist poses risks to your services. After a whitelist is configured, only the IP addresses specified in the whitelist are able to access the SLB listener. If a whitelist is enabled without any IP addresses specified, the SLB listener will not forward any requests. • black: specifies the ACL as a blacklist. Requests from the IP addresses or CIDR blocks specified in the ACL are not forwarded. Blacklists are applicable to scenarios where you want an application to only be denied access from specific IP addresses.	Valid values: • White • Black

Parameter	Type	Required	Editable	Description	Constraint
				If a blacklist is enabled without any IP addresses specified, the SLB listener will forward all requests. This parameter is required when the AclStatus parameter is set to on.	
Protocol	String	No	No	The Internet protocol over which the listener will forward requests.	Valid values: • http • https • tcp • udp
ListenerPort	Integer	Yes	No	The frontend port used by the SLB instance.	Valid values: 1 to 65535.

Parameter	Type	Required	Editable	Description	Constraint
Bandwidth	Integer	Yes	No	The peak bandwidth of the listener. Unit: Mbit/s.	• Valid values: -1 and 1 to 1000. • For an SLB instance that is connected to the Internet and billed by fixed bandwidth, this parameter cannot be set to -1, and the sum of peak bandwidth values assigned to different listeners cannot exceed the Bandwidth value specified when the SLB instance is created. For an SLB instance that is connected to the Internet and billed by traffic, this parameter can be set to -1. Unit: Mbit/s.
BackendServerPort	Integer	Yes	No	The backend port used by the SLB instance.	Valid values: 1 to 65535.
LoadBalancerId	String	No	No	The ID of the SLB instance.	None
HealthCheck	Map	Erased	Released	The health check settings of the listener.	None
Persistence	Map	Erased	Released	The persistence properties.	None

Parameter	Type	Required	Editable	Description	Constraint
Scheduler	String	Yes	Released	The algorithm used to direct traffic to individual servers.	Valid values: • wrr • wlc Default value: wrr
CACertificateId	String	Yes	Released	The ID of the CA certificate.	Only valid for. HTTPS
ServerCertificateId	String	Yes	Released	The ID of the server certificate.	This parameter is required and valid only for HTTPS listeners.
VServerGroupId	String	Yes	Released	The ID of the VServer group.	None
RequestTimeout	String	Optional	Released	The request timeout period. Unit: seconds.	Valid values: 1 to 180.
IdleTimeout	String	Optional	Released	The idle connection timeout period. Unit: seconds.	Valid values: 1 to 60.
HttpConfig	Map	Erased	Released	The HTTP configurations.	None

HealthCheck syntax

```
"HealthCheck": {
 "Domain": String,
 "Interval": Integer,
 "URI": String,
 "HttpCode": String,
 "HealthyThreshold": Integer,
 "Timeout": Integer,
 "UnhealthyThreshold": Integer,
 "Port": Integer
}
```

HealthCheck properties

Parameter	Type	Required	Editable	Description	Constraint

Parameter	Type	Required	Editable	Description	Constraint
Domain	String	Yes	Released	The domain name used for health checks.	• The value can be $_ip, a custom string, or an empty string. • A custom string must be 1 to 80 characters in length and can contain only letters, digits, hyphens (-), and periods (.). • When this parameter is set to $_ip or left empty, the SLB instance uses the private IP addresses of backend servers as the domain names for health checks.
Interval	String	Optional	Released	The time interval between consecutive health checks. Unit: seconds.	Valid values: 1 to 5. Unit: seconds.

Parameter	Type	Required	Editable	Description	Constraint
URI	String	Yes	Released	The URI used for health checks.	• The URI must be 1 to 80 characters in length • and can contain letters, digits, hyphens (-), forward slashes (/), periods (.), percent signs (%), question marks (?), number signs (#), and ampersands (&). It must start with a forward slash (/).
HttpCode	String	Yes	Released	The HTTP status code that indicates a positive health status of the backend servers.	• Valid values: http_2xx, http_3xx, http_4xx, and http_5xx. • Separate multiple HTTP status codes with commas (,). Default value: http_2xx
HealthyThreshold	String	Optional	Released	The threshold used to determine that the backend servers are healthy. This value indicates the number of consecutive successful health checks required before the health status of a backend server can be changed from fail to success.	Valid values: 1 to 10.

Parameter	Type	Required	Editable	Description	Constraint
Timeout	String	Optional	Released	The length of time to wait for the response from a health check. Unit: seconds.	Valid values: 1 to 50. **Notice** This parameter is valid only when its value is greater than or equal to that of the Interval parameter. Otherwise, this parameter will be overridden by the Interval value.
UnhealthyThreshold	String	Optional	Released	The threshold used to determine that the backend servers are unhealthy. This value indicates the number of consecutive failed health checks required before the health status of a backend server can be changed from success to fail.	Valid values: 1 to 10.
Port	String	Optional	Released	The port used for health checks.	Valid values: 0 to 65535.

Persistence syntax

```
"Persistence": {
 "PersistenceTimeout": Integer,
 "CookieTimeout": Integer,
 "XForwardedFor": String,
 "Cookie": String,
 "StickySession": String,
 "StickySessionType": String
}
```

Persistence properties

Parameter	Type	Required	Editable	Description	Constraint
StickySession	String	No	No	Specifies whether to enable session persistence.	Valid values: • on • off
PersistenceTimeout	String	Optional	Released	The maximum duration that the client can be connected to the server. Unit: seconds.	Valid values: 0 to 1000. The default value is 0, which indicates that connection persistence is disabled. Unit: seconds.
CookieTimeout	String	Optional	Released	The maximum duration the cookie can be retained before it expires. Unit: seconds.	This parameter is required when the StickySession parameter is set to on and the StickySessionType parameter is set to insert. Valid values: 1 to 86400. Unit: seconds.
XForwardedFor	String	Yes	Released	Specifies whether to use the X-Forwarded-For header field to obtain the real IP address of the client.	Valid values: • on • off Default value: on

Parameter	Type	Required	Editable	Description	Constraint
Cookie	String	Yes	Released	The cookie configured on the backend server.	• The parameter value must be 1 to 200 characters in length and follow the RFC 2965 standard. It can contain only ASCII characters. It cannot contain commas (,), semicolons (;), or spaces, and cannot start with a dollar sign ($). • This parameter is required when the StickySession parameter is set to on and the StickySessionType parameter is set to server.

Parameter	Type	Required	Editable	Description	Constraint
StickySessionType	String	Yes	Released	The method for processing cookies.	• Valid values: insert and server. • When this parameter is set to insert, SLB adds a cookie to the first response from the backend server. Then, the next request contains the cookie and the listener distributes the request to the same backend server. When this parameter is set to server, SLB overwrites the original cookie when a new cookie is set. The next time the client carries the new cookie to access SLB, the listener distributes the request to the previously recorded backend server. • This parameter is required when the StickySession parameter is set to on. This parameter is ignored when the StickySession parameter is set to off.

HttpConfig syntax

```
"HttpConfig": {
 "ForwardPort": Integer,
 "ListenerForward": String
}
```

HttpConfig properties

Parameter	Type	Required	Editable	Description	Constraint
ForwardPort	String	Optional	Released	The port used to redirect HTTP requests to HTTPS.	Valid values: 1 to 65535. Default value: 443.
ListenerForward	String	No	No	Specifies whether to enable HTTP-to-HTTPS redirection.	Valid values: • on • off Default value: off.

Response parameters

Fn::GetAtt

- LoadBalancerId: the unique ID of the SLB instance.
- ListenerPortsAndProtocol: an array consisting of the ports and protocols used by the SLB listener.

Sample request

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Resources": {
  "LoadBalancer": {
   "Type": "ALIYUN::SLB::LoadBalancer",
   "Properties": {
    "LoadBalancerName": "createdByHeat",
    "AddressType": "internet",
    "InternetChargeType": "paybybandwidth"
   }
  },
  "CreateListener": {
   "Type": "ALIYUN::SLB::Listener",
   "Properties": {
    "LoadBalancerId": {"Ref": "LoadBalancer"},
    "ListenerPort": "8094",
    "BackendServerPort": 8080,
    "Bandwidth": 1,
    "Protocol": "http",
    "HealthCheck": {
     "HealthyThreshold": 3,
     "UnhealthyThreshold": 3,
     "Interval": 2,
     "Timeout": 5,
     "HttpCode": "http_2xx,http_3xx,http_4xx,http_5xx"
    },
    "Scheduler": "wrr",
     "Persistence": {
     "PersistenceTimeout": 1,
     "XForwardedFor": "on",
     "StickySession": "on",
     "StickySessionType": "insert",
     "CookieTimeout": 10,
     "Cookie": "1"
    }
   }
  }
 },
 "Outputs": {
 "LoadBalanceDetails": {
   "Value": {"Fn::GetAtt": ["LoadBalancer", "LoadBalancerId"]}
 }
 }
}
```

5.5.6.7. ALIYUN::SLB::LoadBalancer

ALIYUN::SLB::LoadBalancer is used to create an SLB instance.

Statement

```
{
 "Type": "ALIYUN::SLB::LoadBalancer",
 "Properties": {
  "DeletionProtection": Boolean,
  "AddressType": String,
  "Tags": List,
  "InternetChargeType": String,
  "Bandwidth": Integer,
  "SlaveZoneId": String,
  "ResourceGroupId": String,
  "AutoPay": Boolean,
  "VpcId": String,
  "PricingCycle": String,
  "LoadBalancerName": String,
  "Duration": Number,
  "VSwitchId": String,
  "LoadBalancerSpec": String,
  "MasterZoneId": String,
  "PayType": String
 }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	Yes	Released	The ID of the resource group to which the RDS instance belongs.	None
DeletionProtection	Boolean	Erased	Released	Specifies whether to enable deletion protection to prevent the SLB instance from being deleted by mistake.	Valid values: • true • false
VpcId	String	Yes	Released	The ID of the VPC.	None
SlaveZoneId	String	Yes	Released	The ID of the secondary zone to which the SLB instance belongs.	None

Parameter	Type	Required	Editable	Description	Constraint
Bandwidth	String	Optional	Released	The peak bandwidth of SLB instances that are connected to the Internet and billed by fixed bandwidth.	For SLB instances that are connected to the Internet and billed by fixed Bandwidth, this parameter is valid only when the Bandwidth parameter of the SLB Listener is specified. For Internet instances whose billing type is to pay by traffic, we recommend that you set the peak Bandwidth through the Listener parameter. In this case, this parameter is ignored. Valid values: 1 to 1000. Unit: Mbps. Default value: 1 VPC-type instances are billed by traffic.
AddressType	String	Yes	Released	The address type of the SLB instance.	Valid values: • internet • intranet Default value: internet.
VSwitchId	String	Yes	Released	The ID of the vSwitch in the VPC.	None

Parameter	Type	Required	Editable	Description	Constraint
LoadBalancerName	String	Yes	Released	The name of the SLB instance to be created.	A custom string. The name must be 1 to 80 characters in length and can contain letters, digits, hyphens (-), forward slashes (/), periods (.), and underscores (_). If this parameter is not specified, the system assigns a value.
InternetChargeType	String	Yes	Released	The billing method of SLB instances that are connected to the Internet.	Valid values: • paybybandwidth • paybytraffic Default value: paybytraffic.
MasterZoneId	String	Yes	Released	The ID of the primary zone to which the SLB instance belongs.	None
Tags	List	Erased	Released	The tags to be attached to the SLB instance. The tags are listed in JSON format. Each tag consists of a TagKey and a TagValue.	A maximum of five tags can be attached to an SLB instance.
LoadBalancerSpec	String	Yes	Released	The type of the SLB instance.	Valid values: • slb.s1.small • slb.s2.small • slb.s2.medium • slb.s3.small • slb.s3.medium • slb.s3.large The available types vary by region.

Parameter	Type	Required	Editable	Description	Constraint
AutoPay	Boolean	Erased	Released	Specifies whether to automatically pay for subscription SLB instances that are connected to the Internet.	Valid values: • true • false Default value: false. **Note** This parameter is valid only on the China site (aliyun.com).
PayType	String	Yes	Released	The billing method of the SLB instance.	Valid values: • PayOnDemand • PrePay
PricingCycle	String	Yes	Released	The billing cycle of subscription SLB instances that are connected to the Internet.	Valid values: • month • year **Note** This parameter is valid only on the China site (aliyun.com).

Parameter	Type	Required	Editable	Description	Constraint
Duration	Number	Erased	Released	The subscription period of subscription SLB instances that are connected to the Internet.	Valid values: • Valid values when the PricingCycle parameter is set to month: 1 to 9. • Valid values when the PricingCycle parameter is set to year: 1 to 3. **Note** This parameter is valid only on the China site (aliyun.com).

Tags syntax

```
"Tags": [
 {
  "Value": String,
  "Key": String
 }
]
```

Tags properties

Property	Type	Required or Not	Editable	Description	Constraint
Key	String	No	No	None	None
Value	String	Yes	Released	None	Valid values: 1025 to 10000. You cannot use the following commonly used port numbers: 2222, 4500, 4510, 4560, 7505, 9000, 9001, and 9002.

Response parameters

Fn::GetAtt

- LoadBalancerId: the unique ID of the SLB instance.
- NetworkType: the network type of the SLB instance, which can be vpc or classic.

- AddressType: the address type of the SLB instance, which can be intranet or internet.
- IpAddress: the IP address of the SLB instance.
- OrderId: the ID of the order.

Sample request

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Resources": {
  "CreateLoadBalance": {
   "Type": "ALIYUN::SLB::LoadBalancer",
   "Properties": {
    "LoadBalancerName": "createdByHeat",
    "AddressType": "internet",
    "InternetChargeType": "paybybandwidth",
   }
  }
 },
 "Outputs": {
  "LoadBalanceDetails": {
   "Value": {
    "Fn::GetAtt": ["CreateLoadBalance", "LoadBalancerId"]}
  }
 }
}
```

5.5.6.8. ALIYUN::SLB::LoadBalancerClone

ALIYUN::SLB::LoadBalancerClone is used to clone an SLB instance.

Syntax

```
{
 "Type": "ALIYUN::SLB::LoadBalancerClone",
 "Properties": {
  "Tags": List,
  "ResourceGroupId": String,
  "VSwitchId": String,
  "LoadBalancerName": String,
  "SourceLoadBalancerId": String,
  "TagsPolicy": String,
  "BackendServersPolicy": String,
  "BackendServers": List
 }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	No	No	The ID of the resource group.	None

Property	Type	Required	Editable	Description	Constraint
VSwitchId	String	No	No	The ID of the VSwitch.	The VSwitch must exist in the VPC to which the source SLB instance belongs. If the parameter is not specified, the VSwitch to which the source SLB instance belongs is used.
SourceLoadBalancerId	String	Yes	No	The ID of the SLB instance to be cloned.	None

Property	Type	Required	Editable	Description	Constraint
BackendServersPolicy	String	No	No	The clone policy. The ECS instances listened by the new SLB instance and the weight of each ECS instance are specified in the policy.	Valid values: • clone: The ECS instances listened by the source SLB instance and the ECS instance weights are cloned to the new SLB instance. • empty: No ECS instances are attached to the new SLB instance. • append: The ECS instances listened by the source SLB instance and the ECS instance weights are cloned to the new SLB instance. New ECS instances with specified weights are also attached to the new SLB instance. • replace: New ECS instances with specified weights are attached to the new SLB instance. However, the ECS instances listened by the source SLB instance and the ECS instance weights are not cloned to the new SLB instance. Default value: clone.

Property	Type	Required	Editable	Description	Constraint
BackendServers	List	No	Yes	The new ECS instances to be listened.	None
LoadBalancerName	String	No	No	The name of the new SLB instance.	You can set the name to any string. The name must be 1 to 80 characters in length and can contain letters, digits, hyphens (-), forward slashes (/), periods (.), and underscores (_).
Tags	List	No	Yes	The tags of the SLB instance.	Tags must be specified as key-value pairs. A maximum of five tags can be specified.
TagsPolicy	String	No	No	The policy of the tags.	Valid values: • clone: The tags of the source SLB instance are used. • empty: No tags are configured. • append: The tags of the source SLB instance are reserved while new tags are added. • replace: The tags of the source SLB instance are deleted while new tags are added. Default value: empty.

BackendServers syntax

```
"BackendServers": [
 {
  "ServerId": String,
  "Weight": Integer
 }
]
```

BackendServers properties

Property	Type	Required	Editable	Description	Constraint
ServerId	String	Yes	Yes	The ID of the ECS instance.	The ECS instances must be in the running state.
Weight	Integer	Yes	Yes	The weight of the ECS instance to be attached to the SLB instance.	Valid values: 0 to 100. Default value: 100.

Response parameters

Fn::GetAtt

LoadBalancerId: the ID of the new SLB instance.

Examples

```
{
 "ROSTemplateFormatVersion" : "2015-09-01",
 "Resources" : {
  "CloneLoadBalance": {
   "Type": "ALIYUN::SLB::LoadBalancerClone",
   "Properties": {
    "SourceLoadBalancerId": "150ebed5f06-cn-beijing-btc-***",
    "LoadBalancerName": "rosnew",
    "BackendServersPolicy": "replace",
    "BackendServers": [
      {
        "ServerId": "i-25zsk****",
        "Weight": 20
      }
    ]
   }
  }
 },
 "Outputs": {
  "LoadBalanceDetails": {
     "Value" : {"Fn::GetAtt": ["CloneLoadBalance", "LoadBalancerId"]}
  }
 }
}
```

5.5.6.9. ALIYUN::SLB::MasterSlaveServerGroup

ALIYUN::SLB::MasterSlaveServerGroup is used to create a primary/secondary server group.

> **Notice** A primary/secondary server group contains only two ECS instances: a primary server and a secondary server.

Syntax

```
{
 "Type": "ALIYUN::SLB::MasterSlaveServerGroup",
 "Properties": {
  "MasterSlaveServerGroupName": String,
  "MasterSlaveBackendServers": List,
  "LoadBalancerId": String
 }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
MasterSlaveServerGroupName	String	No	No	The name of the primary/secondary server group.	None
MasterSlaveBackendServers	List	Yes	No	The list of backend servers in the primary/secondary server group.	A primary/secondary server group can contain a maximum of two backend servers. If you do not specify this parameter, an empty primary/secondary server group is created.
LoadBalancerId	String	Yes	No	The ID of the SLB instance.	None

MasterSlaveBackendServers syntax

```
"MasterSlaveBackendServers": [
 {
  "ServerId": String,
  "Port": Integer,
  "Weight": Integer,
  "ServerType": String
 }
]
```

MasterSlaveBackendServers properties

Property	Type	Required	Editable	Description	Constraint

Property	Type	Required	Editable	Description	Constraint
ServerId	String	Yes	No	The ID of the ECS instance or Elastic Network Interface (ENI) to be added.	None
ServerType	String	No	No	The type of the server.	Default value: Master. Valid values: • Master • Slave
Port	Integer	Yes	No	The port number used by the backend server.	Valid values: 1 to 65535.
Weight	Integer	Yes	No	The weight of the backend server.	Valid values: 0 to 100.

Response parameters

Fn::GetAtt

MasterSlaveServerGroupId: the ID of the primary/secondary server group.

Examples

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Resources": {
  "MasterSlaveServerGroup": {
   "Type": "ALIYUN::SLB::MasterSlaveServerGroup",
   "Properties": {
    "MasterSlaveServerGroupName": "Group1",
    "MasterSlaveBackendServers": [
     {
      "ServerId": "vm****",
      "Port": "80",
      "Weight": "100",
      "ServerType": "Master"
     },
     {
      "ServerId": "vm****",
      "Port": "90",
      "Weight": "100",
      "ServerType": "Slave"
     }
    ],
    "LoadBalancerId": "lb-bp1hv944r69al4j9j****"
   }
  }
 },
 "Outputs": {
  "MasterSlaveServerGroupId": {
   "Value": {
    "Fn::GetAtt": [
     "MasterSlaveServerGroup",
     "MasterSlaveServerGroupId"
    ]
   }
  }
 }
}
```

5.5.6.10. ALIYUN::SLB::Rule

ALIYUN::SLB::Rule is used to add forwarding rules for a specified HTTP or HTTPS listener.

Statement

```
{
 "Type": "ALIYUN::SLB::Rule",
 "Properties": {
  "ListenerPort": Integer,
  "RuleList": List,
  "LoadBalancerId": String
 }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
ListenerPort	Integer	Yes	No	The frontend listener port used by the SLB instance.	Valid values: 1 to 65,535.
RuleList	List	Yes	No	The list of forwarding rules to be added.	A maximum of 10 forwarding rules can be added at a time. Each forwarding rule contains the following parameters: RuleName, Domain, Url, and VServerGroupId. You must specify at least one of the following parameters: Domain and URL. The combination of Domain and URL must be unique in a listener.
LoadBalancerId	String	No	No	The IDs of SLB instances.	None

RuleList syntax

```
"RuleList": [
 {
  "Url": String,
  "Domain": String,
  "VServerGroupId": String,
  "RuleName": String
 }
]
```

RuleList properties

Parameter	Type	Required	Editable	Description	Constraint

Parameter	Type	Required	Editable	Description	Constraint
Url	String	Yes	Released	The request URL.	The name must be 1 to 80 characters in length and can contain letters, numbers, and special characters. -/. percent signs (%), question marks (?), #& .
Domain	String	Yes	Released	The request domain name associated with the forwarding rule.	None
VServerGroupId	String	No	No	The ID of the destination VServer group specified in the forwarding rule.	None
RuleName	String	No	No	The name of the forwarding rule.	The name must be 1 to 40 characters in length and can contain letters, numbers, and special characters. -/. _ . Forwarding rule names must be unique within each listener.

Response parameters

Fn::GetAtt

Rules: the list of forwarding rules.

Sample request

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Resources": {
  "Rule": {
   "Type": "ALIYUN::SLB::Rule",
   "Properties": {
    "ListenerPort": {
     "Ref": "ListenerPort"
    },
    "RuleList": {
     "Fn::Split": [",", {
      "Ref": "RuleList"
     }, {
      "Ref": "RuleList"
     }]
    },
    "LoadBalancerId": {
     "Ref": "LoadBalancerId"
    }
   }
  }
 },
 "Parameters": {
  "ListenerPort": {
   "Type": "Number",
   "Description": "The front-end HTTPS listener port of the Server Load Balancer instance. Valid value:\n1-65535",
   "MaxValue": 65535,
   "MinValue": 1
  },
  "RuleList": {
   "MinLength": 1,
   "Type": "CommaDelimitedList",
   "Description": "The forwarding rules to add.",
   "MaxLength": 10
  },
  "LoadBalancerId": {
   "Type": "String",
   "Description": "The ID of Server Load Balancer instance."
  }
 },
 "Outputs": {
  "Rules": {
   "Description": "A list of forwarding rules. Each element of rules contains \"RuleId\".",
   "Value": {
    "Fn::GetAtt": ["Rule", "Rules"]
   }
  }
 }
}
```

5.5.6.11. ALIYUN::SLB::VServerGroup

ALIYUN::SLB::VServerGroup is used to create a VServer group and adds backend servers to the SLB instance.

Syntax

```
{
  "Type" : "ALIYUN::SLB::VServerGroup",
  "Properties" : {
     "VServerGroupName" : String,
     "BackendServers" : List,
     "LoadBalancerId" : String
  }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
VServerGroupName	String	Yes	No	The name of the VServer group.	None
BackendServers	List	Yes	Yes	The list of ECS instances to be added.	A list can contain up to 20 instances.
LoadBalancerId	String	Yes	No	The ID of the SLB instance.	None

BackendServers syntax

```
"BackendServers" : [
  {
     "ServerId" : String,
     "Port" : Integer,
     "Weight" : Integer
  }
]
```

BackendServers properties

Property	Type	Required	Editable	Description	Constraint
ServerId	String	Yes	Yes	The ID of the ECS instance.	None
Port	Integer	Yes	Yes	The backend port used by the SLB instance.	Valid values: 1 to 65535.
Weight	Integer	Yes	Yes	The weight of the ECS instance to be attached to the SLB instance.	Valid values: 0 to 100.

Response parameters

Fn::GetAtt

- VServerGroupId: the ID of the VServer group.
- BackendServers: the list of backend servers added to the SLB instance

Examples

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "CreateVServerGroup": {
      "Type": "ALIYUN::SLB::VServerGroup",
      "Properties": {
        "LoadBalancerId": "lb-2zenh4ndwrqg14yt0****",
        "VServerGroupName": "VServerGroup-****",
        "BackendServers": [
          {
            "ServerId": "i-25zsk****",
            "Weight": 20,
            "Port": 8080
          },
          {
            "ServerId": "i-25zsk****",
            "Weight": 100,
            "Port": 8081
          }
        ]
      }
    }
  },
  "Outputs": {
    "VServerGroupId": {
      "Value" : {"Fn::GetAttr": ["CreateVServerGroup", "VServerGroupId"]
    }
   }
 }
}
```

5.5.7. VPC

5.5.7.1. ALIYUN::VPC::EIP

ALIYUN::VPC::EIP is used to apply for an Elastic IP address.

Statement

```
{
 "Type": "ALIYUN::VPC::EIP",
 "Properties": {
  "Isp": String,
  "Period": Number,
  "ResourceGroupId": String,
  "AutoPay": Boolean,
  "InstanceChargeType": String,
  "PricingCycle": String,
  "InternetChargeType": String,
  "Bandwidth": Number
 }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	Yes	Released	The ID of the resource group to which the RDS instance belongs.	None
Bandwidth	Number	Erased	Released	The network bandwidth. Unit: Mbit/s.	If this parameter is not specified, the default value 5Mbps is used.
InternetChargeType	String	Yes	Released	The billing method for network usage. Default value: PayByBandwidth.	Valid values: • PayByBandwidth: pay-by-bandwidth. • PayByTraffic Default value: PayByBandwidth.
InstanceChargeType	String	Yes	Released	The billing method of the Elastic IP address. Default value: Postpaid.	Valid values: • Prepaid • Postpaid: pay-as-you-go Default value: PostPaid.
PricingCycle	String	Yes	Released	The billing cycle of the subscription. Default value: Month.	Valid values: • Month: paid by month. • Year Default value: Month. **Note** This parameter is required when InstanceChargeType is set to Prepaid.
Period	Number	Erased	Released	The subscription period.	Valid values: • If pay by month is selected, the billing method can be a fee of 1 to 9. • If pay-as-you-go is selected, the payment can be in the range of 1 to 3. Default value: 1 **Note** This parameter is required when InstanceChargeType is set to Prepaid.

Parameter	Type	Required	Editable	Description	Constraint
AutoPay	Boolean	Erased	Released	Specifies whether to enable automatic payment.	Valid values: • false: Automatic payment is disabled. After an order is generated, you must go to the Order Center to make the payment. • true: Automatic payment is enabled. Payments are automatically made. Note This parameter is required when InstanceChargeType is set to Prepaid.
Isp	String	Yes	Released	The ISP tag used for Finance Cloud. This parameter takes effect only when your region is set to China (Hangzhou).	This parameter is ignored if you are not a Finance Cloud user.

Response parameters

Fn::GetAtt

- EipAddress: the allocated Elastic IP address.
- AllocationId: the ID of the instance that the Elastic IP address is allocated to.
- OrderId: The order ID that is returned when you set the InstanceChargeType parameter to Prepaid.

Sample request

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Resources": {
  "Eip": {
   "Type": "ALIYUN::VPC::EIP",
   "Properties": {
    "InternetChargeType": "PayByTraffic",
     "Bandwidth": 200
   }
  }
 },
 "Outputs": {
  "EipAddress": {
   "Value" : {"Fn::GetAtt": ["Eip", "EipAddress"]}
  },
  "AllocationId": {
   "Value" : {"Fn::GetAtt": ["Eip", "AllocationId"]}
  },
  "OrderId": {
   "Value" : {"Fn::GetAtt": ["Eip", "OrderId"]}
  }
 }
}
```

5.5.7.2. ALIYUN::VPC::EIPAssociation

ALIYUN::VPC::EIPAssociation is used to associate an Elastic IP address with a cloud service instance.

Statement

```
{
 "Type": "ALIYUN::VPC::EIPAssociation",
 "Properties": {
  "AllocationId": String,
  "InstanceId": String,
  "PrivateIpAddress": String,
  "Mode": String
 }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
AllocationId	String	No	Yes	The ID of the Elastic IP address.	None

Parameter	Type	Required	Editable	Description	Constraint
InstanceId	String	No	Yes	The ID of the cloud service instance.	The following instance types are supported: • VPC-connected ECS instances • VPC-connected SLB instances • NAT gateways • HAVIP • Elastic network interfaces
PrivateIpAddress	String	Yes	True	The private IP address in the CIDR block of the VSwitch.	None
Mode	String	Yes	True	The association mode.	Valid values: • NAT • MULTI_BINDED

Response parameters

Fn::GetAtt

- EipAddress: The allocated Elastic IP address.
- AllocationId: The ID of the instance to which the Elastic IP address is allocated.

Examples

`JSON` format

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Resources": {
  "Eip": {
   "Type": "ALIYUN::VPC::EIP",
   "Properties": {
    "InternetChargeType": "PayByTraffic",
     "Bandwidth": 200
   }
  },
  "EipAssociation": {
   "Type": "ALIYUN::VPC::EIPAssociation",
   "Properties": {
    "InstanceId": "<LoadBalancerId>",
    "InstanceType": "EcsInstance",
    "AllocationId": {
     "Fn::GetAtt": ["Eip", "AllocationId"]
    }
   }
  }
 },
 "Outputs": {
  "EipAddress": {
   "Value" : {"Fn::GetAtt": ["EipAssociation", "EipAddress"]}
  },
  "AllocationId": {
   "Value" : {"Fn::GetAtt": ["EipAssociation", "AllocationId"]}
  }
 }
}
```

`YAML` format

```
ROSTemplateFormatVersion: '2015-09-01'
Resources:
 Eip:
  Type: ALIYUN::VPC::EIP
  Properties:
   InternetChargeType: PayByTraffic
   Bandwidth: 200
 EipAssociation:
  Type: ALIYUN::VPC::EIPAssociation
  Properties:
   InstanceId: "<LoadBalancerId>"
   InstanceType: EcsInstance
   AllocationId:
    Fn::GetAtt:
    - Eip
    - AllocationId
Outputs:
 EipAddress:
  Value:
   Fn::GetAtt:
   - EipAssociation
   - EipAddress
 AllocationId:
  Value:
   Fn::GetAtt:
   - EipAssociation
   - AllocationId
```

5.5.7.3. ALIYUN::VPC::PeeringRouterInterfaceBinding

ALIYUN::VPC::PeeringRouterInterfaceBinding is used to associate two router interfaces to be interconnected.

Statement

```
{
 "Type": "ALIYUN::VPC::PeeringRouterInterfaceBinding",
 "Properties": {
  "OppositeRouterId": String,
  "OppositeInterfaceId": String,
  "OppositeInterfaceOwnerId": String,
  "RouterInterfaceId": String
 }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
RouterInterfaceId	String	No	No	The ID of the router interface.	None
OppositeInterfaceId	String	No	No	The ID of the peer router interface.	None

Parameter	Type	Required	Editable	Description	Constraint
OppositeRouterId	String	Yes	Released	The ID of the router to which the peer router interface belongs.	None
OppositeInterfaceOwnerId	String	Yes	Released	The ID of the owner of the peer router interface.	None

Response parameters

Fn::GetAtt

RouterInterfaceId: the ID of the vRouter.

Sample request

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Resources": {
  "InitiatorRouterInterfaceBinding": {
   "Type": "ALIYUN::VPC::PeeringRouterInterfaceBinding",
   "Properties": {
    "RouterInterfaceId": "ri-2zedgo0ih64g1me29****",
    "OppositeInterfaceId": "ri-2zex1tkyym98pjaor****",
    "OppositeRouterId": "vrt-2zexb35tzoriu0286****"
   }
  }
 }
}
```

5.5.7.4. ALIYUN::VPC::PeeringRouterInterfaceConnection

ALIYUN::VPC::PeeringRouterInterfaceConnection is used to initiate a router interface connection.

Statement

```
{
 "Type": "ALIYUN::VPC::PeeringRouterInterfaceConnection",
 "Properties": {
  "OppositeInterfaceId": String,
  "RouterInterfaceId": String
 }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
OppositeInterfaceId	String	No	No	The ID of the acceptor router interface.	None

Parameter	Type	Required	Editable	Description	Constraint
RouterInterfaceId	String	No	No	The ID of the router interface to initiate the connection.	None

Response parameters

Fn::GetAtt

- OppositeInterfaceId: the ID of the acceptor router interface.
- RouterInterfaceId: the ID of the router interface that initiates the connection.

Sample request

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Resources": {
  "InitiatorRouterInterfaceBinding": {
   "Type": "ALIYUN::VPC::PeeringRouterInterfaceConnection",
   "Properties": {
    "RouterInterfaceId": "ri-2zedgo0ih64g1me29****",
    "OppositeInterfaceId": "ri-2ze4k5n2aeardu8cy****"
   }
  }
 }
}
```

5.5.7.5. ALIYUN::VPC::RouterInterface

ALIYUN::VPC::RouterInterface is used to create a router interface.

Syntax

```
{
 "Type": "ALIYUN::VPC::RouterInterface",
 "Properties": {
  "OppositeRegionId": String,
  "Description": String,
  "HealthCheckSourceIp": String,
  "RouterType": String,
  "AccessPointId": String,
  "RouterId": String,
  "Role": String,
  "OppositeInterfaceOwnerId": String,
  "OppositeAccessPointId": String,
  "HealthCheckTargetIp": String,
  "OppositeRouterId": String,
  "Spec": String,
  "OppositeRouterType": String,
  "Name": String,
  "PricingCycle": String,
  "Period": Number,
  "AutoPay": Boolean,
  "InstanceChargeType": String
 }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
RouterId	String	Yes	No	The ID of the router	None
Role	String	Yes	No	The role of the router interface.	• When RouterType is set to VBR, set the value to InitiatingSide. • When OppositeRouterType is set to VBR, set the value to AcceptingSide.
RouterType	String	No	No	The type of the router to which the router interface belongs.	Valid values: • VRouter • VBR
AccessPointId	String	No	No	The ID of the access point of the router interface.	• This parameter is required when RouterType is set to VBR. The access point ID cannot be modified after the router interface is created. • This parameter is not required when RouterType is set to VRouter.

Property	Type	Required	Editable	Description	Constraint
Spec	String	No	No	The specifications of the router interface.	The following list includes available specifications and the corresponding bandwidth values: • Mini.2: 2 Mbit/s • Mini.5: 5 Mbit/s • Small.1: 10 Mbit/s • Small.2: 20 Mbit/s • Small.5: 50 Mbit/s • Middle.1: 100 Mbit/s • Middle.2: 200 Mbit/s • Middle.5: 500 Mbit/s • Large.1: 1,000 Mbit/s • Large.2: 2,000 Mbit/s • Large.5: 5,000 Mbit/s • Xlarge.1: 10,000 Mbit/s Note • This parameter is required when Role is set to InitiatingSide. • The value Negative is used by default when Role is set to Accepting Side.
OppositeRegionId	String	No	No	The region ID of the peer router interface.	None
OppositeInterfaceOwnerId	String	No	No	The ID of the owner of the peer router interface.	The default value is the ID of the current user.
OppositeRouterId	String	No	No	The ID of the router to which the peer router interface belongs.	None

Property	Type	Required	Editable	Description	Constraint
OppositeRouterType	String	No	No	The type of the router to which the peer router interface belongs.	Valid values: • When RouterType is set to VBR, set the value to VRouter. • VBR
OppositeAccessPointId	String	No	No	The ID of the access point of the peer router interface.	• When OppositeRouterType is set to VBR, this parameter is required . The access point ID cannot be modified after the router interface is created. • When OppositeRouterType is set to VRouter, this parameter is not required. • When OppositeRouterType is set to VBR, the VBR specified by the OppositeRouterId parameter must be in the access point specified by the OppositeAccessPointId parameter.
Description	String	No	No	The description of the router interface.	The description must be 2 to 256 characters in length. It cannot start with `http://` or `https://` . The parameter is empty by default.
Name	String	No	No	The display name of the router interface.	• The name must be 2 to 128 characters in length and can contain letters, digits, periods(.), underscores (_), and hyphens (-). • It must start with a letter but cannot start with `http://` or `https://` .

Property	Type	Required	Editable	Description	Constraint
HealthCheckSourceIp	String	No	No	The source IP address of health check packets used in leased line disaster recovery and ECMP scenarios.	This parameter is valid only for VRouter interfaces with a peer router interface on a VBR. It must be an unused IP address in the VPC where the local VRouter is located. The HealthCheckSourceIp and HealthCheckTargetIp parameters must either both be specified or both left unspecified.
HealthCheckTargetIp	String	No	No	The destination IP address of health check packets used in leased line disaster recovery and ECMP scenarios.	This parameter is valid only for VRouter interfaces with a peer router interface on a VBR. Typically, you can use the IP address of a customer premises equipment (CPE) on the user side of the leased line, which is the IP address of the peer gateway on the VBR where the peer router interface is located. You can also specify another IP address on the user side of the leased line as the destination IP address. The HealthCheckSourceIp and HealthCheckTargetIp parameters must either both be specified or both left unspecified.

Property	Type	Required	Editable	Description	Constraint
PricingCycle	String	No	No	The billing cycle of the subscription.	Valid values: • Month • Year
Period	Number	No	No	The subscription duration.	• Valid values when the PricingCycle parameter is set to Month: 1 to 9. • Valid values when the PricingCycle parameter is set to Year: 1 to 3.
AutoPay	Boolean	No	No	Specifies whether to enable automatic payment.	Default value: false. Valid values: • true • false
InstanceChargeType	String	No	No	The billing method of the instance.	Valid values: • Postpaid: pay-as-you-go • Prepaid: subscription

Response parameters

Fn::GetAtt

RouterInterfaceId: the ID of the router interface.

Examples

```
{
 "ROSTemplateFormatVersion": "2015-09-01",
 "Resources": {
  "RouterInterface": {
   "Type": "ALIYUN::VPC::RouterInterface",
   "Properties": {
    "Name": "RouterInterface_1",
    "Description": "VPC initiator RouterInterface",
    "RouterId": "vrt-2ze2i147e5n0bicoe****",
    "Role": "AcceptingSide",
    "OppositeRegionId": "cn-beijing",
    "HealthCheckSourceIp": "10.0.XX.XX",
    "HealthCheckTargetIp": "192.168.XX.XX"
   }
  }
 },
 "Outputs": {
  "RouterInterfaceId": {
   "Value": {"Fn::GetAtt": ["RouterInterface", "RouterInterfaceId"]}
  }
 }
}
```

6.Object Storage Service (OSS)

6.1. What is OSS?

Object Storage Service (OSS) is a secure, cost-effective, and highly reliable cloud storage service provided by Alibaba Cloud. It enables you to store a large amount of data in the cloud.

Compared with user-created server storage, OSS has outstanding advantages in reliability, security, cost-effectiveness, and data processing capabilities. OSS enables you to store and retrieve a variety of unstructured data objects, such as text, images, audios, and videos over the network at any time.

OSS is an object storage service based on key-value pairs. Files uploaded to OSS are stored as objects in buckets. You can obtain the content of an object based on the object key.

In OSS, you can perform the following operations:

- Create a bucket and upload objects to the bucket.
- Obtain an object URL from OSS to share or download the object.
- Modify the attributes or metadata of a bucket or an object. You can also configure the ACL of the bucket or the object.
- Perform basic and advanced operations in the OSS console.
- Perform basic and advanced operations by using OSS SDKs or calling RESTful API operations in your application.

6.2. Usage notes

Before you use OSS, you must understand the following content:

To allow other users to use all or part of OSS features, you must create RAM users and grant permissions to the users by configuring RAM policies.

Before you use OSS, you must also understand the following limits.

Item	Limit
Bucket	• You can create up to 100 buckets. • After a bucket is created, its name and region cannot be modified.
Upload objects	• Objects larger than 5 GB cannot be uploaded by using the following modes: console upload, simple upload, form upload, or append upload. To upload an object that is larger than 5 GB, you must use multipart upload. The size of an object uploaded by using multipart upload cannot exceed 48.8 TB. • If you upload an object that has the same name of an existing object in OSS, the new object will overwrite the existing object.
Delete objects	• Deleted objects cannot be recovered. • You can delete up to 100 objects at a time in the OSS console. To delete more than 100 objects at a time, you must call an API operation or use an SDK.
Lifecycle	You can configure up to 1,000 lifecycle rules for each bucket.

6.3. Quick start

6.3.1. Log on to the OSS console

This topic describes how to log on to the OSS console.

Prerequisites

- The URL of the Apsara Uni-manager Management Console is obtained from the deployment personnel before you log on to the Apsara Uni-manager Management Console.
- We recommend that you use Google Chrome.

Procedure

1. In the address bar, enter the URL used to access the Apsara Uni-manager Management Console. Press Enter.
2. Enter your username and password.

   Obtain the username and password that you can use to log on to the console from the operations administrator.

   > **Note** When you log on to the Apsara Uni-manager Management Console for the first time, you must change the password of your username. Your password must meet complexity requirements. The password must be 8 to 20 characters in length and must contain at least two of the following character types:
   >
   > - Uppercase or lowercase letters
   > - Digits
   > - Special characters, which include ! @ # $ %

3. Click **Login** to go to the Apsara Uni-manager Management Console.
4. In the top navigation bar, choose **Products > Object Storage Service**.

6.3.2. Create buckets

Objects uploaded to OSS are stored in a bucket. You must create a bucket before you upload objects to OSS.

Procedure

1. Log on to the OSS console.
2. In the left-side navigation pane, click **Buckets**. On the Buckets page, click **Create Bucket**.
3. On the **Create OSS Bucket** page, configure parameters.

   The following table describes the parameters that you can configure.

Parameter	Description
Organization	Select an organization from the drop-down list for the bucket.
Resource Set	Select a resource set from the drop-down list for the bucket.

Parameter	Description
Region	Select a region from the drop-down list for the bucket. **Note** ◦ The region of a bucket cannot be changed after the bucket is created. ◦ If you want to access OSS from your ECS instance through the internal network, select the same region where your ECS instance is deployed.
Cluster	Select a cluster for the bucket.
Bucket Name	Enter the name of the bucket. **Note** ◦ The bucket name must comply with the naming conventions. ◦ The bucket name must be globally unique among all existing buckets in OSS. ◦ The bucket name cannot be changed after the bucket is created.
Storage Class	Set the value to **Standard**. Only Standard is supported.
Bucket Capacity	Specify the capacity of the bucket. Valid values: 0 to 2000000. Unit: TB or GB.
Access Control List (ACL)	Set the ACL of the bucket. You can select the following options: ◦ **Private**: Only the owner or authorized users of this bucket can read and write objects in the bucket. Other users, including anonymous users cannot access objects in the bucket without authorization. ◦ **Public Read**: Only the owner or authorized users of this bucket can read and write objects in the bucket. Other users, including anonymous users can only read objects in the bucket. ◦ **Public Read/Write**: All users, including anonymous users can read and write objects in the bucket. Fees incurred by such operations are paid by the owner of the bucket. Exercise caution when you configure this option. **Note** You can modify the ACL of a bucket after the bucket is created. For more information, see Modify bucket ACLs.
Server-Side Encryption	Configure server-side encryption for the bucket. You can select the following options: ◦ **None**: Server-side encryption is not performed. ◦ **AES256**: AES256 is used to encrypt each object in the bucket using different data keys. Customer master keys (CMKs) used to encrypt the data keys are rotated regularly. ◦ **KMS**: CMKs managed by KMS are sued to encrypt objects in the bucket.
Encryption Algorithm	You can configure this parameter when you select **KMS** for **Server-Side Encryption**.

Parameter	Description
Key ID	You can configure this parameter when you select **KMS** for **Server-Side encryption**. OSS uses the specified CMK to encrypt objects in the bucket. **Note** To select a CMK ID for server-side encryption, you must create the CMK in the KMS console.

4. Click **Submit**.

6.3.3. Upload objects

After you create a bucket, you can upload objects to it.

Prerequisites

A bucket is created. For more information about how to create a bucket, see Create buckets.

Context

You can upload an object of any format to a bucket. You can use the OSS console to upload an object up to 5 GB in size. To upload an object larger than 5 GB, use OSS SDKs or call an API operation.

Procedure

1. Log on to the OSS console.
2. In the left-side navigation pane, click **Buckets**. On the Buckets page, click the name of the bucket to which you want to upload objects.
3. On the bucket details page, click the **Files** tab.
4. Click **Upload**.
5. In the **Upload** panel, set the parameters described in the following table.

Parameter	Description
Upload To	Set the folder to which objects are uploaded. ○ **Current**: Objects are uploaded to the current folder. ○ **Specified**: Objects are uploaded to the specified folder. You must enter a folder name. If the specified folder does not exist, OSS automatically creates the specified folder and uploads the object to the folder.
File ACL	Set the ACL of the object to upload. Default value: **Inherited from Bucket**. ○ **Inherited from Bucket**: The ACL of uploaded objects is the same as that of the bucket. ○ **Private**: Only the owner or authorized users can read and write objects in the bucket. Other users, including anonymous users cannot access the objects in the bucket without authorization. ○ **Public Read**: Only the bucket owner can perform write operations on objects in the bucket. Other users, including anonymous users, can perform only read operations on objects in the bucket. ○ **Public Read/Write**: All users, including anonymous users, can read and write objects in the bucket.

Parameter	Description
Upload	Drag one or more objects to upload to this section, or click **Upload** to select one or more objects to upload. **Notice** ◦ When the uploaded object has the same name as an existing object in the bucket, the existing object is overwritten. ◦ If you upload a folder, only the files in the folder are uploaded and stored in the same folder in the bucket. ◦ The name of an uploaded object must comply with the following conventions: ▪ The name can contain only UTF-8 characters. ▪ The name is case-sensitive. ▪ The name must be 1 to 1,023 bytes in length. ▪ The name cannot start with a forward slash (/) or backslash (\).

6. In the **Upload Tasks** panel, wait until the upload task is complete.

   Do not refresh or close the **Upload Tasks** panel when objects are being uploaded. Otherwise, the upload tasks are interrupted.

6.3.4. Obtain object URLs

You can obtain the URL of an uploaded object and share the URL with other users to preview or download the object.

Prerequisites

An object is uploaded to the bucket. For more information, see Upload objects.

Procedure

1. Log on to the OSS console.
2. In the left-side navigation pane, click **Buckets**. On the Buckets page, click the name of the bucket in which the object whose URL you want to obtain is stored.
3. Click the **Files** tab.
4. Click the name of the object whose URL you want to obtain. In the **View Details** panel, click **Copy File URL**.

6.4. Buckets

6.4.1. View bucket information

You can view the detailed information about the created buckets in the OSS console.

Prerequisites

A bucket is created. For more information about how to create a bucket, see Create buckets.

Procedure

1. Log on to the OSS console.
2. In the left-side navigation pane, click **Buckets**. On the Buckets page, click the name of the bucket that you

want to view.

3. On the **Overview** tab, you can view the information about the bucket, including the organization, resource set, endpoints, and basic settings.

6.4.2. Delete a bucket

You can delete a bucket in the OSS console.

Prerequisites

All objects and parts in the bucket are deleted. For more information, see Delete objects and Manage parts.

> **Warning** Deleted objects, parts, and buckets cannot be recovered. Exercise caution when you delete objects, parts, and buckets.

Procedure

1. Log on to the OSS console.
2. In the left-side navigation pane, click **Buckets**. On the Buckets page, click the name of the bucket that you want to delete.
3. On the bucket details page that appears, click **Delete Bucket** in the upper right corner. In the message that appears, click **OK**.

6.4.3. Modify bucket ACLs

OSS provides access control list (ACL) to control access to buckets. By default, the ACL of bucket is private. You can modify the ACL of the bucket after it is created.

Prerequisites

A bucket is created. For more information about how to create a bucket, see Create buckets.

Context

You can set the ACL of a bucket to one of the following values:

- Private: Only the owner or authorized users of this bucket can read and write objects in the bucket. Other users, including anonymous users cannot access the objects in the bucket without authorization.
- Public Read: Only the owner or authorized users of this bucket can write objects in the bucket. Other users, including anonymous users can only read objects in the bucket.
- Public Read/Write: Any users, including anonymous users can read and write objects in the bucket.

> **Warning** If you set the ACL of a bucket to Public Read or Public Read/Write, other users can read the data in the bucket without authentication, which results in security risks. To ensure the security of your data, we recommend that you configure the ACL of your bucket to private.

Procedure

1. Log on to the OSS console.
2. In the left-side navigation pane, click **Buckets**. On the Buckets page, click the name of the bucket for which you want to modify the ACL.
3. Click the **Basic Settings** tab. Find the **Access Control List (ACL)** section.
4. Click **Configure**. Modify the bucket ACL.
5. Click **Save**.

6.4.4. Configure static website hosting

You can configure static website hosting for a bucket in the OSS console so that users can access the website by using the domain name of the bucket.

Prerequisites

A bucket is created. For more information about how to create a bucket, see Create buckets.

Procedure

1. Log on to the OSS console.
2. In the left-side navigation pane, click **Buckets**. On the Buckets page, click the name of the bucket for which you want to configure static website hosting.
3. Click the **Basic Settings** tab. Find the **Static Pages** section.
4. Click **Configure** and then set the parameters described in the following table.

Parameter	Description
Default Homepage	Specify an index page that functions similar to index.html. Only HTML objects can be set to the index page. Static website hosting is disabled if you do not specify this parameter. ◦ If Subfolder Homepage is disabled, you must make sure that the index object exists in the root folder and is readable. ◦ If Subfolder Homepage is enabled, you must make sure that the index object exists in both the root folder and the subfolder and the index object is readable. **Note** You can specify only one index object for Default Homepage. If you enable Subfolder Homepage, the index object for the subfolder homepage must have the same name as that for the root folder homepage. However, the content of the index objects can be different.
Default 404 Page	Set the default 404 page that is displayed when the requested resource does not exist. Only the HTML, JPG, PNG, BMP, or WebP object in the root folder can be set to the default 404 page. Default 404 Page is disabled if you do not specify this parameter.
Subfolder Homepage	Specify whether to enable the subfolder homepage feature. ◦ **Disable**: disables Subfolder Homepage. The default homepage of the root folder is displayed if you access the root domain name of a static website or any URL that ends with a forward slash (/) under this domain name. ◦ **Enable**: enables Subfolder Homepage. When you access the root domain name of a static website, the default homepage of the root folder is displayed. When you access a URL ending with a forward slash (/), the default homepage of the corresponding folder is displayed. For example, when you access the URL test.oss-cn-hangzhou.aliyuncs.com/subdir/, the default homepage of the subfolder is displayed if the index object exists in the *subdir/* folder.

Parameter	Description
Subfolder 404 Rule	This parameter is available if you enable Subfolder Homepage. You can configure this parameter to specify the result to return when you access an object whose name does not end with a forward slash (/) and the object does not exist. For example, if *subdir* does not exist when you access test.oss-cn-hangzhou.aliyuncs.com/subdir, the following rules apply: ○ **Redirect**: the default rule that checks whether *subdir/index object* exists. ■ If the index object exists, HTTP status code 302 is returned with the Location header that specifies `test.oss-cn-hangzhou.aliyuncs.com/subdir/`. ■ If the index object does not exist, the default 404 page is returned. If the default 404 page does not exist, HTTP status code 404 is returned. ○ **NoSuckKey**: returns the default 404 page. If the default 404 page does not exist, HTTP status code 404 is returned. ○ **Index**: the rule that checks whether *subdir/index document* exists. ■ If the index document exists, the content of the index document is directly returned. ■ If the index document does not exist, the default 404 page is returned. If the default 404 page does not exist, HTTP status code 404 is returned.

5. Click **Save**.

6.4.5. Configure hotlink protection

You can configure hotlink protection for a bucket in the OSS console to prevent data in your bucket from being accessed by unauthorized domain names.

Prerequisites

A bucket is created. For more information about how to create a bucket, see Create buckets.

Context

The hotlink protection feature allows you to configure a Referer whitelist for a bucket. This way, only requests from domain names included in the Referer whitelist can access data in the bucket. OSS allows you to configure Referer whitelists based on the Referer header field in HTTP and HTTPS requests.

After hotlink protection is configured for a bucket, OSS verifies requests to objects in the bucket only when the requests are initiated from signed URLs or anonymous users. Requests that contain the Authorization field in the header are not verified.

Procedure

1. Log on to the OSS console.
2. In the left-side navigation pane, click **Buckets**. On the Buckets page, click the name of the bucket for which you want to configure hotlink protection.
3. Click the **Basic Settings** tab. Find the **Hotlink Protection** section.
4. Click **Configure**. Configure the parameters.
   - Enter domain names or IP addresses in the **Referer Whitelist** field. Separate multiple Referers by using line feed. You can use asterisks (*) and question marks (?) as wildcards. Example:
     - If you add www.example.com to the Referer whitelist, requests sent from URLs that start with *www.example.com*, such as *www.example.com/123* and *www.example.com.cn* are allowed.
     - If you add *www.example.com/ to the Referer whitelist, requests sent from *http://www.example.com/* and *https://www.example.com/* are allowed.

- An asterisk (*) can be used as a wildcard to indicate zero or more characters. For example, if you add *.example.com to the Referer whitelist, requests sent from URLs such as *help.example.com* and *www.example.com* are allowed.
- A question mark (?) can be used as a wildcard to indicate a single character. For example, if you add example?.com to the Referer whitelist, requests sent from URLs such as *examplea.com* and *exampleb.com* are allowed.
- You can add domain names or IP addresses that include a port number, such as *www.example.com:8080* and *10.10.10.10:8080*, to the Referer whitelist.

- Select whether to turn on **Allow Empty Referer** to allow requests in which the Referer field is empty.

  An HTTP or HTTPS request that contains an empty Referer indicates that the request does not contain the Referer field or the value of the Referer field is empty.

  If you do not allow empty Referers fields, only HTTP or HTTPS requests which include an allowed Referer field can access the objects in the bucket.

> **Note** By default, if you use the bucket endpoint to preview an MP4 object, the browser sends a request that contains the Referer field and a request that does not contain the Referer field at the same time. Therefore, you must not only add the bucket endpoint to the Referer whitelist but also allow empty Referer fields. To use the bucket endpoint to preview an object of other formats, you need only to allow empty Referer fields.

5. Click **Save**.

6.4.6. Configure logging

When you access OSS, a large number of access logs are generated. You can use the logging feature to store OSS access logs in a specified bucket.

Prerequisites

A bucket is created. For more information about how to create a bucket, see Create buckets.

Procedure

1. Log on to the OSS console.
2. In the left-side navigation pane, click **Buckets**. On the Buckets page, click the name of the bucket for which you want to configure logging.
3. Click the **Basic Settings** tab. Find the **Logging** section.
4. Click **Configure**. Turn on the **Logging** switch. Select **Destination Bucket** and set **Log Prefix**.
   - **Destination Bucket**: Select the name of the bucket used to store access logs from the drop-down list. You must be the owner of the selected bucket, and the bucket must be in the same region as the bucket for which logging is enabled.
   - **Log Prefix**: Enter the prefix and folder where the access logs are stored. If you specify *log/<TargetPrefix>* as the prefix, access logs are stored in the *log/* directory.
5. Click **Save**.

6.4.7. Configure CORS

You can configure cross-origin resource sharing (CORS) in the OSS console to enable cross-origin access.

Prerequisites

A bucket is created. For more information about how to create a bucket, see Create buckets.

Context

OSS provides CORS over HTML5 to implement cross-origin access. When OSS receives a cross-origin request (or an OPTIONS request) for a bucket, OSS reads the CORS rules of the bucket and checks the relevant permissions. OSS matches the request with the rules one by one. When OSS finds the first match, OSS returns a corresponding header in the response. If no match is found, OSS does not include any CORS header in the response.

Procedure

1. Log on to the OSS console.
2. In the left-side navigation pane, click **Buckets**. On the Buckets page, click the name of the bucket for which you want to configure CORS.
3. Click the **Basic Settings** tab. In the **Cross-Origin Resource Sharing (CORS)** section, click **Configure**.
4. Click **Create Rule**. In the **Create Rule** panel, configure the parameters described in the following table.

Parameter	Required	Description
Sources	Yes	Specifies the sources from which you want to allow cross-origin requests. Note the following rules when you configure the sources: ◦ You can configure multiple rules for sources. Separate multiple rules with line feeds. ◦ The domain names must include the protocol name, such as HTTP or HTTPS. ◦ Asterisks (*) are supported as wildcards. Each rule can contain up to one asterisk (*). ◦ A domain name must contain the port number if the domain name does not use the default port. Example: https://www.example.com:8080. The following examples show how to configure domain names: ◦ To match a specified domain name, enter the full domain name. Example: https://www.example.com:8080. ◦ Use an asterisk (*) as a wildcard in the domain name to match second-level domains. Example: https://*.example.com. ◦ Enter only an asterisk (*) as the wildcard to match all domain names.
Allowed Methods	Yes	Specifies the cross-origin request methods that are allowed.
Allowed Headers	No	Specifies the response headers for the allowed cross-origin requests. Take note of the following rules when you configure the allowed headers: ◦ This parameter is in the key:value format and case-insensitive. Example: content-type:text/plain. ◦ You can configure multiple rules for allowed headers. Separate multiple rules with new lines. ◦ Each rule can contain up to one asterisk (*) as the wildcard. Set this parameter to an asterisk (*) if you do not have special requirements.

Parameter	Required	Description
Exposed Headers	No	Specifies the response headers for allowed access requests from applications, such as an XMLHttpRequest object in JavaScript. Exposed headers cannot contain asterisks (*).
Cache Timeout (Seconds)	No	Specifies the time the browser can cache the response to a preflight (OPTIONS) request to a specific resource.

> **Note** You can configure up to 10 rules for each bucket.

5. Click **OK**.

6.4.8. Configure lifecycle rules

You can configure lifecycle rules for a bucket and manage the rules in the OSS console.

Prerequisites

A bucket is created. For more information, see Create buckets.

Context

Take note of the following items when you configure lifecycle rules for a bucket:

- After a lifecycle rule is configured, it is loaded within 24 hours and takes effect within 24 hours after it is loaded. Check the configurations of a rule before you save the rule.
- Objects that are deleted based on lifecycle rules cannot be recovered. Configure lifecycle rules based on your requirements.
- You can configure up to 100 lifecycle rules in the OSS console. To configure more than 100 rules, use ossutil or OSS SDKs.

Procedure

1. Log on to the OSS console.
2. In the left-side navigation pane, click **Buckets**. On the Buckets page, click the name of the bucket for which you want to configure lifecycle rules.
3. Click the **Basic Settings** tab. Find the **Lifecycle** section. Click **Configure**.
4. Click **Create Rule**. In the **Create Rule** panel, configure the parameters described in the following table.

Parameter	Description
Basic Settings	
Status	Specify the status of the lifecycle rule. Valid values: **Enabled** and **Disabled**.
Applied To	Select policies used to match objects with the rule. You can select **Files with Specified Prefix** or **Whole Bucket**. Files with Specified Prefix indicates that this rule applies to objects whose names contain a specified prefix. Whole Bucket indicates that this rule applies to all objects in the bucket. **Note** If you select **Files with Specified Prefix**, you can configure multiple lifecycle rules for objects whose names contain different prefixes. If you select **Whole Bucket**, only one lifecycle rule can be configured for the bucket.

Parameter	Description
Prefix	If you set **Applied To** to **Files with Specified Prefix**, you must specify the prefix of the objects to which the rule applies. For example, if you want the rule applies to objects whose names start with img, enter *img*.
Tagging	Select tagging and configure tags. The rule applies only to objects that have the specified tags. Example: Select **Files with Specified Prefix** and set Prefix to img, Key to a, and Value to 1. The rule applies to all objects that has img in their names and has the tag a=1. For more information about object tagging, see Configure object tagging.
Clear Policy	
File Lifecycle	Configure rules for objects to specify when objects expire. You can set File Lifecycle to **Validity Period (Days)**, **Expiration Date**, or **Disabled**. If you select **Disabled**, the configurations of File Lifecycle do not take effect.
Delete	Specify when objects expire based on **Validity Period (Days)** or **Expiration Date** that you set for **File Lifecycle**. Expired objects are deleted. ○ **Validity Period (Days)**: Specify the number of days to retain objects after they are last modified. The objects are deleted the next day after they expire. For example, if you set Validity Period (Days) to 30, objects that are last modified on January 1, 2019 are deleted on February 1, 2019. ○ **Expiration Date**: Specify the expiration date. Objects that are last modified before this date expire and are deleted. For example, if you set Expiration Date to 2019-1-1, objects that are last modified before January 1, 2019 are deleted.
Delete Parts	
Part Lifecycle	Specify the operations to perform on expired parts. You can set Part Lifecycle to **Validity Period (Days)**, **Expiration Data**, or **Disabled**. If you select **Disabled**, the configurations of Part Lifecycle do not take effect. **Notice** ○ You must configure at least one of **File Lifecycle** and **Part Lifecycle**. ○ If you select **Tagging**, **Part Lifecycle** is unavailable.
Delete	Specify when parts expire based on **Validity Period (Days)** or **Expiration Data** that you set for **Part Lifecycle**. Expired parts are deleted. You can configure this parameter in the same way as you configure the Delete parameter in Clear Policy.

5. Click **OK**.

6.4.9. Configure storage quota

If the capacity of a bucket reaches the specified storage quota, write operations such as PutObject, MultipartUpload, CopyObject, PostObject, and AppendObject cannot be performed on the bucket. This topic describes how to configure the storage quota of a created bucket.

Prerequisites

A bucket is created. For more information, see Create buckets.

Context

Take note of the following items when you configure the storage quota of a bucket:

- Before you configure the storage quota of a bucket, make sure that the quota does not limit your business because write operations cannot be performed if the bucket capacity reaches the quota.
- In general, it takes about an hour for OSS to determine whether the bucket capacity exceeds the storage quota. In some cases, it can take longer.

Procedure

1. Log on to the OSS console.
2. In the left-side navigation pane, click **Buckets**. On the Buckets page, click the name of the bucket for which you want to configure storage quota.
3. Click the **Basic Settings** tab, find the **Storage Quota** section.
4. Click **Configure**. Turn on **Storage Quota** and set **Storage Quota**.
   - Units: TB or GB.
   - Valid values: -1 to 2000000

     The default value is -1, which indicates that the bucket capacity is not limited.
5. Click **Save**.

6.4.10. Configure back-to-origin rules

If you access data in a bucket that has no back-to-origin rules configured and the data does not exist, 404 Not Found is returned. However, if you configure back-to-origin rules that contain the correct origin URL, you can obtain the data based on the back-to-origin rules.

Context

Back-to-origin supports the mirroring and redirection modes. You can configure back-to-origin rules for hot migration and specific request redirection.

- Mirroring-based back-to-origin

  After mirroring-based back-to-origin rules are configured for a bucket, you can obtain an object in the bucket based on the rules when the requested object is not found. For example, when you perform the GetObject operation on an object and the object is not found, OSS retrieves the object based on the origin URL, returns the object, and then writes the object to OSS. Mirroring-based back-to-origin rules are used to seamlessly migrate data to OSS. This feature allows you to migrate a service that already runs on a user-created origin or in another cloud service to OSS without interrupting services.
- Redirection-based back-to-origin

  After redirection-based back-to-origin rules are configured for a bucket, you can obtain an object in the bucket based on the rules when the requested object is not found. For example, when you perform the GetObject operation on an object and the object is not found, OSS redirects the request to the origin URL, and then a browser or client returns the content from the origin. You can use this feature to redirect requests for objects and develop various services based on redirection.

You can configure up to 20 back-to-origin rules, which are run in a sequence that they are configured.

> **Notice** Back-to-origin rules and versioning cannot be configured for a bucket at the same time.

Configure a mirroring-based back-to-origin rule

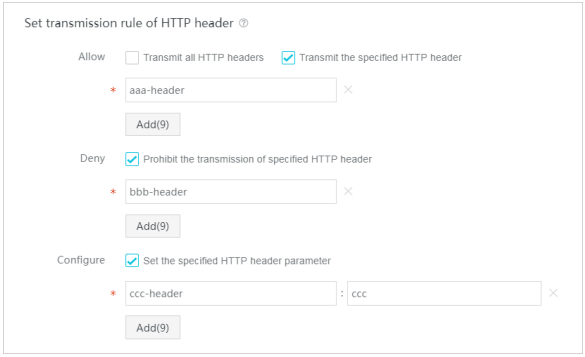
1. Log on to the OSS console.
2. In the left-side navigation pane, click **Buckets**. On the Buckets page, click the name of the bucket for which you want to configure the mirroring-based back-to-origin rule.

3. Click the **Basic Settings** tab. In the **Back-to-Origin** section, click **Configure**.
4. Click **Create Rule**. In the **Create Rule** panel, set the parameters described in the following table to create a mirroring-based back-to-origin rule.

Parameter	Required	Description
Mode	Yes	Select **Mirroring**. In this mode, when a requested object cannot be found in OSS, OSS automatically retrieves the object from the origin, stores the object in OSS, and then returns the content to the requester.
Prerequisite	Yes	Configure the conditions that trigger the back-to-origin rule. A rule is triggered only when all conditions are met. ◦ **HTTP Status Code**: The back-to-origin rule is triggered when the specified HTTP status code is returned. The default HTTP status code is 404, which indicates that the rule is triggered when the requested object is not found in OSS and HTTP status code 404 is returned. By default, this option is selected when you select the **Mirroring** mode. ◦ **File Name Prefix**: The back-to-origin rule is triggered when the name of the requested object contains the specified prefix. For example, when this parameter is set to *abc/*, the back-to-origin rule is triggered when you access `https://bucketname.endpoint/abc/image.jpg`. ◦ **File Name Suffix**: The back-to-origin rule is triggered when the name of the requested object contains the specified suffix. For example, when this parameter is set to *.jpg*, the back-to-origin rule is triggered when you access `https://bucketname.endpoint/image.jpg`. **Note** File Name Prefix and File Name Suffix are optional when you configure only one back-to-origin rule. When you configure multiple back-to-origin rules, you must differentiate the rules by specifying a different prefix or suffix for each of the rules.
Replace or Delete File Prefix	No	You can configure this parameter after you select and configure **File Name Prefix**. When OSS sends a request to the origin, the content of **File Name Prefix** is replaced with that of **Replace or Delete File Prefix**. Example: You want to store the object obtained from the origin in the *mirror* folder under the root folder of the bucket. If the name of the requested object is *path/test/photo.jpg*, set **File Name Prefix** to *mirror/*, **Replace or Delete File Prefix** to *test/*, and the third column of **Origin URL** to *path*. In this case, when you access `https://bucketname.endpoint/mirror/photo.jpg`, if *photo.jpg* does not exist, OSS sends the `https://origin URL/path/test/photo.jpg` request to obtain this object. If the object is obtained from the origin, OSS stores this object in the *mirror/* folder and returns the object to you.

Parameter	Required	Description
Origin URL	Yes	Configure the information about the origin URL. ◦ First column: Select HTTP or HTTPS based on the protocol used by the origin. **Note** If SNI is enabled on the origin, HTTPS that you select does not take effect. ◦ Second column: Enter the domain name or IP address of the origin. Internal endpoints and IP addresses are not supported. If you enter an IP address, ensure that the origin corresponding to the IP address can be accessed by using the IP address. ◦ Third column: Enter the folder where the requested object is stored. Separate subfolders in a folder with forward slashes (/). Example: `abc/123`.
MD5 Verification	No	If this option is selected, the MD5 hash of the object obtained from the origin is checked. When the response contains the Content-MD5 header value, OSS checks whether the MD5 hash of the object matches the Content-MD5 header value. ◦ If the MD5 hash of the object matches the Content-MD5 header value, the client obtains the object, and OSS saves the object by using mirroring-based back-to-origin. ◦ If the MD5 hash of the object does not match the Content-MD5 header value, OSS calculates the Content-MD5 header value of the object based on the data integrity and does not save the object. However, the client can obtain the object because the object is returned to the client.
Keep Forward Slash in Origin URL	No	OSS does not support object names that start with a forward slash (/). Therefore, when the name of the requested object starts with a forward slash (/), you must select this option to obtain the requested object based on the back-to-origin rules. For example, the origin is `https://www.example.com`, the name of the requested object is */object.txt*, and the name of the bucket is examplebucket. If this option is selected, the default public endpoint to access the requested object is `https://examplebucket.endpoint//object.txt`, and the origin URL is `https://www.example.com//object.txt`. The object is obtained from OSS, returned to the client, and then saved in the bucket as *object.txt*.
Other Parameter	No	If this option is selected, the query string included in the request to OSS is transferred to the origin.
3xx Response	No	If this option is selected, OSS follows the origin to direct the request to obtain the resource and stores the resource in buckets. If this option is not selected, OSS passes the 3xx response without obtaining the resource.
Set Transmission Rule of HTTP Header	No	You can configure the transmission rule for HTTP headers to customize transmission actions such as passthrough, filtering, or modification. For more information, see the following examples of transmission rule configurations for HTTP headers.

The following figure provides a sample transmission rule for HTTP headers.



You send a request that contains the following HTTP headers to OSS.

```
GET /object
host : bucket.oss-cn-hangzhou.aliyuncs.com
aaa-header : aaa
bbb-header : bbb
ccc-header : 111
```

After the mirroring-based back-to-origin rule is triggered, OSS sends the following request to the origin:

```
GET /object
host : source.com
aaa-header : aaa
ccc-header : ccc
```

Transmission rules do not support the following HTTP headers:

- Headers that contain the following prefixes:
  - x-oss-
  - oss-
  - x-drs-
- All standard HTTP headers. Examples:
  - content-length
  - authorization2
  - authorization
  - range
  - date

Configure a redirection-based back-to-origin rule

1. Log on to the OSS console.
2. In the left-side navigation pane, click **Buckets**. On the Buckets page, click the name of the bucket for which you want to configure a redirection-based back-to-origin rule.
3. Click the **Basic Settings** tab. In the **Back-to-Origin** section, click **Configure**.
4. Click **Create Rule**. In the **Create Rule** panel, configure the parameters described in the following table to create a redirection-based back-to-origin rule.

Parameter	Required	Description

Parameter	Required	Description
Mode	Yes	Select **Redirection**. In this mode, OSS redirects requests that meet the prerequisites to the origin URL over HTTP, and then a browser or client returns the content from the origin to the requester.
Prerequisite	Yes	Configure the conditions that trigger the back-to-origin rule. A rule is triggered only when all conditions are met. ◦ **HTTP Status Code**: The back-to-origin rule is triggered when the specified HTTP status code is returned. The default HTTP status code is 404, which indicates that the rule is triggered when the requested object is not found in OSS and HTTP status code 404 is returned. ◦ **File Name Prefix**: The back-to-origin rule is triggered when the name of the requested object contains the specified prefix. For example, when this parameter is set to *abc/*, the back-to-origin rule is triggered when you access `https://bucketname.endpoint/abc/image.jpg`. ◦ **File Name Suffix**: The back-to-origin rule is triggered when the name of the requested object contains the specified suffix. For example, when this parameter is set to *.jpg*, the back-to-origin rule is triggered when you access `https://bucketname.endpoint/image.jpg`. **Note** File Name Prefix and File Name Suffix are optional when you configure only one back-to-origin rule. When you configure multiple back-to-origin rules, you must differentiate the rules by specifying a different prefix or suffix for each of the rules.
Replace or Delete File Prefix	No	You can configure this parameter after you select and configure **File Name Prefix**. When OSS sends a request to the origin, the content of **File Name Prefix** is replaced with that of **Replace File Name Prefix**. **Note** If you select this option, you can only set **Replace File Name Prefix** for **Origin URL**.

Parameter	Required	Description
Origin URL	Yes	Configure the information about the origin URL. You must configure the back-to-origin rule based on the origin URL. Configuring the origin URL in accordance with the following rules: ◦ First column: Select HTTP or HTTPS based on the protocol used by the origin. ◦ Second column: Enter the domain name or IP address of the origin. **Note** You can enter IP addresses only when the origin can be directly accessed by using IP addresses. ◦ Third column: Configure the redirection-based back-to-origin rule based on the prefix and suffix configurations. ■ **Add Prefix or Suffix**: Add a prefix or suffix to the redirected URL. The prefix is configured in the third column. The suffix is configured in the fourth column. You can select this option to configure information for the redirected URL when the URL of the requested data excludes a prefix or suffix. For example, the prefix is set to *123/*, and the suffix is set to *.jpg*. When you access **https://bucketname.endpoint/image** , the request is redirected to **https://Origin URL/123/image.jpg** . ■ **Redirect to Fixed URL**: Access to the requested object is redirected to a specified object. The object address is specified in the third column. Example: **abc/myphoto.jpg** . **Note** You can also set the value of this parameter to the URL of a website. For example, if you set the URL to **https://www.aliyun.com/index.html** , access to the bucket is redirected to the Alibaba Cloud homepage. ■ **Replace File Name Prefix**: If you set this parameter and **File Name Prefix** for Prerequisite, the prefix in the name of the object to which the access is redirected is replaced with that of the third column. If you set this parameter without setting **File Name Prefix** for Prerequisite, the specified prefix is added to the name of the object to which the access is redirected. Separate subfolders in a folder with forward slashes (/). The folder name must end with a forward slash (/). The folder name cannot contain asterisks (*).
Other Parameter	No	If this option is selected, the query string included in the request to OSS is transferred to the origin.
Redirection Code	Yes	You can select the redirection code from the drop-down list. Select **Source from Alibaba Cloud CDN** if the redirect request is from Alibaba Cloud CDN.

5. Click **OK**.

6.4.11. Configure server-side encryption

OSS supports server-side encryption. When you upload an object to a bucket for which server-side encryption is enabled, OSS encrypts the object and stores the encrypted object. When you download the encrypted object from OSS, OSS automatically decrypts the object and returns the decrypted object to you. A header is added in the response to indicate that the object is encrypted on the OSS server.

Context

OSS supports the following encryption methods:

- Server-side encryption by using KMS (SSE-KMS)

  OSS uses the default customer master key (CMK) managed by KMS or a specified CMK to encrypt objects. The CMK is managed by KMS to ensure confidentiality, integrity, and availability at minimal costs.

- Server-side encryption by using OSS-managed keys (SSE-OSS)

  OSS uses data keys to encrypt objects and manages the data keys. In addition, OSS uses master keys that are regularly rotated to encrypt data keys.

You can enable server-side encryption in the OSS console by using one of the following methods:

- Method 1: Enable server-side encryption when you create a bucket
- Method 2: Enable server-side encryption on the Basic Settings tab

Method 1: Enable server-side encryption when you create a bucket

1. Log on to the OSS console.
2. In the left-side navigation pane, click **Buckets**. On the Buckets page, click **Create Bucket**.
3. On the **Create OSS Bucket** page, set parameters.

   You can set the following parameters to configure server-side encryption for the bucket.

   - **Server-Side Encryption**: Specify the encryption methods.
     - **None**: Server-side encryption is not performed.
     - **AES256**: AES256 is used to encrypt each object in the bucket by using different data keys. The CMKs used to encrypt the data keys are rotated regularly.
     - **SM4**: SM4 is used to encrypt each object in the bucket by using different data keys. The CMKs used to encrypt the data keys are rotated regularly.
     - **KMS**: CMKs managed by KMS are used to encrypt objects in the bucket.
   - **Encryption Algorithm**: This parameter can be configured when you select **KMS** for **Server-Side Encryption**. You can select **SM4** or **AES256**.
   - **Key ID**: This parameter can be configured when you select **KMS** for **Server-Side Encryption**. OSS uses the specified CMK to encrypt objects in the bucket.

     > **Note** To select a CMK ID for server-side encryption, you must create the CMK in the KMS console.

4. Click **Submit**.

Method 2: Enable server-side encryption on the Basic Settings tab

1. Log on to the OSS console.
2. In the left-side navigation pane, click **Buckets**. On the Buckets page, click the name of the bucket for which you want to configure server-side encryption.
3. Click the **Basic Settings** tab. Find the **Server-side Encryption** section.
4. Click **Configure** and set the following parameters:

- **Encryption Method**: Specify the encryption method.
  - **None**: Server-side encryption is not performed.
  - **OSS-Managed**: Keys managed by OSS are used to encrypt your data.
  - **KMS**: CMKs managed by KMS are used to encrypt objects in the bucket.
- **Encryption Algorithm**: You can select **SM4** or **AES256**.
  - **AES256**: AES256 is used to encrypt each object in the bucket by using different data keys. CMKs used to encrypt the data keys are rotated regularly.
  - **SM4**: SM4 is used to encrypt each object in the bucket by using different data keys. CMKs used to encrypt the data keys are rotated regularly.
- **CMK**: This parameter can be configured when you select **KMS** for **Encryption Method**. OSS uses the specified CMK to encrypt objects in the bucket.

  > **Note** To select a CMK ID for server-side encryption, you must create the CMK in the KMS console.

5. Click **Save**.

> **Notice** The configurations of the default encryption method for a bucket do not affect the encryption configurations of existing objects within the bucket.

6.4.12. Bind a bucket to a VPC network

You can bind your bucket to a specified virtual private cloud (VPC) network to allow only requests from IP addresses within the VPC network to access your bucket.

Prerequisites

A VPC network is created. For more information, see the "Create a VPC" chapter of *VPC User Guide*.

Procedure

1. Log on to the OSS console.
2. In the left-side navigation pane, click **Buckets**. On the Buckets page, click the name of the bucket that you want to bind to the VPC network.
3. Click the **Overview** tab. Click **Bind VPC** in the **VPC Info** section.
4. On the **Bind VPC** page, select the VPC network that you create.

   You can also click **Create VPC** to create a new VPC network.
5. Click **Submit**.

6.4.13. Configure CRR

Cross-region replication (CRR) allows you to perform automatic and asynchronous (near real-time) replication on objects across buckets in different regions. If you enable CRR, operations such as the creation, overwriting, and deletion of objects can be synchronized from the source bucket to the destination bucket.

Prerequisites

The source bucket and destination bucket are created. For more information, see Create buckets.

Context

This feature meets the requirements of geo-disaster recovery or data replication. Objects in the destination bucket are extra replicas of objects in the source bucket. They have the same names, content, and metadata, such as the

created time, owner, user metadata, and object ACL.

Procedure

1. Log on to the OSS console.
2. In the left-side navigation pane, click **Buckets**. On the Buckets page, click the name of the bucket for which you want to configure CRR.
3. On the bucket details page, click the **Basic Settings** tab. Find the **Cross-Region Replication** section.
4. Click **Enable**. In the **Cross-Region Replication** panel, configure the parameters described in the following table.

Parameter	Description
Source Region	The region where the current bucket is located.
Source Bucket	The name of the current bucket.
Destination Region	Select the region where the destination bucket is located. The source and destination buckets for CRR must be located in different regions. Data cannot be synchronized between buckets located within the same region.
Destination Bucket	Select the destination bucket to which data is synchronized. The source bucket and destination bucket specified in a CRR rule are not allowed to synchronize data with other buckets. For example, if you configure a CRR rule to synchronize data from Bucket A to Bucket B, Bucket A and Bucket B are not allowed to synchronize data with other buckets.
Applied To	Select the source data that you want to synchronize. ○ **All Files in Source Bucket**: All objects within the source bucket are synchronized to the destination bucket. ○ **Files with Specified Prefix**: Only objects whose names contain one of the specified prefixes are synchronized to the destination bucket. For example, if you have a folder named *management/* in the root folder of a bucket and want to synchronize objects in a subfolder named *abc/* in *management/*, you can enter the prefix *management/abc/*. You can specify up to 10 prefixes.
Operations	Select the synchronization policy. ○ **Add/Change**: Only newly added and changed data is synchronized from the source bucket to the destination bucket. ○ **Add/Delete/Change**: All changes to data including creation, modification, and deletion of objects are synchronized from the source bucket to the destination bucket.
Replicate Historical Data	Specify whether to synchronize historical data that is generated before you enable cross-cloud replication. ○ **Yes**: Historical data is synchronized to the destination bucket. **Notice** When historical data is synchronized, objects in the destination bucket may be overwritten by historical data from the source bucket with the same name. Before you select this option, make sure that the data is consistent. ○ **No**: Only objects that are uploaded or updated after CRR is enabled are synchronized to the destination bucket.

5. Click **OK**.

> **Note**
>
> - It takes about 3 to 5 minutes to take effect after CRR is configured. Synchronization information is displayed after the source bucket is synchronized.
> - In CRR, data is asynchronously replicated in near-real time. Depending on how much data needs to be replicated, it can take a few minutes to several hours to replicate the data to the destination bucket.

6.5. Objects

6.5.1. Search for objects

You can search for objects whose names contain specific prefixes in buckets or folders in the OSS console.

Prerequisites

Object are uploaded to the bucket. For more information, see Upload objects.

Context

When you search for objects based on a prefix, search strings are case-sensitive and cannot contain forward slashes (/). You can search for objects only in the root folder of the current bucket or in the current folder. Subfolders and objects stored in subfolders cannot be searched.

Procedure

1. Log on to the OSS console.
2. In the left-side navigation pane, click **Buckets**. On the Buckets page, click the name of the bucket in which the objects that you want to search for are stored.
3. Click the **Files** tab.
4. Search for objects.
   - Search for objects or folders within the root folder of the bucket

     In the upper-right corner, enter the prefix to search in the search box and press Enter or click the icon to search for related objects. Objects and subfolders whose names contain the specified prefix within the root folder of the bucket are displayed.
   - Search for objects or subfolders within a specified folder

     Click the folder in which the objects or subfolders that you want to search for are stored. In the upper-right corner, enter the prefix to search in the search box and press Enter or click the icon to search for related objects. Objects and subfolders whose names contain the specified prefix within the current folder are displayed.

6.5.2. Configure object ACLs

You can configure the ACL of an object in the OSS console to control access to the object.

Prerequisites

An object is uploaded to the bucket. For more information, see Upload objects.

Procedure

1. Log on to the OSS console.

2. In the left-side navigation pane, click **Buckets**. On the Buckets page, click the name of the bucket that contains the object whose ACL you want to configure.
3. In the left-side navigation pane, click **Files**.
4. Click the name of the object whose ACL you want to configure. In the **View Details** panel, click **Set ACL** on the right side of **File ACL**.

   You can also choose **More > Set ACL** in the Actions column corresponding to the object whose ACL you want to configure.
5. In the **Set ACL** panel, configure the ACL of the object.

   You can set the ACL of the object to one of the following values:

   - **Inherited from Bucket**: The ACL of the object is the same as that of the bucket.
   - **Private**: Only the owner or authorized users of this bucket can read and write objects in the bucket. Other users, including anonymous users cannot access the objects in the bucket without authorization.
   - **Public Read**: Only the owner or authorized users of this bucket can write objects in the bucket. Other users, including anonymous users can only read objects in the bucket.
   - **Public Read/Write**: All users, including anonymous users can read and write objects in the bucket. Fees incurred by such operations are charged to the owner of the bucket. Exercise caution when you set the object ACL to this value.
6. Click **OK**.

6.5.3. Create folders

You can use the OSS console to create and simulate basic features of folders in Windows. This topic describes how to create a folder by using the OSS console.

Prerequisites

A bucket is created. For more information, see Create buckets.

Context

OSS does not use a hierarchical structure for objects, but instead uses a flat structure. All elements are stored in buckets as objects. To facilitate object grouping and to simplify management, the OSS console displays objects whose names end with a forward slash (/) as folders. These objects can be uploaded and downloaded. You can use OSS folders in the OSS console in the same manner as you use folders in Windows.

> **Note** The OSS console displays objects whose names end with a forward slash (/) as folders, regardless of whether these objects contain data. The objects can only be downloaded by calling an API operation or by using OSS SDKs.

Procedure

1. Log on to the OSS console.
2. In the left-side navigation pane, click **Buckets**. On the Buckets page, click the name of the bucket in which you want to create folders.
3. Click the **Files** tab. On the page that appears, click **Create Folder**.
4. In the **Create Folder** panel, enter the folder name.

   The folder name must comply with the following conventions:

   - The name can contain only UTF-8 characters and cannot contain emojis.
   - The name cannot start with a forward slash (/) or backslash (\). The name cannot contain consecutive forward slashes (/). You can use forward slashes (/) in a folder name to quickly create a subfolder. For example, when you create a folder named *example/test/*, the folder named *example/* is created in the root

folder of the bucket and the subfolder named *test/* is created in the example/ folder.

- The name cannot be two consecutive periods (..).
- The folder name must be 1 to 254 characters in length.

5. Click **OK**.

6.5.4. Delete objects

You can delete uploaded objects in the OSS console when they are no longer needed.

Context

You can delete a single object or batch delete multiple objects. You can batch delete up to 100 objects. To delete specific objects or batch delete more than 100 objects, we recommend that you use API operations or OSS SDKs.

> **Notice** Deleted objects cannot be recovered. Exercise caution when you delete objects.

Procedure

1. Log on to the OSS console.
2. In the left-side navigation pane, click **Buckets**. On the Buckets page, click the name of the bucket in which the objects you want to delete are stored.
3. In the left-side navigation pane, click **Files**.
4. Select one or more objects that you want to delete in the object list, and then choose **Batch Operation > Delete**.

   You can also choose **More > Completely Delete** in the Actions column corresponding to the object you want to delete.
5. In the dialog box that appears, click **OK**.

6.5.5. Manage parts

When you use multipart upload to upload an object, the object is split into several parts. After all of the parts are uploaded to the OSS server, you can call CompleteMultipartUpload to combine the parts into a complete object.

Context

You can also configure lifecycle rules to clear parts that are not needed on a regular basis. For more information, see Manage lifecycle rules.

Procedure

1. Log on to the OSS console.
2. In the left-side navigation pane, click **Buckets**. On the Buckets page, click the name of the bucket in which the parts you want to delete are stored.
3. Click the **Files** tab. On the page that appears, click **Parts**.
4. In the **Parts** panel, delete the parts.
   - To delete all parts in the bucket, select all parts and then click **Delete All**.
   - To delete specific parts in the bucket, select these parts and then click **Delete**.
5. In the dialog box that appears, click **OK**.

6.5.6. Configure object tagging

You can configure object tagging to classify objects. Object tagging uses key-value pairs to identify objects. You can perform operations on multiple objects that have the same tag. For example, you can configure lifecycle rules for objects that have the same tag.

Context

Object tagging uses key-value pairs to identify objects. You can manage multiple objects that have the same tag. For example, you can configure lifecycle rules for objects that have the same tag or authorize Resource Access Management (RAM) users to access objects that have the same tag.

When you configure object tagging, take note of the following items:

- You can add up to 10 tags to an object. The tags added to an object must have unique tag keys.
- A tag key can be up to 128 bytes in length. A tag value can be up to 256 bytes in length.
- Tag keys and tag values are case-sensitive.
- The key and value of a tag can contain letters, digits, spaces, and the following special characters:

  + - = ._:/
- Only the bucket owner and authorized users have read and write permissions on object tags. These permissions are independent of object access control lists (ACLs).
- In cross-region replication (CRR), object tags are also replicated to the destination bucket.

Procedure

1. Log on to the OSS console.
2. In the left-side navigation pane, click **Buckets**. On the Buckets page, click the name of the bucket in which the object that you want to configure tagging is stored.
3. On the bucket details page, click the **Files** tab.
4. Choose **More** > **Tagging** in the Actions column corresponding to the object to which you want to add tags.
5. In the **Tagging** panel, configure the **Key** and **Value** of the tag.

   You can click **Add** to add up to more 10 tags to the object.
6. Click **OK**.

6.6. Create single tunnels

You can create single tunnels between OSS and a virtual private cloud (VPC) to access OSS resources from the VPC.

Prerequisites

A VPC and a vSwitch are created.

For more information, see the *Create a VPC* and *Create a vSwitch* topics in *VPC User Guide*.

Procedure

1. Log on to the OSS console.
2. In the left-side navigation panel, click **Create Single Tunnel**.
3. Click **Create**.
4. On the **Create Single Tunnel** page, configure the parameters described in the following table.

Parameter	Required	Description
Organization	Yes	Select the organization of the VPC from which you want to access OSS resources.

Parameter	Required	Description
Resource Set	Yes	After you select an organization, the resource set is automatically selected based on the organization.
Region	Yes	After you select an organization, a region is automatically selected based on the organization.
Description	No	Enter the description of the single tunnel you want to create. The description cannot exceed 180 characters in length.
VPC	Yes	Select the VPC that you created. You can also click **Create VPC** to create a VPC.
vSwitch	Yes	Select the vSwitch that you created. You can also click **Create vSwitch** to create a vSwitch.

5. Click **Submit**.

6.7. Add OSS paths

You can add the paths of OSS resources in the console for quicker access.

Prerequisites

A bucket is created. For more information about how to create a bucket, see Create buckets.

Procedure

1. Log on to the OSS console.
2. Click the + icon on the right side of **My OSS Paths**.
3. In the **Add Authorized OSS Path** panel, add a path.

   You can configure the following parameters to add a path.

   - **Region**: Select the region of the bucket in the path that you want to add.
   - **File Path**: Add the path of the resource that you want to access. The path is in the `bucket/object-prefix` format. For example, if the OSS resource that you want to access is the root folder of a bucket named *example*, set File Path to *example*. If the OSS resource that you want to access is the *test* folder in the root folder of the bucket named *example*, set File Path to *example/test/*.

7.Tablestore

7.1. What is Tablestore?

Tablestore is a NoSQL database service independently developed by Alibaba Cloud. Tablestore is a proprietary software program that is certified by the relevant authorities in China. Tablestore is built on the Apsara system of Alibaba Cloud, and can store large amounts of structured data and allow real-time access to the data.

Tablestore provides the following features:

- Offers schema-free data storage. You do not need to define attribute columns before you use them, or perform table-level changes to add or delete attribute columns. You can set the time to live (TTL) parameter for a table to manage the lifecycle of data. Expired data is deleted from the table.
- Uses the multi-node cluster architecture. Each management node on the platform implements a high availability mechanism. Therefore, the failure of a service node within a cluster does not affect the overall operating of businesses.
- Adopts the triplicate technology to keep three copies of data across different servers in different racks. A cluster can support single storage type instances (SSD only) or mixed storage type instances (SSD and SATA) to meet different budget and performance requirements.
- Adopts a fully redundant architecture to prevent single points of failure (SPOFs). The support for smooth online upgrades, hot cluster upgrades, and automatic data migration enables you to dynamically add or remove nodes for maintenance without incurring service interruptions. The concurrent read/write throughput and storage capacity can be linearly scaled. Each cluster can have no less than 500 hosts.
- Supports highly concurrent read/write operations. Concurrent read/write capabilities can be scaled out as the number of hosts increases. The read/write performance is indirectly related to the amount of data in a single table.
- Supports identity authentication and multi-tenancy. Comprehensive access control and isolation mechanisms are provided to safeguard your data. VPC and access over HTTPS are supported. Provides multiple authentication and authorization mechanisms so that you can define access permissions on individual tables and operations.

7.2. Precautions

Before you use Tablestore, you need to take note of the following precautions and limits.

The following table describes the limits for Tablestore. A part of the limits indicate the maximum allowable values rather than the suggested values. To ensure better performance, set the table scheme and data size in a single row based on actual conditions, and adjust the following configurations.

Item	Limit	Description
The number of instances under an Apsara Stack tenant account	1024	To raise the limit, contact the technical support personnel.
The number of tables in an instance	1024	To raise the limit, contact the technical support personnel.
The length of an instance name	3 to 16 bytes	The instance name can contain uppercase and lowercase letters, digits, and hyphens (-). It must start with a letter and cannot end with a hyphen (-).
The length of a table name	1 to 255 bytes	The table name can contain uppercase and lowercase letters, digits, and underscores (_). It must start with a letter or underscore (_).

Item	Limit	Description
The length of a column name	1 to 255 bytes	The column name can contain uppercase and lowercase letters, digits, and underscores (_). It must start with a letter or underscore (_).
The number of columns in a primary key	1 to 4	A primary key can contain one to four primary key columns.
The size of the value in a string type primary key column	1 KB	The size of the value in a STRING primary key column cannot exceed 1 KB.
The size of the value in a STRING attribute column	2 MB	The size of the value in a STRING attribute column cannot exceed 2 MB.
The size of the value in a BINARY primary key column	1 KB	The size of the value in a BINARY primary key column cannot exceed 1 KB.
The size of the value in a BINARY attribute column	2 MB	The size of the value in a BINARY attribute column cannot exceed 2 MB.
The number of attribute columns in a single row	Unlimited	A single row can contain an unlimited number of attribute columns.
The number of attribute columns written by one request	1,024	During a PutRow, UpdateRow, or BatchWriteRow operation, the number of attribute columns written in a row cannot exceed 1,024.
The data size of a row	Unlimited	The total size of all column names and column values for a row is unlimited.

7.3. Quick start

7.3.1. Log on to the Tablestore console

This topic describes how to log on to the Tablestore console.

Prerequisites

- The URL of the Apsara Uni-manager Management Console is obtained from the deployment personnel before you log on to the Apsara Uni-manager Management Console.
- A browser is available. We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL of the Apsara Uni-manager Management Console. Press the Enter key.
2. Enter your username and password.

   Obtain the username and password that you can use to log on to the console from the operations administrator.

> **Note** When you log on to the Apsara Uni-manager Management Console for the first time, you must change the password of your username. Your password must meet complexity requirements. The password must be 8 to 20 characters in length and must contain at least two of the following character types:
>
> - Uppercase or lowercase letters
> - Digits
> - Special characters, which include ! @ # $ %

3. Click **Login**.
4. In the top navigation bar, choose **Products > Tablestore**.

7.3.2. Create an instance

An instance is a logical entity in Tablestore and is used to manage tables. An instance is the basic unit of the resource management system of Tablestore. Tablestore controls application access and implements resource measurement at the instance level. This topic describes how to create an instance.

Procedure

1. Log on to the Tablestore console.
2. On the **Overview** tab, click **Create Instance**.

> **Note** You can create different instances to manage the associated tables for different business, or create different instances for development, testing, and production environments of the same business. By default, Tablestore allows you to create up to 1,024 instances and up to 1,024 tables in each instance that belongs to an Apsara Stack tenant account.

3. On the **Create Instance** page, configure parameters.

Parameter	Description
Region	Select a region from the drop-down list for the instance.
Organization	Select an organization from the drop-down list for the instance.
Resource Set	Select a resource set from the drop-down list for the instance.
Instance Name	Enter a name for the instance. Instance naming conventions: The name must be 3 to 16 characters in length and can contain only letters, digits, and hyphens (-). It must start with a letter and cannot start with case-insensitive string `ali` or `ots`.
Description	Enter a description for the instance.
Instance Type	Select an instance type from the drop-down list for the instance. Tablestore provides high-performance instances and capacity instances. The instance types vary based on the type of cluster you deploy.

4. Click **Submit**.
5. In the **Submitted.** dialog box, click **Back to Console**.

   On the **Overview** tab, you can view the created instance.

   After the instance is created, you can perform the following operations on the instance:

- Click the name of the instance or click Manage Instance in the **Actions** column that corresponds to the instance. On the **Instance Management** page, click each tab to perform various operations.
  - On the **Instance Details** tab, you can view the Instance Access URL, Basic Information, and Tables sections.
  - On the **Instance Monitoring** tab, you can view monitoring data by using time ranges, metric categories, and operations.
  - On the **Network Management** tab, you can bind or unbind virtual private clouds (VPCs) and view the list of VPCs.
- Click **Release** in the **Actions** column to release an instance.

  > **Notice**
  > - Before you release an instance, ensure that all tables are deleted, and VPCs are unbound from instances.
  > - To create an instance when you release an existing instance, ensure that the name of the instance you want to create is different from that of the existing instance to avoid conflicts.

7.3.3. Create tables

This topic describes how to create a table in the Tablestore console.

Procedure

1. Log on to the Tablestore console.
2. On the **Overview** page, click the name of the required instance or click **Manage Instance** in the Actions column corresponding to the instance.
3. On the **Instance Details** tab, click **Create Table**.

   > **Note** You can create a maximum of 1,024 tables in each instance.

4. In the **Create Table** dialog box, set **Table Name** and **Primary Key**.

   The following table describes the parameters you can configure.

Parameter	Description
Table Name	The name of the table. This name is used to uniquely identify a table in an instance. The name must be 1 to 255 bytes in length and can contain letters, digits, and underscores (_). The name must start with a letter or an underscore (_).

Parameter	Description
Primary Key	One or more primary key columns in the table that uniquely identify each record in the table. Enter a primary key name and select a data type. Click **Add a Primary Key** to add a primary key column. You can add one to four primary key columns. By default, the first primary key column is the partition key. The configurations and order of primary key columns cannot be modified after the table is created. **Note** ◦ In Tablestore, only a primary key column can be used as an auto-increment primary key column. Partition keys cannot be used as auto-increment primary key columns. ◦ After a primary key column is set to an auto-increment primary key column, Tablestore automatically generates a value for the auto-increment primary key column when you write a row of data. You do not need to specify a value for the auto-increment primary key column. The values of auto-increment primary key columns are incremental and unique within the rows that share the same partition key. ◦ Naming conventions of primary key columns: The name must be 1 to 255 bytes in length and can contain letters, digits, and underscores (_). The name must start with a letter or underscore (_) ◦ Data types supported by primary key columns are **String**, **Integer**, and **Binary**.

5. Optional. Configure advanced parameters.

   If you need to configure parameters such as Time to Live and Max Versions, perform this operation.

   i. Turn on **Advanced Settings**.

ii. Configure advanced parameters.

The following table describes the advanced parameters you can configure.

Parameter	Description
Time to Live	The period for which data in the table can be retained. When the retention period exceeds the Time to Live (TTL) value, the system deletes the expired data. The minimum TTL value is 86,400 seconds (one day). A value of -1 indicates that data never expires.
Max Versions	The maximum number of versions of data that can be retained for an attribute column. When the versions of data in an attribute column exceed the Max Versions value, the system deletes the earliest versions of data to keep the maximum number of versions equal to the Max Versions value. Valid values: 1 to 10.
Max Version Offset	The difference between the version number and the data written time must be within the value of Max Version Offset. Otherwise, an error occurs when the data is written. Unit: seconds. The valid version range for attribute columns is calculated based on the following formula: Valid version range = **[Data written time - Max version offset value, Data written time + Max version offset value)**.
Reserved Read Throughput	You can set this parameter only for high-performance instances. The read and write throughput that is allocated and reserved for the table. Valid values: integers from 0 to 5000. When the specified reserved read and write throughput is **0**, Tablestore does not reserve related resources for the table.
Reserved Write Throughput	

6. Optional. Create secondary indexes.

If you need to create secondary indexes, perform this operation.

i. Turn on **Create Secondary Index**.

ii. Click the **+ Add** button in the Pre-defined Column section. Enter the name of the pre-defined column and select a data type from the drop-down list.

- This operation is performed to create a predefined column for the base table. Tablestore uses a schema-free model. You can write an unlimited number of columns to a row and do not need to specify a fixed number of predefined columns in a schema. When you create a table, you can also predefine columns and specify their data types.
- You can add up to 14 predefined columns. To deleted the predefined column you add, click the icon on the left of the corresponding predefined column.
- The name of a predefined column must be 1 to 255 bytes in length and can contain letters, digits, and underscores (_). The name must start with a letter or underscore (_).
- The data types of predefined columns include STRING, INTEGER, BINARY, FLOAT, and BOOLEAN.

iii. Click **Add Secondary Index**. Enter Index Name and set Primary Key and Pre-defined Column for the index table.

- The name of an index table must be 1 to 255 bytes in length and can contain letters, digits, and underscores (_). The name must start with a letter or underscore (_).
- You can set the primary key of the index table to the primary key or predefined columns of the base table.
- Pre-defined Column is optional. You can set the predefined columns of the index table to only the predefined columns of the base table.

7. Click **OK**.

   After a table is created, you can view the table in the **Table List** section. If the created table is not displayed in the list of tables, click the icon to refresh the list of tables.

   After a table is created, you can perform the following operations on the table:

   - Click the name of the table or click Details in the Actions column. On the **Manage Table** page, you can perform the following operations:
     - On the **Details** tab, you can view the description of the table and the primary key columns list, and modify the attributes of the table.
     - On the **Data Editor** tab, you can insert or update data, query data, view data details, and delete multiple data at a time.
   - Click the icon in the Actions column corresponding to a table and choose **Delete** from the shortcut menu. Click OK in the Delete Table dialog box. The table is deleted.

     > **Notice** If you delete a table, the table and the data in the table are permanently deleted from Tablestore and cannot be recovered. Exercise caution when you perform this operation.

7.3.4. Read and write data in the console

After a table is created, you can read data from and write data to the table in the console.

Add data

1. Log on to the Tablestore console.
2. On the **Overview** page, click the name of the required instance or click **Manage Instance** in the Actions column corresponding to the instance.
3. In the **Table List** section of the **Instance Details** tab, click the name of the target table and click the **Data Editor** tab. You can also click **Data Editor** in the Actions column.
4. On the **Data Editor** tab, click **Insert**.
5. In the **Insert** dialog box that appears, set **Primary Key Value**. Click **Add Column**. Set **Name**, **Type**, **Value**, and **Version**.

   By default, **System Time** is selected, indicating that the current system time is used as the version number of the data. You can also clear **System Time** and enter the version number of the data.
6. Click **OK**.

   Rows that contain the written data are displayed on the **Data Editor** tab.

Update data

You can update data in the attribute columns of a row.

1. Log on to the Tablestore console.

2. On the **Overview** page, click the name of the required instance or click **Manage Instance** in the Actions column corresponding to the instance.
3. In the **Table List** section of the **Instance Details** tab, click the name of the target table and click the **Data Editor** tab. You can also click **Data Editor** in the Actions column.
4. On the **Data Editor** tab, select the row of data to update. Click **Update**.
5. In the **Update** dialog box that appears, modify the type and value for the primary key, add or remove attribute columns, and update or delete data in attribute columns.
   - You can click **+Add Column** to add an attribute column. You can also click the icon to delete an attribute column.
   - If you select **Update**, you can modify data in attribute columns. If you select **Delete**, select the number of version to delete. If you select **Delete All**, all versions of the data are deleted.
6. Click **OK**.

Query data

In the Tablestore console, you can query data in a single row (GetRow) or query data within a specified range (RangeQuery).

To query data in a single row, perform the following operations:

1. Log on to the Tablestore console.
2. On the **Overview** page, click the name of the required instance or click **Manage Instance** in the Actions column corresponding to the instance.
3. In the **Table List** section of the **Instance Details** tab, click the name of the target table and click the **Data Editor** tab. You can also click **Data Editor** in the Actions column.
4. On the **Data Editor** tab, click **Search**.
5. Set filter conditions.
   i. In the **Search** dialog box, Set Modes to **GetRow**.
   ii. By default, the system returns all columns. To return specified attribute columns, turn off **All Columns**. Enter the names of the attribute columns to return. Separate the names of the attribute columns with commas (,).
   iii. Set **Primary Key Value**.

   The integrity and accuracy of the primary key value affect the query results.
   iv. Set **Count of Versions** to specify the maximum number of versions to return.
6. Click **OK**.

   Data that meets the filter conditions is displayed on the **Data Editor** tab.

To perform range query, perform the following steps:

1. Log on to the Tablestore console.
2. On the **Overview** page, click the name of the required instance or click **Manage Instance** in the Actions column corresponding to the instance.
3. In the **Table List** section of the **Instance Details** tab, click the name of the target table and click the **Data Editor** tab. You can also click **Data Editor** in the Actions column.
4. On the **Data Editor** tab, click **Search**.
5. Set filter conditions.
   i. In the **Search** dialog box, Set Modes to **Range Search**.
   ii. By default, the system returns all columns. To return specified attribute columns, turn off **All Columns**. Enter the names of the attribute columns to return. Separate the names of the attribute columns with commas (,).

iii. Set Start Primary Key Column and End Primary Key Column.

You can set Start Primary Key Column to **Min Value** or **Custom** and End Primary Key Column to **Max Value** or **Custom**. If you select **Custom**, enter a custom value.

> Note
>
> - The value in the first primary key column takes priority when the range query mode is used. When the minimum and maximum values for the first primary key column are the same, the system uses the value in the second primary key column to perform the query. The query rules for the subsequent primary keys are the same as those for the first two primary keys.
> - The Custom range is a left-open and right-closed interval.

iv. Set **Count of Versions** to specify the maximum number of versions to return.

v. Set Sequence to **Forward Search** or **Backward Search**.

6. Click **OK**.

Data that meets the filter conditions is displayed based on the specified order on the **Data Editor** tab.

Delete data

You can delete data you no longer need.

1. Log on to the Tablestore console.
2. On the **Overview** page, click the name of the required instance or click **Manage Instance** in the Actions column corresponding to the instance.
3. In the **Table List** section of the **Instance Details** tab, click the name of the target table and click the **Data Editor** tab. You can also click **Data Editor** in the Actions column.
4. On the **Data Editor** tab, select the row of data you want to delete. Click **Delete**.
5. In the **Delete** message that appears, click **OK**.

7.3.5. Bind a VPC to a Tablestore instance

After you bind a VPC to a Tablestore instance, you can access the Tablestore instance from the ECS instances in the VPC in the same region.

Prerequisites

- A VPC that is within the same region as the Tablestore instance is created.
- After the VPC is created, create an ECS instance in the VPC.

Procedure

1. Log on to the Tablestore console.
2. On the **Overview** page, click the name of the required instance or click **Manage Instance** in the Actions column corresponding to the instance.
3. Click the **Network Management** tab.
4. On the **Network Management** tab, click **Bind VPC**.
5. In the **Bind VPC** dialog box, select a VPC and switch, enter **Instance VPC Name**.

   The name of a VPC can contain only letters and digits and must start with a letter. The name must be 3 to 16 bytes in length.
6. Click **OK**.

   After the VPC is bound to the instance, you can view the information of the VPC in the **VPC List** on the **Network Management** tab. You can use the VPC address to access the Tablestore instance from the ECS instances in the VPC.

After you bind a VPC, you can perform the following operations:

- Click **VPC Instance List** in the Actions column to view the VPC instances list, which contains the instance name, instance VPC name, and VPC domain name.
- Click **Unbind** in the Actions column to unbind the VPC from the instance. After the VPC is unbound, the ECS instance in the VPC can no longer access the Tablestore instance by using the VPC address. To access the Tablestore instance from the ECS instance, you must bind the VPC to the Tablestore instance again.

8.ApsaraDB RDS for MySQL

8.1. What is ApsaraDB RDS?

ApsaraDB Relational Database Service (RDS) is a stable, reliable, and scalable online database service. Based on the distributed file system and high-performance storage, ApsaraDB RDS provides a set of solutions for disaster recovery, backup, restoration, monitoring, and migration.

ApsaraDB RDS supports four storage engines, which are MySQL, SQL Server, PolarDB, and PostgreSQL. You can create database instances based on these storage engines to meet your business requirements.

RDS MySQL

Originally based on a branch of MySQL, ApsaraDB RDS for MySQL provides excellent performance. It is a tried and tested solution that handled the high-volume concurrent traffic during Double 11. ApsaraDB RDS for MySQL provides basic features, such as whitelist configuration, backup and restoration, Transparent Data Encryption (TDE), data migration, and management for instances, accounts, and databases. ApsaraDB RDS for MySQL also provides the following advanced features:

- **Read-only instance:** In scenarios where ApsaraDB RDS handles a small number of write requests but a large number of read requests, you can create read-only instances to scale up the reading capability and increase the application throughput.
- **Read/write splitting:** The read/write splitting feature provides a read/write splitting endpoint. This endpoint enables an automatic link for the primary instance and all its read-only instances. An application can connect to the read/write splitting endpoint to read and write data. Write requests are distributed to the primary instance and read requests are distributed to read-only instances based on their weights. To scale up the reading capability of the system, you can add more read-only instances.

8.2. Log on to the ApsaraDB RDS console

This topic describes how to log on to the ApsaraDB RDS console.

Prerequisites

- The URL of the Apsara Uni-manager Management Console is obtained from the deployment personnel before you log on to the Apsara Uni-manager Management Console.
- A browser is available. We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL of the Apsara Uni-manager Management Console. Press the Enter key.
2. Enter your username and password.

   Obtain the username and password that you can use to log on to the console from the operations administrator.

   > **Note** When you log on to the Apsara Uni-manager Management Console for the first time, you must change the password of your username. Your password must meet complexity requirements. The password must be 8 to 20 characters in length and must contain at least two of the following character types:
   >
   > - Uppercase or lowercase letters
   > - Digits
   > - Special characters, which include ! @ # $ %

3. Click **Login**.

4. In the top navigation bar, choose **Products** > Database Services > **ApsaraDB RDS**.

8.3. Quick start

8.3.1. Limits

To ensure instance stability and security, ApsaraDB RDS for MySQL has some service limits, as listed in the following table.

Operation	Description
Instance parameters	Instance parameters can be modified by using the ApsaraDB RDS console or API operations. Due to security and stability considerations, only specific parameters can be modified.
Root permissions of databases	The root or system administrator permissions are not provided.
Database backup	• Logical backup can be performed by using the command line interface (CLI) or graphical user interface (GUI). • Physical backup can be performed only by using the ApsaraDB RDS console or API operations.
Database restoration	• Logical restoration can be performed by using the CLI or GUI. • Physical restoration can be performed only by using the ApsaraDB RDS console or API operations.
ApsaraDB RDS for MySQL storage engine	Only InnoDB is supported. • To ensure performance and security, we recommend that you use the InnoDB storage engine. • The TokuDB engine is not supported. Percona no longer provides support for TokuDB, which leads to bugs that cannot be fixed and business losses in extreme cases. • The MyISAM engine is not supported. Due to the inherent shortcomings of the MyISAM engine, some data may be lost. Only some existing instances use the MyISAM engine. MyISAM engine tables in newly created instances are automatically converted to InnoDB engine tables. • The Memory engine is not supported. Newly created Memory tables are automatically converted into InnoDB tables.
Database replication	ApsaraDB RDS for MySQL provides dual-node clusters based on a primary/secondary replication architecture. The secondary instances in this replication architecture are hidden and cannot be accessed directly.
Instance restart	Instances must be restarted by using the ApsaraDB RDS console or API operations.
Account and database management	ApsaraDB RDS for MySQL manages accounts and databases by using the ApsaraDB RDS console. ApsaraDB RDS for MySQL also allows you to create a privileged account to manage users, passwords, and databases.
Standard account	• Authorization is not allowed. • The ApsaraDB RDS console allows you to manage accounts and databases. • Instances that support standard accounts also support privileged accounts.

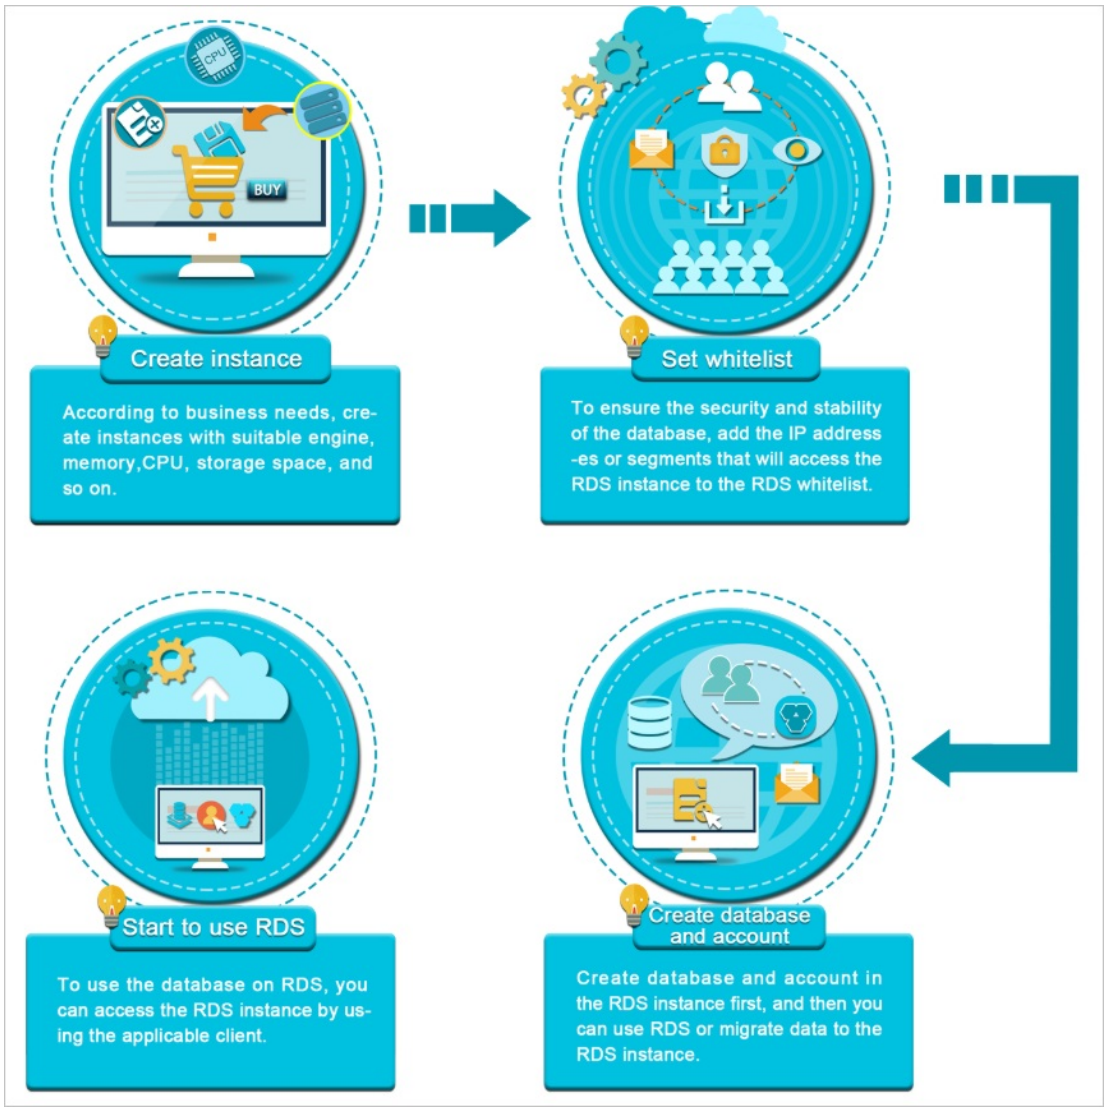
Operation	Description
Privileged account	• Authorization is allowed to standard accounts. • The ApsaraDB RDS console does not provide interfaces to manage accounts or databases. These operations can be performed only by using code or DMS. • The privileged account cannot be reverted to a standard account.

8.3.2. Procedure

ApsaraDB RDS quick start covers the following operations: creating an instance, configuring a whitelist, creating a database, creating an account, and connecting to the instance. This topic describes how to use ApsaraDB RDS and provides all the necessary information to create an ApsaraDB RDS instance. ApsaraDB RDS for MySQL is used in the example.

Typically, after an instance is created, you must perform several operations to make the instance ready for use, as shown in Quick start flowchart.

Quick start flowchart



- Create an instance

  An instance is a virtual database server on which you can create and manage multiple databases.

- Configure a whitelist

  After you create an ApsaraDB RDS instance, you must configure its whitelist to allow access from external devices.

  Whitelists make your ApsaraDB RDS instance more secure. We recommend that you maintain whitelists on a regular basis. The whitelist configuration process does not affect the normal operations of the ApsaraDB RDS instance.

- Create a database and Create an account

  Before you use a database, you must first create the database and an account in the ApsaraDB RDS instance.

- Connect to an ApsaraDB RDS for MySQL instance

  After you create an ApsaraDB RDS instance, configure a whitelist, and create a database and an account, you can connect to the instance by using a database client.

8.3.3. Create an instance

This topic describes how to create one or more instances in the ApsaraDB RDS console.

Prerequisites

An Apsara Stack tenant account is created.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, click **Create Instance** in the upper-right corner.
3. Configure the following parameters.

Section	Parameter	Description
Basic Settings	Organization	The organization to which the instance belongs.
	Resource Set	The resource set to which the instance belongs.
Region	Region	The region in which you want to create the instance. Services in different regions cannot communicate over an internal network. After you create an instance, its region cannot be changed.
	Zone of Primary Node	The zone where the primary instance is deployed.
	Deployment Method	Specifies whether to deploy the primary and secondary instances in separate zones. ApsaraDB RDS supports **Multi-zone Deployment** and **Single-zone Deployment**. If you select **Multi-zone Deployment**, you must configure **Zone of Secondary Node**.
	Zone of Secondary Node	The zone where the secondary instance is deployed. This parameter is available only when **Deployment Method** is set to **Multi-zone Deployment**. **Note** If you select the same zone for both the primary and secondary instances, the deployment is equivalent to single-zone deployment.
	Quantity	The number of ApsaraDB RDS instances that you want to create. Default value: 1.

Section	Parameter	Description
Specifications	**Instance Name**	The name of the instance. ○ The name must be 2 to 64 characters in length ○ The name must start with a letter. ○ The name can contain letters, digits, and the following special characters: _ - : ○ The name cannot start with http:// or https://.
	Connection Type	The connection type of the instance. ApsaraDB RDS instances support the following connection types: ○ **Internet**: ApsaraDB RDS instances of this connection type can be connected over the Internet. ○ **Internal Network**: ApsaraDB RDS instances of this connection type can be connected over an internal network. **Note** The value of this parameter cannot be changed after the instance is created. Proceed with caution.
	Database Engine	The database engine of the instance. Set the value to **MySQL**.
	Engine Version	The version of the database engine. Valid values: ○ 8.0 ○ 5.7 ○ 5.6
	Edition	The edition of the instance. For more information, see Instance types in *ApsaraDB RDS Product Introduction*.
	Storage Type	The storage type of the instance. Select local SSD.
	Instance Type	The instance type of the instance. Memory size determines the maximum number of connections and the input/output operations per second (IOPS). The actual values are displayed in the console. For more information, see Instance types in *ApsaraDB RDS Product Introduction*.
	Storage Capacity	The storage capacity of the instance, which includes the space to store data, system files, binlog files, and transaction files. For more information, see Instance types in *ApsaraDB RDS Product Introduction*.

Section	Parameter	Description
Network	Network Type	The network type of the instance. ApsaraDB RDS instances support the following network types: ○ **Classic Network**: Cloud services in the classic network are not isolated. Unauthorized access to a cloud service is blocked only by the security group or whitelist policy of the service. **Note** Instances that use standard SSDs cannot be deployed in the classic network. ○ **VPC**: A virtual private cloud (VPC) helps you build an isolated network environment on Apsara Stack. You can customize route tables, CIDR blocks, and gateways in a VPC. We recommend that you select VPC for improved security.
	VPC	Select a VPC. **Note** When **Network Type** is set to **VPC**, you must specify this parameter.
	vSwitch	Select a vSwitch. **Note** When **Network Type** is set to **VPC**, you must specify this parameter.
	IP Address Whitelist	The IP addresses that are allowed to connect to the instance.

4. Click **Submit**.

8.3.4. Initialization settings

8.3.4.1. Configure a whitelist

To ensure database security and reliability, you must modify the whitelist of an ApsaraDB RDS instance before you enable the instance. You must add the IP addresses or CIDR blocks that are used for database access to the whitelist.

Context

The whitelist improves the access security of your ApsaraDB RDS instance. We recommend that you maintain the whitelist on a regular basis. The whitelist configuration process does not affect the normal operations of the ApsaraDB RDS instance.

To configure a whitelist, perform the following operations:

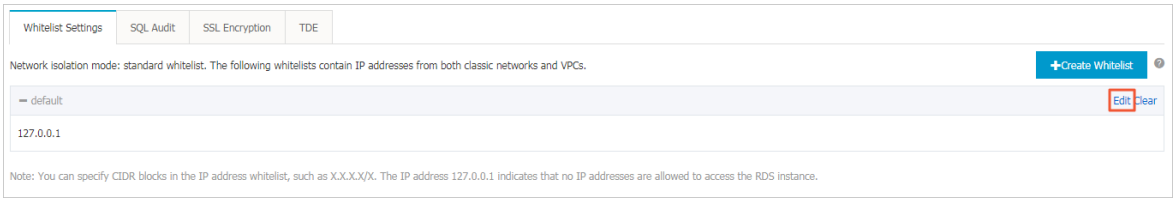
- Configure a whitelist: Add IP addresses to allow them to connect to the ApsaraDB RDS instance.
- Configure an ECS security group: Add an ECS security group for the ApsaraDB RDS instance to allow ECS instances in the group to connect to the ApsaraDB RDS instance.

Precautions

- The default whitelist can be modified or cleared, but cannot be deleted.
- You can add up to 1,000 IP addresses or CIDR blocks to a whitelist. If you want to add a large number of IP addresses, we recommend that you merge them into CIDR blocks, such as 192.168.1.0/24.

Configure a standard IP address whitelist

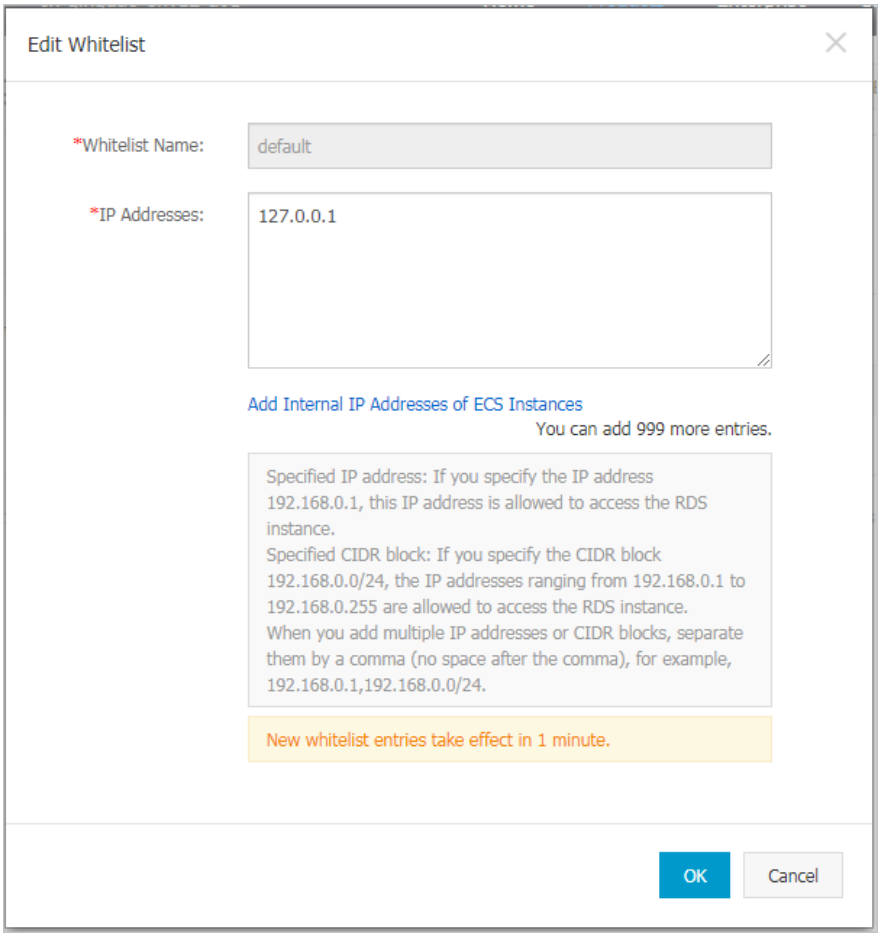
1. For more information, see Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find an instance. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
3. In the left-side navigation pane, click **Data Security**.
4. On the **Whitelist Settings** tab, click **Edit** corresponding to the **default** whitelist.



> **Note**
> - If you want to connect an ECS instance to an ApsaraDB RDS instance by using an internal endpoint, you must make sure that the two instances are in the same region and have the same network type. Otherwise, the connection fails.
> - You can also click **Create Whitelist** to create a new whitelist.

5. In the **Edit Whitelist** dialog box, enter the IP addresses or CIDR blocks that are allowed to access your ApsaraDB RDS instance, and then click **OK**.
   - If you add the CIDR block 10.10.10.0/24, all IP addresses in the 10.10.10.X format are allowed to access the ApsaraDB RDS instance.
   - If you enter more than one IP address or CIDR block, you must separate them with commas (,). Do not add spaces before or after the commas. Example: 192.168.0.1,172.16.213.9.
   - If you click **Add Internal IP Addresses of ECS Instances**, the IP addresses of all of the ECS instances that are created in your Alibaba Cloud account appear. Then, you can select the required IP addresses and add them to the whitelist.

> **Note** If you add a new IP address or CIDR block to the **default** whitelist, the default address 127.0.0.1 is deleted.



8.3.4.2. Create an account

After you create an ApsaraDB RDS instance and configure its IP address whitelist, you must create a database and an account on the instance. This topic describes how to create privileged and standard accounts.

Context

ApsaraDB RDS for MySQL supports two types of database accounts: privileged and standard. You can manage all your accounts and databases in the ApsaraDB RDS console. For more information about permissions that can be granted to each type of account, see Account permissions.

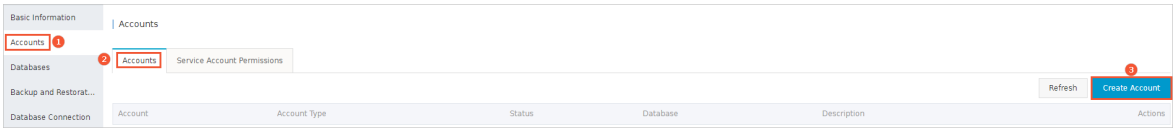
Account type	Description
Privileged account	• You can create and manage privileged accounts by using the ApsaraDB RDS console or API operations. • You can create only one privileged account on each ApsaraDB RDS instance. The privileged account can be used to manage all standard accounts and databases on the instance. • A privileged account allows you to manage permissions to a fine-grained level. For example, you can grant each standard account the permissions to query specific tables. • A privileged account has the permissions to disconnect all standard accounts on the instance.

Account type	Description
Standard account	• You can create and manage standard accounts by using the ApsaraDB RDS console, API operations, or SQL statements. • You can create up to 500 standard accounts on an instance. • You must manually grant standard accounts the specific database permissions. • You cannot use a standard account to create, manage, or disconnect other accounts from databases.

Account type	Maximum number of databases	Maximum number of tables	Maximum number of accounts
Privileged account	Unlimited	< 200,000	Varies based on the kernel parameter settings of the instance.
Standard account	500	< 200,000	Varies based on the kernel parameter settings of the instance.

Create a privileged account

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Accounts**.
5. On the **Accounts** page, click the **Accounts** tab.
6. Click **Create Account**.



7. On the **Create Account** page, configure the following parameters.

Parameter	Description
Database Account	Enter the name of the account. The account name must meet the following requirements: ○ The name is 1 to 16 characters in length. ○ The name starts with a lowercase letter and ends with a lowercase letter or digit. ○ The name contains lowercase letters, digits, and underscores (_).
Account Type	Select Privileged Account.
Password	Enter the password of the account. The password must meet the following requirements: ○ The password is 8 to 32 characters in length. ○ The password contains at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. ○ Special characters include ! @ # $ % ^ & * ( ) _ + - =

Parameter	Description
Re-enter Password	Enter the password of the account again.
Description	Optional. Enter information about the account to facilitate subsequent management. The description can be up to 256 characters in length.

8. Click **Create**.

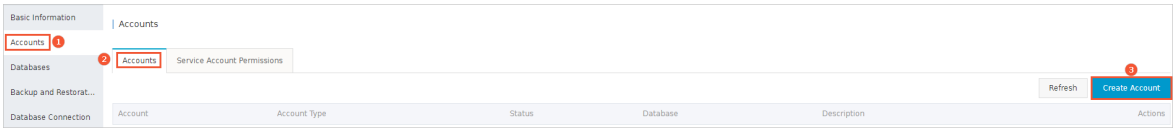
Reset the permissions of a privileged account

If an issue occurs on the privileged account, you can enter the password of the privileged account to reset permissions. For example, you can reset the permissions if the permissions are unexpectedly revoked.

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Accounts**.
5. On the **Accounts** page, click the **Accounts** tab.
6. On the **Accounts** tab, find the privileged account and click **Reset Permissions** in the Actions column.
7. On the **Initialize Account** page, enter the password of the privileged account and click **OK**.

Create a standard account

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Accounts**.
5. On the **Accounts** page, click the **Accounts** tab.
6. Click **Create Account**.



7. On the **Create Account** page, configure the following parameters.

Parameter	Description
Database Account	Enter the name of the account. The account name must meet the following requirements: ○ The name is 1 to 16 characters in length. ○ The name starts with a lowercase letter and ends with a lowercase letter or digit. ○ The name contains lowercase letters, digits, and underscores (_).
Account Type	Select Standard Account.

Parameter	Description
Authorized Databases	Select one or more databases on which you want to grant permissions to the account. You can also leave this parameter empty at this time and authorize databases after the account is created. i. Select one or more databases from the Unauthorized Databases section and click **Add** to add them to the Authorized Databases section. ii. In the Authorized Databases section, select the **Read/Write**, **Read-only**, **DDL Only**, or **DML Only** permissions on each authorized database. If you want to grant the same permissions on multiple databases to the account, click the button in the upper-right corner of the section. The button may appear as **Set All to Read/Write**.
Password	Enter the password of the account. The password must meet the following requirements: ○ The password is 8 to 32 characters in length. ○ The password contains at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. ○ Special characters include ! @ # $ % ^ & * ( ) _ + - =
Re-enter Password	Enter the password of the account again.
Description	Optional. Enter information about the account to facilitate subsequent management. The description can be up to 256 characters in length.

8. Click **Create**.

Account permissions

Account type	Authorization type	Permission				
Privileged account	-	SELECT	INSERT	UPDATE	DELETE	CREATE
		DROP	RELOAD	PROCESS	REFERENCES	INDEX
		ALTER	CREATE TEMPORARY TABLES	LOCK TABLES	EXECUTE	REPLICATION SLAVE
		REPLICATION CLIENT	CREATE VIEW	SHOW VIEW	CREATE ROUTINE	ALTER ROUTINE
		CREATE USER	EVENT	TRIGGER	-	-

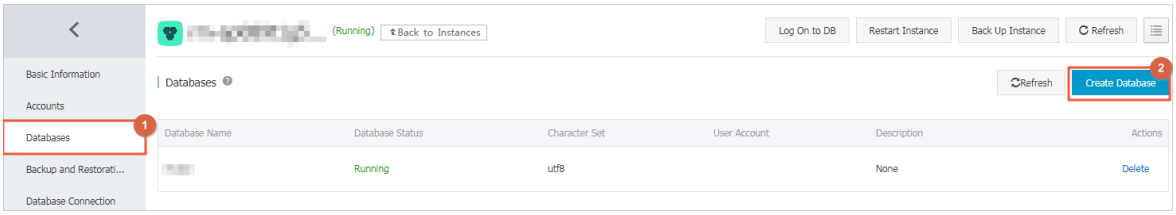
Account type	Authorization type	Permission				
Standard account	Read-only	SELECT	LOCK TABLES	SHOW VIEW	PROCESS	REPLICATION SLAVE
		REPLICATION CLIENT	-	-	-	-
	Read/write	SELECT	INSERT	UPDATE	DELETE	CREATE
		DROP	REFERENCES	INDEX	ALTER	CREATE TEMPORARY TABLES
		LOCK TABLES	EXECUTE	CREATE VIEW	SHOW VIEW	CREATE ROUTINE
		ALTER ROUTINE	EVENT	TRIGGER	PROCESS	REPLICATION SLAVE
		REPLICATION CLIENT	-	-	-	-
	DDL-only	CREATE	DROP	INDEX	ALTER	CREATE TEMPORARY TABLES
		LOCK TABLES	CREATE VIEW	SHOW VIEW	CREATE ROUTINE	ALTER ROUTINE
		PROCESS	REPLICATION SLAVE	REPLICATION CLIENT	-	-
	DML-only	SELECT	INSERT	UPDATE	DELETE	CREATE TEMPORARY TABLES
		LOCK TABLES	EXECUTE	SHOW VIEW	EVENT	TRIGGER
		PROCESS	REPLICATION SLAVE	REPLICATION CLIENT	-	-

8.3.4.3. Create a database

After you create an ApsaraDB RDS instance and configure its whitelist, you must create a database and an account in the instance.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Databases**.
5. Click **Create Database**.



6. Configure the following parameters.

Parameter	Description
Database Name	○ The name must be 1 to 64 characters in length. ○ The name must start with a letter and end with a letter or digit. ○ The name can contain lowercase letters, digits, underscores (_), and hyphens (-). ○ The name must be unique within the instance.
Supported Character Sets	Select utf8, gbk, latin1, utf8mb4, or all. If you want to use other character sets, select **all**, and then select the required character set from the list.
Description	Optional. Enter information about the database to facilitate subsequent management. The description can be up to 256 characters in length.

7. Click **Create**.

8.3.5. Connect to an ApsaraDB RDS for MySQL instance

After you complete the initial configuration of your ApsaraDB RDS for MySQL instance, you can connect to it from an Elastic Compute Service (ECS) instance or an on-premises client.

Context

After you perform operations such as Create an instance, Configure a whitelist, and Create an account, you can use a general database client or configure the endpoint, port number, and account information in an application to connect to the MySQL instance.

If you need to connect an ECS instance to an ApsaraDB RDS instance, you must make sure that both instances are in classic networks or in the same VPC, and the IP address of the ECS instance is correctly configured in the ApsaraDB RDS whitelist.

Connect to an instance from a client

ApsaraDB RDS for MySQL is fully compatible with open source MySQL. You can connect to an ApsaraDB RDS instance from a database client by using a method similar to the method that you use to connect to an open source MySQL database. In the following example, the HeidiSQL client is used.

1. Start the HeidiSQL client.
2. In the lower-left corner of the Session manager dialog box, click **New**.
3. Enter information about the ApsaraDB RDS instance that you want to connect. The following table describes the required parameters.

Parameter	Description
Network type	Select the network type of the ApsaraDB RDS instance that you want to connect. For this example, select **MariaDB or MySQL (TCP/IP)**.
Hostname / IP	Enter the internal or public endpoint of the ApsaraDB RDS instance. ○ If your client is deployed on an ECS instance that is in the same region and has the same network type as the ApsaraDB RDS instance, use the internal endpoint. For example, if your ECS and ApsaraDB RDS instances are both in a VPC located in the China (Hangzhou) region, you can use the internal endpoint of the ApsaraDB RDS instance to create a secure connection. ○ In other scenarios, use the public endpoint. To view the internal and public endpoints and port numbers of the ApsaraDB RDS instance, perform the following operations: i. Log on to the ApsaraDB for RDS console. ii. Find the ApsaraDB RDS instance to which you want to connect and click its ID. iii. In the **Basic Information** section, view the internal endpoint and internal port number of the instance. User	Enter the username of the account that you use to connect to the ApsaraDB RDS instance.
Password	Enter the password of the account.
Port	If you connect to the instance over an internal network, enter the internal port number of the instance. If you connect to the instance over the Internet, enter the public port number of the instance.

4. Click **Open**. If the connection information is correct, you can connect to the instance.

8.4. Instances

8.4.1. Create an instance

This topic describes how to create one or more instances in the ApsaraDB RDS console.

Prerequisites

An Apsara Stack tenant account is created.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, click **Create Instance** in the upper-right corner.
3. Configure the following parameters.

Section	Parameter	Description
Basic Settings	Organization	The organization to which the instance belongs.
	Resource Set	The resource set to which the instance belongs.
Region	Region	The region in which you want to create the instance. Services in different regions cannot communicate over an internal network. After you create an instance, its region cannot be changed.
	Zone of Primary Node	The zone where the primary instance is deployed.
	Deployment Method	Specifies whether to deploy the primary and secondary instances in separate zones. ApsaraDB RDS supports **Multi-zone Deployment** and **Single-zone Deployment**. If you select **Multi-zone Deployment**, you must configure **Zone of Secondary Node**.
	Zone of Secondary Node	The zone where the secondary instance is deployed. This parameter is available only when **Deployment Method** is set to **Multi-zone Deployment**. **Note** If you select the same zone for both the primary and secondary instances, the deployment is equivalent to single-zone deployment.
Specifications	Quantity	The number of ApsaraDB RDS instances that you want to create. Default value: 1.
	Instance Name	The name of the instance. ○ The name must be 2 to 64 characters in length ○ The name must start with a letter. ○ The name can contain letters, digits, and the following special characters: _ - : ○ The name cannot start with http:// or https://.
	Connection Type	The connection type of the instance. ApsaraDB RDS instances support the following connection types: ○ **Internet**: ApsaraDB RDS instances of this connection type can be connected over the Internet. ○ **Internal Network**: ApsaraDB RDS instances of this connection type can be connected over an internal network. **Note** The value of this parameter cannot be changed after the instance is created. Proceed with caution.
	Database Engine	The database engine of the instance. Set the value to **MySQL**.

Section	Parameter	Description
	Engine Version	The version of the database engine. Valid values: ○ 8.0 ○ 5.7 ○ 5.6
	Edition	The edition of the instance. For more information, see Instance types in *ApsaraDB RDS Product Introduction*.
	Storage Type	The storage type of the instance. Select local SSD.
	Instance Type	The instance type of the instance. Memory size determines the maximum number of connections and the input/output operations per second (IOPS). The actual values are displayed in the console. For more information, see Instance types in *ApsaraDB RDS Product Introduction*.
	Storage Capacity	The storage capacity of the instance, which includes the space to store data, system files, binlog files, and transaction files. For more information, see Instance types in *ApsaraDB RDS Product Introduction*.
Network	**Network Type**	The network type of the instance. ApsaraDB RDS instances support the following network types: ○ **Classic Network**: Cloud services in the classic network are not isolated. Unauthorized access to a cloud service is blocked only by the security group or whitelist policy of the service. **Note** Instances that use standard SSDs cannot be deployed in the classic network. ○ **VPC**: A virtual private cloud (VPC) helps you build an isolated network environment on Apsara Stack. You can customize route tables, CIDR blocks, and gateways in a VPC. We recommend that you select VPC for improved security.
	VPC	Select a VPC. **Note** When **Network Type** is set to **VPC**, you must specify this parameter.
	vSwitch	Select a vSwitch. **Note** When **Network Type** is set to **VPC**, you must specify this parameter.
	IP Address Whitelist	The IP addresses that are allowed to connect to the instance.

4. Click **Submit**.

8.4.2. Create an ApsaraDB RDS for MySQL instance with standard SSDs

Cloud disks are block-level data storage products provided by Alibaba Cloud for Elastic Compute Service (ECS). They provide low latency, high performance, durability, and reliability. This topic describes how to create one or more instances that use standard SSDs in the ApsaraDB RDS console.

Prerequisites

An instance that runs MySQL 5.7 on RDS High-availability Edition can be created.

Context

An ApsaraDB RDS instance with standard SSDs uses a distributed triplicate mechanism to ensure high data reliability. If service disruptions occur within a zone due to hardware faults, data in that zone is copied to an unaffected disk in another zone to ensure data availability.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, click **Create Instance** in the upper-right corner.
3. Configure the following parameters.

Section	Parameter	Description
Basic Settings	Organization	The organization to which the instance belongs.
	Resource Set	The resource set to which the instance belongs.
Region	Region	The region in which you want to create the instance. Services in different regions cannot communicate over an internal network. After you create an instance, its region cannot be changed.
	Zone of Primary Node	The zone where the primary instance is deployed.
	Deployment Method	Specifies whether to deploy the primary and secondary instances in separate zones. ApsaraDB RDS supports **Multi-zone Deployment** and **Single-zone Deployment**. If you select **Multi-zone Deployment**, you must configure **Zone of Secondary Node**.
	Zone of Secondary Node	The zone where the secondary instance is deployed. This parameter is available only when **Deployment Method** is set to **Multi-zone Deployment**. **Note** If you select the same zone for both the primary and secondary instances, the deployment is equivalent to single-zone deployment.
	Quantity	The number of ApsaraDB RDS instances that you want to create. Default value: 1.
	Instance Name	The name of the instance. ○ The name must be 2 to 64 characters in length. ○ The name must start with a letter. ○ The name can contain letters, digits, and the following special characters: _ - : ○ The name cannot start with http:// or https://.

Section	Parameter	Description
Specifications	Connection Type	The connection type of the instance. ApsaraDB RDS instances support the following connection types: ○ **Internet**: ApsaraDB RDS instances of this connection type can be connected over the Internet. ○ **Internal Network**: ApsaraDB RDS instances of this connection type can be connected over an internal network. **Note** The value of this parameter cannot be changed after the instance is created. Proceed with caution.
	Database Engine	The database engine of the instance. Select **MySQL**.
	Engine Version	The version of the database engine. Select **5.7**.
	Edition	The edition of the instance. Select **High-availability**.
	Storage Type	The storage type of the instance. Select **cloud ssd**.
	Encrypted	Specifies whether to encrypt the standard SSD. This parameter is available only when **Storage Type** is set to **cloud ssd**. If you select Encrypted, you must specify the **Encryption Key** parameter. If you do not have a key, you must first create one in Key Management Service (KMS). For more information, see Create a CMK in *Key Management Service User Guide*.
	Encryption Key	The key that is used to encrypt the standard SSD. This parameter is available only when you select **Encrypted**.
	Instance Type	The instance type of the instance. Memory size determines the maximum number of connections and the input/output operations per second (IOPS). The actual values are displayed in the console. For more information, see Instance types in *ApsaraDB RDS Product Introduction*.
	Storage Capacity	The storage capacity of the instance, which includes the space to store data, system files, binlog files, and transaction files. For more information, see Instance types in *ApsaraDB RDS Product Introduction*.
Network	Network Type	The network type of the instance. ApsaraDB RDS instances support the following network types: ○ **Classic Network**: Cloud services in the classic network are not isolated. Unauthorized access to a cloud service is blocked only by the security group or whitelist policy of the service. ○ **VPC**: A virtual private cloud (VPC) helps you build an isolated network environment on Apsara Stack. You can customize route tables, CIDR blocks, and gateways in a VPC. We recommend that you select VPC for improved security.
	VPC	Select a VPC. **Note** When **Network Type** is set to **VPC**, you must specify this parameter.

Section	Parameter	Description
	vSwitch	Select a vSwitch. **Note** When **Network Type** is set to **VPC**, you must specify this parameter.
	IP Address Whitelist	The IP addresses that are allowed to connect to the instance.

4. Click **Submit**.

8.4.3. View basic information of an instance

This topic describes how to view the details of an ApsaraDB RDS instance, such as its basic information, internal network connection information, status, and configurations.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. Use one of the following methods to go to the **Basic Information** page of an instance:
   - On the **Instances** page, click the ID of an instance to go to the **Basic Information** page.
   - On the **Instances** page, click **Manage** in the **Actions** column corresponding to an instance to go to the **Basic Information** page.

8.4.4. Restart an instance

This topic describes how to manually restart an ApsaraDB RDS for MySQL instance. This applies if the number of connections exceeds a specific threshold or if an instance has performance issues.

Prerequisites

The instance is in the **Running** state.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. Click **Restart Instance** in the upper-right corner.

   Note When you restart an instance, applications are disconnected from the instance. We recommend that you make appropriate service arrangements before you restart an instance. Proceed with caution.

5. In the Restart Instance message, click **Confirm**.

8.4.5. Change the specifications of an instance

This topic describes how to change specifications of your instance, such as the instance type and storage capacity, if the specifications do not meet the requirements of your application.

Procedure

1. Log on to the ApsaraDB RDS console.
2. Find your ApsaraDB RDS instance and click its ID.
3. In the **Configure Information** section of the **Basic Information** page, click **Change Specifications**.
4. On the **Change Specifications** page, set **Edition**, **Storage Type**, **Instance Type**, and **Storage Capacity**.
5. Click **Submit**.

8.4.6. Set a maintenance window

This topic describes how to set a maintenance window for an ApsaraDB RDS instance.

Context

To ensure the stability of ApsaraDB RDS instances, the backend system performs maintenance of the instances at irregular intervals. The default maintenance window is from 02:00 to 06:00. You can set the maintenance window to the off-peak period of your business to avoid impact on business.

Precautions

- To ensure the stability of the maintenance process, the instance changes to the **Maintaining Instance** state before the maintenance window. When the instance is in this state, access to data in the database and query operations such as performance monitoring are not affected. However, apart from account and database management and IP address whitelist configuration, modification operations such as upgrade, downgrade, and restart are temporarily unavailable.
- During the maintenance window, one or two transient connections may occur. Make sure that you configure automatic reconnection policies for your applications to avoid service disruptions.

Procedure

1. Connect to your ApsaraDB RDS instance. For more information, see Log on to the ApsaraDB RDS console.
2. Click the ID of an instance or click **Manage** in the **Actions** column corresponding to the instance.
3. In the **Configuration Information** section, click **Configure** to the right of **Maintenance Window**.
4. Select a maintenance window and click **Save**.

> **Note** The maintenance window is in UTC+8.

8.4.7. Change the data replication mode

You can set the data replication mode between primary and secondary ApsaraDB RDS instances to improve database availability.

Prerequisites

The ApsaraDB RDS instance uses local SSDs.

Context

- Semi-sync

  After an application-initiated update is complete on the primary instance of a cluster, logs are synchronized to all secondary instances. This transaction is considered committed after at least one secondary instance has received the logs, regardless of whether the secondary instance finishes executing the updates specified in the logs.

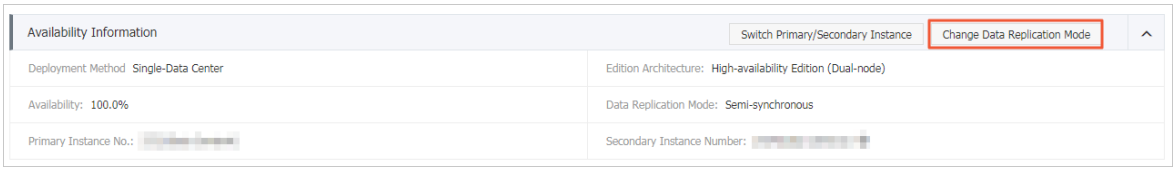
  If the secondary instances are unavailable or a network exception occurs between the primary and secondary instances, semi-synchronous replication degrades to the Asynchronous mode.

- Asynchronous

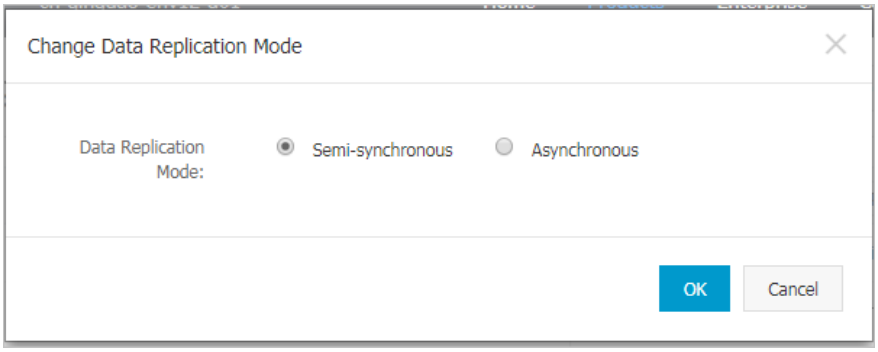
When your application initiates a request to add, delete, or modify data, the primary instance responds to your application immediately after it completes the operation. At the same time, the primary instance starts to asynchronously replicate data to its secondary instances. During asynchronous data replication, operations on the primary instance are not affected if the secondary instances are unavailable. If the primary instance is unavailable, data remains consistent.

Procedure

1. For more information, see Log on to the ApsaraDB RDS console.
2. Find your ApsaraDB RDS instance and click its ID.
3. In the left-side navigation pane, click **Service Availability**.
4. Click **Change Data Replication Mode**.



5. In the Change Data Replication Mode dialog box, select a data replication mode and click **OK**.



8.4.8. Release an instance

This topic describes how to manually release an instance.

Precautions

- Only instances in the running state can be released.
- After an instance is released, the instance data is immediately deleted. We recommend that you back up instance data before you release an instance.

Procedure

1. Log on to the ApsaraDB RDS console.
2. In the Actions column corresponding to the instance you want to release, choose **More > Release Instance**.
3. In the **Release Instance** message, click **Confirm**.

8.4.9. Upgrade the minor version of an instance

ApsaraDB RDS for MySQL supports automatic and manual updates of the minor version. These updates increase performance, unveil new features, and fix known issues.

Overview

ApsaraDB RDS for MySQL automatically upgrades the minor version by default. You can log on to the ApsaraDB RDS console, go to the **Basic Information** page of your ApsaraDB RDS instance, and then view the current **Minor Version Upgrade Mode** in the Configuration Information section.

- **Automatic Upgrade**: When a new minor version is released, the system automatically upgrades the minor version of your instance during the specified maintenance window. For more information, see Set a maintenance window.
- **Manual Upgrade**: You can manually upgrade the minor version on the **Basic Information** page. For more information, see Manually upgrade the minor version.

Precautions

- When you upgrade the minor version of your ApsaraDB RDS instance, a 30-second network interruption may occur. We recommend that you upgrade the minor version during off-peak hours or make sure that your applications are configured with automatic reconnection policies.
- The minor version of your ApsaraDB RDS instance cannot be downgraded after it is upgraded.
- After you upgrade the specifications of your ApsaraDB RDS instance, the minor version of the instance is upgraded.

Configure the minor version upgrade mode

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the **Configuration Information** section of the Basic Information page, click **Configure** to the right of **Minor Version Upgrade Mode**.
5. In the Set Minor Version Upgrade Mode dialog box,select **Auto** or **Manual**, and click **OK**.

Manually upgrade the minor version

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the **Configuration Information** section of the page, click **Upgrade Minor Version**.

   > **Note** The **Upgrade Minor Version** button is displayed only when a new minor version is available.

5. In the dialog box that appears, specify the upgrade time and click **OK**.

FAQ

- Q: After I upgraded the minor version of my ApsaraDB RDS instance, why does the SELECT @@version statement still return the source minor version that I used before the upgrade?

  A: The SELECT @@version statement returns the minor version of Alibaba Cloud, not the minor version of the ApsaraDB RDS for MySQL instance. You need to execute the `show variables like '%rds_release_date%'` statement to view the minor version of your instance.

- Q: When an upgrade takes effect, is my instance upgraded only to the next minor version?

  A: No, when an upgrade takes effect, your instance is upgraded to the latest minor version.

8.4.10. Modify parameters of an instance

This topic describes how to view and modify the values of some parameters and query parameter modification records in the console.

Precautions

- To ensure instance stability, you can select specific parameters to modify in the ApsaraDB RDS console.
- When you modify parameters on the **Editable Parameters** tab, refer to the **Value Range** column corresponding to each parameter.
- After some parameters are modified, you must restart your ApsaraDB RDS instance for the changes to take effect. For more information, see the **Force Restart** column on the **Editable Parameters** tab. We recommend that you modify the parameters of an instance during off-peak hours and make sure that your applications are configured with automatic reconnection policies.

Modify parameters

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Parameters**.
5. You can perform the following operations:

   Export the parameter settings of the ApsaraDB RDS instance to your computer.

   On the Editable Parameters tab, click **Export Parameters**. The parameter settings of the ApsaraDB RDS instance are exported as a TXT file to your computer.

   Modify and import the parameter settings.

   i. After you have modified parameters in the exported parameter file, click **Import Parameters** and copy the parameter settings to the field.

   ii. Click **OK**.

   iii. In the upper-right corner of the page, click **Apply Changes**.

   > **Note**
   > - If the new parameter value takes effect only after an instance restarts, the system prompts you to restart the ApsaraDB RDS instance. We recommend that you restart the ApsaraDB RDS instance during off-peak hours and make sure that your applications are configured with automatic reconnection policies.
   > - Before the new parameter values are applied, you can click **Cancel Changes** to cancel them.

   Modify a single parameter.

   i. On the **Editable Parameters** tab, find the parameter that you want to reconfigure, and click the icon in the **Actual Value** column.

   ii. Enter a new value based on the prompted value range.

   iii. Click **Confirm**.

iv. In the upper-right corner of the page, click **Apply Changes**.

> Note
>
> - If the new parameter value takes effect only after an instance restarts, the system prompts you to restart the ApsaraDB RDS instance. We recommend that you restart the ApsaraDB RDS instance during off-peak hours and make sure that your applications are configured with automatic reconnection policies.
> - Before the new parameter value is applied, you can click **Cancel Changes** to cancel it.

View the parameter modification history

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Parameters**.
5. On the Parameters page, click the **Edit History** tab.
6. Select a time range and then click **Search**.

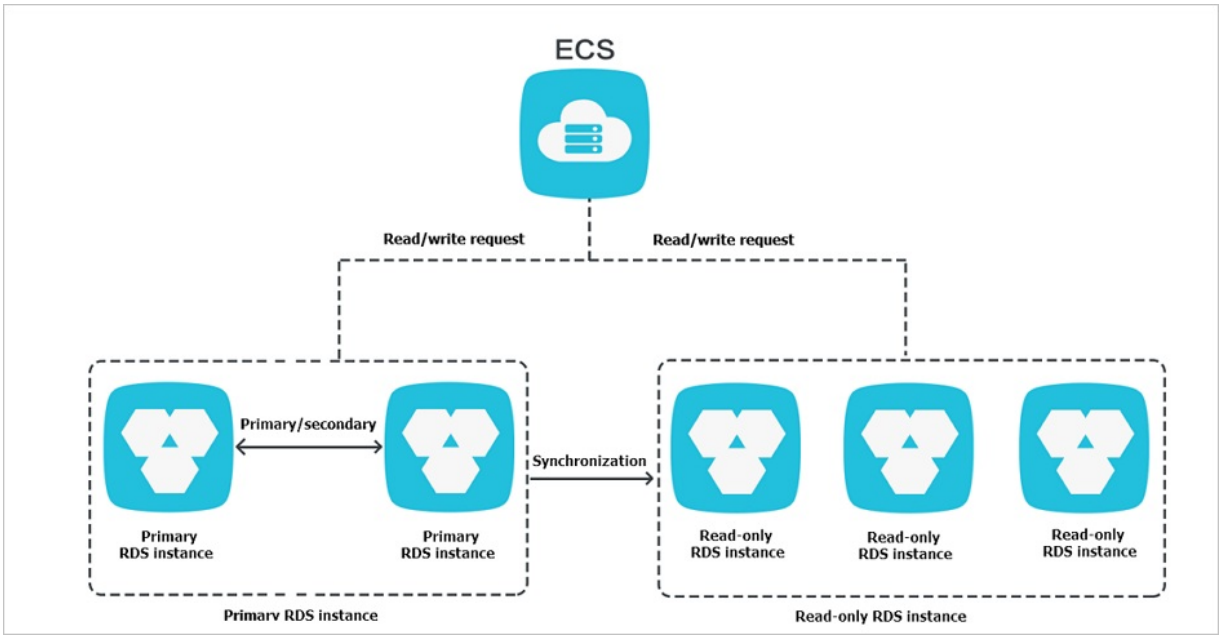
8.4.11. Read-only instances

8.4.11.1. Overview of read-only instances

ApsaraDB RDS for MySQL allows you to create read-only instances. In scenarios where an instance has a small number of write requests but a large number of read requests, you can create read-only instances to distribute database access loads away from the primary instance. This topic describes the features and limits of read-only instances.

To scale up the reading capability and distribute database access loads, you can create one or more read-only instances in a region. Read-only instances can increase the application throughput when a large amount of data is being read.

A read-only instance with a single physical node and no backup node uses the native replication capability of MySQL to synchronize changes from the primary instance to all its read-only instances. Read-only instances must be in the same region as the primary instance but do not have to be in the same zone as the primary instance. The following figure shows the topology of read-only instances.



Read-only instances have the following features:

- Specifications of a read-only instance can be different from those of the primary instance and can be changed at any time. This facilitates elastic scaling.
- Read-only instances do not require account or database maintenance. Account and database information is synchronized from the primary instance.
- The whitelists of read-only instances can be independently configured.
- System performance monitoring is provided.

  ApsaraDB RDS provides up to 20 system performance monitoring views, including those for disk capacity, IOPS, connections, CPU utilization, and network traffic. You can view the load of instances.
- ApsaraDB RDS provides a variety of optimization recommendations, such as storage engine check, primary key check, large table check, and check for excessive indexes and missing indexes. You can optimize your databases based on the optimization recommendations and specific applications.

8.4.11.2. Create a read-only instance

You can create read-only instances of different specifications based on your business requirements.

Precautions

- A maximum of five read-only instances can be created for a primary instance.
- Backup settings and temporary backup are not supported.
- Instance restoration is not supported.
- Data migration to read-only instances is not supported.
- Database creation and deletion are not supported.
- Account creation, deletion, authorization, and password changes are not supported.
- After a read-only instance is created, you cannot restore data by directly overwriting the primary instance with a backup set.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic**

Information page.

4. In the **Distributed by Instance Role** section on the right side of the **Basic Information** page, click **Create Read-only Instance**.
5. On the **Create Read-only Instance** page, configure the following parameters.

Section	Parameter	Description
Region	**Region**	The region in which you want to create the read-only instance.
Specifications	**Database Engine**	The database engine of the read-only instance, which is the same as that of the primary instance and cannot be changed.
	Engine Version	The version of the database engine, which is the same as that of the primary instance and cannot be changed.
	Edition	Set the value to **Read-only**.
	Instance Type	The instance type of the read-only instance. The instance type of the read-only instance can be different from that of the primary instance, and can be changed at any time to facilitate flexible upgrade and downgrade.
	Storage Capacity	The storage capacity of the read-only instance. To ensure sufficient I/O throughput for data synchronization, we recommend that you select at least the same instance type and storage capacity as the primary instance for the read-only instance. Valid values: 20 to 6000. Unit: GB. The value is in 1 GB increments.
Network Type	**Network Type**	The network type of the read-only instance, which is the same as that of the primary instance and cannot be changed.
	VPC	The VPC in which you want to create the read-only instance.
	vSwitch	The vSwitch in the VPC.

6. After you configure the preceding parameters, click **Submit**.

8.4.11.3. View details of read-only instances

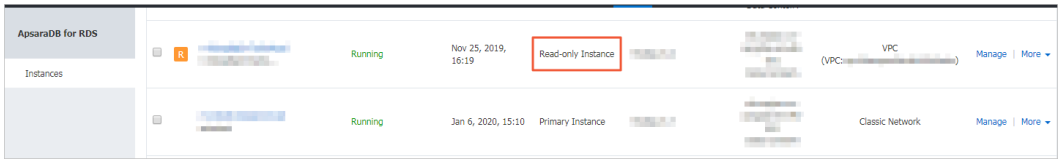
This topic describes how to view details of read-only instances. You can go to the Basic Information page of a read-only instance from the Instances page or from the read-only instance list of the primary instance. Read-only instances are managed in the same way as primary instances. The read-only instance management page shows the management operations that can be performed.

View details of a read-only instance from the Instances page

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, click the ID of a read-only instance. The **Basic Information** page appears.

   In the instance list, Instance Role of read-only instances is displayed as Read-only Instance, as shown in View a read-only instance.

   View a read-only instance



View details of a read-only instance from the Basic Information page of the primary instance

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. On the **Basic Information** page, move the pointer over the number below **Read-only Instance** in the **Distributed by Instance Role** section. The ID of the read-only instance is displayed.
5. Click the ID of the read-only instance to go to the read-only instance management page.

8.5. Accounts

8.5.1. Create an account

After you create an ApsaraDB RDS instance and configure its IP address whitelist, you must create a database and an account on the instance. This topic describes how to create privileged and standard accounts.

Context

ApsaraDB RDS for MySQL supports two types of database accounts: privileged and standard. You can manage all your accounts and databases in the ApsaraDB RDS console. For more information about permissions that can be granted to each type of account, see Account permissions.

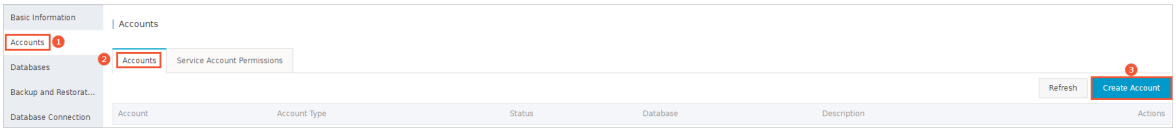
Account type	Description
Privileged account	• You can create and manage privileged accounts by using the ApsaraDB RDS console or API operations. • You can create only one privileged account on each ApsaraDB RDS instance. The privileged account can be used to manage all standard accounts and databases on the instance. • A privileged account allows you to manage permissions to a fine-grained level. For example, you can grant each standard account the permissions to query specific tables. • A privileged account has the permissions to disconnect all standard accounts on the instance.
Standard account	• You can create and manage standard accounts by using the ApsaraDB RDS console, API operations, or SQL statements. • You can create up to 500 standard accounts on an instance. • You must manually grant standard accounts the specific database permissions. • You cannot use a standard account to create, manage, or disconnect other accounts from databases.

Account type	Maximum number of databases	Maximum number of tables	Maximum number of accounts
Privileged account	Unlimited	< 200,000	Varies based on the kernel parameter settings of the instance.

Account type	Maximum number of databases	Maximum number of tables	Maximum number of accounts
Standard account	500	< 200,000	Varies based on the kernel parameter settings of the instance.

Create a privileged account

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Accounts**.
5. On the **Accounts** page, click the **Accounts** tab.
6. Click **Create Account**.



7. On the **Create Account** page, configure the following parameters.

Parameter	Description
Database Account	Enter the name of the account. The account name must meet the following requirements: ○ The name is 1 to 16 characters in length. ○ The name starts with a lowercase letter and ends with a lowercase letter or digit. ○ The name contains lowercase letters, digits, and underscores (_).
Account Type	Select Privileged Account.
Password	Enter the password of the account. The password must meet the following requirements: ○ The password is 8 to 32 characters in length. ○ The password contains at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. ○ Special characters include ! @ # $ % ^ & * ( ) _ + - =
Re-enter Password	Enter the password of the account again.
Description	Optional. Enter information about the account to facilitate subsequent management. The description can be up to 256 characters in length.

8. Click **Create**.

Reset the permissions of a privileged account

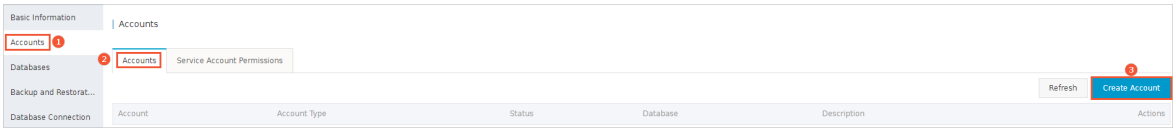
If an issue occurs on the privileged account, you can enter the password of the privileged account to reset permissions. For example, you can reset the permissions if the permissions are unexpectedly revoked.

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.

3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Accounts**.
5. On the **Accounts** page, click the **Accounts** tab.
6. On the **Accounts** tab, find the privileged account and click **Reset Permissions** in the Actions column.
7. On the **Initialize Account** page, enter the password of the privileged account and click **OK**.

Create a standard account

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Accounts**.
5. On the **Accounts** page, click the **Accounts** tab.
6. Click **Create Account**.



7. On the **Create Account** page, configure the following parameters.

Parameter	Description
Database Account	Enter the name of the account. The account name must meet the following requirements: ○ The name is 1 to 16 characters in length. ○ The name starts with a lowercase letter and ends with a lowercase letter or digit. ○ The name contains lowercase letters, digits, and underscores (_).
Account Type	Select Standard Account.
Authorized Databases	Select one or more databases on which you want to grant permissions to the account. You can also leave this parameter empty at this time and authorize databases after the account is created. i. Select one or more databases from the Unauthorized Databases section and click **Add** to add them to the Authorized Databases section. ii. In the Authorized Databases section, select the **Read/Write**, **Read-only**, **DDL Only**, or **DML Only** permissions on each authorized database. If you want to grant the same permissions on multiple databases to the account, click the button in the upper-right corner of the section. The button may appear as **Set All to Read/Write**.
Password	Enter the password of the account. The password must meet the following requirements: ○ The password is 8 to 32 characters in length. ○ The password contains at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. ○ Special characters include ! @ # $ % ^ & * ( ) _ + - =

Parameter	Description
Re-enter Password	Enter the password of the account again.
Description	Optional. Enter information about the account to facilitate subsequent management. The description can be up to 256 characters in length.

8. Click **Create**.

Account permissions

Account type	Authorization type	Permission				
Privileged account	-	SELECT	INSERT	UPDATE	DELETE	CREATE
		DROP	RELOAD	PROCESS	REFERENCES	INDEX
		ALTER	CREATE TEMPORARY TABLES	LOCK TABLES	EXECUTE	REPLICATION SLAVE
		REPLICATION CLIENT	CREATE VIEW	SHOW VIEW	CREATE ROUTINE	ALTER ROUTINE
		CREATE USER	EVENT	TRIGGER	-	-
Standard account	**Read-only**	SELECT	LOCK TABLES	SHOW VIEW	PROCESS	REPLICATION SLAVE
		REPLICATION CLIENT	-	-	-	-
	Read/write	SELECT	INSERT	UPDATE	DELETE	CREATE
		DROP	REFERENCES	INDEX	ALTER	CREATE TEMPORARY TABLES
		LOCK TABLES	EXECUTE	CREATE VIEW	SHOW VIEW	CREATE ROUTINE
		ALTER ROUTINE	EVENT	TRIGGER	PROCESS	REPLICATION SLAVE
		REPLICATION CLIENT	-	-	-	-
	DDL-only	CREATE	DROP	INDEX	ALTER	CREATE TEMPORARY TABLES
		LOCK TABLES	CREATE VIEW	SHOW VIEW	CREATE ROUTINE	ALTER ROUTINE
		PROCESS	REPLICATION SLAVE	REPLICATION CLIENT	-	-

Account type	Authorization type	Permission				
	DML-only	SELECT	INSERT	UPDATE	DELETE	CREATE TEMPORARY TABLES
		LOCK TABLES	EXECUTE	SHOW VIEW	EVENT	TRIGGER
		PROCESS	REPLICATION SLAVE	REPLICATION CLIENT	-	-

8.5.2. Reset the password

You can use the ApsaraDB RDS console to reset the password of your database account.

Prerequisites

The instance is in the **Running** state.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Accounts**.
5. Find an account and click **Reset Password** in the Actions column.
6. In the dialog box that appears, enter and confirm the new password, and then click **OK**.

> **Note** The password must meet the following requirements:
>
> - The password must be 8 to 32 characters in length.
> - The password must contain at least three of the following characters: uppercase letters, lowercase letters, digits, and special characters.
> - Special characters include ! @ # $ % ^ & * ( ) _ + - =

8.5.3. Modify account permissions

You can modify the account permissions of your ApsaraDB RDS instance at any time.

Prerequisites

You can modify the permissions of a standard account. The permissions of privileged accounts can only be reset to the default settings and cannot be changed to a specific set of permissions.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic**

Information page.

4. In the left-side navigation pane, click **Accounts**.
5. Find an account and click **Edit Permissions** in the Actions column.
6. Configure the following parameters

Parameter	Description
Authorized Databases	In the **Unauthorized Databases** section, select a database and click **Add** to authorize the database. In the **Authorized Databases** section, select a database and click **Remove** to remove the permissions from the database.
Authorized Databases	You can set permissions on each database in the Authorized Database section. You can also click the button such as **Set All to Read/Write** in the upper-right corner to set the permissions of the account on all authorized databases. ○ **Read-only**: grants the database read-only permissions to the account. ○ **Read/Write**: grants the database read/write permissions to the account. ○ **DDL Only**: grants the database permissions of DDL operations to the account. ○ **DML Only**: grants the database permissions of DML operations to the account.

7. Click **OK**.

8.5.4. Delete an account

You can delete a database account in the ApsaraDB RDS console.

Prerequisites

You can use the console to delete privileged and standard accounts that are no longer used.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Accounts**.
5. Find the account you want to delete and click **Delete** in the Actions column.
6. In the message that appears, click **Confirm**.

> **Note** Accounts in the **Processing** state cannot be deleted.

8.6. Databases

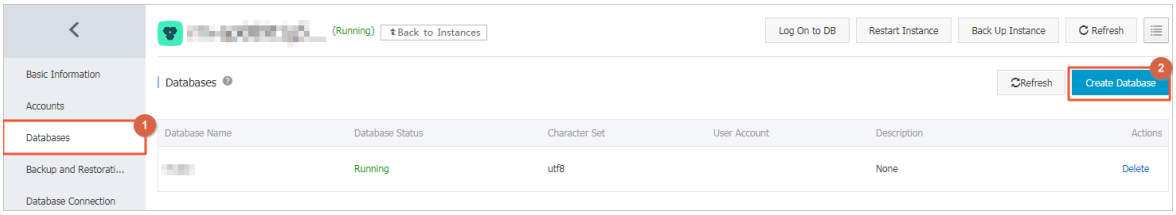
8.6.1. Create a database

After you create an ApsaraDB RDS instance and configure its whitelist, you must create a database and an account in the instance.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.

3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Databases**.
5. Click **Create Database**.



6. Configure the following parameters.

Parameter	Description
Database Name	○ The name must be 1 to 64 characters in length. ○ The name must start with a letter and end with a letter or digit. ○ The name can contain lowercase letters, digits, underscores (_), and hyphens (-). ○ The name must be unique within the instance.
Supported Character Sets	Select utf8, gbk, latin1, utf8mb4, or all. If you want to use other character sets, select **all**, and then select the required character set from the list.
Description	Optional. Enter information about the database to facilitate subsequent management. The description can be up to 256 characters in length.

7. Click **Create**.

8.6.2. Delete a database

You can delete databases that are no longer used in the ApsaraDB RDS console.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Databases**.
5. Find the database you want to delete and click **Delete** in the Actions column.
6. In the Delete Database message, click **Confirm**.

8.7. Database connection

8.7.1. Change the endpoint and port number of an instance

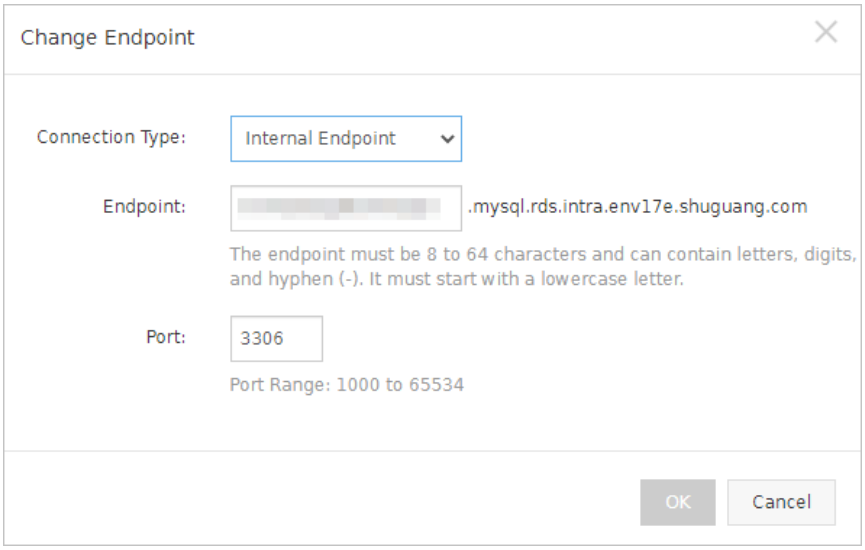
This topic describes how to view and change the endpoint and port number of an instance.

View the endpoint and port number

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Connection**.
   You can view **Internal Endpoint** and **Internal Port** of the instance on the **Database Connection** page. If you apply for a public endpoint, you can also view **Public Endpoint** and **Public Port**.

Change the endpoint and port number

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Connection**.
5. Click **Change Endpoint**.
6. In the **Change Endpoint** dialog box, select a connection type from the **Connection Type** drop-down list.
7. Set **Endpoint** and **Port**, and click **OK**.



> **Note**
> - The prefix of an endpoint must be 8 to 64 characters in length and can contain only letters, digits, and hyphens (-). It must start with a lowercase letter.
> - The port number must be a value within the range of 1000 to 65534.

8.7.2. Log on to an ApsaraDB RDS instance by using DMS

This topic describes how to log on to an ApsaraDB RDS instance by using Data Management (DMS).

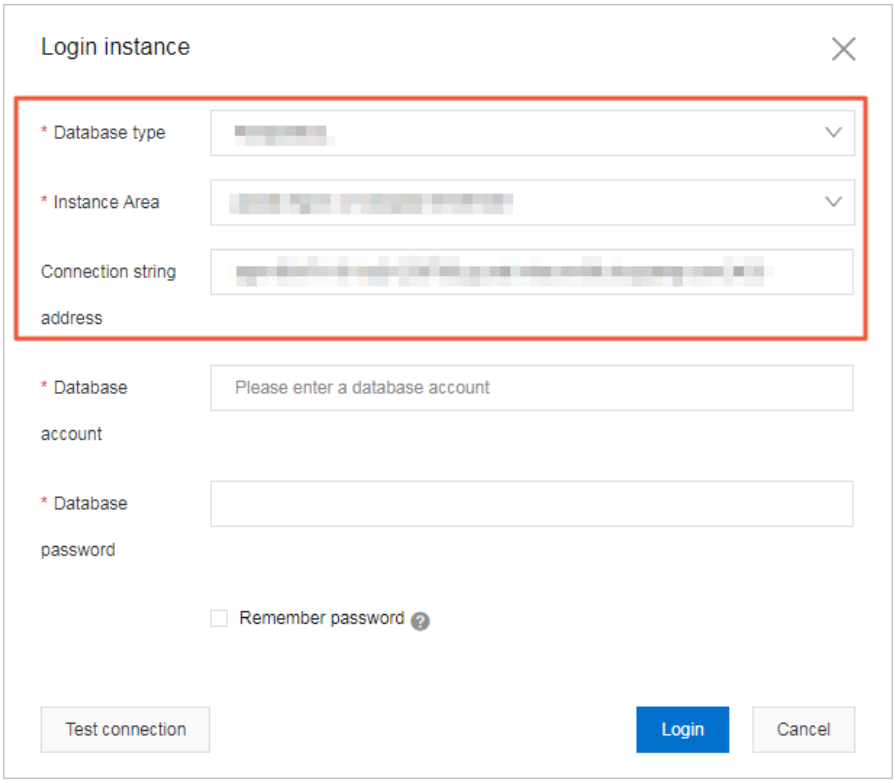
Prerequisites

The IP address whitelist is configured. For more information about how to configure an IP address whitelist, see

Configure a whitelist.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the upper-right corner of the page, click **Log On to DB** to go to the Database Logon page.
5. In the **Login instance** dialog box of the **DMS** console, check the **database type**, **instance area**, and **connection string address**. If the preceding information is correct, enter the **database account** and **database password**, as shown in the following figure.



Parameter	Description
Database type	The database engine of the instance. By default, this parameter is set to the database engine of the instance that you want to access.
Instance Area	The region where the instance resides. By default, this parameter is set to the region where the current instance resides.
Connection string address	The endpoint and port number that are used to connect to the instance. By default, this parameter is set to the endpoint and port number of the current instance.
Database account	The account that is used to connect to the database.
Database Password	The password of the account that is used to connect to the database.

6. Click **Login**.

> **Note** If you want the browser to remember the password, select **Remember password** before you click **Login**.

8.7.3. Hybrid access from both the classic network and VPCs

This topic describes how to use the hybrid access solution of ApsaraDB RDS to change the network type of an instance from classic network to Virtual Private Network (VPC) without network interruptions.

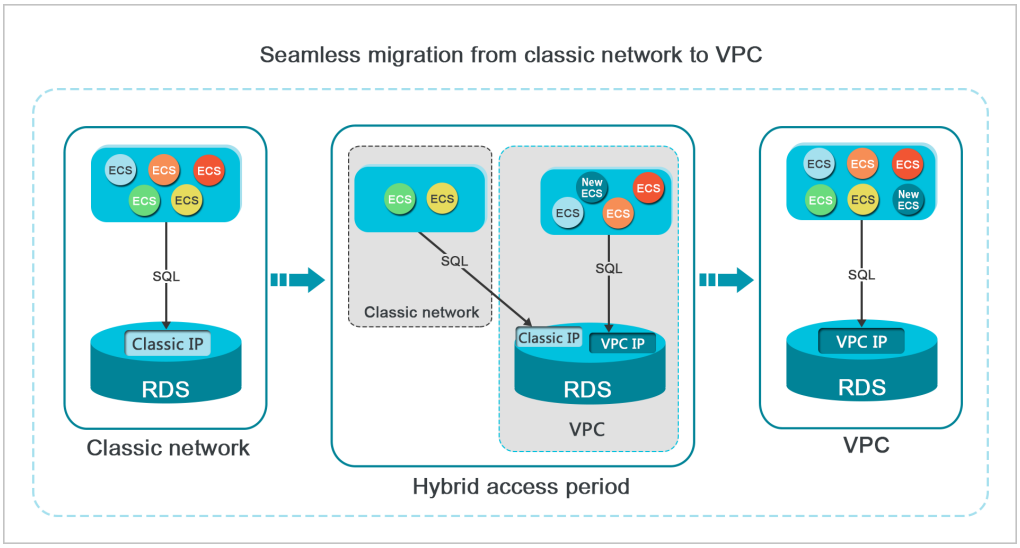
Background

In the past, when you change the network type of an ApsaraDB RDS instance from classic network to VPC, the internal endpoint of the instance would remain the same but the IP address bound to the endpoint would change to the corresponding IP address in the VPC. This change would cause a 30-second network interruption, and ECS instances within the classic network would not be able to access the ApsaraDB RDS instance by using the internal endpoint within this period. To smoothly change the network type, ApsaraDB RDS provides the hybrid access solution.

Hybrid access refers to the ability of an ApsaraDB RDS instance to be accessed by ECS instances in both the classic network and VPCs. During the hybrid access period, the ApsaraDB RDS instance reserves the original internal endpoint of the classic network and adds the internal endpoint of VPCs. This prevents network interruptions during the network type switchover.

For security and performance purposes, we recommend that you use only the internal VPC endpoint. Therefore, ApsaraDB RDS allows the configured hybrid access solution to remain valid only for a specific period. When the hybrid access period elapses, ApsaraDB RDS releases the internal classic network endpoint. In this case, your applications cannot connect to your ApsaraDB RDS instance by using the internal classic network endpoint. You must add the internal VPC endpoint to all your applications during the hybrid access period. This ensures a smooth network migration and avoids interruptions to your workloads.

For example, your company wants to use the hybrid access solution to change the network type from classic network to VPC. During the hybrid access period, some applications can access the database by using the internal endpoint of VPCs, and the other applications can access the database by using the original internal endpoint of the classic network. When all the applications access the database by using the internal endpoint of VPCs, the internal endpoint of the classic network can be released. The following figure illustrates the scenario.



Limits

During the hybrid access period, the instance has the following limits:

- The network type of the instance cannot be changed to classic network.
- The instance cannot be migrated to another zone.

Prerequisites

- The network type of the instance is classic network.
- Available VPCs and vSwitches exist in the zone where the instance resides.

Change the network type from classic network to VPC

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Connection**.
5. On the Instance Connection tab, click **Switch to VPC**.
6. In the Switch to VPC dialog box, select a VPC and a vSwitch and specify whether to retain the endpoint used in the classic network.

   Determine whether to select **Reserve Original Classic Endpoint** based on the details described in the following table.

Operation	Description
Clear the Reserve Original Classic Network Endpoint option	The endpoint used in the classic network is replaced with an endpoint in the VPC. When you change the network type, a network interruption of about 30 seconds occurs, and the connection between ECS instances in the classic network and the ApsaraDB RDS instance are interrupted.
Select the Reserve Original Classic Network Endpoint option	The endpoint used in the classic network is retained, and a new endpoint to be used in the VPC is generated. In such cases, the ApsaraDB RDS instance runs in hybrid access mode. ECS instances in both the classic network and a VPC can connect to the ApsaraDB RDS instance over the internal network. When you change the network type, no network interruption occur. Connections between ECS instances in the classic network and the ApsaraDB RDS instance are available till the endpoint used in the classic network expires. Specify the expiration time of the classic network endpoint. You must add the new VPC endpoint to the ECS instance before the endpoint in the classic network expires. This ensures smooth network switchover.

7. Add the internal IP addresses of ECS instances in the selected VPC to a VPC whitelist. This allows the ECS instances to access the ApsaraDB RDS instance over the internal network. If no VPC whitelists are available, create a whitelist. For more information, see Configure a whitelist.

Change the expiration time for the original internal endpoint of the classic network

During the period in which your instance can be connected over the classic network or VPCs, you can specify the expiration time for the endpoint of the classic network. The setting takes effect immediately. For example, if the endpoint of the classic network expires on August 18, 2017 and you change the expiration time to 14 days later on August 15, 2017, the endpoint of the classic network is released on August 29, 2017.

To change the expiration time, perform the following operations:

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Connection**.
5. Click **Change Expiration Time**.
6. In the **Change Expiration Time** dialog box, select an expiration time and click **OK**.

8.7.4. Change the network type of an instance

This topic describes how to change the network type of an ApsaraDB RDS instance between classic network and VPC.

Context

- Classic network: ApsaraDB RDS instances in the classic network are not isolated. Unauthorized access to these instances can be blocked only by whitelists.
- VPC: Each VPC is an isolated network. We recommend that you select the VPC network type because it is more secure than the classic network.

  You can configure route tables, CIDR blocks, and gateways in a VPC. To smoothly migrate applications to the cloud, you can use leased lines or VPNs to connect on-premises data center to a VPC to create a virtual data center.

Change the network type from VPC to classic network

Precautions

- After you change the network type from VPC to classic network, the internal endpoint of your ApsaraDB RDS instance remains unchanged. However, the IP address that is associated with the internal endpoint changes.
- After you change the network type from VPC to classic network, ECS instances in the same VPC as the ApsaraDB RDS instance can no longer connect to the ApsaraDB RDS instance by using the internal endpoint. You must update the endpoint for the applications deployed on the ECS instances.
- When you change the network type, a 30-second network interruption may occur. To avoid business interruption, change the network type during off-peak hours or make sure that your applications are configured with automatic reconnection policies.

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Connection**.
5. In the upper-right corner of the Database Connection section, click **Switch to Classic Network**.
6. In the message that appears, click **OK**.

Change the network type from classic network to VPC

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Connection**.
5. In the upper-right corner of the Database Connection section, click **Switch to VPC**.
6. In the Switch to VPC dialog box, select a VPC and vSwitch and specify whether to **Reserve Original Classic**

Network Endpoint. Click OK. For more information about **Reserve Original Classic Network Endpoint**, see Hybrid access from both the classic network and VPCs.

8.7.5. Switch an ApsaraDB RDS for MySQL instance to a new VPC or vSwitch

This topic describes how to switch an ApsaraDB RDS for MySQL instance to a new VPC or vSwitch.

Prerequisites

The instance is deployed in a VPC.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Connection**.
5. In the upper-right corner of the Database Connection section, click **Switch VSwitch**.
6. Select a VPC and a vSwitch, and then click **OK**.
7. In the message that appears, click **Switch**.

> **Note**
> - A 30-second network interruption occurs when you switch the VPC and vSwitch of an ApsaraDB RDS for MySQL instance. Make sure that your application is configured to automatically reconnect to the ApsaraDB RDS for MySQL instance.
> - We recommend that you clear the cache immediately after the instance is switched to a new VPC and vSwitch. Otherwise, data can only be read but cannot be written.

8.8. Database proxy

8.8.1. Dedicated proxy

This topic describes the dedicated proxy feature provided by ApsaraDB RDS for MySQL. The dedicated proxy feature provides advanced features such as read/write splitting, connection pooling, and transaction splitting.

Prerequisites

Your ApsaraDB RDS instance runs one of the following MySQL versions and RDS editions:

- MySQL 5.6 on RDS High-availability Edition (with local SSDs)
- MySQL 5.7 on RDS Enterprise Edition
- MySQL 5.7 on RDS High-availability Edition (with local SSDs)
- MySQL 8.0 on RDS High-availability Edition (with local SSDs)

Context

The dedicated proxy feature uses dedicated computing resources. This feature has the following benefits:

- A unified proxy endpoint is provided to connect to all the dedicated proxies that are enabled on your ApsaraDB RDS instance. This reduces maintenance costs by relieving the need to update the endpoints on your application. The proxy endpoint remains valid unless you release the dedicated proxies. For example, you may enable

read/write splitting during peak hours, and then release read-only instances and disable read/write splitting after peak hours. In these cases, you do not need to update the endpoints on your application because the proxy endpoint remains connected.

- Dedicated proxies exclusively serve your ApsaraDB RDS instance and its read-only instances. You do not need to compete with other users for resources. This ensures service stability.
- Dedicated proxies are scalable. You can add dedicated proxies based on your business requirements to handle more workloads.

Limits

- Dedicated proxies do not support Secure Sockets Layer (SSL) encryption.
- Dedicated proxies do not support compression protocols.

Precautions

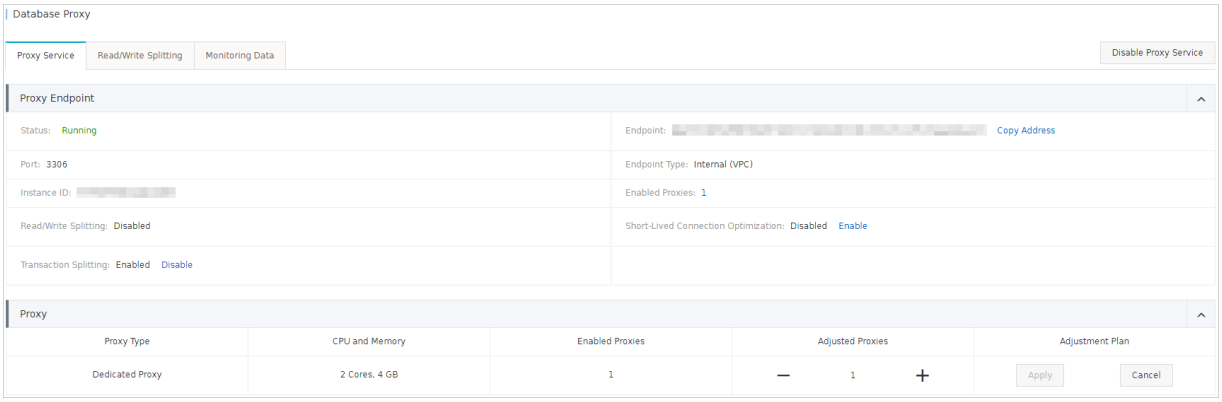
- When you change the specifications of your ApsaraDB RDS instance or its read-only instances, a network interruption may occur.
- If you connect your application to the proxy endpoint, all the requests that are encapsulated in transactions are routed to your ApsaraDB RDS instance. This applies if you do not enable the transaction splitting feature.
- If you use the proxy endpoint to implement read/write splitting, the read consistency of requests that are not encapsulated in transactions cannot be guaranteed. If you require read consistency, you must encapsulate these requests in transactions.
- If you connect your application to the proxy endpoint, the `SHOW PROCESSLIST` statement returns a combination of results from the primary ApsaraDB RDS instance and all of its read-only instances.
- If you execute multi-statements or stored procedures, the read/write splitting feature is disabled and all the subsequent requests over the current connection are routed to the primary ApsaraDB RDS instance. To enable the read/write splitting feature again, you must close the current connection and establish a new connection.
- The dedicated proxy feature supports the `/*FORCE_MASTER*/` and `/*FORCE_SLAVE*/` hints. However, requests that contain hints have the highest route priorities and are not constrained by consistency or transaction limits. Before you use these hints, you must check whether these hints are suitable for your workloads. In addition, these hints cannot contain statements such as `/*FORCE_SLAVE*/set names utf8;`. Such statements can change environment variables. If you include such statements in these hints, errors may occur when you process your subsequent workloads.
- After you enable the dedicated proxy feature, each connection is replicated to the primary ApsaraDB RDS instance and all of its read-only instances in compliance with the 1:N connection model. We recommend that you specify the same connection specifications for these instances. If these instances have different connection specifications, the number of connections allowed varies based on the lowest connection specifications among these instances.
- If you create or restart a read-only instance after you enable the dedicated proxy feature, only the requests sent over new connections are routed to the new or restarted read-only instance.
- The **max_prepared_stmt_count** parameter must be set to the same value for the primary ApsaraDB RDS instance and all of its read-only instances.

Enable the dedicated proxy feature

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Proxy**.
5. Click **Enable now**.

Overview of the Proxy Service tab

After the dedicated proxy feature is enabled, you can use the generated proxy endpoint to implement features such as read/write splitting, connection pooling, and transaction splitting.



Section	Parameter	Description
Proxy Endpoint	**Instance ID**	The ID of the ApsaraDB RDS instance.
	Enabled Proxies	The number of enabled dedicated proxies. You can process more requests by enabling more dedicated proxies. After public preview ends, you must pay for the proxies that you enable.
	Read/Write Splitting	Specifies whether to enable the read/write splitting feature for the proxy endpoint. For more information, see Read/write splitting.
	Short-Lived Connection Optimization	The type of connection pool for the proxy endpoint. This feature is suitable for scenarios where PHP short-lived connections are established. For more information, see Short-lived connection optimization. **Note** You can click **Enable** or **Disable** to the right of Short-Lived Connection Optimization to enable or disable this feature.
	Transaction Splitting	Specifies whether to enable the transaction splitting feature for the proxy endpoint. For more information, see Transaction splitting. **Note** You can click **Enable** or **Disable** to the right of Transaction Splitting to enable or disable this feature.
	Endpoint	The proxy endpoint that is generated after the dedicated proxy feature is enabled. This endpoint connects to all the dedicated proxies that are enabled on the ApsaraDB RDS instance. The read/write splitting feature is also bound to this endpoint. **Note** You can click **Copy Address** to the right of Endpoint to copy the endpoint.
	Port	The port that is used to connect to the proxy endpoint.
	Endpoint Type	The network type of the proxy endpoint.
	Proxy Type	The type of proxy that is enabled. Only **Dedicated Proxy** is supported.

Section	Parameter	Description
Proxy	CPU and Memory	The CPU and memory of the dedicated proxies. Only 2 Cores, 4 GB is supported.
	Enabled Proxies	The number of dedicated proxies that are enabled on the ApsaraDB RDS instance. Up to 60 dedicated proxies are supported. **Note** We recommend that you specify the number of dedicated proxies as the total number of CPU cores of your ApsaraDB RDS instance and its read-only instances divided by 8 and rounded up to the nearest integer. For example, if your ApsaraDB RDS instance has 8 CPU cores and its read-only instances have 4 CPU cores, the recommended number of dedicated proxies is 2, as calculated in the following formula: ⌈(8 + 4)/8⌉ = 2.

Adjust the number of dedicated proxies

Note When you adjust the number of dedicated proxies, your network connection is interrupted. Make sure that your applications are configured with automatic reconnection policies.

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Proxy**.
5. In the **Proxy** section of the Proxy Service tab, change the number in the **Adjusted Proxies** column and click **Apply** in the **Adjustment Plan** column.
6. In the Configure Proxy Resources dialog box, select **Migrate Immediately** to apply the change. You can also select **Next Maintenance Period** to set a maintenance window for the change to take effect. Click **OK**.

View the monitoring data of dedicated proxies

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Proxy**.
5. Click the **Monitoring Data** tab.
6. Select a time range to view the **CPU Utilization** metric within that time range.

Disable the dedicated proxy feature

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Proxy**.
5. In the upper-right corner of the page, click **Disable Proxy Service**.

6. In the message that appears, click **OK**.

8.8.2. Short-lived connection optimization

This topic describes the short-lived connection optimization feature provided by ApsaraDB RDS for MySQL in its dedicated proxy feature.

Prerequisites

- Your ApsaraDB RDS instance runs one of the following MySQL versions and RDS editions:
  - MySQL 5.6 on RDS High-availability Edition (with local SSDs)
  - MySQL 5.7 on RDS Enterprise Edition
  - MySQL 5.7 on RDS High-availability Edition (with local SSDs)
  - MySQL 8.0 on RDS High-availability Edition (with local SSDs)
- The database proxy feature is enabled for the instance. For more information, see Dedicated proxy.

Context

The short-lived connection optimization feature is used to reduce workloads on the ApsaraDB RDS instance caused by frequent short-lived connections. When a client is disconnected, the system checks whether the closed connection is idle. If the connection is considered idle, the dedicated proxy retains the connection in the connection pool for a short period of time. When the client initiates a request for access to your instance again, the dedicated proxy searches the connection pool for an idle connection that matches the request. The connection pool is matched based on the values of the user, clientip, and dbname fields in the request. If the dedicated proxy finds an idle connection that matches the request, it reuses the matched idle connection. If no idle connection can be matched, a new connection is established with your instance to reduce database connection overheads.

> **Note** The short-lived connection optimization feature does not reduce concurrent connections with the instance. It decreases the frequency in which connections are established between an application and your instance to reduce overheads of the primary MySQL thread and improve efficiency to process business requests. However, idle connections in the connection pool still occupy the database threads for a short period of time.

Precautions

You cannot configure different permissions for different source IP addresses by using the same account. Otherwise, errors may occur when connections in the connection pool are reused. For example, if a user account has permissions on database_a when its source IP address is 192.168.1.1 but does not have permissions on database_a when its source IP address is 192.168.1.2, the short-lived connection optimization feature may encounter permission errors.

Enable short-lived connection optimization

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Proxy**.
5. Click the **Proxy Service** tab.
6. In the **Proxy Endpoint** section, click **Enable** to the right of **Short-Lived Connection Optimization**.

8.8.3. Transaction splitting

This topic describes the transaction splitting feature provided by the database proxy of ApsaraDB RDS. This feature identifies and distributes read requests initiated before write requests within a transaction to read-only instances. This reduces workloads on the primary instance.

Prerequisites

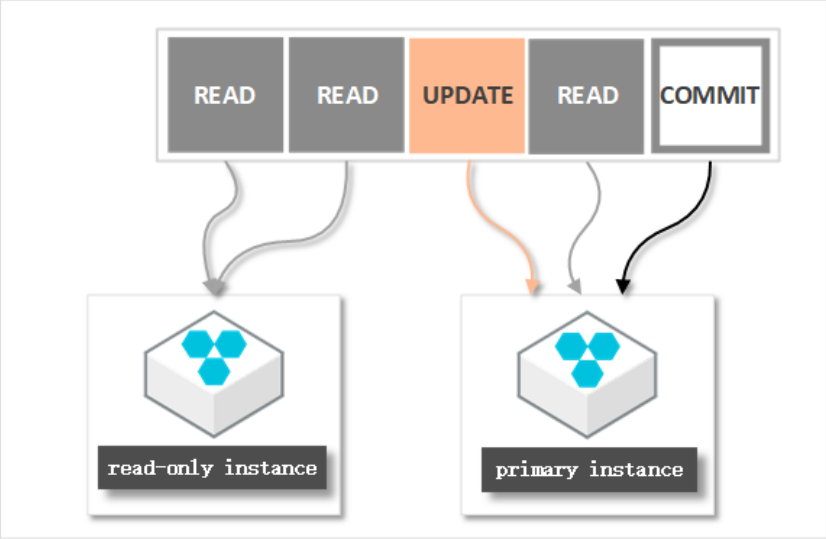
- Your ApsaraDB RDS instance runs one of the following MySQL versions and RDS editions:
  - MySQL 5.6 on RDS High-availability Edition (with local SSDs)
  - MySQL 5.7 on RDS Enterprise Edition
  - MySQL 5.7 on RDS High-availability Edition (with local SSDs)
  - MySQL 8.0 on RDS High-availability Edition (with local SSDs)
- The database proxy feature is enabled for the instance. For more information, see Dedicated proxy.

Context

By default, the dedicated proxy sends all requests in transactions to the primary instance to ensure the correctness of the transactions. If the framework encapsulates all requests in transactions, the primary instance becomes heavily loaded. In this case, you can enable the transaction splitting feature.

When transaction splitting is enabled and the default isolation level READ COMMITTED is used, the ApsaraDB RDS instance starts a transaction only for write requests when autocommit is disabled (set autocommit=0). Read requests that arrive before the transaction is started are distributed to read-only instances by the load balancer.

> Note
> - Explicit transactions do not support splitting, such as transactions started by using the BEGIN or START statement.
> - After you enable the transaction splitting feature, global consistency cannot be ensured. Before you enable this feature, we recommend that you evaluate whether this feature is suitable for your workloads.



Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Proxy**.

5. On the **Proxy Service** tab, click **Enable** to the right of **Transaction Splitting**.

> **Note**
> - When you no longer need transaction splitting, you can click **Disable** to the right of **Transaction Splitting**.
> - The operation to enable or disable transaction splitting takes effect only on new connections.

8.8.4. Read/write splitting

8.8.4.1. Enable read/write splitting

This topic describes the read/write splitting feature of ApsaraDB RDS for MySQL in its dedicated proxy feature and how to enable this feature.

Prerequisites

- Your ApsaraDB RDS instance runs one of the following MySQL versions and RDS editions:
  - MySQL 5.6 on RDS High-availability Edition (with local SSDs)
  - MySQL 5.7 on RDS Enterprise Edition
  - MySQL 5.7 on RDS High-availability Edition (with local SSDs)
  - MySQL 8.0 on RDS High-availability Edition (with local SSDs)
- The database proxy or dedicated database proxy feature is enabled. For more information, see Enable the dedicated proxy feature.
- At least one read-only instance is created. For more information about how to create a read-only instance, see Create a read-only instance.

Context

If your primary instance needs to process a large number of read requests but only a small number of write requests, you can create one or more read-only instances to offload read requests from your primary instance. This ensures service stability. For more information, see Create a read-only instance.

After you create read-only instances, you can enable read/write splitting. In this case, a read/write splitting endpoint is provided. After you add the endpoint to your application, write requests are routed to the primary instance and read requests are routed to the read-only instances.

Differences between the read/write splitting endpoint and the internal and public endpoints

- After you enable read/write splitting and add the read/write splitting endpoint to your application, all requests are first routed to this endpoint, and then to the primary and read-only instances based on the request types and the read weights of these instances.
- If the internal or public endpoint of the primary instance is added to your application, all requests are routed to the primary instance. In this case, you must add the endpoints and read weights of the primary and read-only instances to your application to implement read/write splitting.

Logic to route requests

- The following requests are routed only to the primary instance:
  - All data manipulation language (DML) operations, such as INSERT, UPDATE, DELETE, and SELECT FOR UPDATE.
  - All data definition language (DDL) statements used to perform operations such as creating databases or tables, deleting databases or tables, and changing schemas or permissions.
  - All requests that are encapsulated in transactions.

- Requests for user-defined functions.
- Requests for stored procedures.
- Requests for EXECUTE statements.
- Multi-statements. For more information, see Multi-Statement.
- Requests that involve temporary tables.
- Requests for SELECT last_insert_id() statements.
- All requests to query or modify user environment variables.
- Requests for SHOW PROCESSLIST statements.
- All requests for KILL statements in SQL (not KILL commands in Linux).

- The following requests are routed to the primary instance or its read-only instances:
  - Read requests that are not encapsulated in transactions.
  - Requests for COM_STMT_EXECUTE statements.
- The following requests are routed to all the primary and read-only instances:
  - All requests to modify system environment variables.
  - Requests for USE statements.
  - Requests for COM_STMT_PREPARE statements.
  - Requests for COM_CHANGE_USER, COM_QUIT, and COM_SET_OPTION statements.

Benefits

- Easier maintenance by using a unified endpoint

  If you do not enable the read/write splitting feature, you must add the endpoints of the primary and read-only instances to your application. After you add the endpoints, your database system routes write requests to the primary instance and read requests to the read-only instances.

  If you enable the read/write splitting feature, you can use a dedicated proxy endpoint to implement read/write splitting. After your application is connected to this endpoint, your database system routes read and write requests to the primary and read-only instances based on the read weights of these instances. This reduces maintenance costs.

  You can also improve the read capability of your database system by creating read-only instances. You do not need to modify the configuration data on your application.

- Higher performance and lower maintenance costs by using a native link

  You can build your own proxy layer on the cloud to implement read/write splitting. In this case, data needs to be parsed and forwarded by multiple components before the data reaches your database system. As a result, response latencies increase. The read/write splitting feature is built in the ApsaraDB RDS ecosystem and can efficiently reduce response latencies, increase processing speeds, and reduce maintenance costs.

- Ideal in various use scenarios based on configurable read weights and thresholds

  You can specify the read weights of the primary and read-only instances. You can also specify the latency threshold for data replication to the read-only instances.

- High availability based on instance-level health checks

  The read/write splitting feature enables ApsaraDB RDS to actively check the health status of the primary and read-only instances. If a read-only instance unexpectedly exits or its data replication latency exceeds the specified threshold, ApsaraDB RDS stops routing read requests to the instance. ApsaraDB RDS redirects the read requests that are destined for the faulty read-only instance to other healthy instances in your database system. This ensures service availability in the event of faults on individual read-only instances. After the faulty read-only instance is recovered, ApsaraDB RDS resumes routing read requests to the instance.

> **Note** We recommend that you create at least two read-only instances to mitigate the impacts of single points of failure (SPOFs).

Precautions

- When you change the specifications of your ApsaraDB RDS instance or its read-only instances, a network interruption may occur.
- After you create a read-only instance, only the requests over new connections can be routed to the read-only instance.
- The dedicated proxy endpoint does not support SSL encryption.
- The dedicated proxy endpoint does not support compression.
- If the endpoint of the dedicated proxy is used for connection, all the requests encapsulated in transactions are routed to the primary instance.
- If you use the dedicated proxy endpoint to implement read/write splitting, the read consistency of the requests that are not encapsulated in transactions cannot be guaranteed. If you require read consistency, you must encapsulate these requests in transactions.
- If you connect your application to the dedicated proxy endpoint, the `SHOW PROCESSLIST` statement returns a combination of results from the primary ApsaraDB RDS instance and all of its read-only instances.
- If the short-lived connection optimization feature is enabled, the `SHOW PROCESSLIST` statement may return idle connections.
- If you execute multi-statements or stored procedures, the read/write splitting feature is disabled and all the subsequent requests over the current connection are routed to the primary ApsaraDB RDS instance. To enable the read/write splitting feature again, you must close the current connection and establish a new connection.
- The dedicated proxy feature supports the `/*FORCE_MASTER*/` and `/*FORCE_SLAVE*/` hints. However, requests that contain hints have the highest route priorities and are not constrained by consistency or transaction limits. Before you use these hints, you must check whether these hints are suitable for your workloads. In addition, these hints cannot contain statements such as `/*FORCE_SLAVE*/set names utf8;`. Such statements can change environment variables. If you include such statements in these hints, errors may occur when you process your subsequent workloads.

Prerequisites

A read-only instance is created for the primary instance. For more information, see Create a read-only instance.

Enable read/write splitting

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Proxy**.
5. On the **Read/Write Splitting** tab, click **Enable now**.
6. Configure the following parameters.

Parameter	Description

Parameter	Description
Latency Threshold	The maximum latency that is allowed for data replication from the primary instance to its read-only instances. If the latency of data replication to a read-only instance exceeds the specified threshold, ApsaraDB RDS stops routing read requests to the instance. This applies even if the instance has a high read weight. Valid values: 0 to 3600. Unit: seconds. The read-only instances may replicate data from the primary instance at a specific latency due to SQL statement execution limits. We recommend that you set this parameter to a value that is greater than or equal to 30.
Read Weight Distribution	The read weight of each instance in your database system. A higher read weight indicates more read requests to process. For example, the primary instance is attached with three read-only instances, and the read weights of the primary and read-only instances are 0, 100, 200, and 200. In this case, the primary instance processes only write requests, and the three read-only instances process all of the read requests at the 1:2:2 ratio. ○ **Automatic Distribution**: Your database system assigns a read weight to each instance based on the instance specifications. After you create a read-only instance, ApsaraDB RDS automatically assigns a read weight to the instance and adds the instance to the read/write splitting link. ○ **Customized Distribution**: You must manually specify the read weight of each instance. Valid values: 0 to 10000. After you create a read-only instance, ApsaraDB RDS sets the read weight of the read-only instance to 0. You must manually modify the read weight of the created read-only instance.

7. Click **OK**.

8.8.4.2. Configure read/write splitting

This topic describes how to configure the latency threshold and specify read weights for an ApsaraDB RDS instance in the ApsaraDB RDS console.

Prerequisites

- Your ApsaraDB RDS instance runs one of the following MySQL versions and RDS editions:
  - MySQL 5.6 on RDS High-availability Edition (with local SSDs)
  - MySQL 5.7 on RDS Enterprise Edition
  - MySQL 5.7 on RDS High-availability Edition (with local SSDs)
  - MySQL 8.0 on RDS High-availability Edition (with local SSDs)
- Read/write splitting is enabled. For more information, see Enable read/write splitting.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Proxy**.
5. On the **Read/Write Splitting** tab, click **Configure Read/Write Splitting**.
6. Configure the following parameters.

Parameter	Description

Parameter	Description
Latency Threshold	The maximum latency that is allowed for data replication from the primary instance to its read-only instances. If the latency of data replication to a read-only instance exceeds the specified threshold, ApsaraDB RDS stops routing read requests to the instance. This applies even if the instance has a high read weight. Valid values: 0 to 3600. Unit: seconds. The read-only instances may replicate data from the primary instance at a specific latency due to SQL statement execution limits. We recommend that you set this parameter to a value that is greater than or equal to 30.
Read Weight Distribution	The read weight of each instance in your database system. A higher read weight indicates more read requests to process. For example, the primary instance is attached with three read-only instances, and the read weights of the primary and read-only instances are 0, 100, 200, and 200. In this case, the primary instance processes only write requests, and the three read-only instances process all of the read requests at the 1:2:2 ratio. ○ **Automatic Distribution**: Your database system assigns a read weight to each instance based on the instance specifications. After you create a read-only instance, ApsaraDB RDS automatically assigns a read weight to the instance and adds the instance to the read/write splitting link. ○ **Customized Distribution**: You must manually specify the read weight of each instance. Valid values: 0 to 10000. After you create a read-only instance, ApsaraDB RDS sets the read weight of the read-only instance to 0. You must manually modify the read weight of the created read-only instance.

7. Click **OK**.

8.8.4.3. Disable read/write splitting

This topic describes how to disable the read/write splitting feature of an ApsaraDB RDS instance in the ApsaraDB RDS console.

Prerequisites

- Your ApsaraDB RDS instance runs one of the following MySQL versions and RDS editions:
  - MySQL 5.6
  - MySQL 5.7 on RDS Enterprise Edition
  - MySQL 5.7 on RDS High-availability Edition (with local SSDs)
  - MySQL 8.0 on RDS High-availability Edition (with local SSDs)
- Read/write splitting is enabled. For more information, see Enable read/write splitting.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Proxy**.
5. On the **Read/Write Splitting** tab, click **Disable Read/Write Splitting**.
6. Click **Confirm**.

8.8.4.4. Upgrade an ApsaraDB RDS for MySQL instance from shared proxy to dedicated proxy

To prevent stability, scalability, and performance issues with the shared proxy feature, ApsaraDB RDS for MySQL provides the dedicated proxy feature. If your instance has the shared proxy feature enabled and needs to use the read/write splitting feature, you can upgrade your instance from shared proxy to dedicated proxy. This topic describes how to upgrade an ApsaraDB RDS for MySQL instance from shared proxy to dedicated proxy.

Context

The read/write splitting feature of ApsaraDB RDS for MySQL is implemented based on database proxies. For some existing ApsaraDB RDS instances that run MySQL 5.6 or 5.7, the read/write splitting feature is implemented based on shared proxies. However, shared proxies cannot ensure service stability. We recommend that you upgrade these instances from shared proxy to dedicated proxy. Dedicated proxies have the following advantages over shared proxies:

- Dedicated proxies provide better stability and isolation.
- Dedicated proxies provide higher performance.
- Dedicated proxies support scaling. You can increase the number of dedicated proxies to handle more workloads.
- Dedicated proxies support performance monitoring. You can adjust the number of dedicated proxies based on the monitoring data and your business plan. The adjustment takes effect immediately after it is applied.
- A unified dedicated proxy endpoint is provided. This reduces maintenance costs by relieving the need to modify the endpoint configuration on your application. In addition, the dedicated proxy endpoint remains valid unless you release the dedicated proxies. For example, you may enable read/write splitting during peak hours, and then release read-only instances and disable read/write splitting after peak hours. In these cases, you do not need to update the endpoints on your application because the proxy endpoint remains connected.
- A unified dedicated proxy endpoint is used to implement features such as read/write splitting, short-lived connection optimization, and transaction splitting.

Prerequisites

- The shared proxy feature is enabled for your ApsaraDB RDS instance.
- Your instance runs MySQL 5.7 on RDS High-availability Edition (in minor engine version 20190925 or later) or MySQL 5.6 on RDS High-availability Edition (in minor engine version 20200229 or later).

  > **Note**
  > - If your ApsaraDB RDS instance runs MySQL 5.6 on RDS Enterprise Edition, you cannot upgrade the instance from shared proxy to dedicated proxy.
  > - If a sample error message of **current db not support db proxy** is reported, upgrade the minor engine version first. For more information, see Upgrade the minor version of an instance.

- If the read/write splitting feature is not enabled for your instance, upgrade your instance to the Linux Virtual Server (LVS) link instead of upgrading from shared proxy to dedicated proxy.

Precautions

- During the upgrade, the endpoints of the primary and read-only ApsaraDB RDS instances may be disconnected for 30 seconds, and the read/write splitting endpoint may be unavailable for 30 seconds. We recommend that you perform upgrade operations during off-peak hours.
- The number of allowed connections is determined by the lowest connection specifications among the primary and read-only ApsaraDB RDS instances. We recommend that you specify the same connection specifications for these instances.
- If you create a read-only ApsaraDB RDS instance after you upgrade to the dedicated proxy feature, only the requests over new connections are routed to the new read-only instance. This also applies if you restart a read-only instance.
- The max_prepared_stmt_count parameter must be set to the same value for the primary and read-only ApsaraDB RDS instances.
- For more information, see Dedicated proxy.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Proxy**.
5. On the **Database Proxy** page, click the **Read/Write Splitting** tab.
6. In the **Basic Information of Read/Write Splitting** section, click **Upgrade to Dedicated Proxy**.
7. In the message that appears, click **OK**.

8.9. Monitoring and alerts

8.9.1. View resource and engine monitoring data

The ApsaraDB RDS console provides a variety of performance metrics to monitor the status of your instances.

Prerequisites

The ApsaraDB RDS instance runs one of the following MySQL versions and RDS editions:

- MySQL 5.6
- MySQL 5.7 on RDS High-availability Edition with local SSDs
- MySQL 5.7 on RDS High-availability Edition with standard SSDs

Procedure

1. For more information, see Log on to the ApsaraDB RDS console.
2. Find an instance and click the instance ID.
3. In the left-side navigation pane, click **Monitoring and Alerts**.
4. On the **Monitoring and Alerts** page, select **Resource Monitoring** or **Engine Monitoring**, and select a time range to view the corresponding monitoring data. The following table describes the metrics.

Category	Metric	Description
Resource Monitoring	**Disk Space (MB)**	The disk space usage of the instance. It consists of the following items: ○ Instance size ○ Data usage ○ Log size ○ Temporary file size ○ Other system file size Unit: MB.
	IOPS (Input/Output Operations per Second)	The number of input/output operations per second (IOPS) of the instance.
	Total Connections	The number of active connections to the instance and the total number of connections to the instance.

Category	Metric	Description
	CPU Utilization and Memory Usage (%)	The CPU utilization and memory usage of the instance. These metrics do not include the CPU utilization and memory usage for the operating system.
	Network Traffic (KB)	The inbound and outbound traffic of the instance per second. Unit: KB.
Engine Monitoring	**Transactions per Second (TPS)/Queries per Second (QPS)**	The average number of transactions per second and the average number of SQL statements executed per second.
	InnoDB Buffer Pool Read Hit Ratio, Usage Ratio, and Dirty Block Ratio (%)	The read hit ratio, usage ratio, and dirty block ratio of the InnoDB buffer pool.
	InnoDB Read/Write Volume (KB)	The amount of data that InnoDB reads and writes per second. Unit: KB.
	InnoDB Buffer Pool Read/Write Frequency	The number of read and write operations that InnoDB performs per second.
	InnoDB Log Read/Write/fsync	The average frequency of physical writes to log files per second by InnoDB, the log write request frequency, and the average frequency of fsync writes to log files.
	Temporary Tables Automatically Created on Hard Disk when MySQL Statements Are Executed	The number of temporary tables that are automatically created on the hard disk when the database executes SQL statements.
	MySQL_COMDML	The number of SQL statements that the database executes per second. The following SQL statements are included: ◦ Insert ◦ Delete ◦ Insert_Select ◦ Replace ◦ Replace_Select ◦ Select ◦ Update
	MySQL_RowDML	The numbers of operations that InnoDB performs per second. The following items are included: ◦ The number of physical writes to log files per second. ◦ The number of rows that are read, updated, deleted, and inserted from InnoDB tables per second.

Category	Metric	Description
	MyISAM Read/Write Frequency	The numbers of operations that MyISAM performs per second. The following items are included: ○ The number of MyISAM reads and writes from the buffer pool per second. ○ The number of MyISAM reads and writes from the hard disk per second.
	MyISAM Key Buffer Read/Write/Usage Ratio (%)	The read hit ratio, write hit ratio, and usage of the MyISAM key buffer per second.

8.9.2. Set a monitoring frequency

The ApsaraDB RDS console provides a variety of performance metrics for which you can set a monitoring frequency.

Prerequisites

The ApsaraDB RDS instance runs one of the following MySQL versions and RDS editions:

- MySQL 5.6
- MySQL 5.7 on RDS High-availability Edition with local SSDs
- MySQL 5.7 on RDS High-availability Edition with standard SSDs

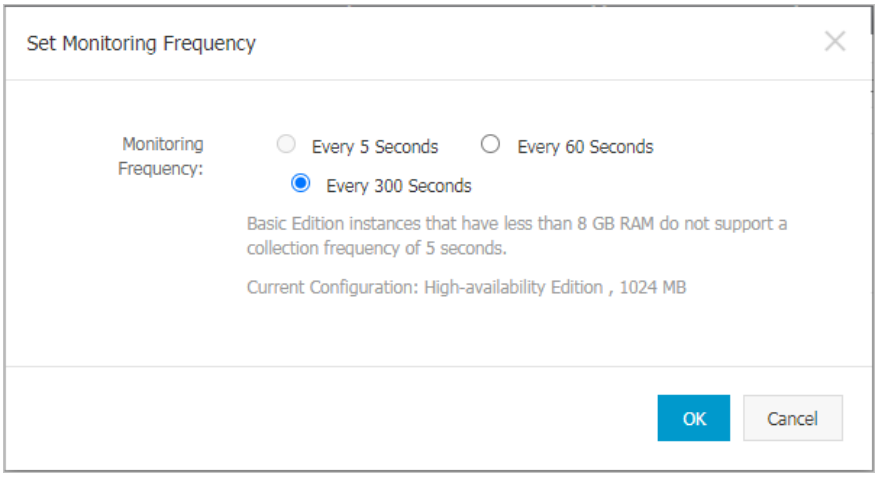
Context

ApsaraDB RDS provides the following monitoring frequencies:

- Every 5 seconds for the first seven days. After the seventh day, performance metrics are monitored every minute.
- Every 60 seconds.
- Every 300 seconds.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Monitoring and Alerts**.
5. On the **Monitoring** tab, click **Set Monitoring Frequency**.
6. In the **Set Monitoring Frequency** dialog box, select a new monitoring frequency.



Note If the RDS instance runs the RDS Basic Edition or its memory capacity is less than 8 GB, the **Every 5 Seconds** monitoring frequency is not supported.

7. Click **OK**.

8.10. Data security

8.10.1. Configure a whitelist

To ensure database security and reliability, you must modify the whitelist of an ApsaraDB RDS instance before you enable the instance. You must add the IP addresses or CIDR blocks that are used for database access to the whitelist.

Context

The whitelist improves the access security of your ApsaraDB RDS instance. We recommend that you maintain the whitelist on a regular basis. The whitelist configuration process does not affect the normal operations of the ApsaraDB RDS instance.

To configure a whitelist, perform the following operations:

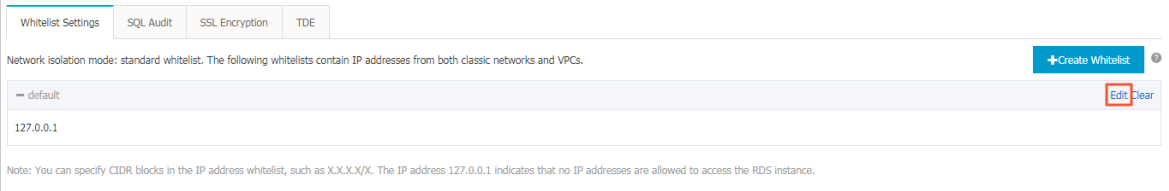
- Configure a whitelist: Add IP addresses to allow them to connect to the ApsaraDB RDS instance.
- Configure an ECS security group: Add an ECS security group for the ApsaraDB RDS instance to allow ECS instances in the group to connect to the ApsaraDB RDS instance.

Precautions

- The default whitelist can be modified or cleared, but cannot be deleted.
- You can add up to 1,000 IP addresses or CIDR blocks to a whitelist. If you want to add a large number of IP addresses, we recommend that you merge them into CIDR blocks, such as 192.168.1.0/24.

Configure a standard IP address whitelist

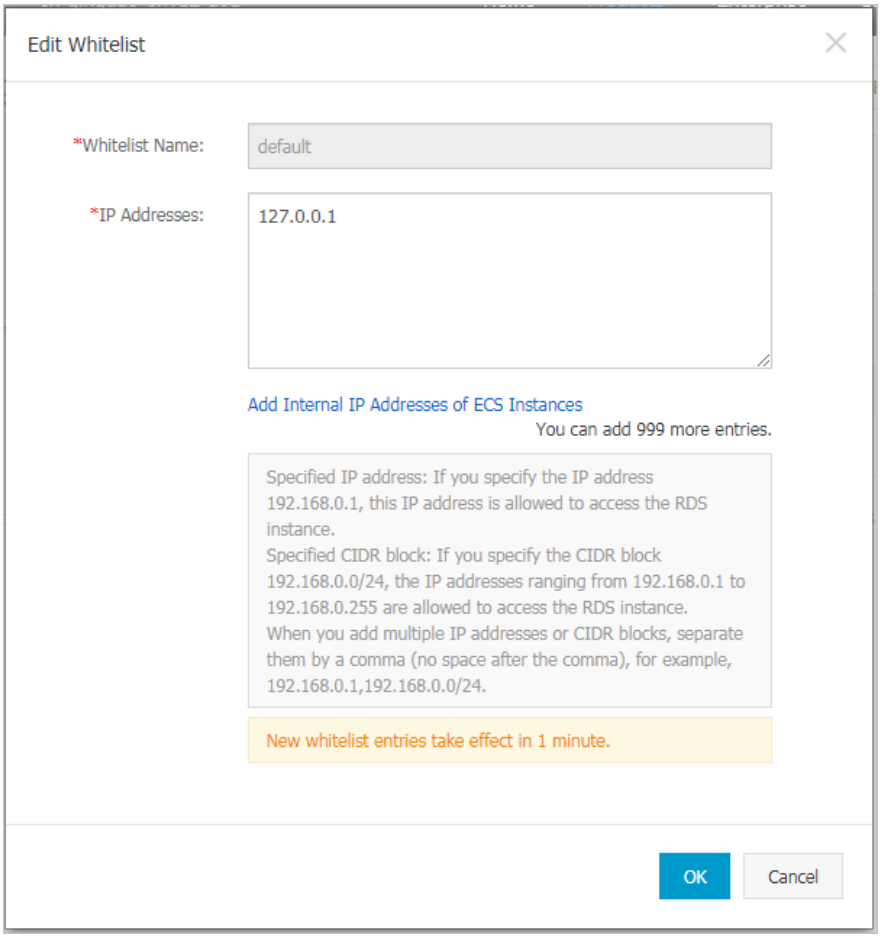
1. For more information, see Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find an instance. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
3. In the left-side navigation pane, click **Data Security**.
4. On the **Whitelist Settings** tab, click **Edit** corresponding to the **default** whitelist.



> **Note**
> - If you want to connect an ECS instance to an ApsaraDB RDS instance by using an internal endpoint, you must make sure that the two instances are in the same region and have the same network type. Otherwise, the connection fails.
> - You can also click **Create Whitelist** to create a new whitelist.

5. In the **Edit Whitelist** dialog box, enter the IP addresses or CIDR blocks that are allowed to access your ApsaraDB RDS instance, and then click **OK**.
   - If you add the CIDR block 10.10.10.0/24, all IP addresses in the 10.10.10.X format are allowed to access the ApsaraDB RDS instance.
   - If you enter more than one IP address or CIDR block, you must separate them with commas (,). Do not add spaces before or after the commas. Example: 192.168.0.1,172.16.213.9.
   - If you click **Add Internal IP Addresses of ECS Instances**, the IP addresses of all of the ECS instances that are created in your Alibaba Cloud account appear. Then, you can select the required IP addresses and add them to the whitelist.

> **Note** If you add a new IP address or CIDR block to the **default** whitelist, the default address 127.0.0.1 is deleted.



8.10.2. Configure SSL encryption

This topic describes how to enhance endpoint security. You can enable Secure Sockets Layer (SSL) encryption and install SSL certificates that are issued by certificate authorities (CAs) to the required application services. SSL is used at the transport layer to encrypt network connections and enhance the security and integrity of communication data. However, SSL increases the response time.

Prerequisites

Your ApsaraDB RDS instance runs one of the following MySQL versions and RDS editions:

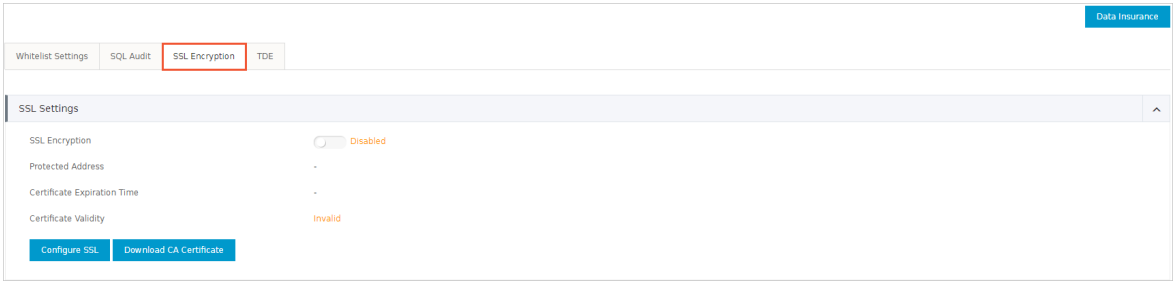
- MySQL 8.0 on RDS High-availability Edition (with local SSDs)
- MySQL 5.7 on RDS High-availability Edition (with local SSDs)
- MySQL 5.6 on RDS High-availability Edition (with local SSDs)

Precautions

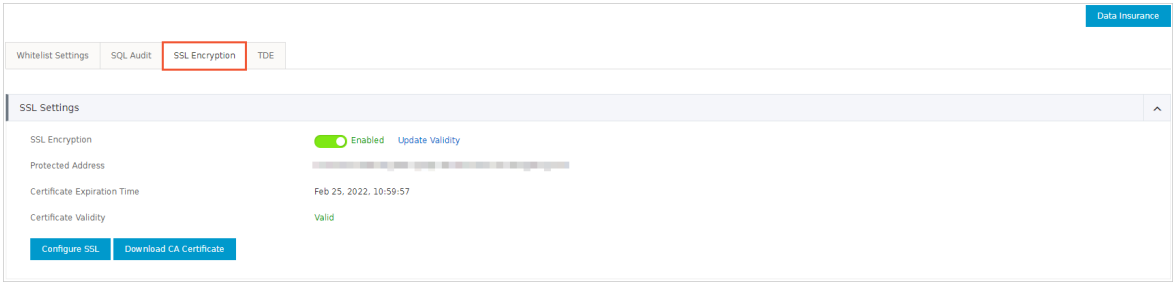
- An SSL CA certificate is valid for one year. You must update the validity period of the SSL CA certificate in your application or client within one year. Otherwise, your application or client that uses encrypted network connections cannot connect to the ApsaraDB RDS instance.
- SSL encryption may cause a significant increase in CPU utilization. We recommend that you enable SSL encryption only when you want to encrypt connections from the Internet. In most cases, connections that use an internal endpoint do not require SSL encryption.
- Read/write splitting endpoints do not support SSL encryption.
- If you disable SSL encryption, the ApsaraDB RDS instance restarts. Proceed with caution.

Enable SSL encryption

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Data Security**.
5. Click the **SSL Encryption** tab.



6. In the **SSL Settings** section, turn on **SSL Encryption**.
7. In the **Configure SSL** dialog box, select the endpoint for which you want to enable SSL encryption and click **OK**.
8. Click **Download CA Certificate** to download the SSL CA certificate files in a compressed package.



The downloaded package contains the following files:

- P7B file: used to import CA certificates to the Windows system.
- PEM file: used to import CA certificates to other operating systems or applications.
- JKS file: the Java truststore file. The password is apsaradb. It is used to import the CA certificate chain to Java programs.

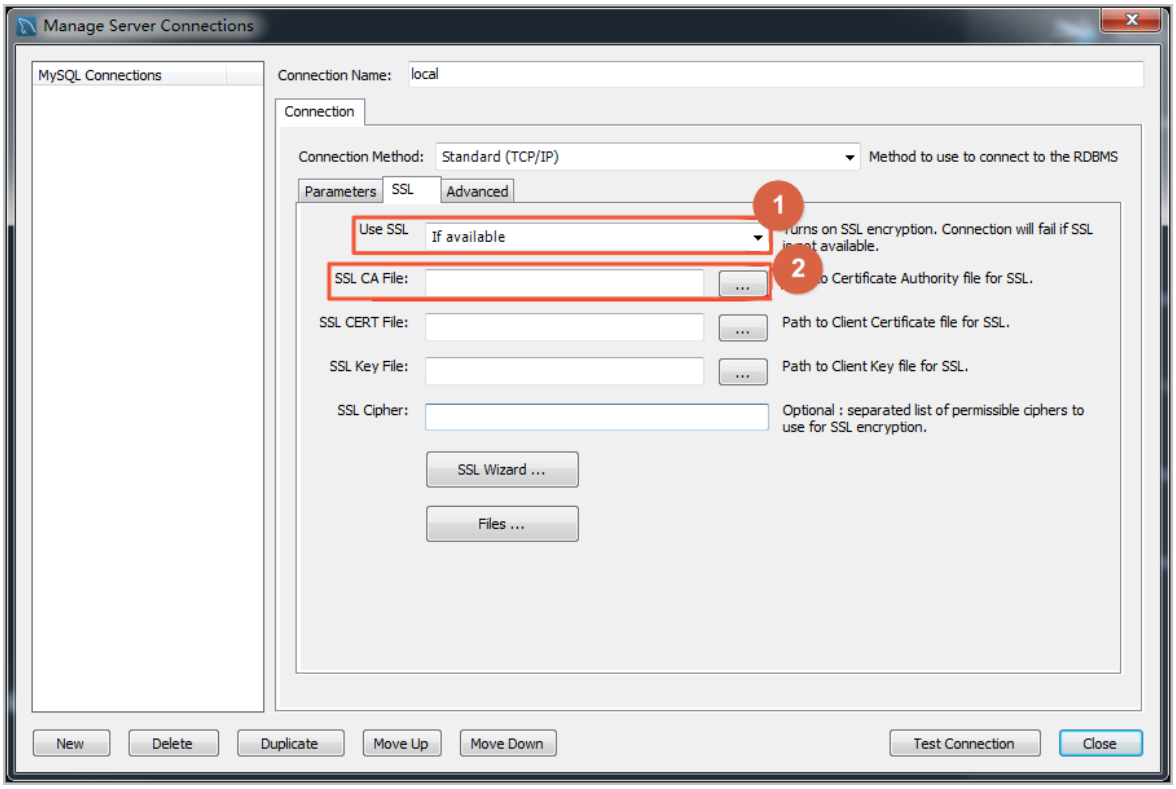
> **Note** When the JKS file is used in Java, you must modify the default JDK security configuration in JDK 7 and JDK 8. Open the `/jre/lib/security/java.security` file on the host where your application resides, and modify the following configurations:
>
> ```
> jdk.tls.disabledAlgorithms=SSLv3, RC4, DH keySize < 224
> jdk.certpath.disabledAlgorithms=MD2, RSA keySize < 1024
> ```
>
> If you do not modify the JDK security configuration, the following error is reported. Similar errors are also caused by the Java security configuration.
>
> ```
> javax.net.ssl.SSLHandshakeException: DHPublicKey does not comply to algorithm constraints
> ```

Configure an SSL CA certificate

After you enable SSL encryption, configure the SSL CA certificate on your application or client before they can connect to the ApsaraDB RDS instance. This section describes how to configure an SSL CA certificate. MySQL Workbench and Navicat are used in the example. If you are using other applications or clients, see the related instructions.

Configure a certificate on MySQL Workbench

1. Start MySQL Workbench.
2. Choose **Database > Manage Connections**.
3. In the **Connection** section, click the **SSL** tab and configure the following parameters.



①: Enable **Use SSL**.

②: Import the SSL CA certificate file.

Configure a certificate on Navicat

1. Start Navicat.
2. Right-click the database and select **Edit Connection**.
3. Click the **SSL** tab. Select the path of the SSL CA certificate file in the PEM format.
4. Click **OK**.

> **Note** If the `connection is being used` error is reported, the previous session is still connected. Restart Navicat.

5. Double-click the database to test whether the database is connected.

Update the validity period of an SSL CA certificate

> **Note** **Update Validity** causes the ApsaraDB RDS instance to restart. Proceed with caution.

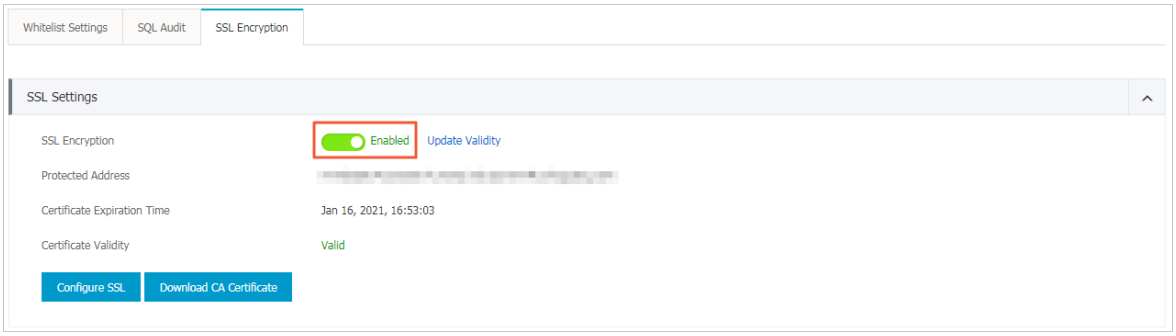
1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Data Security**.

5. Click the **SSL Encryption** tab.
6. Click **Update Validity**.

Disable SSL encryption

> **Note**
> - If you disable SSL encryption, the ApsaraDB RDS instance restarts. To reduce the impact on your business, the system triggers a primary/secondary switchover. We recommend that you disable SSL encryption during off-peak hours.
> - After you disable SSL encryption, access performance increases, but security decreases. We recommend that you disable SSL encryption only in secure environments.

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Data Security**.
5. Click the **SSL Encryption** tab.
6. In the **SSL Settings** section, turn off **SSL Encryption**. In the message that appears, click **OK**.



8.10.3. Configure TDE

This topic describes how to configure Transparent Data Encryption (TDE) for your ApsaraDB RDS for MySQL instance. TDE encrypts and decrypts data files in real time. It encrypts data files when they are written to disks, and decrypts data files when they are loaded to the memory from disks. TDE does not increase the size of data files. You can use TDE without the need to make changes to applications.

Prerequisites

- Your ApsaraDB RDS instance runs one of the following MySQL versions and RDS editions:
  - MySQL 5.7 on RDS High-availability Edition (with local SSDs)
  - MySQL 5.6 on RDS High-availability Edition (with local SSDs)
  - MySQL 8.0 on RDS High-availability Edition (with local SSDs)
- Key Management Service (KMS) is activated. If KMS is not activated, you can activate it when you enable TDE.

Context

The key used for TDE is created and managed by KMS. ApsaraDB RDS does not provide the key or certificates that are required for encryption. For specific zones, you can use the keys that are automatically generated by Apsara Stack, or you can use your own key materials to generate data keys and authorize your ApsaraDB RDS for MySQL instance to use these keys.

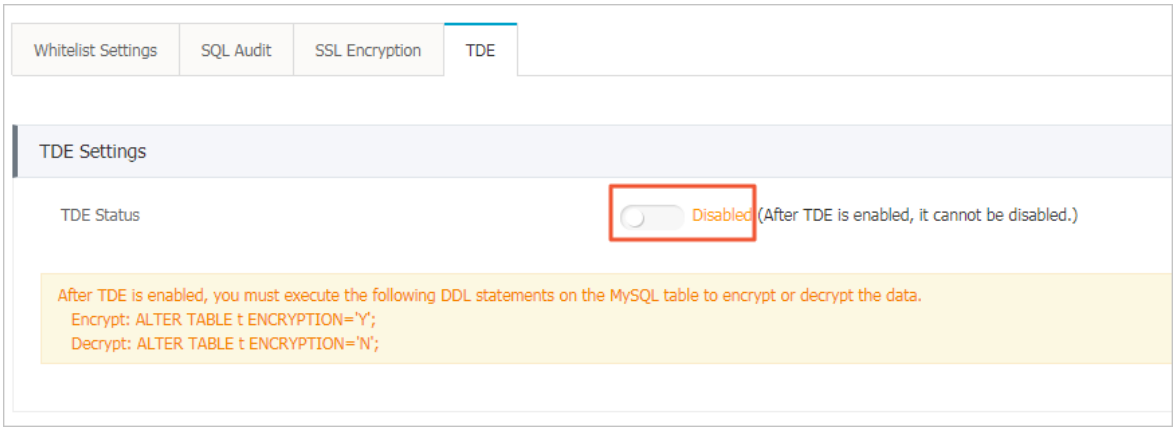
Precautions

- When TDE is being enabled, your ApsaraDB RDS for MySQL instance is restarted and all services are disconnected. Make appropriate service arrangements before you enable TDE. Proceed with caution.
- You cannot disable TDE after it is enabled.
- You cannot change the key used for encryption after TDE is enabled.
- If you want to restore the data to your computer after TDE is enabled, you must decrypt data on your ApsaraDB RDS for MySQL instance. For more information, see the "Decrypt a table" section of this topic.
- After TDE is enabled, CPU utilization significantly increases.
- If you use an existing custom key for encryption, take note of the following items:
  - If you disable a key, set a key deletion plan, or delete the key materials, the key becomes unavailable.
  - If you revoke the key that is authorized for an ApsaraDB RDS for MySQL instance, the instance becomes unavailable after it is restarted.
  - You must use an Apsara Stack tenant account or an account that has the AliyunSTSAssumeRoleAccess permission.

> **Note** For more information, see topics about key management in *Key Management Service User Guide*.

Use a key that is automatically generated by Apsara Stack

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Data Security**.
5. Click the **TDE** tab.
6. In the **TDE Settings** section, turn on **TDE Status**.



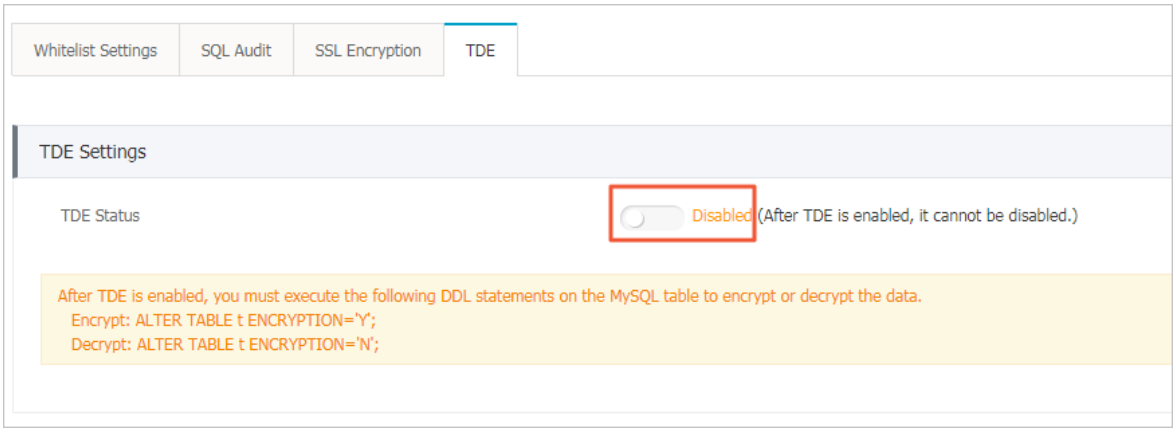
7. In the dialog box that appears, select **Use an Automatically Generated Key** and click **OK**.

> **Note** If the instance runs MySQL 5.7 on RDS High-availability Edition, you can select one of the following encryption methods:
>
> - SM4 encryption
> - AES_256_CBC encryption

Use an existing custom key

1. Log on to the ApsaraDB for RDS console.

2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Data Security**.
5. Click the **TDE** tab.
6. In the **TDE Settings** section, turn on **TDE Status**.



7. In the dialog box that appears, select **Use an Existing Custom Key** and click **OK**.

> **Note** If you do not have a custom key, click **create a key** to go to the KMS console and import the key materials. For more information, see Create a key in *Key Management Service User Guide*.

Encrypt a table

Log on to the database and execute the following statement to encrypt a table:

- MySQL 5.6

```
alter table <tablename> engine=innodb,block_format=encrypted;
```

- MySQL 5.7 and MySQL 8.0

```
alter table <tablename> encryption='Y';
```

Decrypt a table

Execute the following statement to decrypt a table that is encrypted by using TDE:

- MySQL 5.6

```
alter table <tablename> engine=innodb,block_format=default;
```

- MySQL 5.7 and MySQL 8.0

```
alter table <tablename> encryption='N';
```

FAQ

- Q: Can common database tools such as Navicat be used after TDE is enabled?

  A: Yes, after you enable TDE, you can still use common database tools such as Navicat.

- Q: Why is data still displayed in plaintext after it is encrypted?

A: After you enable TDE, your data is stored in ciphertext. However, when the data is queried, it is decrypted and loaded into memory as plaintext. TDE encrypts backup files to prevent data leaks. The encrypted backup files cannot be used to restore data to your computer. If you want to restore these backup files to your computer, you must decrypt them. For more information, see the "Decrypt a table" section of this topic.

8.10.4. SQL audit

You can use the SQL audit feature to audit SQL executions and check the details. SQL audit does not affect instance performance.

Context

> **Note** You cannot view the logs that are generated before you enable SQL audit.

You can view the incremental data of your ApsaraDB RDS for MySQL instance in SQL audit logs or binlogs. However, these two methods differ in the following aspects:

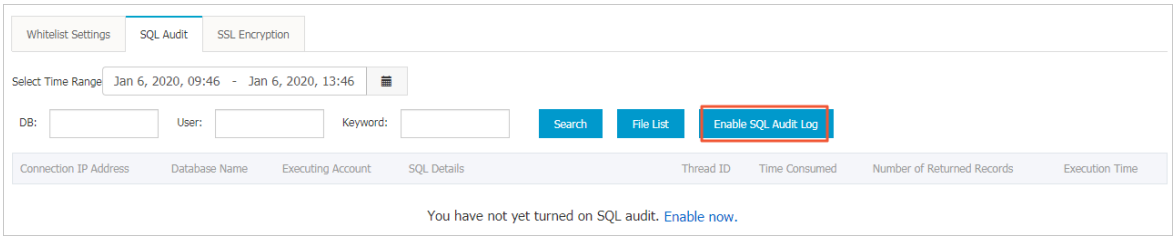
- SQL audit logs are similar to audit logs in MySQL and record all DML and DDL operations by using network protocol analysis. SQL audit does not parse the actual parameter values. Therefore, a small amount of information may be lost if a large number of SQL statements are executed to query data. The incremental data obtained by using this method may be inaccurate.
- Binlogs record all add, delete, and modify operations and the incremental data used for data restoration. Binlogs are temporarily stored in your ApsaraDB RDS instance after they are generated. The system transfers full binlog files to OSS on a regular basis. OSS then stores the files for seven days. However, a binlog file cannot be transferred if data is being written to it. Such binlog files cannot be uploaded to OSS after you click **Upload Binlogs** on the **Backup and Restoration** page. Binlogs are not generated in real time, but you can obtain accurate incremental data from them.

Precautions

- SQL audit is disabled by default. SQL audit does not affect instance performance.
- SQL audit logs are retained for 30 days.
- Log files exported from SQL audit are retained for two days. The system clears files that are retained for more than two days.

Enable SQL audit

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Data Security**.
5. Click the **SQL Audit** tab.



6. Click **Enable SQL Audit**.
7. In the message that appears, click **Confirm**.

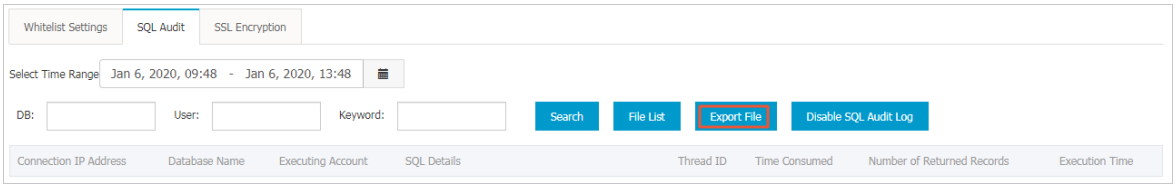
   After SQL audit is enabled, you can query SQL information based on conditions such as the time range, database, user, and keyword.

Disable SQL audit

> **Note** If SQL audit is disabled, all SQL audit logs are deleted. We recommend that you export and store audit logs to your computer before you disable SQL audit.

You can disable SQL audit to avoid charges when you do not need it. To disable SQL audit, perform the following operations:

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Data Security**.
5. Click the **SQL Audit** tab.



6. Click **Export File** to export and store the SQL audit content to your computer.
7. After the file is exported, click **Disable SQL Audit**.
8. In the message that appears, click **Confirm**.

8.11. Service availability

8.11.1. Configure automatic or manual switchover

This topic describes how to automatically or manually switch over services between primary and secondary instances. After a switchover, the original primary instance becomes a secondary instance.

Context

- Automatic switchover: the default switchover mode. If the primary instance experiences a fault, your ApsaraDB RDS services are automatically switched over to the secondary instance.

  > **Note** You can click **Switch Primary/Secondary Instance** on the **Service Availability** page of an ApsaraDB RDS for MySQL instance with standard or enhanced SSDs to disable automatic switchover. This facilitates troubleshooting when errors occur on the primary instance.

- Manual switchover: allows you to manually switch over services between primary and secondary instances.

> **Note** Data is synchronized between the primary and secondary instances in real time. You can connect only to the primary instance. The secondary instances serve only as backups and do not allow external access.

Precautions

- Services may be disconnected during a switchover. Make sure that your applications are configured with automatic reconnection policies to avoid service disruptions.
- If the primary instance is attached with read-only instances, data on the read-only instances shows a latency of several minutes after a switchover. This is because it takes time to re-establish replication connections and synchronize incremental data.

Manually switch over services between primary and secondary instances

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Service Availability**.
5. Click **Switch Primary/Secondary Instance** on the right side of the page.

   > **Note** Services may be disconnected once or twice during the switchover. Make sure that your applications are configured with automatic reconnection policies to avoid service disruptions.

6. In the dialog box that appears, click **OK**.

FAQ

Q: Can I connect to secondary instances?

A: No, you cannot connect to secondary instances. You can connect only to primary instances. Secondary instances serve only as backups and do not allow external access.

8.11.2. Change the data replication mode

You can set the data replication mode between primary and secondary ApsaraDB RDS instances to improve database availability.

Prerequisites

Your ApsaraDB RDS instance runs one of the following MySQL versions and RDS editions:

- MySQL 5.6 on RDS High-availability Edition (with local SSDs)
- MySQL 5.7 on RDS High-availability Edition (with local SSDs)
- MySQL 8.0 on RDS High-availability Edition (with local SSDs)

Data replication modes

- Semi-synchronous

  After an update that is initialized by your application is complete on the primary instance, the log is synchronized to all the secondary instances. After the secondary instances receive the log, the update transaction is considered committed. Your database system does not need to wait for the log to be replayed.

  If the secondary instances are unavailable or a network exception occurs between the primary and secondary instances, semi-synchronous replication degrades to the asynchronous mode.

- Asynchronous

  When your application initiates a request to add, delete, or modify data, the primary instance responds to your application immediately after it completes the operation. At the same time, the primary instance starts to asynchronously replicate data to its secondary instances. During asynchronous data replication, the unavailability of secondary instances does not affect the operations on the primary instance. Data remains consistent even if the primary instance is unavailable.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.

4. In the left-side navigation pane, click **Service Availability**.
5. Click **Change Data Replication Mode** on the right side of the page.
6. In the dialog box that appears, select a data replication mode and click **OK**.

FAQ

Q: Which data replication mode is recommended?

A: You can select a data replication mode based on your business requirements. If you require quick responses, we recommend that you select the asynchronous mode. In other scenarios, you can select the semi-synchronous mode.

8.12. Database backup and restoration

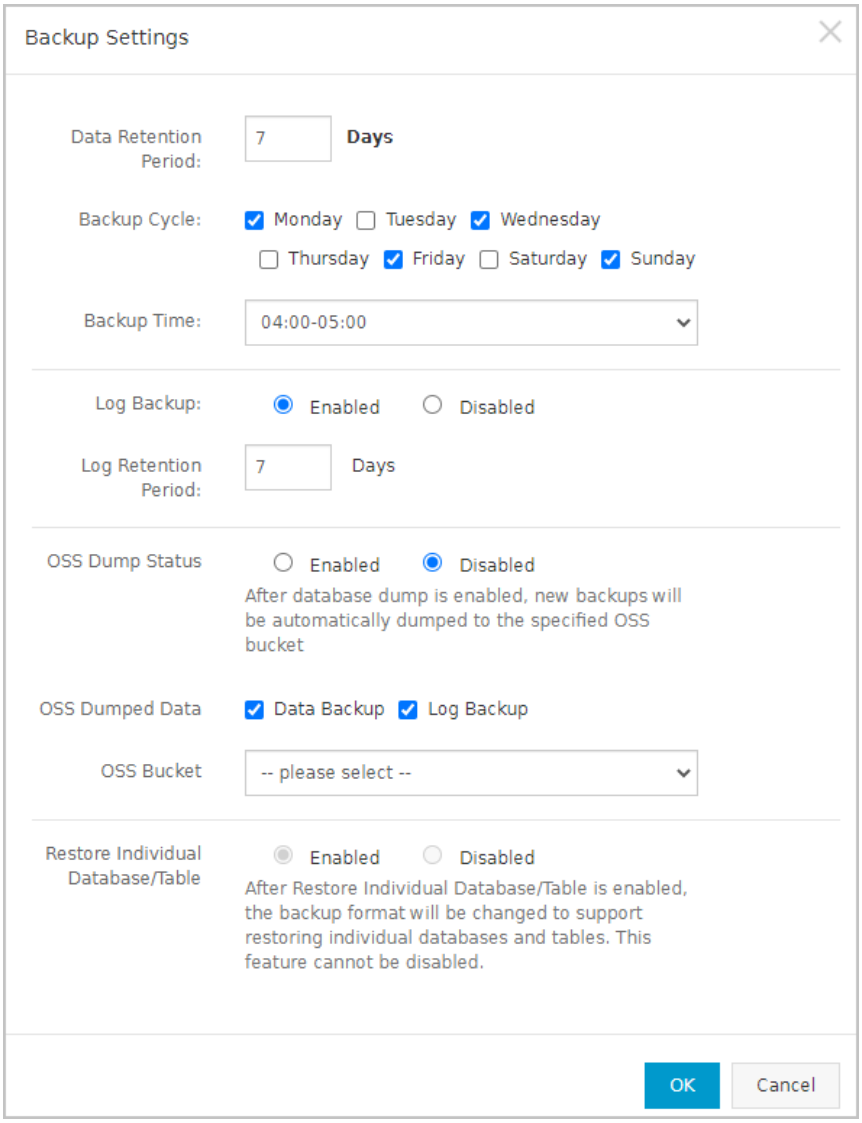
8.12.1. Automatic backup

ApsaraDB RDS automatic backup supports full physical backups. ApsaraDB RDS automatically backs up data based on pre-configured policies. This topic describes how to configure a policy for automatic backup.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Backup and Restoration**.
5. Click the **Backup Settings** tab.
6. Click **Edit**.

> **Note** To ensure data security, the system compares the new backup cycle and time with the original settings, and selects the most recent time point to back up the data. Therefore, the next backup may still be performed based on the original backup cycle and time. For example, if the backup time is set to 19:00-20:00 every Wednesday and you modify the time to 19:00-20:00 every Thursday before 19:00 this Wednesday, the system still backs up data during 19:00-20:00 this Wednesday.



7. Configure the following parameters.

Parameter	Description
Data Retention Period	The number of days for which data backup files are retained. Valid values: 7 to 730. Default value: 7.
Backup Cycle	The backup cycle. You can select one or multiple days within a week.
Backup Time	A period of time within a day. Unit: hours. We recommend that you back up data during off-peak hours.
Log Backup	Specifies whether to enable log backup. **Notice** If you disable log backup, all the log backup files are deleted, and you cannot restore data to a saved point in time.
Log Retention Period	The number of days for which log backup files are retained. Valid values: 7 to 730. Default value: 7.

Parameter	Description
Restore Individual Database/Table	Specifies whether to enable restoration of individual databases or tables. You cannot disable this feature after it is enabled. **Note** Restoration of individual databases or tables can be enabled only on instances with **local SSDs**. For more information about this feature, see Restore individual databases and tables for an ApsaraDB RDS for MySQL instance.

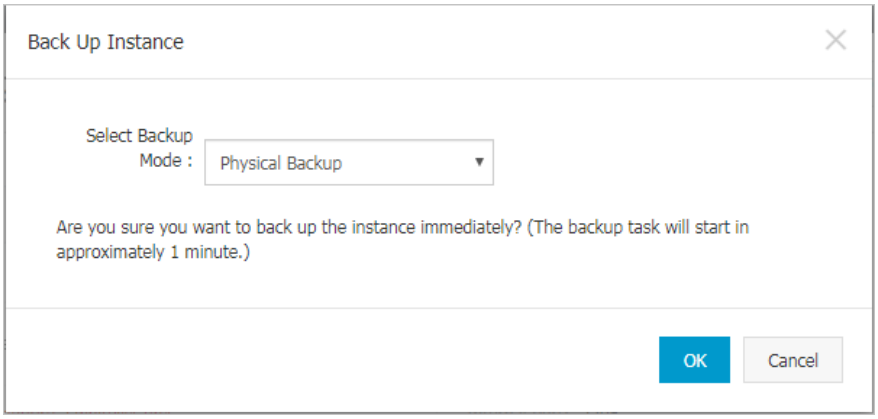
8. After you configure the preceding parameters, click **OK**.

8.12.2. Manual backup

Manual backup supports both full physical backups and full logical backups. This topic describes how to manually back up ApsaraDB RDS data.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. Click **Back Up Instance** in the upper-right corner.



5. Set the backup mode and backup policy, and click **OK**.

Note Two backup methods are available:

- Physical backup: directly backs up all files in all databases.
- Logical backup: extracts data from the databases by using SQL statements and backs up the data in the text format. If you select logical backup, you must select a backup policy:
  - Instance Backup: backs up the entire instance.
  - Single-Database Backup: backs up one of the databases in the instance.

8.12.3. Restore individual databases and tables for an ApsaraDB RDS for MySQL instance

This topic describes how to restore the individual databases and tables that are accidentally deleted from an ApsaraDB RDS for MySQL instance. You can restore these databases and tables from backup files.

Prerequisites

- Your ApsaraDB RDS instance runs one of the following MySQL versions and RDS editions:
  - MySQL 5.7 on RDS High-availability Edition with local SSDs
  - MySQL 5.6 on RDS High-availability Edition
- The number of tables on the ApsaraDB RDS instance does not exceed 50,000.
- If you want to restore individual databases and tables of your ApsaraDB RDS instance to the same instance, the ApsaraDB RDS instance meets the following requirements:
  - The ApsaraDB RDS instance is in the Running state and is not locked.
  - The ApsaraDB RDS instance does not have ongoing migration tasks.
  - If you want to restore individual databases and tables to a point in time, the log backup feature is enabled.
  - If you want to restore an instance from a backup set, at least one backup set is available.

> **Note** For more information about how to restore databases at the instance level, see Restore data to a new instance (formerly known as cloning an instance).

Precautions

- If you restore individual databases and tables to the original ApsaraDB RDS instance, a primary/secondary switchover is triggered. This may cause a network interruption. Make sure that your application is configured to automatically reconnect to the original ApsaraDB RDS instance. If you restore individual databases and tables to a new ApsaraDB RDS instance, no primary/secondary switchover is triggered.
- The Restore Individual Database/Table feature restores only the selected tables. You must select all of the tables that you want to restore. The restoration fails in the following scenarios:
  - The selected tables are deleted during the specified period. The specified period spans from the point in time when the last backup set is generated to the point in time to which you want to restore the selected tables.
  - The restoration involves a table that you have not selected. For example, you selected Table B, but Table B was renamed from Table A before the specified point in time. In this case, the restoration fails because you did not select Table A.
- You can select a maximum of 50 databases or tables at a time.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Backup and Restoration**.
5. In the upper-right corner of the page, click **Restore Individual Database/Table**.

   > **Note** If the **Restore Individual Database/Table** button is not displayed, you can check whether all the requirements that are specified in the "Prerequisites" section of this topic are met.

6. Configure the following parameters.

Parameter	Description

Parameter	Description
Restore To	**Current Instance**: restores individual databases and tables to the original ApsaraDB RDS instance.
Restore Method	◦ **By Backup Set** ◦ **By Time**: restores data to a point in time within the specified log backup retention period. **Note** The **By Time** option appears only when the log backup feature is enabled.
Backup Set	Select the backup set from which you want to restore individual databases and tables. **Note** This parameter appears only when you set the **Restore Method** parameter to **By Backup Set**.
Restore Time	Select the point in time to which you want to restore individual databases and tables. **Note** This parameter appears only when you set the **Restore Method** parameter to **By Time**.
Databases and Tables to Restore	Select the databases or tables that you want to restore.
Selected Databases and Tables	◦ This section displays the selected databases and tables. You can specify new names for these databases and tables. ◦ This section also displays the total size of the selected databases and tables and the remaining storage space. Make sure that the remaining storage space is sufficient before the restoration.

7. Click **OK**.

FAQ

- After the backup file format is changed from TAR to xbstream, are the existing backup files in the TAR format still available?

  Yes, the original backup files in the TAR format are still available.

- Why does the Restore Individual Database/Table feature suddenly become unavailable?

  Check whether the number of tables on your ApsaraDB RDS instance exceeds 50,000. If the number exceeds 50,000, the Restore Individual Database/Table feature is unavailable.

8.12.4. Download data and log backup files

This topic describes how to download unencrypted data and log backup files in the ApsaraDB RDS console to archive the files and restore data to an on-premises database.

Limits

Database engine	Download of data backup files	Download of log backup files
MySQL 5.6 on RDS High-availability Edition (with local SSDs)	Supported	Supported
MySQL 5.7 on RDS High-availability Edition (with local SSDs)	Supported	Supported
MySQL 8.0 on RDS High-availability Edition (with local SSDs)	Supported	Supported

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Backup and Restoration**.
5. Click the Data Backup or Log Backup tab.
   - To download data backup files, click the **Data Backup** tab.
   - To download log backup files, click the **Log Backup** tab.
6. Select a time range to which you want to restore the instance.
7. Find the data or log backup file that you want to download, and click **Download** in the **Actions** column.

   > **Note**
   > - If the Download button is unavailable, see the "Limits" section of this topic.
   > - If you want to use a data backup file to restore data, select the backup file that is the closest to the time for restoration.
   > - If you want to use a log backup file to restore data to an on-premises database, take note of the following items:
   >   - The instance No. of the log backup file must be the same as that of the data backup file.
   >   - The start time of the log backup file must be later than the end time of the data backup file that you select and earlier than the point in time to which you want to restore the data of your instance.

8. In the message that appears, click **Download**.

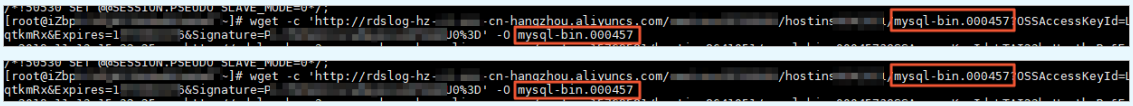
Download method	Description
Download	Use a browser to download the backup file.

Download method	Description
Copy Internal URL	Copy the internal URL to download the file. If your Elastic Compute Service (ECS) and ApsaraDB RDS instances reside within the same region, you can log on to the ECS instance and use the internal URL to download the file. This method is fast and secure.
Copy Public URL	Copy the public URL to download the file. If you want to use other tools to download the file, use the public URL.

Note If you use a Linux operating system, you can run the following command to download the file:

```
wget -c '<The URL that is used to download the backup file>' -O <The name of the backup file>
```

- The -c option enables resumable download.
- The -O option saves the downloaded file by using a specified name. We recommend that you use the file name contained in the download URL.
- If the URL contains more than one parameter, enclose the download URL in a pair of single quotation marks (').



8.12.5. Upload binlogs

Context

This topic describes how to upload binlog files to OSS.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Backup and Restoration** to go to the **Backup and Restoration** page.
5. In the upper-right corner of the page, click **Upload Binlogs**.
6. In the message that appears, click **Confirm**.

8.12.6. Restore data to a new instance (formerly known as cloning an instance)

A cloned instance is a new instance that has the same content as the primary instance, including data and settings. This feature allows you to restore data of the primary instance or create multiple instances that are the same as the primary instance.

Prerequisites

Before you clone an instance, make sure that the following requirements are met:

- The primary instance is in the running state.
- The primary instance does not have an ongoing migration task.

- Data backup and log backup are enabled.
- The primary instance has at least one completed backup set before you clone the instance by backup set.

Context

You can specify a backup set or a point in time within the backup retention period to clone an instance.

> **Note**
> - A cloned instance copies only the content of the primary instance, but not the content of read-only instances. The copied data includes database information, account information, and instance settings such as whitelist settings, backup settings, parameter settings, and alert threshold settings.
> - The database engine of a cloned instance must be the same as that of the primary instance. Other settings can be different, such as the instance edition, zone, network type, instance type, and storage capacity. If you want to restore the data of a primary instance, we recommend that you select a higher instance type and more storage capacity than those of the primary instance. This can speed up the data restoration process.
> - The account type of a cloned instance must be the same as that of the primary instance. The account password of the cloned instance can be changed.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Backup and Restoration**.
5. In the backup list, find a backup and click **Restore** in the Actions column.
6. In the dialog box that appears, select **Restore Database** and click **OK**.
7. On the **Restore Instance** page, configure the following parameters.

Section	Parameter	Description
Region	**Region**	The region where the ApsaraDB RDS instance resides.
Restore Database	**Restore Mode**	The data restore mode of the primary instance. Valid values: ○ **By Time** ○ **By Backup Set**
	Restore Time	The point in time to which you want to restore the database. **Note** When **Restore Mode** is set to **By Time**, you must specify this parameter.
	Backup Set	The backup set for restoration. **Note** When **Restore Mode** is set to **By Backup Set**, you must specify this parameter.
	Instance Name	The name of the cloned instance.

Section	Parameter	Description
Specifications	**Database Engine**	The engine of the database, which cannot be modified.
	Engine Version	The version of the database engine, which cannot be modified.
	Edition	The edition of the database. The actual values are displayed in the console.
	Storage Type	The storage type of the database. The actual values are displayed in the console.
	Instance Type	The type of the cloned instance. **Note** We recommend that you select a higher instance type and more storage capacity than those of the primary instance. This can speed up the data restoration process.
	Storage Capacity	The storage capacity of the instance, which includes the space to store data, system files, binlog files, and transaction files. The available storage capacity is displayed in the console. **Note** AsparaDB RDS instances with local SSDs in the dedicated instance family occupy exclusive resources. The storage capacities are determined based on instance types.
Network Type	**Network Type**	The network type of the instance. ApsaraDB RDS instances support the following network types: ◦ **Classic Network**: Cloud services in the classic network are not isolated. Unauthorized access to a cloud service is blocked only by the security group or whitelist policy of the service. ◦ **VPC**: A virtual private cloud (VPC) helps you build an isolated network environment on Apsara Stack. You can customize route tables, CIDR blocks, and gateways in a VPC. We recommend that you select VPC for improved security.
	VPC	Select a VPC. **Note** When **Network Type** is set to **VPC**, you must specify this parameter.
	vSwitch	Select a vSwitch. **Note** When **Network Type** is set to **VPC**, you must specify this parameter.

8. Click **Submit**.

8.13. CloudDBA

8.13.1. Introduction to CloudDBA

CloudDBA is a cloud service for database self-detection, self-repair, self-optimization, self-maintenance, and self-security ensuring based on machine learning and expert experience. CloudDBA helps you ensure stable, secure, and efficient databases without worrying about the management complexity and services failures caused by manual operations.

Features

In ApsaraDB RDS for MySQL, CloudDBA provides the following features:

- Diagnostics

  You can diagnose your instance and view the visualized diagnostic results.

- Instance sessions

  You can view sessions, collect session statistics, analyze SQL statements, and optimize the execution of SQL statements.

- Real-time monitoring

  You can view the real-time monitoring information of your instance, such as the queries per second (QPS), transactions per second (TPS), number of connections, and network traffic.

- Storage analysis

  You can view the space utilization, trends, exceptions, tablespaces, and data spaces.

- Deadlock analysis

  You can view and analyze the last deadlock in a database.

- Dashboard

  You can view and compare performance trends, customize monitoring dashboards, check exceptions, and view instance topologies.

- Slow query logs

  You can view the trends and statistics of slow queries.

- Diagnostic reports

  You can use this feature to generate diagnostics reports or view automatically generated reports about instance health, alerts, and slow query logs.

8.13.2. Diagnostics

In ApsaraDB RDS for MySQL, CloudDBA provides the diagnostics feature. This feature diagnoses your ApsaraDB RDS for MySQL instance and visualizes the results.

Go to the Diagnostics page

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, choose **CloudDBA > Diagnostics**.
5. Click the **Diagnostics** tab.

> **Note** For more information, see Diagnostics in *Database Autonomy Service User Guide*.

8.13.3. Session management

In ApsaraDB RDS for MySQL, CloudDBA provides the session management feature, which allows you to view and manage sessions of an instance.

Navigate to the Session Management page

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, choose **CloudDBA > Diagnostics**.
5. Click the **Session Management** tab.

> **Note** For more information, see Instance sessions in *Database Autonomy Service User Guide*.

8.13.4. Real-time monitoring

In ApsaraDB RDS for MySQL, CloudDBA provides the real-time monitoring feature. This feature allows you to view the real-time performance of your ApsaraDB RDS for MySQL instance.

Go to the Real-time Monitoring page

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, choose **CloudDBA > Diagnostics**.
5. Click the **Real-time Monitoring** tab.

> **Note** For more information, see Real-time monitoring in *Database Autonomy Service User Guide*.

8.13.5. Storage analysis

In ApsaraDB RDS for MySQL, CloudDBA provides the storage analysis feature. This feature allows you to check and solve storage exceptions in a timely manner to ensure database stability.

Context

You can use the storage analysis feature of CloudDBA to view the disk space usage of your ApsaraDB RDS for MySQL instance and the number of remaining days when disk space is available. It also provides information about the space usage, fragmentation, and exception diagnostic results of a table.

Go to the Storage Analysis page

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, choose **CloudDBA > Diagnostics**.
5. Click the **Storage Analysis** tab.

> **Note** For more information, see Storage analysis in *Database Autonomy Service User Guide*.

8.13.6. Deadlock analysis

In ApsaraDB RDS for MySQL, CloudDBA provides the deadlock analysis feature. This feature allows you to view and analyze the last deadlock in a database.

Open the Deadlock Analysis page

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, choose **CloudDBA > Diagnostics**.
5. Click the **Deadlock Analysis** tab.

> **Note** For more information, see Deadlock analysis in *DAS User Guide*.

8.13.7. Dashboard

In ApsaraDB RDS for MySQL, CloudDBA provides the dashboard feature. This feature allows you to view performance trends in specific ranges, compare performance trends, and customize charts to view performance trends.

Go to the Dashboard page

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, choose **CloudDBA > Dashboard**.

> **Note** For more information, see Performance trends in *Database Autonomy Service User Guide*.

8.13.8. Slow query logs

In ApsaraDB RDS for MySQL, CloudDBA provides the slow query logs feature. This feature allows you to view the trends and execution details of slow queries and obtain optimization suggestions for your ApsaraDB RDS for MySQL instance.

Go to the Slow Query Logs page

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, choose **CloudDBA > Slow Query Logs**.

> **Note** For more information, see Slow query logs in *Database Autonomy Service User Guide*.

8.13.9. Diagnostic reports

In ApsaraDB RDS for MySQL, CloudDBA provides the diagnostic reports feature. This feature allows you to create and view diagnostic reports.

Open the Report page

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, choose **CloudDBA > Diagnostic Reports**.

> **Note** For more information, see **View diagnostic reports** in *Database Autonomy Service User Guide*.

8.14. Logs

All ApsaraDB RDS instances support log management. You can query details about the error logs and slow query logs of an ApsaraDB RDS instance by using the ApsaraDB RDS console. The logs help you locate faults.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Logs**.
5. On the **Logs** page, click the **Error Logs**, **Slow Query Logs**, **Slow Query Log Summary**, or **Primary/Secondary Switching Logs** tab, select a time range, and then click **Search**.

Log type	Description
Error Logs	Records database running errors that occurred within the last month.
Slow Log Details	Records SQL statements within the last month that took longer than one second to execute. Duplicated SQL statements are removed. **Note** Slow query logs in the ApsaraDB RDS console are updated once every minute. However, you can query real-time slow query logs from the mysql.slow_log table.
Slow Query Log Summary	Records and analyzes SQL statements within the last month that took longer than one second to execute. Analysis reports of slow query logs are provided.
Primary/Secondary Switching Logs	Records the primary/secondary instance switching logs. This feature is applicable to ApsaraDB RDS for MySQL instances on High-availability Edition.

8.15. Use mysqldump to migrate MySQL data

This topic describes how to use mysqldump to migrate data from an on-premises database to an ApsaraDB RDS for MySQL instance.

Prerequisites

An ECS instance is created.

Context

mysqldump is easy to use but requires extensive downtime. This tool is suitable for scenarios where the amount of data is small or extensive downtime is allowed.

ApsaraDB RDS for MySQL is fully compatible with the native database service. The procedure of migrating data from the original database to an ApsaraDB RDS for MySQL instance is similar to that of migrating data from one MySQL server to another.

Before you migrate data, you must create an account that is used to migrate data from the on-premises MySQL database. You must grant the read and write permissions on the on-premises MySQL databases to the account.

Procedure

1. Run the following command to create a migration account for the on-premises database:

   ```
   CREATE USER 'username'@'host' IDENTIFIED BY 'password';
   ```

   Parameter description:

   - username: the name of the account to be created.
   - host: the host from which the account is authorized to log on to the on-premises MySQL database. If you want to allow access from a local host, set this parameter to localhost. If you want to allow access from all hosts, set this parameter to a percent sign (%).
   - password: the password of the account.

   For example, you can run the following command to create an account with the username William and the password Changme123. The account is authorized to log on to the on-premises MySQL database from all hosts.

   ```
   CREATE USER 'William'@'%' IDENTIFIED BY 'Changme123';
   ```

2. Run the following command to grant permissions to the migration account in the on-premises database:

   ```
   GRANT SELECT ON databasename.tablename TO 'username'@'host' WITH GRANT OPTION: GRANT REPLICATION SLAVE ON databasename.tablename TO 'username'@'host' WITH GRANT OPTION; GRANT REPLICATION SLAVE ON databasename.tablename TO 'username'@'host' WITH GRANT OPTION;
   ```

   Parameter description:

   - privileges: the operation permissions granted to the account, such as SELECT, INSERT, and UPDATE. To authorize the account to perform all operations, set this parameter to ALL.
   - databasename: the name of the on-premises MySQL database. If you want to grant all database permissions to the account, set this parameter to an asterisk (*).
   - tablename: the name of the table whose data you want to migrate. If you want to grant all table permissions to the account, set this parameter to an asterisk (*).
   - username: the name of the account.
   - host: the host from which the account is authorized to log on to the on-premises MySQL database. If you want to allow access from a local host, set this parameter to localhost. If you want to allow access from all hosts, set this parameter to a percent sign (%).
   - WITH GRANT OPTION: authorizes the account to use the GRANT statement. This parameter is optional.

   For example, you can execute the following statement to grant all permissions on tables and databases to the William account. The account is authorized to log on to the database from all hosts.

   ```
   GRANT ALL ON *. * TO 'William'@'%';
   ```

3. Use the data export tool of mysqldump to export data from the database as a data file.

> **Notice** Do not update data during data export. In this step, only data is exported. Stored procedures, triggers, and functions are not exported.

```
mysqldump -h localIp -u userName -p --opt --default-character-set=utf8 --hex-blob dbName --skip-triggers > /tmp/dbName.sql
```

Parameter description:

- localIp: the IP address of the host where the on-premises MySQL database resides.
- userName: the account that is used to migrate data from the on-premises MySQL database.
- dbName: the name of the on-premises MySQL database.
- /tmp/dbName.sql: the name of the exported data file.

4. Use mysqldump to export stored procedures, triggers, and functions.

> **Notice** Skip this step if no stored procedures, triggers, or functions are used in the database. When stored procedures, triggers, and functions are exported, you must remove the DEFINER to ensure compatibility with ApsaraDB RDS for MySQL.

```
mysqldump -h localIp -u userName -p --opt --default-character-set=utf8 --hex-blob dbName -R | sed -e 's/DEFINER[ ]*=[ ]*[^*]*\*/\*/' > /tmp/triggerProcedure.sql
```

Parameter description:

- localIp: the IP address of the host where the on-premises MySQL database resides.
- userName: the account that is used to migrate data from the on-premises MySQL database.
- dbName: the name of the on-premises MySQL database.
- /tmp/triggerProcedure.sql: the name of the exported stored procedure file.

5. Upload the data file and stored procedure file to the ECS instance.

   In this example, the files are uploaded to the following paths:

   ```
   /tmp/dbName.sql
   ```

   ```
   /tmp/triggerProcedure.sql
   ```

6. Log on to the ECS console and import both the data file and the stored procedure file to the destination ApsaraDB RDS for MySQL instance.

> **Note** For information about how to log on to the ECS instance, see topics in the **Connect to an instance** section of ECS User Guide.

```
mysql -h intranet4example.mysql.rds.aliyuncs.com –u userName -p dbName < /tmp/dbName.sql
```

```
mysql -h intranet4example.mysql.rds.aliyuncs.com -u userName -p dbName < /tmp/triggerProcedure.sql
```

Parameter description:

- intranet4example.mysql.rds.aliyuncs.com: the endpoint of the ApsaraDB RDS for MySQL instance. An internal endpoint is used in this example.
- userName: the migration account of the ApsaraDB RDS for MySQL database.
- dbName: the name of the on-premises MySQL database from which you want to import data.
- /tmp/dbName.sql: the name of the data file that you want to import.
- /tmp/triggerProcedure.sql: the name of the stored procedure file that you want to import.

9.ApsaraDB RDS for SQL Server

9.1. What is ApsaraDB RDS?

ApsaraDB Relational Database Service (RDS) is a stable, reliable, and scalable online database service. Based on the distributed file system and high-performance storage, ApsaraDB RDS provides a set of solutions for disaster recovery, backup, restoration, monitoring, and migration.

ApsaraDB RDS supports four database engines, which are MySQL, SQL Server, PolarDB, and PostgreSQL. You can create database instances based on these engines to meet your business requirements. This topic describes the SQL Server engine.

ApsaraDB RDS for SQL Server

ApsaraDB RDS for SQL Server provides strong support for a variety of enterprise applications under the high-availability architecture. ApsaraDB RDS for SQL Server can also restore data to a specific point in time, which reduces costs.

ApsaraDB RDS for SQL Server provides basic features such as whitelist configuration, backup and restoration, transparent data encryption, data migration, and management for instances, accounts, and databases.

9.2. Log on to the ApsaraDB RDS console

This topic describes how to log on to the ApsaraDB RDS console.

Prerequisites

- The URL of the Apsara Uni-manager Management Console is obtained from the deployment personnel before you log on to the Apsara Uni-manager Management Console.
- A browser is available. We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL of the Apsara Uni-manager Management Console. Press the Enter key.
2. Enter your username and password.

   Obtain the username and password that you can use to log on to the console from the operations administrator.

   > **Note** When you log on to the Apsara Uni-manager Management Console for the first time, you must change the password of your username. Your password must meet complexity requirements. The password must be 8 to 20 characters in length and must contain at least two of the following character types:
   >
   > - Uppercase or lowercase letters
   > - Digits
   > - Special characters, which include ! @ # $ %

3. Click **Login**.
4. In the top navigation bar, choose **Products** > Database Services > **ApsaraDB RDS**.

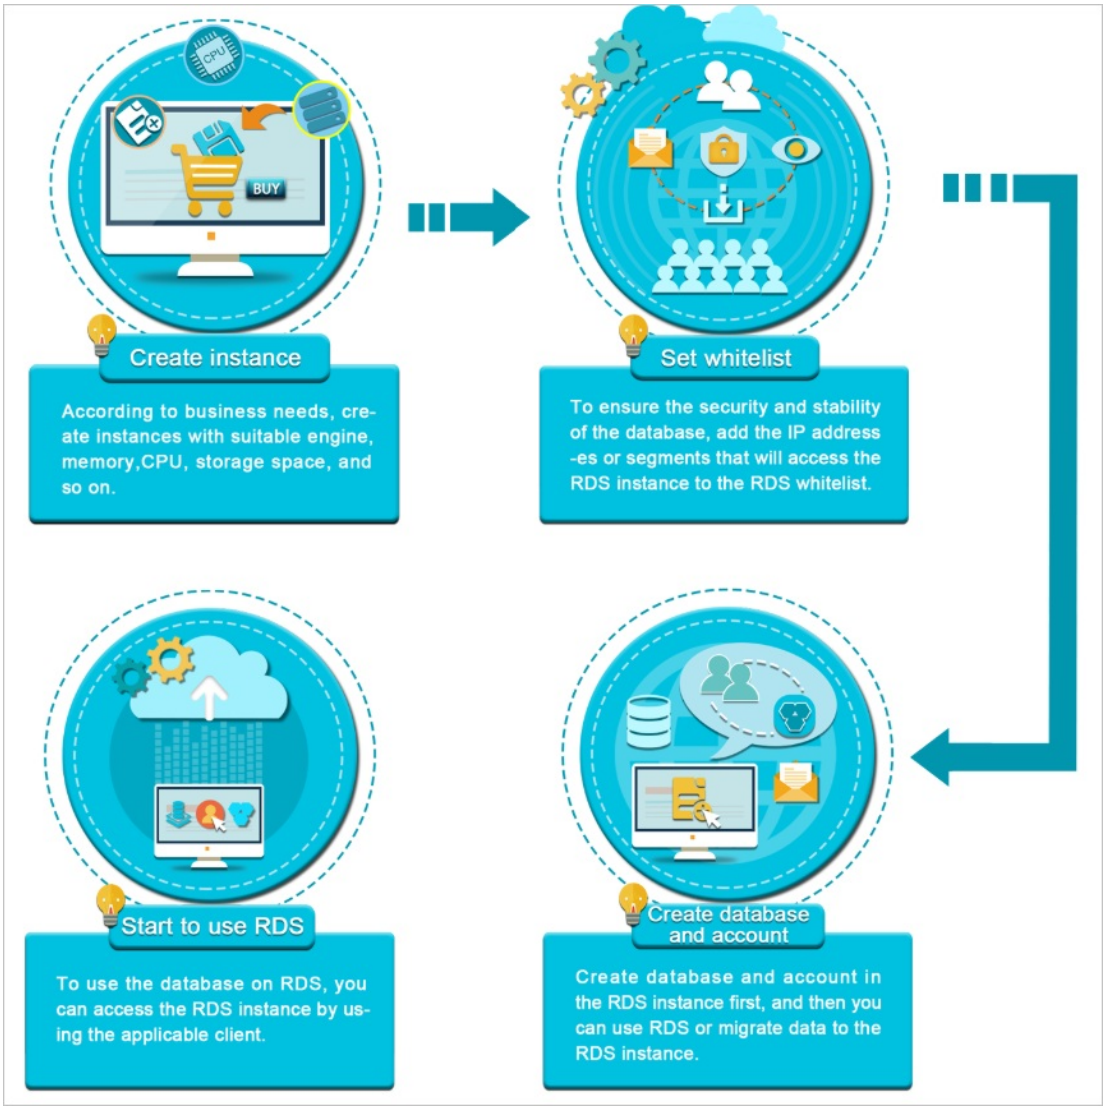
9.3. Quick Start

9.3.1. Procedure

ApsaraDB RDS quick start covers the following topics: creating an ApsaraDB RDS instance, configuring an IP address whitelist, creating a database, creating an account, and connecting to the instance.

The following figure shows the operations that you must perform before you use an ApsaraDB RDS instance.

Quick start flowchart



9.3.2. Create an instance

This topic describes how to create an instance in the ApsaraDB RDS console.

Prerequisites

An Apsara Stack tenant account is created.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, click **Create Instance** in the upper-right corner.
3. Configure the following parameters.

Section	Parameter	Description
Basic Settings	Organization	The organization to which the instance belongs.
	Resource Set	The resource set to which the instance belongs.
Region	Region	The region in which you want to create the instance. Services in different regions cannot communicate over an internal network. After the instance is created, the region cannot be changed.
	Zone of Primary Node	The zone where the primary instance is deployed.
	Deployment Method	Specifies whether to deploy the primary and secondary instances in separate zones. ApsaraDB RDS supports **Multi-zone Deployment** and **Single-zone Deployment**. If you select **Multi-zone Deployment**, you must configure **Zone of Secondary Node**.
	Zone of Secondary Node	The zone where the secondary instance is deployed. This parameter is available only when **Deployment Method** is set to **Multi-zone Deployment**. **Note** If you select the same zone for both the primary and secondary instances, the deployment is equivalent to single-zone deployment.
	Quantity	The number of ApsaraDB RDS instances that you want to create. Default value: 1.
	Instance Name	The name of the instance. ○ The name must be 2 to 64 characters in length. ○ The name must start with a letter. ○ The name can contain letters, digits, and the following special characters: _ - : ○ The name cannot start with http:// or https://.
	Connection Type	The connection type of the instance. ApsaraDB RDS instances support the following connection types: ○ **Internet**: ApsaraDB RDS instances of this connection type can be connected over the Internet. ○ **Internal Network**: ApsaraDB RDS instances of this connection type can be connected over an internal network. **Note** The value of this parameter cannot be changed after the instance is created. Proceed with caution.
	Database Engine	The database engine of the instance. Select **SQLServer**.

Specifications Section	Parameter	Description
	Engine Version	The version of the database engine. Valid values: ○ **2012_ent_ha**: SQL Server 2012 EE ○ **2012_std_ha**: SQL Server 2012 SE ○ **2016_ent_ha**: SQL Server 2016 EE ○ **2016_std_ha**: SQL Server 2016 SE ○ **2017_ent_ha**: SQL Server 2017 EE
	Edition	The edition of the instance. For more information, see Instance types in *ApsaraDB RDS Product Introduction*.
	Storage Type	The storage type of the instance. The storage type is automatically set to **cloud ssd**.
	Encrypted	Specifies whether to encrypt the standard SSD. This parameter is available only when **Storage Type** is set to **cloud ssd**. If you select Encrypted, you must specify the **Encryption Key** parameter. If you do not have a key, you must first create one in Key Management Service (KMS). For more information, see Create a CMK in *KMS User Guide*.
	Encryption Key	The key that is used to encrypt the standard SSD. This parameter is available only when you select **Encrypted**.
	Instance Type	The instance type of the instance. Memory size determines the maximum number of connections and the input/output operations per second (IOPS). The actual values are displayed in the console. For more information, see Instance types in *ApsaraDB RDS Product Introduction*.
	Storage Capacity	The storage capacity of the instance, which includes the space to store data, system files, binlog files, and transaction files. For more information, see Instance types in *ApsaraDB RDS Product Introduction*.
Network	**Network Type**	The network type of the instance. ApsaraDB RDS instances support the following network types: ○ **Classic Network**: Cloud services in the classic network are not isolated. Unauthorized access to a cloud service is blocked only by the security group or whitelist policy of the service. ○ **VPC**: A virtual private cloud (VPC) helps you build an isolated network environment on Apsara Stack. You can customize route tables, CIDR blocks, and gateways in a VPC. We recommend that you select VPC for improved security.
	VPC	Select a VPC. **Note** When **Network Type** is set to **VPC**, you must specify this parameter.
	vSwitch	Select a vSwitch. **Note** When **Network Type** is set to **VPC**, you must specify this parameter.

Section	Parameter	Description
	IP Address Whitelist	The IP addresses that are allowed to connect to the instance.

4. Click **Submit**.

9.3.3. Configure an IP address whitelist

To ensure database security and reliability, you must modify the whitelist of an ApsaraDB RDS instance before you enable the instance. You must add the IP addresses or CIDR blocks that are used for database access to the whitelist.

Context

The whitelist improves the access security of your ApsaraDB RDS instance. We recommend that you maintain the whitelist on a regular basis. The whitelist configuration process does not affect the normal operations of the ApsaraDB RDS instance.

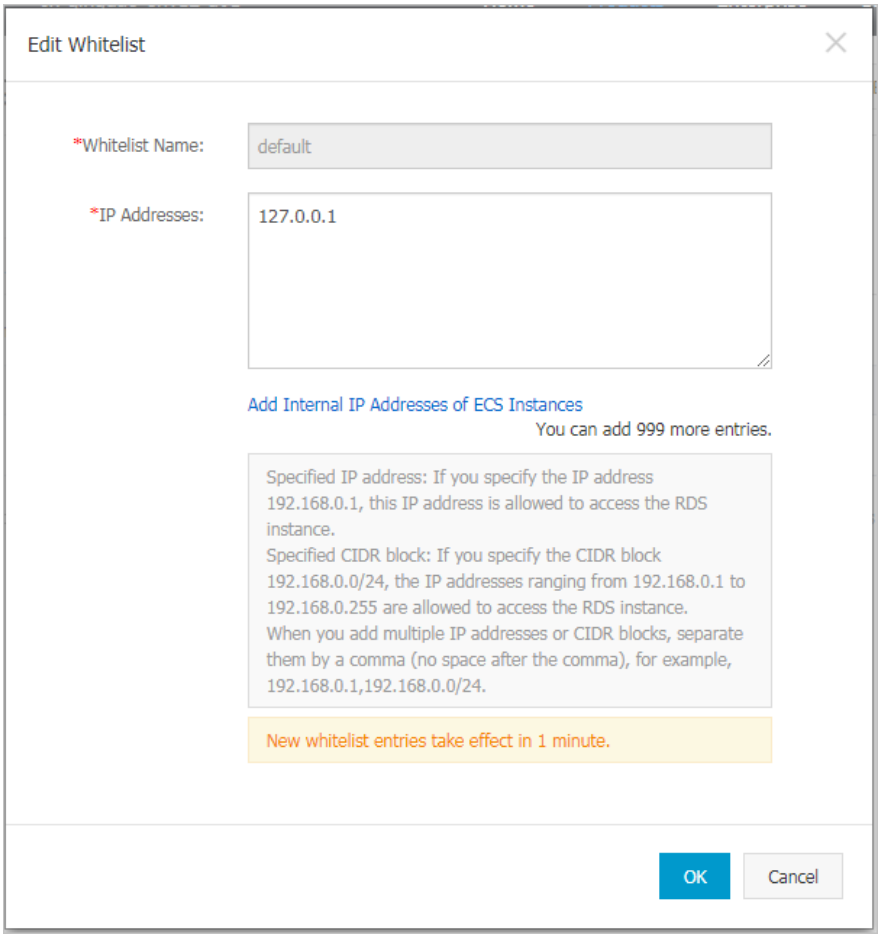
Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Data Security**.
5. On the **Whitelist Settings** tab, click **Edit** corresponding to the **default** whitelist.

   > **Note**
   > - If you want to connect an ECS instance to an ApsaraDB RDS instance by using an internal endpoint, you must make sure that the two instances are in the same region and have the same network type. Otherwise, the connection fails.
   > - You can also click **Create Whitelist** to create a new whitelist.

6. In the **Edit Whitelist** dialog box, enter the IP addresses or CIDR blocks that are allowed to access your ApsaraDB RDS instance, and then click **OK**.
   - If you add the CIDR block 10.10.10.0/24, all IP addresses in the 10.10.10.X format are allowed to access the ApsaraDB RDS instance.
   - If you enter more than one IP address or CIDR block, you must separate them with commas (,). Do not add spaces before or after the commas. Example: 192.168.0.1,172.16.213.9.
   - If you click **Add Internal IP Addresses of ECS Instances**, the IP addresses of all of the ECS instances that are created in your Alibaba Cloud account appear. Then, you can select the required IP addresses and add them to the whitelist.

   > **Note** If you add a new IP address or CIDR block to the **default** whitelist, the default address 127.0.0.1 is deleted.



9.3.4. Connect to an instance

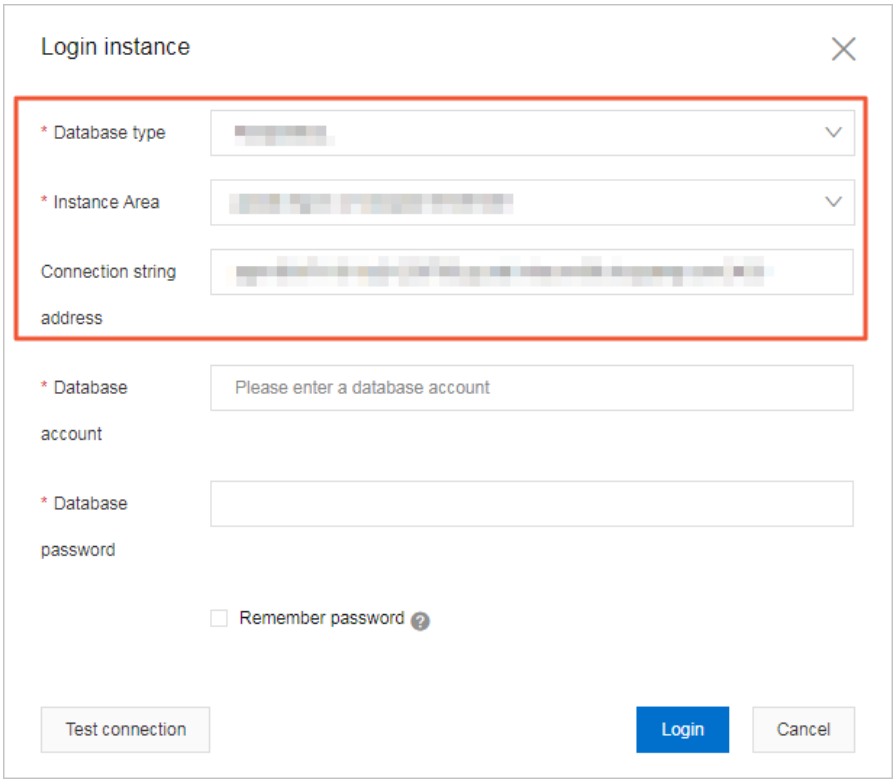
This topic describes how to use Data Management (DMS) to connect to an ApsaraDB RDS instance.

Prerequisites

- A database is created. For more information, see Create a database.
- A database account is created. For more information, see Create an account.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. Click **Log On to DB** in the upper-right corner of the page.
5. In the **Login instance** dialog box of the **DMS** console, check values of **Database type**, **Instance Area**, and **Connection string address**. If the information is correct, enter **Database account** and **Database password**, as shown in the following figure.



Parameter	Description
Database type	The engine of the database. By default, the engine of the database to be connected is displayed.
Instance Area	The region where the instance is deployed. By default, the region of the current instance is displayed.
Connection string address	The endpoint of the instance. By default, the endpoint of the current instance is displayed.
Database account	The account of the database to be connected.
Database password	The password of the account used to connect to the database.

6. Click **Login**.

> **Note**
> - If you want the browser to remember the password, select **Remember password** and click **Login**.
> - If you cannot connect to the instance, check the IP address whitelist settings. For more information, see Configure a whitelist.

9.3.5. Create an account

This topic describes how to create an account on an ApsaraDB RDS for SQL Server instance.

Prerequisites

The instance is in the **Running** state.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Accounts**.
5. On the right side of the page, click **Create Account**.
6. Enter the information of the account that you want to create.

Parameter	Description
Database Account	Enter the name of the account. The name must be 2 to 16 characters in length and can contain lowercase letters, digits, and underscores (_). It must start with a lowercase letter and end with a lowercase letter or digit.
Account Type	○ **Privileged Account**: You can select the **Privileged Account** option only if you create an account on your ApsaraDB RDS instance for the first time. Each ApsaraDB RDS instance can have only a single privileged account. The privileged account of an ApsaraDB RDS instance cannot be deleted. ○ **Standard Account**: You can select the **Standard Account** option only after a privileged account is created on your ApsaraDB RDS instance. Each ApsaraDB RDS instance can have more than one standard account. You must manually grant permissions on databases to each standard account.
Authorized Databases	Select the authorized databases of the account when the **Standard Account** type is selected. If no databases are created, you can leave this parameter empty. You can perform the following steps to grant permissions on more than one database to the account: i. In the **Unauthorized Databases** section, select the databases on which you want to grant permissions to the account. ii. Click **Add** to add the selected databases to the **Authorized Databases** section. iii. In the Authorized Databases section, specify the permissions that the account is granted on each authorized database. The permissions can be **Read/Write**, **Read-only**, or **Owner**. You can also click **Set All to Read/Write**, **Set All to Read-only**, or **Set All to Owner** to set the permissions of the account on all authorized databases. **Note** ■ The account is authorized to create tables, delete tables, and modify schemas in a database only when it has the **Owner** permission on the database. ■ The account has permissions on all databases and does not require authorization if you select the **Privileged Account** type.
Password	Enter the password of the account. The password must meet the following requirements: ○ The password is 8 to 32 characters in length. ○ The password contains at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. ○ Special characters include `!@#$%^&*()_+-=`
Re-enter Password	Enter the password of the account again.

Parameter	Description
Description	Enter a description that helps identify the account. The description can be up to 256 characters in length.

7. Click **Create**.

9.3.6. Create a database

This topic describes how to create a database on an ApsaraDB RDS for SQL Server instance in the ApsaraDB RDS console.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Databases**.
5. In the upper-right corner of the page, click **Create Database**.
6. Configure the parameters for the database that you want to create.

Parameter	Description
Database Name	Enter the name of the database. The name must be 2 to 64 characters in length. It can contain lowercase letters, digits, underscores (_), and hyphens (-). It must start with a lowercase letter and end with a lowercase letter or digit.
Supported Character Sets	Select the character set that is supported by the database. You can also select **all** and then select a character set from the drop-down list that appears.
Description	Enter a description of the database to facilitate subsequent management. The description can be up to 256 characters in length.

7. Click **Create**.

9.4. Instances

9.4.1. Create an instance

This topic describes how to create an instance in the ApsaraDB RDS console.

Prerequisites

An Apsara Stack tenant account is created.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, click **Create Instance** in the upper-right corner.
3. Configure the following parameters.

Section	Parameter	Description
Basic Settings	Organization	The organization to which the instance belongs.
	Resource Set	The resource set to which the instance belongs.
Region	Region	The region in which you want to create the instance. Services in different regions cannot communicate over an internal network. After the instance is created, the region cannot be changed.
	Zone of Primary Node	The zone where the primary instance is deployed.
	Deployment Method	Specifies whether to deploy the primary and secondary instances in separate zones. ApsaraDB RDS supports **Multi-zone Deployment** and **Single-zone Deployment**. If you select **Multi-zone Deployment**, you must configure **Zone of Secondary Node**.
	Zone of Secondary Node	The zone where the secondary instance is deployed. This parameter is available only when **Deployment Method** is set to **Multi-zone Deployment**. **Note** If you select the same zone for both the primary and secondary instances, the deployment is equivalent to single-zone deployment.
	Quantity	The number of ApsaraDB RDS instances that you want to create. Default value: 1.
	Instance Name	The name of the instance. ○ The name must be 2 to 64 characters in length. ○ The name must start with a letter. ○ The name can contain letters, digits, and the following special characters: _ - : ○ The name cannot start with http:// or https://.
	Connection Type	The connection type of the instance. ApsaraDB RDS instances support the following connection types: ○ **Internet**: ApsaraDB RDS instances of this connection type can be connected over the Internet. ○ **Internal Network**: ApsaraDB RDS instances of this connection type can be connected over an internal network. **Note** The value of this parameter cannot be changed after the instance is created. Proceed with caution.
	Database Engine	The database engine of the instance. Select **SQLServer**.

Specifications Section	Parameter	Description
	Engine Version	The version of the database engine. Valid values: ○ **2012_ent_ha**: SQL Server 2012 EE ○ **2012_std_ha**: SQL Server 2012 SE ○ **2016_ent_ha**: SQL Server 2016 EE ○ **2016_std_ha**: SQL Server 2016 SE ○ **2017_ent_ha**: SQL Server 2017 EE
	Edition	The edition of the instance. For more information, see Instance types in *ApsaraDB RDS Product Introduction*.
	Storage Type	The storage type of the instance. The storage type is automatically set to **cloud ssd**.
	Encrypted	Specifies whether to encrypt the standard SSD. This parameter is available only when **Storage Type** is set to **cloud ssd**. If you select Encrypted, you must specify the **Encryption Key** parameter. If you do not have a key, you must first create one in Key Management Service (KMS). For more information, see Create a CMK in *KMS User Guide*.
	Encryption Key	The key that is used to encrypt the standard SSD. This parameter is available only when you select **Encrypted**.
	Instance Type	The instance type of the instance. Memory size determines the maximum number of connections and the input/output operations per second (IOPS). The actual values are displayed in the console. For more information, see Instance types in *ApsaraDB RDS Product Introduction*.
	Storage Capacity	The storage capacity of the instance, which includes the space to store data, system files, binlog files, and transaction files. For more information, see Instance types in *ApsaraDB RDS Product Introduction*.
Network	**Network Type**	The network type of the instance. ApsaraDB RDS instances support the following network types: ○ **Classic Network**: Cloud services in the classic network are not isolated. Unauthorized access to a cloud service is blocked only by the security group or whitelist policy of the service. ○ **VPC**: A virtual private cloud (VPC) helps you build an isolated network environment on Apsara Stack. You can customize route tables, CIDR blocks, and gateways in a VPC. We recommend that you select VPC for improved security.
	VPC	Select a VPC. **Note** When **Network Type** is set to **VPC**, you must specify this parameter.
	vSwitch	Select a vSwitch. **Note** When **Network Type** is set to **VPC**, you must specify this parameter.

Section	Parameter	Description
	IP Address Whitelist	The IP addresses that are allowed to connect to the instance.

4. Click **Submit**.

9.4.2. View basic information of an instance

This topic describes how to view the details of an ApsaraDB RDS instance, such as its basic information, internal network connection information, status, and configurations.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. Use one of the following methods to go to the **Basic Information** page of an instance:
   - On the **Instances** page, click the ID of an instance to go to the **Basic Information** page.
   - On the **Instances** page, click **Manage** in the **Actions** column corresponding to an instance to go to the **Basic Information** page.

9.4.3. Restart an instance

This topic describes how to manually restart an ApsaraDB RDS for MySQL instance. This applies if the number of connections exceeds a specific threshold or if an instance has performance issues.

Prerequisites

The instance is in the **Running** state.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. Click **Restart Instance** in the upper-right corner.

   > **Note** When you restart an instance, applications are disconnected from the instance. We recommend that you make appropriate service arrangements before you restart an instance. Proceed with caution.

5. In the Restart Instance message, click **Confirm**.

9.4.4. Change the specifications of an instance

This topic describes how to change specifications such as the instance type and storage space if they do not meet the requirements of your application. When the specification changes take effect, a 30-second network interruption may occur. Business operations that involve databases, accounts, and networks are interrupted. We recommend that you change the specifications during off-peak hours or make sure that your applications are configured with automatic reconnection policies.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.

3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the **Configuration Information** section, click **Change Specifications**.
5. On the **Change Specifications** page, specify **Instance Type** and **Storage Capacity**.
6. After you configure the preceding parameters, click **Submit**.

9.4.5. Set a maintenance window

This topic describes how to set the maintenance window of an ApsaraDB RDS for SQL Server instance. The backend system performs maintenance on the ApsaraDB RDS instance during the maintenance window. This ensures the stability of the ApsaraDB RDS instance. The default maintenance window is from 02:00 (UTC+8) to 06:00 (UTC+8). We recommend that you set the maintenance window to off-peak hours of your business to avoid impacts on your business.

Context

- An instance enters the **Maintaining Instance** state before the maintenance window to ensure stability during the maintenance process. When the instance is in this state, access to data in the database and query operations such as performance monitoring are not affected. However, except for account and database management and IP address whitelist configuration, modification operations such as upgrade, downgrade, and restart are temporarily unavailable.
- During the maintenance window, one or two network interruptions may occur. Make sure that your applications are configured with automatic reconnection policies.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the **Configuration Information** section, click **Configure** to the right of **Maintenance Window**.
5. Select a maintenance window and click **Save**.

> **Note** The maintenance window is displayed in UTC+8.

9.4.6. Configure primary/secondary switchover

ApsaraDB RDS provides the primary/secondary switchover feature to ensure the high availability of databases. The primary/secondary switchover is performed when the primary instance becomes unavailable. You can also manually switch your business to the secondary instance.

Prerequisites

The instance is in the **Running** state.

Context

An ApsaraDB RDS for SQL Server instance has a secondary instance. Data is synchronized in real time between the primary and secondary instances. You can access only the primary instance. The secondary instance serves only as a backup instance and does not allow external access. If the primary instance cannot be accessed, your business automatically switches over to the secondary instance. After the switchover, the primary instance becomes the secondary instance.

> Notice
> - During a switchover, a network interruption may occur. Make sure that your applications are configured with automatic reconnection policies.
> - During a switchover, a 1-minute data quality protection mechanism is enabled for data synchronization. If the primary and secondary database states are incorrect or if the latency for data synchronization exceeds 1 minute due to SQL Server errors, the HA system does not automatically perform the primary/secondary switchover. You must determine whether to perform the switchover.
> - If an instance is intermittently unavailable due to excessive mirroring event waits, the switchover is not performed. The instance automatically becomes available again.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Service Availability**.
5. In the **Availability Information** section, click **Switch Primary/Secondary Instance**.
6. In the dialog box that appears, click **OK**.

Result

After the switchover is complete, the original primary instance becomes the secondary instance for the next primary/secondary switchover.

9.4.7. Release an instance

This topic describes how to manually release an instance.

Context

- Only instances in the running state can be manually released.
- After an instance is released, the instance data is immediately deleted. We recommend that you back up your data before you release an instance.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. Find the instance that you want to release and choose **More > Release Instance**.
3. In the **Release Instance** message, click **Confirm**.

9.4.8. Read-only instances

9.4.8.1. Overview of read-only ApsaraDB RDS for SQL Server instances

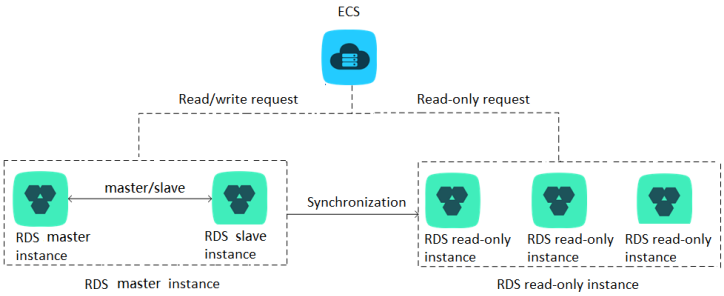
This topic provides an overview of read-only ApsaraDB RDS for SQL Server instances. If a large number of read requests overwhelm the primary instance, your business may be interrupted. In this case, you can create one or more read-only instances to offload read requests from the primary instance. This scales the read capability of your database system and increases the throughput of your application.

Overview

When a read-only instance is created, the data is replicated from the secondary instance. The data is consistent with that of the primary instance. Data updates of the primary instance are synchronized to all read-only instances.

> **Note**
>
> - Only ApsaraDB RDS instances that run SQL Server 2017 EE support read-only instances.
> - Each read-only instance works in a single-node architecture, where no instances are provided as backups.

The following figure shows the topology of read-only instances.



Features

- The specifications of a read-only instance can differ from the specifications of the primary instance, and can be changed at any time. We recommend that you select specifications of a read-only instance that are higher than or equal to those of the primary instance. If the specifications of a read-only instance are lower than those of the primary instance, the read-only instance may have high latency or workloads.
- Read-only instances do not require database or account maintenance, because their database and account information is synchronized with the primary instance.
- A read-only instance automatically replicates the IP address whitelists of the primary instance. However, the IP address whitelists for the read-only instance are independent of those of the primary instance. For information about how to modify the whitelists of a read-only instance, see Configure a whitelist.
- You can monitor up to 20 system performance metrics, such as the disk capacity, input/output operations per second (IOPS), number of connections, CPU utilization, and network traffic.

Limits

- You can create up to seven read-only instances.
- You cannot configure backup policies or manually create backups for read-only instances, because these are already configured or created on the primary instance.
- You cannot create a temporary instance by using a backup set or from a point in time. In addition, you cannot overwrite a read-only instance by using a backup set.
- After a read-only instance is created, you cannot use a data backup file to restore it in overwrite mode.
- You cannot migrate data to read-only RDS instances.
- You cannot create or delete databases on read-only instances.
- You cannot create or delete accounts, authorize accounts, or change the passwords of accounts on read-only instances.

FAQ

Can I manage the accounts created on the primary instance from its read-only instances?

No, although accounts created on the primary instance are replicated to its read-only instances, you cannot manage the accounts on the read-only instances. The accounts have only read permissions on the read-only instances.

9.4.8.2. Create a read-only ApsaraDB RDS for SQL Server instance

This topic describes how to create a read-only instance for your primary ApsaraDB RDS for SQL server instance. This allows your database system to process a large number of read requests and increases the throughput of your application. Each read-only ApsaraDB RDS instance is a replica of the primary instance. Data updates on the primary instance are synchronized to all the read-only instances.

Prerequisites

The primary instance runs SQL Server 2017 EE.

Precautions

- You can create read-only instances for the primary ApsaraDB RDS instance. However, you cannot convert existing ApsaraDB RDS instances into read-only instances.
- While you create a read-only instance, the system replicates data from a secondary instance. Therefore, the operation of your primary instance is not interrupted.
- You can create up to seven read-only instances.
- For more information about read-only ApsaraDB RDS instances, see Overview of read-only ApsaraDB RDS for SQL Server instances.

Create a read-only instance

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the **Distributed by Instance Role** section on the right side of the page, click **Create Read-only Instance**.
5. Configure the following parameters and click **Submit**.

Section	Parameter	Description
Region	**Region**	The region in which you want to create the instance.
	Database Engine	The database engine of the read-only instance, which is the same as that of the primary instance and cannot be changed.
	Engine Version	The engine version of the read-only instance, which is the same as that of the primary instance and cannot be changed.
	Edition	Set the value to **Read-only**.

Section	Parameter	Description
Specifications	**Instance Type**	The instance type of the read-only instance. The instance type of the read-only instance can be different from that of the primary instance, and can be changed at any time to facilitate flexible upgrade and downgrade. For more information, see Instance types in *ApsaraDB RDS Product Information*. **Note** To ensure sufficient I/O throughput for data synchronization, we recommend that you select at least the same instance type as the primary instance for read-only instances.
	Storage Capacity	The storage space of the read-only instance. To ensure sufficient I/O throughput for data synchronization, we recommend that you select at least the same instance type and storage space as the primary instance for the read-only instance. For more information, see Instance types in *ApsaraDB RDS Product Introduction*.
Network Type	**Network Type**	The network type of the read-only instance, which is the same as that of the primary instance and cannot be changed.
	VPC	Select a VPC if the network type is set to VPC.
	vSwitch	Select a vSwitch if the network type is set to VPC.

9.4.8.3. View details of read-only instances

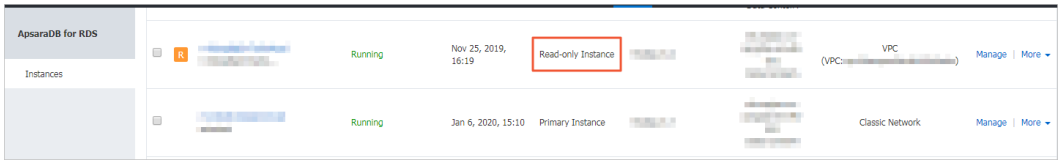
This topic describes how to view details of read-only instances. You can go to the Basic Information page of a read-only instance from the Instances page or the read-only instance list of the primary instance. Read-only instances are managed in the same way as primary instances. The read-only instance management page shows the management operations that can be performed.

View instance details by using a read-only instance

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, click the ID of a read-only instance. The **Basic Information** page appears.

   In the instance list, Instance Role of read-only instances is displayed as Read-only Instance, as shown in View a read-only instance.

   View a read-only instance



View instance details by using the primary instance

1. Log on to the ApsaraDB for RDS console.

2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. On the **Basic Information** page, move the pointer over the number below **Read-only Instance** in the **Distributed by Instance Role** section. The ID of the read-only instance is displayed.
5. Click the ID of the read-only instance to go to the read-only instance management page.

9.5. Accounts

9.5.1. Create an account

This topic describes how to create an account on an ApsaraDB RDS for SQL Server instance.

Prerequisites

The instance is in the **Running** state.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Accounts**.
5. On the right side of the page, click **Create Account**.
6. Enter the information of the account that you want to create.

Parameter	Description
Database Account	Enter the name of the account. The name must be 2 to 16 characters in length and can contain lowercase letters, digits, and underscores (_). It must start with a lowercase letter and end with a lowercase letter or digit.
Account Type	◦ **Privileged Account**: You can select the **Privileged Account** option only if you create an account on your ApsaraDB RDS instance for the first time. Each ApsaraDB RDS instance can have only a single privileged account. The privileged account of an ApsaraDB RDS instance cannot be deleted. ◦ **Standard Account**: You can select the **Standard Account** option only after a privileged account is created on your ApsaraDB RDS instance. Each ApsaraDB RDS instance can have more than one standard account. You must manually grant permissions on databases to each standard account.

Parameter	Description
Authorized Databases	Select the authorized databases of the account when the **Standard Account** type is selected. If no databases are created, you can leave this parameter empty. You can perform the following steps to grant permissions on more than one database to the account: i. In the **Unauthorized Databases** section, select the databases on which you want to grant permissions to the account. ii. Click **Add** to add the selected databases to the **Authorized Databases** section. iii. In the Authorized Databases section, specify the permissions that the account is granted on each authorized database. The permissions can be **Read/Write**, **Read-only**, or **Owner**. You can also click **Set All to Read/Write**, **Set All to Read-only**, or **Set All to Owner** to set the permissions of the account on all authorized databases. **Note** ■ The account is authorized to create tables, delete tables, and modify schemas in a database only when it has the **Owner** permission on the database. ■ The account has permissions on all databases and does not require authorization if you select the **Privileged Account** type.
Password	Enter the password of the account. The password must meet the following requirements: ○ The password is 8 to 32 characters in length. ○ The password contains at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. ○ Special characters include `!@#$%^&*()_+-=`
Re-enter Password	Enter the password of the account again.
Description	Enter a description that helps identify the account. The description can be up to 256 characters in length.

7. Click **Create**.

9.5.2. Reset the password

You can use the ApsaraDB RDS console to reset the password of your database account.

Prerequisites

The instance is in the **Running** state.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.

4. In the left-side navigation pane, click **Accounts**.
5. Find an account and click **Reset Password** in the Actions column.
6. In the dialog box that appears, enter and confirm the new password, and then click **OK**.

> **Note** The password must meet the following requirements:
> - The password must be 8 to 32 characters in length.
> - The password must contain at least three of the following characters: uppercase letters, lowercase letters, digits, and special characters.
> - Special characters include ! @ # $ % ^ & * ( ) _ + - =

9.6. Databases

9.6.1. Create a database

This topic describes how to create a database on an ApsaraDB RDS for SQL Server instance.

Terms

- Instance: a virtualized database server on which you can create and manage more than one database.
- Database: a set of data that is stored in an organized manner and can be shared by a number of users. A database provides the minimal redundancy and is independent of applications. In simple words, a database is a data warehouse that is used to store data.
- Character set: a collection of letters, special characters, and encoding rules that are used in a database.

Prerequisites

An ApsaraDB RDS for SQL Server instance is created. For more information, see Create an instance.

Procedure

For more information, see Create a database.

9.6.2. Delete a database

This topic describes how to delete a database from an ApsaraDB RDS for SQL Server instance. You can delete a database by using the ApsaraDB RDS console or an SQL statement.

Use the console to delete a database

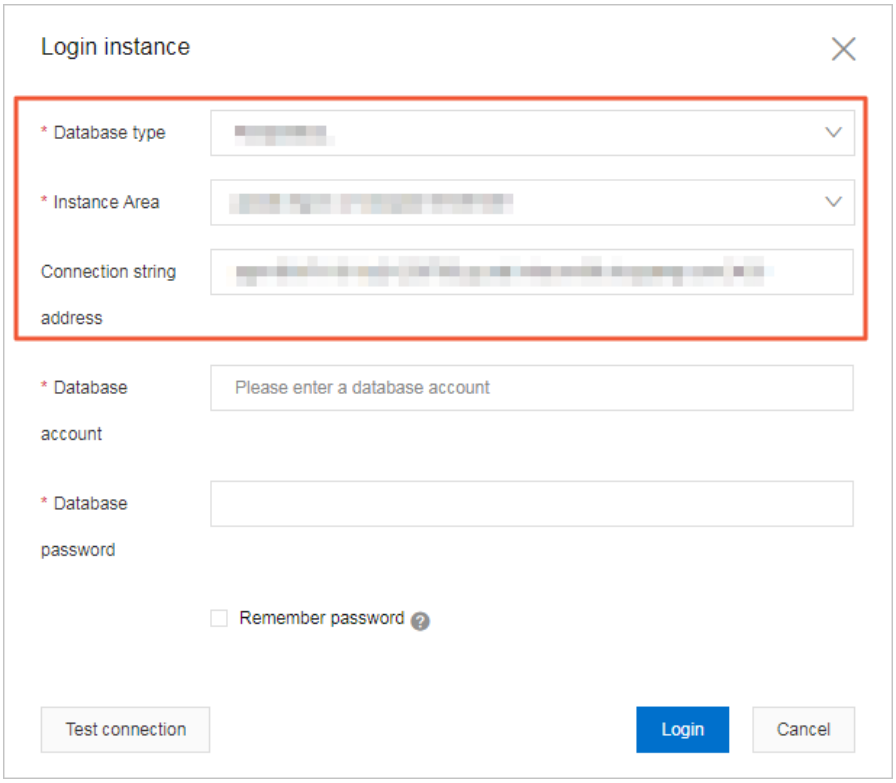
1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Databases**.
5. Find the database that you want to delete and click **Delete** in the **Actions** column.
6. In the message that appears, click **Confirm**.

Execute an SQL statement to delete a database

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic**

Information page.

4. Click **Log On to DB** in the upper-right corner of the page.
5. In the **Login instance** dialog box of the **DMS** console, check values of **Database type**, **Instance Area**, and **Connection string address**. If the information is correct, enter **Database account** and **Database password**, as shown in the following figure.



Parameter	Description
Database type	The engine of the database. By default, the engine of the database to be connected is displayed.
Instance Area	The region where the instance is deployed. By default, the region of the current instance is displayed.
Connection string address	The endpoint of the instance. By default, the endpoint of the current instance is displayed.
Database account	The account of the database to be connected.
Database password	The password of the account used to connect to the database.

6. Click **Login**.

> **Note**
> - If you want the browser to remember the password, select **Remember password** and click **Login**.
> - If you cannot connect to the instance, check the IP address whitelist settings. For more information, see Configure a whitelist.

7. The **SQLConsole** page appears after you log on to the instance. Execute a statement in the following format to delete a database:

```
drop database <database name>;
```

> **Note** If the instance runs SQL Server 2012 or later on RDS High-availability Edition, you can also use the following stored procedure. This stored procedure deletes the specified database, removes the associated image, and closes the connection to the database.
>
> ```
> EXEC sp_rds_drop_database 'database name'
> ```

8. Click **execute**.

9.6.3. Change the character set collation and the time zone of system databases

This topic describes how to change the character set collation and the time zone of system databases. System databases include master, msdb, tempdb, and model.

Prerequisites

- The instance runs SQL Server 2012, 2016, or 2017.
- No database other than system databases exists on the instance.

> **Note** If you have just deleted databases from the instance, the deletion task may be pending in the secondary instance. Before you change the character set collation and the time zone, make sure that the primary and secondary instances do not contain databases.

Precautions

- The default character set collation is Chinese_PRC_CI_AS.
- The default time zone is China Standard Time.
- You can view the available character set collations and time zones in the console.
- The instance is in the unavailable state during the change process. It takes about 1 minute to change the time zone, and 2 to 10 minutes to change the character set collation.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Databases**.
5. On the Databases page, click **Change Character Set Collation and Time Zone**.

> **Note** If you fail to find this button on the page, make sure that the requirements in Prerequisites are met.

6. In the dialog box that appears, select **Time Zone**, **Character Set Collation**, or both of them, and click **OK**.

UTC offsets of time zones

Time zone	UTC offset	Description
Afghanistan Standard Time	(UTC+04:30)	Kabul

Time zone	UTC offset	Description

9.7. Database connection

9.7.1. Change the endpoint and port number of an instance

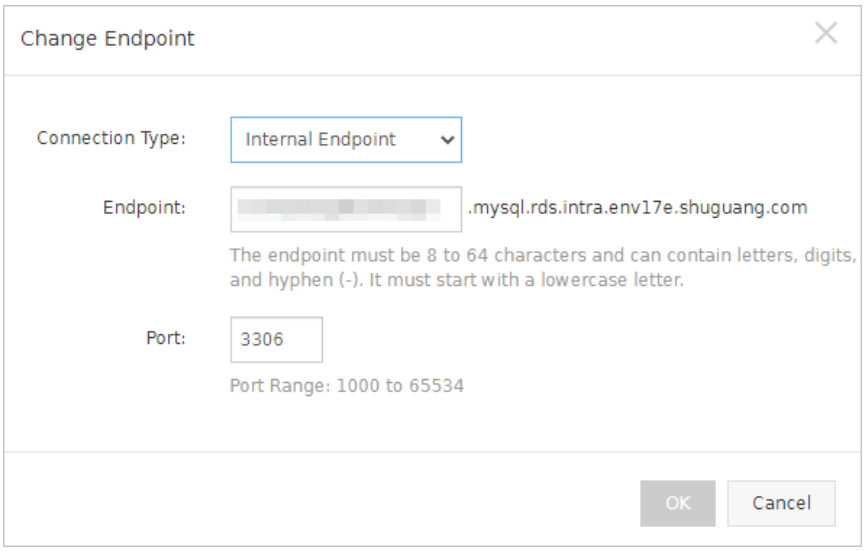
This topic describes how to view and change the endpoint and port number of an instance.

View the endpoint and port number

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Connection**.
   You can view **Internal Endpoint** and **Internal Port** of the instance on the **Database Connection** page. If you apply for a public endpoint, you can also view **Public Endpoint** and **Public Port**.

Change the endpoint and port number

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Connection**.
5. Click **Change Endpoint**.
6. In the **Change Endpoint** dialog box, select a connection type from the **Connection Type** drop-down list.
7. Set **Endpoint** and **Port**, and click **OK**.



> **Note**
> - The prefix of an endpoint must be 8 to 64 characters in length and can contain only letters, digits, and hyphens (-). It must start with a lowercase letter.
> - The port number must be a value within the range of 1000 to 65534.

9.7.2. Connect to an instance

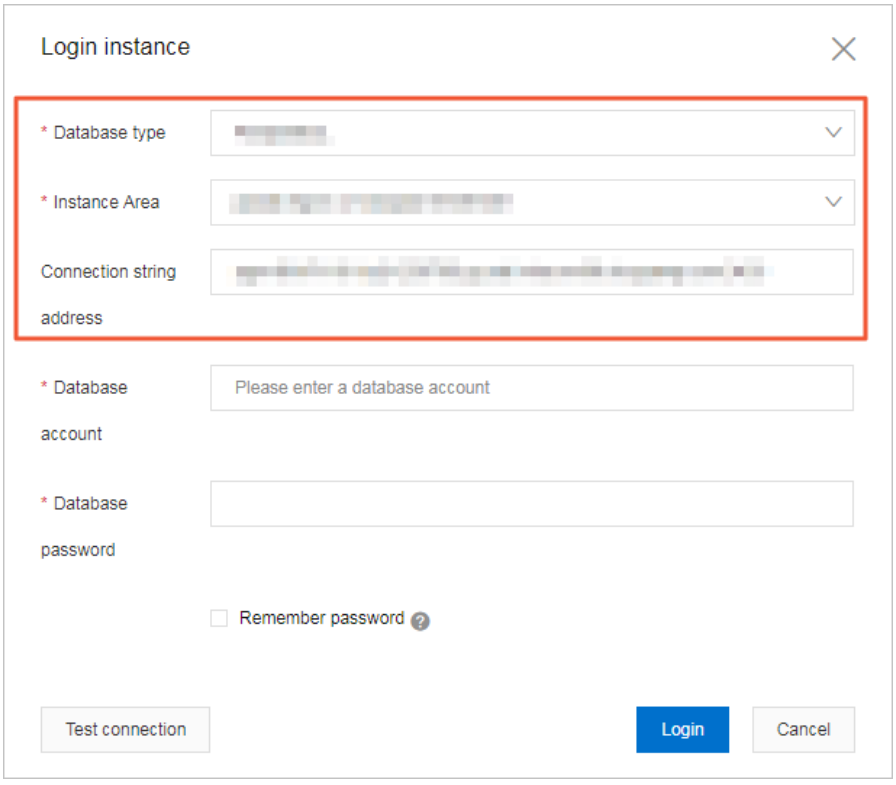
This topic describes how to use Data Management (DMS) to connect to an ApsaraDB RDS instance.

Prerequisites

- A database is created. For more information, see Create a database.
- A database account is created. For more information, see Create an account.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. Click **Log On to DB** in the upper-right corner of the page.
5. In the **Login instance** dialog box of the **DMS** console, check values of **Database type**, **Instance Area**, and **Connection string address**. If the information is correct, enter **Database account** and **Database password**, as shown in the following figure.



Parameter	Description
Database type	The engine of the database. By default, the engine of the database to be connected is displayed.
Instance Area	The region where the instance is deployed. By default, the region of the current instance is displayed.
Connection string address	The endpoint of the instance. By default, the endpoint of the current instance is displayed.

Parameter	Description
Database account	The account of the database to be connected.
Database password	The password of the account used to connect to the database.

6. Click **Login**.

> **Note**
> - If you want the browser to remember the password, select **Remember password** and click **Login**.
> - If you cannot connect to the instance, check the IP address whitelist settings. For more information, see Configure a whitelist.

9.8. Monitoring and alerting

9.8.1. Set a monitoring frequency

This topic describes how to set the monitoring frequency of an ApsaraDB RDS for SQL Server instance.

Context

ApsaraDB RDS provides the following monitoring frequencies:

- Every 60 seconds
- Every 300 seconds

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Monitoring and Alerts**.
5. On the **Resource Monitoring** tab, click **Set Monitoring Frequency**.
6. In the **Set Monitoring Frequency** dialog box, select the required monitoring frequency.
7. Click **OK**.

9.8.2. View resource and engine monitoring data

The ApsaraDB RDS console provides a variety of performance metrics to monitor the status of your instances.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Monitoring and Alerts**.
5. On the **Monitoring and Alerts** page, select **Resource Monitoring** or **Engine Monitoring**, and select a time range to view the corresponding monitoring data. The following table describes the metrics.

Monitoring type	Metric	Description
Resource Monitoring	Disk Space (unit: MB)	The disk usage of the instance, which includes the following items: ○ Instance Size ○ Data Usage ○ Log Size ○ Temporary File Size ○ Other System File Size
	IOPS	The number of input/output operations per second (IOPS) for the instance.
	Total Connections	The total number of current connections of the instance.
	MSSQL Instance CPU Utilization (percentage in the operating system)	The CPU utilization of the instance. This includes the CPU utilization for the operating system. Unit: %.
	SQLServer Average Input/Output Traffic	The inbound and outbound traffic of the instance per second. Unit: KB.
Engine Monitoring	Average Transaction Frequency	The number of transactions processed per second.
	Average QPS	The number of SQL statements executed per second.
	Buffer Hit Ratio (%)	The read hit ratio of the buffer pool.
	Page Write Frequency at Check Point	The number of checkpoints written to pages per second.
	Login Frequency	The number of logons to the instance per second.
	Average Frequency of Whole Table Scans	The number of full table scans per second.
	SQL Compilations per Second	The number of SQL statements compiled per second.
	Lock Timeout Times	The number of lock timeouts on the instance per second.
	Deadlock Frequency	The number of deadlocks on the instance per second.
	Lock Wait Frequency	The number of lock waits on the instance per second.

9.9. Data security

9.9.1. Configure an IP address whitelist

To ensure database security and reliability, you must modify the whitelist of an ApsaraDB RDS instance before you enable the instance. You must add the IP addresses or CIDR blocks that are used for database access to the whitelist.

Context

The whitelist improves the access security of your ApsaraDB RDS instance. We recommend that you maintain the whitelist on a regular basis. The whitelist configuration process does not affect the normal operations of the ApsaraDB RDS instance.

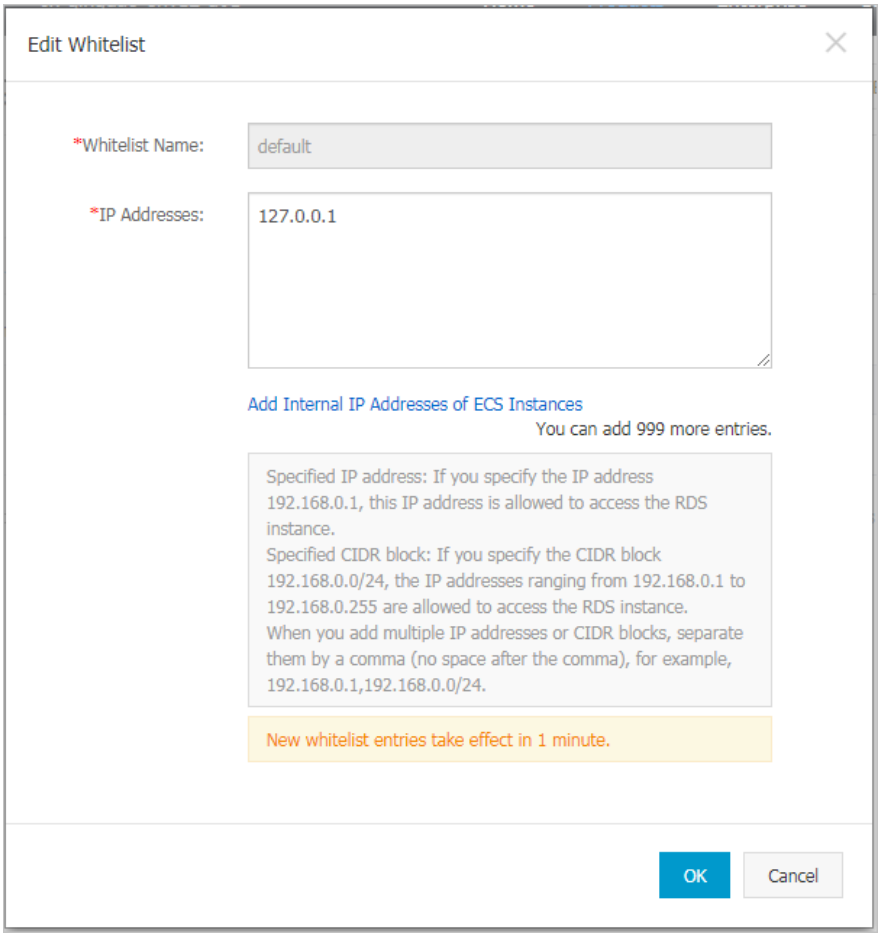
Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Data Security**.
5. On the **Whitelist Settings** tab, click **Edit** corresponding to the **default** whitelist.

   > **Note**
   > - If you want to connect an ECS instance to an ApsaraDB RDS instance by using an internal endpoint, you must make sure that the two instances are in the same region and have the same network type. Otherwise, the connection fails.
   > - You can also click **Create Whitelist** to create a new whitelist.

6. In the **Edit Whitelist** dialog box, enter the IP addresses or CIDR blocks that are allowed to access your ApsaraDB RDS instance, and then click **OK**.
   - If you add the CIDR block 10.10.10.0/24, all IP addresses in the 10.10.10.X format are allowed to access the ApsaraDB RDS instance.
   - If you enter more than one IP address or CIDR block, you must separate them with commas (,). Do not add spaces before or after the commas. Example: 192.168.0.1,172.16.213.9.
   - If you click **Add Internal IP Addresses of ECS Instances**, the IP addresses of all of the ECS instances that are created in your Alibaba Cloud account appear. Then, you can select the required IP addresses and add them to the whitelist.

   > **Note** If you add a new IP address or CIDR block to the **default** whitelist, the default address 127.0.0.1 is deleted.



9.9.2. Configure SSL encryption

This topic describes how to enhance endpoint security. You can enable Secure Sockets Layer (SSL) encryption and install SSL certificates that are issued by certificate authorities (CAs) to the required application services. SSL is used at the transport layer to encrypt network connections and enhance the security and integrity of communication data. However, SSL increases the response time.

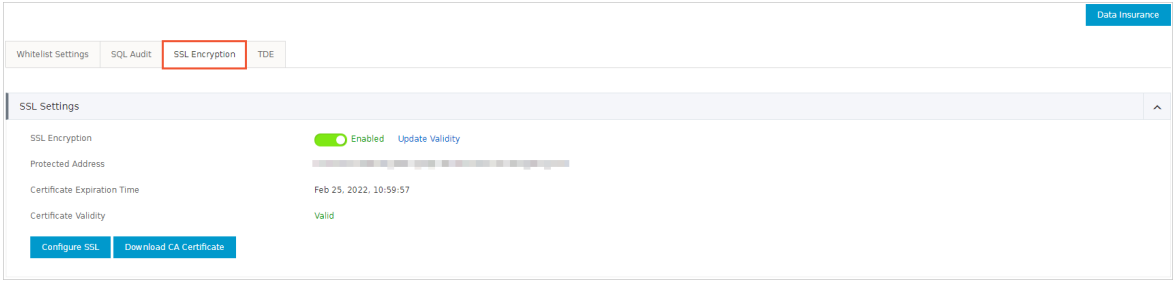
Precautions

- An SSL CA certificate is valid for one year. You must update the validity period of the SSL CA certificate in your application or client within one year. Otherwise, your application or client that uses encrypted network connections cannot connect to the ApsaraDB RDS instance.
- SSL encryption may cause a significant increase in CPU utilization. We recommend that you enable SSL encryption only when you want to encrypt connections from the Internet. In most cases, connections that use an internal endpoint do not require SSL encryption.
- SSL encryption cannot be disabled after it is enabled. Proceed with caution.

Enable SSL encryption

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Data Security**.
5. Click the **SSL Encryption** tab.

6. In the SSL Settings section, turn on **SSL Encryption**.
7. In the **Configure SSL** dialog box, select the endpoint for which you want to enable SSL encryption and click **OK**.
8. Click **Download CA Certificate** to download the SSL CA certificate files in a compressed package.



The downloaded package contains three files:

- P7B file: used to import CA certificates to the Windows operating system.
- PEM file: used to import CA certificates to other operating systems or applications.
- JKS file: the Java truststore file. The password is apsaradb. It is used to import the CA certificate chain to Java programs.

> **Note** When the JKS file is used in Java, you must modify the default JDK security configuration in JDK 7 and JDK 8. Open the `/jre/lib/security/java.security` file on the host where your application resides, and modify the following configurations:
>
> ```
> jdk.tls.disabledAlgorithms=SSLv3, RC4, DH keySize < 224
> jdk.certpath.dis
> abledAlgorithms=MD2, RSA keySize < 1024
> ```
>
> If you do not modify the JDK security configuration, the following error is reported. Typically, other similar errors are also caused by invalid Java security configurations.
>
> ```
> javax.net.ssl.SSLHandshakeException: DHPublicKey does not comply to algorithm constraints
> ```

Configure an SSL CA certificate

After you enable SSL encryption, configure the SSL CA certificate on your application or client before they can connect to the ApsaraDB RDS instance. This section describes how to configure an SSL CA certificate. MySQL Workbench and Navicat are used in the example. For more information, see the instructions for the other applications or clients.

Configure a certificate on MySQL Workbench

1. Start MySQL Workbench.
2. Choose **Database > Manage Connections**.
3. Enable **Use SSL** and import the SSL CA certificate files.

Configure a certificate on Navicat

1. Start Navicat.
2. Right-click the database and select **Edit Connection**.
3. Click the **SSL** tab. Select the path of the PEM-formatted CA certificate, as shown in the following figure.
4. Click **OK**.

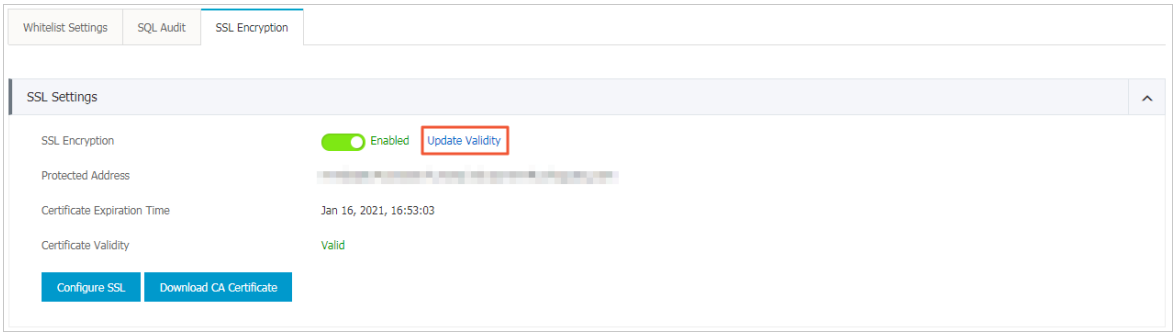
> **Note** If the `connection is being used` error is reported, the previous session is still connected. Restart Navicat.

5. Double-click the database to test whether the database is connected.

Update the validity period of an SSL CA certificate

> **Note**
> - **Update Validity** causes the ApsaraDB RDS instance to restart. Proceed with caution.
> - After you **update the validity period**, you must download and configure the SSL CA certificate again.

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Data Security**.
5. Click the **SSL Encryption** tab.
6. Click **Update Validity**.



7. In the message that appears, click **OK**.

9.9.3. Configure TDE

This topic describes how to configure Transparent Data Encryption (TDE) for your ApsaraDB RDS for SQL Server instance. TDE allows your ApsaraDB RDS instance to encrypt the data that will be written into the disk and decrypt the data that will be read from the disk to the memory. TDE does not increase the sizes of data files. When you use TDE, you do not need to modify the application that uses the ApsaraDB RDS instance.

Precautions

- Instance-level TDE can be enabled but cannot be disabled. Database-level TDE can be enabled or disabled.
- The keys used for data encryption are generated and managed by Key Management Service (KMS). ApsaraDB RDS does not provide the keys or certificates used for data encryption. If you want to restore data to your computer after TDE is enabled, you must decrypt the data on your ApsaraDB RDS instance. For more information, see Decrypt data.
- TDE increases CPU utilization.

Prerequisites

- Your ApsaraDB RDS instance runs SQL Server EE.
- KMS is activated. If KMS is not activated, you can activate it as prompted when you enable TDE.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Data Security**.
5. Click the **TDE** tab.
6. Turn on **TDE Status**.
7. In the dialog box that appears, click **Confirm**.

   > **Note** If you have not enabled KMS, you are prompted to do so when you enable TDE. After you enable KMS, you can turn on **TDE Status** to enable TDE.

8. Click **Configure TDE**. In the Database TDE Settings dialog box, select the databases you want to encrypt from the Unselected Databases list, click the › icon to add them to the **Selected Databases** list, and then click **OK**.

Decrypt data

If you want to decrypt a database that is encrypted by using TDE, you need only to remove the database from the Selected Databases section in the **Database TDE Settings** dialog box.

9.10. Database backup and restoration

9.10.1. Configure an automatic backup policy

Automatic backup supports full physical backups. ApsaraDB RDS automatically backs up data based on pre-configured policies. This topic describes how to configure a policy for automatic backup.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Backup and Restoration**.
5. On the **Backup and Restoration** page, click the **Backup Settings** tab.
6. Click **Edit**.
7. In the dialog box that appears, configure the automatic backup policy.

Parameter	Description
Data Retention Period	The number of days for which you want to retain data backup files. Valid values: 7 to 730. Default value: 7.

Parameter	Description
Backup Cycle	The cycle based on which you want to create a backup. You can select one or more days within a week. **Note** For data security purposes, we recommend that you back up your ApsaraDB RDS instance at least twice a week.
Backup Time	The period of time for which you want to back up data. Unit: hours.
Backup Frequency	The frequency at which you want to back up logs. The following options are available: ○ Same as Data Backup ○ Every 30 Minutes The total size of log backup files remains the same regardless of the backup frequency.

8. Click **OK**.

9.10.2. Manually back up an instance

This topic describes how to manually back up an ApsaraDB RDS instance.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. On the **Basic Information** page, click **Back Up Instance** in the upper-right corner.
5. In the **Back Up Instance** dialog box, select **Automatic Backup** or **Full Backup** from the **Select Backup Mode** drop-down list.

   Note ApsaraDB RDS supports the following backup methods:
   - **Automatic Backup**: After you select Automatic Backup, the system immediately performs an incremental or full backup based on the instance.
   - **Full Backup**: After you select Full Backup, the system immediately performs a full backup.

6. Click **OK**.

Result

After the backup is complete, you can view the backup task on the **Data Backup** tab of the **Backup and Restoration** page.

9.10.3. Shrink transaction logs

ApsaraDB RDS for SQL Server allows you to shrink transaction logs to reduce the log file size.

Prerequisites

The instance is in the **Running** state.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Backup and Restoration**.
5. In the upper-right corner of the page, click **Shrink Transaction Log**. In the message that appears, click **OK**.

> **Note** The shrinkage takes about 20 minutes to complete. ApsaraDB RDS for SQL Server shrinks transaction logs during each backup.

9.11. Migrate full backup data to ApsaraDB RDS for SQL Server

This topic describes how to migrate full backup files of an on-premises database from Object Storage Service (OSS) to ApsaraDB RDS for SQL Server.

Prerequisites

- Your ApsaraDB for RDS instance has sufficient storage space. If the space is insufficient, you must increase it before you migrate data to the instance.
- The destination database on your ApsaraDB for RDS instance has a different name from the on-premises database.
- A privileged account is created on your ApsaraDB for RDS instance. For more information, see Create an account.
- An Object Storage Service (OSS) bucket is created in the region where your ApsaraDB for RDS instance is created. For more information, see Create buckets in the *OSS User Guide*.
- The DBCC CHECKDB statement is executed, and the execution result indicates that no allocation or consistency errors occur.

> **Note** If no allocation or consistency errors occur, the following execution result is returned:
>
> ```
> ...
> CHECKDB found 0 allocation errors and 0 consistency errors in database 'xxx'.
> DBCC execution completed. If DBCC printed error messages, contact your system administrator.
> ```

Precautions

- Full backup files cannot be migrated to an ApsaraDB for RDS instance of an earlier SQL Server version. For example, if the on-premises database runs SQL Server 2016 and your ApsaraDB for RDS instance runs SQL Server 2012, you cannot migrate full backup files of the on-premises database to your ApsaraDB for RDS instance.
- Differential or log backup files are not supported.
- The names of full backup files cannot contain special characters, such as `at signs (@) and vertical bars (|)`. If the file names contain special characters, the migration fails.
- After the service account of your ApsaraDB for RDS instance is granted the access permission on the OSS bucket, the system creates a role named **AliyunRDSImportRole** in RAM. Do not modify or delete this role. Otherwise, you cannot download full backup files when you migrate data to your ApsaraDB for RDS instance. In this case, you must re-authorize the service account of your ApsaraDB for RDS instance.
- Before the migration is complete, do not delete the backup files from the OSS bucket. Otherwise, the migration fails.
- The names of backup files can be suffixed only with bak, diff, trn, or log. If you do not use the script in this topic

to generate a backup file, you must name the backup file by using one of the following suffixes:

- bak: indicates a full backup file.
- diff: indicates a differential backup file.
- trn or log: indicates a log backup file.

Back up the on-premises database

> **Note** Before you perform a full backup, stop writing data to the on-premises database. The data written during the backup process is not backed up.

1. Download the backup script. Double-click the backup script to open it by using the Microsoft SQL Server Management Studio (SSMS) client.
2. Configure the following parameters.

Parameter	Description
@backup_databases_list	The databases that you want to back up. Separate them with semicolons (;) or commas (,).
@backup_type	The backup type. Valid values: ○ FULL: full backup ○ DIFF: differential backup ○ LOG: log backup
@backup_folder	The directory in which you want to store the backup files on your computer. If the specified directory does not exist, the system creates a directory.
@is_run	Specifies whether to perform a backup. Valid values: ○ 1: performs a backup. ○ 0: performs no backup but a check.

3. Run the backup script.

Upload full backup files to the OSS bucket

After the on-premises database is backed up, you must upload full backup files to the OSS bucket. You can use one of the following methods:

- Use the OSS console

  If the size of backup files is smaller than 5 GB, you can upload the files in the OSS console. For more information, see Upload objects in the *OSS User Guide*.

- Call an OSS API operation

  You can call an OSS API operation to upload the full backup files in resumable mode. For more information, see Multipart upload-relevant operations in the *OSS Developer Guide*.

Create a migration task

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Backup and Restoration**.
5. In the upper-right corner of the page, click **Migrate OSS Backup Data to RDS**.

6. Click **Next** twice until the Import Data step appears.
7. Configure the following parameters.

Parameter	Description
Database Name	Enter the name of the destination database on your ApsaraDB for RDS instance. **Note** The name of the database must meet the requirements of SQL Server.
OSS Bucket	Select the OSS bucket that stores the backup files.
OSS Subfolder Name	Enter the name of the OSS subfolder that stores the backup files.
OSS File	Click the search icon to search for backup files by using the prefix-based fuzzy match. The system displays the name, size, and update time of each backup file. Select the backup file that you want to migrate to your ApsaraDB for RDS instance.
Cloud Migration Method	**One-time Full Backup File Migration**: uploads full backup data to your ApsaraDB for RDS instance. Select this option if you want to migrate only a single full backup file.

8. Click **OK**.

Wait for the migration task to complete. You can click **Refresh** to view the latest status of the migration task. If the migration fails, fix the error based on the message displayed in the Task Description column. For more information, see Common errors.

View the migration task

In the left-side navigation pane, click **Backup and Restoration**. Click the **Backup Data Upload History** tab. The system displays the migration tasks in the last week.

Common errors

Each record of a migration task contains a task description, which helps you identify the error cause and fix the error. The following list describes common errors:

- A database with the same name as the on-premises database exists on your ApsaraDB for RDS instance.
  - Error message: The database (xxx) is already exist on RDS, please backup and drop it, then try again.
  - Cause: The on-premises database is named the same as an existing database on your ApsaraDB for RDS instance. For data security purposes, ApsaraDB RDS for SQL Server does not allow such a database to be migrated.
  - Solution: If you need to overwrite the database in your ApsaraDB for RDS instance with the on-premises database, you must back up the database, delete it from your ApsaraDB for RDS instance, and then migrate the on-premises database to your ApsaraDB for RDS instance.
- A differential backup file is used.
  - Error message: Backup set (xxx.bak) is a Database Differential backup, we only accept a FULL Backup.
  - Cause: The file that you uploaded is a differential backup file, but not a full backup file. The migration solution for full backup data supports only full backup files.
- A log backup file is used.
  - Error message: Backup set (xxx.trn) is a Transaction Log backup, we only accept a FULL Backup.
  - Cause: The file that you uploaded is a log backup file, but not a full backup file. The migration solution for full backup data supports only full backup files.
- The backup file fails the verification.

  - Error message: Failed to verify xxx.bak, backup file was corrupted or newer edition than RDS.
  - Cause: The backup file is damaged, or the on-premises database runs an SQL Server version later than your ApsaraDB for RDS instance. For example, if the on-premises database runs SQL Server 2016 and your ApsaraDB for RDS instance runs SQL Server 2012, the error message is returned.
  - Solution: If the backup file is damaged, perform a full backup on the on-premises database again. If the database engine version does not meet the requirements, select an ApsaraDB for RDS instance that runs the same version as or a later version than the on-premises database.

- DBCC CHECKDB fails to be executed.
  - Error message: DBCC checkdb failed.
  - Cause: Allocation or consistency errors occurred in the on-premises database.
  - Solution: Execute the following statement in the on-premises database.

    > **Note** Data loss may occur when you use this statement to fix errors.

    ```
    DBCC CHECKDB (DBName, REPAIR_ALLOW_DATA_LOSS) WITH NO_INFOMSGS, ALL_ERRORMSGS
    ```

- The remaining storage space of your ApsaraDB for RDS instance is insufficient. (1)
  - Error message: Not Enough Disk Space for restoring, space left (xxx MB) < needed (xxx MB).
  - Cause: The remaining storage space of your ApsaraDB for RDS instance does not meet the migration requirements.
  - Solution: Increase the storage space of your ApsaraDB for RDS instance.
- The remaining storage space of your ApsaraDB for RDS instance is insufficient. (2)
  - Error message: Not Enough Disk Space, space left xxx MB < bak file xxx MB.
  - Cause: The remaining storage space of your ApsaraDB for RDS instance is smaller than the size of the backup file.
  - Solution: Increase the storage space of your ApsaraDB for RDS instance.
- No privileged account exists.
  - Error message: Your RDS doesn't have any init account yet, please create one and grant permissions on RDS console to this migrated database (XXX).
  - Cause: No privileged account is created on your ApsaraDB for RDS instance, and the database permissions are not granted to accounts. However, when this error message is returned, the backup file has been restored to your ApsaraDB for RDS instance, and the migration task is successful.
  - Solution: Create a privileged account. For more information, see Create an account.

10.ApsaraDB RDS for PostgreSQL

10.1. What is ApsaraDB RDS?

ApsaraDB RDS is a stable, reliable, and scalable online database service. Based on the distributed file system and high-performance storage, ApsaraDB RDS allows you to perform database operations and maintenance with its set of solutions for disaster recovery, backup, restoration, monitoring, and migration.

ApsaraDB RDS supports four database engines, which are MySQL, SQL Server, PolarDB, and PostgreSQL. You can create database instances based on these database engines to meet your business requirements. This topic describes the PostgreSQL engine.

ApsaraDB RDS for PostgreSQL

ApsaraDB RDS for PostgreSQL is the most advanced open source database. It is fully compatible with SQL and supports a diverse range of data formats such as JSON, IP, and geometric data. In addition to features such as transactions, subqueries, multi-version concurrency control (MVCC), and data integrity check, ApsaraDB RDS for PostgreSQL integrates a series of features including high availability, backup, and restoration to ease operation and maintenance loads.

10.2. Limits on ApsaraDB RDS for PostgreSQL

Before you use ApsaraDB RDS for PostgreSQL, you must understand its limits and take the necessary precautions.

The following table describes the limits on ApsaraDB RDS for PostgreSQL.

Operation	Limit
Root permissions of databases	Superuser permissions are not provided.
Database replication	ApsaraDB RDS for PostgreSQL provides a primary/secondary replication architecture except in the Basic Edition. The secondary instances in the architecture are hidden and cannot be accessed by your applications.
Instance restart	Instances must be restarted by using the ApsaraDB RDS console or API operations.

10.3. Log on to the ApsaraDB RDS console

This topic describes how to log on to the ApsaraDB RDS console.

Prerequisites

- The URL of the Apsara Uni-manager Management Console is obtained from the deployment personnel before you log on to the Apsara Uni-manager Management Console.
- A browser is available. We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL of the Apsara Uni-manager Management Console. Press the Enter key.
2. Enter your username and password.

   Obtain the username and password that you can use to log on to the console from the operations administrator.

> **Note** When you log on to the Apsara Uni-manager Management Console for the first time, you must change the password of your username. Your password must meet complexity requirements. The password must be 8 to 20 characters in length and must contain at least two of the following character types:
>
> - Uppercase or lowercase letters
> - Digits
> - Special characters, which include ! @ # $ %

3. Click **Login**.
4. In the top navigation bar, choose **Products** > Database Services > **ApsaraDB RDS**.

10.4. Quick Start

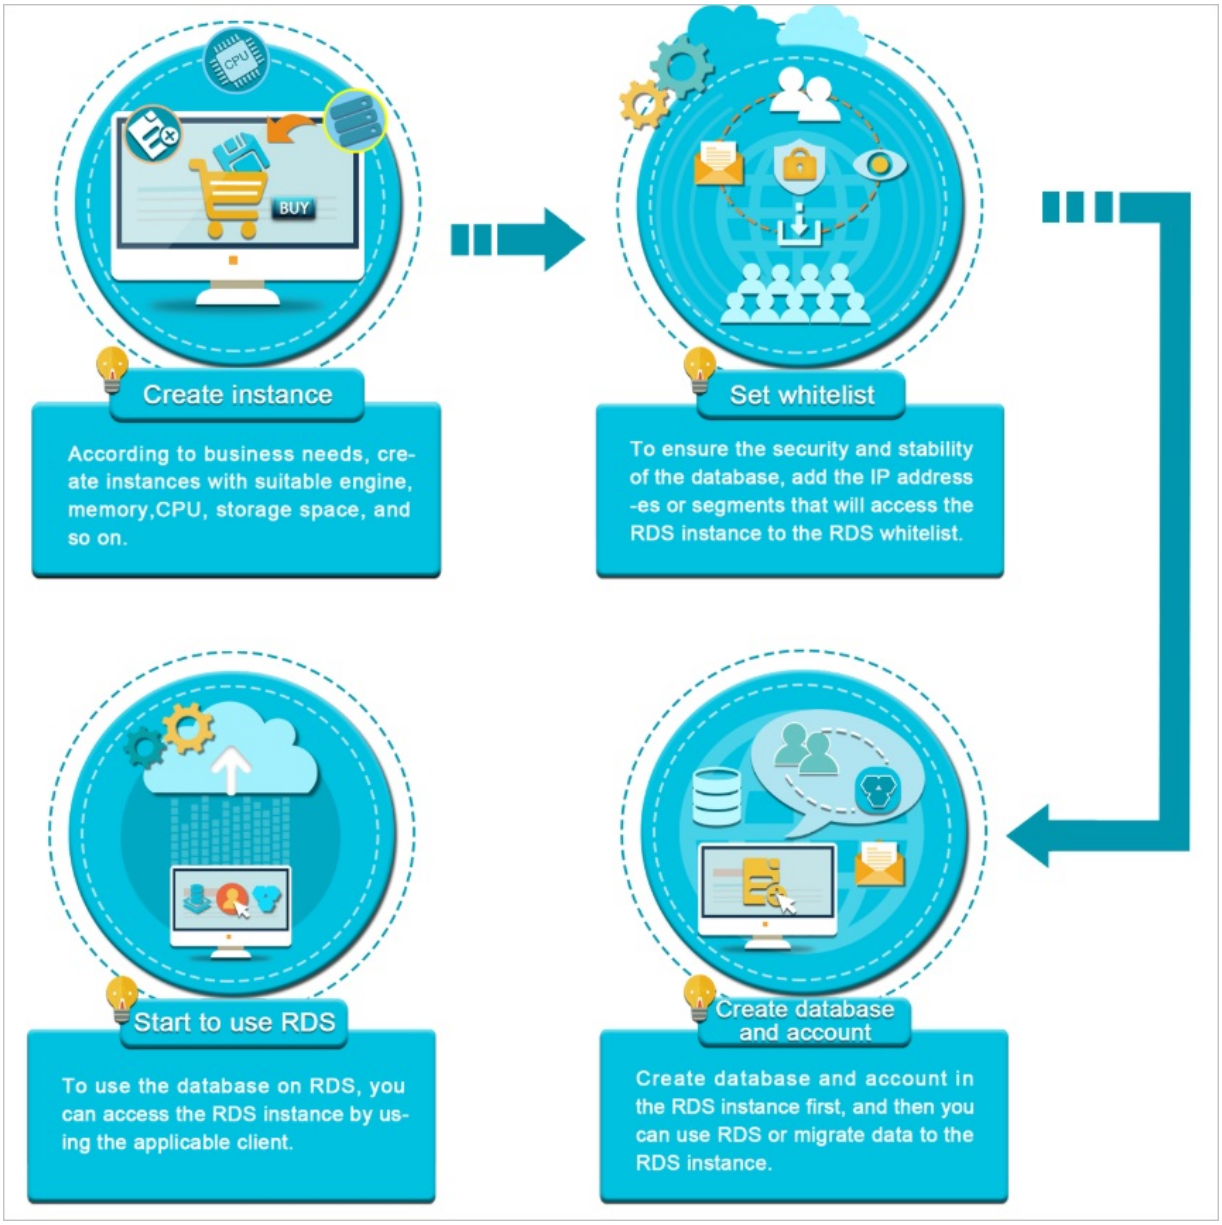
10.4.1. Procedure

ApsaraDB RDS quick start covers the following topics: creating an ApsaraDB RDS instance, configuring a whitelist, creating a database, creating an account, and connecting to the instance.

Flowchart for an ApsaraDB RDS instance

If you are using ApsaraDB RDS for the first time, you can start with Limits.

The following figure shows the operations that you must perform before you use an ApsaraDB RDS instance.



10.4.2. Create an instance

This topic describes how to create one or more ApsaraDB RDS for PostgreSQL instances in the ApsaraDB RDS console.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, click **Create Instance** in the upper-right corner.
3. Configure the following parameters.

Section	Parameter	Description
Basic	**Organization**	The organization to which the instance belongs.

Settings Section	Parameter	Description
	Resource Set	The resource set to which the instance belongs.
Region	**Region**	The region in which you want to create the instance. Services in different regions cannot communicate over an internal network. After the instance is created, the region cannot be changed.
	Zone of Primary Node	The zone where the primary instance is deployed.
	Deployment Method	Specifies whether to deploy the primary and secondary instances in separate zones. ApsaraDB RDS supports **Multi-zone Deployment** and **Single-zone Deployment**. If you select **Multi-zone Deployment**, you must configure **Zone of Secondary Node**.
	Zone of Secondary Node	The zone where the secondary instance is deployed. This parameter is available only when **Deployment Method** is set to **Multi-zone Deployment**. **Note** If you select the same zone for both the primary and secondary instances, the deployment is equivalent to single-zone deployment.
Specifications	**Quantity**	The number of ApsaraDB RDS instances that you want to create. Default value: 1.
	Instance Name	The name of the instance. ○ The name must be 2 to 64 characters in length. ○ The name must start with a letter. ○ The name can contain letters, digits, and the following special characters: _ - : ○ The name cannot start with http:// or https://.
	Connection Type	The connection type of the instance. ApsaraDB RDS instances support the following connection types: ○ **Internet**: ApsaraDB RDS instances of this connection type can be connected over the Internet. ○ **Internal Network**: ApsaraDB RDS instances of this connection type can be connected over an internal network. **Note** The value of this parameter cannot be changed after the instance is created. Proceed with caution.
	Database Engine	The database engine of the instance. Select **PostgreSQL**.
	Engine Version	The version of the database engine. Valid values: ○ 9.4 ○ 10.0 ○ 11.0 ○ 12.0

Section	Parameter	Description
	Edition	The edition of the instance. For more information, see Instance types in *ApsaraDB RDS Product Introduction*.
	Storage Type	The storage type of the instance. Local and standard SSDs are supported. **Note** PostgreSQL 9.4 instances support only local SSDs.
	Encrypted	Specifies whether to encrypt the standard SSD. This parameter is available only when **Storage Type** is set to **cloud ssd**. If you select Encrypted, you must specify the **Encryption Key** parameter. If you do not have a key, you must first create one in Key Management Service (KMS). For more information, see Create a CMK in *KMS User Guide*.
	Encryption Key	The key that is used to encrypt the standard SSD. This parameter is available only when you select **Encrypted**.
	Instance Type	The instance type of the instance. Memory size determines the maximum number of connections and the input/output operations per second (IOPS). The actual values are displayed in the console. For more information, see Instance types in *ApsaraDB RDS Product Introduction*.
	Storage Capacity	The storage capacity of the instance, which includes the space to store data, system files, binlog files, and transaction files. Valid values: 20 to 600. Unit: GB. The value must be in 1 GB increments.
Network	**Network Type**	The network type of the instance. ApsaraDB RDS instances support the following network types: ○ **Classic Network**: Cloud services in the classic network are not isolated. Unauthorized access to a cloud service is blocked only by the security group or whitelist policy of the service. ○ **VPC**: A virtual private cloud (VPC) helps you build an isolated network environment on Apsara Stack. You can customize route tables, CIDR blocks, and gateways in a VPC. We recommend that you select VPC for improved security. **Note** ■ If you configure multi-zone deployment, you must create vSwitches for the zones of primary and secondary instances in the specified VPC. ■ If you select VPC, you must specify a VPC and a vSwitch.
	IP Address Whitelist	The IP addresses that are allowed to connect to the instance.

4. Click **Submit**.

10.4.3. Configure an IP address whitelist

This topic describes how to configure a whitelist for an ApsaraDB RDS instance. Only entities that are listed in a whitelist can access your ApsaraDB RDS instance.

Context

Whitelists make your ApsaraDB RDS instance more secure and do not interrupt the operations of your ApsaraDB RDS instance when you configure whitelists. We recommend that you perform maintenance on your whitelists on a regular basis.

To configure a whitelist, perform the following operations:

- Configure a whitelist: Add IP addresses to allow them to connect to the ApsaraDB RDS instance.

  > **Note** The IP address whitelist labeled default contains only the default IP address 0.0.0.0/0, which allows all entities to access your ApsaraDB RDS instance.

- Configure an ECS security group: Add an ECS security group for the ApsaraDB RDS instance to allow ECS instances in the group to connect to the ApsaraDB RDS instance.

Procedure

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Data Security**.
5. On the **Whitelist Settings** tab, click **Edit** corresponding to the **default** whitelist.

   > **Note** You can also click **Create Whitelist** to create a whitelist.

6. In the **Edit Whitelist** dialog box, enter the IP addresses or CIDR blocks used to access the instance and click **OK**. The following section describes the rules:
   - If you enter the CIDR block 10.10.10.0/24 in the IP Addresses field, all IP addresses in the 10.10.10.X format can access your ApsaraDB RDS instance.
   - If you enter more than one IP address or CIDR block, you must separate them with commas (,). Do not add spaces before or after the commas. Example: 192.168.0.1,172.16.213.9.
   - If you click **Add Internal IP Addresses of ECS Instances**, the IP addresses of all ECS instances created within your Alibaba Cloud account are displayed. You can select the required IP addresses to add them to the IP address whitelist.

10.4.4. Create a database and an account

Before you start to use ApsaraDB RDS, you must create databases and accounts on an ApsaraDB RDS instance. This topic describes how to create a database and an account on an ApsaraDB RDS for PostgreSQL instance.

Account types

ApsaraDB RDS for PostgreSQL instances support two types of accounts: privileged accounts and standard accounts. The following table describes these account types.

Account type	Description

Account type	Description
Privileged account	• You can create and manage privileged accounts only by using the ApsaraDB RDS console or API operations. • If your ApsaraDB RDS instance uses local SSDs, you can create only a single privileged account. If your ApsaraDB RDS instance uses standard or enhanced SSDs, you can create more than one privileged account. A privileged account allows you to manage all the standard accounts and databases that are created on your ApsaraDB RDS instance. • A privileged account has more permissions that allow you to manage your ApsaraDB RDS instance at more fine-grained levels. For example, you can grant the query permissions on different tables to different users. • A privileged account has the permissions to disconnect accounts that are created on your ApsaraDB RDS instance.
Standard account	• You can create and manage standard accounts by using the ApsaraDB RDS console, API operations, or SQL statements. • You can create more than one standard account on your ApsaraDB RDS instance. • You must grant the permissions on specific databases to a standard account. • A standard account does not have the permissions to create, manage, or disconnect other accounts on your ApsaraDB RDS instance.

Precautions

- If your ApsaraDB RDS instance uses local SSDs, you can create one privileged account in the ApsaraDB RDS console. After the privileged account is created, it cannot be deleted. You can also create and manage more than one standard account by using SQL statements.
- If your ApsaraDB RDS instance uses standard or enhanced SSDs, you can create more than one privileged account and standard account in the ApsaraDB RDS console. You can also create and manage more than one standard account by using SQL statements.
- To migrate data from an on-premises database to your ApsaraDB RDS instance, you must create a database and an account on the ApsaraDB RDS instance. Make sure that the created database has the same properties as the on-premises database. Also make sure that the created account has the same permissions on the created database as the account that is authorized to manage the on-premises database.
- Follow the least privilege principle to create accounts and grant them read-only permissions or read and write permissions on databases. If necessary, you can create more than one account and grant them only the permissions on specific databases. If an account does not need to write data to a database, grant only the read-only permissions on that database to the account.
- For security purposes, we recommend that you specify strong passwords for the accounts on your ApsaraDB RDS instance and change the passwords on a regular basis.

Create a privileged account on an instance that uses local SSDs

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Accounts**.
5. On the Accounts page, click **Create Privileged Account** and configure the following parameters.

Parameter	Description

Parameter	Description
Database Account	○ The name of the account must be 2 to 16 characters in length. ○ The name can contain lowercase letters, digits, and underscores (_). ○ The name must start with a letter and end with a letter or digit.
Password	○ The password of the account must be 8 to 32 characters in length. ○ The password must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. ○ Special characters include ! @#$%^&*()_+-=
Re-enter Password	Enter the password of the account again.

6. Click **Create**.

Create a privileged or standard account on an instance that uses standard or enhanced SSDs

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Accounts**.
5. On the Accounts page, click **Create Account** and configure the following parameters.

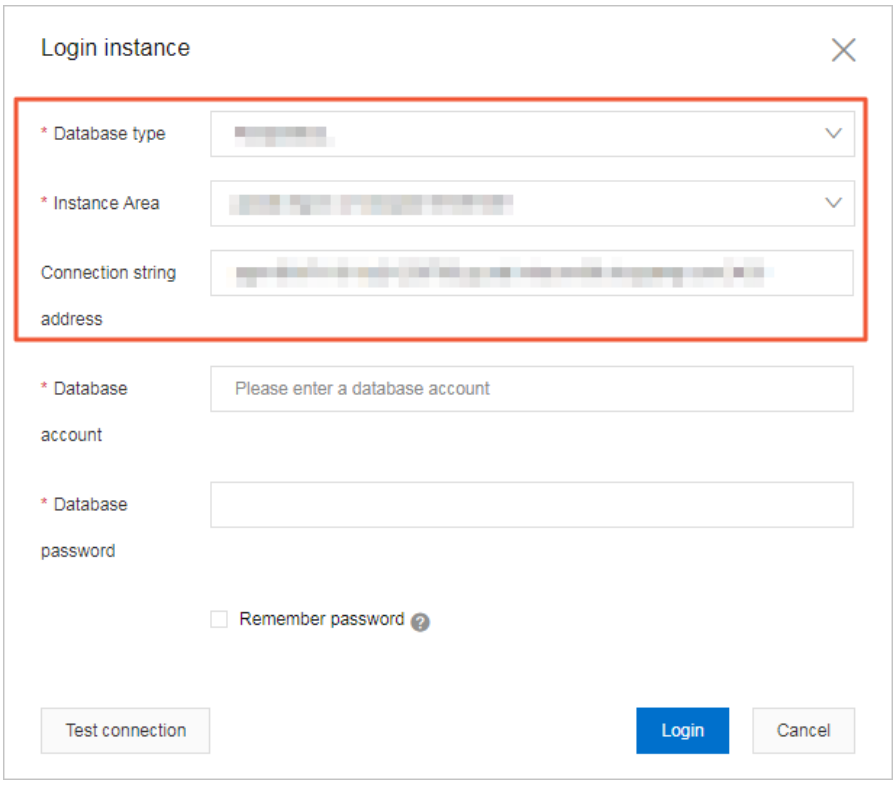
Parameter	Description
Database Account	○ The name of the account must be 2 to 16 characters in length. ○ The name can contain lowercase letters, digits, and underscores (_). ○ The name must start with a letter and end with a letter or digit.
Account Type	Select **Privileged Account** or **Standard Account**.
Password	○ The password of the account must be 8 to 32 characters in length. ○ The password must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. ○ Special characters include ! @#$%^&*()_+-=
Re-enter Password	Enter the password of the account again.
Description	This parameter is optional. You can enter relevant description to make the instance identifiable. The description can be up to 256 characters in length.

6. Click **Create**.

Create a database and a standard account

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.

3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. Click **Log On to DB** in the upper-right corner of the page.
5. In the **Login instance** dialog box of the **DMS** console, check values of **Database type**, **Instance Area**, and **Connection string address**. If the information is correct, enter **Database account** and **Database password**, as shown in the following figure.



Parameter	Description
Database type	The engine of the database. By default, the engine of the database to be connected is displayed.
Instance Area	The region where the instance is deployed. By default, the region of the current instance is displayed.
Connection string address	The endpoint of the instance. By default, the endpoint of the current instance is displayed.
Database account	The account of the database to be connected.
Database password	The password of the account used to connect to the database.

6. Click **Login**. If you want the browser to remember the password, select **Remember password** before you click **Login**.

> **Note** If a message prompts you that the connection fails, the problem may be caused by an improperly configured whitelist. Reconfigure the whitelist in the console. For more information, see Configure an IP address whitelist.

7. The **SQLConsole** page appears after you log on to the instance. Execute a statement in the following format to create a database:

```
CREATE DATABASE name
[ [ WITH ] [ OWNER [=] user_name ]
    [ TEMPLATE [=] template ]
    [ ENCODING [=] encoding ]
    [ LC_COLLATE [=] lc_collate ]
    [ LC_CTYPE [=] lc_ctype ]
    [ TABLESPACE [=] tablespace_name ]
    [ CONNECTION LIMIT [=] connlimit ] ]
```

For example, if you want to create a database named test, execute the following statement:

```
create database test;
```

8. Click **execute**.
9. In the SQL window, execute a statement in the following format to create a standard account:

```
CREATE USER name [ [ WITH ] option [ ... ] ]
where option can be:
  SUPERUSER | NOSUPERUSER
| CREATEDB | NOCREATEDB
| CREATEROLE | NOCREATEROLE
| CREATEUSER | NOCREATEUSER
| INHERIT | NOINHERIT
| LOGIN | NOLOGIN
| REPLICATION | NOREPLICATION
| CONNECTION LIMIT connlimit
| [ ENCRYPTED | UNENCRYPTED ] PASSWORD 'password'
| VALID UNTIL 'timestamp'
| IN ROLE role_name [, ...]
| IN GROUP role_name [, ...]
| ROLE role_name [, ...]
| ADMIN role_name [, ...]
| USER role_name [, ...]
| SYSID uid
```

For example, if you want to create a user account named test2 whose password is 123456, execute the following statement:

```
create user test2 password '123456';
```

10. Click **execute**.

10.4.5. Connect to an ApsaraDB RDS for PostgreSQL instance

This topic describes how to use Data Management (DMS) or the pgAdmin 4 client to connect to an ApsaraDB RDS instance.

Context

You can log on to DMS from the ApsaraDB RDS console and then connect to an ApsaraDB RDS instance.

DMS is a data management service that integrates data, schema, and server management, access security, BI charts, data trends, data tracking, and performance optimization. DMS can be used to manage relational and non-relational databases, such as MySQL, SQL Server, PostgreSQL, MongoDB, and Redis. It can also be used to manage Linux servers.

You can also use a client to connect to an ApsaraDB RDS instance. ApsaraDB RDS for PostgreSQL is fully compatible with PostgreSQL. You can connect to an ApsaraDB RDS for PostgreSQL instance in a similar manner as you would connect to an open source PostgreSQL instance. In this topic, the pgAdmin 4 client is used to connect to an ApsaraDB RDS instance.

Use DMS to connect to an ApsaraDB RDS instance

For more information about how to use DMS to connect to an ApsaraDB RDS instance, see Log on to an ApsaraDB for RDS instance by using DMS.

Use the pgAdmin 4 client to connect to an ApsaraDB RDS instance

1. Add the IP address of the pgAdmin client to an IP address whitelist of the ApsaraDB RDS instance. For more information about how to configure a whitelist, see Configure an IP address whitelist.
2. Start the pgAdmin 4 client.

   > **Note** For information about how to download the pgAdmin 4 client, visit pgAdmin 4 (Windows).

3. Right-click **Servers** and choose **Create > Server**, as shown in the following figure.
4. On the **General** tab of the **Create - Server** dialog box, enter the name of the server, as shown in the following figure.
5. Click the **Connection** tab and enter the information of the instance, as shown in the following figure.

Parameter	Description
Host name/address	The internal endpoint of the ApsaraDB RDS instance. For more information about how to view the internal endpoint, see View and modify the internal endpoint and port number.
Port	The internal port number that is used to connect to the ApsaraDB RDS instance. For more information about how to view the internal port number, see View and modify the internal endpoint and port number.
Username	The name of the privileged account on the ApsaraDB RDS instance. For more information about how to obtain a privileged account, see Create a database and an account.
Password	The password of the privileged account of the ApsaraDB RDS instance.

6. Click **Save**.
7. If the connection information is correct, choose **Servers > Server Name > Databases > postgres**. If the following page appears, the connection is established.

   > **Notice** The postgres database is the default system database of the ApsaraDB RDS instance. Do not perform operations on this database.

10.5. Instances

10.5.1. Create an instance

This topic describes how to create one or more ApsaraDB RDS for PostgreSQL instances in the ApsaraDB RDS console.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, click **Create Instance** in the upper-right corner.
3. Configure the following parameters.

Section	Parameter	Description
Basic Settings	Organization	The organization to which the instance belongs.
	Resource Set	The resource set to which the instance belongs.
Region	Region	The region in which you want to create the instance. Services in different regions cannot communicate over an internal network. After the instance is created, the region cannot be changed.
	Zone of Primary Node	The zone where the primary instance is deployed.
	Deployment Method	Specifies whether to deploy the primary and secondary instances in separate zones. ApsaraDB RDS supports **Multi-zone Deployment** and **Single-zone Deployment**. If you select **Multi-zone Deployment**, you must configure **Zone of Secondary Node**.
	Zone of Secondary Node	The zone where the secondary instance is deployed. This parameter is available only when **Deployment Method** is set to **Multi-zone Deployment**. **Note** If you select the same zone for both the primary and secondary instances, the deployment is equivalent to single-zone deployment.
	Quantity	The number of ApsaraDB RDS instances that you want to create. Default value: 1.
	Instance Name	The name of the instance. ○ The name must be 2 to 64 characters in length. ○ The name must start with a letter. ○ The name can contain letters, digits, and the following special characters: _ - : ○ The name cannot start with http:// or https://.
	Connection Type	The connection type of the instance. ApsaraDB RDS instances support the following connection types: ○ **Internet**: ApsaraDB RDS instances of this connection type can be connected over the Internet. ○ **Internal Network**: ApsaraDB RDS instances of this connection type can be connected over an internal network. **Note** The value of this parameter cannot be changed after the instance is created. Proceed with caution.

Section	Parameter	Description
Specifications	**Database Engine**	The database engine of the instance. Select **PostgreSQL**.
	Engine Version	The version of the database engine. Valid values: ○ 9.4 ○ 10.0 ○ 11.0 ○ 12.0
	Edition	The edition of the instance. For more information, see Instance types in *ApsaraDB RDS Product Introduction*.
	Storage Type	The storage type of the instance. Local and standard SSDs are supported. **Note** PostgreSQL 9.4 instances support only local SSDs.
	Encrypted	Specifies whether to encrypt the standard SSD. This parameter is available only when **Storage Type** is set to **cloud ssd**. If you select Encrypted, you must specify the **Encryption Key** parameter. If you do not have a key, you must first create one in Key Management Service (KMS). For more information, see Create a CMK in *KMS User Guide*.
	Encryption Key	The key that is used to encrypt the standard SSD. This parameter is available only when you select **Encrypted**.
	Instance Type	The instance type of the instance. Memory size determines the maximum number of connections and the input/output operations per second (IOPS). The actual values are displayed in the console. For more information, see Instance types in *ApsaraDB RDS Product Introduction*.
	Storage Capacity	The storage capacity of the instance, which includes the space to store data, system files, binlog files, and transaction files. Valid values: 20 to 600. Unit: GB. The value must be in 1 GB increments.

Section	Parameter	Description
Network	Network Type	The network type of the instance. ApsaraDB RDS instances support the following network types: ○ **Classic Network**: Cloud services in the classic network are not isolated. Unauthorized access to a cloud service is blocked only by the security group or whitelist policy of the service. ○ **VPC**: A virtual private cloud (VPC) helps you build an isolated network environment on Apsara Stack. You can customize route tables, CIDR blocks, and gateways in a VPC. We recommend that you select VPC for improved security. Note ■ If you configure multi-zone deployment, you must create vSwitches for the zones of primary and secondary instances in the specified VPC. ■ If you select VPC, you must specify a VPC and a vSwitch.
	IP Address Whitelist	The IP addresses that are allowed to connect to the instance.

4. Click **Submit**.

10.5.2. Create an ApsaraDB RDS for PostgreSQL instance that uses standard or enhanced SSDs

Cloud disks are block-level data storage products provided by Alibaba Cloud for Elastic Compute Service (ECS). They provide low latency, high performance, durability, and reliability. This topic describes how to create one or more instances that use standard or enhanced SSDs in the ApsaraDB RDS console.

Prerequisites

The instance runs PostgreSQL 10.0 or later.

Context

An ApsaraDB RDS instance with standard or enhanced SSDs uses a distributed triplicate mechanism to ensure 99.9999999% data reliability. If service disruptions occur within a zone due to hardware faults, data in that zone is copied to an unaffected disk in another zone to ensure data availability.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, click **Create Instance** in the upper-right corner.
3. Configure the following parameters.

Section	Parameter	Description
Basic Settings	Organization	The organization to which the instance belongs.
	Resource Set	The resource set to which the instance belongs.
Region	Region	The region in which you want to create the instance. Services in different regions cannot communicate over an internal network. After the instance is created, the region cannot be changed.
	Zone of Primary Node	The zone where the primary instance is deployed.
	Deployment Method	Specifies whether to deploy the primary and secondary instances in separate zones. ApsaraDB RDS supports **Multi-zone Deployment** and **Single-zone Deployment**. If you select **Multi-zone Deployment**, you must configure **Zone of Secondary Node**.
	Zone of Secondary Node	The zone where the secondary instance is deployed. This parameter is available only when **Deployment Method** is set to **Multi-zone Deployment**. **Note** If you select the same zone for both the primary and secondary instances, the deployment is equivalent to single-zone deployment.
Specifications	Quantity	The number of ApsaraDB RDS instances that you want to create. Default value: 1.
	Instance Name	The name of the instance. ○ The name must be 2 to 64 characters in length. ○ The name must start with a letter. ○ The name can contain letters, digits, and the following special characters: _ - : ○ The name cannot start with http:// or https://.
	Connection Type	The connection type of the instance. ApsaraDB RDS instances support the following connection types: ○ **Internet**: ApsaraDB RDS instances of this connection type can be connected over the Internet. ○ **Internal Network**: ApsaraDB RDS instances of this connection type can be connected over an internal network. **Note** The value of this parameter cannot be changed after the instance is created. Proceed with caution.
	Database Engine	The database engine of the instance. Select **PostgreSQL**.
	Engine Version	The version of the database engine. Set the value to **10.0** or a later version number.
	Edition	The edition of the instance. For more information, see Instance types in *ApsaraDB RDS Product Introduction*.

Section	Parameter	Description
	Storage Type	The storage type of the instance. Set the value to **cloud ssd**.
	Encrypted	Specifies whether to encrypt the standard SSD. If you select Encrypted, you must specify the **Encryption Key** parameter. If you do not have a key, you must first create one in Key Management Service (KMS). For more information, see Configure data encryption. **Note** Disk encryption provides maximum protection for your data with minimal impact on your business or applications. Both the snapshots generated from encrypted disks and the disks created from those snapshots are automatically encrypted.
	Encryption Key	The key that is used to encrypt the standard SSD. This parameter is available only when you select **Encrypted**.
	Instance Type	The instance type of the instance. Memory size determines the maximum number of connections and the input/output operations per second (IOPS). The actual values are displayed in the console. For more information, see Instance types in *ApsaraDB RDS Product Introduction*.
	Storage Capacity	The storage capacity of the instance, which includes the space to store data, system files, binlog files, and transaction files. Valid values: 20 to 600. Unit: GB. The value must be in 1 GB increments.
Network	**Network Type**	The network type of the instance. ApsaraDB RDS instances support the following network types: ○ **Classic Network**: Cloud services in the classic network are not isolated. Unauthorized access to a cloud service is blocked only by the security group or whitelist policy of the service. ○ **VPC**: A virtual private cloud (VPC) helps you build an isolated network environment on Apsara Stack. You can customize route tables, CIDR blocks, and gateways in a VPC. We recommend that you select VPC for improved security. **Note** ■ If you configure multi-zone deployment, you must create vSwitches for the zones of primary and secondary instances in the specified VPC. ■ If you select VPC, you must specify a VPC and a vSwitch.
	IP Address Whitelist	The IP addresses that are allowed to connect to the instance.

4. Click **Submit**.

10.5.3. View basic information of an instance

This topic describes how to view the details of an ApsaraDB RDS instance, such as basic information, internal network connection information, status, and configurations.

Procedure

1. Log on to the ApsaraDB RDS console.

2. Use one of the following methods to go to the **Basic Information** page of an instance:
   - On the **Instances** page, click the ID of the instance to go to the **Basic Information** page.
   - On the **Instances** page, find the instance and click **Manage** in the corresponding **Actions** column. The **Basic Information** page appears.

10.5.4. Restart an instance

This topic describes how to manually restart an ApsaraDB RDS instance. This applies if the number of connections exceeds the specified threshold or if an instance has performance issues.

Prerequisites

The instance is in the **Running** state.

Procedure

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the upper-right corner of the page, click **Restart Instance**.

   > **Note** When you restart an instance, applications are disconnected from the instance. We recommend that you make appropriate service arrangements before you restart an instance. Proceed with caution.

5. In the message that appears, click **Confirm**.

10.5.5. Change the specifications of an instance

This topic describes how to change the specifications of an ApsaraDB RDS instance. You can upgrade or downgrade an ApsaraDB RDS instance to meet your business needs.

Prerequisites

The instance is in the **Running** state and is not in the backing up or restoring state.

Procedure

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the **Configure Information** section of the **Basic Information** page, click **Change Specifications**.
5. On the **Change Specifications** page, set **Edition**, **Instance Type**, and **Storage Capacity**.
6. Click **Submit**.

10.5.6. Set a maintenance window

This topic describes how to set a maintenance window for an ApsaraDB RDS instance.

Context

The backend system performs maintenance on the ApsaraDB RDS instances during the maintenance window. This ensures the stability of the ApsaraDB RDS instance. The default maintenance window is from 02:00 (UTC+8) to

06:00 (UTC+8). We recommend that you set the maintenance window to off-peak hours of your business to avoid impacts on your business.

Precautions

- An instance enters the **Maintaining Instance** state before the maintenance window to ensure stability during the maintenance process. When the instance is in this state, access to data in the database and query operations such as performance monitoring are not affected. However, except for account and database management and IP address whitelist configuration, modification operations such as upgrade, downgrade, and restart are temporarily unavailable.
- During the maintenance window, one or two network interruptions may occur. Make sure that your applications are configured with automatic reconnection policies.

Procedure

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the **Configuration Information** section, click **Configure** to the right of **Maintenance Window**.
5. Select a maintenance window and click **Save**.

> **Note** The maintenance window is displayed in UTC+8.

10.5.7. Configure primary/secondary switchover

ApsaraDB RDS provides the primary/secondary switchover feature to ensure the high availability of databases. The primary/secondary switchover is performed when the primary instance becomes unavailable. You can also manually switch your business to the secondary instance. This topic describes how to manually switch over services between a primary instance and its secondary instance.

Context

Data is synchronized in real time between the primary and secondary instances. You can access only the primary instance. The secondary instance serves only as a backup instance and does not allow external access. After the switchover, the original primary instance becomes the secondary instance.

> **Note** Network interruptions may occur during a switchover. Make sure that your applications are configured with automatic reconnection policies.

Procedure

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Service Availability**.
5. In the **Availability Information** section, click **Switch Primary/Secondary Instance**.
6. In the **Switch Primary/Secondary Instance** message, click **OK**.

> **Note**
>
> - During the switchover, operations such as managing databases and accounts and changing network types cannot be performed. Therefore, we recommend that you select Switch Within Maintenance Window.
> - For more information about how to set a maintenance window, see Set a maintenance window.

10.5.8. Release an instance

This topic describes how to manually release an instance.

Precautions

- Only instances in the running state can be released.
- After an instance is released, the instance data is immediately deleted. We recommend that you back up your data before you release an instance.
- When you release a primary instance, all of its read-only instances are also released.

Procedure

1. Log on to the ApsaraDB RDS console.
2. Find the instance that you want to release and choose **More > Release Instance** in the Actions column.
3. In the **Release Instance** message, click **Confirm**.

10.5.9. Modify parameters of an instance

This topic describes how to view and modify the values of some parameters and query parameter modification records in the console.

Precautions

- To ensure instance stability, you can modify only specific parameters in the ApsaraDB RDS console.
- When you modify parameters on the **Editable Parameters** tab, refer to the **Value Range** column corresponding to each parameter.
- After specific parameters are modified, you must restart your instance for the changes to take effect. The necessity of restart is displayed in the **Force Restart** column on the **Editable Parameters** tab. We recommend that you modify the parameters of an instance during off-peak hours and make sure that your applications are configured with automatic reconnection policies.

Modify parameters

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Parameters**.
5. Perform the following operations:

   Export the parameter settings of the instance to your computer.

   On the Editable Parameters tab, click **Export Parameters**. The parameter settings of the instance are exported as a TXT file to your computer.

   Modify and import the parameter settings.

i. After you modify parameters in the exported parameter file, click **Import Parameters** and copy the parameter settings to the field.
ii. Click **OK**.
iii. In the upper-right corner of the page, click **Apply Changes**.

> **Note**
> - If the new parameter value takes effect only after an instance restart, the system prompts you to restart the instance. We recommend that you restart the instance during off-peak hours and make sure that your applications are configured with automatic reconnection policies.
> - Before the new parameter values are applied, you can click **Cancel Changes** to cancel them.

Modify a single parameter.

i. On the **Editable Parameters** tab, find the parameter that you want to modify and click the icon in the **Actual Value** column.
ii. Enter a new value based on the prompted value range.
iii. Click **Confirm**.
iv. In the upper-right corner of the page, click **Apply Changes**.

> **Note**
> - If the new parameter value takes effect only after an instance restart, the system prompts you to restart the instance. We recommend that you restart the instance during off-peak hours and make sure that your applications are configured with automatic reconnection policies.
> - Before the new parameter value is applied, you can click **Cancel Changes** to cancel it.

View the parameter modification history

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Parameters**.
5. On the page that appears, click the **Edit History** tab.
6. Select a time range and click **Search**.

10.5.10. Read-only instances

10.5.10.1. Overview of read-only ApsaraDB RDS for PostgreSQL instances

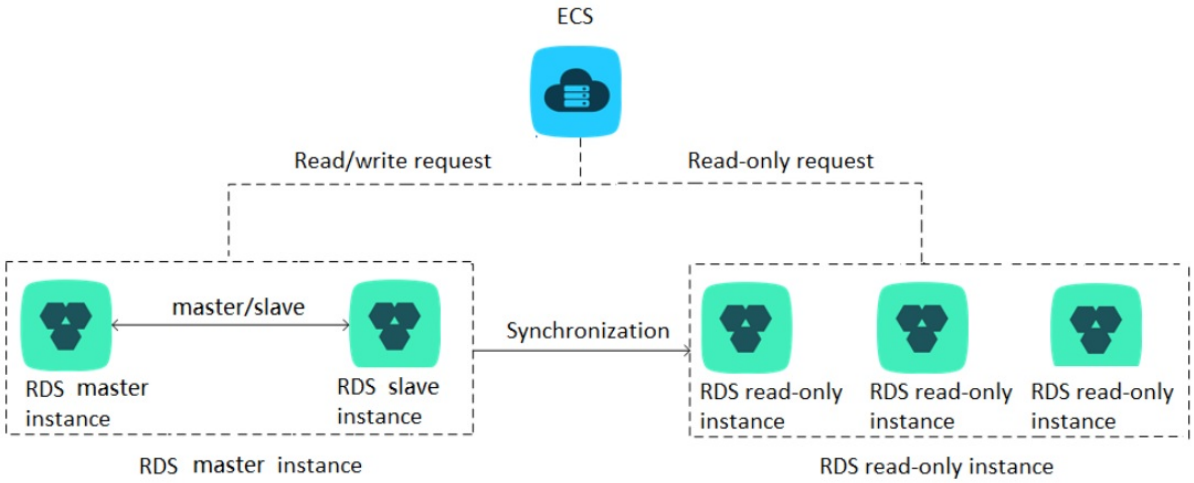
This topic provides an overview of read-only ApsaraDB RDS for PostgreSQL instances. If a large number of read requests overwhelm the primary instance, your business may be interrupted. In this case, you can create one or more read-only instances to offload read requests from the primary instance. This scales the read capability of your database system and increases the throughput of your application.

Overview

When a read-only instance is created, the data is replicated from the secondary instance. The data is consistent with that of the primary instance. Data updates of the primary instance are automatically synchronized to all read-only instances immediately after the primary instance completes operations.

> **Note**
> - Only ApsaraDB RDS instances that run PostgreSQL 10.0 support read-only instances.
> - The specifications of the primary instance must have at least eight CPU cores and 32 GB of memory.
> - Each read-only instance works in a single-node architecture, where no instances are provided as backups.

The following figure shows the topology of read-only instances.



Features

- Region and zone: Read-only instances reside within the same region as the primary instance, but possibly in different zones.
- Specifications and storage space: The specifications and storage space of read-only instances cannot be lower than those of the primary instance.
- Network type: The network type of a read-only instance can differ from that of the primary instance.
- Account and database management: Read-only instances do not require database or account maintenance, because their database and account information is synchronized with the primary instance.
- IP address whitelist: A read-only instance automatically replicates the IP address whitelists of the primary instance. However, the IP address whitelists for the read-only instance are independent of those of the primary instance. For information about how to modify the IP address whitelists of a read-only instance, see Configure an IP address whitelist.
- Monitoring and alerts: You can monitor system performance metrics, such as the disk capacity, IOPS, number of connections, and CPU utilization.

Limits

- Number of read-only instances: A maximum of five read-only instances can be created on a primary instance.
- Instance backup: Read-only instances do not support backup settings or manual backups because backups have been configured or created on the primary instance.
- Data migration: You cannot migrate data to read-only instances.
- Database management: You cannot create or delete databases on read-only instances.
- Account management: You cannot create or delete accounts, authorize accounts, or change the passwords of accounts on read-only instances.

FAQ

Q: Can I manage accounts created on the primary instance from its read-only instances?

A: No, although accounts created on the primary instance are replicated to its read-only instances, you cannot manage the accounts on the read-only instances. The accounts have only read permissions on the read-only instances.

10.5.10.2. Create a read-only ApsaraDB RDS for PostgreSQL instance

This topic describes how to create a read-only instance for your primary ApsaraDB RDS for PostgreSQL instance. This allows your database system to process a large number of read requests and increases the throughput of your application. The data on each read-only instance is a copy of that of the primary instance. Data updates to the primary instance are synchronized to all of its read-only instances.

Prerequisites

- The primary instance runs PostgreSQL 10.0.
- The specifications of the primary instance must have at least eight CPU cores and 32 GB of memory.

Precautions

- You can create read-only instances only for your primary instance. You cannot change existing instances to read-only instances.
- When you create a read-only instance, the system replicates data from a secondary instance. Therefore, operations on your primary instance are not interrupted.
- A read-only instance does not inherit the parameter settings of the primary instance. The system generates default parameter settings for the read-only instance, and you can modify the settings in the ApsaraDB RDS console.
- The instance type and storage capacity of a read-only instance cannot be lower than that of the primary instance.
- You can create up to five read-only instances.

Create a read-only instance

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the Distributed by Instance Role section of the Basic Information page, click **Create Read-only Instance**.
5. On the Create Read-only Instance page, configure parameters and click **Submit**. The following table describes the parameters.

Section	Parameter	Description
Region	Region	The region where the instance is deployed.
	Database Engine	The database engine of the read-only instance, which is the same as that of the primary instance and cannot be changed.
	Engine Version	The engine version of the read-only instance, which is the same as that of the primary instance and cannot be changed.

Section	Parameter	Description
Specifications	Edition	The edition of the read-only instance, which is the same as that of the primary instance and cannot be changed.
	Instance Type	The instance type of the read-only instance. The instance type of the read-only instance can be different from that of the primary instance, and can be changed at any time to facilitate flexible upgrade and downgrade. To ensure sufficient I/O throughput for data synchronization, we recommend that you select at least the same instance type as the primary instance for the read-only instance.
	Storage Capacity	The storage capacity of the read-only instance. To ensure sufficient I/O throughput for data synchronization, we recommend that you select at least the same storage capacity as the primary instance for the read-only instance.
Network Type	Network Type	The network type of the read-only instance, which is the same as that of the primary instance and cannot be changed.
	VPC	Select a VPC if the network type is set to VPC.
	vSwitch	Select a vSwitch if the network type is set to VPC.

10.5.10.3. View a read-only ApsaraDB RDS for PostgreSQL instance

This topic describes how to view details of a read-only ApsaraDB RDS for PostgreSQL instance. You can go to the Basic Information page of a read-only instance from the Instances page or the read-only instance list of the primary instance. Read-only instances are managed in the same manner as primary instances. The Basic Information page shows the management operations that can be performed.

View instance details of a read-only instance by using its ID

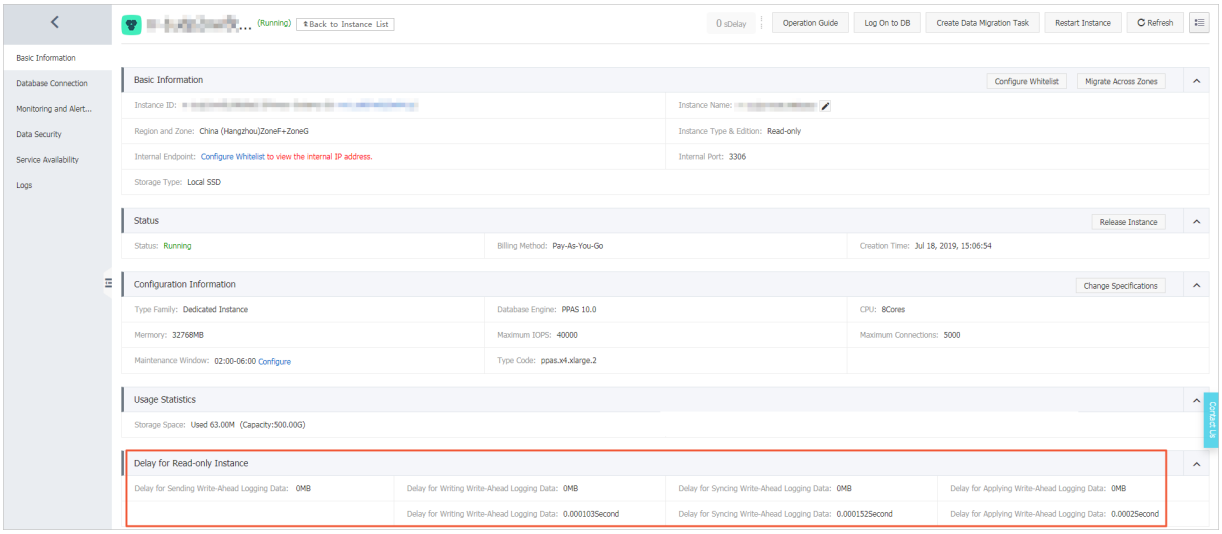
1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the instance that you want to view.
3. Click the ID of the instance or click **Manage** in the corresponding Actions column to go to the Basic Information page.

View details of a read-only instance by using the primary instance

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. On the **Basic Information** page, move the pointer over the number below **Read-only Instance** in the **Distributed by Instance Role** section. The ID of the read-only instance is displayed.
5. Click the ID of the read-only instance to go to the Basic Information page of the read-only instance.

View the latency of a read-only instance

When a read-only instance synchronizes data from its primary RDS instance, latency may occur. You can navigate to the Basic Information page of the read-only instance to view the latency of data synchronization to the instance.



10.6. Database connection

10.6.1. Connect to an ApsaraDB RDS for PostgreSQL instance

This topic describes how to use Data Management (DMS) or the pgAdmin 4 client to connect to an ApsaraDB RDS instance.

Context

You can log on to DMS from the ApsaraDB RDS console and then connect to an ApsaraDB RDS instance.

DMS is a data management service that integrates data, schema, and server management, access security, BI charts, data trends, data tracking, and performance optimization. DMS can be used to manage relational and non-relational databases, such as MySQL, SQL Server, PostgreSQL, MongoDB, and Redis. It can also be used to manage Linux servers.

You can also use a client to connect to an ApsaraDB RDS instance. ApsaraDB RDS for PostgreSQL is fully compatible with PostgreSQL. You can connect to an ApsaraDB RDS for PostgreSQL instance in a similar manner as you would connect to an open source PostgreSQL instance. In this topic, the pgAdmin 4 client is used to connect to an ApsaraDB RDS instance.

Use DMS to connect to an ApsaraDB RDS instance

For more information about how to use DMS to connect to an ApsaraDB RDS instance, see Log on to an ApsaraDB for RDS instance by using DMS.

Use the pgAdmin 4 client to connect to an ApsaraDB RDS instance

1. Add the IP address of the pgAdmin client to an IP address whitelist of the ApsaraDB RDS instance. For more information about how to configure a whitelist, see Configure an IP address whitelist.
2. Start the pgAdmin 4 client.

   > **Note** For information about how to download the pgAdmin 4 client, visit pgAdmin 4 (Windows).

3. Right-click **Servers** and choose **Create > Server**, as shown in the following figure.

4. On the **General** tab of the **Create - Server** dialog box, enter the name of the server, as shown in the following figure.
5. Click the **Connection** tab and enter the information of the instance, as shown in the following figure.

Parameter	Description
Host name/address	The internal endpoint of the ApsaraDB RDS instance. For more information about how to view the internal endpoint, see View and modify the internal endpoint and port number.
Port	The internal port number that is used to connect to the ApsaraDB RDS instance. For more information about how to view the internal port number, see View and modify the internal endpoint and port number.
Username	The name of the privileged account on the ApsaraDB RDS instance. For more information about how to obtain a privileged account, see Create a database and an account.
Password	The password of the privileged account of the ApsaraDB RDS instance.

6. Click **Save**.
7. If the connection information is correct, choose **Servers > Server Name > Databases > postgres**. If the following page appears, the connection is established.

> **Notice** The postgres database is the default system database of the ApsaraDB RDS instance. Do not perform operations on this database.

10.6.2. Use DMS to log on to an ApsaraDB RDS instance

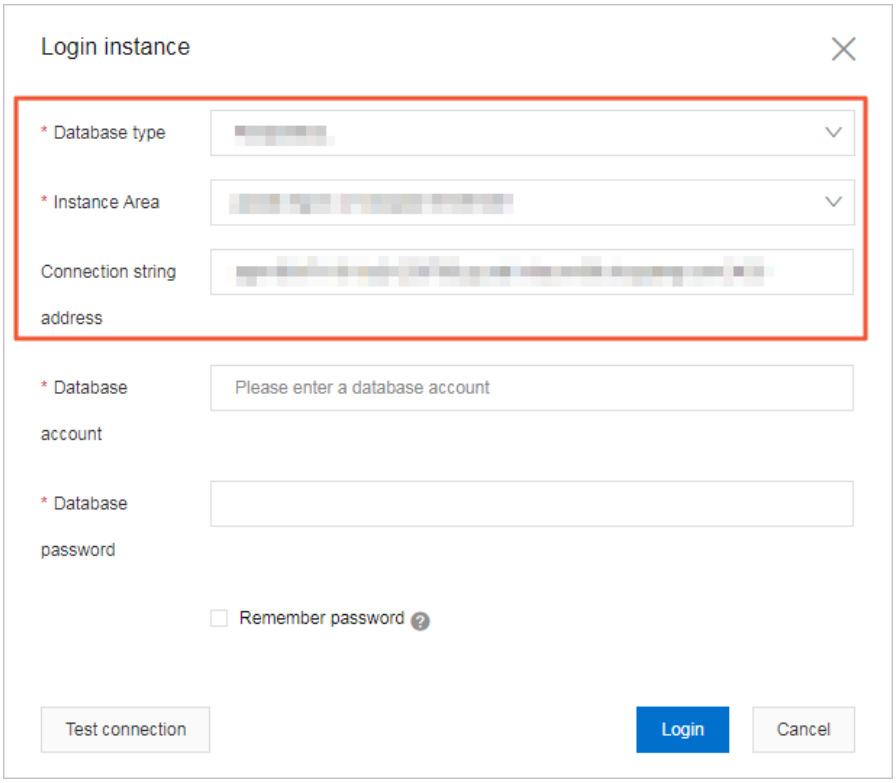
This topic describes how to use Data Management (DMS) to log on to an ApsaraDB RDS instance.

Prerequisites

The IP address whitelist is configured. For more information about how to configure an IP address whitelist, see Configure an IP address whitelist.

Procedure

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. Click **Log On to DB** in the upper-right corner of the page.
5. In the **Login instance** dialog box of the **DMS** console, check values of **Database type**, **Instance Area**, and **Connection string address**. If the information is correct, enter **Database account** and **Database password**, as shown in the following figure.



Parameter	Description
Database type	The engine of the database. By default, the engine of the database to be connected is displayed.
Instance Area	The region where the instance is deployed. By default, the region of the current instance is displayed.
Connection string address	The endpoint of the instance. By default, the endpoint of the current instance is displayed.
Database account	The account of the database to be connected.
Database password	The password of the account used to connect to the database.

6. Click **Login**.

> **Note** If you want the browser to remember the password, select **Remember password** before you click **Login**.

10.6.3. View and modify the internal endpoint and port number

You must use the internal endpoint and port number to access an ApsaraDB RDS instance. This topic describes how to view and modify the internal endpoint and port number of an ApsaraDB RDS instance in the ApsaraDB RDS console.

View the internal endpoint and port number

1. Log on to the ApsaraDB RDS console.

2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the **Basic Information** section, view the internal endpoint and port number of the instance.

Modify the internal endpoint and port number

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Connection**.
5. On the right side of the page, click **Change Endpoint**.
6. In the dialog box that appears, set **Connection Type** to **Internal Endpoint**.
7. Modify the endpoint prefix and port number and click **OK**.

FAQ

- Q: Do I need to modify the endpoint or port number in my application after I modify the endpoint or port number of an instance?

  A: Yes, you must modify the endpoint or port number in the application after you modify them. Otherwise, the application cannot connect to databases of the instance.

- Q: Does the modification of the endpoint take effect immediately? Do I need to restart the instance?

  A: No, you do not need to restart the instance. The modification takes effect immediately.

10.7. Accounts

10.7.1. Create an account

Before you start to use ApsaraDB RDS, you must create an account on an ApsaraDB RDS instance. This topic describes how to create an account on an ApsaraDB RDS for PostgreSQL instance.

Account types

ApsaraDB RDS for PostgreSQL instances support two types of accounts: privileged accounts and standard accounts. The following table describes these account types.

Account type	Description
Privileged account	• You can create and manage privileged accounts only by using the ApsaraDB RDS console or the API. • If your ApsaraDB RDS instance uses local SSDs, you can create only a single privileged account. If your ApsaraDB RDS instance uses standard or enhanced SSDs, you can create more than one privileged account. A privileged account allows you to manage all the standard accounts and databases that are created on your ApsaraDB RDS instance. • A privileged account has more permissions that allow you to manage your ApsaraDB RDS instance at more fine-grained levels. For example, you can grant the query permissions on different tables to different users. • A privileged account has the permissions to disconnect accounts that are created on your ApsaraDB RDS instance.

Account type	Description
Standard account	• You can create and manage standard accounts by using the ApsaraDB RDS console, API operations, or SQL statements. • You can create more than one standard account on your ApsaraDB RDS instance. • You must grant the permissions on specific databases to a standard account. • A standard account does not have the permissions to create, manage, or disconnect other accounts on your ApsaraDB RDS instance.

Precautions

- If your ApsaraDB RDS instance uses local SSDs, you can create one privileged account in the ApsaraDB RDS console. After the privileged account is created, it cannot be deleted. You can also create and manage more than one standard account by using SQL statements.
- If your ApsaraDB RDS instance uses standard or enhanced SSDs, you can create more than one privileged account and standard account in the ApsaraDB RDS console. You can also create and manage more than one standard account by using SQL statements.
- To migrate data from an on-premises database to your ApsaraDB RDS instance, you must create a database and an account on the ApsaraDB RDS instance. Make sure that the created database has the same properties as the on-premises database. Also make sure that the created account has the same permissions on the created database as the account that is authorized to manage the on-premises database.
- Follow the least privilege principle to create accounts and grant them read-only permissions or read and write permissions on databases. If necessary, you can create more than one account and grant them only the permissions on specific databases. If an account does not need to write data to a database, grant only the read-only permissions on that database to the account.
- For security purposes, we recommend that you specify strong passwords for the accounts on your ApsaraDB RDS instance and change the passwords on a regular basis.

Create a privileged account on an instance that uses local SSDs

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Accounts**.
5. On the Accounts page, click **Create Privileged Account** and configure the following parameters.

Parameter	Description
Database Account	◦ The name of the account must be 2 to 16 characters in length. ◦ The name can contain lowercase letters, digits, and underscores (_). ◦ The name must start with a letter and end with a letter or digit.
Password	◦ The password of the account must be 8 to 32 characters in length. ◦ The password must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters.characters. ◦ Special characters include ! @#$%^&*()_+-=
Re-enter Password	Enter the password of the account again.

6. Click **Create**.

Create a privileged or standard account on an instance that uses standard or enhanced SSDs

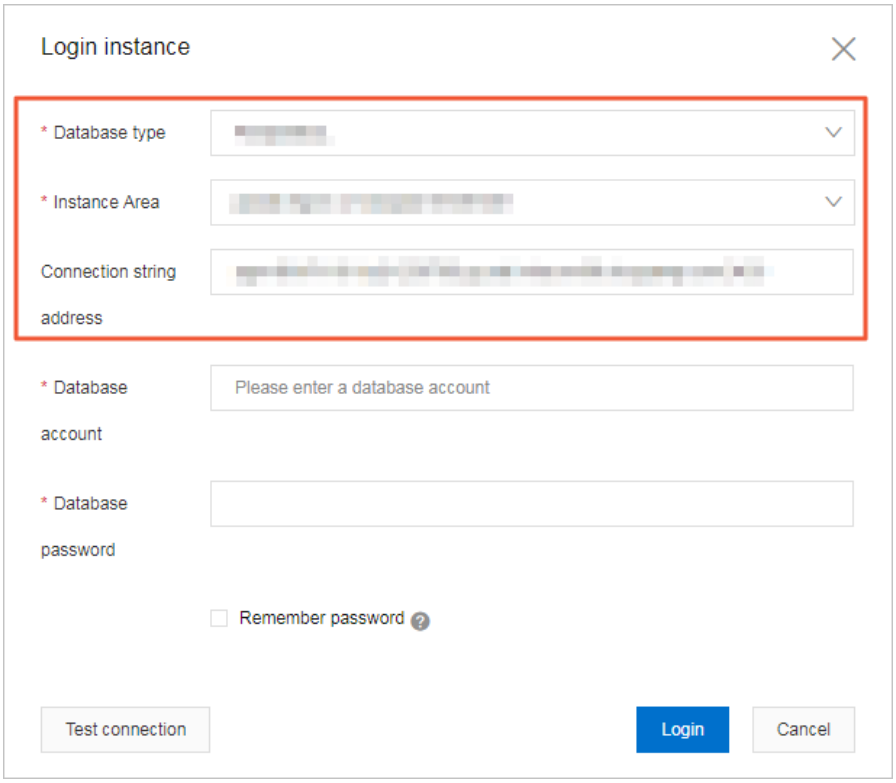
1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Accounts**.
5. On the Accounts page, click **Create Account** and configure the following parameters.

Parameter	Description
Database Account	○ The name of the account must be 2 to 16 characters in length. ○ The name can contain lowercase letters, digits, and underscores (_). ○ The name must start with a letter and end with a letter or digit.
Account Type	Select **Privileged Account** or **Standard Account**.
Password	○ The password of the account must be 8 to 32 characters in length. ○ The password must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters.characters. ○ Special characters include ! @#$%^&*()_+-=
Re-enter Password	Enter the password of the account again.
Description	This parameter is optional. You can enter relevant description to make the instance identifiable. The description can be up to 256 characters in length.

6. Click **Create**.

Create a standard account on an instance that uses local SSDs

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. Click **Log On to DB** in the upper-right corner of the page.
5. In the **Login instance** dialog box of the **DMS** console, check values of **Database type**, **Instance Area**, and **Connection string address**. If the information is correct, enter **Database account** and **Database password**, as shown in the following figure.



Parameter	Description
Database type	The engine of the database. By default, the engine of the database to be connected is displayed.
Instance Area	The region where the instance is deployed. By default, the region of the current instance is displayed.
Connection string address	The endpoint of the instance. By default, the endpoint of the current instance is displayed.
Database account	The account of the database to be connected.
Database password	The password of the account used to connect to the database.

6. Click **Login**. If you want the browser to remember the password, select **Remember password** before you click **Login**.

> **Note** If a message prompts you that the connection fails, the problem may be caused by an improperly configured whitelist. Reconfigure the whitelist in the console. For more information, see Configure an IP address whitelist.

7. The **SQLConsole** page appears after you log on to the instance. Execute a statement in the following format to create a standard account:

```
CREATE USER name [ [ WITH ] option [ ... ] ]
where option can be:
  SUPERUSER | NOSUPERUSER
| CREATEDB | NOCREATEDB
| CREATEROLE | NOCREATEROLE
| CREATEUSER | NOCREATEUSER
| INHERIT | NOINHERIT
| LOGIN | NOLOGIN
| REPLICATION | NOREPLICATION
| CONNECTION LIMIT connlimit
| [ ENCRYPTED | UNENCRYPTED ] PASSWORD 'password'
| VALID UNTIL 'timestamp'
| IN ROLE role_name [, ...]
| IN GROUP role_name [, ...]
| ROLE role_name [, ...]
| ADMIN role_name [, ...]
| USER role_name [, ...]
| SYSID uid
```

For example, if you want to create a user account named test2 whose password is 123456, execute the following statement:

```
create user test2 password '123456';
```

8. Click **execute**.

10.7.2. Reset the password

This topic describes how to use the ApsaraDB RDS console to reset the password of your database account if you forget the password.

Procedure

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Accounts**.
5. In the **Actions** column corresponding to the account, click **Reset Password**.
6. In the dialog box that appears, enter a new password and click **OK**.

> **Note** The password must meet the following requirements:
>
> - The password must be 8 to 32 characters in length.
> - The password must contain at least three of the following characters: uppercase letters, lowercase letters, digits, and special characters.
> - Special characters include ! @ # $ % ^ & * ( ) _ + - =

10.8. Databases

10.8.1. Create a database

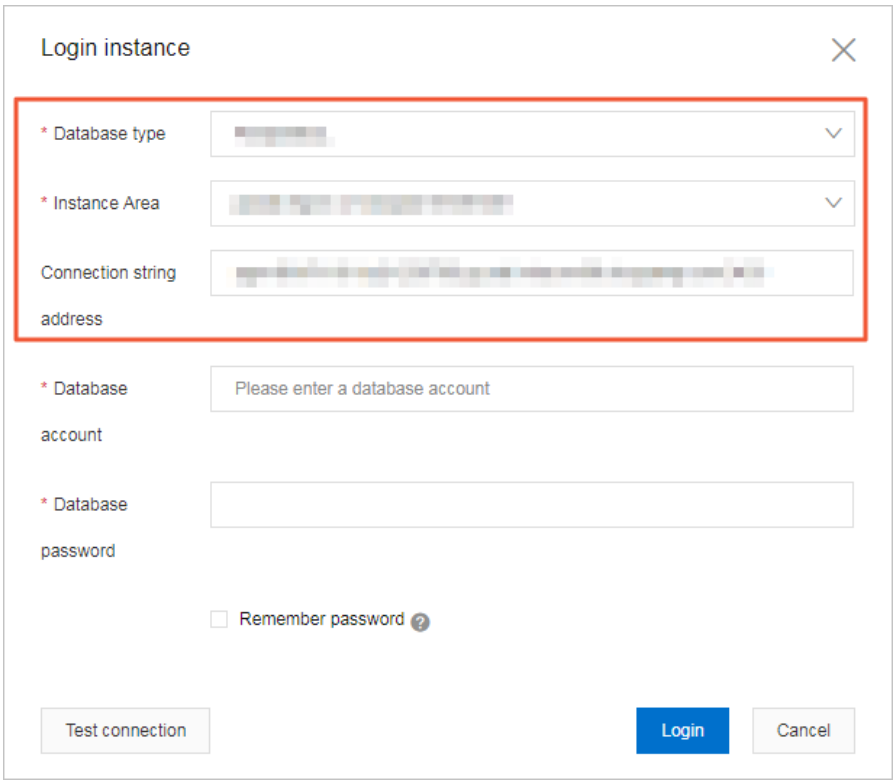
Before you start to use ApsaraDB RDS, you must create a database on an ApsaraDB RDS instance. This topic describes how to create a database on an ApsaraDB RDS for PostgreSQL instance.

Prerequisites

- An ApsaraDB RDS for PostgreSQL instance is created. For more information, see Create an instance.
- An account is created. For more information, see Create an account.

Procedure

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. Click **Log On to DB** in the upper-right corner of the page.
5. In the **Login instance** dialog box of the **DMS** console, check values of **Database type**, **Instance Area**, and **Connection string address**. If the information is correct, enter **Database account** and **Database password**, as shown in the following figure.



Parameter	Description
Database type	The engine of the database. By default, the engine of the database to be connected is displayed.
Instance Area	The region where the instance is deployed. By default, the region of the current instance is displayed.
Connection string address	The endpoint of the instance. By default, the endpoint of the current instance is displayed.
Database account	The account of the database to be connected.
Database password	The password of the account used to connect to the database.

6. Click **Login**. If you want the browser to remember the password, select **Remember password** before you click

Login.

> **Note** If a message prompts you that the connection fails, the problem may be caused by an improperly configured whitelist. Reconfigure the whitelist in the console. For more information, see Configure an IP address whitelist.

7. The **SQLConsole** page appears after you log on to the instance. Execute a statement in the following format to create a database:

```
CREATE DATABASE name;
```

For example, if you want to create a database named test, execute the following statement:

```
create database test;
```

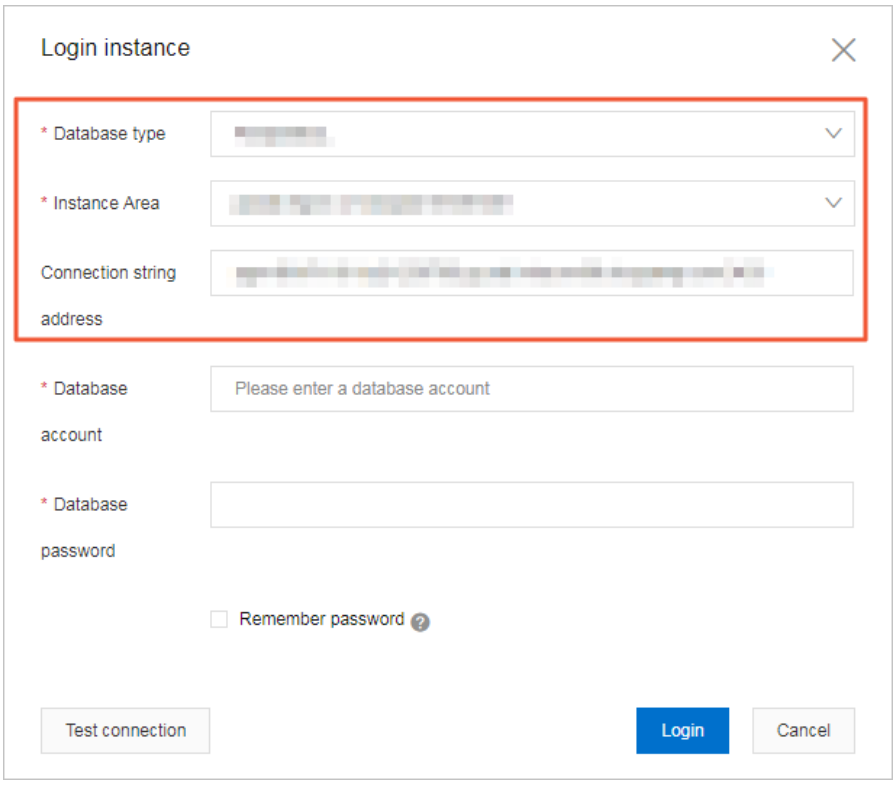
8. Click **execute**.

10.8.2. Delete a database

This topic describes how to delete a database in the ApsaraDB RDS for PostgreSQL console.

Procedure

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. Click **Log On to DB** in the upper-right corner of the page.
5. In the **Login instance** dialog box of the **DMS** console, check values of **Database type**, **Instance Area**, and **Connection string address**. If the information is correct, enter **Database account** and **Database password**, as shown in the following figure.



Parameter	Description
Database type	The engine of the database. By default, the engine of the database to be connected is displayed.
Instance Area	The region where the instance is deployed. By default, the region of the current instance is displayed.
Connection string address	The endpoint of the instance. By default, the endpoint of the current instance is displayed.
Database account	The account of the database to be connected.
Database password	The password of the account used to connect to the database.

6. Click **Login**. If you want the browser to remember the password, select **Remember password** before you click **Login**.

   > **Note** If a message prompts you that the connection fails, the problem may be caused by an improperly configured whitelist. Reconfigure the whitelist in the console. For more information, see Configure an IP address whitelist.

7. The **SQLConsole** page appears after you log on to the instance. Execute the following statement to delete a database:

   ```
   drop database <database name>;
   ```

   For example, if you want to delete a database named test2, execute the following statement:

   ```
   drop database test2;
   ```

8. Click **execute**.

10.9. Networks, VPCs, and vSwitches

10.9.1. Change the network type of an ApsaraDB RDS for PostgreSQL instance

This topic describes how to change the network type of an ApsaraDB RDS for PostgreSQL instance between classic network and Virtual Private Cloud (VPC).

Prerequisites

ApsaraDB RDS instances use local SSDs.

Context

- Classic network: ApsaraDB RDS instances in the classic network are not isolated. You can block unauthorized access only by configuring IP address whitelists on these instances.
- VPC: Each VPC is an isolated network. We recommend that you use the VPC network type because it provides a higher security level.

  You can configure route tables, CIDR blocks, and gateways in a VPC. To smoothly migrate applications to the cloud, you can use leased lines or VPNs to connect your self-managed data center to a VPC to create a virtual data center.

Change the network type from VPC to classic network

Precautions

- The ApsaraDB RDS instance must be in a VPC.
- After you change the network type from VPC to classic network, the internal endpoint of the ApsaraDB RDS instance remains unchanged. However, the IP address that is associated with the internal endpoint changes.
- After you change the network type from VPC to classic network, you cannot connect Elastic Compute Service (ECS) instances deployed in VPCs to the ApsaraDB RDS instance by using the internal endpoint. You must update the endpoint for the applications deployed on the ECS instances.
- When you change the network type, a 30-second network interruption may occur. To avoid business interruption, change the network type during off-peak hours or make sure that your applications are configured with automatic reconnection policies.

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Connection**.
5. In the upper-right corner of the Database Connection section, click **Switch to Classic Network**.
6. In the dialog box that appears, click **OK**.

   > **Note** After the network type is changed to classic network, only ECS instances within the classic network can connect to the ApsaraDB RDS instance by using the internal endpoint. You must configure the internal endpoint for the ECS instances.

7. Configure a whitelist to allow ECS instances within the classic network to connect to the ApsaraDB RDS instance by using the internal endpoint.

   > **Note**
   > - If the network isolation mode of the ApsaraDB RDS instance is standard whitelist, add the internal IP addresses of the ECS instances to a whitelist of your ApsaraDB RDS instance.
   > - If the network isolation mode of the ApsaraDB RDS instance is enhanced whitelist, add the internal IP addresses of the ECS instances to a classic network whitelist. If no classic network whitelists are available, create a whitelist. For more information about the enhanced whitelist mode, see Switch to the enhanced whitelist mode.

Change the network type from classic network to VPC

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Connection**.
5. In the upper-right corner of the Database Connection section, click **Switch to VPC**.
6. In the Switch to VPC dialog box, select a VPC and vSwitch and specify whether to retain the classic network endpoint.

> **Note**
>
> - Select a VPC. We recommend that you select the VPC where your ECS instances are deployed. Otherwise, the ECS instances cannot communicate with the ApsaraDB RDS instance over the internal network.
> - Select a vSwitch. If no vSwitches are available in the selected VPC, create one in the same zone where the ApsaraDB RDS instance is deployed. For more information, see Create a vSwitch in Quick Start of VPC User Guide.
> - Determine whether to select the **Reserve Original Classic Network Endpoint** option. The following table describes the details.
>
> - **Not selected**
>
> The classic network endpoint is not retained, and the endpoint of the instance changes to a VPC endpoint.
>
> When you change the network type, a 30-second network interruption may occur, and connections between ECS instances in the classic network and the ApsaraDB RDS instance are interrupted.
>
> - **Selected**
>
> The classic network endpoint is retained, and a new VPC endpoint is generated. In such cases, the ApsaraDB RDS instance runs in hybrid access mode. ECS instances in both the classic network and a VPC can connect to the ApsaraDB RDS instance over the internal network. You must set **Expiration Time (Important)** to **14 Days Later**, **30 Days Later**, **60 Days Later**, or **120 Days Later** for the classic network. You can also modify the expiration time after the network type is changed. For more information, see Hybrid network access mode.
>
> When you change the network type, no network interruptions occur. Connections between ECS instances in the classic network and the ApsaraDB RDS instance remain available until the classic network endpoint expires.
>
> To migrate your business to the VPC without interruption, you must add the VPC endpoint to access the ECS instances before the classic network endpoint expires. Seven days before the classic network endpoint expires, the system sends a text message to the phone number bound to your Apsara Stack account every day.
>
> For more information, see Hybrid access from both the classic network and VPCs.

7. Add the internal IP addresses of ECS instances in the selected VPC to a VPC whitelist. This allows the ECS instances to access the ApsaraDB RDS instance over the internal network. If no VPC whitelists are available, create a whitelist.

> **Note**
>
> - If you retain the classic network endpoint, add the VPC endpoint to the ECS instances before the classic network endpoint expires.
> - If you do not retain the classic network endpoint, connections between ECS instances in the classic network and the ApsaraDB RDS instance over the internal network are interrupted. You must add the new endpoint to ECS instances in the VPC immediately after the network type is changed.

10.9.2. Configure hybrid access from both the classic network and VPCs

This topic describes how to use the hybrid access solution of ApsaraDB RDS to change the network type of an instance from classic network to Virtual Private Cloud (VPC) without network interruptions.

Prerequisites

- The ApsaraDB RDS instance uses local SSDs.
- The ApsaraDB RDS instance is deployed in the classic network.
- Available VPCs and vSwitches exist in the zone where the ApsaraDB RDS instance is deployed.

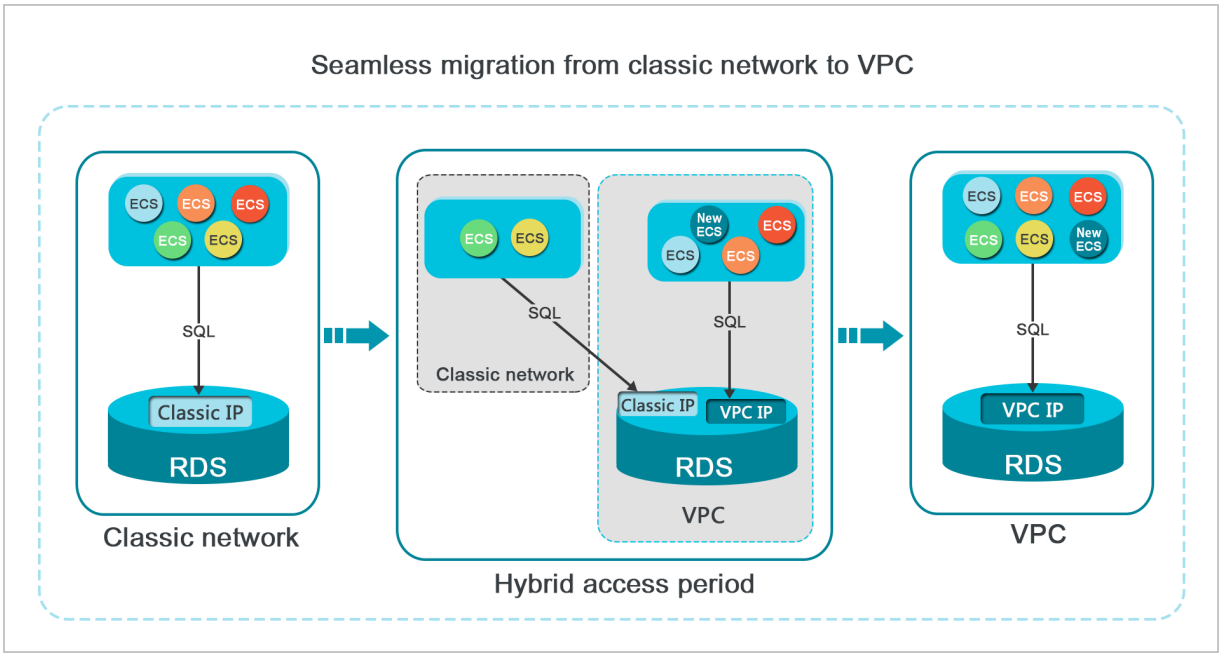
Context

In the past, when you change the network type of an ApsaraDB RDS instance from classic network to VPC, the internal endpoint of the ApsaraDB RDS instance would remain the same but the IP address bound to the endpoint would change to the corresponding IP address in the VPC. This change would cause a 30-second network interruption, and ECS instances within the classic network would not be able to access the ApsaraDB RDS instance by using the internal endpoint within this period. To smoothly change the network type, ApsaraDB RDS provides the hybrid access solution.

Hybrid access refers to the ability of an ApsaraDB RDS instance to be accessed by ECS instances in both the classic network and VPCs. During the hybrid access period, the ApsaraDB RDS instance reserves the original internal endpoint of the classic network and adds the internal endpoint of VPCs. This prevents network interruptions during the network type switchover.

For better security and performance, we recommend that you use the internal endpoint of VPCs. Hybrid access is available for a limited period of time. The internal endpoint of the classic network is released when the hybrid access period expires. In that case, your applications cannot access the ApsaraDB RDS database by using the internal endpoint of the classic network. You must configure the internal endpoint of VPCs in all your applications during the hybrid access period. This ensures smooth network switchover and minimizes the impact on your services.

For example, your company wants to use the hybrid access solution to change the network type from classic network to VPC. During the hybrid access period, some applications can access the database by using the internal endpoint of VPCs, and the other applications can access the database by using the original internal endpoint of the classic network. When all the applications access the database by using the internal endpoint of VPCs, the internal endpoint of the classic network can be released. The following figure illustrates the scenario.



Limits

During the hybrid access period, the instance has the following limits:

- The network type of your instance cannot be changed to classic network.
- Your instance cannot be migrated to another zone.

Change the network type from classic network to VPC

For more information, see Change the network type from classic network to VPC.

Change the expiration time for the original internal endpoint of the classic network

During the period in which your instance can be accessed over the classic network or VPCs, you can specify the expiration time for the endpoint of the classic network. The setting takes effect immediately. For example, if the endpoint of the classic network is about to expire on August 18, 2017 and you change the expiration time to 14 days later on August 15, 2017, the endpoint of the classic network is released on August 29, 2017.

To change the expiration time, perform the following steps:

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Connection**.
5. On the **Instance Connection** tab, click **Change Expiration Time**.
6. In the **Change Expiration Time** dialog box, select an expiration time and click **OK**.

10.10. Monitoring

10.10.1. View monitored resources

ApsaraDB RDS provides a wide range of performance metrics. This topic describes how to view resource monitoring data in the ApsaraDB RDS console.

Procedure

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Monitoring and Alerts**.
5. On the **Monitoring** tab, select a time range to query the corresponding monitoring data. The following table lists the specific metrics.

Metric	Description
Disk Space	The used disk space of the instance. Unit: MB.
IOPS	The number of I/O requests of the data and log disks per second.
Memory Usage	The memory usage of the instance. Unit: %.
CPU Utilization	The CPU utilization of the instance. Unit: %.
Total Connections	The total number of current connections of the instance.

> **Note** You can click **Refresh** in the upper-right corner of the **Monitoring** tab to refresh the monitoring information.

10.10.2. Set a monitoring frequency

This topic describes how to set the monitoring frequency of an ApsaraDB RDS for PostgreSQL instance.

Context

ApsaraDB RDS for PostgreSQL provides the following monitoring frequencies:

- Every 5 seconds
- Every 60 seconds
- Every 300 seconds

Procedure

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Monitoring and Alerts**.
5. On the **Monitoring** tab, click **Set Monitoring Frequency**.
6. In the **Set Monitoring Frequency** dialog box, select a monitoring frequency and click **OK**.

10.11. Data security

10.11.1. Switch to the enhanced whitelist mode

This topic describes how to switch from the standard whitelist mode to the enhanced whitelist mode for an ApsaraDB RDS instance. The enhanced whitelist mode provides higher security.

Network isolation modes

ApsaraDB RDS instances support the following network isolation modes:

- Standard whitelist mode

  IP addresses from both the classic network and VPCs are added to the same IP address whitelist. However, the standard whitelist mode may incur security risks. Therefore, we recommend that you switch the network isolation mode to enhanced whitelist.

- Enhanced whitelist mode

  IP addresses from the classic network and VPCs are added to different IP address whitelists. When you create an enhanced IP address whitelist, you must specify its network type.

Changes after you switch to the enhanced whitelist mode

- If the network type of the instance is VPC, the system generates a new whitelist that contains the same IP addresses as the original whitelists. The new IP address whitelist applies only to access from VPCs.
- If the network type of the instance is classic network, the system generates a new whitelist that contains the same IP addresses as the original whitelists. The new IP whitelist applies only to access from the classic network.
- If the instance supports access from both the classic network and VPCs, two new IP address whitelists are created, and each contains the same IP addresses as the original whitelists. One whitelist applies to access from VPCs, and the other applies to access from the classic network.

> **Note** After you switch to the enhanced whitelist mode, the configured ECS instance groups remain unchanged.

Precautions

- You can switch from the standard whitelist mode to the enhanced whitelist mode, but not the other way around.
- In enhanced whitelist mode, a classic network whitelist also allows access from the Internet. If you want to access the instance from a host over the Internet, you can add the public IP address of the host to a classic network whitelist.

Procedure

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Data Security**.
5. On the **Whitelist Settings** tab, click **Switch to Enhanced Whitelist (Recommended)**.
6. In the message that appears, click **Confirm**.

10.11.2. Configure an IP address whitelist

This topic describes how to configure a whitelist for an ApsaraDB RDS instance. Only entities that are listed in a whitelist can access your ApsaraDB RDS instance.

Context

Whitelists make your ApsaraDB RDS instance more secure and do not interrupt the operations of your ApsaraDB RDS instance when you configure whitelists. We recommend that you perform maintenance on your whitelists on a regular basis.

To configure a whitelist, perform the following operations:

- Configure a whitelist: Add IP addresses to allow them to connect to the ApsaraDB RDS instance.

  > **Note** The IP address whitelist labeled default contains only the default IP address 0.0.0.0/0, which allows all entities to access your ApsaraDB RDS instance.

- Configure an ECS security group: Add an ECS security group for the ApsaraDB RDS instance to allow ECS instances in the group to connect to the ApsaraDB RDS instance.

Procedure

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Data Security**.
5. On the **Whitelist Settings** tab, click **Edit** corresponding to the **default** whitelist.

   > **Note** You can also click **Create Whitelist** to create a whitelist.

6. In the **Edit Whitelist** dialog box, enter the IP addresses or CIDR blocks used to access the instance and click

OK. The following section describes the rules:

- If you enter the CIDR block 10.10.10.0/24 in the IP Addresses field, all IP addresses in the 10.10.10.X format can access your ApsaraDB RDS instance.
- If you enter more than one IP address or CIDR block, you must separate them with commas (,). Do not add spaces before or after the commas. Example: 192.168.0.1,172.16.213.9.
- If you click **Add Internal IP Addresses of ECS Instances**, the IP addresses of all ECS instances created within your Alibaba Cloud account are displayed. You can select the required IP addresses to add them to the IP address whitelist.

10.11.3. Configure SSL encryption

This topic describes how to enable SSL encryption for an ApsaraDB RDS instance.

Prerequisites

The ApsaraDB RDS instance uses standard SSDs.

Precautions

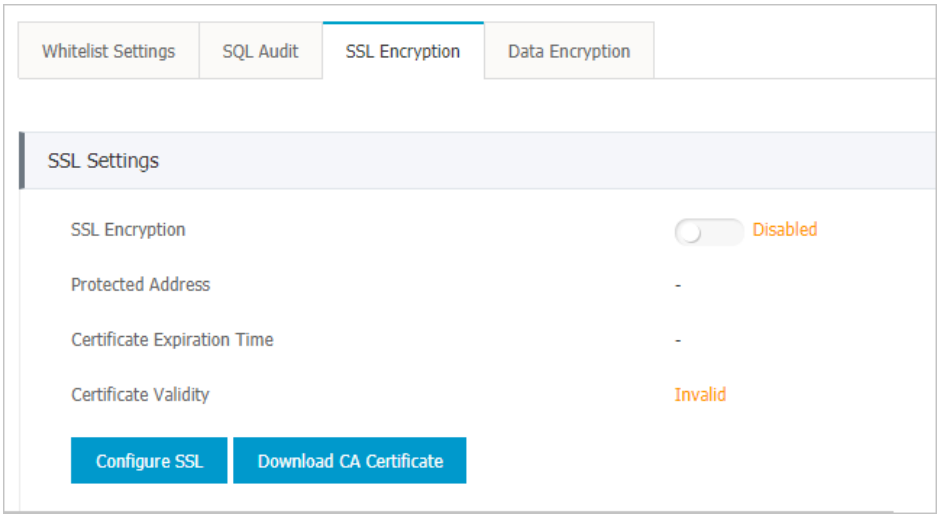
- After SSL encryption is enabled, data transmitted over an internal network or the Internet is encrypted by using SSL. SSL encryption protects data from leaks.
- After SSL encryption is enabled, you must close the existing connection and establish a new one to bring SSL encryption into effect.

Enable SSL encryption

SSL 3.0 has been upgraded by the Internet Engineering Task Force (IETF) to Transport Layer Security (TLS), but the term SSL encryption is still commonly used in the communications industry. Therefore, SSL encryption is used in this topic to refer to TLS encryption.

> **Note** ApsaraDB RDS supports TLS 1.0, 1.1, and 1.2.

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Data Security**.
5. Click the **SSL Encryption** tab.

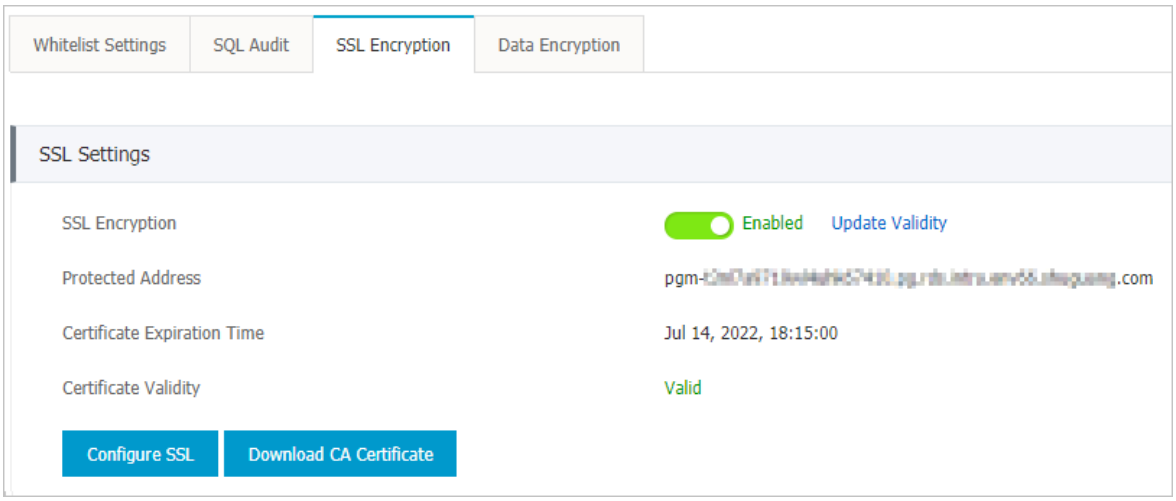


6. Click **Enable SSL**.

> **Note** After SSL encryption is enabled, you must set the SSL mode to **Prefer** when you log on from your client.

Disable SSL encryption

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the **Actions** column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Data Security**.
5. Click the **SSL Encryption** tab.



6. Click **Disable SSL**.

10.11.4. Configure data encryption

This topic describes how to configure data encryption for an ApsaraDB RDS instance that uses standard or enhanced SSDs. The disk encryption feature maximizes the protection for your data and eliminates the need to modify business or application configurations. ApsaraDB RDS automatically applies disk encryption to both the snapshots that are generated from the encrypted SSDs and the SSDs that are created from those snapshots.

Prerequisites

The storage type of the instance is standard SSD.

Configure disk encryption

1. In the address bar, enter the URL of the Apsara Uni-manager Management Console. Press the Enter key.
2. Enter your username and password.

   Obtain the username and password that you can use to log on to the console from the operations administrator.

> **Note** When you log on to the Apsara Uni-manager Management Console for the first time, you must change the password of your username. Your password must meet complexity requirements. The password must be 8 to 20 characters in length and must contain at least two of the following character types:
>
> - Uppercase or lowercase letters
> - Digits
> - Special characters, which include ! @ # $ %

3. Click **Login**.
4. In the top navigation bar, choose **Products** > Security > Key Management Service.
5. On the Keys page, click **Create Key**.
6. Configure the following parameters.

Section	Parameter	Description
Region	**Organization**	The organization to which the key belongs.
	Resource Set	The resource set to which the key belongs.
	Region	The region to which the key belongs.
Basic Settings	**Key Type**	KMS supports the following key types: ○ Symmetric keys: ■ Aliyun_AES_256 ■ Aliyun_SM4 ○ Asymmetric keys: ■ RSA_2048 ■ EC_P256 ■ EC_P256K ■ EC_SM2
	Key Purpose	ENCRYPT/DECRYPT: The purpose of the CMK is to encrypt or decrypt data.
	Protection Level	○ SOFTWARE: Use a software module to protect the CMK. ○ HSM: Host the CMK in a hardware security module (HSM). Managed HSM uses the HSM as dedicated hardware to safeguard the CMK.
	Alias	The identifier of the CMK. For more information, see Use aliases in *KMS User Guide*.
	Description	The description of the CMK.

Section	Parameter	Description
Advanced Settings	Rotation Period	Specifies whether to enable automatic rotation. If you choose to enable automatic rotation, you must select a rotation period. For more information about rotation, see Key rotation in *KMS User Guide*. Valid values: ○ 30 Days ○ 90 Days ○ 180 Days ○ 365 Days ○ Custom: Customize a period that ranges from 7 to 730 days. **Note** You can specify this parameter only if Key Type is set to Aliyun_AES_256 or Aliyun_SM4.
	Key Material Source	The source of key material. ○ Key Management Service: Use KMS to generate key material. ○ External: Manually import external key material. **Note** If **Rotation Period** is set to **Enable**, the **External** option is unavailable.

7. Click **Submit**.
8. Create an ApsaraDB RDS instance with disk encryption enabled. For more information, see Create an ApsaraDB RDS for PostgreSQL instance that uses standard or enhanced SSDs.

10.12. Logs and audit

10.12.1. Configure SQL audit

This topic describes how to configure the SQL audit feature to audit SQL executions and check the details. SQL audit does not affect instance performance.

Precautions

- SQL audit does not affect instance performance.
- SQL audit logs are retained for 30 days.
- Log files exported from SQL audit are retained for two days. The system deletes files that are retained for longer than two days.
- SQL audit is disabled by default. You must manually enable it.
- You cannot view logs that are generated before SQL audit is enabled.

Enable SQL audit

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Data Security**.
5. Click the **SQL Audit** tab.

6. Click **Enable SQL Audit** or **Enable now**.
7. In the message that appears, click **Confirm**.

> **Note** After SQL audit is enabled, you can query SQL information based on conditions such as the time, database, user, and keyword.

Disable SQL audit

You can disable SQL audit when it is no longer needed. To disable SQL audit, perform the following steps:

> **Notice** After SQL audit is disabled, all SQL audit logs are deleted. We recommend that you export and store audit logs to your computer before you disable SQL audit.

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Data Security**.
5. Click the **SQL Audit** tab. Click **Export File**.

> **Note** If more than 1 million SQL audit logs meet the filter conditions you specify, only 1 million logs can be exported. SQL audit logs are exported at a speed of 900 entries per second. It takes about 20 minutes to export 1 million SQL audit logs.

6. Click **Files**. Find a file and click Download in the **Action** column to download the file to your computer.
7. Click **Disable SQL Audit**.
8. In the message that appears, click **Confirm**.

10.12.2. Manage logs

You can view logs for errors, slow queries, and primary/secondary instance switching for ApsaraDB RDS for PostgreSQL instances in the ApsaraDB RDS console or by executing SQL statements. These logs help you troubleshoot errors. This topic describes how to manage logs in the console.

Procedure

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Logs**.
5. On the **Logs** page, click the **Error Logs**, **Slow Query Logs**, or **Primary/Secondary Switching Logs** tab, select a time range, and then click **Search**.

Tab	Description
Error Logs	Records database running errors that occurred within the last month.
Slow Query Logs	Records SQL statements within the last month that took longer than one second to execute. Duplicated SQL statements are removed.

Tab	Description
Primary/Secondary Switching Logs	Records switchovers between the primary and secondary instances within the last month.

10.13. Backup

10.13.1. Back up an ApsaraDB RDS for PostgreSQL instance

This topic describes how to back up an ApsaraDB RDS for PostgreSQL instance. You can configure a backup policy that is used to automatically back up your ApsaraDB RDS instance. If you do not configure a backup policy, the default backup policy is used. You can also manually back up your ApsaraDB RDS instance.

Precautions

- Do not perform data definition language (DDL) operations during a backup. If you do so, the backup may fail due to table locks.
- We recommend that you back up your ApsaraDB RDS instance during off-peak hours.
- If the amount of data is large, it may take a long time to back up your ApsaraDB RDS instance.
- Backup files are retained for a specified retention period. We recommend that you download the required backup files to your computer before they are deleted.

Backup description

ApsaraDB RDS for PostgreSQL allows you to perform full physical backup and back up archived redo log files of databases.

Configure a backup policy to automatically back up your ApsaraDB RDS instance

ApsaraDB RDS automatically backs up your instance based on the specified backup policy.

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Backup and Restoration**.
5. On the **Backup and Restoration** page, click the **Backup Settings** tab and click **Edit**.
6. In the dialog box that appears, configure the following parameters and click **OK**. The following table lists the parameters.

Parameter	Description
Data Retention Period	The number of days for which you want to retain data backup files. Valid values: 7 to 730. Unit: days. Default value: 7.
Backup Cycle	The cycle to create backups. You can select one or more days of the week. **Note** To ensure data security, we recommend that you back up your ApsaraDB RDS instance at least twice a week.

Parameter	Description
Backup Time	The period of time for which you want to back up data. Unit: hours.
Log Backup	Specifies whether to enable the log backup feature. **Notice** If you disable this feature, all log backup files are deleted and your instance cannot be restored to previous points in time.
Log Retention Period	◦ The period of time for which you want to retain log backup files. Valid values: 7 to 730. Unit: days. Default value: 7. ◦ The log retention period must be less than or equal to the data retention period.

Manually back up your ApsaraDB RDS instance

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the upper-right corner of the page, click **Back Up Instance**. The **Back Up Instance** dialog box appears.
5. Select the backup mode and backup policy, and click **OK**.

> **Note** The backup mode is **Full Backup** and the backup policy is **Instance Backup**.

What's next

You can click the icon in the upper-right corner of the page to view the task progress displayed in the **Task Progress** list.

10.13.2. Download data and log backup files

This topic describes how to download unencrypted data and log backup files in the ApsaraDB RDS console to archive the files and restore data to an on-premises database.

Procedure

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Backup and Restoration** to go to the **Backup and Restoration** page.
5. Click the Data Backup or Archived Logs tab.
   - To download data backup files, click the **Data Backup** tab.
   - To download log files, click the **Archived Logs** tab.
6. Select a time range to which you want to restore the instance.
7. Find the data backup or log file that you want to download and click **Download** in the **Actions** column.

> **Note**
> - If you want to use a data backup file to restore data, select the backup file that is the closest to the time for restoration.
> - If you want to use a log file to restore data to an on-premises database, take note of the following items:
>   - The instance No. of the log file must be the same as that of the data backup file.
>   - The start time of the log file must be later than the data backup time and earlier than the time for restoration.

8. In the message that appears, select a download method.

Download method	Description
Download	Download the file by using the public endpoint.
Copy Internal Endpoint	Copy the internal endpoint to download the file. If your ECS and ApsaraDB RDS instances are deployed within the same region, you can log on to the ECS instance and use the internal endpoint to download the file. This method is fast and secure.
Copy Public Endpoint	Copy the public endpoint to download the file. If you want to use other tools to download the file, use the public endpoint.

> **Note** If you use a Linux operating system, you can run the following command to download the file:
>
> ```
> wget -c '<Public endpoint of the backup file, which is the download URL>' -O <File name>
> ```
>
> - The -c option enables resumable download.
> - The -O option saves the downloaded file by using a specified name. We recommend that you use the file name contained in the download URL.
> - If the URL contains more than one parameter, enclose the download URL in a pair of single quotation marks (').

10.13.3. Create a logical backup for an ApsaraDB RDS for PostgreSQL instance

This topic describes how to use pg_dump to create a logical backup for an ApsaraDB RDS for PostgreSQL instance and export the backup file to your computer.

Context

The pg_dump utility provided with PostgreSQL is used to back up individual databases. For more information, visit pg_dump.

In this example, an ApsaraDB RDS for PostgreSQL instance that runs Linux 7 and PostgreSQL 10 is used.

Prerequisites

- The IP address of your ECS instance or host is added to a whitelist of the ApsaraDB RDS for PostgreSQL instance.

For more information, see Configure an IP address whitelist.

- Your ECS instance or host runs the same version of PostgreSQL as the ApsaraDB RDS for PostgreSQL instance.

Precautions

We recommend that you use the privileged account of the ApsaraDB RDS for PostgreSQL instance to ensure that you have all the required permissions.

Back up a database

1. Log on to your ECS instance or host. Then, run the following command to back up a database from the ApsaraDB RDS for PostgreSQL instance:

```
pg_dump -h '<hostname>' -U <username> -p <port> -Fc <dbname> > <dumpdir>
```

Parameter	Description
hostname	The endpoint of the ApsaraDB RDS for PostgreSQL instance. **Note** If your ECS instance connects to the ApsaraDB RDS for PostgreSQL instance by using an internal endpoint, make sure that the ECS and ApsaraDB RDS instances have the same network type. If both instances use the VPC network type, make sure that both instances are deployed within the same VPC. For more information about how to view the internal endpoint, see View and modify the internal endpoint and port number.
username	The username of the privileged account of the ApsaraDB RDS for PostgreSQL instance.
port	The port number of the ApsaraDB RDS for PostgreSQL instance.
-Fc	The output file format. `-Fc` specifies the custom format, which is ideal when you use pg_restore to import logical backup files and restore databases. For more information, visit pg_dump.
dbname	The name of the database that you want to back up.
dumpdir	The directory and name of the logical backup file to export.

Example:

```
pg_dump -h 'pgm-bpxxxxxx.pg.rds.aliyuncs.com' -U test123 -p 3433 -Fc testdb > /tmp/testdb.dump
```

2. When `Password:` appears, enter the password of the privileged account of the ApsaraDB RDS for PostgreSQL instance and press the Enter key.

Back up one or more tables

1. Log on to your ECS instance or host. Then, run the following command to back up one or more tables from a database in the ApsaraDB RDS for PostgreSQL instance:

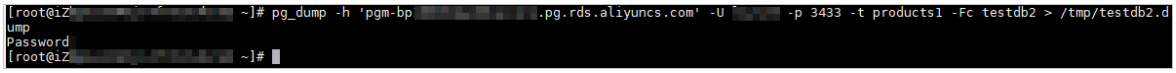
```
pg_dump -h '<hostname>' -U <username> -p <port> -t <table> -Fc <dbname> > <dumpdir>
```

Parameter	Description
hostname	The endpoint of the ApsaraDB RDS for PostgreSQL instance. **Note** If your ECS instance connects to the ApsaraDB RDS for PostgreSQL instance by using an internal endpoint, make sure that the ECS and ApsaraDB RDS instances have the same network type. If both instances use the VPC network type, make sure that both instances are deployed within the same VPC. For more information about how to view the internal endpoint, see View and modify the internal endpoint and port number.
username	The username of the privileged account of the ApsaraDB RDS for PostgreSQL instance.
port	The port number of the ApsaraDB RDS for PostgreSQL instance.
table	The name of the table that you want to back up. You can use `-t <table>` to specify more than one table.
-Fc	The output file format. `-Fc` specifies the custom format, which is ideal when you use pg_restore to import logical backup files and restore databases. For more information, visit pg_dump.
dbname	The name of the database that you want to back up.
dumpdir	The directory and name of the logical backup file to export.

Example:

```
pg_dump -h 'pgm-bpxxxxxx.pg.rds.aliyuncs.com' -U test123 -p 3433 -t products1 -Fc testdb2 > /tmp/testdb2.dump
```

2. When `Password:` appears, enter the password of the privileged account of the ApsaraDB RDS for PostgreSQL instance and press the Enter key.



Back up a database with one or more tables excluded

1. Log on to your ECS instance or host. Then, run the following command to back up a database from the ApsaraDB RDS instance with one or more tables excluded:

```
pg_dump -h '<hostname>' -U <username> -p <port> -T <table> -Fc <dbname> > <dumpdir>
```

Parameter	Description

Parameter	Description
hostname	The endpoint of the ApsaraDB RDS for PostgreSQL instance. **Note** If your ECS instance connects to the ApsaraDB RDS for PostgreSQL instance by using an internal endpoint, make sure that the ECS and ApsaraDB RDS instances have the same network type. If both instances use the VPC network type, make sure that both instances are deployed within the same VPC. For more information about how to view the internal endpoint, see View and modify the internal endpoint and port number.
username	The username of the privileged account of the ApsaraDB RDS for PostgreSQL instance.
port	The port number of the ApsaraDB RDS for PostgreSQL instance.
table	The name of the table that you want to exclude. You can use `-T <table>` to specify more than one table.
-Fc	The output file format. `-Fc` specifies the custom format, which is ideal when you use pg_restore to import logical backup files and restore databases. For more information, visit pg_dump.
dbname	The name of the database that you want to back up.
dumpdir	The directory and name of the logical backup file to export.

Example:

```
pg_dump -h 'pgm-bpxxxxx.pg.rds.aliyuncs.com' -U test123 -p 3433 -T products1 -Fc testdb2 > /tmp/testdb2.dump
```

2. When `Password:` appears, enter the password of the privileged account of the ApsaraDB RDS for PostgreSQL instance and press the Enter key.

Back up the schema of a database with data excluded

1. Log on to your ECS instance or host. Then, run the following command to back up the schema of a database from the ApsaraDB RDS for PostgreSQL instance:

```
pg_dump -h '<hostname>' -U <username> -p <port> -s -Fc <dbname> > <dumpdir>
```

Parameter	Description

Parameter	Description
hostname	The endpoint of the ApsaraDB RDS for PostgreSQL instance. **Note** If your ECS instance connects to the ApsaraDB RDS for PostgreSQL instance by using an internal endpoint, make sure that the ECS and ApsaraDB RDS instances have the same network type. If both instances use the VPC network type, make sure that both instances are deployed within the same VPC. For more information about how to view the internal endpoint, see View and modify the internal endpoint and port number.
username	The username of the privileged account of the ApsaraDB RDS for PostgreSQL instance.
port	The port number of the ApsaraDB RDS for PostgreSQL instance.
-s	Specifies whether to back up only the schema of the database. The data of the database is not backed up. For more information, visit pg_dump.
-Fc	The output file format. `-Fc` specifies the custom format, which is ideal when you use pg_restore to import logical backup files and restore databases. For more information, visit pg_dump.
dbname	The name of the database that you want to back up.
dumpdir	The directory and name of the logical backup file to export.

Example:

```
pg_dump -h 'pgm-bpxxxxx.pg.rds.aliyuncs.com' -U test123 -p 3433 -s -Fc testdb2 > /tmp/testdb2.dump
```

2. When `Password:` appears, enter the password of the privileged account of the ApsaraDB RDS for PostgreSQL instance and press the Enter key.

10.13.4. Create a full backup of an ApsaraDB RDS for PostgreSQL instance

This topic describes how to use the pg_basebackup utility provided by open source PostgreSQL to create a full backup of your ApsaraDB RDS for PostgreSQL instance and export the backup files to your computer.

Prerequisites

- The IP address of your ECS instance or host is added to a whitelist of your ApsaraDB RDS for PostgreSQL instance. For more information, see Configure an IP address whitelist.
- Your ECS instance or host runs the same version of PostgreSQL as the ApsaraDB RDS for PostgreSQL instance.

Context

pg_basebackup backs up all data of a PostgreSQL instance. Backup files can be used for point-in-time recovery. For more information, visit pg_basebackup.

In this example, CentOS 7 is used to create a full backup.

Precautions

We recommend that you use the privileged account of the ApsaraDB RDS for PostgreSQL instance to ensure that you have all the required permissions.

Procedure

> **Note** pg_basebackup cannot back up a single database or database object. For more information about how to back up a single database or database object, see Create a logical backup for an ApsaraDB RDS for PostgreSQL instance.

1. Log on to your ECS instance or host. Then, run the following command to back up a database from the ApsaraDB RDS for PostgreSQL instance:

   ```
   pg_basebackup -Ft -Pv -Xf -z -D <backupdir> -Z5 -h '<hostname>' -p <port> -U <username> -W
   ```

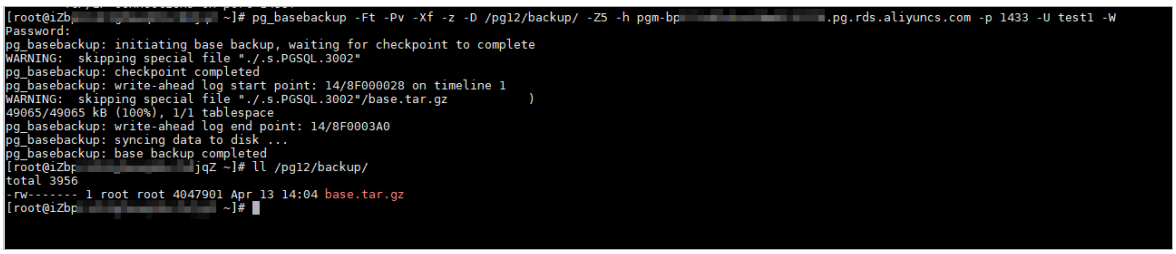
   The following table describes the parameters in this command. For more information, visit pg_basebackup.

Parameter	Description
backupdir	The directory of backup files that are exported. The system automatically creates this directory. However, if this directory already exists and is not empty, the system reports an error.
hostname	The internal endpoint of the ApsaraDB RDS for PostgreSQL instance. For more information about how to view the internal endpoint, see View and modify the internal endpoint and port number.
port	The port number of the ApsaraDB RDS for PostgreSQL instance.
username	A username of the ApsaraDB RDS for PostgreSQL instance.

   Example:

   ```
   pg_basebackup -Ft -Pv -Xf -z -D /pg12/backup1/ -Z5 -h pgm-bpxxxxx.pg.rds.aliyuncs.com -p 1433 -U test1 -W
   ```

2. When `Password:` appears, enter the password of the username of the ApsaraDB RDS for PostgreSQL instance and press the Enter key.



10.14. Restoration

10.14.1. Restore data of an ApsaraDB RDS for PostgreSQL instance

This topic describes how to use the backup data of an ApsaraDB RDS for PostgreSQL instance to restore data.

Precautions

- The new instance must have the same whitelist, backup, and parameter settings as the original instance.
- The new instance must have the same data and account information as the backup set or instance at the time point.

Prerequisites

The original instance must meet the following requirements:

- The original instance is in the Running state and is not locked.
- The original instance does not have ongoing migration tasks.
- If you want to restore data to a point in time, the log backup feature is enabled for the original instance.
- If you want to restore an instance from a backup set, the original instance has at least one backup set.

Restore data of an ApsaraDB RDS for PostgreSQL instance

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Backup and Restoration**.
5. In the upper-right corner of the page, click **Restore Database (Previously Clone Database)**.
6. Configure the following parameters.

Section	Parameter	Description
Region	**Region**	The region where the instance is deployed.
Restore Database	**Restore Mode**	◦ **By Time**: You can restore data to a point in time within the retention period of the log backup. For more information about how to view or change the retention period of log backups, see Back up an ApsaraDB RDS for PostgreSQL instance. ◦ **By Backup Set** **Note** The **By Time** option appears only when the log backup feature is enabled.
	Restore Time	The time to which the database is restored. This parameter is displayed when you set **Restore Mode** to **By Time**.
	Backup Set	The backup set used to restore the database. This parameter is displayed when you set **Restore Mode** to **By Backup Set**.
Specifications	**Instance Name**	The name of the instance.
	Database Engine	The engine of the database. The value of this parameter is set to **PostgreSQL** and cannot be changed.
	Engine Version	The version of the database engine. The value of this parameter is set to the engine version of the current instance and cannot be changed.
	Edition	The edition of the instance.
	Storage Type	The storage type of the instance. The value of this parameter is set to the storage type of the current instance and cannot be changed.

Section	Parameter	Description
	Instance Type	The instance type of the instance. Memory size determines the maximum number of connections and IOPS. The actual values are displayed in the console. For more information, see Instance types in *Instance types* of *ApsaraDB RDS Product Introduction*.
	Storage Capacity	The storage capacity of the instance, including the space to store data, system files, binlog files, and transaction files. Valid values: 20 to 600. Unit: GB. The value must be in 1 GB increments.
Network Type	**Network Type**	The network type of the instance. ApsaraDB RDS instances support the following network types: ○ **Classic Network**: Cloud services on a classic network are not isolated from each other. Unauthorized access to a cloud service is blocked only by the security group or whitelist policy of the service. ○ **VPC**: A virtual private cloud (VPC) helps you build an isolated network environment on Apsara Stack. You can customize route tables, CIDR blocks, and gateways in a VPC. We recommend that you select VPC for improved security. **Note** If you set the network type to **VPC**, you must also select a **VPC** and a **vSwitch**.

7. Click **Submit**.

10.14.2. Restore data from a logical backup file

This topic describes how to restore data from a logical backup file to an ApsaraDB RDS for PostgreSQL instance or an on-premises PostgreSQL database.

Context

A logical backup file is used to restore a small amount of data, such as data in a table. For a large amount of data, we recommend that you restore it from a full physical backup file to a new ApsaraDB RDS instance and then use Data Transmission Service (DTS) to migrate data to the original ApsaraDB RDS instance.

Prerequisites

Data in the ApsaraDB RDS for PostgreSQL instance is logically backed up. For more information, see Create a logical backup for an ApsaraDB RDS for PostgreSQL instance.

Precautions

- We recommend that you do not restore data to the default postgres database.
- When you restore the data of a table, the system does not restore the database objects on which the table depends. The restoration may fail.

Restore the data of a database

1. Log on to the ECS instance or on-premises host that houses the logical backup file and run the following command to restore the data of a database:

```
pg_restore -h '<hostname>' -U <username> -p <port> -d <dbname> <dumpdir>
```

Parameter	Description

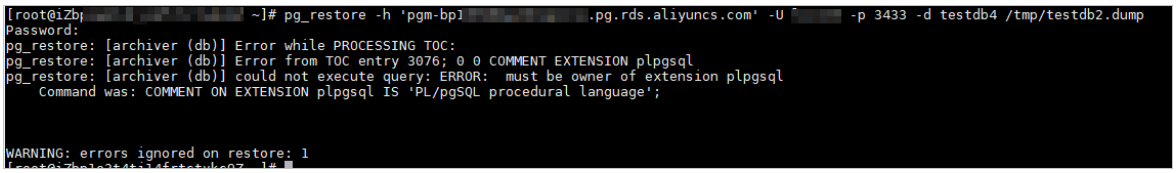
Parameter	Description
hostname	The endpoint of the ApsaraDB RDS for PostgreSQL instance. **Note** If your ECS instance connects to the ApsaraDB RDS for PostgreSQL instance by using an internal endpoint, make sure that the ECS and ApsaraDB RDS instances have the same network type. If both instances are of the VPC network type, make sure that both instances reside within the same VPC. For more information about how to view the internal endpoint, see View and modify the internal endpoint and port number.
username	The username of the privileged account of the ApsaraDB RDS for PostgreSQL instance.
port	The port number of the ApsaraDB RDS for PostgreSQL instance.
dbname	The name of the database whose data you want to restore.
dumpdir	The directory and name of the logical backup file to use.

Example:

```
pg_restore -h 'pgm-bpxxxxx.pg.rds.aliyuncs.com' -U test123 -p 3433 -d testdb2 /tmp/testdb.dump
```

2. When `Password:` appears, enter the password of the privileged account of your ApsaraDB RDS instance and press the Enter key.

Note You can ignore alerts generated by the embedded plpgsql plug-in.



Restore the data of a table

1. Log on to the ECS instance or on-premises host that houses the logical backup file and run the following command to restore the data of a table:

```
pg_restore -h '<hostname>' -U <username> -p <port> -d <dbname> -t <table> -c <dumpdir>
```

Parameter	Description
hostname	The endpoint of the ApsaraDB RDS for PostgreSQL instance. **Note** If your ECS instance connects to the ApsaraDB RDS for PostgreSQL instance by using an internal endpoint, make sure that the ECS and ApsaraDB RDS instances have the same network type. If both instances are of the VPC network type, make sure that both instances reside within the same VPC. For more information about how to view the internal endpoint, see View and modify the internal endpoint and port number.

Parameter	Description
username	The username of the privileged account of the ApsaraDB RDS for PostgreSQL instance.
port	The port number of the ApsaraDB RDS for PostgreSQL instance.
dbname	The name of the database whose data you want to restore.
table	The name of the table whose data you want to restore.
-c	`-c`: specifies to delete the database objects on which the table depends before data restoration. For more information, visit pg_restore.
dumpdir	The directory and name of the logical backup file to use.

Example:

```
pg_restore -h 'pgm-bpxxxxx.pg.rds.aliyuncs.com' -U test123 -p 3433 -d testdb2 -t products -c /tmp/testdb.dump
```

2. When `Password:` appears, enter the password of the privileged account of your ApsaraDB RDS instance and press the Enter key.

Restore the schema of a database with data excluded

1. Log on to the ECS instance or on-premises host that houses the logical backup file and run the following command to restore only the schema of a database:

```
pg_restore -h '<hostname>' -U <username> -p <port> -d <dbname> -s <dumpdir>
```

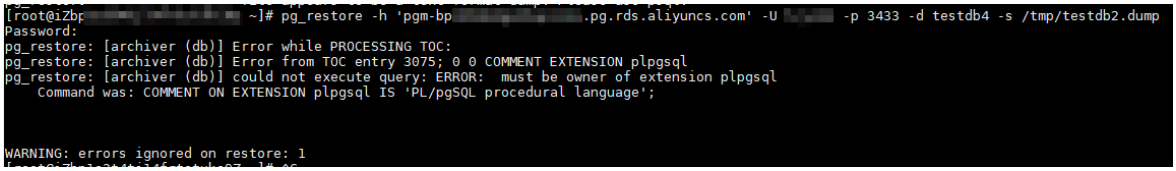
Parameter	Description
hostname	The endpoint of the ApsaraDB RDS for PostgreSQL instance. **Note** If your ECS instance connects to the ApsaraDB RDS for PostgreSQL instance by using an internal endpoint, make sure that the ECS and ApsaraDB RDS instances have the same network type. If both instances are of the VPC network type, make sure that both instances reside within the same VPC. For more information about how to view the internal endpoint, see View and modify the internal endpoint and port number.
username	The username of the privileged account of the ApsaraDB RDS for PostgreSQL instance.
port	The port number of the ApsaraDB RDS for PostgreSQL instance.
dbname	The name of the database whose schema you want to restore.
-s	`-s`: specifies to restore only the schema of the database. The data of the database is not restored. For more information, visit pg_restore.
dumpdir	The directory and name of the logical backup file to use.

Example:

```
pg_restore -h 'pgm-bpxxxxx.pg.rds.aliyuncs.com' -U test123 -p 3433 -d testdb4 -s /tmp/testdb2.dump
```

2. When `Password:` appears, enter the password of the privileged account of your ApsaraDB RDS instance and press the Enter key.

> **Note** You can ignore alerts generated by the embedded plpgsql plug-in.



10.15. Plug-ins

10.15.1. Plug-ins supported

This topic describes the plug-ins that are supported by ApsaraDB RDS for PostgreSQL and their available versions.

PostgreSQL 12

Plug-in	Version
btree_gin	1.3
btree_gist	1.5
citext	1.6
cube	1.4
dblink	1.2
dict_int	1
earthdistance	1.1
fuzzystrmatch	1.1
hstore	1.6
intagg	1.1
intarray	1.2
isn	1.2
ltree	1.1
pg_buffercache	1.3
pg_prewarm	1.2
pg_stat_statements	1.7
pg_trgm	1.4
pgcrypto	1.3

Plug-in	Version
pgrowlocks	1.2

10.15.2. Use mysql_fdw to read data from and write data to a MySQL database

This topic describes how to use the mysql_fdw plug-in of ApsaraDB RDS for PostgreSQL to read data from and write data to a database on an ApsaraDB RDS for MySQL instance or a self-managed MySQL database.

Prerequisites

- The instance runs PostgreSQL 10.
- Communication between your ApsaraDB RDS for PostgreSQL instance and the MySQL database is normal.

Context

PostgreSQL 9.6 and later support parallel computing. PostgreSQL 11 can use joins on up to a billion data records to complete queries in seconds. A number of users prefer to use PostgreSQL to build small-sized data warehouses and process highly concurrent access requests. PostgreSQL 13 is under development. It will support columnar storage engines that further improve analysis capabilities.

The mysql_fdw plug-in establishes a connection to synchronize data from a MySQL database to your ApsaraDB RDS for PostgreSQL instance.

Procedure

1. Log on to a database of your ApsaraDB RDS for PostgreSQL instance. For more information, see Connect to an ApsaraDB RDS for PostgreSQL instance.
2. Create the mysql_fdw plug-in.

   ```
   create extension mysql_fdw;
   ```

3. Define a MySQL server.

   ```
   CREATE SERVER <Name of the MySQL server>
   FOREIGN DATA WRAPPER mysql_fdw
   OPTIONS (host '<Endpoint used to connect to the MySQL server>', port '<Port used to connect to the MySQL server
   >');
   ```

   Example:

```
CREATE SERVER mysql_server
FOREIGN DATA WRAPPER mysql_fdw
OPTIONS (host 'rm-xxx.mysql.rds.aliyuncs.com', port '3306');
```

4. Map the MySQL server to an account created on your ApsaraDB RDS for PostgreSQL instance. Then, the account can be used to access data in the MySQL database on the MySQL server.

```
CREATE USER MAPPING FOR <Username of the account to which the MySQL server is mapped>
SERVER <Name of the MySQL server>
OPTIONS (username '<Username used to log on to the MySQL database>', password '<Password used to log on to the MySQL database>');
```

Example:

```
CREATE USER MAPPING FOR pgtest
SERVER mysql_server
OPTIONS (username 'mysqltest', password 'Test1234!') ;
```

5. Create a foreign MySQL table by using the account that you mapped to the MySQL server in the previous step.

> **Note** The field names in the foreign MySQL table must be the same as those in the table of the MySQL database. You can choose to create only the fields you want to query. For example, if the table in the MySQL database contains the ID, NAME, and AGE fields, you can create only the ID and NAME fields in the foreign MySQL table.

```
CREATE FOREIGN TABLE <Name of the foreign MySQL table> (<Name of Field 1> <Data type of Field 1>,<Name of Field 2> <Data type of Field 2>...) server <Name of the MySQL server> options (dbname '<Name of the MySQL database>', table_name '<Name of the table in the MySQL database>');
```

Example:

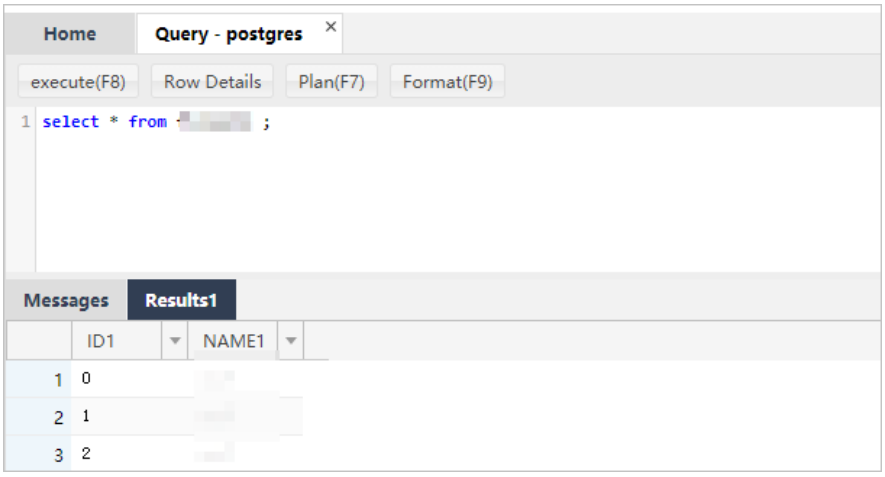
```
CREATE FOREIGN TABLE ft_test (id1 int, name1 text) server mysql_server options (dbname 'test123', table_name 'test');
```

What to do next

You can use the foreign MySQL table to test the performance of read and write operations on the MySQL database.

> **Note** Data can be written to the table in the MySQL database only when the table is assigned a primary key. If the table is not assigned a primary key, the following error is reported:
>
> ```
> ERROR:  first column of remote table must be unique for INSERT/UPDATE/DELETE operation.
> ```

```
select * from ft_test ;
insert into ft_test values (2,'abc');
insert into ft_test select generate_series(3,100),'abc';
select count(*) from ft_test ;
```



Run `postgres=> explain verbose select count(*) from ft_test;` to find out how the requests sent from your ApsaraDB RDS for PostgreSQL instance are executed to query data from the MySQL database. Command output:

```
                        QUERY PLAN
-----------------------------------------------------------------------------
 Aggregate  (cost=1027.50..1027.51 rows=1 width=8)
   Output: count(*)
   -> Foreign Scan on public.ft_test  (cost=25.00..1025.00 rows=1000 width=0)
      Output: id, info
      Remote server startup cost: 25
      Remote query: SELECT NULL FROM `test123`.`test`
(6 rows)
```

10.15.3. Use oss_fdw to read and write foreign data files

This topic describes how to use the oss_fdw plug-in to load data between Object Storage Service (OSS) and PostgreSQL or PPAS databases.

oss_fdw parameters

The oss_fdw plug-in uses a method similar to other Foreign Data Wrapper (FDW) interfaces to encapsulate foreign data stored in OSS. You can use oss_fdw to read data stored in OSS. This process is similar to reading data tables. oss_fdw provides unique parameters to connect and parse file data in OSS.

> **Note**
> - oss_fdw can read and write files of the following types in OSS: TXT and CSV files as well as GZIP-compressed TXT and CSV files.
> - The value of each parameter must be enclosed in double quotation marks (") and cannot contain unnecessary spaces.

CREATE SERVER parameters

- ossendpoint: the endpoint used to access OSS over the internal network, also known as the host.
- id oss: the AccessKey ID of the OSS account.
- key oss: the AccessKey secret of the OSS account.
- bucket: the bucket where the data you want to access is stored. You must create an OSS account before you specify this parameter.

The following fault tolerance parameters can be used for data import and export. If network connectivity is poor, you can adjust these parameters to ensure successful import and export.

- oss_connect_timeout: the connection timeout period. Default value: 10. Unit: seconds.
- oss_dns_cache_timeout: the DNS timeout period. Default value: 60. Unit: seconds.
- oss_speed_limit: the minimum data transmission rate. Default value: 1024. Unit: bytes/s.
- oss_speed_time: the maximum waiting period during which the data transmission rate is lower than the minimum value. Default value: 15. Unit: seconds.

If the default values of oss_speed_limit and oss_speed_time are used, a timeout error occurs when the transmission rate is lower than 1,024 bytes/s for 15 consecutive seconds.

CREATE FOREIGN TABLE parameters

- filepath: a file name that contains a path in OSS.
  - The file name specified by this parameter contains the directory name but not the bucket name.
  - This parameter matches multiple files in the corresponding path in OSS. You can load multiple files to a database.
  - You can import files that adhere to the filepath or filepath.x format to a database. The values of x must be consecutive numbers starting from 1.

    For example, among the files named filepath, filepath.1, filepath.2, filepath.3, and filepath.5, the first four files are matched and imported. The filepath.5 file is not imported.
- dir: the virtual file directory in OSS.
  - The specified directory must end with a forward slash (/).
  - All files (excluding subfolders and files in subfolders) in the virtual file directory specified by dir are matched and imported to a database.
- prefix: the prefix of the path name corresponding to the data file. The prefix does not support regular expressions. The prefix, filepath, and dir parameters are mutually exclusive. Therefore, only one of them can be specified at a time.
- format: the file format, which can only be CSV.
- encoding: the file data encoding format. It supports common PostgreSQL encoding formats, such as UTF-8.
- parse_errors: the fault-tolerant parsing mode. If an error occurs during the parsing process, the entire row of data is ignored.
- delimiter: the string used to delimit columns.
- quote: the quote character for files.
- escape: the escape character for files.
- null: sets the column matching the specified string to null. For example, null 'test' is used to set the value of the 'test' column to null.
- force_not_null: sets the value of a column to a non-null value. For example, force_not_null 'id' is used to set the value of the 'id' column to empty strings.
- compressiontype: the format of the files to be read or written in OSS.
  - none: The files are uncompressed. This is the default value.
  - gzip: The files are compressed in the GZIP format.
- compressionlevel: the degree to which data files written to OSS are compressed. Valid values: 1 to 9. Default value: 6.

Note

- You must specify filepath and dir in the OPTIONS parameter.
- You must specify filepath or dir.
- The export mode can only be dir.

Export mode parameters for CREATE FOREIGN TABLE

- oss_flush_block_size: the buffer size for the data written to OSS at a time. Default value: 32. Valid values: 1 to 128. Unit: MB.
- oss_file_max_size: the maximum size of a data file allowed to be written to OSS. If a data file reaches the maximum size, the remaining data is written to another data file. Default value: 1024. Valid values: 8 to 4000. Unit: MB.
- num_parallel_worker: the maximum number of threads that are allowed to run in parallel to compress the data written to OSS. Valid values: 1 to 8. Default value: 3.

Auxiliary functions

FUNCTION oss_fdw_list_file (relname text, schema text DEFAULT 'public')

- This function obtains the name and size of the OSS file that a foreign table matches.
- The file size is measured in bytes.

The following result is returned after `select * from oss_fdw_list_file('t_oss');` is executed:

```
        name         |  size
---------------------------------+-----------
 oss_test/test.gz.1 | 739698350
 oss_test/test.gz.2 | 739413041
 oss_test/test.gz.3 | 739562048
(3 rows)
```

Auxiliary features

oss_fdw.rds_read_one_file: In read mode, this feature is used to specify a file to match the foreign table. The foreign table matches only the specified file during data import.

Example: set oss_fdw.rds_read_one_file = 'oss_test/example16.csv.1';

The following result is returned after `set oss_fdw.rds_read_one_file = 'oss_test/test.gz.2';` and `select * from oss_fdw_list_file('t_oss');` are executed:

```
        name         |  size
---------------------------------+-----------
 oss_test/test.gz.2 | 739413041
(1 rows)
```

oss_fdw example

```
# Create the plug-in for a PostgreSQL database.
create extension oss_fdw; -- For a PPAS database, execute select rds_manage_extension('create','oss_fdw');
# Create a server.
CREATE SERVER ossserver FOREIGN DATA WRAPPER oss_fdw OPTIONS
   (host 'oss-cn-hangzhou.aliyuncs.com', id 'xxx', key 'xxx', bucket 'mybucket');
# Create an OSS foreign table.
CREATE FOREIGN TABLE ossexample
  (date text, time text, open float,
   high float, low float, volume int)
   SERVER ossserver
   OPTIONS ( filepath 'osstest/example.csv', delimiter ',' ,
     format 'csv', encoding 'utf8', PARSE_ERRORS '100');
# Create a table named example to which to import data.
create table example
     (date text, time text, open float,
      high float, low float, volume int);
# Load data from ossexample to example.
insert into example select * from ossexample;
# Result
# oss_fdw estimates the file size in OSS and formulates a query plan.
explain insert into example select * from ossexample;
                      QUERY PLAN
------------------------------------------------------------------------
 Insert on example  (cost=0.00..1.60 rows=6 width=92)
  ->  Foreign Scan on ossexample  (cost=0.00..1.60 rows=6 width=92)
      Foreign OssFile: osstest/example.csv.0
      Foreign OssFile Size: 728
(4 rows)
# Write the data in the example table to OSS.
insert into ossexample select * from example;
explain insert into ossexample select * from example;
                    QUERY PLAN
-------------------------------------------------------------------
 Insert on ossexample  (cost=0.00..16.60 rows=660 width=92)
  ->  Seq Scan on example  (cost=0.00..16.60 rows=660 width=92)
(2 rows)
```

Additional considerations

- oss_fdw is a foreign table plug-in developed based on the PostgreSQL FOREIGN TABLE framework.
- The data import performance varies based on the PostgreSQL cluster resources (CPU, I/O, and memory) and OSS.
- To ensure data import performance, the ApsaraDB RDS for PostgreSQL instance must be in the same region as the OSS bucket.

ID and key encryption

If the id and key parameters for CREATE SERVER are not encrypted, the `select * from pg_foreign_server` statement execution result displays the information. Your AccessKey ID and AccessKey secret are exposed. You can use symmetric encryption to hide your AccessKey ID and AccessKey secret. Use different AccessKey pairs for different instances to further protect your information. However, to avoid incompatibility with earlier versions, do not add data types as you would in Greenplum.

Encrypted information:

```
postgres=# select * from pg_foreign_server ;
 srvname  | srvowner | srvfdw | srvtype | srvversion | srvacl |                                                     srvoptions
-----------+----------+--------+---------+------------+--------+---------------------------------------------------------------------------------------------------
-------------------------------------
----------------------------------
 ossserver |     10 |  16390 |         |            |        | {host=oss-cn-hangzhou-zmf.aliyuncs.com,id=MD5xxxxxxxx,key=MD5xxxxxxxx,bucket=067862}
```

The encrypted information is preceded by the MD5 hash value. The remainder of the total length divided by 8 is 3. Therefore, encryption is not performed again when the exported data is imported. You cannot create an AccessKey pair that is preceded by MD5.

10.16. Use Pgpool for read/write splitting in ApsaraDB RDS for PostgreSQL

This topic describes how to use the Pgpool tool of PostgreSQL installed on an ECS instance to implement read/write splitting for your primary and read-only ApsaraDB RDS for PostgreSQL instances.

Context

If you do not use Pgpool to ensure high availability, Pgpool is stateless. The decrease in performance can be ignored. Additionally, Pgpool supports horizontal scaling of your database system. You can use Pgpool and the high availability architecture of ApsaraDB RDS for PostgreSQL to implement read/write splitting.

Set up a test environment

If you have purchased a primary ApsaraDB RDS instance that runs PostgreSQL 10 and have attached read-only instances to the primary instance, you need only to install Pgpool . For more information, see Create an instance and Create a read-only ApsaraDB RDS for PostgreSQL instance. After you install Pgpool, go to Configure Pgpool.

1. Run the `vi /etc/sysctl.conf` command to open the sysctl.conf file. Modify the following configurations:

```
# add by digoal.zhou
fs.aio-max-nr = 1048576
fs.file-max = 76724600
# Optional. Set the kernel.core_pattern parameter to /data01/corefiles/core_%e_%u_%t_%s.%p.
# The /data01/corefiles directory that is used to store core dumps is created with the 777 permission before testing.
If a symbolic link is used, change the directory to 777.
kernel.sem = 4096 2147483647 2147483646 512000
# Specify the semaphore. You can run the ipcs -l or -u command to obtain the semaphore count. Each group of 16 processes requires a semaphore with a count of 17.
kernel.shmall = 107374182
# Specify the total size of shared memory segments. Recommended value: 80% of the memory capacity. Unit: pages.

kernel.shmmax = 274877906944
# Specify the maximum size of a single shared memory segment. Recommended value: 50% of the memory capacity.
Unit: bytes. In PostgreSQL versions later than 9.2, the use of shared memory significantly drops.
kernel.shmmni = 819200
# Specify the total number of shared memory segments that can be generated. At least two shared memory segments must be generated within each PostgreSQL cluster.
net.core.netdev_max_backlog = 10000
net.core.rmem_default = 262144
# The default setting of the socket receive buffer in bytes.
net.core.rmem_max = 4194304
# The maximum receive socket buffer size in bytes
net.core.wmem_default = 262144
# The default setting (in bytes) of the socket send buffer.
net.core.wmem_max = 4194304
```

```
# The maximum send socket buffer size in bytes.
net.core.somaxconn = 4096
net.ipv4.tcp_max_syn_backlog = 4096
net.ipv4.tcp_keepalive_intvl = 20
net.ipv4.tcp_keepalive_probes = 3
net.ipv4.tcp_keepalive_time = 60
net.ipv4.tcp_mem = 8388608 12582912 16777216
net.ipv4.tcp_fin_timeout = 5
net.ipv4.tcp_synack_retries = 2
net.ipv4.tcp_syncookies = 1
# Enable SYN cookies. If an SYN waiting queue overflows, you can enable SYN cookies to defend against a small number of SYN attacks.
net.ipv4.tcp_timestamps = 1
# Reduce the time after which a network socket enters the TIME-WAIT state.
net.ipv4.tcp_tw_recycle = 0
# If you set this parameter to 1 to enable the recycle function, network sockets in the TIME-WAIT state over TCP connections are recycled. However, if network address translation (NAT) is used, TCP connections may fail. We recommend that you set this parameter to 0 on the database server.
net.ipv4.tcp_tw_reuse = 1
# Enable the reuse function. This function enables network sockets in the TIME-WAIT state to be reused over new TCP connections.
net.ipv4.tcp_max_tw_buckets = 262144
net.ipv4.tcp_rmem = 8192 87380 16777216
net.ipv4.tcp_wmem = 8192 65536 16777216
net.nf_conntrack_max = 1200000
net.netfilter.nf_conntrack_max = 1200000
vm.dirty_background_bytes = 409600000
# If the size of dirty pages reaches the specified limit, a background scheduling process (for example, pdflush) is invoked to flush the dirty pages to disks. These are the pages that are generated n seconds earlier. The value of n is calculated by using the following formula: n = Value of the dirty_expire_centisecs parameter/100.
# The default limit is 10% of the memory capacity. If the memory capacity is large, we recommend that you specify the limit in bytes.
vm.dirty_expire_centisecs = 3000
# Specify the maximum period to retain dirty pages. Dirty pages are flushed to disks after the time period specified by this parameter elapses. The value 3000 indicates 30 seconds.
vm.dirty_ratio = 95
# The processes that users call to write data onto disks must actively flush dirty pages to disks. This applies when the background scheduling process to flush dirty pages is slow and the size of dirty pages exceeds 95% of the memory capacity. These processes include fsync and fdatasync.
# Set this parameter properly to prevent user-called processes from flushing dirty pages to disks. This allows you to create multiple ApsaraDB RDS instances on a single server and use control groups to limit the input/output operations per second (IOPS) per instance.
vm.dirty_writeback_centisecs = 100
# Specify the time interval at which the background scheduling process (such as pdflush) flushes dirty pages to disks. The value 100 indicates 1 second.
vm.swappiness = 0
# Disable the swap function.
vm.mmap_min_addr = 65536
vm.overcommit_memory = 0
# Specify whether you can allocate more memory space than the physical host has available. If you set this parameter to 1, the system always considers the available memory space sufficient. If the memory capacity provided in the test environment is low, we recommend that you set this parameter to 1.
vm.overcommit_ratio = 90
# Specify the memory capacity that can be allocated when the overcommit_memory parameter is set to 2.
vm.swappiness = 0
# Disable the swap function.
vm.zone_reclaim_mode = 0
# Disable non-uniform memory access (NUMA). You can also disable NUMA in the vmlinux file.
net.ipv4.ip_local_port_range = 40000 65535
# Specify the range of TCP or UDP port numbers for the physical host to allocate.
```

```
fs.nr_open=20480000
# Specify the maximum number of file handles that a single process can open.
# Take note of the following parameters:
#vm.extra_free_kbytes = 4096000  # If the physical host provides a low memory capacity, do not specify a large value such as 4096000. If you specify a large value, the physical host may not start.
#vm.min_free_kbytes = 6291456  # We recommend that you increase the value of the vm.min_free_kbytes parameter by 1 GB for every 32 GB of memory.
# If the physical host does not provide much memory, we recommend that you do not configure vm.extra_free_kbytes and vm.min_free_kbytes.
# vm.nr_hugepages = 66536
# If the size of the shared buffer exceeds 64 GB, we recommend that you use huge pages. You can specify the page size by setting the Hugepagesize parameter in the /proc/meminfo file.
#vm.lowmem_reserve_ratio = 1 1 1
# If the memory capacity exceeds 64 GB, we recommend that you set this parameter. Otherwise, we recommend that you retain the default value 256 256 32.
```

2. Run the `vi /etc/security/limits.conf` command to open the limits.conf file. Modify the following configurations:

```
* soft   nofile  1024000
* hard   nofile  1024000
* soft   nproc  unlimited
* hard   nproc  unlimited
* soft   core   unlimited
* hard   core   unlimited
* soft   memlock unlimited
* hard   memlock unlimited
# Comment out the other parameters in the limits.conf file.
# Comment out the /etc/security/limits.d/20-nproc.conf file.
```

3. Run the following commands to open the rc.local file:

```
chmod +x /etc/rc.local
vi /etc/rc.local
```

Modify the following configurations to disable transparent huge pages, configure huge pages, and start PostgreSQL:

```
# Disable transparent huge pages.
if test -f /sys/kernel/mm/transparent_hugepage/enabled; then
  echo never > /sys/kernel/mm/transparent_hugepage/enabled
fi
# Configure huge pages for two instances. Each instance has a shared buffer of 16 GB.
sysctl -w vm.nr_hugepages=17000
# Start the two instances.
su - postgres -c "pg_ctl start -D /data01/pg12_3389/pg_root"
su - postgres -c "pg_ctl start -D /data01/pg12_8002/pg_root"
```

4. Create a file system.

> **Warning** If you use a new disk, you must verify that the new disk belongs to the vdb partition instead of the vda partition. If the new disk belongs to the vda partition, data may be deleted from the new disk.

```
parted -a optimal -s /dev/vdb mklabel gpt mkpart primary 1MiB 100%FREE
mkfs.ext4 /dev/vdb1 -m 0 -O extent,uninit_bg -E lazy_itable_init=1 -b 4096 -T largefile -L vdb1
vi /etc/fstab
LABEL=vdb1 /data01 ext4 defaults,noatime,nodiratime,nodelalloc,barrier=0,data=writeback 0 0
mkdir /data01
mount -a
```

5. Start the irqbalance command line tool.

```
systemctl status irqbalance
systemctl enable irqbalance
systemctl start irqbalance
systemctl status irqbalance
```

6. Install PostgreSQL 10 and Pgpool.

```
yum install -y https://dl.fedoraproject.org/pub/epel/epel-release-latest-7.noarch.rpm
yum install -y https://download.postgresql.org/pub/repos/yum/reporpms/EL-7-x86_64/pgdg-redhat-repo-latest.noarch.rpm
yum search all postgresql
yum search all pgpool
yum install -y postgresql12*
yum install -y pgpool-II-12-extensions
```

7. Initialize the data directory of your database system.

```
mkdir /data01/pg12_3389
chown postgres:postgres /data01/pg12_3389
```

8. Configure environment variables for the postgres user.

```
su - postgres
vi .bash_profile
```

Append the following parameters to the environment variables:

```
export PS1="$USER@`/bin/hostname -s`-> "
export PGPORT=3389
export PGDATA=/data01/pg12_$PGPORT/pg_root
export LANG=en_US.utf8
export PGHOME=/usr/pgsql-12
export LD_LIBRARY_PATH=$PGHOME/lib:/lib64:/usr/lib64:/usr/local/lib64:/lib:/usr/lib:/usr/local/lib:$LD_LIBRARY_PATH
export DATE=`date +"%Y%m%d%H%M"`
export PATH=$PGHOME/bin:$PATH:.
export MANPATH=$PGHOME/share/man:$MANPATH
export PGHOST=$PGDATA
export PGUSER=postgres
export PGDATABASE=db1
alias rm='rm -i'
alias ll='ls -lh'
unalias vi
```

9. Initialize your primary ApsaraDB RDS instance.

```
initdb -D $PGDATA -U postgres -E UTF8 --lc-collate=C --lc-ctype=en_US.utf8
```

10. Modify the postgresql.conf file.

```
listen_addresses = '0.0.0.0'
port = 3389
max_connections = 1500
superuser_reserved_connections = 13
unix_socket_directories = '., /var/run/postgresql, /tmp'
tcp_keepalives_idle = 60
tcp_keepalives_interval = 10
tcp_keepalives_count = 10
shared_buffers = 16GB
huge_pages = on
work_mem = 8MB
```

```
work_mem = 8MB
maintenance_work_mem = 1GB
dynamic_shared_memory_type = posix
vacuum_cost_delay = 0
bgwriter_delay = 10ms
bgwriter_lru_maxpages = 1000
bgwriter_lru_multiplier = 10.0
bgwriter_flush_after = 512kB
effective_io_concurrency = 0
max_worker_processes = 128
max_parallel_maintenance_workers = 3
max_parallel_workers_per_gather = 4
parallel_leader_participation = off
max_parallel_workers = 8
backend_flush_after = 256
wal_level = replica
synchronous_commit = off

lc_monetary = 'en_US.utf8'
lc_numeric = 'en_US.utf8'
lc_time = 'en_US.utf8'
default_text_search_config = 'pg_catalog.english'
```

11. Modify the pg_hba.conf file.

> **Note** Pgpool-II is installed on the same ECS instance as the database server where PostgreSQL resides. If you specify the 127.0.0.1 IP address in the pg_hba.conf file, you must enter the correct password to ensure a successful logon.

```
# "local" is for Unix domain socket connections only
local   all         all                               trust
# IPv4 local connections:
host    all         all         127.0.0.1/32          md5
# IPv6 local connections:
host    all         all         ::1/128               trust
# Allow replication connections from localhost, by a user with the
# replication privilege.
local   replication     all                           trust
host    replication     all         127.0.0.1/32      trust
host    replication     all         ::1/128           trust
host db123 digoal 0.0.0.0/0 md5
```

12. Execute a statement in the database to create a user authorized with streaming replication permissions. Example:

```
create role rep123 login replication encrypted password 'xxxxxxx';
```

13. Execute statements in the database to create a user and authorize it to manage your ApsaraDB RDS instances. Example:

```
create role digoal login encrypted password 'xxxxxxx';
create database db123 owner digoal;
```

14. Create a user who is authorized to check the health heartbeats between Pgpool and your read-only ApsaraDB RDS instances. With the parameters of Pgpool properly configured, this user can check the write-ahead logging (WAL) replay latency on each read-only ApsaraDB RDS instance. Example:

```
create role nobody login encrypted password 'xxxxxxx';
```

Create a secondary ApsaraDB RDS instance

To simplify the test procedure, perform the following steps to create a secondary ApsaraDB RDS instance on the same ECS instance as your primary ApsaraDB RDS instance:

1. Use the pg_basebackup tool to create a secondary ApsaraDB RDS instance.

```
pg_basebackup -D /data01/pg12_8002/pg_root -F p --checkpoint=fast -P -h 127.0.0.1 -p 3389 -U rep123
```

2. Run the following commands to open the postgresql.conf file of the secondary ApsaraDB RDS instance:

```
cd /data01/pg12_8002/pg_root
vi postgresql.conf
```

Modify the following configurations:

```
# The secondary ApsaraDB RDS instance has the following configurations different from the primary ApsaraDB RDS i
nstance:
port = 8002
primary_conninfo = 'hostaddr=127.0.0.1 port=3389 user=rep123' # You do not need to set the password. This is bec
ause trust relationships are configured on the primary ApsaraDB RDS instance.
hot_standby = on
wal_receiver_status_interval = 1s
wal_receiver_timeout = 10s
recovery_target_timeline = 'latest'
```

3. Configure the standby.signal file of the secondary ApsaraDB RDS instance.

```
cd /data01/pg12_8002/pg_root
touch standby.signal
```

4. Execute the `SELECT * FROM pg_stat_replication ;` statement in the database to check whether data is properly synchronized between the primary and secondary ApsaraDB RDS instances. The following output is returned:

```
-[ RECORD 1 ]----+------------------------------
pid          | 21065
usesysid     | 10
usename      | postgres
application_name | walreceiver
client_addr  | 127.0.0.1

replay_lag   |
sync_priority  | 0
sync_state   | async
reply_time   | 2020-02-29 01:32:40.635183+08
```

Configure Pgpool

1. Query the location where Pgpool is installed.

```
rpm -qa|grep pgpool
pgpool-II-12-extensions-4.1.1-1.rhel7.x86_64
pgpool-II-12-4.1.1-1.rhel7.x86_64
rpm -ql pgpool-II-12-4.1.1
```

2. Run the following commands to open the pgpool.conf file:

```
cd /etc/pgpool-II-12/
cp pgpool.conf.sample-stream pgpool.conf
vi pgpool.conf
```

Modify the following configurations:

```
listen_addresses = '0.0.0.0'
port = 8001
socket_dir = '/tmp'
reserved_connections = 0
pcp_listen_addresses = ''
pcp_port = 9898
pcp_socket_dir = '/tmp'
# - Backend Connection Settings -
backend_hostname0 = '127.0.0.1'
                    # Host name or IP address to connect to for backend 0
backend_port0 = 3389
                    # Port number for backend 0
backend_weight0 = 1
                    # Weight for backend 0 (only in load balancing mode)
```

```
backend_data_directory0 = '/data01/pg12_3389/pg_root'
                # Data directory for backend 0
backend_flag0 = 'ALWAYS_MASTER'
                # Controls various backend behavior
                # ALLOW_TO_FAILOVER, DISALLOW_TO_FAILOVER
                # or ALWAYS_MASTER
backend_application_name0 = 'server0'
                # walsender's application_name, used for "show pool_nodes" command
backend_hostname1 = '127.0.0.1'
backend_port1 = 8002
backend_weight1 = 1
backend_data_directory1 = '/data01/pg12_8002/pg_root'
backend_flag1 = 'DISALLOW_TO_FAILOVER'
backend_application_name1 = 'server1'
# - Authentication -

                # error and disconnect the session.
relcache_expire = 0  # After the configuration file is restructured, we recommend that you set this parameter to 1, reload the configuration file, and then set this parameter to 0 again. You can also set this parameter to a specific point in time.
                # Life time of relation cache in seconds.
                # 0 means no cache expiration(the default).
                # The relation cache is used for cache the
                # query result against PostgreSQL system
                # catalog to obtain various information
                # including table structures or if it's a
                # temporary table or not. The cache is
                # maintained in a pgpool child local memory
                # and being kept as long as it survives.
                # If someone modify the table by using
                # ALTER TABLE or some such, the relcache is
                # not consistent anymore.
                # For this purpose, cache_expiration
                # controls the life time of the cache.
relcache_size = 8192
                # Number of relation cache
                # entry. If you see frequently:
                # "pool_search_relcache: cache replacement happend"
                # in the pgpool log, you might want to increate this number.
```

3. Run the `cd /etc/pgpool-II-12` command to configure the pool_passwd file.

   > **Note** If you connect to your ApsaraDB RDS instances by using Pgpool, you must configure the pool_passwd file. This is because Pgpool supports the authentication protocol of PostgreSQL.

   ```
   # Run the following command:
   #pg_md5 --md5auth --username=username password
   # Generate the passwords of the digoal and nobody users. The passwords are automatically written into the pool_passwd file.
   pg_md5 --md5auth --username=digoal "xxxxxxx"
   pg_md5 --md5auth --username=nobody "xxxxxxx"
   ```

4. Use the system to automatically generate the pool_passwd file.

   ```
   cd /etc/pgpool-II-12
   cat pool_passwd
   ```

5. Run the following commands to configure the pgpool_hba file:

   ```
   cd /etc/pgpool-II-12
   cp pool_hba.conf.sample pool_hba.conf
   vi pool_hba.conf
   ```

Configure the following parameters:

```
host all all 0.0.0.0/0 md5
```

6. Configure the pcp.conf file.

> **Note** The pcp.conf file is used to manage the users and passwords of Pgpool. It is not related to the users and passwords of your ApsaraDB RDS instances.

```
cd /etc/pgpool-II-12
# pg_md5 abc  # In this command, you set the password to abc and encrypt it by using the MD5 encryption algorithm.
900150983cd24fb0d6963f7d28e17f72
cp pcp.conf.sample pcp.conf
vi pcp.conf
# USERID:MD5PASSWD
manage:900150983cd24fb0d6963f7d28e17f72  # In this command, the manage user is used to manage PCP.
```

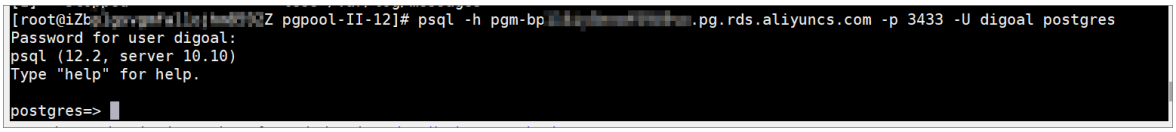
7. Start Pgpool.

```
cd /etc/pgpool-II-12
pgpool -f ./pgpool.conf -a ./pool_hba.conf -F ./pcp.conf
```

> **Note** If you want to view the logs of Pgpool, run the following command:
>
> ```
> less /var/log/messages
> ```

8. Use Pgpool to connect to your ApsaraDB RDS instances.

```
psql -h 127.0.0.1 -p 8001 -U digoal postgres
```



FAQ

- Q: How do I test whether read/write splitting is enabled?

  A: You can connect to your ApsaraDB RDS instances by using Pgpool and call the pg_is_in_recovery() function. Then, close the connection, establish a connection again, and call the pg_is_in_recovery() function again. If you receive a value of false and then a value of true, Pgpool routes requests to your primary ApsaraDB RDS instance and then to your read-only ApsaraDB RDS instances, and read/write splitting is enabled.

- Q: Does Pgpool increase the latency?

  A: Pgpool increases the latency slightly. In the test environment you set up in this topic, the latency increases by about 0.12 milliseconds.

- Q: How does Pgpool check the latency and health on my read-only ApsaraDB RDS instances?

- A: If the WAL replay latency on a read-only ApsaraDB RDS instance exceeds the specified limit, Pgpool stops routing SQL requests to the read-only instance. Pgpool resumes routing SQL requests to the read-only instance only after it detects that the WAL replay latency on the read-only instance falls below the specified limit.

  > **Note** Connect to your primary ApsaraDB RDS instance and query the location where the current WAL data record is written. This location is referred to as log sequence number (LSN) 1. Then, connect to a read-only ApsaraDB RDS instance and query the location where the current WAL data record is replayed. This location is referred to as LSN 2. You can obtain the number of bytes between LSN 1 and LSN 2. This number indicates the latency.

- Pgpool monitors the health of your read-only ApsaraDB RDS instances. If a read-only instance is unhealthy, Pgpool stops routing requests to the read-only instance.

- Q: How do I stop Pgpool and reload the configuration of Pgpool?

  A: Run the `pgpool --help` command to obtain more information about the commands used in Pgpool. Example:

  ```
  cd /etc/pgpool-II-12
  pgpool -f ./pgpool.conf -m fast stop
  ```

- Q: How do I configure Pgpool if more than one read-only ApsaraDB RDS instance is attached to my primary ApsaraDB RDS instance?

  A: Add the configurations of all the attached read-only ApsaraDB RDS instances to the pgpool.conf file. Example:

  ```
  backend_hostname1 = 'xx.xx.xxx.xx'
  backend_port1 = 8002
  backend_weight1 = 1
  backend_data_directory1 = '/data01/pg12_8002/pg_root'
  backend_flag1 = 'DISALLOW_TO_FAILOVER'
  backend_application_name1 = 'server1'
  backend_hostname2 = 'xx.xx.xx.xx'
  backend_port1 = 8002
  backend_weight1 = 1
  backend_data_directory1 = '/data01/pg12_8002/pg_root'
  backend_flag1 = 'DISALLOW_TO_FAILOVER'
  backend_application_name1 = 'server1'
  ```

- Q: How do I use pcp commands to view the status of my read-only ApsaraDB RDS instances?

  A: To obtain the status of your read-only ApsaraDB RDS instances by using pcp commands, run the following command:

  ```
  # pcp_node_info -U manage -h /tmp -p 9898 -n 1 -v
  Password: # Enter the password.
  Hostname           : 127.0.0.1
  Port               : 8002
  Status             : 2
  Weight             : 0.500000
  Status Name        : up
  Role               : standby
  Replication Delay  : 0
  Replication State  :
  Replication Sync State :
  Last Status Change  : 2020-02-29 00:20:29
  ```

- Q: Which listening ports are used by Pgpool for read/write splitting?

  A: The following listening ports are used by Pgpool for read/write splitting:

- Primary ApsaraDB RDS instance: Port 3389
- Secondary ApsaraDB RDS instance: Port 8002
- Pgpool: Port 8001
- PCP: Port 9898

10.17. Use ShardingSphere to develop ApsaraDB RDS for PostgreSQL

ShardingSphere is an open source ecosystem that consists of a set of distributed database middleware solutions.

Prerequisites

All PostgreSQL versions used with ApsaraDB RDS support ShardingSphere.

Context

ApsaraDB RDS for PostgreSQL supports database-integrated sharding plug-ins (such as Citus, Postgres-XC, and AntDB) and massively parallel processing (MPP) products. It also supports sharding middleware products that are similar to those widely used in MySQL, such as ShardingSphere.

ShardingSphere is suitable for services that run in databases with thorough, well-organized logical sharding. It offers the following features:

- Data sharding
  - Database and table sharding
  - Read/write splitting
  - Sharding strategy customization
  - Decentralized distributed primary key
- Distributed transaction
  - Unified transaction API
  - XA transaction
  - BASE transaction
- Database orchestration
  - Dynamic configuration
  - Orchestration and governance
  - Data encryption
  - Tracing and observability
  - Elastic scaling out (planning)

For more information, visit the ShardingSphere documentation.

ShardingSphere products

ShardingSphere includes three independent products. You can choose the product that best suits your business requirements. The following table describes these products.

Parameter	Sharding-JDBC	Sharding-Proxy	Sharding-Sidecar
Supported database engine	All JDBC-compatible database engines such as MySQL, PostgreSQL, Oracle, and SQL Server	MySQL and PostgreSQL	MySQL and PostgreSQL

Parameter	Sharding-JDBC	Sharding-Proxy	Sharding-Sidecar
Connections consumed	High	Low	High
Supported heterogeneous language	Java	All	All
Performance	Low consumption	Moderate consumption	Low consumption
Decentralized	Yes	No	Yes
Stateless API	No	Yes	No

Prepare configuration templates

1. On your ECS instance, run the following command to go to the directory where configuration templates are stored. The directory is under the root directory in this example.

   ```
   cd /root/apache-shardingsphere-incubating-4.0.0-sharding-proxy-bin/conf
   ```

2. Run the `ll` command to view all files stored in the directory: Command output:

   ```
   total 24
   -rw-r--r-- 1 501 games 3019 Jul 30  2019 config-encrypt.yaml
   -rw-r--r-- 1 501 games 3582 Apr 22  2019 config-master_slave.yaml
   -rw-r--r-- 1 501 games 4278 Apr 22  2019 config-sharding.yaml
   -rw-r--r-- 1 501 games 1918 Jul 30  2019 server.yaml
   ```

   > **Note**
   > - config-encrypt.yaml: the data encryption configuration file.
   > - config-master_slave.yaml: the read/write splitting configuration file.
   > - config-sharding.yaml: the data sharding configuration file.
   > - server.yaml: the common configuration file.

3. Modify the configuration files.

Note For more information about the configuration files, visit the ShardingSphere documentation. In this example, the data sharding and common configuration files are used.

- Example of a data sharding configuration file:

```
schemaName: # The name of the logical data source.
dataSources: # The configuration of the data source. You can configure more than one data source by using the data_source_name variable.
 <data_source_name>: # You do not need to configure a database connection pool. This is different in Sharding-JDBC.
   url: # The URL used to connect to your database.
   username: # The username used to log on to the database.
   password: # The password used to log on to the database.
   connectionTimeoutMilliseconds: 30000 # The connection timeout period in milliseconds.
   idleTimeoutMilliseconds: 60000 # The idle-connection reclaiming timeout period in milliseconds.
   maxLifetimeMilliseconds: 1800000 # The maximum connection time to live (TTL) in milliseconds.
   maxPoolSize: 65 # The maximum number of connections allowed.
shardingRule: # You do not need to configure a sharding rule, because it is the same in Sharding-JDBC.
```

- Example of a common configuration file:

```
Proxy properties
# You do not need to configure proxy properties that are the same in Sharding-JDBC
props:
 acceptor.size: # The number of worker threads that receive requests from the client. The default number is equal to the number of CPU cores multiplied by 2.
 proxy.transaction.type: # The type of transaction processed by the proxy. Valid values: LOCAL | XA | BASE. Default value: LOCAL. Value XA specifies to use Atomikos as the transaction manager. Value BASE specifies to copy the .jar package that implements the ShardingTransactionManager operation to the lib directory.
 proxy.opentracing.enabled: # Specifies whether to enable link tracing. Link tracing is disabled by default.
 check.table.metadata.enabled: # Specifies whether to check the consistency of metadata among sharding tables during startup. Default value: false.
 proxy.frontend.flush.threshold: # The number of packets returned in a batch during a complex query.
Permission verification
This part of the configuration is used to verify your permissions when you attempt to log on to Sharding-Proxy. After you configure the username, password, and authorized databases, you must use the correct username and password to log on to Sharding-Proxy from the authorized databases.
authentication:
 users:
   root: # The username of the root user.
     password: root# The password of the root user.
   sharding: # The username of the sharding user.
     password: sharding# The password of the sharding user.
     authorizedSchemas: sharding_db, masterslave_db # The databases in which the specified user is authorized. If you want to specify more than one database, separate them with commas (,). You are granted the permissions of the root user by default. This way, you can access all databases.
```

Set up a test environment

- On your ECS instance, install Java.

```
yum install -y java
```

- Configure an ApsaraDB RDS instance that runs PostgreSQL 10.
  - Create an account with username r1.
  - Set the password of the account to "PW123321!".

- Create the following databases whose owners are user r1: db0, db1, db2, and db3.
- Add the IP address of your ECS instance to an IP address whitelist of the ApsaraDB RDS for PostgreSQL instance.

> **Note**
> - For more information about how to create an ApsaraDB RDS for PostgreSQL instance, database, and account, see Create an instance and Create a database and an account.
> - For more information about how to configure an IP address whitelist, see Configure an IP address whitelist.

- Run `vi /root/apache-shardingsphere-incubating-4.0.0-sharding-proxy-bin/conf/server.yaml` to configure the following common configuration file:

```
authentication:
 users:
  r1:
   password: PW123321!
   authorizedSchemas: db0,db1,db2,db3
props:
 executor.size: 16
 sql.show: false
```

Test horizontal sharding

1. Run `vi /root/apache-shardingsphere-incubating-4.0.0-sharding-proxy-bin/conf/config-sharding.yaml` to modify the following data sharding configuration file:

```
schemaName: sdb
dataSources:
 db0:
  url: jdbc:postgresql://pgm-bpxxxxx.pg.rds.aliyuncs.com:1433/db0
  username: r1
  password: PW123321!
  connectionTimeoutMilliseconds: 30000
  idleTimeoutMilliseconds: 60000
  maxLifetimeMilliseconds: 1800000
  maxPoolSize: 65
 db1:
  url: jdbc:postgresql://pgm-bpxxxxx.pg.rds.aliyuncs.com:1433/db1
  username: r1
  password: PW123321!
  connectionTimeoutMilliseconds: 30000
  idleTimeoutMilliseconds: 60000
  maxLifetimeMilliseconds: 1800000
  maxPoolSize: 65
 db2:
  url: jdbc:postgresql://pgm-bpxxxxx.pg.rds.aliyuncs.com:1433/db2
  username: r1
  password: PW123321!
  connectionTimeoutMilliseconds: 30000
  idleTimeoutMilliseconds: 60000
  maxLifetimeMilliseconds: 1800000
  maxPoolSize: 65
 db3:
  url: jdbc:postgresql://pgm-bpxxxxx.pg.rds.aliyuncs.com:1433/db3
  username: r1
  password: PW123321!
  connectionTimeoutMilliseconds: 30000
```

```
  idleTimeoutMilliseconds: 60000
  maxLifetimeMilliseconds: 1800000
  maxPoolSize: 65
shardingRule:
 tables:
  t_order:
   actualDataNodes: db${0..3}.t_order${0..7}
   databaseStrategy:
    inline:
     shardingColumn: user_id
     algorithmExpression: db${user_id % 4}
   tableStrategy:
    inline:
     shardingColumn: order_id
     algorithmExpression: t_order${order_id % 8}
   keyGenerator:
    type: SNOWFLAKE
    column: order_id
  t_order_item:
   actualDataNodes: db${0..3}.t_order_item${0..7}
   databaseStrategy:
    inline:
     shardingColumn: user_id
     algorithmExpression: db${user_id % 4}
   tableStrategy:
    inline:
     shardingColumn: order_id
     algorithmExpression: t_order_item${order_id % 8}
   keyGenerator:
    type: SNOWFLAKE
    column: order_item_id
 bindingTables:
  - t_order,t_order_item
 defaultTableStrategy:
  none:
```

2. Start ShardingSphere and listen to Port 8001.

```
cd /root/apache-shardingsphere-incubating-4.0.0-sharding-proxy-bin/bin/
./start.sh 8001
```

3. Connect to the destination database.

```
psql -h 127.0.0.1 -p 8001 -U r1 sdb
```

4. Create a table.

```
create table t_order(order_id int8 primary key, user_id int8, info text, c1 int, crt_time timestamp);
create table t_order_item(order_item_id int8 primary key, order_id int8, user_id int8, info text, c1 int, c2 int, c3 int, c4 int, c5 int, crt_time timestamp);
```

> **Note** When you create a table, the system creates horizontal shards in the destination database based on the sharding strategy that you specify.

FAQ

- If you want to view the SQL parsing and routing statements used in ShardingSphere, run `vi /root/apache-shardingsphere-incubating-4.0.0-sharding-proxy-bin/conf/server.yaml`.

```
 authentication:
 users:
  r1:
   password: PW123321!
   authorizedSchemas: db0,db1,db2,db3
props:
 executor.size: 16
 sql.show: true # Specifies to log parsed SQL statements.
```

- If you want to test writes and queries, run the following commands:

```
insert into t_order (user_id, info, c1, crt_time) values (0,'a',1,now());
insert into t_order (user_id, info, c1, crt_time) values (1,'b',2,now());
insert into t_order (user_id, info, c1, crt_time) values (2,'c',3,now());
insert into t_order (user_id, info, c1, crt_time) values (3,'c',4,now());
select * from t_order;
```

  The following result is returned in this example:

```
    order_id     | user_id | info | c1 |       crt_time
--------------------+---------+------+----+----------------------------
 433352561047633921 |       0 | a    |  1 | 2020-02-09 19:48:21.856555
 433352585668198400 |       1 | b    |  2 | 2020-02-09 19:48:27.726815
 433352610813050881 |       2 | c    |  3 | 2020-02-09 19:48:33.721754
 433352628370407424 |       3 | c    |  4 | 2020-02-09 19:48:37.907683
(4 rows)
```

- If you want to view ShardingSphere logs, run the following command:

```
/root/apache-shardingsphere-incubating-4.0.0-sharding-proxy-bin/logs/stdout.log
```

- If you want to use pgbench for stress testing, run the following commands:

```
vi test.sql
\set user_id random(1,100000000)
\set order_id random(1,2000000000)
\set order_item_id random(1,2000000000)
insert into t_order (user_id, order_id, info, c1 , crt_time) values (:user_id, :order_id,random()::text, random()*1000, now()) on conflict (order_id) do update set info=excluded.info,c1=excluded.c1,crt_time=excluded.crt_time;
insert into t_order_item (order_item_id, user_id, order_id, info, c1,c2,c3,c4,c5,crt_time) values (:order_item_id, :user_id,:order_id,random()::text, random()*1000,random()*1000,random()*1000,random()*1000,random()*1000, now()) on conflict(order_item_id) do nothing;
pgbench -M simple -n -r -P 1 -f ./test.sql -c 24 -j 24  -h 127.0.0.1 -p 8001 -U r1 sdb -T 120
progress: 1.0 s, 1100.9 tps, lat 21.266 ms stddev 6.349
progress: 2.0 s, 1253.0 tps, lat 18.779 ms stddev 7.913
progress: 3.0 s, 1219.0 tps, lat 20.083 ms stddev 13.212
```

11.Cloud Native Distributed Database PolarDB-X

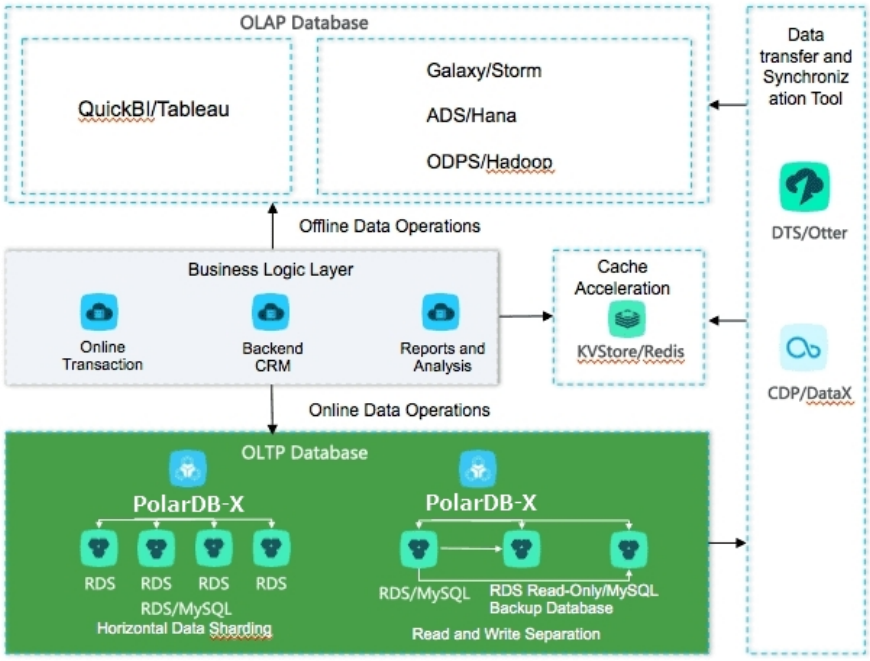
11.1. What is PolarDB-X?

Cloud Native Distributed Database PolarDB-X is a database product that is developed by Alibaba Group and focuses on scaling out single-instance relational databases. This service is compatible with former Distributed Relational Database Service (DRDS).

Compatible with the MySQL communication protocols, PolarDB-X supports most MySQL data manipulation language (DML) and data definition language (DDL) syntax. It provides the core capabilities and features of distributed databases, such as sharding, smooth scale-out, service upgrade and downgrade, and transparent read/write splitting. PolarDB-X is lightweight (stateless), flexible, stable, and efficient, and provides you with O&M capabilities throughout the lifecycle of distributed databases.

PolarDB-X is used for operations on large-scale online data. PolarDB-X maximizes the operation efficiency by partitioning data in specific business scenarios. This meets the requirements of online business on relational databases in an effective way.

Figure of the PolarDB-X architecture



Fixed issues

- Capacity bottlenecks of single-instance databases: As the data volume and access increase, traditional single-instance databases encounter great challenges that cannot be solved by hardware upgrades in a complete way. In distributed database solutions, multiple instances work in a joint way. This resolves the bottlenecks of data storage capacity and access volumes in an effective way.
- Difficult scale-out of relational databases: Due to the inherent attributes of distributed databases, you can change the shards where data is stored through smooth data migration. This way, the dynamic scale-out of relational databases is achieved.

11.2. Quick start

This topic describes how to get started with Cloud Native Distributed Database PolarDB-X.

A PolarDB-X instance is physically a distributed cluster that consists of multiple PolarDB-X server nodes and underlying storage instances. A PolarDB-X database is a logical concept and only contains metadata. Specific data is stored in the physical database of the underlying storage instance. To get started with PolarDB-X, follow these steps:

1. Create a PolarDB-X instance.
2. Create a database.

   To create a database in a PolarDB-X instance, you must select one or more ApsaraDB RDS for MySQL instances as the data storage nodes. If no RDS instance exists, create one first. For more information about how to create and manage ApsaraDB RDS for MySQL instances, see *User Guide of RDS* .
3. After a PolarDB-X database is created, you also need to create tables in the PolarDB-X database like in a single-instance database. However, the syntax is different, mainly in the expression of data partitioning information in the PolarDB-X table creation statement. For more information about how to create a table, see Table creation syntax.

11.3. Log on to the PolarDB-X console

This topic describes how to log on to the Cloud Native Distributed Database PolarDB-X console by using Google Chrome.

Prerequisites

- The URL of the Apsara Uni-manager Management Console is obtained from the deployment personnel before you log on to the Apsara Uni-manager Management Console.
- A browser is available. We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL of the Apsara Uni-manager Management Console. Press the Enter key.
2. Enter your username and password.

   Obtain the username and password that you can use to log on to the console from the operations administrator.

   > **Note** When you log on to the Apsara Uni-manager Management Console for the first time, you must change the password of your username. Your password must meet complexity requirements. The password must be 8 to 20 characters in length and must contain at least two of the following character types:
   >
   > - Uppercase or lowercase letters
   > - Digits
   > - Special characters, which include ! @ # $ %
3. Click **Login**.
4. In the top navigation bar, choose **Products > Database Services > Distributed Relational Database Service**.

11.4. Instance management

11.4.1. Create an instance

Before you use PolarDB-X, create an instance. This topic describes how to create a PolarDB-X instance.

1. Log on to the PolarDB-X console.
2. In the upper-right corner of the page, click **Create Instance**.

3. On the **Create PolarDB-X Instance** page, configure the parameters as needed.

   Parameters for creating an instance describes the parameters.

   Parameters for creating an instance

Category	Parameter	Description
Region	**Organization**	The organization to which the instance belongs.
	Resource Set	The resource set to which the instance belongs.
	Region	The region in which the instance is deployed. The instances in different regions cannot communicate with each other over an internal network. After an instance is created, you cannot change the region for the instance.
	Zone	The zone in which the instance is deployed.
Basic Settings	**Instance Type**	The type of the instance. Select an instance type from the options that are available on the page.
	Edition	The edition of the instance. Valid values: ○ Standard ○ Enterprise ○ Starter
	Specifications	The specifications of the instance. The specifications vary based on instance editions. Select the instance specifications from the options that are available on the page.
Network Type	**Network Type**	The network type of the PolarDB-X instance. Valid values: ○ **Classic Network**: Cloud services on the classic network are not isolated from each other. Unauthorized access to a cloud service is blocked only by the security group or based on the whitelist policy of the service. ○ **VPC**: You can create a virtual private cloud (VPC) to build an isolated network environment on Apsara Stack. You can customize route tables, IP address ranges, and gateways in a VPC. We recommend that you select a VPC for improved security. If you set Network Type to VPC, you must set **VPC** and **vSwitch**. **Note** The PolarDB-X instance and the Elastic Compute Service (ECS) instance to connect must use the same network type. Otherwise, they cannot communicate with each other over an internal network.
	VPC	Select a VPC. **Note** If you set **Network Type** to **VPC**, specify this parameter.
	vSwitch	Select a vSwitch in the VPC. **Note** If you set **Network Type** to **VPC**, specify this parameter.

4. Click **Submit**.

   After the instance is created, the instance appears in the instance list and the status of the instance changes to **Running**. The instance name is a unique identifier of an instance. You can identify a PolarDB-X instance based on this unique identifier.

11.4.2. Change instance specifications

When you use PolarDB-X, you can change the specifications of a PolarDB-X instance as needed.

Procedure

1. Log on to the PolarDB-X console.
2. Find the target instance in the instance list.
3. Click the target instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. In the **Common Actions** section or the **Configuration Information** section, click **Upgrade** or **Downgrade** to go to the Change Specifications page.

   > **Note** Alternatively, on the **DRDS Instance Management** page, choose **More > Downgrade** in the **Actions** column of the instance.

5. On the Change Specifications page, set **Instance Edition** and **Instance Specifications**, and click **Submit**.

   After a few minutes, you can view the new specifications of the PolarDB-X instance in the instance list.

   > **Note** Specifications downgrade leads to transient disconnections between applications and PolarDB-X within a short period of time. Make sure that your applications can be automatically reconnected.

11.4.3. Read-only PolarDB-X instances

11.4.3.1. Overview

Read-only PolarDB-X instances are extension and supplement to primary PolarDB-X instances and are compatible with SQL query syntax of primary PolarDB-X instances.

Features

Read-only and primary PolarDB-X instances can share the same replica of data. You can perform complex data query and analysis directly on read-only or primary ApsaraDB RDS for MySQL instances. Multiple instance types are provided to handle highly concurrent access requests and reduce the response time (RT) for complex queries. Resource isolation alleviates the load pressure on the primary instances and reduces the link complexity of the business architecture. It reduces the O&M and budget costs, eliminating the need for additional data synchronization.

Instance type

Concurrent read-only instances: For high-concurrency and high-traffic simple queries or offline data extraction, resource isolation protects you against highly concurrent queries, ensuring the stability of online business links.

> **Note** For the businesses with primary PolarDB-X instances, concurrent read-only instances can be used in the following scenarios:
>
> - High-concurrency and high-traffic simple queries are performed.
> - Data is extracted offline.

Limits

- Primary and read-only PolarDB-X instances must be in the same region, but they can be in different zones.
- A read-only PolarDB-X instance must belong to a primary PolarDB-X instance. Before creating a read-only instance, you must create a primary instance. After you create a database on the primary instance, the database is replicated to the read-only instance. If you delete the database from the primary instance, the corresponding database on the read-only instance is also deleted.
- You are not allowed to migrate data to read-only PolarDB-X instances.
- You are not allowed to create or delete databases in PolarDB-X read-only instances.
- PolarDB-X read-only instances cannot be cloned.
- PolarDB-X read-only instances support data definition language (DDL) statements but do not support data manipulation language (DML) statements for data modification.

11.4.3.2. Create a read-only PolarDB-X instance

This topic describes how to create a read-only Cloud Native Distributed Database PolarDB-X (PolarDB-X) instance.

Procedure

1. Log on to the PolarDB-X console.
2. Find the target instance in the instance list.
3. Click the target instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. On the Basic Information page, click **Create DRDS Read-only Instance** in the Related Instances section.
5. Set Region, Basic Settings, and Network Type, and then click **Submit**.

   Parameters for creating a read-only PolarDB-X instance

Type	Parameter	Description
Region	**Region**	The region where the read-only instance resides. Services in different regions are not interconnected over the internal network. After the instance is created, the region cannot be changed.
	Zone	The zone where the read-only instance resides.
Basic Settings	**Instance Type**	The type of the read-only instance. Select an instance type from the options available on the page.
	Instance Edition	The edition of the read-only instance. Valid values: ○ Starter ○ Standard ○ Enterprise
	Instance Specifications	The specifications of the read-only instance. The rules vary with instance editions. Select the instance specifications from the options available on the page.

Type	Parameter	Description
	Description	The description of the read-only instance. We recommend that you provide an informative description to simplify future management operations.
Network Type	**Network Type**	The network type of the read-only instance. PolarDB-X instances support the following network types: ○ **Classic Network**: Cloud services on a classic network are not isolated from each other. Unauthorized access to a cloud service is blocked only by the security group or whitelist policy of the service. ○ **VPC**: A virtual private cloud (VPC) helps you build an isolated network environment on Apsara Stack. You can customize routing tables, IP address ranges, and gateways in a VPC. We recommend that you select VPC for higher security. Select VPC for Network Type, and then set **VPC** and **VSwitch**. **Note** Make sure that the PolarDB-X instance has the same network type as the Elastic Compute Service (ECS) instance to which you want to connect. If the PolarDB-X and ECS instances have different network types, they cannot communicate over an internal network.

6. It takes several minutes to create the instance. Please wait. After the instance is created, it appears in the instance list in the PolarDB-X console.

11.4.3.3. Manage a read-only PolarDB-X instance

Read-only PolarDB-X instances are managed in a similar way as primary instances. However, databases cannot be created or deleted on the read-only instance management page. Databases on read-only instances are created or deleted with databases on primary instances. In the PolarDB-X console, you can go to the read-only instance management page in two ways.

Manage a read-only PolarDB-X instance by its ID

1. Log on to the PolarDB-X console.
2. On the **DRDS Instance Management** page, find the target read-only instance.
3. Click the target instance ID or choose **More > Manage** from the Actions column of the target read-only instance to access the **Basic Information** page.

Manage a read-only PolarDB-X instance by the ID of its primary instance

1. Log on to the PolarDB-X console.
2. On the **DRDS Instance Management** page, find the target primary instance.
3. Click the target instance ID or choose **More > Manage** from the Actions column of the target primary instance to access the **Basic Information** page.
4. On the **Basic Information** page, move the pointer over the number of read-only instances in the **Related Instances** section to view the ID of the read-only PolarDB-X instance.
5. Click the ID of the target read-only PolarDB-X instance. The **Basic Information** page of the read-only instance appears.

11.4.3.4. Release a read-only PolarDB-X instance

If you no longer need a read-only PolarDB-X instance, you can release it.

Prerequisites

The read-only instance must be in the **Running** state.

Procedure

1. Log on to the PolarDB-X console.
2. Find the target instance in the instance list.
3. In the PolarDB-X instance list, find the target instance, and choose **More > Release** from the Actions column.

   > **Notice** You cannot recover the PolarDB-X instances that have been released. Exercise caution when you perform this operation.

4. In the **Release DRDS Instance** dialog box, click **OK**.

11.4.4. Restart a PolarDB-X instance

This topic describes how to restart a PolarDB-X instance.

Prerequisites

The PolarDB-X instance must be in the **Running** state.

Procedure

1. Log on to the PolarDB-X console.
2. Find the target instance in the instance list.
3. Click the target instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. Click **Restart Instance** in the upper-right corner.
5. In the **Restart Instance** dialog box, click **OK**.

   > **Notice** Restarting a PolarDB-X instance terminates all its connections. Make appropriate service arrangements before you restart a PolarDB-X instance. Exercise caution when you perform this operation.

11.4.5. Release a PolarDB-X instance

This topic describes how to release a running PolarDB-X instance in the PolarDB-X console.

Prerequisites

- All databases on the PolarDB-X instance have been deleted.
- The PolarDB-X instance must be in the Running state.

Procedure

1. Log on to the PolarDB-X console.
2. Find the target instance in the instance list.
3. In the PolarDB-X instance list, find the target instance, and choose **More > Release** from the Actions column.
4. In the **Release DRDS Instance** dialog box, click **OK**.

   > **Warning** After the PolarDB-X instance is released, data is not deleted from its attached ApsaraDB RDS for MySQL instances. However, a released PolarDB-X instance cannot be restored. Exercise caution when you perform this operation.

11.4.6. Recover data

11.4.6.1. Backup and restoration

PolarDB-X allows you to back up data of instances and databases and restore them by using the backup data. Instances can be automatically or manually backed up. PolarDB-X provides fast backup and consistent backup. Existing backup sets are used to restore data in instances. Data is restored to the new PolarDB-X and ApsaraDB RDS for MySQL instances by using the existing backup sets.

Considerations

- By default, the automatic backup policy of PolarDB-X is disabled. You must manually enable it.
- The log backup capability of PolarDB-X relies on underlying ApsaraDB RDS for MySQL instances. Therefore, the log backup policy configured in the PolarDB-X console is automatically synchronized to all underlying ApsaraDB RDS for MySQL instances. After the policy is configured, do not modify it in the ApsaraDB RDS console. Otherwise, related data backup sets may be invalid.
- The backup and restoration feature of PolarDB-X relies on log backup. We recommend that you enable the log backup policy by default to prevent backup sets from becoming invalid.
- Data definition language (DDL) operations cannot be performed during the backup process. Otherwise, instance backup and restoration may fail.
- During data backup, ensure that the underlying ApsaraDB RDS for MySQL instances for the PolarDB-X instance are normal. Otherwise, data backup may fail.
- Consistent backup and restoration is supported only by PolarDB-X 5.3.8 and later.
- Ensure that all tables have primary keys. Otherwise, data accuracy may be affected during consistent backup and restoration.
- During consistent backup, distributed transactions on PolarDB-X instances are locked for seconds. During the locking period, the execution of non-transactional SQL statements and non-distributed transactions is not affected. However, the commitment of distributed transactions is blocked and the response time (RT) for executing SQL statements may have millisecond-level jitters. We recommend that you perform consistent backup during off-peak hours.
- Due to changes in the inventory of PolarDB-X and ApsaraDB RDS for MySQL resources, PolarDB-X automatically adjusts the instance type and zone during instance restoration. We recommend that you confirm and adjust the instance type and zone after the instance restoration to avoid business disruption.

Backup methods

For different scenarios, PolarDB-X provides fast backup and consistent backup and the related data restoration capabilities. The following table compares the two backup methods.

Backup method	Scenario	Benefit	Disadvantage
Fast backup	Applies to routine backup and restoration scenarios.	• Fast data backup and restoration is enabled. • Data can be restored by backup set or by time. • All PolarDB-X instance versions support this feature.	In sharding scenarios, data consistency can be ensured only within a single ApsaraDB RDS for MySQL instance. Global data consistency cannot be ensured.

Backup method	Scenario	Benefit	Disadvantage
Consistent backup	Applies to backup and restoration for the financial industry and online core transactions that require high data consistency.	In sharding scenarios, global data consistency is ensured.	• Backup and restoration is slow. • Data can be restored by backup set, but cannot be restored by time. • Only PolarDB-X 5.3.8 and later support this feature. • During data backup, distributed transactions on PolarDB-X instances are locked for seconds. During the locking period, the RT for executing SQL statements may have millisecond-level jitters. Therefore, we recommend that you perform consistent backup during off-peak hours.

11.4.6.2. Configure an automatic backup policy

PolarDB-X provides the automatic backup feature. This topic describes how to configure an automatic backup policy.

Procedure

1. Log on to the PolarDB-X console.
2. Find the target instance in the instance list.
3. Click the target instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. In the left-side navigation pane, choose **Data Recovery > Backup and Recovery**.
5. On the page that appears, choose **Backup Policy > Edit**.
6. In the **Backup Policy** dialog box, set parameters as needed, and click **OK**.

11.4.6.3. Configure local logs

You can use local logs and the backup and restoration feature or the SQL flashback feature of PolarDB-X to accurately restore an instance or a database to the desired point in time. This topic describes how to configure local logs.

Procedure

1. Log on to the PolarDB-X console.
2. Find the target instance in the instance list.
3. Click the target instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. In the left-side navigation pane, choose **Data Recovery > Backup and Recovery**.

5. Click the **Local Log Settings** tab and then click **Edit**.
6. In the **Local Binlog Settings** dialog box, specify the parameters based on the business requirements and click **OK**.

> **Notice** The local log settings are applied to all the underlying ApsaraDB RDS for MySQL instances.

11.4.6.4. Manual backup

PolarDB-X also provides the manual backup capability, so that you can back up data at any time. This topic describes how to manually back up instances and databases.

Procedure

1. Log on to the PolarDB-X console.
2. Find the target instance in the instance list.
3. Click the target instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. In the left-side navigation pane, choose **Data Recovery > Backup and Recovery**.
5. On the page that appears, click **Data Backup** on the right.
6. In the dialog box that appears, set Backup Method and Backup Level.
   - Backup Method can be set to **Fast Backup** and **Consistent Backup**. For more information about differences between the two methods, see Backup methods.

     > **Notice** If you select Consistent Backup, distributed transactions are locked within seconds and the response time (RT) may vary by sub-seconds. Therefore, we recommend that you perform this operation during off-peak hours.

   - Backup Level can be set to **Instance Backup** or **Database Backup**. You can select **Instance Backup** to back up the entire instance, or select **Database Backup** to back up a database as needed.
7. Click **OK**.

11.4.6.5. Recover data

You can use the data recovery feature of PolarDB-X to recover an instance or a database to the time when the backup is created. You can perform this operation at any time. This topic describes how to recover the data of an instance or a database to a specific point in time.

Procedure

1. Log on to the PolarDB-X console.
2. Find the target instance in the instance list.
3. Click the target instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. In the left-side navigation pane, choose **Data Recovery > Backup and Recovery**.
5. On the page that appears, click **Data Recovery (Original Clone Instance)** on the right.
6. Select a recovery method
   - **By Time**: Recover data to the selected point in time. You must set **Restoration Time** and **Recovery Level**.
   - **By Backup Set**: Recover data from the selected backup file.

> **Note** You can also click **Recover** in the Actions column of the target backup set to recover data by backup set

7. Click **Precheck** to check whether a valid backup set is available for data recovery. If the precheck fails, the data cannot be restored.
8. Click **Enable** to access the order confirmation page.
9. Confirm the order details and then click **Enable** to recover the data. You can view the data recovery progress in **Task Progress** in the upper-right corner of the page.

11.4.6.6. SQL flashback

11.4.6.6.1. Overview

PolarDB-X provides the SQL flashback feature to recover data of particular rows.

When you mistakenly run an SQL statement such as INSERT, UPDATE, or DELETE on PolarDB-X, provide the relevant SQL information to match the event in the binary log file and generate the corresponding recovery file. You can download the file and recover data as needed. SQL flashback automatically chooses **fuzzy match** or **exact match** to locate lost data caused by the error. For more information, see Exact match and fuzzy match and Rollback SQL statements and original SQL statements.

Features

- Easy-to-use: SQL flashback allows you to retrieve the lost data by entering required information about the corresponding SQL statement.
- Fast and lightweight: Regardless of the backup policy of ApsaraDB RDS for MySQL instances, you only need to enable log backup before an SQL statement error occurs.
- Flexible recovery: Rollback SQL statements and original SQL statements are available for different scenarios.
- Exact match: SQL flashback supports exact match of data about the corresponding SQL statement, which improves precision of data recovery.

Limits

- SQL flashback depends on the binary log retention time and the log backup feature of ApsaraDB RDS for MySQL must be enabled. Binary log files can be retained only for a certain period. Use SQL flashback to generate files for recovery as soon as possible when an error occurs.
- The recovery files generated by SQL flashback are retained for seven days by default, and you need to download these files as soon as possible.
- The following conditions must be met for SQL flashback exact match:
  - The PolarDB-X instance version is 5.3.4-15378085 or later.
  - The version of the ApsaraDB RDS for MySQL instance used by the PolarDB-X database is 5.6 or later.
  - SQL flashback exact match is enabled before the error SQL statement is executed.
  - The TRACE_ID information for the error SQL statement is provided.
- To ensure the precision of data recovery, the exact match feature is enabled by default for the database created in a PolarDB-X instance of 5.3.4-15378085 or later. After this feature is enabled, SQL execution information is included in the binary log file by default, which requires more storage space for ApsaraDB RDS for MySQL instances. If you need to use the exact match feature, we recommend that you upgrade PolarDB-X before enabling the feature. For more information, see Enable exact match.

11.4.6.6.2. Generate a recovery file

Procedure

1. Log on to the PolarDB-X console.
2. Find the target instance in the instance list.
3. Click the target instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. In the left-side navigation pane, choose **Data Recovery > SQL Flashback**. The **SQL Flashback** page appears.
5. On the **SQL Flashback** page, enter the basic information about a mistaken SQL statement, including Database, Time Range, Table Name, TRACE_ID, and SQL Statement Type. The following table describes the parameters.

Parameter	Description
Database	The database where the mistaken SQL statement was executed.
Time Range	The time range during which the mistaken SQL statement was executed. The start time is earlier than the start time when the mistaken SQL statement was executed, whereas the end time is later than the time when the execution of the mistaken SQL statement ended. To ensure efficient recovery, we recommend that you limit the time range to five minutes.
Table Name	The name of the table on which the mistaken SQL statement was executed. This parameter is optional.
TRACE_ID	The unique TRACE_ID that PolarDB-X allocates for each executed SQL statement. You can obtain the TRACE_ID of the mistaken SQL statement by using the SQL audit feature of PolarDB-X.
SQL Statement Type	The type of the mistaken SQL statement. Valid values: ○ INSERT ○ UPDATE ○ DELETE

6. Click **Precheck**. The system checks whether a binary log file exists within the specified time range. For more information about binary log files, see Configure local logs.

> **Note**
> - If no binary log file exists within specified the time range, the precheck fails and the system cannot recover the data for you.
> - If a binary log file exists within the specified time range, the precheck is successful and you can go to the next step.

7. Set SQL Statement Type for Recovery to **Rollback SQL** or **Original SQL Statement**. For more information about differences between the two methods, see Rollback SQL statements and original SQL statements.
8. Click **Generate SQL** to generate an SQL flashback task. The statuses of the SQL flashback tasks that are running on the current instance appear at the bottom of the page.

What's next

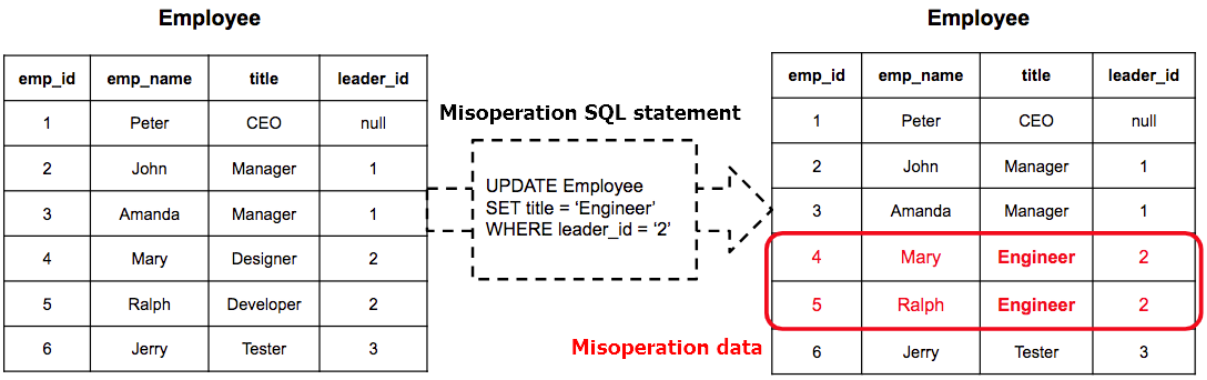
After an SQL flashback task is completed, the task information such as the exact match status and the number of recovered rows appears. You can click **Download** next to the target SQL flashback task to download the corresponding recovery file.

> **Notice** By default, the recovery file is retained for seven days. Download it as soon as possible.

11.4.6.6.3. Rollback SQL statements and original SQL statements

To support different business scenarios, PolarDB-X SQL flashback provides rollback SQL statements and original SQL statements. Before generating an SQL statement for recovering data, you must select a corresponding recovery method based on your scenario.

Recovery methods



Recovery method	Description	Example
Rollback SQL statement	Traverses the events in the binary log file in reverse order to reverse the INSERT, UPDATE, and DELETE events. • The reverse of INSERT is equivalent to DELETE. • The reverse of DELETE is equivalent to INSERT. • The reverse of UPDATE is equivalent to the value before UPDATE.	UPDATE Employee SET title = 'Developer' WHERE emp_id = '5' UPDATE Employee SET title = 'Designer' WHERE emp_id = '4'
Original SQL statement	Traverses the events in the binary log file in order to mirror all records of the INSERT, UPDATE, and DELETE events. • An INSERT mirror is equivalent to INSERT. • A DELETE mirror is equivalent to INSERT. • An UPDATE mirror is equivalent to the value before INSERT.	INSERT INTO Employee(emp_id,emp_name,title,leader_id) values('4','Mary','Designer','2') INSERT INTO Employee(emp_id,emp_name,title,leader_id) values('5','Ralph','Developer','2')

11.4.6.6.4. Exact match and fuzzy match

SQL flashback supports **exact match** and **fuzzy match** for binary log events. You do not need to select a match policy. SQL flashback automatically detects and selects the optimal match policy, and notifies you when the flashback task is completed.

Match mode	Description	Advantage	Disadvantage
Exact match	The system performs exact match on the event of a mistaken SQL statement in the binary log file and generates a recovery file.	The recovery file contains only data that is deleted or modified by the mistaken SQL statement. You can use the file directly to ensure the precision and efficiency of data recovery.	The following requirements must be met: • The PolarDB-X instance is Version 5.3.4-15378085 or later. • The version of the ApsaraDB RDS for MySQL instance used by the PolarDB-X database is Version 5.6 or later. • You have enabled exact match of SQL flashback before the mistaken SQL statement is executed. • You must provide the TRACE_ID of the mistaken SQL statement.
Fuzzy match	The system matches the information about the mistaken SQL statement in the binary log file, including the time range, table name, and SQL statement type. Then, the system generates a recovery file.	Fuzzy match is supported for all instances, regardless of the instance version or parameter settings.	Data that is deleted or modified by the mistaken SQL statement cannot be accurately matched. The recovery file contains data changes made by other business SQL operations. You must filter the required data.

Enable exact match

> **Note** Fuzzy match is enabled by default.

1. Log on to PolarDB-Xconsole, and go to the parameter settings page of the specified instance. For more information, see Set parameters.
2. Change the value of **ENABLE_SQL_FLASHBACK_EXACT_MATCH** to **ON**.

11.4.6.7. Table recycle bin

11.4.6.7.1. Overview

The table recycle bin of PolarDB-X allows you to recover mistakenly deleted tables.

After the table recycle bin is enabled for your PolarDB-X database, the tables that are deleted by using the DROP TABLE statement are moved to the recycle bin and are no longer visible to you. After the tables are moved to the recycle bin for two hours, they are automatically cleared and cannot be recovered. You can view, recover, and clear the deleted tables in the recycle bin.

Limits and notes

- The table recycle bin feature is only supported by PolarDB-X 5.3.3-1670435 and later. For more information, see View the instance version.
- The table recycle bin is disabled for your PolarDB-X database by default. For more information about how to

enable it, see Enable the table recycle bin.

- The table recycle bin of PolarDB-X does not support the recovery of tables deleted by the TRUNCATE TABLE command.
- Tables in the recycle bin still occupy the storage space of ApsaraDB RDS for MySQL before they are automatically cleared. To release the storage space as soon as possible, you can access the recycle bin to manually delete them.

11.4.6.7.2. Enable the table recycle bin

This topic describes how to enable the table recycle bin.

Procedure

1. Log on to the PolarDB-X console.
2. On the **DRDS Instance Management** page, find the target instance.
3. Click the instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. In the left-side navigation pane, choose **Data Recovery > Table Recycle Bin**. The **Table Recycle Bin** page appears.
5. On the top of the **Table Recycle Bin** page, click the tab of the database for which the table recycle bin needs to be enabled.
6. Click **Enable**.
7. In the dialog box that appears, click **OK**.

11.4.6.7.3. Recover tables

This topic describes how to recover your tables from the table recycle bin.

Procedure

1. Log on to the PolarDB-X console.
2. On the **DRDS Instance Management** page, find the target instance.
3. Click the instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. In the left-side navigation pane, choose **Data Recovery > Table Recycle Bin**. The **Table Recycle Bin** page appears.
5. On the top of the **Table Recycle Bin** page, click the tab of the database in which the tables need to be recovered.
6. Click **Restore** in the **Actions** column of the target table.

11.4.6.7.4. Delete tables from the recycle bin

This topic describes how to delete unnecessary tables from the table recycle bin.

Procedure

1. Log on to the PolarDB-X console.
2. On the **DRDS Instance Management** page, find the target instance.
3. Click the instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. In the left-side navigation pane, choose **Data Recovery > Table Recycle Bin**. The **Table Recycle Bin** page appears.

5. On the top of the **Table Recycle Bin** page, click the tab of the database in which the tables need to be cleared.
6. Click **Delete** in the **Actions** column of the target table.

11.4.6.7.5. Disable the table recycle bin

If you no longer need the table recycle bin, you can disable it.

Procedure

1. Log on to the PolarDB-X console.
2. On the **DRDS Instance Management** page, find the target instance.
3. Click the instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. In the left-side navigation pane, choose **Data Recovery > Table Recycle Bin**. The **Table Recycle Bin** page appears.
5. On the top of the **Table Recycle Bin** page, click the tab of the database for which the table recycle bin needs to be disabled.
6. Click **Disable** to disable the table recycle bin for the database.

11.4.7. Set parameters

PolarDB-X allows you to set parameters for instances and databases. You can view and modify parameter values in the PolarDB-X console based on business needs.

> **Note** Parameters cannot be set for read-only PolaDB-X instances.

Procedure

1. Log on to the PolarDB-X console.
2. On the **DRDS Instance Management** page, find the target instance.
3. Click the instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. In the left-side navigation pane, choose **Diagnostics and Optimization > Parameter Settings**. Click the Instance or Database tab to view parameters that you can modify for instances and databases, respectively. For more information about the parameters, see Parameter description.
5. Click next to the parameter you want to modify, enter the target value, and click **OK**.
6. Click **Submit** in the upper-right corner to commit the modification.

   > **Note** To undo parameter modification, click **Cancel** in the upper-right corner.

Parameter description

Parameter	Level	Description
Slow SQL threshold	Instance	The threshold for slow SQL statements. SQL statements whose thresholds exceed this threshold are recorded in logical slow SQL logs.
Logical idle link timeout	Instance	The logical timeout period of the idle connection between user applications and PolarDB-X (unit: ms).

Parameter	Level	Description
Maximum package size	Instance	The maximum network packet for the interaction between user applications and PolarDB-X (unit: byte).
Instance memory pool size limit	Instance	The maximum size of the memory pool for an instance. If the memory usage on an instance exceeds the value, an error is reported and the query ends.
Whether to prohibit all table deletion/update	Database	Specifies whether to disable full table deletion or update.
Whether to open the recycle bin	Database	Specifies whether to enable the recycle bin for storing deleted PolarDB-X logical tables.
Temporary table size	Database	The size of the temporary table used during distributed queries in PolarDB-X (unit: row).
Number of join tables	Database	The maximum number of table shards that can be combined through JOIN when you query multiple table shards in a database.
Physical SQL timeout	Database	The timeout period of SQL statements for interaction between PolarDB-X and ApsaraDB RDS for MySQL (unit: ms). The value 0 indicates the timeout period is not limited.
SQL exact flashback switch	Database	Specifies whether to support SQL flashback exact match. It is disabled by default. After it is enabled, information about the queries is added to the binary log file used by the PolarDB-X database.
Whether to enable logical INFORMATION_SCHEMA query	Database	Specifies whether to enable logical INFORMATION_SCHEMA query (not relying on the shadow database but returning the aggregation results of logical databases and tables). When it is disabled, the original status is restored (relying on the shadow database and returning the physical database and table information).
Transaction log cleanup start time period	Database	The period during which transaction log cleanup starts at a random time.
Library-level memory pool size limit	Database	The maximum size of the database-level memory pool. When the memory usage of a PolarDB-X database exceeds this value, an error is reported and the query terminates. The value -1 indicates no limit.
Query-level memory pool size limit	Database	The maximum size of the query-level memory pool. When the memory usage of a query exceeds this value, an error is reported and the query terminates. The value -1 indicates no limit.
Whether CBO is enabled	Database	Specifies whether to enable the cost-based optimizer (CBO), including features such as Join Reorder and Hash Join.
Whether to enable the asynchronous DDL engine	Database	Specifies whether to enable the data definition language (DDL) engine. If you disable it, the execution logic of the original DDL engine remains.

Parameter	Level	Description
Whether to enable asynchronous-only mode under asynchronous DDL engine	Database	Specifies whether to enable the asynchronous-only mode when the asynchronous DDL engine is enabled. • Enabled: The status is returned immediately after the client connects to PolarDB-X and executes the DDL statement. The execution status can be viewed only through asynchronous DDL management statements. • Disable: The synchronous mode remains. That is, the status is returned only after the client completes executing the DDL statement.
Maximum number of physical tables allowed to be created in a single physical database	Database	The maximum number of table shards that can be created in a database shard.
INFORMATION_SCHEMA.TABLES queries whether statistics are aggregated	Database	Specifies whether to aggregate statistics of INFORMATION_SCHEMA.TABLES queries. To ensure the performance, it is not aggregated by default.
Maximum number of physical sharding links	Database	The maximum number of connections between PolarDB-X and a single ApsaraDB RDS for MySQL shard.
Minimum number of physical sharding links	Database	The minimum number of connections between PolarDB-X and a single ApsaraDB RDS for MySQL shard.
Physical idle link timeout	Database	The idle time of the connection between PolarDB-X and ApsaraDB RDS for MySQL (unit: minute).

11.4.8. SQL audit and analysis

11.4.8.1. Description

Cloud Native Distributed Database PolarDB-X (PolarDB-X) combines the SQL audit and analysis feature with Log Service (SLS). This feature not only audits historical SQL records, but also provides real-time diagnosis and analysis of SQL execution status, performance metrics, and security risks. You can enable SQL audit and analysis in the PolarDB-X console.

Benefits

- Easy operation: SQL audit and analysis can be enabled with easy configuration to help you audit and analyze SQL logs in real time.
- Lossless performance: Pulling SQL log files from PolarDB-X nodes and uploading these logs to SLS in real time does not affect instance performance.
- Trace to historical issues: This feature supports importing historical SQL logs to trace issues.
- Real-time analysis: This feature provides real-time SQL analysis and an out-of-the-box report center based on SLS. This feature also supports custom reports and drill-down analysis, and helps you understand the execution status, performance, and security risks of databases.
- Real-time alerts: This feature supports real-time monitoring and alerts based on customized metrics to ensure timely response to critical business exceptions.

Limits and instructions

- You must activate Alibaba Cloud SLS to use the SQL audit and analysis feature.
- SQL audit logs are saved for 30 days by default. You can modify the log storage time as needed.
- Do not delete or modify the default settings for the project, Logstore, index, or dashboard that are created by SLS. SLS updates and upgrades the SQL log audit feature from time to time. The indexes and default reports of the exclusive Logstore are also automatically updated.
- The maximum length of a single SQL statement is 5 MB.

Scenarios

- Troubleshoot SQL problems

  After the SQL audit and analysis feature is enabled, you can quickly search SQL logs to locate and troubleshoot problems. For example, to check whether a DROP operation is performed, you can perform the following query:

  ```
  sql_type: Drop
  ```

  The query result contains information such as the SQL execution time, user, and IP address of the client that runs the SQL statement.

- Analyze costly SQL templates

  In most applications, SQL statements are dynamically generated based on several templates, with different parameters. The real-time analysis feature of SLS allows you to obtain the list of costly SQL statements in the current database.

  For example, execute the following query:

  ```
  | SELECT sql_code as "SQL template ID",
  round(total_time * 1.0 /sum(total_time) over() * 100,2) as "execution time share (%)",
  execute_times as "number of execution times",
  round(avg_time) as "average execution time",
  round(avg_rows) as "average number of affected rows",
  CASE WHEN length(sql) > 200 THEN  concat(substr(sql, 1, 200), '.....') ELSE trim(lpad(sql, 200,$) end as "sample SQL" FR
  OM (SELECT sql_code, count(1) as execute_times,
  sum(response_time) as total_time,
  avg(response_time) as avg_time,
  avg(affect_rows) as avg_rows,
  arbitrary(sql) as sql FROM log GROUP BY sql_code) ORDER BY "execution time share (%)" desc limit 10
  ```

  The search result contains the SQL template ID, ratio of response time of the statement generated from the template in the total response time of SQL statements, number of executions, average execution time, average number of affected rows, and sample SQL statement. You can find and optimize the most costly SQL templates in the application based on the analysis result.

- Collect log statistics

  To help you analyze issues, PolarDB-X combines the SQL audit and analysis feature with SLS and provides out-of-the-box reports. You can diagnose and analyze the running status, performance, and potential security risks of databases in real time.

11.4.8.2. Enable SQL audit and analysis

The SQL audit and analysis feature is disabled by default. You can manually enable it in the PolarDB-X console. By default, you can perform only audit and analysis on the log data generated after the SQL audit and analysis feature is enabled. You can also import a portion of historical data.

Prerequisites

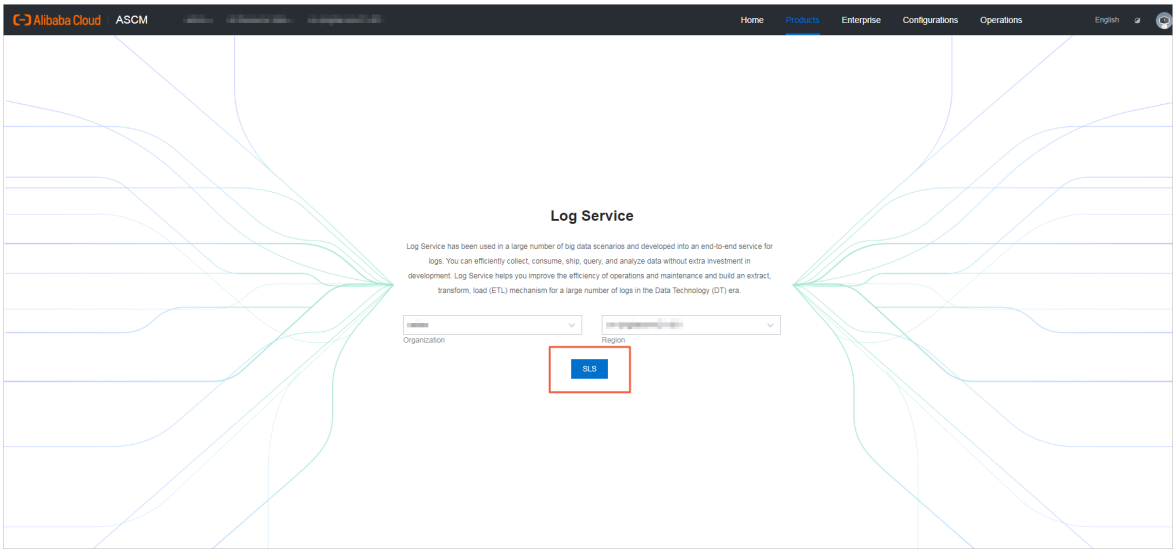
The SQL audit and analysis feature depends on Log Service (SLS). You must activate SLS before you use this feature.

Procedure

1. Log on to the SLS console. For more information, see *Log Service* **User Guide > Quick Start > Log on to the Log Service console**.
2. Select the organization to which the PolarDB-X instance belongs.

   > **Note** The logon account must be consistent with the logon account of PolarDB-X.

3. Click **SLS** to go to the Log Service page.



4. Log on to the PolarDB-X console.
5. Find the target instance in the instance list.
6. Click the target instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
7. In the left-side navigation pane, choose **Diagnostics and Optimization > SQL Audit and Analysis**.
8. In the left-side section, select the database for which you want to enable the SQL audit and analysis feature.
9. On the SQL Audit and Analysis page, turn on the switch next to **SQL Audit Log Status of Current Database** on the right.

   > **Note** On the SQL Audit and Analysis page, you can also turn on the switch of **SQL Audit and Analysis** next to the target database in the left-side section.

10. Confirm whether to import historical data.

    > **Note** By default, you can analyze and audit only the logs that are generated after the SQL audit and analysis feature is enabled. If you find the historical data of the PolarDB-X database is modified but the SQL audit and analysis feature is not enabled, you can import historical data and include historical logs in the audit and analysis scope to trace data tampering. PolarDB-X dynamically checks the scope of historical data that can be imported based on the log storage on the PolarDB-X instance. Logs within seven days can be imported.
    >
    > - If you need to import historical data, enable **Import Historical Data or Not**, specify the backtrace start time and end time, and then click **Enable**.
    > - If you do not need to import historical data, click **Enable**.

What's next

Every time you use the SQL audit and analysis feature, you must repeat the preceding steps.

11.4.8.3. Log fields

This topic describes the log fields in SQL audit and analysis.

Field	Description	Supported version
__topic__	The log topic in the format of `drds_audit_log_{instance_id name}_{db_name}`, such as `drds_audit_log_drdsxyzabcd_demo_drds_db`.	All versions
instance_id	The ID of the PolarDB-Xinstance.	All versions
db_name	The name of the PolarDB-X database	All versions
user	The user name used to run the SQL statement.	All versions
client_ip	The IP address of the client that accessed the PolarDB-X instance.	All versions
client_port	The port of the client that accessed the PolarDB-X instance.	All versions
sql	The executed SQL statement.	All versions
trace_id	The trace ID of the SQL statement when it was executed. If a transaction was executed, it is tracked by an ID that consists of the trace ID, a hyphen, and a number, for example, `drdsabcdxyz-1` and `drdsabcdxyz-2`.	All versions
sql_code	The hash value of the template SQL statement.	All versions
hint	The hint that was used to execute the SQL statement.	All versions
table_name	The name of the table involved in the query. Separate multiple tables by commas (,).	All versions
sql_type	The type of the SQL statement. Valid values: SELECT, INSERT, UPDATE, DELETE, SET, ALTER, CREATE, DROP, TRUNCATE, REPLACE, and Other.	All versions
sql_type_detail	The name of the SQL parser.	All versions
sql_time	The start time for the execution of the SQL statement. The time follows the `yyyy-MM-dd HH:mm:ss.SSS` format.	All versions

Field	Description	Supported version
response_time	The response time. Unit: milliseconds.	Version 5.3.4-15378085 and later
affect_rows	The number of rows returned when the SQL statement was executed. The number of rows affected when the INSERT, DELETE, or UPDATE statement was executed.	Version 5.3.4-15378085 and later
fail	Indicates whether an error occurred in the execution of the SQL statement. Valid values: • 0: successful • 1: failed	Version 5.3.4-15378085 and later

11.4.8.4. Log analysis

The SQL audit and analysis feature is based on Log Service (SLS) and provides powerful log analytics capabilities. This topic describes SQL statements for log analysis in common scenarios and provides relevant examples.

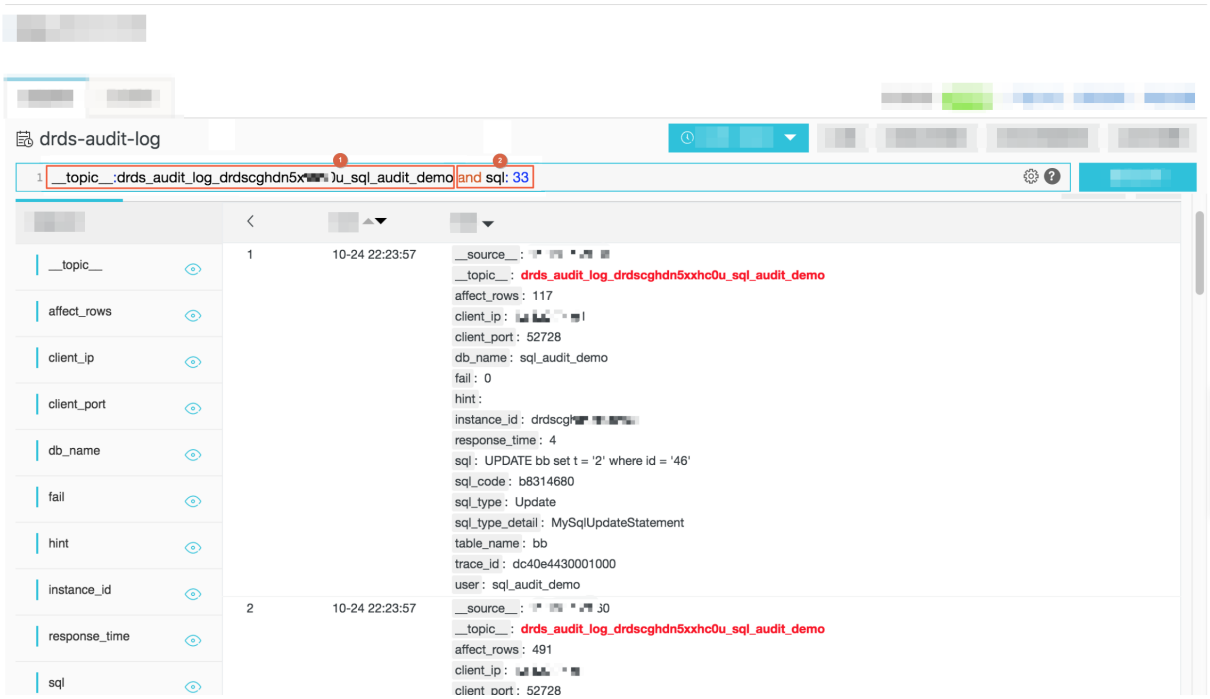
After the SQL audit and analysis feature is enabled, you can perform audit and analysis on SQL log files by using the query and analysis syntax of SLS on the SQL Audit and Analysis page. Based on the query and analysis syntax of SLS, you can find problematic SQL statements on the Log Analysis tab and analyze the SQL statement execution status, performance metrics, and security issues of PolarDB-X. For more information about the query and analysis syntax of SLS, see *Log Service User Guide > Query and Analysis > Query Syntax and Functions > Query Syntax.*

Precautions

All the audit logs of PolarDB-X databases in the same region are written to the same Logstore in SLS. Therefore, by default, the SQL Audit and Analysis page provides the filter conditions based on __topic__, to ensure that the searched SQL log files are from PolarDB-X. Therefore, all the statements provided in this topic must be used after the existing filter conditions.

An example is shown in the following figure:

- The ① part is the default filter condition.
- The ② part is the additional filter condition.



Find problematic SQL statements

- Fuzzy search

  For example, to query SQL statements that contain the "34" keyword, enter the following content in the search box:

  ```
  and sql: 34
  ```

  The result is shown in the following figure.

  ```
  __source__ :
  __topic__ : drds_audit_log_drdscghdn u_sql_audit_demo
  affect_rows : 100
  client_ip :
  client_port : 32452
  db_name : sql_audit_demo
  fail : 0
  hint :
  instance_id : drdsc 5xxhc0u
  response_time : 11
  sql : insert into bb(id, b, t, c, d, f, v) values(0, 0, false, "null", now(), rand(), "abcdefghijklmn"), (1, 0, false, "null", now(), rand(), "abcdefghijklmn"), (2, 0, false, "null", now(), rand(), "abcdefghijklmn"), (3, 0, false, "null", now(), rand(), "abcdefghijklmn"), (4, 0, false, "null", now(), rand(), "abcdefghijklmn"), (5, 0, false, "null", now(), rand(), "abcdefghijklmn"), (6, 0, false, "null", now(), rand(), "abcdefghijklmn"), (7, 0, false, "null", now(), rand(), "abcdefghijklmn"), (8, 0, false, "null", now(), rand(), "abcdefghijklmn"), (9, 0, false, "null", now(), rand(), "abcdefghijklmn"), (10, 0, false, "null", now(), rand(), "abcdefghijklmn"), (11, 0, false, "null", now(), rand(), "abcdefghijklmn"), (12, 0, false, "null", now(), rand(), "abcdefghijklmn"), (13, 0, false, "null", now(), rand(), "abcdefghijklmn"), (14, 0, false, "null", now(), rand(), "abcdefghijklmn"), (15, 0, false, "null", now(), rand(), "abcdefghijklmn"), (16, 0, false, "null", now(), rand(), "abcdefghijklmn"), (17, 0, false, "null", now(), rand(), "abcdefghijklmn"), (18, 0, false, "null", now(), rand(), "abcdefghijklmn"), (19, 0, false, "null", now(), rand(), "abcdefghijklmn"), (20, 0, false, "null", now(), rand(), "abcdefghijklmn"), (21, 0, false, "null", now(), rand(), "abcdefghijklmn"), (22, 0, false, "null", now(), rand(), "abcdefghijklmn"), (23, 0, false, "null", now(), rand(), "abcdefghijklmn"), (24, 0, false, "null", now(), rand(), "abcdefghijklmn"), (25, 0, false, "null", now(), rand(), "abcdefghijklmn"), (26, 0, false, "null", now(), rand(), "abcdefghijklmn"), (27, 0, false, "null", now(), rand(), "abcdefghijklmn"), (28, 0, false, "null", now(), rand(), "abcdefghijklmn"), (29, 0, false, "null", now(), rand(), "abcdefghijklmn"), (30, 0, false, "null", now(), rand(), "abcdefghijklmn"), (31, 0, false, "null", now(), rand(), "abcdefghijklmn"), (32, 0, false, "null", now(), rand(), "abcdefghijklmn"), (33, 0,
  ```

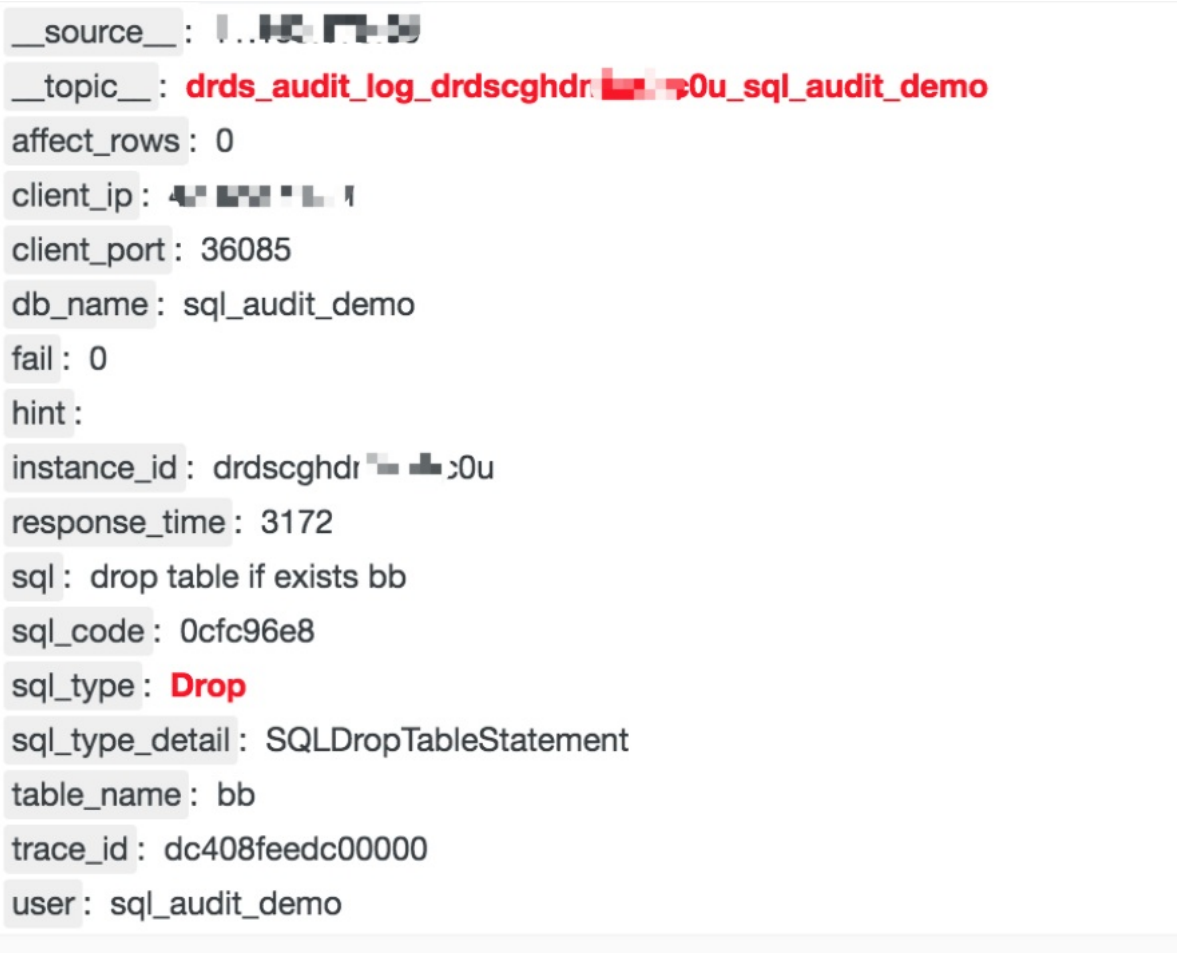
- Field search

Based on built-in index fields, the SQL audit and analysis feature also supports field-based search.

For example, to query SQL statements of the Drop type, execute the following statement:

```
and sql_type:Drop
```

The result is shown in the following figure.



- Multi-condition search

  You can use the "and" and "or" keywords to perform a multi-condition search.

  For example, you can query the delete operation on the rows whose id is 34:

  ```
  and sql:34 and sql_type: Delete
  ```

- Search based on numeric comparison

  affect_rows and response_time in the index filed are numeric values and support comparison operators.

  For example, you can query the SQL INSERT statements whose response_time is greater than 1s.

  ```
  and response_time > 1507 and sql_type: Insert
  ```

  For example, you can query the SQL statement that deletes more than 100 rows of data:

  ```
  and affect_rows > 100 and sql_type: Delete
  ```

Analysis of the SQL statement execution status

This section introduces the statements used to query the SQL statement execution status in PolarDB-X.

- Failure rate of SQL statement execution

  Execute the following statement to query the failure rate of SQL statement execution:

  ```
  | SELECT sum(case when fail = 1 then 1 else 0 end) * 1.0 / count(1) as fail_ratio
  ```

  The result is shown in the following figure.

  
  If your business is sensitive to the error rate of SQL statement execution, you can customize the alert information based on the query result. Click **Save as Alert** in the upper-right corner of the page.

  In the alert settings shown in the preceding figure, the number of log entries that have an error rate of SQL statement execution greater than 0.01 within 15 minutes is checked within every 15 minutes. You can also customize alerts as needed.

- Total number of rows returned by SELECT statements

  Execute the following statement to query the cumulative number of rows queried by SELECT statements:

  ```
  and sql_type: Select | SELECT sum(affect_rows)
  ```

- SQL statement type distribution

  Execute the following statement to query the SQL statement type distribution:

  ```
  | SELECT  sql_type, count(sql) as times GROUP BY sql_type
  ```

- IP address distribution of SQL independent users

  Execute the following statement to query the distribution of IP addresses of independent users who execute SQL statements:

  ```
  | SELECT  user, client_ip, count(sql) as times GROUP BY user, client_ip
  ```

SQL performance analysis

This section describes typical SQL statements for SQL performance analysis.

- Average response time of SELECT statements

  Execute the following statement to query the average response time of SELECT statements:

  ```
  and sql_type: Select | SELECT avg(response_time)
  ```

- Distribution of SQL statement response time

  Execute the following statement to query the distribution of SQL statement response time:

  ```
  and response_time > 0 | select case when response_time <=10 then '<=10 ms when response_time > 10 and response_time <= 100 then '10~100 ms when response_time > 100 and response_time <= 1000 then '100 ms ~ 1s 'When response_time > 1000 and response_time <= 10000 then '1s ~ 10s' when response_time > 10000 and response_time <= 60000 then '10s ~ 1 min'> 1 min' end as latency_type, count(1) as cnt group by latency_type order by latency_type DESC
  ```

  The preceding query shows the distribution of SQL statement execution time based on a given time range. You can adjust the time range to obtain finer-grained results.

- Top 50 slow SQL statements

  Execute the following statement to query slow SQL statements:

```
| SELECT date_format(from_unixtime(__time__), '%m/%d %H:%i:%s') as time, user, client_ip, client_port, sql_type, affect_rows, response_time, sql ORDER BY  response_time desc LIMIT 50
```

The following figure shows the result, which includes the SQL statement execution time, user name, IP address, port number, SQL statement type, number of affected rows, response time, and text of SQL statements.

time	user	client_ip	client_port	sql_type	affect_rows	response_time	sql
09/28 14:04:05	sql_audit_demo	[redacted]	[redacted]7	Drop	0	9583	drop table if exists bb
09/28 14:04:05	sql_audit_demo	[redacted]	[redacted]7	Drop	0	9583	drop table if exists bb
09/28 14:04:05	sql_audit_demo	[redacted]	[redacted]77	Drop	0	9583	drop table if exists bb
09/27 17:38:18	sql_audit_demo	[redacted]	[redacted]073	Drop	0	7200	drop table if exists bb

- Top 10 costly SQL templates

  In most applications, SQL statements are dynamically generated based on several templates, and only the parameters are different. You can find, analyze, and optimize the costly SQL templates based on template IDs. Enter the following query statement:

  ```
  | SELECT sql_code as "SQL template ID", round(total_time * 1.0 /sum(total_time) over() * 100, 2) as "response time share (%)" ,execute_times as "number of executions", round(avg_time) as "average response time", round(avg_rows) as "average number of affected rows", CASE WHEN length(sql) > 200 THEN concat(substr(sql, 1, 200°C, '.....') ELSE trim(lpad(sql, 200,'hour) end as "sample SQL" FROM (SELECT sql_code, count(1) as execute_times, sum(response_time) as total_time, avg(response_time) as avg_time, avg(affect_rows) as avg_rows, arbitrary(sql) as sql FROM log GROUP BY sql_code) ORDER BY "execution time share (%)" desc limit 10
  ```

  The statistics include the SQL template ID, percentage of response time of the statement generated from the template in the total response time of SQL statements, number of executions, average response time, average number of affected rows, and sample SQL statement. For better display effect, each page displays 200 entries. In the preceding query result, statements are ranked by the response time share. However, you can rank the statements by the average response time or the number of executions to troubleshoot relevant issues.

- Average transaction response time

  For SQL statements within the same transaction, the preset trace_id field prefixes are the same, and the suffixes are '-' followed by sequence numbers. trace_id of non-transactional SQL statements does not contain '-'. Based on this, you can analyze the performance of transactions.

  > **Note** Transaction analysis is less efficient than other query operations because it involves prefix matching.

  For example, execute the following statement to query the average response time of transactions:

  ```
  | SELECT  sum(response_time) / COUNT(DISTINCT substr(trace_id, 1, strpos(trace_id, '-') - 1)) where strpos(trace_id, '-') > 0
  ```

- Top 10 slow transactions

  You can query the list of slow transactions by response time of transactions. Use the following statement:

  ```
  | SELECT substr(trace_id, 1, strpos(trace_id, '-') - 1) as "transaction ID" , sum(response_time) as "response time" where strpos(trace_id, '-') > 0 GROUP BY substr(trace_id, 1, strpos(trace_id, '-') - 1) ORDER BY "response time" DESC LIMIT 10
  ```

  Based on this, you can use the transaction ID to search for all the SQL statements under the transaction and analyze the specific causes of slow execution. Use the following statement:

```
and trace_id: db3226a20402000*
```

- Top 10 transactions with batch operations

  Based on the number of rows affected by SQL statements in a transaction, you can obtain the list of transactions that contain batch operations. Use the following statement:

```
| SELECT substr(trace_id, 1, strpos(trace_id, '-') - 1) as "transaction ID" , sum(affect_rows) as "number of affected rows " where strpos(trace_id, '-') > 0 GROUP BY substr(trace_id, 1, strpos(trace_id, '-') - 1) ORDER BY "number of affected rows" DESC LIMIT 10
```

SQL security analysis

This section provides typical query statements for SQL security analysis.

- Distribution of types of failed SQL statements

```
and fail > 0 | select sql_type, count(1) as "number of errors" group by sql_type
```

- High-risk SQL statements

  High-risk SQL statements are of the Drop or Truncate type. You can also add more conditions as needed.

```
and sql_type: Drop OR sql_type: Truncate
```

- SQL batch delete events

```
and affect_rows > 100 and sql_type: Delete | SELECT date_format(from_unixtime(__time__), '%m/%d %H:%i:%s') as time, user, client_ip, client_port, affect_rows, sql ORDER BY affect_rows desc LIMIT 50
```

11.4.8.5. Log reports

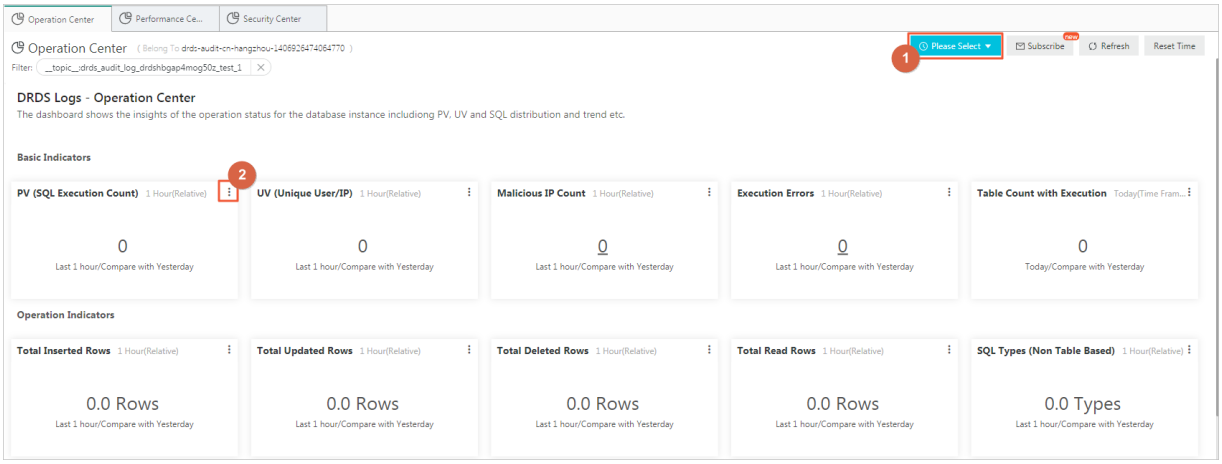
Based on Log Service (SLS), the SQL audit and analysis feature of PolarDB-X provides out-of-the-box report centers, including the Operation Center, Performance Center, and Security Center. This feature allows you to fully understand the performance status, performance metrics, and potential security risks of your PolarDB-X databases.

After Enable SQL audit and analysis, click the **Log Reports** tab on the current page. You can view the reports pages provided by SLS, including **Operation Center**, **Performance Center**, and **Security Center**.

> **Note**
>
> - All the audit logs of PolarDB-X databases in the same region are written to the same Logstore in SLS. Therefore, when you view the reports of the current PolarDB-X database, filter conditions based on the __topic__:drds_audit_log_ instance id_database name are added by default, which indicates that you are viewing the data of the current database. For example, `drds_audit_log_drdsxyzabcd_demo_drds_db`.
> - If the version of the PolarDB-X instance is earlier than Version 5.3.4-15378085, the relevant fields are missing from SQL logs. For more information about log fields, see Log fields. The Log Reports tab provides only a simplified version of Operation Center. To use a full version of reports, upgrade the instance to the latest version.

View reports

Statistics in the charts on the Log Reports tab are generated for different time periods. You can change the time range as needed. You can change the time range for all charts or a single chart.



- Click the time selector (position ① in the figure). In the dialog box that appears, you can change the time range of all the charts on the current page.
- Click the time selector of a chart (position ② in the figure) to modify the time range of the chart.

Operation Center

Operation Center shows the metrics, distribution, and trends of SQL statement execution in PolarDB-X databases.

Item	Type	Default time range	Description
PV (SQL Execution Count)	Single value	1 Hour (Relative)	The number of SQL statement executions
UV (Unique User/IP)	Single value	1 Hour (Relative)	The number of unique user-IP groups
Malicious IP Count	Single value	1 Hour (Relative)	The number of malicious IP addresses. For more information about the definition of malicious IP addresses, see security detection functions.
Execution Errors	Single value	1 Hour (Relative)	The number of SQL statements with execution errors
Table Count with Execution	Single value	1 Hour (Relative)	The total number of tables operated by SQL statements
Total Inserted Rows	Single value	1 Hour (Relative)	The total number of rows inserted by INSERT statements
Total Updated Rows	Single value	1 Hour (Relative)	The total number of rows updated by UPDATE statements
Total Deleted Rows	Single value	1 Hour (Relative)	The total number of rows deleted by DELETE statements

Item	Type	Default time range	Description
Total Read Rows	Single value	1 Hour (Relative)	The total number of rows returned by SELECT statements
SQL Types (Non Table Based)	Single value	1 Hour (Relative)	The types of SQL statements used for non-table operations, such as SHOW VARIABLES LIKE
SQL Execution Trend	Column chart	1 Hour (Relative)	The distribution trend of SQL statement executions and the distribution trend of failed SQL statements
Operated Tables	Flow diagram	1 Hour (Relative)	The distribution of tables operated by SQL statements
SQL Type	Flow diagram	1 Hour (Relative)	The distribution of SQL statement types by time
User Distribution	Pie chart	1 Hour (Relative)	The distribution of users who execute SQL statements
SQL Type Distribution	Area chart	1 Hour (Relative)	The percentage of SQL statement types in the current time range
Tables with Most Operations (Top 50)	Table	1 Hour (Relative)	The list of top tables by the number of operations, including table names and the number of operations such as read, delete, update, and insert
SQL Type (World)	Map	1 Hour (Relative)	The distribution of IP addresses of clients that execute the SQL statements, on the world map
SQL Type (China)	Map	1 Hour (Relative)	The distribution of IP addresses of clients that execute the SQL statements, on the map of China

Performance Center

Performance Center shows performance metrics, the distribution of slow and fast SQL statements, and the distribution and sources of costly SQL statements in PolarDB-X databases.

Item	Data type	Default time range	Description
Peak SQL Execution Traffic	Single value	1 Hour (Relative)	The maximum number of SQL statements executed per second

Item	Data type	Default time range	Description
Peak Select Traffic	Single value	1 Hour (Relative)	The maximum number of rows returned by SELECT statements per second
Peak Insert Traffic	Single value	1 Hour (Relative)	The maximum number of rows inserted by INSERT statements per second
Peak Update Traffic	Single value	1 Hour (Relative)	The maximum number of rows updated by UPDATE statements per second
Peak Delete Traffic	Single value	1 Hour (Relative)	The maximum number of rows deleted by DELETE statements per second
Average Response Time	Single value	1 Hour (Relative)	The average response time of SQL statements
Select SQL	Single value	1 Hour (Relative)	The average number of SELECT statements executed per second
Insert SQL	Single value	1 Hour (Relative)	The average number of INSERT statements executed per second
Update SQL	Single value	1 Hour (Relative)	The average number of UPDATE statements executed per second
Delete SQL	Single value	1 Hour (Relative)	The average number of DELETE statements executed per second
Select/Update Traffic Trend	Line chart	1 Hour (Relative)	The distribution of rows affected by the SELECT and UPDATE statements over time
SQL Execution Time Distribution	Pie chart	1 Hour (Relative)	The distribution of execution time of SQL statements
Slow SQL Table Distribution	Pie chart	1 Hour (Relative)	The distribution of tables targeted by slow SQL statements whose response time exceeds 1s
Slow SQL User Distribution	Pie chart	1 Hour (Relative)	The distribution of users who execute slow SQL statements with response time of more than 1s
Slow SQL Type Distribution	Pie chart	1 Hour (Relative)	The distribution of types of slow SQL statements whose response time exceeds 1s

Item	Data type	Default time range	Description
Slow SQL (Top 50)	Table	1 Hour (Relative)	The table of slow SQL statements whose response time exceeds 1s, including the time, client, response time, PolarDB-X instance, database, table, user, affected rows, SQL type, and SQL text
SQL Template Execution Time Top 20	Table	1 Hour (Relative)	Statistics of the execution status of the SQL statements in the template based on the specified SQL template, including the SQL template ID, response time share, number of executions, average response time, average number of affected rows, and sample SQL statement
Transaction Affected Rows Top 20	Table	1 Hour (Relative)	The table of top 20 transaction-by the number of affected rows, including the transaction ID and the number of affected rows
Transaction Executed Time Top 20	Table	1 Hour (Relative)	The table of top 20 transactions by response time, including the transaction ID and the number of affected rows

Security Center

Security Center shows failed and malicious SQL statement executions in PolarDB-X databases, and the details, distribution, and trends of malicious SQL batch delete and update events.

Item	Type	Default time range	Description
Error Count	Single value	1 Hour (Relative)	The number of failed SQL statement executions
Batch Delete Events	Single value	1 Hour (Relative)	The number of SQL statements for batch delete events (more than 100 rows)
Batch Update Events	Single value	1 Hour (Relative)	The number of SQL statements for batch update events (more than 100 rows)
Malicious SQL Executions	Single value	1 Hour (Relative)	The number of malicious SQL statement executions (Drop and Truncate)

Item	Type	Default time range	Description
Malicious IP Count	Single value	1 Hour (Relative)	The number of malicious IP addresses. For more information about the definition of malicious IP addresses, see security detection functions.
Error Distribution	Area chart	1 Hour (Relative)	The distribution of types of failed SQL statements
Distribution of Client with Errors	Map	1 Hour (Relative)	The distribution of clients for failed SQL statements on the map of China
Client with Most Errors	Table	1 Hour (Relative)	The table of clients on which the execution of SQL statements failed, including the IP address, number of errors, type of failed SQL statement, and sample failed SQL statement
Malicious SQL Executions	Table	1 Hour (Relative)	The table of malicious SQL statement executions, including the time, IP address, SQL, PolarDB-X instance ID, database, table, and user
Batch Delete Events (Top 50)	Table	1 Hour (Relative)	The table of top SQL batch delete events, including the earliest execution time, most recent execution time, PolarDB-X instance ID, database, table, number of executions, average number of deleted rows, average response time, and sample SQL statement
Batch Update Events (Top 50)	Table	1 Hour (Relative)	The table of top SQL batch update events, including the earliest execution time, most recent execution time, PolarDB-X instance ID, database, table, number of executions, average number of updated rows, average response time, and sample SQL statement

11.4.9. Monitor PolarDB-X instances

11.4.9.1. View monitoring information

PolarDB-X provides multi-dimensional monitoring. This topic describes how to view monitoring information in the PolarDB-X console.

Procedure

1. Log on to the PolarDB-X console.
2. On the **DRDS Instance Management** page, find the target instance.
3. Click the instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. On the **Basic Information** page, choose **Monitoring and Alerts > Instance Monitoring** from the left-side navigation pane.
5. On the **Instance Monitoring** page, select a monitoring dimension and the corresponding metrics to view details. For more information about monitoring metrics, see Monitoring metrics.

11.4.9.2. Monitoring metrics

Instance monitoring is divided into resource monitoring and engine monitoring. Engine monitoring metrics are classified into metrics at the PolarDB-X instance level and metrics at the PolarDB-X database level. When some engine monitoring metrics are abnormal, you can directly check the metrics of each database to locate the database with performance problems. The following table describes the metrics of these two types in details.

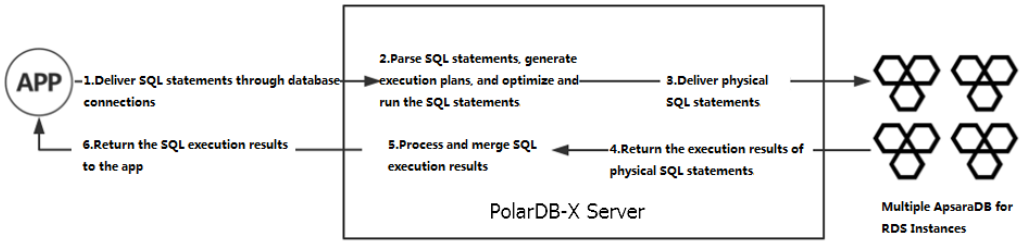
Monitoring item	Category	Description	Data collection cycle	Data retention period	Description
CPU Utilization (%)	Resource monitoring	The average CPU utilization of PolarDB-X server nodes.	1 minute	3 days	-
Memory Usage (%)	Resource monitoring	The memory usage of JVM Old Generation on PolarDB-X server nodes.	1 minute	3 days	Memory usage fluctuations are normal.
Inbound Traffic (Kbps)	Resource monitoring	The total inbound network traffic of PolarDB-X server nodes.	1 minute	3 days	Inbound network traffic is generated when ApsaraDB RDS for MySQL returns data to PolarDB-X.
Outbound Traffic (Kbps)	Resource monitoring	The total outbound network traffic of PolarDB-X server nodes.	1 minute	3 days	Outbound network traffic is generated when a PolarDB-X instance sends a physical SQL statement to an AparaDB RDS for MySQL instance or a PolarDB-X instance returns data to an application.

Monitoring item	Category	Description	Data collection cycle	Data retention period	Description
Logical QPS	Engine monitoring	The total number of SQL statements processed per second on PolarDB-X server nodes.	5 seconds	7 days	-
Physical QPS	Engine monitoring	The total number of SQL operations sent from PolarDB-X server nodes to ApsaraDB RDS for MySQL per second.	5 seconds	7 days	One logical SQL statement can be partitioned into multiple physical SQL statements.
Logical RT (ms)	Engine monitoring	The average response time (RT) for processing each SQL statement by PolarDB-X.	5 seconds	7 days	If a logical SQL statement is partitioned into physical SQL statements for delivery, the logical RT of the SQL statement contains the RT of the physical SQL statements.
Physical RT (ms)	Engine monitoring	The average RT for transmitting SQL statements from PolarDB-X to ApsaraDB RDS for MySQL.	5 seconds	7 days	-
Connections	Engine monitoring	The total number of connections established between an application and PolarDB-X.	5 seconds	7 days	The connections from PolarDB-X to ApsaraDB RDS for MySQL are not included.
Active Threads	Engine monitoring	The number of threads that are used by PolarDB-X to run SQL statements.	5 seconds	7 days	-

11.4.9.3. How metrics work

Before analyzing metrics, you need to understand the execution process of SQL statements on PolarDB-X.

PolarDB-X SQL execution flowchart



In the entire SQL execution process, the execution status of steps 2 through 4 is reflected in various metrics of PolarDB-X.

- In step 2, SQL parsing, optimization, and execution consume CPU resources. A more complex SQL statement (with a complex structure or ultra-long length) consumes more CPU resources. You can run the **TRACE** command to trace the SQL execution process. You can see the time consumed by an SQL statement during optimization. The longer time consumed indicates a higher CPU utilization.
- In step 3, the delivery and execution of physical SQL statements consume I/O resources. You can analyze the execution status of physical SQL statements based on metrics such as logical queries per second (QPS), physical QPS, logical response time (RT), and physical RT. For example, if the physical QPS is low and the physical RT is high, the current ApsaraDB RDS for MySQL instance is processing SQL statements very slowly. You need to check the performance of the ApsaraDB RDS for MySQL instance.
- In step 5, the SQL execution results are processed and integrated. These operations convert the execution results of physical SQL statements. In most cases, only SQL metadata is converted, which consumes few resources. However, the CPU utilization is high for steps such as `heap sort`. For more information about how to determine the consumption of SQL statements at this stage, see Details about a low SQL statement.

11.4.9.4. Prevent performance problems

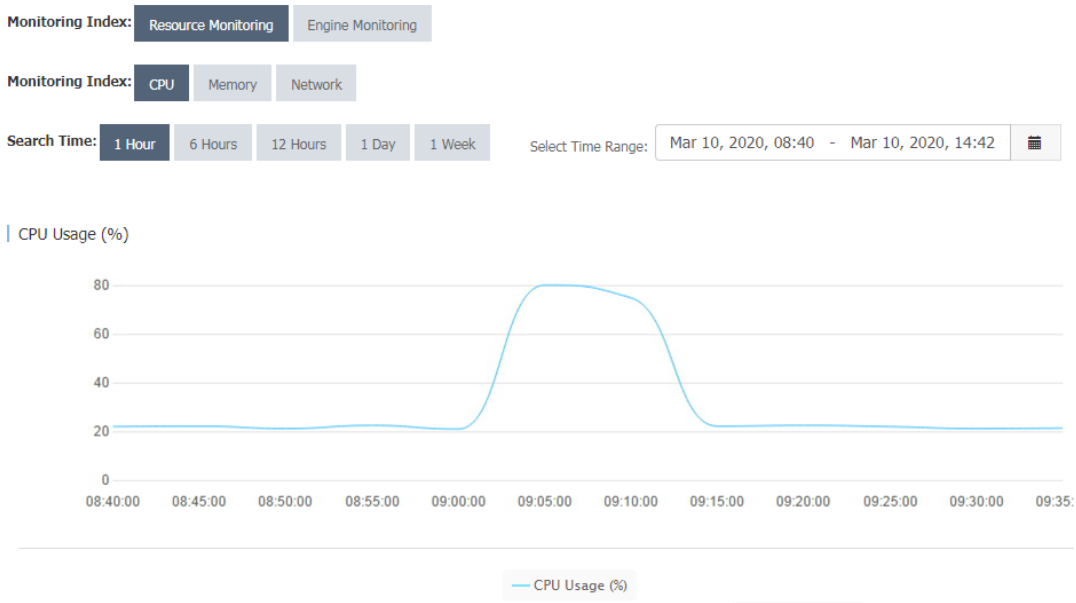
11.4.9.4.1. Example 1: PolarDB-X CPU utilization

Performance metrics change with the system business traffic.

The following describes the CPU utilization in two common cases:

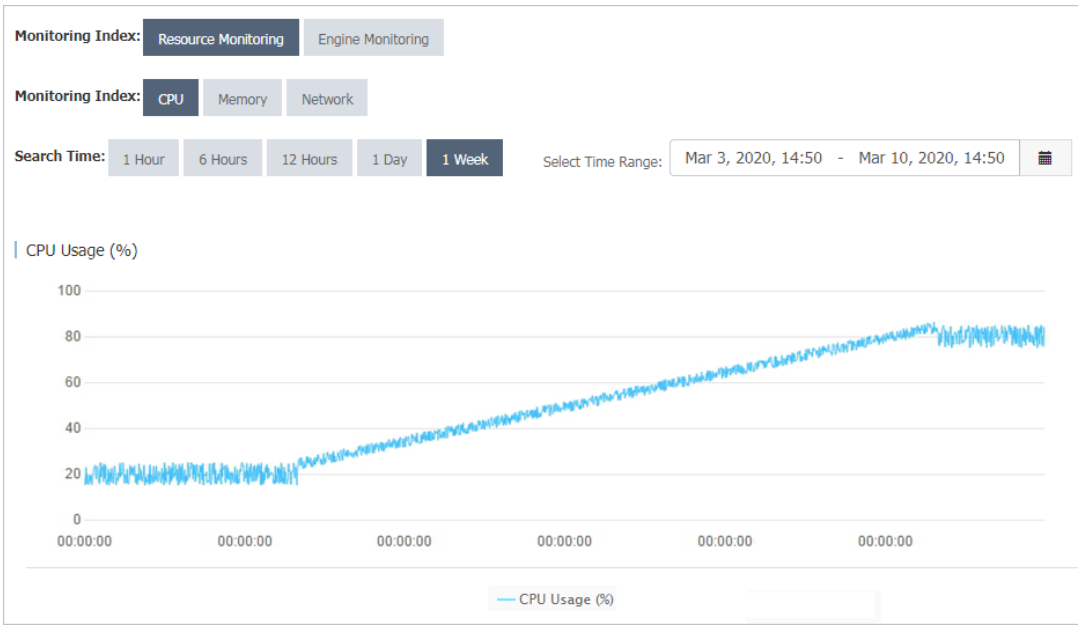
- An application has a shopping spree activity at 09:00 every morning. Therefore, the traffic of the system increases significantly at this time point. According to the monitoring data, the CPU utilization of the PolarDB-X instance increased from 20% to about 80% from about 09:00, with the traffic peak lasting about 10 minutes.

  CPU utilization-1



- The system traffic keeps increasing with an application until it reaches a plateau. The monitored CPU utilization of the PolarDB-X instance also reflects this change.

  CPU utilization-2



When the load on the PolarDB-X instance changes with the business, you must pay close attention to the changes in metrics. If the CPU utilization exceeds the threshold, you must upgrade the PolarDB-X specifications to alleviate the performance pressure.

You can set alert rules for instances in the PolarDB-X console. When the average CPU utilization exceeds the preset threshold, the system sends short messages to the corresponding contacts. You can set the CPU utilization threshold as needed. We recommend that you set it to 80%.

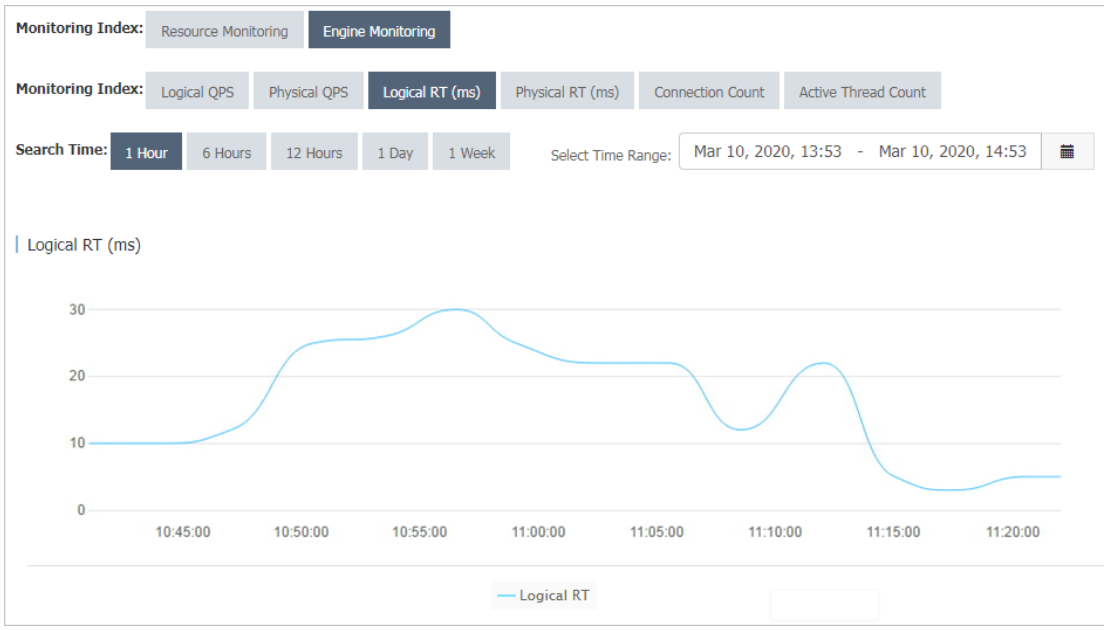
11.4.9.4.2. Example 2: Logical RT and physical RT

You can observe the difference between the logical response time (RT) and physical RT.

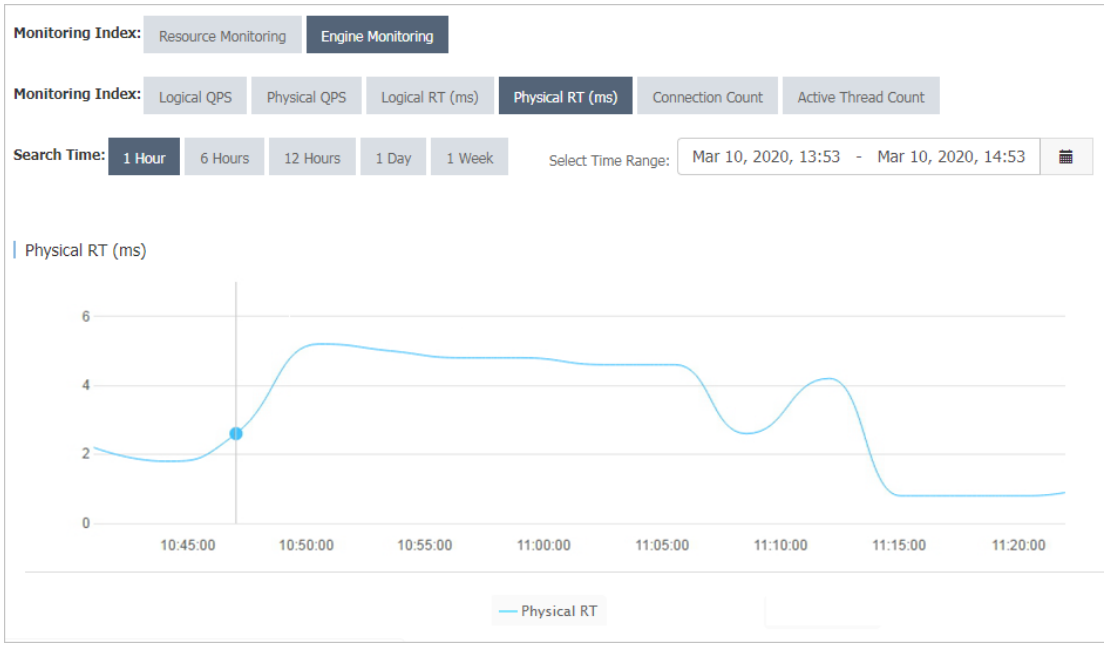
Logical RT refers to the time from when a PolarDB-X instance receives a logical SQL statement to when it returns data to an application. Physical RT refers to the time from when a PolarDB-X instance sends a physical SQL statement to an ApsaraDB RDS for MySQL instance to when it receives the data returned by the ApsaraDB RDS for MySQL instance.

If a logical SQL statement is partitioned into one or more physical SQL statements, the logical RT is greater than or equal to the physical RT. Ideally, PolarDB-X performs only a few operations on the data returned by ApsaraDB RDS for MySQL. Therefore, logical RT is slightly longer than physical RT. Under special circumstances, physical SQL queries are run fast, while logical SQL queries take a long time to run. In this case, the logical RT and physical RT are as follows.

Logical RT



Physical RT



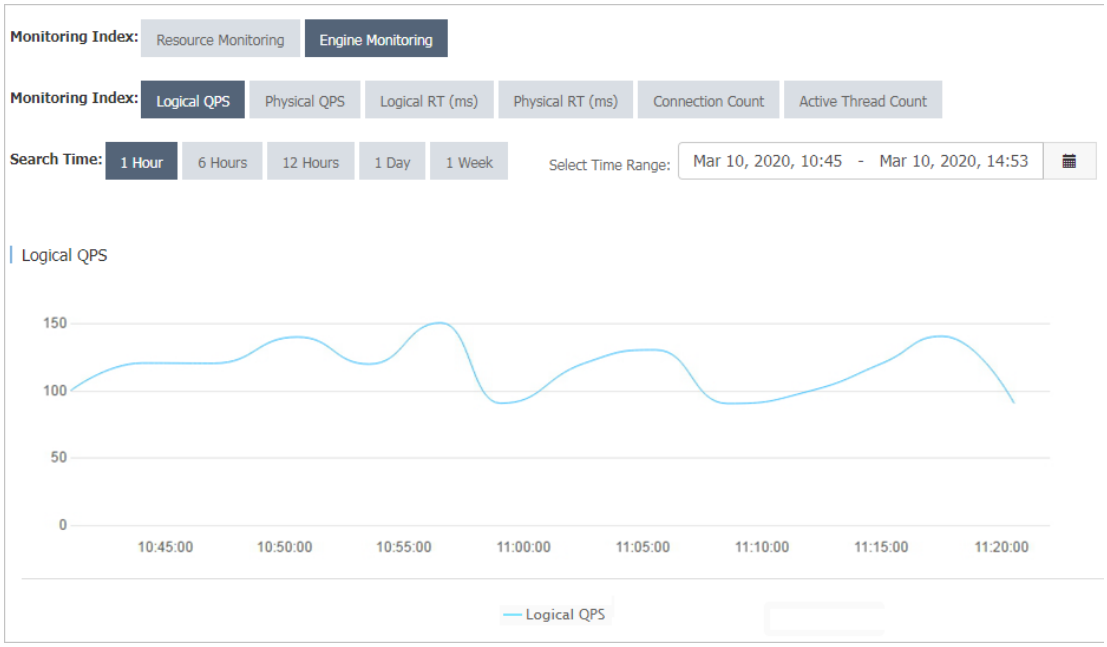
As shown in the preceding figures, the change trends of logical RT and physical RT in the two monitoring charts are basically the same, while logical RT fluctuates between 10 ms and 20 ms and physical RT fluctuates between 2 ms and 5 ms. This means that PolarDB-X has a heavy load, which can be solved by upgrading the PolarDB-X configuration. If both the logical RT and physical RT are high, you can upgrade the ApsaraDB RDS for MySQL configuration or optimize SQL statements on the ApsaraDB RDS for MySQL instance.

11.4.9.4.3. Example 3: Logical QPS and physical QPS

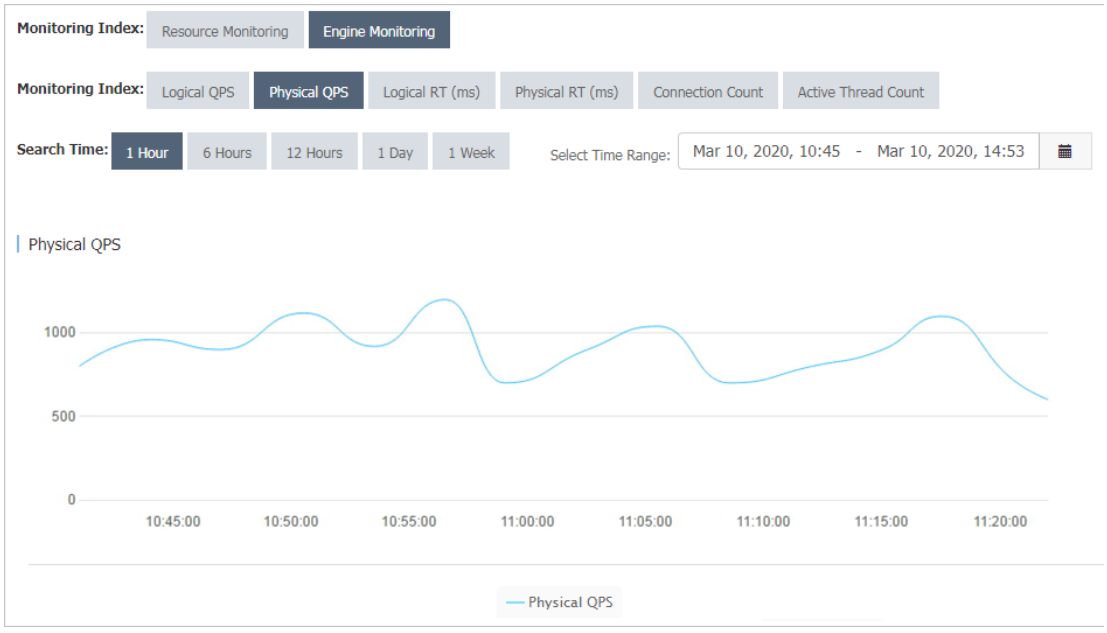
You can observe the difference between the logical queries per second (QPS) and physical QPS.

According to the monitoring data, the logical QPS and physical QPS have the same trends, but the difference between the two is relatively large and in a certain proportion.

Logical QPS



Physical QPS



As shown in the preceding figures, logical QPS fluctuates between 80 and 150, and physical QPS fluctuates between 700 and 1,200.

The reason is that PolarDB-X generates physical SQL statements based on logical SQL statements. The ratio of logical SQL statements to physical SQL statements is not necessarily 1:1. For example, a PolarDB-X logical table is created by using the following statement:

```
CREATE TABLE drds_user
(id int,
name varchar(30))
dbpartition by hash(id);
```

When the query condition contains the database shard key, PolarDB-X pushes the logical SQL statement down to the ApsaraDB RDS for MySQL instance for execution. According to the execution plan, the number of physical SQL statements is 1:

```
mysql> explain select name from drds_user where id = 1;
+----------------------------+-----------------------------------------------------------------------------+--------+
| GROUP_NAME          | SQL                                                 | PARAMS |
+----------------------------+-----------------------------------------------------------------------------+--------+
|   SANGUAN_BSQT_0001_RDS | select `drds_user`.`name` from `drds_user` where (`drds_user`.`id` = 1) | {}   |
+----------------------------+-----------------------------------------------------------------------------+--------+
```

When the query does not contain the database shard key, PolarDB-X partitions the logical SQL statement into multiple physical SQL statements. The following execution plan shows that there are eight physical SQL statements:

```
mysql> explain select name from drds_user where name = 'LiLei';
+---------- ---------------+-----------------------------------------------------------------------------+--------+
| GROUP_NAME          | SQL                                                 | PARAMS |
+----------------------------+-----------------------------------------------------------------------------+--------+
| SANGUAN_BSQT_0001_RDS   | select `drds_user`.`name` from `drds_user` where (`drds_user`.`name` = 'LiLei') | {}
|
| SANGUAN_BSQT_0001_RDS   | select `drds_user`.`name` from `drds_user` where (`drds_user`.`name` = 'LiLei') | {}
|
| SANGUAN_BSQT_0001_RDS   | select `drds_user`.`name` from `drds_user` where (`drds_user`.`name` = 'LiLei') | {}
|
| SANGUAN_BSQT_0001_RDS   | select `drds_user`.`name` from `drds_user` where (`drds_user`.`name` = 'LiLei') | {}
|
| SANGUAN_BSQT_0001_RDS   | select `drds_user`.`name` from `drds_user` where (`drds_user`.`name` = 'LiLei') | {}
|
| SANGUAN_BSQT_0001_RDS   | select `drds_user`.`name` from `drds_user` where (`drds_user`.`name` = 'LiLei') | {}
|
| SANGUAN_BSQT_0001_RDS   | select `drds_user`.`name` from `drds_user` where (`drds_user`.`name` = 'LiLei') | {}
|
| SANGUAN_BSQT_0001_RDS   | select `drds_user`.`name` from `drds_user` where (`drds_user`.`name` = 'LiLei') | {}
|
+----------------------------+-----------------------------------------------------------------------------+--------+
8 rows in set (0.06 sec)
```

Logical or physical QPS indicates the total number of logical or physical SQL statements processed per unit of time. When most SQL statements in the system contain the shard key, the ratio of logical QPS to physical QPS is close to 1:1. If the difference between the logical and physical QPS is too large, many SQL statements of the current application do not contain the shard key. In this case, check the SQL statements of the application to improve performance.

11.4.9.4.4. Example 4: High memory usage

The overly high memory usage of the PolarDB-X instance is mostly caused by the large number of SQL queries in your application and the overlarge result set that is returned. If the memory usage of your PolarDB-X instance remains at about 100%, perform the Restart a PolarDB-X instance operations to locate and optimize the slow SQL queries of your application.

11.4.10. View the instance version

You can view the PolarDB-X instance version in two ways.

View the instance version in the console

1. Log on to the PolarDB-X console.
2. On the **DRDS Instance Management** page, find the target instance.
3. Click the instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. In the **Configuration Information** section, view the value of **Current Version**.

View the instance version by using the *version()* function

Connect to the PolarDB-X instance through the MySQL command line and run the `SELECT version()` statement to view the version of the PolarDB-X instance.

```
mysql> select version();
+----------------------------+
| VERSION()                  |
+----------------------------+
| 5.6.29-TDDL-5.1.28-1320920 |
+----------------------------+
1 row in set (0.00 sec)
```

In the preceding statement, 5.1.28-1320920 indicates the version of the PolarDB-X instance.

11.5. Account management

11.5.1. Terms

This topic describes the terms of the PolarDB-X account and permission system.

The usage of the account and permission system in PolarDB-X is the same as that in MySQL. PolarDB-X supports statements such as `GRANT`, `REVOKE`, `SHOW GRANTS`, `CREATE USER`, `DROP USER`, and `SET PASSWORD`. Currently, PolarDB-X allows you to grant permissions at the database and table levels, but does not allow you to grant permissions at the global or column level.

For more information about the MySQL account and permission system, see MySQL official documentation.

> **Notice** Accounts created by using `CREATE USER` in PolarDB-X only exist in the PolarDB-X instance and will not be synchronized to the backend ApsaraDB RDS for MySQL instances.

Account

An account is specified by the user name and hostname in the username@'host' format. Accounts with the same user name but different hostnames are different accounts. For example, lily@30.9.73.96 and lily@30.9.73.100 are two different accounts, and their passwords and permissions may be different.

After a database is created in the PolarDB-X console, the system automatically creates two system accounts for the database: administrator account and read-only account. These two accounts are built-in accounts. You cannot delete them or modify their permissions.

- The administrator account name is the same as the database name. For example, if the database name is easydb, the administrator account name is easydb.
- The read-only account name is the database name suffixed with _RO. For example, if the database name is easydb, the read-only account name is easydb_RO.

Assume that the dreamdb and andordb databases are available. According to the preceding rules, the dreamdb database contains the dreamdb administrator account and the dreamdb_RO read-only account, while the andordb database contains the andordb administrator account and the andordb_RO read-only account.

Account rules

- Each administrator account has all permissions.
- Only the administrator account can create accounts and grant permissions. Other accounts can only be created and granted permissions by the administrator account.
- The administrator account is bound to a database and does not have permissions on other databases. It can only access the bound database, and cannot grant permissions of other databases to an account. For example, the easydb administrator account can only connect to the easydb database, and can only grant permissions of the easydb database or tables in the easydb database to an account.
- A read-only account has only the SELECT permission.

User name rules

- User names are case-insensitive.
- A user name must be 4 to 20 characters in length.
- A user name must start with a letter.
- A user name can contain letters and digits.

Password rules

- A password must be 6 to 20 characters in length.
- A password can contain letters, digits, and special characters (@ # $ % ^ & + =).

Hostname matching rules

- A hostname must be an IP address. It can contain underscores (_) and wildcards (%). A underscore (_) indicates a character and a wildcard (%) indicates no or more characters. Quote hostnames that contain wildcards with single quotations marks ('), for example, `lily@'30.9. %.%'` and `david@'%'`.
- If there are two user names that can be used to log on to the system, the user name with the longest prefix (the longest IP segment excluding wildcards) prevails. For example, if the `david@'30.9.12_.234'` and `david@'30.9.1%.234'` user names are available in the system, use `david@'30.9.12_.234'` to log on from the 30.9.127.234 host as david.
- When you enable the Virtual Private Cloud (VPC) access feature for a host, the IP address of the host changes. To avoid invalid configurations in the account and permission system, set the hostname to `'%'` to match any IP address.

Permission support

Permission support by level

- Global permission (not supported currently)
- Database-level permission (supported)
- Table-level permission (supported)
- Column-level permission (not supported currently)
- Subprogram-level permission (not supported currently)

Permissions

Currently, eight table-associated basic permissions are supported: `CREATE`, `DROP`, `ALTER`, `INDEX`, `INSERT`, `DELETE`, `UPDATE`, and `SELECT`.

- The `TRUNCATE` statement requires the table-level DROP permission.
- The `REPLACE` statement requires the table-level INSERT and DELETE permissions.
- `CREATE INDEX` and `DROP INDEX` statements are supported.
- The `CREATE SEQUENCE` statement requires the database-level CREATE permission.
- The `DROP SEQUENCE` statement requires the database-level DROP permission.
- The `ALTER SEQUENCE` statement requires the database-level ALTER permission.
- The `INSERT ON DUPLICATE UPDATE` statement requires the table-level INSERT and UPDATE permissions.

Permission rules

- Permissions are bound to an account (`username@'host'`) rather than a user name (`username`).
- An error occurs if the table does not exist during authorization.
- The database permissions in descending order are as follows: global permissions (not supported currently), database-level permissions, table-level permissions, and column-level permissions (not supported currently). A granted higher-level permission overwrites a lower-level permission. If you remove the higher-level permission, the lower-level permission is also removed.
- USAGE authorization is not supported.

11.5.2. Create an account

This topic describes how to create a PolarDB-X account in the PolarDB-X console and by using SQL statements.

Create an account in the console

1. Log on to the PolarDB-X console.
2. On the **DRDS Instance Management** page, find the target instance.
3. Click the instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. In the left-side navigation pane, choose **Configuration and Management > Account Management**.
5. On the **Account Management** page, click **Create Account** in the upper-right corner.
6. Configure the following parameters.

Parameter	Description
Database Account	Enter the account name. The account name must meet the following requirements: ○ The name must be 4 to 20 characters in length. ○ The name must start with a letter and end with a letter or digit. ○ The name can contain letters, digits, and underscores (_).
New Password	Enter an account password. The password must meet the following requirements: ○ The password must be 8 to 32 characters in length. ○ The password must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. ○ Special characters include ! @#$%^&*()_+-=
Confirm New Password	Enter the password again.

Parameter	Description
Authorization Databases	You can grant permissions on one or multiple databases to the account. i. Select one or more databases in the left-side section, and click **Add** to add them to the right-side section. ii. In the right-side section, select **Read/Write**, **Read-only**, **DDL Only**, or **DML Only**. **Note** You can also grant permissions on multiple authorized databases by clicking **Set All to Read-only**, **Set All to DDL Only**, **Set All to DML Only**, or **Set All to Read/Write** in the upper-right corner of the right-side section. The button in the upper-right corner changes as you click it. For example, after you click **Set All to Read-only**, the button is changed to **Set All to DDL Only**.

Create an account in the command line

Syntax rules:

```
CREATE USER user_specification [, user_specification] ...
 user_specification: user [ auth_option ]
 auth_option: IDENTIFIED BY 'auth_string'
```

Examples:

Create an account with the user name lily and password 123456, which can be used to log on only from 30.xx.xx.96.

```
CREATE USER lily@30.xx.xx.96 IDENTIFIED BY '123456';
```

Create an account named david with no password, which can be used to log on from any host.

```
CREATE USER david@'%';
```

11.5.3. Reset the password

When using PolarDB-X, you can reset the password of your database account in the PolarDB-X console or by using the command line.

Note

- Accounts with ROOT permissions cannot be deleted or modified.
- For data security, we recommend that you change your password periodically.

Reset the password in the console

1. Log on to the PolarDB-X console.
2. On the **DRDS Instance Management** page, find the target instance.
3. Click the instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. In the left-side navigation pane, choose **Configuration and Management > Account Management**.

5. Find the target account, and click **Reset Password**.
6. In the **Reset Account Password** dialog box, set **New Password** and **Confirm New Password**.

   > **Note** The password must meet the following requirements:
   > - The password must be 8 to 32 characters in length.
   > - The password must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters.
   > - Special characters include ! @#$%^&*()_+-=

7. After you confirm that the password is correct, click **OK**.

Reset the password in the command line

Syntax rules:

```
SET PASSWORD FOR user = password_option
password_option: {
  PASSWORD('auth_string')
}
```

Examples:

Change the password of the account lily@30.xx.xx.96 to 123456.

```
SET PASSWORD FOR lily@30.xx.xx.96 = PASSWORD('123456')
```

11.5.4. Modify account permissions

You can modify the account permissions of your instances at any time when using PolarDB-X.

Precautions

- Privileged accounts cannot be modified.
- In the console, you can only grant data manipulation language (DML), data definition language (DDL), read-only, and read/write permissions to standard accounts. To grant more permissions, use the command line.

Modify account permissions in the console

1. Log on to the PolarDB-X console.
2. On the **DRDS Instance Management** page, find the target instance.
3. Click the instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. In the left-side navigation pane, choose **Configuration and Management > Account Management**.
5. Find the target account and click **Modify Permission**.
6. In the **Modify Permissions** dialog box, **grant** or **remove** the permissions on one or more databases to or from the account.
   - Authorize a database:

     Select one or more databases in the left-side section, and click **Add** to add them to the right-side section.
   - Remove an authorized database:

     Select one or more databases in the right-side section, and click **Remove** to remove them. The removed databases are displayed in the left-side section.

- Modify permissions of an authorized database:

  In the right-side section, select **Read/Write**, **Read-only**, **DDL Only** or **DML Only**.

  > **Note** You can also grant permissions on multiple authorized databases by clicking **Set All to Read-only**, **Set All to DDL Only**, **Set All to DML Only**, or **Set All to Read/Write** in the upper-right corner of the right-side section.
  >
  > The button in the upper-right corner changes as you click it. For example, after you click **Set All to Read-only**, the button is changed to **Set All to DDL Only**.

7. After the configuration is complete, click **OK**.

GRANT statements

Syntax rules:

```
GRANT
  priv_type[, priv_type] ...
  ON priv_level
  TO user_specification [, user_specification] ...
  [WITH GRANT OPTION]
priv_level: {
 | db_name.*
 | db_name.tbl_name
 | tbl_name
}
user_specification:
  user [ auth_option ]
auth_option: {
  IDENTIFIED BY 'auth_string'
}
```

> **Notice**
>
> - If the account in the GRANT statement does not exist and no IDENTIFIED BY information is provided, an error message indicating that the account does not exist is returned.
> - If the account specified in the GRANT statement does not exist but the IDENTIFIED BY information is provided, the account is created and granted with the specified permission.

For example, in the easydb database, create an account named david, which can be used to log on from any host and has all the permissions on easydb.

Method 1: Create an account and then grant permissions to the account.

```
CREATE USER david@'%' IDENTIFIED BY 'your#password';
GRANT ALL PRIVILEGES ON easydb.* to david@'%';
```

Method 2: Create an account and grant permissions to the account by using one statement.

```
GRANT ALL PRIVILEGES ON easydb.* to david@'%' IDENTIFIED BY 'your#password';
```

In the easydb database, create an account named hanson, which can be used to log on from any host and has all the permissions on the easydb.employees table.

```
GRANT ALL PRIVILEGES ON easydb.employees to hanson@'%' IDENTIFIED BY 'your#password';
```

In the easydb database, create an account named hanson, which can be used to log on only from 192.xx. xx.10 and has the INSERT and SELECT permissions on the easydb.emp table.

```
GRANT INSERT,SELECT ON easydb.emp to hanson@'192.xx.xx.10' IDENTIFIED BY 'your#password';
```

In the easydb database, create a read-only account named actro, which can be used to log on from any host.

```
GRANT SELECT ON easydb.* to actro@'%' IDENTIFIED BY 'your#password';
```

REVOKE statements

Syntax rules:

- Delete the permissions at a certain level from an account. The permission level is specified by priv_level.

```
REVOKE
  priv_type
   [, priv_type] ...
  ON priv_level
  FROM user [, user] ...
```

- Delete all permissions of the account at the database and table levels.

```
REVOKE ALL PRIVILEGES, GRANT OPTION
  FROM user [, user] ...
```

Examples:

Delete the CREATE, DROP, and INDEX permissions from hanson@'%' on the easydb.emp table.

```
REVOKE CREATE,DROP,INDEX ON easydb.emp FROM hanson@'%';
```

Delete all permissions from the account lily@30.xx.xx.96.

```
REVOKE ALL PRIVILEGES,GRANT OPTION FROM lily@30.xx.xx.96;
```

Notice GRANT OPTION must be added to the statement for compatibility with MySQL.

SHOW GRANTS statements

Syntax rules:

```
SHOW GRANTS[FOR user@host];
```

Query all permissions:

```
SHOW GRANTS;
```

Query the permissions of an account:

```
SHOW GRANTS FOR user@host;
```

11.5.5. Delete an account

You can delete an account in the Cloud Native Distributed Database PolarDB-X (PolarDB-X) console or by using the command line.

Delete an account in the console

> **Note** You can only delete standard accounts that are created in the console.

1. Log on to the PolarDB-X console.
2. On the **DRDS Instance Management** page, find the target instance.
3. Click the instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. In the left-side navigation pane, choose **Configuration and Management > Account Management**.
5. Find the target account and click **Delete**.
6. In the **Delete Account** dialog box, click **OK**.

Delete an account by using the command line

Syntax rules:

```
DROP USER user [, user] ...
```

Examples:

Delete the account lily@30.xx.xx.96:

```
DROP USER lily@30.xx.xx.96;
```

11.6. Database management

11.6.1. Create a database

After you create a PolarDB-X instance, create a database that runs on one or more ApsaraDB RDS for MySQL instances.

Prerequisites

- An ApsaraDB RDS for MySQL instance is created in the same department of the PolarDB-X instance.
- The permissions on Resource Access Management (RAM) resources are granted. For more information about how to grant permissions, see *RAM management* in *Apsara Uni-manager user guide*.

1. Log on to the PolarDB-X console.
2. Find the target instance in the instance list.
3. Click the target instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. On the **Basic Information** page, click **Create Database** in the upper-right corner.
5. In the **Enter Basic Information** step, configure the following parameters:

Parameter	Description
Partition Mode	Select **Horizontal Partition**.

Parameter	Description
Database Name	Enter a custom name for the PolarDB-X database. The name must meet the following requirements: ○ The name must be 2 to 24 characters in length. ○ The name must start with a letter and end with a letter or a digit. ○ The name can contain lowercase letters, digits, and underscores (_). ○ The name must be unique on the instance.
Character Set	Select utf8, gbk, latin1, or utf8mb4.
DRDS Link Password	Set the password for the database in PolarDB-X. The password must meet the following requirements: ○ The password must be 8 to 30 characters in length. ○ The password must contain at least three of the following types: uppercase letters, lowercase letters, digits, and underscores (_).
Confirm Password	Enter the password again.

6. Click **Next**.
7. In the **Select RDS Instance** step, select **Buy New RDS Instance** or **Use Existing RDS Instance**.
   i. **Buy New RDS Instance**: Click the **Buy New RDS Instance** tab.
   ii. Set **Storage Type**, **Series**, **Instance Specifications**, **Storage Capacity**, **Availability Zone**, and **Quantity**.
   iii. Click **Next**.
   i. **Use Existing RDS Instance**: Click the **Use Existing RDS Instance** tab.
   ii. In the left-side section, click the ApsaraDB RDS for MySQL instances that you want to add.
   iii. Click > to add the selected instances to the **Selected RDS Instances** section on the right side.
   iv. Click **Next**.
8. After the precheck is successful in the **Precheck** step, click **Next**.

   Note If the precheck fails, fix the issue based on the instructions on the page.
9. In the **Preview** step, click **Next**. Wait until the database is created.

11.6.2. View a database

After the database is created, you can view the basic information of the database in database management in the console.

Procedure

1. Log on to the PolarDB-X console.
2. On the **DRDS Instance Management** page, find the target instance.
3. Click the instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. In the left-side navigation pane, choose **Configuration and Management > Database Management**.
5. Find the target database, and click **Manage**. The **Basic Information** page of the database appears.

> **Note** On the **Basic Information** page, you can delete the database or reset the password.

What's next

PolarDB-X is fully compatible with the MySQL protocol. You can use **Command Line URL** on the MySQL client to connect to the PolarDB-X instance and enter the user name and password to log on to the PolarDB-X database. When using the MySQL client, note the following points:

> **Note**
> - Some MySQL clients of earlier versions have limits on the user name length, which cannot be more than 16 characters. The PolarDB-X database name and user name are the same. If the database name exceeds 16 characters, an error is reported.
> - When using the MySQL client, you must add the `-c` parameter to the hint command. In PolarDB-X, HINT is implemented by using annotations. If the `-c` parameter is not added, the annotation is lost and the PolarDB-X hint is lost.

11.6.3. Perform smooth scale-out

When the underlying storage of the logical database reaches the physical bottleneck, for example, when the remaining disk space is about 30%, you can smoothly scale it out to improve the performance. The smooth scale-out process is divided into four steps: configuration > migration > switchover > cleanup.

Configuration

> **Note** In smooth scale-out, ApsaraDB RDS for MySQL instances are added, and some source database shards are migrated to the new ApsaraDB RDS for MySQL instances. In this way, the overall data storage capacity is increased and the number of requests that a single ApsaraDB RDS for MySQL instance needs to process is reduced.

1. Log on to the PolarDB-X console.
2. On the **DRDS Instance Management** page, find the target instance.
3. Click the instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. In the left-side navigation pane, choose **Configuration and Management > Database Management**.
5. Find the target database, and click **Manage**. The **Basic Information** page of the database appears.
6. In the left-side navigation pane, choose **Configuration and Management > Scale-out Management**.
7. In the upper-right corner of the **Scale-out Management** page, click **Scale Out**.
8. Select **Smooth Scale-out**, and then click **Next**.
9. After all prechecks are passed on the **Precheck** page, click **Next**.

   > **Note** If a precheck fails, rectify the configuration as prompted.

10. On the **Select RDS Instance** page, you can click the **Buy New RDS Instance** or **Use Existing RDS Instance** tab.
    i. **Buy New RDS Instance**: Click the **Buy New RDS Instance** tab.
    ii. Set **Storage Type**, **Edition**, and **Storage Capacity**.
    iii. Click **Next**.
    i. **Use Existing RDS Instance**: Click the **Use Existing RDS Instance** tab.

ii. Click the ApsaraDB RDS for MySQL instances to be added on the left.

iii. Click > to move the selected instances to the **Selected RDS Instances** section on the right.

iv. Click **Next**.

11. On the **Preview** page, click **Start Scale-out**.

> **Note** By default, the console evenly distributes the physical database shards to the ApsaraDB RDS for MySQL instances you added. You can also manually add or delete physical database shards to or from the new ApsaraDB RDS for MySQL instances.

12. Click the icon in the upper-right corner to view the details of the scale-out task.

Migration

Some physical database shards are migrated during smooth scale-out.

The migration does not change the data in the source database, and therefore it does not affect online services. Before the switchover, you can cancel the smooth scale-out operation through a rollback.

> **Note**
> - This is because before the switchover, the current scale-out operation does not have a real impact on the data in the source database.
> - During scale-out, the binary log files of the source ApsaraDB RDS for MySQL instance are not cleaned, which may result in insufficient disk space. Therefore, you must reserve sufficient disk space on the source ApsaraDB RDS for MySQL instance. Generally, the remaining disk space should be more than 30%. If the disk space cannot be guaranteed, you can submit a ticket to expand the ApsaraDB RDS for MySQL storage space.
> - To reduce the pressure of read operations on the source ApsaraDB RDS for MySQL instance, perform scale-out when the load on the source ApsaraDB RDS for MySQL instance is low.
> - During the scale-out, do not submit data description language (DDL) tasks in the console or connect to the PolarDB-X instance to directly run DDL statements. Otherwise, the scale-out task may fail.
> - Make sure that all tables in the source database have primary keys before scale-out.

After historical data and incremental data are migrated, the migration progress reaches 100%. Then, you can **switch** the read and write traffic to the new ApsaraDB RDS for MySQL instance or **roll back** to cancel this scale-out.

Switchover

The switchover task switches the read and write traffic to the new ApsaraDB RDS for MySQL instance. The whole process takes 3 to 5 minutes. During the switchover process, the service is not affected except for one or two transient disconnections. Perform the switchover during off-peak hours.

1. In the upper-right corner of the **Basic Information** page, click the icon. The **Task Progress** dialog box appears.
2. In the **Task Progress** dialog box, click **Switch Over** and then **OK**.

   During the switchover process, a switchover task is generated and displayed in the Task Progress dialog box.
3. After the switchover is complete, the **Clean Up** button appears in the **Task Progress** dialog box, which means that the switchover task is complete.

Cleanup

In this step, the migrated database shards are deleted from the source ApsaraDB RDS for MySQL instance.

1. After switchover is complete, click **Clean Up** next to the target task.
2. Click **OK**. A cleanup task appears in the Task Progress dialog box.

> **Note**
> - The cleanup task is an asynchronous task. You can view the execution status in the Task Progress dialog box.
> - After the cleanup task is complete, the smooth scale-out process ends. The new ApsaraDB RDS for MySQL instance becomes the storage node of the PolarDB-X logical database.
> - Currently, you can implement smooth scale-out by migrating physical database shards. If no further scale-out is allowed after the number of database shards exceeds the capacity of a single ApsaraDB RDS for MySQL instance, you can submit a ticket to apply for increasing the number of database shards and scaling out the database. In this case, Hash calculation is performed again to reallocate data.
> - The cleanup task deletes database shards that are no longer used after the current scale-out. You can back up the database shards before running the cleanup task.
> - The cleanup operation brings pressure to databases. We recommend that you perform this operation during off-peak hours.

11.6.4. View database monitoring information

PolarDB-X displays the historical monitoring information of a PolarDB-X database in two dimensions: data metrics and query time.

Procedure

1. Log on to the PolarDB-X console.
2. On the **DRDS Instance Management** page, find the target instance.
3. Click the instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. In the left-side navigation pane, choose **Monitoring and Alerts > Database Monitoring**.
5. Select **Data Indexes** and **Query Time**. Then, the corresponding monitoring information appears.

> **Note** For more information about instance-level monitoring, see View monitoring information.

11.6.5. Set the IP address whitelist

PolarDB-X provides the access control function. Only IP addresses in the whitelist of a database can access the database.

Procedure

1. Log on to the PolarDB-X console.
2. On the **DRDS Instance Management** page, find the target instance.
3. Click the instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. In the left-side navigation pane, choose **Configuration and Management > Database Management**.
5. Find the target database, and click **Manage**. The **Basic Information** page of the database appears.
6. On the **Basic Information** page of the database, choose **Data Security > Whitelist Settings** from the left-

side navigation pane.

7. On the Whitelist Settings page, click **Manually Modify**.
8. Enter the IP address that is allowed to access the database, and click **OK**.

> **Note**
> - The whitelist supports the following formats:
>   - IP address, for example, 192.168.1.1.
>   - CIDR IP address, for example, 192.168.1.1/24.
>   - IP address with an asterisk (*) as the wildcard, for example, 192.168.1. *, indicating that access is allowed from any host with an IP address in the range of 192.168.1.1 to 192.168.1.254.
>   - CIDR block, for example, 192.168.1.1-192.168.1.254.
> - If you want to add multiple IP addresses or CIDR blocks, separate them with commas (,) without spaces, for example, 192.168.0.1,172.16.213.9.

11.6.6. Delete a database

This topic describes how to delete a database in the Cloud Native Distributed Database PolarDB-X (PolarDB-X) console.

Procedure

1. Log on to the PolarDB-X console.
2. On the **DRDS Instance Management** page, find the target instance.
3. Click the instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. In the left-side navigation pane, choose **Configuration and Management > Database Management**.
5. Find the target database and click **Delete**.

> **Warning** You cannot recover databases that have been deleted. Exercise caution when you perform this operation.

6. In the **Delete Database** dialog box, click **OK**.

11.6.7. Fix database shard connections

Context

When using a PolarDB-X instance, you need to access ApsaraDB RDS for MySQL. If the network configuration of the connected ApsaraDB RDS for MySQL instance changes, for example, if the zone is switched or the network type is changed from classic to Virtual Private Cloud (VPC), the network connection between the PolarDB-X instance and the ApsaraDB RDS for MySQL instance is broken. As a result, the PolarDB-X instance cannot access the ApsaraDB RDS for MySQL instance. In this case, you must manually fix the database shard link in the PolarDB-X console to restore the network connection from the PolarDB-X instance to the ApsaraDB RDS for MySQL instance.

Procedure

1. Log on to the PolarDB-X console.
2. On the **DRDS Instance Management** page, find the target instance.
3. Click the instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.

4. In the left-side navigation pane, choose **Configuration and Management > Database Management**.
5. Find the target database, and click **Manage**. The **Basic Information** page of the database appears.
6. In the **Shortcuts** section, click **Fix Database Shard Connections**.
7. In the pop-up window, click **OK**.

11.7. Custom control commands

PolarDB-X provides a series of auxiliary SQL commands to help you conveniently use PolarDB-X.

11.7.1. Overview

PolarDB-X provides unique auxiliary statements for you to use and maintain PolarDB-X.

Syntax description: The identifier provided by the user is in [] and optional content is in (). In addition, this document applies to the current version. If some statements are unavailable, the version is earlier than required.

11.7.2. Help statements

This topic describes all the auxiliary SQL commands of PolarDB-X and their descriptions.

SHOW HELP statements:

```
mysql> show help;
+----------------------------------------+-----------------------------------------------------------+-----------------------------------------+
| STATEMENT                              | DESCRIPTION                                               | EXAMPLE                                 |
+----------------------------------------+-----------------------------------------------------------+-----------------------------------------+
| show rule                              | Report all table rule                                     |                                         |
| show rule from TABLE                   | Report table rule                                         | show rule from user                     |
| show full rule from TABLE              | Report table full rule                                    | show full rule from user                |
| show topology from TABLE               | Report table physical topology                            | show topology from user                 |
| show partitions from TABLE             | Report table dbPartition or tbPartition columns           | show partitions from user               |
|
| show broadcasts                        | Report all broadcast tables                               |                                         |
| show datasources                       | Report all partition db threadPool info                   |                                         |
| show node                              | Report master/slave read status                           |                                         |
| show slow                              | Report top 100 slow sql                                   |                                         |
| show physical_slow                     | Report top 100 physical slow sql                          |                                         |
| clear slow                             | Clear slow data                                           |                                         |
| trace SQL                              | Start trace sql, use show trace to print profiling data | trace select count(*) from user; show tra
ce |
| show trace                             | Report sql execute profiling info                         |                                         |
| explain SQL                            | Report sql plan info                                      | explain select count(*) from user       |
| explain detail SQL                     | Report sql detail plan info                               | explain detail select count(*) from user  |
| explain execute SQL                    | Report sql on physical db plan info                       | explain execute select count(*) from user  |

```

11.7.3. Statements for viewing rules and node topologies

SHOW RULE [FROM tablename]

Usage notes:

- `show rule` : shows the partitioning status of each logical table in a database.
- `show rule from tablename` : shows the partitioning status of a specified logical table in a database.

The following describes the meanings of important columns:

- BROADCAST: indicates whether the table is a broadcast table. 0 indicates "No" and 1 indicates "Yes".
- DB_PARTITION_KEY: indicates the database shard key. If no database shards exist, the parameter value is NULL.
- DB_PARTITION_POLICY: indicates the database sharding policy. Options are Hash and date policies such as YYYYMM, YYYYDD, and YYYYWEEK.
- DB_PARTITION_COUNT: indicates the number of database shards.
- TB_PARTITION_KEY: indicates the table shard key. If no table shards exist, the parameter value is NULL.
- TB_PARTITION_POLICY: indicates the table sharding policy. Options are Hash and date policies such as MM, DD, MMDD, and WEEK.
- TB_PARTITION_COUNT: indicates the number of table shards.

```
mysql> show rule;
+------+--------------+-----------+-----------------+--------------------+--------------------+-----------------+--------------------+-------------------
-+
| ID   | TABLE_NAME   | BROADCAST | DB_PARTITION_KEY | DB_PARTITION_POLICY | DB_PARTITION_COUNT | TB_PARTITIO
N_KEY | TB_PARTITION_POLICY | TB_PARTITION_COUNT |
+------+--------------+-----------+-----------------+--------------------+--------------------+-----------------+--------------------+-------------------
-+
|  0 | dept_manager |     0 |           | NULL         | 1          |          | NULL         | 1          |
|  1 | emp          |     0 | emp_no       | hash         | 8          | id       | hash         | 2          |
|  2 | example      |     0 | shard_key    | hash         | 8          |          | NULL         | 1          |
+------+--------------+-----------+-----------------+--------------------+--------------------+-----------------+--------------------+-------------------
-+
3 rows in set (0.01 sec)
```

SHOW FULL RULE [FROM tablename]

You can run this SQL statement to view the sharding rules of logical tables in a database. It displays more detailed information than the SHOW RULE command.

The following describes the meanings of important columns:

- BROADCAST: indicates whether the table is a broadcast table. 0 indicates "No" and 1 indicates "Yes".
- JOIN_GROUP: a reserved field.
- ALLOW_FULL_TABLE_SCAN: indicates whether to allow data querying when no table shard key is specified for database or table sharding. If this parameter is set to True, each physical table is scanned to find data that meets the condition, which is a full table scan.
- DB_NAME_PATTERN: The value 0 between {} in DB_NAME_PATTERN is a placeholder. When the SQL statement is run, this value is replaced by the value of DB_RULES_STR, with the number of digits unchanged. For example, if the value of DB_NAME_PATTERN is SEQ_{0000}_RDS and the value of DB_RULES_STR is [1,2,3,4], four DB_NAME values are generated: SEQ_0001_RDS, SEQ_0002_RDS, SEQ_0003_RDS, and SEQ_0004_RDS.
- DB_RULES_STR: indicates the database sharding rule.
- TB_NAME_PATTERN: The value 0 between {} in TB_NAME_PATTERN is a placeholder. When the SQL statement is run, this value is replaced by the value of TB_RULES_STR, with the number of digits unchanged. For example, if the value of TB_NAME_PATTERN is table_{00} and the value of TB_RULES_STR is [1,2,3,4,5,6,7,8], eight tables are generated: table_01, table_02, table_03, table_04, table_05, table_06, table_07, and table_08.
- TB_RULES_STR: indicates the table sharding rule.
- PARTITION_KEYS: indicates a set of database and table shard keys. When database sharding and table sharding coexist, the database shard key is placed before the table shard key.
- DEFAULT_DB_INDEX: indicates the database shard in which a single database and a single table are stored.

```
mysql> show full rule;
+------+-------------+----------+-----------+---------------------+---------------------------------------------------+----------------------------------
-----------------+----------------+--------------------------------+---------------+---------------------------------------------+
| ID  | TABLE_NAME  | BROADCAST | JOIN_GROUP | ALLOW_FULL_TABLE_SCAN | DB_NAME_PATTERN                    | DB_
RULES_STR                      | TB_NAME_PATTERN | TB_RULES_STR             | PARTITION_KEYS | DEFAULT_DB_INDEX
|
+------+-------------+----------+-----------+---------------------+---------------------------------------------------+----------------------------------
-----------------+----------------+--------------------------------+---------------+---------------------------------------------+
|   0 | dept_manager |      0 | NULL    |              0 | SEQ_TEST_1487767780814RGKKSEQ_TEST_WNJG_0000_RDS  | NULL
| dept_manager   | NULL                  | NULL       | SEQ_TEST_1487767780814RGKKSEQ_TEST_WNJG_0000_RDS |
|   1 | emp        |       0 | NULL     |             1 | SEQ_TEST_1487767780814RGKKSEQ_TEST_WNJG_{0000}_RDS | ((#emp_no,1,

+------+-------------+----------+-----------+---------------------+---------------------------------------------------+----------------------------------
-----------------+----------------+--------------------------------+---------------+---------------------------------------------+
3 rows in set (0.01 sec)
```

SHOW TOPOLOGY FROM tablename

You can run this SQL statement to view the topology of a specified logical table, that is, the database shards to which data in the logical table is partitioned and the table shards in each database shard.

```
mysql> show topology from emp;
+------+--------------------------------------------------+------------+
| ID  | GROUP_NAME                          | TABLE_NAME |
+------+--------------------------------------------------+------------+
|   0 | SEQ_TEST_1487767780814RGKKSEQ_TEST_WNJG_0000_RDS | emp_0     |
|   1 | SEQ_TEST_1487767780814RGKKSEQ_TEST_WNJG_0000_RDS | emp_1     |
|   2 | SEQ_TEST_1487767780814RGKKSEQ_TEST_WNJG_0001_RDS | emp_0     |
|   3 | SEQ_TEST_1487767780814RGKKSEQ_TEST_WNJG_0001_RDS | emp_1     |
|   4 | SEQ_TEST_1487767780814RGKKSEQ_TEST_WNJG_0002_RDS | emp_0     |
|   5 | SEQ_TEST_1487767780814RGKKSEQ_TEST_WNJG_0002_RDS | emp_1     |
|   6 | SEQ_TEST_1487767780814RGKKSEQ_TEST_WNJG_0003_RDS | emp_0     |
|   7 | SEQ_TEST_1487767780814RGKKSEQ_TEST_WNJG_0003_RDS | emp_1     |
|   8 | SEQ_TEST_1487767780814RGKKSEQ_TEST_WNJG_0004_RDS | emp_0     |
|   9 | SEQ_TEST_1487767780814RGKKSEQ_TEST_WNJG_0004_RDS | emp_1     |
|  10 | SEQ_TEST_1487767780814RGKKSEQ_TEST_WNJG_0005_RDS | emp_0     |
|  11 | SEQ_TEST_1487767780814RGKKSEQ_TEST_WNJG_0005_RDS | emp_1     |
|  12 | SEQ_TEST_1487767780814RGKKSEQ_TEST_WNJG_0006_RDS | emp_0     |
|  13 | SEQ_TEST_1487767780814RGKKSEQ_TEST_WNJG_0006_RDS | emp_1     |
|  14 | SEQ_TEST_1487767780814RGKKSEQ_TEST_WNJG_0007_RDS | emp_0     |
|  15 | SEQ_TEST_1487767780814RGKKSEQ_TEST_WNJG_0007_RDS | emp_1     |
+------+--------------------------------------------------+------------+
16 rows in set (0.01 sec)
```

SHOW PARTITIONS FROM tablename

You can run this SQL statement to view the set of database shard keys and table shard keys, which are separated by commas (,). If the final result contains two values, both database sharding and table sharding are performed. The first value is the database shard key and the second value is the table shard key. If only one value is returned, only database sharding is performed. This value is the database shard key.

```
mysql> show partitions from emp;
+-----------+
| KEYS      |
+-----------+

1 row in set (0.00 sec)
```

SHOW BROADCASTS

You can run this SQL statement to view the list of broadcast tables.

```
mysql> show broadcasts;
+------+------------+
| ID   | TABLE_NAME |
+------+------------+
|    0 | brd2       |
|    1 | brd_tbl    |
+------+------------+
2 rows in set (0.01 sec)
```

SHOW DATASOURCES

You can run this SQL statement to view the information about the underlying storage, including the database name, database group name, connection URL, user name, storage type, read/write weight, and connection pool information.

The following describes the meanings of important columns:

- SCHEMA: indicates the database name.
- GROUP: indicates the database group name. Grouping aims to manage multiple groups of databases that have identical data, such as the primary and secondary databases after data replication through ApsaraDB RDS for MySQL. It is mainly used for read/write splitting and primary/secondary switchovers.
- URL: indicates the connection information of the underlying ApsaraDB RDS for MySQL instance.
- TYPE: indicates the type of the underlying storage. Currently, only ApsaraDB RDS for MySQL instances are supported.
- READ_WEIGHT: indicates the read weight of the database. When the primary ApsaraDB RDS for MySQL instance is under a heavy load of many read requests, you can use the read/write splitting function of PolarDB-X to distribute the read traffic. PolarDB-X automatically identifies the read and write traffic. It directs the write traffic to the primary ApsaraDB RDS for MySQL instance and the read traffic to all ApsaraDB RDS for MySQL instances based on the configured weight.
- WRITE_WEIGHT: indicates the write weight. For more information, see READ_WEIGHT.

```
mysql> show datasources;
+------+--------------------------+--------------------------------------------+----------------------------------------------+----------------------
---------------------------------------------------------+-----------+-------+------+------+------+-------------+----------+-------------+--------------
+--------------------------------------------+------------+-------------+

SHOW NODE

You can run this SQL statement to view the accumulative number of read and write operations and accumulative read/write weights of a physical database.

The following describes the meanings of important columns:

- MASTER_READ_COUNT: indicates the accumulative number of read-only queries processed by the primary ApsaraDB RDS for MySQL instance.
- SLAVE_READ_COUNT: indicates the accumulative number of read-only queries processed by the secondary ApsaraDB RDS for MySQL instances.
- MASTER_READ_PERCENT: indicates the actual percentage of read-only queries processed by the primary

ApsaraDB RDS for MySQL instance, not the configured percentage.

- SLAVE_READ_PERCENT: indicates the actual percentage of read-only queries processed by the secondary ApsaraDB RDS for MySQL instances, not the configured percentage.

> **Note**
> - Read-only queries in transactions are sent to the primary ApsaraDB RDS for MySQL instance.
> - The `MASTER_READ_PERCENT` and `SLAVE_READ_PERCENT` fields indicate the accumulative historical data. After the read/write weight ratio has been changed, these values do not immediately reflect the latest read/write weight ratio, which appears after a long period of time has passed.

```
mysql> show node;
+------+-------------------------------------------------+------------------+-----------------+--------------------+--------------------+
| ID   | NAME                                            | MASTER_READ_COUNT | SLAVE_READ_COUNT | MASTER_READ_PERCENT | SLAVE_READ_

11.7.4. SQL tuning statements

SHOW [FULL] SLOW [WHERE expr] [limit expr]

SQL statements that take more than 1 second to execute are slow SQL statements. Slow logical SQL statements are the slow SQL statements sent from an application to a PolarDB-X instance.

- `SHOW SLOW`: You can run this SQL statement to view the 100 slowest logical SQL queries that are recorded since the PolarDB-X instance is started or the last time when `CLEAR SLOW` is executed.

  > **Note** The recorded 100 slowest SQL queries are stored in the PolarDB-X system. When the PolarDB-X instance is restarted or executes `CLEAR SLOW`, these queries will be discarded.

- `SHOW FULL SLOW`: You can run this SQL statement to view all the slow logical SQL queries that are recorded and persisted to the built-in database of the PolarDB-X instance since the PolarDB-X instance is started. The upper limit for the number of records is specified in the specifications of the PolarDB-X instance. The PolarDB-X instance scrolls to delete the earliest slow SQL statements. If the specifications of the PolarDB-X instance is 4-core 4 GB, a maximum of 10,000 slow SQL statements can be recorded, including slow logical and physical SQL statements. If the specifications of the PolarDB-X instance is 8-core 8 GB, a maximum of 20,000 slow SQL statements can be recorded, including slow logical and physical SQL statements. The same rule applies to other specifications.

The following describes the meanings of important columns:

- HOST: the IP address of the host from which the SQL statement is sent.
- START_TIME: the time when the SQL statement starts to be executed.
- EXECUTE_TIME: the time when the SQL statement is executed.
- AFFECT_ROW: For data manipulation language (DML) statements, this parameter indicates the number of affected rows. For query statements, this parameter indicates the number of returned records.

```
mysql> show slow where execute_time > 1000 limit 1;
+-----------+---------------------+--------------+------------+-----------+
| HOST      | START_TIME          | EXECUTE_TIME | AFFECT_ROW | SQL       |
+-----------+---------------------+--------------+------------+-----------+
| 127.0.0.1 | 2016-03-16 13:02:57 |         2785 |          7 | show rule |
+-----------+---------------------+--------------+------------+-----------+
1 row in set (0.02 sec)
```

SHOW [FULL] PHYSICAL_SLOW [WHERE expr] [limit expr]

SQL statements that take more than 1 second to execute are slow SQL statements. Slow logical SQL statements are the slow SQL statements sent from an application to a PolarDB-X instance.

- `SHOW SLOW` : You can run this SQL statement to view the 100 slowest logical SQL queries that are recorded since the PolarDB-X instance is started or the last time when `CLEAR SLOW` is executed.

  > **Note** The recorded 100 slowest SQL queries are stored in the PolarDB-X system. When the PolarDB-X instance is restarted or executes `CLEAR SLOW` , these queries will be discarded.

- `SHOW FULL SLOW` : You can run this SQL statement to view all the slow logical SQL queries that are recorded and persisted to the built-in database of the PolarDB-X instance since the PolarDB-X instance is started. The upper limit for the number of records is specified in the specifications of the PolarDB-X instance. The PolarDB-X instance scrolls to delete the earliest slow SQL statements. If the specifications of the PolarDB-X instance is 4-core 4 GB, a maximum of 10,000 slow SQL statements can be recorded, including slow logical and physical SQL statements. If the specifications of the PolarDB-X instance is 8-core 8 GB, a maximum of 20,000 slow SQL statements can be recorded, including slow logical and physical SQL statements. The same rule applies to other specifications.

The following describes the meanings of important columns:

- GROUP_NAME: the name of the group to which the database that executes the SQL statement belongs.
- START_TIME: the time when the SQL statement starts to be executed.
- EXECUTE_TIME: the time when the SQL statement is executed.
- AFFECT_ROW: For data manipulation language (DML) statements, this parameter indicates the number of affected rows. For query statements, this parameter indicates the number of returned records.

```
mysql> show physical_slow;
+---------------+---------------------------------+---------------------+--------------+-----------------+-------------------------+-----------------------
-+------------+----------------+
| GROUP_NAME    | DBKEY_NAME                      | START_TIME          | EXECUTE_TIME | SQL_EXECUTE_TIME | GETLOCK_CONNECT
ION_TIME | CREATE_CONNECTION_TIME | AFFECT_ROW | SQL         |
+---------------+---------------------------------+---------------------+--------------+-----------------+-------------------------+-----------------------
-+------------+----------------+
| TDDL5_00_GROUP | db218249098_sqa_zmf_tddl5_00_3309 | 2016-03-16 13:05:38 |         1057 |            1011 |                       0 |
0 |          1 | select sleep(1) |
+---------------+---------------------------------+---------------------+--------------+-----------------+-------------------------+-----------------------
-+------------+----------------+
1 row in set (0.01 sec)
```

CLEAR SLOW

You can run this SQL statement to clear the 100 slowest logical SQL queries and the 100 slowest physical SQL queries that are recorded since the PolarDB-X instance is started or the last time when `CLEAR SLOW` is executed.

> **Note** Both `SHOW SLOW` and `SHOW PHYSICAL_SLOW` can be executed to display the 100 slowest SQL statements. If `CLEAR SLOW` has not been executed for a long time, these SQL statements may have been recorded a long time ago. Therefore, after SQL tuning statements are executed, we recommend that you execute `CLEAR SLOW`. After the system runs for a while, check the tuning results of slow SQL statements.

```
mysql> clear slow;
Query OK, 0 rows affected (0.00 sec)
```

EXPLAIN SQL

You can run this SQL statement to view the execution plan of a specified SQL statement in the PolarDB-X. Note that this SQL statement is not truly executed.

Example:

You can run this SQL statement to view the execution plan of the SQL `select * from doctest` statement. The doctest table is stored in database shards according to values in the id column. According to the execution plan, the SQL statement will be routed to each database shard for execution, and the execution results will be aggregated.

```
mysql> explain select * from doctest;
+------------------------------------------------+--------------------------------------+--------+
| GROUP_NAME                                     | SQL                                  | PARAMS |
+------------------------------------------------+--------------------------------------+--------+
| DOCTEST_1488704345426RCUPDOCTEST_CAET_0000_RDS | select `doctest`.`id` from `doctest` | {}     |
| DOCTEST_1488704345426RCUPDOCTEST_CAET_0001_RDS | select `doctest`.`id` from `doctest` | {}     |
| DOCTEST_1488704345426RCUPDOCTEST_CAET_0002_RDS | select `doctest`.`id` from `doctest` | {}     |
| DOCTEST_1488704345426RCUPDOCTEST_CAET_0003_RDS | select `doctest`.`id` from `doctest` | {}     |
| DOCTEST_1488704345426RCUPDOCTEST_CAET_0004_RDS | select `doctest`.`id` from `doctest` | {}     |
| DOCTEST_1488704345426RCUPDOCTEST_CAET_0005_RDS | select `doctest`.`id` from `doctest` | {}     |
| DOCTEST_1488704345426RCUPDOCTEST_CAET_0006_RDS | select `doctest`.`id` from `doctest` | {}     |
| DOCTEST_1488704345426RCUPDOCTEST_CAET_0007_RDS | select `doctest`.`id` from `doctest` | {}     |
+------------------------------------------------+--------------------------------------+--------+
8 rows in set (0.00 sec)
```

You can run this SQL statement to view the execution plan of the SQL `select * from doctest where id = 1` statement. The doctest table is stored in database shards according to values in the id column. According to the execution plan, the PolarDB-X instance will calculate a specified database shard based on the shard key, which is id, directly route the SQL statement to the database shard, and aggregate the execution results.

```
mysql> explain select * from doctest where id = 1;
+------------------------------------------------+-----------------------------------------------------------------------+--------+
| GROUP_NAME                                     | SQL                                                                   | PARAMS |
+------------------------------------------------+-----------------------------------------------------------------------+--------+
| DOCTEST_1488704345426RCUPDOCTEST_CAET_0001_RDS | select `doctest`.`id` from `doctest` where (`doctest`.`id` = 1) | {}     |
+------------------------------------------------+-----------------------------------------------------------------------+--------+
1 row in set (0.01 sec)
```

EXPLAIN DETAIL SQL

You can run this SQL statement to view the execution plan of a specified SQL statement in the PolarDB-X. Note that this SQL statement is not truly executed.

```
mysql> explain detail select * from doctest where id = 1;
+-----------------------------------------------+-------------------------------------------------------------------------------------------------------------------
------------------------------------------------------------------------------------+--------+
| GROUP_NAME                        | SQL
| PARAMS |
+-----------------------------------------------+-------------------------------------------------------------------------------------------------------------------
------------------------------------------------------------------------------------+--------+
| DOCTEST_1488704345426RCUPDOCTEST_CAET_0001_RDS | Query from doctest as doctest
  keyFilter:doctest.id = 1
  queryConcurrency:SEQUENTIAL
  columns:[doctest.id]
  tableName:doctest
  executeOn:DOCTEST_1488704345426RCUPDOCTEST_CAET_0001_RDS
 | NULL  |
+-----------------------------------------------+-------------------------------------------------------------------------------------------------------------------
------------------------------------------------------------------------------------+--------+
1 row in set (0.02 sec)
```

EXPLAIN EXECUTE SQL

You can run this SQL statement to view the execution plan of underlying storage. This statement is equivalent to the MySQL EXPLAIN statement.

```
mysql> explain execute select * from tddl_mgr_log limit 1;
+----+-------------+--------------+------+---------------+------+---------+------+------+-------+
| id | select_type | table        | type | possible_keys | key  | key_len | ref  | rows | Extra |
+----+-------------+--------------+------+---------------+------+---------+------+------+-------+
|  1 | SIMPLE      | tddl_mgr_log | ALL  | NULL          | NULL | NULL    | NULL |    1 | NULL  |
+----+-------------+--------------+------+---------------+------+---------+------+------+-------+
1 row in set (0.07 sec)
```

TRACE SQL and SHOW TRACE

You can run these SQL statements to view the execution results of an SQL statement. Note that you must use TRACE SQL and SHOW TRACE together. The difference between TRACE SQL and EXPLAIN SQL is that TRACE SQL is truly executed.

For example, you can run these statements to view the execution results of the select 1 statement.

```
mysql> trace select 1;
+---+
| 1 |
+---+
| 1 |
+---+
1 row in set (0.03 sec)
mysql> show trace;
+------+----------+---------------+--------------------------------+--------------+------------------------+------+-----------+--------+
| ID   | TYPE     | GROUP_NAME    | DBKEY_NAME                     | TIME_COST(MS) | CONNECTION_TIME_COST(MS) | ROWS | STATE
MENT | PARAMS |
+------+----------+---------------+--------------------------------+--------------+------------------------+------+-----------+--------+
|    0 | Optimize | DRDS          | DRDS                           | 3            | 0.00                   |    0 | select 1  | NULL   |
|    1 | Query    | TDDL5_00_GROUP | db218249098_sqa_zmf_tddl5_00_3309 | 7         | 0.15                   |    1 | select 1  | NULL   |
+------+----------+---------------+--------------------------------+--------------+------------------------+------+-----------+--------+
2 rows in set (0.01 sec)
```

CHECK TABLE tablename

You can run this SQL statement to check a data table. This SQL statement is mainly used when a table failed to be created by using a data definition language (DDL) statement.

- If the data table is a table shard, this SQL statement allows you to check whether any underlying physical table shard is missing and whether the columns and indexes of the underlying physical table are consistent.
- If the data table is a single-database non-partition table, this SQL statement allows you to check whether this table exists.

```
mysql> check table tddl_mgr_log;
+------------------------+-------+----------+----------+
| TABLE                  | OP    | MSG_TYPE | MSG_TEXT |
+------------------------+-------+----------+----------+
| TDDL5_APP.tddl_mgr_log | check | status   | OK       |
+------------------------+-------+----------+----------+
1 row in set (0.56 sec)
mysql> check table tddl_mg;
+--------------------+-------+----------+-----------------------------------------+
| TABLE              | OP    | MSG_TYPE | MSG_TEXT                                |
+--------------------+-------+----------+-----------------------------------------+

SHOW TABLE STATUS [LIKE 'pattern' | WHERE expr]

You can run this SQL statement to obtain the information about a table. This command aggregates the data of all underlying physical table shards.

The following describes the meanings of important columns:

- NAME: indicates the name of the table.
- ENGINE: indicates the storage engine of the table.
- VERSION: indicates the version of the storage engine of the table.
- ROW_FORMAT: indicates the format of the rows in the table. Valid values include Dynamic, Fixed, and Compressed. The value Dynamic indicates that the row length is variable, for example, is a VARCHAR or BLOB field. The value Fixed indicates that the row length is constant, for example, is a CHAR or INTEGER field.
- ROWS: indicates the number of rows in the table.
- AVG_ROW_LENGTH: indicates the average number of bytes in each row.
- DATA_LENGTH: indicates the data volume of the entire table, in bytes.
- MAX_DATA_LENGTH: indicates the maximum volume of data that can be stored in the table.
- INDEX_LENGTH: indicates the size of the disk space occupied by indexes.
- CREATE_TIME: indicates the time when the table was created.
- UPDATE_TIME: indicates the time when the table was last updated.
- COLLATION: indicates the default character set and character sorting rule of the table.
- CREATE_OPTIONS: indicates all the other options specified when the table was created.

```
mysql> show table status like 'multi_db_multi_tbl';
+--------------------+--------+---------+------------+------+----------------+-------------+-----------------+--------------+-----------+----------------+---
-------------------+-------------+------------+-----------------+----------+----------------+---------+
| NAME           | ENGINE | VERSION | ROW_FORMAT | ROWS | AVG_ROW_LENGTH | DATA_LENGTH | MAX_DATA_LENGTH | IND

-------------------+-------------+------------+-----------------+----------+----------------+---------+
1 row in set (0.03 sec)
```

The combination of the SHOW TABLE STATUS statement and the PolarDB-X SCAN hint allows you to view the data volume of each physical table shard.

```
mysql> /! TDDL:SCAN='multi_db_multi_tbl'*/show table status like 'multi_db_multi_tbl';

11.7.5. Statistics query statements

SHOW [FULL] STATS

You can run this SQL statement to view the overall statistics of a Distributed Relational Database Service (DRDS) instance. The statistics are instantaneous values. Note that the results of `DRDS SHOW FULL STATS` vary with the version of the DRDS instance.

The following describes the meanings of important columns:

- QPS: the number of queries per second (QPS) sent from an application to the DRDS instance. These queries are usually called logical QPS.
- RDS_QPS: the number of QPS sent from the DRDS instance to an ApsaraDB RDS for MySQL instance. These queries are usually called physical QPS.

- ERROR_PER_SECOND: the total number of errors that occur on the DRDS instance per second. These errors include various errors such as SQL syntax errors, primary key conflicts, system errors, and connectivity errors.
- VIOLATION_PER_SECOND: the number of conflicts that occur on primary keys or unique keys per second.
- MERGE_QUERY_PER_SECCOND: the number of queries processed on multiple tables through database sharding and table sharding per second.
- ACTIVE_CONNECTIONS: the number of active connections to the DRDS instance.
- CONNECTION_CREATE_PER_SECCOND: the number of connections that are created for the DRDS instance per second.
- RT(MS): the time to respond to an SQL query sent from an application to the DRDS instance. This response time (RT) is usually called logical RT.
- RDS_RT(MS): the time to respond to an SQL query sent from the DRDS instance to an ApsaraDB RDS for MySQL instance. This RT is usually called physical RT.
- NET_IN(KB/S): the amount of inbound traffic of the DRDS instance per second.
- NET_OUT(KB/S): the amount of outbound traffic of the DRDS instance per second.
- THREAD_RUNNING: the number of threads that are running in the DRDS instance.
- HINT_USED_PER_SECOND: the number of SQL queries that contain hints and are processed by the DRDS instance per second.
- HINT_USED_COUNT: the total number of SQL queries that contain hints and have been processed by the DRDS instance since startup.
- AGGREGATE_QUERY_PER_SECCOND: the number of aggregate SQL queries processed by the DRDS instance per second.
- AGGREGATE_QUERY_COUNT: the total number of aggregate SQL queries that have been processed by the DRDS instance.
- TEMP_TABLE_CREATE_PER_SECCOND: the number of temporary tables created in the DRDS instance per second.
- TEMP_TABLE_CREATE_COUNT: the total number of temporary tables that have been created in the DRDS instance since startup.
- MULTI_DB_JOIN_PER_SECCOND: the number of multi-database JOIN queries processed by the DRDS instance per second.
- MULTI_DB_JOIN_COUNT: the number of multi-database JOIN queries that have been processed by the DRDS instance since startup.

SHOW DB STATUS

You can run this SQL statement to view the capacity and performance information of a physical database, which is also called a database shard. All the returned values indicate the real-time information. The capacity information is obtained from the ApsaraDB RDS for MySQL system table, and therefore may be different from the actual capacity information.

The following describes the meanings of important columns:

- NAME: the internal tag that represents a logical database corresponding to the database shard. The value is different from the name of the logical database.
- CONNECTION_STRING: the information about a connection from the DRDS instance to the database shard.
- PHYSICAL_DB: the name of the database shard. The `TOTAL` row indicates the total amount of capacity of all the database shards corresponding to the logical database.
- SIZE_IN_MB: the size of the space occupied by the data in the database shard. Unit: MB
- RATIO: the ratio of the data volume of the database shard to the total data volume of the current logical database.
- THREAD_RUNNING: the number of threads that are running in the ApsaraDB RDS for MySQL instance to which the physical database belongs. The meaning of this parameter is the same as that of the THREAD_RUNNING parameter returned by the MySQL `SHOW GLOBAL STATUS` command. For more information, see MySQL Documentation.

```
mysql> show db status;
+------+--------------------------+-------------------+------------------+------------+--------+----------------+
| ID   | NAME                     | CONNECTION_STRING | PHYSICAL_DB      | SIZE_IN_MB | RATIO  | THREAD_RUNNING |
+------+--------------------------+-------------------+------------------+------------+--------+----------------+
|  1 | drds_db_1516187088365daui | 100.100.64.1:59077 | TOTAL           | 13.109375 | 100%  | 3              |

```

SHOW FULL DB STATUS [LIKE {tablename}]

You can run this SQL statement to view the capacity and performance information of a table shard in a physical database, which is also called a database shard. All the returned values indicate the real-time information. The capacity information is obtained from the ApsaraDB RDS for MySQL system table, and therefore may be different from the actual capacity information.

The following describes the meanings of important columns:

- NAME: the internal tag that represents a logical database corresponding to the database shard. The value is different from the name of the logical database.
- CONNECTION_STRING: the information about a connection from the DRDS instance to the database shard.
- PHYSICAL_DB: the name of the database shard. If the LIKE keyword is used for filtering in the statement, the TOTAL row indicates the total amount of capacity of the database shard. If the LIKE keyword is not used for filtering in the statement, the TOTAL row indicates the total amount of capacity of all database shards.
- PHYSICAL_TABLE: the name of the table shard in the database shard. If the LIKE keyword is used for filtering in the statement, the TOTAL row indicates the total amount of capacity of the table shard. If the LIKE keyword is not used for filtering in the statement, the TOTAL row indicates the total amount of capacity of all table shards in the database shard.
- SIZE_IN_MB: the size of the space occupied by the data in the database shard. Unit: MB
- RATIO: the ratio of the data volume of the table shard to the total data volume of all the table shards obtained through filtering.
- THREAD_RUNNING: the number of threads that are running in the ApsaraDB RDS for MySQL instance to which the physical database belongs. The meaning of this parameter is the same as that of the THREAD_RUNNING parameter returned by the MySQL `SHOW GLOBAL STATUS` command. For more information, see MySQL Documentation.

```

11.7.6. SHOW PROCESSLIST and KILL commands

> **Note**
>
> - If the version of PolarDB-X is 5.1.28-1408022 or later, PolarDB-X support the SHOW PROCESSLIST and KILL commands for both logical and physical connections. For more information, see this topic.
> - If the version of PolarDB-X is earlier than 5.1.28-1408022, PolarDB-X support the SHOW PROCESSLIST and KILL commands only for physical connections. For more information, see SHOW PROCESSLIST and KILL commands in earlier versions.

SHOW PROCESSLIST command

In a PolarDB-X instance, you can run the `SHOW PROCESSLIST` command to view information such as connections to the PolarDB-X instance and SQL statements that are being executed in the PolarDB-X instance.

Syntax

```
SHOW [FULL] PROCESSLIST
```

Examples

```
mysql> SHOW PROCESSLIST\G
    ID: 1971050
  USER: admin
  HOST: 111.111.111.111:4303
    DB: drds_test
COMMAND: Query
  TIME: 0
 STATE:
  INFO: show processlist
1 row in set (0.01 sec)
```

The following describes the meanings of the fields in the result set:

- ID: the ID of the connection. The value is a long-type number.
- USER: the name of the user who sets up the connection.
- HOST: the IP address and port number of the host that sets up the connection.
- DB: the name of the database accessed by the connection.
- COMMAND: the usage state of the connection. Currently, this field can be set to the following values:
  - Query: the current connection is executing an SQL statement.
  - Sleep: the current connection is idle.
- TIME: the duration when the connection is in the current state:
  - When the value of COMMAND is Query, this field indicates how long the SQL statement has been being executed on the connection.
  - When the value of COMMAND is Sleep, this field indicates how long the connection has been in the idle state.
- STATE: currently, no meaning has been assigned for this field. The value is constantly empty.
- INFO:
  - When the value of COMMAND is Query, this field indicates the content of the SQL statement that is being executed on the connection. If the FULL parameter is not specified, a maximum of the first 30 characters of the SQL statement are returned. If the FULL parameter is specified, a maximum of the first 1000 characters of the SQL statement are returned.
  - When the value of COMMAND is other values, this field is meaningless and left empty.

SHOW PHYSICAL_PROCESSLIST command

In a PolarDB-X instance, you can run the SHOW PHYSICAL_PROCESSLIST command to view information about all the SQL statements that are being executed on underlying ApsaraDB RDS for MySQL instances.

Syntax

```
SHOW [FULL] PHYSICAL_PROCESSLIST
```

When an SQL statement is excessively long, the responses of the `SHOW PHYSICAL_PROCESSLIST` command may be truncated. In this case, you can run the `SHOW FULL PHYSICAL_PROCESSLIST` command to obtain the complete SQL statement.

The meaning of each column in the responses is equivalent to that in the responses of the `SHOW PROCESSLIST` command. For more information, see SHOW PROCESSLIST Syntax.

> **Note** Different from ApsaraDB RDS for MySQL, the PolarDB-X instance returns a string instead of a number in the ID column of a physical connection.

```
mysql> SHOW PHYSICAL_PROCESSLIST\G
*************************** 1. row ***************************
       ID: 0-0-521414
     USER: tddl5
       DB: tddl5_00
  COMMAND: Query
     TIME: 0
    STATE: init
     INFO: show processlist
*************************** 2. row ***************************
       ID: 0-0-521570
     USER: tddl5
       DB: tddl5_00
  COMMAND: Query
     TIME: 0
    STATE: User sleep
     INFO: /*DRDS /88.88.88.88/b67a0e4d8800000/ */ select sleep(1000)
2 rows in set (0.01 sec)
```

KILL command

The KILL command is used to terminate an SQL statement that is being executed.

The PolarDB-X instance connects to an ApsaraDB RDS for MySQL instance by using the username created by the PolarDB-X instance on the ApsaraDB RDS for MySQL instance. Therefore, if you directly connect to the ApsaraDB RDS for MySQL instance, you do not have the permission to run the KILL command on a request initiated by the PolarDB-X instance.

To terminate an SQL statement that is being executed on the PolarDB-X instance, you must use tools such as the MySQL command line and to connect to the PolarDB-X instance, and then run the KILL command on the PolarDB-X instance.

Syntax

```
KILL PROCESS_ID | 'PHYSICAL_PROCESS_ID' | 'ALL'
```

The KILL command can be used in the following ways:

- Run `KILL PROCESS_ID` to terminate a specified logical SQL statement.

  The PROCESS_ID parameter is obtained from the ID column in the responses of the `SHOW [FULL] PROCESSLIST` command.

  Running the `KILL PROCESS_ID` command in the PolarDB-X instance will terminate both logical and physical SQL statements that are being executed on this connection, and disconnect this connection.

  The PolarDB-X instance does not support the `KILL QUERY` command.

- Run `KILL 'PHYSICAL_PROCESS_ID'` to terminate a specified physical SQL statement.

  The PHYSICAL_PROCESS_ID parameter is obtained from the ID column in the responses of the `SHOW PHYSICAL_PROCESS_ID` command.

  > **Note** The PHYSICAL_PROCESS_ID column is a string instead of a number. Therefore, the PHYSICAL_PROCESS_ID parameter must be enclosed in single quotation marks (') in the KILL command.

  Examples:

  ```
  mysql> KILL '0-0-521570';
  Query OK, 0 rows affected (0.01 sec)
  ```

- Run `KILL 'ALL'` to terminate all the physical SQL statements that are executed by the PolarDB-X instance in the

current logical database.

When the underlying ApsaraDB RDS for MySQL instance is overloaded due to some SQL statements, you can use the `KILL 'ALL'` command to terminate all the physical SQL statements that are being executed in the current logical PolarDB-X database.

All physical SQL statements indicated by PROCESS that meet the following conditions can be terminated by running `KILL 'ALL'`:

- The value of the User parameter for the physical SQL statement indicated by PROCESS is a username created by the PolarDB-X instance in the ApsaraDB RDS for MySQL instance.
- The physical SQL statement indicated by PROCESS is executing a query. In other words, the value of COMMAND is Query.

11.7.7. SHOW PROCESSLIST and KILL commands in earlier versions

> **Note**
>
> - If the version of PolarDB-X is 5.1.28-1408022 or later, PolarDB-X support the SHOW PROCESSLIST and KILL commands for both logical and physical connections. For more information, see SHOW PROCESSLIST and KILL commands.
> - If the version of PolarDB-X is earlier than 5.1.28-1408022, PolarDB-X only supports the SHOW PROCESSLIST and KILL commands for physical connections. For more information, see this topic.

SHOW PROCESSLIST command

In a PolarDB-X instance, you can run the `SHOW PROCESSLIST` command to view information about all the SQL statements that are being executed on the ApsaraDB RDS for MySQL instances.

Syntax

```
SHOW [FULL] PROCESSLIST
```

When an SQL statement is excessively long, the responses of the `SHOW PROCESSLIST` command may be truncated. In this case, you can run the `SHOW FULL PROCESSLIST` command to obtain the complete SQL statement.

The meaning of each column in the responses is equivalent to that in the responses of the `SHOW PROCESSLIST` statement. For more information, see SHOW PROCESSLIST Syntax.

```
mysql> SHOW PROCESSLIST\G
*************************** 1. row ***************************
       ID: 0-0-521414
     USER: tddl5
       DB: tddl5_00
  COMMAND: Query
     TIME: 0
    STATE: init
     INFO: show processlist
  ROWS_SENT: NULL
ROWS_EXAMINED: NULL
  ROWS_READ: NULL
*************************** 2. row ***************************
       ID: 0-0-521570
     USER: tddl5
       DB: tddl5_00
  COMMAND: Query
     TIME: 0
    STATE: User sleep
     INFO: /*DRDS /88.88.88.88/b67a0e4d8800000/ */ select sleep(1000)
  ROWS_SENT: NULL
ROWS_EXAMINED: NULL
  ROWS_READ: NULL
2 rows in set (0.01 sec)
```

KILL

You can execute the KILL statement to terminate an SQL statement that is being executed.

The PolarDB-X instance connects to an ApsaraDB RDS for MySQL instance by using the username created by the PolarDB-X instance on the ApsaraDB RDS for MySQL instance. Therefore, if you directly connect to the ApsaraDB RDS for MySQL instance, you are not authorized to execute the KILL statement to terminate a request initiated by the PolarDB-X instance.

To terminate an SQL statement that is being executed on the PolarDB-X instance, you must use tools to connect to the PolarDB-X instance. You can use tools such as the MySQL command line and . Then, execute the KILL statement on the PolarDB-X instance.

Syntax

```
KILL 'PROCESS_ID' | 'ALL'
```

The KILL command can be used in the following ways:

- Run `KILL 'PROCESS_ID'` to terminate a specified SQL statement.

  The PROCESS_ID parameter is obtained from the ID column in the responses of the `SHOW PROCESSLIST` command.

  > **Note** Different from ApsaraDB RDS for MySQL, the PolarDB-X instance returns a string instead of a number in the ID column. Therefore, the PROCESS_ID parameter must be enclosed in single quotation marks (') in the KILL command.

  Examples

  ```
  mysql> KILL '0-0-521570';
  Query OK, 0 rows affected (0.01 sec)
  ```

- Run `KILL 'ALL'` to terminate all the SQL statements executed by the PolarDB-X instance in the current logical database.

When the underlying ApsaraDB RDS for MySQL instance is overloaded due to several SQL statements, you can use the `KILL 'ALL'` command to terminate all the SQL statements that are being executed in the current logical PolarDB-X database.

All SQL statements indicated by PROCESS that meet the following conditions can be terminated by running `KILL 'ALL'`:

- The value of the User parameter for the physical SQL statement indicated by PROCESS is a username created by the PolarDB-X instance in the ApsaraDB RDS for MySQL instance.
- The physical SQL statement indicated by PROCESS is executing a query, which means that the value of COMMAND is Query.

PolarDB-X instances in earlier versions do not support the `KILL 'ALL'` command. An error will be reported if this command is being executed in these instances. To resolve this problem, you can upgrade the version of the PolarDB-X instance.

11.8. Custom hints

Note This topic is applicable to PolarDB-X 5.3 and later. For earlier versions, see PolarDB-X 5.2 hints.

11.8.1. Introduction to hints

As a supplement to the SQL syntax, hints play a critical role in relational databases. They allow you to influence execution plans of SQL statements by using relevant syntax, to specially optimize the SQL statements. PolarDB-X also provides special hint syntax.

For example, if you know the target data is stored in table shards in certain database shards and you need to route the SQL statement directly to the database shards for execution, you can use custom hints provided by PolarDB-X.

```
SELECT /*+TDDL:node('node_name')*/ * FROM table_name;
```

In the preceding SQL statement, the part between `/*` and `*/`, namely, `+TDDL:node('node_name')`, is a PolarDB-X hint. The hint specifies the ApsaraDB RDS for MySQL database shard where the SQL statement is to be executed.

Note

- PolarDB-X hints can be in the formats of `/*+TDDL:hint_command*/` and `/! +TDDL:hint_command*/`.
- In the MySQL command-line client, if you need to run an SQL statement that contains a PolarDB-X hint in the format of `/*+TDDL:hint_command*/`, add the `-c` parameter to the logon command, because PolarDB-X hints are based on the MySQL Comment Syntax. Otherwise, the client deletes the PolarDB-X hint and then sends the SQL statement to the server for execution, which causes the hint to fail to take effect. For more information, see MySQL Client Options.

PolarDB-X hint syntax

Basic syntax

```
/*+TDDL: hint_command [hint_command ...] */
/! +TDDL: hint_command [hint_command ...] */
```

PolarDB-X hints are based on the MySQL Comment Syntax. The hint statements are located between `/*` and `*/` or between `/!` and `*/`, and must begin with `+TDDL:`. The `hint command` parameter indicates a PolarDB-X hint command related to the specific operation. Multiple `hint_command` parameters are separated by spaces.

Examples

```
# Query the names of physical tables in each database shard.
/*+TDDL:scan()*/SHOW TABLES;
# Route the query to database shard 0000 of a read-only ApsaraDB RDS for MySQL instance.
/*+TDDL:node(0) slave()*/SELECT * FROM t1;
```

In the example, `/*+TDDL:scan()*/` and `/*+TDDL:node(0) slave()*/` are PolarDB-X hints that begin with `+TDDL:`. The `scan()`, `node(0)`, and `slave()` functions are PolarDB-X hint commands. Hint commands are separated by spaces.

- Use one hint in an SQL statement:

  PolarDB-X allows you to use hints in data manipulation language (DML), data definition language (DDL), and data access language (DAL) statements. The following describes the syntax in detail.

  - For all statements that support hints, you can specify a hint at the beginning of the statements, for example:

    ```
    /*+TDDL: ... */ SELECT ...
    /*+TDDL: ... */ INSERT ...
    /*+TDDL: ... */ REPLACE ...
    /*+TDDL: ... */ UPDATE ...
    /*+TDDL: ... */ DELETE ...
    /*+TDDL: ... */ CREATE TABLE ...
    /*+TDDL: ... */ ALTER TABLE ...
    /*+TDDL: ... */ DROP TABLE ...
    /*+TDDL: ... */ SHOW ...
    ...
    ```

  - For DML statements, you can specify a hint behind the first keyword of the statements, for example:

    ```
    SELECT /*+TDDL: ... */ ...
    INSERT /*+TDDL: ... */ ...
    REPLACE /*+TDDL: ... */ ...
    UPDATE /*+TDDL: ... */ ...
    DELETE /*+TDDL: ... */ ...
    ...
    ```

    > **Note** Different hints may be applicable to different syntaxes. For more information about the applicable syntaxes, see the documentation of hint commands.

- Use multiple hint commands in an SQL statement:

  PolarDB-X allows you to use multiple hint commands in SQL statements that contain hints.

  ```
  SELECT /*+TDDL:node(0) slave()*/ ... ;
  ```

  PolarDB-X has the following limitations on the use of multiple hint commands:

  ```
  # A single SQL statement cannot contain multiple hint statements.
  SELECT /*+TDDL:node(0)*//*+TDDL:slave()*/ ... ;
  # An SQL statement that contains a hint cannot contain duplicate hint commands.
  SELECT /*+TDDL:node(0) node(1)*/ ... ;
  ```

PolarDB-X hint classification

PolarDB-X hints are classified into the following major categories according to operation types:

- Read/write splitting
- Specify a timeout period for an SQL statement
- Specify a database shard to run an SQL statement
- Scan all or some of database shards and table shards

11.8.2. Read/write splitting

PolarDB-X provides transparent read/write splitting at the application layer. Data synchronization between primary and read-only ApsaraDB RDS for MySQL instances has a delay of several milliseconds. If you need to read changed data immediately after the primary ApsaraDB RDS for MySQL instance is changed, you must ensure that the SQL statement for reading data is routed to the primary ApsaraDB RDS for MySQL instance. To meet this demand, PolarDB-X provides custom hints for read/write splitting, to route SQL statements to a specified primary or read-only ApsaraDB RDS for MySQL instance.

> **Note** This topic is applicable to PolarDB-X 5.3 and later. For earlier versions, see Read/write splitting.

Syntax

```
/*+TDDL:
  master()
  | slave()
*/
```

With this custom hint, you can specify whether to run an SQL statement on a primary or read-only ApsaraDB RDS for MySQL instance. With the custom hint `/*+TDDL:slave()*/`, if a primary ApsaraDB RDS for MySQL instance is configured with multiple read-only ApsaraDB RDS for MySQL instances, the PolarDB-X instance randomly selects a read-only ApsaraDB RDS for MySQL instance based on its weight, to run the SQL statement.

> **Note**
> - PolarDB-X hints can be in the formats of `/*+TDDL:hint_command*/` and `/! +TDDL:hint_command*/`.
> - In the MySQL command-line client, you may need to execute an SQL statement that contains a PolarDB-X hint in the format of `/*+TDDL:hint_command*/`. In this case, add the `-c` parameter to the logon command. Otherwise, the client deletes the PolarDB-X hint before it sends the SQL statement to the server for execution because the PolarDB-X hint is in the format of a MySQL comment. In this case, the hint fails to take effect. For more information, see MySQL Client Options.

Examples

- Specify a primary ApsaraDB RDS for MySQL instance to run an SQL statement:

  ```
  SELECT /*+TDDL:master()*/ * FROM table_name;
  ```

  After the custom hint `/*+TDDL:master()*/` is added behind the first keyword in the SQL statement, this SQL statement is routed to the primary ApsaraDB RDS for MySQL instance for execution.

- Specify a read-only ApsaraDB RDS for MySQL instance to run an SQL statement:

  ```
  SELECT /*+TDDL:slave()*/ * FROM table_name;
  ```

  After the custom hint `/*+TDDL:slave()*/` is added behind the first keyword in the SQL statement, this SQL statement is randomly routed to a read-only ApsaraDB RDS for MySQL instance based on the allocated weight.

Note

- The custom hints for read-write splitting are only applicable to read SQL statements for non-transactional data. SQL statements for transactional data and write SQL statements are still routed to the primary ApsaraDB RDS for MySQL instance for execution.
- The PolarDB-X hint `/*+TDDL:slave()*/` allows you to route the SQL statement randomly to a read-only ApsaraDB RDS for MySQL instance based on the configured weight for execution. If no read-only ApsaraDB RDS for MySQL instance is available, no error is reported. Instead, the primary ApsaraDB RDS for MySQL instance is selected to run the SQL statement.

11.8.3. Specify a timeout period for an SQL statement

In PolarDB-X, the SQL statements for PolarDB-X instances and ApsaraDB RDS for MySQL instances are timed out after 900 seconds (which can be adjusted) by default. However, for some slow SQL statements, the execution duration may exceed 900 seconds. For these slow SQL statements, PolarDB-X provides a custom hint to adjust their timeout periods. You can use this custom hint to adjust the SQL execution duration as needed.

> **Note** This topic is applicable to PolarDB-X 5.3 and later. For earlier versions, see Specify a timeout period for an SQL statement.

Syntax

The syntax of the PolarDB-X hint for specifying a timeout period for an SQL statement is as follows:

```
/*+TDDL:SOCKET_TIMEOUT(time)*/
```

The `SOCKET_TIMEOUT` parameter is measured in milliseconds. With this custom hint, you can adjust the timeout period for the SQL statement based on business requirements.

> **Note**
> - PolarDB-X hints can be in the formats of `/*+TDDL:hint_command*/` and `/! +TDDL:hint_command*/`.
> - In the MySQL command-line client, you may need to execute an SQL statement that contains a PolarDB-X hint in the format of `/*+TDDL:hint_command*/`. In this case, add the `-c` parameter to the logon command. Otherwise, the client deletes the PolarDB-X hint before it sends the SQL statement to the server for execution because the PolarDB-X hint is in the format of a MySQL comment. In this case, the hint fails to take effect. For more information, see MySQL Client Options.

Examples

Set the timeout period of an SQL statement to 40 seconds:

```
/*+TDDL:SOCKET_TIMEOUT(40000)*/SELECT * FROM t_item;
```

> **Note** A longer timeout period causes database resources to be occupied for a longer period of time. If excessive SQL statements are executed over a long time within the same period, a large number of database resources may be consumed. This will make users unable to use PolarDB-X properly. In this case, we need to use this custom hint to optimize the SQL statements that take a long time to execute.

11.8.4. Specify a database shard to run an SQL statement

When running SQL commands in a PolarDB-X instance, you may find that some SQL statements are not supported by the PolarDB-X instance. In this case, you can use the `NODE HINT` provided by PolarDB-X, to route the SQL statements to one or more database shards for execution. In addition, if you need to query the data in a specified database shard or the data in a specified table shard in a known database shard, you can use the `NODE HINT` to directly route the SQL statement to the database shard for execution.

> **Note** This topic is applicable to PolarDB-X 5.3 and later. For earlier versions, see Specify a database shard to run an SQL statement.

Syntax

The `NODE HINT` allows you to specify a database shard by using a shard name, to run the SQL statement in the database shard. A shard name uniquely identifies a database shard in a PolarDB-X instance. You can run the SHOW NODE statement to obtain the shard name.

Specify a database shard by using a shard name, to run an SQL statement

This custom hint allows you to specify one or more database shards to run an SQL statement.

> **Note** If the hint for specifying a database shard is used in an INSERT statement that contains a sequence for the target table, the sequence will not take effect. For more information, see Limits and precautions for sequences.

- Specify one database shard to run an SQL statement:

  ```
  /*+TDDL:node('node_name')*/
  ```

  Specifically, `node_name` indicates the shard name. This PolarDB-X hint enables you to route the SQL statement to the database shard specified by `node_name`.

- Specify multiple database shards to run an SQL statement:

  ```
  /*+TDDL:node('node_name'[,'node_name1','node_name2'])*/
  ```

  You can specify multiple shard names in the parameters and route the SQL statement to multiple database shards for execution. Separate multiple shard names with commas (,).

> **Note**
> - When this custom hint is used, the PolarDB-X instance directly routes the SQL statement to the specified database shards for execution. Therefore, the specified shard names in the SQL statement must correspond to existing database shards.
> - The `NODE HINT` can be used in data manipulation language (DML), data definition language (DDL), and data access language (DAL) statements.
> - PolarDB-X hints can be in the formats of `/*+TDDL:hint_command*/` and `/! +TDDL:hint_command*/`.
> - In the MySQL command-line client, you may need to execute an SQL statement that contains a PolarDB-X hint in the format of `/*+TDDL:hint_command*/`. In this case, add the `-c` parameter to the logon command. Otherwise, the client deletes the PolarDB-X hint before it sends the SQL statement to the server for execution because the PolarDB-X hint is in the format of a MySQL comment. In this case, the hint fails to take effect. For more information, see MySQL Client Options.

Examples

The following shows the responses of the SHOW NODE statement for a logical database named `drds_test` in a PolarDB-X instance.

```
mysql> SHOW NODE\G
*************************** 1. row ******************
          ID: 0
        NAME: DRDS_TEST_1473471355140LRPRDRDS_TEST_VTLA_0000_RDS
 MASTER_READ_COUNT: 212
  SLAVE_READ_COUNT: 0
MASTER_READ_PERCENT: 100%
 SLAVE_READ_PERCENT: 0%
*************************** 2. row ******************

As you can see, each database shard has the `NAME` attribute, which indicates the shard name corresponding to the database shard. Each shard name uniquely corresponds to one database shard name. For example, the shard name `DRDS_TEST_1473471355140LRPRDRDS_TEST_VTLA_0003_RDS` corresponds to the database shard name `drds_test_vtla_0003`. Therefore, after obtaining the shard name, you can use the PolarDB-X hint to specify the corresponding database shard to run the SQL statement.

- Specify database shard 0 to run an SQL statement:

```
SELECT /*TDDL:node('DRDS_TEST_1473471355140LRPRDRDS_TEST_VTLA_0000_RDS')*/ * FROM table_name;
```

- Specify multiple database shards to run an SQL statement:

```
SELECT /*TDDL:node('DRDS_TEST_1473471355140LRPRDRDS_TEST_VTLA_0000_RDS','DRDS_TEST_1473471355140LRPRDRDS_TEST_VTLA_0006_RDS')*/ * FROM table_name;
```

  This SOL statement will be executed in the database shards whose shard names are `DRDS_TEST_1473471355140LRPRDRDS_TEST_VTLA_0000_RDS` and `DRDS_TEST_1473471355140LRPRDRDS_TEST_VTLA_0006_RDS`.

- View the execution plan of an SQL statement in database shard 0:

```
/*TDDL:node('DRDS_TEST_1473471355140LRPRDRDS_TEST_VTLA_0000_RDS')*/ EXPLAIN SELECT * FROM table_name;
```

11.8.5. Scan all or some of database shards and table shards

In addition to routing an SQL statement to one or more database shards for execution, PolarDB-X provides the `SCAN HINT` to scan all or some of database shards and table shards. With the `SCAN HINT`, you can route an SQL statement to each database shard at a time. For example, you can view all the table shards in a specified database shard or view the data volume of each physical table of a specified logical table.

> **Note** This topic is applicable to PolarDB-X 5.3 and later. For earlier versions, see Scan all database shards and table shards.

With the SCAN HINT, you can specify the following SQL execution manners:

- Run an SQL statement in all table shards in all database shards.
- Run an SQL statement in all table shards in a specified database shard.
- Run an SQL statement in the specified table shard in the specified database shard by calculating the name of the physical table based on conditions.
- Run an SQL statement in the specified table shard in the specified database shard by explicitly specifying the name of the physical table.

The `SCAN HINT` can be used in data manipulation language (DML) statements, data definition language (DDL) statements, and some data access language (DAL) statements.

> **Note**
> - PolarDB-X hints can be in the formats of `/*+TDDL:hint_command*/` and `/!+TDDL:hint_command*/`.
> - In the MySQL command-line client, you may need to execute an SQL statement that contains a PolarDB-X hint in the format of `/*+TDDL:hint_command*/`. In this case, add the `-c` parameter to the logon command. Otherwise, the client deletes the PolarDB-X hint before it sends the SQL statement to the server for execution because the PolarDB-X hint is in the format of a MySQL comment. In this case, the hint fails to take effect. For more information, see MySQL Client Options.

Syntax

```
# SCAN HINT
# Route an SQL statement to all table shards in all database shards.
SCAN()
# Route an SQL statement to all table shards in a specified database shard.
SCAN(NODE="node_list")          # Specify the database shard.
# Route an SQL statement to the specified table shard in the specified database shard by calculating the name of the physical table based on conditions.
SCAN(
 [TABLE=]"table_name_list"      # Specify the name of the logical table.
 , CONDITION="condition_string"   # Calculate the names of physical databases based on the content of TABLE and CONDITION.
 [, NODE="node_list"] )         # Filter the results obtained based on the content of CONDITION, to retain only the results of the specified physical database.
# Route an SQL statement to the specified table shard in the specified database shard by explicitly specifying the name of the physical table.
SCAN(
 [TABLE=]"table_name_list"      # Specify the name of the logical table.
 , REAL_TABLE=("table_name_list")  # Specify the name of the physical table. The same physical table names are applied to all physical databases.
 [, NODE="node_list"] )         # Filter the results obtained based on the content of CONDITION, to retain only the results of the specified physical database.
# Specify physical table names or logical table names.
table_name_list:
  table_name [, table_name]...
# Specify physical databases by using GROUP_KEY and GROUP_INDEX, which can be obtained by running the SHOW NODE statement.
node_list:
  {group_key | group_index} [, {group_key | group_index}]...
# Run an SQL WHERE statement. When using this syntax, you must specify conditions for each table, for example, t1.id = 2 and t2.id = 2.
condition_string:
  where_condition
```

Examples

- Run the following SQL statement in all table shards in all database shards:

  ```
  SELECT /*+TDDL:scan()*/ COUNT(1) FROM t1
  ```

  After this statement is executed, the SQL statement is routed to all the physical tables corresponding to the logical table `t1`, and the result sets are merged and returned.

- Run the following SQL statement in all table shards in specified database shards:

  ```
  SELECT /*+TDDL:scan(node='0,1,2')*/ COUNT(1) FROM t1
  ```

  After this statement is executed, all physical tables corresponding to the logical table `t1` in database shards 0000, 0001, and 0002 are calculated, the SQL statement is routed to the physical tables, and the result sets are merged and returned.

- Run the following SQL statement in specified table shards based on conditions:

  ```
  SELECT /*+TDDL:scan('t1', condition='t1.id = 2')*/ COUNT(1) FROM t1
  ```

  After this statement is executed, all physical tables that correspond to the logical table `t1` and meet the conditions are calculated, the SQL statement is routed to the physical tables, and the result sets are merged and returned.

- Run the following SQL JOIN statement in the specified table shards based on conditions:

```
SELECT /*+TDDL:scan('t1, t2', condition='t1.id = 2 and t2.id = 2')*/ * FROM t1 a JOIN t2 b ON a.id = b.id WHERE b.name = "test"
```

After this statement is executed, all physical tables that correspond to the logical tables `t1` and `t2` and meet the conditions are calculated, the SQL statement is routed to the physical tables, and the result sets are merged and returned.

> **Notice** Before using this custom hint, you must ensure that the logical tables t1 and t2 are partitioned into the same number of database shards and the same number of table shards. Otherwise, the database shards calculated by the PolarDB-X instance based on the conditions are different, and an error will be returned.

- Run the following SQL statement in the specified table shards in database shards by explicitly specifying the names of the physical tables:

```
SELECT /*+TDDL:scan('t1', real_table=("t1_00", "t1_01"))*/ COUNT(1) FROM t1
```

After this statement is executed, the SQL statement is routed to the table shards `t1_00``t1_01` in all database shards, and the result sets are merged and returned.

- Run the following SQL JOIN statement in the specified table shards in database shards by explicitly specifying the names of the physical tables:

```
SELECT /*+TDDL:scan('t1, t2', real_table=("t1_00,t2_00", "t1_01,t2_01"))*/ * FROM t1 a JOIN t2 b ON a.id = b.id WHERE b.name = "test";
```

After this statement is executed, the SQL statement is routed to the table shards `t1_00` , `t2_00` , `t1_01` , and `t2_01` in all database shards, and the result sets are merged and returned.

11.8.6. INDEX HINT

- PolarDB-X supports global secondary indexes. The INDEX hint allows you to obtain query results from a specified GSI.
- The INDEX hint takes effect only for SQL SELECT statements.

> **Note** This custom hint is applicable to only MySQL 5.7 and later and PolarDB-X 5.4.1 and later.

Syntax

```
# FORCE INDEX
tbl_name [[AS] alias] [index_hint]
index_hint:
  FORCE INDEX({index_name})
# INDEX()
/*+TDDL:
  INDEX({table_name | table_alias}, {index_name})
*/
```

PolarDB-X INDEX hint can be used in two ways:

- `FORCE INDEX()` : This syntax is the same as that of MySQL FORCE INDEX.
- `INDEX()` : In this syntax, a global secondary index is specified using a table name (or alias) and an index name. This hint does not take effect in the following cases:
  - The query does not contain the specified table name or alias.
  - The specified global secondary index is not in the specified table.

> Note
> - PolarDB-X hints can be in the formats of `/*+TDDL:hint_command*/` and `/! +TDDL:hint_command*/`.
> - In the MySQL command-line client, you may need to execute an SQL statement that contains a PolarDB-X hint in the format of `/*+TDDL:hint_command*/`. In this case, add the `-c` parameter to the logon command. Otherwise, the client deletes the PolarDB-X hint before it sends the SQL statement to the server for execution because the PolarDB-X hint is in the format of a MySQL comment. In this case, the hint fails to take effect. For more information, see MySQL Client Options.

Examples

```
CREATE TABLE t_order (
 `id` bigint(11) NOT NULL AUTO_INCREMENT,
 `order_id` varchar(20) DEFAULT NULL,
 `buyer_id` varchar(20) DEFAULT NULL,
 `seller_id` varchar(20) DEFAULT NULL,
 `order_snapshot` longtext DEFAULT NULL,
 `order_detail` longtext DEFAULT NULL,
 PRIMARY KEY (`id`),
 GLOBAL INDEX `g_i_seller` (`seller_id`) dbpartition by hash(`seller_id`),
 UNIQUE GLOBAL INDEX `g_i_buyer` (`buyer_id`) COVERING(`seller_id`, `order_snapshot`)
  dbpartition by hash(`buyer_id`) tbpartition by hash(`buyer_id`) tbpartitions 3
) ENGINE=InnoDB DEFAULT CHARSET=utf8 dbpartition by hash(`order_id`);
```

Specify the global secondary index `g_i_seller` by using FORCE INDEX in the FROM clause:

```
SELECT a.*, b.order_id
  FROM t_seller a
    JOIN t_order b FORCE INDEX(g_i_seller) ON a.seller_id = b.seller_id
  WHERE a.seller_nick="abc";
```

Specify the global secondary index `g_i_buyer` by using INDEX+table alias:

```
/*+TDDL:index(a, g_i_buyer)*/ SELECT * FROM t_order a WHERE a.buyer_id = 123
```

11.9. PolarDB-X 5.2 hints

11.9.1. Introduction to hints

As a supplement to the SQL syntax, hints play a critical role in relational databases. They allow you to affect execution plans of SQL statements by using relevant syntax, to specially optimize the SQL statements.

Overview of PolarDB-X hints

PolarDB-X provides special hint syntax.

For example, if you know the target data is stored in table shards in certain database shards and you need to route the SQL statement directly to the database shards for execution, you can use custom hints provided by PolarDB-X.

```
/! TDDL:NODE IN('node_name', ...) */SELECT * FROM table_name;
```

In the preceding SQL statement, the part between `/!` and `*/`, namely, `TDDL:node in('node_name', ...)`, is a PolarDB-X hint. The hint specifies the ApsaraDB RDS for MySQL database shard where the SQL statement is to be executed.

Note

- PolarDB-X hints can be in the formats of `/*+TDDL:hint_command*/` and `/! +TDDL:hint_command*/`.
- In the MySQL command-line client, you may need to execute an SQL statement that contains a PolarDB-X hint in the format of `/*+TDDL:hint_command*/`. In this case, add the `-c` parameter to the logon command. Otherwise, the client deletes the PolarDB-X hint before it sends the SQL statement to the server for execution because the PolarDB-X hint is in the format of a MySQL comment. In this case, the hint fails to take effect. For more information, see MySQL Client Options.

PolarDB-X hint syntax

Basic syntax:

```
/! TDDL:hint command*/
```

PolarDB-X hints are based on MySQL Comment Syntax. Therefore, an SOL statement that contains a PolarDB-X hint is located between `/!` and `*/`, and must begin with `TDDL:`. The `hint command` indicates a PolarDB-X hint command related to the specific operation. For example, a PolarDB-X hint is added to the following SQL statement to display the name of each database shard.

```
/! TDDL:SCAN*/SHOW TABLES;
```

In this SQL statement, `/! TDDL:SCAN*/` is the PolarDB-X hint that begins with `TDDL:`, and `SCAN` is a PolarDB-X hint command.

11.9.2. Read/write splitting

PolarDB-X provides transparent read/write splitting at the application layer. Data synchronization between primary and read-only ApsaraDB RDS for MySQL instances has a delay of several milliseconds. If you need to read changed data immediately after the primary ApsaraDB RDS for MySQL instance is changed, you must ensure that the SQL statement for reading data is routed to the primary ApsaraDB RDS for MySQL instance. To meet this demand, PolarDB-X provides custom hints for read/write splitting, to route SQL statements to a specified primary or read-only ApsaraDB RDS for MySQL instance.

Syntax

```
/! TDDL:MASTER|SLAVE*/
```

With this custom hint, you can specify whether to run an SQL statement on a primary or read-only ApsaraDB RDS for MySQL instance. With the custom hint `/!TDDL:SLAVE*/`, if a primary ApsaraDB RDS for MySQL instance is configured with multiple read-only ApsaraDB RDS for MySQL instances, the PolarDB-X instance randomly selects a read-only ApsaraDB RDS for MySQL instance based on its weight, to run the SQL statement.

Note

- PolarDB-X hints can be in the formats of `/*+TDDL:hint_command*/` and `/! +TDDL:hint_command*/`.
- In the MySQL command-line client, you may need to execute an SQL statement that contains a PolarDB-X hint in the format of `/*+TDDL:hint_command*/`. In this case, add the `-c` parameter to the logon command. Otherwise, the client deletes the PolarDB-X hint before it sends the SQL statement to the server for execution because the PolarDB-X hint is in the format of a MySQL comment. In this case, the hint fails to take effect. For more information, see MySQL Client Options.

Examples

- Specify a primary ApsaraDB RDS for MySQL instance to run an SQL statement:

```
/! TDDL:MASTER*/SELECT * FROM table_name;
```

After the custom hint `/! TDDL:MASTER*/` is added at the beginning of the SQL statement, this SQL statement is routed to the primary ApsaraDB RDS for MySQL instance for execution.

- Specify a read-only ApsaraDB RDS for MySQL instance to run an SQL statement:

```
/! TDDL:SLAVE*/SELECT * FROM table_name;
```

After the custom hint `/! TDDL:SLAVE*/` is added at the beginning of the SQL statement, this SQL statement is randomly routed to a read-only ApsaraDB RDS for MySQL instance based on the allocated weight.

Considerations

- The custom hints for read/write splitting are only applicable to read SQL statements for non-transactional data. SQL statements for transactional data and write SQL statements are still routed to the primary ApsaraDB RDS for MySQL instance.
- When you use the `/*+TDDL:slave()*/` hint, the PolarDB-X instance routes the SQL statement randomly to a read-only ApsaraDB RDS for MySQL instance based on the allocated weight. If no read-only ApsaraDB RDS for MySQL instance is available, no error is reported. Instead, the primary ApsaraDB RDS for MySQL instance is selected to execute the SQL statement.

11.9.3. Prevent the delay from a read-only ApsaraDB RDS for MySQL instance

Normally, if you have configured a read-only ApsaraDB for RDS instance for the primary ApsaraDB RDS for MySQL instance of a logical database in a PolarDB-X instance and set read traffic for both the primary and read-only ApsaraDB RDS for MySQL instances, PolarDB-X routes SQL statements to the primary and read-only ApsaraDB RDS for MySQL instances based on the read/write ratio. However, if asynchronous data replication between the primary and read-only ApsaraDB RDS for MySQL instances has a high delay, an error is reported or error results are returned when PolarDB-X routes the SQL statements to the read-only ApsaraDB RDS for MySQL instance.

To address this issue, the PolarDB-X instance provides a custom hint to cut off the delay of the read-only instance. Specifically, based on the maximum delay of primary/secondary replication, PolarDB-X determines whether to route the SQL statement to the primary or the read-only ApsaraDB RDS for MySQL instance.

Syntax

```
/! TDDL:SQL_DELAY_CUTOFF=time*/
```

With this custom hint, you can specify the value of `SQL_DELAY_CUTOFF`. When the value of SQL_DELAY (primary/secondary replication delay of ApsaraDB RDS for MySQL) for the read-only ApsaraDB RDS for MySQL instance reaches or exceeds the value of `time` (which is measured in seconds), the SQL statement is routed to the primary ApsaraDB RDS for MySQL instance.

> Note
> - PolarDB-X hints can be in the formats of `/*+TDDL:hint_command*/` and `/! +TDDL:hint_command*/`.
> - In the MySQL command-line client, you may need to execute an SQL statement that contains a PolarDB-X hint in the format of `/*+TDDL:hint_command*/`. In this case, add the `-c` parameter to the logon command. Otherwise, the client deletes the PolarDB-X hint before it sends the SQL statement to the server for execution because the PolarDB-X hint is in the format of a MySQL comment. In this case, the hint fails to take effect. For more information, see MySQL Client Options.

Examples

- Set the primary/secondary replication delay to 5 seconds:

  ```
  /! TDDL:SQL_DELAY_CUTOFF=5*/SELECT * FROM table_name;
  ```

  In this SQL statement, the value of `SQL_DELAY_CUTOFF` is set to 5. Therefore, when the value of `SQL_DELAY` for the read-only ApsaraDB RDS for MySQL instance reaches or exceeds 5 seconds, the SQL statement is routed to the primary ApsaraDB RDS for MySQL instance.

- Use the custom hint for delay cutoff with other custom hints:

  ```
  /! TDDL:SLAVE AND SQL_DELAY_CUTOFF=5*/SELECT * FROM table_name;
  ```

  The custom hint for cutting off the delay of the read-only ApsaraDB RDS for MySQL instance can be used with other hints. By default, the SQL query request is routed to a read-only ApsaraDB RDS for MySQL instance. However, when the primary/secondary replication delay reaches or exceeds 5 seconds, the SQL query request is routed to the primary ApsaraDB RDS for MySQL instance.

11.9.4. Specify a timeout period for an SQL statement

In PolarDB-X, the SQL statements for PolarDB-X instances and ApsaraDB RDS for MySQL instances are timed out after 900 seconds (which can be adjusted) by default. However, for some slow SQL statements, the execution duration may exceed 900 seconds. For these slow SQL statements, PolarDB-X provides a custom hint to adjust their timeout periods. You can use this custom hint to adjust the SQL execution duration as needed.

Syntax

The syntax of the PolarDB-X hint for specifying a timeout period for an SQL statement is as follows:

```
/! TDDL:SOCKET_TIMEOUT=time*/
```

The `SOCKET_TIMEOUT` parameter is measured in milliseconds. With this custom hint, you can adjust the timeout period for the SQL statement based on business requirements.

> **Note**
> - PolarDB-X hints can be in the formats of `/*+TDDL:hint_command*/` and `/! +TDDL:hint_command*/`.
> - In the MySQL command-line client, you may need to execute an SQL statement that contains a PolarDB-X hint in the format of `/*+TDDL:hint_command*/`. In this case, add the `-c` parameter to the logon command. Otherwise, the client deletes the PolarDB-X hint before it sends the SQL statement to the server for execution because the PolarDB-X hint is in the format of a MySQL comment. In this case, the hint fails to take effect. For more information, see MySQL Client Options.

Examples

Set the timeout period of an SQL statement to 40 seconds:

```
/! TDDL:SOCKET_TIMEOUT=40000*/SELECT * FROM t_item;
```

> **Note** A longer timeout period causes database resources to be occupied for a longer period of time. If excessive SQL statements are executed over a long time within the same period, a large number of database resources may be consumed. This will make users unable to use PolarDB-X properly. In this case, we need to use this custom hint to optimize the SQL statements that take a long time to execute.

11.9.5. Specify a database shard to run an SQL statement

When running SQL commands in a PolarDB-X instance, you may find that some SQL statements are not supported by the PolarDB-X instance. In this case, you can use the custom hint provided by PolarDB-X to route the SQL statements to one or more database shards for execution. In addition, if you need to query the data in a specified database shard or the data in a specified table shard, you can use the custom hint to directly route the SQL statement to the database shard for execution.

Syntax

This custom hint allows you to specify a database shard by using a shard name or the value of the database shard key, to run an SQL statement in the database shard. A shard name uniquely identifies a database shard in a PolarDB-X instance. You can run the `SHOW NODE` command to obtain the shard name.

> **Note** If the hint for specifying a database shard is used in an INSERT statement that contains a sequence for the target table, the sequence will not take effect. For more information, see Limits and precautions for sequences.

- Specify a database shard by using a shard name, to run an SQL statement

  This custom hint allows you to specify one or more database shards to run an SQL statement.

  - Specify one database shard to run an SQL statement:

    ```
    /! TDDL:NODE='node_name'*/
    ```

    Specifically, `node_name` indicates the shard name. This PolarDB-X hint enables you to route the SQL statement to the database shard specified by `node_name`.

  - Specify multiple database shards to run an SQL statement:

    ```
    /! TDDL:NODE IN ('node_name'[,'node_name1','node_name2'])*/
    ```

    The `IN` keyword is used to specify multiple shard names. This custom hint allows you to route the SQL statement to multiple database shards. Separate multiple shard names with commas (,).

    > **Note** When this custom hint is used, the PolarDB-X instance directly routes the SQL statement to the specified database shards for execution. Therefore, the specified shard names in the SQL statement must correspond to existing database shards.

- Specify a database shard by using the value of the database shard key, to run an SQL statement

  ```
  /! TDDL:table_name.partition_key=value [and table_name1.partition_key=value1]*/
  ```

  In this PolarDB-X hint, `table_name` indicates the name of a logical table, and this table is a partitioned table. In addition, `partition_key` indicates a shard key, and `value` indicates the value specified for the shard key. In this custom hint, you can use the `and` keyword to specify the shard keys of multiple partitioned tables. When this PolarDB-X hint is used, the PolarDB-X instance calculates the database shards and table shards where the SQL statement is to be executed, and routes the SQL statement to the corresponding database shards.

Note

- PolarDB-X hints can be in the formats of `/*+TDDL:hint_command*/` and `/! +TDDL:hint_command*/`.
- In the MySQL command-line client, you may need to execute an SQL statement that contains a PolarDB-X hint in the format of `/*+TDDL:hint_command*/`. In this case, add the `-c` parameter to the logon command. Otherwise, the client deletes the PolarDB-X hint before it sends the SQL statement to the server for execution because the PolarDB-X hint is in the format of a MySQL comment. In this case, the hint fails to take effect. For more information, see MySQL Client Options.

Examples

The following shows the responses of the `SHOW NODE` statement for a logical database named `drds_test` in a PolarDB-X instance.

```
mysql> SHOW NODE\G
*************************** 1. row ******************
          ID: 0

```

As you can see, each database shard has the `NAME` attribute, which indicates the shard name corresponding to the database shard. Each shard name uniquely corresponds to one database shard name. For example, the shard name `DRDS_TEST_1473471355140LRPRDRDS_TEST_VTLA_0003_RDS` corresponds to the database shard name `drds_test_vtla_0003`. Therefore, after obtaining the shard name, you can use the PolarDB-X hint to specify the corresponding database shard to run the SQL statement.

- Specify database shard 0 to run an SQL statement:

```
/! TDDL:NODE='DRDS_TEST_1473471355140LRPRDRDS_TEST_VTLA_0000_RDS'*/SELECT * FROM table_name;
```

- Specify multiple database shards to run an SQL statement:

```
/! TDDL:NODE IN('DRDS_TEST_1473471355140LRPRDRDS_TEST_VTLA_0000_RDS','DRDS_TEST_1473471355140LRPRDRDS_TEST_VTLA_0006_RDS')*/SELECT * FROM table_name;
```

  This SOL statement will be executed in the database shards whose shard names are `DRDS_TEST_1473471355140LRPRDRDS_TEST_VTLA_0000_RDS` and `DRDS_TEST_1473471355140LRPRDRDS_TEST_VTLA_0006_RDS`.

- View the execution plan of an SQL statement in a specified database shard:

```
/! TDDL:NODE='DRDS_TEST_1473471355140LRPRDRDS_TEST_VTLA_0000_RDS'*/EXPLAIN SELECT * FROM table_name;
```

  After this SQL statement is executed, the execution plan of the `SELECT` statement in the database shard corresponding to the shard name `DRDS_TEST_1473471355140LRPRDRDS_TEST_VTLA_0000_RDS` will be returned.

- Specify a database shard by using the value of the database shard key, to run an SQL statement:

  PolarDB-X does not support subqueries in the `SET` clause of an `UPDATE` statement, because a shard key must be specified for `UPDATE` statements in PolarDB-X. To address this issue, PolarDB-X provides a custom hint to route the statement to a database shard for execution.

  For example, the following shows the CREATE TABLE statement for creating two logical tables t1 and t2, which are partitioned into table shards in database shards:

```
CREATE TABLE `t1` (
  `id` bigint(20) NOT NULL,
  `name` varchar(20) NOT NULL,
  `val` varchar(20) DEFAULT NULL,
  PRIMARY KEY (`id`)
 ) ENGINE=InnoDB DEFAULT CHARSET=utf8 dbpartition by hash(`id`) tbpartition by hash(`name`) tbpartitions 3
 CREATE TABLE `t2` (
  `id` bigint(20) NOT NULL,
  `name` varchar(20) NOT NULL,
  `val` varchar(20) DEFAULT NULL,
  PRIMARY KEY (`id`)
 ) ENGINE=InnoDB DEFAULT CHARSET=utf8 dbpartition by hash(`id`) tbpartition by hash(`name`) tbpartitions 3
```

  The following SQL statement is to be executed for the two tables:

```
UPDATE t1 SET val=(SELECT val FROM t2 WHERE id=1) WHERE id=1;
```

  If this statement is directly executed in a PolarDB-X instance, an error will be returned indicating that this statement is not supported. In this case, you can add the PolarDB-X hint to this SQL statement before submitting it to the PolarDB-X instance for execution. The SQL statements are as follows:

```
/! TDDL:t1.id=1 and t2.id=1*/UPDATE t1 SET val=(SELECT val FROM t2 WHERE id=1) WHERE id=1;
```

  This statement will be routed to database shards of `t1`, with the `id` of the database shards being 1. You can run the following `EXPLAIN` command to view the execution plan of this SQL statement:

```
mysql> explain /! TDDL:t1.id=1 and t2.id=1*/UPDATE t1 SET val=(SELECT val FROM t2 WHERE id=1) WHERE id=1\G
*************************** 1. row ***************************
GROUP_NAME: TEST_DRDS_1485327111630IXLWTEST_DRDS_IGHF_0001_RDS
   SQL: UPDATE `t1_2` AS `t1` SET `val` = (SELECT val FROM `t2_2` AS `t2` WHERE `id` = 1) WHERE `id` = 1
  PARAMS: {}
*************************** 2. row ***************************
GROUP_NAME: TEST_DRDS_1485327111630IXLWTEST_DRDS_IGHF_0001_RDS
   SQL: UPDATE `t1_1` AS `t1` SET `val` = (SELECT val FROM `t2_1` AS `t2` WHERE `id` = 1) WHERE `id` = 1
  PARAMS: {}
*************************** 3. row ***************************
GROUP_NAME: TEST_DRDS_1485327111630IXLWTEST_DRDS_IGHF_0001_RDS
   SQL: UPDATE `t1_0` AS `t1` SET `val` = (SELECT val FROM `t2_0` AS `t2` WHERE `id` = 1) WHERE `id` = 1
  PARAMS: {}
3 rows in set (0.00 sec)
```

According to the result set of the `EXPLAIN` command, the SQL statement is rewritten into three statements, which are then routed to the database shards for execution. You can further specify a table shard by using the value of the table shard key, to narrow the execution scope of the SQL statement to a specified table shard.

```
mysql> explain /! TDDL:t1.id=1 and t2.id=1 and t1.name='1'*/UPDATE t1 SET val=(SELECT val FROM t2 WHERE id=1) WH
ERE id=1\G
*************************** 1. row ***************************
GROUP_NAME: TEST_DRDS_1485327111630IXLWTEST_DRDS_IGHF_0001_RDS
   SQL: UPDATE `t1_1` AS `t1` SET `val` = (SELECT val FROM `t2_1` AS `t2` WHERE `id` = 1) WHERE `id` = 1
  PARAMS: {}
1 row in set (0.00 sec)
```

Note Before using this custom hint, you must ensure that the logical tables t1 and t2 are partitioned into the same number of database shards and the same number of table shards. Otherwise, the database shards calculated by the PolarDB-X instance based on the conditions are different, and an error will be returned.

11.9.6. Scan all database shards and table shards

In addition to routing an SQL statement to one or more database shards for execution, PolarDB-X provides a custom hint to allow you to scan all database shards and table shards. With this custom hint, you can route an SQL statement to each database shard at a time. For example, you can use this custom hint to view all the table shards in a specified database shard. In addition, you can use this custom hint to view the data volume of table shards in each database shard corresponding to a specified logical table.

Syntax

With this PolarDB-X hint, you can route an SQL statement to all database shards for execution and route an SQL statement to all database shards to perform an operation on a specified logical table.

- Route an SQL statement to all database shards for execution:

  ```
  /! TDDL:SCAN*/
  ```

- Perform an operation on a specified logical table:

  ```
  /! TDDL:SCAN='table_name'*/
  ```

  The `table_name` parameter indicates the name of a logical table in the logical database of a PolarDB-X instance. This custom hint is provided for table shards in database shards. Ensure that the value of `table_name` is the name of a table shard in database shards.

> **Note**
> - PolarDB-X hints can be in the formats of `/*+TDDL:hint_command*/` and `/! +TDDL:hint_command*/`.
> - In the MySQL command-line client, you may need to execute an SQL statement that contains a PolarDB-X hint in the format of `/*+TDDL:hint_command*/`. In this case, add the `-c` parameter to the logon command. Otherwise, the client deletes the PolarDB-X hint before it sends the SQL statement to the server for execution because the PolarDB-X hint is in the format of a MySQL comment. In this case, the hint fails to take effect. For more information, see MySQL Client Options.

Examples

- View the data volume of a specified broadcast table in each database shard:

```
/! TDDL:SCAN*/SELECT COUNT(1) FROM table_name
```

  In this SQL statement, `table_name` indicates a broadcast table. This hint causes the PolarDB-X instance to route the SQL statement to each database shard for execution. Therefore, the result sets include the total data volume of the broadcast table `table_name` in all database shards. This statement allows you to conveniently check whether the data of a broadcast table is normal.

- Scan a single-database non-partition logical table:

```
/! TDDL:SCAN*/SELECT COUNT(1) FROM table_name
```

  This hint causes the PolarDB-X instance to route the SQL `select count(1) from table_name` statement to each database shard for execution. The `table_name` parameter indicates a logical table in a logical database of a PolarDB-X instance. Before using this hint, ensure that each database shard contains the table shard `table_name`. In other words, the table shard `table_name` is a logical table that is only partitioned into database shards, but not partitioned into table shards. Otherwise, an error that indicates that the table is not found will be returned.

- Scan a partitioned logical table in database shards:

```
/! TDDL:SCAN='table_name'*/SELECT COUNT(1) FROM table_name
```

  When executing this statement, the PolarDB-X instance first calculates all the database shards and table shards corresponding to the logical table `table_name`, and then generates a COUNT clause for each table shard in each database shard.

- View the execution plans of all database shards:

```
/! TDDL:SCAN='table_name'*/EXPLAIN SELECT * FROM table_name;
```

11.10. Distributed transactions

11.10.1. Distributed transactions based on MySQL 5.7

> **Note**
> - When you use MySQL 5.7 or later and PolarDB-X 5.3.4 or later, XA distributed transactions are automatically enabled. The user experience of the XA distributed transactions is the same as that of single-database transactions in MySQL. No special commands are required to enable XA distributed transactions.
> - When you use MySQL and a PolarDB-X instance in other versions, see Distributed transactions based on MySQL 5.6.

How it works

When you use MySQL 5.7 or later, the PolarDB-X instance processes distributed transactions based on the XA protocol by default.

Use method

The user experience of distributed transactions in a PolarDB-X instance is the same as that of single-database transactions in MySQL, for example, in terms of the following commands:

- `SET AUTOCOMMIT=0` : Start a transaction.
- `COMMIT` : Commit the current transaction.
- `ROLLBACK` : Roll back the current transaction.

If the SQL statement in a transaction involves only a single shard, the PolarDB-X instance routes the transaction directly to the ApsaraDB RDS for MySQL instance as a single-database transaction. If the SQL statement in the transaction is to modify the data of multiple shards, the PolarDB-X instance automatically upgrades the current transaction to a distributed transaction.

11.10.2. Distributed transactions based on MySQL 5.6

How it works

The XA protocol for MySQL 5.6 is not mature. Therefore, the PolarDB-X instance independently implements two-phase commit (2PC) transaction policies for distributed transactions. When you use MySQL 5.7 or later, we recommend that you use XA transaction policies.

> **Note** The distributed transactions described in this topic are intended for users who use MySQL 5.6 or PolarDB-X earlier than 5.3.4. When you use MySQL 5.7 or later and a PolarDB-X instance in 5.3.4 or later, see Distributed transactions based on MySQL 5.7.

Use method

If a transaction involves multiple database shards, you must declare the current transaction as a distributed transaction. If a transaction involves only a single database shard, you do not need to enable distributed transactions, but can process the transaction as a single-database transaction in MySQL. No additional operations are required.

To enable distributed transactions, do as follows:

After transactions are enabled, run `SET drds_transaction_policy = '...'` .

To enable 2PC transactions in the MySQL command-line client, run the following statements:

```
SET AUTOCOMMIT=0;
SET drds_transaction_policy = '2PC'; -- We recommend that you use MySQL 5.6 to run this command.
.... -- Here, you can run your business SQL statement.
COMMIT; -- You can alternatively write ROLLBACK.
```

To enable 2PC transactions by using the Java database connectivity (JDBC) API, write the code as follows:

```
conn.setAutoCommit(false);
try (Statement stmt = conn.createStatement()) {
  stmt.execute("SET drds_transaction_policy = '2PC'");
}
// ... Here, you can run your business SQL statement.
conn.commit(); // You can alternatively write rollback().
```

FAQ

Q: How can I use PolarDB-X distributed transactions in the Spring framework?

A: If you enable transactions by using the Spring `@Transactional` annotation, you can enable PolarDB-X distributed transactions by extending the transaction manager.

Sample code:

```
import org.springframework.jdbc.datasource.DataSourceTransactionManager;
import org.springframework.transaction.TransactionDefinition;
import javax.sql.DataSource;
import java.sql.Connection;
import java.sql.SQLException;
import java.sql.Statement;
public class DrdsTransactionManager extends DataSourceTransactionManager {
  public DrdsTransactionManager(DataSource dataSource) {
    super(dataSource);
  }
  @Override
  protected void prepareTransactionalConnection(Connection con, TransactionDefinition definition) throws SQLExcept
ion {
    try (Statement stmt = con.createStatement()) {
      stmt.executeUpdate("SET drds_transaction_policy = '2PC'"); // A 2PC transaction is used as an example.
    }
  }
}
```

After that, instantiate the preceding class in the Spring configuration. For example, you can write the code as follows:

```
<bean id="drdsTransactionManager" class="my.app.DrdsTransactionManager">
  <property name="dataSource" ref="yourDataSource" />
</bean>
```

To enable PolarDB-X distributed transactions for a class, you can add the `@Transactional("drdsTransactionManager")` annotation.

11.11. DDL operations

11.11.1. DDL statements

The data definition language (DDL) statement CREATE TABLE in a Distributed Relational Database Service (DRDS) instance is similar to that in a MySQL database, and is extended based on the syntax in a MySQL database. To create a table shard in a DRDS instance, you must specify the table sharding manner and the database sharding manner in the `drds_partition options` parameter. The valid values include `DBPARTITION BY`, `TBPARTITION BY`, `TBPARTITIONS`, and `BROADCAST`.

Currently, you can run a DDL statement in the following ways:

- Run the DDL statement through the MySQL command-line client, for example, by using MySQL command lines, Navicat, or MySQL Workbench.
- Connect to the specified DRDS instance by using program code and then call the DDL statement for execution.

For the syntax of the CREATE TABLE statement in a MySQL database, see MySQL CREATE TABLE Statement.

11.11.2. CREATE TABLE statement

11.11.2.1. Overview

This topic describes the syntax, clauses, parameters, and basic methods for creating a table by using a data definition language (DDL) statement.

> **Note** PolarDB-X instances do not allow you to directly create a database by using a DDL statement. To create a database, you can Log on to the PolarDB-X console. For the information about how to create a database, see Create a database.

Syntax

```
CREATE [TEMPORARY] TABLE [IF NOT EXISTS] tbl_name
  (create_definition,...)
  [table_options]
  [drds_partition_options]
  [partition_options]
drds_partition_options:
  DBPARTITION BY
    HASH([column])
    [TBPARTITION BY
      { HASH(column)
      | {MM|DD|WEEK|MMDD}(column)}
     [TBPARTITIONS num]
    ]
```

Clauses and parameters for database and table sharding

- `DBPARTITION BY hash(partition_key)` : This parameter specifies the shard key and the sharding algorithm for database sharding. Database sharding by time is not supported.
- `TBPARTITION BY { HASH(column) | {MM|DD|WEEK|MMDD}(column)` : (Optional) This parameter specifies the method of mapping data to a physical table. The value is the same as that of DBPARTITION BY by default.
- `TBPARTITIONS num` : (Optional) This parameter specifies the number of physical tables to be created in each database shard. The default value is 1. If no table sharding is required, you do not need to specify this parameter.

11.11.2.2. Create a single-database non-partition table

This topic describes how to create a single-database non-partition table.

Create a single-database non-partition table

```
CREATE TABLE single_tbl(
 id int,
 name varchar(30),
 primary key(id)
);
```

According to the node topology of the logical table, you can see that a single-database non-partition logical table is created in database 0.

```
mysql> show topology from single_tbl;
+------+--------------------------------------------------------------------+------------+
| ID   | GROUP_NAME                                                         | TABLE_NAME |
+------+--------------------------------------------------------------------+------------+
|    0 | SANGUAN_TEST_123_1488766060743ACTJSANGUAN_TEST_123_WVVP_0000_RDS | single_tbl |
+------+--------------------------------------------------------------------+------------+
1 row in set (0.01 sec)
```

Specify parameters

You can also specify the `select_statement` parameter when creating a a single-database non-partition table. If you need to create table shards, you cannot specify this parameter.

```
CREATE [TEMPORARY] TABLE [IF NOT EXISTS] tbl_name
  [(create_definition,...)]
  [table_options]
  [partition_options]
  select_statement
```

For example, you can run the following statement to create a single-database non-partition table single_tbl2 to store the data from the single_tbl table. In this case, no sharding is required.

```
CREATE TABLE single_tbl2(
 id int,
 name varchar(30),
 primary key(id)
) select * from single_tbl;
```

11.11.2.3. Create a non-partition table in database shards

This topic describes how to create a non-partition table in database shards.

Assume that eight database shards have been created. You can run the following command to create a non-partition table in the database shards by calculating the hash function based on the userId shard key.

```
CREATE TABLE multi_db_single_tbl(
 id int,
 name varchar(30),
 primary key(id)
) dbpartition by hash(id);
```

According to the node topology of the logical table, you can see that a table shard is created in each database shard. In other words, the table is only distributed to database shards.

```
mysql> show topology from multi_db_single_tbl;
+------+--------------------------------------------------------------------+--------------------+
| ID   | GROUP_NAME                                                         | TABLE_NAME         |
+------+--------------------------------------------------------------------+--------------------+
|    0 | SANGUAN_TEST_123_1488766060743ACTJSANGUAN_TEST_123_WVVP_0000_RDS | multi_db_single_tbl |
|    1 | SANGUAN_TEST_123_1488766060743ACTJSANGUAN_TEST_123_WVVP_0001_RDS | multi_db_single_tbl |
|    2 | SANGUAN_TEST_123_1488766060743ACTJSANGUAN_TEST_123_WVVP_0002_RDS | multi_db_single_tbl |
|    3 | SANGUAN_TEST_123_1488766060743ACTJSANGUAN_TEST_123_WVVP_0003_RDS | multi_db_single_tbl |
|    4 | SANGUAN_TEST_123_1488766060743ACTJSANGUAN_TEST_123_WVVP_0004_RDS | multi_db_single_tbl |
|    5 | SANGUAN_TEST_123_1488766060743ACTJSANGUAN_TEST_123_WVVP_0005_RDS | multi_db_single_tbl |
|    6 | SANGUAN_TEST_123_1488766060743ACTJSANGUAN_TEST_123_WVVP_0006_RDS | multi_db_single_tbl |
|    7 | SANGUAN_TEST_123_1488766060743ACTJSANGUAN_TEST_123_WVVP_0007_RDS | multi_db_single_tbl |
+------+--------------------------------------------------------------------+--------------------+
8 rows in set (0.01 sec)
```

11.11.2.4. Create table shards in database shards

This topic describes how to create table shards in database shards in different sharding manners.

- Use HASH for sharding

- Use RANGE_HASH for sharding
- Use date functions for sharding

In the following examples, it is assumed that eight database shards have been created.

Use HASH for sharding

Create a table that is split into table shards in database shards, with each database shard containing three physical tables. The database sharding process is calculating the hash function by using id as the shard key, and the table sharding process is calculating the hash function by using bid as the shard key. Specifically, a hash operation is performed on the data of the table based on the id column, to distribute the data to multiple database shards. Then, a hash operation is performed on the data in each database shard based on the bid column, to distribute the data to the three physical tables.

```
CREATE TABLE multi_db_multi_tbl(
 id int auto_increment,
 bid int,
 name varchar(30),
 primary key(id)
) dbpartition by hash(id) tbpartition by hash(bid) tbpartitions 3;
```

According to the node topology of the logical table, you can see that three table shards are created in each database shard.

```
mysql> show topology from multi_db_multi_tbl;
+------+-----------------------------------------------------------------------+-----------------------+
| ID   | GROUP_NAME                                                            | TABLE_NAME            |
+------+-----------------------------------------------------------------------+-----------------------+
|   0 | SANGUAN_TEST_123_1488766060743ACTJSANGUAN_TEST_123_WVVP_0000_RDS | multi_db_multi_tbl_00 |
|   1 | SANGUAN_TEST_123_1488766060743ACTJSANGUAN_TEST_123_WVVP_0000_RDS | multi_db_multi_tbl_01 |
|   2 | SANGUAN_TEST_123_1488766060743ACTJSANGUAN_TEST_123_WVVP_0000_RDS | multi_db_multi_tbl_02 |
|   3 | SANGUAN_TEST_123_1488766060743ACTJSANGUAN_TEST_123_WVVP_0001_RDS | multi_db_multi_tbl_03 |
|   4 | SANGUAN_TEST_123_1488766060743ACTJSANGUAN_TEST_123_WVVP_0001_RDS | multi_db_multi_tbl_04 |
|   5 | SANGUAN_TEST_123_1488766060743ACTJSANGUAN_TEST_123_WVVP_0001_RDS | multi_db_multi_tbl_05 |
|   6 | SANGUAN_TEST_123_1488766060743ACTJSANGUAN_TEST_123_WVVP_0002_RDS | multi_db_multi_tbl_06 |
|   7 | SANGUAN_TEST_123_1488766060743ACTJSANGUAN_TEST_123_WVVP_0002_RDS | multi_db_multi_tbl_07 |
|   8 | SANGUAN_TEST_123_1488766060743ACTJSANGUAN_TEST_123_WVVP_0002_RDS | multi_db_multi_tbl_08 |
|   9 | SANGUAN_TEST_123_1488766060743ACTJSANGUAN_TEST_123_WVVP_0003_RDS | multi_db_multi_tbl_09 |
|  10 | SANGUAN_TEST_123_1488766060743ACTJSANGUAN_TEST_123_WVVP_0003_RDS | multi_db_multi_tbl_10 |
|  11 | SANGUAN_TEST_123_1488766060743ACTJSANGUAN_TEST_123_WVVP_0003_RDS | multi_db_multi_tbl_11 |
|  12 | SANGUAN_TEST_123_1488766060743ACTJSANGUAN_TEST_123_WVVP_0004_RDS | multi_db_multi_tbl_12 |
|  13 | SANGUAN_TEST_123_1488766060743ACTJSANGUAN_TEST_123_WVVP_0004_RDS | multi_db_multi_tbl_13 |
|  14 | SANGUAN_TEST_123_1488766060743ACTJSANGUAN_TEST_123_WVVP_0004_RDS | multi_db_multi_tbl_14 |
|  15 | SANGUAN_TEST_123_1488766060743ACTJSANGUAN_TEST_123_WVVP_0005_RDS | multi_db_multi_tbl_15 |
|  16 | SANGUAN_TEST_123_1488766060743ACTJSANGUAN_TEST_123_WVVP_0005_RDS | multi_db_multi_tbl_16 |
|  17 | SANGUAN_TEST_123_1488766060743ACTJSANGUAN_TEST_123_WVVP_0005_RDS | multi_db_multi_tbl_17 |
|  18 | SANGUAN_TEST_123_1488766060743ACTJSANGUAN_TEST_123_WVVP_0006_RDS | multi_db_multi_tbl_18 |
|  19 | SANGUAN_TEST_123_1488766060743ACTJSANGUAN_TEST_123_WVVP_0006_RDS | multi_db_multi_tbl_19 |
|  20 | SANGUAN_TEST_123_1488766060743ACTJSANGUAN_TEST_123_WVVP_0006_RDS | multi_db_multi_tbl_20 |
|  21 | SANGUAN_TEST_123_1488766060743ACTJSANGUAN_TEST_123_WVVP_0007_RDS | multi_db_multi_tbl_21 |
|  22 | SANGUAN_TEST_123_1488766060743ACTJSANGUAN_TEST_123_WVVP_0007_RDS | multi_db_multi_tbl_22 |
|  23 | SANGUAN_TEST_123_1488766060743ACTJSANGUAN_TEST_123_WVVP_0007_RDS | multi_db_multi_tbl_23 |
+------+-----------------------------------------------------------------------+-----------------------+
24 rows in set (0.01 sec)
```

According to the sharding rule of the logical table, you can see that both database sharding and table sharding are running the hash function, except that the database shard key is id and the table shard key is bid.

```
mysql> show rule from multi_db_multi_tbl;
+------+--------------------+-----------+-----------------+--------------------+-------------------+-----------------+--------------------+-----------------------+
| ID   | TABLE_NAME         | BROADCAST | DB_PARTITION_KEY | DB_PARTITION_POLICY | DB_PARTITION_COUNT | TB_PARTITION_KEY | TB_PARTITION_POLICY | TB_PARTITION_COUNT |
+------+--------------------+-----------+-----------------+--------------------+-------------------+-----------------+--------------------+-----------------------+

Use RANGE_HASH for sharding

- Requirements

  The shard key must be a character or a number.

- Routing method

  Calculate a hash value based on the last N digits of any shard key, and then calculate the route by using RANGE_HASH. The number N is the third parameter in the function. For example, during calculation of the RANGE_HASH(COL1, COL2, N) function, COL1 is preferentially selected and then truncated to obtain the last N digits for calculation. If COL1 does not exist, COL2 is selected and truncated for calculation.

- Scenarios

  RANGE_HASH is applicable to scenarios where two shard keys are used for sharding but only the values of one shard is used for SQL query. Assume that a DRDS database is partitioned into eight physical databases. Our customer has the following requirements:

  i. The order table of each service needs to be split into database shards by buyer ID and order ID.

  ii. The query is executed based on either the buyer ID or order ID as the condition.

  In this case, you can run the following DDL statement to create the order table:

```
create table test_order_tb (
        id int,
        seller_id varchar(30) DEFAULT NULL,
        order_id varchar(30) DEFAULT NULL,
        buyer_id varchar(30) DEFAULT NULL,
        create_time datetime DEFAULT NULL,
        primary key(id)
  ) ENGINE=InnoDB DEFAULT CHARSET=utf8 dbpartition by RANGE_HASH(buyer_id, order_id, 10) tbpartition by RANGE_HASH(buyer_id, order_id, 10) tbpartitions 3;
```

> **Note**
>
> - Neither of the two shard keys can be modified.
> - Data insertion fails if the two shard keys point to different database shards or table shards.

Use date functions for sharding

In addition to using the hash function as the sharding algorithm, you can also use the date functions MM, DD, WEEK, and MMDD as the table sharding algorithms. For more information, see the following examples.

- Create a table and then split the table into table shards in database shards. The database sharding process is calculating the hash function by using userId as the shard key, and the table sharding process is calculating DAY_OF_WEEK through the WEEK(actionDate) function and then splitting the table into table shards based on the actionDate column, with one week counted as seven days.

For example, if the value in the actionDate column is 2017-02-27, which is on Monday, the value obtained by calculating the WEEK(actionDate) function is 2. In this case, the record is stored in table shard 2, because 2 % 7 = 2. This table shard is located in a database shard and is named user_log_2. For another example, if the value in the actionDate column is 2017-02-26, which is on Sunday, the value obtained by calculating the WEEK(actionDate) function is 1. In this case, the record is stored in table shard 1, because 1 % 7 = 1. This table shard is located in a database shard and is named user_log_1.

```
CREATE TABLE user_log(
userId int,
name varchar(30),
operation varchar(30),
actionDate DATE
) dbpartition by hash(userId) tbpartition by WEEK(actionDate) tbpartitions 7;
```

According to the node topology of the logical table, you can see that seven table shards are created in each database shard, because one week is counted as seven days in the function. The responses are very long, and therefore are omitted by using an ellipsis (...).

```
mysql> show topology from user_log;

56 rows in set (0.01 sec)
```

According to the sharding rule of the logical table, you can see that the database sharding process is calculating the hash function by using userId as the shard key, and the table sharding process is calculating the WEEK function by using actionDate as the shard key.

```
mysql> show rule from user_log;
+------+------------+-----------+-----------------+--------------------+--------------------+-----------------+--------------------+-----------------
--+
| ID   | TABLE_NAME | BROADCAST | DB_PARTITION_KEY | DB_PARTITION_POLICY | DB_PARTITION_COUNT | TB_PARTITI
ON_KEY | TB_PARTITION_POLICY | TB_PARTITION_COUNT |
+------+------------+-----------+-----------------+--------------------+--------------------+-----------------+--------------------+-----------------
--+
|  0 | user_log  |      0 | userId       | hash          | 8          | actionDate    | week         | 7          |
+------+------------+-----------+-----------------+--------------------+--------------------+-----------------+--------------------+-----------------
--+
1 row in set (0.00 sec)
```

According to the specified database and table shard key parameters, you can see the specific physical table in the specific physical database to which the SQL statement is routed.

View the route of the SQL statement

```
mysql> explain select name from user_log where userId = 1 and actionDate = '2017-02-27'\G
*************************** 1. row ***************************
GROUP_NAME: SANGUAN_1490167540907XWDVSANGUAN_BSQT_0001_RDS
       SQL: select `user_log`.`name` from `user_log_2` `user_log` where ((`user_log`.`userId` = 1) AND (`user_log`.`actionDate` = '2017-02-27'))
    PARAMS: {}
1 row in set (0.01 sec)
```

- Create a table that is split into table shards in database shards. The database sharding process is calculating the hash function by using userId as the shard key, and the table sharding process is calculating MONTH_OF_YEAR through the MM(actionDate) function and then splitting the table into table shards based on the actionDate column, with one year counted as 12 months.

  For example, if the value in the actionDate column is 2017-02-27, the value obtained by calculating the MM(actionDate) function is 02. In this case, the record is stored in table shard 02, because 02 % 12 = 02. This table shard is located in a database shard and is named user_log_02. For another example, if the value in the actionDate column is 2016-12-27, the value obtained by calculating the MM(actionDate) function is 12. In this case, the record is stored in table shard 00, because 12 % 12 = 00. This table shard is located in a database shard and is named user_log_00.

```
CREATE TABLE user_log2(
userId int,
name varchar(30),
operation varchar(30),
actionDate DATE
) dbpartition by hash(userId) tbpartition by MM(actionDate) tbpartitions 12;
```

According to the node topology of the logical table, you can see that 12 table shards are created in each database shard, because one year is counted as 12 months in the function. The responses are very long, and therefore are omitted by using an ellipsis (...).

```
mysql> show topology from user_log2;

248 rows in set (0.01 sec)
```

According to the sharding rule of the logical table, you can see that the database sharding process is calculating the hash function by using userId as the shard key, and the table sharding process is calculating the DD function by using actionDate as the shard key.

```
mysql> show rule from user_log3;
+------+------------+-----------+-----------------+--------------------+--------------------+-----------------+--------------------+-----------------
--+
| ID   | TABLE_NAME | BROADCAST | DB_PARTITION_KEY | DB_PARTITION_POLICY | DB_PARTITION_COUNT | TB_PARTITI
ON_KEY | TB_PARTITION_POLICY | TB_PARTITION_COUNT |
+------+------------+-----------+-----------------+--------------------+--------------------+-----------------+--------------------+-----------------
--+
|  0 | user_log3 |     0 | userId       | hash          | 8           | actionDate     | dd           | 31          |
+------+------------+-----------+-----------------+--------------------+--------------------+-----------------+--------------------+-----------------
--+
1 row in set (0.01 sec)
```

- Create a table that is split into table shards in database shards. The database sharding process is calculating the hash function by using userId as the shard key, and the table sharding process is calculating DAY_OF_YEAR % 365 through the MMDD(actionDate) tbpartitions 365 function and then splitting the table into 365 physical tables, with one year counted as 365 days.

  For example, if the value in the actionDate column is 2017-02-27, the value obtained by calculating the MMDD(actionDate) function is 58. In this case, the record is stored in table shard 58. This table shard is located in a database shard and is named user_log_58.

  ```
  CREATE TABLE user_log4(
  userId int,
  name varchar(30),
  operation varchar(30),
  actionDate DATE
  ) dbpartition by hash(userId) tbpartition by MMDD(actionDate) tbpartitions 365;
  ```

  According to the node topology of the logical table, you can see that 365 table shards are created in each database shard, because one year is counted as 365 days in the function. The responses are very long, and therefore are omitted by using an ellipsis (...).

```
mysql> show topology from user_log4;
+------+-------------------------------------------------------------------+--------------+

```

11.11.2.5. Use the primary key as the shard key

When no shard key is specified for the sharding algorithm, the system uses the primary key as the shard key by default. The following illustrates how to use the primary key as the database shard key and the table shard key.

Use the primary key as the database shard key

```
CREATE TABLE prmkey_tbl(
id int,
name varchar(30),
primary key(id)
) dbpartition by hash();
```

Use the primary key as the database shard key and the table shard key

```
CREATE TABLE prmkey_multi_tbl(
id int,
name varchar(30),
primary key(id)
) dbpartition by hash() tbpartition by hash() tbpartitions 3;
```

11.11.2.6. Create a broadcast table

The BROADCAST clause is used to specify a broadcast table to be created. A broadcast table is replicated to each database shard and data consistency is ensured between the database shards by using a synchronization mechanism with a delay of several seconds. This feature allows you to route a JOIN operation from a Cloud Native Distributed Database PolarDB-X (PolarDB-X) instance to an underlying ApsaraDB RDS for MySQL instance to prevent the JOIN operation from being performed in multiple databases. Overview describes how to optimize SQL statements by using broadcast tables.

The following is an example statement for creating a broadcast table:

```
CREATE TABLE brd_tbl(
 id int,
 name varchar(30),
 primary key(id)
) ENGINE=InnoDB DEFAULT CHARSET=utf8 BROADCAST;
```

11.11.2.7. Other attributes of the MySQL CREATE TABLE statement

When creating table shards in database shards, you can also specify other attributes of the table shards in the MySQL CREATE TABLE statement. For example, you can specify other attributes as follows:

```
CREATE TABLE multi_db_multi_tbl(
 id int,
 name varchar(30),
 primary key(id)
) ENGINE=InnoDB DEFAULT CHARSET=utf8 dbpartition by hash(id) tbpartition by hash(id) tbpartitions 3;
```

11.11.3. ALTER TABLE statement

The syntax of the ALTER TABLE statement used to modify a table is as follows:

```
ALTER [ONLINE|OFFLINE] [IGNORE] TABLE tbl_name
  [alter_specification [, alter_specification] ...]
  [partition_options]
```

In a Distributed Relational Database Service (DRDS) instance, you can use this data definition language (DDL) statement to perform routine DDL operations, such as adding a column, adding an index, and modifying a data definition. For more information about the syntax, see MySQL CREATE TABLE Statement.

> **Note** If you need to modify a table shard, you are not allowed to modify the shard key.

- Add a column:

```
ALTER TABLE user_log
  ADD COLUMN idcard varchar(30);
```

- Add an index:

```
ALTER TABLE user_log
  ADD INDEX idcard_idx (idcard);
```

- Delete an index:

```
ALTER TABLE user_log
  DROP INDEX idcard_idx;
```

- Modify a field:

```
ALTER TABLE user_log
  MODIFY COLUMN idcard varchar(40);
```

11.11.4. DROP TABLE statement

The syntax of the DROP TABLE statement used to delete a table is as follows:

```
DROP [TEMPORARY] TABLE [IF EXISTS]
  tbl_name [, tbl_name] ...
  [RESTRICT | CASCADE]
```

The DROP TABLE statement in a Distributed Relational Database Service (DRDS) instance is the same as the DROP TABLE statement in a MySQL database. After the statement is executed, the system automatically deletes the corresponding physical table. For more information about the syntax, see MySQL DROP TABLE Statement.

For example, you can run the following statement to delete the user_log table:

```
DROP TABLE user_log;
```

11.11.5. FAQ about DDL statements

What can I do if an error occurs during table creation?

Data definition language (DDL) statements in a PolarDB-X instance are processed in a distributed manner. If an error occurs, the structures of all table shards are inconsistent from each other. Therefore, you need to perform manual cleanup.

Perform the following steps:

1. Check the basic error descriptions provided by the PolarDB-X instance, such as syntax errors. If the error message is too long, the system will prompt you to call the SHOW WARNINGS command to view the failure cause of each database shard.
2. Run the SHOW TOPOLOGY command to view the topology of physical tables.

```
SHOW TOPOLOGY FROM multi_db_multi_tbl;
+------+-----------------+-----------------------+
| ID  | GROUP_NAME    | TABLE_NAME       |
+------+-----------------+-----------------------+
|   0 | corona_qatest_0 | multi_db_multi_tbl_00 |
|   1 | corona_qatest_0 | multi_db_multi_tbl_01 |
|   2 | corona_qatest_0 | multi_db_multi_tbl_02 |
|   3 | corona_qatest_1 | multi_db_multi_tbl_03 |
|   4 | corona_qatest_1 | multi_db_multi_tbl_04 |
|   5 | corona_qatest_1 | multi_db_multi_tbl_05 |
|   6 | corona_qatest_2 | multi_db_multi_tbl_06 |
|   7 | corona_qatest_2 | multi_db_multi_tbl_07 |
|   8 | corona_qatest_2 | multi_db_multi_tbl_08 |
|   9 | corona_qatest_3 | multi_db_multi_tbl_09 |
|  10 | corona_qatest_3 | multi_db_multi_tbl_10 |
|  11 | corona_qatest_3 | multi_db_multi_tbl_11 |
+------+-----------------+-----------------------+
12 rows in set (0.21 sec)
```

3. Run the `CHECK TABLE tablename` command to check whether the logical table has been created. For example, the following response indicates that a physical table corresponding to the logical table multi_db_multi_tbl failed to be created.

```
mysql> check table multi_db_multi_tbl;
+-----------------------------------------------+-------+----------+-----------------------------------------------------------------------------------------+
| TABLE                         | OP   | MSG_TYPE | MSG_TEXT                                                                                |
+-----------------------------------------------+-------+----------+-----------------------------------------------------------------------------------------+
| andor_mysql_qatest. multi_db_multi_tbl | check | Error    | Table 'corona_qatest_0. multi_db_multi_tbl_02' doesn't exist |
+-----------------------------------------------+-------+----------+-----------------------------------------------------------------------------------------+
1 row in set (0.16 sec)
```

4. Continue to create or delete the table in idempotent mode to create or delete the remaining physical tables.

```
CREATE TABLE IF NOT EXISTS table1
(id int, name varchar(30), primary key(id))
dbpartition by hash(id);
DROP TABLE IF EXISTS table1;
```

What can I do if I failed to create an index or add a column?

The method for handling the failure in creating an index or adding a column is similar to that for the failure in creating a table. For more information, see Handle DDL exceptions.

11.11.6. DDL functions for sharding

11.11.6.1. Overview

PolarDB-X is a database service that supports both database sharding and table sharding.

Support for PolarDB-X database sharding and table sharding

The following table lists the support for database sharding and table sharding in PolarDB-Xdata definition language (DDL) sharding functions.

Sharding function	Description	Support for database sharding	Support for table sharding

Sharding function	Description	Support for database sharding	Support for table sharding
HASH	Performs a simple modulus operation.	Yes	Yes
UNI_HASH	Performs a simple modulus operation.	Yes	Yes
RIGHT_SHIFT	Shifts the value to the right.	Yes	Yes
RANGE_HASH	Performs double hashing.	Yes	Yes
MM	Performs hashing by month.	No	Yes
DD	Performs hashing by date.	No	Yes
WEEK	Performs hashing by week.	No	Yes
MMDD	Performs hashing by month and date.	No	Yes
YYYYMM	Performs hashing by year and month.	Yes	Yes
YYYYWEEK	Performs hashing by year and week.	Yes	Yes
YYYYDD	Performs hashing by year and date.	Yes	Yes
YYYYMM_OPT	Performs optimized hashing by year and month.	Yes	Yes
YYYYWEEK_OPT	Performs optimized hashing by year and week.	Yes	Yes
YYYYDD_OPT	Performs optimized hashing by year and date.	Yes	Yes

Note When using database sharding and table sharding in PolarDB-X, note the following:

- In a PolarDB-X instance, the sharding method of a logical table is defined jointly by a sharding function and a shard key. The sharding function contains the number of shards to be created and the routing algorithm. The shard key also specifies the MySQL data type of the shard key.
- When the database sharding function is the same as the table sharding function and the database shard key is the same as the table shard key in a PolarDB-X instance, the same sharding method is used for database sharding and table sharding. This allows the PolarDB-X instance to uniquely locate one physical table in a physical database based on the value of the shard key.
- If the database sharding method and the table sharding method of a logical table are different and an SQL query does not contain both database shard key and table shard key, the PolarDB-X instance scans all database shards or all table shards when processing the SQL query.

Support for data types of PolarDB-X DDL sharding functions

Different PolarDB-X DDL sharding functions support different data types. The following table lists the support for various data types in PolarDB-X sharding functions (√ indicates supported and × indicates not supported).

Support for data types in PolarDB-X DDL sharding functions

Sharding function	BIGINT	INT	MEDIUMINT	SMALLINT	TINYINT	VARCHAR	CHAR	DATE	DATETIME	TIMESTAMP	Other types
HASH	√	√	√	√	√	√	√	×	×	×	×
UNI_HASH	√	√	√	√	√	√	√	×	×	×	×
RANGE_HASH	√	√	√	√	√	√	√	×	×	×	×
RIGHT_SHIFT	√	√	√	√	√	×	×	×	×	×	×
MM	×	×	×	×	×	×	×	√	√	√	×
DD	×	×	×	×	×	×	×	√	√	√	×

Syntax description for PolarDB-X DDL sharding functions

PolarDB-X is compatible with the CREATE TABLE statement in MySQL, and additionally provides the `drds_partition_options` keyword to support database sharding and table sharding:

```
CREATE [TEMPORARY] TABLE [IF NOT EXISTS] tbl_name
  (create_definition,...)
  [table_options]
  [drds_partition_options]
  [partition_options]
CREATE [TEMPORARY] TABLE [IF NOT EXISTS] tbl_name
  [(create_definition,...)]
  [table_options]
  [drds_partition_options]
  [partition_options]
  select_statement
drds_partition_options:
  DBPARTITION BY
    {{HASH|YYYYMM|YYYYWEEK|YYYYDD|YYYYMM_OPT|YYYYWEEK_OPT|YYYYDD_OPT}([column])}
    [TBPARTITION BY
      {{HASH|MM|DD|WEEK|MMDD|YYYYMM|YYYYWEEK|YYYYDD|YYYYMM_OPT|YYYYWEEK_OPT|YYYYDD_OPT}(column)}
     [TBPARTITIONS num]
    ]
```

11.11.6.2. HASH

Requirements

- The shard key must be an integer or a string.
- This sharding function has no requirements on the version of a Distributed Relational Database Service (DRDS) instance. It supports all DRDS instances by default.

Routing method

When the HASH function is run by using different shard keys for database sharding and table sharding, perform the remainder operation on the value of the database shard key based on the number of database shards. If the value of the shard key is a string, the string is converted to a hash value before route calculation. For example, HASH('8') is equivalent to 8 % D, where D indicates the number of database shards.

When the UNI_HASH function is run by using the same shard key for both database sharding and table sharding, perform the remainder operation on the value of the shard key based on the total number of table shards. For example, assume that two database shards are created, each database shard contains four table shards, table shards 0 to 3 are stored in database shard 0, and table shards 4 to 7 are stored in database shard 1. If a key value is 15, the key value 15 is distributed to table shard 7 in database shard 1, because 15 % (2 x 4) = 7.

Scenarios

- HASH is applicable when database sharding is implemented by user ID or order ID.
- HASH is also applicable when the shard key is a string.

Examples

If you need to create a non-partition table in database shards by using the HASH function based on the ID column, you can use the following CREATE TABLE statement:

```
create table test_hash_tb (
  id int,
  name varchar(30) DEFAULT NULL,
  create_time datetime DEFAULT NULL,
  primary key(id)
) ENGINE=InnoDB DEFAULT CHARSET=utf8 dbpartition by HASH(ID);
```

Notes

The HASH is a simple modulus operation. The output distribution of the HASH function can be even only when the values in the shard column are evenly distributed.

11.11.6.3. UNI_HASH

Requirements

- The shard key must be an integer or a string.
- The version of the PolarDB-X instance must be 5.1.28-1508068 or later. For more information about the PolarDB-X release notes, see View the instance version.

Routing method

When the UNI_HASH function is used for database sharding, perform a remainder operation on the value of the database shard key based on the number of database shards. If the value of the shard key is a string, the string is converted to a hash value before route calculation. For example, HASH('8') is equivalent to 8 % D, where D indicates the number of database shards.

When the UNI_HASH function is run by using the same shard key for both database sharding and table sharding, perform the remainder operation on the value of the database shard key based on the number of database shards first (this step is different from that in the HASH function). Then, the data is evenly distributed to the table shards in the database shard.

Scenarios

- UNI_HASH is applicable when database sharding is implemented by user ID or order ID.
- UNI_HASH is also applicable when the shard key is an integer or a string.
- UNI_HASH can be used when the following conditions are met: Two logical tables need to be partitioned into different numbers of table shards in database shards based on the same shard key. In addition, the two tables

are frequently joined by using a JOIN statement based on the shard key.

Comparison with HASH

When you use the UNI_HASH function to create a non-partition table in database shards, the routing method is the same as that used in the HASH function. Specifically, the route is calculated by performing the remainder operation on the key value of the database shard key based on the number of database shards.

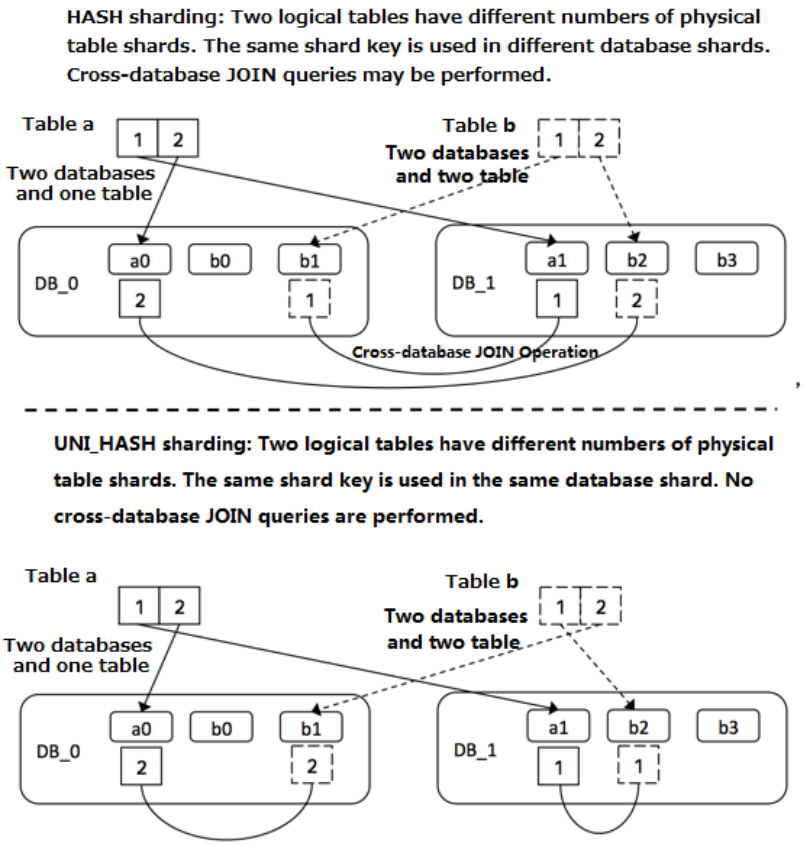
When the UNI_HASH function is run by using the same shard key for both database sharding and table sharding, as the number of table shards changes, the database shard route calculated based on the same key value may also change.

When the UNI_HASH function is run by using the same shard key for both database sharding and table sharding, the database shard route calculated based on the same key value is always the same regardless of the number of table shards.

If two logical tables need to be partitioned into different table shards in database shards based on the same shard key, when the two tables are joined by using the HASH function based on the shard key, multi-database join may occur. However, when the two tables are joined by using the UNI_HASH function based on the shard key, multi-database join does not occur.

Assume that you have two database shards and two logical tables, and each database shard in logical table a stores one table shard and each database shard in logical table b stores two table shards. The following figures separately show the results of a JOIN query for logical tables a and b after the HASH function is used for sharding and the results of a JOIN query for logical tables a and b after the HASH function is used for sharding.

Comparison between HASH and UNI_HASH



Examples

If you need to create four table shards in each database shard by using the UNI_HASH function based on the ID column, you can run the following CREATE TABLE statement:

```
create table test_hash_tb (
  id int,
  name varchar(30) DEFAULT NULL,
  create_time datetime DEFAULT NULL,
  primary key(id)
) ENGINE=InnoDB DEFAULT CHARSET=utf8
dbpartition by UNI_HASH(ID)
tbpartition by UNI_HASH(ID) tbpartitions 4;
```

Precautions

The UNI_HASH is a simple modulus operation. The output distribution of the UNI_HASH function can be even only when the values in the shard column are evenly distributed.

11.11.6.4. RIGHT_SHIFT

Requirements

- The shard key must be an integer.
- The version of the PolarDB-X instance must be 5.1.28-1320920 or later. For more information, see View the instance version.

Routing method

Shift the value of the database shard key to the right by a specified number of binary digits, and then perform the remainder operation on the obtained integer based on the number of database shards or table shards. In particular, you can specify the number of shifted digits by running a data definition language (DDL) statement.

Scenarios

RIGHT_SHIFT is applicable to improve the evenness of the hash results when the lower-digit parts of most shard key values are very similar to each other but the higher-digit parts vary greatly.

Assume that four shard key values are available: 12340000, 12350000, 12460000, and 12330000. The four lower digits of the four values are all 0000. Directly hashing the values of the shard keys outputs poor results. However, if you run the RIGHT_SHIFT(shardKey, 4) statement to shift the values of the shard keys to the right by four digits, to obtain 1234, 1235, 1246, and 1233, the hashing results are improved.

Examples

If you need to use the ID column as a shard key and shift the values of the ID column to the right by four binary digits to obtain hash values, you can run the following CREATE TABLE statement:

```
create table test_hash_tb (
  id int,
  name varchar(30) DEFAULT NULL,
  create_time datetime DEFAULT NULL,
  primary key(id)
) ENGINE=InnoDB DEFAULT CHARSET=utf8
dbpartition by RIGHT_SHIFT(id, 4)
tbpartition by RIGHT_SHIFT(id, 4) tbpartitions 2;
```

Precautions

The number of shifted digits cannot exceed the number of digits occupied by the integer.

11.11.6.5. RANGE_HASH

Requirements

- The shard key must be a character or a number.
- The version of the PolarDB-X instance must be 5.1.28-1320920 or later. For more information, see View the instance version.

Routing method

Calculate the hash value based on the last N digits of any shard key and then perform the remainder operation on the hash value based on the number of database shards. This completes the route computing. The number N is the third parameter in the function.

For example, during calculation of the RANGE_HASH(COL1, COL2, N) function, COL1 is preferentially selected and then truncated to obtain the last N digits for calculation. If COL1 does not exist, COL2 is selected and truncated for calculation.

Scenarios

RANGE_HASH is applicable to scenarios where a table needs to be partitioned by two shard keys but query is performed only based on the value of one shard key.

Examples

Assume that a PolarDB-X database is partitioned into eight physical databases. Our customer has the following requirements:

The order table of a business needs to be partitioned into database shards by buyer ID and order ID. The query is executed based on either the buyer ID or order ID as the condition.

In this case, you can run the following DDL statement to create the order table:

```
create table test_order_tb (
  id int,
  buyer_id varchar(30) DEFAULT NULL,
  order_id varchar(30) DEFAULT NULL,
  create_time datetime DEFAULT NULL,
  primary key(id)
  ) ENGINE=InnoDB DEFAULT CHARSET=utf8
  dbpartition by RANGE_HASH(buyer_id,order_id, 10)
  tbpartition by RANGE_HASH (buyer_id,order_id, 10) tbpartitions 3;
```

Precautions

- Neither of the two shard keys can be modified.
- Data insertion fails if the two shard keys point to different database shards or table shards.

11.11.6.6. MM

Requirements

- The shard key must be of the DATE, DATETIME, or TIMESTAMP type.
- MM is only applicable to table sharding.
- The version of the PolarDB-X instance must be 5.1.28-1320920 or later. For more information, see View the instance version.

Routing method

Perform the remainder operation based on the month that corresponds to the time value of the database shard key to obtain the table shard subscript.

Scenarios

MM can be used to partition tables by month. The table shard name indicates a specific month.

Examples

Assume that we need to perform database sharding by ID, perform table sharding for the create_time column by month, and map every month to a physical table. The data definition language (DDL) statement is as follows:

```
create table test_mm_tb (
  id int,
  name varchar(30) DEFAULT NULL,
  create_time datetime DEFAULT NULL,
  primary key(id)
) ENGINE=InnoDB DEFAULT CHARSET=utf8
dbpartition by HASH(id)
tbpartition by MM(create_time) tbpartitions 12;
```

Precautions

When you partition tables with MM, ensure that each database shard has no more than 12 table shards because a year has 12 months.

11.11.6.7. DD

Requirements

- The shard key must be of the DATE, DATETIME, or TIMESTAMP type.
- DD is only applicable to table sharding.
- The version of the PolarDB-X instance must be 5.1.28-1320920 or later. For more information, see View the instance version.

Routing method

Perform the remainder operation based on the day of the month that corresponds to the time value of the database shard key to obtain the table shard subscript.

Scenarios

DD can be used to partition tables based on a specified number of days in a month, that is, a date. The subscript of the table shard name indicates the day in a month. A month has 31 days at most.

Examples

Assume that we need to perform database sharding by ID, perform table sharding for the create_time column by day, and map every day to a physical table. The data definition language (DDL) statement is as follows:

```
create table test_dd_tb (
  id int,
  name varchar(30) DEFAULT NULL,
  create_time datetime DEFAULT NULL,
  primary key(id)
) ENGINE=InnoDB DEFAULT CHARSET=utf8
dbpartition by HASH(id)
tbpartition by DD(create_time) tbpartitions 31;
```

Precautions

When you partition tables with DD, ensure that each database shard has no more than 31 table shards because a month has 31 days at most.

11.11.6.8. WEEK

Requirements

- The shard key must be of the DATE, DATETIME, or TIMESTAMP type.
- WEEK is only applicable to table sharding.
- The version of the PolarDB-X instance must be 5.1.28-1320920 or later. For more information, see View the instance version.

Routing method

Perform the remainder operation based on the day of a week that corresponds to the time value of the database shard key to obtain the table shard subscript.

Scenarios

WEEK can be used to partition tables based on days in a week. The subscript of the table shard name corresponds to each day of a week, from Monday to Sunday.

Examples

Assume that we need to perform database sharding by ID, perform table sharding for the create_time column by week, and map every day of a week (from Monday to Sunday) to a physical table. The data definition language (DDL) statement is as follows:

```
create table test_week_tb (
  id int,
  name varchar(30) DEFAULT NULL,
  create_time datetime DEFAULT NULL,
  primary key(id)
) ENGINE=InnoDB DEFAULT CHARSET=utf8
dbpartition by HASH(name)
tbpartition by WEEK(create_time) tbpartitions 7;
```

Precautions

When you partition tables with WEEK, ensure that each database shard has no more than seven table shards because a week has seven days.

11.11.6.9. MMDD

Requirements

- The shard key must be of the DATE, DATETIME, or TIMESTAMP type.
- MMDD is only applicable to table sharding.
- The version of the PolarDB-X instance must be 5.1.28-1320920 or later. For more information, see View the instance version.

Routing method

Perform the remainder operation based on the number of days in a year that corresponds to the time value of the database shard key to obtain the table sharding subscript.

Scenarios

MMDD can be used to partition tables based on the number of days in a year that corresponds to a date in that year. The subscript of the table shard name indicates the day in that year, with a maximum of 366 days in a year.

Examples

Assume that we need to perform database sharding by ID, create tables for the create_time column by date (month-day), and map every day of a year to a physical table. The data definition language (DDL) statement is as follows.

```
create table test_mmdd_tb (
  id int,
  name varchar(30) DEFAULT NULL,
  create_time datetime DEFAULT NULL,
  primary key(id)
) ENGINE=InnoDB DEFAULT CHARSET=utf8
dbpartition by HASH(name)
tbpartition by MMDD(create_time) tbpartitions 365;
```

Precautions

When you partition tables with MMDD, ensure that each database shard has no more than 366 table shards because a year has 366 days at most.

11.11.6.10. YYYYMM

Requirements

- The shard key must be of the DATE, DATETIME, or TIMESTAMP type.
- The version of the PolarDB-X instance must be 5.1.28-1320920 or later. For more information, see View the instance version.

Routing method

Calculate the hash value based on the year and months of the year in the time value of the database shard key and then perform the remainder operation on the hash value based on the number of database shards. This completes route computing.

For example, YYYYMM('2012-12-31 12:12:12') is equivalent to (2012 x 12 + 12) % D, where D indicates the number of database shards.

Scenarios

YYYYMM can be used to partition databases by year and month. We recommend that you use YYYYMM with tbpartition YYYYMM(ShardKey).

Assume that a PolarDB-X database is partitioned into eight physical databases. Our customer has the following requirements:

- Perform database sharding for a service by year and month.
- Distribute data from every month within two years to a separate table shard.
- Distribute a query with the database and table shard keys to a physical table shard of a physical database shard.

The preceding requirements can be met by using YYYYMM. For the requirement of distributing data from every month within two years to a table shard (that is, one table shard stores the data of one month), create at least 24 physical table shards because a year has 12 months. Create three physical table shards for each database shard because the PolarDB-X instance contains eight database shards. The data definition language (DDL) statement is as follows.

```
create table test_yyyymm_tb (
    id int,
    name varchar(30) DEFAULT NULL,
    create_time datetime DEFAULT NULL,
    primary key(id)
  ) ENGINE=InnoDB DEFAULT CHARSET=utf8
  dbpartition by YYYYMM(create_time)
  tbpartition by YYYYMM(create_time) tbpartitions 3;
```

Precautions

- YYYYMM does not support distributing data from every month in every year to a separate table shard. Instead, the number of table shards must be fixed.
- After a cycle over months (for example, a cycle exists between 2012-03 and 2013-03), data from the same month may be routed to the same database or table shard, depending on the actual number of table shards.

11.11.6.11. YYYYWEEK

Requirements

- The shard key must be of the DATE, DATETIME, or TIMESTAMP type.
- The version of the PolarDB-X instance must be 5.1.28-1320920 or later. For more information, see View the instance version.

Routing method

Calculate the hash value based on the year and weeks of the year in the time value of the database shard key and then perform the remainder operation on the hash value based on the number of database shards. This completes route computing.

For example, YYYYWEEK('2012-12-31 12:12:12') is equivalent to (2013 x 52 + 1) % D, with the date 2012-12-31 falling on the first week of 2013, where D indicates the number of database shards.

Scenarios

YYYYWEEK can be used to partition databases by year and the number of weeks in a year. We recommend that you use YYYYWEEK with tbpartition YYYYWEEK(ShardKey).

Assume that a PolarDB-X database is partitioned into eight physical databases. Our customer has the following requirements:

- Perform database sharding for a service by year and by week.
- Distribute data from every week within two years to a separate table shard.
- Distribute a query with the database and table shard keys to a physical table shard of a physical database shard.

The preceding requirements can be met by using YYYYWEEK. For the requirement of distributing data from every week within two years to a table shard (that is, one table shard stores the data of one week), create at least 106 physical table shards because a year has roughly 53 weeks (rounded). Create 14 physical table shards for each database shard because the PolarDB-X instance contains eight database shards (14 x 8 = 112 > 106). We recommend that the number of table shards be an integer multiple of the number of database shards. The data definition language (DDL) statement is as follows:

```
create table test_yyyymm_tb (
    id int,
    name varchar(30) DEFAULT NULL,
    create_time datetime DEFAULT NULL,
    primary key(id)
  ) ENGINE=InnoDB DEFAULT CHARSET=utf8
  dbpartition by YYYYWEEK(create_time)
  tbpartition by YYYYWEEK(create_time) tbpartitions 14;
```

Precautions

- YYYYWEEK does not support distributing data from every week in every year to a separate table shard. Instead, the number of table shards must be fixed.
- After a cycle over weeks (for example, a cycle exists between the first week of 2012 and the first week of 2013), data from the same week after a cycle may be routed to the same database shard or table shard, depending on the actual number of table shards.

11.11.6.12. YYYYDD

Requirements

- The shard key must be of the DATE, DATETIME, or TIMESTAMP type.
- The version of the PolarDB-X instance must be 5.1.28-1320920 or later. For more information, see View the instance version.

Routing method

Calculate the hash value based on the year and days of the year in the time value of the database shard key and then perform the remainder operation on the hash value based on the number of database shards. This completes route computing.

For example, YYYYDD('2012-12-31 12:12:12') is equivalent to (2012 x 366 + 365) % D, with 2012-12-31 as the 365th day of 2012, where D indicates the number of database shards.

Scenarios

Database sharding is performed by year and the number of days in a year. We recommend that you use YYYYDD with tbpartition YYYYDD(ShardKey).

Assume that a PolarDB-X database is partitioned into eight physical databases. Our customer has the following requirements:

- Perform database sharding for a service by year and day.
- Distribute data from every week within two years to a separate table shard.
- Distribute a query with the database and table shard keys to a physical table shard of a physical database shard.

The preceding requirements can be met by using YYYYDD. For the requirement of distributing data from every day within two years to a table shard (that is, one table shard stores the data of one day), create at least 732 physical table shards because a year has up to 366 days. Create 92 physical table shards for each database shard because the PolarDB-X instance contains eight database shards (732/8 = 91.5, rounded to 92). We recommend that the number of table shards be an integer multiple of the number of database shards. The data definition language (DDL) statement is as follows:

```
create table test_yyyydd_tb (
    id int,
    name varchar(30) DEFAULT NULL,
    create_time datetime DEFAULT NULL,
    primary key(id)
  ) ENGINE=InnoDB DEFAULT CHARSET=utf8
  dbpartition by YYYYDD(create_time)
  tbpartition by YYYYDD(create_time) tbpartitions 92;
```

Precautions

- YYYYDD does not support distributing data from every day in every year to a separate table shard. Instead, the number of table shards must be fixed.
- After a cycle of a specific date (for example, a cycle exists between 2012-03-01 and 2013-03-01), data from the same date may be routed to the same database shard or table shard, depending on the actual number of table shards.

11.11.6.13. YYYYMM_OPT

Requirements

- The shard key must be of the DATE, DATETIME, or TIMESTAMP type.
- The year and month of user data increase naturally over time, rather than randomly.
- The version of the PolarDB-X instance must be 5.1.28-1320920 or later. For more information, see View the instance version.

Optimizations

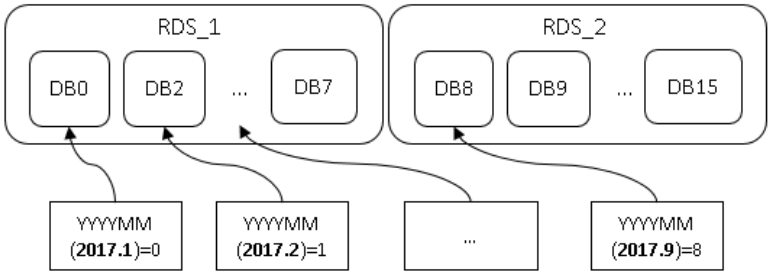
Compared with YYYYMM, YYYYMM_OPT maintains the even distribution of data among ApsaraDB RDS for MySQL instances as the timeline increases.

For example, assume that two ApsaraDB RDS for MySQL instances are attached to a PolarDB-X instance, with 16 database shards. DB0 to DB7 shards are located on one ApsaraDB RDS for MySQL instance, and DB8 to DB15 shards are located on the other ApsaraDB RDS for MySQL instance.

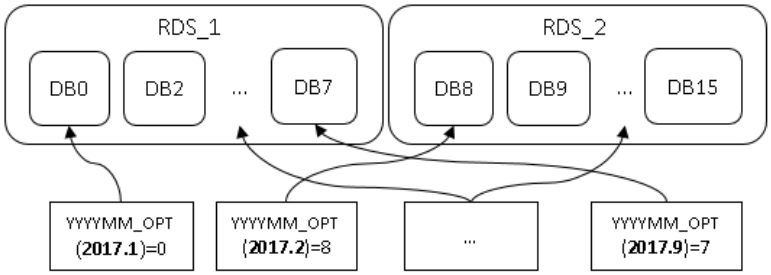
The following figure shows the mappings when YYYYMM and YYYYMM_OPT are used for database sharding, respectively.

Comparison between YYYYMM and YYYYMM_OPT

As the time goes on linearly, YYYYMM fills data in ApsaraDB for RDS instances in sequence (data is first distributed to the database shards of RDS_1, then to the database shards of RDS_2, and then to the database shards of RDS_1 again).



YYYYMM_OPT evenly distributes data between ApsaraDB for RDS instances as the time goes on (data is alternately distributed between RDS_1 and RDS_2, so that the data size of the two RDS instances is balanced).



- YYYYMM_OPT distributes data evenly to each ApsaraDB RDS for MySQL instance, helping to maximize the performance of each ApsaraDB RDS for MySQL instance.
- How to choose between YYYYMM and YYYYMM_OPT:
  - YYYYMM_OPT can be used to distribute data evenly to each ApsaraDB RDS for MySQL instance if the time of service data generation increases sequentially and the data volume does not differ much between the time points.
  - YYYYMM is applicable if the time of data generation increases randomly rather than sequentially.

Routing method

- Calculate the hash value based on the year and months of the year in the time value of the database shard key and then perform the remainder operation on the hash value based on the number of database shards. This completes route computing.
- The hash calculation based on the database and table shard key considers the data distribution among the ApsaraDB RDS for MySQL instances that connect to the PolarDB-X instances.

Scenarios

- Databases and tables need to be partitioned by year and month, respectively.
- Data must be evenly distributed to each ApsaraDB RDS for MySQL instance that connects to the PolarDB-X instance.
- The time of the shard key increases sequentially rather than randomly, and the data volume is relatively average from month to month. For example, the number of monthly journal logs increases every month, and the log data is not concentrated on the same ApsaraDB RDS for MySQL instance.

Precautions

- YYYYMM_OPT does not support distributing data from every month in every year to a separate table shard. Instead, the number of table shards must be fixed.
- After a cycle over months (for example, a cycle exists between 2012-03 and 2013-03), data from the same month may be routed to the same database or table shard, depending on the actual number of table shards.

11.11.6.14. YYYYWEEK_OPT

Requirements

- The shard key must be of the DATE, DATETIME, or TIMESTAMP type.
- The version of the PolarDB-X instance must be 5.1.28-1320920 or later. For more information, see View the instance version.

Optimizations
